Mahogany, Oak

PICTURE SIZE...327 square inches on a 24CP4A Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 24-S-529, 24-S-531 & 24-S-532

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 24-S-529U, 24-S-531U & 24-S-532U

Any of 70 UHF channels....................470 mc. to 890 mc.
Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency....................45.75 mc.
Sound I-F Carrier Frequency....................41.25 mc.

POWER RATING....................245 watts

AUDIO POWER OUTPUT RATING..........4 watts max.

VIDEO RESPONSE....................To 3.5 mc.

SWEEP DEFLECTION....................Magnetic

FOCUS....................Magnetic

ANTENNA INPUT IMPEDANCE

Models 24-S-529, 24-S-531 & 24-S-532

Choice: 300 ohms balanced or 72 ohms unbalanced.

Models 24-S-529U, 24-S-531U & 24-S-532U

UHF—300 ohms balanced.
VHF—300 ohms balanced.

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK22D (24-S-529, 24-S-531 & 24-S-532)	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK30D (or E) (24-S-529U, 24-S-531U & 24-S-532U)	
(1) RCA 6AF4	UHF Oscillator
(2) RCA 6BQ7A	VHF R-F Amplifier UHF I-F Amplifier
(3) RCA 6X8	VHF R-F Oscillator & Mixer UHF I-F Amplifier

A K3D or 1N82 crystal is used as the UHF mixer.

All Models

(1) RCA 6CF6	1st Picture I-F Amplifier
(2) RCA 6CF6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 12AU7	Picture 2nd Det. and Horiz. Sync. Sep.
(5) RCA 6X8	Video Amplifier and Vert. Sync. Sep.
(6) RCA 12AU7	Video Output & AGC
(7) RCA 6AU6	1st Sound I-F Amplifier
(8) RCA 6AU6	2nd Sound I-F Amplifier
(9) RCA 6AL5	Ratio Detector
(10) RCA 6AV6	1st Audio Amplifier
(11) RCA 6AQ5	Audio Output
(12) RCA 12AU7	Vert. Osc. and Disch. & Sync. Output
(13) RCA 6AQ5	Vertical Sweep Output
(14) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(15) RCA 6CD6G	Horizontal Sweep Output
(16) RCA 6AU4GT	Damper
(17) RCA 1B3-GT	High Voltage Rectifier
(18) RCA 24CP4A	Kinescope
(19) RCA 5U4G	Rectifier
(20) RCA 5Y3GT	Rectifier

SCANNING....................Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY..........15,750 cps

VERTICAL SWEEP FREQUENCY....................60 cps

FRAME FREQUENCY (Picture Repetition Rate).....30 cps

CHASSIS DESIGNATIONS

CHASSIS	TUNER	KINE-SCOPE	MODELS
KCS84F	KRK22D	24CP4A	24-S-529 24-S-532 (Horizontal Mounting)

Figure 5—KRK22D R-F Oscillator Adjustments

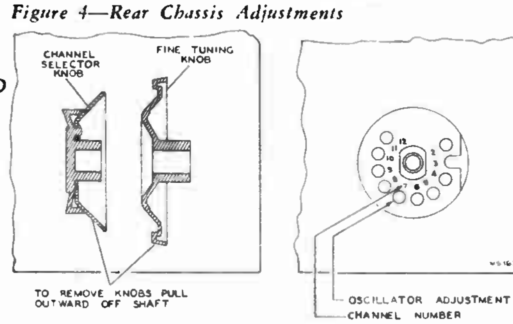

Figure 6—KRK30D (or E) VHF R-F Oscillator

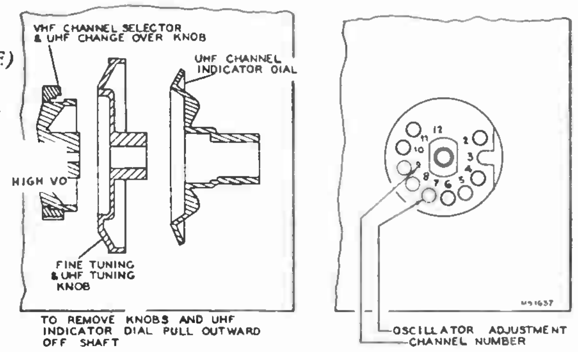

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable preamplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

KRK22D OR KRK30D (OR E) ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 (or L53) to the channel selector switch S1-E (or S4).

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R127 and R148. Set the poteniometer to produce approximaely −5.0 volts of bias at the junction of R127 and R148.

Connect an oscilloscope to the junction of R135 and L102 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 (or L54) in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 (or L57) for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 (or L53) to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 (or L53) to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 19 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by returning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 (or L56) and L3 (or L55) to obtain the response shown in figure 20. L3 (or L55) is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 (or L56) should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L5 (or L53) and S1-E (or S4). Replace V106.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

Models 21-S-529, 21-S-531 and 21-S-532

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R123 and C142. Turn the AGC control fully clockwise.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R123 and C142. The second battery will be used later.

Set the bias to produce approximately —5.0 volt of bias at the junction of R123 and C142.

Connect the "VoltOhmyst" to the junction of R135 and L102 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R135 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R135, L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc.	L118

Models 24-S-529U, 24-S-531U and 24-S-532U

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R123 and C142.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R123 and C142. Adjust the potentiometer for —5.0 volts indication on the "VoltOhmyst."

Connect the "VoltOhmyst" to the junction of R135 and L102 and to ground.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R135 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction

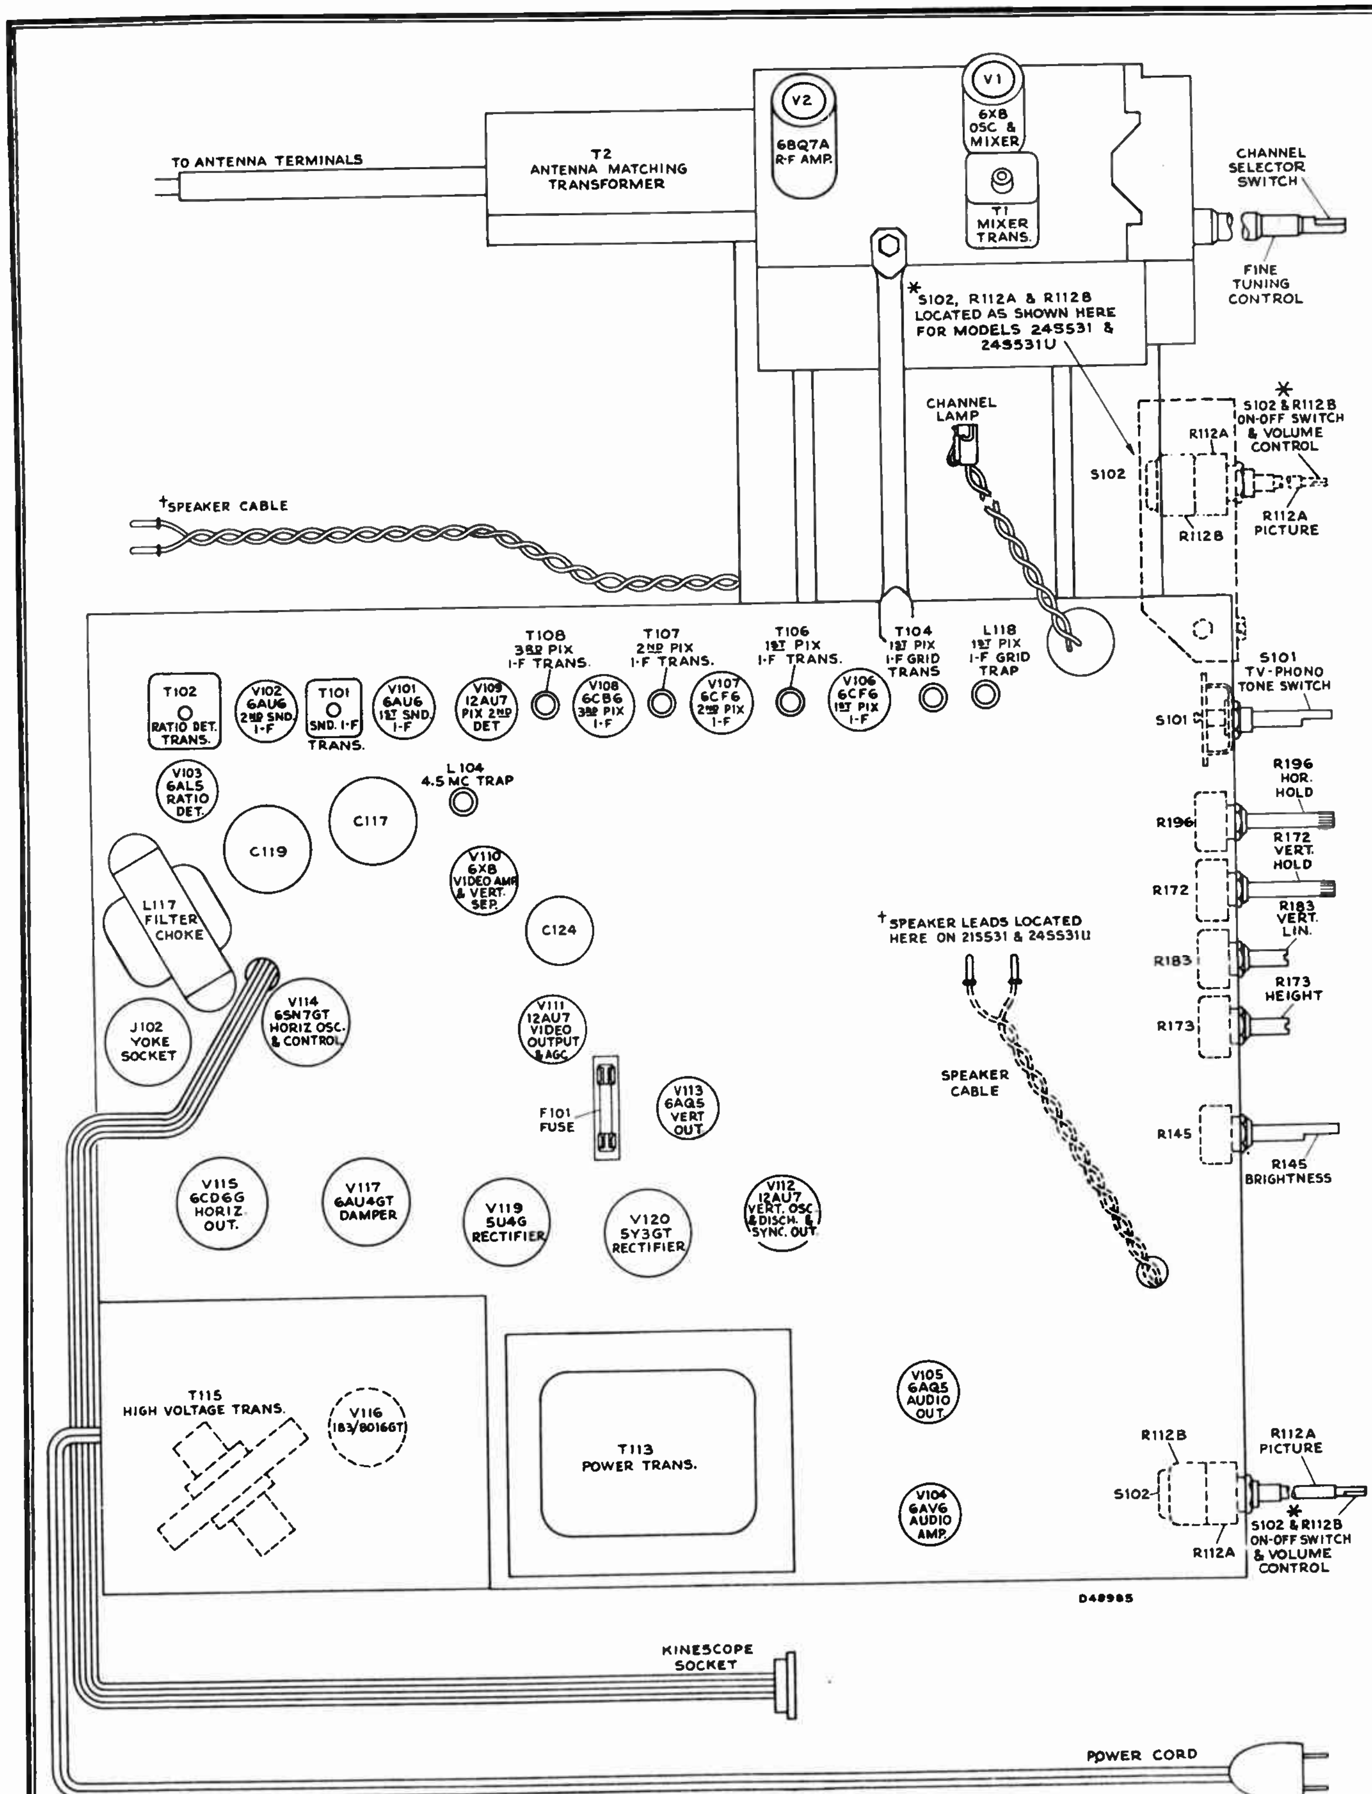

Figure 7—Chassis Top View (shown with KRK22D Tuner)

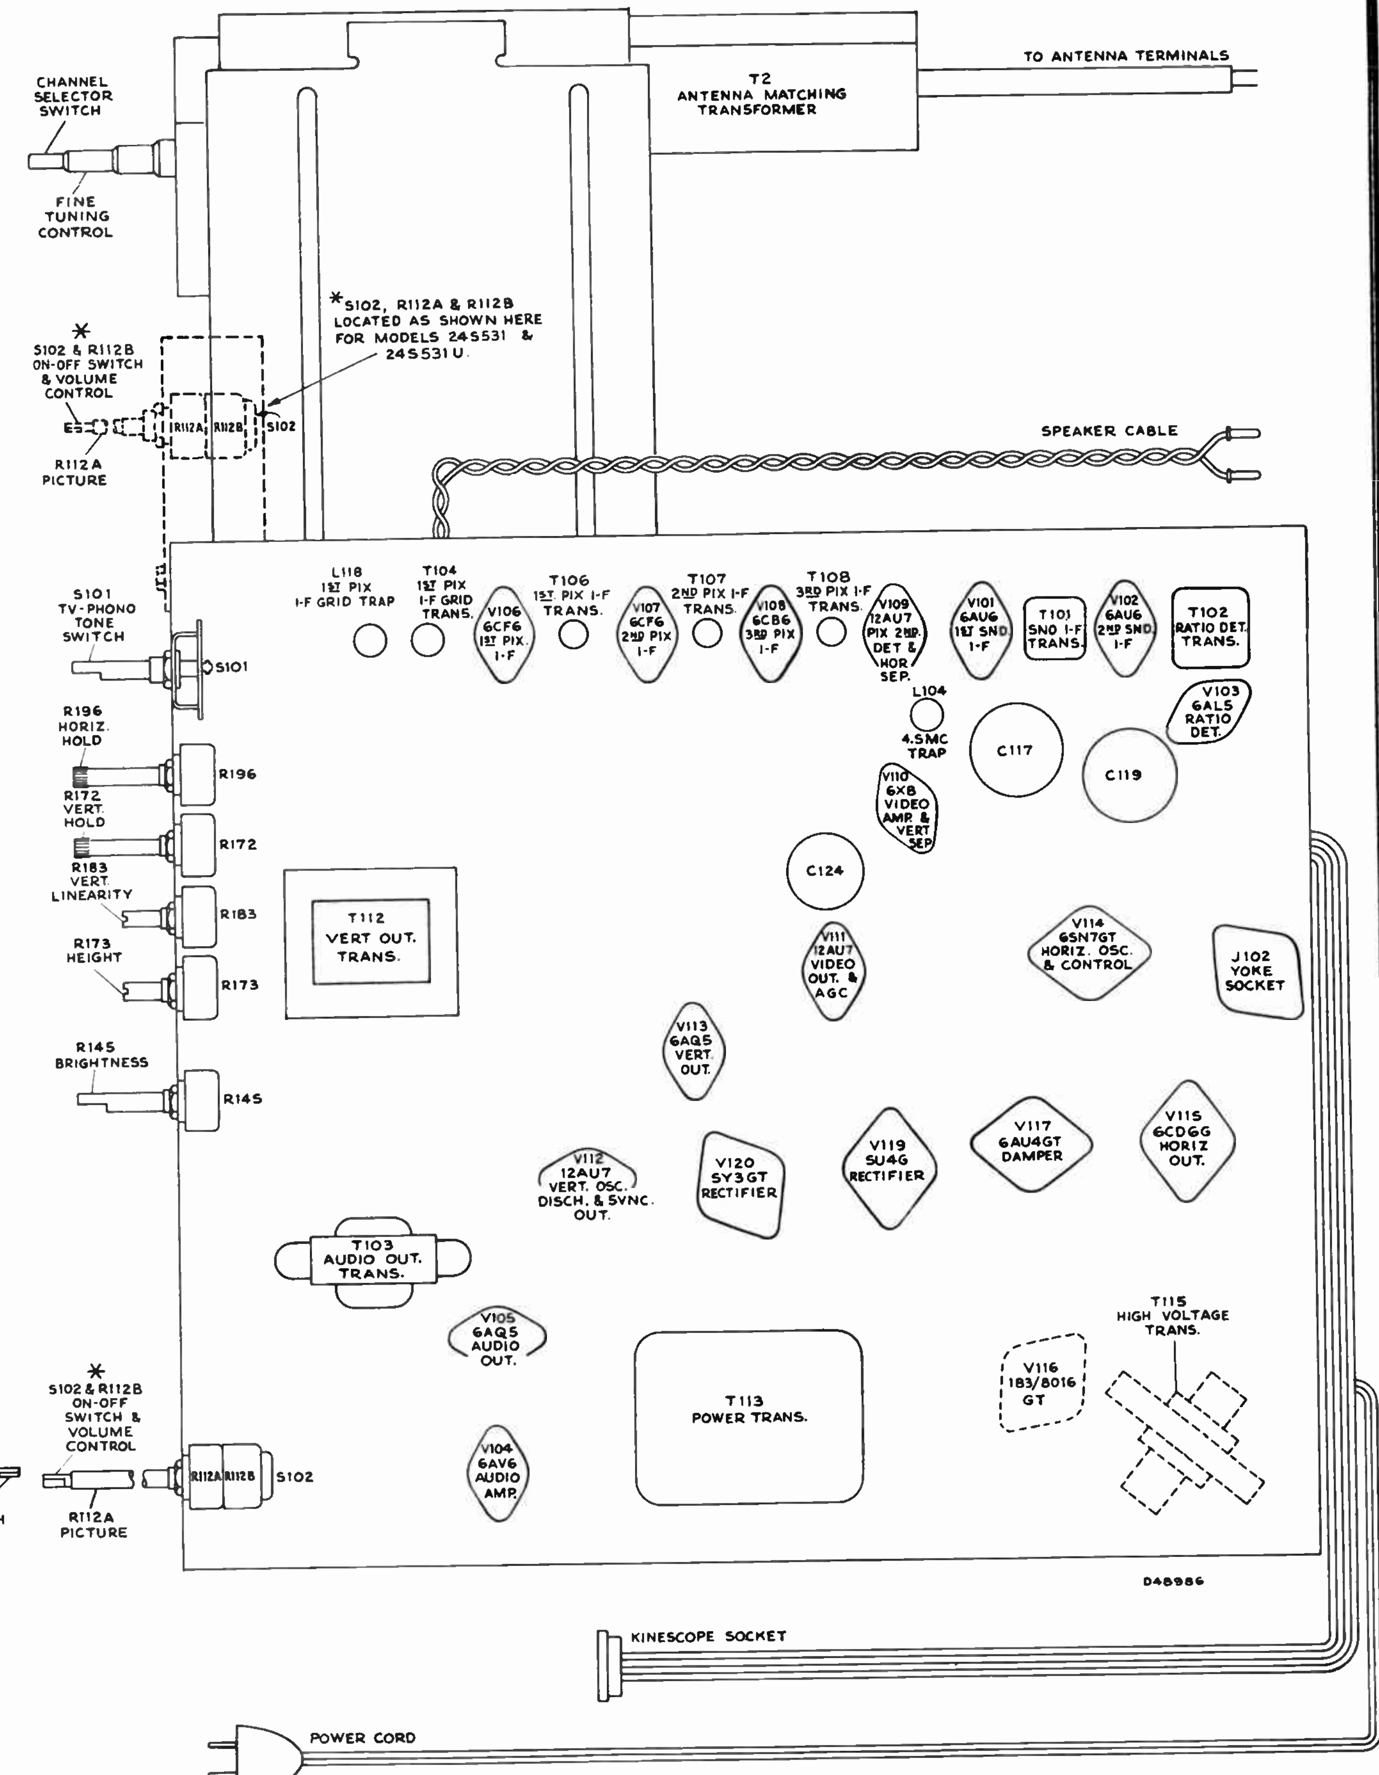

Figure 8—Chassis Bottom View (shown with KRK22D Tuner)

of R135 and L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc. L118

SWEEP ALIGNMENT OF PICTURE I-F.—

Models 21-S-529, 21-S-531 and 21-S-532

To align T1 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C122 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R123 and C142. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T1 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C122 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 23. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 24.

Models 21-S-529U, 21-S-531U and 21-S-532U

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C122 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R123 and C142. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C122 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 12.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 13.

To align the I-F amplifier circuit of the KRK30D (or E), connect the VHF sweep generator to the front terminal of the IN82 crystal holder in series with a 1000 ohms and 1500 mmf ceramic capacitor. Use the shortest leads possible, grounding the sweep ground lead to the tuner case.

To do this, remove the crystal cover and connect the resistor, after insulating the lead with tubing, to the crystal front terminal.

Set the UHF CHANGEOVER switch to the UHF position, and the UHF TUNING between channels 68 and 69 at 800 mc.

Connect a 180 ohm composition resistor and a 1500 mmf. capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground. Connect the oscilloscope diode probe to the junction between the resistor and capacitor.

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.3 or less peak-to-peak on the oscilloscope.

Adjust C308, on the UHF section, and L9, on the VHF section, of the tuner for maximum gain with picture and sound carrier markers as shown in figure 14.

If necessary adjust L27 to place the 45.75 mc. marker at the peak of the curve. Adjust L43 for minimum tilt of the curve as shown in figure 13.

Remove the resistor, capacitor and diode probe from TP3 and connect the oscilloscope to the junction of R135 and L102. Use 3.0v. peak-to-peak on the oscilloscope.

Retouch L307 and L9 slightly, if necessary, to produce the curve shown in figure 14. Do not retouch T2, T104, T106, T107 or T108.

Connect the VHF sweep generator to the antenna terminals. Keep the AGC bias at —3.0 V and the I-F bias at —5.0 volts.

Couple the signal generator loosely to the grid of the first picture I-F amplifier.

Switch through all VHF channels and check for proper curve shape as in figure 13. Retouch T107 and T108 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the antenna terminals. Check on all UHF channels for proper wave shape as shown in figure 13, retouching T107 and T108 if necessary to correct any overall tilt.

Remove the sweep and marker generators and the bias supplies.

KRK22D TUNER ALIGNMENT

Models 24-S-529, 24-S-531 and 21-S-532

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the FM trap L53.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn the C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in Figure 19, to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers, of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in Figure 18.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and bandwidth.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L5 for an audible beat. Adjust L44, L46, and L58 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L58 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK30D (OR E) TUNER ALIGNMENT

Models 24-S-529U, 24-S-531U and 21-S-532U

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f" in terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 19 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in figure 18.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L14, L48 and L32 for proper curve shape as shown in figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT.—R-F alignment of the UHF section of the tuner may only be performed with the UHF section removed from the tuner assembly. RF adjustments require removal of the tuner shield which may only be done with the UHF tuner separate from its mounting.

I-F and oscillator adjustments may be accomplished without removing the tuner.

Connect a 100 ohm composition resistor between the center conductor of the I-F cable W301 and the tuner case.

Connect the oscilloscope to the center conductor of W301 at the 100 ohm resistor, employing the preamplifier if needed with the oscilloscope used. Ground the oscilloscope to the tuner case.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 5° and 164° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. With the stop pin on the tuner against the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 164°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the junction of W301 and L310. This may be done by inserting the lead from the resistor, which should be covered with insulated tubing, through the aperture provided for removal of the crystal. (See figure 9.) Insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitor tabs C304 and C305 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 11(A).

Adjust the oscillator trimmer capacitor C306 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 11(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 5°, Channel 14, position.

Adjust the oscillator trimmer C307 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown. The inductance loop L311 across the oscillator grid coil on some units, may be repositioned, if necessary, to bring the oscillator trimmer within range. Refer to figure 9 for location of the aperture for making this adjustment.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates must be knifed with the cover shield removed. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" between the center conductor of W301 and ground. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .03 and .35 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedance or an oscillator tube outside allowable limits.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 9). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L103 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R108 and C109.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst."

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R108 and C109. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst."

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 100 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video amplifier, pin 9 of V110.

Adjust the core of L104 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L104 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L104 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 9 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ADJUSTMENT.— Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R196, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C174B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 24. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, d-c. The symbol < means less than.

C168	73592	Capacitor—Fixed, paper, 0.047 mf., ±20%, 600 v. DC
C169		Same as C150
C170		Same as C111
C173		Same as C146
C174A, B	75217	Trimmer—dual trimmer, 10-160 mmf.
C176	79063	Capacitor—Fixed, mica, 47 mmf., ±5%, 1000 v. DC
C177		Same as C150
C178	73553	Capacitor—Fixed, paper, 0.047 mf., ±20%, 400 v. DC
C179	73562	Capacitor—Fixed, paper, 0.022 mf., ±20%, 400 v. DC
C180		Same as C110
C181	76476	Capacitor—Fixed, mica, 330 mmf., ±5%, 1000 v. DC
C182	73594	Capacitor—Fixed, paper, 0.01 mf., ±5%, 600 v. DC
C183		Same as C138.
C184	6479	Capacitor—Fixed, paper, 680 mmf., ±10% 600 v. DC
C185	75249	Capacitor—Fixed, paper, 0.001 mf., ±5%, 600 v. DC
L1 to L5 Incl.		Part of Antenna matching transformer
L6	78466	Coil—RF choke
L7	76562	Coil—RF amplifier coupling coil
L8	77859	Coil—RF grid switch return connector coil
L9	79542	Coil—I.F. input coil complete with adjustable core
L10 to L13 Incl.		(Part of S3 and S5)
L14	73458	Coil—Channel No. 6 RF grid coil (Part of S3 and S5)
L15 to L19 Incl.		(Part of S3 and S5)
L20	77921	Coil—Channel No. 13 RF plate coil (Part of S3 and S5)
L21 to L26 Incl.		(Part of S3 and S5)
L27	78584	Coil—RF plate I.F. coil (Part of S3)
L28 to L31 Incl.		(Part of S3 and S5)
L32	73460	Coil—Channel No. 6 RF plate coil (Part of S3 and S5)
L33	77206	Coil—Filament choke coil
L35	76763	Coil—Heater choke coil
L36	77919	Coil—Channel No. 13 mixer coil
L37 to L42 Incl.		(Part of S1 and S2)
L43	78583	Coil—Mixer I.F. coil (Part of S1 and S2)
L44 to L47 Incl.		(Part of S1 and S2)
L48	73874	Coil—Channel No. 6 mixer coil (Part of S1 and S2)
L49	77915	Coil—Channel No. 13 oscillator coil (Part of S1 and S2)
L50 to L60 Incl.		(Part of S1 and S2)
L61	78401	Coil—Channel No. 6 antenna coil
R1	502268	Resistor—Fixed, composition, 6800 ohms, ±20%, ½ w.
R2	502112	Resistor—Fixed, composition, 120 ohms, ±10%, ½ w.
R3	502410	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ w. (Part of S2)
R4, R5	502510	Resistor — Fixed, composition, 1 meg., ±10%, ½ w.
R6	502210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w. (Part of S3)
R7	522315	Resistor—Fixed, composition, 15,000 ohms, ±10%, 2 w.
R8		(Part of T2)
R9	502233	Resistor—Fixed, composition, 3300 ohms, ±10%, ½ w. (Part of S2)
R10, R11		Same as R3 (Part of S2)
R12		Same as R3
R13	522312	Resistor—Fixed, composition, 12,000 ohms, ±10%, 2 w.
R14	502182	Resistor—Fixed, composition, 820 ohms, ±10%, ½ w.
R19	502033	Resistor — Fixed, composition, 33 ohms, ±10%, ½ w. (Part of S2)

SYMBOL NO.	STOCK NO.	DESCRIPTION
R20		Same as R6
R21		Same as R2
T1	78396	Transformer—Antenna matching transformer complete
T2	78399	Transformer—Convertor transformer (R8)
C301 to C303 Incl.	79553	Capacitor—Variable tuning capacitor
C304, C305	79554	Stator—Oscillator stator assembly
C306	79555	Capacitor—Oscillator trimmer capacitor
C307	79556	Capacitor — Adjustable, ceramic, 0.8-3.5 mmf.
C308	79558	Capacitor—Trimmer, 10-50 mmf.
C309 to C311 Incl.	79559	Capacitor—Feed thru, 1000 mmf.
C312, C313	79560	Capacitor—Fixed, ceramic, 1 mmf., ±0.1 mmf., 500 v. DC, non-insulated
CR301	77489	Rectifier — UHF diode crystal germanium rectifier
L301, L302		Coil—RF tank plate
L303	79557	Tank Assembly—complete with capacitor (C7)
L304	79564	Board—Antenna terminal board assembly
L305 to L307 Incl.	79565	Choke—RF choke
L308, L309		Coil—Mixer coupling coil for oscillator and output section
L310	79567	Coil—I.F. output coil 0.15 microhenries
L311	79566	Coil—Oscillator loop coil
R301	502222	Resistor—Fixed, composition, 2200 ohms, ±10%, ½ w.
R302	512268	Resistor—Fixed, composition, 6800 ohms, ±10%, 1 w.
R303	502268	Resistor—Fixed, composition, 6800 ohms, ±10%, ½ w.
C186	73557	Capacitor—Fixed, paper, 0.1 mf., ±10%, 600 v. DC
C187	73786	Capacitor—Fixed, paper, 0.27 mf., ±10%, 200 v. DC
C188, C189	73597	Capacitor—Fixed, paper, 0.047 mf., ±10%, 1000 v. DC
C190	79022	Capacitor—Fixed, mica, 270 mmf., ±20%, 1000 v. DC
C192		Part of Yoke
C193	79018	Capacitor—Fixed, mica, 0.0039 mf., ±10%, 400 v. DC
C194 to C197 Incl.		Same as C120
C198	75643	Capacitor—Fixed, paper, 0.001 mf., ±10%, 600 v. DC
C199	73960	Capacitor—Fixed, ceramic, 1000 mmf., 500 v. DC
F101	78798	Fuse—0.45 amp
J101	35787	Connector—Phono input connector
J102	68590	Connector—Deflection Yoke connector, 8 contact, female
L101	73477	Choke—Filament choke coil
L102	75253	Coil—Peaking coil, 120 UH
L103	98482	Coil—Peaking coil, 250 UH
L104	76983	Coil—4.5 MC. trap
L105	77674	Coil—Peaking coil, 250 UH
L106	78222	Coil—Peaking coil, 250 UH
L107	75252	Coil—Peaking coil, 500 UH
L108	71529	Coil—Peaking coil, 120 UH
L109	76441	Coil—width coil
L110	76640	Choke—RF choke, 1.5 UH
L111	76442	Coil—Horizontal linearity coil
L112	73477	Choke—Filament choke
L113 to L116 Incl.		Part of Yoke
L117	77676	Choke—Filter choke
L118	78204	Coil—1st I.F. grid trap
L119		Same as L112.
P102	74594	Connector—Male connector for deflection yoke
PC101	76433	Transformer—1st, 2nd and 3rd Pix. I.F. transformers Includes T106, T107 and T108
R101	502082	Resistor — Fixed, composition, 82 ohms, ±10%, ½ w.
R102		(Part of T101)
R103	502210	Resistor — Fixed, composition, 1000 ohms, ±20%, ½ w.
R104	522310	Resistor — Fixed, composition, 10,000 ohms, ±20%, 2 w.
R105	512210	Resistor—Fixed, composition, 1000 ohms, ±10%, 1 w.
R106	77670	Resistor—Fixed, wire wound, 3300 ohms, ±10%, 7 w.
R107	502047	Resistor — Fixed, composition, 47 ohms, ±10%, ½ w.
R108	502339	Resistor—Fixed, composition, 39,000 ohms, ±10%, ½ w.
R109, R110	502310	Resistor—Fixed, composition, 10,000 ohms, ±5%, ½ w.
R111	502610	Resistor—Fixed, composition, 10 megohms, ±20%, ½ w.
R112A, B	78208	Control—Power, volume and picture control
R113	502312	Resistor—Fixed, composition, 12,000 ohms, ±10%, ½ w.

SYMBOL NO.	STOCK NO.	DESCRIPTION
R114	502447	Resistor—Fixed, composition, 470,000 ohms, ±20%, ½ w.
R115	502433	Resistor—Fixed, composition, 330,000 ohms, ±20%, ½ w.
R116	512156	Resistor—Fixed, composition, 560 ohms, ±10%, 1 w.
R117	522218	Resistor—Fixed, composition, 1800 ohms, ±10%, 2 w.
R118	502210	Resistor—Fixed, composition, 1000 ohms, ±10%, ½ w.
R119	502515	Resistor—Fixed, composition, 1.5 megohms, ±5%, ½ w.
R120	502418	Resistor—Fixed, composition, 180,000 ohms, ±5%, ½ w.
R121	77671	Resistor—Fixed, composition, 3800 ohms, ±10%, 7 w.

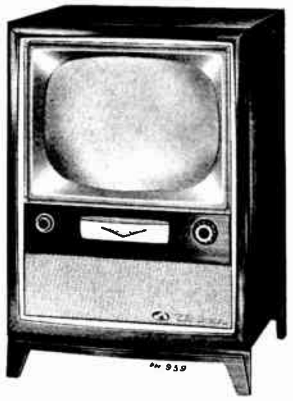
R137		Same as R113
R138		(Part of L105)
R139	522318	Resistor—Fixed, composition, 18,000 ohms, ±10%, 2 w.
R140	502256	Resistor—Fixed, composition, 5600 ohms, ±10%, ½ w.
R141		Same as R114
R142	522275	Resistor — Fixed, composition, 7500 ohms, ±5%, 2 w.
R144	502118	Resistor — Fixed, composition, 180 ohms, ±10%, ½ w.
R145	78209	Control—Brightness control
R146	502127	Resistor — Fixed, composition, 270 ohms, ±10%, ½ w.
R147		Same as R114
R148	502343	Resistor—Fixed, composition, 43,000 ohms, ±5%, ½ w.
R149	502415	Resistor—Fixed, composition, 150,000 ohms, ±5%, ½ w.
R150	512347	Resistor—Fixed, composition, 47,000 ohms, ±20%, 1 w.
R151	502439	Resistor—Fixed, composition, 390,000 ohms, ±10%, ½ w.
R152	502447	Resistor—Fixed, composition, 470,000 ohms, ±10%, ½ w.
R153		Same as R132
R154	78808	Control—AGC Control
R155	502368	Resistor—Fixed, composition, 68,000 ohms, ±10%, ½ w.
R156	502468	Resistor—Fixed, composition, 680,000 ohms, ±10%, ½ w.
R157	502310	Resistor—Fixed, composition, 10,000 ohms, ±10%, ½ w.
R158		Same as R140
R159		Same as R155
R160	502318	Resistor—Fixed, composition, 18,000 ohms, ±10%, ½ w.
R161	502427	Resistor—Fixed, composition, 270,000 ohms, ±10%, ½ w.
R162	502522	Resistor—Fixed, composition, 2.2 megohms, ±10%, ½ w.
R163	502347	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ w.
R164		Same as R108
R165	502512	Resistor—Fixed, composition, 1.2 megohms, ±10%, ½ w.
R166	502222	Resistor—Fixed, composition, 2200 ohms, ±5%, ½ w.
R167	512256	Resistor—Fixed, composition, 5600 ohms, ±10%, 1 w.
R168	502522	Resistor—Fixed, composition, 2.2 megohms, ±10%, ½ w.
R169	502322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ w.
R170, R171		Same as R160
R172	78210	Control—Vertical hold control
R173	78806	Control—Height control
R174		(Part of L108)

SYMBOL NO.	STOCK NO.	DESCRIPTION
R175		Same as R152
R176	502322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ w.
R177	502315	Resistor—Fixed, composition, 15,000 ohms, ±5%, ½ w.
R178	502439	Resistor—Fixed, composition, 390,000 ohms, ±10%, ½ w.
R179	502312	Resistor—Fixed, composition, 12,000 ohms, ±10%, ½ w.
R180	512322	Resistor—Fixed, composition, 22,000 ohms, ±5%, 1 w.
R181	502333	Resistor—Fixed, composition, 33,000 ohms, ±5%, ½ w.
R182	502447	Resistor—Fixed, composition, 470,000 ohms, ±10%, ½ w.
R183	78807	Control—Vertical Linearity Control
R184, R185	502439	Resistor—Fixed, composition, 390,000 ohms, ±5%, ½ w.
R186	502422	Resistor—Fixed, composition, 220,000 ohms, ±10% ½ w.
R187	502410	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ w.
R188	502233	Resistor—Fixed, composition, 3300 ohms, ±10%, ½ w.
R189	502315	Resistor—Fixed, composition, 15,000 ohms, ±20%, ½ w.
R190	502415	Resistor—Fixed, composition, 150,000 ohms ±10%, ½ w.
R191	502433	Resistor—Fixed, composition, 330,000 ohms ±10%, ½ w.
R192	502482	Resistor—Fixed, composition, 820,000 ohms, ±10%, ½ w.
R193	502433	Resistor—Fixed, composition, 330,000 ohms ±10%, ½ w.
R194	502382	Resistor—Fixed, composition, 82,000 ohms, ±10%, ½ w.
R195	502410	Resistor—Fixed, composition, 100,000 ohms, ±5%, ½ w.
R196	77639	Control—Horizontal Hold Control
R198	502239	Resistor—Fixed, composition, 3900 ohms ±10%, ½ w.
R199	512415	Resistor—Fixed, composition, 150,000 ohms, ±5%, 1 w.
R200	502315	Resistor—Fixed, composition, 15,000 ohms, ±10%, ½ w.
R201	512518	Resistor—Fixed, composition, 1.8 megohms, ±5%, 1 w.
R202	512347	Resistor—Fixed, composition, 47,000 ohms, ±5%, 1 w.
R203		Same as R192
R204	502510	Resistor—Fixed, composition, 1 megohm, ±10%, ½ w.
R205	502047	Resistor — Fixed, composition, 47 ohms ±20%, ½ w.
R206	78797	Resistor—Fixed, wire wound, 47 ohms, ±10%, 2 w.
R207	522327	Resistor—Fixed, composition, 27,000 ohms, ±10%, 2 w.
R208		Same as R161
R209	502356	Resistor—Fixed, composition, 56,000 ohms, ±10%, ½ w.
R210	78795	Resistor—Fixed, wire wound, 1.2 ohms, ±5%, ½ w.
R211 to R213 Incl.		(Part of Yoke)
R214	502410	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ w.
R215		(Part of L106)
R216		Same as R113
R217		Same as R207
S101	78211	Switch—TV, Phono and Tone Switch
T101	76981	Transformer—Sound I.F. transformer
T102	77112	Transformer—Ratio Det. transformer
T103	76997	Transformer—Audio output transformer
T104	78203	Transformer—1st I.F. Grid transformer
T106 to T108 Incl.		(Part of PC101)
T112	78809	Transformer—Vertical output transformer
T113	78805	Transformer—Power transformer
T114	76440	Transformer—Syncroguide transformer
T115	78810	Transformer—Hi Voltage transformer
	78869	Yoke—Deflection yoke complete with male connector L113, L114, L115, L116, R211, R212, R213, C192. For Models 24S529 and U, 24S532 and U
	79490	Yoke—Deflection yoke complete with male connector for Models 24S531 and U.

SPEAKER ASSEMBLIES
971692-1
RMA 274

	77777	Speaker—10" PM. (1.47 oz.) speaker complete with cone and voice coil (3.2 ohms) Plug-in type terminal board

NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.



Models 21-D-527, 21-D-527U
"Ashland"
Mahogany, Blonde Tropical Hardwood

PICTURE SIZE...227 square inches on a 21ZP4B Kinescope

TELEVISION R-F FREQUENCY RANGE

Model 21-D-527

All 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Model 21-D-527U

Any of 70 UHF channels................470 mc. to 890 mc.

Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency........................45.75 mc.

Sound I-F Carrier Frequency........................41.25 mc.

VIDEO RESPONSE...To 3.6 mc.

SEE POWER RATING.............................250 watts max.

AUDIO POWER OUTPUT RATING.............4.5 watts max.

CHASSIS DESIGNATIONS.........Model 21-D-527—KCS90
Model 21-D-527U—KCS90A

FOCUS..Magnetic

SWEEP DEFLECTION...Magnetic

SCANNING..Interlaced, 525 line

HORIZONTAL SCANNING FREQUENCY.........15,750 cps

VERTICAL SCANNING FREQUENCY................60 cps

FRAME FREQUENCY (Picture Repetition Rate).....30 cps

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK22D—Model 21-D-527	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer
Tuner KRK30C—Model 21-D-527U	
(1) RCA 6AF4	UHF Oscillator
(2) RCA 6BQ7A	VHF R-F Amplifier / UHF I-F Amplifier
(3) RCA 6X8	VHF R-F Oscillator & Mixer / UHF I-F Amplifier

A K3D or a 1N82 crystal is used as the UHF mixer

Tube Used	Function
All Models	
(1) RCA 6AU6	1st Picture I-F Amplifier
(2) RCA 6CB6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 6CB6	4th Picture I-F Amplifier
(5) RCA 6CL6	Video Amplifier
(6) RCA 6AU6	1st Sound I-F Amplifier
(7) RCA 6AU6	2nd Sound I-F Amplifier
(8) RCA 6AL5	Ratio Detector
(9) RCA 6AV6	1st Audio Amplifier
(10) RCA 6AQ5	Audio Output
(11) RCA 12AU7	Vert. Sync. Sep. and AGC
(12) RCA 12AU7	Horiz. Sync. Sep. and Sync. Ampl.
(13) RCA 6J5	Vert. Sweep Osc. and Discharge
(14) RCA 6AQ5	Vertical Sweep Output
(15) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(16) RCA 6BQ6GT	Horizontal Sweep Output
(17) RCA 6AX4GT	Damper
(18) RCA 1B3-GT	High Voltage Rectifier
(19) RCA 5U4G (2 tubes)	Rectifiers
(20) RCA 21ZP4B	Kinescope

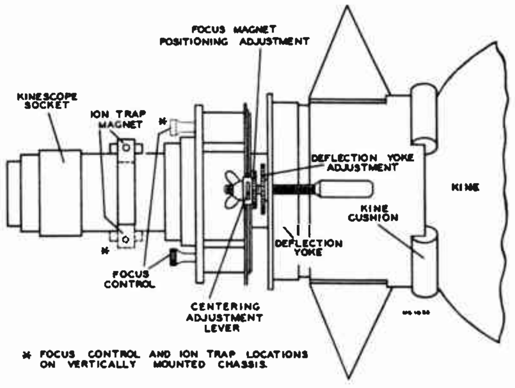


Figure 3—Yoke and Focus Magnet Adjustments

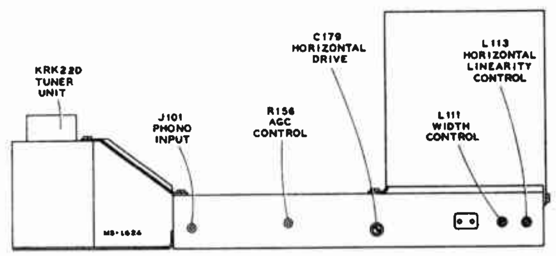

Figure 4—Rear Chassis Adjustments

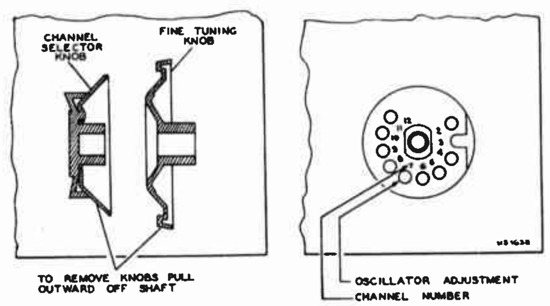

Figure 5—KRK22D R-F Oscillator Adjustments

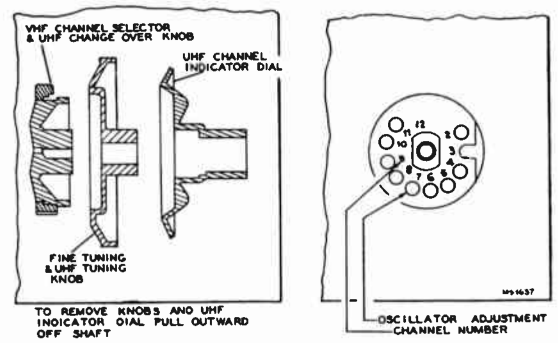

Figure 6—KRK30C VHF R-F Oscillator Adjustment

CHASSIS REMOVAL.—To remove the chassis from the cabinet for repair or installation of a new kinescope, remove the control knobs, the cabinet back, unplug the speaker cable, the kinescope socket, the antenna cable, the yoke and high voltage cable. Take out the chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet.

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generators (two) to provide the following frequencies with crystal accuracy (See Sound Take-Off Alignment on page 15):

Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
Radio frequencies
Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable preamplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

Models 21-D-527 and 21-D-527U

Note: All alignment adjustments should be made with cores at chassis end of coils except T108 (top) which should be peaked with core at end of coil away from chassis.

Connect the i-f signal generator, in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R152, R153 and C122 and to ground. Turn the AGC control to minimum.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R152, R153 and C122. The second battery will be used later.

Set the bias to produce approximately —5.0 volts of bias at the junction of R152, R153 and C122.

Connect the "VoltOhmyst" to pin 9 of V110 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at pin 9 of V110 with —5.0 volts of i-f bias at the junction of R152, R153 and C122.

44.0 mc.	T107
45.5 mc.	T106
42.75 mc.	T105

Set the signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 9 of V110. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the final adjustment is made.

39.25 mc.	L101
41.25 mc.	T104 top core
47.25 mc.	L119

SWEEP ALIGNMENT OF PICTURE I-F.—

Model 21-D-527

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner case.

Set the channel selector to channel 4.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R121 and R125.

Short the grids of the third and fourth picture I-F amplifiers to ground, pin 1 of V108 and V109.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Set the sweep output for 0.5 volts peak-to-peak on the oscilloscope. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C119 across terminals "A" and "F" of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T1 (top) and T104 (top and bottom) for maximum gain with 45.75 mc. at 75% of maximum response.

Adjust the shunt trimmer C119 until 42.25 mc. is at 75% response with respect to the low frequency shoulder as shown in Figure 9. Readjust T1 and T104 if necessary to obtain proper wave shape, see Figure 9. Maximum allowable tilt is 25%.

To align the fourth picture i-f transformer T108 connect the sweep generator to the fourth picture i-f grid, pin 1 of V109. Couple the signal generator loosely to obtain markers.

Connect the oscilloscope to pin 9 of V110 and set to read 3 to 5 volts peak-to-peak.

Adjust T108 top and bottom cores for maximum gain and curve shape as shown in Figure 12.

Adjust C193 to place the 41.25 mc. marker at 80% and 45.75 mc. marker at 90%. Readjust T108 for flat top curve as shown in figure 12.

NOTE: C193 is incorporated as part of T108, fourth picture I-F transformer. Adjustment is made by varying the penetration of the insulated lead, from terminal "E", into the ceramic sleeve at the bottom of T108 as seen in figure 26 on page 16. Care should be taken when adjusting to prevent damage to the lead or its insulation.

Remove the 180 ohm resistor and the shorts on pin 1 of V108 and V109.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R152, R153 and C122.

Connect the sweep generator to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

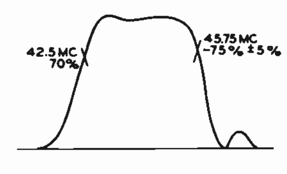

Figure 9—KRK22D T1 and T104 Response

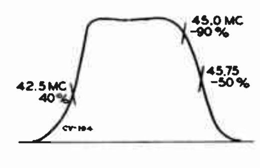

Figure 10—Overall I-F Response

Retouch T105, T106 and T107 to obtain the response shown in Figure 10.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 30 and 40 times down with curve as shown in Figure 10.

Move the sweep generator to the antenna terminals. Connect —3.0 volts bias to pin 5 of V103. Adjust T106 and T107 slightly to correct for any overall tilt while switching from channel to channel.

Model 21-D-527U

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R121 and R125.

Short the grids of the third and fourth picture I-F amplifiers to ground, pin 1 of V108 and V109.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Set the sweep output for 0.5 volts peak-to-peak on the oscilloscope. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C119 across terminals "A" and "F" of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (top and bottom) for maximum gain with 45.75 mc. at 75% of maximum response.

Adjust the shunt trimmer C119 until 42.25 mc. is at 75% response with respect to the low frequency shoulder as shown in Figure 11. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 11. Maximum allowable tilt is 25%.

To align the fourth picture I-F transformer T108, connect the sweep generator to the fourth picture i-f grid, pin 1 of V109. Couple the signal generator loosely to obtain markers.

Connect the oscilloscope to pin 9 of V110 and set to read 3 to 5 volts peak-to-peak.

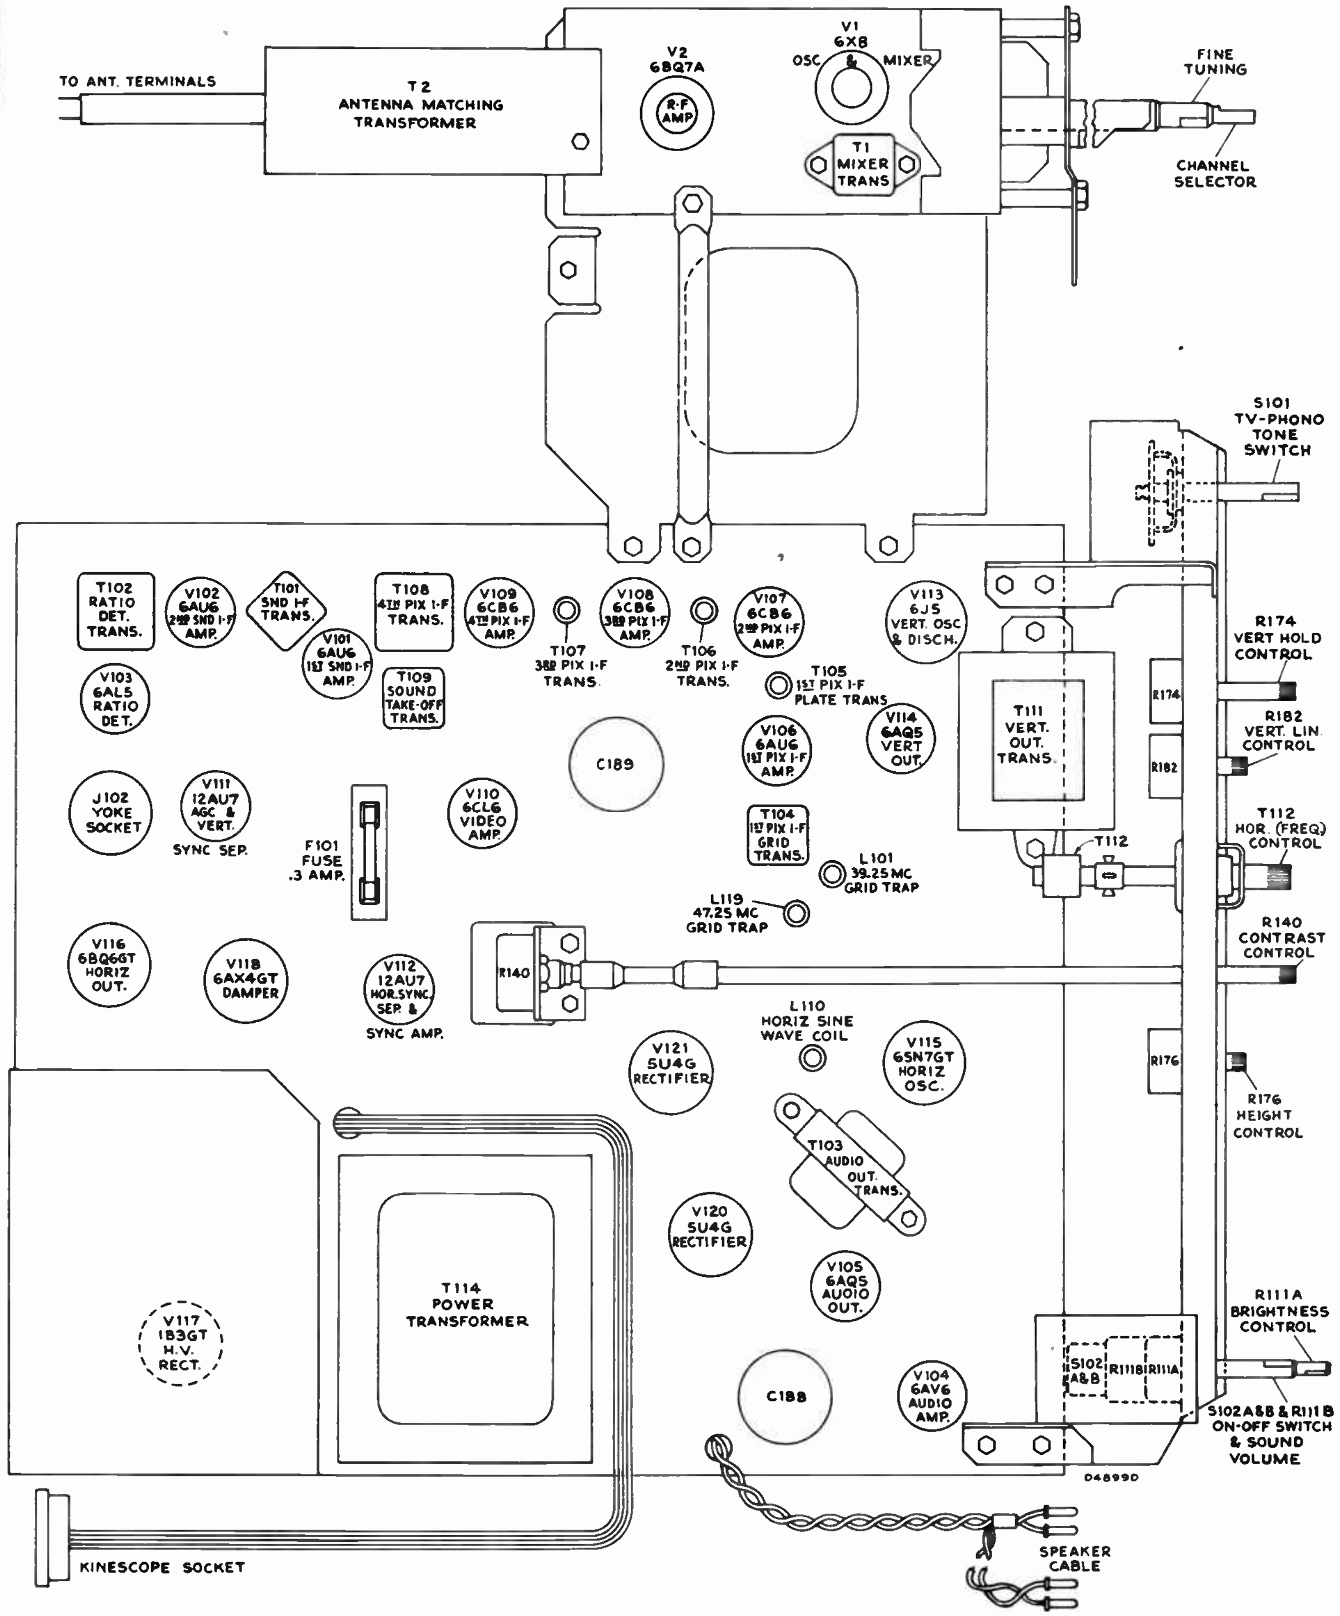

Figure 7—Chassis Top View (shown with KRK22D Tuner)

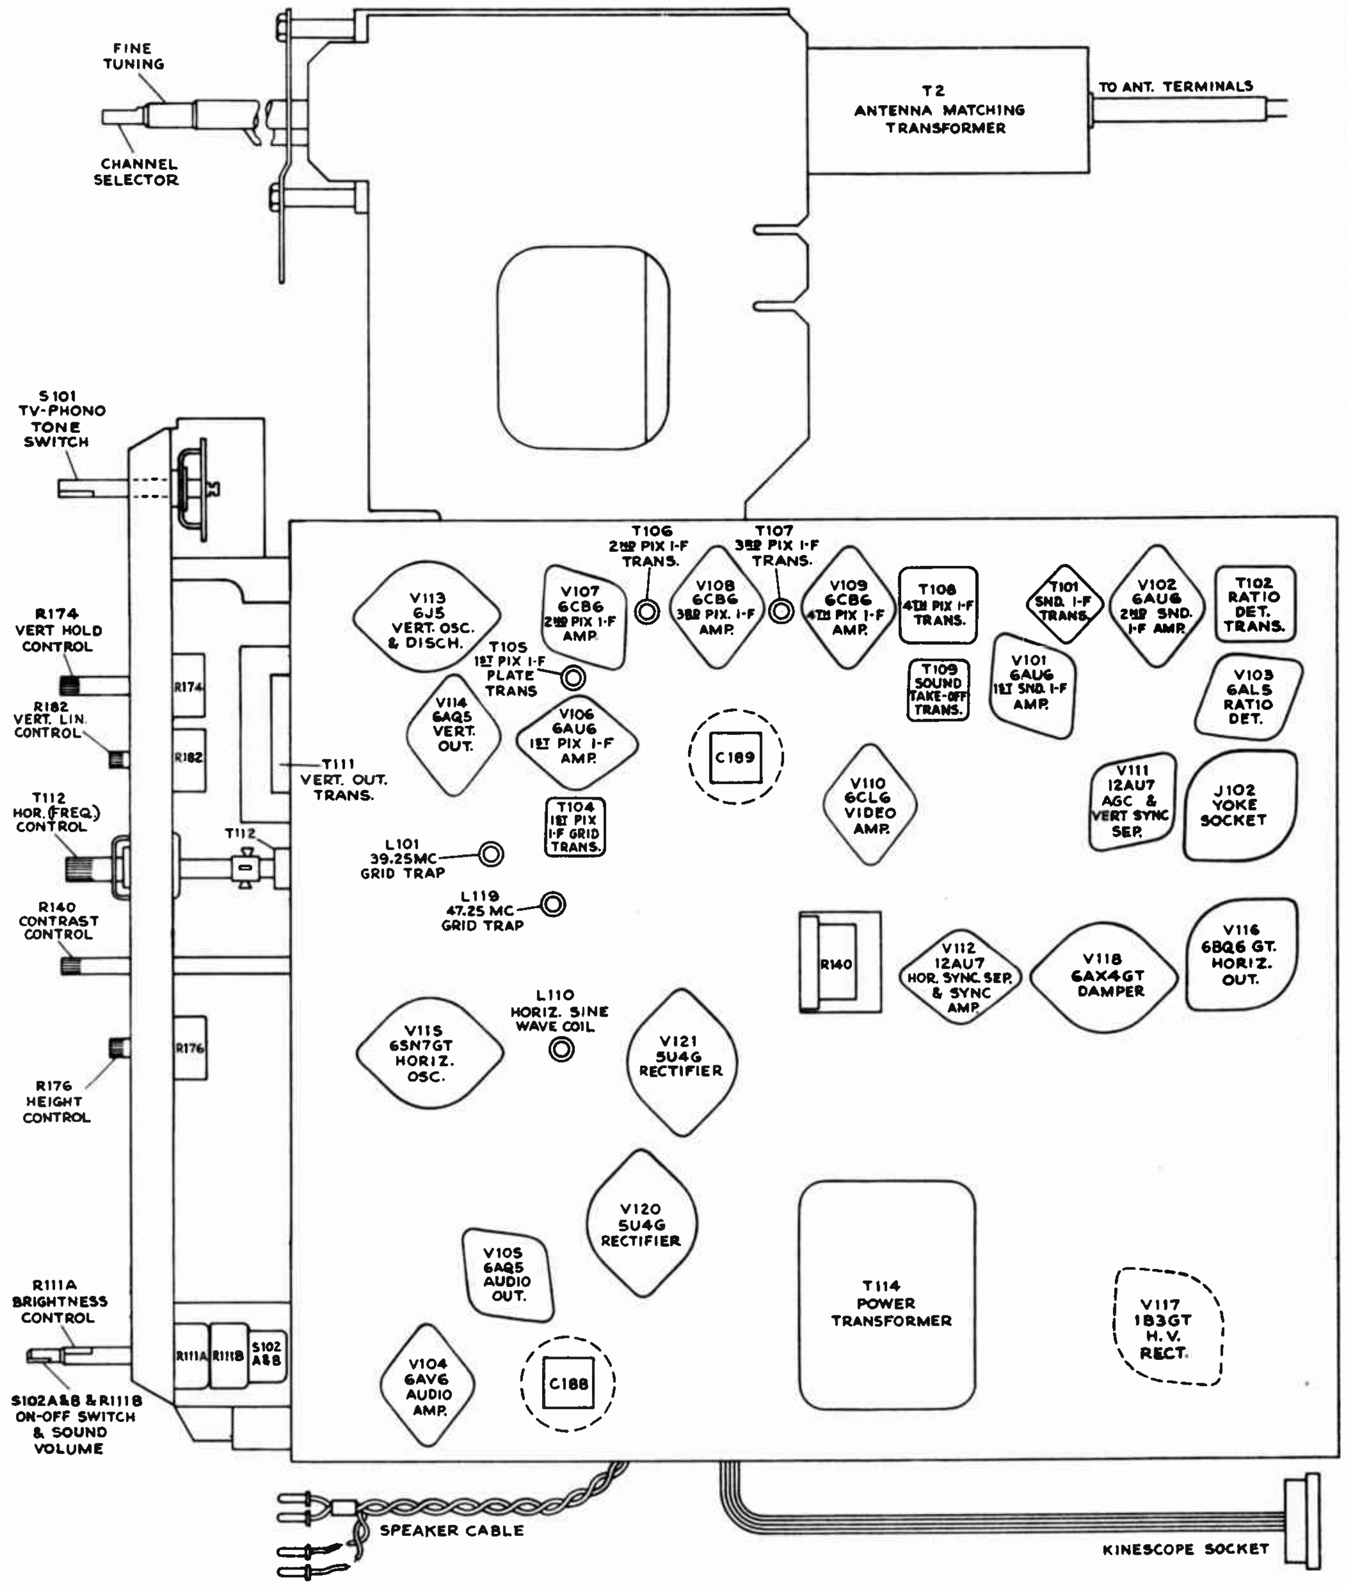

Figure 8—Chassis Bottom View (shown with KRK22D Tuner)

Adjust T108 top and bottom cores for maximum gain and curve shape as shown in Figure 12.

Adjust C193 to place the 41.25 mc. marker at 80% and 45.75 mc. marker at 90%. Readjust T108 for flat top curve as shown in Figure 12.

NOTE: C193 is incorporated as part of T108, fourth picture I-F transformer. Adjustment is made by varying the penetration of the insulated lead, from terminal "E", into the ceramic sleeve at the bottom of T108 as seen in figure 26 on page 16. Care should be taken when adjusting to prevent damage to the lead or its insulation.

Remove the 180 ohm resistor and the shorts on pin 1 of V108 and V109.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R152, R153 and C122.

Connect the sweep generator to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 0.5 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

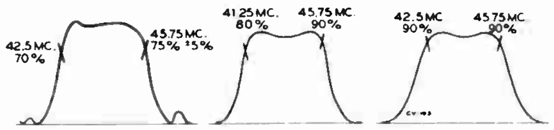

Figure 11—KRK30C T2 and T104 Response

Figure 12—T108—4th Picture I-F Response

Figure 13—KRK30C L9 and C308 I-F Response

Retouch T105, T106 and T107 to obtain the response shown in Figure 10.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 30 and 40 times down with curve as shown in Figure 10.

To align the I-F amplifier circuit of the KRK30C, connect the VHF sweep generator to the rear terminal of the 1N82 crystal holder in series with a 1000 ohm resistor and a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep ground lead to the tuner case. To do this, remove the crystal cover at the right side of the UHF tuner section. (Refer to Figure 20.) Cover one lead of the 1000 ohm resistor with a short piece of insulated tubing and fashion a hook at the end of this lead. Connect to the front terminal of the crystal holder through the aperture under the crystal cover. Connect the capacitor and generator as stated above.

Set the UHF CHANGEOVER switch to the UHF position, and the UHF TUNING between channels 68 and 69 at 800 mc.

Connect a 180 ohm composition resistor and a 1500 mmf. capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground.

Connect the oscilloscope diode probe to the junction between the resistor and capacitor.

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.5 volt or less peak-to-peak on the oscilloscope.

Adjust C308, on the UHF section, and L9, on the VHF section, of the tuner for maximum gain with 45.75 mc. and 42.25 mc. markers as shown in figure 13.

If necessary adjust L27 to place the 45.75 mc. marker at 90% on the curve. Adjust L43 for minimum tilt of the curve as shown in figure 13.

Remove the resistor, capacitor and diode probe from TP3 and connect the oscilloscope to pin 9 of V110. Use 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Connect the VHF sweep generator to the VHF antenna terminals. Keep the AGC bias at —3.0 V and the I-F bias at —5.0 volts.

Couple the signal generator loosely to the grid of the first picture I-F amplifier.

Switch through all VHF channels and check for proper curve shape as in figure 10. Retouch T106 and T107 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the UHF antenna terminals. Check on all UHF channels for proper wave shape as shown in figure 10, retouching C308 and L9 if necessary to correct any overall tilt.

Do not retouch L27, L43, T2, T104, T105, T106 or T107.

Remove the sweep and marker generators and the bias supplies.

KRK22D TUNER ALIGNMENT.—

Model 21-D-527

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T1 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" or T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the FM trap L53.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

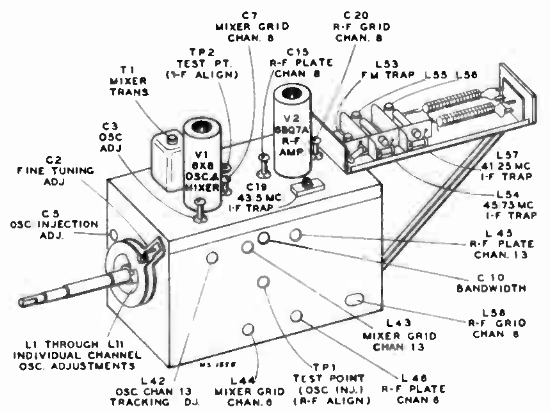

Figure 14—KRK22D Tuner Adjustments

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3.

Set the T1 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15, to the input terminals of the antenna matching unit.

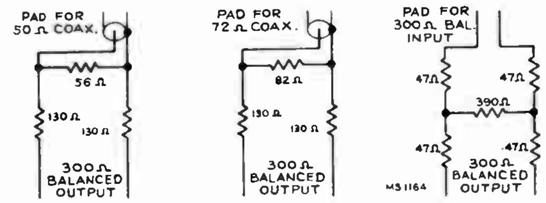

Figure 15—Sweep Attenuator Pads

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in figure 16.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

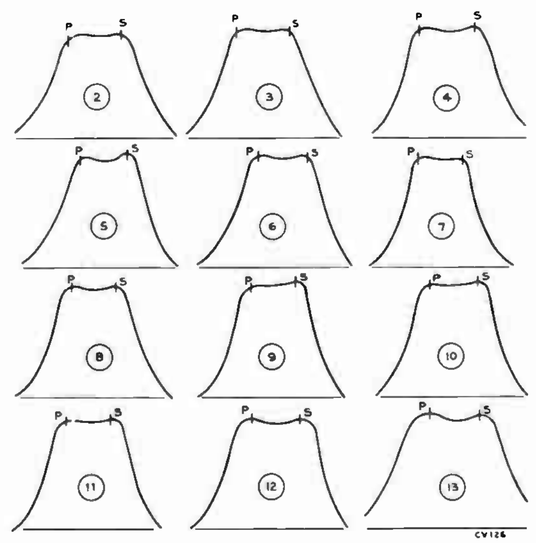

Figure 16—KRK22D R-F Responses

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in figure 16.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L5 for an audible beat. Adjust L44, L46 and L58 for proper curve shape as shown in figure 16. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 16 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L58 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 16 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

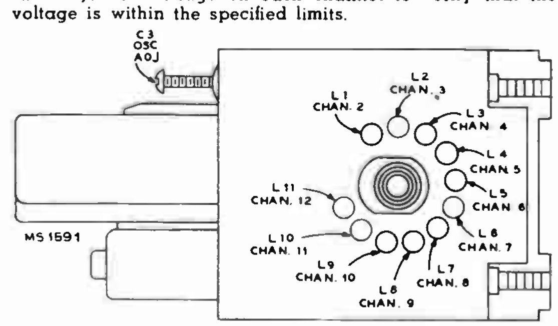

Figure 17—KRK22D Oscillator Adjustments

KRK22D OR KRK30C ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L53 (L5) to the channel selector switch S4 (S1E).

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R118, R146 and C120. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R118, R146 and C120.

Connect an oscilloscope to the junction of R129 and L103 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L54 (L4) in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L57 (L1) for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L53 (L5) to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L53 (L5) to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 15 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L55 (L3) and L56 (L2) to obtain the response shown in figure 18. L55 (L3) is most effective in locating the position of the shoulder of the curve at 52 mc. and L56 (L2) should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L53 (L5) and S4 (S1E). Replace V106.

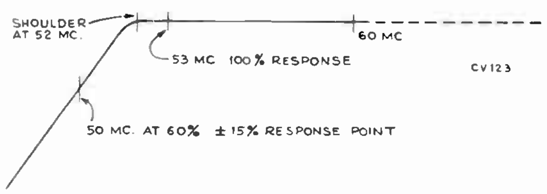

Figure 18—KRK22D or KRK30C Antenna Matching Unit Response

KRK30C TUNER ALIGNMENT

Model 21-D-527U

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f" in terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency of each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in figure 19.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in

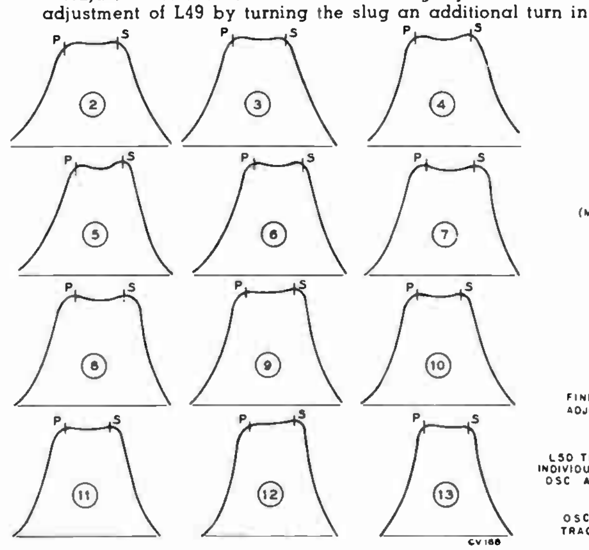

Figure 19—KRK30C VHF R-F Response

the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in figure 19.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L14, L48 and L32 for proper curve shape as shown in figure 19. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 19 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 19 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

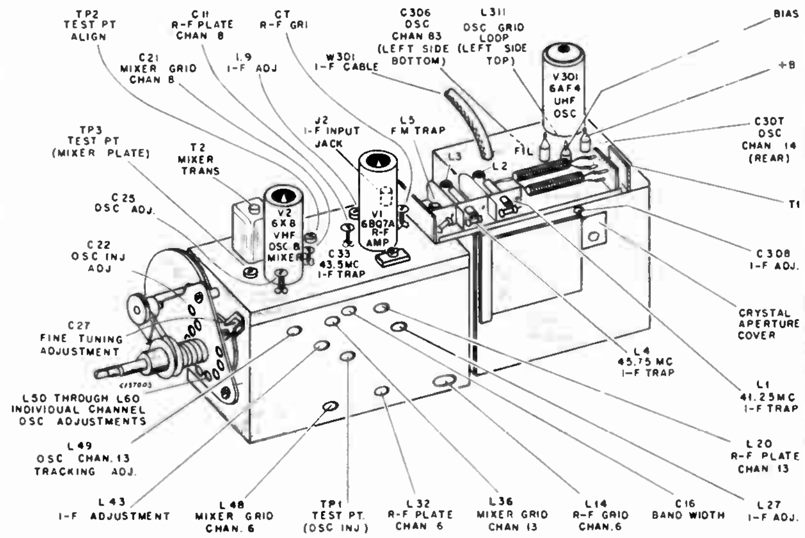

Figure 20—KRK30C Tuner Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT.—R-F alignment of the UHF section of the tuner may only be performed with the UHF section removed from the tuner assembly. R-F adjustments require removal of the tuner shield which may only be done with the UHF tuner separate from its mounting.

I-F and oscillator adjustments may be accomplished without removing the tuner.

Connect a 100 ohm composition resistor between the center conductor of the I-F cable W301 and the tuner case.

Connect the oscilloscope to the center conductor of W301 at the 100 ohm resistor, employing the preamplifier if needed with the oscilloscope used. Ground the oscilloscope to the tuner case.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 5° and 164° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. With the stop pin on the tuner against the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 164°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the junction of W301 and L310. This may be done by inserting the lead from the resistor, which should be covered with insulated tubing, through the aperture provided for crystal removal. (See figure 20.) Insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitor tabs C304 and C305 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 22(A).

Figure 23—KRK30C Dial Cords

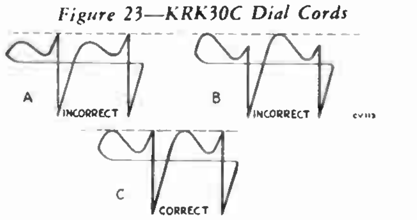

Figure 24—Horizontal Oscillator Waveforms

Adjust the oscillator trimmer capacitor C306 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 22(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 5°, Channel 14, position.

Adjust the oscillator trimmer C307 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown. The inductance loop L311 across the oscillator grid coil on some units, may be repositioned, if necessary, to bring the oscillator trimmer within range. Refer to figure 20 for location of the aperture for making this adjustment.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates must be knifed with the shield cover removed. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" between the center conductor of W301 and ground. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .03 and .35 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedance or an oscillator tube outside allowable limits. This voltage is an indication of correct crystal current and may be varied by repositioning the flag L309 with respect to L3.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 20). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

SOUND I-F AND RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101 in series with a 1500 mmf. capacitor.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector secondary T102 bottom core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked, when making the above adjustments.

Tune the T101 (top) core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the T101 adjustment are made.

Connect the "VoltOhmyst" to the junction of R107 and C109.

Tune T102 bottom for zero d-c at the junction of R107 and C109. (Make adjustment with core at chassis end of coil.)

SOUND TAKE-OFF ALIGNMENT.—Connect two (2) signal generators to the grid of the fourth picture i-f amplifier, pin 1 of V109.

Set one generator to 45.75 mc., unmodulated, and adjust output for .5 volts.

Set the second generator to 41.25 mc., and modulate 30%, at 400 cycles, with an output of .2 volts.

Connect the oscilloscope, in series with diode probe, to the plate of the video amplifier, pin 6 of V110.

Set the oscilloscope to maximum gain.

Adjust T109 for minimum output indication on the oscilloscope.

As an alternate method, this may be accomplished by using a received signal as the source for adjustment.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, short the terminals of the fixed 4.5 mc. trap L105. With a 4.5 mc. beat present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust T109 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 6 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ALIGNMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it usually can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal (freq.) control, then adjust the waveform adjustment core (top of chassis) out of the coil several turns from its original position and readjust the frequency control until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive trimmer C179, the width control L111 and the linearity control L113, until the picture is correct.

Connect the low capacity probe of an oscilloscope to the center terminal of T112, at the junction of R195. Dress the oscilloscope probe at least one inch away from the sine wave coil L110. Turn the horizontal frequency control so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 24. Adjust the waveform adjustment coil L110 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the frequency control if necessary.

Remove the oscilloscope upon completion of this adjustment.

Turn the horizontal frequency control to the extreme clockwise position. The picture should be out of sync, with a minimum of twelve bars slanting downward to the left. Turn the control counter-clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 1½ to 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional counter-clockwise rotation of the control. The picture should remain in sync for approximately two full turns of additional counter-clockwise rotation of the control. Continue counter-clockwise rotation until the picture falls out of sync. Rotation beyond the fall-out position should produce between 2 and 5 bars before interrupted oscillation (motorboat) occurs. Interrupted oscillation (motorboat) should be reached before full counter-clockwise rotation.

When the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned.

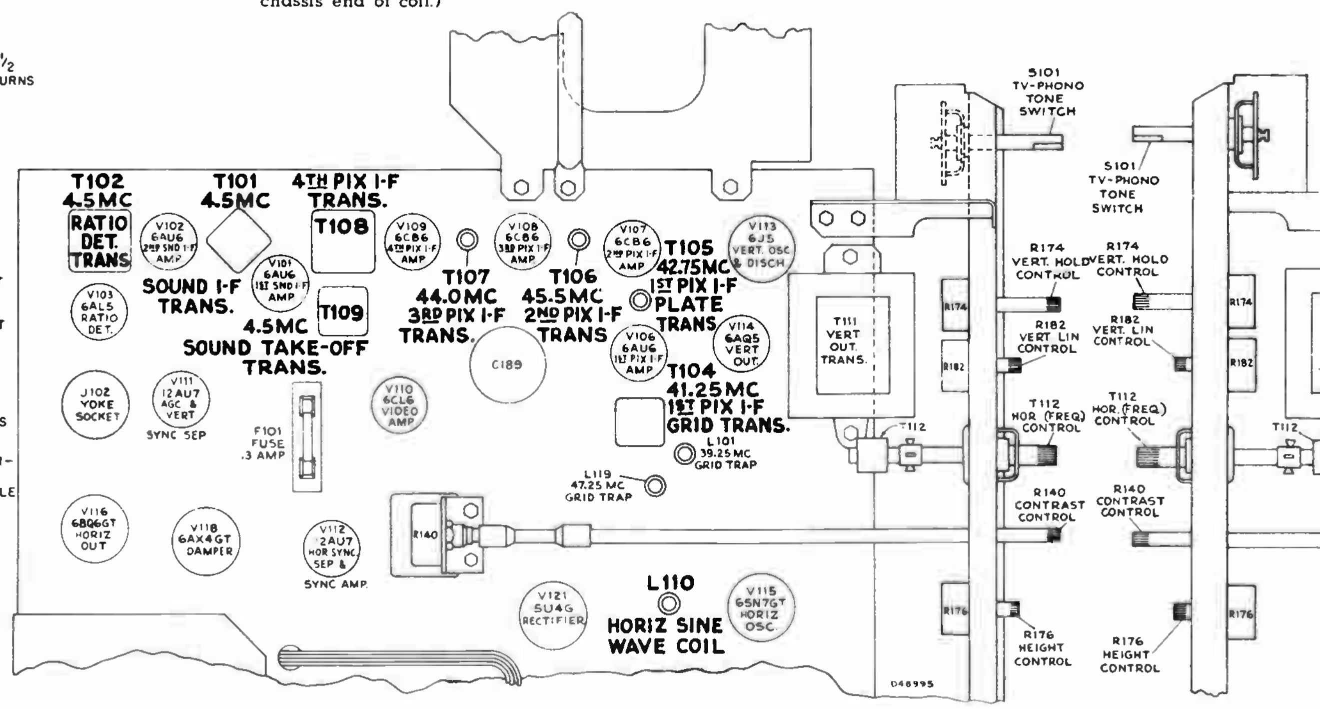

Figure 25—Top Chassis Adjustments

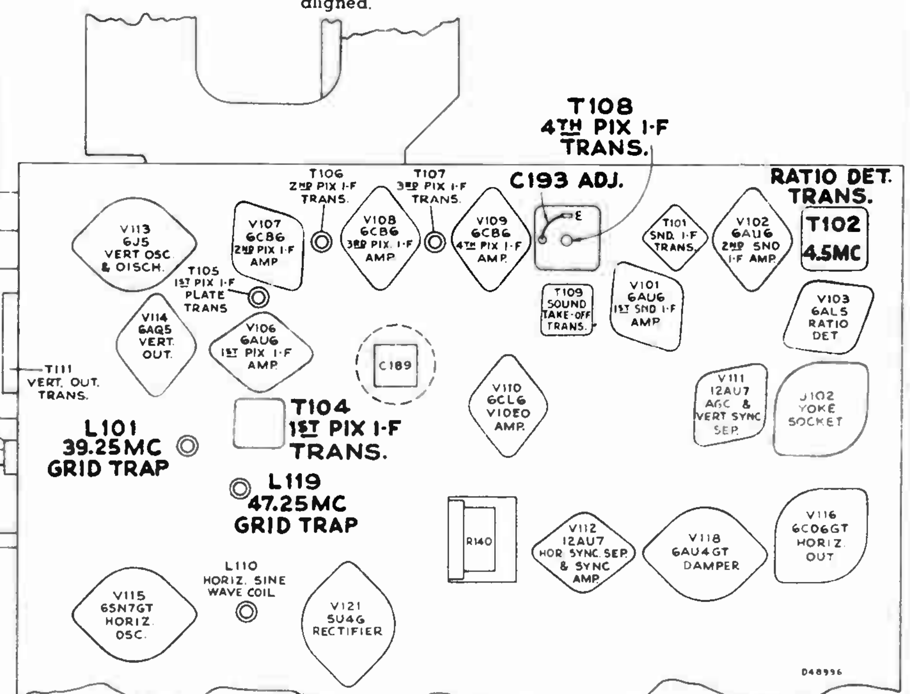

Figure 26—Bottom Chassis Adjustments

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 30,000 microvolt test pattern signal was fed into the receiver, the picture synchronized and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

The schematic is shown in the latest condition at the time of printing.

All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

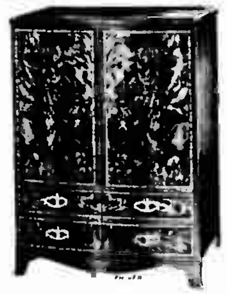
R13	522312	Resistor — Fixed, composition, 12,000 ohms, ±10%, 2 w.
R14	502182	Resistor—Fixed, composition, 820 ohms, ±10%, 1/2 w.
R19	502033	Resistor—Fixed, composition, 33 ohms, ±10%, 1/2 w. (Part of S2)
R20		Same as R6
R21		Same as R2
T1	78396	Transformer—Antenna matching transformer complete
T2	78399	Transformer—Convertor transformer (R8)
C301 to C303 Incl.	79553	Capacitor—Variable tuning capacitor

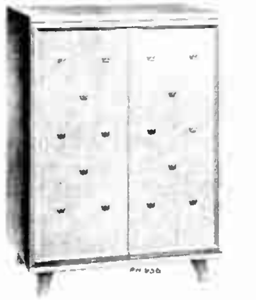
SYMBOL NO.	STOCK NO.	DESCRIPTION
C304, C305	79554	Stator—Oscillator stator assembly
C306	79555	Capacitor—Oscillator trimmer capacitor
C307	79556	Capacitor—Adjustable, ceramic, 0.8-3.5 mmf.
C308	79558	Capacitor—Trimmer, 10-50 mmf.
C309 to C311 Incl.	79559	Capacitor—Feed thru, 1000 mmf.
C312, C313	79560	Capacitor—Fixed, ceramic, 1 mmf., ±0.1 mmf., 500 v. D.C., non-insulated
CR301	77489	Rectifier—UHF diode crystal germanium rectifier
L301, L302		Coil—R.F. tank plate
L303	79557	Tank Assembly—complete with capacitor (C7)
L304	79564	Board—Antenna terminal board assembly
L305 to L307 Incl.	79565	Choke—R.F. choke
L308, L309		Coil—Mixer coupling coil for oscillator & output section
L310	79567	Coil—I.F. output coil 0.15 microhenries

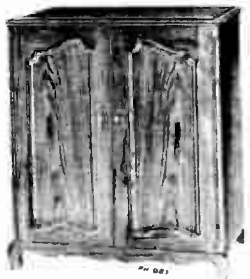
SYMBOL NO.	STOCK NO.	DESCRIPTION
L311	79566	Coil—Oscillator loop coil
R301	502222	Resistor—Fixed, composition, 2200 ohms, ±10%, 1/2 w.
R302	512268	Resistor—Fixed, composition, 6800 ohms, ±10%, 1 w.
R303	502268	Resistor—Fixed, composition, 6800 ohms, ±10%, 1/2 w.
C101, C102	73960	Capacitor—Fixed, ceramic, 0.01 mf., +100%, —0%, 500 v.
C103, C104		Part of T101
C105		Same as C101
C106		Part of T102
C107, C108	39644	Capacitor—Fixed, mica, 470 mmf., ±5%, 500 v.
C109	73595	Capacitor—Fixed, paper, 0.0022 mf., ±5%, 600 v.
C110	73748	Capacitor—Fixed, ceramic, 1500 mmf., +100%, —0%, 500 v.
C111	74521	Capacitor—Electrolytic, 5 mf., +100%, —0%, 50 v.

SYMBOL NO.	STOCK NO.	DESCRIPTION
C112	76508	Capacitor—Fixed, paper, 0.0015 mf., ±5%, 600 v.
C113	73561	Capacitor—Fixed, paper, 0.01 mf., ±10%, 400 v.
C114	73558	Capacitor—Fixed, paper, 0.047 mf., ±10%, 200 v.
C115	47617	Capacitor—Fixed, ceramic, 270 mmf., ±10%, 500 v.
C116	73599	Capacitor—Fixed, paper, 0.0027 mmf., ±10%, 600 v.
C117		Same as C113
C118		Same as C109
C119	71496	Capacitor—Adjustable, mica, 5/70 mmf.
C120	53511	Capacitor—Fixed, ceramic, 10 mmf., ±5%, 500 v.
C121, C122	78905	Capacitor—Fixed, paper, 0.22 mf., ±20%, 200 v.
C123		Part of T104
C124	77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, —0%, 500 v.
C125	73960	Capacitor—Fixed, ceramic, 0.001 mf., +100%, —0%, 500 v. D.C.
C126	78622	Capacitor—Fixed, ceramic, 470 mmf., ±20%, 500 v. D.C.
C127		Same as C124
C128		Same as C125
C129		Same as C126
C130		Same as C125
C131		Same as C126
C132A,B	97947	Capacitor—Fixed, ceramic, 0.001/0.001 mf., +100%, —0%, 500 v. D.C.
C134	78623	Capacitor—Fixed, ceramic, 1000 mmf., ±20%, 500 v. D.C.
C135	75166	Capacitor—Stand-off capacitor, 1500 mmf., 500 volts
C137		Part of T108
C138	39044	Capacitor—Fixed, ceramic, 15 mmf., ±10%, 500 v.
C139		Part of T108
C140		Part of L105
C141	79019	Capacitor—Fixed, paper, 0.0082 mf., ±10%, 400 v.
C142	39042	Capacitor—Fixed, ceramic, 47 mmf., ±10%, 500 v.
C143		Same as C138
C144	73794	Capacitor—Fixed, paper, 0.22 mf., ±10%, 400 v.
C145, C146	73784	Capacitor—Fixed, paper, 0.1 mf., ±10%, 200 v.
C147		Same as C116
C148	73920	Capacitor—Fixed, paper, 0.0047 mf., ±5%, 400 v.
C149	39640	Capacitor—Fixed, mica, 330 mf., ±5%, 500 v.
C150	73562	Capacitor—Fixed, paper, 0.022 mf., ±10%, 400 v.
C151	73552	Capacitor—Fixed, paper, 0.033 mf., ±10%, 400 v.
C152	39632	Capacitor—Fixed, mica, 150 mmf., ±10%, 500 v. D.C.
C153		Same as C141
C154	73561	Capacitor—Fixed, paper, 0.01 mf., ±10%, 400 v.
C155	74250	Capacitor—Fixed, mica, 560 mmf., ±10%, 1000 v.
C156	76474	Capacitor—Fixed, mica, 82 mf., ±5%, 1000 v.
C157	79017	Capacitor—Fixed, paper, 0.0047 mf., ±20%, 400 v.
C158	72809	Capacitor—Fixed, mica, 5 mmf., ±20%, 1500 v.
C159	73554	Capacitor—Fixed, paper, 0.027 mf., ±10%, 400 v. D.C.
C160	73920	Capacitor—Fixed, paper, 0.0047 mf., ±5%, 600 v.
C161	79543	Capacitor—Fixed, paper, 0.068 mf., ±10%, 600 v.
C162	73792	Capacitor—Fixed, paper, 0.068 mf., ±10%, 200 v. D.C.
C163	73592	Capacitor—Fixed, paper, 0.047 mf., ±10%, 600 v.
C164	78980	Capacitor—Fixed, paper, 0.001 mf., ±10%, 1600 v.
C165	73809	Capacitor—Fixed, paper, 0.015 mf., ±10%, 1000 v. D.C.
C167	76574	Capacitor—Fixed, ceramic, 39 mmf., ±10%, 3500 v.
C169	76578	Capacitor—Fixed, mica, 100 mmf., ±10%, 1000 v.
C171		Same as C144
C172		Same as C156
C173	73553	Capacitor—Fixed, paper, 0.047 mf., ±10%, 400 v.
C174		Same as C150
C175	73787	Capacitor—Fixed, paper, 0.47 mf., ±10%, 200 v.
C176	76579	Capacitor—Fixed, mica, 270 mmf., ±5%, 1000 v.
C177	73594	Capacitor—Fixed, paper, 0.01 mf., ±5%, 600 v.
C178	75643	Capacitor—Fixed, paper, 0.001 mf., ±5%, 1000 v.
C179	79376	Trimmer—Mica, 10-160 mmf.
C180	76995	Capacitor—Fixed, paper, 0.0012 mf., ±5%, 600 v.
C181	73557	Capacitor—Fixed, paper, 0.1 mf., ±5%, 600 v.
C182	73786	Capacitor—Fixed, paper, 0.27 mf., ±10%, 200 v.
C183		Same as C113
C184, C185	73597	Capacitor—Fixed, paper, 0.047 mf., ±10%, 1000 v.
C186	79022	Capacitor—Fixed, mica, 270 mmf., ±20%, 1000 v.
C187		Part of Yoke
C188 A,B,C,D	79391	Capacitor—Fixed, electrolytic, 90-20-10-50 mfd., 400-400-400-50 volts respectively
C189 A,B,C,D	79392	Capacitor—Fixed, electrolytic, 5-70-25-5 mfd., 450-400-400-400 volts respectively
C190	79380	Capacitor—Electrolytic, 20 mf., —10%, +250%, 25 v.
C191	79488	Capacitor—Fixed, ceramic, 27 mf., ±5%, 500 v.
C192		Same as C109
C193		Part of T108
C194	33380	Capacitor—Fixed, ceramic, 12 mmf., ±5%, 500 v.
C195	73798	Capacitor—Fixed, paper, 0.022 mf., ±10%, 600 v.
C196		Same as C163
C197		Same as C157
C198		Same as C125
F101	78214	Fuse—0.3 amp.
J101	35787	Connector—Phone input connector
J102	68590	Connector—Deflection yoke connector female
L101	79383	Transformer—1st I.F. grid trap
L102	73477	Coil—Choke coil
L103		Part of T108
L104	98482	Coil—Peaking, 250 UH
L105	76482	Trap—4.5 MC trap (with C140)
L106	75252	Coil—Peaking, 500 UH
L107	76647	Coil—Peaking, 180 UH
L110	79161	Coil—Horizontal sine wave coil
L111	76441	Coil—Width coil
L112	76640	Reactor—R.F. choke, 1.5 UH
L113	76442	Coil—Horizontal linearity coil
L114 to L117 Incl.		Part of Yoke
L118	77676	Choke—Filter choke
L119	79390	Transformer—1st I.F. grid trap
R101	503082	Resistor—Fixed, composition, 82 ohms, ±10%, ½ w.
R102	504447	Resistor—Fixed, composition, 470,000 ohms, ±20%, ½ w.
R103	523322	Resistor—Fixed, composition, 22,000 ohms, ±10%, 2 w.
R104		Part of T101
R105	503210	Resistor—Fixed, composition, 1000 ohms, ±10%, ½ w.
R106	503047	Resistor—Fixed, composition, 47 ohms, ±10%, ½ w.
R107	503339	Resistor—Fixed, composition, 39,000 ohms, ±10%, ½ w.
R108, R109	502310	Resistor—Fixed, composition, 10,000 ohms, ±5%, ½ w.
R110	504610	Resistor—Fixed, composition, 10 meg., ±20%, ½ w.
R111A, B	77655	Control—Volume "On-Off" brightness control
R112	503312	Resistor—Fixed, composition, 12,000 ohms, ±10%, ½ w.
R113	504433	Resistor—Fixed, composition, 330,000 ohms, ±20%, ½ w.
R114		Same as R102
R115	513147	Resistor—Fixed, composition, 470 ohms, ±10%, 1 w.
R116	523210	Resistor—Fixed, composition, 1000 ohms, ±10%, 2 w.
R117	504210	Resistor—Fixed, composition, 1000 ohms, ±10%, ½ w.
R118		Part of T104
R119	502210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w.
R120	502110	Resistor—Fixed, composition, 100 ohms, ±5%, ½ w.
R121		Same as R119
R122	36714	Resistor—Fixed, composition, 15,000 ohms, ±5%, ½ w.
R123		Same as R119
R124	502022	Resistor—Fixed, composition, 22 ohms, ±5%, ½ w.
R125	512215	Resistor—Fixed, composition, 1500 ohms, ±20%, ½ w.
R126	502356	Resistor—Fixed, composition, 56,000 ohms, ±5%, ½ w.
R127	502068	Resistor—Fixed, composition, 68 ohms, ±5%, ½ w.
R128		Same as R119
R129	502247	Resistor—Fixed, composition, 4700 ohms, ±5%, ½ w.
R130	502118	Resistor—Fixed, composition, 180 ohms, ±5%, ½ w.
R131	77668	Resistor—Fixed, w.w., 4000 ohms, ±10%, 7 w.
R132		Same as R119
R133		Part of T108
R134	523310	Resistor—Fixed, composition, 10,000 ohms, ±10%, 2 w.
R135	502239	Resistor—Fixed, composition, 3900 ohms, ±5%, ½ w.
R136	503033	Resistor—Fixed, composition, 33 ohms, ±10%, ½ w.
R137	504122	Resistor—Fixed, composition, 220 ohms, ±20%, ½ w.
R138	513318	Resistor—Fixed, composition, 18,000 ohms, ±10%, 1 w.
R139	76642	Resistor—Fixed, w.w., 6750 ohms, ±10%, 10 w.
R140	76445	Control—Contrast control
R141	523282	Resistor—Fixed, composition, 8200 ohms, ±10%, 2 w.
R142		Part of L107
R143	513282	Resistor—Fixed, composition, 8200 ohms, ±10%, 1 w.
R144	504210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w.
R145	503433	Resistor—Fixed, composition, 330,000 ohms, ±10%, ½ w.
R146	503447	Resistor—Fixed, composition, 470,000 ohms, ±10%, ½ w.
R147	512522	Resistor—Fixed, composition, 2.2 meg., ±5%, 1 w.
R148	503310	Resistor—Fixed, composition, 10,000 ohms, ±10%, ½ w.
R149	502427	Resistor—Fixed, composition, 270,000 ohms, ±5%, ½ w.
R150	503418	Resistor—Fixed, composition, 180,000 ohms, ±10%, ½ w.
R151		Same as R149
R152		Same as R148
R153	502362	Resistor—Fixed, composition, 62,000 ohms, ±5%, ½ w.
R154	502468	Resistor—Fixed, composition, 680,000 ohms, ±10%, ½ w.
R155		Same as R145
R156	78808	Control—AGC control
R157	503539	Resistor—Fixed, composition, 3.9 meg., ±10%, ½ w.
R158	503468	Resistor—Fixed, composition, 680,000 ohms, ±10%, ½ w.
R159	503547	Resistor—Fixed, composition, 4.7 meg., ±10%, ½ w.
R160	503427	Resistor—Fixed, composition, 270,000 ohms, ±10%, ½ w.
R162	36714	Resistor—Fixed, composition, 15,000 ohms, ±10%, ½ w.
R163	502356	Resistor—Fixed, composition, 56,000 ohms, ±10%, ½ w.
R164	503322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ w.
R165	503227	Resistor—Fixed, composition, 2700 ohms, ±10%, ½ w.
R166	503422	Resistor—Fixed, composition, 220,000 ohms, ±10%, ½ w.
R167	503456	Resistor—Fixed, composition, 560,000 ohms, ±10%, ½ w.
R168	503327	Resistor—Fixed, composition, 27,000 ohms, ±10%, ½ w.
R169	503310	Resistor—Fixed, composition, 1 meg., ±10%, ½ w.
R170		Same as R143
R171	30733	Resistor—Fixed, composition, 3300 ohms, ±5%, ½ w.
R172	503318	Resistor—Fixed, composition, 18,000 ohms, ±10%, ½ w.
R173	503482	Resistor—Fixed, composition, 820,000 ohms, ±10%, ½ w.
R174	79384	Control—Vertical hold control
R175	503415	Resistor—Fixed, composition, 150,000 ohms, ±10%, ½ w.
R176	78807	Control—Height control
R177		Same as R113
R178	502239	Resistor—Fixed, composition, 3900 ohms, ±10%, ½ w.
R179	502368	Resistor—Fixed, composition, 68,000 ohms, ±10%, ½ w.
R180	522343	Resistor—Fixed, composition, 43,000 ohms, ±5%, 2 w.
R181	503522	Resistor—Fixed, composition, 2.2 meg., ±20%, ½ w.
R182	79491	Control—Vertical linearity control
R183	514147	Resistor—Fixed, composition, 470 ohms, ±20%, 1 w.
R185	504315	Resistor—Fixed, composition, 15,000 ohms, ±20%, ½ w.
R186		Same as R175
R188	503415	Resistor—Fixed, composition, 150,000 ohms, ±10%, ½ w.
R189	503433	Resistor—Fixed, composition, 330,000 ohms, ±10%, ½ w.
R190		Same as R173
R191	503422	Resistor—Fixed, composition, 220,000 ohms, ±10%, ½ w.
R192	503368	Resistor—Fixed, composition, 68,000 ohms, ±10%, ½ w.
R193	503239	Resistor—Fixed, composition, 3900 ohms, ±10%, ½ w.
R194	513410	Resistor—Fixed, composition, 100,000 ohms, ±10%, 1 w.
R195		Same as R192
R196	513356	Resistor—Fixed, composition, 56,000 ohms, ±10%, 1 w.
R197		Same as R169
R198	504047	Resistor—Fixed, composition, 47 ohms, ±20%, ½ w.
R199	76410	Resistor—Fixed, wire wound, 220 ohms, ±10%, 4 w.
R200	523315	Resistor—Fixed, composition, 15,000 ohms, ±10%, 2 w.
R202		Same as R160
R203	76382	Resistor—Fixed, w.w., 0.82 ohms, ±5%, ⅓ w.
R204, R205		Part of Yoke
R206	514410	Resistor—Fixed, composition, 100,000 ohms, ±20%, 1 w.
R207	79377	Resistor—Fixed, w.w., 250 ohms, ±10%, 7 w.
R208	76989	Resistor—Fixed, w.w., 4650 ohms, ±10%, 7 w.
R209	513327	Resistor—Fixed, composition, 27,000 ohms, ±10%, 1 w.
R210	503247	Resistor—Fixed, composition, 4700 ohms, ±10%, ½ w.
R211		Same as R164
R212		Part of Yoke
R213	514347	Resistor—Fixed, composition, 47,000 ohms, ±10%, 1 w.
R215	503512	Resistor—Fixed, composition, 1.2 meg., ±10%, ½ w. (in yoke)
R216	503233	Resistor—Fixed, composition, 3300 ohms, ±10%, ½ w.
R217	502010	Resistor—Fixed, composition, 10 ohms, ±20%, ½ w.
S101	77656	Control—Rotary switch control tone
T101	76981	Transformer—1st sound transformer
T102	77112	Transformer—Ratio detector transformer
T103	77821	Transformer—Audio output transformer
T104	79388	Transformer—1st I.F. grid transformer
T105, T106, T107	76433	Transformer—1st, 2nd & 3rd pix transformer
T108	79389	Transformer—4th pix I.F. transformer
T109	79386	Transformer—Sound take-off transformer
T110	79379	Transformer—Vertical oscillator transformer
T111	79394	Transformer—Vertical output transformer
T112	79160	Coil—Horizontal frequency coil
T113	78810	Transformer—High voltage transformer
T114	79387	Transformer—Power transformer



Models 24-D-542 24-D-542U "Chesterton" Mahogany





Models 24-D-543, 24-D-543U "Freemont" Natural Walnut, Blonde Tropical Hardwood

Models 24-D-544, 24-D-544U "Prentiss" Natural Walnut, Mahogany

PICTURE SIZE . . . 327 square inches on a 24CP4A Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 24-D-542, 24-D-543 and 24-D-544

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 24-D-542U, 24-D-543U and 24-D-544U

Any of 70 UHF channels . . . . 470 mc. to 890 mc.

Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency . . . . 45.75 mc.

Sound I-F Carrier Frequency . . . . 41.25 mc.

POWER RATING . . . . 275 watts

AUDIO POWER OUTPUT RATING . . . . . . 4.5 watts max.

VIDEO RESPONSE . . . . To 3.6 mc.

SWEEP DEFLECTION . . . . Magnetic

FOCUS . . . . Magnetic

ANTENNA INPUT IMPEDANCE

Models 24-D-542, 24-D-543 and 24-D-544

Choice: 300 ohms balanced or 72 ohms unbalanced.

Models 24-D-542U, 24-D-543U and 24-D-544U

UHF—300 ohms balanced.

VHF—300 ohms balanced.

CHASSIS DESIGNATIONS

CHASSIS	TUNER	KINE-SCOPE	MODELS
KCS89	KRK22D	24CP4A	24-D-542 24-D-543 (Horizontal Mounting)
KCS89A	KRK30B	24CP4A	24-D-542U 24-D-543U (Horizontal Mounting)
KCS89B	KRK22D	24CP4A	24-D-544 (Vertical Mounting)
KCS89C	KRK30B	24CP4A	24-D-544U (Vertical Mounting)

RCA TUBE COMPLEMENT

Tube Used — Function

Tuner KRK22D (Models with VHF only)

(1) RCA 6BQ7A . . . . R-F Amplifier

(2) RCA 6X8 . . . . R-F Oscillator and Mixer

RCA TUBE COMPLEMENT

Tube Used — Function

Tuner KRK30B (UHF/VHF Models)

(1) RCA 6AF4 . . . . UHF Oscillator

(2) RCA 6BQ7A . . . . VHF R-F Amplifier / UHF I-F Amplifier

(3) RCA 6X8 . . . . VHF R-F Oscillator & Mixer / UHF I-F Amplifier

A K3D or a 1N82 crystal is used as the UHF mixer.

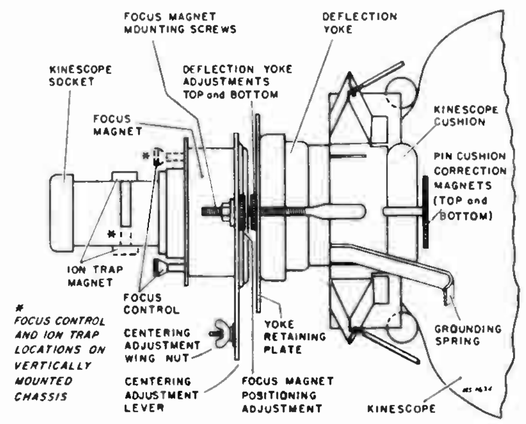

Figure 3—Yoke and Focus Magnet Adjustments

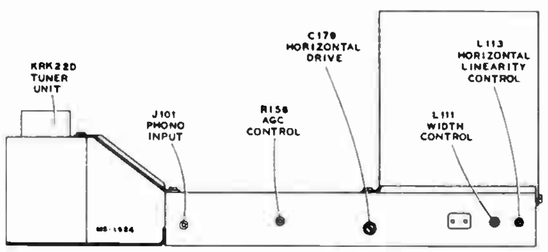

Figure 4—Rear Chassis Adjustments

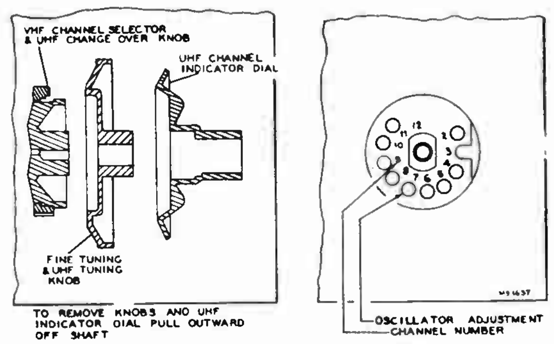

Figure 6—KRK30B VHF R-F Oscillator Adjustment

CHECK OF HORIZONTAL OSCILLATOR ADJUSTMENT.—Turn the horizontal (freq.) control to the extreme clockwise position. The picture should be out of sync, with a minimum of twelve bars slanting downward to the left. Turn the control counter-clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 1½ to 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional counter-clockwise rotation of the control. The picture should remain in sync for approximately two full turns of additional counter-clockwise rotation of the control. Continue counter-clockwise rotation until the picture falls out of sync. Rotation beyond the fall-out position should produce between 2 and 5 bars before interrupted oscillation (motorboat occurs). Interrupted oscillation (motorboat) should be reached before full counter-clockwise rotation.

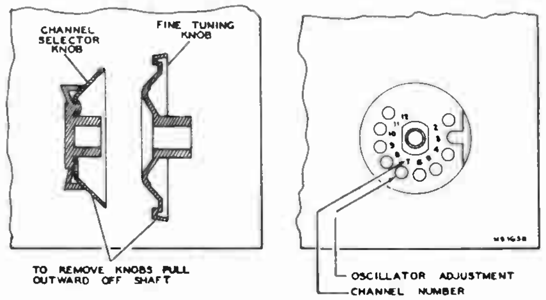

Figure 5—KRK22D R-F Oscillator Adjustments

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges

35 to 90 mc., 1 mc. to 12 mc. sweep width

170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generators (two) to provide the following frequencies with crystal accuracy (See Sound Take-Off Alignment on page 15):

Intermediate frequencies

4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

All Models

Note: All alignment adjustments should be made with cores at chassis end of coils except T108 (top) which should be peaked with core at end of coil away from chassis.

Connect the i-f signal generator, in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R152, R153 and C122 and to ground. Turn the AGC control to minimum.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R152, R153 and C122. The second battery will be used later.

Set the bias to produce approximately —5.0 volts of bias at the junction of R152, R153 and C122.

Connect the "VoltOhmyst" to pin 9 of V110 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at pin 9 of V110 with —5.0 volts of i-f bias at the junction of R152, R153 and C122.

44.0 mc. T107

45.5 mc. T106

42.75 mc. T105

Set the signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 9 of V110. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the final adjustment is made.

39.25 mc. L101

41.25 mc. . . . . T104 top core

47.25 mc. L119

SWEEP ALIGNMENT OF PICTURE I-F.—

Models 24-D-542, 24-D-543 and 24-D-544

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner case.

Set the channel selector to channel 4.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R121 and R125.

Short the grids of the third and fourth picture I-F amplifiers to ground, pin 1 of V108 and V109.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Set the sweep output for 0.5 volts peak-to-peak on the oscilloscope. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C119 across terminals "A" and "F" of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T1 (top) and T104 (top and bottom) for maximum response at 45.75 mc. at 75% of maximum response.

Adjust the shunt trimmer C119 until 42.25 mc. is at 75% response with respect to the low frequency shoulder as shown in Figure 9. Readjust T1 and T104 if necessary to obtain proper wave shape, see Figure 9. Maximum allowable tilt is 25%.

To align the fourth picture i-f transformer T108 connect the sweep generator to the fourth picture i-f grid, pin 1 of V109. Couple the signal generator loosely to obtain markers.

Connect the oscilloscope to pin 9 of V110 and set to read 3 to 5 volts peak-to-peak.

Adjust T108 top and bottom cores for maximum gain and curve shape as shown in Figure 12.

Adjust C193 to place the 41.25 mc. marker at 80% and 45.75 mc. marker at 90%. Readjust T108 for flat top curve as shown in figure 12.

NOTE: C193 is incorporated as part of T108, fourth picture I-F transformer. Adjustment is made by varying the penetration of the insulated lead, from terminal "E", into the ceramic sleeve at the bottom of T108 as seen in figure 26 on page 16. Care should be taken when adjusting to prevent damage to the lead or its insulation.

Remove the 180 ohm resistor and the shorts on pin 1 of V108 and V109.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R152, R153 and C122.

Connect the sweep generator to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

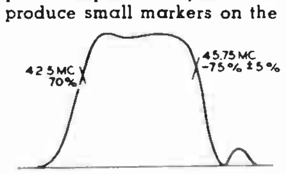

Figure 9—KRK22D T1 and T104 Response

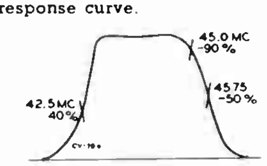

Figure 10—Overall I-F Response

Retouch T105, T106 and T107 to obtain the response shown in Figure 10.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 30 and 40 times down with curve as shown in Figure 10.

Move the sweep generator to the antenna terminals. Connect —3.0 volts bias to pin 5 of V103. Adjust T106 and T107 slightly to correct for any overall tilt while switching from channel to channel.

Models 24-D-542U, 24-D-543U and 24-D-544U

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R121 and R125.

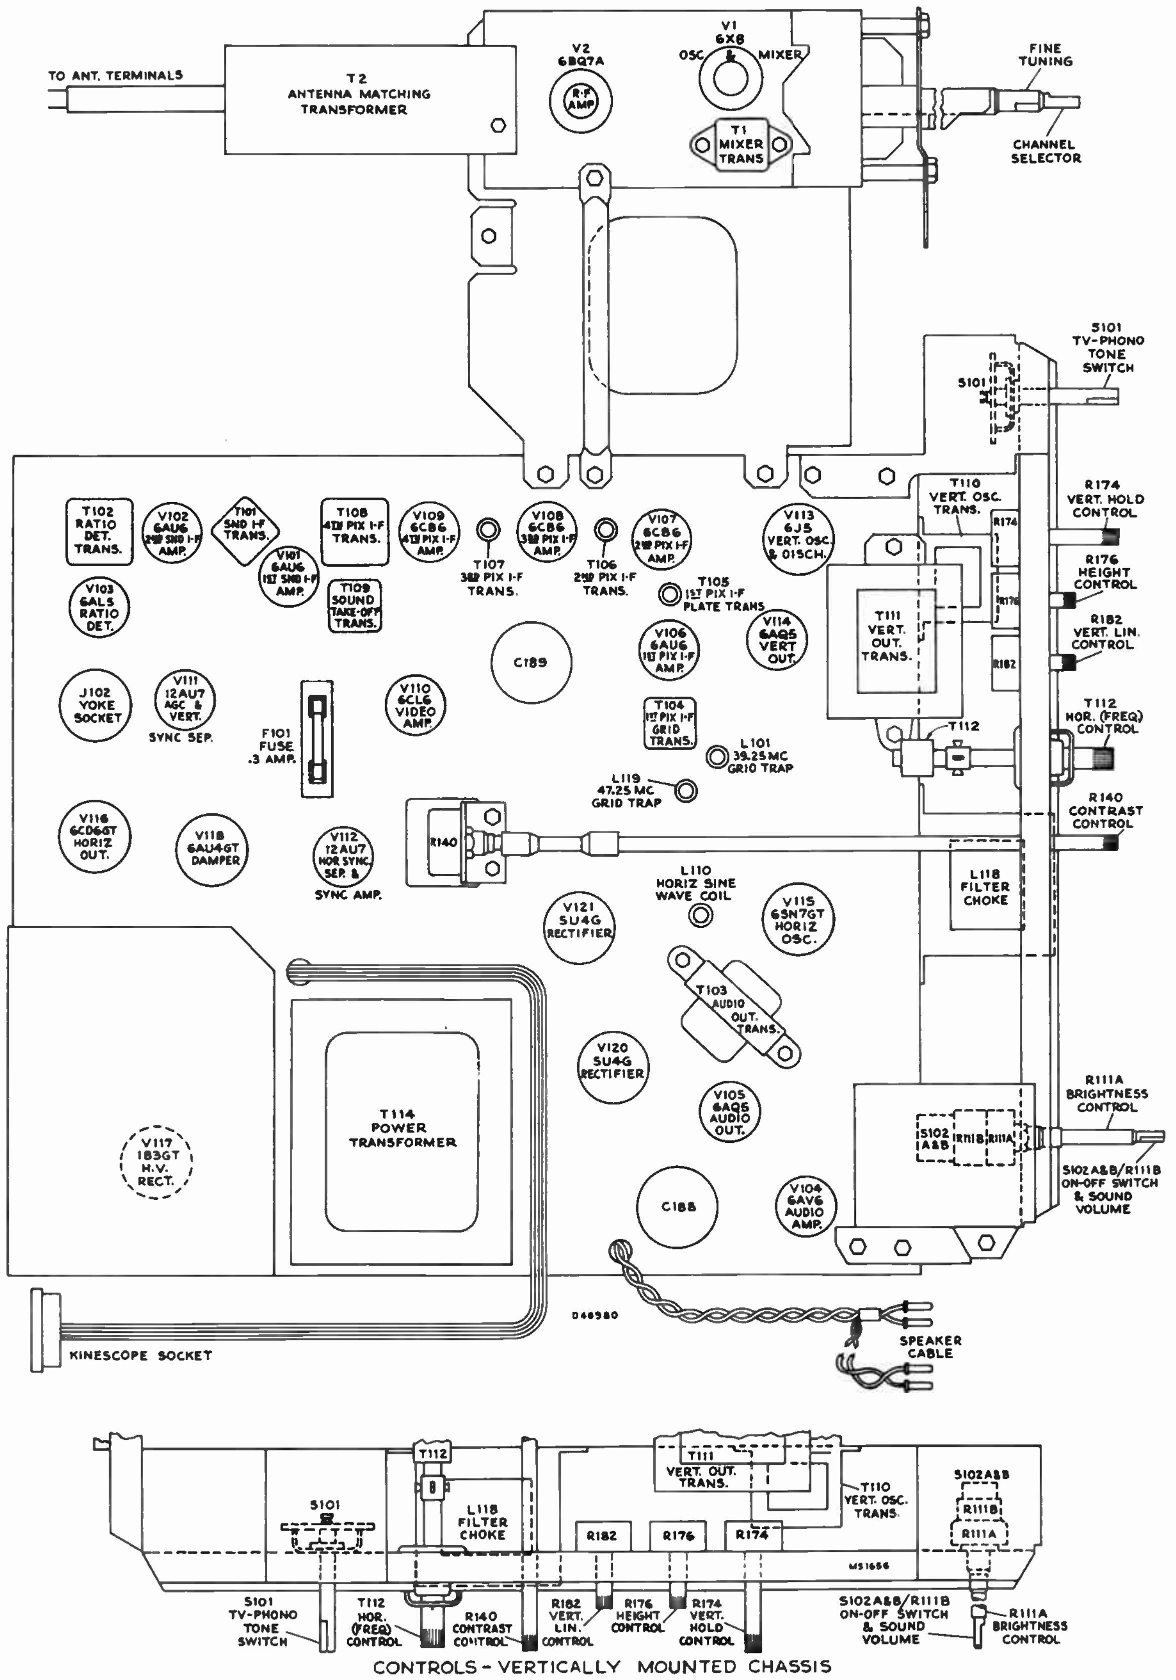

Figure 7—Chassis Top View (shown with KRK22D Tuner)

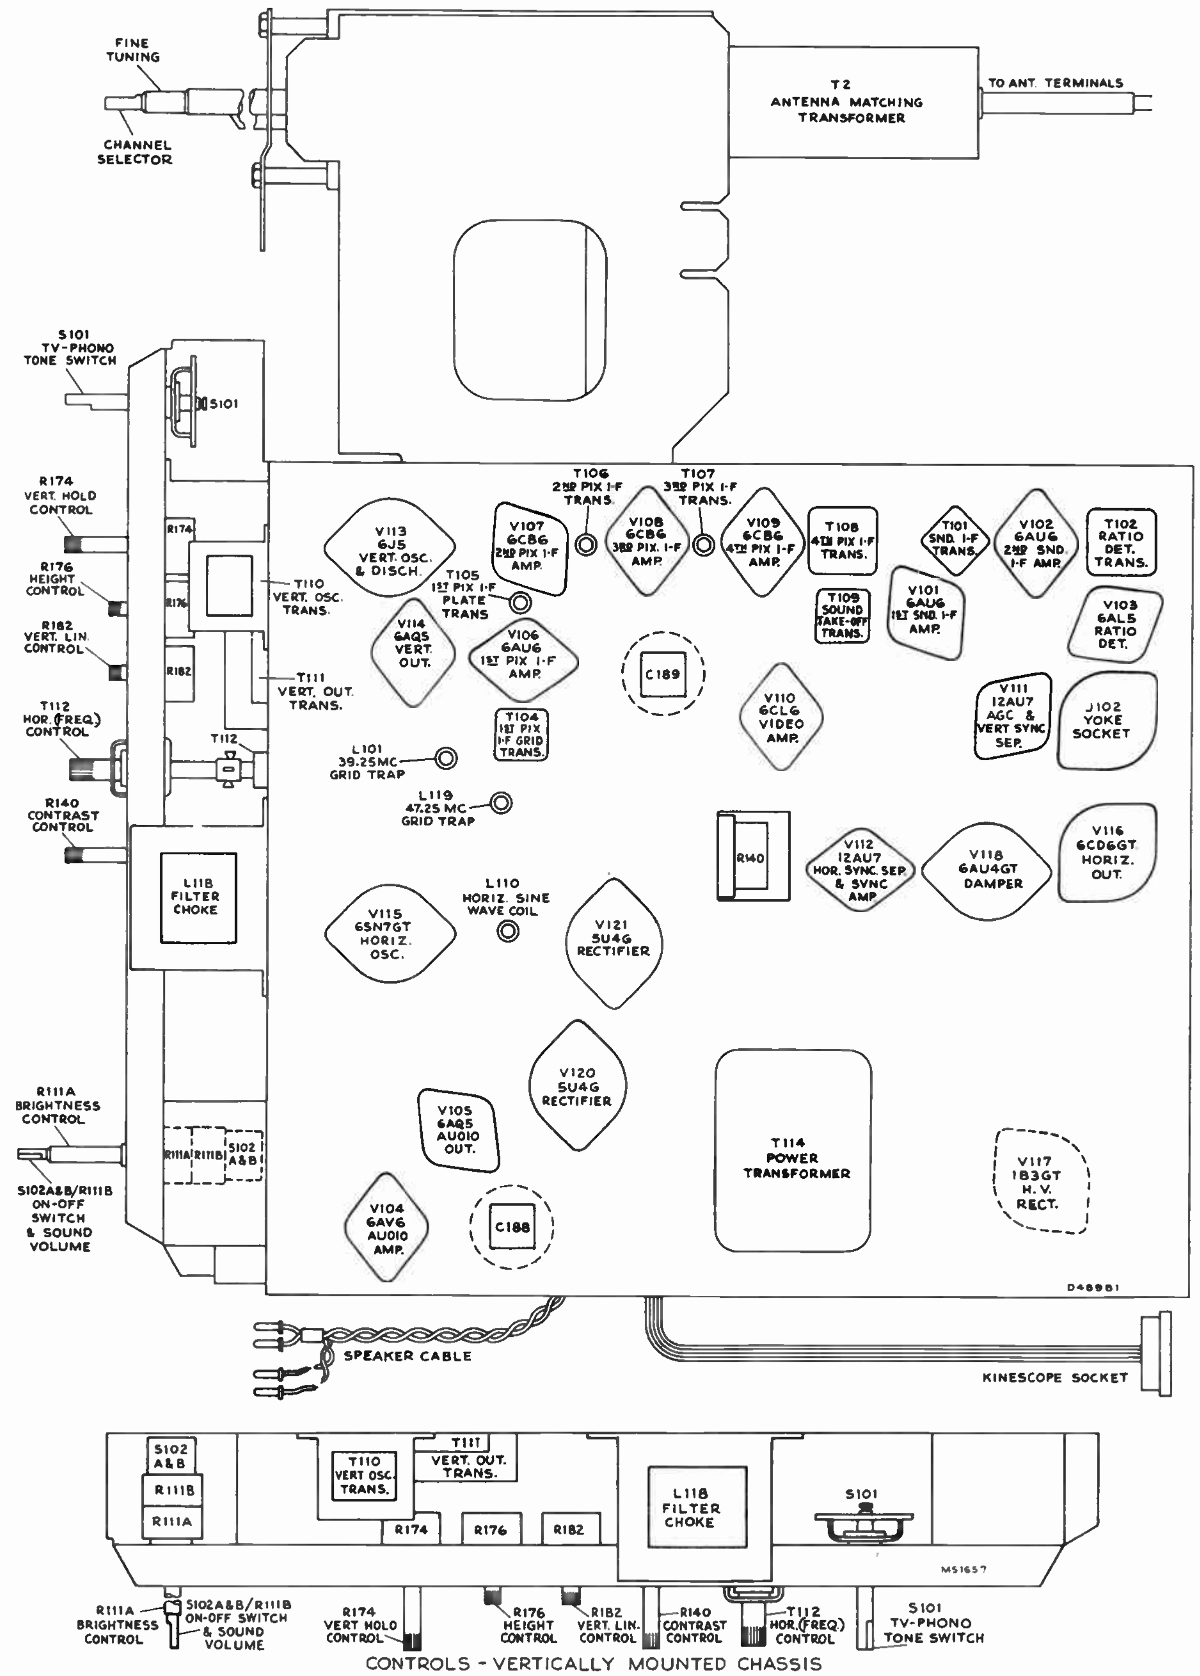

Figure 8—Chassis Bottom View (shown with KRK22D Tuner)

Short the grids of the third and fourth picture I-F amplifiers to ground, pin 1 of V108 and V109.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Set the sweep output for 0.5 volts peak-to-peak on the oscilloscope. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C119 across terminals "A" and "F" of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (top and bottom) for maximum gain with 45.75 mc. at 75% of maximum response.

Adjust the shunt trimmer C119 until 42.25 mc. is at 75% response with respect to the low frequency shoulder as shown in Figure 11. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 11. Maximum allowable tilt is 25%.

To align the fourth picture I-F transformer T108, connect the sweep generator to the fourth picture i-f grid, pin 1 of V109. Couple the signal generator loosely to obtain markers.

Connect the oscilloscope to pin 9 of V110 and set to read 3 to 5 volts peak-to-peak.

Adjust T108 top and bottom cores for maximum gain and curve shape as shown in Figure 12.

Adjust C193 to place the 41.25 mc. marker at 80% and 45.75 mc. marker at 90%. Readjust T108 for flat top curve as shown in Figure 12.

NOTE: C193 is incorporated as part of T108, fourth picture I-F transformer. Adjustment is made by varying the penetration of the insulated lead, from terminal "E", into the ceramic sleeve at the bottom of T108 as seen in figure 26 on page 16. Care should be taken when adjusting to prevent damage to the lead or its insulation.

Remove the 180 ohm resistor and the shorts on pin 1 of V108 and V109.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R152, R153 and C122.

Connect the sweep generator to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 0.5 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

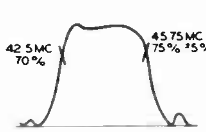

Figure 11—KRK30B T2 and T104 Response

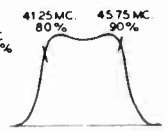

Figure 12—T108—4th Picture I-F Response

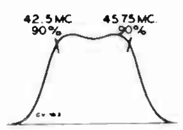

Figure 13—KRK30B L9 and C308 I-F Response

Retouch T105, T106 and T107 to obtain the response shown in Figure 10.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 30 and 40 times down with curve as shown in Figure 10.

To align the I-F amplifier circuit of the KRK30B, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1000 ohm resistor and a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep ground lead to the tuner case. To do this, remove the crystal cover at the right side of the UHF tuner section. (Refer to Figure 20.) Cover one lead of the 1000 ohm resistor with a short piece of insulated tubing and fashion a hook at the end of this lead. Connect to the front terminal of the crystal holder through the aperture under the crystal cover. Connect the capacitor and generator as stated above.

Set the UHF CHANGEOVER switch to the UHF position, and the UHF TUNING between channels 68 and 69 at 800 mc.

Connect a 180 ohm composition resistor and a 1500 mmf. capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground.

Connect the oscilloscope diode probe to the junction between the resistor and capacitor.

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.5 volt or less peak-to-peak on the oscilloscope.

Adjust C308, on the UHF section, and L9, on the VHF section, of the tuner for maximum gain with 45.75 mc. and 42.25 mc. markers as shown in figure 13.

If necessary adjust L27 to place the 45.75 mc. marker at 90% on the curve. Adjust L43 for minimum tilt of the curve as shown in figure 13.

Remove the resistor, capacitor and diode probe from TP3 and connect the oscilloscope to pin 9 of V110. Use 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Connect the VHF sweep generator to the VHF antenna terminals. Keep the AGC bias at —3.0 V and the I-F bias at —5.0 volts.

Couple the signal generator loosely to the grid of the first picture I-F amplifier.

Switch through all VHF channels and check for proper curve shape as in figure 10. Retouch T106 and T107 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the UHF antenna terminals. Check on all UHF channels for proper wave shape as shown in figure 10, retouching C308 and L9 if necessary to correct any overall tilt.

Do not retouch L27, L43, T2, T104, T105, T106 or T107.

Remove the sweep and marker generators and the bias supplies.

KRK22D TUNER ALIGNMENT.—

Models 24-D-542, 24-D-543 and 24-D-544

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T1 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" or T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the FM trap L53.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

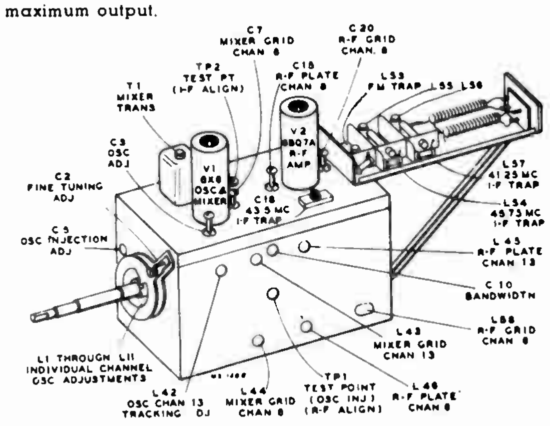

Figure 14—KRK22D Tuner Adjustments

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3

Set the T1 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15, to the input terminals of the antenna matching unit.

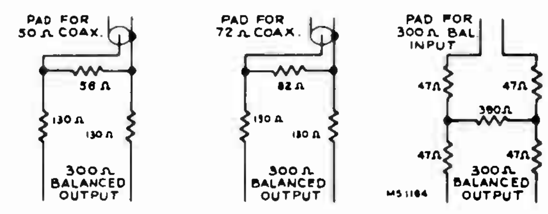

Figure 15—Sweep Attenuator Pads

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

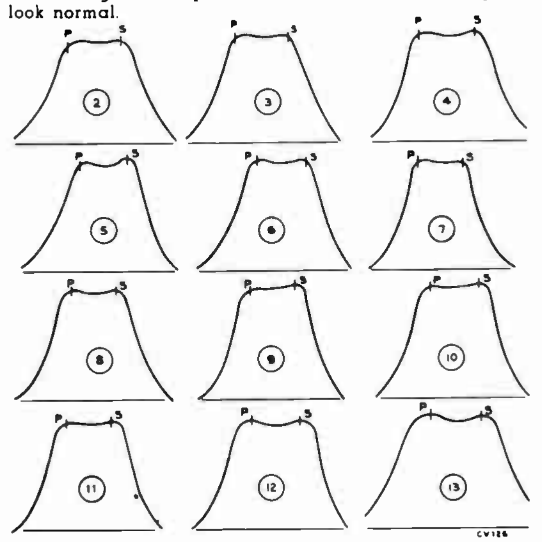

Figure 16—KRK22D R-F Responses

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in figure 16.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in figure 16.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response.

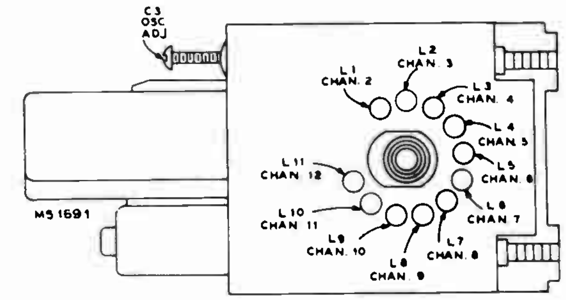

Figure 17—KRK22D Oscillator Adjustments

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L5 for an audible beat. Adjust L44, L46 and L58 for proper curve shape as shown in figure 16. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 16 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L58 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 16 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK22D OR KRK30B ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L53 (L5) to the channel selector switch S4 (S1E).

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R118, R146 and C120. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R118, R146 and C120.

Connect an oscilloscope to the junction of R129 and L103 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L54 (L5) in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L57 (L1) for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L53 (L5) to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L53 (L5) to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 15 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L55 (L3) and L56 (L2) to obtain the response shown in figure 18. L55 (L3) is most effective in locating the position of the shoulder of the curve at 52 mc. and L56 (L2) should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L53 (L5) and S4 (S1E). Replace V106.

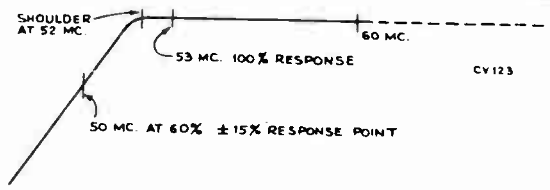

Figure 18—KRK22D or KRK30B Antenna Matching Unit Response

KRK30B TUNER ALIGNMENT

Models 24-D-542U, 24-D-543U and 24-D-544U

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f" in terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency of each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

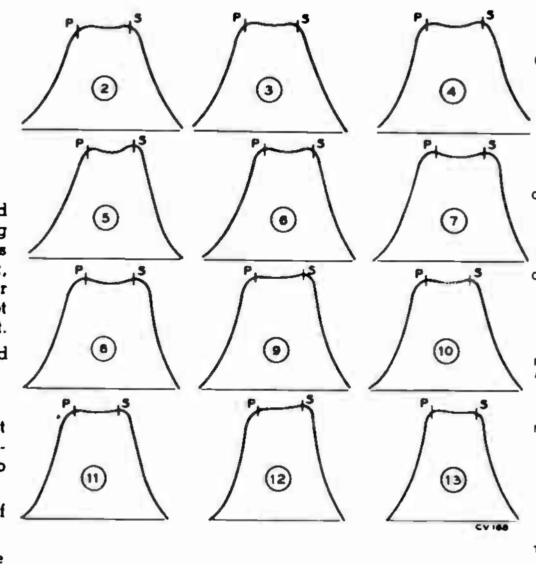

Figure 19—KRK30B VHF R-F Response

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in figure 19.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in figure 19.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

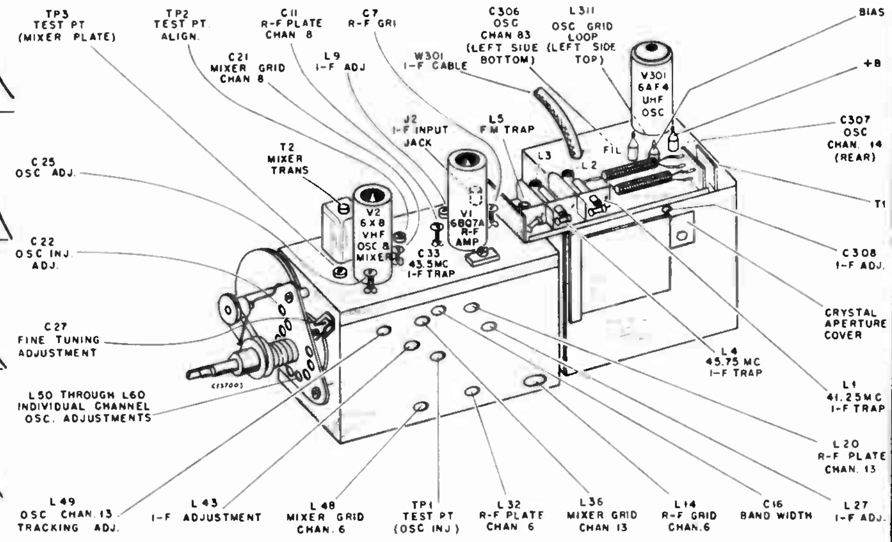

Figure 20—KRK30B Tuner Adjustments

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L14, L48 and L32 for proper curve shape as shown in figure 19. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 19 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 19 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT.—R-F alignment of the UHF section of the tuner may only be performed with the UHF section removed from the tuner assembly. R-F adjustments require removal of the tuner shield which may only be done with the UHF tuner separate from its mounting.

I-F and oscillator adjustments may be accomplished without removing the tuner.

Connect a 100 ohm composition resistor between the center conductor of the I-F cable W301 and the tuner case.

Connect the oscilloscope to the center conductor of W301 at the 100 ohm resistor, employing the preamplifier if needed with the oscilloscope used. Ground the oscilloscope to the tuner case.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft

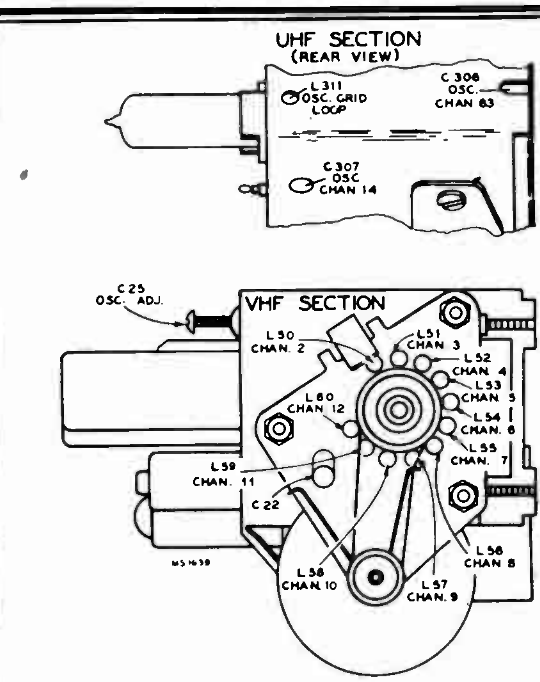

Figure 21—KRK30B VHF Oscillator Adjustments

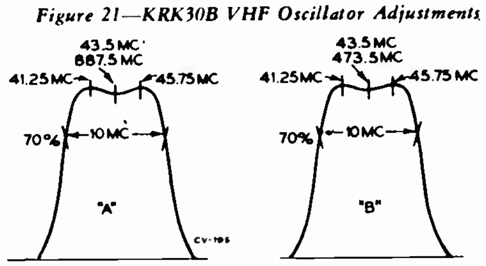

Figure 22—KRK30B UHF R-F Response

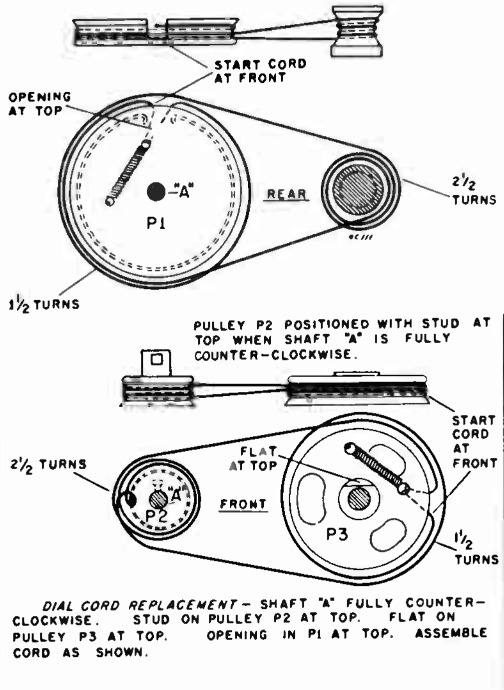

Figure 23—KRK30B Dial Cords

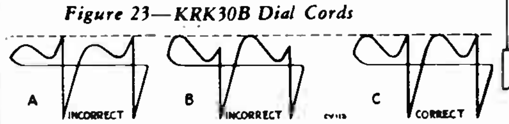

Figure 24—Horizontal Oscillator Waveforms

is necessary for accurate alignment. Scribe marks at 0°, 5° and 164° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. With the stop pin on the tuner against the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 164°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the junction of W301 and L310. This may be done by inserting the lead from the resistor, which should be covered with insulated tubing, through the aperture provided for crystal removal. (See figure 20.) Insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitor tabs C304 and C305 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 22(A).

Adjust the oscillator trimmer capacitor C306 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 22(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 5°, Channel 14, position.

Adjust the oscillator trimmer C307 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown. The inductance loop L311 across the oscillator grid coil on some units, may be repositioned, if necessary, to bring the oscillator trimmer within range. Refer to figure 20 for location of the aperture for making this adjustment.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates must be knifed with the shield cover removed. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" between the center conductor of W301 and ground. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .03 and .35 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedance or an oscillator tube outside allowable limits. This voltage is an indication of correct crystal current and may be varied by repositioning the flag L309 with respect to L3.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 20). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

SOUND I-F AND RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101 in series with a 1500 mmf. capacitor.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector secondary T102 bottom core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked, when making the above adjustments.

Tune the T101 (top) core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the T101 adjustment are made.

Connect the "VoltOhmyst" to the junction of R107 and C109.

Tune T102 bottom for zero d-c at the junction of R107 and C109. (Make adjustment with core at chassis end of coil.)

SOUND TAKE-OFF ALIGNMENT.—Connect two (2) signal generators to the grid of the fourth picture i-f amplifier, pin 1 of V109.

Set one generator to 45.75 mc., unmodulated, and adjust output for .5 volts.

Set the second generator to 41.25 mc., and modulate 30%, at 400 cycles, with an output of .2 volts.

Connect the oscilloscope, in series with diode probe, to the plate of the video amplifier, pin 6 of V110.

Set the oscilloscope to maximum gain.

Adjust T109 for minimum output indication on the oscilloscope.

As an alternate method, this may be accomplished by using a received signal as the source for adjustment.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, short the terminals of the fixed 4.5 mc. trap L105. With a 4.5 mc. beat present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust T109 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 6 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ALIGNMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it usually can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal (freq.) control, then adjust the waveform adjustment core (top of chassis) out of the coil several turns from its original position and readjust the frequency control until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive trimmer C179, the width control L111 and the linearity control L113, until the picture is correct.

Connect the low capacity probe of an oscilloscope to the center terminal of T112, at the junction of R195. Dress the oscilloscope probe at least one inch away from the sine wave coil L110. Turn the horizontal frequency control so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 24. Adjust the waveform adjustment coil L110 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the frequency control if necessary.

Remove the oscilloscope upon completion of this adjustment.

Turn the horizontal frequency control to the extreme clockwise position. The picture should be out of sync, with a minimum of twelve bars slanting downward to the left. Turn the control counter-clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 1½ to 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional counter-clockwise rotation of the control. The picture should remain in sync for approximately two full turns of additional counter-clockwise rotation of the control. Continue counter-clockwise rotation until the picture falls out of sync. Rotation beyond the fall-out position should produce between 2 and 5 bars before interrupted oscillation (motorboat) occurs. Interrupted oscillation (motorboat) should be reached before full counter-clockwise rotation.

When the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned.

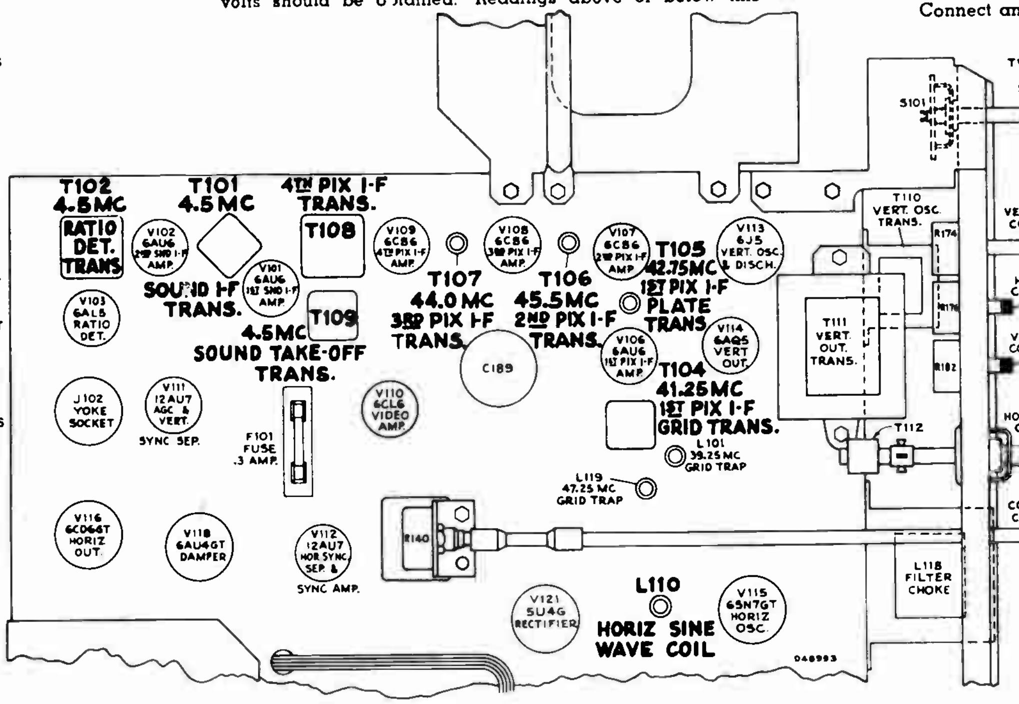

Figure 25—Top Chassis Adjustments

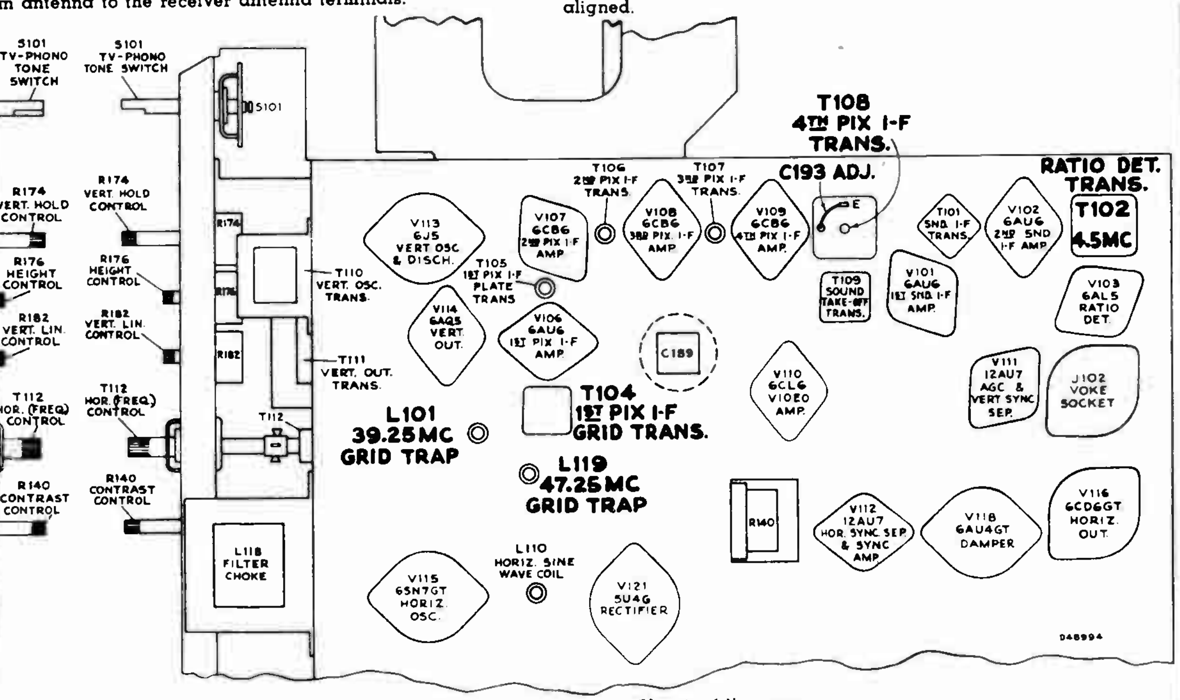

Figure 26—Bottom Chassis Adjustments

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 30,000 microvolt test pattern signal was fed into the receiver, the picture synchronized and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

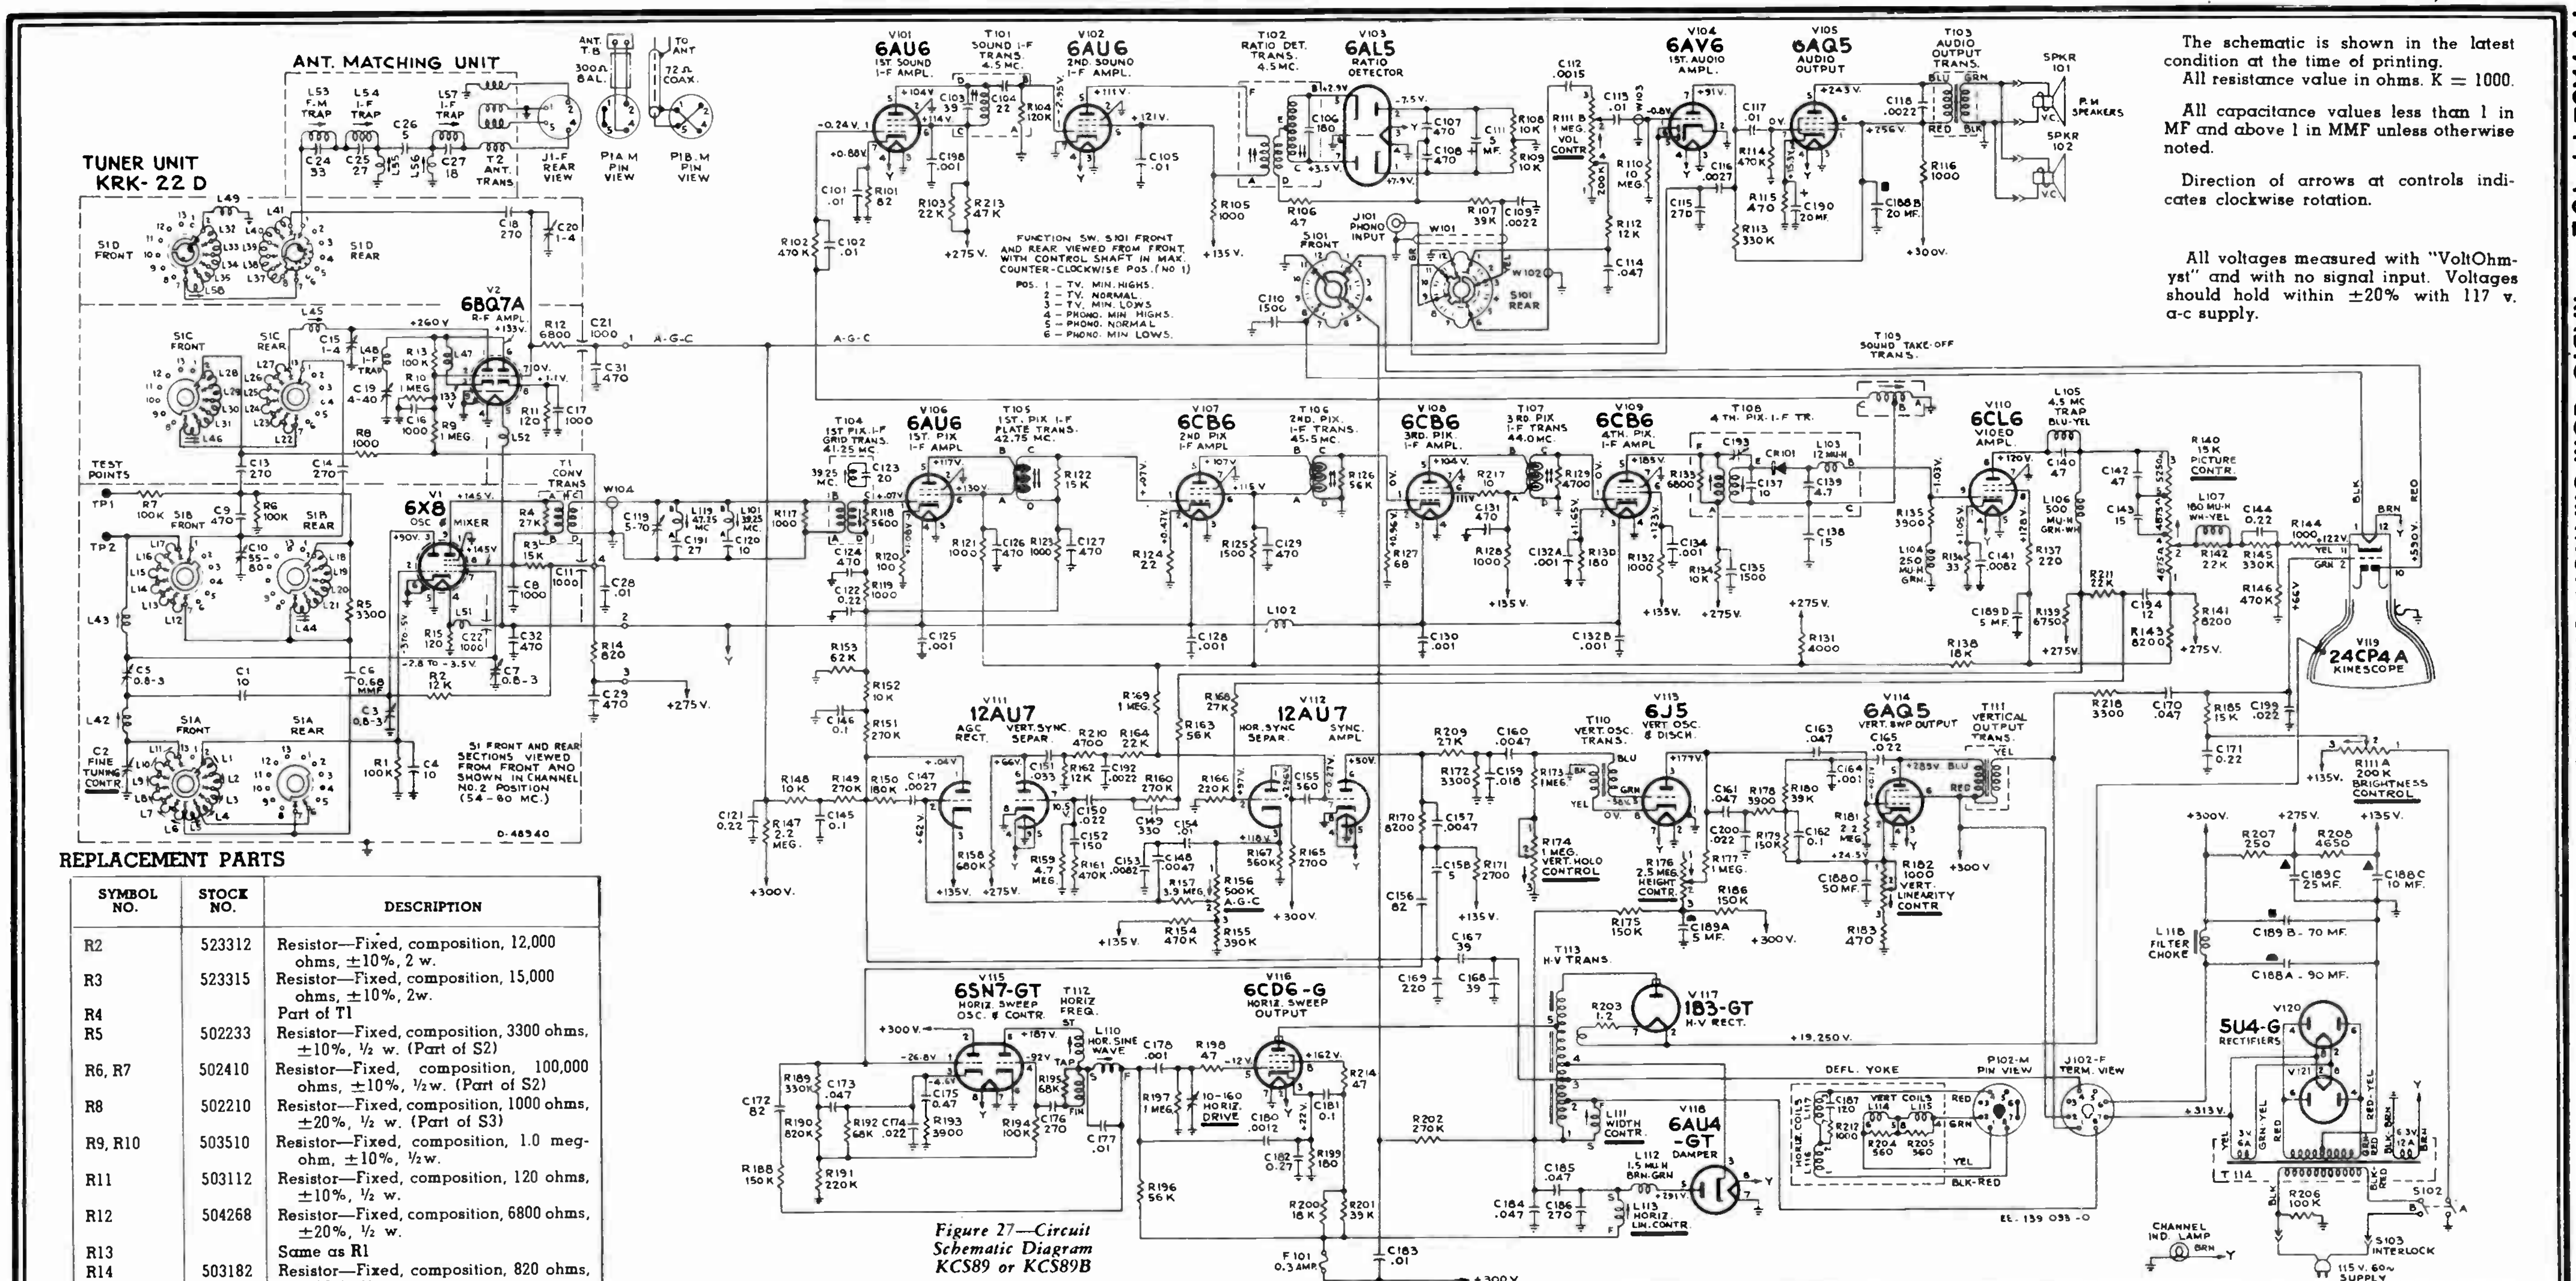

Figure 27—Circuit Schematic Diagram KCS89 or KCS89B

The schematic is shown in the latest condition at the time of printing.
All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

REPLACEMENT PARTS

SYMBOL NO.	STOCK NO.	DESCRIPTION
R2	523312	Resistor—Fixed, composition, 12,000 ohms, ±10%, 2 w.
R3	523315	Resistor—Fixed, composition, 15,000 ohms, ±10%, 2w.
R4		Part of T1
R5	502233	Resistor—Fixed, composition, 3300 ohms, ±10%, ½ w. (Part of S2)
R6, R7	502410	Resistor—Fixed, composition, 100,000 ohms, ±10%, ½w. (Part of S2)
R8	502210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w. (Part of S3)
R9, R10	503510	Resistor—Fixed, composition, 1.0 megohm, ±10%, ½w.
R11	503112	Resistor—Fixed, composition, 120 ohms, ±10%, ½ w.
R12	504268	Resistor—Fixed, composition, 6800 ohms, ±20%, ½ w.
R13		Same as R1
R14	503182	Resistor—Fixed, composition, 820 ohms, ±10%, ½w.
R15		Same as R11
T1	78399	Transformer—Convertor transformer
T2	78396	Transformer—Antenna matching transformer complete (C24, C25, C26, C27, J1, L53, L54, L55, L56, L57)
C1 to C4 Incl.		Part of Antenna matching transformer
C5	77084	Capacitor—Ceramic, feed-thru, 1000 mmf.
C6	75199	Capacitor—Fixed, ceramic, 270 mmf., ±20%, 500 v.
C7	76532	Trimmer—Adjustable, 1-4 mmf.
C8, C9	77252	Capacitor—Fixed, ceramic, 1000 mmf., +100%, —0%, 500 v.
C10	75199	Capacitor—Fixed, ceramic, 270 mmf., ±20%, 500 v. D.C. (Part of S4)
C11	77151	Trimmer—Adjustable, 0.8-3.0 mmf.
C12	78276	Capacitor—Fixed, ceramic, 150 mmf., ±10%, 500 v. D.C. (Part of S3)
C13	71599	Capacitor—Fixed, ceramic, 270 mmf., ±20%, 500 v. D.C. (Part of S2)
C15		Same as C5
C16	78397	Trimmer—Mica, 80-150 mmf.
C17 to C19 Incl.		Same as C5
C20	78603	Capacitor—Fixed, ceramic, 82 mmf., ±10%, 500 v.
C21		Same as C11
C22	77913	Capacitor—Adjustable, steatite, 0.8-3.0 mmf. (Part of S1)
C23	71504	Capacitor—Fixed, headed-lead, 0.68 mmf., ±20%, 500 v. D.C. (Part of S2)
C24	78247	Capacitor—Fixed, ceramic, 10 mmf., ±1 mmf., 500 v.
C25		Same as C11
C26	77865	Capacitor—Fixed, ceramic, 10 mmf., ±1.0 mmf., 500 v.
C27	79192	Trimmer—Ceramic, variable—fine tuning type
C28	73960	Capacitor—Fixed, ceramic, 10,000 mmf., 500 v.
C29	77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, —0%, 500 v.
C31		(Part of S3) Capacitor—Fixed, headed-lead type, 2.2 mmf., ±20%, 500 v. D.C.
C33	77616	Capacitor—Adjustable, mica, 4-40 mmf.
C34, C35		Same as C29
C36	75437	Capacitor—Fixed, ceramic, 100 mmf., ±20%, 500 v. D.C. (Part of S2)
C38	71503	Capacitor—Fixed, headed-lead type, 3.3 mmf., ±20%, 500 v. D.C. (Part of S5)
C39		Same as C31 (Part of S3)
L1 to L5 Incl.		Part of Antenna matching transformer
L6	78466	Coil—R.F. choke
L7	76562	Coil—R.F. amplifier coupling coil
L8	77859	Coil—R.F. grid switch return connector coil
L9	79542	Coil—I.F. input coil complete with adjustable core
L10 to L13 Incl.		Part of S3 & S5
L14	73458	Coil—Channel #6 R.F. grid coil (Part of S3 & S5)
L15 to L19 Incl.		Part of S3 & S5
L20	77921	Coil—Channel #13 R.F. plate coil (Part of S3 & S5)
L21 to L26 Incl.		Part of S3 & S5
L27	78584	Coil—R.F. plate I.F. coil (Part of S3)
L28 to L31 Incl.		Part of S3 & S5
L32	73460	Coil—Channel #6 R.F. plate coil (Part of S3 & S5)
L33	77206	Coil—Filament choke coil
L35	76763	Coil—Heater choke coil
L36	77919	Coil—Channel #13 mixer coil
L37 to L42 Incl.		Part of S1 & S2
L43	78583	Coil—Mixer I.F. coil (Part of S1 & S2)
L44 to L47 Incl.		Part of S1 & S2
L48	73874	Coil—Channel #6 mixer coil (Part of S1 & S2)
L49	77915	Coil—Channel #13 oscillator coil (Part of S1 & S2)
L50 to L60 Incl.		Part of S1 & S2
L61	78401	Coil—Channel #6 antenna coil
R1	502268	Resistor—Fixed, composition, 6800 ohms, ±20%, ½w.
R2	502112	Resistor—Fixed, composition, 120 ohms, ±10%, ½ w.
R3	502410	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ w. (Part of S2)

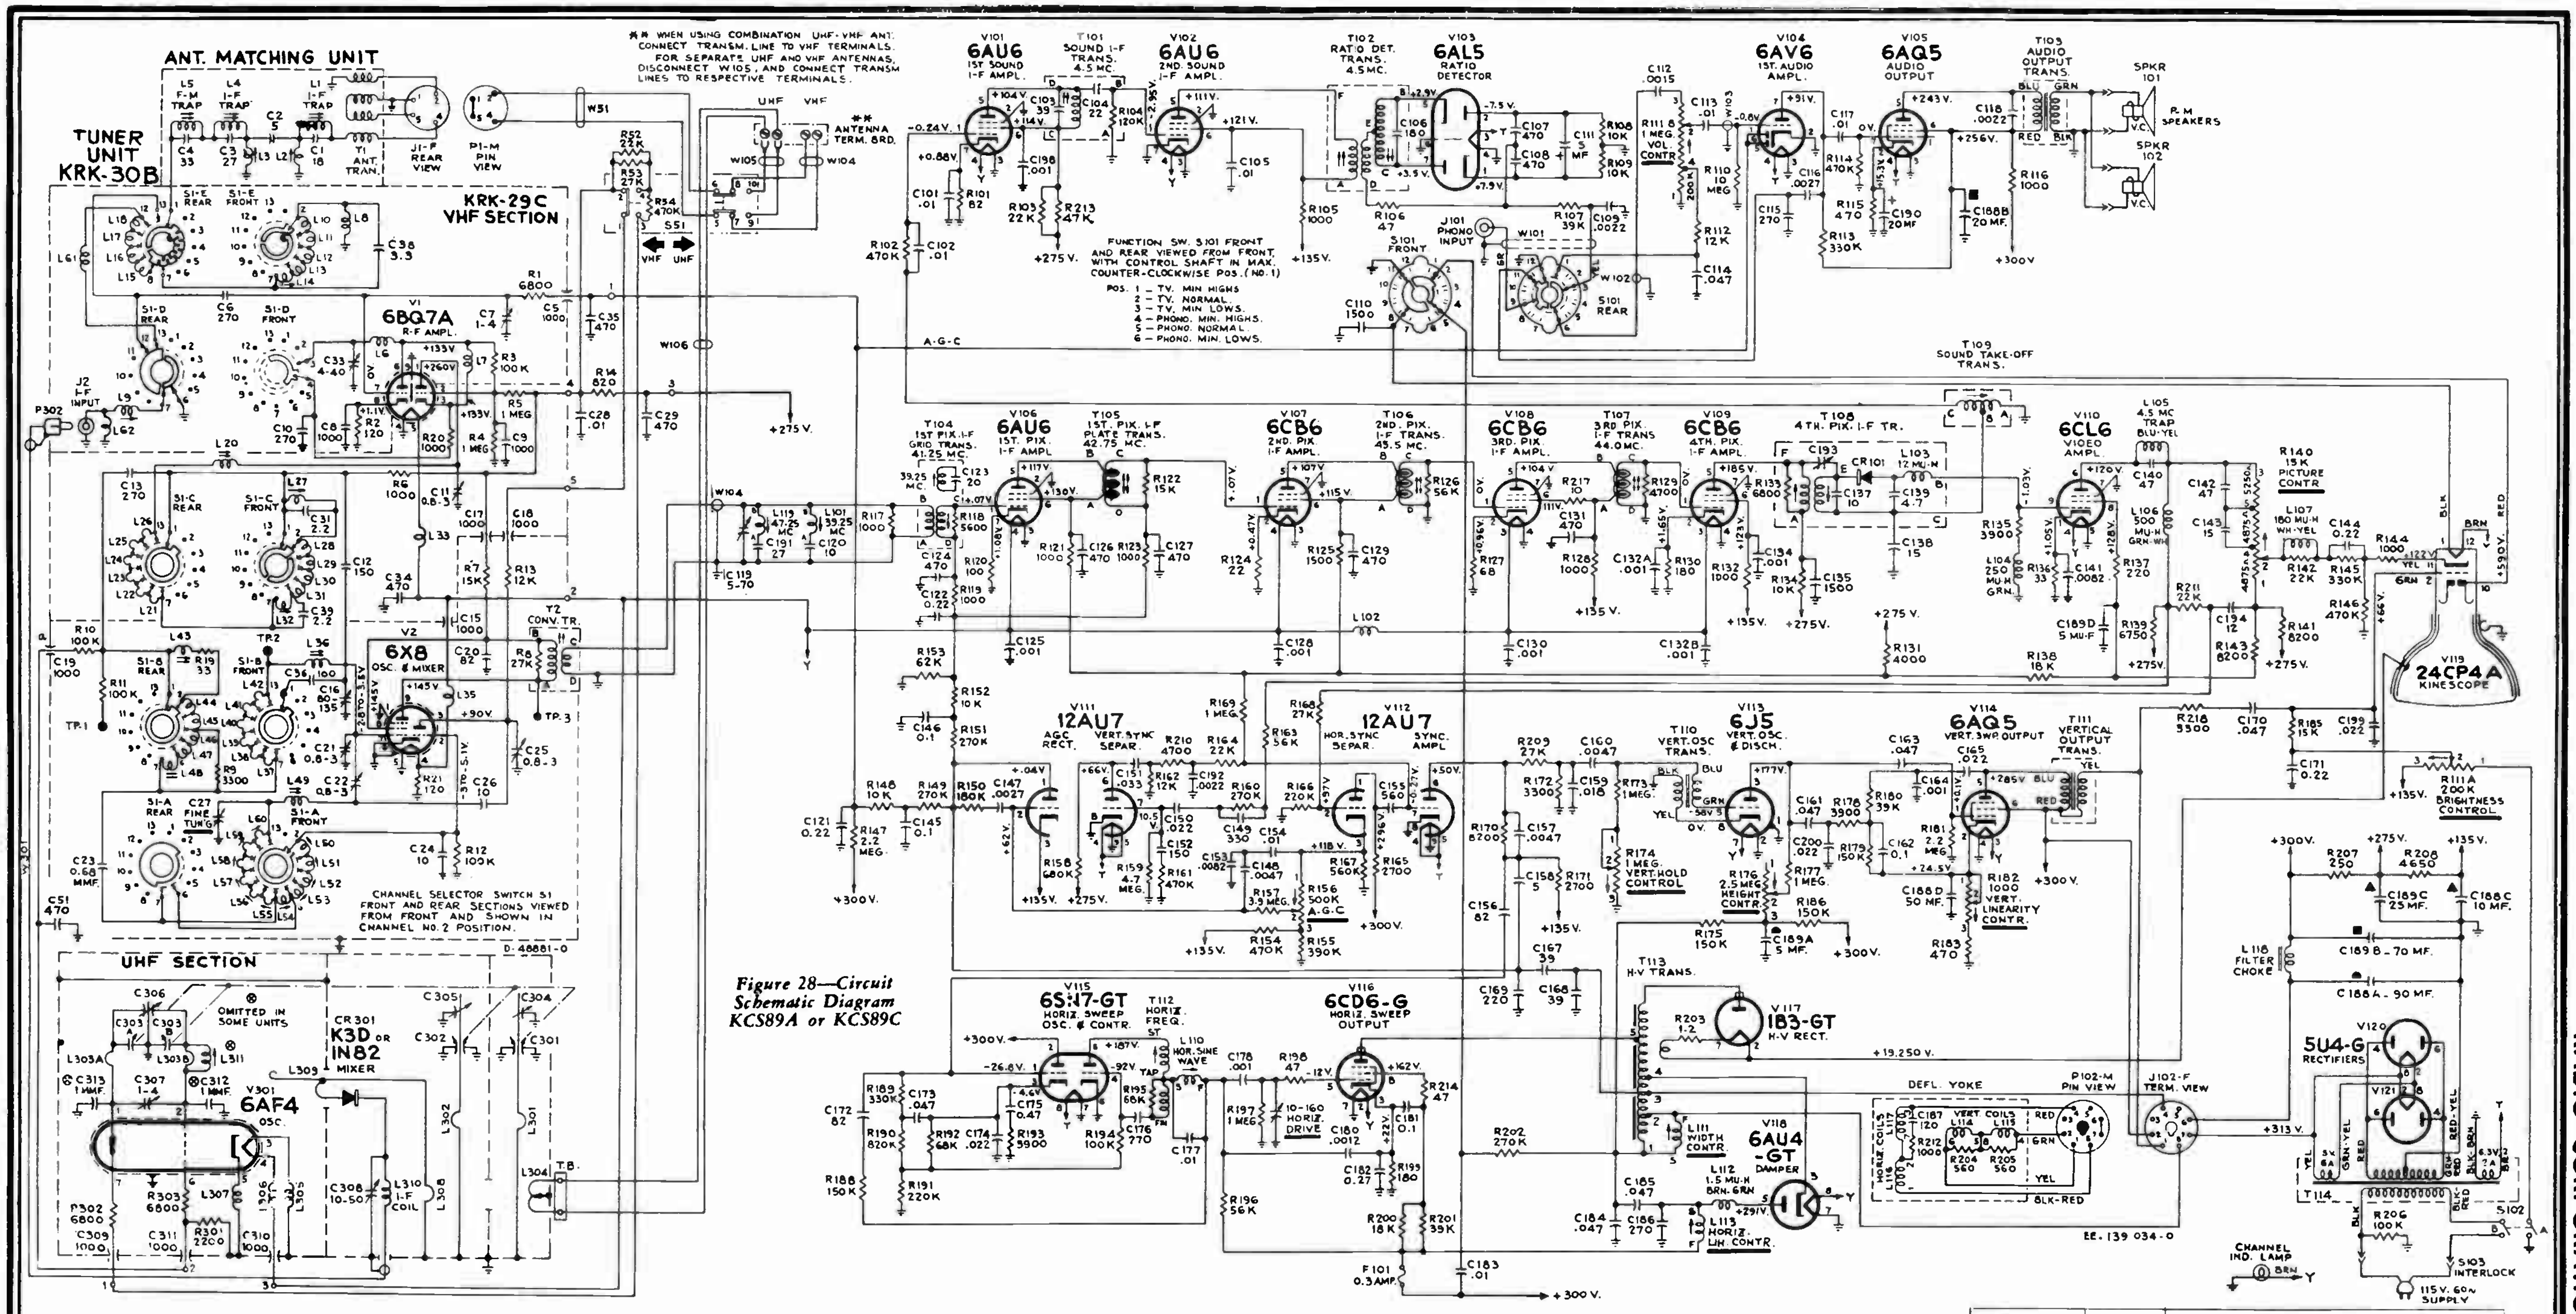

Figure 28—Circuit Schematic Diagram KCS89A or KCS89C

SYMBOL NO.	STOCK NO.	DESCRIPTION
R4, R5	502510	Resistor—Fixed, composition, 1 meg., ±10%, ½ w.
R6	502210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w. (Part of S3)
R7	522315	Resistor—Fixed, composition, 15,000 ohms, ±10%, 2 w.
R8		Part of T2
R9	502233	Resistor—Fixed, composition, 3300 ohms, ±10%, ½ w. (Part of S2)
R10, R11		Same as R3 (Part of S2)
R12		Same as R3
R13	522312	Resistor—Fixed, composition, 12,000 ohms, ±10%, 2 w.
R14	502182	Resistor—Fixed, composition, 820 ohms, ±10%, ½ w.
R19	502033	Resistor—Fixed, composition, 33 ohms, ±10%, ½ w. (Part of S2)
R20		Same as R6
R21		Same as R2

SYMBOL NO.	STOCK NO.	DESCRIPTION
T1	78396	Transformer—Antenna matching transformer complete
T2	78399	Transformer—Convertor transformer (R8)
C301 to C303 Incl.	79553	Capacitor—Variable tuning capacitor
C304, C305	79554	Stator—Oscillator stator assembly
C306	79555	Capacitor—Oscillator trimmer capacitor
C307	79556	Capacitor—Adjustable, ceramic, 0.8-3.5 mmf.
C308	79558	Capacitor—Trimmer, 10-50 mmf.
C309 to C311 Incl.	79559	Capacitor—Feed thru, 1000 mmf.
C312, C313	79560	Capacitor—Fixed, ceramic, .1 mmf., ±0.1 mmf., 500 v. D.C. non-insulated
CR301	77489	Rectifier—UHF diode crystal germanium rectifier
L301, L302		Coil—R.F. tank plate
L303	79557	Tank Assembly—complete with capacitor (C7)

SYMBOL NO.	STOCK NO.	DESCRIPTION
L304	79564	Board—Antenna terminal board assembly
L305 to L307 Incl.	79565	Choke—R.F. choke
L308, L309		Coil—Mixer coupling coil for oscillator & output section
L310	79567	Coil—I.F. output coil 0.15 microhenries
L311	79566	Coil—Oscillator loop coil
R301	502222	Resistor—Fixed, composition, 2200 ohms, ±10%, ½ w.
R302	512268	Resistor—Fixed, composition, 6800 ohms, ±10%, 1 w.
R303	502268	Resistor—Fixed, composition, 6800 ohms, ±10%, ½ w.
C101, C102	73960	Capacitor—Fixed, ceramic, .01 mf., 500 v.
C103, C104		Part of T101
C105		Same as C101
C106		Part of T102
C107, C108	39644	Capacitor—Fixed, mica, 470 mmf., ±5%, 500 v.

SYMBOL NO.	STOCK NO.	DESCRIPTION
C109	73595	Capacitor—Fixed, paper, .0022 mf., ±5%, 600 v.
C110	73748	Capacitor—Fixed, ceramic, 1500 mmf., 500 v.
C111	74521	Capacitor—Electrolytic, 5 mfd., 50 v.
C112	76508	Capacitor—Fixed, paper, .0015 mf., ±5%, 600 v.
C113	73561	Capacitor—Fixed, paper, .01 mf., ±10%, 400 v.
C114	73558	Capacitor—Fixed, paper, .047" mf., ±10%, 200 v.
C115	47617	Capacitor—Fixed, ceramic, 270 mmf., 500 v.
C116	73599	Capacitor—Fixed, paper, .0027 mf., ±10%, 600 v.
C117	73561	Capacitor—Fixed, paper, .01 mf., ±10%, 400 v. D.C.
C118	73595	Capacitor—Fixed, paper, .0022 mf., ±5%, 600 v. D.C.
C119	71496	Capacitor—Adjustable mica, 4-70 mmf.
C120	98225	Capacitor—Fixed, ceramic, 10 mmf., 500 v. D.C.
C121, C122	78905	Capacitor—Fixed, paper, 0.22 mf., ±20%, 200 v. D.C.

SYMBOL NO.	STOCK NO.	DESCRIPTION
C123		Part of T104
C124	77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, —0%, 500 v. D.C.
C125	73960	Capacitor—Fixed, ceramic, 0.001 mf., 500 v. D.C.
C126	78622	Capacitor—Fixed, ceramic, 470 mmf., ±10%, 500 v. D.C.
C127		Same as C124
C128		Same as C125
C129		Same as C126
C130		Same as C125
C131		Same as C126
C132A,B	79319	Capacitor—Fixed, ceramic, 0.001/0.001 mf., +100%, —0%, 500 v. D.C.
C134		Same as C125
C135	75166	Capacitor—Fixed, ceramic, 1500 mmf., +100%, —0%, 500 v.
C137		Part of T108
C138	39044	Capacitor—Fixed, ceramic, 15 mmf., 500 v. D.C.
C139		Part of T108
C140		Part of L105
C141	79019	Capacitor—Fixed, paper, 0.0082 mf., +10%, 400 v. D.C.
C142	39042	Capacitor—Fixed, ceramic, 47 mmf., 500 v. D.C.
C143		Same as C138
C144	73794	Capacitor—Fixed, paper, 0.22 mf., ±20%, 400 v. D.C.
C145, C146	73784	Capacitor—Fixed, paper, 0.1 mf., ±20%, 200 v. D.C.
C147	73599	Capacitor—Fixed, paper, 0.0027 mf., +10%, 600 v. D.C.
C148	73920	Capacitor—Fixed, paper, 0.0047 mf., ±10%, 400 v. D.C.
C149	39640	Capacitor—Fixed, mica, 330 mmf., ±5%, 500 v. D.C.
C150	73562	Capacitor—Fixed, paper, 0.022 mf., ±20%, 400 v. D.C.
C151	73552	Capacitor—Fixed, paper, 0.033 mf., ±20%, 400 v. D.C.
C152	39632	Capacitor—Fixed, mica, 150 mf., ±10%, 500 v. D.C.
C153		Same as C141
C154	73561	Capacitor—Fixed, paper, 0.01 mf., ±10%, 400 v. D.C.
C155	74250	Capacitor—Fixed, mica, 560 mmf., ±10%, 1000 v. D.C.
C156	76474	Capacitor—Fixed, mica, 82 mmf., ±5%, v. D.C.
C157	79017	Capacitor—Fixed, paper, 0.0047 mf., ±20%, 400 v. D.C.
C158	72809	Capacitor—Fixed, mica, 5 mmf., ±20%, 1500 v. D.C.
C159	58476	Capacitor—Fixed, paper, 0.018 mf., ±10%, 400 v. D.C.
C160	73920	Capacitor—Fixed, paper, 0.0047 mf., ±5%, 600 v. D.C.
C161	73592	Capacitor—Fixed, paper, 0.047 mf., ±10%, 600 v. D.C.
C162	73784	Capacitor—Fixed, paper, 0.1 mf., ±10%, 200 v. D.C.
C163	73592	Capacitor—Fixed, paper, 0.047 mf., ±20%, 600 v. D.C.
C164	73849	Capacitor—Fixed, paper, 0.001 mf., ±10%, 1600 v. D.C.
C165	73798	Capacitor—Fixed, paper, 0.022 mf., ±10%, 600 v. D.C.
C167, C168	76574	Capacitor—Fixed, ceramic, 39 mmf., ±10%, 3500 v. D.C.
C169	79021	Capacitor—Fixed, mica, 220 mmf., ±10%, 1000 v. D.C.
C170	73553	Capacitor—Fixed, paper, 0.047 mf., ±10%, 400 v. D.C.
C171		Same as C144
C172	76474	Capacitor—Fixed, mica, 82 mmf., ±5%, 1000 v. D.C.
C173	73553	Capacitor—Fixed, paper, 0.047 mf., ±20%, 400 v. D.C.
C174		Same as C150
C175	73787	Capacitor—Fixed, paper, 0.47 mf., ±20%, 200 v. D.C.
C176	76579	Capacitor—Fixed, mica, 270 mmf., ±5%, 1000 v. D.C.
C177	73594	Capacitor—Fixed, paper, 0.01 mf., ±5%, 600 v. D.C.
C178	75643	Capacitor—Fixed, paper, 0.001 mf., ±10%, 1000 v. D.C.
C179	79376	Capacitor—Trimmer, 10-160 mmfd.
C180	76995	Capacitor—Fixed, paper, 0.0012 mf., ±5%, 600 v. D.C.
C181	73557	Capacitor—Fixed, paper, 0.1 mf., ±10%, 600 v. D.C.
C182	73786	Capacitor—Fixed, paper, 0.27 mf., ±10%, 200 v. D.C.
C183	73561	Capacitor—Fixed, paper, 0.01 mf., ±20%, 400 v. D.C.
C184, C185	73597	Capacitor—Fixed, paper, 0.047 mf., ±10%, 1000 v. D.C.
C186	79022	Capacitor—Fixed, mica, 270 mmf., ±20%, 1000 v. D.C.
C187		Part of Yoke
C188 A,B,C,D	79391	Capacitor—Fixed, electrolytic, 90-20-10 —10 +50%, 450 v.; 70-25-5 mf., —10 mf., —10 +250%, 50 v. D.C.
C189 A,B,C,D	79292	Capacitor—Fixed, electrolytic, 5 mf., mfd., —10 +50%, 400 volts D.C.; 50 +50%, 400 v.
C190	79380	Capacitor—Electrolytic, 20 mf., —10 +250%, 25 v.
C191	79488	Capacitor—Fixed, ceramic, 27 mmf., ±5%, 500 v. Temp. coef. —750° non-insulated
C192	73595	Capacitor—Fixed, paper, 0.0022 mf., ±10%, 600 v. D.C.
C193		Part of T108
C194	33380	Capacitor—Fixed, ceramic, 18 mmf., ±5%, 500 v.
C198		Same as C125
C199		Same as C150
C200		Capacitor—Fixed, paper, .022 mfd., ±10%, 200 v. D.C.
F101	78214	Fuse—.3 amp
J101	35787	Connector—Phono input connector
J102	68590	Connector—Deflection yoke connector —female
L101	79383	Trap—I.F. grip trap—39.25 MC
L102	73477	Coil—Choke coil
L103		Part of T108
L104	98482	Coil—Peaking coil, 250 mh
L105	76482	Coil—Trap, 4.5 M.C. trap includes C140
L106	75252	Coil—Peaking, 500 mh
L107	76647	Coil—Peaking, 180 mh includes R142
L110	79161	Coil—Horizontal sine wave coil
L111	76441	Coil—Width coil
L112	76640	Coil—R.F. choke coil—1.5 mh
L113	76442	Coil—Horizontal linearity coil
L114 to L117 Incl.		Part of Yoke
L118	77676	Choke—Filter choke
L119	79390	Trap—I.F. grid trap 47.25 MC
R101	502082	Resistor—Fixed, composition, 82 ohms, ±10%, ½ w.
R102	502447	Resistor—Fixed, composition, 470,000 ohms, ±20%, ½w.
R103	522322	Resistor—Fixed, composition, 22,000 ±10%, 2 w.
R104		Part of T101
R105	502210	Resistor—Fixed, composition, 1000 ohms, ±10%, ½ w.
R106	502047	Resistor—Fixed, composition, 47 ohms, ±10%, ½ w.
R107	502339	Resistor—Fixed, composition, 39,000 ohms, ±10%, ½ w.
R108, R109	502310	Resistor—Fixed, composition, 10,000 ohms, ±5%, ½ w.
R110	502610	Resistor—Fixed, composition, 10 meg-ohm, ±20%, ½ w.
R111A,B	77655	Control—Volume—"On-Off" brightness control
R112	502312	Resistor—Fixed, composition, 12,000 ohms, ±10%, ½ w.
R113	502430	Resistor—Fixed, composition, 330,000 ohms, ±20%, ½ w.
R114		Same as R102
R115	512147	Resistor—Fixed, composition, 470 ohms, ±10%, 1 w.
R116	522210	Resistor—Fixed, composition, 1000 ohms, ±10%, 2 w.
R117	502210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w.
R118		Part of T104
R119		Same as R117
R120	502110	Resistor—Fixed, composition, 100 ohms, ±5%, ½ w.
R121		Same as R117
R122	36714	Resistor—Fixed, composition, 15,000 ohms, ±5%, ½ w.
R123		Same as R117
R124	502022	Resistor—Fixed, composition, 22 ohms, ±5%, ½ w.
R125	512215	Resistor—Fixed, composition, 1500 ohms, ±20%, 1 w.
R126	502356	Resistor—Fixed, composition, 56,000 ohms, ±5%, ½ w.
R127	502068	Resistor—Fixed, composition, 68 ohms, ±5%, ½ w.
R128		Same as R117
R129	502247	Resistor—Fixed, composition, 4700 ohms, ±5%, ½ w.
R130	502118	Resistor—Fixed, composition, 180 ohms, ±5%, ½ w.
R131	77668	Resistor—Fixed, wire wound, 4000 ohms, ±10%, 7 w.
R132		Same as R117
R133		Part of T108
R134	522310	Resistor—Fixed, composition, 10,000 ohms, ±10%, 2 w.
R135	502239	Resistor—Fixed, composition, 3900 ohms, ±5%, ½ w.
R136	502033	Resistor—Fixed, composition, 33 ohms, ±10%, ½ w.
R137	502122	Resistor—Fixed, composition, 220 ohms, ±20%, ½ w.
R138	512318	Resistor—Fixed, composition, 18,000 ohms, ±10%, 1 w.
R139	76642	Resistor—Fixed, wire wound, 6750 ohms, ±10%, 10 w.
R140	76445	Control—Contrast control
R141	522282	Resistor—Fixed, composition, 8200 ohms, ±10%, 2 w.
R142		Part of L107
R143	512282	Resistor—Fixed, composition, 8200 ohms, ±10%, 1w.
R144		Same as R117
R145	502433	Resistor—Fixed, composition, 330,000 ohms, ±10%, ½ w.
R146	502447	Resistor—Fixed, composition, 470,000 ohms, ±10%, ½ w.
R147	512522	Resistor—Fixed, composition, 2.2 meg-ohm, ±5%, 1 w.
R148	502410	Resistor—Fixed, composition, 10,000 ohms, ±10%, ½ w.
R149	502427	Resistor—Fixed, composition, 270,000 ohms, ±5%, ½ w.
R150	502418	Resistor—Fixed, composition, 180,000 ohms, ±10%, ½ w.
R151		Same as R149
R152		Same as R148
R153	70320	Resistor—Fixed, composition, 62,000 ohms, ±5%, ½ w.
R154		Same as R146
R155	502439	Resistor—Fixed, composition, 390,000 ohms, ±10%, ½ w.
R156	78808	Control—AGC control
R157	502539	Resistor—Fixed, composition, 3.9 meg-ohm, ±10%, ½ w.
R158	502468	Resistor—Fixed, composition, 680,000 ohms, ±10%, ½ w.
R159	502543	Resistor—Fixed, composition, 4.7 meg., ±10%, ½ w.
R160	502427	Resistor—Fixed, composition, 270,000 ohms, ±10%, ½ w.
R161		Same as R102
R162	502312	Resistor—Fixed, composition, 12,000 ohms, ±10%, ½ w.
R163	502356	Resistor—Fixed, composition, 56,000 ohms, ±10%, ½ w.
R164	502322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ w.
R165	502227	Resistor—Fixed, composition, 2700 ohms, ±10%, ½ w.
R166	502422	Resistor—Fixed, composition, 220,000 ohms, ±10%, ½ w.
R167	502456	Resistor—Fixed, composition, 560,000 ohms, ±10%, ½ w.
R168	502327	Resistor—Fixed, composition, 27,000 ohms, ±10%, ½ w.
R169	502510	Resistor—Fixed, composition, 1 meg., ±10%, ½ w.
R171	502227	Resistor—Fixed, composition, 2700 ohms, ±5%, ½ w.
R170		Same as R143
R172	502233	Resistor—Fixed, composition, 3300 ohms, ±10%, ½ w.
R173		Same as R169
R174	79384	Control—Vertical hold control
R175	502415	Resistor—Fixed, composition, 150,000 ohms, ±10%, ½ w.
R176	78807	Control—Height control
R177	502510	Resistor—Fixed, composition, 1.0 meg., ±20%, ½ w.
R178	502239	Resistor—Fixed, composition, 3900 ohms, ±10%, ½ w.
R179	502415	Resistor—Fixed, composition, 150,000 ohms, ±10%, ½ w.
R180	522339	Resistor—Fixed, composition, 39,000 ohms, ±5%, 2 w.
R181	502522	Resistor—Fixed, composition, 2.2 meg., ±20%, ½ w.
R182	79385	Control—Vertical linearity control
R183	512147	Resistor—Fixed, composition, 470 ohms, ±20%, 1 w.
R185	36714	Resistor—Fixed, composition, 15,000 ohms, ±10%, ½ w.
R186		Same as R175
R188	502415	Resistor—Fixed, composition, 150,000 ohms, ±10%, ½ w.
R189	502433	Resistor—Fixed, composition, 330,000 ohms, ±10%, ½ w.
R190	502482	Resistor—Fixed, composition, 820,000 ohms, ±10%, ½ w.
R191	502422	Resistor—Fixed, composition, 220,000 ohms, ±10%, ½ w.
R192	502368	Resistor—Fixed, composition, 68,000 ohms, ±10%, ½ w.
R193	502239	Resistor—Fixed, composition, 3900 ohms, ±10%, ½ w.
R194	512410	Resistor—Fixed, composition, 100,000 ohms, ±10%, 1 w.
R195		Same as R192
R196	512356	Resistor—Fixed, composition, 56,000 ohms, ±10%, 1 w.
R197		Same as R169
R198	502047	Resistor—Fixed, composition, 47 ohms, ±20%, ½ w.
R199	79378	Resistor—Fixed, wire wound, 180 ohms, ±10%, 4 w.
R200	522318	Resistor—Fixed, composition, 18,000 ohms, ±10%, 2w.
R201	512339	Resistor—Fixed, composition, 39,000 ohms, ±10%, 1 w.
R202	502427	Resistor—Fixed, composition, 270,000 ohms, ±10%, ½ w.
R203	78795	Resistor—Fixed, wire wound, 1.2 ohms, ±5%, ⅓ w.
R204, R205		Part of Yoke
R206	512410	Resistor—Fixed, composition, 100,000 ohms, ±20%, 1 w.
R207	79377	Resistor—Fixed, wire wound, 250 ohms, ±10%, 7 w.
R208	76989	Resistor—Fixed, wire wound, 4650 ohms, ±10%, 7 w.
R209	512327	Resistor—Fixed, composition, 27,000 ohms, ±10%, 1 w.
R210	502247	Resistor—Fixed, composition, 4700 ohms, ±10%, ½ w.
R211		Same as R164
R212		Part of Yoke
R213	512347	Resistor—Fixed, composition, 47,000 ohms, ±10%, 1 w.
R214	502047	Resistor—Fixed, composition, 47,000 ohms, ±20%, ½ w.
R217	502010	Resistor—Fixed, composition, 10 ohms, ±20%, ½ w.
R218		Same as R172
S101	77656	Switch—Phono-tone switch
T101	76981	Transformer—1st I.F. sound transformer, 4.5 m.c. includes C103, C104, R104
T102	77112	Transformer—Ratio detector center frequency 4.5 M.C. includes C106
T103	77821	Transformer—Audio output
T104	79386	Transformer—I.F. sound take-off, 4.5 M.C. includes C123, R118
T105 to T107 Incl.	76433	Transformer—1st, 2nd and 3rd pix transformer
T108	79389	Transformer—4th I.F. picture, 44 M.C. includes R133, C137, C139, C193, L103
T109	79388	Transformer—1st I.F. grid transformer
T110	79379	Transformer—Vertical oscillator
T111	79382	Transformer—Vertical output
T112	79160	Coil—Horizontal frequency coil
T113	78810	Transformer—High voltage transformer
T114	79387	Transformer—Power transformer
	79490	Yoke—Deflection yoke assembly includes C187, L114, L115, L116, L117, R204, R205, R212

SPEAKER ASSEMBLY
92586-4W
FOR MODELS
24D542 & U
24D543 & U

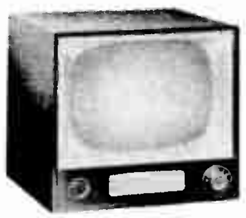
	75024	Cone—Cone and voice coil (3.2 ohms)
	74664	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)

SPEAKER ASSEMBLY
FOR MODELS 24D544 & U ONLY

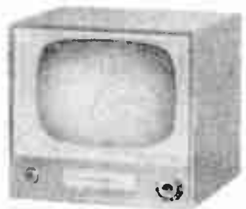
	77777	Speaker—10" P.M. speaker

Note: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.

Models 17-S-450, 17-S-450U "Trent" Metal-Ebony



Models 17-S-451, 17-S-451U "Newton" Metal-Maroon



Models 17-S-453, 17-S-453U "Ashburn" Metal-Oak Grain

GENERAL DESCRIPTION

All models are "17 inch" television receivers. Models 17-S-450, 17-S-451 and 17-S-453 are identical except for cabinets. Models 17-S-450U, 17-S-451U and 17-S-453U are identical except for cabinets. Models 17-S-450, 17-S-451 and 17-S-453 feature full 12 channel VHF coverage. Models 17-S-450U, 17-S-451U and 17-S-453U feature full 12 channel VHF coverage plus any UHF channels desired.

All models include intercarrier FM sound system; ratio detector; improved picture brilliance; A-F-C horizontal hold; stabilized vertical hold; and reduced hazard high voltage supply.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE

..........Approx. 156 sq. ins. on a 17HP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 17-S-450, 17-S-451 & 17-S-453

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 17-S-450U, 17-S-451U & 17-S-453U

Any of 70 UHF channels..................470 mc. to 890 mc.
Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency......................45.75 mc.
Sound I-F Carrier Frequency.......................41.25 mc.
POWER RATING ....175 watts
AUDIO POWER OUTPUT RATING............1.5 watts max.
VIDEO RESPONSE ....To 3.2 mc.
SWEEP DEFLECTION ....Magnetic
FOCUS ....Electrostatic

ANTENNA INPUT IMPEDANCE

Models 17-S-450, 17-S-451 & 17-S-453

300 ohms balanced.

Models 17-S-450U, 17-S-451U & 17-S-453U

UHF—300 ohms balanced.
VHF—300 ohms balanced.

RCA TUBE COMPLEMENT

Tube Used — **Function**

Tuner KRK30A (17-S-450U, 17-S-451U & 17-S-453U)

(1) RCA 6AF4 ....UHF Oscillator
(2) RCA 6BQ7A .... VHF R-F Amplifier / UHF I-F Amplifier
(3) 6X8 ....VHF R-F Oscillator and Mixer / UHF I-F Amplifier

A K3D or a 1N82 crystal is used as the UHF mixer.

All Models

(1) RCA 6CF6 ....1st Picture I-F Amplifier
(2) RCA 6CB6 ....2nd Picture I-F Amplifier
(3) RCA 6CB6 ....3rd Picture I-F Amplifier
(4) RCA 6AN8 ....1st Video Ampl. & 1st Sync.
(5) RCA 6C4 ....Video Output
(6) RCA 6AU6 ....Sound I-F Amplifier
(7) RCA 6AL5 ....Ratio Detector
(8) RCA 6AV6 ....1st Audio Amplifier
(9) RCA 6AS5 ....Audio Output
(10) RCA 12AU7 ....Sync. Output & Vert. Osc. and Disch.
(11) RCA 6K6GT ....Vertical Sweep Output
(12) RCA 6SN7GT....Horizontal Sweep Oscillator and Control
(13) RCA 6BQ6GT ....Horizontal Sweep Output
(14) RCA 6AX4GT .... Damper
(15) RCA 1B3-GT ....High Voltage Rectifier
(16) RCA 17HP4 .... Kinescope
(17) RCA 5U4G .... Rectifier

Tuner KRK32 (17-S-450, 17-S-451 & 17-S-453)

(1) RCA 6CB6 ....R-F Amplifier
(2) RCA 6U8 ....R-F Oscillator and Mixer

CHASSIS DESIGNATIONS

KCS87..........Models 17-S-450, 17-S-451 and 17-S-453 employing a KRK32 Tuner.

KCS87A..........Models 17-S-450U, 17-S-451U and 17-S-453U employing a KRK30A Tuner.

INSTALLATION INSTRUCTIONS

UNPACKING—These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

Take the receiver out of the carton and remove all packing material.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the kinescope high voltage lead clip is in place.

Plug a power cord into the 115 volt a-c power source and into the receiver interlock receptacle.

Turn the receiver power switch to the "on" position, the brightness control fully clockwise, and the picture control counter-clockwise.

ANTENNA INPUT

Models 17-S-450, 17-S-451 & 17-S-453

The KRK32 tuner unit is designed for VHF reception only, with a 300 ohm antenna input provided.

Models 17-S-450U, 17-S-451U & 17-S-453U

The KRK30A tuner unit is designed for UHF-VHF reception with 300 ohm inputs provided for UHF and VHF use. When using a UHF antenna only or a VHF antenna only connect the single transmission line to the proper receiver antenna terminals. Do not connect the terminal board jumper W105. (Refer to figure 27.)

When a combination UHF-VHF antenna is used, connect the transmission line to the VHF terminals on the terminal board. Connect the jumper W105 to the UHF terminals as shown in figure 27.

Signals from separate UHF and VHF antennas may be fed to the tuner. To do this connect the individual transmission lines to their respective terminals on the terminal board. Do not connect the jumper W105. Where a "crossover network" is employed to match the two separate antennas to a common 300 ohm line, connect the line to the VHF terminals. Connect the jumper W105 to the UHF terminals on the terminal board.

CHECK FOR PROPER OPERATION.—Turn the power switch to the "on" position and check the operation of the receiver.

Each unit has been completely and accurately adjusted at the factory and should operate normally at this point. However, a check of all the various functions should be performed. Adjustment should be made as outlined below, only where an indication of improper operation is evident.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 3. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Readjust the ion trap magnet for maximum raster brilliance. The final touches of this adjustment should be made with the brightness control at the maximum clockwise position with which good line focus can be maintained.

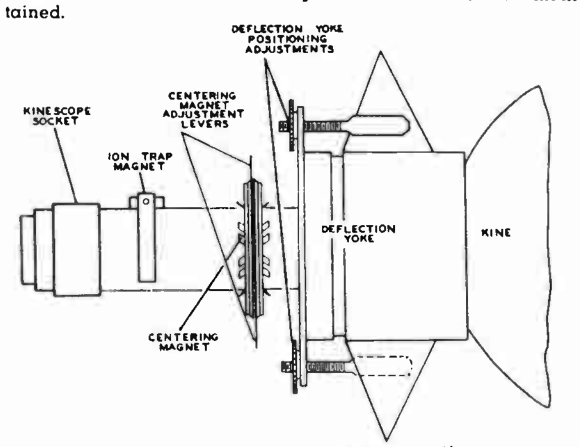


Figure 3—Yoke and Centering Magnet Adjustments

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the knurled yoke nuts.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern or picture in order to make further adjustments.

When the Horizontal Oscillator is operating properly, it should be possible to sync the picture at this point. However, if the AGC (LOCAL-DISTANT) control is misadjusted on UHF-VHF receivers, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, readjust LOCAL-DISTANT control until the set operates normally and the picture can be synced.

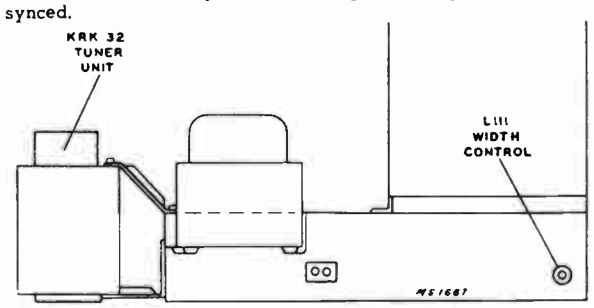

Figure 4—Rear Chassis Adjustments

CHECK OF HORIZONTAL OSCILLATOR ADJUSTMENT.—Turn the horizontal (freq.) control clockwise until the picture is out of sync, with approximately twelve bars slanting downward to the left. Turn the control counter-clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 1½ to 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional counter-clockwise rotation of the control. The picture should remain in sync for approximately two full turns of additional counter-clockwise rotation of the control. Continue counter-clockwise rotation until the picture falls out of sync. Rotation beyond fall-out position should produce between 2 and 5 bars before interrupted oscillation (motorboat occurs). Interrupted oscillation (motorboat) should be reached before full counter-clockwise rotation.

When the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Adjustment of Horizontal Oscillator" and proceed with "Centering Adjustment."

ADJUSTMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync over two full turns of counter-clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Turn the horizontal drive trimmer C171 fully clockwise, then counter-clockwise one full turn. Set the width coil L111 with the stud flush with the inside edge of the chassis. Set the sine wave coil L121 fully counter-clockwise.

Adjustment of the horizontal frequency control in the counter-clockwise direction will show a multiple number of bars before "motorboat" occurs. Adjust the sine wave coil L121 until 3 or 4 bars are present before "motorboat" occurs, when the horizontal frequency control is rotated counter-clockwise from the fall-out point.

If it is impossible to sync the picture and the AGC control (UHF/VHF receivers only) is in proper adjustment it will be necessary to align the Horizontal Oscillator by the method outlined in the alignment procedure

CENTERING ADJUSTMENT—The electrostatic focus kinescope is provided with special centering magnets. These magnets are in the form of two discs mounted on a non-magnetic tube which is placed around the neck of the kinescope at a distance of about one-fourth of an inch in back of the deflection yoke plate. When the magnets are rotated on the tube so that the levers are together, maximum centering effect is produced. To shift the picture, rotate one of the magnets with respect to the other. To shift the picture in the desired direction rotate the entire centering magnet assembly on the neck of the kinescope. By alternately rotating one magnet with respect to the other, then rotating the entire assembly around the neck of the tube, proper centering of the picture can be obtained.

WIDTH AND DRIVE ADJUSTMENTS.—Set the horizontal control at the "pull-in" point. Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer counter-clockwise until a bright vertical line appears in the middle of the picture then clockwise until the bright line just disappears.

At maximum brightness adjust the width control L111 to obtain correct picture width.

Return the brightness to normal level and readjust the drive trimmer C171 as before.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R165 behind front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R174 behind front control panel), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—An electrostatic focus type kinescope is employed in these receivers. The receivers operate with fixed focus, having a fixed voltage applied to the focusing electrode.

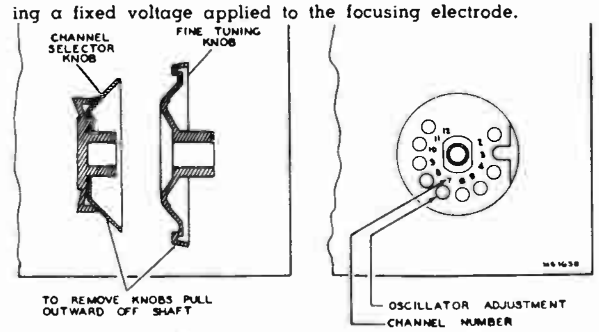

Figure 5—KRK32 R-F Oscillator Adjustments

KRK32, or KRK30A VHF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 11 or 14. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the channel selector and fine tuning knobs and the indicator dial on UHF-VHF models as shown in Figure 5 or 6. The oscillator for the UHF tuner section of the KRK30A tuner should be adjusted by the method outlined on page 14 under Alignment Procedure.

AGC CONTROL.—The AGC (LOCAL-DISTANT) control R149 is provided as a customer control on UHF/VHF models. Adjustment should be made as outlined under "OPERATING INSTRUCTIONS"

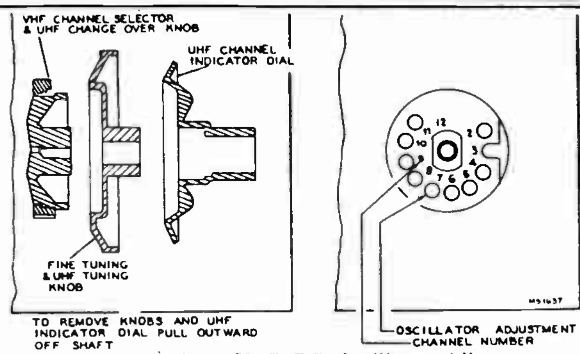

Figure 6—KRK30A VHF R-F Oscillator Adjustment

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the FM trap for minimum interference in the picture. The trap is L5 and is located on the antenna matching transformer.

CAUTION.—In some receivers, the FM trap L5 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L5 to make sure that adjustment does not affect sensitivity on these two channels.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding the back are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

INTERFERENCE.—Auto ignition, street cars, electrical machinery and diathermy apparatus may cause interference which spoils the picture. Whenever possible, the antenna location should be removed as far as possible from highways, hospitals, doctors' offices and similar sources of interference. In mounting the antenna, care must be taken to keep the antenna rods at least ¼ wave length (at least 6 feet) away from other antennas, metal roofs, gutters or other metal objects.

Short-wave radio transmitting and receiving equipment may cause interference in the picture in the form of moving ripples. In some instances it may be possible to eliminate the interference by the use of a trap in the antenna transmission line. However, if the interfering signal is on the same frequency as the television station, a trap will provide no improvement.

CHASSIS TOP VIEW

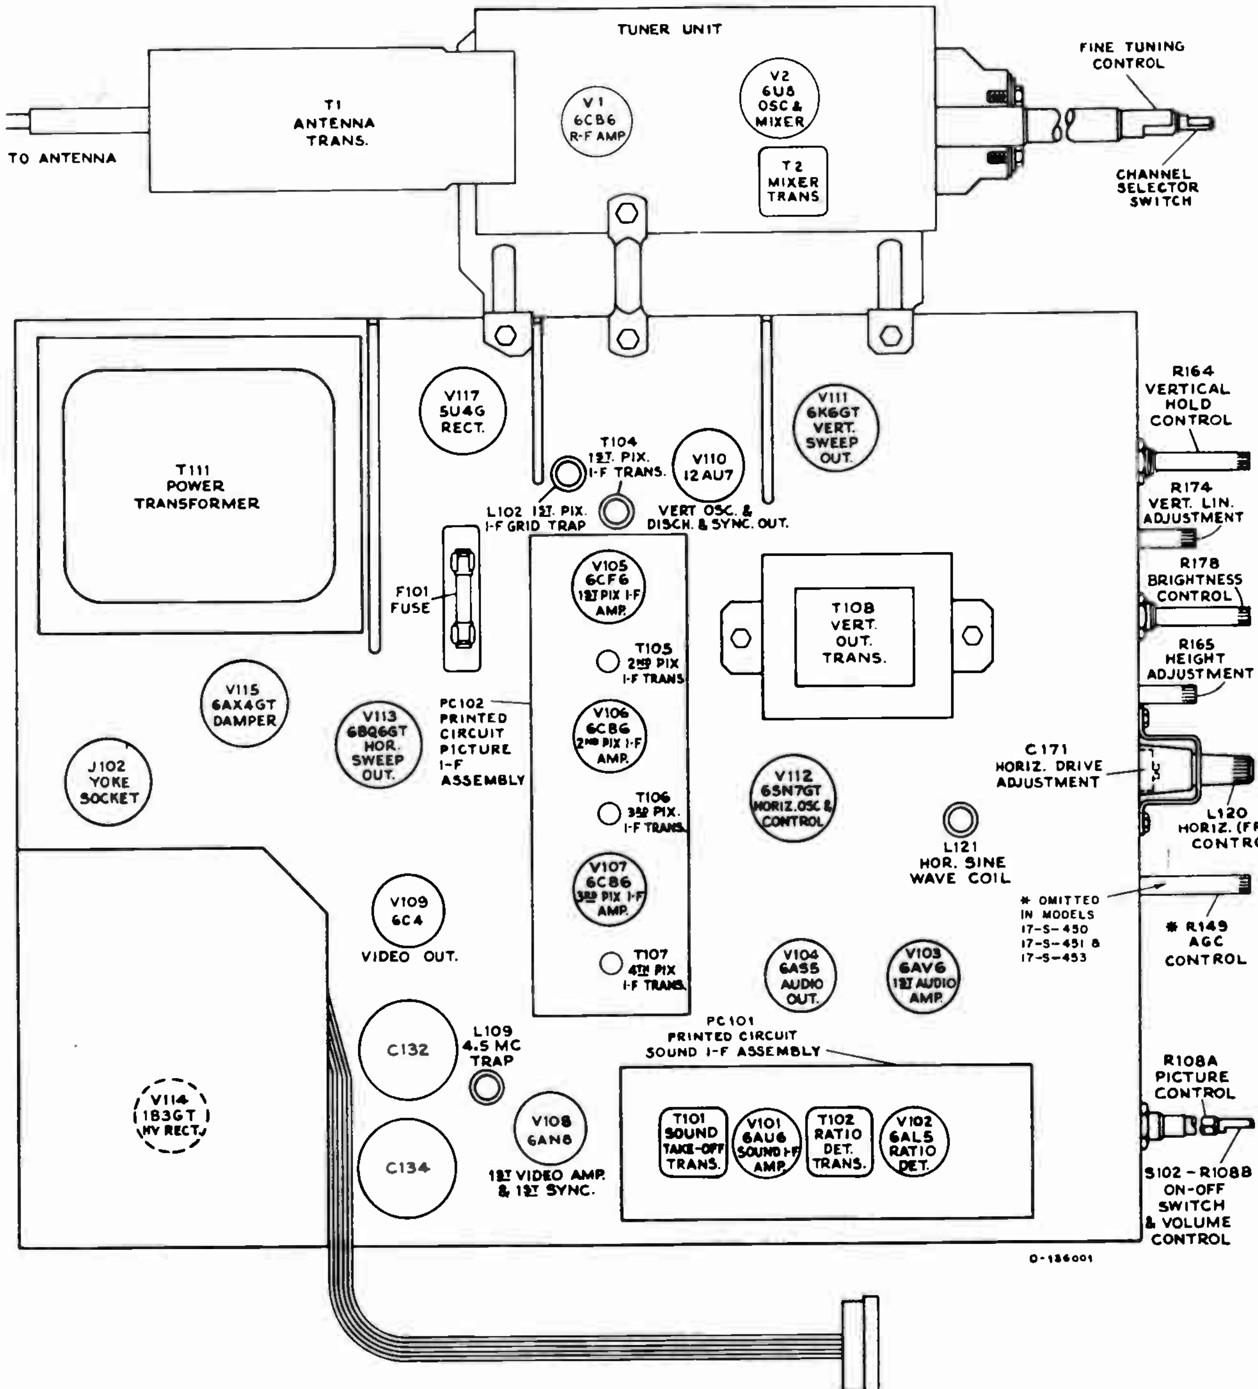

Figure 7—Chassis Top View (shown with KRK32 Tuner)

CHASSIS BOTTOM VIEW

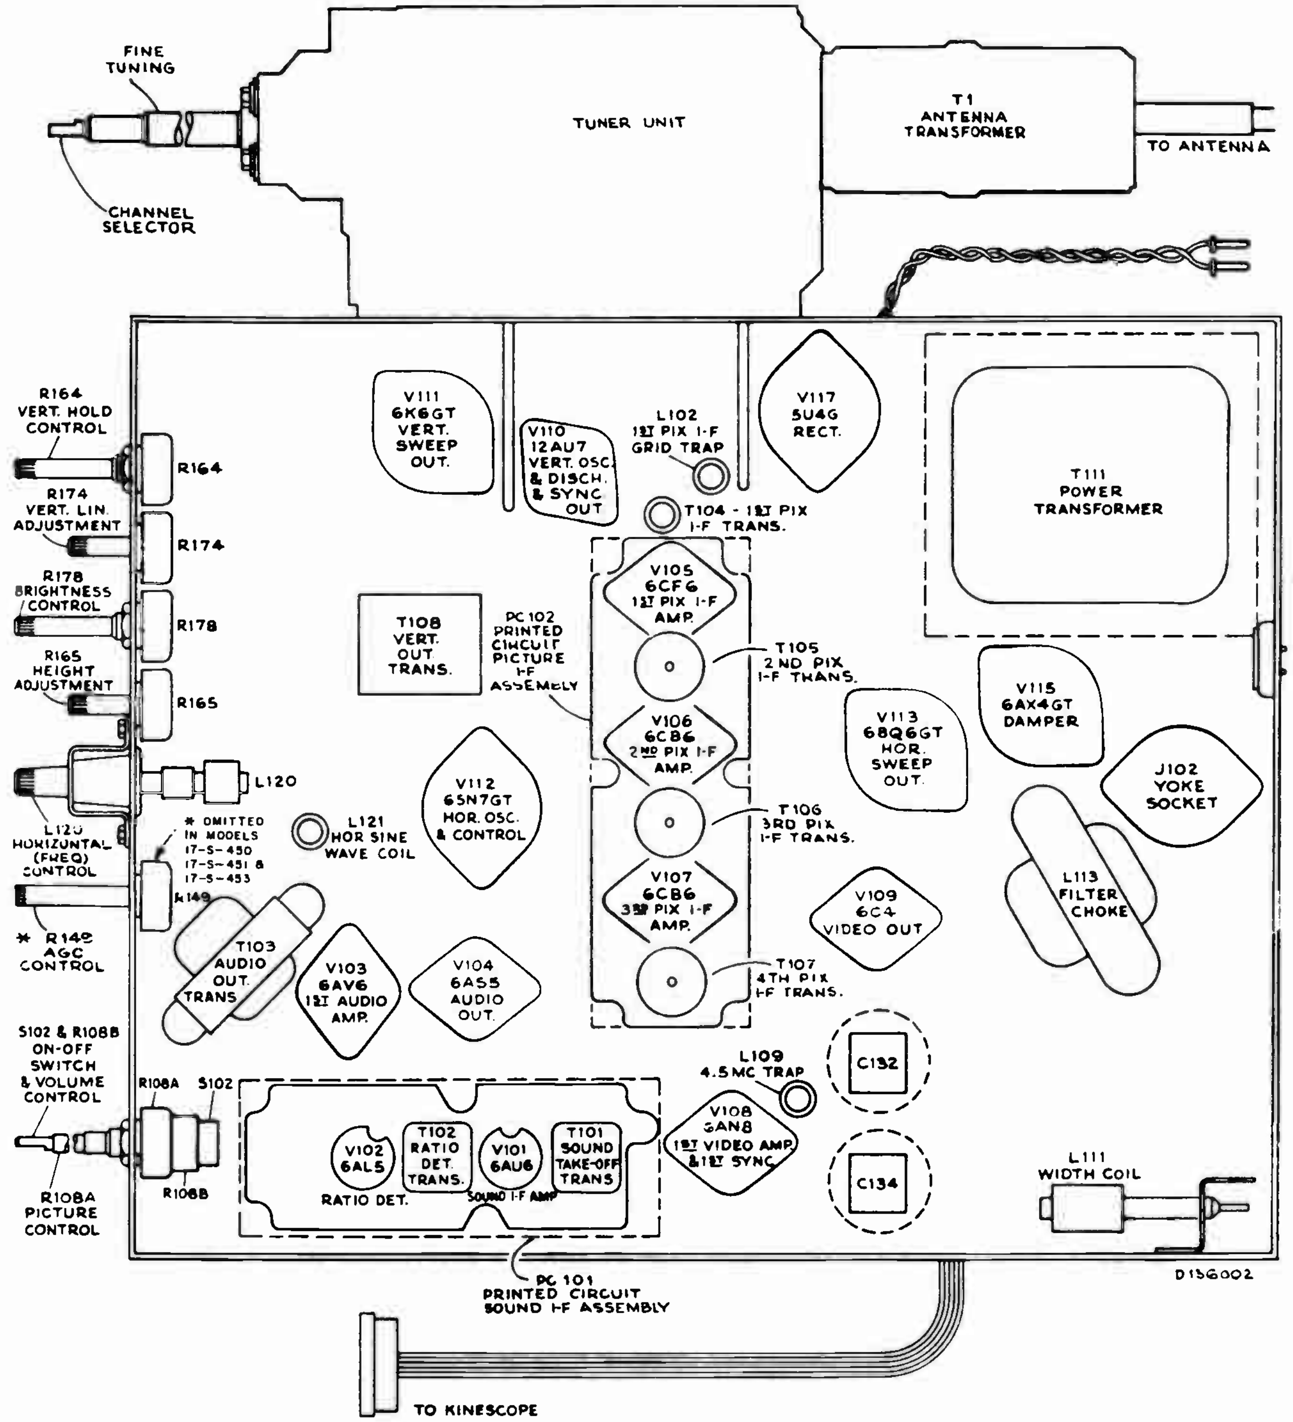

Figure 8—Chassis Bottom View (shown with KRK32 Tuner)

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:
(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:
(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least 1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529
17	489.25	493.75	535
18	495.25	499.75	541
19	501.25	505.75	547
20	507.25	511.75	553
21	513.25	517.75	559
22	519.25	523.75	565
23	525.25	529.75	571
24	531.25	535.75	577
25	537.25	541.75	583
26	543.25	547.75	589
27	549.25	553.75	595
28	555.25	559.75	601
29	561.25	565.75	607
30	567.25	571.75	613
31	573.25	577.75	619
32	579.25	583.75	625
33	585.25	589.75	631
34	591.25	595.75	637

82	879.25	883.75	925
83	885.25	889.75	931

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable preamplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—
Models 17-S-450, 17-S-451 & 17-S-453

Connect the i-f signal generator, in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R115, R117 and C120 and to ground.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R115, R117 and C120. The second battery will be used later.

Set the bias to produce approximately —3.5 volts of bias at the junction of R115, R117 and C120.

Connect the "VoltOhmyst" to the junction of R129 and L103 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." (Note: These transformers should be peaked with their cores at the ends of the coils nearest the chassis.) During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R129 and L103 with —3.5 volts of i-f bias at the junction of R115, R117 and C120.

44.5 mc. T107
45.5 mc. T106
43.0 mc. T105

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R129, L103. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc. L102

(Note: Core should be at end of coil nearest chassis when properly adjusted.)

Models 17-S-450U, 17-S-451U & 17-S-453U

Connect the i-f signal generator in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R115, R117 and C120.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R115, R117 and C120. Adjust the potentiometer for —3.5 volts indication on the "VoltOhmyst."

Connect the "VoltOhmyst" to the junction of R129 and L103 and to ground.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R129 and L103 with —3.5 volts of i-f bias at the junction of R115, R117 and C120.

44.5 mc. T107
45.5 mc. T106
43.0 mc. T105

(Note: Peak transformers with cores at end of coils nearest chassis.)

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction of R129 and L103. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc. L102

(Note: Core should be at end of coil nearest chassis when properly adjusted.)

SWEEP ALIGNMENT OF PICTURE I-F.—
Models 17-S-450, 17-S-451 & 17-S-453

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Preset C116 to minimum capacity.

Adjust the bias box potentiometer to obtain —3.5 volts of bias as measured by a "VoltOhmyst" at the junction of R115, R117 and C120.

Connect a 180 ohm composition resistor from pin 5 of V105 to pin 6 of V105. Connect the oscilloscope diode probe to pin 5 of V105 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T1 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 to 0.5 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C116 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 9. Maximum allowable tilt is 20%.

Readjust T1 and T104 if necessary to obtain proper wave shape as in Figure 9.

Disconnect the diode probe and the 180 ohm resistor.

Connect the oscilloscope to the junction of R129 and L103.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

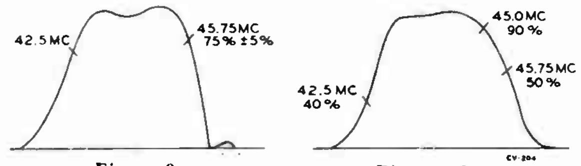

Figure 9— T1 and T104 Response with KRK32

Figure 10— Overall I-F Response with KRK32

Retouch T105, T106 and T107 to obtain the response shown in Figure 10.

Increase sweep output ten times and check attenuation at 41.5 mc. Adjust T105 and T107 to set 41.25 mc. between 25 and 35 times down with curve as shown in Figure 10.

Move the sweep generator to the antenna terminals. Connect —3.5 volts bias to pin 5 of V103. Adjust T106 and T107 slightly to correct for any overall tilt while switching from channel to channel.

Models 17-S-450U, 17-S-451U & 17-S-453U

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Preset C116 to minimum capacity.

Adjust the bias box potentiometer to obtain —3.5 volts of bias as measured by a "VoltOhmyst" at the junction of R115, R117 and C120.

Connect a 180 ohm composition resistor from pin 5 of V105 to pin 6 of V105. Connect the oscilloscope diode probe to pin 5 of V105 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 to 0.5 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C116 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 11. Maximum allowable tilt is 20%.

Disconnect the diode probe and the 180 ohm resistor.

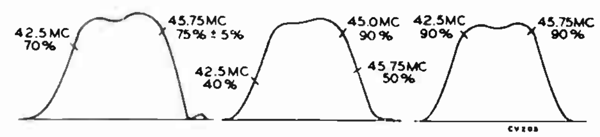

Figure 11— T2 and T104 Response with KRK30A

Figure 12— Overall I-F Response with KRK30A

Figure 13— KRK30A L9 and C308 I-F Response

Connect the oscilloscope to the junction of R129 and L103.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 0.5 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T105, T106 and T107 to obtain the response shown in Figure 12.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 25 and 35 times down with curve as shown in Figure 12.

To align the I-F amplifier circuit of the KRK30A, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1000 ohm resistor and a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep ground lead to the tuner case.

To do this, remove the crystal cover and connect the resistor, after insulating the lead with tubing, to the crystal front terminal.

Set the UHF CHANGEOVER switch to the UHF position, and the UHF TUNING between channels 68 and 69 at 800 mc.

Connect a 180 ohm composition resistor and a 1500 mmf. capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground.

Connect the oscilloscope diode probe to the junction between the resistor and capacitor. (See Figure 20.)

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.5 volt or less peak-to-peak on the oscilloscope.

Adjust C308, on the UHF section, and L9, on the VHF section, of the tuner for maximum gain with 45.75 mc. and 42.5 mc. markers as shown in figure 13.

If necessary adjust L27 to place the 45.75 mc. marker at the peak of the curve. Adjust L43 for minimum tilt of the curve as shown in figure 13.

Remove the resistor, capacitor and diode probe from TP3 and connect the oscilloscope to pin 8 of V110. Use 3.0v peak-to-peak on the oscilloscope.

Connect the VHF sweep generator to the antenna terminals. Keep the R-F AGC bias at —3.5 V and the I-F bias at —3.5 volts.

Couple the signal generator loosely to the grid of the first picture I-F amplifier.

Switch through all VHF channels and check for proper curve shape as in figure 12. Retouch T106 and T107 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the antenna terminals. Check on all UHF channels for proper wave shape as shown in figure 12, retouching C308 and L9 if necessary to correct any overall tilt.

Do not retouch L27, L43, T2, T104, T105, T106 or T107. Remove the sweep and marker generators and the bias supplies.

KRK32 TUNER ALIGNMENT.—

Models 17-S-450, 17-S-451 & 17-S-453

A tuner unit which is operative and requires only touch up adjustments requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from the terminals of T2 and shunt the terminals with a 39 ohm composition resistor.

Connect the oscilloscope to the test point TP1 on the side of the tuner unit. Set the oscilloscope to maximum gain.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts. Since there is no adjustment for varying the oscillator injection voltage, a check for injection voltage being within limits should be made after proper oscillator tracking has been established on channels 8 through 13.

Turn the fine tuning control to the mechanical center of its range.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C18. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

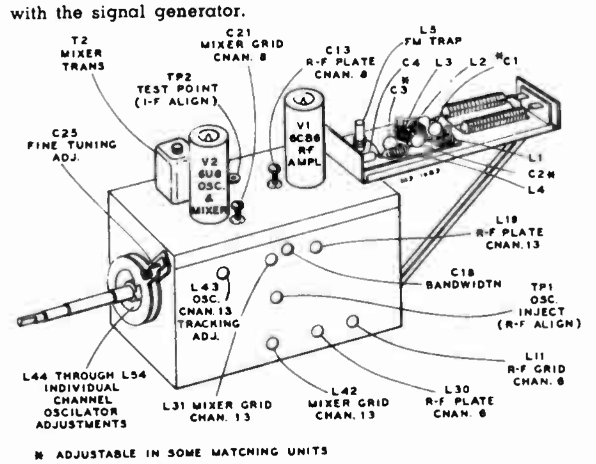

Figure 14—KRK32 Tuner Adjustments

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L43 to obtain proper channel 13 oscillator frequency as indicated in the table

Then, switch to channel 12 and adjust L54 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L43 and back to channel 8 and adjust C25.

Connect the sweep generator through a suitable attenuator, as shown in figure 15, to the input terminals of the antenna matching unit.

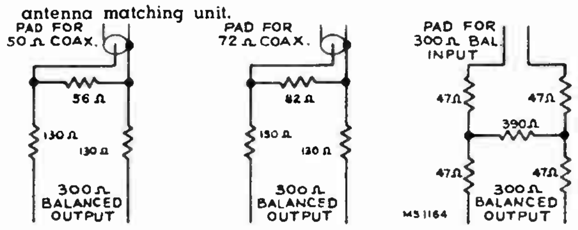

Figure 15—Sweep Attenuator Pads

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the maximum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C13, C18 and C21 for approximately correct curve shape, frequency, and band width as shown in figure 16.

C-13 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably. C18 is the coupling adjustment and hence primarily affects the response band width.

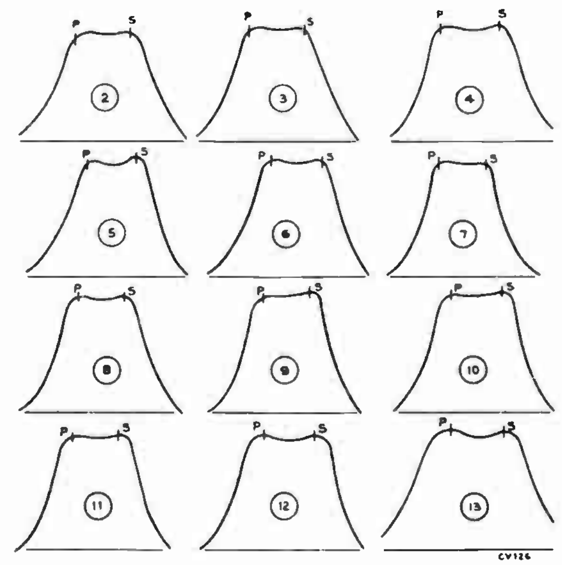

Figure 16—KRK32 Tuner R-F Responses

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control to the mechanical center of its range.

Adjust L43 to obtain an audible beat. Slightly overshoot the adjustment of L43 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C25 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L19 and L31 for proper response as shown in figure 16.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Where the voltage is not within the previously specified limits after the correct adjustment for oscillator tracking on channels 8 through 13 has been achieved, the 6U8 oscillator-mixer tube should be replaced. If the voltage is still outside limits, replace C22.

If it was necessary to replace the 6U8 or C22, turn the sweep and signal generators back on and repeat the oscillator tracking procedure for channels 8 through 13.

Set the receiver channel selector switch to channel 8 and readjust C25 for proper channel 8 oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C13, C18 and C21 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L48 for an audible beat. Adjust L11, L30 and L42 for proper curve shape as shown in figure 16. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified.

The correct adjustment of L11 is indicated by maximum amplitude of the curve midway between the markers. L30 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. L42 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that L11 has been properly adjusted).

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 16 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L11, L30 and L42 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 16 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C13, C21, or C18 to obtain the proper response.

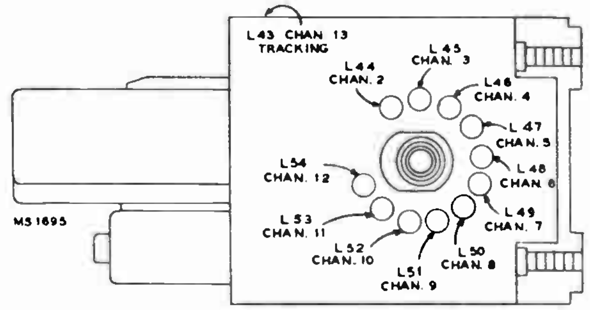

Figure 17—KRK32 Tuner Oscillator Adjustments

With the receiver and signal generator on channel 13 adjust L43 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK32 or KRK30A ANTENNA MATCHING UNIT ALIGNMENT. —The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The tuner unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the tuner unit should be re-aligned.

The F-M Trap which is counted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 to the channel selector switch S1D (S1E).

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R115, R117 and C120. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R115, R117 and C120.

Connect an oscilloscope to the junction of R129 and L103 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Note.—Inductances in KRK32 matching units are not slug tuned and therefore must be knifed for adjustment except those units in which C1, C2 and C3 are variable.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 (core or knife coil) or C3 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 (core or knife coil) or C1 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 15 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 and L3 (core or knife coil) of C2 to obtain the response shown in figure 18. L3 is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary. (Note.—Second harmonic output from the sweep generator may cause distortion of the response. Tune L5 F-M trap for maximum inductance to eliminate distortion when adjusting the matching unit. Be sure to return the L5 slug to its original position after adjusting the matching unit to prevent attenuation on channel 5 or 6.)

Restore the connection between L5 and S1D (S1E). Replace V106.

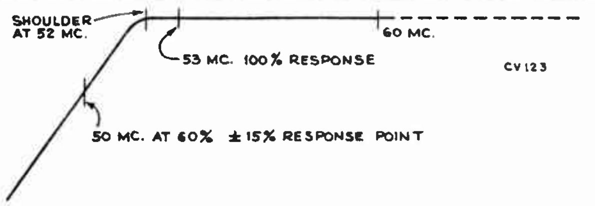

Figure 18—KRK32 or KRK30A Antenna Matching Unit Response

KRK30A TUNER ALIGNMENT

Models 17-S-450U, 17-S-451U & 17-S-453U

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from the terminals of T2 and shunt the terminals with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f" in terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency of each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals. Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in figure 19.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

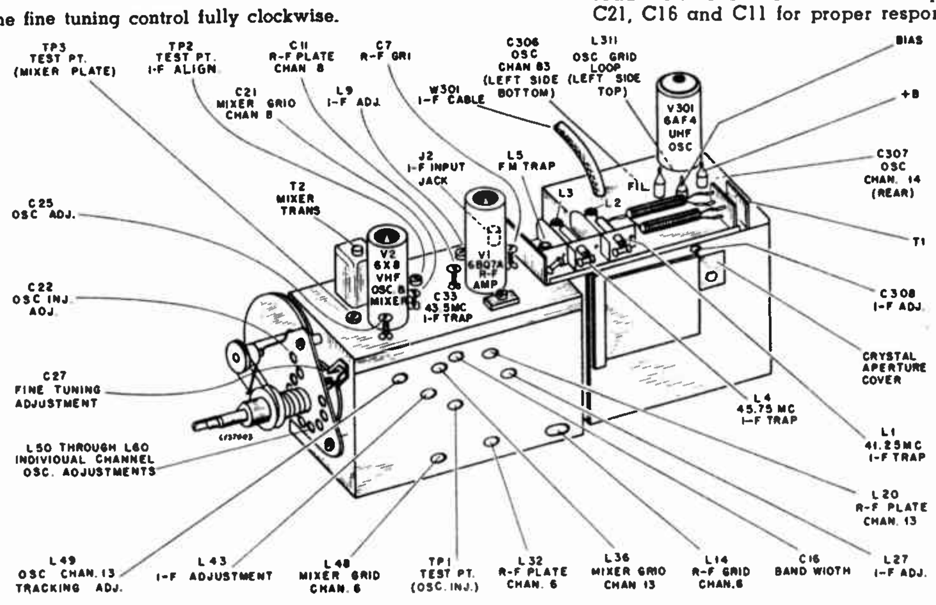

Figure 20—KRK30A Tuner Adjustments

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in figure 19.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

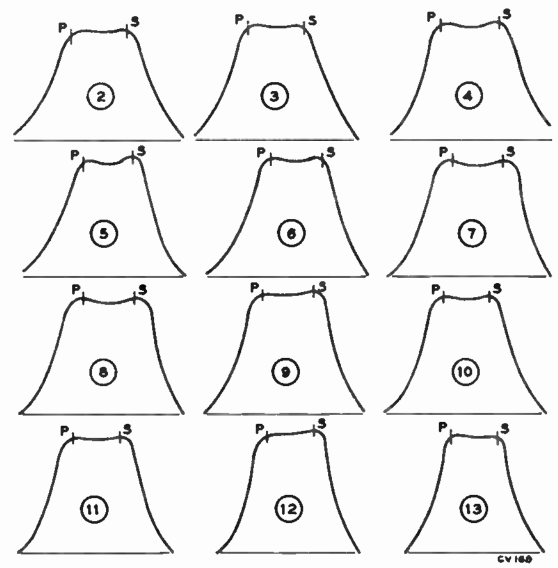

Figure 19—KRK30A Tuner VHF R-F Responses

If the initial setting of the oscillator injection trimmer was far off it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L14, L48 and L32 for proper curve shape as shown in figure 19. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 19 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 19 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

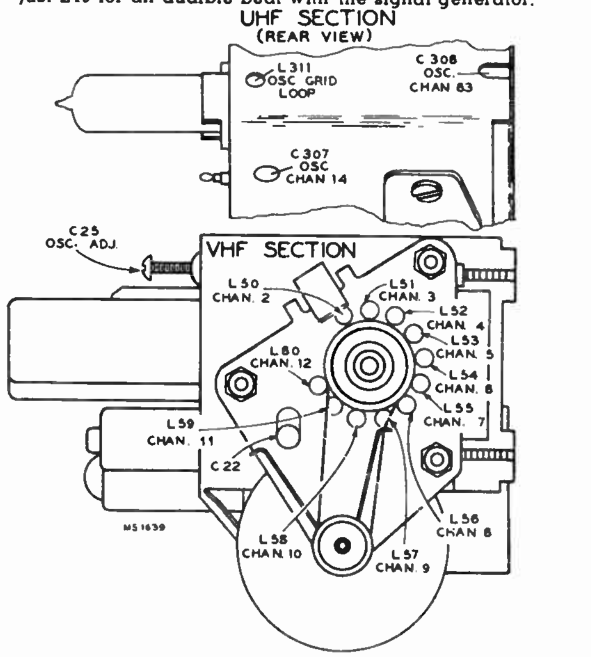

Figure 21—KRK30A Tuner Oscillator Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT R-F.—Alignment of the UHF section of the tuner may only be performed with the UHF section removed from the tuner assembly. RF adjustments require removal of the tuner shield which may only be done with the UHF tuner separate from its mounting.

I-F and oscillator adjustment may be accomplished without removing the tuner.

Connect a 100 ohm composition resistor between the center conductor of the I-F cable W301 and the tuner case.

Connect the oscilloscope to the center conductor of W301 at the 100 ohm resistor, employing the preamplifier if needed with the oscilloscope used. Ground the oscilloscope to the tuner case.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 5° and 164° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. With the stop pin on the tuner against the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 164°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the junction of W301 and L310. This may be done by inserting the lead from the resistor, which should be covered with insulated tubing, through the aperture provided for crystal removal. (See figure 20.) Insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitor tabs C304 and C305 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 22(A).

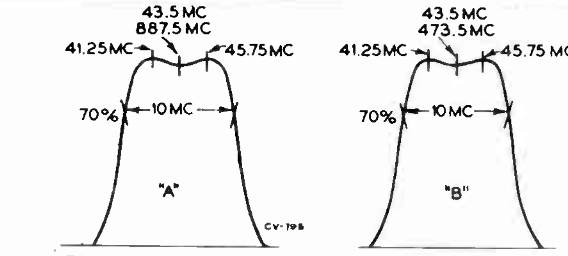

Figure 22—KRK30A Tuner UHF R-F Responses

Adjust the oscillator trimmer capacitor C306 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 22(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 5°, Channel 14, position.

Adjust the oscillator trimmer C307 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown. The inductance loop L311 across the oscillator grid coil on some units, may be repositioned, if necessary, to bring the oscillator trimmer within range. Refer to figure 20 for location of the aperture for making this adjustment.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates must be knifed with the shield cover removed. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" between the center conductor of W301 and ground. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .03 and .35 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedance or an oscillator tube outside allowable limits. This voltage is varied by repositioning the flag L309 with respect to L303.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 20). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first video amplifier grid, pin 8 of V108A, in series with a .01 mfd. capacitor.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix r-f amplifier, pin 1 of V107.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at pin 6 of V108A and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R104 and C107.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst." (Adjust with core at chassis end of coil.)

Repeat adjustments of T102 top for maximum d-c at pin 7 of V102 and T102 bottom for zero d-c at the junction of R104 and C107. Make the final adjustments with the signal input level adjusted to produce 5 volts d-c on the "VoltOhmyst" at pin 7 of V102.

SOUND TAKE-OFF ALIGNMENT.—Connect the signal generator to the first video amplifier grid, pin 8 of V108A.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the T101 top core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

(Alternate Method for Ratio Detector and Sound I-F Alignment)

Set the signal generator at 4.5 mc. and connect it to the first video amplifier grid, pin 8 of V108A in series with a .01 mfd. capacitor.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the ratio detector secondary T102 bottom core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked, when making the above adjustments.

Tune the T101 (top) core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the T101 adjustment are made.

Connect the "VoltOhmyst" to the junction of R104 and C107.

Tune T102 bottom for zero d-c at the junction of R104 and C107. (Make adjustment with core at chassis end of coil.)

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 1500 mmf. capacitor to pin 8 of V108A. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V107, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video output, pins 1-5 of V109A.

Adjust the core of L109 for minimum output on the oscilloscope. (Make adjustment with core at chassis end of coil.)

Remove the short from pin 1, V107 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L109 requires no adjustment. If a 4.5 mc. beat is present, tune the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L109 for minimum beat.

HORIZONTAL OSCILLATOR AND OUTPUT ALIGNMENT.—Normally the alignment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned.

Turn the horizontal drive trimmer C171 fully clockwise then counter-clockwise one full turn. Set the stud of the width coil L111 flush with the inside rear edge of the chassis.

Place a jumper across the terminals of the sine wave coil L121 and adjust the horizontal (frequency) control until the picture pulls into sync. Remove the short across the sine wave coil.

Connect the low capacity probe of an oscilloscope to the junction of L120, L121 and R189. Turn the horizontal (frequency) control clockwise until the picture falls out of sync, then counter-clockwise until the picture just pulls into sync. The pattern on the oscilloscope should be as shown in Figure 23. Adjust the sine wave adjustment core L121 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the horizontal (frequency) control if necessary.

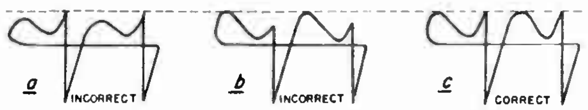

Figure 23—Horizontal Oscillator Waveforms

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator may occur. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Drive Adjustment *(for correct locking range)*. Turn the horizontal (frequency) control until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal control counter-clockwise and note the number of diagonal bars obtained just before the picture pulls into sync.

Pull-in should occur with one and one-half to three bars present.

With the horizontal control set at the pull-in point, adjust the horizontal drive trimmer C171 counter-clockwise for a bright vertical line in the center of the picture. Turn the trimmer clockwise until the line just disappears.

Set the brightness control to maximum and adjust the width control so the picture fills the mask. Return the brightness control to normal and readjust the horizontal drive trimmer as above.

The picture should pull into sync with one and one-half to three bars present, remain in sync for approximately two full turns counter-clockwise from pull-in, and fall out of sync with between 2 and 5 bars present before interrupted oscillation (motorboating) occurs.

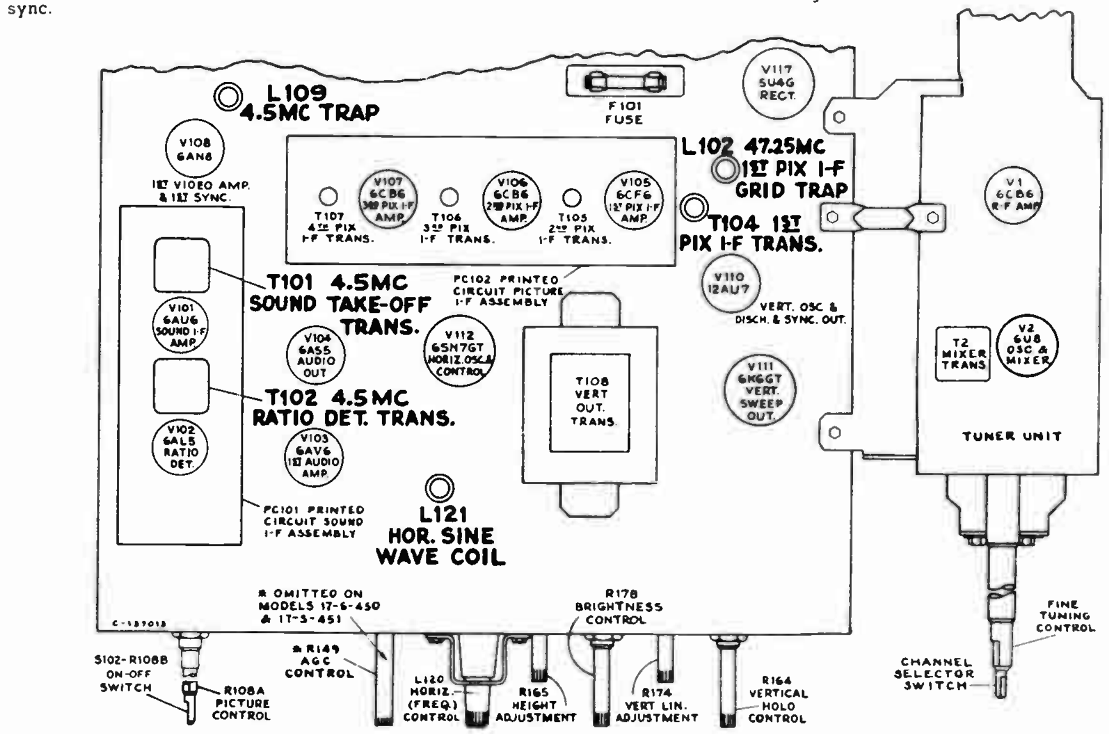

Figure 24—Top Chassis Adjustments

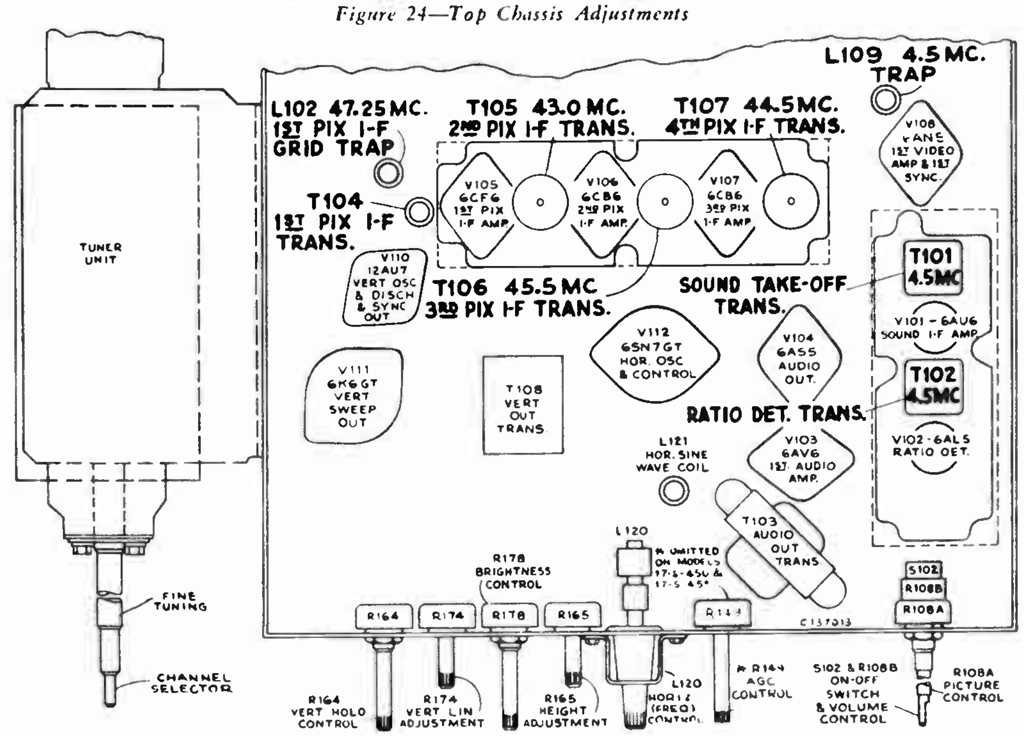

Figure 25—Bottom Chassis Adjustments

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 30000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

		KRK30A—TUNER UNIT ASSEMBLY (VHF SECTION)
C5	77084	Capacitor—Ceramic, feed-thru, 1000 mmf.
C6	75199	Capacitor—Fixed, ceramic, 270 mmf., ±20%, 500 v.
C7	76532	Trimmer—Adjustable, 1-4 mmf.
C8, C9	77252	Capacitor — Fixed, ceramic, 1000 mmf., +100%, —0%, 500 v.
C10	75199	Capacitor—Fixed, ceramic, 270 mmf., ±20%, 500 v. D.C. Part of S4
C11	77151	Trimmer—Adjustable, 0.8-3.0 mmf.
C12	78276	Capacitor—Fixed, ceramic, 150 mmf., ±10%, 500 v. D.C. Part of S3
C13	71599	Capacitor—Fixed, ceramic, 270 mmf., ±20%, 500 v. D.C. Part of S2
C16	78397	Trimmer—Mica, 80-150 mmf.
C20	78603	Capacitor—Fixed, ceramic, 82 mmf., ±10%, 500 v.
C22	77913	Capacitor—Adjustable, steatite, 0.8-3.0 mmf. Part of S1
C23	71504	Capacitor—Fixed, headed-lead, 0.68 mmf., ±20%, 500 v. D.C. Part of S2
C24	78247	Capacitor—Fixed, ceramic, 10 mmf., ±1 mmf., 500 v.
C25		Same as C11
C26	77865	Capacitor—Fixed, ceramic, 10 mmf., ±1.0 mmf., 500 v.
C27	79192	Trimmer—Ceramic, variable — fine tuning type
C28	73960	Capacitor—Fixed, ceramic, 10,000 mmf., 500 v.
C29	77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, —0%, 500 v. Part of S3
C31		Capacitor — Fixed, headed-lead type, 2.2 mmf., ±20%, 500 v. D.C.
C33	77616	Capacitor—Adjustable, mica, 4-40 mmf.
C34, C35		Same as C29
C36	75437	Capacitor—Fixed, ceramic, 100 mmf., ±20%, 500 v. D.C. Part of S2
C38	71503	Capacitor—Fixed, headed-lead type, 3.3 mmf., ±20%, 500 v. D.C. Part of S5
C39		Same as C31. Part of S3

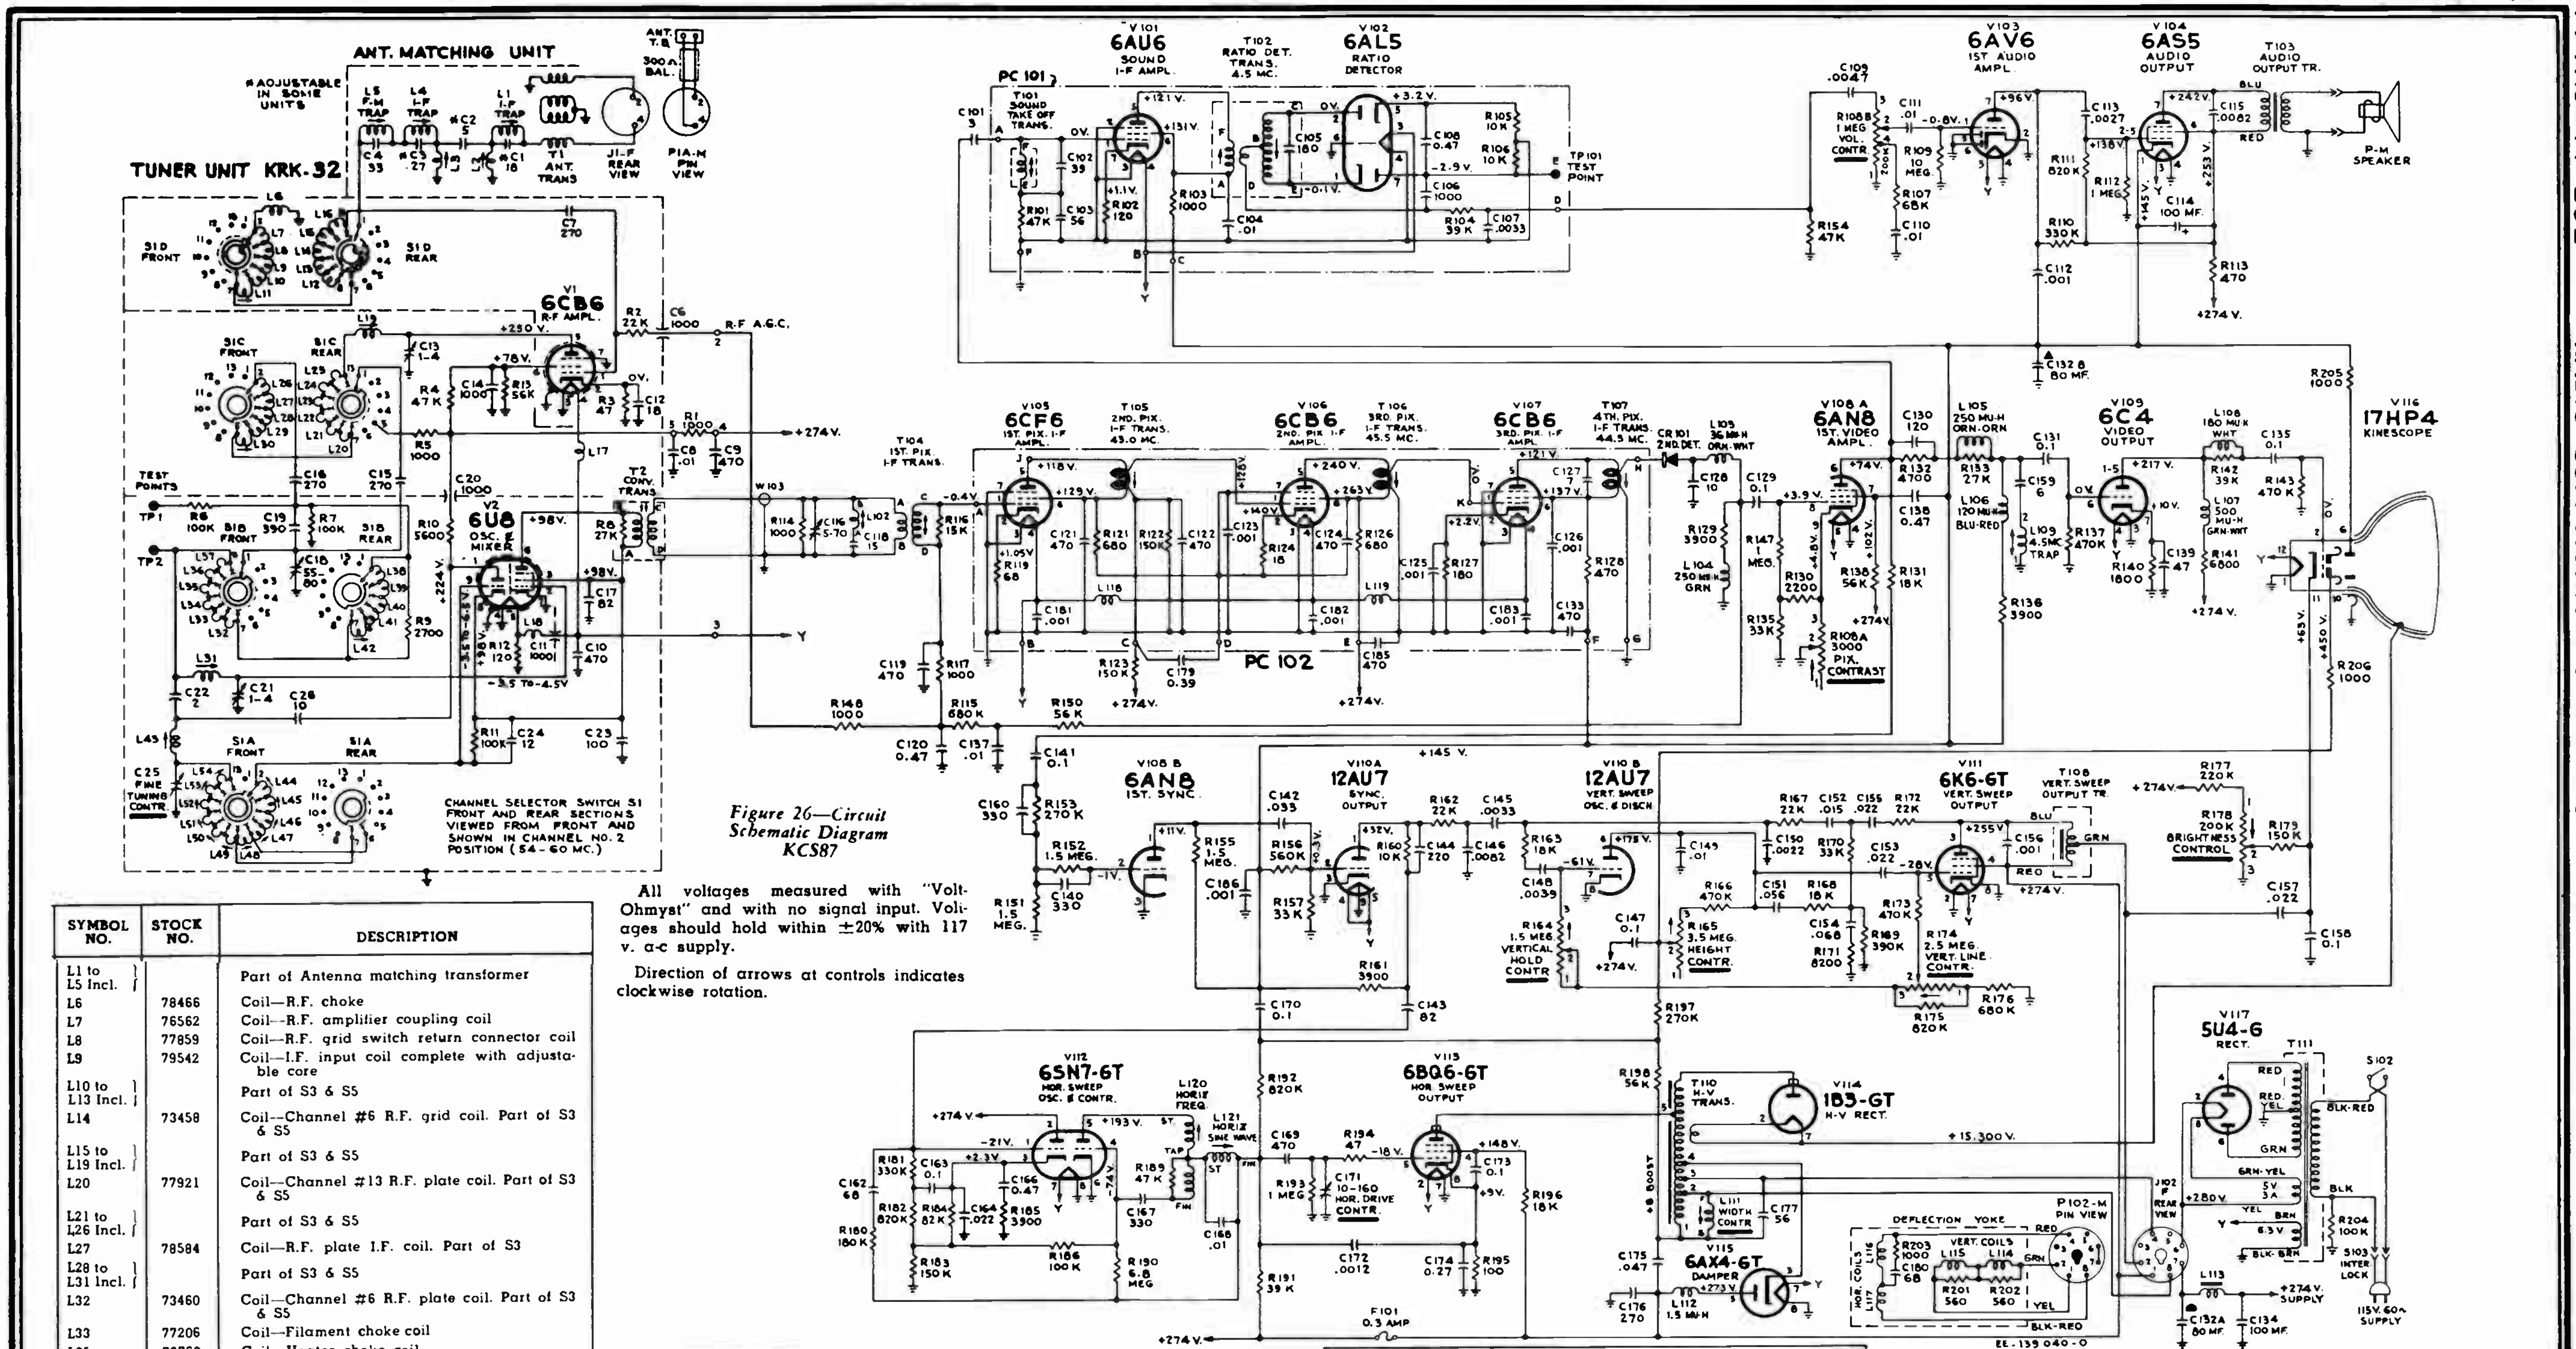

Figure 26—Circuit Schematic Diagram KCS87

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Direction of arrows at controls indicates clockwise rotation.

SYMBOL NO.	STOCK NO.	DESCRIPTION
L1 to L5 Incl.		Part of Antenna matching transformer
L6	78466	Coil—R.F. choke
L7	76562	Coil—R.F. amplifier coupling coil
L8	77859	Coil—R.F. grid switch return connector coil
L9	79542	Coil—I.F. input coil complete with adjustable core
L10 to L13 Incl.		Part of S3 & S5
L14	73458	Coil—Channel #6 R.F. grid coil. Part of S3 & S5
L15 to L19 Incl.		Part of S3 & S5
L20	77921	Coil—Channel #13 R.F. plate coil. Part of S3 & S5
L21 to L26 Incl.		Part of S3 & S5
L27	78584	Coil—R.F. plate I.F. coil. Part of S3

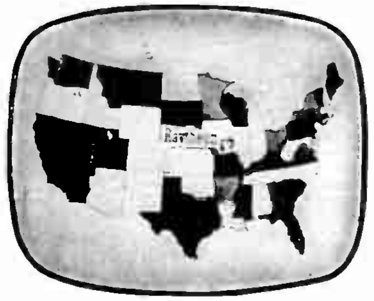
R101	503347	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ w. Part of PC101
R102	503112	Resistor — Fixed, composition, 120 ohms, ±10%, ½ w. Part of PC101
R103	504210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w. Part of PC101
R104	503339	Resistor—Fixed, composition, 39,000 ohms, ±10%, ½ w. Part of PC101
R105, R106	502310	Resistor—Fixed, composition, 10,000 ohms, ±5%, ½ w. Part of PC101
R107	502368	Resistor—Fixed, composition, 68,000 ohms, ±10%, ½ w.
R108A, B	79699	Control—"On-Off" volume control
R109	502610	Resistor—Fixed, composition, 10 meg., ±20%, ½ w.
R110	502433	Resistor—Fixed, composition, 330,000 ohms, ±20%, ½ w.
R111	502482	Resistor—Fixed, composition, 820,000 ohms, ±5%, ½ w.
R112	502510	Resistor—Fixed, composition, 1 meg., ±5%, ½ w.
R113	522147	Resistor — Fixed, composition, 470 ohms, ±20%, 2 w.
R114	502210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w.
R115	30562	Resistor—Fixed, composition, 680,000 ohms, ±10%, ½ w.
R116	36714	Resistor—Fixed, composition, 15,000 ohms, ±10%, ½ w.
R117		Same as R114
R118	502456	Resistor—Fixed, composition, 560,000 ohms, ±10%, ½ w.
R119	502068	Resistor—Fixed, composition, 68 ohms, ±5%, ½ w. Part of PC102
R120		Same as R114
R121	504168	Resistor — Fixed, composition, 680 ohms, ±20%, ½ w. Part of PC102
R122	502415	Resistor—Fixed, composition, 150,000 ohms, ±5%, ½ w. Part of PC102
R123		Same as R122
R124	33568	Resistor—Fixed, composition, 18 ohms, ±5%, ½ w. Part of PC102
R126		Same as R121. Part of PC102
R127	502118	Resistor — Fixed, composition, 180 ohms, ±5%, ½ w. Part of PC102
R128	504147	Resistor — Fixed, composition, 470 ohms, ±20%, ½ w. Part of PC102
R129	502239	Resistor—Fixed, composition, 3900 ohms, ±5%, ½ w.
R130	502222	Resistor—Fixed, composition, 2200 ohms, ±10%, ½ w.
R131	3219	Resistor—Fixed, composition, 18,000 ohms, ±10%, ½ w.
R132	502247	Resistor—Fixed, composition, 4700 ohms, ±10%, ½ w.
R133		Part of L105
R135	502333	Resistor—Fixed, composition, 33,000 ohms, ±10%, ½ w.
R136	502239	Resistor—Fixed, composition, 3900 ohms, ±10%, ½ w.
R137	502447	Resistor—Fixed, composition, 470,000 ohms, ±20%, ½ w.
R138	512356	Resistor—Fixed, composition, 56,000 ohms, ±10%, 1 w.
R140	502218	Resistor—Fixed, composition, 1800 ohms, ±10%, ½ w.
R141	512268	Resistor—Fixed, composition, 6800 ohms, ±5%, 1 w.
R142		Part of L108
R143		Same as R137
R147	502510	Resistor—Fixed, composition, 1 megohm, ±10%, ½ w.
R149	79697	Control—AGC control—"Local-Distant" (For 17S450U only)
R150	502356	Resistor—Fixed, composition, 56,000 ohms, ±10%, ½ w.
R151, R152	502515	Resistor—Fixed, composition, 1.5 megohm, ±5%, ½ w.
R153	502427	Resistor—Fixed, composition, 270,000 ohms, ±10%, ½ w.
R154	502347	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ w.
R155		Same as R151
R156		Same as R118
R157		Same as R135
R160	512310	Resistor—Fixed, composition, 10,000 ohms, ±10%, 1 w.
R161	502239	Resistor—Fixed, composition, 3900 ohms, ±5%, ½ w.
R162	502322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ w.
R163		Same as R131
R164	78210	Control—Vertical hold control
R165	78806	Control—Height control
R166	502447	Resistor—Fixed, composition, 470,000 ohms, ±10%, ½ w.
R167	502322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ w.
R168	3219	Resistor—Fixed, composition, 18,000 ohms, ±5%, ½ w.
R169	502439	Resistor—Fixed, composition, 390,000 ohms, ±10%, ½ w.
R170	502333	Resistor—Fixed, composition, 33,000 ohms, ±5%, ½ w.
R171	502282	Resistor—Fixed, composition, 8200 ohms, ±10%, ½ w.
R172	502322	Resistor—Fixed, composition, 22,000 ohms, ±5%, ½ w.
R173		Same as R166
R174	78807	Control—Vertical linearity control
R175		Same as R111
R176	30562	Resistor—Fixed, composition, 680,000 ohms, ±5%, ½ w.
R177	502422	Resistor—Fixed, composition, 220,000 ohms, ±10%, ½ w.
R178	79139	Control—Brightness control
R179	502415	Resistor—Fixed, composition, 150,000 ohms, ±20%, ½ w.
R180	502418	Resistor—Fixed, composition, 180,000 ohms, ±10%, ½ w.
R181	502433	Resistor—Fixed, composition, 330,000 ohms, ±10%, ½ w.
R182	502482	Resistor—Fixed, composition, 820,000 ohms, ±10%, ½ w.
R183	502415	Resistor—Fixed, composition, 150,000 ohms, ±5%, ½ w.
R184	502382	Resistor—Fixed, composition, 82,000 ohms, ±5%, ½ w.
R185	502239	Resistor—Fixed, composition, 3900 ohms, ±10%, ½ w.
R186	512410	Resistor—Fixed, composition, 100,000 ohms, ±5%, 1 w.
R187	11769	Resistor—Fixed, composition, 1.8 megohm, ±10%, ½ w.
R189	502347	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ w.
R190	31071	Resistor—Fixed, composition, 6.8 megohm, ±10%, ½ w.
R191	71084	Resistor—Fixed, composition, 39,000 ohms, ±10%, 1 w.
R192		Same as R182
R193	502510	Resistor—Fixed, composition, 1 meg., ±10%, ½ w. Same as R147
R194	502047	Resistor — Fixed, composition, 47 ohms, ±20%, ½ w.
R195	79701	Resistor—Fixed, wire wound, 100 ohms, ±10%, 2 w.
R196	522318	Resistor—Fixed composition, 18,000 ohms, ±10%, 2 w.
R197		Same as R153
R198		Same as R150
R201 to R203		Part of Yoke
R204	502410	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ w.
R205, R206	502210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ w.
T101	79140	Coil—Sound take-off coil, 4.5 MC. Part of PC101
T102	79141	Transformer—Ratio detector transformer complete with adjustable cores. Part of PC101
T103	79159	Transformer—Audio output transformer
T104	78203	Transformer—1st I.F. grid transformer
T105 to T107	76433	Transformer—1st, 2nd and 3rd I-F picture transformer. Part of PC102
T108	79143	Transformer—Vertical output transformer
T110	79736	Transformer—High voltage transformer
T111	79162	Transformer—Power transformer
		YOKE AND MAGNET ASSEMBLY
	79460	Cushion—Deflection yoke hood cushion
	78309	Cushion—Deflection yoke plate cushion
	79695	Hood—Deflection yoke hood assembly
	76375	Magnet—Centering magnet
	76141	Magnet—Ion trap magnet
	78817	Plate—Deflection yoke hood plate
	79687	Rod—Deflection yoke rod
	78445	Spring—Deflection yoke spring
	79510	Yoke—Deflection yoke
		SPEAKER ASSEMBLY 972308-2
	79696	Speaker—4" P.M. speaker (3.2 ohms)

8



AVERAGE PICTURE

An average picture is portrayed as a guide or reference to enable a better analysis of the conditions when attempting to observe the various distortions and deviations.

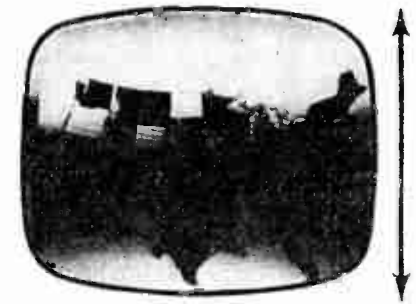
60 CYCLE HUM

Usually caused by a filament to cathode short or leakage in the RF, IF or video amplifier tube.

CHECK:

V-4-5-6	IF Amplifier (6CB6)
V-2	VHF RF Amplifier (6BZ7)
V-9	Video Amplifier (25C6)

NOTE: A quick method other than substituting tubes, is to short each tube's cathode to ground while observing the picture. Shorting the cathode of the defective tube will produce a radical reduction of hum or a filament failure.

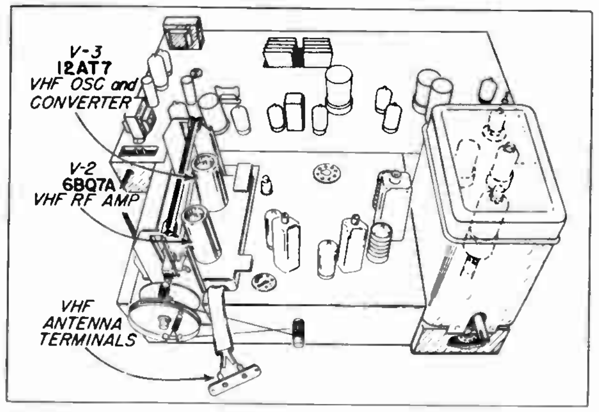


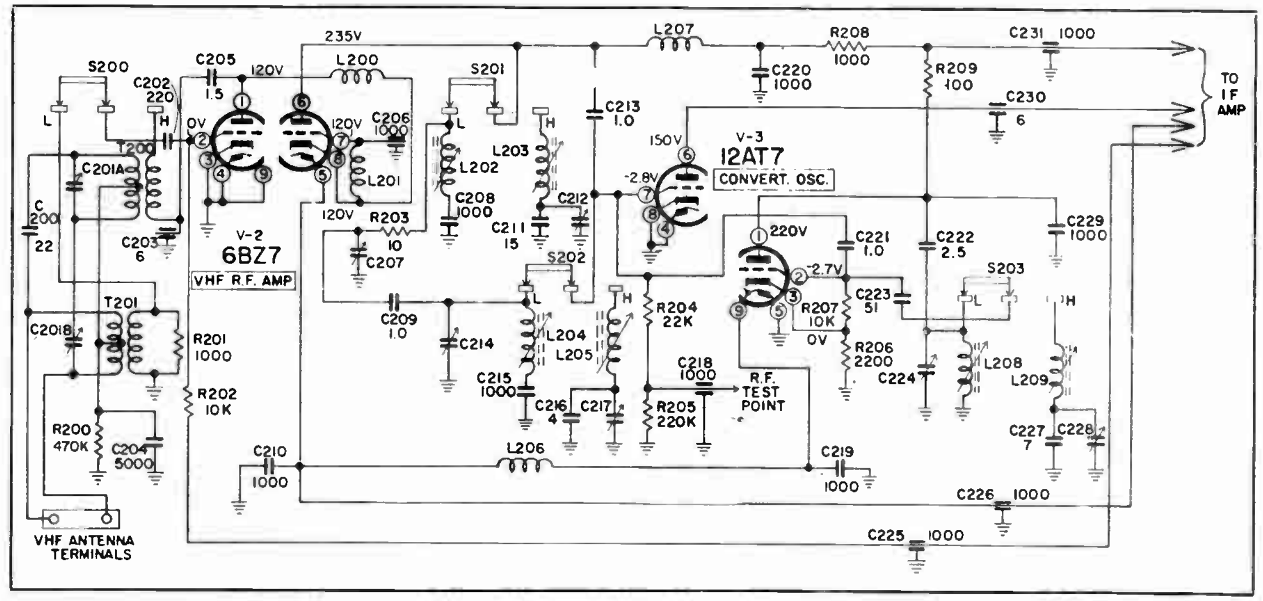
38

TUNER SERVICE HINTS

When attempting tuner servicing, it may prove helpful to bear in mind that when trouble occurs in the oscillator the picture will generally disappear and when there is a defect in the RF or mixer stage a decrease in signal will usually result.

If a condition arises where trouble occurs on either the high or low VHF band only, then it can be assumed that the trouble is definitely in the VHF tuner or VHF antenna installation. One other possibility may be due to defective switch contacts. Defective switch contacts can easily be replaced by removing the two question mark shaped springs, lifting up the switch plate assembly and removing the black switch contact holder and replacing the switch contact.





VHF TUNER SCHEMATIC

1

MISTUNING:

Condition is generally caused by a lack of care when tuning in a station. A similar condition may be due to a faulty antenna installation or result from a defective oscillator or RF Amplifier tube.

CHECK:

V-2	VHF RF Amplifier (6BZ7)
V-3	VHF Oscillator—Converter (12AT7)

***WEAK PICTURE WITH SNOW**
***NO PICTURE WITH SNOW (Raster Visible)**

This condition is usually caused by a defective antenna installation or a defective tube or component in the tuner or possibly the first IF Amplifier.

CHECK:

Antenna Installation and Connections

V-2	VHF RF Amplifier (6BZ7)
V-3	VHF Oscillator-Converter (12AT7)
V-4	IF Amplifier (6CB6)
R208	V-2 Decoupling Resistor
L207-301	B Supply Choke
C229	V-3Plate Capacitor
C220-230-231-301	Decoupling Capacitor

*Based on the assumption that the receiver was once functioning normally.

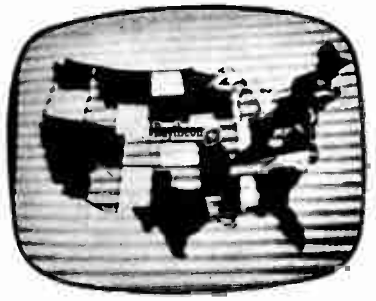
REPLACEMENT PARTS

Ref. No.	Part No.	Description
C201A-B	8E-17142	5-20 mmf, dual trimmer
C203	8G-20880	6 mmf, ceramic feed thru
C207-214-217-224-228	201-22333	Trimmer condenser
C212	201-15142	Trimmer condenser
C218-225-226-231	8G-20878	1000 mmf, ceramic feed thru
C230	8G-20879	6 mmf, ceramic feed thru
T200	13E-22082	H.B. antenna transformer
T201	13E-21673	L.B. antenna transformer
L200	13M-20781	Cascode coil
L201	13M-20780	Cascode coil
L202	13E-12046	L.B. RF primary coil
L203	13E-17140	H.B. RF primary coil
L204	13E-12046	L.B. RF secondary coil
L205	13E-17140	H.B. RF secondary coil
L206	16A-20777	Filament coil

Ref. No.	Part No.	Description
L207	16A-17128	RF choke coil
L208	13D-12155	L.B. oscillator coil
L209	13E-17140	H.B. oscillator coil
	201-22081	Antenna transformer assembly
S200-201-202-203	2J-16310	Sliding switch contact
	5F-16311	Switch contact holder
	201-20769	Capacitor plate assembly
	2M-16276	Core mounting clip
	43A2-5444	Iron core nuts
	51A-15713	Iron core (white) for L209
	51A-17162	Iron core (brown) for L203-205
	51A-21200	Iron core (pink) for L208
	51A-15715	Iron core (blue) for L202
	51A-17161	Iron core (orange) for L204
	49A-18799	Link spring
	2M-19150-1	Flat spring

4



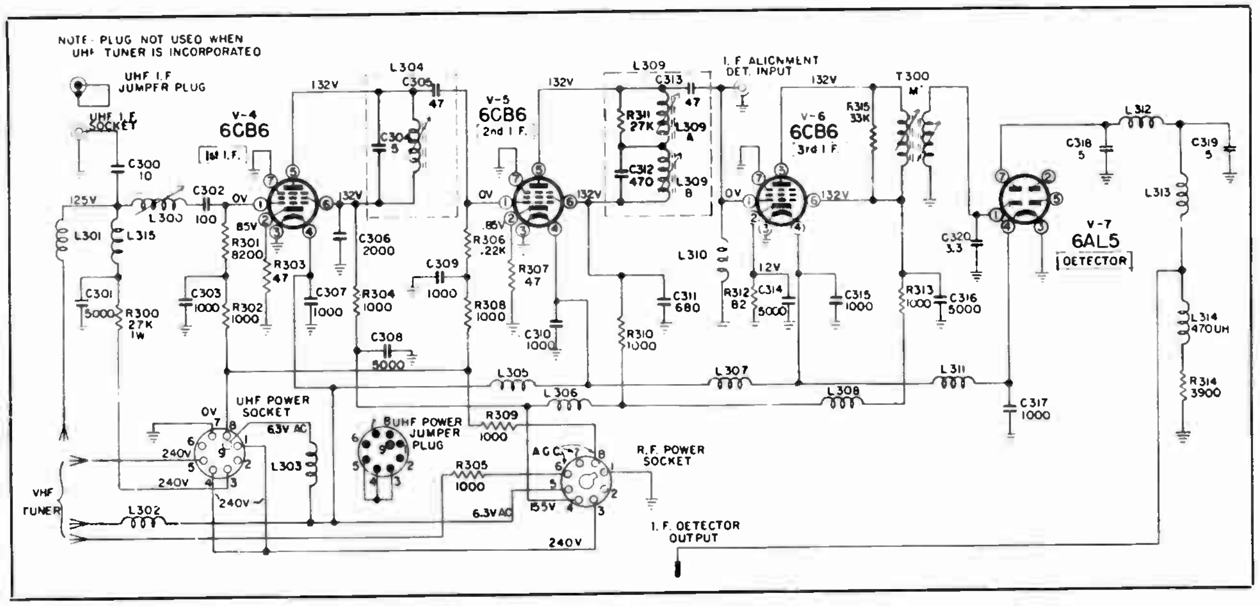
SOUND BARS:

The appearance of sound bars may possibly be due to mistuning of the receiver, microphonic station equipment or due to microphonic RF, IF, or Video Amplifier tubes.

CHECK:

V-15B	Vertical Blocking Oscillator (12AU7)
V-16	Vertical Output (6S4)
V-4-5-6	IF Amplifier (6CB6)
V-2	VHF RF Amplifier (6BZ7)
V-3	VHF Converter (12AT7)
V-9	Video Amplifier (25C5)

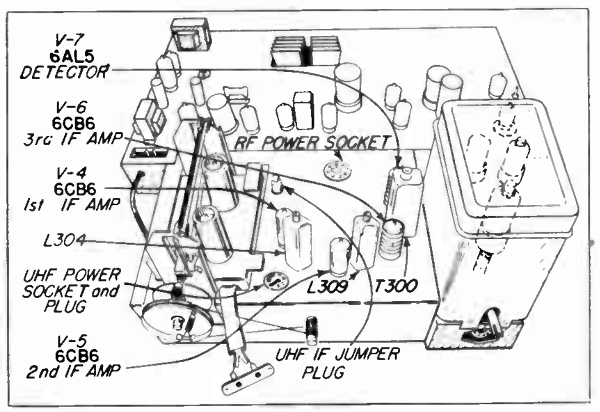
NOTE: To determine possible cause of condition, properly tune in a station and then turn the volume control to its minimum volume setting. If the bars remain visible the trouble is usually due to the station or outside interference. If however, the bars disappear and by jarring the cabinet they reappear, the cause is most likely due to microphonic tube. Gently tap each tube specified above while observing the picture.



IF AMPLIFIER SCHEMATIC

REPLACEMENT PARTS

Ref. No.	Part No.	Description
T300	13B-22939	Output IF transformer
L300	201-22924	Converter coil
L301	16A-21656	RF choke coil
L302-303	16A-17937	Filament choke coil
L304	201-22927	IF coil assembly
L305	16A-17937	Filament choke coil
L306	16A-18776	RF choke coil
L307	16A-17937	Filament choke coil
L308	16A-18676	RF choke coil
L309	201-22929	IF coil assembly
L310	201-15608	RF choke coil
L311	16A-17937	Filament choke coil
L312-313	16A-22923	Peaking coil
L314	16A-19365	Peaking coil
L315	201-20265	Peaking coil
	201-21657	UHF IF jumper plug
	19A-21244	UHF power jumper plug



WEAK PICTURE
NO PICTURE (Raster Visible)

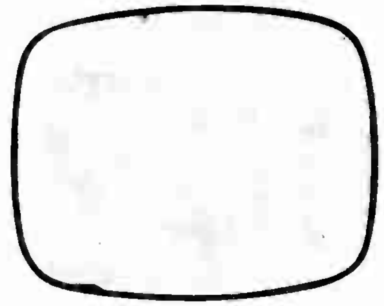
These conditions are generally caused by a defective tube or component in the IF or Video Amplifiers. Note the absence of snow.

CHECK:

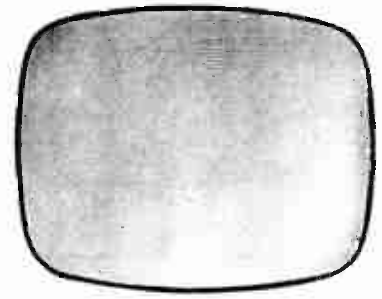
R409	Picture Control
V-5-6	IF Amplifier (6CB6)
V-9	Video Amplifier (25C5)
R310-313	Decoupling Resistors
L304-309-310-T300	IF Coils
L312-313-314	Detector Peaking Coil
L400-401-402	V-9 Peaking Coils
C404	V-9 Coupling Capacitor
R412-413	V-9 Plate Resistor

NOTE: Check RF Power and detector output plugs for proper seating.

As a fast method to help localize the defective stage causing the trouble, observe the face of the picture tube at both minimum and maximum picture control settings. If an increase in snow is NOT apparent at the maximum picture control setting the trouble is usually in the video amplifier, video detector or IF amplifier circuits. If an increase in snow is observed the trouble may be in the tuner or possibly the first IF amplifier stage.

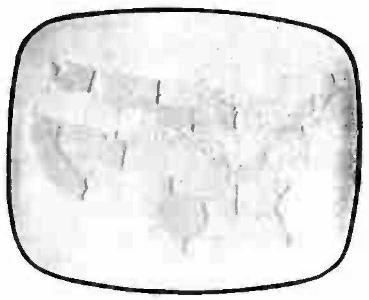


34



29

OVERLOADING WASHOUT



33

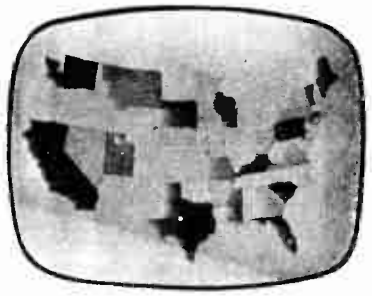
A washout condition (or insevere cases overloading) is generally caused by a defect in the IF amplifiers, video amplifier or A.G.C. circuits.

CHECK:

V-4-5-6	IF amplifier (6BC6)
V-7	Video Detector (6AL5)
V-9	Video Amplifier (25C5)
V-2	VHF RF Amplifier (6BZ7)

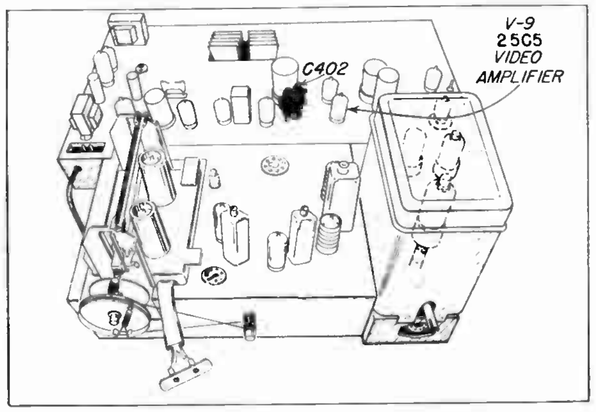
NOTE: A defective picture tube may cause a similar condition. Check as a last resort.

R400-C400	AGC Filter Network
C303-309	AGC Decoupling Capacitors
C302-305-313	IF Grid Coupling Capacitors
R314	Detector Load Resistor
R409	Picture Control



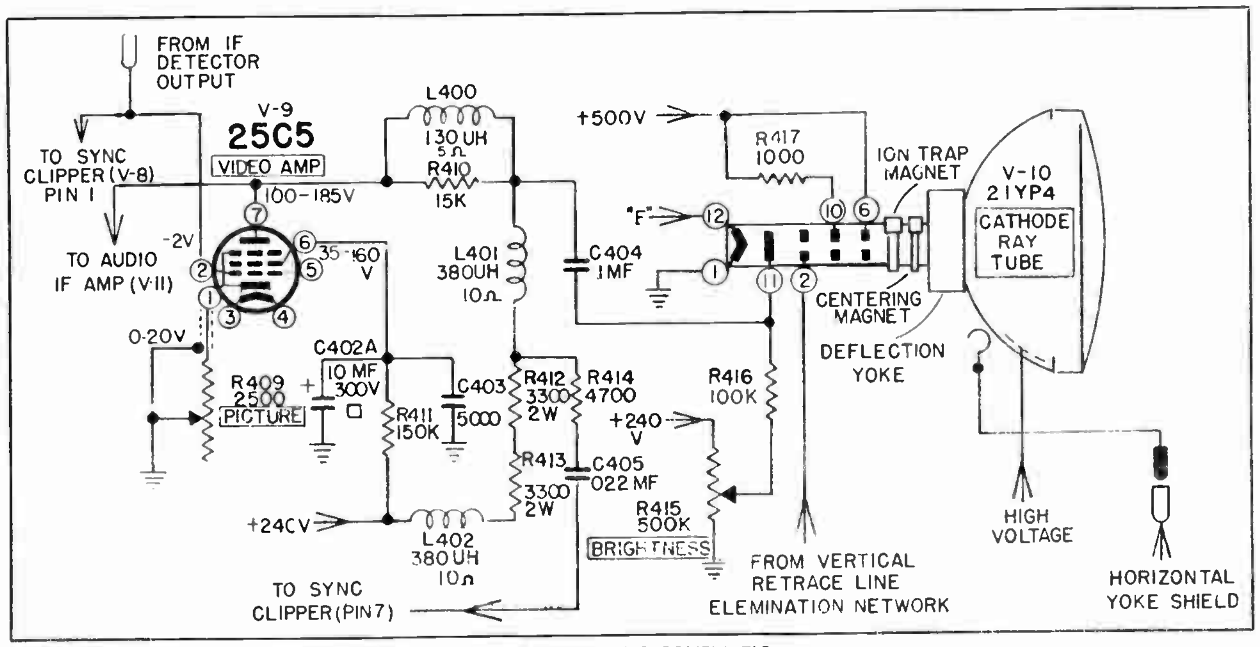
6

NOTE: Check RF Power plug for proper seating. For a rapid AGC check disconnect antenna lead-in wire from receiver and couple close to antenna terminals to reduce signal strength. If picture improves the AGC can be suspected. Compare AGC and detector output voltage. Under normal operating conditions these two negative voltages should be approximately equal. If the AGC voltage is low, the cause may be due to a gassy RF or IF tube, leaky IF grid coupling capacitor or a defective component in the AGC circuit.



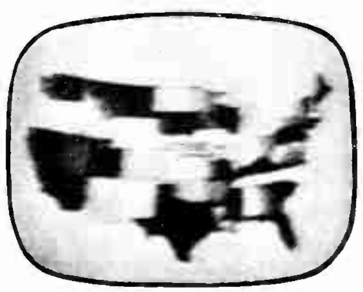
REPLACEMENT PARTS

Ref. No.	Part No.	Description
R409	10B-22311	Picture control—2500 ohm
R415	10B-21456	Brightness control—500K ohm
C402A	8C-22523	10 mfd, 300 volt,—part of lytic
L400	16A-20021	Peaking coil 130 UH
L401-402	16A-19486	Peaking coil—380UH
T405	201-22697	Deflection yoke assembly
	15B-17278-9	CRT socket and cable
	16M-19906	Ion trap magnet
	16M-20697	Centering magnet
	16M-22602	Linearity magnet
	16M-22607	Anti-pin cushion magnet



VIDEO AMPLIFIER SCHEMATIC

36



SMEAR

This condition is generally due to a defective tube or component in the IF or Video Amplifier circuits.

CHECK:

V-9	Video Amplifier (25C5)
V-7	Video Detector (6AL5)
V-4-5-6	IF Amplifiers (6CB6)
R412-413	V-9 Plate Resistors
L312-313-314	Detector Peaking Coils
L400-401-402	V-9 Peaking Coils
C404	V-9 Coupling Capacitor
R314	Detector Load Resistor
R411	V-9 Screen Capacitor
C402A-403	V-9 Screen Resistor
R409	Picture Control

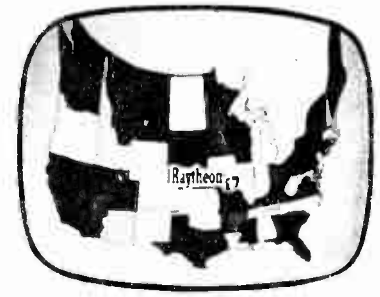
POOR VERTICAL LINEARITY

Condition is generally due to a misadjustment of the vertical size, linearity or centering controls.

CHECK:

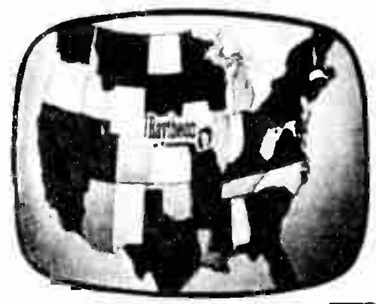
R440	Vertical Size Control Adjustment
R442	Vertical Linearity Control Adjustment
	Centering Control Adjustment
V-15B	Vertical Blocking Oscillator (12AU7)
V-16	Vertical Output (6S4)
T403	Vertical Output Transformer
R443	V-16 Plate resistor
C427	V-16 Plate capacitor
C426	Coupling capacitor
C402B	V-16 Cathode by-pass
R441	V-16 Grid resistor

NOTE: In the absence of a test pattern it is possible to adjust the receiver for reasonable vertical distribution. Turn the V. Size and the V. Linearity controls to their minimum adjustment position and then with the centering control properly adjust the remaining picture to the vertical center of the tube. Adjust the V. Size and V. Linearity controls until the picture fills the mask, bearing in mind that the size control effects the bottom portion of the picture and the linearity control affects the upper portion of the picture. To check vertical distribution, roll the picture slowly using the V. Hold Control and observe the blanking bar as it drifts. If the V. Size, V. Linearity and centering controls are properly adjusted the thickness of the bar will not change during its movement.



11

12



EXCESSIVE VERTICAL SIZE

This condition is generally due to misadjustment of the vertical size and linearity controls.

CHECK:

R440	Vertical Size Control Adjustment
R442	Vertical Linearity Control Adjustment

10

INSUFFICIENT VERTICAL SIZE

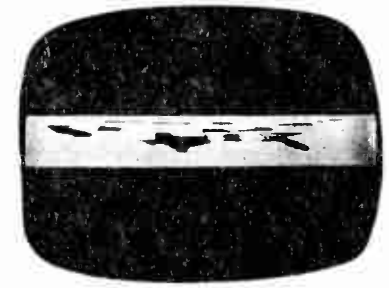
This condition is usually caused by misadjustment of the vertical size and linearity controls or due to a defective tube or component in the vertical deflection circuit.

CHECK:

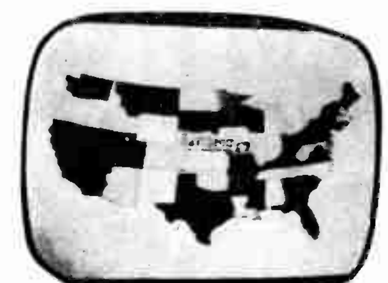
R440	Vertical Size Control Adjustment
R442	Vertical Linearity Control Adjustment
V-15B	Vertical Blocking Osclllator (12AU7)
V-16	Vertical Output (6S4)
T403	Vertical Output Transformer
T405	Deflection Yoke
R443	V-16 Plate Resistor
C427	V-16 Plate Capacitor
C402B	V-16 Cathode By-pass
C426	V-16 Coupling Capacitor

REPLACEMENT PARTS

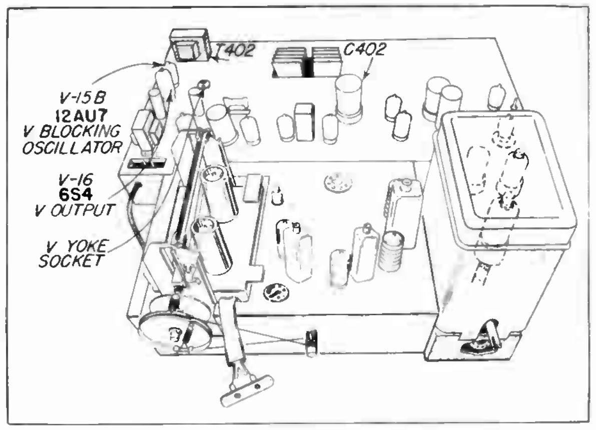
Ref. No.	Part No.	Description
R437	10B-17318	Vertical hold control—3 meg
R440	10B-22307	Vertical size control—750K ohm
R442	10B-22304	Vertical linearity control—6000 ohm
C402B	8C-22523	60 mfd, 50 volt—part of lytic
C442	17A-22376	Printed circuit
T402	12M-18241	Vertical oscillator transformer
T403	12C-20761-2	Vertical output transformer



15



26

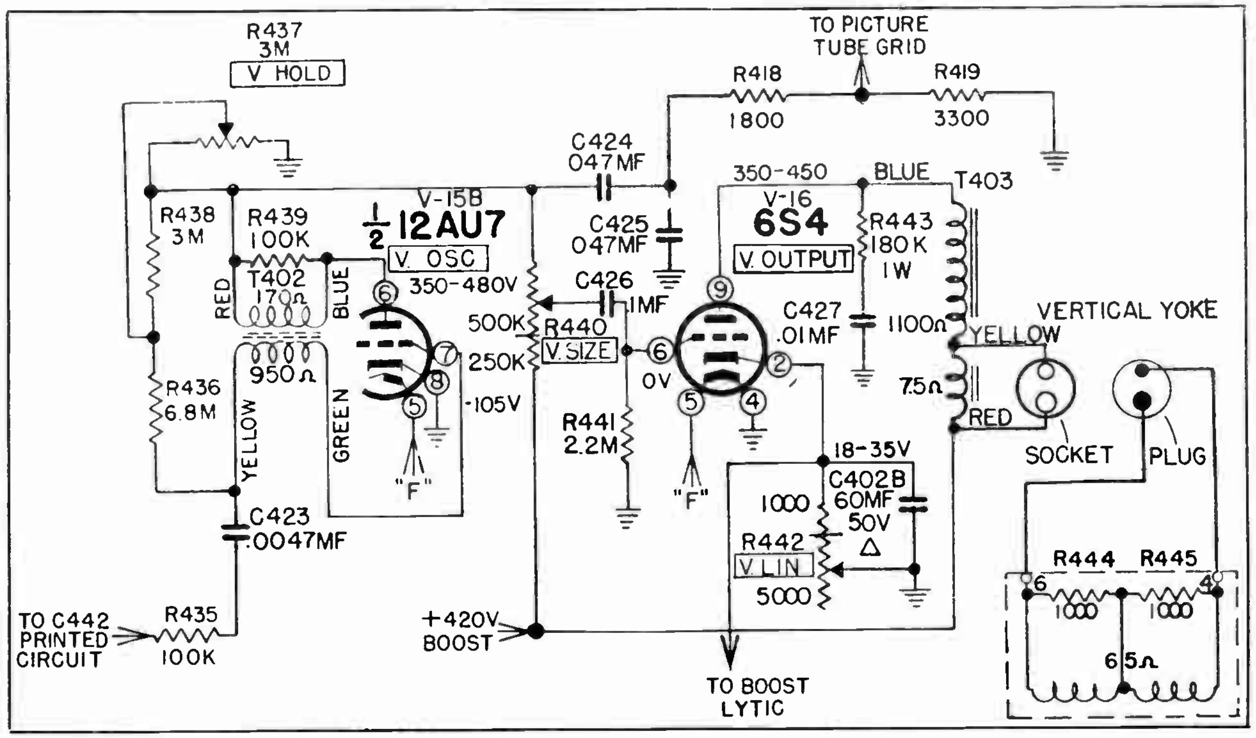


V. Hold:

The Vertical Hold control should be adjusted when the picture is rolling or flipping up or down. The proper setting of the vertical hold control is that point where the picture is moving slowly upward and just locks into place. At this control setting, noise will have the least tendency to interrupt vertical sync.

V. Size and V. Linearity:

The vertical size and linearity controls should be adjusted while a test pattern is being received. The linearity control affects the upper portion of the picture while the size control affects the overall size especially the lower portion of the picture. Adjust both controls simultaneously until the test pattern is symmetrical and fills the entire screen vertically. Readjust the vertical hold control if necessary.



VERTICAL DEFLECTION SCHEMATIC

NO VERTICAL SWEEP

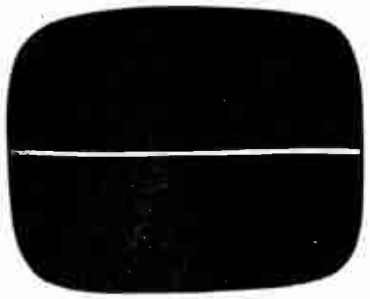
This condition is generally caused by a defective tube or component in the vertical deflection circuit.

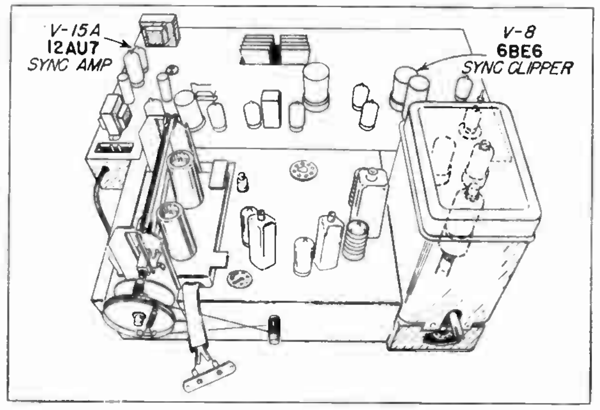
CHECK:

V-15B	Vertical Blocking Oscillator (12AU7)
V-16	Vertical Output (6S4)
T402	Vertical Blocking Oscillator Transformer
T403	Vertical Output Transformer
T405	Deflection Yoke
C426-423-424	Coupling Capacitor
R440	Vertical Size Control

NOTE: Check Vertical Yoke socket for proper seating. One method of isolating the defective stage is to apply a 60 cycle 6.3 filament voltage through a .5 MFD capacitor to various points in the vertical deflection circuit. If an increase of vertical deflection is not observed as the 60 cycle voltage is applied the defect is located between the point tested and the deflection yoke.

14



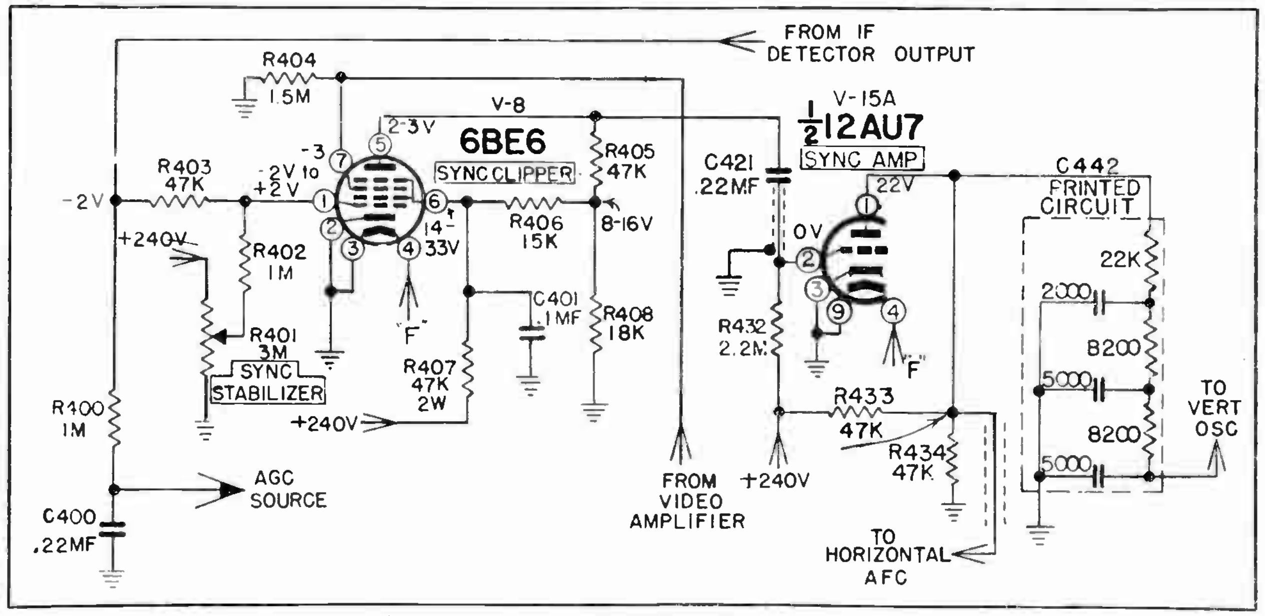


Sync Stabilizer:

The control varies the operational characteristics of the sync clipper stage to obtain the optimum operation point for the least effect of noise interrupting synchronization. The control should be adjusted for a steady picture.

REPLACEMENT PARTS

Ref. No.	Part No.	Description
R401	10B-17318	Sync Stabilizer control—3 meg
C442	17A-22376	Printed circuit



SYNC CLIPPER AND AMPLIFIER SCHEMATIC

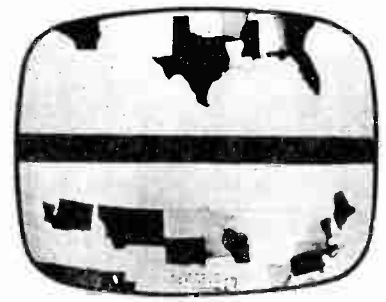
POOR VERTICAL SYNC

Poor vertical sync is generally caused by improper adjustment of the vertical hold control or a defect in the oscillator, sync amplifier or sync clipper circuits.

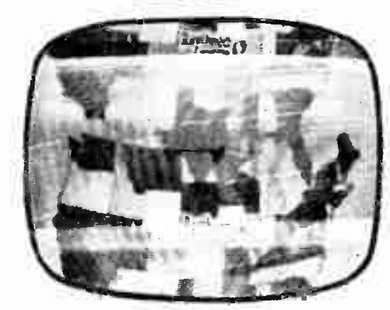
CHECK:

R437	Vertical Hold Control Adjustment
R401	Sync Stabilizer Control Adjustment
V-15	Vertical Blocking Oscillator and Sync Amplifier (12AU7)
V-8	Sync Clipper (6BE6)
C422	Intergrating network
R435-436-437-438	Vertical Hold Control Resistors
C423	Coupling Capacitor
T402	Oscillator Transformer

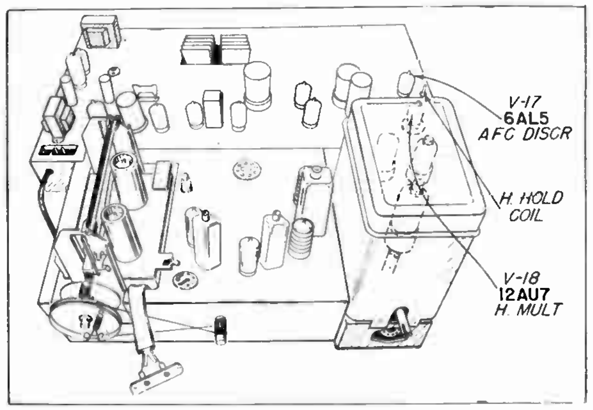
NOTE: A poor vertical sync condition may possibly be due to a defect in the RF, IF or video amplifier stages. This may be quickly checked by observing the blanking bar as illustrated in condition 16. If the detail in the blanking bar is not blacker than the blackest portion of the picture an overloading condition exists. Refer to overloading, condition number 33.



16



17

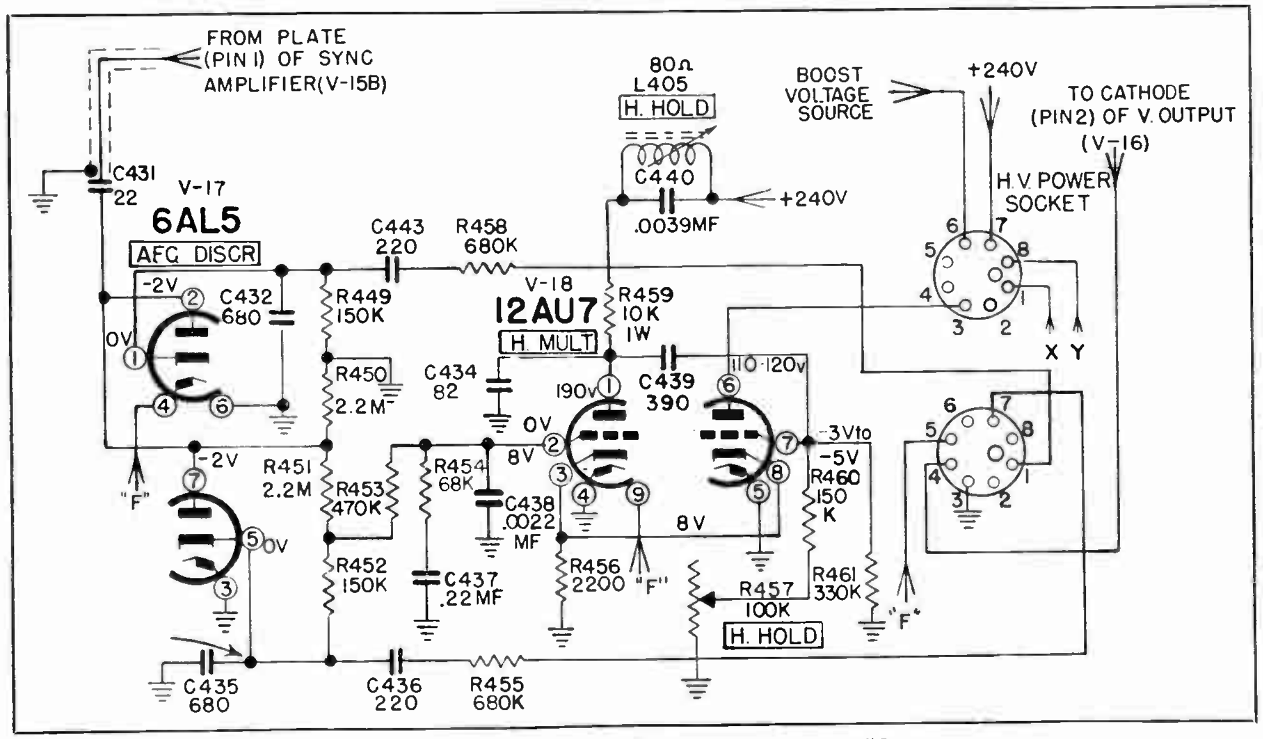


H. Hold:

Set the H. Hold control on the front of the set to the center of its range. Adjust the H. Hold coil on top of the chassis until a steady picture is obtained. Set the H. Hold coil to the center of its range (center position before going out of sync in either direction). To check the adjustment, tune from one station to another. If the controls are properly adjusted the picture will remain in sync at all times.

REPLACEMENT PARTS

Ref. No.	Part No.	Description
R457	108-17275	Horizontal hold control—100k ohm
L405	201-22302	Horizontal hold coil
	51A-21740	Iron core for L405



AFC AND HORIZONTAL MULTIVIBRATOR SCHEMATIC

SERVICE HINTS

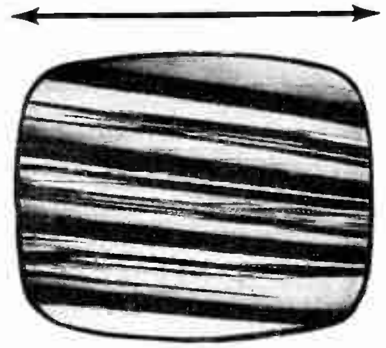
Whenever the sync, AFC, Horizontal Multivibrator or H. Pulse Amplifier stage is suspected as the cause of the trouble, it will prove helpful to short the input grid of the Horizontal Multivibrator (pin 2, V18) to ground, readjust the horizontal hold control and then observe the picture. If the condition disappears you can assume that the source of the trouble is before the input grid of the oscillator. If, however, the condition remains, the trouble is probably after the grid of the multivibrator.

POOR HORIZONTAL SYNC

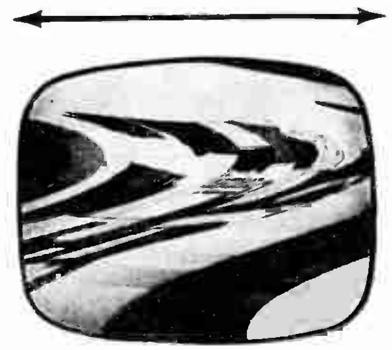
Poor horizontal sync is usually caused by misadjustment of the horizontal hold control, hold coil or the sync stabilizer control or due to a defective tube or component in the horizontal multivibrator, AFC, sync amplifier or sync clipper circuits.

CHECK:

R457-L405	Horizontal Hold Control Adjustment
R401	Sync Stabilizer Control Adjustment
V-18	Horizontal Multivibrator (12AU7)
V-17	Horizontal AFC Discriminator (6AL5)
V-15A	Sync Amplifier (12AU7)
V-8	Sync Clipper (6BE6)
L405	Horizontal Hold Coil
C440	Horizontal Hold Coil Capacitor
C437-438	V-18 Grid Capacitors
C431-439	V-18 Coupling Capacitors
R458-455	V-17 Feedback Resistors
C443-436	V-17 Feedback Capacitors
R456-459-460-500	V-18 Plate and Grid Resistors
R433-434	Voltage Divider Resistors



19



20

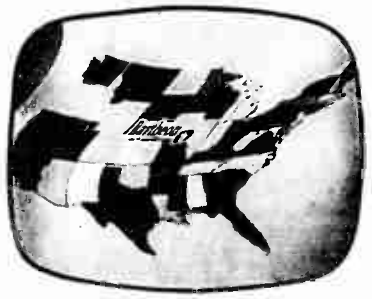
HORIZONTAL DISPLACEMENT

Condition can be caused by improper adjustment of the sync stabilizer or horizontal hold control or a defective tube or component in the sync clipper or amplifier, AFC, horizontal multivibrator or pulse amplifier circuits.

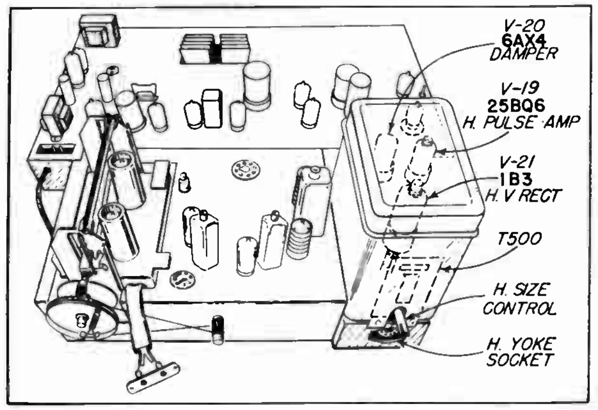
CHECK:

R457-L405	Horizontal Hold Control Adjustment
R401	Sync Stabilizer Control Adjustment
V-17	AFC Discriminator (6AL5)
V-18	Horizontal Multivibrator (12AU7)
V-19	Horizontal Pulse Amplifier (25BQ6)
V-15A	Sync Amplifier (12AU7)
V-8	Sync Clipper (6BE6)
C503-R503	Boost Voltage Filter
R500	V-18 Plate Resistor
C437-438	V-18 Grid Capacitor
R458-455	AFC Feedback Resistor
C443-436	AFC Feedback Capacitor

NOTE: Check H.V. Power and Yoke plug.



22

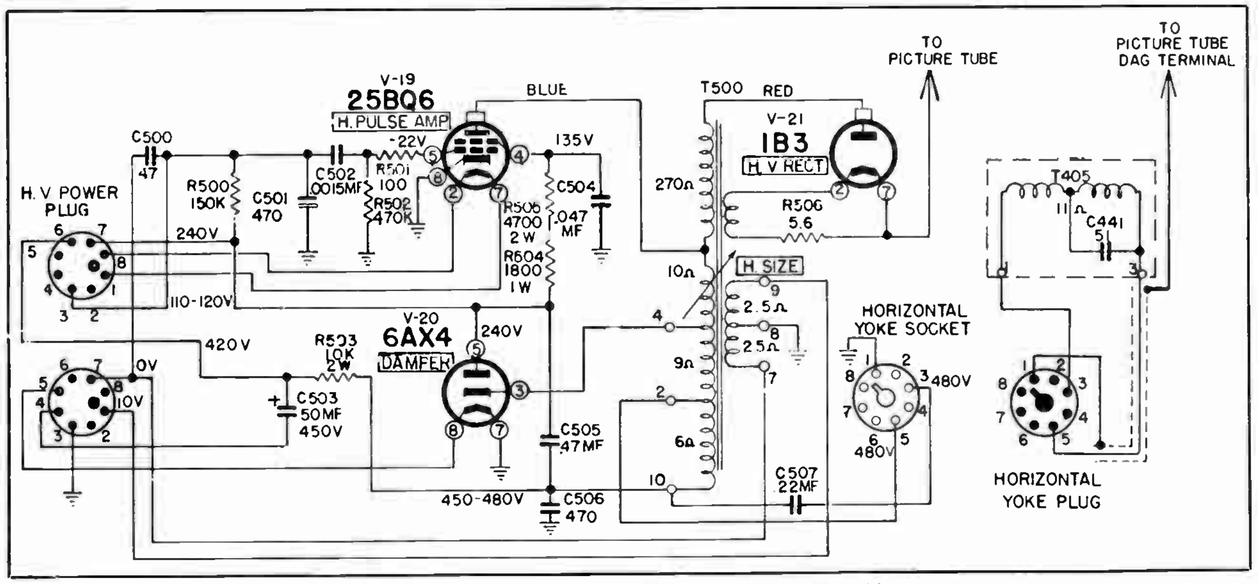


H. Size:

The horizontal size control should be adjusted until the picture fills the entire screen horizontally. A clockwise rotation will decrease size. To some extent the vertical size control setting may be affected by a major horizontal size adjustment.

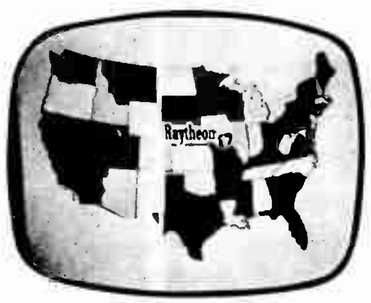
REPLACEMENT PARTS

Ref. No.	Part No.	Description
C503	8C-22544	50 mfd, 450 volt, lytic
C506	8G-21440	470 mmf, 1000 volt, ceramic
T500	201-22396	H. V. Deflection transformer
T405	201-22697	Deflection yoke assembly



HORIZONTAL OUTPUT AND HIGH VOLTAGE SCHEMATIC

21



DRIVE BAR

This condition is generally caused by a defective tube or component in the horizontal output section.

CHECK:

	Horizontal Size Control Adjustment
V-19	Horizontal Pulse Amplifier (25BQ6)
V-20	Horizontal Damper (6AX4)
V-18	Horizontal Multivibrator (12AU7)
R504-505	V-19 Screen Resistor
R502	V-19 Grid Resistor
C504	V-19 Screen Capacitor
C501-502	V-19 Grid Capacitor
R500	V-18 Plate resistor

NOTE: Check H.V. Power plug for proper seating.

INSUFFICIENT HORIZONTAL SIZE

This condition is usually caused by misadjustment of the horizontal size control or a defective tube or component in the high voltage circuit.

CHECK:

	Horizontal Size Control Adjustment
V-19	Horizontal Pulse Amplifier (25BQ6)
V-20	Horizontal Damper (6AX4)
R504-505	V-19 Screen Resistor
R500	V-18 Plate Resistor
R502	V-19 Grid Resistor
C501-502	V-19 Grid Capacitor

23

NO RASTER WITH NORMAL SOUND

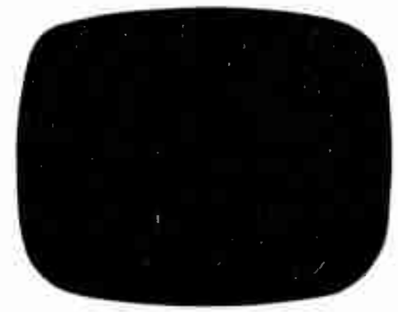
No Raster (no brightness on face of picture tube) with normal sound is usually caused by a defect in the high voltage supply or the components associated with the picture tube.

CHECK:

R415	Brightness Control Adjustment
	Ion Trap Magnet Adjustment
V-21	High Voltage Rectifier (1B3)
V-19	Horizontal Pulse Amplifier (25BQ6)
V-18	Horizontal Multivibrator (12AU7)
V-20	Horizontal Damper (6AX4)
V-10	Picture Tube (21YP4)
R504-505	V-19 Screen Resistor
C504	V-19 Screen Capacitor
R500	V-18 Plate Resistor
T500	H.V. Deflection Transformer
T405	Deflection Yoke

NOTE: Check H.V. Power and H. Yoke plugs for proper seating, CRT sockets and high voltage anode lead for proper connections.

31A



31

NO RASTER NO SOUND

A condition of No Raster with No Sound is generally caused by a filament failure in the series filament string or a defect in the B supply voltage source.

CHECK:

V-9	Video Amplifier (25C5)
V-14	Audio Output (25C5)
V-19	Horizontal Pulse Amplifier (25BQ6)
R446	Resistor Type Fuse
R447	Series Filament Resistor
C402A-414C	B Supply Filter Lytics
R448	Voltage Divider Resistor
L404	B Supply Filter Choke
T404	Filament Transformer
	Selenium Rectifiers

31B

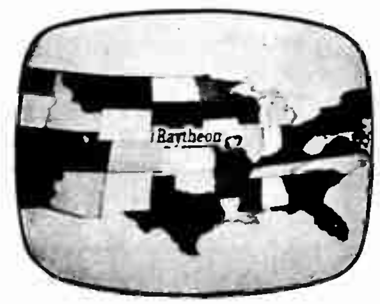
NOTE: Check AC line cord, safety interlock and on-off switch.

EXCESSIVE HORIZONTAL WIDTH

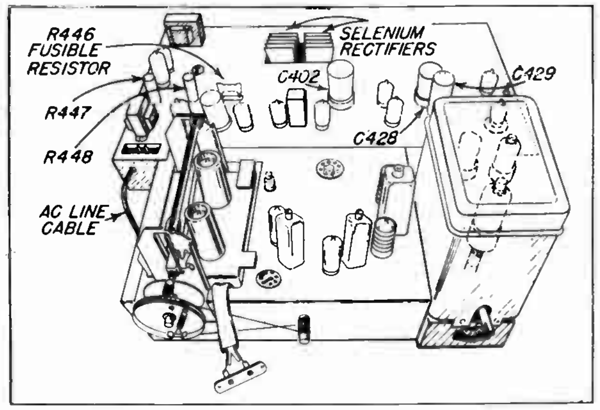
Condition is generally due to improper adjustment of the H. Size control, insufficient high voltage or possibly caused by high AC line voltage.

CHECK:

	Horizontal Size Control Adjustment
V-21	High Voltage Rectifier (1B3)
V-19	Horizontal Pulse Amplifier (25BQ6)
V-20	Horizontal Damper (6AX4)
V-18	Horizontal Multivibrator (12AU7)
R504-505	V-19 Screen Resistor
C504	V-19 Screen Capacitor
R502	V-19 Grid Resistor
C501-C502	V-19 Grid Capacitor
R500	V-18 Plate Resistor
T500	H.V. Deflection Transformer
R506	V-21 Filament Resistor



9



REPLACEMENT PARTS

Ref. No.	Part No.	Description

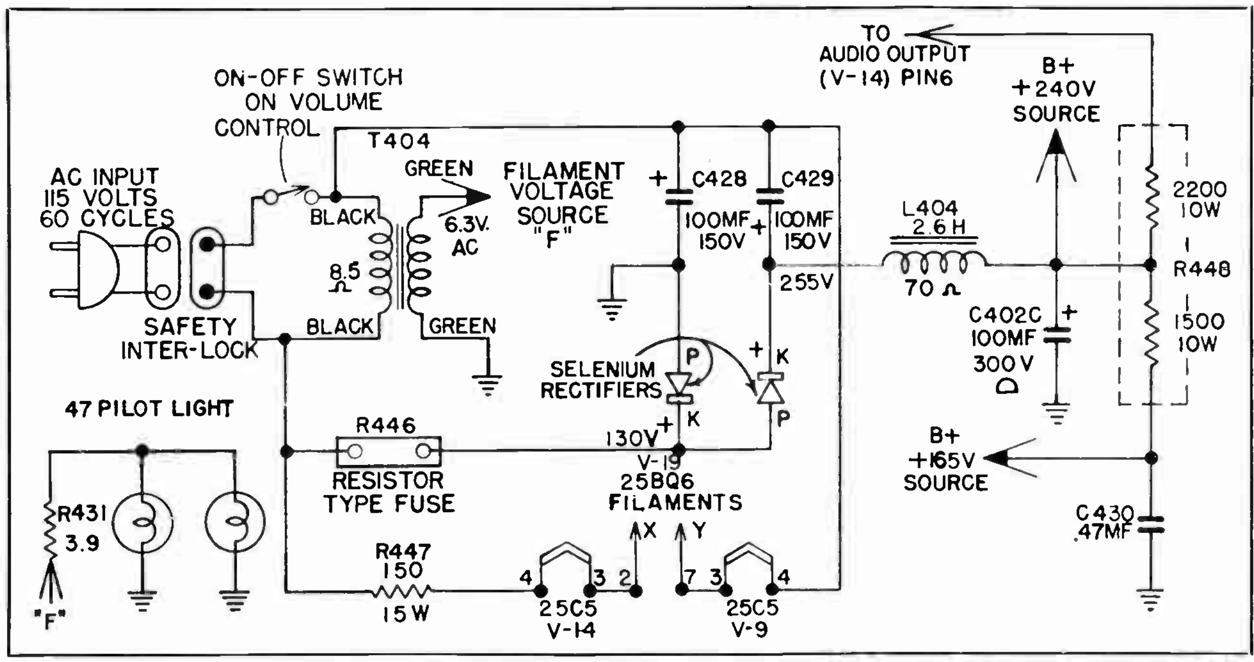
T404	12D-22586	Filament transformer
L404	16A-21214	Filter choke
	15B-21186	Mounting plate for C429
	21J-20097	Selenium rectifier
	201-22551	AC line cable assm.



LOW VOLTAGE SCHEMATIC

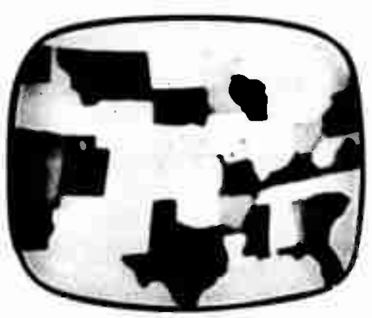
BLOOMING

The blooming effect will vary with adjustment of the picture and brightness controls and is usually caused by a defective tube or component in the high voltage or B supply voltage circuits.

CHECK:

V-21	High Voltage Rectifier (1B3)
V-19	Horizontal Pulse Amplifier (25BQ6)
V-20	Horizontal Damper (6AX4)
V-10	Picture Tube (21YP4)
R506	V-21 Filament Resistor
R503-C503	Boost Voltage Filter
T500	H. V. Deflection Transformer
C402C-428-429	B Supply Filter Lytics
L404	Filter Choke
	Selenium Rectifiers

37



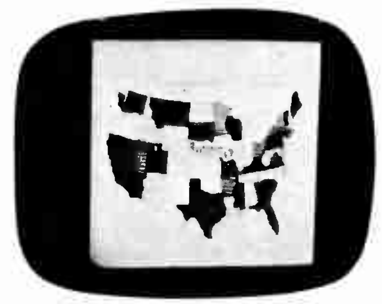
INSUFFICIENT HORIZONTAL AND VERTICAL SIZE

This condition can possibly be caused by incorrect horizontal size, vertical size and linearity control adjustments, low B supply voltage or possibly due to low AC line voltage.

CHECK:

V-19	Horizontal Pulse Amplifier (25BQ6)
V-20	Horizontal Damper (6AX4)
R503-C503	Boost Voltage Filter
C402C-428-429	B Supply Filter Capacitors
	Selenium Rectifiers

NOTE: Check H.V. power plug for proper seating and AC line voltage



24

POOR FOCUS

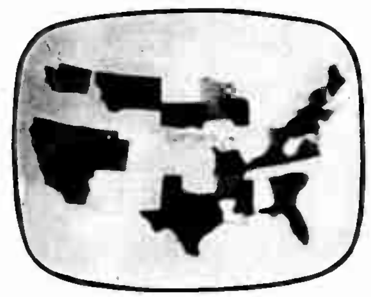
This condition is generally caused by an incorrect adjustment of the ion trap magnet, insufficient high voltage or a defect in the B supply voltage source.

CHECK:

Ion Trap Magnet Adjustment

V-21	High Voltage Rectifier (1B3)
V-19	Horizontal Pulse Amplifier (25BQ6)
V-20	Horizontal Damper (6AX4)
V-18	Horizontal Multivibrator (12AU7)
V-10	Picture Tube (21YP4)
C402C-428-429	B Supply Filter Lytics
T405	Deflection Yoke
	Selenium Rectifiers

NOTE: Since the centering control will be effective in either of two positions, the preferred position is approximately 180 degrees away from the magnet of the ion trap to minimize interaction.



35

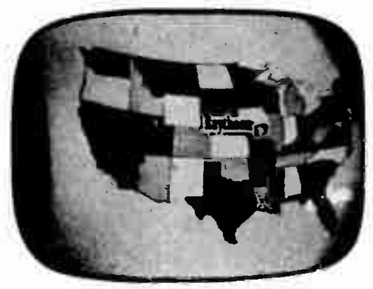
INCORRECT CENTERING

Condition is due to incorrect adjustment of the centering control.

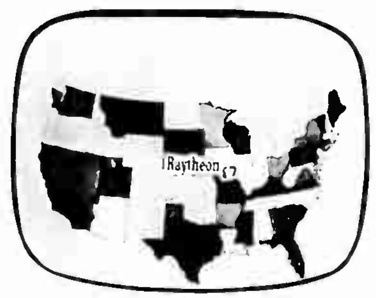
CHECK:

Centering Control Adjustment (Refer to page 20)

NOTE: Do not attempt to correct for vertical centering with either the vertical size or linearity controls and do not use the horizontal hold control to affect horizontal centering.



27



25

18

TILTED PICTURE

This condition is caused by an incorrectly positioned deflection yoke.

CHECK:

Deflection Yoke Positioning Adjustment

28

TUBE SHADOW

This condition is usually caused by an incorrectly positioned deflection yoke or a misadjusted centering control or ion trap magnet.

CHECK:

Deflection Yoke Positioning Adjustment
Centering Magnet Adjustment
Ion Trap Magnet Adjustment

REPLACEMENT PARTS

Part No.	Description	Part No.	Description
201-22697	Deflection yoke assembly	16M-20697	Centering magnet
15B-17278-9	CRT socket and cable	16M-22602	Linearity magnet
16M-19906	Ion trap magnet	16M-22607	Anti-pin cushion magnet

Anti-Pin Cushion Magnet:

Adjust centering until left edge of the raster is visible. Loosen the positioning screw and slide the magnet until the edge of the raster is vertically straight. If keystoning is noticed adjust magnet in vertical plane.

Deflection Yoke:

The correct position for the deflection yoke is as far forward on the neck of the picture tube as the shape of the tube will allow. Tube shadow or a tilted raster may result from an incorrectly positioned yoke. If a position adjustment is necessary, loosen the yoke wing nut located at the top of the picture tube assembly.

H. Linearity Magnet:

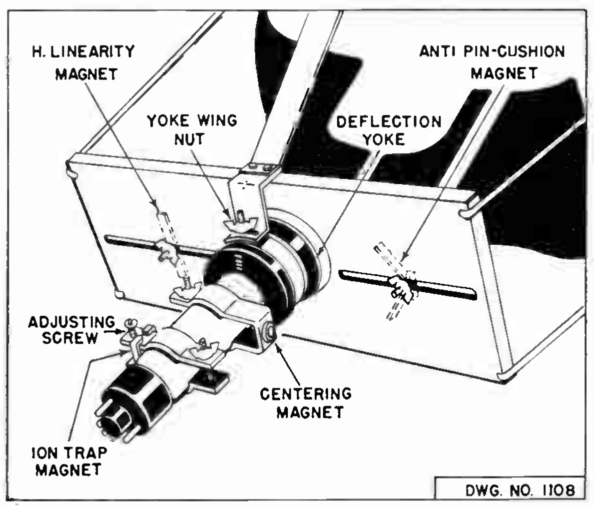
The horizontal linearity magnet affects the linearity of the right side of the picture only. The magnet pulls or stretches the right side and has a greater effect when closer to the picture tube.

Ion Trap Magnet:

If adjustment is determined necessary, loosen the wing nut, rotate and slide the magnet until the position which gives maximum illumination is found. Adjust the screw for maximum illumination. Repeat the above two steps. Rotate and slide the magnet until the best focus position is found without sacrificing brilliance. Tighten wing nut. Adjustment should be made with brightness and picture controls set for normal viewing. The position of the ion trap magnet MUST be over the grid of the picture tube (second cylinder from the base identified by a flared forward lip) after the adjustment is complete.

Centering Magnet:

The centering magnet should be rotated and the control adjusted until the picture is properly framed keeping in mind that the effect of the control is governed by the position of rotation. If the control is above or below the neck of the picture tube, the picture can be moved up or down. To the left or right of the neck of the picture tube, the picture can be moved either to the left or right. The position of the centering magnet should be 1/4 to 1/2 inch behind the deflection yoke.

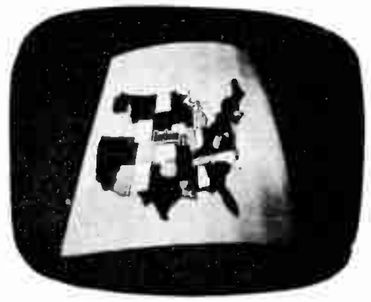


TRAPEZOIDAL RASTER

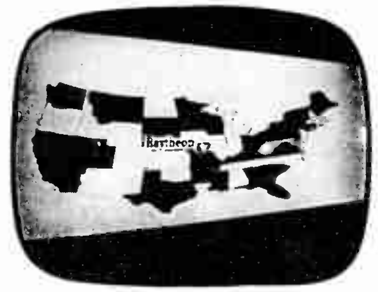
A trapezoidal raster is generally caused by a defective deflection yoke or associated components.

CHECK:

T405	Deflection Yoke
R444-445	Yoke Loading Resistors
C441	Yoke Equalizing Capacitors



39



40

SOUND CONDITIONS

It will always prove helpful when analysing a service condition to first determine if the sound section is functioning normally. Since the receiver is of the intercarrier type, both the sound and picture information are amplified simultaneously by the tuner, I F and video amplifiers. Due to the design of the receiver the video amplifier also amplifies both the sound and picture information. By analysing the above, it can be assumed that if the picture appears to be normal and the sound is not functioning properly the defect is located between the sound take off point (plate of the video amplifier) and speaker.

B - NO SOUND

A no sound condition with a normal picture is generally caused by a defective tube or component between the plate of the video amplifier and speaker.

CHECK:

V-11	Audio I F Amplifier (6AU6)
V-12	Audio Detector (6AL5)
V-13	Audio Amplifier (6AV6)
V-14	Audio Output (25C5)
R422	V-11 Screen Resistor
C410	V-11 Screen Capacitor
R428	V-13 Plate Resistor
R425	Volume Control
C418	Coupling Capacitor
R448	Voltage Divider Resistor
R430	V-14 Cathode Resistor
T401	Output Transformer
T400	Ratio Detector Transformer
	Speaker

NOTE: Check Speaker cable connections.

C - WEAK SOUND

A weak sound condition is generally caused by a weak tube or misalignment of the sound section.

CHECK:

V-11	Audio I F Amplifier (6AU6)
V-13	Audio Amplifier (6AV6)
V-14	Audio Output (25C5)
T400	Ratio Detector Transformer Adjustment (Primary-Bottom Slug)
L403	Audio Pick-Off Coil Adjustment

SOUND CONDITIONS

D - DISTORTED SOUND

This condition is usually caused by a defective tube or component in the sound section.

CHECK:

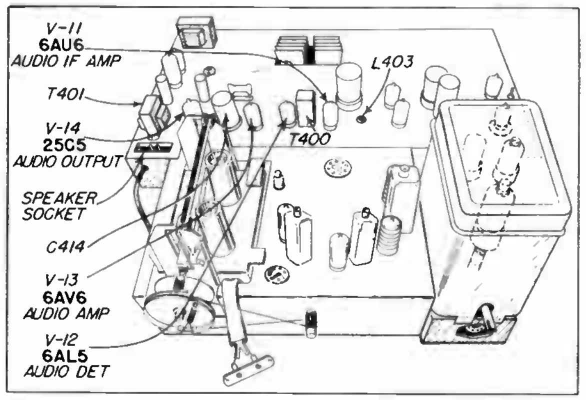
V-14	Audio Output (25C5)
V-12	Audio Detector (6AL5)
V-13	Audio Amplifier (6AV6)
C-414A-B-C	Filter Lytic
C418	Coupling Capacitor
R428	V-13 Plate Resistor
R430	V-14 Cathode Resistor
T400	Ratio Detector Transformer
	Speaker
T400	Ratio Detector Transformer Adjustment (Secondary - Top Slug)

E - HUM OR BUZZ IN SOUND

This condition is generally due to a defective tube or component in the sound section or due to a misalignment of the sound coils.

CHECK:

V-12	Audio Detector (6AL5)
V-14	Audio Output (25C5)
V-13	Audio Amplifier (6AV6)
V-11	Audio I F Amplifier (6AU6)
C414A-B-C	Filter Lytic
C420	Speaker Voice Coil Bypass
T400	Ratio Detector Transformer Adjustment (Secondary-Top Slug)
L403	Audio Pick-Off Coil Adjustment



NOTE: A fast method of isolating the defective stage when a troublesome sound condition occurs is to apply a 60 cycle 6.3 filament voltage through a .5 mfd capacitor to various points in the sound section. If an increase of volume is not observed as the 60 cycle is applied, the defect is located between the point tested and the speaker.

REPLACEMENT PARTS

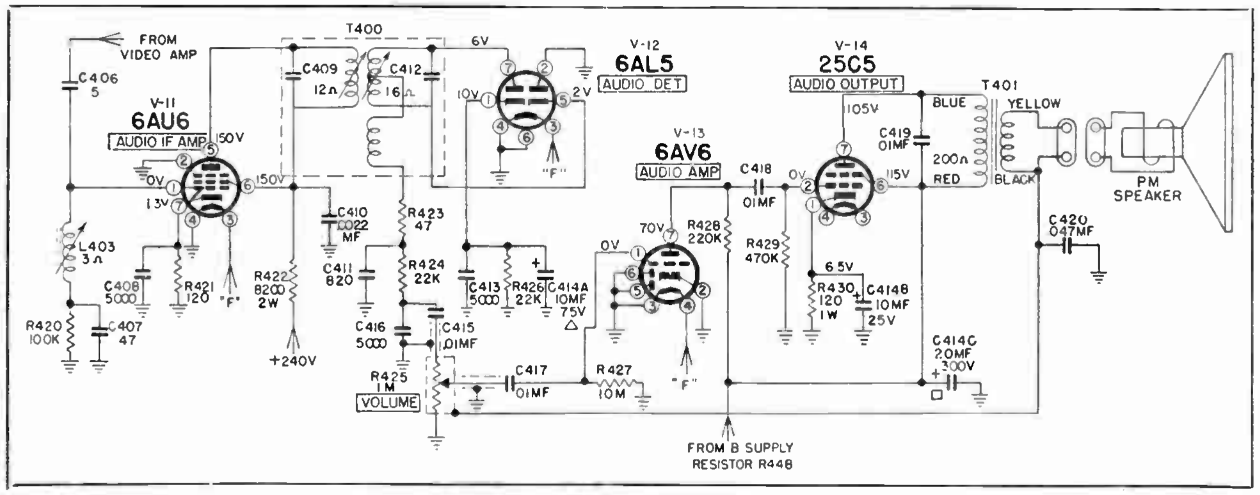
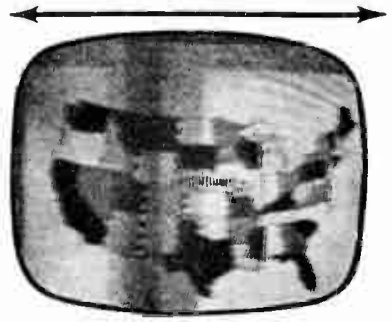
L403	201-22581	Video trap coil
	51A-22370	Iron core for L403



SOUND SECTION SCHEMATIC

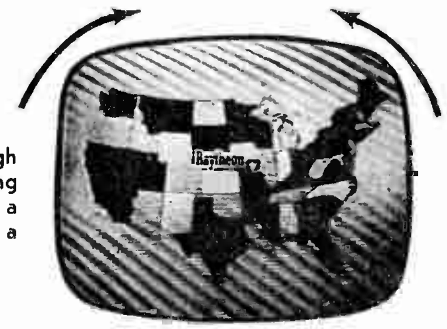
EXTERNAL INTERFERENCE

The five service conditions below which are usually caused by external interference have been included in the "Service Saver" as they are common service complaints. These conditions are presented so that they can easily be identified and usually the effects in the picture are little affected by a control adjustment, tube or component substitution or circuit modification. These conditions result from an interfering external signal and are seldom caused or due to a defect in the receiver.



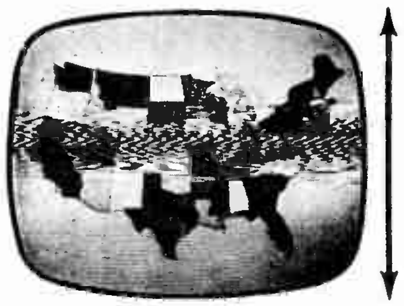
CHANNEL CROSS TALK 2

Due to interference from a nearby station on same channel or due to adjacent channel interference—Orientation, relocation or an antenna with sharper directivity characteristics and the use of traps are suggested to reduce or eliminate channel cross talk.



RF INTERFERENCE 3

Due to a beat frequency between the incoming signal and high powered radio equipment or a local oscillator in a receiver being operated in the vicinity—Orientation, relocation or installing a higher gain and more directional type antenna or the use of a booster may be effective in eliminating this interference.

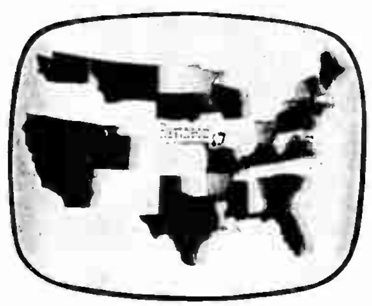


DIATHERMY INTERFERENCE 5

Caused by X-Ray, commercial RF heating, ultra-violet and fluorescent lights, brush motors and other 60 cycle operated equipment—Filters or other corrective measures installed at the source of interference may be tried to eliminate the herring-bone pattern from the picture.

IGNITION INTERFERENCE 7

Caused by ignition systems of cars or trucks or by breaking contact type of electrical appliances in vicinity. Similar condition may result from arcing in high voltage supply. — Effects in the picture may be reduced by relocation or installing a more directional type antenna, shielding or redressing the transmission line or by installing a power line filter.



GHOSTS 13

Due to the transmitted signal being reflected from buildings, hills or mountains and other surrounding structures. — To eliminate or reduce the effects in the picture, orientation, relocation or probing, or installing an antenna with improved directivity characteristics should be attempted.

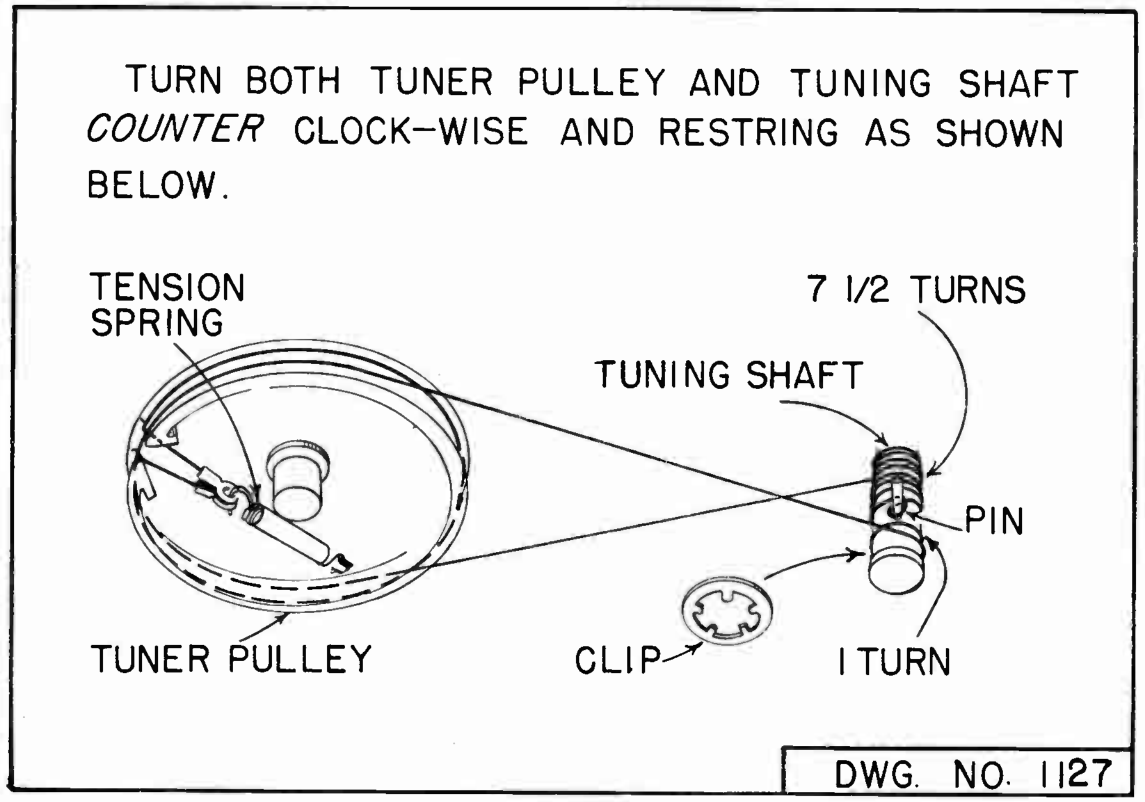


Figure 1. Dial Stringing

CIRCUIT CHANGES

CHASSIS CODE	SUB UNIT	CODE UNIT	CHANGE	REASON
233	DEF	C	R403 (47K) changed to 68K.	Reduce horizontal phase shift.
633	HV	G	C507 (.22MF) changed to .1MF, R504 (1800-1W) deleted and T500 part number changed to -1	To increase high voltage.
134	RF	L	R306 (33K) changed to 22K.	Improve IF response.
933	DEF	J	R434 (47K) changed to 100K.	To improve vertical and horizontal sync.
243	DEF	M	C437 (.22MF) changed to .1MF.	Reduce horizontal waves.
443	DEF	P	R417 wired to boost instead of 240V.	Increase resolution.
543	DEF	Q	R419 (3300) changed to 5600, R418 (1800) changed to 22K and relocated, and C443 (100) added to pin 2 of V-10.	Improve vertical retrace.
643	RF	O	V-2 (6BQ7A) changed to 6BZ7.	To increase sensitivity.
743	HV	S	V-20 (6AX4) changed to 25AX4, V-19-20 filament wiring revised and T404 changed.	Reduce cost.
743	DEF	S	R447 (150-15W) changed to 47-5W.	

CHASSIS CODE	SUB UNIT	CODE UNIT	CHANGE	REASON
943	DEF	U	R428 (220K) changed to 470K and wired to 240V, C406 (5) changed to 3.3 and wired to detector output, L406 (270 UH) and R463 (10K) added to pin 2 of V9, L403 (sound-pick-off coil) changed and C444 (22) added across L403.	Eliminate smear.
No Code Change	DEF	V	L407 and C445 added to cathode lead of CRT.	Eliminate sand in picture.
No Code Change	DEF		C411 (470) replaced by a Trimmer.	Correct unbalance in Ratio Detector transformer.

NOTE: Earlier code 21" deflection and high voltage units cannot be interchanged with code "S" units.
DEF—Deflection sub-chassis.
H.V.—High voltage sub-chassis.
R.F.—Tuner and IF sub-chassis.

PARTS LIST

Ref. No.	Part No.	Description	Price
C406	8G-12495-5	3.3 mmf. ceramic	.25
C407	8G-12198	47 mmf, ceramic	.25
C411	8E-23378	80-480 mmf, trimmer	.55
C437	8J-16085	.1 mfd, 200 volt, molded	.30
C443	8G-22657	100 mmf, ceramic	.25
C444	8G-11789	10 mmf, ceramic	.25
C445	8G-22657	100 mmf, ceramic	.25
C507	8J-16085	.1 mfd, 200 volt, molded	.30
R306	9B1-78	22K ohm, ½ watt, ±10%	.25
R403	9B1-84	68K ohm, ½ watt 10%	.25
R416	9B1-90	100K ohm, ½ watt, ±10%	.25
R418	9B1-78	22K ohm, ½ watt, 10%	.25
R419	9B1-71	5600 ohm, ½ watt, 10%	.25
R428	9B1-94	470K ohm, ½ watt, 10%	.25
R434	9B1-86	100K ohm, ½ watt, 10%	.25
R446	46M-23018	Fuse Resistor, 5.6 Amp.	.55
R447	9C12-1083	47 ohm, 5 watt, 10%	.30
R460	9B1-88	150K ohm, ½ watt, ±10%	.25
R463	9B1-74	10K ohm ½ watt, 10%	.25
L107-108	13E-23181	UHF Antenna trap coil	.05
L403 (inc. R420, C407, C406, and C444)	201-23477	Sound pick-off coil	—
L406	16A-20970	Choke coil—270 UH	.50
L407 (incl. C445)	201-22571	Video trap coil	1.30
T500	201-22396-1	H. V. Deflection transformer	—
V-2	6BZ7	VHF RF amplifier	3.80
V-20	25AX4	Damper	2.75

MISCELLANEOUS PART CHANGES

Ref. No.	Part No.	Description	Price
	2C-21201	Capacitor plate	2.15
	201-20183	L403 core and clips assem.	.15
	14C-22282-21	H. V. Cable assembly	.50
	47A-22592	R. H. Pilot light socket bracket	.25
	47A-22513	L. H. Pilot light socket bracket	.25
	37A-22512	Pilot light shield	.05
	2D-22564	Pilot light mounting bracket	.05
L405 (incl. C440)	201-23180	H. Hold coil	2.50
T404	12D-21160-1	Filament transformer	3.66
T402	12M-18241-3	Vertical oscillator transformer	2.05

V–S

CAPACITORS CAPACITOR VALUES ARE REPRESENTED IN MICRO-MICROFARAD (MMF) UNLESS OTHERWISE INDICATED. "MF" DENOTES MICROFARAD.

RESISTORS RESISTOR WATTAGE IS REPRESENTED IN 1/2 WATT UNLESS OTHERWISE INDICATED "K" DENOTES X 1,000 & "M" DENOTES X1,000,000.

SWITCHES ALL SWITCHES ARE SHOWN IN THE POSITION FOR VHF OPERATION.

VOLTAGE READINGS THE VOLTAGE READINGS INDICATED AT THE VARIOUS TUBE SOCKET PINS WERE MEASURED WITH A 20,000 OHM PER VOLT VOLTMETER, NORMAL OPERATION, NO SIGNAL INPUT AND LINE VOLTAGE AT 115V AC WHERE CONTROL SETTINGS AFFECT VOLTAGE READINGS THE MINIMUM AND MAXIMUM ARE INDICATED. (SEE WARNING BELOW)

HIGH VOLTAGE HIGH VOLTAGE ON PLATE CAPS OF THE 1B3 HIGH VOLTAGE RECTIFIER AND 25BQ6 HORIZONTAL PULSE AMPLIFIER. DO NOT MEASURE THIS VOLTAGE. MEASURE CRT 2nd ANODE VOLTAGE WITH H. V. PROBE

COIL DC RESISTANCE THE DC RESISTANCE READING INDICATED NEAR THE TRANSFORMERS AND COILS HAVE BEEN TAKEN WITH AN OHMMETER DIRECTLY ACROSS THE COIL BEING MEASURED. COILS SHOWN WITHOUT A RESISTANCE READING HAVE A DC RESISTANCE OF LESS THAN ONE OHM. A TOLERANCE OF ±10% IS PERMISSIBLE. DO NOT MEASURE WITH SET TURNED ON.

WAVE FORMS THE WAVE FORMS ILLUSTRATED ARE EXACT COPIES OF THAT SHOWN ON A LABORATORY OSCILLOSCOPE. THE WAVE FORMS WERE TAKEN UNDER NORMAL OPERATING CONDITIONS, WITH A TRANSMITTED SIGNAL AND THE PICTURE IN SYNC AT ALL TIMES. WITH EACH WAVE FORM IS THE PEAK-TO-PEAK VOLTAGE AND A HORIZONTAL OR A VERTICAL NOTATION REPRESENTING VERTICAL (60 CYCLES) OR HORIZONTAL (15,750 CYCLES) SCOPE FREQ. THE WAVE FORM AND PEAK-TO-PEAK VOLTAGE READINGS MAY VARY SOMEWHAT DEPENDING ON THE STRENGTH OF THE SIGNAL, THE PICTURE INFORMATION BEING TRANSMITTED AND THE ADJUSTMENT OF THE VARIOUS CONTROLS. WHEN CHECKING WAVE FORMS, CONNECT THE GROUND LEAD FROM THE OSCILLOSCOPE TO THE CHASSIS AND THE HOT LEAD TO THE POSITION INDICATED BY THE ARROW. (SEE WARNING BELOW)

REPLACING TUBES BEFORE REPLACING TUBES THE CABINET BACK MUST FIRST BE REMOVED. REMOVING THE CABINET BACK DISENGAGES THE SAFETY INTERLOCK AND REMOVES THE POWER TO THE RECEIVER. DO NOT TAMPER WITH OR ATTEMPT TO DEFEAT THE PURPOSE OF THE SAFETY INTERLOCK, AS SEVERE SHOCK MAY RESULT. DO NOT REMOVE TUBES WHILE THE RECEIVER IS IN OPERATION AS OVERLOADING OR COMPONET FAILURE MAY RESULT.

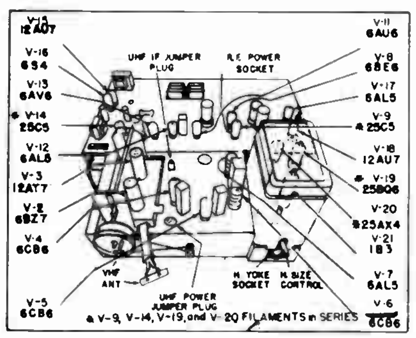
PICTURE TUBE HANDLING DUE TO LARGE SURFACE AND EXTREME HIGH VACUUM OF THE PICTURE TUBE, CARE SHOULD BE USED WHEN HANDLING THE CHASSIS OUTSIDE THE CABINET. DO NOT SUBJECT THE TUBE TO EXCESSIVE PRESSURE OR ROUGH HANDLING AS AN IMPLOSION MAY RESULT CAUSING SERIOUS PERSONAL INJURY.

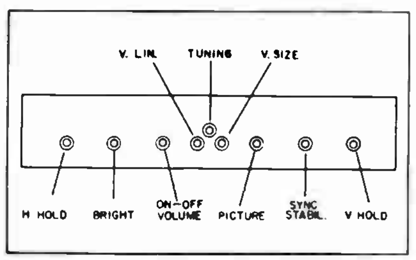
WARNING

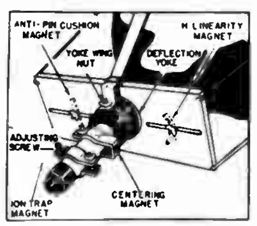
AT ALL TIMES DURING OPERATION THE CHASSIS IS AT 125 VOLTS DC POTENTIAL ABOVE GROUND AND IT ALSO MAY BE AT THE LINE VOLTAGE POTENTIAL DEPENDING ON HOW THE LINE CORD PLUG IS INSERTED IN THE POWER RECEPTACLE.

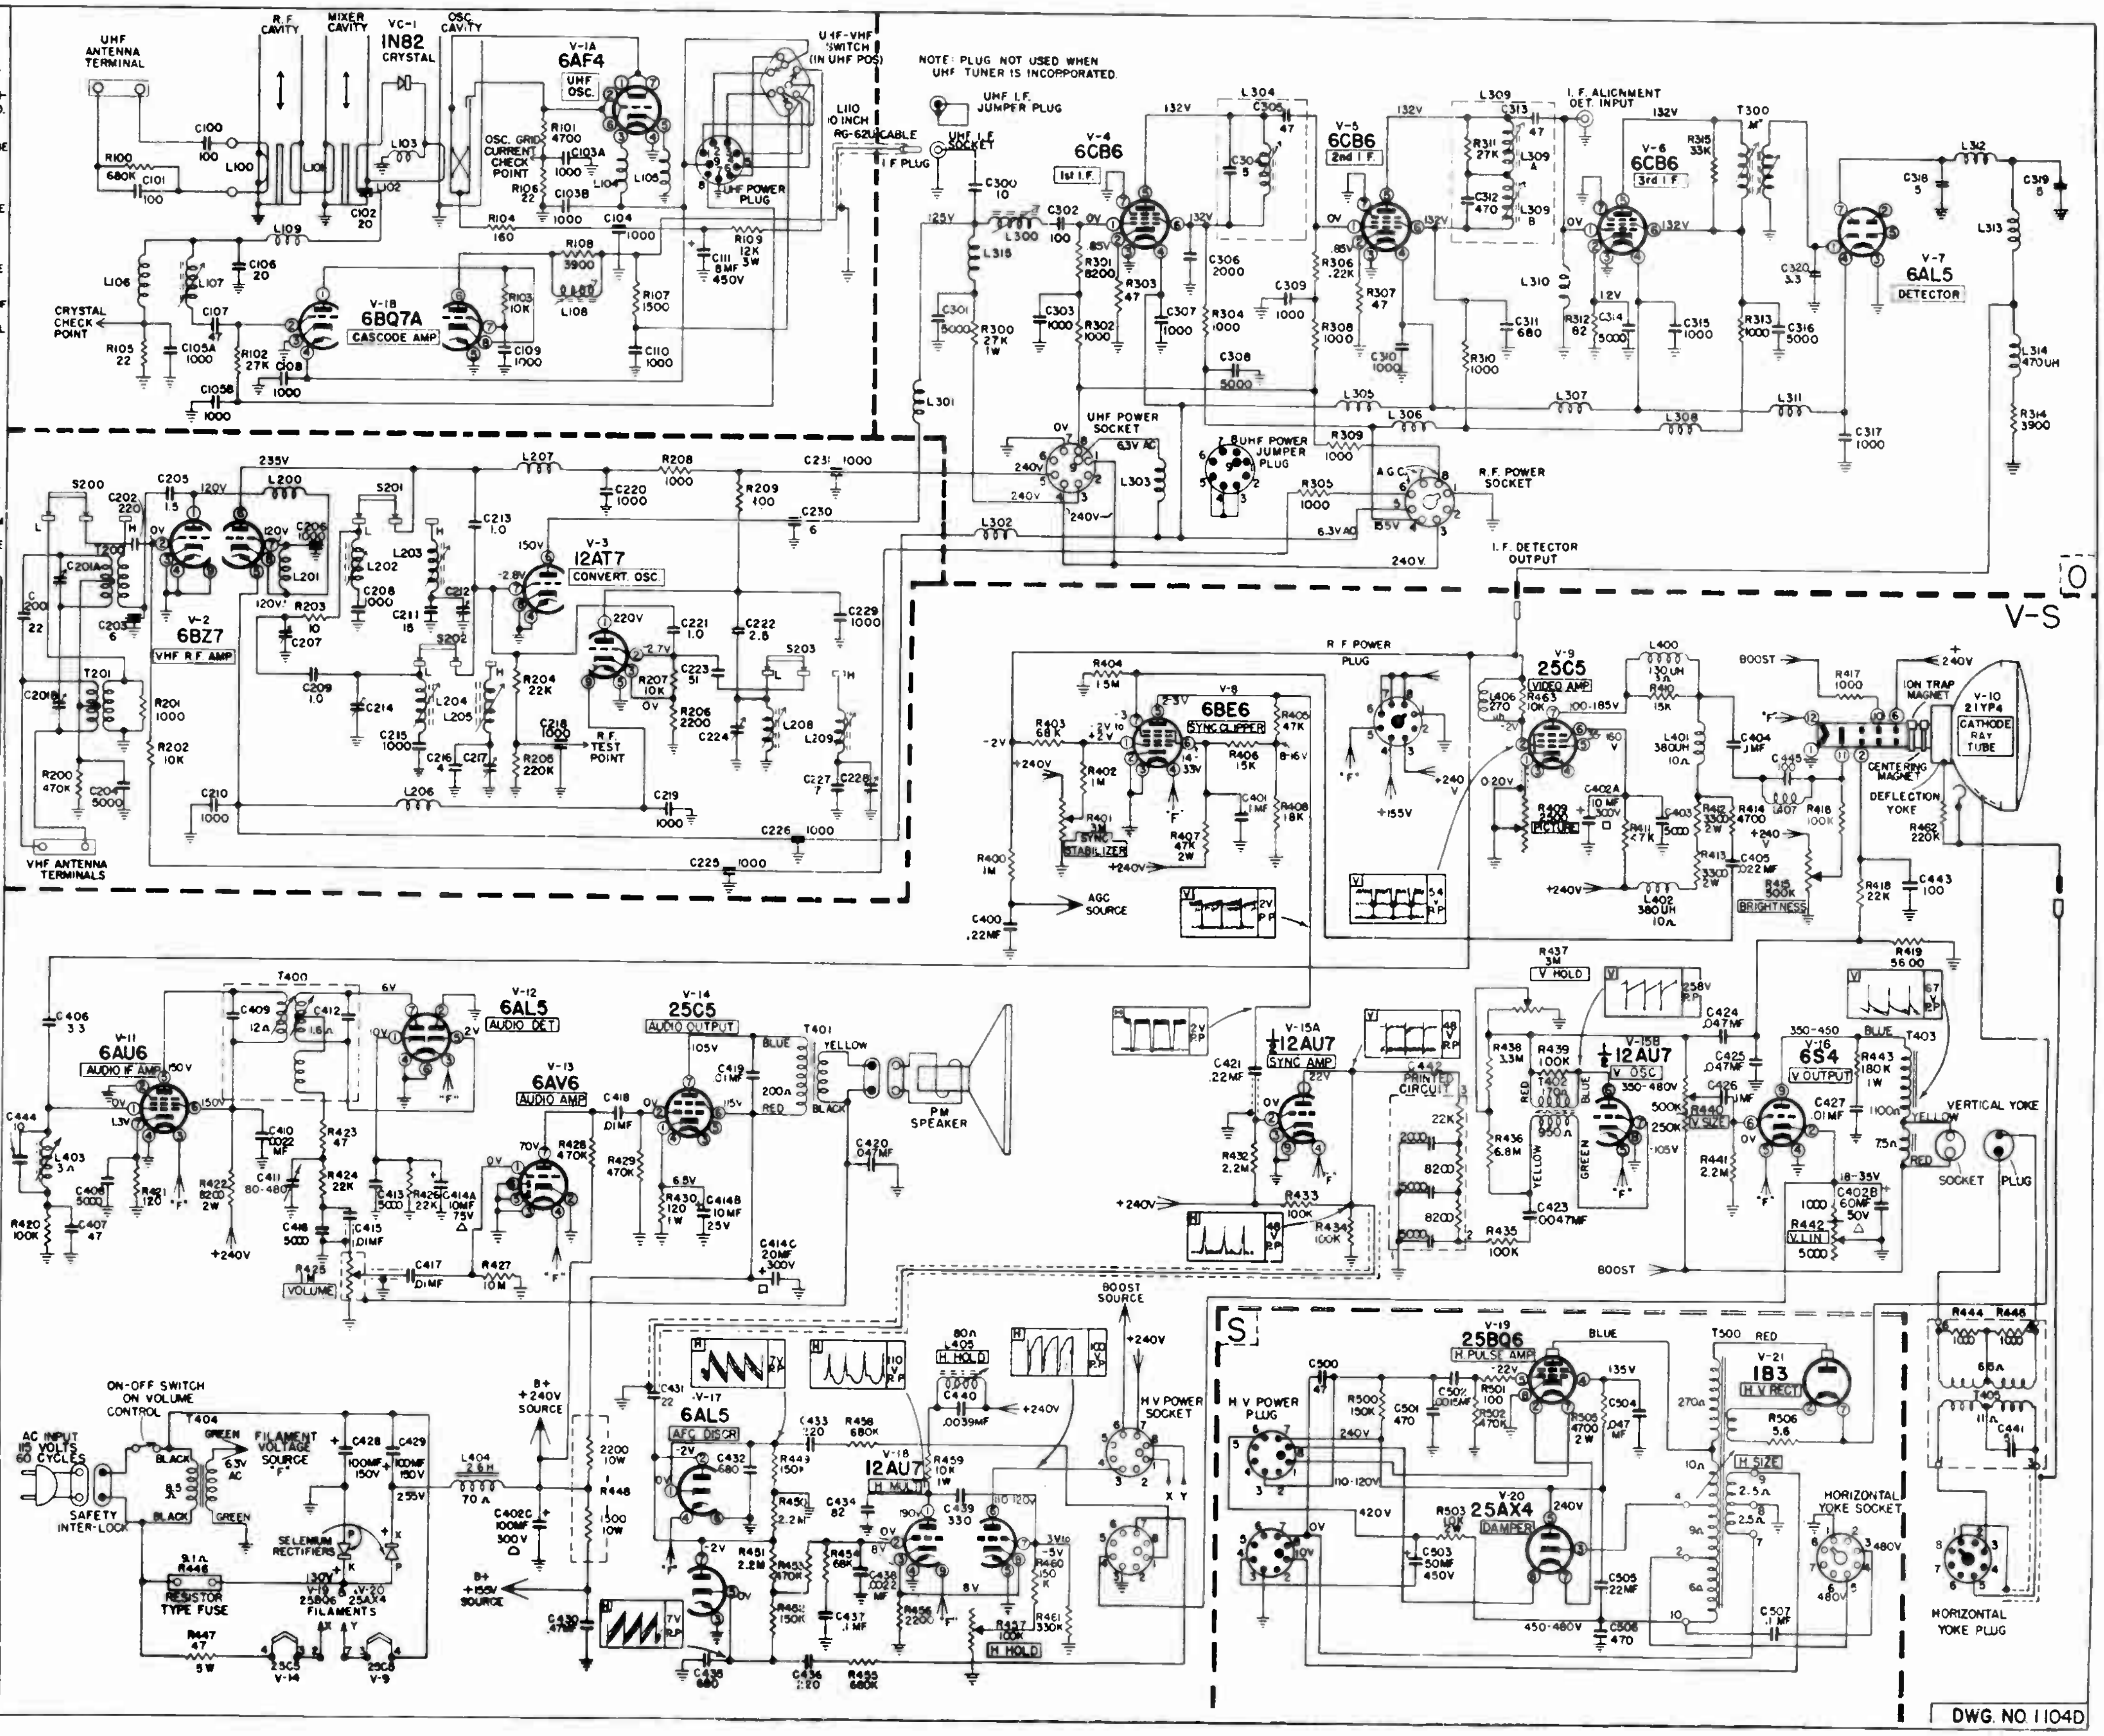
EXTREME CAUTION MUST BE OBSERVED WHEN WORKING WITH THE CHASSIS OUTSIDE THE CABINET AND WHEN POWER IS APPLIED TO THE RECEIVER WITH THE CABINET BACK REMOVED. *SEVERE SHOCK* MAY RESULT FROM CONTACT WITH CHASSIS.

AN ISOLATION TRANSFORMER BETWEEN THE LINE CORD PLUG AND POWER RECEPTACLE MUST BE USED WHEN SERVICE IS REQUIRED. THIS REMOVES AC LINE SHOCK HAZARDS. DAMAGE TO THE RECEIVER AND TEST EQUIPEMENT MAY RESULT WITHOUT THE USE OF AN ISOLATION TRANSFORMER.









VIDEO IF ALIGNMENT

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response
1	23.9 26.3	25	IF alignment input	Scope at IF detector output	Connect short between pin 5 and 6 of tube 5	T300 pri. (top) T300 sec. (bot.) Coupling rod	
2	Markers should fall 10% down. If response curve is not as shown., readjust coupling rod (bottom T300) for proper bandwidth and T300 primary and secondary for flat response and maximum gain.						
3	21.2	———	Converter grid	VTVM at IF detector output	Remove short. Adjust generator for output of approx. 2 volts DC.	L309B (bottom core)	Maximum reading
4	26.5	———	Converter grid	VTVM at IF detector output	Adjust generator for output of approx. 2 volts DC.	L309A (top core)	Maximum reading
5	21.2	———	Converter grid	VTVM at IF detector output	Adjust generator for output of approx. 2 volts DC.	L309B (bottom core)	Maximum reading
6	24.0	———	Converter grid	VTVM at IF detector output	Adjust generator for output of approx. 2 volts DC.	L304	Maximum reading
7	25.0	———	Converter grid	VTVM at IF detector output	Adjust generator for output of approx. 2 volts DC.	L300	Maximum reading
8	———	25	Converter grid	Scope at IF detector output	———	T300 pri. (top)	Rock for flat response
9	23.8 26.65	25	Converter grid	Scope at IF detector output	Markers should be 50% down and response curve should be as shown. If not, repeat alignment	Check point only	

Picture IF frequency 26.75 MC — Sound IF frequency 22.25MC.

NOTE: A very short lead from the generator must be used to prevent regeneration.

VIDEO TRAP COIL (L-403) ADJUSTMENT

1. Tune in a station.
2. Adjust the tuner until sound bars just appear.
3. Turn L-403 slug all the way out (counter-clockwise).
4. Turn the slug in (clockwise) until the horizontal scanning lines are smooth and continuous.

SOUND IF ALIGNMENT

Short antenna to ground

1	4.5	———	IF Detector Output	VTVM across C-416	———	T400 Primary (Botom of can)	Maximum Reading on V.T.V.M.
2	———	4.5	IF Detector Output	Scope across C-416	Sweep approx. ± 100 KC. Adjust for maximum linearity	T400 Secondary (Top of can)	
3	———	4.5	IF Detector Output	Scope across C-416	Sweep approx. ± 100 KC. Adjust for maximum linearity	T400 Primary (Botom of can)	

PRE-ALIGNMENT PRECAUTIONS

1. If sweep generator does not have a balanced output, connect a 150 ohm resistor in series with the ground lead and 150 ohms minus the internal resistance of the generator in series with the hot lead.
2. Connect a 1000 mmf capacitor across scope terminals and a 10K ohm resistor in series with hot lead as close to test point as possible.
3. Connect signal generator through a 1000 mmf capacitor.
4. When aligning the IF Amplifier be sure tuner is set approximately to channel 11.

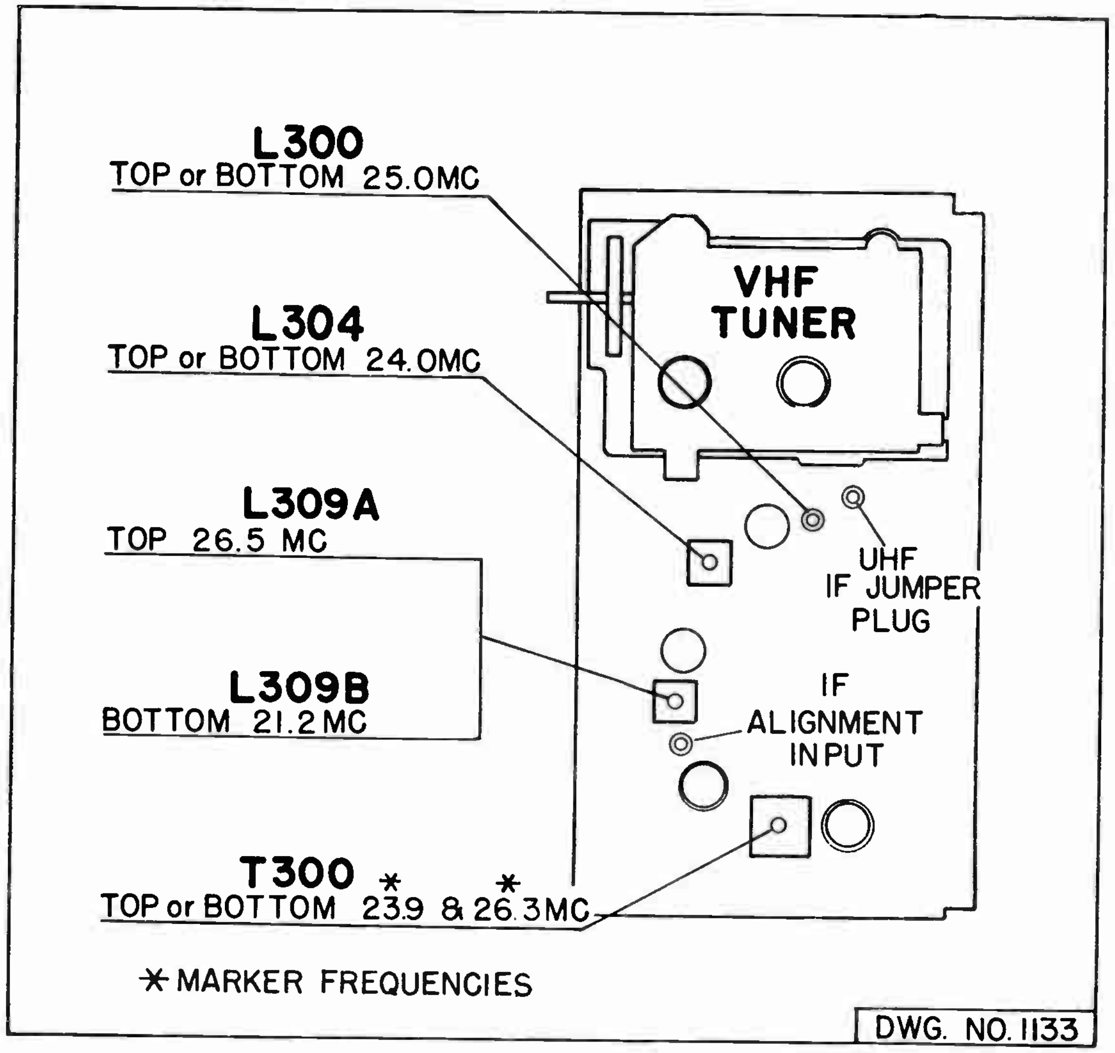


Figure 2. Top RF Chassis View

TUNER ALIGNMENT

1. Preset trimmer screws C-212-217-207-214-228-224 to dimensions shown on page 29.
2. Preset coil cores L-203-202-205-204-209-208 in the following manner.
   - (a) In low band position, turn tuner to top of stroke (cores furthest out of coil).
   - (b) Switch will be in low band position.
   - (c) Adjust coil cores 1.6 inch from core to end of coil form (use core aligning tool if available).

V-video
S-sound

LOW BAND RF TRACKING Turn Tuner to Channel 6.

NOTE: Low Band must be aligned before High Band.

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq. (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response
1	V—83.25 S—87.75	Channel 6	Antenna Terminals	R. F. Test Point	Adjust for maximum response	C-201B	
2	V—83.25 S—87.75	Channel 6	Antenna Terminals	R. F. Test Point	Adjust for maximum response	C-207 C-214	
3	V—77.25 S—81.75 V—67.25 S—71.75 V—61.25 S—65.75 V—55.25 S—59.75	Channel 5 Channel 4 Channel 3 Channel 2	Antenna Terminals	R. F. Test Point	Adjust tuner until response curve appears on scope. Adjust trimmers for compromise which will give the best overall response across band.	C-207 C-214	V S

HIGH BAND RF TRACKING Turn Tuner to Channel 13.

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq. (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response
1	V—211.25 S—215.75	Channel 13	Antenna Terminals	R. F. Test Point	Adjust for maximum response	C-201-A	
2	V—211.25 S—215.75	Channel 13	Antenna Terminals	R. F. Test Point	Adjust for maximum response	C-212 C-217	
3	V—205.25 S—209.75 V—199.25 S—203.75 V—193.25 S—197.75 V—187.25 S—191.75 V—181.25 S—185.75 V—175.25 S—179.75	Channel 12 Channel 11 Channel 10 Channel 9 Channel 8 Channel 7	Antenna Terminals	R. F. Test Point	Adjust tuner until response curve appears on scope. Adjust trimmers for compromise which will give the best overall response across band.	C-212 C-217	V S

LOW BAND OSCILLATOR TRACKING Turn Tuner to Channel 6.

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq. (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response
1	83.25	Channel 6	Antenna Terminals	Scope at IF Detector Output	Adjust until marker is 50% down on low frequency slope	C-224	50% VIDEO LOW FREQ.
2	67.25 55.25	Channel 4 Channel 2	Antenna Terminals	Scope at IF Detector Output	Marker should be 50% down on low frequency slope	———	50% VIDEO LOW FREQ.

HIGH BAND OSCILLATOR TRACKING Turn Tuner to Channel 13.

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq. (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response
1	211.25	Channel 13	Antenna Terminals	Scope at IF Detector Output	Adjust until marker is 50% down on low frequency slope	C-228	50% VIDEO LOW FREQ.
2	193.25 175.25	Channel 10 Channel 7	Antenna Terminals	Scope at IF Detector Output	Marker should be 50% down on low frequency slope	———	50% VIDEO LOW FREQ.

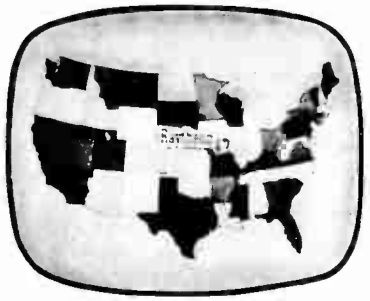
AVERAGE PICTURE

An average picture is portrayed as a guide or reference to enable a better analysis of the conditions when attempting to observe the various distortions and deviations.



8

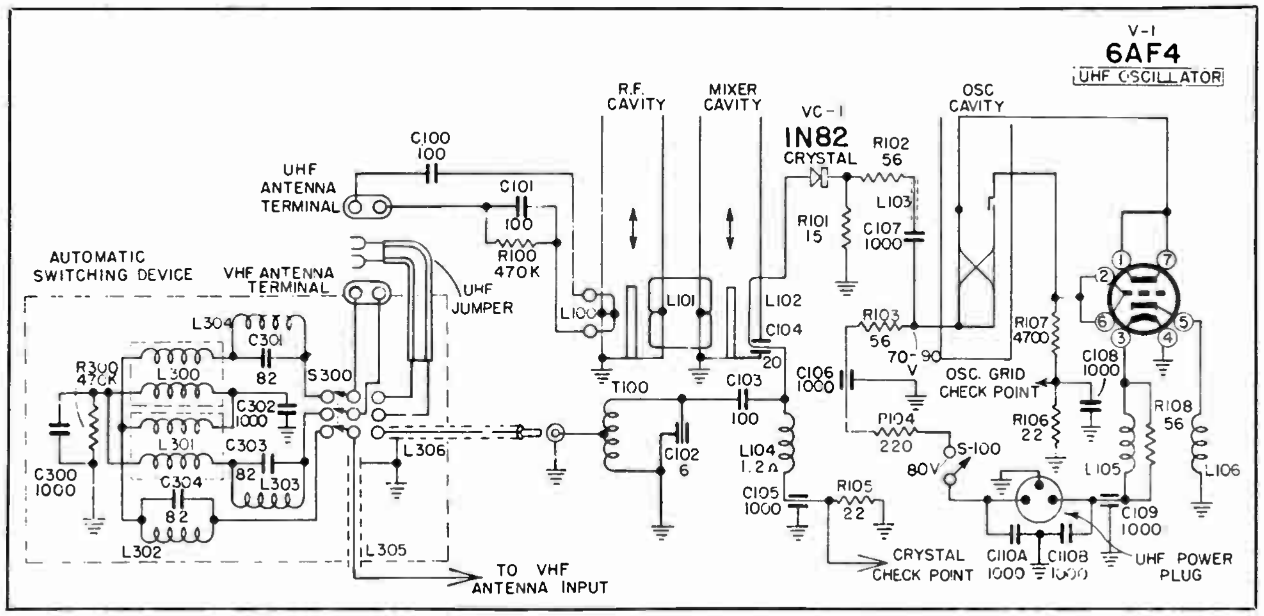
TUNER SERVICE HINTS

A convenient service check point is provided for measuring the UHF oscillator grid current to determine whether the oscillator is functioning. To measure this current place a multimeter on the 100 microamperes scale across resistor R106 (22 ohms). A reading of 10 to 30 microamperes should be obtained if the oscillator is functioning normally. Another check point has been provided for measuring the crystal current to check both the UHF crystal detector and oscillator. Place a multimeter on the 100 microamperes scale across resistor R105 (22 ohms) and a reading of 5 to 40 microamperes should be obtained if both the oscillator and crystal are functioning normally.

Before attempting service of the UHF tuner, it may prove helpful to check, if the same condition appears when tuned to a VHF station. If the condition appears on both UHF and VHF the cause of the trouble will generally be located in the I F amplifier or Video amplifier circuits. If, however, the condition appears only on UHF and a normal picture is observed on VHF, the UHF antenna installation should be checked for the possible source of trouble before suspecting the UHF tuner.

When attempting UHF servicing, it may prove helpful to bear in mind that when trouble occurs in the oscillator the picture will generally disappear and when there is a defect in the RF or mixer stage a decrease in signal will usually result.

If a condition arises where trouble occurs on either high or low VHF band only, then it can be assumed that the trouble is definitely in the VHF tuner or VHF antenna installation. One other possibility may be due to defective switch contacts. Defective switch contacts can easily be replaced by removing the two question mark shaped springs, lifting up the switch plate assembly and removing the black switch contact holder and replacing the switch contact.



UHF TUNER SCHEMATIC

1

MISTUNING:

Condition is generally caused by a lack of care when tuning in a station. A similar condition may be due to a faulty antenna installation or result from a defective oscillator or RF Amplifier tube.

CHECK:

V-1	UHF Oscillator (6AF4)
V-2	VHF RF Amplifier (6BZ7)
V-3	VHF Oscillator—Converter (6U8)

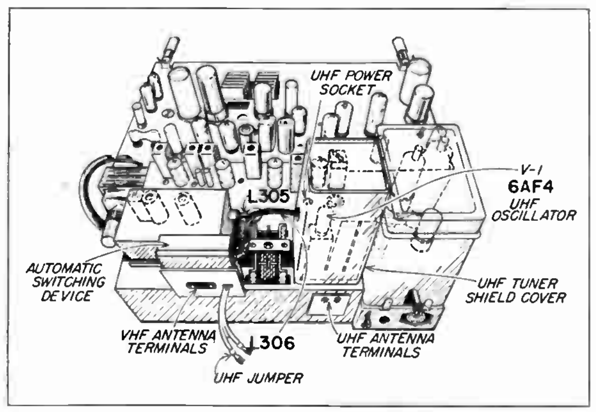
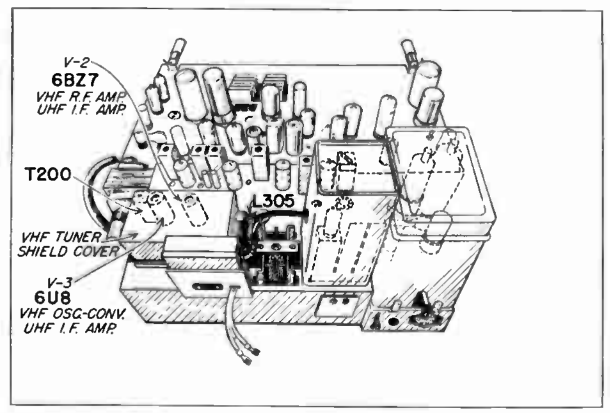
	2B-21801	6AF4 Tube shield
	49A-21511	Tube shield spring





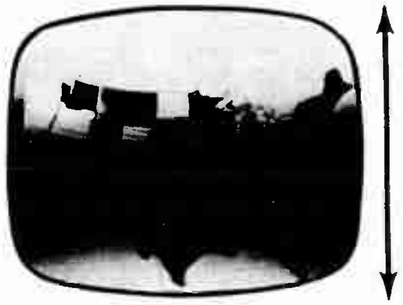
60 CYCLE HUM

Usually caused by a filament to cathode short or leakage in the RF, IF or video amplifier tube.

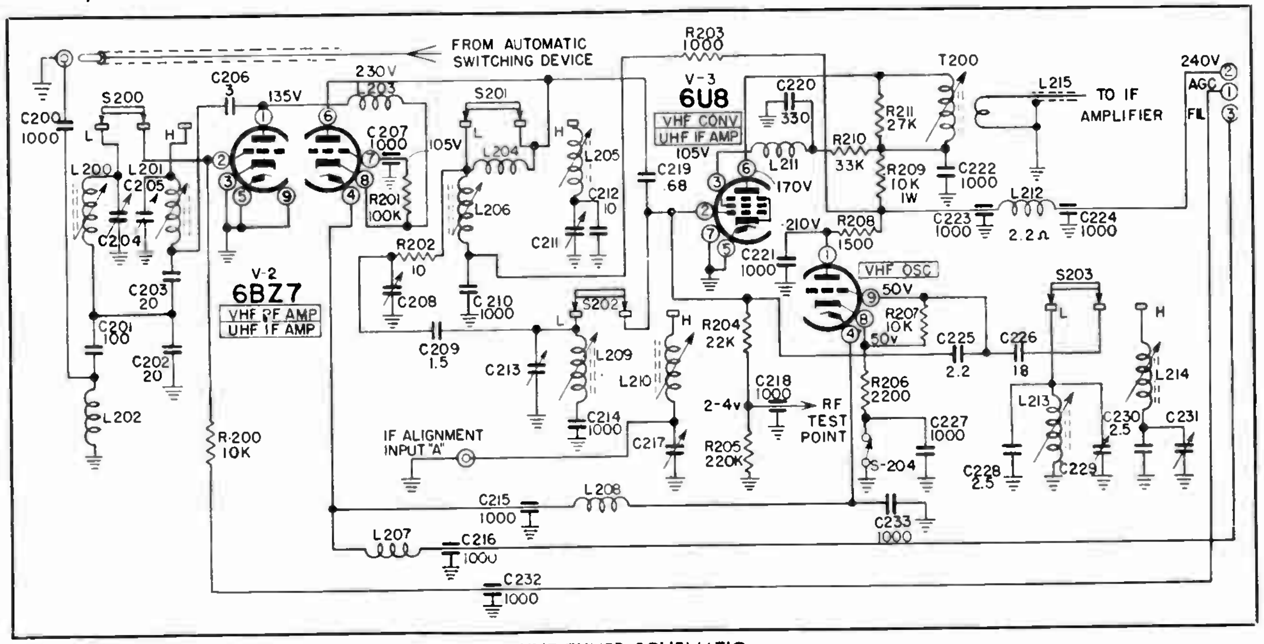
CHECK:

V-4-5-6-7	I F Amplifier (6CB6)
V-2	VHF RF Amplifier— UHF I F Amplifier (6BZ7)
V-9	Video Amplifier (6AH6V)

NOTE: A quick method other than substituting tubes, is to short each tube's cathode to ground while observing the picture. Shorting the cathode of the defective tube will produce a radical reduction of hum or a filament failure.



38



VHF TUNER SCHEMATIC

***WEAK PICTURE WITH SNOW**

***NO PICTURE WITH SNOW (Raster Visible)**

This condition is usually caused by a defective antenna installation or a defective tube or component in the tuner or possibly the first IF Amplifier.

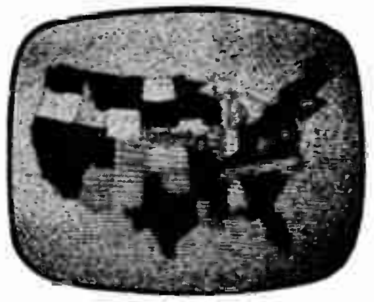
CHECK:

Antenna Installation and Connections

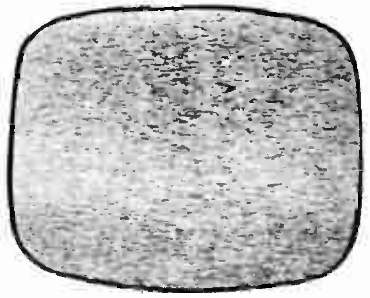
V-1	UHF Oscillator (6AF4)
V-2	VHF RF Amplifier— UHF IF Amplifier (6BZ7)
V-3	VHF Oscillator-Converter— UHF IF Amplifier (6U8)
V-4	IF Amplifier (6CB6)
VC-1	UHF Crystal (1N82)
R203	V-2 Decoupling Resistor
R209	V-3 Decoupling Resistor
R210	V-3 Screen Resistor
L212-307	B Supply Choke
C222	V-3 Plate Capacitor
C220	V-3 Screen Capacitor
C210-309-223-224	Decoupling Capacitor
T200	IF Transformer
S300	Antenna Switch & Associated Components
S204	VHF Oscillator Cathode Switch
S100	UHF Oscillator Switch

NOTE: Check antenna plugs to tuners and UHF power plug for proper seating.

*Based on the assumption that the receiver was once functioning normally.



32



30

SOUND BARS:

The appearance of sound bars may possibly be due to mistuning of the receiver, microphonic station equipment or due to microphonic Vertical, RF, IF, or Video Amplifier tubes.

CHECK:

V-17	Vertical Blocking Oscillator (6BF6)
V-18	Vertical Output (6S4)
V-4-5-6-7	IF Amplifier (6CB6)
V-2	VHF RF Amplifier— VHF IF Amplifier (6BZ7)
V-3	VHF Converter—UHF IF Amplifier (6U8)
V-9	Video Amplifier (6AH6V)

NOTE: To determine possible cause of condition, properly tune in a station and then turn the volume control to its minimum volume setting. If the bars remain visible the trouble is usually due to the station or outside interference. If however, the bars disappear and by jarring the cabinet they reappear, the cause is most likely due to a microphonic tube. Gently tap each tube specified above while observing the picture.

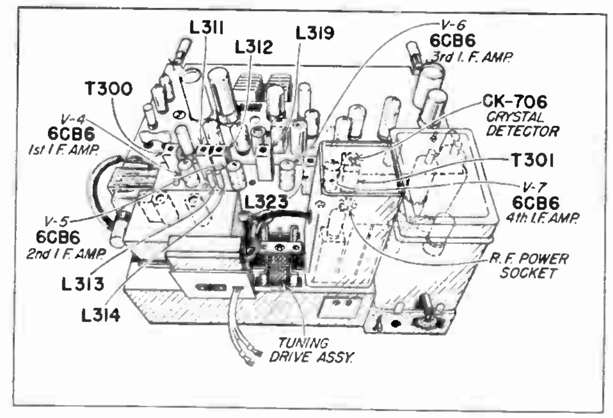
	2H-17588	Tube shield
	200-22722	IF coil shield can
	2C-22167	Drive coupling bar
	49A-22223	Coupling bar spring
	53A-22815	Dial drive cord
	49A-22277	Cord tension spring



WEAK PICTURE
NO PICTURE (Raster Visible)

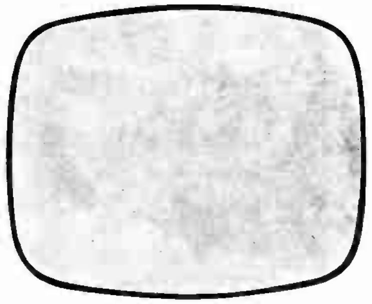
These conditions are generally caused by a defective tube or component in the IF or Video Amplifiers. Note the absence of snow.

CHECK:

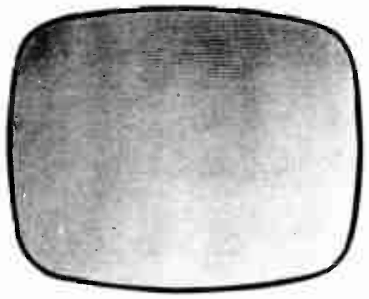
V-5-6-7	IF Amplifier (6CB6)
V-9	Video Amplifier (6AH6V)
VC-2	Crystal Detector (CK-706)
R321-322	V-7 Screen Resistors
R314-319-323	Decoupling Resistors
T301-L319-323	IF Coils
L320-324	IF Grid Coils
L327-328	Detector Peaking Coil
L400-401-402-403	V-9 Peaking Coils
C403	V-9 Coupling Capacitor
R411	V-9 Plate Resistor
R407	Picture Control
R408	V-9 Screen Resistor
C401A-402	V-9 Screen Capacitor

NOTE: Check RF Power and detector output plugs for proper seating

As a fast method to help localize the defective stage causing the trouble, observe the face of the picture tube at both minimum and maximum picture control settings. If an increase in snow is NOT apparent at the maximum picture control setting the trouble is usually in the video amplifier, video detector or IF amplifier circuits. If an increase in snow is observed the trouble may be in the tuner or possibly the first IF amplifier stage.



34



29

OVERLOADING WASHOUT

A washout condition (or in severe cases overloading) is generally caused by a defect in the IF amplifiers, video amplifier or A.G.C. circuits.

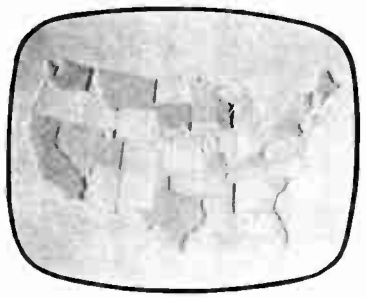
CHECK:

V-15	AGC Amplifier (6AU6)
V-4-5-6-7	IF amplifier (6CB6)
V-9	Video Amplifier (6AH6V)
VC-2	Video Detector (CK-706)
V-2	VHF RF Amplifier— UHF IF Amplifier (6BZ7)

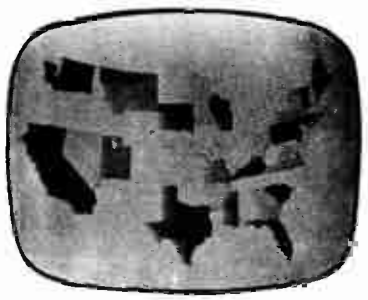
NOTE: A defective picture tube may cause a similar condition. Check as a last resort.

C424-425-426-427	A.G.C. Capacitors
R434-435-436-437-443	A.G.C. Resistors
T500	H. V. Deflection Transformer
C307-311-317 318-324-232	AGC Decoupling Capacitors
C313-322-328	IF Grid Coupling Capacitors
R325	Detector Load Resistor
R407	Picture Control
R409-411	V-9 Plate Resistors

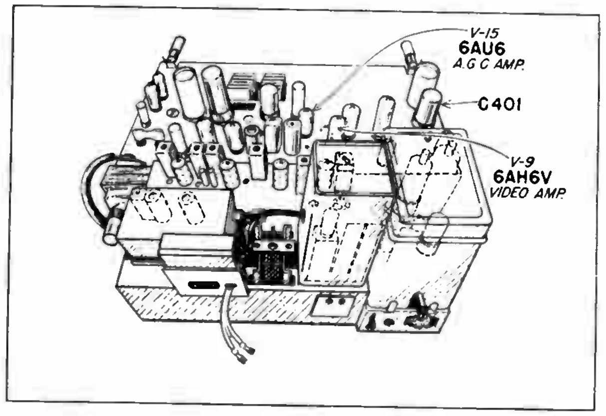
NOTE: Check RF Power plug for proper seating. For a rapid AGC check disconnect antenna lead-in wire from receiver and couple close to antenna terminals to reduce signal strength. If picture improves the AGC can be suspected. Compare AGC and detector output voltage. Under normal operating conditions these two negative voltages should be approximately equal. If the AGC voltage is low, the cause may be due to a gassy RF or IF tube, leaky IF grid coupling capacitor or a defective component in the AGC circuit.



33



6



REPLACEMENT PARTS

Ref. No.	Part No.	Description
C401A	8C-22536	10 mfd, 300 volt—part of lytic
C426	8C-20557	5 mfd, 50 volt, lytic
R407	10B-22306	Contrast Control—750 ohm
R413	10B-21456	Brightness Control—500K ohm
L400	16A-19365	Peaking Coil—240 UH

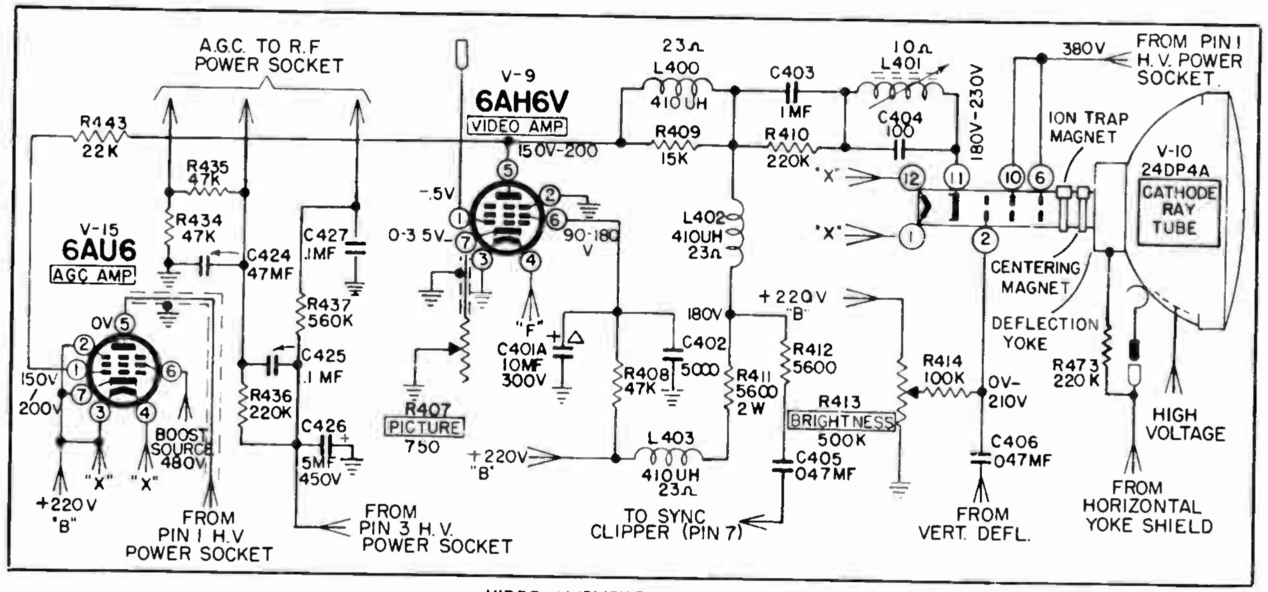
	16M-20697	Centering Magnet
	16M-19906	Ion Trap Magnet



VIDEO AMPLIFIER SCHEMATIC

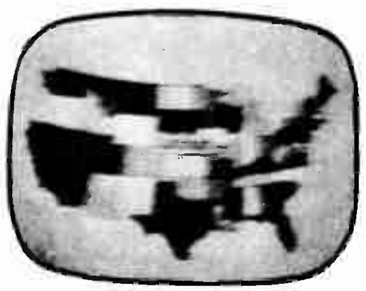
SMEAR

This condition is generally due to a defective tube or component in the IF or Video Amplifier circuits.

CHECK:

V-9	Video Amplifier (6AH6V)
VC-2	Crystal detector (CK-706)
V-4-5-6-7	IF Amplifiers (6CB6)
R411	V-9 Plate Resistor
L327-328	Detector Peaking Coils
L400-401-402-403	V-9 Peaking Coils
C403	V-9 Coupling Capacitor
R325	Detector Load Resistor
R408	V-9 Screen Resistor
C-401A-402	V-9 Screen Capacitor
R407	Picture Control

36



POOR VERTICAL LINEARITY

Condition is generally due to a misadjustment of the vertical size, linearity or centering controls.

CHECK:

R447	Vertical Size Control Adjustment
R450	Vertical Linearity Control Adjustment
	Centering Control Adjustment
V-17	Vertical Blocking Oscillator (6BF6)
V-18	Vertical Output (6S4)
T403	Vertical Output Transformer
R451	V-18 Plate resistor
C437	V-18 Plate capacitor
C435	Coupling capacitor
C401D	V-18 Cathode by-pass
R448	V-18 Grid resistor

NOTE: In the absence of a test pattern it is possible to adjust the receiver for a reasonable vertical distribution. Turn the V. Size and the V. Linearity controls to their minimum adjustment position and then with the centering control properly adjust the remaining picture to the vertical center of the tube. Adjust the V. Size and V. Linearity controls until the picture fills the mask, bearing in mind that the size control effects the bottom portion of the picture and the linearity control affects the upper portion of the picture. To check vertcial distribution, roll the picture slowly using the V. Hold Control and observe the blanking bar as it drifts. If the V. Size, V. Linearity and centering controls are properly adjusted the thickness of the bar will not change during its movement.

11

12

10

EXCESSIVE VERTICAL SIZE

This condition is genreally due to misadjustment of the vertical size and linearity controls.

CHECK:

R447	Vertical Size Control Adjustment
R450	Vertical Linearity Control Adjustment

INSUFFICIENT VERTICAL SIZE

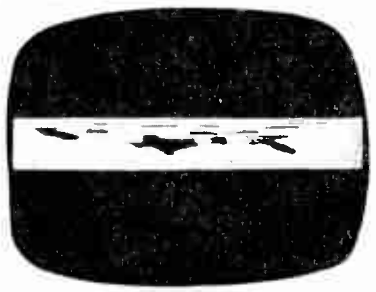
This condition is usually caused by misadjustment of the vertical size and linearity controls or due to a defective tube or component in the vertical deflection circuit.

CHECK:

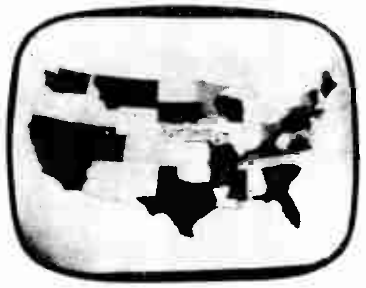
R447	Vertical Size Control Adjustment
R450	Vertical Linearity Control Adjustment
V-17	Vertical Blocking Oscillator (6BF6)
V-18	Vertical Output (6S4)
T403	Vertical Output Transformer
T406	Deflection Yoke
R451	V-18 Plate Resistor
C437	V-18 Plate Capacitor
C401D	V-18 Cathode By-pass
C435	V-18 Coupling Capacitor

REPLACEMENT PARTS

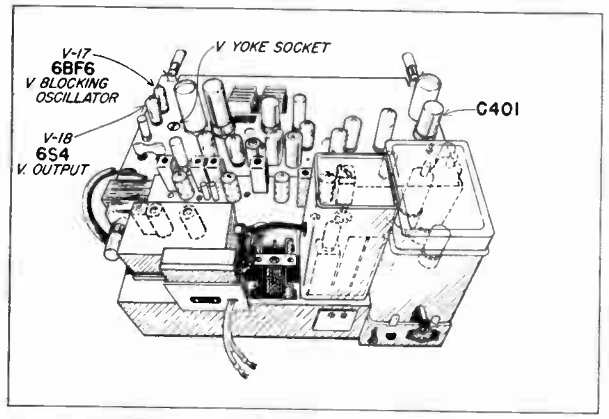
Ref. No.	Part No.	Description
C401D	8C-22536	60 mfd, 50 volt,—part of lytic
C429	17A-22376	Printed Circuit
C436	8C-22550	20 mfd, 450 volt, lytic
R445	10B-17318	V. Hold Control—3M ohm
R447	10B-22307	V. Size Control—750K ohm
R450	10B-22687	V. Linearity Control—5000 ohm
T402	12M-18241	Vertical Oscillator Transformer
T403	12C-20761-2	Vertical Output Transformer



15



26

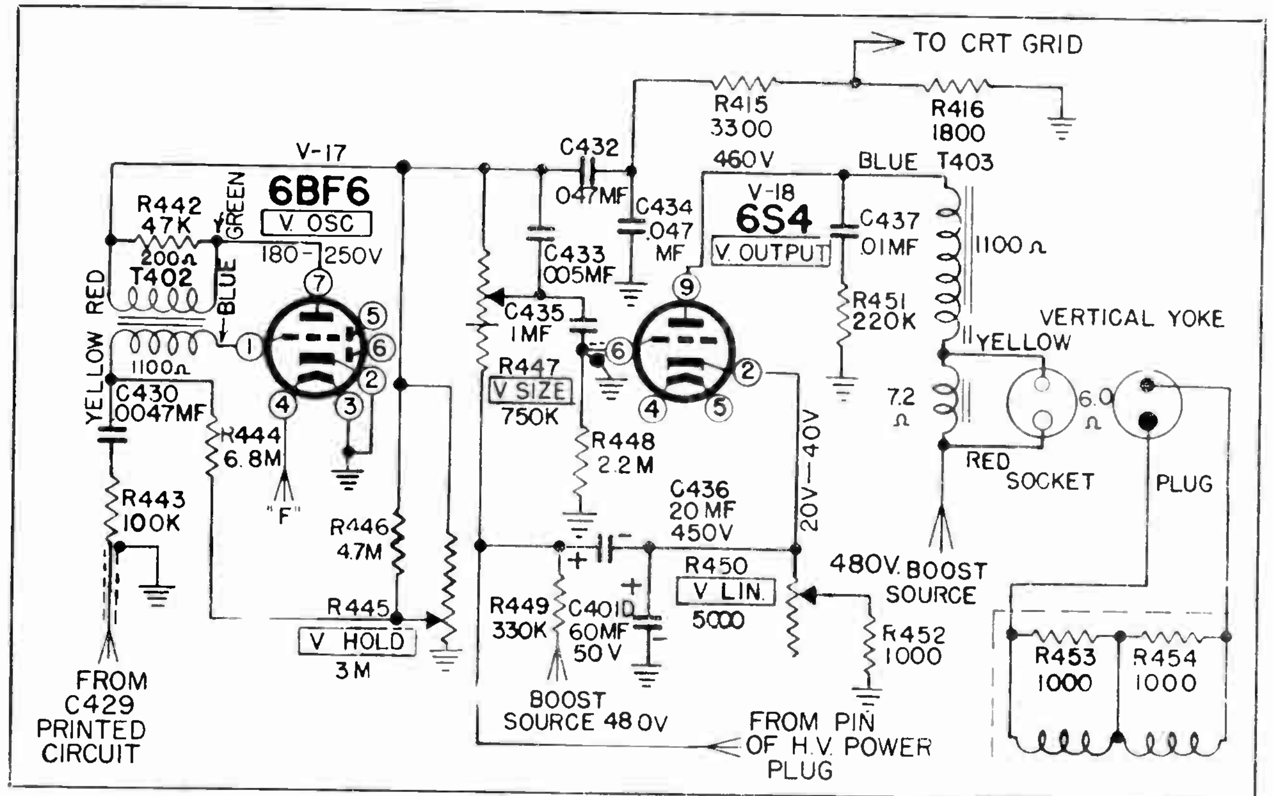


V. Hold:

The Vertical Hold control should be adjusted when the picture is rolling or flipping up or down. The proper setting of the vertical hold control is that point where the picture is moving slowly upward and just locks into place. At this control setting, noise will have the least tendency to interrupt vertical sync.

V. Size and V. Linearity:

The vertical size and linearity controls should be adjusted while a test pattern is being received. The linearity control affects the upper portion of the picture while the size control affects the overall size especially the lower portion of the picture. Adjust both controls simultaneously until the test pattern is symmetrical and fills the entire screen vertically. Readjust the vertical hold control if necesary.



VERTICAL DEFLECTION SCHEMATIC

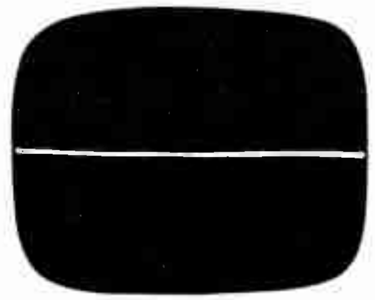
NO VERTICAL SWEEP

This condition is generally caused by a defective tube or component in the vertical deflection circuit.

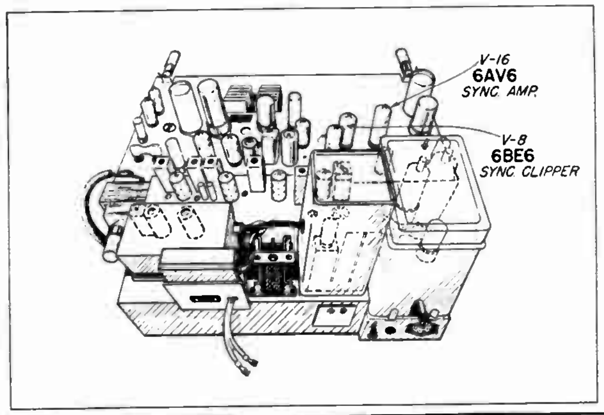
CHECK:

V-17	Vertical Blocking Oscillator (6BF6)
V-18	Vertical Output (6S4)
T402	Vertical Blocking Oscillator Transformer
T403	Vertical Output Transformer
T406	Deflection Yoke
C430-432-435	Coupling Capacitor
R447	Vertical Size Control

NOTE: Check Vertical Yoke socket for proper seating. One method of isolating the defective stage is to apply a 60 cycle 6.3 filament voltage through a .5 MFD capacitor to various points in the vertical deflection circuit. If an increase of vertical deflection is not observed as the 60 cycle voltage is applied the defect is located between the point tested and the deflection yoke.

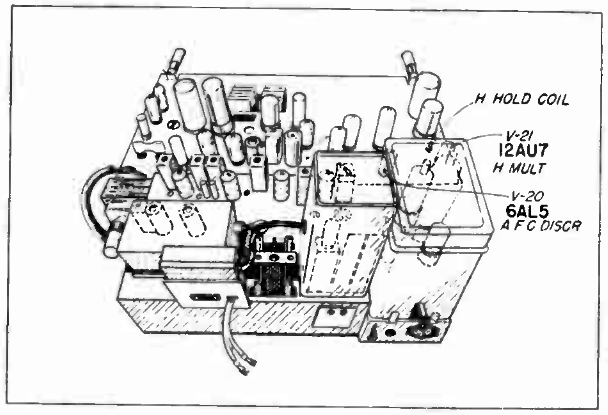


14



Service Hint

A poor vertical sync condition may possibly be due to a defect in the RF, IF or video amplifier stages. This may be quickly checked by observing the blanking bar as illustrated in condition 16. If the detail in the blanking bar is not blacker than the blackest portion of the picture an overloading condition exists. Refer to overloading, condition number 33.



H. Hold:

Set the H. Hold control on the front of the set to the center of its range. Adjust the H. Hold coil on top of the chassis until a steady picture is obtained. Set the H. Hold coil to the center of its range (center position before going out of sync in either direction). To check the adjustment, tune from one station to another. If the controls are properly adjusted the picture will remain in sync at all times.

REPLACEMENT PARTS

Ref. No.	Part No.	Description

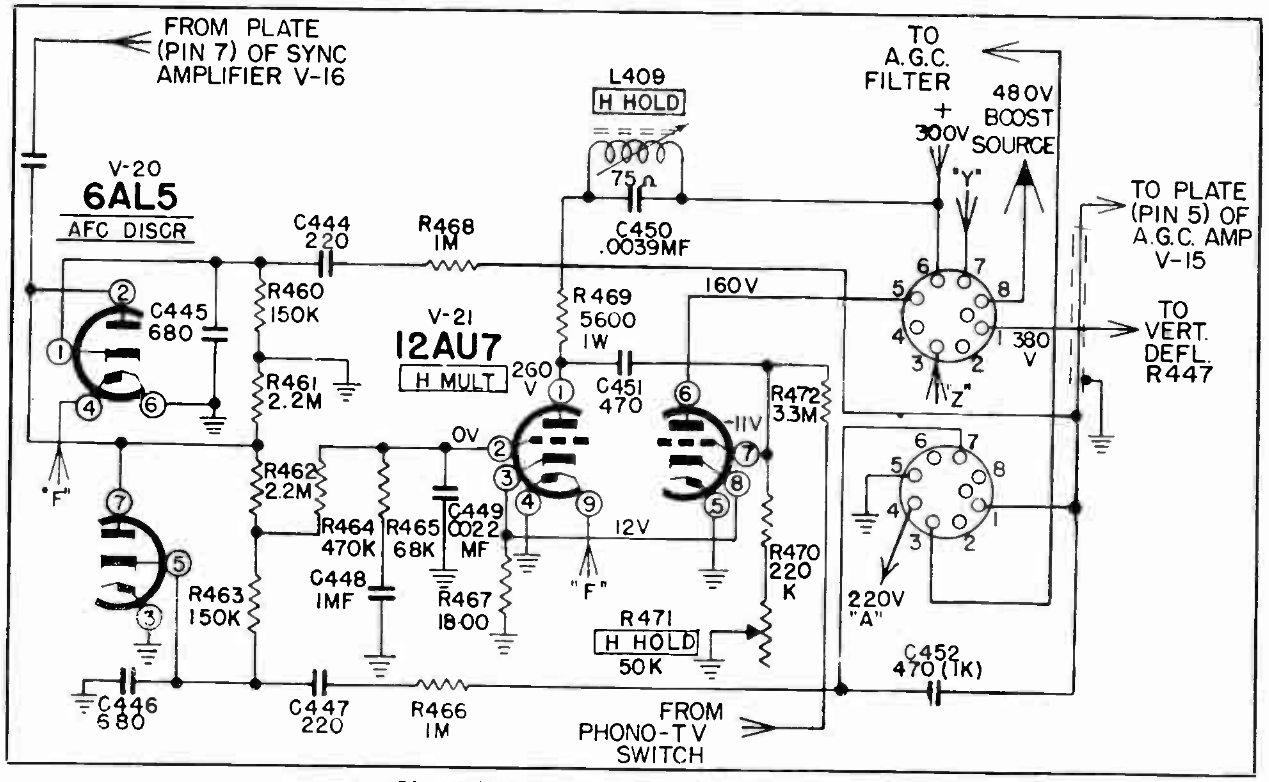
SYNC CLIPPER AND AMPLIFIER SCHEMATIC



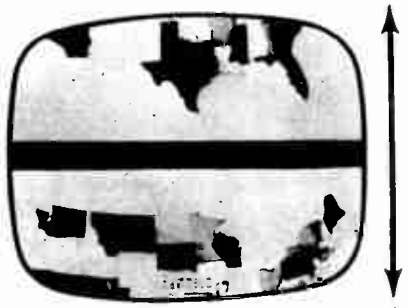
AFC AND HORIZONTAL MULTIVIBRATOR SCHEMATIC

POOR VERTICAL SYNC

Poor vertical sync is generally caused by improper adjustment of the vertical hold control or a defect in the oscillator, sync amplifier or sync clipper circuits.

CHECK:

R445	Vertical Hold Control Adjustment
V-16	Sync Amplifier (6AV6)
V-17	Vertical Blocking Oscillator (6BF6)
V-8	Sync Clipper (6BE6)
C429	Intergrating network
R443-444-445-446	Vertical Hold Control Resistors
C430	Coupling Capacitor
T402	Oscillator Transformer



16

17

SERVICE HINTS

Whenever the sync, AFC, Horizontal Multivibrator or H. Pulse Amplifier stage is suspected as the cause of the trouble, it will prove helpful to short the input grid of the Horizontal Multivibrator (pin 2, V21) to ground, readjust the horizontal hold control and then observe the picture. If the condition disappears you can assume that the source of the trouble is before the input grid of the oscillator. If, however, the condition remains, the trouble is probably after the grid of the multivibrator.

POOR HORIZONTAL SYNC

Poor horizontal sync is usually caused by misadjustment of the horizontal hold control, hold coil or due to a defective tube or component in the horizontal multivibrator, AFC, sync amplifier or sync clipper circuits.

CHECK:

R471-L409	Horizontal Hold Control Adjustment
V-21	Horizontal Multivibrator (12AU7)
V-20	Horizontal AFC Discriminator (6AL5)
V-16	Sync Amplifier (6AV6)
V-8	Sync Clipper (6BE6)
L409	Horizontal Hold Coil
C450	Horizontal Hold Coil Capacitor

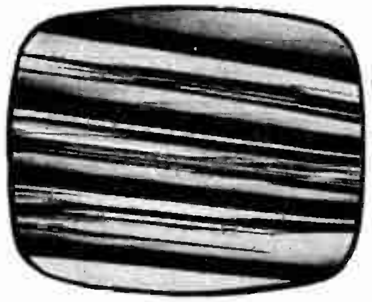
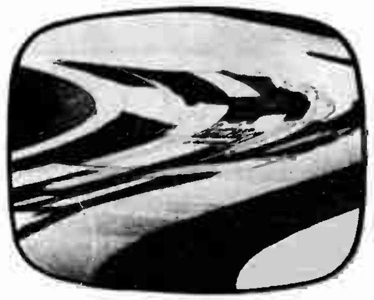
C444-447	V-20 Feedback Capacitors
R467-469-470-501	V-21 Plate and Grid Resistors
R439-441	V-16 Voltage Divider Resistors



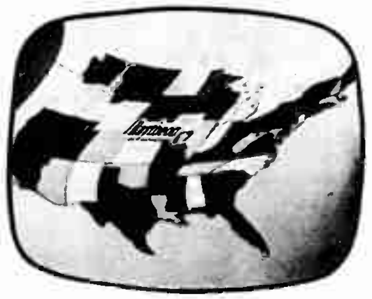
19



20

HORIZONTAL DISPLACEMENT

Condition can be caused by improper adjustment of the Horizontal Hold control or a defective tube or component in the sync clipper or amplifier, AFC, horizontal multivibrator or pulse amplifier circuits.



22

CHECK:

R471-L409	Horizontal Hold Control Adjustment
V-20	AFC Discriminator (6AL5)
V-21	Horizontal Multivibrator (12AU7)
V-22	Horizontal Pulse Amplifier (25CD6)
V-16	Sync Amplifier (6AV6)
V-8	Sync Clipper (6BE6)
C502-R502	Boost Voltage Filter
R501	V-21 Plate Resistor
C448-449	V-21 Grid Capacitor
R466-468	AFC Feedback Resistor
C444-447	AFC Feedback Capacitor

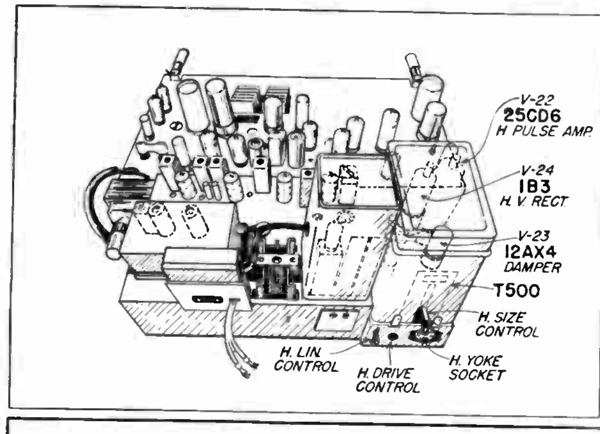
NOTE: Check H. V. Power and Yoke plug.

H. Drive

The H. Drive control should be adjusted only after a station is properly tuned in and the H. Size and H. Linearity controls are adjusted for correct size and good linearity. The Drive control should be turned clockwise until a fold-over (sectional scan slow down evidenced by a white vertical line) appears in the center portion of the picture. Turn the Drive control counter-clockwise until all traces of fold over disappear and then give an additional one-eighth turn counter-clockwise. As a check turn the brightness control to maximum and minimum brilliance and observe the face of the picture tube. If the Drive control is adjusted properly a fold over will not appear as the brightness control is varied.

H. Size and H. Linearity

The H. Size and H. Linearity controls should be adjusted while a test pattern is being received. The Size control should be adjusted until the raster fills the entire screen horizontally and the Linearity control should be adjusted for a horizontal symmetrical test pattern. The H. Size and Centering controls may require readjustment. Each time a major adjustment of either the H. Size or Linearity controls are made the H. Drive control should be re-adjusted.



REPLACEMENT PARTS

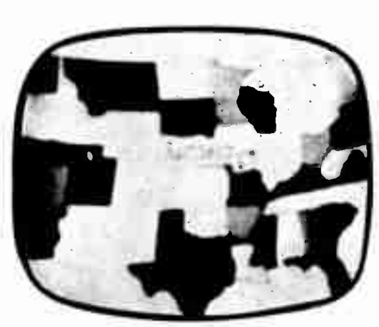
LOW VOLTAGE SCHEMATIC

37



BLOOMING

The blooming effect will vary with adjustment of the picture and brightness controls and is usually caused by a defective tube or component in the high voltage or B supply voltage circuits.

CHECK:

V-24	High Voltage Rectifier (1B3)
V-22	Horizontal Pulse Amplifier 25CD6)
V-23	Horizontal Damper (12AX4)
V-19	Low Voltage Rectifier (5Y3)
V-10	Picture Tube (24DP4)
R507	V-24 Filament Resistor
R502-C502	Boost Voltage Filter
T500	H. V. Deflection Transformer
C401-439-440-441	B Supply Filter Lytics
L406-407-408	Filter Choke
	Selenium Rectifiers

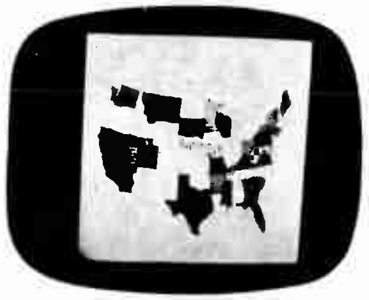
INSUFFICIENT HORIZONTAL AND VERTICAL SIZE

This condition can possibly be caused by incorrect horizontal size, vertical size and linearity control adjustments, low B supply voltage or possibly due to low AC line voltage.

CHECK:

V-19	Low Voltage Rectifier (5Y3)
V-22	Horizontal Pulse Amplifier (25CD6)
V-23	Horizontal Damper (12AX4)
C502-R502	Boost Voltage Filter
C401-439-440-441	B Supply Filter Capacitors
	Selenium Rectifiers

NOTE: Check H.V. power plug for proper seating and AC line voltage.



24

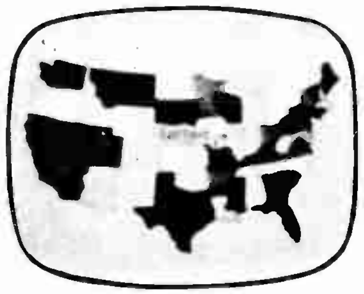
POOR FOCUS

This condition is generally caused by an incorrect adjustment of the ion trap magnet, insufficient high voltage or a defect in the B supply voltage source.

CHECK:

	Ion Trap Magnet Adjustment
V-21	Low Voltage Rectifier (5Y3)
V-24	High Voltage Rectifier (1B3)
V-22	Horizontal Pulse Amplifier (25CD6)
V-23	Horizontal Damper (12AX4)
V-21	Horizontal Multivibrator (12AU7)
V-10	Picture Tube (24DP4)
C401-439-440-441	B Supply Filter Lytics
T406	Deflection Yoke
	Selenium Rectifiers

NOTE: Since the centering control will be effective in either of two positions, the preferred position is approximately 180 degrees away from the magnet of the ion trap to minimize interaction.



35

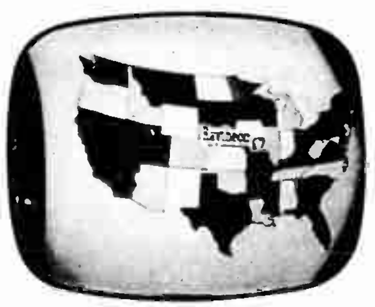
INCORRECT CENTERING

Condition is due to incorrect adjustment of the centering control.

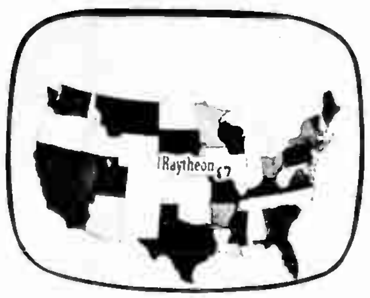
CHECK:

Centering Control Adjustment (Refer to page 20)

NOTE: Do not attempt to correct for vertical centering with either the vertical size or linearity controls and do not use the horizontal hold control to affect horizontal centering.



27



25

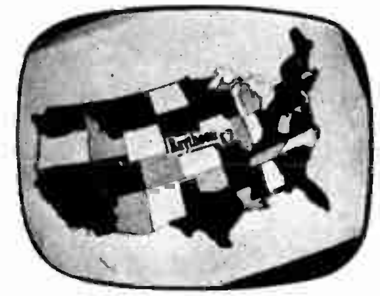
TILTED PICTURE

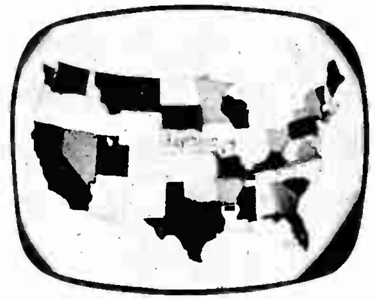
18

This condition is caused by an incorrectly positioned deflection yoke.

CHECK:

Deflection Yoke Positioning Adjustment





28

TUBE SHADOW

This condition is usually caused by an incorrectly positioned deflection yoke or a misadjusted centering control or ion trap magnet.

CHECK:

Deflection Yoke Positioning Adjustment
Centering Magnet Adjustment
Ion Trap Magnet Adjustment

REPLACEMENT PARTS

Ref. No.	Part No.	Description
	201-22857	Deflection Yoke Assembly
	15B-17278-10	CRT Socket and Cable
	16M-19906	Ion Trap Magnet
	16M-20697	Centering Magnet
	16M-22873	Anti-Pin Cushion Magnet

Ion Trap Magnet:

If adjustment is determined necessary, loosen the wing nut, rotate and slide the magnet until the position which gives maximum illumination is found. Adjust the screw for maximum illumination. Repeat the above two steps. Rotate and slide the magnet until the best focus position is found without sacrificing brilliance. Tighten wing nut. Adjustment should be made with brightness and picture controls set for normal viewing. The position of the ion trap magnet MUST be over the grid of the picture tube (second cylinder from the base identified by a flared forward lip) after the adjustment is complete.

Centering Magnet:

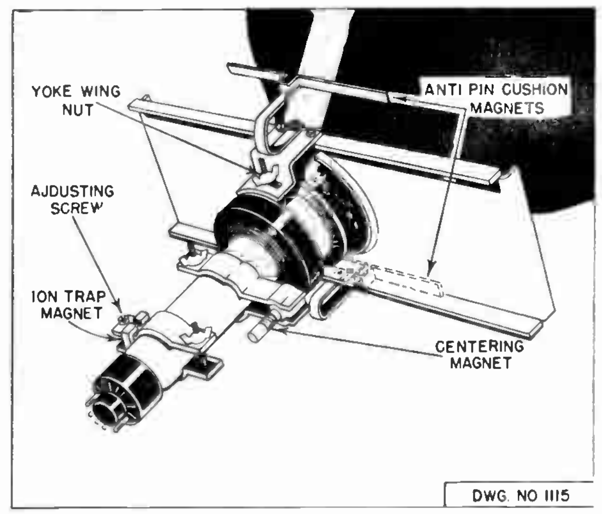
The centering magnet should be rotated and the control adjusted until the picture is properly framed keeping in mind that the effect of the control is governed by the position of rotation. If the control is above or below the neck of the picture tube, the picture can be moved up or down. To the left or right of the neck of the picture tube, the picture can be moved either to the left or right. The position of the centering magnet should be $\frac{1}{4}$ to $\frac{1}{2}$ inch behind the deflection yoke.

Anti-Pin Cushion Magnet:

Adjust centering until edge of the raster is visible. Loosen the positioning screw and slide the magnet until the edge of the raster is vertically straight. If keystoning is noticed adjust magnet in vertical plane.

Deflection Yoke:

The correct position for the deflection yoke is as far forward on the neck of the picture tube as the shape of the tube will allow. Tube shadow or a tilted raster may result from an incorrectly positioned yoke. If a position adjustment is necessary, loosen the yoke wing nut located at the top of the picture tube assembly.

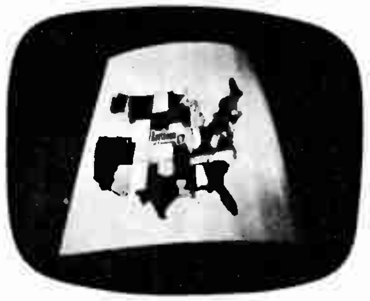


TRAPEZOIDAL RASTER

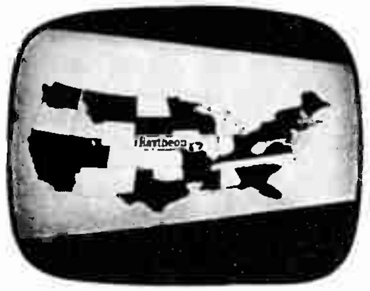
A trapezoidal raster is generally caused by a defective deflection yoke or associated components.

CHECK:

T406	Deflection Yoke
R453-454-455	Yoke Loading Resistors
C438	Yoke Equalizing Capacitors



39



40

SOUND CONDITIONS

It will always prove helpful when analysing a service condition to first determine if the sound section is functioning normally. Since the receiver is of the intercarrier type, both the sound and picture information are amplified simultaneously by the tuner and IF amplifiers. By analysing the above, it can be assumed that if the picture appears to be normal and the sound is not functioning properly the defect is located between the sound take off point (IF Detector Output) and speaker.

B - NO SOUND

A no sound condition with a normal picture is generally caused by a defective tube or component between the IF Detector Output and speaker.

CHECK:

S400	Phono-TV Switch Position
V-11	Audio I F Amplifier (6AU6)
V-12	Audio Detector (6AL5)
V-13	Audio Amplifier (6AV6)
V-14	Audio Output (50C5)
R419	V-11 Screen Resistor
C415	V-11 Screen Capacitor
R427	V-13 Plate Resistor
R422	Volume Control
C422	Coupling Capacitor
R459	Voltage Divider Resistor
R430	V-14 Cathode Resistor
T401	Output Transformer
T400	Ratio Detector Transformer
	Speaker

NOTE: Check Speaker cable connections.

C - WEAK SOUND

A weak sound condition is generally caused by a weak tube or misalignment of the sound section.

CHECK:

V-11	Audio I F. Amplifier (6AU6)
V-13	Audio Amplifier (6AV6)
V-14	Audio Output (50C5)
T400	Ratio Detector Transformer Adjustment (Primary-Bottom Slug)
L404	Audio Pick-Off Coil Adjustment

SOUND CONDITIONS

D - DISTORTED SOUND

This condition is usually caused by a defective tube or component in the sound section.

CHECK:

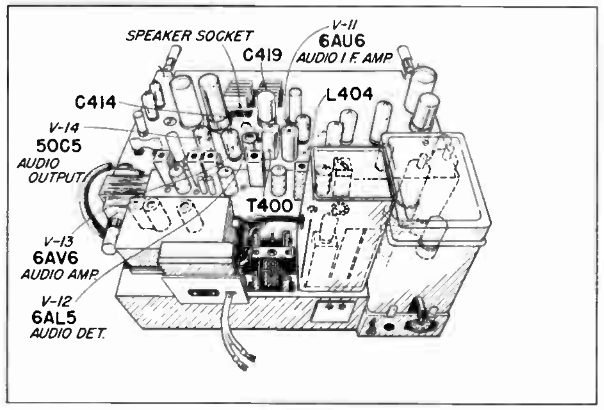
V-14	Audio Output (50C5)
V-12	Audio Detector (6AL5)
V-13	Audio Amplifier (6AV6)
C-419A-B-C	Filter Lytic
C422	Coupling Capacitor
R427	V-13 Plate Resistor
R430	V-14 Cathode Resistor
T400	Ratio Detector Transformer
	Speaker
T400	Ratio Detector Transformer Adjustment (Secondary-Top Slug)

E - HUM OR BUZZ IN SOUND

This condition is generally due to a defective tube or component in the sound section or due to a misalignment of the sound coils.

CHECK:

V-12	Audio Detector (6AL5)
V-14	Audio Output (50C5)
V-13	Audio Amplifier (6AV6)
V-11	Audio IF Amplifier (6AU6)
C419A-B-C	Filter Lytic
T400	Ratio Detector Transformer Adjustment (Secondary -TopSlug)
L404	Audio Pick-Off Coil Adjustment
C414	Buzz Control Adjustment



NOTE: A fast method of isolating the defective stage when a troublesome sound condition occurs is to apply a 60 cycle 6.3 filament voltage through a .5 mfd capacitor to various points in the sound section. If an increase of volume is not observed as the 60 cycle is applied, the defect is located between the point tested and the speaker.

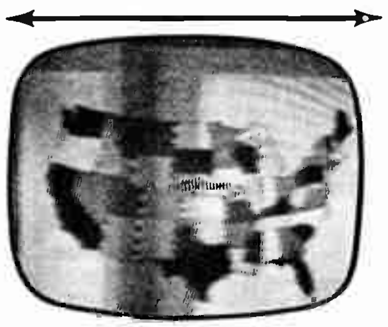
SOUND SECTION SCHEMATIC

EXTERNAL INTERFERENCE

The five service conditions below which are usually caused by external interference have been included in the "Service Saver" as they are common service complaints. These conditions are presented so that they can easily be identified and usually the effects in the picture are little affected by a control adjustment, tube or component substitution or circuit modification. These conditions result from an interfering external signal and are seldom caused or due to a defect in the receiver.



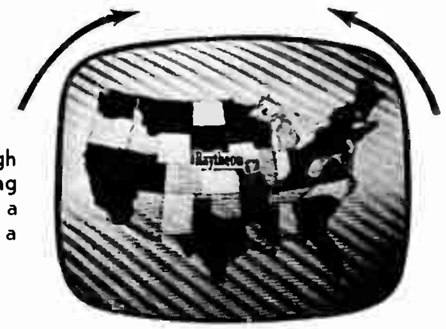
CHANNEL CROSS TALK

Due to interference from a nearby station on same channel or due to adjacent channel interference—Orientation, relocation or an antenna with sharper directivity characteristics and the use of traps are suggested to reduce or eliminate channel cross talk.

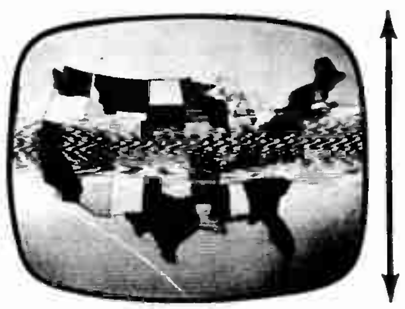
2

RF INTERFERENCE

Due to a beat frequency between the incoming signal and high powered radio equipment or a local oscillator in a receiver being operated in the vicinity—Orientation, relocation or installing a higher gain and more directional type antenna or the use of a booster may be effective in eliminating this interference.



3



DIATHERMY INTERFERENCE

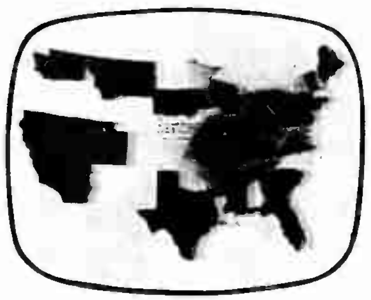
Caused by X-Ray, commercial RF heating, ultra-violet and fluorescent lights, brush motors and other 60 cycle operated equipment—Filters or other corrective measures installed at the source of interference may be tried to eliminate the herring-bone pattern from the picture.

5

IGNITION INTERFERENCE

Caused by ignition systems of cars or trucks or by breaking contact type of electrical appliances in vicinity. Similar condition may result from arcing in high voltage supply. — Effects in the picture may be reduced by relocation or installing a more directional type antenna, shielding or redressing the transmission line or by installing a power line filter.

7



GHOSTS

Due to the transmitted signal being reflected from buildings, hills or mountains and other surrounding structures. — To eliminate or reduce the effects in the picture, orientation, relocation or probing, or installing an antenna with improved directivity characteristics should be attempted.

13

TUNER DRIVE ASSEMBLY

TO REMOVE TUNER DRIVE ASSEMBLY FROM RF CHASSIS

1. Remove coupling arm spring from each side of tuner drive assembly.
2. Remove coupling arm connecting bar from each side of tuner drive assembly.
3. Remove the four tuner drive mounting screws from top of RF chassis and remove tuner drive assembly from bottom of RF chassis.

TO DISASSEMBLE TUNER DRIVE ASSEMBLY

1. Place tuner drive assembly on it's VHF side, the end plate assembly is now the top end, which is the UHF side. (See Fig. 1.)
2. Remove coupling arm screw, two washers, lock washer and coupling arm.
3. Disconnect locking arm spring.
4. Loosen tie plate mounting screws and remove the top one from each tie plate.
5. Loosen four set screws. Two on each locking collar located on each end of tuning shaft.
6. Loosen dial cord.
7. Remove top end plate assembly.
8. Remove dial cords.
9. Remove two idler pulleys.
10. Remove thrust spring.
11. Remove driven plate assembly.
12. Remove three small and one large ball bearing.
13. Remove drive pulley.

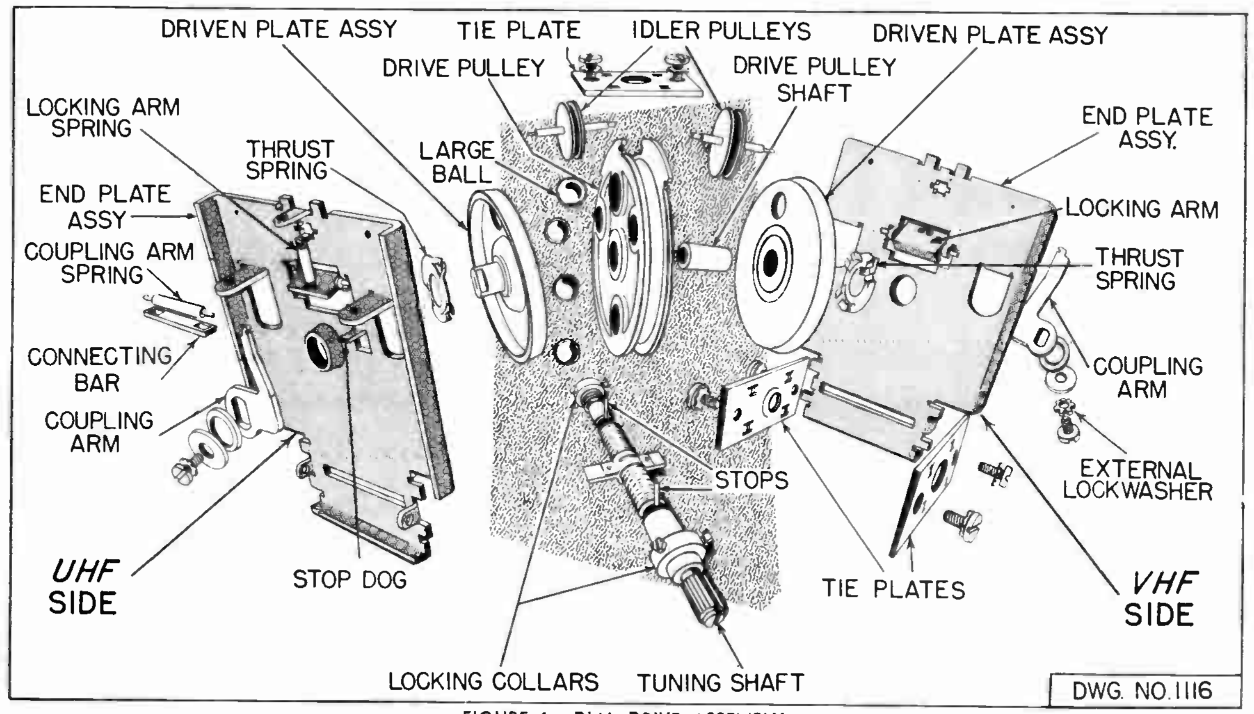


FIGURE 1. DIAL DRIVE ASSEMBLY

TO ASSEMBLE TUNER DRIVE ASSEMBLY AND RESTRING DIAL CORD

1. Place tuner drive assembly on it's VHF side.
2. Cut dial cord to 33 inches length as needed.
3. On one end of dial cord tie a tension spring and insert the other through locking collar hole and tie a knot. (See Fig. 2.)
4. Place the above dial cord with tension spring and collar on one end of drive pulley. Place dial cord tension spring on right side of right wing. (on out side of drive pulley). Wrap around wing and make two full turns in clock-wise direction. Tape may be used on right side of right wing to hold dial cord tight.
5. Place second dial cord with tension spring on left side (on outside of drive pulley) of left wing. Wrap around wing and make two complete turns in a counter clock-wise direction. Again tape may be used on left side of left wing to hold dial cord tight.
6. Insert drive pulley over drive pulley shaft.
7. Put the 3 small ball bearings and 1 large ball bearing in their respective holes in drive pulley.
8. Place driven plate assembly over drive pulley shaft
9. Place thrust spring over driven plate (refer to Figure 1).
10. Insert two idler pulleys at top of end plate assembly. Make sure excess dial cord is on the outside of idler pulleys.
11. Add end plate assembly, making sure that locking arm can swing out.
12. Replace three tie plate screws.

13. The next three steps are most easily done with the help of an assistant. Set tuning shaft 6½ turns from either stop and hold at that point. Also set drive pulley to center position, wings will be centered looking through hole at top tie plate. Remove tape from right wing. By-pass idler pulley and wrap dial string around knurl end of tuning shaft in a counter-clockwise direction. (See Figure 2.)
14. Remove tape from left wing, by-pass other idler pulley and wrap dial string around tuning shaft in a clockwise direction (looking from knurl end of shaft).
15. Take a small screw driver or pick, and increase spring tension of both dial cords and place over idler pulleys. Dial cord should be fairly tight. If not, (keep drive pulley in center of wings and tuning shaft at 6½ turns from either stop) take up all slack of dial cord with locking collars at both ends of tuning shaft and lock in place with set screws.
16. Tighten all tie plate screws.
17. Hook up locking arm spring.
18. Assemble coupling arm and washers. With both wings in center of top tie plate hole, and tuning shaft still at 6½ turns. Coupling arms should both be touching their respective stop dogs.
19. As a check to determine if the tuner drive assembly was assembled correctly, measure distance from both coupling arms to their respective stop dogs when tuning shaft is turned from one stop to other stop. This distance should be equal (approximately ⅛") on both sides. (opposite side of stop dog as in step 18)
20. Mechanical tracking is incorrect if distance between locking arm and stop dogs are not equal on both sides. If not equal, let up on dial string by loosening set screws on locking collar on the side which has the locking arm further away from stop dog. Loosen set screw on other locking collar and take up slack in dial cord and tighten screws on that collar. (If so desired, take dial string off of idler pulleys to relieve tension on dial string.
21. If tuner drive assembly tunes both UHF and VHF at same time, the drive assembly has not been correctly assembled and the following checks should be made.
    (a) Check both coupling arms to make sure that they are touching stop dogs with tuning shaft at 6½ turns.
    (b) Make sure the UHF tuner is set slightly off its stop at the high frequency end when tuner drive assembly is installed.
    (c) Make sure VHF coupling arm hits stop dog before VHF tuner reaches its mechanical stop. (transfer position)
    (d) Where the VHF tuner drives correctly, but UHF tuner tends to jam at time of transfer, check collar of UHF tuner coupling arm. Make sure that the UHF switch is open when slightly off the high frequency end stop (ribbons out of cavity) and then measure to see if connecting bar will fit between the UHF tuner coupling and drive assembly coupling arm. Loosen allen screws on UHF tuner locking collar so connecting bar will fit, then tighten set screws on collar.

    UHF or VHF tuner stops must not prevent coupling arms on tuner drive assembly from touching their respective stop dogs at time of transfer. Uncouple connecting bars to check if either tuner is causing unit to jam.

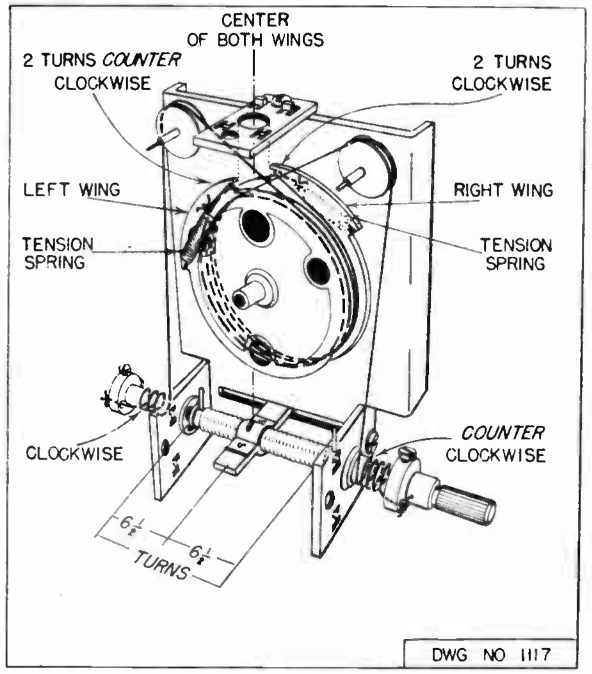

FIGURE 2. DIAL CORD REPLACEMENT

TO INSTALL TUNER DRIVE ASSEMBLY INTO RF CHASSIS

1. Make sure that the tuning shaft is 6½ turns from either stop, wings in center, looking through top tie plate hole.
2. Replace tuner drive assembly through bottom of RF chassis, and mount with the four self-tapping screws from top of RF chassis. The tuner drive assembly will fit only one way.
3. Set the UHF tuner slightly away from the high frequency end stop where the cam opens up the UHF switch. Set VHF tuner at the low frequency end. (where cam actuates VHF oscillator switch.
4. Replace coupling arm connecting bars and springs.

NOTE: Jamming will result at time of transfer if either tuner reaches its stop and prevents coupling arms on drive unit to reach their respective stop dogs. Adjust coupling arm collar set screws on tuners if necessary. Make sure tuners actuate their respective switches.

VIDEO IF ALIGNMENT

NOTE: (a) Preheat the unit for at least five minutes.
(b) Set VHF tuner to approximately Channel 7.
(c) Use 10K ohm resistor (isolation) in series with VTVM and scope for the following steps.

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response
1	43.7	——	IF Alignment Input "A"	VTVM at IF Detector Output	Adjust generator for output of approx. 2 volts DC on VTVM	T-301	Maximum Reading
2	41.4	——	IF Alignment Input "A"	VTVM at IF Detector Output	Adjust generator for output of approx. 2 volts DC on VTVM	L-323A (Top)*	Minimum Reading
3	45.15	——	IF Alignment Input "A"	VTVM at IF Detector Output	Adjust generator for output of approx. 2 volts DC on VTVM	L-323B (Bottom)*	Maximum Reading
4	42.1	——	IF Alignment Input "A"	VTVM at IF Detector Output	Adjust generator for output of approx. 2 volts DC on VTVM	L-319	Maximum Reading
5	41.25	——	IF Alignment Input "A"	VTVM at IF Detector Output	Adjust generator for output of approx. 2 volts DC on VTVM	L-313 (Bottom)	Minimum Reading
6	47.25	——	IF Alignment Input "A"	VTVM at IF Detector Output	Adjust generator for output of approx. 2 volts DC on VTVM	L-314 (Bottom)	Minimum Reading
7	41.4	——	IF Alignment Input "A"	VTVM at IF Detector Output	Adjust generator for output of approx. 2 volts DC on VTVM	T-300A (Top)*	Minimum Reading
8	Remove VTVM from IF Detector output and substitute an oscilloscope in its place. Calibrate scope for sensitivity of one volt per inch.						
9	42.0 46.0	40	IF Alignment Input "B"	Scope at IF Detector Output	Adjust wave form for approx. 20 divisions on scope with sweep gen.	L-311 (Bottom) L-312 (Bottom) Adjust for maximum amplitude with proper bandwidth	10	42.0 45.6	40	IF Alignment Input "A"	Scope at IF Detector Output	Adjust wave form for approx. 20 divisions on scope with sweep gen.	T-200 T-300B (Bottom)* C-305 Adjust for maximum amplitude with proper bandwidth	
* NOTE: Two Peaks can be obtained. Use Peak with core furthest out of coil form.

SOUND IF ALIGNMENT

NOTE: Short antenna to ground.

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response
1	4.5	——	IF Detector Output	VTVM across C-413	——	L-404 T400 Primary (Bottom of can)	Maximum Reading on V.T.V.M.
2	——	4.5	IF Detector Output	Scope across C-413	Sweep approx. ± 100 KC. Adjust for maximum Linearity	T400 Secondary (Top of can)	3	——	4.5	IF Detector Output	Scope across C-413	Sweep approx. ± 100 KC. Adjust for symmetry of peaks	T400 Primary (Bottom of can)	4	——	——	——	——	Tune in any Station	C-414 Repeat step No. 2	Adjust for minimum noise in speaker

VIDEO TRAP COIL (L-401) ADJUSTMENT

(a) Tune in station.
(b) Adjust tuner until sound bars just appear.
(c) Turn L-401 Slug all the way out (counter-clockwise).
(d) Turn the slug in (clockwise) until the horizontal scanning lines are smooth and continuous.

ALIGNMENT PLUG

For ease of alignment and to reduce the possibility of regeneration, it is suggested that a simple generator alignment plug be made and used during the alignment.

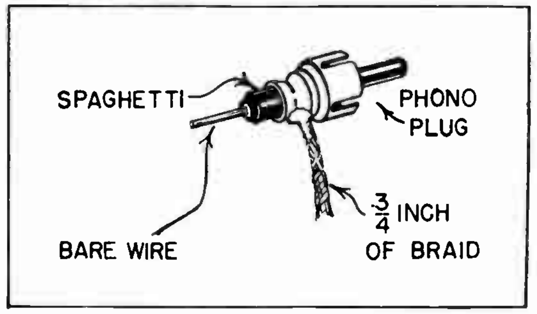

FIGURE 3. ALIGNMENT PLUG

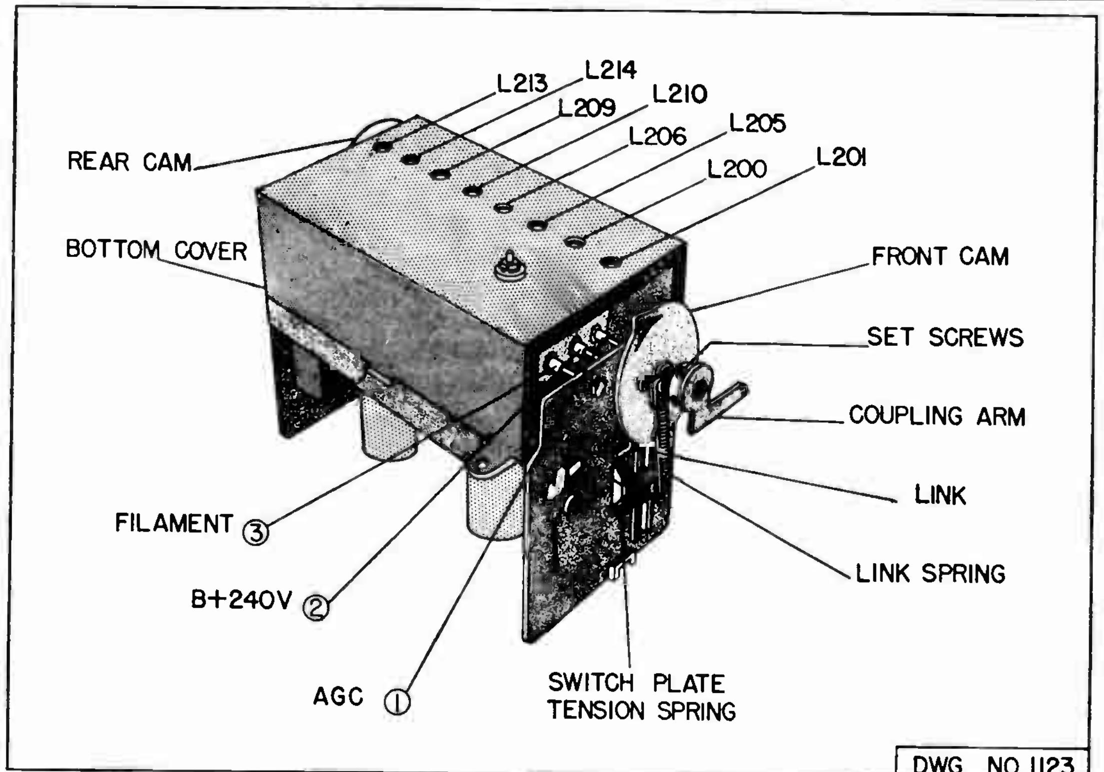

FIGURE 6. BOTTOM VHF TUNER VIEW

VHF TUNER ALIGNMENT

NOTE: IF amplifier must be aligned before tuner adjustments are made. Also Low Band of Tuner must be aligned before High Band.

1. Preset trimmer screws as shown in Figure 5.
2. Preset coil cores as following:
   (A) With Band Sw. in Low Band pos., set treadle bar to top of stroke (Cores furthest out of coil)
   (B) Adjust Cores: L200, L201, L205, L206, L209, L210 to 1-1/2" from cores to end of coil form.
   (C) Adjust Core: L213, L214 to 1-5/8" from cores to end of coil form. (See Figure 6.)

Note 1: From bottom of treadle bar 1¾" to top of tuner chassis.
Note 2: From bottom of treadle bar 1⅛" to top of tuner chassis.
Note 3: From bottom of treadle bar ⅝" to top of tuner chassis.
Note 4: From bottom of treadle bar ⅞" to top of tuner chassis.

UHF TUNER SERVICE DATA

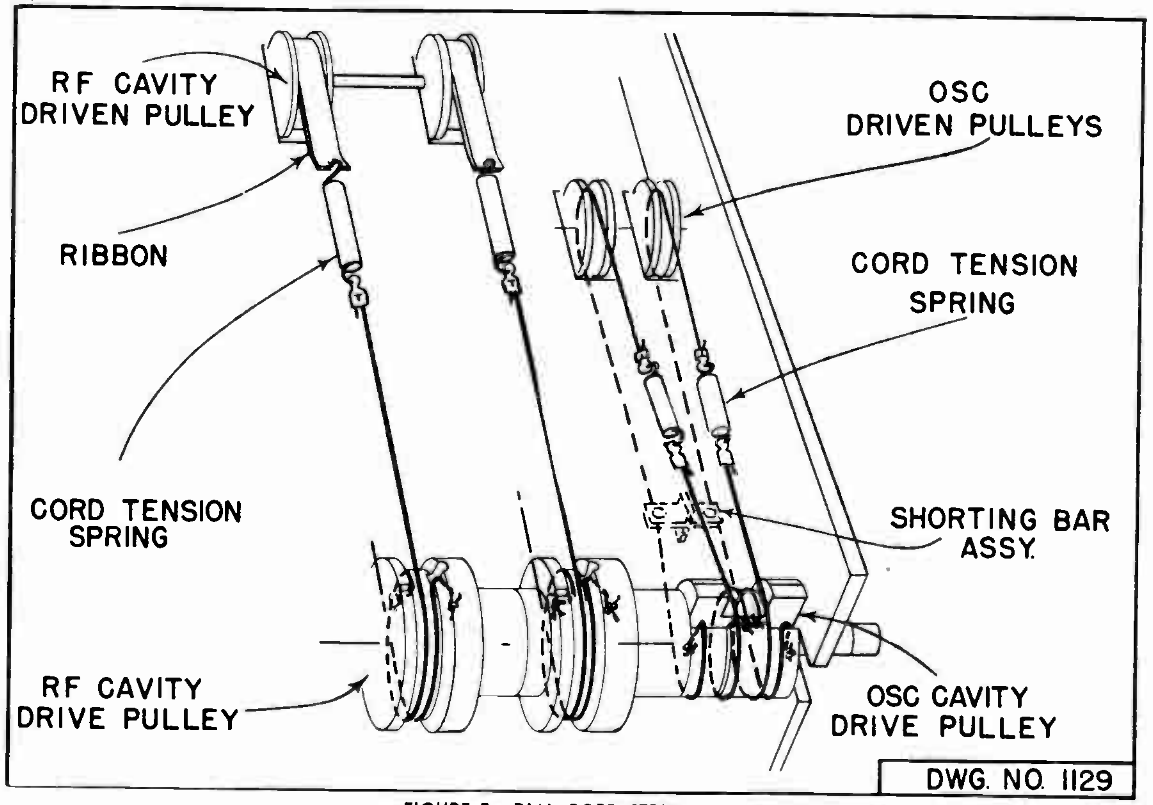

FIGURE 7. DIAL CORD STRINGING

OSCILLATOR GRID CHECK

To determine whether the oscillator section is functioning, a convenient check point has been provided where the oscillator grid current can be measured. To measure the oscillator grid current, place a Simpson Model 260 Multimeter (or equivalent) on the 100 microamp scale across the 22 ohm resistor (R106). See Figure 8. A reading of 10 to 30 microamperes should be obtained if the oscillator is functioning normally.

CRYSTAL CHECK

Both the oscillator and crystal detector can easily be checked by measuring the oscillator injection current. Place a Simpson Model 260 Multimeter (or equivalent) on the 100 microamp scale across the 22 ohm resistor (R105) at the terminal indicated in Figure 8. A reading of 5 to 40 microamperes should be obtained if both the oscillator and crystal are functioning normally.

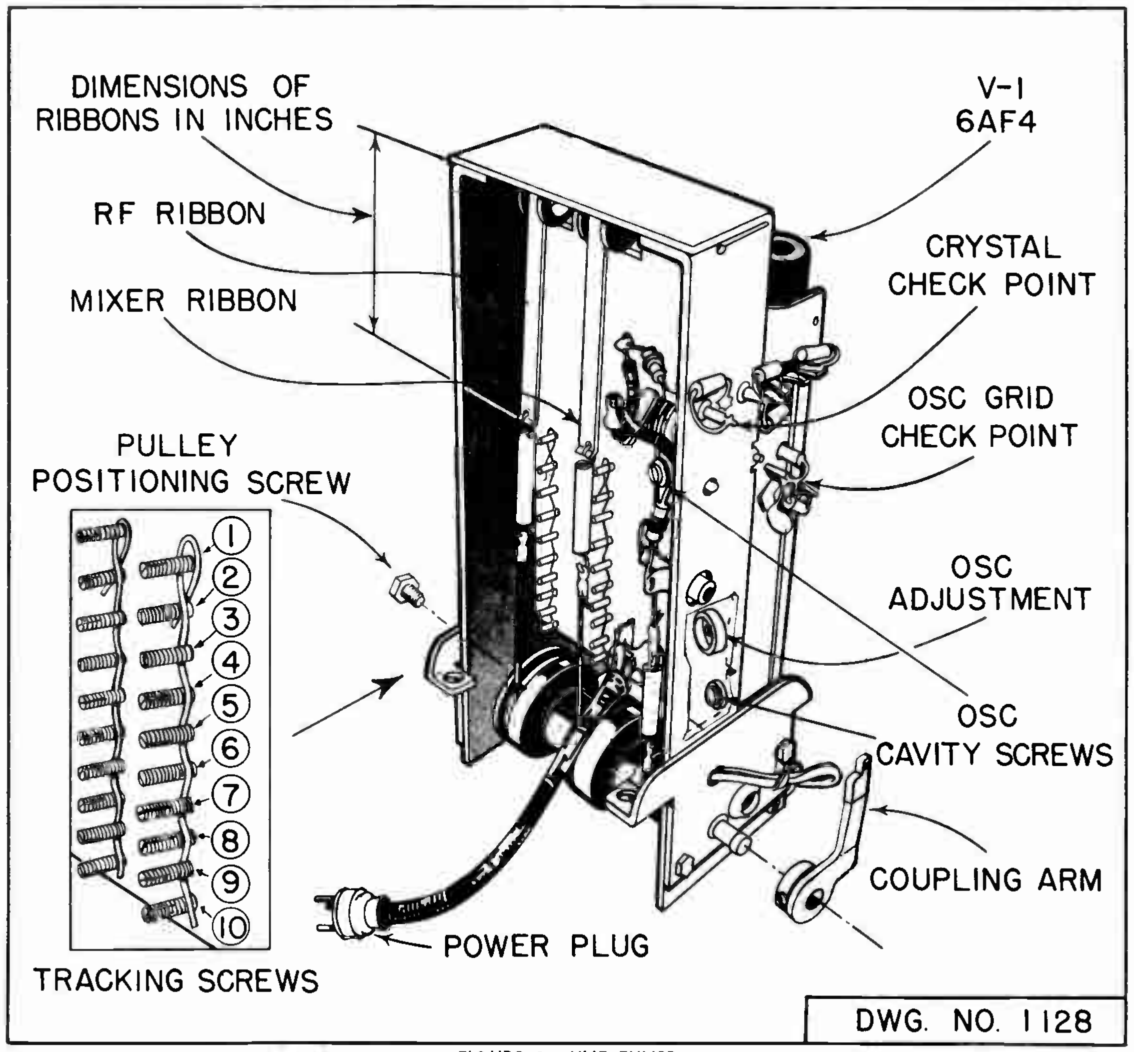

FIGURE 8. UHF TUNER

UHF ALIGNMENT

Read Following Notes Before Proceeding With the Alignment.

NOTE:

(A) Both the VHF Tuner and Video IF must be properly aligned before attempting UHF alignment.

(B) Accurate sweep and marker generators are required for the alignment. Do not attempt alignment without proper equipment.

(C) Do not remove UHF Tuner from chassis.

(D) Make sure 6AF4 tube is firmly seated in its socket and the shield clip is seated in the tube shield notch.

(E) Check oscillator grid current and crystal current. Meter readings must be within specifications. Refer to page 30.

(F) Check mechanical alignment of RF and Mixer ribbons.

1. Disconnect spring and connecting bar on UHF Tuner coupling arm.
2. Turn UHF Tuner coupling arm to its counterclockwise stop .
3. RF and Mixer ribbons should be 4⅞ inches as indicated in Figure 8.
4. If ribbons are not at correct distance loosen pulley positioning screw slightly and reposition by turning drive pulleys. For easy accessibility of the pulley positioning screw it is suggested that the High Voltage Chassis be removed.
5. Reinstall spring and connecting bar on UHF Tuner coupling arm.

UHF ALIGNMENT PROCEDURE

STEP 1: Use a 10K ohm isolation resistor in series with hot lead of the oscilloscope and connect to IF Detector output.

STEP 2: Connect a 6 volt bias battery to the AGC with positive to ground and negative to pin 8 of RF Power socket. Connect a jumper between pins 7 and 8 of RF power socket.

STEP 3: Connect sweep generator with output impedance of 300 ohms to the UHF antenna terminals and loosely couple signal generator to sweep generator leads.

STEP 4: Set RF and Mixer ribbons to the dimensions listed in the chart below and adjust the sweep generator until the response curve indicated in figure 9 appears on the scope.

STEP 5: Adjustments should be made for maximum gain with marker appearing at the 6db or 50% point on the video slope of the IF response curve (see Figure 9).

STEP NUMBER	RIBBON DIMENSION IN INCHES	SWEEP GENERATOR FREQ. (MC)	SIGNAL GENERATOR FREQ. (MC)	ADJUST TRACKING SCREW PAIR
1	4¾	890	895	See Note "I"
2	4⅝	865	870.5	# 1
3	4-3/16	775	780.5	# 2
4	3⅞	726	731	# 3
5	3-7/16	671	676	# 4
6	3⅛	624	629.5	# 5
7	2¾	585	590	# 6
8	2-7/16	545	550	# 7
9	2-1/16	507	512	# 8
10	1-11/16	478	483.5	# 9
11	1⅜	455	460	#10

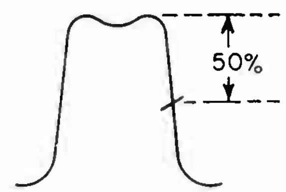

FIGURE 9.

NOTE "I" Loosen two oscillator cavity screws and turn oscillator adjustment so that the 895 MC marker falls at the point indicated in Figure 9. Tighten both oscillator cavity screws.

NOTE "II" Adjustment of tracking screws must be made from the back or crystal side of the tuner and in sequence from 1 through 10.

NOTE "III" To reach position number 11 it may require disconnecting the spring and connecting bar on the UHF tuner coupling arm and turning the UHF Tuner coupling arm clockwise.

F

CAPACITORS CAPACITOR VALUES ARE REPRESENTED IN MICRO-MICROFARAD (MMF) UNLESS OTHERWISE INDICATED. "MF" DENOTES MICRO-FARAD

RESISTORS RESISTORS WATTAGE IS REPRESENTED IN 1/2 WATT UNLESS OTHERWISE INDICATED "K" DENOTES X 1,000 & "M" DENOTES X1,000,000.

SWITCHES ALL SWITCHES ARE SHOWN IN THE POSITION FOR VHF OPERATION

VOLTAGE READINGS THE VOLTAGE READINGS INDICATED AT THE VARIOUS TUBE SOCKET PINS WERE MEASURED WITH A 20,000 OHM PER VOLT VOLTMETER, NORMAL OPERATION, NO SIGNAL INPUT AND LINE VOLTAGE AT 115V AC WHERE CONTROL SETTINGS AFFECT VOLTAGE READINGS THE MINIMUM AND MAXIMUM ARE INDICATED.

WARNING HIGH VOLTAGE ON PLATE CAPS OF THE 1B3 HIGH VOLTAGE RECTIFIER AND 25CD6 HORIZONTAL PULSE AMPLIFIER. DO NOT MEASURE THIS VOLTAGE

COIL DC RESISTANCE THE DC RESISTANCE READING INDICATED NEAR THE TRANSFORMERS AND COILS HAVE BEEN TAKEN WITH AN OHMMETER DIRECTLY ACROSS THE COIL BEING MEASURED COILS SHOWN WITHOUT A RESISTANCE READING HAVE A DC RESISTANCE OF LESS THAN ONE OHM A TOLERANCE OF + OR − 5 % IS PERMISSIBLE

WAVE FORMS THE WAVE FORMS ILLUSTRATED ARE EXACT COPIES OF THAT SHOWN ON A LABORATORY OSCILLOSCOPE THE WAVE FORMS WERE TAKEN UNDER NORMAL OPERATING CONDITIONS, WITH A TRANSMITTED SIGNAL AND THE PICTURE IN SYNC AT ALL TIMES WITH EACH WAVE FORM IS THE PEAK-TO-PEAK VOLTAGE AND A HORIZONTAL OR A VERTICAL NOTATION REPRESENTING VERTICAL (60 CYCLES) OR HORIZONTAL (15,750 CYCLES) SCOPE PATTERN THE WAVE FORM AND PEAK-TO PEAK VOLTAGE READINGS MAY VARY SOMEWHAT DEPENDING ON THE STRENGTH OF THE SIGNAL, THE PICTURE INFORMATION BEING TRANSMITTED AND THE ADJUSTMENT OF THE VARIOUS CONTROLS WHEN CHECKING WAVE FORMS, CONNECT THE GROUND LEAD FROM THE OSCILLOSCOPE TO THE CHASSIS AND THE HOT LEAD TO THE POSITION INDICATED BY THE ARROW.

REPLACING TUBES BEFORE REPLACING TUBES THE CABINET BACK MUST FIRST BE REMOVED REMOVING THE CABINET BACK DISENGAGES THE SAFETY INTERLOCK AND REMOVES THE POWER TO THE RECEIVER DO NOT TAMPER WITH OR ATTEMPT TO DEFEAT THE PURPOSE OF THE SAFETY INTERLOCK, AS SEVERE SHOCK MAY RESULT DO NOT REMOVE TUBES WHILE THE RECEIVER IS IN OPERATION AS OVERLOADING OR COMPONET FAILURE MAY RESULT

PICTURE TUBE HANDLING DUE TO LARGE SURFACE AND EXTREME HIGH VACUUM OF THE PICTURE TUBE, CARE SHOULD BE USED WHEN HANDLING THE CHASSIS OUTSIDE THE CABINET DO NOT SUBJECT THE TUBE TO EXCESSIVE PRESSURE OR ROUGH HANDLING AS AN IMPLUSION MAY RESULT CAUSING SERIOUS PERSONAL INJURY

WARNING

AT ALL TIMES DURING OPERATION THE CHASSIS IS AT 125 VOLTS DC POTENTIAL ABOVE GROUND AND IT ALSO MAY BE AT THE LINE VOLTAGE POTENTIAL DEPENDING ON HOW THE LINE CORD PLUG IS INSERTED IN THE POWER RECEPTACLE

EXTREME CAUTION MUST BE OBSERVED WHEN WORKING WITH THE CHASSIS OUTSIDE THE CABINET AND WHEN POWER IS APPLIED TO THE RECEIVER WITH THE CABINET BACK REMOVED *SEVERE SHOCK* MAY RESULT FROM CONTACT WITH CHASSIS

AN ISOLATION TRANSFORMER BETWEEN THE LINE CORD PLUG AND POWER RECEPTACLE MUST BE USED WHEN SERVICE IS REQUIRED. THIS REMOVES ALL SHOCK HAZARDS AND IS THE *ONLY* SAFEGUARD. DAMAGE TO THE RECEIVER AND TEST EQUIPEMENT MAY RESULT WITHOUT THE USE OF AN ISOLATION TRANSFORMER

CHASSIS DIFFERENCES

The chassis used in the models differ mainly with respect to picture tube size and type, and the associated picture tube mounting parts. Chassis 456.150 and 456.150-2 use a 20 inch glass rectangular picture tube, and chassis 456.150-1 uses a 21 inch metal rectangular picture tube. Chassis 456.150 differs somewhat in tube complement and circuitry from its successors chassis 456.150-1 and 456.150-2. The vertical sweep output tube in the 456.150 chassis was a type 6S4. This was changed in the later models to a type 12BH7. Other changes were made in the video amplifier output circuits. These differences can be seen in the schematic diagrams and Repair Parts List.

NOISE BALANCE CONTROL

This Silvertone television chassis is equipped with a unique circuit which allows it to perform satisfactorily in the presence of interference of the type encountered in fringe areas and congested business locations. It is particularly effective on the type of noise caused by automobiles, street cars, electrical storms, etc. To adjust for best performance under these conditions turn the channel selector to the strongest station which can be received. Start with the Noise Balance control in the fully clockwise position and then adjust it slowly counterclockwise until the picture just starts to show a distorted shape, then advance the control slightly so that the picture shape is normal. Turn the channel selector to all other stations one at a time. If the picture shape is distorted on any channel advance the control slightly clockwise to restore normal shape. The Noise Balance control is now set.

NOTE - WHENEVER DISTORTED PICTURES OR SLANTING BARS ARE ENCOUNTERED WHICH CANNOT BE ADJUSTED CORRECTLY WITH THE HORIZONTAL LOCK OR FINE TUNING CONTROLS ALWAYS SET THE NOISE BALANCE CONTROL FULLY CLOCKWISE BEFORE MAKING OTHER ADJUSTMENTS.

SERVICE ADJUSTMENTS

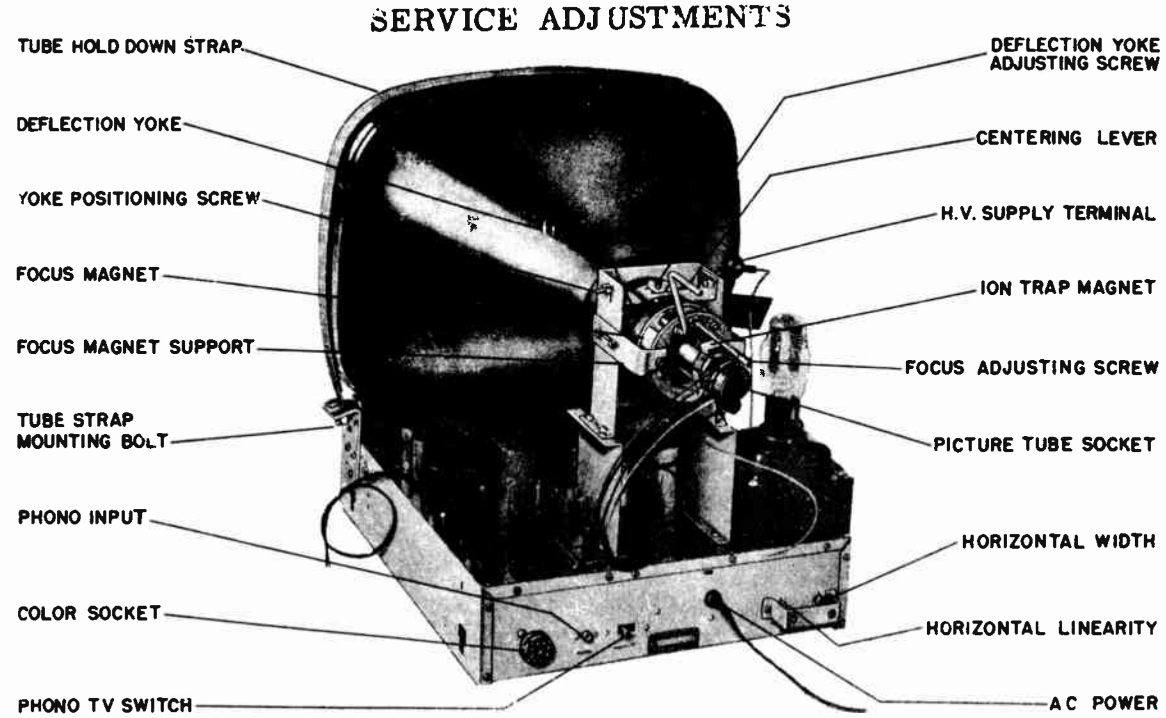

FIGURE 4

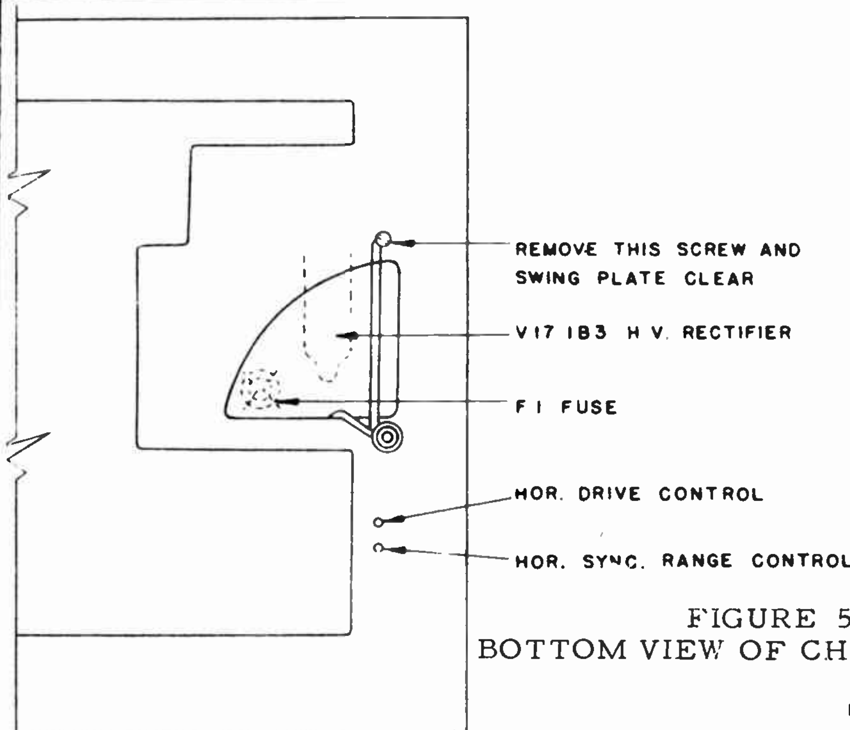

FIGURE 5
BOTTOM VIEW OF CHASSIS SHELF

The Service Adjustments normally will need an occasional minor adjustment if any circuit work or tube replacement is required. A test pattern, generated either locally in the shop or obtained from a television station is recommended for best results. The operating and auxiliary controls, located on the front panel and the rear apron should be set for as good a pattern as possible before making the following adjustments.

CENTERING MISADJUSTMENTS

If the picture is not properly centered move the Centering Control Lever on the rear of the receiver a short distance in any direction necessary to correctly center the picture. Do not use force in making this adjustment as excessive strain may be exerted on the neck of the picture tube. If proper centering cannot be restored in this manner a slight readjustment of the deflection yoke or focus magnet mountings may be necessary.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT

1. Turn the Horizontal Hold control (front panel auxiliary controls) to the extreme counterclockwise position, and momentarily interrupt the signal by switching to another channel and then switching back again. The picture should hold horizontal sync.

2. Turn the Horizontal Hold control fully clockwise and momentarily interrupt the signal. The picture should break sync and resolve into approximately 3 sloping bars.

3. Rotating the Horizontal Hold control counterclockwise (within 1/2 turn) should make the picture lock in.

If the receiver passes the above checks, the horizontal oscillator is adjusted and need not be aligned. In that case, merely set the Horizontal Hold control to a position where the picture locks in instantly when switching channels.

HORIZONTAL OSCILLATOR ALIGNMENT

1. Set the NOISE BALANCE control to maximum clockwise.
2. Connect the oscilloscope to terminal "D" on the synchroguide transformer T8 through a small capacitor approximately 15 mmfd, or use a low capacity probe.
3. Set the HORIZONTAL LOCK to 1/4 rotation from counterclockwise side.
4. Adjust front screw of synchroguide to lock picture horizontally.
5. Set drive control C51b to show bright drive line in center of raster, then screw in 1 turn.
6. Adjust inside core of synchroguide can to give correct scope waveform (a). Readjust front screw simultaneously to keep in sync. Use non-metallic screwdriver on inside core.

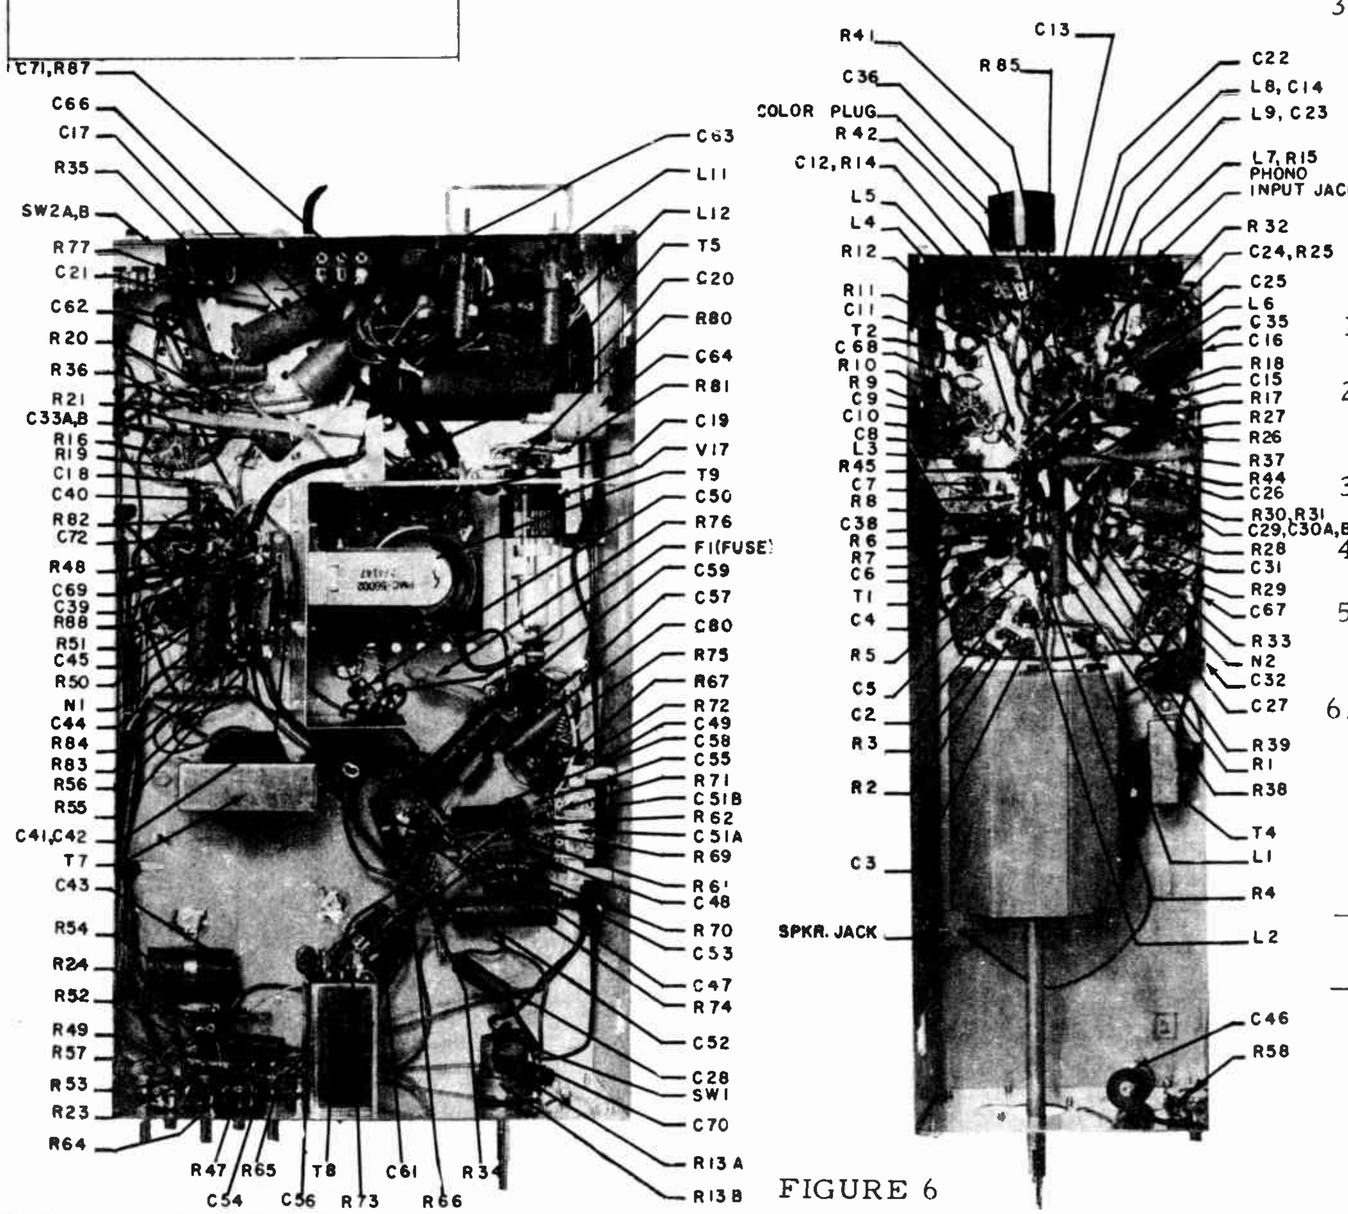

FIGURE 6

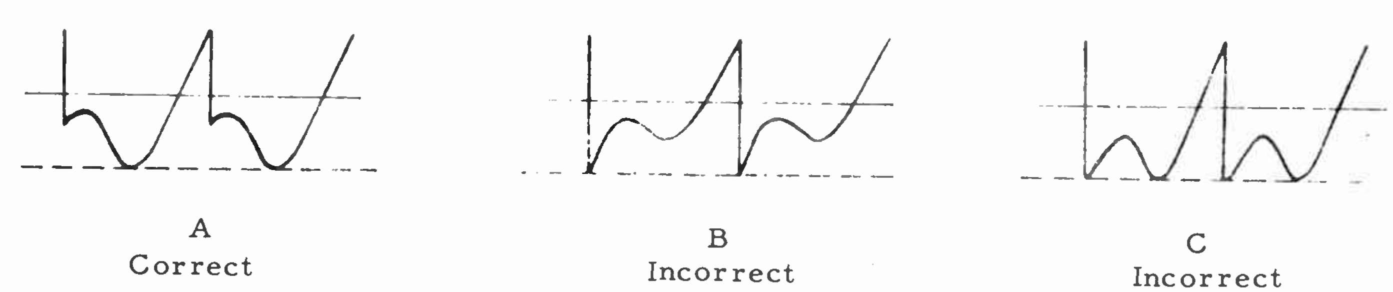

FIGURE 14

HORIZONTAL OSCILLATOR ALIGNMENT - Continued

7. Trim front screw to get approximately 3 bars breakout with HORIZONTAL LOCK in maximum clockwise position when switching channels. Sync should hold in maximum counterclockwise position and picture should not jitter at any position of the HORIZONTAL LOCK control. If it does jitter leave the HORIZONTAL LOCK in maximum counterclockwise position and adjust front screw of the synchroguide in clockwise direction until the jitter stops. Recheck breakout on clockwise end when switching channels. Horizontal sync should pull in when switching channels over at least 1/2 of the rotation range of the HORIZONTAL LOCK control. If it does not, unscrew sync amplitude control C51a 1/4 turn at a time until correct lock-in range is established.

TELEVISION ALIGNMENT PROCEDURE

NOTE:

Always set noise balance control fully clockwise before making any alignment tests or adjustments.

Preliminary

This alignment is an exacting procedure and should be undertaken only when necessary. Before deciding that alignment is necessary, check the following:

IN HOME OF CUSTOMER:

1. Be sure of the antenna installation.
2. Check all operating controls and adjustments.
3. Check reception on all channels.
4. Check tubes by substitution of known good tubes.

IN THE REPAIR SHOP

5. Substitute a known good picture tube.
6. If picture definition is still inadequate, observe the overall I.F. response curve by following step (11) below

ALIGNMENT PROCEDURE

1. TEST EQUIPMENT

CATHODE RAY OSCILLOSCOPE

SWEEP GENERATOR - The sweep generator used should cover the range from 20 to 220 megacycles. The output should be flat over a sweep range of 20 Mc. It should be capable of an output of about 0.1 volt.

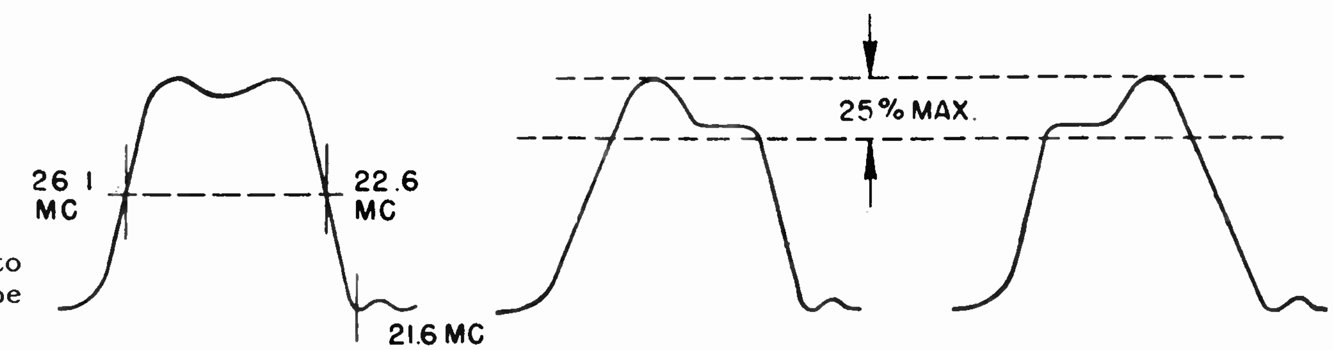
AM SIGNAL GENERATOR - This generator should have a frequency range of from 4.0 to 220 megacycles. As this generator is used occasionally as a marker generator, accuracy is an important factor. It should be capable of 0.1 volt output.

VACUUM TUBE VOLTMETER - Almost any standard VTVM will do. It should preferably have a reversible polarity switch.

I. F. ALIGNMENT

1. Lift the top section of the shield on the 6J6 mixer so that the shield does not make electrical contact with the base of the shield. Connect the output of the AM signal generator to the shield, and the ground lead to the chassis.
2. Connect the VTVM across R12, 4.7K video detector load.
3. Set the volume and contrast controls to minimum position.
4. Tune the signal generator to 24.35 Mc. and attenuate the signal generator output for a reading of -1 to -1.5 volts to avoid overload and consequent inaccurate alignment.
5. Peak the fourth I.F. transformer T2 to 24.35 Mc. keeping the VTVM reading at -1 to -1.5 volts by adjustment of the attenuator on the signal generator.
6. Connect a 1K resistor from the grid of V1 to the junction of R2 and R4. Adjust the first I.F. coil located (L9 Fig. I) on the tuner for a maximum reading on the VTVM of between -1 and -1.5 volts. Remove the 1K resistor.
7. Place the tuner turret so that it is between any two channels and adjust L1 for maximum indication on the VTVM. (Note: On sets below serial number 10525 L1 is fixed and step 7 should be disregarded for these sets.)
8. Peak the third I.F. coil L3 to 23.2 Mc. keeping the VTVM reading at -1 to -1.5 volts.
9. Tune the signal generator to 25.2 Mc. and adjust the second I.F. transformer T1 for maximum keeping the VTVM reading at -1 to -1.5 volts.
10. Adjust the signal generator to 21.6 Mc. and tune the trap L2 for a minimum reading.
11. The I.F. passband may be observed by connecting a sweep generator across the terminals of the AM signal generator, connected as in (1), and substituting an oscilloscope for the VTVM as described in the above procedure. Place a 3V battery with the positive terminal connected to the chassis and the negative terminal connected to the junction of R2 and R4. The sweep generator should be set to approximately 24.35 Mc. and then adjusted to center the waveform on the scope face. To avoid overload, and to assure a true view of the wave shape, the output of the sweep generator should be attenuated until further attenuation has a minimum effect on the curve shape.

If necessary a slight adjustment of the I.F. transformers may be made to obtain a close approximation to the ideal curve. Adjustment of T2 affects the slope of the top, while adjustment of L3 or T1 affects the bandwidth.



Correct Acceptable Acceptable

G
FIGURE 15

I. F. ALIGNMENT CHART

Signal Generator Frequency AM	Adjustment	V.T.V.M. Indication
24.35 Mc.	T2	Maximum
24.35 Mc.	1st I.F. Coil on Tuner (See step 6 in text for detailed instructions)	Maximum
24.35 Mc. (With tuner turret between channels) *	L1	Maximum
23.2 Mc.	L3	Maximum
25.2 Mc.	T1	Maximum
21.6 Mc.	L2	Minimum

(*) This adjustment can be disregarded on those few early chassis which had a FIXED L1.

SOUND ALIGNMENT

Connect an AM signal generator tuned to 4.5 Mc. between the grid of V5 (6CB6) and ground. Connect the alignment test circuit as shown below, and tune L8 for a minimum reading on the VTVM.

47 mmf Mica

100,000 1/2 W

Connect to Pin No. 11 of Picture Tube

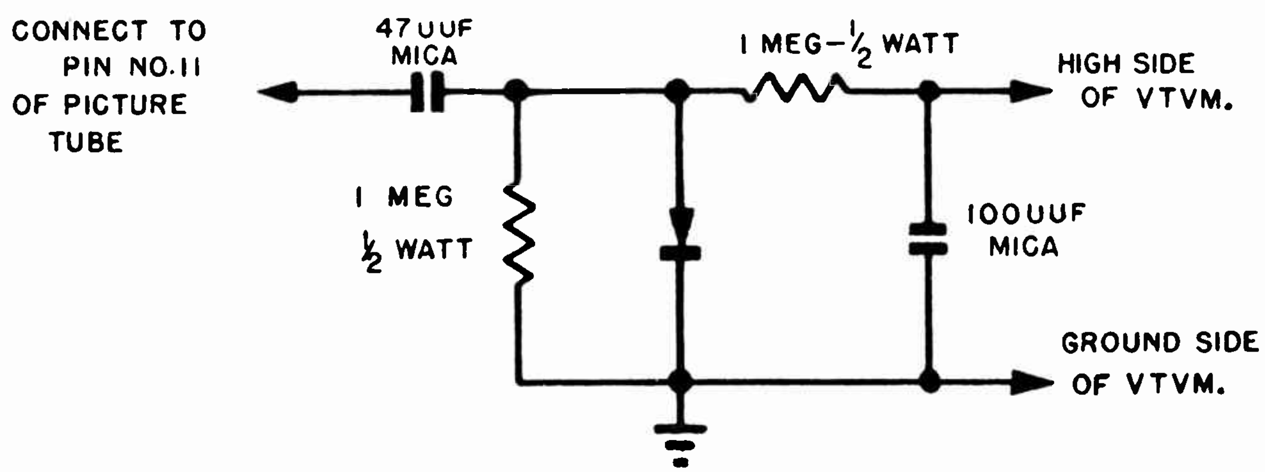
Connect High Side of V.T.V.M. here

1 Meg 1/2 W

1N34 Crystal

Ground Lead of V.T.V.M.

Gnd



SOUND ALIGNMENT TEST CIRCUIT

2. Disconnect the alignment test circuit and connect the VTVM to ground and Pin 5 of V7 (6AL5). Adjust L9 and primiary (Bottom) of the ratio detector transformer for maximum indication.

3. Remove the VTVM and reconnect it to ground and junction of R27 and R28. Adjust secondary of ratio detector coil (top) for zero. (Note: When tuning through the proper setting, the meter reading should swing negative on one side and positive on the other side.)

TUNER ALIGNMENT

The tuner supplied with this television receiver was carefully aligned at the factory and should not require complete realignment under normal conditions. A slight readjustment of the individual oscillator slugs may be required as the tubes in the tuner age or are replaced. In some rare cases it will be necessary to realign the tuner after replacing either of the two tubes. If any service work is performed on the tuner, realignment may or may not be required. NO ATTEMPT TO REALIGN THE TUNER SHOULD BE MADE UNTIL THE BALANCE OF THE TV RECEIVER IS KNOWN TO BE IN PROPER OPERATING CONDITION AND IS PROPERLY ALIGNED. When replacing the R. F. amplifier tube use the same type tube as the one found in the tuner. The other alternate tubes may be used for V-20 but the use of a tube other than the type found in the tuner may make it necessary to realign the R. F. and mixer stages.

R. F. AND MIXER ALIGNMENT

1. Set the CHANNEL SELECTOR to Channel 12.
2. Connect the oscilloscope through a 10,000 ohms resistor to test point (Fig. 1).

3. Connect the negative side of a 1.5 volt battery to the AGC lead of the tuner which is soldered to the blank lug of L2. The positive side of the battery should be connected to the receiver chassis.
4. Set the FINE TUNING control at the approximate midpoint of its tuning range.
5. Connect the sweep generator to the 300 ohm antenna terminals and adjust the output to sweep Channel 12.
6. Loosely couple the output from the marker generator to the antenna terminals. Use the minimum amount of coupling and signal from the marker generator required to give a good marker or pip on the oscilloscope pattern.
7. Adjust A1, A2, and A16 in the tuner for maximum gain and flat-top response curve approximately 4.5 mc. wide. All other channels should be checked to be sure they have approximately the same responses. The correct marker frequencies for each channel are given in the Picture Carrier and Sound Carrier columns of the chart on page 16. The response to the two marker frequencies should be essentially equal.
8. Disconnect the battery used to obtain negative bias.
9. Disconnect the test equipment and air check the receiver on all active channels. If it is possible to receive a normal picture on all active channels by adjusting the Fine Tuning control, further alignment will not be necessary.

OSCILLATOR ALIGNMENT

1. Set the Fine Tuning control at the approximate midpoint of its tuning range.
2. Place a non-metallic screwdriver through the openings provided in the front of the chassis and the tuner assembly and adjust the individual oscillator coil slug for each active channel to give the best possible picture. (A3 - A14 Fig. 1) This is usually the point just before sound breakup occurs.

If the oscillator slug adjustment does not have sufficient range to tune in a good picture on any active channel, it will be necessary to adjust (A15) in the tuner. The procedure for this adjustment is as follows:

WITH INSTRUMENTS

3. Set the Channel Selector to Channel 12.
4. Connect the marker generator to one of the 300 ohm antenna terminals and ground. Set the generator to 209.753 Mc.
5. Connect the output of another signal generator through 47,000 ohm resistor to Pin 3, the cathode of V4, the 12AX7 video detector and adjust the signal generator frequency to 26.1 Mc.

WITHOUT INSTRUMENTS

3. Set the Channel Selector switch to any channel on which a picture or test pattern can be received. Preferably select a station operating on the highest frequency.
4. Adjust A15 for best possible picture.
5. Repeat steps 1 and 2.
6. Repeat steps 3 through 5 if necessary

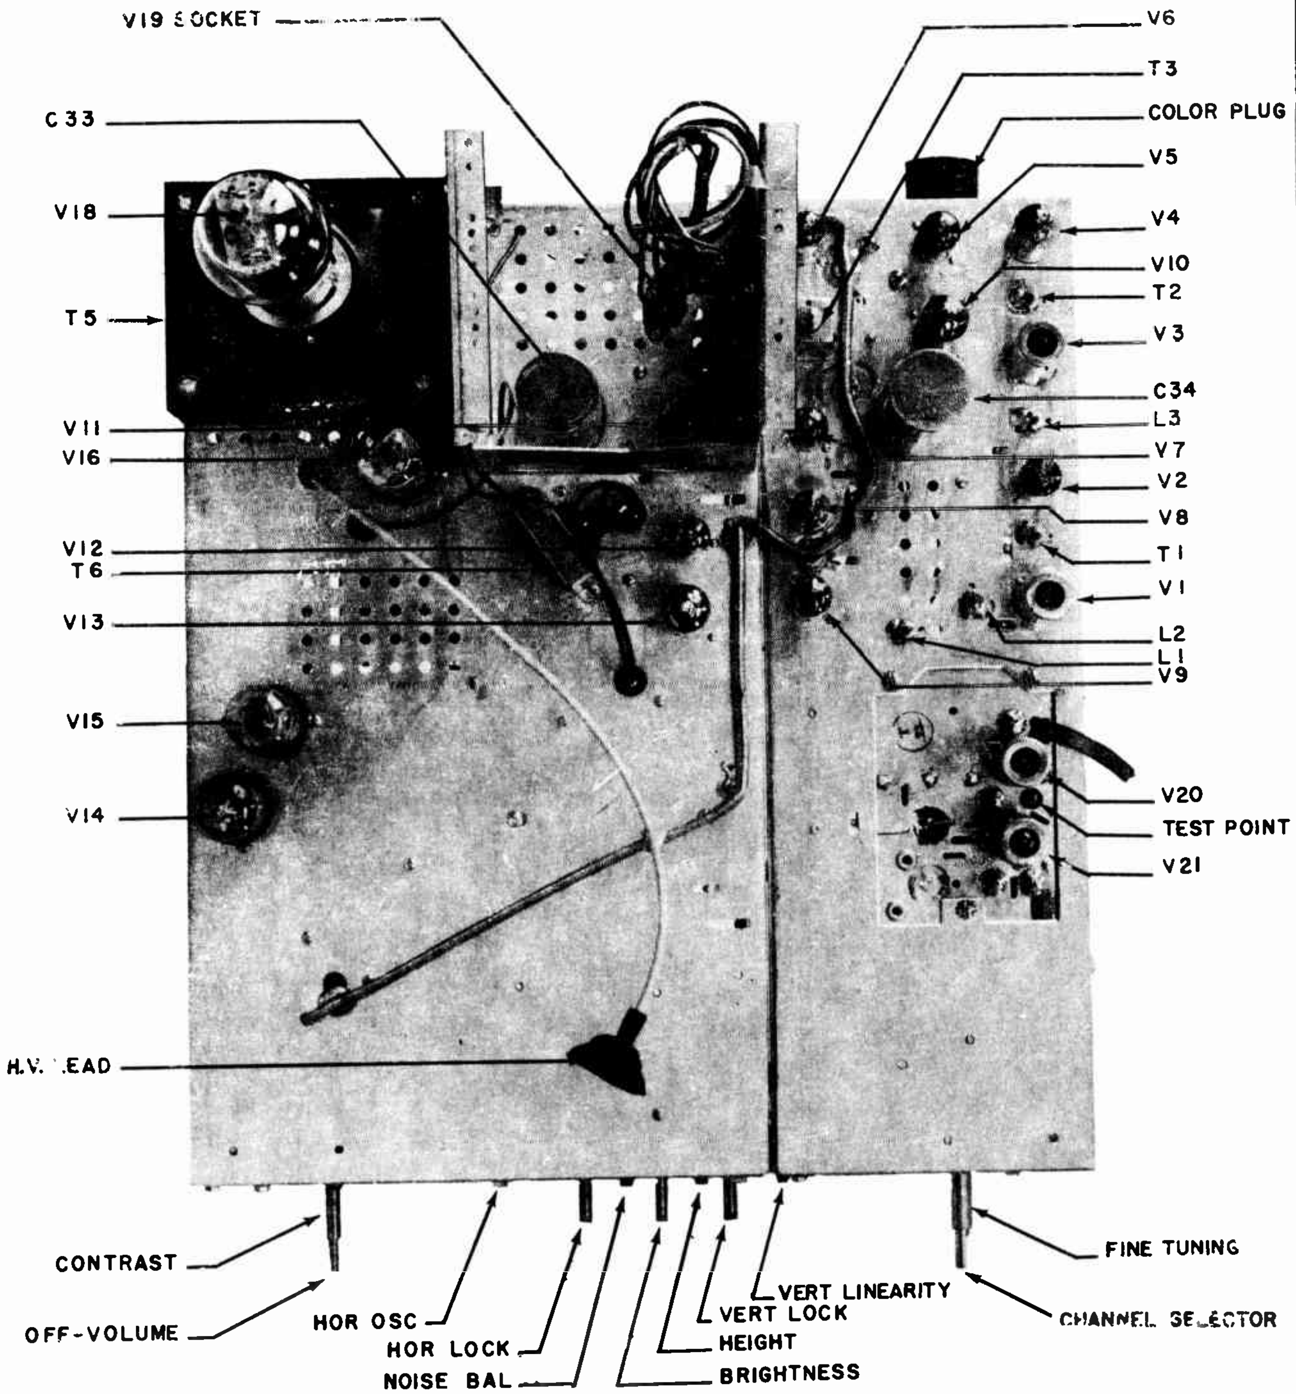

FIGURE 17
TOP VIEW - COMPONENT LOCATION

6. Connect the VTVM across C26 and adjust A15 for a zero reading on the VTVM between a positive and negative peak.
7. Use the lowest signal generator output which will provide an adequate meter indication.
8. Repeat steps 1 and 2.
9. Repeat steps 3 through 8 if necessary.

NOTES

1. Last C - 62; last R - 88. All capacitors in UUF, all resistors 1/2 watt, unless otherwise noted.
2. Pin voltages taken with VTVM. Antenna shorted. TV-PHONO switch in TV position. Contrast control minimum contrast. Noise Balance control maximum clockwise. Other controls at normal operating position. All voltages positive DC unless otherwise noted. All readings to ground except Pin 3 to Pin 4 on V11.
3. Wave form peak to peak voltages taken with video output 45 volts peak to peak.
4. PRODUCTION CHANGES:
   a. Previous serial No. 39,818, Terminal 1, N2 connected directly to 290 B+.
   b. After serial No. 46,264, Linearity coil (L-11) and capacitor C-63 eliminated from circuit and Pin 3, V16, directly connected to jumper between terminals 7 & 8, T9.
   c. After serial No. 46,889 by-pass capacitors C-70 & C-71 eliminated from primary of T-5.
   d. After serial No. 46,610, a 220 UUF by-pass capacitor (C-73) added from Pin 7, V4 to ground
   e. Previous serial No. 47,610 C-25 connected Pin 2 to Pin 7, V8.

T9	PMC-56002	Horizontal Output Transformer	8.43

This supplement covers certain modifications in the basic 456.150 Series television receiver chassis described in 57 RL 639. These modifications entail the use of one or more of the following:

A. Electrostatic focus picture tube.
B. Twenty tube chassis.
C. Rotary switch tuner (PMB-57003).

The model numbers of chassis which have these modifications, are:

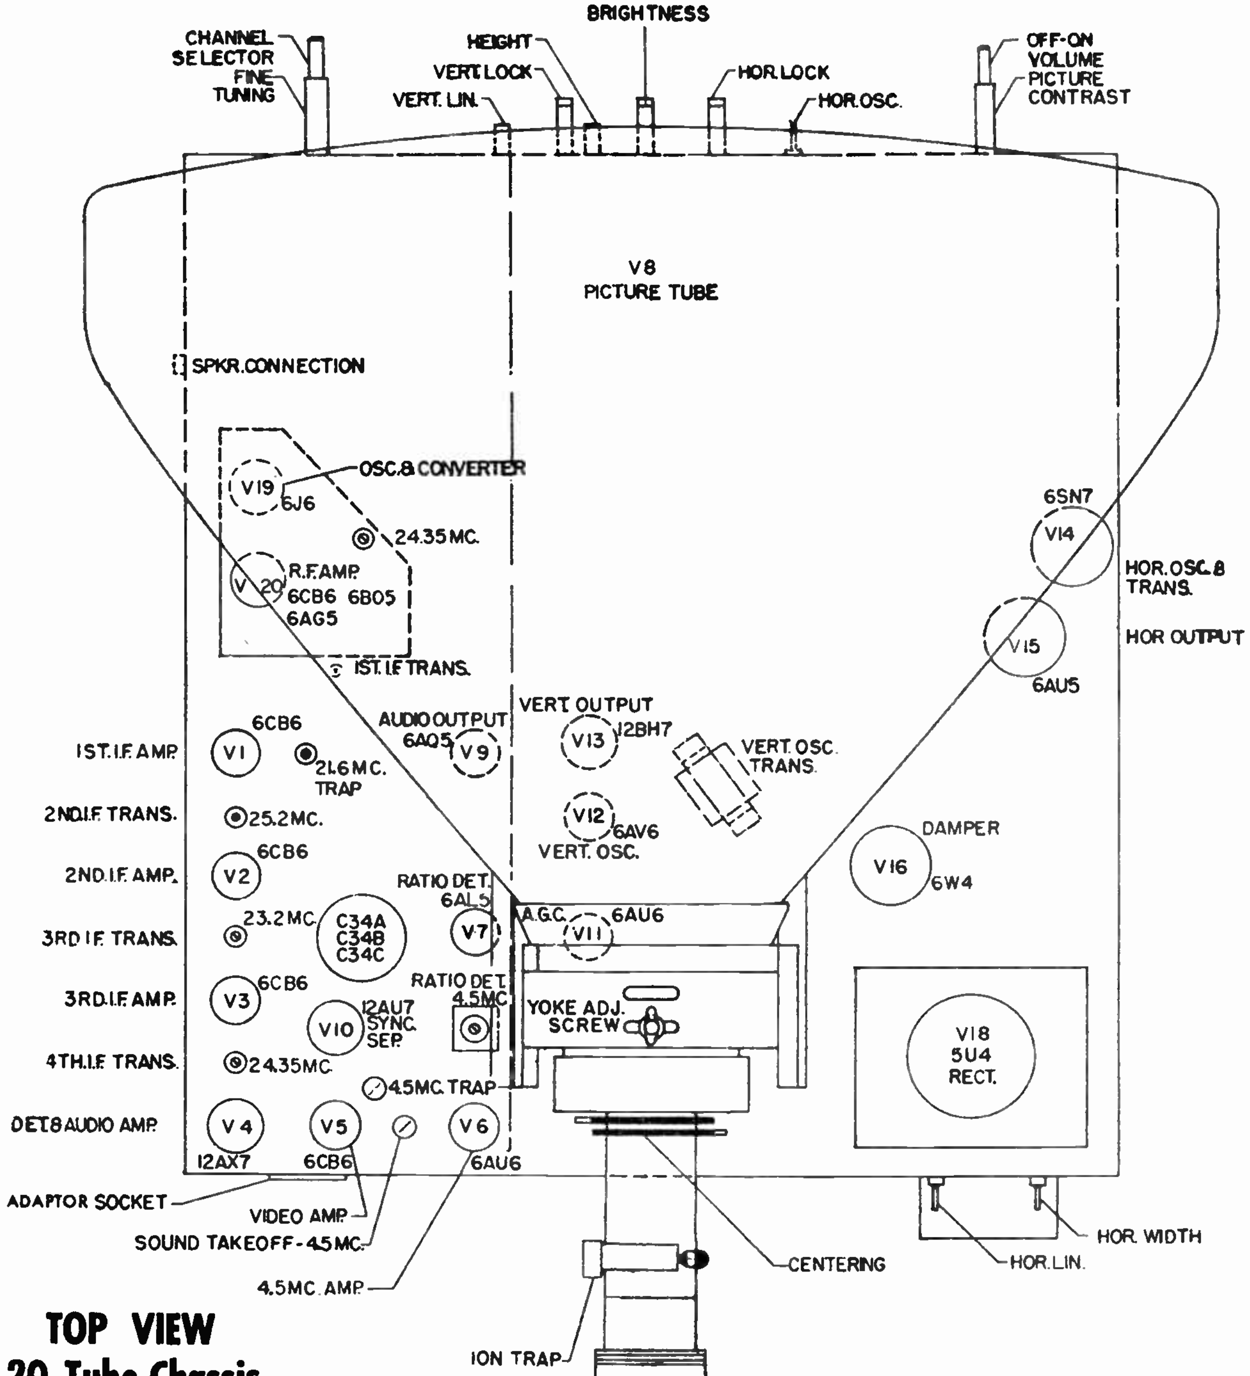
CHASSIS MODEL NUMBER	ELECTROSTATIC-FOCUS PICTURE TUBE SIZE	ELECTROSTATIC-FOCUS PICTURE TUBE TYPE	R-F TUNER	CHASSIS CIRCUIT
456.150-3	21"	21MP4	Turret Pentode (PMB-57001)*	20 Tube
456.150-6	20"	20HP4/20MP4	Rotary Switch (PMB-57003)†	21 Tube*
456.150-7	17"	17HP4	Rotary Switch	20 Tube
456.150-9	17"	17HP4	Turret Pentode*	21 Tube*
456.150-12	17"	17HP4	Turret Pentode*	20 Tube
456.150-13	20"	20HP4/20MP4	Turret Pentode*	21 Tube*
456.150-17	17"	17HP4	Rotary Switch	21 Tube*

*This is the chassis circuit and tuner described in Service Instructions 57 RL 639.
†Chassis 456.150-6 used the Rotary Switch tuner only in limited production. It is now being produced with Turret Pentode tuner.

The Chassis Listed Above Are Used in the Following Models:

CATALOG NO.	TYPE	CHASSIS NUMBERS
1260*	Table Model	456.150-6
1266*	Consolette	456.150-6
1299	Table Model	456.150-7; 456.150-9; 456.150-12; 456.150-17
2260*	Table Model	456.150-6
2266	Consolette	456.150-6
2280	Table Model	456.150-6; 456.150-13
2286	Consolette	456.150-6
2287	Consolette	456.150-6
2289	Table Model	456.150-9; 456.150-12; 456.150-17
2290	Consolette	456.150-9; 456.150-17
2297	Consolette	456.150-3
2298	Consolette	456.150-3

*Some units of these models also contain the chassis described in Service Instructions 57 RL 639.



TOP VIEW
20 Tube Chassis

ALL MODELS USING THE TWENTY TUBE CHASSIS

The twenty tube chassis is similar to the basic chassis described in Service Instructions 57 RL 639 except for the omission of the Noise Balance circuit.

The second half of V-4 (Type 12AX7), which formerly functioned as the Noise Balance Control, is used as the audio amplifier in these models, and V-8, the type 6AV6 tube, which was formerly used for audio amplification is omitted. There is no coupling between the two halves of the twin triode V-4, in the twenty tube receivers even though they are in the same envelope. The output from the first half, the video detector, is coupled to the video amplifier (V-5) only. The signal input to the second half of V-4 is taken off the potentiometer, R13A (Volume Control), across which is developed the audio signal voltage from the 4.5 Mc ratio detector, V-7. There is no phono jack on the twenty tube chassis. The voltage reading on the pins of V-4 are as follows:

VIDEO DETECTOR PIN NO.	VIDEO DETECTOR VOLTAGE	FUNCTION	AUDIO AMPLIFIER PIN NO.	AUDIO AMPLIFIER VOLTAGE
1	0	Plate	6	100
2	—.25	Control Grid	7	—.75
3	0	Cathode	8	0
4	6.3 AC	Filament	5	6.3 AC

Pin No. 9 is a common ground for both halves of the filament. The voltage readings on the pins of the other tubes in the twenty tube chassis are the same as for the twenty-one tube chassis described in Service Instructions

ALL MODELS USING AN ELECTROSTATIC FOCUS PICTURE TUBE

The use of an electrostatic focus picture tube requires no change in the basic 456.150 Series chassis circuit described in Service Instructions The voltage for the focusing element, Pin 6 (Omitted on electromagnetic focus tubes), is applied to the corresponding pin in the picture tube socket of all chassis. This voltage is taken from a binding post on a terminal strip, and is derived, by means of a jumper, from the red lead of the vertical output transformer (T-7). This terminal is also the source for the voltage on Pin 10 of the 20HP4, 20MP4, and 21MP4 type tubes. Pin 10 of the 17HP4 type picture tube (And all electromagnetic focus tubes) receives its voltage from the 290V B+ supply.

To remove or install an electrostatic focus picture tube, follow the directions given in 57 RL 639 on picture tubes except for reference to the focus assembly and focus adjusting screw, which are not used with these tubes.
Centering adjustment is accomplished by the Centering Rings, consisting of two co-axial rings adjustable with respect to each other. These rings should be located as far forward on the neck of the tube as possible. To make the centering adjustments, rotate each of the Centering Rings separately until the picture is properly centered. With the picture properly centered, set the Brightness control slightly above its normal value and re-adjust the Ion Trap Magnet for maximum brightness.

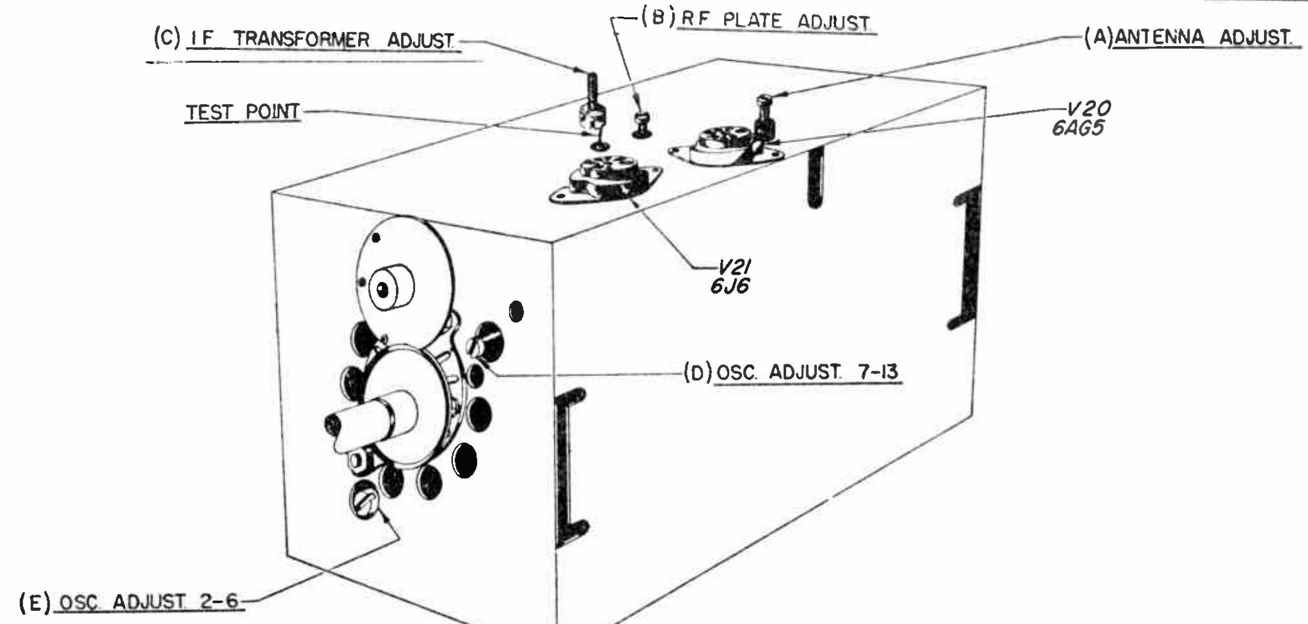


DIAGRAM R-F TUNER PMB-57003

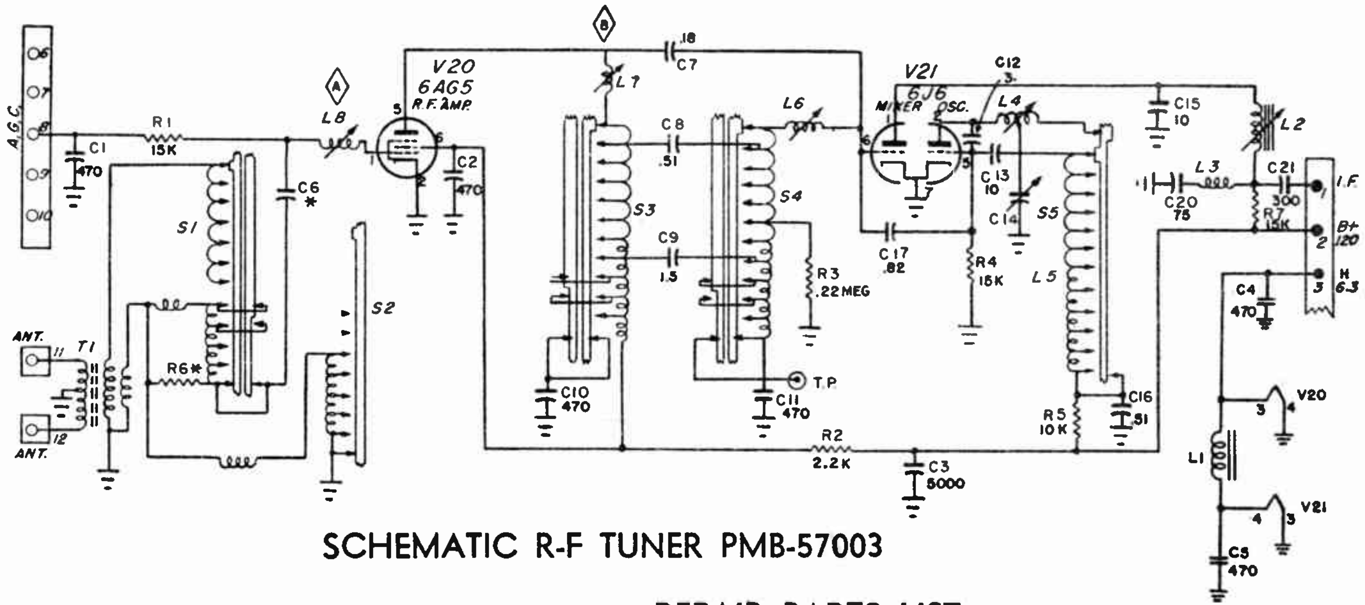
ALL MODELS USING THE ROTARY SWITCH TUNER — PMB-57003

The Rotary Switch tuner has an R-F selector that is electrically equivalent to a tapped coil whose inductance is reduced from its maximum value by means of a rotary switch. This switch progressively shorts additional taps to ground as the selector knob is rotated and the oscillator coils are switched in and out of the circuit from channel 2 to channel 13.

The R-F amplifier tube is a type 6AG5, 6BC5, or 6CB6. A twin triode, type 6J6, is used for the combination mixer and oscillator.



SCHEMATIC R-F TUNER PMB-57003

ALIGNMENT PROCEDURE

Note: This tuner has been carefully checked and aligned at the factory to give the best possible performance. Alignment should not be necessary in the field unless tubes or other components are replaced.

OSCILLATOR ADJUSTMENT

1. Turn station selector to channel 13.
2. Connect signal generator, adjusted to correct channel 13 oscillator frequency, to the antenna.
3. Connect oscilloscope to test point through 10,000 ohms.
4. Set fine tuning in center of range. Check channel 13 and 6 for zero beat on scope.

If necessary to make adjustments to the oscillator, the following steps should be followed:

A. Align high channels for correct frequency with channel 13 oscillator screw (Adjustment "D," see illustration). A non-metallic screwdriver is advisable.

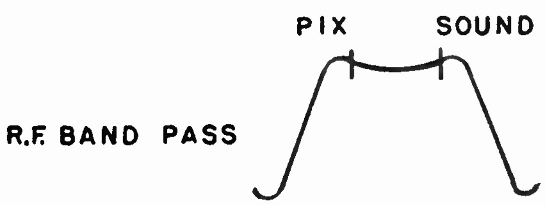
B. Align low channels for correct frequency with channel 6 oscillator screw (Adjustment E).

C. Adustment of channel 13 and channel 6 oscillator brings all other channels in adjustment. Do not back up the screws more than 8 turns from tight. At that point the electrical effect has ceased. Further backing will cause the screw to drop out.

Notes: Cover and tube shields to be on. Have rated supply voltages fed to tuner. Allow at least 3 minutes to warm up. When replacing oscillator tube, select one which requires minimum touch-up. Clockwise rotation of screws increases frequency.

BAND PASS ALIGNMENT

1. Use R-F sweep to antenna and oscilloscope to the test point through 10,000 ohms.



2. The oscillator must be operating for each channel at nearly the correct frequency.
3. Align channel 13 R-F plate (Adjustment B) and R-F grid (Adjustment A) end inductances. Align channel 13 mixer grid end inductances by spreading or pushing together the turns. The band pass should include both carriers, have steep sides, and maximum gain.
4. Align the incremental loops of the R-F plate, R-F grid, and mixer grid from 12 to 7, in that order. Pushing the loops inwards increases the frequency.
5. Align channel 6 R-F plate, R-F grid, and mixer grid to obtain a flat response with maximum gain. Spreading the coils increases the frequency. Band pass should include both carriers and have steep sides.
6. Align incremental coils of R-F plate, R-F grid, and mixed grid from 5 to 2 in that order. Spreading coils increases the frequency. A tuning wand may be used to determine what change is necessary.

CAUTION: Band pass alignment is carefully made at the factory. Attempt this alignment only with proper equipment and set-up.

B+ Supply .... 120 Volts
Heater Supply .... 6.3 Volts A.C.
Grid Bias .... —.5 Volts

NOTES

1. Last C-72; last R-88. All capacitors in UUF, all resistors 1/2 watt unless otherwise noted. For wattages of wirewound resistors, see Parts List.
2. Pin voltages taken with VTVM. Antenna shorted. Contrast control minimum contrast. Noise Balance control maximum clockwise. Other controls at normal operating position. All voltages positive DC unless otherwise noted. All readings to ground except Pin 3 to Pin 4 on V-11.
3. Wave form peak to peak voltage taken with video output 45 volts peak to peak.
4. PRODUCTION CHANGES:
   a. Previous serial No. 39,828, Terminal 1, N2 connected directly to 290 B+.
   b. Previous serial No. 46,264, Linearity coil was used connected from Pin 3, V16 to Terminal 8, T9 with tap to Terminal 7, T9. Also Terminal 7 & 8, T9 connected through .04 mfd. capacitor (C-63).
   c. Previous serial No. 46,889, each side of primary, T5 by-passed to ground through .01 mfd. capacitor (C-70 & C71).
   d. Previous serial No. 47,610, C-25 connected Pin 6 to Pin 7, V6.
   e. Previous serial No. 57,858, C-19 had value of 470 UUF in chassis model 456.150-3 only.
5. C-19 connected from terminals 7 to 3, T-9, in chassis 456.150-3 only.

TELEVISION RECEIVER REPAIR PARTS LIST and SERVICE INSTRUCTIONS

This supplement covers certain modifications in the basic 456.150 Series television receiver chassis described in Service Instructions 57 RL 639. These modifications entail the use of either or both of the following:

A. Turret cascode R-F tuner, PMB-57002 or PMB-57002-1.

B. 24 inch picture tube, type 24AP4.

The model numbers of the chassis in which these modifications appear, are:

CHASSIS MODEL NUMBER	PICTURE TUBE TYPE	R-F TUNER
456.150-5	24AP4	Turret Pentode (PMB-57001)*
456.150-11†	21AP4	Turret Cascode (PMB-57002 or PMB-57002-1)
456.150-15†	20HP4/20MP4	Turret Cascode
456.150-16†	17HP4	Turret Cascode
456.150-21†	20CP4	Turret Cascode
456.150-51	24AP4	Turret Cascode
456.150-81†	21MP4	Turret Cascode

* Described in Service Instructions 57 RL 639.

† Except for CRT & R-F tuner, these chassis are same as basic 150-Series chassis. See 57 RL 639 for Repair Parts List & service Instructions.

The Chassis Listed Above Are Used in the Following Models:

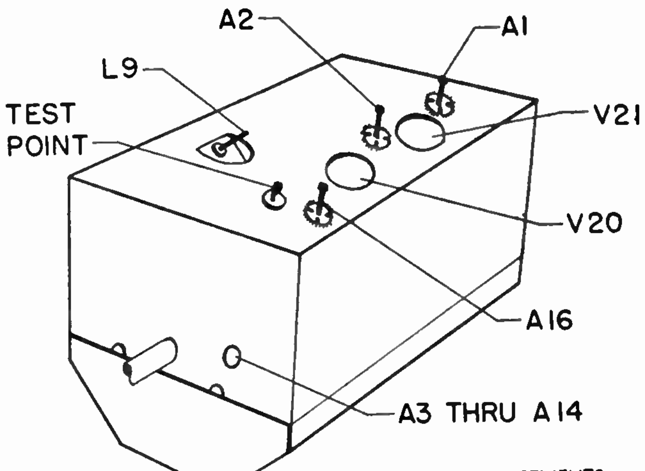
USE TYPE "Q" COIL ASSEMBLY STRIPS

R-F TUNER PMB-57002-1



TURRET TUNER ADJUSTMENTS

ALL MODELS USING THE TURRET CASCODE TUNER PMB-57002

The turret cascode tuner is a radio frequency selector that functions in the same manner as the turret pentode tuner (PMB-57001) used with the chassis models described in Service Instructions 57 RL 639 and Supplement No. 1. However, the turret cascode tuner has a twin triode tube (Type 6BK7 or 6BQ7) for the R-F amplifier. This provides two stages of R-F amplification. The second stage, a grounded grid amplifier, is directly coupled to the first stage.

The mixer-oscillator circuit in this tuner and the one in the turret pentode tuner is similar including the use of a twin triode tube, type 6J6.

The antenna, R-F, and oscillator coil assemblies are separate units for each channel and are made up of small strips that are easily removed and replaced. Each strip is held in place by a spring detent. These strips are marked with the channel number and an identification letter, which differs with each type of tuner.

For example: 3G channel 3, G type tuner.

PMB-57002-1

Certain improvements were made in the turret cascode tuner, and, beginning with production unit, Serial No. 63,838, this revised model (PMB-57002-1) replaced the original version (PMB-57002) in all applicable chassis.

There is little modification in the wiring circuit of the new cascode tuner although the value of the components have been changed. See schematic. The principal difference is in the antenna, R-F, and oscillator coil assemblies. A type 6BQ7A or 6BZ7 tube is used for the R-F amplifier.

The following identification letters have been used on the coil assembly strips of the turret tuners.

Pentode tuners, PMB-57001: "F" or "G."

Cascode tuner PMB-57002: "K."

Cascode tuner PMB-57002-1: "Q."

WHEN REPLACING A COIL ASSEMBLY STRIP, ALWAYS USE THE SAME TYPE (LETTER) AS THE ONE FOUND IN THE TUNER.

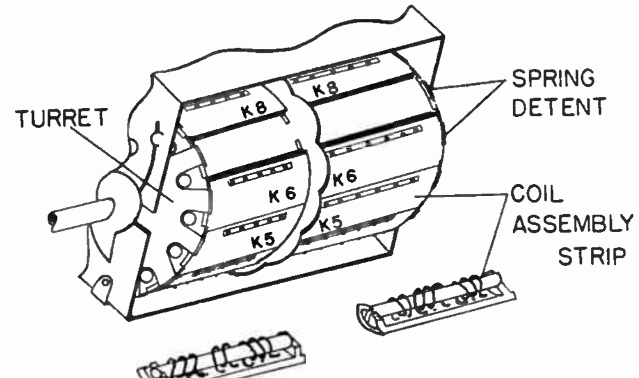
"F" and "G" strips are interchangeable in an emergency, but a substitution may make aligning adjustment difficult.

"K" and "Q" strips are never interchangeable.

In addition to the markings on the strips for each channel, a "K" or "Q" is stamped on the back of the chassis above the chassis number, to identify which cascode tuner is in the set. The new tuners are also stamped PMB-57002-1 on the bottom shield.

REPLACING A COIL ASSEMBLY

1. Remove the bottom shield of the tuner. This shield is a clip-on type, but it may be anchored in place with two machine screws on the front of the tuner.
2. Rotate the turret until the strips of the desired channel are exposed.
3. Remove the antenna coil strip or the R-F & Oscillator strip by gently prying outward on the spring detent, and pressing upward and outward on the edge of the strip.
4. Replace the strip with one for the same channel and same identification letter.
5. Replace bottom shield.



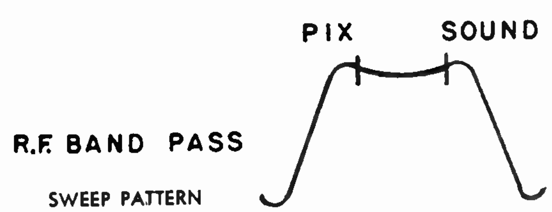
TURRET ASSEMBLY

ALIGNMENT

The following suggested method of alignment takes into consideration the changes in turret tuners discussed in the above paragraphs.

R-F AND MIXER

1. Set the Selector to channel 10, with the Fine-Tuning control at the approximate mid-point of its range.
2. Connect an oscilloscope through a 10,000 ohms resistor to test point.
3. Connect 2 volts negative bias to the AGC lead of the tuner. This lead is soldered to the blank lug of L-2 in the I-F circuit.
4. Connect a sweep generator to the 300 ohms antenna terminals and adjust the output to sweep channel 10.
5. Loosely couple the output from an A-M marker generator to the antenna terminals. Use the minimum amount of coupling and signal required to give a good marker or pip on the oscilloscope pattern.
6. Adjust A-1, A-2, and A-16 for maximum gain and flat top response curve, approximately 4.5 Mc wide. The amplitude of the middle of the curve should be judged when determining the maximum gain.
7. Set Selector and sweep generator to channel 6 and adjust A-1 (Antenna trimmer) only.
8. Check all other channels for approximately the same response. The response to the two marker frequencies should be essentially equal.
9. Disconnect equipment and air-check receiver on all active channels.



OSCILLATOR

1. Set the Fine Tuning control at the approximate mid-point of its range.
2. Place a non-metallic screwdriver through the openings provided in the front of the chassis and the tuner assembly, and adjust the individual oscillator coil slugs (A-3 through A-14) for each active channel to give the best possible picture. This is usually the point just before sound break-up occurs.

NOTE: Alignment should not be necessary unless tubes or other components have been replaced. Prior to alignment (If it is necessary), check B+ voltage supply with antenna leads disconnected and the two wires shorted. The DC voltage should be 305 volts in chassis 456.150-51, and 290 volts in the other chassis.

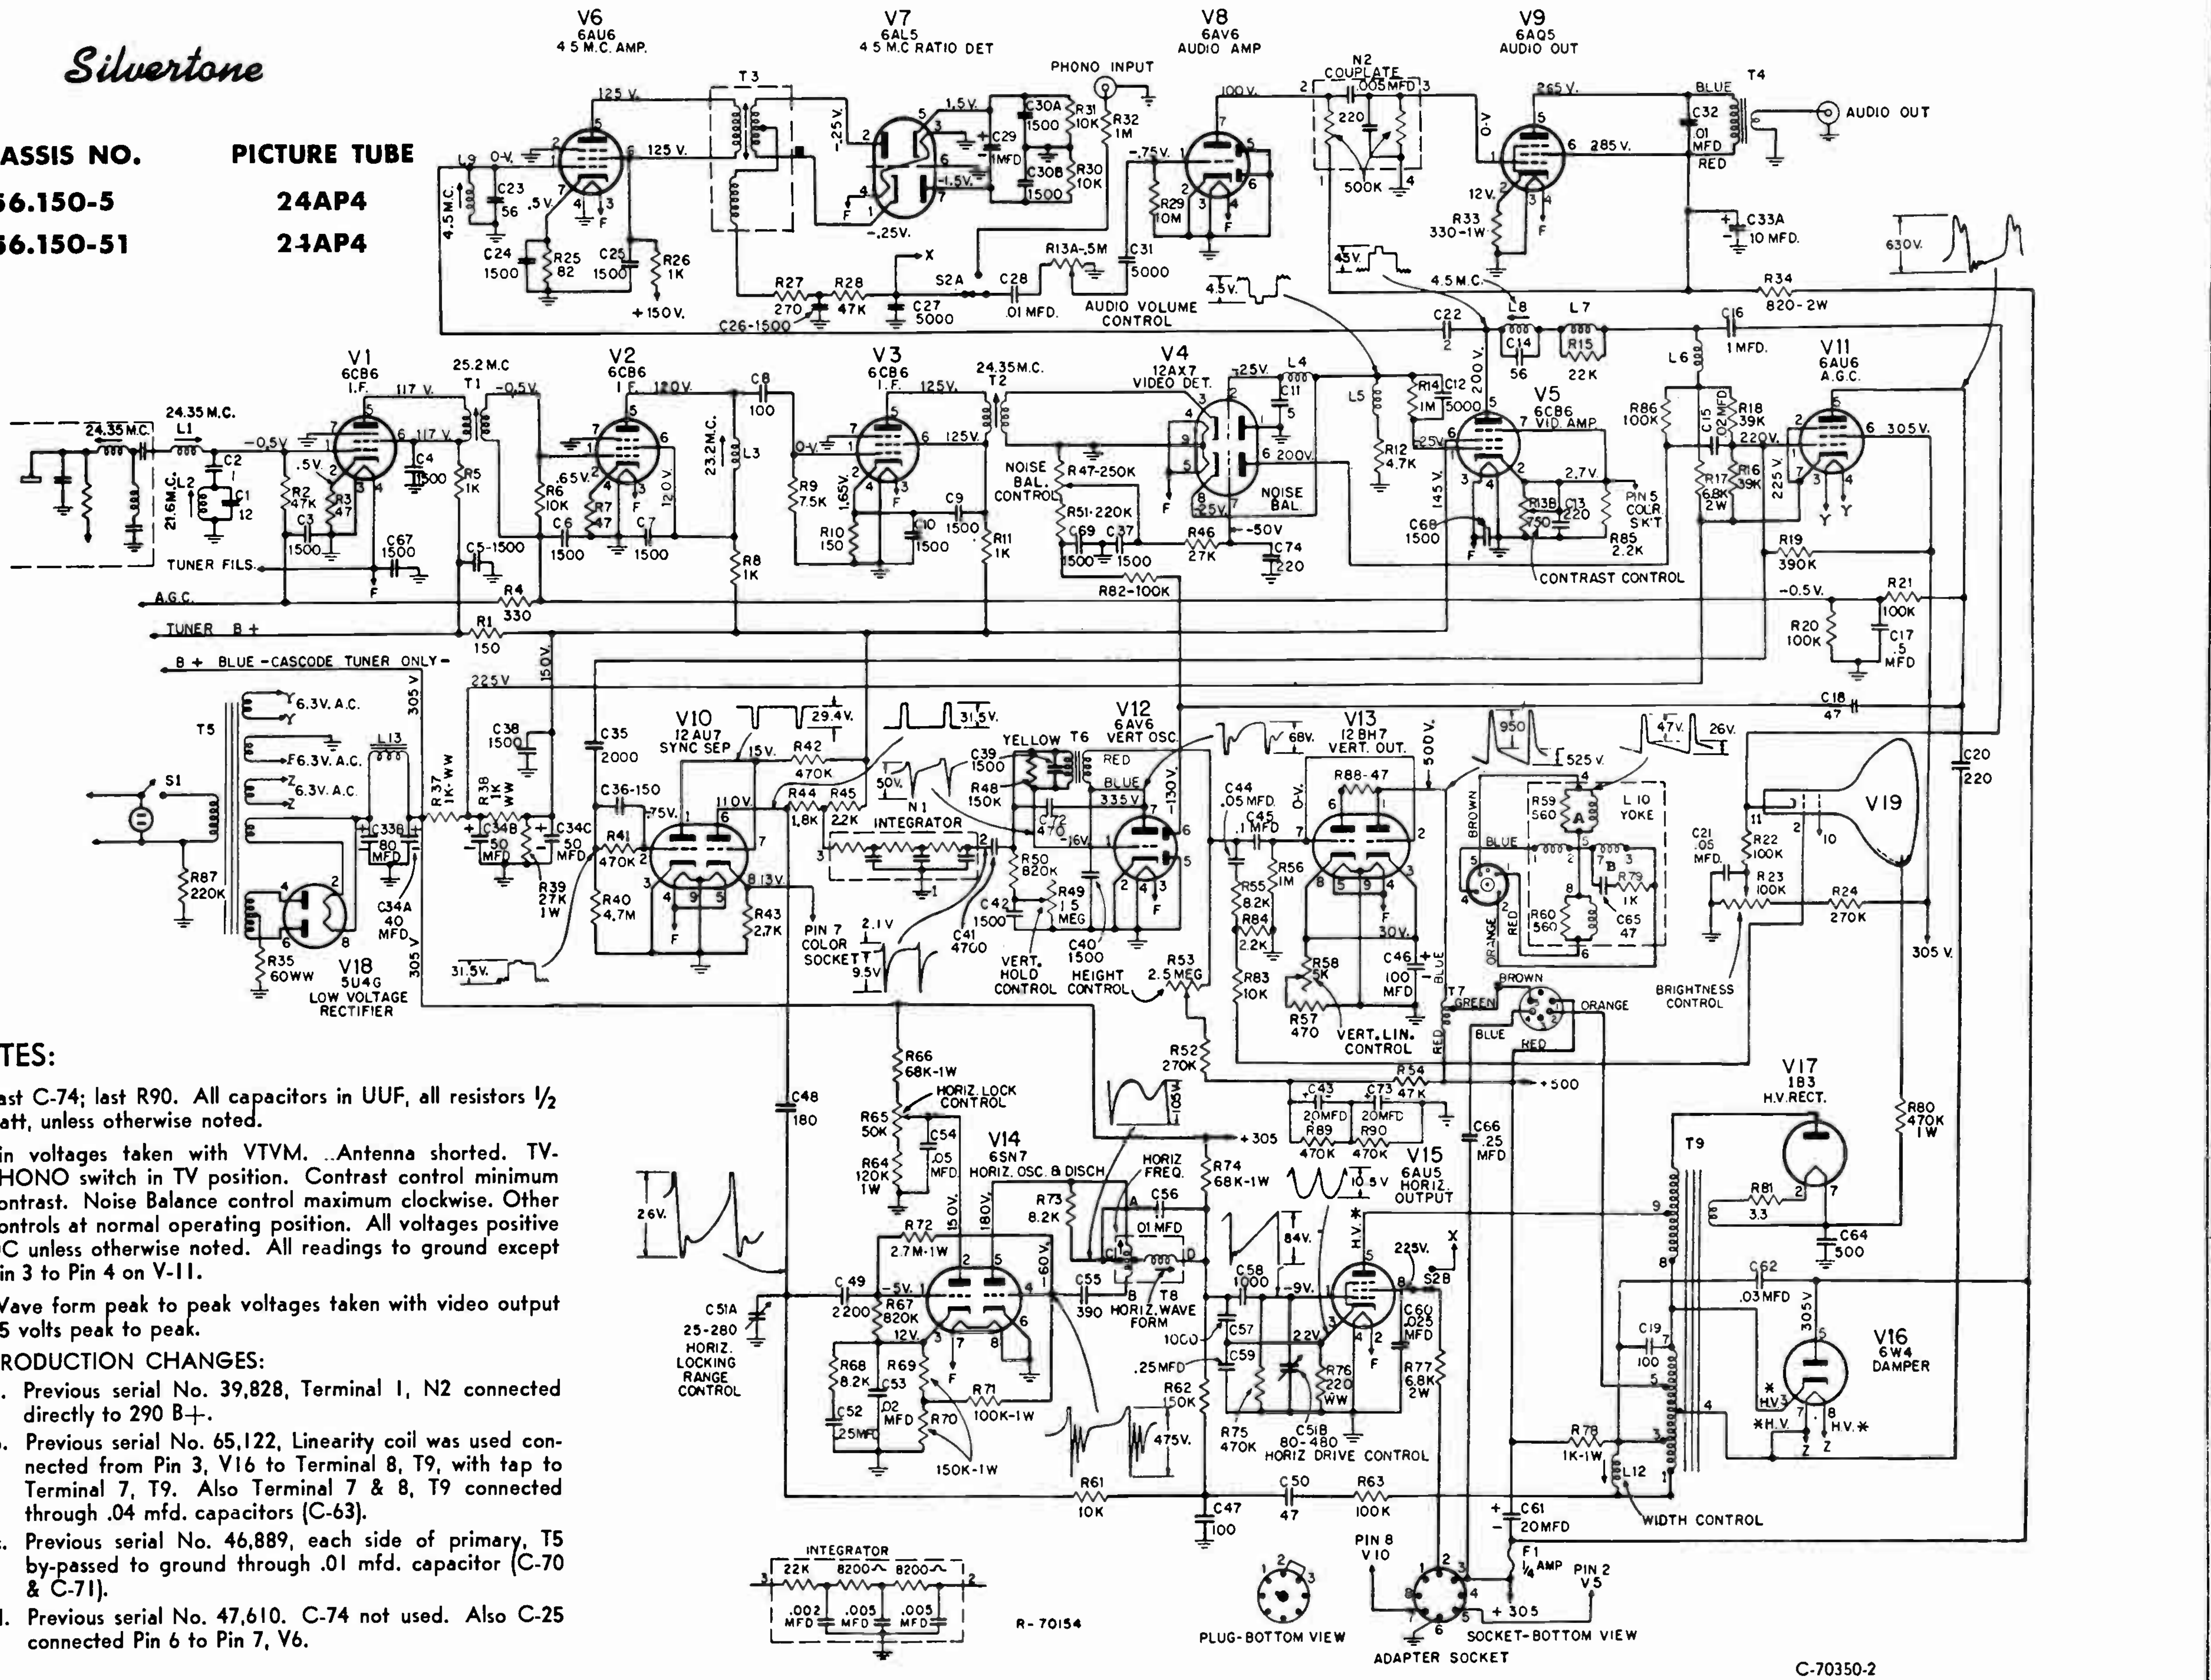
Silvertone

TV CHASSIS NO. 456.150-5, 456.150-51 — PICTURE TUBE 24AP4, 24AP4

TV CHASSIS NO.	PICTURE TUBE
456.150-5	24AP4
456.150-51	24AP4



NOTES:

1. Last C-74; last R90. All capacitors in UUF, all resistors 1/2 watt, unless otherwise noted.
2. Pin voltages taken with VTVM. Antenna shorted. TV-PHONO switch in TV position. Contrast control minimum contrast. Noise Balance control maximum clockwise. Other controls at normal operating position. All voltages positive DC unless otherwise noted. All readings to ground except Pin 3 to Pin 4 on V-11.
3. Wave form peak to peak voltages taken with video output 45 volts peak to peak.
4. PRODUCTION CHANGES:
   a. Previous serial No. 39,828, Terminal 1, N2 connected directly to 290 B+.
   b. Previous serial No. 65,122, Linearity coil was used connected from Pin 3, V16 to Terminal 8, T9, with tap to Terminal 7, T9. Also Terminal 7 & 8, T9 connected through .04 mfd. capacitors (C-63).
   c. Previous serial No. 46,889, each side of primary, T5 by-passed to ground through .01 mfd. capacitor (C-70 & C-71).
   d. Previous serial No. 47,610. C-74 not used. Also C-25 connected Pin 6 to Pin 7, V6.

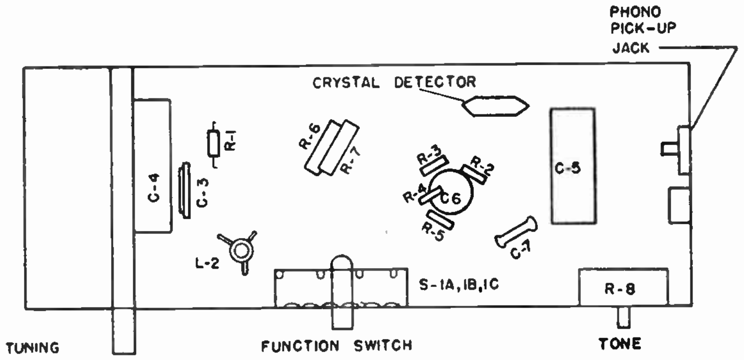
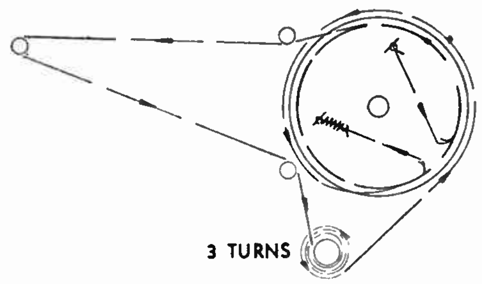
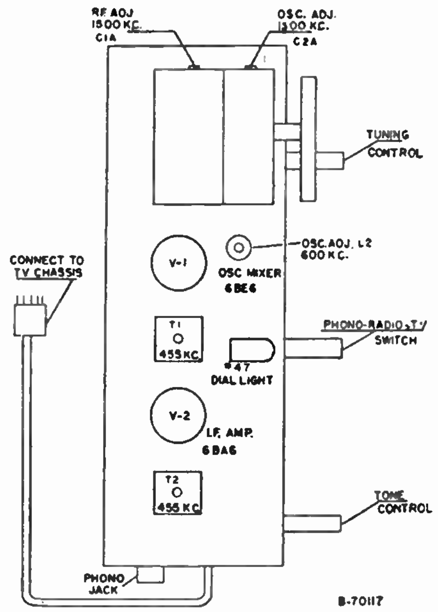
CHASSIS 456.155 — SCHEMATIC



CHASSIS 456.155 — BOTTOM VIEW



456.155 RADIO DIAL STRINGING



CHASSIS 456.155 — TOP VIEW

A-M RADIO TUNER, CHASSIS 456.155

This A-M radio tuner is mounted in the phono drawer below the picture tube and has a control panel separate from the television controls. The audio amplifying and audio output circuits of the television receiver provide these functions for radio reception. The automatic record changer, 456.216, also uses the audio circuit of the television receiver. A three position function switch on the radio control panel S-1a, 1b, 1c (radio schematic) permits changing the source of the audio signal voltage across the volume control potentiometer (R-13a, TV schematic) from TV to radio or phonograph, as desired. The A-M radio tuner is connected to the television circuit through an adapter socket on the back of the TV chassis. The AC line from the phono motor is also plugged into the back of the TV chassis, but the phono pick-up lead is plugged into the A-M radio tuner.

AM RADIO TUNER CHASSIS 456.155 ALIGNMENT PROCEDURE

PRELIMINARY INSTRUCTIONS

Disconnect radio plug and phono motor from television chassis.

Remove radio chassis from phono drawer after disconnecting phono jack. The radio chassis mounting board is held in place with wood screws that may be reached from the underside of the phono drawer. The drawer can be withdrawn from the cabinet by removing the two pins in the metal drawer slides on the bottom.

After removing the radio chassis, replace plug-connect on back of television chassis.

Set RADIO-PHONO-TV function switch to RADIO position.

Set Volume and Tone control at full clockwise position.

With tuning gang fully closed, align dial pointer exactly ⅝" from left edge of dial panel background.

Connect output meter across voice coil.

NOTES: Use an insulated alignment screwdriver.

Use signal generator having 30% modulation at 400 cycles.

Attenuate signal generator to keep output meter reading below 1.25 volts A.C.

DUMMY ANTENNA	SIG. GEN. COUPLING	SIG. GEN. FREQUENCY	DIAL SETTING	ADJUST	REMARKS
1.) .1 mfd.	High side to Pin No. 7, V-1 Radio, through .05 mfd. Low side to ground.	455 KC	Tuning gang fully open.	Top & Bottom T1. 1st I-F Top & Bottom T2 2nd I-F.	Adjust for Maximum.
2.) None	To loop (form from a few turns of wire). Place in proximity of built-in antenna.	1500 KC	Adjust gang to bring pointer 4⅛" from left edge of dial panel background.	C-2a Osc. trimmer.	Adjust for Maximum.
3.) None	Same as (2).	600 KC	1½" from left edge.	L-2 Osc. Slug Rock Gang.	Adjust for Maximum.
4.) None	Same as (2).	1500 KC	4⅛" from left edge.	C-1a R-F.	Adjust for Maximum.
		Repeat (2), (3) and (4) if necessary.			

For Service Instructions on record changer 456.216 see 57 RL 570, Supplement No. 1.

2279	Console Combination	456.150-11 456.150-81	456.860-1	456.216

Models 2276 and 2277

Chassis 456.150-8, used in models 2276 and 2277, is a 20 tube chassis with a 20 inch electrostatic focus picture tube, type 20HP4 or 20MP4, and Rotary Switch tuner, PMB-57003. For a description of a chassis of this design, see Supplement No. 1.

Chassis 456.150-14, also used in models 2276 and 2277, is a 21 tube chassis with a 20 inch electrostatic focus picture tube, type 20HP4 or 20MP4, and Turret Pentode tuner, PMB-57001. A chassis of this design is also described in Supplement No. 1. Chassis 456.150-18 is the same as chassis 456.150-14 except that it uses a Turret Cascode tuner, PMB-57002-1.

Models 3276 and 3277

Chassis 456.150-61, used in models 3276 and 3277, is a 21 tube chassis with a 21 inch electrostatic focus picture tube, type 21MP4, and a Turret Cascode tuner, PMB-57002-1. For a description of a chassis of this design, see Supplements No. 1 and No. 2.

For radio reception, these four models use chassis 456.155, a two tube A-M radio tuner. Chassis 456.155 has a built-in loop antenna and uses a type 6BE6 for the converter tube, a type 6BA6 for the 455 Kc I-F amplifier tube, and a crystal diode detector, type 1N65.

Models 2278 and 2279

Chassis 456.150-11, used in models 2278 and 2279, is a 21 tube chassis, with a 21 inch electromagnetic focus picture tube, type 21AP4, and a Turret Cascode tuner, PMB-57002-1. For a description of this chassis, see Service Instructions Supplement No. 2.

456.150-81, the alternate chassis used in these models, is a 21 tube chassis with a 21 inch electrostatic focus picture tube, type 21MP4, and a Turret Cascode tuner, PMB-57002-1. For a description of this chassis, see Service Instructions Supplements No. 1 and No. 2.

A-M - F-M radio chassis No. 456.860-1 is an eight tube superheterodyne radio receiver. For a complete description of this radio see Service Instructions

Both the television and radio units are complete within themselves, with separate chassis and control panels. However, only one speaker is used, with the secondaries of the two voice coils coupled in parallel. The radio's AC power is supplied from the television's AC power line. The phonograph operates through the audio circuit of the radio, and the phonograph motor receives its power from the radio's AC power line.

SUPPLEMENT NO. 4

Silvertone

TELEVISION RECEIVER REPAIR PARTS LIST and SERVICE INSTRUCTIONS

This Supplement covers 456.150-Series television receivers that use a type 21YP4/21AFP4, electrostatic focus, glass CRT. There are also repair parts, listed in this supplement, for catalog numbers not covered previously, that contain a 456.150-Series chassis.

Chassis No. 456.150-19 has 21 tubes and uses the turret cascode tuner, PMB-57002-1. It is identical to chassis No. 456.150-81, except for the substitution of a 21YP4/21AFP4 for the 21MP4 CRT. See Service Instructions 57 RL 639 and Supplement No. 2 for a complete description of this chassis.

No. 456.150-19 is used in the following catalog numbers:

3260 Table Model	3272 Console	3280 Table Model	3298 Consolette
3261 Table Model	3273 Console	3295 Consolette	4114W Table Model
3268 Console	3274 Console	3296 Consolette	
3271 Console	3275 Console	3297 Consolette	

These catalog numbers may also use chassis No. 456.150-81.

Chassis No. 456.150-22 has 23 tubes, including the two tube AM radio tuner 456.155, and also uses the turret cascode tuner PMB-57002-1. This chassis is an alternate and is identical to No. 456.150-61 except for the CRT substitution. See Service Instructions 57 RL 639 and Supplement No. 3 for a complete description of this chassis.

No. 456.150-22 is used in the following catalog numbers:

3276 Consolette Combination — 3277 Consolette Combination

These models have a 456.216 record changer. See Service Instructions 57 RL 570, Supplement No. 1, for description.

Chassis No. 456.150-16 has 21 tubes, and uses the PMB-57002-1 tuner and a 17HP4 CRT. See Service Instructions 57 RL 639 and Supplements Nos. 1 and 2 for description.

No. 456.150-22 is used in the following catalog numbers:

SPECIFICATIONS

POWER SUPPLY

All models 117 volts AC, 60 cycle unless otherwise specified. Power Consumption 105 watts.

FREQUENCY RANGE

Standard Broadcast	540-1600 KC.
Frequency Modulation (FM)	88-108 MC.

ANTENNA EQUIPMENT

These models have a Silvertone built-in antenna system which will provide excellent local reception on both the AM and FM bands. For locations where an outside antenna is necessary a special Silvertone AM-FM Antenna Kit Catalog No. 6710 is available.

INTERMEDIATE FREQUENCIES

AMIF Carrier	455 KC.
FM IF Carrier	10.7 MC.

POWER OUTPUT

Undistorted	2.75 Watts
Maximum	4.50 Watts

ALIGNMENT PROCEDURE

WARNING: No attempt should be made to adjust the alignment of this receiver without using the following equipment: Signal Generator, FM Sweep Generator, Cathode Ray Oscilloscope, Output Meter Insulated Screw Driver.

AM ALIGNMENT

Output meter connection	Across speaker voice coil
Generator ground lead connection	Receiver chassis
Generator modulation	30% 400 cycles
Position of volume control	Fully on
Position of tone control	Fully counterclockwise
Position of FM-AM-PHO Switch	AM

A Hazeltine loop may be used to radiate a signal into the receiver loop instead of the dummy antenna connections listed below.

TUNER POSITION	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	CORE & TRIMMER ADJUSTMENTS (IN ORDER SHOWN)	CORE OR TRIMMER FUNCTION
Open	455 KC.	0.1 Mfd.	Transl-Grid	T4-A, T4-B T2-A, T2-B	I. F.
1650 KC.	1650 KC.	50 Mmfd.	Ext. Ant.	C11	Osc.
1400 KC.	1400 KC.	50 Mmfd.	Ext. Ant.	C 5	Ant.

FM IF ALIGNMENT

Sweep generator frequency	10.7 MC.
Sweep generator deviation	300 KC.
Dummy antenna	0.1 Mfd.
Sweep generator ground lead connection	Receiver chassis
Position of tuner	Open
Position of volume control	Fully on
Position of tone control	Fully counterclockwise
Position of FM-AM-PHO switch	FM

Make shielded probe shown in Figure 1 for use with Oscilloscope where indicated below.

GENERATOR CONNECTION	OSCILLOSCOPE CONNECTION	CORE ADJUSTMENTS	ADJUST FOR CURVE IN	CORE FUNCTION
FM - First IF grid	Probe - across T5 - Primary	T3-A, T3-B	Figure 2	IF
Trans-Grid	Probe - across T5 - Primary	T1-A, T1-B	Figure 2	IF
FM - Second IF grid	Across C35	T5-A, T5-B	Figure 3	Disc.

FM RF ALIGNMENT

Output meter connection	Across speaker voice coil
Sweep generator deviation	22.5 KC.
Dummy antenna	Two 120 ohm resistors
Sweep generator connection	FM antenna board
Position of volume control	Fully on
Position of tone control	Fully counterclockwise
Position of FM-AM-PHO switch	FM

POSITION OF TUNER	GENERATOR FREQUENCY	TRIMMER & COIL ADJUSTMENT	TRIMMER OR COIL FUNCTION
Open	108.5 MC.	C10	Osc.
108MC.	108.0 MC.	C 9	Transl.
Closed	88.5 MC.	L 4	Osc.
88 MC.	88.0 MC.	L 3	Transl.

T7	R55-74585-1	Transformer - Power

The models covered in this RL are fundamentally the same, differences being mainly in values of component parts rather than in basic circuit arrangement. All employ a 23 tube circuit and provide for 82 channel reception by the use of a 12 channel, turret type, VHF tuner, and a continuous tuning UHF converter. See Fig. 1 for tubes and function.

Chassis 528.247, 528.247-1, 528.247-2 and 528.256 use a 21AP4 Silvertone metal picture tube; all other chassis use a 21ZP4 Silvertone glass picture tube. In addition all chassis except 528.256, 528.263, 528.263-1 and 528.263-2 are equipped with a tone control, and phono jack and switch for use with any standard phonograph.

Component parts differences within the four basic chassis groups of 528.247, 528.256, 528.263 and 528.266 are shown in the parts price lists at the rear of this booklet, and in the schematic diagrams of all the models.

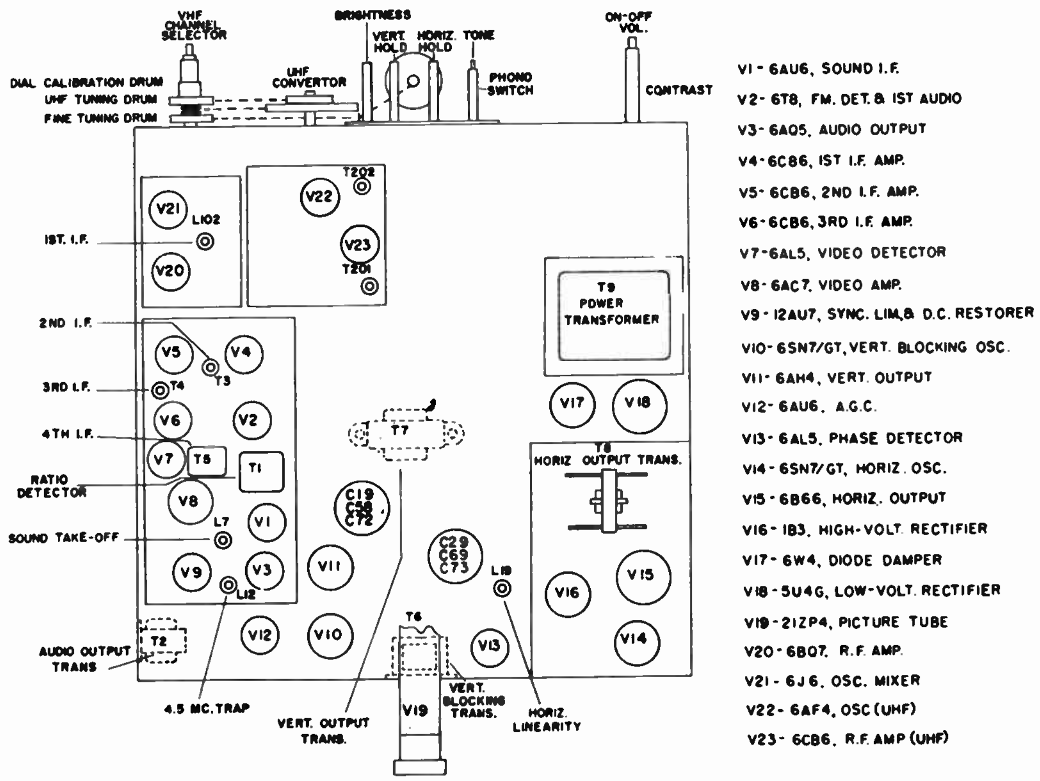

Fig. 2 Top View—Chassis 528.247, 247-1, 247-2 and 528.266, 266-1
(Components shown in broken lines can be reached from bottom of chassis.)

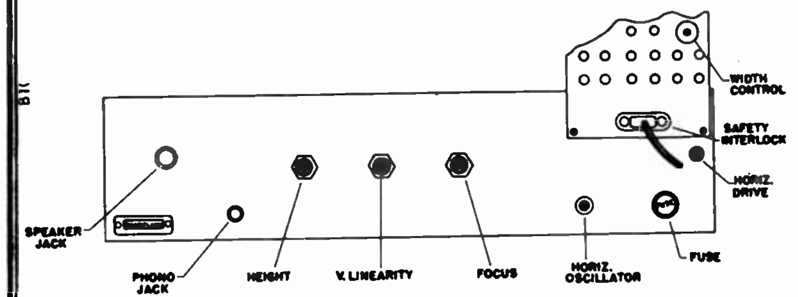

Fig. 4. Rear view of chassis showing controls

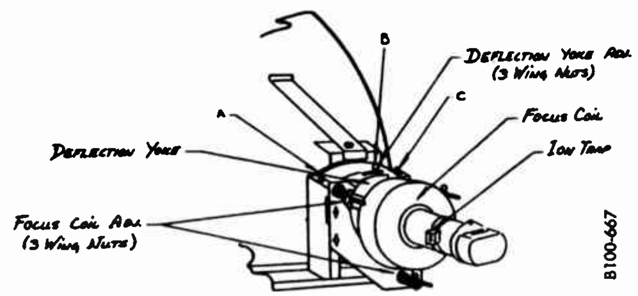

Fig. 5. Deflection and Focus Adjustments

(Chassis 528.256, 263, 263-1 and 263-2 do not contain Phono Jack.)

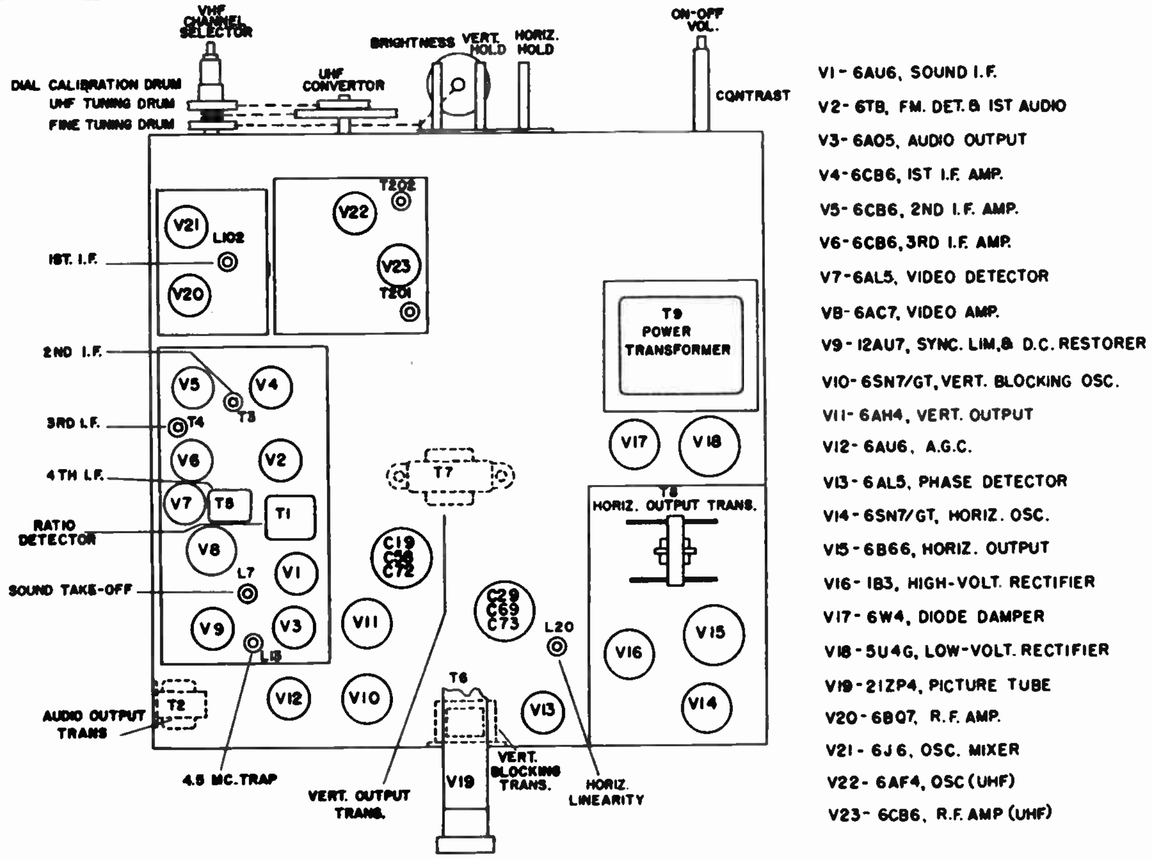

Fig. 3. Top View—Chassis 528.256 and 528.263, 263-1, 263-2
(Components show in broken lines can be reached from bottom of chassis)

TELEVISION SERVICE ADJUSTMENTS

CAUTION HIGH VOLTAGES are used in the operation of this receiver. The back cover, while in place, prevents accidental contact with this voltage and therefore should not be removed by anyone except a qualified television serviceman.

THE HIGH VOLTAGE LEAD, which supplies 12 to 16 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves. Be sure to discharge the voltage developed across the capacitor formed by the inner and outer coating of the picture tube. This can be done by connecting the high voltage socket on the tube to the outer coating.

HORIZONTAL OSCILLATOR ADJUSTMENT
If the Horizontal Hold control fails to maintain sync, the horizontal oscillator should be reset. To reset this screwdriver-adjustment, set the horizontal hold control in the center of its range and sync the picture with the horizontal oscillator adjustment screw. Check the control action on various channels and alter the screw adjustment as required to provide sync on all channels with these two controls.

DEFLECTION YOKE, ION TRAP ADJUSTMENT
Following is the proper procedure for adjusting the Deflection Yoke, Ion Trap and Focus.
The receiver should be turned on but not connected to an antenna. These steps should then be taken in the following order:

1. The Deflection Yoke should be moved as far forward as possible on the neck of the picture tube.
2. The Brightness control should be turned to maximum (clockwise) and the Picture control should be turned to minimum (counterclockwise).
3. The Ion Trap should be rotated and at the same time moved forward and backward to find the position which produces the brightest raster on the screen.
4. The Deflection Yoke should be rotated so that the top and bottom edges of the raster are parallel to the top of the chassis.
5. The Brilliance control should now be reduced (ccw) to a point where the raster is slightly above normal brilliance.
6. Center the picture within the opening of the mask and eliminate shaded corners by adjusting the three positioning wing-nuts on the focus coil. Corner-cutting or shadows at the corners may be caused by mis-adjustment of either the ion trap magnet or the Focus coil, and the two may require simultaneous adjustment to secure the brightest, yet evenly distributed light on the screen. Four self-tapping screws on the focus coil U-bracket are provided to permit vertical movement of the focus coil when necessary.

CAUTION: While adjusting the focus coil, make sure there is no strain exerted by the focus coil on the neck of the picture tube. The focus coil is supported by a U-shaped bracket held in place by four screws. Loosen these screws and raise or lower the bracket until focus coil is centered about neck of tube.

HORIZONTAL DRIVE, WIDTH AND LINEARITY ADJUSTMENTS

The horizontal drive control should be adjusted by the following procedure:
Turn the Channel Selector off of a station and loosen the Horizontal Drive Control screw until a white vertical line appears approximately 1/3 from the left edge of the raster. Then slowly tighten the Horizontal Drive until the line just disappears. Re-adjustment of the horizontal drive control may necessitate readjustment of the horizontal oscillator. Turn Channel Selector knob back to test pattern. Adjust width and horizontal linearity controls for proper width and linearity picture.
The Width control (in the H.V. cage) should be adjusted to give a picture that will fill the mask horizontally.

HEIGHT AND FOCUS ADJUSTMENTS

To adjust the overall size and linearity of the picture it is almost mandatory that a test pattern transmitted from a local station be used. Linearity adjustments, particularly, cannot be accurately made on moving transmission. It should also be remembered that in areas where more than one station is being received, that pictures transmitted from different stations will vary slightly in size. The smallest transmitted picture should be made to fill the area delineated by the mask.
With Brightness and Picture controls at normal positions for a station being received, adjust the Focus control (rear of chassis) for well-defined scanning lines.

The Height and Vertical Linearity controls (both rear of chassis) should then be adjusted for a linear picture that will fill the mask vertically. At this point the Focus adjustment previously set, should be retouched for maximum definition of the lines in the vertical wedge of the test pattern. Proper adjustment and alignment of the receiver should result in clear and sharp definition.

4.5 MEGACYCLE TRAP ADJUSTMENT

The adjustment of the 4.5 megacycle trap as given in the alignment table is a very critical adjustment; very often, satisfactory results may be obtained by adjusting this coil very slightly while looking at the picture on the raster. If this coil is adjusted very slowly and carefully the 4.5 megacycle interference can be cleaned up.
This interference may be described as a moving, shadowy bead-like appearance in the picture which is caused by a break-up at extremely close intervals in the horizontal lines. This is most easily discernable in the neutral grey shades in the raster.

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE

If raster cannot be obtained, check following for possible causes:

1. Ion trap magnet adjustment is incorrect.
2. Check ¼ amp. fuse in plate circuit of horizontal output tube.
3. No high voltage—check horizontal output tube (6BG6) and high voltage rectifier (1B3) tubes and circuits.
4. Damper tube (6W4) defective. Plate voltage supply for (6BG6) horizontal output tube is obtained through damper tube. Check tube and heater winding on power transformer.
5. Defective picture tube. Heater open, cathode return circuit open.
6. No plate voltage. Electrolytic capacitor shorted. All B+ voltages are accessible for measurement underneath chassis.

HORIZONTAL DEFLECTION ONLY

If only horizontal deflection is obtained as evidenced by straight line across the face of the picture tube, it can be caused by the following:

1. Vertical oscillator (6SN7) inoperative. Check voltages on grid and plate.
2. Vertical output transformer open.
3. Yoke vertical coils open.
4. Vertical blocking transformer open or shorted.
5. Vertical output tube (6AH4) defective.

POOR VERTICAL LINEARITY

If adjustment of the vertical height and linearity controls will not correct this condition, any of the following may be the cause:

1. Vertical output transformer.
2. Vertical oscillator (6SN7) defective; check voltages.
3. Low plate and bias voltages. Check rectifier tube, capacitors in B+ supply, and cathode circuit.

SMALL RASTER

This condition can be caused by:
Low B+ or line voltage.

2. Insufficient output from horizontal output tube (6BG6). Replace tube.
3. Insufficient output from vertical output tube (6AH4) or vertical oscillator tube (6SN7). Replace tube.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND

This condition can be caused by:

1. No signal on picture tube cathode. Check for open coupling condenser.
2. Bad contact to picture tube or lead to socket broken.

PICTURE CANNOT BE SYNCHRONIZED HORIZONTALLY AND VERTICALLY

A condition of this nature can be caused by:

1. Defective sync limiter (12AU7).
2. If tube is O.K. check voltages and associated circuits.

PICTURE STABLE BUT WITH POOR RESOLUTION

If the picture resolution is not up to standard, it may be caused by any of the following:

1. Defective video detector tube (6AL5) or video amplifier tube (6AC7).
2. Open video peaking coil. Check the following coils for continuity:
   a. On chassis 528.247, 247-1, 247-2, and chassis 528.266, 266-1, check L9, L10, L11, L12, and L13.
   b. On chassis 528.256, and 528.263, 263-1, 263-2, check L10, L11, L12, L13 and L14.
3. Leakage in grid capacitor of video amplifier tube (6AC7), or in capacitor C36 of picture tube cathode circuit.

POOR HORIZONTAL LINEARITY

Check the following:

1. Horizontal output tube (6BG6) screen voltage.
2. Horizontal drive for incorrect adjustment.
3. Horizontal output tube (6BG6).
4. Damper tube (6W4).

TRAPEZOIDAL RASTER

Check for defective yoke.

PICTURE JITTER

1. Vertical instability may be due to loose connections or noise received with the signal.
2. Horizontal instability may be due to unstable transmitted sync or to noise.

If above components are found to be not defective, check the following:

A. Check all potentials in video circuits.

B. Check the picture tube socket for poor or dirty contacts.

C. Check adjustment of focus control. It should be effective on either side of proper focus.

D. Check, and re-align if necessary, the picture IF and the local oscillator.

PICTURE SMEAR

1. Normal smear can be attributed to phase shift at the low frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits.
2. This trouble can also originate at the transmitter. Check reception from another station.

TELEVISION ALIGNMENT PROCEDURE

PRELIMINARY

This alignment is an exacting procedure and should be undertaken only when necessary. Before fully deciding that alignment is necessary and before removing the chassis from the customer's home:

1. Be sure of the antenna installation.
2. Check all operating controls and adjustments including the channel selector.
3. Check reception on all channels.
4. Check tubes by substitution of known good tubes.

TEST EQUIPMENT REQUIRED

1. Signal generator (with an output variable and at least 0.1 volt max.) to provide the following frequencies:
   (a) 4.5 Mc Sound IF
   (b) 21.75 Mc Trap (Top T5)
   (c) 24.0 Mc 1st IF (L102)
   (d) 26.1 Mc 2nd IF (T3)
   (e) 23.2 Mc 3rd IF (T4)
   (f) 25.2 Mc 4th IF (Bottom T5)
2. Vacuum tube voltmeter (VTVM).
3. Cathode ray oscilloscope, preferably with a wide band vertical amplifier and an input calibrating source.
4. Sweep generator, providing both IF and RF sweep frequencies.

ALIGNMENT PROCEDURE

I-F ADJUSTMENTS

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust
1	Raise tube shield on V21 (tuner-oscillator), so that it is not grounded, then clip the "hot" lead of the signal generator to the tube shield.	25.2	Junction R29 and L9 on Chassis 528.247, 247-1 247-2, 266 and 266-1. Junction R29 and L10 on Chassis 528.256, 263, 263-1 and 263-2	Disconnect the antenna. Set channel selector to channel on which there is no signal and no interference such as harmonics or I.F.).	T5 (bottom maximum
2		23.2			T4 maximum
3		26.1			T3 maximum
4		24.0			L102 maximum
5		21.75			T5 (top) minimum

RATIO DETECTOR AND SOUND I-F ALIGNMENT

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust
1	Video Grid (pin 4, V-8)	4.5 .1 volt output	Pin 2, V2	Meter on 10 Volt scale	T1 (bottom) and L7 for max. on meter.
2	Video Grid (pin 4, V-8)	4.5 .1 volt output	See Note 1	Meter on 3 volt scale	T1 (top) for zero (center) on meter
3	Junction C36, R39	4.5 .1 volt output	Pin 2, V-2	Meter on 10 Volt scale	L12 for min. on Chassis 247, 247-1, 247-2, 266, 266-1. L13 for min. on Chassis 256, 263, 263-1, 263-2.

NOTE 1: Connect two 100K ohm resistors in series. Connect one end to pin 2 of V-2 (6T8) and the other end to ground Connect the hot side of VTVM to center of the two 100K resistors, and ground side to following:

(a) In chassis 528.247, 247-1, 247-2, 266, 266-1, connect to junction of R89 (150 ohms) and R88 (47 K ohms).

(b) In chassis 528.256, 263, 263-1, 263-2, connect to junction of R88 (150 ohms) and R1 (47 K ohms).

VHF TUNER ALIGNMENT PROCEDURE

Before attempting to align the VHF tuner it is necessary that the IF amplifier be correctly aligned. It is desirable that all adjustments of the trimmers be made at channel No. 12. Where schematic locations are given in the instructions below, refer to tuner schematic diagram – Fig. 14. Refer also to Figs. 8 and 9 for adjustment points. To align the tuner proceed as follows:

(1) Connect an RF sweep generator to the antenna terminals, and a 3 volt negative bias battery to AGC bus.

(2) If the generator is not provided with internal crystal controlled or crystal calibrated markers, connect a marker generator to the antenna terminals.

(3) Connect a cathode ray oscilliscope across the picture detector diode load resistor (6.8 K ohms).

(4) Adjust the RF generator for a 10 Mc. sweep width with a center frequency at approximately 207 Mc.

(5) Adjust the marker generator for the sound carrier of channel 12 (209.75 Mc.).

(6) Set the range switch to channel 12 with the fine tuning in the middle of its range.

(7) Turn the receiver on and allow it 15 minutes to warm up and stabilize.

(8) Set the PICTURE control for 1 volt, measured from pin "5" of Video Amplifier to chassis.

(9) Align C101, C102, and C103 for a curve similar to that shown in Fig. 7.

(10) Change the station selector to the various channels and using the correct setting of the RF sweep generator (to center it in the channel) and the correct marker frequency for the sound carrier, adjust the core in L101 so that the sound marker will be in the proper position on the curve (Fig. 7).

NOTE: Each core is independent of those for other channels. This enables you to adjust any one channel without changing the adjustment on all other channels.

UHF CONVERTER ALIGNMENT PROCEDURE

(Where schematic locations are given ,in the below instructions, refer to schematic diagram, Fig. 13. Refer also to Fig. 12, below, for adjustment points.)

1. VHF should be aligned properly before setting up UHF.
2. Remove UHF Oscillator Tube 6AF4 from socket; connect VTVM across video detector laod resistor of receiver. (L101, Fig. 12), same as on all VHF channel oscillator slugs.
3. Turn chnanel knob to UHF position.
4. Note that the oscillator slug for converter channel (124 Mc) is accessible from the front end of the tuner slugs.
5. Adjust oscillator slug for converter channel with 124 Mc signal into UHF antenna lead. Use 124 Mc signal from VHF Marker Generator Hickok 680.
6. Replace 6AF4.
7. A UHF signal from a suitable UHF signal generator should be fed into the antenna terminal of the UHF converter; attach vacuum tube voltmeter or detector probe to TV set detector.
8. Adjust two transformer slugs (T201, T202) for maximum meter indications.

ON AIR ADJUSTMENTS

1. Tune UHF receiver to a UHF station.
2. Adjust transformer (T201, T202) on UHF tuner for best sound and picture.

PRODUCTION CHANGES

(See schematic diagram — Fig. 17.)

The following changes were made on the above chassis as production progressed. These changes, while representing certain improvements, are not retroactive. If you have a production model which does not incorporate the changes below, do not make the change except to correct an actual complaint.

To prevent overloading of the video amplifier tube, resistor R94 has been added to chassis 528.263-1 and 263-2. Chassis 528.256 and 263 do not contain this resistor. With this change, capacitor C37 changed value. On chassis 528.263-1 and 263-2 the capacitor (C37) marked "" has replaced the other listed.

†On chassis 528.263-2 these parts replace the others listed.

PRODUCTION CHANGES

(For part numbers of these components see parts list. See also, notes, page 23.)

This diagram has incorporated the following changes, which were made c these chassis as production progressed, in order to make certain improvements. The changes are not retroactive. If you have an earlier production chassis which does n include them, do not make the change except to correct an actual complaint.

Schematic Location	Connected:	Change:
*R94	In series with screen grid of V8.	Added to chassis 528.263-1 and 263- (To prevent overloading of V8.)
*C37	Pin 6 of V8 to B minus.	Changed value — .005 mfd. in chass 528.256 and 263; now .47 mfd., in chass 528.263-1 and 263-2, as shown. (Th change accompanied change in R94 above.)
†C4	Junction of L7 and C3, to B minus	Changed value — .005 mfd. in chass 528.256, 263, and 263-1; now .01 mfd as shown. (To eliminate regeneration i sound IF.)
†R53	T6 to Vertical Hold (R54).	Changed value — 1.2 megohm in chassi 528.256, 263 and 263-1; now 1 megohn as shown. (To provide better centerin of Vertical Hold.)

The changes in the coils listed below were made simultaneously in order to improve video response.

†L9	Pin 7 of V7 to L11.	Changed value—14 uh in chassis 528.256 263 and 263-1; now 20 uh as shown.
†L10	L11 to R29.	Changed value — 550 uh in chassis 528.256, 263, and 263-1; now 220 uh as shown.
†L11	L9 to L10.	Changed value—90 uh in chassis 528.256 263 and 263-1; now 120 uh, wound or 10K ohm resistor (R96), as shown.
†L12	Pin 8 of V8 to L13.	Changed value — 175 uh, wound on 8.2K ohm resistor in chassis 528.256, 263 and 263-1; now 262 uh, wound on 10K ohm resistor (R30) as shown.
†L14	L13 to R36.	Changed value — 410 uh in chassis 528.256, 263 and 263-1; now 463 uh as shown.

PRODUCTION CHANGES

PRODUCTION CHANGES

(See schematic diagram — Fig. 16.)

The following changes were made on the above chassis as production progressed. These changes, while representing certain improvements, are not retroactive. If you have a production model which does not incorporate the changes below, do not make the change except to correct an actual complaint.

*To supply reduced B+ voltage to the UHF converter, the resistor R94 has been added to all chassis except early models of chassis 528.247. These early models do not contain this resistor.

To prevent overloading of the video amplifier tube, resistor R95 has been added to all chassis except 528.247. Chassis 528.247 does not contain this resistor. With this change capacitor C37 changed value. On chassis 528.247, the capacitor (C37) marked "" is used in place of the other listed.

†On chassis 528.247-2 this part has replaced the other listed.

††On chassis 528.266, this part has replaced the other part listed.

‡On chassis 528.247-2, 266 and 266-1, these parts have replaced the other parts listed.

‡‡On chassis 528.247-2 and 266-1, these parts have replaced the other parts listed.

This diagram has incorporated the following changes, which were made on these chassis as production progressed, in order to make certain improvements. These changes are not retroactive. If you have an earlier production chassis which does not include them, do not make the change except to correct an actual complaint.

Schematic Location	Connected:	Change:
*R94	In series with screen grid of V8.	Added to chassis 528.263-1 and 263-2 (To prevent overloading of V8.)
*C37	Pin 6 of V8 to B minus.	Changed value — .005 mfd. in chassis 528.256 and 263; now .47 mfd., in chassis 528.263-1 and 263-2, as shown. (This change accompanied change in R94 above.)
†C4	Junction of L7 and C3, to B minus	Changed value — .005 mfd. in chassis 528.256, 263, and 263-1; now .01 mfd., as shown. (To eliminate regeneration in sound IF.)
†R53	T6 to Vertical Hold (R54).	Changed value — 1.2 megohm in chassis 528.256, 263 and 263-1; now 1 megohm as shown. (To provide better centering of Vertical Hold.)

The changes in the coils listed below were made simultaneously in order to improve video response.

†L9	Pin 7 of V7 to L11.	Changed value—14 uh in chassis 528.256, 263 and 263-1; now 20 uh as shown.
†L10	L11 to R29.	Changed value — 550 uh in chassis 528.256, 263, and 263-1; now 220 uh as shown.

†L12	Pin 8 of V8 to L13.	Changed value — 175 uh, wound on 8.2K ohm resistor in chassis 528.256, 263 and 263-1; now 262 uh, wound on 10K ohm resistor (R30) as shown.
†L14	L13 to R36.	Changed value — 410 uh in chassis 528.256, 263 and 263-1; now 463 uh as shown.

TELEVISION ALIGNMENT PROCEDURE

PRELIMINARY

This alignment is an exacting procedure and should be undertaken only when necessary. Before fully deciding that alignment is necessary and before removing the chassis from the customer's home:

1. Be sure of the antenna installation.
2. Check all operating controls and adjustments including the channel selector.
3. Check reception on all channels.
4. Check tubes by substitution of known good tubes.

TEST EQUIPMENT REQUIRED

1. Signal generator (with an output variable and at least 0.1 volt max.) to provide the following frequencies:

(a) 4.5 mc	Sound IF	(d) 25.5 mc	2nd IF (T5)
(b) 21.75 mc	Trap (L8)	(e) 23.8 mc	3rd IF (T4)
(c) 24.0 mc	1st IF (L6)	(f) 26.1 mc	4th IF (T3)

2. R.F. Sweep Generator with a frequency range from 40 to 220 megacycles with a sweep width of 10 megacycles and an adjustable output of at least 0.1 volts.
3. Crystal controlled or crystal calibrated markers for the sound carrier of each channel. Picture carrier markers are desirable but not necessary.
4. Cathode ray oscilloscope, preferably with a wide band vertical amplifier and an input calibrating source.
5. Vacuum tube voltmeter (VTVM).

ALIGNMENT PROCEDURE

I-F ADJUSTMENTS

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust
3	Raise tube shield on V18 (tuner-oscillator), so that it is not grounded, then clip the "hot" lead of the signal generator to the tube shield.	26.1	Junction R13 and L2	Disconnect the antenna. Set channel selector to channel on which there is no signal and no interference (such as harmonics of I.F.).	T3 (top) maximum
4		23.8			T2 (top) maximum
5		25.5			T1 (top) maximum
6		24.0			L15 maximum
7		21.75			L14 minimum

ALIGNMENT TABLE

DISCRIMINATOR AND SOUND I-F ALIGNMENT

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust
1	Video Grid (pin 1, V-8)	4.5 .1 volt output	Pin 2 V-2	Meter on 10 Volt scale	T1 (bottom) and L7 for max. on meter. L12 for min.
2	Video Grid (pin 1, V-8)	4.5 .1 volt output	See Note 1	Meter on 3 volt scale	T1 (top) for zero on meter

NOTE 1: Connect two 100K resistors in series. Connect one end to pin of V-2 (6T8) and the other end tion of R4 (150 ohms) and R5 (47K ohms).

HORIZONTAL OSCILLATOR ADJUSTMENT

If the Horizontal Hold control fails to maintain sync, the horizontal oscillator should be reset. To reset this screwdriver adjustment, set the horizontal hold control in the center of its range and sync the picture with the horizontal oscillator adjustment screw. Check the control action on various channels and alter the screw adjustment as required to provide sync on all channels with these two controls.

DEFLECTION YOKE, ION TRAP ADJUSTMENT

Following is the proper procedure for adjusting the Deflection Yoke, Ion Trap and Focus.

The receiver should be turned on but *not* connected to an antenna. These steps should then be taken in the following order:

1. The Deflection Yoke should be moved as far forward as possible on the neck of the CRT.
2. The Brightness control should be turned to maximum (clockwise) and the Picture control should be turned to minimum (counterclockwise).
3. The Ion Trap should be rotated and at the same time moved forward and backward to find the position which produces the brightest raster on the screen.
4. The Deflection Yoke should be rotated so that the top and bottom edges of the raster are parallel to the top of the chassis.
5. The Brilliance control should now be reduced (ccw) to a point where the raster is slightly above normal brilliance.
6. Center the picture within the opening of the mask and eliminate shaded corners by adjusting the three positioning wing-nuts on the focus coil. Corner-cutting or shadows at the corners may be caused by mis-adjustment of either the ion trap magnet or the Focus coil, and the two may require simultaneous adjustment to secure the brightest, yet evenly distributed light on the screen. Four self-tapping screws on the focus coil U-bracket are provided to permit vertical movement of the focus coil when necessary.

HORIZONTAL DRIVE, WIDTH AND LINEARITY ADJUSTMENTS

The horizontal drive control should be adjusted by the following procedure:

Turn the Channel Selector off of a station and loosen the Horizontal Drive Control screw until a white vertical line appears approximately 1/3 from the left edge of the raster. Then slowly tighten the Horizontal Drive until the line just disappears. Readjustment of the horizontal drive control may necessitate readjustment of the horizontal oscillator. Turn Channel Selector knob back to test pattern. Adjust width, horizontal and linearity control for proper width and linearity picture.

On this receiver (20") there are two points on the adjustment of the the horizontal linearity control where good linearity is obtained.

The proper linearity adjustment is with the core screwed down into its coil to the second position. The first or upper position (which is improper) is with the adjustment screw protruding from the chassis to a greater extent. (Do not leave it in this position or other troubles may develop.) Recheck horizontal drive control setting and adjustment of focus control.

The Width control (in the H.V. cage) should be adjusted to give a picture that will fill the mask horizontally.

HEIGHT AND FOCUS ADJUSTMENTS

To adjust the overall size and linearity of the picture it is almost mandatory that a test pattern transmitted from a local station be used. Linearity adjustments, particularly, cannot be accurately made on moving transmissions. It should also be remembered that in areas where more than one station is being received, that pictures transmitted from different stations will vary slightly in size. The smallest transmitted picture should be made to fill the area delineated by the mask.

With Brightness and Picture controls at normal positions for a station being received, adjust the Focus control (rear of chassis) for well-defined scanning lines.

The Height and Vertical Linearity controls (both rear of chassis) should then be adjusted for a linear picture that will fill the mask vertically. At this point the Focus adjustment previously set, should be retouched for maximum definition of the lines in the vertical wedge of the test pattern. Proper adjustment and alignment of the receiver should result in clear and sharp definition.

4.5 MEGACYCLE TRAP ADJUSTMENT

The adjustment of the 4.5 megacycle trap (L12) as given in the alignment table is a very critical adjustment; very often, satisfactory results may be obtained by adjusting this coil very slightly while looking at the picture on the raster. If this coil is adjusted very slowly and carefully the 4.5 megacycle interference can be cleaned up.

This interference may be described as a moving, shadowy bead-like appearance in the picture which is caused by a break-up at extremely close intervals in the horizontal lines. This is most easily discernable in the neutral grey shades in the raster.

TRANSFORMERS AND COILS

Schematic Location	Part Number	DESCRIPTION
T1	T10-552	Transformer, Ratio Detector, 4.5 MC
T2	T80-253	Transformer, output, (audio)
T3	T10-541	Transformer, 2nd I.F. (blue)
T4	T10-542	Transformer, 3rd I.F. (white)
T5	T10-577	Coil, 4th I.F. (shielded)
T6	T80-257	Transformer, vertical blocking
T7	T80-261	Transformer, vertical output
T8	T80-279	Transformer, horizontal output
T9	T80-264	Transformer, power
L7	T10-556	Coil, 4.5 MC Sound take off (includes C7, C8, C9)
L8	T10-574	Coil, 21.75 wave trap (includes C25)
L9	T10-579	Coil, peaking 550 uh (white and black)
L10	T10-557	Coil, peaking (orange) 90 uh
L11	T10-580	Coil, peaking 175 uh wound (includes R30) (yellow and black)
L12	T10-581	Coil, 4.5 MC trap (includes C40)
L13	T10-578	Coil, peaking 410 uh wound (includes R33) (yellow and red)
L14, L19	T83-694	Coil, deflection yoke (includes C75, R64, R65)
L15	T10-560	Coil, FOCUS
L16	T10-555	Coil, HORIZONTAL OSCILLATOR (includes C66, R74)
L17	T10-551	Coil, WIDTH CONTROL
L18	T10-561	Coil, LINEARITY CONTROL

MISCELLANEOUS CHASSIS PARTS

T22-165	Connector, high voltage
T84-447	Cover assembly
T21-161	Cover, high voltage cage
T43-13	Fuse, ¼ amp., 250 v.
T43-12	Fuse, 5 amp., 250 v. (3 AG type)
T47-115	Grommet, Rubber (3)
T83-684	Ion trap, single magnet
T37-139	Insulator, resistor support
T22-133	Jack, speaker
T23-161	Line cord (8 ft.) and plug
T95-30	R. F. Tuner (Cascode)
T87-43	Receptacle, AC line
T87-44	Receptacle, fuse holder
T83-661	Retainer, tube shield (2)
T71-42	Shield, tube (2)
T68-56	Socket, shell, Corona
T68-57	Socket, octal type
T68-18	Socket, octal molded (5)
T68-43	Socket, miniature, 7 pin (8)
T68-48	Socket, miniature, 9 pin (V11)
T68-44	Socket, miniature, 9 pin (V2 & V9) (2)
T68-50	Socket, picture tube
T68-55	Socket, Ring mounting (Corona Shell)
T70-167	Spring, Focus coil (3)
T70-153	Spring, tube grounding (2)
T27-24	Strap, picture tube support
T83-693	Yoke Mounting hood

Chassis 528.258 and 528.268 are 22 tube receivers providing for 82 channel reception by the use of a 13 position, turret type VHF tuner, and a continuous tuning UHF converter (see Fig. 1 for tubes and function).

These receivers employ a 41 Mc. Intermediate Frequency in place of the more common 21 Mc. IF. The higher IF is produced by increasing the frequency output of the local oscillator circuits in the VHF tuner and UHF converter, and is designed to eliminate harmonic interference in the IF strip. Proper amplification of the signal carrying IF is obtained by the addition of a 4th pentode stage to the stagger tuned, unity coupled IF circuit. In the video detector stage a 1N64 crystal is used, providing demodulation within the higher intermediate frequency range.

Chassis 528.258 and 528.268 are basically the same except that chassis 528.258 contains a tone control and phono circuit for hook-up with any standard phonograph. Other differences are outlined in the parts list and schematic diagram included with this RL.

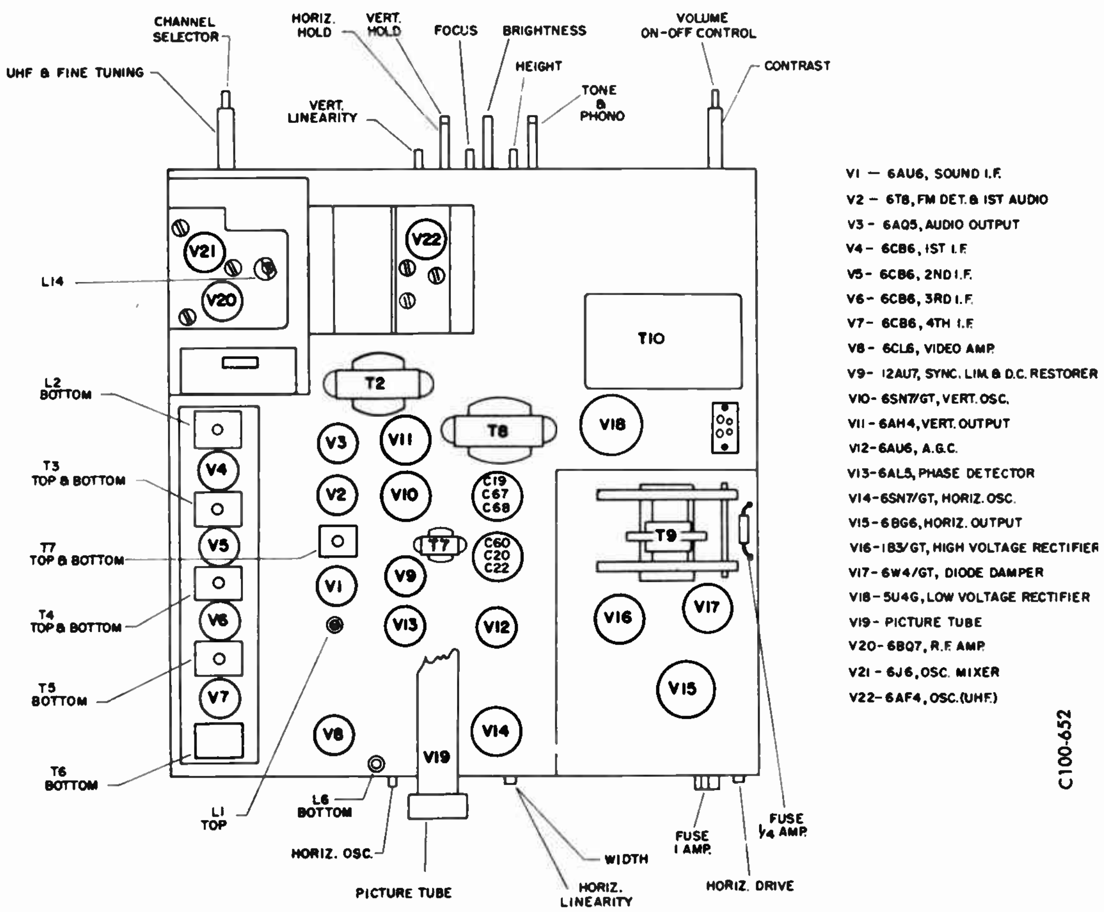

Fig. 2. Top View — Chassis 528.258

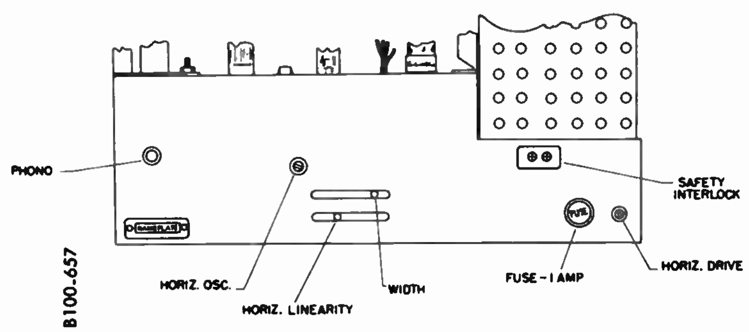

Fig. 4. Rear View Chassis Showing Controls (Chassis 528.268 does not contain Phono Jack)

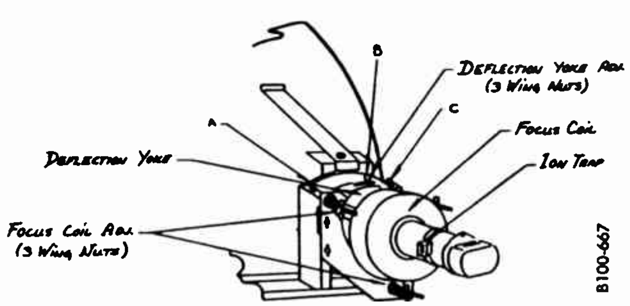

Fig. 5. Deflection and Focus Adjustments

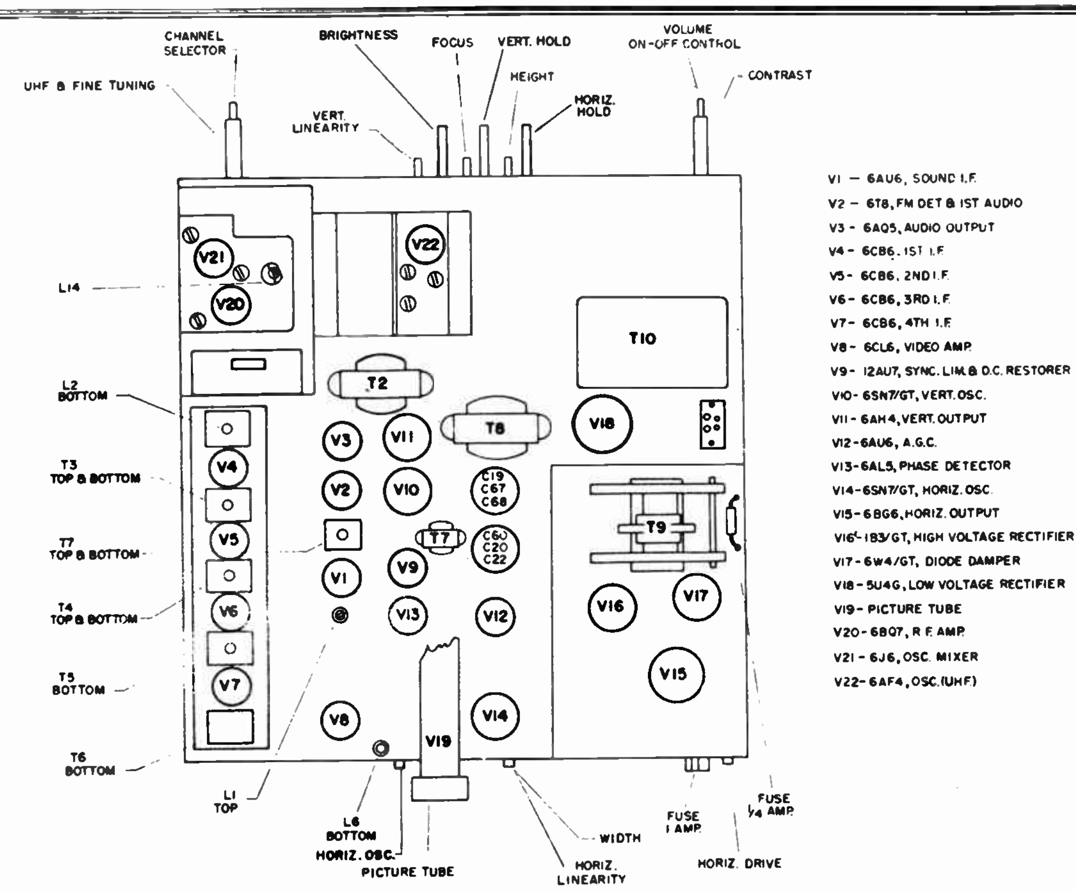

Fig. 3. Top View — Chassis 528.268

TELEVISION SERVICE ADJUSTMENTS

CAUTION HIGH VOLTAGES are used in the operation of this receiver. The back cover, while in place, prevents accidental contact with this voltage and therefore should not be removed by anyone except a qualified television serviceman.

THE HIGH VOLTAGE LEAD, which supplies 12 to 16 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves. Be sure to discharge the voltage developed across the capacitor formed by the inner and outer coating of the picture tube. This can be done by connecting the high voltage socket on the tube to the outer coating.

DEFLECTION YOKE, ION TRAP AND FOCUS ADJUSTMENTS:

Follow this procedure in adjusting the Deflection Yoke, Ion Trap and Focus Coil:

1. Turn the receiver on and disconnect the antenna.
2. Move the Deflection Yoke as far forward as possible on the neck of the picture tube by loosening wingnuts A and C, and by loosening wingnut B, rotate it so that the top and bottom edges of the raster are parallel to the chassis. See Fig. 5.
3. Turn the Brightness control to maximum (clockwise) and the contrast control to minimum (counterclockwise).
4. Rotate the Ion Trap while moving it forward and backward on the neck of the picture tube to find the position which produces the brightest raster.
5. Reduce the brightness to a point slightly above normal.
6. Center the raster within the opening of the mask and eliminate shaded corners by adjusting the three wing-nuts on the Focus Coil. Corner cutting or shadows at the corners may be caused by maladjustment of either the Focus Coil or the Ion Trap and the two may require simultaneous adjustment to obtain the brightest, yet evenly distributed light on the screen. Four self-tapping screws on the Focus Coil U-bracket are provided to permit vertical movement of the Focus Coil if necessary.

CAUTION: While adjusting the focus coil, make sure there is no strain exerted by the focus coil on the neck of the picture tube. The focus coil is supported by a U-shaped bracket held in place by four screws. Loosen these screws and raise or lower the bracket until focus coil is centered about neck of tube.

HORIZONTAL OSCILLATOR ADJUSTMENT

If the Horizontal Hold Control cannot be positioned to lock the picture in, the Horizontal Oscillator Coil may require adjustment. To reset this screwdriver adjustment, place the Horizontal Hold Control in the center of its range and lock the picture in with the Horizontal Oscillator Coil adjustment screw. Check the Horizontal Hold Control range on various channels and alter the screw adjustment as required to provide lock-in on all channels.

HORIZONTAL DRIVE, WIDTH AND LINEARITY ADJUSTMENTS

Set the Channel Selector on an unused channel and loosen the Horizontal Drive Control screw until a white vertical line appears approximately 1/3 from the left edge of the raster. Then slowly tighten the Horizontal Drive Control screw until the white line just disappears. This adjustment may necessitate readjustment of the Horizontal Oscillator. Adjust Width and Horizontal Linearity Controls for proper picture.

FINE TUNING

If the range of the Fine Tuning Control is not sufficient to tune the picture in clearly, set the Fine Tuning Control in the center of its range as shown in Fig. 15. Insert a screwdriver into the opening provided and tune the picture in clearly by adjusting the screw to the right or left. This procedure should be repeated on any channels with which difficulty is experienced.

SOUND ALIGNMENT

Step	Signal Generator Frequency	Signal Generator Connect to	Output Indicator	Connect to	Adjust	Remarks
1	4.5 Mc	Junction of R45 and L1	VTVM	See Note 1	L1 Bottom for maximum reading, T1 Bottom for maximum reading	Signal generator output below .1 volts, VTVM on low range (0-3 volts).
2	4.5 Mc	Same	Same	Junction of R6 and C9	T1 Top for zero (mid-scale)	
3	4.5 Mc	Junction of C45 and R45	Same	See Note 1	L6 for minimum reading	This adjusts the 4.5 Mc sound trap. For field adjustment see Note 2.

NOTE 1. Connect two 100K ohm matched resistors in series between Pin 2 of V2 (6T8) and ground. Connect negative lead of VTVM to the junction of the two resistors and the positive lead to junction of R6 and C9.

NOTE 2. As a field adjustment, the 4.5 Mc trap (L6) may be set on a signal by adjusting L6 for a minimum amount of graininess in the picture. This interference can be described as a moving, shadowy, bead-like appearance in the picture which is caused by a break-up at extremely close intervals of the horizontal lines. This is most easily seen in the neutral grey shades in the raster.

TELEVISION ALIGNMENT PROCEDURE

PRELIMINARY

Alignment is an exacting procedure and should be undertaken only when necessary. The following equipment is required for alignment work.

1. Signal generator, with an output of at least 1 volt maximum. Crystal controlled or calibrated markers for the sound (41.25 Mc) and picture (45.75 Mc) IF carriers are required in addition to the following variable frequencies.

4.5 Mc	Intercarrier Sound IF
41.25 Mc	Sound IF Trap (T-3, top)
42.9 Mc	1st & 3rd I.F. (T-3, bottom; T-5 bottom)
44.1 Mc	Converter and I.F. input (L-2 bottom; L-102 top)
45.2 Mc	2nd & 4th I.F. (T-4 bottom; T-6 bottom)
47.25 Mc	Adjacent Sound Trap (T-4 Top)

2. Electronic voltmeter (VTVM)
3. R.F. sweep generator with a frequency range of 40 to 220 Mc with a sweep width of at least 10 Mc, having an adjustable output of at least 0.1 volts.
4. Cathode ray oscilloscope, preferably with a wide band vertical amplifier and an input calibrating source.

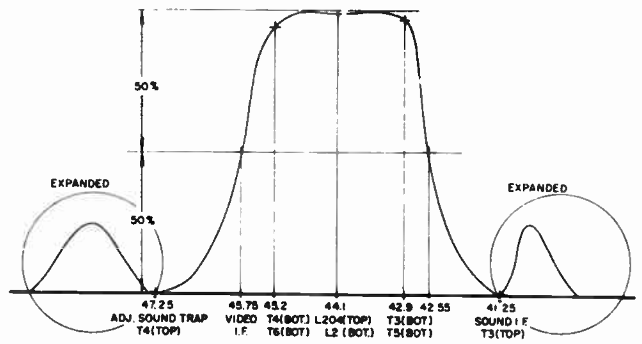

Fig. 6. 41 Mc I.F. Response

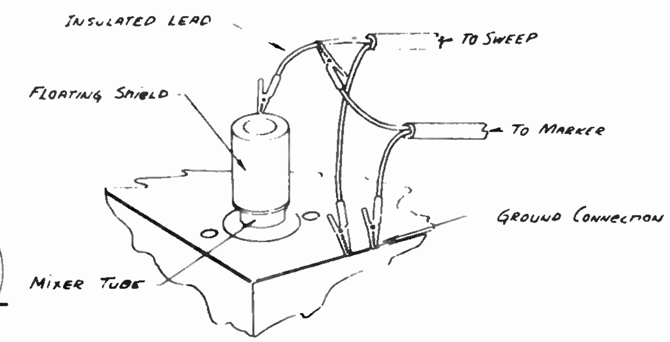

Fig. 7. I.F. Test Equipment Connections

VIDEO IF ALIGNMENT

Step	Signal Generator Frequency	Signal Generator Connect to	Output Indicator	Connect to	Adjust	Remarks
1	42.9 Mc	Floating shield on mixer tube, V-21	VTVM	Junction of R35 and L4	T3 Bottom for maximum reading	
2	42.9 Mc	Same	Same	Same	T5 Bottom for maximum reading	Apply —4.5 volt bias to AGC line, — side to C-24, + side to chassis. Short antenna terminals, set channel selector to unused channel free of harmonics or other interference. Adjust signal generator to give reading of approximately 2.5 volts on VTVM. On all "maximum" adjustments reduce generator output so that VTVM reading does not exceed 2.5 volts. On minimum adjustments increase generator output to provide definite dip on meter.
3	45.2 Mc	Same	Same	Same	T4 Bottom for maximum reading	
4	45.2 Mc	Same	Same	Same	T6 Bottom for maximum reading	
5	41.25 Mc	Same	Same	Same	T3 Top for minimum reading	
6	47.25 Mc	Same	Same	Same	T4 Top for minimum reading	
7	42.9 Mc	Same	Same	Same	T3 Bottom for maximum reading	
8	45.2 Mc	Same	Same	Same	T4 Bottom for maximum reading	
9	44.1 Mc	Same	Same	Same	L2 Bottom for maximum reading	
10	44.1 Mc	Same	Same	Same	L-102 Top for maximum reading	
11	Sweep 44 Mc, 10 Mc Sweep, Marker to freqs. in Fig. 4	See Fig. 7	Oscilloscope	Vertical terminals to junction of R35 and L4. Horizontal terminals to sweep Gen.	T6 for 45.75 Mc 50% position. L2 for correct tilt. See Fig. 6 for correct wave form	When sweeping overall pattern do not exceed 2 volts P-P (or approximately .3 volts D.C. at detector load resistor) to avoid overload and distortion of response curve.

ALIGNMENT PROCEDURE—VHF CASCODE TUNER NO. T95-33

Before attempting to align the VHF tuner it is necessary that the IF amplifier strip be correctly aligned. It is desirable that all adjustments of the trimmers be made first at channel No. 11. Where schematic locations are given in the following instructions, refer to tuner schematic diagram, Fig. 15. For adjustment points refer to detail illustration, schematic diagram and also to Fig. 8 below. To align the tuner proceed as follows:

(1) Connect an Rf sweep generator to the antenna terminals, and a 4.5 volt negative bias to AGC bus.
(2) If the generator is not provided with internal crystal controlled or crystal calibrated markers, loosely couple a marker generator to the antenna (be sure that coupling clip does not bite through antenna insulation).
(3) Connect a cathode ray oscilloscope to the test point indicated in Fig. 8.
(4) Adjust the RF generator for a 20 Mc. sweep width, with a center frequency at approximately 201 Mc.
(5) Set the channel selector to channel 11; turn the receiver on and allow it 15 minutes to warm up and stabilize.
(6) Align C101, C102, C103 for a curve similar to that shown in Fig. 9. Since there is some interaction between these adjustments, alignment should be repeated until a curve most nearly ideal is approached. Adjustments affect the curve as follows:
    C101—Greatest effect is on tilt of curve.
    C102—Greatest effect is on frequency of curve (will move it to right or left as viewed on scope).
    C103—Greatest effect is on gain (height) of curve.
(7) Change the station selector to the various channels and, using the correct setting of the RF sweep generator to center it in the channel and the correct marker frequency for the picture and sound carriers, test to see that response curve for each channel is correct. Note: The response curve may vary between higher and lower frequency channels. Alignment, in this case, may be made to favor those channels which the set actually receives.
(8) Change oscilloscope leads from RF test point to video detector load resistor.
(9) Set fine tuning control in middle of its range.
(10) Using correct picture carrier marker for each channel, adjust the individual cores (for each channel) in L101 to place picture carrier marker of 50% point on I.F. response curve (see Fig. 6).

IDEAL *Fig. 9 VHF Tuner Response* ACCEPTABLE

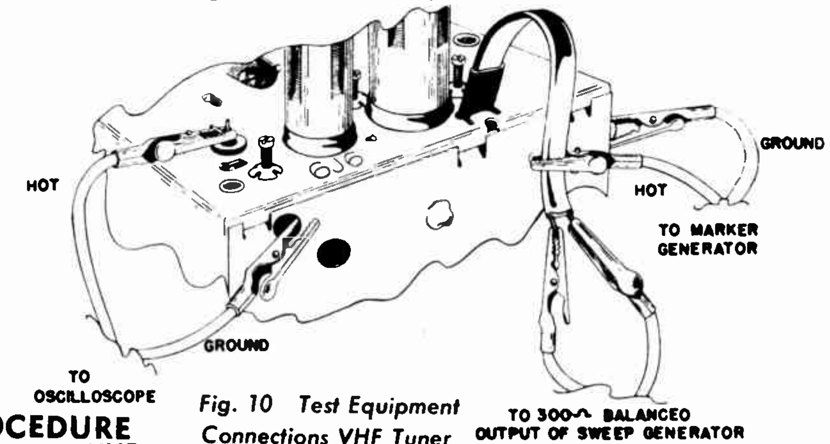

Fig. 10 Test Equipment Connections VHF Tuner

UHF CONVERTER ALIGNMENT PROCEDURE

1. VHF should be aligned properly before setting up UHF.

2. Turn channel knob to UHF position.

3. A UHF signal from a suitable UHF signal generator should be fed into the antenna terminal of the UHF converter; attach vacuum tube voltmeter or detector probe to TV set detector.

4. Adjust output transformer slug for maximum meter indications.

REPAIR PARTS LIST

Following is a combined parts list for chassis 528.258 and 528.268. Parts listed herein are used on both chassis except where otherwise specified. For explanatory notes see reverse side of schematic diagram.

Schematic Location	Part Number	DESCRIPTION	Sears Selling Price Each
		CAPACITORS	
C1, C2		Part of Coil, 4.5 Mc Sound take-off (L1)	
C3, C5, C6, C11, C42, C56	T16-177	Capacitor, Ceramic .005 mfd.	$ .25
C4, C15†	T16-177	Capacitor, ceramic, .005 mfd. (used in chassis 528-258 only)	.25
C8*	T15-218	Capacitor, mica, 220 mmfd. (used in chassis 528-268 only)	.40
C8†	T15-258	Capacitor, mica, 270 mmfd., 5% (used in chassis 528-258 only)	.55
C9	T15-228	Capacitor, disc, .002 mfd.	.25
C10	T15-211	Capacitor, ceramic, .01 mfd.	.30
C12, C24, C49	T18-292	Capacitor, electrolytic, 4 mfd. 50 v.	1.25
C13†	T16-177	Capacitor, ceramic, .005 mfd. (not used in some 528-268 models)	.25
C14	T16-240	Capacitor, molded, .47 mfd. 200 v.	.70
C16, C21, C69, C83, C84	T16-237	Capacitor, molded, .01 mfd. 600 v.	.30
C17, C46, C50, C51	T15-220	Capacitor, ceramic, .001 mfd.	.25
C18, C45, C73	T16-218	Capacitor, molded, .22 mfd. 600 v.	.95
C19, C22, C60, C66, C67, C68	T18-295	Capacitor, electrolytic, 40-40 mfd. 450 v. 100 mfd. 200 v.	5.10
C20	T18-308	Capacitor, electrolytic, 40 mfd. 400 v.	2.20
C23, C25, C27, C29, C30, C31, C33, C34, C35, C36, C37	T15-247	Capacitor, disc, .001 mfd.	.20
C26, C38	T16-241	Capacitor, ceramic, .0015 mfd. 10%	.25
C28		Part of T3, 1st I. F.	
C32		Part of T4, 2nd I. F.	
C39, C40		Part of T6, 4th I. F.	
C41	T15-249	Capacitor, ceramic, 3 mmfd. + − .5 mfd.	.20
C43		Part of 4.5 Mc Trap (L6)	
C44	T16-246	Capacitor, molded, .47 mfd. 400 v.	.75
C47	T15-235	Capacitor, mica, 150 mmfd.	.25
C48, C81	T16-235	Capacitor, molded, .047 mfd. 600 v.	.40
C52, C53, C54		Parts of Vertical Integrator Network	
C55, C63, C70	T16-233	Capacitor, molded, .0047 mfd. 600 v.	.35
C57	T16-236	Capacitor, molded, .056 mfd. 600 v.	.45

GENERAL INFORMATION

The information contained in this service RL Supplement covers the Catalog Nos. listed on the cover page.

The chassis used in these receivers are basically similar to the chassis covered in 57RL650, differing as described below:

1. Chassis 110.817-10, 110.817-11, 110-821M-10 similar to 110.817-1 except magnetic centering is used in place of electrical centering.

   If the picture requires centering;

   The angle between the vanes on the deflection yoke cover, moves any small area of the picture in a straight line along a radius. See Fig. 1.

   Rotating the vanes simultaneously, moves the same small area along the circumference of a circle. See Fig. 2.

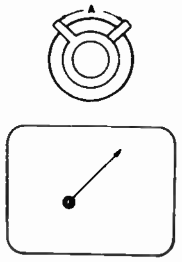

FIG. 1

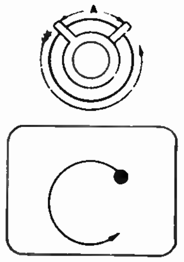

FIG. 2

2. All the chassis covered in this supplement use VHF Cascode Tuner PC541336 in conjunction with UHF Tuner PC541335 to provide complete VHF and UHF band coverage.

3. Chassis 110.817-10 and 110.821M-10 have Focus, Brightness, Vertical and Horizontal Hold Controls located on the front chassis apron.

4. Chassis 110.821M-35 has Brightness, Vertical and Horizontal Hold Controls and Phono TV switch in place of Focus Control on front chassis apron. Focus Control is on rear chassis apron.

HORIZONTAL OSCILLATOR ALIGNMENT

If the Horizontal Hold control fails to maintain sync, the horizontal oscillator should be reset. To reset this screwdriver adjustment, set the horizontal hold control, if one is provided, to the center of its range and sync the picture with the horizontal A.F.C. adjustment screw. Check the hold control action on various channels and alter the screw adjustment as required to provide sync on all channels.

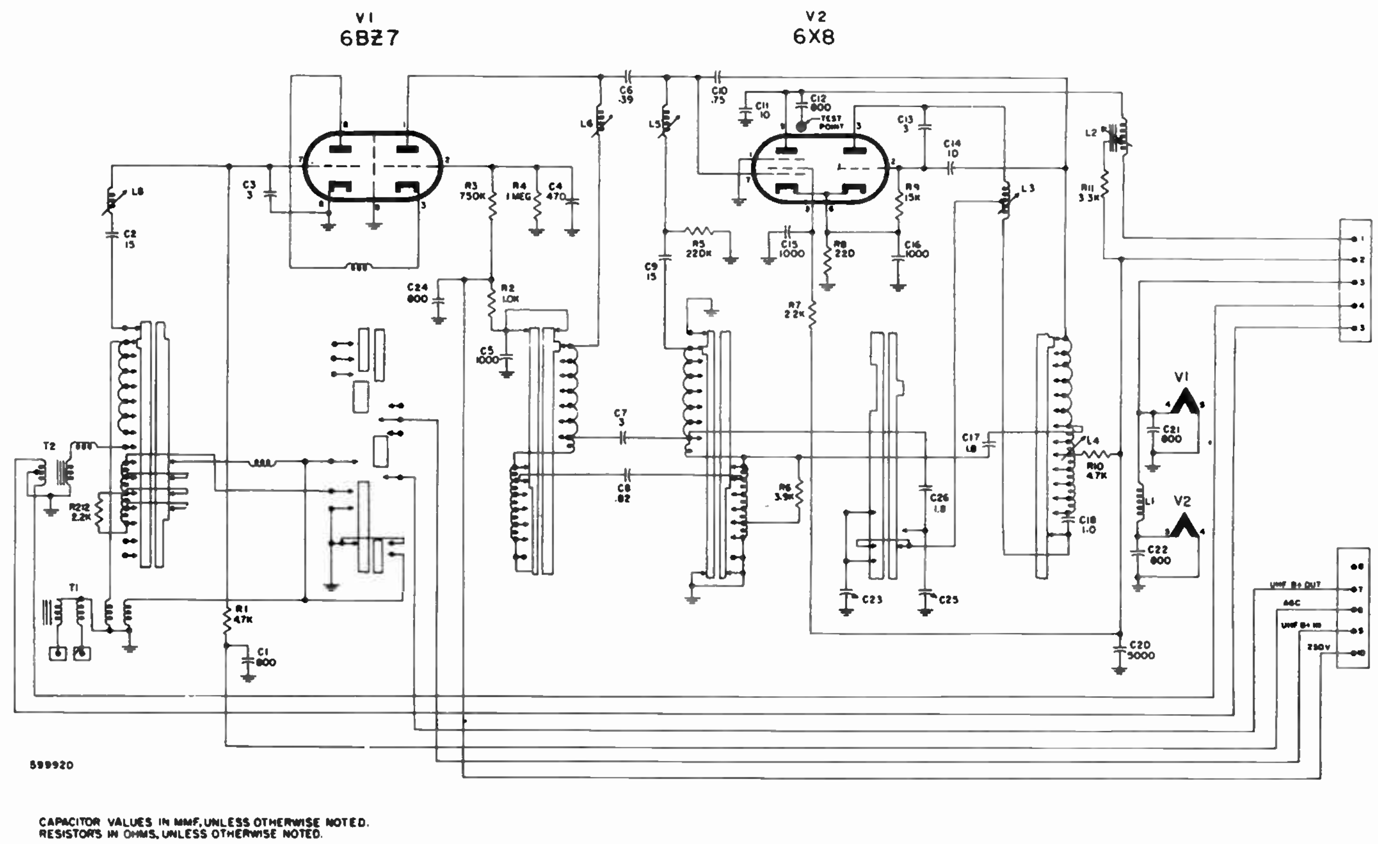
VHF CASCODE SWITCH TYPE TUNER

PART NO. PC541336

R. F. AMPLIFIER

The signal from the television receiving antenna is brought into the cascode R.F. amplifier through a coupling transformer which couples the balanced-to-ground twin-lead transmission line to the unbalanced single-ended grid drive of this stage. The channel switch picks out suitable lumped resonant elements in the circuits of this stage to permit selective amplification of the desired frequencies. A.G.C. is introduced at the grid of this stage also. The values of the shunt loading, the degree of the transformer coupling, and the values of the tuning inductances are chosen by the selector switch to provide uniform bandpass on all channels.



TUNER SCHEMATIC & TUBE LOCATION
CASCODE VHF TUNER PC-541336

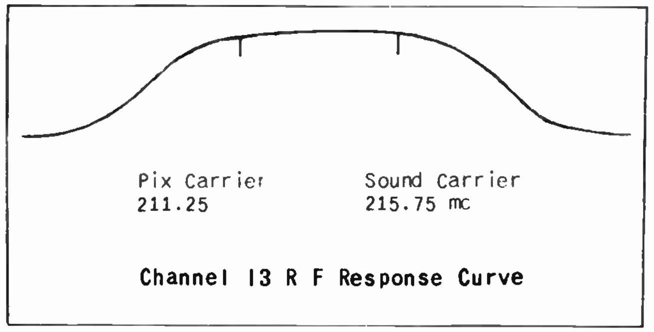
R. F. CONVERTER

The amplified signals from the previous R.F. stage are delivered to the input grid of V2. The 2nd section of the V2 is a modified Hartley oscillator, and the output of this local oscillator is heterodyned with the amplified R.F. in the mixer load. The channel selector functions in this circuit to select suitable fixed tank circuit elements so that the local oscillator frequency is always above the R.F. frequencies by an amount equal to the desired I.F. frequencies. The front panel "Fine Tuning" is mechanically connected to a variable capacitor in this oscillator tank circuit to provide vernier adjustment on the local oscillator frequency.

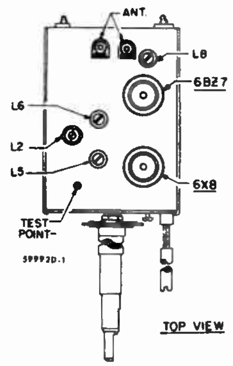
VHF TUNER RF BANDPASS ALIGNMENT

NOTE: DO NOT ATTEMPT RF BANDPASS ALIGNMENT UNTIL THE IF AMPLIFIERS ARE PROPERLY ALIGNED.

1. Connect the R.F. Sweep Generator, Marker Generator, and Oscilloscope as shown in Fig. 9a. Refer to Fig. 11 for instruments setting for each channel alignment. Put minus 3 volt bias between ground and AGC by means of the 3 volt battery. (Figs. refer to instruction manual 57RL650).
2. Set the RF sweep generator for 10mc. sweep width, and its center frequency at 213mc.
3. Set the CHANNEL SELECTOR to channel 13, and the fine tuning control at the middle of its rotation range.
4. Turn on the television receiver and test equipment and allow about 15 minutes for the set to warm up and stabilize.
5. Set the oscilloscope gain control for a maximum gain and the sweep attenuator for minimum output necessary to give a convenient size trace.
6. The response curve of the tuner should be flat over a 4.5mc band between the limits of 211.25mc and 215.75mc. If it is not L5, L6 and L8 (see Tuner Schematic and Tube Location) should be adjusted so the response is as near to this specification as possible. (See Sketch).



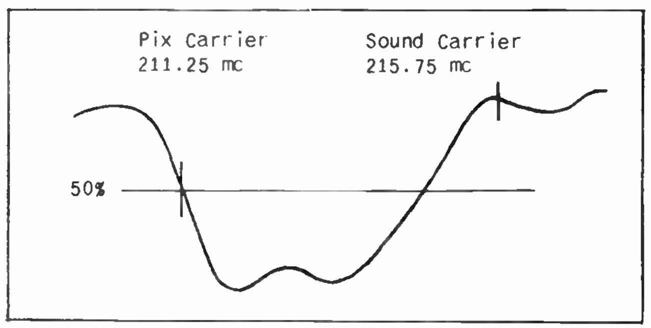
Channel 13 R F Response Curve

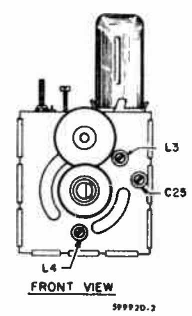


The RF Band pass alignment for all other channels is a factory adjustment.

VHF TUNER LOCAL OSCILLATOR ALIGNMENT

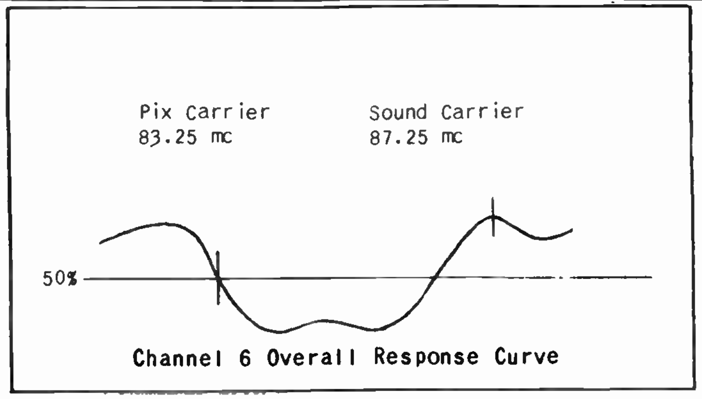
1. Connect the RF sweep generator to the antenna terminals as in figure 9A. Put minus 3 volt bias between ground and an AGC terminal by means of the 3 volt battery.
2. If the sweep generator is not provided with internal crystal-controlled or crystal-calibrated markers, connect a marker generator to the antenna terminals as in figure 9A.
3. Connect the cathode ray oscilloscope across the video detector load resistor R113. See figure 9B.
4. Adjust the R.F. sweep generator for 10mc. sweep width, with center frequency at approximately 213mc.
5. Adjust the marker generator for the picture carrier of channel 13 (211.25mc.)
6. Set the Channel Selector switch to channel 13, with the fine tuning control at the middle of its rotation range.
7. Turn on the receiver and test equipment and allow about 15 minutes for it to warm up and stabilize.
8. Set the oscilloscope gain control for a convenient size picture on the oscilloscope.
9. Adjust L3, the slug in Channel 13 oscillator coil, so the marker pip (211.25mc) is at the 50% point on the overall response curve. (See sketch)





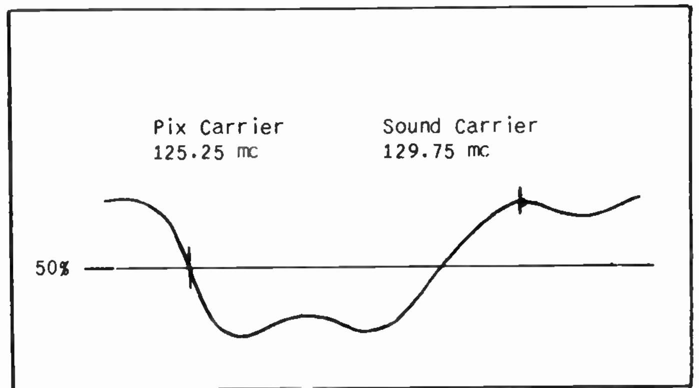
The oscillator alignment for all other high band channels is a factory adjustment.

10. Set the Channel Selector to Channel 6, the sweep generator frequency to approximately 85mc and the marker generator to the picture carrier (83.25mc) of Channel 6.
11. Adjust L4, the slug in Channel 6 oscillator coil so the marker pip (83.25mc) is at the 50% point on the slope of the overall response curve. (see sketch)



Channel 6 Overall Response Curve

The oscillator alignment for all other low band channels is a factory adjustment.



This completes the VHF tuner oscillator alignment.

12. Transfer the Sweep Signal Generator output terminals to the VHF tuner UHF input terminals on top of the UHF tuner. (Connecting to terminals 4 and 5 on the VHF tuner terminal strip – see schematic.)
13. Set the Channel Selector to UHF, and the sweep Generator to 127mc center frequency (or use the second harmonic of Channel 3 on selector switch type generators)
14. Adjust C25 so a marker generator 125.25mc pip is at the 50% response point on the overall response curve. (See sketch).

TELEVISION ALIGNMENT PROCEDURE, UHF

Alignment of the UHF Tuner is a simple procedure since its bandpass is essentially predetermined by the fixed characteristics of original component design, physical layout and associated circuitry. Except as stated otherwise in this procedure, band-pass is not subject to serious change during alignment, however, replacement of any component within the R-F or I-F curcuits may disturb the band-pass characteristics. Accordingly, whenever parts within these circuits are replaced, electrical and physical specifications of the original components must be duplicated as closely as possible. Wires, parts and other accessories must be replaced in their former positions.

Complicated or specially designed test equipment is not required for practical alignment of the UHF Tuner. Instruments used for testing VHF sets are usually satisfactory. However, the following instruments are needed;

1. VHF signal generator with AM output and a sweep modulation of at least 12 megacycles.
2. Oscilloscope or vacuum tube volt-ohmmeter for measurement of the relative signal.

The oscilloscope or VTVM should be connected to the TV set video detector load resistor R113.

The procedure for alignment consists of the following steps in the suggested sequence given:

1. Adjustment of the oscillator for proper band coverage.
2. Alignment of R-F-circuits for maximum effectiveness.

OSCILLATOR ADJUSTMENT

1. Adjust UHF channel tuning control to extreme counter-clockwise position.
2. Feed a 465-megacycle AM signal to the UHF Tuner antenna terminals through a resistive matching network, consisting of 50 ohms across the generator output with 120 ohms in one side of the line to the tuner and 150 ohms in the other. The input impedance of the tuner is 300 ohms balanced. Adjust oscillator trimmer (C3) for maximum signal. (Use non-metallic alignment tool.) (When using a VHF signal generator, a fundamental of 93 megacycles may be employed to produce the 5th harmonic energy of 465 megacycles.)
3. Adjust VHF channel to extreme clockwise position.
4. Set signal generator for a 900-megacycle output (5th harmonic of 180 megacycles). Carefully spread or pinch together the legs of the oscillator end-inductor (L3) for a maximum signal.
5. Repeat above steps until no further improvement in signal is apparent. (The oscillator alignment figures of 465 and 900 megacycles are only approximate, and may not fall precisely at the maximum dial settings; however, in every case the oscillator must be aligned so that both frequencies can be tuned by normal manipulation of the dial.)

R.F. ALIGNMENT

1. Adjust UHF channel tuning control to extreme counter-clockwise position.
2. Feed a 465-megacycle signal into the UHF tuner antenna terminals (as indicated above for oscillator alignment).
3. Adjust R-F trimmers (C1 & C2) for maximum signal.
4. Readjust tuning control to extreme clockwise position.
5. Set signal generator for 900-megacycle output.
6. Adjust end-inductors (L1 & L2) for maximum signal.
7. Repeat above steps until no further improvement in signal is apparent.

Catalog No. 4170 a 27" Console Model UHF-VHF Television Receiver with full doors. (Mahogany)

SPECIFICATIONS

Power Supply Rating	300 watts 105-120 volt 60 cycle AC
Audio Power Rating	3.5 watts maximum 1.5 watts undistorted
Antenna Input Impedance	300 ohm
Video Response	4 M.C.
Focus	Magnetic
Sweep Deflection	Magnetic
Picture Carrier	45.75 MC
Sound Carrier	41.25 MC
Adjacent Channel Sound Traps	47.25 MC
Adjacent Channel Picture Traps	39.75 MC

TUBE COMPLEMENT

V1	6AU6	Intercarrier Sound Amp.	V13	6AL5	Horizontal Discr.
V2	6BN6	Sound Limiter Detector	V14	6SN7GTA	Horizontal Oscillator
V3	6BK5	Audio Output	V15	6CD6G	Horizontal Output

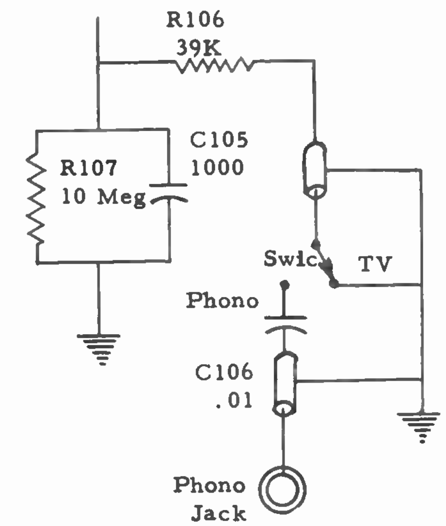
V11A	6SN7GTA	Sync Splitter		6X8	R. F. Oscillator
V11B	6SN7GTA	Vertical Oscillator	V23	6AF4	UHF Oscillator
V12	6AH4GT	Vertical Output	V24	6BZ7	UHF I.F.

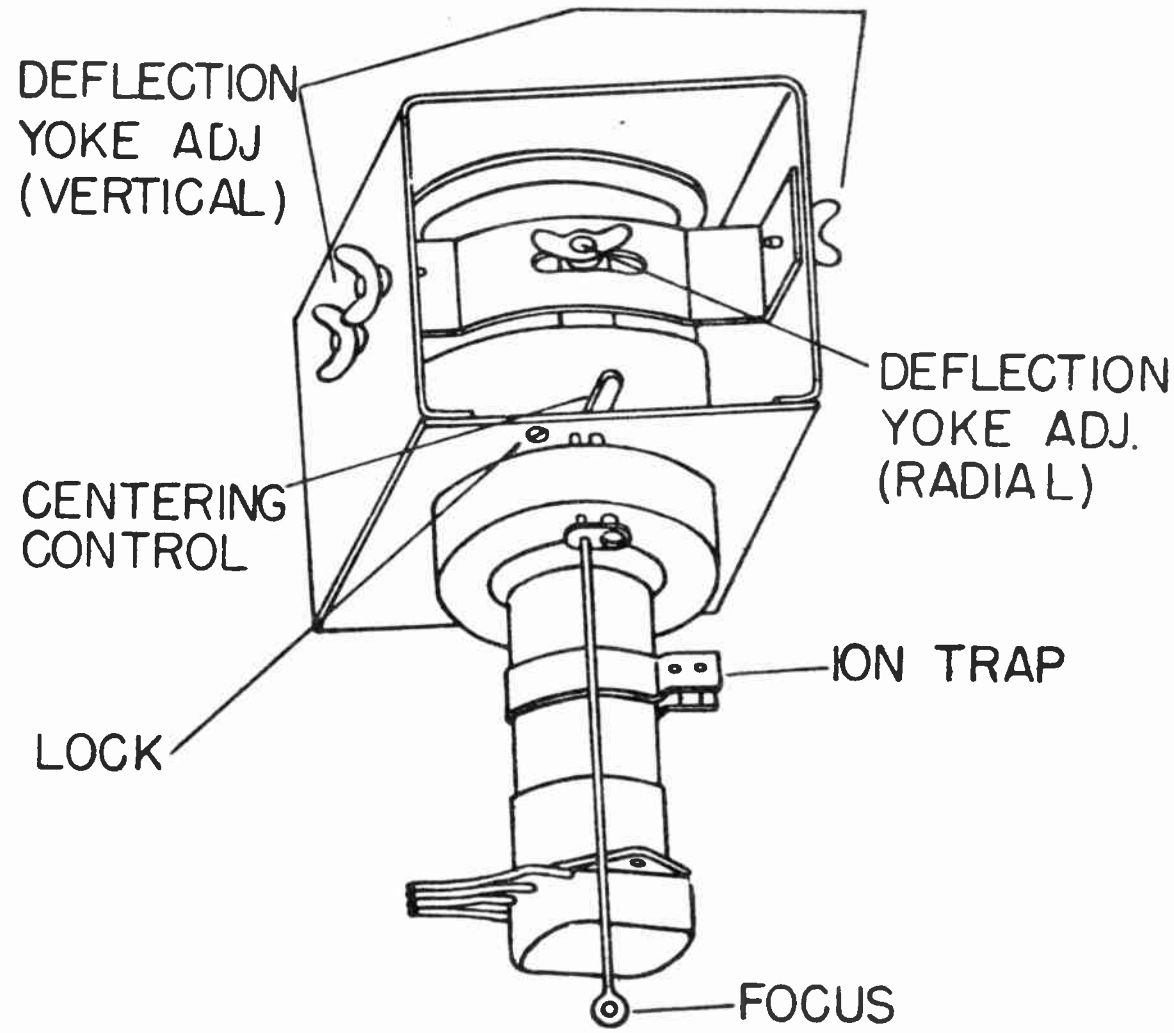
HIGH VOLTAGE WARNING

Operation of this receiver outside the cabinet or with covers removed involves a shock hazard from the receiver power supplies. Work on the receiver should not be attempted by personnel not thoroughly familiar with the precautions necessary when working on high-voltage equipment. Do not operate the television receiver with its compartment cover removed.

PRODUCTION CHANGES

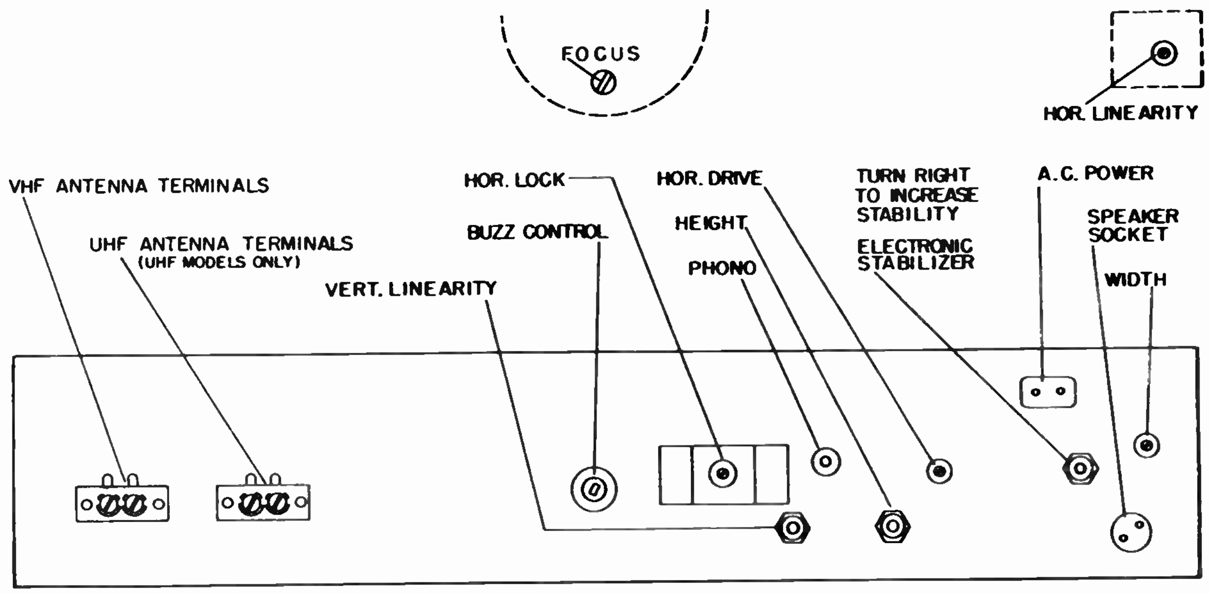
Schematic diagrams packed with Chassis 132.068, Model 4170, were in error in the connections to the Phono-TV switch (SW1C). The correct portion of this schematic is shown below.



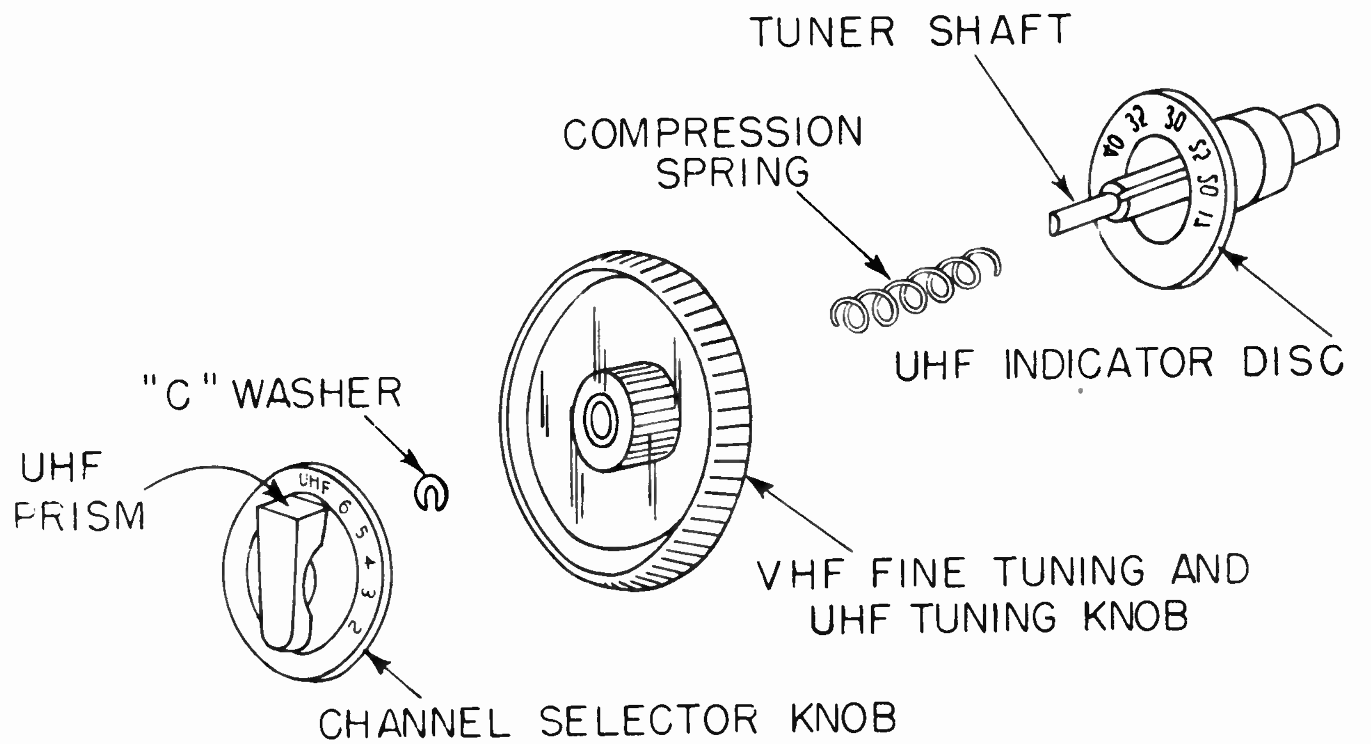


ION TRAP

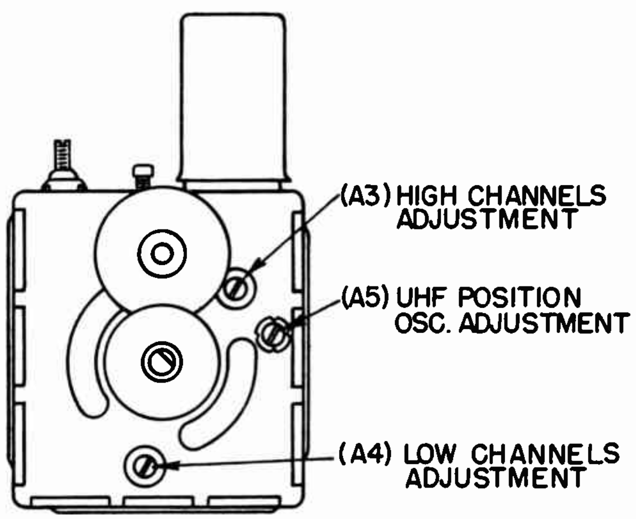
A single-magnet "beam bender" is used with the picture tube. Rotate the trap around the tube neck and slide it forward or back until a light appears on the screen. Adjust the trap for the point closest to the bakelite tube base which gives maximum light on the screen.



If the tuning knobs need to be pulled off, the Channel Selector knob must be removed first and the "C" washer must be taken out before the Fine Tuning knob can be removed (See Figure No. 1). The UHF indicator disc is held on by a compression spring and is not keyed to the shaft. Install the "C" washer in place before attempting to remove the UHF indicator disc, to prevent breakage of the VHF Fine Tuning drive wheel.



TUNER ADJUSTMENT



VHF TUNER (FRONT)

NOTE: The design purpose of A3 and A4 is for adjustment for channel 13 and channel 6--- for High and Low channels coverage. The above procedure gives optimum adjustment for any available stations.

The UHF position oscillator trimmer (C20 - A5) should not be adjusted unless some type of interference is present at the 127 megacycle frequency. This adjustment (C20 - A5) corresponds to the adjustments A3 and A4 for the VHF ranges.

ALIGNMENT

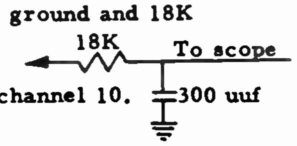
STAGGER-TUNED I.F. ALIGNMENT PROCEDURE

1. Set tuner to channel 9-10 or 11.
2. Pull AGC tube V9 out.
3. Connect -2.5 volts bias from junction R304 and R303 to ground with triple power switch in Suburban position.
4. Connect VTVM across R217 & R218. Isolate VTVM with 18K resistor. Use -5V scale.
5. Connect RF signal generator to ungrounded mixer tube sheild i.e. lift mixer tube sheild until it is just ungounded.
6. Good R.F. grounding between TV receiver on test and test equipment is necessary. A metal surface bench top should be used to insure proper RF grounding.

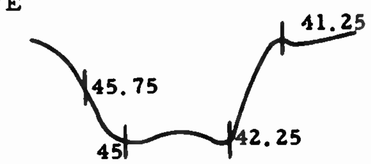
STEP	FREQUENCY	ADJUSTMENT	INSTRUCTIONS
1.	39.75 mc	Top T201 for min.	
2.	41.25 mc	Bottom T202 for min.	Outer peak
3.	47.25 mc.	Bottom T203 for min.	Outer peak
4.	43.2 mc UHF-VHF 42.8 mc VHF	Tuner coil for max.	Note: Turn bottom T201 completely out before making this adjustment.
5.	45.2 mc UHF-VHF 45.0 mc VHF	Bottom T201 for max.	
6.	44 mc	Top T202 for max.	Outer peak
7.	42.2 mc	Top T203 for max.	Outer peak-recheck steps 6 and 7
8.	40.3 mc	Bottom T204 for max.	
9.	45.2 mc	Bottom T205 for max.	
10.	43 mc	Bottom T206 for max.	Recheck steps 8-9 and 10

OVERALL SWEEP CHECK

1. Connect RF signal generator to chassis near V4 for marker generator. Push shield down on mixer tube.
2. Connect oscilloscope across R217 & R218. Isolate oscilloscope lead with 300 uuf to ground and 18K resistor in series.
3. Increase bias to -3.5 volts.
4. Connect sweep generator to antenna terminals. Adjust sweep generator & tuner to channel 10.



CURVE



ADJUSTMENT	INSTRUCTIONS
T205	T205 positions 45.75 marker
T206	T206 adjusts tilt of curve

Note: If desired curve cannot be obtained, slight adjustment of tuner coil and bottom T201 may be necessary.

SOUND AND 4.5 MC TRAP ALIGNMENT

1. Tune in available TV station and reduce signal into set until hiss is heard with sound. This can be done by inserting an attenuator in the antenna lead-in or by removing antenna lead-in from the set and stray feeding in signal by placing lead-in in close proximity of the set.

2. Set buzz control in the middle of its range. Adjust take off coil L201, top and bottom T101, Quadrature coil (L101) and buzz control for cleanest sound and minimum buzz. If any adjustment causes hiss to disappear reduce signal into set until hiss reappears and continue with adjustments.

Note: If difficulty is encountered either in reducing signal sufficiently or adjustments being very broad. The following proceedure may be used.

SOUND ALIGNMENT

STEP	EQUIPMENT	CONNECTION	FREQUENCY	ADJUSTMENT	INSTRUCTIONS
1.	Det. jig *	Input of jig to pin 2 of V2			Keep lead between 15K resistor and pin 2 as short as possible
2.	VTVM	out put of jig	Tune in available channel	L201-T101 (top and bottom) for max.	Adjust L201 on inner peak
3.		remove jig	Same	Quadrature coil (L101) for max. sound	Set buzz control in middle of its range before adjusting L101
4.			Same	Buzz control for minimum buzz	Correct adjustment of buzz control is approx. middle of its range
5.	Det. jig *	Junction L205 and L206			Connect VTVM to output of jig
6.	RF signal generator	Pin 9 (V8)	4.5 mc	Tune 4.5 mc trap (L205) for minimum	

*Detector jig

PRODUCTION CHANGES IN CHASSIS 132.045

(NOTE: SEE PARTS LIST FOR PART NUMBER AND DESCRIPTION OF PARTS DELETED & ADDED.)

I. Chassis TE 132.045-1 differs from 132.045 as follows:

1. VHF tuner changed from pentode to cascode circuit.
2. Horizontal and vertical hold controls and circuits changed to provide a wider operating range.
3. A dissapation change made in low voltage power supply to limit peak current in 5U4 tube.

II. Chassis 132.045-2 differs from 132.045-1 as follows:

1. Combination tuner connection changed to minimize regeneration.
2. New design volume and channel selector knobs.
3. C28 changed on VHF tuner to decrease Band width.

III. Chassis 132.045-3 differs from 132.045-2 as follows:

1. L110 and L112 peaking coils revisedto reduce smear and ringing.
2. 6C4 tube (V25) and associated circuit added to improve vertical noise immunity.

IV. Chassis 132.045-4 differsfrom 132.045-3 as follows:

1. B plus voltage to VHF tuner is changed from 100 volts to 135 volts to improve sensitivity.
2. Band elimination filter redesigned to improve sensitivity.

TOP VIEW — CHASSIS 132.045

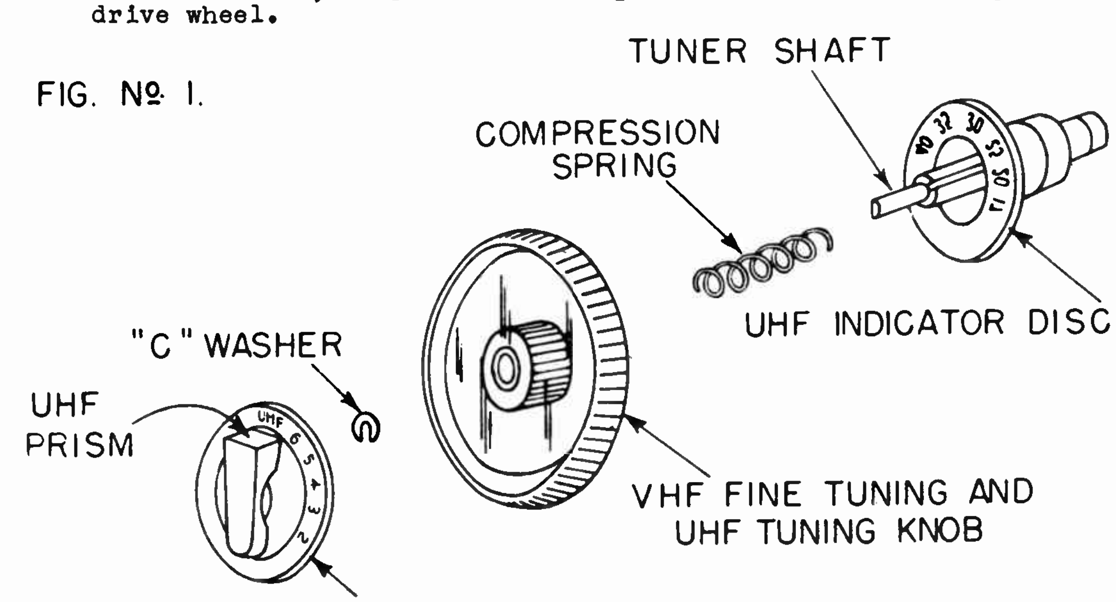
THE ALL CHANNEL VHF-UHF COMBINATION

TUNER SYSTEM

The combination tuner employs individual UHF and VHF tuners mechanically ganged together to be operated by one set of control knobs. UHF tuning is accomplished by a two-speed pulley system. The prism (UHF position) indicates the UHF channels which are tuned by the VHF Fine Tuning knob. Rapid UHF tuning is achieved by pressing in the VHF Fine Tuning knob to engage a direct-drive mechanism. When this Fine Tuning knob is released, the UHF tuning ratio is approximately 12 to 1.

If the tuning knobs need to be pulled off, the Channel Selector knob must be removed first and the "C" washer must be taken out before the Fine Tuning knob can be removed (See Figure No. 1). The UHF indicator disc is held on by a compression spring and is not keyed to the shaft. Install the "C" washer in place before attempting to remove the UHF indicator disc, to prevent breakage of the VHF Fine Tuning drive wheel.

FIG. Nº. 1.



SUBJECT: Addition of suffix -5, to Chassis No. 132.045. Catalog No. 3106 & 3146 This supplement covers parts changes and the UHF schematic diagram. For all other service information or repair parts refer to 57 RL 667 dated May, 1953

	N25267-11	Combination Tuner	65.00	B5

NOTE: Pre-selector circuit of the UHF tuner was revised to improve the noise figure.

I. VHF OPERATION

A. GENERAL

The VHF tuner is a conventional 12-position switch type where the Fine Tuning is accomplished with a variable capacitor in the R.F. oscillator tuning circuit. This variable capacitor is mechanically connected to the Fine Tuning shaft.

There is an additional position on the VHF tuner (between Channels 6 and 7) which is used during UHF operation. Filament voltage is applied to the UHF tuner tubes during VHF operation; however, the B plus voltage is applied to the UHF tuner only during UHF operation.

B. ADJUSTMENT

The frequency of the VHF R.F. oscillator may be adjusted as follows: A High-Channels adjustment (A3), and a Low-Channels adjustment (A4), of the R.F. oscillator is accessible when the channel tuning knobs are removed. (See Figure 2).

1. High-Channels.

   a. Set the Channel Selector Switch to the highest available station between channels 7 and 13.

   b. Adjust (A3) so that the picture will just disappear at one point when turning the Fine-Tuning control clockwise.

   c. The remaining lower "High-Channels" should be within the range of the Fine-Tuning.

2. Low Channels

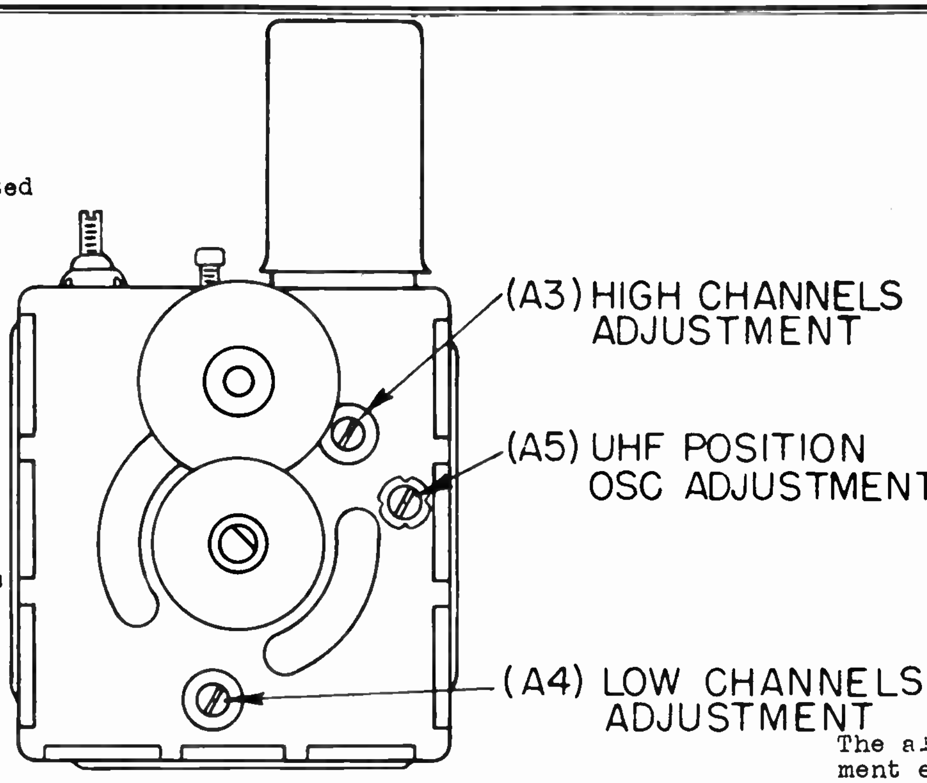
   a. Set the Channel Selector Switch to the highest available station between channels 2 and 6.

   b. Adjust (A4) so that the picture will just disappear at one point when turning the Fine-Tuning control clockwise.

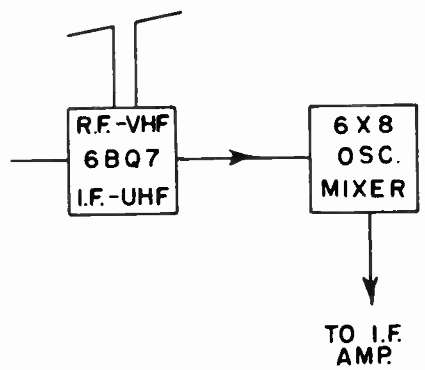
   c. The remaining lower "Low-Channels" should be within the range of the Fine-Tuning.

NOTE: - The design purpose of A3 and A4 is for adjustment for channel 13 and channel 6 --- for High and Low channels coverage. The above procedure gives optimum adjustment for any available stations.

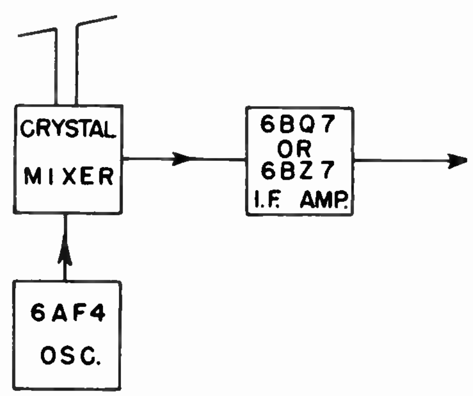
The UHF position oscillator trimmer (C20 - A5) (See Figures 2 and 4) should not be adjusted unless some type of interference is present at the 127 megacycle (1st I.F.) frequency. This adjustment (C20 - A5) corresponds to the adjustments A3 and A4 for the VHF ranges.



VHF SECTION



UHF SECTION



II. UHF OPERATION

A. GENERAL

A double conversion superheterodyne system is employed when the receiver is operating in a UHF position. The UHF tuner consists of a three-element concentric line tuning element which is used as two preselector circuits and a UHF oscillator tuning circuit. A crystal diode serves as a mixer and from it a 127 megacycle signal is applied to the UHF I.F. amplifier. The R.F. tube in the VHF tuner is used as an extra 127 megacycle I.F. amplifier for UHF operation. The oscillator mixer tube in the VHF tuner converts this 127 megacycle signal to the 41 megacycle I.F. frequency of the television chassis. See Block diagram (Figure No. 3). As the channel selector knob is turned to UHF, the following connections are made:

1. The B plus voltage is applied to the UHF tuner unit.
2. The UHF output circuit is applied to the matching transformer which is switched into the input circuit of the VHF tuner.
3. The conventional VHF tuner input circuit is isolated and grounded by this switching operation.

B. ADJUSTMENT

The alignment of a UHF tuner is quite similar to the alignment encountered in a VHF tuner. The most noticeable difference is the frequencies covered. The most important problem when using these high frequencies is that of obtaining a suitable test signal. If suitable UHF test equipment is not available, it is suggested that harmonics from a VHF signal generator be used to obtain these signals. It is well to bring out at this point that the harmonics will be so small in magnitude that it will probably be necessary to use the entire television chassis in order to get enough amplification to see the response curve on an oscilloscope. When using the television chassis to obtain a complete response curve, it would be well to mark the VHF only response curve on the face of the oscilloscope tube before attempting UHF alignment. The VHF adjustments should not be changed after UHF alignment is undertaken as it would be possible to misalign the VHF circuits making complete realignment necessary. It is well to point out that each UHF tuner has been carefully tracked over the entire UHF range and that major realignment should not be necessary. In general the two tubes or the crystal detector can be replaced with little or no change noticed in the alignment of the tuner. Note: For best overall performance (tracking) replace crystal with same type; i.e., 1N72, 1N82, 1N110.

CAUTION: - In attempting to service a tuner, (UHF or VHF) do not move or rearrange any of the components as this would easily change the distributed capacity enough to cause serious misalignment. If it is necessary to replace a component, make sure that the exact lead length and physical characteristics are obtained with the new component. The following checks can be made:

1. Oscillator section and crystal detection --- the grounding wire from the tuner test point (See Figure No. 5) can be unsoldered and a 0 to 5 milliampere meter inserted from this tuner test point to the chassis. A .001 capacitor should be connected from the tuner test point to chassis to keep R.F. from the meter leads. With the meter in this position, a reading from 0.5 to 2.5 millamperes should be indicated over the tuning range. (Indicates diode current resulting from oscillator injection.) If no reading or incorrect reading is indicated, replace either oscillator tube or crystal detector. If trouble is still evident, replace both items. (Note: Be sure to resolder grounding wire from tuner test point to chassis.)

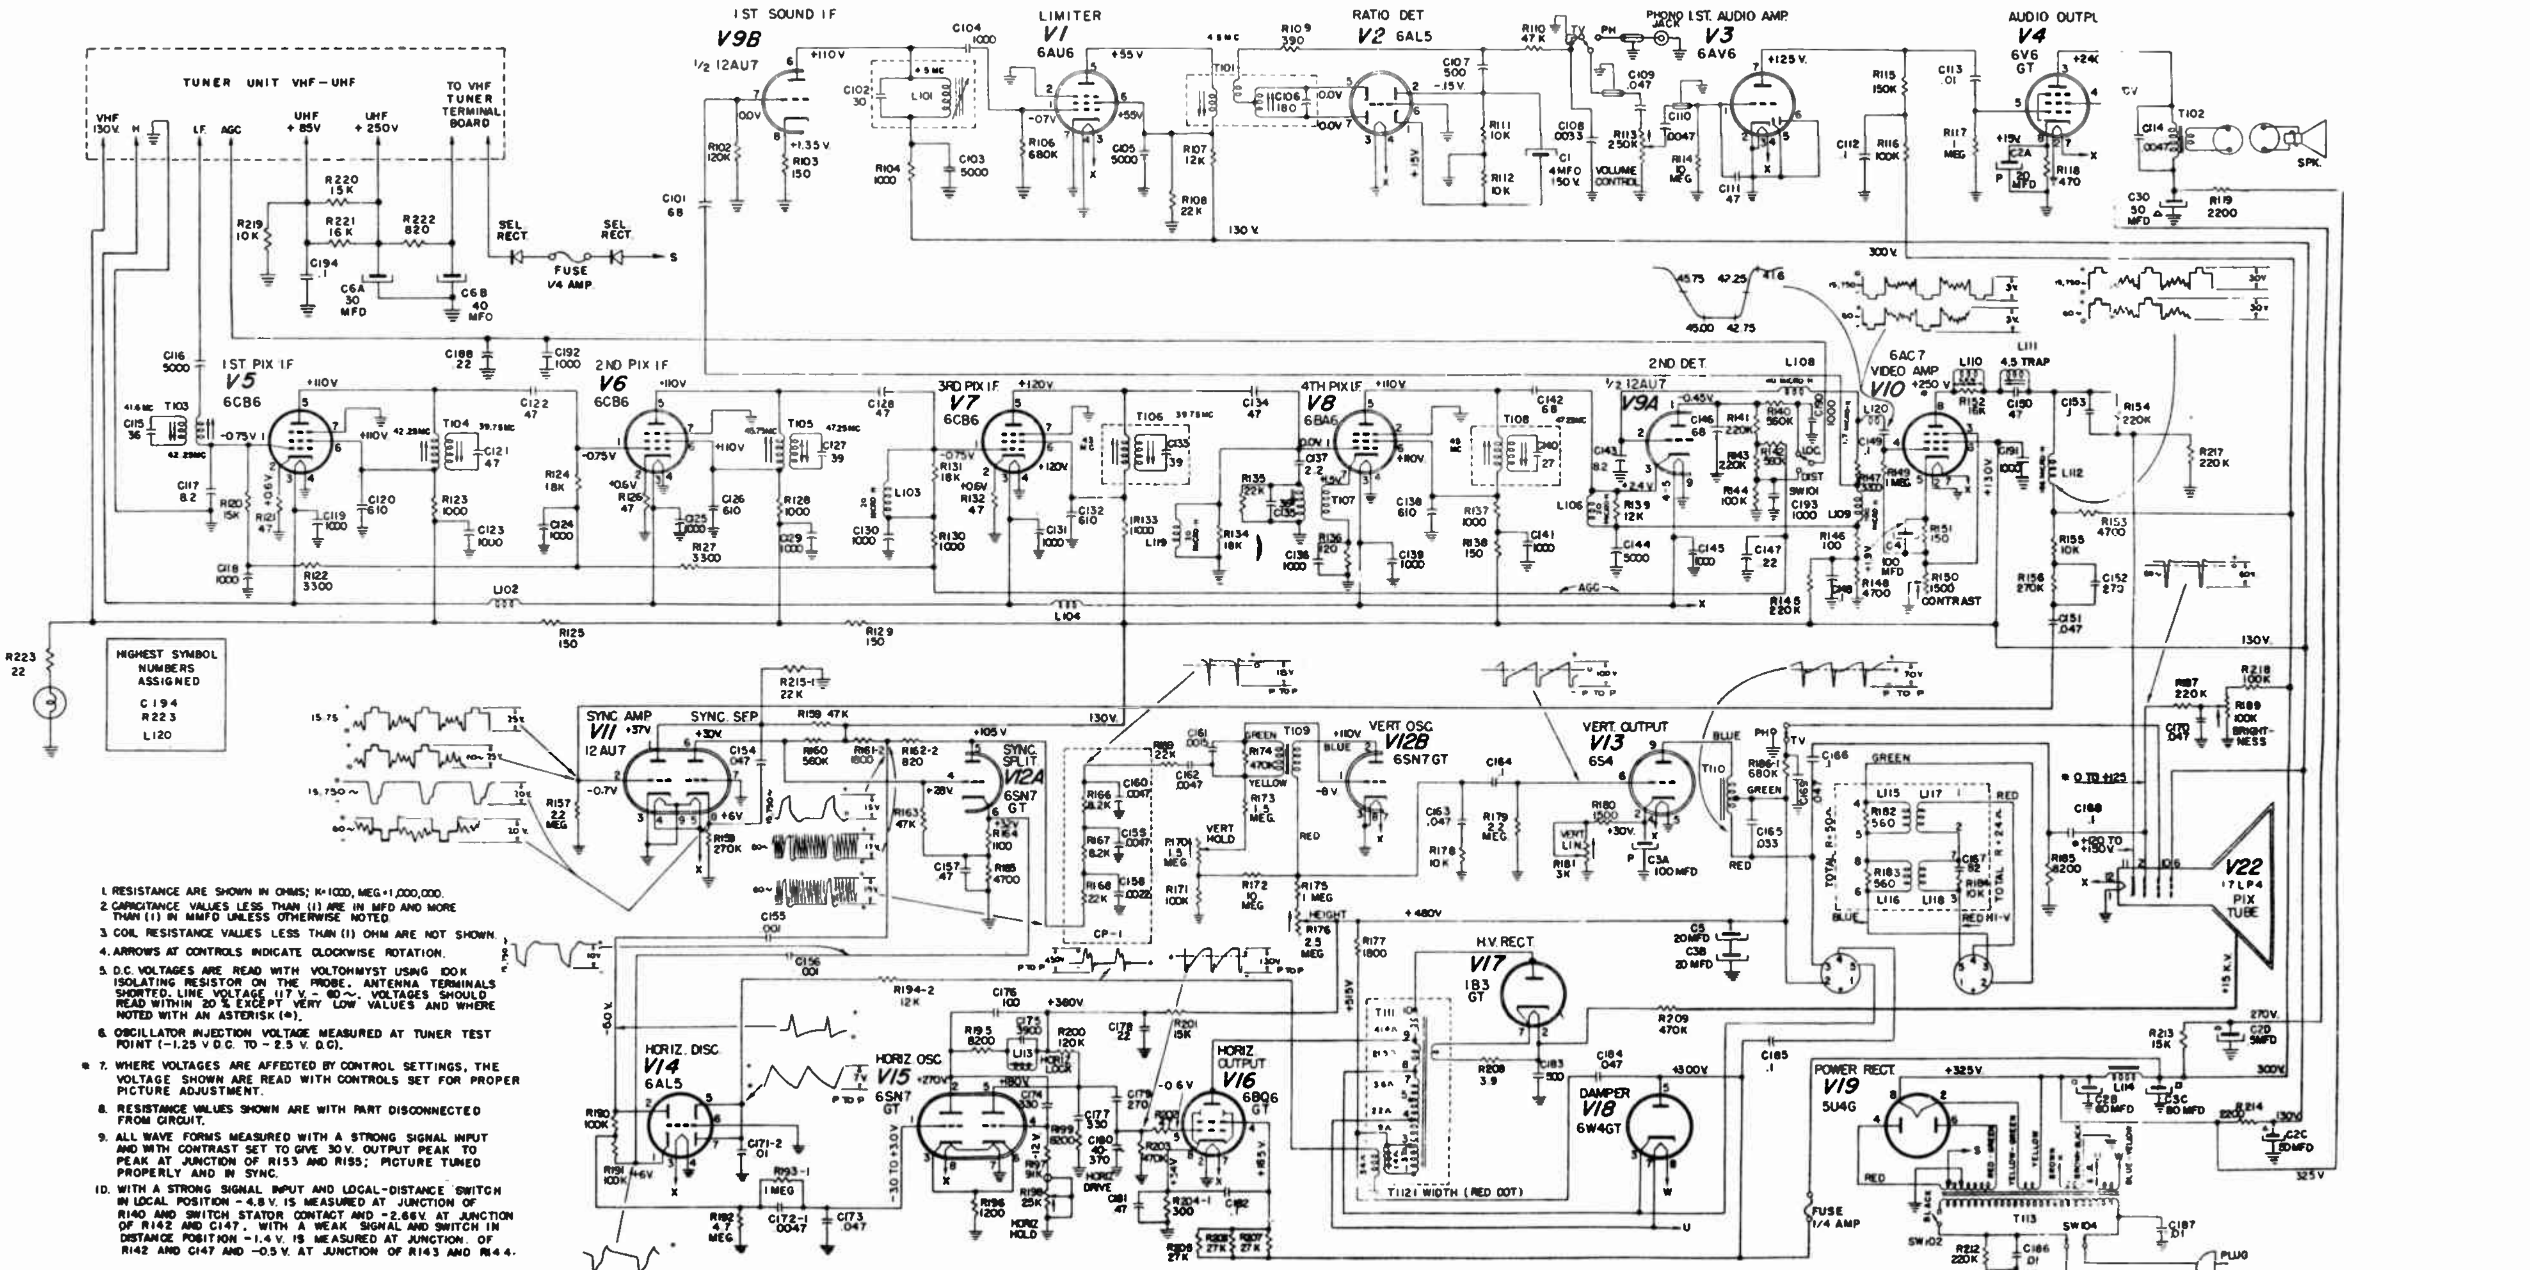
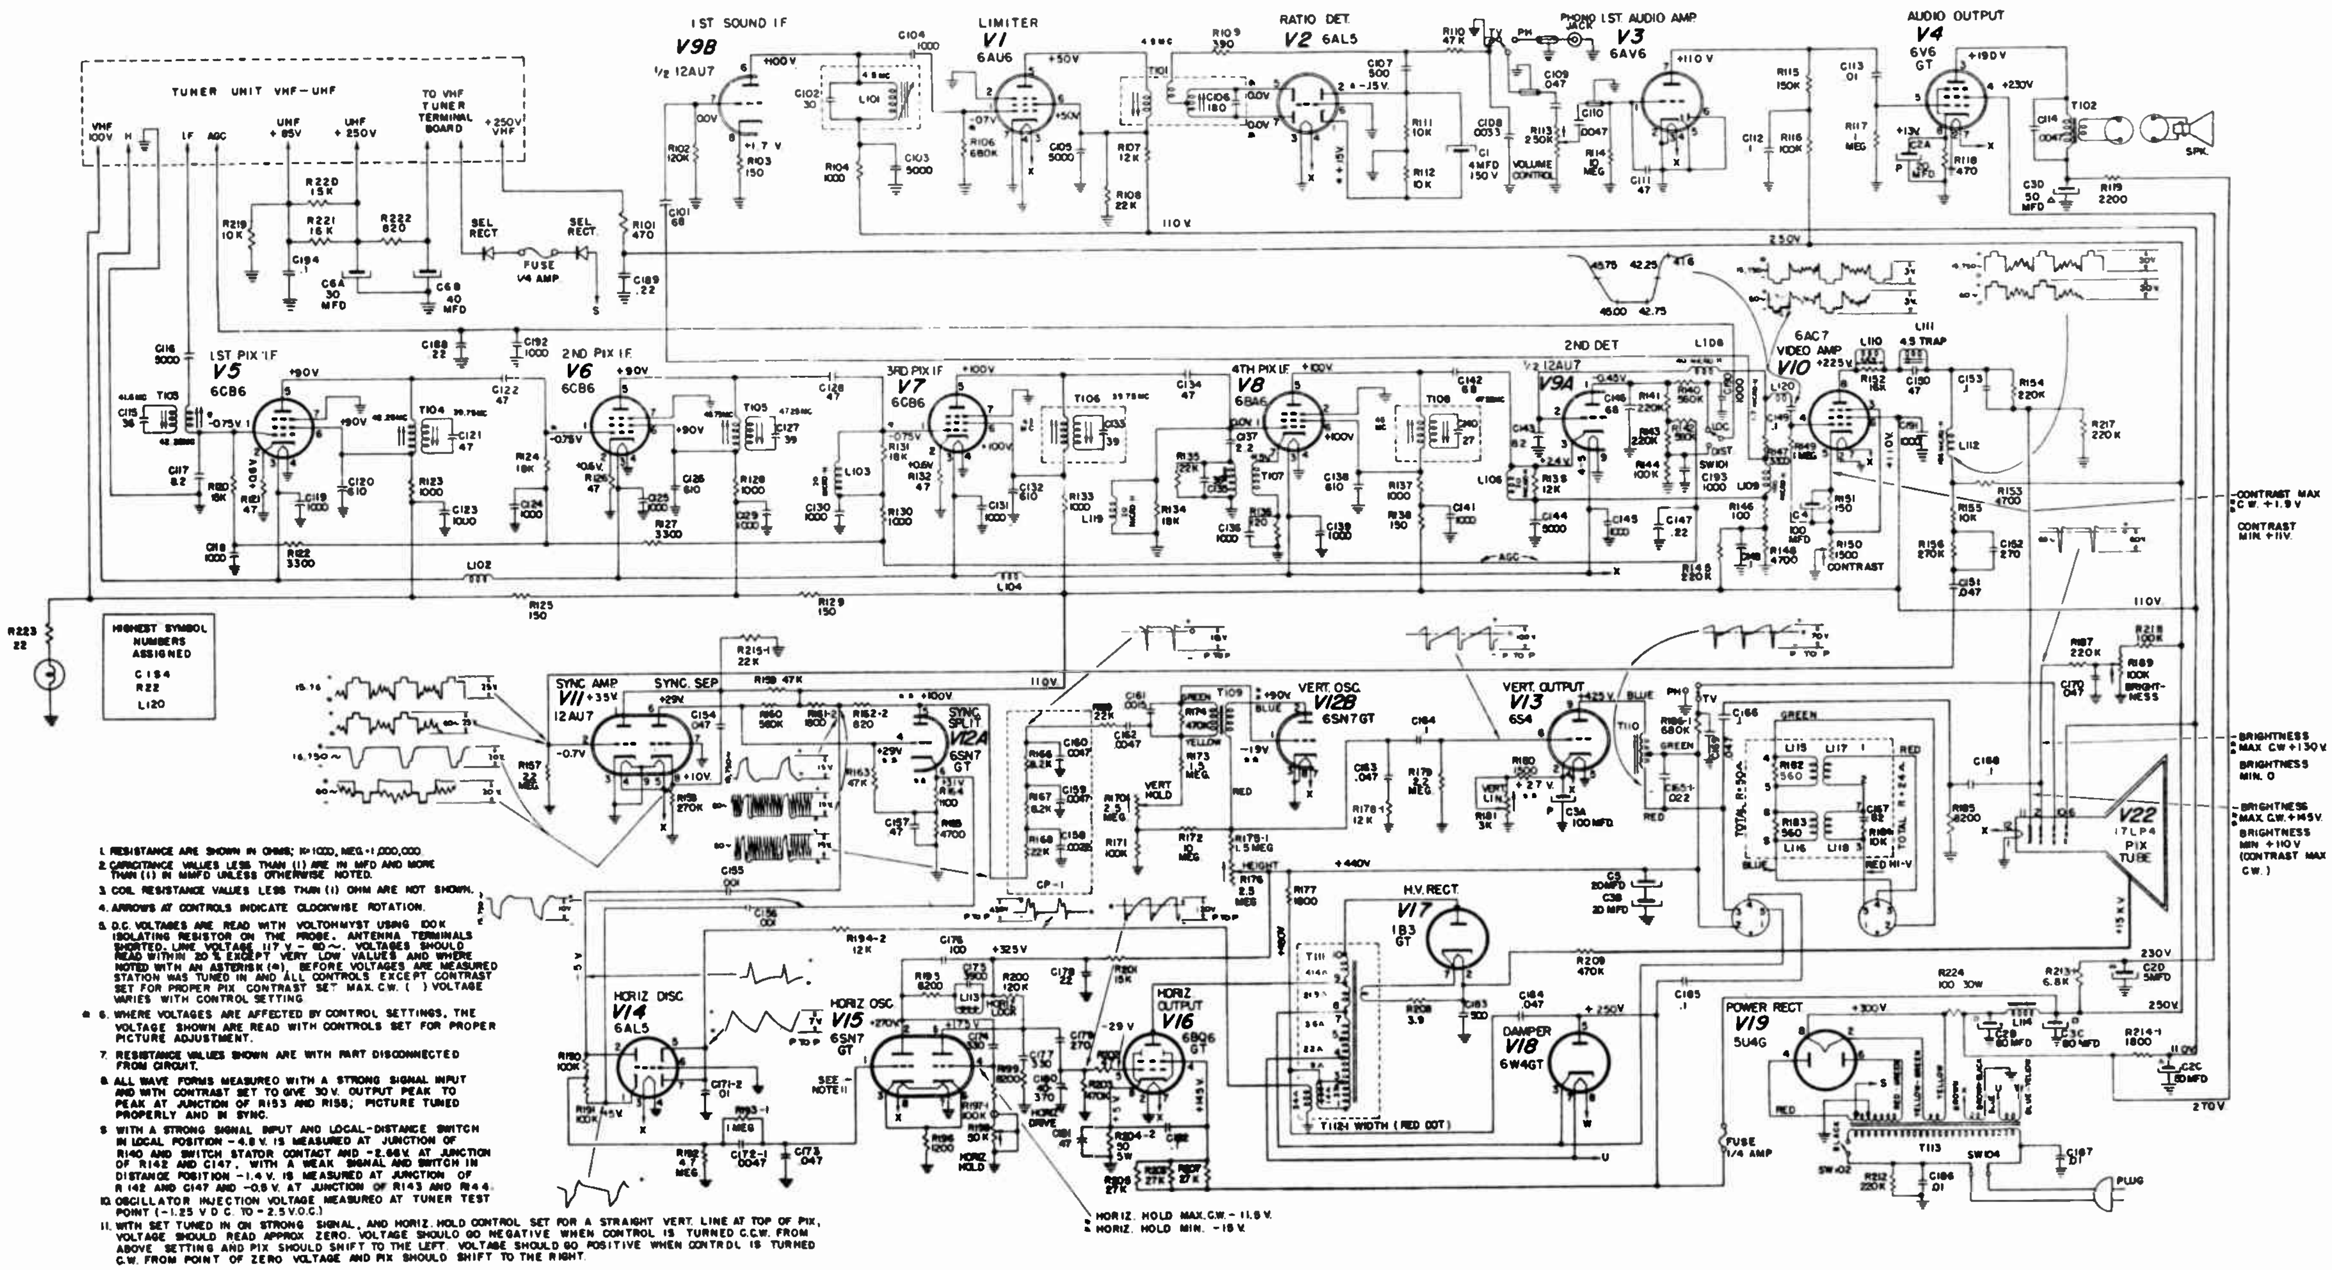
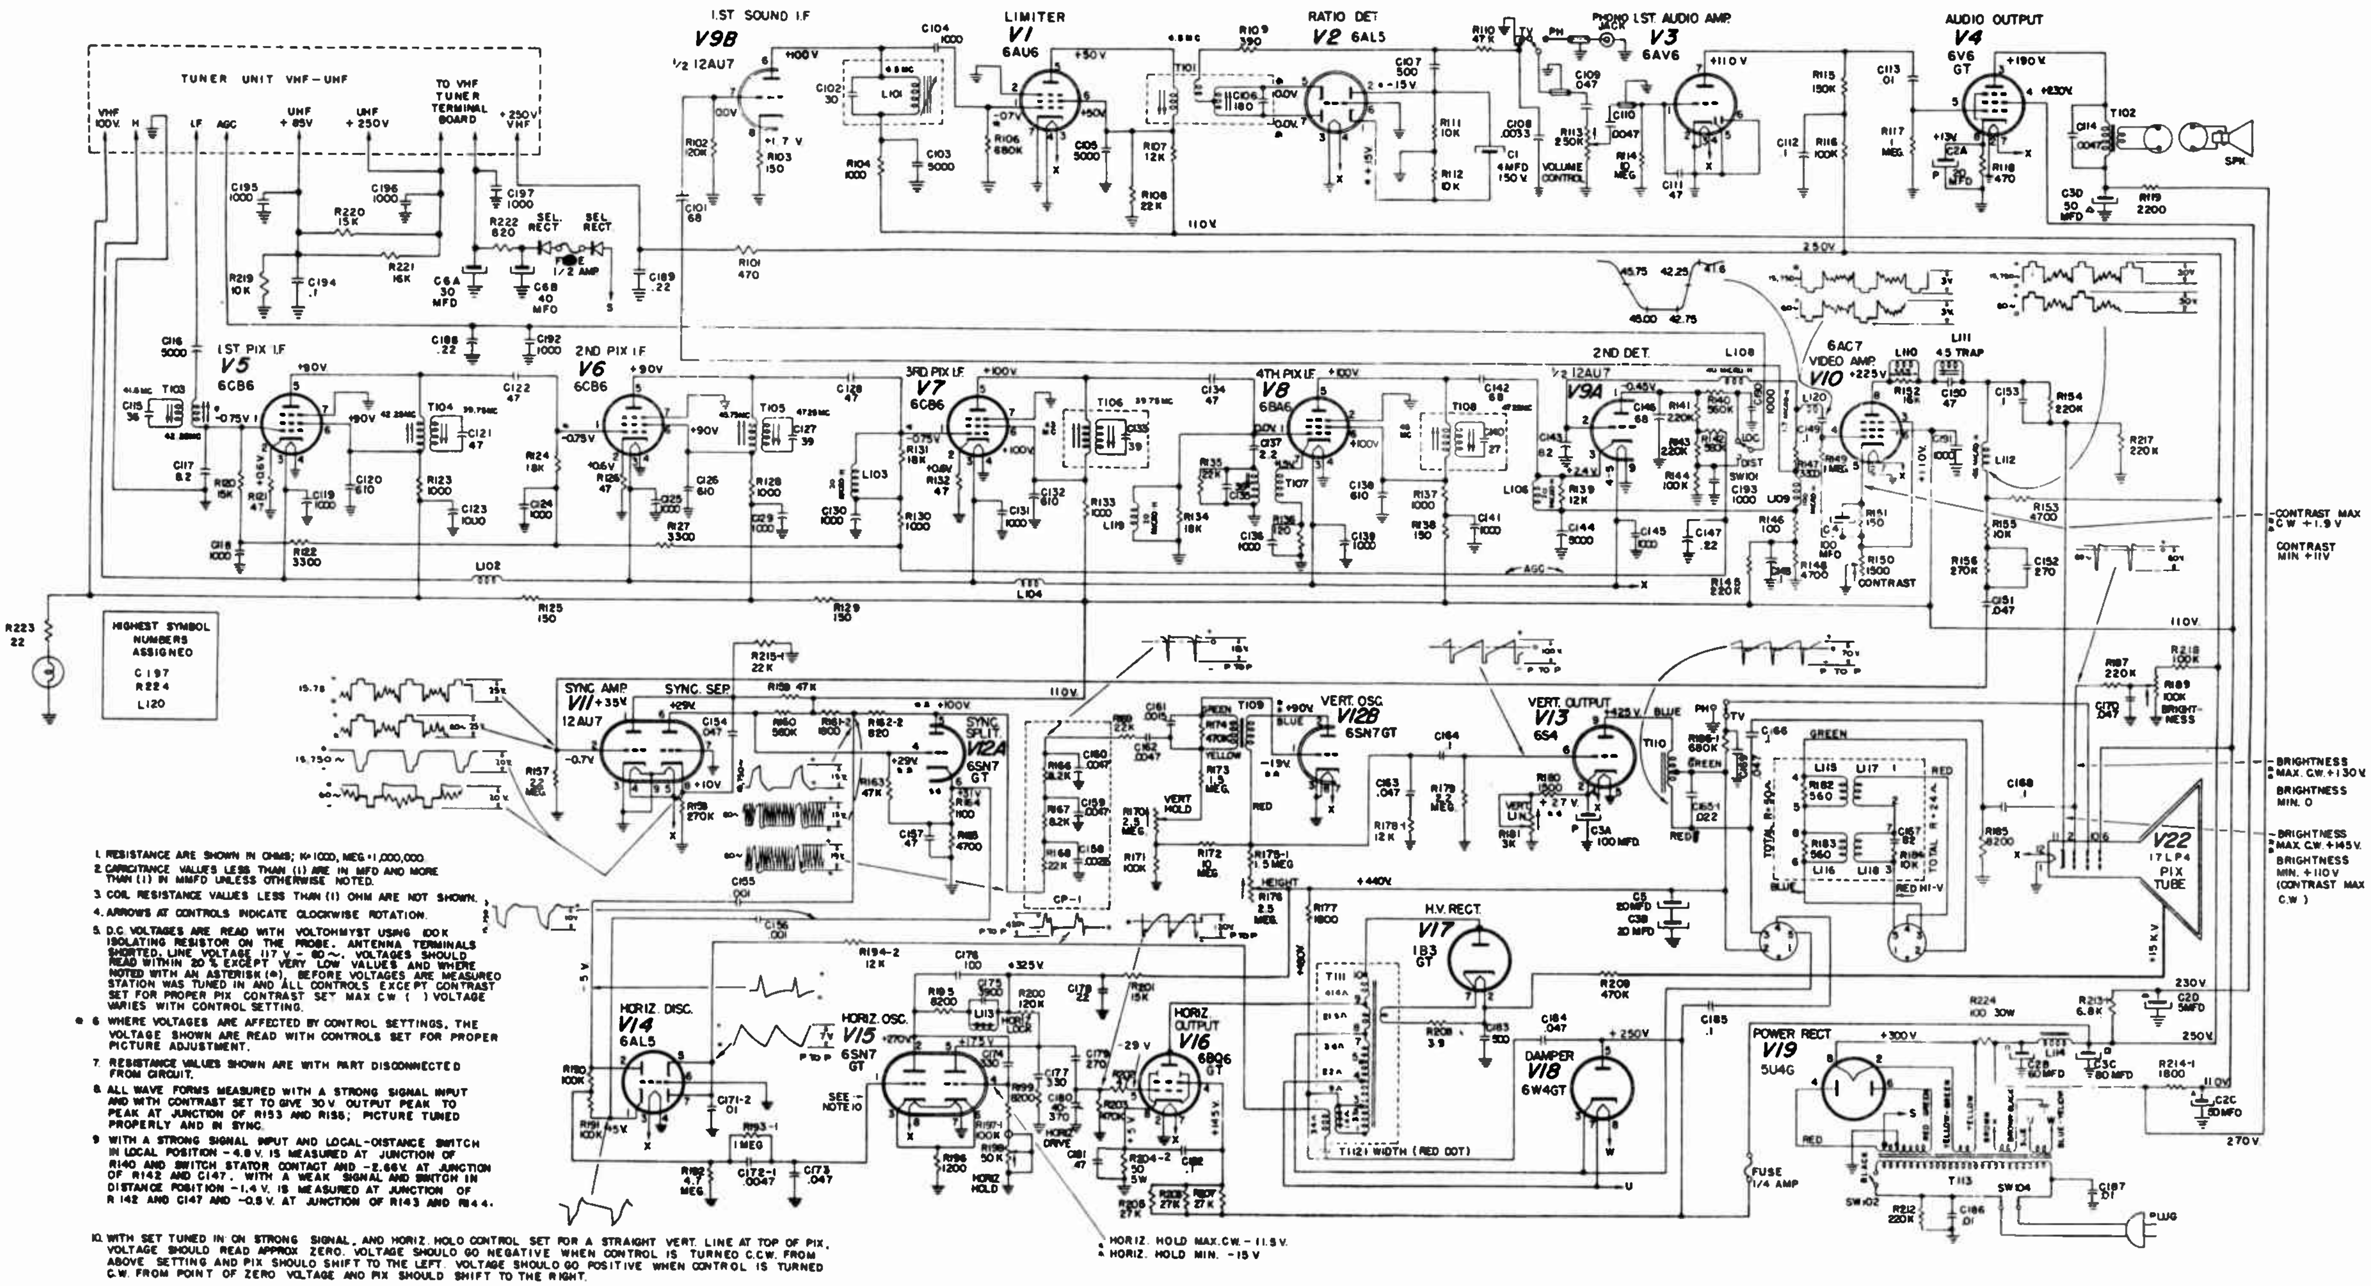
SCHEMATIC DIAGRAM 132.045



1. RESISTANCE ARE SHOWN IN OHMS; K=1000, MEG=1,000,000.
2. CAPACITANCE VALUES LESS THAN (1) ARE IN MFD AND MORE THAN (1) IN MMFD UNLESS OTHERWISE NOTED.
3. COIL RESISTANCE VALUES LESS THAN (1) OHM ARE NOT SHOWN.
4. ARROWS AT CONTROLS INDICATE CLOCKWISE ROTATION.
5. D.C. VOLTAGES ARE READ WITH VOLTOHMYST USING 100K ISOLATING RESISTOR ON THE PROBE. ANTENNA TERMINALS SHORTED. LINE VOLTAGE 117 V. - 60~. VOLTAGES SHOULD READ WITHIN 20% EXCEPT VERY LOW VALUES AND WHERE NOTED WITH AN ASTERISK (*).
6. OSCILLATOR INJECTION VOLTAGE MEASURED AT TUNER TEST POINT (-1.25 V D.C. TO - 2.5 V. D.C).
* 7. WHERE VOLTAGES ARE AFFECTED BY CONTROL SETTINGS, THE VOLTAGE SHOWN ARE READ WITH CONTROLS SET FOR PROPER PICTURE ADJUSTMENT.
8. RESISTANCE VALUES SHOWN ARE WITH PART DISCONNECTED FROM CIRCUIT.
9. ALL WAVE FORMS MEASURED WITH A STRONG SIGNAL INPUT AND WITH CONTRAST SET TO GIVE 30 V. OUTPUT PEAK TO PEAK AT JUNCTION OF R153 AND R155; PICTURE TUNED PROPERLY AND IN SYNC.
10. WITH A STRONG SIGNAL INPUT AND LOCAL-DISTANCE SWITCH IN LOCAL POSITION -4.8 V. IS MEASURED AT JUNCTION OF R140 AND SWITCH STATOR CONTACT AND -2.66V. AT JUNCTION OF R142 AND C147. WITH A WEAK SIGNAL AND SWITCH IN DISTANCE POSITION -1.4 V. IS MEASURED AT JUNCTION OF R142 AND C147 AND -0.5 V. AT JUNCTION OF R143 AND R144.

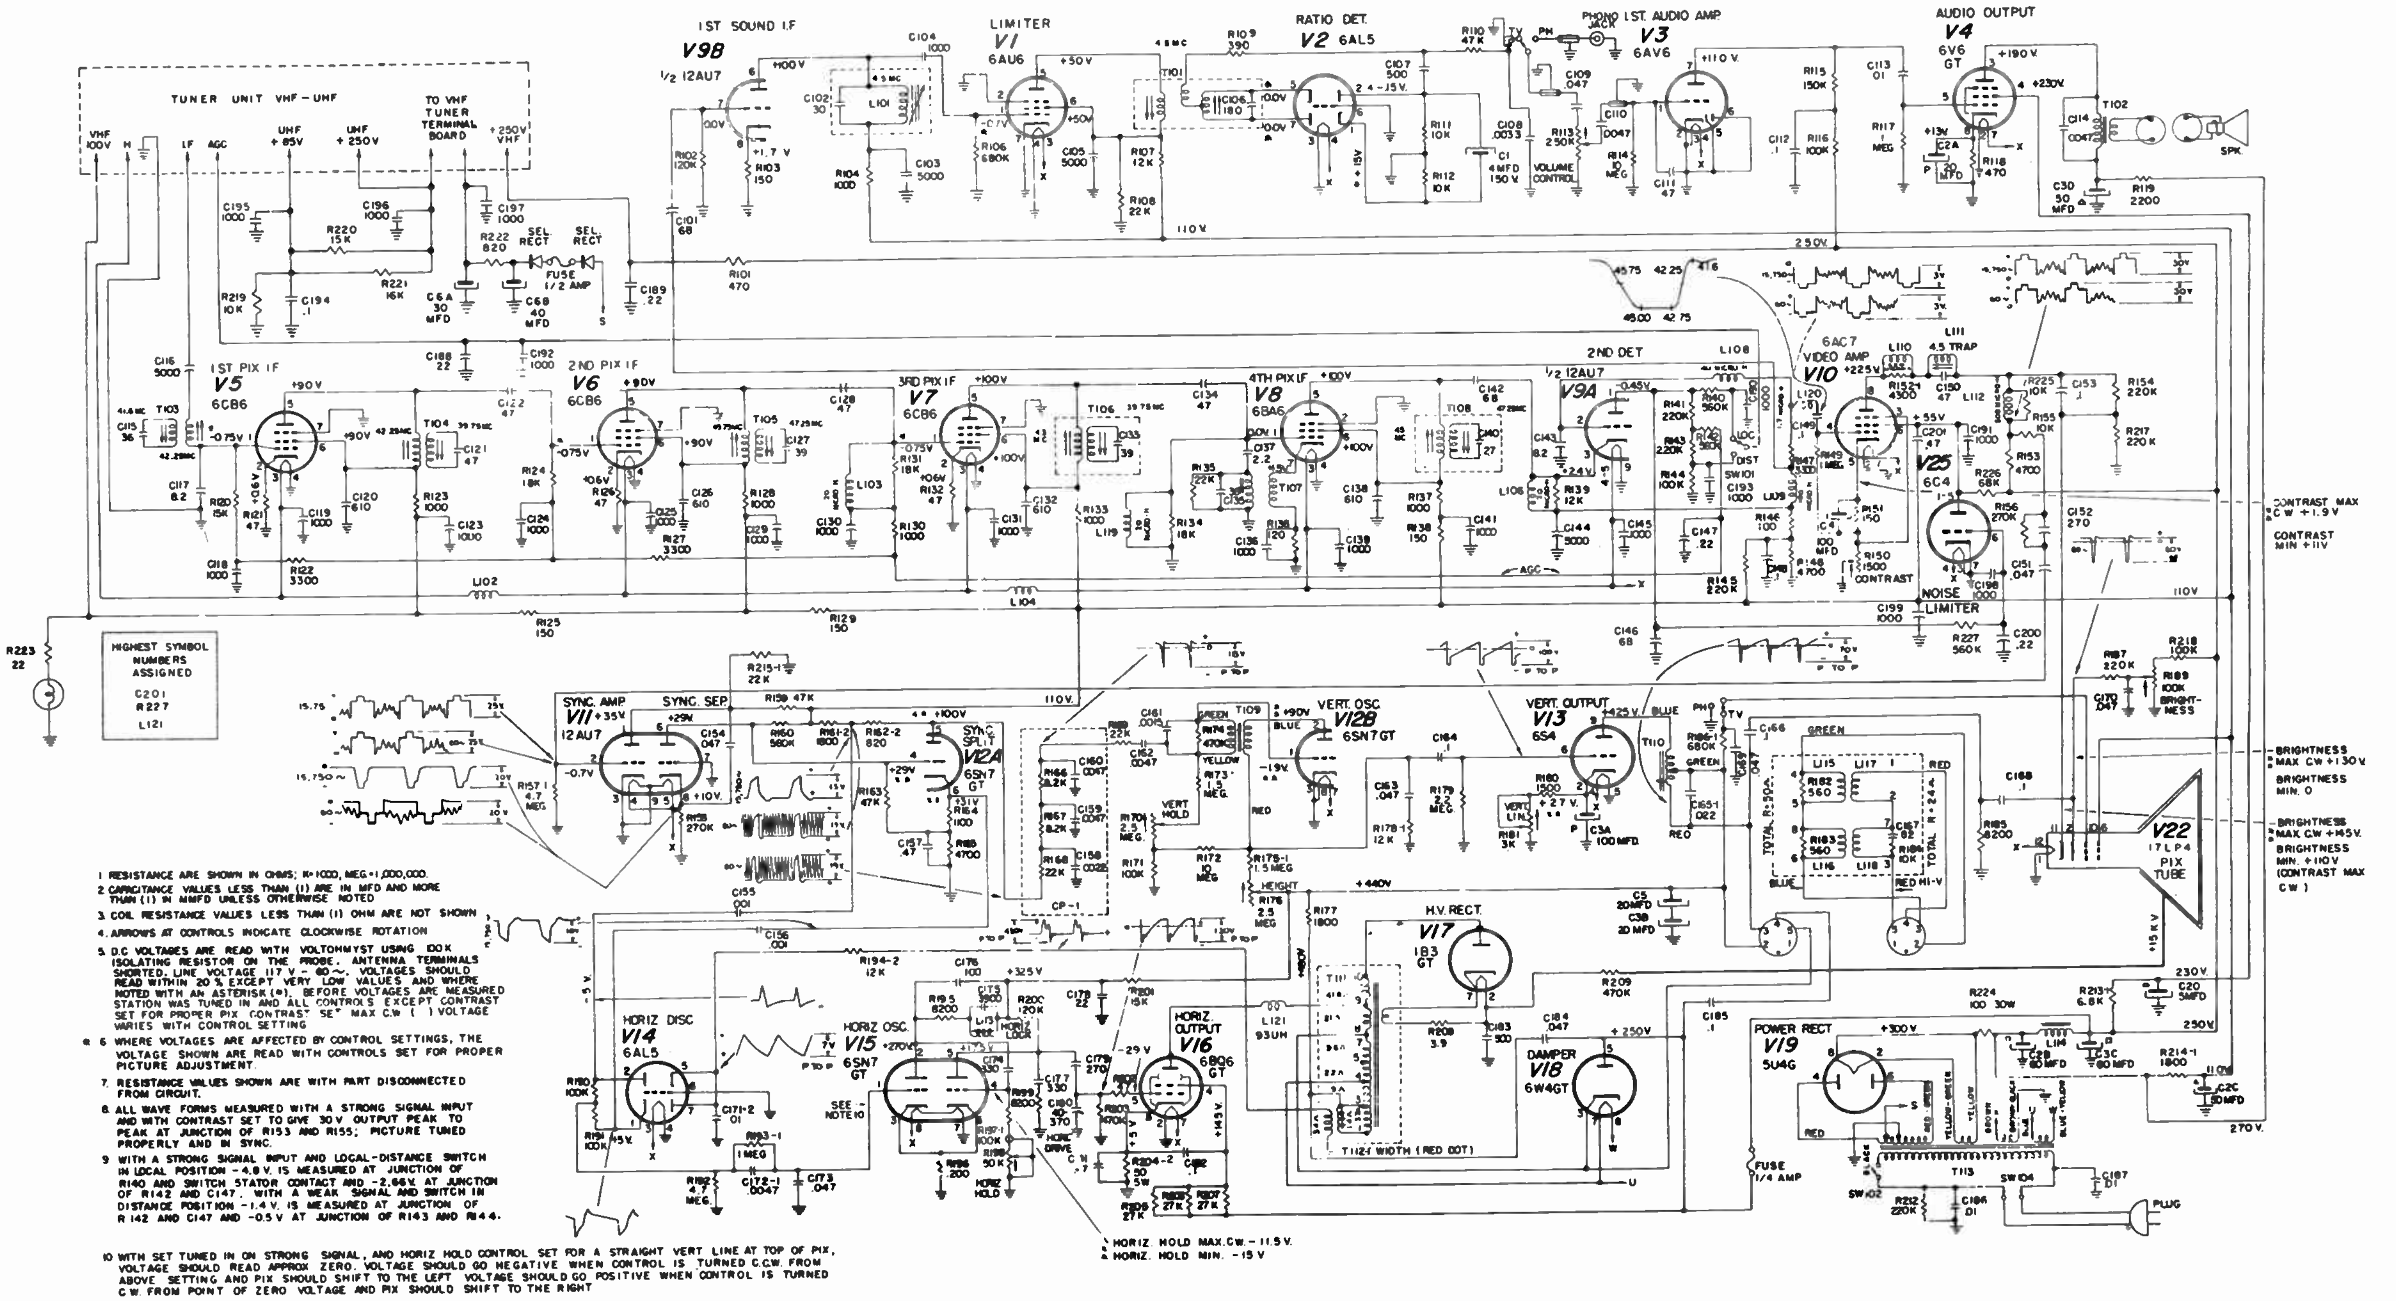
SCHEMATIC DIAGRAM 132.045- 1





1. RESISTANCE ARE SHOWN IN OHMS; K=1000, MEG=1,000,000.
2. CAPACITANCE VALUES LESS THAN (1) ARE IN MFD AND MORE THAN (1) IN MMFD UNLESS OTHERWISE NOTED.
3. COIL RESISTANCE VALUES LESS THAN (1) OHM ARE NOT SHOWN.
4. ARROWS AT CONTROLS INDICATE CLOCKWISE ROTATION.
5. D.C. VOLTAGES ARE READ WITH VOLTOHMYST USING 100K ISOLATING RESISTOR ON THE PROBE. ANTENNA TERMINALS SHORTED. LINE VOLTAGE 117 V - 60 ~. VOLTAGES SHOULD READ WITHIN 20 % EXCEPT VERY LOW VALUES AND WHERE NOTED WITH AN ASTERISK (*). BEFORE VOLTAGES ARE MEASURED STATION WAS TUNED IN AND ALL CONTROLS EXCEPT CONTRAST SET FOR PROPER PIX CONTRAST SET MAX C.W. ( ) VOLTAGE VARIES WITH CONTROL SETTING.
6. * WHERE VOLTAGES ARE AFFECTED BY CONTROL SETTINGS, THE VOLTAGE SHOWN ARE READ WITH CONTROLS SET FOR PROPER PICTURE ADJUSTMENT.
7. RESISTANCE VALUES SHOWN ARE WITH PART DISCONNECTED FROM CIRCUIT.
8. ALL WAVE FORMS MEASURED WITH A STRONG SIGNAL INPUT AND WITH CONTRAST SET TO GIVE 30 V. OUTPUT PEAK TO PEAK AT JUNCTION OF R153 AND R155; PICTURE TUNED PROPERLY AND IN SYNC.
9. WITH A STRONG SIGNAL INPUT AND LOCAL-DISTANCE SWITCH IN LOCAL POSITION -4.8 V. IS MEASURED AT JUNCTION OF R140 AND SWITCH STATOR CONTACT AND -2.66 V. AT JUNCTION OF R142 AND C147. WITH A WEAK SIGNAL AND SWITCH IN DISTANCE POSITION -1.4 V. IS MEASURED AT JUNCTION OF R142 AND C147 AND -0.8 V. AT JUNCTION OF R143 AND R144.
10. WITH SET TUNED IN ON STRONG SIGNAL, AND HORIZ. HOLD CONTROL SET FOR A STRAIGHT VERT. LINE AT TOP OF PIX, VOLTAGE SHOULD READ APPROX ZERO. VOLTAGE SHOULD GO NEGATIVE WHEN CONTROL IS TURNED C.C.W. FROM ABOVE SETTING AND PIX SHOULD SHIFT TO THE LEFT. VOLTAGE SHOULD GO POSITIVE WHEN CONTROL IS TURNED C.W. FROM POINT OF ZERO VOLTAGE AND PIX SHOULD SHIFT TO THE RIGHT.

SCHEMATIC DIAGRAM 132.045 - 2



1 RESISTANCE ARE SHOWN IN OHMS; K=1000, MEG=1,000,000.

2 CAPACITANCE VALUES LESS THAN (1) ARE IN MFD AND MORE THAN (1) IN MMFD UNLESS OTHERWISE NOTED

3 COIL RESISTANCE VALUES LESS THAN (1) OHM ARE NOT SHOWN

4. ARROWS AT CONTROLS INDICATE CLOCKWISE ROTATION

5 D.C VOLTAGES ARE READ WITH VOLTOHMYST USING 100K ISOLATING RESISTOR ON THE PROBE. ANTENNA TERMINALS SHORTED. LINE VOLTAGE 117 V - 60 ~. VOLTAGES SHOULD READ WITHIN 20 % EXCEPT VERY LOW VALUES AND WHERE NOTED WITH AN ASTERISK (*). 7. RESISTANCE VALUES SHOWN ARE WITH PART DISCONNECTED FROM CIRCUIT.
8. ALL WAVE FORMS MEASURED WITH A STRONG SIGNAL INPUT AND WITH CONTRAST SET TO GIVE 30 V. OUTPUT PEAK TO PEAK AT JUNCTION OF R153 AND R156; PICTURE TUNED PROPERLY AND IN SYNC.
9. WITH A STRONG SIGNAL INPUT AND LOCAL-DISTANCE SWITCH IN LOCAL POSITION -4.8 V. IS MEASURED AT JUNCTION OF R140 AND SWITCH STATOR CONTACT AND -2.66V. AT JUNCTION OF R142 AND C147. WITH A WEAK SIGNAL AND SWITCH IN DISTANCE POSITION -1.4 V. IS MEASURED AT JUNCTION OF R142 AND C147 AND -0.8 V. AT JUNCTION OF R143 AND R144.
10. WITH SET TUNED IN ON STRONG SIGNAL, AND HORIZ. HOLD CONTROL SET FOR A STRAIGHT VERT. LINE AT TOP OF PIX, VOLTAGE SHOULD READ APPROX ZERO. VOLTAGE SHOULD GO NEGATIVE WHEN CONTROL IS TURNED C.C.W. FROM ABOVE SETTING AND PIX SHOULD SHIFT TO THE LEFT. VOLTAGE SHOULD GO POSITIVE WHEN CONTROL IS TURNED C.W. FROM POINT OF ZERO VOLTAGE AND PIX SHOULD SHIFT TO THE RIGHT.

HOW TO ORDER PARTS

1. Use correct form.
2. On the Purchase Order always give the following information:
   (1) PART NUMBER (number printed on the part if different from that shown in this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).
   (2) The CHASSIS NUMBER, which is 132.045. See "DIV. 57 STANDARD NOMENCLATURE INDEX" for source, name and address.
3. ORDERING INSTRUCTIONS:
   Send Purchase Orders DIRECT to SOURCE No. 132. See "DIV. 57 STANDARD NOMENCLATURE INDEX" for source, name and address.
4. MARK-UP: Selling prices in the following list produce a MARK-UP of AA5, unless otherwise noted in the M.U. Code Column.
5. In all correspondence relating to cabinets, always mention the source code letter stamped in the upper rear rail of consoles or on sticker on the back, bottom or inside of cabinet.

GENERAL DESCRIPTION

The information contained in this service R.I. covers catalog numbers 3177-A and 3187-A. Both receivers utilize chassis 100.400 and differ only as to cabinet design.

Seventeen tubes are used solely for reproduction of the visual and aural portions of the television broadcast. In addition, a heavy duty transformer and two rectifier tubes provide power for operation of all stages.

Outstanding circuit features of the receivers include a high gain R.F. tuner which is noted for its stability and rugged mechanical construction, an inter-carrier sound system which is free from distortion normally caused by oscillator drift, automatic frequency control of horizontal sync system, automatic gain control, and retrace line suppression.

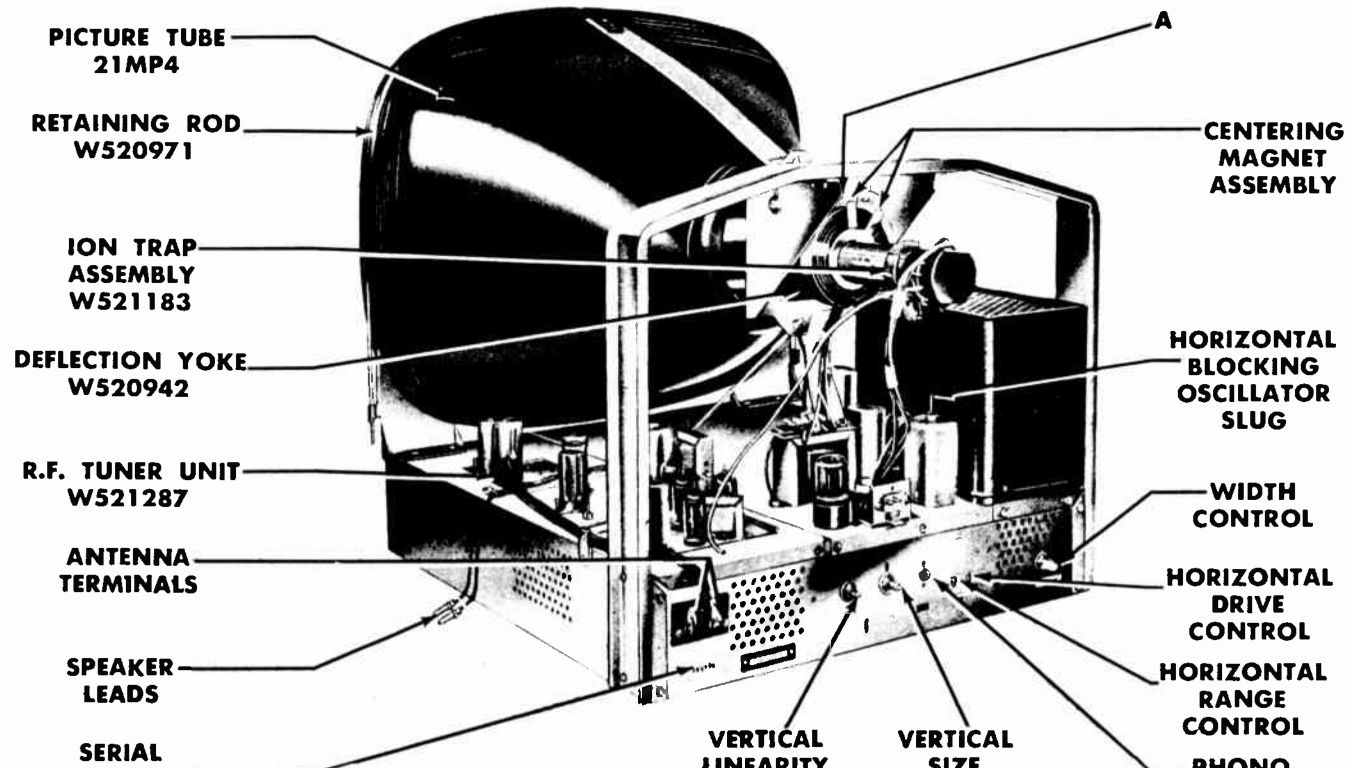
The R.F. tuner is of a turret type construction with individual coils easily replaceable. The circuit uses a cascode R.F. amplifier which provides good gain on both high and low television channels, while keeping inherent tube noise to a minimum.

A three stage I.F. amplifier is used with the first two stages connected as a cascode amplifier. Good overall sensitivity is achieved by a stable R.F. and I.F. amplifier which is controlled by an excellent A.G.C. system and A.G.C. controlled R.F. amplifier, and I.F. system.

These stages are followed by a video amplifier. Also keyed A.G.C. and Gated Sync. Amplifier provides the receiver with good immunity to noise and other interference.

Suppression of retrace lines by an ingenious circuit arrangement contributes to ease of operation of the receiver. This highly desirable performance feature permits a wide variety of picture brightness and contrast control settings without appearance of retrace lines.

Orderly and well spaced arrangement of all components on a generously proportioned chassis pan permits easy access to all tube and circuits for analysis and measurement. In addition, some of the major components such as the yoke and horizontal output transformer, are easily replaced because electrical connection is made by "snap-on" or "plug-in" connectors.



CHASSIS AND PICTURE TUBE ASSEMBLY

SPECIFICATIONS

SPEAKER

Catalog	Type	Size	V.C. Imped.
3177-A	P.M. Dynamic	10"	3.2 Ohms
3187-A	P.M. Dynamic	10"	3.2 Ohms

DIMENSIONS

Model	Height	Width	Depth
3177-A	38"	25"	20¾"
3187-A	37⅝"	23⅛"	23⅜"

INTERMEDIATE FREQUENCIES

Sound Carrier—22.1 Mc.
Picture Carrier—26.6 Mc.

I.F. SYSTEM

Three Stages—stagger tuned—for composite signal.
One additional stage for sound channel.

DETECTOR

Sound—Ratio Type
Picture—Germanium Crystal Type

RETRACE LINE SUPPRESSOR

Eliminates retrace lines thruout the normal range of picture brightness and contrast.

DEFLECTION

Magnetic

POWER REQUIREMENTS

117 volts 60 cycles 200 watts

ANTENNA INPUT IMPEDANCE

300 ohms—balanced to ground.

PICTURE SIZE

21" Rectangular

R. F. TUNER

Turret type construction; individually removable coil assemblies for all channels. All components are easily accessible for servicing.

FOCUS

Electrostatic

HORIZONTAL SYNCHRONIZATION

Automatic frequency control provides excellent picture stability.

HIGH VOLTAGE POWER SUPPLY

"Fly-back" type. Completely enclosed in a shielded compartment.

BUILT-IN ANTENNA

Broad band dipole.

TUBE COMPLEMENT

Tube No.	Tube Type	Function
V1	6CB6	1st I.F. Amplifier
V2	6CB6	2nd I.F. Amplifier
V3	6CB6	3rd I.F. Amplifier
V4	6CL6	Video Amplifier
V5	6AU6	Keyer—A.G.C.
V6	6BE6	Gated Sync. Separator
V7 A&B	12AT7	Sync. Amplifier—Vertical Blocking Oscillator
V8 A&B	6SN7GT	Horiz. A.F.C.—Horiz. Blocking Osc.
V9	6BQ6GT	Horiz. Scanning Output
V10	1B3GT	High Voltage Rectifier
V11	6AX4GT	Horizontal Damping
V12	5U4G	Rectifier
V13	6AU6	Sound I.F. Amp.—Limiter
V14	6T8	Sound Discriminator—Sound Amplifier
V15	6AQ5	Sound Output
V16	6AH4GT	Vertical Scanning Output
V17	21MP4	Picture Tube
V18	6BQ7, or 6BZ7	R.F. Amplifier
V19	6J6	Mixer—Oscillator

PHONOGRAPH CONNECTIONS

This receiver may be used in conjunction with a separate record player to play your favorite records. When a record player utilizing a high impedance pick-up unit is connected as described in the following paragraphs, the television receiver serves to faithfully reproduce the recorded sound. A pin-jack type phono-socket, located at the back of the television chassis is used for the connection of the phonograph unit. Record players have a cable for connection to an amplifying device which contains two wires (or one wire and a braided shield). The end of this cable which is to be connected to the television chassis must be equipped with a pin type Phono Plug which fits the socket on the chassis and one may be ordered from any Sears Store by requesting a Phono Plug W500966.

After properly connecting the record player to the television receiver, connect the 117 Volt power cord from the record player to a convenient wall outlet. Slide the "PHONO TELEV" switch (located under the name plate) to the up position, then turn on the television receiver. Operate the record player in the prescribed manner. If the phonograph has a separate volume control, that control should be set to nearly the maximum volume position. Volume can then be controlled by adjusting the "VOLUME" knob on the television receiver.

When it is desired to again use the receiver for regular television reception it is not necessary to disconnect the record player; merely slide the "PHONO TELEV" switch to the down position and turn the record player's "ON-OFF" switch to the "OFF" position.

CLEANING GLASS WINDOW AND PICTURE TUBE FACE

These receivers are equipped with removable glass windows for easy cleaning. Removal can be accomplished by following the procedure below.

1. Remove power cord from wall outlet.
2. Take off the gold colored picture frame or escutcheon that retains glass window by taking out the cross-slotted screws in this frame while at the same time supporting the glass window to keep it from falling forward.
3. Carefully remove the glass window avoiding any possibility of scratching or chipping it.
4. Using a slightly dampened lint free soft cloth, carefully wipe the inside of the glass window and the face of the picture tube. Avoid any scratching, scraping or chipping that might impair the glass surface.
5. When replacing the glass window be sure that screws are securely tightened.

SYNCROGUIDE TRANSFORMER ALIGNMENT

Alignment of the Syncroguide transformer, circuit diagram #128, which is used in the Horizontal Oscillator circuit, can be accomplished by utilizing the procedure outlined below. To perform this alignment, it will be necessary to use an oscilloscope, preferably one that has a 2 megacycle response and a low input capacity probe—under 100 mmfd. to ground.

1. Set the "Top Slug" and "Bottom Slug" of the Syncroguide transformer to their maximum counter-clockwise positions.
2. Short together terminals C and D of the Syncroguide transformer.
3. Set "Horizontal Range" control, located on rear of chassis pan, to its maximum clockwise position.
4. Set "Horizontal Hold" control, located at front of chassis to its maximum counter-clockwise position.
5. Turn on receiver and tune in any local TV channel.
6. Adjust "Top Slug" clockwise until picture just locks in horizontally.
7. Remove short from terminals C and D. If picture does not hold sync when short is removed, adjust "Bottom Slug" clockwise until picture locks in.
8. Connect 'scope to terminal C of Syncroguide transformer and adjust sweep rate of 'scope until two cycles of oscillogram remain stationary. Turn "Bottom Slug" clockwise until wave form peaks are equal in height as shown in Fig. 21.

IMPORTANT: The first peak of the wave form should never be higher than the second peak nor should the first peak be lower than the second peak by more than 3%. Also when adjusting the "Bottom Slug," the picture must be in sync, therefore it may be necessary to turn the "Horizontal Hold" control clockwise when performing this step. After this adjustment has been completed, disconnect 'scope from receiver.

9. Set "Horizontal Hold" control counter-clockwise and adjust "Top Slug" until picture is locked in and does not lose sync when switching "Channel Selector" knob. Then, turn "Top Slug" slowly counter-clockwise until picture is just ready to lose sync as shown in Fig. 24.
10. Horizontal holding action of receiver should now be as follows:
    a. When "Horizontal Hold" control is at its maximum counter-clockwise position and "Channel Selector" knob is switched, picture may appear as shown in Fig. 24 or be out of sync.
    b. When "Horizontal Hold" control is at its maximum clockwise position, picture may lose sync when switching "Channel Selector" knob.
    c. When "Horizontal Hold" control is in the center or near the center of its range, picture remains stable when switching "Channel Selector" knob.
11. If the foregoing steps fail to correct for loss of horizontal holding action under normal receiver operation, be sure that condenser 130 (.01 mfd.) connected across terminals C and D of the Syncroguide transformer is part W512311, tubular, .01 mfd., 400 V. Do not use a substitute part.

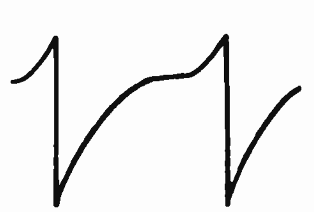
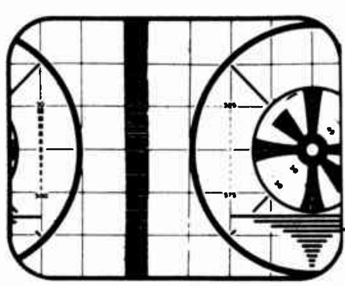
INCORRECT
Fig. 22



INCORRECT
Fig. 23



ALIGNMENT PROCEDURE

The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits.

Alignment of all RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts. These procedures should preferably be applied in the order in which they are presented. Alignment of Sound Channel or IF Channel may be accomplished individually if desired.

The RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned.

CAUTION

The picture tube is highly evacuated and if broken fragments will be violently expelled. Handle with care. Avoid contact with metal shell of picture tube as this is part of the high voltage circuit.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated.
   a. IF Frequencies:
      4.5 Mc. Sound Channel
      22.1 Mc. to 26.6 Mc. IF Channel
   b. RF Frequencies:
      54 to 88 Mc.
      174 to 216 Mc.
2. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.
3. **RF SWEEP GENERATOR** to provide frequency modulated signal for observing the over-all bandpass characteristic and RF Channel alignment at the following frequencies:
   20 to 30 Mc. with 10 Mc. sweep width.
   54 to 88 Mc. with 10 Mc. sweep width.
   174 to 216 Mc. with 10 Mc. sweep width.
4. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe. This instrument is used for observing the over-all bandpass characteristic and for RF Channel alignment.

SOUND CHANNEL ALIGNMENT PROCEDURE

Short antenna terminals together with a jumper wire.

Set receiver Channel Selector to any inactive television channel and Picture control to its maximum counter-clockwise position; other controls may be left at any desired setting.

3. A small screwdriver (preferably non-metallic) can be used for alignment of Sound IF. The blade of this tool will fit the slot in the core of the transformer.

STANDARD SIGNAL GENERATOR CONNECTIONS	STANDARD SIGNAL GENERATOR FREQUENCY	VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Picture control to its maximum counter-clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in Fig. 3. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2. 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V1, V2 or V3). This will prevent noise in the RF stages from affecting the voltage reading while adjusting the sound trap.	#1 4.5 MC Sound Trap (See Fig. 10)	Adjust for minimum reading on VTVM.
Same as above	Same as above.	Connect as shown in Fig. 4.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This spurious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	#2 Discriminator Secondary (See Fig. 10)	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary (See Fig. 11)	Adjust for maximum reading on VTVM.
				#4 Sound IF Transformer (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 5.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 5.	#2 Discriminator Secondary (See Fig. 10)	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #2 is obtained when the meter reads zero as the slug is moved thru this point.

Replace the type 6CB6 tube previously removed in the above procedure and turn set on. Tune in to a local channel and should there be an unusual amount of "Intercarrier Buzz" refer to procedure on adjoining page to remove this aforementioned fault.

REDUCTION OF INTERCARRIER BUZZ

Under actual reception conditions slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under these conditions.

Disconnect all instruments (be sure that I.F. tube removed for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

IF CHANNEL ALIGNMENT PROCEDURE

1. In order to eliminate the possibility of spurious oscillations, it is desirable to render the RF oscillator inoperative. This may be readily accomplished by insulating oscillator terminals of tuner. Remove tuner bottom shield and place a piece of transparent cellulose tape on the first two contacts (from front) of drum assembly. Use any inoperative channel and rotate drum to this insulated position.
2. Short antenna terminals together with a jumper wire.
3. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to the AGC line and positive terminal of battery connects to receiver chassis. See Fig. 11 for convenient point of connection.
4. If the IF channel is badly misaligned and two or more immediately adjoining IF stages are tuned to the same frequency, oscillation may occur. Such oscillation shows up as an excessive voltage across the video detector load, circuit reference number 42 and 43, and is indicated by the VTVM that is connected to this point during alignment. It should be noted that voltage due to IF oscillation is unaffected by strength of signal from the generator.

Where IF oscillation is encountered, it is generally possible to correct the condition by detuning the IF coils in different directions. If that does not have the desired effect, increase fixed bias on AGC line by using a 4½ volt battery instead of the 3 volt battery referred to in instruction #3. After stopping the oscillation in this manner it will then be possible to align all IF stages using the following procedure, however, the AGC bias battery must be changed back to 3 volts when using the oscilloscope to observe band pass characteristics. Once all stages have been aligned using the 4½ volt bias, the IF channel should be stable with reduced bias.

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	'SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
Connect as shown in Fig. 7.	23.4 MC.	Not used.	—	Connect as shown in Fig. 9.	Not used.	Be sure that RF oscillator has been rendered inoperative as outlined in instruction #1 at the head of this chart.	#5 Converter plate coil (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	24.2 MC.	Not used.	—	Same as above.	Not used.	Same as above.	#6 1st I.F. (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	26.2 MC.	Not used.	—	Same as above.	Not used.	Same as above.	#7 2nd I.F. (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	25.4 MC.	Not used.	—	Same as above.	Not used.	Same as above.	#8 3rd I.F. (See Fig. 10)	Adjust for maximum reading on VTVM.
Connect as shown in Fig. 8.	26.6	Connect as shown in Fig. 8.	25 MC. Sweep Width 10 Mc.	Same as above.	Connect as shown in Fig. 9	IMPORTANT: 1. Adjust output attenuator on sweep generator so that reading on VTVM is approximately one-half volt. 2. Set attenuator on standard signal generator so that marker signal does not distort the pattern on the oscilloscope. 3. Be sure that a 3 volt battery is connected to AGC line as specified in instruction #3 at the head of this chart. Do not use a battery of any other voltage.	The I.F. bandpass characteristic can now be observed by the use of a 'scope. Its general shape and contour should compare with the curve shown in Fig. 6. The picture carrier marker (26.6 Mc.) should appear at the 50% (±10%) amplitude position of the curve as shown in Fig. 6. (see Fig. 6 below) Should this observation fail to meet the above requirements, the complete I.F. alignment procedure must be repeated, exercising greater care in frequency setting of the marker generator and adjusting the I.F. transformer slugs for maximum output at the prescribed frequencies.	
Same as above.	22.1	Same as above.	Same as above.	Same as above.	Same as above.	Same as above.	The sound carrier marker (22.1 Mc.) can be observed by the use of a 'scope and should be compared with that shown in Fig. 6. Increase the vertical gain control on 'scope in order to magnify the sound portion of the response curve. This marker should appear at the position indicated in Fig. 6. Should the sound marker not be properly positioned, check the setting of the picture carrier marker as indicated in the previous step.

RF CHANNEL ALIGNMENT PROCEDURE

1. **CAUTION:** The shell of the picture tube has a high voltage potential, approximately 14,000 volts, and contact should be avoided. As the adjustment screws are in relatively close proximity to this shell, some means of insulation from accidental contact should be provided.
2. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 11 for convenient point of connection.)

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNEC-TIONS	SCOPE CONNEC-TIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUST-MENT AND OUTPUT INDICATION
CONNEC-TIONS	FREQUENCY	CONNEC-TIONS	FREQ.					
RF AMPLIFIER AND MIXER ALIGNMENT								
Connect as shown in Fig. 12.	**209.75 MC.** Sound Carrier **205.25 MC.** Picture Carrier Marker.	Connect as shown in Fig. 12 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	**CHANNEL #12**	Not used.	Connect as shown in Fig. 13.	Set Channel Selector to #12. IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	**#9** Mixer Grid. (See Fig. 19) **#10** RF Amp. Plate. (See Fig. 19) **#11** RF Amp. Grid. (See Fig. 19)	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 16. Use Mixer Grid trimmer #9; and RF Amplifier Plate trimmer #10 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #11 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained. **IMPORTANT:** When adjusting trimmers #9, 10 and 11 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that wauld result in a loss of sensitivity.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 15.	Same as above.	Set sweep generator to channel frequencies being observed.	Not used.	Same as above.	Set channel selectar to channel being observed.		The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #9, 10 and 11. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers. Band pass characteristic of these channels should conform close ta the RF response curve in Fig. 16. If necessary, a compromise may be obtained ta compensate for large variations in channel response by returning to channel #12 and moking slight changes in the settings of trimmers #9, 10 and 11.

OSCILLATOR ALIGNMENT

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in Fig. 6.
2. During oscillator alignment, it is necessary to set the Fine Tuning control so that the tooth on the fiber fine tuning cam points downward (correct position for this control is shown in Fig. 18).
3. During this step and thru-out all succeeding steps it is necessary to: keep output of sweep generator at a level that does nat allow reading an VTVM to exceed one-half valt.
4. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.

Connect as shown in Fig. 12.	**209.75 MC.** Saund Carrier Marker. **205.25 MC.** Picture Carrier Marker.	Connect as shown in Fig. 12 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	**CHANNEL #12**	Cannect as shown in Fig. 14.	Connect as shown in Fig. 14.	Set Channel Selector to #12 Be sure that generator's output does not exceed voltage specified in instructions #3 and 4 above.	Using a nan-metallic screwdriver to adjust channel #12 oscillator slug (accessible thru hole on front of RF Tuner Unit—see Fig. 18) shift response curve so that picture carrier marker is located at the position indicated in Fig. 17. Position of sound carrier marker should appear as indicated in Fig. 17.
Some as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 15.	Same as above.	Set sweep generator to channel frequencies being observed.	Same as above.	Same as above.	Set channel selector to channel being observed.	Adjust the RF sweep generator and marker generator for operation on the other television channels. After setting Channel Selector to corresponding channel, adjust oscillator slug thru hole on front of RF Tuner Unit (see Fig. 18). This permits response curve to be shifted so that picture and sound carrier markers will appear at the position indicated in Fig. 17. **NOTE:** Make sure that cam on fine tuning control shaft remains properly positioned during this step (tooth on the cam pointing downward—see Fig. 18).

If an oscillator slug "falls into" its coil farm during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it shauld be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position. (See Fig. 20.)

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel. If characteristic does not conform reasonably well within the typical curve shown in Fig. 16, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channels.

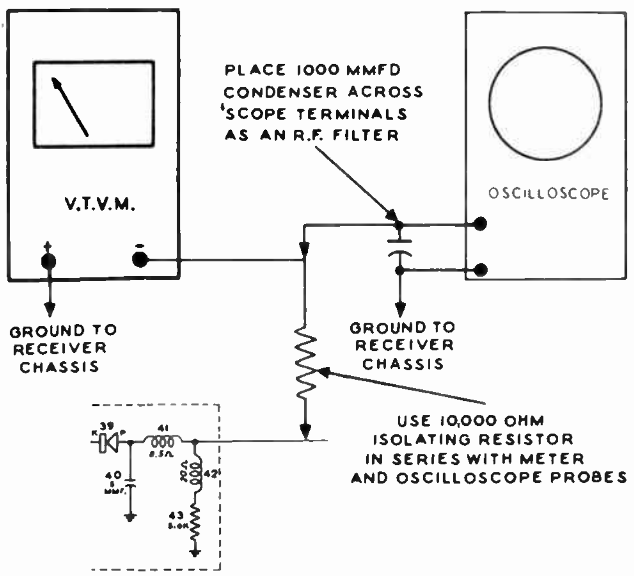

FIG. 14
VTVM and Oscilloscope Connections for Oscillator Alignment

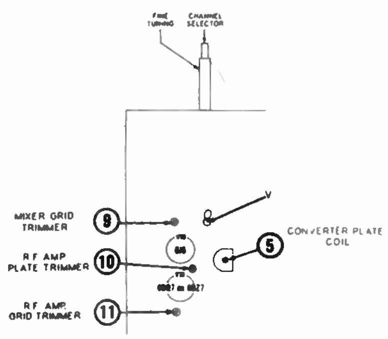

FIG. 19
Trimmer Location of R.F. Tuner

The turret type tuner incorporated in this chassis is of the latest design and utilizes a 6BQ7 or 6BZ7 tube as the R.F. amplifier (V5) and a 6J6 tube (V6) as the Mixer-Oscillator.

Channel selection is accomplished by rotation of the turret containing two sets of easily removable coil assemblies for each channel. The individual antenna coil sections consist of a balanced primary to minimize noise pick-up on the transmission line and an R.F. grid coil which couples the incoming signal to the grid of the first section of the R.F. Amplifier tube (V5). The inductance and amount of coupling of the tuned antenna input circuit are changed for each channel so that a constant input impedance of 300 ohms is maintained. This provides maximum transfer of energy to the R.F. Amplifier stage, particularly when interconnection between an outdoor antenna and the receiver is made with 300 ohm transmission line.

The R.F. Amplifier tube is a dual-triode tube and is connected in the circuit as a direct coupled grounded-grid type amplifier. This circuit was developed to meet the demand for an R.F. Amplifier that would provide more nearly equal gain on both the low and high Television Channels, while keeping inherent tube noise to a minimum. The circuit can be thought of very simply as two triode tubes in series, the first or driver unit acting not as an amplifier, but rather as an antenna impedance matching device and also as a variable cathode impedance, or bias source, for the second, or grounded-grid unit. In addition the first unit of the R.F. Amp. acts as a power amplifier due to its extremely low plate impedance, which is in reality the cathode circuit of unit two, and converts the weak signal voltage from the antenna to a low voltage-high current signal which is then applied to the cathode of unit number two. The signal coupling unit between the first and second units is a series peaking coil, symbol 406, similar to that found in a video amplifier circuit. Its purpose is to form a series resonant circuit with the input capacity of the second unit. The coil is so made as to resonate at a frequency slightly higher than channel 13. In a standard pentode type amplifier, the gain falls off rapidly as progressively higher channels are selected. With the use of the plate to cathode peaking coil an almost equal gain can be realized for all channels.

The R.F. Amp. tube has inherently low interelectrode capacity due to physical design and this factor in conjunction with the low output impedance of the first section is responsible for the low noise factor at this stage. While neutralization of the first unit is not necessarily due to its low plate to grid capacity, additional noise reduction has been realized, with only a slight decrease in gain, by the addition of a neutralizing condenser, item 405. Due to the low output impedance of the stage, it is not necessary that the neutralizing condenser be turnable.

Because of the circuits' excellent internal shielding, low input impedance and radiation rejection, the second section of the R.F. Amp. is connected as a driven grounded-grid amplifier. While this might not be apparent at first glance due to the fact that grid has no direct D.C. return, it will be found upon further examination that any high frequency A.C. potentials are by-passed to ground through condenser 407.

The second section of turret coils includes the tuned R.F. amplifier plate coil, tuned mixer grid coil, and oscillator coil. The output of the R.F. amplifier stage is coupled to the grid of the mixer stage, which utilizes one triode section of a 6J6 tube (V6). The other half of the 6J6 is connected as a modified Colpitts oscillator which injects oscillator voltage into the mixer stage through coupling between the oscillator coil and the mixer grid coil. Course oscillator tuning is accomplished by adjusting the positions of the slugs in the individual oscillator coils, while Fine Tuning is obtained when using condenser #417 in the oscillator plate circuit. This Fine Tuning condenser is composed of two fixed plates, and its capacitance is changed by the insertion of a bakelite com between these plates.

Signal output from the mixer stage is coupled to the IF amplifiers through the converter plate I.F. coil, diagram #427, located on the tuner unit.

REPAIR DATA FOR W521287 RF TUNER

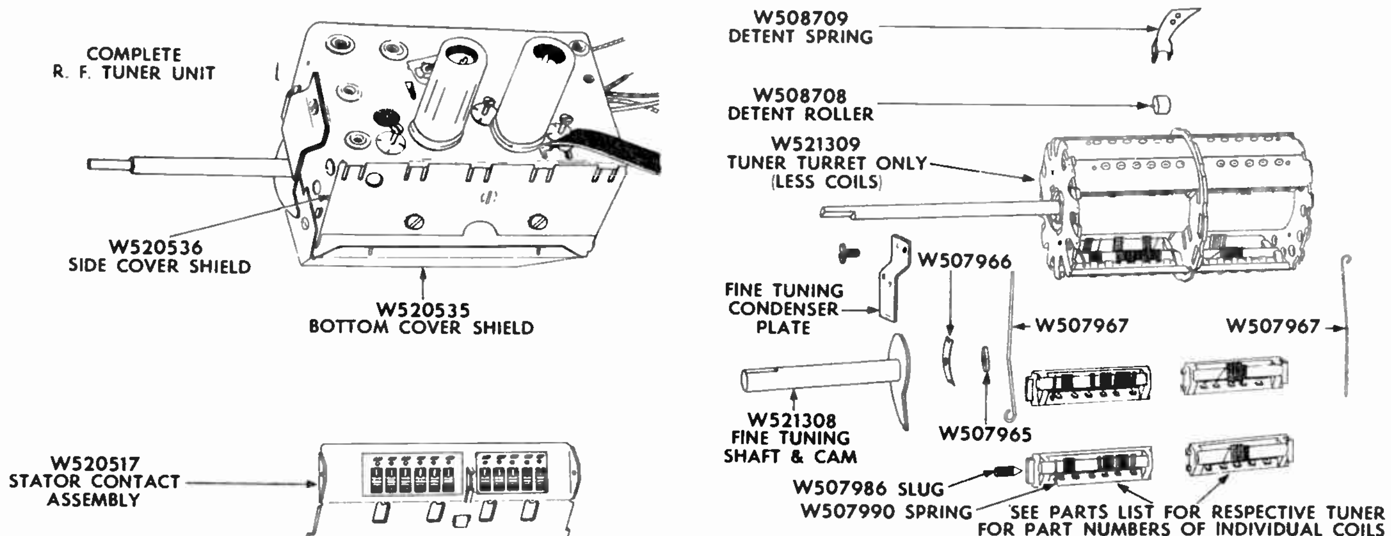

FIG. 20

SERVICE PRECAUTIONS

SUBJECT	PRECAUTIONS
ELECTRICAL COMPONENTS	The high frequencies used in the RF section of a television receiver make it necessary that considerable care be exercised in servicing the tuner. Lead dress and location of components are very critical at these frequencies. When replacing parts, it is important to use components of identical electrical characteristics and physical size. Always reconnect the replacement item in the same location and position in the tuner as the original component.
TUBES	Replacement of tubes in the Tuner Unit may cause slight detuning of RF circuits due to inherent differences in inter-electrode capacitances. When replacing tubes (especially 6J6 mixer-oscillator tube) make sure that Fine Tuning control will tune in television stations at approximately the middle of its range. It may be necessary to change the setting of the individual oscillator coil slugs for some channels to accomplish this.

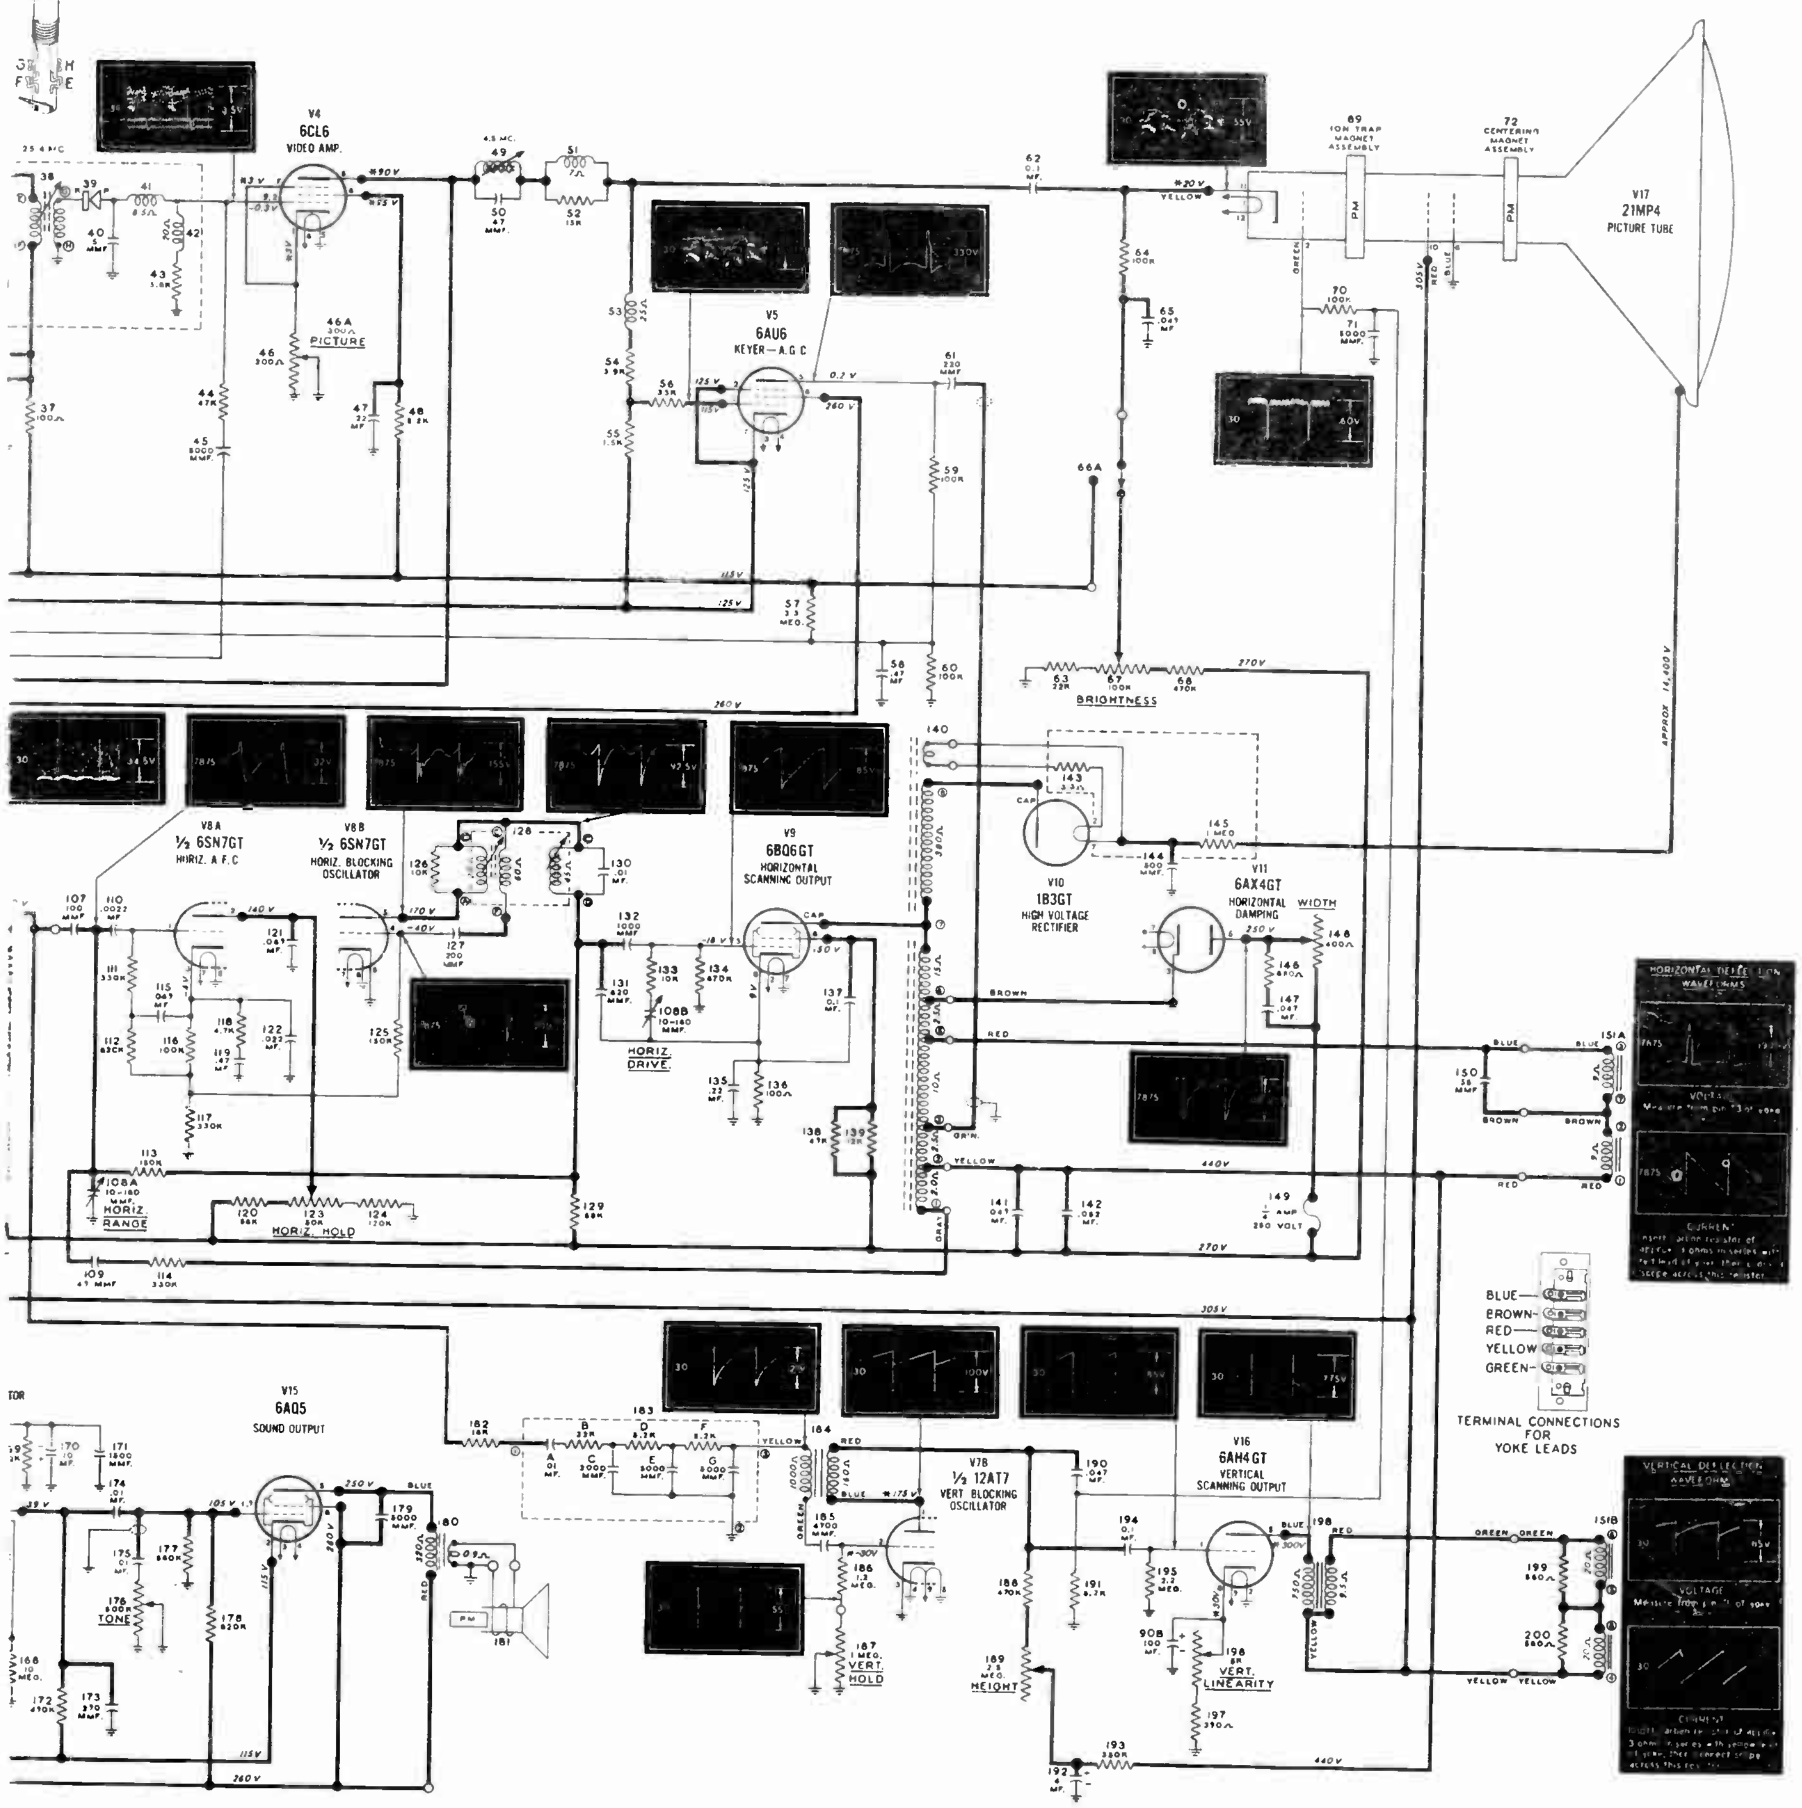
SCHEMATIC AND PARTS LIST DIAGRAM FOR CHASSIS 100.400



SUBJECT	PRECAUTIONS
CHANNEL COILS AND SLUGS	Channel Coils must be handled with care. **Do not disturb coil windings.** If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.
FINE TUNING CONTROL	Rubbing of the bakelite Fine Tuning Cam against the Fine Tuning Condenser Plate is intentional in order to avoid vibration with resulting microphonics. However, the Fine Tuning Cam should **not** rub or contact the small circular plate located on the body of the tuner.

REMOVAL AND REPLACEMENT OF PARTS

ITEM	PROCEDURE
RF TUNER UNIT	To remove the Tuner Unit from receiver chassis, proceed as follows: 1. Remove channel selector dial lamp socket. 2. Remove front and rear tuner mounting screws. 3. Disconnect the leads from the tuner to the main chassis. See illustration on circuit diagram page showing tuner connections. 4. Tuner unit may now be withdrawn from underside of chassis.
CHANNELS COILS	It is not necessary to remove entire tuner unit to replace a snap-in channel coil but removal of bottom shield will be required. This may be accomplished by grasping the front end of the shield and pulling downward and unhooking it from rear of tuner frame. Insert a screwdriver blade between Coil Retainer Spring and the end of the Tuner Turret. Twist the blade to pull spring away from the molded body of Channel Coil. Lift this end of coil body upward and remove individual coil assembly from tuner. When replacing Channel Coils, be sure they are reinstalled in their correct positions. Coil numbers should increase consecutively in a counter-clockwise direction when tuner is viewed from the front. If all the Channel Coils have been removed from the Tuner Turret, rotate turret until flat surface on end of tuner shaft points down. Install #3 Channel Coils into bottom position on turret. Then follow the correct sequence indicated above to replace other coils.
TUNER TURRET ASSEMBLY	To remove turret from RF Tuner Unit, remove complete tuner and bottom shield as described in previous sections and proceed as follows: 1. Remove rear Turret Shaft Retaining Spring by disengaging straight end of spring from projection on tuner frame. 2. Remove Fine Tuning Condenser Plate from front of Tuner Unit. This plate forms one side of Fine Tuning control condenser and is held in place by one screw. 3. Slide Fine Tuning Cam and Shaft off of main Channel Selector Shaft. 4. Remove Spring Contactor Washer and Fiber Spacer Washer from Channel Selector Shaft. 5. Remove Shaft Retaining Spring at front of tuner by disengaging straight end of spring from projection on frame. 6. Remove turret assembly from frame. To replace turret, reverse the above procedure. Tooth on bakelite Fine Tuning Cam should point downward during assembly so that it does not become locked between the stops on the Fine Tuning Condenser Plate. Also be sure to replace bottom shield.
STATOR CONTACT ASSEMBLY	To remove this assembly, remove complete tuner as described in previous sections and proceed as follows: 1. Remove side shield by taking out the two retaining screws and unsolder shield at one point. Now, disengage shield from upper edge of tuner frame. 2. Remove the two screws at the front and rear of the Stator Contact Assembly. 3. Unsolder all electrical connections to contact plate. 4. Unsolder five soldered joints between Stator Contact Assembly and Tuner Unit. 5. Contact Assembly may now be withdrawn from frame. To reinstall this assembly: 1. Place Stator Contact Assembly in position and replace, but do not tighten, the two screws at the front and rear of the assembly. 2. Remove 3 consecutive pairs of Channel Coils from the turret (for example, the antenna and rf-osc. coils for channels #5, 6 and 7). 3. Position Tuner Turret so that the edges of the next highest Channel Coils (in this case, the coils for channel #8) just pass the row of 11 contacts on the Stator Contact Assembly. 4. Adjust position of the Stator Contact Assembly so that there are a few thousandths of an inch spacing between the contacts on the contact plate and the molded body of the Channel Coils. 5. The Contact Assembly is now correctly positioned and screws at front and rear may be tightened. 6. Solder Stator Contact Assembly to tuner frame at same points that were used previously. 7. Make all electrical connections to contact plate. 8. Replace Channel Coils. 9. Replace side shield.

	W520978	Socket and cable assembly for picture tube	.90
	W115326	Strap, anchor; upper (insulated)	.95
	W521063	Strip, retains H.V. lead	.10
	W520981	Support for tuner shaft (plastic)	.03
	W520754-A	Tab, U.H.F.	.15
	W520993	Terminal strip for TV antenna connections	.25
	W521095	Terminal strip for deflection yoke connections (fits on vertical output transformer)	.25
	W170741	Wing screw #8-32; far maunting or forward adj. of yoke	.10

VOLTAGE MEASUREMENTS

All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception — Power Booster control completely counterclockwise.

Voltages marked with an asterisk (*) will vary widely with control settings.

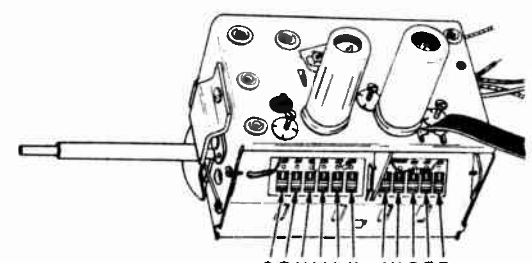
R.F. tuner voltages were measured with tubes removed from sockets.

No voltage reading at a tube element indicates zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.

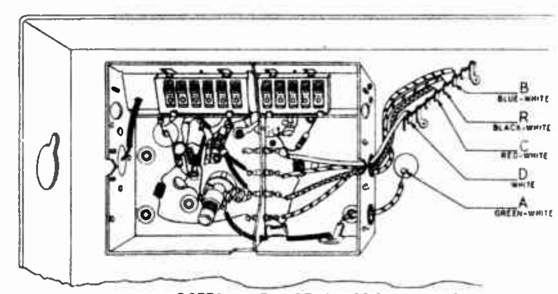
OSCILLOGRAMS

All oscillograms taken with ground lead of 'Scope connected to receiver chassis and controls set for normal reception. Power Booster control adjusted to give 55 volts peak to peak at cathode of picture tube. Oscilloscope vertical amplifier response was flat to within 20% at 2 MC.

Number appearing to the left of oscillogram specifies setting of horizontal sweep frequency control on 'Scope.



W521287 R.F. TUNER UNIT
(SHOWN WITH SIDE SHIELD REMOVED)



BOTTOM VIEW OF CHASSIS SHOWING CONNECTIONS TO RF TUNER UNIT

Fundamentally, the Sears Model 6950 UHF Converter operates in the same manner as the superheterodyne "front end" and the first I-F stage employed in many makes of VHF television sets. The primary difference is the operation of the Model 6950 on a higher frequency band--- 470 mc. to 890 mc. Allowing for this difference in operating frequency, the converter can be aligned as quickly and effectively as its VHF counterpart.

Alignment of the Model 6950 is a simple procedure since its bandpass is essentially predetermined by the fixed characteristics of original component design, physical layout and associated circuitry. Except as stated otherwise in this bulletin, band-pass is not subject to serious change during alignment adjustment; however, replacement of any component within the R-F or I-F circuits may disturb the band-pass characteristics of the instrument. Accordingly, whenever parts within these circuits are replaced, electrical and physical specifications of the original components must be duplicated as closely as possible. Wires, parts and other accessories must be replaced in their former positions.

Complicated or specially-designed test equipment is not required for practical alignment of the Model 6950. Instruments used in most TV service shops for testing VHF sets usually are satisfactory for aligning the converter. In addition to these tools, the following instruments are needed: a VHF signal generator with AM output and a sweep modulation of at least 12 megacycles; an oscilloscope or vacuum tube volt-ohmmeter for measurement of the relative signal; and an operating VHF television set. The latter is suggested as a practical amplifier for raising the output signal of the Converter to a level which permits convenient observation.

Before attempting to align the Model 6950, acceptability of the resistance and voltage values, which are found at each tube socket, should be determined by comparison with typical values listed below. The 6AF4 oscillator voltages, in particular, should be examined carefully. When tuning from one end of the dial to the other, plate and grid voltages should remain within the limits prescribed. Separate charts have been prepared for early and late 1952 models.

ALIGNMENT

The Sears UHF Converter to be tested should be connected to the VHF television set in the usual manner. The oscilloscope or VTVM should then be connected to the TV set at a point which permits satisfactory observation of the relative intensity and character of the AM (or sweep-modulated) signal introduced into the converter. The procedure for alignment consists of the following steps in the suggested sequence shown: (1) alignment of the I-F stage; (2) positioning of the oscillator for proper band coverage; and (3) alignment of R-F circuits for maximum effectiveness.

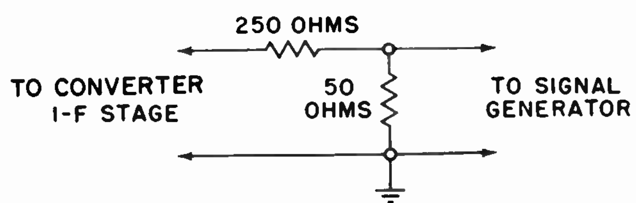


Figure 1

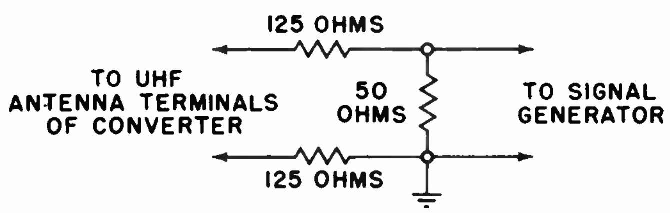

Figure 2

I-F ALIGNMENT

Chassis 725.101

1. Connect the VHF signal generator, through a suitable resistor-matching network (Fig. 1), to the crystal mixer of the Converter at the junction of Items 21, 29, 45 and 51 (Fig. 3). Apply an AM signal centered at 82 megacycles.
2. Align input and output I-F transformers (Items 5 and 6, Fig. 3) to obtain the maximum signal. Location of I-F alignment points is shown in Figures 5 and 6.
3. Replace AM signal with a sweep of at least 12 megacycles centered at 82 megacycles.
4. Readjust slugs of double-tuned, I-F output transformer (Item 6, Fig. 3) for equal signal response at VHF channels 5 and 6. The I-F amplifier must be aligned for a minimum 12-megacycle band-width, and the maximum gain possible with this band-width.

Chassis 725.101-1

1. Connect the VHF signal generator, through a suitable resistor-matching network (Fig. 1), to the crystal mixer of the Converter at the junction of Items 13, 14, 37 and 68 (Fig. 4). Apply an AM signal centered at 82 megacycles.
2. Align input and output I-F transformers (Items 5 and 6, Fig. 4) to obtain the maximum signal. Location of I-F alignment points is shown in Figures 7 and 8.
3. Replace AM signal with a sweep of at least 12 megacycles centered at 82 megacycles.
4. Readjust slugs of double-tuned, I-F output transformer (Item 6, Fig. 4) for equal signal response at VHF channels 5 or 6. The I-F amplifier must be aligned for a minimum 12-megacycle band-width, and the maximum gain possible with this band-width.

OSCILLATOR ADJUSTMENT

Chassis 725.101

1. Adjust tuning control so that indicating pointer is positioned at extreme left-hand edge of dial.
2. Feed a 465-megacycle AM signal into converter antenna terminals through a matching network described in Figure 2. Adjust oscillator trimmer (Item 48, Fig. 5) for maximum signal. (Use non-metallic alignment tool). When using a VHF signal generator, a fundamental of 93 megacycles may be employed to produce the 5th harmonic energy of 465 megacycles.
3. Adjust the Converter tuning control so that indicator is positioned at extreme right-hand edge of dial.
4. Set signal generator for 900-megacycle output (5th harmonic of 180 megacycles). Carefully spread or pinch together the legs of the oscillator end-inductor (Fig. 5) for maximum signal.
5. Repeat above steps until no further improvement in signal is apparent. The oscillator alignment figures of 465 and 900 megacycles are approximate only, and may not fall precisely at the maximum and minimum dial settings; however, in every case, the oscillator must be aligned so that both frequencies can be tuned by normal manipulation of the dial.

Chassis 725.101-1

1. Adjust tuning control so that indicating point is positioned at extreme left-hand edge of dial.
2. Feed a 465-megacycle AM signal into the converter antenna terminals through a matching network (described in Fig. 2). Adjust oscillator trimmer (Item 21, Fig. 6) for maximum signal. When using a VHF signal generator, a fundamental of 93 megacycles may be employed to produce the 5th harmonic energy of 465 megacycles.
3. Adjust the Converter tuning control so that indicator is positioned at extreme right-hand edge of dial.
4. Set signal generator for 900-megacycle output (5th harmonic of 180 megacycles). Carefully spread or pinch together the legs of the oscillator end-inductor (Fig. 6) for maximum signal.
5. Repeat above steps until no further improvement in signal is apparent. The oscillator alignment figures of 465 and 900 megacycles are approximate only, and may not fall precisely at the maximum and minimum dial settings; in every case, however, the oscillator must be aligned so that both frequencies can be tuned by normal manipulation of the dial.

R-F ALIGNMENT

Chassis 725.101

1. Adjust tuning control so that indicator is positioned at extreme left-hand edge of dial.
2. Feed a 465-megacycle signal into the Converter antenna terminals (as indicated above for oscillator alignment).
3. Adjust R-F trimmers (Item 72, Fig. 5) for maximum signal. Physical location of R-F alignment points is shown in Figures 5 and 6.
4. Readjust tuning control so that indicator rests at extreme right-hand edge of dial.
5. Set signal generator for 900 megacycles output.
6. Adjust end-inductors (Fig. 5) for maximum signal.
7. Repeat above steps until no further improvement in signal is apparent.
8. Readjust tuning control so that indicator is positioned at extreme left-hand edge of dial.
9. Adjust coupling trimmer (Item 74, Fig. 6) for maximum signal.

Chassis 725.101-1

1. Adjust tuning control so that indicator is positioned at extreme left-hand edge of dial.
2. Feed a 465-megacycle signal into the Converter antenna terminals (as indicated above for oscillator alignment).
3. Adjust R-F trimmers (Item 5, Fig. 8) for maximum signal. Physical location of R-F alignment points is shown in Figures 7 and 8.
4. Readjust tuning control so that indicator rests at extreme right-hand edge of dial.
5. Set signal generator for 900-megacycle output.
6. Adjust end-inductors (Fig. 7) for maximum signal.
7. Repeat above steps until no further improvement in signal is apparent.

VOLTAGE MEASUREMENTS

Note: -- Voltage measurements, made by means of an electronic voltmeter (VTVM), should be taken between tube socket terminals and the chassis. Measurements within 20 per cent of the specified value usually will assure satisfactory performance of the Converter.

RESISTANCE MEASUREMENTS

Note: -- Resistance measurements, made by means of an electronic ohmmeter (VTVM), should be taken between tube socket terminals and the chassis. Measurements within 20 per cent of the specified value usually will assure satisfactory performance of the Converter. When taking these measurements, the Converter switch must be turned to the "UHF" position and the line cord detached from the house circuit.

HOW TO ORDER PARTS

1. Use the Correct Order Form.
2. On the Purchase Order always give the following information:
   (1) PART NUMBER (number printed on the part if different from that shown in this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).
   (2) The CHASSIS NUMBER, which is 725.101. This number is found on a metal plate (picture on page 1) at the rear of the chassis.
3. ORDERING INSTRUCTIONS:
   Send Purchase Orders DIRECT to SOURCE No. 725. See "DIV. 57 STANDARD NOMENCLATURE INDEX", for source name and address.
4. MARK-UP: Selling prices in the following produce a MARK-UP of AA5 unless otherwise noted.

There will be a minimum charge of 50¢ made by the source on each parts order totaling less than 50¢ (cost to Sears). The customer is to be charged only the actual selling price shown in this RL.

SPECIFICATIONS

POWER SUPPLY
105 to 125 Volts — 60 Cycle AC

POWER CONSUMPTION
290 Watts

POWER OUTPUT (AUDIO)
2 Watts (undistorted)

INPUT IMPEDANCE
72 Ohms. or 300 Ohms.

PICTURE SIZE
10⅛" x 13¾"

PICTURE TUBE
16" Rectangular

585

SPEAKER
4"x 6"Oval P.M.–Voice Coil–3 Ohms.

VERTICAL SCANNING FREQ.
60 cycles per second

HORIZONTAL SCANNING FREQ.
15,750 cycles per second

GENERAL DESCRIPTION

This Silvertone console receiver consists of a combination television, standard broadcast and frequency modulation broadcast receiver and a record changer. A BUILT-IN-ANTENNA system permits reception of local television, FM or AM broadcasting facilities directly without external antenna equipment. Where required, external antennas may be readily connected to the receiver.

Features of the television receiver include full twelve channel coverage, an intercarrier sound system, automatic frequency control horizontal hold, and stabilized vertical hold.

The high sensitivity AM-FM broadcast receiver is also used to furnish the audio power for the television sound output.

The record changer will automatically play standard 78 RPM, fine-groove 45 RPM and long-play 33-1/3 RPM records of standard commercial dimensions.

FREQUENCY RANGE

Radio —
Standard Broadcast (A.M.) — 535-1600 K.C.
Frequency Modulation (F.M.) — 88-108 M.C.

Television —
Channels 2 through 13.
For channel frequencies, see table

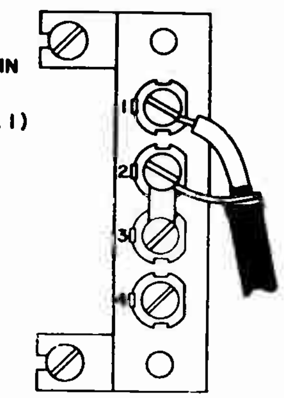

FIG. 3A

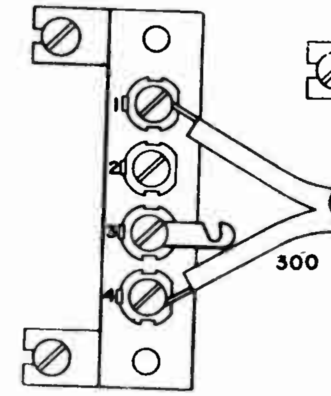

CONNECT
300 OHM FLAT TWIN LEAD-IN
TO TERMINALS 1-4
AS SHOWN ABOVE.
LINK MUST BE OPEN.

FIG. 3B

TELEVISION ALIGNMENT PROCEDURE

The alignment of this Receiver can be broken down into three basic parts.

1 — Video IF Alignment
2 — RF Alignment
3 — Sound Alignment

TEST EQUIPMENT

CATHODE RAY OSCILLOSCOPE — The tube size is relatively unimportant, however, anything under 5" usually makes fine adjustment quite difficult.

SWEEP GENERATOR—The sweep generator used should have linear coverage of a center range from 30 to 220 megacycles. The output should be fairly flat over wide frequency variation of the sweep. It should be capable of an output of about 0.1 volt with attenuation. It is preferable that the generator have a deflection output for the test oscilloscope.

TELEVISION RECEIVER REAR CHASSIS CONTROLS

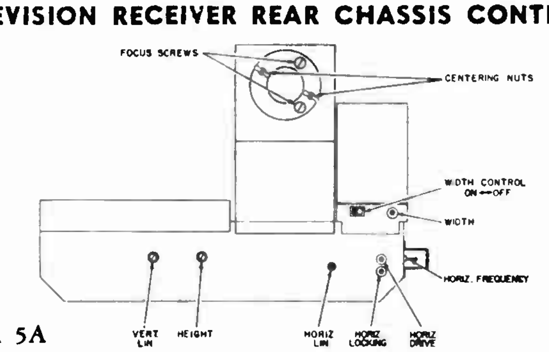

FIG. 5A

AM SIGNAL GENERATOR — This generator should have a frequency range of from 4.5 to 220 megacycles. As this generator is used occasionally as a marker generator, accuracy is an important factor. It should be capable of 0.1 volt output with attenuation and should be linear through the range.

VACUUM TUBE VOLTMETER — Any standard make VTVM will do. It should preferably have a reversible polarity switch.

WAVE TRAP — 32.8 M.C.

TEST SOCKET

In this model a Test Socket is provided which gives convenient access to the various points where either a vacuum tube voltmeter or an oscilloscope must be inserted for proper alignment. A letter diagram in the margin of the schematic will locate these points by means of corresponding letters in the schematic proper. A typical Octal socket is used and it should be noted that the diagram shows a TOP VIEW. Two ground points are supplied on separate pins of the test socket for easy metering. Reference is made, in the following Alignment Procedures, to the pins on this Test Socket.

R.F. OSCILLATOR ALIGNMENT

To align the R.F. oscillator it is first necessary to connect a working antenna to the set. Turn the selector switch to the channel to be aligned. With the fine tuning control set at the center of its range, adjust the correct brass slug (see Fig. 8) until the best picture is obtained. Adjusting channel 2 will affect all other channel adjustments, therefore, channel 2 should not be disturbed after aligning channels 3 to 13.

VIDEO IF ALIGNMENT

An adequate signal can be fed through the video IF string by feeding the output of the signal generator into a tube shield placed over the mixer tube (6AG5) (V-17). Care should be taken that this shield is NOT grounded. The ground side of the Generator output can be conveniently grounded to the shield of the adjacent oscillator tube.

The vacuum tube voltmeter should be connected across the 8200 ohm detector load resistor (Pin B Test Socket) and should be set on the minus 3 Volt scale. Set channel selector to an unused low band channel.

The Signal generator should be set to a frequency of 36.9 MC. The output of the generator should be adjusted to the point where the reading on the VTVM is between minus 1 to minus 1.5 volts.

The First and Third I.F. coils should be peaked for a maximum reading on the VTVM. As the voltage reading increases with tuning, the generator should be attenuated to maintain a maximum of minus 1.5 volts.

Set the Signal Generator to a Frequency of 34.8 MC and tune the Second and Fourth I.F. coils in the same manner as above:

The Generator should now be shut off (or tuned to different band) and the VTVM should read no more than minus .5 volt. If there is a higher voltage reading, check for regeneration in the I.F. stages.

To look at the actual response curve of the I.F. Amplifier connect the Sweep Generator and the A.M. Signal Generator to the antenna. Then connect "hot" or "high" side of the Oscilloscope to Pin B of the Test Socket. The "low" or ground side should be connected to the nearest convenient ground point. Care should be taken to separate the Oscilloscope leads from the Generator leads.

The Sweep Generator is set at the approximate mid-frequency of an unused low channel and the Signal Generator is set at the sound carrier frequency of the channel used. The Sweep Generator Amplitude is set so that a VTVM will read — 1.5 volts D.C. at test point B. Loosely couple a wave trap tuned to 32.8 MC into one of the I.F. coils until a small dip is noticed on the trace (see Fig. 9). The fine tuning control on the tuner should now be adjusted to make the Signal Generator marker coincide with the trap valley. The Signal Generator can now be tuned to the R.F. Picture Carrier frequency and the position of the Picture Carrier on the response curve noted. It should be between the 40% and 60% points on the slope of the curve. The band width between 50% points should be approximately 3.2 MC. Slight readjustment of the I.F. transformers may be necessary to obtain the desired response. Small variations from the ideal are acceptable as shown in Fig. 9.

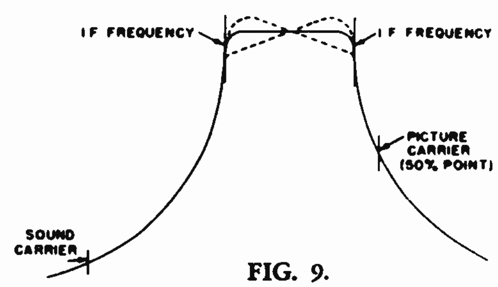

FIG. 9.

SOUND ALIGNMENT

Sound alignment on these receivers is best accomplished by using an actual transmission received on an antenna and fed in the normal manner to the antenna terminals. A Vacuum Tube Voltmeter should first be inserted between the output plate of the Ratio Detector Diode (pin 2 V15) and ground. This point may be reached through pin C of the Test Socket. The meter should be set on the *minus* 10 volt scale. With the equipment so placed the 4.5 MC pick-off coil (T8) and the primary of the Ratio Detector Transformer (bottom adjustment, T9) should be adjusted for a maximum deflection of the meter. The hot lead of the meter should now be moved to the junction point of R71, C60 and C61 (Pin A Test Socket), and the secondary of the Ratio Detector Transformer should be adjusted for a *ZERO* reading. (Note: There are 3 points at which the meter will zero. Only one of these is correct. At the proper setting the meter should swing negative on one side and positive on the other side of zero). In cases where it is necessary to align the sound section when no station transmission is available a single frequency signal generator tuned to 4.5 megacycles may be fed into the output circuit of the Video Detector (Pin B Test Socket). The receiver should then be aligned in the same manner as described above. The disadvantage of this method is that any inaccuracy in your signal generator will show up as misalignment when the set is in actual operation, since proper adjustment is very critical.

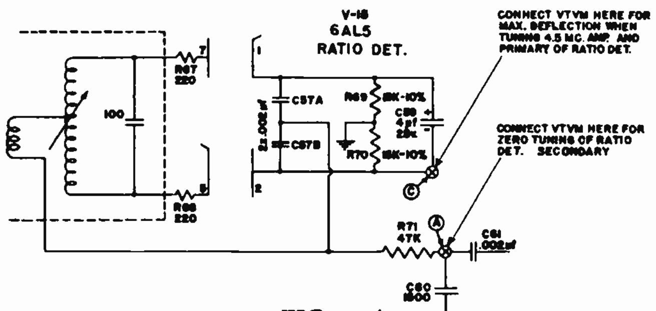

FIG. 10A

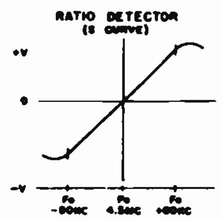

FIG. 10B

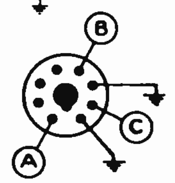

TEST SOCKET
(BOTTOM VIEW)
FIG. 10C

PICTURE ADJUSTMENTS

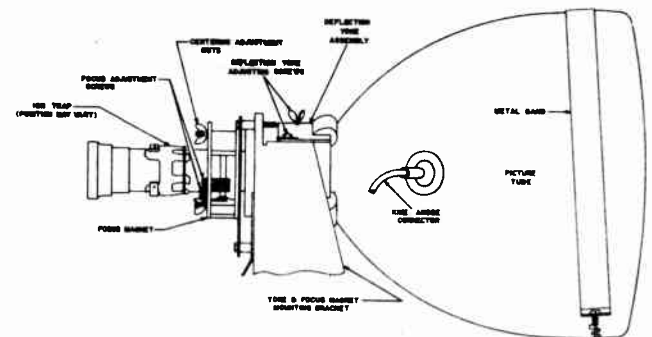

FIG. 11

ION TRAP MAGNET ADJUSTMENT

Position the ion trap so that the arrow points toward the second anode contact.

The ion trap rear magnet poles should be aproximately over the ion trap flags in the picture tube. The ion trap flags are small, rectangular plates in the neck of the picture tube about 1 inch from the black base of the tube. Starting from this position, adjust the magnet by moving it forward or backward until the raster (illuminated area of picture tube within the mask)is observed. Rotate it slightly around the neck of the picture tube for the brightest raster on the screen, and at the same time reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the focus adjustment screws (see Fig. 11) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

DEFLECTION YOKE ADJUSTMENT

If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment screws

NOTE: Be sure the deflection yoke as well as the picture tube mounting is positioned forward as far as possible against the flare of the picture tube.

It will now be necessary to obtain a test pattern picture in order to obtain further adjustments.

FOCUS MAGNET ADJUSTMENT

A permanent magnet type focus control is used in some receivers.The two focus adjustment screws shown in Fig.11 should be adjusted for sharpest focus. It is recommended that a brass screw-driver be used for this operation, otherwise the focus will change slightly when the screw-driver is removed.

Centering is accomplished by loosening the two wing nuts on the back of the focus control and shifting the control both vertically and horizontally in a vertical plane until proper centering is obtained. Rotation of the focus magnet about its axis will result in an optimum position for the removal of any remaining shadows in the corners of the picture. The wing nuts should then be tightened.

The ion trap magnet should now be rechecked for maximum brilliance.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT

Turn the horizontal control (on the front panel) to the extreme counter-clockwise position. The picture should remain in sync. Momentarily remove the signal by switching to another channel and then switching back again. The picture should break horizontal sync and the picture will be resolved into a series of black bars sloping down to the left.

Turn the horizontal control clockwise slowly bringing the picture into sync again. At the extreme clockwise position the picture will again show a tendency to break sync as indicated by anything from a shimmy to 2½ black diagonal bars sloping down to the right.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is adjusted and need not be aligned.

HORIZONTAL OSCILLATOR ALIGNMENT

1. The HORIZONTAL HOLD CONTROL should be set at approximately the center of its mechanical range. The HORIZONTAL LOCKING RANGE and the HORIZONTAL DRIVE trimmers should be set at two full turns counter-clockwise from maximum capacity.

2. Turn the HORIZONTAL DRIVE trimmer clockwise until the bright, vertical bars running through the picture are eliminated. If, in so doing, the picture should fall out of sync it should be brought back by re-adjusting the Horizontal Oscillator Transformer. This is the long screw adjustment which extends through the side of the chassis (see Fig. 12). (SEE NOTE).

3. Rotate the HORIZONTAL HOLD CONTROL (front panel auxiliary control) to the maximum clockwise position. The Horizontal Oscillator Transformer should now be adjusted to a point where the black horizontal blanking bar starts to come into the picture from the left side.

4. The HORIZONTAL HOLD CONTROL should now be rotated to its maximum counter-clockwise position. The picture should stay in sync. However, shorting the antenna terminals or rapidly switching to an unused channel and back should cause the picture to fall out of sync. If this condition does not exist readjust in accordance with step 3 above.

5. When the HORIZONTAL HOLD CONTROL is rotated to maximum clockwise position it is acceptable for the picture to vary in sync from a shimmy to 2½ bars sloping downward to the right. The picture should stay locked, however, through approximately ¾ of the mechanical rotation of the HORIZONTAL HOLD CONTROL.

6. If the HORIZONTAL DRIVE Trimmer must be readjusted at this time for improved width or linearity, steps 3, 4 and 5 should be rechecked.

NOTE: In the above procedure adjustment of the Horizontal Oscillator Transformer is mentioned a number of times. The adjustment referred to is the long screw which extends from the Horizontal Oscillator Transformer (T6) through the chassis and which would be adjusted from the outside of the chassis. There is an adjustment at the other (inside) end of this same coil can. This is the HORIZONTAL PHASE CONTROL adjustment. *IT IS IMPORTANT TO NOTE THAT THIS LATTER ADJUSTMENT SHOULD NOT BE TOUCHED IN THE FIELD.* This is a Factory adjustment and should not be attempted in the service shop. If this circuit is suspected of being defective or mistuned the entire assembly including the .01 mfd. — 600 volt Molded Paper condenser (C-43) should be removed and returned to the factory as a defective part.

HEIGHT, WIDTH AND LINEARITY

To adjust the overall size and linearity of the picture it is almost mandatory that a pattern transmitted from a local station be used. Linearity adjustments, particularly, cannot be accurately made on moving transmissions. It should also be remembered that in areas where more than one station is being received, that pictures transmitted from different stations will vary slightly in size. The smallest transmitted picture should be made to fill the area delineated by the mask.

The first step in linearity and size adjustment is to turn the WIDTH control (rear of chassis) all the way in (clockwise).

The HORIZONTAL DRIVE trimmer should then be adjusted for the best compromise between maximum brightness and good horizontal linearity. This control will affect the left side of the picture primarily. The HORIZONTAL LINEARITY control (rear of chassis) should then be adjusted for linearity of the right side of the picture. If it has been found necessary to adjust the HORIZONTAL DRIVE trimmer, steps 3, 4 and 5 of Horizontal Oscillator Alignment must be repeated.

The WIDTH Control should now be readjusted to achieve a picture that will fill the mask horizontally. If necessary the width coil may be entirely removed from the circuit of the WIDTH SWITCH on rear of chassis.

The HEIGHT and VERTICAL LINEARITY controls (both rear of chassis) should then be adjusted for a linear picture that will fill the mask vertically. At this point the FOCUS ADJUSTMENT screw previously set, should be retouched for maximum definition of the lines in the vertical wedge of the test pattern. Proper adjustment and alignment of the receiver should result in clear and sharp definition.

CONDITIONS:

1. Switch on - set connected to 117 Volt 60 cycle AC.
2. No antenna connected and set tuned to unused channel.
3. All controls at "Normal" setting.
4. Measurements taken with RCA volt-Ohmist.

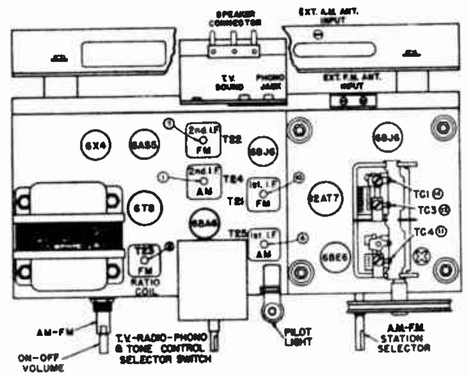
Notes:

* Reading will vary with setting of Picture Control.
** Reading will vary with setting of Horizontal Hold Control.
\+ Reading will vary with setting of Vertical Hold Control.
\+\+ Reading will vary with setting of Height Control.

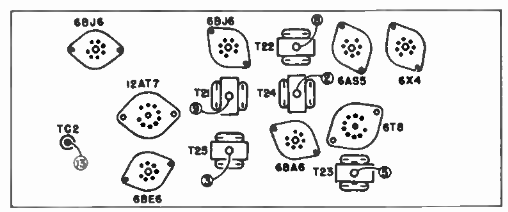
AM-FM RADIO ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection .... Across speaker voice coil
Output meter reading to indicate 500 MW (Standard Output) .... 1.27 volt
Generator modulation .... 30% 400 cycles
Position of volume control .... Fully clockwise
Set Dial Pointer .... 1-3/32" from center of right shaft, variable condenser closed
Set band switch .... To left for AM alignment; to right for FM alignment



TOP VIEW OF RADIO CHASSIS
FIG. 14



BOTTOM VIEW OF RADIO CHASSIS
FIG. 15

AM ALIGNMENT

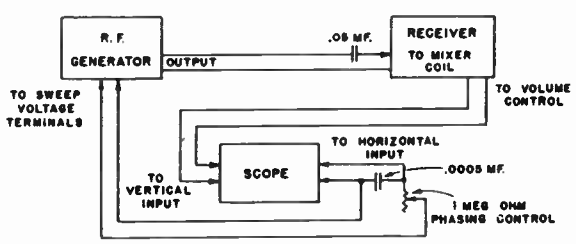
POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN FOR MAX. OUTPUT	TRIMMER FUNCTION
Open	455 Kc	.05 Mfd	Mixer grid	Chassis	1, 2, 3, 4	I.F.
1620 Kc	1620 Kc		*Test loop	Test loop	11	Oscillator
1400 Kc	1400 Kc		*Test loop	Test loop	12	Antenna
**600 Kc	600 Kc		*Test loop	Test loop	Check-point	Antenna

*Connect generator lead to a Standard Hazeltine Test Loop, Model 1150, placed two feet from the set loop, or three turns of wire about six inches in diameter, placed about one foot from the set loop.

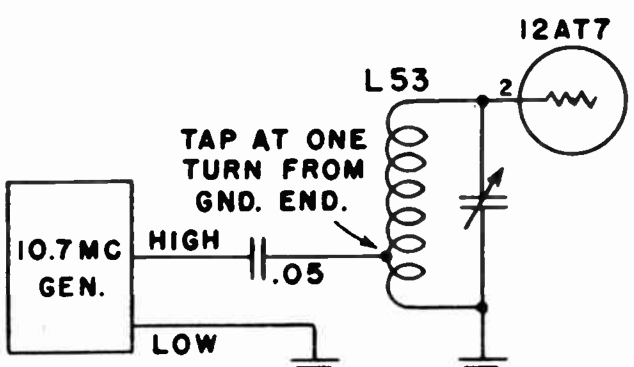
**With a generator signal of 600 Kc, tune the set to the point where maximum output is obtained, which should be approximately 600 Kc on the dial. Adjust antenna section plates of variable for maximum output.

The alignment procedure should be repeated in the original order for greatest accuracy.

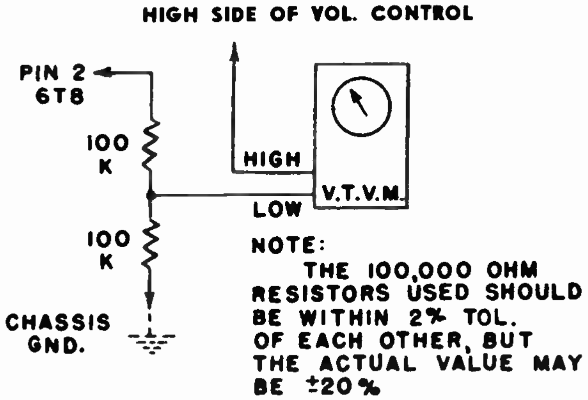
Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.



BLOCK DIAGRAM FOR I.F. AND DETECTOR ALIGNMENT USING SIGNAL GENERATOR AND OSCILLOSCOPE.
FIG. 16



RF ALIGNMENT CONNECTIONS
FIG. 17



DETECTOR ALIGNMENT CONNECTIONS
FIG. 18

FM ALIGNMENT

DETECTOR AND IF ALIGNMENT USING SIGNAL GENERATOR AND OSCILLOSCOPE

1. Connect vertical input of scope across volume control of receiver (Grounded terminal to chassis, ungrounded terminal to high side of the control).
2. Connect FM Generator, High Side, to grid of 2nd IF tube through .01 mfd. dummy, Low Side, to chassis.
3. Connect sweep voltage of generator to horizontal terminals of scope.
4. Set generator frequency to 10.7 Mc modulated either 60 cycles or 400 cycles, 250 Kc sweep (125 Kc deviation).
5. Set volume control to maximum, variable condenser fully open, band switch to right (FM).
6. Adjust detector primary slug #5 for maximum vertical sweep of the scope pattern.
7. Adjust detector secondary slug #6 for symmetry of the pattern. Pattern should look like Fig.19, with the same amount of curve on both ends.
8. Connect generator, high side, to mixer coil as in Fig.17, low side to chassis.
9. Short A. V. C. to chassis at junction of R125 and R129.
10. Disconnect the negative lead of C132 from pin #2 of 6T8.
11. Connect vertical input of scope across R124. (Grounded terminal to chassis, ungrounded terminal to high side of resistor.)
12. Adjust IF slugs 7, 8, 9, 10 for greatest vertical sweep of the pattern. Stagger tune (detune) slightly so that pattern looks like Fig.22.
13. Resolder the negative lead of condenser disconnected after alignment is completed.

NOTE: A double trace pattern, as in Fig.20 or Fig.21 for detector alignment, or Fig.23 for IF alignment, may be caused by a slight out of phase condition between the sweep voltage to the horizontal terminals of the scope and the modulation on the generator signal. To correct this condition, connect a condenser of about .0005 mf. across the horizontal input terminals of the scope and a 1 megohm variable resistance in series with the lead to the ungrounded terminal. Adjust the resistance until the two traces coincide.

OSCILLOSCOPE PATTERNS

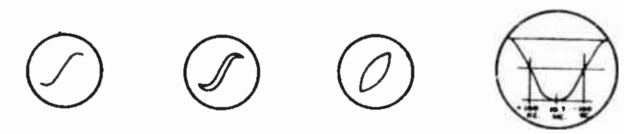


FIG. 19 **FIG. 20** **FIG. 21** **FIG. 22** **FIG. 23**

DETECTOR ALIGNMENT USING SIGNAL GENERATOR AND VTVM

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN	TRIMMER FUNCTION
Open	10.7 Mc	.01 Mfd.	2d IF grid	Chassis	#*5, #*6	Detector

#*5 is adjusted for maximum A. V. C. voltage. A vacuum tube voltmeter or a 20,000 ohm per volt voltmeter with a low V. range can be used to measure the A. V. C. voltage. Connect negative lead to junction of R125 and R129 on band switch and positive lead to the chassis.

#*6 is adjusted for zero reading of a vacuum tube voltmeter or a 20,000 ohm per volt voltmeter, connected as shown in Fig.18. Rock this adjustment through the zero point to see that the voltage is positive on one side of the zero point and negative on the other.

NOTE: If a 10.7 Mc FM generator is not available for alignment of detector, an unmodulated signal of 10.7 Mc from an accurately calibrated conventional AM type generator can be used. (Voltmeter alignment only).

I.F. alignment using signal generator and V.T.V.M. not recommended.

RF ALIGNMENT

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION HIGH SIDE	GENERATOR CONNECTION GROUND LEAD	ADJUST TRIMMERS IN ORDER SHOWN	TRIMMER FUNCTION
Open	109 Mc	300 Ohm	Ant. Term.	Ant. Term.	#13	Oscillator
Closed	87.5 Mc	300 Ohm	Ant. Term.	Ant. Term.	Spacing of L-55	Oscillator

Repeat the above oscillator adjustments until proper coverage is obtained on both ends of band since the two adjustments effect each other.

106 Mc	106 Mc	300 Ohm	Ant. Term.	Ant. Term.	#14	RF
90 Mc	90 Mc	300 Ohm	Ant. Term.	Ant. Term.	Spacing of L-53	RF

Repeat "RF and Ant." adjustments until proper tracking is obtained at both 90 and 106 Mc, since tracking the set at one frequency affects the tracking at the other frequency.

All RF trimmers are adjusted for maximum output, measured with output meter across speaker voice coil.

For RF alignment, use FM generator signal modulated with 400 cycles 45 Kc sweep (22.5 Kc deviation).

GENERAL INSTALLATION INSTRUCTIONS

While each receiver is correctly aligned at the factory rough handling in transit, ageing, drift, etc., may throw the receiver off, so we suggest that the proper oscillator trimmers, ratio detector, and rear panel controls be checked for correct adjustment with a transmitted television pattern, in the customer's home at the time of installation. Be sure to have the receiver operating for one-quarter hour before making these adjustments. Listed below is the correct procedure to follow in making these adjustments.

(A) Check all operating channels, using FINE TUNING CONTROL for best picture detail. (See paragraph PEAKING THE INDIVIDUAL OSCILLATOR TRIMMERS.)

(B) Check LOCALITY ADJUSTER CONTROL located on back of chassis for proper setting.

NOTE: The signal strength (too strong or too weak) will be affected by location and distance from the station, type of antenna used, terrain obstructions such as tall buildings, electrical disturbances.

PEAKING THE INDIVIDUAL VHF OSCILLATOR TRIMMERS

(A) Set channel selector knob to the desired channel.

(B) Remove the channel and fine tuning knobs. This will expose the individual channel adjustment screw opening located above the channel shaft.

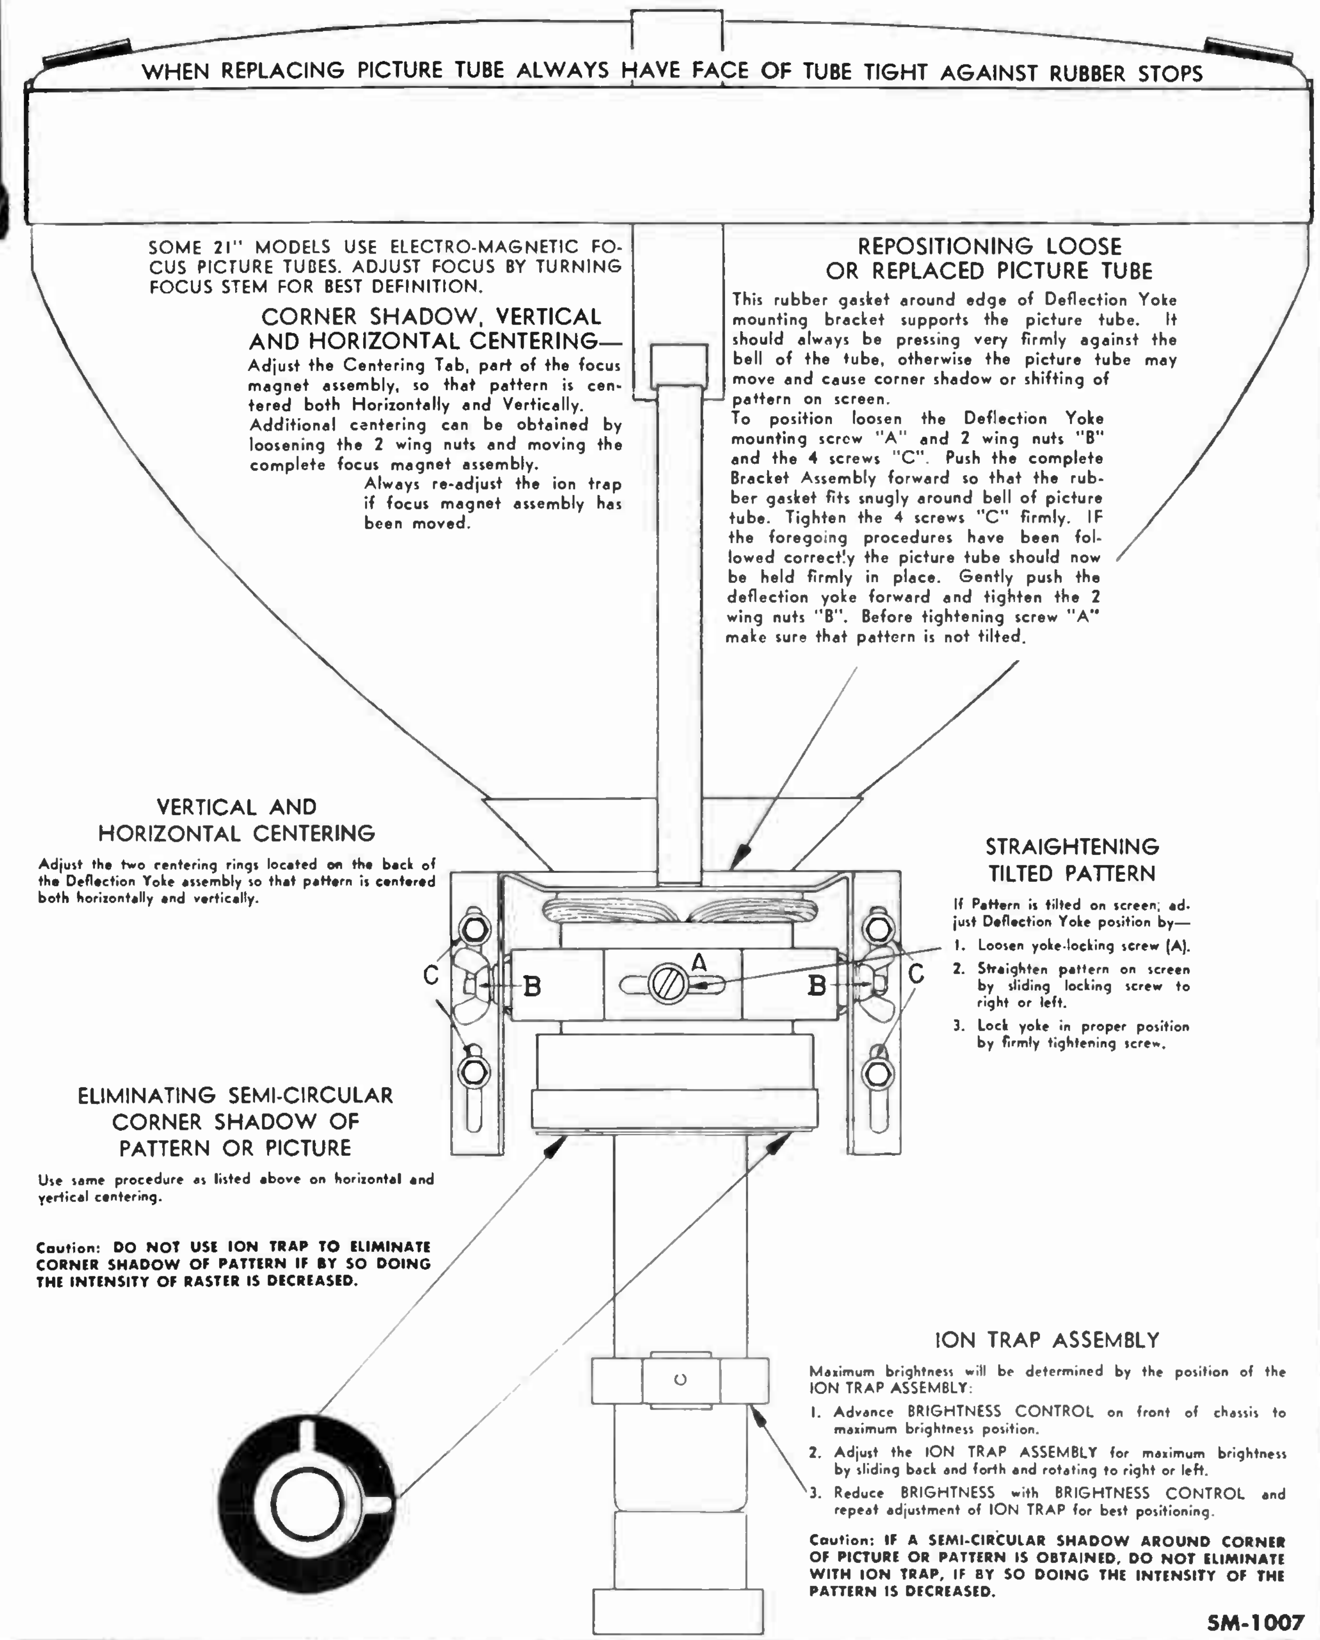
(C) Set the FINE TUNING CONTROL to the center position. Flat of fine tuning shaft facing up.

(D) Use a non-metallic screwdriver such as polystyrene or nylon.

Adjust the individual oscillator screw for best picture detail. A slight adjustment in either direction is all that is necessary. CAUTION: DO NOT ADJUST INDISCRIMINATELY, this may cause the adjustment screw to fall from its locking position.

ADJUSTMENT FOR STATION BUZZ

If station buzz is excessive and is NOT DUE to "contrast control" being advanced too far in a clockwise direction or the locality adjuster control in the incorrect position, adjust the ratio detector secondary adjustment screw located on top of the ratio detector for minimum buzz. MAKE SURE THAT THIS POSITION IS BETWEEN the two MAXIMUM buzz peaks that will be noticed when adjustment screw is turned to the right or left of the m'n'mum buzz position.



SOME 21" MODELS USE ELECTRO-MAGNETIC FOCUS PICTURE TUBES. ADJUST FOCUS BY TURNING FOCUS STEM FOR BEST DEFINITION.

CORNER SHADOW, VERTICAL AND HORIZONTAL CENTERING—

Adjust the Centering Tab, part of the focus magnet assembly, so that pattern is centered both Horizontally and Vertically. Additional centering can be obtained by loosening the 2 wing nuts and moving the complete focus magnet assembly.

Always re-adjust the ion trap if focus magnet assembly has been moved.

REPOSITIONING LOOSE OR REPLACED PICTURE TUBE

This rubber gasket around edge of Deflection Yoke mounting bracket supports the picture tube. It should always be pressing very firmly against the bell of the tube, otherwise the picture tube may move and cause corner shadow or shifting of pattern on screen.

To position loosen the Deflection Yoke mounting screw "A" and 2 wing nuts "B" and the 4 screws "C". Push the complete Bracket Assembly forward so that the rubber gasket fits snugly around bell of picture tube. Tighten the 4 screws "C" firmly. IF the foregoing procedures have been followed correct!y the picture tube should now be held firmly in place. Gently push the deflection yoke forward and tighten the 2 wing nuts "B". Before tightening screw "A" make sure that pattern is not tilted.

VERTICAL AND HORIZONTAL CENTERING

Adjust the two centering rings located on the back of the Deflection Yoke assembly so that pattern is centered both horizontally and vertically.

STRAIGHTENING TILTED PATTERN

If Pattern is tilted on screen; adjust Deflection Yoke position by—

1. Loosen yoke-locking screw (A).
2. Straighten pattern on screen by sliding locking screw to right or left.
3. Lock yoke in proper position by firmly tightening screw.

ELIMINATING SEMI-CIRCULAR CORNER SHADOW OF PATTERN OR PICTURE

Use same procedure as listed above on horizontal and yertical centering.

Caution: DO NOT USE ION TRAP TO ELIMINATE CORNER SHADOW OF PATTERN IF BY SO DOING THE INTENSITY OF RASTER IS DECREASED.

ION TRAP ASSEMBLY

Maximum brightness will be determined by the position of the ION TRAP ASSEMBLY:

1. Advance BRIGHTNESS CONTROL on front of chassis to maximum brightness position.
2. Adjust the ION TRAP ASSEMBLY for maximum brightness by sliding back and forth and rotating to right or left.
3. Reduce BRIGHTNESS with BRIGHTNESS CONTROL and repeat adjustment of ION TRAP for best positioning.

Caution: IF A SEMI-CIRCULAR SHADOW AROUND CORNER OF PICTURE OR PATTERN IS OBTAINED, DO NOT ELIMINATE WITH ION TRAP, IF BY SO DOING THE INTENSITY OF THE PATTERN IS DECREASED.

SM-1007

UHF TUNER DATA

The UHF TUNER has been aligned for optimum operation by special factory equipment and should not require alignment.

The 6T4 OSCILLATOR TUBE and 1N82 CRYSTAL are parts that may require replacement. The 1N82 crystal, located on top of UHF TUNER under square metal cover, is a snap-in type and no soldering is required.

In the UHF position, the 6BZ7 and 6U8 are used as additional IF stages.

Great care should be taken that parts location and lead dress are not altered in UHF TUNER.

UHF ALIGNMENT SHOULD NOT BE ATTEMPTED UNLESS ABSOLUTELY NECESSARY.

UHF TUNER ALIGNMENT

EQUIPMENT REQUIRED
UHF MARKER GENERATOR
PROCEDURE
UHF SWEEP GENERATOR
CATHODE RAY OSCILLOSCOPE

Set VHF tuner to UHF position.
Connect sweep generator to UHF antenna terminals.

NOTE: Sweep generator must match the 300 Ohm input impedance.
Loosely couple UHF marker generator to UHF sweep generator leads.
Connect oscilloscope to test point on VHF tuner.
Locality adjuster switch in weak position.
Carefully detune TU-2 mixer IF coil located on VHF tuner by turning core OUT exactly 10 turns.

NOTE: Radiated horizontal pulses may appear on the response curve. This will not affect the response or tilt of curve. DO NOT disable the horizontal sweep circuit; damage to the horizontal output tube may result.

ALIGNMENT

(1) Set sweep and marker generator to 460 MC.
Set UHF tuner to maximum counter-clockwise position.

Adjust CU-26 until marker is in the center of response curve.

If marker cannot be centered on response curve: carefully bend and move oscillator inductor tab Fig. 1 and re-adjust CU-26 until marker is in center of response curve.

(2) Leave marker and sweep generator at 460 MC.
Leave UHF tuner at maximum counter-clockwise position.

Carefully bend and move PRESELECTOR INDUCTOR TAB Fig. 1 for maximum response and minimum tilt. See response curve Fig. 2.
Repeat steps 1 and 2.

(3) Turn TU-2 mixer IF coil located on VHF tuner IN 10 turns until exact position is reached as before alignment.

DO NOT BEND OR MOVE INDUCTOR TABS INDISCRIMINATELY OR EXCESSIVELY.

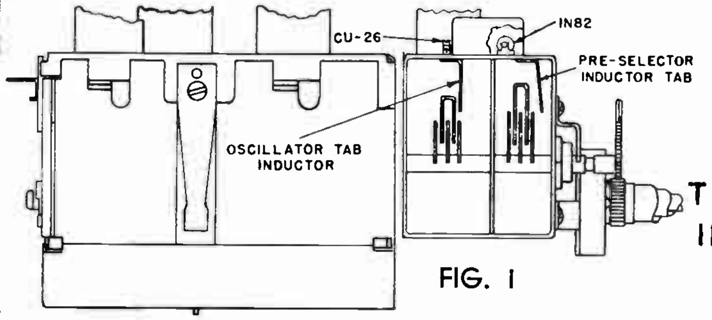


FIG. 1

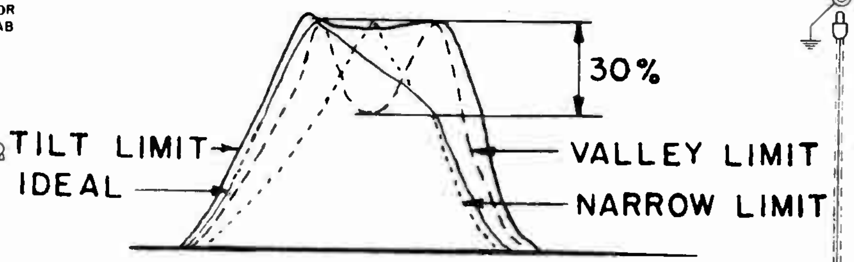
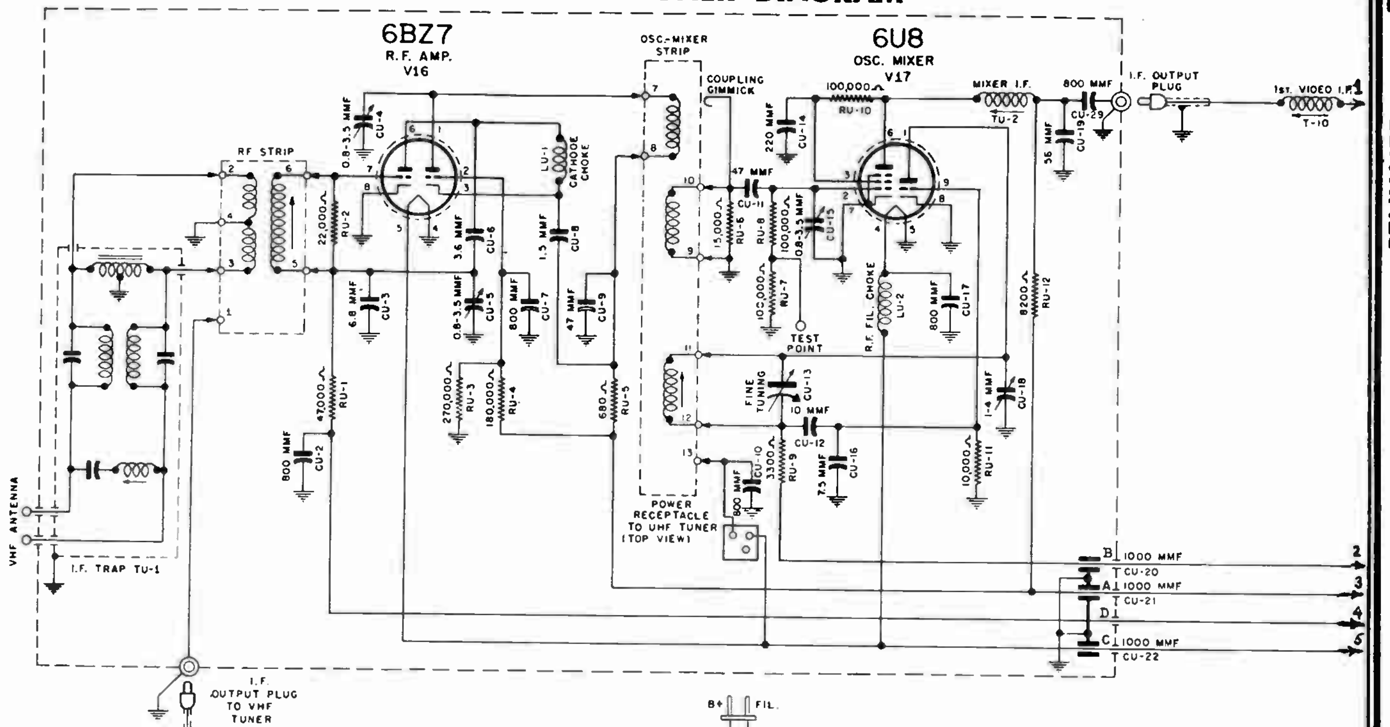
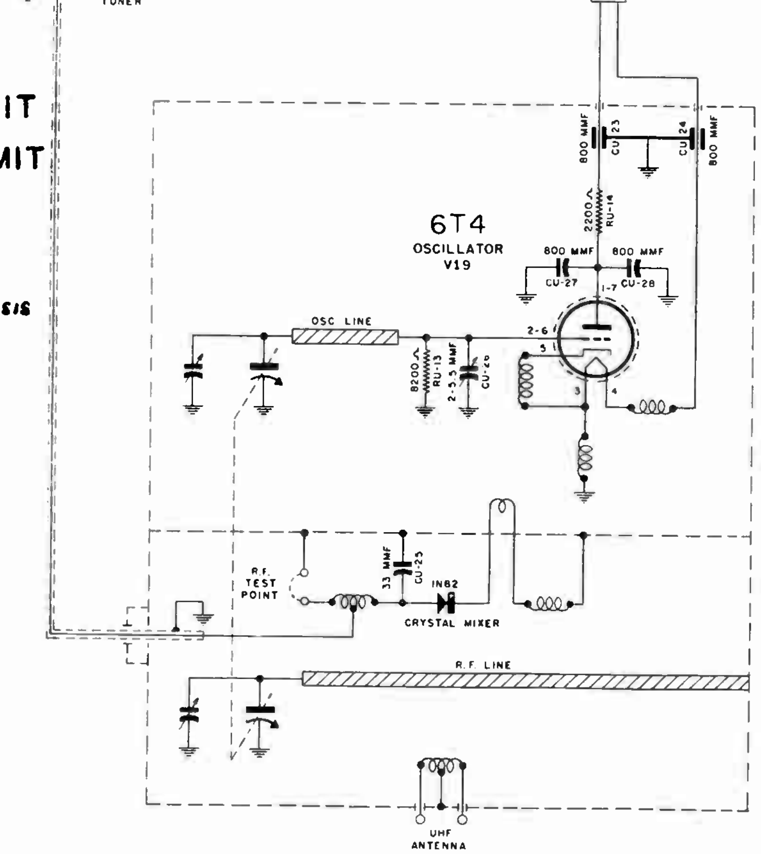
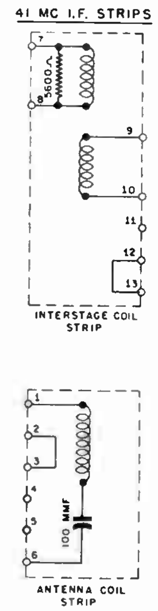


UHF – VHF TUNER DIAGRAM







NOTE:

To complete circuit for models 721, 724, 762, 765 768 and 791 open page 11 and fold page 6 over page 8.

VHF ALIGNMENT DATA

ALIGNMENT PROCEDURE

All circuits are very stable and will seldom require adjustment. Only when major parts of the tuner or the video I-F strip have been replaced or tampered with will it be necessary to realign the receiver.

Generally under normal conditions only the INDIVIDUAL CHANNEL TRIMMERS in the tuner unit may require adjustment by the service technician.

RATIO DETECTOR AND SOUND I-F ALIGNMENT

In most cases only the secondary of the ratio detector coil will require adjustment. This can be done simply by adjusting the top adjustment screw of the ratio detector for minimum buzz with the sound carrier of a TV station. For complete alignment use steps 1, 2, and 3 in the alignment table.

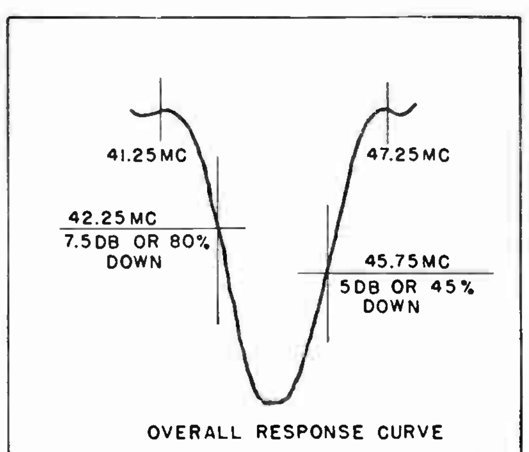

FIG. 3

PICTURE I-F ALIGNMENT

Receiver should be run for at least ¼ hour before proceeding with alignment.

EQUIPMENT REQUIRED

VACUUM TUBE VOLTMETER
For video I-F alignment maintain readings in middle of low volt scale.

SIGNAL GENERATOR supplying a 4.5 MC. (within .25%) 40 to 216 MC. (within 1%) signal. With output adjustable to at least .1 volt maximum.

CATHODE-RAY OSCILLOSCOPE. Must have good frequency and phase response from 10 cycles to at least 2 MC.

SWEEP GENERATOR. Capable of covering 40 to 270 MC. with a 10 MC. sweep with output adjustable to at least .1 volt maximum.

3 VOLT "A" BATTERY to provide fixed bias during video I-F and R-F alignment.

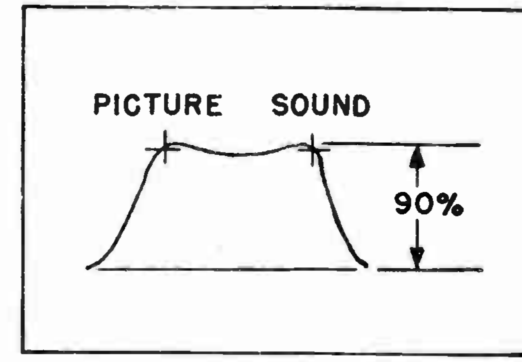

FIG. 4

VHF ALIGNMENT TABLE

RATIO DETECTOR AND SOUND ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
1	In series with .001 Mfd. Cond. to junction of L-15 and L-16. See fig. 6	4.5 MC.	In series with 47,000 ohm res. across C-66 a 10 Mfd. cond. See fig. 6	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-15 (top) and T-16 (bottom) for max. reading. See fig. 5 & 6
2	In series with .001 Mfd. Cond. to junction of L-15 and L-16. See fig. 6	4.5 MC.	In series with 47,000 ohm res. to junction of R-60 and C-69 See fig. 6	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-16 (top) for zero reading. See fig. 5
3	In series with .001 Mfd. Cond. to cathode of picture tube yellow lead. See fig. 6	4.5 MC.	In series with 47,000 ohm res. across C-66 a 10 Mfd. cond. See fig. 6	Maintain reading on low volt scale. Remove 3rd video IF tube 6CB6.	T-14 (top) for minimum reading. See fig. 5

NOTE 1: For **minimum buzz** always adjust T-16 (top) with the sound carrier of a TV station.
NOTE 2: Alternate 4.5 MC. trap alignment: Adjust T-14 (top) for minimum 4.5 MC. beat on picture with a strong station signal.

PICTURE I-F ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
4	Ungrounded converter tube (6U8) shield	44.0 MC.	In series with 47,000 ohm res. to junction of R-46 and L-16. See fig. 6	Tuner on channel 3, 3 volts bias across C-49 positive side to ground. Locality switch in strong position. See fig. 6	T-13 (top) for maximum reading. See fig. 5
5	Ungrounded converter tube (6U8) shield	43.2 MC.	In series with 47,000 ohm res. to junction of R-46 and L-16. See fig. 6	Tuner on channel 3, 3 volts bias across C-49 positive side to ground. Locality switch in strong position. See fig. 6	T-12 (top) for maximum reading. See fig. 5
6	Ungrounded converter tube (6U8) shield	41.25 MC.	In series with 47,000 ohm res. to junction of R-46 and L-16. See fig. 6	Tuner on channel 3, 3 volts bias across C-49 positive side to ground. Locality switch in strong position. See fig. 6 Repeat Steps 5 & 6	T-12 (bottom) for minimum reading. See fig. 6
7	Ungrounded converter tube (6U8) shield	45.4 MC.	In series with 47,000 ohm res. to junction of R-46 and L-16. See fig. 6	Tuner on channel 3, 3 volts bias across C-49 positive side to ground. Locality switch in strong position. See fig. 6	T-11 (top) for maximum reading. See fig. 5
8	Ungrounded converter tube (6U8) shield	47.25 MC.	In series with 47,000 ohm res. to junction of R-46 and L-16. See fig. 6	Tuner on channel 3, 3 volts bias across C-49 positive side to ground. Locality switch in strong position. See fig. 6 Repeat Steps 7 & 8	T-11 (bottom) for minimum reading. See fig. 6

9	Ungrounded converter tube (6U8) shield	44.5 MC.	In series with 47,000 ohm res. to junction of R-46 and L-16. See fig. 6	Tuner on channel 3, 3 volts bias across C-49 positive side to ground. Locality switch in strong position. See fig. 6 **NOTE:** Detune T-10 by turning slug out as far as possible.	T-1 (top) for maximum reading. See fig. 5
10	Ungrounded converter tube (6U8) shield	45.75 MC.	In series with 47,000 ohm res. to junction of R-46 and L-16. See fig. 6	Tuner on channel 3, 3 volts bias across C-49 positive side to position. See fig. 6	T-10 (top) for maximum reading. See fig. 5

NOTE 3: For visual check of IF response curve (see fig. 3) connect signal and sweep generator to ungrounded converter tube shield (6J6). Connect oscilloscope in series with 47,000 ohm resistor to junction of R-46 and L-16.

TUNER R-F ALIGNMENT

NOTE 4: NEVER ADJUST C-3, C-4 and C-12 UNLESS ABSOLUTELY NECESSARY. (CU-4, CU-5 and CU-15 on VHF-UHF Tuner). THEY ARE FACTORY PRESET BY SPECIAL EQUIPMENT.

Step No.	Connect Marker Generator to	Marker Gen. Freq.	Connect Sweep Gen. to	Sweep Gen. Chan.	Connect Oscilloscope to	Miscellaneous Connections	Adjust
11	Loosely couple to sweep gen. leads.	205.25 MC. and 209.75 MC.	300 ohm antenna terminals.	12	Lead extending from top of tuner. See fig. 5	Tuner on channel 12 3 volt bias to junction of C-49 locality switch in strong position.	C-3, C-4 and C-12 for max. response having linear peaks with picture and sound markers at 90% maximum response. See fig. 4
12	OBSERVE RESPONSE CURVE FOR ALL CHANNELS USING CORRECT FREQUENCIES AND CHANNELS. A SLIGHT COMPROMISE SHOULD BE MADE WITH C-3, C-4 and C-12 IF MARKERS ARE BELOW 70%.						

NOTE 5: FOR RF OSCILLATOR ALIGNMENT, SET VHF TUNER TO HIGHEST VHF OPERATING CHANNEL IN YOUR AREA. SET FINE TUNING CONTROL TO CENTER POSITION (FLAT OF SHAFT FACING UP.) ADJUST C-15 (CU-18 ON VHF—UHF TUNER) FOR BEST PICTURE DETAIL ON A TEST PATTERN OF A TV STATION.
ADJUST INDIVIDUAL CHANNEL SLUGS FOR BEST PICTURE DETAIL ON ALL OPERATING CHANNELS WITH A TEST PATTERN OF A TV STATION. NOTE: USE A NON-METALLIC SCREWDRIVER.

NOTE 6: T-2 (TU-1 in VHF-UHF Tuner, see fig. 5) part of a 40 MC. tuned trap need only be adjusted when local interferences from 40 thru 45 MC. affect the picture. Adjust T-2 for minimum 40 MC. beat on picture with a station signal.

R-11	27E104K-½	Carbon, 100,000 Ohm ½ W. ± 10%	.10
R-12	27E822K-½	Carbon, 8200 Ohm ½ W. ± 10%	.10

COILS AND CHOKES

Illus. No.	Part No.	Description	List Price
T-1	31K-109	Mixer IF	.81
T-2	31K-225-01	40 MC. Trap Assembly Antenna Input	6.75
L-1	31B-629	Choke Cathode	.27
L-2	34A-704	RF Filament Choke	.10
		When ordering channel strips specify required channel and code number. For example: part number for channel 2 strips would be 31M-012-2U for the antenna strip and 31M-112-2U for RF and oscillator strip.	
	31M-012	Antenna Strips Channels 2 Thru 6 Code U. Green	1.20
	31M-012	Antenna Strips Channels 7 Thru 13 Code U, Green	1.00
	31M-112	RF and Oscillator Strips Channels 2 Thru 6 Code U, Green	1.60
	31M-112	RF and Oscillator Strips Channels 7 Thru 13 Code U. Green	1.50
		Kits containing the necessary strips to convert to any UHF channel are available. When ordering please be sure to: Specify required UHF channel number, and code letter U.

CABINET AND CHASSIS REMOVAL INSTRUCTIONS

IMPORTANT: The cabinet of the table model receivers can be removed from cabinet base for service adjustments. Care should be taken that only the proper screws are removed when separating cabinet from cabinet base.

REMOVING CABINET FROM CABINET BASE (TABLE MODELS ONLY)

1. Remove all control knobs and cabinet back.
2. Remove antenna terminal plate from cabinet and disconnect speaker leads.
3. Place cabinet face down on a soft clean cloth.
4. Remove ONLY the cabinet mounting screws located under and on the outer edges of cabinet base. DO NOT REMOVE CHASSIS MOUNTING SCREWS. Remove the 2 wood screws from the lower rear corner support braces of cabinet.
5. Carefully guide cabinet and cabinet base to its normal upright position. Remove cabinet by lifting straight up.

REMOVING CHASSIS BASE FROM CONSOLE CABINETS

1. Remove all knobs and cabinet back.
2. Remove antenna terminal plate from cabinet and disconnect speaker leads.
3. Remove the screws under guide rails of chassis base and the one screw under center support bridge.
4. Slide chassis base out.

HEIGHT CONTROL

This control increases the overall height of the picture. When making this adjustment it is sometimes necessary to also adjust the VERTICAL LINEARITY to obtain a picture that is correctly proportioned.

VERTICAL LINEARITY CONTROL

This control increases or decreases the height of the upper portion of the picture.

BRIGHTNESS CONTROL

This control is used in adjusting for brilliance or light intensity of the screen. When picture is too light adjust Brightness Control.

NOTE: The Brightness Control has an extended shaft that permits adjustment from the rear of the cabinet without removing the cabinet back.

ION TRAP ASSEMBLY

Maximum brightness will be determined by the position of the ION TRAP ASSEMBLY:

1. Advance BRIGHTNESS CONTROL on rear of chassis to maximum brightness position.
2. Adjust the ION TRAP ASSEMBLY for maximum brightness by sliding back and forth and rotating to right or left.
3. Reduce BRIGHTNESS with BRIGHTNESS CONTROL and repeat adjustment of ION TRAP for best positioning.

CAUTION: IF A SEMI-CIRCULAR SHADOW AROUND CORNER OF PICTURE OR PATTERN IS OBTAINED, DO NOT ELIMINATE WITH ION TRAP, IF BY SO DOING THE INTENSITY OF THE PATTERN IS DECREASED.

BUZZ CONTROL See "Sound Alignment"

SERVICING FRONT OF CHASSIS

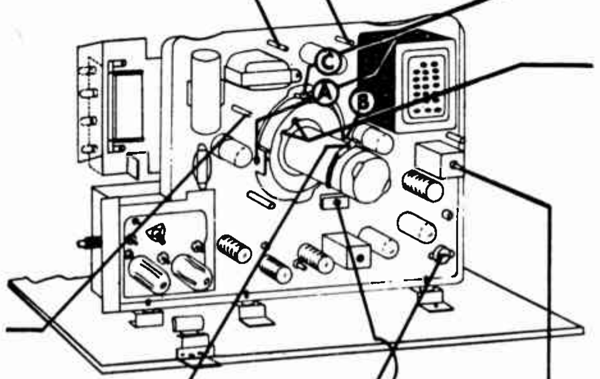
Picture tube and chassis are self supported and servicing on front of chassis can be accomplished by removing chassis only.

Disconnect picture tube socket, ion trap, HV connector, and AC receptacle before removing chassis from chassis base.

If picture tube is required while servicing front of chassis, proceed as follows:

1. Remove yoke wingnut, and turn yoke around to face rear of chassis.
2. Turn chassis around and carefully slide yoke around neck of picture tube.
3. Tape yoke to bell of picture tube.
4. Add a jumper wire between HV connector and second anode of picture tube.
5. Replace ion trap and picture tube socket.

REAR VIEW



DEFLECTION YOKE ADJUSTMENT

The deflection yoke must be positioned as far forward as possible on the neck of the picture tube and centered around the picture tube neck at the same time. To make this adjustment, loosen screws "A" and "B" enough to permit the yoke bracket to be pushed forward. While holding the bracket in this position, tighten screws "A" and "B." If the picture is tilted, loosen wing nut "C" on the top side of the yoke. Then, rotate the yoke to left or right as required to make the picture parallel with respect to top and bottom of window frame. Be sure to hold the yoke in position while tightening the wing nut.

CENTERING MAGNET ADJUSTMENT

If the picture is off center and or has neck shadow rotate either or both centering magnet levers to the right or left until the picture is centered on the screen and the picture is free of all neck shadow. Then readjust the Ion Trap.

HORIZONTAL FREQUENCY ADJUSTMENT

If the Horizontal Hold Control is insufficient to lock in a single stationary picture, the Horizontal Frequency Adjustment will require adjustment. See "Horizontal Blocking Oscillator Alignment"

HORIZONTAL LOCK

If the range of the Horizontal Hold Control is insufficient to lock in a single stationary picture the Horizontal Lock trimmer will require adjustment. See "Horizontal Blocking Oscillator Alignment"

FOCUS

It may be possible to obtain better focus with replacement picture tubes, if the electronic focus anode is connected to a point other than the +150 volt line.

Suggested points to try are: chassis ground, +260 volts, +285 volts (picture tube pin 10) and +480 volt line.

SERVICING HINTS FOR LOCATING FAULTY TUBES

This receiver employs a series-parallel filament circuit.
Receiver should never be operated with any tube removed.

1. **VISUAL INSPECTION:** Turn receiver "ON" and make a visual inspection of all tubes to see if they light up. All tubes except 1X2B will have an apparent glow.
2. **IF ALL TUBES DO NOT LIGHT UP:** Replace the 12AX4 (V-111), 12BH7 (V-110), 6SN7 (V-107). Check continuity across pins 1 and 12 of picture tube. Check resistance of R-153 (tube life extender)—125 ohms (cold).

SM-1008

3. **IF TUBES LIGHT UP:**

Sound but no raster........replace 25CU6 (V-109), 1X2B (V-112)
Picture but no sound........replace 25L6 (V-108), 6BN6 (V-106)
No sound or picture with raster......replace 6BC5 (V-1), 6J6 (V-2), 6CB6 (V-101), 6CB6 (V-102) 6AM8 (V-103), 6AN8 (V-104)
Picture, but no sync. or Sound........replace 6U8 (V-105)
Sound, no vertical deflection or sync........replace 12BH7 (V-110)

TABLE OF SOCKET VOLTAGES

The following voltages were measured with an electronic voltmeter while the set was operating on 117 volts, 60 cycle a.c. with no signal input, antenna terminals shorted, Station Selector set to channel 3, and the Brightness and Contrast Controls at minimum setting. Electronic voltmeter connected between socket lug and chassis. * = AC. voltages. Voltages may vary depending upon the setting of other controls.

D. C. current at junction of L108 and C132B, with contrast control in the maximum counter-clockwise position, 190 ma. With contrast set at maximum clockwise position, D.C. current at this point is 200 ma.

Symbol	Type	Pin 1	Pin 2	Pin 3	Pin 4	Pin 5	Pin 6	Pin 7	Pin 8	Pin 9

● Do not measure. High voltage pulse over 2 kv. on cathode of Damper Tube and over 1 kv. on pin 6 of V110.

UHF TUNER ALIGNMENT

EQUIPMENT REQUIRED

UHF SWEEP GENERATOR

UHF MARKER GENERATOR

CATHODE RAY OSCILLOSCOPE

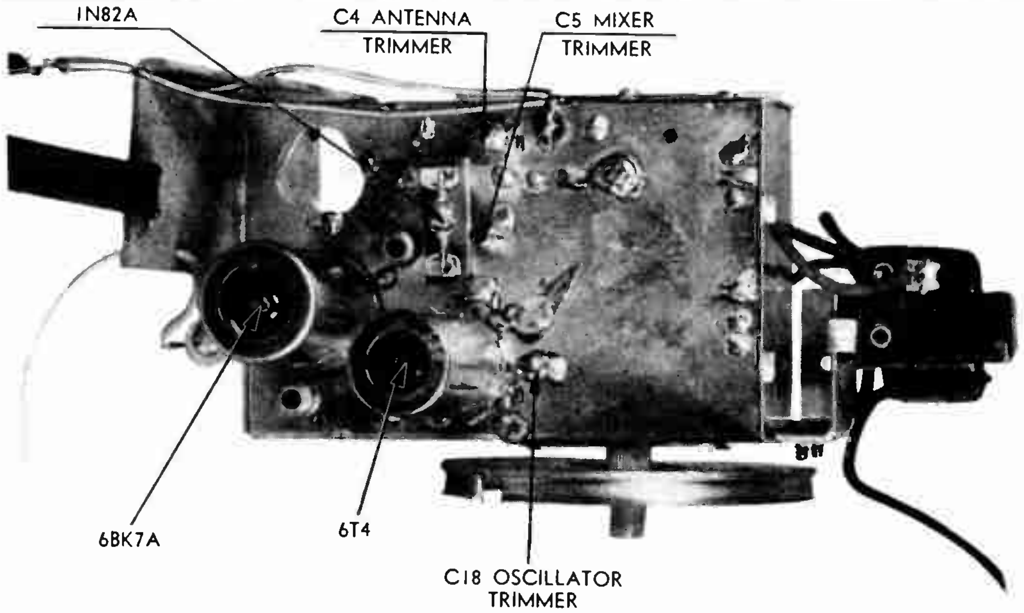
PROCEDURE

Set VHF tuner to channel 5 or 6.
Turn VHF-UHF Switch to UHF Position.
Remove dial cord and 3 UHF Tuner mounting screws.
Connect sweep generator to UHF antenna terminals.
NOTE: Sweep generator must match the 300 ohm input impedance.

Loosely couple UHF marker generator to UHF sweep generator leads.

Connect oscilloscope to test point on VHF tuner.

Carefully detune L-9 mixer IF coil located on VHF tuner by turning core OUT exactly 7 turns.



ALIGNMENT

(1) Set sweep and marker generator to 460 mc.

Set UHF tuner to maximum counter-clockwise position. Adjust C-18 until marker is in the center of response curve.

(2) Set sweep and marker generator to 910 mc.

Set UHF tuner to maximum clockwise position.

CAREFULLY bend and move oscillator end inductor ribbon connected to C-18 until marker is in center of response curve.

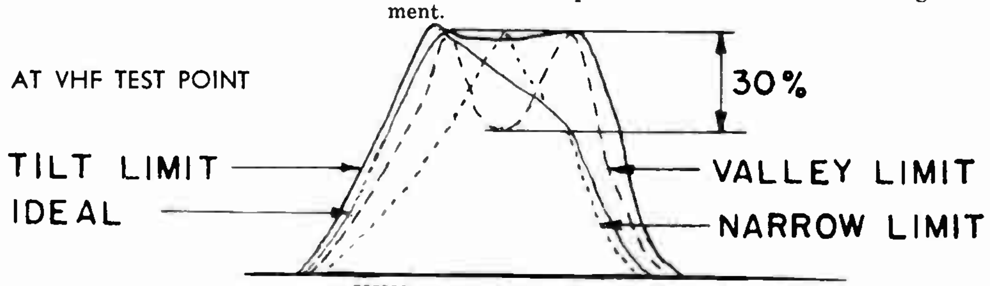
Repeat steps 1 and 2.

(3) Set marker and sweep generator to 460 mc. Set UHF tuner to maximum counter-clockwise position. Adjust C-4 and C-5 for maximum response with minimum tilt.

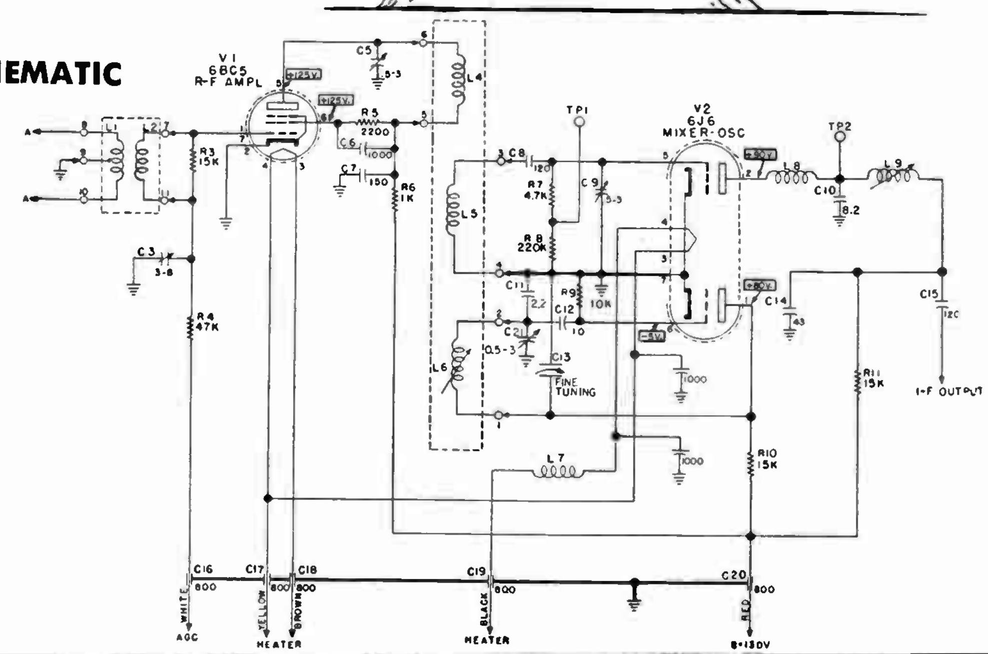
(4) Set marker and sweep generator to 910 mc. Set UHF tuner to maximum clockwise position. CAREFULLY bend and move the antenna and mixer end inductor ribbons connected to C-4 and C-5 respectively for maximum response and for minimum tilt. (See response curve below.) Repeat steps 3 and 4.

(5) Turn L-9 mixer IF coil located on VHF tuner IN 7 turns until exact position is reached as before alignment.

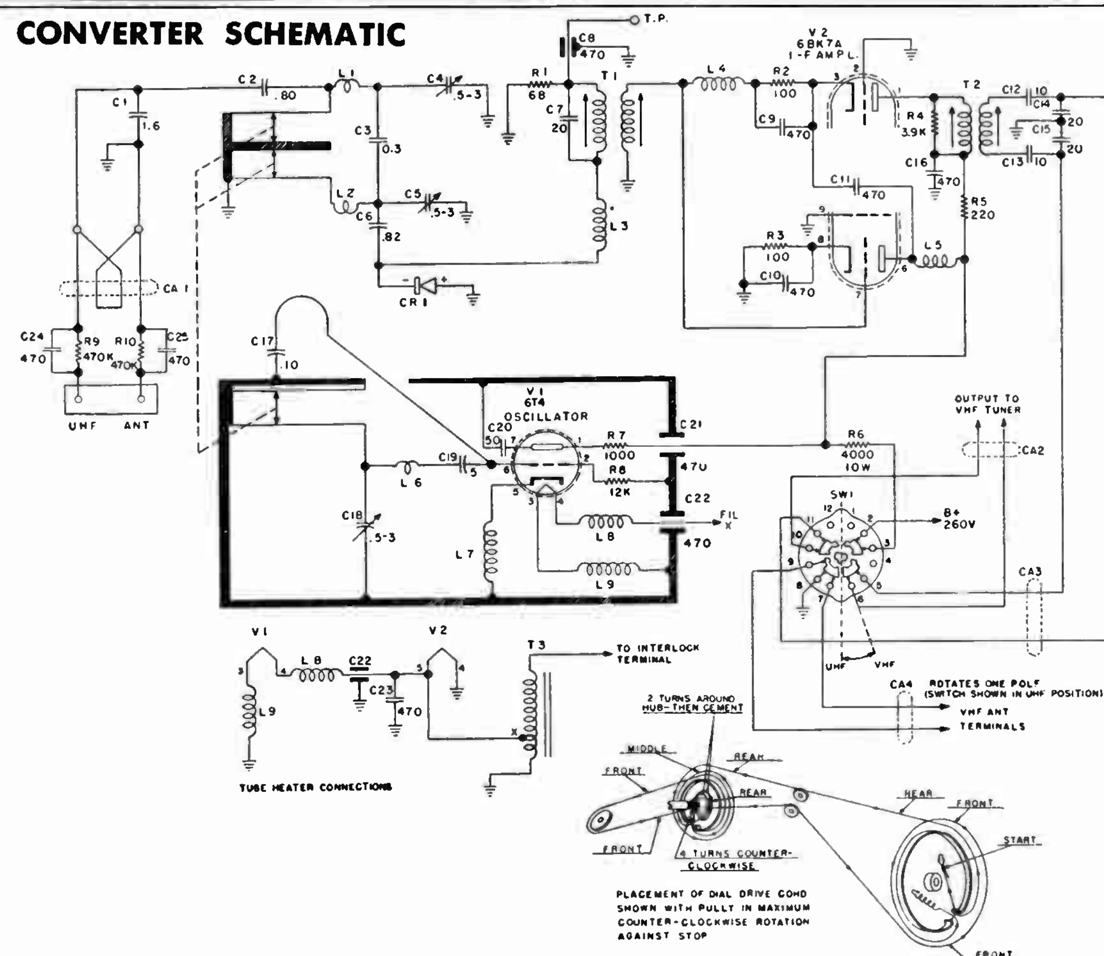
UHF CONVERTER RESPONSE AT VHF TEST POINT



VHF TUNER SCHEMATIC



UHF CONVERTER SCHEMATIC



ALIGNMENT DATA

CAUTION: One side of the chassis is connected to the power line. Therefore, test equipment should not be connected to the receiver unless an isolation transformer is used between the power line and the receiver. DO NOT GROUND THE RECEIVER CHASSIS UNLESS AN ISOLATION TRANSFORMER IS USED.

The front side of the chassis as referred to below means the side opposite the tubes.

The rear side of the chassis means the side on which the tubes are mounted.

HORIZONTAL BLOCKING OSCILLATOR ALIGNMENT

Tune Receiver to TV signal, adjust contrast control for normal picture below limiting in the Video Amplifier, and proceed as follows:

Step No.	Contrast Control Set For	Miscellaneous	Adjust
1	Normal Picture	....	Horizontal Hold Control (R164) and Horizontal Frequency Adjustment (rear slug of T108) until picture is in sync.
2	Normal Picture	Connect scope in series with 10 mmf. to lug 4 of T108.	Adjust Horizontal BTO Trap (front slug of T108) to obtain the wave-form shown below. Keep the picture in sync at all times by readjusting the Horizontal Hold, Horizontal Frequency and/or Horizontal Lock Trimmer (C142).  Adjust so that the peak of pulse is equal or 10% higher than peak of sine wave.
3	Normal Picture	Horizontal Hold set fully clockwise.	Adjust Horizontal Frequency (rear slug of T108) by turning out until the picture is just out of sync. Then turn the control slowly in until the picture is just ready to fall into sync (indicated by a wide black vertical or diagonal horizontal blanking bar).
4	Normal Picture	Horizontal Hold set fully counter-clockwise.	Picture should normally be in sync. Remove the signal by tuning off and then re-tuning to the station. If more than seven bars are present, adjust the Horizontal Lock Trimmer slightly counter-clockwise until three or four bars appear when the receiver is tuned off and then re-tuned to the station (Horizontal Hold Control still set fully counter-clockwise). If less than three bars are present, adjust the Horizontal Lock Trimmer clockwise to obtain the three or four bars as described above.

				Since the Horizontal Lock Trimmer adjustment affects the horizontal frequency, the adjustment of both the Horizontal Frequency Adjustment and the Horizontal Lock Trimmer must be repeated until the conditions outlined in steps 3 and 4 exist simultaneously at the extreme positions of the Horizontal Hold control. Check pull-in range, which should be normally 60° to 120°.
5	Weak Picture		....	Set the Horizontal Hold Control so that when the receiver is tuned off and then re-tuned to the station, the picture returns completely in sync.

SOUND ALIGNMENT

Step No.	Connect Signal Generator Through a .01 Capacitor	Signal Gen. Freq. MC.	Connect VTVM	Miscellaneous Connections and Instructions	Adjust
1	Cathode of Picture Tube	4.5 mc.	Across secondary of output trans. T105.	Use a high input level on signal generator.	Adjust L109 (rear slug) for minimum reading.
2	Pin 8 of V104.	4.5 mc. FM modulated 400 c.p.s., 25 kc. deviation	Across secondary of output trans. T105.	Set Buzz Control (R132) to approximately 90° from clockwise stop. Set the Volume Control (R135) at a low level.	L106 for maximum reading.
3	Pin 8 of V104.	4.5 mc. FM modulated 400 c.p.s., 25 kc. deviation	Across secondary of output trans. T105.	Set Buzz Control (R132) to approximately 90° from clockwise stop. Set the Volume Control (R135) at a low level.	L111 for maximum reading keeping input signal at a low level (below limiting).
4	Pin 8 of V104.	4.5 mc. FM modulated 400 c.p.s., 25 kc. deviation	Across secondary of output trans. T105.	Set Buzz Control (R132) to approximately 90° from clockwise stop. Set the Volume Control (R135) at a low level.	L109 (front slug) for maximum reading keeping input signal at a low level.
5	Pin 8 of V104.	4.5 mc. AM modulated 400 c.p.s.	Across secondary of output trans. T105.	Use a high input level on signal generator.	Buzz Control (R132) for null (minimum reading).
6	Pin 8 of V104.	4.5 mc. FM modulated 400 c.p.s., 25 kc. deviation	Across secondary of output trans. T105.	Set the Volume Control (R135) at a low level.	Re-peak L106 for maximum reading.

I.F. ALIGNMENT

All lead connections from the signal marker generator and sweep generator must be shielded. Keep exposed ends and ground leads as short as possible (about one inch). Always locate the ground lead connections as close as possible to their respective "hot" leads in the television receiver chassis. The sweep generator output, signal generator output, and contrast control must be kept low enough to prevent overloading the television receiver circuits.

VIDEO I. F. ALIGNMENT (with VTVM)

In the I.F. Alignment, limit input of signal generator so that reading on VTVM does not exceed —2 volts.

Step No.	Connect Signal Generator Through a .01 Capacitor	Signal Gen. Freq. MC.	Connect VTVM	Miscellaneous Connections and Instructions	Adjust
1	Test Point No. 2 on Tuner (closest to L9 slug adjustment).	24.4 mc.	Junction of R118 and C113 and chassis.	Connect 3 volt bias battery negative lead to white lead from tuner, positive lead to chassis.	T101 for maximum indication on meter, limit input to make peak less than —2 volts D.C. on VTVM.
2	Test Point No. 2 on Tuner (closest to L9 slug adjustment).	22.9 mc.	Junction of R118 and C113 and chassis.	Connect 3 volt bias battery negative lead to white lead from tuner, positive lead to chassis.	L103 (rear slug) for maximum. Use first peak from tinnerman clip end of coil.
3	Test Point No. 2 on Tuner (closest to L9 slug adjustment).	21.9 mc.	Junction of R118 and C113 and chassis.	Connect 3 volt bias battery negative lead to white lead from tuner, positive lead to chassis.	L103 (front slug) for minimum. Input level should be high enough to produce at least .5 volts at null on VTVM. Use first null obtained from end of coil form opposite tinnerman clip.
4	Repeat steps 2 and 3.				
5	Test Point No. 2 on Tuner (closest to L9 slug adjustment).	25.5 mc.	Junction of R118 and C113 and chassis.	Connect 3 volt bias battery negative lead to white lead from tuner, positive lead to chassis.	L102 for maximum.
6	Test Point No. 2 on Tuner (closest to L9 slug adjustment).	25.1 mc.	Junction of R118 and C113 and chassis.	Connect 3 volt bias battery negative lead to white lead from tuner, positive lead to chassis.	L101 (front slug), for maximum. Use first peak from tinnerman clip end of coil.
7	Test Point No. 1 on Tuner (closest to C21 trimmer screw).	25.1 mc.	Junction of R118 and C113 and chassis.	Connect a 100 ohm resistor in series with a 1000 mmf. cap. across L101.	L9 (brass screw) on the Tuner for maximum.

TO CHECK I. F. ALIGNMENT (with scope)

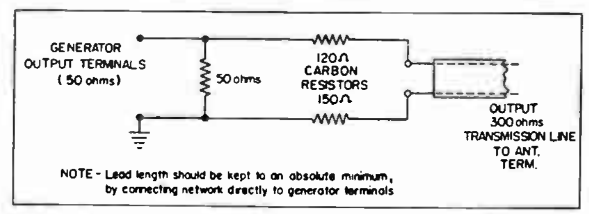
Excessive sweep input will overload the circuit and cause distortion in the wave form. Check for possible overload by temporarily increasing and decreasing the signal input level and noting any change in the wave form.

Excessive signal from the marker generator will also distort the wave form. Be sure to keep the marker at the minimum usable amplitude.

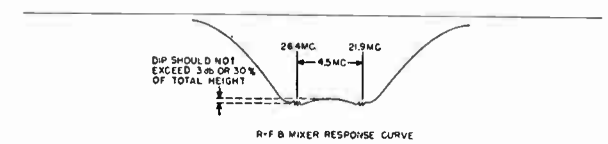
Sweep Gen. Connected to	Scope Connected to	Bias	Sweep Gen. Set to	Remarks
Ungrounded shield of V2 and chassis.	High side of contrast control R120 and chassis. Contrast control at minimum contrast.	Connect 3 volt bias battery negative lead to white lead from tuner, positive lead to chassis.	Sweep from 20 to 30 mega-cycles.	Provide markers as shown on curve.  NOMINAL OVERALL I-F RESPONSE CURVE A slight deviation in response curve is tolerable, but if any great deviation is noted, the I. F. stages will have to be realigned.

R.F. AND MIXER ALIGNMENT

Step No.	Station Selector	Oscilloscope	Bias	Signal Generator To	Adjust
1.	Chan. #10	High side through a 10,000 ohm resistor to TP1 on Tuner. Ground lead to Tuner Case.	-1.5 volts to white lead on tuner.	Signal Generator set to 195.5 MC., 400 cycle 30% AM modulated. Through Dummy Antenna to the Antenna lead-in.	C-3 for maximum 400 cycle response on scope. Remove signal Generator.
2.	Chan. #10	High side through a 10,000 ohm resistor to TP1 on Tuner. Ground lead to Tuner Case.	-1.5 volts to white lead on tuner.	Sweep Generator to Antenna lead-in through dummy antenna. Set Generator to sweep Channel 10 freq. Loosely couple Marker Generator to sweep output cable. Set marker to either 21.9 or 26.4 mc.	Adjust C5 & C9, to produce a response curve similar to R.F. and Mixer Response Curve.



DUMMY ANTENNA



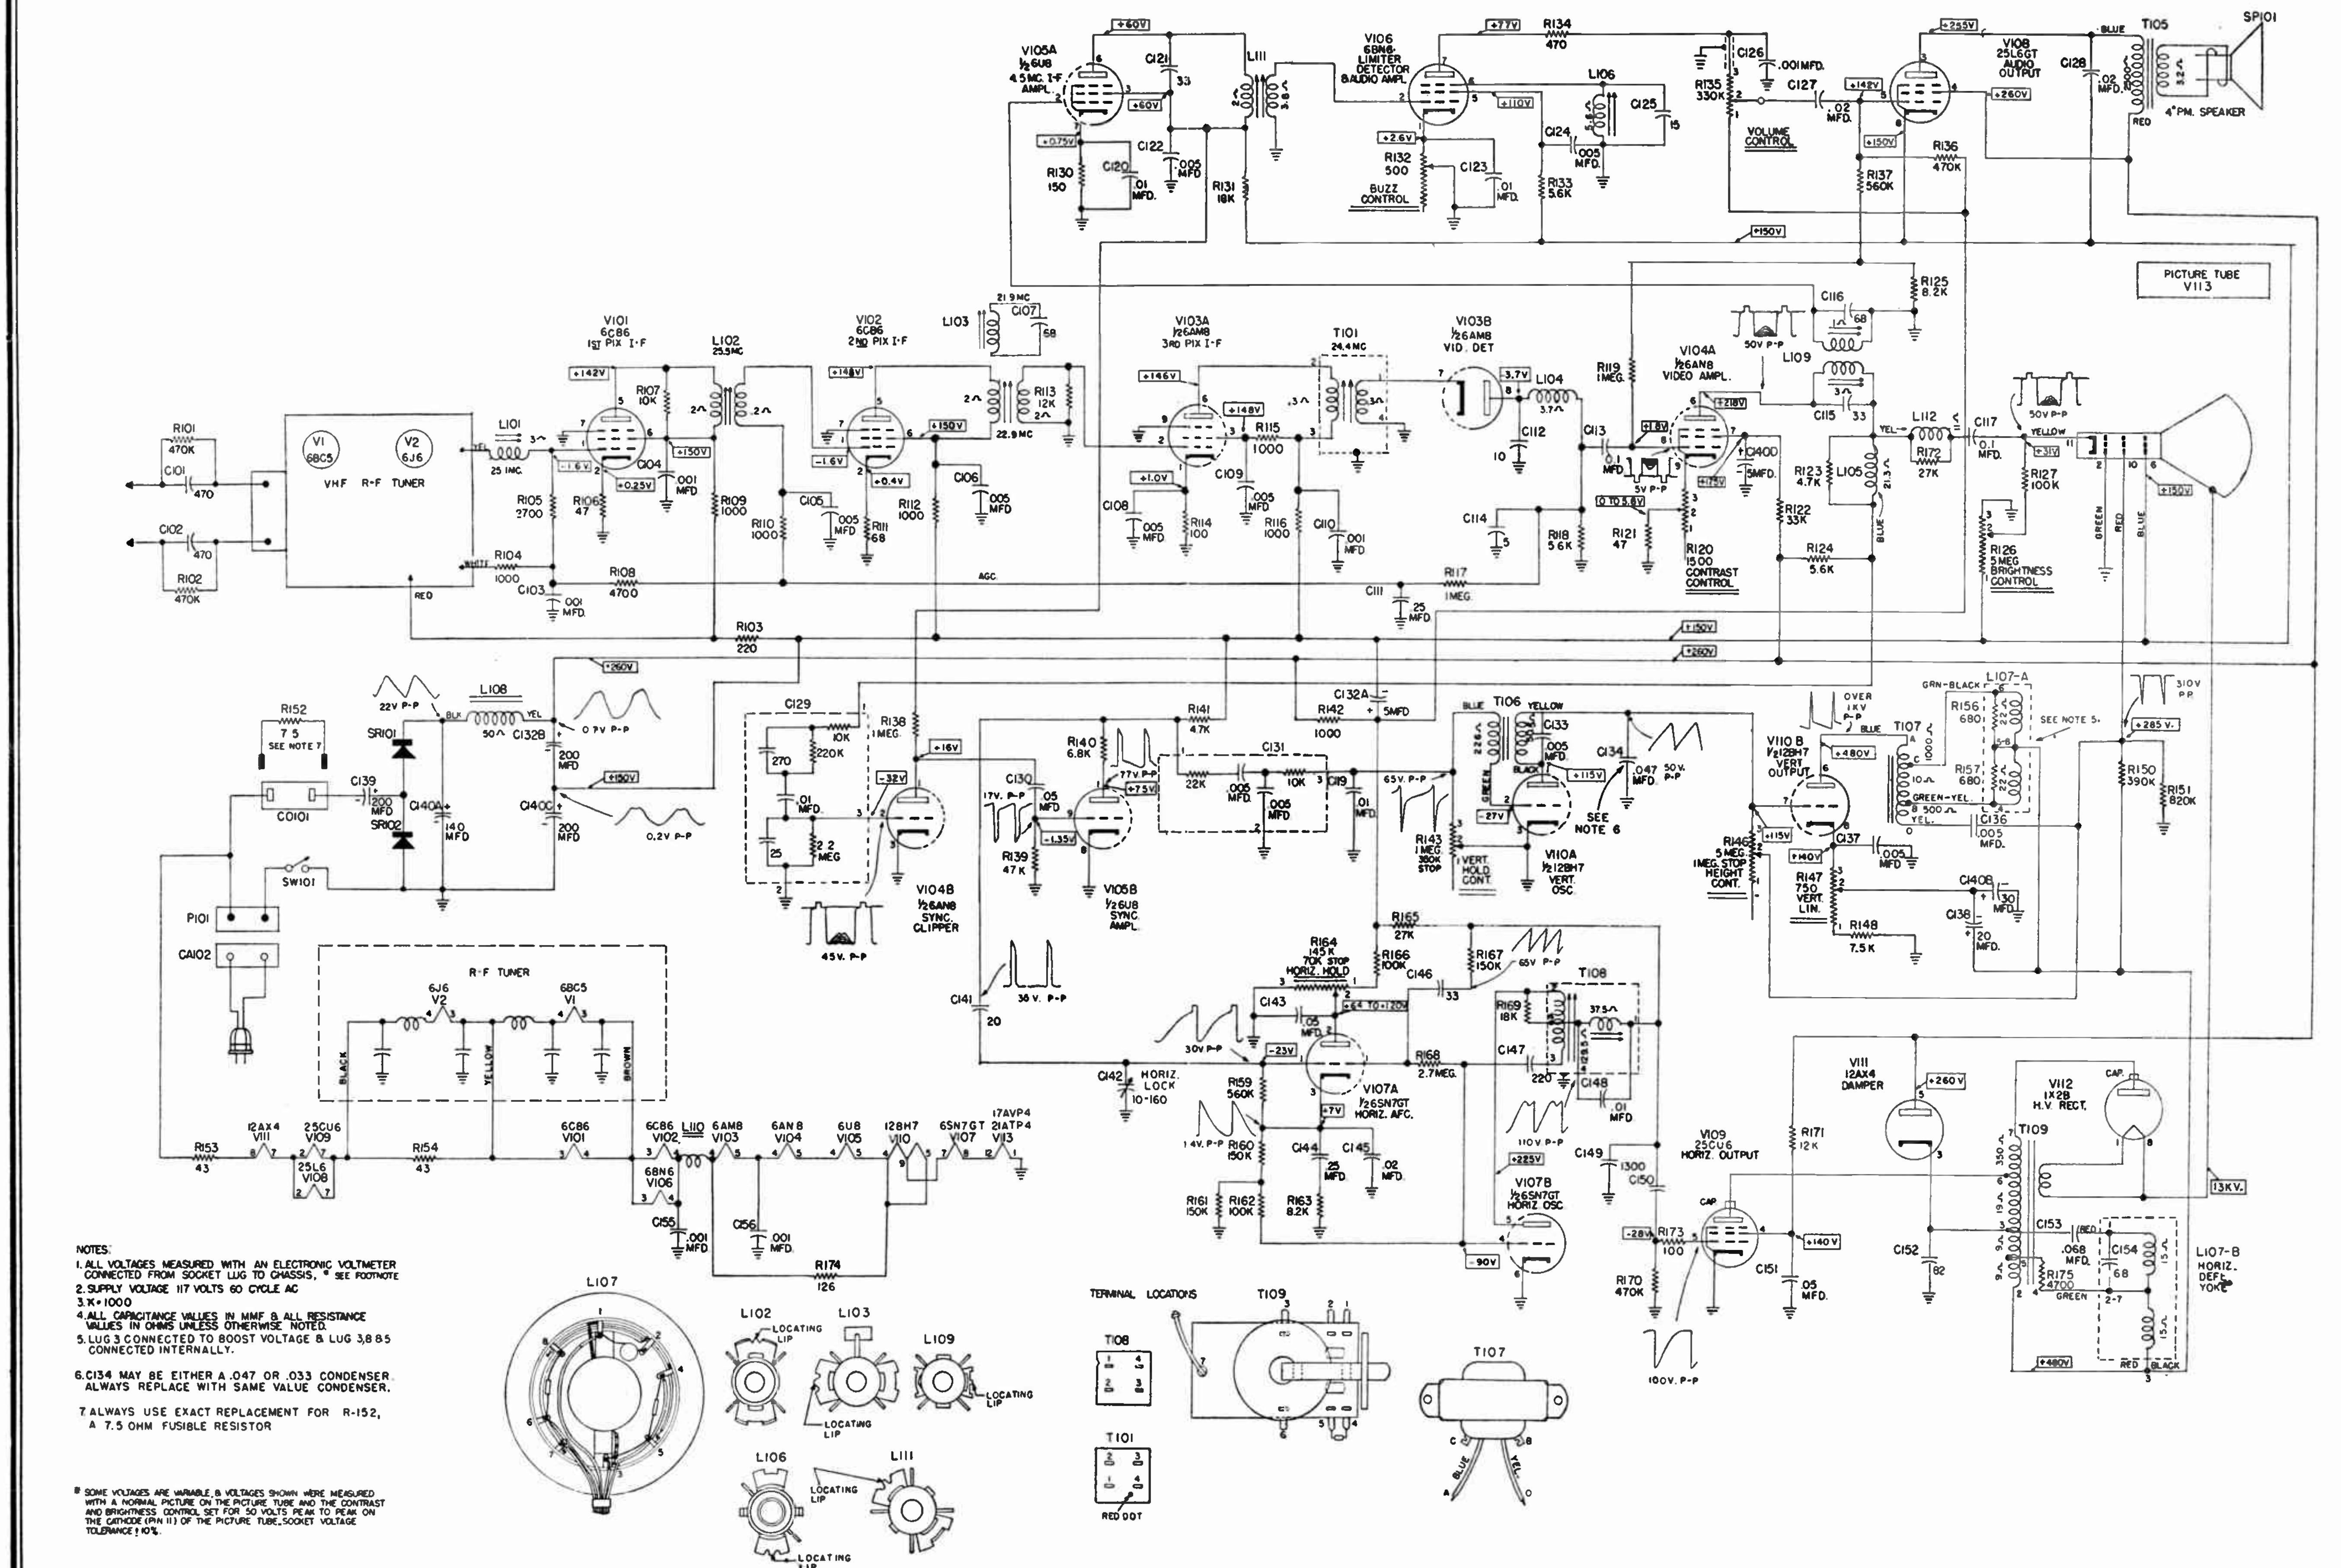
R. F. & MIXER RESPONSE CURVE

Without disturbing the R.F. grid, R.F. plate, and mixer-grid trimmer, check the response on the other VHF TV channels by setting the station selector to the desired channel and changing the frequency of the sweep generator to correspond to the channel being checked. The response curve should be essentially the same on all channels and the markers should fall in similar positions on the response curve. A slight amount of tilt can be tolerated. The amount of tilt indicated by the relative amplitudes of the response curves where the picture and sound I.F. Markers rest should not exceed 30% of the over-all response curve amplitude.

VHF OSCILLATOR ALIGNMENT

FOR RF OSCILLATOR ALIGNMENT, SET VHF TUNER TO HIGHEST VHF OPERATING CHANNEL IN YOUR AREA. SET FINE TUNING CONTROL TO CENTER POSITION (FLAT OF SHAFT FACING UP.) ADJUST C-21 OSCILLATOR TANK TRIMMER FOR BEST PICTURE DETAIL ON A TEST PATTERN OF A TV STATION.

ADJUST INDIVIDUAL CHANNEL SLUGS FOR BEST PICTURE DETAIL ON ALL OPERATING CHANNELS WITH A TEST PATTERN OF A TV STATION. NOTE: USE A NON-METALLIC SCREWDRIVER.



NOTES:

1. ALL VOLTAGES MEASURED WITH AN ELECTRONIC VOLTMETER CONNECTED FROM SOCKET LUG TO CHASSIS, * SEE FOOTNOTE
2. SUPPLY VOLTAGE 117 VOLTS 60 CYCLE AC
3. K=1000
4. ALL CAPACITANCE VALUES IN MMF & ALL RESISTANCE VALUES IN OHMS UNLESS OTHERWISE NOTED.
5. LUG 3 CONNECTED TO BOOST VOLTAGE & LUG 3,8 & 5 CONNECTED INTERNALLY.
6. C134 MAY BE EITHER A .047 OR .033 CONDENSER. ALWAYS REPLACE WITH SAME VALUE CONDENSER.
7. ALWAYS USE EXACT REPLACEMENT FOR R-152, A 7.5 OHM FUSIBLE RESISTOR

* SOME VOLTAGES ARE VARIABLE, & VOLTAGES SHOWN WERE MEASURED WITH A NORMAL PICTURE ON THE PICTURE TUBE AND THE CONTRAST AND BRIGHTNESS CONTROL SET FOR 50 VOLTS PEAK TO PEAK ON THE CATHODE (PIN 11) OF THE PICTURE TUBE. SOCKET VOLTAGE TOLERANCE ± 10%.

PARTS LIST

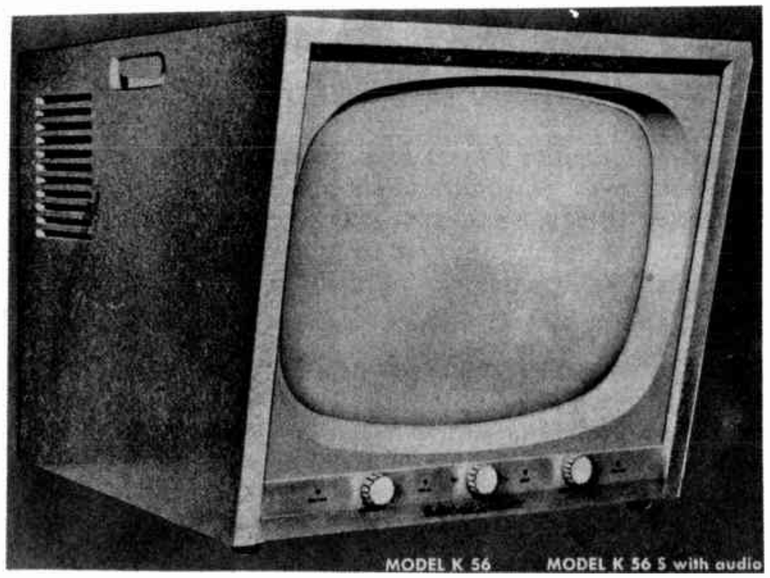
	1E34-3	Speaker, 8" PM, Models 914, 924



Models 553 and 5503 are equiped with "slide out" compartments to accommodate an automatic 3-speed VM Record Changer with a High Fidelity tone arm that opens a new world of listening pleasure when records are played through SETCHELL CARLSON'S HI-FI sound system.

SPECIFICATIONS

CABINET

- Finest Dark Mahogany veneers and Blonde Oak cabinets in all models.
- Filter-Ray tinted glass is removable from front by removing screws and moulding under "Top-Tuning" Panel.
- Access to chassis is accomplished by removing 2 screws under front of hinged lid of cabinet.
- Luma-Dials provide soft indirect lighting of channel selector and radio dial.
- Picture tube guaranteed for one full year.

Model 551—21" Console TV.
Model 552—21" Console TV with super-powered 3 gang AM radio.
Model 553—21" Console TV with super-powered 3 gang AM radio and slide out phono compartment (for VM 3-speed Record Changer with Hi-Fi Tone Arm and 45 RPM spindle).
DIMENSIONS: 21" MODELS 24$\frac{9}{16}$" wide, 22½" deep, 35¾" high.
SHIPPING WEIGHT 140 lbs.

Model 5501—27" Console TV.
Model 5502—27" Console TV with super powered 3 gang AM radio.
Model 5503—27" Console TV with super powered 3 gang AM radio and slide out phone compartment (for VM 3-speed Record Changer with Hi-Fi Tone Arm and 45 RPM spindle).
DIMENSIONS: 27" MODELS 29$\frac{1}{16}$" wide, 22½" deep, 41" high.
SHIPPING WEIGHT 167 lbs.

Model VM 950-271 Record Changer: 9½ lbs. (packed separately).

CHASSIS

- Chassis has ample power to produce a brilliant picture on tube sizes ranging from 17" to 27". Ideal for use in custom installations.
- Improved Automatic Self-Focusing ALUMINIZED Picture Tube for finest picture detail.
- Cascode tuner with dial controlled vernier.
- VHF and UHF pre-tuned strips assure instant accurate "snap-in" channel selection.
- Lifetime aluminum chassis—excellent conductor—rust-proof—lighter—durable.
- 4 double tuned stages of IF and crystal video detector.
- 44.25 M.C. Sound, 48.75 M.C. Pix, I.F. Pass Band.
- Horizontal output tube protected by automatic bias.
- Simplified picture centering. • Simple, efficient width control sleeve.
- Shielded horizontal deflection and hi-voltage supply.
- Push-pull audio for high level wide range sound output 30 CPS to 20,000 CPS.
- Individual bass and treble tone controls permit full adjustment of audio range.
- Improved keyed A. G. C. circuit minimizes interference and increases locking stability.
- Fused power input circuit 105 to 125 volts AC—220 watts.
- 25 tubes plus 2 crystals and 2 rectifier tubes and picture tube (with radio).
- Filaments of TV tubes turn off when radio or phonograph is in use.
- High gain, selective superheterodyne (535-1700 KC) AM radio with tuned RF Stage, 3 gang condenser.
- New coupling utilizes T.V. antenna for radio reception.
- All models with radio include phono jack and AC phono outlet.
- Shipping weight—approximately 40 lbs.

INSTRUCTIONS AND INFORMATION

The Model K-56 black and white Television Monitor is a high quality low priced instrument for television broadcasting stations and other places where it is important to know the quality of picture, information which is being transmitted. Special care has been taken to insure a brilliant image acceptable for studio use, and a wide band video amplifier suitable for control room use. The "unitized" construction offers simplicity and speed of maintenance. It can be supplied to include audio amplifier and twin 6" speakers.

The video amplifier has internal-external sync provisions where composite and non-composite video signals may be encountered, and, rear chassis plug for wiring to permit remote switching. Local sync input is negative from .5 to 4 volts peak to peak.

The 17" kinescope is of the self or electrostatic focus type. This type of tube was chosen to insure finest full face focus regardless of line voltage changes and/or high voltage variation. The type 17KP4 as made by Dumont will be used as standard equipment unless otherwise specified. For replacement purposes any spherical face 17" tube can be used, such as the 17HP4 made by RCA, Sylvania and other tube manufacturers. The type 17KP4, however, as made by Dumont produces a very small spot size which is far superior to older type self-focus tubes.

Care should be taken to adjust the ion trap for best brilliance and focus after the centering magnets have been positioned.

Secondary controls are located in the front panel and are clearly identified. Instructions as to the adjustment of the yoke, centering and ion trap are located inside of the back cover.

The main power transformer is located on the chassis proper and all other units are removable. It was desirable to place the power transformer as far from the neck of the tube as possible to prevent sweep distortion.

The "E" unit, which is plug-in and removable, incorporated the vertical oscillator and output tube and is available with or without audio. All main chassis are wired to use either unit--with or without audio. The audio power output is 1.7 watts at 400 cps. at less than 10% distortion.

The "D" unit, which is plug-in and removable, incorporates two stages of video amplification, DC restorer, wync separator, sync amplifier, AFC detector and internal-external sync control amplifier.

The "F" unit, which is plug-in and removable, incorporates the horizontal oscillator, horizontal output, damper, high voltage rectifier, flyback transformer, etc.
Type designations of the units are as follows:

"D" Unit	Series M2S	Video Amplifier with internal-external sync.
"E" Unit	Series M2	Vertical Deflection. (Without audio amplifier.)
"E" Unit	Series M2S	Vertical Deflection, (With audio amplifier.)
"F" Unit	Series M2	H. V. and Horizontal Deflection.

Speakers - 6" round, 312 ohm V. C.
Ion Trap - 55 gausses.
Kinescope - 17KP4 (preferred).

It is advantageous to have an extra unit or part as listed above to facilitate immediate service or repair of monitor, thus avoiding "time out."

The Model K-56 Monitor is covered by the standard RTMA warranty, which includes one year guarantee on the kinescope.

SERVICE HINTS

It is recommended that a chassis having all units in good working order be used for checking units that are doubtful or after repair has been made. The resistance values as shown on the schematic were all taken with units removed from main chassis, therefore, an "ohm meter" is all that is necessary for locating 90% of unit trouble.

1. If television reveiver is completely dead, no picture tube illumination and no sound, check the power fuse located at the rear of the chassis. If all tubes (except picture tube) light up, check the B voltage as supplied by the G Unit. Check the focus coil continuity. Check voltages to each unit as shown on schematic to locate open or short circuit.
2. If picture tube face illuminates but no picture or sound, check first video amplifier 6AU6 tube in D Unit. Check all tubes of the A and B Units. Check A, B and C Units. Check 2 K ohm 10 watt resistor supplying B voltage to terminal D-11 of the D Unit.
3. If there is picture information and no sound, check the tubes in the C Unit. Check the C Unit. Check the speaker voice coil. Check 2 K ohm 10 watt resistor connected to terminal C-10.
4. If there is sound but not picture information, and picture tube face is illuminated, check the 3 ohm filament resistor on the 6AU6 tube (V-15) of the D Unit. Check all of the tubes of the D Unit. Check the D Unit. Check the 1N60 germanium crystal connected to terminal B-12 of the B Unit. Check the picture tube socket connections. Check the contrast control.
5. If there is sound and picture tube face does not illuminate, check the ion trap on the neck of the picture tube. Check the brightness control. Check all of the tubes in the F Unit. Check the F Unit. Check for continuity the horizontal coils of the yoke. Check the cathode voltage of the picture tube as shown on schematic pin #11. Check the picture tube.
6. Excessive interference or sync buzz in the sound. This is usually remedied by adjusting the top slug of the ratio detector coil B13M19257, or replacing 6AL5 (V-9) tube in the C Unit.

Be careful when adjusting C-4501, which is the sound take-off coil located in the C Unit. This should be adjusted to exactly 4.5 mc. and not necessarily maximum sound. Adjustment of this coil may be made on station by noting the removal of 4.5 mc. sound frequencies from appearing on the picture tube. Correct adjustment of this coil will eliminate the jagged vertical lines between the horizontal trace lines. The adjustment of this coil is critical as it not only is a sound frequency take-off coil, but is a 4.5 mc. trap to reduce or eliminate unwanted frequencies from appearing on picture tube.

7. Poor vertical linearity can usually be traced to the 6V6GT tube or the output transformer of the vertical or E Unit.
8. Insufficient contrast may be caused by a weak 6AU6 first video amplifier (V-16) or 6K6 (V-14) second video amplifier. Too much contrast causing picture bending and/or pulling may also be traced to the first video amplifier 6AU6 tube located in the D Unit.
9. If poor picture information, check the D-2000 coils in the D Unit. Check the 1N60 germanium crystal in the B Unit. Check all resistors and condensers associated with V-14 and V-16 tubes located in the D Unit. Check the alignment of the I.F. coils. Check the picture tube.
10. For poor vertical locking, check the resistors and condensers on terminals E-1, E-2, E-3 and E-4 of the E Unit. Check the resistor connected to terminal D-3 of the D Unit. Check the 12BH7 tube of the D Unit. Check the 6AU6 tube (V-15) of the D Unit and its 3 ohm filament resistor. Check the E Unit. Check the D Unit.
11. For poor horizontal locking, check the 12BH7 tube (V-19) in the F Unit. Try more than one tube before determining that it is not tube trouble. Check the 3.9 K resistor which connects the plate of the 12BH7 tube to the horizontal frequency coil. Check the 1500 ohm cathode resistor on the 12BH7 tube. Check the two 270 mmfd. silver mica condensers--use only 5% 500 Volt DC silver mica condensers for replacement. Check the 6AL5 (V-12) and the 12BH7 (V-13) of the D Unit. Check the F Unit. Check the D Unit.
12. Insufficient width--check the 5U4 tube (V- 23) in the G Unit. Check the 6BQ6 tube (V-20) in the F Unit. Check the 6W4 tube (V-22) in the F Unit. Check the horizontal drive condenser. Check the position of the yoke on the neck of the tube as it must be as far forward as possible. Check the F Unit. Check the G Unit. It is satisfactory to use a 24 ohm resistor in series with the selenium rectifier, however, the D-2002 choke provides for higher second anode voltage. The use of a 24 ohm resistor in place of this choke provides for additional sweep with about 1000 volts decrease in second anode voltage.
13. Blooming or loss of picture when attempting to increase brightness is usually caused by a poor 1X2A high voltage rectifier tube located in the F Unit. It is possible, however, for a poor 6BQ6 or 6W4 tube to be responsible for such trouble.
14. To eliminate high voltage arcing around the #2 anode terminal of the picture tube, it is recommended that at least a 6" area around the terminal be cleaned periodically with carbon tetrachloride.
15. High frequency ''sing'' or noise coming from the F Unit is usually traced to the 6W4 tube (V-22) or bracket of flyback transformer.
16. All units should be secured fairly tight to the main chassis by their mounting bolts for good grounding reasons.
17. On TV #151 series, the yoke and focus coil housing should be grounded to the top of the F Unit by means of a metal strap at least 1/2" wide and no longer than necessary. This eliminates or reduces barkhausen.
18. Excessive vertical lines or shading on the left side of the picture tube can usually be traced to the yoke coil itself or the flyback transformer. The horizontal drive condenser, note 3 on schematic, should be properly adjusted before looking for this trouble elsewhere.
19. Parts that have given some trouble in the field are as follows:

(a) The 3 ohm filament resistor on 6AU6 tube (V-15) of the D Unit. Do not eliminate but replace with new resistor.
(b) The 270 mmfd. 5% silver mica condenser located in the F Unit may test okay, but may cause an unstable horizontal oscillator condition.
(c) The 25 ma. selenium rectifier in the F Unit should be replaced with a 65 ma. selenium rectifier as the actual running load is 20 to 25 ma.
(d) The .00047-20 KV condenser located in the F Unit has in some cases developed a partial short, thereby, causing arcing under 1X2A tube socket or loss of high voltage.
(e) The .25 mfd. 400 volt coupling condenser connected to the grid of the 6V6 tube (V-18) of the E Unit, in some cases has developed a leakage, thereby, causing poor vertical linearity.
(f) The 120 mmfd. condenser connected from terminal #5 of the coil strip to ground of the A Unit has shorted out occasionally, which in turn burns out the 1 K ohm resistor. This refers to the pentode unit as well as the cascode unit.
(g) The 2000 ohm 4 watt focus control can be damaged if the set is turned on with the focus coil and yoke assembly plug disconnected.
(h) The use of the 3.9 K ohm resistor connecting the plate of the 12BH7 tube (V-19) to the horizontal frequency coil located in the F Unit provides a less critical circuit for 12BH7 tubes.
(i) 12AU7 tubes may be used as substitutes for 12BH7 tubes in the F and D Units.

TT-107	Filter choke, 200 MA. DC. #M-571	1-2	4.00
TZ-106	Hold-down bolt 8-32 x 1¾"	1-2	.05

UNIT "H"

Part No.	Description	Unit Series	List Price
TC-108	Coil, I.F. 456 K.C., slug tuned #570-455	1-2-3	$2.00
TC-109	Coil, oscillator, ceramic form 3-lug #416C	1-2-3	.80
TC-110	Coil, loop antenna, ferrite core "Hot-Rod" 6" long	1-2-3	1.20
TC-111	Coil, R.F., untuned, double peaking #BC-416	2	1.00
TC-207	Condenser, 270 uuf — 500 V reg. mica	1-2-3	.30
TC-210	Condenser, .047 uf — 400 V paper tubular molded	1-2-3	.30
TC-223	Condenser, 100 uuf — 500 V reg. mica, tol. 10%	1-2-3	.30
TC-224	Condenser, variable, 2-gang tuning	1-2-3	3.20
TC-301	Crystal, germanium, diode #1N60	2	1.50
TR-106	Resistor, 27,000 ohms 2 watt, tol. 10%	1-2-3	.20
	Resistors, ½ watt, 10% tol., any value used	1-2-3	.10
TS-101	Socket, 7-contact min. with center pin 1" MC.	1-2-3	.20
TS-102	Socket, 7-contact min. no center pin 1" MC.	1-2-3	.20
TS-111	Socket strip, 5-contact #TV1-13	1-2-3	.35
TS-115	Socket, pilot lite with 6" leads #420-90	3	.35
TZ-103	Hold-down bolt 8-32 x 3"	1-2-3	.08

MAIN CHASSIS

Part No.	Description	Where Used	List Price
TC-203	Condenser, .0027 uf — 400 V paper tubular molded		$ .25
TC-210	Condenser, .047 uf — 400 V paper tubular molded		.30
TC-212	Condenser, .22 uf — 400 V paper tubular molded		.40
TC-303	Control, pot. .5 meg. ohm, with switch #TV1-60 off-on-vol.		1.25
TC-304	Control, pot. 4000 ohm contrast #TV1-61		1.00
TC-305	Control, pot. 4000 ohm vert. lin. #TV1-61-62A		1.00
TC-306	Control, pot. 100,000 ohm hor. hold #TV1-62A		$1.00
TC-307	Control, pot. 2 meg ohm brt., hgt., vert. hold TV1-51-5		1.00
TC-309	Control variable, 2000 ohm 4 watt focus		2.00
TF-101	Fuse holder, type HCM		1.00
TF-102	Fuse holder, #342003		1.00
TF-103	Fuse, 3 amp. type 3 AG		.10
TP-101	Plug strip, 5-pin for Units A and H TV1-14		.15
TP-102	Plug strip, 12-pin for Units B, C, D, E, F and G #TV1-12		.35
TR-107	Resistor, 100 ohm 5 watt wire wound		.50
TR-110	Resistor, 175 ohm 5 watt wire wound		.50
TR-111	Resistor, 500 ohm 5 watt wire wound		.50
TR-112	Resistor, 750 ohm 10 watt wire wound		.75
TR-113	Resistor, 1500 ohm 12 watt wire wound		.80
TR-114	Resistor, 2000 ohm 10 watt wire wound		.75
TR-115	Resistor, 3000 ohm 10 watt wire wound		.75
TR-202	Receptacle, phono motor, convenience outlet #402		.40
TS-106	Socket, 5-contact, wafer 1½" MC		.20
TS-107	Socket, 6-contact, wafer 1½" MC		.20
TS-108	Socket, single contact, for phono and tuner		.15
TS-109	Socket, 1-contact, molded for A unit conn.		.15
TS-114	Socket, for picture tube, 6 leads 18" long #99-10-C		1.00
TS-115	Socket, pilot lite #420-90		.35
TT-201	Terminal strip, 1 lug		.10
TT-202	Terminal strip, 2 lug		.10
TT-203	Terminal strip, 4 lug		.12
TW-103	Wire, AC cord with plug, 11 ft.		.90
TZ-101	Nut and housing for "A" Unit hold-down bolt		.10
TZ-102	Nut and housing for B, C, D, E, F, G, H unit hold-down bolts		.10

FINAL ASSEMBLY

Part No.	Description	Where Used	List Price
FA53-101	Speaker, 10" P.M., 3.15 oz. AL V		$9.00
FA53-102	Yoke, with res., cond., leads and plug		10.00
FA53-103	Ion trap, for 12½", 17", 20" and 21" CRT		.75
FA53-104	Width sleeve		.60
FA53-105	Knob assembly, TV channel selector		2.50
FA53-106	Knob assembly, Radio selector		2.50
FA53-107	Knob assembly, Off-on-volume		2.00
FA53-108	Knob, small size, contrast, etc.		.50
FA53-109	Glass, safety, 16" x 22" for #53, #531, #5301		6.00
	Crating charge 1 to 8 pieces		3.00
FA53-110	Mask, picture tube, for #53, #531, #5301, #5302		4.50
FA53-111	Mounting band for picture tube, 21"		3.50
FA53-112	Mounting bracket for yoke		.70
FA53-113	Glass, safety, 16" x 21⅛" for #5302		6.00
	Crating charge 1 to 8 pieces		3.00
FA53-114	Centering magnets and cap for yolk		1.00
FA-201	Speaker, 6" P.M., 1 oz AL V		5.00
FA-202	Speaker, 5" P.M., 1 oz AV V		4.00
FA-203	Knob, TV channel selector #A52A-39-1		3.00
FA-204	Knob, radio selector, off-on-volume, #A52A-39-2		2.55
FA-206	Knob, small size, black plastic, metal trim TV-151-6, for TV—Radio—Phono. contr., off-on-vol.		.60
FA-207	Lever, for TV fine tuning and radio pointer TV1-38		.25
FA-208	Plate, channel selector TV1-43		.60
FA-209	Plate, radio selector TV1-44		.60
FA-210	Plate, adjustment and name TV1-12		.60
FA-211	Plate, channel selector TV1-66		.60
FA-212	Plate, radio selector TV1-67		.60
FA-213	Plate, adjustment and name TV1-65		.60
FA-214	Plate, channel selector TV-65A		.60
FA-216	Plate, radio selector TV-66		.60
FA-216	Plate, adjustment and name TV-151-2		.60
FA-217	Plate, off-on-volume		.60
FA-220	Focus coil with leads		5.00

PARTS LIST NUMERICALLY

Part No.	Description	Where Used	List Price
FA53-101	Speaker, 10" P.M. 3.15 oz AL V		9.00
FA53-102	Yoke, with res., cond., leads and plug		10.00
FA53-103	Ion trap, for 12½", 17", 20", 21", CRT		.75
FA-201	Speaker, 6" PM. 1 oz AL V		5.00
FA-220	Focus coil with leads		5.00
TA-101	Coil strip, oscillator (Channel 2 - 13) specify channel and series	A	$2.00

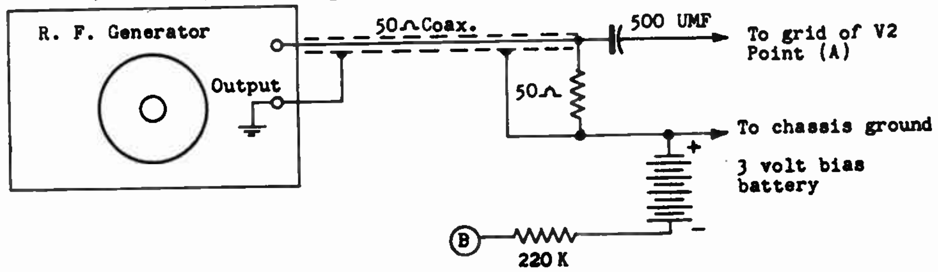
TR-201	Rectifier, selenium, 65MA-150V #8J1	F	1.35
TT-101	Transformer, Audio Output M-681	C	$ 2.00
TT-102	Transformer, vertical ocs. #M-682	E	2.00
TT-103	Transformer, vertical output #M-685	E	4.00
TT-104	Transformer, main power, 115 V prim. #M-575C	G	20.00
TT-105	Transformer, flyback, for 12½" CRT #X100	F1	7.50
TT-106	Transformer, Flyback for 17", 20" CRT 30-6145	F2, 3, 4	10.00
TT-107	Transformer, Filter Choke 200 M.A. #M-571	G	4.00

ALIGNMENT PROCEDURE UNMODULATED (CW) GENERATOR METHOD

Step One: SOUND TRAP ALIGNMENT

A. Adjust all controls to normal operating position. Connect the R. F. Signal Generator to the grid of V-2 (Point A.) I. F. input adapter, as shown below.



B. Connect VTVM across R56 (Point C.) Use low volts D. C. Scale.
C. Connect a 4.5 volt bias battery between Point G and ground. (Positive terminal of battery to chassis ground.) Remove 6AU6 (V8).
D. Set R. F. Tuner to channel which gives minimum indication of voltmeter.
E. Adjust L25 and L26 for minimum indication on voltmeter at the specified frequency:

L25	=	27.75 mc
L26	=	21.75 mc

Step Two: PIX I F ALIGNMENT

A. Adjust L10, L27, L28, L29, L30, for maximum indication on voltmeter at the specified frequency.

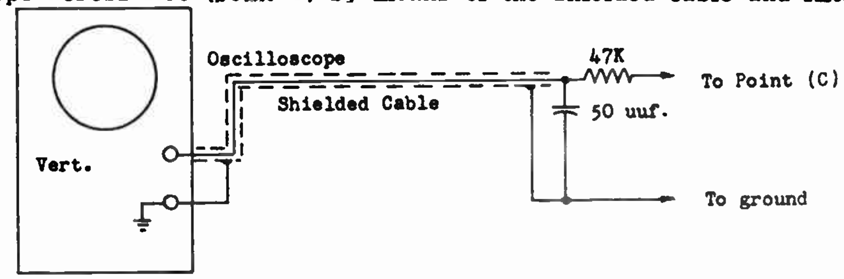
L10	22.5 mc
L27	25.25 mc
L28	24.25 mc
L29	23.25 mc
L30	26.0 mc

Step Three: SOUND IF ALIGNMENT

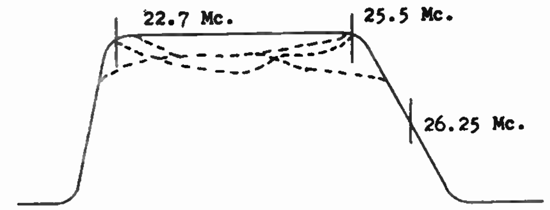
A. Connect the R. F. Signal Generator to Point C.
B. Inject the 4.5 mc signal. (Frequency accuracy important.)
C. Connect VTVM from Point E to ground. Use - 10 volt DC Scale.
D. Adjust L33, T1, and T2 primary for maximum indication of voltmeter.
E. Connect VTVM from Point F to ground. Use lowest D. C. Scale. Adjust secondary of T2 for zero output, as indicated by voltmeter. Note: It is possible to produce a positive or negative voltage indicated by varying this adjustment. The point where the voltage swings from positive to negative is zero output and indicates correct alignment. (If Ratio Detector is seriously misaligned repeat alignment of primary and secondary until no improvement can be made.)
F. Connect VTVM with detector probe from Point D to ground. Use lowest DC Scale
G. Adjust L37 for minimum indication on voltmeter.

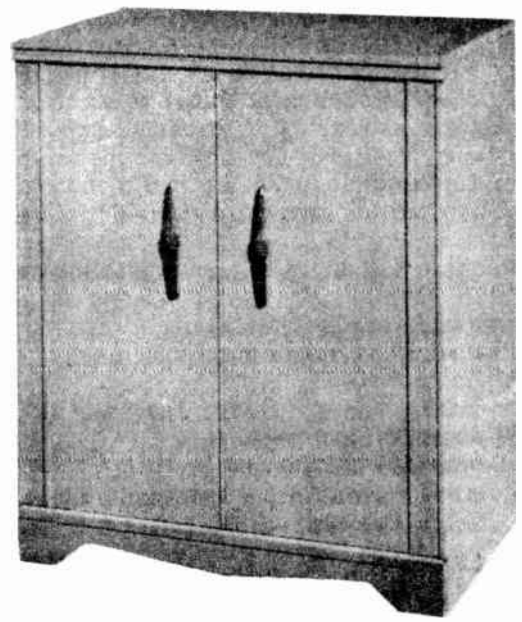
VISUAL ALIGNMENT CHECK USING SWEEP GENERATOR, MARKER GENERATOR, AND OSCILLOSCOPE.

A. Adjust all controls to normal operating position. Connect the sweep generator to the grid of V2 (point A). Connect a 4.5 volt bias battery between point G and ground. (Positive terminal of battery to chassis ground).
B. Connect the oscilloscope across R56 (point C) by means of the shielded cable and filter system shown below.



C. Adjust the R. F. sweep generator so that it sweeps from approximately 20 to 30 mc.
D. Adjust the oscilloscope so that the I.F. response is visible. (Set tuner to channel where rotation of Fine Tuning does not change observed response.)
E. Inject proper marker signals as recommended by manufacturer of R. F. sweep generator used.
F. Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary, slightly vary the tuning of the picture I.F. coils L10, L27, L28, L29, L30 until the picture I.F. response shown is obtained The solid curve depicts the ideal I.F. response while the dotted curves show permissable variations.





ELECTRICAL SPECIFICATIONS

Power supply	105-125 Volts AC 60 Cycle only
Power Consumption	325 Watts
Audio Power Output	Maximum Undistorted 2.5 Watts
Tuning Range	T. V. Channels 2 thru 83
Antenna Input Impedance	300 Ohms Balanced
Intermediate Frequencies	Picture 26.25 Mc.
Intercarrier Sound System	4.5 Mc.
Voice Coil Impedance	3.2 Ohms at 400 Cycles

MISCELLANEOUS SERVICE HINTS

VHF R.F. AND MIXER ALIGNMENT

1. Set station selector to Channel 12.
2. Connect oscilloscope thru 10,000 ohms to test point T (Wire loop on top of tuner.)
3. For negative bias connect -3volts DC to A.G.C. lead (white covered wire) from tuner.
4. Feed sweep generator into antenna terminals, sweeping Channel 12.
5. Adjust C3, C6 and C13 (upright screws on top of tuner) for flat top response curve and maximum gain. Check markers on all channels. They should fall in automatically on all channels.

VHF OSCILLATOR ALIGNMENT

1. Turn on set and select channel to be viewed.
2. Center fine tuning control.
3. Place a non inductive screwdriver through opening, and adjust oscillator coil for best picture and sound.
4. Repeat this adjustment for each channel that can be viewed in the area.

ADJUSTMENT SUGGESTIONS FOR PM FOCUS UNIT

UNDER NORMAL CONDITIONS, ALL FOCUS ADJUSTMENTS CAN BE MADE BY INSERTING A SCREWDRIVER THRU THE HOLE IN THE BACK OF THE CABINET AND INTO THE SLOTTED END OF THE FOCUS CONTROL SHAFT. ROTATE THE SHAFT EITHER CLOCKWISE OR COUNTER-CLOCKWISE UNTIL BEST OVERALL FOCUS IS OBTAINED.

1. IT IS RECOMMENDED THAT THE PHYSICAL POSITIONING OF THE PM FOCUS UNIT BE PLACED SO THAT THE MOUNTING BRACKET HAS THE TWO SELF-TAPPING SCREWS IN THE CENTER OF THE SLOT.

2. IN THE EVENT THE BRIGHTNESS VARIES WHILE ADJUSTING THE FOCUS UNIT FOR BEST OVERALL FOCUS, MOVE THE FOCUS UNIT ASSEMBLY FORWARD (TOWARD THE YOKE) APPROXIMATELY 3/8" AND RESET THE ION TRAP FOR MAXIMUM BRIGHTNESS THEN REFOCUS (PM) UNIT.

3. FOR BEST COMPROMISE, TO OFFSET VARIATIONS IN FOCUS WITH DIFFERENT BRIGHTNESS SETTINGS, MAKE ALL FINAL FOCUS ADJUSTMENTS AT A HIGH BRIGHTNESS CONTROL SETTING.

MISCELLANEOUS SERVICE HINTS

Horizontal Drive Adjustments:

With 125V.A.C. line adjust vertical deflection for 10% over-scan with best linearity then adjust horizontal linearity control for best linearity and follow with adjustment of horizontal width control for maximum width. Adjust horizontal hold control to its maximum counter-clockwise position. Decrease horizontal drive control resistance until the compression near the center of the picture disappears. Reset horizontal hold control to its mid-position.

With 117 A. C. line volts, the cathode current of the 6CD6 must not exceed 140 Ma. with zero beam current.

Hor. Oscillator Adjustment:

With 117 A. C. line volts and the horizontal hold control set at the mid-point of its range, adjust L-41 for synchronization with approx. zero volts from Pin #1 of V20 to ground as measured with a vacuum tube or other high impedance voltmeter.

Vertical Peaking Control R130 (Part No. PA4465-1)

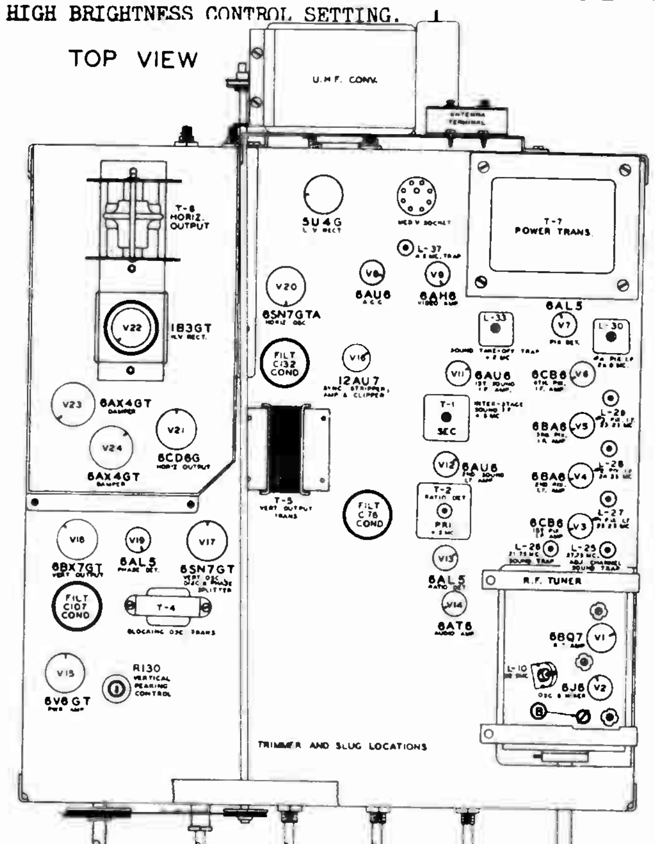
This control has been added on later models due to variation in 6BX7GT tubes. The control is adjusted for best vertical linearity at the top of the raster.

Adjustment of Anti-Pin Cushion Corrector Magnets:

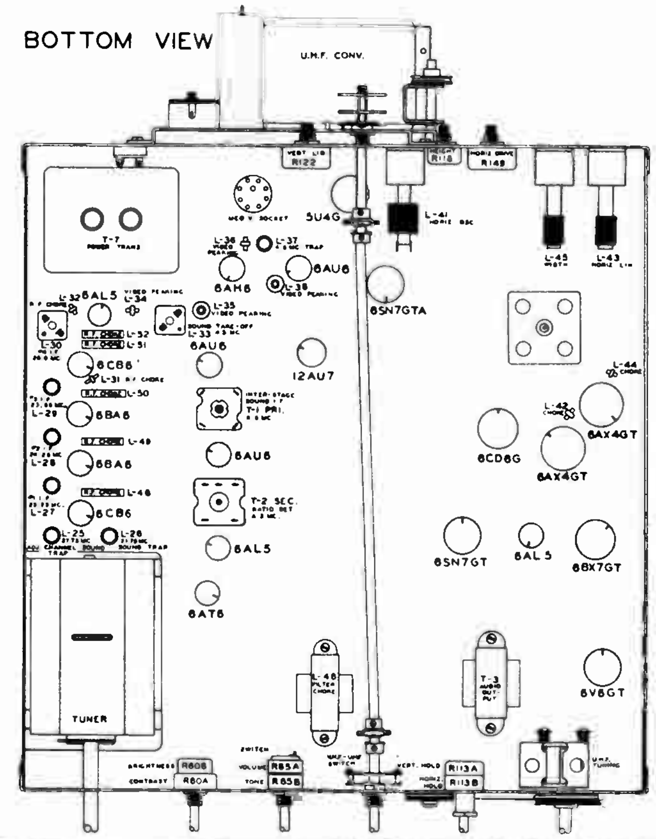
These magnets are mounted on the deflection coil mounting bracket and can be moved in and out by first loosening the mounting screws. Under certain conditions it may be necessary to form, or bend the flexible arms which support the magnets. The above adjustment is made at the factory and should not require re-adjustment unless the original position of the magnets is accidently disturbed. Adjustment can be made in the following manner:

1. With the size controls reduce the size of the raster until the sides are visible.
2. Adjust the corrector magnets for straightest possible raster edges. Restore the picture to normal size.

TOP VIEW



BOTTOM VIEW



VOLTAGE TEST SPECIFICATIONS:

1. All Voltages & Current measured with VHF - UHF Switch in VHF Position.
2. Channel Switch Position - Channel #2.
3. Line Voltage - 117 Volts A.C. No signal input applied to set.
4. Brightness & Contrast Control Position - Maximum Clockwise.
5. Horizontal & Vertical Hold Control Positions - Set correct position to lock in picture.
6. Width Control Position - Set for normal size.
7. Vertical Size & Linearity Control Position - Set for normal size best linearity.
8. Focus Control Position - Properly focused.
9. Volume Control & Tone Control Position - Maximum Counter - Clockwise.
10. Instrument (Meter) Used - (VTVM) Vacuum Tube Volt Meter.
11. Unless otherwise designated all voltages measured in respect to Chassis Ground.

NOTE:
The points indicated by the letters A,B,C,D,E,F & G are the alignment test points referred to in the alignment procedure.

(A) Pin #6 of V2 (6J6) Osc. & Mixer Tube.
Apply signals here for spot I.F. Alignment or I.F. Sweep.

(B) Apply minus 3 volts through 220K Ohms to test terminal, located between the tubes on top of R.F. Tuner (See Suggested input adapter.)

(C) Diode Load Resistor
Read D.C. output here for spot I.F. Alignment.
Connect scope here for visual I.F. Alignment.

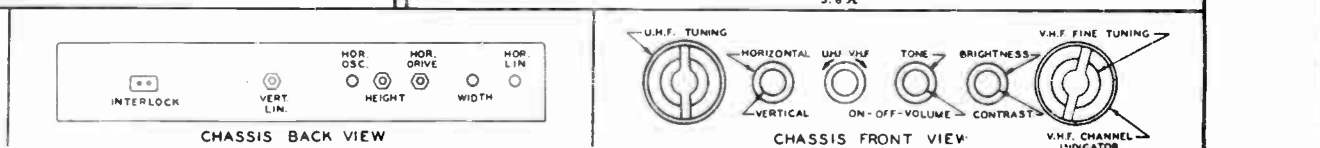
(D) Cathode of Picture Tube
Read A.C. output here for overall sensitivity.
Read 4.5Mc output here for aligning 4.5 Mc. Trap.

(E) Ratio Detector Output
Read D.C. here for alignment of sound take-off trap, inter-stage sound I.F. trans. and primary of ratio det. trans.

(F) Ratio Detector Balanced Output
Read D.C. here for alignment of secondary of ratio det. trans.

(G) A.G.C. Line
apply 4.5 volts bias here for visual check of I.F. or overall with oscilloscope.

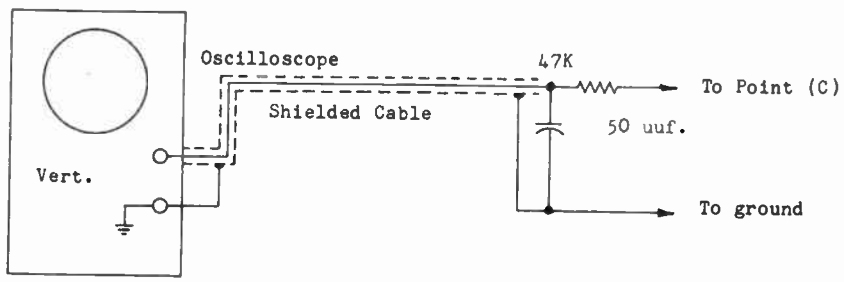
Note: Adjustment of Contrast, Brightness, Focus, Vertical Size, Horizontal Hold and Horizontal Drive Controls will change voltages from those indicated in their respective associated circuits.



VISUAL ALIGNMENT CHECK USING SWEEP GENERATOR, MARKER GENERATOR, AND OSCILLOSCOPE.

A. Adjust all controls to normal operating position. Connect the sweep generator to the grid of V2 (point A.) Connect a 4.5 volt bias battery between point G and ground. (Positive terminal of battery to chassis ground.)

B. Connect the oscilloscope across R32 (point C) by means of the shielded cable and filter system shown below.

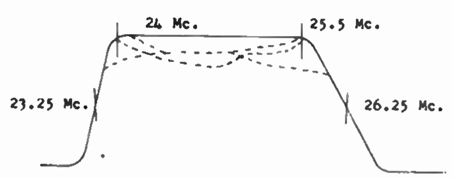


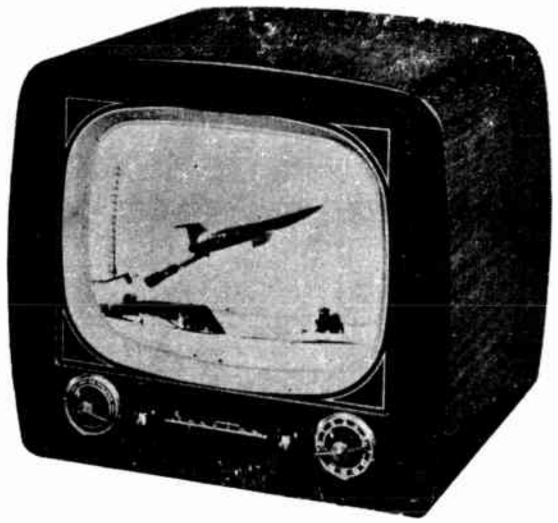
C. Adjust the R. F. sweep generator so that it sweeps from approximately 20 to 30 mc.

D. Adjust the oscilloscope so that the I.F. response is visible. (Set tuner to channel where rotation of Fine Tuning does not change observed response.)

E. Inject proper marker signals as recommended by manufacturer of R.F. sweep generator used.

F. Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary, slightly vary the tuning of the picture I.F. coils L11, L13, L14, L15, until the picture I.F. response shown is obtained. The solid curve depicts the ideal I.F. response while the dotted curves show permissable variations.

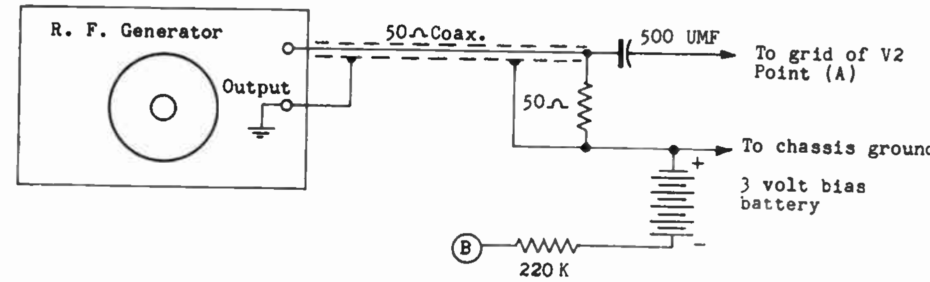




ALIGNMENT PROCEDURE UNMODULATED (CW) GENERATOR METHOD

Step One: SOUND TRAP ALIGNMENT

A. Adjust all controls to normal operating position. Connect the R.F. Signal Generator to the grid of V-2 (Point A.) I.F. input adapter, as shown below.



B. Connect VTVM across R32 (Point C.) Use low volts D. C. Scale.
C. Connect a 4.5 volt bias battery between Point G and ground. (Positive terminal of battery to chassis ground.)
D. Set R.F. Tuner to channel which gives minimum indication on voltmeter.
E. Adjust L12 for minimum indication on voltmeter at the specified frequency:

L12 = 21.75 mc

Step Two: PIX IF ALIGNMENT

A. Adjust L11, L13, L14, L15, for maximum indication on voltmeter at the specified frequency:

L11	22.5 mc
L13	25.0 mc
L14	23.8 mc
L15	26.0 mc

Step Three: SOUND IF ALIGNMENT

A. Connect the R.F. Signal Generator to Point C.
B. Inject the 4.5 mc signal. (Frequency accuracy important.)
C. Connect VTVM from Point E to ground. Use — 10 volt DC Scale.
D. Adjust L25 and T1 primary for maximum indication on voltmeter.
E. Connect VTVM from Point F to ground. Use lowest D. C. Scale. Adjust secondary of T1 for zero output, as indicated by voltmeter. Note: It is possible to produce a positive or negative voltage indicated by varying this adjustment. The point where the voltage swings from positive to negative is zero output and indicates correct alignment.(If Ratio Detector is seriously misaligned repeat alignment of primary and secondary until no improvement can be made.)
F. Connect VTVM with detector probe from Point D to ground. Use lowest DC Scale.
G. Adjust L19 for minimum indication on voltmeter.

ELECTRICAL SPECIFICATIONS

POWER SUPPLY	105-125 VOLTS AC 60 CYCLE ONLY
POWER CONSUMPTION	235-210 WATTS
AUDIO POWER OUTPUT	MAXIMUM UNDISTORTED 2.5 WATTS
TUNING RANGE	T.V. CHANNELS 2 THRU 83 *
ANTENNA INPUT IMPEDANCE	300 OHMS BALANCED.
INTERMEDIATE FREQUENCIES	PICTURE 26.25 MC.
INTERCARRIER SOUND SYSTEM	4.5 MC.
VOICE COIL IMPEDANCE	3.2 OHMS AT 400 CYCLES

* CONVERSION "STRIPS AND CONVERTERS" ARE AVAILABLE FOR STANDARD TUNER TO CONVERT REGULAR VHF TUNERS FOR RECEPTION OF SIGNALS IN ANY UHF TELEVISION BAND.

MISCELLANEOUS SERVICE HINTS

VHF R.F. AND MIXER ALIGNMENT

1. Set station selector to Channel 12.
2. Connect oscilloscope through 10,000 ohms to test point T (Wire loop on top of tuner.)
3. For negative bias connect -3 volts DC to A.G.C. lead (white covered wire) from tuner.
4. Feed sweep generator into antenna terminals, sweeping Channel 12.
5. Adjust C3, C6 and C13 (upright screws on top of tuner) for flat top response curve and maximum gain. Check markers on all channels. They should fall in automatically on all channels.

VHF OSCILLATOR ALIGNMENT

1. Turn on set and select channel to be viewed.
2. Center fine tuning control.
3. Place a non inductive screwdriver through opening, and adjust oscillator coil for best picture and sound.
4. Repeat this adjustment for each channel that can be viewed in the area.

MISCELLANEOUS SERVICE HINTS

Horizontal Drive Adjustments:

With 125V.A.C. line adjust vertical deflection for 10% over-scan with best linearity then adjust horizontal linearity control for best linearity and follow with adjustment of horizontal width control for maximum width. Adjust horizontal hold control to its maximum counter-clockwise position. Decrease horizontal drive control resistance until the compression near the center of the picture disappears. Reset horizontal hold control to its mid-position.

With 117 A.C. line volts, the cathode current of the 6BQ6 must not exceed 110 Ma. with zero beam current.

Horizontal Oscillator Adjustment:

With 117 A.C. line volts and the horizontal hold control set at the mid-point of its range, adjust L-36 for synchronization with approx. zero volts from Pin #1 of V-17 to ground as measured with a vacuum tube or other high impedance voltmeter.

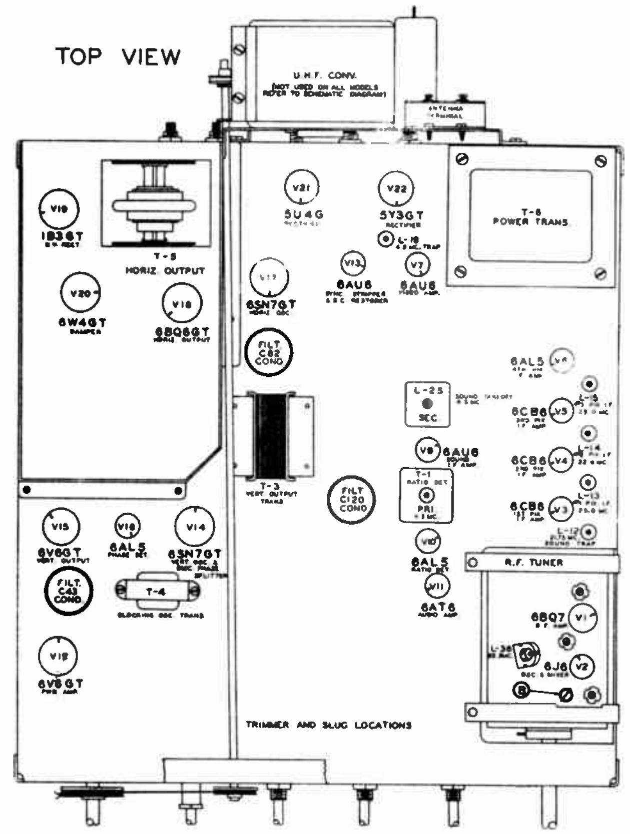
INSTRUCTIONS FOR INSTALLATION OF UHF CHANNEL IDENTIFICATION NUMBERS.

UPON INSTALLATION OF THE UHF CONVERTER STRIPS, YOU MAY CHANGE THE ORIGINAL VHF IDENTIFICATION NUMBER ON THE CHANNEL SELECTOR KNOB TO THE DESIRED UHF CHANNEL NUMBER. THE FOLLOWING INSTALLATION PROCEDURE IS SUGGESTED:

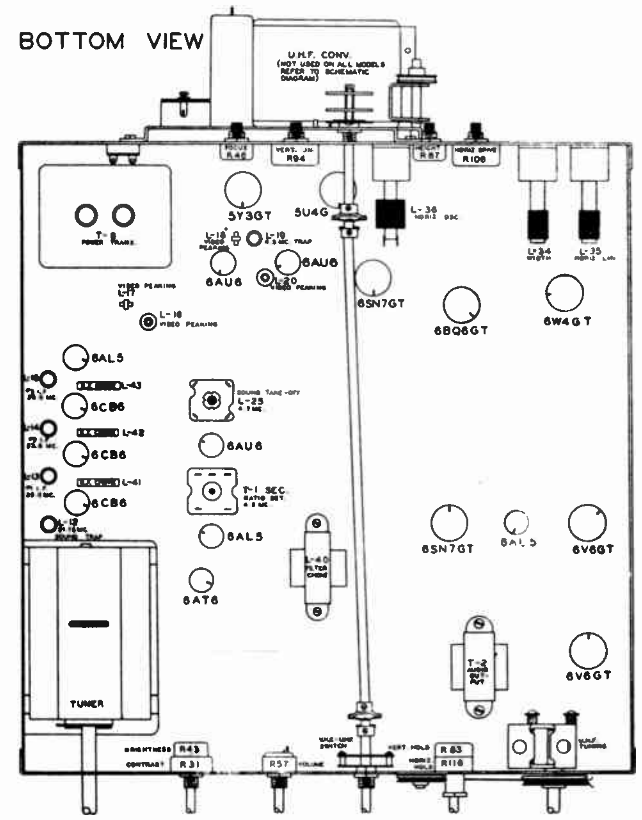
1. REMOVE CHANNEL SELECTOR KNOB
2. REMOVE THE TWO SCREWS HOLDING CHANNEL INDICATOR INSERT.
3. WITH A SHARP KNIFE OR SIMILAR INSTRUMENT, SCRAPE THE UNDESIRED VHF CHANNEL NUMBER FROM FRONT OF INDICATOR INSERT. CAUTION: DO NOT SCRAPE BEYOND THE EDGE LIMITS OF NEW UHF NUMBER.
4. MOISTEN ADHESIVE ON UHF STICKER AND PLACE IN POSITION.
5. ASSEMBLE INDICATOR INSERT TO KNOB, USING CAUTION NOT TO STRIP SCREWS.
6. REPLACE KNOB.

SELECTOR IDENTIFICATION NUMBERS ARE SUPPLIED IN GREEN AND MAROON TO MATCH BOTH BLOND AND MAHOGANY MODELS, AND WILL BE SHIPPED WITH YOUR SPARTON TV RECEIVER. THEY MAY BE FOUND IN THE CUSTOMER INSTRUCTION ENVELOPE ATTACHED TO THE BACK OF THE SET.

TOP VIEW



BOTTOM VIEW

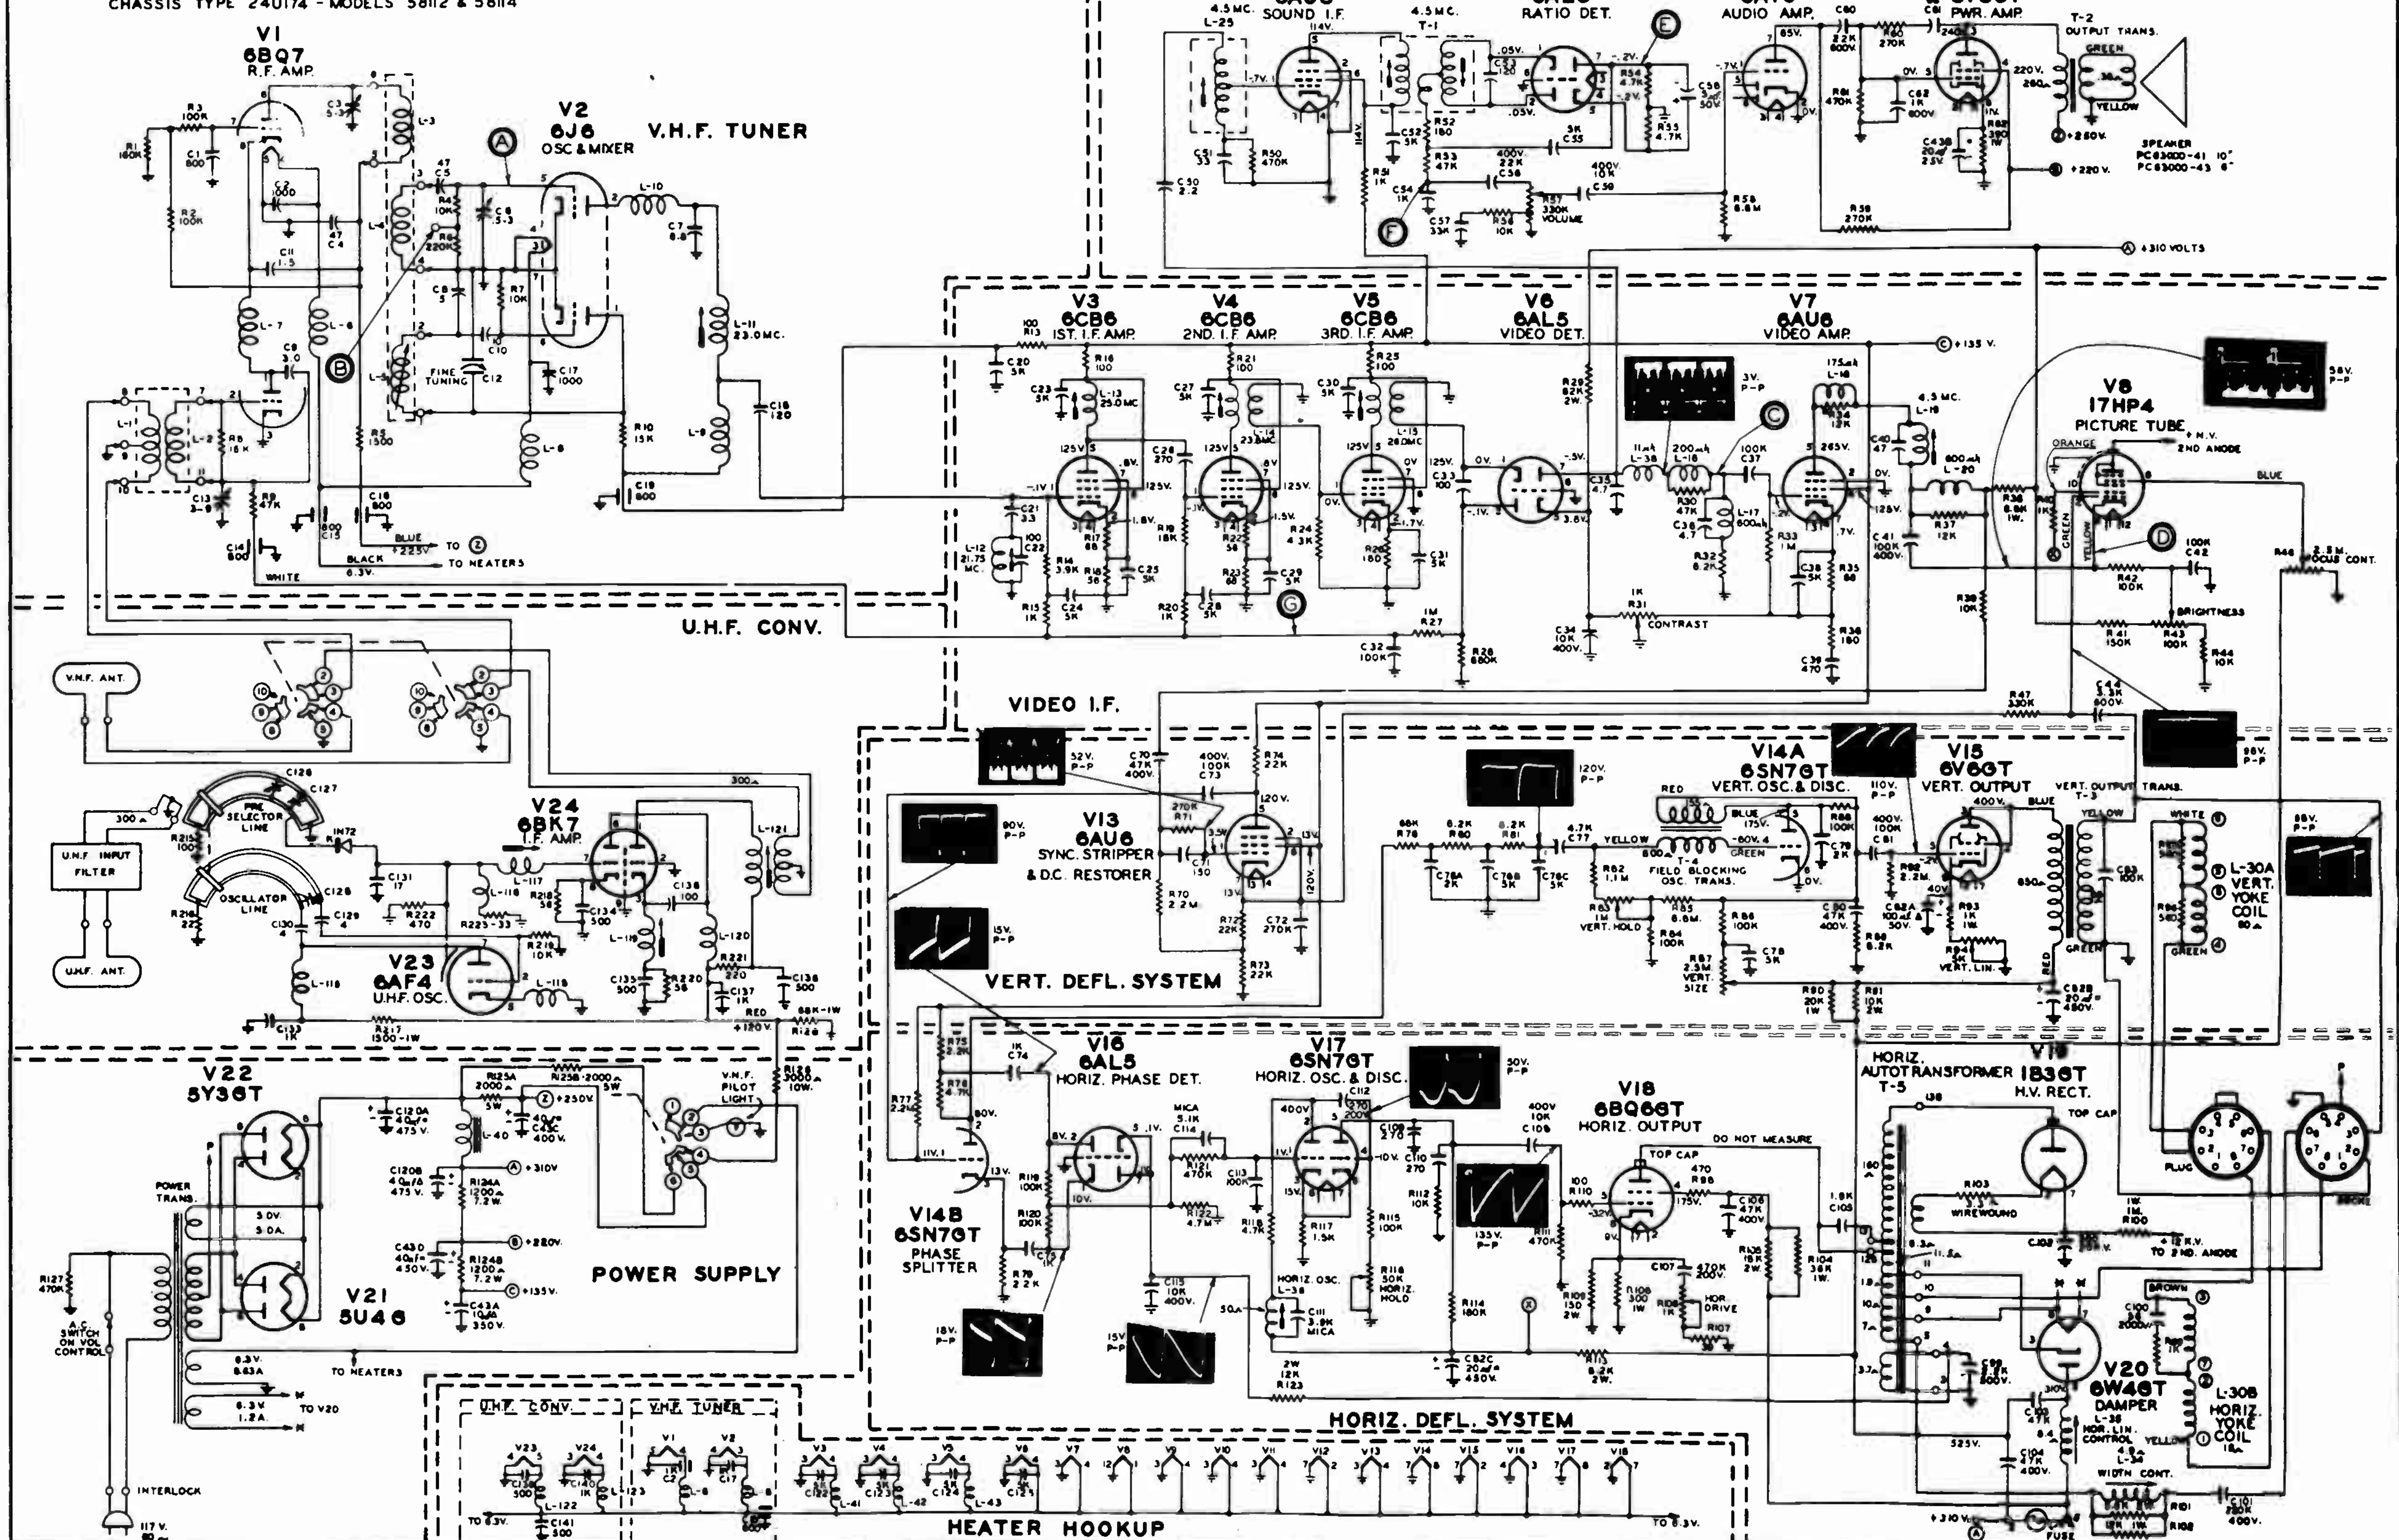


VOLTAGE TEST SPECIFICATIONS:

1. All Voltages & Current measured with VHF - UHF Switch in VHF position.
2. Channel Switch Position - Channel 2-
3. Line Voltage - 117 Volts A.C. No signal input applied to set.
4. Brightness & Contrast Control Position - Maximum Clockwise.
5. Horizontal & Vertical Hold Control Positions - Set correct position to lock in picture.
6. Width Control Position - Set for normal size.
7. Vertical Size & Linearity Control Position - Set for normal size best linearity.
8. Focus Control Position - Properly focused.
9. Volume Control & Tone Control Position - Maximum Counter-Clockwise.
10. Instrument (Meter) Used - (VTVM) Vacuum Tube Volt Meter.
11. Unless otherwise designated all voltages measured in respect to Chassis Ground.

SPARTON TELEVISION SCHEMATIC DIAGRAM

CHASSIS TYPE 24U174 - MODELS 5812 & 58114



NOTE:
The points indicated by the letters A,B,C,D,E,F, & G are the alignment test points referred to in the alignment procedure.

(A) Pin 5 of V2 (6J6) Osc. & Mixer Tube. Apply signals here for spot I.F. Alignment or I.F. Sweep.
(B) Apply minus 3 volts through 220K Ohms to test terminal, located between the tubes on top of R. F. Tuner. (See Suggested input adapter.)
(C) Diode Load Resistor. Read D.C. output here for spot I.F. Alignment. Connect scope here for visual I.F. Alignment.
(D) Cathode of Picture Tube. Read A.C. output here for overall sensitivity. Read 4.5 Mc output here for overall sensitivity.
(E) Ratio Detector Output. Read D.C. here for alignment of sound take-off trap, inter-stage sound. I.F. trans. and primary of ratio det. trans.
(F) Ratio Detector Balanced output. Read D.C. here for alignment of secondary of ratio det. trans.
(G) A.G.C. Line. apply 4.5 volts bias here for visual check of I.F. or overall with oscilloscope.

Note: Adjustment of Contrast, Brightness, Focus, Vertical Size, Horizontal Hold and Horizontal Drive Controls will change voltages from those indicated in their respective associated circuits.

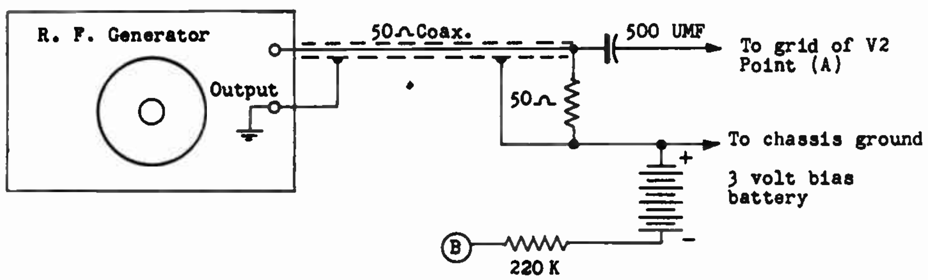
ALIGNMENT PROCEDURE UNMODULATED (CW) GENERATOR METHOD

Step One: SOUND TRAP ALIGNMENT

A. Adjust all controls to normal operating position. Connect the R.F. Signal Generator to the grid of V-2 (Point A.) I.F. input adapter, as shown below.



B. Connect VTVM across R32 (Point C.) Use low volts D. C. Scale.
C. Connect a 4.5 volt bias battery between Point G and ground. (Positive terminal of battery to chassis ground.)
D. Set R.F. Tuner to channel which gives minimum indication on voltmeter.
E. Adjust L12 for minimum indication on voltmeter at the specified frequency:

L12 = 21.75 mc

Step Two: PIX IF ALIGNMENT

A. Adjust L11, L13, L14, L15, for maximum indication on voltmeter at the specified frequency:

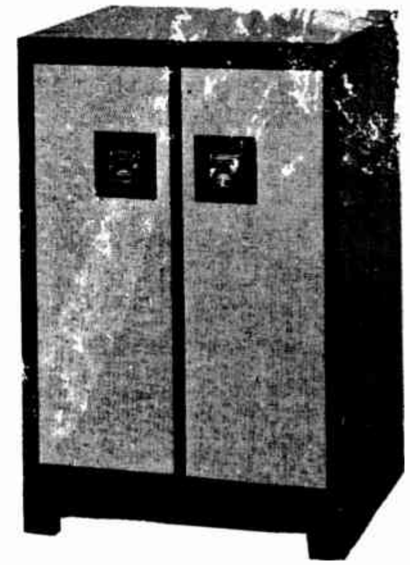
L11	22.5 mc
L13	25.0 mc
L14	23.8 mc
L15	26.0 mc

Step Three: SOUND IF ALIGNMENT

A. Connect the R.F. Signal Generator to Point C.
B. Inject the 4.5 mc signal. (Frequency accuracy important.)
C. Connect VTVM from Point E to ground. Use — 10 volt DC Scale.
D. Adjust L25 and T1 primary for maximum indication on voltmeter.
E. Connect VTVM from Point F to ground. Use lowest D. C. Scale. Adjust secondary of T1 for zero output, as indicated by voltmeter. Note: It is possible to produce a positive or negative voltage indicated by varying this adjustment. The point where the voltage swings from positive to negative is zero output and indicates correct alignment.(If Ratio Detector is seriously misaligned repeat alignment of primary and secondary until no improvement can be made.)
F. Connect VTVM with detector probe from Point D to ground. Use lowest DC Scale.
G. Adjust L19 for minimum indication on voltmeter.

ELECTRICAL SPECIFICATIONS

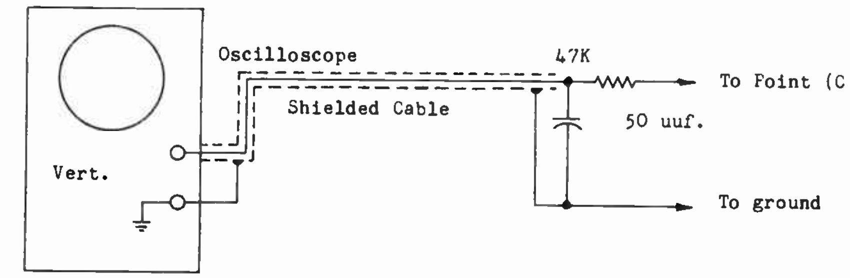
Power Supply	105-125 Volts AC 60 Cycle only
Power Consumption	235 Watts
Audio Power Output	Maximum Undistorted 2.5 Watts
Tuning Range	T.V. Channels 2 thru 83
Antenna Input Impedance	300 Ohms Balanced
Intermediate Frequencies	Picture 26.25 Mc.
Intercarrier Sound System	4.5 Mc.
Voice Coil Impedance	3.2 Ohms at 400 Cycles



VISUAL ALIGNMENT CHECK USING SWEEP GENERATOR, MARKER GENERATOR, AND OSCILLOSCOPE.

A. Adjust all controls to normal operating position. Connect the sweep generator to the grid of V2 (point A.) Connect a 4.5 volt bias battery between point G and ground. (Positive terminal of battery to chassis ground.)

B. Connect the oscilloscope across R32 (point C) by means of the shielded cable and filter system shown below.

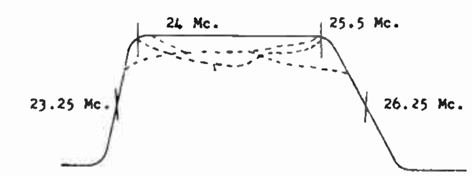


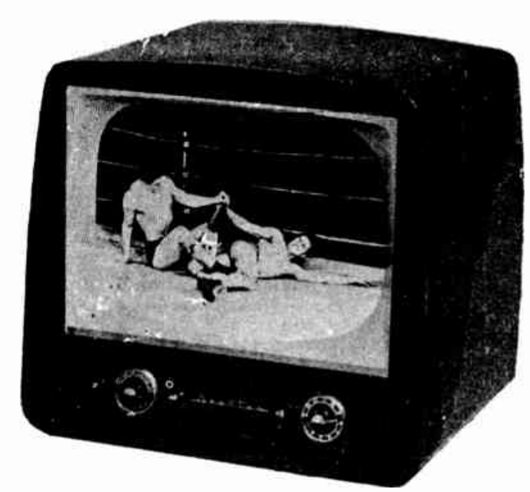
C. Adjust the R. F. sweep generator so that it sweeps from approximately 20 to 30 mc.

D. Adjust the oscilloscope so that the I.F. response is visible. (Set tuner to channel where rotation of Fine Tuning does not change observed response.)

E. Inject proper marker signals as recommended by manufacturer of R.F. sweep generator used.

F. Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary, slightly vary the tuning of the picture I.F. coils L11, L13, L14, L15, until the picture I.F. response shown is obtained. The solid curve depicts the ideal I.F. response while the dotted curves show permissable variations.





MISCELLANEOUS SERVICE HINTS

VHF R.F. AND MIXER ALIGNMENT

1. Set station selector to Channel 12.
2. Connect oscilloscope through 10,000 ohms to test point T (Wire loop on top of tuner.)
3. For negative bias connect -3 volts DC to A.G.C. lead (white covered wire) from tuner.
4. Feed sweep generator into antenna terminals, sweeping Channel 12.
5. Adjust C3, C6 and C13 (upright screws on top of tuner) for flat top response curve and maximum gain. Check markers on all channels. They should fall in automatically on all channels.

VHF OSCILLATOR ALIGNMENT

1. Turn on set and select channel to be viewed.
2. Center fine tuning control.
3. Place a non inductive screwdriver through opening, and adjust oscillator coil for best picture and sound.
4. Repeat this adjustment for each channel that can be viewed in the area.

ADJUSTMENT SUGGESTIONS FOR PM FOCUS UNIT

UNDER NORMAL CONDITIONS, ALL FOCUS ADJUSTMENTS CAN BE MADE BY INSERTING A SCREWDRIVER THRU THE HOLE IN THE BACK OF THE CABINET AND INTO THE SLOTTED END OF THE FOCUS CONTROL SHAFT. ROTATE THE SHAFT EITHER CLOCKWISE OR COUNTER-CLOCKWISE UNTIL BEST OVERALL FOCUS IS OBTAINED.

1. IT IS RECOMMENDED THAT THE PHYSICAL POSITIONING OF THE PM FOCUS UNIT BE PLACED SO THAT THE MOUNTING BRACKET HAS THE TWO SELF-TAPPING SCREWS IN THE CENTER OF THE SLOT.

2. IN THE EVENT THE BRIGHTNESS VARIES WHILE ADJUSTING THE FOCUS UNIT FOR BEST OVERALL FOCUS, MOVE THE FOCUS UNIT ASSEMBLY FORWARD (TOWARD THE YOKE) APPROXIMATELY 3/8" AND RESET THE ION TRAP FOR MAXIMUM BRIGHTNESS THEN RE-FOCUS (PM) UNIT.

3. FOR BEST COMPROMISE, TO OFFSET VARIATIONS IN FOCUS WITH DIFFERENT BRIGHTNESS SETTINGS, MAKE ALL FINAL FOCUS ADJUSTMENTS AT A HIGH BRIGHTNESS CONTROL SETTING.

MISCELLANEOUS SERVICE HINTS

Horizontal Drive Adjustments:

With 125V.A.C. line adjust vertical deflection for 10% over-scan with best linearity then adjust horizontal linearity control for best linearity and follow with adjustment of horizontal width control for maximum width. Adjust horizontal hold control to its maximum counter-clockwise position. Decrease horizontal drive control resistance until the compression near the center of the picture disappears. Reset horizontal hold control to its mid-position.

With 117 A.C. line volts, the cathode current of the 6BQ6 must not exceed 110 Ma. with zero beam current.

Horizontal Oscillator Adjustment:

With 117 A.C. line volts and the horizontal hold control set at the mid-point of its range, adjust L-36 for synchronization with approx. zero volts from Pin #1 of V-17 to ground as measured with a vacuum tube or other high impedance voltmeter.

Adjustment of Anti-Pin Cushion Corrector Magnets:

These magnets are mounted on the deflection coil mounting bracket and can be moved in and out by first loosening the mounting screws. Under certain conditions it may be necessary to form, or bend the flexible arms which support the magnets. The above adjustment is made at the factory and should not require re-adjustment unless the original position of the magnets is accidently disturbed. Adjustment can be made in the following manner:

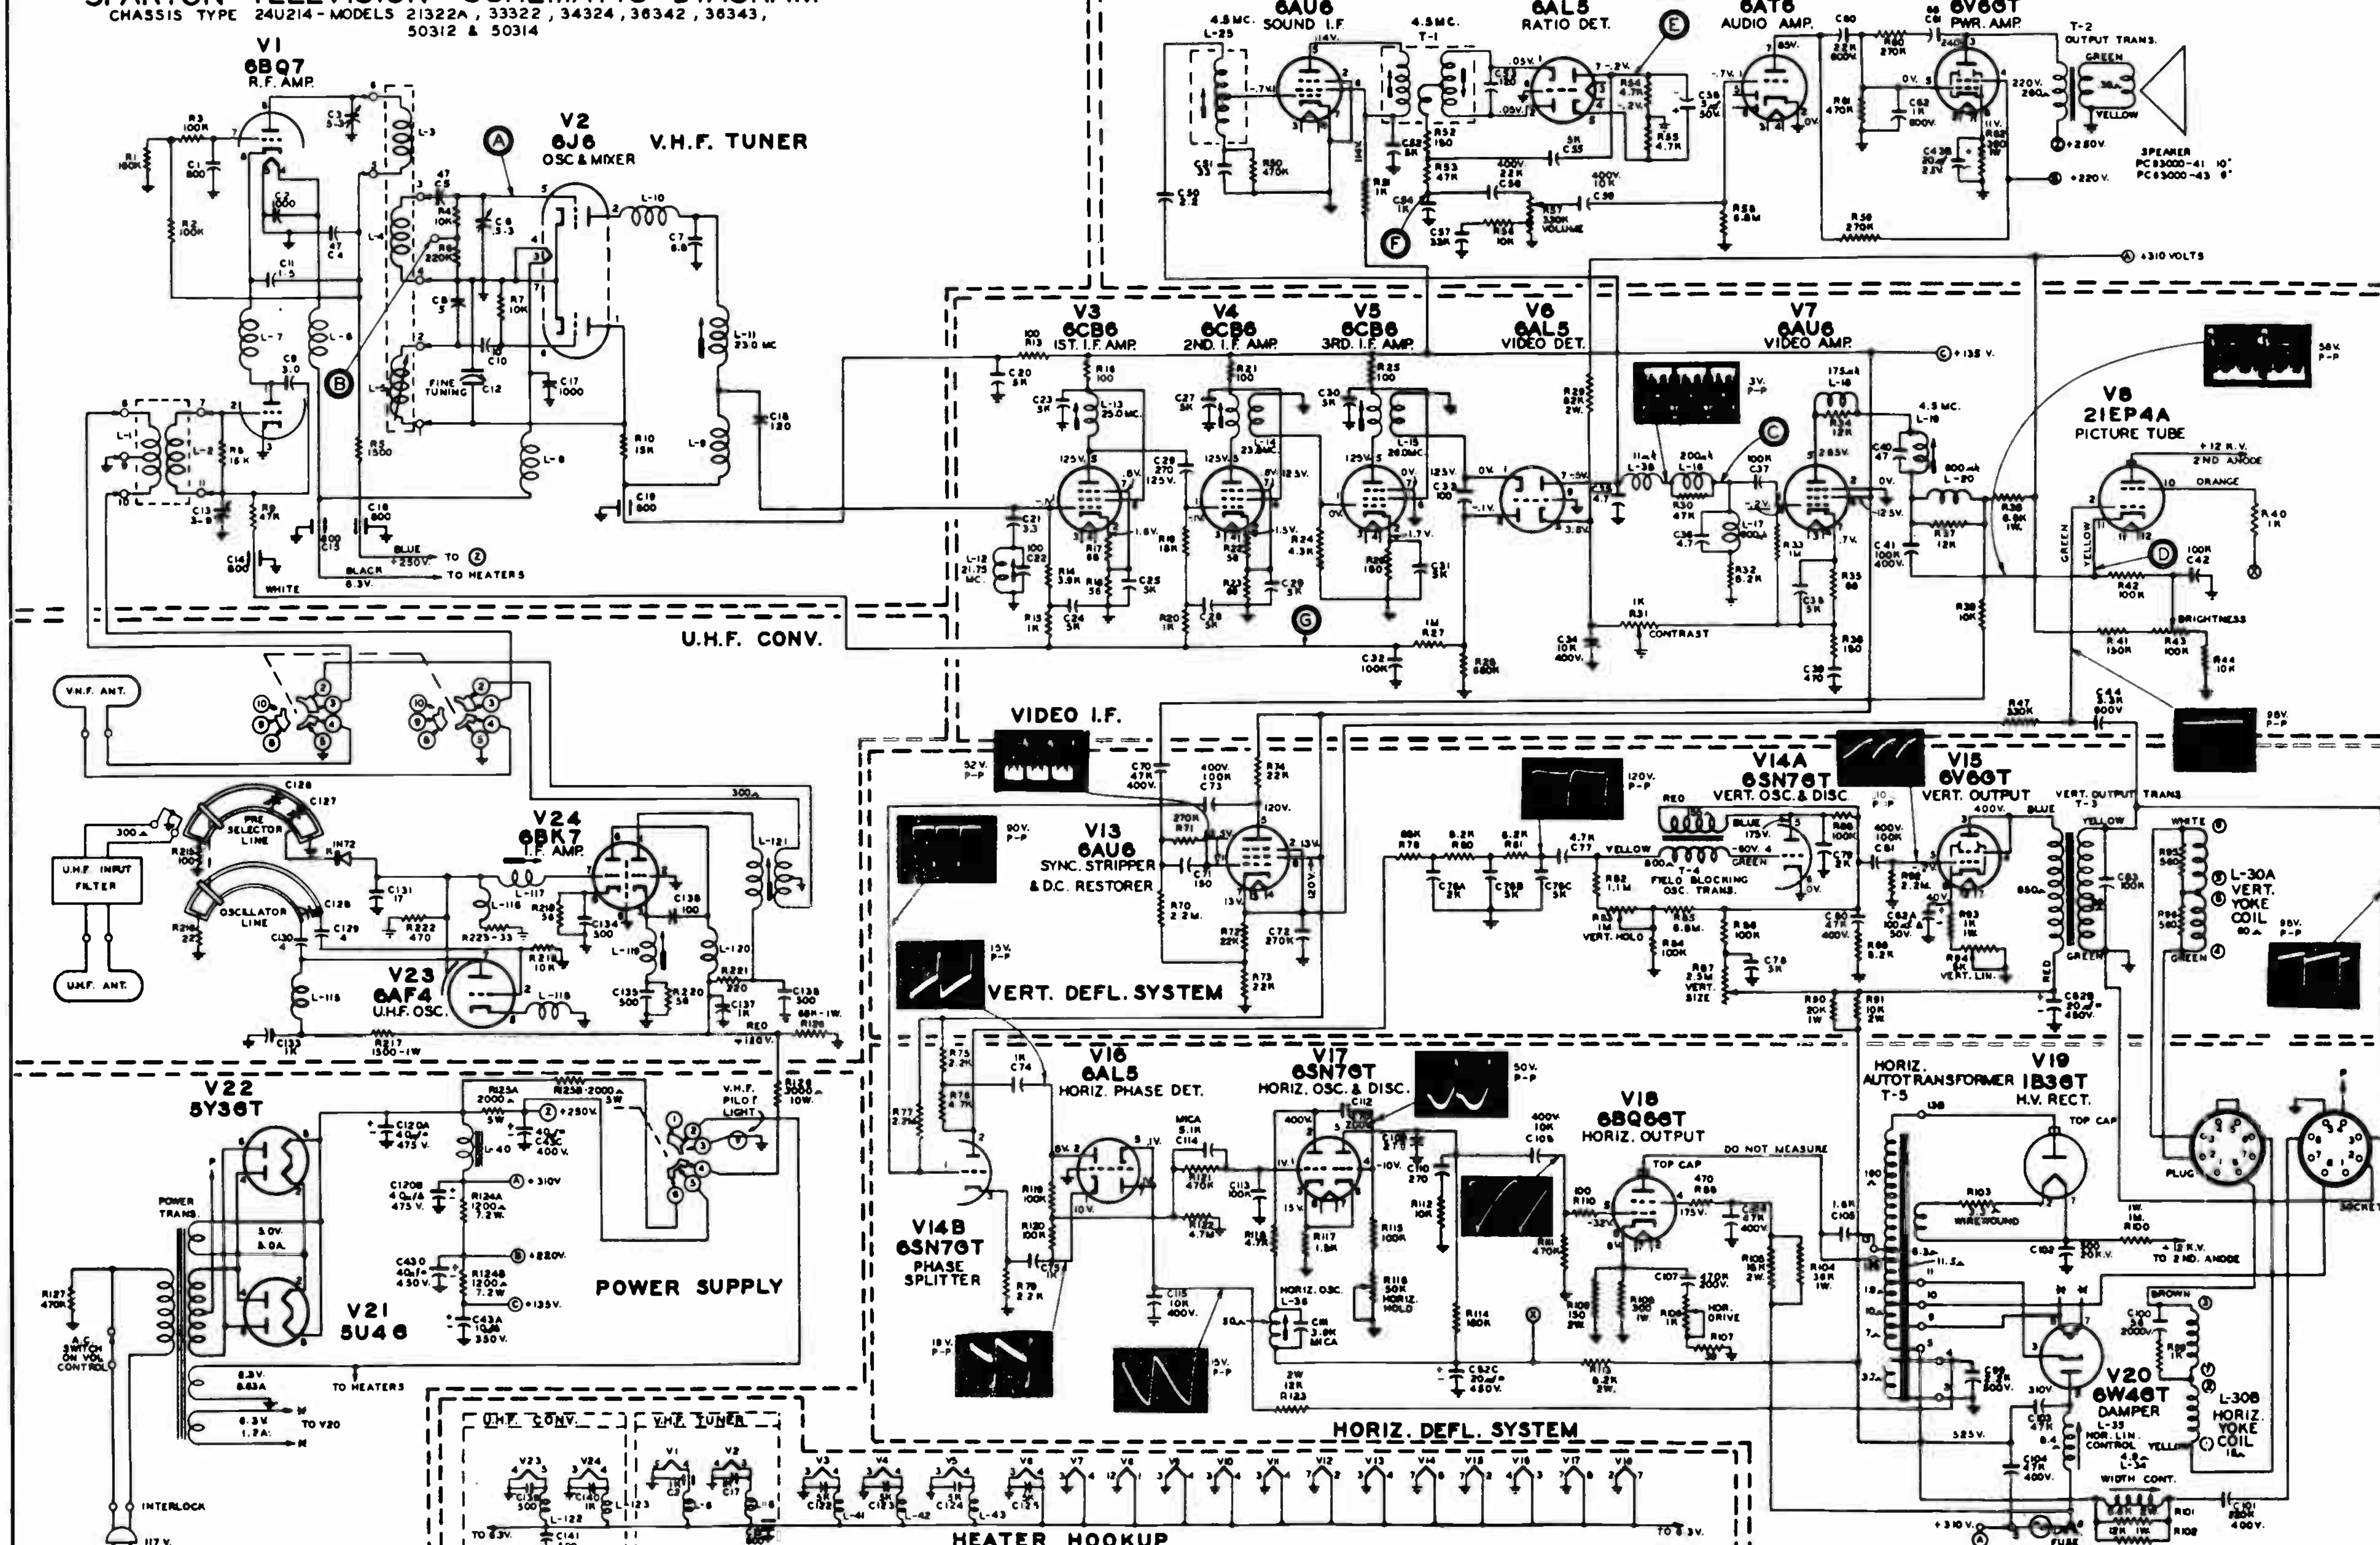
1. With the size controls reduce the size of the raster until the sides are visible.

2. Adjust the corrector magnets for straightest possible raster edges. Restore the picture to normal size.

Misadjustment of the corrector magnets may cause barreling, keystoning and/or poor linearity.

SPARTON TELEVISION SCHEMATIC DIAGRAM

CHASSIS TYPE 24U214 - MODELS 21322A, 33322, 34324, 36342, 36343, 50312 & 50314



NOTE:
The points indicated by the letters A,B,C,D,E,F, & G are the alignment test points referred to in the alignment procedure.
(A) Pin 5 of V2 (6J6) Osc. & Mixer Tube.
Apply signals here for spot I.F. Alignment or I.F. Sweep
(B) Apply minus 3 volts through 220K Ohms to test terminal, located between the tubes on top of R.F. Tuner. (See Suggested input adapter.)
(C) Diode Load Resistor
Read D.C. output here for spot I.F. Alignment
Connect scope here for visual I.F. Alignment.
(D) Cathode of Picture tube
Read A.C. output here for overall sensitivity
Read 4.5 Mc output here for overall sensitivity.
(E) Ratio Detector Output
Read D.C. here for alignment of sound take-off trap, inter-stage sound.
(F) Ratio Detector Balanced output
Read D.C. here for alignement of secondary of ratio det. trans.
(G) A.G.C. line
Apply 4.5 volts bias here for visual check of I.F. or overall with oscilloscope.

Note: Adjustment of Contrast, Brightness, Focus, Vertical Size, Horizontal Hold and Horizontal Drive Controls will change voltages from those indicated in their respective associated circuits.

VOLTAGE TEST SPECIFICATIONS:
1. All Voltages & Current measured with VHF - UHF Switch in VHF position.
2. Channel Switch Position - Channel 2-
3. Line Voltage - 117 Volts A.C. No signal input applied to set.
4. Brightness & Contrast Control Position - Maximum Clockwise.
5. Horizontal & Vertical Hold Control Positions - Set correct position to lock in picture.
6. Width Control Position - Set for normal size.
7. Vertical Size & Linearity Control Position - Set for normal size best linearity.
8. Focus Control Position - Properly focused.
9. Volume Control & Tone Control Position - Maximum Counter-Clockwise.
10. Instrument (Meter) Used - (VTVM) Vacuum Tube Volt Meter.
11. Unless otherwise designated all voltages measured in respect to Chassis Ground.

BRIEF ELECTRICAL SPECIFICATIONS

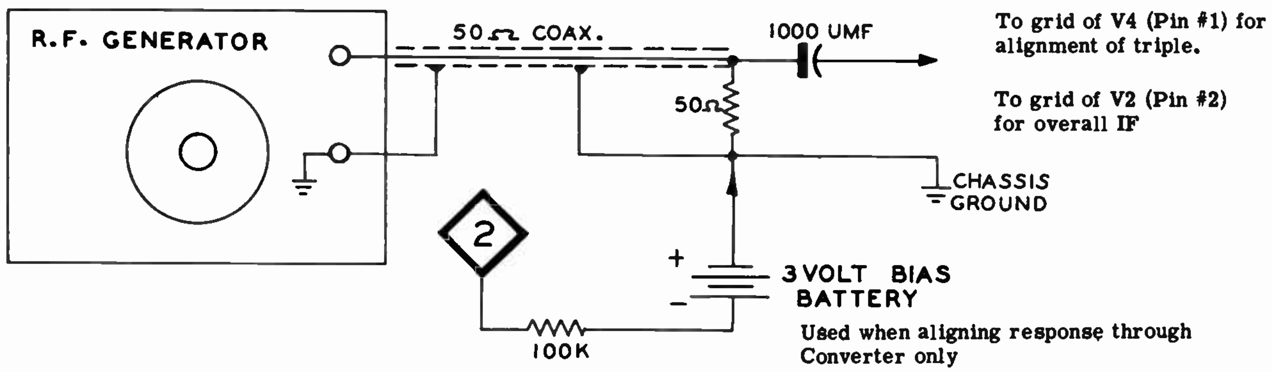
Power Supply	105-125 Volts AC 60 Cycle only
Power Consumption	230 Watts
Audio Power Output	Maximum 2.5 Watts *
Tuning Range	T. V. Channels 2 thru 83
Antenna Input Impedance	300 Ohms Balanced
Intermediate Frequencies	Picture 45.75 Mc.
Intercarrier Sound System	4.5 Mc.
Voice Coil Impedance	3.2 Ohms at 400 Cycles

*Total harmonic distortion 8% at 400 cycles.

SUGGESTED ALIGNMENT PROCEDURE

Since the picture I. F. system in the receiver consists of a flat staggered triple (V4, V5, &V6) preceded by a double tuned, over coupled converter stage, it is necessary to align the picture I. F. in two steps. First, the triple is aligned for a flat overall response from the first picture I. F. grid. Second, the over coupled converter stage is aligned against the flat response of the triple to produce the desired I. F. response characteristic.

Picture I. F. Alignment -
Conditions:
- A. V7 (6AU6) tube removed from socket
- B. -4.5 volts applied across C48, Test Point #7
- C. Tuner set to Channel #12 or some other high channel
- D. Adjust all other controls for normal picture
- E. Signals applied to grid of V4 (1st Pix I. F.) thru suitable adapter (Fig. #1).
- F. Connect V.T.V.M. across diode load R48 using low volts DC scale, Test Point #3



Note: When applying signal to V2, remove 6U8 (converter) and wrap small insulated wire around Pin #2. Strip enough to go around and make contact on Pin #2. Replace tube.

FIG. #1

ALIGNMENT OF TRIPLE

Step 1. Unmodulated generator set at 43.8 Mc then adjust T1 for maximum meter indication on V.T.V.M.

2. Unmodulated generator set at 45 Mc adjust L32A (bottom) for maximum meter indication on V.T.V.M.

3. Unmodulated generator set at 42.7 Mc adjust L31A (bottom) for maximum meter indication on V.T.V.M.

4. Unmodulated generator set at 47.25 Mc adjust L32B (top) for minimum dip indication on V.T.V.M.

5. Unmodulated generator set at 41.25 Mc adjust L31B (top) for minimum dip indication on V.T.V.M.

6. Remove V.T.V.M. and connect scope to Test Point #3. Adjust generator to sweep 40 to 50 Mc. Touch up T1, L32A, L31A for flat response from 42.7 Mc to 45.0 Mc. Fig. #3.

7. Inject marker signal at 41.25 Mc and 47.25 Mc as recommended by manufacturer of R. F. Sweep generator used. Check alignment of traps L31B and L32B. This completes alignment of triple.

OVERALL ALIGNMENT

Step 1. Apply signal to grid of V2 (converter) thru suitable adapter. Fig. #1. (For overall response curve check).

2. Apply -3 volts bias to tuner, Test Point #2 thru 100K resistor (see Fig. #1). (-4.5 volts remains connected to Point #7).

3. Remove scope and connect V.T.V.M. to Test Point #3.

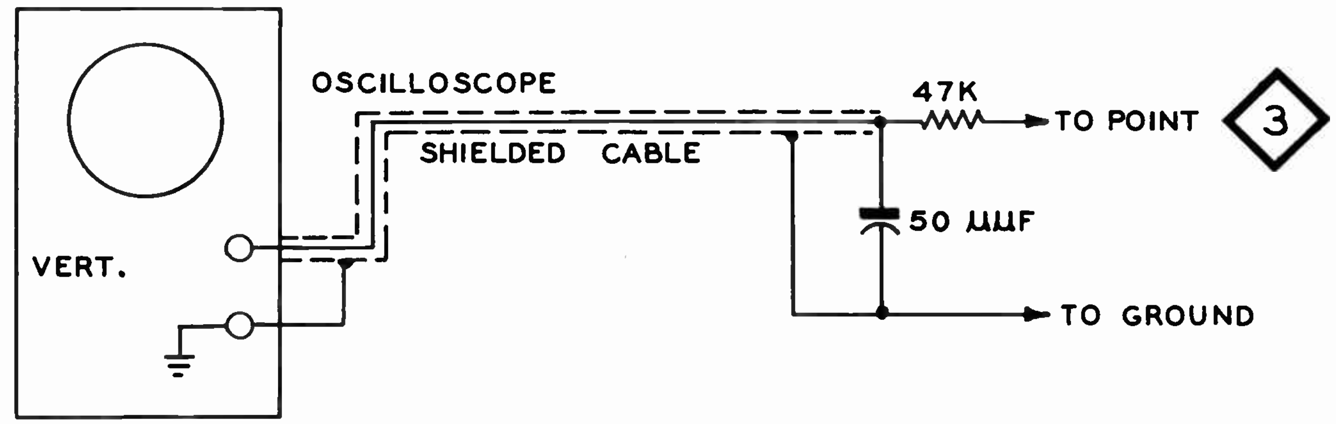


FIG. #2

4. Unmodulated generator set at 41.25 Mc adjust L30B for minimum dip indication of V.T.V.M.

5. Detune L14 on tuner to high frequency limit. (Core out of coil-maximum counter-clockwise)

6. Unmodulated generator set at 43.8 Mc align L30A (bottom) for maximum meter indication on V.T.V.M.

7. Shunt L30A with 1 K resistor.

8. Unmodulated generator set at 43.8 Mc align L14 (Tuner output) for maximum meter indication on V.T.V.M.

9. Adjust generator to sweep from 40 to 50 Mc. Observe the bandwidth, relative position of pix carrier, and flatness of the overall I. F. response curve. Fig. #3. If necessary, slightly vary the tuning of L14 and L30A for flat response between 42.7 Mc and 45.0 Mc. Picture carrier (45.75 Mc) should be down 50%.

10. Inject markers at 41.25 Mc and 47.25 Mc, check alignment of traps (over swept curve) L31B (top) and L32B (top).

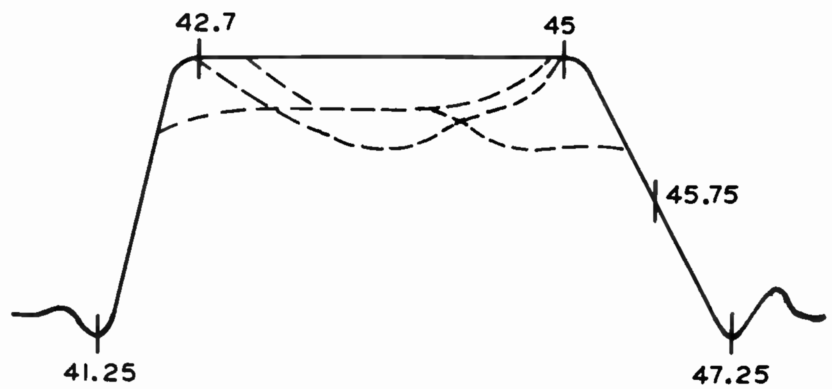

FIG. #3 IDEAL I. F. RESPONSE WITH PERMISSABLE VARIATIONS

Sound I.F. Alignment:

A. Connect R. F. Signal Generator set at 4.5 Mc between the anode of the crystal video detector and chassis ground.

B. Connect V.T.V.M. across R77, Test Point #5 (use -10V scale).

C. Adjust L45 for maximum indication.

D. Align T2 primary (bottom) and secondary (top) for maximum indication.

E. Align T3 (bottom only) primary for maximum indication.

F. Connect V.T.V.M. across C85, Test Point #6.

G. Using lowest DC scale, adjust T3 Ratio Detector secondary (top) to zero output, as indicated by V.T.V.M.

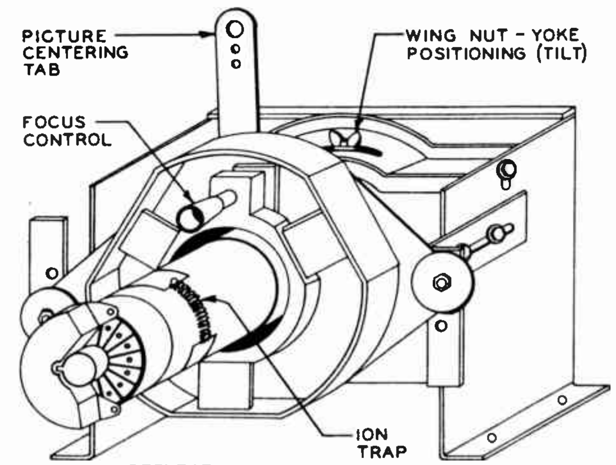
Note: It is possible to produce a positive or negative indication by varying this adjustment. The point where the voltage swings from positive to negative is zero output and indicates correct alignment. (If Ratio Detector is seriously misaligned, repeat alignment of primary and secondary until no improvement can be made).

H. Using an R. F. Probe, connect V.T.V.M. across R57, Test Point #4.

I. Adjust L38 (4.5 trap) for minimum dip indication.

General Note: It may be possible to find two positions at which tuning slugs resonate coils being aligned. In the case of all multiple winding coils only one position, the one with the tuning slug nearest the end of the coil form, is correct. The other slug position will change coupling between windings and cause improper circuit operation.

INSTALLATION INSTRUCTIONS



DEFLECTION YOKE AND FOCUS UNIT ASSEMBLY

Ion Trap and Focus

THIS ADJUSTMENT IS IMPORTANT TO LIFE OF PICTURE TUBE AND SHOULD BE MADE ON EVERY SET AS FOLLOWS:

1. With brightness control set for low brilliance, move trap forward or backward and at the same time rotate until maximum brightness of raster is obtained.
2. Readjust raster brilliance to normal.
3. Adjust focus control until best picture detail is observed over entire face of picture tube.
4. Readjust ion trap once more for maximum brilliance.

THERE MAY BE TWO LOCATIONS WHERE ION TRAP WILL PRODUCE BRILLIANCE ON CRT; USE ONLY THE POSITION NEAR THE CRT BASE SOCKET; NEVER USE THE FORWARD POSITION

Deflection Yoke

1. The yoke must be held firmly against the flare of CRT.
2. To level picture, loosen and adjust wing nut on yoke.

Centering Raster

1. Center with magnet control tab on focus unit.
2. Readjust ion trap for maximum brilliance.

Picture Symmetry

Sometimes linearity and corresponding size controls may have to be re-adjusted. A test pattern is most practical for these adjustments which consist of HEIGHT, VERT LIN., WIDTH, and HOR LIN.

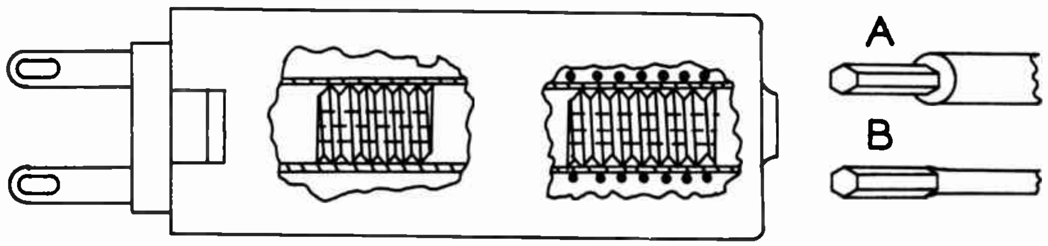
Peak Performance Control

1. With receiver operating, set the peak performance control to extreme counter-clockwise position (fringe area).
2. Tune in strongest signal in your area.
3. Set contrast to maximum (extreme clockwise position).
4. If picture appears normal leave control set in fringe position.
5. If picture shows any signs ov overload, rotate control clockwise towards local position until picture becomes normal.
6. Do not turn control toward local position any more than necessary.

Horizontal Oscillator (Make only when necessary)

1. Pull 6AL5 (phase detector).
2. Set hor. hold to center of range.
3. Shunt L47 with .1 MFD 400V condenser from test point on high voltage transformer to ground.
4. Adjust R133 until picture floats in horizontal sync.
5. Remove .1 condenser and adjust L47 until picture floats in horizontal sync.
6. Replace 6AL5.
7. Pull-in should occur when 2 or 3 diagonal bars are observed as hor. hold is rotated towards center of range.

MISCELLANEOUS SERVICE HINTS



CAUTION: DOUBLE TUNED I. F. COIL ASSEMBLY PERMITS ADJ. OF BOTH SLUGS FROM TOP OR BOTTOM OF CAN.

A. This tool end permits adj. of top slug (from top) and bottom slug (from bottom).
B. This tool end permits adj. of both from either end since it will pass on thru the tuning slug.

I.F. Tube Replacement
Due to the fundamental characteristics of 45Mc I.F. circuits we would like to express a word of caution. To minimize any detuning effects caused by differences in interelectrode capacities it is suggested that several tubes of same type and make are tried to obtain original quality picture.

Spooks.
The damper-tube current rises from zero to a maximum of 300 to 400 milliamperes in 1/10 microsecond or less. A wave form with such a short rise time is certain to contain many harmonics (of 15,750 cycles). If these harmonics are allowed to radiate and be picked up by the RF and IF circuits they will there be amplified, detected, and applied to picture tube, resulting in a narrow vertical line very close to the left edge of raster. Since the damper is the principal offender, the SPARTON "Dyna-Volt" chassis incorporates RF chokes in cathode and plate to minimize the "spook". Since the energy in each higher harmonic becomes progressively less, the spook is most noticable in the lower VHF channels.

TUNER DISASSEMBLY:

CAUTION: TUNER MUST BE IN THE VHF POSITION WHEN REMOVING TURRET TO PREVENT DAMAGE TO UHF DECADE STRIPS. WHEN REPLACING COVER, NOTE POSITION OF PIGTAIL LEADS TO ROCKER BAR SO AS NOT TO PINCH OR SHEAR WIRES UNDER COVER.

FOCUS ADJUSTMENTS:

Under certain conditions the focus may be improved by adjusting focus unit mounting brackets to locate the focus unit approximately 4-1/4 to 4-3/8 inches from the base of the picture tube (measured from the end of center locating key of duodecal base). With the ion trap set as previously described, adjust the focus control for best overall picture detail.

CAUTION: READJUST ION TRAP AFTER ALL ADJUSTMENTS OF FOCUS.

Replacing Crystal Video Detector:

If replacement of crystal becomes necessary, be sure to prevent exposing crystal to excessive heat. Holding crystal lead with long nose pliers placed between crystal and soldering lug will help conduct heat away from crystal.

Horizontal Drive Adjustments:

With 125V A.C. line adjust vertical deflection for 10% over-scan with best linearity, then adjust horizontal linearity control for best linearity and follow with adjustment of horizontal width control for maximum width. Adjust horizontal hold control to its maximum counter-clockwise position. Decrease horizontal drive control resistance until the compression near the center of the picture disappears. Reset horizontal hold control to its mid-position.

Adjustment of Anti-Pin Cushion Corrector Magnets:

These magnets are mounted on the deflection coil mounting bracket and can be moved in and out by first loosening the mounting screws. Under certain conditions it may be necessary to form, or bend, the flexible arms which support the magnets. The above adjustment is made at the factory and should not require re-adjustment unless the original position of the magnets is accidently disturbed. Adjustment can be made in the following manner:

1. With the size controls, reduce the size of the raster until the sides are visible.
2. Adjust the corrector magnets for straightest possible raster edges. Restore the picture to normal size.

Cleaning Picture Tube Face:

Remove three screws in the decorative bottom rail and carefully lower safety glass from cabinet. Observe great care while cleaning picture tube face, especially when replacing safety glass. A sharp blow on face of exposed tube could result in personal injury.

NOTE: Relocation of Horizontal Oscillator Tank Coil, L-47.

The accessibility of the adjustment for the L47 has been sacrificed in favor of improved set performance by relocating the L47. The new position is indicated on chassis top and bottom view diagrams.

NOTE:
The points indicated by the numbers 1 2 3 4 5 6 & 7 are the alignment test points referred to in the alignment procedure.
1. Pin #2 of V2 (6U8) Osc. & Mixer Tube.
   Apply signals for spot and sweep alignment of converter stage.
2. For Tuner alignment only.
3. Diode load resistor
   Read D.C. output here for spot I.F. alignment
   Connect scope here for visual I.F. alignment
4. Cathode of Picture Tube
   Read A.C. output here for overall sensitivity
   Connect VTVM for 4.5 Mc trap alignment
5. Ratio Detector Output
   Read D.C. here for alignment of sound take-off trap, inter-stage sound I.F. transformer and primary of ratio detector transformer
6. Ratio Detector Balanced Output
   Read D.C. here for alignment of secondary of ratio detector trans.
7. A.G.C. Line
   Apply 4.5 volts bias here for visual check of I.F. overall with oscilloscope

NOTE: ADJUSTMENT OF CONTRAST, BRIGHTNESS, VERTICAL SIZE, HORIZONTAL HOLD AND HORIZONTAL DRIVE CONTROLS WILL CHANGE VOLTAGES FROM THOSE INDICATED IN THEIR RESPECTIVE ASSOCIATED CIRCUITS.

WAVE FORMS TAKEN WITH CONTRAST CONTROL ADJUSTED FOR 80V. P to P at PIN 11 of V9.

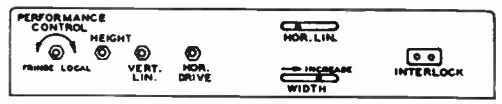
DEFECTIVE MATERIAL WILL NOT BE ACCEPTED FOR REPLACEMENT NO CHARGE UNLESS WITHIN WARRANTY. SPARTON WILL NOT CREDIT ANY PARTS NOT OUR MAKE, ORIGIN, OR PURCHASED LOCALLY FROM AN OUTSIDE SOURCE. CREDIT WILL ONLY BE ISSUED ON PARTS ORDERED AS ADVANCE REPLACEMENT. ALL OTHER IN WARRANTY PARTS RETURNED TO THE FACTORY WILL BE REPLACED. ALL MATERIAL SUBJECT TO FACTORY COUNT AND INSPECTION. TRANSPORTATION CHARGES MUST BE FULLY PREPAID IN ALL CASES.



CHASSIS BACK VIEW

VOLTAGE TEST SPECIFICATIONS:
1. ALL VOLTAGES & CURRENT MEASURED IN VHF POSITION - CHANNEL 2.
2. LINE VOLTAGE - 117 VOLTS A.C. NO SIGNAL INPUT APPLIED TO SET.
3. BRIGHTNESS & CONTRAST CONTROL POSITION - MAXIMUM CLOCKWISE.
4. HORIZONTAL & VERTICAL HOLD CONTROL POSITIONS - SET CORRECT POSITION TO LO PICTURE.
5. WIDTH CONTROL POSITION - SET FOR NORMAL SIZE.
6. VERTICAL SIZE & LINEARITY CONTROL POSITION - SET FOR NORMAL SIZE BEST LINE.
7. VOLUME CONTROL & TONE CONTROL POSITION - MAXIMUM COUNTER-CLOCKWISE.
8. INSTRUMENT (METER) USED - (VTVM) VACUUM TUBE VOLT METER.
9. UNLESS OTHERWISE DESIGNATED ALL VOLTAGES MEASURED IN RESPECT TO CHASSIS GROUND.

GENERAL

The *Standard Tuner* is the "front-end" in millions of television receivers. It is a vacuum-tube frequency selecting device whereby the television receiver may be selectively "tuned" to any one of twelve available television channels.

Electrically, the tuner consists of a tuned r-f amplifier stage with resonant grid and plate circuits, a tuned mixer stage, and a variable frequency oscillator. The input circuit of the tuner accepts the modulated picture and sound carriers; the output circuit delivers individual or common sound and picture i-f output for further processing in the receiver. The input circuit of the tuner is designed for use with balanced 300-ohm transmission lines. The mixer output circuits are designed to supply i-f signals between 19 and 26 mc in one group of tuners, and from 40 to 46 mc in the remaining group of tuners. Both sets of signal frequencies are subject to specific selection to suit different designs of receivers.

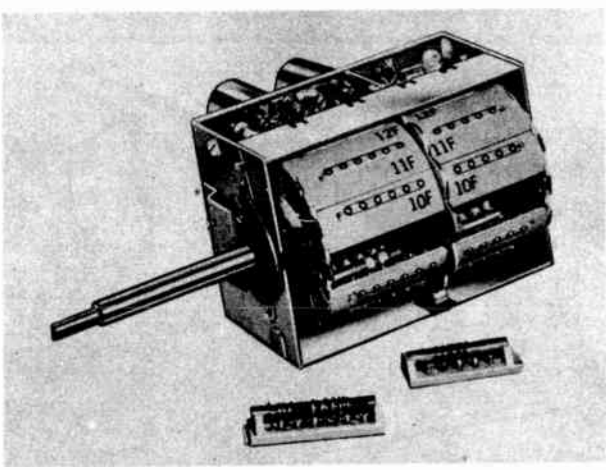


Fig. 1. A view of the turret and a matched pair of channel-9 coil strips.

Selection of television channel frequencies is accomplished by changing the position of a rotatable turret which carries the coils for the tuned circuits. The resonant coils for each television channel are divided between two mounting strips which are spring attached to the turret. One strip carries the antenna coils and grid coil for the r-f stage; the other strip mounts the tuned plate coil for the r-f stage, the grid coil for the mixer, and the oscillator coil. The remaining circuit components are fixed in position on the tuner chassis. A view showing the turret and a "matched-pair" of coil strips for television channel 9, removed from their places on the turret, appears in Fig. 1. The entire mechanical arrangement gives rise to the term "turret tuner" as identification of the *Standard Tuner.*

Rotating the turret by means of the station selector shaft connects the appropriate coils to the tubes and associated circuitry, by placing the coil contacts in electrical junction with a set of fixed position contact fingers which are connected to the tubes and other circuit elements. The contact finger mounting is illustrated in Fig. 2.

Eight basic types of the *Standard Tuner* have been supplied to the TV receiver manufacturing industry. Each bears a type number indicative of the basic tuner design series. These tuners differ in a number of ways, among these being the type of tube used for the r-f amplifier and the circuitry. The first four types use a pentode r-f amplifier, hence they bear the *general* identification of "pentode" tuners. The remaining four types of tuners bear the *general* classification of "cascode" tuners because of the circuit arrangement used in their r-f amplifier stage. These four use a dual-triode r-f stage, described in complete detail under the heading of The Cascode Series of Tuners (as is the circuitry used in the pentode group).

Regardless of differences in tubes and circuitry, a general order of identifying features has been retained. Being distinctive and unique, these features enable immediate recognition of the *Standard Tuner* when encountered in commercial television receivers.

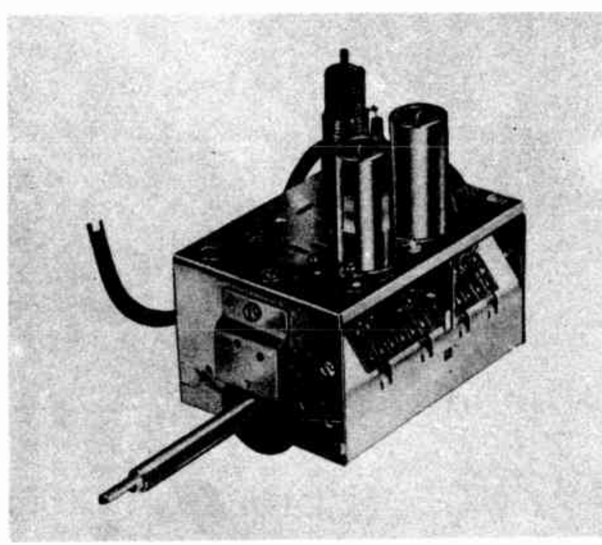

Fig. 2. Photograph showing the contact-finger mounting in an early version of the *Standard Tuner* (TV 200 series).

Identifying Features

An early version of the *Standard Tuner* is shown in Fig. 2. Specifically this is the second production (Type TV 200 series), but with few exceptions, its general physical features are identical to its predecessor, and those which followed.

The general physical outline of the device is a rectangular box, with two shielded tubes mounted on the top. Two tubes with shields of *like diameter and height* identify the entire *pentode* series of tuners. Adjacent to the tube farthest from the front wall of the tuner is the antenna input. This location is consistent in *all* models of the *Standard Tuner* and is another identification. Also mounted on top of the tuner are three, four, or five variable adjustments, as the case may be. In addition, the top of the tuner is the location for the r-f "test" point used for tuner response curve determination.

Another identifying feature is the rotatable, cam shaped, dielectric disc attached to the outer drive shaft, more appropriately identified as the "fine tuning" shaft. This disc tunes the oscillator. All versions of the *Standard Tuner,* except the very first, mount the fine tuning dielectric disc on the *outside* of the front wall. The early production of TV 100 series tuners used a circular dielectric disc for the same purpose, except that it was located *inside* the tuner, behind the front wall. In all instances, the dielectric disc moves between a "hot" stator plate and a grounded plate. This is clearly visible in the illustration.

The TV 100 series used rivet shaped contacts for the stator as well as drum contacts. The stator contacts were staked to flat, dual, cantilever springs which were in turn riveted to molded strips in the stator bracket. All other series of the *Standard Tuner* use stator contacts of flat spring stock, folded into a "kidney shaped" loop. In conjunction with the change to this "kidney spring" contact, the rivet contacts on the coil drum were raised above the greater portion of the drum circumference by small ribs along the plastic segments.

A later version of the *Standard Tuner* is shown in Fig. 3. It is representative of the entire *cascode* group. One distinctive feature added to the others enables immediate recognition of the cascode series: a *wider* and *higher* tube shield for the r-f stage is used on the tube nearest the antenna input than for the mixer-oscillator tube. When the *Standard Tuner* uses differently dimensioned tubes (and shields) it is a cascode tuner; when it uses similarly dimensioned tubes and shields it is a pentode tuner.

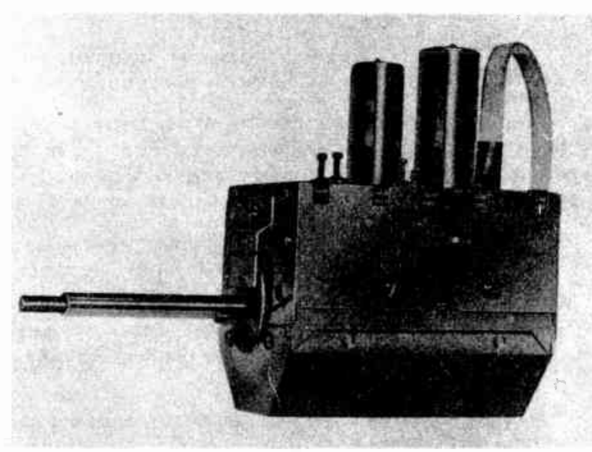

Fig. 3. Later version of the *Standard Tuner* which is representative of the cascode group.

A feature common to all cascode tuners and pentode tuners after the TV 200 series, is complete shielding. Shielding the bottom as well as the contact finger strip minimizes radiation from the tuner. The other identifying features are the same as previously described in connection with Fig. 2.

Attention is called to possible departures from the appearance of the top of the *Standard Tuners* shown in Figs. 2 and 3. These may be encountered in television receivers. Frequently the set manufacturers elect to include special traps or even the first video i-f transformer in the tuner. These components are usually, though not always, mounted on the top of the tuner, consequently modifying its physical outline. They do not, however, alter the general identifying features as described here. Hence ease of recognition of the Standard Coil product is not reduced.

An exploded view of a typical *Standard Tuner* is shown in Fig. 4. The numbers refer to the part's nomenclature. The mechanical design contributes to the attainment of a number of desirable electrical features, as well as convenient accessibility and disassembly. The underside of the chassis is divided into two compartments by the shield (22). The turret is removable as a unit. When set to a specific television channel, the turret is held firmly in place by means of the spring (8) pressure exerted on a detent roller (7), which is in firm contact with the scalloped-edged detent disc. This disc is seen protruding from the center of the turret. The detent roller spring is another positive identification of the *Standard Tuner.*

The contact finger bracket (21) is shown in position, and also removed from the unit. The lugs at the top of the contact bracket are the connecting points for the circuit components (the capacitors and resistors). Removing the side wall shield affords access to some of the components and also to the pins on the tube socket.

The coil mounting strips (41 through 52 and 53 through 64) are shown in position on the turret, and removed from the turret. These snap into position (on the turret) and are held firmly in place by spring tension. The fingers of the spring can be seen on the front side of the turret, similar spring fingers are located on the opposite end. The smaller coil strips mount the antenna transformer primary and secondary windings; the larger strips mount the r-f tube plate winding, the mixer grid winding, and the oscillator tank coil. The coils for each channel come in *matched* pairs for each television channel. They can be removed instantly from the turret by lifting the appropriate spring fingers.

The oscillator coils (one for each channel) have individual tuning slugs (25). This adjustment is accessible through the hole shown directly above the fine-tuner ground retainer spring (11) on the front wall of the tuner.

The complete listing of the parts' numbers for these mechanical items for each type of tuner is given elsewhere in this manual.

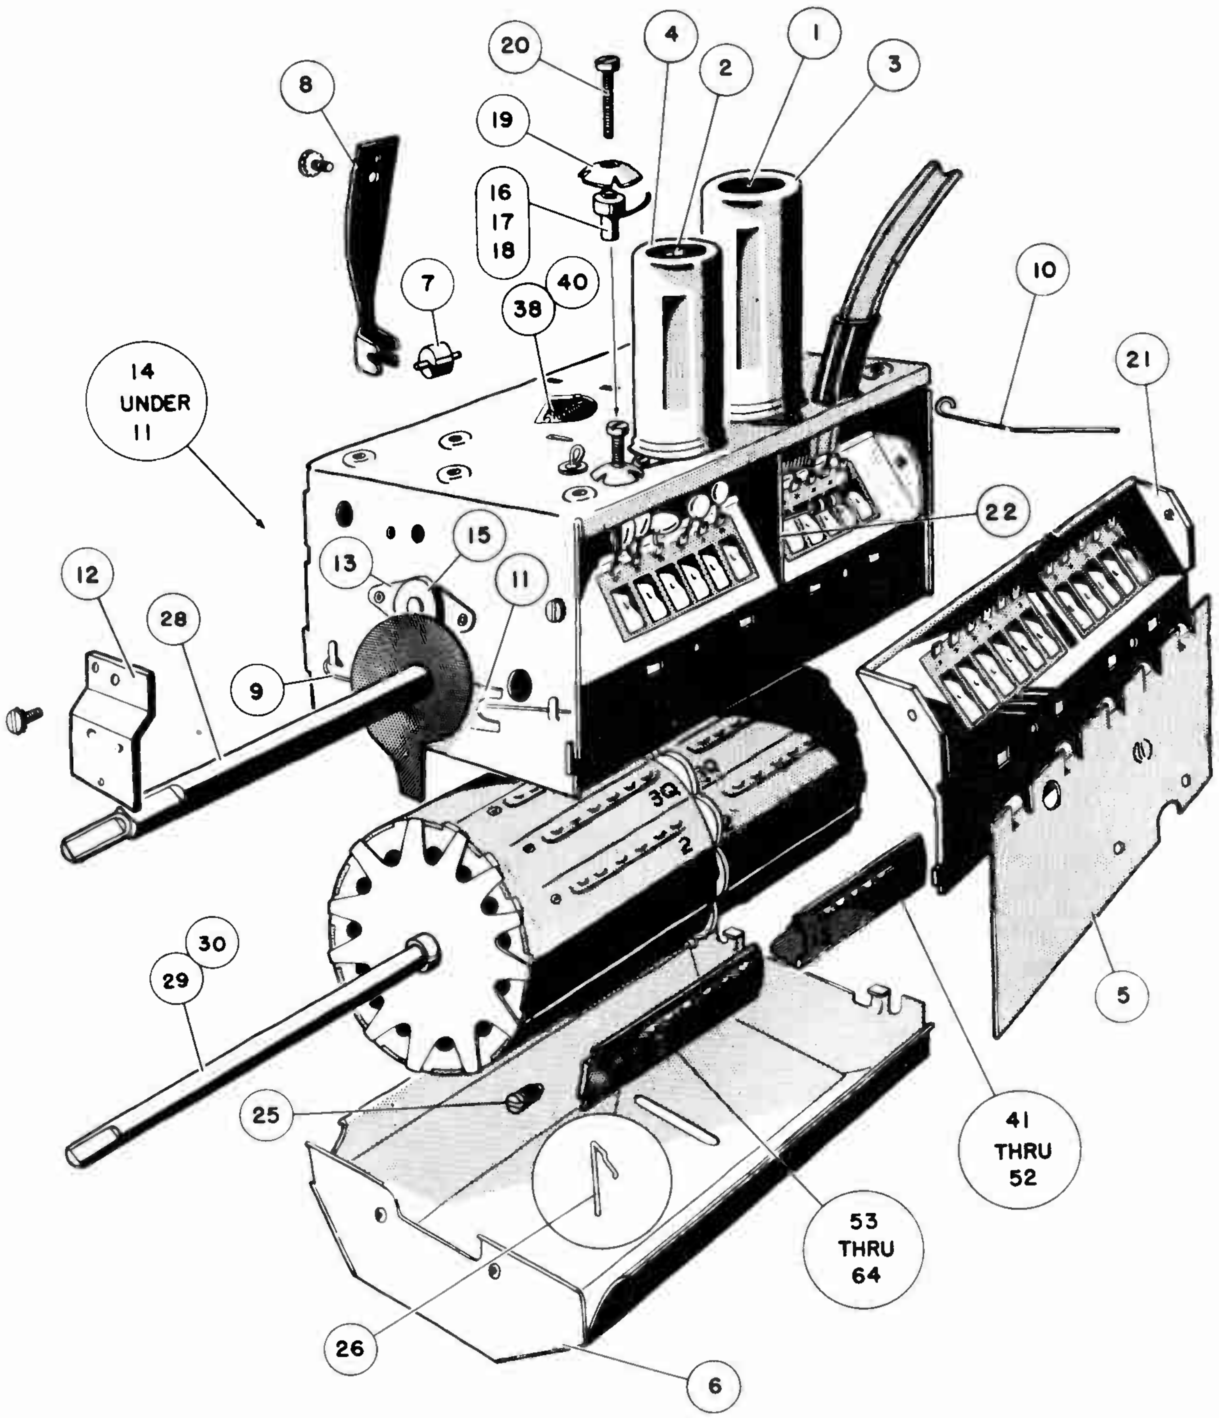

Fig. 4. Exploded view of a typical *Standard Tuner.*

Basic Type Identification Numbers

While the series numbers of the *Standard Tuner* using the pentode r-f amplifier are below 2000, the chronological sequence in which the series were introduced is as follows:

TV 100, the original turret tuner. This series ran through TV 134.

TV 200, introducing mechanical improvements in contact structure and lower torque positive detent action. This series ran through TV 353.

TV 1000, electrically the same as TV 200 but with additional shielding to make possible compliance with the oscillator radiation recommendations of the RTMA and the FCC. This series ran through TV 1357.

TV 2000, improved performance by the use of the cascode r-f amplifier. This series ran through TV 2047.

TV 3000, adaption of the TV 2000 circuitry for use with 42 mc. i-f amplifier. This series ran through TV 3005.

TV 2200, improved performance over TV 2000.

TV 3100, improved performance over TV 3000.

TV 1500, an improved performance tuner over TV 1000 but at lower cost than the cascode group.

The TV 1500, TV 2200 and TV 3100 are current models, the others having been discontinued.

Frequently the receiver manufacturer assigns his own type number to the tuner, but retains the series identification; for example 101, etc., for the basic 100 series, or 201, 230, 241, etc., for the basic 200 series, etc. It is to be noted, however, that some other manufacturers of receivers assign their own distinctive part numbers which bear no relation to the basic series numbers as used by Standard Coil. In this event recognition of the specific type is possible only by comparison of the circuitry, exclusive of output circuit components, which may have been added to the mixer-output system.

DESCRIPTION OF "PENTODE" TUNER CIRCUITS

The schematic wiring diagrams of the four pentode tuners appear in Figs. 5, 6, and 7. The circuit description given here is for the TV 100 and TV 200 series. Significant variations between this design and those which followed using a pentode for the r-f amplifier, will be stated individually in connection with the respective schematics.

Referring to Fig. 5, the antenna transformer primary (*L1*) is designed for a balanced input. The inductively-coupled secondary (*L2*) is connected to the control-grid circuit of the r-f amplifier tube. Resistor *R1* is the grid circuit loading resistor for proper bandwidth, and *C1* is the pre-set general coverage trimmer which tunes the r-f grid coil. Resistor *R2* is the decoupling resistor in the agc bus; the bus is stated as being a white lead but in some of the very early TV 100 series tuners it was a green lead. The antenna transformer coils, *L1* and *L2*, are mounted on the smaller coil strip which is located on the rear half of the turret.

The plate circuit of the r-f amplifier is tuned. The related circuit elements are the plate coil *L3*, the plate tank loading resistor *R3*, and the general coverage tuning trimmer *C3*. Resistor *R3* loads the plate coil to produce the required bandwidth on each channel; resistor *R5* and capacitor *C4* are the decoupling elements for the B+ supply. In turn, *L6* and *C17* are the r-f isolating and by-pass elements in the r-f tube heater circuit.

The r-f tube plate coil, *L3*, is inductively coupled to the mixer coil, *L4*. The mixer tube is one half of a 6J6. The mixer grid coil is tuned by the pre-set general coverage trimmer *C6*. The grid blocking and resonating capacitor is *C5* and the grid leak and grid coil loading for the mixer is the series network of *R4* and *R6*. These resistors develop the grid bias for the mixer, and the junction between them is the r-f *test* point for use in determining the response curve of the tuned r-f and mixer stages.

The oscillator is the second half of the 6J6. Coil *L5* is the tank coil and is permeability tuned by a slug and by the general coverage pre-set trimmer *C2*. The oscillator fine-tuning capacitor using the dielectric disc previously mentioned is labeled "fine tuning." The operation of this capacitor is as follows: Using two fixed plates, one "hot" and the other grounded, changing the position of the dielectric disc in relation to the two plates changes the dielectric constant of the capacitor, and so varies the capacitance. The exact amount of frequency change is about 3 mc on the high-frequency channels and about .7 mc on the low-frequency channels.

The oscillator-blocking capacitor is *C10* and the related grid leak is *R7*. The coupling from the oscillator to the mixer is through the mutual inductance between *L4* and *L5*. Capacitor *C8* is a part of the oscillator feed-back system. The heater circuit of the oscillator is isolated from the remainder of the tube system with respect to r-f coupling by the r-f choke *L8* and the bypass capacitor *C21*.

The plate circuit of the mixer may contain a variety of devices, but in the basic unit it is as shown. The r-f bypass capacitor is *C7*, the permeability tuned first i-f stage picture i-f coil is *L11*, which is in series with the fixed resonating capacitor, *C18*. The plate circuit of the mixer also contains the sound i-f trap and transformer, consisting of windings *L10* and *L12*, as well as the fixed tuning capacitor, *C14*. The secondary of this transformer, *L12*, is permeability tuned. The sound i-f transformer, which is the upright unit shown in back of the tubes in Fig. 1, is deleted from tuners used in intercarrier systems.

Summarizing the TV 100 and 200 series, the circuitry is the same; the difference between them is the contact structure.

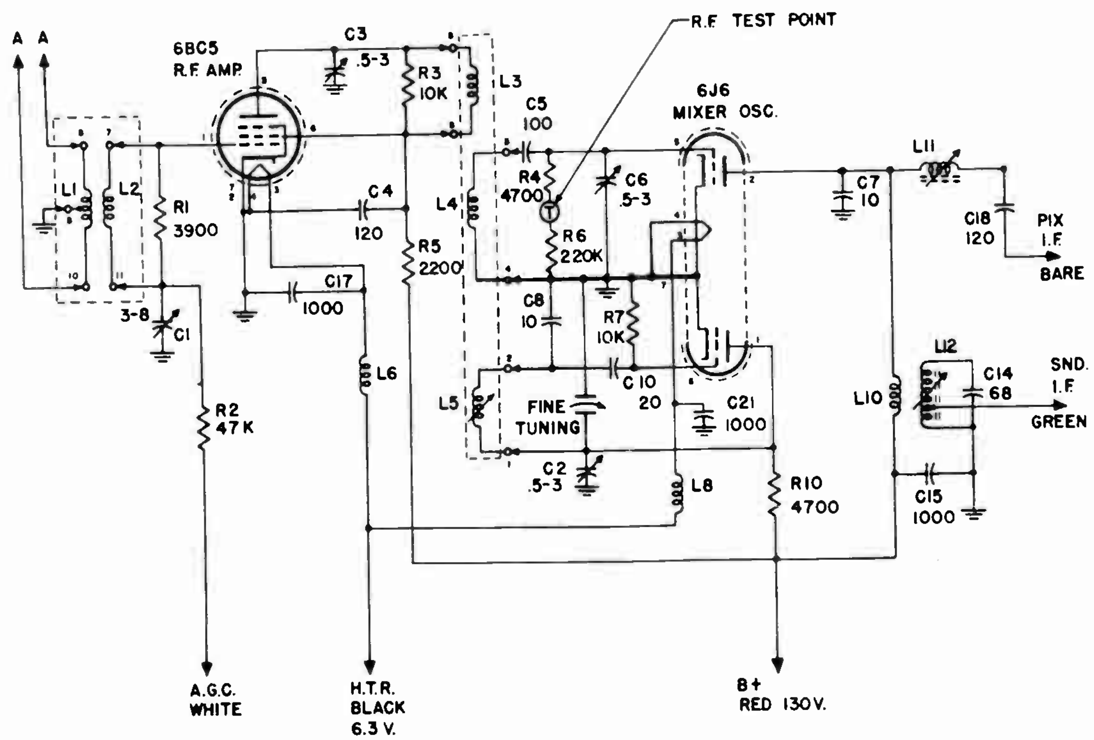

Fig. 5. Schematic diagram of the TV 100 and TV 200 series pentode tuner.

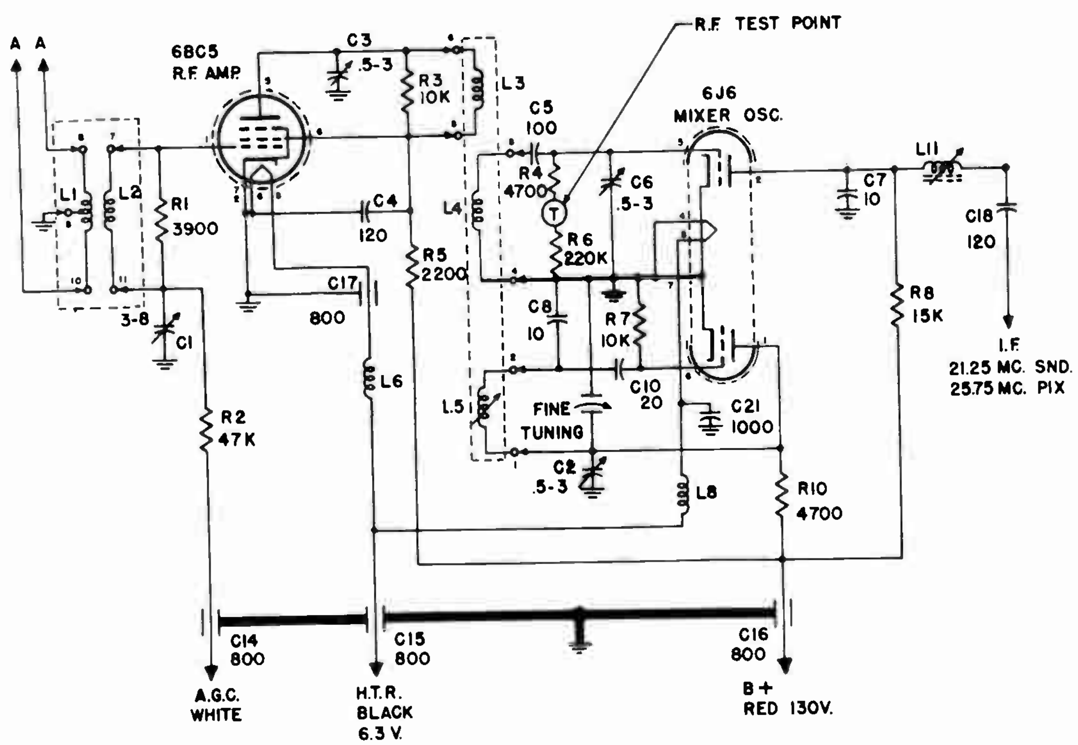

Fig. 6. Schematic diagram of the TV 1000 series pentode tuner.

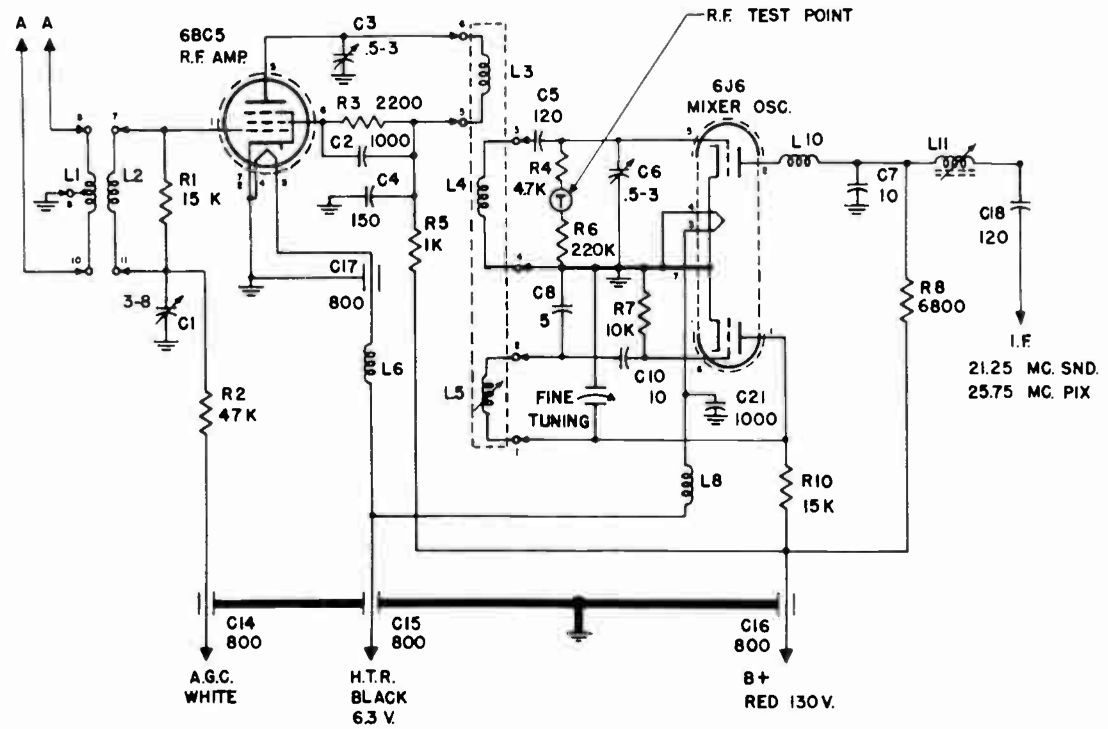

Fig. 7. Schematic diagram of the TV 1500 series pentode tuner.

TV 1000 Series. The TV 1000 series tuner schematic appears in Fig. 6. It is very much like the TV 100 and 200 series except for the sound i-f trap and transformer which has been removed, and a side and bottom cover shield have been added. These changes were made to lower the oscillator radiation to comply with the FCC-RTMA proposed limits.

The mixer plate load resistor is *R8*. The 130 volt B+ bypass capacitor was changed from 1000 $\mu\mu f$ to a low inductive feed-through type of 800 $\mu\mu f$. In addition, feed-through bypass capacitors of 800 $\mu\mu f$ each, were added to the agc bus and to the live heater wire.

TV 1500 Series. The TV 1500 series schematic appears in Fig. 7. It is like the circuit used in the TV 1000 series with a few changes in circuit constants. The r-f stage plate coil-loading resistor, *R3*, used in earlier models, was removed from across the plate coil, changed to 2200 ohms (*R3*) and placed in series with the r-f tube screen and the B+ end of the r-f plate coil. The antenna coil load resistor *R1* was also increased in value. This increased gain and reduced the noise.

The plate load resistor (*R8*) serving the mixer tube was lowered from 15000 ohms to 6800 ohms, thus increasing the plate voltage on that tube. A peaking coil, *L10*, was added in series with the output of the mixer plate system. This coil raises the gain on the higher channels by providing an inductive plate load for the mixer on channels 7 through 13. The pre-set general coverage trimmer, *C2*, was removed from the oscillator system. This reduced the number of pre-set trimmers located on top of the tuner from four to three.

THE CASCODE SERIES OF TUNERS

The cascode series of tuners introduced a new design. The four versions are shown schematically in Figs. 8, 9, 10, and 11. The major differences between these and those which preceded them is to be found in the r-f amplifier tube and circuitry.

The TV 2000 Series. The TV 2000 was the first to use dual triodes as r-f amplifiers. Later tuners are modifications of this design. The circuit change resulted in a tuner with higher gain and a lower noise factor than ever achieved before.

With reference to Fig. 8, the two halves of the dual triode (either 6BK7 or 6BQ7) comprise the two r-f amplifying stages connected in series. The antenna transformer consists of two inductively coupled windings *L1* and *L2*. The primary, *L1*, is designed for a balanced input. The inductively coupled secondary, *L2*, is connected into the grid circuit of one half (V1A) of the dual triode. The shunt resistor *R8*, 22,000 ohms, is the grid loading resistor used to provide a specific bandwidth for the antenna transformer. The trimmer *C13* is the pre-set general coverage trimmer for the antenna transformer. The resistor *R9* is the decoupling resistor in the agc line.

The capacitor *C9* of 2.2 μf, is used to neutralize the tuned r-f stage; also to offset to some degree the loading effect of the tube grid on the tuned circuit at the high frequencies.

The V1B section of the dual-triode functions as a grounded-grid amplifier. As far as signal voltages are concerned, the control grid is effectively grounded by the 800 $\mu\mu$f feed-through capacitor *C1*. The cathode (8) of the grounded grid stage is connected to the plate of the other half-triode through the coil *L7*. In effect this is series connection of the two amplifiers, and whatever signal voltage is delivered from the V1A section is applied between the cathode and control grid of the V1B section. This circuit arrangement places the cathode of V1B above the chassis by a voltage equal to the plate voltage applied to the V1A triode plate.

The coupling choke, *L7*, performs two functions in the circuit.

1. It provides an inductive load for the plate of the grounded cathode section of the cascode amplifier, thus reducing the loading of the grid circuit at higher frequencies.
2. *L7*, the plate to ground capacitance of the grounded cathode section, and the cathode to ground capacitance of the grounded-grid section form a π type impedance transforming network, resonating above the operating frequency of the amplifier. This presents the plate with a higher impedance load at the higher frequencies.

The bias for the grounded grid half-section is obtained from the voltage divider *R1-R2* which is seen connected across the high voltage B circuit. With the cathode of V1B positive because of its junction to the plate of V1A, the control grid of V1B must receive a slightly less positive potential than its cathode. The tuned plate coil *L3* is resonated by the pre-set general purpose trimmer *C3*. This is the same as in all of the previous tuners. The B+ plate supply dropping resistor is *R5* and its related bypass capacitor is *C4*. The heater bypass capacitor is *C2*, and the r-f isolating coil in the heater system of the r-f amplifiers is *L6*.

The transfer of the signal from the V1A section to the V1B section occurs in the following manner: With the cathode of the V1B section directly coupled to the plate of the V1A section, a change in effective voltage at the plate of the latter, due to the signal voltage applied to the V1A control grid, results in a corresponding change in voltage at the cathode of the former, and an opposite polarity change in voltage at the grid of V1B. Thus the swing in voltage at the plate of V1A appears as a changing signal voltage between cathode and control grid of V1B. From this point on V1B behaves as a conventional amplifier.

The general design of the mixer-oscillator section of the tuner is the same as has been described for the TV 100 through the TV 1500 pentode series tuners; hence will not be repeated here. However, some changes in the circuit constants warrant comment. The grid capacitor *C5* in the mixer circuit is 100 $\mu\mu$f. The oscillator tank capacitor *C8* is changed to 10 $\mu\mu$f because the general purpose oscillator, pre-set trimmer *C11*, is restored to the circuit. The TV 2000 series tuners, therefore, mount four trimmers on the top of the chassis.

Because individual B+ voltages are required by the r-f and mixer-oscillator stages, two B+ supply lines are used in all cascode tuners. This required the addition of an other feed-through type bypass-capacitor of 800 $\mu\mu$f; the four of them being *C14*, *C15*, *C16*, and *C17*.

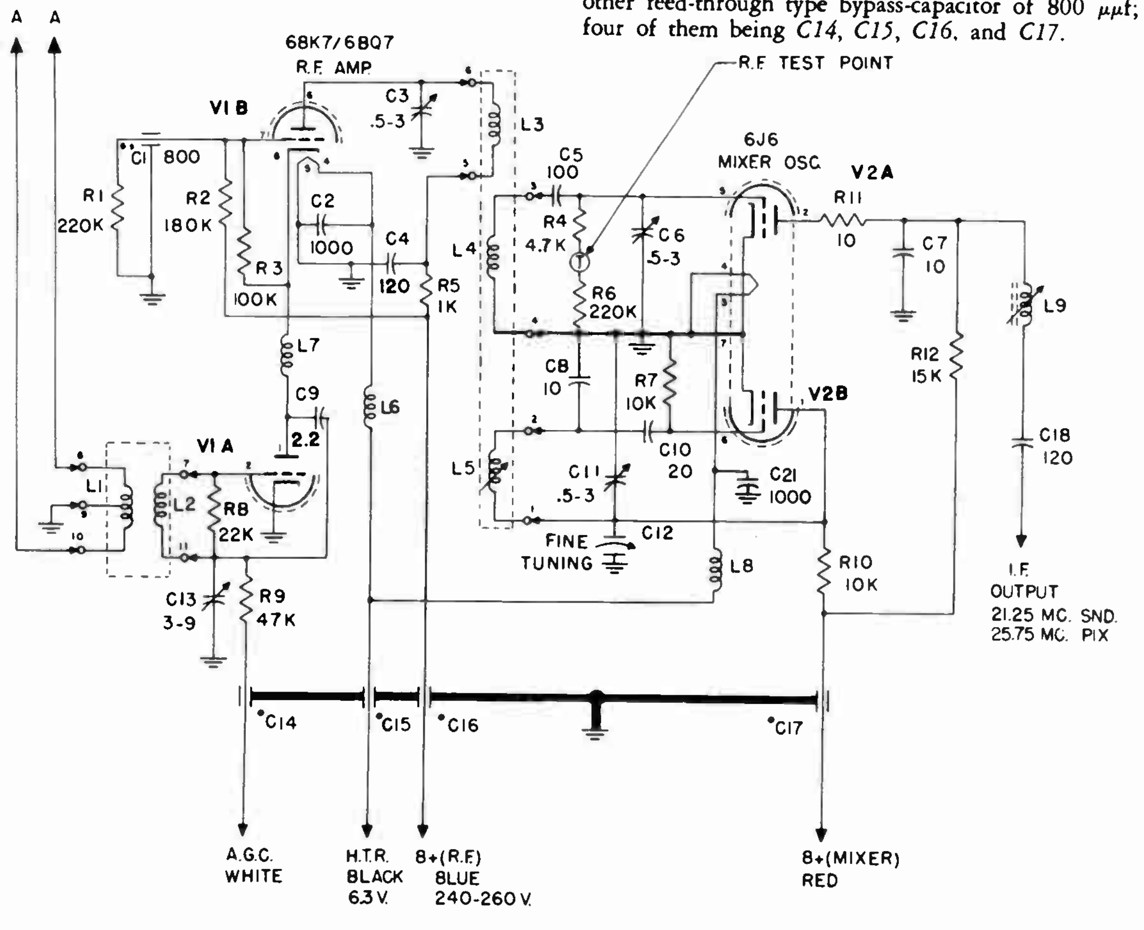

Fig. 8. Schematic diagram of the TV 2000 series cascode tuner.

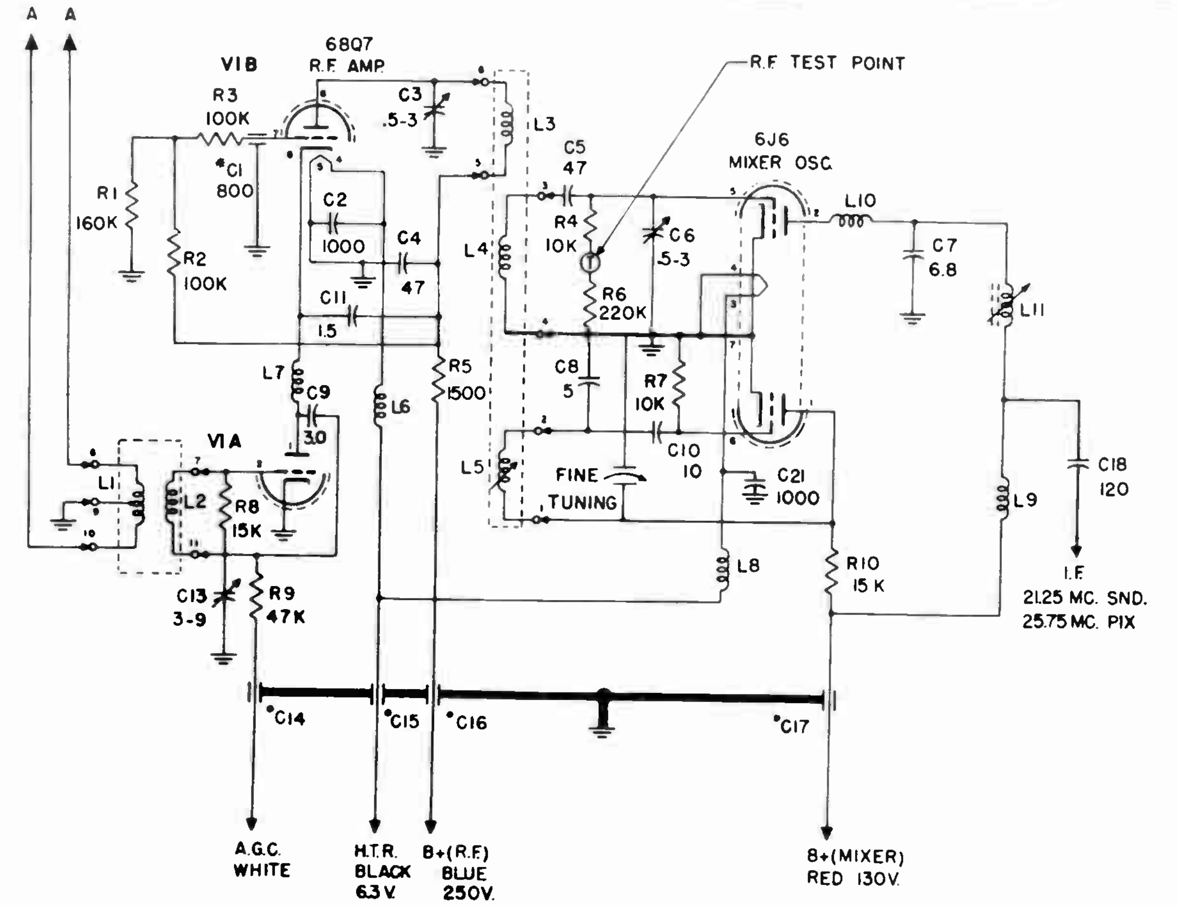

Fig. 9. Schematic diagram of the TV 2200 series cascode tuner.

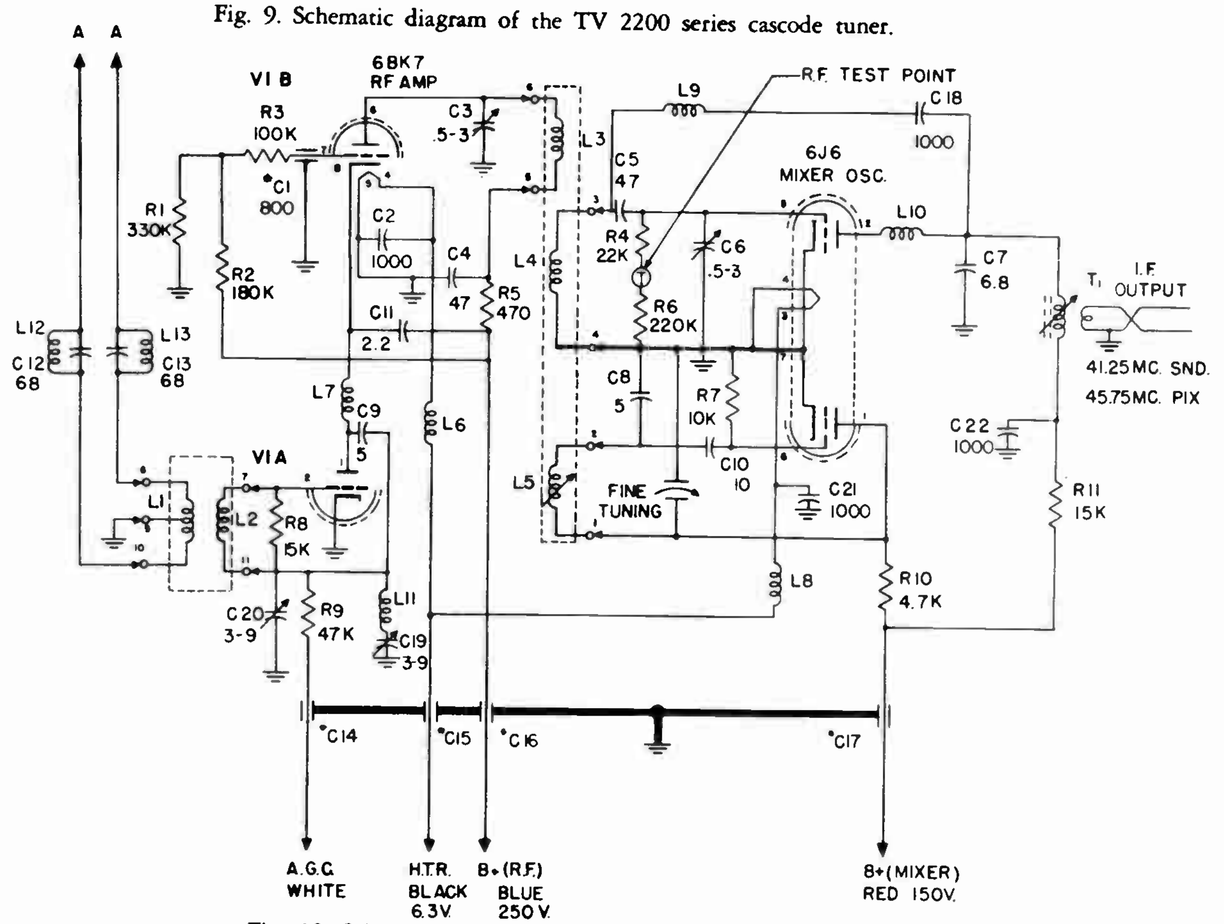

Fig. 10. Schematic diagram of the TV 3000 series cascode tuner.

The plate circuits of the mixer and oscillator systems are the same as the TV 1000 series with two exceptions: One is the addition of a resistor *R11* in series with the converter plate for i-f isolation purposes, the other is the increase in value of the oscillator plate resistor *R10* to 10,000 ohms.

TV 2200 Series. The TV 2200 series tuner schematic appears in Fig. 9. It is like the TV 2000 except for changes in circuit constants. To improve the neutralization of the r-f system, another neutralizing capacitor, *C11*, is added between the cathode of the grounded-grid amplifier and the low end of its tuned plate coil.

The plate circuit of the mixer tube is altered by the addition of a peaking coil *L10* and by the reduction in value of the resonating capacitor *C7* to 6.8 $\mu\mu$f. The mixer plate voltage is increased by replacing the plate-load resistor with an r-f choke *L9*. This change increased the mixer gain. The remainder of the mixer-output system remained as before in the TV 2000 series.

The oscillator stage was subjected to several changes. The pre-set trimmer is removed and the oscillator-tank capacitor decreased to 5.0 $\mu\mu$f. The oscillator grid capacitor is reduced in value from the previously used 20 $\mu\mu$f to 10 $\mu\mu$f.

The TV 3000 Series. This series, shown schematically in Fig. 10, heralded a new set of output-intermediate-frequencies. The basic r-f, mixer, and oscillator circuitry resembles the earlier cascode tuners although it contains a number of circuit changes. The r-f tube is a dual-triode 6BK7. The i-f signal-output frequencies are 41.25 mc sound, and 45.75 mc picture.

The antenna input circuit contains two i-f traps, *L12-C12* and *L13-C13*, one trap in each leg of the antenna feeder. Each is tuned between 43 and 44 mc. An adjustable series-resonant trap, *L11-C19*, in the input circuit of the grid-tuned r-f stage is intended for the elimination of local interference, which might otherwise pass through the r-f stystem and appear in the output of the mixer. Slight changes appear in the grid circuit of the grounded-grid amplifier in the form of reduced constants for the divider network *R1* and *R2*, thus altering the grid bias.

A feedback control circuit *L9* and *C18* is added between the input and output circuits of the mixer. This is used to reduce i-f reflections and to prevent regeneration. The i-f output is via the transformer *T1*. In series with the primary of the output i-f transformer is a voltage-dropping resistor *R11*. This is a change from the plate coil used in the TV 2200 series.

IDENTIFICATION OF COILS IN TUNERS

To aid recognition and replacement of coils used in the different series of tuners, each set of coils required for a channel is supplied in matched pairs. The identification consists of two labels, a number followed by a letter. The number indicates the channel; for instance coils numbered 2 are intended for channel 2; coils numbered 3 are intended for channel 3, etc. Since the tuners of all series are designed for use on the same television channels, like numbers will be encountered on the coil strips in each series of tuners.

The number designating the coils intended for a channel is duplicated on each coil strip of the two used for each channel. Thus if the channel is number 3, the antenna coil mounting strip will bear the number 3, and so will the mounting strip which carries the r-f plate coil, the mixer-grid coil, and the oscillator coil for the same channel. This can be seen in any of the illustrations which show the turret.

The letter designation also is duplicated on both mounting strips of a pair, but in this case the letter differs according to the *series* tuner for which they were designed. The following is the list of letter identifications relative to the different tuner series:

TV 100 series
Channel number only. No suffix letter.

TV 200 series
Channel number suffixed by "F" in green.

TV 1000 series
Channel number 2 through 9 suffixed by "G" in green.
Channel number 10 through 13 suffixed by "F" in green.
All antenna segment numbers suffixed by "F" in green.

TV 1500 series
Channel number suffixed by "H" in black.

TV 2000 series
Channel number suffixed by "K" in black.

TV 2200 series
Channel number suffixed by "Q" in red.

TV 3000 series
Channel number suffixed by "M" in black.

TV 3100 series
Channel number suffixed by "R" in red.

Interchangeability of coils is limited to coils of like channel number ***and*** like suffix letter. No other combination will work properly; adjustments of coils of unlike suffix letter to make them function in a tuner should ***not*** be attempted. When replacing a set of coils removed from a tuner, the replacement must bear the same suffix letter.

Many manufacturers of receivers assign their own distinctive part numbers to the different coil strips. This situation does not modify the conditions set forth above. Even these coils bear the aforementioned channel numbers and suffix letters pursuant to the series tuner involved.

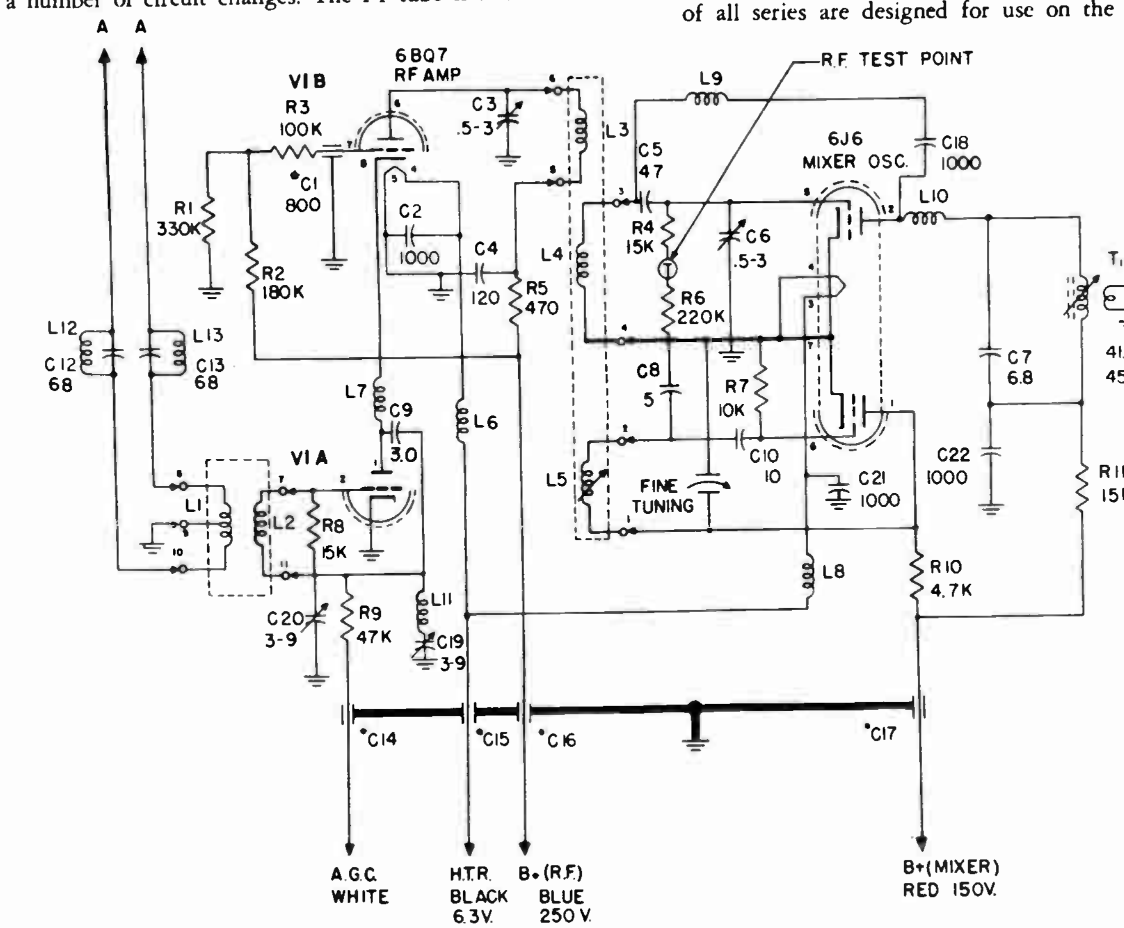

Fig. 11. Schematic diagram of the TV 3100 series cascode tuner.

The TV 3100 series is shown in schematic form in Fig. 11. The organization of the circuitry is like that of the TV 3000 except that some of the constants are changed.

MAINTENANCE AND REPAIR

Alignment

Proper alignment of the Standard Coil tuner in every television receiver determines the kind of performance which the receiver will deliver. Improper alignment will not only degrade the quality of the picture, but it can very easily defeat the usefulness of the receiver completely.

Four sections of the tuner are related to alignment operations. These are the r-f stage (two trimmers), the mixer stage (one trimmer), the oscillator stage (possibly one trimmer and always a slug), and the i-f system in the output of the mixer. The frequencies at which all adjustments, other than the i-f system are to be made, are prescribed for all Standard Coil tuners. The frequency at which the i-f components contained in the tuner are adjusted is a variable; it is determined by the specific picture and sound intermediate frequencies used in the receiver and the i-f amplifier design. Since these vary greatly, the data given here are based on the basic procedure rather than specific frequencies, with the exception of an example which assumes a specific set of conditions.

The alignment of all Standard Coil tuners follows substantially the same method with but few exceptions. The variables appear in the amount of grid bias which must be applied to the agc bus. This is critical and the information given here should be followed. If this is in conflict with data contained in a receiver manufacturer's service manual, the *latter* should be followed. In the absence of such information, the instructions contained herein should be observed.

Because of the general similarity between all pentode type tuners, and because of the general similarity between all cascode type tuners, complete instructions will be given for the first type in each group. Reference to these instructions is made under the alignment instructions for each specific type, and variations from the basic procedures are indicated. The location of the adjustment elements for each tuner series is shown in small sketches under the appropriate tuner headings.

The adjustment of the oscillator-coil slug for each channel is the same on all tuners. In order to obtain access to this slug through the hole in the front wall of the tuner, it is necessary to position the fine-tuning dielectric disc correctly. It is set to its mid-range position as shown in Fig. 12. Since this practice is standard in all instances, no further reference to positioning of the fine-tuning disc will be made; simple reference to adjustment of the oscillator slug is deemed sufficient.

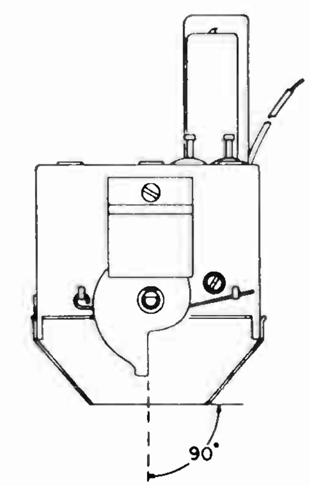

Fig. 12. Front view of tuner showing fine-tuning control set to its mid-range position.

All shields must be in place before and during alignment.

Test Equipment Required

The test equipment required for proper alignment is the following:

1. A sweep generator affording frequency-modulated test signals on all twelve VHF television channels, and at intermediate frequencies from 20 to 45 mc. The frequency setting should be adjustable according to frequency calibrations secured from an internal crystal calibrator or marker or from an external device.
2. A cathode-ray oscilloscope with at least from 10 to 50 millivolt sensitivity in the vertical amplifiers and with good low-frequency response and low-phase distortion. A scope which passes 60-cps square wave properly is satisfactory.
3. An electronic voltmeter.
4. An a-m signal generator which affords accurately set frequencies from 20 to 45 mc.

5. Suitable non-metallic alignment tools with 1/8 inch heads.
6. Proper means for matching the output of the sweep generator to the balanced 300-ohm input of the tuners.

Alignment of TV 100 and TV 200 Series

Some of these series tuners contain a sound i-f trap and sound take-off point as well as a resonant picture i-f system corresponding to the first video i-f input. Adjustment described here should be made at the frequencies prescribed for the sound i-f and for the first picture i-f stage in the receiver. As a typical case we are *assuming* that the tuners are used in a split-sound receiver which uses a stagger-tuned picture i-f system, wherein the sound i-f is 21.25 mc and the first picture i-f stage is tuned to 21.8 mc. If the sound i-f and the first picture i-f stage use other frequencies, the instructions given herein apply, except for the specific frequencies stated. The locations of the alignment adjustments are shown in Fig. 13.

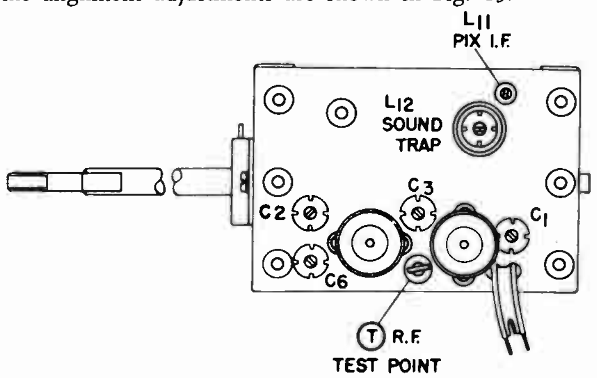

Fig. 13. Location of alignment adjustments in TV 100 and TV 200 series tuners.

It is further assumed that, regardless of the nature of the sound and picture i-f systems used in the receiver, their electrical condition is satisfactory. Finally, it is stressed that these instructions apply to the basic Standard Coil tuners listed herein, whether found in a receiver or to be used as a replacement in the receiver.

I-F and Trap Alignment

1. Connect a VTVM through a 10,000-ohm isolating resistor across the video-detector load resistor.
2. Remove the mixer-tube shield on the tuner.
3. Feed an unmodulated signal, corresponding to the *sound i-f,* to the mixer tube in the tuner by any one of a number of possible methods. The use of capacity coupling, via a tightly fitting ungrounded shield placed around the outside of a mixer tube, is satisfactory. Feed a substantial signal to the ungrounded shield. Tune *L12* for *minimum* indication on the VTVM.
4. Tune the unmodulated signal source to the frequency of the first picture i-f stage. Tune *L11* for *maximum* indication on the VTVM. Use the lowest possible signal output from the unmodulated generator consistent with a usable indication on the VTVM.

Note: Assuming a sound i-f of 21.25 mc, and the first picture i-f stage frequency in a stagger-tuned receiver being 21.8 mc, step 3 refers to a 21.25-mc setting of the unmodulated oscillator, and step 4 refers to a 21.8-mc setting of the unmodulated oscillator. Assuming use of the tuner in an intercarrier receiver, step 3 would be eliminated, and step 4 would involve the frequency stipulated for the first stage of the common video-sound i-f amplifier.

R-F and Mixer Alignment

1. Set station selector dial to channel 12.
2. Connect test oscilloscope vertical input through 10,000-ohm isolating resistor to r-f test point (wire loop) on top of tuner, and ground close by.
3. Apply a fixed negative bias of —1.5 volts to agc feed to tuner. This is white or green lead. Value of bias must be exact, otherwise distortion of the response curve may result.
4. Connect sweep generator to antenna terminals. Make certain that proper impedance match exists and that termination is correct.
5. Set sweep generator to sweep channel 12 frequencies. Use minimum output from sweep generator consistent with readable trace on oscilloscope screen.
6. Loosely couple marker generator to sweep-output cable at antenna terminals. Set marker generator to sound or picture i-f. Feed minimum signal from marker, consistent with seeing marker on response curve on scope screen.
7. Adjust antenna (r-f grid) trimmer; then the r-f plate circuit trimmer, and finally the mixer-grid circuit trimmer, to produce a response curve similar to that shown in Fig. 14. The response curve should be symmetrical, the depth of the valley between the peaks should not exceed 30 percent in over-all amplitude. In production, tolerances of 30 percent differences in

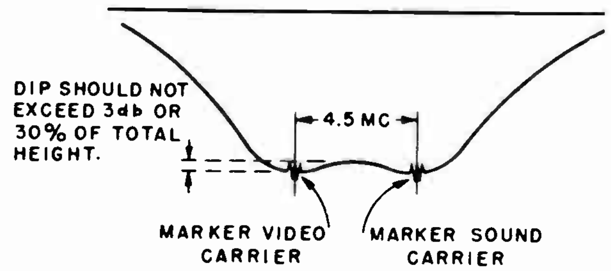

Fig. 14. R-f and mixer response curve of the tuner.

pattern height at or between the carrier frequencies are permissible. In the alignment, care should be taken not to "stagger tune" these circuits. This can best be accomplished by tuning for maximum pattern height at the point midway between the two carrier frequencies. The skirts of the curve will not fall to zero if the sweep width is less than 12 mc. The adjustments should result in the maximum amplitude of the response curve, proper positioning of the two marker frequencies, the closest possible approach to like amplitudes for each of the two humps, and minimum valley in between. Figure 14 is the r-f and mixer response curve of the tuner and should not be confused with the overall r-f and i-f response curve.

8. Without disturbing the r-f grid, r-f plate, and mixer-grid trimmer, check the response curves on the other TV channels by setting the station selector switch to the desired channel and changing the frequency of the sweep generator to correspond to the channel being checked. The response curves should be substantially the same on all channels and the two marker frequencies should fall in similar positions on the response curves. A slight amount of tilt can be tolerated. The amount of tilt indicated by the relative amplitudes of the response curves where the picture and sound i-f markers rest should not exceed 30 percent of the overall response curve amplitude. The ideal response curve is a flat-top.

Oscillator Alignment for Split Sound I-F Circuits

1. Set the station selector to channel 12.
2. Connect the a-m signal generator, or a marker calibrator, or whatever other type of signal capable of supplying an *accurately* calibrated unmodulated signal over the television channel frequencies is available, to the antenna terminals. (Remove the sweep generator connection to the antenna terminals, unless that device also is the source of the unmodulated test signal for oscillator adjustment.)
3. Set the unmodulated signal source precisely to that frequency which, when mixed with the local oscillator for channel 12, will produce the sound i-f required by the receiver. For example, if the sound i-f is 21.25 mc, set the signal generator to exactly 209.75 mc, which is the sound-carrier frequency for channel 12.
4. Connect the VTVM to the output of the sound discriminator (or ratio detector).
5. Adjust the oscillator tank trimmer for zero indication on the VTVM *between* positive and negative peaks. If zero cannot be attained proceed as described in step 6.
6. Check all channels by setting the station selector dial to the desired channel, and changing the frequency of the signal generator to correspond with the sound-carrier frequency for each channel as described in step 3. If it is found necessary to further adjust the oscillator coils on channel 12, or on any channel, this is done by means of the individual oscillator-coil slugs as described in steps 7 and 8.
7. Center the oscillator fine-tuning-control dielectric disc as shown in Fig. 12.
8. With the turret set for the desired channel, and with the appropriate generator frequency as indicated in step 3 applied to the antenna, insert a non-metallic screw driver through the hole in the front face of the tuner and adjust the slug until the VTVM connected to the sound-discriminator output indicates zero *between* the positive and negative peaks. Only a small movement of the slug will generally be necessary. (See below.)

Note: Be careful when adjusting the oscillator-coil slug. If turned too far the slug will fall into the coil. If this happens, remove the coil mounting strip from the turret. Remove the retaining spring which normally holds the slug in place. Upend the coil so that the hole is facing downwards and lightly tap the coil until the slug falls out. Replace the slug and the retaining spring; replace the coil strip in the turret and adjust as described.

Oscillator Alignment for Intercarrier Sound I-F Circuits

1. Set the station selector to the alignment channel.
2. Connect the oscilloscope across the load resistor of the video detector.
3. With the sweep generator fed into the antenna and the marker generator set at the frequency of the *video* carrier of the channel, adjust the oscillator tank trimmer until the marker is at the 6db point (half amplitude) on the high-frequency slope of the i-f response curve.
4. Adjust the oscillator coil slug for each of the other channels with the generators set to the proper frequencies for each channel.

Note: Types TV 1500, TV 2200, TV 3000 and TV 3100 do not use a common oscillator tank trimmer and the oscillator-coil slug must be individually adjusted on all channels.

TV 1000 Series Alignment

The reference alignment instructions are those stated for the TV 100 and 200 series tuners. The adjustment locations are shown in Fig. 15.

I-F Alignment
Complete steps 1, 2, and 4.
R-F and Mixer Alignment
Complete steps 1 through 8.
Oscillator Alignment
Complete alignment as shown under intercarrier i-f.

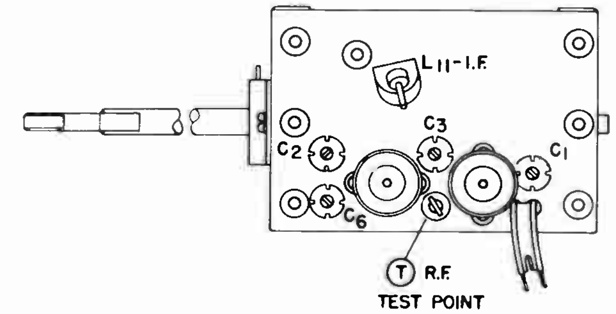

Fig. 15. Location of alignment adjustments in TV 1000 series tuners.

TV 1500 Series Alignment

The reference alignment instructions are those for TV 100 and TV 200 series. The adjustment locations are shown in Fig. 16.

I-F Alignment
Complete steps 1, 2, and 4.

R-F and Mixer Alignment
Complete steps 1 through 8. The alignment channel is *number 10.*

Oscillator Alignment
Complete alignment as shown under intercarrier i-f using slugs only as the oscillator trimmer is omitted.

Note: The adjustment of the TV 1500 series tuner requires extreme care.

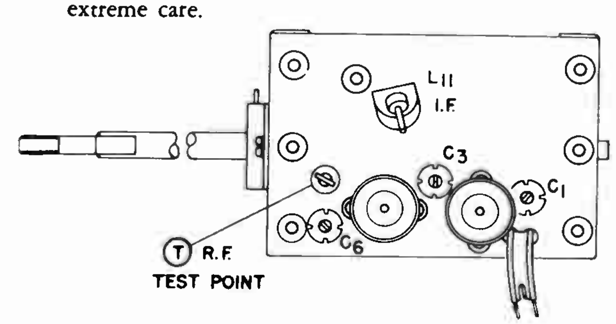

Fig. 16. Location of alignment adjustments in TV 1500 series tuners.

TV 2000 Series Alignment

The reference alignment instructions are those given for the TV 100 and TV 200 series. The TV 2000 series tuners were designed for 21.25-mc sound i-f and 25.75-picture i-f. The tuner is set nominally for 22.3 mc but can be tuned to any desired i-f between 19 and 26 mc. The adjustment locations of the TV 2000 series tuners are given in Fig. 17.

I-F Alignment
Complete steps 1, 2, and 4.

R-F and Mixer Alignment
Complete steps 1 through 8. The alignment channel is *number 12*. The fixed bias required for the agc lead is exactly —3 volts.

Oscillator Alignment
Complete alignment as shown under intercarrier i-f.

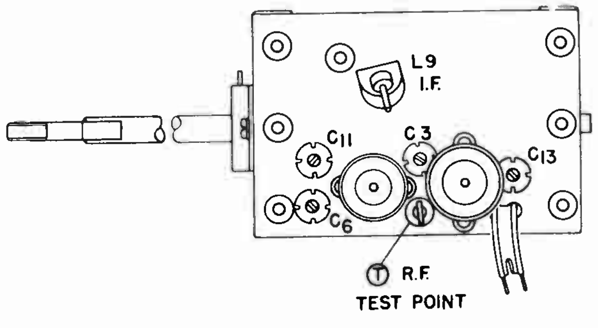

Fig. 17. Location of alignment adjustments in TV 2000 series tuners.

TV 2200 Series Alignment

The reference alignment instructions are those given for TV 100 and 200 series tuners. Adjustment locations are given in Fig. 18.

I-F Alignment
Complete steps 1, 2, and 4.

R-F and Mixer Alignment
Complete steps 1 through 8. The alignment channel is *10*. The fixed-bias voltage for the agc is exactly —3 volts. It is possible that adjusting the r-f grid (or antenna) trimmer may have little effect. In that event channel 6 should be used for readjustment of this trimmer (*C13*) only.

Oscillator Alignment
Complete alignment as shown under intercarrier i-f using slugs only as oscillator trimmer is omitted.

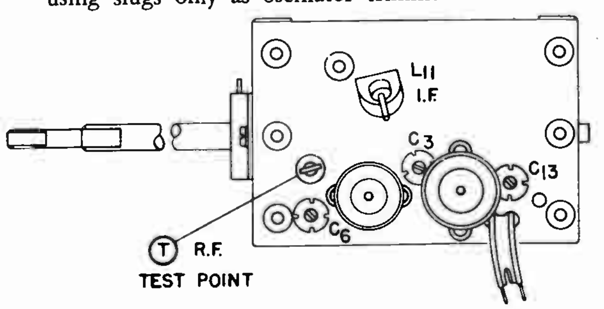

Fig. 18. Location of alignment adjustments in TV 2200 series tuners.

TV 3000 and 3100 Series Alignment

The reference alignment instructions are those given for the TV 100 and TV 200 series tuners, except that the TV 3000 and 3100 series are designed for 41.25-mc sound i-f, and 45.75-mc picture i-f. Also that the tuners incorporate the first stage i-f transformer, *T1* in the schematics of Figs. *10* and *11*. The locations of the adjustments referred to in the alignment instructions are shown in Fig. 19.

I-F Alignment
Complete steps 1, 2, and 4. The reference to *L11* in the alignment instructions is the primary of the i-f transformer in the TV 3000 and 3100 series tuners.

R-F and Mixer Alignment
Complete steps 1 through 8. The alignment channel is *10*. The fixed bias required for the agc is exactly —2 volts. Reference to the r-f grid trimmer under TV2200 also applies.

Oscillator Alignment
Complete alignment as shown under intercarrier i-f using slugs only as oscillator trimmer is omitted.

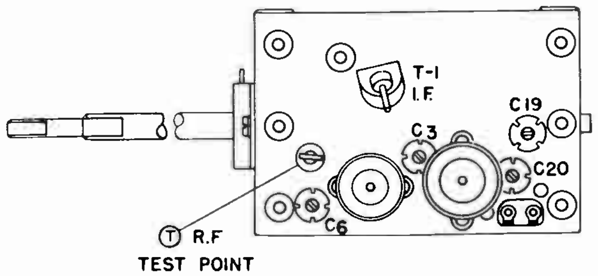

Fig. 19. Location of alignment adjustments in TV 3000 and TV 3100 series tuners.

Servicing

In the event servicing of the tuner is necessary, the following disassembly instructions should be followed.

Removing Tuner Turret

When removal of the turret is necessary, proceed as follows, using the parts identifications in Fig. 4 for guidance.

1. Remove bottom cover shield.
2. Remove the fine tuning ground plate (12)
3. Remove the fine tuning control shaft (28) and dielectric disc. Also remove the fine tuner ground spring (11) and the fibre washer (14). *For reassembly note reverse order of disassembly.*
4. Remove front and rear shaft retaining spring, (9) and (10), by pressing straight away from tab on tuner chassis.
5. Grasp tuner drum and slip out of end bearings by a slight rolling action.

Adjusting Contact Finger Springs

In the event that the stationary contact fingers make poor contact with the studs on the coil strips, the tension of the springs can be increased.

1. Remove the shield on the contact bracket side and the bottom shield.
2. Remove a number of coil strips and rotate the turret so that the fingers on the contact mounting bracket (21) are accessible. With a thin, narrow blade screwdriver, adjust the contact finger spring tension by carefully bending the spring inward until the highest point on the spring contact is about 9/64th of an inch above the surface of the plastic mounting plate. Adjust each spring separately. With correct tension, the contact finger will clear the flat service of the mounted coil strip by about 1/64th of an inch.

Removing Coil Strips

1. Remove bottom cover shield of tuner.
2. Insert thin screwdriver between end plate of turret and appropriate coil retainer spring. Twist the blade away from the turret and raise end of coil. Front retainer spring holds r-f and oscillator coil strips and rear retainer spring holds antenna coil strips.

Cleaning and Lubrication

When it becomes necessary to clean the contacts and springs, proceed as follows. Contacts on coil strips can be cleaned without removing the coils from the turret by using a toothbrush dipped in carbon tetrachloride; do not douse coils. Allow a few minutes for evaporation and then wipe the coil contacts with a lint-free cloth to remove any film deposit.

To clean the stationary contacts, remove several coil strips so as to expose them. Clean with stiff brush dipped into carbon tetrachloride and remove film deposit with clean lint-free cloth. Remove any accumulation of dirt and grease from contact plate surface in the same manner. After cleaning contacts it may be necessary to reset them; see procedure for adjusting contact finger springs.

In the event that lubrication of tuner contacts is necessary, which is generally so after cleaning, use a sulphur and acid-free, non-drying lubricant such as *Viscosity Oil Company #7069*. Do not use any so-called noise-eliminating lubricants or cleaning substances. Lubricate all moving parts including the stationary and moving coil contacts, the inner side of the outer shaft, and all bearings and springs. For lubricating bearings use *Viscosity Oil Company #8857* lubricant or light vaseline.

Parts Replacement

When it becomes necessary to replace electrical parts in the tuner, extreme care must be exercised. The constants of the different electrical components are given in the parts lists elsewhere in this manual. The replacement part must be exactly the same as the original. This applies to its electrical value, tolerance and temperature coefficient if applicable, physical dimension, location, and lead length. The lead dress is extremely important. Observe the lead dress arrangement before making parts changes.

In the case of fixed resistors which must be replaced, make certain that the type used is that originally used in the tuner.

UHF ADAPTABILITY

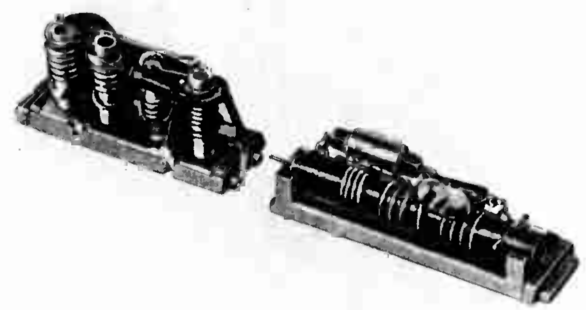

Fig. 20. Photograph of uhf strips for *Standard Tuners*.

Conversion "strips" are available for the Standard Tuner to convert regular VHF tuners for reception of signals in the UHF television band. Fig. 20 shows such a strip which can be inserted in the coil drum in place of any of the normal VHF channel strips.

These UHF strips operate by double conversion of the signal, using a harmonic frequency of the local oscillator in the first conversion and the fundamental frequency for the second conversion as shown in the circuit of Fig. 21.

Since the width of the structure extends well toward the center of the drum, only six UHF strips may be inserted in the coil drum.

Different series of these converter strips are supplied for each series of tuners and are identified by the same letter as marked on the VHF coil assemblies.

While production tolerances may make it possible for strips of one series to work in a tuner of another series, optimum performance can be obtained only with strips of the proper series.

UHF strips should be ordered by channel number and coil series letter. Presently available are:

F/G	Series for TV 200 and TV 1000
H	Series for TV 1500
K	Series for TV 2000
Q	Series for TV 2200
R	Series for TV 3100 and TV 3000

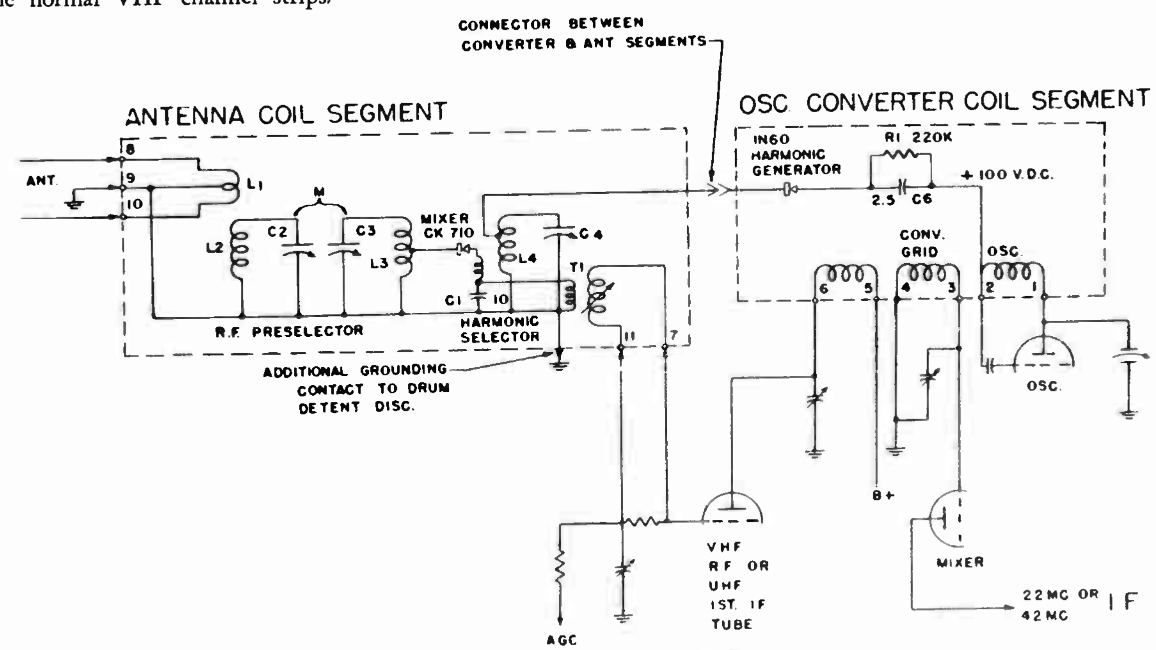

Fig. 21. Circuit arrangement of the *Standard Tuner* uhf strip.

34	Choke, Neutralizing -L9								34A-660	34A-660
35	Trap, Pretuned 45 mc. -L12, C12								31B-299	31B-649
36	Trap, Pretuned 44 mc.								31B-601	31B-601
37	Terminal Board, Antenna								31B-607	31B-607
38	Core, I. F. Tuning	20C-055	20C-055	20C-055	20C-055	20C-055	20C-055	20C-055	20C-055	20C-055
39	Choke, Mixer Plate Feed -L9							31B-230		
40	I. F. Coil & Core Assembly - -	Because of Tuning Range this varies - Specific part numbers are given for each tuner.								

* Shaft length of Items 27, 28 and 29 are indicated by digits in place of the asterisks after the part number.
Example: #31B-202-22 is the complete drum assembly for TV-250 tuner.

Item 27 on some tuners may be #31B-613-** which gives greater fine tuning range. With this, item 12 is 31B-124.

**Use letter B as channel no. suffix for UHF strips.

Resistance and capacitance values and part numbers are given below by circuit symbol number for "R" or "C" in the schematics on preceeding pages. All components from the antenna trimmers to and including the mixer plate by-pass (C-7) are common to all tuners of each series. Components peculiar to the different I. F. circuits of various receivers are identified separately with reference to individual tuner schematics.

RESISTORS - All 1/2 watt insulated composition resistors are suitable replacements, except those marked with asterisk which should be IRC type BTS.

CAPACITORS - Since small disc capacitors are now available, it is recommended that they be used for service in the earlier models except in critical circuits. Care must be taken to keep the leads as close to the same as the capacitor replaced.

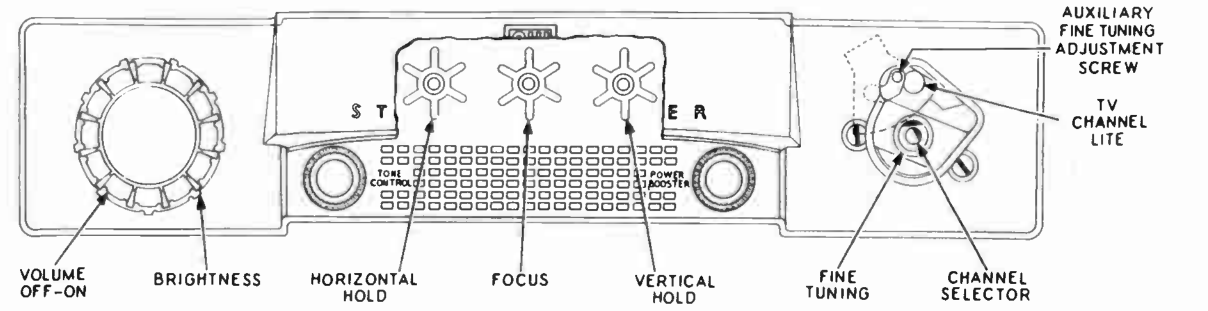

Fig. 14—LOCATIONS OF PRE-SET CONTROLS

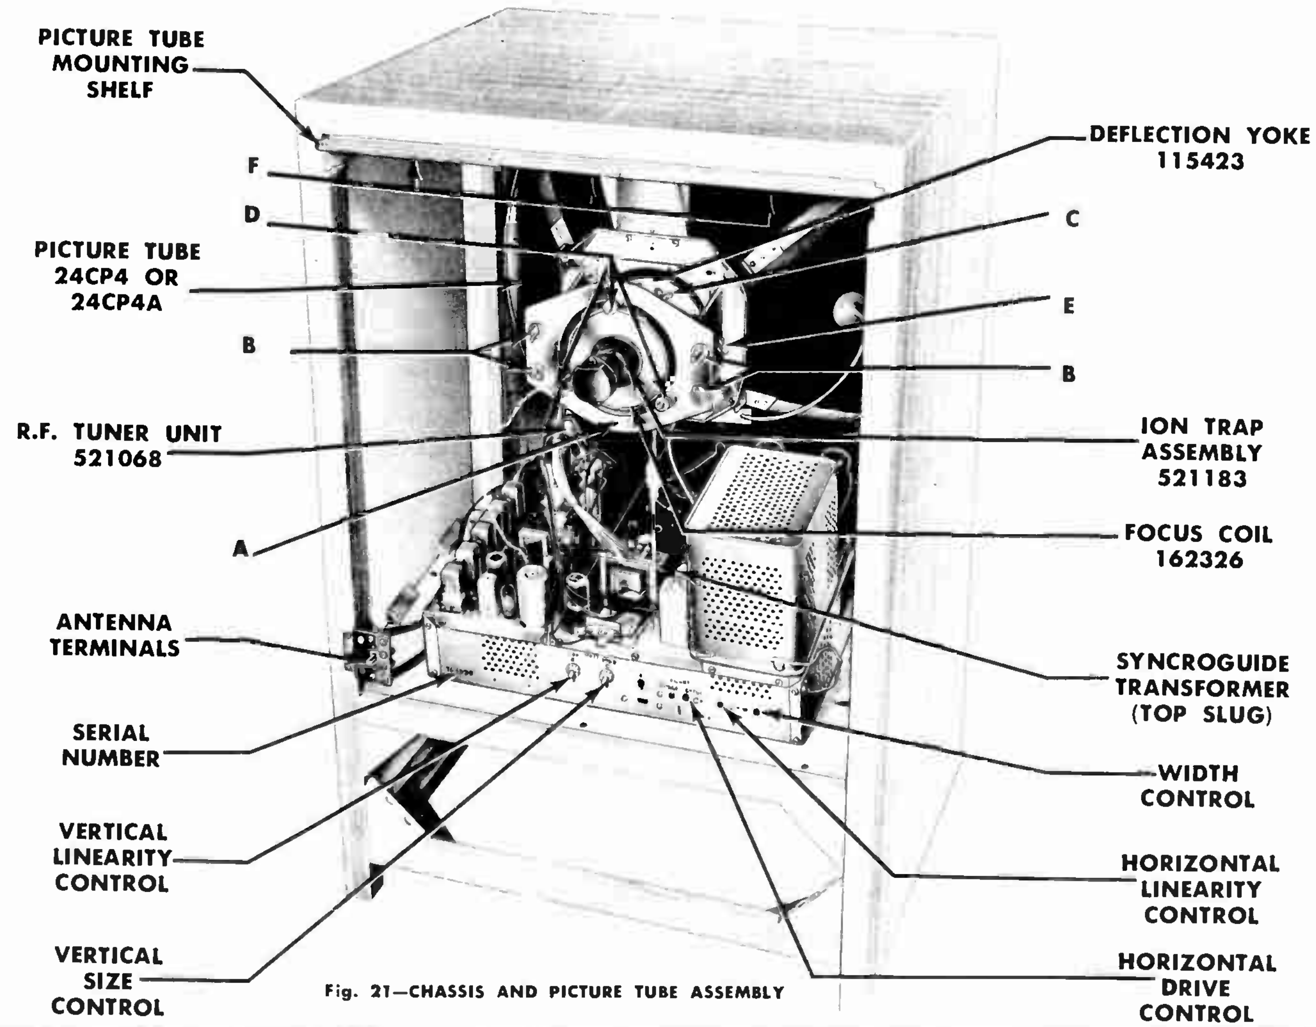

Fig. 21—CHASSIS AND PICTURE TUBE ASSEMBLY

ALIGNMENT PROCEDURE

The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits.

Alignment of all VHF RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts.

These procedures should preferably be applied in the order in which they are presented. Alignment of Sound Channel or IF Channel may be accomplished individually if desired.

The VHF RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned.

CAUTION

The picture tube is highly evacuated and if broken fragments will be violently expelled. Handle with care.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated.
   a. IF Frequencies:
      4.5 Mc. Sound Channel
      39.75 Mc. to 47.25 Mc. IF Channel
   b. RF Frequencies:
      54 to 88 Mc.
      174 to 216 Mc.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the RF Tuner, part 521150, must be returned to the factory.
2. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.
3. **RF SWEEP GENERATOR** to provide frequency modulated signal for observing the over-all bandpass characteristic and RF Channel alignment at the following frequencies:

   40 to 50 Mc. with 10 Mc. sweep width.
   54 to 88 Mc. with 10 Mc. sweep width.
   174 to 216 Mc. with 10 Mc. sweep width.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the RF Tuner, part 521150, must be returned to the factory.
4. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe. This instrument is used for IF and RF Channel alignment and for observing the over-all band-pass characteristic.

SOUND CHANNEL ALIGNMENT PROCEDURE

1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel and Power Booster control to its maximum counter-clockwise position; other controls may be left at any desired setting.
3. A small screwdriver (preferably non-metallic) can be used for alignment of Sound IF. The blade of this tool will fit the slot in the core of the transformer.

STANDARD SIGNAL GENERATOR		VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY				
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Power Booster control to its maximum counter-clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in Fig. 3. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2. 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V1, V2 or V3). This will prevent noise in the RF stages from affecting the voltage reading while adjusting the sound trap.	**#1** 4.5 MC Sound Trap (See Fig. 10)	Adjust for minimum reading on VTVM.

Same as above	Same as above.	Connect as shown in Fig. 4.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This sourious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	#2 Discriminator Secondary (See Fig. 10)	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary (See Fig. 8)	Adjust for maximum reading on VTVM.
				#4 Sound IF Transformer (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 5.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 5.	#2 Discriminator Secondary (See Fig. 10)	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #2 is obtained when the meter reads zero as the slug is moved thru this point.
Replace the type 6CB6 tube previously removed in the above procedure and turn set on. Tune in to a local channel and should there be an unusual amount of "Intercarrier Buzz" refer to procedure on adjoining page to remove this aforementioned fault.					

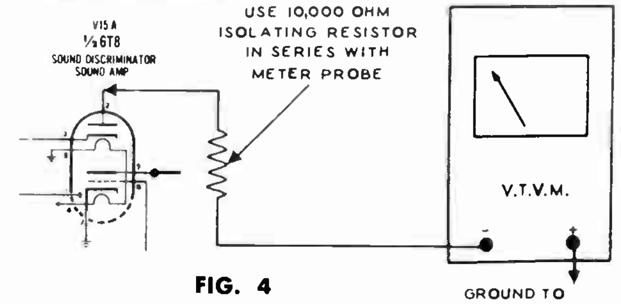

FIG. 4
VTVM Connections for Sound IF Alignment

REDUCTION OF INTERCARRIER BUZZ

Under actual reception conditions slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under these conditions.

Disconnect all instruments (be sure that I.F. tube removed for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

IF CHANNEL ALIGNMENT PROCEDURE

1. A non-metallic screw driver must be used when adjusting the trimmers of the IF transformers to prevent a false indication.
2. In order to eliminate the possibility of spurious oscillation, it is desirable to render the VHF RF oscillator inoperative. This may be accomplished by insulating oscillator contacts on the tuner strips. Remove tuner bottom shield and place a piece of transparent cellulose tape on the first two contacts (from front) of drum assembly. Use any inoperative channel and rotate drum to this insulated position.
3. Short antenna terminals together with a jumper wire.
4. Connect a V.T.V.M. and oscilloscope as shown in Fig. 7.
5. Adjust output attenuator on sweep generator so that reading on V.T.V.M. is not in excess of one volt.
6. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.
7. Certain alignment steps will require a fixed 3 volt A.G.C. bias. When necessary, connect negative terminal of battery to the receiver A.G.C. line and positive terminal to receiver chassis. See Fig. 8 for convenient point of connection.

	STANDARD SIGNAL GENERATOR **39.75 Mc.** SWEEP GENERATOR Not Used	Disconnect 3 volt AGC battery from receiver.	# 13 Adjacent Picture IF Trap (See Fig. 9)	Adjust for minimum reading on V.T.V.M.
	STANDARD SIGNAL GENERATOR **42.5 Mc. & 44.5 Mc.** SWEEP GENERATOR **45 Mc.** Sweep Width 10 Mc.	Connect a 3 volt battery to receiver AGC system as explained in instruction 7 at the head of this chart.	# 14 1st IF Grid Coil (See Fig. 9) #15 Converter Plate Coil (See Fig. 10)	Adjust trimmers for maximum amplitude, bandwidth and correct positioning of markers as shown. 	STANDARD SIGNAL GENERATOR **39.75 Mc., 41.25 Mc., 45.75 Mc. & 47.25 Mc.** SWEEP GENERATOR **45 Mc.** Sweep Width 10 Mc.	Same as above.	The general shape of the overall IF response curve and position of markers should compare with that shown. The picture carrier marker (45.75 Mc.) should appear at approximately the 50% amplitude position. Should this observation fail to meet the above requirement, it will be necessary to make a small change in the setting of one or a combination of the following trimmers until the desired results are achieved. Trimmers, # 5, 6, 7, 8, 11, 12, 14 and slug 15. The sound carrier marker (41.25 Mc.) should appear at the position shown on the curve. If the position of this marker is not correct, then it will be necessary to readjust the setting of trimmer # 9 as explained previously in this procedure.	
To properly observe the position of the adjacent channel picture carrier (39.75 Mc.) and the adjacent channel sound carrier (47.25 Mc.), it will be necessary to increase the vertical gain control on the 'scope and the output of the sweep and standard signal generators. Also, be sure to disconnect the 3 volt AGC battery from receiver. If these markers do not compare favorably with that shown, repeat the adjustment of trimmers # 10 and 13 as explained previously in this procedure, exercising greater care in obtaining a minimum reading on the VTVM.

VHF RF CHANNEL ALIGNMENT PROCEDURE

The procedure listed is only for the VHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the RF Tuner, part 521150, must be returned to the factory.

1. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 8 for convenient point of connection.)
2. During alignment, it is necessary to set the Fine Tuning control so that Fine Tuning Quadrant is in the center of its range (correct position shown in Fig. 17).

STANDARD SIGNAL GENERATOR CONNECTIONS	STANDARD SIGNAL GENERATOR FREQUENCY	SWEEP GENERATOR CONNECTIONS	SWEEP GENERATOR FREQ.	VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
RF AMPLIFIER AND MIXER ALIGNMENT								
Connect as shown in Fig. 11.	197.75 MC. Sound Carrier 193.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #10	Not used.	Connect as shown in Fig. 12.	Set tuner to receive channel #10 by rotating center shaft to the V.H.F. position and inner shaft to channel #10. (See flat position on shafts in Fig. 17) IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	#16 Mixer Grid. (See Fig. 18) #17 RF Amp. Plate. (See Fig. 18) #18 RF Amp. Grid. (See Fig. 18)	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 15. Use Mixer Grid trimmer #16 and RF Amplifier Plate trimmer #17 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #18 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained. IMPORTANT: When adjusting trimmers #16, 17 and 18 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that would result in a loss of sensitivity.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Not used.	Same as above.	Set channel selector to channel being observed.	The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #16, 17 and 18. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers. Band pass characteristic of these channels should conform close to the RF response curve in Fig. 15. If necessary, a compromise may be obtained to compensate for large variations in channel response by returning to channel #10 and making slight changes in the settings of trimmers #16, 17 and 18.	
OSCILLATOR ALIGNMENT								

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in IF alignment procedure.
2. During this step and thru-out all succeeding steps it is necessary to keep output of sweep generator at a level that does not allow reading on VTVM to exceed one volt.
3. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.

STANDARD SIGNAL GENERATOR CONNECTIONS	STANDARD SIGNAL GENERATOR FREQUENCY	SWEEP GENERATOR CONNECTIONS	SWEEP GENERATOR FREQ.	VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig. 11.	197.75 MC. Sound Carrier Marker. 193.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #10	Connect as shown in Fig. 13.	Connect as shown in Fig. 13.	Set tuner to receive channel #10 by rotating center shaft to the V.H.F. position and inner shaft to channel #10. (See flat position on shafts in Fig 17) Be sure that generator's output does not exceed voltage specified in instructions #2 and 3 above.	#19 Oscillator Trimmer (See Fig. 18)	Before undertaking this adjustment, position oscillator slug, located in channel #10 R.F. and Mixer and Oscillator Strip, to the center of its range. Also set Fine Tuning Quadrant to the center of its range as shown in Fig. 17. Adjust Oscillator Trimmer #19 to shift response curve so that picture carrier marker is located at the position indicated in Fig. 16. Position of sound carrier marker should appear as indicated in Fig. 16.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Same as above.	Same as above.	Set channel selector to channel being observed.		Adjust the R.F. sweep generator and marker generator for operation on the other television channels and set Channel Selector to corresponding channel. Using a long, non-metallic screwdriver (approx. 12"), adjust oscillator slug thru hole on front of R.F. Tuner Unit (see Fig. 17). This permits response curve to be shifted so that picture and sound carrier markers will appear at the position indicated in Fig. 16. NOTE: Make sure that cam on fine tuning control shaft remains properly positioned during this step (tooth on the cam pointing downward—see Fig. 17).

If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel. If characteristic does not conform reasonably well within the typical curve shown in Fig. 15, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channels.

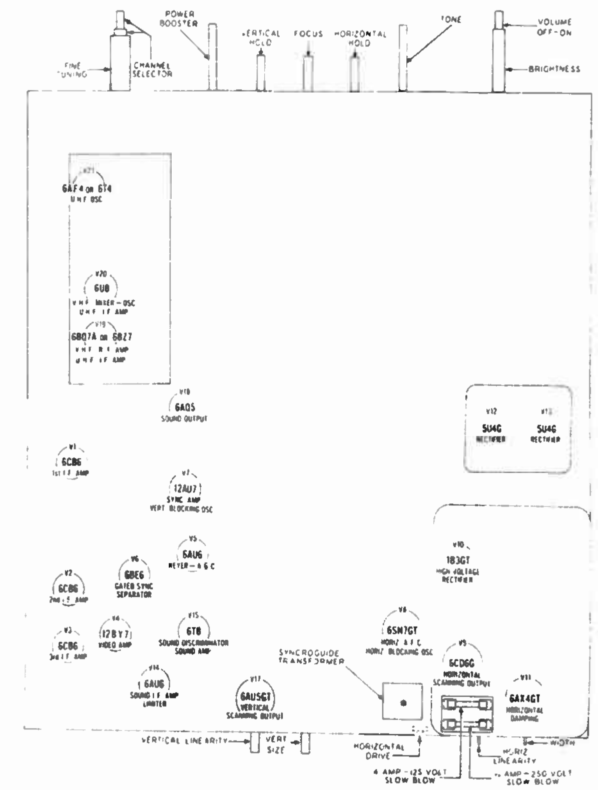
PRODUCTION CHANGES

The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. The coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D".

The circuit shown on this page applies to "SERIES ABCDEF" chassis

A letter following the component circuit diagram number thus—201A, indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change column, from which complete change information can be obtained.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
UNCODED	INITIAL PRODUCTION
"A"	The following change was incorporated to facilitate the inclusion of condenser 240 within the 1st I.F. coil can. When this modification is made, the complete I.F. strip, part 521816, is changed to part 522088. 1. Relocate condenser 240 from the junction of 1st I.F. Coil and Adjacent Picture I.F. Trap to the grid side of the 1st I.F. Coil and change its value from 470 Mmfd. to 680 Mmfd.
"B"	The following change was incorporated to improve sync. stability in the presence of electrical interference or weak signal. 1. Disconnect resistor 94 (18,000 Ohms) from the plate of tube V4-12BY7 (Video Amp.), and reconnect it to the junction of resistors 54 (2200 Ohms) and 55 (1800 Ohms) located in plate load circuit of tube V4. Note: The sound take-off for tube V14 (Sound I.F. Amp.) remains connected to the plate of tube V4 (Video Amp.) The following change was incorporated to provide for adequate width of the picture under the condition of low line voltage. 1. Change resistor 88 in 270 volt supply from 400 Ohms to 200 Ohms. The following change was incorporated to provide a greater margin of safety for the plate load resistor of tube V7A (12AU7). 1. Change resistor 105 located in plate circuit of tube V7A (Sync. Amp.) from 4700 Ohms 1/2 watt to 4700 Ohms 1 watt.
"C"	The following change was incorporated to protect resistor 88, located in the 270 volt supply, in the event of abnormal current drain in the high voltage system. 1. Change fuse 149 in the horizontal sweep circuit from a 1/2 Amp. 250 volt to a 1/4 Amp. "Slow Blow" 250 volt.
"D"	The following changes were incorporated to improve the range of the horizontal hold control. 1. Change resistor 120, located in the plate circuit of tube V7A (Horiz. A.F.C.) from 22,000 Ohms to 68,000 Ohms. 2. Change resistor 124 located in the plate circuit of tube V7A (Horiz. A.F.C.) from 68,000 Ohms to 120,000 Ohms. The above change should only be undertaken when the letter "B" is included in the SERIES designation at rear of chassis.
"E"	The following change was incorporated to protect the filament winding of power transformer 76 that connects to the 6AX4GT (Horiz. Damping) in the event this tube develops a cathode to filament short. 1. Change resistor 83, located in filament supply, from 100,000 Ohms to 18,000 Ohms, 2 watt.
"F"	The following changes were incorporated to improve picture quality by reducing the noise level (snow) in Video Amp. system. 1. Add resistor 242 (6800 Ohms) in parallel with peaking coil 41 located in grid circuit of V4 (Video Amp.) 2. Change peaking coil 42 located in grid circuit of tube V4 (Video Amp.) from part 520985 (double pi, coded with green dot) to part 509341 (single pi, coded with green dot). 3. Change peaking coil 51 located in plate circuit of tube V4 (Video Amp.) from part 520689 (single pi, coded with purple dot) to part 520984 (single pi, coded with red dot). 4. Change resistor 52 located across peaking coil 51 in plate circuit of V4 (Video Amp.) from 12,000 Ohms to 15,000 Ohms. 5. Change peaking coil 53 located in plate circuit of tube V4 (Video Amp.) from part 509342 (single pi, coded with yellow dot) to part 509340 (single pi, coded with white dot).



TUBE AND CONTROL LOCATIONS

VOLTAGE MEASUREMENTS

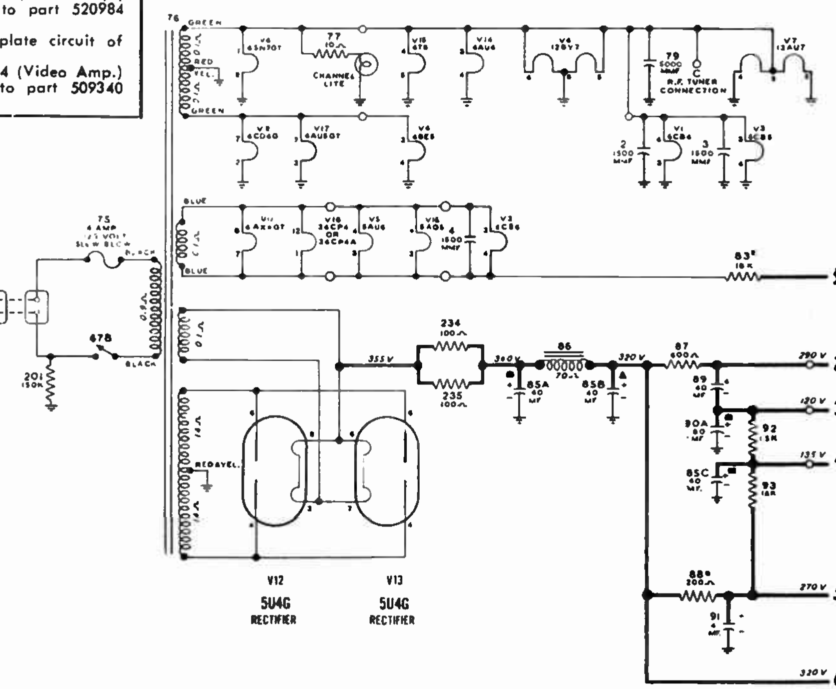
All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

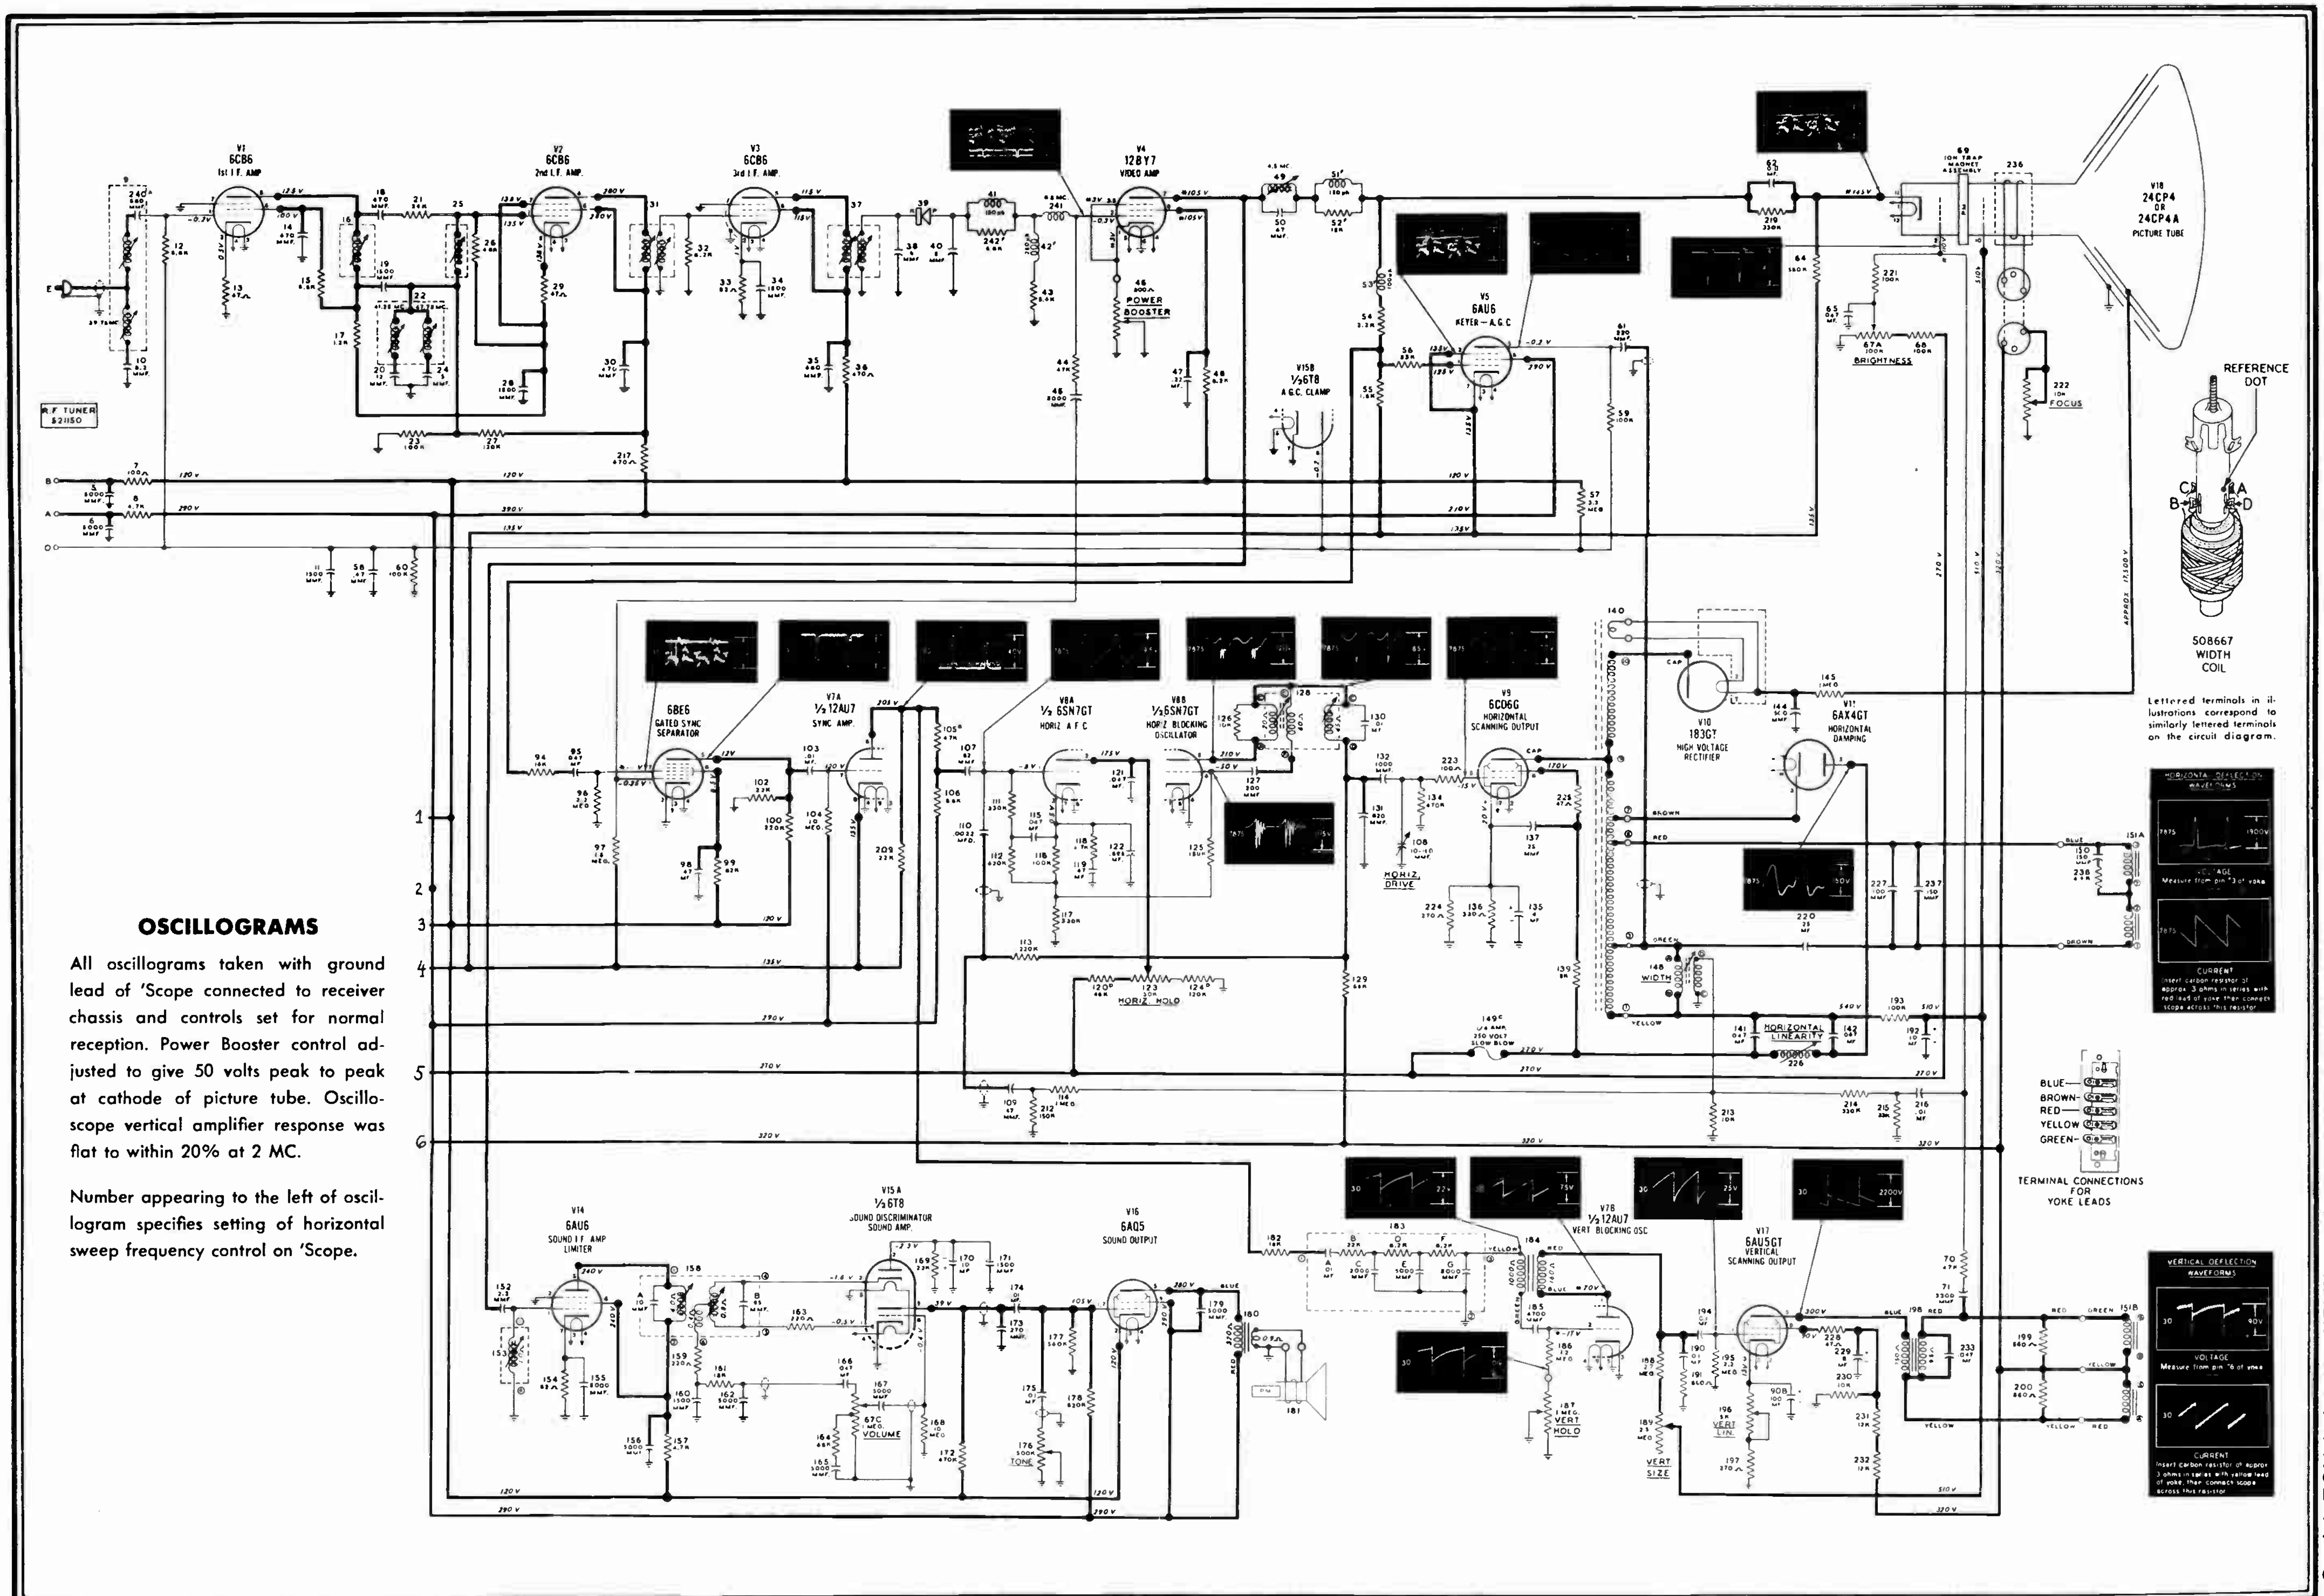
Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception—Power Booster control completely counterclockwise.

Voltages marked with an asterisk (*) will vary widely with control settings.

No voltage reading at a tube element indicate zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.





OSCILLOGRAMS

All oscillograms taken with ground lead of 'Scope connected to receiver chassis and controls set for normal reception. Power Booster control adjusted to give 50 volts peak to peak at cathode of picture tube. Oscilloscope vertical amplifier response was flat to within 20% at 2 MC.

Number appearing to the left of oscillogram specifies setting of horizontal sweep frequency control on 'Scope.

GENERAL SPECIFICATIONS

DIMENSIONS

Model	Height	Width	Depth
27C-9350A	42¾"	29¼"	23¼"
27C-9350AB	42¾"	29¼"	23¼"

WEIGHT (packed)

Model	Weight
27C-9350A	210 lbs.
27C-9350AB	210 lbs.

POWER REQUIREMENTS

117 volts 60 cycles 275 watts

SPEAKER

Model	Type	Size	V.C. Imped.
27C-9350A	P.M. Dynamic	6" x 9"	3.2 ohms
27C-9350AB	P.M. Dynamic	6" x 9"	3.2 ohms

INTERMEDIATE FREQUENCIES

Sound Carrier—41.25 Mc.
Picture Carrier—45.75 Mc.

I.F. SYSTEM

Three Stages—overcoupled—for composite signal.
One additional stage for sound channel.

DEFLECTION

Magnetic

FOCUS

Magnetic

R.F. TUNER

Turret type construction; individually removable coil assemblies for 83 channels.

ALIGNMENT PROCEDURE

The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits.

Alignment of all VHF RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts.

These procedures should preferably be applied in the order in which they are presented. Alignment of Sound Channel or IF Channel may be accomplished individually if desired.

The VHF RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned.

CAUTION

The picture tube is highly evacuated and if broken fragments will be violently expelled. Handle with care.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated.

   a. IF Frequencies:
   4.5 Mc. Sound Channel
   39.75 Mc. to 47.25 Mc. IF Channel

   b. RF Frequencies:
   54 to 88 Mc.
   174 to 216 Mc.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the RF Tuner, part 521150, must be returned to the factory.

2. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.

3. **RF SWEEP GENERATOR** to provide frequency modulated signal for observing the over-all bandpass characteristic and RF Channel alignment at the following frequencies:

   40 to 50 Mc. with 10 Mc. sweep width.
   54 to 88 Mc. with 10 Mc. sweep width.
   174 to 216 Mc. with 10 Mc. sweep width.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the RF Tuner, part 521150, must be returned to the factory.

4. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe. This instrument is used for IF and RF Channel alignment and for observing the over-all band-pass characteristic.

SOUND CHANNEL ALIGNMENT PROCEDURE

1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel and Power Booster control to its maximum counter-clockwise position; other controls may be left at any desired setting.
3. A small screwdriver (preferably non-metallic) can be used for alignment of Sound IF. The blade of this tool will fit the slot in the core of the transformer.

STANDARD SIGNAL GENERATOR CONNECTIONS	STANDARD SIGNAL GENERATOR FREQUENCY	VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Power Booster control to its maximum counter-clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in Fig. 3. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2. 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V1, V2 or V3). This will prevent noise in the RF stages from affecting the voltage reading while adjusting the sound trap.	**#1** 4.5 MC Sound Trap (See Fig. 10)	Adjust for minimum reading on VTVM.
Same as above	Same as above.	Connect as shown in Fig. 4.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This sourious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment af the sound channel.	**#2** Discriminatar Secondary (See Fig. 10)	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary (See Fig. 8)	Adjust for maximum reading on VTVM.
				#4 Sound IF Transformer (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 5.	To obtain zero bolance af the discriminotar circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is nat critical. Connect the two resistars in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 5.	**#2** Discriminatar Secandary (See Fig. 10)	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from o positive to a negative reading or vice versa. The correct setting af slug #2 is abtained when the meter reads zero as the slug is moved thru this point.

Replace the type 6CB6 tube previously removed in the above procedure and turn set on. Tune in ta a local channel and should there be an unusual amount of "Intercarrier Buzz" refer to procedure on adjoining page to remove this aforementioned fault.

REDUCTION OF INTERCARRIER BUZZ

Under actual reception conditions slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under these conditions.

Disconnect all instruments (be sure that I.F. tube removed for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

IF CHANNEL ALIGNMENT PROCEDURE

1. A non-metallic screw driver must be used when adjusting the trimmers of the IF transformers to prevent a false indication.
2. In order to eliminate the possibility of spurious oscillation, it is desirable to render the VHF RF oscillator inoperative. This may be accomplished by insulating oscillator contacts on the tuner strips. Remove tuner bottom shield and place a piece of transparent cellulose tape on the first two contacts (from front) of drum assembly. Use any inoperative channel and rotate drum to this insulated position.
3. Short antenna terminals together with a jumper wire.
4. Connect a V.T.V.M. and oscilloscope as shown in Fig. 7.
5. Adjust output attenuator on sweep generator so that reading on V.T.V.M. is not in excess of one volt.
6. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.
7. Certain alignment steps will require a fixed 3 volt A.G.C. bias. When necessary, connect negative terminal of battery to the receiver A.G.C. line and positive terminal to receiver chassis. See Fig. 8 for convenient point of connection.

IF CHANNEL ALIGNMENT PROCEDURE—Continued

GENERATOR CONNECTIONS	GENERATOR FREQUENCIES	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
	STANDARD SIGNAL GENERATOR 42.5 Mc. & 44.5 Mc. SWEEP GENERATOR 45 Mc. Sweep Width 10 Mc.	Connect a 3 volt battery to receiver AGC system as explained in instruction 7 at the head of this chart.	# 14 1st IF Grid Coil (See Fig. 9) #15 Converter Plate Coil (See Fig. 10)	Adjust trimmers for maximum amplitude, bandwidth and correct positioning of markers as shown. 	STANDARD SIGNAL GENERATOR 39.75 Mc., 41.25 Mc., 45.75 Mc. & 47.25 Mc. SWEEP GENERATOR 45 Mc. Sweep Width 10 Mc.	Same as above.		The general shape of the overall IF response curve and position of markers should compare with that shown. The picture carrier marker (45.75 Mc.) should appear at approximately the 50% amplitude position. Should this observation fail to meet the above requirement, it will be necessary to make a small change in the setting of one or a combination of the following trimmers until the desired results are achieved. Trimmers, # 5, 6, 7, 8, 11, 12, 14 and slug 15.  The sound carrier marker (41.25 Mc.) should appear at the position shown on the curve. If the position of this marker is not correct, then it will be necessary to readjust the setting of trimmer # 9 as explained previously in this procedure. To properly observe the position of the adjacent channel picture carrier (39.75 Mc.) and the adjacent channel sound carrier (47.25 Mc.), it will be necessary to increase the vertical gain control on the 'scope and the output of the sweep and standard signal generators. Also, be sure to disconnect the 3 volt AGC battery from receiver. If these markers do not compare favorably with that shown, repeat the adjustment of trimmers # 10 and 13 as explained previously in this procedure, exercising greater care in obtaining a minimum reading on the VTVM.

VHF RF CHANNEL ALIGNMENT PROCEDURE

The procedure listed is only for the VHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the RF Tuner, part 521150, must be returned to the factory.

1. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 8 for convenient point of connection.)
2. During alignment, it is necessary to set the Fine Tuning control so that Fine Tuning Quadrant is in the center of its range (correct position shown in Fig. 17).

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
RF AMPLIFIER AND MIXER ALIGNMENT								
Connect as shown in Fig. 11.	197.75 MC. Sound Carrier 193.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #10	Not used.	Connect as shown in Fig. 12.	Set tuner to receive channel #10 by rotating center shaft to the V.H.F. position and inner shaft to channel #10. (See flat position on shafts in Fig. 17) IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	#16 Mixer Grid. (See Fig. 18) #17 RF Amp. Plate. (See Fig. 18) #18 RF Amp. Grid. (See Fig. 18)	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 15. Use Mixer Grid trimmer #16 and RF Amplifier Plate trimmer #17 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #18 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained. IMPORTANT: When adjusting trimmers #16, 17 and 18 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that would result in a loss of sensitivity.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Not used.	Same as above.	Set channel selector to channel being observed.		The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #16, 17 and 18. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers. Band pass characteristic of these channels should conform close to the RF response curve in Fig. 15. If necessary, a compromise may be obtained to compensate for large variations in channel response by returning to channel #10 and making slight changes in the settings of trimmers #16, 17 and 18.

OSCILLATOR ALIGNMENT

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in IF alignment procedure.
2. During this step and thru-out all succeeding steps it is necessary to keep output of sweep generator at a level that does not allow reading on VTVM to exceed one volt.
3. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.

STANDARD SIGNAL GENERATOR CONNECTIONS	FREQUENCY	SWEEP GENERATOR CONNECTIONS	FREQ.	VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig. 11.	197.75 MC. Sound Carrier Marker. 193.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #10	Connect as shown in Fig. 13.	Connect as shown in Fig. 13.	Set tuner to receive channel #10 by rotating center shaft to the V.H.F. position and inner shaft to channel #10. (See flat position on shafts in Fig. 17) Be sure that generator's output does not exceed voltage specified in instructions #2 and 3 above.	#19 Oscillator Trimmer (See Fig. 18)	Before undertaking this adjustment, position oscillator slug, located in channel #10 R.F. and Mixer and Oscillator Strip, to the center of its range. Also set Fine Tuning Quadrant to the center of its range as shown in Fig. 17. Adjust Oscillator Trimmer #19 to shift response curve so that picture carrier marker is located at the position indicated in Fig. 16. Position of sound carrier marker should appear as indicated in Fig. 16.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Same as above.	Same as above.	Set channel selector to channel being observed.		Adjust the R.F. sweep generator and marker generator for operation on the other television channels and set Channel Selector to corresponding channel. Using a long, non-metallic screwdriver (approx. 12"), adjust oscillator slug thru hole on front of R.F. Tuner Unit (see Fig. 17). This permits response curve to be shifted so that picture and sound carrier markers will appear at the position indicated in Fig. 16. NOTE: Make sure that cam on fine tuning control shaft remains properly positioned during this step (tooth on the cam pointing downward—see Fig. 17).

If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel. If characteristic does not conform reasonably well within the typical curve shown in Fig. 15, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channels.

SYNCROGUIDE TRANSFORMER ALIGNMENT

Alignment of the Syncroguide transformer, circuit diagram #128, which is used in the Horizontal Oscillator circuit can be accomplished by utilizing the procedure outlined below. To perform this alignment, it will be necessary to use an oscillascope, preferably one that has a 2 megacycle response and a low input capacity probe—under 100 mmfd. to ground.

1. Set the "Top Slug" and "Bottom Slug" of the Syncroguide transformer to their maximum counter-clockwise positions.
2. Short together terminals C and D of the Syncroguide transformer.
3. Adjust "Horizontal Drive" control, located on rear of chassis pan, one-half turn out from its maximum clockwise position.
4. Set "Horizontal Hold" control, located at front of chassis, to its maximum clockwise position.
5. Turn on receiver and tune in any local TV channel.
6. Adjust "Top Slug" clockwise until picture just locks in horizontally.
7. Remove short from terminals C and D. If picture does not hold sync when short is removed, adjust "Bottom Slug" clockwise until picture locks in.
8. Connect 'scope to terminal C of Syncroguide transformer and adjust sweep rate of 'scope until two cycles of oscillogram remain stationary. Turn "Bottom Slug" clockwise until wave form peaks are equal in height as shown in Fig. 19.

IMPORTANT: The first peak of the wave form should never be higher than the second peak nor should the first peak be lower than the second peak by more than 3%. Also, when adjusting the "Bottom Slug," the picture must be in sync, therefore, it may be necessary to turn the "Horizontal Hold" control counter-clockwise when performing this step. After this adjustment has been completed, disconnect 'scope from receiver.

9. Set "Horizontal Hold" control counter-clockwise and adjust "Top Slug" until picture is locked in and does not lose sync when switching "Channel Selector" knob. Then, turn "Top Slug" slowly counter-clockwise until picture is just ready to lose sync as shown in Fig. 22.
10. Horizontal Holding action of receiver should now be as follows:
    a. When "Horizontal Hold" control is at its maximum counter-clockwise position and "Channel Selector" knob is switched, picture may appear as shown in Fig. 22 or be out of sync.
    b. When "Horizontal Hold" control is at its maximum clockwise position, picture may lose sync when switching "Channel Selector" knob.
    c. When "Horizontal Hold" control is in the center or near the center of its range, picture remains stable when switching "Channel Selector" knob.

PRODUCTION CHANGES

The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. The coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D".

The circuit shown on this page applies to "SERIES ABCDEF" chassis

A letter following the component circuit diagram number thus—201A, indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change column, from which complete change information can be obtained.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
UNCODED	**INITIAL PRODUCTION**
"A"	The following change was incorporated to facilitate the inclusion of condenser 240 within the 1st I.F. coil can. When this modification is made, the complete I.F. strip, part 521816, is changed to part 522088. 1. Relocate condenser 240 from the junction of 1st I.F. Coil and Adjacent Picture I.F. Trap to the grid side of the 1st I.F. Coil and change its value from 470 Mmfd. to 680 Mmfd.
"B"	The following change was incorporated to improve sync. stability in the presence of electrical interference or weak signal. 1. Disconnect resistor 94 (18,000 Ohms) from the plate of tube V4-12BY7 (Video Amp.) and reconnect it to the junction of resistors 54 (2200 Ohms) and 55 (1800 Ohms) located in plate load circuit of tube V4. Note: The sound take-off for tube V14 (Sound I.F. Amp.) remains connected to the plate of tube V4 (Video Amp.) The following change was incorporated to provide for adequate width of the picture under the condition of low line voltage. 1. Change resistor 88 in 270 volt supply from 400 Ohms to 200 Ohms. The following change was incorporated to provide a greater margin of safety for the plate load resistor of tube V7A (12AU7). 1. Change resistor 105 located in plate circuit of tube V7A (Sync. Amp.) from 4700 Ohms ½ watt to 4700 Ohms 1 watt.
"C"	The following change was incorporated to protect resistor 88, located in the 270 volt supply, in the event of abnormal current drain in the high voltage system. 1. Change fuse 149 in the horizontal sweep circuit from a ½ Amp. 250 volt to a ¼ Amp. "Slow Blow" 250 volt.
"D"	The following changes were incorporated to improve the range of the horizontal hold control. 1. Change resistor 120, located in the plate circuit of tube V7A (Horiz. A.F.C.) from 22,000 Ohms to 68,000 Ohms. 2. Change resistor 124 located in the plate circuit of tube V7A (Horiz. A.F.C.) from 68,000 Ohms to 120,000 Ohms. The above change should only be undertaken when the letter "8" is included in the SERIES designation at rear of chassis.
"E"	The following change was incorporated to protect the filament winding of power transformer 76 that connects to the 6AX4GT (Horiz. Damping) in the event this tube develops a cathode to filament short. 1. Change resistor 83, located in filament supply, from 100,000 Ohms to 18,000 Ohms, 2 watt.
"F"	The following changes were incorporated to improve picture quality by reducing the noise level (snow) in Video Amp. system. 1. Add resistor 242 (6800 Ohms) in parallel with peaking coil 41 located in grid circuit of V4 (Video Amp.) 2. Change peaking coil 42 located in grid circuit of tube V4 (Video Amp.) from part 520985 (double pi, coded with green dot) to part 509341 (single pi, coded with green dot). 3. Change peaking coil 51 located in plate circuit of tube V4 (Video Amp.) from part 520689 (single pi, coded with purple dot) to part 520984 (single pi, coded with red dot). 4. Change resistor 52 located across peaking coil 51 in plate circuit of V4 (Video Amp.) from 12,000 Ohms to 15,000 Ohms. 5. Change peaking coil 53 located in plate circuit of tube V4 (Video Amp.) from part 509342 (single pi, coded with yellow dot) to part 509340 (single pi, coded with white dot).

VOLTAGE MEASUREMENTS

All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception—Power Booster control completely counterclockwise.

Voltages marked with an asterisk (*) will vary widely with control settings.

No voltage reading at a tube element indicate zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.

OSCILLOGRAMS

All oscillograms taken with ground lead of 'Scope connected to receiver chassis and controls set for normal reception. Power Booster control adjusted to give 50 volts peak to peak at cathode of picture tube. Oscilloscope vertical amplifier response was flat to within 20% at 2 MC.

Number appearing to the left of oscillogram specifies setting of horizontal sweep frequency control on 'Scope.

CIRCUIT DESCRIPTION FOR R. F. TUNER USED ON ALL MODELS 21C-9340; 21T-9340; 24C-9360; AND 27C-9350 SERIES TELEVISION RECEIVERS.

(All circuit diagram numbers mentioned refer to circuit diagram on the reverse side of this page.)

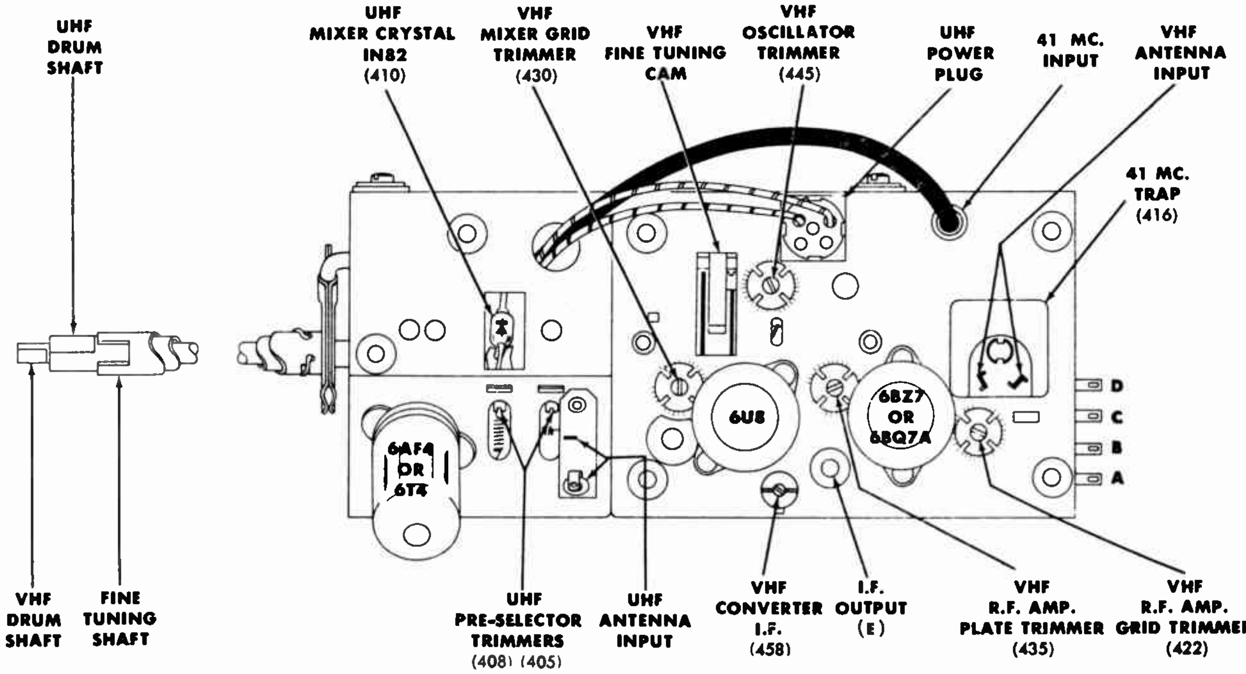

FIG. 1—Complete VHF-UHF R.F. Tuner 521150

The all wave turret type tuner, part 521150, is of the latest design and is capable of tuning all standard television channels in the VHF and UHF range fram channels 2 to 83. It consists of twa separate chassis joined together as ane unit. The front section tunes the UHF stations, channels 14 to 83, and incorporates 2 pre-selectar stages, a 6AF4 or 6T4 tube as the Oscillator and a 1N82 crystal as the Mixer. The rear sectian performs a dual function in that it tunes all the VHF stations, channels 2 to 13 and operates as a 41 Mc. I.F. amplifier when the receiver is tuned to any UHF channel. It incorporates a 6BZ7 or 6BQ7A tube as a cascaded R.F. amplifier for VHF operation and as a cascoded 41 Mc. I.F. amplifier for UHF operation. A 6U8 tube is used as a Mixer-Oscillator for VHF and as a 41 Mc. I.F. amplifier for UHF. In the UHF position, the Oscillatar section of the 6U8 tube is rendered inoperative. See Fig. 4 for block diagram of tuner.

Fine tuning of both the VHF and UHF channels are performed by the same control. The shaft of the fine tuning control rotates two separate pieces of dielectric material simultaneously between two separate sets of capacitor plates connected to their respective UHF and VHF oscillator tank circuit. Front panel oscillator adjustment is similar to that of our VHF turret type tuner and is discussed in its entirety in the instruction book for this receiver under the heading "Auxiliary Fine Tuning Adjustment." The adjustment tool should be a non-metallic screw driver, having a narrow blade, about ⅛" wide, and at least 9 inches long so it can make contact with the VHF oscillator slug which is located in back of the UHF section.

UHF OPERATION

UHF channel selection is accomplished in a dual manner. Rotation of the UHF turret, which is accomplished by turning the middle shaft or middle knob, sets into position a coil assembly that can be tuned through a range of 10 channels. For example, channels 20 to 29, 30 to 39 etc. Eight different coil assemblies are used and they are easily removable for replacement. There are nine settings of the UHF turret one of which is blank, containing no coil assembly. For VHF operation, the UHF turret is placed in the blank position. For tuning of an individual UHF channel, the inner shaft or front knob is turned to the second digit af the desired station within the range of 10 channels set previously. This rotates three eccentric cams of a dielectric material through a group of capacitor plates. These plates are connected to the 2 pre-selector stages and the oscillator circuit.

The UHF signal entering the tuner is first fed through a high pass filter consisting of condensers 402A and 4028, and inductances 403 and 404 that attenuate all frequencies below 470 Mc. It is then coupled to the first pre-selector circuit which consists of a coil connected between terminal "F" and a capacitor plate.

From here it is coupled through condenser 406 to the second pre-selector stage that consists of a cail connected between terminal "H" and a capacitar plate. There is one capacitor plate that is cammon to both pre-selectar stages which is graunded through terminal "G." These pre-selector coils and capacitor plates are maunted on a form (see Fig. 2) and are tunable thraugh a range af 10 channels. Selection af any one channel is accomplished by varying the amount of dielectric material between the capacitor plates.

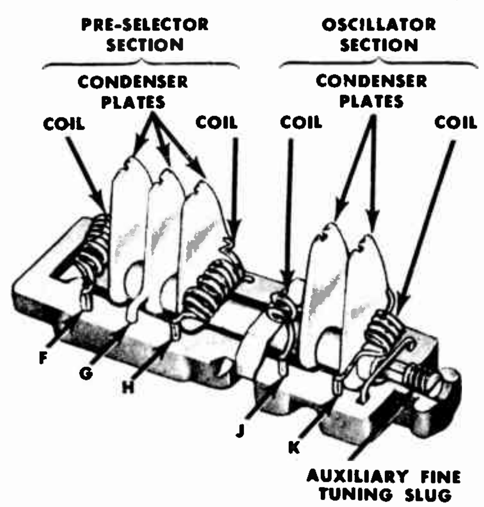

FIG. 2—UHF Coil Form Showing Condenser Plates

Additional tuning, for alignment purposes, is accomplished by adjustment of condensers 405 and 408, (see Fig. 1), and either compressing or expanding the pre-selector coils. **CAUTION:** Exercise extreme care if it is ever found necessary to make these adjustments.

A 6AF4 tube is operated as the UHF oscillator and its tank circuit consists of two capacitor plates and a cail connected ta each plate (see Fig. 2). These oscillator coils and capacitor plates are mounted on the same farm as the pre-selector coils and capacitor plates and forms a complete coil assembly that is tunable through a range of 10 channels. Correct selection of any one channel is achieved by varying the amount of dielectric material between the oscillator plates. The dielectric far the oscillator and pre-selector stages is in the shope of an eccentric cam and ganged together on the same shaft.

Fine tuning is accomplished in a similar manner with the exception that the dielectric material is on a separate shaft and rotates between the bottom section of the oscillator capacitor plate (see Fig. 3). The frequency range of fine tuning on all UHF channels is approximately 2 to 3 Mc.

Auxiliary fine tuning is accomplished by adjusting a metal slug between the oscillator condenser plates on the coil form. On some tuners, auxiliary fine tuning is performed by a screw mounted on the face of UHF drum, which varied the capacity between the oscillator plate and ground. On other tuners this auxiliary fine tuning screw is mounted on the coil form. Adjustment of this screw changes the capacitane between the oscillator plates. Additional tuning, for alignment purposes only, can be brought about by either compressing or expanding the oscillator coils. **CAUTION:** Exercise extreme care if it is ever found necessary to make this type of adjustment.

The output of the oscillator is capacitively coupled ta the second pre-selector stage by a short length of wire; one end is close to one of the oscillator plates and the ather end is clase to the secand pre-selector plate. Note thot na physical contact is made with either plate, (see Fig. 3).

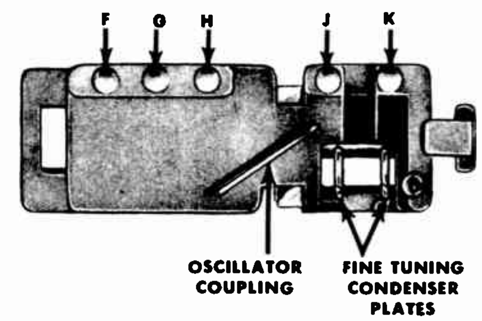

Fig. 3—UHF Coil Form Showing Contact Side

This ascillator frequency and UHF signal are then fed to a 1N82 crystal operating as a UHF Mixer. This action praduces the desired IF frequency of 41 Mc. which is fed thraugh a coaxial cable and connected to the primary af transformer 421 which is mounted on a 41 Mc. contact board.

This board maintains electrical cantact in the circuit of the 6BZ7 and 6U8, only when the tuner is set for UHF operation. This contact board is switched in by a cam action on the rear of the UHF drum which at the same time, breaks contact between the VHF drum and its associated circuit. The reverse af this occurs during VHF operation. The secondary af transformer 421 is connected to the input circuit of the 6BZ7 tube, which is now operating as an 41 Mc. amplifier. The 6BZ7 tube is a dual triode and is connected in the circuit as a direct coupled grounded grid amplifier. Transformer 438 couples the output from the plate, pin 1, of the 6BZ7 to the grid input of the pentade section of the 6U8 tube which operates as a 41 Mc. amplifier during UHF operatian. Transfarmers 421, 438 and coil 440 are all mounted on the 41 Mc. contact board. Note that, when in UHF operation, terminal V3 on the 41 Mc. contact board is left open thus, removing plate valtage from the triode section of the 6U8 tube which makes this section of the tube inoperative. Signal output from the 6U8 tube is coupled through the plate coil, 458, to a coaxial socket on the tuner and then fed to the receivers' I.F. amplifiers.

VHF OPERATION

VHF channel selection is accomplished in a dual manner. The UHF turret must be ratated until the blank setting is detented into position. This occurs when the middle knob shows the letters "VHF" in an upright position or when the flat of the middle knob is in its uppermost position, i.e.: in a horizontal plane. With drum in this position, there is no connection to the UHF drum thus rendering the UHF oscillator inoperative. At the same time this occurs, the 41 Mc. contact board is switched out of the circuit and the VHF drum is placed into operation. VHF channel selection is now performed by the front knob which rotates the VHF drum containing two sets of easily removable coil assemblies for each VHF channel.

From the antenna, the signal is first fed to a 41 Mc. trap network, item 416, which is tunable from the top of the tuner, (see Fig. 1). The output of this trap is coupled to the individual antenna coil section consisting of a balanced primary to minimize noise pick-up on the transmission line and an R.F. grid coil which couples the incoming signal to the grid of the first section of the 6BZ7 R.F. Amplifier. The inductance and amount of coupling of the tuned antenna input circuit are changed for each channel so that a constant input impedance of 300 ohms is maintained. This provides maximum transfer of energy to the R.F. Amplifier stage, particularly when interconnectian between an outdoor antenna and the receiver is made with 300 ohm transmission line.

The R.F. Amplifier tube is a dual-triade tube and is connected in the circuit as a direct coupled ground-grid type amplifier. This circuit was developed to meet the demand far an R.F. Amplifier that wauld provide more nearly equal gain on both the low and high VHF Television Channels, while keeping inherent tube noise ta a minimum. The circuit can be thought of very simply as twa triode tubes in series, the first or driver unit acting not as an amplifier, but rather as an antenna impedance matching device and also as a variable cathade impedance, or bias saurce, for the second, or grounded-grid unit. In addition the first unit of the R.F. Amp. acts as a power amplifier due to its extremely low plate impedance, which is in reality the cathade circuit of unit two, and converts the weak signal voltage from the antenna to a low valtage-high current signal which is then applied to the cathode of unit number two. The signal coupling unit between the first and second units is a series peaking coil, symbol 429, similar to that found in a video amplifier circuit. Its purpose is to form a series resonant circuit with the input capacity of the second unit. The cail is so made as to resonate at a frequency slightly higher than channel 13. In a standard pentode type amplifier, the gain falls off rapidly as progressively higher channels are selected. With the use af the plate to cathode peaking coil an almost equal gain can be realized for all VHF channels.

The R.F. Amp. tube has inherently low interelectrode capacity due to physical design and this factor in conjunction with the low output impedance of the first section is responsible for the low noise factor at this stage. While neutralization of the first unit is not necessary, due to its low plate to grid capacity, additianal noise reduction has been realized, with only a slight decrease in gain, by the addition of a neutralizing condenser, item 427. Due to the low output impedance of the stage, it is not necessary that the neutralizing condenser be tuneable.

Because of the circuits' excellent internal shielding, low imput impedance and radiation rejectian, the secand section of the R.F. Amp. is connected as a driven grounded-grid amplifier. While this might not be apparent at first glance due to the fact that grid has no direct D.C. return, it will be found upon further examination that any high frequency A.C. potentials are by-passed to ground through condenser 430.

The second section of turret coils includes the tuned R.F. amplifier plate coil, tuned mixer grid cail, and oscillator coil. The output af the R.F. amplifier stage is coupled to the grid of the mixer stage, which utilizes the pentode section of a 6U8 tube, V19. The other half of the 6U8 is a triode and is connected as a modified Colpitts oscillator which injects oscillator voltage into the mixer stage through coupling between the oscillator coil and the mixer grid coil. Course oscillator tuning is accomplished by adjusting the positions of the slugs in the individual oscillator coils, while Fine Tuning is obtained when using condenser 444 in the oscillotor plate circuit. This Fine Tuning condenser is composed of two fixed plates, and its capacitance is changed by the insertion of a dielectric material between these plates.

Signal output from the mixer stage is coupled through the converter plate I.F. coil, 458, located on the tuner unit, ta a coaxial socket and then fed to the receivers I.F. amplifiers.

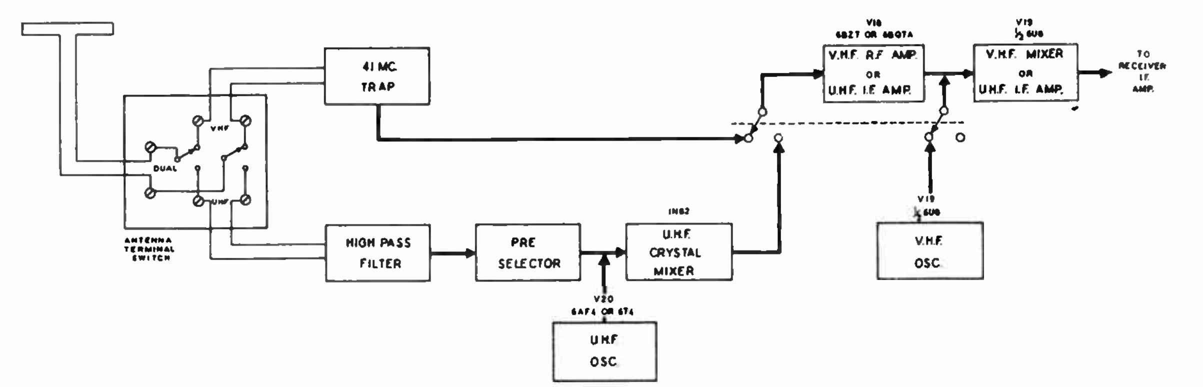

FIG. 4—Block Diagram

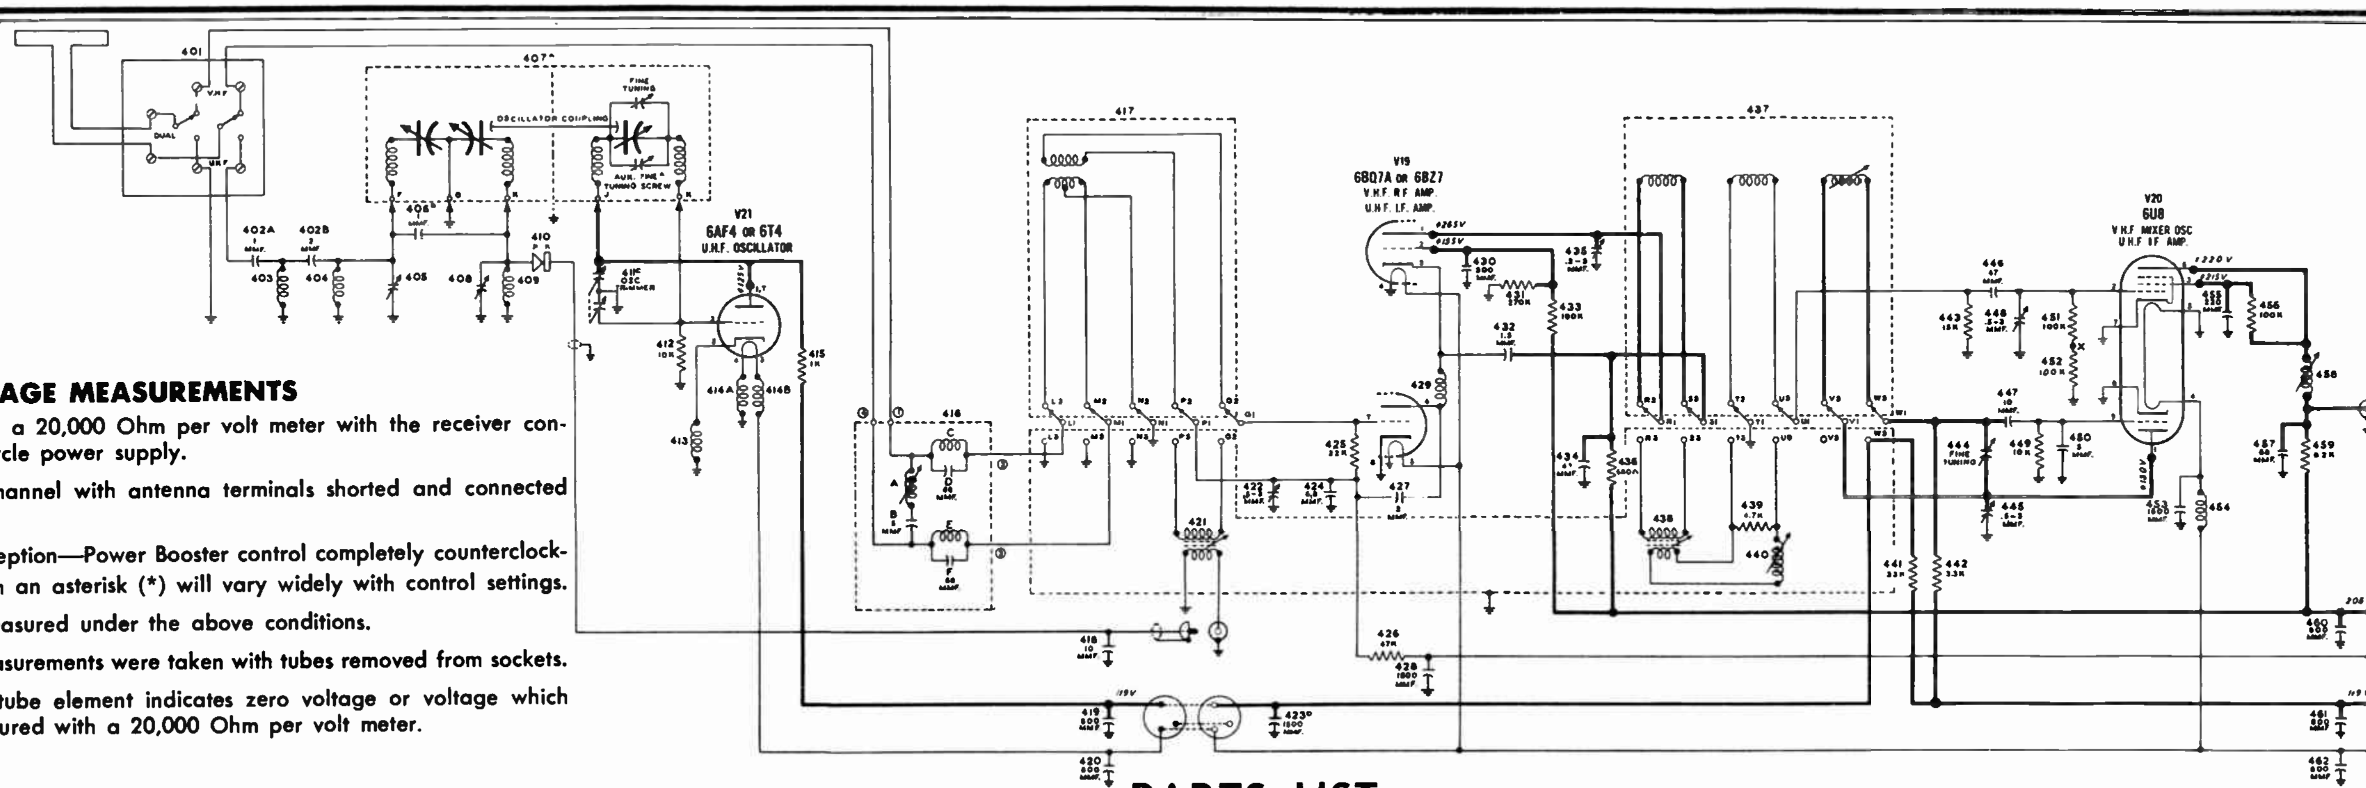

VOLTAGE MEASUREMENTS

All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception—Power Booster control completely counterclockwise. Voltages marked with an asterisk (*) will vary widely with control settings.

B supply voltages were measured under the above conditions.

‡ RF tuner socket voltage measurements were taken with tubes removed from sockets.

No voltage reading at a tube element indicates zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.

PARTS LIST

PRODUCTION CHANGES

The changes listed below were incorporated during the course of tuner production. The letter following the component on the circuit diagram number, thus—407 A, indicates that this item was affected by a circuit change and corresponds to the notes shown below.

NOTE A: There are five different types of U.H.F. tuner strips used in conjunction with this tuner, therefore, inspection of tuner should be made to determine type of strip used for replacement.

With three of these types, the auxiliary fine tuning screw is mounted on the front face of the U.H.F. drum assembly. The color of the plastic coil form is either blue-gray, brown or white. These three coils are interchangeable.

Two of the five types have the auxiliary fine tuning slug mounted directly on the coil form. The color of the plastic form is either brown or white. These latter two coils are interchangeable.

Strips that have the auxiliary fine tuning slug as part of the coil form can not be interchanged with strip whose auxiliary fine tuning screw is mounted on the face of the U.H.F. drum assembly.

NOTE B: On some tuners, condenser 406 (1 Mmfd.), located across the U.H.F. preselection tuning circuit, was formed by a pair of twisted insulated leads.

NOTE C: Some tuners do not have oscillator, trimmer #411.

NOTE D: Condenser #29 (1500 Mmfd.) was added to the 119 volt supply to reduce V.H.F. oscillator radiation.

27" Rectangular Picture Tube
Model 27C-9310A (Mahogany)
Model 27C-9310AB (Blond)

PROCEDURE FOR REMOVAL AND REPLACEMENT OF PICTURE TUBE

Due to the size and weight of the picture tube and the fact that the tube is suspended within the cabinet, the following procedure should be observed whenever replacement is undertaken.

REMOVAL:

1. Disconnect power cord from wall outlet and take off the back of cabinet by removing screws around edges.

2. Remove receiver chassis by first taking off all knobs which may be done by pulling them straight forward. Next, take out the five chassis mounting screws located under chassis mounting shelf. Disconnect focus coil, deflection yoke, picture tube and speaker leads, as well as grounding wire from deflection yoke mounting bracket. Chassis may now be withdrawn from cabinet.

3. CABINET SHOULD NEXT BE PLACED ON ITS FACE ON A CARPETED OR OTHERWISE PROTECTED SURFACE. ALL WORK DESCRIBED IN THE FOLLOWING STEPS SHOULD BE DONE WITH THE CABINET IN THIS POSITION.

4. Slide Ion Trap off picture tube neck.

5. Remove the four corner retaining nuts labeled A in Fig. 24 as well as the four curved retaining plates. Picture tube may be lifted straight up from cabinet **by grasping it under FACE of tube—CAUTION: DO NOT GRASP OF LIFT TUBE BY ITS NECK AS THE WEIGHT OF TUBE (APPROX. 45 LBS.) MIGHT CAUSE IT TO SNAP OFF.** Place tube on its face on a flat protected surface.

6. After tube has been removed loosen the four mounting bracket retaining nuts, labeled B in Fig. 24, and disengage rods from corner brackets. Lift entire focus coil and yoke mounting assembly from neck of tube. This should be done carefully as adhesion of :ubber ring to the flare of the neck may cause assembly to stick to picture tube. Corner brackets on tube may now be removed by loosening the nut labeled C in Fig. 24, that retains the tube mounting strap.

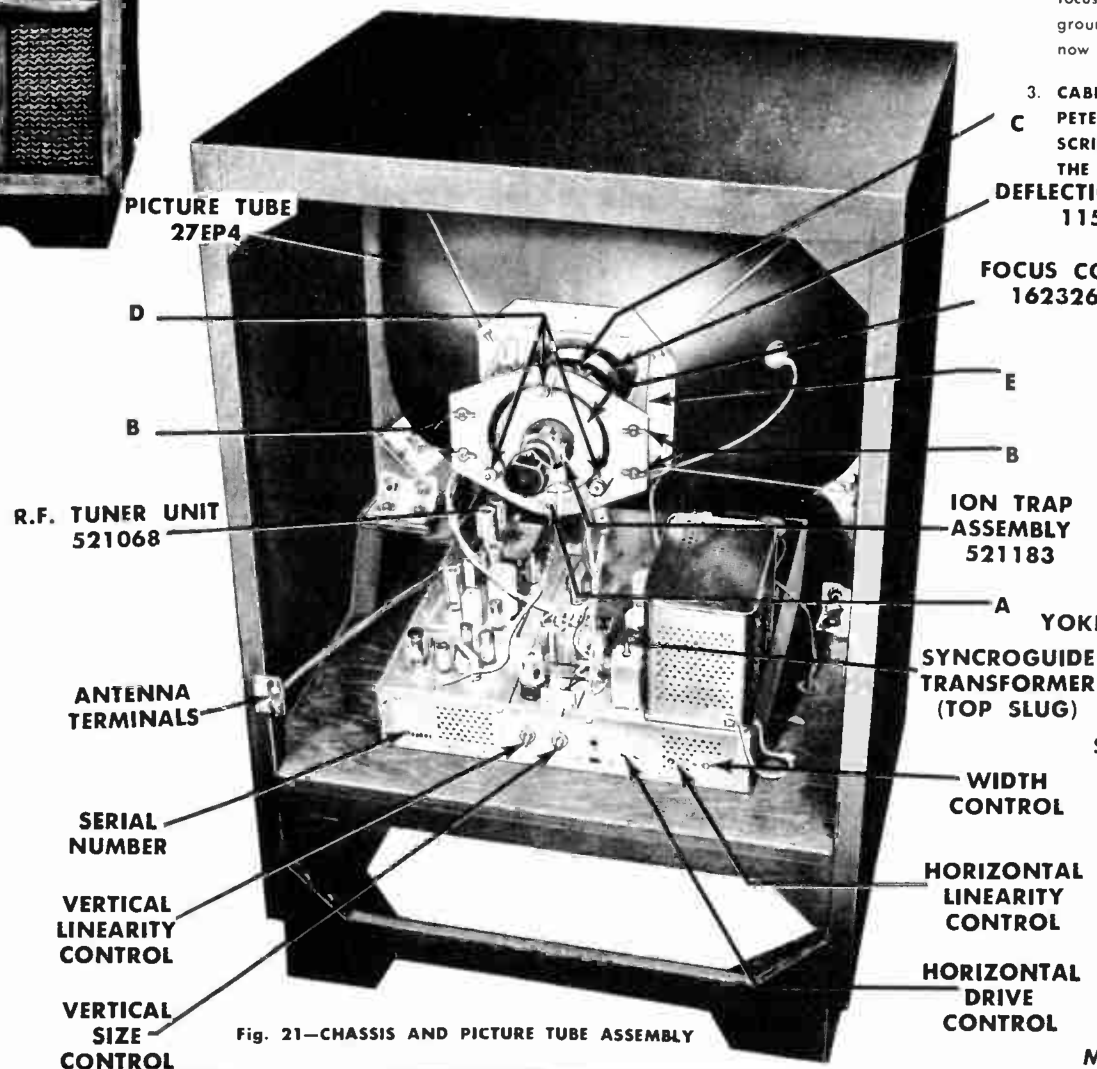

Fig. 21—CHASSIS AND PICTURE TUBE ASSEMBLY

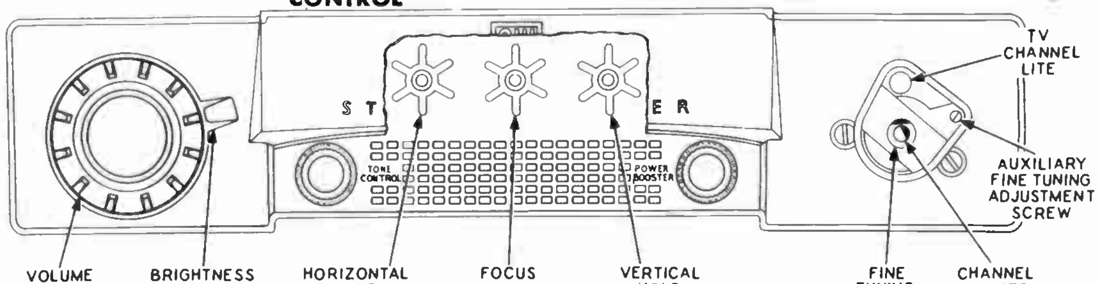

Fig. 11—LOCATIONS OF PRE-SET CONTROLS

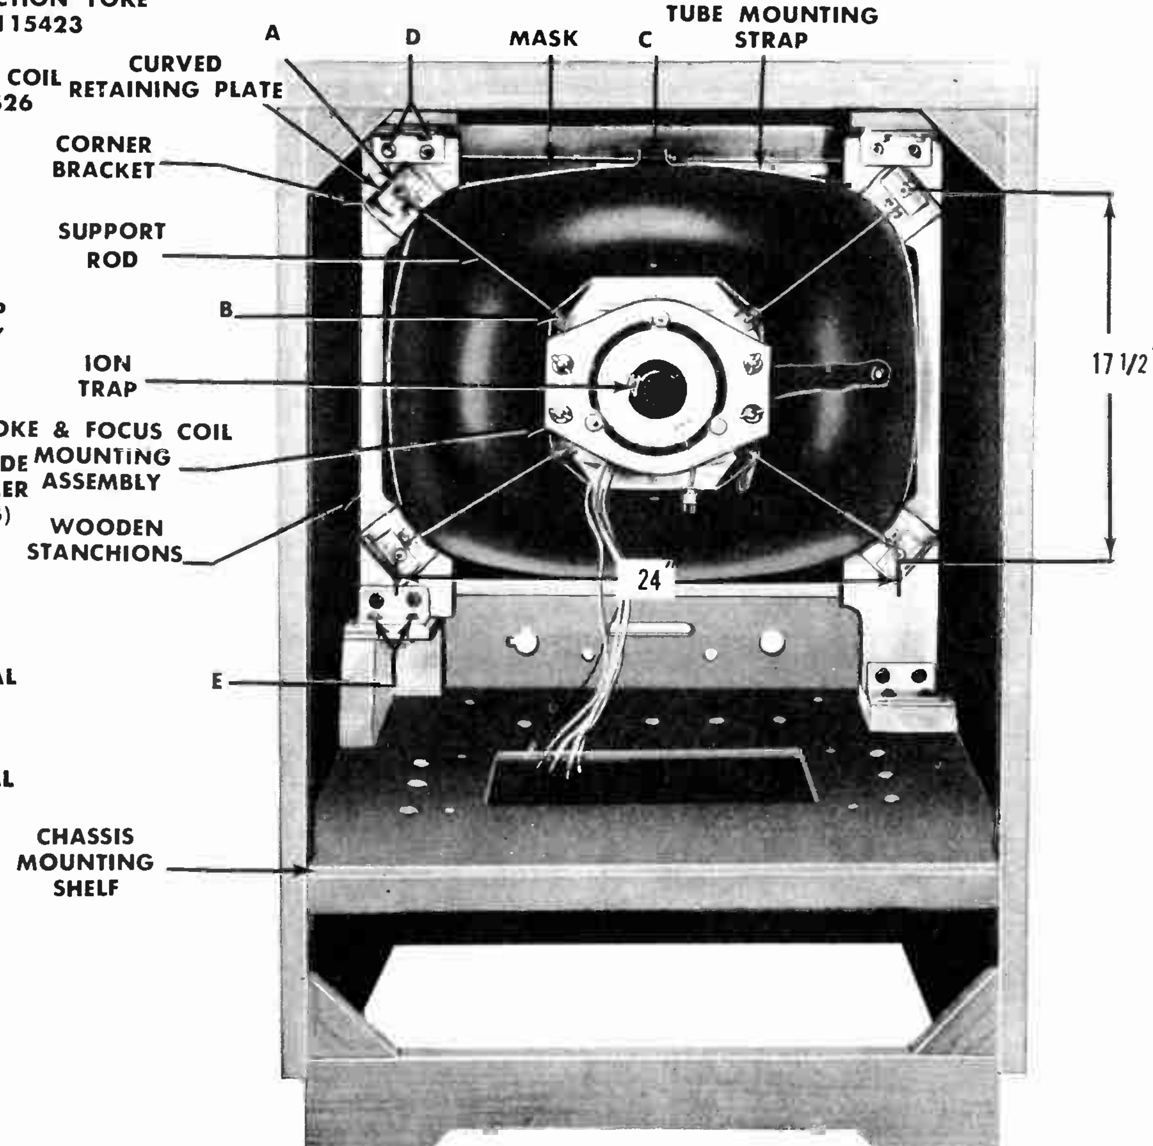

Fig. 24—PICTURE TUBE MOUNTING

REPLACEMENT

The reverse order of the removal procedure should be followed while at the same time exercising the following precautions:

1. Corner brackets and tube mounting strap must be assembled to the picture tube before it is installed into the cabinet and this is accomplished as follows:

   a. Brackets can be temporarily attached to each corner of the picture tube by the use of adhesive tape. They must be placed on each corner of the tube so that the curve of the bracket conforms to the curve of the tube and must be oriented so that the distance between the centers of the square mounting holes, in the brackets, will be 24" on the long side of the tube and 17½" on the short side of the tube. (See Fig. 24 for proper method of measurement.)

   b. Set the tube mounting strap into recesses on corner brackets and tighten nut labeled C until strap is taut. Heel of strap bracket will start to kick up when this tautness is reached.

2. Lower tube into cabinet **by grasping it under its face—CAUTION: DO NOT GRASP OR LIFT TUBE BY ITS NECK.** Should wood stanchions fail to keep tube from seating properly (due to a tolerance difference in the size of the tube) it would then be necessary to again remove tube and to spread distance between stanchions. To do this, loosen ceiling nuts labeled D in Fig. 24 and chassis mounting shelf bolts labeled E.

3. After re-inserting tube into cabinet, and before tightening nuts labeled B, be sure that stanchions are up against corner mounting brackets as far as possible, that there is equal distance on each side between side of stanchion and side wall of cabinet and that ceiling nuts labeled D and chassis mounting shelf bolts labeled E are securely tightened.

4. After tube has been secured and yoke and focus coil mounting assembly has been re-assembled to tube, cabinet can be raised to its normal position. Any forward or backward adjustment of tube with respect to mask can be made by loosening nuts labeled D and bolts labeled E and adjusting position of stanchions.

GENERAL SPECIFICATIONS

PICTURE SIZE

27" Rectangular

DIMENSIONS

Model	Height	Width	Depth
27C-9310A	42¾"	29¼"	23¼"
27C-9310AB	42¾"	29¼"	23¼"

WEIGHT (packed)

Model	Weight
27C-9310A	207 lbs.
27C-9310AB	207 lbs.

POWER REQUIREMENTS

117 volts 60 cycles 275 watts

ANTENNA INPUT IMPEDANCE

300 ohms—balanced to ground.

BUILT-IN ANTENNA

Broad band dipole.

27C-9310AB	P.M. Dynamic	6" x 9"	3.2 ohms

R.F. TUNER

Turret type construction; individually removable coil assemblies for all channels. All components are easily accessible for servicing.

INTERMEDIATE FREQUENCIES

Sound Carrier—21.5 Mc.
Picture Carrier—26 Mc.

I.F. SYSTEM

Three Stages—stagger tuned—for composite signal.
One additional stage for sound channel.

DETECTOR

Sound—Ratio Type
Picture—Germanium Crystal Type

RETRACE LINE SUPPRESSOR

Eliminates retrace lines thruout the normal range of picture brightness and contrast.

DEFLECTION

Magnetic

FOCUS

Magnetic

HORIZONTAL SYNCHRONIZATION

Automatic frequency control provides excellent picture stability.

HIGH VOLTAGE POWER SUPPLY

"Fly-back" type. Completely enclosed in a shielded compartment.

HORIZONTAL OSCILLATOR ADJUSTMENTS

NOTE: These adjustments are very critical and should only be performed by a qualified serviceman. Failure to comply with this caution may result in serious malperformance of the receiver.
If adjustment of the "Horizontal Hold" control as explained in step 3 under the section entitled "Control Adjustment Procedure" fails to lock the picture horizontally, it will be necessary to make the following adjustments:

1. Set "Horizontal Hold" control to its maximum counter-clockwise position.
2. Set "Top Slug" of Syncroguide transformer to its maximum counterclockwise position. Then, adjust "Top Slug" clockwise until picture locks in and does not lose sync when switching "Channel Selector" knob. Turn "Top Slug" counterclockwise until picture is just about ready to lock in sync as shown in Fig. 23.

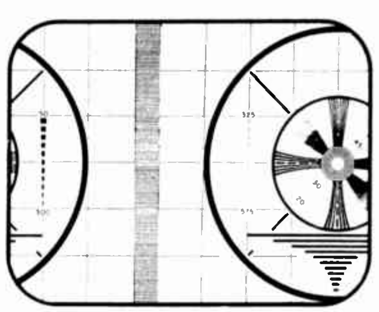

Fig. 23

3. Rotate "Horizontal Hold" control slowly clockwise and picture should hold sync at its maximum clockwise setting.
4. Horizontal holding action of receiver should now be as follows:

   a. When "Horizontal Hold" control is at its maximum counter-clockwise position and "Channel Selector" knob is switched, picture may appear as shown in Fig. 23 or be just out of sync.

   b. When "Horizontal Hold" control is at its maximum clockwise position, picture may lose sync when switching "Channel Selector" knob.

   c. When "Horizontal Hold" control is set in the center or near the center of its range, picture remains stable when switching "Channel Selector" knob.

5. If the preceding steps fail to correct for horizontal movement, then proceed as follows:

   a. Set "Horizontal Drive" control to its maximum counter-clockwise position. See Fig. 21 for location of control.

   b. If any vertical bars appear near the left counter of the picture, adjust "Horizontal Drive" control clockwise until these bars are removed.

   c. Repeat steps 1, 2, 3 and 4.

6. If it still becomes impossible to obtain proper horizontal sync and all tubes and components relating to the horizontal circuit are found to be in good working order, it will be necessary to perform a complete adjustment of the Syncroguide transformer as outlined in the service data section of the service manual.

ALIGNMENT PROCEDURE

The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits.

Alignment of all RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts.

These procedures should preferably be applied in the order in which they are presented. Alignment of Sound Channel or IF Channel may be accomplished individually if desired.

The RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned.

CAUTION

The picture tube is highly evacuated and if broken, fragments will be violently expelled. Handle with care, using safety goggles and gloves.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment process. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated.

   a. IF Frequencies:
   4.5 Mc. Sound Channel
   21.5 Mc. to 26 Mc. IF Channel

   b. RF Frequencies:
   54 to 88 Mc.
   174 to 216 Mc.

2. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.

3. **RF SWEEP GENERATOR** to provide frequency modulated signal for observing the over-all bandpass characteristic and RF Channel alignment at the following frequencies:

   20 to 30 Mc. with 10 Mc. sweep width.
   54 to 88 Mc. with 10 Mc. sweep width.
   174 to 216 Mc. with 10 Mc. sweep width.

4. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe. This instrument is used for observing the over-all band-pass characteristic and for RF Channel alignment.

SOUND CHANNEL ALIGNMENT PROCEDURE

1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel and Power Booster control to its maximum counter-clockwise position; other controls may be left at any desired setting.
3. A small screwdriver (preferably non-metallic) can be used for alignment of Sound IF. The blade of this tool will fit the slot in the core of the transformer.

STANDARD SIGNAL GENERATOR		VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY				
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Power Booster control to its maximum counter-clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in Fig. 3. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2. 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V3, V4 or V5). This will prevent noise in the RF stages from affecting the voltage reading while adjusting the sound trap.	**#1** 4.5 MC Sound Trap (See Fig. 10)	Adjust for minimum reading on VTVM.
Same as above	Same as above.	Connect as shown in Fig. 4.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This spurious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	**#2** Discriminator Secondary (See Fig. 10)	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary (See Fig. 11)	Adjust for maximum reading on VTVM.
				#4 Sound IF Transformer (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 5.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 5.	**#2** Discriminator Secondary (See Fig. 10)	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #2 is obtained when the meter reads zero as the slug is moved thru this point.

Replace the type 6CB6 tube previously removed in the above procedure and turn set on. Tune in to a local channel and should there be an unusual amount of "Intercarrier Buzz" refer to procedure on adjoining page to remove this aforementioned fault.

REDUCTION OF INTERCARRIER BUZZ

Under actuol reception conditions slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an occurate setting of the discriminatar secondary slug under these conditions.

Disconnect all instruments (be sure that I.F. tube remc ved for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

IF CHANNEL ALIGNMENT PROCEDURE

1. A special aligning tool designed to fit the stems on adjustable cores of the I.F. coils (see points 6, 7 and 8 in Fig. 10) is available and may be obtained from Stewart-Warner by requesting I.F. Alignment Tool #507479.

2. In order to eliminate the possibility of spurious oscillations, it is desirable to render the RF oscillator inoperative. This may be readily accomplished by insulating oscillator terminals of tuner. Remove tuner bottom shield and place a piece of transparent cellulose tape on the first two contacts (from front) of drum assembly. Use any inoperative channel and rotate drum to this insulated position.

3. Short antenna terminals together with a jumper wire.

4. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to the AGC line and positive terminal of battery connects to receiver chassis. See Fig. 11 for convenient point of connection.

5. If the IF channel is badly misaligned and two or more immediately adjoining IF stages are tuned to the same frequency, oscillation may occur. Such oscillation shows up as an excessive voltage across the video detector load, circuit reference number 49 and 50, and is indicated by the VTVM that is connected to this point during alignment. It should be noted that voltage due to IF oscillation is unaffected by strength of signal from the generator.

   Where IF oscillation is encountered, it is generally possible to correct the condition by detuning the IF coils in different directions. If that does not have the desired effect, increase fixed bias on AGC line by using a 4½ volt battery instead of the 3 volt battery referred to in instruction #4. After stopping the oscillation in this manner it will then be possible to align all IF stages using the following procedure, however, the AGC bias battery must be changed back to 3 volts when using the oscilloscope to observe band pass characteristics. Once all stages have been aligned using the 4½ volt bias, the IF channel should be stable with reduced bias.

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	'SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
Connect as shown in Fig. 7.	23.5 MC.	Not used.	—	Connect as shown in Fig. 9.	Not used.	Be sure that RF oscillator has been rendered inoperative as outlined in instruction #2 at the head of this chart.	#5 Converter plate coil (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	23.5 MC.	Not used.	—	Same as above.	Not used.	Same as above.	#6 1st I.F. (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	25.9 MC.	Not used.	—	Same as above.	Not used.	Same as above.	#7 2nd I.F. (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	25.9 MC.	Not used.	—	Same as above.	Not used.	Same as above.	#8 3rd I.F. (See Fig. 10)	Adjust for maximum reading on VTVM.
Connect as shown in Fig. 8.	26 MC.	Connect as shown in Fig. 8.	25 MC. Sweep Width 10 Mc.	Same as above.	Connect as shown in Fig. 9	IMPORTANT: 1. Adjust output attenuator on sweep generator so that reading on VTVM is approximately one-half volt. 2. Set attenuator on standard signal generator so that marker signal does not distort the pattern on the oscilloscope. 3. Be sure that a 3 volt battery is connected to AGC line as specified in instruction #4 at the head of this chart. Do not use a battery of any other voltage.	The I.F. bandpass characteristic can now be observed by the use of a 'scope. Its general shape and contour should compare with the curve shown in Fig. 6. The picture carrier marker (26 Mc.) should appear at the 50% (±10%) amplitude position of the curve as shown in Fig. 6. Should this observation fail to meet the above requirements, the complete I.F. alignment procedure must be repeated, exercising greater care in frequency setting of the marker generator and adjusting the I.F. transformer slugs for maximum output at the prescribed frequencies.	
Same as above.	21.5 MC.	Same as above.	Same as above.	Same as above.	Same as above.	Same as above.	The sound carrier marker (21.5 Mc.) can be observed by the use of a 'scope and should be compared with that shown in Fig. 6. Increase the vertical gain control on 'scope in order to magnify the sound portion of the response curve. This marker should appear at the position indicated in Fig. 6. Should the sound marker not be properly positioned, check the setting of the picture carrier marker as indicated in the previous step.

OSCILLATOR ALIGNMENT

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in Fig. 6.
2. During this step and thru-out all succeeding steps it is necessary to keep output of sweep generator at a level that does not allow reading on VTVM to exceed one-half volt.
3. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.

Connect as shown in Fig. 12.	**197.75 MC.** Sound Carrier Marker. **193.25 MC.** Picture Carrier Marker.	Connect as shown in Fig. 12 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	**CHANNEL #10**	Connect as shown in Fig. 14.	Connect as shown in Fig. 14	Set Channel Selector to Channel #10. Be sure that generator's output does not exceed voltage specified in instructions #2 and 3 above.	Using a long non-metallic screwdriver (approx. 12"), adjust channel #10 oscillator slug (accessible thru hole on front of RF Tuner Unit—see Fig. 18) to shift response curve so that picture carrier marker is located at the position indicated in Fig. 17. Position of sound carrier marker should appear as indicated in Fig. 17.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 15.	Same as above.	Set sweep generator to channel frequencies being observed.	Same as above	Same as above.	Set channel selector to channel being observed.	Adjust the RF sweep generator and marker generator for operation on the other television channels. After setting Channel Selector to corresponding channel, adjust oscillator slug thru hole on front of RF Tuner Unit (see Fig. 18). This permits response curve to be shifted so that picture and sound carrier markers will appear at the position indicated in Fig. 17. NOTE: Make sure that cam on fine tuning control shaft remains properly positioned during this step (tooth on the cam pointing downward—see Fig. 18.)

If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel. If characteristic does not conform reasonably well within the typical curve shown in Fig. 16, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channels.

RF CHANNEL ALIGNMENT PROCEDURE

1. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 11 for convenient point of connection.)
2. During alignment, it is necessary to set the Fine Tuning control so that the tooth on the fiber fine tuning cam points downward (correct position for this control is shown in Fig. 18).

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
RF AMPLIFIER AND MIXER ALIGNMENT								
Connect as shown in Fig. 12.	**197.75 MC.** Sound Carrier Marker. **193.25 MC.** Picture Carrier Marker.	Connect as shown in Fig. 12 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	**CHANNEL #10**	Not used.	Connect as shown in Fig. 13.	Set Channel Selector to Channel #10. IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	**#9** Mixer Grid. (See Fig. 19) **#10** RF Amp. Plate. (See Fig. 19) **#11** RF Amp. Grid. (See Fig. 19)	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 16. Use Mixer Grid trimmer #9; and RF Amplifier Plate trimmer #10 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #11 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained. IMPORTANT: When adjusting trimmers #9, 10 and 11 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that would result in a loss of sensitivity.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 15.	Same as above.	Set sweep generator to channel frequencies being observed.	Not used.	Same as above.	Set channel selector to channel being observed.	The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #9, 10 and 11. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers. Band pass characteristic of these channels should conform close to the RF response curve in Fig. 16. If necessary, a compromise may be obtained to compensate for large variations in channel response by returning to channel #10 and making slight changes in the settings of trimmers #9, 10 and 11.	

SYNCROGUIDE TRANSFORMER ALIGNMENT

Alignment of the Syncroguide transformer, circuit diagram #128, which is used in the Horizontal Oscillator circuit can be accomplished by utilizing this procedure. To perform this alignment, it will be necessary to use an oscilloscope, preferably one that has a 2 megacycle response and a low input capacity probe—under 100 mmfd. to ground.

1. Set the "Top Slug" and "Bottom Slug" of the Syncroguide transformer to their maximum counter-clockwise positions.
2. Short together terminals C and D of the Syncroguide transformer.
3. Adjust "Horizontal Drive" control, located on rear of chassis pan, one-half turn out from its maximum clockwise position.
4. Set "Horizontal Hold" control, located at front of chassis, to its maximum clockwise position.
5. Turn on receiver and tune in any local TV channel.
6. Adjust "Top Slug" clockwise until picture just locks in horizontally.
7. Remove short from terminals C and D. If picture does not hold sync when short is removed, adjust "Bottom Slug" clockwise until picture locks in.
8. Connect 'scope to terminal C of Syncroguide transformer and adjust sweep rate of 'scope until two cycles of oscillogram remain stationary. Turn "Bottom Slug" clockwise until wave form peaks are equal in height as shown in Fig. 24.

IMPORTANT: The first peak of the wave form should never be higher than the second peak nor should the first peak be lower than the second peak by more than 3%. Also, when adjusting the "Bottom Slug," the picture must be in sync, therefore, it may be necessary to turn the "Horizontal Hold" control counter-clockwise when performing this step. After this adjustment has been completed, disconnect 'scope from receiver.

9. Set "Horizontal Hold" control counter-clockwise and adjust "Top Slug" until picture is locked in and does not lose sync when switching "Channel Selector" knob. Then, turn "Top Slug" slowly counter-clockwise until picture is just ready to lose sync. as shown in Fig. 27.
10. Horizontal Holding action of receiver should now be as follows:
    a. When "Horizontal Hold" control is at its maximum counter-clockwise position and "Channel Selector" knob is switched, picture may appear as shown in Fig. 27 or be out of sync.
    b. When "Horizontal Hold" control is at its maximum clockwise position, picture may lose sync when switching "Channel Selector" knob.
    c. When "Horizontal Hold" control is in the center or near the center of its range, picture remains stable when switching "Channel Selector" knob.

CIRCUIT DESCRIPTION FOR 521068 RF TUNER

The turret type tuner incorporated in this chassis is of the latest design and utilizes a 6BQ7 or 6BZ7 tube as the R.F. amplifier (V5) and a 6J6 tube (V6) as the Mixer-Oscillator.

Channel selection is accomplished by rotation of the turret containing two sets of easily removable coil assemblies for each channel. The individual antenna coil sections consist of a balanced primary to minimize noise pick-up on the transmission line and an R.F. grid coil which couples the incoming signal to the grid of the first section of the R.F. Amplifier tube (V5). The inductance and amount of coupling of the tuned antenna input circuit are changed for each channel so that a constant input impedance of 300 ohms is maintained. This provides maximum transfer of energy to the R.F. Amplifier stage, particularly when interconnection between an outdoor antenna and the receiver is made with 300 ohm transmission line.

The R.F. Amplifier tube is a dual-triode tube and is connected in the circuit as a direct coupled grounded-grid type amplifier. This circuit was developed to meet the demand for an R.F. Amplifier that would provide more nearly equal gain on both the low and high Television Channels, while keeping inherent tube noise to a minimum. The circuit can be thought of very simply as two triode tubes in series, the first or driver unit acting not as an amplifier, but rather as an antenna impedance matching device and also as a variable cathode impedance, or bias source, for the second, or grounded-grid unit. In addition the first unit of the R.F. Amp. acts as a power amplifier due to its extremely low plate impedance, which is in reality the cathode circuit of unit two, and converts the weak signal voltage from the antenna to a low voltage-high current signal which is then applied to the cathode of unit number two. The signal coupling unit between the first and second units is a series peaking coil, symbol 406, similar to that found in a video amplifier circuit. Its purpose is to form a series resonant circuit with the input capacity of the second unit. The coil is so made as to resonate at a frequency slightly higher than channel 13. In a standard pentode type amplifier, the gain falls off rapidly as progressively higher channels are selected. With the use of the plate to cathode peaking coil an almost equal gain can be realized for all channels.

The R.F. Amp. tube has inherently low interelectrode capacity due to physical design and this factor in conjunction with the low output impedance of the first section is responsible for the low noise factor at this stage. While neutralization of the first unit is not necessarily due to its low plate to grid capacity, additional noise reduction has been realized, with only a slight decrease in gain, by the addition of a neutralizing condenser, item 405. Due to the low output impedance of the stage, it is not necessary that the neutralizing condenser be tunable.

Because of the circuits' excellent internal shielding, low input impedance and radiation rejection, the second section of the R.F. Amp. is connected as a driven grounded-grid amplifier. While this might not be apparent at first glance due to the fact that grid has no direct D.C. return, it will be found upon further examination that any high frequency A.C. potentials are by-passed to ground through condenser 407.

The second section of turret coils includes the tuned R.F. amplifier plate coil, tuned mixer grid coil, and oscillator coil. The output of the R.F. amplifier stage is coupled to the grid of the mixer stage, which utilizes one triode section of a 6J6 tube (V6). The other half of the 6J6 is connected as a modified Colpitts oscillator which injects oscillator voltage into the mixer stage through coupling between the oscillator coil and the mixer grid coil. Course oscillator tuning is accomplished by adjusting the positions of the slugs in the individual oscillator coils, while Fine Tuning is obtained when using condenser #417 in the oscillator plate circuit. This Fine Tuning condenser is composed of two fixed plates, and its capacitance is changed by the insertion of a bakelite cam between these plates.

Signal output from the mixer stage is coupled to the IF amplifiers through the converter plate I.F. coil, diagram #427, located on the tuner unit.

REPAIR DATA FOR 521068 RF TUNER

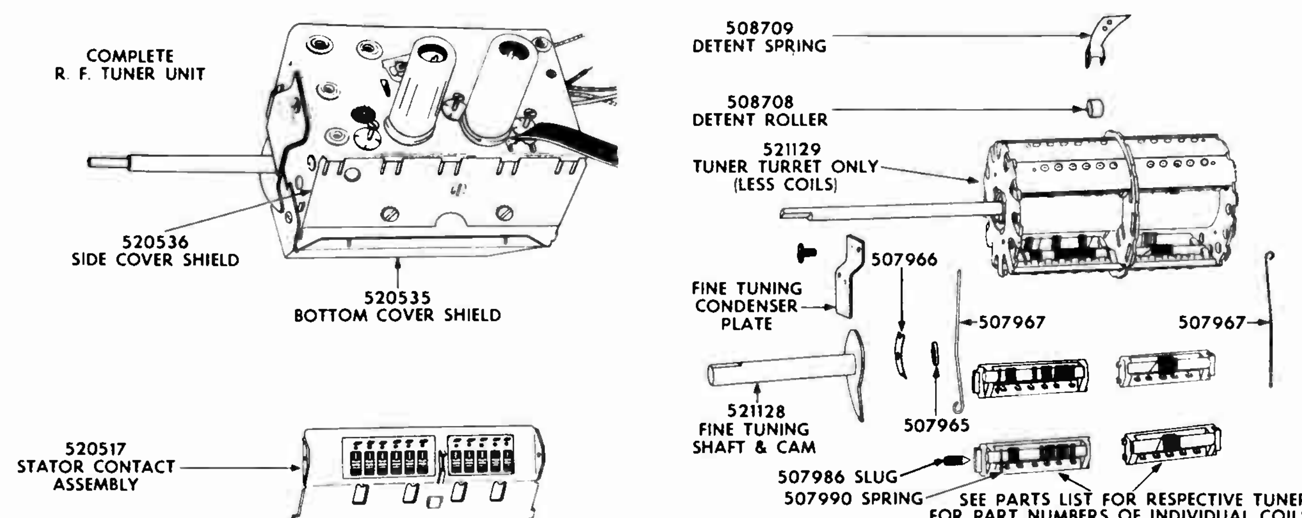

FIG. 20

SERVICE PRECAUTIONS

SUBJECT	PRECAUTIONS
ELECTRICAL COMPONENTS	The high frequencies used in the RF section of a television receiver make it necessary that considerable care be exercised in servicing the tuner. Lead dress and location of components are very critical at these frequencies. When replacing parts, it is important to use components of identical electrical characteristics and physical size. Always reconnect the replacement item in the same location and position in the tuner as the original component.
TUBES	Replacement of tubes in the Tuner Unit may cause slight detuning of RF circuits due to inherent differences in inter-electrode capacitances. When replacing tubes (especially 6J6 mixer-oscillator tube) make sure that Fine Tuning control will tune in television stations at approximately the middle of its range. It may be necessary to change the setting of the individual oscillator coil slugs for some channels to accomplish this.

SUBJECT	PRECAUTIONS
CHANNEL COILS AND SLUGS	Channel Coils must be handled with care. **Do not disturb coil windings.** If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.
FINE TUNING CONTROL	Rubbing of the bakelite Fine Tuning Cam against the Fine Tuning Condenser Plate is intentional in order to avoid vibration with resulting microphonics. However, the Fine Tuning Cam should **not** rub or contact the small circular plate located on the body of the tuner.

REMOVAL AND REPLACEMENT OF PARTS

ITEM	PROCEDURE
RF TUNER UNIT	To remove the Tuner Unit from receiver chassis, proceed as follows: 1. Remove channel selector dial lamp socket. 2. Remove screws which hold tuner to front and rear support brackets. 3. Disconnect the leads from the tuner to the main chassis. See illustration on circuit diagram page showing tuner connections. 4. Tuner unit may now be withdrawn from underside of chassis.
CHANNELS COILS	It is not necessary to remove entire tuner unit to replace a snap-in channel coil but removal of bottom shield will be required. This may be accomplished by grasping the front end of the shield and pulling downward and unhooking it from rear of tuner frame. Insert a screwdriver blade between Coil Retainer Spring and the end of the Tuner Turret. Twist the blade to pull spring away from the molded body of Channel Coil. Lift this end of coil body upward and remove individual coil assembly from tuner. When replacing Channel Coils, be sure they are reinstalled in their correct positions. Coil numbers should increase consecutively in a counter-clockwise direction when tuner is viewed from the front. If all the Channel Coils have been removed from the Tuner Turret, rotate turret until flat surface on end of tuner shaft points down. Install #3 Channel Coils into bottom position on turret. Then follow the correct sequence indicated above to replace other coils.
TUNER TURRET ASSEMBLY	To remove turret from RF Tuner Unit, remove complete tuner and bottom shield as described in previous sections and proceed as follows: 1. Remove rear Turret Shaft Retaining Spring by disengaging straight end of spring from projection on tuner frame. 2. Remove Fine Tuning Condenser Plate from front of Tuner Unit. This plate forms one side of Fine Tuning control condenser and is held in place by one screw. 3. Slide Fine Tuning Cam and Shaft off of main Channel Selector Shaft. 4. Remove Spring Contactor Washer and Fiber Spacer Washer from Channel Selector Shaft. 5. Remove Shaft Retaining Spring at front of tuner by disengaging straight end of spring from projection on frame. 6. Remove turret assembly from frame. To replace turret, reverse the above procedure. Tooth on bakelite Fine Tuning Cam should point downward during assembly so that it does not become locked between the stops on the Fine Tuning Condenser Plate. Also be sure to replace bottom shield.
STATOR CONTACT ASSEMBLY	To remove this assembly, remove complete tuner as described in previous sections and proceed as follows: 1. Remove side shield by taking out the two retaining screws and unsolder shield at one point. Now, disengage shield from upper edge of tuner frame. 2. Remove the two screws at the front and rear of the Stator Contact Assembly. 3. Unsolder all electrical connections to contact plate. 4. Unsolder five soldered joints between Stator Contact Assembly and Tuner Unit. 5. Contact Assembly may now be withdrawn from frame. To reinstall this assembly: 1. Place Stator Contact Assembly in position and replace, but do not tighten, the two screws at the front and rear of the assembly. 2. Remove 3 consecutive pairs of Channel Coils from the turret (for example, the antenna and rf-osc. coils for channels #5, 6 and 7). 3. Position Tuner Turret so that the edges of the next highest Channel Coils (in this case, the coils for channel #8) just pass the row of 11 contacts on the Stator Contact Assembly. 4. Adjust position of the Stator Contact Assembly so that there are a few thousandths of an inch spacing between the contacts on the contact plate and the molded body of the Channel Coils. 5. The Contact Assembly is now correctly positioned and screws at front and rear may be tightened. 6. Solder Stator Contact Assembly to tuner frame at same points that were used previously. 7. Make all electrical connections to contact plate. 8. Replace Channel Coils. 9. Replace side shield.

CIRCUIT DIAGRAM FOR 521068 RF TUNER

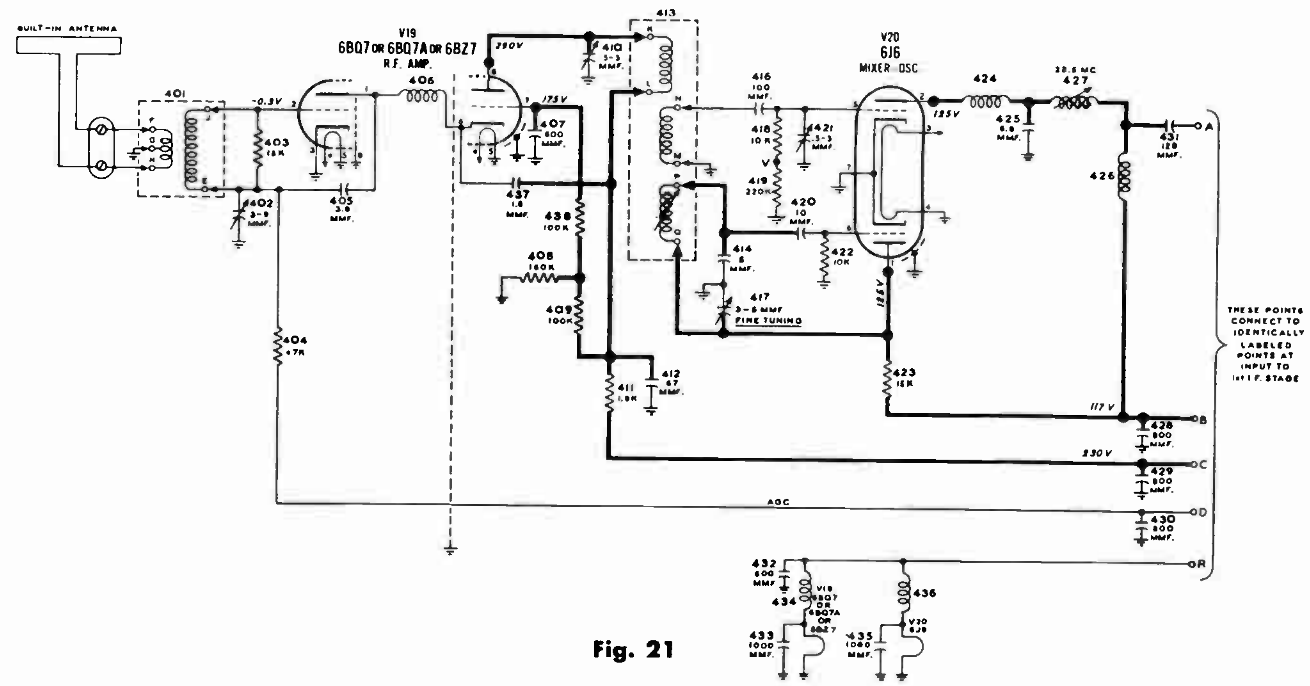

Fig. 21

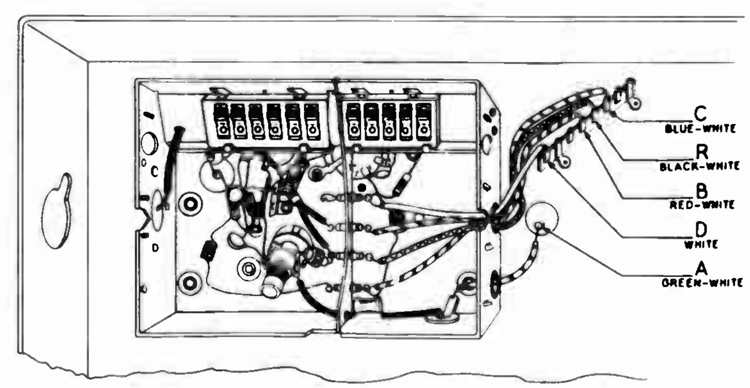

BOTTOM VIEW OF CHASSIS SHOWING CONNECTIONS TO RF TUNER UNIT

FIG. 22

VOLTAGE MEASUREMENTS

All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception—Power Booster control completely counterclockwise.

Voltages marked with an asterisk (*) will vary widely with control settings.

B supply voltages were measured under the above conditions.

R.F. tuner socket voltage measurements were taken with tubes removed from socket.

No voltage reading at a tube element indicate zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.

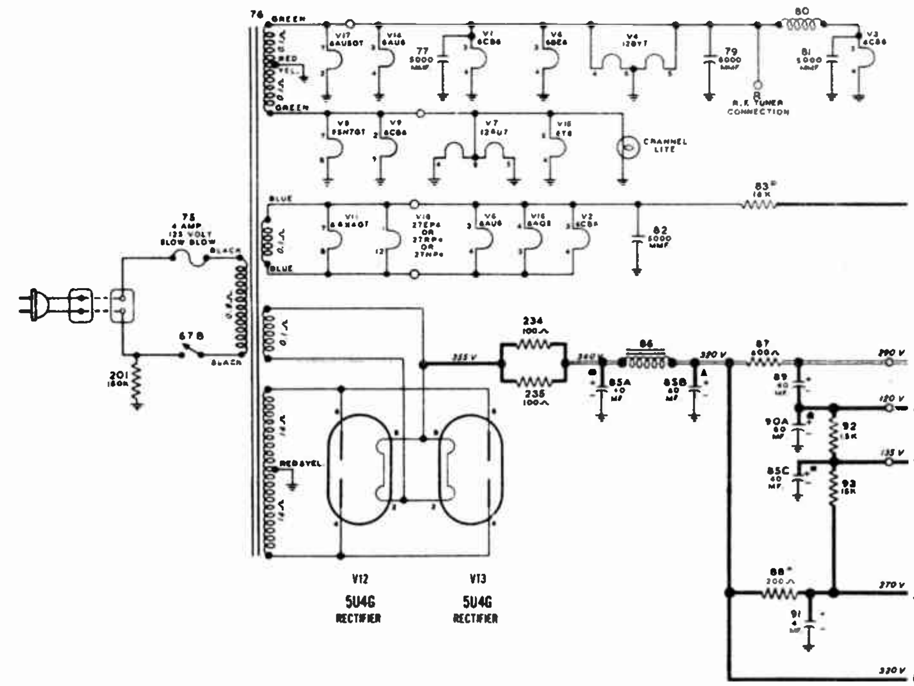
PRODUCTION CHANGES

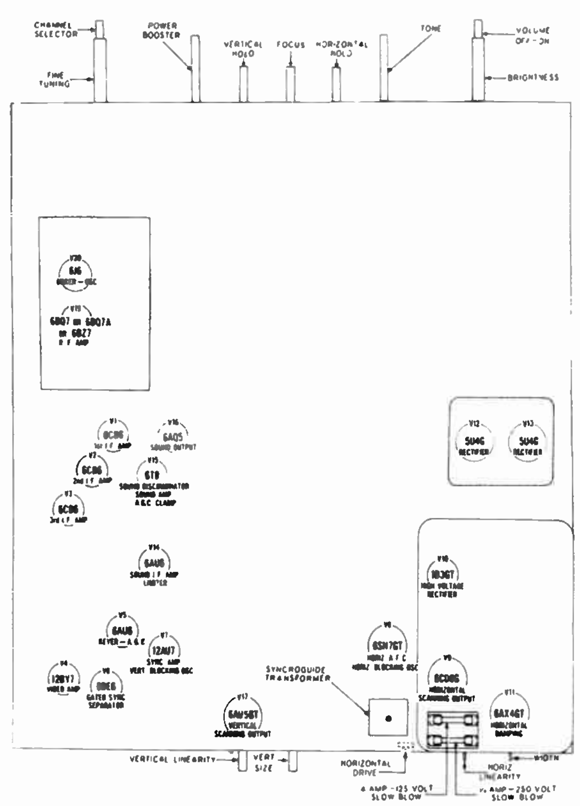
The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. The coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D".

The circuit shown on this page applies to "SERIES ABCD" chassis

A letter following the component circuit diagram number thus—201^A, indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change column, from which complete change information can be obtained.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
UNCODED	**INITIAL PRODUCTION**
"A"	The following change was incorporated to improve sync. stability in the presence of electrical interference or weak signal. 1. Disconnect resistor 94 (18,000 Ohms) from the plate of tube V4-12BY7 (Video Amp.) and reconnect it to the junction of resistors 54 (2200 Ohms) and 55 (1800 Ohms) located in plate load circuit of tube V4. Note: The sound take-off for tube V14 (Sound I.F. Amp.) remains connected to the plate of tube V4 (Video Amp.) The following change was incorporated to provide for adequate width of the picture under the condition of low line voltage. 1. Change resistor 88 in 280 volt supply from 400 Ohms to 200 Ohms. The following change was incorporated to provide a greater margin of safety for the plate load resistor of tube V7A (12AU7). 1. Change resistor 105 located in plate circuit of tube V7A (Sync. Amp.) from 4700 Ohms ½ watt to 4700 Ohms 1 watt.
"B"	The following change was incorporated to protect resistor 88, located in the 280 volt supply, in the event of abnormal current drain in the high voltage system. 1. Change fuse 149 in the horizontal sweep circuit from a ½ Amp. 250 volt to a ¼ Amp. "Slow Blow" 250 volt.
"C"	The following changes were incorporated to improve the range of the horizontal hold control. 1. Change resistor 120, located in the plate circuit of tube V7A (Horiz. A.F.C.) from 22,000 Ohms to 68,000 Ohms. 2. Change resistor 124 located in the plate circuit of tube V7A (Horiz. A.F.C.) from 68,000 Ohms to 120,000 Ohms. The above change should only be undertaken when the letter "A" is included in the SERIES designation at rear of chassis.
"D"	The following change was incorporated to protect the filament winding of power transformer 76 that connects to the 6AX4GT (Horiz. Damping) in the event this tube develops a cathode to filament short. 1. Change resistor 83, located in filament supply, from 100,000 Ohms to 18,000 Ohms.





TUBE AND CONTROL LOCATIONS

VOLTAGE MEASUREMENTS

All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception—Power Booster control completely counterclockwise.

Voltages marked with an asterisk (*) will vary widely with control settings.

No voltage reading at a tube element indicates zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.

OSCILLOGRAMS

All oscillograms taken with ground lead of 'Scope connected to receiver chassis and controls set for normal reception. Power Booster control adjusted to give 50 volts peak to peak at cathode of picture tube. Oscilloscope vertical amplifier response was flat to within 20% at 2 MC.

Number appearing to the left of oscillogram specifies setting of horizontal sweep frequency control on 'Scope.

21" Rectangular Picture Tube
Model 21C-9325F (Mahogany)
Model 21C-9325G (Blond)

GENERAL SPECIFICATIONS

DIMENSIONS

Model	Height	Width	Depth
21C-9325F	37½"	25⅛"	22¾"
21C-9325G	37½"	25⅛"	22¾"

WEIGHT (packed)

Model	Weight
21C-9325F	130 lbs.
21C-9325G	132 lbs.

POWER REQUIREMENTS

117 volts 60 cycles 220 watts

PICTURE SIZE

21" Rectangular

ANTENNA INPUT IMPEDANCE

300 ohms—balanced to ground.

BUILT-IN ANTENNA

Broad band dipole.

R. F. TUNER

V.H.F.—Turret type
U.H.F.—Continuous tuning type

SPEAKER

Model	Type	Size	V.C. Imped.
21C-9325F	P.M. Dynamic	6"x9"	3.2 ohms
21C-9325G	P.M. Dynamic	6"x9"	3.2 ohms

INTERMEDIATE FREQUENCIES

Sound Carrier—41.25 Mc.
Picture Carrier—45.75 Mc.

I.F. SYSTEM

Three Stages—overcoupled—for composite signal.
One additional stage for sound channel.

DETECTOR

Sound—Ratio Type
Picture—Germanium Crystal Type
U.H.F. Mixer—Silicone Crystal Type

RETRACE LINE SUPPRESSOR

Eliminates retrace lines thruout the normal range of picture brightness and contrast.

DEFLECTION

Magnetic

FOCUS

Electrostatic

HORIZONTAL SYNCHRONIZATION

Automatic frequency control provides excellent picture stability.

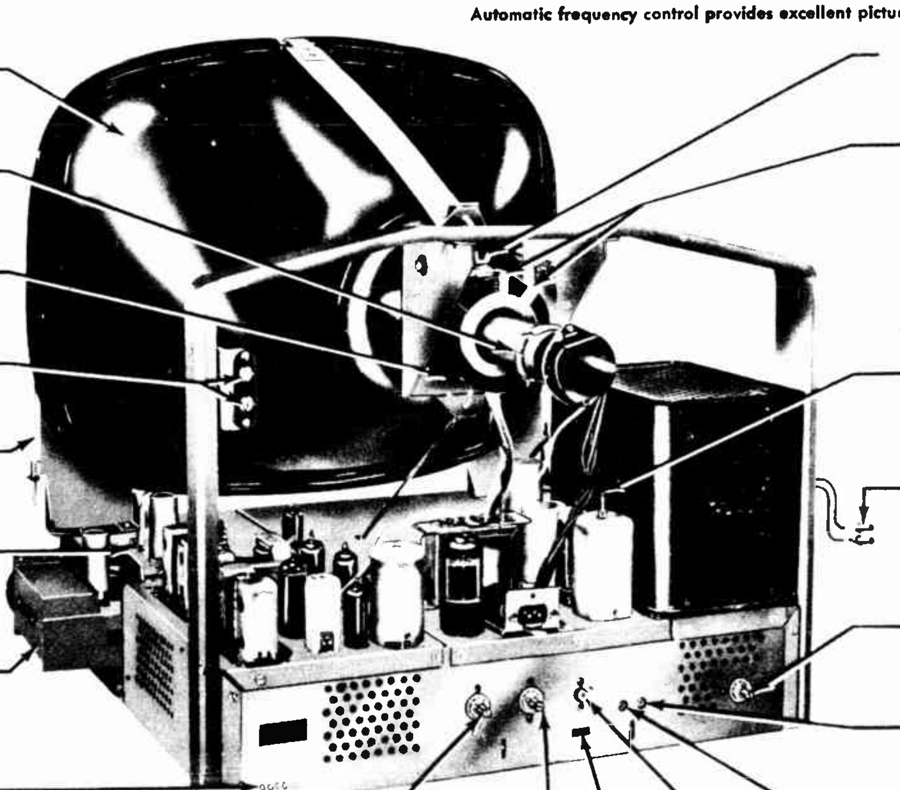

Fig. 16—CHASSIS AND PICTURE TUBE ASSEMBLY

ALIGNMENT PROCEDURE

The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits.

Alignment of all VHF RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts. These procedures should preferably be applied in the order in which they are presented. Alignment of Sound Channel or IF Channel may be accomplished individually if desired.

The VHF RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned.

CAUTION

The picture tube is highly evacuated and if broken, fragments will be violently expelled. Handle with care. Avoid contact with metal shell of picture tube as this is part of the high voltage circuit.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated.
   a. IF Frequencies:
   4.5 Mc. Sound Channel
   39.75 Mc. to 47.25 Mc. IF Channel
   b. RF Frequencies:
   54 to 88 Mc.
   174 to 216 Mc.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the UHF Tuner, part 521170, must be returned to the factory in accordance with the removal instructions, listed in a subsequent section under the heading "VHF-UHF Tuner Servicing Procedure" located on page 1953-33.
2. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.
3. **RF SWEEP GENERATOR** to provide frequency modulated signal for observing the over-all bandpass characteristic and RF Channel alignment at the following frequencies:

   40 to 50 Mc. with 10 Mc. sweep width.
   54 to 88 Mc. with 10 Mc. sweep width.
   174 to 216 Mc. with 10 Mc. sweep width.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the UHF Tuner, part 521170, must be returned to the factory in accordance with the removal instructions, listed in a subsequent section under the heading "VHF-UHF Tuner Servicing Procedure" located on page 1953-33.
4. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe. This instrument is used for observing the over-all bandpass characteristic and for RF Channel alignment.

SOUND CHANNEL ALIGNMENT PROCEDURE

1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel and Power Booster control to its maximum counter-clockwise position; other controls may be left at any desired setting.
3. A small screwdriver (preferably non-metallic) can be used for alignment of Sound IF. The blade of this tool will fit the slot in the core of the transformer.

STANDARD SIGNAL GENERATOR: CONNECTIONS	STANDARD SIGNAL GENERATOR: FREQUENCY	VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Power Booster control to its maximum counter-clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in Fig. 3. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V1, V2 or V3). This will prevent noise in the RF stages from affecting the voltage reading while adjusting the sound trap.	#1 4.5 MC Sound Trap (See Fig. 10)	Adjust for minimum reading on VTVM.
Same as above	Same as above.	Connect as shown in Fig. 4.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This spurious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	#2 Discriminator Secondary (See Fig. 10)	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary (See Fig. 8)	Adjust for maximum reading on VTVM.
				#4 Sound IF Transformer (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 5.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 5.	#2 Discriminator Secondary (See Fig. 10)	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #2 is obtained when the meter reads zero as the slug is moved thru this point.

Replace the type 6CB6 tube previously removed in the above procedure and turn set on. Tune in to a local channel and should there be an unusual amount of "Intercarrier Buzz" refer to procedure on adjoining page to remove this aforementioned fault.

INSTRUMENT CONNECTIONS FOR SOUND CHANNEL ALIGNMENT

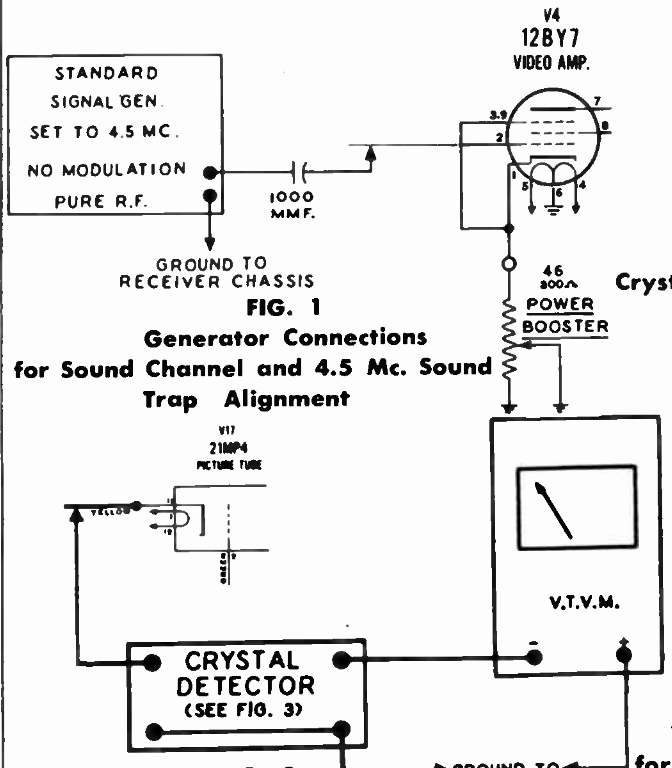

FIG. 1
Generator Connections for Sound Channel and 4.5 Mc. Sound Trap Alignment

FIG. 2
Crystal Detector and VTVM Connections for 4.5 Mc. Sound Trap Alignment

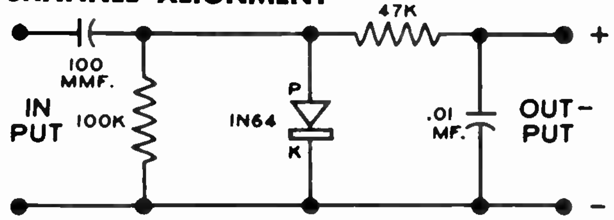

FIG. 3
Circuit Diagram for Crystal Detector shown in Fig. 2

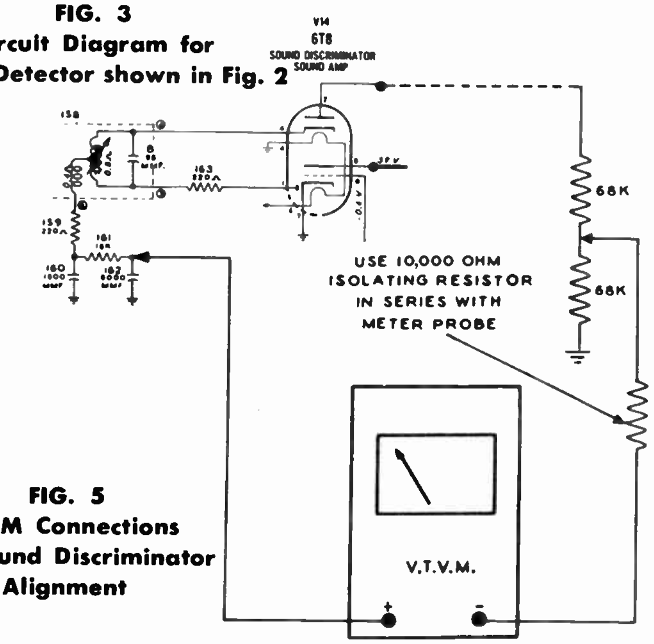

FIG. 5
VTVM Connections for Sound Discriminator Alignment

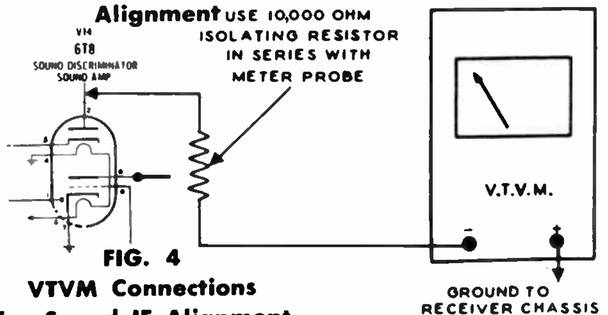

FIG. 4
VTVM Connections for Sound IF Alignment

REDUCTION OF INTERCARRIER BUZZ

Under actual reception conditions slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under these conditions.

Disconnect all instruments (be sure that I.F. tube removed for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

IF CHANNEL ALIGNMENT PROCEDURE

1. A non-metallic screw driver must be used when adjusting the trimmers of the IF transformers to prevent a false indication.
2. In order to eliminate the possibility of spurious oscillation, it is desirable to render the VHF RF oscillator inoperative. This may be accomplished by insulating oscillator contacts on the tuner strips. Remove tuner bottom shield and place a piece of transparent cellulose tape on the first two contacts (from front) of drum assembly. Use any inoperative channel and rotate drum to this insulated position.
3. Short antenna terminals together with a jumper wire.
4. Connect a V.T.V.M. and oscilloscope as shown in Fig. 7.
5. Adjust output attenuator on sweep generator so that reading on V.T.V.M. is not in excess of one volt.
6. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.
7. Certain alignment steps will require a fixed 3 volt A.G.C. bias. When necessary, connect negative terminal of battery to the receiver A.G.C. line and positive terminal to receiver chassis. See Fig. 8 for convenient point of connection.

GENERATOR CONNECTIONS	GENERATOR FREQUENCIES	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
	STANDARD SIGNAL GENERATOR 42 Mc. & 45 Mc. SWEEP GENERATOR 45 Mc. Sweep Width 10 Mc.	Detune 2nd IF transformer by soldering a short piece of wire or connecting a clip to pin 5 of V2 (6CB6, 2nd IF Amp.) Other end of wire or clip is left unconnected.	# 5 and # 6 3rd IF Trans. (See Fig. 9)	Adjust trimmers for maximum amplitude, bandwidth and correct positioning of markers as shown. 	STANDARD SIGNAL GENERATOR 42 Mc., 43.5 Mc. & 44.9 Mc. SWEEP GENERATOR 45 Mc. Sweep Width 10 Mc.	Remove detuning clip discussed in previous step. Connect a 3 volt battery to receiver AGC system as explained in instruction 7 at the head of this chart.	# 7 and # 8 2nd IF Trans. (See Fig. 9)	Adjust trimmers for maximum amplitude, bandwidth and correct positioning of markers as shown. 	STANDARD SIGNAL GENERATOR 41.25 Mc. SWEEP GENERATOR Not Used	Disconnect 3 volt AGC battery from receiver.	# 9 Sound IF Trap (See Fig. 9)	Adjust for minimum reading on V.T.V.M.
	STANDARD SIGNAL GENERATOR 47.25 Mc. SWEEP GENERATOR Not Used	Same as above.	# 10 Adjacent Sound IF Trap (See Fig. 9)	Adjust for minimum reading on V.T.V.M.
	STANDARD SIGNAL GENERATOR 42.5 Mc. & 44.5 Mc. SWEEP GENERATOR 45 Mc. Sweep Width 10 Mc.	Connect a 3 volt battery to receiver AGC system as explained in instruction 7 at the head of this chart.	# 11 2nd IF Grid Coil and # 12 1st IF Plate Coil (See Fig. 9)	Adjust trimmers for maximum amplitude bandwidth and correct positioning of markers as shown. 	STANDARD SIGNAL GENERATOR 39.75 Mc. SWEEP GENERATOR Not Used	Disconnect 3 volt AGC battery from receiver.	# 13 Adjacent Picture IF Trap (See Fig. 9)	Adjust for minimum reading on V.T.V.M.
	STANDARD SIGNAL GENERATOR 42.5 Mc. & 44.5 Mc. SWEEP GENERATOR 45 Mc. Sweep Width 10 Mc.	Connect a 3 volt battery to receiver AGC system as explained in instruction 7 at the head of this chart.	# 14 1st IF Grid Coil (See Fig. 9) #15 Converter Plate Coil (See Fig. 10)	Adjust trimmers for maximum amplitude, bandwidth and correct positioning of markers as shown. 	STANDARD SIGNAL GENERATOR 39.75 Mc., 41.25 Mc., 45.75 Mc. & 47.25 Mc. SWEEP GENERATOR 45 Mc. Sweep Width 10 Mc.	Same as above.		The general shape of the overall IF response curve and position of markers should compare with that shown. The picture carrier marker (45.75 Mc.) should appear at approximately the 50% amplitude position. Should this observation fail to meet the above requirement, it will be necessary to make a small change in the setting of one or a combination of the following trimmers until the desired results are achieved. Trimmers, # 5, 6, 7, 8, 11, 12, 14 and slug 15. The sound carrier marker (41.25 Mc.) should appear at the position shown on the curve. If the position of this marker is not correct, then it will be necessary to readjust the setting of trimmer # 9 as explained previously in this procedure. To properly observe the position of the adjacent channel picture carrier (39.75 Mc.) and the adjacent channel sound carrier (47.25 Mc.), it will be necessary to increase the vertical gain control on the 'scope and the output of the sweep and standard signal generators. Also, be sure to disconnect the 3 volt AGC battery from receiver. If these markers do not compare favorably with that shown, repeat the adjustment of trimmers # 10 and 13 as explained previously in this procedure, exercising greater care in obtaining a minimum reading on the VTVM.

VHF RF CHANNEL ALIGNMENT PROCEDURE

The procedure listed below is only for the VHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the UHF Tuner, part 521170, must be returned to the factory in accordance with the removal instructions, listed in a subsequent section under the heading "VHF-UHF Tuner Servicing Procedure," located on page 1953-33.

1. **CAUTION:** The shell of the picture tube has a high voltage potential, approximately 14,000 volts, and contact should be avoided. As the adjustment screws are in relatively close proximity to this shell, some means of insulation from accidental contact should be provided.
2. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 8 for convenient point of connection.)

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
RF AMPLIFIER AND MIXER ALIGNMENT								
Connect as shown in Fig. 11.	197.75 MC. Sound Carrier 193.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #10	Not used.	Connect as shown in Fig. 12.	Set Channel Selector to #10. IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	#16 Mixer Grid. (See Fig. 18) #17 RF Amp. Plate. (See Fig. 18) #18 RF Amp. Grid. (See Fig. 18)	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 15. Use Mixer Grid trimmer #16; and RF Amplifier Plate trimmer #17 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #18 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained. **IMPORTANT:** When adjusting trimmers #16, 17 and 18 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that would result in a loss of sensitivity.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Not used.	Same as above.	Set channel selector to channel being observed.	The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #16, 17 and 18. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers. Band pass characteristic of these channels should conform close to the RF response curve in Fig. 15. If necessary, a compromise may be obtained to compensate for large variations in channel response by returning to channel #10 and making slight changes in the settings of trimmers #16, 17 and 18.	

OSCILLATOR ALIGNMENT

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in IF alignment procedure.
2. During oscillator alignment, it is necessary to set the Fine Tuning control so that the tooth on the fiber fine tuning cam points downward (correct position for this control is shown in Fig. 17).
3. During this step and thru-out all succeeding steps it is necessary to: keep output of sweep generator at a level that does not allow reading on VTVM to exceed one volt.
4. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.

Connect as shown in Fig. 11.	197.75 MC. Sound Carrier Marker. 193.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #10	Connect as shown in Fig. 13.	Connect as shown in Fig. 13.	Set Channel Selector to #10. Be sure that generator's output does not exceed voltage specified in instructions #3 and 4 above.	Using a long, non-metallic screwdriver (approx. 12"), adjust channel #10 oscillator slug (accessible thru hole on front of RF Tuner Unit—see Fig. 17) shift response curve so that picture carrier marker is located at the position indicated in Fig. 16. Position of sound carrier marker should appear as indicated in Fig. 16.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Same as above.	Same as above.	Set channel selector to channel being observed.	Adjust the RF sweep generator and marker generator for operation on the other television channels. After setting Channel Selector to corresponding channel, adjust oscillator slug thru hole on front of RF Tuner Unit (see Fig. 17). This permits response curve to be shifted so that picture and sound carrier markers will appear at the position indicated in Fig. 16. NOTE: Make sure that cam on fine tuning control shaft remains properly positioned during this step (tooth on the cam pointing downward—see Fig. 17).

If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel. If characteristic does not conform reasonably well within the typical curve shown in Fig. 15, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channels.

REPAIR DATA FOR V.H.F. RF TUNER

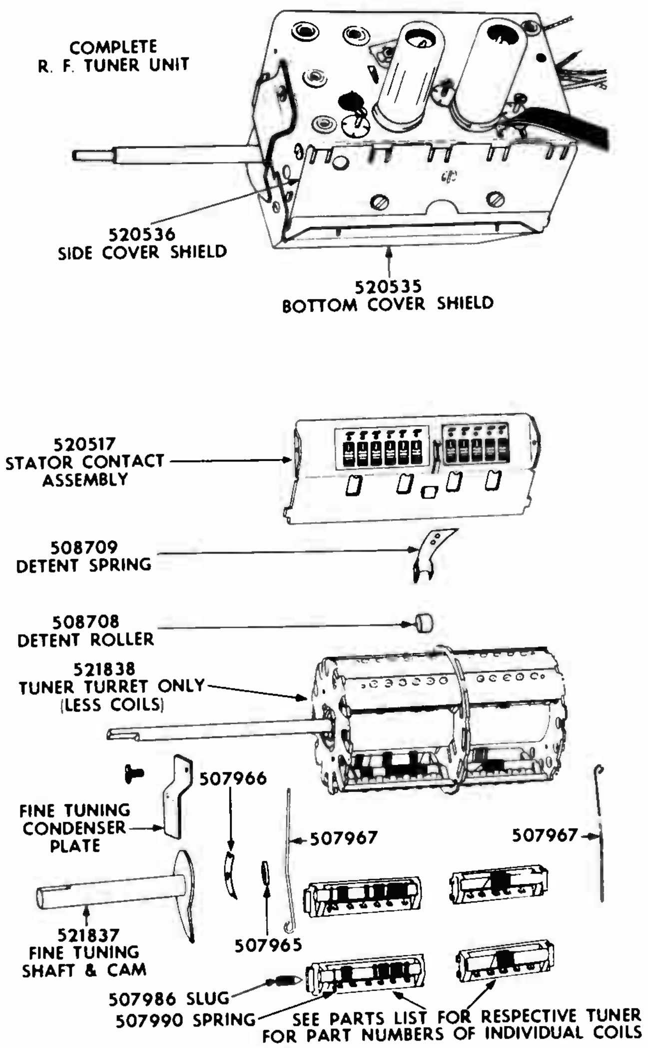

FIG. 19

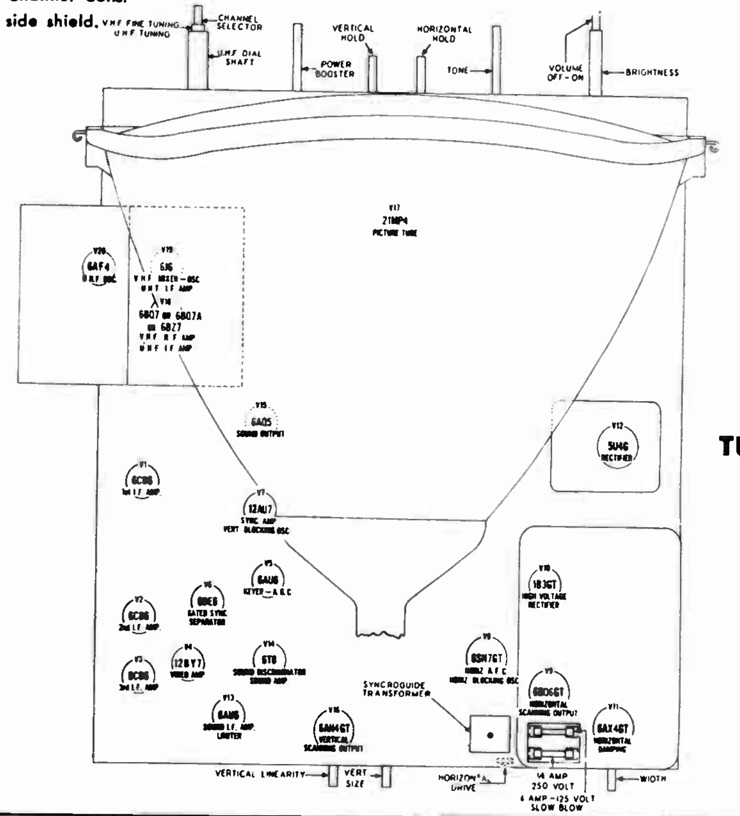
SERVICE PRECAUTIONS

SUBJECT	PRECAUTIONS
ELECTRICAL COMPONENTS	The high frequencies used in the RF section of a television receiver make it necessary that considerable care be exercised in servicing the tuner. Lead dress and location of components are very critical at these frequencies. When replacing parts, it is important to use components of identical electrical characteristics and physical size. Always re-connect the replacement item in the same location and position in the tuner as the original component.
TUBES	Replacement of tubes in the Tuner Unit may cause slight detuning of RF circuits due to inherent differences in inter-electrode capacitances. When replacing tubes (especially 6J6 mixer-oscillator tube) make sure that Fine Tuning control will tune in television stations at approximately the middle of its range. It may be necessary to change the setting of the individual oscil-lator coil slugs for some channels to accomplish this.
CHANNEL COILS AND SLUGS	Channel Coils must be handled with care. **Do not disturb coil windings.** If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retain-ing Spring when that spring is returned to its normal position.
FINE TUNING CONTROL	Rubbing of the bakelite Fine Tuning Cam against the Fine Tuning Condenser Plate is intentional in order to avoid vibration with resulting microphonics. However, the Fine Tuning Cam should **not** rub or contact the small circular plate located on the body of the tuner.

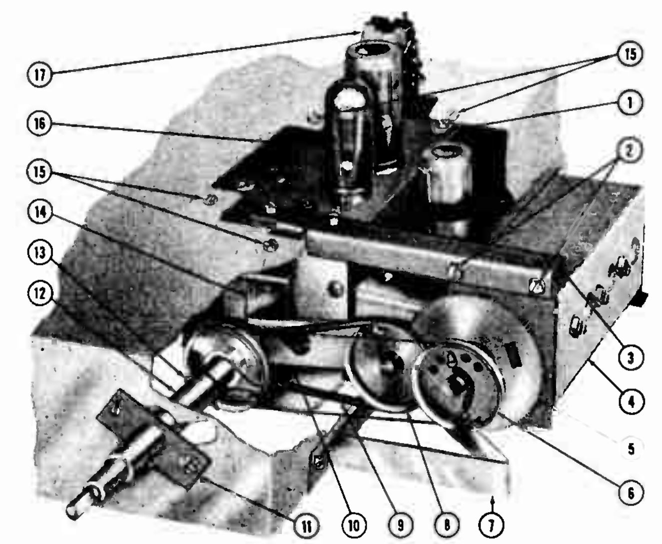
REMOVAL AND REPLACEMENT OF PARTS

ITEM	PROCEDURE
RF TUNER UNIT	To remove the Tuner Unit from receiver chassis, refer to "Removing V.H.F. Tuner" in section entitled "V.H.F.—U.H.F. Tuner Servicing Procedure" located on page 1953-33.
CHANNELS COILS	It is not necessary to remove entire tuner unit to replace a snap-in channel coil but removal of bottom shield will be re-quired. This may be accomplished by grasping the front end of the shield and pulling downward and unhooking it from rear of tuner frame. Insert a screwdriver blade between Coil Retainer Spring and the end of the Tuner Turret. Twist the blade to pull spring away from the molded body of Channel Coil. Lift this end of coil body upward and remove individual coil assembly from tuner. When replacing Channel Coils, be sure they are reinstalled in their correct positions. Coil numbers should increase consecu-tively in a counter-clockwise direction when tuner is viewed from the front. If all the Channel Coils have been removed from the Tuner Turret, rotate turret until flat surface on end of tuner shaft points down. Install #3 Channel Coils into bottom position on turret. Then follow the correct sequence indicated above to replace other coils.
TUNER TURRET ASSEMBLY	To remove turret from RF Tuner Unit, remove complete tuner and bottom shield as described in previous sections and proceed as follows: 1. Remove rear Turret Shaft Retaining Spring by disengaging straight end of spring from projection on tuner frame. 2. Remove Fine Tuning Condenser Plate from front of Tuner Unit. This plate forms one side of Fine Tuning control condenser and is held in place by one screw. 3. Slide Fine Tuning Cam and Shaft off of main Channel Selector Shaft. 4. Remove Spring Contactor Washer and Fiber Spacer Washer from Channel Selector Shaft. 5. Remove Shaft Retaining Spring at front of tuner by disengaging straight end of spring from projection on frame. 6. Remove turret assembly from frame. To replace turret, reverse the above procedure. Tooth on bakelite Fine Tuning Cam should point downward during assembly so that it does not become locked between the stops on the Fine Tuning Condenser Plate. Also be sure to replace bottom shield.
STATOR CONTACT ASSEMBLY	To remove this assembly, remove complete tuner as described in previous sections and proceed as follows: 1. Remove side shield by taking out the two retaining screws and unsolder shield at one point. Now, disengage shield from upper edge of tuner frame. 2. Remove the two screws at the front and rear of the Stator Contact Assembly. 3. Unsolder all electrical connections to contact plate. 4. Unsolder five soldered joints between Stator Contact Assembly and Tuner Unit. 5. Contact Assembly may now be withdrawn from frame. To reinstall this assembly: 1. Place Stator Contact Assembly in position and replace, but do not tighten, the two screws at the front and rear of the assembly. 2. Remove 3 consecutive pairs of Channel Coils from the turret (for example, the antenna and rf-osc. coils for channels #5, 6 and 7). 3. Position Tuner Turret so that the edges of the next highest Channel Coils (in this case, the coils for channel #8) just pass the row of 11 contacts on the Stator Contact Assembly. 4. Adjust position of the Stator Contact Assembly so that there are a few thousandths of an inch spacing between the con-tacts on the contact plate and the molded body of the Channel Coils. 5. The Contact Assembly is now correctly positioned and screws at front and rear may be tightened. 6. Solder Stator Contact Assembly to tuner frame at same points that were used previously. 7. Make all electrical connections to contact plate. 8. Replace Channel Coils. 9. Replace side shield.



TUBE AND CONTROL LOCATIONS

V.H.F.–U.H.F. TUNER SERVICING PROCEDURE



The tuning mechanism of this receiver comprises two R.F. tuning units—a 13-position V.H.F. tuner which covers the 12 V.H.F. channels and a continuous type U.H.F. tuner which covers all of the U.H.F. television channels.

When it is necessary to remove the tuning units for service, it can be accomplished by following the procedure given in the following paragraphs. For simplicity, there is a separate removal procedure for each of the tuners.

Instructions for replacing the U.H.F. tuning belt and the dial drive cord are also given below.

REMOVING U.H.F. TUNER

(Numbers which appear after parts mentioned in text refer to parts shown in illustration above.)

1. Disconnect leads marked S, R and T on "Bottom View of Chassis Showing Connections of R.F. Tuners." Also disconnect 300-ohm twin-lead to U.H.F. Tuner (4) at V.H.F. Selector Switch (17); terminals S3 and S12.
2. Remove Bracket and Triangular Shaped Guard (7) shielding U.H.F. Tuning Gear (5).
3. Turn fine tuning knob until U.H.F. tuner shaft is fully counter-clockwise, then loosen two set screws and slide U.H.F. Dial Drive Pulley (6) off of shaft. (To avoid the necessity of restringing U.H.F. dial drive cord, hold Drive Pulley (6) so that cord does not slip off and clamp cord tightly around pulley by wrapping "scotch" tape around the two strands of cord as near as possible to the pulley. Also clamp cord around Dial Pulley and Shaft (12) in this manner.)
4. Remove the two U.H.F. Tuner Mounting Screws (2) and a third screw (not shown in illustration) located underneath chassis on Mounting Bracket (1).
5. Loosen the two set screws on U.H.F. Tuning Gear (5) and free tuner from mounting by pulling away from bottom of chassis. Tuner may now be completely removed by sliding it toward rear of chassis, thus disengaging unit from Gear (5) and Pulley Brackets (10).

If tuner is returned to factory for repair it must be shipped with all parts removed as indicated above.

REMOVING V.H.F. TUNER

(Numbers which appear after parts mentioned in text refer to parts shown in illustration above.)

1. Remove U.H.F. tuner as described above.
2. Disconnect leads marked M, N, P, Q and U on "Bottom View of Chassis Showing Connections of R.F. Tuners." Also disconnect the two white and yellow leads from the tuner to the V.H.F. Selector Switch (17); at terminals S8 and S17.
3. Rotate Channel Selector knob until V.H.F. Selector Switch Actuator Cam is completely disengaged from Switch (17) and remove the two switch mounting screws.
4. Remove channel Selector knob, Fine Tuning knob and U.H.F. Dial from their shafts by pulling them forward.
5. Remove Fiber Bracket (11) which supports tuner operating shafts. Also remove fiber dial lite shield which is fastened by one of the fiber bracket mounting screws.
6. Remove the four Tuner Mounting Screws (15) and lift V.H.F. tuner (16) from chassis.
7. Remove Clip (13) which retains U.H.F. Dial Shaft and Pulley (12) and slide shaft and pulley off of inner shaft.
8. Remove U.H.F. Tuning Belt (9) from pulleys.
9. Loosen two set screws and remove U.H.F. Tuning Pulley (14).
10. Remove U.H.F. Tuning Pulley and Bracket Assembly (10).
11. Remove Front Mounting Bracket (3) and Rear Mounting Bracket (1).
12. Loosen set screw and remove V.H.F. Selector Switch Actuator Cam mounted on rear of turret shaft.

If tuner is returned to factory for repair it must be shipped with all parts removed as indicated above.

REINSTALLING TUNERS

The reinstallation of the tuner can be made in the reverse order given in the removal procedure, observing the following precautions.

1. Remount V.H.F. Tuner (16) in mounting holes that place tuner as far forward on chassis as possible.
2. Position coaxial cable lead so that it completely clears the V.H.F. Selector Switch Actuator Cam.
3. When reinstalling U.H.F. Dial Drive Pulley (6), turn U.H.F. tuning shaft to its extreme counter-clockwise position and turn Drive Pulley (6) until the opening in its rim is as shown in **lower** illustration before tightening pulley set screws.
4. When removing "scotch" tape from U.H.F. dial drive cord, hold drive pulleys so that cord is sufficiently taut to prevent it from sliding off of pulleys.
5. Before replacing U.H.F. dial, be sure that **"Fine Tuning" shaft** is in a fully counter-clockwise position or until U.H.F. dial shaft is fully **clockwise**. Place U.H.F. dial on its shaft so that the number 83 is in top center position.

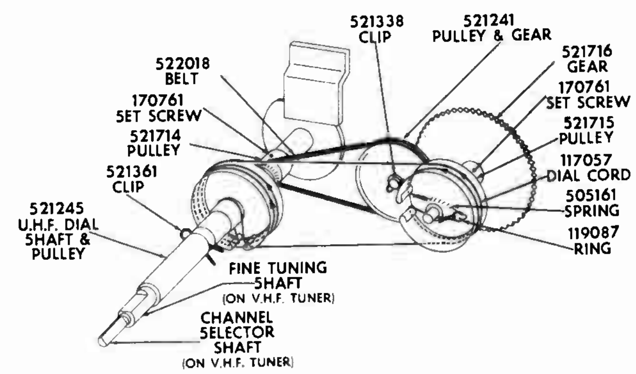
REPLACING U.H.F. DIAL DRIVE CORD

As it is necessary to remove drive cord when replacing U.H.F. Tuning Belt (9), the belt should be replaced at this time if it is worn. The method of accomplishing this is given in a separate procedure outlined below.

1. Remove Bracket and Triangular Shaped Guard (7).
2. Turn U.H.F. tuner shaft fully counter-clockwise and if necessary loosen set screws and turn Drive Pulleys (6) and (12) until opening in their rims are located as shown in **lower** illustration.
3. String drive cord by placing ring at end of cord over tongue of Drive Pulley (6) and winding cord around pulleys as shown in **lower** illustration.
4. Replace U.H.F. dial by following procedure given in paragraph 5 in section entitled "Reinstalling Tuners."

REPLACING U.H.F. TUNING BELT

1. Follow steps 2 and 3 in procedure entitled "Removing U.H.F. Tuner" and step 4 in procedure entitled "Removing V.H.F. Tuner."
2. Remove old Tuning Belt (9) by pulling it over Drive Pulleys (6) and (12) and through shaft opening on front of chassis.
3. Install new belt by using reverse of procedure given in step 2 above.
4. Replace Drive Pulley (6) following procedure given in paragraphs 3, 4 and 5 in section "Reinstalling Tuners."



DIAL DRIVE CORD ARRANGEMENT

PRODUCTION CHANGES

The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. The coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D".

The circuit shown on this page applies to "SERIES ABCD" chassis

A letter following the component circuit diagram number thus—201A, indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change column, from which complete change information can be obtained.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
UNCODED	**INITIAL PRODUCTION**
"A"	The following changes were incorporated to improve the video response. 1. Change peaking coil 51 in plate circuit of tube V4 (Video Amp.) from part 520984 to 520689. 2. Change resistor 52 in parallel with peaking coil 51 from 15,000 Ohms to 12,000 Ohms. 3. Change peaking coil 53 in plate circuit of tube V4 (Video Amp.) from part 520986 to part 509342. 4. Change resistor 54 in plate circuit of tube V4 (Video Amp.) from 3900 Ohms to 2200 Ohms. 5. Change resistor 55 in plate circuit of tube V4 (Video Amp.) from 1500 Ohms to 1800 Ohms.
"B"	The following change was incorporated to maintain proper focus for the normal range of the brightness control. 1. Change resistor 68 in brightness circuit from 100,000 Ohms to 220,000 Ohms.
"C"	The following change was incorporated to facilitate production. 1. Add condenser 240 (680 Mmfd.) between the grid of tube V1 (1st I.F. Amp.) and I.F. transformer 9.
"D"	The following change was incorporated to improve sync. stability in the presence of electrical interference or weak signal. 1. Disconnect resistor 94 (18,000 Ohms) from the plate of tube V4-12BY7 (Video Amp.) and reconnect it to the junction of resistors 54 (2200 Ohms) and 55 (1800 Ohms) located in plate load circuit of tube V4. Note: The sound take-off for tube V13 (Sound I. F. Amp.) remains connected to the plate of tube V4 (Video Amp.) 2. Change resistor 106 located in plate circuit of tube V7A (Sync. Amp.) from 4700 Ohms ±10% ½ watt to 6800 Ohms ±10% 1 watt. The following changes were incorporated to improve picture quality. 1. Change resistor 219 in the cathode circuit of tube V17 (Picture Tube) from 470,000 Ohms to 330,000 Ohms. 2. Change connection of grid, pin 10, of tube V17 (Picture Tube) from 320 volt supply to 450 volt supply. 3. Change connection of grid, pin 6, of tube V17 (Picture Tube) from 270 volt supply to receiver chassis. The following change was incorporated to provide a greater margin of safety for the plate load resistor of tube V7A (12AU7). 1. Change resistor 105 located in plate circuit of tube V7A (Sync. Amp.) from 4700 Ohms ½ watt to 4700 Ohms 1 watt.
"E"	The following change was incorporated to improve picture quality by reducing the noise level (snow) in Video Amp. system. 1. Add resistor 242 (6800 Ohms) in parallel with peaking coil 41 located in grid circuit of V4 (Video Amp.) 2. Change peaking coil 42 located in grid circuit of tube V4 (Video Amp.) from part 520985 (double pi, coded with green dot) to part 509341 (single pi, coded with green dot). 3. Change peaking coil 51 located in plate circuit of tube V4 (Video Amp.) from part 520689 (single pi, coded with purple dot) to part 520984 (single pi, coded with red dot). 4. Change resistor 52 located across peaking coil 51 in plate circuit of V4 (Video Amp.) from 12,000 Ohms to 15,000 Ohms. 5. Change peaking coil 53 located in plate circuit of tube V4 (Video Amp.) from part 509342 (single pi, coded with yellow dot) to part 509340 (single pi, coded with white dot).

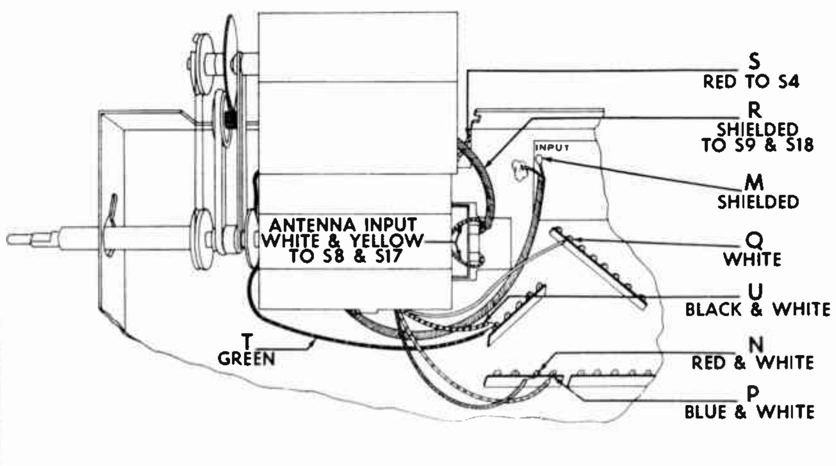
(SHOWN WITH SIDE SHIELD REMOVED)

(See Service Data section for Tuner Repair and Replacement)



VOLTAGE MEASUREMENTS

All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception—Power Booster control completely counterclockwise.

Voltages marked with an asterisk (*) will vary widely with control settings.

R.F. tuner voltages were measured with tubes removed from sockets.

No voltage reading at a tube element indicates zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.

OSCILLOGRAMS

All oscillograms taken with ground lead of 'Scope connected to receiver chassis and controls set for normal reception. Power Booster control adjusted to give 50 volts peak to peak at cathode of picture tube. Oscilloscope vertical amplifier response was flat to within 20% at 2 MC.

Number appearing to the left of oscillogram specifies setting of horizontal sweep frequency control on 'Scope.

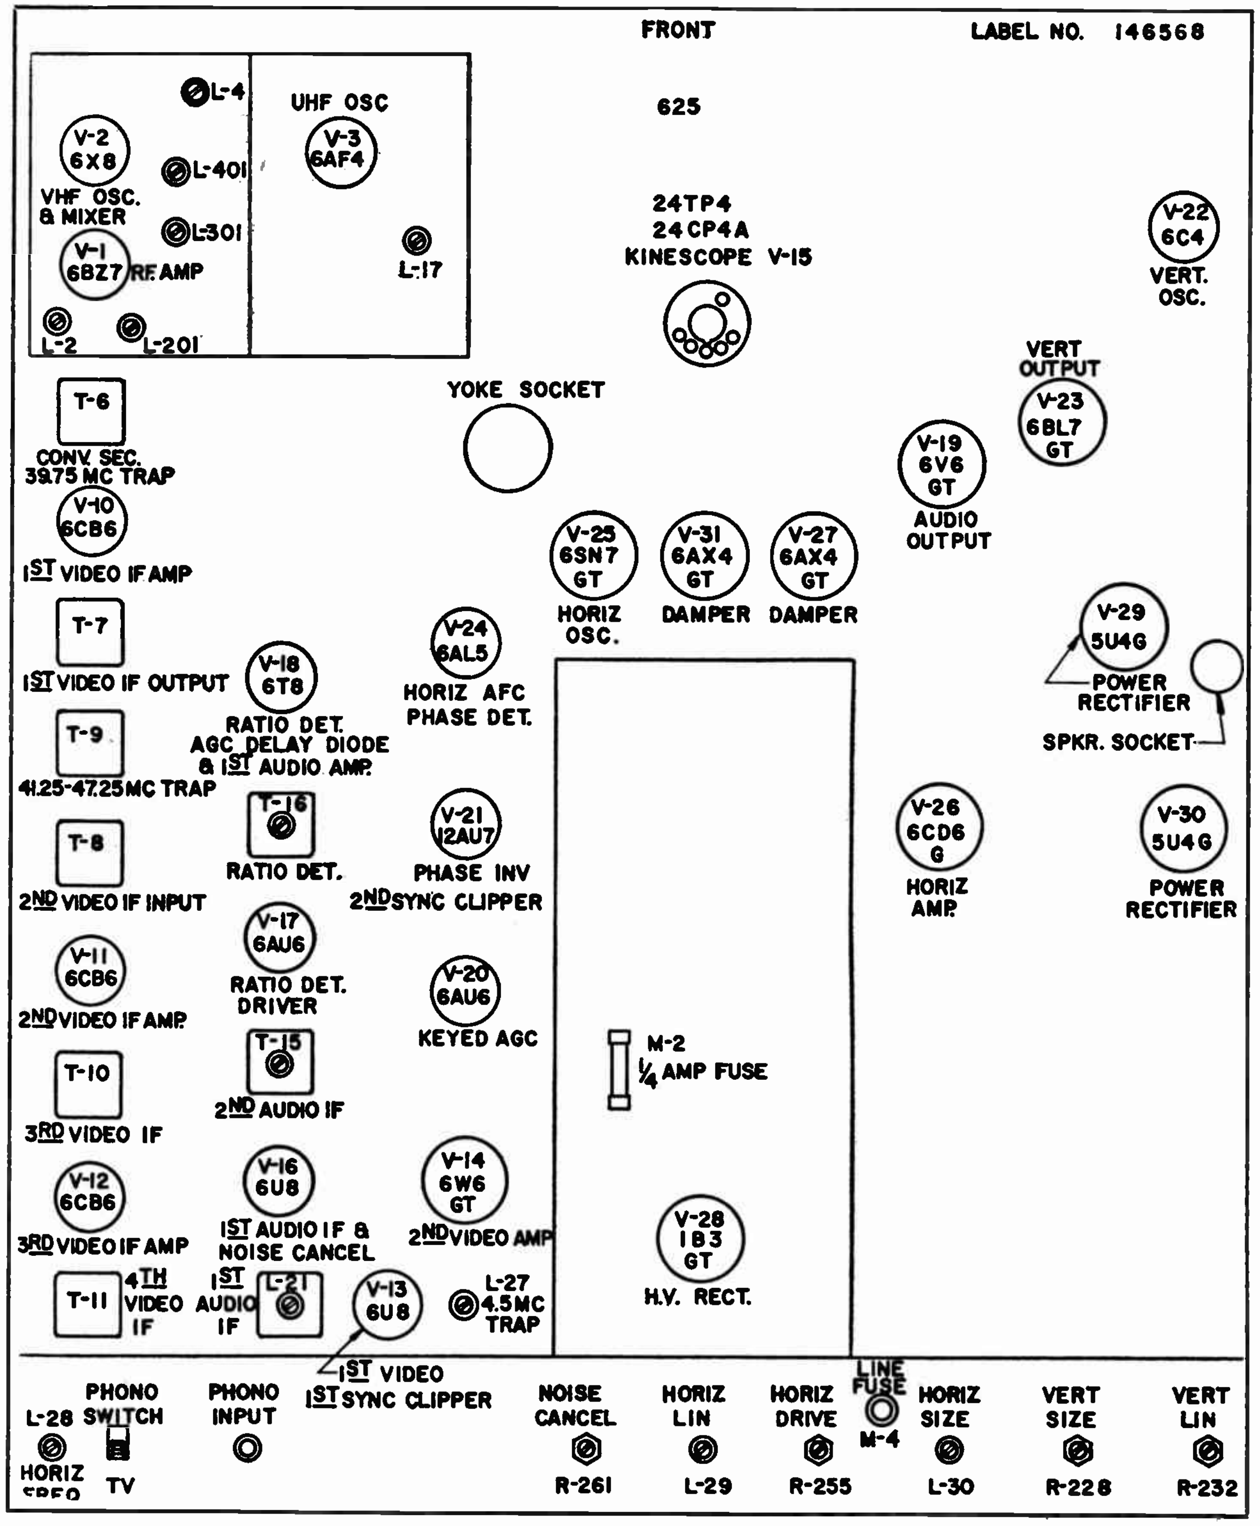
625 SERIES (CONSOLE) TELEVISION RECEIVER



TUBE VOLTAGE CHART

1. Measurements are made at 117 Volts line using vacuum tube voltmeter. All voltages are D.C. and are positive with respect to chassis ground except where noted.
2. Contrast and brightness controls set at minimum, antenna disconnected.

ALIGNMENT PROCEDURE

Apply A.G.C. bias of approximately—2 V to A.G.C. Line (across C-202). Maintain the output level of the sweep generator such that the second detector output is 2 volts peak to peak. Scope Cal. 1-V per inch.

NOTE—USE A NON-METALLIC ALIGNING TOOL AND LIGHT PRESSURE ON ALL SLUGS.

Signal Generator Connection	Oscilloscope or VTVM Connection	Adjustments	Figure
1. Output of 40mc. Sweep Generator to grid of 3rd I.F. Tube, pin 1 of 6CB6 V-12 thru 100 MMF isolating capacitor.	Input of scope to grid of Video Amplifier, pin 2 of 6U8 V-13 thru 47K ohm isolating resistor.	1. Adjust top and bottom of T-11 for marker positions as shown on curve Figure 1.	 FIG. 1
2. Output of 40mc. Sweep Generator to grid of 2nd I.F. Tube, pin 1 of 6CB6 V-11 thru 100 MMF isolating capacitor.	Same as Step #1.	1. Adjust top and bottom of T-10 for marker positions as shown on curve Figure 2.	 FIG. 2
3. Output of 40mc. Sweep Generator to grid of 1st I.F. Tube, pin 1 of 6CB6 V-10 thru 100 MMF isolating capacitor.	Same as Step #1.	1. Adjust top of T-9 for marker position of 47.25mc. 2. Adjust bottom of T-9 for marker positions at 41.25mc. 3. Adjust bottom of T-6 for marker position at 39.75mc. 4. Adjust bottom of T-7 and T-8 to produce curve as shown on Figure 3.	 FIG. 3
4. Raise converter tube shield from ground and connect output of 40mc. sweep generator to the shield.	Same as Step #1.	1. Adjust top of T-6 and L-4 on tuner (L-14 on standard coil tuner) assembly to produce a curve as shown on Figure 4.	 FIG. 4
5. Connect a 400 cycle modulated 4.5mc. signal to the junction of Video detector M-13 and C-130. Adjust generator output to a level to indicate 1.5 Volts on VTVM.	Connect 2-100 resistors in series from plate of ratio detector pin 2 of V-18, 6T8 to ground. Connect VTVM from junction of the 2-100K resistors to ground.	1. Adjust L-21, T-15 and bottom slug of T-16 for maximum indication.	
6. Same as Step #5.	Connect — VTVM ground lead to the junction of the 2-100K resistors (see 5 above). Connect VTVM D.C. lead to the junction of C-183 and R-182.	1. Adjust the secondary (Top slug) of T-16 for zero volts between the positive and negative excursions. (Increase Generator output for good deflection).	

Alternate Trap Alignment

IF THIS METHOD IS USED, IT SHOULD BE PERFORMED BEFORE THE I.F. CURVE ALIGNMENT

Signal Generator Connection	Oscilloscope or VTVM Connection	Adjustments
1. Connect a modulated (400 cycle) 39.75mc. signal to grid, pin 1 of the 1st video I.F. Tube—V-10.	Same as Step #1.	1. Adjust bottom of T-6 for minimum response on scope.
2. Connect a modulated (400 cycle) 41.25mc. signal to the grid, pin 1 of 1st video I.F. Tube 6CB6—V-10.	Same as Step #1.	1. Adjust bottom of T-9 for minimum response on scope.
3. Connect a modulated (400 cycle) 47.25mc. signal to grid, pin 1 of 1st video I.F. Tube 6CB6—V-10.	Same as Step #1.	1. Adjust top of T-9 for minimum response on scope.

TUBE VOLTAGE CHART

1. Measurements are made at 117 Volts line using vacuum tube voltmeter. All voltages are D.C. and are positive with respect to chassis ground except where noted.
2. Contrast and brightness controls set at minimum, antenna disconnected.

TUNER Blue Lead—Plate RF 245 Volts
TUNER Red Lead—B+ to Conv. 115 Volts

NOTE—
NC—No connection.

ALIGNMENT PROCEDURE

Apply A.G.C. bias of approximately—2 V to A.G.C. Line (across C-202). Maintain the output level of the sweep generator such that the second detector output is 2 volts peak to peak. Scope Cal. 1-V per inch.

NOTE—USE A NON-METALLIC ALIGNING TOOL AND LIGHT PRESSURE ON ALL SLUGS.

Signal Generator Connection	Oscilloscope or VTVM Connection	Adjustments	
1. Output of 40mc. Sweep Generator to grid of 3rd I.F. Tube, pin 1 of 6CB6 V-12 thru 100 MMF isolating capacitor.	Input of scope to grid of Video Amplifier, pin 2 of 6U8 V-13 thru 47K ohm isolating resistor.	1. Adjust top and bottom of T-11 for marker positions as shown on curve Figure 1.	 FIG. 1
2. Output of 40mc. Sweep Generator to grid of 2nd I.F. Tube, pin 1 of 6CB6 V-11 thru 100 MMF isoloting capacitor.	Same as Step #1.	1. Adjust top and bottom of T-10 for marker positions as shown on curve Figure 2.	 FIG. 2
3. Output of 40mc. Sweep Generator to grid of 1st I.F. Tube, pin 1 of 6CB6 V-10 thru 100 MMF isolating capacitor.	Same as Step #1.	1. Adjust top of T-9 for marker position of 47.25mc. 2. Adjust bottom of T-9 for marker positions at 41.25mc. 3. Adjust bottom of T-6 for marker position of 39.75mc. 4. Adjust bottom of T-7 and T-8 to produce curve as shown on Figure 3.	 FIG. 3
4. Raise converter tube shield from ground and connect output of 40mc. sweep generator to the shield.	Same as Step #1.	1. Adjust top of T-6 and L-4 on tuner (L-14 on standord coil tuner) assembly to produce a curve as shown on Figure 4.	 FIG. 4
5. Connect a 400 cycle modulated 4.5mc. signal to the junction of Video detector M-13 and C-130. Adjust generator output to a level to indicate 1.5 Volts on VTVM.	Connect 2-100 resistors in series from plate of ratio detector pin 2 of V-18, 6T8 to ground. Connect VTVM from junction of the 2-100K resistors to ground.	1. Adjust L-21, T-15 and bottom slug of T-16 for maximum indication.	
6. Same as Step #5.	Connect — VTVM ground lead to the junction of the 2-100K resistors (see 5 above). Connect VTVM D.C. lead to the junction of C-183 and R-182.	1. Adjust the secondary (Top slug) of T-16 for zero volts between the positive and negative excursions. (Increase Generator output for good deflection).	

Alternate Trap Alignment

IF THIS METHOD IS USED, IT SHOULD BE PERFORMED BEFORE THE I.F. CURVE ALIGNMENT

Signal Generator Connection	Oscilloscope or VTVM Connection	Adjustments
1. Connect a modulated (400 cycle) 39.75mc. signal to grid, pin 1 of the 1st video I.F. Tube—V-10.	Same as Step #1.	1. Adjust bottom of T-6 for minimum response on scope.
2. Connect a modulated (400 cycle) 41.25mc. signal to the grid, pin 1 of 1st video I.F. Tube 6CB6—V-10.	Same as Step #1.	1. Adjust bottom of T-9 for minimum response on scope.
3. Connect a modulated (400 cycle) 47.25mc. signal to grid, pin 1 of 1st video I.F. Tube 6CB6—V-10.	Same as Step #1.	1. Adjust top of T-9 for minimum response on scope.

ALIGNMENT PROCEDURE

Apply AGC bias of approximately 3 volts to AGC line (across C-160).

Maintain the output level of the sweep generator to obtain a second detector output of 2 volts peak-to-peak. Oscilloscope should be calibrated to read 1-VOLT per inch vertical deflection.

NOTE: To Perform IF Alignment it is not necessary to Remove Picture Tube. Use a non metallic aligning tool such as Walsco No. 2526 or equivalent which permits all slugs to be adjusted from the underside of the chassis.

SIGNAL GENERATOR CONNECTION	OSCILLOSCOPE OR VTVM CONNECTION	ADJUSTMENTS
1. Output of 40MC. sweep generator to grid of 1st IF tube, pin 1 of V9, 6CB6 thru 100 MMF isolating capacitor.	Input of scope to grid of Video Amp., pin 1 of V-13, 6AU6 thru 47K-Ohm isolating resistor.	1. Adjust the bottom slug of T-7 1st IF transformer for low intermediate frequency (43.2 MC approx.). 2. Adjust the bottom slug of T-9 3rd IF transformer for low frequency. (42.0 MC approx.). 3. Adjust the bottom slug of T-8 2nd IF transformer for high frequency. (45.0 MC approx.). 4. Adjust the bottom slug of T-10 4th IF transformer for high intermediate frequency. (44.5 MC approx.). 5. Maintaining the above relative frequency positions of the individual stages, adjust the slugs to produce a curve as shown with the 41.9 and 45.75 MC markers at 50% response Fig. # 1.
2. Output of 40MC sweep generator to junction of T-6 and L-18. Using 39.75MC marker.	Same as Step # 1.	1. Adjust the top slug of T-6 for response 39.75MC as shown on curve Fig. 2.
3. Same as Step # 2. Using 41.25MC marker.	Same as Step # 1.	1. Adjust the top slug of T-7 and T-11 for response as shown on curve Fig. 2.
4. Same as Step # 1 using 47.25 MC marker.	Same as Step # 1.	1. Adjust the top slug of T-8 for response curve as shown on Fig. 3. 2. Repeat Step # 1 (IF response) to reproduce the curve as shown in Fig. 1.
5. Raise converter tube shield from ground and connect output of 40 MC sweep generator to the shield.	Same as Step # 1.	1. Adjust the bottom slug of T-6 and T-5 tuner assembly to produce a curve as shown in Fig. 4.
6. Connect a 400 cycle modulated 4.5 MC signal to the junction of Video Detector M-13 and C-126. Adjust generator output to a level to indicate 1.5 volts VTVM.	Connect 2-100K resistors in series from the plate of ratio detector, pin 2 of V-18, 6T8 to ground, connect VTVM from junction of the resistors to ground.	1. Adjust L-21, T-15, and the bottom slug of T-16 for maximum indication.
7. Same as Step # 6.	Connect VTVM ground Lead to the junction of the 2-100K resistors (see step # 6 above). Connect VTVM D.C. lead to the junction of C-181 and R-181.	1. Adjust the secondary (top slug) of T-16 for zero volts between the positive and negative excursions. (Increase generator output for good deflection).

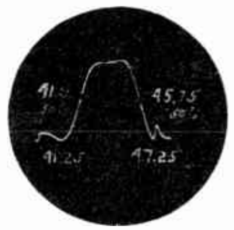

FIG. 1

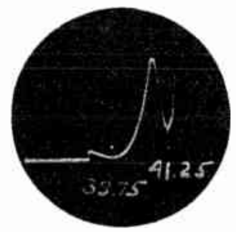

FIG. 2

FIG. 3

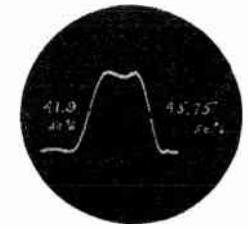

FIG. 4

ALTERNATE TRAP ALIGNMENT

IF THIS METHOD IS USED, IT SHOULD BE PERFORMED BEFORE THE IF CURVE ALIGNMENT

SIGNAL GENERATOR CONNECTION	OSCILLOSCOPE OR VTVM CONNECTION	ADJUSTMENTS
1. Connect a modulated (400 cycle) 39.75 MC signal to the grid of 1st IF tube, pin 1 of V-9, 6CB6.	Same as Step # 1. (above).	1. Adjust top slug of T-6 for minimum response on scope.
2. Connect a modulated (400 cycle) 47.25 MC signal to the grid of 1st IF tube, pin 1 of V-9, 6CB6.	Same as Step # 1.	2. Adjust top slug of T-8 for minimum response on scope.
3. Connect a modulated (400 cycle) 41.25 MC signal to the grid, pin 1 of V-9, 6CB6.	Same as Step # 1.	3. Adjust top slug of T-7 and T-11 for minimum response on scope.

CAUTION: Speaker is mounted in cabinet assembly. Be sure to disconnect speaker plug before removing chassis.

The 22-T series receiver is identical to the 21-T receiver with the exception that the VHF tuner has a thirteenth position, employed as a 40 Mc amplifier when the UHF continuous tuner is in operation.

VIDEO IF, 4.5MC TRAP AND SOUND ALIGNMENT PROCEDURES

VIDEO IF ALIGNMENT

PREALIGNMENT INSTRUCTIONS READ CAREFULLY

1. Stand chassis on side with high voltage shield down for under chassis adjustments.
2. Set Fringe (AGC) switch to fully counterclockwise position (normal or "non-fringe" position).
3. Ground all test equipment unless otherwise stated.
4. Keep detector circuit leads as short as possible.
5. Use non-metallic alignment tools for powdered iron cores. Metallic screwdriver may be used for brass screw adjustments.

STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1.	Connect 3V. battery (-) terminal to junction of C130 (.22 mfd.) and R145 (220K) and connect (+) terminal to chassis. Set VHF tuner to signal-free channel with minimum interference.	MARKER GENERATOR - to ungrounded tube shield on Osc./Mixer tube on VHF tuner. VTVM - D.C. Probe to junction of L58 peaking coil and R147 (4.7K).	L54 (top core) for MIN. at 39.75 MC. T55 (top core) for MIN. at 41.25 MC. L55 for MIN. at 41.25 MC. T56 (top core) for MIN. at 47.25 MC. Use sufficient marker generator output for satisfactory VTVM reading.
2.	Same as 1.	Same as 1.	T58 for MAX. at 44.0 MC. T57 for MAX. at 42.0 MC. T56 (bottom core) for MAX. at 45.2 MC. T55 (bottom core) for MAX. at 43.2 MC. Adjust marker generator output to keep VTVM reading between 1 and 2 volts.
3.	Repeat step 1 trap adjustments.		
4.	Remove 3V. AGC battery. Disconnect T55 lead from pin 5 of V1 (6CB6). Connect 330 ohm resistor from R128 (1K) to pin 5 of V1. Set VHF tuner: To any signal-free high channel on Sarkes tuner chassis, OR Between any two channels on G.I. tuner chassis.	SWEEP GENERATOR - to looker point "B" on Sarkes tuner; OR to pin 5 of 6J6 tube on G.I. tuners. Set to 43.5 MC with 10 MC sweep. MARKER GENERATOR - loosely couple to sweep generator lead. OSCILLOSCOPE - through detector circuit to pin 5 of V1 (6CB6).	SARKES TUNER CHASSIS ONLY: L54 (bottom core) and T2 (VHF tuner) for response curve shown: 42.1 MC. 45.75 MC. L54 (TOP) 39.75 MC. L54 (BOT) T2 (TUNER) G.I. TUNER CHASSIS ONLY: L54 (bottom core), L8 (VHF tuner) and L53 for response curve shown: 42.1 MC. L53 L54 (BOT) L8 (TUNER) 45.75 MC. L54 (TOP) 39.75 MC.
5.	Repeat step 4 adjustments until response curve is flat with 42.1 MC and 45.75 MC markers on corners.		
6.	Connect 3V. battery (-) terminal to junction of C130 (.22 mfd.) and R145 (220K) and connect (+) terminal to chassis. REMOVE 330 OHM RESISTOR AND RECONNECT T55. Set VHF tuner to signal-free channel with minimum interference	SWEEP GENERATOR - to ungrounded tube shield on Osc./Mixer tube on VHF tuner. Set to 43.5 MC with 10 MC sweep. MARKER GENERATOR - loosely couple to sweep generator lead. OSCILLOSCOPE - through 33K resistor to junction of L58 peaking coil and R147 (4.7K).	Retouch T58, T57, T56 (bottom core) and T55 (bottom core) if necessary to obtain response curve shown: 46.0 MC. RESPONSE 100% 42.1 MC. 45.75 MC. SOUND 41.25 MC. 70% 50% 47.25 MC.

4.5MC TRAP ALIGNMENT

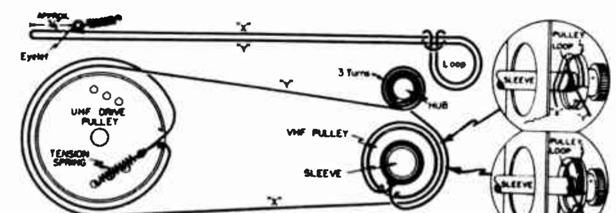
STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1.	Short pin 1 of V4 (6CB6) to chassis	SIGNAL GENERATOR - to pin 2 of V5 (12BY7). Set to 4.5 MC. VTVM - R.F. Probe to pin 11 of V20 (Picture Tube); Ground Lead to chassis.	L81 for MINIMUM.

SOUND ALIGNMENT

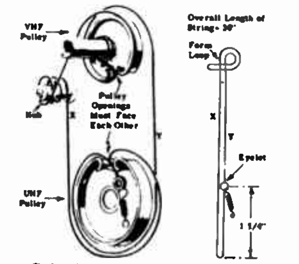
STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1.	Set VHF tuner to signal-free channel with minimum interference. DO NOT GROUND VTVM.	MARKER GENERATOR #1 - through 1K resistor to pin 1 of V1 (6CB6). Set to 45.0 MC. MARKER GENERATOR #2 - through 1K resistor to pin 1 of V1 (6CB6). Set to 4.5 MC. OR MARKER GENERATOR - through 1K resistor to pin 1 of V1 (6CB6). Set to 45.0 MC with a crystal controlled 4.5 MC marker. ALSO VTVM - D.C. Probe to pin 5 of V7 (6AL5); Ground Lead to pin 7 of V7 (6AL5).	T52 (both cores) for MAXIMUM. L82 for MAXIMUM. Repeat adjustments until maximum reading is reached.
2.	Same as 1	USE SAME MARKER GENERATOR HOOKUP AS IN STEP 1 VTVM - D.C. Probe to junction of two matched 100K resistors connected in series across R104 (68K); Ground Lead through 100K resistor to terminal 5 of T52	T52 (top core) for ZERO. Use lowest VTVM scale set to zero center. At correct core setting, a slight turn of core will give either a positive or negative reading.
3.	Remove test equipment and resistors; then, tune in a weak station and adjust T52 (top core) for optimum signal-to-noise ratio.		

ALTERNATE SOUND ALIGNMENT

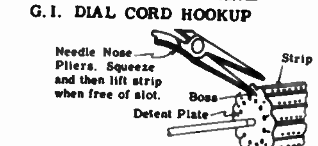
STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1	Connect a good antenna installation to receiver. Set VHF tuner to a strong station. DO NOT GROUND VTVM	VTVM - D.C. Probe to pin 5 of V7 (6AL5); Ground Lead to pin 7 of V7 (6AL5).	T52 (bottom core) for MAXIMUM. L82 for MAXIMUM. Repeat adjustments until maximum reading is reached.
2	Same as 1	VTVM - D.C. Probe to junction of two matched 100K resistors connected in series across R104 (68K), Ground Lead through 100K resistor to terminal 5 of T52	T52 (top core) for ZERO. Use lowest VTVM scale set to zero center. At correct core setting, a slight turn of core will give either a positive or negative reading.
3	Remove test equipment and resistors, then, tune in a weak station and adjust T52 (top core) for optimum signal-to-noise ratio.		



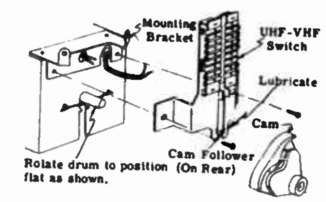
S.T. DIAL CORD HOOKUP



G.I. DIAL CORD HOOKUP

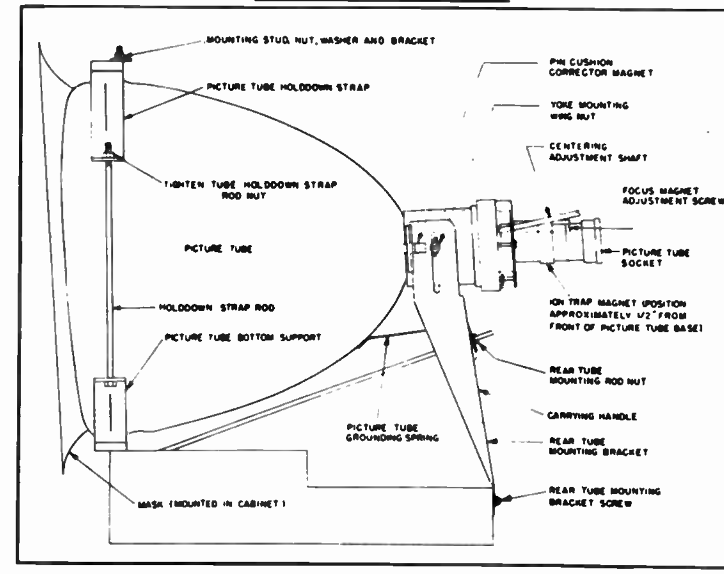


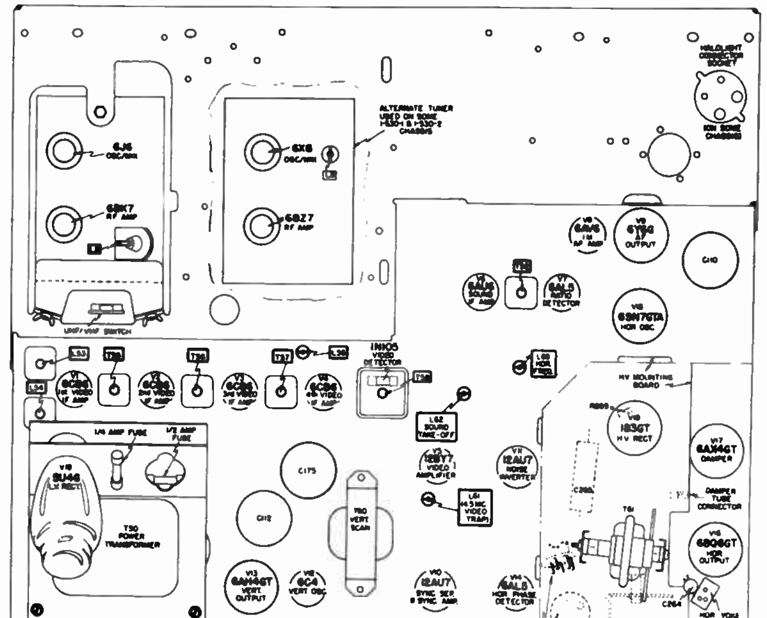
G.I. TUNER STRIP REMOVAL



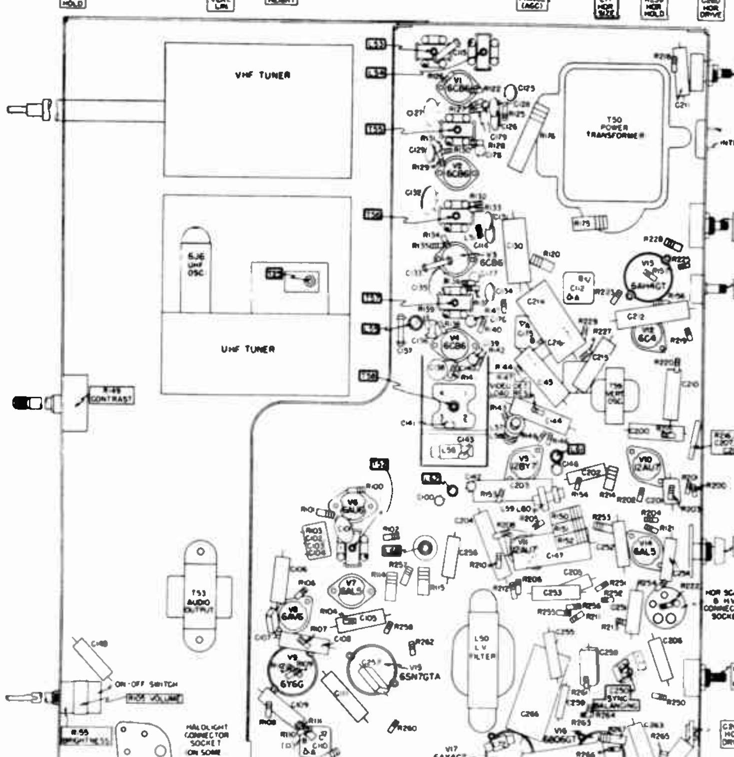
G.I. UHF/VHF SWITCH ASSEMBLY

PICTURE TUBE REPLACEMENT

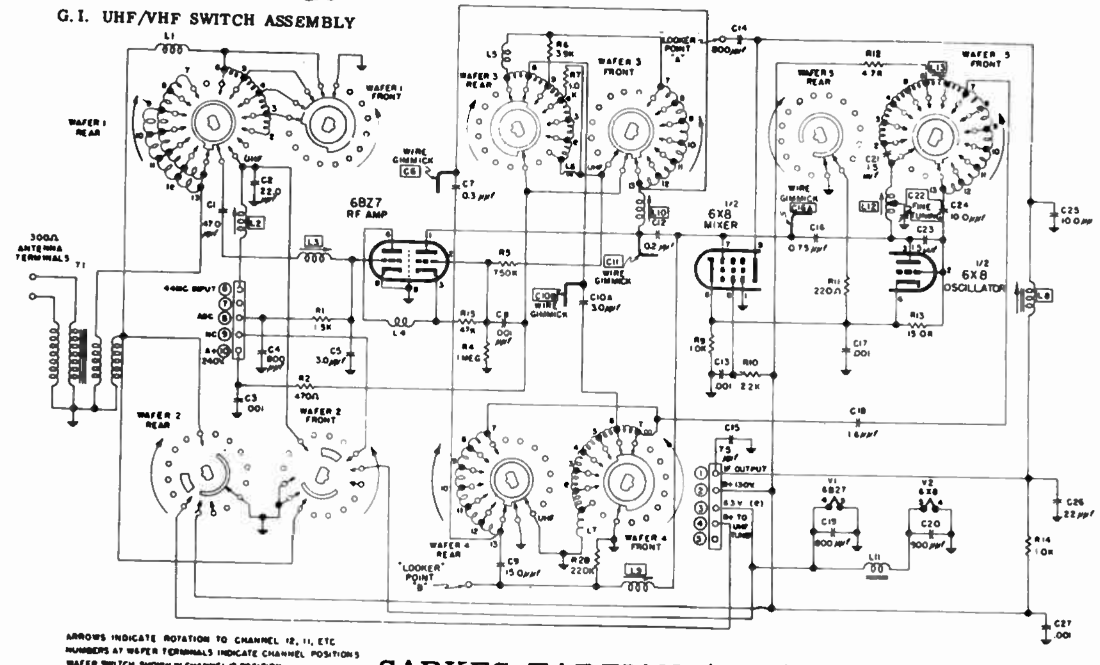




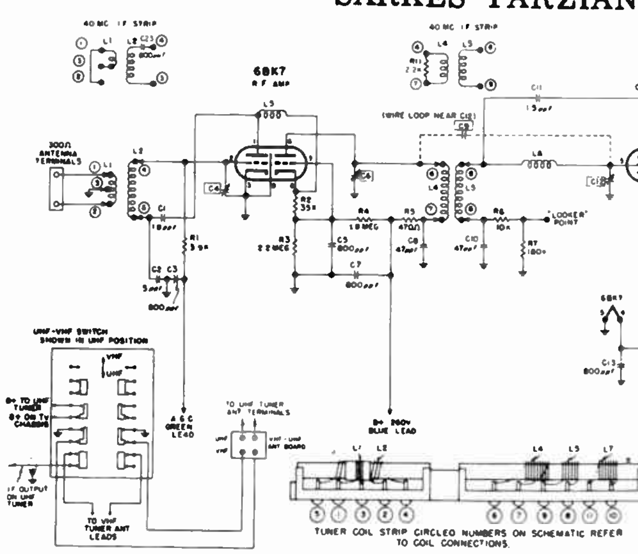
TOP OF PARTS



BOTTOM OF PARTS



SARKES TARZIAN (S.T.) TYPE TUNER



GENERAL INSTRUMENT (G.I.) TYPE TUNER

STEP	TUNER SET TO CHANNEL	GENERATORS SWEEP (10 MC)	GENERATORS IF MARKER	GENERATORS RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
1	4	Channel 4 69 MC	———	67 25 MC (P) 71 75 MC (S)	RF Output	C12, C6, C4, then C9* (wire loop near C12)	30% deviation permissible as shown below	Connect 300 ohm resistor across Antenna Leads. Passband should be somewhat broader than that with antenna circuit operating and with picture marker inside
2	13	Channel 13 213 MC	———	211 25 MC (P) 215 75 MC (S)	RF Output	See "Comments" and note at bottom of chart		Interstage band width is adjusted by C9*. When proper band width cannot be obtained by adjustment of C9, it may be necessary to move C8* and C10* slightly farther apart. Overall band width also depends on antenna selectivity. Interstage band width should be adjusted so that proper overall band width occurs with antenna circuit aligned
3	4	Channel 4 69 MC	———	67 25 MC (P) 71 75 MC (S)	RF Output	C4 Antenna Trimmer		Obtain symmetrical response curve
4	Set VHF tuner between any two channels. Connect sweep generator set to 43.25 MC (sweeping 10 MC) thru hole in VHF tuner cover to pin 5 of 6J6 Osc./Mixer tube. Inject 42.1 MC and 45.75 MC markers.				RF Output	L8, then L54 and L53 (both on TV Chassis)	OR	Adjust for symmetrical overcoupled, double peaked response curve with markers on peaks. L8 and L54 determine position of 45.75 MC marker. L53 determines band width or position of 42.1 MC marker
5	4	Channel 4 69 MC	45.75 MC	71.75 MC	IF Output	C15		If C15 cannot be made to track properly, L7 is out of adjustment and must be tuned as in step 8
6	2	Channel 2 57 MC	Alternate 42.1 MC and 45.75 MC or two Markers	55 25 MC (P) 59 75 MC (S)	IF Output	L7	30% TILT	Check RF Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels
7	3	Channel 3 63 MC	Alternate 42.1 MC and 45.75 MC or two Markers	61 25 MC (P) 65 75 MC (S)	IF Output	L7		Check RF Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels
8	4	Channel 4 69 MC	Alternate 42.1 MC and 45.75 MC or two Markers	67 25 MC (P) 71 75 MC (S)	IF Output	L7		Check RF Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels
9	5	Channel 5 79 MC	Alternate 42.1 MC and 45.75 MC or two Markers	77 25 MC (P) 81 75 MC (S)	IF Output	L7	OR	Check RF Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels
10	6	Channel 6 85 MC	Alternate 42.1 MC and 45.75 MC or two Markers	83 25 MC (P) 87 75 MC (S)	IF Output	L7	30%	Check RF Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels
11	7	Channel 7 177 MC	Alternate 42.1 MC and 45.75 MC or two Markers	175 25 MC (P) 179 75 MC (S)	IF Output	L7		See note below
12	8	Channel 8 183 MC	Alternate 42.1 MC and 45.75 MC or two Markers	181 25 MC (P) 185 75 MC (S)	IF Output	L7	P=PICTURE MARKER S=SOUND MARKER	See note below
13	9	Channel 9 189 MC	Alternate 42.1 MC and 45.75 MC or two Markers	187 25 MC (P) 191 75 MC (S)	IF Output	L7		Same as for steps 6 through 18
NOTE: If one or more coil strips cannot be made to track properly, replace strips. Do not peak coils to correct passbands. If Channels 7 and 8 show deep valley, adjust L9 as in step 18. If this does not correct conditions change the 6J6 Oscillator/Mixer tube. This will necessitate repetition of steps 1 through 5								
14	10	Channel 10 195 MC	Alternate 42.1 MC and 45.75 MC or two Markers	193 25 MC (P) 197 75 MC (S)	IF Output	L7	See curves above	Check Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels.
15	11	Channel 11 201 MC	Alternate 42.1 MC and 45.75 MC or two Markers	199 25 MC (P) 203 75 MC (S)	IF Output	L7	See curves above	Check Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels.
16	12	Channel 12 207 MC	Alternate 42.1 MC and 45.75 MC or two Markers	205 25 MC (P) 209 75 MC (S)	IF Output	L7	See curves above	Check Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels.
17	13	Channel 13 213 MC	Alternate 42.1 MC and 45.75 MC or two Markers	211 25 MC (P) 215 75 MC (S)	IF Output	L7	See curves above	Check Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels.
18	13	Channel 13 213 MC	Alternate 42.1 MC and 45.75 MC or two Markers	211 25 MC (P) 215 75 MC (S)	IF Output	See "Comments" and note at bottom of chart.	See curves above	A valley that is too deep can be flattened by adjusting turns spacing on L9*.

*In order to adjust C8, C9, C10 and L9, it is necessary to remove side cover of tuner. Remove side cover by means of a small wrench and slide cover out between chassis and tuner. The above mentioned adjustments may then be made through hole in chassis opposite tuner. Replace cover when adjustments are complete.

UHF TUNER ALIGNMENT

STEP	SIGNAL GENERATOR Connection	SIGNAL GENERATOR Freq.	SWEEP GENERATOR Connection	SWEEP GENERATOR Freq.	VTVM CONNECTION	OSCILLOSCOPE CONNECTION	ADJUST	OUTPUT READING	COMMENTS
	PERFORM "OSCILLATOR ALIGNMENT" ONLY IN CASES OF POOR UHF TUNER TRACKING								
1.	UHF RF gen. to UHF ant. terminals. (SEE COMMENTS)	896 MC			Across video detector load resistor, R147 4.7K.		C28	Max.	Turn UHF tuning shaft until tuning capacitor plates are fully unmeshed. If UHF RF generator is not internally terminated to 300 ohms, use matching pad in Fig. B.
2.	Check Video IF bandpass response as outlined in step 2 of "Video IF Alignment". Leave detector circuit connected for use in following step 3.								
3.	IF marker to test point on UHF tuner.	42.1 and 45.75 MC	IF sweep to test point on UHF tuner.	43.25 MC (10 MC sweep)		See preceding step 2.	T25	Response curve in Fig. A.	Set VHF tuner to "UHF" position. Maintain marker generator coupling as small as possible to prevent loading and distortion of response curve.
4.	IF marker to test point on UHF tuner.	42.1 and 45.75 MC	UHF sweep to UHF ant. terminals.	464 to 896 MC		Pin 5, 1st Video IF Amp. thru detector circuit in Fig. C.	C37, C38, C39* (C39 adjustment very critical at high end. See Note.)	Response curves in Fig. D.	Tune UHF sweep generator and UHF tuner simultaneously across UHF band. Adjust C37, C38 and C39* for best compromise on dip, tilt and amplitude. Additional adjustment may be accomplished by a slight bending of rotor plates.
CAUTION: Do not attempt to correct for excessive dip or tilt in overall UHF response curves by adjusting bandpass circuit (L8, L53, L54). Readjustment of these circuits will adversely affect VHF reception of receiver.									
5.	Remove detector circuit, 330 Ohm resistor, all test equipment and reconnect T55.								

*NOTE: As a double check for proper C39 adjustment, connect microammeter from UHF tuner test point to chassis. Tune through range; current will vary slightly with frequency. However, improper adjustment of C39 may cause current to drop to O on high end of range, while on low end operation is satisfactory.

Fine Tuning Shaft Positioning

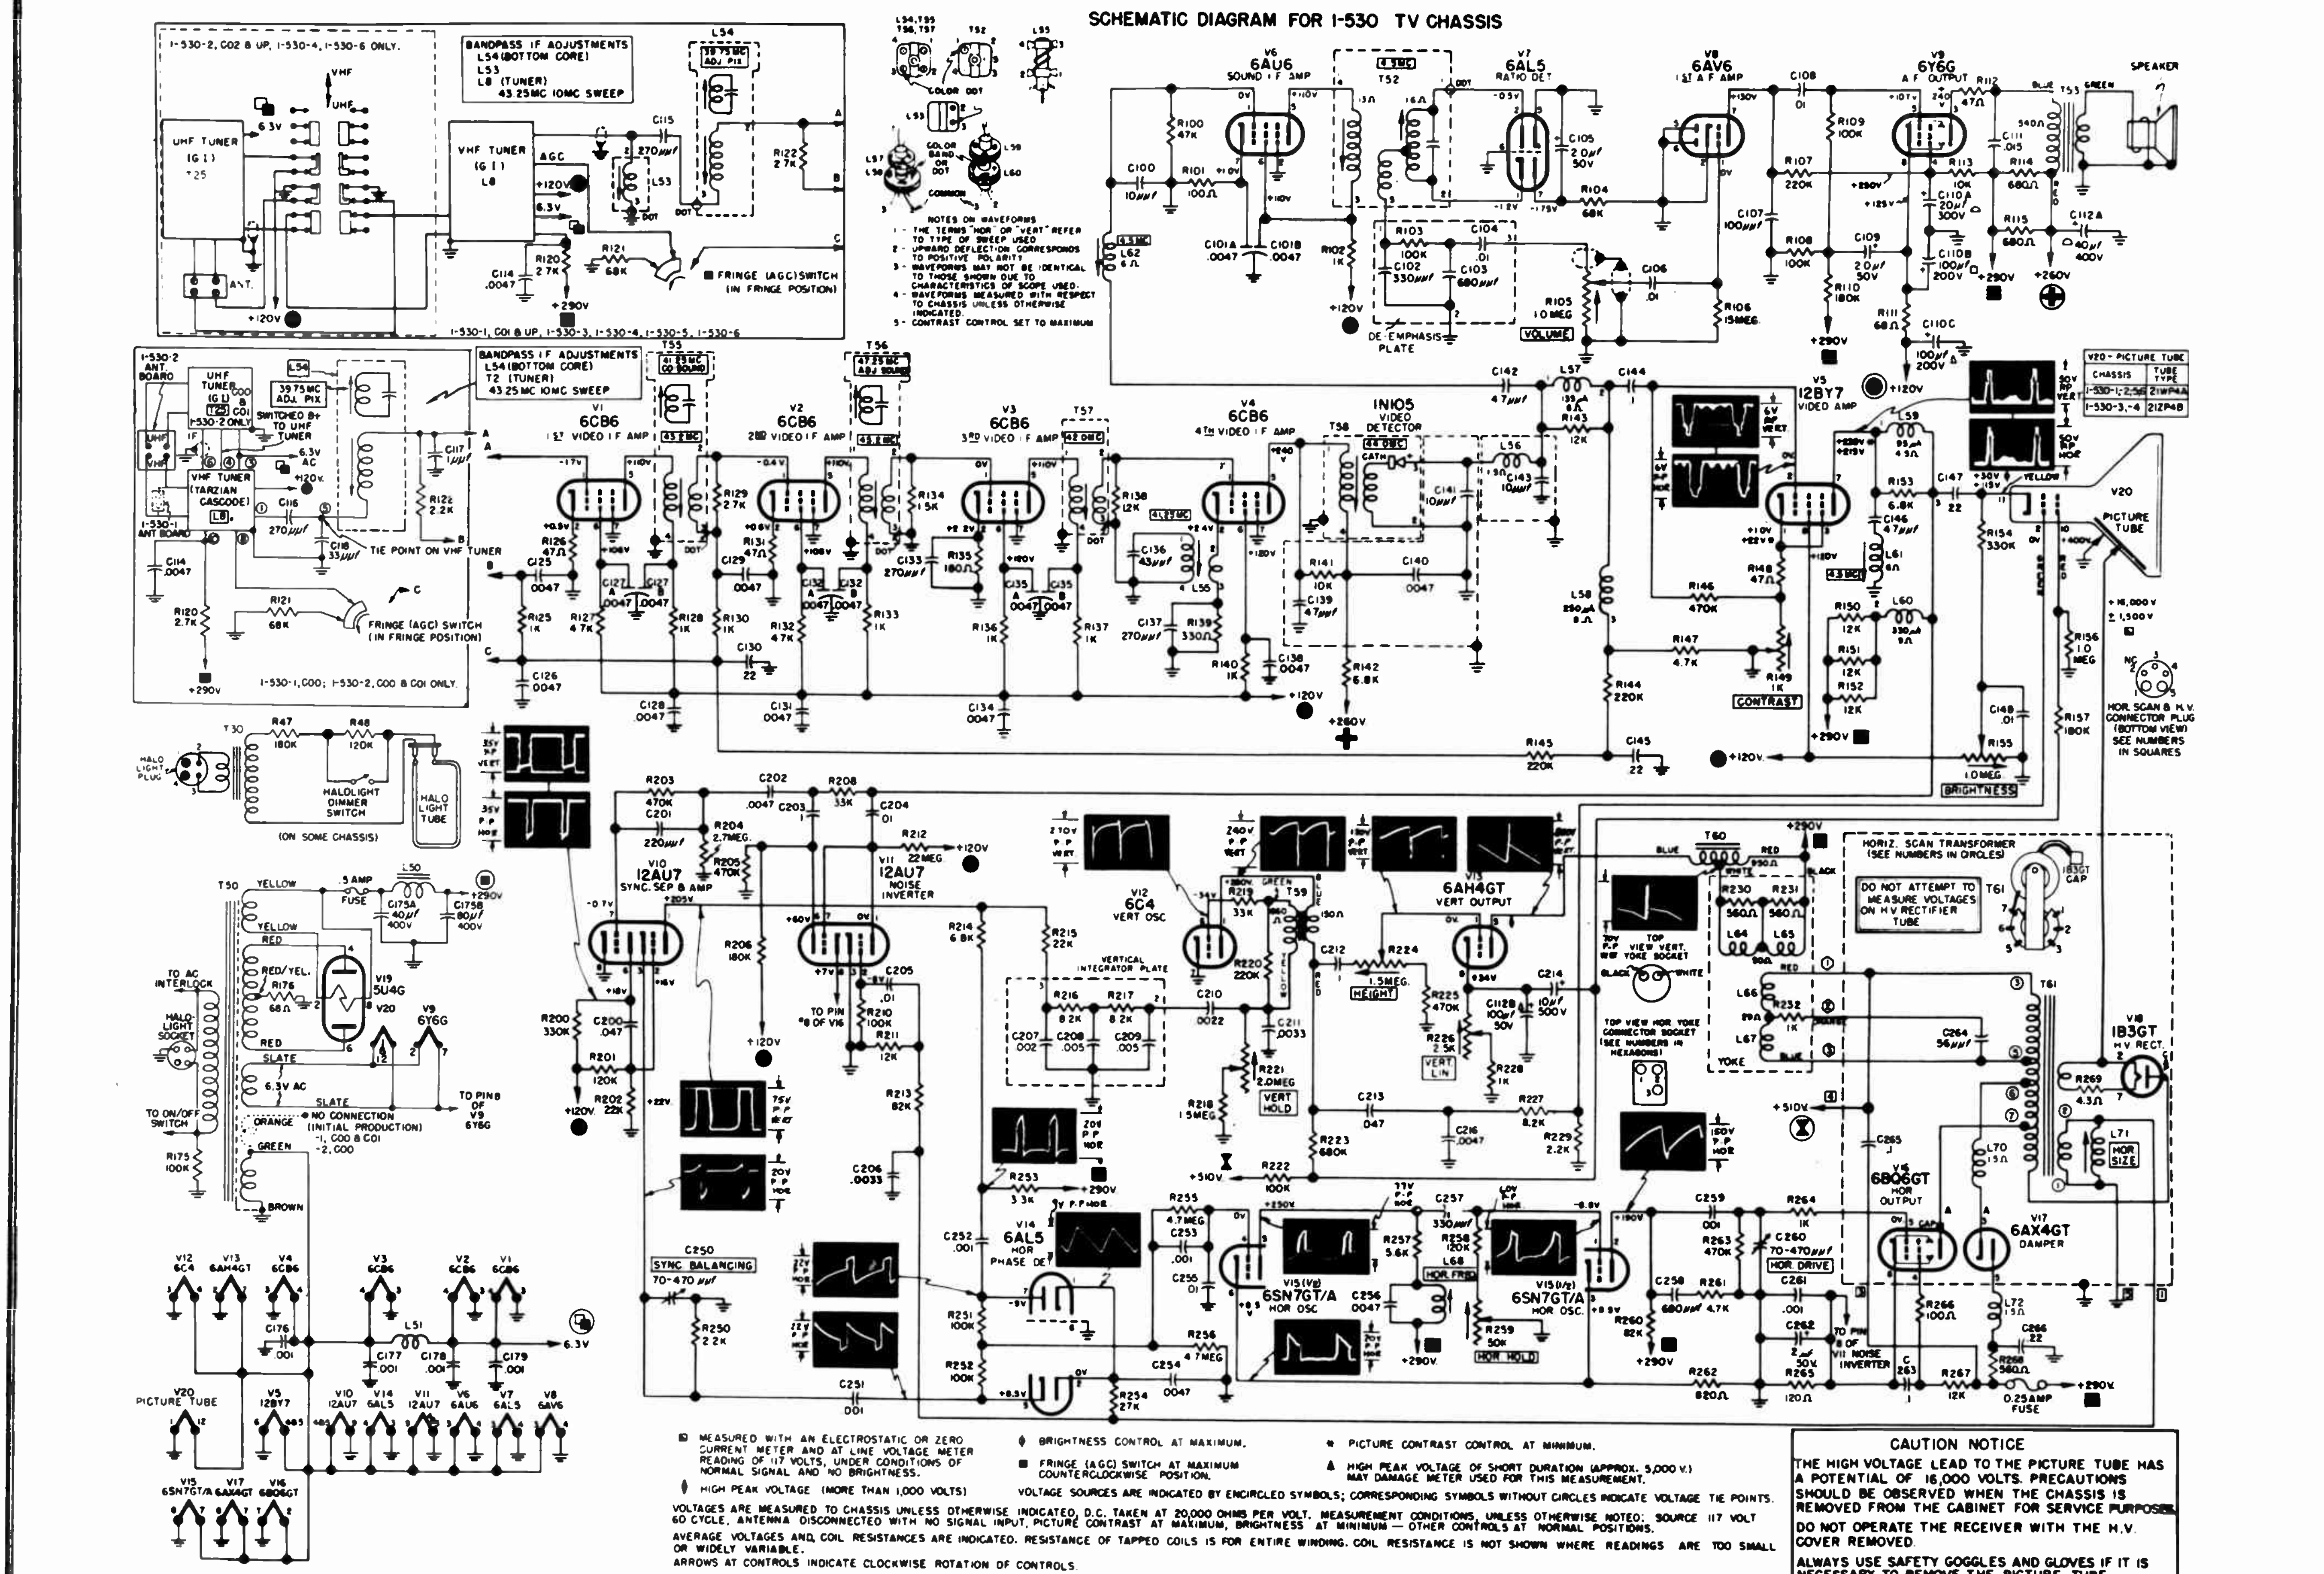
VHF TUNER LAYOUT

Orient Fine Tuning shaft as shown.

HIGH BAND OSCILLATOR ALIGNMENT

STEP	TUNER SET TO CHANNEL	GENERATORS SWEEP (10 MC)	GENERATORS IF MARKER	GENERATORS RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
1.	13	Channel 13 213 MC	45.75 MC	211.25 MC	RF Output	L12 Screw	See Curves below	Coincide Markers as shown.
NOTE: Refer to VHF Tuner Layout and VHF Tuner Schematic for location of specified Wafers, Coil Increments, and Screw Adjustments mentioned in the following steps. As Channels 12 to 7 and 5 to 2 are aligned by means of consecutive coil increments, the aligned increments that precede must not be disturbed.								
2.	12	Channel 12 207 MC	45.75 MC	205.25 MC	RF Output	Channel 12 Loop on Wafer 5	TYPICAL CURVES IF & RF MARKERS 100%	Squeeze or spread loop for Channel 12 on Wafer 5 to coincide Markers as shown.
3.	11	Channel 11 201 MC	45.75 MC	199.25 MC	RF Output	Channel 11 Loop on Wafer 5		Adjust each succeeding Hi-Channel Loop on Wafer 5 (steps 3 to 7) to coincide appropriate Markers for that Channel.
4.	10	Channel 10 195 MC	45.75 MC	193.25 MC	RF Output	Channel 10 Loop on Wafer 5	IF & RF MARKERS 100%	
5.	9	Channel 9 189 MC	45.75 MC	187.25 MC	RF Output	Channel 9 Loop on Wafer 5		
6.	8	Channel 8 183 MC	45.75 MC	181.25 MC	RF Output	Channel 8 Loop on Wafer 5	Note: Curves may not be symmetrical until RF alignment is complete.	
7.	7	Channel 7 177 MC	45.75 MC	175.25 MC	RF Output	Channel 7 Loop on Wafer 5		

SCHEMATIC DIAGRAM FOR 1-530 TV CHASSIS



■ MEASURED WITH AN ELECTROSTATIC OR ZERO CURRENT METER AND AT LINE VOLTAGE METER READING OF 117 VOLTS, UNDER CONDITIONS OF NORMAL SIGNAL AND NO BRIGHTNESS.

♦ HIGH PEAK VOLTAGE (MORE THAN 1,000 VOLTS)

♦ BRIGHTNESS CONTROL AT MAXIMUM.

■ FRINGE (AGC) SWITCH AT MAXIMUM COUNTERCLOCKWISE POSITION.

* PICTURE CONTRAST CONTROL AT MINIMUM.

▲ HIGH PEAK VOLTAGE OF SHORT DURATION (APPROX. 5,000 V.) MAY DAMAGE METER USED FOR THIS MEASUREMENT.

VOLTAGE SOURCES ARE INDICATED BY ENCIRCLED SYMBOLS; CORRESPONDING SYMBOLS WITHOUT CIRCLES INDICATE VOLTAGE TIE POINTS.

VOLTAGES ARE MEASURED TO CHASSIS UNLESS OTHERWISE INDICATED, D.C. TAKEN AT 20,000 OHMS PER VOLT. MEASUREMENT CONDITIONS, UNLESS OTHERWISE NOTED: SOURCE 117 VOLT 60 CYCLE, ANTENNA DISCONNECTED WITH NO SIGNAL INPUT, PICTURE CONTRAST AT MAXIMUM, BRIGHTNESS AT MINIMUM — OTHER CONTROLS AT NORMAL POSITIONS.

AVERAGE VOLTAGES AND COIL RESISTANCES ARE INDICATED. RESISTANCE OF TAPPED COILS IS FOR ENTIRE WINDING. COIL RESISTANCE IS NOT SHOWN WHERE READINGS ARE TOO SMALL OR WIDELY VARIABLE.

ARROWS AT CONTROLS INDICATE CLOCKWISE ROTATION OF CONTROLS.

CAUTION NOTICE

THE HIGH VOLTAGE LEAD TO THE PICTURE TUBE HAS A POTENTIAL OF 16,000 VOLTS. PRECAUTIONS SHOULD BE OBSERVED WHEN THE CHASSIS IS REMOVED FROM THE CABINET FOR SERVICE PURPOSES.

DO NOT OPERATE THE RECEIVER WITH THE H.V. COVER REMOVED.

ALWAYS USE SAFETY GOGGLES AND GLOVES IF IT IS NECESSARY TO REMOVE THE PICTURE TUBE.

LOW BAND OSCILLATOR ALIGNMENT

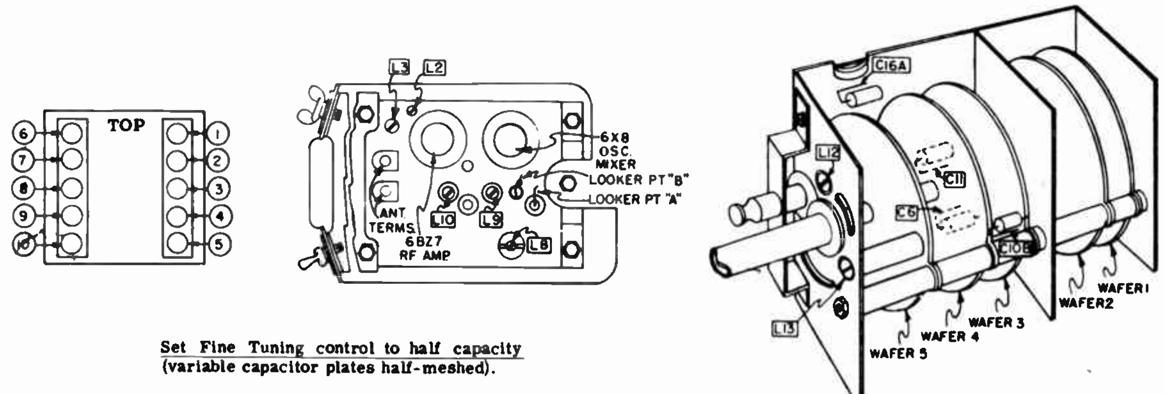
8.	6	Channel 6 85 MC	45.75 MC	83.25 MC	RF Output	L13 Screw	See Curves above	Coincide Markers as shown.
9.	5	Channel 5 79 MC	45.75 MC	77.25 MC	RF Output	Channel 5 Coil on Wafer 5		Squeeze or spread turns of Channel 5 Coil on Wafer 5 to coincide Markers as shown.
10.	4	Channel 4 69 MC	45.75 MC	67.25 MC	RF Output	Channel 4 Coil on Wafer 5		Adjust each succeeding Lo-Channel Coil on Wafer 5 (steps 10 to 12) to coincide appropriate Markers for that Channel.
11.	3	Channel 3 63 MC	45.75 MC	61.25 MC	RF Output	Channel 3 Coil on Wafer 5		
12.	2	Channel 2 57 MC	45.75 MC	55.25 MC	RF Output	Channel 2 Coil on Wafer 5		

HIGH AND LOW BAND RF ALIGNMENT

1.	13	Channel 13 213 MC	——	211.25 MC (P) 215.75 MC (S)	RF Output	L3, L9, L10 Screws	211.25 MC / 215.75 MC	Adjust L3 for maximum mid-band height regardless of skirts. Adjust L10 for proper skirt figuring. Adjust L9 for flat top. Picture carrier must be at 100%; sound carrier may ride down 30%.
2.	13	Same as 1	45.75 MC and 42.1 MC		IF Output	L8 on Tuner and L54 on main Chassis	42.1 MC / 45.75 MC	Adjust for response curve shown.
3.	13	Same as 1	——	211.25 MC (P) 215.75 MC (S)	RF Output	L9 Screw	211.25 MC / 215.75 MC	Touch up for flat top if necessary. There must not be more than 5% dip.
4.	12	Channel 12 207 MC	——	205.25 MC (P) 209.75 MC (S)	RF Output	Channel 12 Loops on Wafers 1, 3 and 4	PICTURE 100% / SOUND	Squeeze or spread loops for Channel 12 to acquire acceptable response curve. Loop on Wafer 1 adjusts mid-band amplitude; Loop on Wafer 3 adjusts skirt frequency; Loop on Wafer 4 adjusts for flat top. Align each succeeding channel (steps 5 to 14) adjusting inductances of appropriate loops or coils on Wafers 1, 3, and 4. Refer to VHF Tuner Schematic and Parts Layout for locations of specified loop increments. Picture and Sound carriers must remain on top of curve.
5.	11	Channel 11 201 MC	——	199.25 MC (P) 203.75 MC (S)	RF Output	Channel 11 Loops on Wafers 1, 3 and 4	OR	
6.	10	Channel 10 195 MC	——	193.25 MC (P) 197.75 MC (S)	RF Output	Channel 10 Loops on Wafers 1, 3 and 4	PICTURE / SOUND / 70%	
7.	9	Channel 9 189 MC	——	187.25 MC (P) 191.75 MC (S)	RF Output	Channel 9 Loops on Wafers 1, 3 and 4	OR	
8.	8	Channel 8 183 MC	——	181.25 MC (P) 185.75 MC (S)	RF Output	Channel 8 Loops on Wafers 1, 3 and 4	PICTURE / SOUND / 70%	
9.	7	Channel 7 177 MC	——	175.25 MC (P) 179.75 MC (S)	RF Output	Channel 7 Loops on Wafers 1, 3 and 4	OR	
10.	6	Channel 6 85 MC	——	83.25 MC (P) 87.75 MC (S)	RF Output	Channel 6 Coils on Wafers 1, 3 and 4	PICTURE 70% / SOUND 100%	
11.	5	Channel 5 79 MC	——	77.25 MC (P) 81.75 MC (S)	RF Output	Channel 5 Coils on Wafers 1, 3 and 4		
12.	4	Channel 4 69 MC	——	67.25 MC (P) 71.75 MC (S)	RF Output	Channel 4 Coils on Wafers 1, 3 and 4		
13.	3	Channel 3 63 MC	——	61.25 MC (P) 65.75 MC (S)	RF Output	Channel 3 Coils on Wafers 1, 3 and 4		
14.	2	Channel 2 57 MC	——	55.25 MC (P) 59.75 MC (S)	RF Output	Channel 2 Coils on Wafers 1, 3 and 4		

NOTE: As each Channel is aligned by adjustment of its inductance increments in the order listed in steps 4 to 14, care must be exercised not to disturb the aligned increments preceding the one being adjusted.

15. Recheck all channels for flat top response curve, touching up L9 for Chan. 13 and appropriate coil increments for other channels. Up to 30% Dip is permissible for all channels. If bandwidth on any channel is insufficient after these adjustments, touch up by bending gimmick capacitors C6, C10B and C11 towards or away from C7, C10A and C12, respectively.



Set Fine Tuning control to half capacity (variable capacitor plates half-meshed).

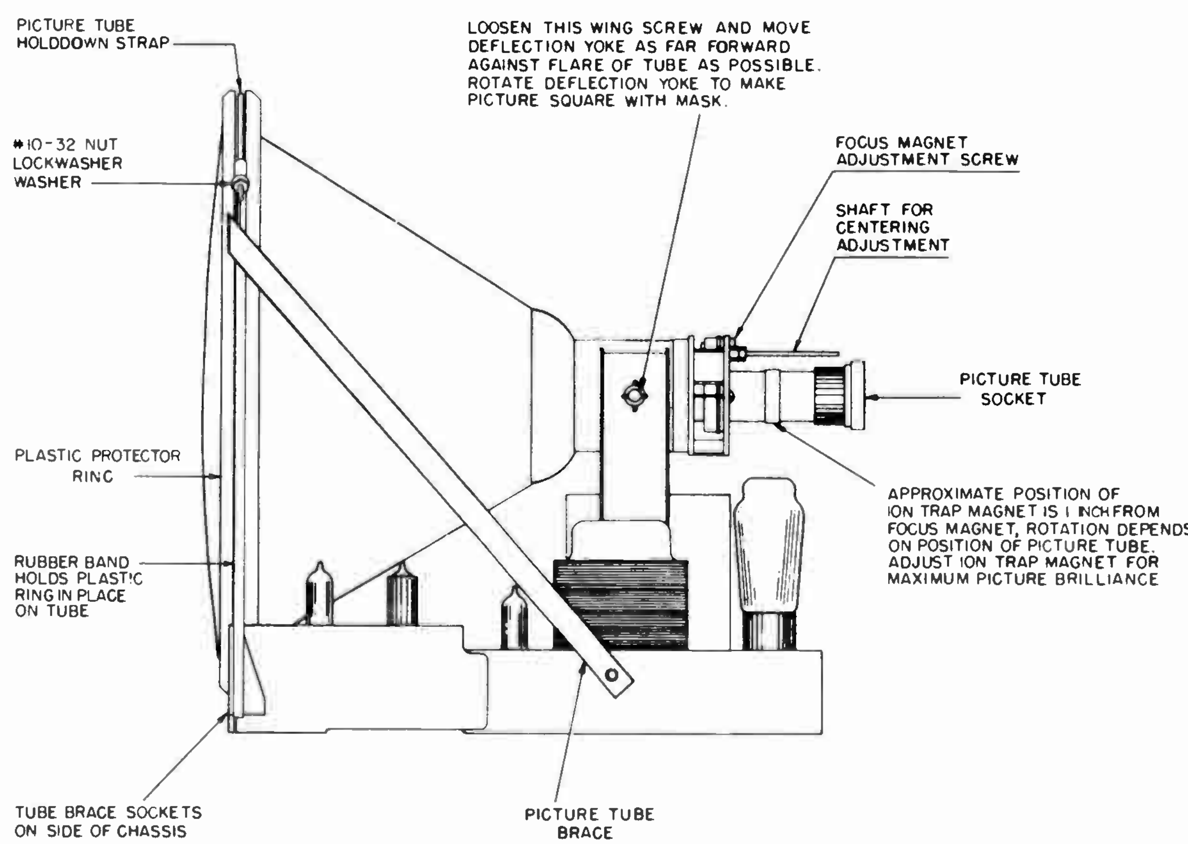

FIGURE 3 - PICTURE TUBE INSTALLATION

GENERAL DESCRIPTION

Model 1210X is a direct viewing television receiver which provides reception of all 12 commercial television channels. The television picture is reproduced on a round 16 inch white-faced, electromagnetically deflected, tetrode type picture tube.

ADJUSTMENT OF HORIZONTAL AFC CIRCUIT

Check of Operation

The operation of the AFC circuit should be checked as follows:

A. Tune the receiver to a channel on which no signal is received and return to the original channel. The picture should immediately fall into synchronization.

B. Switch off the power to the receiver for about five minutes and then switch back on. Picture should immediately fall into sync.

C. Check for correct phasing of Horizontal AFC circuit by noting that there is approximately 1/8" of blanking visible on the right hand edge of the picture. It will be necessary to turn the contrast control to minimum and readjust the brightness control to see the blanking.

NOTE: Before making check C above, be sure the horizontal drive control is correctly adjusted. Refer to "Preset Controls Adjustment," page 8. If the receiver passes the above checks, no adjustments to the horizontal AFC circuits need be made.

If the receiver cannot pass checks "A," "B," or "C" the adjustment of the Horizontal Hold Control as noted under "Horizontal Hold Adjustment" should be made.

Horizontal Hold Adjustment

A. Tune in a station and adjust the tuning control for best picture quality. Adjust the contrast and brightness controls for normal picture.

B. Remove V15 - 6AL5 - Horizontal Discriminator tube.

C. Turn the Horizontal Hold Control until the picture moves back and forth across the screen with blanking bars vertical.

D. Replace the Horizontal Discriminator tube and repeat A, B, and C under "Check of Operation" above.

E. If receiver still will not pass these checks, it will be necessary to proceed with "Phase Adjustment."

F. Check the "free-running" of the horizontal oscillator as described under paragraphs "B," "C," and "D," and, if necessary, readjust the frequency adjustment screw on top of horizontal discriminator transformer.

G. Make a final check of the phasing as described in paragraph "E" above. It is important that both the "free-running" and the phasing are correct.

H. Remove the short from across the 4700 ohm resistor R226 and re-adjust the horizontal drive control as described in "A". Turn the core in the horizontal "ringing" coil clockwise until approximately 1/8" of "blanking" is again visible on the right-hand edge of the picture.

I. Before the horizontal synchronization circuit is adjusted to the final position, it will be necessary to check the operation as follows:

Slowly turn the oscillator frequency adjustment screw (top of transformer T62) in either direction until the picture suddenly falls out of synchronization as indicated by the presence of a number of diagonal bars. The total number of bars visible must not be less than six. These bars may consist of either several full bars and two half bars for the total number or they may be all full bars for the same total number. Slowly turn the adjustment screw so as to decrease the number of bars and note the total number of bars visible just before the picture again falls into synchronization. The last number of bars visible must not be less than three, or more than four. In order to get an accurate indication of the minimum number of bars obtainable, the adjustment screw must be turned very slowly and carefully once the number of bars has been reduced to four or five.

Turn the adjustment screw in the opposite direction until the picture suddenly falls out of synchronization in the opposite direction and repeat the foregoing procedure. Again, the total number of bars visible when the picture falls out of synchronization must not be less than six, and not less than three or more than four bars must be visible just before the picture falls into synchronization.

J. After checking the operation as in I, it is necessary to repeat the procedure described in paragraphs "B," "C," and "D."

K. Remove the signal by tuning to a "free" channel, then retuning to the original channel. The picture should immediately fall into synchronization.

L. Switch "off" the power to the receiver for about five minutes and then switch receiver "on" and check that the picture pulls into synchronization.

Phase Adjustment

A. Turn the core in the horizontal "ringing" coil all the way out (counterclockwise). Short out the 4700 ohm horizontal charge circuit peaking resistor R226.

With the horizontal size coil set for approximately the correct picture width, and with the horizontal linearity coil adjusted for best linearity, rotate the horizontal drive control fully counterclockwise. Slowly turn the drive control clockwise until crowding is visible in the center of the picture. Now carefully turn the control back (counterclockwise) only enough to remove the crowding in the picture or pattern. On some chassis, it may not be possible to obtain crowding of the picture. In such cases the control should be set to the fully clockwise position.

NOTE: Do not operate the receiver with the horizontal drive control mis-adjusted.

B. Remove V15 - 6AL5 - Horizontal Discriminator Tube from its socket.

C. Carefully turn the frequency adjustment screw (top of discriminator transformer T62) until the picture moves back and forth across the screen of the picture tube with the blanking bar vertical.

D. Replace the 6AL5 - Horizontal Discriminator Tube in its socket.

E. Adjust the phase adjustment screw (underside of discriminator transformer T62) until approximately 1/8" of "blanking" is visible on the right-hand edge of the picture. In order to see the "blanking", turn contrast control almost to minimum, readjust brightness control, and reduce picture size.

AGC CONTROL ADJUSTMENT

This control has been correctly adjusted at the factory and should require no further adjustment. If adjustment becomes necessary as evidenced by poor horizontal or vertical sync; or a video signal with poor contrast, proceed as follows:

1. Connect a good antenna installation to the receiver.

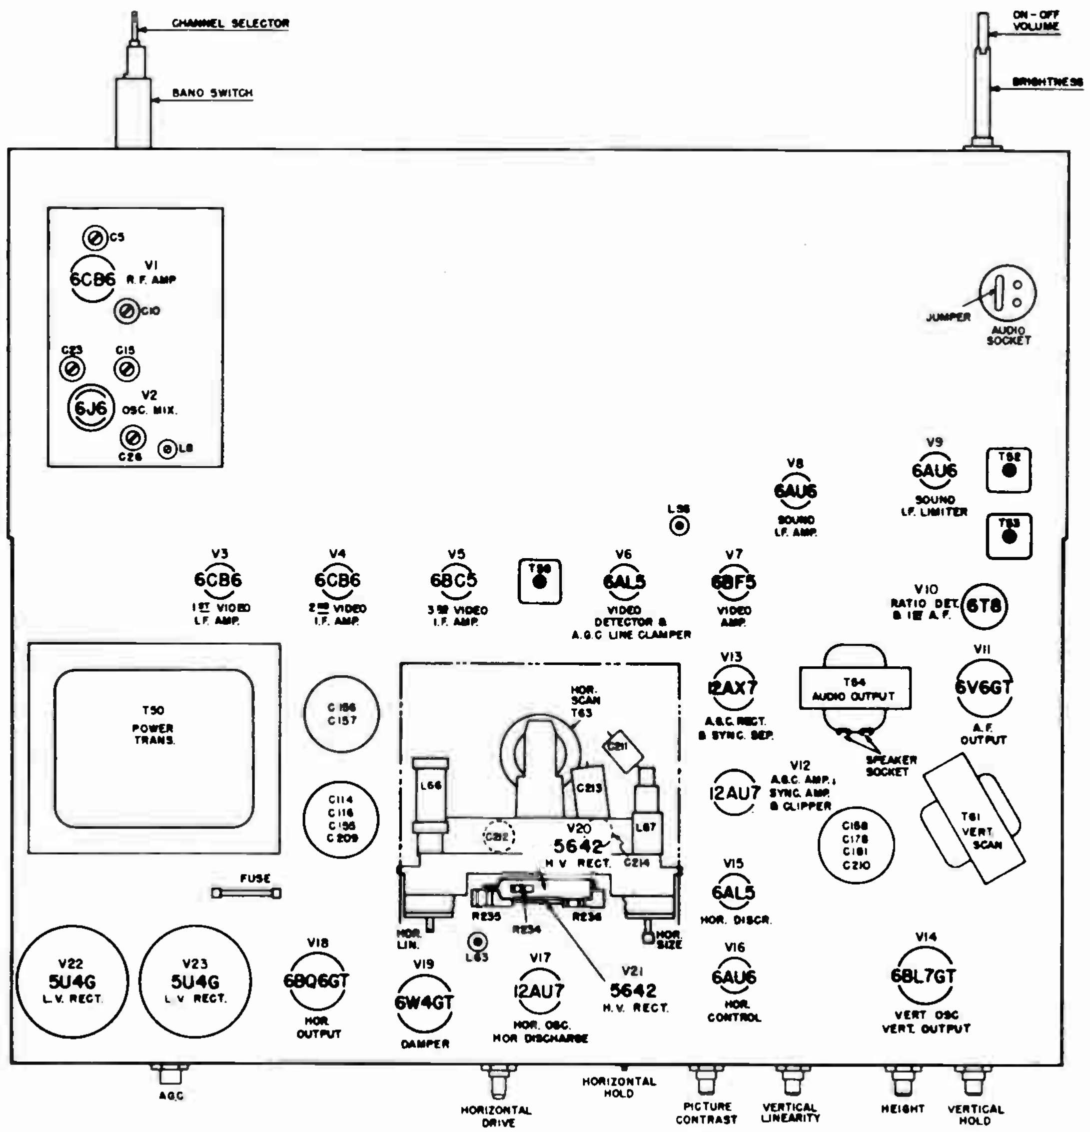

FIGURE 4 - CHASSIS TOP LAYOUT

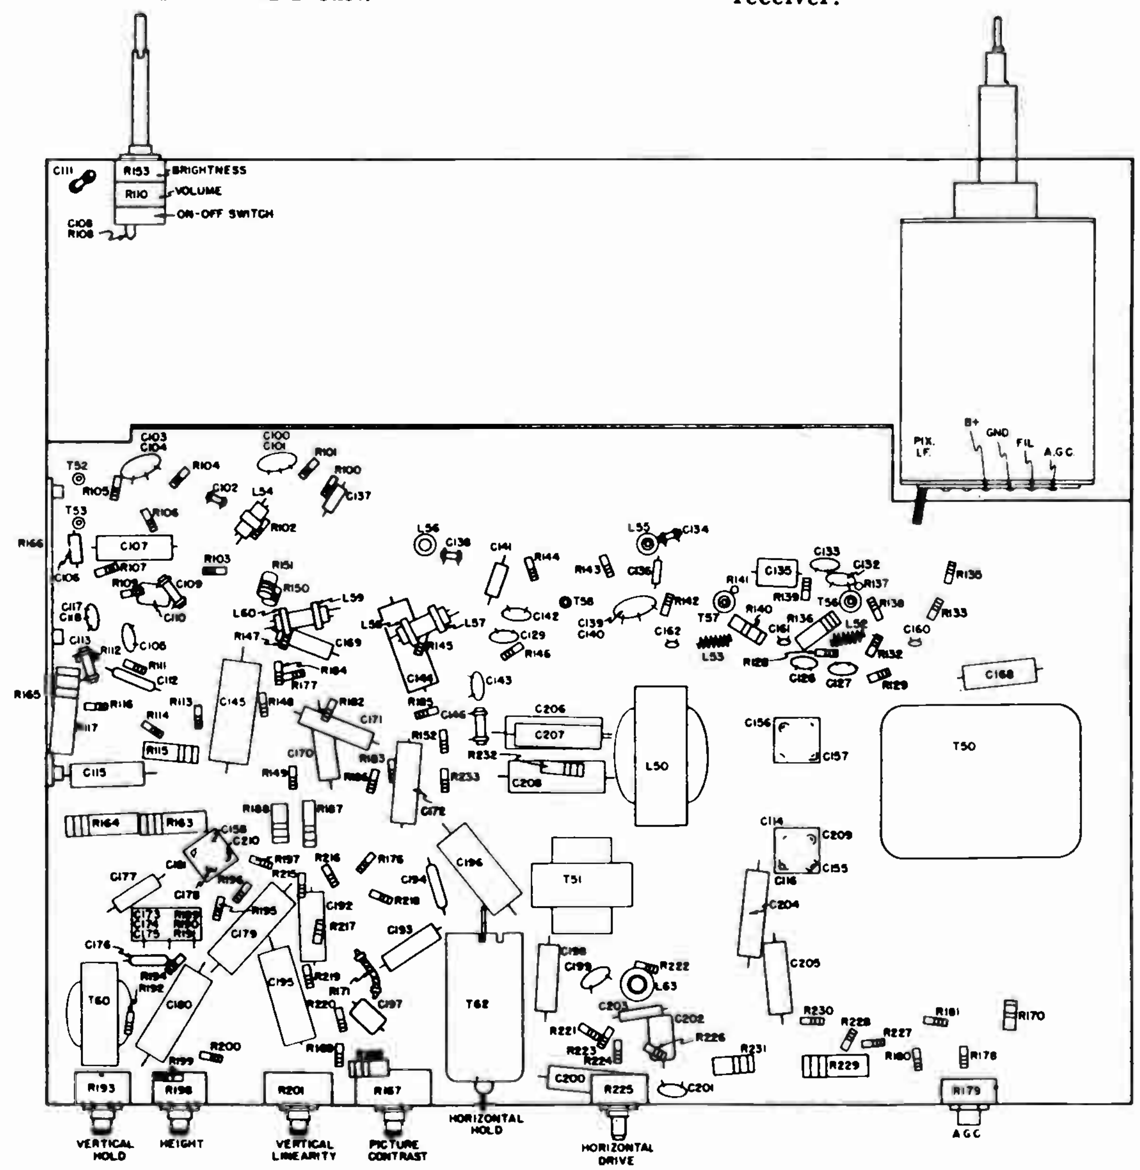

FIGURE 6 - CHASSIS BOTTOM LAYOUT

2. Tune the receiver to a channel on which no picture is received.

3. Set the contrast control to mid-position.

4. Turn the AGC control fully clockwise. The AGC control is located on the rear panel of the chassis.

5. Connect a VTVM from the AGC Amplifier plate to ground (V12, 12AU7, pin 6) and set the AGC control to obtain a negative 0.1 volt reading.
Note: On some receivers the closest approach to this reading will be the fully clockwise position.

6. With the AGC Control set as above, turn the contrast control almost to maximum (about 7/8) and tune in the strongest station available in the area.

7. Again read the AGC Amplifier plate voltage; if reading is less than a negative 2.0 volts leave the control as set.

8. If the AGC Amplifier plate voltage is more than 2 volts negative, slowly turn the AGC control counterclockwise observing the picture.

9. The picture will get darker and then finally start to fall out of sync as evidenced by a sudden shift or jittering of the picture in either the horizontal or vertical direction. Do not turn beyond this point.

10. Back off (clockwise) slowly on the control until the picture holds in sync without flutter and turn slightly beyond. (Experience will dictate how far beyond to turn).

11. Rock the tuning control slightly either side of the best tuning point to insure picture stays in sync; if not, turn slightly further clockwise and check again.

12. As a final check, turn the volume control up to normal level. Intercarrier buzz should be negligible.

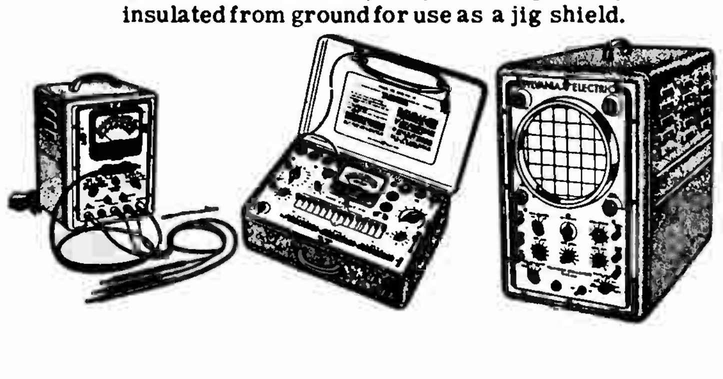
13. Remove objectionable intercarrier buzz by turning the AGC control slightly further clockwise. (Note: The intercarrier buzz is merely a reference for correct adjustment of the AGC control and only a slight touch-up should be necessary. If much adjustment is required to remove intercarrier buzz, the sound section is maladjusted and requires realignment.

14. Rock the tuning control slightly either side of the best tuning point and turn the AGC control slightly more clockwise as necessary to remove objectionable intercarrier buzz.

The intent of the above AGC control adjustment is to provide a maximum of AGC action consistent with proper sync and minimum intercarrier buzz on strong signals.

TEST EQUIPMENT REQUIREMENTS

1. RF sweep generator or generators with frequency range from 4-220 Mc. having sweep width adjustable from 50 Kc. to 10 Mc. with an output of at least 0.1 volt, a marker system, either built-in or external type and flat within ± 1 Db.
2. Signal generator or generators with a frequency range from 4-222 Mc. and an adjustable output of at least 0.1 volt.
3. Sylvania cathode ray oscilloscope type 400 or equivalent capable of passing a 60 cycle square wave.
4. Sylvania Polymeter type 221 or equivalent vacuum tube voltmeter.
5. Sylvania High Voltage Probe Adapter type 225 or equivalent with 0-30 KV DC range (not shown).
6. Sylvania tube tester type 220 or equivalent capable of testing shorts with proper voltages and performance under dynamic conditions.
7. Jig Tube Shield - made by insulating or cutting off a tube shield, so it will not ground when in place on the converter tube. The existing shield around V2, oscillator-converter tube, may be temporarily insulated from ground for use as a jig shield.



SYLVANIA POLYMETER TYPE 221 | SYLVANIA TUBE TESTER TYPE 220 | SYLVANIA OSCILLOSCOPE TYPE 400

FIGURE 7 - SYLVANIA TEST EQUIPMENT

ALIGNMENT PROCEDURE

Should any chassis under service require complete realignment, the alignment procedure should be carried out in the following listed order.

PRE-ALIGNMENT INSTRUCTIONS - READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT.

Lay chassis on left side for alignment. Ground all equipment to receiver chassis. Use special alignment tool Service Part No. 898-0003.

VIDEO I F ALIGNMENT

1. Connect signal generator to the jig shield on the Oscillator-Converter tube. Allow generator and set to warm-up for fifteen minutes.

2. Connect the negative lead of a 3 volt battery to the AGC Line, positive lead to ground.

3. Connect D.C. VTVM across the diode load resistor R145 - 3900 ohm.

4. Tune generator to 27.9 Mc. and adjust trap coil L55 for minimum output. Keep voltmeter reading under 2 volts by reducing generator output as required.

5. Adjust the cores of the Video IF Transformers in the following order. Reduce generator output to keep voltmeter reading between 1 and 2 volts.

Set Signal Generator At:	Adjust:
26.2 Mc.	Core on 2nd Video IF Transformer T57 for maximum output
24.1 Mc.	Core on 1st Video IF Transformer T56 for maximum output
25.3 Mc.	Core on Converter Coil L8 for maximum output
27.9 Mc.	Core on trap coil L55 for minimum output

6. Disconnect signal generator and VTVM.

7. Connect sweep generator (frequency 25 Mc., sweeping 10 Mc.) using a .005 Mfd. capacitor to pin 1 of 3rd Video IF Amplifier - 6BC5.

8. Connect oscilloscope to junction of diode load resistor R145 - 3900 ohm and coil L58.

9. Adjust primary (top core) and then secondary (bottom core) of IF Bandpass T58 to obtain curve shown in Figure 8. (Both cores adjusted from bottom of transformer using hex end of special alignment tool).

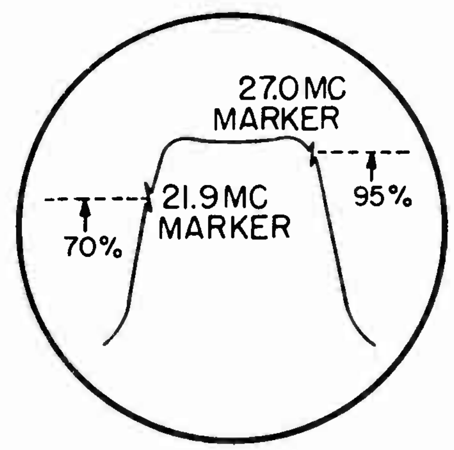


FIGURE 8 - IF BANDPASS RESPONSE

10. Disconnect Sweep Generator from 3rd IF Grid and connect it to the Jig Shield on the Converter Tube. Loosely couple signal generator at this point for markers.

11. Observe IF Response Curve and if necessary adjust IF Transformer Cores slightly to obtain response curve shown in Figure 9. Keep oscilloscope gain high enough to prevent overload of the receiver as overload will distort the curve.

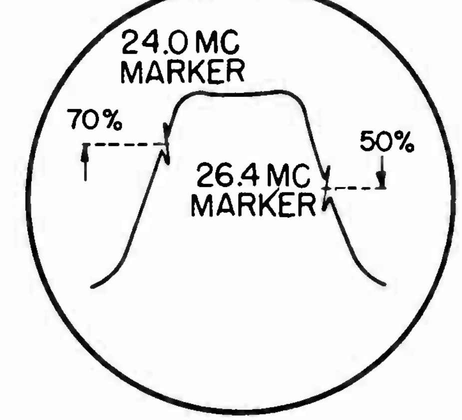

FIGURE 9 - OVERALL IF RESPONSE

SOUND TAKE-OFF & 4.5 MC. TRAP ALIGNMENT

1. Connect a 4.5 Mc. sweep generator having a 250 Kc. sweep through .005 Mfd. to pin 7 of video detector - 6AL5. Loosely connect signal generator for use as markers.

2. Connect oscilloscope to limiter grid resistor R104 - 47M through a 270M isolating resistor. Adjust trap core L56 until 4.5 Mc. marker is centered at the peak of the response curve. See Figure 10.

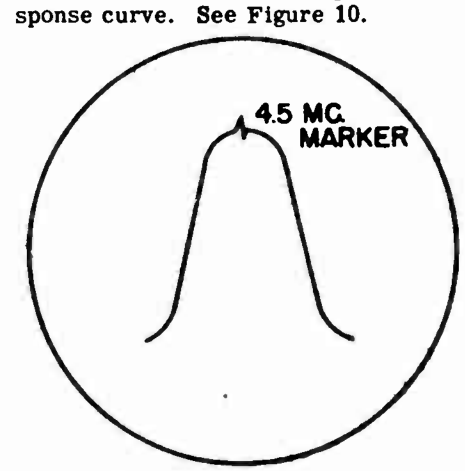

FIGURE 10 - SOUND IF RESPONSE

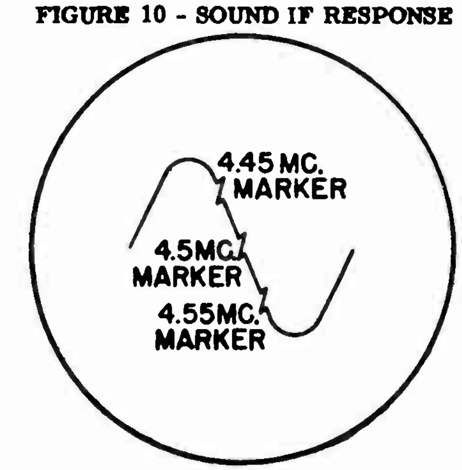

FIGURE 11 - SOUND DISCRIMINATOR RESPONSE

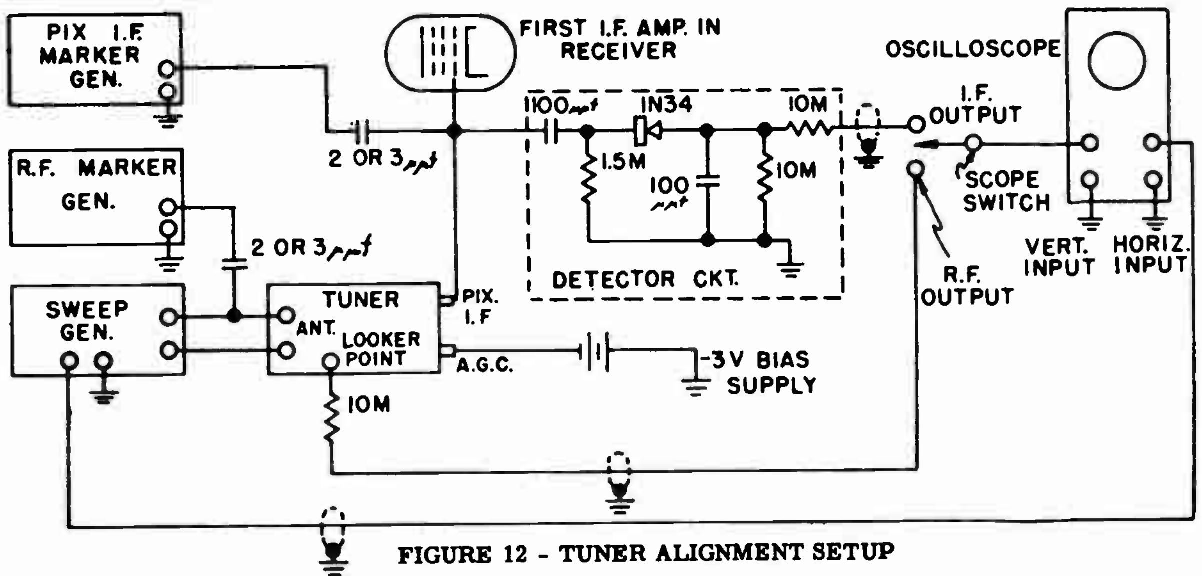

FIGURE 12 - TUNER ALIGNMENT SETUP

SOUND DISCRIMINATOR ALIGNMENT

1. Connect oscilloscope across the Volume Control.

2. Adjust the cores of the discriminator transformers T52 and T53 until the discriminator curve corresponds to that in Figure 11. Note especially that:

   (a) 4.5 Mc. marker is exactly in the center of the curve.
   (b) The curve is linear between the outside two markers.
   (c) The amplitude is the greatest obtainable.

R F TUNER ALIGNMENT

NOTES ON TUNER ALIGNMENT SETUP

In reference to Figure 12, the following precautions should be taken in making the equipment setup.

1. The detector circuit should be so constructed as to maintain leads as short as possible. Connection of the detector circuit to the 1st IF grid terminal (see Fig. 12 for location) should also be made with short leads.

2. Shielded leads should be used in making the following connections to reduce hum and synchronous voltage pick-up.

   (a) The lead for observation of the RF response from the scope isolating resistor (10,000 ohms located at the tuner "looker point") to the RF output switch position of the scope switch.
   (b) The connection from the IF detector circuit output to the IF switch position of the scope switch.
   (c) The connection from the sweep generator to the horizontal input of the scope. (Use externally generated sweep instead of internal oscilloscope sweep in order to obtain synchronization).

3. The single pole double throw "Scope Switch" should be located at the vertical input terminals of the scope. This switching arrangement will permit observation of either the IF response or the overall RF response. The aforementioned positions will be referred to in subsequent text as the "IF" and "RF" positions respectively.

4. The marker generator coupling condenser should be as small a value as possible to prevent any effect on tuner response, but must be large enough to permit easy observation of markers on either the IF response or overall RF response. (Approximately 2 or 3 MMF should be satisfactory in most cases).

5. For all tuner alignment tests which are outlined in this text, remove the second IF amplifier tube or bypass its plate circuit with approximately 1000 MMF to prevent coupling back from the receiver IF system.

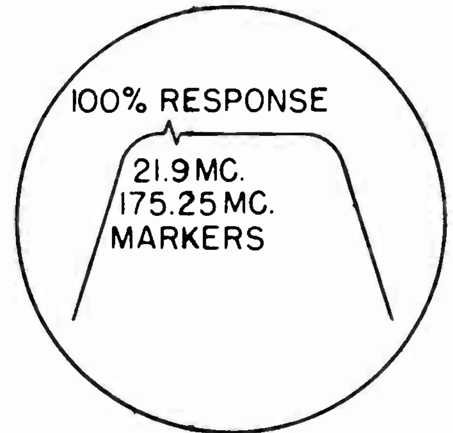
6. In all of the following tests the oscilloscope vertical gain should be as close to maximum gain as possible, consistent with hum and synchronous voltage interference limitations. This precaution will allow the use of low levels from RF sweep Generator and increase the visibility of IF and RF markers.

OSCILLATOR ALIGNMENT

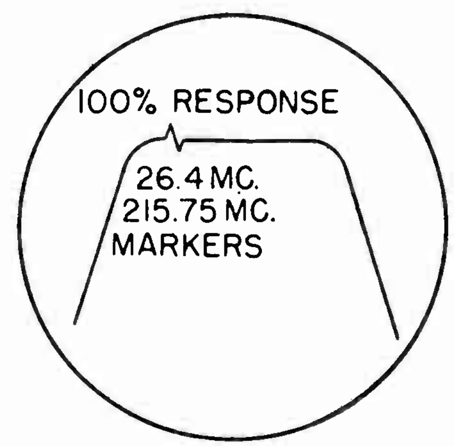
In making adjustments of the oscillator alignment it should be noted that any change in the setting of the high band oscillator trimmer will also effect the low band oscillator tuning, however, because of switching, the adjustment of the low band oscillator trimmer will not affect high band oscillator tuning. Also, there is a slight shift of oscillator frequency in the high band position only when the bottom cover is removed.

High Band Oscillator Alignment

1. Remove the bottom cover and rotate the band switch to the high band position.
2. Rotate variable capacitor to maximum capacity position (fully counterclockwise position of tuning control knob).
3. Tune sweep generator to channel 7 and set scope switch to IF output position.
4. Inject 175.25 Mc. and 21.9 Mc. markers.
5. With a non-metallic pick vary the turns spacing on the high band oscillator coil L9 until markers coincide (squeezing the coil lowers the oscillator frequency and spacing the turns farther apart raises oscillator frequency.



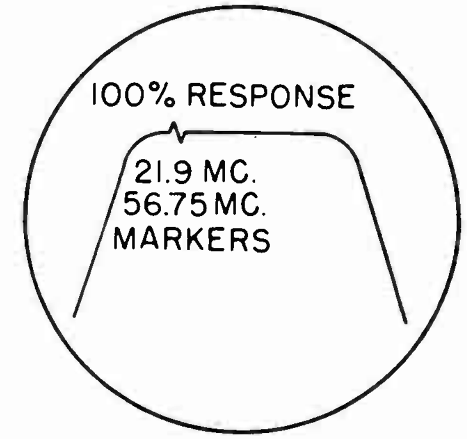
6. Replace bottom cover and check for shift of markers. If there is a shift remove the bottom cover and compensate by re-adjusting L9 as necessary. Repeat until markers coincide with bottom cover in place.
7. Rotate variable capacitor to minimum capacity (fully clockwise position of tuning control knob).
8. Tune sweep generator to channel 13.
9. Inject 215.75 Mc. and 26.4 Mc. markers.
10. With bottom cover in place, adjust oscillator grid trimmer C23 to make markers coincide.



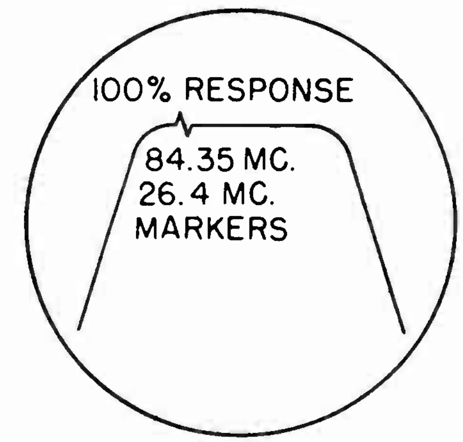
11. Repeat steps one through ten until proper end frequencies are reached at maximum and minimum capacity settings.

Low Band Oscillator Alignment

12. Remove bottom cover, turn band switch to low band position and rotate variable capacitor to maximum capacity (tuning control knob fully counterclockwise).
13. Tune sweep generator to channel 2.
14. Inject 56.75 Mc. and 21.9 Mc. markers.
15. Using a non-metallic pick adjust the spacing between turns on the low band oscillator coil L9 until the markers coincide.



16. Rotate the variable capacitor to minimum capacity (tuning control knob fully clockwise).
17. Tune sweep generator to channel 6.
18. Inject 84.35 Mc. and 26.4 Mc. markers.
19. Adjust oscillator plate trimmer C26 to make markers coincide.
20. Replace bottom cover and recheck in steps 12-19.



21. Recheck all four oscillator frequencies as in steps 1-19.

R. F. PASSBAND ALIGNMENT

1. If only the RF Passband is being aligned it is advisable to check oscillator coverage as noted under Oscillator Alignment step 21 above.
2. Remove bottom cover and turn band switch to high band position.
3. Rotate tuning control so that pointer is at channel 7 on the dial calibration.
4. Tune sweep generator to channel 7. Set scope switch to the IF output.
5. Inject 175.25 Mc. and 26.4 Mc. markers and adjust tuning control so the markers coincide. Leave tuning control at this setting for the remainder of channel 7 adjustment.

6. Change scope switch to the RF output.
7. Check that the RF response curve is similar to those shown in Figure 13.
8. If the response curve differs much from those shown in Figure 13, adjust the inductance and coupling of the high band RF plate coil L3, the high band mixer grid coil L4, and the high band antenna coil L1, for proper band width and symmetry. In determining the band width, it will be necessary to switch the marker generator alternately between channel 7 picture carrier (175.25 Mc.) and sound carrier (179.75 Mc.).
9. The high band RF plate coil L3 and the high band mixer grid coil L4 are properly adjusted when a slight variation in the inductance of either coil will result in a frequency shift of the entire response with no noticeable narrowing of the band width.
10. The high band antenna coil L1 is properly adjusted when a slight variation of its inductance will cause both peaks to rock slightly. If only one peak moves, the high band antenna coil L1 is staggered away from the center of the passband.
11. The inductance of these coils (L1, L3, L4) is varied by pushing the coil on or off the brass stud. Pushing the coil on the stud will raise the frequency and pushing the coil off the stud will lower the frequency.
12. The band width of channel 7 interstage transformer (L3, L4) is controlled by dressing the ground leads of these coils past the cut out in the RF shield plate (see Fig. 13). When both leads cross the cutout the greater separation of peaks occurs. For maximum gain the band width should be adjusted so that the response is no greater than that required to keep the sound and picture carrier frequency markers on the peaks of the overall RF curves.
13. Replace tuner bottom cover and check RF passband response.
14. If necessary, remove bottom cover and make slight compensating adjustments.
15. With the bottom cover in place, rotate the tuning control knob so that the pointer indicates channel 13.
16. Tune sweep generator to channel 13 and change scope switch to IF output.
17. Inject 215.75 Mc. and 21.9 Mc. markers and adjust tuning control so markers coincide. Leave tuning control as set for remainder of channel 13 adjustments.
18. Change scope switch to RF output position, if RF response differs noticeably from the curves in Figure 14. (The antenna trimmer C5), the RF plate trimmer (C10) and mixer grid trimmer (C15) must be adjusted for proper passband and maximum amplitude of response.
19. Return tuner and sweep generator to channel 7 and check response as in part 13 above. A slight compensation of coils L1, L3, and L4 may be necessary.
20. Recheck passband on both channel 7 and channel 13, compromising adjustments for tilt as necessary until satisfactory High Band RF passband responses are obtained.

Low Band RF Alignment

21. Rotate band switch to Low Band position.
22. Turn the tuning control knob so that the pointer indicates channel 2 on the dial.
23. Set the scope switch to the IF output position and inject 59.75 Mc. and 21.9 Mc. markers. Adjust the tuning control so the markers coincide. Leave the tuning control as set for the remainder of the channel 2 adjustments.
24. Change the scope switch to the RF output position.
25. If the desired passband response is not obtained (as shown in Fig. 14) the Low Band RF coil L5, the low band mixer coil (L6), and the low band antenna transformer (T1) secondary must be adjusted until the desired passband is obtained.
26. When the low band RF coil (L5) and the low band mixer coil are aligned slight variation in the inductance of either should cause no noticeable narrowing of the passband.
27. When the secondary of the low band antenna transformer is properly adjusted, a slight variation in its inductance should cause both peaks to rock slightly. If only one peak moves, the T1 secondary is staggered away from the center of the double tuned circuit response.
28. The low band mutual coil (L7) varies the band width of the interstage coupling circuit. Squeezing the turns together broadens the band width and separating the turns narrows the band width. The band width should be adjusted so that it is not greater than that required to keep both the picture carrier and sound carrier markers at the peaks of the response curve.
29. Replace the tuner bottom cover and check passband response.
30. Remove bottom cover and make any compensating adjustments as needed.
31. With the bottom cover in place, rotate the tuning control knob to align the pointer with channel 6 on the dial.
32. Tune the sweep generator to channel 6 and change the scope output switch to the IF output position.
33. Inject 83.25 Mc. and 26.4 Mc. markers and adjusting tuning control to make the markers coincide. Leave the tuning control at this setting for the remainder of the channel 6 adjustments.
34. Change the scope switch to the RF output position.
35. Check the response curve. If not as desired, remove the bottom cover and slightly readjust the inductance of the low band RF coil L5, the low band mixer coil (L6), the low band mutual coil (L7) and the secondary of the low band antenna transformer (T1) as necessary, keeping in mind that these adjustments must be compromised with those made for channel 2 in steps 21-30 above.
36. Recheck passband on channel 2 and channel 6 and re-adjust as necessary to obtain acceptable passband on both channel 2 and 6.

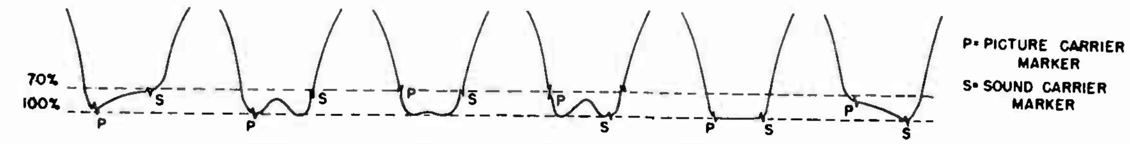


FIGURE 13 - ACCEPTABLE RF RESPONSE CURVES FOR TUNER

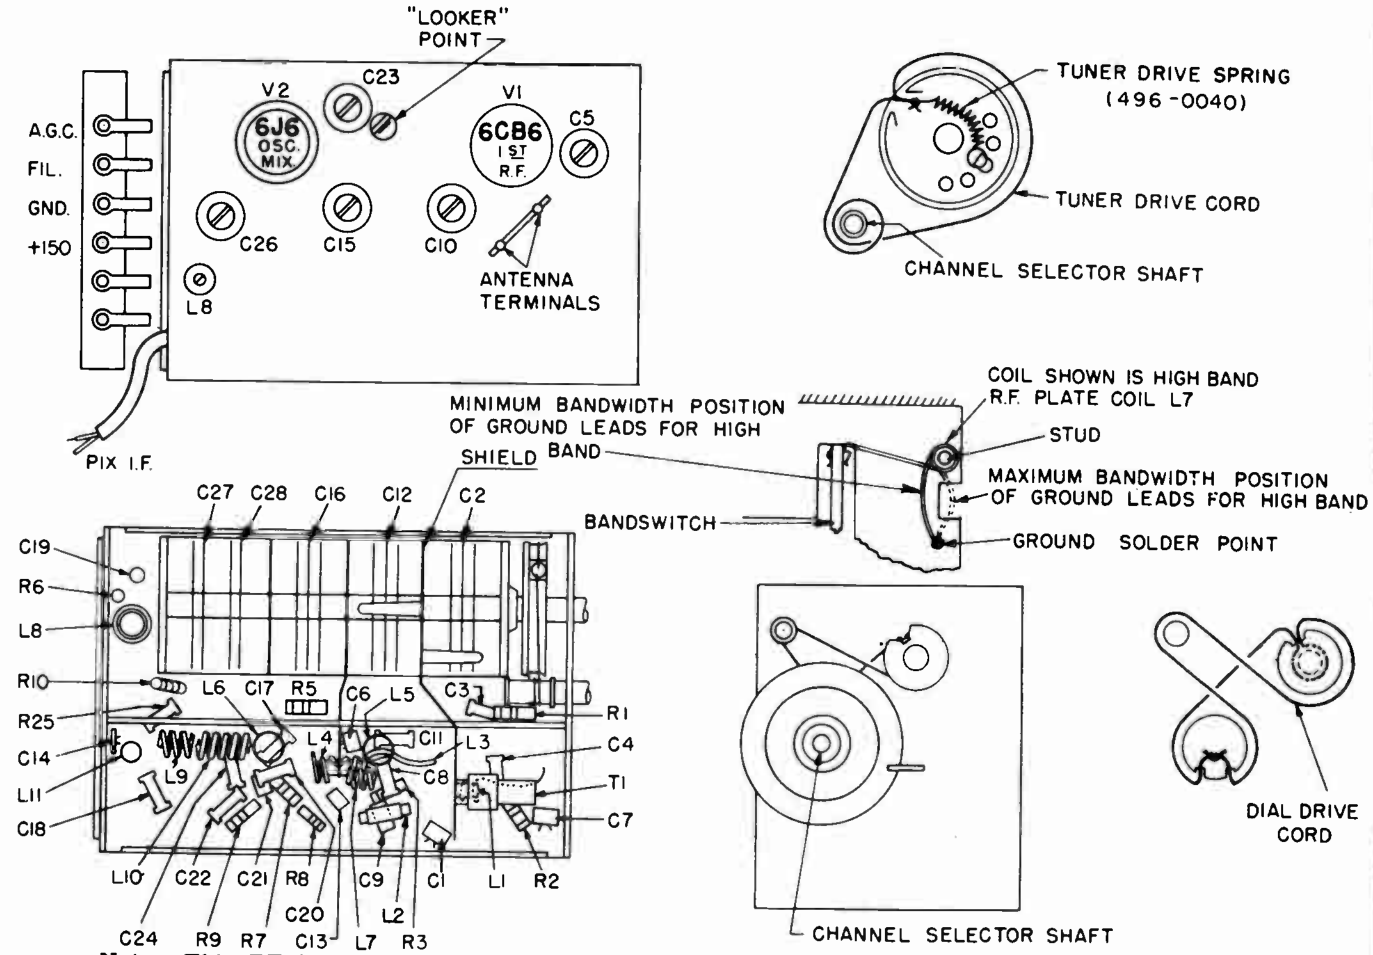

Note: This RF tuner has been thoroughly tested at the factory and should provide trouble-free reception throughout the life of the chassis. However, if service other than alignment is required, return the complete tuner to the factory for replacement.

FIGURE 14 - TUNER LAYOUT

GENERAL DESCRIPTION

Sylvania Model 1110X is a direct viewing television receiver which provides reception of the 12 commercial television channels 2 through 13. The television picture is reproduced on a round 16 inch, electromagnetically deflected, tetrode type picture tube.

The 1-329 chassis used in Model 1110X very closely resembles the 1-381 chassis described in Bulletin 9-15.

Circuitwise, chassis 1-329 differs from the 1-381 in that a new type RF Tuner Unit is used and the High Voltage Scan circuit has been modified to eliminate the Heater Isolation Transformer for the 6W4GT Damper tube V19.

The 1-329 chassis uses 6SN7GT tubes for V12 and V17, but the associated circuits remain the same as those of the 1-381 where V12 and V17 are 12AU7 tubes.

Front panel controls on the 1110X are On-Off & Volume, Tuning, and Brightness. No Band Switch is needed on this model because of the continuous tuning feature of the new type RF Tuner Unit.

LOW BAND ALIGNMENT

1. Tune sweep generator to channel 6. Rotate tuner drive shaft to channel 6. (Correct position may be determined by replacing dial and knob on tuner. Desired channel number should be vertical at top of dial.)
2. Load T2-C, Low Band RF coil (touch C12 stator plate, as described in 6 of "Notes on Tuner Alignment"), adjust C9, Low Band mixer trimmer, until the single peaked response curve falls midway between the RF carrier markers (Fig. A).

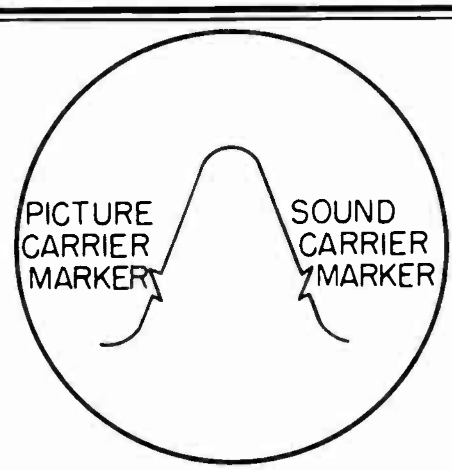

FIGURE A

3. Load T2-B, Low Band mixer coil (touch C13 stator plate), and adjust C8, Low Band RF trimmer, until the single peaked response curve falls midway between the RF carrier markers (Fig. A).

4. Without loading, adjust C15, Low Band oscillator trimmer, until the IF marker is almost coincident with the sound marker and both sound and picture markers are above the 70% level. (Fig. B).

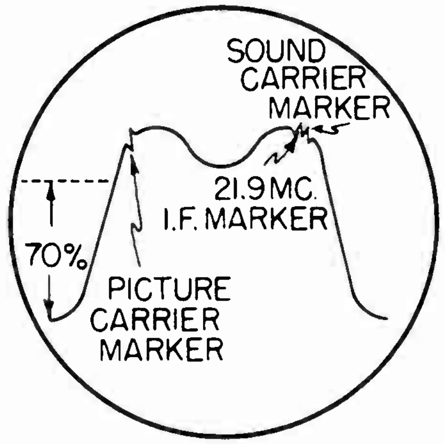

FIGURE B

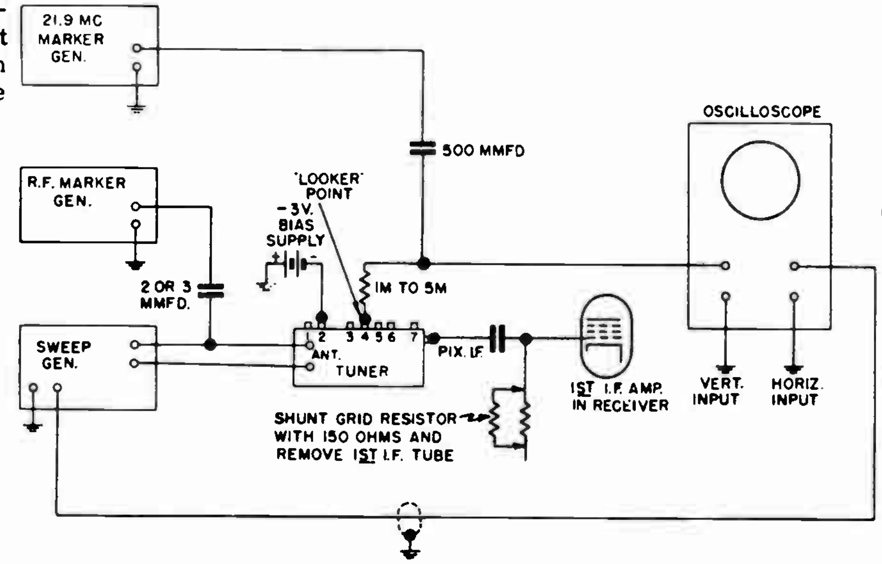

FIGURE 19 - TUNER ALIGNMENT SETUP

5. Tune sweep generator to channel 2. Rotate tuner drive shaft to channel 2 position.
6. Load T2-C, Low Band RF coil (touch C12 stator plate), and, with a non-metallic pick, vary spacing on T2-B, Low Band mixer grid coil, until the single peaked response curve is midway between the RF carrier markers (Fig. A).
7. Repeat step 6, only load T2-B, Low Band mixer coil (touch C13 stator plate), and adjust T2-C, Low Band RF coil.
8. Without loading, adjust turns on T2-A, Low Band oscillator coil, so the IF marker nearly coincides with the sound marker. (Fig. B)
9. Adjust spacing between T2-C, RF coil, and T2-B, mixer coil, to obtain a peak to valley ratio of precisely 30%. Decreasing the spacing will deepen the valley.
10. Repeat steps 2 to 9 to obtain best possible adjustments.

HIGH BAND ALIGNMENT

1. Adjust sweep generator and tuner drive shaft to channel 13.

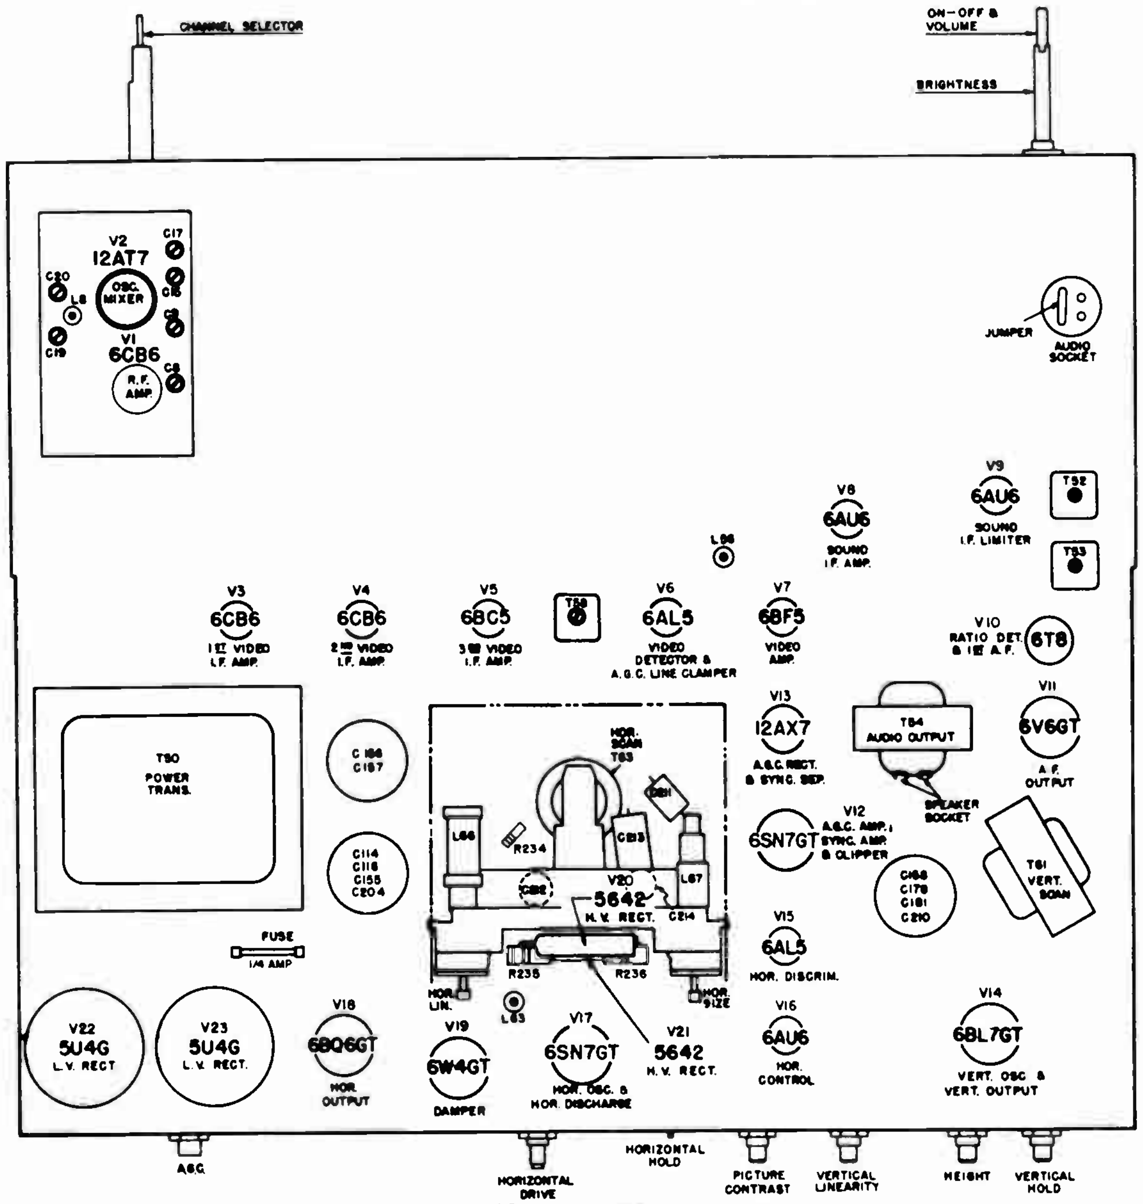

FIGURE 18 - CHASSIS TOP LAYOUT

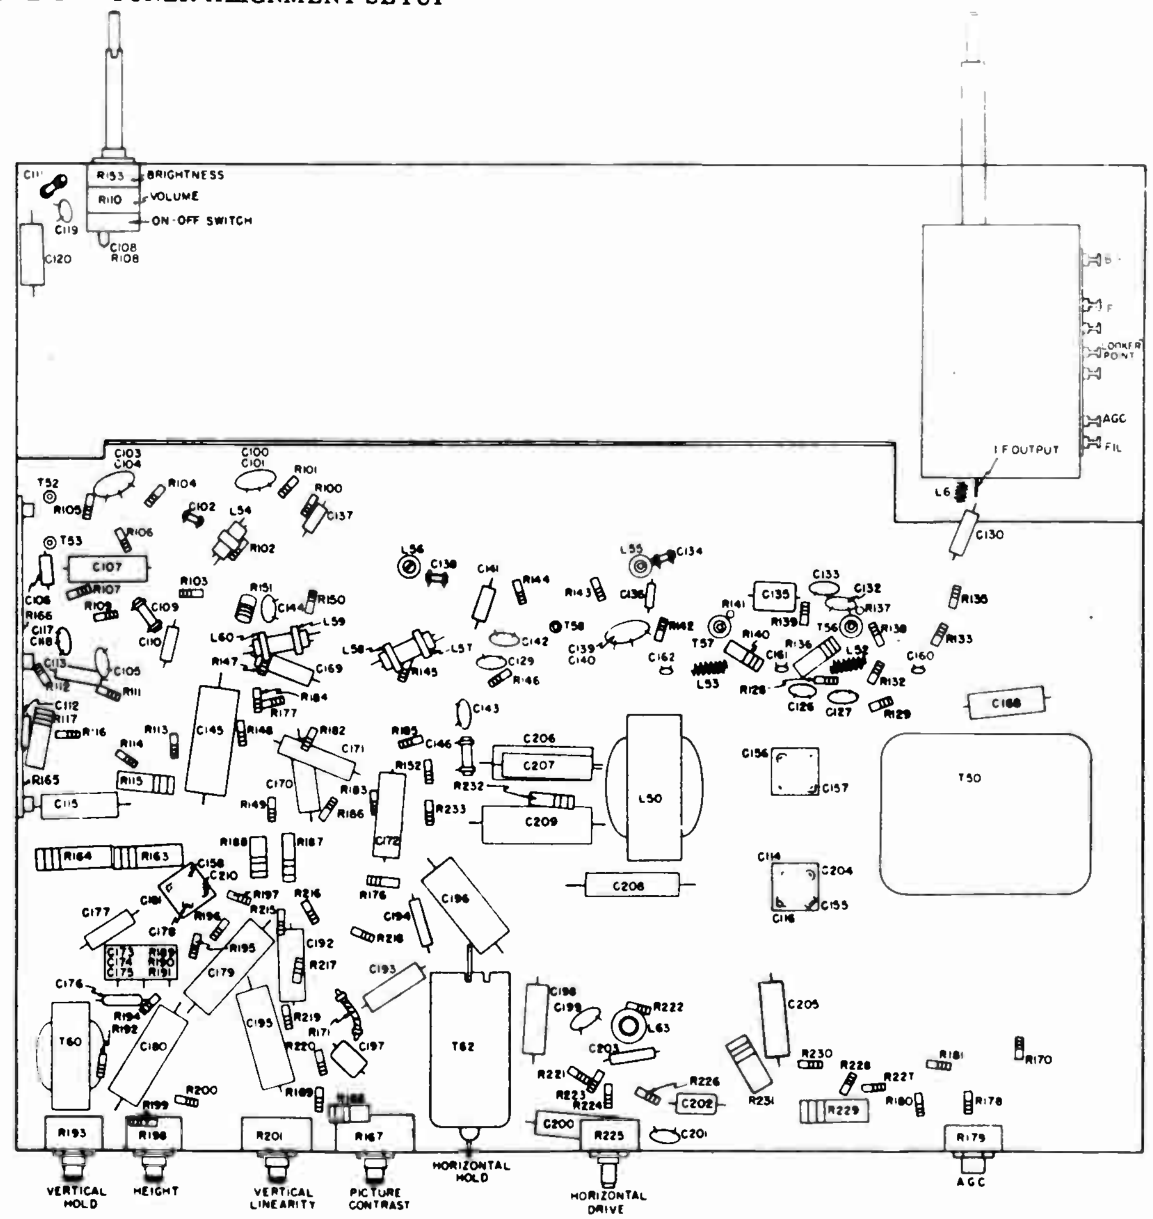

FIGURE 20 - CHASSIS BOTTOM LAYOUT

2. Load L3, High Band RF coil (touch #7 switch lug as described in 6 of "Notes on Tuner Alignment") and adjust C20, High Band mixer trimmer so the single peaked response curve falls midway between the RF carrier markers (Fig. A).

3. Repeat step 2, only loading L4, High Band mixer coil (touch #4 switch lug) and adjusting C19, High Band RF trimmer.

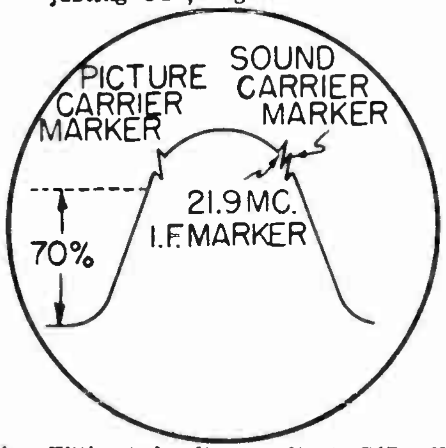

FIGURE C

4. Without loading, adjust C17, High Band oscillator trimmer, so the IF marker and sound carrier marker are coincident. (Fig. C)

Should either carrier, or carrier markers, fall below the 70% level, increase coupling between the double tuned coils by decreasing the angle made by L4, mixer grid coil strap and the ground leg of L3, the RF coil (see Fig. 21).

5. Adjust sweep generator and tuner drive shaft to channel 7.

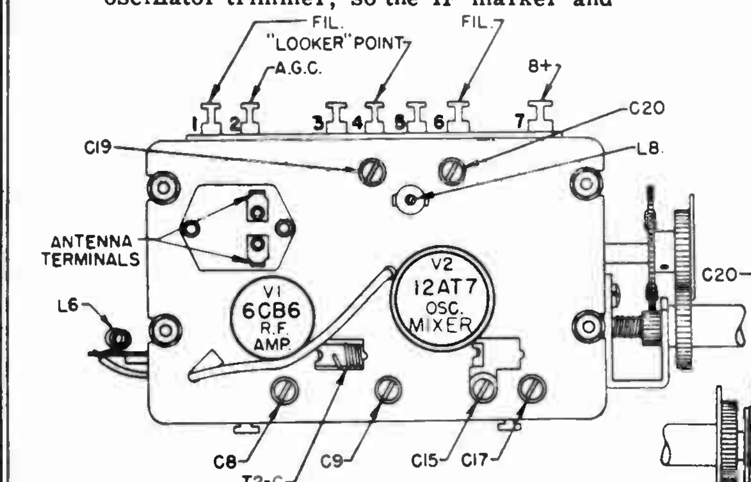
6. Spread or compress L5, High Band oscillator coil, turns as necessary to make the sound carrier marker and IF marker coincide. Load L3, High Band RF coil (touch #7 switch lug), and bend L4, mixer coil strap slightly in or out as necessary to make the mixer grid coil response curve fall about midway between the RF carrier markers (Fig. A).

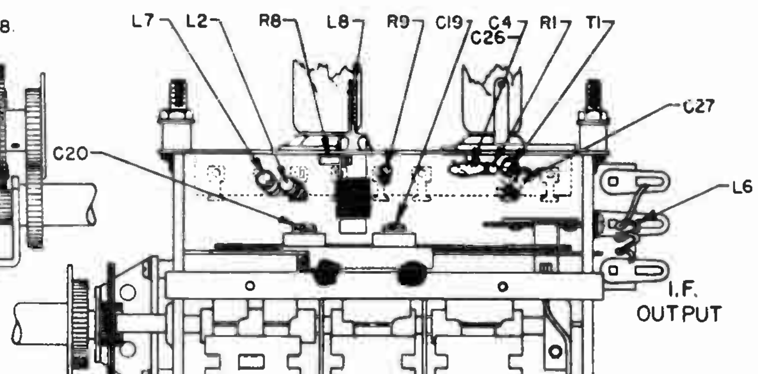
7. Repeat step 6, only loading L4, mixer coil (touch #4 switch lug), and adjusting L3, RF coil, turns so its response is at same frequency as the mixer response.

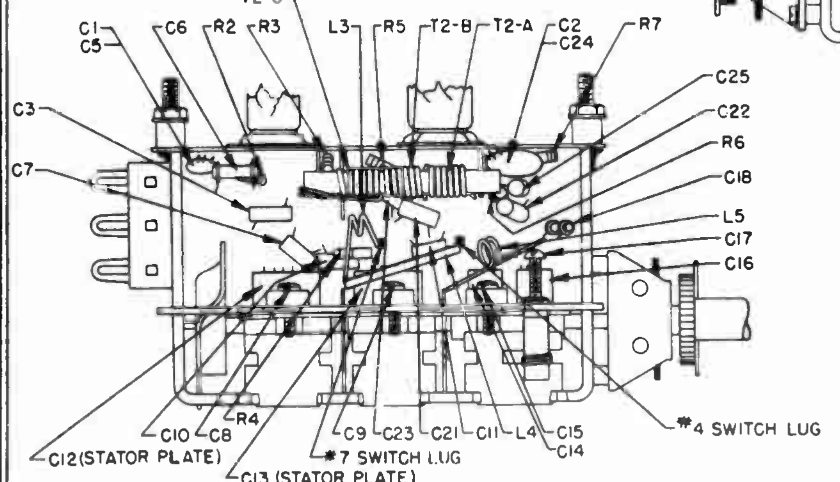
8. Without loading, adjust turns on L5, High Band oscillator coil, so the IF marker and sound carrier marker almost coincide (Fig. B).

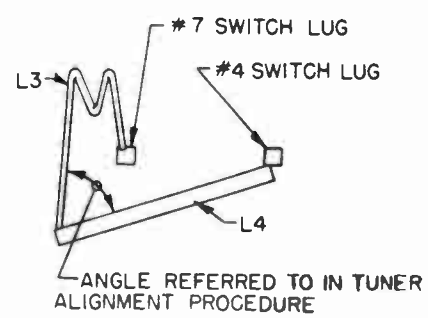
9. If peak to valley ratio on channel 7 is more or less than 30%, change mixer coil-RF coil angle (Fig. 21) as necessary to achieve this optimum coupling.

10. Repeat steps 1 to 8 to obtain optimum adjustments.









NOTE: This RF tuner has been thoroughly tested at the factory and should provide trouble-free reception throughout the life of the chassis. However, if service other than alignment is required, return the complete tuner to the factory for replacement.

FIGURE 21 - TUNER LAYOUT

WAVEFORMS

Note 1: The terms "Horizontal," "Vertical" or "60 cps sine wave" refer to the oscilloscope sweep employed.

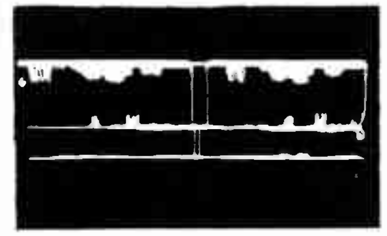
Note 2: All waveforms are taken with the oscilloscope horizontal sweep direction from left to right and with upward deflection corresponding to positive polarity.

Note 3: In some instances the waveforms obtained will not be identical with those shown, due to the electrical characteristics of the oscilloscope used.

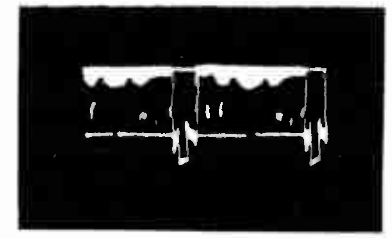
Note 4: All waveforms are measured with respect to chassis unless otherwise indicated.

Note 5: Contrast maximum unless otherwise indicated.

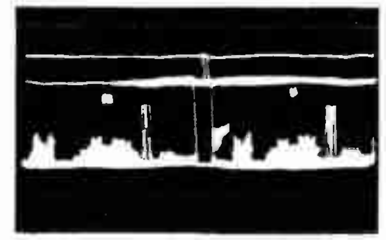
*The peak to peak (P/P) voltages of these waveforms are dependent on the depth of modulation of the transmitted signal; voltages shown are obtained when modulation is approximately 90 percent.



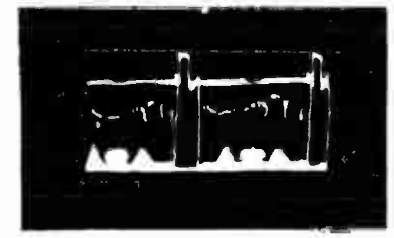
*6BF5 (V7) Video Amplifier Control Grid (Pins 1 and 7) 3.5 Volts P/P Vertical



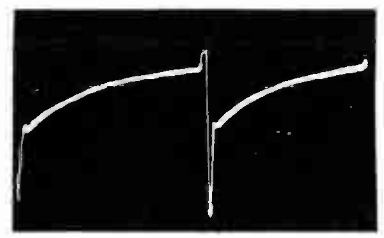
*6BF5 (V7) Video Amplifier Control Grid (Pins 1 and 7) 3.5 Volts P/P Horizontal



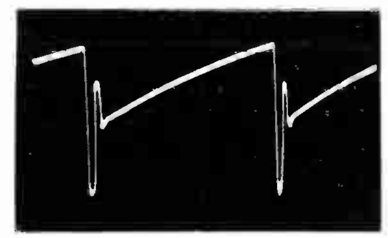
*6BF5 (V7) Video Amplifier Plate (Pin 5) 55 Volts P/P Vertical



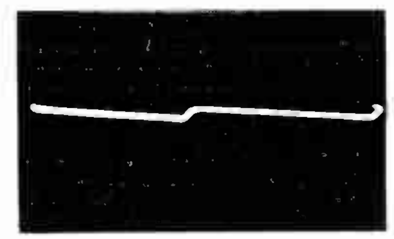
*6BF5 (V7) Video Amplifier Plate (Pin 5) 55 Volts P/P Horizontal



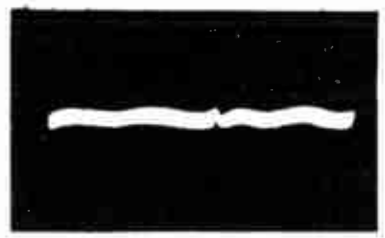
6BL7GT (V14) Vertical Oscillator Control Grid (Pin 1) 600 Volts P/P Vertical



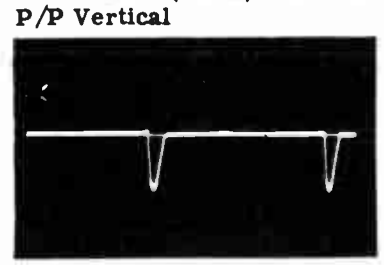
6BL7GT (V14) Vertical Oscillator Plate (Pin 2) 235 Volts P/P Vertical



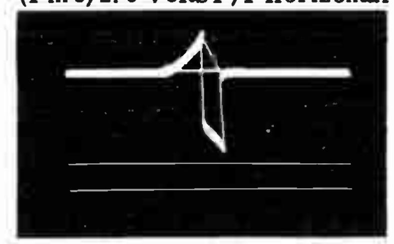
12AX7 (V13) Hor. Sync. Sep. and AGC Rectifier Cathode (Pin 8) 2.6 Volts P/P Horizontal



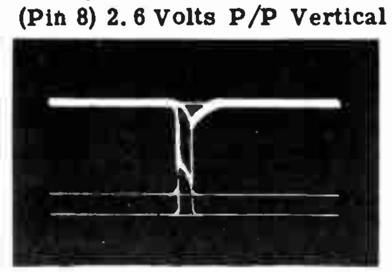
12AX7 (V13) Hor. Sync. Sep. and AGC Rectifier Cathode (Pin 8) 2.6 Volts P/P Vertical



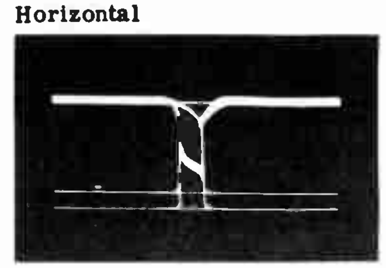
12AX7 (V13) Hor. Sync. Sep. Plate (Pin 6) 37 Volts P/P Horizontal



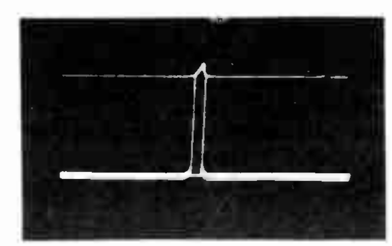
12AX7 (V13) Hor. Sync. Sep. Plate (Pin 6) 37 Volts P/P Vertical



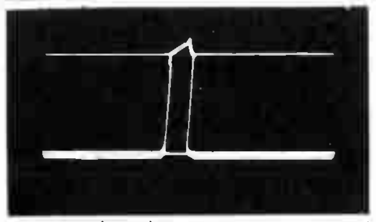
12AX7 (V13) Sync Separator Plate (Pin 1) 25 Volts P/P Vertical



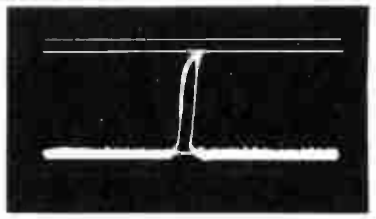
12AX7 (V13) Sync. Separator Plate (Pin 1) 25 Volts P/P 60 cps sine wave



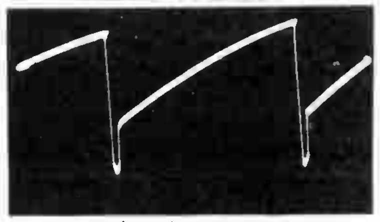
12AU7 (V12) Sync. Amp. and Clipper Plate (Pin 1) 110 Volts P/P Vertical



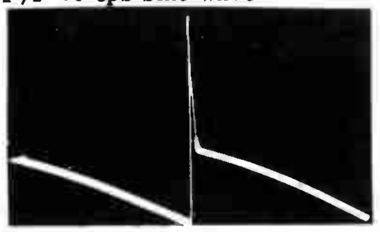
12AU7 (V12) Sync. Amp. and Clipper Plate (Pin 1) 110 Volts P/P 60 cps sine wave



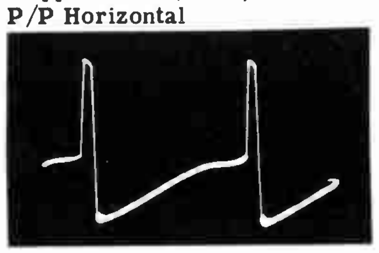
12AU7 (V12) Sync. Amp. and Clipper Plate (Pin 1) 100 Volts P/P Horizontal



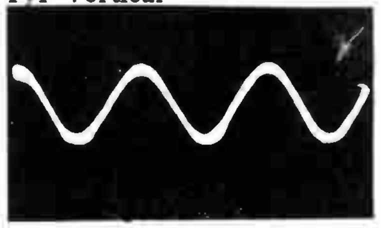
6BL7GT (V14) Vertical Output Control Grid (Pin 4) 95 Volts P/P Vertical



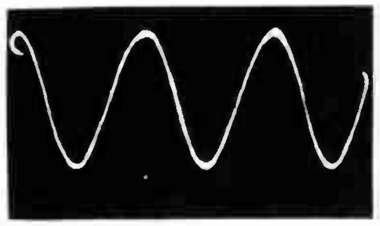
6BL7GT (V14) Vertical Output Plate (Pin 5) 830 Volts P/P Vertical



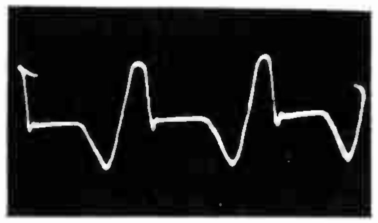
6AL5 (V15) Hor. Discriminator Plate (Pin 7) 70 Volts P/P Horizontal



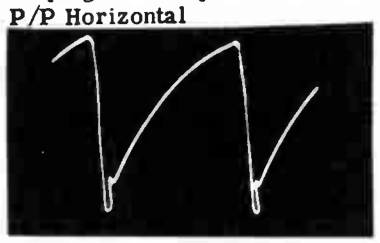
6AL5 (V15) Hor. Discriminator Plate to Plate (Pin 7 to Pin 2) Scope ground to pin 7 - 23 Volts P/P Horizontal



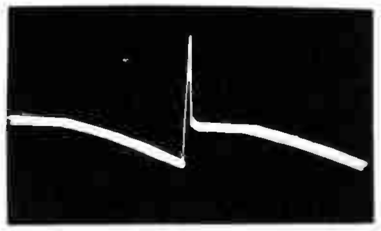
6AU6 (V16) Hor. Control Plate (Pin 5) 68 Volts P/P Horizontal



12AU7 (V17) Hor. Oscillator Plate (Pin 6) 95 Volts P/P Horizontal

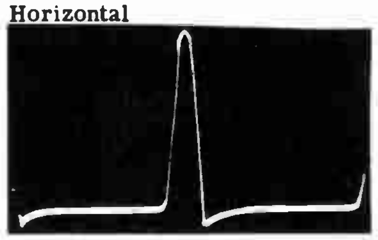


12AU7 (V17) Hor. Discharge Plate (Pin 1) 105 Volts P/P Horizontal

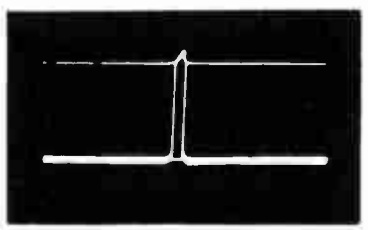


Vertical Yoke Coils (Test Point 1) 55 Volts P/P Vertical

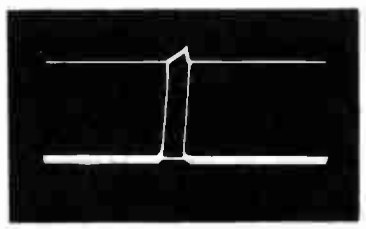
6W4GT Damper Cathode (Pin 3) 2000 Volts P/P Horizontal



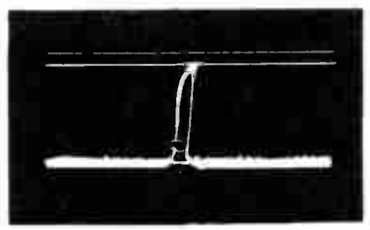
Waveform data in Bulletin 9-15 applies to chassis 1-329 except as shown here. This information replaces that given for 12AU7 and 6W4GT tubes.



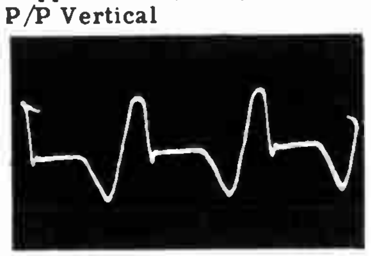
6SN7GT (V12) Sync. Amp. and Clipper Plate (Pin 2) 110 Volts P/P Vertical



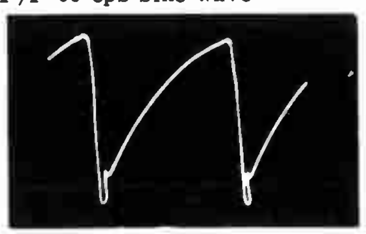
6SN7GT (V12) Sync. Amp. and Clipper Plate (Pin 2) 110 Volts P/P 60 cps sine wave



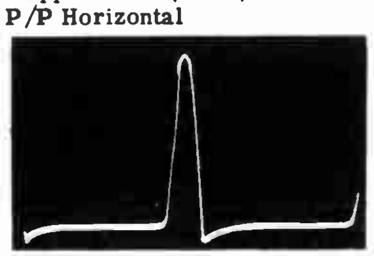
6SN7GT (V12) Sync. Amp. and Clipper Plate (Pin 2) 100 Volts P/P Horizontal



6SN7GT (V17) Hor. Oscillator Plate (Pin 5) 95 Volts P/P Horizontal



6SN7GT (V17) Hor. Discharge Plate (Pin 2) 105 Volts P/P Horizontal



6W4GT (V19) Damper Cathode (Pin 3) 1000 Volts P/P Horizontal

CHASSIS 1-381 C01 &C02

The C01 & C02 changes are indicated on the Schematic Diagram (Figure 15) and are included in the parts list.

C01 added the Audio Socket, Jumper and the Spring and Foil Shields.

C02 changed R169 from 47 ohms to 180 ohms and moved it and the cathode return of V16 (6AU6) (see schematic) from below R168 to below R164. The bottom end of R164 was previously connected directly to -135 V. C144 was changed from .1 Mfd. to .005 Mfd. The grounded end of this capacitor was previously connected to -135 V.

CHASSIS 1-329 CHANGES

The following changes have been made as noted below. A partial schematic of the revised Sound IF Limiter circuit under code C02 and an add and delete parts list are given here.

C01 Factory Change:
Remove C117 & C118 - .004 Mfd. - 450 V. Dual Ceramic Capacitor - Service Part 168-0003D. Change C211 from Mica Capacitor .00047 Mfd. - 1000 V. -Service Part 174-0470 to Paper Capacitor .00075 Mfd. - 1600 V. - Service Part 162-16375.

C02 Factory Change:
Remove C103 & C104 - .004 Mfd. - 450 V. Dual Ceramic Capacitor - Service Part 168-0003D. Remove R105 - 330 Ohm - 1/2 W. Resistor Service Part 181-0331. Add C103 - .005 Mfd. - 500 V. Ceramic Capacitor Service Part 166-5000D as screen grid bypass on V9-6AU6 Sound IF Limiter tube. Return cathode on V9-6AU6 Sound IF Limiter tube to ground.

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION

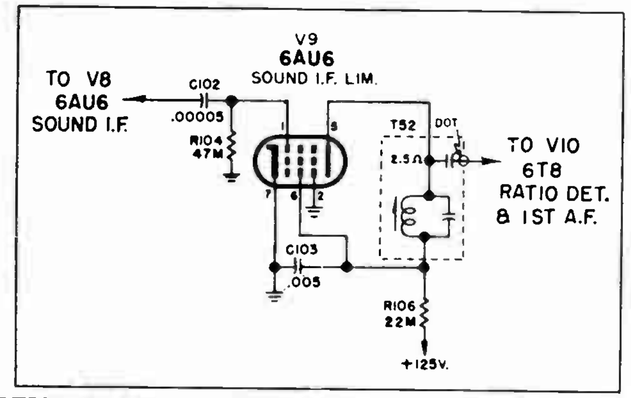

FIGURE 27 - PARTIAL SCHEMATIC DIAGRAM SHOWING 1-329 CHASSIS C02 CHANGE

CHASSIS 1-381 CHANGES

The following change has been made in the 1-381 chassis under code C05. A partial schematic diagram and an add and delete parts list covering this change are given. For all other service information refer to original Bulletin 9-15 and supplements.

C05 C119 - .005 Mfd. - 500 V. ceramic capacitor added. C112 and C115 returned to ground. To eliminate 4.5 Mc. Harmonic Interference.

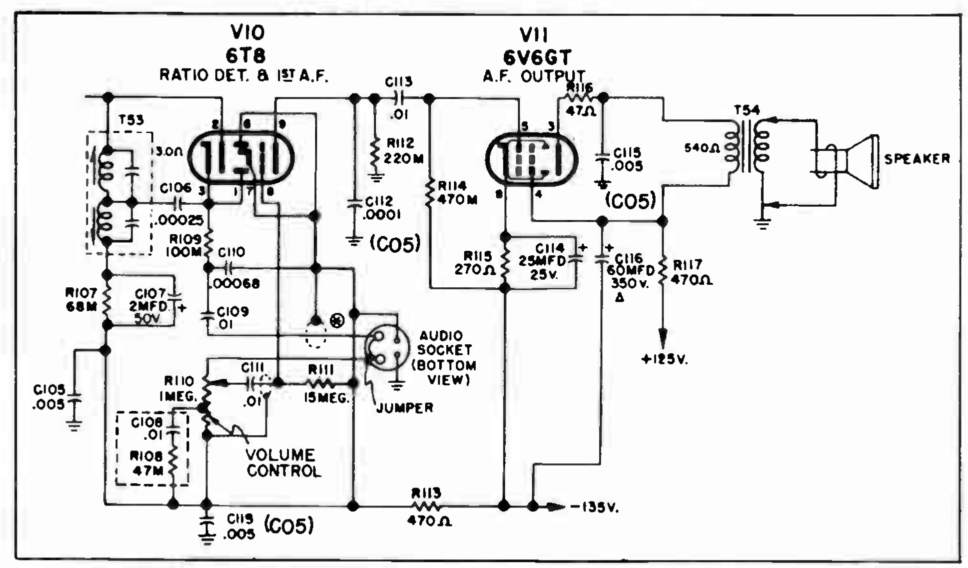

FIGURE 26 - PARTIAL SCHEMATIC DIAGRAM SHOWING 1-381 CHASSIS C05 CHANGE

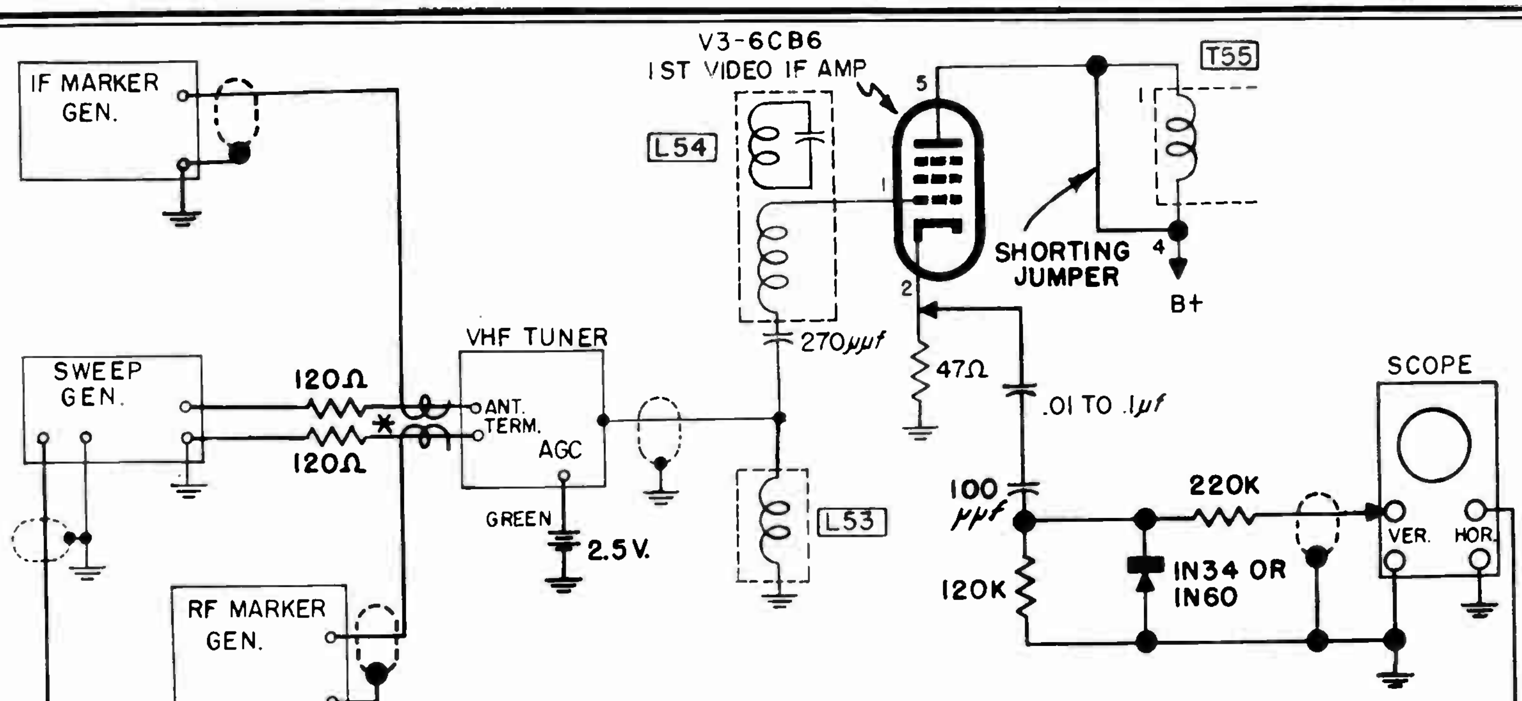
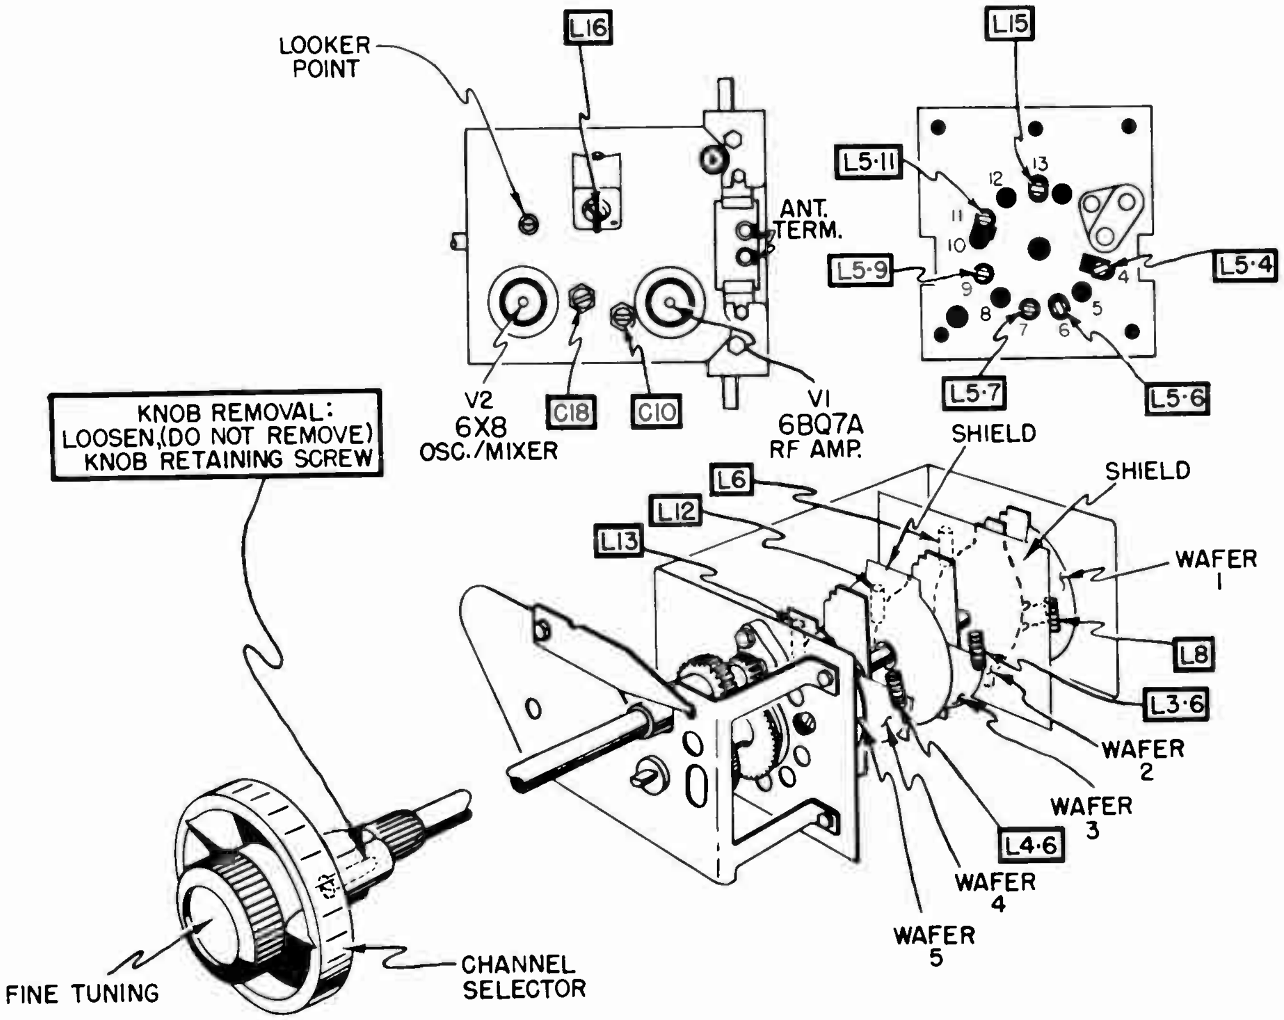
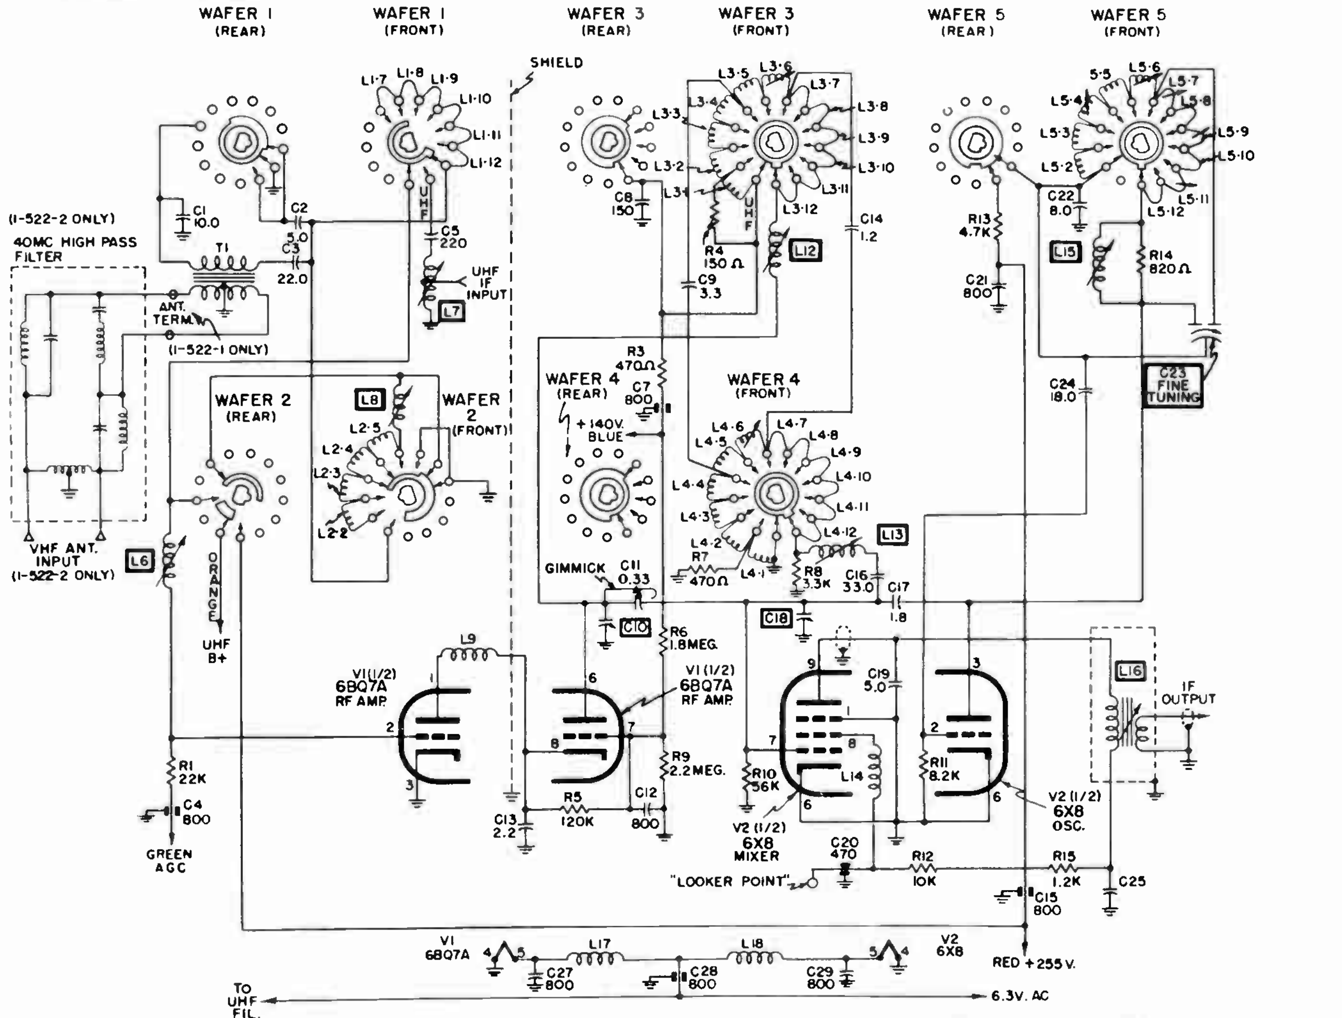


VHF TUNER ALIGNMENT SETUP



VHF TUNER PARTS LAYOUT



NOTES:
CHANNEL SELECTOR WAFER SWITCH SHOWN IN CHANNEL 13 POSITION.
WAFER SWITCH INDUCTANCE INCREMENTS CODED ACCORDING TO WAFER AND CHANNEL. FOR EXAMPLE, L5.11 INDICATES WAFER 5, CHANNEL 11; L3.6 INDICATES WAFER 3, CHANNEL 6, ETC.

VHF TUNER SCHEMATIC

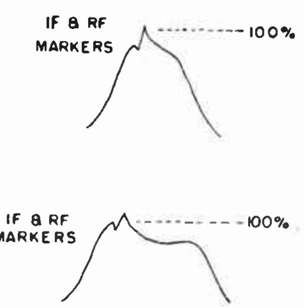
VHF TUNER ALIGNMENT

NOTES ON VHF TUNER ALIGNMENT
Refer to "VHF Tuner Alignment Setup" illustration:

1. Construct detector circuit with short leads.
2. Use shielded leads where indicated.
3. Connect shorting jumper across T55 primary, from terminal 1 to terminal 4.
4. Remove V4 (6CB6) to prevent coupling back from receiver IF system.
5. A turn or two of wire around points marked "*" will provide sufficient marker coupling without distorting response curve.
6. Use high scope gain and low sweep generator output.
7. Use non-metallic tools for all alignment adjustments.

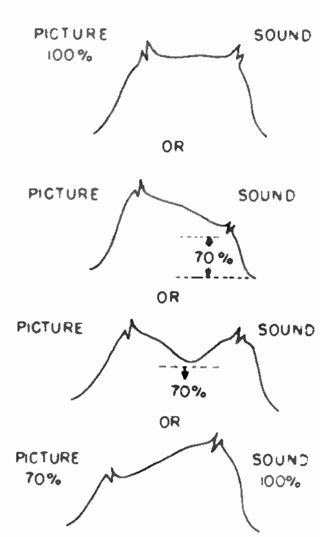
OSCILLATOR ALIGNMENT

STEP	TUNER SETTING	GENERATORS SWEEP (10 MC)	IF MARKER	RF MARKER	ADJUST	ACCEPTABLE RESPONSE CURVES
1.	Channel 13	Channel 13 213 MC	45.75 MC	211.25 MC	L15 Screw on Wafer 5	COINCIDE IF and RF markers as shown below.
2.	Channel 11	Channel 11 201 MC	45.75 MC	199.25 MC	L5.11 Screw on Wafer 5	
3.	Channel 9	Channel 9 189 MC	45.75 MC	187.25 MC	L5.9 Screw on Wafer 5	
4.	Channel 7	Channel 7 177 MC	45.75 MC	175.25 MC	L5.7 Screw on Wafer 5	
5.	Channel 6	Channel 6 85 MC	45.75 MC	83.25 MC	L5.6 Screw on Wafer 5	
6.	Channel 4	Channel 4 69 MC	45.75 MC	67.25 MC	L5.4 Screw on Wafer 5	NOTE: Curves may not be symmetrical until RF alignment is complete.
7.	If a touch up adjustment of channels 5, 3 and 2 is desired, "spike" (squeeze or spread) turns of the appropriate coil on wafer 5 (L5.5, L5.3 and L5.2 respectively) to coincide appropriate markers for those channels.					



RF ALIGNMENT

STEP	TUNER SETTING	GENERATORS SWEEP (10 MC)	RF MARKER	ADJUST	ACCEPTABLE RESPONSE CURVES
1.	CHECK BANDPASS CIRCUIT ALIGNMENT AS DESCRIBED IN STEP 4 OF "VIDEO IF ALIGNMENT".				
2.	Channel 13	Channel 13 213 MC	211.25 MC (P) 215.75 MC (S)	L12 core for skirt frequency. L13 core for flat top. L6 core for maximum height.	30% DEVIATION PERMISSIBLE:
3.	Channel 7	Channel 7 177 MC	175.25 MC (P) 179.75 MC (S)	C10 and C18 trimmer for best symmetrical response.	
4.	Switch tuner and generators through channels 8 to 12 and observe response curve. If any response curve is not within acceptable limits, repeat steps 2 and 3 and, if necessary, compromise the adjustments.				
5.	Channel 6	Channel 6 85 MC	83.25 MC (P) 87.75 MC (S)	L3.6 core for skirt frequency. L4.6 core for flat top. L8 core for maximum height.	
6.	Switch tuner and generators through channels 5 to 2 and observe response curve. If any response curve is not within acceptable limits, "spike" (squeeze or spread) turns of appropriate coils on wafers 2, 3 and 4 until response curve is acceptable. SEE VHF TUNER LAYOUT AND VHF TUNER SCHEMATIC DIAGRAM FOR LOCATIONS OF SPECIFIC CHANNEL COILS AND WAFERS.				



7.	REWAX COIL CORES by placing hot soldering iron near coil. Do not lay hot iron directly on coil.

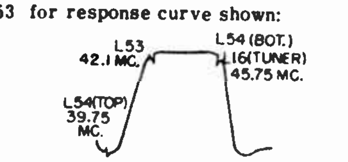
VIDEO IF, 4.5MC TRAP AND SOUND ALIGNMENT PROCEDURES

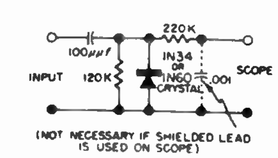
VIDEO IF ALIGNMENT

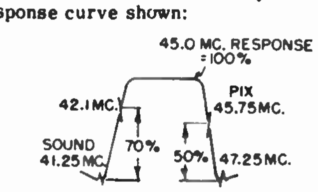
PREALIGNMENT INSTRUCTIONS
READ CAREFULLY

1. Stand chassis on side with high voltage shield down for under chassis adjustments.
2. Ground all test equipment unless otherwise stated.
3. Keep detector circuit leads as short as possible.
4. Allow test equipment and receiver chassis to warm up for 15 minutes after the intial equipment and AGC battery setup.
5. Deflection yoke should be connected during alignment.
6. Use non-metallic alignment tools for powdered iron cores. Metallic screwdriver may be used for brass screw adjustments.
7. Wrap a short length of insulated wire around pin 7 prong of V2 (6X8) tube in VHF tuner to facilitate test equipment connections.

STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1.	Connect 20V. battery (-) terminal to junction of C129 (.047 mfd.) and R128 (120K) and connect (+) terminal to chassis. Set VHF tuner to signal-free channel with minimum interference.	SIGNAL GENERATOR - to ungrounded tube shield on Osc./Mixer tube on VHF tuner. VTVM - D.C. Probe to junction of L58 peaking coil and R151 (2.7K).	L54 (top core) for MIN. at 39.75 MC. T55 (top core) for MIN. at 41.25 MC. L55 for MIN. at 41.25 MC. T56 (top core) for MIN. at 47.25 MC. Use sufficient signal generator output for satisfactory VTVM reading.
2.	Same as 1.	Same as 1.	T58 for MAX. at 44.0 MC. T57 for MAX. at 42.0 MC. T56 (bottom core) for MAX. at 45.2 MC. T55 (bottom core) for MAX. at 43.2 MC. Adjust signal generator output to keep VTVM reading between 1 and 2 volts.
3.	Repeat step 1 trap adjustments.		
4.	Remove 20V. AGC battery. Disconnect T55 lead from pin 5 of V3 (6CB6). Connect 330 ohm resistor across T55 primary from R132 (1K) to pin 5 of V3. Set VHF tuner to signal-free channel with minimum interference.	SWEEP GENERATOR - to pin 7 of V2 (6X8). Set to 43.5 MC with 10 MC sweep. SIGNAL GENERATOR - loosely couple to sweep generator lead. OSCILLOSCOPE - through detector circuit to pin 5 of V3 (6CB6).	L54 (bottom core), L16(VHF tuner) and L53 for response curve shown:
5.	Repeat step 4 adjustments until response curve is flat with 42.1 MC and 45.75 MC markers on corners.		
6.	Connect 20V. battery (-) terminal to junction of C129 (.047 mfd.) and R128 (120K) and connect (+) terminal to chassis. REMOVE 330 OHM RESISTOR AND RECONNECT T55. Set VHF tuner to signal-free channel with minimum interference.	SWEEP GENERATOR - to ungrounded tube shield on Osc./Mixer tube on VHF tuner. Set to 43.5 MC with 10 MC sweep. SIGNAL GENERATOR - loosely couple to sweep generator lead. OSCILLOSCOPE - through 33K resistor to junction of L58 peaking coil and R151 (2.7K).	Retouch T58, T57, T56 (bottom core) and T55 (bottom core) if necessary to obtain response curve shown:







SYLVANIA TV PAGE 14-19

4.5MC TRAP ALIGNMENT

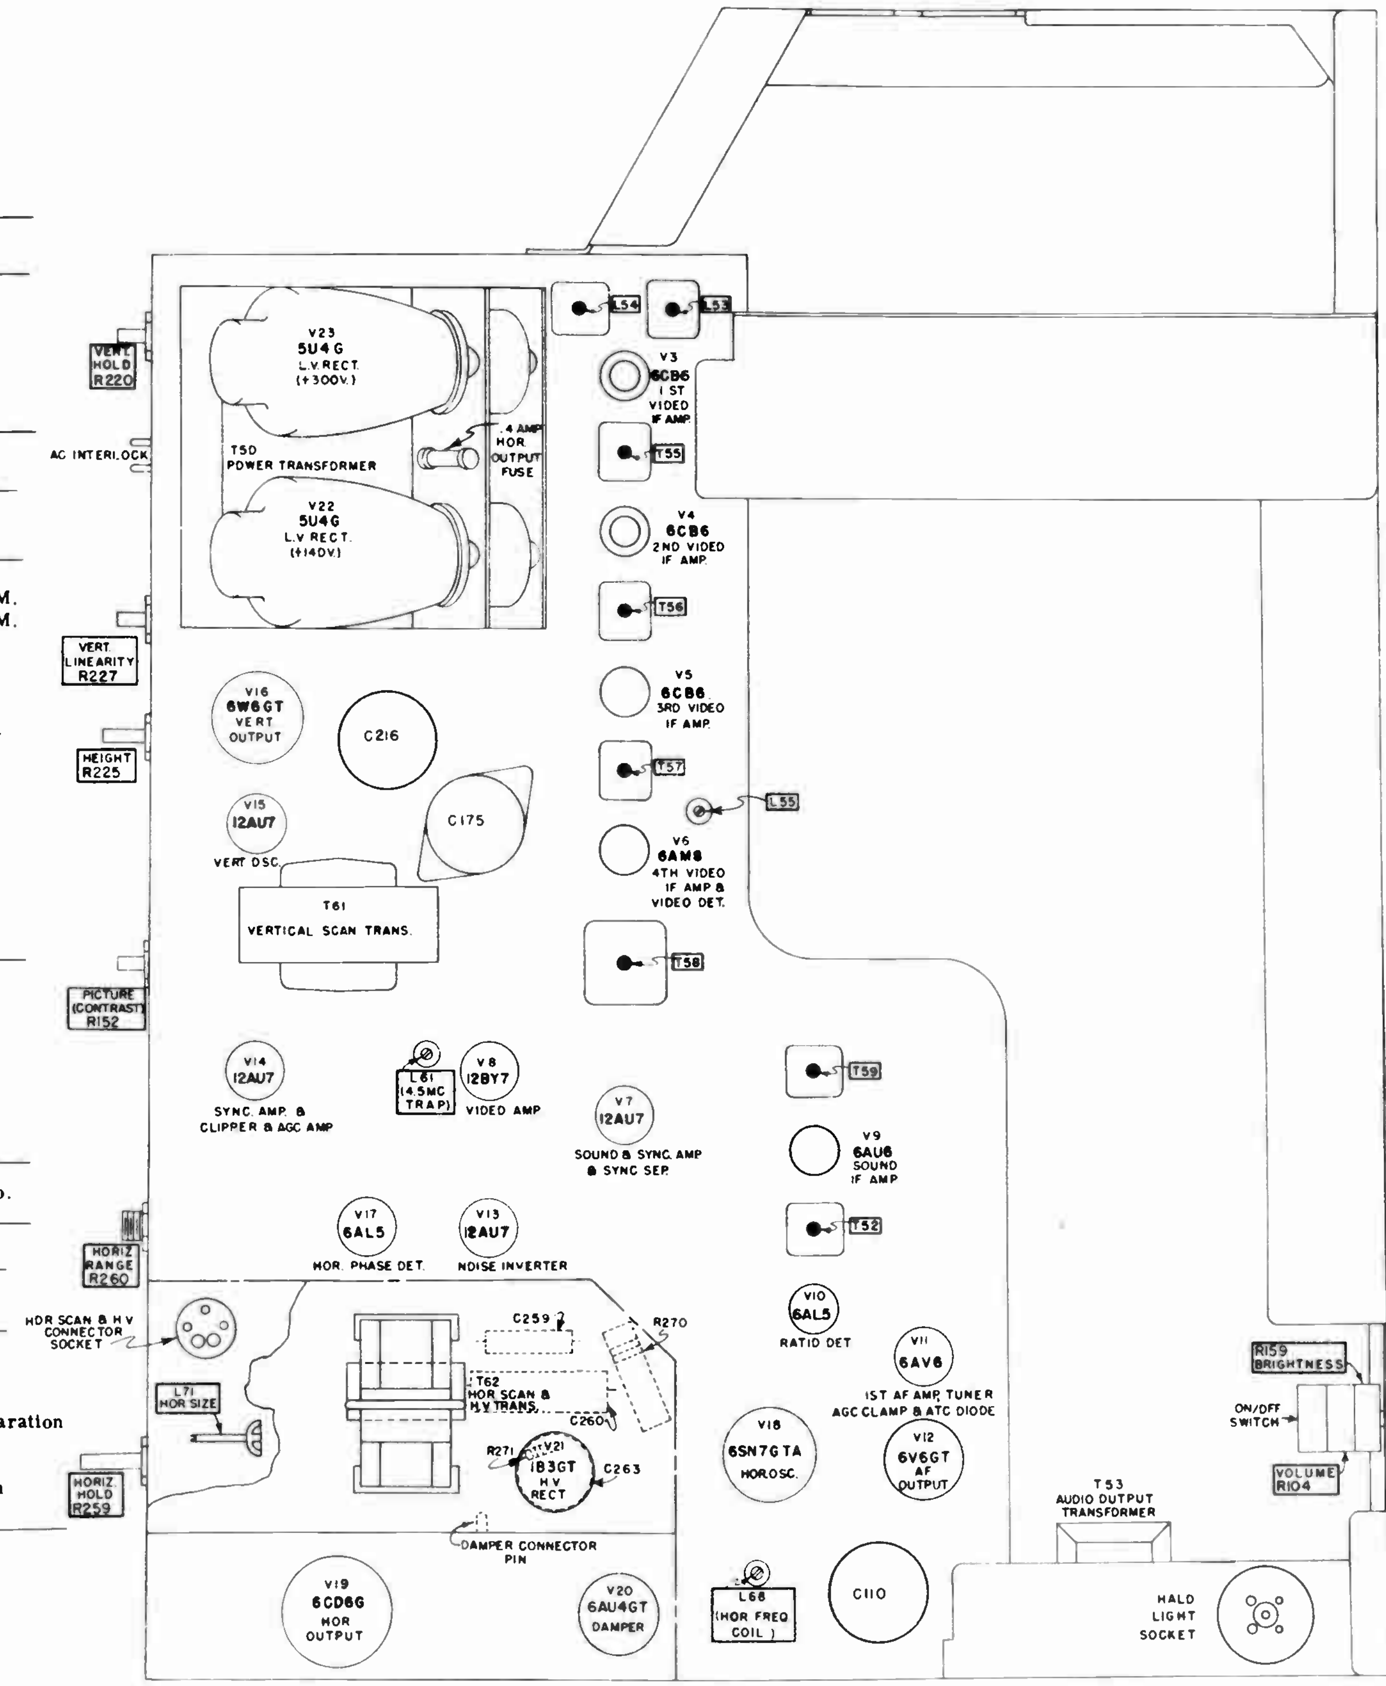
STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1.	Short pin 2 of V6 (6AM8) to chassis.	SIGNAL GENERATOR - to pin 2 of V8 (12BY7). Set to 4.5 MC. VTVM - R. F. Probe to pin 11 of V24 (Picture Tube); Ground Lead to chassis.	L61 for MINIMUM.

SOUND ALIGNMENT

STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1.	Short pin 1 of V5 (6CB6) to chassis. DO NOT GROUND VTVM.	SIGNAL GENERATOR #1 - through 1K resistor to pin 2 of V6 (6AM8). Set to 45.0 MC. SIGNAL GENERATOR #2 - through 1K resistor to pin 2 of V6 (6AM8). Set to 4.5 MC. OR SIGNAL GENERATOR - through 1K resistor to pin 2 of V6 (6AM8). Set to 45.0 MC with a crystal controlled 4.5 MC marker. ALSO VTVM - D.C. Probe to pin 5 of V10 (6AL5); Ground Lead to pin 7 of V10 (6AL5).	T52 (both cores) for MAXIMUM. T59 (both cores) for MAXIMUM. Use peak resulting in greatest separation of cores. Repeat adjustments until maximum reading is reached.
2.	Same as 1.	USE SAME SIGNAL GENERATOR HOOKUP AS IN STEP 1. VTVM - D.C. Probe through 100K resistor to terminal #1 of de-emphasis plate; Ground Lead to junction of two matched 100K resistors connected in series across R106 (68K).	T52 (top core) for ZERO. Use lowest VTVM scale set to zero center. At correct core setting, a slight turn of core will give either a positive or negative reading.
3.	Remove test equipment and resistors; then, tune in a weak station and adjust T52 (top core) for optimum signal-to-noise ratio.		

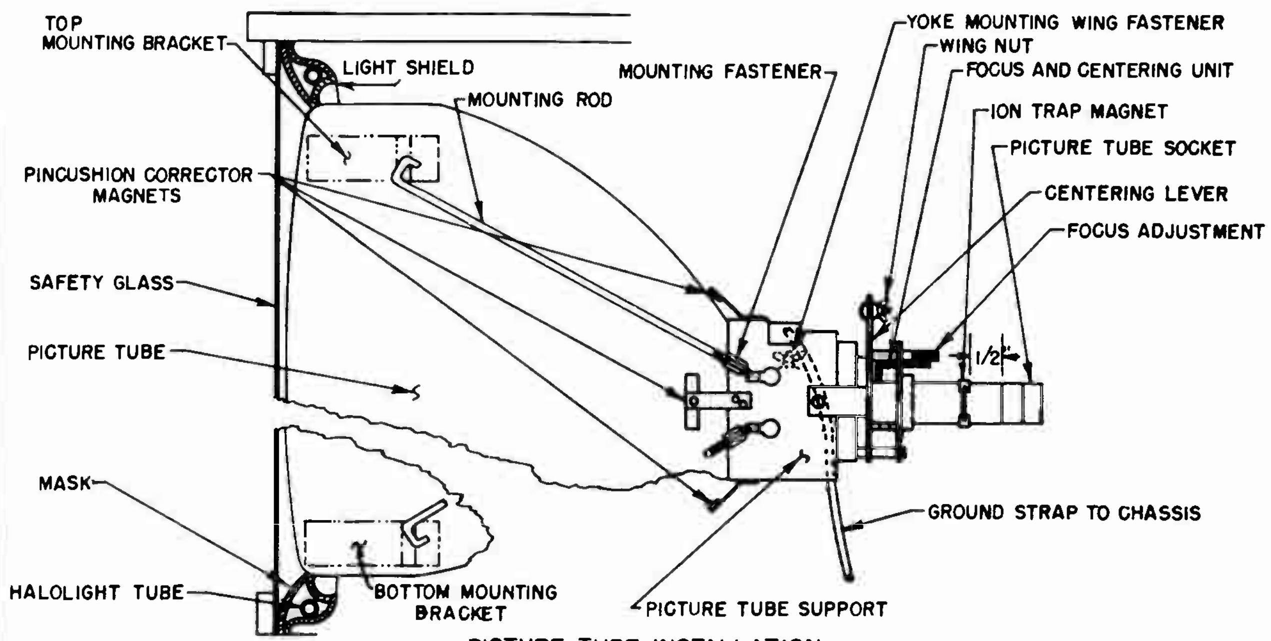
ALTERNATE SOUND ALIGNMENT

STEP	ALIGNMENT SETUP NOTES	TEST EQUIPMENT HOOKUP	ADJUST
1.	Connect a good antenna installation to receiver. Set VHF tuner to a strong station. DO NOT GROUND VTVM.	VTVM - D.C. Probe to pin 5 of V10 (6AL5); Ground Lead to pin 7 of V10 (6AL5).	T52 (both cores) for MAXIMUM. T59 (both cores) for MAXIMUM. Use peak resulting in greatest separation of cores. Repeat adjustments until maximum reading is reached.
2.	Same as 1.	VTVM - D.C. Probe through 100K resistor to terminal #1 of de-emphasis plate; Ground Lead to junction of two matched 100K resistors connected in series across R106 (68K).	T52 (top core) for ZERO. Use lowest VTVM scale set to zero center. At correct core setting, a slight turn of core will give either a positive or negative reading.
3.	Remove test equipment and resistors; then, tune in a weak station and adjust T52 (top core) for optimum signal-to-noise ratio.		



CHASSIS TOP PARTS LAYOUT

SPECIAL INSTALLATION AND SERVICE INSTRUCTIONS



PICTURE TUBE INSTALLATION

CHASSIS REMOVAL AND PICTURE TUBE INSTALLATION

To remove the picture tube, observe the following procedure. Refer to Picture Tube Installation illustration. GOGGLES AND GLOVES SHOULD BE WORN and special caution exercised while handling the picture tube.

1. Disconnect receiver from power outlet; remove antenna connection and rear interlock cover.

2. Disconnect the following items prior to removal of receiver chassis:

   a. High voltage anode lead.
   b. Speaker plug.
   c. Horizontal and vertical yoke connector plugs.
   d. Picture tube socket.
   e. HaloLight connector plug.
   f. Ground strap to chassis.

3. Remove front panel knobs, chassis mounting bolts, antenna terminal board from chassis and slide chassis from cabinet.

4. LAY CABINET ON FRONT SIDE. Remove Ion Trap magnet.

5. Unscrew four Mounting Fasteners until heads can be removed through enlarged openings in Picture Tube Support; remove Mounting Rods from Mounting Brackets in cabinet.

6. Remove Picture Tube Support with yoke and Focus and Centering unit attached.

7. TWO PERSONS should now reach down along opposite sides of picture tube, reach under face of tube with fingers, and lift tube from cabinet. DO NOT GRASP NECK OF TUBE AT ANY TIME.

8. To install a new picture tube, reverse the preceding steps. Tighten the four Mounting Fasteners evenly and snugly. Apply just enough pressure against Mounting Rods to seat them properly at cabinet Mounting Brackets. Be careful that dust or dirt does not get inside mask or on picture tube face.

HORIZONTAL AFC CIRCUIT ADJUSTMENT

1. Tune in a normal air signal and adjust L71 Horizontal Size control for approximately normal scan using a locked-in picture.

2. Turn receiver power "off" and connect shorting jumpers as follows:

   a. From junction of R212 (330 ohm) and T60 sync phase splitting coil to chassis.

   b. Across terminals of L68 Horizontal Frequency coil.

3. Turn receiver power "on" and tune in a normal air signal.

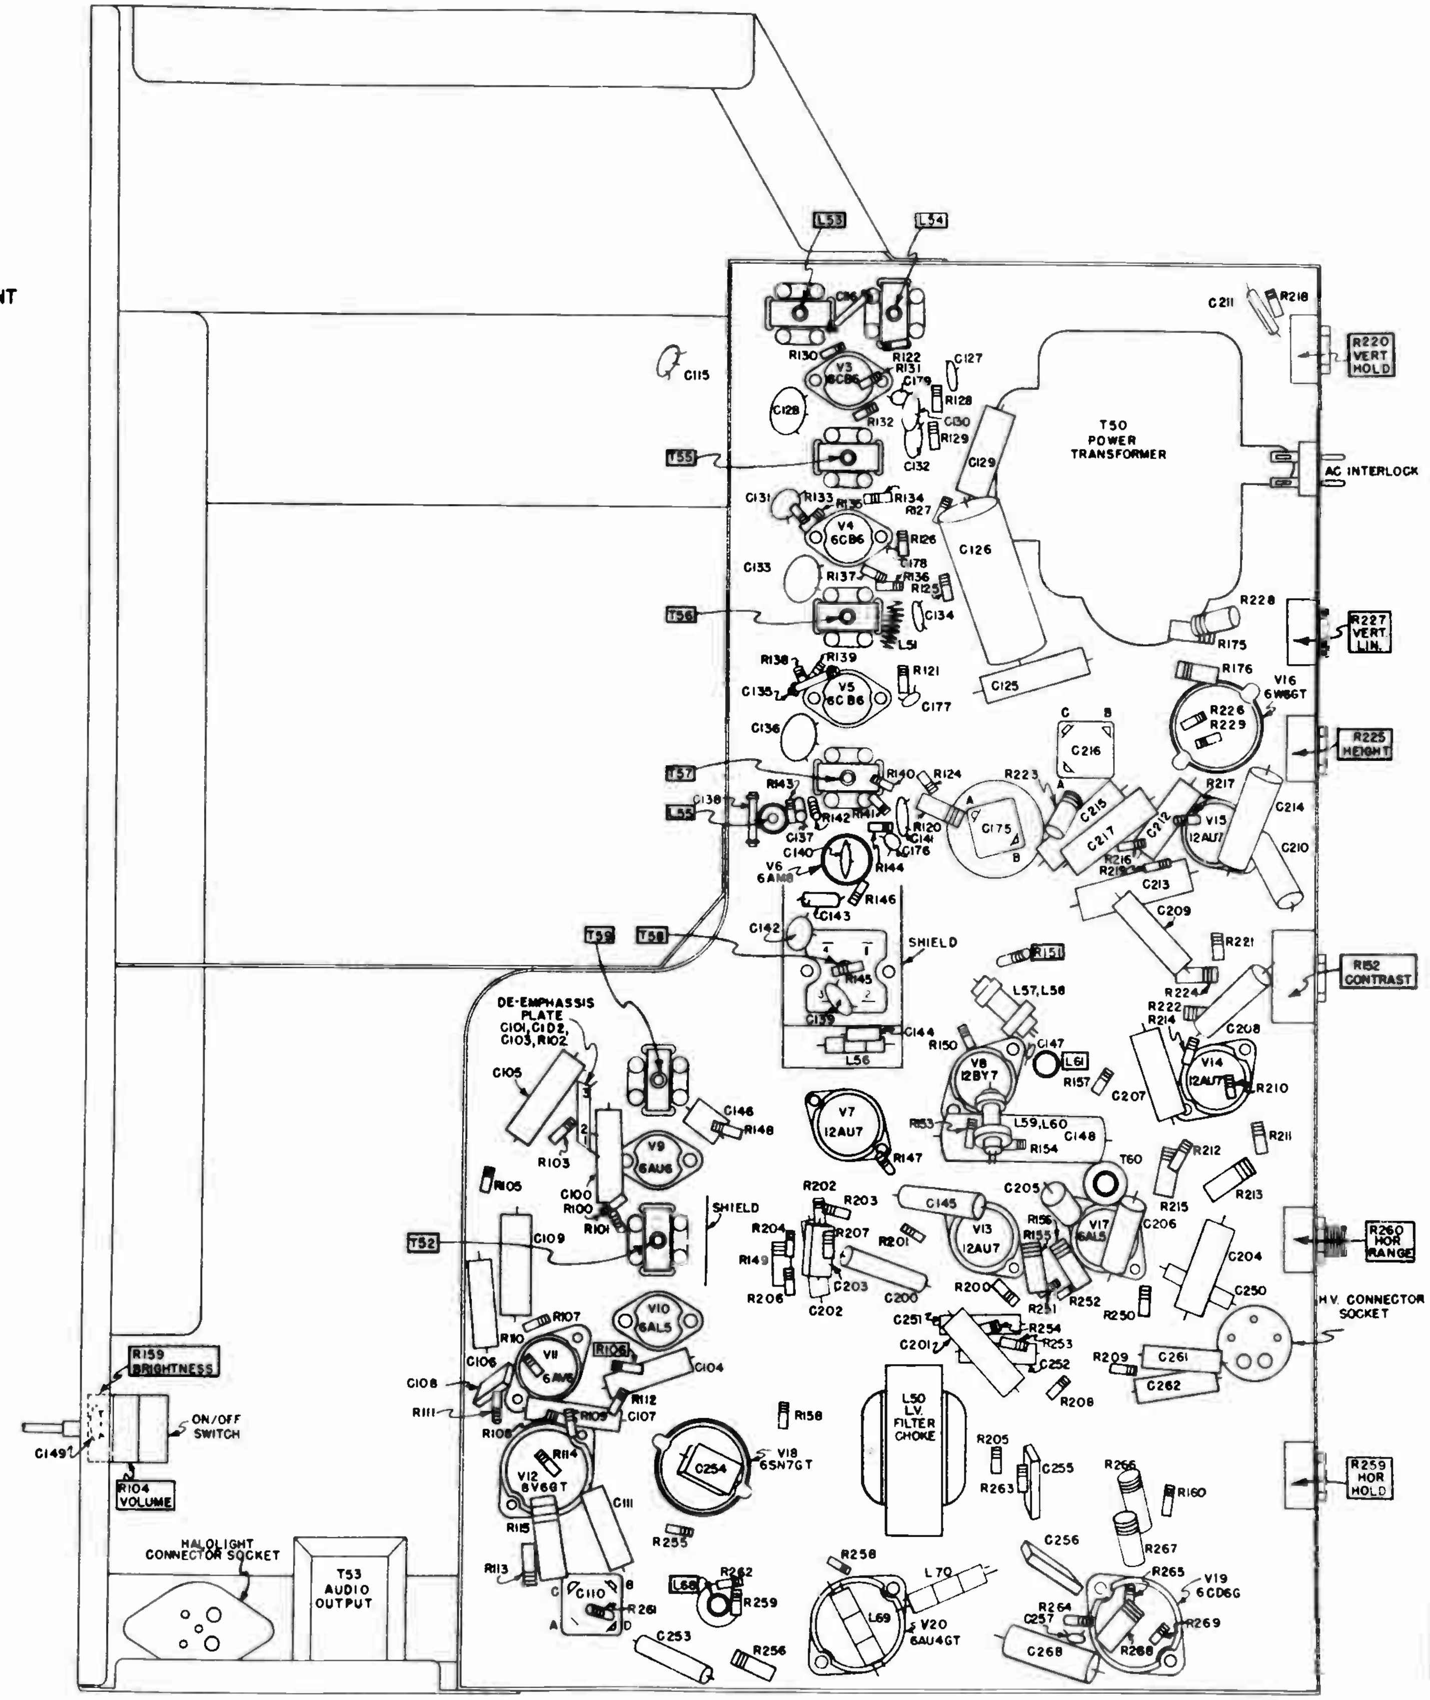
4. Rotate R259 Horizontal Hold control to center position.

5. Adjust R260 Horizontal Range control until picture moves back and forth across screen with blanking bar vertical.

6. Remove shorting jumper from L68 Horizontal Frequency coil.

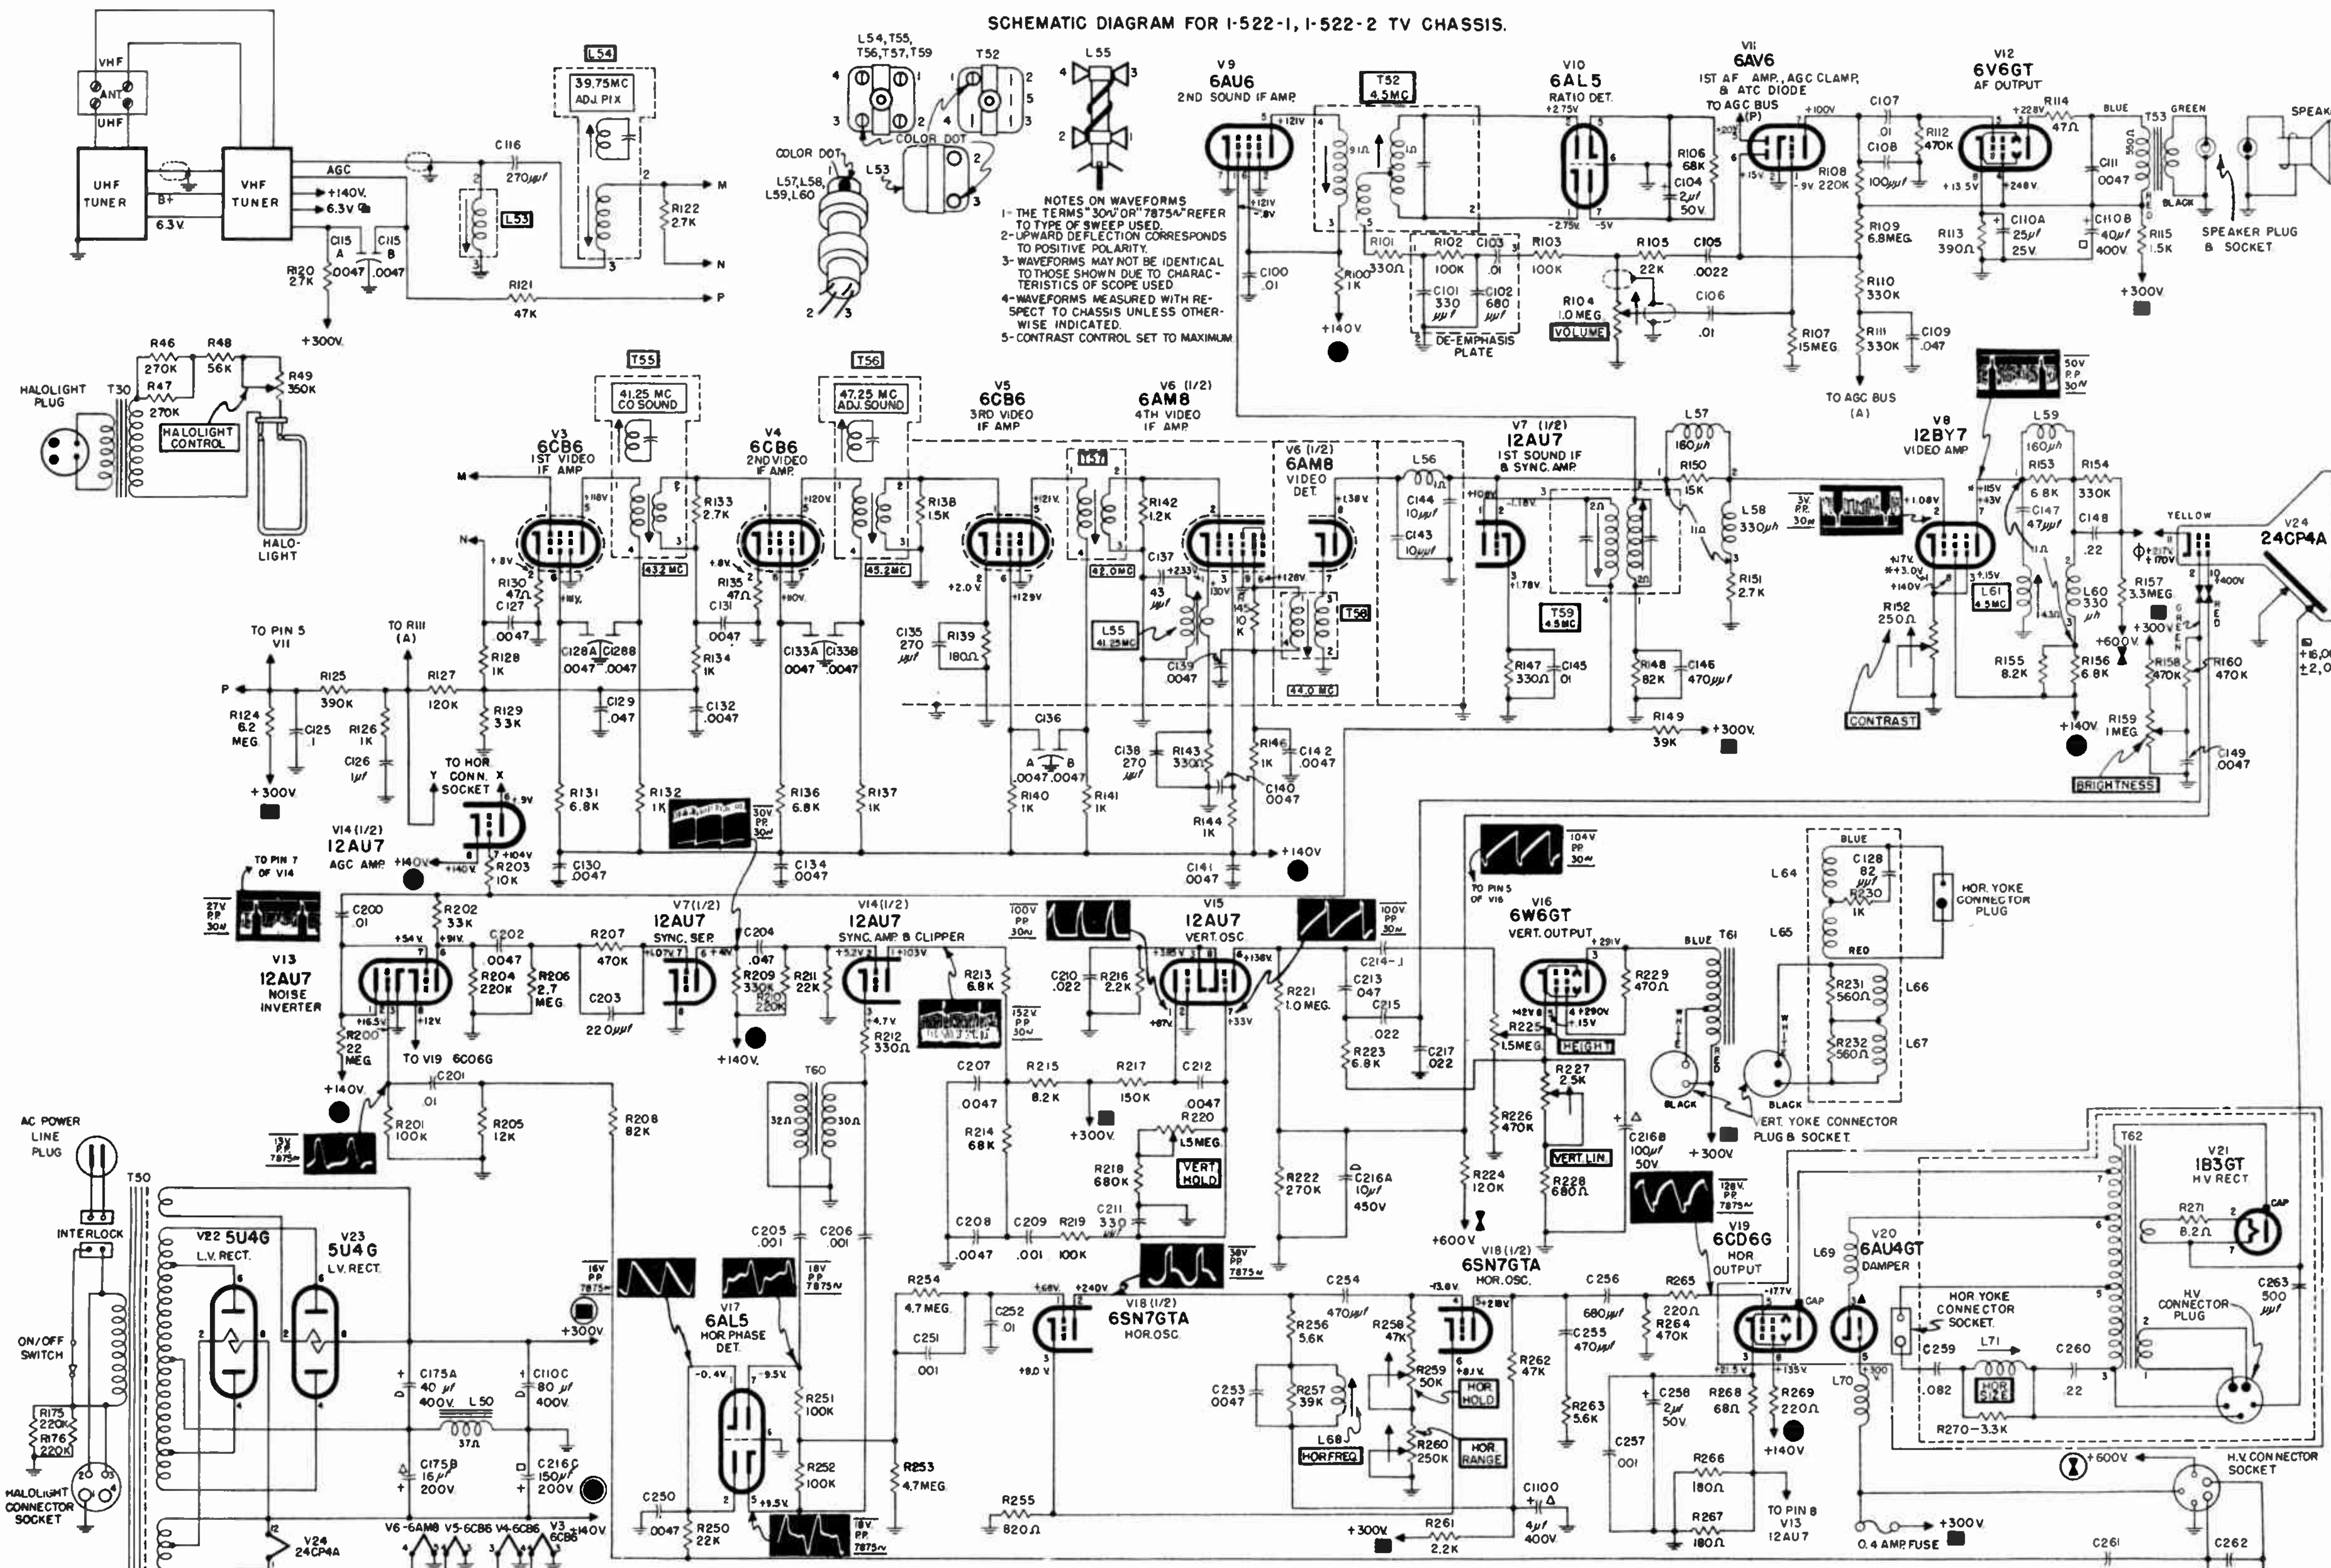
7. Adjust L68 Horizontal Frequency coil until picture moves back and forth across screen with blanking bar vertical.

8. Remove shorting jumper from junction of R212 (330 ohm) and T60 sync phase splitting coil to chassis.



CHASSIS BOTTOM PARTS LAYOUT

SCHEMATIC DIAGRAM FOR 1-522-1, 1-522-2 TV CHASSIS.



■ MEASURED WITH A VTVM HIGH VOLTAGE PROBE AND AT LINE VOLTAGE METER READING OF 117 VOLTS, UNDER CONDITIONS OF NORMAL SIGNAL, NO BRIGHTNESS AND CORRECT SCAN SIZE.

Φ BRIGHTNESS CONTROL AT MAXIMUM.
* CONTRAST CONTROL AT MINIMUM.
VOLTAGE SOURCES ARE INDICATED BY ENCIRCLED SYMBOLS; CORRESPONDING SYMBOLS WITHOUT CIRCLES INDICATE VOLTAGE TIE POINTS.

▲ HIGH PEAK VOLTAGE OF SHORT DURATION MAY DAMAGE METER USED FOR THIS MEASUREMENT.

VOLTAGES ARE MEASURED TO CHASSIS UNLESS OTHERWISE INDICATED USING VACUUM TUBE VOLTMETER. MEASUREMENT CONDITIONS, UNLESS OTHERWISE NOTED: SOURCE 117 VOLT, 60 CYCLE, ANTENNA DISCONNECTED, ANTENNA TERMINALS SHORTED AND GROUNDED, PICTURE CONTRAST AT MAXIMUM, BRIGHTNESS AT MINIMUM—OTHER CONTROLS AT NORMAL POSITIONS. AVERAGE VOLTAGES AND COIL RESISTANCES ARE INDICATED. RESISTANCE OF TAPPED COIL IS FOR ENTIRE WINDING. RESISTANCE IS NOT SHOWN WHERE READINGS ARE TOO SMALL OR WIDELY VARIABLE.

ARROWS AT CONTROLS INDICATE CLOCKWISE ROTATION OF CONTROLS.

CAUTION NOTICE

THE HIGH VOLTAGE LEAD TO THE PICTURE TUBE MAY HAVE A POTENTIAL OF 18,000 VOLTS. PRECAUTIONS SHOULD BE OBSERVED WHEN THE CHASSIS IS REMOVED FROM THE CABINET FOR SERVICE PURPOSES.

DO NOT OPERATE THE RECEIVER WITH THE H.V. COVER REMOVED.

ALWAYS WEAR SAFETY GOGGLES AND GLOVES WHEN NECESSARY TO REMOVE THE PICTURE TUBE.

SPECIAL SERVICE INSTRUCTIONS

1. To maintain the correct electrical relationships between circuits, all cabinet mounted components (except HaloLight) should be connected to chassis during any electrical tests to receiver with AC power applied.

2. An extension cable assembly to accomplish the above requirements may be constructed using extra plugs and sockets identical to those utilized by the receiver chassis.

3. The metal shorting bar on high voltage shield must be held in a forward (non-shorting) position; place a plate over high voltage shield hole through which the shorting bar enters.

4. REMOVAL AND CALIBRATION OF CHANNEL SELECTOR KNOB:

   a. To remove Channel Selector knob, loosen (do not remove completely) knob retaining clamp screw. Knob may then be pulled off tuner shaft.

   b. To calibrate Channel Selector knob, rotate Channel Indicator Dial in cabinet front until channel number that tuner is set to appears behind picture window glass. Install Channel Selector knob meshing its gears with those of the dial. Make any minor adjustments required to insure that dial number corresponds to tuner setting.

VIDEO IF ALIGNMENT *

1- Connect the common lead of a Vacuum Tube Volt Meter to chassis ground. Set the meter on −volts setting, and connect DC probe to junction of L188 and R137 (load resistor of second pix detector).

2- Remove 6AU6 AGC control tube (V132).

3- Apply -3 volts bias to the AGC line (junction of C230, R255, and R260). This bias voltage may be obtained by connecting two 1.5 volt flashlight batteries in series. The positive end should be connected to ground and the negative end to AGC line. (For fringe areas, −1.5V bias should be used)

4- Turn the tuner channel selector to a station which does not have a local signal, (i. e., in New York City, channel 6).

5- Apply the IF signal with an accurate generator (20to 30 Mc range) to the 6J6 tube in the tuner. This may be done by placing an ungrounded shield over the 6J6 tube and applying the signal to the shield. The ground connection for the IF signal generator should be kept as short as possible. However, under no circumstances should the shield over the 6J6 tube be allowed to touch ground during alignment.

6- Set the generator to 23.4 Mc with high output and adjust L185 for maximum reading on the VTVM (keep meter on lowest scale). Always keep generator output low enough to prevent VTVM from reading over 1.5 volts during all alignment steps.

7- Set signal generator to 25.2 Mc and adjust L183 for maximum reading on VTVM, as above.

8- Set VTVM to 21.25 Mc and adjust T105 for minimum reading on VTVM.

9a- Set signal generator to 19.75 Mc† and adjust T104 (top) for minimum reading on VTVM.

b- Set signal generator to 22.3 Mc and adjust T104 (bottom) for maximum reading on VTVM, as in step 6.

c- Repeat steps 9a and 9b.

10a- Set signal generator to 27.25 Mc and adjust T103 (Top) for minimum reading on VTVM.

b- Set signal generator to 25.3 Mc and adjust T103 (bottom) for maximum reading on VTVM, as in step 6.

11- Set signal generator to 21.8 Mc and adjust L11 on tuner (see figure 2) for maximum reading on VTVM, as in step 6.

* All wired and tested chassis are completely aligned before shipment from our factory.

SOUND IF ALIGNMENT

1- Connect signal generator to pin 1 of V106 and set it accurately at 21.25 Mc. The setting of the signal generator should be kept at 21.25 Mc for this complete section. Commence alignment with high generator output and reduce output whenever necessary to keep meter reading within specified scale.

2- Connect the VTVM common lead to ground and the other lead in series with a one megohm resistor to the junction of the diode resistors R219 and R220. Do not remove the discriminator shield to make these connections as it can be made by fashioning a hook on the 1 megohm resistor lead and making connection to the transformer lug "C" through the hole provided for the adjusting tool. The meter should be set on the +10 volt scale and the primary of T113 (top) should be adjusted for maximum reading on the VTVM. (A20,000 ohm per volt meter may be used on the 2.5V scale in series with a 150,000 ohm resistor)

† On 2430 chassis, (without sound trap on tuner) T104 top should be adjusted for minimum response at 21.25 Mc.

3- Connect meter common lead to ground and other lead to junction of R236 and C205. The VTVM should be set to plus 3 or 5 volt scale. Adjust T113 (bottom) for zero reading on meter. It will be found that it is possible to produce either a positive or negative voltage on the meter depending upon this adjustment. T113 (bottom) should be adjusted so that the meter indicates zero output as the voltage swings from positive to negative.

4- Connect probe of VTVM to terminal A of T112. Set meter on -3 or 5 volt scale and adjust both top and bottom of T112 for maximum reading of the VTVM. (a 20,000 ohm per volt meter may be used on 10V scale)

5- Apply 21.25 Mc signal to the 6J6 tube in the same manner as that done in step 5 of the "Video IF Alignment" section. Adjust T111 top and bottom for maximum reading of the VTVM.

6-*Adjust L12, sound takeoff trap on tuner (see figure 2), for maximum reading of the VTVM.

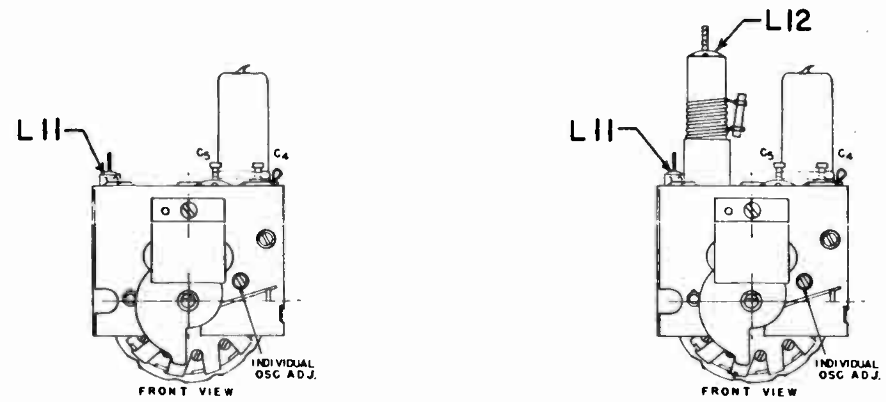
RF OSCILLATOR ALIGNMENT

The RF unit, or tuner, is factory pre-aligned and requires only oscillator adjustment for each channel.

1- Connect an antenna having 300 ohms input impedance to the antenna terminal posts of the receiver. Make certain all tubes are placed firmly in their proper sockets. Turn on the set.

2- Set the channel selector to any channel that is known to be on the air.

3- Set the fine tuning control to its midway position. This will expose a 1/4" hole to the right of the tuner shaft when the chassis is viewed from the front. (see figure below)



MODEL 2430 MODEL 630

FIG. 2

* Model 2430 does not have this coil.

4- Insert a fibre or plastic screw driver through the oscillator adjustment hole and slightly turn the adjustable slug in or out until maximum volume without distortion is obtained. Do not screw slug more than 3/16" from its flush position or it will fall out of the coil, necessitating removal of the coil from the tuner and replacement of the adjustable screw.

5- Keep the fine tuning vernier in the center of its range and adjust each individual channel from which a signal can be received in your location as described in steps 1 through 4 above.

6- Disconnect the antenna from the television chassis.

OVERALL ALIGNMENT

While it is generally unnecessary to use a sweep generator, it may be desirable to view the overall response curve. This curve should be similar to that illustrated below. To obtain it, a 50-216 Mc sweep signal generator is used together with a standard signal generator and an oscilloscope.

1- In a normal signal area, the -3V bias should be applied to the IF strip, as in steps 2 and 3 of the Video IF Alignment section. For fringe area reception, -1.5V bias should be used in the same manner.

2- Connect the RF sweep generator to the receiver antenna terminals and set to channel 12 or 13. Set the receiver channel selector to the same channel.

3- Connect the common lead of a VTVM to ground and the DC probe to the junction of L188 and R137. Set the meter to -3 or -5V scale.

4- Connect the ground lead of an oscilloscope to the chassis ground and the vertical input lead to the junction of L188 and R137.

5- Set the sweep generator to high output and adjust the fine tuning control on the receiver until a response curve appears on the oscilloscope screen. Reduce generator output until a reading of .3 volts is obtained at the VTVM. Readjust oscilloscope gain if necessary to get an adequate sized pattern.

6- Connect the signal generator to the antenna terminals through a small capacitor and feed in a 25.75 Mc IF picture carrier marker.

7- Observe and analyse the response curve obtained. If necessary, the IF adjustments should be slightly retouched in order to obtain a curve similar to the one illustrated below.

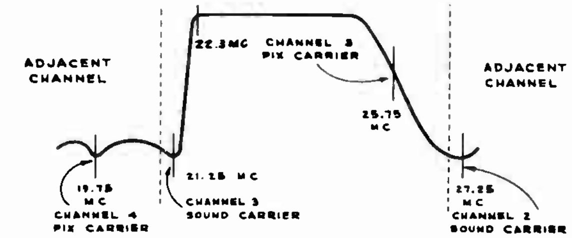


FIG. 3 - OVERALL PICTURE I-F RESPONSE.

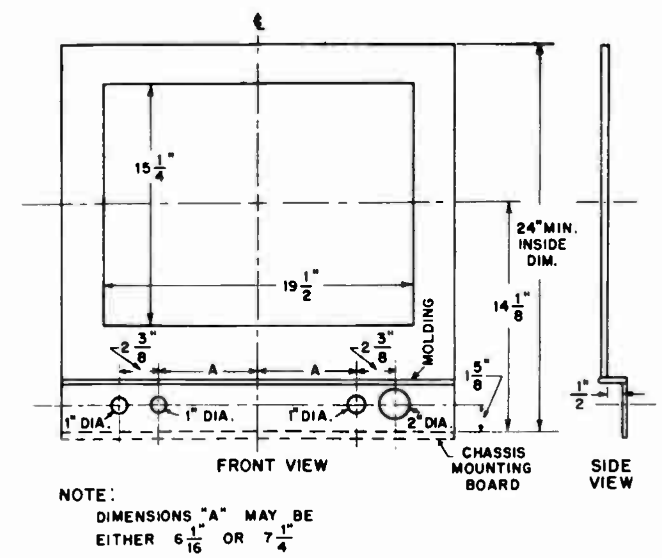
8- If T104 (bottom) requires any adjustment, it may be necessary to readjust T104 (top). When all final adjustments are made, the picture carrier marker 25.75 Mc should be at approximately 50% response. The curve must be approximately flat top with a 22.3 Mc marker at approximately 100% response (a 22.3 Mc marker may be obtained by readjusting the signal generator, as in step 6 above).

9- Throughout the video IF alignment, care should be taken to see that no two transformers are tuned to the same frequency as IF oscillation may result.

10- Check response curve in like manner on several other channels. Slight differences are acceptable.

11- Replace 6AU6 AGC tube and remove bias batteries.

12- Turn off receiver.



UNIVERSAL MOUNTING BRACKET

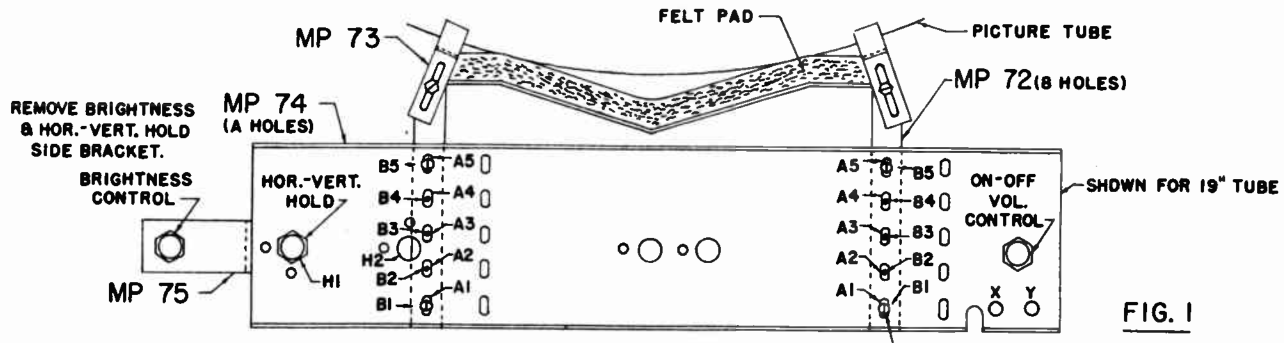


FIG. 1

FRONT VIEW

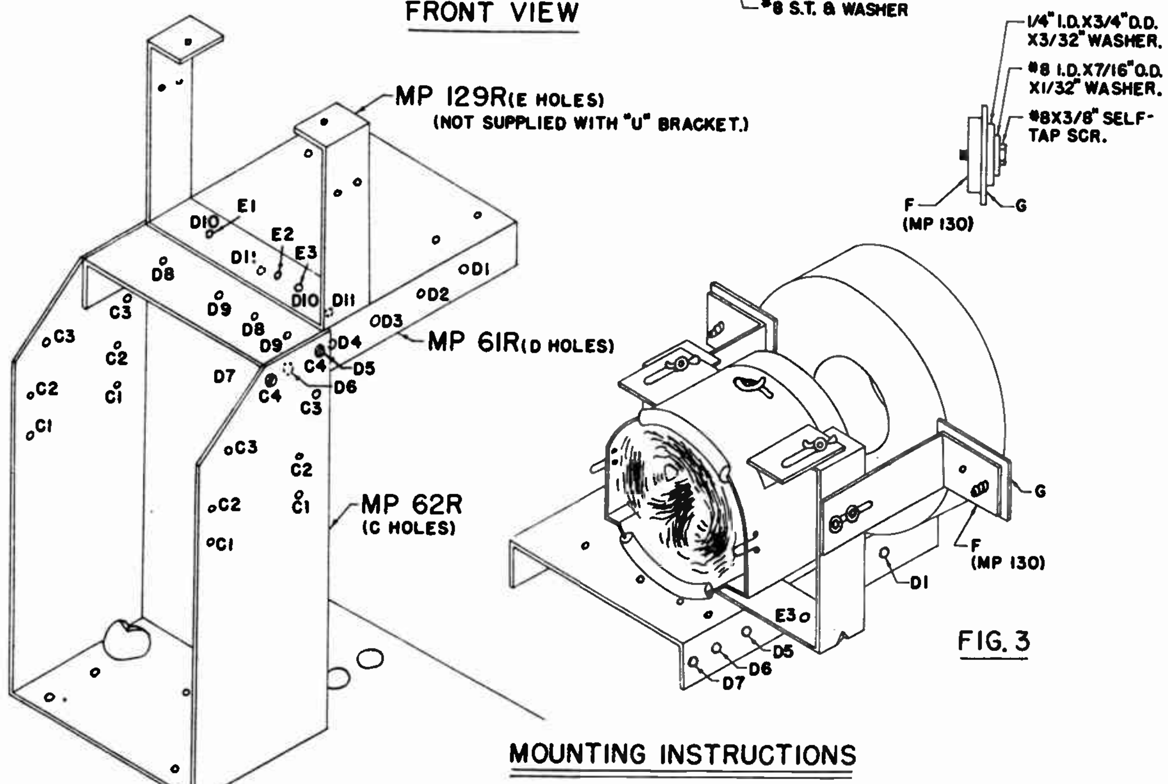

FIG. 2

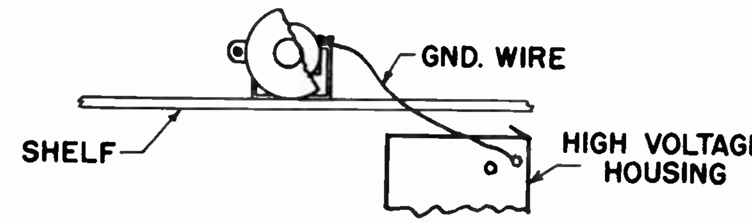
FIG. 3



1- After mounting the kinescope, the deflection yoke should be placed all the way up on the neck of the tube as far as it will go. On some tubes, it is necessary to remove the rubber cushion from the deflection yoke mounting hood and replace them with strips of tape. This will allow the deflection yoke to be moved closer to the bell portion of the tube.

2- Center the yoke around the neck of the tube by inserting a thin fibre or plastic strip between the inside of the yoke and the neck of the tube.

3- Mount the focus coil, with gap forward, so that the neck of the tube passes through the center of the coil with equal spacing all around the neck. The focus coil should be about 1/4'' behind the yoke and should be parallel to it, not tilted.

4- Mount the ion trap on the kinescope tube near the base. Be certain that the proper type of ion trap magnet is used for the particular kinescope being utilized.

5- Carefully place kinescope socket on the base of the tube, making certain the kinescope grid lead (green lead) is separate from all other leads.

6- Remove insulation from the end of the high voltage lead and solder on proper anode connector. Connect to the picture tube.

MOUNTING INSTRUCTIONS

REMOVE THE TWO SCREWS LOCATED AT X & Y (FIG. 1) FROM THE MOUNTING FOOT. MOUNT MP 74. THEN MOUNT MOUNTING FOOT BACK ON. ASSEMBLE FRONT & REAR BRACKETS USING HOLES AS TABULATED BELOW:

KINESCOPE SIZE	FRONT BKT. HOLES USED		REAR BKT. HOLES USED		
	MP 74	MP 72	MP 62R	MP 61R	MP 129R

NOTES
1. USE FELT PADS FOR GLASS TUBES ONLY.
2. USE ANCHOR PLASTIC OR EQUIVALENT PLASTIC RING & SLEEVE FOR METAL TUBES.
3. ⊖: #8 S.T. & WASHER; ⊘: 6-32X1/2 RHMS.
4. PLACE PADDING BETWEEN MP 73 & PICTURE TUBE.

IN SOME CABINET INSTALLATIONS, IT MAY BE NECESSARY TO REMOVE MP 75, THE BRIGHTNESS CONTROL BRACKET. FOR SUCH INSTALLATIONS, FOLLOW THE INSTRUCTIONS BELOW:
1. SHIFT BRACKET MP 72 1-3/16" FROM SETTING IN ABOVE TABLE TO THE RIGHT BY USING ALTERNATE SET OF HOLES IN MP 74.
2. MOUNT HOR.-VERT. HOLD CONTROL IN HOLE H2 & BRIGHTNESS CONTROL IN H1.
3. SHIFT MP 129R 1-3/16" TO THE RIGHT BY LINING UP HOLES E1 & E2 (MP 129R) WITH D9 HOLES (MP 61R) INSTEAD OF D8 HOLES, OR D11 HOLES INSTEAD OF D10 HOLES. SEE FIG. 3 FOR SHIFT.
4. MOUNT YOKE & FOCUS COIL ASSEMBLY TO MP 129R AS SHOWN IN FIG. 3.

PRELIMINARY ION TRAP ADJUSTMENT

Turn on receiver.

Adjust the brightness control to about 3/4 clockwise position. Then slowly rotate ion trap while moving it gently forward and backward until a bright area begins to appear on the picture tube face. Continue rotating while reducing the brightness control setting until the best brightness has been obtained on the face of the picture tube for a relatively low setting of the brightness control. If either a single horizontal bright line or a vertical bright line appears, turn off receiver to avoid burning the picture tube screen, and check the vertical or horizontal deflection circuits for errors (see trouble shooting chart). If, for any reason, no brightness appears after several trials, rotate the brightness control completely counter clockwise until the trouble is found as picture tube damage may result from incorrect placement of the ion trap.

PRELIMINARY ADJUSTMENTS ON AIR SIGNAL

Before final adjustments can be made, several preliminary adjustments must be made on an air signal. Connect an antenna having 300 ohms input impedance to the antenna terminal posts on the receiver. Turn on the set, and set the channel selector to any channel that is known to be on the air.

1- Turn brightness control completely counter clockwise and then slightly clockwise until a glow begins to appear on the face of the picture tube.

2- On receivers with a rear panel AGC level control, turn control 3/4 clockwise.

3- Turn up contrast until a series of diagonal or horizontal black and white lines are seen on the face of the tube.

4- Adjust secondary of synchrolock transformer, T108 (i. e., located on rear of chassis) until a single picture is seen on the screen. If it is rolling up or down, adjust the vertical hold control until it remains stationary.

Set the horizontal hold control to the extreme clockwise position and readjust the rear screw of synchrolock transformer, if necessary to lock the picture. Next, set the horizontal hold control to the extreme counter clockwise position and re-adjust the synchrolock transformer as stated above. Observe the number of turns necessary for readjustment of the synchrolock transformer. Set the horizontal hold control to the center of the range and readjust the synchrolock transformer by 1/2 the number of turns between the clockwise and counter clockwise positions of the horizontal hold control. When functioning properly, the horizontal hold control may be varied to approximately 80% of its extreme positions and still maintain proper horizontal sync.

5- Adjust the width and horizontal drive controls so that both edges of the picture may be observed.

6- If foldover (i. e., a bright vertical band at either extreme of the received picture) is observed, a slight adjustment of the phasing screw may be necessary. This screw is in the primary of the synchrolock transformer and must be reached from the inside of the chassis. With the horizontal hold control completely clockwise, adjust the phasing screw until the foldover just disappears. Then rotate the horizontal hold control completely counter clockwise. If no foldover occurs, the adjustment is complete. If there is slight foldover, re-adjust the phasing screw, so that the foldover line is 1/2 as wide as previously. The foldover should then disappear over the greatest part of the horizontal hold range.

7- If necessary, readjust the rear screw of the synchrolock transformer according to the instructions in step 4 above.

8- On receivers having an AGC level control, set receiver on strongest channel, turn control clockwise until picture just begins to overload, then back off slightly.

FINAL ADJUSTMENTS ON AIR SIGNAL

For the following adjustments, a test pattern is required:

1- Adjust the deflection yoke so that it is snug against the bell portion of the picture tube, and the top and bottom of the test pattern are in a straight horizontal line, parallel with the floor and table top.

2- Adjust the focus control until the picture is as clear as possible.

3- Adjust vertical linearity and height controls until the top half and bottom half of the test pattern are equal in height and just fill the cabinet mask. The height control has the greatest effect on the bottom half of the picture while the linearity control has the greatest effect on the top half of the picture. It may be necessary during these adjustments to occasionally reset the vertical hold control.

4- Adjust the horizontal and vertical centering controls* until test pattern is properly centered on face of tube.

5a- For picture tubes requiring from 53 to 60 degrees horizontal deflection (i. e., 12LP4, 16AP4, 16DP4, etc.) the width plug on the rear of the chassis should be placed in the 60 degree position.

b- For tubes requiring from 63 to 70 degrees horizontal deflection, (i. e., 19AP4, 16GP4, all rectangular tubes, etc.) the width plug should be placed in the 70 degree position.

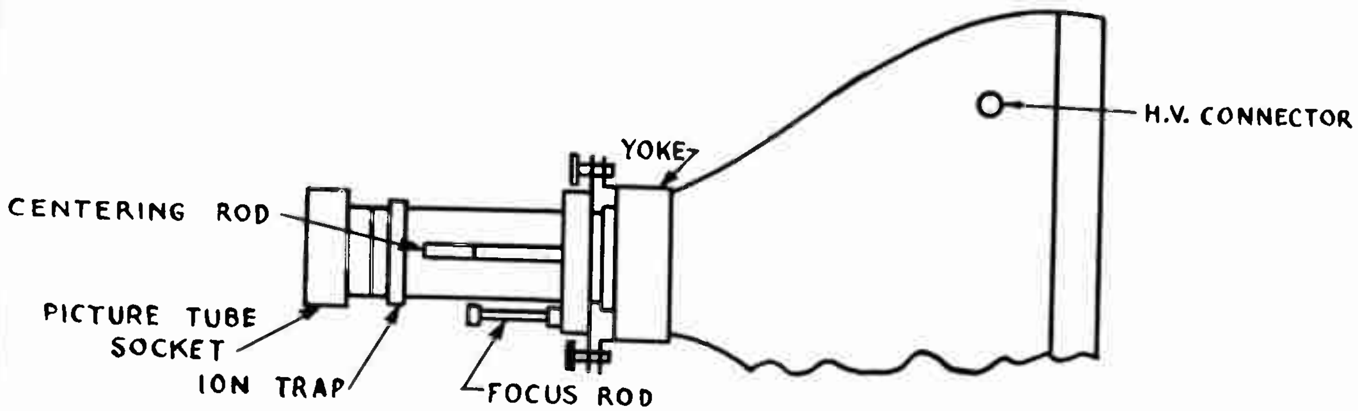
6- Adjust horizontal drive control for greatest width without excessive stretching of left hand portion of picture. If width is excessive, turn width screw out. If too narrow, turn width screw in.†

7- A slight readjustment of the ion trap and focus control may be required.

* On some models, a slight adjustment of position of focus coil will correct centering.

† On some models, a separate width coil is provided for 60 degree adjustments.

A. Installation of Kinescope Components



1-Place components on neck of tube using appropriate mechanical mounting brackets.
2-Connect all plugs and connectors to their proper receptacles.
3-Place deflection yoke forward as close to the bell of the picture tube as possible.
4-Mount the focus coil about 1/4" behind the yoke and parallel to it, leaving an equal clear space around the picture tube neck.
5-Mount the ion trap near the base of the picture tube. Make sure ion trap is correct for picture tube being used.
6-Fasten high voltage connector to picture tube.
7-Turn set on. Adjust "BRIGHTNESS" control 3/4 clockwise. Slowly rotate ion trap magnet while moving it back and forth until best brightness is obtained. If, after several times, no brightness appears or single line is seen, turn "BRIGHTNESS" control completely counter-clockwise until trouble is found.
8-Move centering rod, on focus coil, up and down to center picture horizontally and left to right to center vertically.
9-Reduce brightness to slightly above normal, readjust ion trap for maximum brightness, then screw focus rod in or out until the picture is sharpest.
10-If shadows appear at any corner of the raster, recheck position of yoke and focus coil. The ion trap may be moved slightly provided that it is kept within the range of maximum brightness. A careless adjustment may injure the picture tube.

B. Operating Instructions (applicable only after receiver has been properly set up and adjusted)

1-Turn set ON by rotating "VOLUME" control clockwise.
2-Set "CHANNEL SELECTOR" todesired station.
3-Turn"BRIGHTNESS" control clockwise until a faint glow appears on screen.
4-Adjust "CONTRAST" control for desired contrast.
5-Adjust "FINE TUNING" control for clearest sound and then set "VOLUME" for adequate sound level.
6-If the picture rolls vertically, adjust "VERTICAL HOLD" control.
7-If diagonal lines rather than a stationary pattern appear, adjust "HORIZONTAL HOLD" control.
8-When switching to another station, it may be necessary to repeat step 4.
9-For phonograph operation, turn "BRIGHTNESS" control completely counter-clockwise until click is heard. Then turn phono motor on.

C. Rear Control Adjustment(if required)

1-The "VERTICAL LINEARITY" and "HEIGHT" controls are used to obtain a linear vertical pattern. The "HEIGHT" control affects mainly the bottom half of the picture while the "VERTICAL LINEARITY" control affects the top half. Adjust these controls a little at a time, first one, then the other, and repeat. It may be necessary when adjusting these controls to readjust the "VERTICAL HOLD" control on front of chassis.
2-Screw "HORIZONTAL DRIVE" control in until one or two white vertical lines appear near the center of the screen, back off control until lines just disappear.
3-Rotate "HORIZONTAL HOLD" control (front panel) completely clockwise. Picture may start to pull out at right hand side or one to three diagonal bars slanting down to right may appear. This is normal. Rotate horizontal hold control completely counter-clock-wise. Picture may fall out of sync with one to six bars slanting to left. Slowly rotate "HORIZONTAL" control clockwise. Picture should pull in at about two to four bars. The picture should remain in sync over at least 75% of the horizontal range.

If control does notperform as above, first rotate "HOLD" control to extreme clockwise position. Adjust horizontal oscillator slug in rear until picture is in sync and about to pull out to the right. Recheck operation as in preceeding paragraph. If control does not perform as described, or excessive bend appears in picture a complete readjustment of both horizontal stabilizing coil and oscillator coil is indicated.

a) Temporarily short out stabilizing coil with a very short wire (3").
b) Turn "HORIZONTAL HOLD" control completely clockwise.
c) Adjust horizontal oscillator coil until picture is in sync and about to pull out to the right.
d) Remove short. Attach oscilloscope through 3 mmf. capacitor to tap on oscillator coil and observe waveform.
e) Adjust horizontal stabilizing coil until broad and sharp peaks are equal in amplitude, keeping picture in sync with "HOLD" control if necessary. Readjust horizontal oscillator coil if required as in step B and C.
f) If oscilloscope is not available, a fairly satisfactory adjustment of the stabilizing coil may be had by turning it out until the picture is centered in the raster without foldover on either side. (To observe this, width must be reduced to expose at least one edge of the picture, contrast must be reduced and brightness increased so that raster is visible.)
g) Recheck horizontal oscillator coil setting as in "C" above.

4- Adjust "WIDTH" coil for proper width; clockwise rotation to increase width; counter-clockwise to reduce width.
5- Adjust "HORIZONTAL LINEARITY" coil for best horizontal linearity with no white vertical lines in raster.
6- Set "AGC LINK" to open or closed position, depending on signal strength in area.

ALIGNMENT INSTRUCTIONS

Check other possible causes carefully before considering realignment. The following adjustments rarely require attention and alignment should not be attempted unless the circuits are definitely known to be out of adjustment and suitable equipment is available to make these adjustments.

Refer to Figs. 9 and 10 for location of alignment adjustments. Refer to the schematic for location of the test points indicated by the circled letters in the following chart.

PRESETTING IF TRAP COILS USING AM SIGNAL GENERATOR AND VTVM

Connect the negative lead of a 3-volt battery at point (B) shown on the schematic diagram; connect the positive lead to the chassis. Connect the signal generator to the grid of the 1st IF tube. Connect the DC probe of the VTVM at point (A); connect the negative lead to the chassis. Set the picture and fine tuning controls fully clockwise. Set the receiver to channel 12.

DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	CHANNEL	CONNECT VTVM	ADJUST	REMARKS
Direct	To 1st IF grid	20.6 Mc (Unmod.)	12	DC probe to point (A). Common to chassis.	Bottom adjustments of L-42B and L-42C.	Adjust for maximum voltage at VTVM.

CAUTION—Once the IF trap coils have been preset, no further adjustment with these coils will be necessary. Proceed to the overall IF response as described below to complete the alignment.

OVERALL IF AMP. RESPONSE CHECK

Connect the synchronized sweep voltage from the sweep signal generator to the horizontal input of the oscilloscope for horizontal deflection. Connect the sweep generator to the loosely coupled shield of the 6J6 tube, making certain that the shield is not grounded; connect the ground lead to the chassis.

DUMMY ANTENNA	SWEEP GENERATOR COUPLING	SWEEP GENERATOR FREQUENCY	MARKER GENERATOR FREQUENCY	CHANNEL	CONNECT SCOPE	ADJUST	REMARKS
Direct	High side to loosely coupled shield of 6J6; low side to chassis.	24 Mc (10 Mc sweep)	21.75 Mc 26.25 Mc	12	Vertical amplifier to point (A). Common to chassis.	L-13A L-42B (top) L-42C (top) L-6 L-38	Check for response curve similar to Fig. 6 with markers as shown. It is generally necessary to retouch settings of L-13A, L-42B (top), and L-42C (top) for proper response. Note that the adjustment of L-13A will affect the video side of the curve, L-42B (top) the audio side, and L-42C (top) the intermediate range. It may be necessary to touch up settings of L-6 and L-38 for proper symmetry, flatness, and bandpass. A pass band width of 3.5 Mc measured at the 50% response points is recommended at this point.

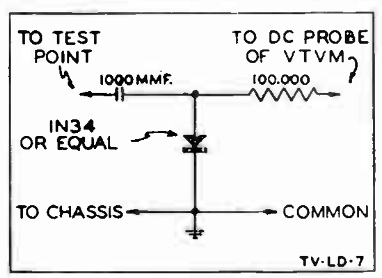

FIG. 5. Diode Detector Detail

SOUND IF AMP ALIGNMENT USING AM SIGNAL GENERATOR AND VTVM

DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	CHANNEL	CONNECT VTVM	ADJUST	REMARKS
Direct	High side to point (A). Low side to chassis.	4.5 Mc (Unmod.)	Any channel unused locally.	Dc probe to point (C). Common to chassis.	L-16A and bottom adjustment of L-17.	Adjust for max. voltage at VTVM.
"	"	"	"	DC probe to point (E). Common to chassis.	Adjust top slug of L-17.	Adjust for zero voltage. A positive and negative reading will be obtained on either side of the correct setting.

CHECK ON SOUND IF AMP ALIGNMENT USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

Connect the synchronized sweep voltage from the signal generator to the horizontal input of the oscilloscope for horizontal deflection.

DUMMY ANTENNA	SWEEP GENERATOR COUPLING	SWEEP GENERATOR FREQUENCY	MARKER GENERATOR FREQUENCY	CHANNEL	CONNECT SCOPE	ADJUST	REMARKS
Direct	High side to point (A). Low side to chassis.	4.5 Mc (500 Kc sweep)	4.45 Mc 4.5 Mc 4.55 Mc	Any channel unused locally.	Vertical amplifier input to point (C). Common to chassis.	L-17	Touch up the adjustments of L-17 maintaining max. amplitude while adjusting for max. steepness and straightness of the slope. See Fig. 7. Note that the 4.5 Mc marker pip tends to disappear as the correct setting of the top adjustment of L-17 is reached.

4.5 MC TRAP ADJUSTMENT

DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	CHANNEL	CONNECT VTVM	ADJUST	REMARKS
Direct	High side to point (A). Low side to chassis.	4.5 Mc (Unmod.)	Any channel unused locally.	AC probe to cathode of picture tube. Test point (D). Common to chassis.	L-16B	Adjust for minimum voltage. A crystal detector shown in Fig. 5 may be used with the VTVM in place of a commercial AC probe if desired.

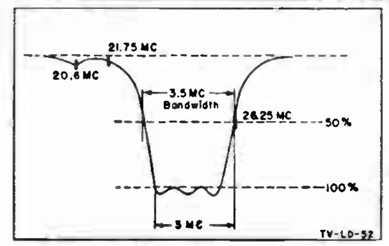

FIG. 6. IF Response Curve

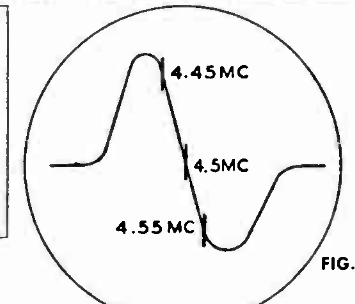

FIG. 7. Audio Response Curve

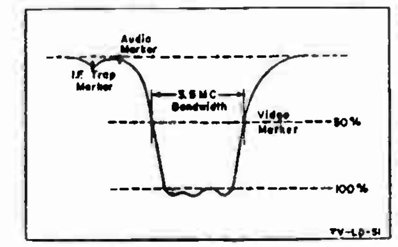

FIG. 8. Overall RF Response Curve

TUNER ALIGNMENT

Unless the tuner assembly has been serviced (tube or parts replacement) an adjustment of the RF stage trimmers will generally not be required. Tuner service, wherever possible, should be restricted to the adjustment of the oscillator trimmers outlined under INSTALLATION AND SERVICE ADJUSTMENTS.

Alignment of the tuner assembly should not be attempted unless suitable equipment is available.

Connect the synchronized sweep voltage from the sweep signal generator to the horizontal input of the oscilloscope for horizontal deflection.

Connect the negative lead of a 3-volt battery at point (B) shown on the schematic diagram; connect the positive lead to the chassis.

Set the fine tuning control to an approximate midway position.

DUMMY ANTENNA	SWEEP GENERATOR COUPLING	SWEEP GENERATOR FREQUENCY	MARKER GENERATOR FREQUENCY	CHANNEL	CONNECT SCOPE	ADJUST	REMARKS
Two carbon resistors. See Fig. 4	To receiver antenna terminals.	207 Mc (10 Mc sweep)	205.25 Mc 209.75 Mc	12	Vertical amplifier input to point (A). Common to chassis.	C-3 C-6 C-13 Osc. 12	Adjust C-3 RF amp. trimmer, C-6 mixer trimmer, and C-13 RF amp. trimmer for proper pass band and symmetry. Adjust oscillator coil to place the video marker at the 50% response point. Refer to Fig 8.
"	"	213 Mc (10 Mc sweep)	211.25 Mc 215.75 Mc	13	"	Osc. 13	Check frequency response for symmetrical peaks as above and if necessary touch-up adjustments C-3, C-6, and C-13. Adjust oscillator coils so that the video marker will be at the 50% response point of the curve. Note that the oscillator adjustment screw is found to the right of the fine tuning shaft and is made accessible as the channel selector is rotated to each channel.

fold up, indicating over-drive and finally turn the screw clockwise slightly to eliminate this folding action. With this setting the receiver is operating at maximum anode potential necessary for maximum picture brilliance and also eliminates linearity distortion at the center of the picture due to over-drive. (Do not confuse this linearity distortion with the overall linearity adjustment made with the HORIZ. LINEARITY control.) Because of manufacturing tolerances, not all receivers can be over-driven to the extent that fold-over will be observed. In these cases, the HORIZ. DRIVE trimmer screw should be set near minimum capacity (counter-clockwise) for optimum performance.

2. Check the horizontal linearity of the test pattern. It should be symmetrical from left to right and the center of the pattern should line up with the center of the escutcheon. If not, turn the HORIZ. LINEARITY screw adjustment in the direction that produces a symmetrical pattern from left to right.
3. Check the width of the test pattern. If it does not match the escutcheon, turn the HORIZ. WIDTH screw in the direction that produces the desired picture width. If this adjustment affects horizontal sync., reset the HORIZ. FREQUENCY adjustment.

HEIGHT AND VERTICAL LINEARITY—Set the VERT. HEIGHT and VERT. LINEARITY controls for vertical size and symmetry. These two controls interact somewhat and are usually adjusted together to obtain the desired effect.

FOCUS AND CENTERING

1. Chassis 46A3, 46A4, and 46B3—The picture tubes used in these chassis are electrostatically focused by means of a focus electrode in the gun assembly connected to the primary B+ in the receiver. The picture is centered to the escutcheon by removing the cabinet back* and adjusting the centering device at the rear of the deflection yoke. The ion trap adjustment described under ION TRAP ADJUSTMENT should be made before proceeding to center the picture. To shift the picture, rotate the centering device and adjust the two tabs which project from this device until the pattern is centered without shadowed corners.
2. Chassis 46C3 and 46C4—These chassis employ a P.M. focusing unit located on the neck of the picture tube directly behind the deflection yoke. The picture is centered to the escutcheon by removing the cabinet back* and adjusting the position of the metal tab located at the top of the focusing unit. The metal tab is held in position with a retaining screw and bracket. To re-set the tab, first loosen the retaining screw to permit movement of the tab. Centering can be accomplished by moving the tab in the required direction until the pattern is centered without shadowed corners. Tighten the retaining screw to prevent the tab from shifting. To focus the picture adjust the focusing stud, projecting from the focus unit along the neck of the picture tube, until proper focus is obtained. Focusing can be accomplished without removing the cabinet back. The cup on the cabinet back is provided with a hole to permit focus adjustment. Locate the slotted end of the focus stud and by means of a screwdriver, rotate the stud until the picture is in focus. Care must be used not to disturb the position of the ion trap when making the focus adjustment without removing the cabinet back.

DEFLECTION YOKE ADJUSTMENT—If the picture is tilted at an angle, it may be straightened out by removing the cabinet back* and loosening the single deflection yoke locking screw at the top center of the deflection yoke and rotating the yoke slightly as desired. Tighten the screw after adjustment making certain that the yoke is pushed forward against the flare of the tube.

OSCILLATOR TRIMMER ADJUSTMENTS—The oscillator trimmer adjustments have been set at the factory so that the picture just begins to appear and the sound is at maximum when the fine tuning control is about centered. Check the reception on all active TV channels in the area. When the oscillator trimmers are properly adjusted, the fine tuning control should not require readjustment when switching from channel to channel and the control should be about centered when optimum picture quality and sound volume are established. If extensive use of the fine tuning control is necessary when changing stations, proceed as follows:

1. Turn the receiver on and allow 15 minutes to warm up.
2. Select the desired television station by rotating the channel selector control. Set all other controls for a normal picture.
3. Set the fine tuning control in the center of its range.
4. Remove channel selector and fine tuning knobs.
5. The oscillator adjustment is found to the right of the fine tuning shaft. Insert a non-metallic screwdriver with a 1/8" wide tip and about 5 inches long and adjust for best picture and sound. The slug requires a slight rotation only. Should the slug be turned too far, it will fall into the coil. If this happens, it will be necessary to remove the chassis from the cabinet. Remove the bottom cover of the tuner and remove the coil. Hold the retaining spring to one side and lightly tap the open end of the coil until the slug slips out. Then replace the slug and reset the retaining spring.
6. With the fine tuning control still set as in step 3, repeat the procedure in steps 4 and 5 for each active television channel in the area.

*Note—Removing the cabinet back disconnects the line cord. An alternate test cord must be substituted for this adjustment.

ELECTRICAL SPECIFICATIONS

Power Supply	117 Volts AC 60 Cycles Only
Power Consumption	210 Watts
Power Output	2.4 Watts (Max.) 1.8 Watts (10% Distortion)
Tuning Range	VHF—Channels 2 thru 13
Intermediate Freq. (Tel.)	Picture—26.20 MC Sound—21.70 MC
Tel. Antenna Input Imp.	300 Ohms Balanced
Intercarrier Sound System	4.5 MC
Loud Speaker	See Parts List
Voice Coil Impedance	3.2 Ohms 400 Cycles

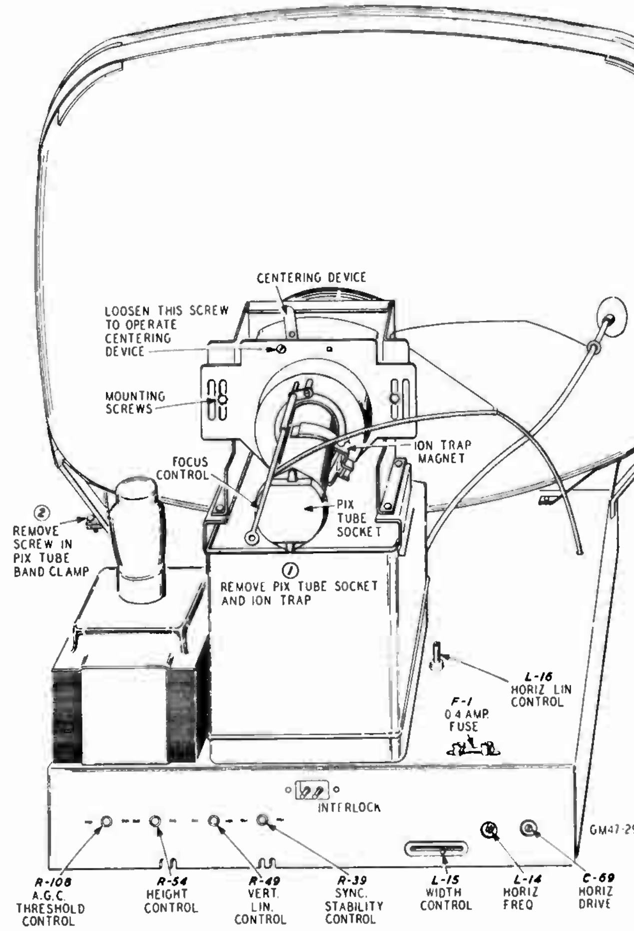

Fig. 3—Removal of Picture Tube and Rear Chassis Controls

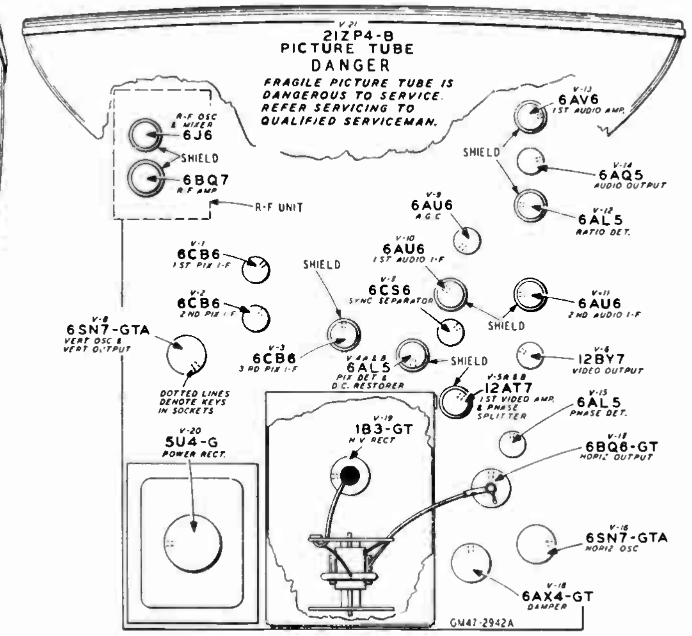

Fig. 1—Tube Layout.

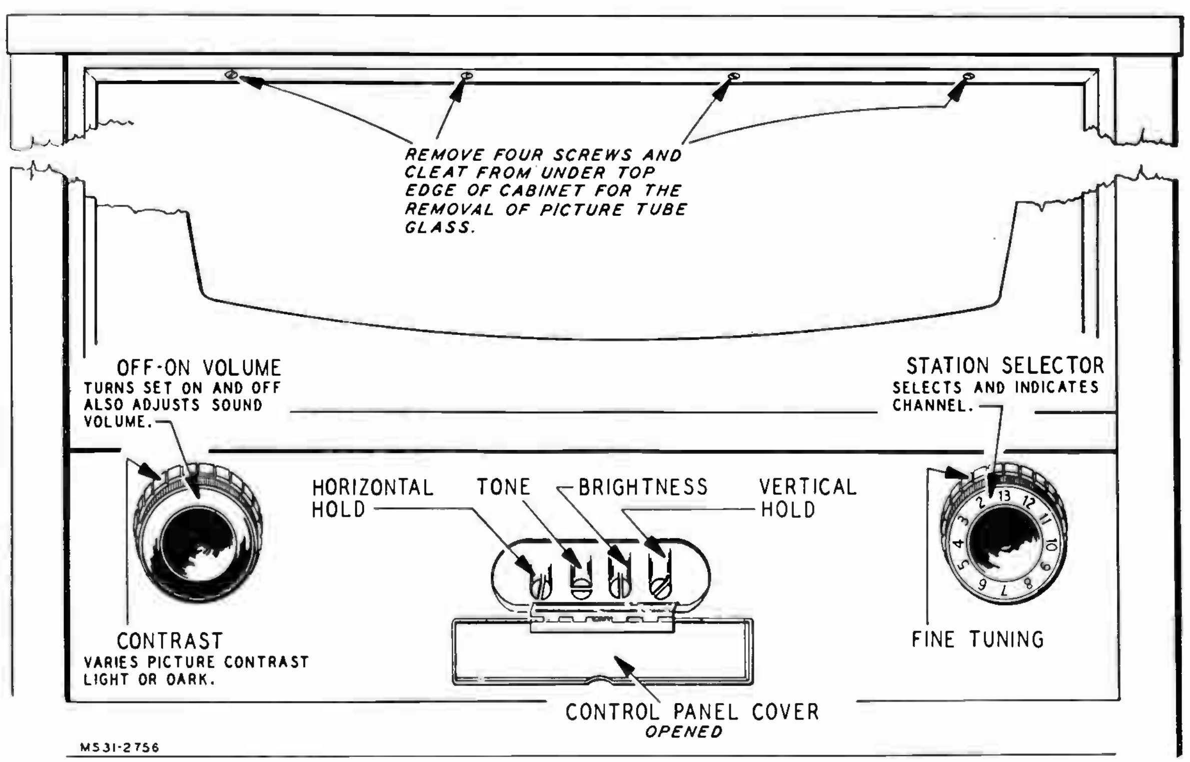

Fig. 2—Front Panel Controls

ADJUSTMENT OF AGC THRESHOLD CONTROL — Tune the receiver to the strongest station in the area in which the receiver will be used. While observing the picture and listening to the sound, turn the control clockwise until signs of overloading (buzz in sound, washed-out picture) appear. Then turn the control a few degrees counter-clockwise from the point at which overloading occurs. (The stronger the signal input, the more counter-clockwise this setting will be.) In areas where the strongest signal does not exceed 1000 uv the setting will usually be maximum clockwise. With the control set correctly, the AGC will automatically adjust the bias on the R.F. and I.F. amplifiers so that the best possible signal to noise ratio (Minimum snow) will be obtained for any signal input to the receiver.

ADJUSTMENT OF SYNC STABILITY CONTROL — When receiving strong (500 MV or more) signals, set hold controls so that the picture is locked in. Turn the sync control slowly clockwise until bending occurs at top of picture. Then turn the control a few degrees counter-clockwise until bending disappears. If the control is set incorrectly bending, tearing, etc., will be present and when switching from channel to channel the picture will not lock in quickly.

In weak signal areas the control should be set for maximum picture stability. In general the weaker the signal the more clockwise the control should be turned.

When the sync stability control is correctly adjusted the receiver will hold sync without tearing or rolling under even the most adverse noise conditions.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT — Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, it will be necessary to make the following adjustment.

HORIZONTAL FREQUENCY ADJUSTMENT — With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-14) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

HEIGHT AND VERTICAL LINEARITY ADJUSTMENT — Adjust the height control (R-54) until the picture fills the mask vertically. Adjust the vertical linearity control (R-49) until the picture is symmetrical from top to bottom. Adjust the picture centering device to align picture with the mask. Adjustment of any control will require a re-adjustment of the other control.

WIDTH, DRIVE AND LINEARITY ADJUSTMENTS— While receiving a signal from a station (with picture locked in sync) turn contrast control fully counter-clockwise, turn the brightness control (R-25) up so that the picture appears washed out. Adjust width control (L-15) until the picture fills the mask. Turn the horizontal drive control (C-69) clockwise until white bars appear in the left center portion of the raster, then turn counter-clockwise until the white bars just disappear. This adjustment will allow the horizontal system to operate at maximum efficiency. Adjust horizontal linearity control (L-16) for best linearity. If adjustment of the horizontal drive (C-69) or horizontal linearity (L-16) is required, it usually will be necessary to recheck the horizontal oscillator alignment. If adjustment of the horizontal linearity control (L-16) is required, readjustment of the horizontal drive control (C-69) will be necessary. Adjust the picture centering device to align the picture with the mask.

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is preset at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PROCEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

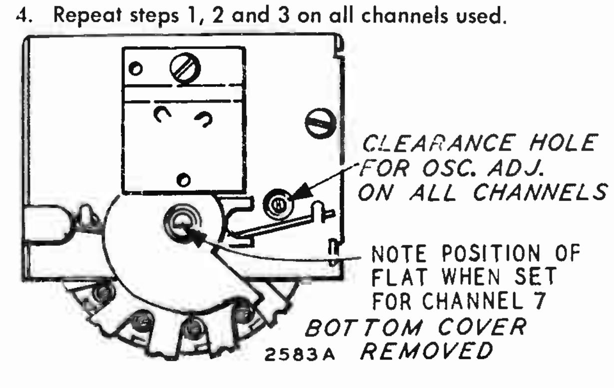

Fig. 4—Tuner Oscillator Adjustments

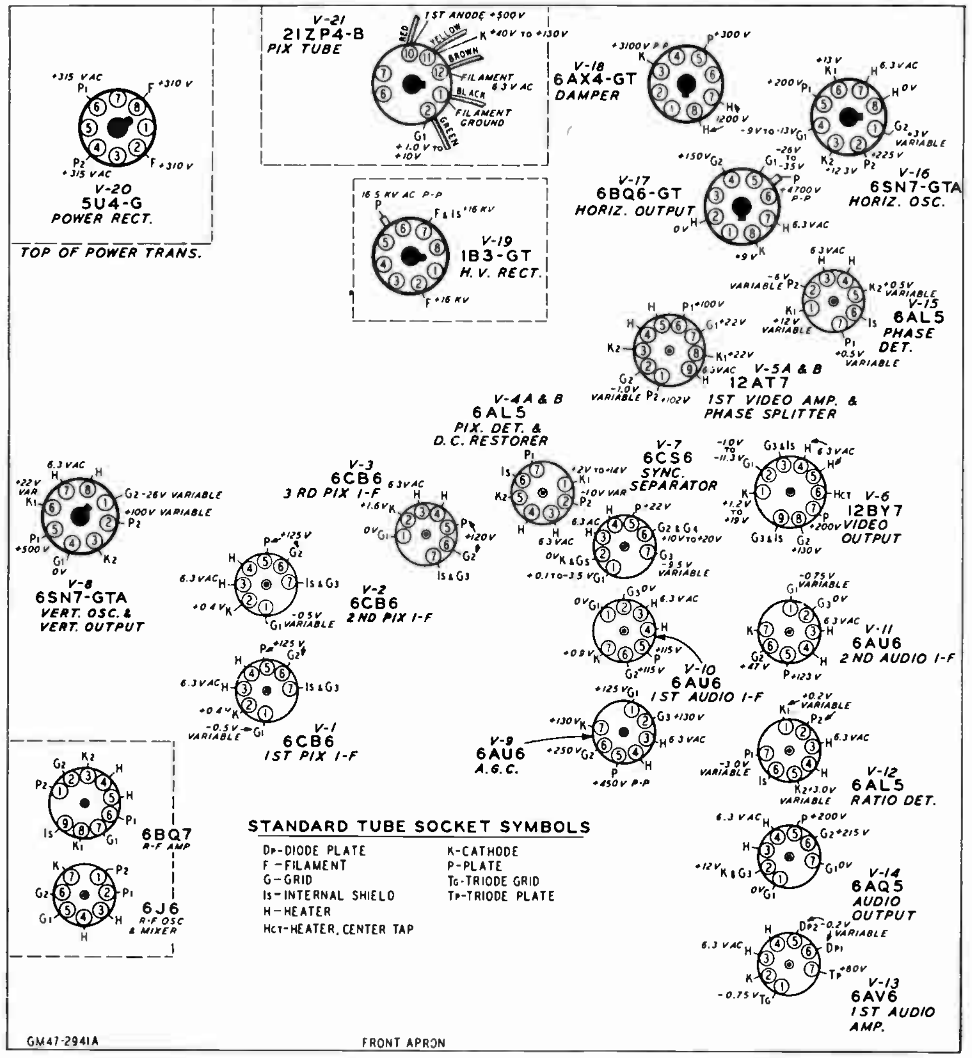

Fig. 5—Bottom Socket Voltages

ALIGNMENT PROCEDURE

TEST EQUIPMENT— To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency ranges:
- 18 to 30 mc, 10 mc sweep width
- 40 to 90 mc, 10 mc sweep width
- 170 to 225 mc, 10 mc sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)

(a) Intermediate alignment frequencies.
- 23.1 mc first picture I-F coil.
- 24.1 mc third picture I-F coil.
- 25.9 mc second picture I-F coil.
- 21.7 mc sound trap.
- 4.5 mc video trap & sound I-F.
- 25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS — To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, remove the antenna terminal board at rear of cabinet, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the power transformer and pix tube brackets.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-99.

ALIGNMENT PROCEDURE
PIX I-F

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-100) 4700 ohms, in series with peaking coil (L-6) from Pin 2 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply -4.5V battery bias on AGC line. (Junction of R-28 & R-32).

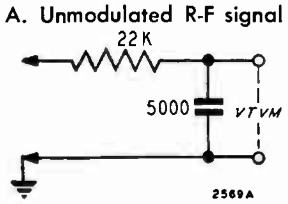

Fig. 9—VTVM Connections

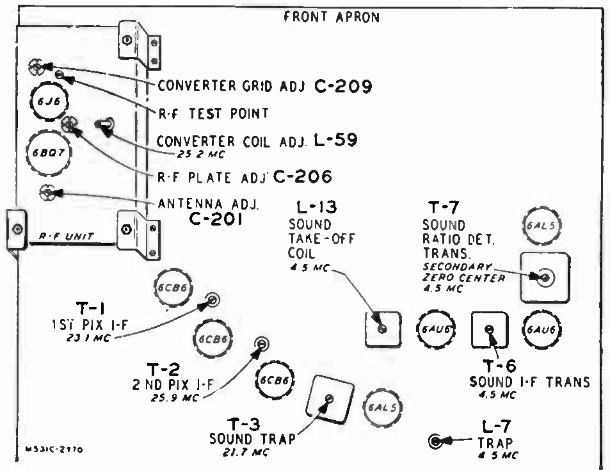

Fig. 7—Top Chassis Video and Audio I-F Adjustments

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil on top of tuner for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.

Connect oscilloscope across R-100 (in place of VTVM). Apply -4.5V bias (DC) to AGC line (battery).

Tuner should be switched to dead channel so as not to cause interference.

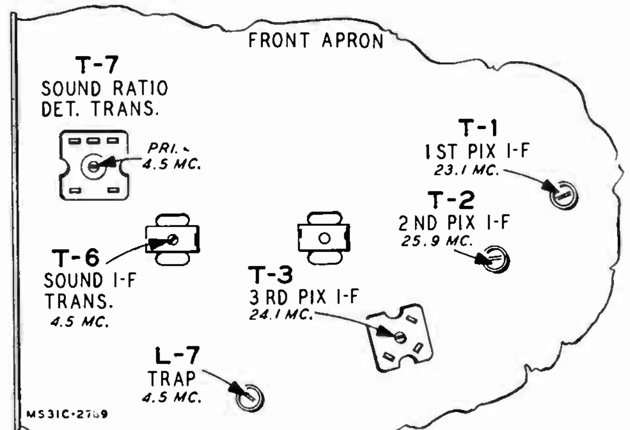

Fig. 8—Bottom Chassis Video and Audio I-F Adjustments

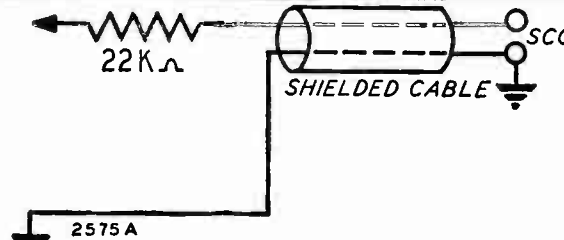

Fig. 10—Oscilloscope Connections

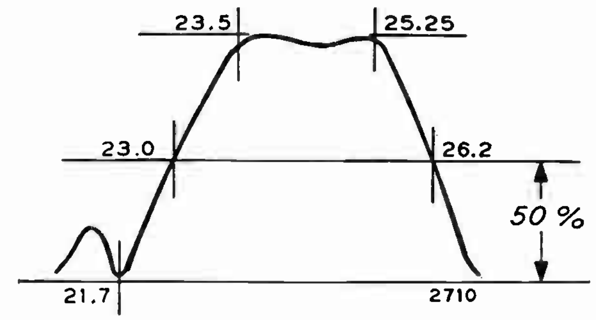

Fig. 11—Overall Response Curve

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is NOT advisable to change the setting of the coil, due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 2-6AL5) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response. VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1: With signal generator set to 4.5 MC and dc VTVM connected to junction of R-62 and C-46, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.

2: With VTVM connected to pin 7 of V-12 (6AL5) adjust the ratio detector primary (T-7 Bottom) for maximum.

3: With VTVM connected to junction of R-66, R-69 and C-50, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE — If no signal generator is available, the procedure above may be followed by tuning in a station and using the 4.5 MC beat between picture and sound carrier.

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" Figure 12) on tuner. Connect 1½ V bias to AGC line at junction of R-33 and C-20 on the receiver.

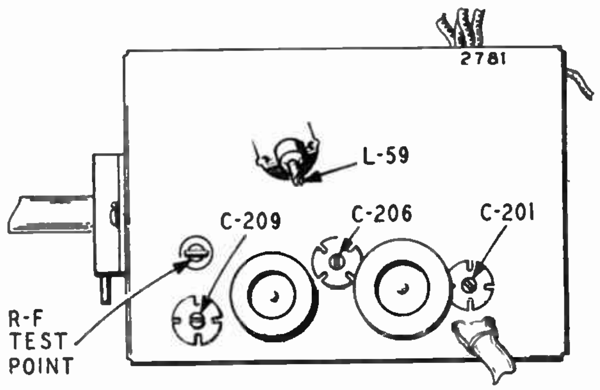

Fig. 12—Top Tuner Adjustments.

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 13. Picture and sound markers at 90% maximum response.

2. Check response on all channels. If markers are below 70% on any channels, readjust C-201, C-206, and C-209. Recheck all channels.

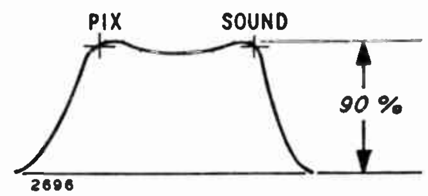

Fig. 13—Pix & Audio Markers

C. OSCILLATOR ADJUSTMENT.

1. Apply -4.5 volts on I-F AGC line at junction of R-1 and C-21.

2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 11).

3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.

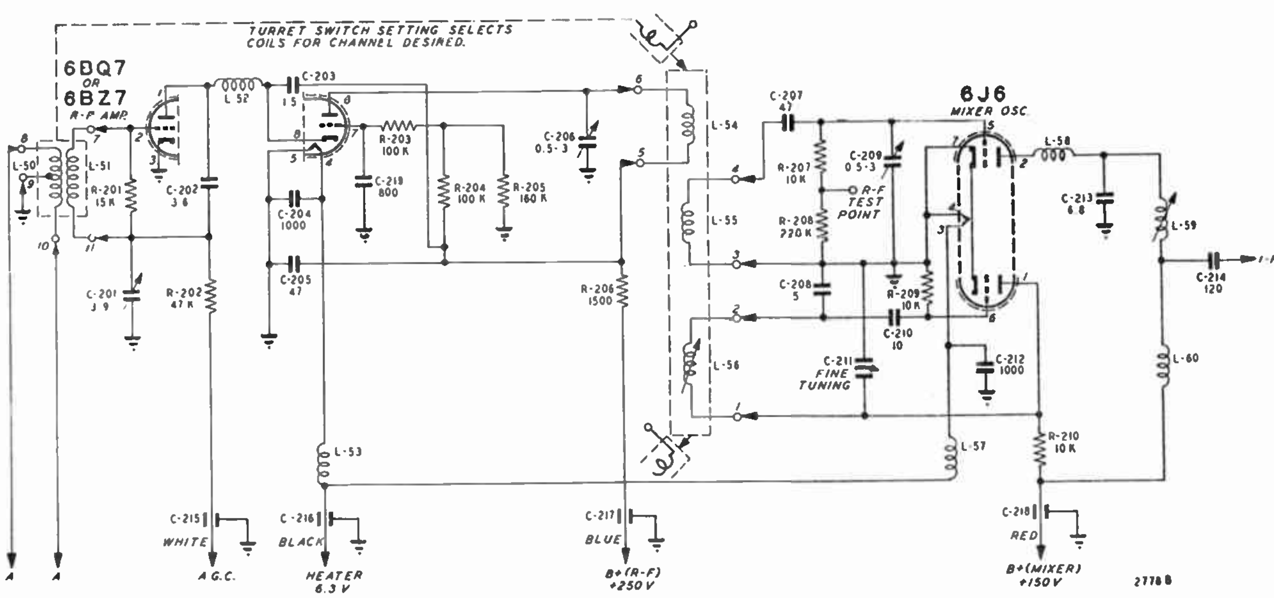

Fig. 15—Tuner Schematic Diagram.

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.
The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicate the repetition rate of the waveform, not the sweep rate of the oscilloscope. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.

INSTALLATION

Instructions

The complete installation of your new Television Receiver and the Television Antenna should be made by a qualified Television Service Technician. The Western Auto Store from whom you purchased the receiver will arrange for its unpacking and proper installation, and instruction in the use of the receiver for best results.

PLACEMENT -- The location in the room for your new Television Receiver should be given careful consideration.

Choose the location -- Where no bright light will fall directly on the picture. (Some illumination in the room is desirable.)

-- To give easy access for operation and comfortable viewing.

-- To permit a convenient connection to the antenna.

-- Convenient to an A-C electrical outlet of the proper voltage and frequency.

-- To allow adequate ventilation.

POWER SUPPLY -- This receiver is designed to operate on 105-125 volts A.C. power only. If plugged into an incorrect power supply, damage to the receiver may result.

CAUTION -- The receiver is provided with adequate ventilation holes in the bottom, back and the top of the cabinet. Care should be taken not to allow these holes to be covered or ventilation impeded in any way.

ANTENNA -- A correctly designed antenna, properly installed, is essential for good picture and sound reception.

Reception up to and sometimes beyond the line of sight to the transmitted antenna may be obtained if local interference conditions permit.

Whenever trouble is experienced, call the Western Auto Store from whom you purchased the instrument. He will arrange for a competent Service Television Technician to service the receiver.

OPERATING INSTRUCTIONS

This Television Receiver produces high definition pictures with fine detail and brilliance. Reception of these pictures is easily accomplished by following the instructions outlined below.

LOCATION OF CONTROLS

2D1303A Console Set

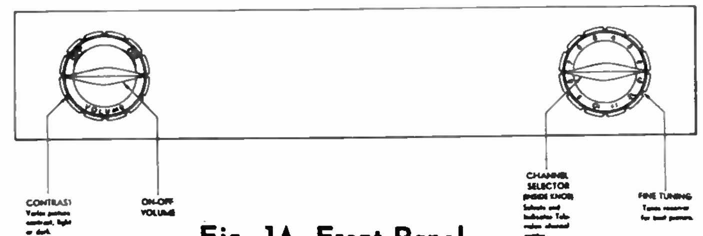

Fig. 1A Front Panel.

2D2302A Mantle Set

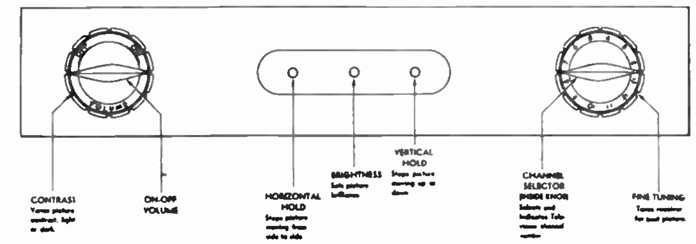

Fig. 2A Front Panel

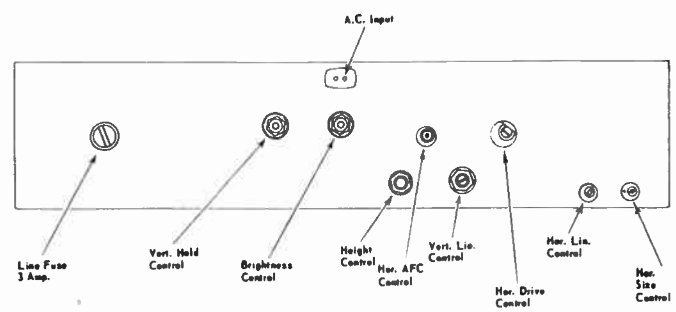

Fig. 1B Rear Panel

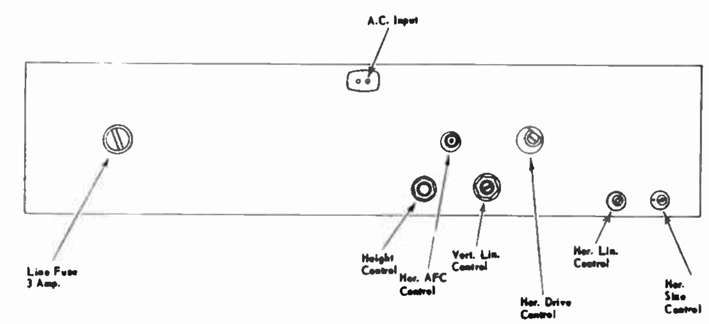

Fig. 2B Rear Panel

TUNING

All the controls normally used in tuning in a program -- both picture and sound -- are located on the front of the receiver. At the rear of the set are several controls which are pre-set at the factory and may need slight readjustment at the time of installation. After installation, they should not be adjusted further, unless required by replacement or aging of tubes, variations in power-line voltage, or other external conditions.

(1) Turn OFF-ON SOUND volume control slightly clockwise to switch the receiver on. Then turn the control clockwise to increase the sound volume.

(2) Set STATION SELECTOR to the desired channel.

(3) Allow a brief warm-up period.

(4) If the station is broadcasting, music or speech will be heard and the FINE TUNING control should be reset for best picture quality. Adjust SOUND volume control to the desired level.

(5) If necessary, adjust PICTURE control so that the picture is clear on the screen.

If the receiver has been in previous operation and other controls have been disturbed besides the OFF-ON knob then proceed as follows:

After switching on and setting for channel and volume as explained previously in steps 1 to 5, proceed as follows:

(a) Turn BRIGHTNESS control fully clockwise.

(b) Turn the PICTURE control fully clockwise until a picture becomes apparent.

(c) If the pattern is moving up or down adjust VERTICAL HOLD control until pattern is stationary in vertical direction.

(d) Adjust PICTURE control until picture is suitable and if necessary make a readjustment of the BRIGHTNESS at the same time.

(e) Adjust FINE TUNING for best picture quality. The sound will always be automatically optimum when the picture is correctly tuned. After the receiver has been on for some time, it may be necessary to readjust FINE TUNING for improved picture quality.

GENERAL DESCRIPTION

The model covered in this manual is a 21 tube, (including the picture tube and rectifiers), AC operated, direct view, 21-inch rectangular television receivers. The receiver is complete in one unit and features full coverage of all 12 V.H.F. channels (with easy conversion to U.H.F.) automatic gain control, automatic horizontal frequency control, inter-carrier sound system, electrostatic focusing, magnetically deflected picture tube and vertical and horizontal blanking circuit to improve picture quality.

At the rear of the receiver is a safety interlock to prevent dangerous electrical shock and as an added safety measure, a fuse is located in the low voltage power supply as well as in the A.C. input to protect the receiver in case of overloading.

OPERATOR'S CONTROLS

Toble Model

FRONT

ON-OFF VOLUME - Turns the receiver on or off and adjusts the sound volume level.

PICTURE - Varies in contrast between the light and the dark portions of picture.

CHANNEL SELECTOR - Selects and indicates desired station or Channel. May be turned in either direction.

FINE TUNING - Tuning receiver for best picture.

BRIGHTNESS - Adjusts picture brilliance, light or dark.

HORIZONTAL HOLD - Stops picture from moving side to side.

VERTICAL HOLD - Stops picture from moving up or down.

Console Molel

FRONT

ON-OFF VOLUME - Turns the receiver on or off and adjusts the sound volume level.

PICTURE - Varies in contrast between the light and the dark portions of picture.

CHANNEL SELECTOR - Selects and indicates desired station or Channel. May be turned in either direction.

FINE TUNING - Tuning receiver for best picture.

REAR

BRIGHTNESS - Controls the brilliance of the picture.

HORIZONTAL HOLD - Controls synchronization of the picture horizontally.

VERTICAL HOLD - Controls synchronization of the picture vertically.

SERVICEMAN'S CONTROLS

V. SIZE - Controls the size of the picture vertically.

V. LINEARITY - Controls vertical distribution of picture.

H. SIZE - Controls the size of the picture horizontally.

H. LINEARITY - Controls horizontal distribution of right side of picture.

CENTERING MAGNET - Controls positioning of picture for proper framing.

ION TRAP MAGNET - Controls focus and picture tube illumination.

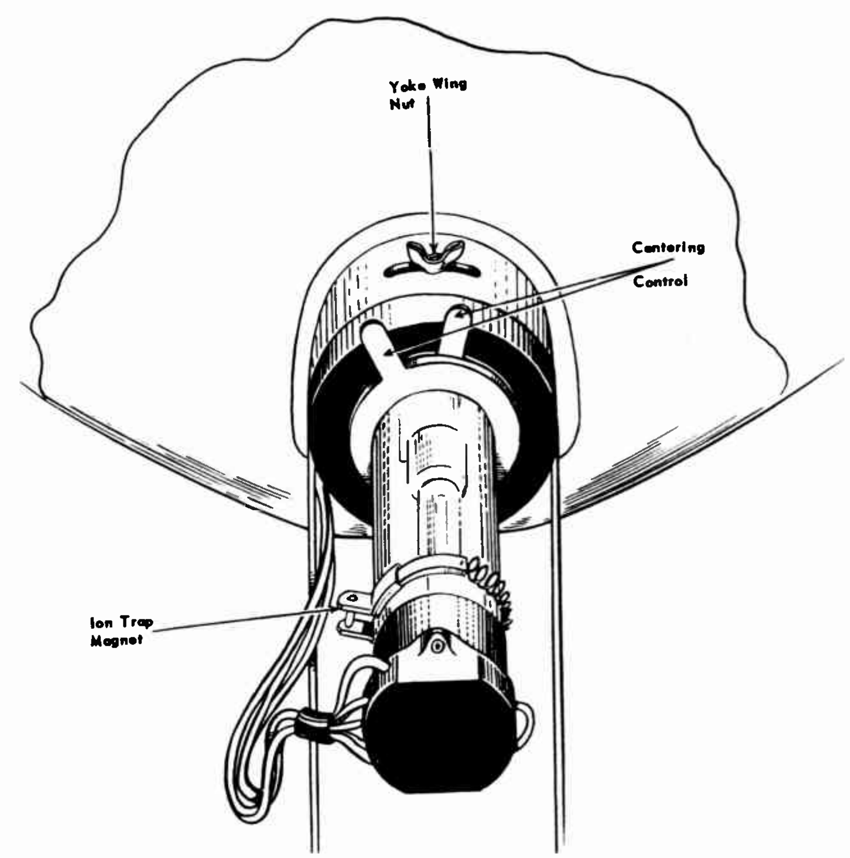

Figure 3. 21-inch Tube Assembly

SERVICE DATA

The front and rear controls are located as shown in figures 1, 2 and 3. All identifying names stamped on chassis.

SERVICE ADJUSTMENTS

VERTICAL SIZE AND VERTICAL LINEARITY CONTROLS

The vertical size and linearity controls should both be adjusted at the same time while a test pattern is being transmitted. The linearity control affects the upper portion of the picture while the size control affects the overall size especially the lower portion of the picture. Adjust both controls simultaneously until the test pattern is symmetrical and fills the entire screen vertically. Readjust the Vertical Hold control if necessary.

ION TRAP MAGNET (Figure 3)

The position of the ion trap magnet MUST be over the grid of the picture tube (second cylinder from the base identified by a flared forward lip). If adjustment is necessary loosen the tape and rotate until the position which gives maximum illumination is found. Rotate and slide magnet until the best focus position is found. Adjustment should be made with brightness and picture controls set for normal viewing.

HORIZONTAL SIZE CONTROL (Figure 2B)

The horizontal size control should be adjusted until the picture fills the entire screen horizontally. A clockwise rotation will increase size. To some extent the vertical size control setting may be affected by a major horizontal size adjustment.

HORIZONTAL AFC CONTROL (L-5)

The horizontal AFC control is located on the rear flange of the chassis and should be adjusted in the following manner. Set the Picture control to its normal operating position. Turn the AFC Stud with a small screwdriver or adjusting tool until the picture is steady (no horizontal movement). Set the core to the middle of its range (Straight vertical wedges).

CENTERING MAGNET

The centering magnets should be rotated and adjusted until the picture is properly framed keeping in mind that the effect of the magnet is governed by the position of rotation.

DEFLECTION YOKE

The correct position for the deflection yoke is as far forward on the neck of the picture tube as the shape of the tube will allow.

Tube shadow or a tilted raster may result from an incorrectly positioned yoke. If a positioning adjustment is necessary, loosen the yoke wing nut located at the top of the picture tube assembly.

HORIZONTAL LINEARITY COIL

The horizontal linearity coil affects the linearity of the right side of the picture only. It also affects phasing of the picture.

SPECIFICATIONS

Sensitivity at the Antenna

Audio - 5 microvolts
Video - 75-100 microvolts
(20V. P-P at Kinescope)

Antenna Impedance Requirements

Balanced 300-ohm

Audio Power Output Rating

3 watts undistorted

Speaker

Permanent magnet type
3.2 ohm voice coil impedance

Power Supply Rating

115 volts 60 Cycles, AC
Power Consumption, 190 watts

Intermediate Frequencies

Video - 26.0 MC
Audio - 21.5 MC
Intercarrier Sound - 4.5 MC

* May be a 6BC5 or 6CB6.

WARNING:

High voltage on the plate caps of the 1B3 high voltage rectifier and the 6AV5 horizontal pulse amplifier. DO NOT MEASURE this voltage.

SCHEMATIC DIAGRAM:

The schematic diagram located at the rear of this manual shows all the values of resistance and capacitance and the Voltage Measurements Chart gives all the proper voltages at the pins of the tube sockets. The voltage readings were taken with a 20,000 ohm/volt voltmeter with normal operation, no signal input, and line voltage at 115 volts A. C.

REPLACING TUBES

Before replacing the tubes the cabinet back must first be removed. Removing the cabinet back disengages the safety interlock and removes the power to the receiver. Do not tamper with or attempt to defeat the purpose of the safety interlock as shock may result.

Before replacing the High Voltage tubes first be sure the power is turned off and then short the H. V. anode cap to the chassis.

WARNING:

If the receiver has been in operation for some time, the tubes become hot and gloves should be used when replacing tubes to prevent finger burns.

PICTURE TUBE HANDLING:

Due to the large surface and extreme high vacuum of the picture tube, care should be used when handling the chassis outside the cabinet. Do not subject the tube to excessive pressure or rough handling as an implosion may result causing serious personal injury.

HIGH VOLTAGE POWER SUPPLY:

In the process of inspection, repair, changing of tubes or transformers, or for any other reason where it is necessary to work within the high voltage power supply, the following should be closely observed.

1. The corona insulator should not be omitted.
2. The corona insulator must be dressed in such a way as to make its presence useful; that is, covering the top socket terminals.
3. All leads must be dressed as far away as possible from the transformer winding. Excess lead length should be transferred to the top side of the chassis.

When replacement of the H. V. deflection transformer is necessary, be sure to closely follow the precautions listed above. The transformer can easily be replaced with the chassis in the cabinet by the following procedure.

1. Remove the hex head screw holding the H. V. cage.
2. Remove the H. V. assembly hex screws.
3. Remove flyback hex screw.

SERVICE DATA - TELEVISION FREQUENCY RANGES

GENERAL DESCRIPTION

VHF TUNER:

The Tuner is composed of a separate sub-chassis consisting of a 6CB6 pentode RF Amplifier and a 6J6 tube (twin triode) for the oscillator and converter. Separate high and low band coils and trimmers are used with a manual switching device to change bands. The tuner selects and amplifies the station's signal and converts it to the carrier IF frequency of 26.0 MC for video and 21.5 MC for sound which in turn is then fed to the IF amplifiers for further amplification.

VIDEO IF AMPLIFIER:

The Video IF Amplifiers are mounted on a separate sub-chassis along with the low level circuit. The IF amplifier section consists of three (3) stagger-tuned stages with an over-coupled output IF transformer using one 6AU6 and two 6CB6 (pentode) tubes with self-resonant core-tuned coils. Since the receiver is of the intercarrier type both the video and sound IF frequencies are amplified simultaneously and then detected by a 6AL5. The signal is then coupled to the video amplifier and the sync clipper. The A. G. C. network, R-11 and C-7, develops a negative bias voltage proportional to the average composite video signal.

VIDEO AMPLIFIER:

The Video Amplifier section consists of a 12BH7 duo-triode tube with a degenerative picture (or contrast) control (R-19) to vary the signal to the grid of the picture tube. The audio signal is also amplified in this stage and then separated by a 4.5 MC trap (T-4). This trap also serves to separate or keep the audio from appearing in the picture.

SOUND SECTION:

The Sound Section consists of a 6AU6 (pentode) 4.5 MC audio IF amplifier, 6AL5 twin diode ratio detector, 6AV6 (triode) audio amplifier and a 6K6 (pentode power amplifier) output tube. Due to the hetrodyne action between the video and sound IF frequencies at the video detector, a 4.5 MC signa' is obtained containing the audio information. After the video detector the audio information is amplified by the video amplifier, separated from the video by the trap, amplified, detected and further amplified before being coupled to the speaker.

SYNC. CLIPPER:

The Sync. stage utilizes a 12AU7 (duo-triode) tube which functions as a sync. separator and noise clipper. The signal from the output of the video amplifier is coupled to pin 8 through R-27 and C-29. With the negative going signal at Pin 8 and the low plate voltage, sync. separation is accomplished.

VERTICAL DEFLECTION:

The Vertical Deflection section consists of a 6C4 and 6V6 tube, being used as a blocking oscillator and output amplifier. The signal from the plate of the sync. separator is coupled through the Vertical Integrating Network to the grid of the blocking oscillator. The vertical hold control (R-54) in the grid circuit varies the oscillator operating frequency, thus providing adjustment for synchronization. The vertical size control (R-58) varies the amplitude of the pulse to the grid of the amplifier and controls the amount of vertical deflection. The vertical linearity control (R-60) varies the cathode resistance, in the 6V6 vertical output tube circuit thus adjusting the operating characteristics of the amplifier to provide the proper wave shape to obtain a linear picture vertically. The blanking network is designed to eliminate vertical retrace lines at high brightness levels.

AFC DISCRIMINATOR:

The Automatic Frequency Control section utilizes a 6AL5 (twin-diode) tube which functions as a discriminator. The horizontal sync. pulses from the output of the sync separator are coupled to the AFC tube. At the same time a comparison sawtooth is applied from the horizontal sweep amplifier. Any phase shift between the horizontal sync pulses and the horizontal sawtooth will cause one diode section to conduct more than the other. This will result in a DC bias voltage applied to the grid of the multivibrator and change the operating frequency. The output of the AFC discriminator thus synchronizes the horizontal sync. pulse.

HORIZONTAL MULTIVIBRATOR:

The Horizontal Multivibrator uses a 12BH7 (twin-triode) tube and is of the conventional cathode coupled type. The core-tuned parallel resonant circuit (L-5 and C-42) is used as a hold adjustment to stabilize the frequency of oscillation. Because of the wide pull-in range of the automatic frequency control tube a fine hold control is not necessary. The output signal of the multivibrator is coupled to the horizontal pulse amplifier. Capacitor C58 is a negative peaking device to aid in cutting off the pulse amplifier tube at the proper time.

HORIZONTAL PULSE AMPLIFIER:

The Horizontal Pulse Amplifier utilizes a 6AV5 (beam pentode) tube to develop the necessary power for the fly back pulse and the horizontal winding of the deflection yoke.

DAMPER:

The 6W4 Damper tube (diode) performs three functions:

1. Aids in horizontal scanning.
2. Suppresses oscillations which occur over part of the horizontal scanning cycle; and
3. Gives an increase in plate supply voltage for the vertical blocking oscillator, vertical output amplifier and first anode of the pciture tube.

HI-VOLTAGE SUPPLY:

The High Voltage (second anode voltage) is obtained from the primary winding of the HV deflection transformer. When the plate current of the Hor. pulse amplifier tube is cut off, the field built up in the primary winding collapses and induces a high voltage surge which is rectified by the 1X2A tube, filtered by the H. V. capacitor C52 and applied to the second anode. The 1X2A is a conventional half-wave high voltage rectifier and obtains its filament power from a separate secondary winding of the HV deflection transformer.

LOW VOLTAGE SUPPLY

The B plus voltage for the receiver is obtained from the power transformer-driven brute force filter. The receiver tubes obtain their filament power from the filament winding. A safety interlock is provided to reduce shock hazards and a line fuse is connected in series to protect the receiver in case of overloading.

SERVICE HINTS

V. H. F. TUNER:

Before looking into the tuner for a particular trouble, first make the following observations. Since the receiver is of the inter-carrier type both the sound and video information are amplified simultaneously by the tuner, IF and video amplifiers. Therefore, if the sound section is functioning normally it can be assumed that there are no defects in the tuner, IF or video amplifiers. If the receiver is "dead" (no sound or picture - raster normal) first determine whether a signal is being transmitted and then check the antenna, lead-in and connections to the receiver. Next, rotate the contrast or picture control completely to the left (counter-clockwise) and observe the face of the picture tube. Advance the control to the extreme clockwise position and again observe the face of the picture tube. If no snow appears check the video amplifier, detector and second and third IF amplifiers. If, however, an increase of "snow" appears check the first IF amplifier before looking into the tuner.

When working inside the tuner do not move any component a great distance as a change in the distributed capacity may result and offset the alignment. When replacing components be sure to obtain the same lead length and replace them in the same position.

A majority of tuner troubles are often open and high resistance ground or coil solder connections, defective trimmers or coils and defective switch contacts.

Open or high resistance connections can easily be repaired by placing a hot soldering iron at the solder connection.

Defective switch contacts may cause an intermittent condition.

A. G. C.

The A. G. C. is a negative bias voltage proportional to the average composite video signal applied to the RF and first and second IF amplifiers. The magnitude of the A. G. C. voltage will vary according to the strength of the signal being received. However, it will closely correspond to the detector output voltage. As a fast and simple check to determine whether the A. G. C. voltage is normal, measure both the A. G. C. and detector output voltage. Under normal operating conditions these two voltages will be approximately the same.

VERTICAL DISTRIBUTION (LINEARITY)

A fast and simple method to check the vertical distribution of a TV picture, without a test pattern, rotate the vertical hold control until the picture is moving slowly downward. Observe the black horizontal bar. If the vertical size and linearity controls are properly adjusted, the bar will not change in thickness as it moves from top to bottom.

TROUBLE SHOOTING

Trouble	Probable Location
No Raster - No Sound	1. Blown fuse in "B +" Circuit. 2. Defective V14 (5U4G) L. V. Rectifier 3. Defective resistor R46. 4. Defective capacitors C60-61 5. Defective transformer T6 or choke L1. 6. Defective safety interlock or on-off switch.
No Raster - Sound Normal	1. Insufficient or no high voltage, (refer to "No High Voltage" section). 2. Defective picture tube. 3. Second anode lead disconnected. 4. Ion trap magnet misadjusted. 5. Defective C. R. T. socket.
No High Voltage	1. Defective tubes V16, 17, 18, 19. 2. Defective transformer T10, or yoke coil L6, 7, 8, 9. 3. Defective coils L5, L11, L10. 4. Defective resistor R69, 70, 71, 75, 76, 78, 79. 5. Defective capacitors C43, C44, C45, C46, C47, C48, C50, C51, C52, C58.
No Picture - No Sound Raster Normal	1. Defective antenna or lead-in. 2. Defective tuner tube V20, 21. 3. Defective tuner. 4. Defective tubes V5, 6, 7, 8, 9. 5. Improper voltages or resistances at sockets of tubes V5, 6, 7, 8, 9. 6. Improper alignment.
No Sound - Picture Normal	1. Defective tubes V1, 2, 3, 4. 2. Improper voltages or resistances at socket of tube V1, 2, 3, 4. 3. Defective speaker or plug. 4. Defective transformer T5, T7 or T4. 5. Improper sound alignment.
No Sync.	1. Defective tube V11. 2. Improper voltages or resistances at socket of tube V11.
Insufficient or no Vertical Sweep	1. Defective tube V12, V13. 2. Defective transformer T8-9 or yoke L6, 7, 8, 9. 3. Defective capacitor. 4. Defective resistor, R56, 57, 58, 59, 60, 61, 62. 5. Defective C62A, 33, 34, 60D.

TROUBLE - SHOOTING -- (Continued)

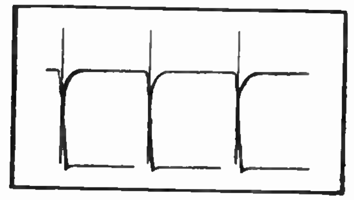
Trouble	Probable Location
Picture Cannot be Centered	1. Defective picture tube. 2. Defective centering magnet. 3. Defective ion trap magnet.
Poor Focus	1. Improper adjustment of Ion trap. 2. Defective picture tube.
Poor Horizontal Linearity	1. Improper adjustment of linearity coil. 2. Defective tube V17-18. 3. Defective capacitor C43, 44, 45. 4. Defective transformer T10 or Coil L10.
Snow or Poor Picture	1. Insufficient signal input. 2. Defective antenna or lead-in. 3. Weak tubes V20, 21, 5, 6, 7. 4. Improper video IF alignment.
Lack of Contrast	1. Defective tube V8, 9. 2. Improper video IF alignment.
Washed Out or Picture Smear	1. Defective V8. 2. Gassy tube V20, 5, 6. 3. Improper video IF alignment.

WAVE FORM ANALYSIS

The drawings on this page illustrate the wave forms at various positions within the receiver. The wave forms are not theoretical but exact copies of that shown by an oscilloscope and were taken under normal operating conditions, with a transmitter signal and the picture in sync. at all times.

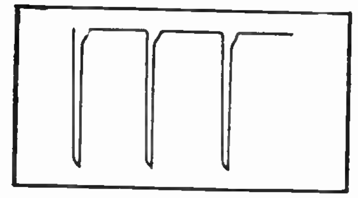
When checking the wave forms, connect the ground lead from the oscilloscope to the chassis and the hot lead to the position indicated. The wave shapes may vary somewhat depending on the strength of the signal, the picture information being transmitted and the adjustments of the various controls.

Under each wave form is the schematic reference, position taken at, peak-to-peak voltage and the type of wave form indicated (Vertical 60 cycles and Horizontal 15, 750 cycles).



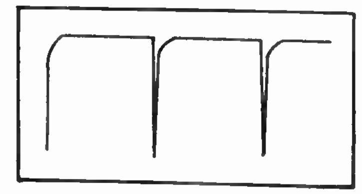
VERTICAL PULSE

Pin 3 of Tube V11. Cath. of Sync. Separator 15 volts Peak-to-Peak.



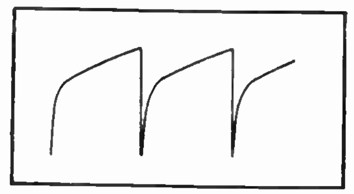
HORIZONTAL PULSE

Pin 3 of Tube V11. Cath. of Sync. Separator 15 volts Peak-to-Peak.



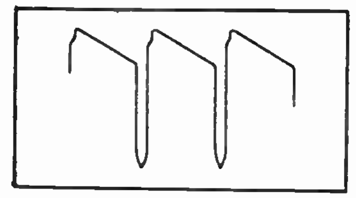
VERTICAL PULSE

Pin 6 of Tube V12 Grid of V. Blocking Osc. 125 volts Peak-to-Peak.



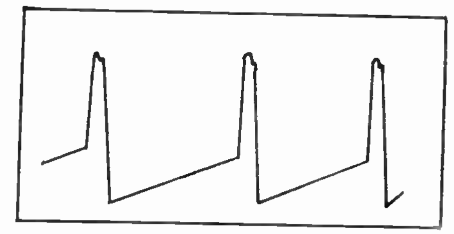
VERTICAL PULSE

Pin 5 of Tube V13. Grid of V. Output 95 volts Peak-to-Peak.



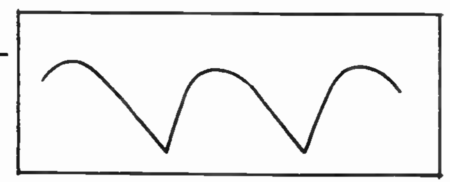
HORIZONTAL PULSE

Pin 5 of Tube V15 Cathode of A. F. C. Discr. 15 volts Peak-to-Peak.



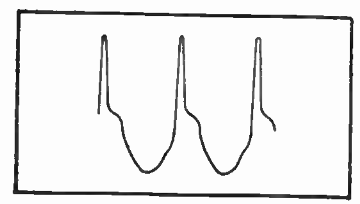
HORIZONTAL PULSE

Pin 7 of Tube V15 Plate of A. F. C. Discr. 15 volts Peak-to-Peak.



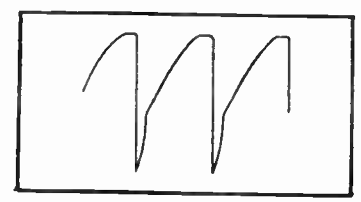
HORIZONTAL PULSE

Pin 1 or 2 of Tube V15 Plate of A. F. C. Discr. 15 volts Peak-to-Peak.



HORIZONTAL PULSE

Pin 6 of Tube V16 Plate of H. Mult. 35 volts Peak-to-Peak



HORIZONTAL PULSE

Pin 1 of Tube V17 Grid of H. Pulse Amp. 100 volts Peak-to-Peak.

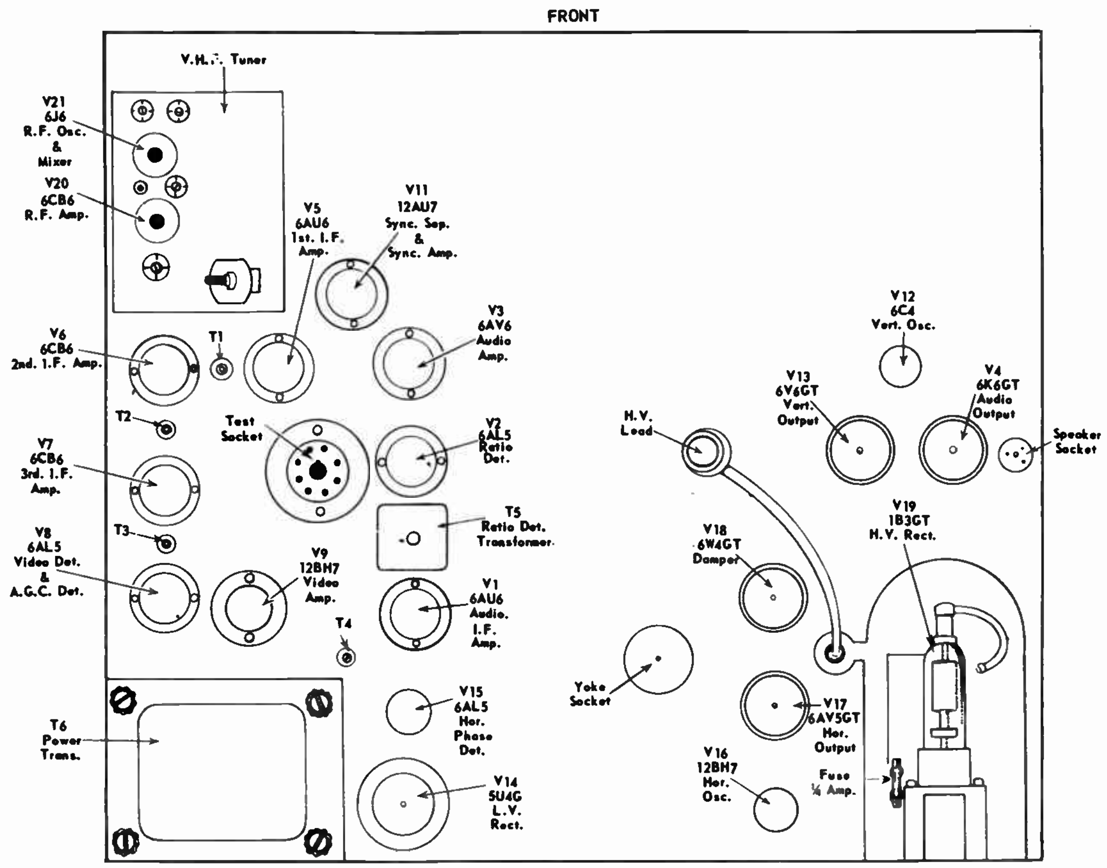


Figure 4. Top Chassis View.

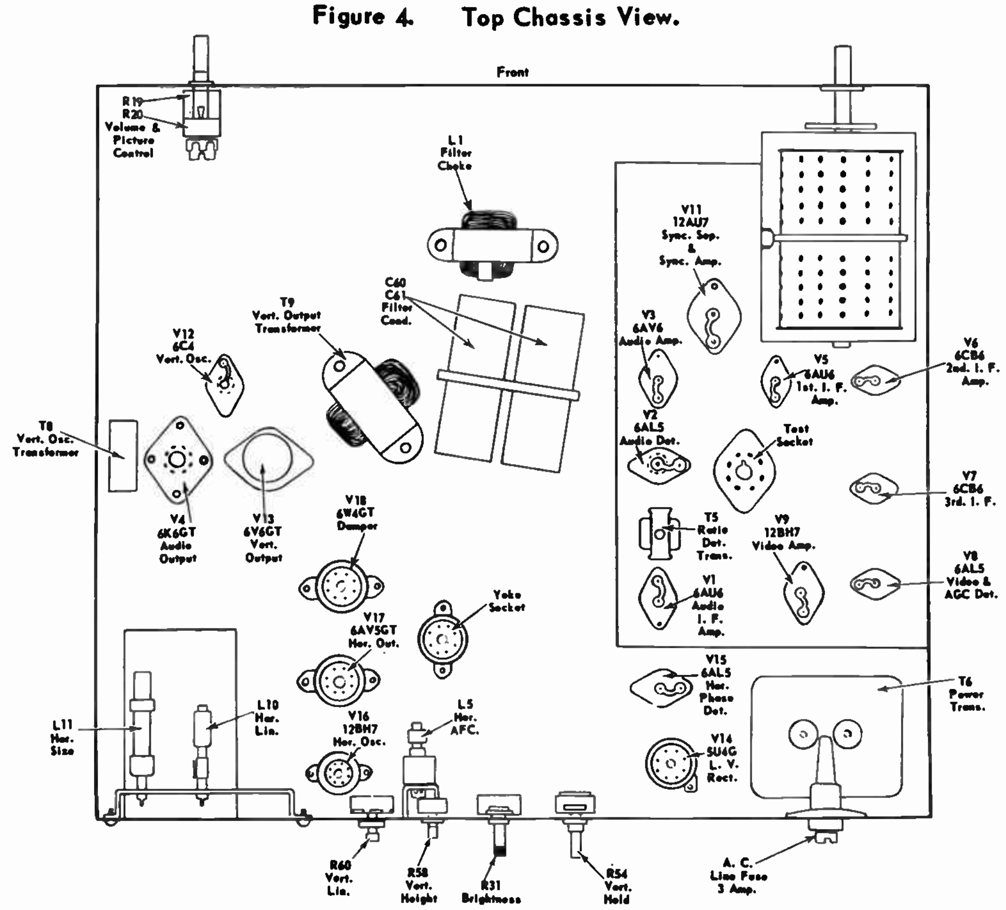

Figure 5. Bottom Chassis View.

ALIGNMENT PROCEDURE

NOTE: Test-socket pins are numbered like tube-sockets, i.e. clockwise from the keyway at the lug side of the socket.

I. Video I. F. Spot Frequency Alignment.

A. Connect 3 volts bias between pins 1 and 2 of the Test-Socket, with negative lead connected to pin 2.

B. Set tuner on a low band channel which does not have a strong local station. Short the antenna input terminal. Set Picture control at maximum clockwise position.

C. Feed the output of an audio-modulated signal generator through a condenser to the tuner test point.

D. Connect the high side of an AC Voltmeter to the Test-Socket, pin no. 4, and low side of the meter to pin no. 1. If necessary, the kinescope lead may be removed.

E. Control output of the signal generator so that the reading on the AC voltmeter goes no higher than 20 volts.

F. Use the proper alignment tool -- an internal male screwdriver for the coil studs, and proceed as follows:

Step Number	Signal Generator Frequency	Adjust	Remarks
1	25.7 MC	T3-Top	Adjust for maximum reading of voltmeter
2	25.7 MC	T1-Top	Same
3	23.6 MC	T2-Top	Same
4	23.6 MC	Tuner Top Slug	Same

II. Intercarrier Sound I. F. Alignment.

A. Remove the 6AL5 video detector from its socket. Set Picture control at maximum clockwise.

B. Connect the high side of the signal generator, through a condenser, to pin 7 of this tube socket. Connect the low side to the chassis. (NOTE: Pins are numbered from the lug side of the socket.)

C. Connect a DC voltmeter or VTVM to the Test-socket, the negative lead to pin 1 and the positive lead to pin 6.

D. Set the signal generator to 4.5 MC, unmodulated, and adjust output of generator so the DC meter reads no higher than 10 volts.

E. Use proper alignment tool: one internal male tool for stud; one external male tool for K-tran Ratio Detector.

Proceed as follows:

Step Number	Signal Generator Frequency	Adjust	Remarks
5	4.5 MC	T4-Top	Adjust for maximum reading of voltmeter.
6	Same	T5-Bottom	Same

F. Now disconnect voltmeter from Test-Socket, and replace with a matched pair of resistors. (NOTE: These resistors should be around 270K each, and should be connected in series between pins 6 and 1 of the test-socket.)

G. Connect the positive lead of the voltmeter to the mid-point of these resistors, and the negative lead to pin 7 of the test-socket.

H. Use 5-volt range of meter, and proceed as follows:

Step Number	Signal Generator Frequency	Adjust	Remarks
7	4.5 MC	T5-Top	Adjust for zero which occurs between a maximum negative and a maximum positive reading.

III. Tuner Oscillator Alignment.

A. Set fine-tuning in mid-position of its range.

B. Align all twelve channels with either an "off the air" station or a monoscope modulated local transmitter.

C. Procedure: Tune oscillator screws until 4.5 m.c. sound "wiggles" are just visible at all vertical edges.

* Do Not Measure

All voltages are with respect to chassis.

Measurements were made with receiver controls set for normal picture with 117 volts line voltage. Normal signal applied to antenna terminals. VTVM used for all readings.

NOTES:

1. UNLESS OTHERWISE NOTED:
   (A) CAPACITORS MARKED LESS THAN ONE(1) IN MFD.
   (B) CAPACITORS MARKED GREATER THAN ONE(1) IN MMFD.
   (C) RESISTORS IN OHMS; K=1000, M=1,000,000.
   (D) RESISTORS 1/2 WATTS.
2. PHONO & COLOR JACKS & ACCESSORIES OPTIONAL AND FURNISHED ONLY ON REQUEST.
3. UNLESS OTHERWISE INDICATED ALL FILAMENTS ARE CONNECTED TO POINT "Y".
4. UNLESS OTHERWISE INDICATED:
   (A) CONDENSERS RATED AT 500 W.V.
   (B) INDUCTANCE VALUES IN UH.

*R85 may or may not be in circuit depending on Power transformer used.

MODEL IDENTIFICATION CHART

MODEL	CHASSIS	CABINET	TYPE
2D-1316A	21T2A	Console	Mahogany
2D-2313A	17T2A	Mantel	Leatherette
2D-2315A	21T2A	Mantel	Leatherette

This booklet has been prepared to enable you to tune in better television pictures more easily and to acquaint you with some facts about television of interest to every set owner. Take the time to read the book thoroughly—you'll be more than amply repaid.

The functions of the controls and the operating procedure are presented first for ready reference. Information concerning installation and other general facts are placed at the rear of the booklet; however, they should be read carefully *before the set is operated.*

GENERAL DESCRIPTION

The models covered in this manual are an 18 tube, including the picture tube, 20 tubes with the UHF Tuner incorporated, AC operated, direct view, 17 and 21-inch rectangular television receivers. The receivers are complete in one unit and feature full coverage of all 12 V.H.F. channels and complete coverage of the entire UHF band with the UHF Tuner, automatic gain control, automatic horizontal frequency control, inter-carrier sound system, electrostatic focusing, magnetically deflected picture tube and a sync stabilizer switch and control to adjust the operational characteristics of the receiver for various signal areas.

At the rear of the receivers is a safety interlock to prevent dangerous electrical shock and as an added safety measure, a fusible resistor is located in the low voltage power supply to protect the receiver in case of overloading.

WARNING

At all times during operation the top chassis plate is at 125 volts DC potential above ground and it also may be at the line-voltage potential depending on how the line cord plug is inserted in the power receptacle.

Extreme caution must be observed when working with the chassis outside the cabinet and when power is applied to the receiver with the cabinet back removed. SEVERE SHOCK may result from contact with chassis.

Use an isolation transformer between the line cord plug and power receptacle when service is required. This removes all shock hazards and is the ONLY safeguard. Damage to the receiver and test equipment may result without the use of an isolation transformer.

CONTROLS

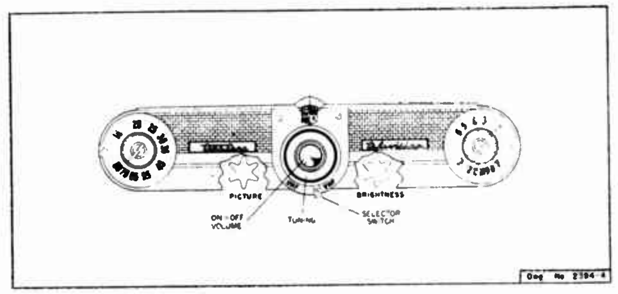

Figure 1. Front Controls.

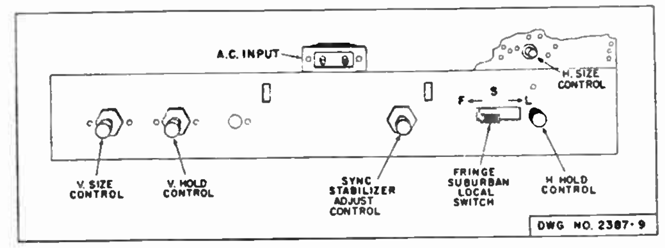

Figure 2. Rear Controls.

FUNCTIONS OF THE CONTROLS

All the controls normally used in tuning in a program—both picture and sound—are located on the front of the receiver and at the top of the back of the cabinet. At the rear of the set are several controls which are preset at the factory and may need slight readjustment at the time of installation. After installation, they should not be adjusted further, unless required by replacement or aging of tubes, variations in power-line voltage, or other external conditions.

The receiver actually requires only three controls when tuning in a program; on-off volume, tuning and picture. The on-off volume and tuning controls are located in the center (dual knob) while the picture control is a finger-tip knob to the left.

The other front controls, brightness and the selector switch, need only be adjusted when required. The front controls are shown below.

The controls at the rear of the receiver should be properly adjusted at the time of installation and should only require readjustment occasionally. The V. Linearity, Ion Trap and Centering control adjustments should not be attempted by the operator as they should be made only by a serviceman.

FRONT CONTROLS

On-Off Volume — Turns the receiver on or off and adjusts the sound volume level.

Tuning—Tunes the receiver to the desired channel or station. This knob may be turned in either direction.

Picture — Varies the contrast between the light and dark portions of the television picture.

Brightness — Varies the brightness of the television picture.

Selector Switch—Selects either the VHF or UHF television band for operation.

REAR CONTROLS

VHF Antenna Knob—Tunes the built-in VHF antenna for maximum signal.

V. Size—Changes size of picture vertically.

V. Hold — Stops picture from moving up or down.

Sync Stabilizer Adjust Control—Changes the operational characteristics of the receiver for the area in which the receiver is located.

Fringe-Suburban-Local Switch — Selects the proper operational characteristics of the receiver for various signal strength areas.

H. Hold—Provides adjustment for a steady picture, no horizontal movement.

H. Size—Changes size of picture horizontally.

V. Linearity—Changes vertical distribution of picture.

Ion Trap—Controls illumination and focus of picture.

Centering—Centers picture for proper framing.

OPERATION

When once you have become familiar with the use of the controls, tuning in a television program— picture and sound — is a simple matter. Carefully follow the procedure detailed below; you'll find the set as easy to operate as your present radio.

Note that the dial at the right is calibrated in VHF channel numbers and the dial at the left in UHF channel numbers. Each station in the country is assigned a definite channel number which represents operating frequencies.

Before attempting to tune in a station, check with your newspaper to see if the station is on the air, and note the channel number. If you experience any difficulty with the operation of the set, try a different station or turn off the set and tune in again at a later time; the fault may have been in the transmission.

TUNING PROCEDURE

1. Turn the ON-OFF VOLUME control clockwise to turn the set on. Allow one-half minute for the set to warm up.
2. Place the SELECTOR SWITCH in the proper position for the desired television range.
3. Turn the Picture control fully clockwise.
4. Rotate the TUNING knob until the indicator points to the desired channel number.
5. Turn the TUNING knob back and forth until the best picture is obtained with adequate sound.
6. Turn the PICTURE control fully counter-clockwise.
7. Turn the BRIGHTNESS control fully counter-clockwise, and then turn it slowly clockwise until the picture tube just becomes light.
8. Adjust the PICTURE control until the proper contrast between black and white is obtained. Readjust the BRIGHTNESS control if necessary.
9. Adjust the VOLUME control for the desired sound level.
10. When tuning from one station to another, it may be necessary to readjust the PICTURE control.

CONTROL ADJUSTMENT HINTS

VHF ANTENNA KNOB—The antenna tuning knob for the built-in VHF antenna should be used as a fine tuning control and should be adjusted until the best picture is obtained. In order to eliminate "Body Effect" when adjusting the antenna, stand in front and reach over the top of the set. Do not at any time force the knob in either direction if it becomes difficult to turn.

TUNING—The tuning knob should be used as a tuning knob on an ordinary home radio. Rotate the knob so the indicator points to the desired chanel number. Turn the knob back and forth until the best picture is obtained with adequate sound, and then adjust the picture control for proper picture contrast.

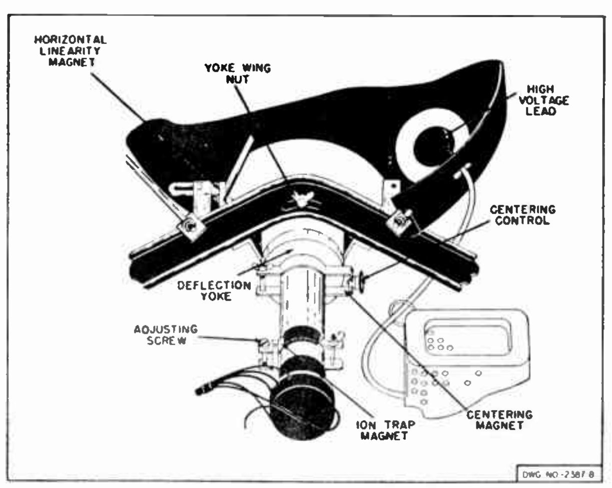

Figure 3A. 17-inch Tube Assembly.

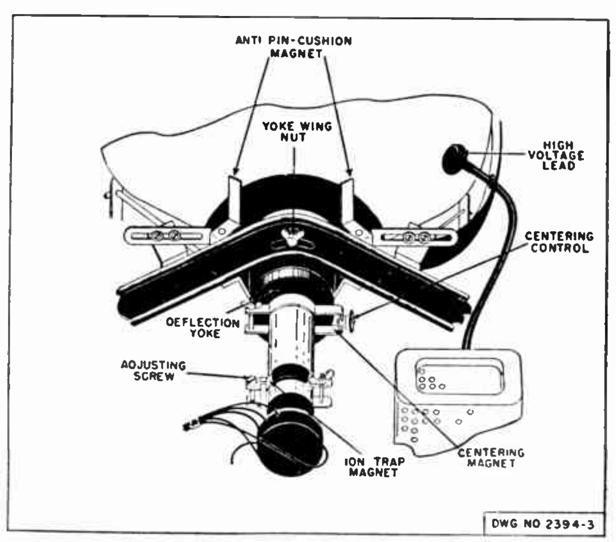

Figure 3B. 21-inch Tube Assembly.

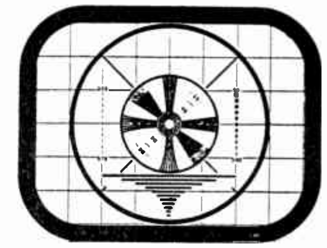
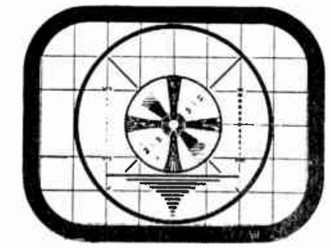
ADJUSTMENT OF PICTURE

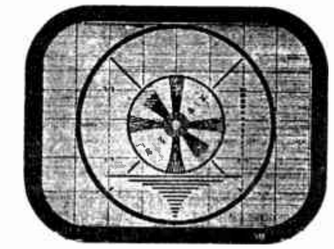
The following pictures illustrate the results of misadjustment of various controls on the receiver and also the effects on the picture of certain conditions external to the set. Underneath each picture is the correction to be made, if one is available. Some of these adjustments should be made only by a serviceman.



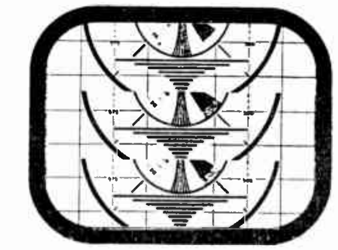
CORRECTLY ADJUSTED—Pattern is clear, steady. Proper contrast between black, white and various shades of gray.



TOO BRIGHT—Adjust brightness and picture controls for proper contrast.

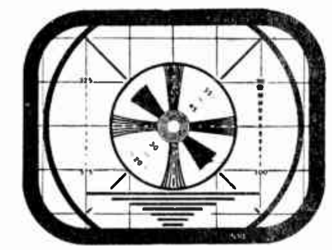


TOO MUCH CONTRAST — Adjust picture and brightness controls for proper contrast.

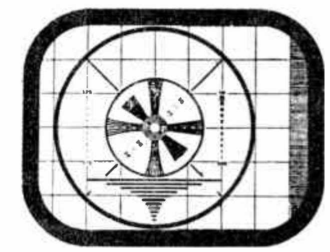


VERTICAL MOVEMENT UP OR DOWN —Adjust V. HOLD control.

TOO SMALL HORIZONTALLY AND VERTICALLY— Adjust both H. SIZE and V. SIZE controls.

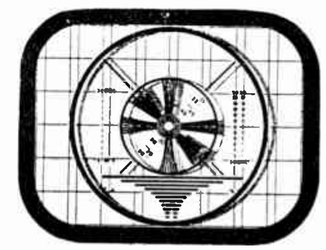


TOO LARGE HORIZONTALLY AND VERTICALLY—Adjust both H. SIZE and V. SIZE controls.

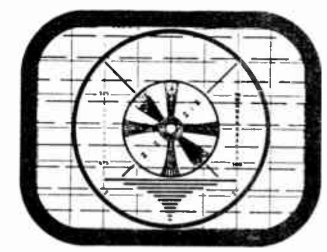


OFF CENTER HORIZONTALLY— Serviceman should adjust CENTERING control.

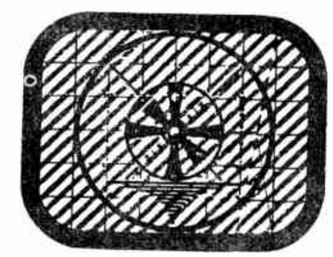
HORIZONTAL MOVEMENT LEFT OR RIGHT—Adjust H. HOLD control



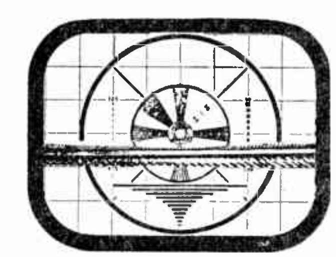
MULTIPLE IMAGES (Ghosts) — Condition can be minimized by proper orientation of antenna.



IGNITION INTERFERENCE—Caused by automobile ignition systems or by electrical motor-driven appliances in vicinity.



R-F INTERFERENCE — Caused by high-powered radio transmitting equipment in vicinity.



DIATHERMY INTERFERENCE—Due to certain electrically operated medical equipment. This herring-bone pattern may move vertically or may remain stationary as shown.

INSTALLATION

POWER SOURCE

The set should be operated from a 115-volt, 60 cycle, AC power source. The power consumption is 230 watts.

LOCATION OF RECEIVER

The set should be so located in the room that no direct light strikes the face of the picture tube. (The surface on which the picture appears is the end of a large, horizontally mounted tube.) However, some indirect illumination in the room is desirable; it is not necessary to darken the room completely for proper viewing of the picture. Due consideration should be given also to the convenience of the electric outlet, and to the position of the receiver which gives the best reception with the built-in antenna.

BUILT-IN VHF TELEVISION ANTENNA

The new Built-in VHF Television Antenna incorporated in your receiver eliminates the need of an outside VHF antenna in most locations. In areas too distant for normal reception with a built-in antenna, provision is made for outside antenna connections. If any other type of antenna is used with the set, disconnect the transmission line from the built-in antenna to the antenna terminals. When connections are made, check to see that the antenna terminal screws are moderately tight.

The antenna is mounted inside the cabinet and is operated by the use of a knob at the top of the back of the cabinet. Since the antenna is fastened to the cabinet, it may be necessary to orient the cabinet to obtain the best reception. It is desirable that either the front or the back of the cabinet face the transmitting station. If however, "ghosts" or multiple images appear, the cabinet may be rotated slightly to minimize this condition. In some cases it may be necessary to face the back or the front of the cabinet toward a window to obtain a television picture. This may be due to walls, water pipes, or a steel structure in your location preventing television reception.

SERVICE ADJUSTMENTS

Vertical Size and Vertical Linearity Controls (R-73 and R-75):

The vertical size and linearity controls should both be adjusted at the same time while a test pattern is being transmitted. The linearity control affects the upper portion of the picture while the size control affects the overall size especially the lower portion of the picture. Adjust both controls simultaneously until the test pattern is symmetrical and fills the entire screen vertically. Readjust the vertical hold control if necessary.

CAUTION:

The vertical linearity control is on the top chassis plate, therefore, severe shock may result from contact. If an isolation transformer is unavailable, use an insulated screwdriver for the adjustment to reduce shock hazards. The adjustment can be made from either the top or bottom of the chassis.

Fringe-Suburban-Local Switch (Figure 2):

The three position switch selects the proper operational characteristics of the receiver for the signal strength area in which located. The position of the switch is governed by the signal strength available.

In the Fringe position the A.G.C. voltage is reduced to a bare minimum and the sync stabilizer adjust control affects the sync clipping level to reduce noise affects.

In the Suburban position full A.G.C. is applied and the sync stabilizer adjust control functions as in the fringe position.

In the Local position full A.G.C. is applied and the sync stabilizer adjust control is disabled.

Sync Stabilizer Adjust Control (R-61):

The control varies the operational characteristics of the sync clipper stage to obtain the optimum operation point for the least effect of noise interrupting synchronization. The control should be adjusted for a steady picture.

Ion Trap Magnet (Figure 3):

The position of the ion trap magnet MUST be over the grid of the picture tube (second cylinder from the base identified by a flared forward lip). If the adjustment is necessary, loosen the wing nut and rotate until the position which gives maximum illumination is found. Adjust the screw for maximum illumination. Repeat the above two steps. Rotate and slide magnet until the best focus position is found. Tighten wing nut. Adjustment should be made with brightness and picture controls set for normal viewing.

Horizontal Size Control (Figure 2):

The horizontal size control should be adjusted until the picture fills the entire screen horizontally. A clockwise rotation will decrease size. To some extent the vertical size control setting may be affected by a major horizontal size adjustment.

Horizontal Hold Control (L-30):

The horizontal hold control is located on the rear flange of the chassis and should be adjusted in the following manner.

Set the picture control to its normal operating position. Turn the thumb screw clockwise until it reaches its stop. Turn two complete turns counter-clockwise. The thumb screw is a vernier adjustment and will then be in the center of its range.

Turn the iron core with a small screwdriver or adjusting tool until the picture is steady (no horizontal movement). Set the core to the middle of its range.

After the iron core has been properly adjusted the thumb screw should then be used as a vernier adjustment to control synchronization when necessary.

Centering Magnet (Figure 3):

The centering magnet should be rotated and the control adjusted until the picture is properly framed keeping in mind that the effect of the control is governed by the position of rotation. If the control is above or below the neck of the picture tube, the picture will be moved up or down. To the left or right of the neck of the picture tube, the picture will be moved either to the left or right.

Deflection Yoke (Figure 3):

The correct position for the deflection yoke is as far forward on the neck of the picture tube as the shape of the tube will allow. Tube shadow or a tilted raster may result from an incorrectly positioned yoke. If a positioning adjustment is necessary, loosen the yoke wing nut located at the top of the picture tube assembly (fig 2).

Horizontal Linearity Magnet - 17" only (Fig. 3A):

The horizontal linearity magnet affects the linearity of the right side of the picture only. The magnet pulls or stretches the right side and has a greater effect closer to the picture tube.

Anti-Pin Cushion Magnet - 21" only (Figure 3B):

Adjust centering until an edge of the raster is visible. Loosen the positioning screws and slide the magnet backward or forward until the edge of the raster is vertically straight. If keystoning is noticed adjust magnets in vertical plane.

SERVICE DATA

20	6BK7	UHF Pre-IF Amplifier

Picture Tube Handling:

Due to the large surface and extreme high vacuum of the picture tube, care should be used when handling the chassis outside the cabinet. Do not subject the tube to excessive pressure of rough handling as an implosion may result causing serious personal injury.

High Voltage Power Supply:

In the process of inspection, repairs, changing of tubes or transformers, or for any other reason where it is necessary to work within the high voltage power supply, the following should be closely observed.

1. Terminals on the 1X2A socket must be dressed toward the inside of the corona ring and be free of sharp protrusions.
2. The corona ring must be dressed in such a way as to make its presence useful; that is, properly centered and about 1/8-inch below the socket terminals.
3. All leads must be dressed as far away as possible from the transformer winding. Excess lead length should be transferred to the top side of the chassis.

When replacement of the H.V. deflection transformer is necessary, be sure to closely follow the precautions listed above. The transformer can easily be replaced with the chassis in the cabinet by the following procedure.

1. Remove two (2) hex head screws on either side of the H. Size control.
2. Disengage the H.V. lead holder ring. (back side of shield can)
3. Remove 25BQ6 plate cap.
4. Remove shield can by pushing back side of shield can toward front and lifting up.

WARNING:

High voltage on the plate caps of the 1X2A high voltage rectifier and the 25BQ6 horizontal pulse amplifier. DO NOT MEASURE this voltage.

Schematic Diagram:

The schematic diagram located at the rear of this manual shows all the values of resistance and capacitance and gives all the proper voltages at the pins of the tube sockets. The voltage readings were taken with a 20,000 ohm/volt voltmeter with normal operation, no signal input, and line voltage at 115 volts A.C.

Replacing Tubes

Before replacing the tubes the cabinet back must first be removed. Removing the cabinet back disengages the safety interlock and removes the power to the receiver. Do not tamper with or attempt to defeat the purpose of the safety interlock as severe shock may result.

Before replacing the High Voltage tubes first be sure the power is turned off and then short the corona ring of the 1X2A to the chassis.

WARNING:

Do not remove any tubes while the receiver is in operation as over-loading and component failures may result. Also contact with the top chassis plate during operation may produce a severe shock.

If the receiver has been in operation for some time, the tubes become hot and gloves should be used when replacing tubes to prevent finger burns.

L32	72	25BQ6 plate to term 1	25.5
L33	8.5	term 7 to term 8	2.6
L34	2.3	term 7 to term 10	5.4
T3 pri.	4.7	T9 pri.	7

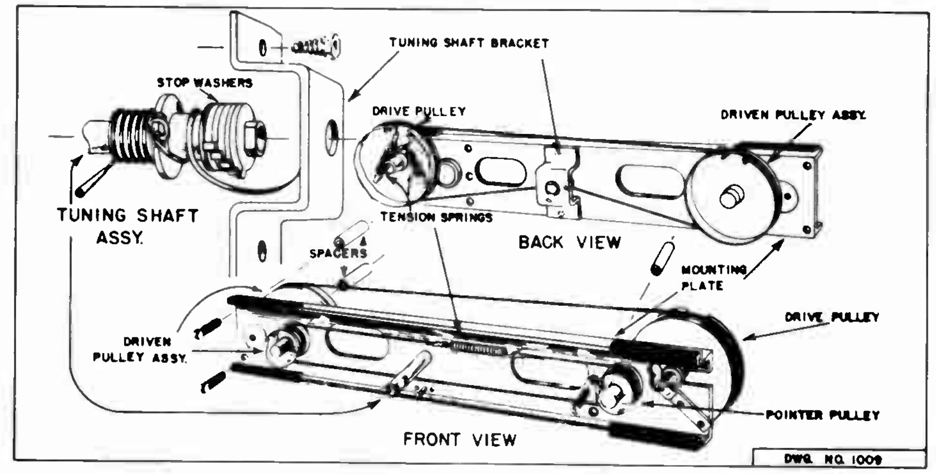
WARNING

Before the chassis can be removed from the cabinet, the escutcheon, on-off-volume and tuning knobs must be removed. Pull knobs straight out and remove the two outside escutcheon screws and escutcheon.

REMOVABLE SAFETY GLASS

To clean the inside of the safety glass or the face of the picture tube, simply follow the procedure below.

1. Remove the three (3) phillips head screws in the safety glass holder directly above the escutcheon.
2. Remove the safety glass holder.
3. Carefully remove the safety glass by pulling out and down from the bottom.



DIAL CORD REPLACEMENT

DIAL CORD STRINGING: Two separate dial cords are used and can be restrung separately if replacement is necessary.

POINTER PULLEY STRINGING: Follow the above diagram (front view) and start by attaching the dial cord to the tension spring, route to pointer pulley and make 2½ clockwise turns around pulley. Route under tuning shaft to small pulley of driven pulley assembly, make 2½ clockwise turns around pulley and connect to other end of tension spring. Tension spring must be in location shown when tuning shaft is rotated to extreme clockwise position.

MECHANICAL TRACKING: If for any reason the stop washers do not correspond to the stop position of the tuner, loosen the two(2) drive pulley allen head set screws and reposition. Turn both the tuning shaft and tuner shaft to the extreme counter-clockwise position. Turn tuning shaft only 1/6 turn clockwise. Tighten allen head set screws.

POINTER POSITIONING: If when a station is properly tuned in and the pointer is off calibration, reposition the pointers as follows.

1. Remove the on-off volume and tuning knobs. (pull straight out)
2. Remove two outside escutcheon screws and escutcheon
3. Remove pointer indicator and reposition.

DRIVE PULLEY STRINGING: Drive pulley restringing requires removal of the mounting plate assembly. To remove the mounting plate assembly follow the simple instructions below.

1. Remove two (2) star knobs
2. Remove two (2) pilot light shields and pilot light bulbs.
3. Loosen two (2) drive pulley allen head set screws.
4. Remove three (3) space screws
5. Pulley assembly straight out.

To restring the drive pulley turn the tuning shaft completely counter-clockwise. Follow the above diagram (back view) and start by attaching the dial cord to the tension spring shown at the extreme left on the drive pulley. Route the cord through the opening in the pulley and make a 1/2 counter-clockwise turn around the pulley and route under the tuning shaft. Make 5 1/2 counter-clockwise turn around tuning shaft between mounting plate and lugged washer. Then make one counter-clockwise turn around lug on washer and continue in the counter-clockwise direction and make 1 1/2 turn around the tuning shaft between the lugged washer. Route to the large driven pulley and make 1 1/2 turn around the pulley and route to the drive pulley. Make 2 complete counter-clockwise turns around the pulley and route through the opening and attach to the tension spring. Add second tension spring as shown.

Replace mounting plate assembly and follow directions for mechanical tracking.

TROUBLE-SHOOTING

Trouble	Probable Location
No Raster No Sound	1. Defective tubes 11-13-16. 2. Defective selenium rectifier. 3. Defective resistors R52-82-101. 4. Defective capacitors C70-72-74-90-91. 5. Defective transformer T9 or choke L32. 6. Defective safety interlock or on-off switch.
No Raster Sound Normal	1. Insufficient or no high voltage, (refer to "No High Voltage" section). 2. Defective picture tube. 3. Second anode lead disconnected. 4. Ion trap magnet misadjusted. 5. Defective C.R.T. socket.
No High Voltage	1. Defective tubes 15-16-17-18. 2. Defective transformer T8, yoke T7 or coil L30-31. 3. Defective capacitor C105-106-107-108-110-111-112. 4. Defective resistor R92-96-97-98-99-100.
No Picture No Sound Raster Normal	1. Defective antenna or lead-in. 2. Defective tuner tube 1-2. 3. Defective tuner (refer to page 14). 4. Defective tubes 3-4-5-6. 5. Improper voltages or resistances at sockets of tubes 3-4-5-6. 6. Improper alignment. 7. Defective crystal detector. 8. UHF power plug not in place.
No Sound Picture Normal	1. Defective tubes 8-9-10-11. 2. Improper voltages or resistances at socket of tube 8-9-10-11. 3. Defective speaker or leads broken or not in place. 4. Defective transformer T3-4 or coil L29. 5. Improper sound alignment.

Trouble	Probable Location
No Sync	1. Defective tube 12. 2. Improper voltages or resistances at socket of tube 12. 3. Defective F-S-L switch or in wrong position. 4. Sync stabilizer adjust control misadjusted.
Insufficient or no Vertical Sweep	1. Defective tube 13. 2. Defective transformer T5-6 or yoke T7. 3. Defective capacitor C70-85-86-87. 4. Defective resistor R68-73-74-75-76-77.
Picture Cannot be Centered	1. Defective picture tube. 2. Defective centering magnet. 3. Defective ion trap magnet.
Poor Focus	1. Improper adjustment of Ion trap. 2. Defective picture tube.
Poor Horizontal Linearity	1. Improper adjustment of linearity magnet (17") or anti-pin cushion magnets (21"). 2. Defective tube 16-17. 3. Defective capacitor C105-106-111. 4. Defective transformer T8 or coil L31.
Snow or Poor Picture	1. Insufficient signal input. 2. Defective antenna or lead-in. 3. Improper alignment of C1-A-B. 4. Weak tubes 1-2-3-4-5. 5. Improper video IF alignment.
Lack of Contrast	1. Defective tube 6. 2. Defective crystal detector. 3. Improper video IF alignment.
Washed Out or Picture Smear	1. F-S-L switch in wrong position. 2. Defective crystal detector. 3. Gassy tube 1-3-4. 4. Improper video IF alignment.

WAVE FORM ANALYSIS

The drawings on this page illustrate the wave forms at various positions within the receiver. The wave forms are not theoretical but exact copies of that shown by an oscilloscope and were taken under normal operating conditions, with a transmitted signal and the picture in sync at all times.

When checking the wave forms, connect the ground lead from the oscilloscope to the top chassis plate and the hot lead to the position indicated. The wave shapes may vary somewhat depending on the strength of the signal, the picture information being transmitted and the adjustments of the various controls.

Under each wave form is the schematic reference, position taken at, peak-to-peak voltage and the type of wave form indicated (Vertical -60 cycles and Horizontal -15,750 cycles).

GENERAL DESCRIPTION

VHF Tuner:

The Tuner is composed of a separate sub-chassis consisting of a 6BK7 (twin triode) cascode RF Amplifier and a 12AT7 tube (twin triode) for the oscillator and converter. Separate high and low band coils and trimmers are used with an automatic switching device to change bands. The tuner selects and amplifies the stations signal and converts it to the carrier IF frequency of 26.75 MC for video and 22.25 MC for sound which in turn is then fed to the IF amplifiers for further amplification.

Video IF Amplifier:

The Video IF Amplifiers are mounted on a separate sub-chassis along with a crystal video detector and the A.G.C. network. The IF amplifier section consists of three (3) staggered tuned stages with an over coupled output IF transformer using 6CB6 (pentode) tubes with self resonant core tuned coils. Since the receiver is of the intercarrier type both the video and sound IF frequencies are amplified simultaneously and then detected by a Raytheon CK-706 crystal. The signal is then coupled to the video amplifier and the first grid of the sync clipper. The A.G.C. network of R-59 and C-78 develops a negative bias voltage proportional to the average composite video signal.

Video Amplifier:

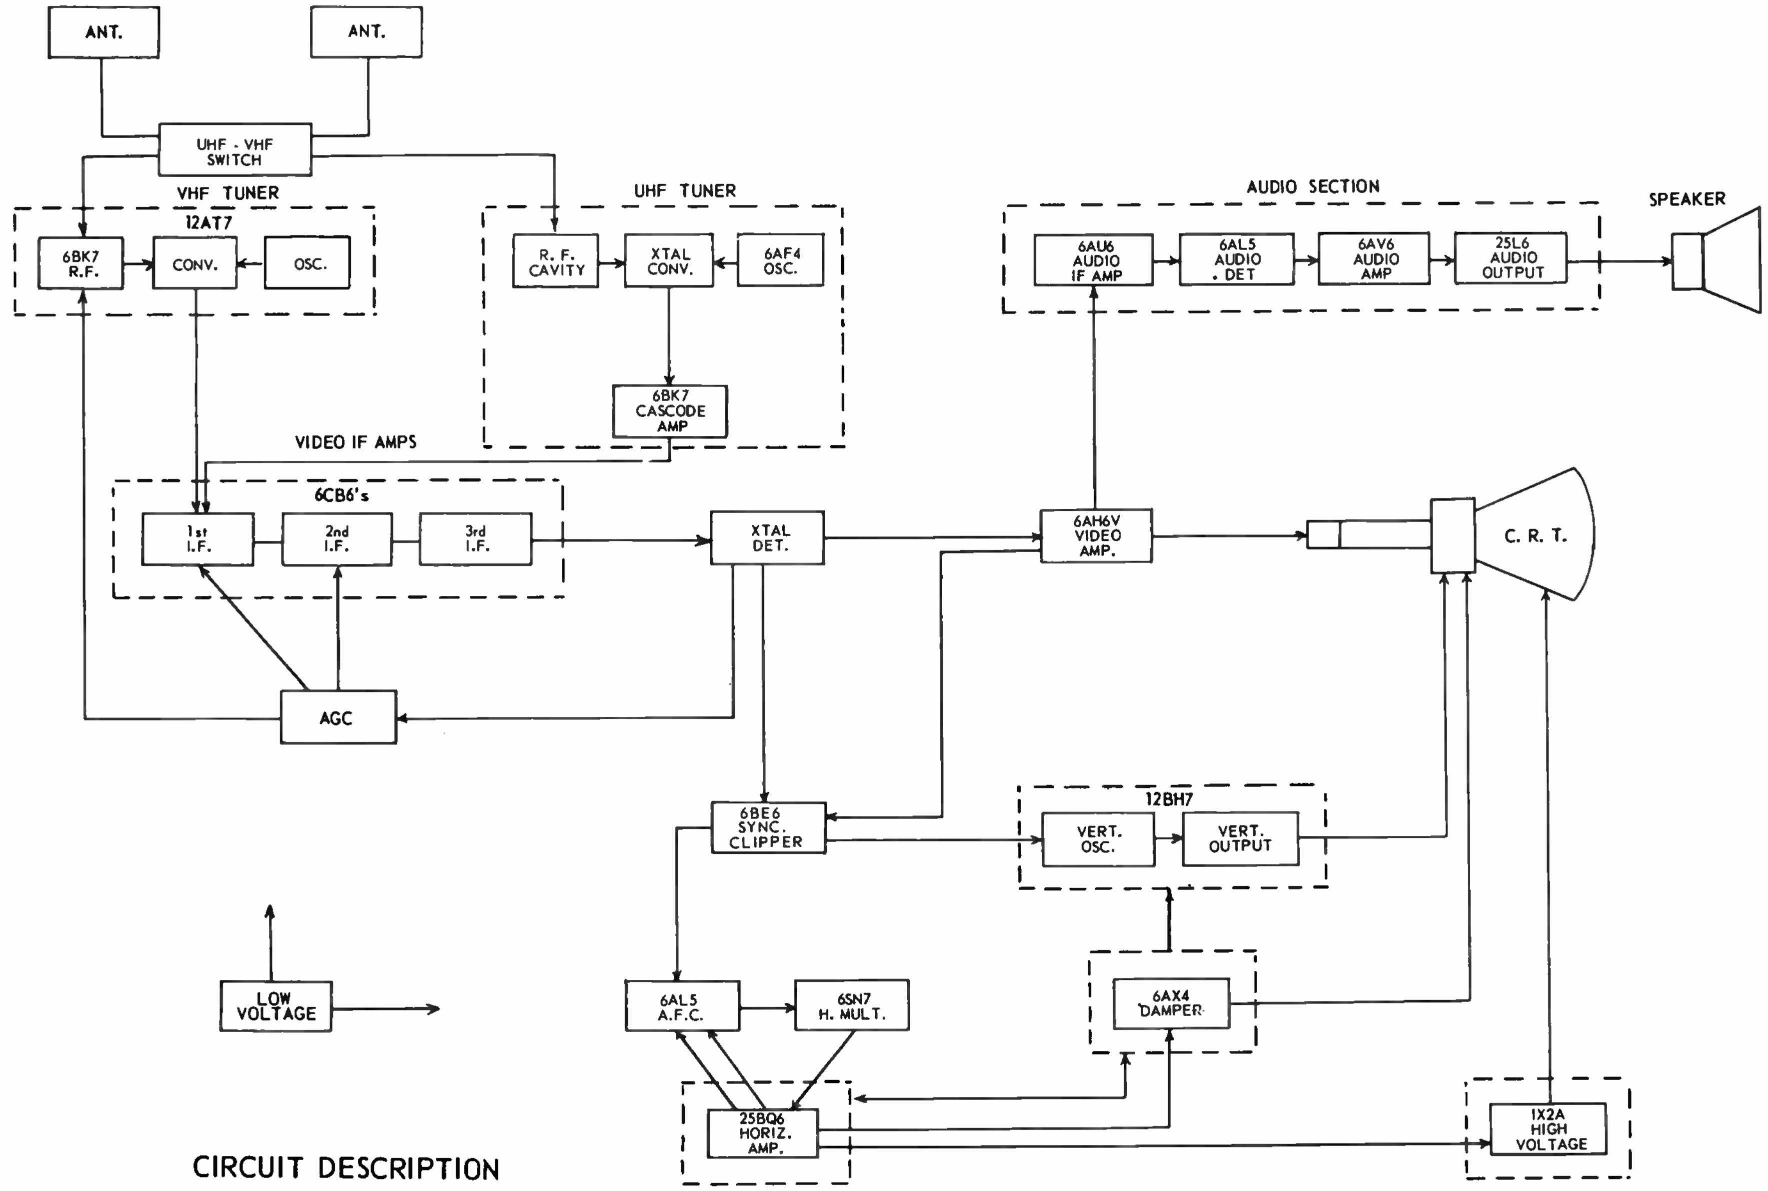
The Video Amplifier section consists of a 6AH6V (pentode) tube with a degenerative picture (or contrast) control (R-33) to vary the signal to the cathode of the picture tube. The audio signal is also amplified in this stage and then separated by a 4.5 MC trap (L-29). This trap also serves to separate or keep the audio from appearing in the picture.

Sound Section:

The Sound Section consists of a 6AU6 (pentode) 4.5 MC audio IF amplifier, 6AL5 (twin diode) ratio detector, 6AV6 (triode) audio amplifier and a 25L6 (beam power amplifier) output tube. Due to the hetrodyne action between the video and sound IF frequencies at the video detector a 4.5 MC signal is obtained containing the audio information. After the video detector the audio information is amplified by the video amplifier, separated from the video by the trap (L-29), amplified, detected and further amplified before being coupled to the speaker.

Sync Clipper:

The Sync Clipper stage utilizes a 6BE6 (heptode) tube which functions as a sync separator and noise clipper. The signal from the output of the video amplifier is coupled to pin 7 through R-34 and C-77. With the positive going signal at pin 7 and the low plate voltage sync separation is accomplished. When noise bursts are present the negative going signal from the video detector, coupled through R-58 to pin 1, cuts the tube off and eliminates false sync information in the output. A sync stabilizer adjust control (R-61) is provided to adjust the cut-off or clipping level by varying the bias voltage to pin number 1. A three position F-S-L switch is also provided to change the operational characteristics of the receiver for various signal level areas. The switch disconnects the control (R-61) from the circuit and applies a fixed bias voltage only in the "local" position. In the "fringe" position the A.G.C. source is connected to 240 volt B plus through 10 megohms of resistance (R-56, R-60). No bias voltage to the RF and IF tubes is utilized in this position allowing maximum amplification. In the "suburban" and "local" positions, full A.G.C. is applied. Sync pulses are separated from the video signal without the noise effects and then coupled to the vertical blocking oscillator cathode and horizontal A.F.C.



CIRCUIT DESCRIPTION

Vertical Deflection:

The Vertical Deflection section consists of a 12SN7 (twin triode) tube, one-half being used as a blocking oscillator and the other half as an output amplifier. The signal from the sync clipper is coupled through R-67 and C-81 to the cathode of the blocking oscillator. The vertical hold control (R-69) in the grid circuit varies the oscillator operating frequency, thus providing adjustment for synchronization. The vertical size control (R-73) varies the amplitude of the pulse to the grid of the amplifier and controls the amount of vertical deflection. The vertical linearity control (R-75) varies the cathode resistance, thus adjusting the operating characteristics of the amplifier to provide the proper wave shape to obtain a linear picture vertically. The network of C-84, C-85 and R-70, R-71 is designed to eliminate vertical retrace lines at high brightness levels.

AFC Discriminator:

The Automatic Frequency Control section utilizes a 6AL5 (twin diode) tube which functions as a discriminator. The horizontal sync pulses from the output of the sync clipper are coupled to the plate of the AFC tube through capacitor C-79. At the same time two feed back voltages of opposite polarity are intergrated and applied to the plates of the AFC tube. The two feed back voltages are obtained from a separate winding (terminals 7 and 10) of the H V deflection transformer and are of the same frequency as the horizontal multivibrator. Any phase shift between the horizontal sync pulses and the horizontal multivibrator signal will cause one diode section to conduct more than that of the other. This will result in a DC bias voltage applied to the grid of the multivibrator and change the operating frequency. The output of the AFC discriminator thus synchronizes the horizontal multivibrator to the incoming horizontal sync pulse.

Horizontal Multivibrator:

The Horizontal Multivibrator uses a 6SN7 (twin triode) tube and is of the conventional cathode coupled type. The core tuned parallel resonant circuit (L-30 and C-97) is used as a hold adjustment to stabilize the frequency of oscillation. Because of the wide pull-in range of the automatic frequency control tube a fine hold control is not necessary. The output signal of the multivibrator is coupled to the horizontal pulse amplifier through capacitor C-106. Capacitor C-107 is a negative peaking device to aid in cutting off the pulse amplifier tube at the proper time.

Horizontal Pulse Amplifier:

The Horizontal Pulse Amplifier utilizes a 25BQ6 (beam pentode) tube to develop the necessary power for the fly back pulse and the horizontal winding of the deflection yoke.

CIRCUIT DESCRIPTION

Damper:

The Damper tube (6AX4-diode) performs three functions: aids in horizontal scanning, suppresses oscillations which occur over part of the horizontal scanning cycle and gives an increase in plate supply voltage for the vertical blocking oscillator, vertical output amplifier and first anode of the picture tube.

Hi-Voltage Supply:

The High Voltage (second anode) is obtained from the auto-transformer type primary winding of the HV deflection transformer (T-8). When the plate current of the H pulse amplifier tube is cut off, the field built up in the primary winding collapses and induces a high voltage surge which is rectified by the 1X2A tube, filtered by the capacity of the aquadag coating of the picture tube and applied to the second anode. The 1X2A is a conventional half-wave high voltage rectifier and obtains its filament power from a separate secondary winding of the HV deflection transformer.

Low Voltage Supply:

The B plus voltage for the receiver is obtained from the voltage doubler arrangement of two selenium rectifiers and filter capacitors C-90 and C-91. The majority of the receivers tubes obtain its filament power from the filament transformer (T-9), however, three tubes are connected in series with resistor R-101 and placed across the 115 volt AC line. A safety interlock is provided to reduce shock hazards and a resistor type fuse is connected in series to protect the receiver in case of overloading.

SERVICE HINTS

V.H.F. Tuner:

Before looking into the tuner for a particular trouble, first make the following observations. Since the receiver is of the inter-carrier type both the sound and video information are amplified simultaneously by the tuner, IF and video amplifiers. Therefore, if the sound section is functioning normally it can be assumed that there are no defects in the tuner, IF or video amplifiers. If the receiver is "dead" (no sound or picture - raster normal) first determine whether a signal is being transmitted and then check the antenna, lead-in and connections to the receiver. Next, rotate the contrast or picture control completely to the left (counter-clockwise) and observe the face of the picture tube. Advance the control to the extreme clockwise position and again observe the face of the picture tube. If no "snow" appears check the video amplifier, detector and second and third IF amplifiers. If, however, an increase of "snow" appears check the first IF amplifier before looking into the tuner.

The tuner can easily be serviced by removing the three hex-head nuts on top and the one on the bottom which holds bottom cover in place. Removing the bottom cover makes all the tuner components within easy reach and all parts can be serviced. When working inside the tuner do not move any component a great distance as a change in the distributed capacity may result and offset the alignment. When replacing components be sure to obtain the same lead length and replace them in the same position.

A majority of tuner troubles are often open and high resistance ground or coil solder connections, defective trimmers or coils and defective switch contacts.

Open or high resistance connections can easily be repaired by placing a hot soldering iron at the solder connection.

Defective switch contacts may cause an intermittent condition or the loss of one or both bands. Contact replacement is easily accomplished by removing the two switch plate tension springs, the hex-head bolt and the switch plate bracket. Lift up the switch plate assembly and remove the switch contact holder and replace contacts (see page 17.

A. G. C.

The A.G.C. is a negative bias voltage proportional to the average composite video signal, developed by the network of R-59 and C-78 and applied to the RF and first and second IF amplifiers. The magnitude of the A.G.C. voltage will vary according to the strength of the signal being received. However, it will closely correspond to the detector output voltage (across R-27). As a fast and simple check to determine whether the A.G.C. voltage is normal, measure both the A.G.C. and detector output voltage. Under normal operating conditions these two voltages will be approximately the same.

Sync Stability:

For optimum sync stability the following points should be considered. A three position F-S-L switch and a sync stabilizer adjust control are provided along with the two hold controls. The position of the switch is governed by the strength of the signal being received and the control should be adjusted for a steady picture. The position of the switch and the adjustment of the control are important for good sync stability (control will not function in "local" switch position).

For good horizontal sync stability both the horizontal hold thumb screw and coil core should be set to the center of their respective ranges. (Center position before going out of sync in either direction).

For good vertical sync stability the vertical hold control can be adjusted to reduce the effect of noise that may interrupt synchronization in reception areas where noise conditions exist. Rotate the vertical hold control until the picture is moving upward and just locks into place. At this control setting, the noise will have the least tendency to interrupt vertical synchronization.

Vertical Distribution:

A fast and simple method to check the vertical distribution of a TV picture, without a test pattern, rotate the vertical hold control until the picture is moving slowly downward. Observe the black horizontal bar. If the vertical size and linearity controls are properly adjusted, the bar will not change in thickness as it moves from top to bottom.

VIDEO IF ALIGNMENT

Step No.	Signal Generator Freq. (mc.)	Sweep Generator Freq. (mc.)	Signal Input Point	Output Point	Remarks	Adjust	Response

NOTE: L-29 coil should only be adjusted as prescribed. Do not adjust for maximum sound.

PRE-ALIGNMENT PRECAUTIONS

1. If sweep generator does not have a balanced output, connect a 150 ohm resistor in series with the ground lead and 150 ohms minus the internal resistance of the generator in series with the hot lead.
2. Connect a 1000 mmf capacitor across scope terminals and a 10K ohm resistor in series with hot scope lead as close to test point as possible.
3. Connect signal generator through a 1000 mmf capacitor.
4. Set F-S-L switch to "Fringe" position.
5. When aligning the IF Amplifier be sure tuner is turned to high band channel 13.

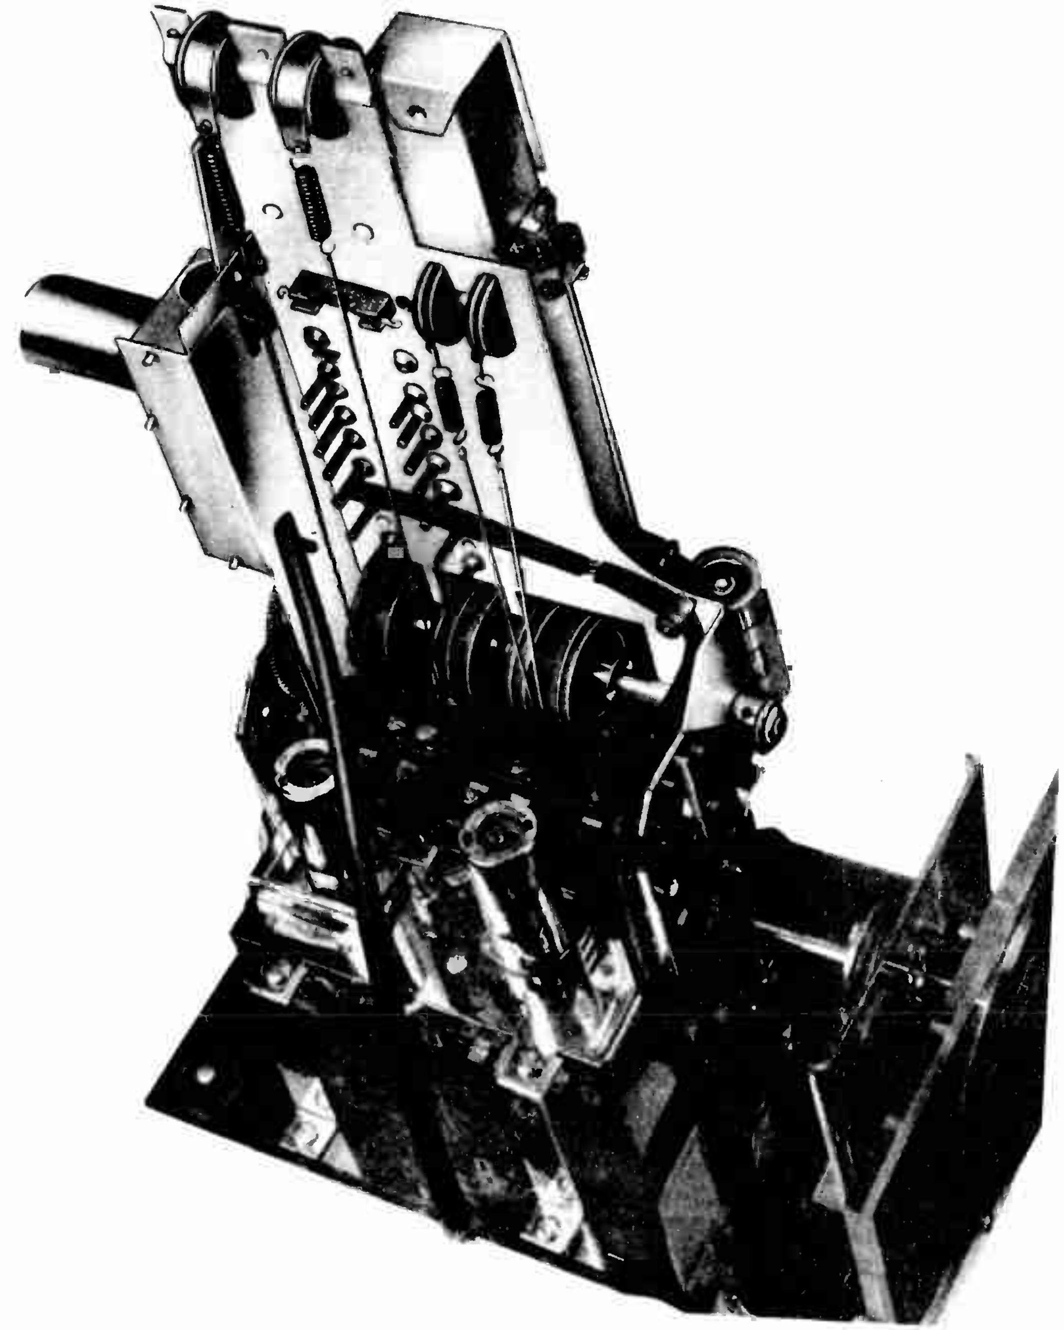
UHF TUNER SERVICE MANUAL



GENERAL DESCRIPTION

The UHF Tuner is a single conversion, continuous tuning device which mechanically mounts directly over the VHF tuner in the receiver. The tuner is coupled to the VHF tuner by drive gears which thus provides tuning of both UHF and VHF by the same tuning knob. The tuner obtains its filament and plate supply voltages from the TV chassis and a switch is provided to select the desired tuner for operation. Signal points and filament leads are not switched.

Two variations of UHF tuners may be encountered. Only minor differences exist as can be seen by referring to figures 3 (early version) and 4 (later version). The later version tuner can easily be identified by the terminal strip below resistor R-2. (see figure 5).

The UHF Tuner selects the UHF stations video and sound carrier and converts them to the carrier IF frequency of 26.75 MC for video and 22.25 MC for sound which is coupled to the IF amplifiers in the receiver by 10 inches of RG-62U cable.

CIRCUIT DESCRIPTION

The UHF Tuner employs a double coaxial line RF cavity pre-selector. The coaxial line arrangement has the advantages of high selectivity, low insertion losses, uniform band-width and good shielding against oscillator radiation. The coaxial cavity is basically a one-quarter wave shorted tuned stub. The electrical length of the cavities is varied by a ribbon which is attached to the dial cord and pulley arrangement. In this manner tuning is accomplished similar to varying the length of a tuned stub which would change the resonant length for various frequencies. The dial cord is of a special material which is not affected by temperature or moisture and is locked to the pulleys which eliminates the possibility of slippage. Tracking screws are provided in the cavities to obtain uniform band width and sensitivity. The tracking screws vary the capacity between the ribbon and the cavity wall and thus vary the electrical length of the ribbon.

The oscillator tube used is a 6AF4 which is similar to the 6F4. Oscillator tuning is accomplished by a one-quarter wave shorted parallel wire transmission line arrangement. It differs from the RF cavities, in that a shorting bar is used to vary the electrical length of the lines. This method provides very stable operation.

Inductive or link coupling is employed to transfer the signal between stages. The arrangement of link coupling gives maximum selectivity and constant band-width over the entire UHF band. The signal from the output coupling link is mixed and detected by a CK-710 crystal detector and then applied to the tuned input of the cascode Pre-IF amplifier which is tuned to a center frequency of 25 MC and has the features of low noise and broad band-width. The signal is amplified by the cascode amplifier and then coupled to the IF amplifier section in the receiver through 10 inches of RG-62U coaxial cable.

The UHF Tuner maintains a fairly constant antenna input impedance of 300 ohms, has an overall band-width of 6 to 8 megacycles and has an oscillator injection current ratio of approximately 2 to 1. The only amplification of the signal takes place in the cascode amplifier. The signal is not amplified in the RF cavities, therefore, the sensitivity of the receiver on UHF will not quite equal that of VHF. A receiver equipped with a UHF tuner will have an overall UHF sensitivity of approximately 150 microvolts.

Service features of this tuner provides a convenient check point for measuring the oscillator grid current to determine whether the oscillator is functioning. Also provisions have been made for measuring the oscillator injection current to check both the crystal detector and the oscillator. An opening is also provided for coupling to the input grid coil when alignment of the cascode amplifier is necessary.

SCHEMATIC DIAGRAM

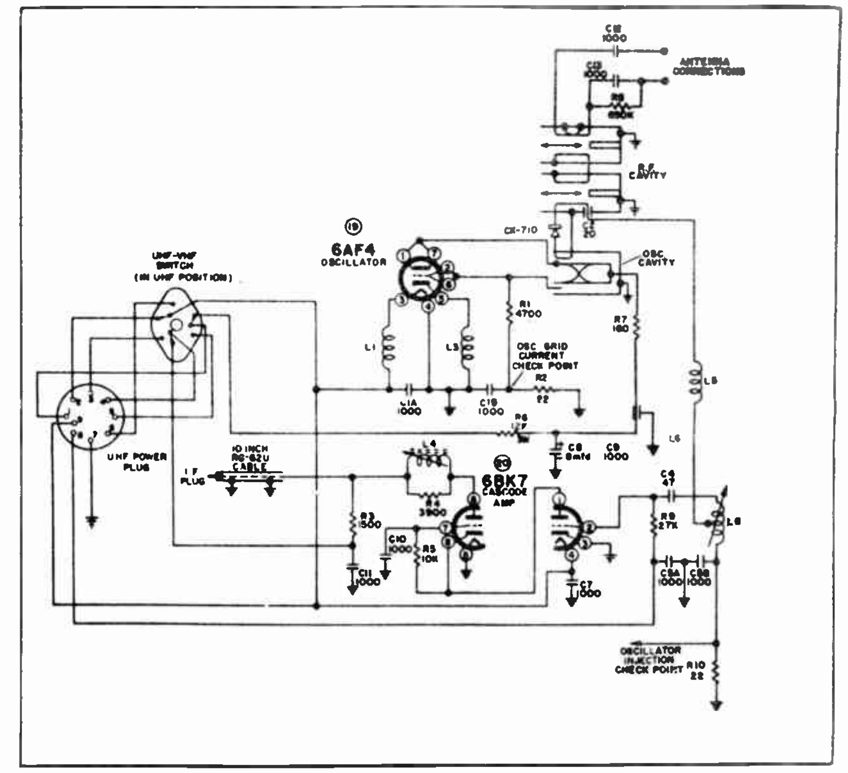


Figure 2 -- Early Version

SERVICE HINTS

If the receiver is "dead" when attempting to view a UHF program, first check the position of the selector switch, then determine whether a signal is being transmitted and then check the antenna and lead-in connections before suspecting the tuner for trouble.

Also as a fast check, view the face of the picture tube at minimum contrast or picture control setting and advance the control to maximum. Compare the difference. If there is little or no difference (no "snow") check the video detector and IF amplifiers. If an increase of "snow" appears at maximum control setting, check the first IF stage before looking to the tuner for a defect.

If the UHF tuner is not functioning properly, first substitute the oscillator (6AF4) and cascode amplifier (6BK7) tubes. Next check the voltages at the UHF power socket or cable connections in the receiver.

If soldering iron servicing, crystal detector or component parts replacement is necessary, the picture tube must be removed. Removing the picture tube makes the majority of the UHF Tuner components within easy reach and most of the parts can be serviced. The tuner should not be removed from the chassis when service is required, also caution must be observed not to lay the chassis on the tuner side. Damage to the UHF Tuner may result.

CAUTION: When attempting to service the Tuner, do not move or rearrange components or mechanical parts as a change in distributed capacity may result and offset the alignment. When replacing a component, be sure to obtain the same lead lengths and replace in the same physical position.

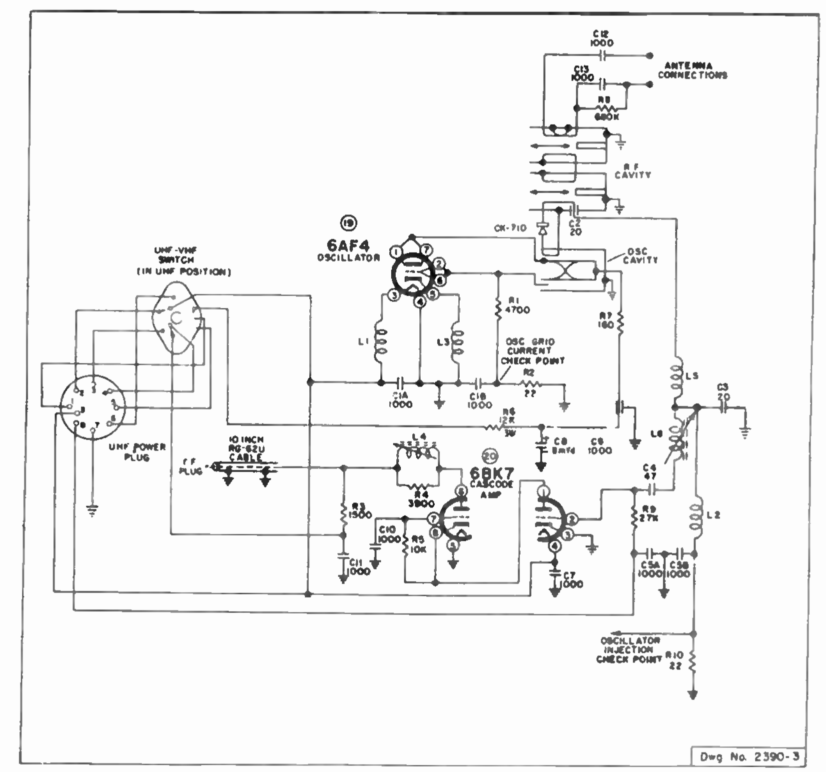

Figure 3 -- Later Version

SERVICE DATA

To determine whether the oscillator section is functioning, a convenient check point has been provided where the oscillator grid current can be measured. To measure the oscillator grid current, place a Simpson Model 260 Multimeter (or equivalent) on the 100 microamp scale across the 22-ohm resistor (R2). See figure 4. A reading of 10 to 30 microamperes should be obtained if the oscillator is functioning normally.

Both the oscillator and crystal detector can easily be checked by measuring the oscillator injection current. Place a Simpson Model 260 Multimeter (or equivalent) on the 100 microamp scale across the 22 ohm resistor (R 10) at the terminal indicated in Figure 5A or 5B depending on the version of the tuner. A reading of 5 to 40 microamperes should be obtained if both the oscillator and crystal are functioning normally.

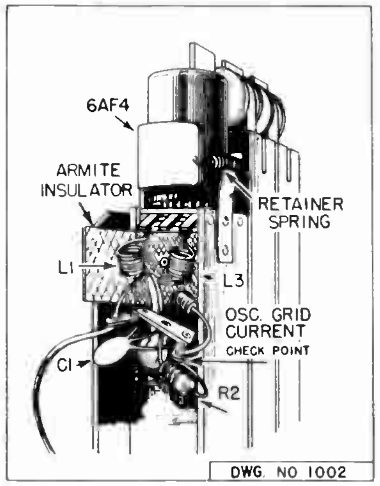

Figure 4

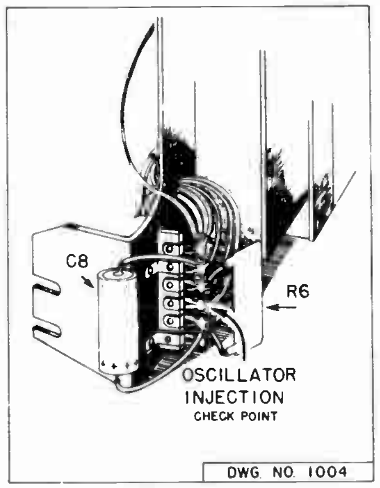

Figure 5A
Early Version

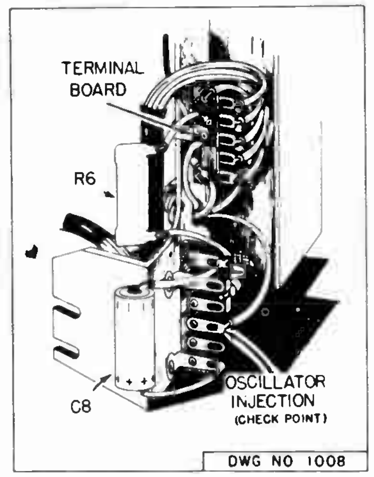

Figure 5B
Later Version

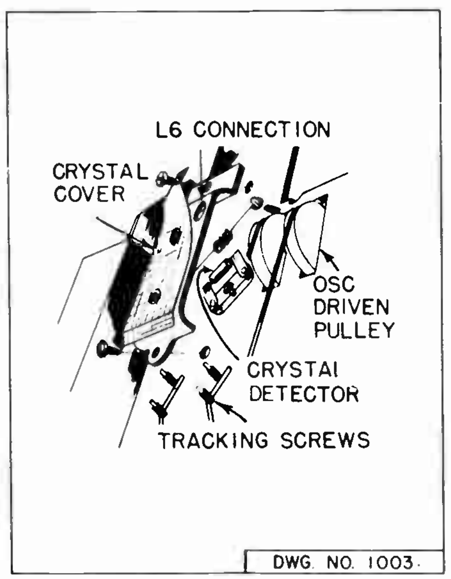

Figure 6

CRYSTAL DETECTOR: If replacement of the CK-710 Crystal Detector is necessary, the picture tube must be removed along with the crystal cover (refer to figure 6). The crystal is soldered into place and should be carefully resoldered after replacement. Overheating may damage the crystal. To dissipate the heat, grasp each crystal lead with a pliers when soldering into place.

ALIGNMENT

Since UHF is a relatively new field, test equipment necessary for RF and Oscillator Alignment is highly expensive and not readily available on the market at the present time. Therefore, a complete alignment procedure is not presented in this manual.

The cascode Pre-IF Amplifier can easily be realigned if necessary by connecting a 25 MC unmodulated signal to the center tap of L6 (see figure 7) or to the junction of Coil L-5 and Capacitor C-2 (see figure 6), depending on the version of the tuner and a VTVM at the video IF Detector output of the receiver. Connect generator through a 1 mmf capacitor. Adjust both L4 and L6 for maximum VTVM reading.

If for any reason such as dial cord replacement, component replacement, etc., the RF cavities may be adjusted for peak performance. Before attempting adjustment, note position of ribbons and mark the UHF drive gear so that original positions can be relocated if necessary. Loosen the pulley positioning screw (refer to figure 8) and rotate tate the pulleys for the sharpest and clearest picture.

CAUTION: Do not under any circumstances attempt adjustment of the tracking screws, oscillator trimmer screw or oscillator cavity. Precision test equipment is necessary for the adjustment.

NOTE: The UHF oscillator frequency listed is only for those UHF tuners which employ single conversion and a low frequency video IF strip. (25MC) Below is a simple formula for determining the particular frequencies for any UHF channel.

Fl — (N-14) 6 + 470 MC
Fh -- Fl + 6 MC
Pc -- Fl + 1.25 MC
Sc -- Fl + 4.5 MC
O — Fl + 28 MC

N — UHF Channel number
Fl -- UHF Channel low frequency end
Fh — UHF Channel high frequency end
Pc -- UHF Picture Carrier frequency
Sc — UHF Sound carrier frequency
O -- UHF Oscillator frequency

Chokes, Transformers and Coils

Ref. No.	Part No.	Description
T1 (Incl. T1A, T1B, C1, C2A, C2B, C3 and R1)	201-21192	Antenna transformer assembly
T1A	13E-20767	H.B. Antenna transformer (incl. with T1)
T1B	13E-21189	L.B. Antenna transformer (incl. with T1)
L1	13M-20781	Cascode plate-to-cathode coil
L2	13M-20780	Cascode cathode-to-grid coil
L3	13E-17140	H.B. R.F. primary coil
L4	16A-20777	Filament choke
L5	13E-12046	L.B. R.F. primary coil
L6	16A-17128	R.F. choke
L7	13E-17140	H.B. R.F. secondary coil
L8	13E-12046	L.B. R.F. secondary coil
L10	13E-17140	H.B. oscillator coil
L11	13D-12155	L.B. oscillator coil

Miscellaneous

Ref. No.	Part No.	Description
	200-20772	T1 shield assembly
	201-20766	Coil alignment strip
	200-20779	Switch lever assembly
	2D-20893	Switch lever bracket
	200-18824	Rear cam
	200-21193	Shaft and front cam
	200-20881	Bottom cover
	201-20769	Capacitor plate assembly (included C5-8-16-30-32)
	49A-20763	Hair-pin spring (for trimmer)
	5M-18807	Treadle bar
	2M-16276	Core mounting clip
	43A2-5444	Hex nut, 2-56x3/16"
	51A-15713	Iron core (white) for L-10
	51A-17162	Iron core (brown) for L3-7
	51A-21200	Iron core (pink) for L-11
	51A-15715	Iron core (blue) for L-5
	51A-17161	Iron core (orange) for L-8
	2C-21099-1	Front end plate
	2C-18805-1	Rear end plate
	49A-18799	Link spring
	2M-18800	Front link
	2M-21278	Rear link
	2M-19150	Flat spring
	2B-19323	Tube shield (12AT7)
	2B-20864	Tube shield (6BK7)
	2J-16310	Sliding switch contact
	5F-16311	Switch contact holder

Power Consumption	200 Watts
Power Output	2.4 Watts (Max.) 1.8 Watts (10% Distortion)
Tuning Range	12 Channel
Antenna Input Imp.	300 Ohms balanced
Intermediate Frequencies	Picture 26.20 MC Sound 21.70 MC
Intercarrier Sound System	4.5 MC
Loud Speaker	8" PM Dynamic
Voice Coil Imp.	3.2 Ohms 400 Cycles

RECEIVER LOCATION -- Advise the owner as to the proper location for the television receiver. The following may be used as a guide.

1. Choose an area in the home where sunlight or light from lamps does not strike the face of the picture tube and cause glare.

2. Remember the necessity of an electrical outlet and the location of the point at which the antenna leads enter the room.

3. The receiver should be placed a short distance from the wall to allow adequate ventilation.

4. The receiver should be placed to permit easy access for all operation and comfortable viewing from all angles.

ANTENNA -- This receiver has been designed to use an antenna with a 300 ohm balanced transmission line. This line must be as short as possible because the longer the line the greater the chances are for picking up electrical disturbances. Stand-off insulation should be used to keep the line away from the mast, metal or walls. Twist this line about one turn per foot throughout the line to cancel out direct signal and/or noise pickup by the transmission line. It should also be securely anchored in place so that a change in weather will not affect its position.

HIGH VOLTAGE WARNING

This television receiver contains high voltages which are dangerous to life. Never operate or service the receiver outside of the cabinet or with the covers removed until all the safety precautions necessary for working with high voltage equipment have been observed.

PICTURE TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves must be worn by individuals while handling the picture tube or installing the picture tube into the receiver.

The picture tube encloses a high vacuum and due to the large surface area, is subjected to very high air pressure. Therefore, care should be taken not to bump or scratch the picture tube accidentally as it may cause the tube to implode resulting in damage to property or injury to an individual.

TUNING PROCEDURE

1. To turn the television receiver on, turn the OFF-ON VOLUME control clockwise until a click is heard. Allow approximately 30 seconds for the tubes to warm up.

2. Turn the STATION SELECTOR control to the desired channel. This control may be turned in either direction.

3. Turn the CONTRAST control clockwise until activity or definite form is noted on the screen.

4. Adjust the FINE TUNING control for clearest picture and the VOLUME control for desired volume.

5. To turn off the receiver, turn the OFF-ON VOLUME control counterclockwise until a click is heard.

6. TONE CONTROL -- When this control is turned clockwise, the high notes will predominate and when turned counterclockwise, a deep bass effect will result.

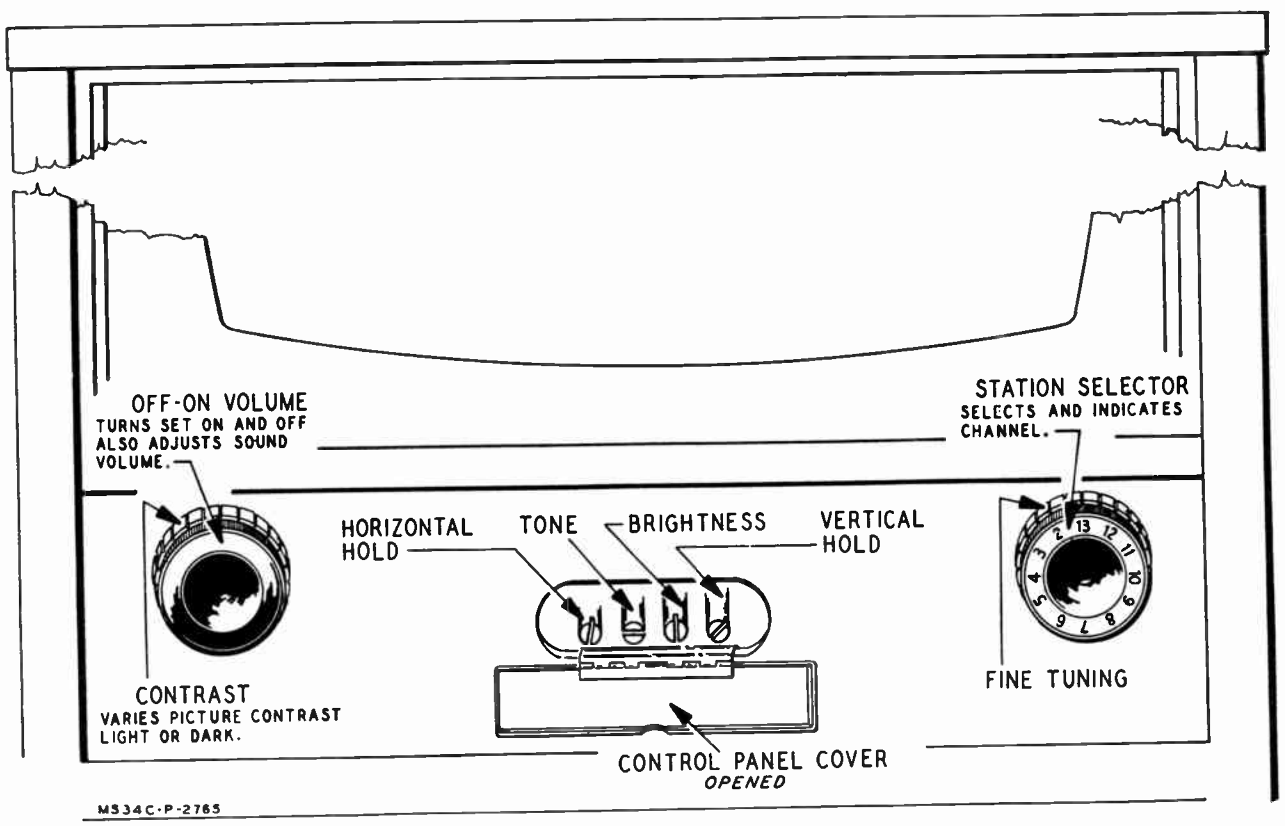

Fig. 2. Front Panel Controls

OCCASIONAL ADJUSTMENTS TO IMPROVE PICTURE RECEPTION

There are four controls at the front of the chassis which are accessible when the hinged control panel is pulled downward. See illustration. These controls are pre-set at the factory and may occasionally need adjustment due to aging of the components in the receiver and the fluctuating line voltages in different areas.

If any adjustments are necessary follow the instructions under "Controls and Functions."

IMPORTANT -- Be sure that the FINE TUNING control has been set for the clearest picture before adjusting any controls.

CONTROLS AND FUNCTIONS

HORIZONTAL HOLD -- Stops horizontal movement (diagonal bars.)

TONE -- Adjusts for tonal quality bass or treble.

BRIGHTNESS -- Adjusts for desired picture brilliance.

VERTICAL HOLD -- Stops upward or downward picture movement.

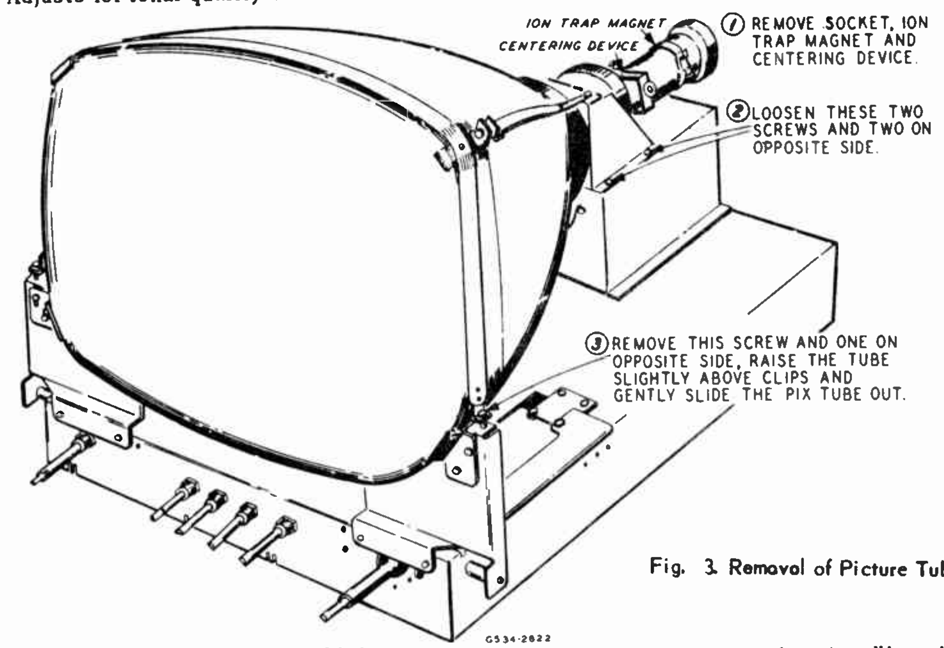

Fig. 3. Removal of Picture Tube

FRONT OF CHASSIS

Horizontal Drive	R-89
Horizontal Frequency	L-14
Vertical Linearity	R-49
Height	R-54
Sync Stability	R-39
AGC Threshold	R-108

WARNING -- Before handling the picture tube, it will be necessary to remove the static charge. In receivers with glass picture tubes, ground the anode lead to chassis, and insert an insulated wire from the well in the tube to chassis. In receivers with metal picture tubes, remove the static charge by grounding an insulated wire from the chassis to the metal portion of the tube.

PICTURE TUBE REPLACEMENT -- To replace the picture tube it is necessary to remove the chassis from the cabinet. This may be accomplished in the following manner:

1. Remove the front panel control knobs by pulling them straight from their shafts.

2. Remove the cabinet back.

3. Disconnect the leads from the speaker, remove the antenna terminal board at the rear of the cabinet and then the five chassis mounting bolts. Pull chassis CAREFULLY out of the cabinet.

4. Remove the picture tube as shown and outlined in the illustration. To install a new picture tube, reverse the procedure making sure that the picture tube fits close against the picture tube cushion. If the picture tube sticks or fails to slip into place smoothly, investigate and remove the source of the trouble. Never force the tube. It is important that all the clips and shims used in mounting the tube be replaced, otherwise difficulty may be encountered when horizontal or vertical centering is required.

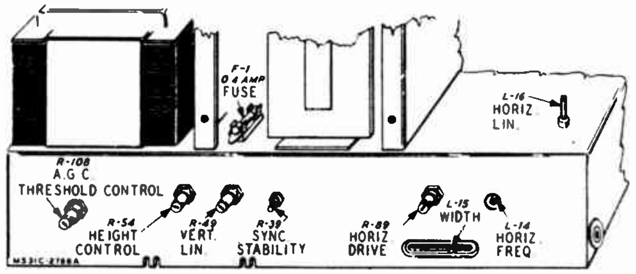

Fig. 4 Adjustments Rear of Chassis

ION TRAP MAGNET ADJUSTMENT -- The ion trap magnet should be positioned close to the base of the tube. From this position adjust the magnet by moving it back and forth and at the same time rotating it slightly around the neck of the picture tube until the brightest raster is obtained on the picture screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Readjust the ion trap magnet for maximum raster brilliance and best focus. MAXIMUM RASTER BRILLIANCE AND BEST FOCUS OCCUR AT THE SAME POINT. Do not sacrifice brilliance for best focus. The ion trap magnet adjustment is a very critical one especially with the electrostatic type zero focus picture tube. Consequently, great care should be taken to make sure that the ion trap magnet is correctly adjusted.

DEFLECTION YOKE ADJUSTMENT -- If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

CENTERING ADJUSTMENT -- If horizontal or vertical centering is required, adjust each ring in the centering device until proper centering is obtained. If a clamp type centering device is used, rotate the device to the left or right and turn the knob located at the top of the device until the picture is centered correctly.

PICTURE ADJUSTMENT -- For further adjustments, obtain a test pattern on the receiver. Turn on receiver and follow tuning procedure on page 3. When a test pattern is obtained it may be necessary to slightly re-adjust the fine tuning control for clearest picture.

ADJUSTMENT OF AGC THRESHOLD CONTROL -- Tune the receiver to the strongest station in the area in which the receiver will be used. While observing the picture and listening to the sound, turn the control clockwise until signs of overloading (buzz in sound, washed-out picture) appear. Then turn the control a few degrees counter-clockwise from the point at which overloading occurs. (The stronger the signal input, the more counter-clockwise this setting will be.) In areas where the strongest signal does not exceed 10,000 uv the setting will usually be maximum clockwise. With the control set correctly, the AGC will automatically adjust the bias on the R.F. and I.F. amplifiers so that the best possible signal to noise ratio (Minimum snow) will be obtained for any signal input to the receiver.

ADJUSTMENT OF SYNC STABILITY CONTROL -- When receiving strong (500 MV or more) signals, set hold controls up that the picture is locked in. Turn the sync control fully counter-clockwise, then, while observing the picture, turn the control slowly clockwise until a minimum amount of bending occurs. If the control is set incorrectly bending, tearing, etc., will be present and when switching from channel to channel the picture will not lock in quickly.

In weak signal areas the control should be set for maximum picture stability. In general the weaker the signal the more clockwise the control should be turned. When the sync stability control is correctly adjusted the receiver will hold sync without tearing or rolling under even the most adverse noise conditions.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT -- Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, it will be necessary to make the following adjustment.

HORIZONTAL FREQUENCY ADJUSTMENT -- With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-14) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

HEIGHT AND VERTICAL LINEARITY ADJUSTMENT -- Adjust the height control (R-54) until the picture fills the mask vertically. Adjust the vertical linearity control (R-49) until the picture is symmetrical from top to bottom. Adjust the picture centering device to align picture with the mask. Adjustment of any control will require a re-adjustment of the other control.

WIDTH, DRIVE AND LINEARITY ADJUSTMENTS -- While receiving a signal from a station (with picture locked in sync) turn contrast control fully counter-clockwise, turn the brightness control (R-25) up so that the picture appears washed out. Adjust width control (L-15) until the picture fills the mask. Turn the horizontal drive control (R-89) clockwise until white bars appear in the left center portion of the raster, then turn counter-clockwise until the white bars just disappear. This adjustment will allow the horizontal system to operate at maximum efficiency. Adjust horizontal linearity control (L-16) for best linearity. If adjustment of the horizontal drive (R-89) or horizontal linearity (L-16) is required, it usually will be necessary to recheck the horizontal oscillator alignment. If adjustment of the horizontal linearity control (L-16) is required, readjustment of the horizontal drive control (R-89) will be necessary. adjust the picture centering device to align the picture with the mask.

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is preset at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PROCEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

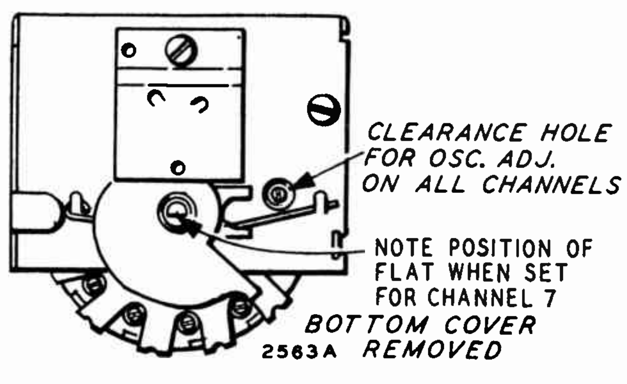

Fig. 5 Tuner Oscillator Adjustments

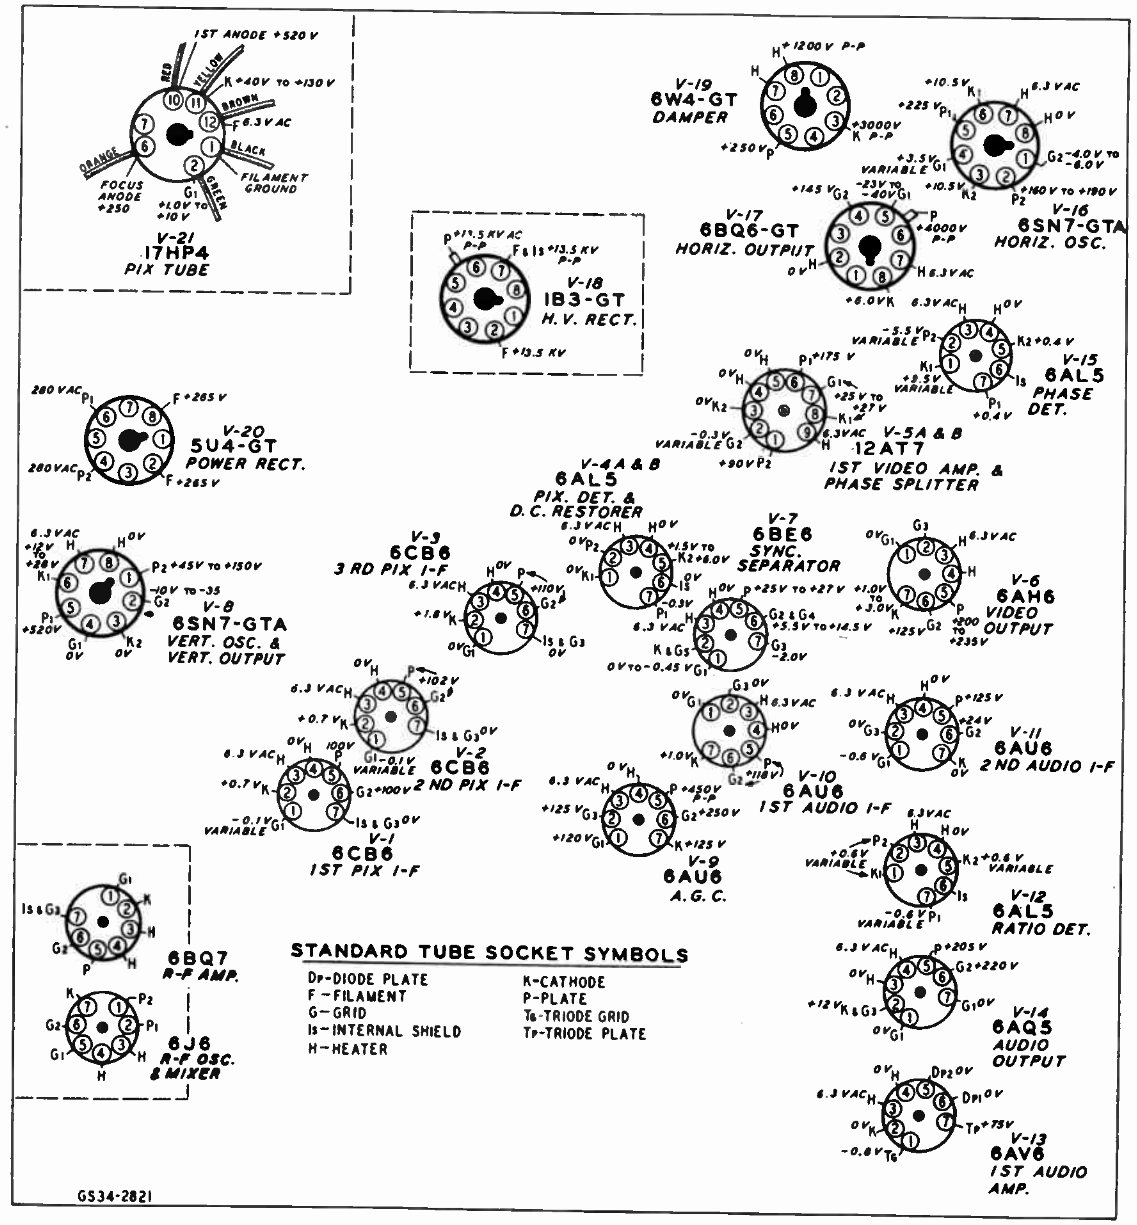

Fig. 6 Bottom Socket Voltages

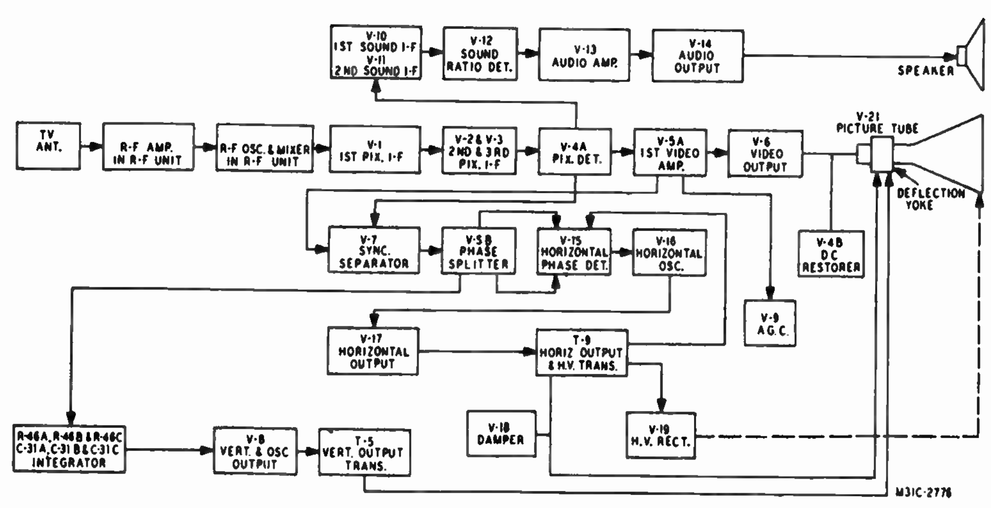

Fig. 7 Block Diagram

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE -- If raster cannot be obtained check below for the possible causes.

1: Ion trap magnet adjustment is incorrect.

2: No +B voltage. Check 4/10 ampere fuse. Replace if defective. If fuse continually burns out, check
   (A) Horizontal output tube V-17 (6BQ6-GT)
   (B) Check damper tube V-18 (6W4-GT).
   (C) Check horizontal oscillator tube V-16 (6SN7-GTA) for proper operation.
   (D) With an ohm meter, check for a short between terminal 1 of the horizontal output transformer (T-9) and the chassis.
   (E) Check DC resistance of T-9.

3: No high voltage. Check V-17, V-18 and V-19 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage (600V) measured on terminal No. 1 of T-9, the trouble can be isolated to the high voltage rectifier circuit. Either the high voltage winding to the 6BQ6-GT plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, R-99 and C-78 defective or pix tube elements shorted internally.

4: Defective picture tube heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY -- If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:

1: Vertical oscillator and vertical output tube V-8 inoperative. Check socket voltages.
2: Vertical oscillator transformer (T-4) defective.
3: Vertical output transformer (T-5) open or shorted.
4: Yoke vertical coils open or shorted.
5: Vertical hold, height or linearity controls may be defective.

POOR VERTICAL LINEARITY -- If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.

1: Check variable resistors R-49 and R-54.
2: Vertical output transformer (T-5) defective.
3: Capacitors C-35A, C-39 or C-70 defective.
4: V-8 defective, check voltages.
5: Excess leakage or incorrect value of capacitor C-37, or open or incorrect value of resistors R-55 & R-56.
6: Low plate voltages. Check rectifier tube and capacitors in +B supply circuits.
7: Capacitor C-36 defective.
8: Vertical deflection coils (L-12) defective.

POOR HORIZONTAL LINEARITY -- If adjustment of Horizontal drive and linearity controls does not correct this condition, check the following:

1: Check or replace horizontal output tube V-17.
2: Check or replace damper tube V-18 (6W4-GT).
3: Check capacitors C-74, C-76, C-77 and horizontal linearity control (L-16) for defects.
4: Horizontal deflection coils (L-17) defective.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER
1: Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER -- This condition can be caused by:

1: Defective yoke due to C-75 or R-98 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.
2: V-18 (6W4-GT) defective.

SMALL RASTER -- This condition can be caused by:
1: Low +B or line voltage. Check V-20 (5U4G).
2: Insufficient output from horizontal output tube V-17. Replace tube.
3: Insufficient output from vertical oscillator and vertical output tube V-8. Replace tube.
4: Incorrect setting of horizontal drive control R-89.
5: V-18 (6W4-GT) defective.
6: Incorrect setting of (L-15) width control.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND -- This condition can be caused by:

1: No signal on picture tube grid. Check V-5A (12AT7) and V-6 (6AH6) tubes and associated circuits.
2: Bad contact to picture tube grid (lead to socket broken).
3: AGC tube (V-9) may be defective. Check tube and its associated circuit.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY -- A condition of this nature can be caused by:
1: Defective sync separator V-7 or phase splitter V-5B.
2: If tubes are O.K. check voltages, and associated circuits.
3: AGC system inoperative. Check V-9 (6AU6) AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY -- If this condition is encountered, check:
1: Vertical integrating network capacitors C-31A, B & C, and resistors R-46 A, B & C.
2: Vertical hold control (R-51) defective.

SIGNAL ON PICTURE TUBE GRID AND VERTICAL SYNC ONLY:
1: V-15 or V-16 defective.
2: Improper setting of (L-14) horizontal frequency control.
3: Check setting of horizontal drive control and horizontal linearity control.
4: Check V-15 and 16 socket voltages.

PICTURE STABLE BUT WITH POOR RESOLUTION -- If the picture resolution is not up to standard, it may be caused by any of the following:
1: Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2: Defective picture detector V-4A, (6AL5), or video amplifier V-5A or video output V-6 (6AH6).
3: Defective picture tube.
4: Open video peaking coil. Check all peaking coils L-5, L-6, L-8, L-9, L-10 and L-11 for continuity. Note that L-5, L-9 and L-10 have shunting resistors.
5: Leakage in V-6 (6AH6) grid capacitor C-11. If the capacitor is not found to be defective, check the following:
1: Check all potentials in video circuits.
2: Check picture tube grid circuit for poor or dirty contact.
3: Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE SMEAR:
1: A smear can be attributed to phase shift at the low or high frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6 (6AH6), open or shorted peaking coils, video amplifier load resistors are of improper value (high).
2: This trouble can also originate at the transmitter. Check reception from another station.
3: Check and realign, if necessary, the picture I-F and R-F circuits.

MAN MADE NOISE IN SOUND (Ignition, etc)
1: Check sound I-F tubes V-10, 11 & 12 and associated circuits.
2: Check sound I-F alignment.

BENDING OR S-ING
1: Check sync stability control adjustment.
2: Check capacitors C-35B and C-79B.
3: V-17 (6BQ6-GT) defective or V-16 (6SN7-GTA) defective.
4: Check sync separator tube V-7 (6BE6) and phase splitter V-5B (12AT7) and V-5A (12AT7) video amplifier.
5: Check AGC threshold control.

PICTURE NORMAL -- NO SOUND OR WEAK OR DISTORTED SOUND.
1: Check sound I-F alignment.
2: Check V-10 (6AU6) V-11 (6AU6) V-12 (6AL5) V-13 (6AV6) V-14 (6AQ5) and associated circuits.

POOR FOCUS
1: Improper setting of Ion Trap magnet.
2: Defective picture tube or picture tube socket.

PICTURE JITTER:
1: If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2: Vertical instability may be due to loose connections or noise received with the signal.
3: Horizontal instability may be due to unstable transmitted sync.
4: Check receiver AGC system for proper operation.
5: Check phase splitter V-5B, (12AT7) and sync separator V-7 (6BE6).
6: Check for improper setting of sync stability control.
7: Picture tube grid lead not held in position by support spring, ie: close proximity of grid lead to sync and horizontal tubes will cause picture to jitter at high contrast setting.
8: Check AGC threshold control.

ALIGNMENT PROCEDURE

TEST EQUIPMENT -- To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR -- meeting the following requirements:
(a) Frequency ranges:
    18 to 30 mc, 10 mc sweep width
    40 to 90 mc, 10 mc sweep width
    170 to 225 mc, 10 mc sweep width
(b) Output adjustable with at least .1 volt maximum
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE -- preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR -- To provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)
(a) Intermediate alignment frequencies.
    23.1 mc first picture I-F coil.
    24.1 mc third picture I-F coil.
    25.9 mc second picture I-F coil.
    21.7 mc sound trap.
    4.5 mc video trap & sound I-F.
    25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS — To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, remove the antenna terminal board at rear of cabinet, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the power transformer and pix tube brackets.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-99.

ALIGNMENT PROCEDURE PIX I-F

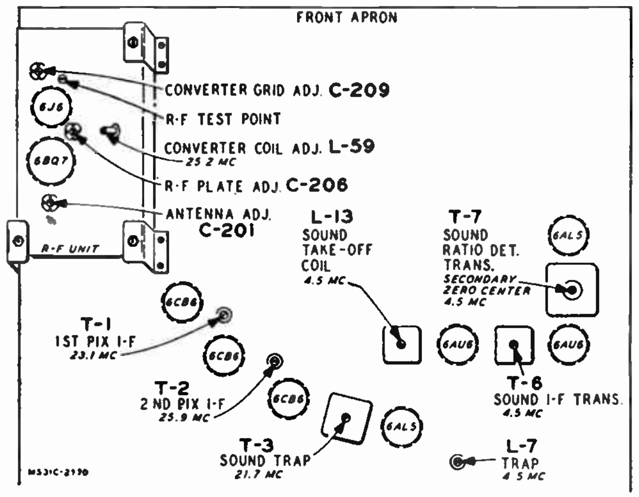

Fig. 8 Top Chassis Video and Audio I-F Adjustments

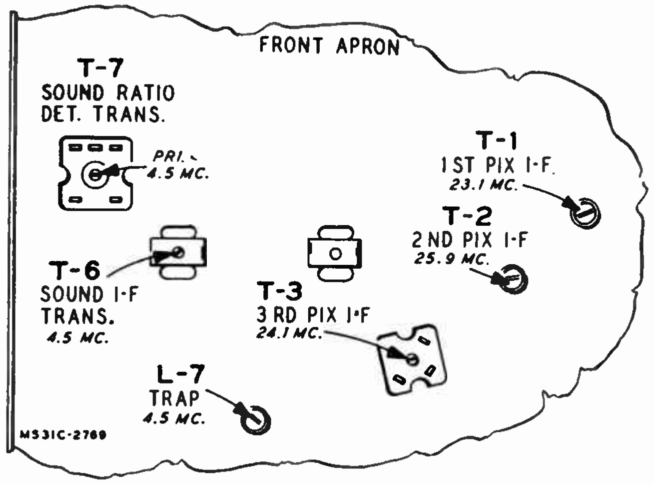

Fig. 9 Bottom Chassis Video and Audio I-F Adjustments

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coils
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is NOT advisable to change the setting of the coil due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 7-6AL5) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response. VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1: With signal generator set to 4.5 MC and dc VTVM connected to junction of R-62 and C-46, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.
2: With VTVM connected to pin 7 of V-12 (6AL5) adjust the ratio detector primary (T-7 Bottom) for maximum.
3: With VTVM connected to junction of R-66, R-69 and C-50, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE -- If no signal generator is available, the procedure above may be followed by tuning in a station and using the 4.5 MC beat between picture and sound carrier.

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-100) 4700 ohms, in series with peaking coil (L-6) from Pin 7 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply -4.5V battery bias on AGC line.

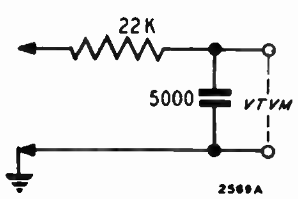

Fig. 10 VTVM Connections

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil on top of tuner for maximum dc at picture detector.
2.	23.9 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.
Connect oscilloscope across R-100 (in place of VTVM). Apply -4.5V bias (DC) to AGC line (battery).
Tuner should be switched to dead channel so as not to cause interference.

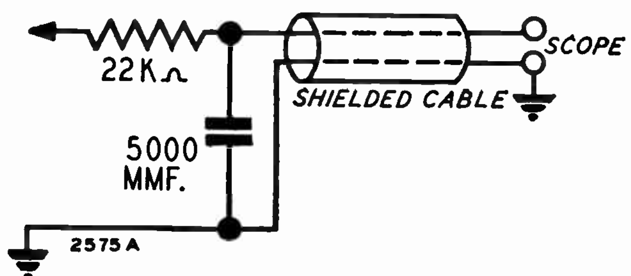

Fig. 11 Oscilloscope Connections

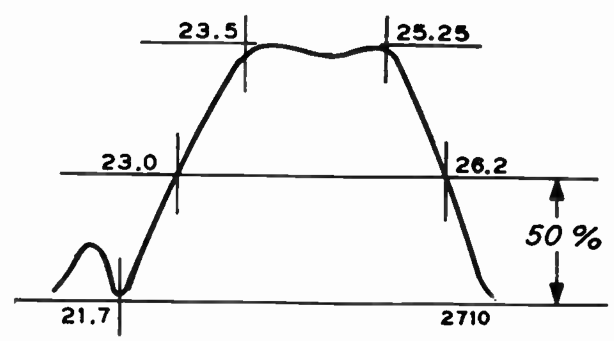

Fig. 12 Overall Response Curve

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" (Figure 13) on tuner. Connect 1½ V bias to AGC line at junction of R-33 and C-20 on the receiver.

2. Check response on all channels. If markers are below 70% on any channels, readjust C-201, C-206, and C-209. Recheck all channels.

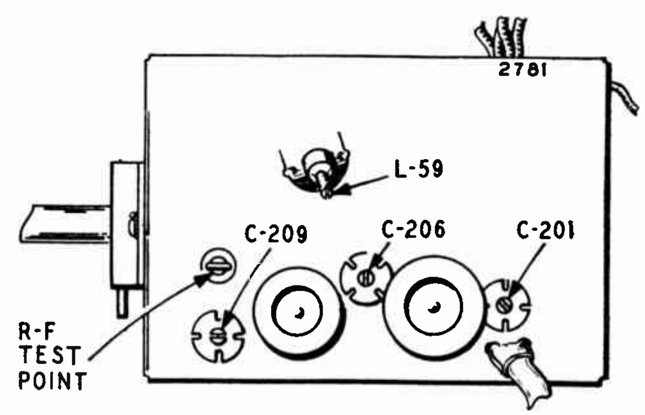

Fig. 13 Top Turner Adjustments

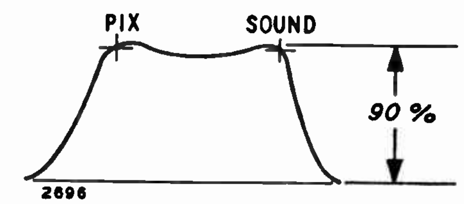

Fig. 14 Pix and Audio Markers

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 14. Picture and sound markers at 90% maximum response.

C. OSCILLATOR ADJUSTMENT.

1. Apply -4.5 volts on I-F AGC line at junction of R-1 and C-21.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 12).
3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.

The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicates the repetition rate of the waveform, not the sweep rate of the oscilloscope If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.

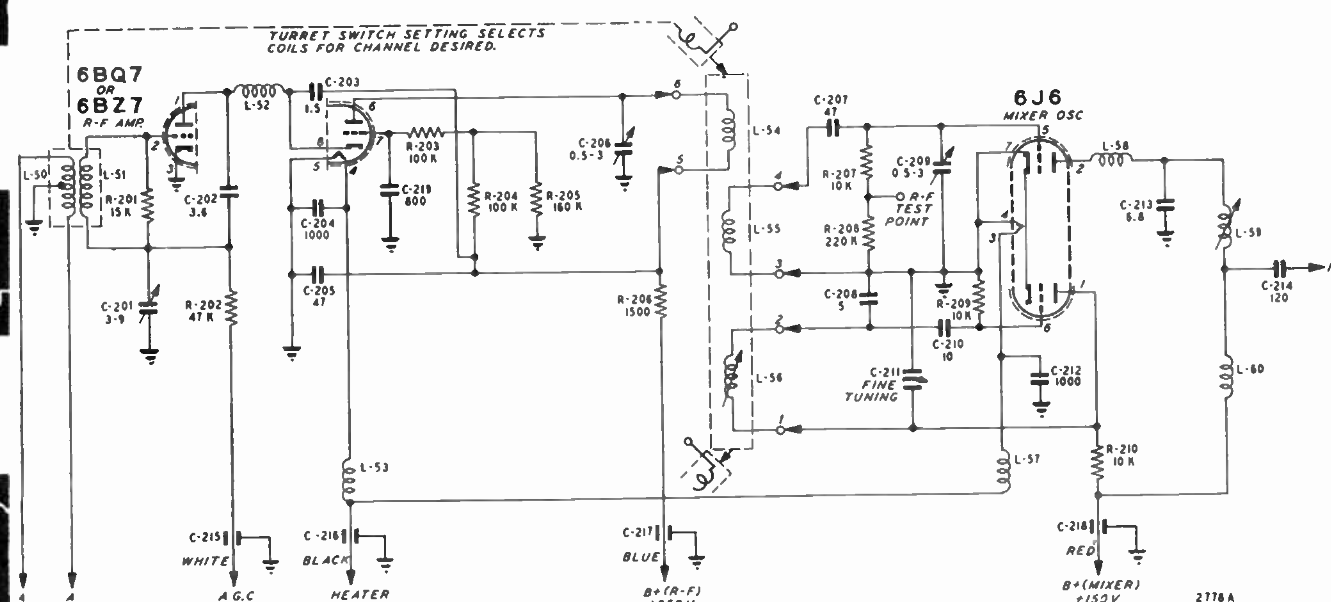

Fig. 16 "Q" Tuner Schematic Diagram

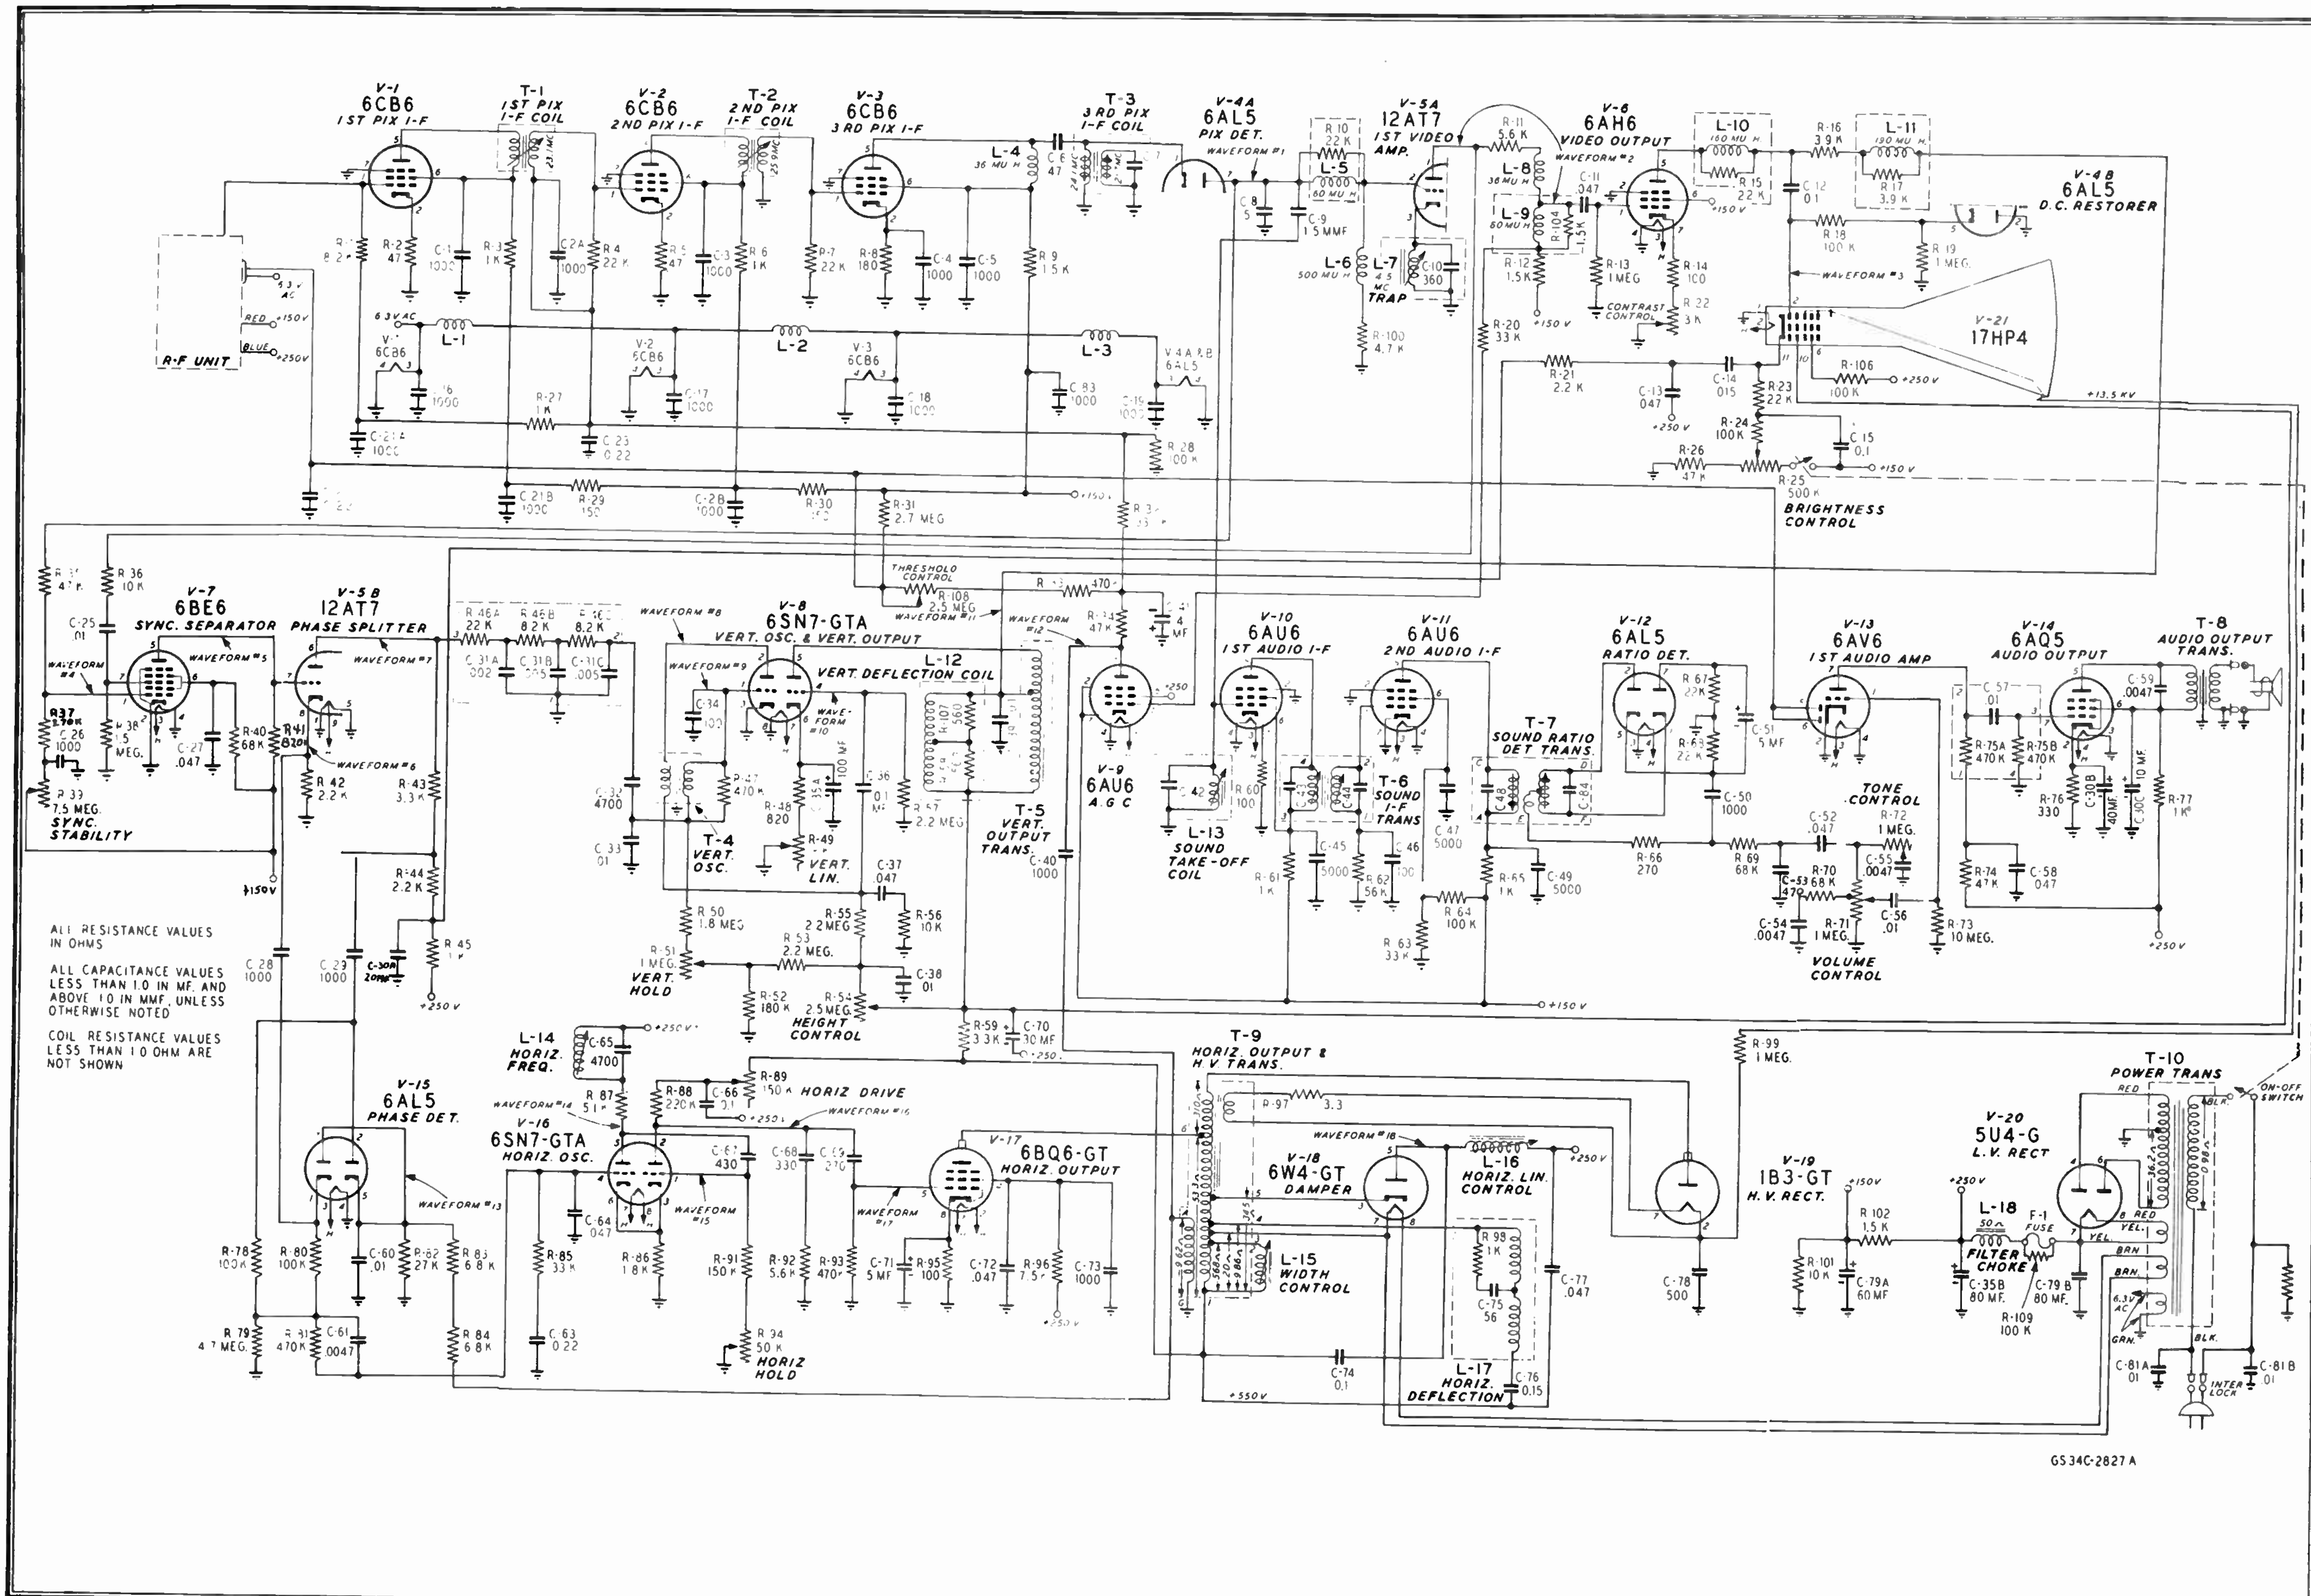
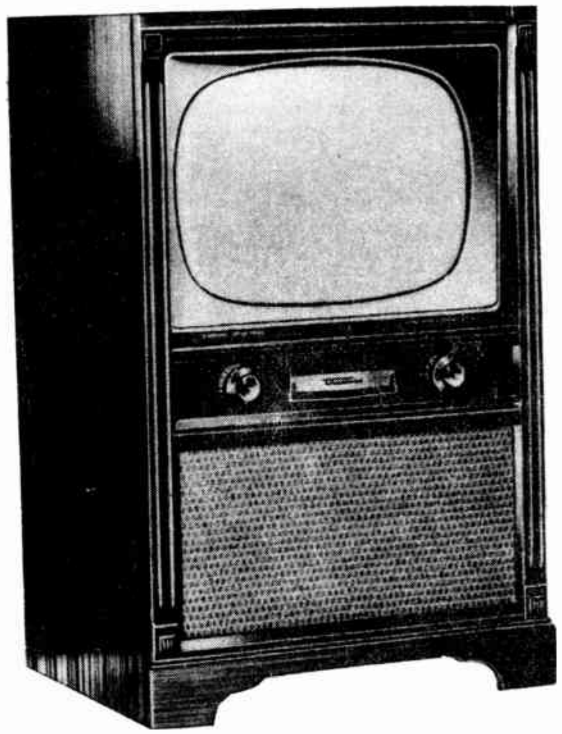


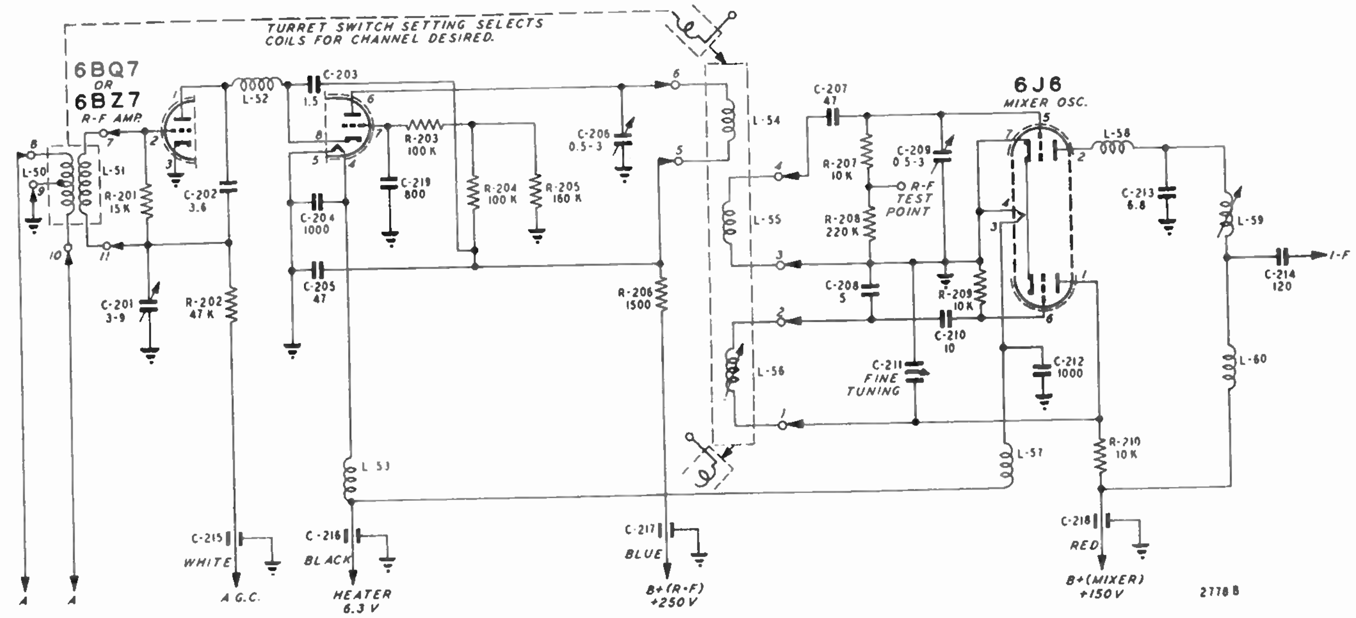
WESTERN AUTO SUPPLY TV PAGE 14-35

MODEL 2D1235C, D, E, Ch. 217GS34C-266

MODEL 2D1235E

Model 2D1235D is identical to model 2D1235C except for a Gold Tooled Border and Gold Lettered Names on the leatherette covered control panel.





Tuner Schematic Diagram.

MODEL 2D1235E
(Supplement to 2D1235D)

Model 2D1235E is identical to Model 2D1235D except for a change in the V-18 damper tube from a 6W4-GT to a 6AX4-GT. A schematic diagram with this change incorporated is attached. Illustration on the next page shows the bottom socket voltage chart.

TUBE COMPLEMENT

Symbol	Type	Function
Tuner	6J6	R-F Osc. and Mixer
*Tuner	6BQ7	R-F Amplifier
V-1	6CB6	1st Pix I-F Amplifier
V-2	6CB6	2nd Pix I-F Amplifier
V-3	6CB6	3rd Pix I-F Amplifier
V-4 A&B	6AL5	Pix Det. and DC Restorer
V-5 A&B	12AT7	1st Video Amp. and Phase Splitter
V-6	6AH6	Video Output
V-7	6BE6	Sync. Separator
V-8	6SN7-GTA	Vertical Osc. & Vertical Output
V-9	6AU6	Automatic Gain Control
V-10	6AU6	1st Audio I-F
V-11	6AU6	2nd Audio I-F
V-12	6AL5	Ratio Detector
V-13	6AV6	1st Audio Amplifier
V-14	6AQ5	Audio Output
V-15	6AL5	Phase Detector
V-16	6SN7-GTA	Horizontal Oscillator
V-17	6BQ6-GT	Horizontal Output
V-18	6AX4-GT	Damper
V-19	1B3-GT	High Voltage Rectifier
V-20	5U4-G	Low Voltage Rectifier
V-21	17HP4	Picture Tube 17" Glass Rectangular (Electrostatic)

*For replacement purposes a 6BZ7 tube may be used in place of a 6BQ7 tube.

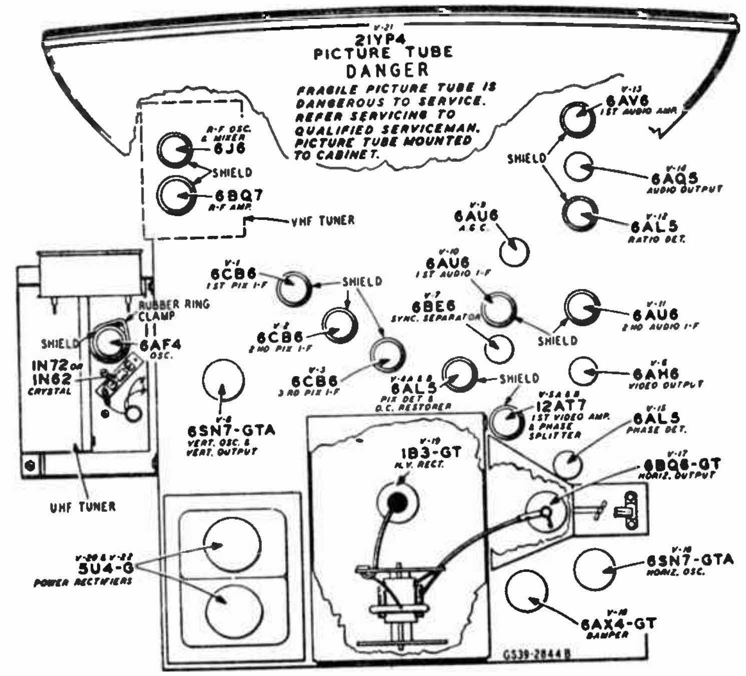

Fig. 1 -- Tube Layout.

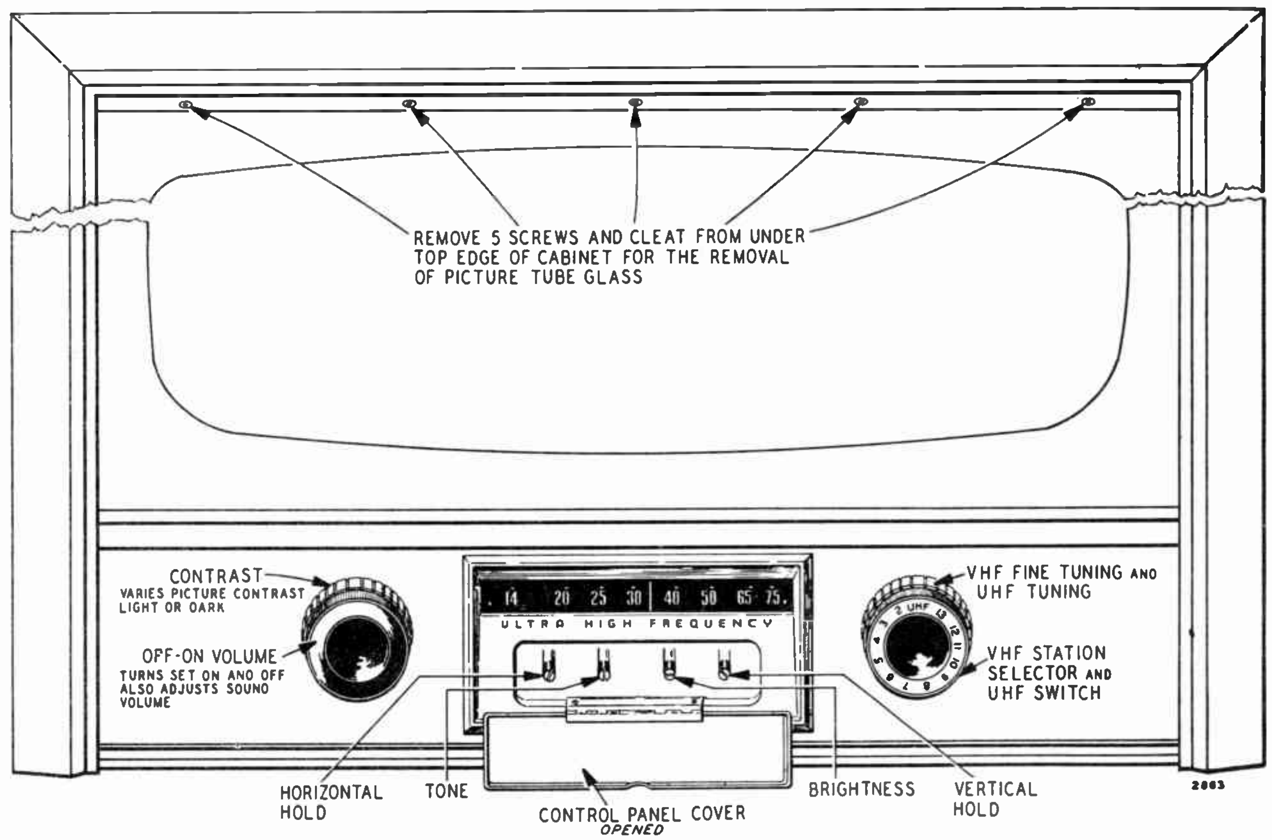

Fig. 2 -- Front Panel Controls

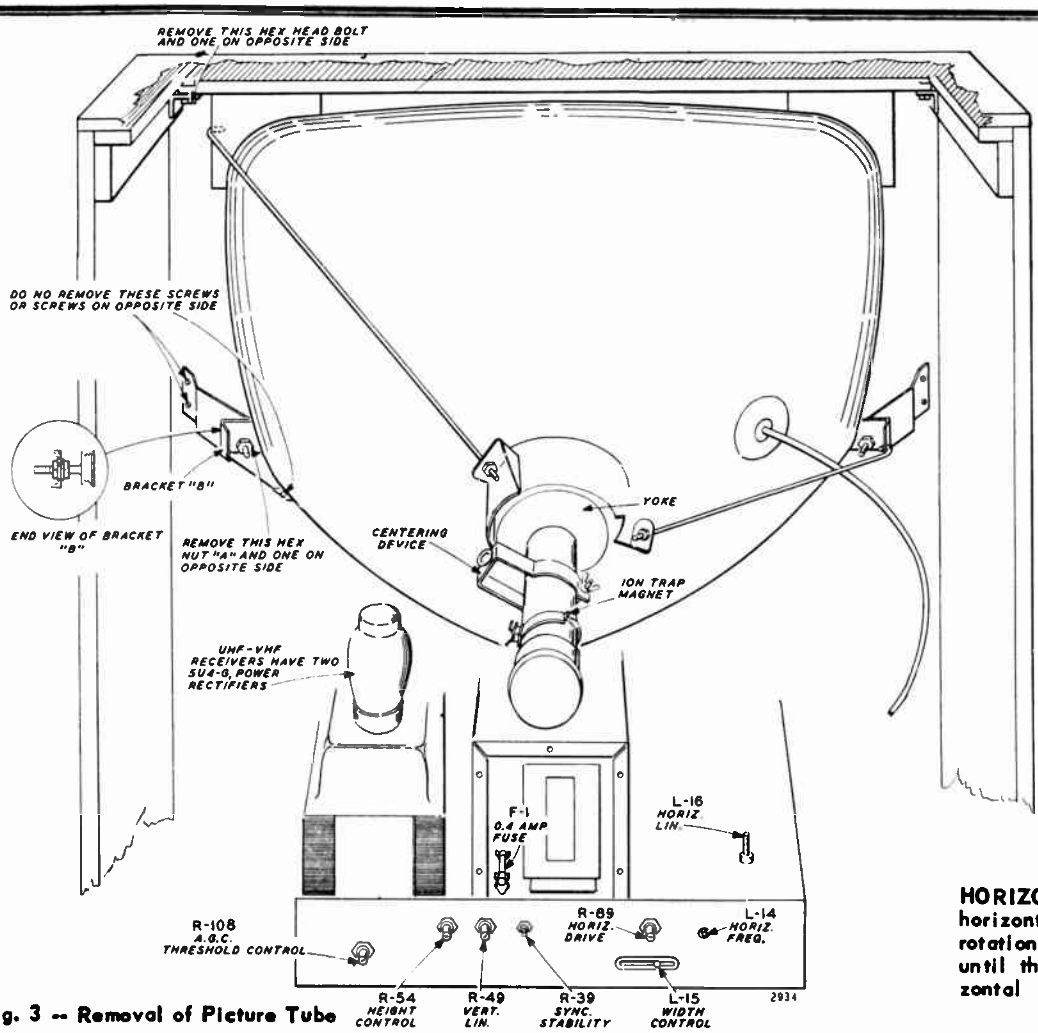

Fig. 3 -- Removal of Picture Tube

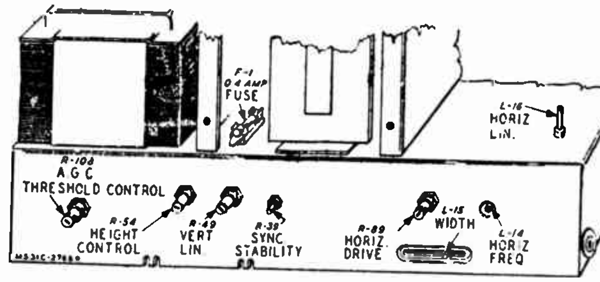

Fig. 4 -- Adjustments Rear of Chassis

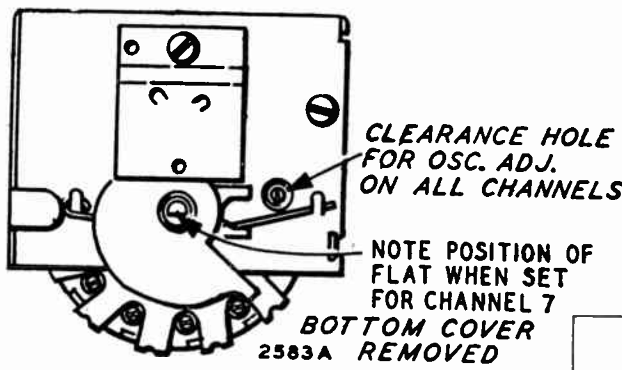

Fig. 5 -- Tuner Oscillator Adjustments

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is pre-set at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PRODEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

CAUTION -- These adjustments are only intended for VHF Channels. For information regarding UHF alignment, see paragraph "Tuner Alignment" on page 11.

HORIZONTAL FREQUENCY ADJUSTMENT

-- With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-14) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

ADJUSTMENT OF SYNC STABILITY CONTROL

-- When receiving strong (500 MV or more) signals, set hold controls so that the picture is locked in. Turn the sync control fully counter-clockwise, then, while observing the picture, turn the control slowly clockwise until a minimum amount of bending occurs. If the control is set incorrectly bending, tearing, etc., will be present and when switching from channel to channel the picture will not lock in quickly.

In weak signal areas the control should be set for maximum picture stability. In general the weaker the signal the more clockwise the control should be turned.

When the sync stability control is correctly adjusted the receiver will hold sync without tearing or rolling under even the most adverse noise conditions.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT

-- Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, it will be necessary to make the following adjustment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENT

-- Adjust the height control (R-54) until the picture fills the mask vertically. Adjust the vertical linearity control (R-49) until the picture is symmetrical from top to bottom. Adjust the picture centering device to align picture with the mask. Adjustment of any control will require a re-adjustment of the other control.

WIDTH, DRIVE AND LINEARITY ADJUSTMENTS

-- While receiving a signal from a station (with picture locked in sync) turn contrast control fully counter-clockwise, turn the brightness control (R-25) up so that the picture appears washed out. Adjust width control (L-15) until the picture fills the mask. Turn the horizontal drive control (R-89) clockwise until white bars appear in the left center portion of the raster, then turn counter-clockwise until the white bars just disappear. This adjustment will allow the horizontal system to operate at maximum efficiency. Adjust horizontal linearity control (L-16) for best linearity. If adjustment of the horizontal drive (R-89) or horizontal linearity (L-16) is required, it usually will be necessary to recheck the horizontal oscillator alignment. If adjustment of the horizontal linearity control (L-16) is required, readjustment of the horizontal drive control (R-89) will be necessary. Adjust the picture centering device to align the picture with the mask.

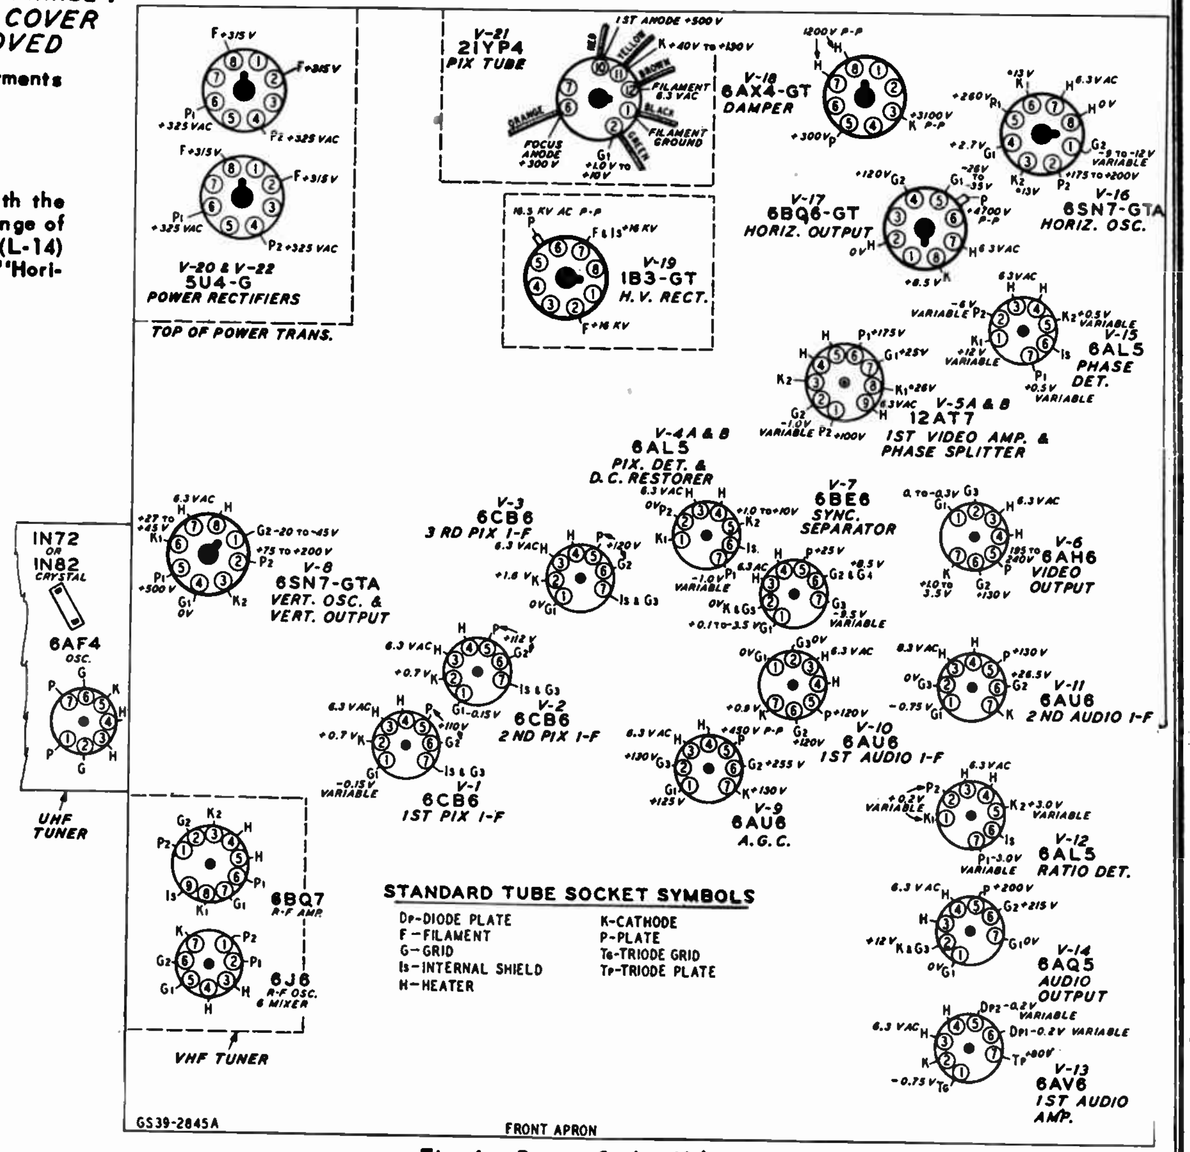

Fig. 6 -- Bottom Socket Voltages

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE -- If raster cannot be obtained check below for the possible causes.
1. Ion trap magnet adjustment is incorrect.
2. No +B voltage. Check 4/10 ampere fuse. Replace if defective. If fuse continually burns out, check.
   (A) Horizontal output tube V-17 (6BQ6-GT)
   (B) Check damper tube V-18 (6AX4-GT).
   (C) Check horizontal oscillator tube V-16 (6SN7-GTA) for proper operation.
   (D) With an ohm meter, check for a short between terminal 1 of the horizontal output transformer (T-9) and the chassis.
   (E) Check DC resistance of T-9
3. No high voltage. Check V-17, V-18 and V-19 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage (600V) measured on terminal No. 1 of T-9, the trouble can be isolated to the high voltage rectifier circuit. Either the high voltage winding to the 6BQ6-GT plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, R-99 and C-78 defective or pix tube elements shorted internally.
4. Defective picture tube heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY -- If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:
1. Vertical oscillator and vertical output tube V-8 inoperative. Check socket voltages.
2. Vertical oscillator transformer (T-4) defective.
3. Vertical output transformer (T-5) open or shorted.
4. Yoke vertical coils open or shorted.
5. Vertical hold, height or linearity controls may be defective.

POOR VERTICAL LINEARITY -- If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.
1. Check variable resistors R-49 and R-54.
2. Vertical output transformer (T-5) defective.
3. Capacitors C-35A, C-39 or C-70 defective.
4. V-8 defective, check voltages.
5. Excess leakage or incorrect value of capacitor C-37, or open or incorrect value of resistors R-55 & R-56.
6. Low plate voltages. Check rectifier tube and capacitors in +B supply circuits.
7. Capacitor C-36 defective.
8. Vertical deflection coils (L-12) defective.

POOR HORIZONTAL LINEARITY -- If adjustment of the Horizontal drive and linearity controls does not correct this condition, check the following:
1. Check or replace horizontal output tube V-17.
2. Check or replace damper tube V-18 (6AX4-GT).
3. Check capacitors C-74, C-76, C-77 and horizontal linearity control (L-16) for defects.
4. Horizontal deflection coils (L-17) defective.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER
1. Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER -- This condition can be caused by:
1. Defective yoke due to C-75 or R-98 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.
2. V-18 (6AX4-GT) defective.

SMALL RASTER -- This condition can be caused by:
1. Low +B or line voltage. Check V-20 & V-22 (5U4G).
2. Insufficient output from horizontal output tube V-17. Replace tube.
3. Insufficient output from vertical oscillator and vertical output tube V-8. Replace tube.
4. Incorrect setting of horizontal drive control R-89.
5. V-18 (6AX4-GT) defective.
6. Incorrect setting of (L-15) width control.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND -- This condition can be caused by:
1. No signal on picture tube grid. Check V-5A (12AT7) and V-6 (6AH6) tubes and associated circuits.
2. Bad contact to picture tube grid (lead to socket broken).
3. AGC tube (V-9) may be defective. Check tube and its associated circuit.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY -- A condition of this nature can be caused by:
1. Defective sync separator V-7 or phase splitter V-5B.
2. If tubes are O. K. check voltages, and associated circuits.
3. AGC system inoperative. Check V-9 (6AU6) AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY -- If this condition is encountered, check:
1. Vertical integrating network capacitors C-31A, B & C, and resistors R-46 A, B & C.
2. Vertical hold control (R-51) defective.

SIGNAL ON PICTURE TUBE GRID AND VERTICAL SYNC ONLY
1. V-15 or V-16 defective.
2. Improper setting of (L-14) horizontal frequency control.
3. Check setting of horizontal drive control and horizontal linearity control.
4. Check V-15 and V-16 socket voltages.

PICTURE STABLE BUT WITH POOR RESOLUTION -- If the picture resolution is not up to standard, it may be caused by any of the following:
1. Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2. Defective picture detector V-4A, (6AL5) or video amplifier V-5A or video output V-6 (6AH6).
3. Defective picture tube.
4. Open video peaking coil. Check all peaking coils L-5, L-6, L-8, L-9, L-10 and L-11 for continuity. Note that L-5, L-9 and L-10 have shunting resistors.
5. Leakage in V-6 (6AH6) grid capacitor C-11. If the capacitor is not found to be defective, check the following:
   1. Check all potentials in video circuits.
   2. Check picture tube grid circuit for poor or dirty contact.
   3. Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE SMEAR:
1. A smear can be attributed to phase shift at the low or high frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6 (6AH6), open or shorted peaking coils, video amplifier load resistors are of improper value (high).
2. This trouble can also originate at the transmitter. Check reception from another station.
3. Check and realign, if necessary, the picture I-F and R-F circuits.

MAN MADE NOISE IN SOUND (Ignition, etc.)
1. Check sound I-F tubes V-10, 11 & 12 and associated circuits.
2. Check sound I-F alignment.

BENDING OR S-ING
1. Check sync stability control adjustment.
2. Check capacitors C-35B and C-79B.
3. V-17 (6BQ6-GT) defective or V-16 (6SN7-GTA) defective.
4. Check sync separator tube V-7 (6BE6) and phase splitter V-5B (12AT7) and V-5A (12AT7) video amplifier.
5. Check AGC threshold control.

SERVICE SUGGESTIONS -- (continued)

PICTURE NORMAL -- NO SOUND OR WEAK OR DISTORTED SOUND
1. Check sound I-F alignment.
2. Check V-10 (6AU6) V-11 (6AU6) V-12 (6AL5) V-13 (6AV6) V-14 (6AQ5) and associated circuits.

RASTER ON TUBE BUT NO PICTURE OR SOUND
This condition can be caused by,
1. Defective pix I-F Amplifier tubes V-1, V-2 or V-3.
2. Defective pix detector tube V-4A (6AL5). Check tube and its associated circuit.
3. Defective R-F Amplifier or oscillator mixer tubes in the tuner.
4. UHF-VHF switch defective.

POOR FOCUS
1. Improper setting of Ion Trap magnet.
2. Defective picture tube or picture tube socket.

PICTURE JITTER:
1. If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2. Vertical instability may be due to loose connections or noise received with the signal.
3. Horizontal instability may be due to unstable transmitted sync.
4. Check receiver AGC system for proper operation.
5. Check phase splitter V-5B, (12AT7) and sync separator V-7 (6BE6).
6. Check for improper setting of sync stability control.
7. Picture tube grid lead not held in position by support spring, ie; close proximity of grid lead to sync and horizontal tubes will cause picture to jitter at high contrast setting.
8. Check AGC threshold control.

NO PICTURE OR SOUND OR WEAK PICTURE OR SOUND (UHF Position)
If this condition is encountered:
1. Check to see whether or not a UHF station is operating in the vicinity.
2. The 6AF4 oscillator tube or the 1N72 (or 1N82) crystal may be defective.
3. Pre-selector in UHF tuner defective.
4. Low pass filter defective.
5. The UHF position antenna and oscillator strips in the VHF tuner defective.
6. Defective Switch on UHF tuner.

ALIGNMENT PROCEDURE

TEST EQUIPMENT -- To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:
(a) Frequency ranges:
- 18 to 30 mc, 10 mc sweep width
- 40 to 90 mc, 10 mc sweep width
- 120 to 130 mc, 10 mc sweep width
- 170 to 225 mc, 10 mc sweep width
- 470 to 890 mc, 10 mc sweep width

(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)
(a) Intermediate alignment frequencies.
- 23.1 mc first picture I-F coil.
- 24.1 mc third picture I-F coil.
- 25.9 mc second picture I-F coil.
- 21.7 mc sound trap.
- 4.5 mc video trap & sound I-F.
- 25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-99.

ALIGNMENT PROCEDURE
PIX I-F

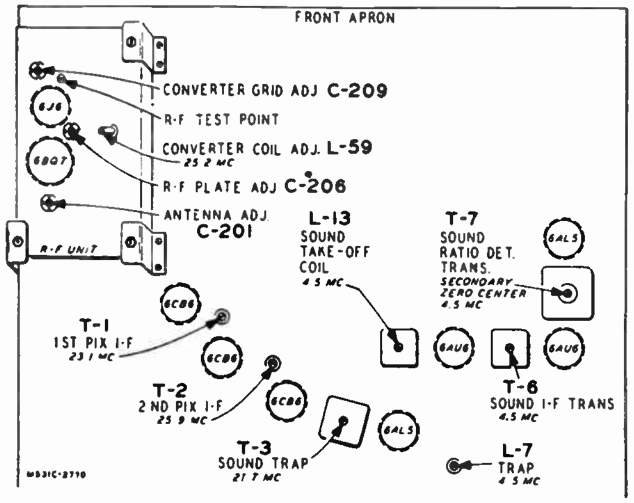

Fig. 8 -- Top Chassis Video and Audio I-F Adjustments

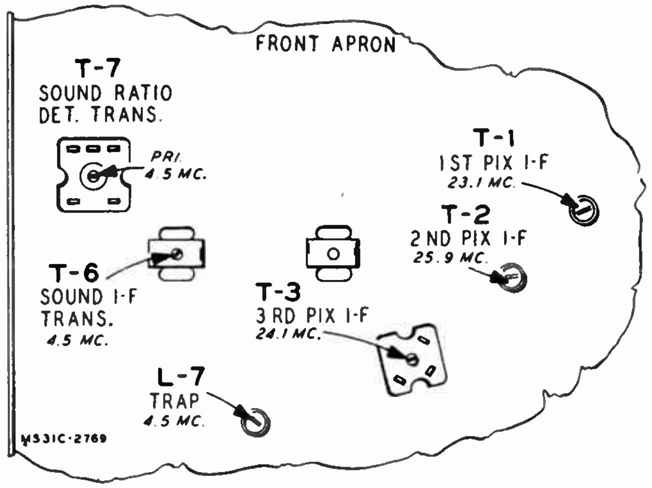

Fig. 9 -- Bottom Chassis Video and Audio I-F Adjustments

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-100) 4700 ohms, in series with peaking coil (L-6) from Pin 7 of 6ALS. Input signal level should be such that output is less than 2 volts DC. Apply -4.5V battery bias on AGC line.

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil on top of tuner for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.

Connect oscilloscope across R-100 (in place of VTVM). Apply -4.5V bias (DC) to AGC line (battery).

Tuner should be switched to dead channel so as not to cause interference.

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

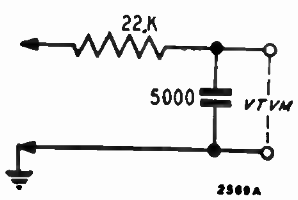

Fig. 10 -- VTVM Connections

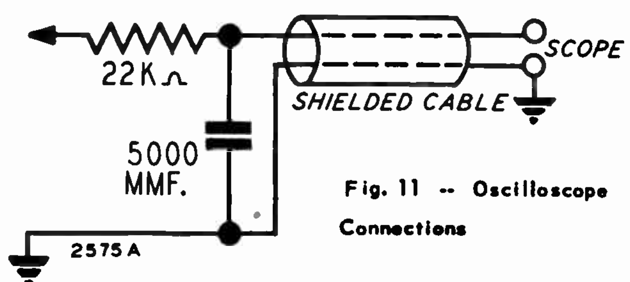

Fig. 11 -- Oscilloscope Connections

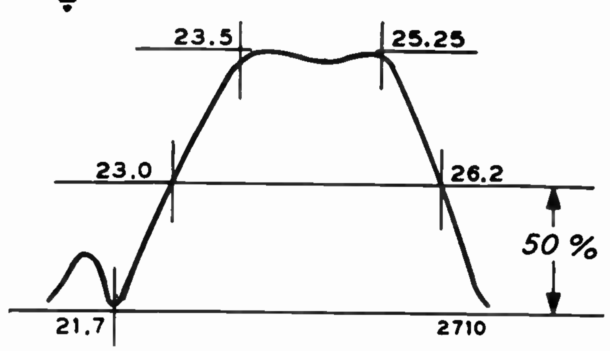

Fig. 12 -- Overall Response Curve

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is not advisable to change the setting of the coil, due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

ALIGNMENT PROCEDURE (Continued)

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 7-6ALS) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response. VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1. With signal generator set to 4.5 MC and dc VTVM connected to junction of R-62 and C-46, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.
2. With VTVM connected to pin 7 of V-12 (6ALS) adjust the ratio detector primary (T-7 Bottom) for maximum.
3. With VTVM connected to junction of R-66, R-69 and C-50, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE-- If no signal generator is available, the procedure above may be followed by tuning in a station and using the 4.5 MC beat between picture and sound carrier.

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" (Figure 13) on tuner. Connect 1½ V bias to AGC line at junction of R-33 and C-20 on the receiver.

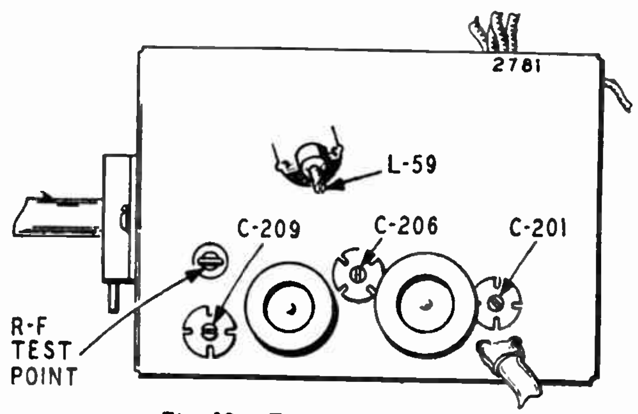

Fig. 13 -- Top Tuner Adjustments

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 14. Picture and sound markers at 90% maximum response.
2. Check response on all channels. If markers are below 70% on any channels, readjust C-201, C-206, and C-209. Recheck all channels.

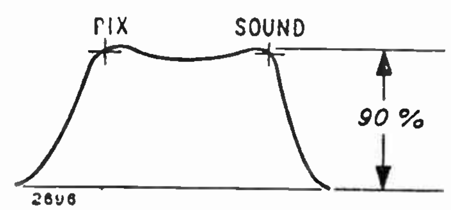

Fig. 14 -- Pix & Audio Markers

C. OSCILLATOR ADJUSTMENT.

1. Apply -4.5 volts on I-F AGC line at junction of R-1 and C-21.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 12).
3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.
4. To adjust oscillator on UHF position, feed the sweep generator with center frequency of 124 MC and markers at 121.75 and 126.25 into the input of the low pass filter (output of UHF tuner). Adjust oscillator slug in the VHF tuner so that the 121.75 pix carrier marker is at 50% and that 126.25 marker is in the sound notch. If a sweep generator is not available, a single frequency generator set to 126.25 MC and VTVM may be used. Connect VTVM to the pix detector load resistor R-100. Feed generator into the low pass filter. Adjust oscillator slug in the VHF tuner so that the 126.25 marker is in the sound notch of the I-F curve.
5. If the 6AF4 oscillator tube in the UHF tuner is replaced, it may be necessary to adjust the oscillator trimmer C-309 on the UHF tuner located underneath the chassis. (See Figure 15). Adjust this trimmer until the tuner will cover a range of below 470 MC to above 890 MC.

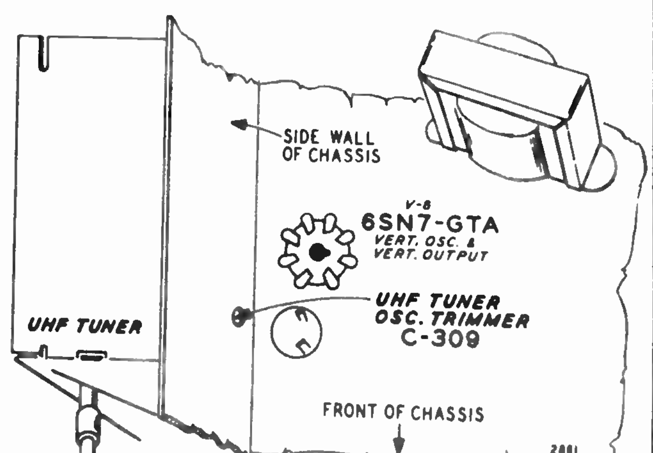

Fig. 15 -- UHF Tuner

DRIVE CORD REPLACEMENT

You will note that there are two cords used for the pointer drive system on this receiver. Part number 10X88 Drive Cord assembly and part number 28X113 Spring are used on the tuning shaft and large pulley, while part number 10X89 Drive Cord and a part number 28X603 Spring are used on the small pulley system and the pointer. Install the cords as shown in the illustration. After completing the installation rotate the fine tuning shaft a few turns to take up the slack in the cord.

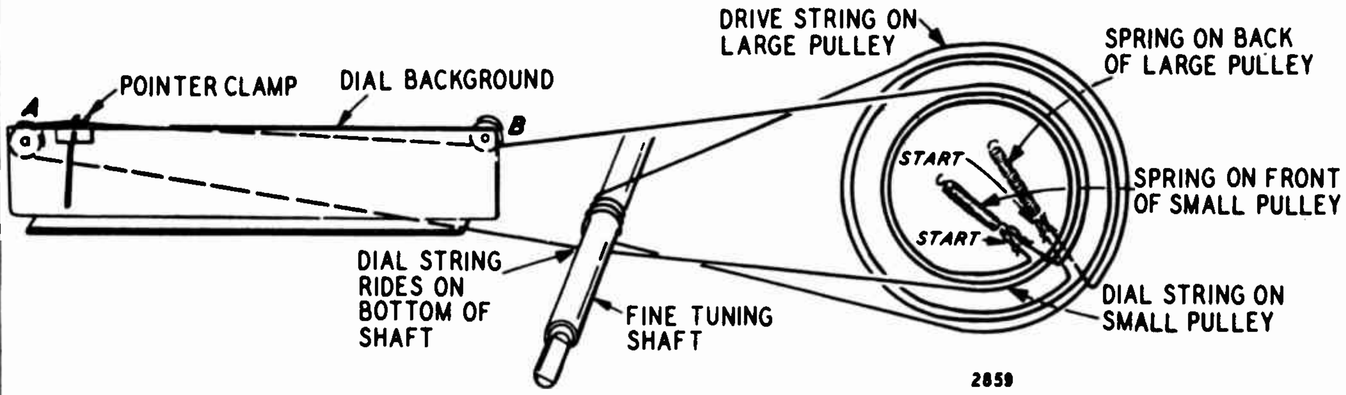

Fig. 16 – Drive Cord Replacement

UHF TUNER INFORMATION

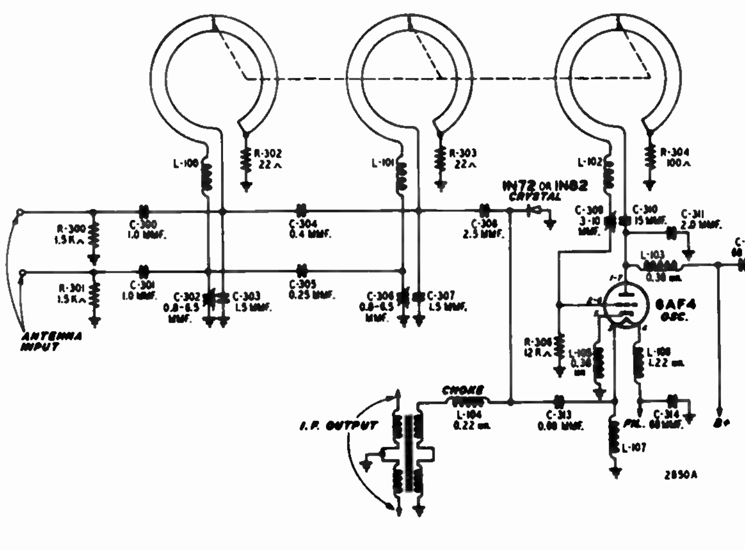

Fig. 17 -- UHF Tuner Schematic

Due to the complexity of the UHF tuner, neither servicing nor aligning is encouraged in the field because replacement of any component within the R-F circuit may disturb the band-pass characteristics of the tuner. However, the 6AF4 tube or the 1N72 (or 1N82) crystal may be replaced in the field if found to be defective. A schematic diagram of this tuner is shown only for the purpose of outlining the circuit used.

If the UHF tuner does not operate satisfactorily after the tube or crystal replacement, disconnect the tuner and return it to the factory for repair.

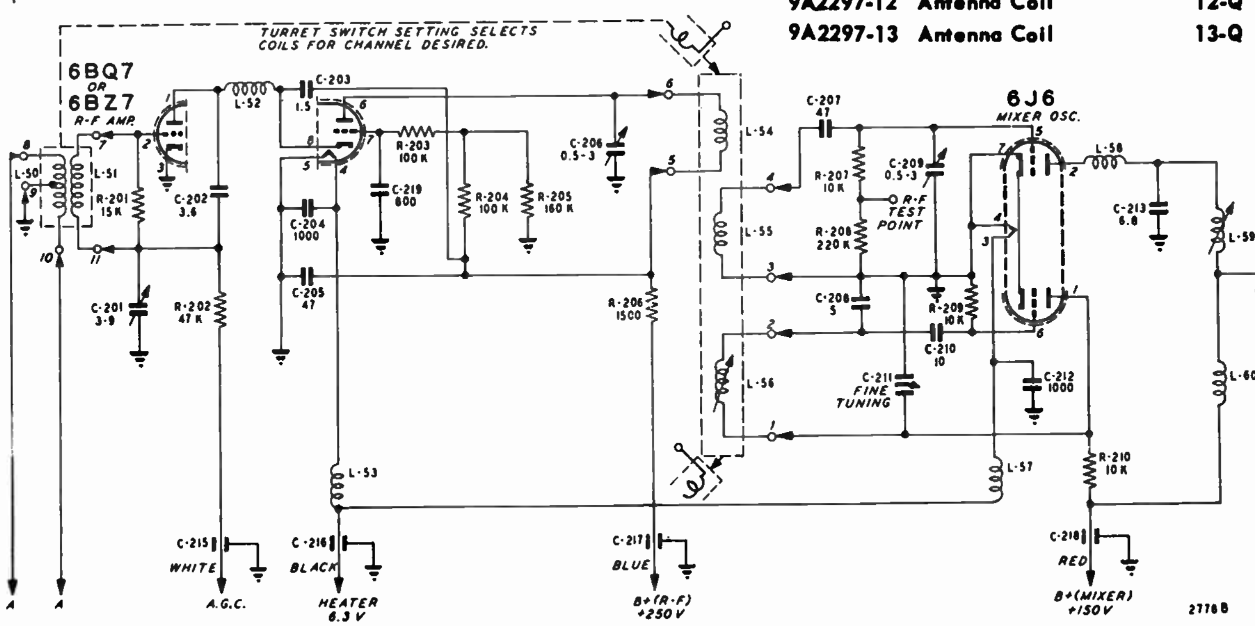

Fig. 19 -- "Q" Tuner Schematic Diagram

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.
The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicates the repetition rate of the waveform, not the sweep rate of the oscilloscope. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.

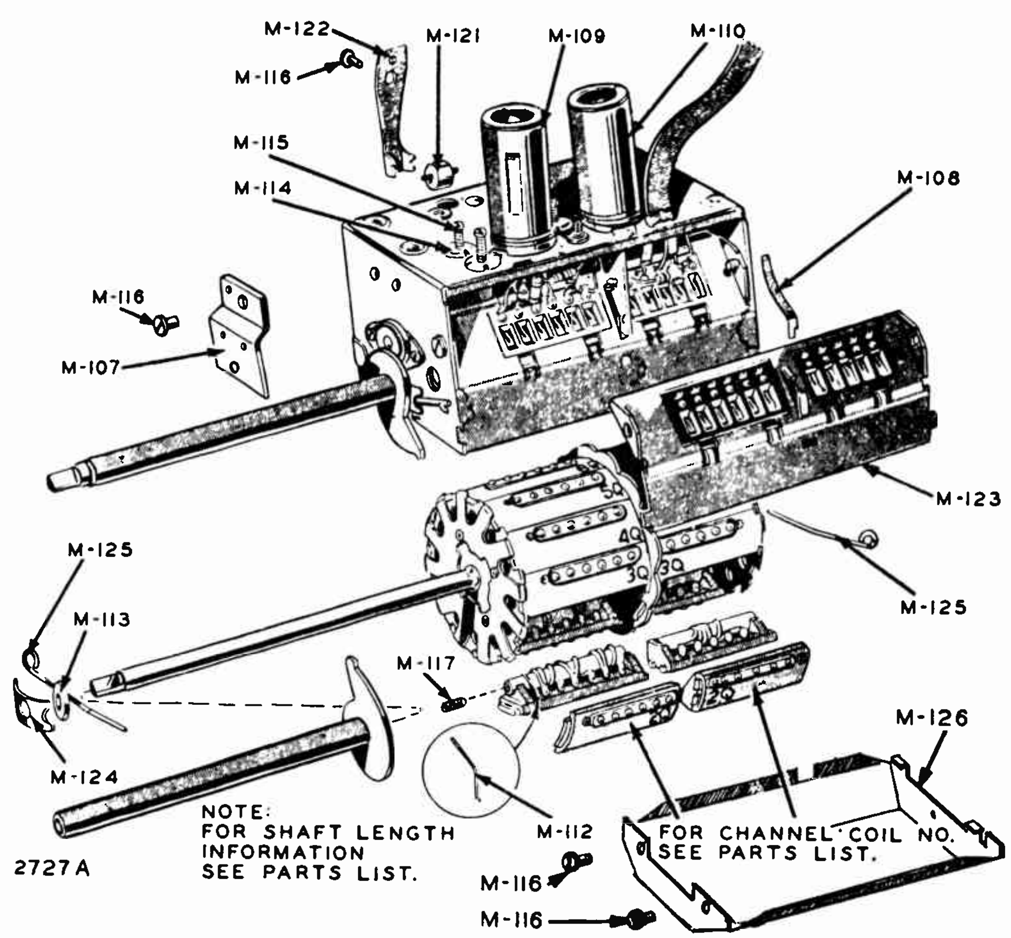
VHF TUNER ASSEMBLY INFORMATION



"Q" Tuner Pictorial

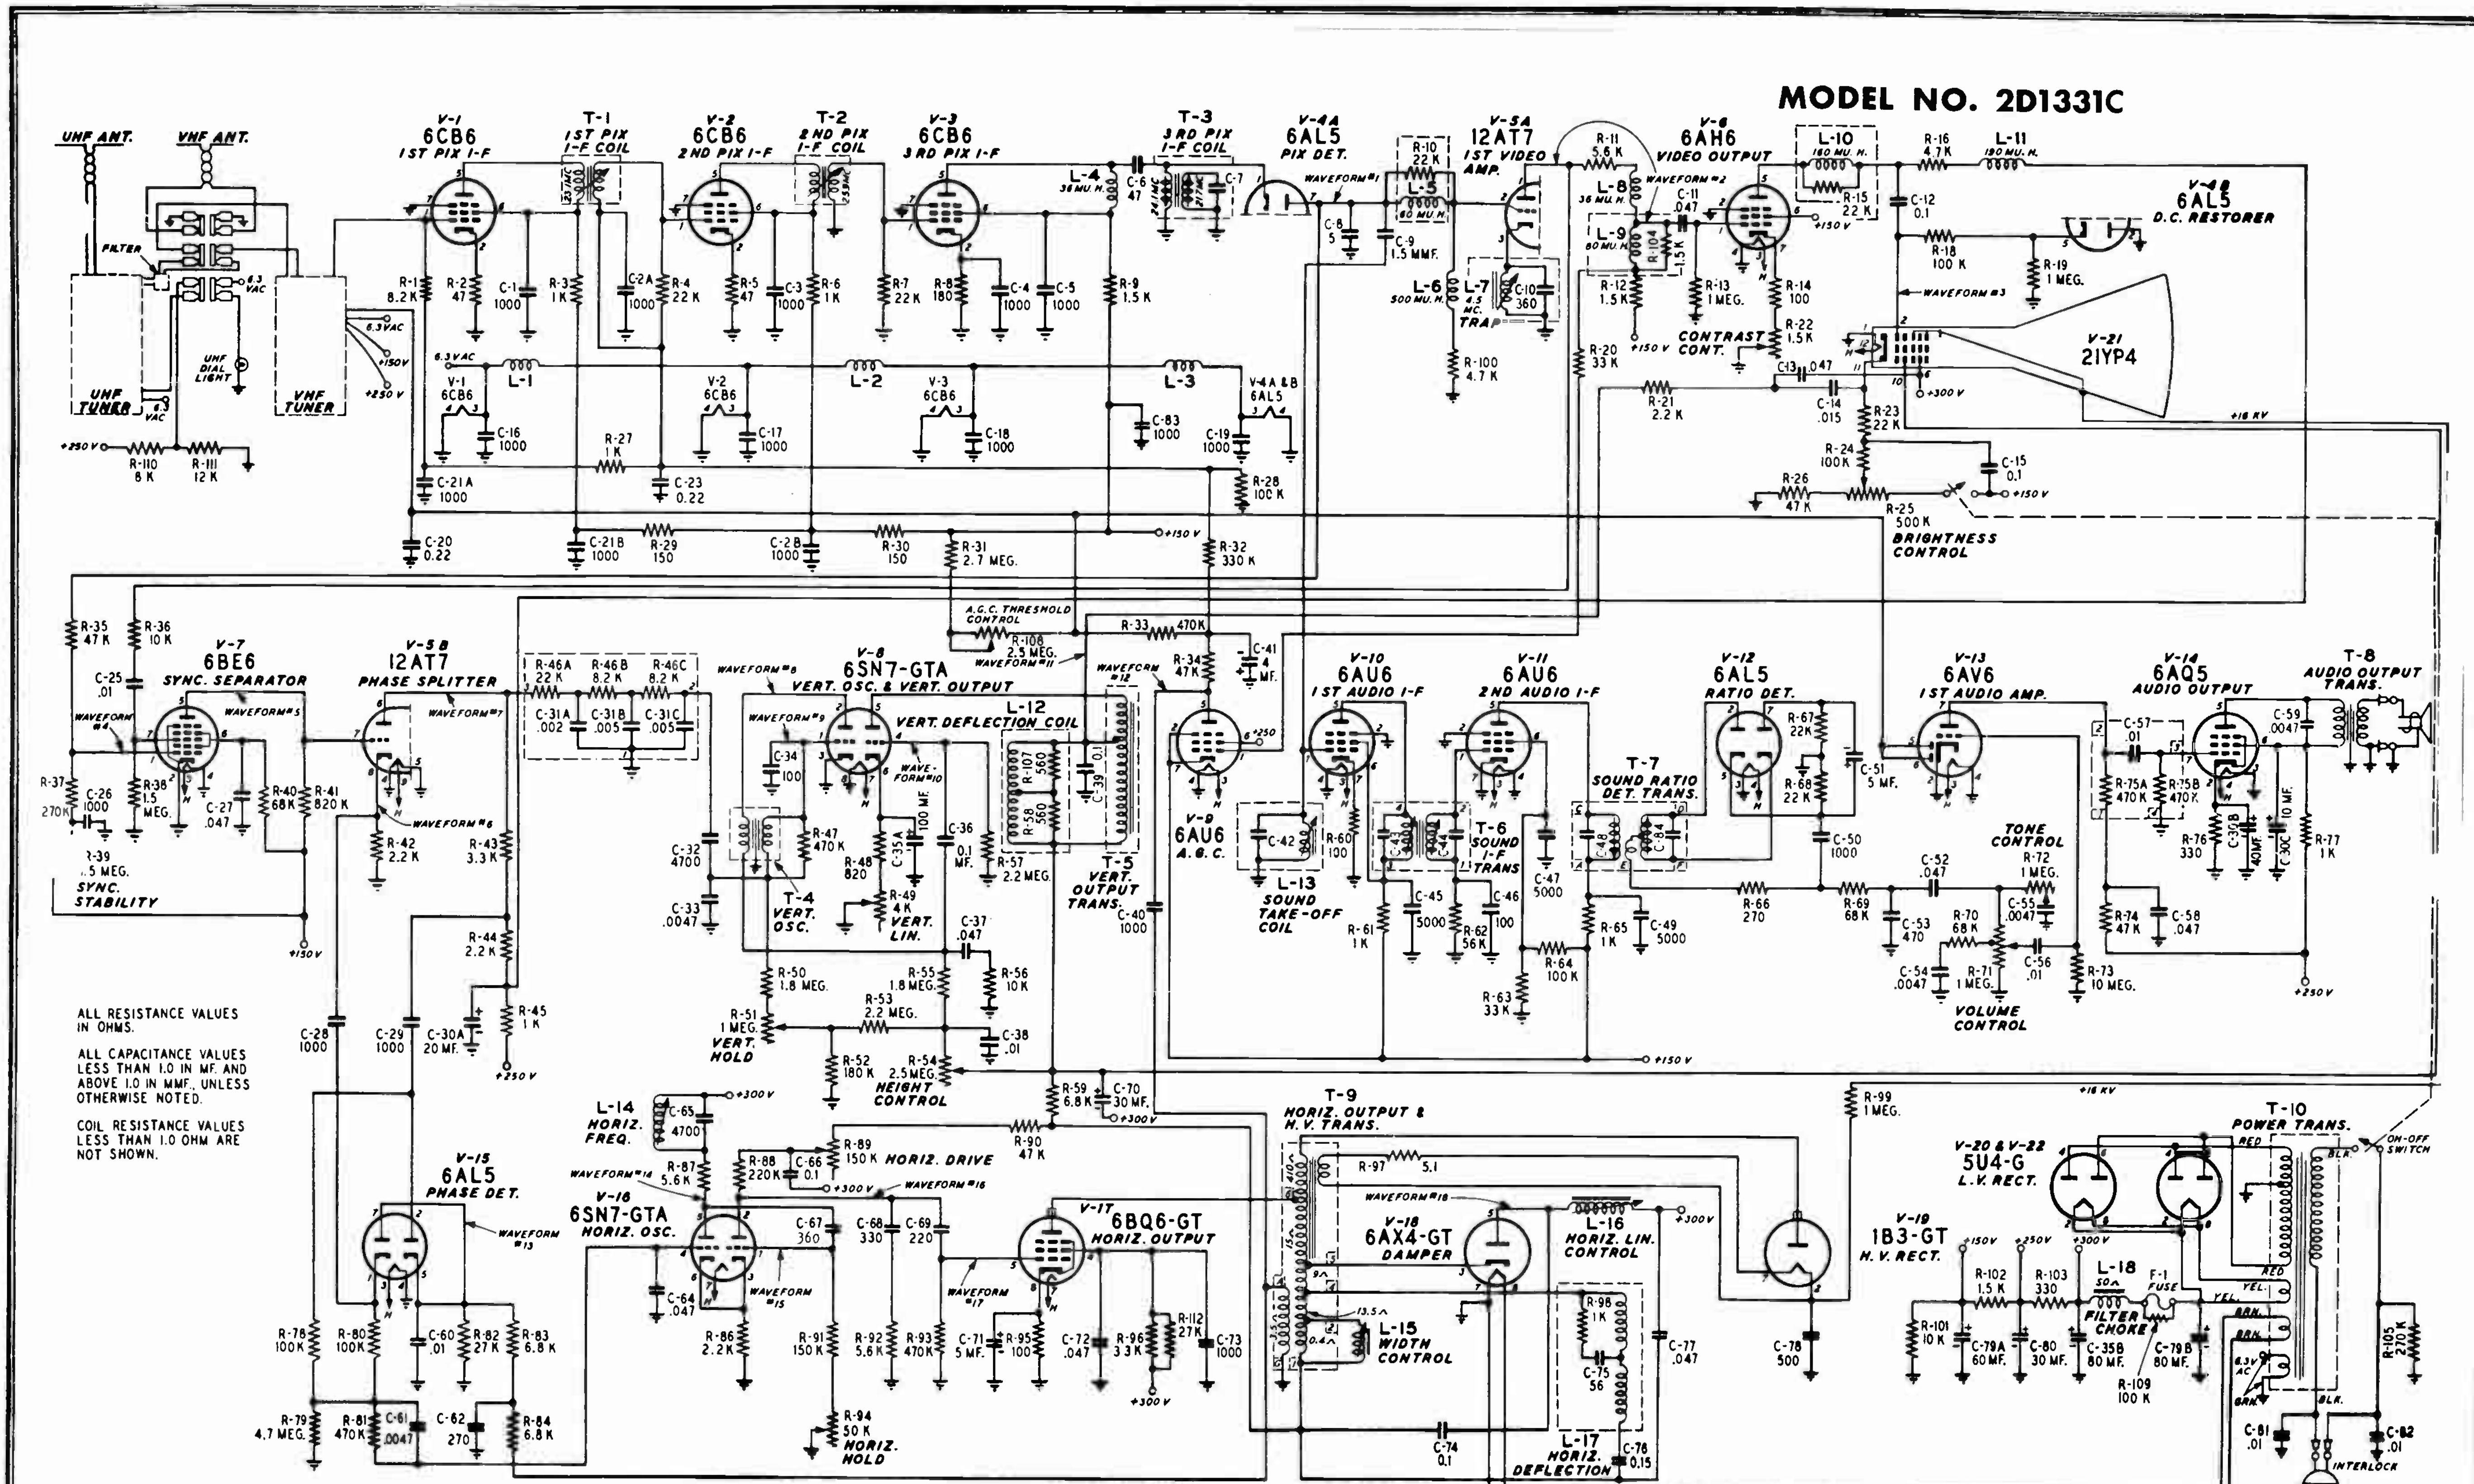
HIGH VOLTAGE WARNING

This television receiver contains high voltages which are dangerous to life. Never operate or service the receiver outside of the cabinet or with the covers removed until all the safety precautions necessary for working with high voltage equipment have been observed.

PICTURE TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves must be worn by individuals while handling the picture tube or installing the picture tube into the receiver.

The picture tube encloses a high vacuum and due to the large surface area, is subjected to very high air pressure. Therefore, care should be taken not to bump or scratch the picture tube accidentally as it may cause the tube to implode resulting in damage to property or injury to an individual.



ALL RESISTANCE VALUES IN OHMS.

ALL CAPACITANCE VALUES LESS THAN 1.0 IN MF. AND ABOVE 1.0 IN MMF., UNLESS OTHERWISE NOTED.

COIL RESISTANCE VALUES LESS THAN 1.0 OHM ARE NOT SHOWN.

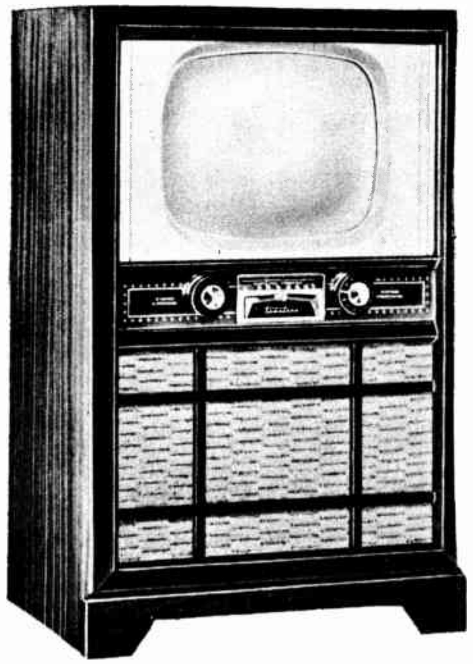
PRODUCTION CHANGES

There are two different ratio detector transformers (T-7) used in these receivers, Part Numbers 9A2269 and 9A2295. The T-7 circuit shown in this schematic diagram covers the 9A2269 ratio detector. Receivers using the 9A2295 ratio detector can be identified by the following changes:

C-50 becomes 47X570 330 mmf molded mica condenser
R-64 becomes B84333 33K ohm 0.5 W carbon resistor

R-67) R-68) become B83103 10K ohm 0.5 W carbon resistors

In addition, the 9A2295 ratio detector has terminals with numerical identification (1, 2, 3 etc.) whereas the 9A2269 ratio detector has terminals with alphabetical identification (A, B, C etc.)



MODEL NO. 2D1336A

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 Volts AC 60 Cycles Only
Power Consumption	200 Watts
Power Output	2.4 Watts (Max) 1.8 Watts (10% Distortion)
Tuning Range: VHF	Channels 2 thru 13
Tuning Range: UHF	Channels 14 thru 83
Antenna Input Imp.	300 Ohms Balanced
Intermediate Frequencies	Picture 26.20 MC Sound 21.70 MC
I-F (UHF Position Only)	Picture 121.75 Sound 126.25
Intercarrier Sound System	4.5 MC
Loud Speaker	See Parts List
Voice Coil Imp.	3.2 Ohms 400 Cycles

TUBE COMPLEMENT

Symbol	Type	Function
VHF Tuner	6J6	R-F Osc. and Mixer
VHF Tuner	6BQ7*	R-F Amplifier
UHF Tuner	6AF4	R-F Osc.
UHF Tuner	1N72 or 1N82	Crystal Mixer
V-1	6CB6	1st Pix I-F Amplifier
V-2	6CB6	2nd Pix I-F Amplifier
V-3	6CB6	3rd Pix I-F Amplifier
V-4 A & B	6AL5	Pix Det. and DC Restorer
V-5 A & B	12AT7	1st Video Amp. and Phase Splitter
V-6	6AH6	Video Output
V-7	6BE6	Sync. Separator
V-8	6SN7-GTA	Vertical Osc. & Vertical Output
V-9	6AU6	Automatic Gain Control
V-10	6AU6	1st Audio I-F
V-11	6AU6	2nd Audio I-F
V-12	6AL5	Ratio Detector
V-13	6AV6	1st Audio Amplifier
V-14	6AQ5	Audio Output
V-15	6AL5	Phase Detector
V-16	6SN7-GTA	Horizontal Oscillator

V-21	17HP4	Picture Tube 17" Glass Rectangular (Electrostatic)

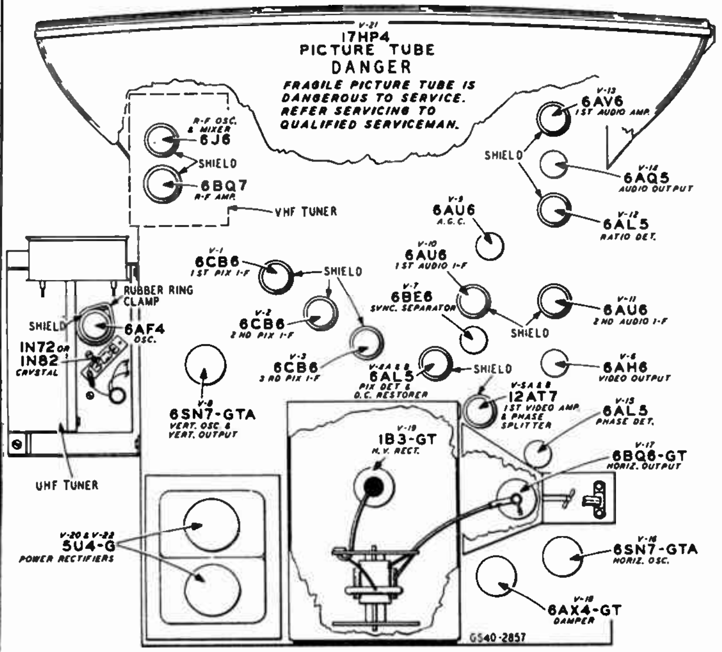

Fig. 1 -- Tube Layout.

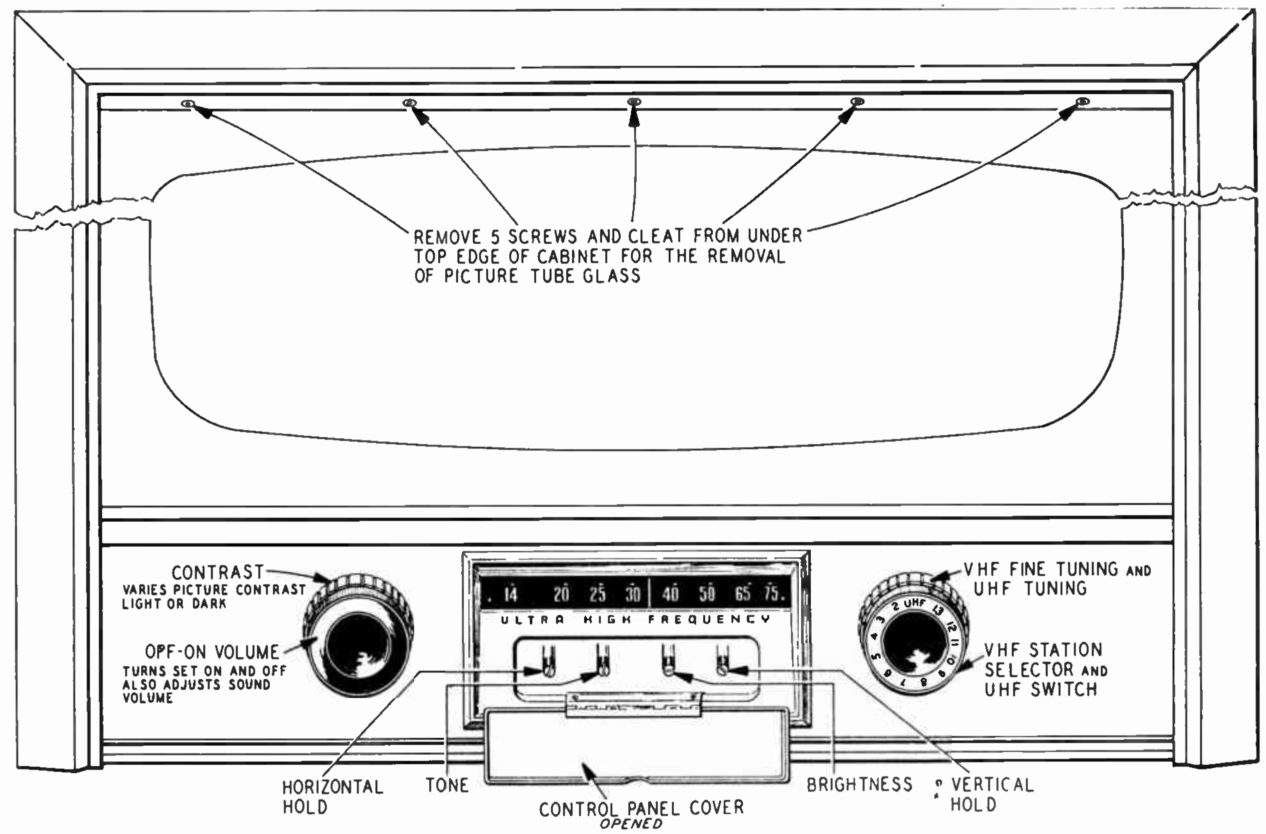

Fig. 2 -- Front Panel Controls

TUNING PROCEDURE

1. To turn the television receiver on, turn the OFF-ON VOLUME control clockwise until a click is heard. Allow approximately 30 seconds for the tubes to warm up.
2. Turn the STATION SELECTOR control to the desired channel. This control may be turned in either direction.
3. Turn the CONTRAST control clockwise until activity or definite form is noted on the screen.
4. Adjust the FINE TUNING control for clearest picture and the VOLUME control for desired volume.
5. To turn off the receiver, turn the OFF-ON VOLUME control counter-clockwise until a click is heard.
6. TONE CONTROL -- When this control is turned clockwise, the high notes will predominate and when turned counter-clockwise, a deep bass effect will result.
7. In localities where UHF programs are available, turn the STATION SELECTOR control to the UHF position and tune in the desired station with the UHF Tuning Control. The dial scale is calibrated in channel numbers and covers the entire UHF range of channels 14 through 83.

OCCASIONAL ADJUSTMENTS TO IMPROVE PICTURE RECEPTION

There are four controls at the front of the chassis which are accessible when the hinged control panel is pulled downword. See illustration above. These controls are pre-set at the factory and may occasionally need adjustment due to aging of the components in the receiver and fluctuating line voltages in different areas.

If any adjustments are necessary follow the instructions under "Controls and Functions."

IMPORTANT -- Be sure that the FINE TUNING control has been set for the clearest picture before adjusting any controls.

CONTROLS AND FUNCTIONS

HORIZONTAL HOLD -- Stops horizontal movement (diagonal bars.)

TONE -- Adjusts for tonal quality bass or treble.

BRIGHTNESS -- Adjusts for desired picture brilliance.

VERTICAL HOLD -- Stops upward or downward picture movement.

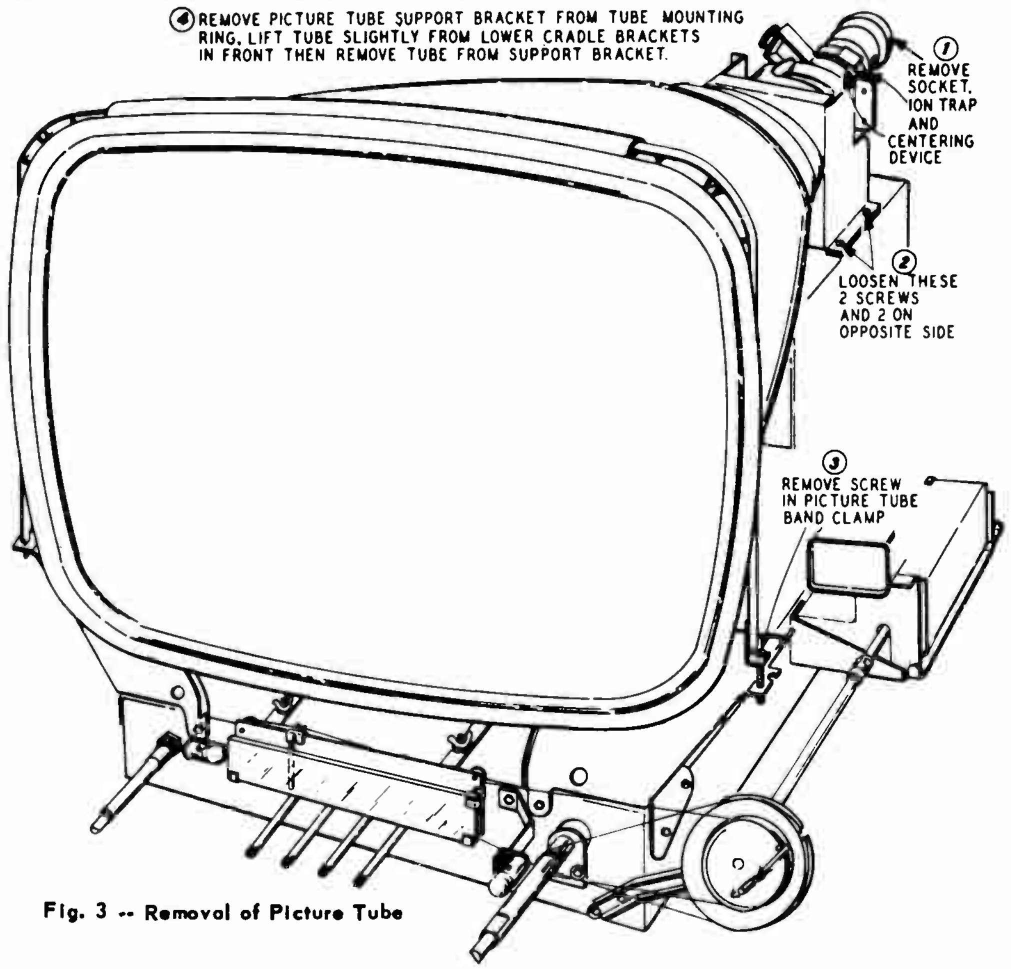

Fig. 3 -- Removal of Picture Tube

When the sync stability control is correctly adjusted the receiver will hold sync without tearing or rolling under even the most adverse noise conditions.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT -- Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, it will be necessary to make the following adjustment.

HORIZONTAL FREQUENCY ADJUSTMENT -- With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-14) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

HEIGHT AND VERTICAL LINEARITY ADJUSTMENT -- Adjust the height control (R-54) until the picture fills the mask vertically. Adjust the vertical linearity control (R-49) until the picture is symmetrical from top to bottom. Adjust the picture centering device to align picture with the mask. Adjustment of any control will require a re-adjustment of the other control.

WIDTH, DRIVE AND LINEARITY ADJUSTMENTS -- While receiving a signal from a station (with picture locked in sync) turn contrast control fully counter-clockwise, turn the brightness control (R-25) up so that the picture appears washed out. Adjust width control (L-15) until the picture fills the mask. Turn the horizontal drive control (R-89) clockwise until white bars appear in the left center portion of the raster, then turn counter-clockwise until the white bars just disappear. This adjustment will allow the horizontal system to operate at maximum efficiency. Adjust horizontal linearity control (L-16) for best linearity. If adjustment of the horizontal drive (R-89) or horizontal linearity (L-16) is required, it usually will be necessary to recheck the horizontal oscillator alignment. If adjustment of the horizontal linearity control (L-16) is required, readjustment of the horizontal drive control (R-89) will be necessary. Adjust the picture centering device to align the picture with the mask.

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is pre-set at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PRODEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

CAUTION -- These adjustments are only intended for VHF Channels. For information regarding UHF alignment, see paragraph "Tuner Alignment" on page 11.

ADJUSTMENT OF AGC THRESHOLD CONTROL -- Tune the receiver to the strongest station in the area in which the receiver will be used. While observing the picture and listening to the sound, turn the control clockwise until signs of overloading (buzz in sound, washed-out picture) appear. Then turn the control a few degrees counter-clockwise from the point at which overloading occurs. (The stronger the signal input, the more counter-clockwise this setting will be.) In areas where the strongest signal does not exceed 10,000 uv the setting will usually be maximum clockwise. With the control set correctly, the AGC will automatically adjust the bias on the R.F. and I.F. amplifiers so that the best possible signal to noise ratio (Minimum snow) will be obtained for any signal input to the receiver.

ADJUSTMENT OF SYNC STABILITY CONTROL -- When receiving strong (500 MV or more) signals, set hold controls so that the picture is locked in. Turn the sync control fully counter-clockwise, then, while observing the picture, turn the control slowly clockwise until a minimum amount of bending occurs. If the control is set incorrectly bending, tearing, etc., will be present and when switching from channel to channel the picture will not lock in quickly.

In weak signal areas the control should be set for maximum picture stability. In general the weaker the signal the more clockwise the control should be turned.

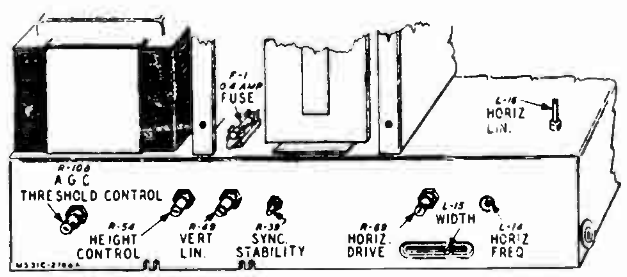

Fig. 4 - Adjustments Rear of Chassis

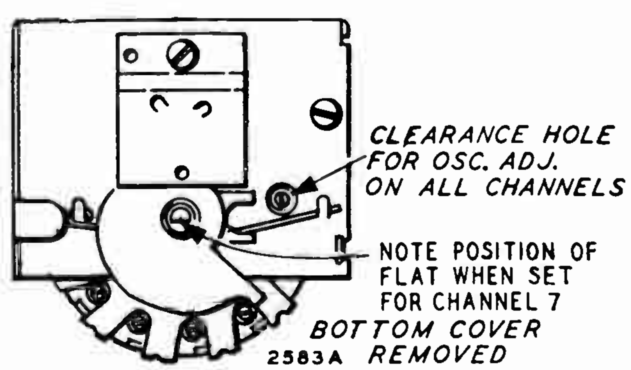

Fig. 5 -- Tuner Oscillator Adjustments

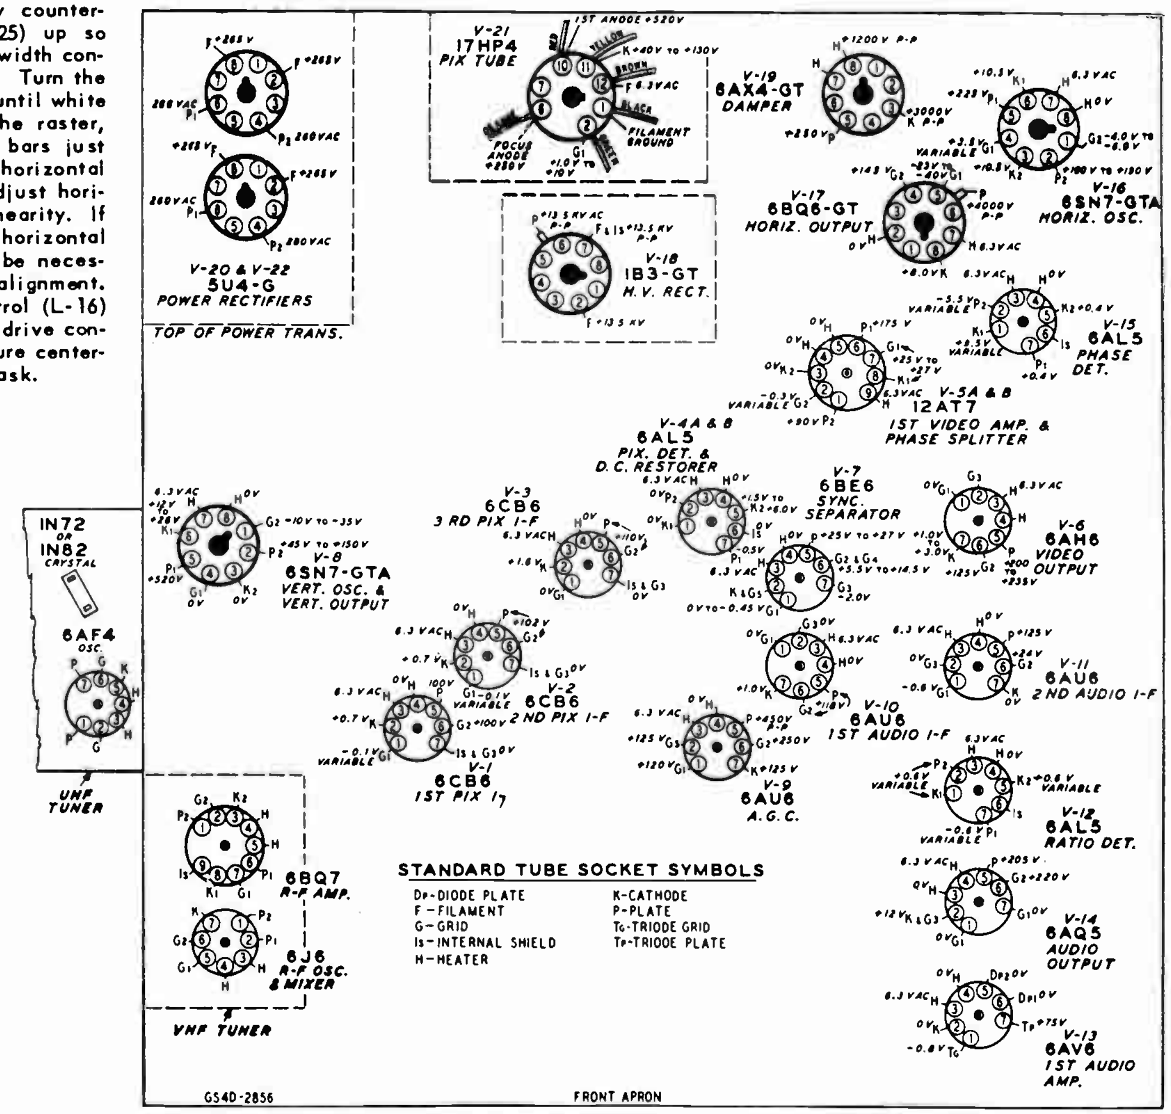

Fig. 6 -- Bottom Socket Voltages

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE -- If raster cannot be obtained check below for the possible causes.
1. Ion trap magnet adjustment is incorrect.
2. No +B voltage. Check 4/10 ampere fuse. Replace if defective. If fuse continually burns out, check.
   (A) Horizontal output tube V-17 (6BQ6-GT)
   (B) Check damper tube V-18 (6AX4-GT).
   (C) Check horizontal oscillator tube V-16 (6SN7-GTA) for proper operation.
   (D) With an ohm meter, check for a short between terminal 1 of the horizontal output transformer (T-9) and the chassis.
   (E) Check DC resistance of T-9
3. No high voltage. Check V-17, V-18 and V-19 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage (600V) measured on terminal No. 1 of T-9, the trouble can be isolated to the high voltage rectifier circuit. Either the high voltage winding to the 6BQ6-GT plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, R-99 and C-78 defective or pix tube elements shorted internally.
4. Defective picture tube heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY -- If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:
1. Vertical oscillator and vertical output tube V-8 inoperative. Check socket voltages.
2. Vertical oscillator transformer (T-4) defective.
3. Vertical output transformer (T-5) open or shorted.
4. Yoke vertical coils open or shorted.
5. Vertical hold, height or linearity controls may be defective.

POOR VERTICAL LINEARITY -- If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.
1. Check variable resistors R-49 and R-54.
2. Vertical output transformer (T-5) defective.
3. Capacitors C-35A, C-39 or C-70 defective.
4. V-8 defective, check voltages.
5. Excess leakage or incorrect value of capacitor C-37, or open or incorrect value of resistors R-55 & R-56.
6. Low plate voltages. Check rectifier tube and capacitors in +B supply circuits.
7. Capacitor C-36 defective.
8. Vertical deflection coils (L-12) defective.

POOR HORIZONTAL LINEARITY -- If adjustment of the Horizontal drive and linearity controls does not correct this condition, check the following:
1. Check or replace horizontal output tube V-17.
2. Check or replace damper tube V-18 (6AX4-GT).
3. Check capacitors C-74, C-76, C-77 and horizontal linearity control (L-16) for defects.
4. Horizontal deflection coils (L-17) defective.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER
1. Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER -- This condition can be caused by:
1. Defective yoke due to C-75 or R-98 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.
2. V-18 (6AX4-GT) defective.

SMALL RASTER -- This condition can be caused by:
1. Low +B or line voltage. Check V-20 & V-22 (5U4G).
2. Insufficient output from horizontal output tube V-17. Replace tube.
3. Insufficient output from vertical oscillator and vertical output tube V-8. Replace tube.
4. Incorrect setting of horizontal drive control R-89.
5. V-18 (6AX4-GT) defective.
6. Incorrect setting of (L-15) width control.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND -- This condition can be caused by:
1. No signal on picture tube grid. Check V-5A (12AT7) and V-6 (6AH6) tubes and associated circuits.
2. Bad contact to picture tube grid (lead to socket broken).
3. AGC tube (V-9) may be defective. Check tube and its associated circuit.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY -- A condition of this nature can be caused by:
1. Defective sync separator V-7 or phase splitter V-5B.
2. If tubes are O. K. check voltages, and associated circuits.
3. AGC system inoperative. Check V-9 (6AU6) AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY -- If this condition is encountered, check:
1. Vertical integrating network capacitors C-31A, B & C, and resistors R-46 A, B & C.
2. Vertical hold control (R-51) defective.

SIGNAL ON PICTURE TUBE GRID AND VERTICAL SYNC ONLY
1. V-15 or V-16 defective.
2. Improper setting of (L-14) horizontal frequency control.
3. Check setting of horizontal drive control and horizontal linearity control.
4. Check V-15 and V-16 socket voltages.

PICTURE STABLE BUT WITH POOR RESOLUTION -- If the picture resolution is not up to standard, it may be caused by any of the following:
1. Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2. Defective picture detector V-4A, (6AL5) or video amplifier V-5A or video output V-6 (6AH6).
3. Defective picture tube.
4. Open video peaking coil. Check all peaking coils L-5, L-6, L-8. L-9, L-10 and L-11 for continuity. Note that L-5, L-9, L-10, L-11 have shunting resistors.
5. Leakage in V-6 (6AH6) grid capacitor C-11. If the capacitor is not found to be defective, check the following:
   1. Check all potentials in video circuits.
   2. Check picture tube grid circuit for poor or dirty contact.
   3. Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE SMEAR:
1. A smear can be attributed to phase shift at the low or high frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6 (6AH6), open or shorted peaking coils, video amplifier load resistors are of improper value (high).
2. This trouble can also originate at the transmitter. Check reception from another station.
3. Check and realign, if necessary, the picture I-F and R-F circuits.

MAN MADE NOISE IN SOUND (Ignition, etc.)
1. Check sound I-F tubes V-10, 11 & 12 and associated circuits.
2. Check sound I-F alignment.

BENDING OR S-ING
1. Check sync stability control adjustment.
2. Check capacitors C-35B and C-79B.
3. V-17 (6BQ6-GT) defective or V-16 (6SN7-GTA) defective.
4. Check sync separator tube V-7 (6BE6) and phase splitter V-5B (12AT7) and V-5A (12AT7) video amplifier.
5. Check AGC threshold control.

PICTURE NORMAL -- NO SOUND OR WEAK OR DISTORTED SOUND
1. Check sound I-F alignment.
2. Check V-10 (6AU6) V-11 (6AU6) V-12 (6AL5) V-13 (6AV6) V-14 (6AQ5) and associated circuits.

RASTER ON TUBE BUT NO PICTURE OR SOUND
This condition can be caused by,
1. Defective pix I-F Amplifier tubes V-1, V-2 or V-3.
2. Defective pix detector tube V-4A (6AL5). Check tube and its associated circuit.
3. Defective R-F Amplifier or oscillator mixer tubes in the tuner.
4. UHF-VHF switch defective.

POOR FOCUS
1. Improper setting of Ion Trap magnet.
2. Defective picture tube or picture tube socket.

PICTURE JITTER:
1. If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2. Vertical instability may be due to loose connections or noise received with the signal.
3. Horizontal instability may be due to unstable transmitted sync.
4. Check receiver AGC system for proper operation.
5. Check phase splitter V-5B, (12AT7) and sync separator V-7 (6BE6).
6. Check for improper setting of sync stability control.
7. Picture tube grid lead not held in position by support spring, ie; close proximity of grid lead to sync and horizontal tubes will cause picture to jitter at high contrast setting.
8. Check AGC threshold control.

NO PICTURE OR SOUND OR WEAK PICTURE OR SOUND (UHF Position)
If this condition is encountered:
1. Check to see whether or not a UHF station is operating in the vicinity.
2. The 6AF4 oscillator tube or the 1N72 (or 1N82) crystal may be defective.
3. Pre-selector in UHF tuner defective.
4. Low pass filter defective.
5. The UHF position antenna and oscillator strips in the VHF tuner defective.
6. Defective Switch on UHF tuner.

ALIGNMENT PROCEDURE

TEST EQUIPMENT -- To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:
(a) Frequency ranges:
- 18 to 30 mc, 10 mc sweep width
- 40 to 90 mc, 10 mc sweep width
- 120 to 130 mc, 10 mc sweep width
- 170 to 225 mc, 10 mc sweep width
- 470 to 890 mc, 10 mc sweep width

(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)
(a) Intermediate alignment frequencies.
- 23.1 mc first picture I-F coil.
- 24.1 mc third picture I-F coil.
- 25.9 mc second picture I-F coil.
- 21.7 mc sound trap.
- 4.5 mc video trap & sound I-F.
- 25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS -- To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, remove the antenna terminal board at rear of cabinet, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the power transformer and pix tube brackets.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-99.

ALIGNMENT PROCEDURE

PIX I-F

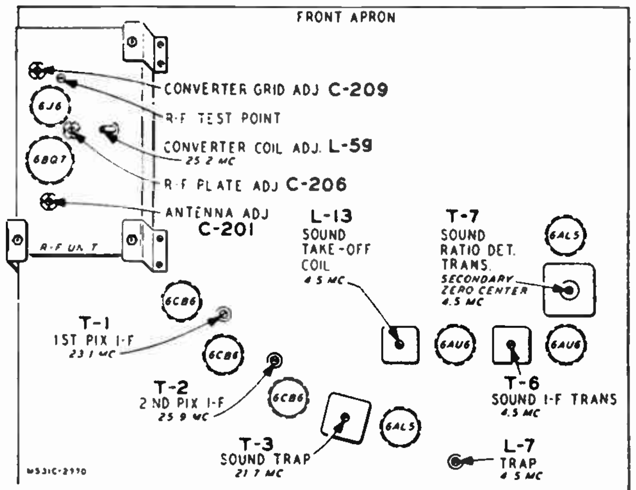

Fig. 8 -- Top Chassis Video and Audio I-F Adjustments

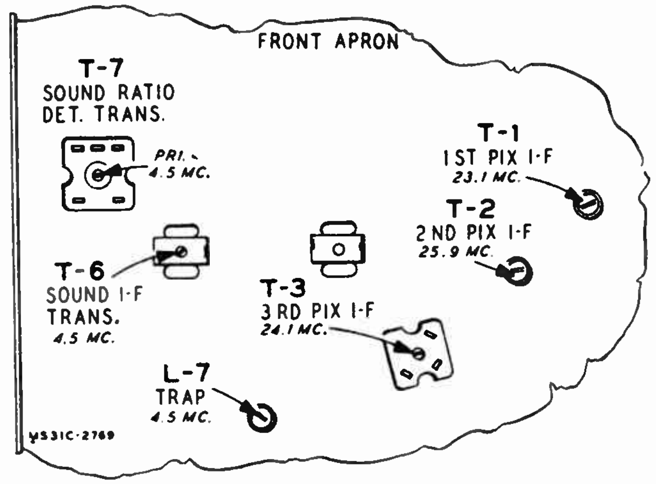

Fig. 9 -- Bottom Chassis Video and Audio I-F Adjustments

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-100) 4700 ohms, in series with peaking coil (L-6) from Pin 7 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply −4.5V battery bias on AGC line.

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil on top of tuner for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.

Connect oscilloscope across R-100 (in place of VTVM). Apply −4.5V bias (DC) to AGC line (battery).

Tuner should be switched to dead channel so as not to cause interference.

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

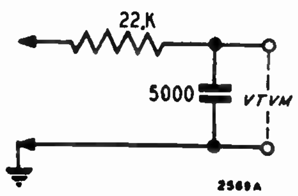

Fig. 10 -- VTVM Connections

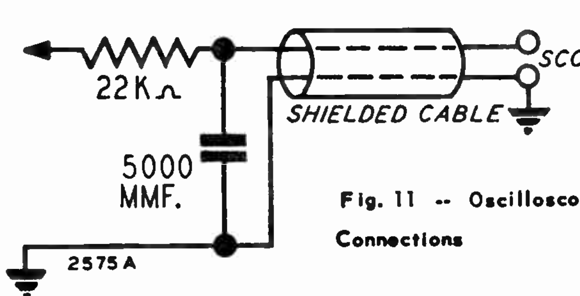

Fig. 11 -- Oscilloscope Connections

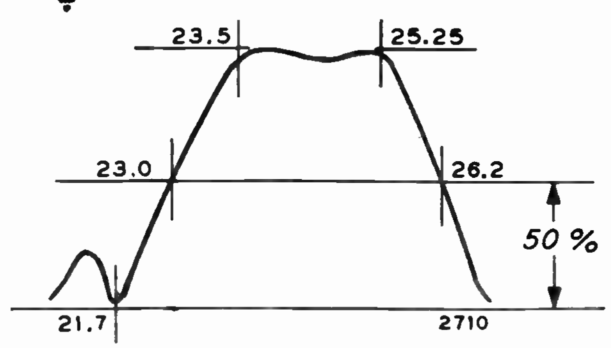

Fig. 12 -- Overall Response Curve

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is not advisable to change the setting of the coil, due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 7-6AL5) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response. VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1. With signal generator set to 4.5 MC and dc VTVM connected to junction of R-62 and C-46, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.
2. With VTVM connected to pin 7 of V-12 (6AL5) adjust the ratio detector primary (T-7 Bottom) for maximum.
3. With VTVM connected to junction of R-66, R-69 and C-50, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE-- If no signal generator is available, the procedure above may be followed by tuning in a station and using the 4.5 MC beat between picture and sound carrier.

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" (Figure 13) on tuner. Connect 1½ V bias to AGC line at junction of R-33 and C-20 on the receiver.

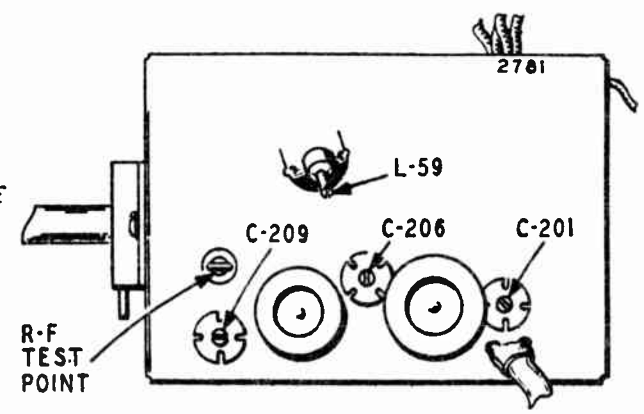

Fig. 13 -- Top Tuner Adjustments

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 14. Picture and sound markers at 90% maximum response.
2. Check response on all channels. If markers are below 70% on any channels, readjust C-201, C-206, and C-209. Recheck all channels.

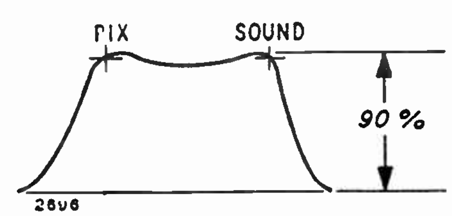

Fig. 14 -- Pix & Audio Markers

C. OSCILLATOR ADJUSTMENT.

1. Apply −4.5 volts on I-F AGC line at junction of R-1 and C-21.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 12).
3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.
4. To adjust oscillator on UHF position, feed the sweep generator with center frequency of 124 MC and markers at 121.75 and 126.25 into the input of the low pass filter (output of UHF tuner). Adjust oscillator slug in the VHF tuner so that the 121.75 pix carrier marker is at 50% and that 126.25 marker is in the sound notch. If a sweep generator is not available, a single frequency generator set to 126.25 MC and VTVM may be used. Connect VTVM to the pix detector load resistor R-100. Feed generator into the low pass filter. Adjust oscillator slug in the VHF tuner so that the 126.25 marker is in the sound notch of the I-F curve.
5. If the 6AF4 oscillator tube in the UHF tuner is replaced, it may be necessary to adjust the oscillator trimmer C-309 on the UHF tuner located underneath the chassis. (See Figure 15). Adjust this trimmer until the tuner will cover a range of below 470 MC to above 890 MC.

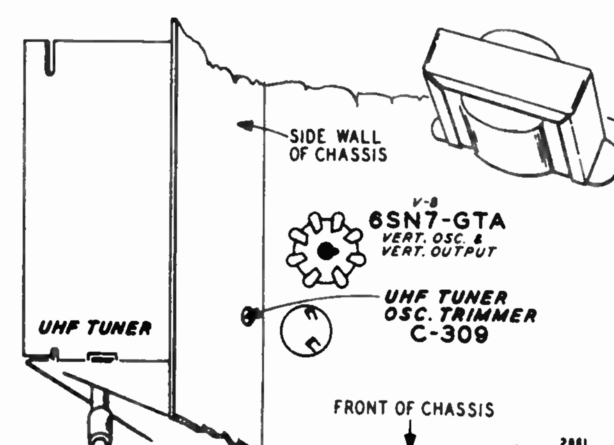

Fig. 15 -- UHF Tuner

DRIVE CORD REPLACEMENT

You will note that there are two cords used for the pointer drive system on this receiver. Part number 10X88 Drive Cord assembly and part number 28X113 Spring are used on the tuning shaft and large pulley, while part number 10X89 Drive Cord and a part number 28X603 Spring are used on the small pulley system and the pointer. Install the cords as shown in the illustration. After completing the installation rotate the fine tuning shaft a few turns to take up the slack in the cord.

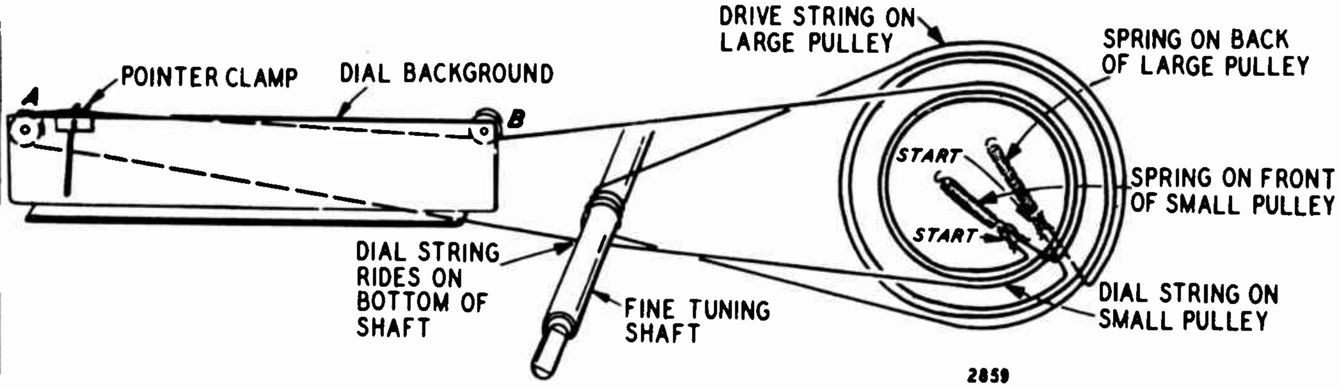

Fig. 16 -- Drive Cord Replacement

UHF TUNER INFORMATION

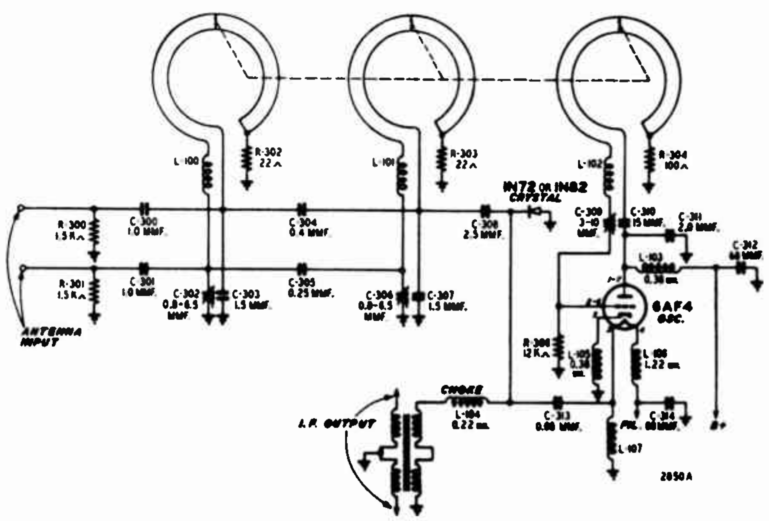

Fig. 17 -- UHF Tuner Schematic

Due to the complexity of the UHF tuner, neither servicing nor aligning is encouraged in the field because replacement of any component within the R-F circuit may disturb the band-pass characteristics of the tuner. However, the 6AF4 tube or the 1N72 (or 1N82) crystal may be replaced in the field if found to be defective. A schematic diagram of this tuner is shown only for the purpose of outlining the circuit used.

If the UHF tuner does not operate satisfactorily after the tube or crystal replacement, disconnect the tuner and return it to the factory for repair.

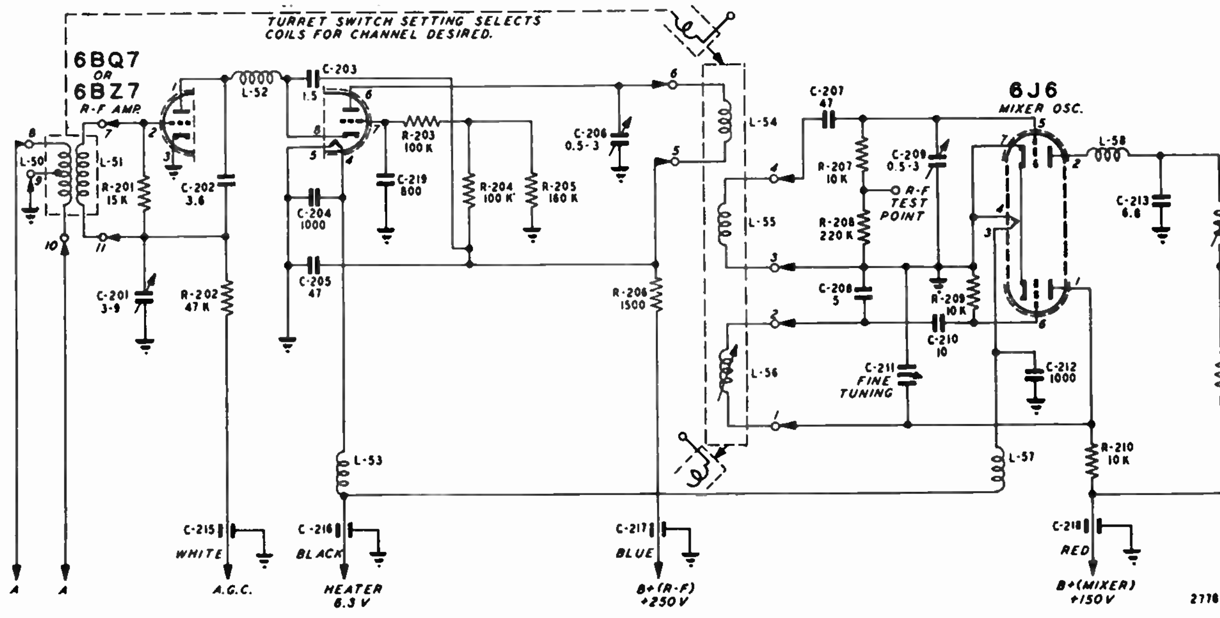

Fig. 19 -- "Q" Tuner Schematic Diagram

VHF TUNER ASSEMBLY INFORMATION

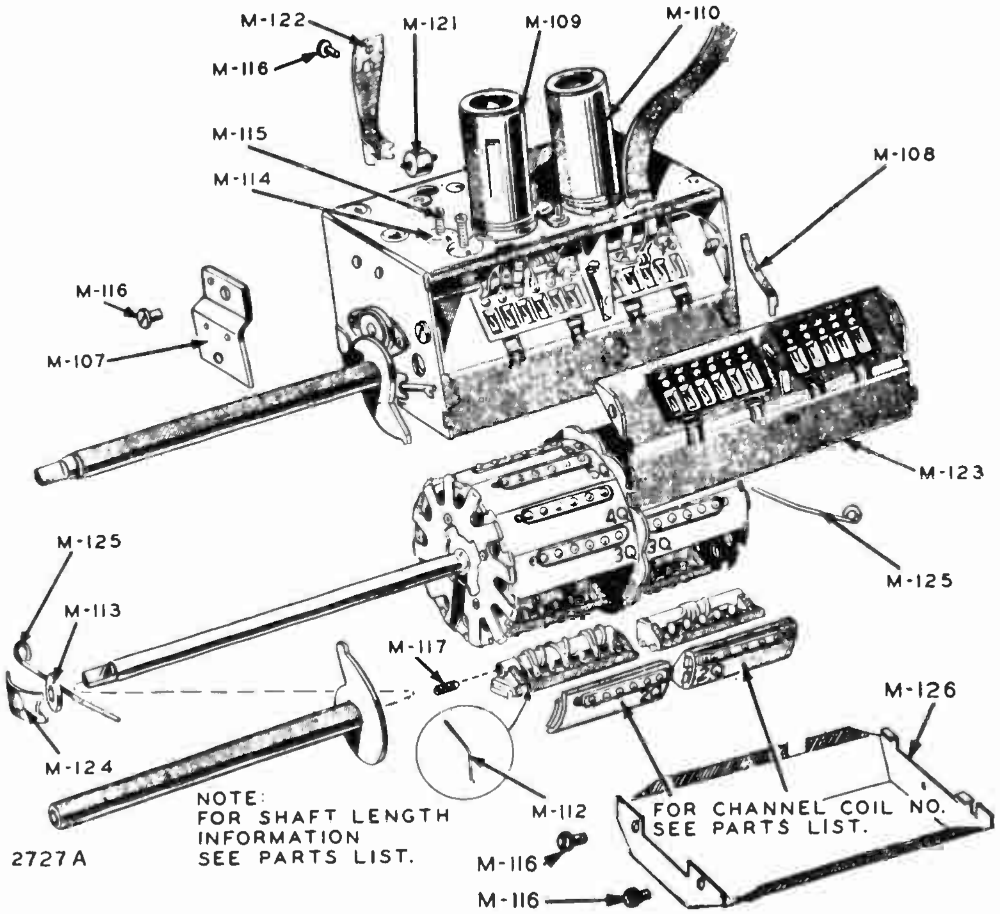

Fig. 18 – "Q" Tuner Pictorial

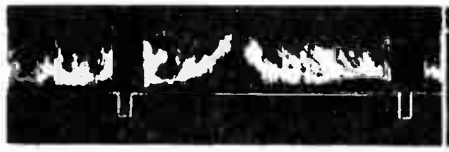
OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.

The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicates the repetition rate of the waveform, not the sweep rate of the oscilloscope. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.



No. 1—6AL5 Pix Det. Plate
3.5V P-P 60 C.P.S.
No. 4—6BE6 Sync Sep.
Grid No. 1 .2V P-P 60 C.P.S.

No. 6—12AT7 Phase Splitter Cathode
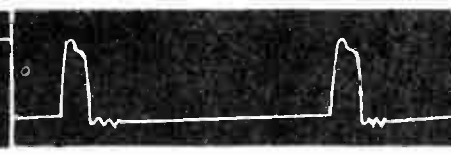
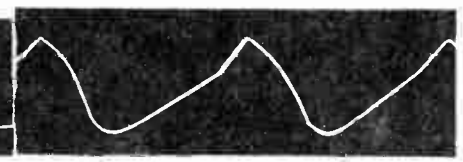
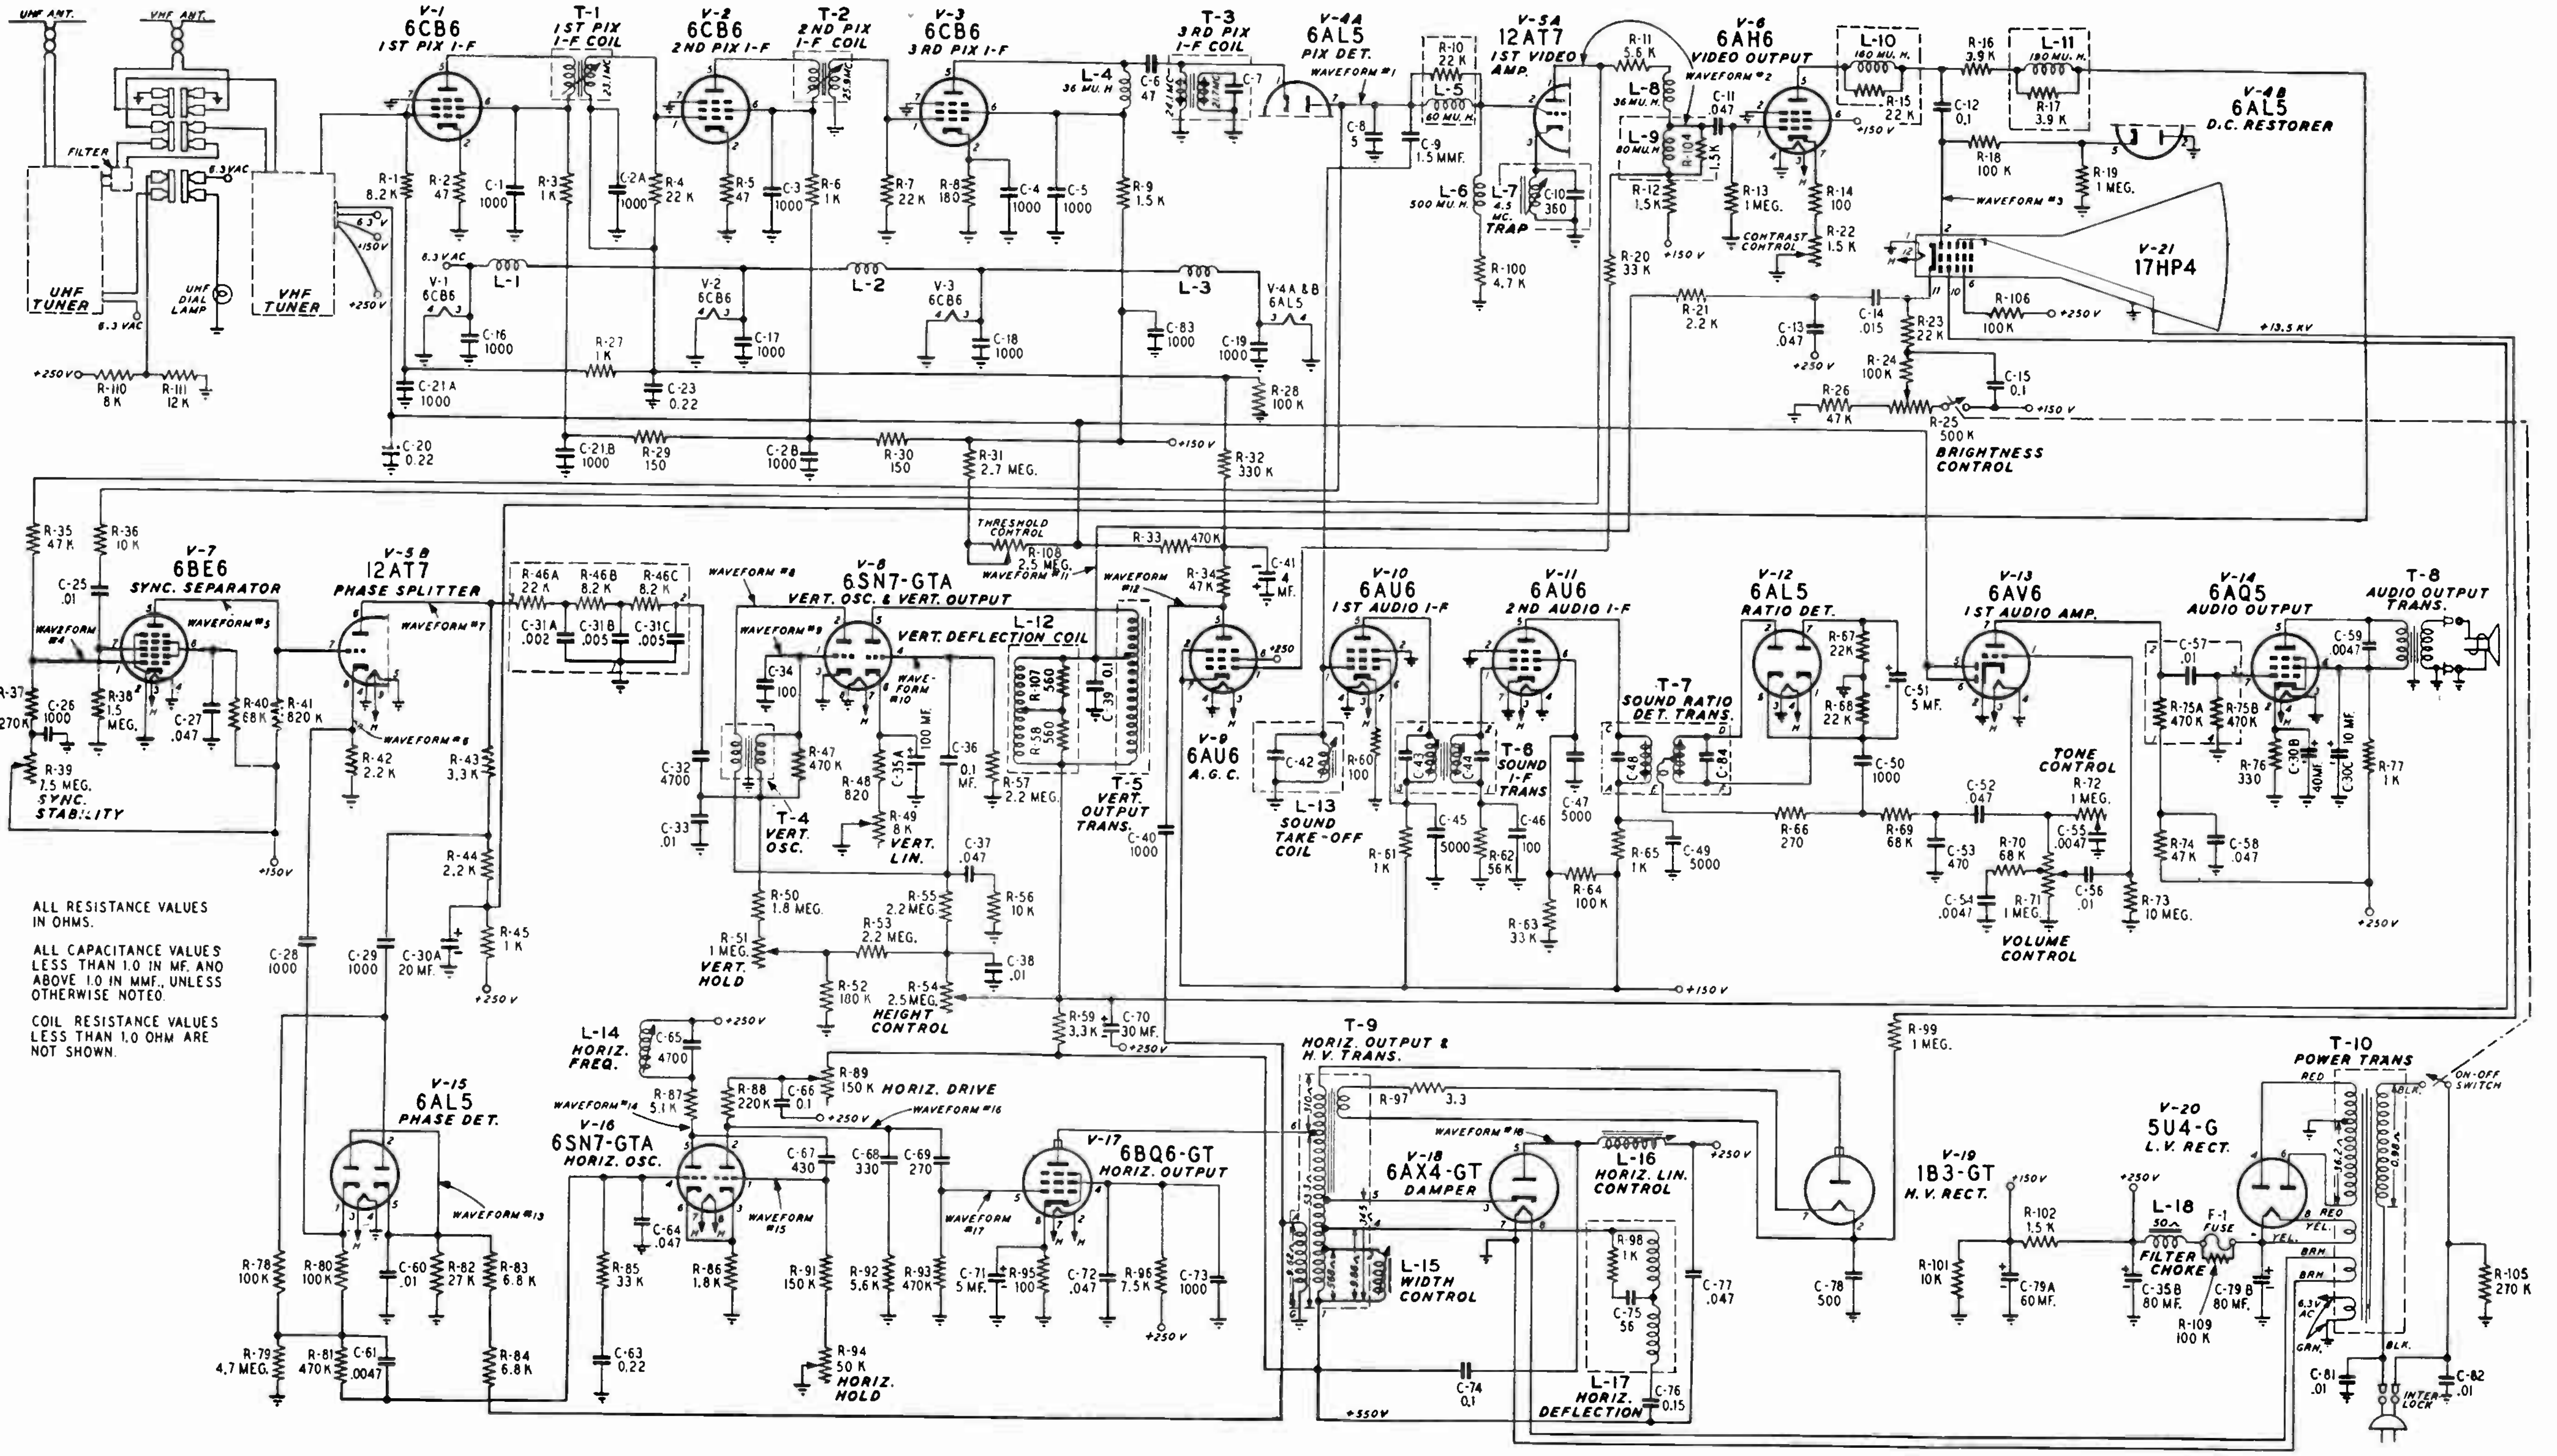
18V P-P 15,750 C.P.S.



No. 12—6AU6 A.G.C.
450V P-P 15,750 C.P.S.



No. 18—6AX4-GT Damper Plate
120V P-P 15,750 C.P.S.



NOTE - There are two different ratio detector transformers used in these receivers, Part numbers 9A2269 and 9A2295. The T-7 circuit shown in this schematic diagram covers the 9A2269 ratio detector. Receivers using the 9A2295 ratio detector can be identified by the following changes:

C-50 becomes 47X570 330 mmf molded mica condenser.
R-64 becomes B84333 33K ohm 0.5W carbon resistor.
R-67, R-68 become B83103 10K ohm 0.5W carbon resistors.

In addition to the above, the 9A2295 ratio detector has terminals with numerical identification (1,2,3 etc) whereas the 9A2269 has alphabetical identification (A,B,C etc) on its terminals.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 Volts AC 60 Cycles Only
Power Consumption	Television-245 Watts Radio-35 Watts Phonograph-55 Watts
Power Output	2.4 Watts (Max.) 1.8 watts (10% Distortion)
Tuning Ranges	TV-12 Channel AM-540-1600 KC
Intermediate Freq. (Tel.)	Picture-26.20 MC Sound-21.70 MC
Intermediate Freq. (Radio)	AM-455 KC
Selectivity (Radio)	AM-45 KC Broad at 1000 Times Signal, measured at 1000 KC
Sensitivity (Radio)	(For .5 Watt Output) AM-10 Microvolts Average
Tel. Antenna Input Imp. .	300 Ohms Balanced
Loud Speaker	8" PM Dynamic
Voice Coil Impedance ...	3.2 Ohms 400 Cycles

RECEIVER LOCATION -- Advise the owner as to the proper location for the television receiver. The following may be used as a guide.

1. Choose an area in the home where sunlight or light from lamps does not strike the face of the picture tube and cause glare.
2. Remember the necessity of an electrical outlet and the location of the point at which the antenna leads enter the room.
3. The receiver should be placed a short distance from the wall to allow adequate ventilation.
4. The receiver should be placed to permit easy access for operation and comfortable viewing from all angles.

ANTENNA -- This receiver has been designed to use an antenna with a 300 ohm balanced transmission line. This line must be as short as possible because the longer the line the greater the chances are for picking up electrical disturbances. Stand-off insulation should be used to keep the line away from the mast, metal or walls. Twist this line about one turn per foot throughout the line to cancel out direct signal and/or noise pickup by the transmission line. It should also be securely anchored in place so that a change in weather will not affect its position.

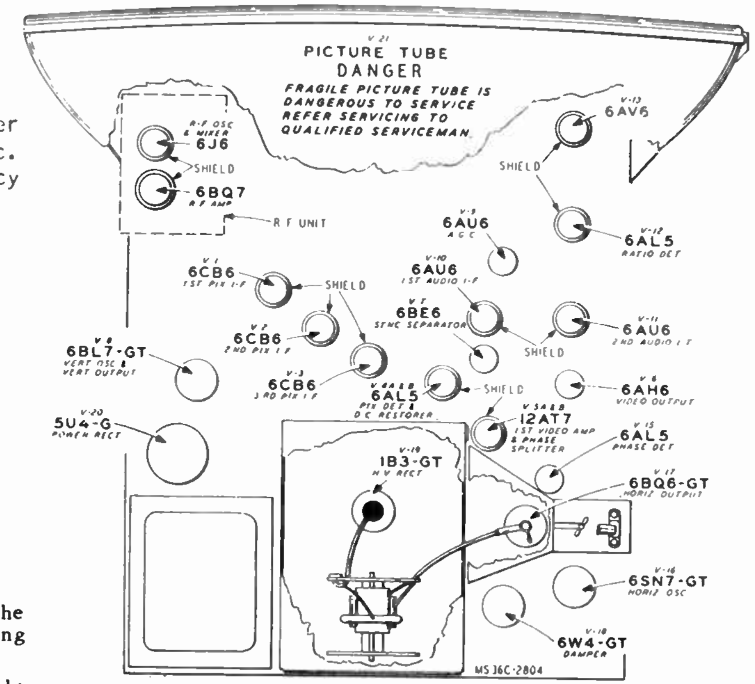

Fig. 1 -- Tube Layout.

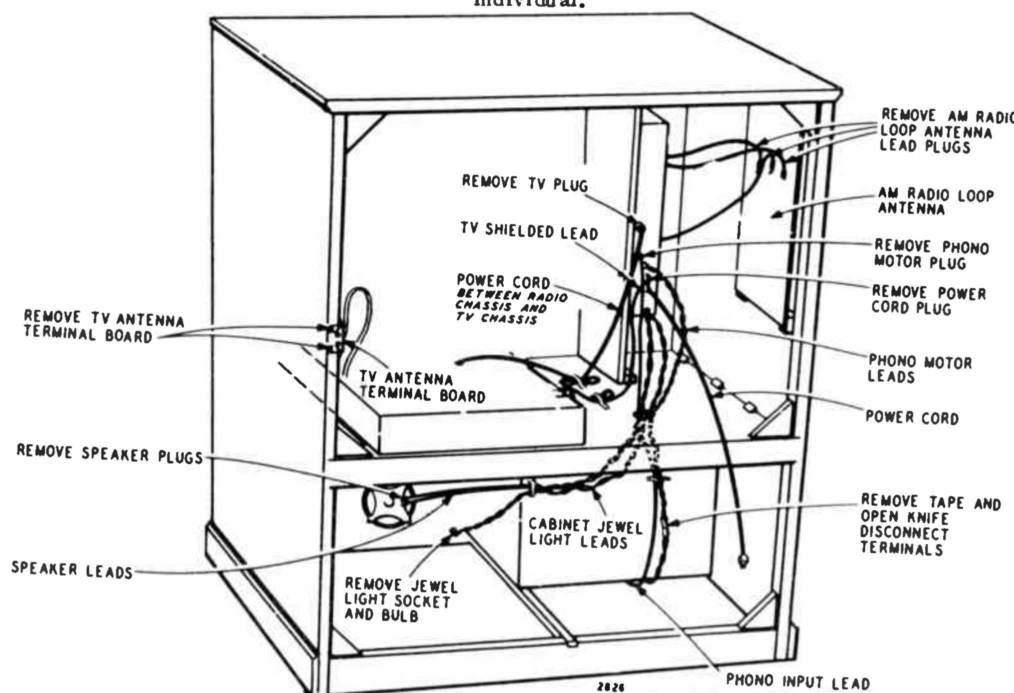
HIGH VOLTAGE WARNING

This television receiver contains high voltages which are dangerous to life. Never operate or service the receiver outside of the cabinet or with the covers removed until all the safety precautions necessary for working with high voltage equipment have been observed.

PICTURE TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves must be worn by individuals while handling the picture tube or installing the picture tube into the receiver.

The picture tube encloses a high vacuum and due to the large surface area, is subjected to very high air pressure. Therefore, care should be taken not to bump or scratch the picture tube accidentally as it may cause the tube to implode resulting in damage to property or injury to an individual.



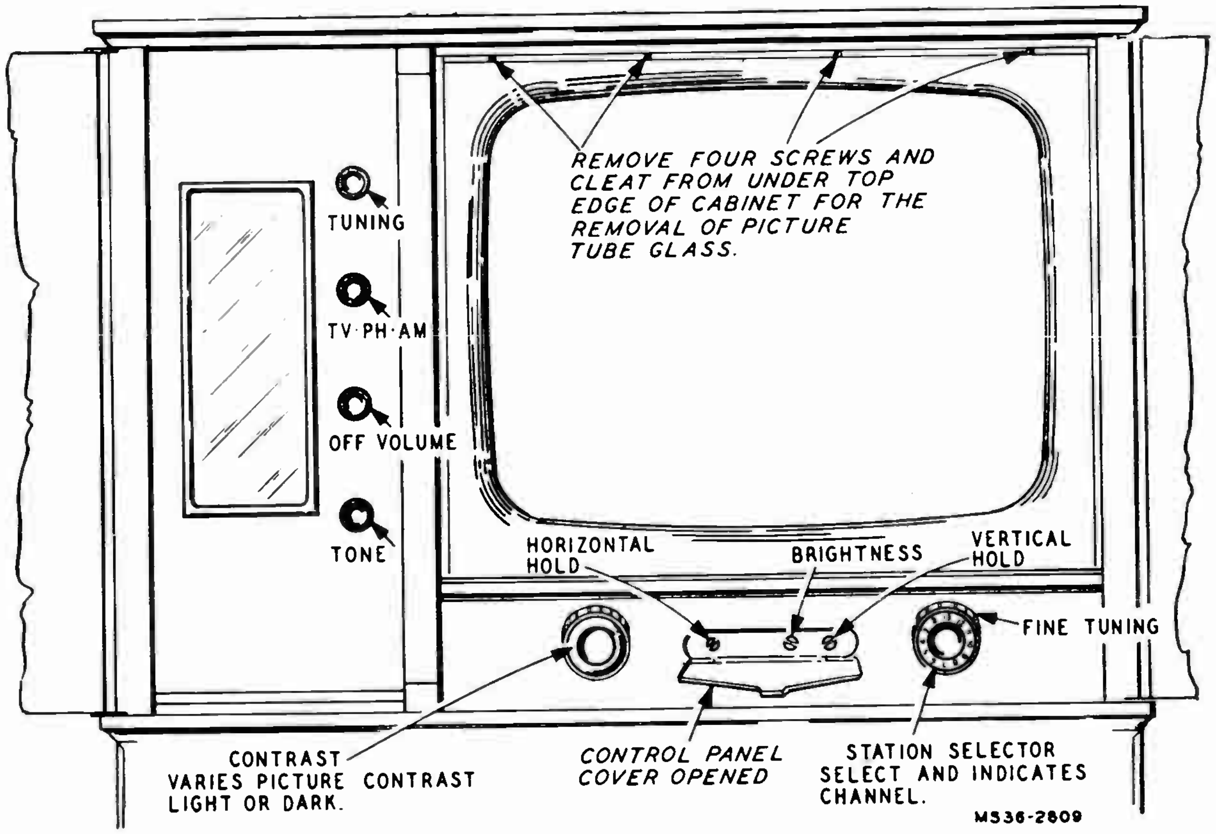


Fig. 2. -- Front Panel Controls

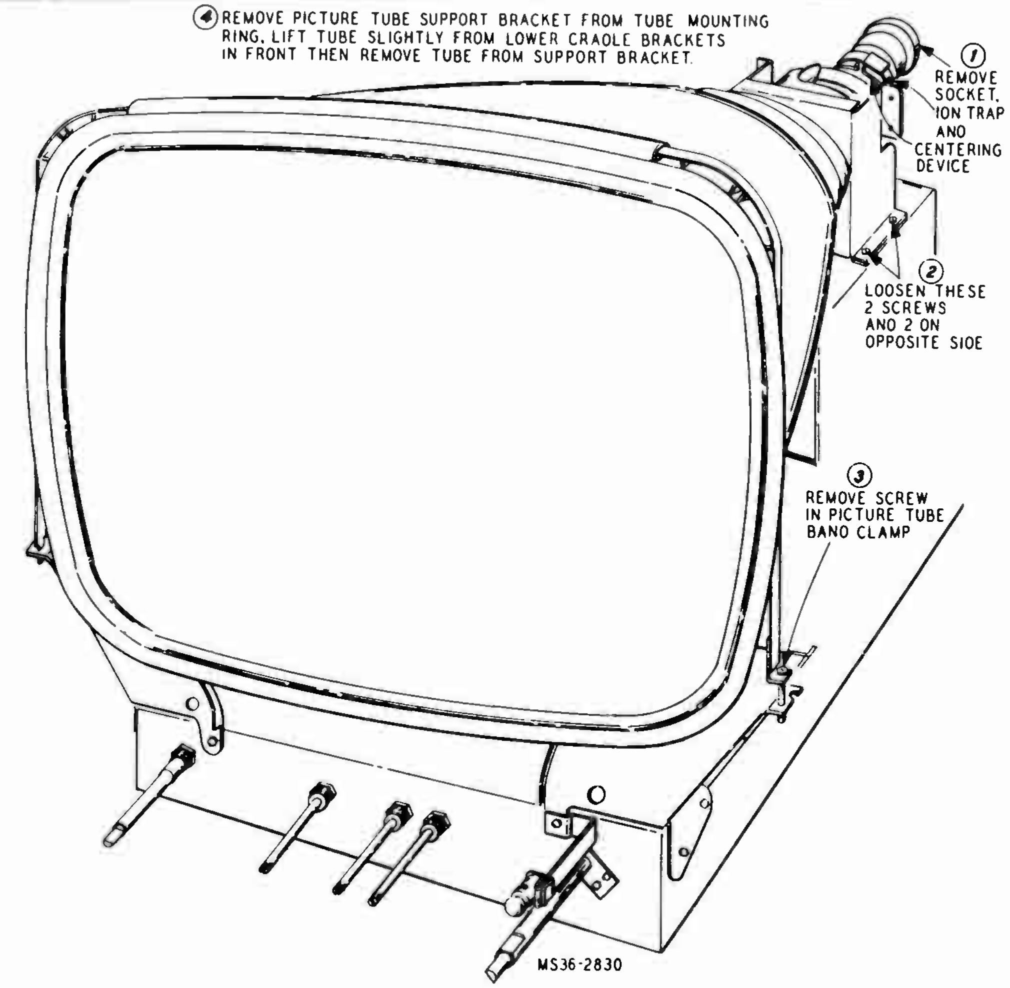

Fig. 3 -- Removal of Picture Tube

TUNING PROCEDURE

1. To turn the television receiver on, turn the OFF-ON VOLUME control on the radio panel clockwise until a click is heard. Allow approximately 30 seconds for the tubes to warm up.
2. Turn BAND SWITCH control on the radio panel to the TV position.
3. Turn the STATION SELECTOR control to the desired channel. This control may be turned in either direction.
4. Turn the CONTRAST control clockwise until activity or definite form is noted on the screen.
5. Adjust the FINE TUNING control for clearest picture and the VOLUME control for desired volume.
6. To turn off the receiver, turn only the OFF-ON VOLUME control counterclockwise until a click is heard.

OCCASIONAL ADJUSTMENTS TO IMPROVE PICTURE RECEPTION

There are three controls at the front of the chassis which are accessible when the hinged control panel is pulled downward. See illustration on this page. These controls are pre-set at the factory and may occasionally need adjustment due to aging of the components in the receiver and the fluctuating line voltages in different areas.

If any adjustments are necessary follow the instructions under "Controls and Functions."

IMPORTANT -- Be sure that the FINE TUNING control has been set for the clearest picture before adjusting any controls.

CONTROLS AND FUNCTIONS

HORIZONTAL HOLD -- Stops horizontal movement (diagonal bars.)

BRIGHTNESS -- Adjusts for desired picture brilliance.

VERTICAL HOLD -- Stops upward or downward picture movement.

PICTURE TUBE SAFETY GLASS

It will be necessary to clean this glass and the face of the picture tube occasionally. Remove the safety glass carefully as outlined in the illustration.

CAUTION--UPON REMOVAL OF THE LAST SCREW AND THE CLEAT THE GLASS WILL FALL FORWARD. SUPPORT THE GLASS WITH ONE HAND AS YOU LIFT IT GENTLY FROM THE CABINET. Clean the safety glass and the face of the picture tube with a soft lint-free cloth dampened with water or mild soapsuds.

WARNING -- Before handling the picture tube, it will be necessary to remove the static charge. In receivers with glass picture tubes, ground the anode lead to chassis, and insert an insulated wire from the well in the tube to chassis. In receivers with metal picture tubes, remove the static charge by grounding an insulated wire from the chassis to the metal portion of the tube.

PICTURE TUBE REPLACEMENT -- To replace the picture tube it is necessary to remove the chassis from the cabinet. This may be accomplished in the following manner:

1. Remove the front panel control knobs by pulling them straight from their shafts.
2. Remove the cabinet back.
3. Disconnect the leads from the speaker and radio chassis, remove the antenna terminal board at the rear of the cabinet and then the five chassis mounting bolts. Pull chassis CAREFULLY out of the cabinet.
4. Remove the picture tube as shown and outlined in the illustration. To install a new picture tube, reverse the procedure making sure that the picture tube fits close against the picture tube cushion. If the picture tube sticks or fails to slip into place smoothly, investigate and remove the source of the trouble. Never force the tube. It is important that all the clips and shims used in mounting the tube be replaced, otherwise difficulty may be encountered when horizontal or vertical centering is required.

FRONT OF CHASSIS

(Accessible After Opening Front Panel Control Cover)

Horizontal Hold	R-94
Brightness	R-25
Vertical Hold	R-51

NON-OPERATING CONTROLS REAR OF CHASSIS

Horizontal Centering	) Centering
Vertical Centering	) Device
Ion Trap Magnet	Wing Nut Adjustment
Deflection Yoke	Wing Screw
Width	L-15
Horizontal Linearity	L-16
Horizontal Drive	R-89
Horizontal Frequency	L-14
Vertical Linearity	R-49
Height	R-54
Sync Stability	R-39

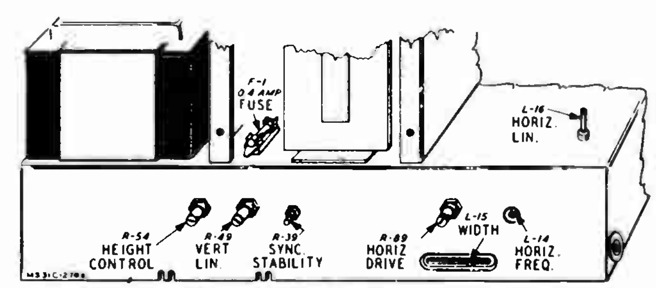

Fig. 4 -- Adjustments Rear of Chassis

ION TRAP MAGNET ADJUSTMENT -- The ion trap magnet should be positioned close to the base of the tube. From this position adjust the magnet by moving it back and forth and at the same time rotating it slightly around the neck of the picture tube until the brightest raster is obtained on the picture screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Readjust the ion trap magnet for maximum raster brilliance and best focus. MAXIMUM RASTER BRILLIANCE AND BEST FOCUS OCCUR AT THE SAME POINT. Do not sacrifice brilliance for best focus. The ion trap magnet adjustment is a very critical one especially with the electrostatic type zero focus picture tube. Consequently, great care should be taken to ensure that the ion trap magnet is correctly adjusted.

DEFLECTION YOKE ADJUSTMENT -- If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

CENTERING ADJUSTMENT -- If horizontal or vertical centering is required, adjust each ring in the centering device until proper centering is obtained. If a clamp type centering device is used, rotate the device to the left or right and turn the knob located at the top of the device until picture is centered correctly.

PICTURE ADJUSTMENT -- For further adjustments, obtain a test pattern on the receiver. Turn on receiver and follow tuning procedure on page 4. When a test pattern is obtained it may be necessary to slightly re-adjust the fine tuning control for clearest picture.

ADJUSTMENT OF SYNC STABILITY CONTROL -- When receiving strong (500 MV or more) signals, set hold controls so that the picture is locked in. Turn the sync control fully counter-clockwise, then, while observing the picture, turn the control slowly clockwise until a minimum amount of bending occurs. If the control is set incorrectly bending, tearing, etc., will be present and when switching from channel to channel the picture will not lock in quickly.

In weak signal areas the control should be set for maximum picture stability. In general the weaker the signal the more clockwise the control should be turned. When the sync stability control is correctly adjusted the receiver will hold sync without tearing or rolling under even the most adverse noise conditions.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT -- Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, it will be necessary to make the following adjustment.

HORIZONTAL FREQUENCY ADJUSTMENT -- With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-14) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

HEIGHT AND VERTICAL LINEARITY ADJUSTMENT -- Adjust the height control (R-54) until the picture fills the mask vertically. Adjust the vertical linearity control (R-49) until the picture is symmetrical from top to bottom. Adjust the picture centering device to align picture with the mask. Adjustment of any control will require a re-adjustment of the other control.

WIDTH, DRIVE AND LINEARITY ADJUSTMENTS -- While receiving a signal from a station (with picture locked in sync) turn contrast control fully counter-clockwise, turn the brightness control (R-25) up so that the picture appears washed out. Adjust width control (L-15) until the picture fills the mask. Turn the horizontal drive control (R-89) clockwise until white bars appear in the left center portion of the raster, then turn counter-clockwise until the white bars just disappear. This adjustment will allow the horizontal system to operate at maximum efficiency. Adjust horizontal linearity control (L-16) for best linearity. If adjustment of the horizontal drive (R-89) or horizontal linearity (L-16) is required, it usually will be necessary to recheck the horizontal oscillator alignment. If adjustment of the horizontal linearity control (L-16) is required, readjustment of the horizontal drive control (R-89) will be necessary. Adjust the picture centering device to align the picture with the mask.

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is preset at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PROCEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps, 1, 2 and 3 on all channels used.

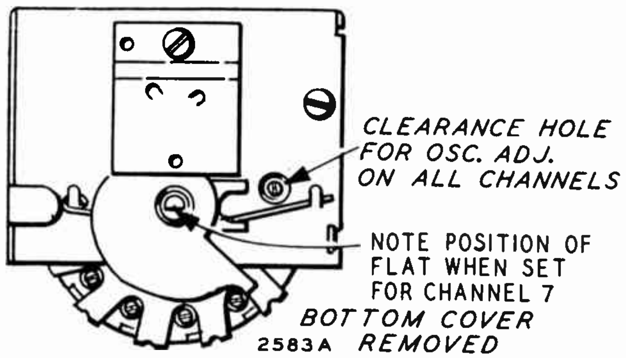

Fig. 5 -- Tuner Oscillator Adjustments

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE -- If raster cannot be obtained check below for the possible causes.

1: Ion trap magnet adjustment is incorrect.
2: No B+ voltage. Check 4/10 ampere fuse. Replace if defective. If fuse continually burns out, check
   (A) Horizontal output tube V-17 (6BQ6-GT)
   (B) Check damper tube V-18 (6W4-GT)
   (C) Check horizontal oscillator tube V-16 (6SN7-GTA) for proper operation.
   (D) With an ohm meter, check for a short between terminal 1 of the horizontal output transformer (T-9) and the chassis.
   (E) Check DC resistance of T-9.
3: No high voltage. Check V-17, V-18 and V-19 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage (600V) measured on terminal No. 1 of T-9, the trouble can be isolated to the high voltage rectifier circuits. Either the high voltage winding to the 6BQ6-GT plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, R-99 and C-78 defective or pix tube elements shorted internally.
4: Defective picture tube heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY -- If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:

1: Vertical oscillator and vertical output tube V-8 (6BL7) inoperative. Check socket voltages.
2: Vertical oscillator transformer (T-4) defective.
3: Vertical output transformer (T-5) open or shorted.
4: Yoke vertical coils open or shorted.
5: Vertical hold, height or linearity controls may be defective.

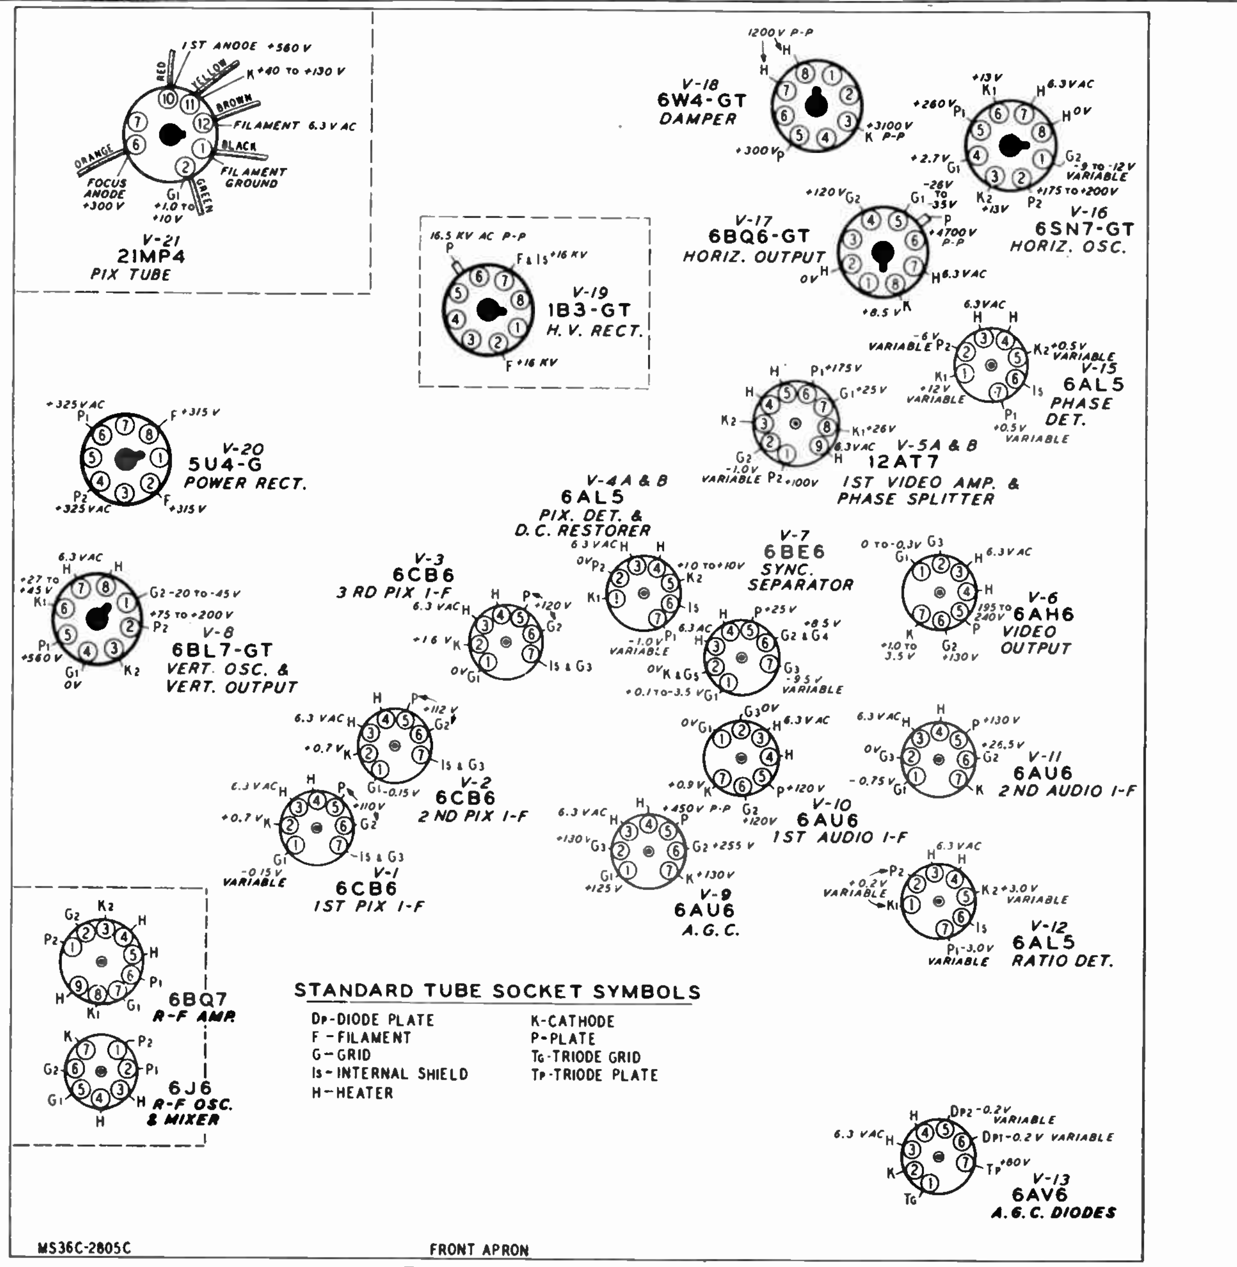

Fig. 6 -- Bottom Socket Voltages

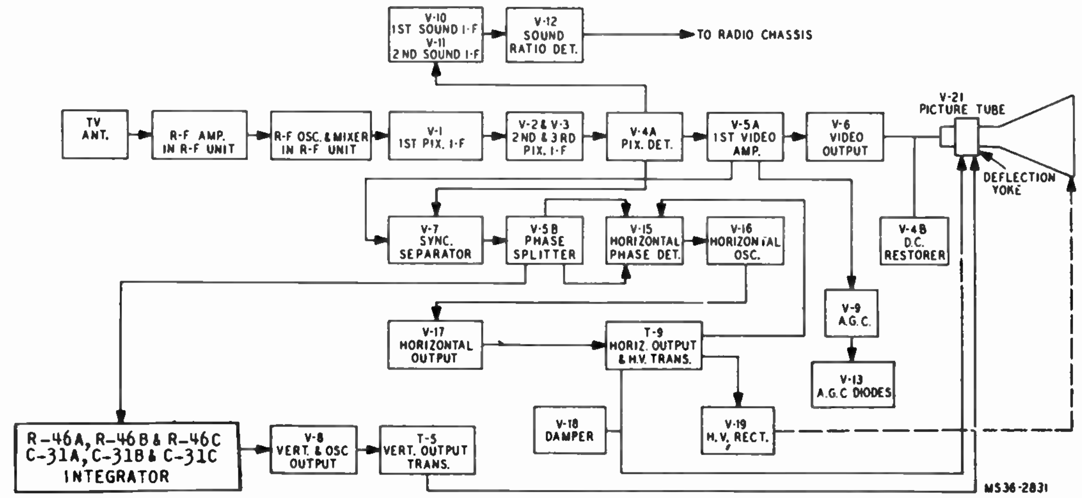

Fig. 7 -- Block Diagram

SERVICE SUGGESTIONS -- (continued)

POOR VERTICAL LINEARITY -- If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.

1: Check variable resistors R-49 and R-54.
2: Vertical output transformer (T-5) defective.
3: Capacitors C-35A, C-39 or C-70 defective.
4: V-8 (6BL7) defective, check voltages.
5: Excess leakage or incorrect value of capacitor C-37, or open or incorrect value of resistors R-55 & R-56.
6: Low plate voltages. Check rectifier tube and capacitors in +B supply circuits.
7: Capacitors C-36 defective.
8: Vertical deflection coils (L-12) defective.

POOR HORIZONTAL LINEARITY -- If adjustment of the Horizontal drive and linearity controls does not correct this condition, check the following:

1: Check or replace horizontal output tube V-17.
2: Check or replace damper tube V-18 (6W4-GT).
3: Check capacitors C-74, C-76, C-77 and horizontal linearity control (L-16) for defects.
4: Horizontal deflection coil (L-17) defective.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER

1: Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER -- This condition can be caused by:

1: Defective yoke due to C-75 or R-98 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.
2: V-18 (6W4-GT) defective.

SMALL RASTER -- This condition can be caused by:

1: Low +B or line voltage. Check V-20 (5U4G).
2: Insufficient output from horizontal output tube V-17. Replace tube.
3: Insufficient output from vertical oscillator and vertical output tube V-8. Replace tube.
4: Incorrect setting of horizontal drive control R-89.
5: V-18 (6W4-GT) defective.
6: Incorrect setting of (L-15) width control.

RASTER: NO IMAGE, BUT ACCOMPANYING SOUND -- This condition can be caused by:

1: No signal on picture tube grid. Check V-5A (12AT7) and V-6 (6AH6) tubes and associated circuits.
2: Bad contact to picture tube grid (lead to socket broken).
3: AGC tube (V-9) may be defective. Check tube and its associated circuit.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY -- If this condition is encountered check:

1: Defective sync separator V-7 or splitter V-5B.
2: If tubes are O.K. check voltages, and associated circuits.
3: AGC system inoperative. Check V-9 (6AU6) AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY -- If this condition is encountered check:

1. Vertical network capacitors C-31A, B & C and resistors R-46A, B & C.
2: Vertical control (R-61) defective.

SIGNAL ON PICTURE TUBE GRID AND VERTICAL SYNC ONLY

1: V-15 or V-16 defective.
2: Improper setting of (L-14) horizontal frequency control.
3: Check setting of horizontal drive control and horizontal linearity control.
4: Check V-15 and V-16 socket voltages.
5: If R-90 (see schematic) is connected as shown with dotted lines, reposition resistor as solid lines indicate.

PICTURE STABLE BUT WITH POOR RESOLUTION -- If the picture resolution is not up to standard, it may be caused by any of the following:

1: Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2: Defective picture detector V-4A, (6AL5) or video amplifier V-5A or video output V-6 (6AH6).
3: Defective picture tube.
4: Open video peaking coil. Check all peaking coils L-5, L-6, L-8, L-9, L-10 and L-11 for continuity. Note that L-5, L-9 and L-10 have shunting resistors.
5: Leakage in V-6 (6AH6) grid capacitor C-11. If the capacitor is not found to be defective, check the following:
1: Check all potentials in video circuits.
2: Check picture tube grid circuit for poor or dirty contact.
3: Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE SMEAR:

1: A smear can be attributed to phase shift at the low or high frequency and of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6 (6AH6), open or shorted peaking coils, video amplifier load resistors are of improper value (high).
2: This trouble can also originate at the transmitter. Check reception from another station.
3: Check and realign, if necessary, the picture I-F and R-F circuits.

MAN MADE NOISE IN SOUND (Ignition, etc.)

1: Check sound I-F tubes V-10, 11 & 12 and associated circuits.
2: Check sound I-F alignment.

BENDING OR S-ING

1: Check sync stability control adjustment.
2: Check capacitors C-35B and C-79B.
3: V-17 (6BQ6-GT) defective or V-16 (6SN7-GTA) defective.
4: Check sync separator tube V-7 (6BE6) and phase splitter V-5B (12AT7) and V-5A (12AT7) video amplifier.

PICTURE NORMAL-NO SOUND OR WEAK OR DISTORTED SOUND

1: Check sound I-F alignment.
2: Check V-10 (6AU6) V-11 (6AU6) V-12 (6AL5) V-13 (6AV6) and associated circuits.

POOR FOCUS

1: Improper setting of Ion Trap magnet.
2: Defective picture tube or picture tube socket.

PICTURE JITTER:

1: If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2: Vertical instability may be due to loose connections or noise received with the signal.
3: Horizontal instability may be due to unstable transmitted sync.
4: Check receiver AGC system for proper operation.
5: Check phase splitter V-5B, (12AT7) and sync separator V-7 (6BE6).
6: Check for improper setting of sync stability control.
7: Picture tube grid lead not held in position by support spring, ie: close proximity of grid lead to sync and horizontal tubes will cause picture to jitter at high contrast setting.

ALIGNMENT PROCEDURE

TEST EQUIPMENT -- To service this receiver properly, it is recommended that the following test equipment be available.

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency ranges:

18 to 30 mc, No. mc sweep width
40 to 90 mc, No. mc sweep width
170 to 225 mc, 10 mc sweep width

(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)

(a) Intermediate alignment frequencies.

23.1 mc first picture I-F coil.
24.1 mc third picture I-F coil.
25.9 mc second picture I-F coil.
21.7 mc sound trap.
4.5 mc video trap & sound I-F.
25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS -- To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, remove the antenna terminal board at rear of cabinet, and then the 5 chassis mounting bolts, The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the high voltage housing.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-99.

ALIGNMENT PROCEDURE
PIX I-F

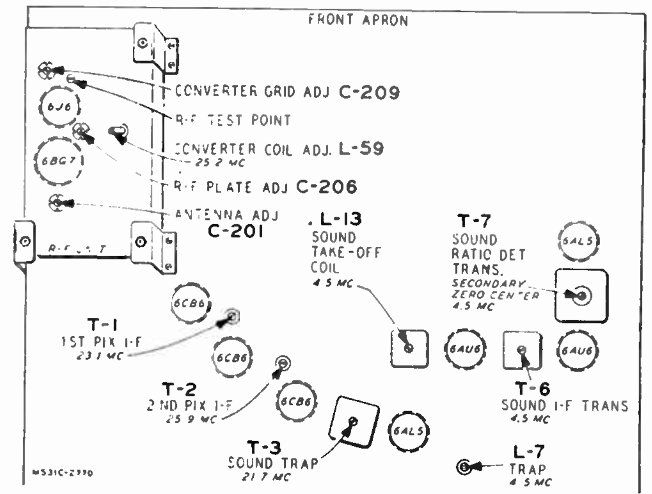

Fig. 8 -- Top Chassis Video and Audio I-F Adjustments

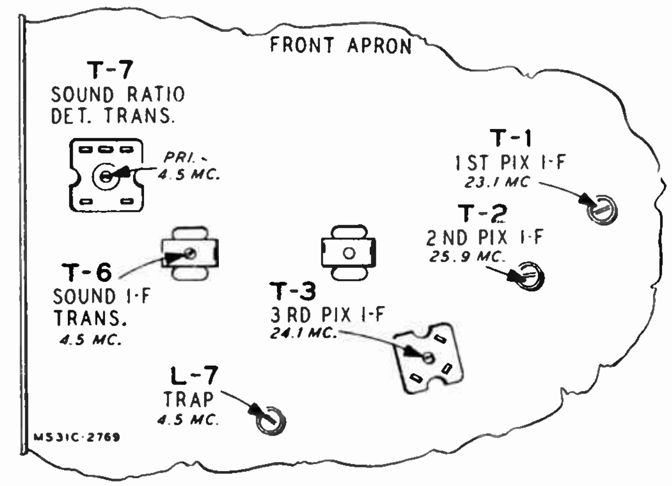

Fig. 9 -- Bottom Chassis Video and Audio I-F Adjustment

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-100) 4700 ohms, in series with peaking coil (L-6) from Pin 7 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply -4.5V battery bias on AGC line.

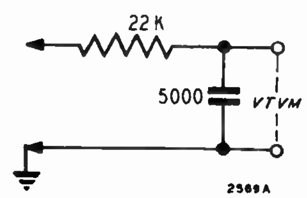

Fig. 10 -- VTVM Connections

ALIGNMENT PROCEDURE (Continued)

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil (L-59) for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

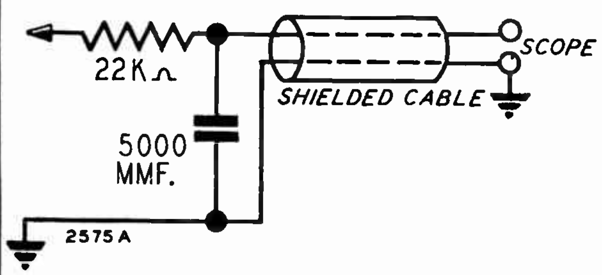

Fig. 11 -- Oscilloscope Connection

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.

Connect oscilloscope across R-100 (in place of VTVM). Apply -4.5V (DC) bias to AGC line (battery). Tuner should be switched to dead channel so as not to cause interference.

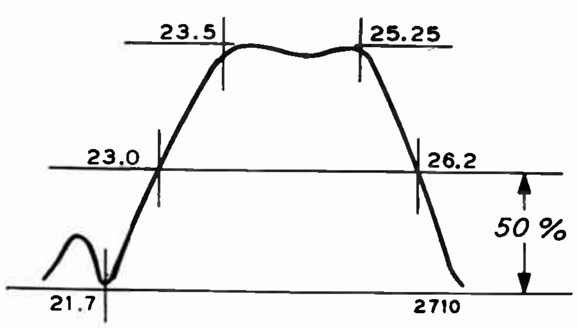

Fig. 12 -- Overall Response Curve

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is NOT advisable to change the setting of the coil due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 7-6AL5) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response, VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1: With signal generator set to 4.5 MC and dc VTVM connected to junction of R-62, and C-46, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.

2: With VTVM connected to pin 7 of V-12 (6AL5) adjust the ratio detector primary (T-7 Bottom) for maximum.

3: With VTVM connected to junction of R-66, R-69 & C-50, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE -- If no signal generator is available, the procedure above may be followed by tuning in a station and using a 4.5 MC beat between picture and sound carrier.

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" (Figure 13) on tuner. Connect $1\frac{1}{2}$ V bias to AGC line at junction of R-33 and C-20 on the receiver.

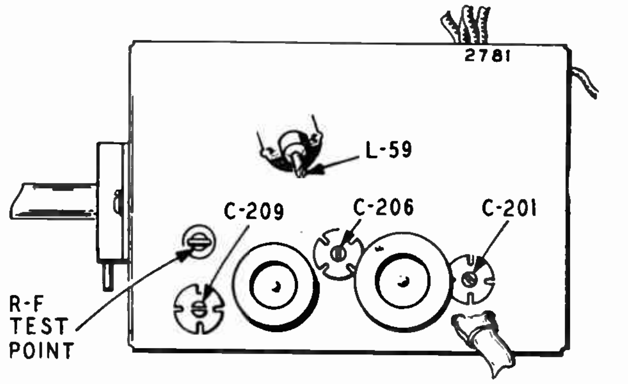

Fig. 13 -- Top Tuner Adjustment

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 14. Picture and sound markers at 90% maximum response.
2. Check response on all channels. If markers are below 70% an any channels, readjust C-201, C-206, and C-209. Recheck all channels.

C. OSCILLATOR ADJUSTMENT.

1. Apply -4.5 volts on I-F AGC line at junction of R-1 and C-21.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 12).
3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.

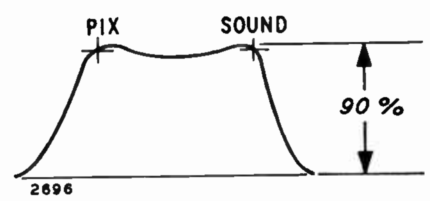

Fig. 14 -- Pix & Audio Markers

TUNER ASSEMBLY INFORMATION

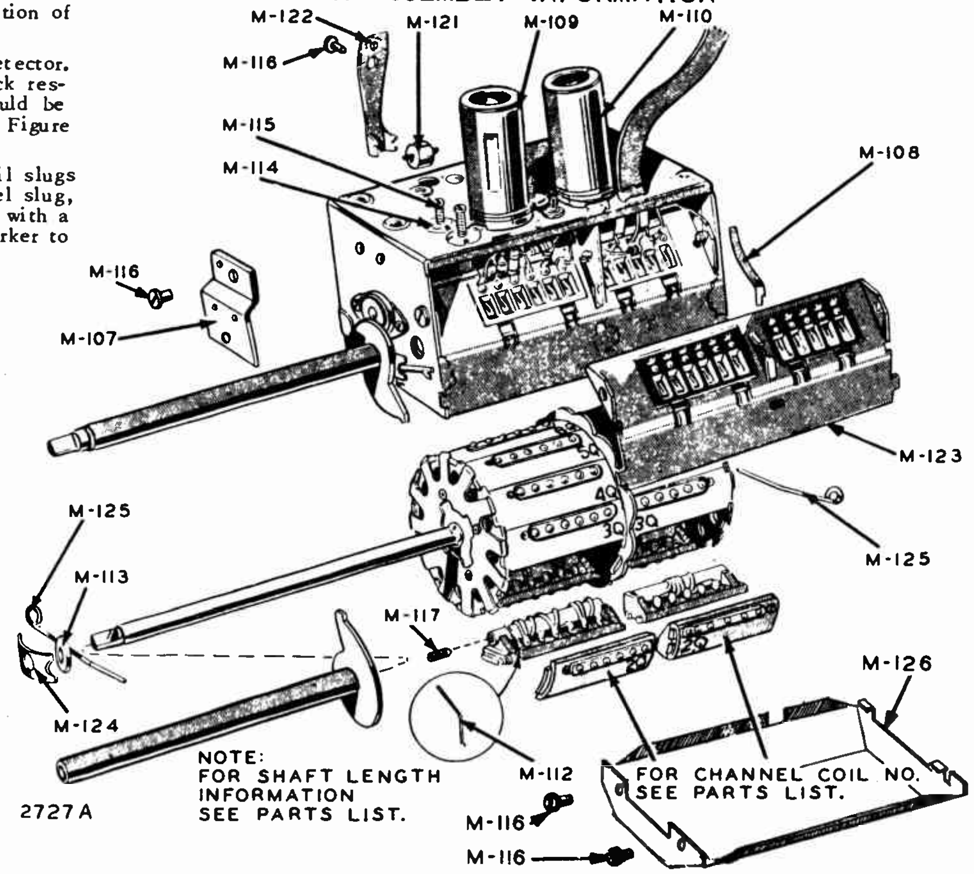

Fig. 15 -- "Q" Tuner Pictorial

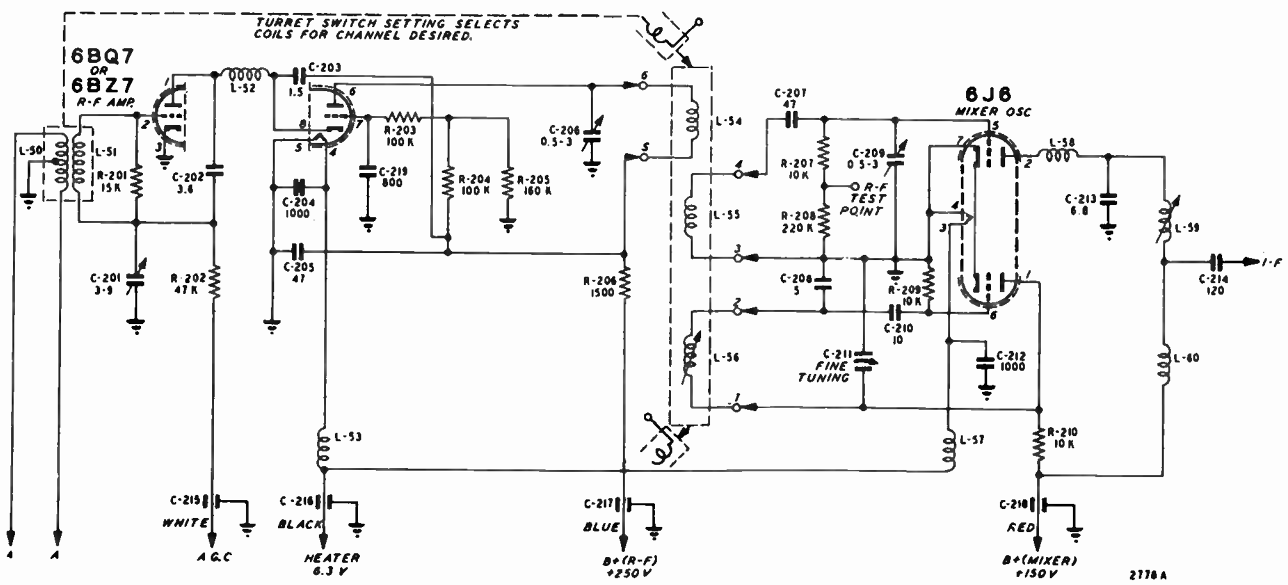

Fig. 16 -- "Q" Tuner Schematic Diagram

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.

The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicates the repetition rate of the waveform, not the sweep rate of the oscilloscope. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.

RADIO INFORMATION

ALIGNMENT PROCEDURE

RADIO

The following is required for aligning:

An all Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas, -- .1 mf, and 50 mmf.

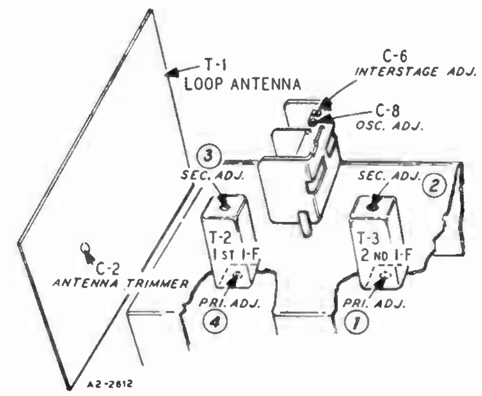
Volume Control Maximum all Adjustments.

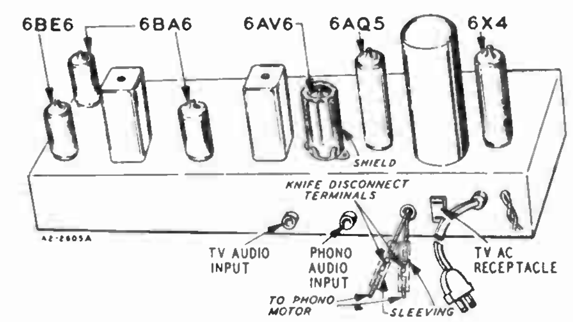
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid I-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I-F. Pri. (1) and Sec. (2)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. (4) and Sec. (3)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
1620 KC	Control Grid R-F 6BA6 Pin NO. 1	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-8	Maximum Output
1400 KC	Control Grid R-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Turn Rotor to Max Output. Set Pointer to 1400 KC See Note A	Interstage C-6 See Note B	Maximum Output
1400 KC	External Antenna Terminal	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2 See Note B	Maximum Output

NOTE A -- If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.
NOTE B -- Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

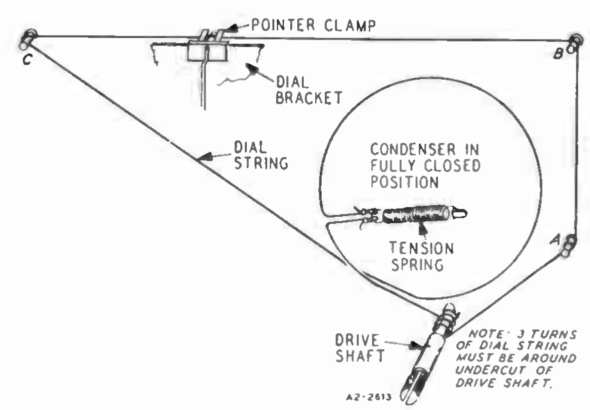


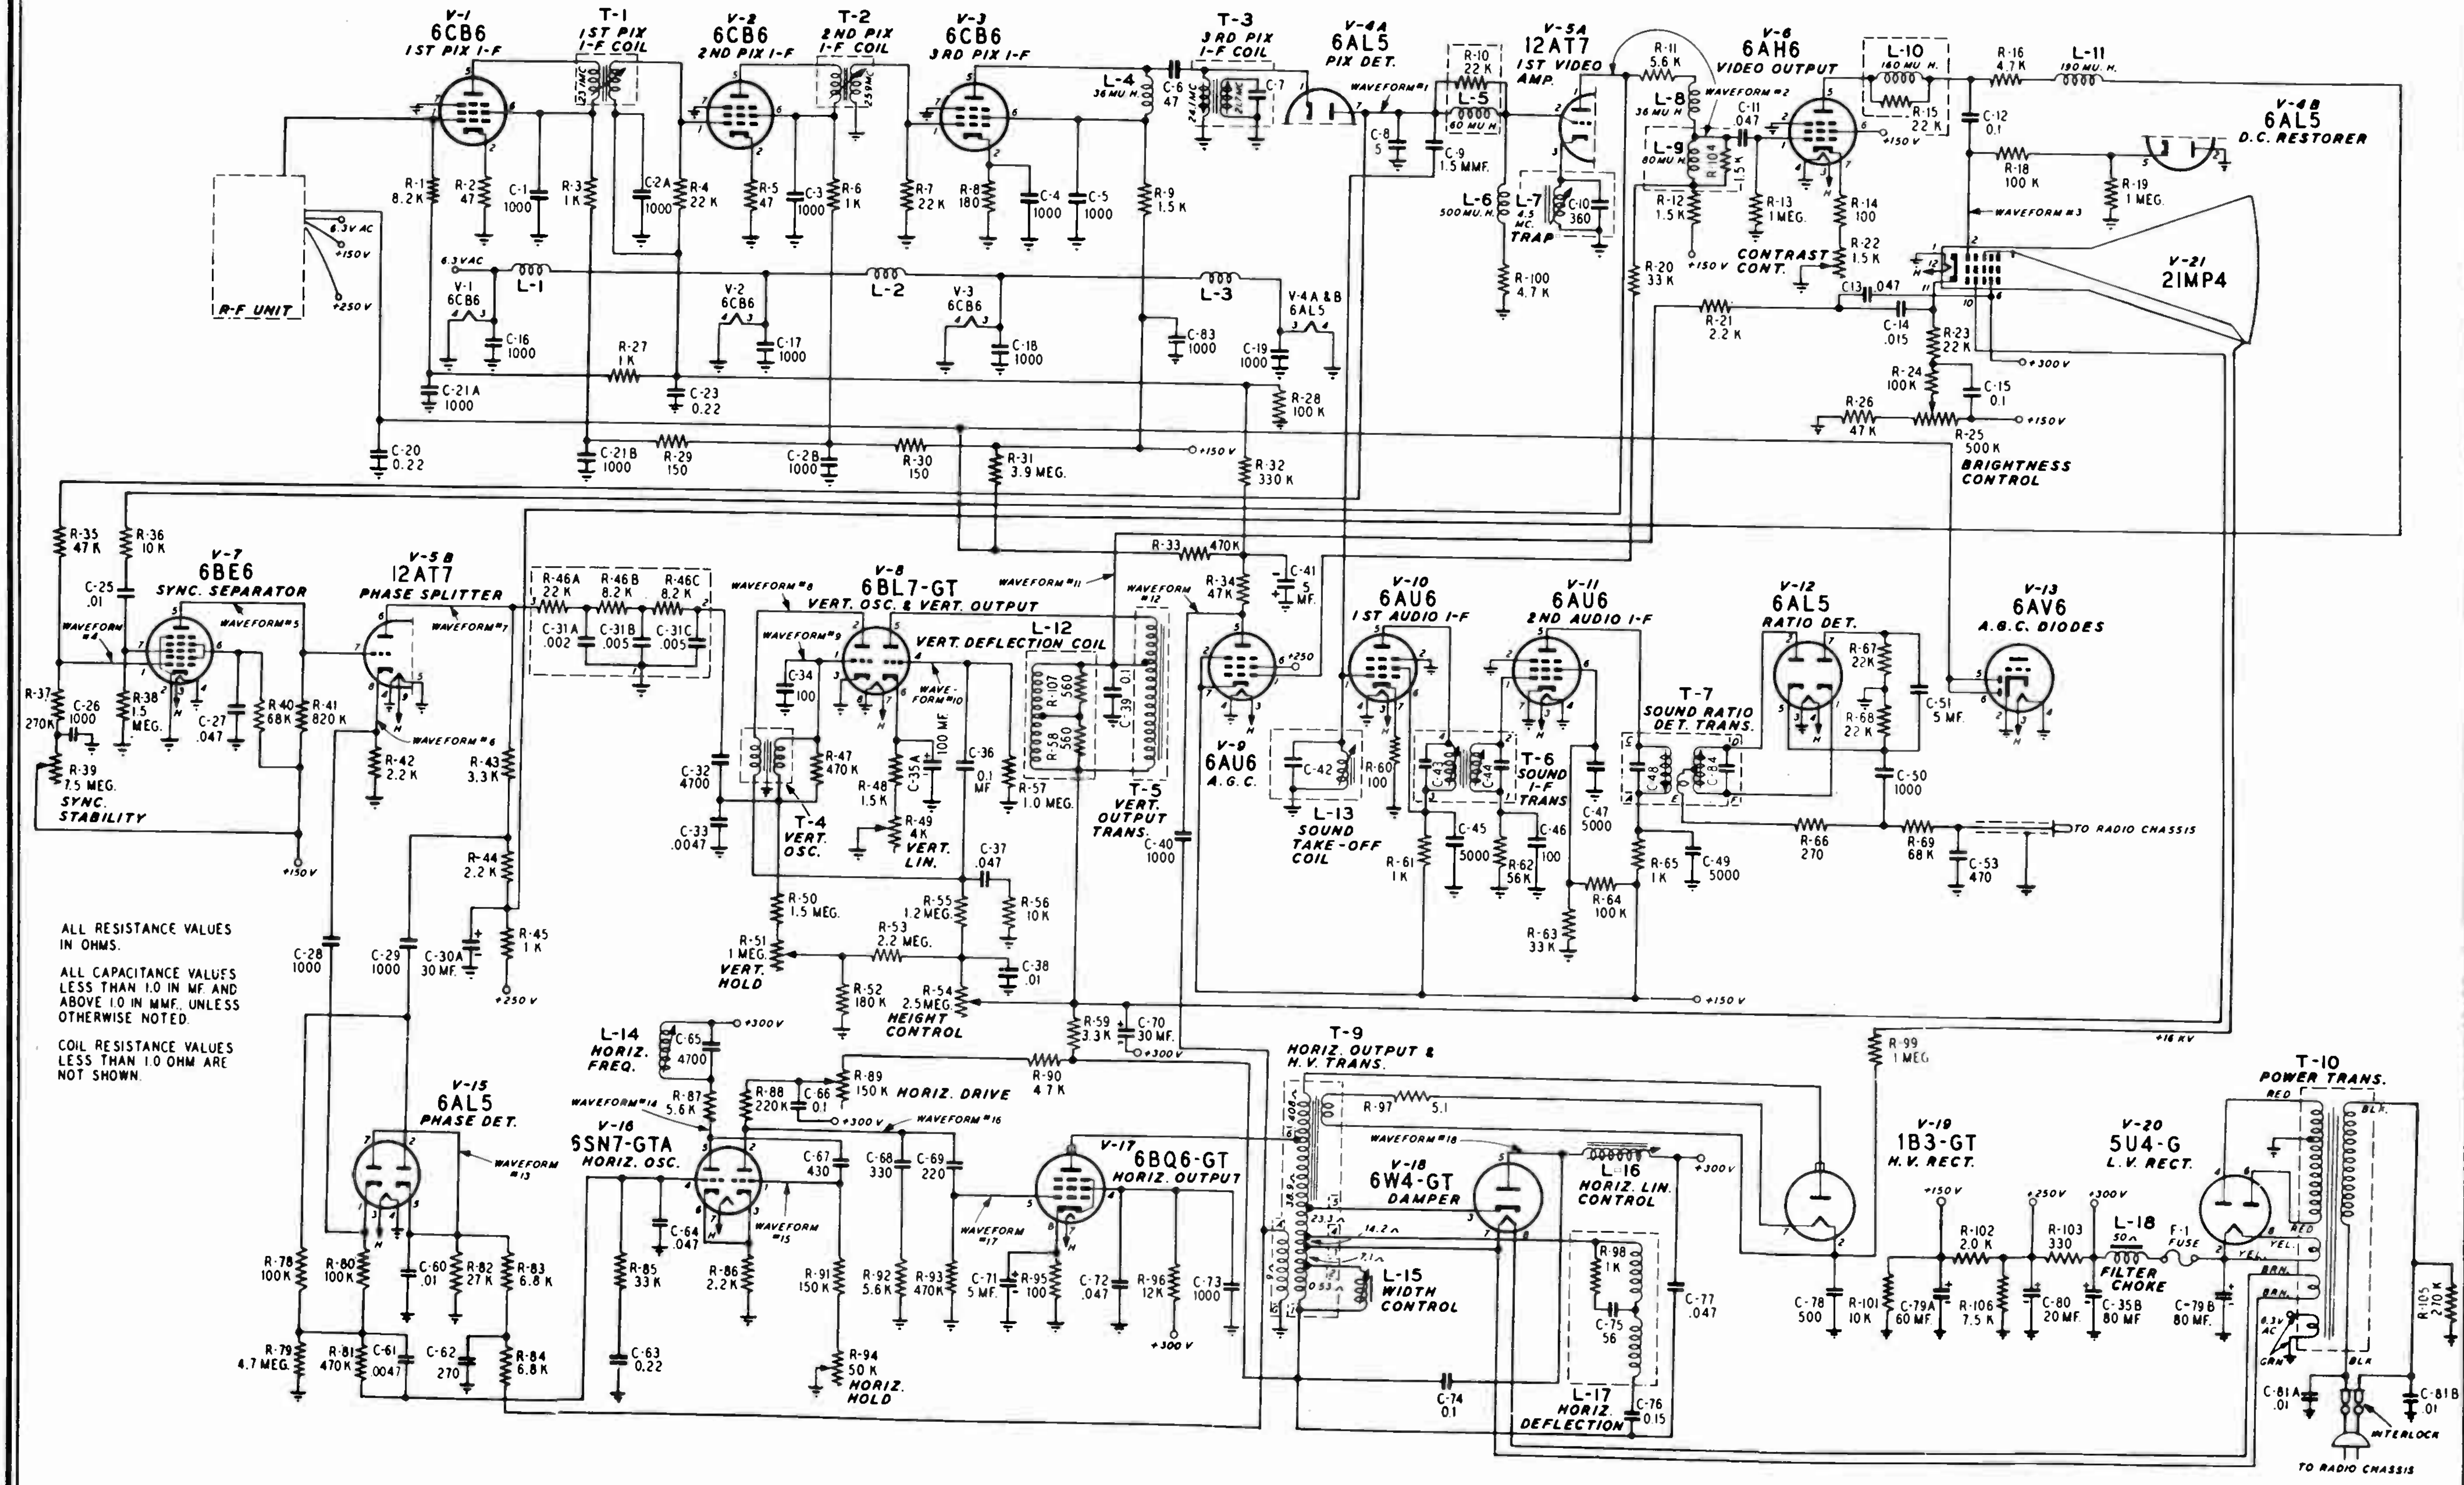


DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new S-10X77 drive cord assembly or a new length of cord 48 inches long for the installation. Install the cord as shown in the illustration, winding three turns counterclockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

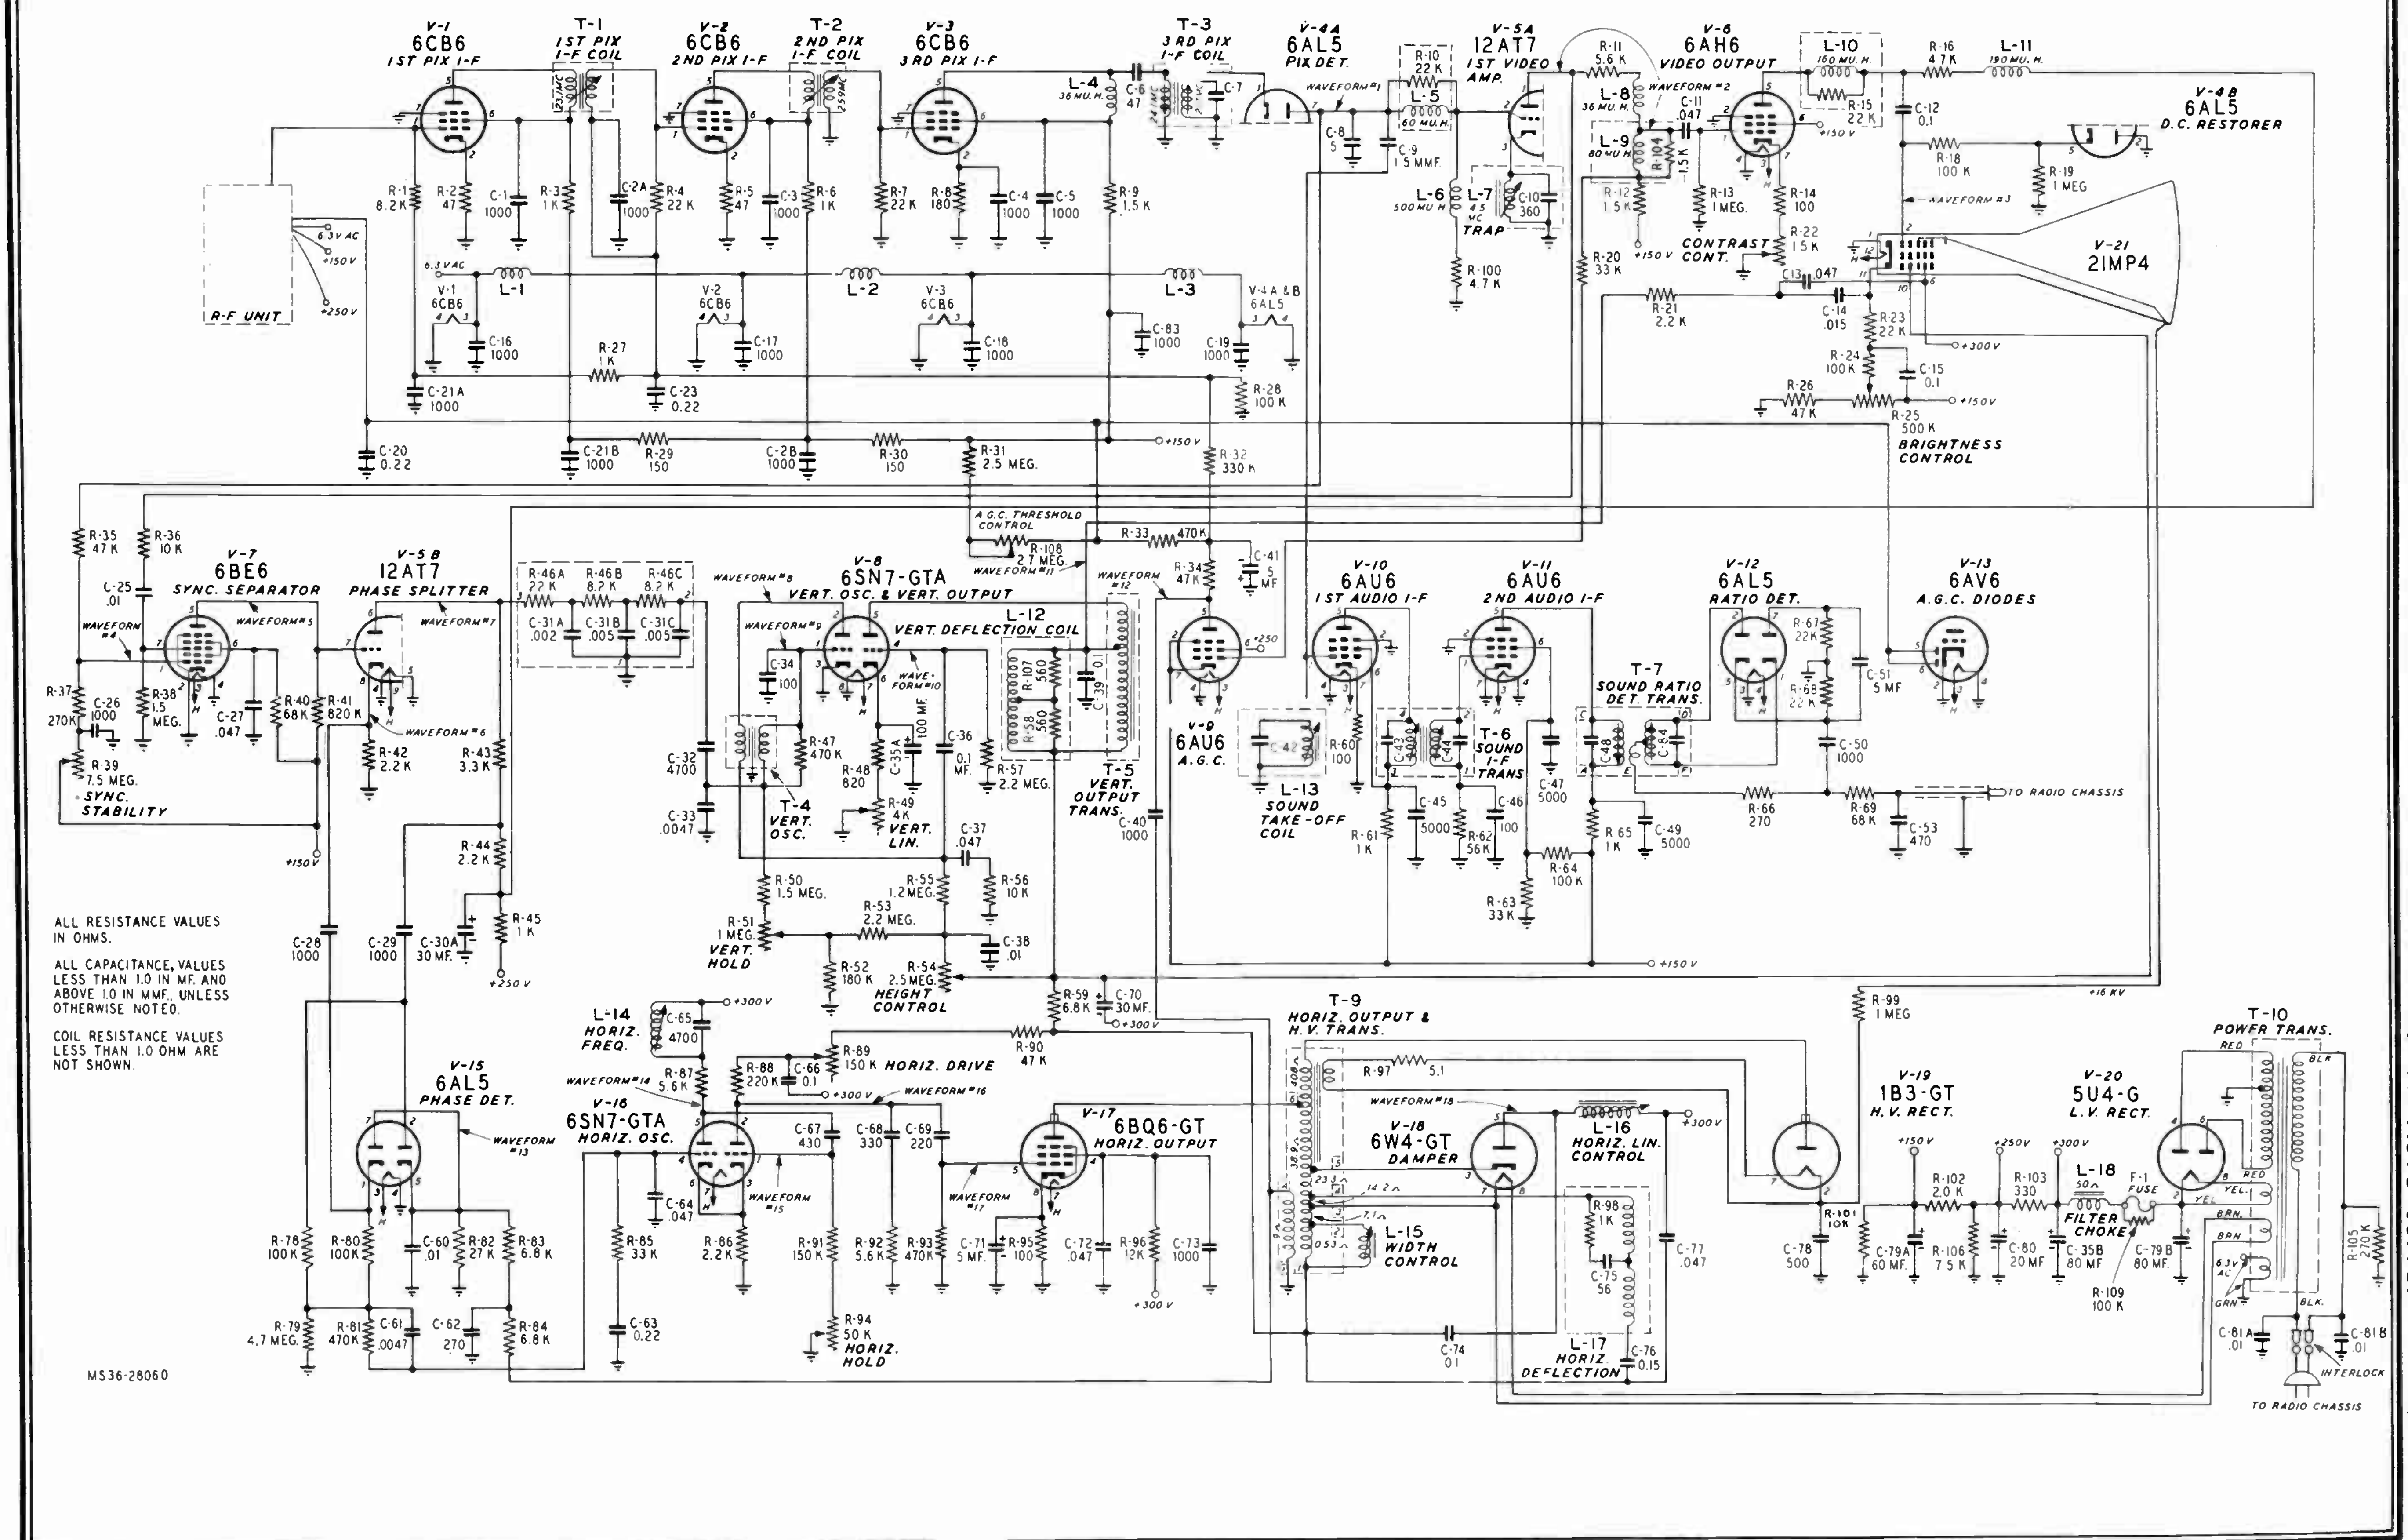




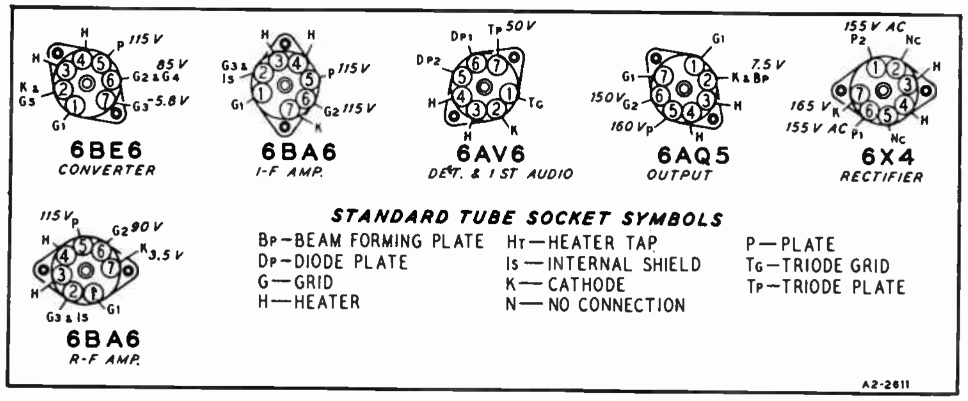
SCHEMATIC DIAGRAM

MODEL 2D1344B

W.G.



WESTERN AUTO SUPPLY TV PAGE 14-63



NOTICE: There is a model number label on the chassis. This label identifies the receiver as to chassis and issue letter. When ordering parts or writing, give ALL information on this label.

TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .... 117 Volts AC
Signal Input .... None
A Variation of ±10% is usually permissible.

S-14X67	Cabinet Back Assembly
14X485	Ventilator Grille
4X1157	Pix Tube Mtg. Ring

Models 2D1344B are identical to models 2D1344A except for the following changes:

1. An AGC Control was added to the circuit, reference number R-108.
2. Resistor R-31 was changed in value from 3.9 megohms to 2.7 megohms.
3. V-8 6BL7-GT (Vertical Oscillator and Vertical OutputLtube has been replaced with a 6SN7-GTA tube.
4. Resistor R-48 has been changed in value from 1500 ohms to 820 ohms.
5. Resistor R-57 has been changed in value from 1.0 megohm to 2.2 megohms.
6. Resistor R-59 has been changed in value from 15,000 ohms to 6800 ohms.
7. Resistor R-109 100,000 ohms added to fuse circuit to discharge electrolytic in case of fuse failure.

The part numbers and description of the new resistors are as follows:

REF. NO.	PART NO.	DESCRIPTION	
R-31	B84275	2.7 megohms	0.5 W
R-48	B84821	820 ohms	0.5 W
R-57	B84225	2.2 megohms	0.5 W
R-59	D84682	6800 ohms	2.0 W
R-108	40X364	2.5 megohms	AGC Control
R-109	D85104	100 K ohms	2.0 W

A new schematic diagram MS36-2806D showing all these changes is on the next page.

ADJUSTMENT OF AGC THRESHOLD CONTROL

Tune the receiver to the strongest station in the area in which the receiver will be used. While observing the picture and listening to the sound, turn the control clockwise until signs of overloading (buzz in sound, washed-out picture) appear. Then turn the control a few degrees counter-clockwise from the point at which overloading occurs. (The stronger the signal input, the more counter-clockwise this setting will be.) In areas where the strongest signal does not exceed 10,000 uv the setting will usually be maximum clockwise. With the control set correctly, the AGC will automatically adjust the bias on the R.F. and I.F. amplifiers so that the best possible signal to noise ratio (Minimum snow) will be obtained for any signal input to the receiver.

TUBE COMPLEMENT

Symbol	Type	Function
Tuner	6J6	R-F Osc. and Mixer
*Tuner	6BQ7	R-F Amplifier

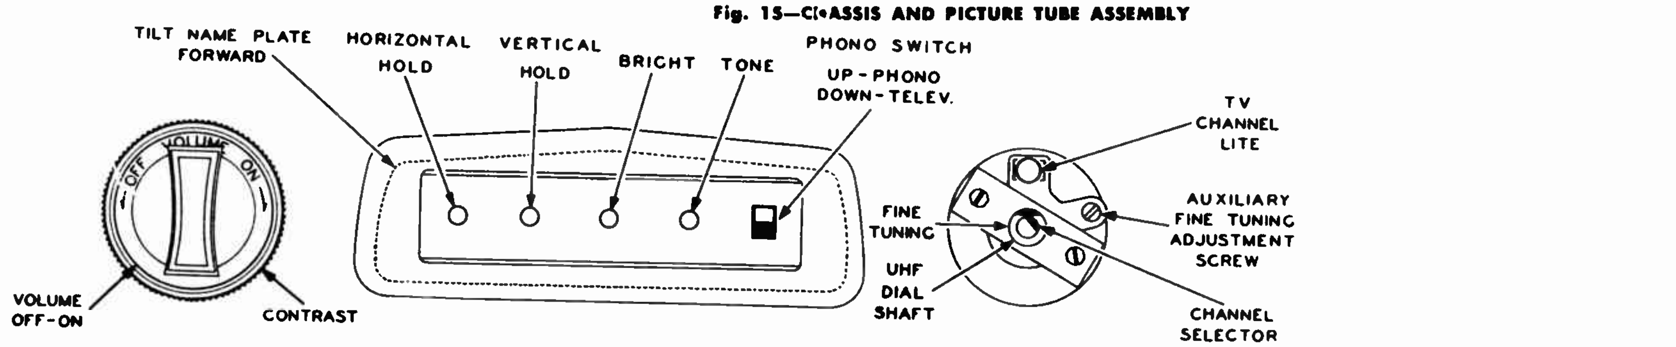

Fig. 11—LOCATIONS OF PRE-SET CONTROLS

HORIZONTAL OSCILLATOR ADJUSTMENTS

NOTE: These adjustments are very critical and should only be performed by a qualified serviceman. Failure to comply with this caution may result in serious malperformance of the receiver.

If adjustment of the "Horizontal Hold" control as explained in step 3 under the section entitled "Control Adjustment Procedure" fails to lock the picture horizontally, it will be necessary to make the following adjustments:

1. Set the "Horizontal Hold" control to the center of its range.
2. Adjust the "Horizontal Blocking Oscillator Slug" until picture remains stationary and does not lose horizontal sync when operating "Channel Selector" knob. See Fig. 15 for location of slug.
3. If the preceding step fails to correct for horizontal movement, then proceed as follows:
   a. Set the "Horizontal Blocking Oscillator Slug" to a position which is approximately in the center of its range.
   b. Remove snap button cover of "Horizontal Range" control and adjust this control until picture locks in horizontally and does not lose sync when operating "Channel Selector" knob. See Fig. 15 for location of control. Then repeat step 2 for a greater degree of horizontal stability.
4. If it still becomes impossible to obtain proper horizontal sync, it will be necessary to adjust the "Horizontal Sine Wave Oscillator Slug" by the method outlined in the alignment section of the service manual.

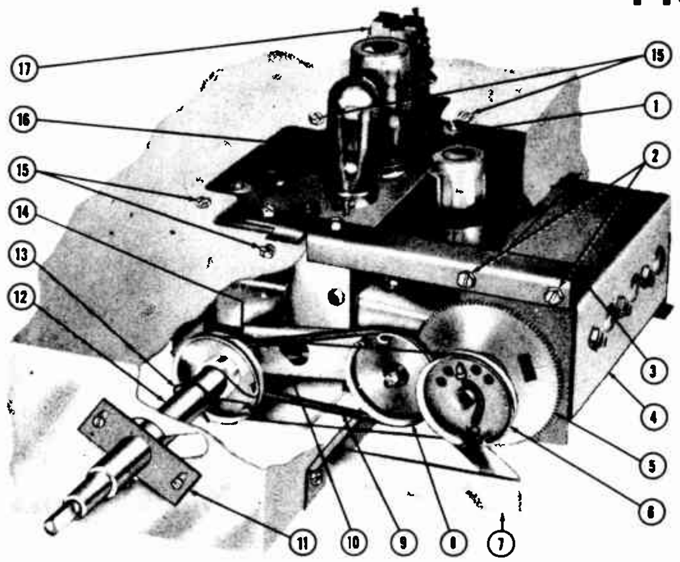
V.H.F.–U.H.F. TUNER SERVICING PROCEDURE



The tuning mechanism of this receiver comprises two R.F. tuning units—a 13-position V.H.F. tuner which covers the 12 V.H.F. channels and a continuous type U.H.F. tuner which covers all of the U.H.F. television channels.

When it is necessary to remove the tuning units for service, it can be accomplished by following the procedure given in the following paragraphs. For simplicity, there is a separate removal procedure for each of the tuners.

Instructions for replacing the U.H.F. tuning belt and the dial drive cord are also given below.

REMOVING U.H.F. TUNER

(Numbers which appear after parts mentioned in text refer to parts shown in illustration above.)

1. Disconnect leads marked S, R and T on "Bottom View of Chassis Showing Connections of R.F. Tuners." Also disconnect 300-ohm twin-lead to U.H.F. Tuner (4) at V.H.F. Selector Switch (17); terminals S3 and S12.
2. Remove Bracket and Triangular Shaped Guard (7) shielding U.H.F. Tuning Gear (5).
3. Turn fine tuning knob until U.H.F. tuner shaft is fully counter-clockwise, then loosen two set screws and slide U.H.F. Dial Drive Pulley (6) off of shaft. (To avoid the necessity of restringing U.H.F. dial drive cord, hold Drive Pulley (6) so that cord does not slip off and clamp cord tightly around pulley by wrapping "scotch" tape around the two strands of cord as near as possible to the pulley. Also clamp cord around Dial Pulley and Shaft (12) in this manner.)
4. Remove the two U.H.F. Tuner Mounting Screws (2) and a third screw (not shown in illustration) located underneath chassis on Mounting Bracket (1).
5. Loosen the two set screws on U.H.F. Tuning Gear (5) and free tuner from mounting by pulling away from bottom of chassis. Tuner may now be completely removed by sliding it toward rear of chassis, thus disengaging unit from Gear (5) and Pulley Brackets (10).

If tuner is returned to factory for repair it must be shipped with all parts removed as indicated above.

REMOVING V.H.F. TUNER

(Numbers which appear after parts mentioned in text refer to parts shown in illustration above.)

1. Remove U.H.F. tuner as described above.
2. Disconnect leads marked M, N, P, Q and U on "Bottom View of Chassis Showing Connections of R.F. Tuners." Also disconnect the two white and yellow leads from the tuner to the V.H.F. Selector Switch (17); at terminals S8 and S17.
3. Rotate Channel Selector knob until V.H.F. Selector Switch Actuator Cam is completely disengaged from Switch (17) and remove the two switch mounting screws.
4. Remove channel Selector knob, Fine Tuning knob and U.H.F. Dial from their shafts by pulling them forward.
5. Remove Fiber Bracket (11) which supports tuner operating shafts. Also remove fiber dial lite shield which is fastened by one of the fiber bracket mounting screws.
6. Remove the four Tuner Mounting Screws (15) and lift V.H.F. tuner (16) from chassis.
7. Remove Clip (13) which retains U.H.F. Dial Shaft and Pulley (12) and slide shaft and pulley off of inner shaft.
8. Remove U.H.F. Tuning Belt (9) from pulleys.
9. Loosen two set screws and remove U.H.F. Tuning Pulley (14).
10. Remove U.H.F. Tuning Pulley and Bracket Assembly (10).
11. Remove Front Mounting Bracket (3) and Rear Mounting Bracket (1).
12. Loosen set screw and remove V.H.F. Selector Switch Actuator Cam mounted on rear of turret shaft.

If tuner is returned to factory for repair it must be shipped with all parts removed as indicated above.

REINSTALLING TUNERS

The reinstallation of the tuner can be made in the reverse order given in the removal procedure, observing the following precautions.

1. Remount V.H.F. Tuner (16) in mounting holes that place tuner as far back on chassis as possible.
2. Position coaxial cable lead so that it completely clears the V.H.F. Selector Switch Actuator Cam.
3. When reinstalling U.H.F. Dial Drive Pulley (6), turn U.H.F. tuning shaft to its extreme counter-clockwise position and turn Drive Pulley (6) until the opening in its rim is as shown in **lower** illustration before tightening pulley set screws.
4. When removing "scotch" tape from U.H.F. dial drive cord, hold drive pulleys so that cord is sufficiently taut to prevent it from sliding off of pulleys.
5. Before replacing U.H.F. dial, be sure that **"Fine Tuning" shaft** is in a fully counter-clockwise position or until U.H.F. dial shaft is fully **clockwise.** Place U.H.F. dial on its shaft so that the number 83 is in top center position.

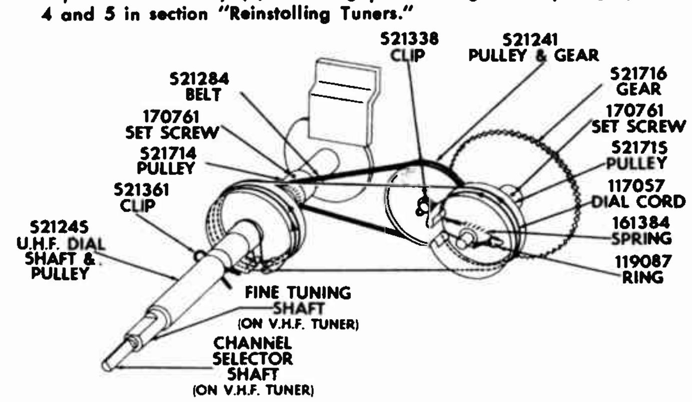
REPLACING U.H.F. DIAL DRIVE CORD

As it is necessary to remove drive cord when replacing U.H.F. Tuning Belt (9), the belt should be replaced at this time if it is worn. The method of accomplishing this is given in a separate procedure outlined below.

1. Remove Bracket and Triangular Shaped Guard (7).
2. Turn U.H.F. tuner shaft fully counter-clockwise and if necessary loosen set screws and turn Drive Pulleys (6) and (12) until opening in their rims are located as shown in **lower** illustration.
3. String drive cord by placing ring at end of cord over tongue of Drive Pulley (6) and winding cord around pulleys as shown in **lower** illustration.
4. Replace U.H.F. dial by following procedure given in paragraph 5 in section entitled "Reinstalling Tuners."

REPLACING U.H.F. TUNING BELT

1. Follow steps 2 and 3 in procedure entitled "Removing U.H.F. Tuner" and step 4 in procedure entitled "Removing V.H.F. Tuner."
2. Remove old Tuning Belt (9) by pulling it over Drive Pulleys (6) and (12) and through shaft opening on front of chassis.
3. Install new belt by using reverse of procedure given in step 2 above.
4. Replace Drive Pulley (6) following procedure given in paragraphs 3, 4 and 5 in section "Reinstalling Tuners."



DIAL DRIVE CORD ARRANGEMENT

SYNCROGUIDE TRANSFORMER ALIGNMENT
(Chassis that do not include series "E" change)

Alignment of the Syncroguide transformer, circuit diagram #128, which is used in the Horizontal Oscillator circuit on those receivers that **do not** include the letter "E" in the series designation at the rear of the chassis, can be accomplished by utilizing the procedure outlined below. To perform this alignment, it will be necessary to use an oscilloscope, preferably one that has a 2 megacycle response and a low input capacity probe—under 100 mmfd. to ground.

1. Set the "Top Slug" and "Bottom Slug" of the Syncroguide transformer to their maximum counter-clockwise positions.
2. Short together terminals C and D of the Syncroguide transformer.
3. Set "Horizontal Range" control, located on rear of chassis pan, to its maximum clockwise position.
4. Set "Horizontal Hold" control, located at front of chassis to its maximum counter-clockwise position.
5. Turn on receiver and tune in any local TV channel.
6. Adjust "Top Slug" clockwise until picture just locks in horizontally.
7. Remove short from terminals C and D. If picture does not hold sync when short is removed, adjust "Bottom Slug" clockwise until picture locks in.
8. Connect 'scope to terminal C of Syncroguide transformer and adjust sweep rate of 'scope until two cycles of oscillogram remain stationary. Turn "Bottom Slug" clockwise until wave form peaks are equal in height as shown in Fig. 1.

IMPORTANT: The first peak of the wave form should never be higher than the second peak nor should the first peak be lower than the second peak by more than 3%. Also when adjusting the "Bottom Slug," the picture must be in sync, therefore it may be necessary to turn the "Horizontal Hold" control clockwise when performing this step. After this adjustment has been completed, disconnect 'scope from receiver.

9. Set "Horizontal Hold" control counter-clockwise and adjust "Top Slug" until picture is locked in and does not lose sync when switching "Channel Selector" knob. Then, turn "Top Slug" slowly counter-clockwise until picture is just ready to lose sync as shown in Fig. 4.
10. Horizontal holding action of receiver should now be as follows:
    a. When "Horizontal Hold" control is at its maximum counter-clockwise position and "Channel Selector" knob is switched, picture may appear as shown in Fig. 4 or be out of sync.
    b. When "Horizontal Hold" control is at its maximum clockwise position, picture may lose sync when switching "Channel Selector" knob.
    c. When "Horizontal Hold" control is in the center or near the center of its range, picture remains stable when switching "Channel Selector" knob.
11. If the foregoing steps fail to correct for loss of horizontal holding action under normal receiver operation, be sure that condenser 130 (.01 mfd.) connected across terminals C and D of the Syncroguide transformer is Stewart-Warner part 512311, tubular, .01 mfd., 400 V. Do not use a substitute part.

SYNCROGUIDE TRANSFORMER ALIGNMENT
(Series "E" type chassis)

Alignment of the Syncroguide transformer, circuit diagram #128, which is used in the Horizontal Oscillator circuit can be accomplished by utilizing the procedure outlined below. To perform this alignment, it will be necessary to use an oscilloscope, preferably one that has a 2 megacycle response and a low input capacity probe—under 100 mmfd. to ground.

1. Set the "Top Slug" and "Bottom Slug" of the Syncroguide transformer to their maximum counter-clockwise positions.
2. Short together terminals C and D of the Syncroguide transformer.
3. Adjust "Horizontal Drive" control, located on rear of chassis pan, one-half turn out from its maximum clockwise position.
4. Set "Horizontal Hold" control, located at front of chassis, to its maximum clockwise position.
5. Turn on receiver and tune in any local TV channel.
6. Adjust "Top Slug" clockwise until picture just locks in horizontally.
7. Remove short from terminals C and D. If picture does not hold sync when short is removed, adjust "Bottom Slug" clockwise until picture locks in.
8. Connect 'scope to terminal C of Syncroguide transformer and adjust sweep rate of 'scope until two cycles of oscillogram remain stationary. Turn "Bottom Slug" clockwise until wave form peaks are equal in height as shown in Fig. 1.

IMPORTANT: The first peak of the wave form should never be higher than the second peak nor should the first peak be lower than the second peak by more than 3%. Also, when adjusting the "Bottom Slug," the picture must be in sync, therefore, it may be necessary to turn the "Horizontal Hold" control counter-clockwise when performing this step. After this adjustment has been completed, disconnect 'scope from receiver.

9. Set "Horizontal Hold" control counter-clockwise and adjust "Top Slug" until picture is locked in and does not lose sync when switching "Channel Selector" knob. Then, turn "Top Slug" slowly counter-clockwise until picture is just ready to lose sync as shown in Fig. 4.
10. Horizontal Holding action of receiver should now be as follows:
    a. When "Horizontal Hold" control is at its maximum counter-clockwise position and "Channel Selector" knob is switched, picture may appear as shown in Fig. 4 or be out of sync.
    b. When "Horizontal Hold" control is at its maximum clockwise position, picture may lose sync when switching "Channel Selector" knob.
    c. When "Horizontal Hold" control is in the center or near the center of its range, picture remains stable when switching "Channel Selector" knob.

ALIGNMENT PROCEDURE

The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits.

Alignment of all RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts.

These procedures should preferably be applied in the order in which they are presented. Alignment of Sound Channel or IF Channel may be accomplished individually if desired.

The RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned.

CAUTION

The picture tube is highly evacuated and if broken fragments will be violently expelled. Handle with care. Avoid contact with metal shell of picture tube as this is part of the high voltage circuit.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated.
   a. IF Frequencies:
      4.5 Mc. Sound Channel
      39.75 Mc. to 47.25 Mc. IF Channel
   b. RF Frequencies:
      54 to 88 Mc.
      174 to 216 Mc.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the UHF Tuner, part 521170, must be returned to the factory in accordance with the removal instructions, listed in a subsequent section under the heading "VHF-UHF Tuner Servicing Procedure."
2. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.
3. **RF SWEEP GENERATOR** to provide frequency modulated signal for observing the over-all bandpass characteristic and RF Channel alignment at the following frequencies:

   40 to 50 Mc. with 10 Mc. sweep width.
   54 to 88 Mc. with 10 Mc. sweep width.
   174 to 216 Mc. with 10 Mc. sweep width.

   No frequencies are listed for the UHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the UHF Tuner, part 521170, must be returned to the factory in accordance with the removal instructions, listed in a subsequent section under the heading "VHF-UHF Tuner Servicing Procedure."
4. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe. This instrument is used for observing the over-all bandpass characteristic and for RF Channel alignment.

SOUND CHANNEL ALIGNMENT PROCEDURE

1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel and Contrast control to its maximum counter-clockwise position; other controls may be left at any desired setting.
3. A small screwdriver (preferably non-metallic) can be used for alignment of Sound IF. The blade of this tool will fit the slot in the core of the transformer.

STANDARD SIGNAL GENERATOR CONNECTIONS	STANDARD SIGNAL GENERATOR FREQUENCY	VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Contrast control to its maximum counter-clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in Fig. 3. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V1, V2 or V3). This will prevent noise in the RF stages from affecting the voltage reading while adjusting the sound trap.	#1 4.5 MC Sound Trap (See Fig. 10)	Adjust for minimum reading on VTVM.
Same as above	Same as above.	Connect as shown in Fig. 4.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This spurious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	#2 Discriminator Secondary (See Fig. 10)	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary (See Fig. 8)	Adjust for maximum reading on VTVM.
				#4 Sound IF Transformer (See Fig. 10)	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 5.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 5.	#2 Discriminator Secondary (See Fig. 10)	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #2 is obtained when the meter reads zero as the slug is moved thru this point.

Replace the type 6CB6 tube previously removed in the above procedure and turn set on. Tune in to a local channel and should there be an unusual amount of "Intercarrier Buzz" refer to procedure on adjoining page to remove this aforementioned fault.

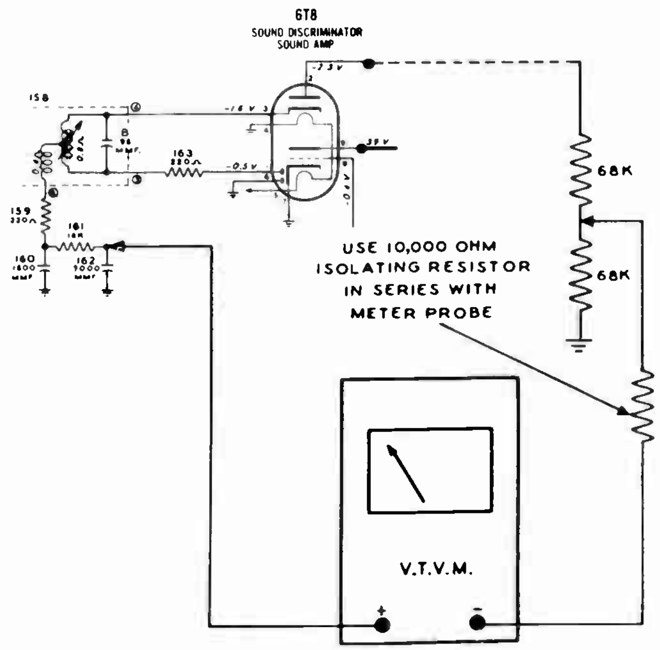

FIG. 5
VTVM Connections for Sound Discriminator Alignment

REDUCTION OF INTERCARRIER BUZZ

Under actual reception conditions slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under these conditions.

Disconnect all instruments (be sure that I.F. tube removed for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

IF CHANNEL ALIGNMENT PROCEDURE

1. A non-metallic screw driver must be used when adjusting the trimmers of the IF transformers to prevent a false indication.
2. In order to eliminate the possibility of spurious oscillation, it is desirable to render the RF oscillator inoperative. This may be accomplished by insulating oscillator contacts on the tuner strips. Remove tuner bottom shield and place a piece of transparent cellulose tape on the first two contacts (from front) of drum assembly. Use any inoperative channel and rotate drum to this insulated position.
3. Short antenna terminals together with a jumper wire.
4. Connect a V.T.V.M. and oscilloscope as shown in Fig. 7.
5. Adjust output attenuator on sweep generator so that reading on V.T.V.M. is not in excess of one volt.
6. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.
7. Certain alignment steps will require a fixed 3 volt A.G.C. bias. When necessary, connect negative terminal of battery to the receiver A.G.C. line and positive terminal to receiver chassis. See Fig. 8 for convenient point of connection.

IF CHANNEL ALIGNMENT PROCEDURE—Continued

GENERATOR CONNECTIONS	GENERATOR FREQUENCIES	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
	STANDARD SIGNAL GENERATOR 42.5 Mc. & 44.5 Mc. SWEEP GENERATOR 45 Mc. ±5 Mc.	Connect a 3 volt battery to receiver AGC system as explained in instruction 7 at the head of this chart.	# 14 1st IF Grid Coil (See Fig. 9) #15 Converter Plate Coil (See Fig. 10)	Adjust trimmers for maximum amplitude, bandwidth and correct positioning of markers as shown. 	STANDARD SIGNAL GENERATOR 39.75 Mc., 41.25 Mc., 45.75 Mc. & 47.25 Mc. SWEEP GENERATOR 45 Mc. ±5 Mc.	Same as above.		The general shape of the overall IF response curve and position of markers should compare with that shown. The picture carrier marker (45.75 Mc.) should appear at approximately the 50% amplitude position. Should this observation fail to meet the above requirement, it will be necessary to make a small change in the setting of one or a combination of the following trimmers until the desired results are achieved. Trimmers, # 5, 6, 7, 8, 11, 12, 14 and slug 15. The sound carrier marker (41.25 Mc.) should appear at the position shown on the curve. If the position of this marker is not correct, then it will be necessary to readjust the setting of trimmer # 9 as explained previously in this procedure.  To properly observe the position of the adjacent channel picture carrier (39.75 Mc.) and the adjacent channel sound carrier (47.25 Mc.), it will be necessary to increase the vertical gain control on the 'scope and the output of the sweep and standard signal generators. Also, be sure to disconnect the 3 volt AGC battery from receiver. If these markers do not compare favorably with that shown, repeat the adjustment of trimmers # 10 and 13 as explained previously in this procedure, exercising greater care in obtaining a minimum reading on the VTVM.

VHF RF CHANNEL ALIGNMENT PROCEDURE

The procedure listed below is only for the VHF RF Channels. If it ever becomes necessary to align the UHF RF Channels, the UHF Tuner, part 521170, must be returned to the factory in accordance with the removal instructions, listed in a subsequent section under the heading "VHF-UHF Tuner Servicing Procedure."

1. **CAUTION:** The shell of the picture tube has a high voltage potential, approximately 14,000 volts, and contact should be avoided. As the adjustment screws are in relatively close proximity to this shell, some means of insulation from accidental contact should be provided.
2. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 10 for convenient point of connection.)

STANDARD SIGNAL GENERATOR: CONNECTIONS	STANDARD SIGNAL GENERATOR: FREQUENCY	SWEEP GENERATOR: CONNECTIONS	SWEEP GENERATOR: FREQ.	VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
RF AMPLIFIER AND MIXER ALIGNMENT								
Connect as shown in Fig. 11.	209.75 MC. Sound Carrier 205.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #12	Not used.	Connect as shown in Fig. 12.	Set Channel Selector to #12. IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	#16 Mixer Grid. (See Fig. 18) #17 RF Amp. Plate. (See Fig. 18) #18 RF Amp. Grid. (See Fig. 18)	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 15. Use Mixer Grid trimmer #16; and RF Amplifier Plate trimmer #17 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #18 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained. IMPORTANT: When adjusting trimmers #9, 10 and 11 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that would result in a loss of sensitivity.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Not used.	Same as above.	Set channel selector to channel being observed.		The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #16, 17 and 18. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers. Band pass characteristic of these channels should conform close to the RF response curve in Fig. 15. If necessary, a compromise may be obtained to compensate for large variations in channel response by returning to channel #12 and making slight changes in the settings of trimmers #16, 17 and 18.

OSCILLATOR ALIGNMENT

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in IF alignment procedure.
2. During oscillator alignment, it is necessary to set the Fine Tuning control so that the tooth on the fiber fine tuning cam points downward (correct position for this control is shown in Fig. 17).
3. During this step and thru-out all succeeding steps it is necessary to: keep output of sweep generator at a level that does not allow reading on VTVM to exceed one volt.
4. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.

STANDARD SIGNAL GENERATOR: CONNECTIONS	STANDARD SIGNAL GENERATOR: FREQUENCY	SWEEP GENERATOR: CONNECTIONS	SWEEP GENERATOR: FREQ.	VTVM CONNECTIONS	SCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig. 11.	209.75 MC. Sound Carrier Marker. 205.25 MC. Picture Carrier Marker.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #12	Connect as shown in Fig. 13.	Connect as shown in Fig. 13.	Set Channel Selector to #12. Be sure that generator's output does not exceed voltage specified in instructions #3 and 4 above.		Using a non-metallic screwdriver to adjust channel #12 oscillator slug (accessible thru hole on front of RF Tuner Unit—see Fig. 17) shift response curve so that picture carrier marker is located at the position indicated in Fig. 16. Position of sound carrier marker should appear as indicated in Fig. 16.
Same as above.	The bandpass characteristic for each of the successive channels should now be observed individually. For frequency setting of marker signals see table in Fig. 14.	Same as above.	Set sweep generator to channel frequencies being observed.	Same as above.	Same as above.	Set channel selector to channel being observed.		Adjust the RF sweep generator and marker generator for operation on the other television channels. After setting Channel Selector to corresponding channel, adjust oscillator slug thru hole on front of RF Tuner Unit (see Fig. 17). This permits response curve to be shifted so that picture and sound carrier markers will appear at the position indicated in Fig. 16. NOTE: Make sure that cam on fine tuning control shaft remains properly positioned during this step (tooth on the cam pointing downward—see Fig. 17).

If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel. If characteristic does not conform reasonably well within the typical curve shown in Fig. 15, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channels.

BOTTOM VIEW OF CHASSIS SHOWING CONNECTIONS TO RF TUNER UNITS

VOLTAGE MEASUREMENTS

All voltages measured with a 20,000 Ohm per volt meter with the receiver connected to a 117 volt 60 cycle power supply.

Tuner set to an inactive channel with antenna terminals shorted and connected to ground.

Controls set for normal reception — Contrast control completely counterclockwise.

Voltages marked with an asterisk (*) will vary widely with control settings.

R.F. tuner voltages were measured with tubes removed from sockets.

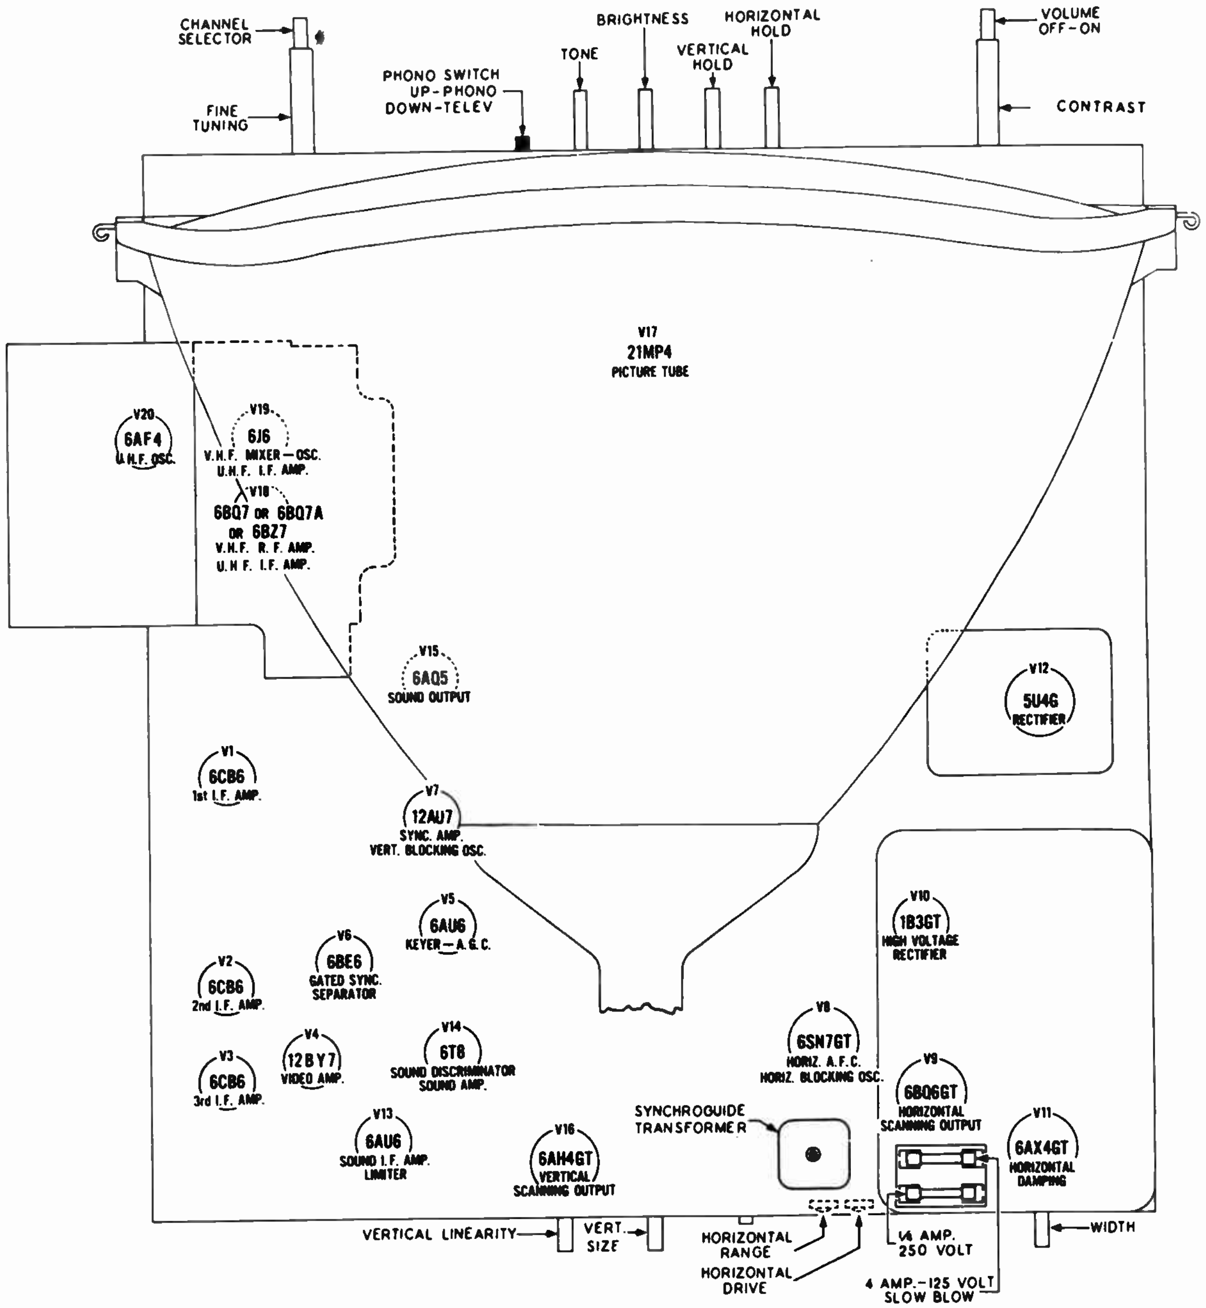
No voltage reading at a tube element indicates zero voltage or voltage which cannot be accurately measured with a 20,000 Ohm per volt meter.

OSCILLOGRAMS

All oscillograms taken with ground lead of 'Scope connected to receiver chassis and controls set for normal reception. Contrast control adjusted to give 50 volts peak to peak at cathode of picture tube. Oscilloscope vertical amplifier response was flat to within 20% at 2 MC.

Number appearing to the left of oscillogram specifies setting of horizontal sweep frequency control on 'Scope.

TUBE AND CONTROL LOCATIONS



PARTS LIST

Notice: Some parts listed below have special characteristics. Do not use substitutes for replacement purposes.

CONDENSERS

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
C 1	513447	Condenser—ceramic 9 Mmfd. ±10% 500v.	1.05

	161384	Spring—dial cord tension	.06

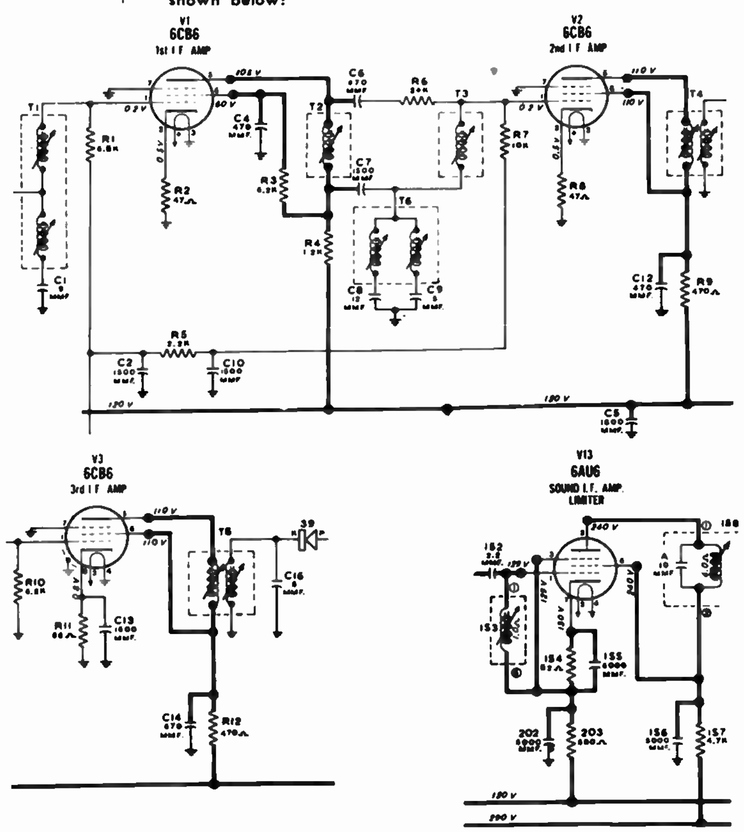
PRODUCTION CHANGES

The following tabulation furnishes complete detoils on changes which occurred during receiver production. The receivers incorporoting these changes are identified by coding stamped on rear surfoce of chassis. The coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" ar "D".

The circuit shown on this page applies to "SERIES ABCDEFGHJK" chassis

A letter following the component circuit diagram number thus—201 A, indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change calumn, from which complete change information can be obtoined.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
UNCODED	**INITIAL PRODUCTION**
"A"	The following changes were incorporated to provide for the use of an alternate type of I. F. system. 1. The voltage supply of the various elements of tube V1 (1st I.F. Amp.) and V2 (2nd I.F. Amp.) and V13 (Sound I.F. Amp-Limiter) as well as components to these elements were changed. The circuit, for tubes V1, V2, V3, and V13 for chassis that do not incorporate the letter "A" is shown below:



LETTER DESIGNATION	DESCRIPTION OF CHANGE
"B"	The following changes were incorporated to improve interlace and vertical hold action. 1. Change condenser 71 in plate circuit of tube V7B (Vert. Blocking Osc.) from 5000 Mmfd./to .03 Mfd. 2. Change resistor 186 in grid circuit of tube V7B (Vert. Blocking Osc.) from 1.5 Meg. to 1.2 Meg.
"C"	The following change was incorporated to reduce current drain. 1. Omit resistor 208 (7500 Ohms) connected between the 120 volt supply and the 270 volt supply. This change should only be undertaken when the letter "A" is incorporated in series designation at rear of chassis.
"D"	The following change wos incorporated to prevent regeneration in I.F. system. 1. Add trap coil 241 (Part 522020) between the grid of tube V4 (Video Amp.) and perking coil 41.

PRODUCTION CHANGES—Continued

LETTER DESIGNATION	DESCRIPTION OF CHANGE
"E"	The following changes were incorporated to extend the useful range of the Horizontal Hold control. 1. Change Horizontal Range 108-A control in the grid circuit of V8A (Horizontal A.F.C.) from a variable condenser (10-160 Mmfd.) to a fixed condenser 218 (47 Mmfd.). 2. Change resistor 113 in grid circuit of tube V8A (Horizontal A.F.C.) from 150,000 Ohms to 220,000 Ohms. 3. Change resistor 114 in grid circuit of tube V8A (Horizontal A.F.C.) from 330,000 Ohms to 1 Meg. 4. Add resistor 212 (150,000 Ohms) from the junction of condenser 109 (47 Mmfd.) and resistor 114 (1 Meg.) to chassis ground. 5. Remove resistor 133 (10,000 Ohms) in grid circuit of tube V9 (Horizontal Scanning Output) and replace with condenser 133 (270 Mmfd.). 6. Change resistor 97 in grid circuit of tube V6 (Gated Sync. Separator) from 820,000 Ohms to 1.5 Meg. 7. Change resistor 106 from 10,000 Ohms to 4700 Ohms and add resistor 105 (4700 Ohms) in series with resistor 106 and plate of tube V7A. Resistor 182 (18,000 Ohms) remains connected to the plate of tube V7A—12AU7 while condenser 107 (100 Mmfd.) is reconnected to the junction of resistors 105 and 106. In addition to the above changes the Syncroguide transformer must be readjusted in accordance with the procedure (for a Series "E" chassis) given in the service data section of the manual.
"E" (cont.)	The following changes were incorporated to improve the blanking during horizontal retrace interval. 1. Add resistor 213 (150,000 Ohms) between cathode of tube V9 (Horizontal Scanning Output) and the grid circuit of tube V17 (Picture Tube). 2. Add resistor 214 (1 Meg.) between pin 1 of the horizontal output transformer and grid circuit of tube V17 (Picture Tube). 3. Add resistor 215 (56,000 Ohms) from the junction of resistors 213 and 214 to chassis ground. 4. Add condenser 216 (100 Mmfd.) from the junction of resistors 213 and 214 to the grid of tube V17 (Picture Tube). The following change was incorporated to reduce illumination of picture tube with minimum setting of the Brightness Control. 1. Change resistor 68 in the brightness circuit from 470,000 Ohms to 330,000 Ohms.
"F"	The following change was incorporated to minimize frequency drift in the syncroguide circuit. 1. Change condenser 130 from a .01 Mfd. to a .01 Mfd. (Special characteristic) part 512311 only.
"G"	The following changes were incorporated to improve the useful range of the Contrast control. 1. Change connection of Brightness control 67A associated circuit from cathode of tube V17 (Picture tube) to grid of the same tube. The Brightness circuit for chassis that do not incorporate the letter "G" is shown at the right:  2. Add resistor 219 (470,000 Ohms) in parallel with condenser 62 (.1 Mfd.) located in cathode circuit of tube V17 (Picture tube). 3. Change resistor 70 in plate circuit of tube V7B (Vert. Blocking Osc.) from 100,000 Ohms to 47,000 Ohms and add condenser 210 (.1 Mfd.) in series with resistor 70. Connect other end of condenser 210 to the junction of condenser 190 (.047 Mfd.) and resistor 191 (8200 Ohms).
"H"	The following changes were incorporated to improve the video response. 1. Change peaking coil 51 in plate circuit of tube V4 (Video Amp.) from port 520984 to 520689. 2. Change resistor 52 in parallel with peaking coil 51 from 15,000 Ohms to 12,000 Ohms. 3. Change peaking coil 53 in plate circuit of tube V4 (Video Amp.) from part 520986 to part 509342. 4. Change resistor 54 in plate circuit of tube V4 (Video Amp.) from 3900 Ohms to 2200 Ohms. 5. Change resistor 55 in plate circuit of tube V4 (Video Amp.) from 1500 Ohms to 1800 Ohms.
"J"	The following change was incorporated to maintain proper focus for the normal range of the brightness control. 1. Change resistor 68 in brightness circuit from 100,000 Ohms to 220,000 Ohms.
"K"	The following change was incorporated to permit the use of the I.F. system in various type chassis. 1. Add condenser 240 (680 Mmfd.) between the grid of tube V1 (1st I.F. Amp.) and I.F. transformer 9.

CHASSIS ASSEMBLY V-2243-1

MODELS CONTAINING ALL-CHANNEL UHF TUNERS

When the letter "U" appears in the model number, it indicates that the receiver contains an all-channel UHF tuner in addition to its VHF facilities. For example, Model H-770TU21 is the same as Model H-770T21 except that an all-channel UHF tuner has been added to it. For service information on the UHF tuner, refer to the Model H-804 service notes.

SERVICE NOTES

SPECIFICATIONS

FREQUENCY RANGES:

CHANNEL NUMBER	CHANNEL FREQUENCY (MC.)	VIDEO CARRIER FREQUENCY (MC.)	SOUND CARRIER FREQUENCY (MC.)	RECEIVER H-F OSCILLATOR FREQUENCY (MC.)
2	54 - 60	55.25	59.75	101
3	60 - 66	61.25	65.75	107
4	66 - 72	67.25	71.75	113
5	76 - 82	77.25	81.75	123
6	82 - 88	83.25	87.75	129
7	174 - 180	175.25	179.75	221
8	180 - 186	181.25	185.75	227
9	186 - 192	187.25	191.75	233
10	192 - 198	193.25	197.75	239
11	198 - 204	199.25	203.75	245
12	204 - 210	205.25	209.75	251
13	210 - 216	211.25	215.75	257

NOTE: Provisions for UHF reception are included. To activate the UHF positions of the channel selector, small single-channel UHF units can be inserted into the UHF sockets at the rear of the RF tuner or an all-channel UHF tuner can be installed. Installation instructions are furnished with the units.

FINE TUNING RANGES:
1 mc. minimum; 2 mc. maximum

OPERATING VOLTAGE:
105 to 120 volts, 60 cycles A-C

POWER CONSUMPTION: .... 225 watts

AUDIO POWER OUTPUT:
Undistorted .... 2.5 watts
Maximum .... 3 watts

LOUDSPEAKER:
Type .... P.M.
Voice Coil Impedance ..3.2 ohms at 400 cycles

RECEIVER ANTENNA INPUT IMPEDANCE:
......300 ohms balanced or 72 ohms unbalanced

TUBE COMPLEMENT:

1	1B3GT	High voltage rectifier
1	5U4G	Low voltage rectifiers
1	6AL5	Horizontal AFC
1	6AU6	Sound I-F amplifier
1	6AU6	Sync separator
1	6AU6	Keyed AGC
1	6AX4GT	Horizontal damper
1	6BK5	Audio output
1	6BN6	FM detector
1	6BQ6GT	Horizontal output
1	6BZ7	RF amplifier
3	6CB6	I-F amplifiers
1	6SN7GT	Vertical multivibrator
1	6X8	HF oscillator and mixer
1	12AT7	Sync amplifier and sync control
1	12AU7	Horizontal multivibrator
1	12BH7	Vert. output and noise clipper
1	12BY7	Video output
1	21YP4	Cathode ray tube

VIDEO CARRIER INTERMEDIATE FREQUENCY:
.... 45.75 mc.

VIDEO RESPONSE: .... 3.5 mc.

SOUND CARRIER INTERMEDIATE FREQUENCY:
.... 4.5 mc.

FOCUS: .... Electrostatic

SWEEP DEFLECTION: .... Magnetic

SCANNING: .... Interlaced 525 line

HORIZONTAL SCANNING FREQUENCY:
.... 15,750 CPS

VERTICAL SCANNING FREQUENCY: ....60 CPS

FRAME FREQUENCY:
(picture repetition rate): .... 30 CPS

HIGH VOLTAGE WARNING

The danger accompanying shock is always present when the receiver is operated outside the cabinet or when the rear cover is removed from the cabinet. Only a person familiar with the precautions to be observed when working with high-voltage equipment should service this receiver.

CATHODE RAY TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves should be worn at all times when handling a cathode ray tube. The tube should not be handled in the vicinity of any person not so equipped. When handling the tube, always keep it away from the body.

Due to the large surface area of the tube and the high vacuum contained within, more than ordinary care is required to prevent shattering the tube. The large end of the bulb, particularly the rim of the viewing surface, must not be struck, scratched, or subjected to more than moderate pressure. If the tube binds during removal or replacement, determine the cause of the trouble — **DO NOT FORCE THE TUBE.**

An additional precaution is required when handling a cathode ray tube that has an aquadag coating on the outside of the tube. The outside aquadag coating forms one plate of a capacitor, and the inside coating to which the high voltage is applied serves as the other plate. The high voltage charge may be retained in this capacitor for a long time after the high voltage lead is disconnected. Since the charge could produce a shock that would startle the handler into dropping the tube, the charge should be dissipated before any handling of the tube is attempted. To dissipate the charge, place a jumper from the outside aquadag coating to the high voltage button on the tube. Due to the relatively high resistance of the aquadag, the jumper should be held in place for some time to insure complete discharge.

PRODUCTION CHANGES AFFECTING CHASSIS V-2243-1

In production, any or all of the following changes may be incorporated in the V-2243-1 chassis. See Fig. 12, V-2243-1 schematic revised.

1. SPECIFICATION CHANGES. C100, .005 mfd. and C101, .005 mfd. are replaced with a dual .005 mfd. capacitor designated C100. C206, .005 mfd. and C208, .005 mfd. are replaced with a dual capacitor designated C206.

2. ALTERNATE HORIZONTAL OUTPUT TUBE. A 6BQ6G can be substituted for the 6BQ6GT horizontal output tube.

3. IMPROVED UHF RECEPTION. The gain of the pentode section of the 6X8 tube, when operating as an IF amplifier stage for the UHF tuner, has been increased. The 220 ohm cathode resistor, previously out of the circuit during UHF operation, is now grounded by soldering a piece of #22 bus wire from the junction of the 220 ohm resistor and wafer switch section 1B to the ground terminal of wafer switch 2A.

4. TWEET SUPPRESSION. To eliminate tweet interference in the picture which might otherwise occur under certain conditions, a resistor, R223, is inserted between C211 and the junction of R203, C210 and R204. At the same time a filament choke, L505, is added in series with filament (pin 3) of the 6BN6 FM detector.

5. INCREASED SOUND ATTENUATION. C302 has been changed from 1.5 mmf to 2.2 mmf. This change increases the attenuation of the sound trap, L301 – C303, to a point where any 4.5 mc. tweet, that might appear in the picture, is suppressed. C301 is now unnecessary and has been removed.

6. SOUND HASH ELIMINATION. To avoid hash in the sound which occurred in some sets due to pick-up of scanning energy in sound system, C319 has been increased to .02 mfd.

7. IMPROVED PICTURE QUALITY. To reduce ringing in the video amplifier plate circuit, R314 has been changed to 6800 ohms.

8. REDUCTION OF HORIZONTAL DRIVE. To prevent overdrive of the horizontal output stage R435 is increased to 12,000 ohms.

9. IMPROVED AGC PERFORMANCE. To improve the action of the AGC circuit under strong signal conditions and to provide a wider range of AGC control settings, R326 is increased to 390,000 ohms and R327, the AGC control is changed to 750,000 ohms.

10. DECREASED PLATE DISSIPATION TO REDUCE 6BQ6 TUBE FAILURE. The output voltage of the low voltage power supply has been reduced from 290VDC to 278VDC. To compensate for this change in other circuits, R442, 68,000 ohms and R456, 100,000 ohms have been removed. R444 is decreased to 1800 ohms, the audio decoupling resistor R211 is changed to 560 ohms and a 27,000 ohm resistor has been added in parallel with R454. This resistor is designated R464. The power transformer is changed to part no. V-11544-3N.

11. IMPROVED SYNC. The gain of the 6AU6 sync separator tube is increased by reducing the cathode resistor (R405) from 2,700 ohms to 1,200 ohms.

12. SPECIFICATION CHANGE. C209 and C210 have been replaced with a single .0015 mfd. capacitor designated C210.

13. UHF TUNER DRIVE BELT. To prevent slippage, the UHF tuner drive belt has been changed to part number V-11338-4.

INSTALLATION AND SERVICE ADJUSTMENTS

THE INDIVIDUAL CHANNEL OSCILLATOR ADJUSTMENTS OF EVERY RECEIVER SHOULD BE CHECKED AT THE TIME OF INSTALLATION AND WHENEVER SERVICING IS NECESSARY.

If these adjustments are made correctly, the receiver can be switched from channel to channel by merely turning the channel selector. With proper adjustment, the best picture detail and sound quality will be found when the fine tuning control is in the center of its range.

Individual channel oscillator adjustments can be made on an "air signal". It is not necessary to remove the chassis from its cabinet.

Proceed as follows:

1. Allow 5 min. for receiver warm-up.

2. Set the channel selector for the channel to be adjusted. Set the other operating controls for a normal picture and sound.

3. Remove the channel selector knob and fine tuning knob.

4. Set the fine tuning control to the center of its range by rotating the fine tuning shaft until the flat side faces up.

5. Insert a non-metallic alignment tool (see Fig. 3) through the opening in the cabinet and into the small hole provided in the tuner. The oscillator slug for the channel being adjusted will be in position to receive the alignment tool. Adjust the slug for best picture detail and sound quality. In most instances, only a slight rotation of the slug is necessary. Always adjust the slug by turning it counterclockwise first. Turning the slug too far clockwise will cause it to pass its retaining spring. If this occurs, it will be necessary to remove the coil strip and reset the slug in its retaining spring.

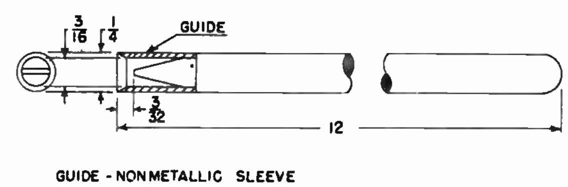

FIG. 4 – OSCILLATOR ADJUSTMENT TOOL

ALIGNMENT CHARTS

COMMON I-F SECTION

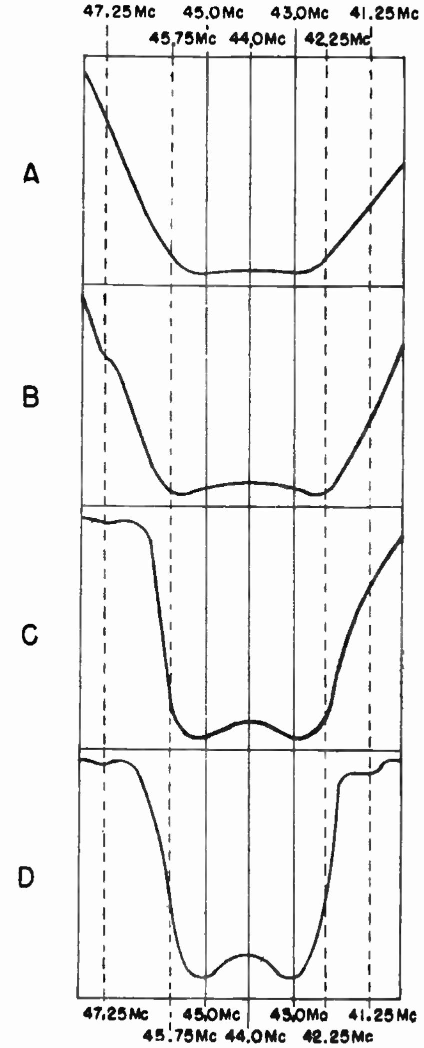
Rotate the channel selector to channel 13.

Connect the oscilloscope to the video test terminal, point "B" on Fig. 5, through the decoupling network shown in Fig. 2.

Connect a 9 volt bias battery to the AGC line, point "A" on Fig. 8.

Couple the marker generator output to the sweep generator output. In the steps that follow, use the marker to check the response curve at the frequencies indicated on Fig. 6.

Step	Alignment Signal	Remarks	Adjust –
1.	Remove the 6BZ7 RF amplifier tube.		
2.	44 mc. sweep to 3rd IF grid	Connect detuning clips to 1st & 2nd IF plates	Pri. of T302 for max. response and sec. of T302 for symmetrical curve shown in Fig. 6A
3.	47.25 mc. amplitude modulated to 1st IF grid	Use sufficient signal to produce sine wave response on oscilloscope	L302 for min. response
4.	44 mc. sweep to 2nd IF grid	Connect detuning clip to 1st IF plate	Pri. of T301 for max. response and sec. of T301 for symmetrical curve shown in Fig. 6B
5.	44 mc. sweep to 1st IF grid	Detune L103 before adjusting T300	Pri. of T300 for max. response and sec. of T300 for symmetrical curve
6.	44 mc. sweep to 1st IF grid		L103 for "suck-out" at 44 mc. (center of curve). See Fig. 6C
7.	Replace the 6BZ7 RF amplifier tube		
8.	213 mc. sweep to antenna terminals through network	Fine tuning set to mid-range	L300 for symmetrical curve and L301 for min. 41.25 mc. marker amplitude. See Fig. 6D



– RESPONSE CURVES AT VARIOUS STAGES OF ALIGNMENT

Connect the signal generator to the video test terminal (point "B" on Fig. 5) through a .001 mfd capacitor.

Step	Signal Gen. Frequency	VTVM Connections	Remarks	Adjust –
1.	4.5 mc. unmodulated	RF probe to point "C" (see Fig. 8) and common lead to chassis.	Use strong signal from generator	L303 for minimum voltage

SOUND SECTION

Using a weak signal, adjust L200 and L201 for maximum response to a 4.5 mc. FM signal. Using a strong signal, adjust L202 for maximum response on a 4.5 mc. FM signal. Using a weak signal, adjust the quieting control for minimum AM noise.

Model H-793KU21 is the same as Model H-793K21 except that it contains a built-in all- channel UHF tuner. For service information on the UHF tuner, refer to the H-804 service notes.

MODELS H-786KU21 AND H-787KU21 are the same as Models H-786K21 and H-787K21 except that they contain a built-in all-channel UHF tuner. For service information on the UHF tuner, refer to the H-804

For service information on the V-2243-1 and V-2243-2 chassis, refer to the H-770T21, H-771T21, H-772K21, H-773K21, H-774K21. H-775K21, and H-776T21 service notes and supplementary information thereto.

R. F. AND MIXER ALIGNMENT

1. Refer to the basic service notes on the H-770T21, H-771T21, H-772K21, H-773K21, H-774K21, H-775K21 and the H-776T21 for test equipment details and general information.

2. Disconnect the tuner AGC lead (white wire) from the junction of C324, R327 and R326. Apply -2 volts bias to the tuner.

3. Connect the output of the sweep generator to the receiver antenna terminals. Be sure the proper impedance matching network is used.

4. Loosely couple the marker generator to the sweep output cable at antenna terminals.

5. Connect the oscilloscope, through a 10,000 ohm isolating resistor, to the "VHF test point" on the tuner. (See Fig. 1).

6. Turn on the receiver and test equipment and allow 5 min. warm-up.

7. Set the receiver channel selector to channel 12 and adjust the sweep generator to sweep channel 12 frequencies. Sweep width of 12 mc. is desirable so that the skirts of the response curve will fall to zero.

8. Set the marker generator to 207 mc. and adjust the output level so that the marker pip is barely visible. Excessive marker injection will distort the response curve.

9. Using 205.25 mc. and 209.75 mc. settings of the marker generator as reference, adjust in sequence the antenna (RF) trimmer, C117; the RF plate circuit trimmer, C119; and the mixer grid trimmer, C120 to produce a response curve similar to that shown in Fig. 4. The response curve should be symmetrical and the depth of the valley between peaks should not exceed 30% of the overall amplitude. Tolerances in amplitude of 30% at or between carrier frequencies are permissable. Avoid "stagger tuning" these circuits by tuning each for maximum pattern height at the point midway between the two markers.

The adjustment should result in maximum amplitude of the response curve, proper positioning of the sound and picture carriers and the closest approach to equal amplitude of the two humps with minimum valley between. Fig. 4 is the RF and mixer response curve and should not be confused with the overall RF-IF response curve of the tuner.

10. Without disturbing the settings of C117, C119 and C120, check the response curve on the other TV channels by changing the frequency of the sweep generator and the marker generator to correspond with the channel being checked. (See Fig. 7) The response curves should be substantially the same on all channels and the marker frequencies should fall in the same positions on the response curve. A slight amount of "tilt" indicated by the relative amplitude of the two humps can be tolerated but should not exceed 30% of the overall amplitude of the response curve. The ideal response curve has a flat top.

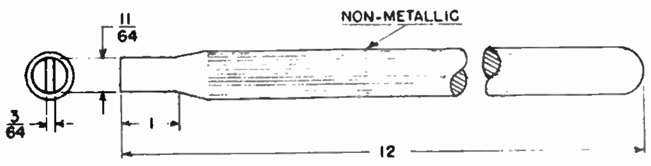


FIG. 3 – Alignment Tool

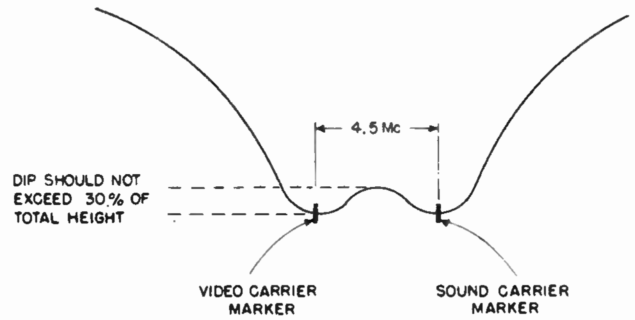

FIG. 4 – RF-Mixer Response Curve

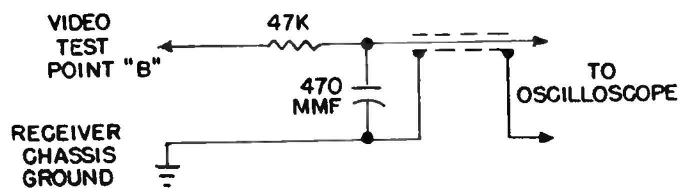

FIG. 5 – Decoupling Network

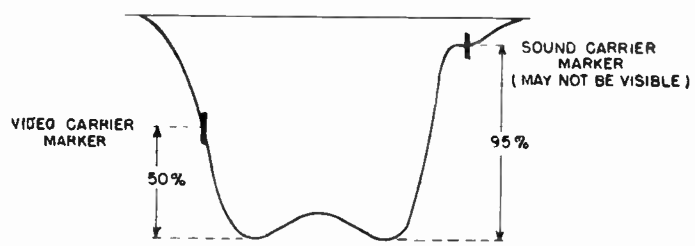

FIG. 6 – Overall Response Curve

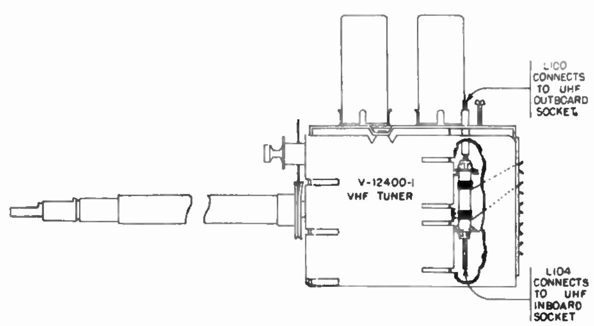

V-12400-1 – Tuner UHF Adjustments

OSCILLATOR ALIGNMENT

Under the INSTALLATION AND SERVICE ADJUSTMENTS section of this note, adjustment of the individual oscillator circuits using "air signals" was outlined. The following procedure covers shop alignment of the oscillator circuits and does not require "air signals". Before undertaking oscillator alignment, all IF circuits must be properly aligned for pass band characteristics and trap settings. (Refer to basic service note).

1. With the exception of the oscilloscope, the test equipment hook-up is the same as that used when aligning the RF and mixer stages. Connect the vertical input of the oscilloscope to the video test point "B" (See Fig. 10 schematic diagram) through the decoupling network shown in Fig. 5.

2. Set the fine tuning control to center frequency by turning the fine tuning shaft until the flat section faces up. Using the sweep and marker generator frequencies in the chart, (See Fig. 7) adjust the oscillator slug so that the video carrier marker is at half amplitude on the high frequency slope of the IF response curve. (See Fig. 6)

CHANNEL	SWEEP GENERATOR CENTER FREQUENCY 12 MC. SWEEP	MARKER GENERATOR FREQUENCY PIX	SOUND
2	57 MC	55.25	59.75

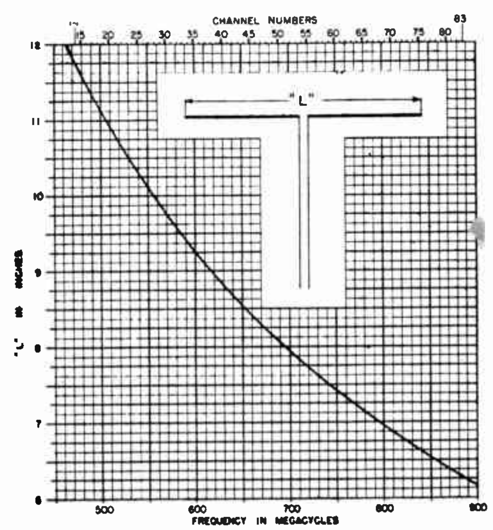

FIG. 9 – UHF Dipole Lengths

CHASSIS ASSEMBLY V-2243-4

In addition to the V-2243-1 and V-2243-3 chassis assemblies, the V-2243-4 chassis assembly is also used in production of some of the models covered by this service note. The V-2243-4 chassis uses a new tuner, part V-12400-1, otherwise it is identical to chassis V-2243-1.

V-12400-1 TUNER ASSEMBLY

The V-12400-1 tuner is basically the same as the V-11794-1 tuner, which is used in the 2243-1 chassis, with the exception that the UHF input circuit has been modified to provide link-coupling for an all-channel UHF continuous tuner. (See circuit schematic Fig. 12). Refer to the Model H-804 service notes for specific information covering all-channel UHF continuous tuners.

Model H-802 plug-in receptors can also be used for UHF reception in the V-2243-4 chassis. Both sections

in frequency. 300 ohm tubular transmission line is acceptable.

Where two or more antennas are used for receivers containing a single antenna input, an antenna switching or isolating device may be required. A low capacity, manually operated switch can be attached to the back of the receiver. (See Fig. 8) A variety of antenna isolating devices are now available. Their installation is simple and their operation is automatic. Some are designed for installation on the antenna mast, thus avoiding the need for additional transmission lines.

of the dual UHF input circuit of the V-12400-1 VHF tuner are adjustable to provide optimum coupling between the UHF receptors and the VHF tuner.

Referring to Figs. 10 and 11, L100 is the coupling adjustment for the receptor installed in the outboard UHF socket; L104 is the coupling adjustment for the receptor installed in the inboard UHF socket. To make the adjustment, set the channel selector to the proper UHF position, tune the receiver in the normal manner and adjust the slug (L100 or L104) for best picture quality.

NOTE: The series resonant trap, L106-C118 is normally set for maximum capacity but should be adjusted in the field if local interference on channel 2 is encountered.

UHF ANTENNA INFORMATION

Antenna requirements for satisfactory UHF television reception are determined by the signal conditions in the particular locality.

Some of the possibilities are as follows:

1. In areas where signals are very strong and reflections are not troublesome, satisfactory reception can be obtained by using a single broad-band VHF-UHF antenna.

2. In medium signal areas, a separate UHF antenna may be required. A simple resonant dipole usually provides satisfactory UHF reception. The chart, Fig. 9, gives the total length of a half-wave dipole element for any frequency in the UHF spectrum.

3. Where signals are weak or reflections are troublesome, a high gain, directive UHF antenna system should be used. Typical of this type are the Corner Reflector, the Conical and the Yagi.

Transmission lines should be of an approved low loss type. The use of 300 ohm ribbon type transmission line for UHF installations is not recommended as its attenuation factor, when wet, rises sharply with increase

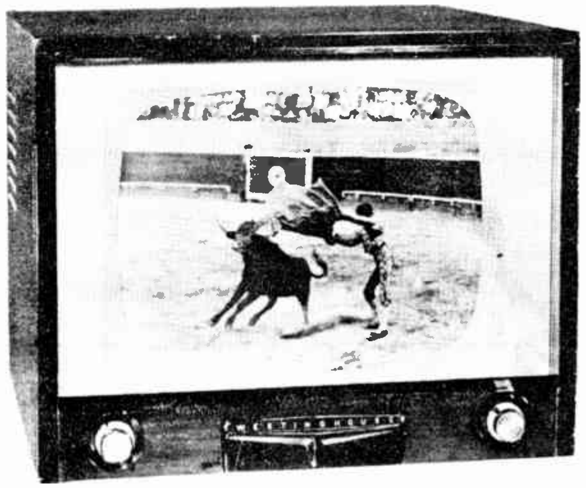
H-765T17 **H-766T17**



The V-2260-14 chassis is the same as the V-2260-12 chassis with the exception that a V-12415 RF tuner is used. For service and alignment information on the V-12415 tuner, refer to Supplement 1 of the H-765T17 and H-766T17 service notes.

For alignment, adjustments, and other service information refer to the H-765T17 and H-766T17 service notes.

MODELS H-798TU17 AND H-799TU17 USING A V-2270 CHASSIS

The V-2270 chassis is identical to the V-2260 chassis with the exception that an all-channel UHF has been factory installed to provide reception of the UHF television channels (14 through 83). For service information on the UHF tuner, refer to the Model H-804 service note and any supplementary information thereto.

Several different combinations of VHF and UHF tuners are used in the V-2270 chassis. The following chart will identify these combinations.

Chassis assembly	*VHF tuner*	*Positions*	*UHF tuner*
V-2270-122	V-12400-1	16	V-12390-1
V-2270-124	V-12400-1	16	V-11972-1

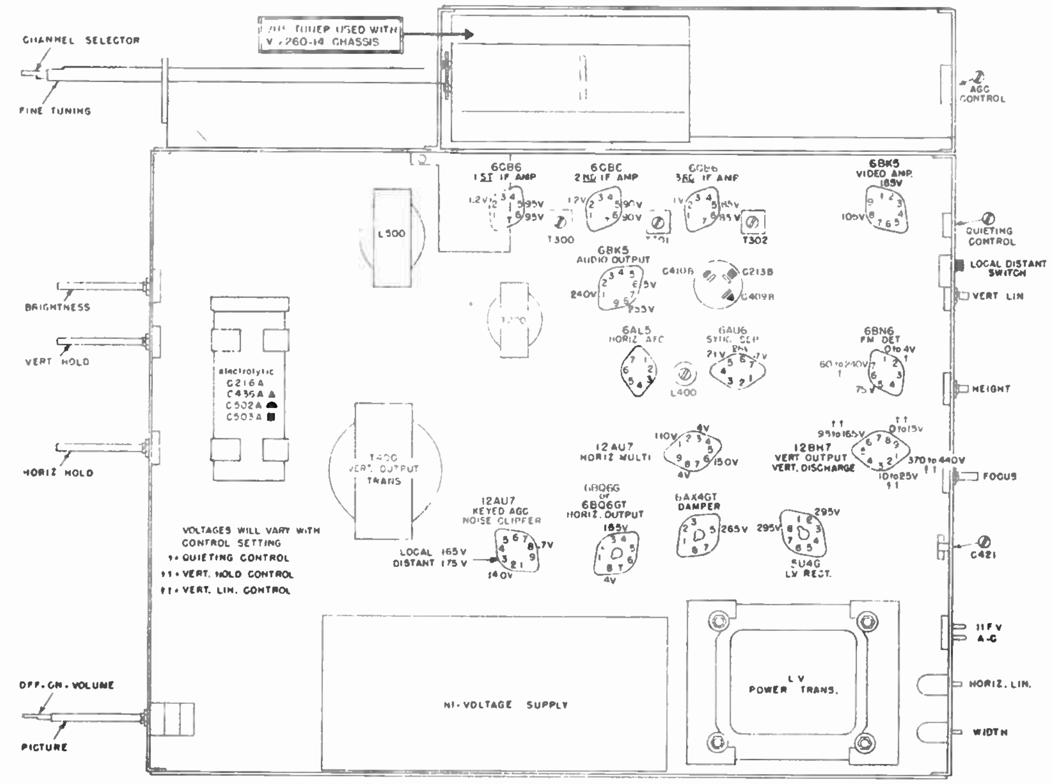


FIG 1 BOTTOM VIEW OF V-2260-12 AND V-2260-14 CHASSIS

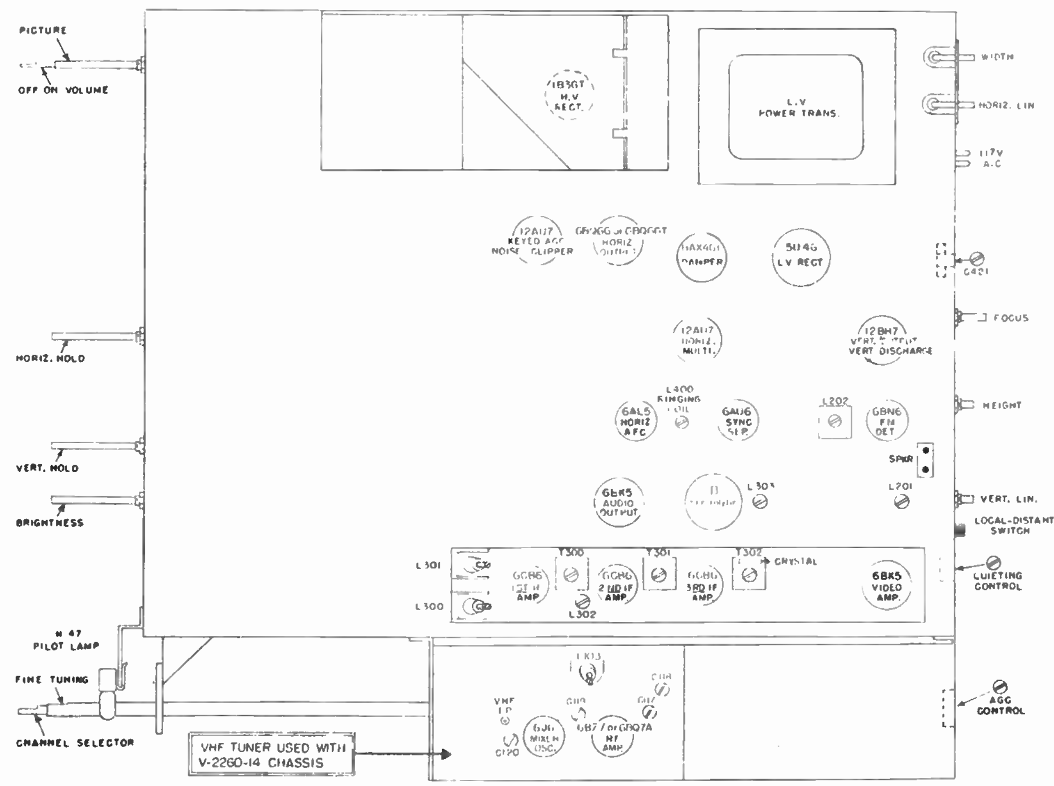

FIG. 2 TOP VIEW OF V-2260-12 AND V-2260-14 CHASSIS

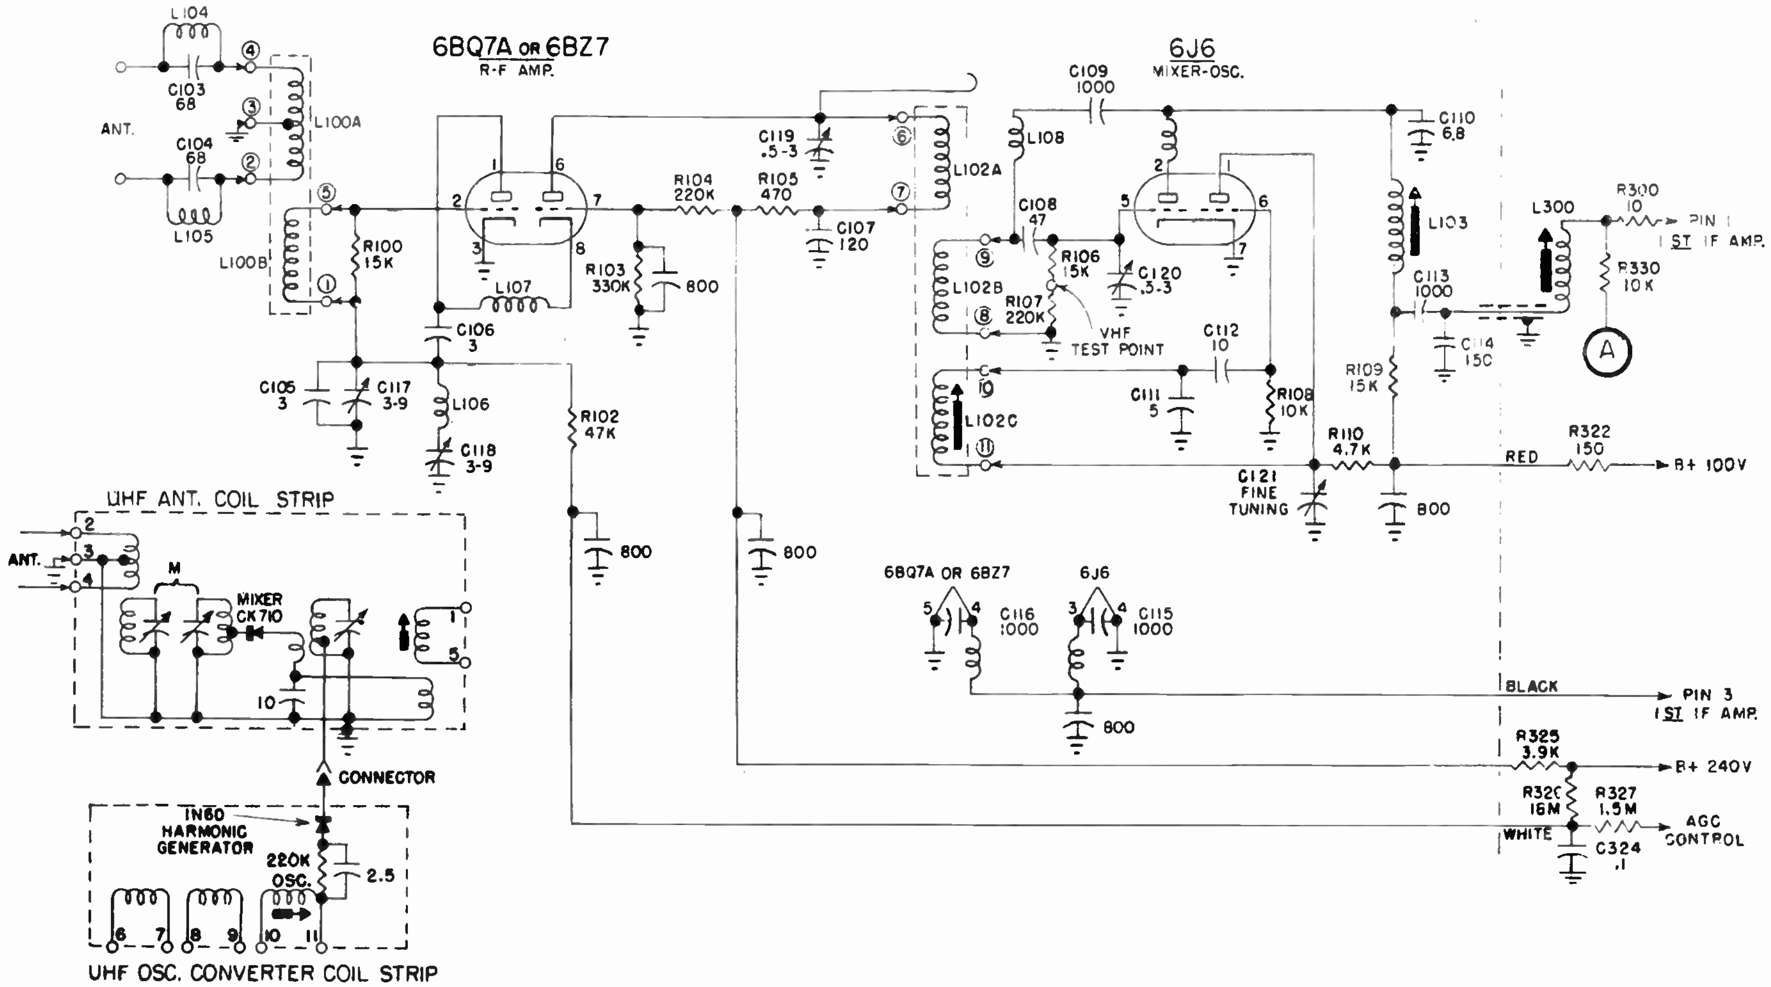

Fig. 2 V-12415-1 Tuner — Schematic Diagram

Production Changes Affecting Chassis V-2240-1

In production, any or all of the following changes may be incorporated in V-2240-1 chassis. See Fig. 10, V-2240-1 Schematic Revised.

1. R450 is changed from 6.8K to 12K to prevent horizontal overdrive.

2. A condenser C447, 47mmf. is added between the plate (pin 5) of the 6AU6 sync separator and ground. C447 provides additional video modulation filtering to prevent bending of the picture at the top.

3. R316 is increased to 270K and R332 to 120K to prevent picture streaking at high brightness.

4. C100, .005 mfd., and C101, .005 mfd. are replaced with a dual .005 mfd. capacitor. The new capacitor is designated C100.

5. C206, .005 mfd., and C208, .005 mfd. are replaced with a dual .005 mfd. capacitor. The new capacitor is designated C206.

6. Filament choke L505 part #V-4886-2 has been added in series with the filament (pin 3) of the 6BN6. A 12K resistor has been inserted between R203, 470 ohms and C211, .02 mfd. These changes were made to reduce tweet in the picture caused by harmonics generated in the 6BN6.

7. C419 is changed from 100 mmf. to 150 mmf. to improve the locking range of the horizontal hold control.

8. C302, 1.5 mmf. has been changed to 2.2 mmf. to increase sound attenuation. With this change C301, 3.3 mmf., is unnecessary and has been removed.

9. To increase the gain of the pentode section of the 6X8 when working as an IF stage for the UHF tuner, the 220 ohm cathode resistor is connected to ground. This is done by soldering a piece of #22 wire from the junction of the 220K resistor and wafer switch section 1B to the ground terminal of wafer switch section 2A.

10. Ion trap magnet, part V-9784-5, has been replaced with, ion trap magnet, part V-9784-4 to improve ion trap action.

11. The two outside connections to R400 have been reversed, decreasing the B+ to the picture control, thus stabilizing the picture brightness at various settings of the picture control.

12. To prevent slippage the UHF tuner drive belt has been replaced with part V-11338-4.

R. F. AND MIXER ALIGNMENT

1. Refer to page 5 of the basic service notes on the H-765T17 and the H-766T17 for test equipment details and general information.

2. Disconnect the tuner AGC lead (white wire) from the junction of C324, R327 and R326. Apply -2 volts bias to the tuner.

3. Connect the output of the sweep generator to the receiver antenna terminals. Be sure the proper impedance matching network is used.

4. Loosely couple the marker generator to the sweep output cable at antenna terminals.

5. Connect the oscilloscope, through a 10,000 ohm isolating resistor, to the "VHF test point" on the tuner. (See Fig. 1).

6. Turn on the receiver and test equipment and allow 5 min. warm-up.

7. Set the receiver channel selector to channel 12 and adjust the sweep generator to sweep channel 12 frequencies. Sweep width of 12 mc. is desirable so that the skirts of the response curve will fall to zero.

8. Set the marker generator to 207 mc. and adjust the output level so that the marker pip is barely visible. Excessive marker injection will distort the response curve.

9. Using 205.25 mc. and 209.75 mc. settings of the marker generator as reference, adjust in sequence the antenna (RF) trimmer, C117; the RF plate circuit trimmer, C119; and the mixer grid trimmer, C120 to produce a response curve similar to that shown in Fig. 4. The response curve should be symmetrical and the depth of the valley between peaks should not exceed 30% of the overall amplitude. Tolerances in amplitude of 30% at or between carrier frequencies are permissable. Avoid "stagger tuning" these circuits by tuning each for maximum pattern height at the point midway between the two markers.

The adjustment should result in maximum amplitude of the response curve, proper positioning of the sound and picture carriers and the closest approach to equal amplitude of the two humps with minimum valley between. Fig. 4 is the RF and mixer response curve and should not be confused with the overall RF-IF response curve of the tuner.

10. Without disturbing the settings of C117, C119 and C120, check the response curve on the other TV channels by changing the frequency of the sweep generator and the marker generator to correspond with the channel being checked. (See Fig. 7) The response curves should be substantially the same on all channels and the marker frequencies should fall in the same positions on the response curve. A slight amount of "tilt" indicated by the relative amplitude of the two humps can be tolerated but should not exceed 30% of the overall amplitude of the response curve. The ideal response curve has a flat top.

NOTE: The series resonant trap, L106-C118 is normally set for maximum capacity but should be adjusted in the field if local interference on channel 2 is encountered.

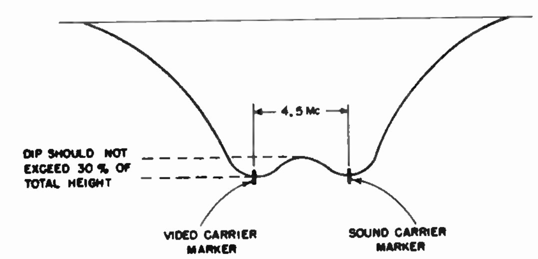

Fig. 4 RF Mixer Response Curve

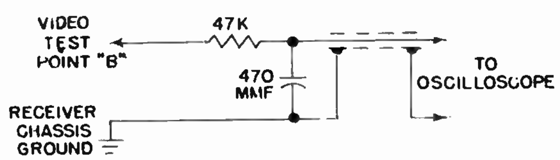

Fig. 5 Decoupling Network

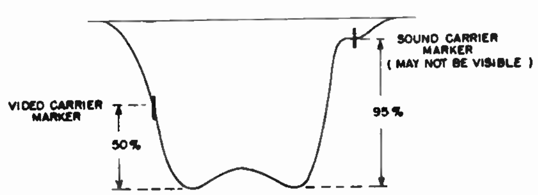

Fig. 6 Overall Response Curve

OSCILLATOR ALIGNMENT

Under the INSTALLATION AND SERVICE ADJUSTMENTS section of this note, adjustment of the individual oscillator circuits using "air signals" was outlined. The following procedure covers shop alignment of the oscillator circuits and does not require "air signals". Before undertaking oscillator alignment, all IF circuits must be properly aligned for band pass characteristics and trap settings. (Refer to basic service note)

1. With the exception of the oscilloscope, the test equipment hoop-up is the same as that used when aligning the RF and mixer stages. Connect the vertical input of the oscilloscope to the video test point "B" (See Fig. 10 schematic diagram) through the decoupling network shown in Fig. 5.

2. Set the fine tuning control to center frequency by turning the fine tuning shaft until the flat section faces up. Using the sweep and marker generator frequencies in the chart, (See Fig. 7) adjust the oscillator slug so that the video carrier marker is at half amplitude on the high frequency slope of the IF response curve. (See Fig. 6)

Channel	Sweep Generator Center Frequency 12 mc. Sweep	Marker Generator Frequency Pix	Sound
2	57 mc.	55.25	59.75
3	63 mc.	61.25	65.75
4	69 mc.	67.25	71.75
5	79 mc.	77.25	81.75
6	85 mc.	83.25	87.75

13	213 mc.	211.25	215.75

Fig. 7 Alignment Frequencies

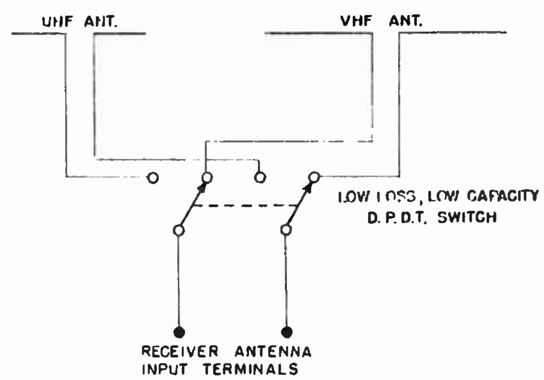

Fig. 8 VHF-UHF Antenna Switch

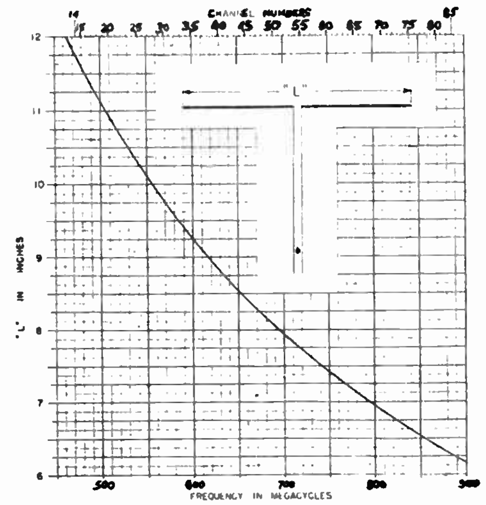

Fig. 9 UHF Dipole Antenna Length

UHF ANTENNA INFORMATION

Antenna requirements for satisfactory UHF television reception are determined by the signal conditions in the particular locality.

Some of the possibilities are as follows:

1. In areas where signals are very strong and reflections are not troublesome, satisfactory reception can be obtained by using a single broadband VHF-UHF antenna.

2. In medium signal areas, a separate UHF antenna may be required. A simple resonant dipole provides satisfactory UHF reception. The chart, Fig. 9 gives the total length of a half-wave dipole element for any frequency in the UHF spectrum.

3. Where signals are weak or reflections are troublesome, a high gain, directive UHF antenna system should be used. Typical of this type are the Corner Reflector, the Conical and the Yagi.

Transmission lines should be of an approved low loss type. The use of 300 ohm ribbon type transmission line for UHF installations is not recommended as its attenuation factor, when wet, rises sharply with increase in frequency. 300 ohm tubular transmission line is acceptable.

Where two or more antennas are used for receivers containing a single antenna input, an antenna switching or isolating device may be required. A low capacity, manually operated switch can be attached to the back of the receiver. (See Fig. 8) A variety of antenna isolating devices are now available. Their installation is simple and their operation is automatic. Some are designed for installation on the antenna mast, thus avoiding the need for additional transmission lines.

ADDITIONS AND CHANGES TO THE MODEL H-765T17 AND H-766T17 PARTS LIST

When ordering parts, specify model number of set in addition to part number and description of part.

ADDITIONAL PARTS USED IN V-2240-3 CHASSIS AND FOR PRODUCTION CHANGES IN V-2240-1 CHASSIS

POWER CONSUMPTION: .... 225 watts

AUDIO POWER OUTPUT:
- Undistorted .... 2.8 watts
- Maximum .... 3.2 watts

LOUDSPEAKER:
- Type .... 5¼" P.M.
- Voice Coil Impedance .. 3.2 ohms at 400 cycles

RECEIVER ANTENNA INPUT IMPEDANCE:
...... 300 ohms balanced or 72 ohms unbalanced

TUBE COMPLEMENT:
- 1 1B3GT .... High voltage rectifier
- 1 5U4G .... Low voltage rectifier
- 1 6AL5 .... Horizontal AFC
- 1 6AS4GT or 6AX4GT ...... Horizontal damper
- 1 6AU6 .... Sync separator
- 1 6BQ7A or 6BZ7 .... RF amplifier
- 1 6BK5 .... Video amplifier
- 1 6BK5 .... Audio output
- 1 6BN6 .... FM detector
- 1 6BQ6GT .... Horizontal output
- 1 6CB6 .... IF amplifiers
- 1 6X8 .... HF osc. and mixer
- 1 12AU7 .... Keyed AGC and noise clipper
- 1 12AU7 .... Horizontal multivibrator
- 1 12BH7 ...... Vert. output and vert. discharge
- 1 17LP4 or 17VP4 .... Cathode ray tube

VIDEO CARRIER INTERMEDIATE FREQUENCY:
.... 45.75 mc.

VIDEO RESPONSE: .... 3.5 mc.

SOUND CARRIER INTERMEDIATE FREQUENCY:
.... 4.5 mc.

FOCUS: .... Electrostatic

SWEEP DEFLECTION: .... Magnetic

SCANNING: .... Interlaced 525 line

HORIZONTAL SCANNING FREQUENCY:
.... 15,750 CPS

VERTICAL SCANNING FREQUENCY: .... 60 CPS

FRAME FREQUENCY:
(picture repetition rate): .... 30 CPS

72Ω	82Ω	110Ω

FIG. 3 — IMPEDANCE MATCHING NETWORK

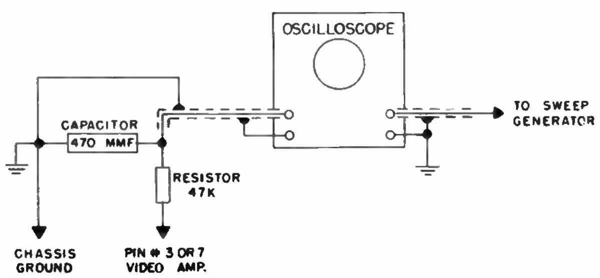

FIG. 2 — OSCILLOSCOPE CONNECTIONS

H. F. OSCILLATOR ALIGNMENT PROCEDURE

If the 6X8 oscillator tube is replaced, the different inter-electrode capacitance of the new tube may change the oscillator frequency enough to necessitate re-alignment of the oscillator.

Alignment of the oscillator on the high band is accomplished by adjusting the brass slug located adjacent to the vernier drive wheel on the front of the tuner. Alignment of the oscillator on the low band is accomplished by adjusting the brass slug on the lower front of the tuner. These slugs can be adjusted from the front of the receiver without removing the chassis from the cabinet if a non-metallic tool similar to that shown in Fig. 4 is used. The guide on the end of the tool is helpful in seating the tool in the screw slot. The adjustment procedure is as follows:

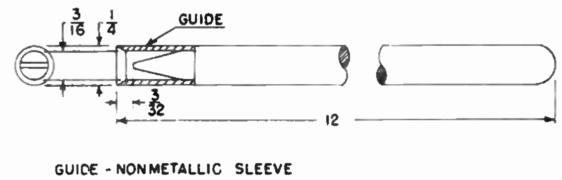

FIG. 4 — OSCILLATOR ADJUSTMENT TOOL

1. Set the fine tuning control to the middle of its range by rotating it until the middle hole near the edge of the fine tuning drive wheel is straight up, and keep it in this position during the following adjustments.
2. Set the channel selector to the highest of the low band (channels 2 through 6) stations operating in your vicinity.
3. Peak the low band adjustment slug (L102) for the best picture detail.
4. Set the channel selector to the highest of the high band (channels 7 through 13) stations operating in your vicinity.
5. Peak the high band adjustment slug (L101) for the best picture detail.
6. Check the previously made low band adjustment, and if the tuning has changed repeat steps 2 and 3.

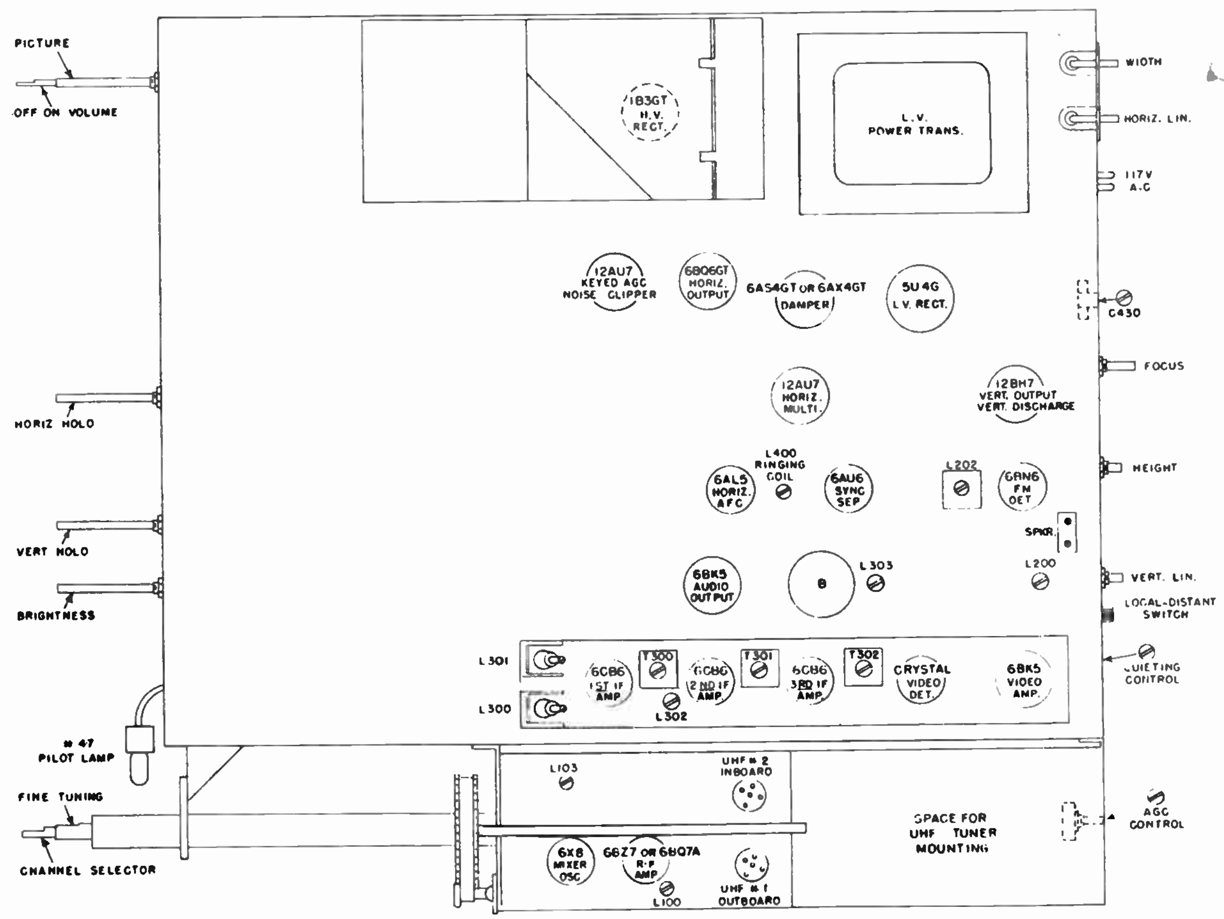

FIG. 5 — TOP VIEW OF CHASSIS

COMMON I-F SECTION

Rotate the channel selector to channel 13.

Connect the oscilloscope to the video test terminal, point "B" on Fig. 8, through the decoupling network shown in Fig. 2.

Connect a 9 volt bias battery to the AGC line, point "A" on Fig. 8.

Couple the marker generator output to the sweep generator output. In the steps that follow, use the marker to check the response curve at the frequencies indicated on Fig. 6.

Step	*Alignment Signal*	*Remarks*	*Adjust —*
1.	Remove the 6BZ7 R-F amplifier tube		
2.	44 mc. sweep to 3rd I-F grid	Connect detuning clips to 1st & 2nd I-F plates	Pri. of T302 for max. response and sec. of T302 for symmetrical curve shown in Fig. 6A
3.	47.25 mc. amplitude modulated to 1st I-F grid	Use sufficient signal to produce sine wave response on oscilloscope	L302 for min. response
4.	44 mc. sweep to 2nd I-F grid	Connect detuning clip to 1st I-F plate	Pri. of T301 for max. response and sec. of T301 for symmetrical curve shown in Fig. 6B
5.	44 mc. sweep to 1st I-F grid	Detune L103 before adjusting T300	Pri. of T300 for max. response and sec. of T300 for symmetrical curve
6.	44 mc. sweep to 1st I-F grid		L103 for "suck-out" at 44 mc. (center of curve). See Fig. 6C
7.	Replace the 6BZ7 R-F amplifier tube		
8.	213 mc. sweep to antenna terminals through network	Fine tuning set to mid-range	L300 for symmetrical curve and L301 for min. 41.25 mc. marker amplitude. See Fig. 6D

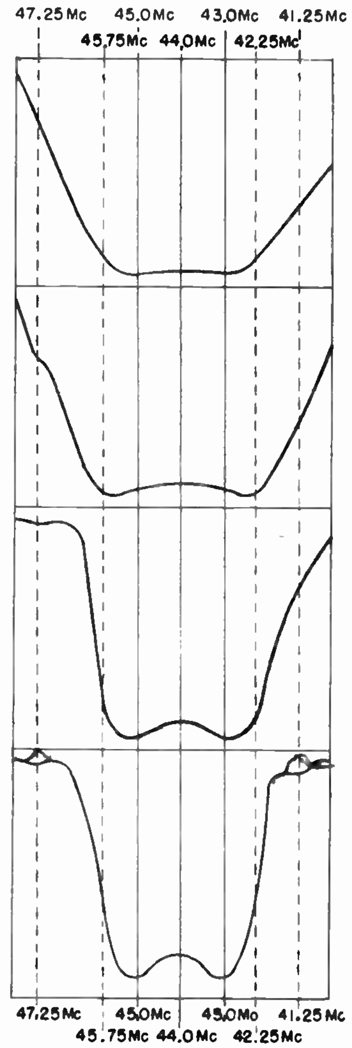

FIG. 6 — RESPONSE CURVES AT VARIOUS STAGES OF ALIGNMENT

4.5 MC. TRAP

Connect the signal generator to pin #3 or #7 of the 6BK5 video amplifier (point "B" on Fig. 8) through a .001 mfd capacitor.

Step	*Signal Gen. Frequency*	*VTVM Connections*	*Remarks*	*Adjust —*
1.	4.5 mc. unmodulated	R-F probe to point "C" (see Fig. 8) and common lead to chassis .	Use strong signal from generator	L303 for minimum voltage

SOUND SECTION

Refer to SOUND ALIGNMENT PROCEDURE on page 7. Using a weak signal, adjust L200 for maximum response to a 4.5 mc. FM signal. Using a strong signal, adjust L202 for maximum response on a 4.5 mc. FM signal. Using a weak signal, adjust the quieting control for minimum AM noise.

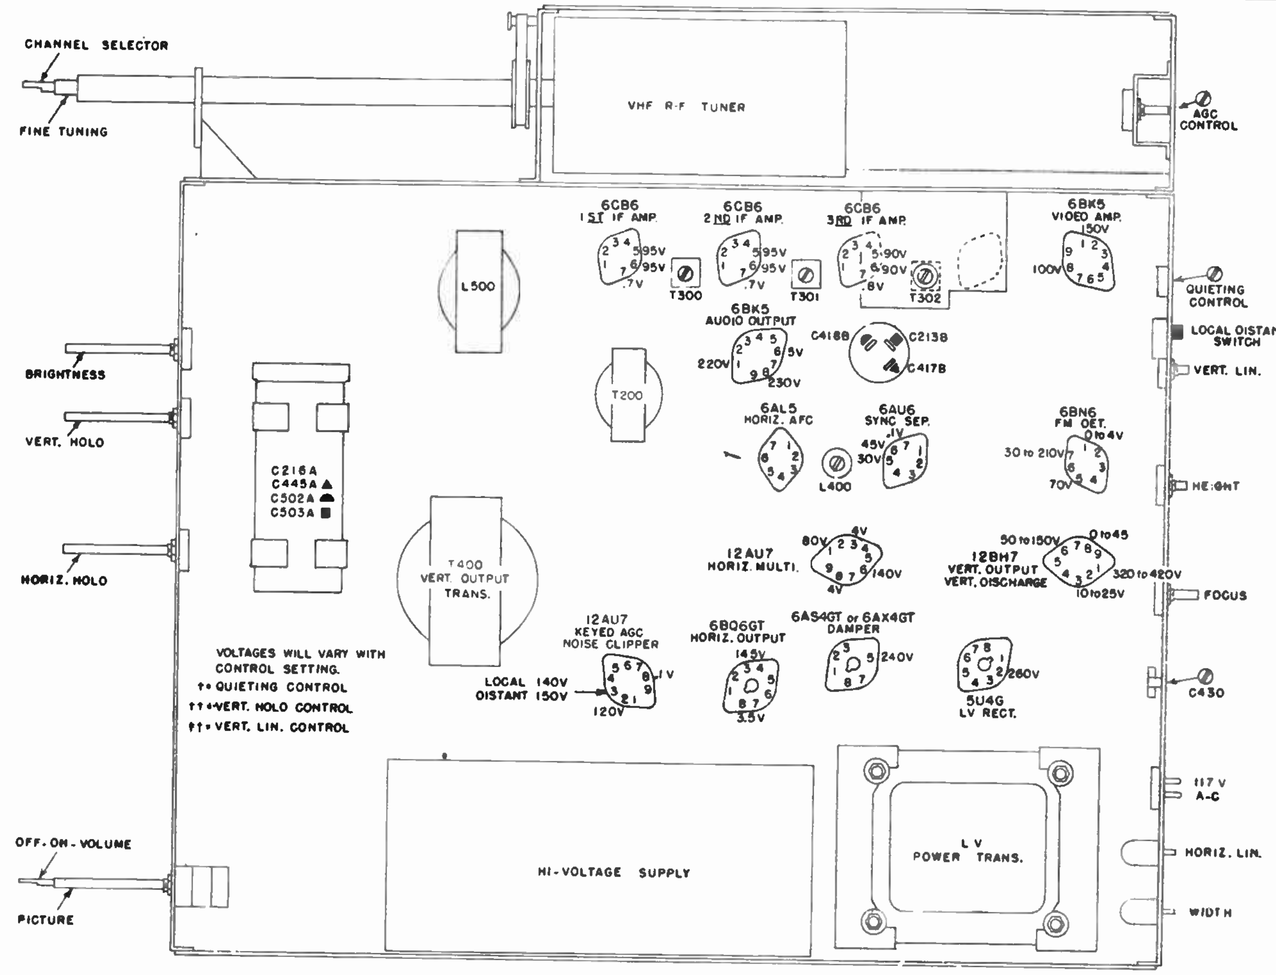

FIG. 7 — BOTTOM VIEW OF CHASSIS

CHASSIS REMOVAL

To avoid scratching or chipping the cathode ray tube, the speaker and baffle should be removed before attempting to remove the chassis from the cabinet. To release the speaker and baffle from the cabinet, remove the four No. 6 Phillips-head screws from the top of the cabinet.

CRITICAL LEAD DRESS

All leads located near the horizontal multivibrator trimmer capacitor, C430, must be dressed away from the capacitor and close to the chassis.

All resistors rated above one watt must be dressed away from each other and clear of other components and wires.

Video peaking coils should be dressed away from the chassis and clear of adjacent parts.

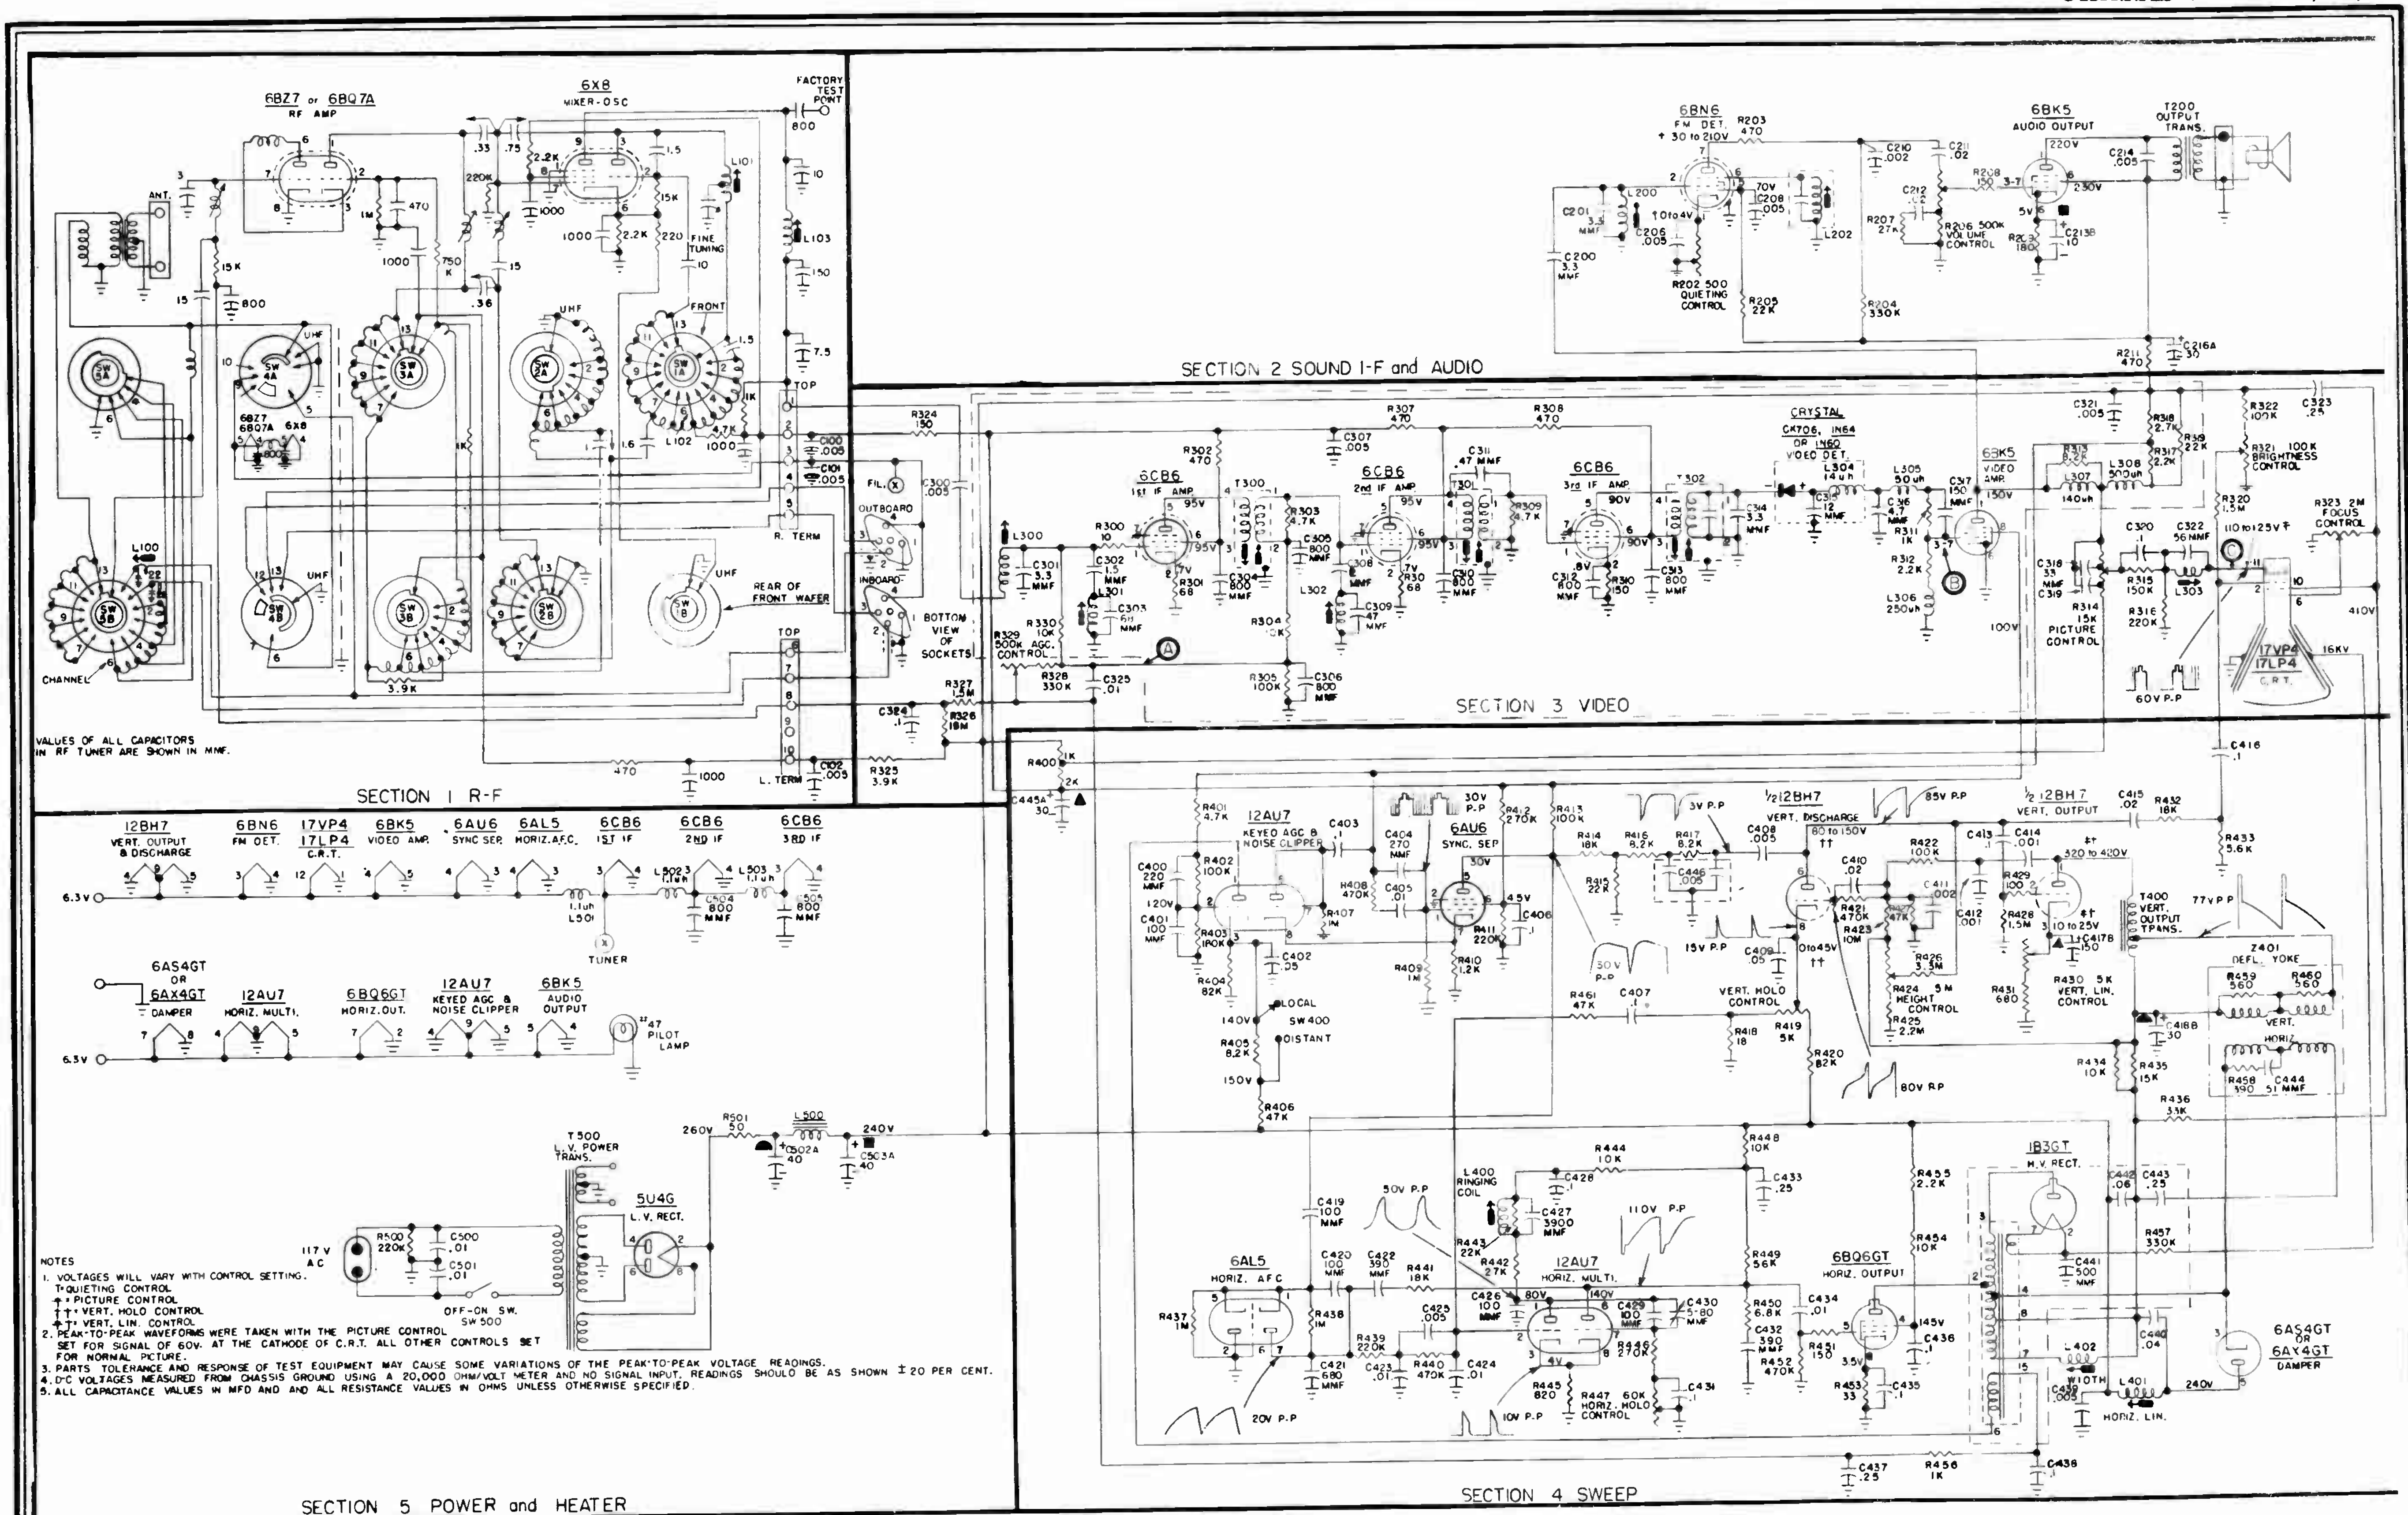
All leads in the high voltage unit must be dressed away from the high voltage transformer to prevent arcing.

Keep all leads in the I-F and video circuits as short as possible.

REFLECTION ELIMINATION

Light reflection from the pilot lamp can appear on the lower right hand corner of the CRT unless preventive measures are taken. To eliminate the reflection, a piece of electrical tape (1" x 6") is applied to the edge of the lower right corner of the CRT face.

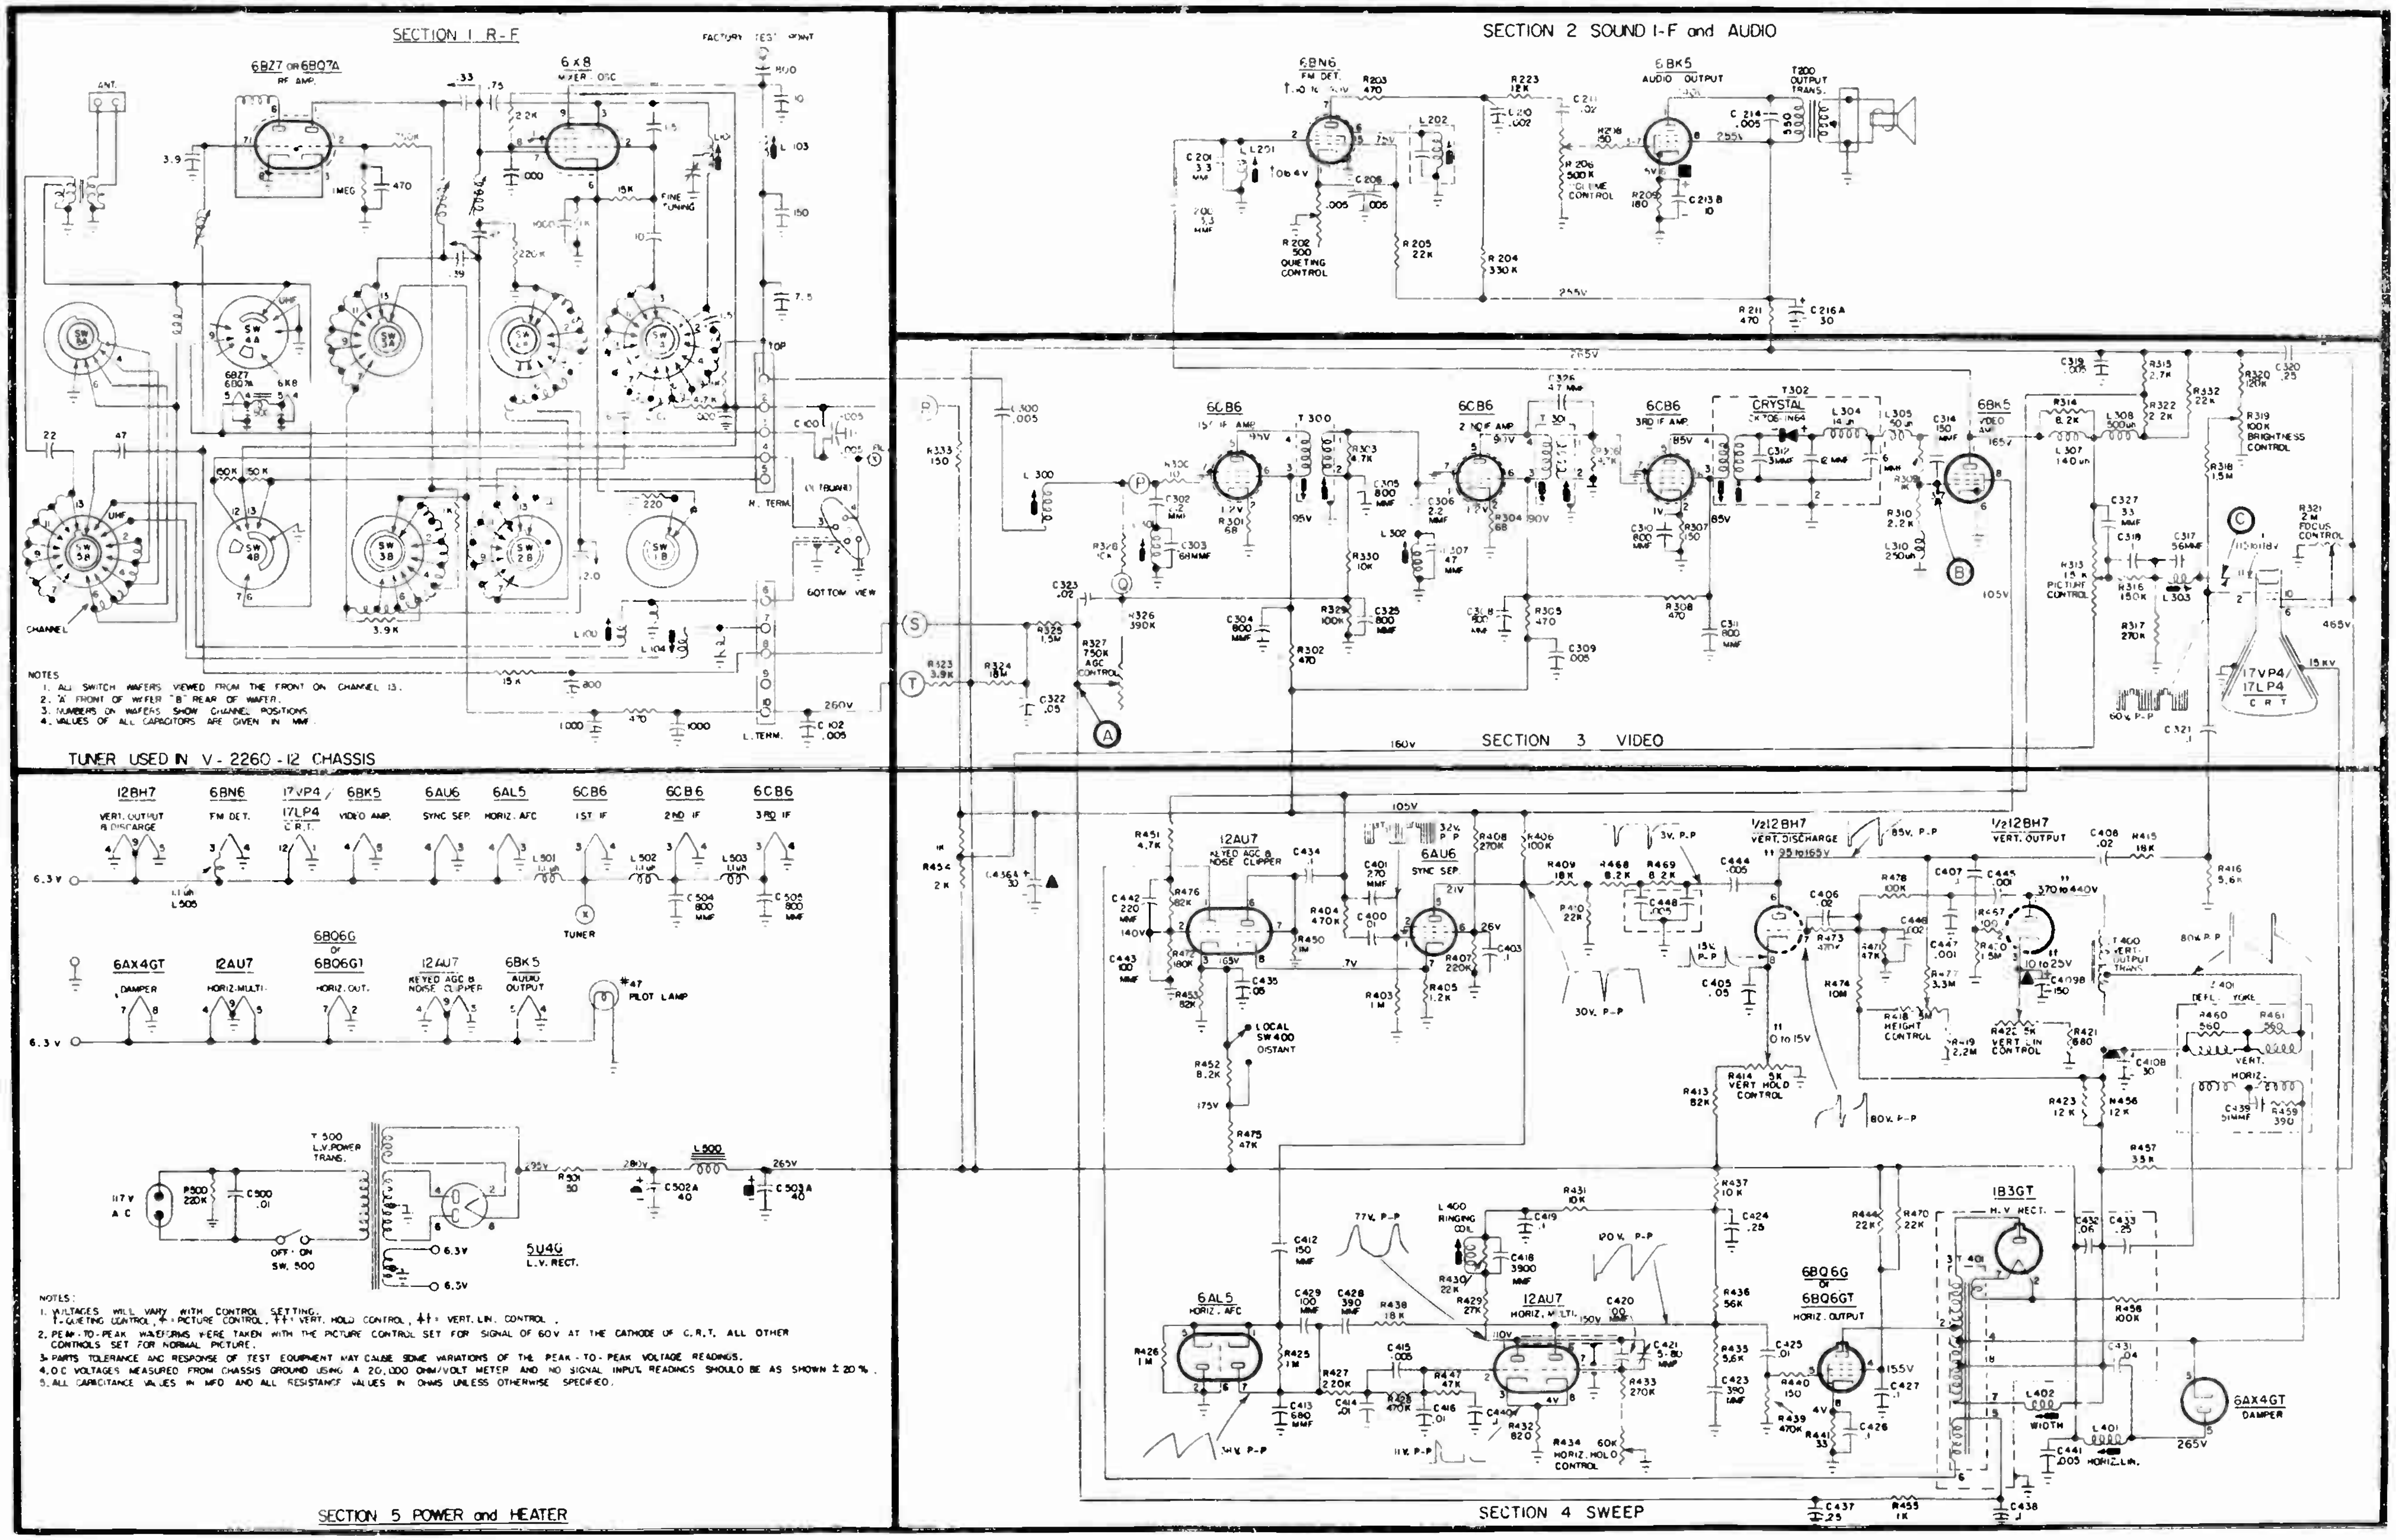
When replacing a CRT, the electrical tape must be applied to the new tube in the same manner as it was applied to the old tube.



CHASSIS NO. V2240-1

FIG. 8 — SCHEMATIC DIAGRAM

IMPORTANT — Since many of the components are very critical, exact duplicates must be used for replacement purposes. However, any substitute supplied by Westinghouse will assure performance equal to or better than the list part.



CHASSIS NO. V-2260-12

PARTS LIST FOR MODELS H-765T17 AND H-766T17

SECTION 1 — R-F

DESCRIPTION

Model H-802 UHF Receptors are designed for use with Westinghouse television receivers that contain specific provisions for their use. Receivers that contain the necessary provisions will accommodate two UHF Receptors, and each receptor used will provide reception on one UHF television channel. If only one UHF station is active in a particular locality, only one UHF Receptor is required. If two UHF stations transmit in the locality, they can both be received by installing two UHF Receptors. The UHF reception provided by these receptors is in addition to the standard VHF reception provided by the VHF tuner in the television receiver.

Each receptor contains a local oscillator which employs a 6AF4 tube and operates 45.75 mc. *higher* than the video carrier frequency of the received UHF signal. The oscillator frequency is initially adjusted by the oscillator trimmer, C10, and fine tuning is provided by the fine tuning capacitor which is mechanically coupled to the fine tuning control on the television receiver. Suitable band-pass circuits tuned to the frequency of the received signal by the R-F trimmers (C1 and C2) serve as the antenna input circuit in each receptor. The incoming UHF signal mixes with the local oscillator signal in a crystal mixer circuit, and the resultant I-F output (center frequency is 44 mc.) is fed to the R-F amplifier in the television receiver. When the channel selector on the television receiver is set to either of the UHF positions, the R-F amplifier and mixer circuits in the television receiver serve as I-F amplifiers at 44 mc., and the VHF oscillator is disabled. Thus, the 44 mc. output of the UHF Receptor is amplified in these circuits and fed into the I-F strip in the receiver.

IDENTIFICATION

Model H-802 Receptors are shipped pre-adjusted to receive a particular UHF channel. The channel to which the receptor is tuned is marked on the label which is attached to the unit.

In addition, the receptors are divided into categories depending on the frequency range covered by each. The identifying markings which are stamped on the receptors and the corresponding frequency coverages are as follows:

Receptors Marked —	*Can Be Tuned To —*
V-11900-1	Channels 14 through 29
V-11900-2	Channels 28 through 43
V-11900-3	Channels 43 through 58
V-11900-4	Channels 58 through 73
V-11900-5	Channels 73 through 83
V-11213 (early production)	Special ranges

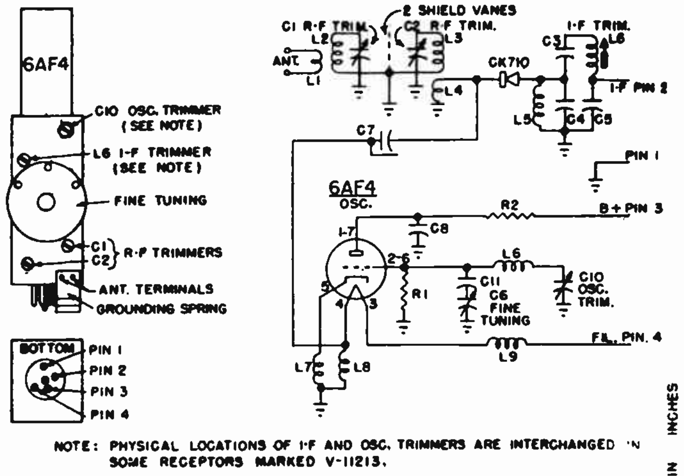

FIG. 1 — MODEL H-802 UHF RECEPTOR

INSTALLATION

To install a UHF Receptor:

1. Remove the rear of the television receiver.

2. Plug the receptor into either of the two UHF sockets located on the rear of the VHF tuner mounting plate in the television receiver. If the receptor is plugged into the socket nearer the side of the chassis, the UHF position nearer channel 13 on the channel selector is activated. If the receptor is plugged into the socket nearer the center of the chassis, the UHF position next to channel 2 on the channel selector is activated. The receptor should be seated firmly in the socket with the slots in the top of the receptor engaging the top of the VHF tuner bracket. If the center tongue of the tuner bracket is bent too far toward the back of the cabinet, it will catch the top of the receptor and prevent proper insertion. In this event, bend the center tongue toward the front of the cabinet just enough to allow insertion of the receptor. The sharp bend in the center tongue must bear on the top of the receptor when the receptor is fully seated. The fine tuning wheel on the receptor must engage the drive wheel located on the shaft between the two sockets. If the two wheels are not correctly aligned, undue pressure will be required to mesh the wheels, and the drive torque will be excessive. In this event, loosen the set screw in the metal drive wheel and slide the wheel to the correct position on the shaft.

3. Connect the ribbon-type antenna lead from the receptor to the UHF antenna terminals on the back cover of the receiver. To prevent impaired reception which may result if the antenna lead runs close to the receiver chassis, the lead should be passed through the same clip that supports the VHF antenna lead, but do not allow the two antenna leads to run close together for any appreciable distance.

4. Replace the rear cover of the television receiver.

5. Make appropriate antenna arrangements (see ANTENNA INFORMATION), and check the operation.

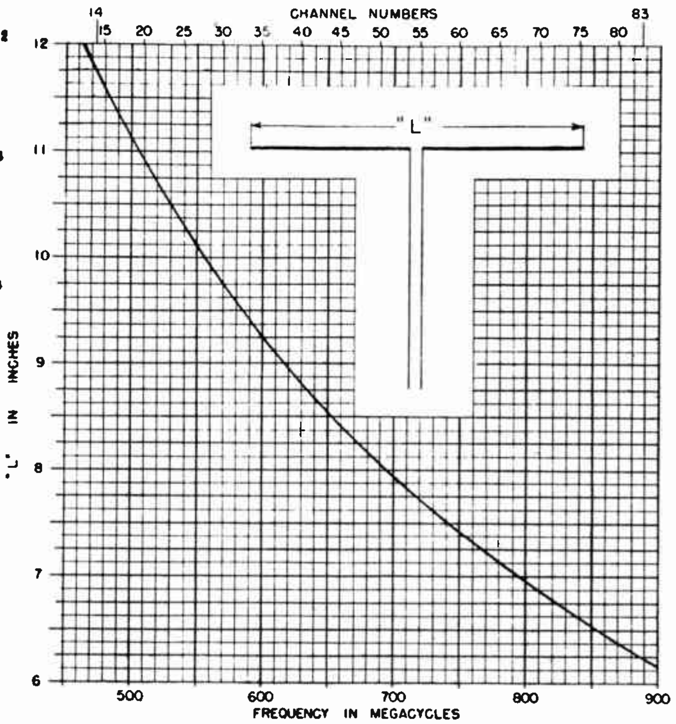

FIG. 2 — UHF DIPOLE ANTENNA LENGTH

ANTENNA INFORMATION

Antenna requirements for satisfactory UHF television reception are determined by the signal conditions in the particular locality. Some of the possibilities are as follows:

1. In areas where signals are strong and reflections are not troublesome, satisfactory reception may be obtained by using the existing VHF antenna (built-in or external) for both VHF and UHF. This can be done by connecting two jumper wires from the UHF antenna terminals to the STD antenna terminals so as to connect the two sets of terminals in parallel. If this method is used, make certain that it does not adversely affect reception on the standard VHF channels.

If an external antenna is used for VHF reception, satisfactory UHF reception may be obtained by connecting the built-in VHF antenna to the UHF antenna terminals.

2. If the above methods are not satisfactory, a simple, resonant dipole antenna may provide satisfactory reception in medium-signal areas. The chart, Fig. 2, gives the total length of a dipole element for any frequency in the UHF television spectrum.

3. Where signals are weak or reflections are troublesome, a high gain, directive antenna system should be used. Typical of this type of antenna are the corner reflector, the rhombic, and the Yagi.

ADJUSTMENTS

It is desirable to check for best adjustment each time a receptor is installed. This is accomplished as follows:

1. Rotate the fine tuning wheel on the receptor to its center frequency position. The fine tuning capacitor is centered when the middle hole in the rim of the wheel is straight up from the center of the wheel.

2. Rotate the channel selector on the receiver to the appropriate UHF position (see step 2 under INSTALLATION).

3. Rotate the oscillator trimmer (C10) to the position that provides best picture detail. *NOTE: Since the units are pre-adjusted for a particular frequency, only a slight re-adjustment at most should be needed to bring in the station. If the station is not received, make certain the antenna facilities are adequate before moving the oscillator trimmer far from its original setting.*

4. Rotate the R-F trimmers (C1 and C2) to the positions that provide best picture detail. *NOTE: If the R-F trimmers are rotated too far counterclockwise, they will be detached from the unit, and the procedure given under SERVICE must be followed to avoid damage when replacing the screws.*

5. Rotate the I-F trimmer (L6) for best picture detail. This trimmer has a broad tuning characteristic and is effective mostly in weak signal areas.

SERVICE

Troubleshooting inside the UHF Receptor is not recommended.

There are critical adjustments inside. One critical adjustment consists of two shield vanes located between the R-F coils (L2 and L3) which determine the coupling between the coils. Since special equipment and techniques are required to make the adjustments, care must be exercised to avoid altering the original factory placement of wires and components.

The R-F trimmers (C1 and C2) will detach from the unit if they are rotated too far counterclockwise. If this occurs, the following procedure should be used to avoid damaging the ceramic part of the trimmer when replacing the screw:

1. With the screw removed from the unit and the metal locking device placed on the screw, rotate the locking device until it is near the head of the screw.

2. Insert the screw in place and rotate it clockwise several full turns.

While keeping the screw from turning, rotate the locking device clockwise until it is moderately tight against the outside of the receptor.

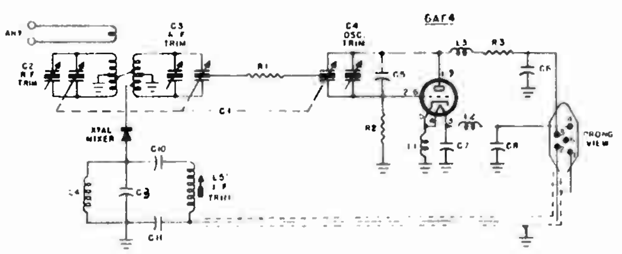

FIG. 1 — V-11390-1 TUNER

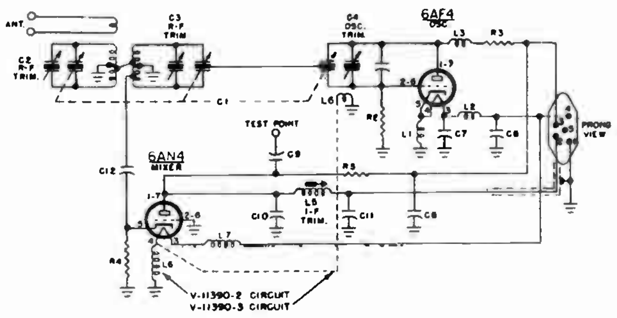

FIG. 2 — V-11390-2 AND V-11390-3 TUNERS

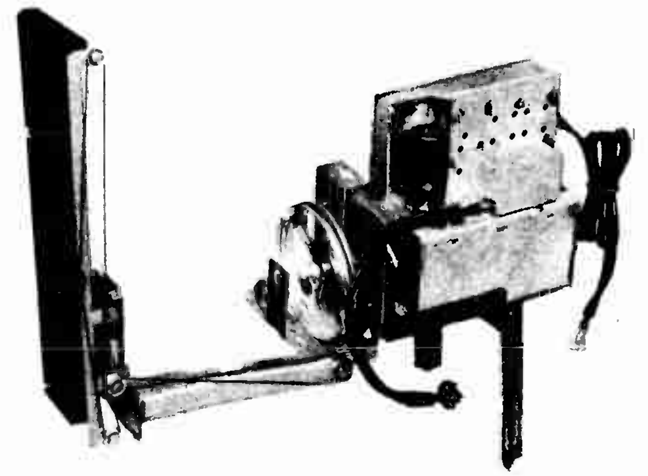

GENERAL DESCRIPTION

Model H-803 All-Channel UHF Television Tuner is designed for use with Westinghouse television receivers that contain specific provisions for its use. Receivers that contain the necessary provisions have two UHF positions on the channel selector and two UHF sockets mounted on the rear of the tuner bracket. When the UHF tuner is correctly installed in such a receiver, reception of all the UHF television channels (14 through 83) is provided in addition to the VHF channels (2 through 13).

The UHF tuner contains an oscillator and a mixer circuit and can be tuned over the entire UHF TV spectrum. In the tuner, the UHF signal is converted to the intermediate frequency of the television receiver (center IF is 44 mc.), and this IF output is fed into the VHF tuner in the receiver. When the channel selector on the receiver is set to the UHF positions, the VHF oscillator in the receiver is disabled and the RF amplifier and mixer circuits serve as IF amplifier stages at 44 mc. Thus, the output of the UHF tuner is amplified in the VHF tuner and fed into the IF strip in the receiver.

IDENTIFICATION

In production, several different UHF tuners are used. They are designated V-11390-1, V-11390-2, V-11390-3, and V-11613-1, and the identifying numbers are stamped on each tuner. Figures 1, 2, 3, and 4 indicate the electrical and mechanical variations between tuners.

Model H-803 tuner assemblies are divided into six categories depending on the type of tuner employed and the type of receiver with which the assembly can be used. On tuner assemblies packed for field installation, the category is identified by a number following the basic model number (H-803) marked on the outside of the carton. The coding is as follows:

Marking on Outside of Carton	*Tuner Type*	*Type of Receiver With Which the Assembly Can Be Used*
H-803-1	V-11390-1, -2, or -3	21" Models
H-803-2	V-11390-1, -2, or -3	17" Models Except Those With Plastic Cabinets
H-803-3	V-11390-1, -2, or -3	17" Models With Plastic Cabinets
H-803-4	V-11613-1	21" Models
H-803-5	V-11613-1	17" Models Except Those With Plastic Cabinets
H-803-6	V-11613-1	17" Models With Plastic Cabinets

V-11390-1, -2, AND -3 CIRCUIT DESCRIPTIONS

As indicated in Figs. 1 and 2, the incoming UHF signal is coupled into the tuner through a 300 ohm balanced input circuit which is double tuned to provide the desired RF bandpass. Operating 45.75 mc. higher than the video carrier frequency of the received signal, the oscillator tuning is ganged with that of the bandpass circuit. A portion of the oscillator voltage is coupled into the bandpass circuit where it mixes with the incoming UHF signal. The difference frequency (center IF is 44 mc.) is extracted in the mixer circuit and fed through a shielded cable to the UHF socket on the television receiver. In the V-11390-1 tuner, a germanium crystal serves as the mixer, while the V-11390-2 and V-11390-3 tuners use a 6AN4 tube in a grounded-grid mixer circuit. Otherwise, the three tuners are basically alike.

V-11613-1 CIRCUIT DESCRIPTION

The bandpass circuit in the V-11613-1 tuner consists of two tuned sections as indicated on Fig. 3. Each section is a capacitor-tuned quarter-wave coaxial line, and the sections are over-coupled through the coupling loops, L3 and L4. Coupling of the UHF signal into the the circuit is effected through the antenna input coupling loops, L1 and L2, and the signal is fed from the bandpass circuit to the mixer through L6.

Also fed to the mixer (through L7) is a locally generated signal which is 45.75 mc. higher than the video carrier frequency of the received signal. This signal is not the fundamental output frequency of the oscillator, however. Instead, the oscillator operates at one-half frequency and its second harmonic is utilized. The second harmonic content of the oscillator output is increased by the action of the harmonic generating crystal and coupled into the oscillator doubler section through L8. Consisting of a quarter-wave coaxial line which is capacitor-tuned 45.75 mc. above the video carrier of the received signal, the oscillator doubler section selects the second harmonic of the oscillator and discriminates against the fundamental.

In the crystal mixer circuit, the difference frequency (center IF is 44 mc.) is derived from the UHF signal and the locally generated signal. A shielded cable carries the IF signal to the UHF socket on the television receiver.

INSTALLATION

1. Remove the back cover, and remove the chassis from the cabinet.

2. Remove the wheel from the back end of the UHF drive shaft, and install the 13/16" pulley on the drive shaft.

3. Mount the tuner support bracket to the tuner and mounting plate assembly as shown in Fig. 4. The bracket is shock-mounted to the assembly by placing rubber grommets in the two large mounting holes, inserting metal spacers inside the grommets, and using ½" self-tapping screws.

4. On models that have the on-off-volume and picture control mounted above the channel selector, loosen the 3/8" palnut which holds the control to the chassis.

5. Make certain the dial background bracket is fitted into the correct slots in the mounting plate assembly. As indicated on Fig. 4, the "A" slots are used for all 17" receivers and the "B" slots are used for all 21" receivers.

6. Place the tuner assembly as shown in Fig. 4. The slots in the mounting plate assembly must be placed over the tongues at the top of the UHF bracket and pressed down until firmly locked in place.

7. On models that have the on-off-volume and picture control mounted above the channel selector, the slot in the front lip of the mounting plate assembly must be positioned down over the shank of the control, between the palnut and the vertical section of chassis, and then tighten the palnut.

8. On models that have the on-off-volume and picture controls located other than above the channel selector, use a 6-32 screw, 6-32 nut and #6 lockwasher to secure the front lip of the mounting plate assembly to the vertical section of chassis. Insert the screw through the slot located near the center of the mounting plate lip and through the similar slot located near the center of the chassis vertical section, and apply the lockwasher and nut.

9. Insert a ¼" self-tapping screw into the hole located to the right of the palnut mentioned in step 7 or the screw mentioned in step 8, and tighten the screw.

10. Insert a ¼" self-tapping screw into the hole located in front of the mounting plate assembly slots which engage the tongues of the UHF bracket, and tighten the screw.

11. With the large pulley rotated to its maximum counterclockwise position, install the 19" drive string and spring as shown in Fig. 5.

12. Insert the UHF plug into the UHF socket farthest from the side of the chassis as indicated in Fig. 4. This socket corresponds to the UHF position next to channel 2 on the channel selector. *The socket nearer the side of the chassis is left unoccupied.*

13. With the large pulley rotated fully counterclockwise, see that the dial pointer is positioned as in-

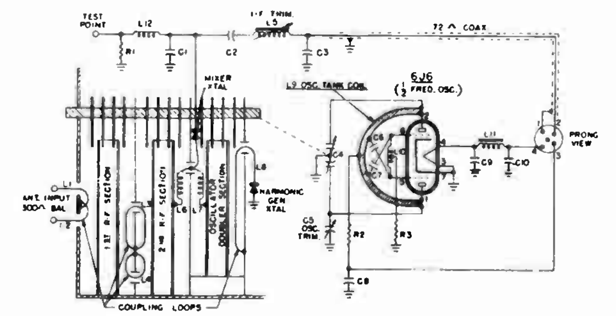

FIG. 3 — V-11613-1 TUNER

dicated in the lower left corner of Fig. 4.

14. Remove the plastic plate from the picture mask inside the cabinet by removing the clips which hold it in place.

15. Install the calibrated UHF dial in place of the plastic plate which was removed in step 14, and replace the clips.

16. Replace the chassis in the cabinet.

17. Connect a suitable antenna to the UHF antenna lead (SEE ANTENNA INFORMATION), and check the operation. If the dial pointer does not indicate the correct channel, turn off the receiver, reach in along the left side of the cabinet, and slide the pointer to the correct position.

18. Route the ribbon type antenna lead from the UHF tuner through the opening above the UHF antenna terminals on the back cover, and attached the lead to the UHF antenna terminals.

19. Replace the back cover.

REPLACING V-11390-1, V-11390-2, OR V-11390-3 TUNER USED WITH MODELS H-803-1, H-803-2, AND H-803-3

1. Remove the two drive strings and springs from the large pulley.

2. Remove the tuner support.

3. Remove the UHF plug from its socket.

4. Unsolder the ground strap from the tuner.

5. Release the tuner from the mounting plate assembly by removing the two self-tapping screws used to shock-mount the tuner.

6. Loosen the two small set screws in the hub of the large pulley, and remove the pulley.

7. With the tuning shaft of the replacement tuner rotated completely counterclockwise, place the large pulley on the shaft so that the opening in the rim of the pulley is as indicated in Fig. 5. Tighten the set screws in the hub of the pulley.

8. Place the tuner in position, and install the shock-mount screws.

9. Solder the ground strap to the tuner, and install the tuner support.

10. String the two dial drive cords, and see hat the dial pointer is positioned as shown in Fig. 4 with the large pulley rotated completely counterclockwise.

11. Insert the UHF plug into the UHF socket farthest from the side of the chassis.

12. Check the dial calibration using an air signal. If the dial pointer does not indicate the correct channel, turn off the receiver, reach in along the left side of the cabinet, and slide the pointer to the correct position.

REPLACING V-11613-1 TUNER USED WITH MODELS H-803-4, H-803-5 AND H-803-6

1. Remove the UHF plug from its socket.

2. Remove the two drive strings and springs from the large pulley.

3. Remove the self-tapping screw which secures the front lip of the mounting plate to the vertical section of chassis.

4. Loosen the off-on-volume and picture control planut or remove the 6-32 screw (whichever is used to secure the front lip of the mounting plate).

5. Remove the self-tapping screw which secures the the mounting plate to the UHF bracket.

6. Remove the two self-tapping screws that secure the tuner support to the receiver chassis.

7. Release the mounting plate assembly from the UHF bracket by pulling straight up.

8. Remove the tuner by removing the three screws from the side of the tuner.

9. Mount the replacement tuner by replacing the three screws in the side.

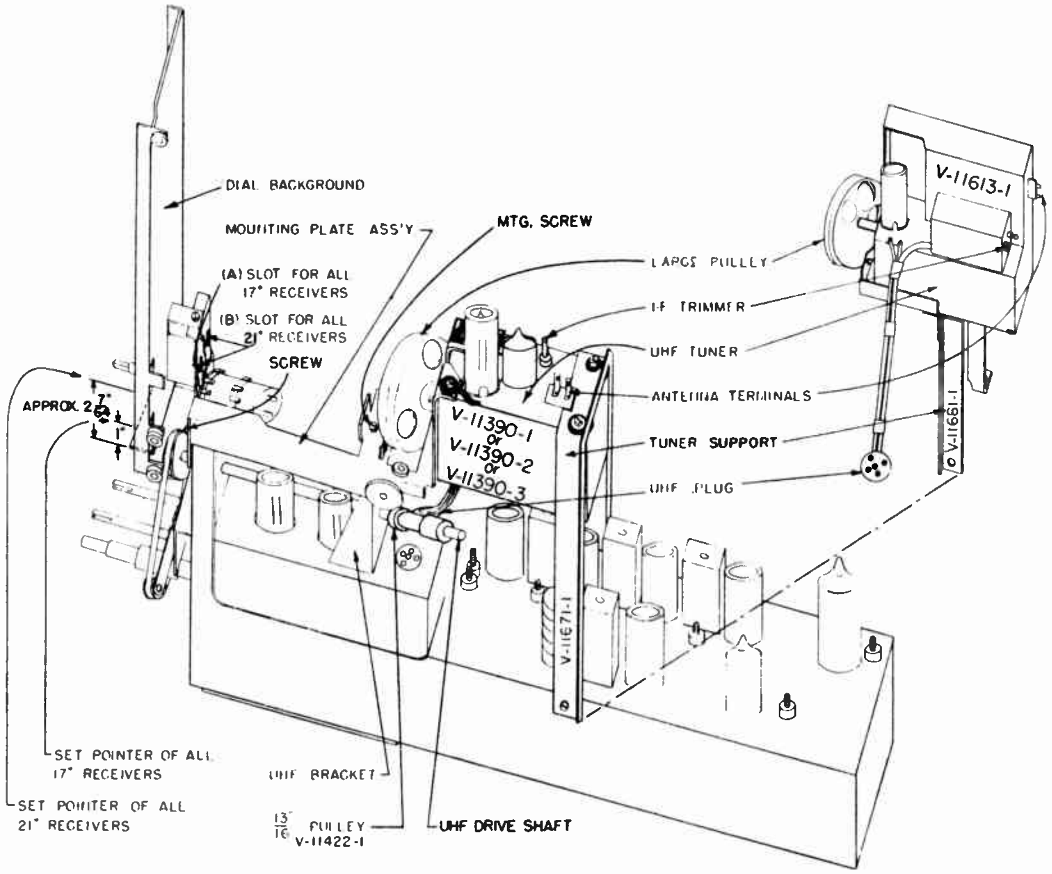

FIG. 4 — INSTALLATION DETAILS

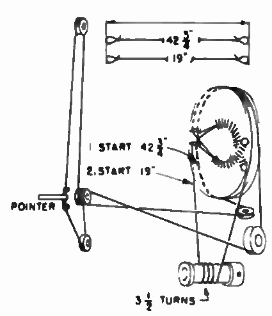
10. Mount the assembly to the chassis by replacing the items removed in the preceding steps.

11. Check the dial calibration using an air signal. If the dial pointer does not indicate the correct channel, turn off the receiver, reach in along the left side of the cabinet, and slide the pointer to the correct position.

FIG. 5 — DIAL STRINGING



ANTENNA INFORMATION

Antenna requirements for satisfactory UHF television reception are determined by the signal conditions in the particular locality. Some of the possibilities are as follows:

1. In areas where signals are strong and reflections are not troublesome, satisfactory reception may be obtained by using the existing VHF antenna (built-in or external) for both VHF and UHF. This can be done by connecting two jumper wires from the UHF antenna terminals to the STD antenna terminals so as to connect the two sets of terminals in parallel. If this method is used, make certain that it does not adversely affect reception on the standard VHF channels.

If an external antenna is used for VHF reception, satisfactory UHF reception may be obtained by connecting the built-in VHF antenna to the UHF antenna terminals.

2. A simple, resonant dipole antenna may provide satisfactory reception in medium-signal areas. The chart, Fig. 6, gives the total length of a half-wave element for any frequency in the UHF television spectrum.

3. Where signals are weak or reflections are troublesome, a high-gain, directive antenna system should be used. Typical of this type of antenna are the corner reflector, the rhombic, and the Yagi.

ADJUSTMENTS

Model H-803 All-Channel UHF Television Tuner is shipped pre-adjusted to receive UHF channels 14 through 83, and additional adjustments are not normally required. In some cases, however, it may be desirable to adjust the IF trimmer, L5, located as shown in Fig. 4 for best picture detail and sound.

SERVICE

A high degree of precision is used in the manufacture of UHF television tuners. Critical factors include lead lengths, lead and component dress, and component sizes. In servicing UHF tuners, problems arise which are not encountered in ordinary service work. Therefore, troubleshooting inside the tuner is not recommended. Defective tuners should be returned through a Westinghouse distributor.

GENERAL DESCRIPTION

Model H-804 All-Channel UHF Television Tuner is designed for use with the following models of Westinghouse television receivers that contain specific provisions for its use:

H-765T17	H-772K21	H-783K21	H-790C21
H-766T17	H-773K21	H-784K21	H-791K21
H-810T17	H-774K21	H-785K21	H-792K21
H-811T17	H-775K21	H-786K21	H-793K21
H-769T21	H-776T21	H-787K21	H-794C21
H-770T21	H-780T21	H-788C21	H-795T27
H-771T21	H-782K21	H-789C21	

These receivers have two UHF positions on the channel selector and provision to plug in the connecting cable of the UHF Television Tuner into a socket located on the VHF Tuner mounting bracket. When the UHF tuner is correctly installed in such a receiver, reception of all the UHF television channels (14 through 83) is provided in addition to the VHF channels (2 through 13).

The UHF Television Tuner contains the RF Preselector, oscillator and mixer circuits. It can be tuned over the entire UHF TV spectrum. In the tuner, the UHF signal is converted to the intermediate frequency of the television receiver (center IF is 44mc.), and this IF output is fed into the VHF tuner in the receiver. When the channel selector on the receiver is set to the UHF position, the VHF oscillator in the receiver is disabled and the RF amplifier and mixer circuits serve as IF amplifier stages at 44mc. The output of the UHF tuner is amplified in the VHF tuner and fed into the IF strip in the receiver.

IDENTIFICATION

In production two basic UHF tuner types are used. They are designated V-11972-1 and V-12325-1. Tuner assemblies packed for field installation will be identified by a number following the basic model number (H-804) marked on the outside of the carton.

Model No. on Outside of Carton	*UHF Tuner Type*	*For Use in Receivers containing VHF Tuner Type*
H-804-1	V-12325-1	V-11794-1
H-804-2	V-11972-1	V-12100-1. V-12400-1

V-12325-1 CIRCUIT DESCRIPTION

See schmeatic Fig. 1 In this tuner the incoming UHF signal is inductively coupled to the preselector stage of the tuner through a 300 ohm balanced input circuit. The preselector stage is double tuned to provide the desired RF bandpass. The ultraudion oscillator circuit uses a type 6AF4/6T4 tube and operates at a frequency 45.75 mc. higher than the video carrier of the received signal. A portion of the oscillator voltage is link-coupled to the preselector stage. The difference frequency is extracted by a crystal mixer stage (center IF is 44mc.) and is capacitively coupled to the VHF tuner via a shielded. cable.

V-11972-1 CIRCUIT DESCRIPTION

See Schematic Fig. 2. This tuner employs four tuned sections. Three are modified end-tuned quarter-wave coaxial lines and are used in the preselector and oscillator doubler circuits. The fundamental oscillator uses a 6J6 dual triode in a capacitor tuned circuit, operating at one-half the frequency required to mix with the incoming signal. The capacitor tuning plates for the four sections are mounted on a common tuning shaft.

Considering the first two sections comprising the preselector, the input signal is inductively coupled to the first tuning section. The coupling loops L1 and L2 present a 300 ohm impedence to the antenna transmission line. The 1st and 2nd sections of the preselector are over-coupled by means of the coupling loops L3 and L4.

The oscillator doubler section selects the second harmonic of the fundamental via a harmonic generating crystal. This second harmonic frequency is 45.75 mc. higher than the video carrier of the incoming signal.

A crystal mixer taps into the 2nd RF and the oscillator doubler sections, receiving energy from both to produce the IF signal. (center IF is 44mc.) The output of the UHF tuner is link-coupled to the VHF tuner via a shielded cable.

INSTALLATION

The following procedure is recommended for installing the H-804 tuner.

1. Remove the back cover from the cabinet. Installation can be made without removing the receiver chassis from the cabinet.

2. The drive shaft for the UHF tuner is mounted directly above the VHF tuner. It is already coupled to the fine tuning shaft of the VHF tuner and to the fiber shaft on which the UHF channel indicating dial will be installed. (See Fig. #3)

3. Remove and discard the split pulley wheel which is found on the rear of the UHF drive shaft. Also remove the button plug bearing from the rear support bracket for the UHF drive shaft. This part is no longer needed as the rear of the UHF drive shaft will be supported by the UHF tuner shaft. (See Fig. #3)

4. Turn the VHF fine tuning control until the flat section of the UHF drive shaft is in the proper position to slide into the flexible coupling on the UHF tuner shaft.

NOTE: The flexible coupling may be a press fit or secured by set screws. Set screws should be properly tightened.

5. Insert the plug on the connecting cable from the UHF tuner into the UHF socket located on left top of the VHF tuner mounting bracket when viewed from rear. Some receivers will have the UHF socket mounted vertically on the left side of the VHF tuner mounting bracket.

6. Slide the UHF tuner assembly into position so that the bottom of the UHF tuner mounting bracket is securely locked under the protruding lip found on the VHF mounting bracket. While doing this, guide the UHF drive shaft into the flexible coupling on the UHF tuner. Two ¼ self-tapping screws are supplied to secure the rear of the UHF mounting bracket firmly to the VHF tuner mounting bracket. (See Fig. #3)

7. Remove the VHF channel selector knob and calibrated dial from the front of the cabinet. Remove the tape stamped UHF from the inside of the VHF calibrated dial to uncover the window between channel numbers 2 and 13.

8. Rotate the VHF fine tuning knob counter-clockwise until the fiber tuning shaft stops turning.

9. Remove the VHF fine tuning knob.

10. Without disturbing the position of the fiber tuning shaft press the calibrated UHF dial onto the fiber tuning shaft so that channel 14 is barely visible on the left when viewed through the window in the cabinet.

11. Discard both the fiber washer and the felt washer found on the VHF fine tuning knob. Place the felt washer supplied with the kit on the outside shoulder of the calibrated UHF dial and replace the VHF fine tuning knob and the channel selector knob.

12. Route the ribbon type antenna lead from the UHF tuner through the opening provided above the UHF antenna terminals on the back cover and attach.

13. Replace the back cover.

ADJUSTMENTS

Model H-804 All-Channel UHF Television Tuner is shipped pre-adjusted to receive UHF channels 14 through 83. Additional adjustments are not normally required In some cases, however, it may be desirable to adjust the IF trimmers, L5 and L100 (See Fig. #3) for best picture detail and sound. Refer to alignment information for procedure.

OPERATION

1. See the channel selector to the position which allows the UHF channel numbers to be visible through the window in the selector knob.

2. Rotate the VHF fine tuning knob until the calibrated UHF dial is in the approximate position for the desired channel. Since the UHF stations operating in any particular locality are widely separated over the entire UHF tuning range it is not necessary to indicate their exact location on the UHF dial.

3. Adjust the VHF fine tuning knob until the desired program is received with the best picture detail and sound quality.

4. The other controls on the receiver have the same function and are operated in the same manner as they would be when receiving a standard VHF program.

ALIGNMENT INFORMATION

When a H-840 tuner is installed in a fringe area or as a replacement it may be necessary to make minor alignment adjustments. When the channel selector of the VHF tuner is turned to the UHF position the VHF tuner becomes a two stage IF amplifier. It amplifies the signals from the UHF tuner and applies them to the IF stages of the receiver. It is therefore necessary that the combination of the output circuit of the UHF tuner and the input circuit of the VHF tuner have the required band-pass to maintain the desired ratio between sound carrier and picture carrier amplification.

TEST EQUIPMENT

1. UHF Sweep Generato
   Range 470-890 mc.
   Sweep width 10 mc.
2. High Gain Oscilloscope
3. Calibrated Marker Generator capable of producing an accurate 43 mc. marker signal.
4. Resistor network to match sweep generator output to 300 ohm impedance of UHF tuner input. (See Fig. 7)
5. Detector Probe (See Fig. 5)
6. 9 Volt bias battery.

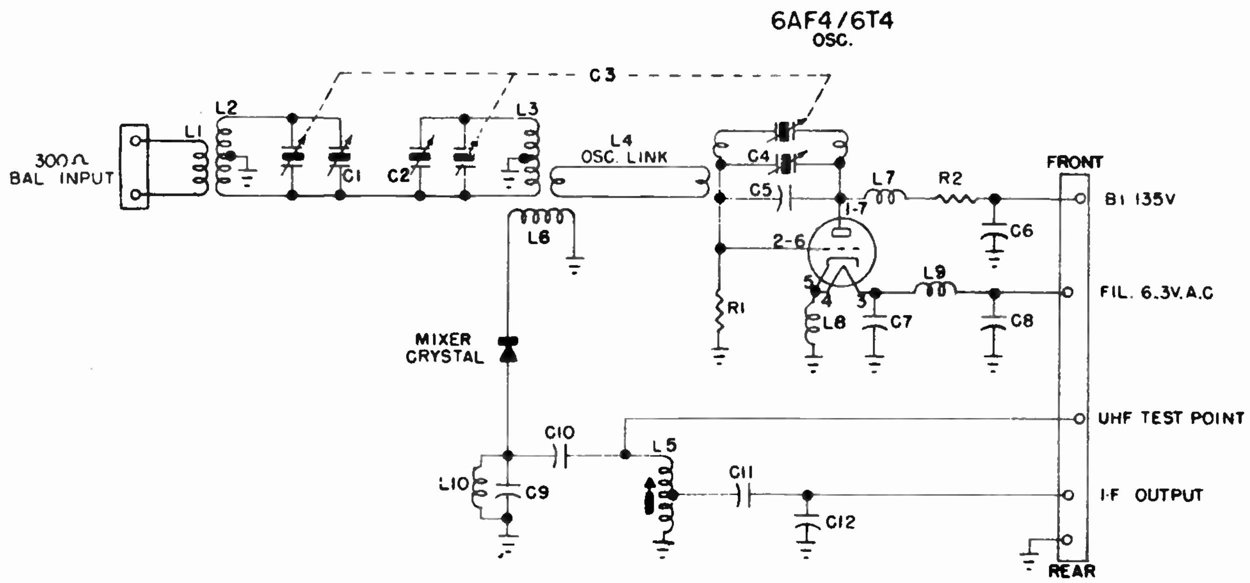

Fig. 1. V-12325-1 Tuner

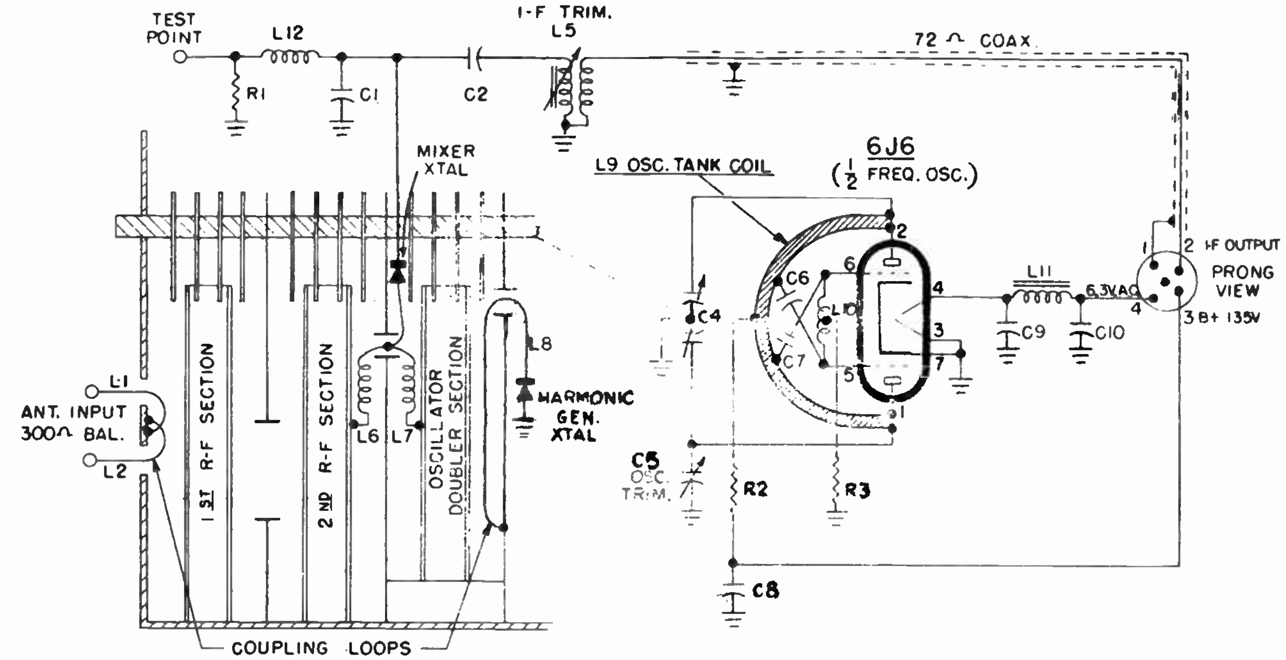

Fig. 2. V-11972-1 Tuner

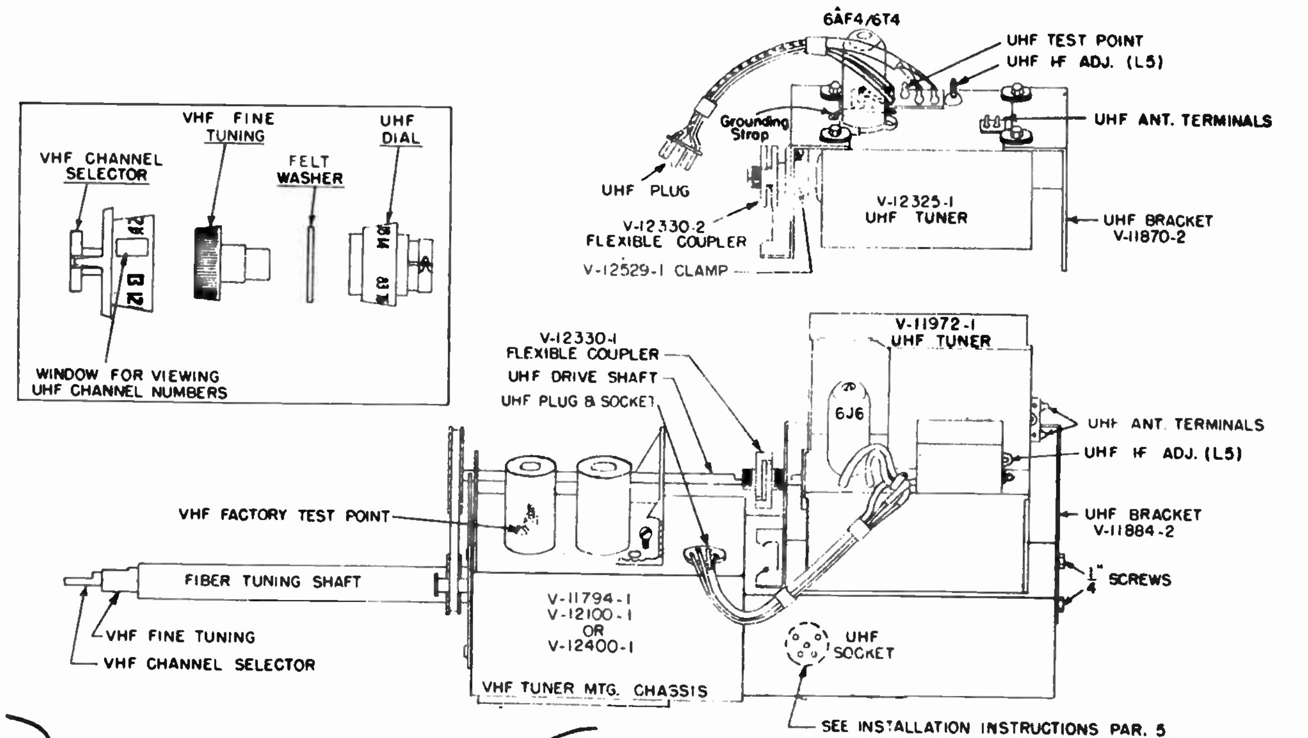

Fig. 3. Installation Details

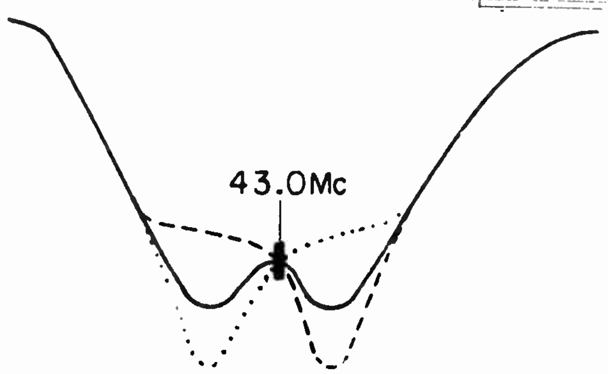

Fig. 4. Response Curve

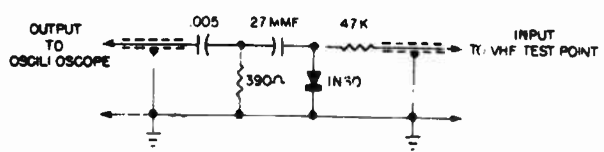

Fig. 5. Detector Probe

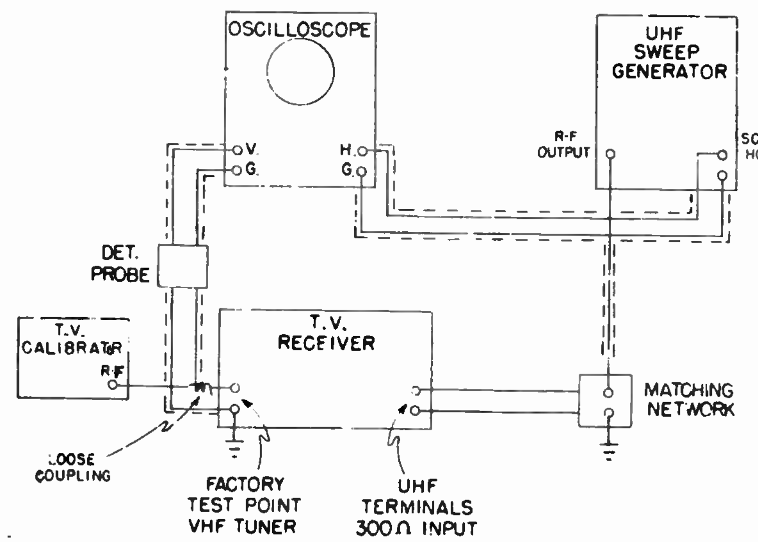

Fig. 6. Test Equipment Hook-up

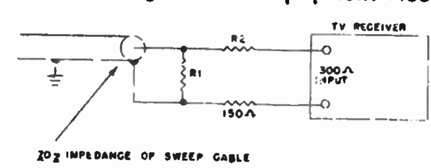

ZO	R1	R2
50 Ω	56 Ω	120 Ω
72 Ω	82 Ω	110 Ω

Fig. 7. Matching Network

ALIGNMENT PROCEDURE

1. Refer to block diagram Fig. #6 for test equipment hookup.

2. Connect a 9 volt bias battery between the receiver A.G.C. line and ground. Negative to A.G.C. line. Positive grounded to receiver chassis.

3. Connect the input lead of the detector probe (Fig. 5) to the VHF factory test point on the VHF tuner. Connect the output of the detector probe to the vertical input of the oscilloscope. Use shielded cable for all leads. Cable shields should be grounded as close as possible to the point at which the "hot" lead is connected.

4. If the sweep generator has built-in provisions to produce a synchronized horizontal sweep in the oscilloscope, connect a sheilded cable from the horizontal input of the oscilloscope to the corresponding terminals on the sweep generator, (Usually marked "Scope Horiz".)

5. Connect a shielded lead from the UHF Sweep Generator output terminals through the impedance matching network (Fig. 7) to the UHF tuner antenna terminals.

6. Set the receiver channel selector in the UHF position and rotate the VHF fine tuning knob until channel #48 is viewed through the channel selector window.

7. Set the sweep generator to 677 mc. (center frequency of channel 48) and the sweep width to 10 mc. With all equipment on and the oscilloscope controls properly adjusted, adjust the VHF fine tuning control until the response curve appears on the oscilloscope.

8. Set the marker generator to 43 mc. (accuracy is important) Loosely couple the output to the VHF tuner factory test point. Adjust marker signal output so that the pip is barely visible on the scope. Excessive marker injection will distort the response curve.

9. Simultaneously adjust L5 UHF IF Trimer and L100 located on the VHF Tuner (see Fig. 1, 2 and 3) until the response curve is symmetrical and 43 mc. marker pip appears in the center of the response curve. (See Fig. 4)

Replacing V-12325-1 and V-11972-1 UHF Tuner

1. Remove back cover from receiver.

2. Remove the plug on the UHF tuner connecting cable from its socket on the VHF tuner bracket.

3. Unsolder the antenna lead from the UHF tuner antenna terminals.

4. The coupling device between the VHF tuner and the UHF tuner drive shaft is either a press fit or secured by set screws. If set screws are used they must be loosened to release the coupling device from the UHF tuner drive shaft.

5. Remove the two ¼"self-tapping screws that secure the rear of the UHF tuner mounting bracket to the VHF tuner mounting bracket. Pull the tuner assembly toward the rear of the receiver chassis to release the front of the UHF tuner mounting bracket from the VHF tuner mounting bracket.

6. Unsolder the connecting cable from the old tuner and install on the replacement.

7. Remove coupler and install on replacement tuner.

8. Remove UHF mounting bracket from old tuner and install on the replacement.

a. The V-12325-1 tuner is shock mounted to the bracket by four ¼"self-tapping screws located on the top four corner of the tuner. It is grounded by a bonding strap located on the top front of the tuner. It is important that this strap is soldered to the replacement tuner.

b. The V-11972-1 tuner is mounted to the bracket by three 8-32 screws located on the side.

9. Follow the procedure used when installing a H-804 tuner assembly, starting with step #4.

ANTENNA INFORMATION

Antenna requirements for satisfactory UHF television reception are determined by the signal conditions in the particular locality.

Some of the possibilities are as follows:

1. In areas where signals are strong and reflections are not troublesome, satisfactory reception may be obtained by using the existing VHF antenna (built-in or external) for both VHF and UHF. This can be done by connecting two jumper wires from the UHF antenna terminals to the STD antenna terminals so as to connect the two sets of terminals in parallel. If this method is used, make certain that it does not adversely affect reception on the standard VHF channels.

If an external antenna is used for VHF reception, satisfactory UHF reception may be obtained by connecting the built-in VHF antenna to the UHF antenna terminals.

2. A simple, resonant dipole antenna may provide satisfactory reception in medium-signal areas, where reflections are not troublesome. The chart, Fig. 8, gives the total length of a half-wave element for any frequency in the UHF television spectrum.

3. Where signals are weak or reflections are troublesome, a high-gain, directive UHF antenna system should be used. Typical of this type of antenna are corner reflector, the conical, and Yagi.

Transmission lines should be of an approved low loss type. The use of tubular 300 ohm line is preferred over ribbon type 300 ohm line.

SERVICE

A high degree of precision is used in the manufacture of UHF television tuners. Critical factors include lead lengths, lead and component dress, and component sizes. In servicing UHF tuners, problems arise which are not encountered in ordinary service work. Therefore, troubleshooting inside the tuner is not recommended. Defective tuners should be returned through a Westinghouse distributor.

36	602-608	59	740-746	82	878-884
				83	884-890

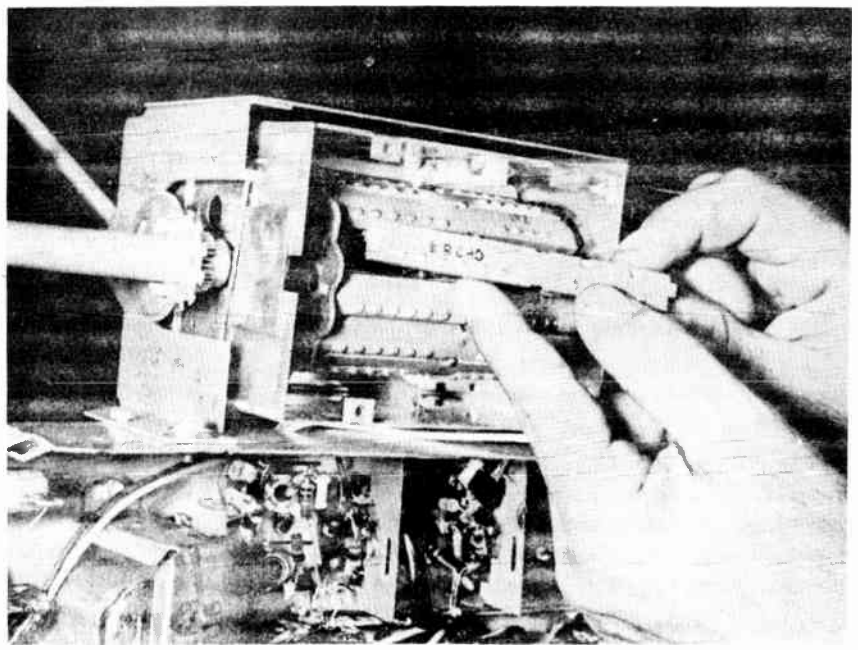
A third UHF tuner assembly is being used in the production of the Model H-804 all-channel UHF tuner kit. This tuner is designated V-12390-1 and will be used in the H-804-3 kit. The V-12390-1 UHF tuner is basically the same as the V-12325-1 UHF tuner (see basic H-804 service note) except that its IF output is designed for link-coupling to the VHF tuner.

Refer to the following chart for identification:

Model No. on Outside of Carton	UHF Tuner Type	For Use in Receivers containing VHF Tuner Type
H-804-1	V-12325-1	V-11974-1
H-804-2	V-11972-1	V-12100-1 or V-12400-1
H-804-3	V-12390-1	V-12100-1 or V-12400-1

PARTS LIST FOR MODEL H-804

Part No.	Description
V-12325-1	Tuner UHF (H-804-1)
V-11972-1	Tuner UHF (H-804-2)
V-12330-2	Coupler, flexible (H-804-1) (Includes one compression ring)
V-12529-1	Clamp for H-804-1 coupler.
V-12330-1	Coupler, flexible (H-804) (Includes two compression rings)
V-11424-1	Cable Assy., includes UHF Male Plug
V-11962-1	Knob, dial UHF (Includes compression ring)
V-5421-13	Washer, Felt UHF dial



GENERAL DESCRIPTION

The Model H-805 single channel UHF coil strips provide reception of the UHF television channels (14 through 83). They are used with Westinghouse television receivers that contain the type V-12100-1 R.F. tuner and are installed in place of unused VHF coil strips. The Model H-805 is a single section assembly comprised of the RF preselector, mixer and local oscillator harmonic generator circuits. Because of size limitations a maximum of six UHF strips can be installed. They cannot be installed adjacent to each other. Fig. 1 is the schematic diagram and also shows the physical layout of the components. All Model H-805 strips are factory aligned and with the exception of the oscillator coil slug, do not require adjustment when installed. THE OSCILLATOR SLUG MUST BE ADJUSTED AT THE TIME OF INSTALLATION.

CIRCUIT DESCRIPTION

Refer to schematic diagram Fig. 1 and block diagram Fig. 2. The received signal is coupled to the double tuned preselector circuit by the 300 balanced antenna input coupling coil. The output of the preselector is applied to the mixer crystal by means of a tap on the second preselector coil.

The frequency required to beat with the incoming signal to produce the IF carrier frequency is obtained by operating the local oscillator at a sub-harmonic and applying its output to the crystal harmonic generator. Thus, to receive channel 30, (567.25 mc.), using a 45.75 mc. video carrier IF frequency, the local oscillator would operate at 204.33 mc. and be tripled in the harmonic generator. (204.33 mc. x 3 = 613 mc. = 567.25 mc. + 45.75 mc.)

As shown in Fig. 1, the output of the local oscillator is fed to the harmonic generator crystal through the 100K resistor and 4.7 mmf capacitor network. This network biases the crystal so that it operates over a non-linear portion of its characteristic curve. The third harmonic of the local oscillator is developed across the harmonic selector circuit and applied to the mixer transformer by means of a coupling loop. The sound and video IF signals appear across the primary of the mixer transformer which serves as an IF transformer to couple the IF signals to the grid of the 6BK7 or 6BK7A cascode amplifier. This stage and one section of the 6J6 dual triode (normally operated as the tuner mixer) function as IF amplifiers.

INSTALLATION INSTRUCTIONS

Extreme care must be exercised when handling UHF coil strips. Component parts positioning and lead dress are important factors in the construction of these strips. Careless handling can easily impair their performance.

To install UHF coil strips, proceed as follows:

1. Remove the receiver chassis from the cabinet.
2. Remove the VHF tuner bottom cover. It is secured by four hex head self tapping screws.
3. Remove unused VHF coil strips and replace with the desired UHF coil strips.
4. Replace bottom cover, turn on the receiver and allow 5 min. warm-up time. Set the channel selector to the channel corresponding to the UHF coil strip, set the fine tuning control in the center of its range (flat of shaft facing down and tilted approximately 10% counterclockwise) and adjust the oscillator slug for best picture detail and sound quality. A non-metallic alignment tool should be used. Always adjust the slug in a counterclockwise direction first. If it is turned too far clockwise, it will pass its retaining spring and slide into the coil form.
5. Replace the chassis in the cabinet and recheck the oscillator setting.

SERVICE

A high degree of precision is used in the manufacture of UHF coil strips, and therefore, component parts replacement or preselector and mixer alignment is not recommended. When ordering replacement UHF coil strips, order by the service part no. V-12550-(14-83). The dash number following the basic part number indicates the channel number, i.e., V-12550-28 is the part number for a channel 28 coil strip.

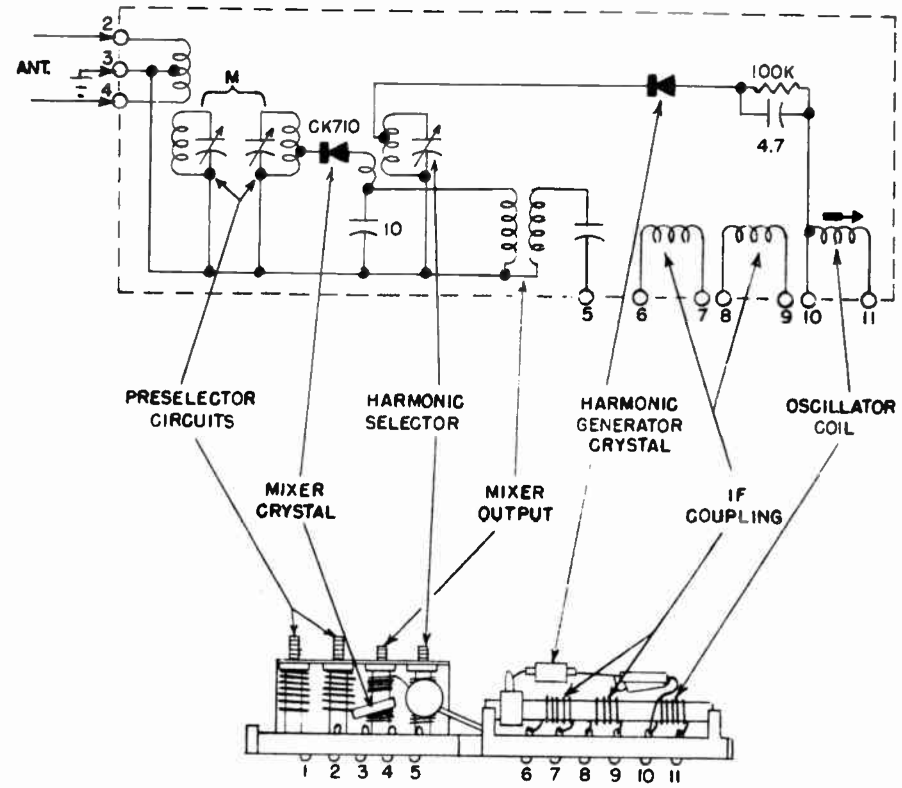


FIG. 1. H-805 – Schematic Diagram

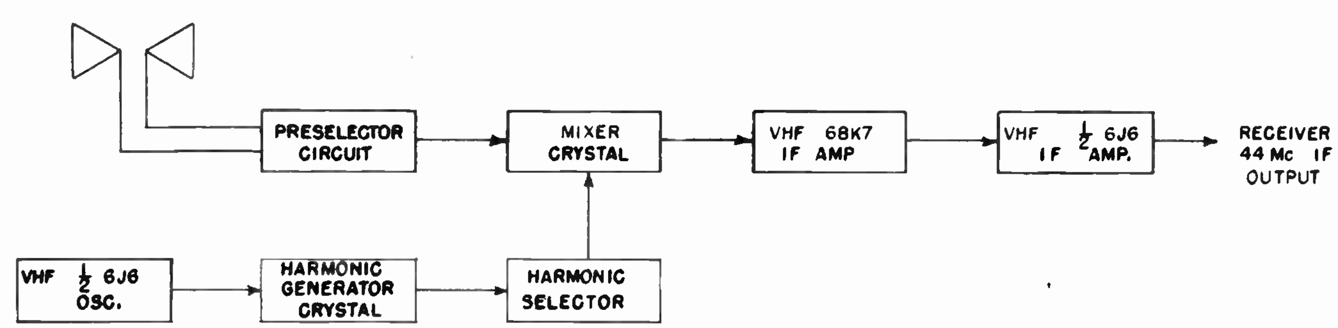

FIG. 2. H-805 – Block Diagram

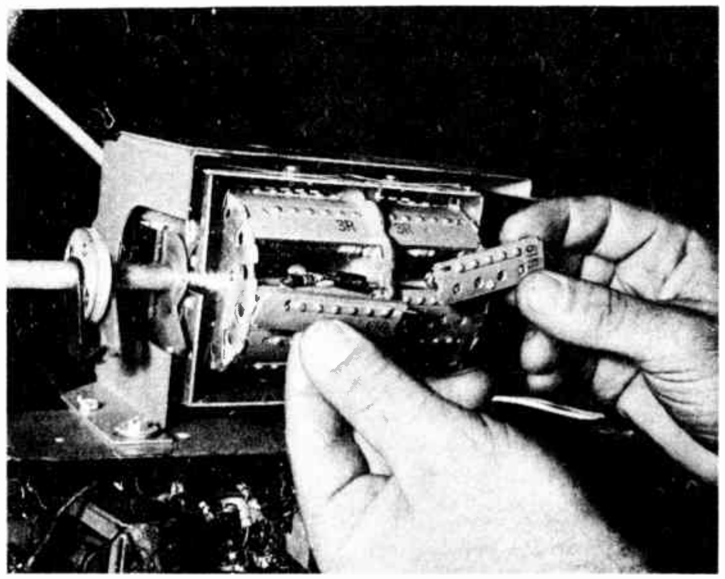

GENERAL DESCRIPTION

The model H-806 single channel UHF coil strips provide reception of UHF television channels 14 through 83. They are used with Westinghouse television receivers that contain the type V-12415-1 R.F. tuner and are installed in place of unused VHF coil strips. The model H-806 is a dual section coil strip. One section contains the RF preselector, local oscillator harmonic selector and the mixer circuit for the first conversion. The other section contains the oscillator coil and the mixer circuit for the second conversion. Because of size limitations, a maximum of six sets of UHF strips can be installed. They cannot be installed adjacent to each other. Fig. 1 is the schematic diagram and shows the physical layout of the components. All Model H-806 coil strips are factory aligned, and with the exception of the oscillator coil slug, do not require adjustment when installed. THE OSCILLATOR COIL SLUG MUST BE ADJUSTED AT THE TIME OF INSTALLATION.

CIRCUIT DESCRIPTION

Refer to schematic diagram Fig. 1 and block diagram Fig. 2. These UHF strips operate by double conversion of the received signal, using a harmonic of the local oscillator frequency for the first conversion and the fundamental frequency for the second conversion. The received signal is coupled to the double tuned preselector by the 300 ohm balanced antenna input coupling coil. The first mixer circuit (UHF crystal) receives energy from both the preselector and the oscillator harmonic selector to produce the first conversion. This first conversion frequency is amplified by the tuner RF amplifier tube, fed to the second mixer circuit where it beats with the fundamental frequency of the local oscillator to produce the receiver IF frequency.

INSTALLING MODEL H-806 COIL STRIPS

Extreme care must be exercised when handling UHF coil strips. Component parts positioning and lead dress are important factors in the construction of these strips. Careless handling can easily impair their performance.

To install UHF coil strips, proceed as follows:

1. Remove the chassis from its cabinet.

2. Remove the bottom cover of the tuner by pulling the front end away from the tuner chassis and unhooking the rear end.

3. Remove unused VHF coil strips and replace with the desired UHF coil strips. Be sure that the pin connector on the long section makes firm contact with the antenna section. DO NOT BEND THE PIN.

4. Replace bottom cover, turn on the receiver and allow 5 min. warm up. Set the channel selector to the channel corresponding to the UHF coil strip, set the fine tuning control in the center of its range (flat of shaft facing down) and adjust the oscillator slug for best picture detail and sound quality. A non-metallic alignment tool should be used. Always adjust the slug in a counter-clockwise direction first. If it is turned too far clockwise it will pass its retaining spring and slide into the coil form.

5. Replace chassis in the cabinet and recheck the oscillator setting.

SERVICE

A high degree of precision is used in the manufacture of UHF coil strips, and therefore, component parts replacement or alignment is not recommended. When ordering replacement coil strips, order by service part nos.

V-12384-(14-83) for the antenna section, and V-12485-(14-83) for the oscillator section. The dash number following the basic part number indicates the channel number, i.e., V-12484-28 is the antenna section for channel 28.

INTRODUCTION

The 19R20, 19R21, 22R20 and 22R21 chassis described in this manual are similar in design. Alignment and adjustment procedures are identical. The 22R series is similar to the basic 19R series except for the horizontal output tube, an additional 5U4G rectifier, higher second anode voltage and high fidelity sound. In addition, receivers using the 22R chassis are equipped with a phono connector, push pull audio and top tuning with the switch and volume control mounted in the upper left corner of the cabinet, the channel selector at the right and the fine tuning at the rear adjacent to the turret tuner. The main differences between various chassis are in the type of tuner, audio system and picture tube size (see chart).

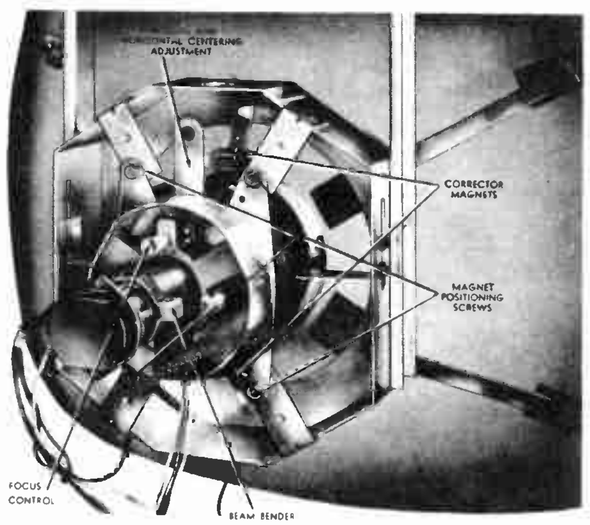

Fig. 9 Adjustments on Neck of Picture Tube 22R21 Chassis

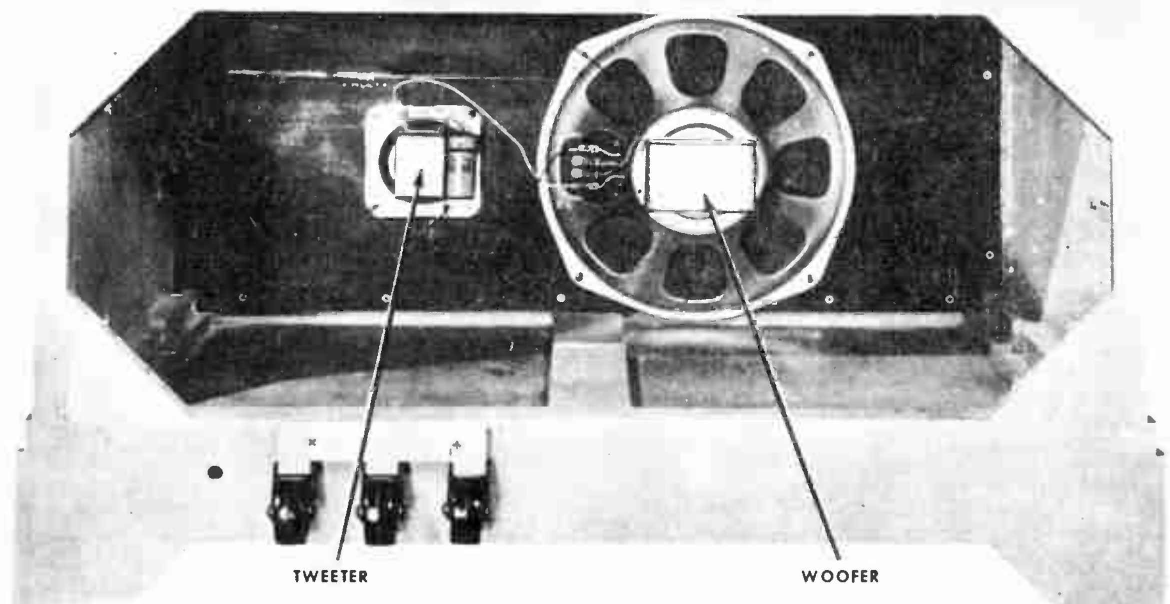

Fig. 10 Rear View of R23--Series Receiver.

ADJUSTMENTS

REMOVABLE PICTURE TUBE PROTECTIVE CUP

With the exception of a few models, a removable cup is provided to allow easy access to the adjustments on the neck of the picture tube.

To remove cup turn it counterclockwise a few degrees at a time and depress each of the three catches with a screwdriver until the cup is unlocked.

To install cup match the cup flanges (different widths) with the cabinet slots and turn clockwise until cup is locked in place.

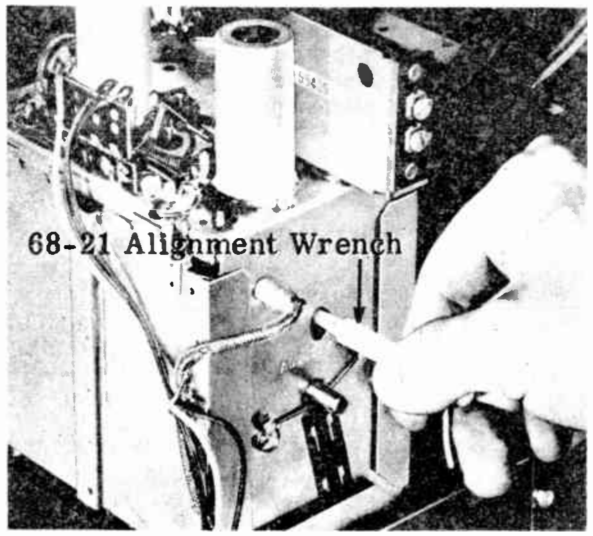

Fig. 11 Bulls-eye Tuning Adjustment

BULLS EYE TUNER ADJUSTMENTS

To adjust the receiver for bulls-eye tuning, set the fine tuning control to its approximate center position as shown in Fig. 1 . Without further adjustment of the fine tuning control insert a 68-21 alignment wrench into the tuner (See Fig. 11) and adjust each operating channel to resonance. It will be noted that tuning to one side of resonance results in a faded, washed-out picture with the spacing between the wedge lines fogged and tuning in the opposite direction causes the spaces between the lines to clear up. However, going beyond this point causes the picture to take on a "wormy" appearance from sound getting into the picture. Correct adjustment is obtained by tuning to the "wormy" picture and then backing the control off slightly until the picture clears up.

CENTERING ADJUSTMENT

In the 19R series, the centering assembly is built into the yoke housing. This assembly is made up of two magnetic rings which can be rotated by means of tabs. Centering is accomplished by gradually rotating the tabs with respect to each other then rotating both tabs simultaneously until the picture is centered.

In the 22R series, PM focusing and centering is utilized. The top screwdriver adjustment on the centering assembly is used to move the picture up or down and the bottom adjustment for side to side movement. The center adjustment is for focusing.

In some 22R20 and 22R21 receivers, a single centering lever is used for both vertical and horizontal centering. The up-down movement of this lever moves the picture horizontally while a left-right movement moves the picture vertically. A screwdriver adjustment is provided for focusing.

AFC ADJUSTMENT

The AFC is adjusted by setting the horizontal hold control L21 to a position where it is virtually impossible to "throw" the receiver out of horizontal sync when switching from channel to channel.

CORRECTOR MAGNET ADJUSTMENT

Two corrector magnets are used (not required in the 19R series) to obtain straight, sharply focused sweep lines across the face of the picture tube. In the 22R21 chassis, the corrector magnets are mounted top and bottom. The magnets are mounted on the deflection coil mounting brackets and can be moved in and out or up and down by bending the flexible arms which support them. Adjustment has been made at the factory and should not require re-adjustment unless accidentally bent out of position. If this occurs, proceed as follows:

1. With the vertical and horizontal size controls, reduce the size of the picture to a point where the four corners and sides of the picture are visible. (In some receivers it may not be possible to reduce the picture size sufficiently to see all the sides and in this case it may be necessary to shift the picture with the centering control to view one side at a time.)

2. Bend the corrector magnet arms until the corners become right angles and the top of the raster is parallel with the bottom and the left side is parallel with the right side. After adjustment, the picture should be restored to normal size.

NOTE: Mis-adjustment of the corrector magnets may cause pincushioning, barreling, keystoning, poor linearity, etc.

THE FRINGE LOCK CIRCUIT

The fringe lock circuit utilizes a 6BE6 heptode, which can be adjusted to assure sync stability over the wide range of noise and signal levels encountered in different areas. In this circuit the output of the crystal detector, approximately -3 volts peak to peak, is fed to grid #1 (pin 1) of the 6BE6. The same signal, after it has been inverted and amplified to approximately 40 volts peak to peak by the first video amplifier, is applied to grid #3 (pin 7) which in this circuit is the signal grid. The fringe lock control is used to pre-set the bias on grid #1 so that the normal 3 volt signal allows proper sync clipping action, i.e. the sync pulses, which have been stripped from the composite video signal appearing at grid #3, will appear at the plate. If a noise pulse drives grid #1 beyond the 3 volt level, plate current cutoff occurs and the noise pulse cannot get through to falsely trigger the sweep oscillators. On rare occasions, a strong noise pulse may occur at the time of the sync pulse and the tube likewise may cut off, however, the flywheel action of the sweep oscillators will maintain sync during this brief period. The entire fringe lock system is based on the principle that the loss of an occasional sync pulse is to be preferred over having a noise pulse get through to falsely trigger the sweep oscillator.

FRINGE LOCK ADJUSTMENT

1. Turn the fringe lock control fully clockwise and then back it off approximately 1/4 turn. Adjust the vertical and horizontal hold controls and check operation of the receiver to see that it syncs normally when the turret is switched from channel to channel.

2. If the picture jitters or shows evidence of delay, tearing, split phase, etc., back down the fringe lock control further, a few degrees at a time, each time re-adjusting the hold controls and switching from channel to channel until normal sync action is obtained. It will be found that under normal signal conditions, the correct adjustment will be near the counter-clockwise position of the control.

3. In fringe and noisy areas, the best adjustment will be found at or near the maximum clockwise position of the control, however, do not automatically turn the fringe lock fully clockwise in fringe areas as has been done on previous models. Follow the procedure outlined. In areas where both local and fringe signals are received, a compromise setting should be made for best overall performance.

DOUBLE DELAYED GATED AGC

In order to obtain the best possible performance in fringe and weak signal areas, it is important that the application of AGC voltage to the 6BK7A RF tube be delayed until the signal level reaches approximately 500 microvolts at the antenna input. The noise figure of the tuner will be optimized only under this condition of no AGC voltage. To accomplish this, the cathode of the 6CB6 1st IF tube is approximately 8 volts positive by virtue of the drop through the cathode resistor of the 6CB6 3rd IF. This voltage plus the voltage which results from current flow through the tube makes the grid of the 6CB6 1st IF approximately 8.6 volts negative with respect to its cathode. It should be noted here that the bias voltage for the 3rd IF is obtained across the 120 ohm portion of the cathode resistor only. The voltage at the junction of the two resistors varies from 8 volts with no signal to 4 volts with strong signals. The 2nd IF tube is in series with the 1st IF tube and any changes in the plate current of the 1st IF tube will also change the 2nd IF tube thus the 2nd IF tube is also controlled indirectly by the AGC.

Under weak signal conditions, the output of the AGC tube at point "E" is approximately 6.8 volts positive. This positive voltage however, does not reach the grid of the 6BK7A because of the 2.2 megohm resistor. Actually the grid of this tube is slightly negative because of contact potential developed as a result of the high resistance in its grid circuit (2.2 megohms). The 6.8 volts positive voltage however, is applied to the grid of the 6CB6 1st IF but because the cathode is 8.6 volts positive the grid is actually 1.8 volts negative with respect to its cathode and AGC control of the IF results under weak signal conditions.

When the receiver is used with normal signals, the signal voltage applied to the grid of the AGC tube will increase and as a result the output of the AGC tube will become 4 to 5 volts negative. This negative voltage will be applied to the 6BK7A through the 2.2 megohm resistor thus both the RF and IF stages will then be controlled by the AGC.

With the application of a negative AGC voltage to the 6BK7A tube under normal signal conditions, the noise figure of the tuner will not be optimized as under weak signal conditions, however, this is not a consideration with normal signal levels.

AGC ADJUSTMENTS

IMPORTANT: THE AGC CONTROL CANNOT BE USED IN ANY WAY TO IMPROVE THE RECEIVER SENSITIVITY. The sole function of this control is to set the level applied to the video amplifier (12BY7) tube so that the output of this tube is approximately 100 volts peak (100% modulated video signal) for application to the picture tube cathode.

The adjustment can also be made by connecting a calibrated oscilloscope through a 10K isolation resistor, to test point "D" (See Fig. 27) and, while receiving the strongest TV signal adjust the AGC delay control for 2.75 volts peak output.

Satisfactory adjustment can also be made by observing the picture and slowly turning the AGC delay control from its maximum clockwise position, counterclockwise until a point is reached where the picture distorts and buzz is heard in the sound. The control should then be turned slowly clockwise and set at a point comfortably below this level of intercarrier buzz, picture distortion and improper sync.

CAUTION: Misadjustment of the AGC delay control can result in a washed-out picture, distorted picture, buzz in sound OR COMPLETE LOSS OF PICTURE AND SOUND.

REMOVING TURRET TUNER FROM THE CHASSIS

1. Pull out the power connector, IF connector and disconnect the antenna transmission line. On some models it is also necessary to pull out the UHF IF connector and unsolder the pilot light and the oscillator B+ lead.

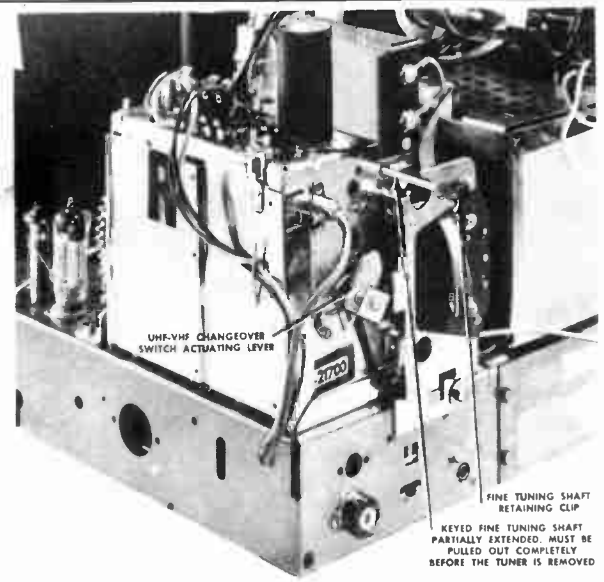

Fig. 12 Removing Fine Tuner Shaft.

2. On those models with the fine tuning control on the front panel it is also necessary to remove the fine tuning shaft from the tuner. This is done by pulling out the fine tuning shaft retaining clip (See Fig. 12) and completely removing the keyed shaft. On those models with the fine tuning control at the rear of the cabinet it is unnecessary to take out the shaft before removing the tuner.

3. To insure proper indexing, note the channel to which the receiver is tuned so that if the turret drum is rotated while the tuner is out of its case it can be turned back to the original channel.

4. Remove the three hex nuts and one machine screw and lift the tuner out of its case.

NOTE: When installing the tuner follow this procedure in reverse. The tuner fine tuning shaft is keyed and can only be inserted one way.

REMOVING CHANNEL STRIPS

1. Rotate the turret drum until the strip to be removed is readily accessible.

2. Insert a small screwdriver in the slot (See Fig. 13). Push in the direction of arrow until the channel strip clears the drum slot then lift straight out in direction of screwdriver shaft. Some strips have a round hole instead of a slot and a pointed tool is used in place of the screwdriver.

CAUTION: TO AVOID DAMAGE TO CHANNEL STRIPS, DO NOT USE PRYING ACTION IN REMOVING STRIPS.

S21845 UHF AND VHF TUNER ASSEMBLY

This unit combines the S21700 Turret Tuner and the S21864 Continuous Tuner. The turret tuner section is conventional except that on UHF a pair of 40Mc IF coils are switched into position making the 6BK7A and the 6U8 tube IF amplifiers. The 6AF4 high frequency oscillator mixes with the incoming UHF signal and produces a 40 Mc IF which is applied to the turret tuner section through terminal "F" see Fig. 33. The turret tuner in this unit is designed for VHF only, UHF strips cannot be used.

UHF-VHF CHANGEOVER SWITCH

The low loss UHF-VHF changeover switch is part of the S21845 UHF-VHF tuner package. The switch performs 3 functions.

1. Is used to switch the antenna between tuners.
2. Switches the oscillator B+ between tuners.
3. Actuates the UHF pilot light.

The switch is actuated by a lever (see Fig. 12) which is mounted on the turret tuner shaft. When the VHF tuner is in the UHF position, the lever, if properly aligned, will actuate the changeover switch.

REMOVING THE S21700 CONTINUOUS TUNER FROM THE CHASSIS

Although it may be more convenient to first take out the VHF tuner before removing the UHF tuner it is not a necessity. The UHF tuner can be removed as follows:

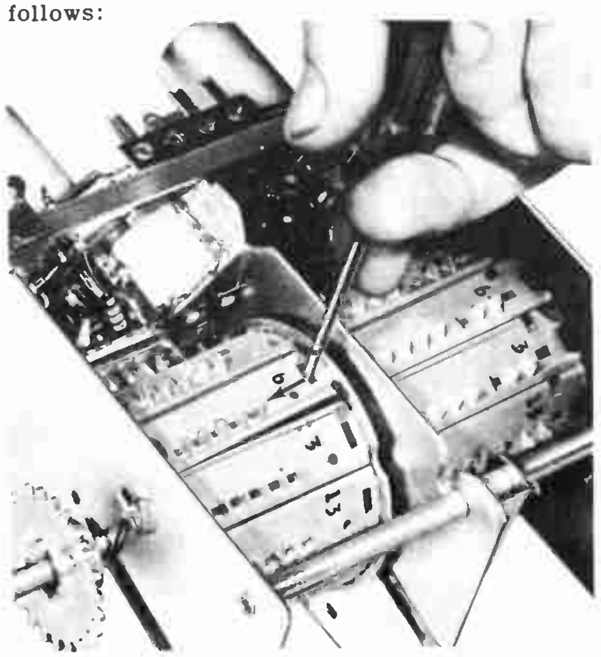

Fig. 13 Removing Channel Strips.

1. Loosen the screws and hex nuts which hold the VHF tuner in place (See Fig. 15). This step is necessary so that the VHF tuner case can be moved slightly to obtain clearance for removal of the UHF tuner. This step is not required in those models in which the tuner is secured to the top of the cabinet.

2. Remove the UHF heater and B+ connections (See Fig. 15).

3. Loosen the set screw and remove the UHF tuner drive pulley.

4. Loosen or remove the UHF tuner locking screw and lift out the tuner. It may be necessary to bear slightly against the VHF tuner case to obtain sufficient clearance for removing the UHF tuner.

When the tuner is reinstalled, reverse this procedure. Do not tighten the UHF tuner drive pulley until the tuner and the indicator dial are in synchronism on channels 14, 54 and 83.

METAL WRAPPED RESISTORS

In servicing the TV receiver, the serviceman will find several circuits in which metal wrapped resistors are used. The metal wrapping dissipates much of the resistor heat and doubles the wattage rating. In replacing a resistor care should be used to mount it as the original. If the metal mounting clamp is discarded, the resistor wattage must be doubled.

ALIGNMENT

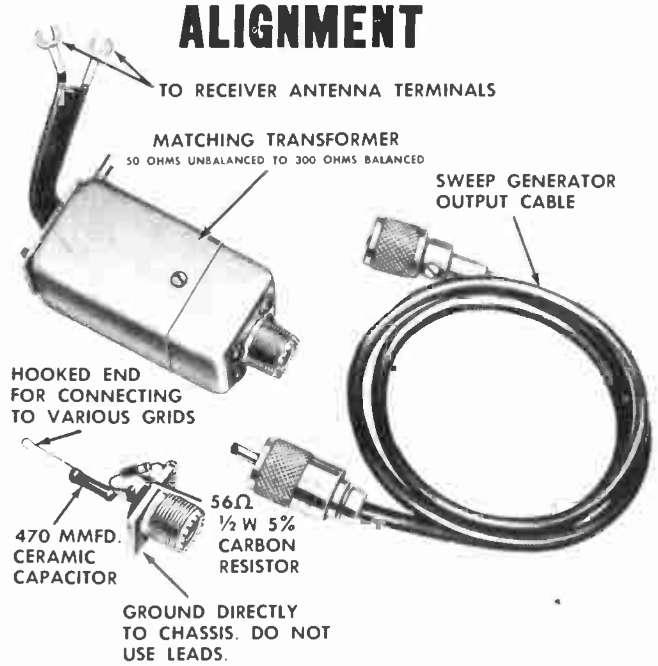

Fig. 14 IF-RF Alignment Fixtures

A suitable VHF and UHF sweep generator in conjunction with an accurate marker must be used for alignment work. It is very important to have the sweep generator output cable properly terminated and to check whether or not its attenuator is reactive. If the attenuator is reactive or if the output cable is improperly terminated, correct alignment cannot be made since the degree of attenuation then may change the shape as well as the amplitude of the response curve. The position of the attenuator should only vary the amplitude and not the shape of the response curve.

CALIBRATING THE OSCILLOSCOPE

When aligning the RF and IF stages of the receiver, it is necessary to measure detector peak output.

This may be done with a voltage calibrator used in conjunction with an oscilloscope. If a calibrator is not available, the oscilloscope can be calibrated with a known DC voltage. To make the calibration, connect the ground lead of the vertical input cable to the negative side of a 3 volt battery supply. Turn the horizontal gain control fully counterclockwise. With the "hot" lead, make a momentary contact to the positive connection on the battery and observe the instantaneous spot deflection on the screen. Discharge the scope input capacitor by shorting out the leads and repeat the procedure, each time re-adjusting the scope vertical gain until the spot deflects 3 large divisions on the screen. Each division then represents 1 volt peak. The position of the vertical gain control should be marked for future reference.

SOUND ALIGNMENT

Proper alignment of the 4.5 Mc intercarrier sound channel can only be obtained if the signal to the receiver antenna terminals is reduced to a level below the limiting point of the 6BN6 Gated Beam Detector. This level can be easily identified by the "hiss" which then accompanies the sound.

Various methods may be used to reduce the signal level, however, it is recommended that a step attenuator similar to the S-17203 unit be used for most satisfactory results. (See Fig. 25).

1. Connect the step attenuator between the antenna and the receiver antenna terminals.

2. Tune in a tone modulated TV signal and adjust the step attenuator until the signal is reduced to a level where "hiss" is heard with the sound.

3. Adjust the sound take-off coil L17 (top and bottom slugs), intercarrier coil L19, quadrature coil L20 and buzz control R32 for the cleanest sound and minimum buzz. It must be remembered that any of these adjustments may cause the "hiss" to disappear and further reduction of the signal will be necessary so that the "hiss" does not disappear during alignment.

If intercarrier buzz is in evidence, after all normal sound adjustments have been made, the cause may be attributed to one or more of the following:

1. Improper adjustment of the AGC delay control.

2. Defective 6AU6 sound limiter.

3. Extremely high signal levels which require attenuation in the antenna circuit.

4. Transmitter over modulation.

VIDEO IF ALIGNMENT

1. Slowly turn the channel selector until the turret is made to rest between two channels. Connect the negative lead of a 2 volt battery supply to terminal "E" (Fig. 27) and the positive lead to chassis. The bias supply should be made variable so that it can be varied from negative 3 volts to positive 3 volts. Keep the supply leads short.

2. Connect the calibrated oscilloscope through a 10,000 ohm isolation resistor between terminal "D" and chassis. The sweep generator input to the receiver should be adjusted for 3 volts peak to peak detector output. Do not exceed this output level during any of the adjustments.

3. Feed the output from the sweep generator through the special termination unit shown in Fig. 14 to point "C" (Pin 1 of 6CB6, 3rd IF). Adjust the generator until a pattern similar to Fig. 16 is obtained.

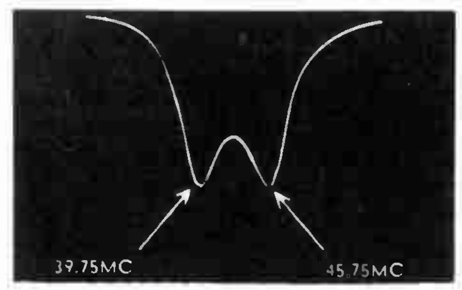

Fig. 16 4th IF Response.

4. Set the Marker Generator to 45.75 Mc and alternately adjust the top and bottom slugs of the 4th IF transformer for maximum gain and symmetry with the 45.75 Mc markers positioned as shown in Fig. 16 The 39.75 Mc marker can be within ±0.5 Mc of the specified frequency. If the correct response curve cannot be obtained in this step, check the position of the two slugs to see that they are entering their respective coils from the opposite ends of the coil form. The position of the slugs near the center of the coils may change the coefficient of coupling, making correct alignment difficult if not impossible.

5. Connect the sweep generator cable to terminal "A" (Mixer Grid). In this step it may be necessary to temporarily reduce the bias to zero or even to go to a slightly positive voltage in order to see the highly attenuated trap slots with the oscilloscope vertical gain near maximum.

6. Adjust the 47.25 Mc, 41.25 Mc (Top slug of 1st IF transformer) and 39.75 Mc traps for minimum marker amplitude, See Fig. 17. It can be seen that maximum oscilloscope gain has been used and as a result the top of the response curve has been "run off" the oscilloscope screen in order to see a "blow-up" of the trap slots.

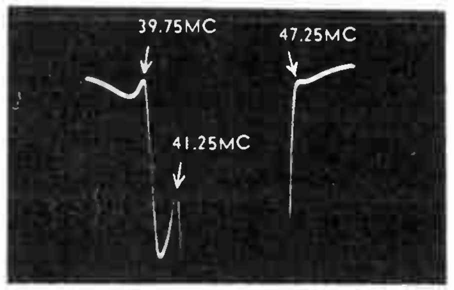

Fig. 17 Exploded View of Traps.

7. Readjust the bias to -2 volts and set the oscilloscope vertical gain to the calibrated position. Adjust the sweep generator for a 3 volt peak to peak output from the video detector.

8. With the test equipment set up as in Step 7, alternately adjust the 2nd IF, 3rd IF, 1st IF and the converter plate coil until an overall response curve similar to Fig. 18 is obtained. Do not adjust the 4th IF in this step. It will be found that the 2nd IF affects the low side (42.75 Mc) and the 3rd IF the high side of the response curve.

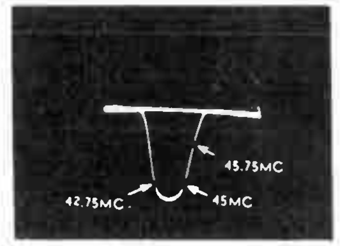

Fig. 18 Overall IF Response.

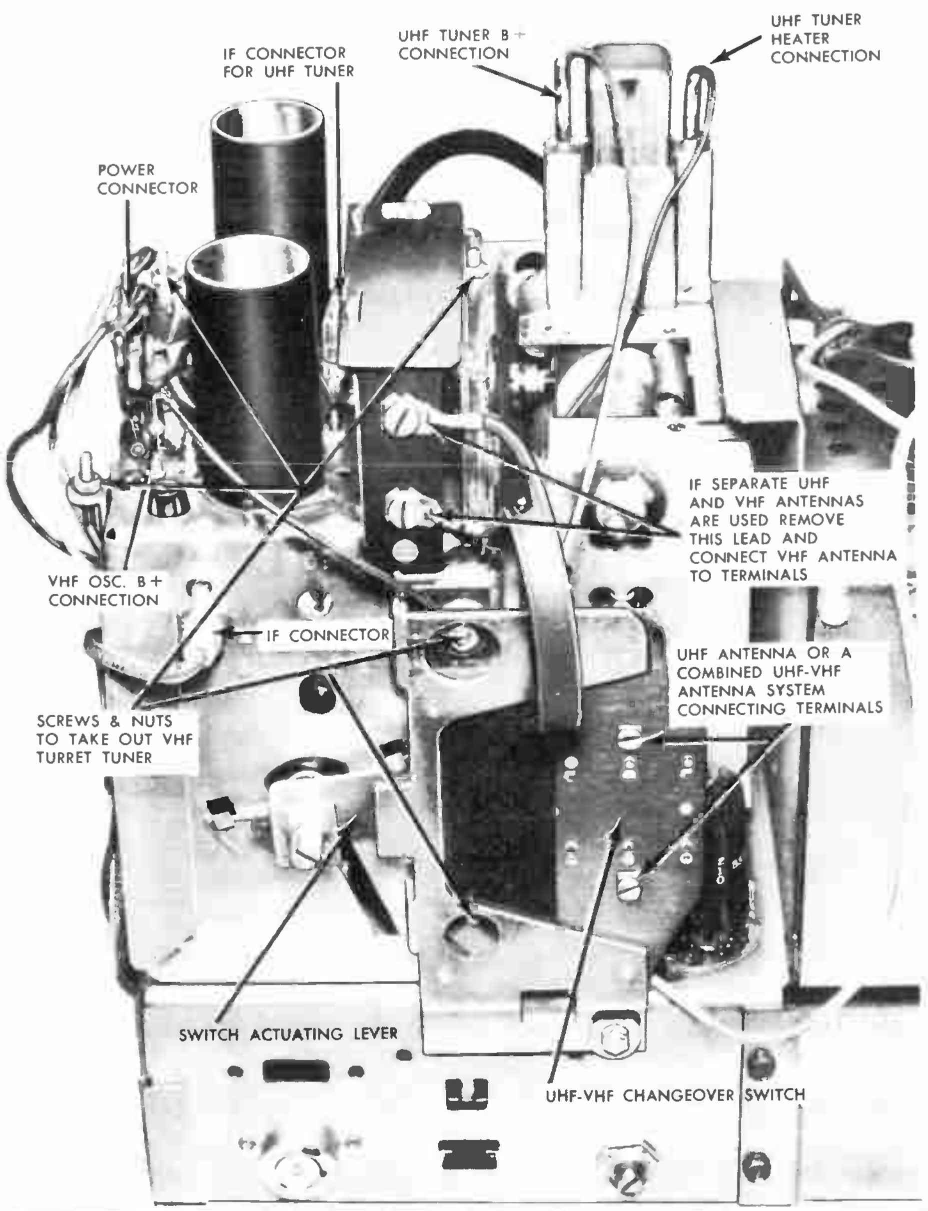
TURRET TUNER ALIGNMENT

The RF chassis adjustments have been made at the factory and normally do not require readjustment in the field unless tampered with. If adjustment becomes necessary check the overall IF response and proceed as follows:

1. Temporarily ground the turret AGC by connecting a jumper between the AGC bus (yellow lead) and chassis. (If sufficient output from the signal generator is available moderately better results may be obtained with 2 volts of bias.)



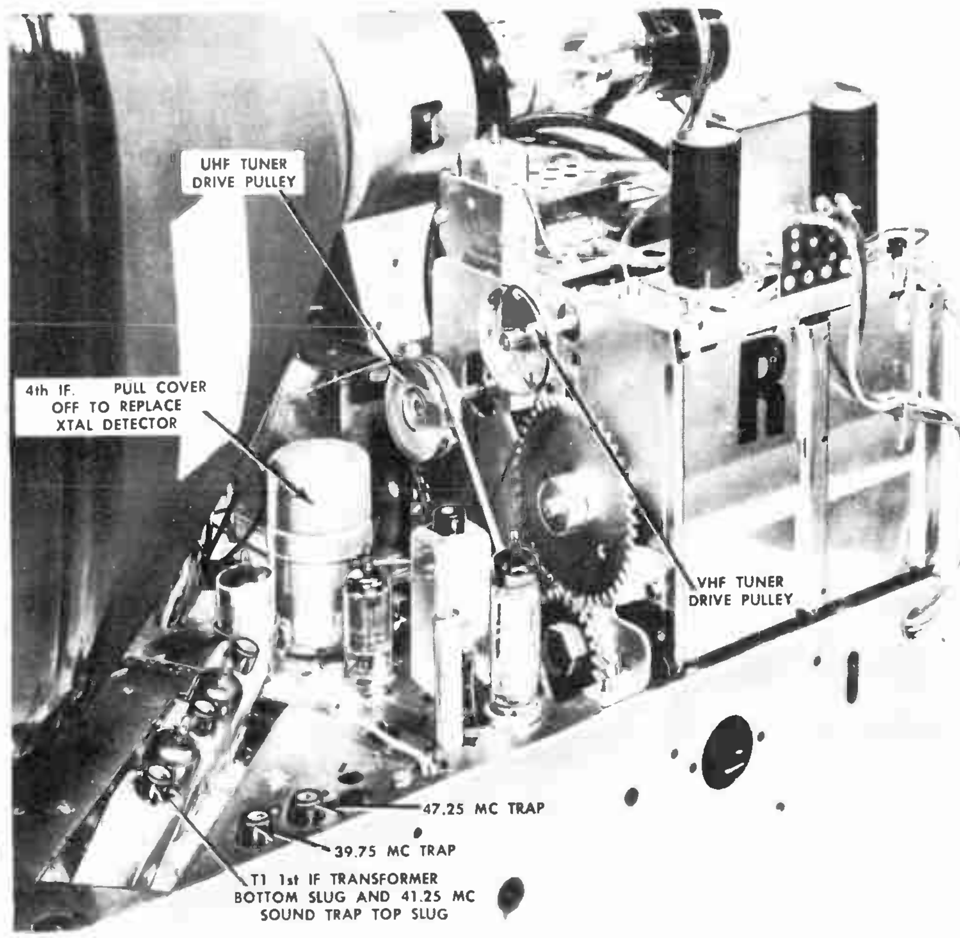


Fig. 15 Front and Rear views of S21845 VHF-UHF Tuners Used in "U" Models

2. Connect the calibrated oscilloscope to the feed through terminal "H" (Fig. 4) through a 10K isolation resistor. This terminal is the screen of the 6U8 mixer.

3. Use a 50 to 300 ohm matching transformer (Fig. 14) and feed the output from the sweep generator to the antenna terminals of the receiver.

4. Turn the channel selector to Channel 4 and adjust the sweep generator until a response curve somewhat similar to Fig. 19 is obtained.

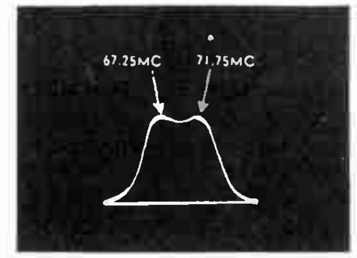

Fig. 19 Channel 4 RF Response.

5. Study Fig. 4 and adjust the converter grid capacitor (C9), the RF plate capacitor (C8) and the RF grid capacitor (C5) until a response curve similar to Fig. 19 is obtained.

6. Turn the channel selector to Channel 11 and adjust the sweep generator until a response somewhat similar to Fig. 20 is obtained. Adjust L5 and L6 to obtain symmetry. If the band pass is too great or too narrow also adjust L7.

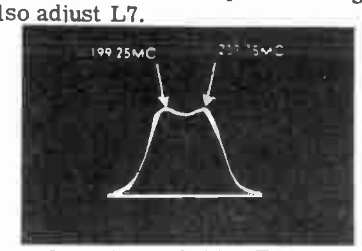

Fig. 20 Channel 11 RF Response.

7. Repeat steps 5 and 6 until the best overall symmetry is obtained. REMOVE AGC JUMPER.

MASTER OSCILLATOR ALIGNMENT

The master oscillator adjustment is to be made only if resonance cannot be obtained with the strip oscillator adjustment wrench with the fine tuning control in its center position, and after it has been determined that the channel strip itself is not at fault.

If channels 2 through 6 can be made to resonate with the bull's-eye adjustment at the rear of the turret and the high channels do not resonate, a slight readjustment of the oscillator inductance L10 (See Fig. 4) may be necessary to affect resonance on the high channels.

S21700 UHF TUNER ALIGNMENT PROCEDURE

The Zenith continuous tuner has been aligned at the factory with precision test equipment. Adjustments should not be attempted in the field unless adequate test equipment is available. It must be remembered that any attempt to peak any one particular channel will usually cause serious degradation of the other channels. If alignment becomes necessary, use a sweep generator, marker and oscilloscope and proceed as follows:

1. Switch the receiver to the UHF position. In this position the UHF pilot light will light up.
2. Through the matching network illustrated in Fig.21 feed the sweep generator to the UHF antenna terminals.
3. Set the UHF tuning knob to channel 54. When this is done, the rocker arm on the tuner should be in the horizontal position. If the rocker arm is not in this position loosen the set screw on the drive pulley and turn the tuner shaft independently of the pulley until the arm is in the horizontal position with the channel indicator on channel 54. Tighten the set screw.

4. Use a marker generator and check calibration on channels 14, 54 and 83. Do not adjust the oscillator unless the calibration is off more than 3 channels. If the calibration is incorrect, the following steps are necessary.

5. Connect an oscilloscope to terminal "D" and 2 volts bias to terminal "E" (Fig. 27). Feed a FM signal to the UHF tuner and adjust sweep to obtain a band pass on channel 54 similar to Fig. 22. Set the positioning adjustments (Fig. 23) so that the channel 54 video marker (711.25 Mc) falls at the 50% point on

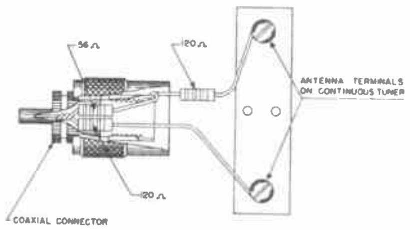

Fig. 21 Matching Network Required for UHF alignment.

the response curve. When adjusting the oscillator, the image (weaker response) and the fundamental will appear. The proper response is towards the counterclockwise position of the oscillator positioning adjustment. Use just enough signal from the sweep generator to obtain 3 volts peak detector output.

6. Turn the UHF tuning indicator to channel 14. Adjust sweep to obtain response as in step 5 and check calibration. If the oscillator is off more than 3 channels, use a pair of slip joint pliers and adjust

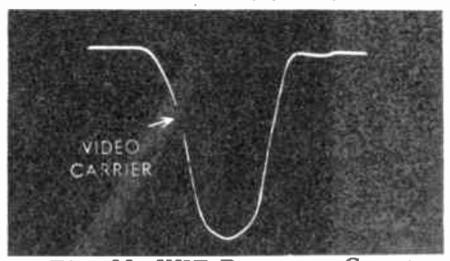

Fig. 22 UHF Response Curve.

the oscillator travel adjustments to scale. When adjusting the travel adjustments, it is possible to move the rocker arm out of its bearing and get an incorrect setting. Check to see that the rocker arm remains seated at all times. After the oscillator is adjusted, set the mixer and antenna travel adjustments for maximum response.

7. Turn the UHF tuning indicator to channel 83 and check for calibration as on channels 54 and 14. Set C94 to scale and adjust C92 and C89 for maximum response.

8. Check calibration on channels 14, 54 and 83. It may be necessary to repeat the above steps to obtain best overall performance.

NOTE: If a high output sweep generator is available, it is unnecessary to go through the IF when aligning the UHF tuner. The output can be viewed at terminal "F" (Fig. 33) by use of an oscilloscope demodulator probe. The adjustments are then made so that the sound and picture carriers appear symmetrical (as in Fig. 20).
