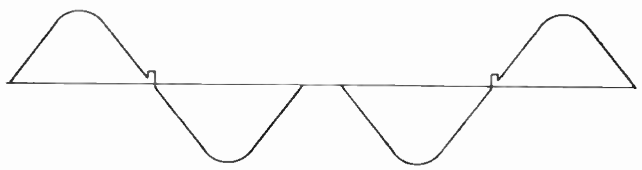
When "free running," the Horizontal Sine Wave Oscillator operates at a frequency approximately correct for horizontal scanning. The sine wave is applied through T105, to the plates of the AFC Detector 180° out of phase. The horizontal sync pulses are applied to the center tap of the plate winding of the transformer, and appear at the plates of the AFC Detector in phase. When the oscillator operates in synchronism with the transmitter, the pulses appear on the sine waves as one plate goes through zero voltage in the negative direction, and as the other plate goes through zero voltage in a positive direction. Because the sync pulses appear when both plates are at zero voltage, there is no change in the operation of the circuit. However, if the oscillator changes in frequency, the sync pulses at the detector plates do not appear when the oscillator voltage is zero, but at a point on each sine wave either before or after it goes through zero. As the sine wave on one plate is of opposite polarity from the other, and as the sync pulse on one plate is of the same polarity as the other, the sync pulse will add to the sine wave that is positive, and subtract from the one that is negative. This condition will produce a voltage unbalance in the cathode circuit of the AFC Detector. This voltage is applied to the grid of the Horizontal Reactance tube, thereby controlling the variable reactance in shunt with the horizontal oscillator tank circuit. This causes the Horizontal Sine Wave Oscillator to change frequency in such a direction so as to come back into exact synchronism.

PLATE 1 PLATE 2

OSCILLATOR SINE WAVE IN PHASE WITH SYNC PULSE



HORIZONTAL DEFLECTION

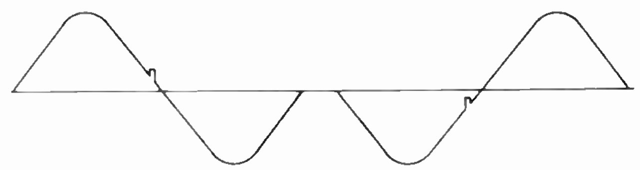
The horizontal sine wave oscillator has in its plate circuit an inductance that is shock excited. This inductance is damped so that its natural frequency of oscillation is damped out in considerably less than one horizontal line. The initial positive excursion is applied to the grid of the discharge tube. This tube then draws heavy current for a very short period. The plate potential decays very abruptly. Because of the peaking resistor in its plate circuit, the discharge condenser does not discharge as much as the plate potential decays. When the tube stops drawing current, its plate potential returns to the potential of the discharge condenser. This condenser then proceeds to charge at the rate determined by the circuit time constant. This saw-tooth wave, with its peaking, is then applied to the horizontal output grid.

SOUND

As previously mentioned, the Video Detector produces, in addition to its conventional function, a 4.5 mc. beat between the sound I-F and the video I-F carriers. This is amplified by the video amplifier and removed from its plate circuit by T108. It is again amplified by the Sound I-F, and its audio component removed by the Ratio Detector, which is essentially immune to amplitude modulation. The resultant audio frequencies are applied to the 1st Audio Amplifier in the CT-247 and CT-249, or to the audio amplifier of the associated radio receiver for the CT-248. The Audio Output stage of CT-247 and CT-249 is a conventional power pentode, operating into an output transformer and speaker.

PLATE 1 PLATE 2

OSCILLATOR SINE WAVE OUT OF PHASE WITH SYNC PULSE



PART IV

PRELIMINARY ADJUSTMENTS

The CT-247, CT-248 and CT-249 television instruments are shipped completely assembled, with the picture tube installed. All that is necessary for installation is the proper location, adjustment of the various controls, and removal of the back cover for adjustment of the ion trap on the 12LP4 (the 12KP4 requires none) and adjustment of the cabinet antenna. A check should be made that all tubes are properly seated, and the red shipping bracket removed from the focus coil and deflection yoke assembly.

The safety glass, mask, filter and frame constitute an assembly, which is easily removed for access to the picture tube by removal of the two angle brackets above the control panel.

The chassis is held in the cabinet by six mounting screws through the bottom.

SETTING UP FOR OPERATION

(a) Tune in a television station and adjust the fine tuning control for best picture quality. At this point, tuning should be for the best detail or clearest picture. It is possible to tune for maximum audio output, but such an adjustment is incorrect for this type of receiver.

(b) Adjust the AGC Set Control on the rear panel and the Picture Control on the front panel alternately for proper contrast. A standard test pattern is necessary for this adjustment in order to observe correctly the various degrees of black, grey, and white. It is also necessary to switch to all available channels in order to arrive at a good average contrast. Once set, only the front panel control need be used.

(c) If horizontal linearity is unsatisfactory, turn the Horizontal Drive Control as far as possible without causing crowding of the right side of the picture. This position provides maximum high voltage to the picture tube. Too much drive will cause a bright vertical line about 1/3 from the left side of the raster. Then adjust the Horizontal Linearity Coil to improve linearity.

(d) Height and Vertical Linearity Adjustment. Adjust the Height Control until the picture just fills the mask vertically. Adjust the Vertical Linearity Control until the test pattern is symmetrical from top to bottom. Adjustment of either control will require readjustment of the other.

(e) Rotate the Vertical Hold Control, located on the rear panel, until the picture slowly moves in a downward direction (A). Then reverse the rotation of the control slowly until the picture falls into sync (direction B). Switch off channel and then switch back on the channel. The picture should fall into sync immediately. It is possible that the picture may pull into sync slowly. If this occurs, rotate the Vertical Hold Control a bit more in direction (B) noted above. Switching from channel to channel should now produce immediate vertical synchronism.

(f) Functions of the Sound, Focus, and Horizontal Centering controls are conventional. Vertical centering is accomplished by tilting the focus coil. Earlier models had no Width Control, but it was later added, inside the high voltage compartment. It should be adjusted so that the picture just fills the mask horizontally.

(g) Horizontal Hold Adjustment. If the receiver does not snap into horizontal sync immediately on being switched to a picture channel, but instead it slowly pulls in as indicated by diagonal blanking bars which slowly reduce in frequency until the picture snaps into synchronism, the following adjustment should be made. Remove the horizontal AFC Discriminator tube (type 6AL5, V108) and adjust the Horizontal Hold Control until the picture slowly moves back and forth with the blanking bar vertical. Now replace the horizontal AFC Discriminator tube. The picture should then fall into horizontal sync immediately on switching from channel to channel.

(h) Horizontal Phasing. If step G does not provide immediate horizontal synchronism, it is possible that the horizontal phasing is incorrect. The bottom cover must be removed from the cabinet for this adjustment. Adjust the (phasing) core of the horizontal AFC and oscillator transformer, front of transformer, until there is ¼ inch of blanking visible on the right hand edge of the picture. This adjustment is located inside the chassis, at the opposite end of the coil from the Horizontal Hold Control.

©John F. Rider

World Radio History

If the adustment (H) resulted in any great adjustment of the phasing core, repeat the procedure covered in (g).

(i) Cabinet Antenna Adjustment. An indoor antenna is built into the television cabinet for use in areas where receiving conditions are favorable. In some models the antenna is rotatable, and has a switch on the back cover. On some stations, reception will be better with the switch in one position, and on others it will be better in the other position, due to the direction of the television stations from the receiver.

The antenna can be rotated by the serviceman and should be set for best all around performance. The switch provides a shift in the main pickup lobe of as much as 30° on some channels, and is the only antenna adjustment to be used by the customer. The serviceman should so orient the antenna so that with one switch position or the other, all signals are received with maximum clarity. The customer should then be instructed, for example, to have the switch pushed to the left for channel 2, 7 and 9, and to the right for 5 and 11, or whatever the case may be.

The suggested procedure for antenna adjustment is as follows:

1. Tune in a station and rotate the antenna through 360° for maximum signal and minimum ghosts.

2. Snap the antenna switch and re-orient the antenna through 360° for best picture. Compare the results of each of these tests and make a mental note of antenna position and switch positions for best performance.

3. Repeat these tests for each of the other channels, making note of the antenna and switch positions for best results on each channel.

4. The final position for the antenna shall be that compromise which receives the majority of stations with best picture, regardless of switch position. The customer then can change the switch for various channels in order to get the best possible picture.

In other models, the cabinet antenna consists of a fixed antenna in the top of the cabinet and a power line antenna. The fixed portion is primarily designed for use on high channels, and the power line antenna is for low channels. However, they may be used separately or together, depending on local conditions. Each should be tried on all available channels, and that antenna or combination giving best results should be selected.

1. Connect the power line antenna lead (the grey wire extending from the rear of the chassis) to first one and then the other terminal on the antenna terminal board, tune for all local stations, and note which gives the better result.

2. Remove the power line antenna lead from the terminal board, connect the cabinet antenna lead to first one and then the other antenna terminal, tune for all stations, and note the results.

3. Connect the power line antenna and the cabinet antenna leads to the terminal board, tune for all stations, and note the results. It may be necessary to reverse the connections for the best compromise of pictures.

PICTURE TUBE REPLACEMENT

Should it become necessary to replace the picture tube, it should be done in the following manner. Remove the chassis from the cabinet. Then remove the tube socket and the ion trap from the rear of the tube. Loosen the lock nut that secures the support strap over the bell of the tube, and loosen the clamping screw. Remove the high voltage anode connector. Remove the tube supports at the bottom front of the tube, and lift out the tube.

Replace with another tube. Replace the tube supports at the bottom front of the tube. Loosen the wing nuts on the yoke mounting bracket and push this assembly as far forward on the picture tube as possible. The end result should have the tube up against the bottom front tube supports, the yoke against the bell of the tube, the grounding springs on the yoke assembly making contact with the grounding coating on the picture tube, and the neck of the tube parallel to the deck of the chassis. The wing nuts should now be tightened, as should the tube clamp. Replace the chassis in the cabinet.

PART V
ALIGNMENT
I-F ALIGNMENT

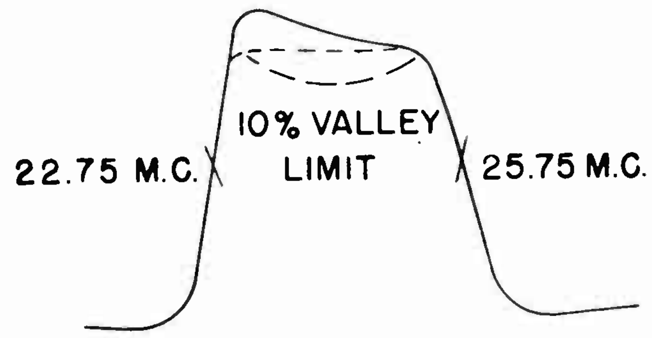
TEST EQUIPMENT

For proper television alignment, it is recommended that the following test equipment be available:

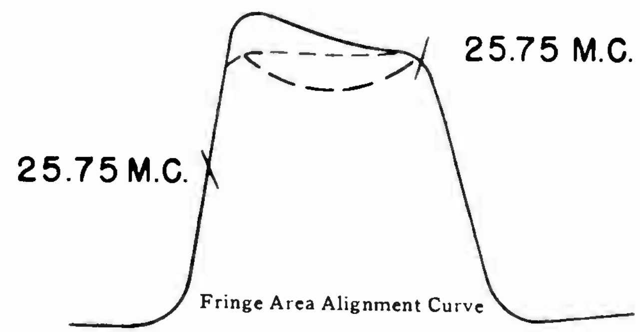
1. R-F Sweep Generator meeting the following requirements:
   a. Frequency range 18 to 30 Mc.
      40 to 90 Mc.
      170 to 225 Mc.
   b. Sweep width adjustable from 1 to 12 Mc.
   c. Output at least .1 volt maximum.
2. Cathode Ray Oscilloscope—wide band vertical deflection.
3. Electronic Voltmeter with high voltage probe.
4. 500K potentiometer with clip leads.
5. Signal generator to cover the following frequency ranges:
   I-F range from 19.75 Mc. to 27.75 Mc.
   R-F range from 45.25 Mc. to 215.75 Mc.

Channel No.	Band Width (Mc.)	Picture Carrier	Sound Carrier	Local Oscillator
2	54-60	55.25	59.75	81
3	60-66	61.25	65.75	87
4	66-72	67.25	71.75	93
5	76-82	77.25	81.75	103
6	82-88	83.25	87.75	109
7	174-180	175.25	179.75	201
8	180-186	181.25	185.75	207
9	186-192	187.25	191.75	213
10	192-198	193.25	197.75	219
11	198-204	199.25	203.75	225
12	204-210	205.25	209.75	231
13	210-216	211.25	215.75	237

10% TILT NOMINAL



Nominal Alignment Curve



Fringe Area Alignment Curve

VIDEO I-F ALIGNMENT

For proper alignment, the bias on the first and second I-F grids must be maintained at —4 volts. This may be accomplished by either of two approved methods.

(a) A battery with a potentiometer across it may be connected from the grid return of either tube to ground, and adjusted to —4 volts.

(b) A potentiometer of 500K ohms may be connected across the AGC amplifier tube V121 from plate (pin 6) to cathode (pin 8), and adjusted to give a —4 volt reading at the I-F grid return.

A convenient method for injection of the signals necessary for alignment is to place a tight-fitting ungrounded tube shield over the converter tube (middle tube on the R-F Unit), and connect the signal generator or sweep generator to it.

1. Connect oscilloscope to the high side of the detector load resistor R-109, 3300 ohms (junction of R-109 and L-102), and to chassis ground. A 10K resistor in series with the scope probe will prevent radiation and feedback.

2. Tune the converter plate transformer for maximum at 22.75 Mc., using a modulated signal.

3. Tune the first I-F transformer T-101 for maximum at 23.4 Mc.

4. Tune the second I-F transformer T-102 for maximum at 25.2 Mc.

5. Tune the third I-F transformer T-103 for maximum at 25.3 Mc.

6. Remove the I-F signal generator and tube shield and connect the R-F Sweep Generator to the antenna terminals.

7. Set the receiver and R-F Sweep Generator to a high channel, because those are more broad and flat topped.

8. The I-F transformers can now be retouched if necessary in order to obtain a standard response curve, with the picture carrier at 50% of maximum response, and the 3 Mc. marker (22.75 Mc.) also at 50%.

The converter coil will correct the low frequency side, as will T-103 correct the high frequency side when necessary. Proper position ing of the markers on the response curve is important since no traps are used. T-101 will control the tilt of the response curve.

9. All twelve channels should be checked for alignment. The nominal curve shall have a tilt of 10% with respect to the base line of sweep. The low limit of tilt is shown in the above curve.

SOUND I-F ALIGNMENT

Test equipment required:

4.5 Mc. Signal Generator, A-M Modulated
4.5 Mc. Sweep Generator
Oscilloscope
VTVM (Voltohmist type)
Crystal Detector (Assembly diagram shown below)
Tapped Resistor and Clip Assembly (two 22,000 ohm 5% resistors in series with a clip lead at each end)

1. Connect the signal generator to pin 1 of V-104 and chassis, and set frequency at 4.5 Mc.
2. Connect XTAL detector to the kinescope end of L-105 and chassis. Connect Scope or VTVM across output of XTAL detector. Adjust bottom slug of T-108 for minimum response.
3. Clip tapped resistor from pin 7 of V-114 to chassis. Connect VTVM minus lead to the resistor tap, and the probe to junction of R-149 and R-150. Align slugs top of T-108 and bottom of T-109 for maximum response.
4. Adjust top slug of T-109 for approximately —½ volt, then readjust bottom slug of T-109 for maximum reading.
5. Adjust top slug of T-109 for zero.
6. Remove signal generator and apply sweep generator to pin 1 of V-104 and ground. Remove tapped resistor and connect scope to junction of R-149 and R-150 and chassis

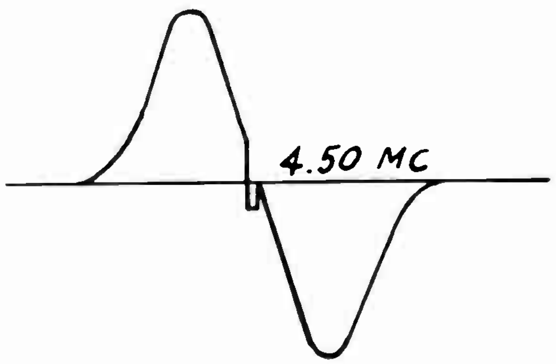
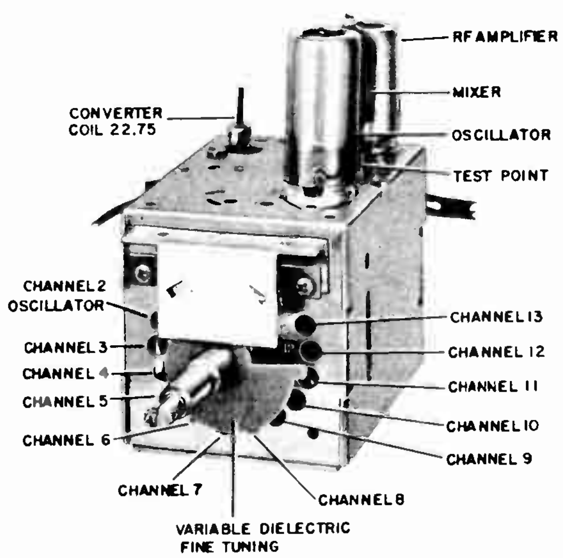
ground. Check the curve for symmetry as shown on the following curve:



7. Touch up only if necessary top slug of T-109 to obtain proper curve.

R-F UNIT ALIGNMENT, TYPE "S" TUNER

FRONT VIEW RF UNIT



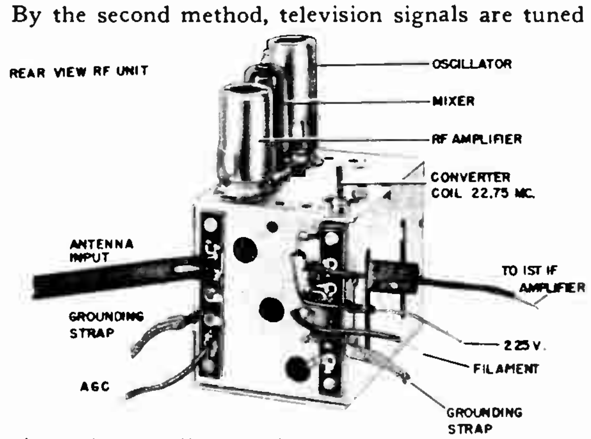
OSCILLATOR ALIGNMENT

The criteria of proper oscillator alignment is that the combination of the assigned video carrier and the local oscillator produce a signal that falls at the 25.75 Mc. marker point on the overall I-F curve.

Adjustment should be made only when the fine tuning control tunes in the extreme clockwise or counterclockwise position from its center, or if it will not tune at all within its tuning range. Such a condition may be brought about by changes in the inductance of the oscillator coils or changes in the circuit capacitance which might occur when the oscillator tube is replaced.

The oscillator coils are tunable by means of slug-adjustments, accessible from the front of the chassis. Alignment of one does not appreciably effect the tuning of the other coils.

Alignment may be accomplished by two approved methods. By the first, a video carrier frequency is coupled to the antenna, which produces an I-F signal, and another I-F signal is coupled to the first I-F tube. If the oscillator is properly aligned, the two will produce a zero beat visible at the video detector. By the second method, television signals are tuned



in, and the oscillator coil for each channel is adjusted so tuning occurs at mid-range of the tuning control. The detailed procedures follow:

FIRST METHOD

Remove the 1st I-F tube.

(1) Connect an oscilloscope across the video detector load resistor.

(2) Loosely couple an unmodulated signal to the first I-F, and set the frequency at 25.75 Mc.

(3) Connect another signal generator to the antenna leads, and tune it to the video carrier frequency of the channel to be aligned. Rotate the channel selector to the correct position. Rotate the fine tuning control until a zero beat is noticed. If the zero beat does not occur at the mid-range of the fine tuning control, adjust the oscillator tuning slug for that channel.

SECOND METHOD

(1) Connect the television antenna to the antenna terminals of the receiver.

(2) Tune in the signal on all available channels. If the best picture does not occur at mid-range of the fine tuning control, adjust the oscillator slug for that channel.

OSCILLATOR ALIGNMENT

The oscillator coils in this R-F unit are all tunable by slug adjustments. The order of alignment is from channel 6-2, 13-7, 6-2 and 13-7. The repeated adjustment is necessary to correct any detuning caused by the capacity change due to slug adjustments of adjacent coils.

1. Set the sweep generator and channel switch to No. 6 channel. Adjust as outlined in instructions for untuned input tuner.
2. Proceed through channels 5-2 in the same manner.
3. Align channels 13-7.
4. Proceed as above through channels 6-2 and 13-7, and retouch if necessary.

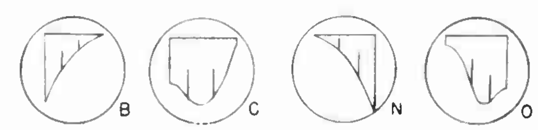
ANTENNA, R-F AMPLIFIER AND CONVERTER ALIGNMENT

There are three variables which will give the desired pattern. If the antenna coil (wafer nearest the rear of the tuner) is first expanded, then the grid coil and finally the plate coil is expanded, the proper pattern will appear. These coils must be very carefully adjusted with only slight movement, particularly the plate coil. The final pattern is obtained by working back and forth between these three coils.

1. Remove the AGC rectifier-amplifier tube and connect bias control.
2. Connect sweep generator to antenna terminals, using a balanced resistor network if generator has unbalanced output cable. Connect scope to terminal provided on the tuner.
3. Set the sweep generator and channel switch to No. 13 channel. If the coils are very badly aligned, the pattern on the scope will probably be either of these:

The meaning of "A" is that some coils must be opened up. The meaning of "M" is that some coils should be closed or squeezed together.

4. When they are far off from their proper tuning, all three coil circuits have their main affect on pattern height, so tune for increasing height of the pattern.
5. As a coil is changed, one side of the picture will get higher and then a hump will start to move across the screen.

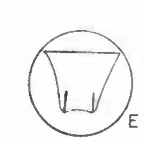


If the first pattern was like "A", the next will be "B" and then "C" as the coil is opened. If the first pattern was like "M", the next will be "N" and then "O" as the coil is closed. When the hump, due to the tuning of that coil, is between the markers, it indicates that this coil is very close to where it should be. So leave it and immediately go to another coil.

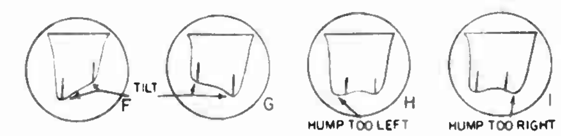
6. The side of the picture which is higher indicates what to do to the next coil. In "C", the left hand side is higher, which indicates that said coil should be opened. In "O", the right side is higher, indicating that said coil should be closed. A picture similar to "D" or "P" should be then obtained.

The fact that there are now two humps in the pattern shows that both converter wafer and R-F wafer are tuned nearly right. If picture height is near what it should be with the scope settings unchanged, the antenna wafer is near correct. It should be adjusted a bit to see if pattern height improves.

7. When all three coils are nearly tuned, the antenna wafer controls the tilt, the RF wafer controls the left hand hump, and the converter wafer controls the right hand hump. Adjust them for a perfect flat pattern on channel 13 as below.

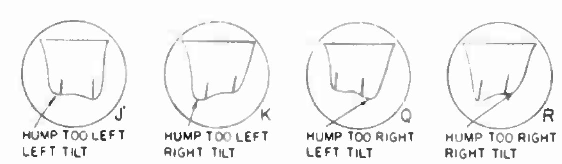


8. Proceeding through channels 12, 11, 10, etc., the pattern will change slightly as shown below. In general, three things occur: (1) tilt, (2) hump too far left, or (3) hump too far right.



For right tilt as in "F", press down the loops on the antenna wafer. For left tilt as in "G", pull up the loops on the antenna wafer. For hump to left as in "H", push down on the loops on the R-F wafer. For hump to right as in "I", use iron and screwdriver and pull out channel 12 or channel 7 loops on converter wafer.

9. Combinations of detuning also occur.



In these cases, two wafers must be adjusted to bring in the best picture. For a case like "J", R-F wafer must be adjusted to bring in the hump and antenna wafer to correct the tilt. In

©John F. Rider

a case like "Q", the converter wafer should be adjusted to bring in the hump and the antenna wafer to correct the tilt. In combination cases like these, where the antenna wafer and one of the other two must be adjusted, always adjust the antenna wafer for tilt correction after all adjustments have been made on the other two wafers.

10. It is best to prevent the left hump from going so far to the left that it cannot be brought back, or the tilt to become so bad that it cannot be corrected. If the best possible pattern is obtained on each successive channel, then proper adjustment of the next one will always be within its range.

11. When both coils are near to proper tuning, a slight adjustment of either R-F or converter wafer will give a flat pattern, with very little tilt, and the humps right on the markers; but only the correct coil will give this correct pattern shape plus best pattern height.

When the pattern is like "S" on a low band, opening a coil on either wafer will move the pattern to the right, but try both slightly and make the final adjustment by opening that coil which causes the pattern to become higher as it moves toward the right.

The pattern on all channels is approximately as shown

Note *1 All voltages vary with AGC.
Note *2 All voltages vary with selector switch setting.
Note *3 Plate voltage varies with different tubes.
Note *4 Bias varies with picture control setting.
Note *5 Cathode varies with different video amplifier tubes.
Note *6 Cathode varies with horizontal oscillator tuning.
Note *7 Do not measure Horiz. Output plate or Damper plate with VTVM. Pulses cause grid rectification in meter so reading is meaningless. Pulses may damage meter.
Note *8 Used only in CT 248 and 249.
Note *9 Used only in CT 248.
Note *10 AC plate voltage measured from —100 volt tap.

PARTS LIST

Ref. No.	Part No.	DESCRIPTION
T 101	360461-1	Transformer, 1st video I-F
T 102	360461-1	Transformer, 2nd video I-F
T 103	360461-1	Transformer, 3rd video I-F
T 104	320040-1	Transformer, vertical output
T 105	360435-1	Transformer, horizontal oscillator
T 106	320048-1	Transformer, horizontal scanning
T 107	300057-1	Transformer, power
T 108	360440-1	Transformer, 4.5 mc. trap and take off
T 109	360434-1	Transformer, ratio det.
L 101	360332-9	Coil, peaking—white
L 102	360332-17	Coil, peaking—violet
L 103	360443-1	Coil, peaking—brown
L 104	360443-2	Coil, peaking—red
L 105	360443-3	Coil, peaking—orange
L 106	320041-1	Coil, filter reactor
L 107	360332-8	Coil, R-F choke
L 108	360443-4	Coil, peaking—yellow
L 109	360372-4	Coil, R-F choke insulated 6.8 uh
L 110	360455-1	Coil, R-F choke insulated .4 uh
L 111	360334-1	Coil, linearity
L 112	360451-1	Coil, peaking

ADDENDA

The vertical circuit was changed twice in order to improve linearity. The following paragraphs will indicate the original component values used, and the first and second changes in the order in which they were made. The chassis schematic includes these improvements:

1. Add R-120, 8200 ohms, 10%, ½ watt resistor (230104-73) in series with discharge condenser C-117. (See following paragraph, item 1.)
2. Add R-211, 27 K ohms, 10%, ½ watt resistor (230104-79) in series with C-178.
3. Replace R-129 (1 megohm) with one 820 K ohm, 10%, ½ watt resistor (230104-97).
4. Replace R-197 (1500 ohm) with one 2200 ohm, 10%, ½ watt resistor (230104-66).

1. Replace R-210 (8200 ohm) with one 10 K, 10%, ½ watt resistor (230104-74).
2. Replace R-120 (2.2 megohm) with one 3.9 megohm, 10%, ½ watt resistor (230104-105).
3. Add R-213, 100 K ohm, 10%, ½ watt resistor (230104-86).
4. Add C-183, .033 mfd., 20%, 600 v. capacitor (250201-10).
5. Replace C-118 (.047 mfd.) with one .1 mfd., 20%, 600 v. capacitor (250201-13).

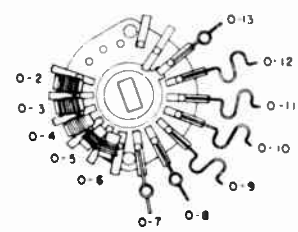
MAGNAVOX MODEL "M" TUNER

Most CT 247, 248 and 249 chassis use the Model "S" tuner No. 700333 as described herein. However some current production chassis use the Model "M" tuner No. 700340. This tuner is capable of increased sensitivity and selectivity, and has low noise factors. It uses a 6BC5 RF Amplifier and a 6J6 Oscillator and Converter. If all channels tune toward the same side of the fine tuning control, they may be brought in by adjusting the trimmer which extends through the front of the tuner. Individual channel oscillator alignment is accomplished by knifing the coils. The antenna, RF Amplifier and Converter coils are over-coupled for the necessary passband, and adjustment is different from that outlined for the type "S" tuner, and will be included in a subsequent service manual.

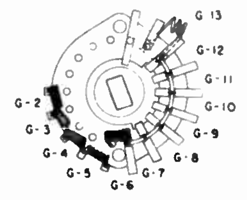
CHASSIS CT 255

This maintenance information covers Magnavox television receiver chassis model CT 255, and is supplementary to Manual No. 7206 covering the CT 247, 248 & 249 chassis. All data of 7206 is applicable to the CT 255 chassis excepting reference to the tuner. Tuner No. 700337 is used in CT 255, and is described below.

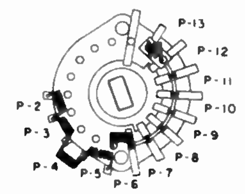
TUNER NO. 700337 ALIGNMENT INSTRUCTIONS



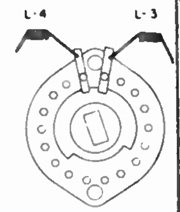
SECTION 2-FRONT



SECTION 3-FRONT



SECTION 4-FRONT



SECTION 5-REAR

OSCILLATOR ALIGNMENT

1. TOUCH-UP

a. If some low channels do not tune at all, or not near enough the center of the fine tuning range, adjust the oscillator tuning slug for those channels.

b. Check all other channels to determine if their tuning has been affected enough to warrant further touch-up.

c. If the tuning on some channels is unsatisfactory, proceed with complete oscillator alignment as follows:

2. COMPLETE OSCILLATOR ALIGNMENT

a. Connect an unmodulated signal generator to the antenna terminals and tune it to channel 13 video carrier frequency.

b. Connect a sweep generator to the antenna terminals and set it on channel 13.

c. Loosely couple an unmodulated signal generator to the 1st I-F grid and tune it to 25.75 mc.

d. Connect an oscilloscope across the video detector load resistor.

e. Turn the receiver on and set the fine tuning control at mid range. After the receiver has warmed up, and if there are two markers on the scope, adjust the oscillator coil until the markers merge.

Coils having a 1 turn loop (channels 13, 8 and 7) may be tuned higher by spreading the loop apart or making it smaller. They may be tuned lower by squeezing the loop closer, making the loop as large as possible and making the adjacent sides of the loop as parallel as possible.

Coils consisting of a single bent wire (channels 12, 11, 10 and 9) may be adjusted by adjusting them as shown below.

Care should be taken to prevent any coil from touching the switch stator contact in any place except where it is soldered to that contact.

World Radio History

R-F AMPLIFIER & CONVERTER ALIGNMENT

a. Set the channel selector on channel 13. Connect the sweep generator to the antenna terminals using a balanced resistor network for those generators having an unbalanced output. Set the sweep generator to sweep channel 13. Connect an oscilloscope across the video detector load resistor.

b. Set the fine tuning control to mid-range. Loosely couple a signal generator to the antenna terminals, and tune it to the channel 13 picture carrier frequency, and tune the receiver to that frequency. Adjust the sweep input in such a manner as to avoid overload in the R-F amplifier. Adjust the R-F amplifier plate coil (P13) and the converter grid coil (G13) for maximum response. Set the marker generator to the channel 13 sound carrier frequency and adjust these coils for proper bandpass with optimum gain.

c. Set the channel selector and sweep generator successively to channels 12 through 7. If the R-F amplifier plate coil and the converter grid coil are correctly tuned, channels 12 to 7 will give symmetrical bandpass patterns and the height of the pattern will not vary by more than 3 to 1 between channels 13 and 7.

d. Set the channel selector and the sweep generator to channel 6, and set the marker generator to the channel 6 picture carrier frequency.

e. Adjust the R-F amplifier plate coil (P6) and the converter grid coil (G6) for maximum response. Set the marker generator to the channel 6 sound carrier frequency and adjust these coils for proper bandpass with optimum gain.

f. Align channels 5, 4, 3 and 2 in a similar fashion. The difference between peaks on any channel should be no more than 30% of the total height of the response curve.

INDEX

SECTION I

FEATURES & SPECIFICATIONS

Magnavox Series 103 chassis are all direct view units with self contained power supplies. They provide a wide choice of picture tubes, and a selection of types for use in models which feature television only, or which include a radio chassis and record changer. Special features are:

* RF tuner having tuned input; gives improved signal to noise ratio, sensitivity.
* Four stages of video I-F amplification, stagger-tuned for reduced phase distortion, for increased stability and for ease of alignment.
* Four stages of high gain sound I-F amplification, including the 1st video IF which amplifies both the video IF and sound IF.
* Direct coupled video amplifiers, eliminating the necessity for DC re-insertion.
* Separate audio amplifier chassis, which may be omitted when TV chassis is used in combination with a radio, or used in models which feature TV only. In straight TV models, the audio amplifier may be operated alone, for use with a record player, etc.
* Magnalok horizontal AFC system. Frequency control is accomplished by comparing the sine wave oscillator frequency with the sync pulses. The result is applied to a reactance tube, which in turn controls the oscillator frequency.
* Amplified automatic gain control. Affords maximum uniformity of reproduction when switching between stations and reduces fading. Less necessity for adjusting picture and brightness controls.
* De-energizing circuit which eliminates a bright spot on the picture tube when the power is turned off.
* Facilities for connection of an external phonograph on models which feature TV only.

CHASSIS DIFFERENCES

All Series 103 chassis are identical, with the exception of the picture tube size, shape and mounting; and audio section. A round picture tube is identified in the following chart by a circle, and a rectangular one by a square. The audio amplifier section of the associated radio chassis is used in models which do not use the #127 amplifier.

SECTION III

OPERATION AND INSTALLATION

All Series 103 television instruments are shipped completely assembled, with the picture tube installed. All that is necessary is the proper location, connection to a suitable antenna, adjustment of the various controls, and removel of the back cover for adjustment of the ion trap and focus magnet, and orientation of the cabinet antenna if an adjustable one is used. A check should be made that all tubes are properly seated.

The safety glass and mask constitute an assembly, which is easily removed for access to the picture tube by removal of the two screws securing the glass support bracket.

The chassis is held in the cabinet by six mounting screws through the bottom.

1. Plug the receiver power cord into the power outlet.
2. Set the TV-Phono switch on the rear panel of the chassis to TV.
3. Turn on the radio chassis and set the selector switch to TV in combination models. For TV, the AC switch on the PICTURE control. Turn it to the right.
4. Set the STATION SELECTOR to the desired channel number.
5. Adjust the FINE TUNING control for the best volume and quality sound. Select the desired sound volume by turning the VOLUME control.
6. Advance the BRIGHTNESS control until the picture tube screen is only slightly illuminated. If no light appears, it may be limited by incorrect adjustment of the ion trap magnet. Proper procedure for correct adjustment follows:

   Advance the brightness control and adjust the ion trap until light appears on the screen. Then reduce the brilliance to a point near extinction by turning the brightness control counter-clockwise. Then readjust the ion trap until maximum brilliance is obtained. It may be necessary to turn the brightness control still further counter-clockwise.

7. Adjust the PICTURE control for the proper degree of contrast.
8. If the picture "rolls" up or down, turn the VERTICAL control knob to the left so the "roll" is downward, then turn it to the right until the picture stops moving. Switching from channel to channel will not cause the picture to lose sync if the control is properly set.
9. If the picture does not snap into horizontal sync immediately on being switched to a picture channel, but instead it slowly pulls in as indicated by diagonal blanking bars which slowly reduce in frequency until the picture snaps into synchronism, the following adjustments should be made. Remove the Horizontal AFC Discriminator tube (type 6AL5, V116) and adjust the HORIZONTAL SPEED coil until the picture slowly moves back and forth with the blanking bar vertical. Now replace the AFC discriminator tube. The picture should then fall into horizontal sync immediately on switching from channel to channel.
10. If horizontal linearity is unsatisfactory, adjust the linearity coil so that 1/2 to 5/8 inch of the adjusting screw is above the tinerman clip. Adjust the drive control for maximum width and high voltage. Both occur simultaneously. Maximum high voltage can be detected by a minimum height. Adjust the linearity control for best linearity. A slight readjustment of the drive control may be necessary, but always use the maximum possible drive comparable with good linearity.
11. HEIGHT and VERTICAL LINEARITY adjustment. Adjust the height control until the picture just fills the mask vertically. Adjust the vertical linearity control until the test pattern is symmetrical from top to bottom. It is difficult to adjust linearity with a picture on the screen. Adjustment of either control will require readjustment of the other.
12. The FOCUS MAGNET has an adjustable shunt ring that governs the amount of magnetic flux which controls the size of the electron stream. Set the FOCUS CONTROL at about mid-range, and adjust the shunt ring so proper focus occurs at that point. Any subsequent focusing can then be accomplished with the focus control. It will probably be necessary to readjust the ion trap after the shunt ring has been moved.
13. To center the picture: Loosen the screw on each side of the focus coil and move the coil about the neck of the tube until proper centering is accomplished. If this adjustment does not provide proper centering, refer to PICTURE TUBE REPLACEMENT.

USING THE AUDIO AMPLIFIER FOR ANOTHER PURPOSE

1. Set the TV-PHONO switch to PHONO.
2. Plug the reproducer to be used into the PHONO JACK.
3. Turn the PICTURE, OFF-ON control to the right until a snap is heard. This applies power to the audio amplifier, but not to the TV chassis.
4. Put the reproducer into operation.
5. Adjust the VOLUME control for the desired sound volume.

PICTURE TUBE REPLACEMENT, HORIZONTAL CHASSIS

If it becomes necessary to replace the picture tube, it should be done in the following manner.

1. Remove the tube socket from the rear of the picture tube, then remove the ion trap.
2. Remove the safety glass assembly by taking out the screws which hold the glass rail in position.
3. Loosen the nuts that secure the tube strap over the rim of the tube, and remove the strap.

©John F. Rider

World Radio History

4. Slip the high voltage anode connector from beneath the insulating ring and lift out the tube.
5. Transfer the insulating ring to the replacement tube.
6. Install the HV connector, replace the support strap, and fasten it down securely with the nuts removed in step 3.
7. Loosen the thumbscrew on top of the deflection yoke, so the yoke moves freely. Loosen the two hex-head screws on each side of the deflection yoke mounting bracket, and push the top section forward until the rubber bumper fits against the bell of the tube, all the way around. Then tighten the screws. If the screw heads on the left side are difficult to reach, use a right-angle spintite, an end wrench, or remove the HV compartment cover. Then press the deflection yoke forward as far as possible, and tighten the thumbscrew.
8. Tighten the three focus coil plate adjustment screws until the plate is near the deflection yoke, perpendicular to the neck of the tube.
9. Loosen the two screws which secure the focus coil, and move it so the neck of the tube is properly centered in it. Then tighten the screws and adjust the ion trap.
10. If centering is not satisfactory, move the focus coil around the neck of the tube until the picture is properly centered in the mask. It may be necessary to readjust the ion trap each time the focus coil is moved.

NOTICE: in the event that proper centering cannot be accomplished, remove the ion trap, turn the front edge to the rear, install and readjust it. Then proceed with the centering adjustment. If proper centering still cannot be accomplished, remove the focus coil and reverse the right and left sides on the chassis.

PICTURE TUBE REPLACEMENT, VERTICAL CHASSIS

In models wherein the chassis is mounted in a vertical position, the following procedure is recommended.

1. Remove the safety glass and mask assembly by taking out the screws which hold the glass rail in place.
2. Lay the cabinet on its side on a clean piece of felt or other soft material, with the chassis side down.
3. Remove the two metal wedges that brace the rim of the picture tube top and side. Two wood screws hold each in place.
4. Two 1/4-20 screws secure each side of the chassis to the mounting rails of the cabinet. Remove these screws, all connections to the amplifier, and pull the chassis out of the cabinet. Then proceed through steps 1 to 10 in the preceeding section. Then replace the chassis.

CABINET ANTENNA ADJUSTMENT

Two types of cabinet antennae may be used. One is fixed and the other may be adjusted.

The first consists of a power line antenna and one mounted in the cabinet top. They may be used separately or together, depending on local conditions. Each should be tried on all available channels, and that antenna or combination thereof giving the best results would be selected.

1. Connect the power line antenna lead (grey wire extending from the rear of the chassis) to first one and then the other terminal of the antenna terminal board, tune for all local television stations and note which gives the better results.
2. Remove the power line antenna lead from the terminal board, connect the cabinet antenna leads first one way and then reversed, tune for all available stations, and note the results.
3. Leave the cabinet antenna leads connected, then try the power line antenna to first one side of the terminal board and then the other. Reverse the cabinet antenna leads and repeat the two power line connections. Tune for all available stations in each condition (4) and note the results.
4. Select the one connection as described in 1, 2 or 3 that gives the best overall performance for all available stations.
5. Disconnect the power line antenna and cabinet antenna when an outside antenna is used.

The latter antenna can be rotated and should be set for best all around performance. The switch provides a shift in the main pickup lobe of as much as 30° on some channels and is the only antenna adjustment to be used by the customer.

1. Tune in a station and rotate the antenna through 360° for maximum signal and minimum ghosts.
2. Snap the antenna switch and re-orient the antenna through 360° for best picture. Compare the results of each of these tests and make a mental note of antenna position and switch positions for best performance.
3. Repeat these tests for each of the other channels, making note of the antenna and switch positions for best results on each channel.
4. The final position for the antenna shall be that compromise which receives the majority of stations with best picture, regardless of switch position.

SECTION IV

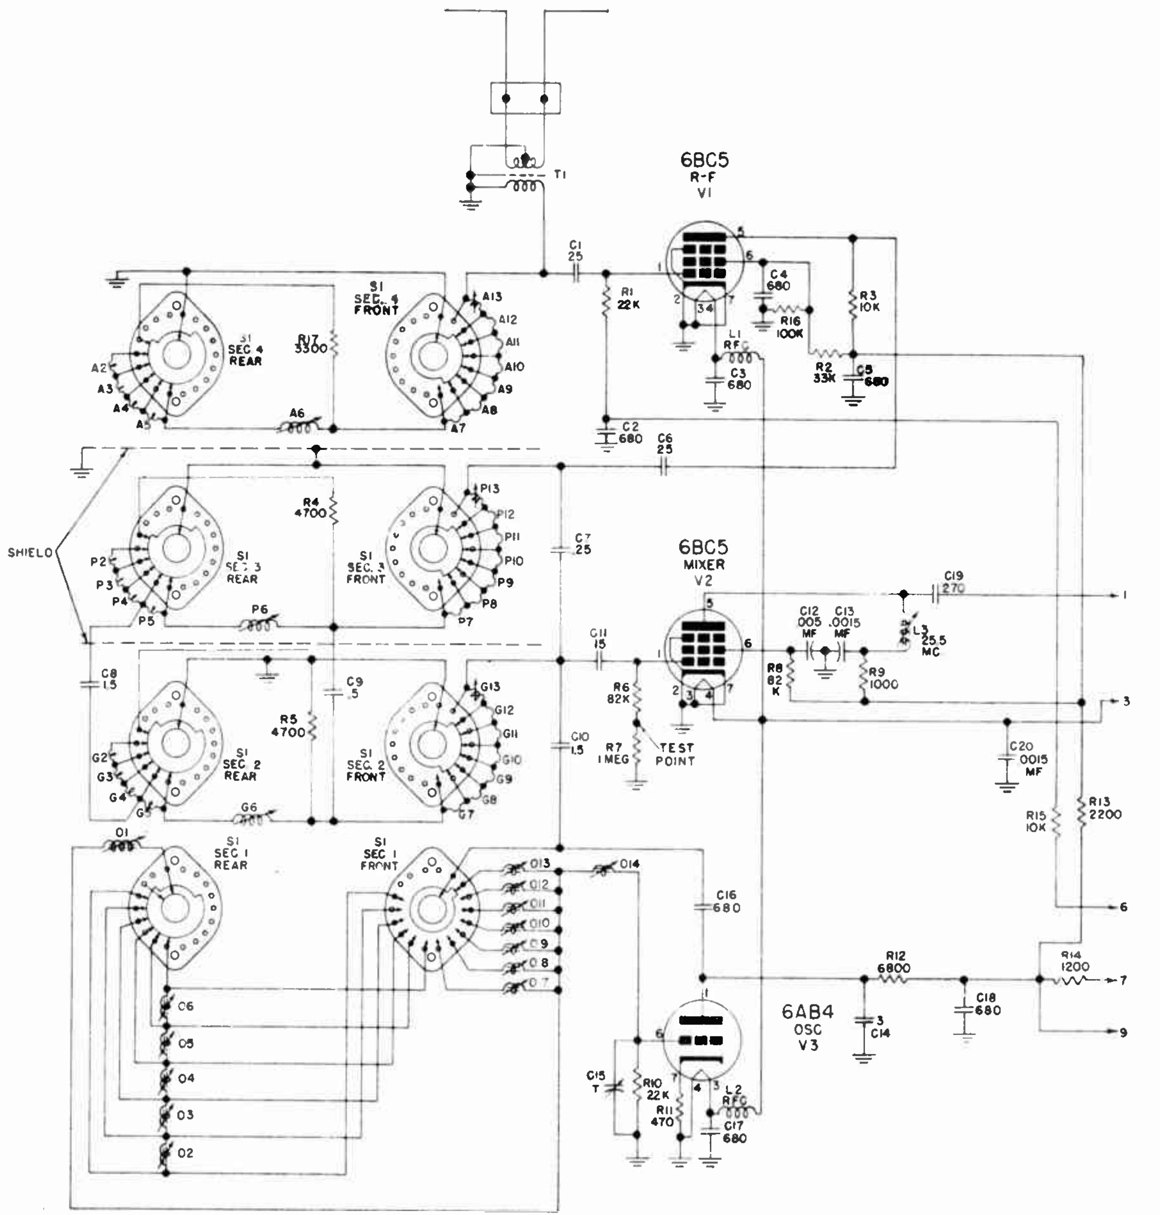
CIRCUIT DESCRIPTION

The Magnavox 700351 tuner consists basically of three tubes, four sets of coils, and a four section wafer switch having twelve active and six inactive positions.

The antenna input transformer T1 is provided to match a balanced 300 ohm antenna to the tuner. The ANTENNA COILS A-13 to A-2 are in the grid circuit of the RF Amplifier stage, and are grouped around the rear wafer of the unit. The RF Amplifier PLATE coils P-13 to P-2 are mounted on the second wafer from the rear. The converter GRID coils G-13 to G-2 are on the third wafer from the rear. The OSCILLATOR coils O-13 to O-2 are on the front wafer. In each, coil 13 is tuned for channel 13, coils 13 plus 12 are for channel 12, coils 13 plus 12 and 11 are for channel 11, etc. The following diagram outlines its design and operation.

©John F. Rider

World Radio History



Antenna coils A-13 to A-2 are tuned to their respective channels, a band pass sufficiently wide to accept all the information therein, and with sides of the pattern sufficiently steep so as to reduce signals on adjacent channels. The same applies to P-13 to P-2. Under weak signal conditions, the RF amplifier stage is capable of a gain of 15 times its input. In the presence of a strong signal, the automatic gain control bias on the grid limits its output to a fraction of its input.

The oscillator is tuned to a frequency 25.75 mc. higher than the video carrier, and when hetrodyned with the carriers in the converter, produces a modulated video IF signal of 25.75 mc. and a modulated sound IF signal of 21.25 mc. These are applied to the first IF amplifier through C-19. L-3 in the converter plate circuit is the converter plate IF transformer.

The fine tuning control, a variable dielectric capacitor, shifts the oscillator frequency about 0.5 mc. on channel 2, and relatively more on the other channels up to 13, where it is about 2.0 mc. Individual oscillator adjustments for each channel, accessible from the front of the chassis by removal of the channel scale and fine tuning knob, are provided to compensate for any long time drift or for different tube capacities when the oscillator tube is replaced, although it is best to select a tube that provided tuning in the correct position of the fine tuning knob.

The oscillator signal is applied to the converter grid through C10. The amplified RF signal is applied to the converter grid coils through C7, C8 and C9 depending on the position of the channel selector switch. These capacitors are used to provide adequate bandpass coupling. The converter stage is capable of a gain of about 5 times its input.

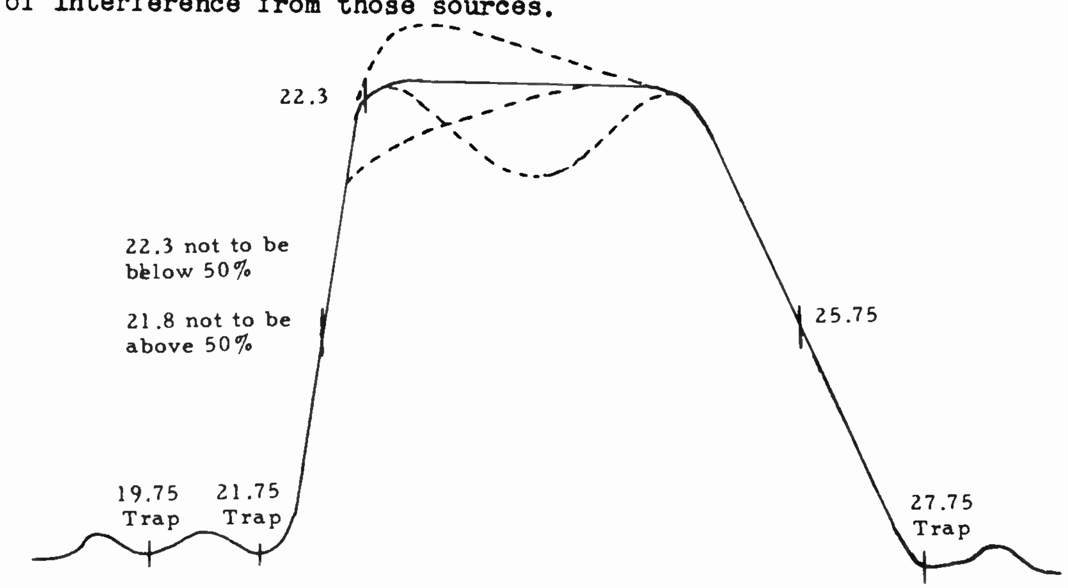
A test point is provided on the top of the tuner near the middle tube for connecting the oscilloscope used in alignment of the antenna, RF and converter coils. A complete schematic of the 700351 RF Unit, alignment procedure and service instructions are included in a later chapter.

The tuner is capable of a gain of about 75 times from the antenna to the first IF amplifier grid.

The video IF amplifier strip is of the latest design, and incorporates adequate gain and high fidelity. It consists of four 6CB6 tubes V106, V107, V108 and V109, coupled by IF transformers T104, T106, T108 and T109. The primary and secondary windings of the transformers are bifilar wound, and coupling between stages is by the capacitive and inductive coupling between windings. Each transformer is tuned by an adjustable iron core.

The IF passband is 3.75 mc. wide, with a response of 50% at 22.0 mc.

The converter coil and four transformers are stagger tuned. A 19.75 mc. adjacent channel picture trap is included in the first stage, a 27.25 mc. adjacent channel sound trap is included in the second stage and a 21.25 mc. sound trap is included in the third stage, to insure a minimum of interference from those sources.



©John F. Rider

World Radio History

The first stage accomodates both the sound and video IF signals and the sound portion is then removed by T105.

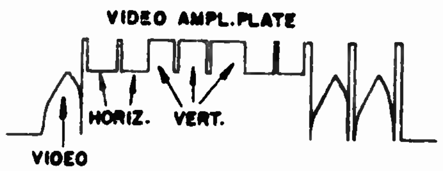
AGC bias is applied to V106, V107 and V108 and controls their gain inversely proportional to the applied signal strength. V109 operates at fixed bias. The output of the IF system is essentially constant despite variations of the input signal level.

Complete alignment instructions are included in a later chapter.

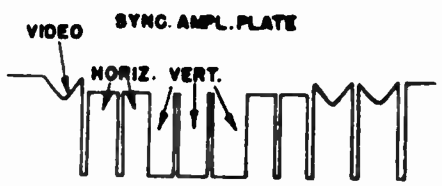
The 1N60 crystal detector conducts on negative cycles, and current flows through its load resistor. This develops a voltage which varies with modulation of the IF carrier. The high frequency IF component is by-passed to ground through a 10 mmf capacitor and C-137, .0015 mmf.

V-110A, the first video amplifier is conventional and has a gain of about 6.5 times. It is direct coupled to the next stage, and presents a posi-

The vertical and horizontal sync pulses appear on the video carrier, through the IF amplifiers, detector and video amplifiers, between scanning lines of video modulation. Their appearance at the picture tube grid is always during retrace time, and cuts the beam to blanking level at those intervals.



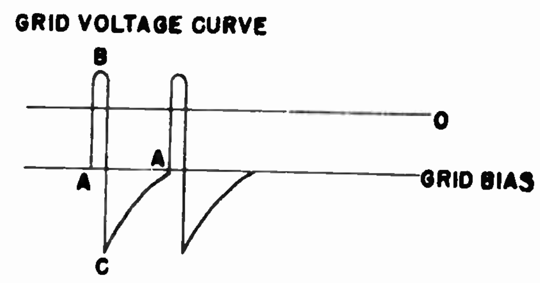
A portion of the positive going signal is removed from the plate of the first video amplifier, and applied to the grid of the first sync amplifier V-112A. This tube is biased so the video portion of the signal falls below the knee of its characteristic curve, and receives but little amplification, and the sync pulses appear on the linear portion of the curve, and are greatly accentuated.



The negative signal that is fed to the second sync amplifier grid V-112B is again amplified. This tube is also biased so that any noise on the crest of the pulses is removed, and any noise between the sync pulses is reduced to their amplitude.

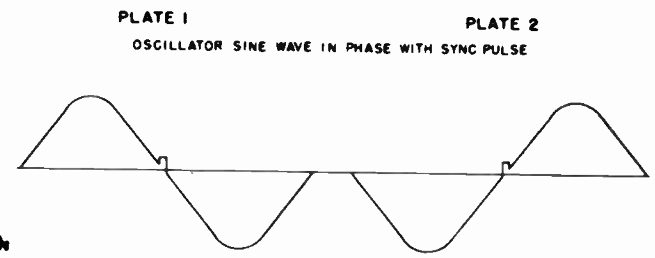
The signal is in a positive direction at the sync clipper grid V-113A, and in that stage the lower half of the signal is removed, leaving only clean, square sync pulses.

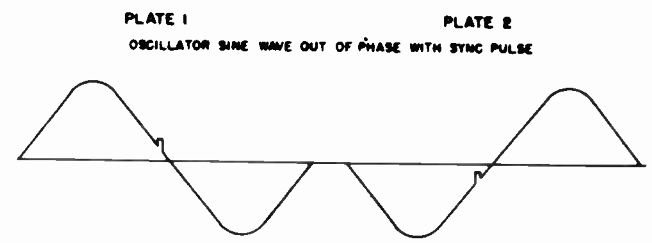
These are applied to the vertical oscillator stage V-113B, through RC-101, a filter network which passes only the low frequency vertical pulses. The vertical blocking oscillator and discharge stage, V-113B, is 1/2 of a 6SN7. During non-conduction, the grid voltage is negative with respect to the cathode. The plate draws current during discharge at a rate determined by the setting of the height control R-239. Due to the coupling of the oscillator transformer, there is a corresponding voltage rise on the grid, A to B on the following curve. When the grid becomes more positive than the cathode, it draws grid current. This quickly charges C-205, which drives the grid negative and cuts off the plate current, see B to C. Then the charge on C-205 is slowly discharged through the verticalspeed control, R-218 and R-216, which allows the grid voltage to slowly rise to its normal bias, see C to A. Then plate current begins to flow again and the cycle is repeated at a frequency depending on the rate of C-205 discharge, which is controlled by the setting of R-218.



The frequency is adjusted at slightly slower than 60 cps. During the charging period of C-205 (C to A), the vertical sync pulse is applied just before it would "trip" in its free-running cycle. The magnitude of the sync pulse is sufficient to drove the tube into conduction, and therefore controls the frequency of the blocking oscillation.

The sync clipper output signal is also used to synchronize horizontal scanning. When free running, the Horizontal Oscillator V-117A operates at a frequency approximately correct for horizontal scanning. The resultand sine wave output is applied through T-112 to the plates of the Horizontal Discriminator V-116 180° out of phase. The horizontal sync pulses are applied to the center tap of the plate winding of the transformer, and appears at the plates of the Discriminator in phase. When the oscillator operates in synchronism with the transmitter, the pulses appear on the sine waves as one plate goes through zero voltage in a negative direction and as the other plate goes through zero voltage in a positive direction.





Because the pulses appear when both plates are at zero voltage, there is no change in the operation of the circuit. However if the oscillator changes in frequency, the sync pulses at the detector plates do not appear when the oscillator voltage is zero, but at a point on each sine wave either before or after it goes through zero.

As the sine wave on one plate is of opposite polarity from the other, and as the sync pulse on one plate is of the same polarity as the other, the sync pulse will add to the sine wave that is positive, and subtract from the one that is negative. This condition will produce a voltage unbalance in the cathode circuit of the Discriminator.

This voltage difference, applied to the grid of V-115, the 6AU6 Horizontal Control stage, controls the variable reactance in shunt with the horizontal oscillator tank circuit, and causes the oscillator to change frequency in such a direction so as to come back into exact synchronism with the sync pulses.

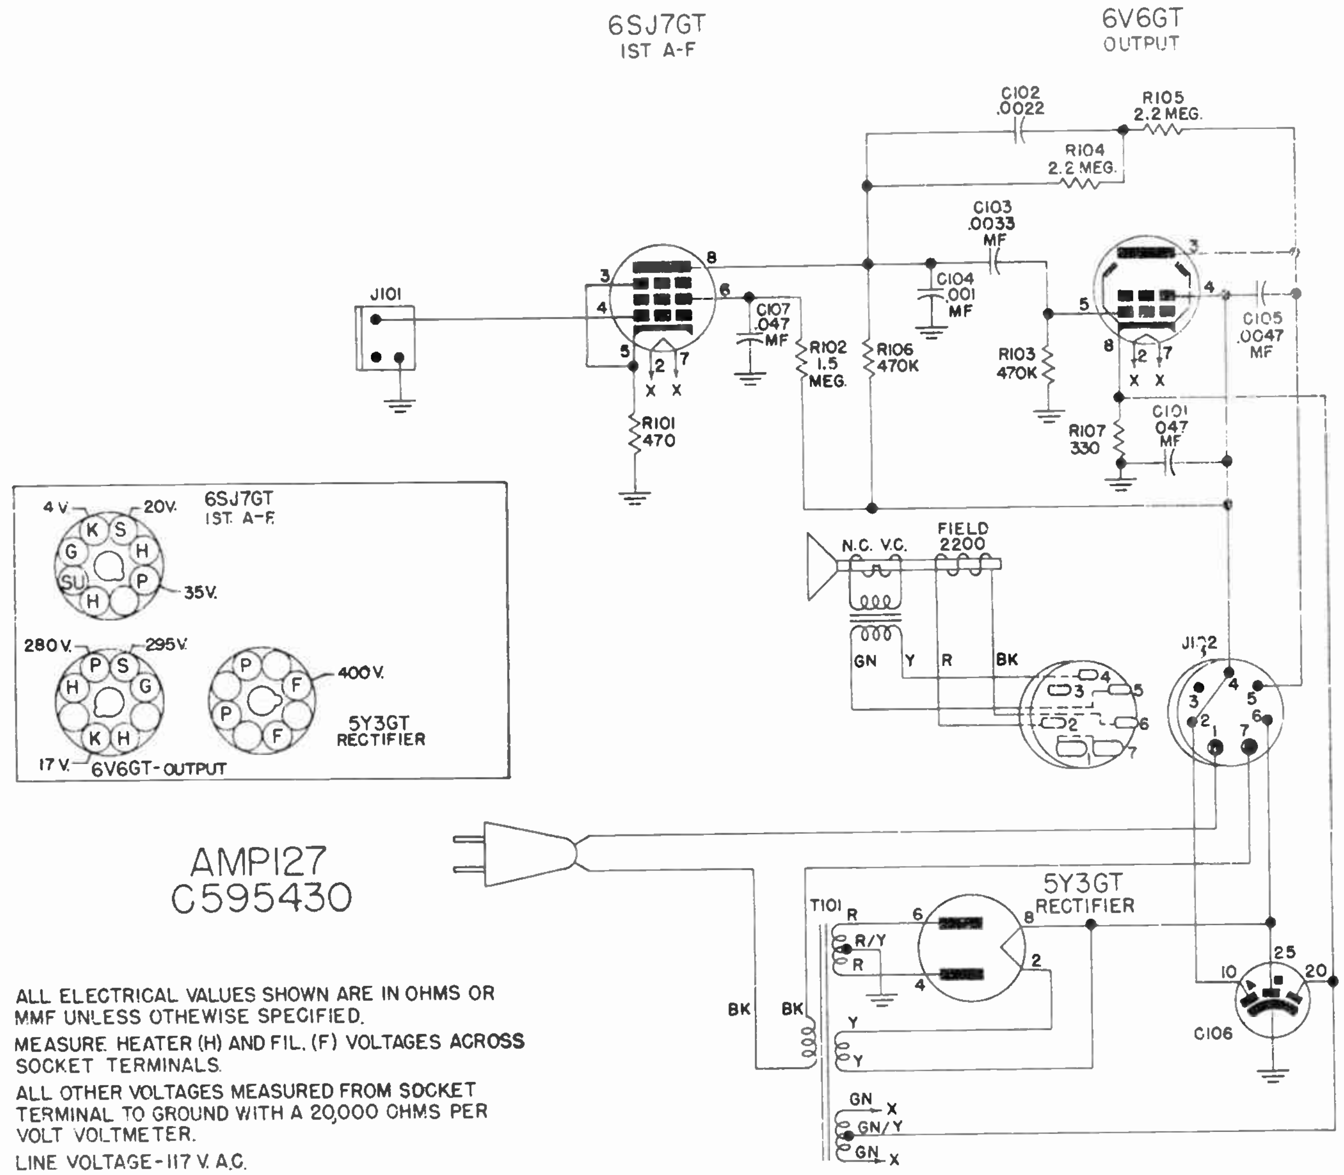
World Radio History



SECTION VI
ALIGNMENT

In aligning the IF amplifiers, it must be remembered that feedback between output and input circuits lead to regeneration and, if feedback be appreciable, to oscillation. It may be determined whether the amplifier is oscillating as follows:
Increasing signal generator output by a factor of (for example) two should result in a rise in output voltage in approximately the same degree. If, instead a decrease in output with increased input is noted, and if there be a steady output voltage as indicated on the VTVM even without input signal, the circuit is oscillating.

Regeneration insufficient to cause oscillation gives rise to distortion of the reproduced response curve, and proper alignment is not possible in such event.
While the distortion due to overload is not as important for the trap adjustments, it is very important for the tuning adjustments of the staggered toned IF system. The trap adjustments would normally need the maximum signal available since the trap circuit so greatly attenuates the signal there is very little danger of overload.

Regeneration may be caused by poor bonding between the chassis of the receiver and of test equipment being used. Connection should be made by short, heavy leads.
Before attempting to align the chassis it is advisable to measure voltages at the power supply bleeder. These voltages are nominally +280, +270, +200, +135, +90, +3.5, -50, and -100 but are subject to a wide variation, when the various circuits are not properly adjusted.

PICTURE IF ALIGNMENT PROCEDURE

For proper alignment, it is recommended that the following test equipment be available

Signal Generator covering the following frequency ranges:

4.5 mc.
19.75 to 27.25 mc.

Sweep Generator meeting the following requirements:

a. Frequency Range 19 - 28 mc.
40 - 90 mc.
170 - 225 mc.

b. Sweep Width, 0 - 12 mc.

c. Output, at least .1 volt maximum.

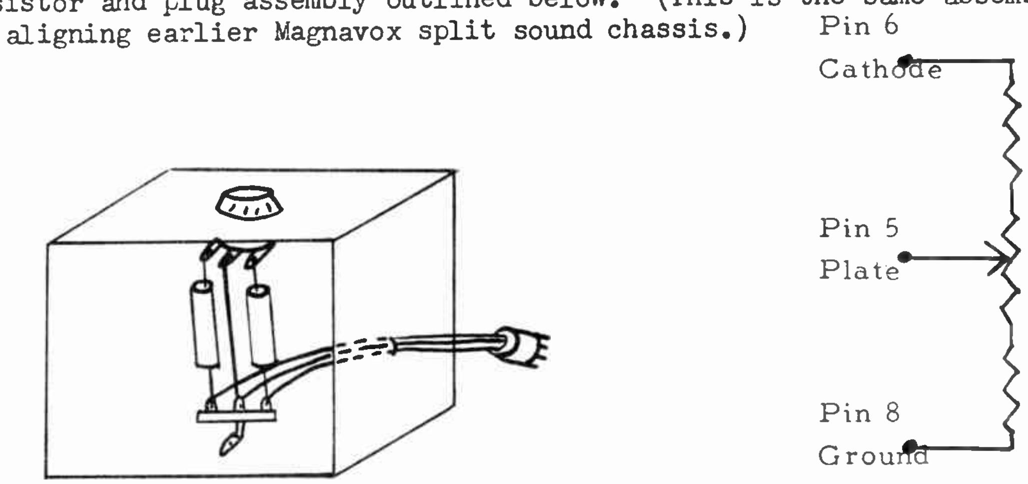
Electronic Voltmenter with HV probe.

Cathode ray oscilloscope-wide band vertical deflection.

Variable resistor - cable and plug assembly.

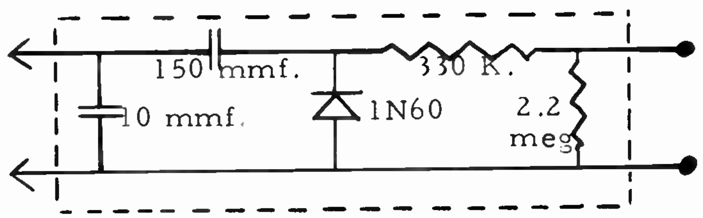
Crystal detector.

1. Adjust the bias on the tuner AGC lead to - volts by use of the variable resistor and plug assembly outlined below. (This is the same assembly used in aligning earlier Magnavox split sound chassis.)



©John F. Rider

2. Connect the IF signal generator to the converter grid wafer (through the hole provided in the bottom of the tuner shield) and chassis ground. Short the primary of the first IF transformer, T101, to ground.



Crystal Detector

3. Connect the oscilloscope across the first video plate through an isolating resistor of 10K. Adjust the signal generator to 19.75 megacycles and adjust the trap coil L101 for minimum response. The purpose of the oscilloscope is to observe demodulated signal and to thus make sure that no overload condition develops because of too much signal input.

4. Adjust the signal generator to 21.25 megacycles. Adjust the trap L103 and then the sound pick-off coil T105 for minimum response.

5. Adjust the signal generator to 27.25 megacycles and adjust the trap L102 for minimum response.

6. Adjust the signal generator to 21.8 and adjust the first I.F. transformer T104 for maximum output. Again, caution should be observed that the signal does not overload the receiver.

7. Adjust the signal generator to 23.8 megacycles. Adjust transformer T106 for maximum response.

8. Adjust the signal generator to 22.3 megacycles. Adjust transformer T108 for maximum response.

9. Adjust the signal generator to 25.2 megacycles. Adjust transformer T109 for maximum response.

10. Adjust the signal generator to 21.25 megacycles and readjust the trap L103 and the sound pick-off coil T105 for maximum response.

SOUND IF ALIGNMENT PROCEDURE

1. Remove the short from T101 to ground. Adjust the bias on the tuner AGC lead to -2 volts by use of the variable resistor and plug assembly described in the Picture IF Alignment Procedure. Connect the signal generator to Pin 1 of V101 (grid of the 6AU6 1st sound IF), and ground. Connect oscilloscope to terminal 1 of T102 through a 470K resistor. Align both slugs of T1 and T2 for maximum output at 21.25 megacycles. Connect sweep generator to the converter grid wafer (through the hole provided in the bottom of the tuner shield) and chassis ground. Set the Channel Selector to channel 2, and check for symmetrical response about 21.25 megacycles.

2. Connect oscilloscope to C126. Align bottom slug of discriminator transformer for minimum output, at 21.25 megacycles. Connect sweep generator to the converter grid wafer and align top slug of discriminator transformer for symmetrical output. The alignment should produce, when limiting, a symmetrical discriminator characteristic with a peak separation of 300 ± 50 KC. The average slope sensitivity is .08 volts per KC.

OVERALL RESPONSE OF THE RECEIVER

A. Check the overall RF alignment with the sweep generator connected to the antenna terminals through a suitable balancing network. The picture intermediate-frequencies can now be retouched if necessary to obtain the standard overall frequency response curves with the picture carrier at approximately 50% of maximum response. In making the final touch-up adjustments, it should be remembered that the converter stage and the first picture intermediate stage use relatively high Q circuits and tend to control the response at the high and low frequency ends of the pass band. The third and fourth picture intermediate frequencies are relatively low Q circuits and they control the response over the center of the passband. The second intermediate frequency circuit controls the tilt. The limits shown represent the position of the markers which determine acceptable selectivity. All twelve channels should be checked for alignment.

1. After acceptable curves are obtained, each channel is to be checked for proper tuning. The null should occur more than 30 degrees rotation from either end of the tuning vernier.

2. Average Sensitivity Characteristics.

Input signal required at antenna terminals to produce one volt DC rise across Pins 1 & 3 of V110A first video amp.

Channel	Midband Input Microvolts
2	32
6	30
7	22
13	26

Input required at sound carrier frequency for one volt above contact potential across R107 (limiter grid return) shall be 30 microvolts.

4.5 Mc Trap Alignment

A 4.5 Mc Signal modulated approximately 400 cycles, 50% should be connected to the grid of the first video amplifier. Turn CONTRAST control maximum counter-clockwise. Connect a crystal detector to the picture tube grid lead. Observe the signal at the crystal detector load resistor on an oscilloscope and adjust the trap for minimum output at the scope.

SERVICE ADJUSTMENTS

Below is given a description of the steps required in adjustment of the Beam Bender, Deflection Yoke, Focusing, Vertical and Horizontal Peaking and Horizontal A.F.C. However, it should be remembered that these adjustments are to be made only when picture quality is such that service adjustment is warranted. Use this description as a check-list and if a particular phase of quality is good, leave it alone and go on to the next operation. Refer to figure 1 for location of front panel controls, or to figure 2 for location of rear panel controls.

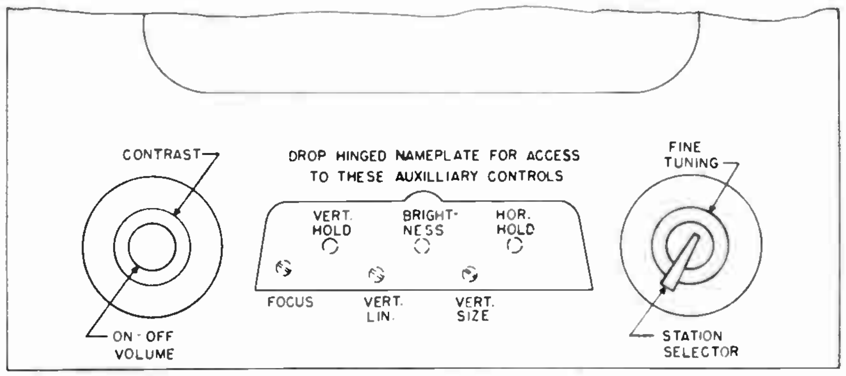

FIG. 1 — FRONT PANEL SERVICE ADJUSTMENTS

Before proceeding, tune in a station transmitting a test pattern.

A. BEAM BENDER (ION TRAP) ADJUSTMENT

1. Advance the BRIGHTNESS control almost fully clockwise.
2. Position the Beam Bender over the "flags" or kink in the gun structure. Starting from this position, adjust the Beam Bender by moving it fordward or backward, and at the same time rotating it slightly around the neck of the tube until the brightest raster appears on the screen. If two maximum brightness positions are found, the one nearest the tube base is the correct setting. This adjustment should be done quickly to avoid damaging the gun structure.
3. Adjust the BRIGHTNESS control setting until the raster is slightly above average brilliance.
4. Re-adjust the Beam Bender carefully for maximum raster brilliance.

B. DEFLECTION YOKE ADJUSTMENT

1. Loosen the wing thumb screw located at the top of the deflection yoke frame.
2. Rotate the yoke until the raster-lines are squared with the picture mask.
3. Make sure the yoke presses firmly against the flare of the tube and tighten the wing screw.

C. FOCUSING ADJUSTMENTS

1. Adjust BRIGHTNESS and CONTRAST controls so that the raster brilliance corresponds to that of an average picture.
2. If the corner of the raster is shadowed, loosen the Focus Coil Wing Nuts and screws slightly, and carefully twist the focus coil in such a direction that the shadow is eliminated. The focus coil should be positioned close to, but not necessarily touching the back of the deflection yoke. Tighten the wing nuts and screws while the focus coil is held in this position. The Beam Bender may now require slight readjustment.
3. Adjust the focus control (see fig. 1) so that the lines of the raster are sharp and distinct over the greatest screen area.

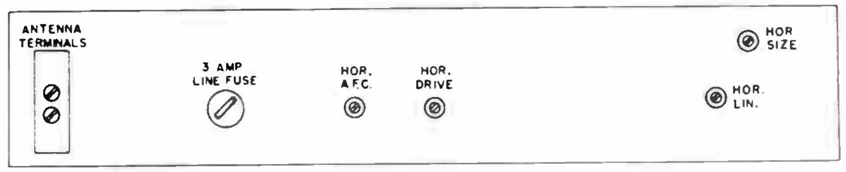

FIG. 2 — REAR PANEL ADJUSTMENTS

D. PICTURE CENTERING, SIZE, AND LINEARITY

1. Horizontal or Vertical Centering is accomplished mechanically. To center the picture, loosen the Focus Coil Wing Nuts sufficiently to twist the Focus Coil slightly about its horizontal or vertical axis. Make sure the corners of the rasters are not shadowed. See step C-2.
2. Adjust the VERTICAL SIZE and VERTICAL LINEARITY controls (see fig. 1) until the test pattern is vertically linear and symmetrical, and fills the mask. Adjustment of either control may require readjustment of the other. If vertical synchronization "falls out," re-adjust the VERTICAL HOLD control.
3. Adjust the HORIZONTAL SIZE control for correction of horizontal width.
4. Adjust the HORIZONTAL PEAKING control trimmer (see fig. 2) for a horizontally symmetrical pattern and for elimination of any existing vertical bars in left-center of picture.
5. Adjust the HORIZONTAL LINEARITY control (see fig. 2) for central alignment of the inner circles of the test pattern.

E. HORIZONTAL A.F.C. ADJUSTMENT

If difficulty is encountered in locking the picture horizontally, or if it locks-in only when the HORIZONTAL HOLD control is counterclockwise, adjust the HORIZONTAL A.F.C. control as follows:

1. Turn CONTRAST down about half way.
2. Turn HORIZONTAL HOLD control fully clockwise.
3. If the picture is not locked-in, turn the HORIZONTAL A.F.C. control till it does lock-in.
4. Turn the HORIZONTAL A.F.C. control counterclockwise till it just tends to fall out of sync. — This is the correct position of the HORIZONTAL A.F.C. control for optimum range of the HORIZONTAL HOLD control.

ALIGNMENT INSTRUCTIONS

I-F and Sound Alignment Procedure

TV I-F ALIGNMENT

1. Tune receiver to quiet portion of TV High Band.
2. Set contrast control fully counterclockwise.
3. Connect TV I-F Signal Generator through a 1500 MMF condenser to Test Point (A) of tuner unit; (See Fig. 4) low side to ground.
4. Connect negative lead of V.T.V.M. (or meter of 20,000 ohms-per-volt, or better) to 8.2K diode load resister TEST POINT (B); positive lead to ground. See schematic diagram.
5. Feed 24.9 MC (±.05 MC) from Signal Generator, and adjust T4 for maximum deflection on meter. *Maintain Signal Generator output so low that meter reads no more than 1.5 volts at peak.*
6. Feed 24.1 MC (±.05 MC) from Signal Generator, and adjust T3 as above.
7. Feed 22.3 MC (±.05 MC) from Signal Generator, and adjust T2 as above.
8. Feed 23.0 MC (±.05 MC) from Signal Generator, and adjust T1 as above.
9. Replace the meter with the vertical input of an Oscilloscope; low side to ground.
10. Replace Signal Generator with a video I-F Sweep Generator.
11. Loosely couple high side of a TV I-F Marker Generator to the high Sweep Generator Lead; low side to ground.
12. Feed I-F Sweep, and observe response on 'scope.
13. If response does not approximate that shown in Fig. 5, repeat steps 3 to 8, making sure that frequencies are precise, and that the Signal Generator output voltage is kept low. Continue with steps 9 to 12. A slight touch-up of individual slugs may be required to approximate the recommended curve of Fig. 5.

SOUND ALIGNMENT

1. Connect a 4.5 MC Signal Generator (±.01 MC) through a 1500 MMF condenser to the 8.2K video diode load resistor—TEST POINT (B); low side to ground. See schematic diagram.
2. Obtain two resistors of approximately 100,000 ohms each, whose resistances have been matched accurately with an ohmmeter. Connect them in series across the 18K resistor (R19) at the 6T8 tube socket (V4).
3. Connect negative lead of V.T.V.M. to junction of matched resistors of step 2; positive lead to ground.
4. Feed 4.5 MC (±.01 MC) from Signal Generator, and adjust L15 and bottom slug of T5 for maximum deflection on V.T.V.M.
5. Connect positive lead of V.T.V.M. to junction of C25, C26, and R17—TEST POINT (C), leaving negative lead of V.T.V.M. connected as in step 4. See schematic diagram for TEST POINT (C).
6. Adjust top of T5 for zero output on V.T.V.M., between two opposite polarity peaks.

R.F. AND OSCILLATOR ALIGNMENT PROCEDURE

The oscillator adjustments are readily accessible from the front panel. If the picture is out of range of the Fine Tuning control, slight readjustment of L7 and/or L8 (see Fig. 4) can be accomplished without an elaborate test set-up.

The perforated bottom cover is removable, permitting access to the important alignment points. If proper test equipment is available, alignment may be performed, particularly on table model receivers, without taking the chassis out of the cabinet.

R.F. ALIGNMENT

1. Connect TV Sweep Generator to Antenna Terminals.
2. Couple R.F. Marker Generator loosely to Antenna Terminals.
3. Connect vertical amplifier of Oscilloscope through a 10,000 ohm ½W. resistor to TEST POINT (A), Figs. 3 and 4.
4. Short the A.G.C. Buss to ground on the TV chassis (across C34A 5000 MMF Single Section of Dual Discap condenser).
5. Set Station Selector to channel 13.
6. Feed 213 MC at 10 MC Sweep from Sweep Generator, and 211.25 MC and 215.75 MC fixed frequencies from R-F Marker Generator.
7. Observe response curve on 'scope. If necessary, adjust L1, L3, or L4 (see Fig. 3) so that curve approximates that shown in Fig 6. If curve is too wide or too narrow, the coupling between V1 and V2 can be adjusted by bringing the wire "gimmic" (see schematic diagram) either further from, or closer to the .25 MMF condenser, C4. Caution. DO NOT SHORT "GIMMIC" WIRES.
8. Set Station Selector, Sweep Generator and Marker Generator at frequencies which correspond to channel 12 (see Table I) and adjust wire-loop inductances on switch wafers 2 and 3 which tune to channel 12, so that observed curve approximates that in Fig. 6.

   To adjust these inductances, carefully bend the wire loops closer to, or further from the switch wafers. *Sequence of wafers 1 to 4 is from front to back of tuner.*
9. Repeat, as above, on channels 11, 10, 9, 8, and 7 (in that order) setting Station Selector, and test equipment at corresponding frequencies (see Table I). Adjust corresponding wire-loop inductances on switch wafers 2 and 3 as above.
10. If the tops of the response curves of channels 12 to 7 tilt in one direction, repeat steps 5 and 6 and adjust L1 so that the response curve tilts in a direction which will compensate for the tilt of the offending channels.

    A compromise must be reached where no channel is badly adjusted.

    NOTE: *If any individual channel is adjusted, all remaining high band channels which are lower in frequency must be re-adjusted.*
11. Set Station Selector, Sweep Generator and Marker Generator at frequencies which correspond to channel 6 (see Table I) and adjust inductances on switch wafers 2, 3, and 4 which tune channel 6, so that observed response curve approximates that shown in Fig. 6. Caution: ADJUST ONLY HEAVY-WIRE SECONDARY WINDING OF L2 on WAFER 4.
12. Set Station Selector, Sweep Generator and Marker Generator at frequencies which correspond to channels 5, 4, 3, and 2 (in that order—see Table I) and adjust corresponding inductances on switch wafers 2, 3, and 4 so that observed response curve approximate that shown in Fig. 6.

    NOTE: *If any individual low-band channel is adjusted, all remaining channels lower in frequency must be re-adjusted.*

OSCILLATOR ALIGNMENT

1. Connect TV Sweep Generator to Antenna Terminals.
2. Couple R-F Marker Generator loosely to Antenna Terminals.
3. Connect vertical amplifier of Oscilloscope across the video amplifier grid and ground (Pin 2 of 12AU7, V9).
4. Couple 24.75 mc. Video I.F. Marker Generator loosely to first I.F. grid (pin 1 of 6BC5, V6). This frequency remains fixed throughout oscillator alignment.
5. Rotate Fine Tuning Control to center of range.
6. Set Station Selector to channel 13.
7. Set Sweep Generator to 213 MC at 10 MC sweep and Marker Generator to 211.25 MC (Video Carrier).
8. Observe response curve, and adjust L8 (see Fig. 4) for zero-beat with 24.75 MC marker. The zero-beat is indicated by an unmistakable break-up of the observed response curve.

   NOTE: *Quality of response curve does not affect accuracy of oscillator alignment, so long as zero-beat is obtained.*
9. Set Station Selector, Sweep Generator, and Video Carrier R-F Marker Generator to channels 12, 11, 10, 9, 8, and 7 (in that order) adjusting at the same time the corresponding inductances on wafer 1 for zero-beat with 24.75 MC marker. If zero-beat is within central range of the Fine Tuning control, alignment is satisfactory.
10. Set Station Selector, Sweep Generator, and Video Carrier R-F Marker Generator at channel 6 frequencies (see Table I) and adjust L7 (see Fig. 4) for zero-beat as above.
11. Set Station Selector, Sweep Generator, and Video Carrier R-F Marker Generator at frequencies of channels 5, 4, 3 and 2 (in that order) and adjust corresponding inductances on switch wafer 1 for zero-beat as above.

SERVICE ADJUSTMENTS

MODELS 160, 160B, 162, 1600, 1600B, Ch. 101; 1605, 1605B, 1610, 1610B, Ch. 102

Below is given a description of the steps required in adjustment of the Beam Bender, Deflection Yoke, Focusing, Vertical and Horizontal Peaking and Horizontal A.F.C. However, it should be remembered that these adjustments are to be made only when picture quality is such that service adjustment is warranted. Use this description as a check-list and if a particular phase of quality is good, leave it alone and go on to the next operation. Refer to figure 1 for location of front panel controls, or to figure 2 for location of rear panel controls.

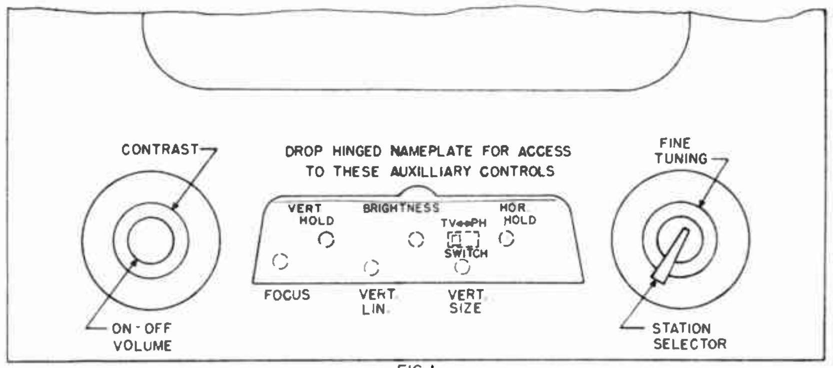

FIG. 1 — FRONT PANEL SERVICE ADJUSTMENTS

Before proceeding, tune in a station transmitting a test pattern.

A. BEAM BENDER (ION TRAP) ADJUSTMENT

1. Advance the BRIGHTNESS control almost fully clockwise.
2. Position the Beam Bender over the "flags" or kink in the gun structure. Starting from this position, adjust the Beam Bender by moving it forward or backward, and at the same time rotating it slightly around the neck of the tube until the brightest raster appears on the screen. If two maximum brightness positions are found, the one nearest the tube base is the correct setting. This adjustment should be done quickly to avoid damaging the gun structure.
3. Adjust the BRIGHTNESS control setting until the raster is slightly above average brilliance.
4. Re-adjust the Beam Bender carefully for maximum raster brilliance.

B. DEFLECTION YOKE ADJUSTMENT

1. Loosen the wing thumb screw located at the top of the deflection yoke frame.
2. Rotate the yoke until the raster-lines are squared with the picture mask.
3. Make sure the yoke presses firmly against the flare of the tube and tighten the wing screw.

C. FOCUSING ADJUSTMENTS

1. Adjust BRIGHTNESS and CONTRAST controls so that the raster brilliance corresponds to that of an average picture.
2. If the corner of the raster is shadowed, loosen the Focus Coil Wing Nuts and screws slightly, and carefully twist the focus coil in such a direction that the shadow is eliminated. The focus coil should be positioned close to, but not necessarily touching the back of the deflection yoke. Tighten the wing nuts and screws while the focus coil is held in this position. The Beam Bender may now require slight readjustment.
3. Adjust the focus control (see fig. 1) so that the lines of the raster are sharp and distinct over the greatest screen area.

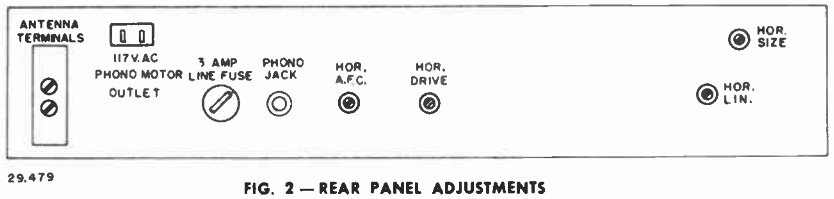

FIG. 2 — REAR PANEL ADJUSTMENTS

D. PICTURE CENTERING, SIZE, AND LINEARITY

1. Horizontal or Vertical Centering is accomplished mechanically. To center the picture, loosen the Focus Coil Wing Nuts sufficiently to twist the Focus Coil slightly about its horizontal or vertical axis. Make sure the corners of the rasters are not shadowed. See step C-2.
2. Adjust the VERTICAL SIZE and VERTICAL LINEARITY controls (see fig. 1) until the test pattern is vertically linear and symmetrical, and fills the mask. Adjustment of either control may require readjustment of the other. If vertical synchronization "falls out," re-adjust the VERTICAL HOLD control.
3. Adjust the HORIZONTAL SIZE control for correction of horizontal width.
4. Adjust the HORIZONTAL PEAKING control trimmer (see fig. 2) for a horizontally symmetrical pattern and for elimination of any existing vertical bars in left-center of picture.
5. Adjust the HORIZONTAL LINEARITY control (see fig. 2) for central alignment of the inner circles of the test pattern.

E. HORIZONTAL A.F.C. ADJUSTMENT

If difficulty is encountered in locking the picture horizontally, or if it locks-in only when the HORIZONTAL HOLD control is counterclockwise, adjust the HORIZONTAL A.F.C. control as follows:

1. Turn CONTRAST down about half way.
2. Turn HORIZONTAL HOLD control fully clockwise.
3. If the picture is not locked-in, turn the HORIZONTAL A.F.C. control till it does lock-in.
4. Turn the HORIZONTAL A.F.C. control counterclockwise till it just tends to fall out of sync. — This is the correct position of the HORIZONTAL A.F.C. control for optimum range of the HORIZONTAL HOLD control.

ALIGNMENT INSTRUCTIONS

I-F and Sound Alignment Procedure

TV I-F ALIGNMENT

1. Tune receiver to quiet portion of TV High Band.
2. Set contrast control fully counterclockwise.
3. Connect TV I-F Signal Generator through a 1500 MMF condenser to Test Point (A) of tuner unit; (See Fig. 3) low side to ground.
4. Connect negative lead of V.T.V.M. (or meter of 20,000 ohms-per-volt, or better) to 8.2K diode load resister TEST POINT (B); positive lead to ground. See schematic diagram.
5. Feed 23.0 MC (±.05 MC) from Signal Generator, and adjust T4 for maximum deflection on meter. *Maintain Signal Generator output so low that meter reads no more than 1.5 volts at peak.*
6. Feed 22.3 MC (±.05 MC) from Signal Generator, and adjust T3 as above.
7. Feed 24.1 MC (±.05 MC) from Signal Generator, and adjust T2 as above.
8. Feed 24.9 MC (±.05 MC) from Signal Generator, and adjust T1 as above.
9. Replace the meter with the vertical input of an Oscilloscope; low side to ground.
10. Replace Signal Generator with a video I-F Sweep Generator.
11. Loosely couple high side of a TV I-F Marker Generator to the high Sweep Generator Lead; low side to ground.
12. Feed I-F Sweep, and observe response on 'scope.
13. If response does not approximate that shown in Fig. 5, repeat steps 3 to 8, making sure that frequencies are precise, and that the Signal Generator output voltage is kept low. Continue with steps 9 to 12. A slight touch-up of individual slugs may be required to approximate the recommended curve of Fig. 5.

SOUND ALIGNMENT

1. Connect a 4.5 MC Signal Generator (±.01 MC) through a 1500 MMF condenser to the 8.2K video diode load resistor—TEST POINT (B); low side to ground. See schematic diagram.
2. Obtain two resistors of approximately 100,000 ohms each, whose resistances have been matched accurately with an ohmmeter. Connect them in series across the 18K resistor (R19) at the 6T8 tube socket (V4).
3. Connect negative lead of V.T.V.M. to junction of matched resistors of step 2; positive lead to ground.
4. Feed 4.5 MC (±.01 MC) from Signal Generator, and adjust L15 and bottom slug of T5 for maximum deflection on V.T.V.M.
5. Connect positive lead of V.T.V.M. to junction of C25, C26, and R17—TEST POINT (C), leaving negative lead of V.T.V.M. connected as in step 4. See schematic diagram for TEST POINT (C).
6. Adjust top of T5 for zero output on V.T.V.M., between two opposite polarity peaks.

R.F. AND OSCILLATOR ALIGNMENT PROCEDURE

R.F. ALIGNMENT

1. Connect TV Sweep Generator to Antenna Terminals.
2. Connect R.F. Marker Generator loosely to Antenna Terminals.
3. Connect vertical amplifier of Oscilloscope through a 10,000 ohm ½w. resistor to Test Point (A) fig. 3.
4. Short A.G.C. Bus to ground on TV chassis (across C34A 5000 MMF Discap condenser).
5. Set Station Selector switch to Channel 12.
6. Feed 207 mc at 10 mc sweep from Sweep Generator, and 205.25 mc & 209.75 mc fixed frequencies from R.F. Marker Generator.
7. Observe response curve on Scope. If necessary adjust C2, C3, or C4 (See fig. 3) so that response curve corresponds approximately to that shown in fig. 6 and has maximum gain.
8. Check markers on response curve of all remaining channels, setting Sweep and Marker Generators at corresponding frequencies for each channel. See Table I for convenient tabulation of proper frequencies. If the R.F. Markers do not fall in automatically in their proper places on all channels, a compromise must be made by slight readjustment of C2, C3, or C4.

OSCILLATOR ALIGNMENT

1. Connect TV Sweep Generator to Antenna Terminals.
2. Couple R.F. Marker Generator loosely to Antenna Terminals.
3. Connect verticle amplifier of Oscilloscope across the video amplifier grid and ground (Pin 2 of 12AU7, V9).
4. Couple 24.75 mc video I.F. Marker Generator loosely to first I.F. grid (Pin 1 of 6BC5, V6).
5. Rotate Fine Tuning control to center of range.
6. Set Station Selector switch to Channel 12.
7. Set Sweep Generator to 207 mc at 10 mc sweep and Marker Generator to 205.25 mc (video carrier).
8. Observe response curve and adjust C5, (figs. 3 & 4) for Zero-beat with 24.75 mc marker.

NOTE: Quality of response curve does not affect accuracy of oscillator alignment, so long as a zero-beat is obtained.

9. Check for zero-beat on all channels in this manner, setting the Station Selector, Sweep Generator and Marker Generator at corresponding frequencies. (See Table I). It is not usually necessary to make any further adjustments. However, if the individual oscillator coils must be touched-up, the following procedure should be employed:

a) Rotate Fine Tuning control to center of range.

b) Set Station Selector to desired channel, Sweep Generator to its center frequency with 10 mc sweep, and Marker Generator to the corresponding video carrier frequency (See Table I).

c) Place a non-metallic screwdriver through the opening marked 'Recessed Individual Osc. Adjustment', fig. 4, and adjust oscillator coil zero-beat with 24.75 mc marker on response curve.

d) This adjustment can be repeated on any single channel, or, if necessary, on all channels.

e) If difficulty is encountered in tuning any particular channel well within limits of Fine Tuning control after these adjustments are made, readjust C5 slightly (as in Step 8) shifting the whole range of frequencies in the desired direction.

RECORD-PLAYER OR CHANGER OPERATION

A Phono-Jack and a 117V. A.C. outlet are provided at the rear of the chassis (See fig. 2) for connection of a record-player or changer. A TV-Phono transfer switch is concealed behind the trap door on the front of the cabinet (See fig. I).

To operate phonograph, switch should be thrown to "phono" position. Sound volume is regulated by means of volume control as in the case of TV operation. (See main schematic diagram for circuit details).

Alignment Procedure

MECK 10", 12", 16" and 19" Models

NECESSARY EQUIPMENT

Television Sweep Generator
Marker Freq. Generator
Vacuum Tube Voltmeter
4.5 MC fixed freq. Generator or equivalent

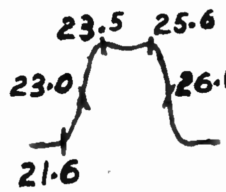

Fig. 1

I. F. ALIGNMENT

1. Connect VTVM and the input terminal of the oscilloscopes' vertical amplifier to the juncture of the 8200 ohm video detector load resistor and the 600 uh choke.

2. I. F. Signal should be introduced as follows:

   a. Models employing TT-10002A and TT-10005 tuners - connect signal generator to miniature tube shield floated over the 6AG5 mixer tube.
   b. Models employing TT-10003 tuner - connect signal generator to bare wire extending through top of tuner cover.
   c. Models employing TT-10004 tuner-connect signal generator to terminal lug #4 located on the side of tuner cover.

3. With the sweep off and the marker freq. set to 23.3MC, adjust the 1st and 3rd I. F. coils for maximum response, as indicated by VTVM. Generator should be attenuated so as not to provide more than threshold sensitivity (1 volt on VTVM at fixed freq., 1/2 volt on sweep).

4. Re-set marker frequency to 25.6MC and adjust 2nd and 4th I. F. transformers for maximum VTVM indication, as above

©John F. Rider

World Radio History

MODELS MM-510T, MM-512C, MM-512T, MM-516C, MM-516C, XOB, XQA, XTA, XRA, XSA, XQR, XTR, XRPS, XRPT, XSPS, XSPT

5. With sweep turned on, observe the I. F. curve on the oscilloscope. See Fig. 1 for desired response curve. If original alignment did not produce a satisfactory curve, it may be modified by adjusting the I. F. tuning while observing the curve on the oscilloscope. Care must be taken that both peaks are approximately the same height and that the mid-portion of the curve is not down more than 3BD. The sound carrier, which is 21.6MC, should be at least 26DB below the flat top. The marker indicating the position of the video carrier (26 1MC) should be located at a point 6DB down (1/2 way down) on the curve. The curve should be about 3 1MC wide at 6DB down.

A convenient method, of checking this curve, is to observe markers at 23.0MC and 26.1MC. If these markers appear 6DB down on opposite sides of the curve as indicated in Fig. 1, the response curve can be considered normal.

I. F. ALIGNMENT (V. C. TUNER)

Note: The following instructions apply only to models employing the TT-10006 tuner.

1. Connect RF Generator to pin 1 of 1st 6AU6 through a .01 mfd. condenser. Connect ground side to chassis.
2. Connect V.T.V.M. to TB between 600 uh shunt coil and 8.2K resistor.
3. Set generator to 25.8MC and align 2nd I.F. to peak reading on V.T.V.M.
4. Set generator to 23.3MC and align 3rd I.F. to peak reading on V.T.V.M.
5. Set generator to 24.4MC and align 4th I.F. to peak reading on V.T.V.M.
6. Disconnect RF generator and V.T V.M.
7. Connect scope to same point as V.T.V.M. as above.
8. Apply RF sweep through antenna at channel 5 and adjust top slug in tuner for proper band width (3.1MC) markers at 23MC and 26.1MC to be at 6DB down point on curve.
   Slight readjustment of 2nd, 3rd, 4th I.F.'s may be necessary.

SOUND ALIGNMENT

1. Connect 4.5MC generator to the grid of the video amplifier tube (here again, low signal level is important, so that limiting action does not occur). Metering may be accomplished at the sound take-off point of the ratio detector (at the juncture of the 15,000 ohm resistor and the 3900 mmf capacitor) with meter ground connected to pin #8 of 6V6GT tube.
2. Adjust the top and bottom slugs on the sound transformer for maximum meter indication.
3. Adjust primary of ratio detector (top slug) for maximum reading.
4. Connect meter ground to the juncture of the two 6800 ohm resistors in the sound detector circuit, and adjust bottom slug on ratio detector to Zero voltage. Other meter lead remains connected as in step 1.

R. F. ALIGNMENT

The R.F. Tuner in this receiver has been pre-aligned by the manufacturer, and it is not recommended that adjustment be made in the field. Elaborate test equipment and personnel having specialized knowledge are required to properly align the R.F. Tuner.

TROUBLE SHOOTING CHART - 10", 12" and 16" MODELS

SYMPTOMS	CHECK	REMARKS
No Raster; Sound O.K.	Ion Trap adjustment; H.V. Pwr. Sply; C.R.T. Voltages; 1/4 Amp. fuse in H.V. supply.	If no drive on 6BG6 grid, check 6SN7. If 6SN7 is not oscillating check associated components and voltages.
No Sound; Picture O.K.	Spkr. connections; 6V6 6T8; 6AU6; sound driver and ratio detector coils.	The Sound section of the receiver is used as a voltage regulator; all sound tubes must be in their sockets when set is on.
Weak Sound; Picture O.K.	6AU6; 6T8; 6V6; 4 mfd, 50 V cond. on 6T8 socket for short; alignment; voltages.	Negative return for sound strip is 140 V above ground. Alignment must be done only with accurate 4.5 mc. signal source and V.T.V.M.
Weak Video; Sound O.K.	6AC7 voltages; 12AU7 D.C. restorer; C.R.T. grid, cath. and anode voltages; peaking coils.	
No Sound or Picture	6AC7; 6A15; 6AU6 IF's; tuner power supply.	The difficulty can most easily be determined by starting at the 6AC7 video amp. and working toward the front end of the receiver. In tuner, first check osc. tube.
Insufficient Raster Brilliance	Ion Trap adjustment; 1B3 H.V. rectifier; 6BG6; C.R.T. voltages and C.R.T.	
Shadows or rounded corners on Raster	Deflection yoke too far back on neck of tube; ION trap adjustment; focus coil adjustment.	
Tilted Raster	Rotate deflection yoke.	
Picture not centered	Adjustment of focus coil.	
Insufficient Raster Height	Vertical heighth and linearity controls; 6SN7 and associated voltages; Vertical osc. and output transformers; yoke.	
Insufficient Raster Width	6BG6 by substitution; 6SN7; horz. size adjustment; horz. drive adjustment.	In extreme cases an .05 to .1 mfd. condenser may be added across the width control for additional horz. deflection.

©John F. Rider

World Radio History

SYMPTOMS	CHECK	REMARKS
Excessive Raster Brilliance; Brill. Cont. has little or no effect.	Brill. cont. for short; C.R.T. cathode circuit; C.R.T.	
Trapezoidal Raster	Deflection Yoke.	
Light and Dark Vertical Bars Left Side of Raster	Horz. drive adjustment; Horz. damper tube, 6W4 and associated circuit.	
Light and Dark Vertical Bars Right Side of Picture	Last section of triple 40 mfd. input filter (CL 10039) for open or low capacity.	
Improper Focus or No Control of Focus	Focus coil; focus control circuit; picture tube; horz. drive setting.	Can be caused by too much or too little B+ current drain, shorted turns in focus coil, or gassy picture tube.
Smeared Effect in Picture	6AC7; Video peaking chokes for open.	
Sound Bars in Picture	Setting of fine tuning control; Incorrect slope on low freq. side of IF curve; 40 mfd. lytics in 140V. line.	
No Vertical Sync.	12AU7 and associated components; 6SN7 and associated components.	
No. Horz. Sync.	6AL5 and horz. phase detector circuit; horz. osc. control circuit.	For best results set horz. hold control in the center of its range and with weak signal input adjust A.F.C. coil for horz. lock.

SYMPTOMS	CHECK	REMARKS
No Horz. or Vertical Sync.	12AU7; .1 mfd. to C.R.T. grid for leakage; grid current in C.R.T.	C.R.T. may draw grid current if brilliance setting is too high, causing loss of sync.
Horiz. Syncs. in Center of Raster	6SN7; 6AL5; improperly connected Horizontal output transformer.	
Raster Very Rough on both Edges	Parasitics in 6BG6 horz. amp; 10 mmf. 1.5 KV from damper plate; horz. drive; Horz. output trans; 6W4.	
Horizontal Non-linearity.	Horz. drive and horz. linearity controls; 6SN7 horz. osc; 6W4 damper; damper resistor.	Too high a setting of the contrast control may cause the picture to distort.
Vertical Non-linearity.	Vert. size and linearity controls; 6SN7 and associated circuit and voltages.	Leaking .25 mfd. condenser on Pin #4 6SN7 will cause foldover at bottom of raster.
Weak Picture and Sound in Strong Signal Area	Weak RF, If, or video det. and amp. tubes; Check all voltages; Check for malfunctioning antenna system.	The R.F. and I.F. tuned circuits are precisely aligned at factory. Alignment should not be necessary except when components directly connected with these tuned circuits are replaced.
Sync. Buzz	Sound Alignment; IF Alignment; 4 mfd. Electrolytic condenser in 6T8 circuit.	Improper Setting of fine tuning and contrast controls will cause sync. buzz.

World Radio History

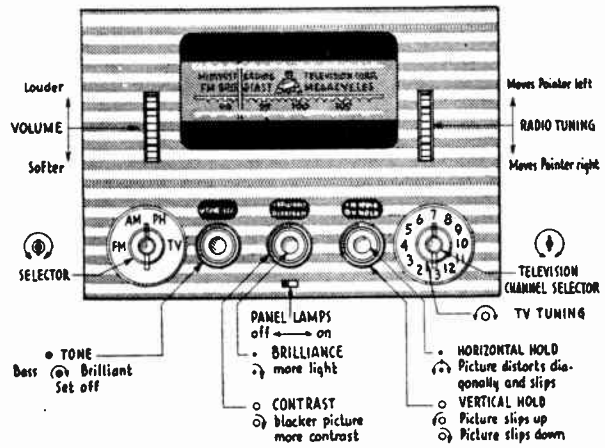
OPERATION



The controls on the panel are: two ivory plastic wheels whose rims extend out on either side of the dial, two pointer knobs, the one on the right being dual purpose, two dual purpose knobs, and one single purpose knob. This last knob has the same appearance as the dual knobs but is in one piece, being used to operate the **TONE** control and **OFF-ON** switch.

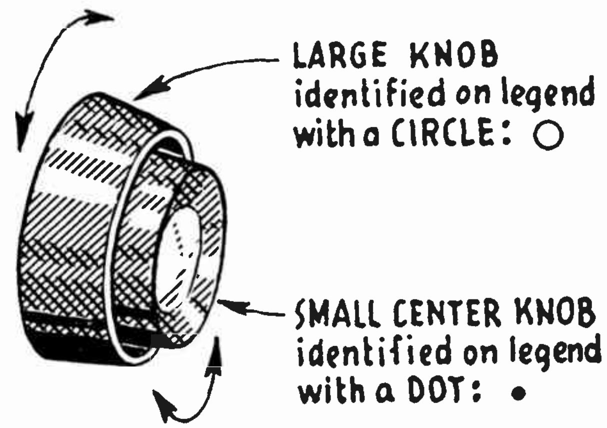
The **HOR HOLD & VERT HOLD** and the **BRILLIANCE & CONTRAST** controls are actually two knobs in one. There is a small knob in the center of the larger knob and these two can be turned separately. In the small window above each control is a legend describing the control, the dot before the name refers to the small center knob whereas the circle refers to the larger part of the knob.

Until you have used the receiver enough to know what each control does it will be best to follow a step by step procedure. This is given in skeleton form on the card which is attached to the receiver. These same steps are described here in greater detail, with suggestions and further information about the use of the controls.

Your Midwest Radio-Television receiver provides radio reception, phonograph reproduction and television programs. Radio reception includes the standard American Broadcast band and the FM Broadcast band.

The three speed automatic record changer will play twelve 10 inch records or ten 12 inch records or ten intermixed sizes, either all standard, all long play microgroove, or all 45 rpm 7 inch, and stops after the last record is played. The receiver, however, remains on and must be turned off manually.

The television programs may be chosen from any of the television stations in your area.



Dual control made of two concentric knobs which are rotated independently.

The first step to select the type of entertainment you wish is to turn the **SELECTOR** lever. This lever has four positions where the following letters appear: **TV**, **PH**, **AM** and **FM**. These letters represent television, phonograph, and radio bands AM–Standard American Broadcast and FM–FM Broadcast.

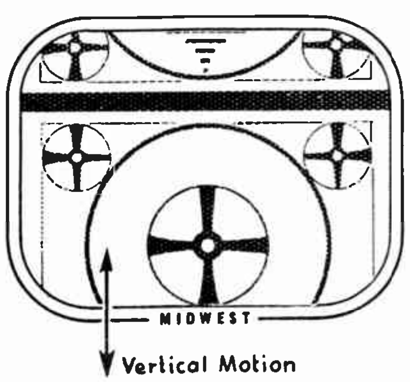
To turn the receiver **ON** rotate the **TONE** control knob clockwise. The **OFF-ON** switch is operated by the first few degrees of rotation of the **TONE** control after which it serves to change the tone, reducing bass and boosting high frequencies as it is rotated clockwise. Since the best fidelity is obtained when this control is at the intermediate point, it is best to leave it in this position until all adjustments are completed after which it may be returned to the setting most pleasing to you. This will depend somewhat upon the kind of program being received.

Having selected one of the radio bands, preferably the American Broadcast band A for first trial, roll the **VOLUME** control wheel up to increase volume until some sound or signal is heard.

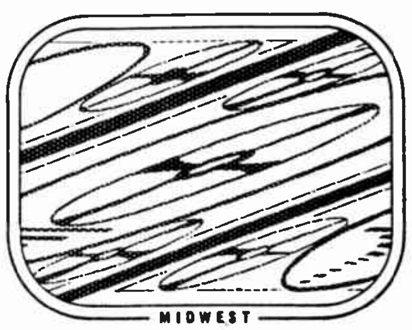
To tune to any station roll the radio **TUNING** control wheel up or down, upwards motion moves the dial pointer to the right and downwards rotation of the **TUNING** drum moves the pointer to the left.

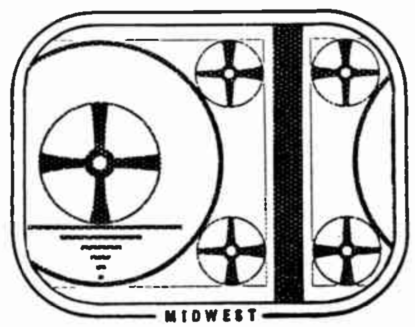
The dial calibration for the A band, Standard Broadcast, is from 55 to 160, if you add a zero to these numbers they will represent kilocycles. For example 700 kilocycles, WLW, appears on the dial as 70.

Your FM Broadcast band is calibrated in channel numbers, these channel numbers were assigned by the Federal Communications Commission for the convenience of the general public. However, in many parts of the country FM stations use a frequency designation so that we repeat the calibration in megacycles on the foil dial.



Vertical Motion





Horizontal Motion

Adjust **VOLUME** for a comfortable level. You should be able to hear the TV program at this point. If you do not hear it, turn the **TV TUNING** control full left and then slowly right until you do hear the program.

The **TV TUNING** control knob is the round, brown knob behind the **CHANNEL SELECTOR** pointer knob. The **CONTRAST** and **BRILLIANCE** controls are a dual concentric pair, the center knob is used to control picture brightness and the outer ring knob is used to adjust picture contrast. First turn the **CONTRAST** control full left, then turn **BRILLIANCE** control to the right only as much as is necessary to make a bright screen. The **BRILLIANCE** control should not be turned past the point at which the picture begins to grow larger, since detail is lost due to loss of focus.

Now advance the **CONTRAST** control, if necessary, to produce a visible pattern in black and white on the screen. It may be necessary to turn the **BRILLIANCE** control back so that the picture does not grow.

Too much contrast, even after everything is adjusted will cause the picture to be poor in detail and may cause flickering and distortion or complete loss of holding so that it moves sidewise. The pattern then will probably be unintelligible because of rapid motion up and down and sidewise, and there may be multiple patterns.

Before the **HOLD** controls are adjusted these motions are combined on the screen. The result is an appearance of violent motion. You must first stop the vertical motion with the **VERT HOLD** control. Beginning with it in the full counter clockwise position turn it slowly to the right until the horizontal black bar has slowed enough to be seen. Then proceed carefully to turn the control further until it stops altogether. At this setting you will notice that the bar has been pulled into the top of the screen, and slight movement of the **VERT HOLD** control does not set it in motion again.

The **HOR HOLD** may now be rotated towards the position where horizontal motion slows down. The first effect will be a reduction in the number of diagonal lines, nearer to correct setting results in an upright pattern which may still be sliding to left or right. As the proper setting is reached a vertical black bar, much larger than the one observed in adjustment of the **VERT HOLD**, may be seen. This black area will slip into the left or right side of the picture screen. Further adjustment should then stabilize the picture so that no flicker or bending occurs.

If there is trouble reaching a steady picture, reduce the **CONTRAST** control again until the screen is dim and advance the **BRILLIANCE** for visibility. During the first few minutes the **HOLD** controls may let loose of the picture and require readjustment but the new setting will be close and much more easily found. Once they are set and the receiver has been on for some time neither hold control should need further adjustment, since both the vertical and horizontal circuits lock in with the transmitter.

The **TV TUNING** Control is primarily for tuning the picture to the very best detail. Starting from full left the picture should be soft and lacking in sharp detail. As the control is turned right there is first a point, fairly critical, where a herringbone pattern begins to show over the entire picture. Turn slightly more and this pattern disappears. Further rotation to the right results in the herringbone pattern again. Past this second "pattern" point the picture rapidly becomes weak and streaked. The best position is right between the "pattern" points and at this point the picture is best. There may also be a buzz in the sound if the **TV TUNING** is not set at this critical point.

You have, of necessity, become familiar to some degree with the purpose of the **CONTRAST** and **BRILLIANCE** controls while setting the **HOLD** controls. When the **CONTRAST** is turned clockwise the **BRILLIANCE** control may need adjustment counter-clockwise, as this direction of adjustment is continued, in small steps, the picture becomes more black and white with less of the grey tones which give you details in shadow and highlight areas. Note again that if too much contrast is used the picture will bend and distort. You must choose, by repeated trial settings of the **BRILLIANCE** and **CONTRAST**, the best degree of contrast for your normal viewing distance, if you become lost or confused in this step start all over by turning the **CONTRAST** completely counter-clockwise.

This initial adjustment may seem involved at first. Actually it involves only these steps:

1. Turn receiver **ON** by turning the **TONE** control clockwise.
2. Select the **CHANNEL** on which the desired television program is being broadcast.
3. Turn **CONTRAST** full counterclockwise.
4. Advance the **VOLUME** control and tune in the sound with the **TV TUNING** control.
5. Advance the **BRILLIANCE** control clockwise until the picture screen glows, then advance the **CONTRAST** control until the picture appears.
6. Stop movement of the picture with the **HOLD** controls.
7. Tune **TV TUNING** for sharpest picture.
8. Adjust **CONTRAST** and **BRILLIANCE** for the desired shading.

After this, adjustments, necessary when the receiver is used again need only involve:

1. Turn the receiver **ON.**
2. Select the desired **CHANNEL.**
3. Adjust **VOLUME** and **TV TUNING** for sharpest picture since these may be slightly different on each channel.

The **HOLD** controls should not be touched unless necessary.

There is sufficient brightness available on the screen for comfortable viewing inside the home during daylight, unless in direct sun or skylight, and in the usual home illumination at night. If you desire to dim the room lights the picture will appear much brighter and in that case the panel lamps might be too noticeable, the **PANEL LAMP** switch is provided so that these may be turned **OFF.**

In the section following are described various controls not on the front panel which you can adjust to cure certain faults or failure.

NON-OPERATING ADJUSTMENTS

There are a number of seldom used adjustments for centering the picture, correcting distortion in the picture, changing the size of the picture and for rotating the picture to line up square on the screen. Some of these controls may never be needed but they must be available when aging of the parts, tube changes or some actual physical change is caused by violence (as may occur in shipment) makes it necessary to correct any of the things mentioned above.

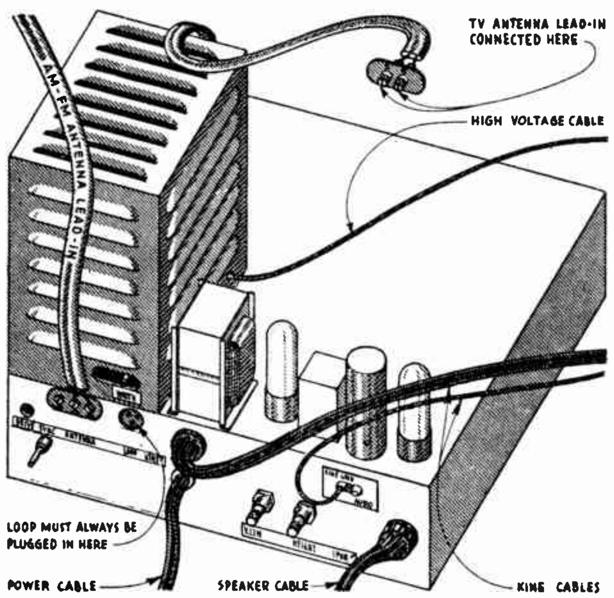
World Radio History

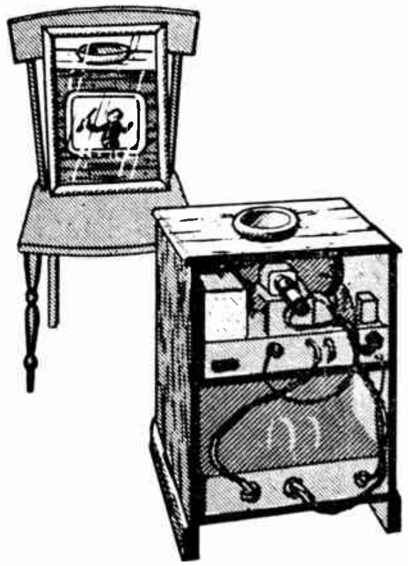
WARNING

It is here necessary to warn you against reaching into the receiver past the rear apron. It is necessary to use voltages which can be deadly if contacted and in any case would result in an unpleasant shock, every precaution has been taken for your safety by enclosing the high voltage, 14,000 volts, in a metal cage, using low regulation of voltage and by using high safety-factor wire for the lead to the kinescope. This is a bright red wire which is plugged into the side of the picture tube, if it has come loose the open end, although hooded by a rubber cup, may be dangerous. Other voltages do not exceed 400 volts but will supply considerable current and can also be dangerous, these voltages are carried in the cables connecting the two chassis together and in the speaker cable.



The metal chassis and the controls on the rear apron of the chassis may be adjusted in complete safety if you do not at the same time handle any of the cables or wiring connected to the chassis, or when the receiver is disconnected or turned off.

HORIZONTAL SYNC. The horizontal hold control on the front panel is a vernier control and is not too critical in adjustment. The **HOR SYNC** control on the rear apron of the chasis is critical and some care should be used in its adjustment. As long as the panel control, **HOR HOLD**, can be used, do not touch the **HOR SYNC** but when the panel control must be turned full left or right then, in small adjustments, rotate the **HOR HOLD** towards a center position and follow it with compensating adjustments of the **HOR SYNC** needed to keep the picture steady.



To observe the screen while adjusting the controls on the rear of the chassis you will find the use of a mirror is very helpful.

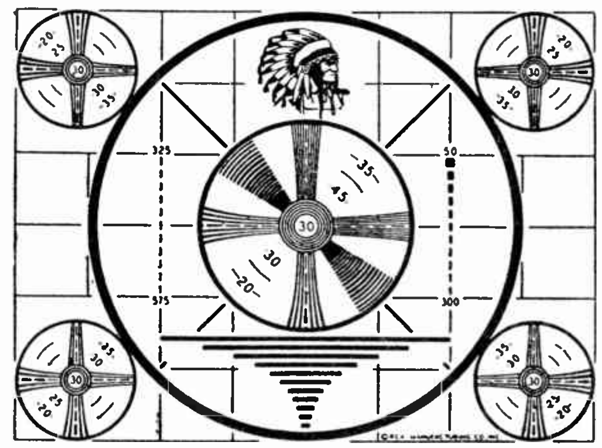
WIDTH. When the picture is too small or too large, both width and height can be adjusted within limits. When the picture is too small because of low line voltage, weak tubes or mechanical reasons there may not be enough adjustment. The **WIDTH** control is a threaded screw and as it is screwed out the picture will slowly increase in width.

HEIGHT. To increase or decrease the size of the picture vertically rotate the **HEIGHT** control. Although the width and height are adjusted separately the final adjustment must result in a ratio of 4 units wide to 3 units high, or there will be distortion of the picture.

LINEARITY. Distortion of the picture proportions may still occur even with the correct aspect ratio in use. This distortion may occur in either the transmitter or receiver, this you can check if there is more than one television transmitter in your locality by comparing the test patterns to see if the same sort of distortion occurs on both. When this distortion is determined to be in the receiver, and is pronounced, correction may be undertaken, the work must be done when there is a pattern being transmitted. Each station has a variation of the fundamental pattern, one of these is shown below but any pattern having a large circle will provide a picture where non-linearity is easily noticed in the distortion of the circle.

VERT LIN control interacts with the **HEIGHT** adjustment so that each control affects both height and linearity. You will find that with increased height caused by advancing the **HEIGHT** control the pattern is stretched slightly more at the bottom.

The **VERT LIN** control actually has most effect on the top half of the pattern, as this control is turned to increase the height, the top half of the pattern is stretched more than the bottom. This sort of adjustment can be done most easily by reducing one of these controls for minimum height and then setting the other for correct height. Now advance the first control in small steps, at each step reducing height with the second control, as the pattern approaches good vertical linearity the adjustments should be made in still smaller steps. You must use your judgment as to the best relative setting of **HEIGHT** and **VERT LIN.**

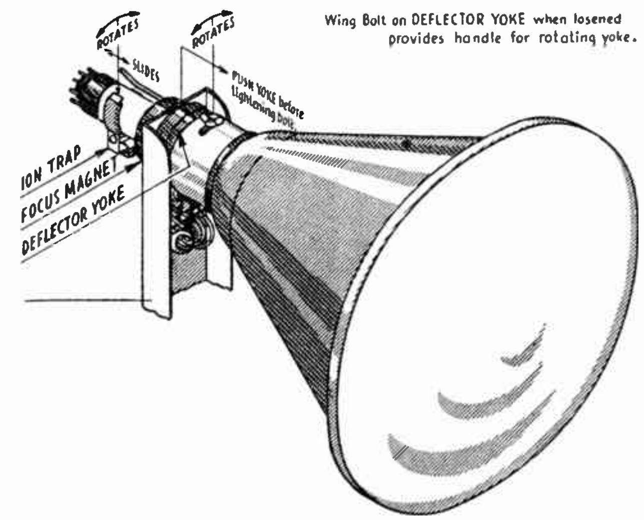


There is no adjustment of horizontal linearity. This is held to the commercial limits of plus or minus 10%, this being evenly distributed. There is also a commercial limit of plus or minus 2% on trapezoid, pin cushion and barrel effects.

The only control over rotation of the picture is a mechanical one, and as a corollary, if the picture is not square in the frame there has been a disturbance of the mechanical adjustments. Besides this mechanical control, ion trap adjustments are made with mechanically operated controls. To make these changes it is necessary to reach past the rear of the chassis, where an additional hazard is encountered in addition to the possibility of shock.

FURTHER WARNING

The kinescope (picture tube) being a large glass bottle with the inside evacuated, has a few tons of pressure over its surface because of atmospheric pressure. The face is thick but if a fracture of the glass is started by a blow or scratch so that a sudden collapse occurs, the force of the resulting implosion may throw all sizes of pieces of glass with dangerous violence and in every direction. The violence of the implosion can not be predicted and it may result merely in no more damage than would occur when a small lamp bulb is broken, further, the amount of abuse that the kinescope will withstand is likewise not predictable. Some of these large tubes have collapsed even when no visible or known force was used. To be safe, never hold the tube against the body or handle it without gloves and eyeglasses or goggles.



Here are the mechanical adjustments that can be used to rotate the picture in the frame, correct corner cutting and adjust the ion trap. To make them accessible when the receiver is in the cabinet, you may remove the wood strip holding the paper tube over the small end of the kinescope.

FOCUS: Midwest uses an all PM focus unit, to change the effect of this device, there are two **FOCUS ADJUSTMENT SCREWS** as shown in the illustration.

The screws are magnetic material so that they will provide a variable, alternate path for the magnetic field generated by the Alnico magnets in the unit. If an iron screw driver is used, it also distorts the magnetic field, so that you should use a copper penny or a non-ferrous screw driver to adjust these screws.

This aspect ratio is transmitted by all stations.

The same ratio must be used in the receiver.

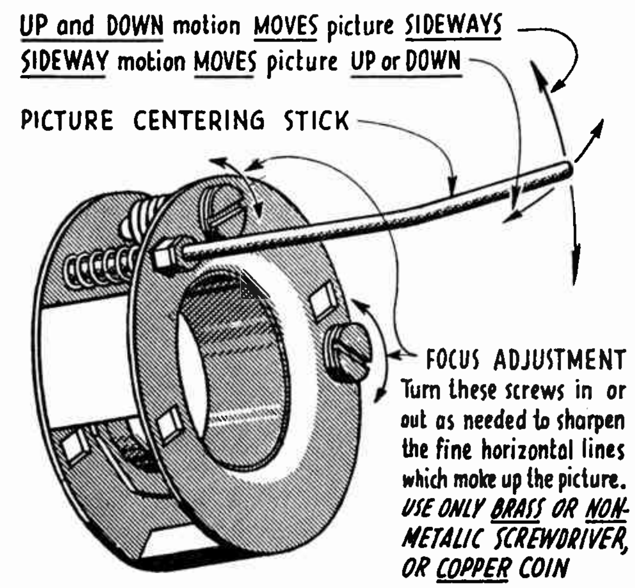
Otherwise — *this occurs.*

©John F. Rider

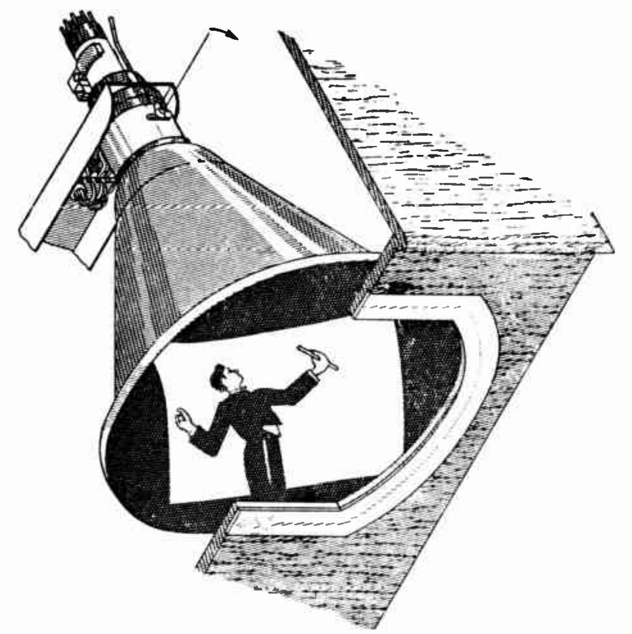
World Radio History

At one certain position there will appear very fine horizontal lines in the picture screen, at a viewing distance of several feet these would not be visible and this may be the best setting. If you prefer, however, a small amount of rotation in either direction will cause the picture to smooth out and appear slightly better if you are going to watch the screen from a distance of less than three feet.

CENTERING: To center the picture on the face of the kinescope, there is a sliding aperture plate in the focus unit, this plate is moved by the **CENTERING CONTROL STICK** so that the axis of the magnetic field in the gun



of the kinescope is tilted. Because of the way the plate is held, the movement of the **CENTERING STICK** combines the vertical and horizontal movement of the picture, if you set up a mirror in front of the receiver and watch the picture in the mirror while adjusting the **CENTERING**, this is not a diffcult adjustment. The illustration above shows roughly the relation between the motion of the picture and the motion of the **CENTERING STICK.**

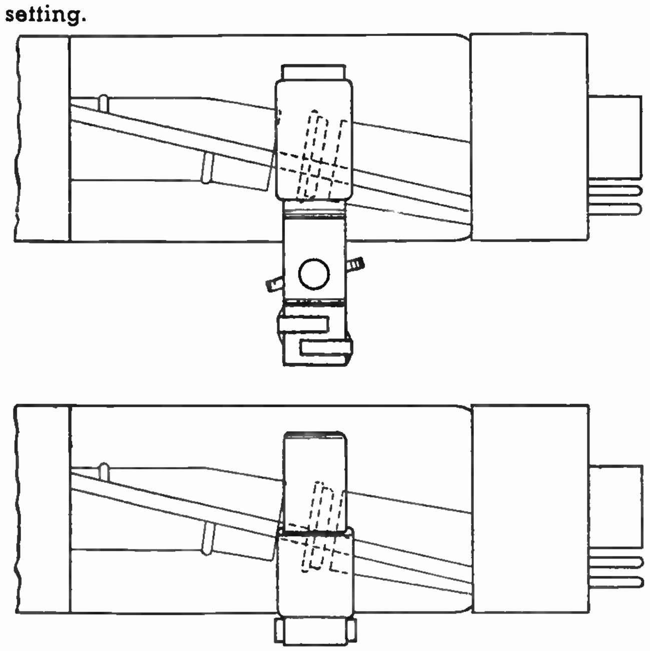


TO ROTATE the picture in the frame you simply loosen the **WING BOLT** one half turn and, using it as a handle, rotate the **DEFLECTION YOKE** in the metal tube to straighten up the picture. The receiver must be operating for you to observe the correction being made, otherwise you will need to make a number of trial adjustments. Each time the **WING BOLT** is loosened the yoke must be pushed forward, using the paper collar which is exposed between the metal yoke mounting tube and the **MOUNTING FOOT.** The relation between the rotation of the picture and the yoke is direct, being in the same direction and amount, be sure to tighten the bolt only after the yoke has been pushed forward against the kinescope.

THE ION TRAP is a device for removing ions from the electron beam generated in the gun of the kinescope. The ions removed are molecules of matter which have been excited by electron bombardment so as to have a negative charge and if allowed to remain in the electron beam will eventually cause a dark spot in the center of the kinescope tube face since they continually strike a small area, not being as easily bent from their path by the magnetic fields used to bend the electron beam. This function is not demonstrable but you may be sure it is operating if there is a picture on the screen, since wrong placement of the ion trap, or no trap, on tubes designed for them results in no picture or light on the screen or in a corner of the picture being cut off. The aluminized kinescope and hard vacuum kinescopes do not use ion traps.

There are numerous types of ion traps, all differing in appearance but identical in action. Two types are illustrated here, showing approximate location on the gun of the kinescope.

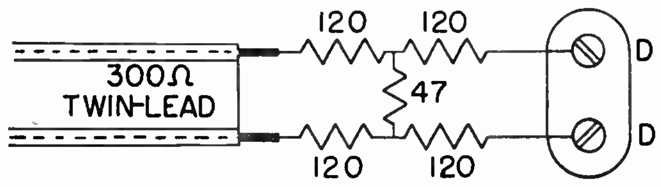
The principle involved is the same one used by the mass spectograph where isotopes are separated. If the ion trap is placed on the kinescope as shown here, only slight movement will be needed to give you the desired results. First, rotation will show that light intensity is peaked at one point and second, longitudinal movement will show a cutting of picture corners except at one point, by combining the back and forth motion with rotation side to side will quickly show you the optimum setting.



Note: If polarity of the magnets are reversed these traps would be up instead of down, as shown. Either position is OK.

There are no more corrective adjustments unless the chassis is removed from the cabinet and these adjustments must then be moved only when service equipment is used to make and check them. However, you will find some information of interest to you in the following section on service and we suggest that you should finish reading this manual.

of black areas, this is the result of loss of all low video frequency detail. To correct this trouble insert an attentuator pad in the 300 ohm line to the receiver antenna terminals. The values shown here are recommended, using only carbon resistors and adding sections until detail is obtained in the picture.



Interference from unwanted signals, such as the image of an FM station or high frequency diathermy and automatic control devices should be eliminated as far as possible with relocation of the antenna.

To reduce interference from shortwave stations, parallel tuned traps may be installed, one in each lead of the twin lead. A high-pass filter may also be used. For strong short wave interference additional RF filter may be necessary in the power line, your Midwest receiver has two .01 mfd. condensers from the lines to chassis.

Interference from VHF stations may be attenuated by an open stub wave trap. Cut a length of twin lead which is 1/4 the wave length of the interfering station (reduce length by the V. P. factor), connect one end across the antenna terminals and leave the other end open. This effectively shorts the lead-in at the interfering frequency only. If using 300 ohm twin lead with a V. P. of 82% divide 201 by the station frequency in MC for the answer in feet. In "fringe" areas a directional, narrow band antenna will discriminate against interference, a tuned "booster" would also increase the selective characteristics of the receiving set-up.

Adjustment of the controls, both operating and concealed non-operating is described in detail in the two sections of this manual immediately preceding. Failures ranging from complete lack of light on the screen to slight non-linearity in the picture can be caused by

Black dashes - caused by arcs or ignitions systems

Herringbone effect - caused by radio frequency only

Sound bars - caused by modulated carrier

loss of detail - caused by excessive signal

TUBE MAP MODELS OJ-19 & OR-16 CHASSIS'
MIDWEST RADIO & TELEVISION CORP
CINCINNATI, OHIO

misadjustment of these controls, and it is worth the time required to check them before removing the receiver for shop service.

If failure is not due to improper installation or operation you will find tube trouble is the major cause for failure.

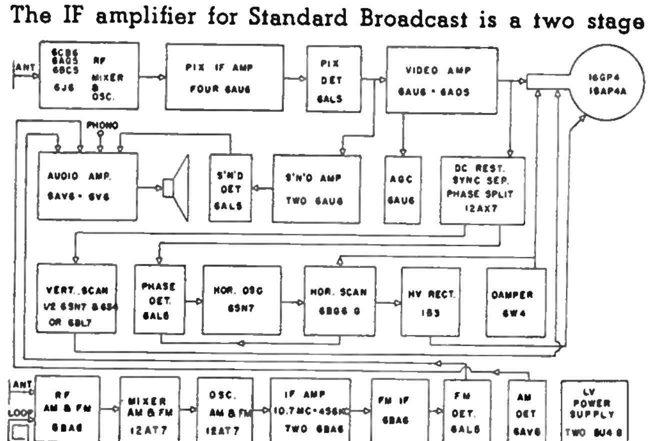
Depending upon the type of trouble encountered certain sections of the receiver can be suspected, so that you do not usually need to check all the tubes in the receiver.

This block diagram and the tube map provide the information necessary to locate physically the sections of the receiver where tube trouble can be, assuming that experience or previous instruction provides you the knowledge to interpret the symptoms. No attempt is made in this manual to duplicate the abundant and excellent literature on television circuit theory now available.

The following description will supplement the block diagram with some detail about the type of circuits used.

A tuned RF stage is used on both radio bands, a 6BA6 pentode is the RF amplifier. Separate triode mixers are used for AM and FM, a 12AT7 dual triode is the mixer. Another 12AT7 dual triode is used or separate AM and FM local oscillators.

The IF amplifier for Standard Broadcast is a two stage



amplifier using six tuned circuits and two 6BA6 remote cut-off pentodes. The AM detector uses the diodes of a 6AV6, which also generates automatic volume control voltage.

The IF amplifier for FM Broadcast reception has three stages, over coupled for band width and using eight tuned circuits. One additional 6BA6 is needed here for the extra IF amplifier stage. The detector is the accepted Ratio Detector using one 6AL5 duo-diode for the very best in fidelity and noise rejection.

The television carrier is amplitude modulated with the video signal and only one side band is transmitted, the sound carrier is frequency modulated and is always 4.5 megacycles higher. Our local oscillator is always 25.75 megacycles above the picture carrier and 21.25 megacycles above the sound carrier and thus produces two beats, one for the Pix intermediate frequency amplifier. The front end is a completely shielded unit containing a tuned balanced 300 ohm input to a 6AG5 pentode RF amplifier, with automatic contrast control voltage applied to its grid, the coupling from RF plate to mixer grid is made with tuned, over-coupled circuits for wide band flat top response, the mixer tube is ½ of a 6J6, the local oscillator is the other ½ of the 6J6. The sound IF amplifier has two transformer coupled, tuned stages using two 6AU6 adjacent cut-off pentodes followed by a ratio detector, which is a 6AL5 duo-diode. Automatic volume control voltage generated in the detector is applied to the first and second sound IF tubes. The audio system has two stages, with a continuously variable, double action tone control in the first stage for full control over both bass and treble. The first audio stage is the triode section of a 6AV6, followed by a class A single 6V6. The speaker is a 12 inch P.M.

The adaptor models omit the 6V6 audio output tube.

The Pix IF amplifier is a four stage stagger tuned wide band amplifier, substantially flat from 25.75 to 22 megacycles, two traps are used for attenuation of the sound IF carrier. Four 6AU6 sharp cut-off pentodes are used in the picture IF amplifier, fast automatic keyed picture contrast control voltage is applied to the control grids in the first three stages. The Pix detector is a 6AL5.

The video amplifier is a two stage wide band amplifier using series and parallel peaking coils to hold the response flat from 40 cycles to 4 megacycles. The first stage has a 6AU6 sharp cut-off pentode and the second stage uses a 6AQ5 beam power amplifier.

At this point the black level is automatically set (brightness level is thus automatically established for each scene) by the dc restorer circuit, ½ of a 12AX7 is used.

The 12AX7 is used to separate the sync tips from the complete modulation. The second section is a phase splitter, to provide 180° different horizontal sync tips for the 6AL5 phase detector. The vertical sync integrator is also fed from the plate of the second section. The 6AL5 phase detector compares the horizontal oscillator frequency with the transmitter sync frequency and develops a DC control voltage which is applied to the horizontal oscillator.

The vertical scanning generator consists of a triggered blocking oscillator, discharge and peaking circuit, followed by a power output stage, transformer coupled to the deflection yoke on the kinescope. The self blocking oscillator is ½ of a 6BL7 dual triode which is triggered by the vertical pulse formed by an integrating network directly from the transmitted sync pulses, the output tube is the other ½ of the 6BL7. Some models may use ½ of a 6SN7 for oscillator and a 6S4 for output. The horizontal scanning generator is a combined sine and multivibrator oscillator, cathode coupled, a 6SN7 dual triode is used. Frequency is controlled in most part by the tuned circuit. **AFC** and the **HOR HOLD** control correct the frequency within narrow limits. The horizontal scanning output stage uses a 6BG6G beam power amplifier. This is transformer coupled to the deflection yoke on the kinescope.

A 6W4 high-vacuum rectifier is used as a damper load in the output circuit to prevent shock excited oscillation after retrace, to partially shape the sawtooth scanning current and to salvage some power for reuse by the output tube.

For brilliance and definition the kinescope requires a mimimum of 13,000 volts at the anode. To provide this voltage the peak voltage produced in the output transformer during field collapse is rectified and filtered. A 1B3 half-wave high-vacuum rectifier is used.

The low voltage power supply is designed for continuous service at the rated current and 400 volts. Two 5U4G full-wave high-vacuum rectifiers are employed in a full-wave circuit. Filter capacitors total 100 microfarads in the hum filter circuit. Further details of the circuit are available by study of the schematic diagram.

When failure of the receiver occurs because of components or circuit alignment drift, shop service is indicated. Here again a knowledge of theory, or experience, is necessary to interpret the symptoms for approximate location of the faulty circuit. Further tests in that circuit will either confirm or refute your deduction. To make these tests we suggest that the following equipment is desirable:

(1) General purpose volt-ohmmeter, ac and dc.
(2) Vacuum tube voltmeter, with probe for 30 KV dc.
(3) Oscilloscope.

The oscilloscope need only to have 15 cycles to 22 KC sweep frequency and vertical amplifier response to 70 KC to observe response of the IF and Video amplifiers using RF sweep generators.

Drift in the tuned circuits should be minor, even over a long period of time and with tube changes. When the operation of the receiver is indicative of drift the alignment of the circuits should be first observed with appropriate sweep generators on an oscillograph, using accurate, preferably crystal controlled, markers to determine the limits of the bands covered. Experience and self confidence will not replace this necessary display equipment and attempts to align with step by step procedure always results in an inferior alignment. The equipment needed for service alignment, is shown here:

(4) a. 0-10 megacycles sweep, 1/10 volt minimum.
b. 19 to 29 megacycles sweep, 1/10 volt minimum.
c. 54 to 88 MC and 174-216 MC ± 6 megacycle.

(5) a. Accurate CW marker signals at 21.25 and 25.75.
b. Accurate CW marker signals for RF alignment at

Channel	Video MC	Sound MC	Oscillator MC
2	55.25	59.75	81
3	61.25	65.75	87
4	67.25	71.75	93
5	77.25	81.75	103
6	83.25	87.75	109
7	175.25	179.75	201
8	181.25	185.75	207
9	187.25	191.75	213
10	193.25	197.75	219
11	199.25	203.75	225
12	205.25	209.75	231
13	211.25	215.75	237

(6) Crystal probe for detection of resonant response for display on the oscillograph.
(7) Accurate CW signal at 4.5 MC for Picture Sound IF.
(8) Accurate CW signals from 20 to 26 MC for Pix IF point alignment.
(9) 10.7 MC ± 250 KC deviation for FM IF.
(10) 456 KC AM modulated for AM IF.
(11) Accurate signals for Radio RF alignment.

Radio Band	Coil Adj.	Trimmer Adj.
AM	560 KC	1500 KC
FM	----	105 MC

Item (4) is combined in the **RCA WR-59A** sweep generator but there is no objection to separate generators and the **0-10 MC** video sweep is not necessary unless the components in the video amplifier are replaced with physically or electrically different components. Complications caused by this sort of repair are very difficult to clear.

Item (5), (7) and (8) is combined in the **RCA WR-39A** calibrator and in the Kay Electric megamarkers, but any calibrated generator or crystal calibrator which you have checked against some frequency standard may be used, the markers should provide 1 or 2 volts so that the coupling may be very loose, and ideally should be by radiation.

The television RF response is shown here, the frequency of the markers for Pix carrier and sound carrier were given previously with the list of marker frequencies needed.

The schematic shows the frequencies for the Pix IF alignment together with the procedure and final curve. The Pix Sound IF alignment is also given in the schematic.

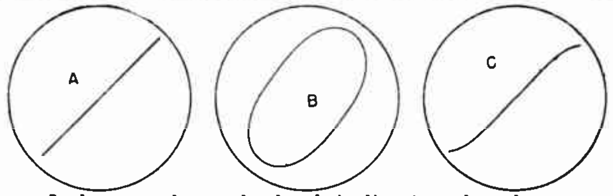
The television RF circuits are overcoupled and only appropriate alignment techniques may be used, unless you are sure of your equipment do not touch the RF circuits.

The alignment points are shown on the top and bottom views of the chassis as well as certain part numbers.

AM IF should be aligned at 456 KC. There are three transformers and six adjustments, the transformers are coupled with less than critical coupling and there is only one peak. Couple the generator into the mixer grid and use either AVC or audio for the output meter.

FM IF should be aligned at 10.7 MC. There are four transformers and eight adjustments, the transformers are over-coupled and must be aligned with a scope and sweep generator.

1. Connect generator to 3rd IF grid and vertical input of scope to the audio of the receiver at any point where sufficient signal is available and phasing can be properly adjusted.
2. Adjust the top screw for greatest length of straight line. This is the secondary winding, the bottom screw should give improvement in signal level.



A does not have the hook indicating that the sweep generator has a greater deviation than the detector capability.

B shows improper phasing of the horizontal sweep with the audio output of the receiver.

C is preferred because it shows the limits of deviation and you obtain it simply by adjusting the deviation (sweep width) control on the signal generator. Approximately 150 KC is normal.

3. Connect generator to 2nd IF grid and adjust the 2nd IF slugs for maximum signal **and** band width. This you can be sure of by the amount of hook at the ends of the line on the scope. Repeat this procedure for 1st IF grid and mixer grid. Adjust for greatest signal without appreciable loss of band width.

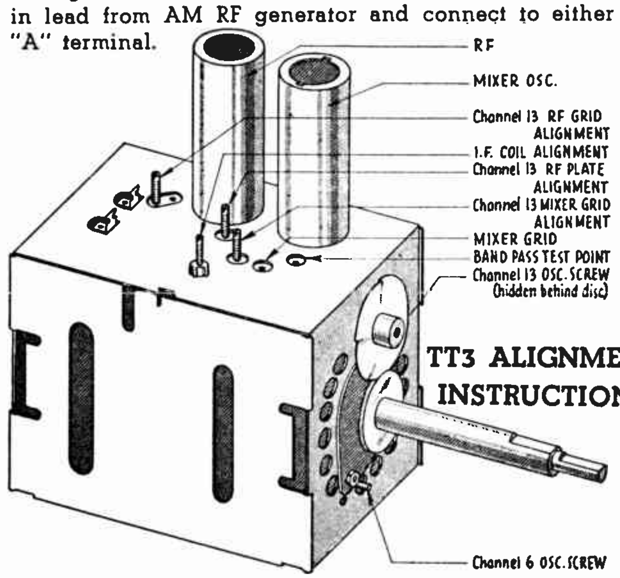
Alternate Method: The IF response of the 1st, 2nd and 3rd transformer may be observed more directly if you use a crystal detector at the plate of the tube following the transformer and feed the vertical plates of the scope from that point. Feed signal into grid of tube preceding transformer. Use a CW marker at 10.7 to be sure the double peaked response curve straddles the ratio detector response. Observe each stage separately.

Notice: Do not use AM or CM signal to peak the FM transformers. Regeneration may result and band-width and noise rejection will be poor, although signal strength will increase.

FM RF should be trimmed at 105 MC. There should not be any reason to adjust the low end but if this is necessary it can be done by distorting the FM coils on the tuning gang.

AM RF should be peaked at the high end with the trimmer and at the low end by core adjustment.

Notice: Use as low signal input as possible for readable output indication. Feed signal in from FM RF generator through 150 ohms in each lead to "A-A." Use 400 ohms in lead from AM RF generator and connect to either "A" terminal.



TT3 ALIGNMENT INSTRUCTIONS

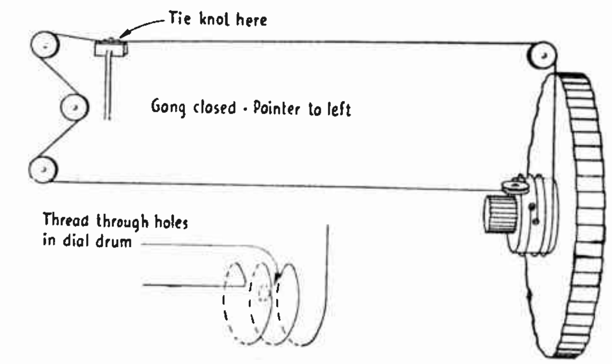
Oscillator Realignment Instructions

1. Set fine tuning ½ way.
2. Align channel 13 oscillator by means of screw.
3. Check frequency of channel 13 thru 7. They all should fall within ⅓ of the range of the **fine** tuning.
4. Align channel 6 oscillator by means of screw.
5. Check frequency of channel 6 thru 2. They all should fall within ⅓ of the range of the fine tuning.

Note: After replacement of parts, if the original L/C ratio in the oscillator has been altered, it may be necessary to re-align the incremental loops in the switch, to obtain correct frequency for every channel. Pushing the loops in increases the frequency. This must be done in order, from 12 to 7. For the lower channels, spreading the incremental coils will increase the frequency. This operation must be done in order from 5 to 2.

Band Pass Realignment Instructions

1. Use R.F. Sweep & Oscilloscope to the test point.
2. The oscillator must be operating at nearly the correct frequency for each channel.
3. Align channel 13 R.F. plate and mixer grid by spreading or pushing together the turns. **Use a** tuning wand to determine whether the inductance should be increased or decreased. The band pass should include both carriers and have steep sides. Align the antenna coil by spreading or pushing the last turn to obtain flat response, usually then the frequency of the antenna coil falls at the center channel frequency or nearly so.
4. Align the incremental loops of the plate and grid from 12 to 7 in that order. Pushing the loops in, increases the frequency.
5. Align channel 6 R.F plate, mixer grid and antenna to obtain a flat response, with maximum gain. Use tuning wand to determine what change is necesary. Band pass should include both carriers and have steep sides.
6. Align incremental coils of R.F. plate, mixer grid and antenna from 5 to 2, in that order. Spreading coils increases the frequency.



For dial stringing use a light weight dial cord such as Bevin-Wilcox 6-18 Imperial silk cord.

If replacement parts of identical manufacture and rating are not available for service repairs these should be ordered from Midwest Radio & Television Corporation, giving model number and serial number of the chassis and name of the part.

Repair data for the record changer mechanism is available separately, please specify Model.

REVISIONS -- October 25, 1950

1. The 1K 1W resistor in the 6AQ5 video tube plate should be changed to 1.5K 1W 10%; this will make a total of 3K in the plate load for better low frequency response.
2. To reduce regeneration on the FM band, .01 mfd ceramic condensers may be used to bypass heaters at the 2nd and 3rd 6BA6 IF tubes.
3. To make trimming less critical 10 or 15 mmfd may be added across the FM oscillator gang section. Use zero temperature co-efficient ceramic condensers.
4. Grid resistor of the 3rd Pix IF should be changed from 12K 10% to 22K, and Pix IF alignment frequencies revised as follows:

1st Stage	23.4 MC
2nd Stage	22.2 MC
3rd Stage	25.3 MC
4th Stage	21.0 MC
Detector	25.5 MC

The 1st Sound Trap should be adjusted to slightly less than 21.25 MC to reduce the response below that frequency. This will improve the tuning characteristics.

5. The tuning gang should be grounded at the division plate between RF and and Mixer sections to the mounting screw of the Mixer Coil Plate. A ground lug may be used under the Mixer Coil Plate mounting nuts and bent over to touch the gang division plate where it should be soldered. This will reduce FM RF regeneration.
6. To improve both sync and sensitivity a 5000 ohm 10 watt resistor should be put in parallel with the end section of the "Candohm," from the terminal supplying 215V to the 100V terminal. This will increase the "B" on the Pix IF tubes and on the tuner.

World Radio History

These models use 20 Tubes (Including Picture Tube and Rectifiers) and employ an inter-carrier sound circuit. The picture Tube in both receivers is the 16TP4. Both receivers use ratio detector for the sound.

SAFETY PRECAUTIONS: The kinescope should be handled with extreme care. The person handling this tube should wear gloves and protective goggles as an added precaution.

When the power is connected, care must be taken in servicing the High Voltage Supply of these receivers. The interlock opens one side of the line only leaving one side of the line connected when the back is removed. For servicing with chassis out of the cabinet the interlock-socket can be shorted.

VOLTAGE READINGS: The voltage readings to be obtained at various locations in the receiver have been indicated on the schematic diagram. These voltages will be very advantageous when "trouble shooting". Check voltages, tubes, fuse and inspect for damaged or burned parts before attempting to re-align receiver. A wired-in 1/4 amp fuse is used to protect the high voltage circuit of the receiver.

All voltages were taken with a 117.5 V. line and with no signal input. The contrast control set at the maximum clockwise position; the brightness control at 50% rotation and all other controls in normal operating position. The tuner set for Channel 2. All voltages are positive with respect to ground unless otherwise indicated.

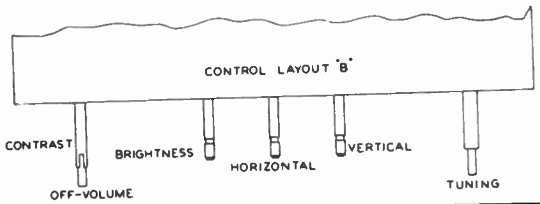
PICTURE CARRIER	26.1
SOUND CARRIER	21.6

FOCUS ADJUSTMENT AND CENTERING

These receivers use a permanent magnet (PM) type of focusing. This focalizer is attached to a plate which is mounted behind the Yoke.

CENTERING OF PICTURE: The picture may be centered in relationship with the opening of the glass panel at the face of the receiver by shifting the brass centering stud at the rear of the focalizer. (See top view of chassis on Page 2).

FOCUS ADJUSTMENT: (The focus adjustment must be made with a screw-driver of non-magnetic material.) The focus adjustment (the large slotted screw) is located at the rear of the focalizer. The picture focus is adjusted by either increasing or decreasing the amount of screw insertion to either decrease or increase the magnetic flux as required.



CONTROL OPERATION

HEIGHT CONTROL (Rear Apron of Chassis) To increase the vertical size of the picture, turn this control in a counter-clockwise rotation. To reduce the size of the picture vertically, turn this control clockwise.

VERTICAL LINEARITY: (Rear Apron of Chassis) As this knob is turned to the left (counter-clockwise) the size of the top half of the picture is increased vertically; as it is turned clockwise, it is reduced.

HORIZONTAL LINEARITY: (Top of Chassis - See Layout on page 2) moving the slug out of the coil increases the left hand side of the picture and moving the slug in decreases the left and increases the right hand side.

WIDTH CONTROL: (Top of Chassis - See Layout on page 2) Screw slug in to increase width and out to decrease width.

HORIZONTAL FREQUENCY: (Top of Chassis - See Layout on page 2) Locate the horizontal hold control (located on front apron) in the center of its rotation. Adjust horizontal frequency screw to lock in picture. When properly adjusted the horizontal hold control should hold in the picture when the picture is turned approximately equal amounts from the center position.

HORIZONTAL DRIVE: (Screw Driver Adjustment on rear apron of chassis) Turn counter-clockwise to increase drive and clockwise to decrease drive. Drive should be as high as possible without producing a bright vertical line on the raster.

CAUTION: INSUFFICIENT DRIVE WILL OVERLOAD HORIZONTAL DRIVER (6BQ6GT).

TUNER ADJUSTMENTS

TUNER ALIGNMENT

The tuner should normally retain its alignment and need no realignment in the field. However, if it is tampered with or a condenser or resistor is replaced due to failure, realignment may be necessary but should not be attempted until the video I.F. is aligned. If a part is replaced be careful not to disturb any other parts and the replacement part should be placed in the same position as the previous part and with the same length of leads.

This tuner employs a gang condenser which retains its alignment. The adjusting is accomplished at the high and low ends of the two bands; channels 6 and 2, and 13 and 7.

The oscillator trimmers act independently, but the R.F. and mixer trimmers must be aligned first on the low channels as they are in parallel with high band trimmers.

Connect the antenna lead to the sweep generator which must terminate in 300 ohm. Connect signal generator to piece of wire and wrap around 300 ohm antenna lead. (If sweep generator has sound and picture markers the signal generator is not necessary.)

Adjust channel 6 first. Set the tuner to the center of channel 6 and set the signal generator to the picture carrier (83.25 MC). Adjust the low band oscillator trimmer (C10) to bring the marker approximately 60% up from the base of the curve. As this trimmer is increased in capacity the marker should move towards the top of the curve. If this is not the case, the marker is on the audio side of the curve. Reduce the trimmer until the marker is on the other side of the curve. Next adjust the low band R.F. (C5) and Mixer trimmers (C6) to give maximum sensitivity on the oscilloscope being careful to have sufficent width on the audio side of the curve. Check channel 2 with a marker frequency of 55.25 MC.

Adjust channel 13 in the same manner as for channel 6 except using the High Band trimmers (RF-C15, Mixer C16, and Oscillator C19) and the picture marker frequency which is 211.25 MC. Check channel 7 with a marker frequency of 175.25 MC.

I.F. ALIGNMENT PROCEDURE

STEP NO.	Connect Signal Generator to	Signal Gerator Frequency MC	Connect Sweep Generator to	Sweep Generator Frequency	Connect Oscilloscope to	REMARKS	ADJUSTMENTS (Use peak obtained when screw is farthest out of can or coil.)
1. AUDIO IF ALIGNMENT	Grid of Video Amp. (6CB6) Pin #1. Contrast control at maximum.	4.5 MC. No Modulation. See Adjustments column.	NOT USED		NOT USED	Connect Vacuum Tube Voltmeter and zero center Microammeter as shown in note 1 (50,000 ohm resistors shown in note 1 must match within 5%)	Adjust L17 and T3 (Bottom) for maximum on Vacuum Tube Voltmeter. This adjustment should be made with voltage on Vacuum Tube Voltmeter under 12 Volts. Adjust T3 (Top) for zero on Microammeter. If the receiver is receiving a signal, the above adjustment can be made off a weak station keeping the reading on the Vacuum Tube Voltmeter under 12 Volts.
2. PRELIMINARY VIDEO IF ALIGNMENT	Grid (Pin 2) of 12AT7 through 10,000 ohm resistor or a tube shield and slip over 12AT7. Do Not Ground Shield	25.5 MC. No Modulation.	NOT USED		NOT USED	Connect Vacuum Tube Voltmeter to A.G.C. point. Junction of R19 and R25.	Adjust 2nd and 4th I.F. coils (L8 and L12) for maximum on Vacuum Tube Voltmeter. Adjust at approximately one volt.
3. PRELIMINARY VIDEO IF ALIGNMENT	Grid (Pin 2) of 12AT7 through 10,000 ohm resistor or a tube shield and slip over 12AT7. Do Not Ground Shield	23.0 MC. No Modulation.	NOT USED.		NOT USED	Connect Vacuum Tube Voltmeter to A.G.C. point. Junction of R19 and R25.	Adjust 1st and 3rd I.F. coils (L5 in Tuner and L10) for maximum on Vacuum Tube Voltmeter. Adjust at approximately one volt.
4. FINAL VIDEO IF ALIGNMENT	Signal Generator as shown in note 2.	26.1 and 22.8 MC MC. No Modulation. See Note 3.	Grid of 12AT7 through 10,000 ohm resistor, or a tube shield and slip over 12AT7. See Note 2.	24 MC Center Frequency and at least 6 MC wide.	Junction of R29 and L14.		With signal generator set at 26.1 MC adjust 2nd and 4th I.F. coils to give correct marker position as shown in note 3. Set signal generator at 22.8 MC and adjust 1st and 3rd I.F. coils for pattern shown in note 3. A slight readjustment of 2nd and 4th I.F. coils may be necessary. Curve shape should be between "A" and "C" on note 3 with maximum signal output for a low sweep input.

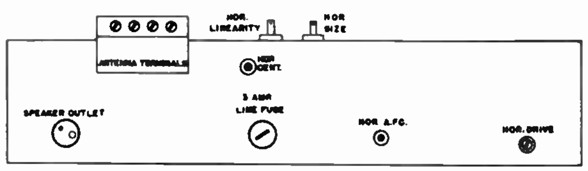

FIG. 5—Rear Panel Adjustments For Later Production Receivers Using Standard Coil R-F Tuner. (Models 16K1/63-3019 and 05GCB3019A)

SERVICE ADJUSTMENTS

Refer to figures 1 or 2 for location of front panel controls, or to figures 3, 4, or 5 for location of rear panel controls. Since these controls are located differently for several different production runs, select those diagrams which correspond to the receiver in question.

Antenna Installation

The installation and orientation of an antenna is one of the most important single factors in realizing optimum performance from a television receiver. An improperly oriented, or poorly matched, or unwisely chosen antenna can completely offset the good design engineered into this television receiver. For these reasons, choose, locate and install your antenna carefully, especially in poor signal areas. Models 16K1/63-3019 and O5GCB3019A are equipped with a built-in antenna which performs satisfactorily in locations where good signal strength is available, and where a minimum of noise is present.

When an outdoor antenna must be installed, use a standard, approved antenna, having a 300 ohm impedance, and match it with a balanced 300 ohm transmission line. Orient the antenna for maximum signal strength from the greatest number of stations, and for the minimum amount of interference and reflection. Where the receiver is to be installed beyond the range of good signal strength (about 30 miles) use a stacked array, being careful to match the impedance of the antenna, transmission line, and receiver (300 ohms). If additional gain is required, try a "booster" for improvement of signal-to-noise ratio.

In critical locations, where the receiver is surrounded by several stations, most of which are located beyond the 30 mile radius, a careful appraisal of the terrain and the measurement of field strength will usually yield acceptable television operation where a haphazard installation might have failed. To make full use of the directional and "gain" properties of a stacked array and booster, the following procedure is recommended:

1. Measure the field-strength of the transmittal signal from each of the desired stations on a calibrated field-strength meter.
2. Tabulate your results and conclude which stations are within reasonable quality distance. A field-strength of 300 microvolts-per-meter or higher will give acceptable results. A field-strength measurement of 100 microvolts-per-meter or lower is usually unsatisfactory.
3. Let the consumer decide which of the acceptable channels he desires, and orient the antenna to receive maximum signal from those desired stations.
4. Always twist the 300 ohm lead-in about once for every foot of length to minimize transmission line noise pick-up.

On receivers with no built-in antenna, provision has been made on the antenna terminal strip located at the rear of the chassis for a choice of two connections of the antenna lead-in. Terminals 1 and 2 are used for all normal operation. In some cases, however, where the receiver is located in close proximity to powerful local stations, some overload may result with consequent distortion. In that event, terminals 3 and 4 should be used.

BUILT-IN ANTENNA

Receiver Model 16K1/63-3019 and O5GCB3019A are shipped with the built-in antenna completely connected. The power line-cord functions as the low frequency element, while a folded dipole inside the cabinet forms the high-frequency element. A few precautions should be observed, upon installing this receiver, if optimum performance is to be obtained.

1. Try to locate the receiver in such a position so that it is not adjacent to a street having heavy automobile traffic which may cause ignition interference.
2. Unwind the line-cord which is shipped "hanked" in a spool, leaving no kinks and plug it into a power outlet. Make sure that the line-cord does not run close to grounded metallic objects.
3. After performing the Service Adjustments try a few stations and observe if their signals are received with acceptable quality.
4. If signal strength and noise conditions are known to be good and operation is not satisfactory, it may be best to try a new receiver location, choosing one where the receiver will be rotated 90 degrees relative to its former position.

If however, it is found that the receiver is not permitted to perform at its best because of limitations of the built-in antenna in a noisy or weak signal area, an outdoor antenna should be installed. To connect an outdoor antenna to this receiver:—

1. Loosen the four screws on the antenna terminal strip (see Fig. 5A).
2. Extend the shorting links to their open position (see Fig 5B).
3. Connect the 300 ohm lead-in from the external antenna to terminals 2 and 3 (see Fig. 5B).
4. Tighten all screws, leaving the built-in antenna wires connected to terminals 1 and 4. (See Fig. 5B).

Alignment Procedure

Although each receiver is correctly adjusted at the factory, rough handling during transit and aging of components may cause misalignment of the critical circuits. If picture and/or sound defects indicate that re-alignment is warranted, carefully follow the step-by-step procedure outlined below. Adjust only that portion of the receiver which is defective, avoiding for example, re-alignment of the r-f stages if "touching-up" the i-f section clears the trouble.

SERVICE EQUIPMENT—The quality of your test equipment is second in importance only to the manner in which it is used. To perform satisfactory alignment, the calibration of the r-f and i-f generating equipment should be within the limits specified below, for uniform resettability as well as for individual dial reading. The signals generated by these instruments, and shaped by the system under test, must be faithfully recorded on the V.T.V.M. or Scope to be properly interpreted. You can have confidence in equipment which meets the following specifications:

1. **R-F SWEEP GENERATOR:**
   a) Frequency Range: 18 to 30 mc., 50 to 90 mc., and 170 to 225 mc.
   b) Sweep Width: Variable up to 10 mc.
   c) Output: Constant over sweep width at any center frequency, and "flat" on all ranges and all attenuator positions, with maximum output of at least .1 volt.
   d) Output Impedance: 300 ohms balanced to ground.
2. **R-F MARKER GENERATOR:**
   a) Frequency Range: 18 to 30 mc., 50 to 90 mc., and 170 to 225 mc.
   b) Calibration: Accurate to within ±.05 mc. at any freqency.
   c) If marker generator output voltage is sufficient, it may also be used as a signal generator; if not, a separate signal generator is required whose frequency may be accurately checked with the marker generator.
3. **I.F. MARKER GENERATOR:**
   This piece of equipment is required in addition to the r-f marker generator for proper alignment of the H.F. Oscillator section of the R-F tuner unit.
   a) Frequency: 24.75 mc.
   b) Accuracy: Within ±.05 mc.
4. **4.5 MC SIGNAL SOURCE:**
   a) Accuracy: Within ±0.25%, or ±10,000 cps.
5. **CATHODE-RAY OSCILLOSCOPE:**
   a) Vertical Sensitivity: .07 volts-per-inch if r-f sweep generator provides .1 volt output.
   b) Vertical Response: A wide-band scope is not necessary for r-f, osc., or i-f alignment, so long as the low-frequency response is satisfactory and does not cause excessive phase shift.
6. **VACUUM TUBE VOLTMETER:**
   a) Response: To 4.5 mc with a detector probe.
   b) Range: As low as 3 volts d-c., zero-center scale.
   c) Accuracy: Extreme accuracy not essential for alignment.

World Radio History

Video I-F and Sound Alignment

NOTE #1—The following description will aid in locating the signal injection point for each of the two types of tuners used:

a. G.I. Tuner—Physically at Point (A) in Fig. 11; (across R5 and C27, see Fig. 10).

b. Standard Coil Tuner—Physically at Point (A) in Fig. 12; (across R4—220K resistor, see main schematic diagram).

Where the available signal generator output voltage is sufficient, it is preferable to couple directly around the converter tube. This method has the advantage of causing less loading, less de-tuning, and less wave-form distortion; and where the signal injection point is difficult to reach, it may be more convenient. To couple in this manner, slip a tight-fitting conductive shield over the converter tube, being careful not to ground the shield to the tuner chassis. Connect the signal generator high output end to the shield, the low end to ground.

NOTE #2—Due to differences in tube gain and component values, it is highly recommended that a visual alignment of the i-f response be performed after alignment has been completed by the signal generator—v.t.v.m. method. If, after the procedure given below is followed, it is found that the response curve differs greatly from that shown in Fig. 11, repeat alignment using the signal generator—v.t.v.m. method, making certain that the frequencies are precise, adjustments are accurate, and that signal generator output voltage is so low that the v.t.v.m. reads only about 1.5 v.d.c. at peak adjustment. During visual re-inspection, a slight touch-up of the individual slug adjustments may be necessary to approximate the recommended curve of Fig. 6.

For visual alignment proceed as follows:

a) Maintain the Contrast control at minimum setting.

b) Replace the v.t.v.m. with the vertical input of the oscilloscope; across the video diode load resistor. Keep the leads away from the receiver.

c) Replace the signal generator with a sweep generator which has been set to sweep the i-f frequencies over a range of about 8 mc. Use the preferred method of direct tube coupling described in Note #1.

d) Loosely couple the high side of the marker generator to the high sweep generator lead; low side to ground.

IMPORTANT: Keep the sweep generator and marker generator outputs at minimum to avoid curve distortion. Marker pips should be kept barely visible.

NOTE #3—The Ratio Detector Transformer, T6 is of three types, depending upon the period of production. In some receivers, transformer types "A" and "B" are used, having the primary slug (adjustment for maximum voltmeter deflection) on bottom, and the secondary slug (adjustment for zero output between plus and minus peaks) on top. In other receivers, transformer type "C" is used, having the slugs reversed; primary on top and secondary on bottom. Table 1 will aid in distinguishing between the three types.

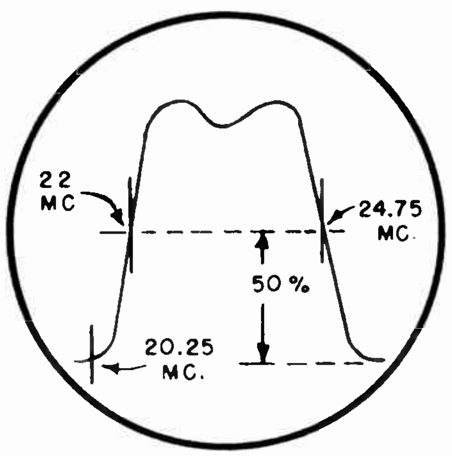

FIG. 6—Recommended I-F Response Curve

TABLE I—DISTINGUISHING FEATURES BETWEEN TYPES 'A', 'B' & 'C' RATIO DETECTOR TRANSFORMERS

		TYPE 'A'	TYPE 'B'	TYPE 'C'

	To Pin 3 of 6T8	2	F	A

R.F. and Oscillator Alignment

Alignment of the radio-frequency and oscillator stages involves adjustment of the "front end" tuner unit. This portion of the receiver is the most critical, hence re-alignment should be resorted to only after its need has been definitely determined.

I. R-F ALIGNMENT PROCEDURE (See Fig. 8)

Basically, the r-f alignment procedure is the same for each type of tuner used. A radio-frequency sweep voltage, whose center frequency corresponds to that of a particular TV channel, is injected into the antenna terminals of the receiver under test. This signal is amplified by the r-f stage (or stages), and detected at the converter grid, where it is taken-off through a 10,000 ohm isolating resistor and impressed upon the vertical input of the oscilloscope. The scope is swept horizontally by the same 60-cycle voltage which varies the r-f sweep frequency, tracing on the oscilloscope screen a pattern which represents the bandpass response of the r-f amplifier. The r-f marker generator, which is loosely coupled to the antenna terminals, serves to accurately locate a particular frequency (video carrier or sound carrier) represented on the scope. The r-f response curve should ideally look like that shown in Fig. 7 regardless of the type of tuner tested. Before proceeding with r-f alignment, the A.G.C. buss is shorted to ground at the low end of the 1st i-f grid resistor, R53. If the output impedance of the sweep generator is neither 300 ohms nor balanced to ground, a dummy antenna, consisting of two 150 ohm resistors is used, one in series with each lead of the output cable of the sweep generator.

II. OSCILLATOR ALIGNMENT PROCEDURE (See Fig. 9).

As in r-f alignment, the TV sweep generator and r-f marker generator are connected to the antenna terminals; the sweep generator set to the center frequency of a particular channel; and the r-f marker generator is carefully adjusted to the r-f video carrier frequency of that channel. Differing from the r-f set-up however, the oscilloscope is now connected directly across the video diode load impedance while an additional i-f marker generator is loosely coupled to the 1st i-f grid and accurately adjusted to 24.75 mc, the correct i-f frequency of the video carrier. On the scope, which is swept horizontally at the same rate as the r-f sweep generator, is seen the overall response curve of the receiver—from the antenna to the diode detector. If the oscillator is correctly adjusted, the "beat" between the oscillator voltage and the incoming video r-f signal will be exactly 24.75 mc. In turn, this 24.75 mc signal resulting from conversion will zero-beat with the 24.75 mc i-f marker, causing ripples and an unmistakable "break-up" in the observed response curve. If, on the other hand, the oscillator is incorrectly adjusted, the frequency of the converted video i-f signal will be something other than 24.75 mc, and there will be no zero-beat. Therefore, by adjusting the oscillator for zero-beat on the response curve, a simple and highly accurate means of alignment is achieved.

Note that the quality of the response curve does not affect the accuracy of the oscillator alignment so long as the zero-beat is obtained. If there is a Fine Tuning control, set it to the center of its range before proceeding with the alignment.

On the following pages are presented two sets of alignment information, giving special instructions for alignment of the r-f and oscillator stages of both types of tuners.

Alignment Instructions — Standard Coil Tuner

R.F. ALIGNMENT

1. Connect TV Sweep Generator to Antenna Terminals.
2. Connect R.F. Marker Generator loosely to Antenna Terminals.
3. Connect vertical amplifier of Oscilloscope through a 10,000 ohm ½w. resistor to Test Point (A) Fig. 12.
4. Short A.G.C. Bus to ground on TV chassis (across C58, 5000 MMF Discap condenser).
5. Set Station Selector switch to Channel 12.
6. Feed 207 mc at 10 mc sweep from Sweep Generator, and 205.25 mc & 209.75 mc fixed frequencies from R.F. Marker Generator.
7. Observe response curve on Scope. If necessary adjust C2, C3, or C4 (see Fig. 12) so that response curve corresponds approximately to that shown in Fig. 7, and has maximum gain.
8. Check markers on response curve of all remaining channels, setting Sweep and Marker Generators at corresponding frequencies for each channel. See Table II for convenient tabulation of proper frequencies. If the R.F. Markers do not fall in automatically in their proper places on all channels, a compromise must be made by slight readjustment of C2, C3, or C4.

OSCILLATOR ALIGNMENT

1. Connect TV Sweep Generator to Antenna Terminals.
2. Couple R.F. Marker Generator loosely to Antenna Terminals.
3. Connect vertical amplifier of Oscilloscope across the video amplifier grid and ground (pin 4 of 6AC7, V11).
4. Couple 24.75 mc video I.F. Marker Generator loosely to first I.F. grid (pin 1 of 6AU6, V7).
5. Rotate Fine Tuning control to center of range.
6. Set Station Selector switch to Channel 12.
7. Set Sweep Generator to 207 mc at 10 mc sweep and Marker Generator to 205.25 mc (video carrier).
8. Observe response curve and adjust C5, (Fig. 12) for Zero-beat with 24.75 mc marker. **NOTE: Quality of response curve does not affect accuracy of oscillator alignment, so long as a zero-beat is obtained.**
9. Check for zero-beat on all channels in this manner, setting the Station Selector, Sweep Generator and Marker Generator at corresponding frequencies. (See Table II). It is not usually necessary to make any further adjustments. However, if the individual oscillator coils must be touched up, the following procedure should be employed:

a) Rotate Fine Tuning control to center of range.

b) Set Station Selector to desired channel, Sweep Generator to its center frequency with 10 mc sweep, and Marker Generator to the corresponding video carrier frequency (see Table II).

c) Place a non-metallic screwdriver through the opening marked "Recessed Individual Osc. Adjustment," Fig. 12, and adjust oscillator coil for zero-beat with 24.75 mc marker on response curve.

d) This adjustment can be repeated on any single channel, or if necessary, on all channels.

e) If difficulty is encountered in tuning any particular channel well within limits of Fine Tuning control after these adjustments are made, readjust C5 slightly (as in Step 8) shifting the whole range of frequencies in the desired direction.

TABLE II - ALIGNMENT FREQUENCIES

CHANNEL NUMBER	SWEEP GEN. CENTER FREQ. (10 MC. SWEEP)	MARKER GENERATOR FREQUENCIES VIDEO CARRIER	MARKER GENERATOR FREQUENCIES SOUND CARRIER

Service Notes

For additional information, be sure to see the section entitled "PRODUCTION CIRCUIT CHANGES" on pages 11, 12 and 13.

The Television Serviceman can usually save considerable time by combining his training and experience to deduce the origin of the trouble from the appearance of the defective picture on the screen. Detailed instruction of the application of this technique is beyond the scope of this manual. Rather than repeat this information, which can be found in most good general service literature, this section presents special service notes and hints which apply mainly to these receivers.

I ELIMINATION OF PICTURE TWIST

a) If twist occurs mainly upon advancing the brightness control, see (and perform if necessary) the production change entitled "Twist Due to Brightness."

b) If twist is apparent even at low settings of the brightness and Contrast controls, check:—

1. Proximity of 6.3 volt filament wires to Horizontal A.F.C. Coil. If wires run close, reroute the filament wires further from the A.F.C. circuit.

2. Wire from Horizontal Hold control to R77, 100K resistor at grid (pin 4) of 6SN7 Horizontal Sweep Oscillator. If unshielded, replace with shielded wire.

3. Horizontal Sweep Oscillator 1.5K Cathode Resistor (R76). Slight increase of resistance value may reduce twist.

4. See PRODUCTION CHANGE #6 entitled, "HORIZONTAL PARASITICS".

5. See PRODUCTION CHANGE #12 entitled, "A.F.C. BALANCE".

II STANDARD COIL R-F TUNER: The antenna, R-F and Oscillator Coils of the Standard Coil Tuner are retained by bronze spring clips. Defective coils may be removed and replaced by identical sections which are supplied by the manufacturer. Re-alignment of the particular channels will probably be necessary after this change is made. See the Parts List for identification numbers. Do not tamper with the main tuner assembly; replace as a complete unit.

III RATIO DETECTOR TRANSFORMER, T6: Three types of transformers are used. See Note #3 under Alignment Procedure (page 5) if identification is required. (See PRODUCTION CHANGE # 10).

IV INCREASE PICTURE SIZE IN LOW LINE-VOLTAGE AREA: If greater picture size is required, shunt the terminals of the Horizontal Deflection Yoke with a 470 mmfd, 2000 volt (or equivalent) condenser.

V SOUND-AND-PICTURE COINCIDENCE: See (and perform if necessary) PRODUCTION CHANGE #9 entitled "Sound-and-Picture Coincidence".

VI MINIMIZING "INTERCARRIER BUZZ": SEE PRODUCTION CHANGE #1. This type of buzz is usually more noticeable on a test pattern with a 400 or 1000 cycle tone modulation. If, however, it is determined that the buzz is objectionable on a live program, when contrast is not advanced too far clockwise, the following corrections are suggested:

1. Check filter condenser C38 (40 MF - 350V.) for leakage or an open condition.

2. If possible, align video I.F. visually (see Alignment Procedure), making sure that 24.75 MC and 22.0 MC markers are both at the 50% points.

Production Circuit Changes

1. "INTERCARRIER BUZZ." To minimize "intercarrier buzz" on earlier receivers, the circuit revision described below is recommended. This revision has been performed on Model O5GCB3019A.

Note: All reference to the 6AU6 Ratio Detector Driver (V6) will be indicated here as merely "6AU6" for simplicity. Refer to Fig. 13 for identification of components.

a) Remove the .02 MF 400V. paper condenser. (At junction of 1K (R34) and 47K (R25) located at a terminal of the Raito Detector Trans.)

b) Remove the 33K 6AU6 screen bleeder resistor. (Located at 6AU6 pins 6 and 7.)

c) Clip the small buss wire which connect 6AU6 pins 2 and 7.

d) Carefully unsolder the lead of the 5000 mmf disc condenser (C48) which connects to 6AU6 pin 7, and re-solder this lead to 6AU6 pin 2. Do not clip this lead or it will be too short.

e) Insert an 82 ohm ½w. resistor (R26) and a 5000 mmf disc condenser (C34) in parallel between 6AU6 terminals 2 and 7.

f) Insert a 5000 mmf disc condenser (C55) between junction of 1K (R34) and 47K (R25) located at the Ratio Det. Trans., and 6AU6 pin 7, keeping leads as short as possible.

g) Remove from 6AU6 pin 1 the leads of 47K (R28) and 39 mmf (C49) and insert from that junction (R28 and C49) a 100 ohm ½w. resistor (R10) to 6AU6 pin 1.

h) Remove from a terminal on the ratio det. trans. the lead of 15K (R24) and 1500 mmf (C42) and insert from that junction (R24 and C42) a 220 ohm ½w. resistor (R11) to the same terminal on the ratio det. trans.

i) Remove jumpers between terminals 5, 6, and 7 of the 6T8 (V5). Remove the 8.2K resistor (R22) from 6T8 pin 6 and re-connect to 6T8 pin 7. Insert jumper between 6T8 pins 5 and 7. Insert jumper (with spaghetti) between 6T8 pins 6 and 1.

j) Align the sound circuit. (See Alignment Procedure.)
Note: In absence of alignment equipment, the above adjustments can usually be performed with acceptable accuracy by tuning-in an offending TV channel and utilizing the 4.5MC difference frequency as the signal source. While tuning T5 and T6, listen for maximum audio signal with corresponding minimum buzz. An audio output meter across the speaker voice coil may be helpful.

k) Check sound on all channels. If, after careful alignment, instability is encountered, (tendency toward regeneration) insert a 47K (approx.) screen bleeder resistor between 6AU6 pins 2 and 6.

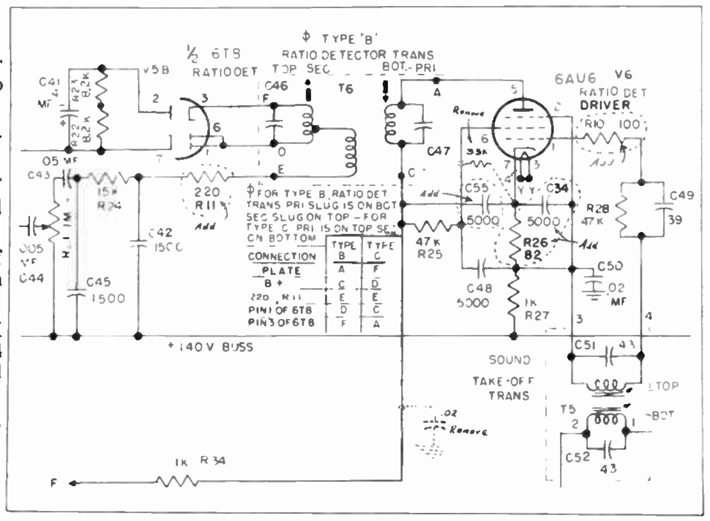

FIG. 13—Partial Schematic Diagram Showing Buzz Changes.

Production Circuit Changes

(CONTINUED)

2. ¼ AMP. FUSE: To provide additional protection to the fly-back transformer, the ¼ amp. fuse was removed from the 6BG6 cathode circuit and inserted, instead, in series with terminal #1 of the fly-back transformer on Model 05GCB3019A.

3. EARLY 16" CONSOLETTES: In Models 94GCB3023A and 94GCB3023B a 10" electrodynamic speaker is used and a separate selenium rectifier power supply is employed to furnish the 60 volts required for the speaker field winding. See Fig. 14 below. In addition, the following variations will be found in these receivers:

a) By-pass condenser (C36) across output transformer primary is .003 mfd.

b) Resistor (R58) across focus control is 1.8K 2 watt.

c) Model 94GCB3023A uses a 16" 60° Picture Tube, and in some cases a 52° Picture Tube.

d) Model 94GCB3023B uses a 16" 52° Picture Tube.

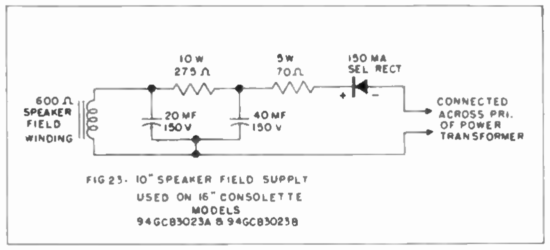

FIG. 14—10" Speaker Field Supply Used on 16" Consolette Models 94GCB3023A & 94GCB3023 B.

4. TWIST DUE TO BRIGHTNESS: If required, the D-C Restorer Circuit should be altered on Models 94GCB3023A and 94GCB3023B as follows: (See Fig. 15).

a) Change resistor at picture-tube grid (R55) to 1 meg.

b) Add .1 mfd 400V capacitor (C11) in series with an 8.2K ½w. resistor (R108) connected from the cathode (pin 6) of the D-C Restorer (V12A) to junction of L18 and R54.

Note: R108 is 7K in earlier production receivers.

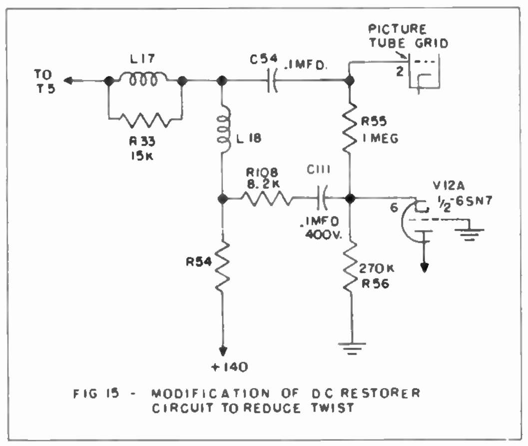

FIG. 15—Modification of D-C Restorer Circuit to Reduce Twist.

5. PICTURE "BLOOMING": To reduce picture "blooming" on Models 94GCB3023A and 94GCB3023B, drop the screen voltage on the picture-tube from 360 volts to 250 volts as follows: (Refer to main diagram).

a) Change resistor (R32) at picture-tube screen from 1K to 100K, ½w.

b) Add a 220K ½w. resistor (R115) from picture-tube screen to ground.

6. HORIZONTAL "PARASITICS": If "parasitics" is the horizontal sweep circuit are encountered in Models 94GCB3023A or 94GCB3023B, proceed as follows: (Refer to main diagram).

a) Change R75, located at pin 2 of the Horizontal Sweep Oscillator (V15) from 5.6K to 4.7K, ½w. (Some receivers may have a 3.9K resistor here).

b) Reverse the leads on the Horizontal A.F.C. Coil (L9).

c) If necessary, relocate the Horizontal A.F.C. Coil.

7. VARIATIONS IN VIDEO PEAKING COILS ARE AS FOLLOWS:

EARLY PRODUCTION

PART NUMBER	DOT COLOR CODE	ITEM NUMBER	INDUCTANCE
C-1.503-1	RED	L15	120 μh
C-1.503-2	GREEN	L16	419 μh
C-1.503-3	BLUE	L17, L18	169 μh

LATE PRODUCTION

PART NUMBER	DOT COLOR CODE	ITEM NUMBER	INDUCTANCE
C-1.522-1	GRAY	L16	760 μh
C-1.522-2	GREEN	L18	419 μh
C-1.522-3	BLUE	L15, L17	169 μh

8. 6BC5 TUBE: The 6BC5 Tube is an exact replacement for the 6AG5 which has been used in earlier receivers. When replacement of the 6AG5 is required, use the 6BC5, whos transconductance is held to closer tolerance. Slight realignment may be required when this change is made.

9. SOUND-AND-PICTURE COINCIDENCE: If sound-and-picture are not coincident on weak signals on early production receivers, change R26 screen voltage divider on 6AU6 Ratio Detector Drive tube from 10K to 33K, ½watt. See PRODUCTION CHANGE #1.

©John F. Rider

World Radio History

Production Circuit Changes

(CONTINUED)

10. RATIO DETECTOR TRANSFORMERS: As a result of use of types "B" and "C" ratio detector transformers in later production receivers (employing Standard Coil Tuners), the Ratio Detector Driver Grid Resistor (R28) and by-pass condenser across the output transformer primary (C36) were changed from 470K to 47K and from .005 mfd to .01 mfd respectively. For identification of these transformers, see main schematic diagram and Note #3 in ALIGNMENT section.

11. FILTER CONDENSERS: For increased voltage safety factor, the triple-section 40-40-40 mfd; 450-450-450 Volt single-can electrolytic filter condenser was replaced by two units (C80 and C81) of higher voltage ratings (475 volts each section). See main schematic diagram.

12. A.F.C. BALANCE: To minimize picture twist due to unbalance of positive and negative sync voltage at 6AL5 A.F.C. diodes, the following revisions were made: (See main schematic diagram.)

a) Plate resistor (R98) of ½ 6SN7 Sync Amp.-Split. (V12B) changed from 3.9K to 6.8K.

b) Plate resistor (R99) of above tube changed from 3.9K to 2.2K.

c) Vert. integ. resistor (R97) changed from 22K to 33K.

d) Saw-tooth feedback resistor (R94) changed from 4.7K to 3.9K.

13. MISCELLANEOUS CHANGES: In addition to those changes given above, the following variations will be found in these receivers.

a) High Voltage Filter Condenser (C95) is rated at 10KV when used with Fly-Back Transformer #9.236-1; it is rated at 20KV when used with Fly-Back Transformer #9.240-1.

b) Integrating Network Condensers (C70 and C71) may be either 4700 mmfd or 5000 mmfd "discaps".

c) Picture Tube grid resistor (R55) may be either 2.2K, 18K, 22K, or 1 meg (depending upon period of production). See PRODUCTION CHANGE #4.

d) De-emphasis Condenser (C45) changed from 3900 mmfd to 1500 mmfd in later production receivers.

e) First Video I.F. Grid Resistor (R35) changed from 8.2K to 4.7K in receivers with Standard Coil Tuner.

f) Voice-Coil By-Pass Condenser (C35) may be either 1000 mmfd, 1500 mmfd, or omitted on earlier receivers.

g) Audio Output Transformer (T7) was #9.238 on earlier table model receivers and is #9.241 on all later production receivers.

h) A 10" Permanent Magnet Speaker is used in Models 94GCB3023C, 16K1/63-3019, and 05GCB3019A. See PRODUCTION CHANGE #3.

i) Indoor Antenna: An indoor antenna is used in Models 16K1/63-3019 and 05GCB3019A.

j) Video Amplifier Plate Load: Video Amplifier plate load resistors R52 and R53 as follows:

1. 56K, 2 watts each; connected in parallel in all receivers using the General Instrument Tuner.
2. R52 is 11K, 2 watt; R53 is 15K, 2 watts in early receivers using Standard Coil Tuner.
3. R52 is 12K, 2 watts; R53 is 15K, 2 watts in latest production receivers using Standard Coil Tuner.

PICTURE TUBE REPLACEMENT GUIDE

TUBE TYPE	RESIST. ACROSS FOCUS POT.	MFG. LIST FOCUS CURRENT, MA.	TUBE DEFL. ANGLE AND DEFL. YOKE PART NO.	H. V. CONTACT	BEAM BENDER	MAX. BULB DIA.	OVER-ALL LENGTH	DIRECT REPLACE-MENT
16CP4	TWO 1000 OHM RESISTORS IN PARALLEL (R58 & R59)	115	52° C-9.209	Recess	Single or Double	15⅞"	22¾"	None
16DP4		115	60° C-9.242	Recess	Single or Double	15⅞"	20¾"	THESE FOUR TYPES ARE INTERCHANGEABLE
16JP4		110	60° C-9.242	Recess	Single or Double	16⅛"	20¾"

16HP4		110	60° C-9.242	Recess	Single or Double	15⅞"	21¼"	
16FP4 Dumont	None	140	62° C-9.242	Pin	Single	16⅛"	20¼"	None

TO REPLACE A TUBE NOT GIVEN ON THIS CHART, PROCEED AS FOLLOWS:

1. Check physical dimensions, socket connections, anode connector. Allow for physical variations.
2. Assemble tube in receiver, turn on receiver and observe picture.
3. If variation of focus control is not sufficient to focus tube—
   a) If more current is required, increase resistance of either or both R58 & R59. Try placing them in series.
   b) If less current is required, decrease resistance of either or both R58 & R59. Shunt them with other resistors.
4. If sweep is not sufficient on wide angle tubes, a change of deflection yoke or circuit values may be required.

PARTS LIST *(Continued)*

Symbol	Part No.	Description	
R109*	D-7.103-153	39,000 ohm ± 10%	2 w. Carbon
R110*	D-7.101-226	100 ohm	½ w. Carbon
R111	D-7.101-38	3,300 ohm	½ w. Carbon
R114	C-6.215-8	1,800 ohm	7 w. wire wound
R115	D-7.101-115	220,000 ohm	½ w. Carbon

R114 & R115 used on Models 94C, 16K1 & 05A

*R109 & R110 are interchanged on Models 94A & 94B

CAPACITORS

Symbol	Part No.	Description
C34	B-4.115-1	5000 MMF, 500V, Ceramic Used on Model 05A
C35	D-4.108-12	1500 MMF, 500V, Ceramic Used on Models 16K1 and 05A
C36	D-3.100-3	.003 MF, 600V, Paper Tubular Used on Models 94A, 94B & 94C
	D-3.100-7	.01 MF, 400V, Paper Tubular Used on Models 16K1 and 05A
C37	B-5.432	40 MF, 350V, Tubular Electrolytic
C38	B-5.432	40 MF, 350V, Tubular Electrolytic
C39	D-3.100-11	.02 MF, 400V, Paper Tubular
C40	D-3.100-19	.05 MF, 400V, Paper Tubular
C41	C-5.430-1	4 MF, 50V, Tubular Electrolytic
C42	D-4.108-12	1500 MMF, 500V, Ceramic
C43	D-3.100-19	.05 MF, 400V, Paper Tubular
C44	D-3.100-4	.005 MF, 400V, Paper Tubular
C45	C-4.109-21	3900 MMF, 500V, Ceramic Used on Models 94A, 94B & 94C
	C-4.108-12	1500 MMF, 500V, Ceramic Used on Models 16K1 & 05A
C48	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C49	D-4.104-21	39 MMF Mica
C50	D-3.100-11	.02 MF, 400V, Paper Tubular
C51	Part of T5	43 MMF
C52	#C-1.509-1	43 MMF
C53	D-3.100-23	.1 MF, 400V, Paper Tubular
C54	D-3.100-23	.1 MF, 400V, Paper Tubular
C55	D-3.100-11	.02 MF, 400V, Paper Tubular Used on All Except Model 05A
	B-4.115-1	5000 MMF, 500V, Disc, Ceramic Used on Model 05A
C56	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C57	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C58	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C59	D-3.100-23	.1 MF, 400V, Paper Tubular
C60	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C61	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C62	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C63	C-4.111-6	5 MMF, 500V, Ceramic
C64	D-3.100-23	.1 MF, 400V, Paper Tubular
C65	C-4-109-5	680 MMF, 500V, Ceramic
C66	C-4.109-2	470 MMF, 500V, Ceramic
C67	C-5.430-2	10 MF 150V, Tubular Electrolytic
C68	D-4.104-11	22 MMF Mica
C69	D-4.108-12	1500 MMF, 500V, Ceramic
C70	B-4.115-1	5000 MMF, 500V, Ceramic
C71	B-4.115-1	5000 MMF, 500V, Ceramic
C72	C-4.109-2	470 MMF, 500V, Ceramic
C73	D-1.105-24	4700 MMF Mica ± 10%
C74	D-3.100-32	.25 MF 600V, Paper Tubular
C75	D-3.100-23	.1 MF, 400V, Paper Tubular
C76	C-5.420-1	100 MF, 25V, Tubular Electrolytic Used on Models 94A, 94B and 94C
	C-5.420-2	100 MF, 50V, Tubular Electrolytic Used on Models 16K1 and 05A
C77A	C-5.421-5	20 MF, 450V, Electrolytic
C77B		10 MF, 450V, Electrolytic
C77C		10 MF, 450V, Electrolytic
C78	D-3.100-7	.01 MF, 400V, Paper Tubular
C79	D-3.100-7	.01 MF, 400V, Paper Tubular
C80A	C-5.421-6	10 MF, 450V, Elect. (Used on Models 94A and 94B)
C80B		40 MF, 450V, Elect. (Used on Models 94A and 94B)
C80C		40 MF, 450V, Elect. (Used on Models 94A and 94B)
C81B	C-5.400-7	40 MF, 150V, Elect. (Used on Models 94A and 94B)
C81C		20 MF, 150V, Elect. (Used on Models 94A and 94B)
C80	C-5.433-1	40 MF, 150V, Elect. (Used on Models 94C, 16K1 and 05A)
C81A	C-5.434-1	40 MF, 475V, Elect. (Used on Models 94C, 16K1 and 05A)
C81B		40 MF, 475V, Elect. (Used on Models 94C, 16K1 and 05A)
C83	B-5.431	500 MF, 6V, Tubular Electrolytic
C84	D-4.105-20	3900 MF, Mica ± 10%
C85	D-3.100-19	.05 MF, 400V, Paper Tubular
C86	D-4.104-60	330 MMF, Mica
C87	D-4.104-63	390 MMF, Mica ± 10%
C88	C-4.109-22	15 MMF, 400V, Ceramic
C89	D-4.104-56	270 MMF, Mica
C91	D-3.100-19	.05 MF, 400V, Paper Tubular
C92	D-3.100-32	.25 MF, 600V, Paper Tubular
C93	D-3.100-46	.035 MF, 600V, Paper Tubular
C94	D-3.100-24	.1 MF, 600V, Paper Tubular
C95	B-4.114	500 MMF, 10KV Ceramic Used on Models 94A and 94B
	B-4.122	500 MMF, 20KV Ceramic Used on Models 94C, 16K1 and 05A
C96	D-3.100-32	.25 MF, 600V, Paper Tubular Used on Models 94A and 94B
	C-5.420-1	100 MF, 25V, Tubular Elect. Used on Model 94C
	C-5.420-2	100 MF, 50V, Tubular Elect. Used on Models 16K1 and 05A
C97	B-4.121	13 MMF, 1500V, Ceramic
C98	D-3.100-19	.05 MF, 400V, Paper Tubular
C99	D-3.100-7	.01 MF, 400V, Paper Tubular
C100	D-3.100-4	.005 MF, 600V, Paper Tubular
C101	D-4.108-12	1500 MMF, 500V, Ceramic
C102	D-4.108-12	1500 MMF, 500V, Ceramic
C103	D-3.100-7	.01 MF, 400V, Paper Tubular
C104	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C105	D-3.100-23	.1 MF, 400V, Paper Tubular
C106	B-4.119	25 — 280 MMF, Ceramic Trimmer
C107	C-4.111-6	4.7 MMF, 500V, Ceramic
C108	C-4.109-10	100 MMF, 500V, Ceramic
C109	D-3.100-7	.01 MF, 400V, Paper Tubular
C110	B-4.115-1	5000 MMF, 500V, Disc, Ceramic
C111	D-3.100-23	.1 MF, 400V, Paper Tubular Used on Models 94C, 16K1 and 05A
C112, C113, C114, C115	B-4.115-1	5000 MMF, 500V, Disc, Ceramic Used on Models 16K1 and 05A

TRANSFORMERS AND COILS

Symbol	Part No.	Description
T2	C-1.476	1st Video I.F., 24.3 mc
T3	C-1.476	2nd Video I.F., 22.0 mc
T4	C-1.476	3rd Video I.F., 24.0 mc.
T5	C-1.509-1	Sound Take-Off, 4.5 mc
T6	C-1.510-1	Ratio Det. Trans., 4.5 mc Used on Models 94A and 94B
	C-1.521	Ratio Det. Trans., 4.5 mc Used on Models 94C, 16K1 and 05A
T7	C-9.241	Audio Output Transformer Used on Models 94C, 16K1 and 05A

Note. Audio Out. Trans. on Models 94A & 94B is part of Speaker #C-30.309-2

Symbol	Part No.	Description
T8	C-9.230-2	Vert. Block. Osc. Trans.
T9	C-9.228-3	Vert. Output Trans.
T11	D-9.235	Power Trans., 405 V. D.C.
T12	C-9.236	Hor. Output Transformer Used on Models 94A and 94B
	C-9.240-1	Hor. Output Transformer Used on Models 94C, 16K1, & 05A
L9	B-1.507	Hor. A.F.C. Coil Used on Models 94A, 94B and 94C
	B-1.519	Hor. A.F.C. Coil Used on Models 16K1 and 05A
L10	C-1.458	Horiz. Size
L11	C-1.459	Horiz. Linearity
L12	C-9.237	Filter Choke, 2.5 Hy.
L13	C-9.209	Deflection Yoke Used on Models 94A, 94B & 94C
	C-9.242	Deflection Yoke Used on Models 16K1 and 05A
L14	C-9.234-2	Focus Coil, 365 ohms
L15, L16, L17 & L18	C-1.503-1	Video Peaking, Red Dot, 120 µh
	C-1.503-2	Video Peaking, Green Dot, 419 µh
	C-1.503-3	Video Peaking, Blue Dot, 169 µh
	C-1.503-3	Video Peaking, Blue Dot, 169 µh L15, L16, L17 & L18 used on Models 94A & 94B
Con-secu-tively	C-1.522-3	Video Peaking, Blue Dot, 169 µh
	C-1.522-1	Video Peaking, Gray Dot, 760 µh
	C-1.522-3	Video Peaking, Blue Dot, 169 µh
	C-1.522-2	Video Peaking, Green Dot, 419 µh L15, L16, L17 & L18 used on Models 94C, 16K1, & 05A
L21	C-1.523	Line Choke Used on Models 16K1 & 05A

MISCELLANEOUS

ALL RECEIVERS, MODELS 94A, 94B, 94C, 16K1 & 05A

Part No.	DESCRIPTION
B-24.236	Min. Socket, with Center Shield
B-24.235	Min. Socket, no Center Shield
B-24.228	Min. Socket, 9 pin, with center shield
B-24.205	Octal Socket, Moulded
C-24.225-4	Picture Tube Socket with Leads
B-36.131	Line Fuse Holder
B-24.232	Line Cord Receptacle, Interlock
B-36.123	Beam Bender (Double)
B-36.126	Beam Bender (Single)
20.217	Line Cord 6 Feet
C-26.585	Safety Glass
D-29.309	Bottom Cover, Perforated Masonite
B-33.125	Service Adjustment Plug Button

MODELS 94A and 94B

Part No.	DESCRIPTION
C-30.309-2	Speaker, 10" E.D. with output trans.
B-20.209-1	Speaker, plug and cable
D-36.134-1	Tuner, G.I., with tubes, drum and strap
B-36.132	Selenium Rectifier, 150 ma
L-35.346	1B3 Tube Socket & Insulator Plate
C-24.241-1	Pilot Light Socket
E-12.341	Picture Tube Mask
D-29.326	Back Cover, Perforated Masonite
C-13.167	Bar Knob
B-33.138	Spring for Knob #C-13.167
C-13.168	Round Knob
B-13.198	Bar Knob for Volume Control
B-33.317	Spring for Knob #C-13.168 or #B-13.198
B-26.560-1	Dial Pointer
C-26.587	Dial Scale
B-26.570	Dial Escutcheon
B-31.101	Dial Spring

MODELS 94C, 16K1 & 05A

Part No.	DESCRIPTION
C-30.320	Speaker, 10" P.M.
D-36.137	Tuner Unit, S.C., with tubes
L-35.346	1B3 Socket & Plate (Model 94C)
L-35.366	1B3 Socket & Plate (Model 16K1)
E-12.341	Pix Tube Mask (Models 94C & 16K1)
D-12.378	Pix Tube Mask (Model 05A)
D-29.326	Back Cover (Models 94C & 16K1)
D-29.423	Back Cover (Model 05A)
B-13.201	Knob, Fine Tuning Only
B-13.202	Knob, Large Round
B-13.203	Contrast or Hor. Hold
B-13.204	Knob, Volume

INDEX

Loud Speaker . . . . 12 inch PM Dynamic
Voice Coil Impedance . . . . 3.2 Ohms 400 Cycles
Video Response . . . . To 3.5 MC
Picture Area . . . . 52 Square Inch
Focus . . . . Magnetic
Sweep Deflection . . . . Magnetic
Scanning . . . . Interlaced, 525 Line
Horizontal Scanning Frequency. 15,750 CPS
Vertical Scanning Frequency . . . 60 CPS
Frame Frequency . . . . 30 CPS
Record Changer . . . . See Manual 5073A

ELECTRICAL SPECIFICATIONS

Power Supply . . . . 105-125 Volts AC, 60 Cycles only
Power Consumption . . . . Television—300 Watts; Radio—80 Watts; Phonograph—100 Watts
Tuning Ranges . . . . TV—12 Channel; BC—540-1600 KC; FM—88-108 MC
Power Output . . . . 8.5 Watts (Max.); 6.0 Watts (10% Distortion)
Antenna Input Impedance . . . . . 300 Ohms Balanced
Intermediate Frequencies (Tel.). Picture 25.75 MC; Sound 21.25 MC
Intermediate Frequencies (Rad.). FM—10.7 MC; AM—455 KC
Selectivity . . . . AM—43 KC Broad at 1,000 Times Signal measured at 1,000 KC; I.F. FM—190 KC Broad at 2 Times down; I.F. FM—760 KC Broad at 200 times down
Sensitivity . . . . (For .5 Watt Output); AM—10 Microvolts Average; FM—30 Microvolts Average

13	210-216	211.25	215.75	237

RECEIVER LOCATION—Advise the owner as to the proper location for the television receiver. The following may be used as a guide:

1. Choose an area in the home where sunlight or light from lamps do not strike the face of the picture tube and cause glare.
2. Remember the necessity of an electrical outlet and the location of the point at which the antenna leads enter the room.
3. The receiver should be placed a short distance from the wall to allow adequate ventilation.
4. The receiver should be placed to permit easy access for operation and comfortable viewing from all angles.

ANTENNA— This receiver has been designed to use an antenna with a 300 ohm balanced transmission line. This line must be as short as possible because the longer the line the greater the chances are for picking up electrical disturbances. Stand-off insulation should be used to keep the line away from the mast, metal or walls. Twist this line about one turn per foot throughout the line to cancel out direct signal and/or noise pickup by the transmission line. It should also be securely anchored in place so that a change in weather will not affect its position.

HIGH VOLTAGE WARNING

This television receiver contains high voltages which are dangerous to life. Never operate or service the receiver outside of the cabinet or with the covers removed until all the safety precautions necessary for working with high voltage equipment have been observed.

KINESCOPE (Picture Tube) HANDLING PRECAUTION

Shatterproof goggles and heavy gloves must be worn by individuals while handling the kinescope or installing the kinescope into the receiver.

The kinescope encloses a high vacuum and due to the large surface area, is subjected to excessive air pressure. Therefore, care should be taken not to bump or scratch the picture tube accidentally as it may cause the tube to implode resulting in damage to property or injury to an individual.

©John F. Rider

World Radio History

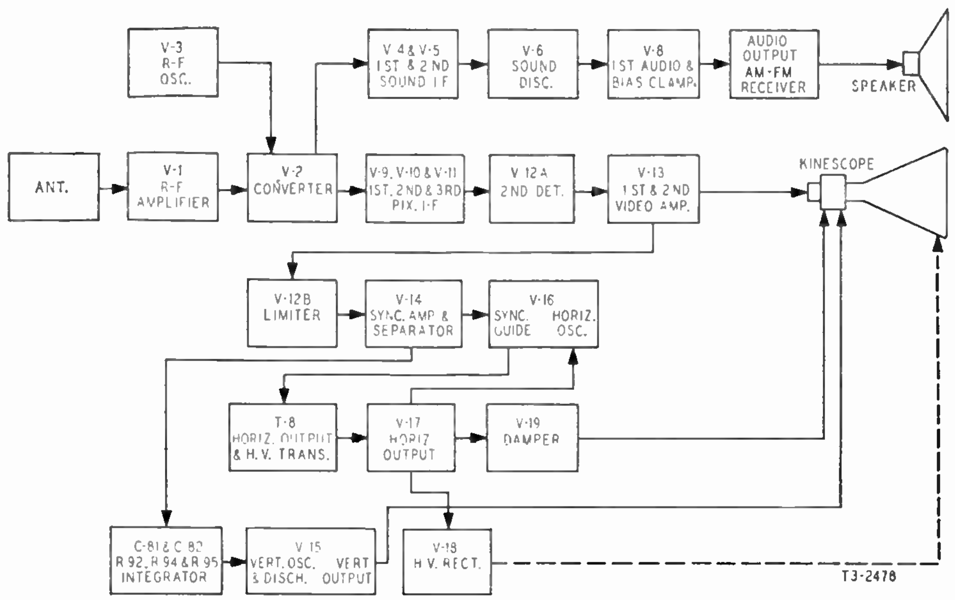

Fig. 2—Block Diagram

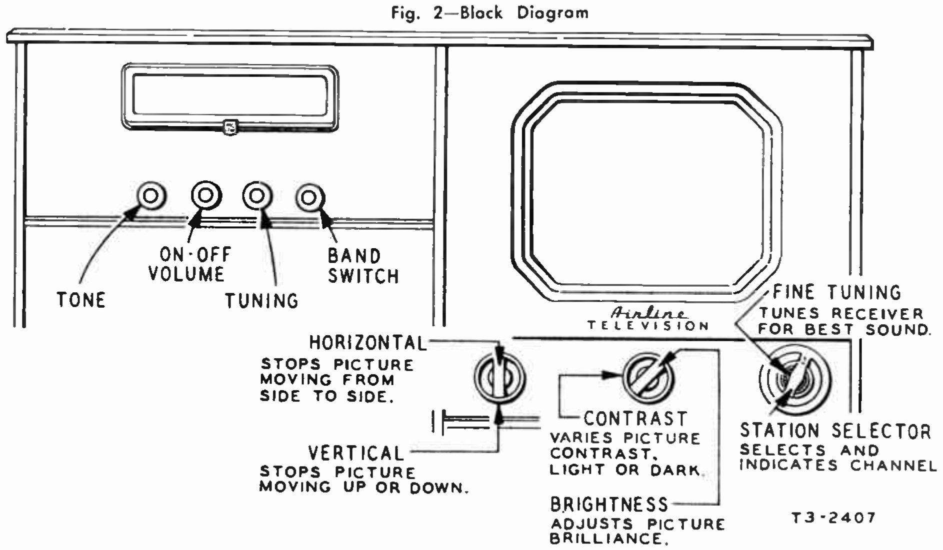

Fig. 3—Front Panel Controls

TUNING PROCEDURE

1. To turn the television receiver on, turn the ON-OFF VOLUME CONTROL on the radio panel until a click is heard. Allow approximately 30 seconds for the tubes to warm up.
2. Turn BAND SWITCH CONTROL on the radio panel fully counterclockwise to the TV position.
3. Turn the STATION SELECTOR CONTROL to the desired channel. This control may be turned in either direction.
4. Turn the CONTRAST CONTROL fully counterclockwise.
5. Turn the BRIGHTNESS CONTROL fully counterclockwise and then very slowly clockwise until light is readily visible on the screen.
6. Turn the CONTRAST CONTROL clockwise until activity or definite form is noted on the screen.
7. Adjust the FINE TUNING CONTROL for best tonal quality and the VOLUME CONTROL for desired volume.
8. Turn the VERTICAL CONTROL until the picture stops moving up or down.
9. Adjust the HORIZONTAL CONTROL until the picture is obtained and centered.
10. Adjust the CONTRAST CONTROL until the best picture is obtained and if necessary make a slight readjustment of the BRIGHTNESS CONTROL.
11. After the receiver has been on for a while it may be necessary to readjust the FINE TUNING CONTROL for best sound quality.
12. When switching from one channel to another, it may be necessary to repeat steps number 7 and 10.
13. To turn off the receiver, turn the ON - OFF VOLUME CONTROL counterclockwise until a click is heard.
14. When the receiver is turned on again and the positions of the controls have not been changed, no further adjustments will be necessary except for the FINE TUNING CONTROL and VOLUME CONTROL for the desired volume.
15. If the positions have been disturbed since the last time the receiver has been used it may be necessary to follow steps 1 to 11.

KINESCOPE—The receiver is shipped with the kinescope in place, however some of the kinescope adjustments may have been jarred loose in shipment. If adjustments are necessary, the following should be used as a guide:

1. After the receiver has been unpacked and the cradle removed, take off the cabinet back and make sure all the tubes are properly mounted in their respective sockets.
2. Remove the tape from the kinescope socket base and the corrugated cardboard lock holding the focus coil in place.
3. Connect an antenna to the antenna terminals at the rear of the radio chassis and insert the line cord plug into a convenient outlet.
4. Turn on the receiver and wait about 60 seconds for the receiver to warm up. Turn the channel selector to a station that is transmitting and check the picture. If the picture is not centered on the screen, or visible at all, make the adjustments on the deflection yoke, focus coil and ion trap magnet assemblies as outlined

KINESCOPE REPLACEMENT—Should the kinescope have to be replaced, remove the defective kinescope in the following manner:

1. Remove the front panel control knobs by pulling them straight from their shafts.
2. Remove two ornamental screws holding the front panel to the cabinet (see figure 5) and lift out panel.
3. Remove the cabinet back.
4. Disconnect the kinescope socket connector at the base of the tube and the high voltage anode lead from the front of the kinescope.
   WARNING—REMOVE STATIC CHARGE FROM THE ANODE LEAD BY GROUNDING IT AGAINST THE CHASSIS.
5. Remove the ion trap magnet, slipping it from the neck of the kinescope past the socket.
6. Loosen the wing nuts and wing screws on the deflection yoke and focus coil.
7. Loosen the strap holding the front of kinescope in place and withdraw the kinescope toward the front of the chassis.
8. To install a new kinescope, reverse the above procedure making sure that the kinescope is fitted closely against the kinescope cushion and that the high voltage well connector is at the top of the kinescope. If the kinescope sticks or fails to slip into place smoothly, investigate and remove the source of the trouble. Never force the tube.

KINESCOPE WINDOW — Clean the kinescope window with a dampened cloth or a soft lint-free cloth if dust or finger marks are present.

World Radio History

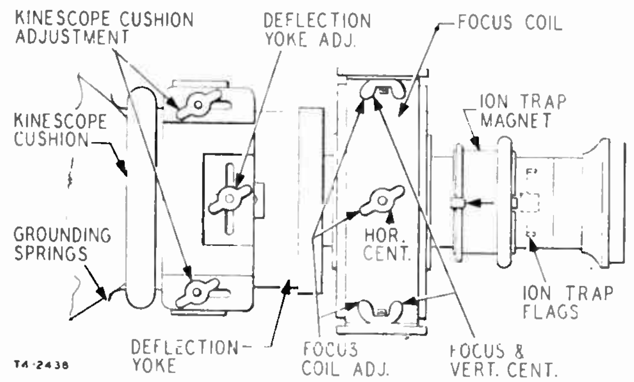

Fig. 7—Yoke, Focus and Ion Trap Magnet Adjustment

DEFLECTION YOKE ADJUSTMENT — If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

FOCUS COIL ADJUSTMENT — Turn the HORIZONTAL CENTERING (R-106) and VERTICAL CENTERING (R-105) CONTROLS to the halfway position. (See Figure 6). If a corner of the raster is shadowed, it indicates that the electron beam is striking the neck of the tube. Loosen the focus coil adjustment wing nuts and rotate the coil about its vertical and horizontal axes until the entire raster is visible, approximately centered and with no shadowed corners. Tighten the focus coil adjustment wing nuts with the coil in this position.

ION TRAP MAGNET ADJUSTMENT—The ion trap magnet should be positioned exactly as shown in Figure 7. Adjust the magnet by moving it back and forth and at the same time rotating it slightly around the neck of the kinescope until the brightest raster is obtained on the picture screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the Focus Control R-104 (see Figure 6) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

PICTURE ADJUSTMENT —For further adjustments, obtain a test pattern on the receiver. Turn on receiver and follow tuning procedure

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel and then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal bars will be gradually reduced and when only 3-1/2 to 4-1/2 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. The pull-in should occur when the control is approximately 90 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should be out of sync and should show from 3-1/2 to 4-1/2 bars sloping downward to the right.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus" adjustment.

ALIGNMENT OF HORIZONTAL OSCILLATOR — If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync for at least 60 degrees of clockwise rotation of the control from the pull in point, it will be necessary to make the following adjustments.

HORIZONTAL FREQUENCY ADJUSTMENT—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the rear apron horizontal frequency trimmer C-55B (see Figure 6) until the picture is out of sync and shows 3-1/2 to 4-1/2 bars sloping downward to the right. If the trimmer has insufficient range, set the trimmer to mid-position (1 turn out from maximum capacity) and adjust the L-14 horizontal frequency adjustment until this condition is obtained. See Figure 9 for the location of L-14.

HORIZONTAL LOCKING RANGE ADJUSTMENT —Set the horizontal hold control to the extreme counter-clockwise position. Momentarily remove the signal by switching off channel and then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync. If more than 4-1/2 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C-55A (See Figure 6) slightly clockwise. If less than 3-1/2 bars are present, adjust trimmer C-55A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 3-1/2 to 4-1/2 bars are present. Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the condition specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS — Adjust the height control R-86 (See Figure 6) until the picture fills the mask vertically. Adjust the vertical linearity control R-93 (See Figure 6) until the picture is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust vertical centering control R-105 (See Figure 6) to align the picture with the mask.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS —Turn the width control L-15 (at top of power supply cover) to the maximum clockwise position. Vary the horizontal drive trimmer C-55C (See Figure 6) to yield the best compromise between brightness and linearity. Adjust the horizontal linearity control L-16 (See Figure 6) for best linearity of the right half of the picture. Readjust the width control L-15, until the picture just fills the mask. Adjust horizontal centering control R-106 (See Figure 6) to align the picture with the mask.

FOCUS —Adjust the focus control R-104 (see Fig. 6) for maximum definition of the vertical wedge of the picture. Check to see that all cushion, yoke and focus coil thumb screws are tight. Replace the cabinet back making sure that the back is on tight, otherwise it may rattle at high volume.

CHECK OF R-F OSCILLATOR ADJUSTMENTS-With a crystal calibrated test oscillator or heterodyne frequency meter, check to see if the receiver R-F oscillator is adjusted to the proper frequency on all channels. The adjustments for all channels are available from the front of the cabinet by removing the front panel as shown in Figure 5. Tune in all available television stations.

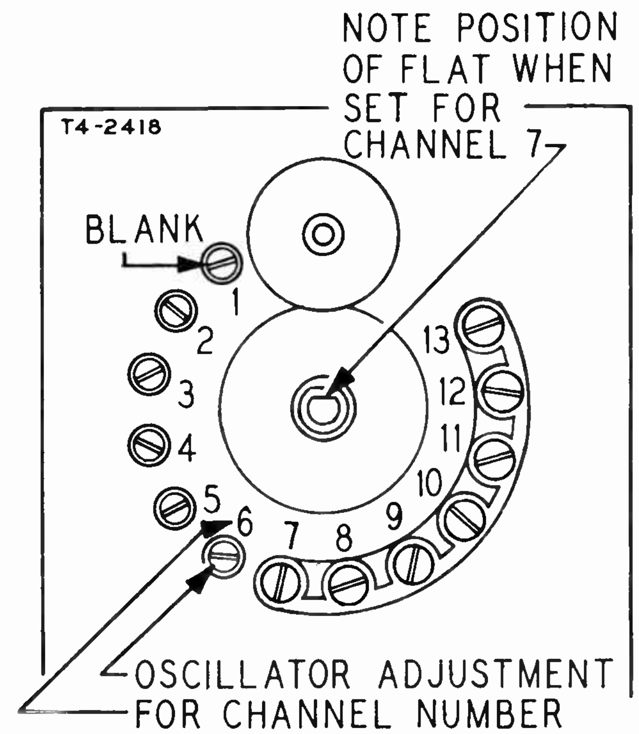

Fig. 8—R-F Oscillator Adjustments

VIDEO PEAKING LINK—A video peaking link is provided to permit changing the video response. This link is connected at the factory with the peaking in. However, if transients are produced on high contrast pictures, or picture is smeared or fuzzy, or if the receiver is operated in areas where the signal strength is weak, open the video peaking link connecting L-13 and R-52.

VENTILATION CAUTION—The receiver is provided with adequate ventilation holes in the bottom and back of the cabinet. Care should be taken not to allow these holes to be covered or ventilation to be impeded in any way.

World Radio History

SERVICE SUGGESTIONS

NO RASTER ON KINESCOPE —If raster cannot be obtained check below for the possible causes.

1. Ion trap magnet adjustment is incorrect.
2. No high voltage, check V-17 (6BG6-G) and V-18 (1B3-GT/8016) tubes and circuits. If the horizontal deflection circuits are operating, as evidenced by the correct wave form measured on terminal 4 of horizontal output transformer (T-8), the trouble can be isolated to the high voltage rectifier (V-18) circuit. Either the high voltage winding (points 2 to 3 on T-8) is open, tube V-18 is defective, its filament circuit is open, or the high voltage filter capacitor (C-76) is shorted.
3. Damper tube V-19 (5V4-G) defective. Plate voltage supply for V-17 (6BG6-G) horizontal output tube is obtained through the damper tube. Check tube and heater winding on power transformer (T-9). If the tube is alright, check the horizontal linearity coil (L-16) for continuity and check capacitors C-69 and C-75 for short circuit.
4. Defective kinescope. Heater open, cathode return circuit open.
5. No plate voltage. Electrolytic capacitor shorted. All +B measurements are accessible for measurement by removing cover from bleeder box.
6. Horizontal oscillator and control tube V-16 (6SN7-GT) defective. Check for sawtooth on grid of horizontal output tube V-17 (6BG6-G). If not present, check voltages and components in the V-16 (6SN7-GT) circuits.

HORIZONTAL DEFLECTION ONLY —If only horizontal deflection is obtained as evidenced by a straight line across the face of the kinescope, it can be caused by the following:

1. Vertical oscillator and output tube V-15 (6SN7-GT) inoperative. Check voltages on grid and plate.
2. Vertical output transformer (T-7) open.
3. Yoke vertical coils open.

POOR VERTICAL LINEARITY—If adjustment of the vertical, height and linearity controls will not correct this condition, any of the following may be the cause:

1. Vertical output transformer (T-7) defective.
2. Capacitors C-80A or C-78A defective.
3. V-15 (6SN7-GT) defective, check voltages.
4. Excess leakage or incorrect value in capacitor C-82.
5. Low plate and bias voltages. Check rectifier tube and capacitors in +B supply circuits.
6. Capacitor C-81 defective.

POOR HORIZONTAL LINEARITY—If adjustment of controls does not correct this condition, check the following:

1. Check or replace horizontal output tube V-17 (6BG6-G).
2. Check or replace damper tube V-19 (5V4-G).
3. Check linearity coil L-16 for short circuit.
4. Check capacitors C-69 and C-75 for defects.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER —

1. Improper adjustment of focus coil or ion trap magnet.
2. Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER—This condition can be caused by:

Defective yoke due to R-97, R-98 or C-86 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.

SMALL RASTER —This condition can be caused by:

1. Low +B or line voltage.
2. Insufficient output from horizontal output tube V-17 (6BG6-G). Replace tube.
3. Insufficient output from vertical output tube V-15 (6SN7-GT). Replace tube.

SERVICE SUGGESTIONS (Continued)

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND—This condition can be caused by:

1. No signal on kinescope grid. Check picture I-F amplifier tubes V-9, 10 and 11 (6AG5's), second detector V-12 (6AL5) and video amplifier V-13 (12AU7).
2. Bad contact to kinescope grid (lead to socket broken).

SIGNAL APPEARS ON KINESCOPE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY —A condition of this nature can be caused by:

1. Defective sync amplifier and separator V-14 (6SN7-GT).
2. If tube is O.K. check voltages, and associated circuits.

SIGNAL ON KINESCOPE GRID AND HORIZONTAL SYNC ONLY —If this condition is encountered, check:

1. Vertical integrating network capacitors C-71, C-72, C-73 and C-74; and resistors R-79, R-80 and R-81.

PICTURE STABLE BUT WITH POOR RESOLUTION —If the picture resolution is not up to standard, it may be caused by any of the following:

1. Defective picture detector V-12 (6AL5) or video amplifier V-13 (12AU7).
2. Open video peaking coil. Check all peaking coils L-8, L-9, L-10, L-11 for continuity. Note that L-9 and L-11 have shunting resistors.
3. Leakage in V-13 (12AU7) grid capacitor C-42. If the above components are not found to be defective, check the following:

1. Check all potentials in video circuits.
2. Check kinescope grid circuit for poor or dirty contact.
3. Check adjustment of focus control R-104. It should be effective on either side of proper focus.
4. Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE SMEAR:

1. Normally, smear can be attributed to phase shift at the low frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video amplifier tube V-13 (12AU7).
2. This trouble can also originate at the transmitter. Check reception from another station.

PICTURE JITTER:

1. If regular sections at left of the picture are displaced, replace the horizontal output tube V-17 (6BG6-G).
2. Vertical instability may be due to loose connections or noise received with the signal.
3. Horizontal instability may be due to unstable transmitted sync or to noise.

ALIGNMENT PROCEDURE

TEST EQUIPMENT —To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency ranges:

18 to 30 mc, 1 mc sweep width
40 to 90 mc, 10 mc sweep width
170 to 225 mc, 10 mc sweep width

(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)

(a) Intermediate frequencies:

21.25 mc sound i-f and sound traps
22.8 mc converter transformer
23.9 mc first picture i-f coil
24.5 mc third picture i-f coil
26.0 mc second picture i-f coil
27.5 mc adjacent picture trap

ALIGNMENT TABLE

DISCRIMINATOR AND SOUND I-F ALIGNMENT

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Sweep Generator to	Sweep Gen. Freq. Mc.	Connect Oscilloscope to	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust	Refer to
1	2nd sound i-f grid (pin 1, V-5)	21.25 .1 volt output	Not used		Not used	In series with 1 meg. to junction of R-14 and R-13	Meter on 10 volt scale	Detune T-3 (bottom) Adjust T-3 (top) for max. on meter.	Fig. 11 Fig. 12
2	2nd sound i-f grid (pin 1, V-5)	21.25 .1 volt output	Not used		Not used	Discriminator output (pin 1 of V-6)	Meter on 3 volt scale	T-3 (bottom) for zero on meter.	Fig. 12
3	2nd sound i-f grid (pin 1, V-5)	21.25 .1 volt output	2nd sound i-f grid (pin 1, V-5)	21.25 center 1 mc .1 volt output	Discriminator output (pin 1 of V-6)	Not used	Check for symmetrical response waveform (positive and negative). If not equal adjust T-3 (top) until they are equal. See Note 1.		Fig. 11 Fig. 12 A
4	Trap winding on T-1 (top of chassis)	21.25 reduced output	Trap winding on T-1	21.25 reduced output	Terminal A, T-2 in series with 33,000 ohms. See Note 2.	Not used	Sweep output reduced to provide .3 volt p-to-p on scope. See Note 3.	T-2 (top and bottom) for max. gain and symmetry at 21.25 mc.	Fig. 11 Fig. 12 B

NOTE: 1: The peak to peak bandwidth of the discriminator should be approximately 350 kc. and should be linear from 21.175 mc. to 21.325 mc.

NOTE 2: If a 60 cycle sweep rate is used, it will be necessary to reduce the time constant in the 2nd sound i-f grid circuit in order to reproduce the desired response curve. To do this, shunt R-10 (Terminal "A" of T-2 to chassis) with 5600 ohms.

NOTE 3: The sweep generator output should be set to produce approximately 0.3 volt peak-to-peak at the second sound i-f grid return (Terminal "A" of T-2) for final touch-up on this adjustment. Signal voltage in excess of 0.3 volt will tend to broaden the response curve—permitting misadjustment to pass unnoticed.

2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 10 kilovolts.

SERVICE PRECAUTIONS—To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the front panel, the cabinet back, disconnect all leads to the radio chassis and then the 5 chassis mounting bolts. The chassis normally should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, the kinescope should be inserted only after the chassis is turned on end. The kinescope should never be allowed to support its weight by resting in the deflection yoke. A bracket should be used to support the tube at its viewing screen. By turning the chassis on end with the power transformer up, all adjustments will be conveniently available. Since this is the only safe position in which the chassis will rest and still leave adjustment accessible, the trimmer location drawings are oriented similarly for ease of use.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high-voltage filter resistor R-82.

12	Junction C-31 and R-23	24.5	Not used		Not used	Junction of L-8 and R-51		L-7 (top chassis) for max.	Fig. 14

NOTE: Oscillation may occur if the i-f section is badly out of alignment. This will be evidenced by a meter reading in excess of 3 volts and is caused by the "staggered" i-f stages being tuned to approximately the same frequency. If this condition is encountered, adjust the core studs of T-1 (bottom) L-5, T-10 and L-7 until oscillation ceases. Oscillation may not be encountered until proceeding with steps 9, 10, or 11.

RETOUCHING OF PICTURE I-F ADJUSTMENTS —The picture i-f response curve varies somewhat with change of bias and for this reason it should be aligned with approximately the same signal input as it will receive in operation.

If the receiver is located at the edge of the service area, it should be aligned with approximately —1 volt i-f grid bias. However, for normal conditions, (signals of 1000 microvolts or greater), it is recommended that the picture i-f be aligned with a grid bias of —3 volts. Set the picture control for —3 volts at the junction of R-41 and R-43.

Connect the r-f sweep generator to the receiver antenna terminals.

Connect the signal generator to the antenna terminals and feed in the 25.75 megacycles i-f picture carrier marker and a 23 megacycles marker.

Connect the oscilloscope across the picture detector load resistor R-51.

Set the channel switch to channel (between 1 and 6) found to have the best response.

Set the sweep output to produce approximately .3 volt peak to peak across the picture detector load resistor.

Observe and analyze the response curve obtained. The response will not be ideal and the i-f adjustments must be retouched in order to obtain the desired curve. In making these adjustments, care should be taken that no two transformers are tuned to the same frequency as i-f oscillation may result.

On final adjustment the picture carrier marker must be at approximately 45% response. The curve must be approximately flat topped and with the 23 mc marker at 90% response.

The most important consideration in making the i-f adjustments is to get the picture carrier at the 45% response point. If the picture carrier operates too low on the response curve, loss of low frequency video response, of picture brilliance, of blanking, and of sync may occur. If the picture carrier operates too high on the response curve, the picture definition is impaired by loss of high frequency video response.

SENSITIVITY CHECK —A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through an attenuator pad of the type shown in Figure 17. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position.

Only carbon type resistors should be used to construct the attenuator pad. Since many of the low value molded resistors generally available are of wire wound construction, it is advisable to break and examine one of each type of resistor used in order to determine its construction.

RESPONSE CURVES — The response curves shown in Figure 18 were taken from a production set. Although these curves are typical, some variations can be expected.

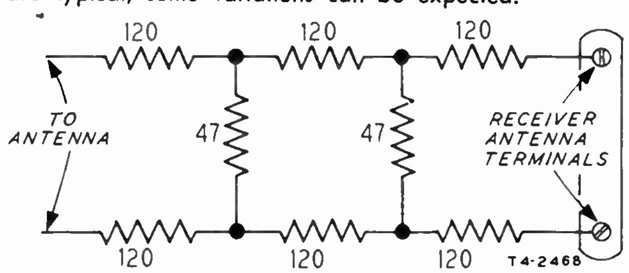

Fig. 17—Attenuator Pad

The response curves are shown in the classical manner of presentation, that is with response up and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

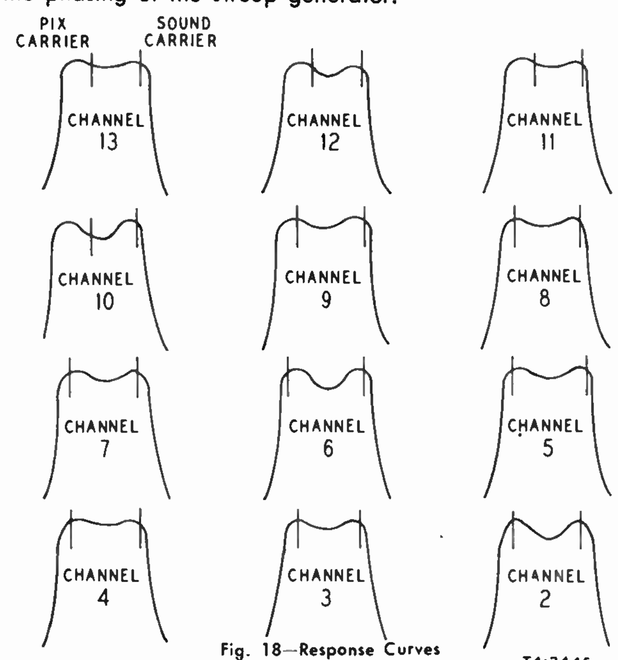

Fig. 18—Response Curves

CRITICAL LEAD DRESS—

1. Do not permit any strains to be placed on the leads of R-68, R-59, R-63, R-62, R-58, R-61, R-67 and R-64. Do not permit these resistors to be exposed to the heat of a soldering iron any more than is absolutely necessary.
2. Dress the temperature compensating resistor R-64 approximately one quarter inch from the power transformer and the chassis.
3. Dress all video coupling capacitors and peaking coils up and away from the chassis.
4. Contact between the R-F oscillator frequency adjustment screws and the oscillator coils on channel switch outlets must be avoided.
5. Dress T-8 winding leads as shown in Figure 16.

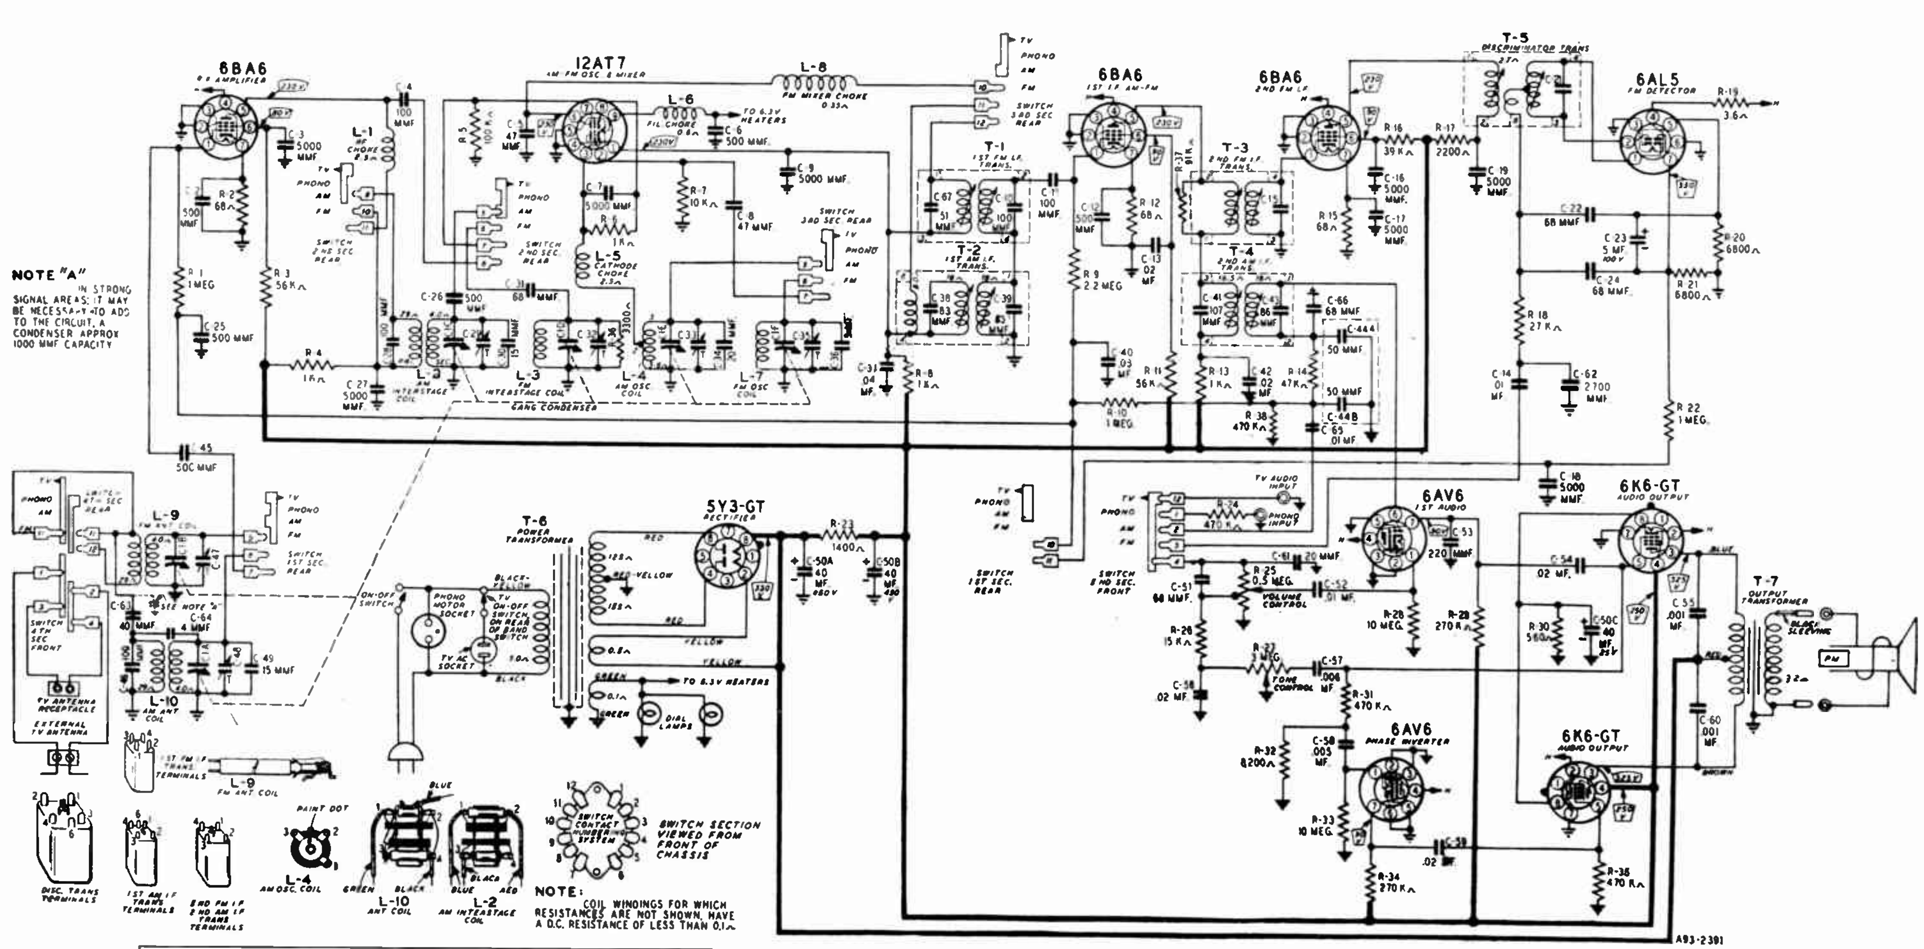
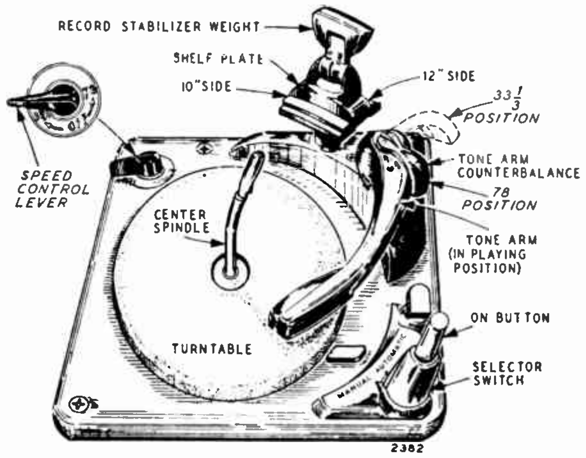
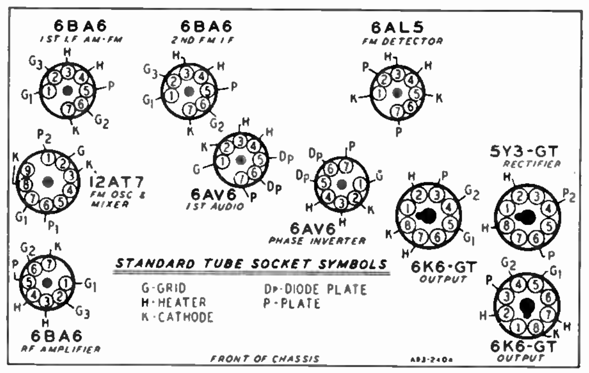
RADIO SCHEMATIC DIAGRAM





WEBSTER No. 256 DUAL SPEED RECORD CHANGER



TUBE SOCKET VOLTAGES

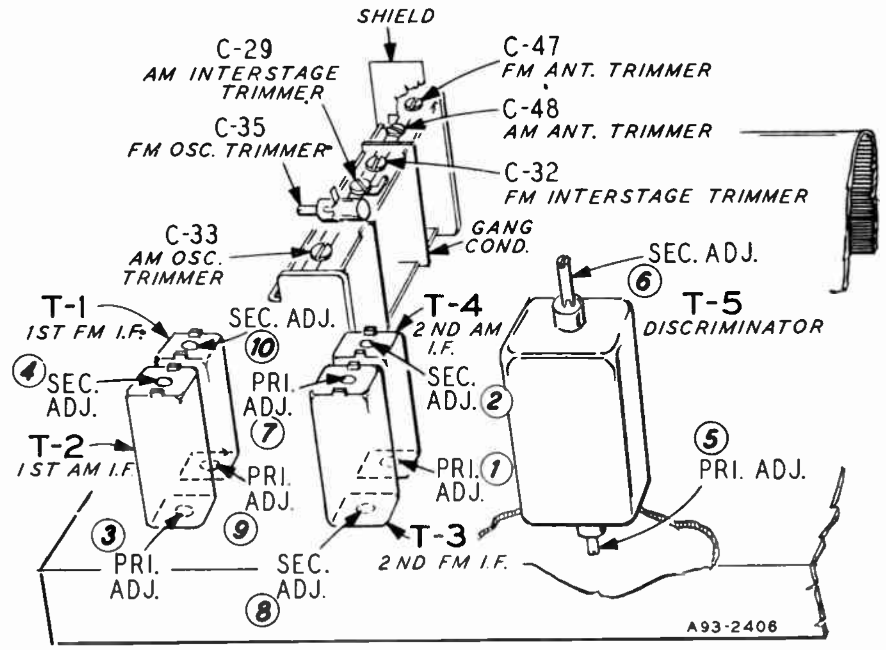
Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage ....117 Volts AC

Signal Input ....None

A variation of ±10% is usually permissible.

RADIO MISCELLANEOUS DATA



TRIMMER POSITIONS

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

RADIO ALIGNMENT PROCEDURE

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas —.1 mf, 200 mmf.

Volume Control—Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
I-F	455 kc	12AT7 Pin 7 and Chassis	.1 mf	Broadcast	Rotor Fully Open	2nd I-F Pri. & Sec. 1 & 2 1st I-F Pri. & Sec. 3 & 4	Maximum Output
Broadcast	1620 kc	Dipole Antenna Terminal and Ground	200 mmf	Broadcast	Rotor Fully Open	Broadcast Oscillator C-33	
	1400 kc	Dipole Antenna Terminal and Ground	200 mmf	Broadcast	Turn Rotor to Max. Output Set pointer to 1400 kc See Note A	Broadcast Interstage C-29	
	1400 kc	Dipole Antenna Terminal and Ground	200 mmf	Broadcast		AM Trimmer C-48	

Note A—If the pointer is not at 1400 KC on dial, reset pointer at the 1400 KC mark on the dial scale.

FM STAGES

The following equipment is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 1000 ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)
Allow chassis and signal generator to warm up for several minutes.

R-F & Osc.	108.4 Note H	Disconnect dipole and connect generator to dipole terminals with resistor in series connected to terminal No. 1.	300 ohms	FM	Rotor Fully Open	Oscillator C-35 Note G	Maximum Deflection
	104.5		300 ohms	FM	Tune Rotor for Max. AVC voltage	FM Interstage C-32	Maximum Deflection
	104.5		300 ohms	FM	Tune Rotor for Max. AVC voltage	Ant. C-47	Maximum Deflection
Recheck R-F and Osc. Adjustments in order given							

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the junction of resistor R-22 and condenser C-18 for all adjustments except the discriminator secondary adjustment, for which See Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and connect to junction of R-18 c–d C-62. Adjust for zero voltage indication.

NOTE D—Before adjusting Pri. core connect 1000 ohm load resistor across the 2nd I.F. secondary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE E—Disconnect 1000 ohm load resistor from secondary terminals and connect across the 2nd I.F. primary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillator frequency above signal frequency.

NOTE H—Remove the 1000 ohm load resistor before attempting to check the R-F and oscillator adjustments.

SUPPLEMENTARY MANUAL

All service information applicable to models 94WG-3016A, B and C is contained in service manual 3008A, and this Supplementary Service Manual. The differences between the models are as follows:

1. Models 94WG-3016A and 94WG-3016B are identical to model 94WG-3008A, except for the use of a 12½" picture tube and minor resistor, condenser, and mechanical part changes that are required for a larger tube. A new schematic diagram and a new replacement parts list is incorporated in this Supplementary manual. For all other service and replacement parts information, refer to manual 3008A.

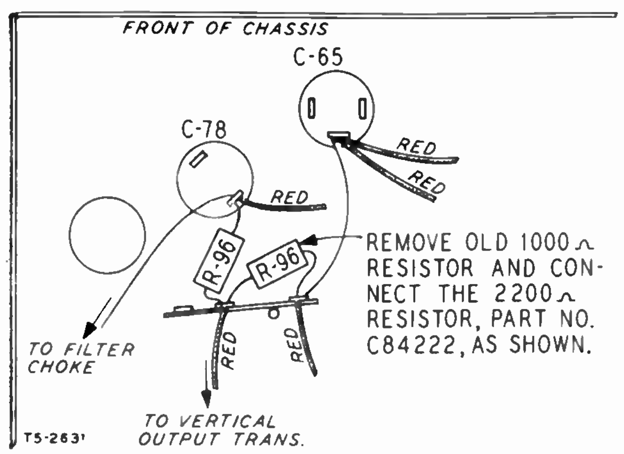
2. Model 94WG-3016C is a Model 94WG-3008A converted by a field modification to use a 12½" picture tube. This was accomplished by the use of a kit, part number 26A503, now no longer available. An illustration of the few circuit changes is in this manual. For a complete parts list and other service information, refer to manual 3008A.

CIRCUIT CHANGES

MODEL 94WG-3016C

The changes shown in the illustration applies +265 volts to the primary of the vertical deflection transformer instead of +225 volts as shown in Manual No. 3008A.

In addition, a .05 mf 400V condenser (part no. D67503) was installed between pin No. 6 of the 6BG6 horizontal output socket and the yellow wire connected to the upper end of the horizontal size control. Then a black wire (9½") was connected between pin No. 6 of the 6BG6 horizontal output socket and terminal No. 6 of the horizontal output transformer. This procedure connected the .05 mf 400V condenser across the width control L-15.



PARTS LIST

MODELS 94WG-3016A&B

The partial parts list shown below constitute the changes that were made on the 94WG-3008A so that a 12½" picture tube could be used. This necessitated the changing of the model number to 94WG-3016A&B. For all other service and replacement parts information refer to manual 3008A.

13	210-216	211.25	215.75	237

RECEIVER LOCATION—Advise the owner as to the proper location for the television receiver. The following may be used as a guide:

1. Choose an area in the home where sunlight or light from lamps do not strike the face of the picture tube and cause glare.
2. Remember the necessity of an electrical outlet and the location of the point at which the antenna leads enter the room.
3. The receiver should be placed a short distance from the wall to allow adequate ventilation.
4. The receiver should be placed to permit easy access for operation and comfortable viewing from all angles.

NATENNA—This receiver has been designed to use an antenna with a 300 ohm balanced transmission line. This line must be as short as possible because the longer the line the greater the chances are for picking up electrical disturbances. Stand-off insulation should be used to keep the line away from the mast, metal or walls. Twist this line about one turn per foot throughout the line to cancel out direct signal and/or noise pickup by the transmission line. It should also be securely anchored in place so that a change in weather will not affect its position.

HIGH VOLTAGE WARNING

This television receiver contains high voltages which are dangerous to life. Never operate or service the receiver outside of the cabinet or with the covers removed until all the safety precautions necessary for working with high voltage equipment have been observed.

PICTURE TUBE HANDLING PRECAUTION

Shatterproof goggles and heavy gloves must be worn by individuals while handling the picture tube or installing the picture tube into the receiver.

The picture tube encloses a high vacuum and due to the large surface area, is subjected to excessive air pressure. Therefore, care should be taken not to bump or scratch the picture tube accidentally as it may cause the tube to implode resulting in damage to property or injury to an individual.

©John F. Rider

World Radio History

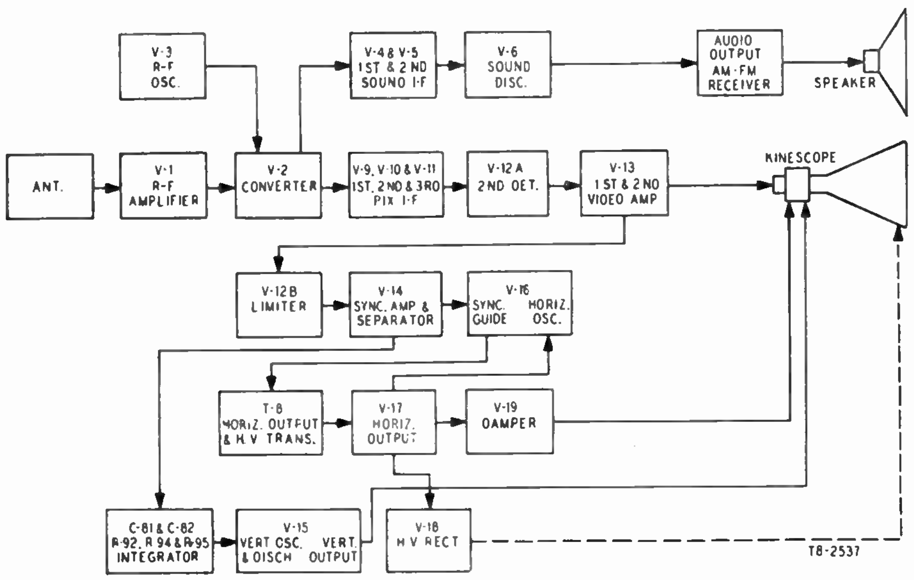

Fig. 2—Block Diagram

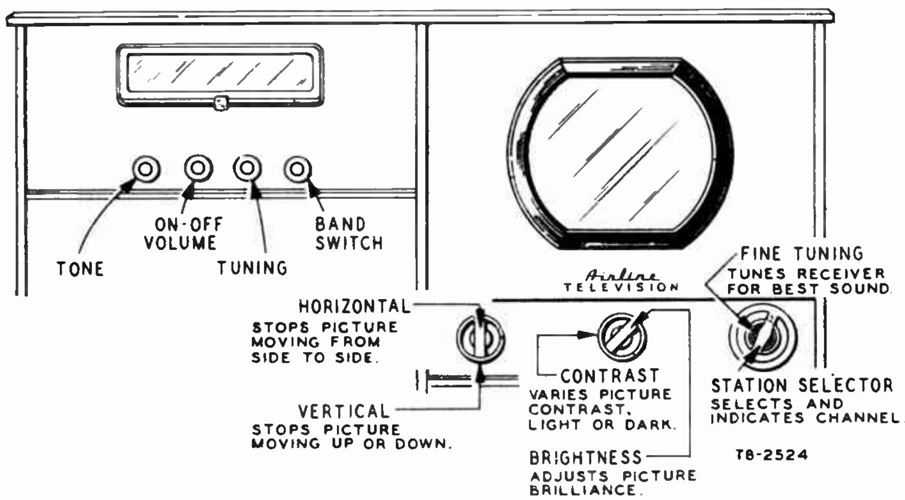

Fig. 3—Front Panel Controls

TUNING PROCEDURE

1. To turn the television receiver on, turn the ON-OFF VOLUME CONTROL on the radio panel until a click is heard. Allow approximately 30 seconds for the tubes to warm up.
2. Turn BAND SWITCH CONTROL on the radio panel fully counterclockwise to the TV position.
3. Turn the STATION SELECTOR CONTROL to the desired channel. This control may be turned in either direction.
4. Turn the CONTRAST CONTROL fully counterclockwise.
5. Turn the BRIGHTNESS CONTROL fully counterclockwise and then very slowly clockwise until light is readily visible on the screen.
6. Turn the CONTRAST CONTROL clockwise until activity or definite form is noted on the screen.
7. Adjust the FINE TUNING CONTROL for best tonal quality and the VOLUME CONTROL for desired volume.
8. Adjust the HORIZONTAL CONTROL until the picture is obtained and centered.
9. Turn VERTICAL CONTROL clockwise until the picture rolls slowly downward, then turn control counter clockwise until picture stops moving up.
10. Adjust the CONTRAST CONTROL until the best picture is obtained and if necessary make a slight readjustment of the BRIGHTNESS CONTROL.
11. After the receiver has been on for a while it may be necessary to readjust the FINE TUNING CONTROL for best sound quality.
12. When switching from one channel to another, it may be necessary to repeat steps number 7 and 10.
13. To turn off the receiver, turn the ON - OFF VOLUME CONTROL counterclockwise until a click is heard.
14. When the receiver is turned on again and the positions of the controls have not been changed, no further adjustments will be necessary except for the FINE TUNING CONTROL and VOLUME CONTROL for the desired volume.
15. If the positions have been disturbed since the last time the receiver has been used it may be necessary to follow steps 1 to 11.

PICTURE TUBE — Some receivers are shipped with the picture tube in place. However, some of the picture tube adjustments may have been jarred loose in shipment. If adjustments are necessary, the following should be used as a guide:

1. After the receiver has been unpacked and the cradle removed, take off the cabinet back and make sure all the tubes are properly mounted in their respective sockets.
2. Connect an antenna to the antenna terminals at the rear of the radio chassis and insert the line cord plug into a convenience outlet.
3. Turn on the receiver and wait about 60 seconds for the receiver to warm up. Turn the channel selector to a station that is transmitting and check the picture. If the picture is not centered on the screen, or visible at all, make the adjustments on the deflection yoke, focus coil and ion trap magnet assemblies as outlined on page 5.

PICTURE TUBE REPLACEMENT — Should the picture tube have to be replaced, remove the defective picture tube in the following manner:

1. Remove the front panel control knobs by pulling them straight from their shafts.
2. Remove two ornamental screws holding front panel to the Cabinet (see figure 5) and lift out panel.
3. Remove the cabinet back.
4. Disconnect the picture tube socket connector at the base of the tube and the high voltage anode lead from the front of the picture tube.

   WARNING—REMOVE STATIC CHARGE FROM THE ANODE LEAD BY GROUNDING IT AGAINST THE CHASSIS.
5. Remove the ion trap magnet, slipping it from the neck of the picture tube past the socket.
   NOTE: Ion trap magnets not used with 12KP4 Tubes.
6. Loosen the wing nuts and wing screws on the deflection yoke and focus coil.
7. Loosen the strap holding the front of the picture tube in place and withdraw the picture tube toward the front of the chassis.
8. To install a new picture tube, reverse the above procedure making sure that the picture tube is fitted closely against the picture tube cushion and that the high voltage well connector is at the top of the picture tube. If the picture tube sticks or fails to slip into place smoothly, investigate and remove the source of the trouble. Never force the tube.

PICTURE TUBE WINDOW — Clean the picture tube window with a dampened cloth or a soft lint-free cloth if dust or finger marks are present.

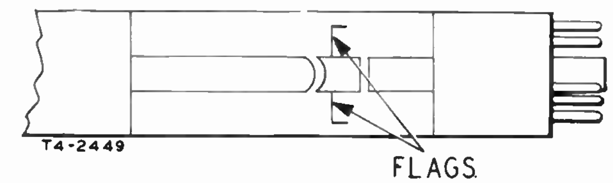

Fig. 4—Ion Trap Flags

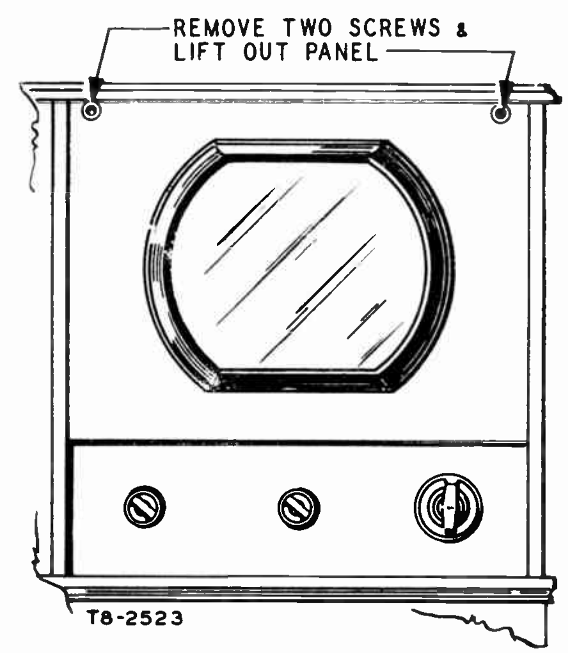

Fig. 5—Front Panel Removal

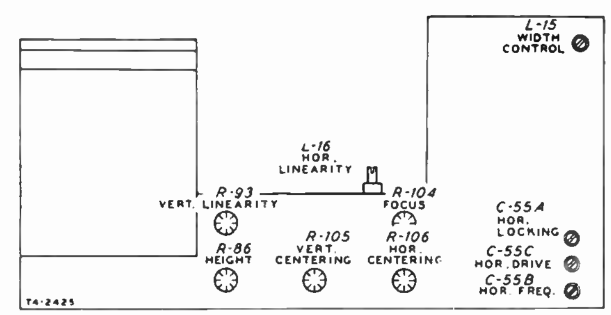

Fig. 6—Rear Chassis Adjustments

World Radio History

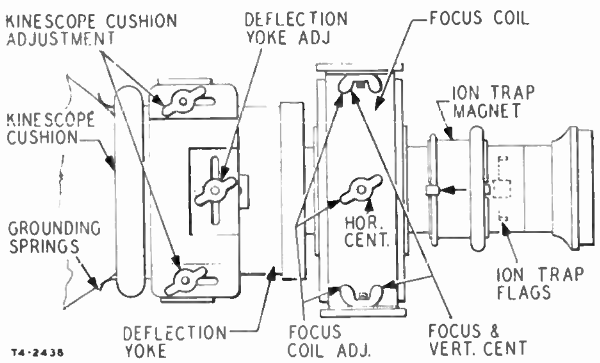

Fig. 7—Yoke, Focus and Ion Trap Magnet Adjustment

NON-OPERATING CONTROLS
(Rear Of Chassis)

Horizontal Centering	R-106
Vertical Centering	R-105
Width	L-15
Height	R-86
Horizontal Linearity	L-16
Vertical Linearity	R-93
Horizontal Drive	C-55C
Horizontal Frequency (Fine)	C-55B
Horizontal Oscillator Frequency (Bottom Chassis)	L-14
Horizontal Locking Range	C-55A
Focus	R-104
Focus Coil	Wing Nut Adjustment
Ion Trap Magnet	Wing Nut Adjustment
Deflection Coil	Wing Screw Adjustment

DEFLECTION YOKE ADJUSTMENT — If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

FOCUS COIL ADJUSTMENT — Turn the HORIZONTAL CENTERING (R-106) and VERTICAL CENTERING (R-105) CONTROLS to the halfway position. (See Figure 6). If a corner of the raster is shadowed, it indicates that the electron beam is striking the neck of the tube. Loosen the focus coil adjustment wing nuts and rotate the coil about its vertical and horizontal axes until the entire raster is visible, approximately centered and with no shadowed corners. Tighten the focus coil adjustment wing nuts with the coil in this position.

ION TRAP MAGNET ADJUSTMENT—The ion trap magnet should be positioned exactly as shown in Figure 7. Adjust the magnet by moving it back and forth and at the same time rotating it slightly around the neck of the picture tube until the brightest raster is obtained on the picture screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the Focus Control R-104 (see Figure 6) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

PICTURE ADJUSTMENT—For further adjustments, obtain a test pattern on the receiver. Turn on receiver and follow tuning procedure on page 24.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel and then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal bars will be gradually reduced and when only 3-1/2 to 4-1/2 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. The pull-in should occur when the control is approximately 90 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should be out of sync and should show from 3-1/2 to 4-1/2 bars sloping downward to the right.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus" adjustment.

ALIGNMENT OF HORIZONTAL OSCILLATOR — If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync for at least 60 degrees of clockwise rotation of the control from the pull in point, it will be necessary to make the following adjustments.

HORIZONTAL FREQUENCY ADJUSTMENT—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the rear apron horizontal frequency trimmer C-55B (see Figure 6) until the picture is out of sync and shows 3-1/2 to 4-1/2 bars sloping downward to the right. If the trimmer has insufficient range, set the trimmer to mid-position (1 turn out from maximum capacity) and adjust the L-14 horizontal frequency adjustment until this condition is obtained. See Figure 9 for the location of L-14.

HORIZONTAL LOCKING RANGE ADJUSTMENT—Set the horizontal hold control to the extreme counter-clockwise position. Momentarily remove the signal by switching off channel and then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync. If more than 4-1/2 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C-55A (See Figure 6) slightly clockwise. If less than 3-1/2 bars are present, adjust trimmer C-55A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 3-1/2 to 4-1/2 bars are present. Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the condition specified under each are fulfilled. When the horizontal hold operates as outlined ender "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS — Adjust the height control R-86 (See Figure 6) until the picture fills the mask vertically. Adjust the vertical linearity control R-93 (See Figure 6) until the picture is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust vertical centering control R-105 (See Figure 6) to align the picture with the mask. See note on page 13.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS—Turn the width control L-15 (at top of power supply cover) to the maximum clockwise position. Vary the horizontal drive trimmer C-55C (See Figure 6) to yield the best compromise between brightness and linearity. Adjust the horizontal linearity control L-16 (See Figure 6) for best linearity of the right half of the picture. Readjust the width control L-15, until the picture just fills the mask. Adjust horizontal centering control R-106 (See Figure 6) to align the picture with the mask.

FOCUS—Adjust the focus control R-104 (see Fig. 6) for maximum definition of the vertical wedge of the picture. Check to see that all cushion, yoke and focus coil thumb screws are tight. Replace the cabinet back making sure that the back is on tight, otherwise it may rattle at high volume.

CHECK OF R-F OSCILLATOR ADJUSTMENTS—With an accurately calibrated signal generator (crystal calibrated type preferred), check to see if the receiver R-F oscillator is adjusted to the proper frequency on all channels. The adjustments for all channels are available from the front of the cabinet by removing the front panel as shown in Figure 5. Tune in all available television stations.

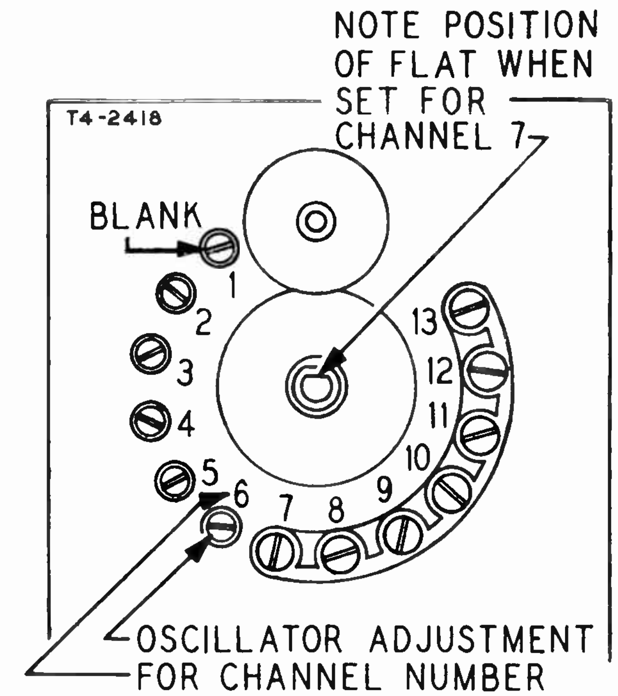

Fig. 8—R-F Oscillator Adjustments

VIDEO PEAKING LINK—A video peaking link is provided to permit changing the video response. This link is connected at the factory with the peaking in. However, if transients are produced on high contrast pictures, or picture is smeared or fuzzy, or if the receiver is operated in areas where the signal strength is weak, open the video peaking link connecting L-13 and R-52. See the television schematic diagram for the location of the video peaking link.

UHF CONNECTION—When UHF (Ultra High Frequency) television programs become available, this receiver may be used in conjunction with a converter to reproduce the UHF programs. After the converter is connected to the antenna terminals on the receiver, the station selector switch must be turned one position clockwise past channel 2 to permit reception of the UHF signals.

VENTILATION CAUTION—The receiver is provided with adequate ventilation holes in the bottom and back of the cabinet. Care should be taken not to allow these holes to be covered or ventilation to be impeded in any way.

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE—If raster cannot be obtained check below for the possible causes.

1. Ion trap magnet adjustment is incorrect.
2. No high voltage, check V-17 (6BG6-G) and V-18 (1B3-GT/8016) tubes and circuits. If the horizontal deflection circuits are operating, as evidenced by the correct voltage measured on terminal 2 of horizontal output transformer (T-8), the trouble can be isolated to the high voltage rectifier (V-18) circuit. Either the high voltage winding (points 2 to 3 on T-8) is open, tube V-18 is defective, its filament circuit is open, or the high voltage filter capacitor (C-76) is shorted.
3. Damper tube V-19 (5V4-G) defective. Plate voltage supply for V-17 (6BG6-G) horizontal output tube is obtained through the damper tube. Check tube and heater winding on power transformer (T-9). If the tube is alright, check the horizontal linearity coil (L-16) for continuity and check capacitors C-69 and C-75 for short circuit.
4. Defective picture tube. Heater open, cathode return circuit open.
5. No plate voltage. Electrolytic capacitor shorted. All +B measurements are accessible for measurement by removing cover from bleeder box.
6. Horizontal oscillator and control tube V-16 (6SN7-GT) defective. Check voltages and components in the V-16 (6SN7-GT) circuits.

HORIZONTAL DEFLECTION ONLY—If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:

1. Vertical oscillator and output tube V-15 (6SN7-GT) inoperative. Check voltages on grid and plate.
2. Vertical output transformer (T-7) open.
3. Yoke vertical coils open.

POOR VERTICAL LINEARITY—If adjustment of the vertical, height and linearity controls will not correct this condition, any of the following may be the cause:

1. Vertical output transformer (T-7) defective.
2. Capacitors C-80A or C-78A defective.
3. V-15 (6SN7-GT) defective, check voltages.
4. Excess leakage or incorrect value in capacitor C-82
5. Low plate and bias voltages. Check rectifier tube and capacitors in +B supply circuits.
6. Capacitor C-81 defective.

POOR HORIZONTAL LINEARITY—If adjustment of controls does not correct this condition, check the following:

1. Check or replace horizontal output tube V-17 (6BG6-G).
2. Check or replace damper tube V-19 (5V4-G).
3. Check linearity coil L-16 for short circuit.
4. Check capacitors C-69 and C-75 for defects.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER—

1. Improper adjustment of focus coil or ion trap magnet.
2. Defective yoke.
3. Open condenser C-86 on horizontal yoke coil L-19.

WRINKLES ON LEFT SIDE OF RASTER—This condition can be caused by:

Defective yoke due to R-97, R-98 or C-86 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.

SMALL RASTER—This condition can be caused by:

1. Low +B or line voltage.
2. Insufficient output from horizontal output tube V-17 (6BG6-G). Replace tube.
3. Insufficient output from vertical output tube V-15 (6SN7-GT). Replace tube.

SERVICE SUGGESTIONS (Continued)

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND—This condition can be caused by:

1. No signal on picture tube grid. Check picture I-F amplifier tubes V-9, 10 and 11 (6AG5's), second detector V-12 (6AL5) and video amplifier V-13 (12AU7).
2. Bad contact to picture tube grid (lead to socket broken).
3. Leakage in V-13 (12AU7) grid capacitor C-42. If the above components are not found to be defective check the following:

1. Check all potentials in video circuits.
2. Check picture tube grid circuit for poor or dirty contact.
3. Check adjustment of focus control R-104. It should be effective on either side of proper focus.
4. Check and realign, if necessary, the picture I-F and R-F circuits.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY—A condition of this nature can be caused by:

1. Defective sync amplifier and separator V-14 (6SN7-GT).
2. If tube is O.K. check voltages, and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY—If this condition is encountered, check:

1. Vertical integrating network capacitors C-71, C-72, C-73 and C-74; and resistors R-79, R-80 and R-81.

PICTURE STABLE BUT WITH POOR RESOLUTION—If the picture resolution is not up to standard, it may be caused by any of the following:

1. Defective picture detector V-12 (6AL5) or video amplifier V-13 (12AU7).
2. Open video peaking coil. Check all peaking coils L-8, L-9, L-10, L-11 for continuity. Note that L-9 and L-11 have shunting resistors.

PICTURE SMEAR:

1. Normally, smear can be attributed to phase shift at the low frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video amplifier tube V-13 (12AU7).
2. This trouble can also originate at the transmitter. Check reception from another station.

PICTURE JITTER:

1. If regular sections at left of the picture are displaced, replace the horizontal output tube V-17 (6BG6-G).
2. Vertical instability may be due to loose connections or noise received with the signal.
3. Horizontal instability may be due to unstable transmitted sync or to noise.

ALIGNMENT PROCEDURE

TEST EQUIPMENT—To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency ranges:

18 to 30 mc, 1 mc sweep width
40 to 90 mc, 10 mc sweep width
170 to 225 mc, 10 mc sweep width

(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)

(a) Intermediate frequencies:

21.25 mc sound i-f and sound traps
22.8 mc converter transformer
23.9 mc first picture i-f coil
24.5 mc third picture i-f coil
26.0 mc second picture i-f coil
27.5 mc adjacent channel trap

World Radio History

ALIGNMENT PROCEDURE (Continued)

(b) Radio frequencies:

Channel Number	Picture Carrier Freq. Mc	Sound Carrier Freq. Mc
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal calibrated.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 10 kilovolts.

SERVICE PRECAUTIONS —To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the front panel, the cabinet back, disconnect all leads to the radio chassis and then the 5 chassis mounting bolts. The chassis normally should be serviced without the picture tube. However, if it is necessary to view the raster during servicing, the picture tube should be inserted only after the chassis is turned on end. The picture tube should never be allowed to support its weight by resting in the deflection yoke. A bracket should be used to support the tube at its viewing screen. By turning the chassis on end with the power transformer up, all adjustments will be conveniently available. Since this is the only safe position in which the chassis will rest and still leave adjustments accessible, the trimmer location drawings are oriented similarly for ease of use.

CAUTION: Do not permit the picture tube second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high-voltage filter resistor R-82.

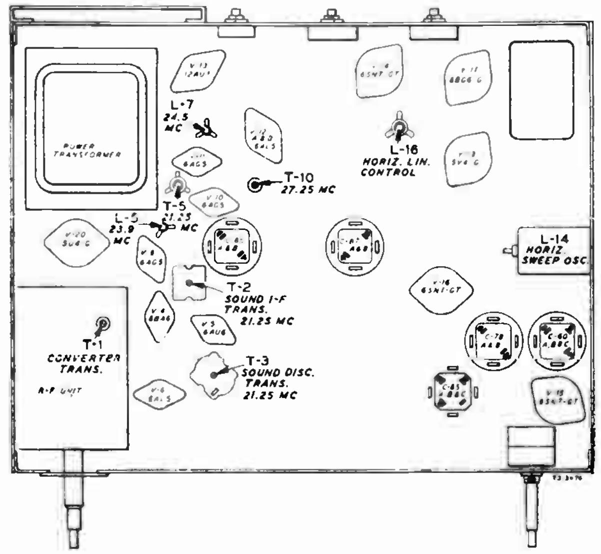

Fig. 9—Bottom Chassis Components

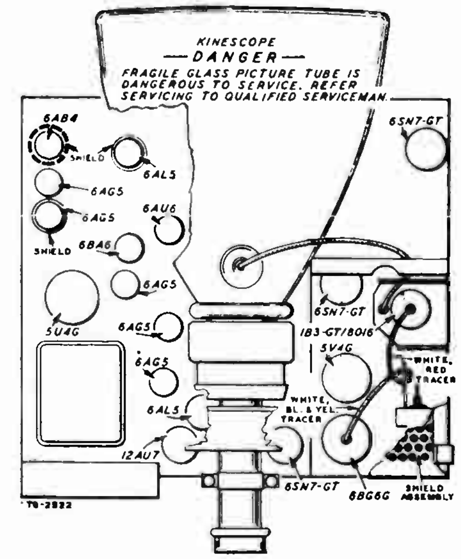

Fig. 10—Tube Layout Diagram

ALIGNMENT TABLE

DISCRIMINATOR AND SOUND I-F ALIGNMENT

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Sweep Generator to	Sweep Gen. Freq. Mc.	Connect Oscilloscope to	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust	Refer to
1	2nd sound i-f grid (pin 1, V-5)	21.25 .1 volt output	Not used		Not used	In series with 1 meg. to junction of R-14 and R-13	Meter on 10 volt scale	Detune T-3 (bottom) Adjust T-3 (top) for max. on meter.	Fig. 11 Fig. 12 Fig. 13
2	2nd sound i-f grid (pin 1, V-5)	21.25 .1 volt output	Not used		Not used	Discriminator output (pin 1 of V-6)	Meter on 3 volt scale	T-3 (bottom) for zero on meter.	Fig. 12 Fig. 13
3	2nd sound i-f grid (pin 1, V-5)	21.25 .1 volt output	2nd sound i-f grid (pin 1, V-5)	21.25 center 1 mc .1 volt output	Discriminator output (pin 1 of V-6)	Not used	Check for symmetrical response waveform (positive and negative). If not equal adjust T-3 (top) until they are equal. See Note 1.		Fig. 11 Fig. 12 Fig. 13
4	Trap winding on T-1 (top of chassis)	21.25 reduced output	Trap winding on T-1	21.25 reduced output	Terminal A, T-2 in series with 33,000 ohms. See Note 2.	Not used	Sweep output reduced to provide .3 volt p-to-p on scope. See Note 3.	T-2 (top and bottom) for max. gain and symmetry at 21.25 mc.	Fig. 11 Fig. 12 Fig. 13

NOTE: 1: The peak to peak bandwidth of the discriminator should be approximately 350 kc. and should be linear from 21.175 mc. to 21.325 mc.

NOTE 2: If a 60 cycle sweep rate is used, it will be necessary to reduce the time constant in the 2nd sound i-f grid circuit in order to reproduce the desired response curve. To do this, shunt R-10 (Terminal "A" of T-2 to chassis) with 5600 ohms.

NOTE 3: The sweep generator output should be set to produce approximately 0.3 volt peak-to-peak on the oscilloscope at the second sound i-f grid return (Terminal "A" of T-2) for final touch-up on this adjustment. Signal voltage in excess of 0.3 volt will tend to broaden the responsive curve—permitting misadjustment to pass unnoticed.

10	Junction R-6 and R-7	23.9	Not used		Not used	Junction of L-8 and R-51		L-5 (top chassis) for max.	Fig. 14 Fig. 15
11	Junction R-6 and R-7	26.0	Not used		Not used	Junction of L-8 and R-51		T-10 (top chassis) for max.	Fig. 14 Fig. 15
12	Junction R-6 and R-7	24.5	Not used		Not used	Junction of L-8 and R-51		L-7 (top chassis) for max.	Fig. 14 Fig. 15

NOTE: Oscillation may occur if the i-f section is badly out of alignment. This will be evidenced by a meter reading in excess of 3 volts and is caused by the "staggered" i-f stages being tuned to approximately the same frequency. If this condition is encountered, adjust the core studs of T-1 (bottom) L-5, T-10 and L-7 until oscillation ceases. Oscillation may not be encountered until proceeding with steps 9, 10, or 11.

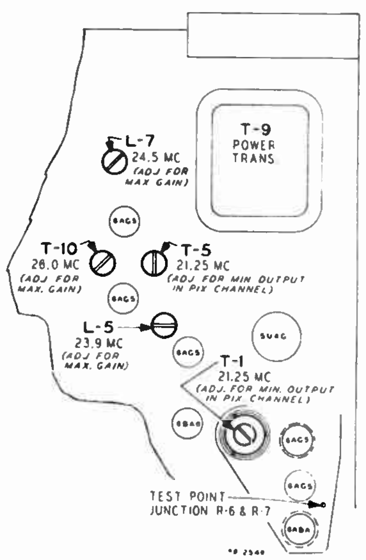

Fig. 14—Top Chassis Video I-F Adjustments

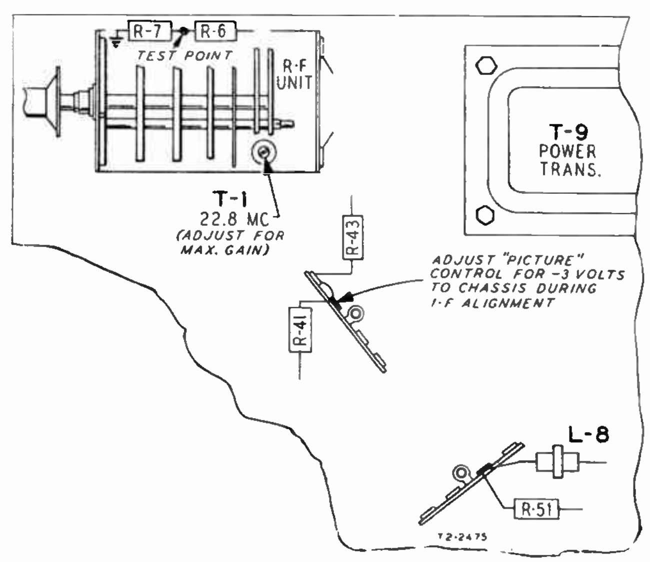

Fig. 15—Bottom Chassis Video I-F Adjustments

RETOUCHING OF PICTURE I-F ADJUSTMENTS—The picture i-f response curve varies somewhat with change of bias and for this reason it should be aligned with approximately the same signal input as it will receive in operation.

If the receiver is located at the edge of the service area, it should be aligned with approximately —1 volt i-f grid bias. However, for normal conditions, (signals of 1000 microvolts or greater), it is recommended that the picture i-f be aligned with a grid bias of —3 volts. Set the picture control for —3 volts at the junction of R-41 and R-43.

Connect the r-f sweep generator to the junction of R-6 and R-7. See Figure 14.

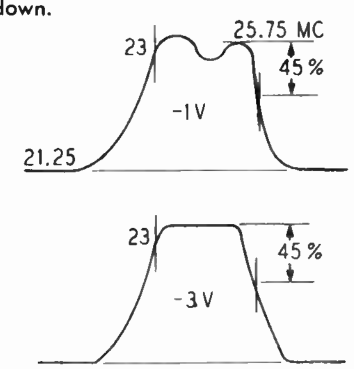
Loosely couple the signal generator to the sweep generator leads and feed in the 25.75 megacycles i-f picture carrier marker and a 23 megacycles marker.

Connect the oscilloscope across the picture detector load resistor R-51.

Set the channel switch to channel (between 1 and 6) found to have the best response.

Set the sweep output to produce approximately .3 volt peak to peak across the picture detector load resistor.

On final adjustment the picture carrier marker must be at approximately 45% down. The curve must be approximately flat topped and with the 23 mc marker at 10% down.



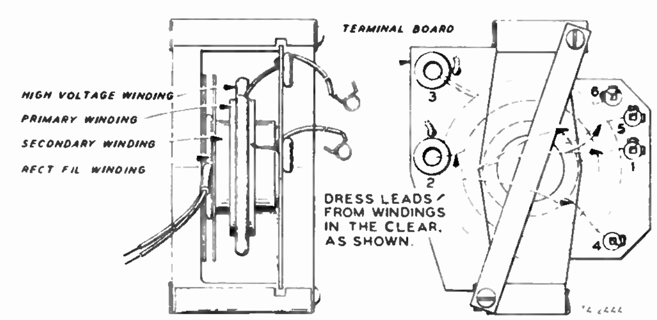


Fig. 16—Transformer Winding Leads

SENSITIVITY CHECK—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through an attenuator pad of the type shown in Figure 17. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position.

Only carbon type resistors should be used to construct the attenuator pad. Since many of the low value molded resistors generally available are of wire wound construction, it is advisable to break and examine one of each type of resistor used in order to determine its construction.

RESPONSE CURVES—The R-F response curves shown in Figure 18 were taken from a production set. Although these curves are typical, some variations can be expected.

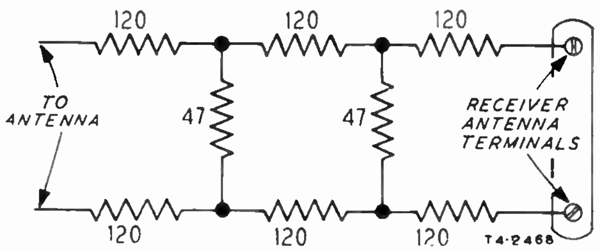

Fig. 17—Attenuator Pad

The response curves are shown in the classical manner of presentation, that is with response up and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. These curves may be observed by connecting the sweep and marker generators to the antenna input and connecting the oscilloscope between the test point (see figure 14) and chassis.

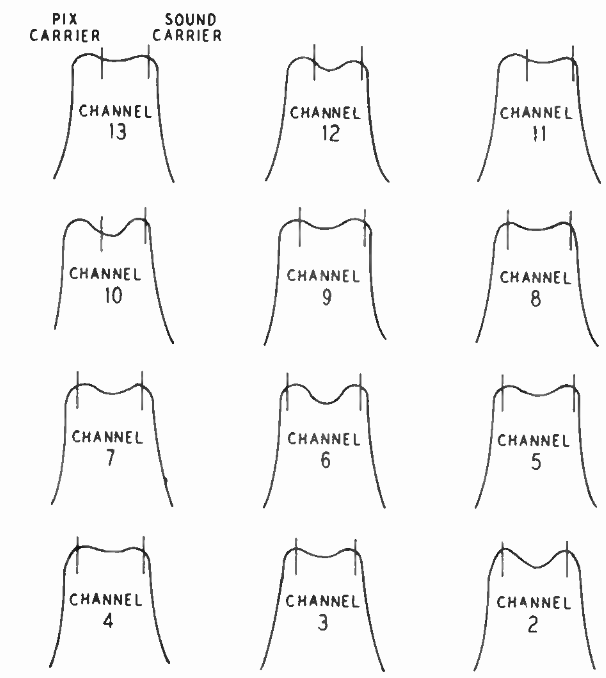

Fig. 18—Response Curves

CRITICAL LEAD DRESS—

1. Do not permit any strains to be placed on the leads of R-68, R-59, R-63, R-62, R-58, R-61, R-67 and R-64. Do not permit these resistors to be exposed to the heat of a soldering iron any more than is absolutely necessary.
2. Dress the temperature compensating resistor R-64 approximately one quarter inch from the power transformer and the chassis.
3. Dress all video coupling capacitors and peaking coils up and away from the chassis.
4. Contact between the R-F oscillator frequency adjustment screws and the oscillator coils on channel switch outlets must be avoided.
5. Dress T-8 winding leads as shown in Figure 16.

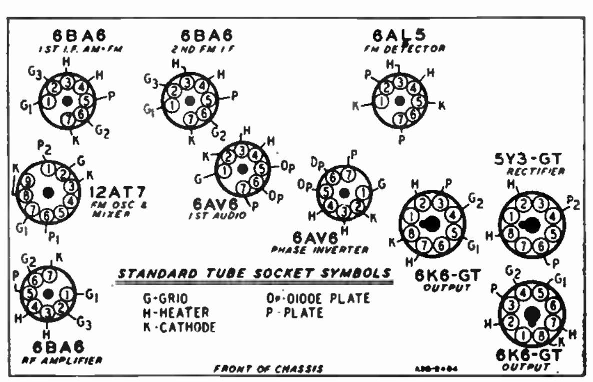
TUBE LAYOUT

RADIO MISCELLANEOUS DATA



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .... 117 Volts AC

Signal Input .... None

A variation of ±10% is usually permissible.

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

RADIO ALIGNMENT PROCEDURE

AM STAGES

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas —.1 mf, 200 mmf.

Volume Control—Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
I-F	455 kc	12AT7 Pin 7 and Chassis	.1 mf	Broadcast	Rotor Fully Open	2nd I-F Pri. & Sec. 1 & 2 1st I-F Pri. & Sec. 3 & 4	Maximum Output

	1400 kc	Antenna Lead and Ground	200 mmf	Broadcast	Turn Rotor to Max. Output Set pointer to 1400 kc See Note A	Broadcost Interstage C-29	
	1400 kc	Antenna Lead and Ground	200 mmf	Broadcast		Loop Trimmer C-48	

Note A—If the pointer is not at 1400 KC on dial, reset pointer at the 1400 KC mark on the dial scale.

FM STAGES

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 1000 ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximotely 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

Allow chossis and signal generator to warm up for several minutes.

Recheck R-F and Osc. Adjustments in order given							

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the junction of resistor R-22 and condenser C-18 for all adjustments except the discriminator secondary adjustment, for which See Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and connect to junction of R-18 and C-62. Adjust for zero voltage indication.

NOTE D—Before adjusting Pri. core connect 1000 ohm load resistor across the 2nd I.F. secondary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE E—Disconnect 1000 ohm load resistor from secondary terminals and connect across the 2nd I.F. primary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillotor frequency above signal frequency.

NOTE H—Remove the 1000 ohm load resistor before attempting to check the R-F and oscillator adjustments.

REPLACEMENT PARTS INFORMATION

HOW TO ORDER PARTS — Should it be necessary to write us or to order any repair parts, it is important that the complete model number which appears on the label attached to the rear of the chassis be specified.

12K3	Console-red-brn mahogany	"
12K3B	Console-limed oak	"

TV CHASSIS - Television chassis TS-53 contains 19 tubes plus a 12-1/2" picture tube. The picture, sound, and scanning circuits, together with a selenium rectifier, voltage doubler "B" supply, are contained on a single chassis.

TV TUNING RANGE - Channels 2 through 13

TV IF FREQ - Channels 2 to 6: sound: 21.9 mc
picture: 26.4 mc
Channels 7 to 13: sound: 27.3 mc
picture: 22.8 mc

NOTE: In late chassis, using TT-13 tuner channels 11, 12, and 13: sound 21.9 mc, picture 26.4 mc.

ANTENNAS - TV: table model; TA-6 "Bilt-In-Tenna"
TV: console; TA-4 "Bilt-In-Tenna". Provision for connection of an external antenna in both cases.

TV ANTENNA IMPEDANCE - 300 ohms

POWER SUPPLY - 117 volts, 60 cycle AC current only

POWER CONSUMPTION - TV: 160 watts

TV AUDIO OUTPUT - 4 watts

TV CHASSIS TUBE COMPLEMENT -

V-19	1B3GT	High Voltage Rectifier
V-20	12LP4	Picture Tube

HIGH VOLTAGE WARNING

Operation of this receiver, outside its cabinet or with covers removed, involves a shock hazard from the power supplies. No work should be attempted on this receiver by anyone not thoroughly familiar with the precautions necessary when working on high voltage equipment.

CATHODE RAY PICTURE TUBE HANDLING PRECAUTIONS

Extreme care must be used in handling the picture tube. The tube is highly evacuated and, due to its large size, is subjected to a considerable atmospheric pressure. The handler should wear safety goggles and gloves for protection. Avoid nicking or scratching the glass by rough contact with other objects.

Before removing glass tubes, discharge the capacity formed by the inner and outer aquadag coatings on the tube by shorting the anode contact on the side of the tube to the outer surface with a well insulated piece of wire.

INSTALLATION AND OPERATING INSTRUCTIONS

RECEIVER LOCATION

The receiver may be placed anywhere in the room, but for greatest satisfaction it should be located:

1. Away from any bright light that may fall directly on the screen or be reflected from it; this includes windows and lamps. Some illumination in the room, off to one side, is desirable, however, to prevent eye-strain.

2. To provide comfortable viewing and ease of operation.

3. At least one-inch away from a wall to allow for cabinet ventilation. This is very important.

ANTENNAS

The choice of television antenna depends entirely on the location of the receiver with respect to all television station transmitting antennas in the area. Maximum pick-up is obtained when the receiving antenna is directly in line of sight with the transmitting antenna.

"Bilt-In-Tenna". All receivers using the TS-53 series television chassis are equipped with the Motorola "Bilt-In-Tenna", mounted inside the cabinet, for use in good signal areas.

When this antenna is used, the following precautions should be observed for best reception:

1. In order to get maximum performance and satisfactory pictures from the "Bilt-In-Tenna", ample signals from the television station must be present at the location of the receivers. Normally, the strength of the signals will vary throughout the room in which the receiver is located. For this reason, better pictures will be obtained if the receiver is tried in all possible locations in the viewing room and is then placed where the clearest pictures are received from all stations. Avoid large metallic objects, such as radiators, metal panels, etc.

2. Lamps, vases and metallic objects, when placed on top of the receiver, may affect the efficiency of the "Bilt-In-Tenna".

Indoor Antenna. If additional pick-up is necessary, an indoor antenna, placed on or near the receiver, may be used. The antenna should be rotated and the arms should be adjusted for best signal, with no ghosts or reflections. Normally, the arms should be extended on the low channels (2-6) and telescoped on the high channels (7-13).

Outdoor Antenna. The Motorola "Bilt-In-Tenna" or the indoor type antenna will give satisfactory reception in strong signal areas; but, if the receiver is located in a fringe or weak signal area, an outdoor antenna is recommended.

In areas free of obstructions and reflections, within reasonable proximity to television transmitters, a dipole and reflector will prove satisfactory. Since such an antenna has a relatively small band coverage, a special antenna covering all twelve television channels should be used if it is desired to receive stations on channels of widely separated frequencies.

Location of the antenna should be decided from the standpoint of maximum signal pick-up. In general, the antenna should be broadside to the transmitting antenna and should be as high as possible. If a reflector is used, the antenna should be oriented so that the driver element is closest to the station and the reflector farthest away.

Locating the antenna and lead-in as far away as possible from highways, hospitals, doctors' offices, electrical machinery, etc., will help to reduce noise pick-up from such sources. Also, it is desirable to keep the antenna at least six feet away from other antennas, metal roofs, gutters, or other metal objects to prevent unwanted reflections and shielding.

Lead-in. Since the TS-53 chassis is designed for 300 ohms input, the standard 300 ohm twin lead line should be used for connecting the outside antenna to the receiver. Twisting the line one complete turn per foot of running length helps to reduce noise pick-up on the line. The lead-in should be supported on stand-off insulators and kept tight enough to prevent mechanical damage through swaying. Avoid running the lead-in close to metal gutters, iron standpipes, etc.

In areas of very strong signals, or where severe local electrical interference is encountered, 300 ohm shielded twin lead is recommended. The shield braid should be grounded.

An approved lightning arrestor should be used.

RECEIVER ANTENNA CONNECTION

The antenna lead-in to the television receiver is connected to the two screws of the terminal strip on the rear of the cabinet. Disconnect the "Bilt-In-Tenna" leads from the terminal strip before attaching an external antenna lead-in. Sometimes reversing the lead-in connections at the receiver may improve picture quality and overall performance.

World Radio History

OPERATING CONTROLS

There are two dual controls, consisting of a small and a large knob each, on the front panel of the receiver. The function of each control is marked on the front panel; the "circle" indicating the large knob, and the "dot" indicating the small knob. See Figure 1 for front panel control functions.

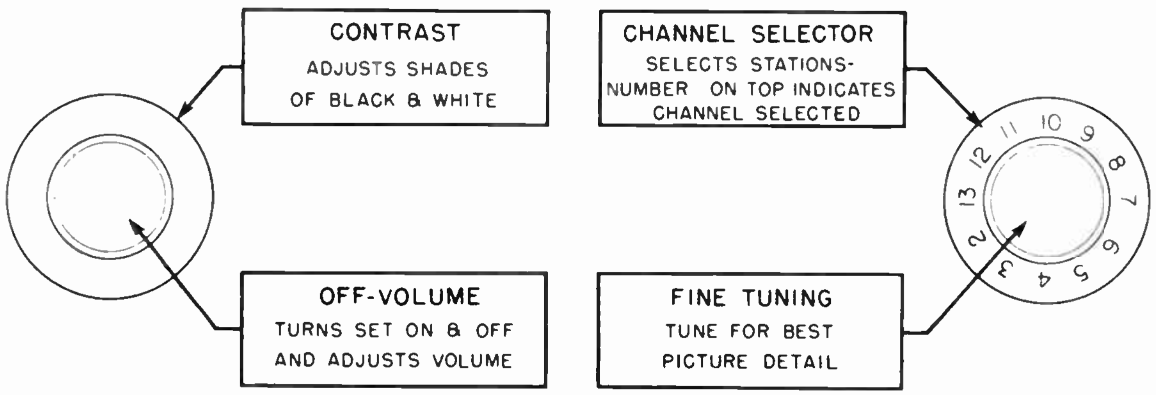

FIGURE 1. OPERATING CONTROLS

SERVICE ADJUSTMENT CONTROLS

The receiver is completely adjusted at the factory, so normally none other than the front panel control operating instructions need be followed in putting the receiver in operation. However, to provide for any misadjustment of the service controls, due to handling, the following instructions are in order. See Figure 2 for location of the service adjustment controls.

FOCUS CONTROL

The FOCUS control should be adjusted until the fine horizontal line structure of the raster is clearly visible over the picture area. The control should be tuned through the correct point several times so that optimum focus is obtained.

CENTERING

By means of a lever extending from the focus coil, thru the rear screen, the focus coil can be shifted to center the picture in its mask.

VERTICAL SIZE AND VERTICAL LINEARITY

Adjust the VERTICAL SIZE control until the picture fills the mask vertically. Adjust the VERTICAL LINEARITY control for best overall vertical linearity. Adjustment of the VERTICAL SIZE control will require a readjustment of the VERTICAL LINEARITY control and possibly of the vertical hold control. Center picture with the centering lever on the focus coil.

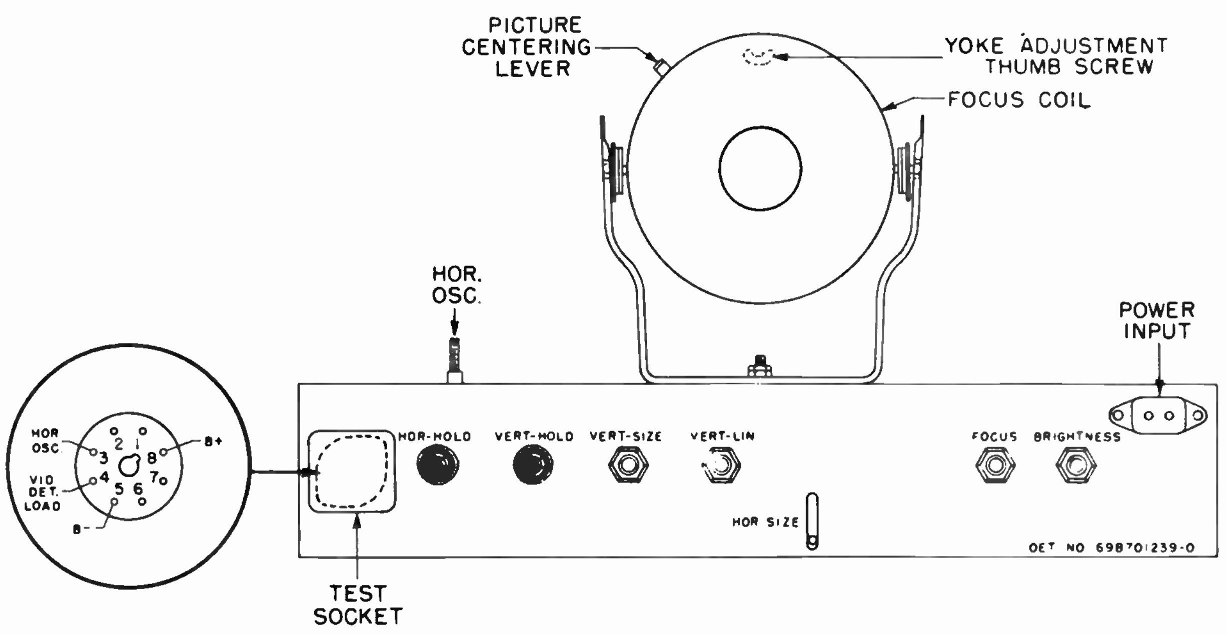

FIGURE 2. SERVICE ADJUSTMENT CONTROLS

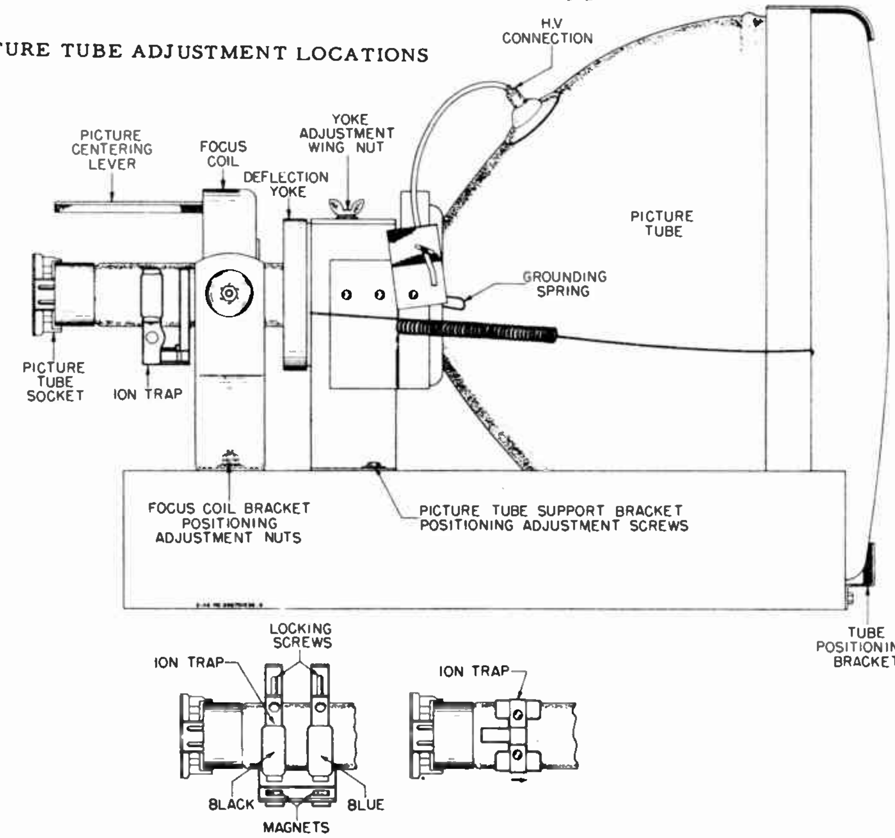
FIGURE 3. PICTURE TUBE ADJUSTMENT LOCATIONS



HORIZONTAL SIZE

Adjust the HORIZONTAL SIZE lever until the picture fills the mask horizontally. Center picture with the centering lever.

HORIZONTAL HOLD ADJUSTMENT

The HORIZONTAL HOLD control should have a sync range of approximately 180 degrees. If the control is too critical, adjust as follows:

1. Short out HORIZONTAL OSCILLATOR coil L-25. This may be done with the chassis in the cabinet by shorting pins 3 & 8 of the test socket on chassis rear.

2. With the centering lever, move the picture to the left so that the right edge of the raster can be seen. Adjust the HORIZONTAL HOLD control to about the middle of its range and note the width of the blanking pulse. (The blanking pulse appears as a gray bar at the right edge of the picture).

3. Remove short from HORIZONTAL OSCILLATOR coil.

4. Adjust HORIZONTAL OSCILLATOR coil until the same amount of blanking pulse can be seen as was noted in step 2.

VERTICAL HOLD ADJUSTMENT

Adjust the VERTICAL HOLD control for the center of the vertical sync lock-in range.

BRIGHTNESS

Adjust the BRIGHTNESS control, in combination with the CONTRAST control for the most pleasing picture. Keep the brilliance slightly below maximum, however, in order to protect the fluorescent screen of the picture tube and to prevent poor picture detail.

ADJUSTMENT OF ION TRAP

Under conditions of rough shipment, it is possible for the ion trap to become misaligned. To prevent serious damage to the picture tube, the following method of adjustment should be used. See Figure 3.

The magnet should be placed on the neck of the tube in the direction indicated by the marking on the magnet (usually an arrow which points toward the picture tube screen) so that the stronger magnet of the double magnet type or the only magnet in the single magnet type is positioned over the internal pole pieces which are mounted on the gun structure. Adjust the brightness control for low intensity and move the magnet a short distance forward and backward at the same time rotating it to obtain the brightest raster. If, in obtaining the brightest raster, the ion trap magnet has to be moved more than 1/4" from the gun pole pieces the magnet is probably weak and a new magnet should be tried. Never correct for a shadowed raster with the ion trap magnet if such correction results in decreased brightness. The ion trap magnet must always be adjusted for maximum brightness and if shadows occur at this setting they should be eliminated by adjusting the focus and deflection coils as explained under "Focus Coil and Deflection Yoke Adjustment"

CAUTION: Keep brightness control at low intensity until ion trap is properly set.

A mirror placed in front of the receiver will aid in making this adjustment.

World Radio History

DEFLECTION YOKE ADJUSTMENT

If the deflection yoke shifts, the picture will be tilted. To correct, loosen the thumb screw on top of the deflection yoke and rotate yoke until the picture is straight. Before tightening the thumb screw, make certain that the deflection yoke is as far forward as possible.

If the yoke support and the picture tube have shifted in transit, or if for any reason these parts have been removed and replaced, it is best to do a complete job of repositioning. See Figure 3. The starting point is the position of the picture tube. It should be adjusted so that the tube fits snugly up against the tube positioning bracket on the front edge of the chassis. The clamp on the front of the tube should then be tightened. The picture tube support bracket positioning adjustment screws should be loose enough to permit sliding the bracket forward until the rubber cushion fits snugly up against the flare of the tube. Loosen the yoke adjustment thumb screw and push the yoke up against the flare of the tube. CAUTION: Do not use force in sliding the bracket up. If too much force is used, a strain will be placed on the neck of the tube when the support bracket positioning adjustment screws are tightened. Also the yoke may be forced out of position. The opening in the yoke should be concentric with the neck of the tube.

FOCUS COIL

The focus coil bracket positioning screw nuts should now be loosened and the focus coil bracket moved up so that when the focus coil is parallel with the deflection yoke the space between them is 1/4". In tightening the focus coil bracket positioning screw nuts, tighten the first one so that the spring washers will have enough tension to hold the bracket firmly, but not so tightly as to cause difficulty in making picture centering adjustment. Then tighten the second nut to act as a lock to prevent loosening of the tension.

TEST SOCKET

A test socket is provided on the rear of the chassis which allows adjustment of the horizontal oscillator and checking of sensitivity without removing chassis from cabinet. See Figure 2 for socket connections.

ALIGNMENT

GENERAL

The chassis should be mounted on angle iron brackets (Motorola Part No. 7X700210) so that all connections and adjustments may be made easily.

Since the power cord circuit is broken by the interlock when the cabinet back is removed, it will be necessary to obtain an extra power cord with the female interlock receptacle in order to make a power connection to the receiver. Order Motorola Part No. 30B470756.

It is recommended that an isolation transformer be used between the receiver and the AC line whenever any test equipment is attached to the chassis. This precaution is especially important if grounded test equipment is used. NEVER GROUND THE RECEIVER CHASSIS DURING TESTING OPERATIONS OR INSTALLATION UNLESS AN ISOLATION TRANSFORMER IS USED.

ORDER OF ALIGNMENT

A complete receiver alignment can be most conveniently performed in the following order:

1. Audio Take-Off & Ratio Detector
2. 4.5 Mc Trap
3. IF coils & Mixer Transformer
4. Osc & RF Sections

AUDIO TAKE-OFF & RATIO DETECTOR ALIGNMENT

Equipment Required:

AM Signal Generator: (Optional)	Accurately calibrated at 4.5 mc
	Adjustable output
DC Meter:	Low range electronic meter

Procedure:

Refer to Figure 4 for location of adjustments.

1. If possible, it is desirable to align the audio section from an actual station signal, since the 4.5 mc alignment frequency will be exact. The fine tuning trimmer should be turned off the station slightly, to prevent overloading the ratio detector.
2. If a signal generator is used, tune it accurately to 4.5 mc, and adjust the output to approximately 10,000 microvolts. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to B-. The following applies whether the station signal or signal generator is used.
3. From either side of capacitor C-60 (10 mf), connect an electronic voltmeter to B- decoupled thru 10K ohms.
4. Set the contrast control for maximum gain (fully clockwise).
5. Peak L-23 for maximum reading on meter.
6. Peak T-3 primary (top core) for maximum reading on meter.
7. Move the meter and decoupling resistor from C-60 to junction of R-42 (33K) and lead to volume control.
8. Adjust T-3 secondary (bottom core) for zero response on 2.5V scale of meter. This corresponds to the cross-over point on the FM detector curve. If desired, the symmetry of the curve may be checked by tuning the signal generator 25 Kc above and below 4.5 mc and noting the plus and minus voltage produced, reversing the meter connections as necessary. For proper balance of the ratio detector system, the voltage in each direction should be approximately equal. If not, check the tuning of L-23 and the primary and secondary of T-3, the ratio detector. If necessary, replace the ratio detector tube V-9 (6AL5). It is desirable to calibrate the generator on a station signal. This may be done by nulling the secondary on a station signal and then connecting the generator and tuning it to produce the same null without touching the trimmers in the set.

NOTE: As the adjustments are brought to resonance, it is advisable to reduce signal generator output to prevent overloading.

With a 10,000 microvolt signal into the grid of the video amplifier tube, with the contrast control turned fully clockwise, and the focus control at center of its range, the voltage read from one side of capacitor C-60 to B- should be greater than 5.0V.

4.5 MC TRAP ALIGNMENT

1. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to B-.
2. Connect the voltmeter and germanium crystal rectifier, as shown in Figure 5, between the cathode of the picture tube (yellow lead) and B-. Use the lowest voltage scale on the meter.
3. With the signal generator accurately set at 4.5 mc and maximum output, adjust trap L-21 for minimum reading on the meter.

IF AMPLIFIER ALIGNMENT

Equipment Required:

IF Sweep Generator meeting the following requirements:

18 to 30 mc, approximately 12 mc sweep width. Output constant and adjustable to at least .1 volt maximum with accurately calibrated, adjustable markers.

Cathode Ray Oscilloscope: preferably one with a calibrated input attenuator.

NOTE: If there is no built-in marker in the sweep generator, loosely couple the output of an accurately calibrated AM signal generator to the IF strip. At all times, keep the marker output low enough to prevent the marker from distorting the response curve.

If a wide band scope is used, the marker will be more distinct if a capacitor of 100 to 1000 mmf is placed across the scope input. Use the smallest size possible, since too large a value will affect the shape of the curve.

Procedure:

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket to eliminate horizontal pick-up in the oscilloscope.
2. By means of an external battery, apply a negative 3.0 volt bias from the bottom of the 1st IF tube grid resistor R-11 (6800) to B-.
3. Using leads as short as possible, connect the hot side of the sweep generator to the grid (pin 1) of the 1st IF tube V-3 (6AU6) through a 5000 mmf capacitor (do not use the loose or "spraying" method of coupling). The low side is connected to B-. Set the center frequency of the sweep to about 24.6 mc and adjust initially for a sweep deviation of approximately 12 mc. However, a sweep of from 8 to 10 mc may be found better for overall alignment.
4. Using R-27 (100K) as a decoupling resistor, connect the scope to pin 4 of test socket. If a stronger output is desired, connect the scope between the picture tube cathode and B-. The curve seen at this position will be the reverse of the polarity shown in Figure 6.
5. Set the contrast control at minimum.

NOTE: If a distorted or unstable picture is seen on the oscilloscope during alignment, it may be necessary to stop the oscillator by disconnecting resistor R-10 (1000) from the plate (pin 6) of the oscillator tube V-2B (12AT7), or by substituting another tube with pin 6 removed.

CAUTION:

1. Do not reduce the oscilloscope gain and increase signal input so that the top of the curve is flattened due to limiting in the video or scope amplifiers.
2. The dress of plate and grid components in the IF affects tuning. Do not move indiscriminately.
3. On the IF coils and on the traps the resonance point will be found at two settings of the slug. The correct setting is the one which is found with the greater part of the adjusting screw out of the coil.

NOTE: The 1st & 2nd IF traps are tuned from bottom of chassis, while IF cores are adjusted from the top.

6. Tune the low frequency trap L-17, located on the 2nd IF coil, for maximum attenuation on the curve at 21.9 mc.
7. Tune the high frequency trap L-13, located on the 1st IF coil, for maximum attenuation on the curve at 27.3 mc.
8. Adjust the 1st IF coil, L-12, to place a 26.6 mc marker on the high side of the response curve 60% down from maximum response. See Figure 6.
9. Adjust the 2nd IF coil, L-16, to place a 22.7 mc marker on the low side of the response curve 60% down from maximum response.
10. Adjust the 3rd IF plate transformer T-2 to provide a flat top or symmetrical response curve.
11. Reset the traps (steps 6 & 7) and again check the IF for proper response.

NOTE: It is suggested that the bias be removed for accurate resetting of the traps.

12. With bias applied, connect the sweep between the grid (pin 2) of the mixer tube V-2A (12AT7) and B-.
13. Disconnect the trimmer, C-16, in LC circuit in the grid of the mixer tube, or short the trimmer through a 10,000 mmf ceramic disc type to B-.

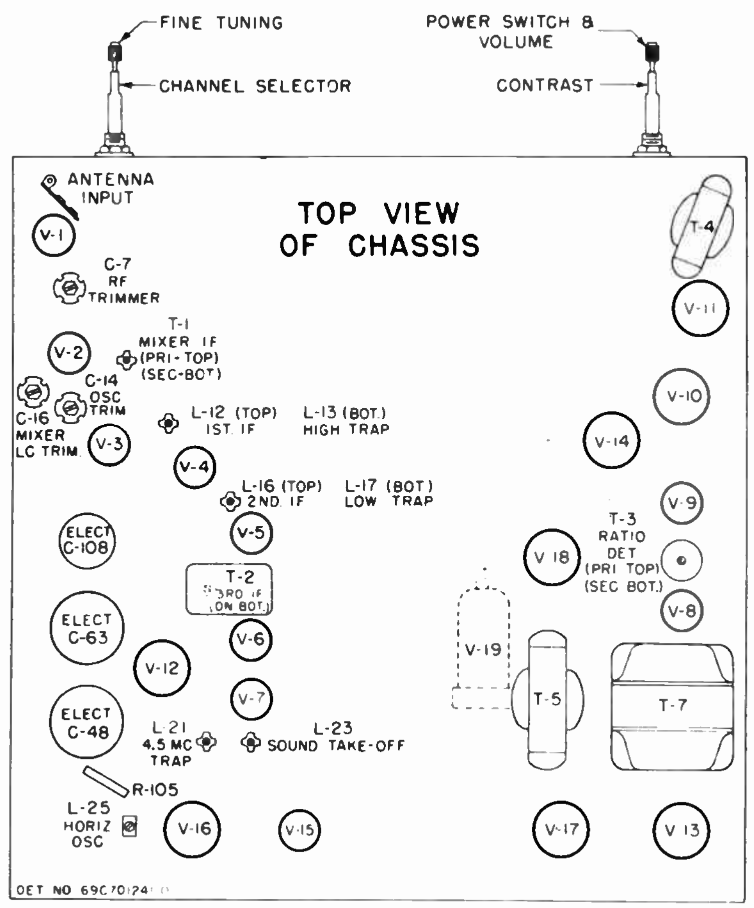

FIGURE 4. TUBE AND ALIGNMENT ADJUSTMENT LOCATIONS

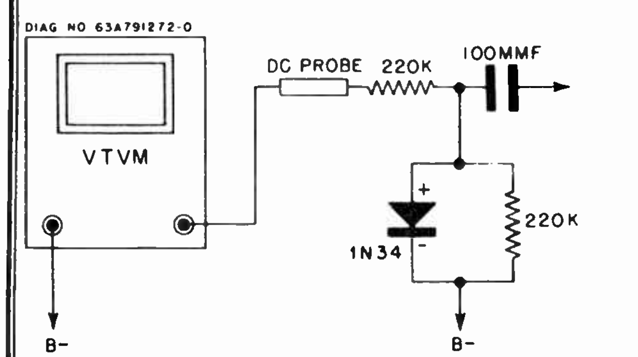

FIGURE 5. ELECTRONIC VOLTMETER CONNECTIONS

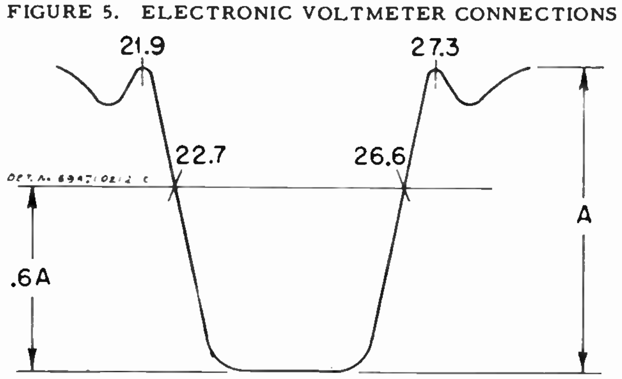

FIGURE 6. IF RESPONSE CURVE

14. Bring both cores of the mixer transformer, T-1, simultaneously from the outside towards the center. The half-way markers should be 26.4 mc and 22.9 mc. See Figure 7.

NOTE: In aligning the three IF coils, each coil is adjusted individually, but when adjusting the primary and secondary of the mixer transformer, the adjustments should be made simultaneously. The important point to keep in mind is to obtain a flat response curve with as much gain as possible. The sides of the curve should be straight and as steep as possible. Simultaneous adjusting of the primary and secondary is the easiest way to obtain this result. The transformer by itself is, in effect, tuned for the same pass band as the three staggered circuits. See Figure 7. The only difference in the overall waveform should be that the sides of the overall wave are steeper. Constant use of the 50% markers (22.9 mc & 26.4 mc) should be resorted to, since it is absolutely necessary to obtain the proper curve. A slight dip (not exceeding 10%) is permissible in the mixer transformer response curve.

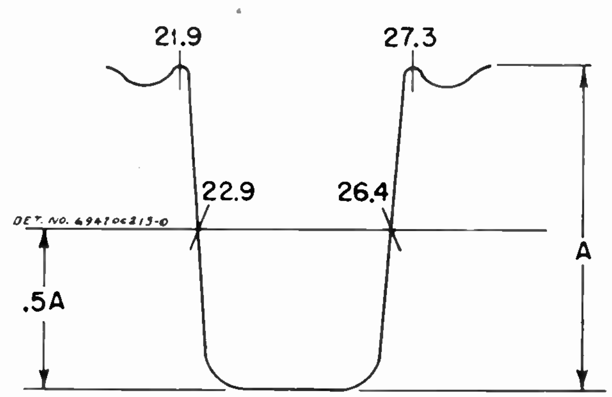

FIGURE 7. OVERALL RESPONSE CURVE FROM MIXER

BANDWIDTH

The bandwidth may be determined by connecting an AM generator to the mixer grid. With the generator frequency at 24.6 mc, adjust the output for 1 volt reading on a VTVM connected at the plate (pin 2) of the video detector tube V-6 (6AL5) and B-. Double the output of the generator. Now by tuning either side of 24.6 mc and noting the frequencies at which the VTVM again reads 1 volt, the 6 db bandwidth points are indicated.

REGENERATION CHECK

After the above IF and mixer transformer alignment has been made, a check for regeneration in the IF amplifier strip should be made. This is done by removing the battery bias and observing the output response curve on the oscilloscope, as taken between the picture tube cathode and B-. The bandwidth may change with the bias removed but should not change more than 0.2 mc. Set the contrast control to maximum gain. Decrease the input until the output signal shows a marked decrease. Any regeneration present will be indicated by sharp peaks on the overall response curve. The oscillator should be stopped, as described above, during this procedure.

CAUTION: Do not inject too much marker signal.

MIXER LC ADJUSTMENT

Reconnect bias removed for regeneration check. Replace trimmer C-16 in LC circuit of mixer grid or remove 10,000 mmf ceramic between trimmer and B-. Adjust the trimmer so it is tuned to the center of the mixer response curve. This is indicated by observing the effect of the LC circuit on the mixer response. Increasing the capacity of the trimmer and bringing the LC circuit from above the IF range into the IF range, it will be noted that the mixer curve will pull down on the high side, then straighten out as the LC circuit approaches the middle of the range, and pull down on the low side as the LC circuit approaches the low end of the IF range. The proper tuning point is that point at which the mixer curve straightens out. In effect, the LC circuit is similar to a jack coil when it is within the IF range

CAUTION: Tuning the LC circuit very low will cause oscillation.

IF SENSITIVITY MEASUREMENTS

IF Stages Only

1. Remove the battery bias from 1st IF tube grid.

2. Connect an AM signal generator, set at 24.6 mc, through a blocking capacitor of 5000 mmf, between B- and the grid (pin 1) of the 1st IF tube V-3 (6AU6).

3. Connect an electronic voltmeter across the video detector load resistor R-26 (5600). Both leads from the meter should be decoupled with 100K ohm resistors.

4. Set the contrast control for maximum sensitivity.

5. Stop the oscillator tube by disconnecting resistor R-10 (1000) from the plate (pin 6) of tube V-2B (12AT7) or by substituting another tube with pin 6 removed.

6. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 700 microvolts.

Mixer & IF Stages

The preliminary preparations are the same as for checking the sensitivity of the IF stages except:

1. Connect the AM signal generator, set at 24.6 mc through a 5000 mmf capacitor, between B- and the grid (pin 2) of the mixer tube V-2A (12AT7).

2. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 125 microvolts.

OSCILLATOR, ANTENNA AND RF ALIGNMENT

NOTE: The IF must be aligned before the RF section can be properly phased.

Equipment Required:

Sweep Generator: Frequency range 40-220 mc; 10 mc sweep width
Output constant and adjustable
Adjustable markers (markers should be calibrated occasionally by checking against an accurate signal generator).

Oscilloscope: Preferably one with a calibrated input attenuator

Signal Generator: Frequency range 40 to 220 mc
Accurately calibrated
AM modulated, 400 cycle

FREQUENCY CHART

Chan	Frequency	Picture	Sound	Oscillator
2	54-60	55.25	59.75	81.65
3	60-66	61.25	65.75	87.65
4	66-72	67.25	71.75	93.65
5	76-82	77.25	81.75	103.65
6	82-88	83.25	87.75	109.65
7	174-180	175.25	179.75	152.45
8	180-186	181.25	185.75	158.45
9	186-192	187.25	191.75	164.45
10	192-198	193.25	197.75	170.45
11	198-204	199.25	203.75	176.45(225.65*)
12	204-210	205.25	209.75	182.45(231.65*)
13	210-216	211.25	215.75	188.45(237.65*)

(* in later sets)

World Radio History

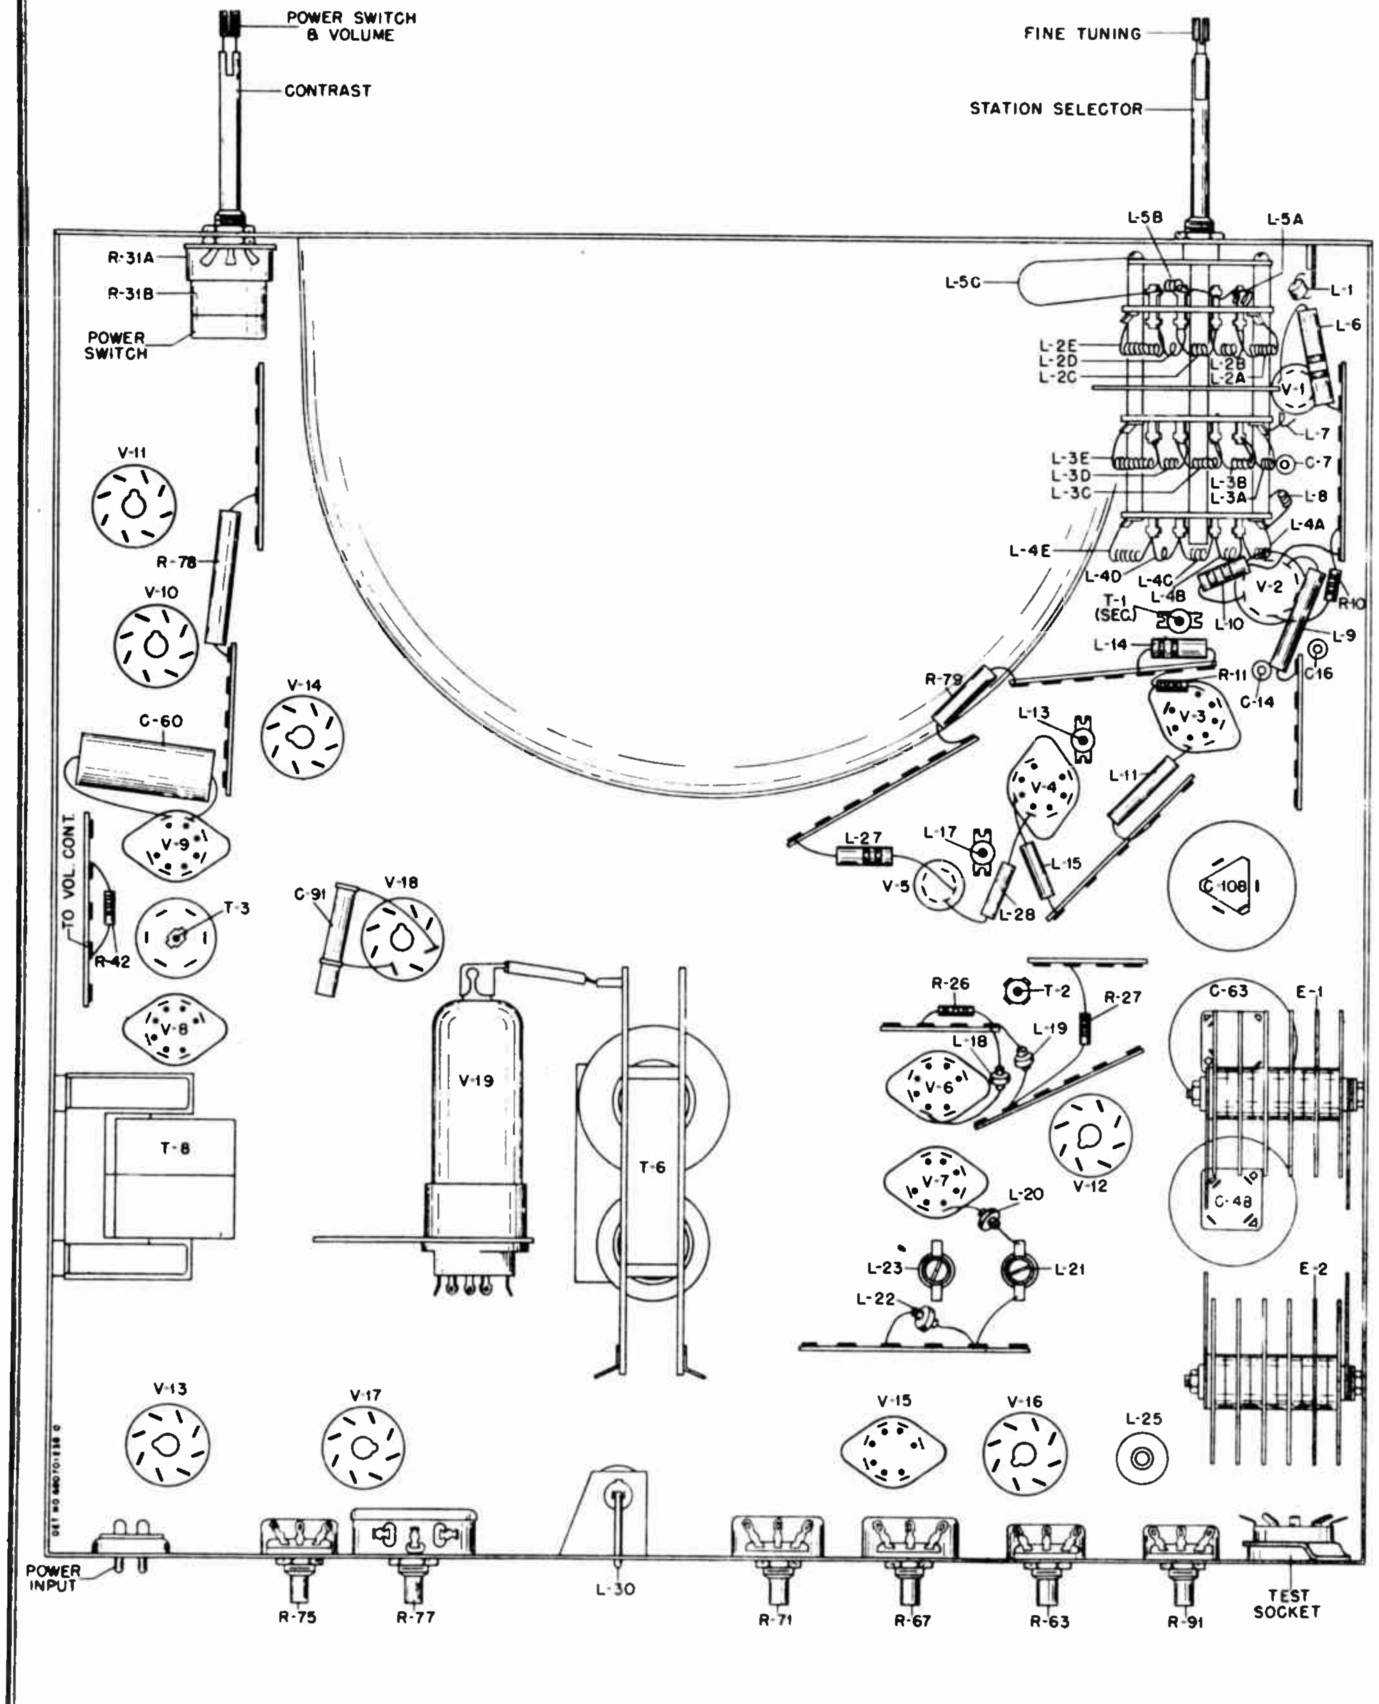

FIGURE 8. BOTTOM VIEW OF CHASSIS

ANTENNA & RF ALIGNMENT PROCEDURE

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket and stop the oscillator by disconnecting R-10 (1000) from plate (pin 6) of V-2B (12AT7).

2. Connect the sweep generator across the antenna terminals on the chassis with the antenna lead-in removed. The line from the sweep generator should be as short as possible.

3. Connect the oscilloscope through a decoupling resistor of 150,000 ohms, between the cathode (pin 3) of the mixer tube V-2 (12AT7) and B-.

4. Short out the AGC circuit with a clip lead from the AGC bus to B-.

5. Refer to Figure 4 for the RF trimmer location and to Figure 9 for the locations of the antenna and RF coils. The frequency chart listed previously gives the channel and alignment frequencies.

6. The antenna coils are tuned to the video carrier frequency and the RF coils are tuned to the sound carriers. Figure 10 shows the shape of the curve which should appear on the scope for channels 2-6 and Figure 11 the curves for channels 7-13.

7. Turn the station selector switch to channel 10. Set the center frequency of the sweep generator to the center frequency of channel 10 (195 mc).

8. Adjust ceramic trimmer, C-7, so that picture and sound markers are as in Figure 11.

9. Check channels 7 to 13 for proper response and, if necessary, tune the coil L-7. These coils may be tuned by spreading them to decrease inductance or compressing them to increase their inductance. See Figure 9 for location of coils. This will have more effect on channels 10 to 13 than 7 to 9. If L-7 is adjusted, it may be necessary to readjust RF trimmer C-7, and recheck the high channels.

10. Move bandswitch to channel 6.

11. With center frequency of sweep generator at the ter frequency of channel 6 (85 mc) introduce markers corresponding to sound and picture carriers and compare with curve of Figure 10.

NOTE: A convenient method of determining whether a coil is tuned correctly is to insert a brass or iron slug into the coil. Brass decreases and iron increases the inductance.

12. After channel 6 has been aligned, progress downward through channel 2.

CAUTION: Make certain the station selector switch is on the correct channel before checking band pass.

OSCILLATOR ADJUSTMENT

1. Put oscillator back in circuit.

2. Remove the short from the AGC circuit and apply -3 volt battery bias to AGC.

3. Move the oscilloscope to the video detector output. To provide decoupling, it is best to connect to the low side of R-27 (100K) which is connected through chokes L-19 and L-18 to the plate (pin 2) of the detector tube V-6 (6AL5).

4. Turn station selector switch to channel 10.

5. Set the contrast control at minimum (counterclockwise).

6. Set the center frequency of the sweep generator to 195 mc and keep the output low enough to show no evidence of limiting in the overall response curve.

7. Introduce a marker corresponding to the sound carrier of channel 10 (197.75).

8. With the fine tuning trimmer at mid-capacity, adjust the oscillator trimmer, C-14, to move the response to the point where the sound marker drops into the trap on the high side of the curve

9. Check channels 7 to 13 to note whether the sound marker will drop into the trap on the low side of the response with the fine tuning trimmer within plus or minus 22-1/2 degrees of mid-capacity. If this is not possible, adjust L-8. This coil has more effect on channels 10 to 13 than 7 to 9. It may have to be adjusted to obtain proper tracking on the high channels.

10. Move to channel 6 and progress downward through channel 2, spreading or compressing the coil sections to make the sound marker drop into the trap on the low side with the fine tuning trimmer within 22-1/2 degrees of mid-setting (each number on the station selector switch knob represents 30 degrees).

NOTE: Overall response should be substantially flat and of proper bandwidth.

REVISED OSCILLATOR ADJUSTMENT

Following is the oscillator alignment procedure for the revised tuners appearing in later production TS-53 chassis. Where formerly the oscillator was tuned beneath the carrier on all high channels, it has been raised above the carrier on channels 11, 12, and 13. This places the oscillator outside the TV spectrum on all high channels and, therefore, eliminates the possibility of its interfering with neighboring television receivers.

The new tuner may be identified by the additional coil in the oscillator section. The new coil is across the cut-out section of the stamped plate on the oscillator deck (see Figure 9). In addition, the switch shaft is color coded (green for the TS-53 chassis).

OSCILLATOR ADJUSTMENT

NOTE: The Antenna & RF Alignment Procedure is the same as in previous TS-53 chassis. The oscillator adjustment is revised as follows:

1. Put oscillator back in circuit.

2. Remove the short from the AGC circuit and apply a -3 volt battery bias to the AGC bus.

3. Move the scope to the test socket on the chassis rear with the high side connected to pin 4 and the low side to pin 5 (B-).

©John F. Rider

World Radio History

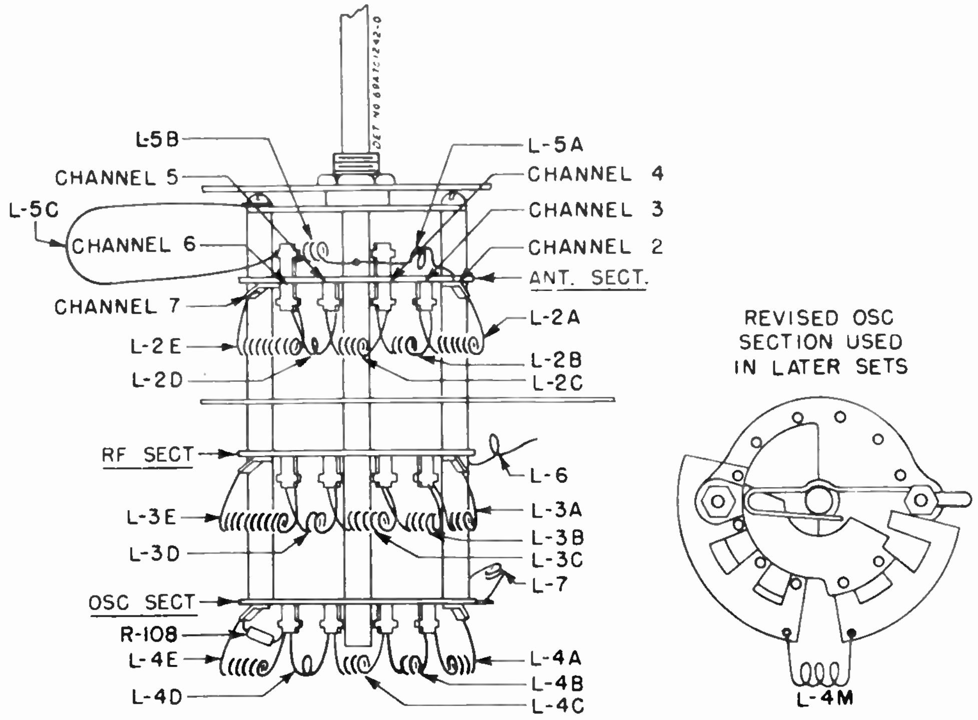

FIGURE 9. ANTENNA, RF AND OSCILLATOR COIL LOCATIONS

4. Set the contrast control at minimum (counterclockwise).

5. Remove the fine tuning knob and turn shaft until the slot is in a horizontal position. This represents the mid-capacity position.

6. Turn station selector switch to channel 12.

7. Set the sweep generator on channel 12 with a center frequency of 207 mc and at least a 12 mc sweep. Keep the output low enough to show no evidence of limiting in the overall response curve.

NOTE: Before aligning the oscillator section, make certain the 3.3 microhenry choke (L-9) in the mixer grid is dressed away from the 3 mmf capacitor (C-17) tied to the same grid.

8. Introduce a marker corresponding to the sound carrier of channel 12 (209.75 mc).

9. Adjust oscillator ceramic trimmer (C-14) so that the sound marker falls into the 21.9 mc trap dip in the response curve.

10. Turn generator and station selector to channel 9 with the fine tuning shaft slot still in the horizontal position.

11. Spread or compress the 3-turn coil located in the center of the oscillator plate (L-4M, Figure 9) so that the sound marker for channel 9 falls into the 27.3 mc trap dip in the response curve. As the oscillator is tuned below the carrier on channels 7, 8, 9, and 10, the 27.3 mc trap will be in the same position as the 21.9 mc trap in step 9.

12. Repeat steps 6, 7, 8 and 9.

13. Turn generator and station selector to channel 13.

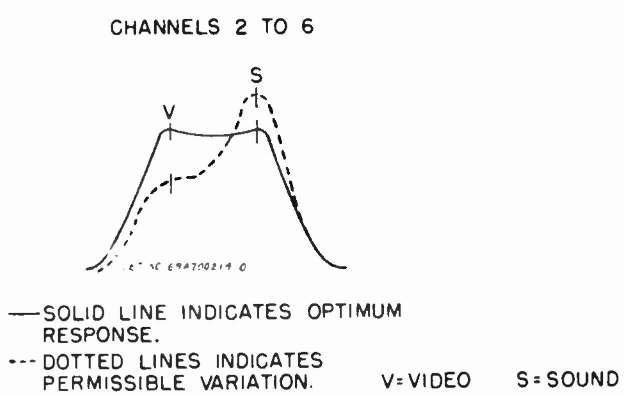

FIGURE 10. RF RESPONSE CURVES CHANNELS 2-6

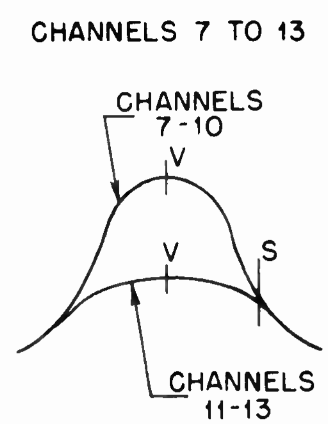

FIGURE 11. RF RESPONSE CURVES CHANNELS 7-13

14. Turn fine tuning trimmer so that the sound marker for channel 13 falls into the 21.9 mc trap dip of response curve. The slot in the fine tuning shaft should not have moved more than 30 degrees from the horizontal position to accomplish this (each number on the station selector knob represents 30 degrees).

15. If more than a 30 degree change in fine tuning trimmer was needed in step 14, adjust channel 13 oscillator coil (L-8) by spreading or compressing until the 30 degree requirement is met.

NOTE: Each adjustment of channel 13 oscillator coil (L-8) will necessitate a rechecking of the oscillator trimmer (C-14) on channel 12 as per steps 6, 7, 8, and 9.

16. Check channels 12, 11, 10, 9, 8, and 7, by noting whether the fine tuning trimmer can drop the sound marker for each channel in the trap dip by a 30 degree rotation. If one of the channels does not meet the 30 degree requirement, a compromise must be made by resetting channel 9 or 12, whichever is closer to the channel in question.

Example: 1) If channel 11 does not meet the 30 degree requirement, return station selector and and generator to channel 12 and tune ceramic trimmer (C-14) toward channel 11 (trimmer frequencies lowered by tightening screw). This will tend to move channel 12 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Do not adjust trimmer any more then is necessary to get the channel in question back within the 30 degree requirement.

Example: 2) If channel 10 does not meet the 30 degree requirement, move station selector and generator to channel 9 and tune the 3-turn coil (L-4M, Figure 9) toward channel 10 (coil freq raised by spreading turns). This will also tend to move channel 9 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Again, do not adjust the coil any more than is necessary to bring the channel in question back within the 30 degree requirement.

17. Turn sweep generator and station selector switch to channel 6.

18. Adjust channel 6 oscillator coil (L-4E, Figure 9) so that the sound marker for channel 6 falls into the 21.9 mc trap dip with the fine tuning trimmer at mid-capacity (shaft slot in horizontal position). Always spread or compress channel #6 oscillator coil in units of 3 turns. Compressing turns will move curve toward sound marker, while spreading will move curve toward video marker.

IMPORTANT: Since the coils are in series, the proper alignment of channel 6 will simplify the phasing of the channels to follow.

19. Adjust channels 5 and 4 so that the sound marker for each channel falls into the 21.9 mc trap dip in the curve with the fine tuning trimmer set no more than 15 degrees from mid-capacity.

20. Channels 3 and 2 should be adjusted so that the sound marker falls into the 21.9 mc trap dip with the fine tuning trimmer within 15 degrees of maximum capacity.

OVERALL RECEIVER SENSITIVITY MEASUREMENT

An overall measurement of sensitivity is made as follows:

1. Connect an AM signal generator to the input terminals of the receiver chassis after removing the short 300 ohm lead which connects to the antenna input strip on the back of the cabinet. To match the generator to the receiver input, a resistor matching network should be used. In the case of a generator with a 50 ohm output impedance, for example, place a 100 ohm resistor in series with the output terminal of the generator and a 150 ohm resistor in series with the ground terminal.

2. From cathode of picture tube to B- connect a calibrated oscilloscope.

NOTE: To calibrate scope, connect it across 6.3 volt filament supply. The peak-to-peak amplitude on the screen will then be approximately 18V (6.3 x 2.8).

3. Set contrast control for maximum sensitivity.

4. Tune signal generator to the video carrier frequency of the channel being checked. Generator signal should be 30% modulated at 400 cycles. The signal from the generator to produce 20 volts peak-to-peak at picture tube cathode should be less than 25 microvolts on channels 2 to 6 and less than 75 microvolts on channels 7 to 13.

CIRCUIT DESCRIPTION

LOW VOLTAGE POWER SUPPLY

The low voltage power supply (Figure 12) provides plate voltage for all tubes except the high voltage applied to the second anode of the picture tube. The heater transformers supply heater voltage to all tubes except the HV rectifier. which is energized by horizontal sweep current.

One low voltage secondary of T-7, the step-down filament transformer, supplies filament voltage to all tubes except the audio driver-limiter (V-8), the vertical output tube (V-14), the picture tube (V-20), and the horizontal damping diode (V-18). Since the damping diode (V-18) develops a high voltage pulse at its cathode, and its cathode is tied to the filament to prevent breakdown in the tube, it is necessary to provide a separate, low-capacity, well-insulated transformer (T-8) to heat this filament. The vertical output tube V-14 (25L6GT) requires a 25 volt filament supply and, hence is provided with a separate 25 volt tap on the transformer. V-8 and V-20 are supplied by an additional winding which, in later sets, is connected series opposing with the primary to increase the 6.3V filament supply voltage slightly to insure that the RF oscillator will operate on low line voltage.

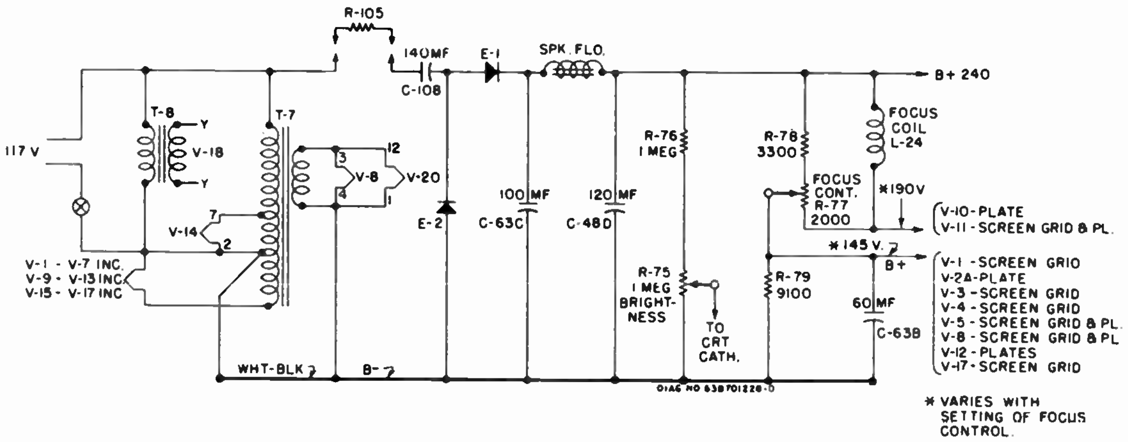

FIGURE 12. SIMPLIFIED SCHEMATIC OF LOW VOLTAGE POWER SUPPLY

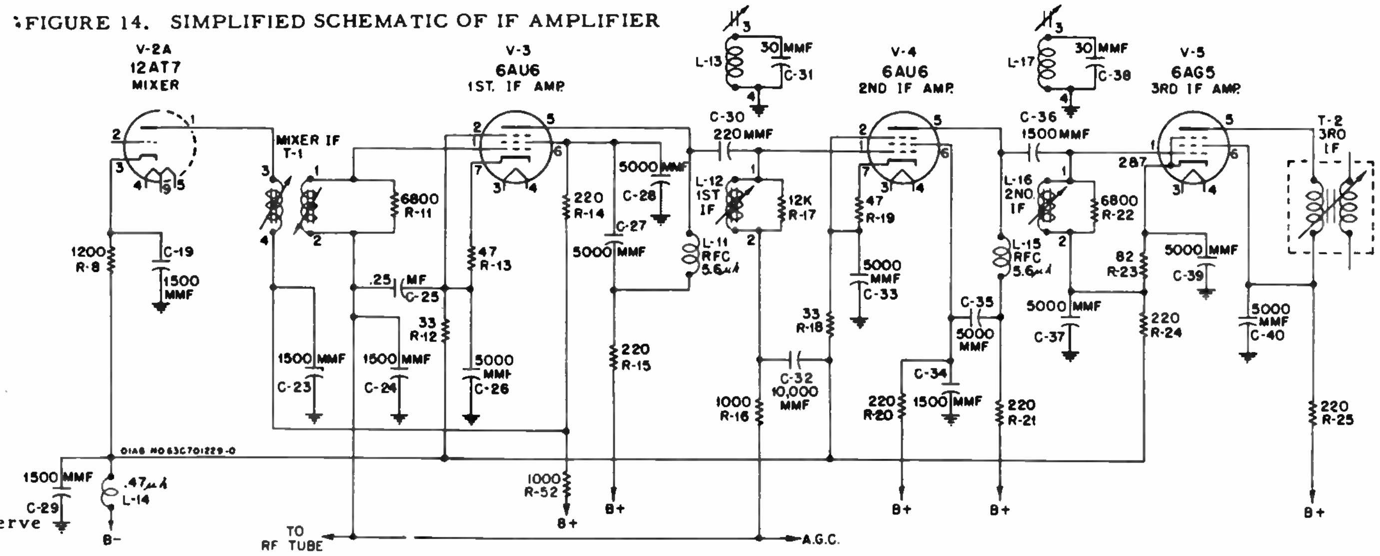

FIGURE 14. SIMPLIFIED SCHEMATIC OF IF AMPLIFIER

The B plus plate supply uses a voltage doubler. R-105 is a limiting resistor to protect the rectifiers from initial current surges and also serves as a fuse in case of B plus shorts. When the polarity of the applied 117 volt AC is such as to make the side of the line connected to R-105 negative, E-2 will conduct and charge C-108 (140 mf) to peak line voltage. On the next alternation, E-1 will conduct and the voltage applied to it is now the peak line voltage plus the peak charge stored in C-108. This results in a charge of about 260 volts on C-63C (100 mf). The speaker field is used as a filter choke. The focus coil and the resistor network, which controls the current thru it, act also as a voltage divider to supply plate and screen voltages to several tubes, as shown in Figure 12.

Another voltage divider from B plus to B-, consisting of R-76 (1 meg) and the potentiometer, R-75 (1 meg) provides a variable bias on the cathode of the picture tube, to serve as a brightness control.

THE RF TUNER

Antenna Input

Figure 13 is a simplified schematic of the tuner.

The antenna input coil, L-1, couples the balanced line to the single ended input circuit for the RF tube, V-1. Optimum antenna coupling for all channels is obtained by the coupling coils L-5A, L-5B, L-5C, and the coupling leads on channel positions 8, 10 and 12 of switch wafer S-1A. These can be considered the primary of the antenna transformer. The secondary, or tuned grid circuit, includes also the continuous, tapped coil mounted on wafer S-1B for the low channels (2-6) and the stamped metal plate in series with the coil for the high channels (7-13). The purpose of the antenna coil, coupling leads, and the secondary circuit, is to match the 300 ohm impedance of the transmission line from the antenna to the input impedance of the RF amplifier grid circuit and to tune this circuit for the channel selected. Referring to Figure 13, it will be seen that the switch in progressing from channel 2 to channel 13, shorts out the unused portion of the secondary winding or stamped metal plate. The bandwidth of channels 7 thru 13 is about 8 mc. The stamped metal plate is carefully designed so that with this bandwidth no alignment adjustment is needed on the high channels. The individual coil sections on the low channels, however, may be tuned by spreading or compressing them as outlined in the alignment procedure.

RF Amplifier

The grid of the RF amplifier V-1 (6CB6) is returned to the AGC bus thru L-6 and a bypass capacity (C-5). The plate load of this tube consists of another tapped coil for the low channels and a stamped metal plate for the high channels mounted, in this case, on switch wafer S-1C. Here again, the switch progressively shorts out the unused sections of the inductance in tuning from channel 2 to 13. In this case, however, a trimmer C-7 and a choke L-7 are provided to center the high channel response while the low channel coils may be tuned by expansion or compression.

The Mixer

The mixer uses 1/2 of V-2 (12AT7). C-15 (8 mmf) couples the RF amplifier output to the mixer grid. Oscillator injection is accomplished by C-17 (2 mmf). L-9 and C-16 form a series resonant circuit tuned to the center of the IF response, to prevent interaction between the IF and the mixer input.

The Oscillator

The oscillator uses the other half of V-2 (12AT7) in a Colpitts circuit. Here again, the tuning inductance consists of the tapped coil for the low channels and the stamped metal plate for the high channels mounted on wafer S-1E. L-8 and C-14 are provided to set the center frequency on the high channels while the low channels are aligned by spreading or compressing the individual coil sections. C-13 is provided as a fine tuning control for customer use. The oscillator operates above the RF on the low channels and below the RF on the high channels except that in later production the circuit was modified to avoid interference by operating the oscillator on the high side for channels 11, 12 and 13.

THE IF AMPLIFIER

The IF amplifier uses two 6AU6 tubes and one 6AG5 tube. Figure 14 is the schematic of the IF amplifier. T-1 couples the mixer plate to the first IF grid. Coupling between primary and secondary, which are individually slug-tuned, is fixed and is designed for proper bandwidth. The plate choke L-11, of the 1st IF tube V-3 (6AU6), is coupled to the grid coil, L-12, of the 2nd IF tube V-4 (6AU6) thru C-30 (220 mmf). At IF frequencies, the impedance of C-30 is negligible and for all practical purposes, L-11 and L-12 can be considered as being in parallel, L-12 being slug-tuned. A similar method is used between the 2nd and 3rd IF tubes. The 3rd IF plate is coupled to the detector by T-2, a unity coupled transformer. The IF circuits are stagger-tuned for proper bandwidth as explained in the Alignment Instructions. L-13 and L-17 are separately tuned trap windings on IF coil forms L-12 and L-16, respectively. Together with C-31 and C-38, they form absorption type trap circuits which steepen the high and low skirts of the IF response for better picture quality and to stabilize the audio response with intercarrier sound.

Decoupling has been used not only in the plate supply and AGC circuits, but also in the filament circuits to prevent regeneration.

THE VIDEO DETECTOR

One-half of V-6 (6AL5) is used as the video detector. Figure 15 is a schematic of the video detector. Since for noise limiting purposes it is desirable to apply a signal with negative going sync pulses to the grid of the video amplifier, the detector load R-26 (5600) is placed in the plate circuit of the diode. L-18, L-19, and C-42, form a low pass filter to keep IF frequencies off the grid of the video amplifier.

Since this chassis operates on the intercarrier sound system, the detector heterodynes the video and sound IF frequencies, and produces the 4.5 mc beat frequency which becomes the new audio IF frequency. The negative DC voltage developed at the high side of the detector load R-26

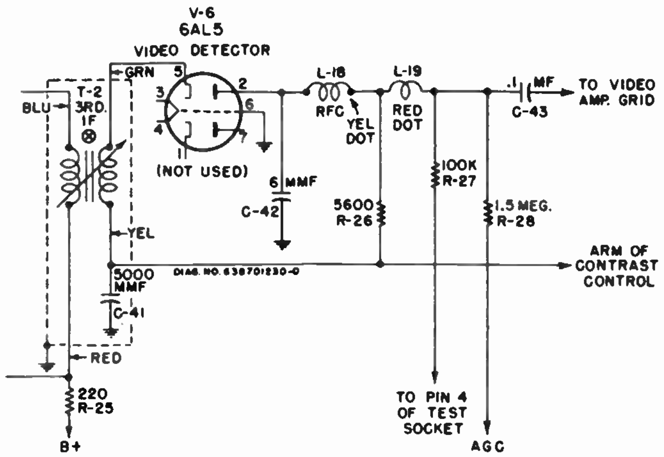

FIGURE 15.
SIMPLIFIED SCHEMATIC OF VIDEO DETECTOR

(5600) will be a function of carrier level. This voltage is fed to the AGC bus thru R-28 (1.5 meg) and controls the gain of the RF and 1st and 2nd IF amplifiers.

THE VIDEO AMPLIFIER

The video amplifier V-7 (6AH6) not only amplifies the video signal but also the 4.5 megacycle audio IF beat. Figure 16 is a schematic of the video amplifier. In its plate circuit, this beat is separated from the video signal and fed to the grid circuit of the audio driver-limiter tube V-8 (6AU6) by C-49 (2.2 mmf) and L-23, the sound take-off coil. The 4.5 mc trap, L-21 and C-50, is a parallel resonant circuit which, when properly tuned, offers a high impedance to this frequency, to prevent its reaching the picture tube.

By applying a negative signal to the grid of the video amplifier, a noise limiting action is achieved because noise pulses of amplitude greater than the sync level will drive the tube to cut off and, therefore, will not be present in the plate circuit. Since a single video amplifier tube is used, the signal at its plate will be positive and, as might be expected, is used to modulate the cathode of the picture tube rather than the grid, because the blanking pulses must cut the picture tube off and the polarity of the video information must be such that dark picture elements result in making the grid more negative with respect to the cathode.

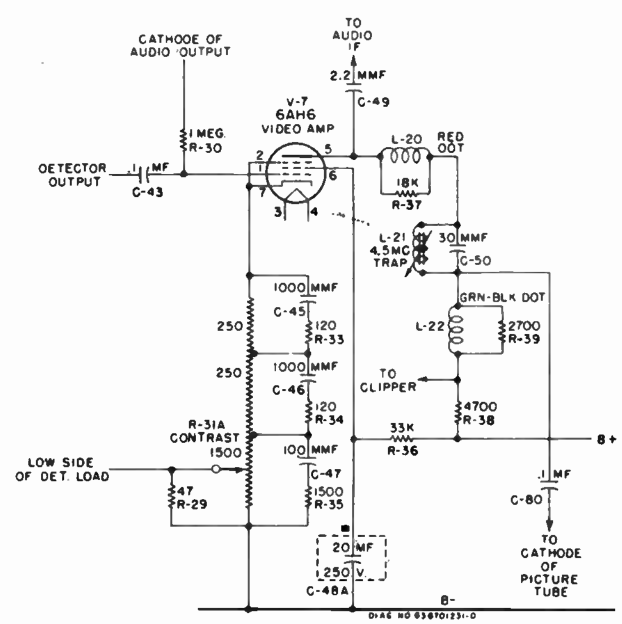

FIGURE 16.
SIMPLIFIED SCHEMATIC OF THE VIDEO AMPLIFIER

L-20 and L-22 are peaking coils to extend the high frequency response of the amplifier. The contrast control, R-31A, is placed in the cathode circuit of the video amplifier and controls the bias and, therefore, the gain of this tube. The network of resistors and condensers across taps on the contrast control decreases degeneration at the higher frequencies and, therefore, helps to extend the high frequency response. The composite video signal is fed to the picture tube cathode thru coupling condenser C-80 (.1).

THE AGC

The negative DC voltage developed across the detector load resistor, R-26 (5600), is the AGC voltage. It will be noted that the low side of this resistor is connected to the arm of the contrast control potentiometer, R-31A. R-29 (47) is shunted across the arm of the contrast control and B-. In weak signal areas, this arrangement results in delay in the AGC action. For a weak signal, minimum bias is desired on the video amplifier, therefore, the arm of the contrast control will be closest to the cathode end of the potentiometer. Because R-29 is then shunted across the entire contrast control, most of the plate current will flow thru it and develop a positive voltage of approximately one volt at the arm with respect to B-. Since the low side of the detector load is tied to this positive voltage, no AGC voltage will develop until the signal is strong enough to overcome this positive voltage and, therefore, no AGC bias is applied to the controlled tubes under weak signal conditions. In a strong signal area, however, where the arm of the contrast control approaches the B- end of the control, R-29 is shorted out and full AGC voltage is developed.

THE AUDIO SYSTEM

The audio system employs a driver-limiter. V-8 (6AU6); a ratio detector V-9 (6AL5); a first audio amplifier, V-10 (6J5), and an audio output tube, V-11 (6V6). Figure 17 is a schematic of the audio system. The driver-limiter is operated at low plate and screen voltages to act as a partial limiter to minimize any amplitude modulation. A conventional ratio detector and audio amplifier are used.

THE CLIPPER

The clipper uses a 6SN7GT tube. The clipper schematic is shown in Figure 18. The composite video signal with positive going sync is applied thru R-55 (10K) and C-66 (.005) to the grid of the first clipper from the plate circuit of the video amplifier. Under no signal conditions, the tube is unbiased. The positive signal, however, will cause the tube to draw grid current and the voltage drop across R-54 (1 meg), negative at the grid, will charge C-66 to such a value that only the most positive part of the signal, which is the sync pulse, will cause plate current to flow. Therefore, the video information and the blanking pulses are clipped off and only the sync pulses, now negative in polarity, appear in the plate circuit. The second clipper is so biased that the peaks of the sync pulses will drive the tube to cut-off, which results in squared pulses of positive polarity in the plate circuit of this tube. A slight increase in sync pulse amplitude is obtained by a small positive voltage applied to the grid of the second clipper by R-107 (330K).

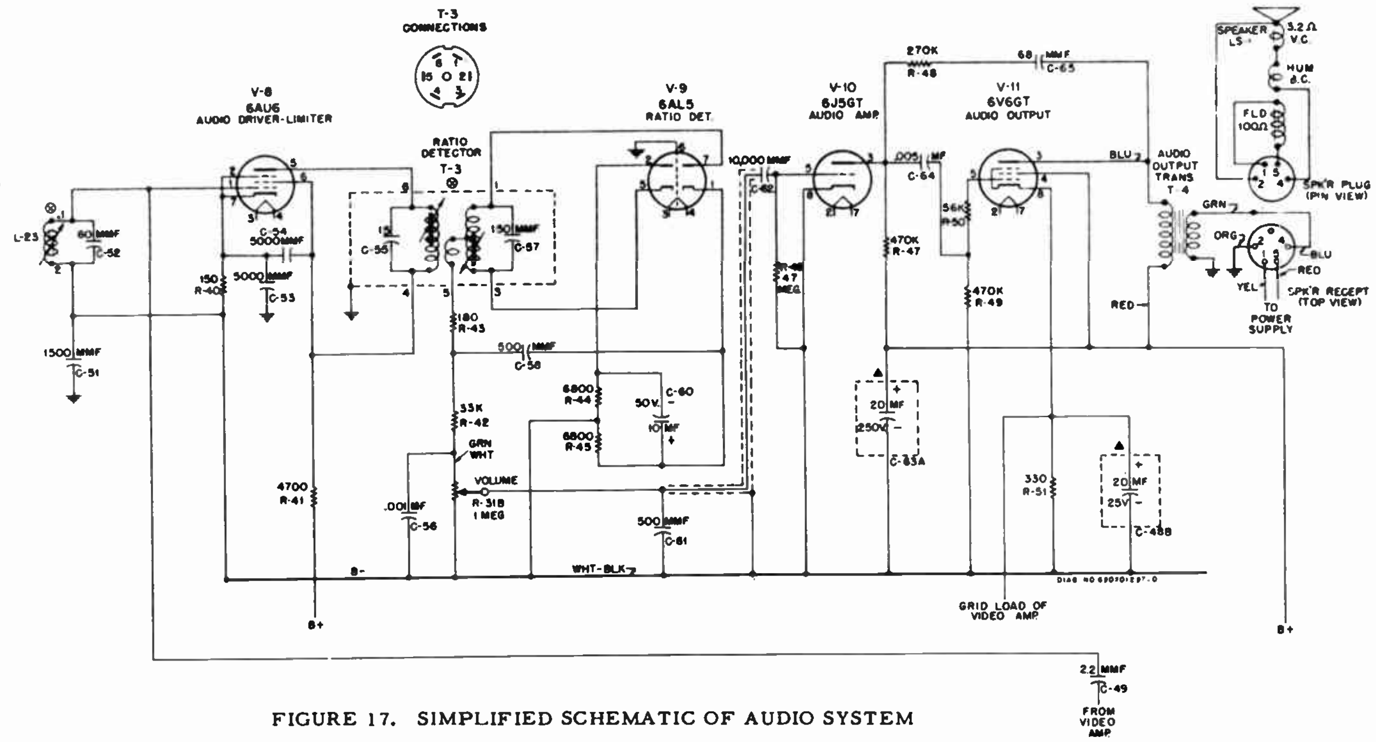

FIGURE 17. SIMPLIFIED SCHEMATIC OF AUDIO SYSTEM

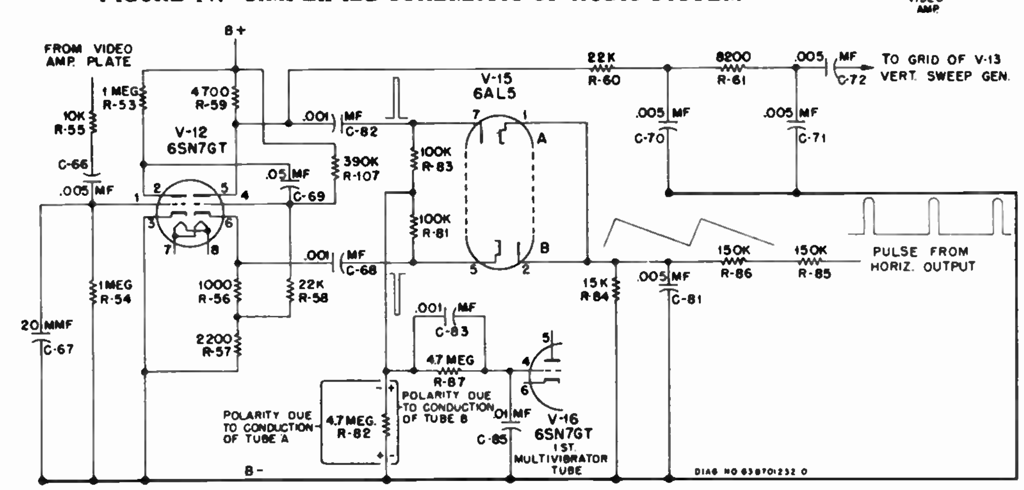

FIGURE 18. SIMPLIFIED SCHEMATIC OF CLIPPERS AND PHASE DETECTOR

THE VERTICAL SCANNING SYSTEM

Figure 19 is a schematic of the Vertical Scanning System.

The integrating network, shown in Figure 18, composed of R-60, C-70, R-61, and C-71, changes the vertical group of sync pulses into a single pulse of suitable amplitude to trigger the vertical oscillator. The vertical oscillator is an asymmetrical multivibrator using two tubes V-13 (6J5) and V-14 (25L6). V-14 also serves as the output tube.

A multivibrator can be considered as a resistance coupled amplifier in which the output of the second tube is coupled back to the input of the first tube. V-13 is the automatic switch which charges and discharges the sawtooth forming condenser C-74 (.05), connected in its plate circuit. The circuit components of the multivibrator are chosen so that V-13's conductance period is about 7% of the entire cycle, to insure that retrace time of the scan will have the proper relationship with the trace time. This circuit is modified from the conventional resistance coupled multivibrator in that the plate of the output stage, which is also the second multivibrator tube, has a fairly large value of inductance, introduced by the output transformer stepping up the yoke inductance. When the tube is cut off, a positive pulse of several hundred volts is developed across this inductance. A portion of this pulse, obtained by means of the feedback network, R-72, R-73, R-74 and C-76, C-77 and C-78, is used to cause the discharge tube V-13 to go into heavy conduction.

©John F. Rider

World Radio History

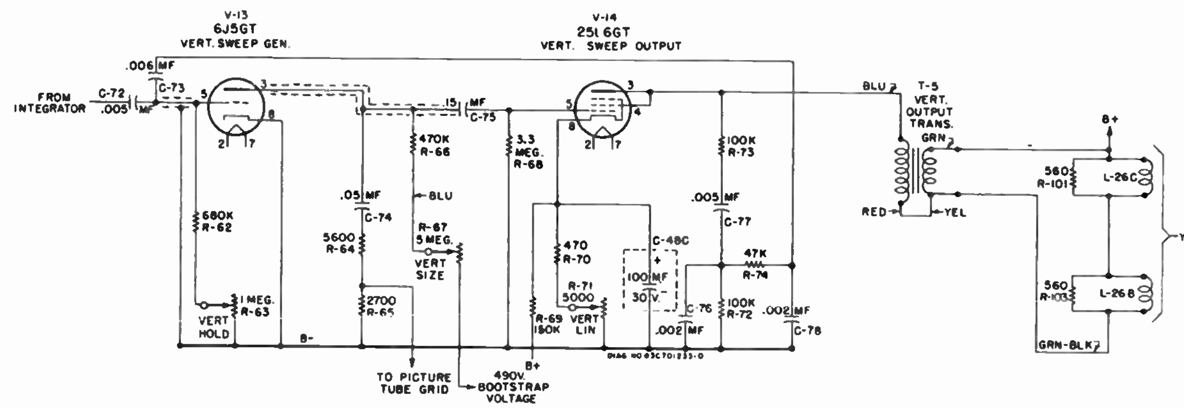

FIGURE 19. SIMPLIFIED SCHEMATIC OF VERTICAL SCANNING SYSTEM

For purposes of explaining the circuit action, assume a time has been reached in the cycle when the trace period is almost completed. During this trace period, V-13 is cut off and V-14 is conducting. C-73 has been discharging thru the grid resistors of V-13, R-62 (680K) and R-63 (the vertical hold control) and resistors R-74 and R-72. This discharge circuit makes the grid end of R-62 negative and biases the tube beyond cut-off. When the energy stored in the condenser has decreased sufficiently, the grid of V-13 reaches the threshold of conductance and the tube begins to draw current. Condenser C-75, which has been charged to nearly the B plus voltage, now starts to discharge thru V-13 and R-68 (3.3 meg) and this discharge current makes the grid end of R-68 negative tending to cut off V-14, and initiates the retrace. With the sudden change of plate current in V-14 developed across the plate inductance, a positive pulse is applied to the grid of V-13 through the feedback network driving this tube into heavy conduction. C-74 will then discharge thru V-13. The voltage developed at the plate of V-13 will be the combination sawtooth and pulse voltage shown in Figure 22(1). The pulse is formed by the peaking resistors R-64 and R-65. When V-13 goes into conduction, the voltage at the plate of V-13 drops suddenly to a value determined by the relationship of the plate resistance of V-13 to the total resistance in the discharge circuit of C-74, which consists of R-64, R-65 and the plate resistance of V-13. After this initial instant, the charge on C-74 decreases, causing the voltage decrease at the plate shown between points "c" and "d" of Figure 22(1). When the positive pulse on the grid of V-13 has decreased to the value where the negative charge on C-73 becomes operative and cuts off V-13, the voltage on the plate of V-13 and correspondingly on the grid of V-14, rises quickly to point "a" on the curve, the start of the trace.

The negative pulse shown between points "b" and "a" of Figure 22(1) acting on the grid of V-14, tends to cut the tube off and raises its plate resistance to the larger value required to dissipate the energy in the plate circuit inductance during the short retrace period.

Since the plate circuit of the vertical output stage V-14 has inductance, and as the time constant of an inductive circuit decreases with an increase of resistance, just the opposite of an RC circuit, the increase in plate resistance of the tube is used to obtain the short time constant circuit required for proper retrace time.

By returning the grid of the picture tube to the junction of the two peaking resistors, R-64 and R-65, a negative pulse of suitable amplitude to cut the picture tube off during retrace is obtained, resulting in elimination of retrace lines on the screen.

The feedback network to the grid of V-13 also serves to filter out horizontal pulses which are present in the plate of V-14 due to coupling in the yoke and which are coupled to the plate thru the output transformer. The windings of the vertical output transformer are connected series opposing, which reduces the step-down ratio and, hence, the inductance in the plate of V-14 in order to shorten the retrace time.

The controls found in this circuit are:

1. The Vertical Hold Control R-63 (1 meg). This control varies the resistance in the discharge circuit of C-73 (.006) and, hence, provides a means of varying the frequency of the multivibrator. In practice, this control is adjusted so that the incoming positive sync pulses, which are of constant amplitude, will fire the tube in exact synchronization with the transmitting station's vertical scan.

2. The Vertical Size Control R-67 (5 meg). This control varies the charging current into C-74 (.05) and, hence, the amplitude of the voltage developed across it. Variation of this voltage varies the drive on the grid of V-14 and controls vertical size.

3. Vertical Linearity R-71 (5000). This control, by bleeder action thru resistor R-69 (150K) and the output tube's plate current, sets the bias and determines the tube's operating point on its plate current curve. Since this curve is not linear, some distortion can be introduced to counteract any non-linearity in the sawtooth grid voltage.

Since all of these controls are also in the multivibrator circuit and have an effect also on its frequency, there will be some interaction between them. Usually readjustment of size or linearity will require readjustment of the hold control.

HORIZONTAL SCANNING SYSTEM

The horizontal scanning system comprises a phase detector V-15 (6AL5), and a cathode coupled multivibrator V-16 (6SN7), the output tube V-17 (6BQ6) and a damping diode V-18 (6W4). Figure 20 is a simplified schematic of this system.

Horizontal Oscillator

In order to see how the phase detector automatically corrects for multivibrator frequency change, it will be necessary to understand how the correction voltage affects the multivibrator. It will be noted that this circuit differs from the vertical multivibrator in that only one coupling condenser is used but that the two tubes have a common cathode resistor. This arrangement is known as a cathode coupled multivibrator.

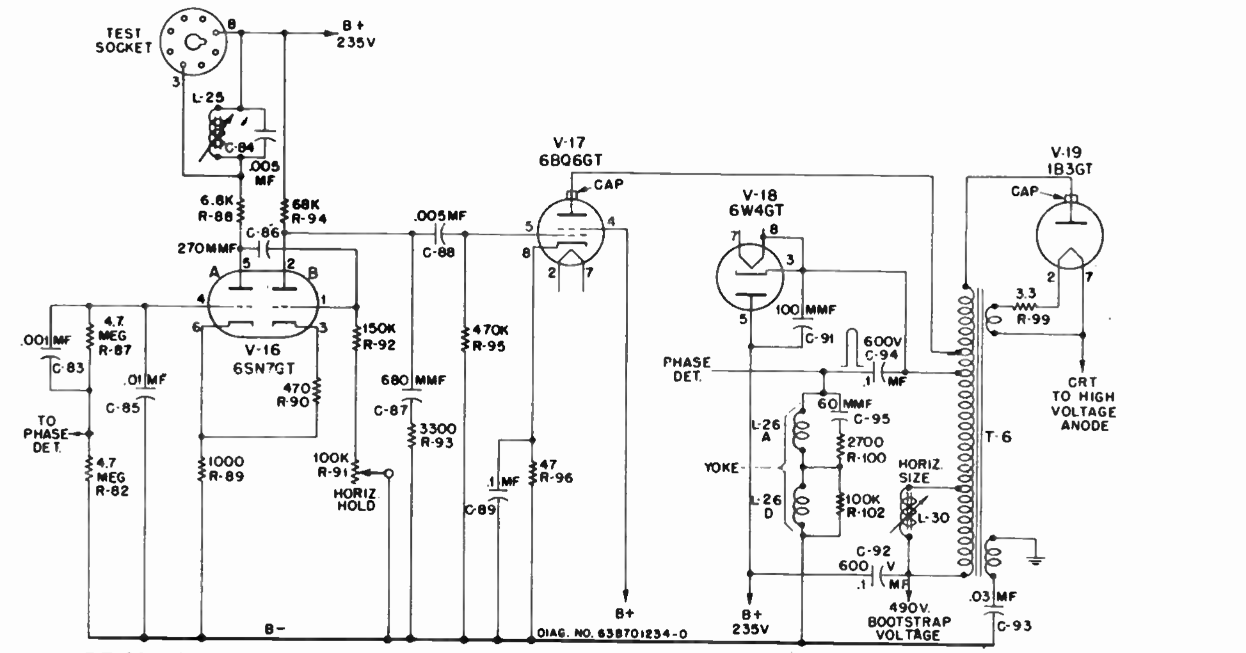

FIGURE 20. SIMPLIFIED SCHEMATIC OF HORIZONTAL SCANNING AND HIGH VOLTAGE SYSTEM

The operation is as follows. Assume that the trace period is almost completed. At this time, tube "A" is conducting, tube "B" is cut off. C-86 is discharging thru tube "A", R-92 (150K) and R-91 (the hold control). The discharge current of C-86 is still high enough to keep the grid of tube "B" negative and cut off. Bias is being applied to both tubes by current flow thru R-89 (1000) the common cathode resistor. When the energy stored in C-86 is reduced to the point where its discharge current no longer holds the grid of tube "B" below conductance, tube "B" starts to pass current and this current causes a greater voltage drop across R-89, the common cathode resistor, which increases the bias on tube "A" reducing its plate current. The resulting increase in voltage at the plate of tube "A" begins to charge C-86 and this charging current applies positive voltage to the grid of tube "B". The resulting heavier conduction of tube "B" develops a pulse of voltage across R-89 which cuts tube "A" off and results in a positive pulse at the plate of tube "A" which throws tube "B" into heavy conduction. This allows C-87, the saw-forming condenser to discharge thru tube "B" and R-93. When C-86 becomes charged the charging current thru R-92 and R-91 decreases and the positive voltage on the grid, which has far exceeded the bias developed across R-89, is reduced. This results in reducing the plate current thru tube "B" and, therefore, the bias applied to tube "A" by the voltage drop across R-89. Tube "A" starts to conduct and condenser C-86 starts to discharge, cutting tube "B" off. C-87 begins to charge, starting the next trace.

L-25 and C-84 in the plate circuit of tube "A", form a resonant circuit which is tuned to the horizontal frequency (15,750 cps). The 15,750 cycle sine wave generated by this circuit, if properly phased, will insure that the positive pulse at the plate of tube "A", which throws tube "B" into conduction, will be more frequency stable.

C-87 and R-93, the peaking resistor, will produce the same combination pulse and sawtooth voltage shown in Figure 22(1). This action was explained in the vertical circuit.

The Phase Detector

The foregoing explanation is based on the assumption that tube "A's" grid is returned to a fixed potential point. It can be seen that if this grid is returned to a point which varies in potential with frequency of the multivibrator, it would be possible to make this variation a means of frequency control. Assume that the grid of "A" in Figure 20 is made more positive. This causes the bias of "B" to increase because of the increased drop across the common cathode resistor R-89. Capacitor C-86 will then discharge for a longer time before "B" conducts, thereby decreasing the frequency of oscillation. If the grid were made more negative, the bias across the common cathode resistor would be less and C-86 would discharge for less time before "B" started to conduct, thereby increasing the frequency.

Figure 18 is a simplified schematic of the clipper and phase detector circuits. The phase detector V-15 (6AL5) is so connected that a comparison of the phase of the incoming sync pulses and a sawtooth derived from the horizontal output system is made. A positive sync pulse from the plate of the 2nd clipper V-12 (6SN7) is fed thru C-82 (.001) to the plate of diode "A" of V-15. A negative sync pulse from the cathode of V-12 is applied thru C-68 (.001) to the cathode of diode "B" of V-15. A sawtooth, derived from the integration of a pulse in the horizontal output circuit, at the yoke, by the integrating network, composed of R-86 (150K), R-85 (150K), and C-81 (.005) is applied to the cathode of diode "A" and the plate of diode "B", which are tied together and returned to B- thru R-84 (15K). The load for diodes "A" and "B" consists of resistors R-83 (100K) and R-81 (100K) whose junction returns to the high side of the grid resistor R-82 of the first horizontal multivibrator tube V-16 (6SN7). The voltage applied to the two diodes will be a function of the amplitude of the sawtooth, the amplitude of the sync pulses and the phase relationship between the pulses and the sawtooth.

World Radio History

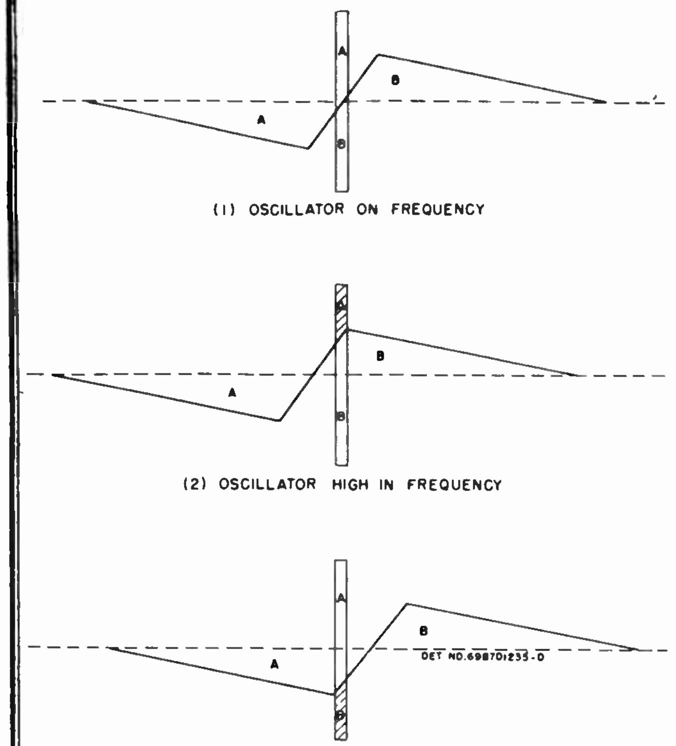

FIGURE 21. WAVEFORMS AT PHASE DETECTOR

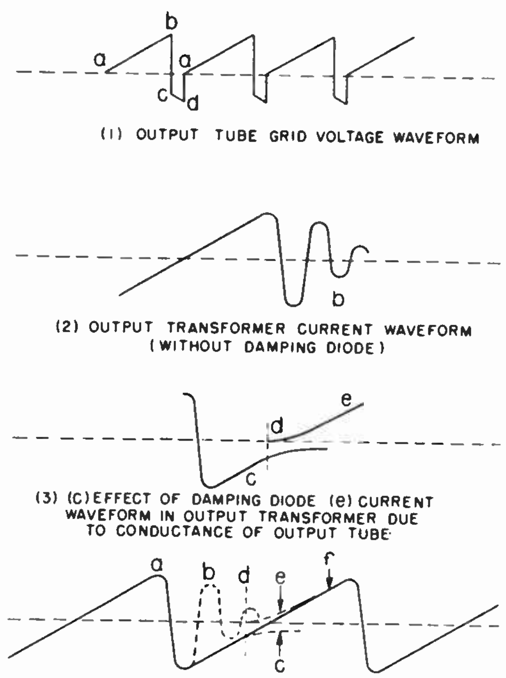

FIGURE 22. WAVEFORMS IN HORIZONTAL SCANNING SYSTEM

If the sawtooth, whose phase and frequency are a function of the multivibrator's phase and frequency, is operating in the middle of the lock-in range, the sync pulse will occur in the center of the retrace time. See Figure 21(1). The sync pulses have an amplitude of from 6 to 8 volts while the sawtooth amplitude is about two volts. The RC time constant in the pulse input circuit to the diodes is long enough to maintain an average pulse voltage of 6 to 8 volts for two or three horizontal lines, which means that in the "on" frequency condition shown in Figure 21(1), the diodes conduct only on the pulses and since these are equal in amplitude and develop voltages of opposite polarity across R-82 in the first multivibrator grid circuit as shown in Figure 18, no control voltage is applied to the grid of V-16.

If the oscillator tends to increase in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(2) exists at the diodes. The phase of the sawtooth has now shifted so that at the same instant that the pulse is applied to the plate of diode "A" the positive saw is also applied to its cathode, so that only the shaded portion of the pulse causes conduction of diode "A". Diode "B", however, still conducts on the total amplitude of the negative pulse applied to its cathode aided by the positive saw applied to its plate at the same time. Since current flow thru diode "A" makes the grid end of R-82 negative, with respect to B-, the decreased current flow caused by the sawtooth voltage bucking the pulse voltage at diode "A" results in a more positive voltage across R-82 applying a more positive voltage to the grid of V-16 which, as we have seen, results in decreasing the oscillator's frequency.

If the oscillator tends to decrease in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(3) exists at the diodes. At the same instant that the negative pulse is applied to the cathode of diode "B", the negative saw is applied to its plate so that only the shaded portion of the pulse causes conduction. Diode "A", however, conducts on the full amplitude of the positive pulse applied to its plate aided by the negative saw applied to its cathode at the same time. Since current flow thru diode "B" makes the grid end of R-82 positive, with respect to B-, the decreased current thru diode "B" results in applying a more negative voltage to the grid of V-16 which, as we have seen, results in increasing the oscillator frequency. C-83, R-87 and C-85 provide two time constant filters which are necessary to obtain "fly-wheel" action of this AFC sync circuit.

The Horizontal Output System

The combination sawtooth and pulse waveform developed across C-87 (680) and R-93 (3300) by the multivibrator circuit, is fed to the grid of the horizontal output tube V-17 (6BQ6). Figure 20 is a simplified schematic of the horizontal output system. It will be noted that in this system an auto-transformer is used. In the horizontal scan it is necessary that retrace be completed in about 7 microseconds. In order to accomplish reversal of current in the inductance of the output transformer and the yoke in this short a time, it is necessary to make this circuit resonant at such a frequency that the half cycle time will equal 7 microseconds, because only by shock exciting such a circuit into oscillation will retrace be accomplished in the time allowed. The circuit is made resonant by the inductance of the output transformer and yoke, the distributed capacity and the tube capacity. Bearing this in mind, the operation can be explained as follows. Referring to Figure 22(1), assume that the voltage on the grid of the output tube is increasing, point "a". The grid is now being made less negative and the output tube starts to draw current which is supplied from B plus thru the damping diode. When point "b" is reached on the grid voltage waveform, the output tube is suddenly cut off because its grid has been made highly negative, (point "c" on the grid voltage waveform). With the tube cut off, the resonant plate load is undamped and the circuit is shocked into oscillation. The reversal of current through the output inductance produces a positive voltage pulse which makes the cathode of the damping diode (V-18) positive, with respect to its plate; therefore, it cannot conduct. C-91 (100) is placed across the diode to provide a low impedance for the oscillatory current. If the damping diode V-18 were not present, this oscillation would continue and current would flow in the output transformer as shown in Figure 22(2). In order to insure a linear trace, however, this oscillation must be stopped and the damping diode serves this purpose. When the current nears its maximum negative value, the polarity and amplitude of the voltage pulse on the damping diode is such that its plate becomes positive, with respect to its cathode, so that the tube conducts heavily and loads the circuit sufficiently to prevent continuation of the oscillation. The current then follows the decay curve shown at "c" in Figure 22(3). At the time ["d" in Figure 22(3)] the voltage at the grid of the output tube has become less then cut off [point "a" in Figure 22(1)] and the tube again demands current. The rising current in the tube results in superimposing the waveform "e" of Figure 22(3) on the current flow already in the output transformer due to the decaying current which resulted from the damped oscillation. Combination of these two currents results in the linear trace current indicated at "f" in Figure 22(4), which is a composite waveform of the entire action. During the peak conduction of the damping diode, C-92 (.1) charges and its polarity is such that when the output tube calls for current the charge on the condenser will be in series with the B plus supply so that the voltage at the output tube plate is raised from the 250 volt B plus supply to about 475 volts by this so-called "bootstrap" voltage. When the grid voltage waveform of the output tube again reaches point "b" of Figure 22(1), the tube is cut off and another cycle starts.

In order to properly match the yoke inductance to the required output inductance for the tube, the yoke is connected to a tap on the winding which effectively makes an auto-transformer of this section. The positive pulse of voltage at this tap is coupled to the yoke thru C-94 (.1) and results in a sawtooth of current thru the yoke. It will be remembered that a portion of this pulse is also fed to the phase detector for the AFC action thru R-86 and R-85.

The small additional winding, one terminal of which is connected to chassis while the other terminal is connected to B- thru C-93 (.03) is used to cancel the pulse of voltage which is placed on the chassis by induction from the output transformer. By connecting this winding in such a way as to place a pulse of suitable amplitude on the chassis 180 degrees out of phase with the induced voltage, cancellation of the induced voltage will take place.

High Voltage

To take advantage of the large voltage pulse developed across the output inductance by the heavy current flow caused by the retrace oscillation, the plate winding is made the primary of an auto-transformer whose step-up ratio is such as to develop pulses of about 12 Kv at its high end. These pulses are rectified by V-19 (1B3) and the resulting DC is applied to the second anode of the picture tube. The filament voltage for the 1B3 rectifier is obtained from an additional winding on the output transformer.

Controls

L-25 is the coil of the sine wave generating circuit in the horizontal multivibrator circuit and should be tuned to 15,750 cycles as explained in the service instructions.

R-91 is the horizontal hold control which can be adjusted for correct frequency operation of the multivibrator.

L-30, paralleling a small portion of the output choke controls, to a small degree, the inductance of the choke and acts as a size control.

TUNERS

Model TT-11 Tuning Unit

Ref. No.	Part No.	Description
S-1	1X792780	TT-11 tuning unit: includes station selector switch, fine tuning trimmer and the following components:
C-3	21K478234	Capacitor, molded: 8 mmf 500V
C-10	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-11	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-12	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-17	21K478280	Capacitor, molded: 2 mmf 500V
C-18	21K470322	Capacitor, molded: 20 mmf 500V
L-2	24C792764	Coil, antenna: channels 2 through 6; includes L-2A through L-2E (L-2F through L-2L are part of switch)
L-3	24K790536	Coil, RF: Channels 2 through 6; includes L-3A through L-3E (L-3F through L-3L are part of switch)
L-4	24K790537	Coil, oscillator: Channels 2 through 6; includes L-4A through L-4E (L-4F through L-4L are part of switch)
L-5	24K792765	Coil, antenna primary: low frequency; includes L-5A, 5B & 5C
L-8	24K790606	Coil, oscillator: Channel 13
R-6	6R5659	Resistor: 3900 10% 1/2W
	43K790136	Clip, spring: phosphor bronze (on collar)

World Radio History

Ref. No.	Part No.	Description
S-1	1X700100	TT-13 tuning unit: includes station selector switch, fine tuning trimmer and the following components:
C-3	21K478234	Capacitor, molded: 8 mmf 500V
C-11	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-12	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-18	21K400173	Capacitor, molded: 10 mmf 500V temp comp
	43K700725	Collar, spring (on rear end of fine tuning shaft)
	47K700726	Shaft, fine tuning

Model TT-13 tuning unit

Note: The TT-13 tuning unit is the revised TT-11 which places the oscillator above the carrier on the three high channels instead of below as in the TT-11. It can be distinguished from the TT-11 by the extra coil across the cut-out section of the plate on the oscillator deck.

L-2	24C792764	Coil, antenna: channels 2 through 6; includes L-2A through L-2E; L-2F through L-2L are part of switch).
L-3	24K790536	Coil, R.F.: channels 2 through 6; includes L-3A through L-3E (L-3F through L-3L are part of switch).
L-4	24C700114	Coil, oscillator: channels 2 through 6; includes L-4A through L-4E (L-4F through L-4L are part of switch)
L-4M	24K700115	Coil, oscillator: channel 10
L-5	24K792765	Coil, antenna primary: low freq; includes L-5A, 5B & 5C
L-8	24K700116	Coil, oscillator: channel 13
R-98	6R6069	Resistor: 2200 10% 1/2W
	42K790136	Clip, spring: phosphor bronze (on collar)
	43K700725	Collar, spring (on rear end of fine tuning shaft)
	47K700726	Shaft, fine tuning

CHASSIS PARTS - MECHANICAL

Part Number	Description
7K485464	Bracket, chassis mtg
7A791168	Bracket, coil mtg (horizontal size coil mtg)
1X792798	Bracket, deflection coil mtg: with yoke bumper mtg brkt, grounding spring & anode lead strip
7B792583	Bracket, focus coil (supports focus coil)
7A791965	Bracket, interlock safety (on chassis rear)
	Bracket, tube positioning (varies with cabinet - see particular cabinet parts list)
7C792737	Bracket, yoke bumper mtg: cad pl (on deflection coil bracket)
35A792454	Bumper, rubber (on each side of picture tube front)
38B792486	Button, plug: 1/2" dia (plugs hole next to focus control)
42K471342	Cap, plate (for high voltage rectifier)
42A5480	Cap, plate (for 6BQ6)
42A700147	Clamp, lead retainer (dresses V-19 filament leads)
42B70721	Clip, coil mtg (T-3 secondary mtg)
42A76244	Clip, coil retainer (L-25)
42A72609	Clip, tube shield grounding (V-10)
42K791405	Connector, 2nd anode: with rubber cap & leads
39K17396	Contact, pin terminal (on speaker leads)
46A478242	Core, brass, & screw (T-2)
46K791756	Core, brass, & screw (L-12 & L-16)
46K480256	Core, iron, & screw (L-13 & T-1 secondary)
46K471143	Core, iron, & screw (L-25)
46A470310	Core, iron, & screw (T-1 primary, L-21 & L-23)
46A70023	Core, iron, & screw (T-3 primary & L-17).
46A470302	Core, iron, & screw (T-3 secondary)
46A700090	Core, iron: with slide adjustment (L-30)
15B791111	Cover, test socket
35A792756	Cushion, focus coil: rubber
35B792739	Cushion, yoke mtg: rubber (circular pad on yoke bumper brkt)
5K470916	Grommet, insulating: 3/16" hole (for V-17 plate cap lead)
5K792031	Grommet, insulating: 9/32" hole (for 2nd anode lead)
5A790684	Grommet, rubber (V-14 & V-16 socket mtg)
14A780184	Insulator, antenna lead (beneath antenna terminal strip)
14K87179	Insulator, coil (in ratio detector can)
14A700081	Insulator, contact strip (wrapped around plug-in resistor receptacle)
9A484098	Insulator, electrolytic mtg: 3-lug; impregnated
9K471267	Insulator, electrolytic mtg: 4-lug; impregnated
14K791892	Insulator, shield (in T-2 shield)
4S7655	Lockwasher, internal: 3/8; cad pl (contrast control & station selector mtg)
4S7666	Lockwasher, external: #6; cad pl (plug-in resistor receptacle mtg).
4S7650	Lockwasher, internal: #6; cad pl (48B700138, 48B700139 & 48B700555 selenium rect mtg)
4S7657	Lockwasher, external: #8; cad pl (48B791694 selenium rectifier mtg)
4S9751	Lockwasher, internal-external: #8; cad pl (deflection yoke adj screw)
29R5239	Lug, soldering: #8 H.T.
2K791404	Nut, coil & core mtg (L-30)
2A470049	Nut, coil & core mtg (T-1, T-2, L-12, L-13, L-16, L-17, L-21 & L-23)
2S7004	Nut, hex: 3/8-32 x 9/16 (contrast control & station selector mtg)
2S7005	Nut, hex: 6-32 x 1/4 stl; cad pl (48B700138, 48B700139 & 48B700555 selenium rect mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (48B791694 selenium rectifier mtg)
2S7051	Nut, hex palnut: 3/8-32 x 9/16; cad pl (rear controls mtg)
2S7050	Nut, hex palnut: 6-32 (T-2 shield mtg)
2B70703	Nut, palnut: special (T-3 primary core mtg)
2A790191	Nut, special: cad pl (mounts trimmers C-7, C-14 & C-16)
35K790637	Pad, cushion: sponge rubber (large pad on tube retainer strap)
35K790169	Pad, cushion: sponge rubber (small pad on tube retainer strap)
35A790110	Pad, cushion: sponge rubber (under picture tube front)
64A700185	Plate, cover (on top rear of chassis)
64K791818	Plate, chassis cover (removable plate on chassis side)
64K792464	Plate, socket cover (covers unused socket hole next to V-17)
28K471323	Plug, line cord: 2-pin (power input)
9A22367	Receptacle: 5-prong (on speaker leads)
5S8497	Rivet: .088 x 1/8 stl; nkl pl (mounts V-1, V-2 & V-5 sockets)
5S7770	Rivet: .088 x 5/32 stl; nkl pl (antenna lead insulator mtg)
5S2815	Rivet: .088 x 7/32 stl; nkl pl (mounts 9K780442 & 9K484167 sockets)
5S7707	Rivet: .122 x 5/32 stl; nkl pl (mounts all octal sockets except V-14, V-16 & V-19)
5S7701	Rivet: .122 x 3/16 stl; nkl pl (mounts plug-in resistor receptacle)
5S7703	Rivet: .122 x 7/32 stl; nkl pl (electrolytic insulator mtg)
5S7700	Rivet: .122 x 1/4 stl; nkl pl (power plug mtg)
5S7728	Rivet: .122 x 5/16 stl; nkl pl (V-19 socket mtg)
5K71246	Rivet, shoulder: nkl pl (V-14 & V-16 socket mtg)
5S6846	Rivet: .145 x 5/32 stl; nkl pl (audio and vertical output trans mtg)
5S6842	Rivet: .145 x 7/32 stl; nkl pl (cover plate mtg)
3S490354	Screw, machine: 6-32 x 5/8 slotted hex head; cad pl (C-7 & C-14 trimmer adj)
3S490822	Screw, machine: 6-32 x 1" slotted hex head; cad pl (C-16 trimmer adj)
3S490459	Screw, machine: 6-32 x 1-1/8 slotted round head; brass (secures HV transformer plates)
3S488195	Screw, machine: 6-32 x 2 plain hex head; cad pl (48B700138 selenium rectifier mtg)
3S400051	Screw, machine: 6-32 x 2-1/2 plain hex head; cad pl (48B700555 & 48B700139 selenium rect mtg)
3S7163	Screw, machine: 8-32 x 1/4 plain hex head; cad pl (mounts high volt rectifier tube mtg plate)
3S7257	Screw, machine: 8-32 x 5/8 plain hex head; cad pl (focus coil bracket adjustment)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (filament transformer mtg)
3S3397	Screw, sheet metal: #8 x 5/16 PKZ plain hex head; cad pl (deflection coil support brkt mtg)
3S7467	Screw, sheet metal: #8 x 3/8 PKZ plain hex head; cad pl (T-8 mtg)
3S7512	Screw, sheet metal: #8 x 1/2 PKZ plain hex head; cad pl (tube retainer strap mtg)
3S7453	Screw, sheet metal: #8 x 1" PKA plain hex head; cad pl (tube retainer strap mtg)
3K790107	Screw, thumb: 8-32; cad pl (defl yoke adj)
26K485936	Shield, coil (ratio detector)
1X792785	Shield, coil: with spade bolts (T-2 shield)
26A26283	Shield, tube (for glass 6J5 audio amp)
26A90301	Shield, tube: miniature
26A790508	Shield, video: cad pl (shields video amp from HV transformer)
9A792167	Socket, tube: miniature; 7-prong (V-1)
9K780442	Socket, tube: miniature; 7-prong (V-3, V-4 & V-6)
9K484167	Socket, tube: miniature; 7-prong (V-7, V-8, V-9 & V-15)
9A471343	Socket, tube: miniature; tan molded (V-5)
9K484816	Socket, tube: noval; molded (V-2)
9K471270	Socket, tube: octal (all octal sockets except V-14, V-16 & V-19)
9A790685	Socket, tube: octal (V-14 & V-16)
9A480274	Socket, tube: octal; (V-19)
9K700039	Socket, picture tube: 5-pin; with leads
9K700036	Socket, picture tube: 12-pin; with leads.
41A700143	Spring, coil (L-30)
41A70705	Spring, coil (T-3)
41A790182	Spring, grounding (grounds picture tube outer coating)
41A471379	Spring, tension (picture tube support)
1X792061	Strap, tube retainer: with cushions (picture tube front support for 12T3 & 12K3)
1X790634	Strap, tube retainer: with cushions (picture tube front support for 12T1, 12T2, 12K1 & 12K2)
35A791581	Strip, anode lead (dresses 2nd anode lead from chassis)
31A700082	Strip, contact (receptacle for plug-in resistor)
1K700078	Strip, terminal: 2-pin (mounts plug-in resistor)
31A21990	Strip, terminal: 2-screw (antenna terminal)
31K76184	Strip, terminal: 2 ins, #1 gnd; 3/8" spacing
31A700148	Strip, terminal: 2 ins, #2 mtg; 3/8" spacing
31A792450	Strip, terminal: 2 ins, #3 mtg; 3/8" spacing
31K471564	Strip, terminal: 3 ins, #2 gnd; 3/8" spacing
31K51511	Strip, terminal: 3 ins, #3 gnd; 3/8" spacing
31K471565	Strip, terminal: 3 ins, #4 gnd; 3/8" spacing
31K37494	Strip, terminal: 4 ins, #3 gnd; 3/8" spacing
31A790122	Strip, terminal: 4 ins, #3 gnd; 1/2" spacing
31K22174	Strip, terminal: 4 ins, #4 mtg; 3/8" spacing
31A780089	Strip, terminal: 4 ins, #5 gnd; 3/8" spacing
31K26658	Strip, terminal: 5 ins, #3 gnd; 3/8" spacing
31K90046	Strip, terminal: 5 ins, #4 gnd; 3/8" spacing
31A791402	Strip, terminal: 6 ins, #4 gnd; 3/8" spacing
31A780091	Strip, terminal: 6 ins, #5 gnd
24A790646	Trap, ion
1X780165	Tube mounting plate: with mounting bracket & tube socket (high-voltage rectifier mounting plate)
4A77577	Washer, insulating (on chassis side of horizontal size coil)
4K470939	Washer, insulating: 3/8 x .136 x .062 (electrolytic insulator mtg)
4A791447	Washer, insulating (T-8 mtg)
4A790132	Washer, spring (focus coil bracket adj screw)
4S7569	Washer, flat; 5/16 x .145 x .027; cad pl (V-14 & V-16 socket mtg)
4S490366	Washer, flat: 3/8 x .156 x .125 stl; cad pl (48B700138, 48B700139 & 48B700555 selenium rectifier mtg).
4A7562	Washer, flat: 7/16 x .187 x .033 stl; cad pl (focus coil bracket mtg)
4S7596	Washer, flat: 1/2 x .195 x .067 stl; cad pl (deflection yoke support bracket mtg)
4S7631	Washer, flat: 1 x .187 x .042; cad pl (cover plate mtg)

INSULATING COMPOUNDS

Part Number	Description
11M490423	Coating, high voltage insulating: red-brn (on high volt rectifier socket)
11M490387	Wax, biwax (on high volt transformer)

©John F. Rider

MODEL 12K1 CABINET PARTS

Part Number	Description
1X792153	Back Cover: complete with centering adjustment cover, picture tube rear cover & line cord (specify diameter of tube rear cover - 2-1/2" or 4")
13D790489	Bezel, picture tube (window frame)
1X792768	Bracket, picture tube positioning: with pad (on chassis front)
1X792484	Bracket, window mtg: with pad
16F792064	Cabinet, console: red-brown mahogany; less bezel, window and gasket
13K792066	Cloth, grille (cabinet front)
30B470756	Cord, line: with plug & receptacle
15B791076	Cover, centering adjustment: rubber
1X792546	Cover, chassis bottom: with hi-volt insulator
15A790586	Cover, picture tube rear: 2-1/2" cup diameter (on back cover)
15K700162	Cover, picture tube rear: 4" cup diameter (on back cover)
5S3139	Eyelet: .202 x .475 brass; ant cop (on back cover)
32D790654	Gasket, picture tube: rubber
14A791829	Insulator, threaded (bezel mtg)
14B792069	Insulator, high voltage (on bottom cover)
14A791827	Insulator, tube base: round (in 2-1/2" picture tube rear cover)
14K791828	Insulator, tube base: rectangular (in 2-1/2" picture tube rear cover)
14B700565	Insulator, tube base (in 4" picture tube rear cover)
14K700567	Insulator, tube base: disc (in 4" picture tube rear cover)
36A485457	Knob, control (hold controls on chassis rear)
36B790505	Knob, control (contrast)
36B790506	Knob, control (station selector)
36C790507	Knob, control: wal-mahog (volume & fine tuning)
62K70581	Logotype: "Motorola" gold enamel
4S7650	Lockwasher, Int: #6; cad pl (line cord mtg)
4S9751	Lockwasher, Int-Ext: #8; cad pl (spkr mtg)
4S7657	Lockwasher, Ext: #8; cad pl (spkr mtg)
13A790824	Medallion ("M" on grille cloth)
2S7007	Nut, hex: 8-32 x 1/4; cad pl (spkr mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (spkr mtg)
2S490424	Nut, teenut: 6-32 (bezel mtg)
35K792459	Pad, cushion (window mtg brkts)
35K792740	Pad, cushion (on tube positioning brkt)
5K791856	Rivet, shoulder: annealed (line cord mtg)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
5S7751	Rivet: .122 x 1/4 stl; ant cop pl (picture tube rear cover mtg)
3S2991	Screw, machine: 6-32 x 1/2 plain hex head; cad pl (window mtg brkts)
3K653	Screw, machine: 8-32 x 1-1/4 (spkr mtg)
3S476115	Screw, sheet metal: #6 x 1/4 PKZ plain hex head; cad pl
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acorn head; ant cop pl (back cover mtg)
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop pl (back cover mtg)
3S490819	Screw, sheet metal: #6 x 7/8 slotted acorn head; statuary bronze pl (back cover mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (tube positioning brkt mtg)
3S8153	Screw, sheet metal: #8 x 3/4 PKA plain hex head; cad pl (bottom cover mtg)
3S3359	Screw, sheet metal: #8 x 1-5/8 PKA plain hex head; cad pl (chassis mtg)
56B791612	Strap, antenna support (for lower loop antenna)
4K780040	Washer, felt (under control knobs)
4K470786	Washer, fibre: 1/2 x 3/16 x 1/16 (bezel mtg)
4S7646	Washer, flat: 11/16 x 3/16 x .067; wrought iron; cop pl (chassis mtg).
4S7629	Washer, flat: 1/2 x 3/16 x .048 stl; (bottom cover mtg)
61K790653	Window, picture tube: 12"; safety glass

MODEL 12K1B CABINET PARTS - Same as 12K1 except:

Part Number	Description
16K792065	Cabinet, console: limed oak; less bezel, window, and gasket
13K792067	Cloth, grille: egg-shell (cabinet front).
36K791431	Knob, control: tan (volume & fine tuning)

MODEL 12K2 CABINET PARTS

Part Number	Description
1X792485	Back Cover: complete with centering adjustment cover, picture tube rear cover, and line cord
13D790489	Bezel, picture tube (window frame)
1X792484	Bracket, picture tube window mtg: with pad
1X792769	Bracket, picture tube positioning: with pad
16F792455	Cabinet, console: red-brown mahogany; less window, bezel & gasket
55K791116	Cloth, grille: red mahogany; 13-5/16 x 19-7/8
30B470756	Cord, line: with plug & receptacle
15B791076	Cover, centering adjustment: rubber (on back cover)
1X792546	Cover, chassis bottom: with hi-volt insulator
15A790586	Cover, picture tube rear: 2-1/2" cup diameter (on back cover)
15K700162	Cover, picture tube rear: 4" cup diameter (on back cover)
5S3139	Eyelet: .202 x .475 brass; ant cop
32D790654	Gasket, picture tube: rubber
55K791113	Grille, metal: brushed brass (on grille cloth)
14B792069	Insulator, high voltage (on bottom cover)
14A791829	Insulator, threaded (bezel mtg)
14A791827	Insulator, tube base: round; (inside 2-1/2" tube rear cover)
14K791828	Insulator, tube base: rectangular (inside 2-1/2" tube rear cover)
14B700565	Insulator, tube base (inside 4" tube rear cover)
14K700567	Insulator, disc (inside 4" tube rear cover)
36A485457	Knob, control: black (hold controls on chassis rear)
36B790505	Knob, control (contrast)
36B790506	Knob, control (station selector)
36C790507	Knob, control: wal-mahog (volume & fine tuning)
62K70581	Logotype: "Motorola"; gold enamel
4S7650	Lockwasher, Int: #6; cad pl (line cord mtg)
4S9751	Lockwasher, Int-Ext: #8; cad pl (spkr mtg)
4S7657	Lockwasher, Ext: #8; cad pl (spkr mtg)
2S7007	Nut, hex: 8-32 x 1/4; cad pl (spkr mtg)
2S7003	Nut, hex: 8-32 x 5/16; stl; cad pl (spkr mtg)
2S490424	Nut, teenut: 6-32 (bezel mtg)
35K792740	Pad, cushion (picture tube positioning brkt)
35K792459	Pad, cushion (on window mtg brkt)
5K791856	Rivet, shoulder: annealed (line cord mtg)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
5S7751	Rivet: .122 x 1/4 stl; ant cop (picture tube rear cover mtg)
3S2991	Screw, machine: 6-32 x 1/2 plain hex head; cad pl (window mtg brkts)
3K653	Screw, machine: 8-32 x 1-1/4 (spkr mtg)
3S476115	Screw, sheet metal: #6 x 1/4 PKA plain hex head; cad pl (bottom cover mtg)
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acorn head; ant cop (back cover mtg)
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop (back cover mtg)
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acorn head; statuary bronze (back cover mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (tube positioning brkt)
3S8153	Screw, sheet metal: #8 x 3/4 PKA plain hex head; cad pl (bottom cover mtg).
3S3359	Screw, sheet metal: #8 x 1-5/8 PKA plain hex head; cad pl (chassis mtg)
56B791612	Strap, antenna support (for lower loop antenna)
35A791581	Strip, lead (dresses spkr leads)
4K780040	Washer, felt (under control knobs)
4K470786	Washer, fibre: 1/2 x 3/16 x 1/16 (bezel mtg)
4S7646	Washer, flat: 11/16 x 3/16 x .067; wrought cop pl (chassis mtg)
4S7629	Washer, flat: 1/2 x 3/16 x .048 stl; cad pl (bottom cover mtg)
61K790653	Window, picture tube: 12"; safety glass

MODEL 12K2B CABINET PARTS - Same as 12K2 except:

Part Number	Description
16K792456	Cabinet, console: limed oak; less window, bexel, and gasket
13K791115	Cloth, grille: blonde; 14-1/8 x 19-7/8
36K791431	Knob, control: tan (volume & fine tuning)

MODEL 12K3 CABINET PARTS

Part Number	Description
1X700654	Back Cover: with picture tube rear cover, centering adjustment cover & line cord.
13D790489	Bezel, picture tube (window frame)
1X700653	Bracket, picture tube positioning: with pad (on chassis front)
1X792484	Bracket, window mtg: with cushion
16F700122	Cabinet, console: red-brn mahogany; less window, gasket & bezel
13K700151	Cloth, grille: 19-1/4 x 12-1/4; "S" Mahogany
30B470756	Cord, line: with plug & receptacle
15B791076	Cover, centering adjustment; rubber (on back cover)
1X792546	Cover, chassis bottom: with high voltage insulator
15B790987	Cover, picture tube rear (on back cover)
5S3139	Eyelet: .202 x .475 brass; ant cop (on back cover)
32D790654	Gasket, picture tube: rubber
14B792069	Insulator, high-voltage (on bottom cover)
14A791829	Insulator, threaded (bezel mtg)
14B700174	Insulator, tube base (in picture tube rear cover)
36B790505	Knob, control (contrast)
36B790506	Knob, control (station selector)
36K780522	Knob, control: ivory (hold controls on chassis rear)
36C790507	Knob, control: wal-mahog (off-volume & fine tuning)
4S7657	Lockwasher, external: #8 (spkr mtg)
4S7650	Lockwasher, internal: #6; cad pl (hi-volt insulator & line cord mtg)
4S9751	Lockwasher, internal-external: #8; cad pl (spkr mtg)
62K70581	Logotype: "Motorola"; gold enamel
13A790824	Medallion: brass pl ("M" on grille cloth)
2S7007	Nut, hex: 8-32 x 1/4; cad pl (spkr mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (spkr mtg)
2S490424	Nut, teenut: 6-32 (bezel mtg)
35K792740	Pad, cushion (on tube positioning bracket)
35K792459	Pad, cushion (on window mtg bracket)
5K791856	Rivet, shoulder: annealed (line cord mtg)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
5S7751	Rivet: .122 x 1/4 stl; ant cop fin (picture tube rear cover mtg)
3S2991	Screw, machine: 6-32 x 1/2 plain hex head; cad pl (window mtg brackets)
3K27913	Screw, machine: 8-32 x 1 (spkr mtg)
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acorn head; ant cop fin (back cover mtg)
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop (back cover mtg)
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acorn head; sta brz (back cover mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (tube positioning brkt mtg)
3S8153	Screw, sheet metal: #8 x 3/4 PKA plain hex head; cad pl (bottom cover mtg).
3S3359	Screw, sheet metal: #8 x 1-5/8 PKA plain hex head; cad pl (chassis mtg)
56K700009	Strap, antenna support (for lower loop antenna)
35A791581	Strip, lead (dresses spkr leads)
64A700112	Strip, trim: brass (across cabinet front)
4K780040	Washer, felt (under control knobs)
4K470786	Washer, fibre: 1/2 x 3/16 x 1/16 (bezel mtg)
4S7629	Washer, flat: 1/2 x 3/16 x .048 stl; cad pl (bottom cover mtg)
61K790653	Window, picture tube: 12"

MODEL 12K3B CABINET PARTS - Same as 12K3 except:

Part Number	Description
16K700135	Cabinet, console: limed oak; less window, gasket, & bezel
13K700136	Cloth, grille: 19-1/4 x 12-1/4; eggshell
36K791431	Knob, control: tan (off-volume & fine tuning)

MODEL 12T1 CABINET PARTS

Part Number	Description
1X791078	Back Cover: with centering adjustment cover, picture tube rear cover, & line cord (specify diameter of tube rear cover 2-1/2" or 4")
13D790489	Bezel, picture tube (window frame)
3S488134	Bolt, chassis mtg: 1/4-20 x 1-1/2 hex head; cad pl
1X792484	Bracket, window mtg: with pad
1X792767	Bracket, tube positioning: with pad (on chassis front)
37A12748	Bumper, recess: rubber (cabinet feet)
16E792106	Cabinet, table model: red-brown mahog; less window, bezel & gasket
13K791038	Cloth, grille: 7 x 8; mahogany (spkr grille)
13K792108	Cloth, grille: 13-1/2 x 18-1/2; negre (cabinet front)
30B470756	Cord, line: with plug & receptacle
15B791076	Cover, centering adjustment: rubber (on back cover)

Part Number	Description
1X792546	Cover, chassis bottom: with high voltage insulator
15K791052	Cover, picture tube rear: 2-1/2" cup diameter (on back cover)
15B790987	Cover, picture tube rear: 4" cup diameter (on back cover)
5S3139	Eyelet: .202 x .475 brass; ant cop (on back cover)
32D790654	Gasket, picture tube: rubber
14B792069	Insulator, high voltage (on bottom cover)
14A791827	Insulator, tube base: round (in 2-1/2" picture tube rear cover)
14K791858	Insulator, tube base (in 2-1/2" picture tube rear cover)
14B700174	Insulator, picture tube base (in 4" picture tube rear cover)
14A791829	Insulator, threaded (bezel mtg)
36A485457	Knob, control: black (hold controls on chassis rear)
36B790505	Knob, control (contrast)
36B790506	Knob, control (station selector)
36B790507	Knob, control: wal-mahog (volume & fine tuning)
62K70581	Logotype: "Motorola"; gold enamel
4S7650	Lockwasher, Int: #6; cad pl (high volt insulator & line cord mtg)
4S9751	Lockwasher, Int-Ext: #8; cad pl (spkr mtg)
2A484897	Nut, chassis mtg: 5/8 x 1/2 x 3/16
2S7007	Nut, hex: 8-32 x 1/4; cad pl (spkr mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (spkr mtg)
2S490424	Nut, teenut: 6-32 (bezel mtg)
35K792740	Pad, cushion (on tube positioning bracket)
35K792459	Pad, cushion (on window mtg brkts)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (high volt insulator mtg)
5S7751	Rivet: .122 x 1/4 stl; cad pl (picture tube rear cover mtg)
5K791856	Rivet, shoulder (line cord mtg)
3S2991	Screw, machine: 6-32 x 1/2 plain hex head; cad pl (window mtg brkts)
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acorn head; ant cop (antenna strip & back cover mtg)
3S476115	Screw, sheet metal: #6 x 1/4 PKZ plain hex head; cad pl
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop (back cover mtg)doz
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acorn head; statuary bronze (back cover mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (tube positioning brkt mtg)
3S3397	Screw, sheet metal: #8 x 5/16 PKZ plain hex head; cad pl (chassis mtg brkt)
3S8153	Screw, sheet metal: #8 x 3/4 PKA plain hex head; cad pl (bottom cover mtg)
3K791825	Screw, spkr mtg: 8-32 x 1; statuary bronze
35A791581	Strip, lead (dresses spkr leads)
4A484894	Washer, cut: cad pl (bottom cover mtg)
4K780040	Washer, felt (under control knobs)
4K470786	Washer, fibre: 1/2 x 3/16 x 1/16 (bezel mtg)
4S7629	Washer, flat: 1/2 x 3/16 x .048; stl; cad pl (bottom cover mtg)
61K790653	Window, picture tube: 12"; safety glass.

MODEL 12T1B CABINET PARTS - Same as 12T1 except:

Part Number	Description
16K792107	Cabinet, table model: limed oak; less window, bezel, and gasket
13K791037	Cloth, grille: 7 x 8; blonde (spkr grille)
36K791431	Knob, control: tan (volume & fine tuning)
3A791324	Screw, spkr mtg: 8-32 x 1; brass pl.

MODEL 12T2 CABINET PARTS

Part Number	Description
1X700045	Back Cover Assembly: with picture tube rear cover, centering adj cover, and line cord (specify diameter of tube rear cover 2-1/2" or 4")
1X700068	Bracket, picture tube positioning: with cushion (on chassis front)
35A790097	Bumper, recess: rubber (cabinet feet)
16F700064	Cabinet, table model: red-brn mahogany; less window & gasket
13K792045	Cloth, grille: mahogany; 5-1/4 x 6-3/8 (spkr grille)
30B470756	Cord, line: with plug and receptacle
15B791076	Cover, centering adjustment: rubber (on back cover)
1X792495	Cover, chassis bottom: with hi-volt insulator
15K791052	Cover, picture tube rear: 2-1/2" cup diameter (on back cover)
15B790987	Cover, picture tube rear: 4" cup diameter (on back cover)
5S3139	Eyelet: .202 x .475 brass; ant cop fin (on back cover)
32D791602	Gasket, picture tube: rubber (on picture window)
14B792069	Insulator, high voltage (on bottom cover)
14K791858	Insulator, tube base: rectangular (inside 2-1/2" picture tube rear cover)
14A791827	Insulator, tube base: round (inside 2-1/2" picture tube rear cover)
14B700174	Insulator, tube base: inside 4" picture tube rear cover)
36B790505	Knob, control: contrast
36A485457	Knob, control: plastic (hold controls on chassis rear)
36B790506	Knob, control: station selector
36C790507	Knob, control: wal-mahog (fine tuning & off-volume)
4S7650	Lockwasher, Int: #6; cad pl (line cord mtg)
4S9751	Lockwasher, Int-Ext: #8; cad pl (spkr mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (spkr mtg)
2S490359	Nut, speednut (spkr mtg)
35K792740	Pad, cushion: sponge rubber (on picture tube positioning bracket)
5K791856	Rivet, shoulder: annealed (line cord mtg)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
5S7751	Rivet: .122 x 1/4 stl; cad pl (picture tube rear cover mtg)
3K791825	Screw, machine: 8-32 x 1 insulated head: statuary bronze (spkr mtg)
3S7536	Screw, sheet metal: #6 x 3/8" PKA slotted acorn head; ant cop finish (bottom & back cover mtg)
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop finish (back cover mtg)
3S490508	Screw, sheet metal: #6 x 3/4 PKA plain acorn head; cad pl (window mtg strips)
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acorn head; statuary bronze (back cover mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (mounts picture tube positioning bracket)
3S8126	Screw, sheet metal: #8 x 1-1/4" PKA plain hex head; cad pl (chassis mtg)
35A791581	Strip, lead (dresses antenna leads and speaker leads)
35K790463	Strip, rubber (on bottom of picture window)
35A790461	Strip, rubber (on sides of picture window)
16B791508	Strip, window mtg (bottom of picture window)
16K700060	Strip, window mtg (sides of picture window)
4K780040	Washer, felt (under control knobs)
4S7614	Washer: 11/16 x 11/64 x .036 stl; cad pl (chassis mtg)
1X700044	Window, picture tube: with gasket and rubber strips

MODEL 12T3 CABINET PARTS

Part Number	Description
1X700045	Back Cover: with picture tube rear cover, centering adjustment cover, and line cord
13D790489	Bezel, picture tube (window frame)
1X792767	Bracket, picture tube positioning: with pad (on chassis front)
1X792484	Bracket, window mtg: with pad
35A790097	Bumper, recess: rubber (cabinet feet)
16F700545	Cabinet, table model: red-brn mahogany; less window, gasket & bezel
13K700546	Cloth, grille: eggshell & brown; 17-1/2 x 13
13K792045	Cloth, grille: mahogany; 5-1/4 x 6-3/8 (spkr grille)
30B470756	Cord, line: with plug & receptacle
15B791076	Cover, centering adjustment: rubber (on back cover)
1X792495	Cover, chassis bottom: with high-voltage insulator
15B790987	Cover, picture tube rear (on back cover).
5S3139	Eyelet: .202 x .475 brass; ant cop fin (on back cover)
32D790654	Gasket, picture tube: rubber
14B792069	Insulator, high-voltage (on bottom cover)
14A791829	Insulator, threaded (bezel mtg)
14B700174	Insulator, tube base (in picture tube rear cover)
36A485457	Knob, control: black (hold controls on chassis rear)
36B790505	Knob, control (contrast)
36B790506	Knob, control (station selector)
36C790507	Knob, control: wal-mahog (off-volume & fine tuning)
4S7650	Lockwasher, internal: #6; H.T. (hi-volt. insulator mtg)
4S9751	Lockwasher, internal-external; #8; cad pl (spkr mtg)
62K70581	Logotype: "Motorola"; gold enamel
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (spkr mtg)
2S490359	Nut, speednut (spkr mtg)
2S490424	Nut, teenut: 6-32 (bezel mtg)
35K792740	Pad, cushion (on tube positioning brkt)
35K792459	Pad, cushion (on window mtg brkt)
5K791856	Rivet, shoulder: annealed (line cord mtg)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
5S7751	Rivet: .122 x 1/4 stl; cad pl (picture tube rear cover mtg)
3S2991	Screw, machine: 6-32 x 1/2" plain hex head; cad pl (window mtg brkts)
3K791825	Screw, machine: 8-32 x 1 insulated head; statuary bronze fin (spkr mtg)
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acorn head; ant. cop (back cover mtg)
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop (back cover mtg)
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acorn head; statuary bronze (back cover mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (mounts tube positioning brkt)
3S8126	Screw, sheet metal: #8 x 1-1/4 PKA plain hex head; cad pl (chassis mtg)
35A791581	Strip, antenna lead (dresses loop antenna & spkr leads from RF)
4K470786	Washer, fibre: 1/2 x 3/16 x 1/16 (bezel mtg)
4S7614	Washer, flat: 11/16 x 11/64 x .036 stl; cad pl (chassis mtg)
61K790653	Window, picture tube: 12"

BILT-IN-TENNAS

Model TA-4 (12K1, 12K2 & 12K3)

Part Number	Description
1X791759	TA-4 Double Loop Antenna: complete
21R6593	Capacitor, mica: 15 mmf 300V
21K70720	Capacitor, molded: 5 mmf
24A791771	Coil, antenna loading
29A791608	Lug, spade
31K471564	Strip, terminal: 3 ins #2 gnd; 3/8" spacing

Model TA-6 (12T1, 12T2 & 12T3)

Part Number	Description
1X791900	TA-6 Single Loop Antenna: complete
21R2763	Capacitor, mica: 6 mmf 300V
21R2764	Capacitor, mica: 18 mmf 300V
24A791748	Coil, antenna loading (on terminal strip)
24A791989	Coil, high frequency compensating
35A791581	Strip, antenna lead
31K34326	Strip, terminal: 2 ins, #3 gnd; 3/8" spacing

INDEX

GENERAL INFORMATION

RECEIVER MODEL BREAKDOWN

Model	Type of Set	Chassis Used
14K1H	Console, red-brn mahogany	TS-115
14K1BH	Console, limed-oak	TS-115

CHASSIS - Television chassis TS-115 contains 20 tubes plus a 14" rectangular picture tube. The picture, sound, and scanning circuits, together with a full-wave rectifier, are contained on a single chassis.

TUNING RANGE - Channels 2 through 13

IF FREQUENCY -

Channels 2, 3, 4, 5, 6, 11, 12 & 13: sound - 21.9 mc
picture - 26.4 mc
Channels 7, 8, 9 & 10: sound - 27.3 mc
picture - 22.8 mc

ANTENNA - TA-4 "Bilt-In-Tenna". Provision for connection of an external antenna.

ANTENNA IMPEDANCE - 300 ohms

POWER SUPPLY - 117 volts, 60 cycle AC current only

POWER CONSUMPTION - 205 watts

AUDIO OUTPUT - 4 watts

CHASSIS TUBE COMPLEMENT

Ref. No.	Tube	Function
V-1	6CB6	RF Amplifier
V-2	12AT7	Mixer-Oscillator
V-3	6AU6	1st IF Amplifier
V-4	6AU6	2nd IF Amplifier
V-5	6AG5	3rd IF Amplifier
V-6	6AL5	Video Detector
V-7	6AH6	Video Amplifier
V-8	6AU6	Audio Driver-Limiter
V-9	6AL5	Ratio Detector
V-10	6J5GT	Audio Amplifier
V-11	6V6GT	Audio Output
V-12	6SN7GT	1st & 2nd Clippers
V-13	12AU7	Vertical Sweep Generator
V-14	6W6GT	Vertical Sweep Output
V-15	6AL5	Phase Detector
V-16	6SN7GT	Horizontal Oscillator
V-17	6BQ6GT	Horizontal Output & High Voltage Generator
V-18	6W4GT	Damping Diode
V-19	1B3GT	High Voltage Rectifier
V-20	14BP4 or 14CP4	Picture Tube: rectangular
V-21	5U4G	Low Voltage Rectifier

HIGH VOLTAGE WARNING

Operation of this receiver, outside its cabinet or with covers removed, involves a shock hazard from the power supplies. No work should be attempted on this receiver by anyone not thoroughly familiar with the precautions necessary when working on high voltage equipment.

CATHODE RAY PICTURE TUBE HANDLING PRECAUTIONS

Extreme care must be used in handling the picture tube. This tube is highly evacuated and, due to its large size, is subjected to a considerable atmospheric pressure. The handler should wear safety goggles and gloves for protection. Avoid nicking or scratching the glass by rough contact with other objects.

Before removing glass tubes, discharge the capacitor formed by the inner and outer aquadag coatings on the tube by shorting the anode contact on the side of the tube to the outer surface with a well insulated piece of wire.

INSTALLATION AND OPERATING INSTRUCTIONS

RECEIVER LOCATION

The receiver may be placed anywhere in the room, but for greatest satisfaction it should be located:

1. Away from any bright light that may fall directly on the screen or be reflected from it; this includes windows and lamps. Some illumination in the room, off to one side, is desirable, however, to prevent eyestrain.

2. To provide comfortable viewing and ease of operation.

3. At lease one-inch away from a wall to allow for cabinet ventilation. This is very important.

ANTENNAS

The choice of a television antenna depends entirely on the location of the receiver with respect to all television station transmitting antennas in the area. Maximum pick-up is obtained when the receiving antenna is directly in line of sight with the transmitting antenna.

"Bilt-In-Tenna." All receivers using the TS-115 series television chassis are equipped with the Motorola "Bilt-In-Tenna", mounted inside the cabinet, for use in good signal areas.

When this antenna is used, the following precautions should be observed for best reception:

1. In order to get maximum performance and satisfactory pictures from the "Bilt-In-Tenna", ample signals from the television station must be present at the location of the receiver. Normally, the strength of the signals will vary throughout the room in which the receiver is located. For this reason, better pictures will be obtained if the receiver is tried in all possible locations in the viewing room and is then placed where the clearest pictures are received from all stations. Avoid large metallic objects, such as radiators, metal panels, etc.

2. Lamps, vases and metallic objects, when placed on top of the receiver, may affect the efficiency of the "Bilt-In-Tenna".

Indoor Antenna. If additional pick-up is necessary an indoor antenna, placed on or near the receiver, may be used. The antenna should be rotated and the arms should be adjusted for the best signal, with no ghosts or reflections. Normally, the arms should be extended on the low channels (2-6) and telescoped on the high channels (7-13).

Outdoor Antenna. The Motorola "Bilt-In-Tenna" or the indoor type antenna will give satisfactory reception in strong signal areas; but, if the receiver is located in a fringe or weak signal area, an outdoor antenna is recommended.

In areas free of obstructions and reflections, within reasonable proximity to television transmitters, a dipole and reflector will prove satisfactory. Since such an antenna has a relatively small band coverage, a special antenna covering all twelve television channels should be used if it is desired to receive stations on channels of widely separated frequencies.

Location of the antenna should be decided from the standpoint of maximum signal pick-up. In general, the antenna should be broadside to the transmitting antenna and should be as high as possible. If a reflector is used, the antenna should be oriented so that the driven element is closest to the station and the reflector farthest away.

Locating the antenna and lead-in as far away as possible from highways, hospitals, doctors' offices, electrical machinery, etc., will help to reduce noise pick-up from such sources. Also, it is desirable to keep the antenna at least six feet away from other antennas, metal roofs, gutters, or other metal objects to prevent unwanted reflections and shielding.

Lead-In. Since the TS-115 chassis is designed for 300 ohm input, the standard 300 ohm twin lead line should be used for connecting the outside antenna to the receiver. Twisting the line one complete turn per foot of running length helps to reduce noise pick-up on the line. The lead-in should be supported on stand-off insulators and kept tight enough to prevent mechanical damage through swaying. Avoid running the lead-in close to metal gutters, iron standpipes, etc.

In areas of very strong signals, or where severe local electrical interference is encountered, 300 ohm shielded twin lead is recommended. The shield braid should be grounded.

An approved lightning arrestor should be used.

RECEIVER ANTENNA CONNECTION

The antenna lead-in to the receiver is connected to the two screws of the terminal strip on the rear of the cabinet. Disconnect the "Bilt-In-Tenna" leads from the terminal strip before attaching an external antenna lead-in. Sometimes, reversing the lead-in connections at the receiver may improve picture quality and overall performance.

OPERATING CONTROLS

There are two dual controls, consisting of a small and a large knob each, on the front panel of the receiver. The function of each control is marked on the front panel, the "circle" indicating the large knob, and the "dot" indicating the small knob. See Figure 1 for front panel control functions.

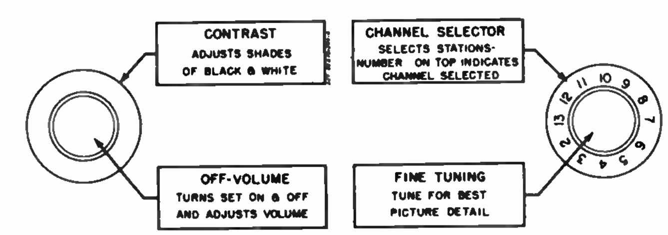

FIGURE 1. OPERATING CONTROLS

World Radio History

SERVICE ADJUSTMENT CONTROLS

The receiver is completely adjusted at the factory, so normally none other than the front panel control operating instructions need be followed in putting the receiver in operation. However, to provide for any misadjustment of the service controls, due to handling, the following instructions are in order. See Figure 2 for location of the service adjustment controls.

FOCUS CONTROL

The FOCUS control should be adjusted until the fine horizontal line structure of the raster is clearly visible over the picture area. The control should be tuned through the correct point several times so that optimum focus is obtained.

CENTERING

By means of a lever extending from the focus coil, thru the rear screen, the focus coil can be shifted to center the picture in its mask.

VERTICAL SIZE AND VERTICAL LINEARITY

Adjust the VERTICAL SIZE control until the picture fills the mask vertically. Adjust the VERTICAL LINEARITY control for best overall vertical linearity. Adjustment of the VERTICAL SIZE control will require a readjustment of the VERTICAL LINEARITY control and possibly of the vertical hold control. Center picture with the centering lever on the focus coil.

HORIZONTAL SIZE

Adjust the HORIZONTAL SIZE lever until the picture fills the mask horizontally. Center picture with the centering lever.

HORIZONTAL HOLD ADJUSTMENT

The HORIZONTAL HOLD control should have a sync range of approximately 180°. If the control is too critical, adjust as follows:

1. Short out HORIZONTAL OSCILLATOR coil L-23. This may be done with the chassis in the cabinet by shorting pins 3 and 8 of the test socket on chassis rear.
2. With the centering lever, move the picture to the left so that the right edge of the raster can be seen. Adjust the HORIZONTAL HOLD control to about the middle of its range and note the width of the blanking pulse. (The blanking pulse appears as a gray bar at the right edge of the picture).
3. Remove short from HORIZONTAL OSCILLATOR coil.
4. Adjust HORIZONTAL OSCILLATOR coil until the same amount of blanking pulse can be seen as was noted in step 2.

VERTICAL HOLD ADJUSTMENT

Adjust the VERTICAL HOLD control for the center of the vertical sync lock-in range.

BRIGHTNESS

Adjust the BRIGHTNESS control, in combination with the CONTRAST control for the most pleasing picture. Keep the brilliance slightly below maximum, however, in order to protect the fluorescent screen of the picture tube and to prevent poor picture detail.

ADJUSTMENT OF ION TRAP

Under conditions of rough shipment, it is possible for the ion trap to become misaligned. To prevent serious damage to the picture tube, the following method of adjustment should be used. See Figure 3.

The magnet should be placed on the neck of the tube in the direction indicated by the marking on the magnet (usually an arrow which points toward the picture tube screen) so that the stronger magnet of the double magnet type or the only magnet in the single magnet type, is positioned over the internal pole pieces which are mounted on the gun structure. Adjust the brightness control for low intensity and move the magnet a short distance forward and backward at the same time rotating it to obtain the brightest raster. If, in obtaining the brightest raster, the ion trap magnet has to be moved more than 1/4" from the gun pole pieces, the magnet is probably weak and a new magnet should be tried. Never correct for a shadowed raster with the ion trap magnet if such correction results in decreased brightness. The ion trap magnet must always be adjusted for maximum brightness and, if shadows occur at this setting, they should be eliminated by adjusting the focus and deflection coils as explained under "Focus Coil and Deflection Yoke Adjustment".

CAUTION: Keep brightness control at low intensity until ion trap is properly set.

A mirror placed in front of the receiver will aid in making this adjustment.

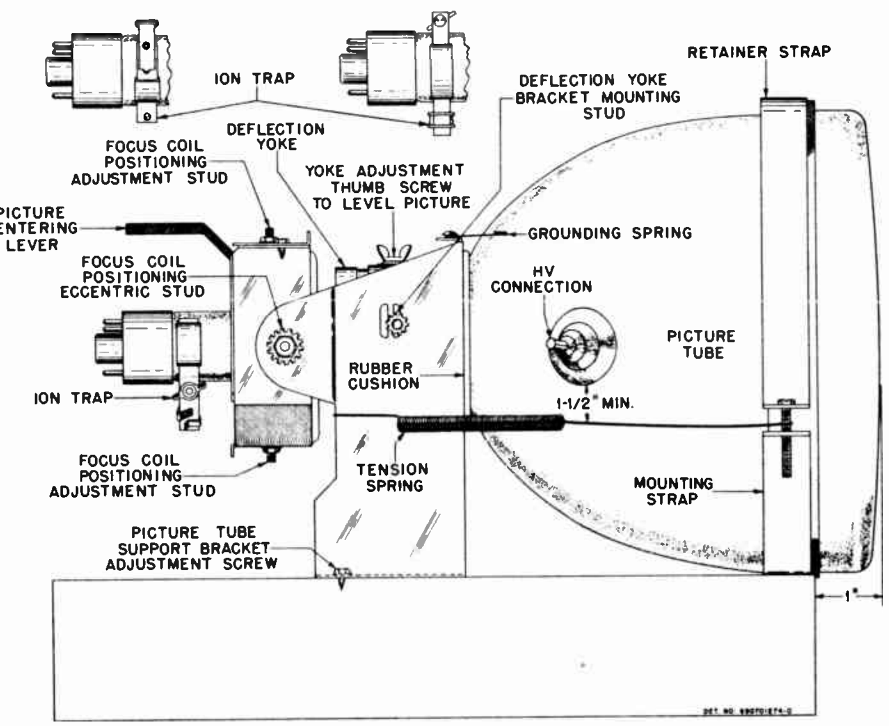

FIGURE 3. PICTURE TUBE ADJUSTMENT LOCATIONS

DEFLECTION YOKE ADJUSTMENT

If the deflection yoke shifts, the picture will be tilted. To correct, loosen the thumbscrew on top of the deflection yoke and rotate yoke until the picture is straight. Before tightening the thumbscrew, make certain that the deflection yoke is as far forward as possible.

If the yoke support and the picture tube have shifted in transit or, if for any reason, these parts have been removed and replaced, it is best to do a complete job of repositioning. See Figure 3. The starting point is the position of the picture tube. It should be adjusted so that the distance from the center of the tube face to the front edge of the chassis is 1". The clamp on the front of the tube should then be tightened. The picture tube rear support bracket positioning adjustment screws should be loose enough to permit sliding the bracket forward until the rubber cushion fits snugly up against the flare of the tube. Loosen the yoke adjustment thumbscrew and push the yoke up against the flare of the tube. CAUTION: Do not use force in sliding the bracket up. If too much force is used, a strain will be placed on the neck of the tube when the support bracket positioning adjustment screws are tightened. Also, the yoke may be forced out of position. The opening in the yoke should be concentric with the neck of the tube.

FOCUS COIL ADJUSTMENT

The focus coil should be positioned so that it is spaced 1/4" from the deflection yoke when parallel with the yoke. The opening in the yoke should be concentric with the neck of the tube. The spacing should be adjusted before the front of the picture tube is clamped down, because it is necessary to remove the tube to change the position of the focus coil. Its position is changed by choice of location of the coil mounting studs in the scalloped holes on the top and bottom of the coil mounting bracket. The opening in the coil can be made concentric with the neck of the tube by loosening the nuts on the studs which support the focus coil bracket and turning the studs with a screwdriver in the slots provided. The studs are eccentric and move the coil both vertically and horizontally. They should be used only to center the neck of the tube in the opening of the coil.

TEST SOCKET

A test socket is provided on the rear of the chassis which allows adjustment of the horizontal oscillator and checking of sensitivity without removing chassis from cabinet. See Figure 2 for socket connections.

World Radio History

ALIGNMENT

GENERAL

The chassis should be mounted on angle iron brackets (Motorola Part No. 7X700210) so that all connections and adjustments may be made easily.

Since the power cord circuit is broken by the interlock when the cabinet back is removed, it will be necessary to obtain an extra power cord with the female interlock receptacle in order to make a power connection to the receiver. Order Motorola Part No. 30B470756.

ORDER OF ALIGNMENT

A complete receiver alignment can be most conveniently performed in the following order:

1. Audio Take-Off & Ratio Detector
2. 4.5 Mc Trap
3. IF Coils & Mixer Transformer
4. Osc & RF Sections

AUDIO TAKE-OFF & RATIO DETECTOR ALIGNMENT

Equipment Required:

AM Signal Generator: (Optional) Accurately calibrated at 4.5 mc

Adjustable output

DC Meter: Low range electronic voltmeter

Procedure:

Refer to Figure 4 for location of adjustments.

1. If possible, it is desirable to align the audio section from an actual station signal, since the 4.5 mc alignment frequency will be exact. The fine tuning trimmer should be turned off the station slightly, to prevent overloading the ratio detector.

2. If a signal generator is used, tune it accurately to 4.5 mc, and adjust the output to approximately 10,000 microvolts. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to chassis. The following applies whether the station signal or signal generator is used.

3. From either side of capacitor C-52 (10 mf), connect an electronic voltmeter to chassis decoupled thru 10K ohms.

4. Set the contrast control for maximum gain (fully clockwise).

5. Peak L-20 for maximum reading on meter.

6. Peak T-3 primary (top core) for maximum reading on meter.

7. Move the meter and decoupling resistor from C-52 to junction of R-41 (33K) and lead to volume control.

8. Adjust T-3 secondary (bottom core) for zero response on 2.5V scale of meter. This corresponds to the cross-over point on the FM detector curve.

If desired, the symmetry of the curve may be checked by tuning the signal generator 25 kc above and below 4.5 mc and noting the plus and minus voltage produced, reversing the meter connections as necessary. For proper balance of the ratio detector system, the voltage in each direction should be approximately equal. If not, check the tuning of L-20 and the primary and secondary of T-3, the ratio detector. If necessary, replace the ratio detector tube V-9 (6AL5). It is desirable to calibrate the generator on a station signal. This may be done by nulling the secondary on a station signal and then connecting the generator and tuning it to produce the same null without touching the trimmers in the set.

NOTE: As the adjustments are brought to resonance, it is advisable to reduce signal generator output to prevent overloading.

With a 10,000 microvolt signal into the grid of the video amplifier tube, with the contrast control turned fully clockwise, and the focus control at center of its range, the voltage read from one side of capacitor C-52 should be greater than 5.0V.

4.5 MC TRAP ALIGNMENT

1. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to chassis.

2. Connect the voltmeter and germanium crystal rectifier, as shown in Figure 5, between the cathode of the picture tube (yellow lead) and chassis. Use the lowest voltage scale on the meter.

3. With the signal generator accurately set at 4.5 mc and maximum output, adjust trap L-18 for minimum reading on the meter.

IF AMPLIFIER ALIGNMENT

Equipment Required:

IF Sweep Generator meeting the following requirements:

18 to 30 mc, approximately 12 mc sweep width. Output constant and adjustable to at least .1 volt maximum with accurately calibrated, adjustable markers.

Cathode Ray Oscilloscope: preferably one with a calibrated input attenuator.

NOTE: If there is no built-in marker in the sweep generator, loosely couple the output of an accurately calibrated AM signal generator to the IF strip. At all times, keep the marker output low enough to prevent the marker from distorting the response curve.

If a wide band scope is used, the marker will be more distinct if a capacitor of 100 to 1000 mmf is placed across the scope input. Use the smallest size possible, since too large a value will affect the shape of the curve.

Procedure:

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket to eliminate horizontal pick-up in the oscilloscope. Replace 6BQ6 tube with dummy load of 2500 ohms 25 watts connected from B plus side of fuse to chassis.

2. By means of an external battery, apply a negative 3.0 volt bias from the bottom of the 1st IF tube grid resistor R-13 (6800) to chassis.

3. Using leads as short as possible, connect the hot side of the sweep generator to the grid (pin 1) of the 1st IF tube V-3 (6AU6) through a 5000 mmf capacitor (do not use the loose or "spraying" method of coupling). The low side is connected to chassis. Set the center frequency of the sweep to about 24.6 mc and adjust initially for a sweep deviation of approximately 12 mc. However, a sweep of from 8 to 10 mc may be found better for overall alignment.

4. Using R-26 (100K) as a decoupling resistor, connect the scope to pin 4 of test socket. If a stronger output is desired, connect the scope between the picture tube cathode and chassis. The curve seen at this position will be the reverse of the polarity shown in Figure 6.

5. Set the contrast control at minimum.

NOTE: If a distorted or unstable picture is seen on the the oscilloscope during alignment, it may be necessary to stop the oscillator by disconnecting resistor R-9 (1500) from the plate (pin 6) of the oscillator tube V-2B (12AT7), or by substituting another tube with pin 6 removed.

CAUTION: 1. Do not reduce the oscilloscope gain and increase signal input so that the top of the curve is flattened, due to limiting in the video or scope amplifiers.

2. The dress of plate & grid components in the IF affects tuning. Do not move indiscriminately.

3. On the IF coils and on the traps, the resonance point will be found at two settings of the slug. The correct setting is the one which is found with the greater part of the adjusting screw out of the coil.

NOTE: The 1st & 2nd IF traps are tuned from bottom of chassis, while IF cores are adjusted from the top.

6. Tune the low frequency trap L-14, located on the 2nd IF coil, for maximum attenuation on the curve at 21.9 mc.

7. Tune the high frequency trap L-12 located on the 1st IF coil for maximum attenuation on the curve at 27.3 mc.

8. Adjust the 1st IF coil, L-11, to place a 26.6 mc marker on the high side of the response curve 60% down

NO.	TYPE	FUNCTION
V-1	6CB6	R-F AMP.
V-2	12AT7	MIXER-OSC.
V-3	6AU6	1ST. I-F AMP.
V-4	6AU6	2ND. I-F AMP.
V-5	6AG5	3RD. I-F AMP.
V-6	6AL5	VIDEO DET.
V-7	6AH6	VIDEO AMP.
V-8	6AU6	AUDIO DRIVER-LIMITER
V-9	6AL5	RATIO DET.
V-10	6J5GT	AUDIO AMP.
V-11	6V6GT	AUDIO OUTPUT
V-12	6SN7GT	1ST. & 2ND. CLIPPER

World Radio History

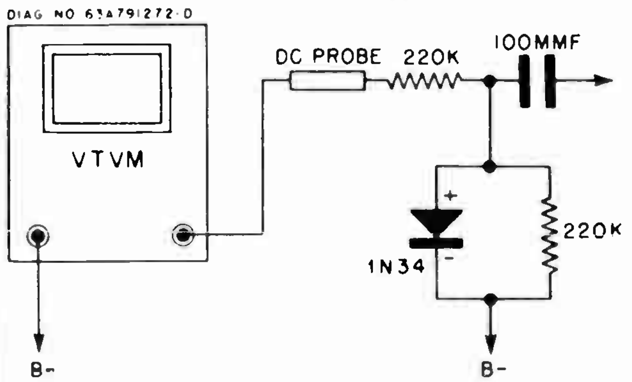

FIGURE 5.
ELECTRONIC VOLTMETER CONNECTIONS

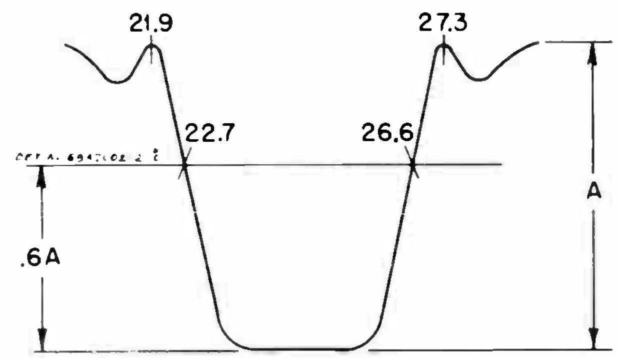

FIGURE 6. IF RESPONSE CURVE

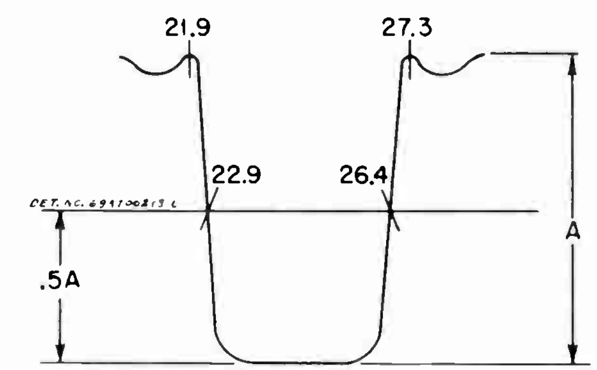

FIGURE 7. OVERALL RESPONSE CURVE FROM MIXER

from maximum response. See Figure 6.

9. Adjust the 2nd IF coil, L-15, to place a 22.7 mc marker on the low side of the response curve 60% down from maximum response.

10. Adjust the 3rd IF plate transformer, T-2, to provide a flat top or symmetrical response curve.

11. Reset the traps (steps 6 & 7) and again check the IF for proper response.

NOTE: It is suggested that the bias be removed for accurate resetting of the traps.

12. With bias applied, connect the sweep between the grid (pin 2) of the mixer tube V-2A (12AT7) and chassis.

13. Disconnect the trimmer, C-14, in LC circuit in the grid of the mixer tube, or short the trimmer through a 10,000 mmf ceramic disc type to chassis.

14. Bring both cores of the mixer transformer, T-1, simultaneously from the outside towards the center. The half-way markers should be 26.4 mc and 22.9 mc. (Figure 7).

NOTE: In aligning the three IF coils, each coil is adjusted individually, but when adjusting the primary and secondary of the mixer transformer, the adjustments should be made simultaneously. The important point to keep in mind is to obtain a flat response curve with as much gain as possible. The sides of the curve should be straight and as steep as possible. Simultaneous adjusting of the primary and secondary is the easiest way to obtain this result. The transformer by itself is, in effect, tuned for the same pass band as the three staggered circuits. See Figure 7. The only difference in the overall waveform should be that the sides of the overall wave are steeper. Constant use of the 50% markers (22.9 mc and 26.4 mc) should be resorted to, since it is absolutely necessary to obtain the proper curve. A slight dip (not exceeding 10%) is permissible in the mixer transformer response curve.

BANDWIDTH

The bandwidth may be determined by connecting an AM generator to the mixer grid. With the generator frequency at 24.6 mc, adjust the output for 1 volt reading on a VTVM connected at the plate (pin 2) of the video detector tube V-6 (6AL5) and chassis. Double the output of the generator. Now, by tuning either side of 24.6 mc and noting the frequencies at which the VTVM again reads 1 volt, the 6 db bandwidth points are indicated.

REGENERATION CHECK

After the above IF and mixer transformer alignment has been made, a check for regeneration in the IF amplifier should be made. This is done by removing the battery bias and observing the output response curve on the oscilloscope, as taken between the picture tube cathode and chassis. The bandwidth may change with the bias removed but should not change more than 0.2 mc. Set the contrast control to maximum gain. Decrease the input until the output signal shows a marked decrease. Any regeneration present will be indicated by sharp peaks on the overall response curve. The oscillator should be stopped, as described above, during this procedure.

CAUTION: Do not inject too much marker signal.

MIXER LC ADJUSTMENT

Reconnect bias removed for regeneration check. Replace trimmer C-14 in LC circuit of mixer grid or remove 10,000 mmf ceramic between trimmer and chassis. Adjust the trimmer so it is tuned to the center of the mixer response curve. This is indicated by observing the effect of the LC circuit on the mixer response. Increasing the capacity of the trimmer and bringing the LC circuit from above the IF range into the IF range, it will be noted that the mixer

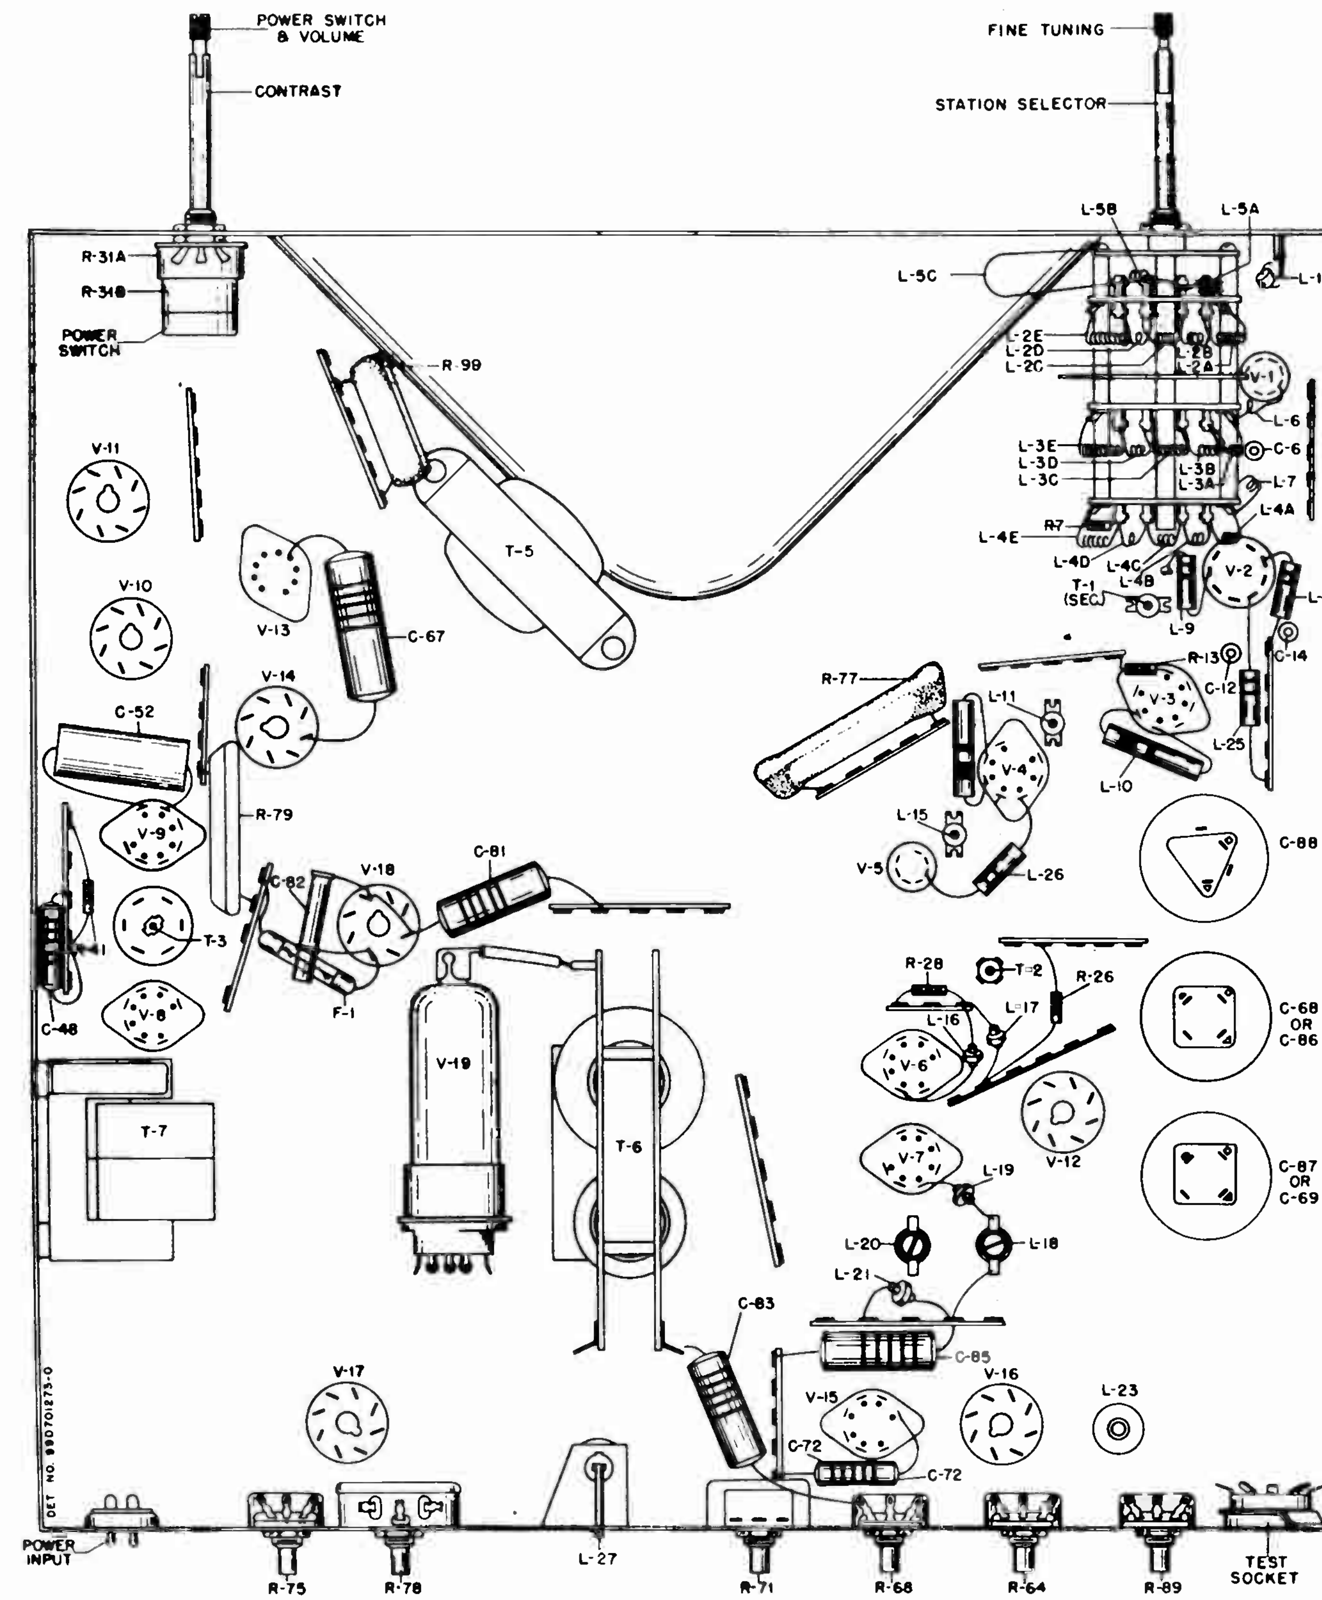

FIGURE 8. BOTTOM VIEW OF CHASSIS

©John F. Rider

curve will pull down on the high side, then straighten out as the LC circuit approaches the middle of the range, and pull down on the low side as the LC circuit approaches the low end of the IF range. The proper tuning point is that point at which the mixer curve straightens out. In effect, the LC circuit is similar to a jack coil when it is within the IF range.

CAUTION: Tuning the LC circuit very low will cause oscillation.

IF SENSITIVITY MEASUREMENTS

IF Stages Only

1. Remove the battery bias from the 1st IF tube grid.
2. Connect an AM signal generator, set at 24.6 mc thru a blocking capacitor of 5000 mmf, between grid (pin 1) of the 1st IF tube V-3 (6AU6) and chassis.
3. Connect an electronic voltmeter across the video detector load resistor R-28 (5600). Both leads from the meter should be decoupled with 100K ohm resistors.
4. Set the contrast control for maximum sensitivity.
5. Stop the oscillator tube by disconnecting resistor R-9 (1500) from the plate (pin 6) of the tube V-2B (12AT7) or by substituting another tube with pin 6 removed.
6. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 700 microvolts.

Mixer & IF Stages

The preliminary preparations are the same as for checking the sensitivity of the IF stages except:

1. Connect the AM signal generator, set at 24.6 mc, through a 5000 mmf capacitor, between the grid (pin 2) of the mixer tube V-2A (12AT7) and chassis.
2. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 125 microvolts.

OSCILLATOR, ANTENNA AND RF ALIGNMENT

NOTE: The IF must be aligned before the RF section can be properly phased.

Equipment Required:

Sweep Generator: Frequency range 40-220 mc; 10 mc sweep width
Output constant and adjustable
Adjustable markers (markers should be calibrated occasionally by checking against an accurate signal generator).

Oscilloscope: Preferably one with a calibrated input attenuator.

Signal Generator: Frequency range 40 to 220 mc
Accurately calibrated
AM modulated 400 cycle

FREQUENCY CHART

Chan	Frequency	Picture	Sound	Oscillator
2	54-60	55.25	59.75	81.65
3	60-66	61.25	65.75	87.65
4	66-72	67.25	71.75	93.65
5	76-82	77.25	81.75	103.65
6	82-88	83.25	87.75	109.65
7	174-180	175.25	179.75	152.45
8	180-186	181.25	185.75	158.45
9	186-192	187.25	191.75	164.45
10	192-198	193.25	197.75	170.45
11	198-204	199.25	203.75	225.65
12	204-210	205.25	209.75	231.65
13	210-216	211.25	215.75	237.65

ANTENNA & RF ALIGNMENT PROCEDURE

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket and replace with a dummy load of 2500 ohms 25 watts connected from B plus side of fuse to chassis. Stop the oscillator by disconnecting R-9 (1500) from plate (pin 6) of V-2B (12AT7).
2. Connect the sweep generator across the antenna terminals on the chassis with the antenna lead-in removed. The line from the sweep generator should be as short as possible.
3. Connect the oscilloscope through a decoupling resistor of 150,000 ohms, between the cathode (pin 3) of the mixer tube V-2 (12AT7) and chassis.
4. Short out the AGC circuit with a clip lead from the AGC bus to chassis.
5. Refer to Figure 4 for the RF trimmer location and to Figure 9 for the locations of the antenna and RF coils. The frequency chart listed previously gives the channel and alignment frequencies.
6. The antenna coils are tuned to the video carrier frequency and the RF coils are tuned to the sound carriers. Figure 10 shows the shape of the curve which should appear on the scope for channels 2-6 and Figure 11 the curves for channels 7-13.
7. Turn the station selector switch to channel 10. Set the center frequency of the sweep generator to the center frequency of channel 10 (195 mc).
8. Adjust ceramic trimmer, C-6, so that picture and sound markers are as in Figure 11.
9. Check channels 7 to 13 for proper response and, if necessary, tune the coil L-6. These coils may be tuned by spreading them to decrease inductance or compressing them to increase their inductance. See Figure 9 for location of coils. This will have more effect on channels 10 to 13 than 7 to 9. If L-6 is adjusted, it may be necessary to readjust RF trimmer C-6, and recheck the high channels.

NOTE: As the bandwidth of the high channels is very broad, a slight variation is permissible.

10. Move bandswitch to channel 6.
11. With the center frequency of sweep generator at the center frequency of channel 6 (85 mc), introduce markers corresponding to sound and picture carriers and compare with curve of Figure 10.

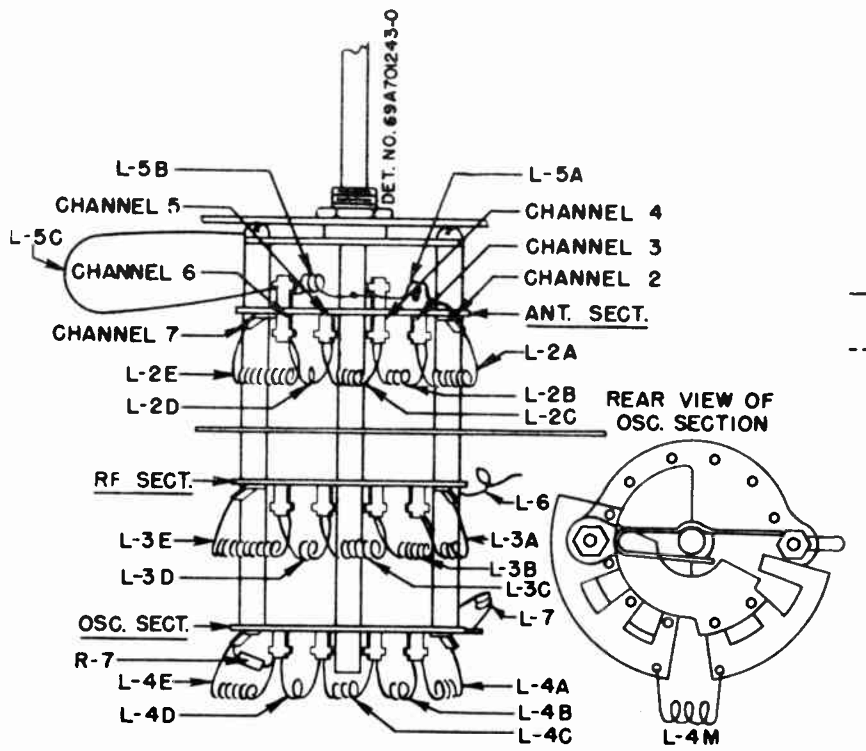

FIGURE 9. ANTENNA, RF AND OSCILLATOR COIL LOCATIONS

NOTE: A convenient method of determining whether a coil is tuned correctly is to insert a brass or iron slug into the coil. Brass decreases and iron increases the inductance.

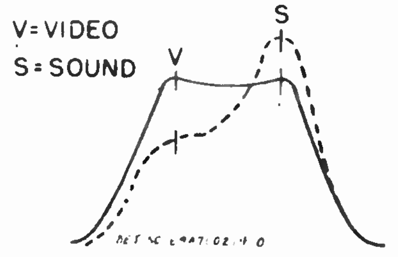
12. After channel 6 has been aligned, progress downward through channel 2.

CAUTION: Make certain the station selector switch is on the correct channel before checking bandpass.

OSCILLATOR ADJUSTMENT

1. Put oscillator back in circuit.
2. Remove the short from the AGC circuit and apply a -3 volt battery bias to the AGC bus.
3. Move the scope to the test socket on the chassis rear with the high side connected to pin 4 and the low side to pin 5 (chassis).
4. Set the contrast control at minimum (counterclockwise).
5. Remove the fine tuning knob and turn shaft until the slot is in a horizontal position. This represents the mid-capacity position.
6. Turn station selector switch to channel 12.
7. Set the sweep generator on channel 12 with a center frequency of 207 mc and at least a 12 mc sweep. Keep the output low enough to show no evidence of limiting in the overall response curve.

NOTE: Before aligning the oscillator section, make



—SOLID LINE INDICATES OPTIMUM RESPONSE.
--- DOTTED LINES INDICATES PERMISSIBLE VARIATION.

FIGURE 10.
RF RESPONSE CURVES CHANNELS 2-6

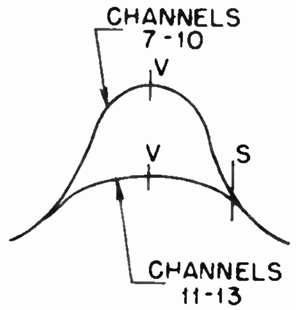


FIGURE 11.
RF RESPONSE CURVES CHANNELS 7-13

certain the 3.3 microhenry choke (L-8) in the mixer grid is dressed away from the 2 mmf capacitor (C-16) tied to the same grid.

8. Introduce a marker corresponding to the sound carrier of channel 12 (209.75 mc).
9. Adjust oscillator ceramic trimmer so that the sound marker falls into the 21.9 mc trap dip in the response curve.
10. Turn generator and station selector to channel 9 with the fine tuning shaft slot still in the horizontal position.
11. Spread or compress the 3-turn coil located in the center of the oscillator plate (L-4M, Figure 9) so that the sound marker for channel 9 falls into the 27.3 mc trap dip in the response curve. As the oscillator is tuned below the carrier on channels 7, 8, 9 & 10, the 27.3 mc trap will be in the same position as the 21.9 mc trap in step 9.
12. Repeat steps 6, 7, 8 & 9.
13. Turn generator and station selector to channel 13.
14. Turn fine tuning trimmer so that the sound marker for channel 13 falls into the 21.9 mc trap dip of response curve. The slot in the fine tuning shaft should not have moved more than 30° from the horizontal position to accomplish this (each number on the station selector knob represents 30°).
15. If more than a 30° change in fine tuning trimmer was needed in step 14, adjust channel 13 oscillator coil

©John F. Rider
World Radio History

(L-7) by spreading or compressing until the 30° requirement is met.

NOTE: Each adjustment of channel 13 oscillator coil (L-7) will necessitate a rechecking of the oscillator trimmer on channel 12 as per steps 6, 7, 8 & 9.

16. Check channels 12, 11, 10, 9, 8, and 7 by noting whether the fine tuning trimmer can drop the sound marker for each channel in the trap dip by a 30° rotation. If one of the channels does not meet the 30° requirement, a compromise must be made by resetting channel 9 or 12, whichever is closer to the channel in question.

Example: 1) If channel 11 does not meet the 30° requirement, return station selector and generator to channel 12 and tune ceramic trimmer toward channel 11 (trimmer frequencies lowered by tightening screw). This will tend to move channel 12 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Do not adjust trimmer any more than is necessary to get the channel in question back within the 30° requirement.

Example: 2) If channel 10 does not meet the 30° requirement, move station selector and generator to channel 9 and tune the 3-turn coil (L-4M, Figure 9) toward channel 10 (coil freq raised by spreading turns.) This will also tend to move channel 9 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Again, do not adjust the coil any more than is necessary to bring the channel in question back within the 30° requirement.

17. Turn sweep generator and station selector switch to channel 6.

18. Adjust channel 6 oscillator coil (L-4E, Figure 9) so that the sound marker for channel 6 falls into the 21.9 mc trap dip with the fine tuning trimmer at mid-capacity (shaft slot in horizontal position). Always spread or compress channel 6 oscillator coil in units of 3 turns. Compressing turns will move curve toward sound marker, while spreading will move curve toward video marker.

IMPORTANT: Since the coils are in series, the proper alignment of channel 6 will simplify the phasing of the channels to follow.

19. Adjust channels 5 and 4 so that the sound marker for each channel falls into the 21.9 mc trap dip in the curve with the fine tuning trimmer set no more than 15° from mid-capacity.

20. Channels 3 and 2 should be adjusted so that the sound marker falls into the 21.9 mc trap dip with the fine tuning trimmer within 15° of maximum capacity.

OVERALL RECEIVER SENSITIVITY MEASUREMENT

An overall measurement of sensitivity is made as follows:

1. Connect an AM signal generator to the input terminals of the receiver chassis after removing the short 300 ohm lead which connects to the antenna input strip on the back of the cabinet. To match the generator to the receiver input, a resistor matching network should be used. In the case of a generator with a 50 ohm output impedance, for example, place a 100 ohm resistor in series with the output terminal of the generator and a 150 ohm resistor in series with the ground terminal.

2. From cathode of picture tube to chassis, connect a calibrated oscilloscope.

NOTE: To calibrate scope, connect it across 6.3 volt filament supply. The peak-to-peak amplitude on the screen will then be approximately 18V (6.3 x 2.8).

3. Set contrast control for maximum sensitivity.

4. Tune signal generator to the video carrier frequency of the channel being checked. Generator signal should be 30% modulated at 400 cycles. The signal from the generator to produce 20 volts peak-to-peak at picture tube cathode should be less than 25 microvolts on channels 2 to 6 and less than 75 microvolts on channels 7 to 13.

CIRCUIT DESCRIPTION

LOW VOLTAGE POWER SUPPLY

The low voltage power supply (Figure 12) provides plate voltage for all tubes except the high voltage applied to the second anode of the picture tube and heater voltage to all tubes except the HV rectifier, which is energized by horizontal sweep current.

Since the damping diode (V-18) develops a high voltage pulse at its cathode, and its cathode is tied to the filament to prevent breakdown in the tube, it is necessary to provide a separate, low-capacity, well-insulated transformer (T-7), to heat this filament.

The plate supply is a conventional full wave rectifier using a 5U4 tube (V-21). The speaker field serves as the filter choke. The focus coil, and its current adjusting resistor network, is used also as a voltage divider to supply plate current to several tubes as shown in Figure 12.

Another voltage divider from this network to chassis consisting of R-76 (1 meg) and the potentiometer R-75 (1 meg) provides a variable bias on the cathode of the picture tube, to serve as a brightness control.

THE RF TUNER

Antenna Input

Figure 13 is a simplified schematic of the tuner.

The antenna input coil, L-1, couples the balanced line to the single ended input circuit for the RF tube, V-1. Optimum antenna coupling for all channels is obtained by the coupling coils L-5A, L-5B, L-5C, and the coupling leads on channel positions 8, 10, and 12 of switch wafer S-1A. These can be considered the primary of the antenna transformer. The secondary, or tuned grid circuit, includes also the continuous, tapped coil mounted on wafer S-1B for the low channels (2-6) and the stamped metal plate in series with the coil for the high channels (7-13). The purpose of the antenna coil, coupling leads, and secondary circuit, is to match the 300 ohm impedance of the transmission line from the antenna to the input impedance of the RF amplifier grid circuit and to tune this circuit for the channel selected. Referring to Figure 13, it will be seen that the switch, in progressing from channel 2 to channel 13, shorts out the unused portion of the secondary winding or stamped metal plate. The bandwidth of channels 7 thru 13 is about 8 mc. The stamped metal plate is carefully designed so that with this bandwidth no alignment adjustment is needed on the high channels. The individual coil sections on the low channels, however, may be tuned by spreading or compressing them, as outlined in the alignment procedure.

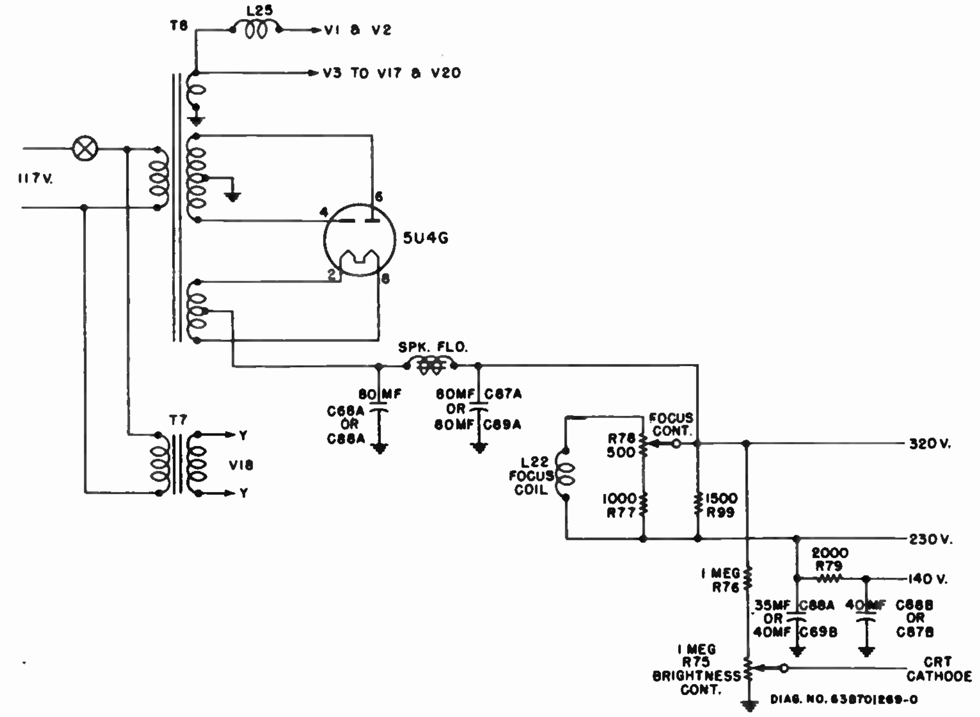

FIGURE 12. SIMPLIFIED SCHEMATIC OF LOW VOLTAGE POWER SUPPLY

RF Amplifier

The grid of the RF amplifier V-1 (6CB6) is returned to the AGC bus thru R-1 (22K) and the decoupling resistor R-2 (47K) is bypassed by capacitor C-3. The plate load of this tube consists of another tapped coil for the low channels and a stamped metal plate for the high channels mounted, in this case, on switch wafer S-1C. Here again, the switch progressively shorts out the unused sections of the inductance in tuning from channel 2 to 13. In this case, however, a trimmer C-6 and a choke L-6 are provided to center the high channel response while the low channel coils may be tuned by expansion or compression.

The Mixer

The mixer uses 1/2 of V-2 (12AT7). C-17 (8 mmf) couples the RF amplifier output to the mixer grid. Oscillator injection is accomplished by C-16 (2 mmf). L-8 and C-14 form a series resonant circuit tuned to the center of the IF response, to prevent interaction between the IF and the mixer input.

The Oscillator

The oscillator uses the other half of V-2 (12AT7) in a Colpitts circuit. Here again, the tuning inductance consists of the tapped coil for the low channels and the stamped plate for the high channels mounted on wafer S-1D. L-7 and C-12 are provided to set the center frequency on the high channels while the low channels are aligned by spreading or compressing the individual coil sections. C-11 is provided as a fine tuning control for customer use. The oscillator operates above the RF on channels 2, 3, 4, 5, 6, 11, 12 & 13 and below the RF on channels 7, 8, 9 & 10. This choice of oscillator frequencies eliminates interference due to oscillator radiation on the high channels.

THE IF AMPLIFIER

The IF amplifier uses two 6AU6 tubes and one 6AG5 tube. Figure 14 is the schematic of the IF amplifier. T-1 couples the mixer plate to the first IF grid. Coupling between primary and secondary, which are individually slug-tuned, is fixed and is designed for proper bandwidth. The plate choke L-10, of the 1st IF tube V-3 (6AU6), is coupled to the grid coil, L-11, of the 2nd IF tube V-4 (6AU6) thru C-27 (220 mmf). At IF frequencies, the impedance of C-27 is negligible and for all practical purposes, L-10 and L-11 can be considered as being in parallel, L-11 being slug-tuned. A similar method is used between the 2nd and 3rd IF tubes. The 3rd IF plate is coupled to the detector by T-2, a unity coupled transformer. The IF circuits are stagger-tuned for proper bandwidth as explained in the Alignment Instructions. L-12 and L-14 are separately tuned trap windings on IF coil forms L-11 and L-15, respectively. Together with C-28 and C-36, they form absorption type trap circuits which steepen the high and low skirts of the IF response for better picture quality and stabilize the audio response with intercarrier sound.

Decoupling is used in the plate supply and AGC circuits to prevent regeneration.

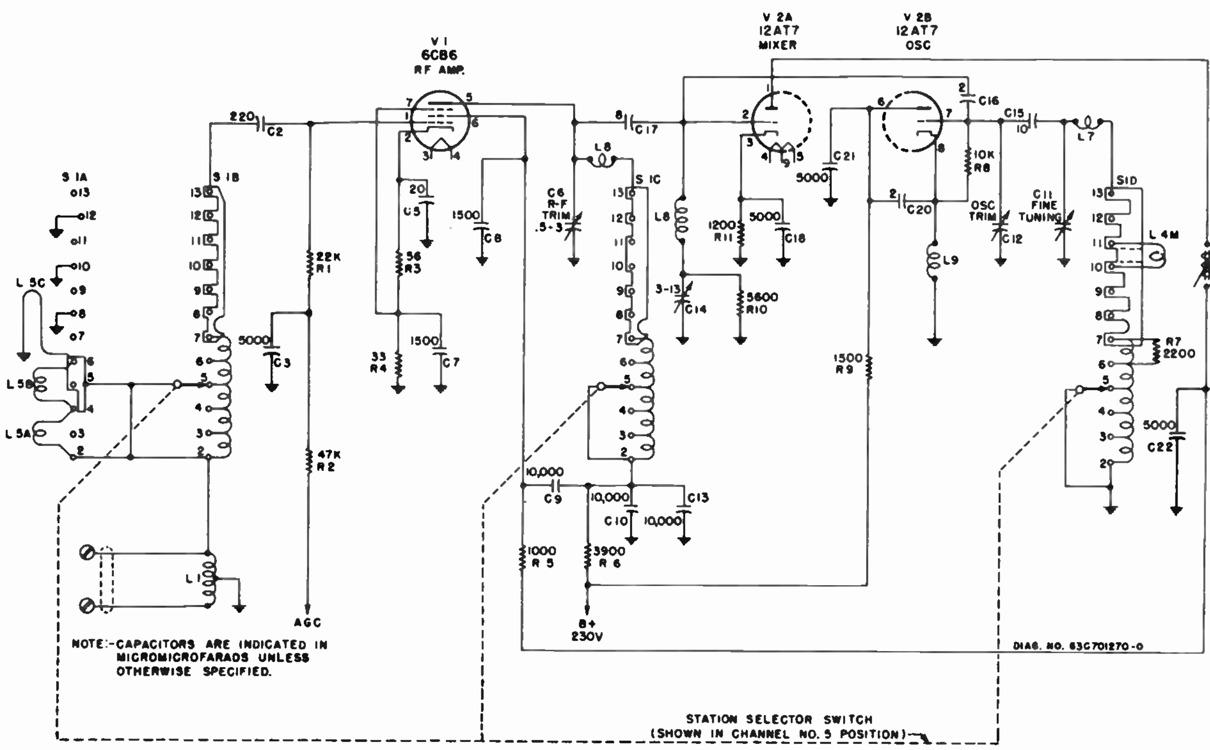

FIGURE 13. SIMPLIFIED SCHEMATIC OF RF TUNER

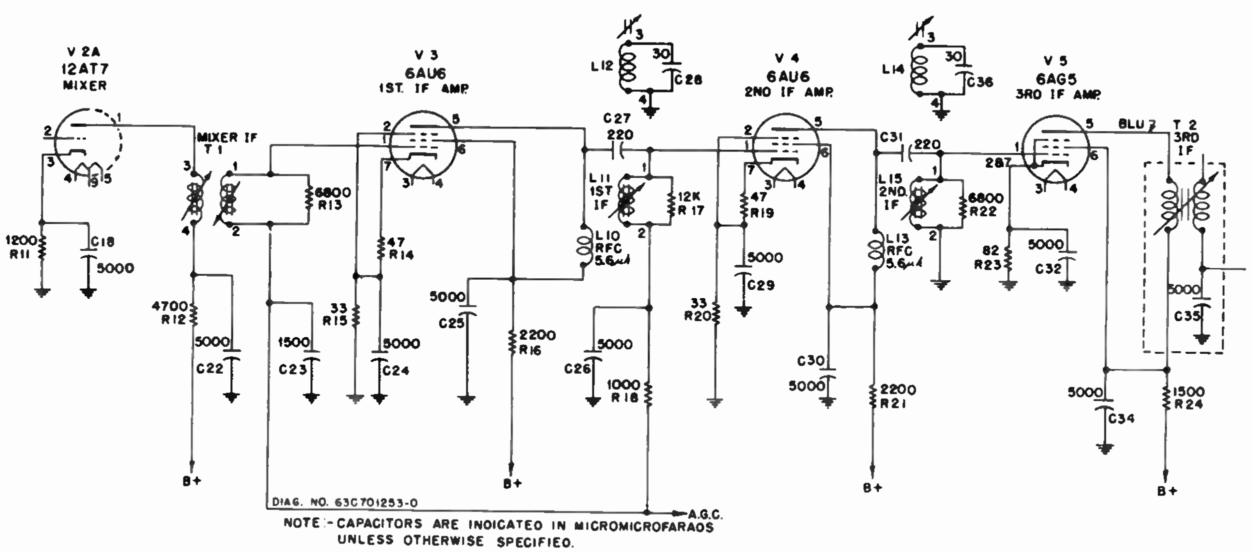

FIGURE 14. SIMPLIFIED SCHEMATIC OF IF AMPLIFIER

THE VIDEO DETECTOR

One-half of V-6 (6AL5) is used as the video detector. Figure 15 is a schematic of the video detector. Since for noise limiting purposes it is desirable to apply a signal with negative going sync pulses to the grid of the video amplifier, the detector load R-28 (5600) is placed in the plate circuit of the diode. L-16, L-17 and C-37, form a low pass filter to keep IF frequencies off the grid of the video amplifier.

Since this chassis operates on the intercarrier sound system, the detector heterodynes the video and sound IF frequencies and produces the 4.5 mc beat frequency which becomes the new audio IF frequency. The negative DC voltage is fed to the AGC bus thru R-27 (1.5 meg) and controls the gain of the RF and 1st and 2nd IF amplifiers.

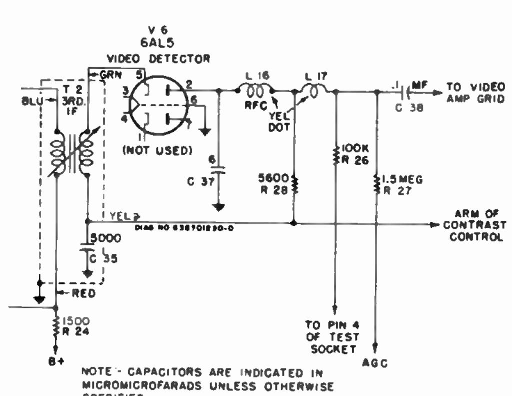

FIGURE 15. SIMPLIFIED SCHEMATIC OF VIDEO DETECTOR

THE VIDEO AMPLIFIER

The video amplifier V-7 (6AH6) not only amplifies the video signal but also the 4.5 megacycle audio IF beat. Figure 16 is a schematic of the video amplifier. In its plate circuit, this beat is separated from the video signal and fed to the grid circuit of the audio driver-limiter tube V-8 (6AU6) by C-43 (2.2 mmf) and L-20, the sound take-off coil. The 4.5 mc trap, L-18 and C-42 is a parallel resonant circuit which, when properly tuned, offers a high impedance to this frequency, to prevent its reaching the picture tube.

By applying a negative signal to the grid of the video amplifier, a noise limiting action is achieved because noise pulses of amplitude greater than the sync level will drive the tube to cut off and, therefore, will not be present in the plate circuit. Since a single video amplifier tube is used, the signal at its plate will be positive and, as might be expected, is used to modulate the cathode of the picture tube rather than the grid, because the blanking pulses must cut the picture tube off and the polarity of the video information must be such that dark picture elements result in making the grid more negative with respect to the cathode.

L-19 and L-21 are peaking coils to extend the high frequency response of the amplifier. The contrast control, R-31A, is placed in the cathode circuit of the video amplifier and controls the bias and, therefore, the gain of this tube. The composite video signal is fed to the picture tube thru coupling condenser C-85 (.1).

THE AGC

The negative DC voltage developed across the detector load resistor, R-28 (5600), is the AGC voltage. It will be noted that the low side of this resistor is connected to the arm of the contrast control potentiometer, R-31A. R-30 (47) is shunted across the arm of the contrast control and chassis. In weak signal areas, this arrangement results in a delay in the AGC action. For a weak signal, minimum bias is desired on the video amplifier and, therefore, the arm of the contrast control will be closest to the cathode end of the potentiometer. Because R-30 is then shunted across the entire contrast control, most of the plate current will flow thru it and develop a positive voltage of approximately one volt at the arm with respect to chassis. Since the low

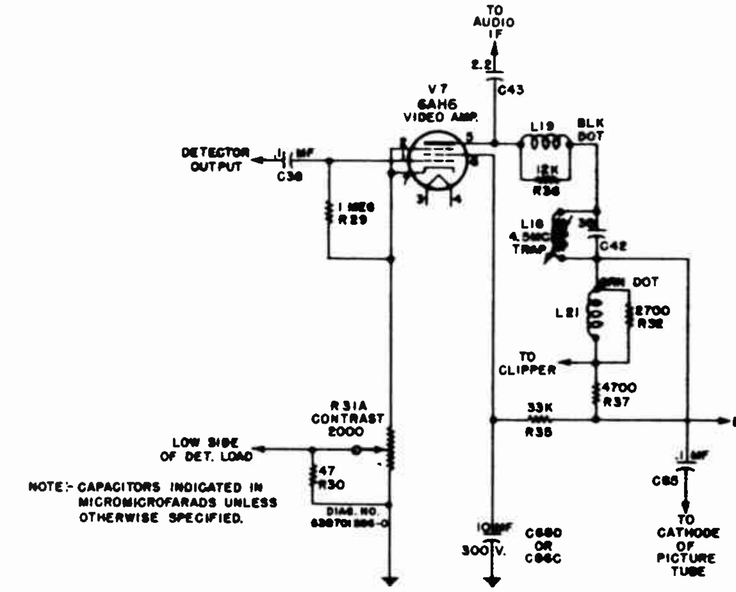

FIGURE 16. SIMPLIFIED SCHEMATIC OF VIDEO AMPLIFIER

side of the detector load is tied to this positive voltage, no AGC voltage will develop until the signal is strong enough to overcome this positive voltage and, therefore, no AGC bias is applied to the controlled tubes under weak signal conditions. In a strong signal area, however, where the arm of the contrast control approaches the chassis end of the control, R-30 is shorted out and full AGC voltage is developed.

THE AUDIO SYSTEM

The audio system employs a driver-limiter, V-8 (6AU6); a ratio detector, V-9 (6AL5); a first audio amplifier, V-10 (6J5) and an audio output tube, V-11 (6V6). Figure 17 is a schematic of the audio system. The driver-limiter is operated at low plate and screen voltages to act as a partial limiter to minimize any amplitude modulation. A conventional ratio detector and audio amplifier are used.

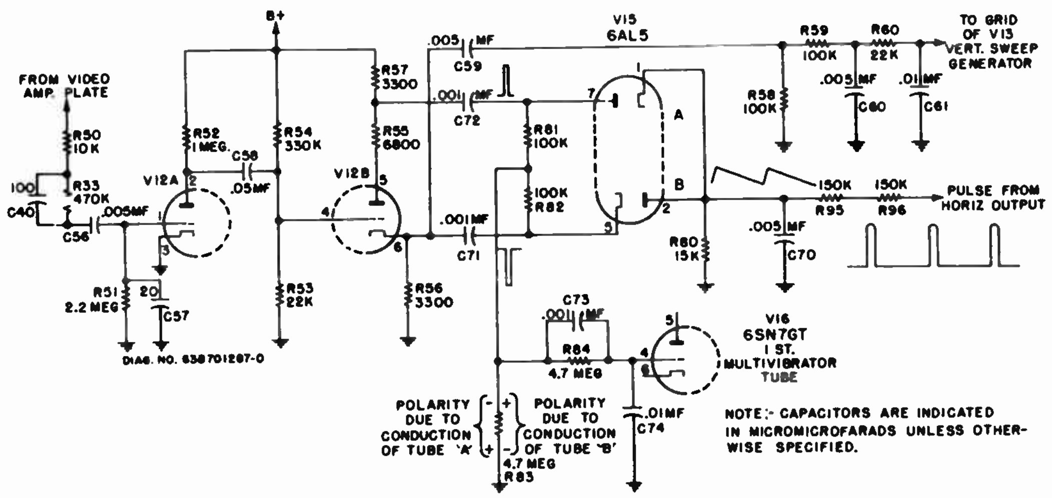

FIGURE 18. SIMPLIFIED SCHEMATIC OF CLIPPERS AND PHASE DETECTOR

THE CLIPPER

The clipper uses a 6SN7GT tube. The clipper schematic is shown in Figure 18. The composite video signal with positive going sync is applied thru R-50 and C-56 (.005) to the grid of the first clipper from the plate circuit of the video amplifier. R-33 (470K) and C-40 (100) provide a short time constant circuit to minimize noise at the clipper grid. Under no signal conditions, the tube is unbiased. The positive signal, however, will cause the tube to draw grid current and the voltage drop across R-51 (2.2 meg), negative at the grid, will charge C-56 to such a value that only the most positive part of the signal, which is the sync pulse, will cause plate current to flow. Therefore, the video information and the blanking pulses are clipped off and only the sync pulses, now negative in polarity, appear in the plate circuit. The second clipper is so biased that the peaks of the sync pulses will drive the tube to cut-off, which results in squared pulses of positive polarity in the plate circuit of this tube. A slight increase in sync pulse amplitude is obtained by a small positive voltage applied to the grid of the second clipper by R-54 (330K).

THE VERTICAL SCANNING SYSTEM

Figure 19 is a schematic of the Vertical Scanning System.

The negative sync pulses are fed from the cathode circuit of the second clipper, V-12B, to the integrating network composed of R-59, C-60, R-60 and C-61 where the serrations of the vertical group are changed to a single negative pulse to trigger the vertical scanning oscillator. C-59 (.005) and R-58 (100K) form a differentiating network which helps to stabilize the vertical scanning system by eliminating low frequency disturbances such as line fluctuations, etc.

The vertical scanning oscillator is an asymmetrical, cathode coupled multivibrator using the dual triode V-13 (12AU7). The circuit component values are chosen so that V-13B's conductance time is about 7% of the entire cycle to insure that retrace of the scan will have the proper relationship to the trace time. The saw-forming condenser, C-66 (.05) is placed in the plate circuit of V-13B while the sync pulses are applied to the grid of V-13A. For the purpose of explaining the free-running action of the circuit, assume that the end of the trace period has almost been reached. At this time, V-13A is conducting, C-63 (.01) is discharging thru V-13A, R-63 (330K) and R-64 (the vertical hold control). This discharge current makes the grid end of R-63 negative and, together with the plate current of V-13A thru R-62 (2700), the common cathode resistor, biases V-13B beyond cut-off. The energy stored in C-63 is finally reduced to the point where the voltage drop across R-63 and R-64, due to the discharge current of C-63, is no longer sufficient to keep the grid of V-13B below cut-off and the tube begins to conduct current. The increased current thru the common cathode resistor R-62, increases the bias on V-13A and reduces its plate current. The rise in voltage at the plate of V-13A starts to charge C-63, and this charging current applies a positive voltage to the grid of V-13B. This pulse of voltage throws V-13B into heavy conduction and develops a pulse of voltage across the common cathode resistor R-62, which drives V-13A beyond cut-off. C-66, the saw-forming condenser, discharges suddenly thru the virtual short circuit caused by the heavy conduction of V-13B. This corresponds to the retrace time in the scanning cycle. As C-63 approaches full charge, the charging current thru the grid circuit of V-13B decreases and the positive voltage applied to the grid of V-13B is reduced, which results in a reduction of plate current and, therefore, a reduction of bias on the grid of V-13A. Eventually, this tube starts to conduct and C-63 begins to discharge and again this discharge current thru R-63 and R-64 cuts V-13B off. C-66 begins to charge from B plus, initiating the trace time of the scan and the beginning of another cycle.

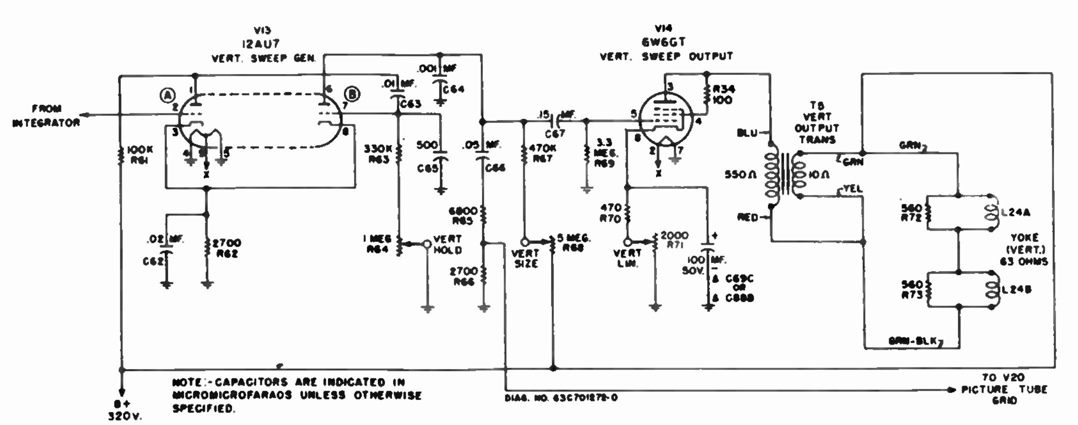

FIGURE 19. SIMPLIFIED SCHEMATIC OF VERTICAL SCANNING SYSTEM

The frequency of the multivibrator is adjusted by means of the hold control R-64, so that the sync pulse from the transmitting station, negative in polarity, arrives at the time when V-13B is beginning to conduct which, as we have seen, causes the grid of V-13A to go negative. The added negative voltage of the sync pulse insures that V-13A will be driven to cut-off at sync pulse rate for each cycle, thus initiating the retrace in exact step with the transmitting station's vertical scan. The voltage developed at the plate of V-13B will be the combination sawtooth and pulse voltage shown in Figure 22(1). The pulse is formed by the peaking resistors R-65 and R-66. When V-13B goes into conduction, the voltage at the plate of V-13B drops suddenly to a value determined by the relationship of the plate resistance of V-13B to the total resistance in the discharge circuit of C-66 which consists of R-65, R-66 and the plate resistance of V-13B. After this initial instant, the charge on C-66 decreases, causing the voltage decrease at the plate shown between points "c" and "d" of Figure 22(1). When the positive pulse on the grid of V-13B has decreased to the value where the negative charge on C-63 becomes operative and cuts off V-13B, the voltage on the plate of V-13B and, correspondingly, on the grid of V-14, rises quickly to point "a" on the curve, the start of the trace.

By returning the grid of the picture tube to the junction of the two peaking resistors R-65 and R-66, a negative pulse of suitable amplitude to cut the picture tube off during retrace is obtained, resulting in elimination of retrace lines on the screen.

The negative pulse shown between point "b" and "a" of Figure 22(1), acting on the grid of V-14, tends to cut the tube off and raises its plate resistance to the larger value required to dissipate the energy in the plate circuit inductance during the short retrace period.

Since the plate circuit of the vertical output stage V-14 has inductance and, as the time constant of an inductive circuit decreases with an increase of resistance, just the opposite of an RC circuit, the increase in plate resistance of the tube is used to obtain the short time constant circuit required for proper retrace time. The windings on the vertical output transformer are connected series opposing which reduces the step-down ratio and, hence, the inductance in the plate of V-14 in order to shorten the retrace time.

The controls found in this circuit are:

1. The Vertical Hold Control R-64 (1 meg). This control varies the resistance in the discharge circuit of C-63 (.01) and, hence, provides a means of varying the frequency of the multivibrator. In practice, this control is adjusted so that the incoming negative sync pulses, on the grid of V-13A, which are of constant amplitude, will cut V-13A off and throw V-13B into conduction in exact synchronization with the transmitting station's vertical scan.

2. The Vertical Size Control R-68 (5 meg). This control varies the charging current into C-66 (.05) and, hence, the amplitude of the voltage developed across it. Variation of this voltage varies the drive on the grid of V-14 and controls vertical size

3. Vertical Linearity R-71 (2000). This control, thru resistor R-70 (470), sets the bias on the grid of the vertical output tube and determines the tube's operating point on its plate current curve. Since this curve is not linear, some distortion can be introduced to counteract any non-linearity in the sawtooth grid voltage.

Since the size control is part of the multivibrator circuit and has an effect also on its frequency, there will be some interaction between the size and hold controls. Usually, readjustment of size will require readjustment of the hold control.

HORIZONTAL SCANNING SYSTEM

The horizontal scanning system comprises a phase detector V-15 (6AL5), a cathode coupled multivibrator V-16 (6SN7), the output tube V-17 (6BQ6) and a damping diode V-18 (6W4). Figure 20 is a simplified schematic of this system.

The Horizontal Oscillator

In order to see how the phase detector automatically corrects for multivibrator frequency change, it will be necessary to understand how the correction voltage affects the multivibrator. The horizontal oscillator is also an asymmetrical cathode coupled multivibrator.

The operation is as follows. Assume that the trace period is almost completed. At this time, tube "A" is conducting, tube "B" is cut off. C-76 is discharging thru tube "A" R-88 (120K), and R-89 (the hold control). The discharge current of C-76 is still high enough to keep the grid of tube "B" negative and cut off. Bias is being applied to both tubes by current flow thru the common cathode resistor R-86 (1000). When the energy stored in C-76 is reduced to the point where its discharge current no longer holds the grid of tube "B" below conductance, tube "B" starts to pass current and this current causes a greater voltage drop across R-86, the common cathode resistor, which increases the bias on tube "A" reducing its plate current. The resulting increase in voltage at the plate of tube "A" begins to charge C-76 and this charging current applies positive voltage to the grid of tube "B". The resulting heavier conduction of tube "B" develops a pulse of voltage across R-86 which cuts tube "A" off and results in a positive pulse at the plate of tube "A" which throws tube "B" into heavy conduction. This allows C-77, the saw-forming condenser, to discharge thru tube "B" and R-91. When C-76 becomes charged, the charging current thru the grid circuit of tube "B" decreases and the positive voltage on the grid, which has far exceeded the bias developed across R-86, is reduced. This results in reducing the plate current thru tube "B" and, therefore, the bias applied to tube "A" by the voltage drop across R-86. Tube "A" starts to conduct and condenser C-76 starts to discharge, cutting tube "B" off. C-77 begins to charge, starting the next trace.

L-23 and C-75 in the plate circuit of tube "A", form a resonant circuit which is tuned to the horizontal frequency (15,750 cps). The 15,750 cycle sine wave generated by this circuit, if properly phased, will insure that the positive pulse at the plate of tube "A", which throws tube "B" into conduction, will be more frequency stable.

C-77 and R-91, the peaking resistor, will produce the

World Radio History

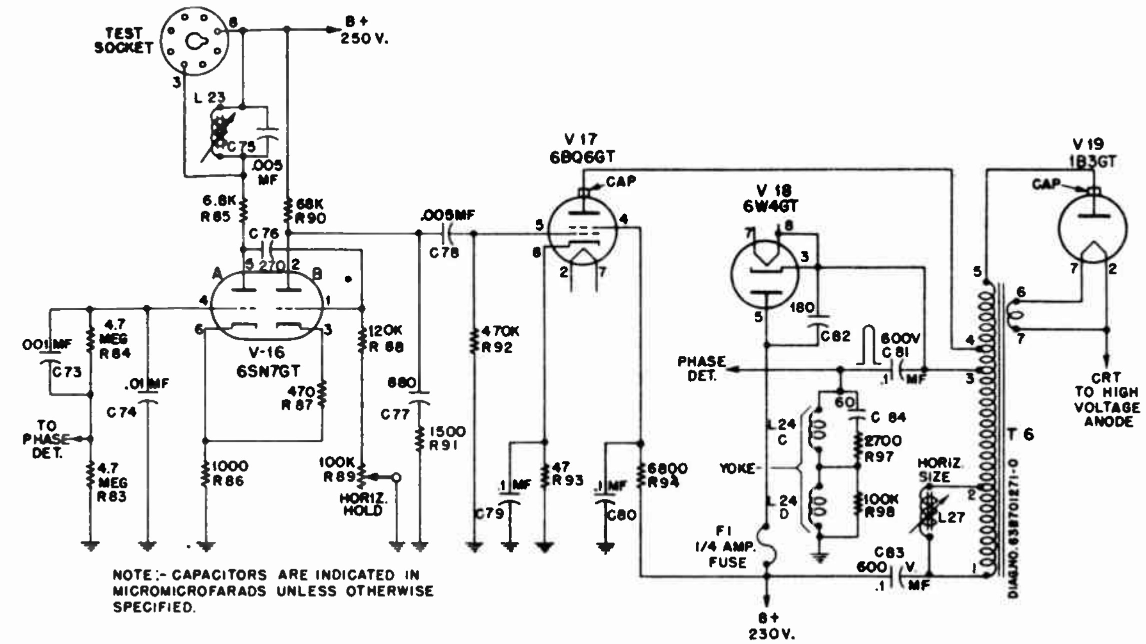

FIGURE 20. SIMPLIFIED SCHEMATIC OF HORIZONTAL SCANNING AND HIGH VOLTAGE SYSTEM

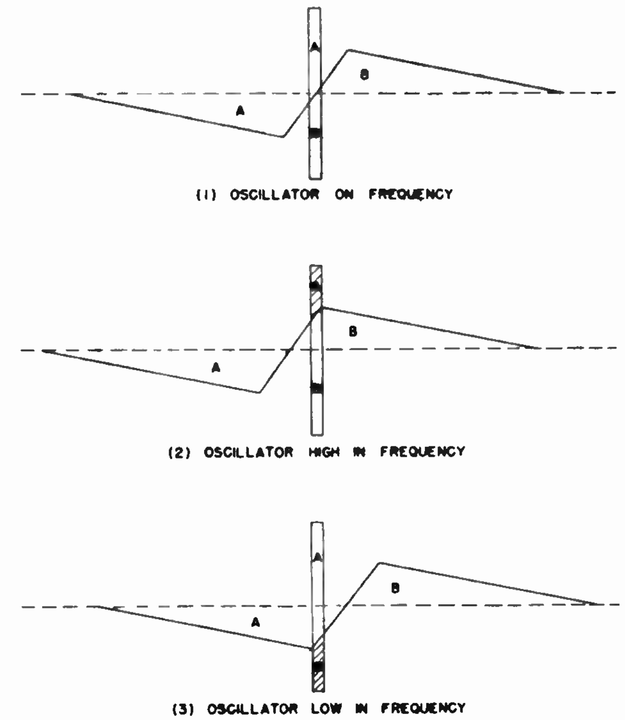

FIGURE 21. WAVEFORMS AT PHASE DETECTOR

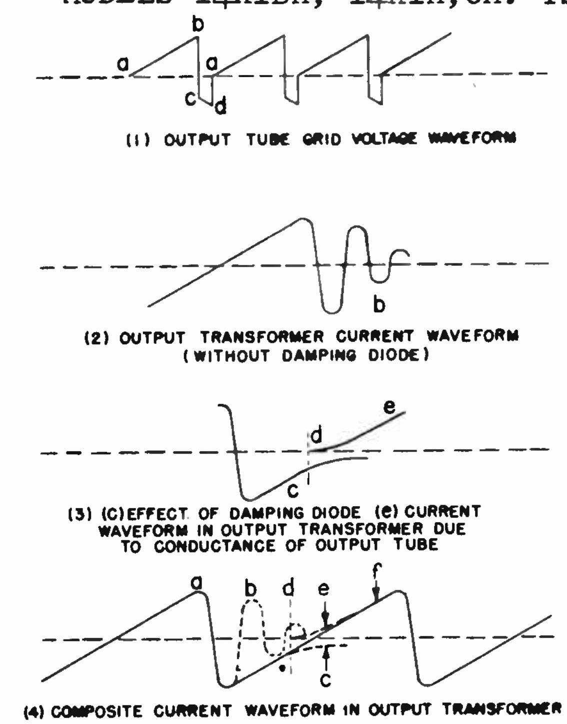

FIGURE 22. WAVEFORMS IN HORIZONTAL SCANNING SYSTEM

same combination pulse and sawtooth voltage shown in Figure 22(1). This action was explained in the vertical circuit.

The Phase Detector

The foregoing explanation is based on the assumption that tube "A's" grid is returned to a fixed potential point. It can be seen that if this grid is returned to a point which varies in potential with frequency of the multivibrator, it would be possible to make this variation a means of frequency control. Assume that the grid of "A" in Figure 20 is made more positive. This causes the bias of "B" to increase because of the increased drop across the common cathode resistor R-86. Capacitor C-76 will then discharge for a longer time before "B" conducts, thereby decreasing the frequency of oscillation. If the grid were made more negative, the bias across the common cathode resistor would be less and C-76 would discharge for less time before "B" started to conduct, thereby increasing the frequency.

Figure 18 is a simplified schematic of the clipper and phase detector circuits. The phase detector V-15 (6AL5) is so connected that a comparison of the phase of the incoming sync pulses and a sawtooth derived from the horizontal output system is made. A positive sync pulse from the plate of the 2nd clipper V-12 (6SN7) is fed thru C-72 (.001) to the plate of diode "A" of V-15. A negative sync pulse from the cathode of V-12 is applied thru C-71 (.001), to the cathode of diode "B" of V-15. A sawtooth, derived from the integration of a pulse in the horizontal output circuit, at the yoke, by the integrating network, composed of R-95 (150K), R-96 (150K), and C-70 (.005), is applied to the cathode of diode "A" and the plate of diode "B", which are tied together and returned to chassis thru R-80 (15K). The load for diodes "A" and "B" consists of resistors R-81 (100K) and R-82 (100K) whose junction returns to the high side of the grid resistor R-83 (4.7 meg) of the first horizontal multivibrator tube V-16 (6SN7). The voltage applied to the two diodes will be a function of the amplitude of the sawtooth, the amplitude of the sync pulses and the phase relationship between the pulses and the sawtooth.

If the sawtooth, whose phase and frequency are a function of the multivibrator's phase and frequency, is operating in the middle of the lock-in range, the sync pulse will occur in the center of the retrace time. See Figure 21(1). The sync pulses have an amplitude of from 6 to 8 volts while the sawtooth amplitude is about two volts. The RC time constant in the pulse input circuit to the diodes is long enough to maintain an average pulse voltage of 6 to 8 volts for two or three horizontal lines, which means that in the "on" frequency condition shown in Figure 21(1), the diodes conduct only on the pulses and since these are equal in amplitude and develop voltages of opposite polarity across R-83 in the first multivibrator grid circuit, as shown in Figure 18, no control voltage is applied to the grid of V-16.

If the oscillator tends to increase in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(2) exists at the diodes. The phase of the sawtooth has now shifted so that at the same instant that the pulse is applied to the plate of diode "A", the positive saw is also applied to its cathode, so that only the shaded portion of the pulse causes conduction of diode "A". Diode "B", however, still conducts on the total amplitude of the negative pulse applied to its cathode aided by the positive saw applied to its plate at the same time. Since current flow thru diode "A" makes the grid end of R-83 negative, with respect to chassis, the decreased current flow, caused by the sawtooth voltage bucking the pulse voltage at diode "A", results in a more positive voltage across R-83, applying a more positive voltage to the grid of V-16 which, as we have seen, results in decreasing the oscillator's frequency.

If the oscillator tends to decrease in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(3) exists at the diodes. At the same instant that the negative pulse is applied to the cathode of diode "B", the negative saw is applied to its plate so that only the shaded portion of the pulse causes conduction. Diode "A", however, conducts on the full amplitude of the positive pulse applied to its plate, aided by the negative saw applied to its cathode at the same time. Since current flow thru diode "B" makes the grid end of R-83 positive, with respect to chassis, the decreased current thru diode "B" results in applying a more negative voltage to the grid of V-16 which, as we have seen, results in increasing the oscillator frequency. C-73, R-84 and C-74 provide two time constant filters which are necessary to obtain "fly-wheel" action of this AFC sync circuit.

The Horizontal Output System

The combination sawtooth and pulse waveform developed across C-77 (680) and R-91 (1500) by the multivibrator circuit, is fed to the grid of the horizontal output tube V-17 (6BQ6). Figure 20 is a simplified schematic of the horizontal output system. It will be noted that in this system an auto-transformer is used. In the horizontal scan, it is necessary that retrace be completed in about 7 microseconds. In order to accomplish reversal of current in the inductance of the output transformer and the yoke in this short a time, it is necessary to make this circuit resonant at such a frequency that the half cycle time will equal 7 microseconds, because only by shock exciting such a circuit into oscillation will retrace be accomplished in the time allowed. This circuit is made resonant by the inductance of the output transformer and yoke, the distributed capacity and the tube capacity. Bearing this in mind, the operation can be explained as follows. Referring to Figure 22(1), assume that the voltage on the grid of the output tube is increasing, point "a". The grid is now being made less negative and the output tube starts to draw current which is supplied from B plus thru the damping diode. When point "b" is reached on the grid voltage waveform, the output tube is suddenly cut off because its grid has been made highly negative, (point "c" on the grid voltage waveform). With the tube cut off, the resonant plate load is undamped and the circuit is shocked into oscillation. The reversal of current through the output inductance produces a positive voltage pulse which makes the cathode of the damping diode (V-18) positive, with respect to its plate; therefore, it cannot conduct. C-82 (180) is placed across the diode to provide a low impedance for the oscillatory current. If the damping diode V-18 were not present, this oscillation would continue and current would flow in the output transformer as shown in Figure 22(2). In order to insure a linear trace, however, this oscillation must be stopped and the damping diode serves this purpose.

When the current nears its maximum negative value, the polarity and amplitude of the voltage pulse on the damping diode is such that its plate becomes positive, with respect to its cathode so that the tube conducts heavily and loads the circuit sufficiently to prevent continuation of the oscillation. The current then follows the decay curve shown at "c" in Figure 22(3). At the time ["d" in Figure 22(3)] the voltage at the grid of the output tube has become less than cut off point[" " in Figure 22(1)], the tube again demands current. The rising current in the tube results in superimposing the waveform "e" of Figure 22(3) on the current flow already in the output transformer due to the decaying current which resulted from the damped oscillation. Combination of these two currents results in the linear trace current indicated at "f" in Figure 22(4), which is a composite waveform of the entire action. During the peak conduction of the damped diode, C-83 (.1) charges and its polarity is such that when the output tube calls for current the charge on the condenser will be in series with the B plus supply so that the voltage at the output tube plate is raised from the 250 volt B plus supply to about 475 volts by this so-called "bootstrap" voltage. When the grid voltage waveform of the output tube again reaches point "b" of Figure 22(1), the tube is cut off and another cycle starts.

In order to properly match the yoke inductance to the required output inductance for the tube, the yoke is connected to a tap on the winding which effectively makes an auto-transformer of this section. The positive pulse of voltage at this tap is coupled to the yoke thru C-81 (.1) and results in a sawtooth of current thru the yoke. It will be remembered that a portion of this pulse is also fed to the phase detector for the AFC action thru R-95 and R-96.

High Voltage

To take advantage of the large voltage pulse developed across the output inductance by the heavy current flow caused by the retrace oscillation, the plate winding is made the primary of an auto-transformer whose step-up ratio is

©John F. Rider
World Radio History

such as to develop pulses of about 14 kv at its high end. These pulses are rectified by V-19 (1B3) and the resulting DC is applied to the second anode of the picture tube. The filament voltage for the 1B3 rectifier is obtained from an additional winding on the output transformer.

Controls

1. Horizontal Oscillator Adjustment. L-23 is the coil of the sine wave generating circuit in the horizontal multivibrator circuit and should be tuned to 15,750 cycles as explained in the service instructions.

2. Horizontal Hold Control. R-89 is the horizontal hold control which can be adjusted for correct frequency operation of the multivibrator.

3. Horizontal Size Control. L-27, paralleling a small portion of the output choke controls, to a small degree, the inductance of the choke and acts as a size control.

TUNER

Model TT-13 Tuning Unit

Ref. No.	Part Number	Description
	1X700100	TT-13 Tuning Unit: includes station selector switch, fine tuning trimmer, and the following components:
C-1	21K478234	Capacitor, molded: 8 mmf 500V
C-10	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-13	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-15	21K400173	Capacitor, molded: 10 mmf 500V (temp. comp.)
L-2	24C792764	Coil, antenna: channels 2 thru 6; includes L-2A thru L-2E (L-2F thru L-2L are part of switch)
L-3	24K790536	Coil, RF: channels 2 thru 6; includes L-3A thru L-3E (L-3F thru L-3L are part of switch)
L-4	24C700114	Coil, oscillator: channels 2 thru 6; includes L-4A thru L-4E (L-4F thru L-4L are part of switch)
L-4M	24K700115	Coil, oscillator: channel 10
L-5	24K792765	Coil, antenna primary: low frequency; includes L-5A, 5B & 5C
L-7	24K700116	Coil, oscillator: channel 13
R-7	6R6069	Resistor: 2200 10% 1/2W
	42K790136	Clip, spring (on collar)
	43K700725	Collar, spring (on rear end of fine tuning shaft)
	47K700726	Shaft, fine tuning

CHASSIS PARTS - MECHANICAL

Part Number	Description
7K700153	Bracket, coil mtg (L-27)
7B700194	Bracket, focus coil mtg: bottom ("U" bracket around focus coil)
7A700196	Bracket, focus coil mtg: top (across top of focus coil)
7A791965	Bracket; interlock safety
7B700515	Bracket, mask mounting
1X700504	Bracket, rear tube support: with tube grounding spring & 2nd anode insulator (large support brkt)
7A792568	Bracket, yoke adj (across top of deflection yoke)
35K700532	Bumper, rubber (circular bumper in rear support brkt)
30A790948	Cable, high voltage (6BQ6 plate cap lead) ... ft
42K471342	Cap, plate (for hi-volt rectifier)
42A701441	Cap, plate (for 6BQ6)
42A700147	Clamp, lead retainer (on hi-volt rect filament leads)
42B70721	Clip, coil mtg (T-3 secondary)
42A76244	Clip, coil retainer (L-23)
42A72609	Clip, grounding (grounds V-10 shield)
42A780193	Connector, 2nd anode: with lead
39K17396	Contact, pin terminal (in spkr receptacle) ... per/c
46A478242	Core, brass & screw (T-3)
46K791756	Core, brass & screw (L-11 & L-15)
46A470310	Core, iron & screw (T-1 primary, L-18 & L-20)
46K480256	Core, iron & screw (T-1 secondary, & L-12)
46A70023	Core, iron & screw (T-3 primary & L-14)
46A470302	Core, iron & screw (T-3 secondary)
46K471143	Core, iron & screw (L-23)
46A700090	Core, iron & slide adjustment (L-27)
15B791111	Cover, test socket
35K792757	Cushion, focus coil (between coil & tube)
5K792031	Grommet, insulating: 9/32" hole
5A790684	Grommet, tube socket (V-14 & V-16 socket mtg)
14A780184	Insulator, antenna lead (dresses antenna input from chassis)
14K791892	Insulator, coil (in T-2 can)
14K87179	Insulator, coil (in T-3 can)
14A791787	Insulator, 2nd anode lead: armite (dresses 2nd anode lead from chassis)
4S7655	Lockwasher, internal: 3/8; cad pl (front controls mtg)
4S2640	Lockwasher, internal: 1/2 thin; cad pl (mounts bottom focus coil mtg brkt)
4S7688	Lockwasher, internal-external: 1/4; cad pl (mounts bottom focus coil mtg brkt)
4S9751	Lockwasher, internal-external: #8; cad pl (T-8 mtg)
29R5220	Lug, formed (on T-8 mtg screw)
29R5239	Lug, soldering: #8 H.T.
2A470049	Nut, coil & core mtg (T-1, T-2, L-11, L-12, L-14, L-15, L-18 & L-20)
2K791404	Nut, coil & core mtg (L-27)
2S7022	Nut, hex: 1/4-20 x 7/16; cad pl (mounts bottom focus coil mtg brkt)
2S7004	Nut, hex: 3/8-32 x 9/16; cad pl (front controls mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (T-8 mtg)
2S7051	Nut, hex: palnut; 3/8-32 x 9/16; cad pl (rear controls mtg)
2S7050	Nut, hex: palnut: 6-32 x 5/16; cad pl (T-2 shield mtg)
2B70703	Nut, palnut: special (T-3 primary coil mtg)
2A790191	Nut: special (ceramic trimmer mtg)
35K792182	Pad, cushion (at bottom of picture tube front)
35K700167	Pad, cushion (small pads on lower picture tube strap)
35K700166	Pad, cushion (on top picture tube strap)
64K791818	Plate, chassis cover (removable plate on chassis side)
64A90034	Plate, electrolytic mtg (mounts 2 electrolytics)
64A700690	Plate, electrolytic mtg (mounts 3 electrolytics)
64K700748	Plate, socket cover (covers unused hole when 2 electrolytics used)
64A700745	Plate, transformer cover (for 25C700161 power trans. only)
28K471323	Plug, line cord: 2-pin; waxed
9A22367	Receptacle: 5-prong (spkr receptacle)
5S8497	Rivet: .088 x 1/8 stl; pol nkl (V-1, V-2, & V-5 socket mtg)
5S7770	Rivet: .088 x 5/32 stl; pol nkl (antenna ins. mtg)
5S2815	Rivet: .088 x 7/32 stl; pol nkl (9A485495, 9K780442 & 9K484167 socket mtg)
5S7707	Rivet: .122 x 5/32 stl; pol nkl (9K471270 socket & terminal strip mtg)
5S7701	Rivet: .122 x 3/16 stl; pol nkl (2nd anode lead insulator mtg)
5S7703	Rivet: .122 x 7/32 stl; pol nkl (tube grounding spring mtg)
5S7700	Rivet: .122 x 1/4 stl; pol nkl (line cord plug mtg)
5S7728	Rivet: .122 x 5/16 stl; pol nkl (V-19 socket mtg)
5S6842	Rivet: .145 x 7/32 stl; pol nkl (T-4 & T-5 mtg)
5K71246	Rivet, shoulder: nkl pl (V-14 & V-16 socket mtg)
3A700198	Screw, eccentric: cad.pl (mounts bottom focus coil mtg brkt)
3S490354	Screw, machine: 6-32 x 5/8 slotted hex head; cad pl (C-6 & C-12 trimmer adj)
3S490822	Screw, machine: 6-32 x 1 slotted hex head; cad pl (C-14 trimmer adj.)
3S490459	Screw, machine: 6-32 x 1-1/8 slotted round head; brass (secures HV trans plates)
3S7163	Screw, machine: 8-32 x 1/4 plain hex head; cad pl (mounts V-19 mtg plate)
3S490642	Screw, machine: 10-32 x 1-1/2 plain hex head; cad pl (picture tube retainer strap mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (chassis side plate mtg)
3S7467	Screw, sheet metal: #8 x 3/8 PKZ plain hex head; cad pl (T-7 mtg)
3A470369	Screw, thumb: cad pl (yoke adj screw)
26K485936	Shield, coil (T-3)
1X792785	Shield, coil: with spade bolts (T-2)
26A26283	Shield, tube (for glass V-10)
26A90301	Shield, tube: miniature
26A700717	Shield, video (shields video amp from hi-volt trans)
9K701447	Socket, picture tube: 5-pin; with leads
9K701448	Socket, picture tube: 12-pin; with leads
9A792167	Socket, tube: miniature 7-prong (V-1)
9K780442	Socket, tube: miniature 7-prong (V-3, V-4, & V-6)
9K484167	Socket, tube: miniature 7-prong (V-7, V-8, V-9 & V-15)
9A471343	Socket, tube: miniature; tan molded (V-5)
9A485495	Socket, tube: noval; laminated; less adaptor (V-13)
9K484816	Socket, tube: noval; molded (V-2)
9K471270	Socket, tube: octal (all octal sockets except V-14, V-16 & V-19)
9A790685	Socket, tube: octal (V-14 & V-16)
9A480274	Socket, tube: octal; molded (hi-volt rectifier)
41A70705	Spring, coil (T-3)
41A700143	Spring, compression (L-27)
41A700563	Spring, grounding (grounds picture tube outer coating)
41A471379	Spring, tension (picture tube support)
1X700520	Strap, picture tube mtg: with pads (lower strap around tube front)
1X700521	Strap, picture tube retainer: with pad (upper strap around tube front)
31K31217	Strip, terminal: 1 ins #2 gnd; 3/8" spacing
31K90044	Strip, terminal: 2 ins #2 gnd; 3/8" spacing

INSULATING COMPOUNDS

Part Number	Description
11M490423	Coating, hi-volt. insulating: red-brn (on hi-volt rect. socket)
11M490387	Wax, bivax (on hi-volt transformer)

MODEL 14K1H CABINET PARTS

Part Number	Description
1X701541	Back cover: complete with picture tube rear cover, centering adjustment cover, and line cored
13C700627	Base, metallic: brass pl (between cabinet legs)
13D700086	Bezel, picture tube (window frame)
1X792494	Bracket, window mtg: with pads
16F700629	Cabinet, console: red-brn mahogany; less window & bezel
42A792502	Clip, mask retainer
13K700631	Cloth, grille: mahogany
30B470756	Cord, line: with plug & receptacle
15K792068	Cover, centering adjustment: rubber (on back cover)
1X792546	Cover, chassis bottom: with hi-volt insulator
15K700596	Cover, picture tube rear (on back cover)
5S3139	Eyelet: .202 x .475 brass; ant cop (on back cover)
14B792069	Insulator, hi-volt (on bottom cover)
36B790505	Knob, control (contrast)
36B790506	Knob, control (station selector)
36A485457	Knob, control: black (hold controls on chassis rear)
36K792078	Knob, control: wal-mahog (fine tuning & off-volume)
4S7657	Lockwasher, external: #8; cad pl (spkr mtg)
4S7650	Lockwasher, internal: #6; cad pl (hi-volt insulator mtg)
62K70581	Logotype: "Motorola"; gold enamel
1X700594	Mask, picture tube: with retainer clips
13A700601	Medallion: brass pl ("M" on grille cloth)
2S7007	Nut, hex: 8-32 x 1/4; cad pl (spkr mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (spkr mtg)
35K700168	Pad, cushion (window mtg)
35K792501	Pad, cushion (on window mtg brkts)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
5S1683	Rivet: .122 x 3/16 brs; pol nkl (mask clip mtg)
5S7703	Rivet: .122 x 7/32 stl; ant cop (picture tube rear cover mtg)
5K791856	Rivet, shoulder: annealed (line cord mtg)
3S7374	Screw, machine: 8-32 x 5/16 plain hex head; cad pl (bezel mtg)
4S7629	Washer, flat: 1/2 x 3/16 x .048 stl; cad pl (bottom cover mtg)
4S8214	Washer, flat: 7/8 x .203 x .067 stl; cad pl (chassis mtg)
61C700134	Window, picture tube: 14" rectangular.

MODEL 14K1BH CABINET PARTS - Same as 14K1H except:

Part Number	Description
16K700630	Cabinet, console: limed oak; less window & bezel
13K700632	Cloth, grille: eggshell
36K792079	Knob, control: tan (fine tuning & off-volume)

BILT-IN-TENNAS

BILT-IN-TENNA

Part Number	Description
1X791759	TA-4 Double Loop Antenna: complete
21R6593	Capacitor, mica: 15 mmf 300V
21K70720	Capacitor, molded: 5 mmf 500V
24A791771	Coil, antenna loading
29A791608	Lug, spade
31K471564	Strip, terminal: 3 ins #2 gnd; 3/8" spacing
3K653	Screw, machine: 8-32 x 1-1/4; cop oxd (spkr mtg)
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acorn head; ant cop (window & back cover mtg)
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop (back cover mtg)
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acorn head; ant cop (back cover mtg)
3S7467	Screw, sheet metal: #8 x 3/8 PKZ plain hex head; cad pl (mask mtg)
3S400220	Screw, sheet metal: #10 x 3/4 PKA plain hex head; cad pl (bottom cover mtg)
3S400221	Screw, sheet metal: #10 x 1-1/2 PKA plain hex head; cad pl (chassis mtg)
56K700009	Strap, antenna support (supports lower loop antenna)
35A791581	Strip, lead (dresses leads to cabinet side)
13K700628	Strip, metallic: brass (across cabinet front)
4A792497	Washer, cut: cad pl (bezel mtg)
4S1767	Washer, flat: 5/16 x .130 x .025 brs; pol nkl (mask clip mtg)
4S1720	Washer, flat: 3/8 x 11/64 x .030 stl; cad pl (mask & line cord mtg)
4S7562	Washer, flat: 7/16 x .187 x .033 stl; cad pl (spkr mtg)

14K1

GENERAL INFORMATION

RECEIVER MODEL BREAKDOWN CHART

Model	Type of Set	TV Chassis Used
14T1	Table, red-brn mahogany	TS-88
14T1B	Table, limed oak	TS-88
14K1	Console, red-brn mahogany	TS-88
14K1B	Console, limed oak	TS-88

TV CHASSIS - Television chassis TS-88 contains 19 tubes plus a 14" rectangular picture tube. The picture, sound, and scanning circuits, together with a selenium rectifier voltage doubler "B" supply are contained on a single chassis.

TV TUNING RANGE - Channels 2 through 13

TV IF FREQUENCY -

Channels 2, 3, 4, 5, 6, 11, 12 & 13: sound - 21.9 mc
picture - 26.4 mc
Channels 7, 8, 9 & 10: sound - 27.3 mc
picture - 22.8 mc

ANTENNAS - table model; TA-6 "Bilt-In-Tenna" console; TA-4 "Bilt-In-Tenna". Provision for connection of an external antenna in both cases.

TV ANTENNA IMPEDANCE - 300 ohms

POWER SUPPLY - 117 volts, 60 cycle AC current only

POWER CONSUMPTION - TV: 170 watts

TV AUDIO OUTPUT - 4 watts

TV CHASSIS TUBE COMPLEMENT

Ref. No.	Tube	Function
V-1	6CB6	RF Amplifier
V-2	12AT7	Mixer-Oscillator
V-3	6AU6	1st IF Amplifier
V-4	6AU6	2nd IF Amplifier
V-5	6AG5	3rd IF Amplifier
V-6	6AL5	Video Detector
V-7	6AH6	Video Amplifier
V-8	6AU6	Audio Driver-Limiter
V-9	6AL5	Ratio Detector
V-10	6J5GT	Audio Amplifier
V-11	6V6GT	Audio Output
V-12	6SN7GT	1st & 2nd Clippers
V-13	6J5GT	Vertical Sweep Generator
V-14	25L6GT	Vertical Sweep Output
V-15	6AL5	Phase Detector
V-16	6SN7GT	Horizontal Oscillator
V-17	6BQ6GT	Horizontal Output & High Voltage Generator
V-18	6W4GT	Damping Diode
V-19	1B3GT	High Voltage Rectifier
V-20	14BP4 or 14CP4	Picture tube: rectangular

HIGH VOLTAGE WARNING

Operation of this receiver, outside its cabinet or with covers removed, involves a shock hazard from the power supplies. No work should be attempted on this receiver by anyone not thoroughly familiar with the precautions necessary when working on high voltage equipment.

CATHODE RAY PICTURE TUBE HANDLING PRECAUTIONS

Extreme care must be used in handling the picture tube. This tube is highly evacuated and, due to its large size, is subjected to a considerable atmospheric pressure. The handler should wear safety goggles and gloves for protection. Avoid nicking or scratching the glass by rough contact with other objects.

Before removing glass tubes, discharge the capacitor formed by the inner and outer aquadag coatings on the tube by shorting the anode contact on the side of the tube to the outer surface with a well insulated piece of wire.

INSTALLATION AND OPERATING INSTRUCTIONS

RECEIVER LOCATION

The receiver may be placed anywhere in the room, but for greatest satisfaction it should be located:

1. Away from any bright light that may fall directly on the screen or be reflected from it; this includes windows and lamps. Some illumination in the room, off to one side, is desirable, however, to prevent eyestrain.

2. To provide comfortable viewing and ease of operation.

3. At least one-inch away from a wall to allow for cabinet ventilation. This is very important.

ANTENNAS

The choice of a television antenna depends entirely on the location of the receiver with respect to all television station transmitting antennas in the area. Maximum pick-up is obtained when the receiving antenna is directly in line of sight with the transmitting antenna.

"Bilt-In-Tenna". All receivers using the TS-88 series television chassis are equipped with the Motorola "Bilt-In-Tenna", mounted inside the cabinet, for use in good signal areas.

When this antenna is used, the following precautions should be observed for best reception:

1. In order to get maximum performance and satisfactory pictures from the "Bilt-In-Tenna", ample signals from the television station must be present at the location of the receiver. Normally, the strength of the signals will vary throughout the room in which the receiver is located. For this reason, better pictures will be obtained if the receiver is tried in all possible locations in the viewing room and is then placed where the clearest pictures are received from all stations. Avoid large metallic objects such as, radiators, metal panels, etc.

2. Lamps, vases and metallic objects, when placed on top of the receiver, may affect the efficiency of the "Bilt-In-Tenna".

Indoor Antenna. If additional pick-up is nececessary, an indoor antenna, placed on or near the receiver, may be used. The antenna should be rotated and the arms should be extended on the low channels (2-6) and telescoped on the high channels (7-13).

Outdoor Antenna. The Motorola "Bilt-In-Tenna", or the indoor type antenna will give satisfactory reception in strong signal areas; but, if the receiver is located in a fringe or weak signal area, an outdoor antenna is recommended.

In areas free of obstructions and reflections, within reasonable proximity to television transmitters, a dipole and reflector will prove satisfactory. Since such an antenna has a relatively small band coverage, a special antenna covering all twelve television channels should be used if it is desired to receive stations on channels of widely separated frequencies.

Location of the antenna should be decided from the standpoint of maximum signal pickup. In general, the antenna should be broadside to the transmitting antenna and should be as high as possible. If a reflector is used, the antenna should be oriented so that the driven element is closest to the station and the reflector farthest away.

Locating the antenna and lead-in as far away as possible from highways, hospitals, doctors' offices, electrical machinery, etc., will help to reduce noise pick-up from such sources. Also, it is desirable to keep the antenna at least six feet away from other antennas, metal roofs, gutters, or other metal objects to prevent unwanted reflections and shielding.

Lead-In. Since the TS-88 chassis is designed for 300 ohms input, the standard 300 ohm twin lead line should be used for connecting the outside antenna to the receiver. Twisting the line one complete turn per foot of running length helps to reduce noise pick-up on the line. The lead-in should be supported on stand-off insulators and kept tight enough to prevent mechanical damage through swaying. Avoid running the lead-in close to metal gutters, iron standpipes, etc.

In areas of very strong signals, or where severe local electrical interference is encountered, 300 ohm shielded twin lead is recommended. The shield braid should be grounded.

An approved lightning arrestor should be used.

RECEIVER ANTENNA CONNECTION

The antenna lead-in to the television receiver is connected to the two screws of the terminal strip on the rear of the cabinet. Disconnect the "Bilt-In-Tenna" leads from the terminal strip before attaching an external antenna lead-in. Sometimes, reversing the lead-in connections at the receiver may improve picture quality and overall performance.

OPERATING CONTROLS

There are two dual controls, consisting of a small and a large knob each, on the front panel of the receiver. The function of each control is marked on the front panel, the "circle" indicating the large knob, and the "dot" indicating small knob. See Figure 1 for front panel control functions.

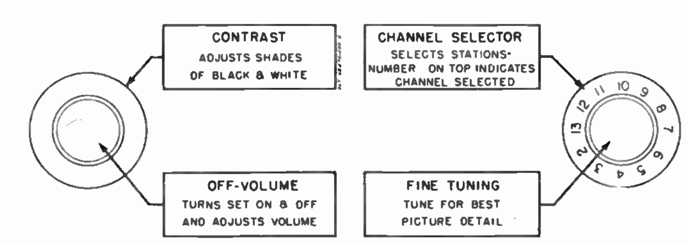

FIGURE 1. OPERATING CONTROLS

©John F. Rider

World Radio History

SERVICE ADJUSTMENTS

The receiver is completely adjusted at the factory, so normally none other than the front panel control operating instructions need be followed in putting the receiver in operation. However, to provide for any misadjustment of the service controls, due to handling, the following instructions are in order. See Figure 2 for location of the service adjustment controls.

FOCUS CONTROL

The FOCUS control should be adjusted until the fine horizontal line structure of the raster is clearly visible over the picture area. The control should be tuned through the correct point several times so that optimum focus is obtained.

CENTERING

By means of a lever extending from the focus coil, thru the rear screen, the focus coil can be shifted to center the picture in its mask.

VERTICAL SIZE AND VERTICAL LINEARITY

Adjust the VERTICAL SIZE control until the picture fills the mask vertically. Adjust the VERTICAL LINEARITY control for best overall vertical linearity. Adjustment of the VERTICAL SIZE control will require a readjustment of the VERTICAL LINEARITY control and possibly of the VERTICAL HOLD control. Center picture with the centering lever on the focus coil.

HORIZONTAL SIZE

Adjust the HORIZONTAL SIZE lever until the picture fills the mask horizontally. Center picture with the centering lever.

HORIZONTAL HOLD ADJUSTMENT

The HORIZONTAL HOLD control should have a sync range of approximately 180°. If the control is too critical, adjust as follows:

1. Short out HORIZONTAL OSCILLATOR coil L-23. This may be done with the chassis in the cabinet by shorting pins 3 and 8 of the test socket on chassis rear.

2. With the centering lever, move the picture to the left so that the right edge of the raster can be seen. Adjust the HORIZONTAL HOLD control to about the middle of its range and note the width of the blanking pulse. (The blanking pulse appears as a gray bar at the right edge of the picture).

3. Remove short from HORIZONTAL OSCILLATOR coil.

4. Adjust HORIZONTAL OSCILLATOR coil until the same amount of blanking pulse can be seen as was noted in step 2.

VERTICAL HOLD ADJUSTMENT

Adjust the VERTICAL HOLD control for the center of the vertical sync lock-in range.

BRIGHTNESS

Adjust the BRIGHTNESS control, in combination with the CONTRAST control for the most pleasing picture. Keep the brilliance slightly below maximum, however, in order to protect the fluorescent screen of the picture tube and to prevent poor picture detail.

ADJUSTMENT OF ION TRAP

Under conditions of rough shipment, it is possible for the ion trap to become misaligned. To prevent serious damage to the picture tube, the following method of adjustment should be used. See Figure 3.

The magnet should be placed on the neck of the tube in the direction indicated by the marking on the magnet (usually an arrow which points toward the picture tube screen) so that the stronger magnet of the double magnet type or the only magnet in the single magnet type is positioned over the internal pole pieces which are mounted on the gun structure. Adjust the BRIGHTNESS control for low intensity and move the magnet a short distance forward and backward at the same time rotating it to obtain the brightest raster. If, in obtaining the brightest raster, the ion trap magnet has to be moved more than 1/4" from the gun pole pieces the magnet is probably weak and a new magnet should be tried. Never correct for a shadowed raster with the ion trap magnet if such correction results in decreased brightness. The ion trap magnet must always be adjusted for maximum brightness and, if shadows occur at this setting, they should be eliminated by adjusting the focus and deflection coils as explained under "Focus Coil and Deflection Yoke Adjustment".

CAUTION: Keep brightness control at low intensity until ion trap is properly set.

A mirror placed in front of the receiver will aid in making this adjustment.

DEFLECTION YOKE ADJUSTMENT

If the deflection yoke shifts, the picture will be tilted. To correct, loosen the thumbscrew on top of the deflection yoke and rotate yoke until the picture is straight. Before tightening the thumbscrew, make certain that the deflection yoke is as far forward as possible.

If the yoke support and the picture tube have shifted in transit or, if for any reason, these parts have been removed and replaced, it is best to do a complete job of repositioning. See Figure 3. The starting point is the position of the picture tube. It should be adjusted so that the distance from the center of the tube face to the front edge of the chassis is 1". The clamp on the front of the tube should then be tightened. The picture tube rear support bracket positioning adjustment screws should be loose enough to permit sliding the bracket forward until the rubber cushion fits snugly up against the flare of the tube. Loosen the yoke adjustment thumbscrew and push the yoke up against the flare of the tube. CAUTION: Do not use force in sliding the bracket up. If too much force is used, a strain will be placed on the neck of the tube when the support bracket positioning adjustment screws are tightened. Also the yoke may be forced out of position. The opening in the yoke should be concentric with the neck of the tube.

FOCUS COIL

The focus coil should be positioned so that it is spaced 1/4" from the deflection yoke when parallel with the yoke. The opening in the focus coil should be concentric with the neck of the tube. The spacing should be adjusted before the front of the picture tube is clamped down because it is necessary to remove the tube to change the position of the focus coil. Its position is changed by choice of location of the coil mounting studs in the scalloped holes on the top and bottom of the coil mounting bracket. The opening in the focus coil can be made concentric with the neck of the tube by loosening the nuts on the studs which support the focus coil bracket and turning the studs with a screwdriver in the slots provided. The studs are eccentric and move the coil both vertically and horizontally. They should be used only to center the neck of the tube in the opening of the coil.

TEST SOCKET

A test socket is provided on the rear of the chassis which allows adjustment of the horizontal oscillator and checking of sensitivity without removing chassis from cabinet. See Figure 2 for socket connections.

World Radio History

ALIGNMENT

GENERAL

The chassis should be mounted on angle iron brackets (Motorola Part No. 7X700210) so that all connections and adjustments may be made easily.

Since the power cord circuit is broken by the interlock when the cabinet back is removed, it will be necessary to obtain an extra power cord with the female interlock receptacle in order to make a power connection to the receiver. Order Motorola Part No. 30B470756.

It is recommended that an isolation transformer be used between the receiver and the AC line whenever any test equipment is attached to the chassis. This precaution is especially important if grounded test equipment is used. NEVER GROUND THE RECEIVER CHASSIS DURING TESTING OPERATIONS OR INSTALLATION UNLESS AN ISOLATION TRANSFORMER IS USED.

ORDER OF ALIGNMENT

A complete receiver alignment can be most conveniently performed in the following order:

1. Audio Take-Off & Ratio Detector
2. 4.5 Mc Trap
3. IF Coils & Mixer Transformer
4. Osc & RF Sections

AUDIO TAKE-OFF & RATIO DETECTOR ALIGNMENT

Equipment Required:

AM Signal Generator: (Optional)	Accurately calibrated at 4.5 mc
	Adjustable output
DC Meter:	Low range electronic voltmeter

Procedure:

Refer to Figure 4 for location of adjustments.

1. If possible, it is desirable to align the audio section from an actual station signal, since the 4.5 mc alignment frequency will be exact. The fine tuning trimmer should be turned off the station slightly, to prevent overloading the ratio detector.

2. If a signal generator is used, tune it accurately to 4.5 mc, and adjust the output to approximately 10,000 microvolts. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to B-. The following applies whether the station signal or signal generator is used.

3. From either side of capacitor C-60 (10 mf), connect an electronic voltmeter to B- decoupled thru 10K ohms.

4. Set the contrast control for maximum gain (fully clockwise).

5. Peak L-20 for maximum reading on meter.

6. Peak T-3 primary (top core) for maximum reading on meter.

7. Move the meter and decoupling resistor from C-60 to junction of R-44 (33K) and lead to volume control.

8. Adjust T-3 secondary (bottom core) for zero response on 2.5V scale of meter. This corresponds to the cross-over point on the FM detector curve. If desired, the symmetry of the curve may be checked by tuning the signal generator 25 kc above and below 4.5 mc and noting the plus and minus voltage produced, reversing the meter connections as necessary. For proper balance of the ratio detector system, the voltage in each direction should be approximately equal. If not, check the tuning of L-20 and the primary & secondary of T-3, the ratio detector. If necessary, replace the ratio detector tube V-9 (6AL5). It is desirable to calibrate the generator on a station signal. This may be done by nulling the secondary on a station signal and then connecting the generator and tuning it to produce the same null without touching the trimmers in the set.

NOTE: As the adjustments are brought to resonance, it is advisable to reduce signal generator output to prevent overloading.

With a 10,000 microvolt signal into the grid of the video amplifier tube, with the contrast control turned fully clockwise, and the focus control at center of its range, the voltage read from one side of capacitor C-60 should be greater than 5.0V.

4.5 MC TRAP ALIGNMENT

1. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to B-.

2. Connect the voltmeter and germanium crystal rectifier, as shown in Figure 5, between the cathode of the picture tube (yellow lead) and B-. Use the lowest voltage scale on the meter.

3. With the signal generator accurately set at 4.5 mc and maximum output, adjust trap L-18 for minimum reading on the meter.

IF AMPLIFIER ALIGNMENT

Equipment Required:

IF Sweep Generator meeting the following requirements:

18 to 30 mc, approximately 12 mc sweep width. Output constant and adjustable to at least .1 volt maximum with accurately calibrated, adjustable markers.

Cathode Ray Oscilloscope: preferably one with a calibrated input attenuator.

NOTE: If there is no built-in marker in the sweep generator, loosely couple the output of an accurately calibrated AM signal generator to the IF strip. At all times, keep the marker output low enough to prevent the marker from distorting the response curve.

If a wide band scope is used, the marker will be more distinct if a capacitor of 100 to 1000 mmf is placed across the scope input. Use the smallest size possible, since too large a value will affect the shape of the curve.

Procedure:

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket to eliminate horizontal pick-up in the oscilloscope.

2. By means of an external battery, apply a negative 3.0 volt bias from the bottom of the 1st IF tube grid resistor R-9 (6800) to B-.

3. Using leads as short as possible, connect the hot side of the sweep generator to the grid (pin 1) of the 1st IF tube V-3 (6AU6) through a 5000 mmf capacitor (do not use the loose or "spraying" method of coupling). The low side is connected to B-. Set the center frequency of the sweep to about 24.6 mc and adjust initially for a sweep deviation of approximately 12 mc. However, a sweep of from 8 to 10 mc may be found better for overall alignment.

4. Using R-27 (100K) as a decoupling resistor, connect the scope to pin 4 of test socket. If a stronger output is desired, connect the scope between the picture tube cathode and B-. The curve seen at this position will be the reverse of the polarity shown in Figure 6.

5. Set the contrast control at minimum.

NOTE: If a distorted or unstable picture is seen on the oscilloscope during alignment, it may be necessary to stop the oscillator by disconnecting resistor R-10 (1000) from the plate (pin 6) of the oscillator tube V-2B (12AT7), or by substituting another tube with pin 6 removed.

CAUTION:

1. Do not reduce the oscilloscope gain and increase signal input so that the top of the curve is flattened due to limiting in the video or scope amplifiers.

2. The dress of plate & grid components in the IF affects tuning. Do not move indiscriminately.

3. On the IF coils and on the traps the resonance point will be found at two settings of the slug. The correct setting is the one which is found with the greater part of the adjusting screw out of the coil.

NOTE: The 1st & 2nd IF traps are tuned from bottom of chassis, while IF cores are adjusted from the top.

6. Tune the low frequency trap L-14, located on the 2nd IF coil, for maximum attenuation on the curve at 21.9 mc.

7. Tune the high frequency trap L-12, located on the 1st IF coil, for maximum attenuation on the curve at 27.3 mc.

8. Adjust the 1st IF coil, L-11, to place a 26.6 mc marker on the high side of the response curve 60% down from maximum response. See Figure 6.

9. Adjust the 2nd IF coil, L-15, to place a 22.7 mc marker on the low side of the response curve 60% down from maximum response.

10. Adjust the 3rd IF plate transformer, T-2, to provide a flat top or symmetrical response curve.

11. Reset the traps (steps 6 & 7) and again check the IF for proper response.

NOTE: It is suggested that the bias be removed for accurate resetting of the traps.

12. With bias applied, connect the sweep between the grid (pin 2) of the mixer tube V-2A (12AT7) and B-.

13. Disconnect the trimmer, C-14, in LC circuit in the grid of the mixer tube, or short the trimmer through a 10,000 mmf ceramic disc type to B-.

14. Bring both cores of the mixer transformer, T-1, simultaneously from the outside towards the center. The half-way markers should be 26.4 mc and 22.9 mc (Figure 7).

NOTE: In aligning the three IF coils, each coil is adjusted individually, but when adjusting the primary and secondary of the mixer transformer, the adjustments should be made simultaneously. The important point to keep in mind is to obtain a flat response curve with as much gain as possible. The sides of the curve should be straight and as steep as possible. Simultaneous adjusting of the primary and secondary is the easiest way to obtain this result. The transformer by itself, is in effect, tuned for the same pass band as the three staggered circuits. See Figure 7. The only difference in the overall waveform should be that the sides of the overall wave are steeper. Constant use of the 50% markers (22.9 mc and 26.4 mc) should be resorted to, since it is absolutely necessary to obtain the proper curve. A slight dip (not exceeding 10%) is permissible in the mixer transformer response curve.

BANDWIDTH

The bandwidth may be determined by connecting an AM generator to the mixer grid. With the generator frequency at 24.6 mc, adjust the output for 1 volt reading on a VTVM connected at the plate (pin 2) of the video detector tube V-6 (6AL5) and B-. Double the output of the generator. Now, by tuning either side of 24.6 mc and noting the frequencies at which the VTVM again reads 1 volt, the 6 db bandwidth points are indicated.

REGENERATION CHECK

After the above IF and mixer transformer alignment has been made, a check for regeneration in the IF amplifier strip should be made. This is done by removing the battery bias and observing the output response curve on the oscilloscope as taken between the picture tube cathode and B-. The bandwidth may change with the bias removed but should not change more than 0.2 mc. Set the contrast control to maximum gain. Decrease the input until the output signal shows a marked decrease. Any regeneration present will be indicated by sharp peaks on the overall response curve. The oscillator should be stopped, as described above, during this procedure.

CAUTION: Do not inject too much marker signal.

MIXER LC ADJUSTMENT

Reconnect bias removed for regeneration check. Re-

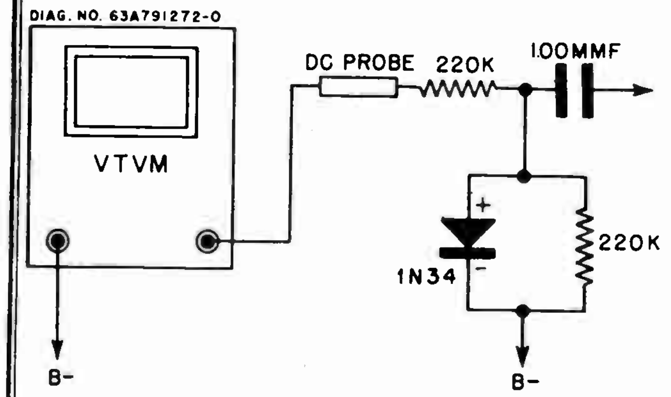

FIGURE 5. ELECTRONIC VOLTMETER CONNECTIONS

place trimmer C-14 in LC circuit of mixer grid or remove 10,000 mmf ceramic between trimmer and B-. Adjust the trimmer so it is tuned to the center of the mixer response curve. This is indicated by observing the effect of the LC circuit on the mixer response. Increasing the capacity of the trimmer and bringing the LC circuit from above the IF range into the IF range, it will be noted that the mixer curve will pull down on the high side, then straighten out as the LC circuit approaches the middle of the range, and pull down on the low side as the LC circuit approaches the low end of the IF range. The proper tuning point is that point at which the mixer curve straightens out. In effect, the LC circuit is similar to a jack coil when it is within the IF range.

CAUTION: Tuning the LC circuit very low will cause oscillation.

IF SENSITIVITY MEASUREMENTS

IF Stages Only

1. Remove the battery bias from 1st IF tube grid.

2. Connect an AM signal generator, set at 24.6 mc, through a blocking capacitor of 5000 mmf, between B- and the grid (pin 1) of the 1st IF tube V-3 (6AU6).

3. Connect an electronic voltmeter across the video detector load resistor R-26 (5600). Both leads from the meter should be decoupled with 100K ohm resistors.

4. Set the contrast control for maximum sensitivity.

5. Stop the oscillator tube by disconnecting resistor R-10 (1000) from the plate (pin 6) of tube V-2B (12AT7) or by substituting another tube with pin 6 removed.

6. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 125 microvolts.

Mixer & IF Stages

The preliminary preparations are the same as for checking the sensitivity of the IF stages except:

1. Connect the AM signal generator, set at 24.6 mc, through a 5000 mmf capacitor, between B- and the grid (pin 2) of the mixer tube V-2A (12AT7).

2. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 125 microvolts.

OSCILLATOR, ANTENNA AND RF ALIGNMENT

NOTE: The IF must be aligned before the RF section can be properly phased.

Equipment Required:

Sweep Generator: Frequency range 40-220 mc; 10 mc sweep width
Output constant and adjustable
Adjustable markers (markers should be calibrated occasionally by checking against an accurate signal generator).

Oscilloscope: Preferably one with a calibrated input attenuator.

Signal Generator: Frequency range 40 to 220 mc
Accurately calibrated
AM modulated, 400 cycle

FREQUENCY CHART

Channel	Frequency	Picture	Sound	Oscillator
2	54-60	55.25	59.75	81.65
3	60-66	61.25	65.75	87.65
4	66-72	67.25	71.75	93.65
5	76-82	77.25	81.75	103.65

13	210-216	211.25	215.75	237.65

ANTENNA & RF ALIGNMENT PROCEDURE

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket and stop the oscillator by disconnecting R-10 (1000) from plate (pin 6) of V-2B (12AT7).

2. Connect the sweep generator across the antenna terminals on the chassis with the antenna lead-in removed. The line from the sweep generator should be as short as possible.

3. Connect the oscilloscope through a decoupling resistor of 150,000 ohms, between the cathode (pin 3) of the mixer tube V-2 (12AT7) and B-.

4. Short out the AGC circuit with a clip lead from the AGC bus to B-.

5. Refer to Figure 4 for the RF trimmer location and to Figure 9 for the locations of the antenna and RF coils. The frequency chart listed previously gives the channel and alignment frequencies.

6. The antenna coils are tuned to the video carrier and the RF coils are tuned to the sound carrier. Figure 10 shows the shape of the curve which should appear on the scope for channels 2-6 and Figure 11 the curves for channels 7-13.

7. Turn the station selector switch to channel 10. Set the center frequency of the sweep generator to the center frequency of channel 10 (195 mc).

8. Adjust ceramic trimmer, C-6, so that picture and sound markers are as in Figure 11.

9. Check channels 7 to 13 for proper response and, if necessary, tune the coil L-6. These coils may be tuned by spreading them to decrease inductance or compressing them to increase their inductance. See Figure 9 for location of coils. This will have more effect on channels 10 to 13 than 7 to 9. If L-6 is adjusted, it may be necessary to readjust RF trimmer C-6, and recheck the high channels.

NOTE: As the bandwidth of the high channels is very broad, a slight variation is permissible.

10. Move bandswitch to channel 6.

11. With the center frequency of sweep generator at the center frequency of channel 6 (85 mc) introduce markers corresponding to sound and picture carriers and compare with curve of Figure 10.

NOTE: A convenient method of determining whether a coil is tuned correctly is to insert a brass or iron slug into the coil. Brass decreases and iron increases the inductance.

12. After channel 6 has been aligned, progress downward through channel 2.

CAUTION: Make certain the station selector switch is on the correct channel before checking bandpass.

OSCILLATOR ADJUSTMENT

1. Put oscillator back in circuit.

2. Remove the short from the AGC circuit and apply a -3 volt battery bias to the AGC bus.

3. Move the scope to the test socket on the chassis rear with the high side connected to pin 4 and the low side to pin 5 (B-).

4. Set the contrast control at minimum (counterclockwise).

5. Remove the fine tuning knob and turn shaft until the slot is in a horizontal position. This represents the mid-capacity position.

6. Turn station selector switch to channel 12.

7. Set the sweep generator on channel 12 with a center frequency of 207 mc and at least a 12 mc sweep. Keep the output low enough to show no evidence of limiting in the overall response curve.

NOTE: Before aligning the oscillator section, make certain the 3.3 microhenry choke in the mixer grid is dressed away from the 2 mmf capacitor tied to the same grid.

8. Introduce a marker corresponding to the sound carrier of channel 12 (209.75 mc).

9. Adjust oscillator ceramic trimmer so that the sound marker falls into the 21.9 mc trap dip in the response curve.

10. Turn generator and station selector to channel 9 with the fine tuning shaft slot still in the horizontal position.

11. Spread or compress the 3-turn coil located in the center of the oscillator plate (L-4M, Figure 9) so that the sound marker for channel 9 falls into the 27.3 mc trap dip in the response curve. As the oscillator is tuned below the carrier on channels 7, 8, & 10 the 27.3 mc trap will be in the same position as the 21.9 mc trap in step 9.

12. Repeat steps 6, 7, 8, & 9.

13. Turn generator and station selector to channel 13.

14. Turn fine tuning trimmer so that the sound marker for channel 13 falls into the 21.9 mc trap dip of response curve. The slot in the fine tuning shaft should not have moved more than 30 degrees from the horizontal position to accomplish this (each number on the station selector knob represents 30 degrees).

15. If more than a 30 degree change in fine tuning trimmer was needed in step 14, adjust channel 13 oscillator coil (L-7) by spreading or compressing until the 30 degree requirement is met.

NOTE: Each adjustment of channel 13 oscillator coil (L-7) will necessitate a rechecking of the oscillator trimmer on channel 12 as per steps 6, 7, 8 & 9.

16. Check channels 12, 11, 10, 9, 8, and 7 by noting whether the fine tuning trimmer can drop the sound marker for each channel in the trap dip by a 30 degree rotation. If one of the channels does not meet the 30 degree requirement, a compromise must be made by resetting channel 9 or 12, whichever is closer to the channel in question.

Example: 1) If channel 11 does not meet the 30 degree requirement, return station selector and generator to channel 12 and tune ceramic trimmer toward channel 11 (trimmer frequencies lowered by tightening screw). This will tend to move channel 12 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Do not adjust trimmer any more than is necessary to get the channel in question back within the 30 degree requirement.

2) If channel 10 does not meet the 30 degree requirement, move station selector and generator to channel 9 and tune the 3-turn coil (L-4M, Figure 9) toward channel 10 (coil freq raised by spreading turns). This will also tend to move channel 9 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Again, do not adjust the coil any more than is necessary to bring the channel in question back within the 30 degree requirement.

17. Turn sweep generator and station selector switch to channel 6.

18. Adjust channel 6 oscillator coil (L-4E, Figure 9) so that the sound marker for channel 6 falls into the 21.9 mc trap dip with the fine tuning trimmer at mid-capacity (shaft slot in horizontal position). Always spread or compress channel #6 oscillator coil in units of 3 turns. Compressing turns will move curve toward sound marker, while spreading will move curve toward video marker.

IMPORTANT: Since the coils are in series, the proper alignment of channel 6 will simplify the phasing of the channels to follow.

19. Adjust channels 5 and 4 so that the sound marker for each channel falls into the 21.9 mc trap dip in the curve with the fine tuning trimmer set no more than 15° from mid-capacity.

20. Channels 3 and 2 should be adjusted so that the sound marker falls into the 21.9 mc trap dip with the fine tuning trimmer within 15° of maximum capacity.

OVERALL RECEIVER SENSITIVITY MEASUREMENT

An overall measurement of sensitivity is made as follows:

1. Connect an AM signal generator to the input terminals of the receiver chassis after removing the short 300 ohm lead which connects to the antenna input strip on the back of the cabinet. To match the generator to the receiver input, a resistor matching network should be used. In the case of a generator with a 50 ohm output impedance, for example, place a 100 ohm resistor in series with the output terminal of the generator and a 150 ohm resistor in series with the ground terminal.

2. From cathode of picture tube to B- connect a calibrated oscilloscope.

NOTE: To calibrate scope, connect it across 6.3 volt filament supply. The peak-to-peak amplitude on the screen will then be approximately 18V (6.3 x 2.8).

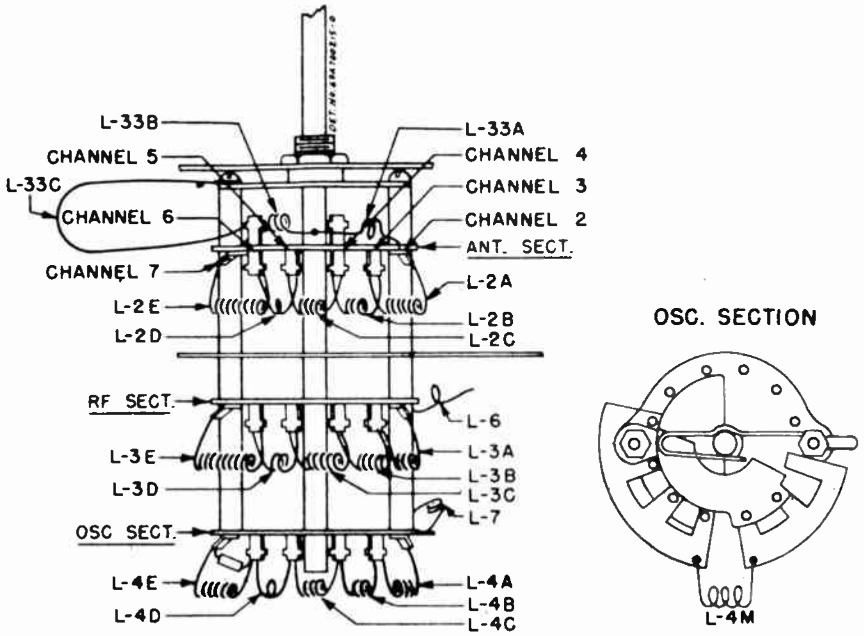

FIGURE 9. ANTENNA, RF AND OSCILLATOR COIL LOCATIONS

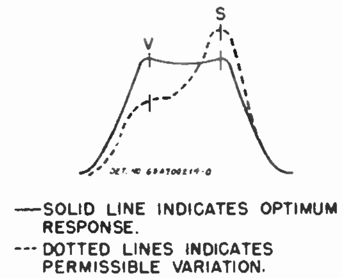

FIGURE 10. RF RESPONSE CURVE - CHANNELS 2-6

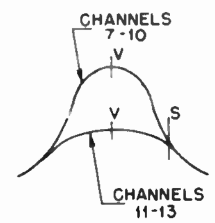

FIGURE 11. RF RESPONSE CURVES - CHANNELS 7-10 & 11-13

3. Set contrast control for maximum sensitivity.

4. Tune signal generator to the video carrier frequency of the channel being checked. Generator signal should be 30% modulated at 400 cycles. The signal from the generator to produce 20 volts peak-to-peak at picture tube cathode should be less than 25 microvolts on channels 2 to 6 and less than 75 microvolts on channels 7 to 13.

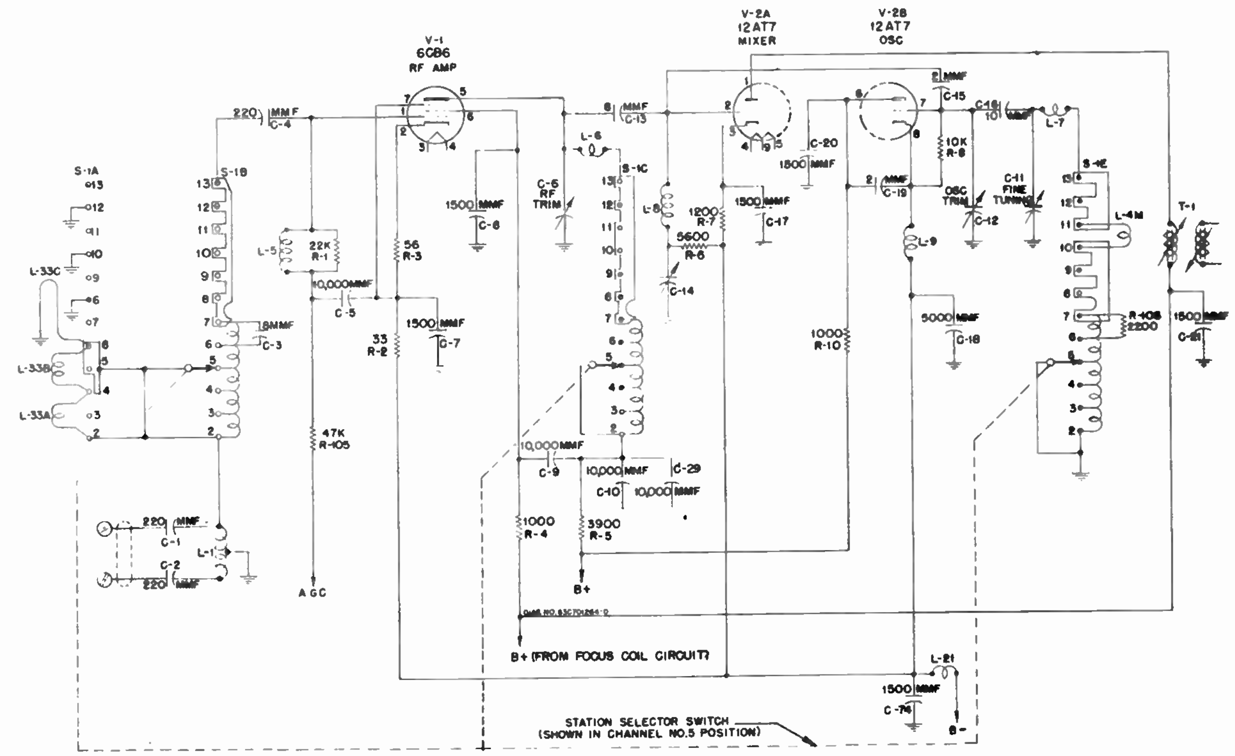

FIGURE 13. SIMPLIFIED SCHEMATIC OF RF TUNER

CIRCUIT DESCRIPTION

LOW VOLTAGE POWER SUPPLY

The low voltage power supply (Figure 12) provides plate voltage for all tubes except the high voltage applied to the second anode of the picture tube. The heater transformers supply heater voltage to all tubes except the HV rectifier, which is energized by horizontal sweep current.

One low voltage secondary of T-7, the step-down filament transformer, supplies filament voltage to all tubes except the audio driver-limiter (V-8), the vertical output tube (V-14), and the horizontal damping diode (V-18). Since the damping diode (V-18) develops a high voltage pulse at its cathode, and its cathode is tied to the filament to prevent breakdown in the tube, it is necessary to provide a separate low-capacity, well-insulated transformer (T-8) to heat this filament. The vertical output tube V-14 (25L6GT) requires a 25 volt filament supply and, hence, is provided with a separate 25 volt tap on the transformer. In earlier production chassis, the audio driver-limiter (V-8) had its cathode connected to a B plus point of about 120 volts. In order to keep the heater to cathode difference of potential low, it was necessary to provide a separate filament winding for this tube. This tube's cathode is now returned to B- but, since the separate winding is still supplied on present production transformers, it is still used for V-8 and in late sets also for V-20.

The B plus plate supply uses a voltage doubler. R-103 is a limiting resistor to protect the rectifiers from initial current surges and also serves as a fuse in case of B plus shorts. When the polarity of the applied 117 volt AC is such as to make the side of the line connected to R-103 negative, E-2 will conduct and charge C-109 (300 mf) to peak line voltage. On the next alternation, E-1 will conduct and the voltage applied to it is now the peak line voltage plus the peak charge stored in C-109. This results in a charge of about 270 volts on C-63C (200 mf). The speaker field is used as a filter choke. The focus coil and the resistor network, which controls the current thru it, act also as a voltage divider to supply plate and screen voltages to several tubes, as shown in Figure 12.

Another voltage divider from B plus to B-, consisting of R-76 (1 meg) and the potentiometer, R-77 (1 meg) provides a variable bias on the cathode of the picture tube, to serve as a brightness control.

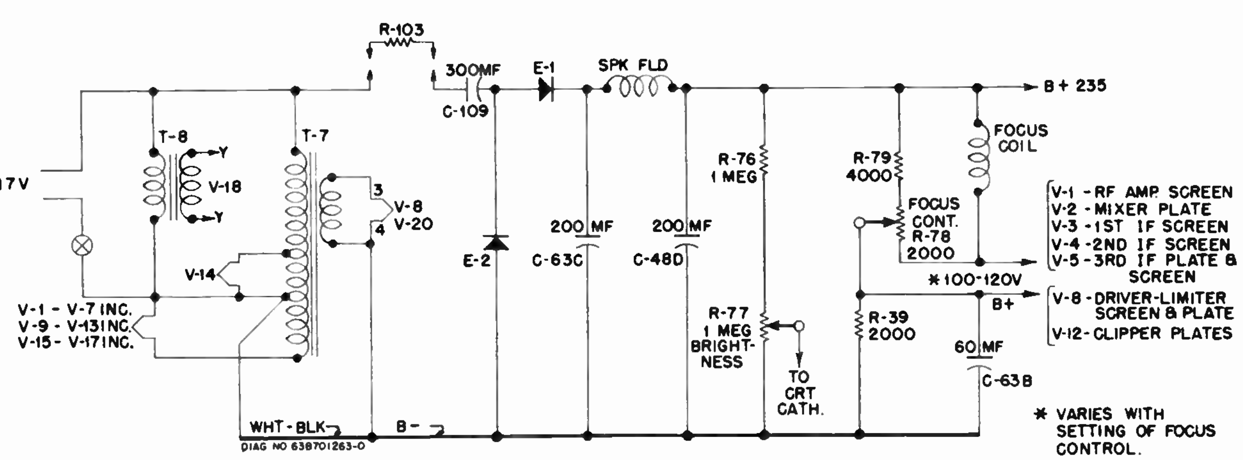

FIGURE 12. SIMPLIFIED SCHEMATIC OF HEATER AND LOW VOLTAGE POWER SUPPLY

THE RF TUNER

Antenna Input

Figure 13 is a simplified schematic of the tuner.

The antenna input coil, L-1, couples the balanced line to the single ended input circuit for the RF tube, V-1. Optimum antenna coupling for all channels is obtained by the coupling coils L-33A, L-33B, L-33C, and the coupling leads on channel positions 8, 10, and 12 of switch wafer S-1A. These can be considered the primary of the antenna transformer. The secondary, or tuned grid circuit, includes also the continuous, tapped coil mounted on wafer S-1B for the low channels (2-6) and the stamped metal plate in series with the coil for the high channels (7-13). The purpose of the antenna coil, coupling leads, and secondary circuit, is to match the 300 ohm impedance of the transmission line from the antenna to the input impedance of the RF amplifier grid circuit and to tune this circuit for the channel selected. Referring to Figure 13, it will be seen that the switch, in progressing from channel 2 to channel 13, shorts out the unused portion of the secondary winding or stamped metal plate. The bandwidth of channels 7 thru 13 is about 8 mc. The stamped metal plate is carefully designed so that with this bandwidth no alignment adjustment is needed on the high channels. The individual coil sections on the low channels, however, may be tuned by spreading or compressing them, as outlined in the alignment procedure.

RF Amplifier

The grid of the RF amplifier V-1 (6CB6) is returned to the AGC bus thru L-5 and a bypass capacitor (C-5). The plate load of this tube consists of another tapped coil for the high channels mounted, in this case, on switch wafer S-1C. Here again, the switch progressively shorts out the unused sections of the inductance in tuning from channel 2 to 13. In this case, however, a trimmer C-6 and a choke L-6 are provided to center the high channel response while the low channel coils may be tuned by expansion or compression.

The Mixer

The mixer uses 1/2 of V-2 (12AT7). C-13 (8 mmf) couples the RF amplifier output to the mixer grid. Oscillator injection is accomplished by C-15 (2 mmf). L-8 and C-14 form a series resonant circuit tuned to the center of the IF response, to prevent interaction between the IF and the mixer input.

The Oscillator

The oscillator uses the other half of V-2 (12AT7) in a Colpitts circuit. Here again, the tuning inductance consists of the tapped coil for the low channels and the stamped metal plate for the high channels mounted on wafer S-1E. L-7 and C-12 are provided to set the center frequency on the high channels while the low channels are aligned by spreading or

©John F. Rider

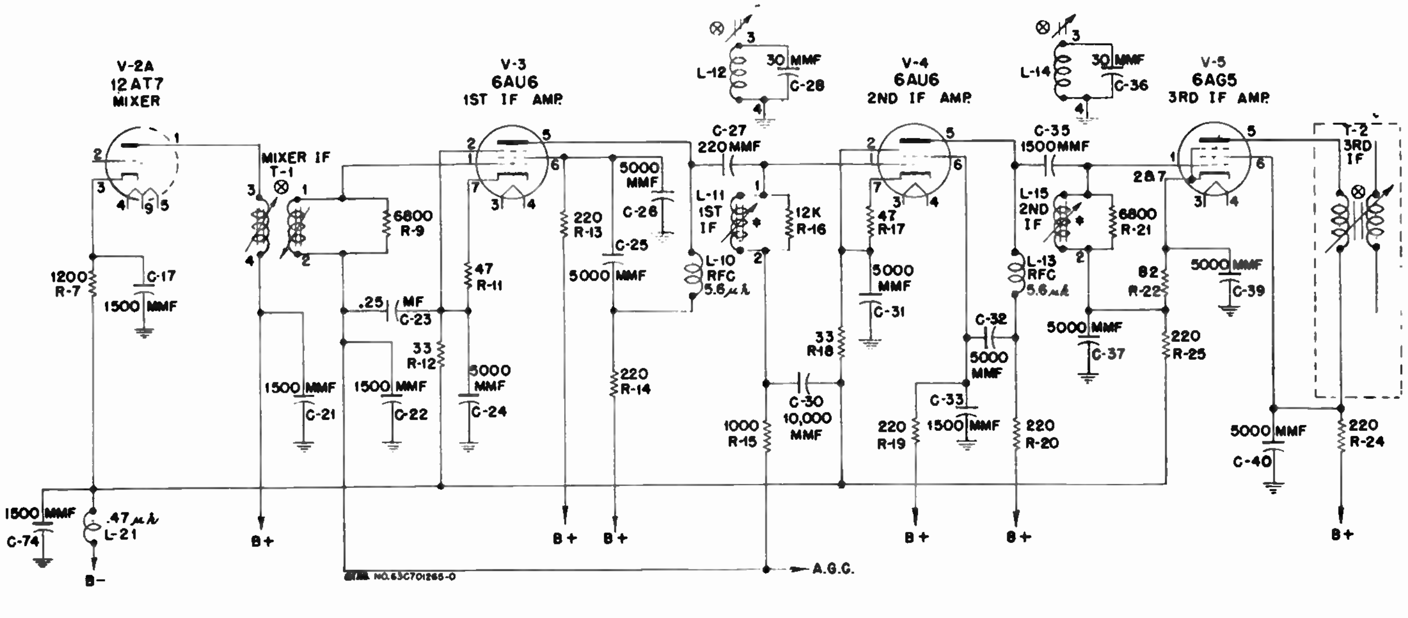

FIGURE 14. SIMPLIFIED SCHEMATIC OF IF AMPLIFIER

compressing the individual coil sections. C-11 is provided as a fine tuning control for customer use. The oscillator operates above the RF on the low channels and below the RF on the high channels except that in later production the circuit was modified to avoid interference by operating the oscillator on the high side for channels 11, 12 and 13.

IF AMPLIFIER

The IF amplifier uses two 6AU6 tubes and one 6AG5 tube. Figure 14 is the schematic of the IF amplifier. T-1 couples the mixer plate to the first IF grid. Coupling between primary and secondary, which are individually slug-tuned, is fixed and is designed for proper bandwidth. The plate choke L-10, of the 1st IF tube V-3 (6AU6), is coupled to the grid coil, L-11, of the 2nd IF tube V-4 (6AU6) thru C-27 (220 mmf). At IF frequencies, the impedance of C-27 is negligible and for all practical purposes, L-10 and L-11 can be considered as being in parallel, L-11 being slug-tuned. A similar method is used between the 2nd and 3rd IF tubes. The 3rd IF plate is coupled to the detector by T-2, a unity coupled transformer. The IF circuits are stagger-tuned for proper bandwidth as explained in the Alignment Instructions. L-12 and L-14 are separately tuned trap windings on IF coil forms L-11 and L-15, respectively. Together with C-28 and C-36, they form absorption type trap circuits which steepen the high and low skirts of the IF response for better picture quality and stabilize the audio response with intercarrier sound.

Decoupling has been used not only in the plate supply and AGC circuits, but also in the filament circuits to prevent regeneration.

THE VIDEO DETECTOR

One-half of V-6 (6AL5) is used as the video detector. Figure 15 is a schematic of the video detector. Since for noise limiting purposes it is desirable to apply a signal with negative going sync pulses to the grid of the video amplifier, the detector load R-26 (5600) is placed in the plate circuit of the diode. L-16, L-29 and C-42, form a low pass filter to keep IF frequencies off the grid of the video amplifier.

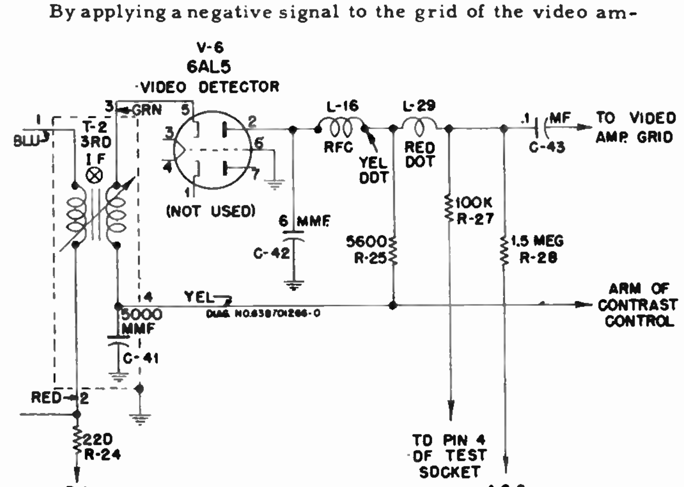

FIGURE 15.
SIMPLIFIED SCHEMATIC OF VIDEO DETECTOR

Since this chassis operates on the intercarrier sound system, the detector heterodynes the video and sound IF frequencies, and produces the 4.5 mc beat frequency which becomes the new audio IF frequency. The negative DC voltage developed at the high side of the detector load R-26 (5600) will be a function of carrier level. This voltage is fed to the AGC bus thru R-28 (1.5 meg) and controls the gain of the RF and 1st and 2nd IF amplifiers.

THE VIDEO AMPLIFIER

The video amplifier V-7 (6AH6) not only amplifies the video signal but also the 4.5 megacycle audio IF beat. Figure 16 is a schematic of the video amplifier. In its plate circuit, this beat is separated from the video signal and fed to the grid circuit of the audio driver-limiter tube V-8 (6AU6) by C-49 (2.2 mmf) and L-20, the sound take-off coil. The 4.5 mc trap, L-18 and C-50, is a parallel resonant circuit which, when properly tuned, offers a high impedance to this frequency, to prevent its reaching the picture tube.

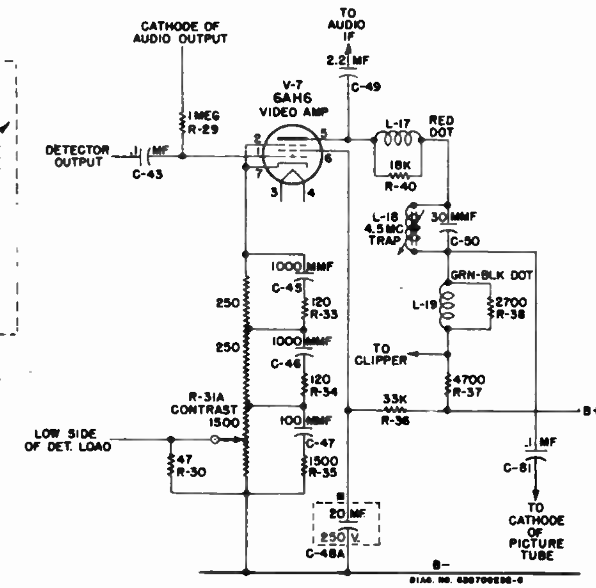

FIGURE 16.
SIMPLIFIED SCHEMATIC OF VIDEO AMPLIFIER

By applying a negative signal to the grid of the video amplifier, a noise limiting action is achieved because noise pulses of amplitude greater than the sync level will drive the tube to cut off and, therefore, will not be present in the plate circuit. Since a single video amplifier tube is used, the signal at its plate will be positive and, as might be expected, is used to modulate the cathode of the picture tube rather than the grid, because the blanking pulses must cut the picture tube off and the polarity of the video information must be such that dark picture elements result in making the grid more negative with respect to the cathode.

L-17 and L-19 are peaking coils to extend the high frequency response of the amplifier. The contrast control, R-31A, is placed in the cathode circuit of the video amplifier and controls the bias and, therefore, the gain of this tube. The network of resistors and condensers across taps on the contrast control decreases degeneration at higher frequencies and, therefore, helps to extend the high frequency response. The composite video signal is fed to the picture tube cathode thru coupling condenser C-81 (.1).

THE AGC

The negative DC voltage developed across the detector load resistor, R-26 (5600), is the AGC voltage. It will be noted that the low side of this resistor is connected to the arm of the contrast control potentiometer, R-31A. R-30 (47) is shunted across the arm of the contrast control and B-. In weak signal areas, this arrangement results in a delay in the AGC action. For a weak signal, minimum bias is desired on the video amplifier and, therefore, the arm of the contrast control will be closest to the cathode end of the potentiometer. Because R-30 is then shunted across the entire contrast control, most of the plate current will flow thru it and develop a positive voltage of approximately one volt at the arm with respect to B-. Since the low side of the detector load is tied to this positive voltage, no AGC voltage will develop until the signal is strong enough to overcome this positive voltage and, therefore, no AGC bias is applied to the controlled tubes under weak signal conditions. In a strong signal area, however, where the arm of the contrast control approaches the B- end of the control, R-30 is shorted out and full AGC voltage is developed.

THE AUDIO SYSTEM

The audio system employs a driver-limiter, V-8 (6AU6); a ratio detector, V-9 (6AL5); a first audio amplifier, V-10 (6J5) and an audio output tube, V-11 (6V6). Figure 17 is a schematic of the audio system. The driver-limiter is operated at low plate and screen voltages to act as a partial limiter to minimize any amplitude modulation. A conventional ratio detector and audio amplifier are used.

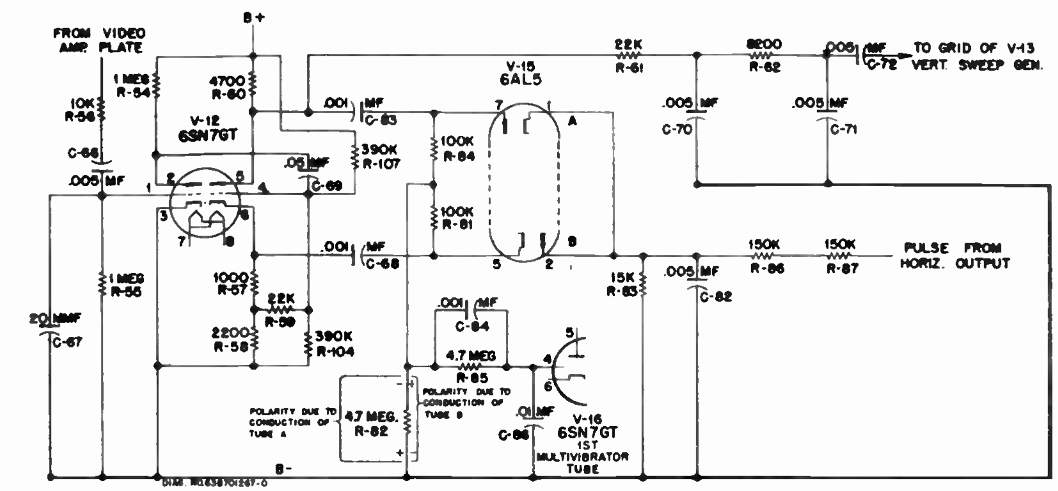

FIGURE 18. SIMPLIFIED SCHEMATIC OF CLIPPERS & PHASE DETECTOR

THE CLIPPER

The clipper uses a 6SN7GT tube. The clipper schematic is shown in Figure 18. The composite video signal with positive going sync is applied thru R-56 (10K) and C-66 (.005) to the grid of the first clipper from the plate circuit of the video amplifier. Under no signal conditions, the tube is unbiased. The positive signal, however, will cause the tube to draw grid current and the voltage drop across R-55 (1 meg), negative at the grid, will charge C-66 to such a value that only the most positive part of the signal, which is the sync pulse, will cause plate current to flow. Therefore, the video information and the blanking pulses are clipped off and only the sync pulses, now negative in polarity, appear in the plate circuit. The second clipper is so biased that the peaks of the sync pulses will drive the tube to cut-off, which results in squared pulses of positive polarity in the plate circuit of this tube. A slight increase in sync pulse amplitude is obtained by a small positive voltage applied to the grid of the second clipper by R-104 (390K).

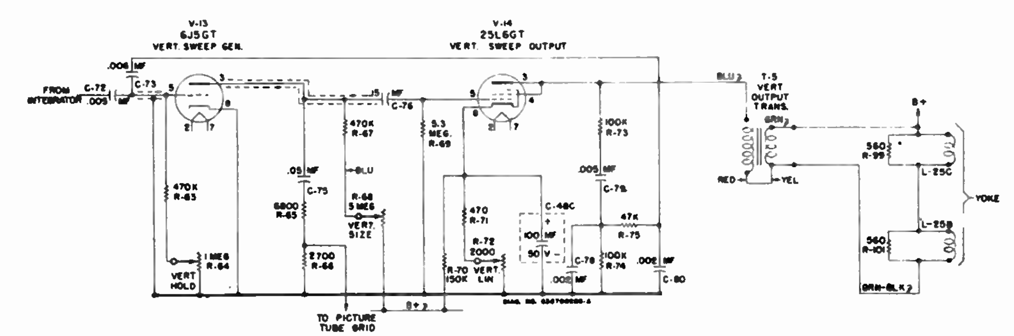
THE VERTICAL SCANNING SYSTEM

Figure 19 is a schematic of the Vertical Scanning System.

The integrating network, shown in Figure 18, composed of R-61, C-70, R-62, and C-71, changes the vertical group of sync pulses into a single pulse of suitable amplitude to trigger the vertical oscillator. The vertical oscillator is an asymmetrical multivibrator using two tubes V-13 (6J5), and V-14 (25L6). V-14 also serves as the output tube.

A multivibrator can be considered as a resistance coupled amplifier in which the output of the second tube is coupled back to the input of the first tube. V-13 is the automatic switch which charges and discharges the sawtooth forming condenser C-75 (.05), connected in its plate circuit. The circuit components of the multivibrator are chosen so that V-13's conductance period is about 7% of the entire cycle, to insure that retrace time of the scan will have the proper relationship with the trace time. This circuit is modified from the conventional resistance coupled multivibrator in that the plate of the output stage, which is also the second multivibrator tube, has a fairly large value of inductance, introduced by the output transformer stepping up the yoke inductance. When the tube is cut off, a positive pulse of several hundred volts is developed across this inductance. A portion of this pulse, obtained by means of the feedback network R-73, R-74, R-75 and C-78, C-79 and C-80, is used to cause the discharge tube V-13 to go into heavy conduction.

For purposes of explaining the circuit action, assume that a time has been reached in the cycle when the trace period is almost completed. During this trace period V-13 is cut off and V-14 is conducting. C-73 has been discharging thru the grid resistors of V-13, R-63 (470K) and R-64 (the vertical hold control) and resistors R-75 and R-74. This discharge circuit makes the grid end of R-63 negative and biases the tube beyond cut-off. When the energy stored in



NOTE - L-24B AND L-24C IN TS-60 ARE L-25B AND L-25C IN TS-88

FIGURE 19. SIMPLIFIED SCHEMATIC OF VERTICAL SCANNING SYSTEM

the condenser has decreased sufficiently, the grid of V-13 reaches the threshold of conductance and the tube begins to draw current. Condenser C-76, which has been charged to nearly the B plus voltage, now starts to discharge thru V-13 and R-69 (3.3 meg) and this discharge current makes the grid end of R-69 negative tending to cut off V-14, and initiates the retrace. With the sudden change of plate current in V-14 developed across the plate inductance, a positive pulse is applied to the grid of V-13 thru the feedback network driving this tube into heavy conduction. C-75 will then discharge thru V-13. The voltage developed at the plate of V-13 will be the combination sawtooth and pulse voltage shown in Figure 22(1). The pulse is formed by the peaking resistors R-65 and R-66. When V-13 goes into conduction, the voltage at the plate of V-13 drops suddenly to a value determined by the relationship of the plate resistance of V-13 to the total resistance in the discharge circuit of C-75, which consists of R-65, R-66 and the plate resistance of V-13. After this initial instant, the charge on C-75 decreases, causing the voltage decrease at the plate shown between points "c" and "d" of Figure 22(1). When the positive pulse on the grid of V-13 has decreased to the value where the negative charge on C-73 becomes operative and cuts off V-13, the voltage on the plate of V-13 and, correspondingly, on the grid of V-14, rises quickly to point "a" on the curve, the start of the trace.

The negative pulse shown between point "b" and "a" of Figure 22(1), acting on the grid of V-14, tends to cut the tube off and raises its plate resistance to the larger value required to dissipate the energy in the plate circuit inductance during the short retrace period.

Since the plate circuit of the vertical output stage V-14 has inductance, and as the time constant of an inductive circuit decreases with an increase of resistance, just the opposite of an RC circuit, the increase in plate resistance of the tube is used to obtain the short time constant circuit required for proper retrace time.

By returning the grid of the picture tube to the junction of the two peaking resistors, R-65 and R-66, a negative pulse of suitable amplitude to cut the picture tube off during retrace is obtained, resulting in elimination of retrace lines on the screen.

The feedback network to the grid of V-13 also serves to filter out horizontal pulses which are present in the plate of V-14 due to coupling in the yoke and which are coupled to the plate thru the output transformer. The windings of the vertical output transformer are connected series opposing, which reduces the step-down ratio and, hence, the inductance in the plate of V-14 in order to shorten the retrace time.

The controls found in this circuit are:

1. The Vertical Hold Control R-64 (1 meg). This control varies the resistance in the discharge circuit of C-73 (.006) and, hence, provides a means of varying the frequency of the multivibrator. In practice, this control is adjusted so that the incoming positive sync pulses, which are of constant amplitude, will fire the tube in exact synchronization with the transmitting station's vertical scan.

2. The Vertical Size Control R-68 (5 meg). This control varies the charging current into C-75 (.05) and, hence, the amplitude of the voltage developed across it. Variation of this voltage varies the drive on the grid of V-14 and controls vertical size.

3. Vertical Linearity R-72 (2000). This control, by bleeder action thru resistor R-70 (150K) and the output tube's plate current, sets the bias and determines the tube's operating point on its plate current curve. Since this curve is not linear, some distortion can be introduced to counteract any non-linearity in the sawtooth grid voltage.

Since all of these controls are also in the multivibrator circuit and have an effect also on its frequency, there will be some interaction between them. Usually, readjustment of size or linearity will require readjustment of the hold control.

HORIZONTAL SCANNING SYSTEM

The horizontal scanning system comprises a phase detector V-15 (6AL5), a cathode coupled multivibrator V-16 (6SN7), the output tube V-17 (6BQ6) and a damping diode V-18 (6W4). Figure 20 is a simplified schematic of this system.

The Horizontal Oscillator

In order to see how the phase detector automatically corrects for multivibrator frequency change, it will be necessary to understand how the correction voltage affects the multivibrator. It will be noted that this circuit differs from the vertical multivibrator in that only one coupling condenser is used but that the two tubes have a common cathode resistor. This arrangement is known as a cathode coupled multivibrator.

The operation is as follows. Assume that the trace period is almost completed. At this time, tube "A" is conducting, tube "B" is cut off. C-87 is discharging thru tube "A", R-92 (150K) and R-91 (the hold control). The discharge current of C-87 is still high enough to keep the grid of tube "B" negative and cut off. Bias is being applied to both tubes by current flow thru R-89 (1000), the common cathode resistor. When the energy stored in C-87 is reduced to the point where its discharge current no longer holds the grid of tube "B" below conductance, tube "B" starts to pass current and this current causes a greater voltage drop across R-89, the common cathode resistor, which increases the bias on tube "A" reducing its plate current. The resulting increase in voltage at the plate of tube "A" begins to charge C-87 and this charging current applies positive voltage to the grid of tube "B". The resulting heavier conduction of tube "B" develops a pulse of voltage across R-89 which cuts tube "A" off and results in a positive pulse at the plate of tube "A" which throws tube "B" into heavy conduction. This allows C-88, the saw-forming condenser, to discharge thru tube "B" and R-93. When C-87 becomes charged, the charging current thru R-92 and R-91 decreases, and the positive voltage on the grid, which has far exceeded the bias developed across R-89, is reduced. This results in reducing the plate current thru tube "B" and, therefore, the bias applied to tube "A" by the voltage drop across R-89. Tube "A" starts to conduct and condenser C-87 starts to discharge, cutting tube "B" off. C-88 begins to charge, starting the next trace.

L-23 and C-85 in the plate circuit of tube "A", form a resonant circuit which is tuned to the horizontal frequency (15,750 cps). The 15,750 cycle sine wave generated by this circuit, if properly phased, will insure that the positive pulse at the plate of tube A", which throws tube "B" into conduction, will be more frequency stable.

C-88 and R-93, the peaking resistor, will produce the same combination pulse and sawtooth voltage shown in Figure 22(1). This action was explained in the vertical circuit.

The Phase Detector

The foregoing explanation is based on the assumption that tube "A's" grid is returned to a fixed potential point.

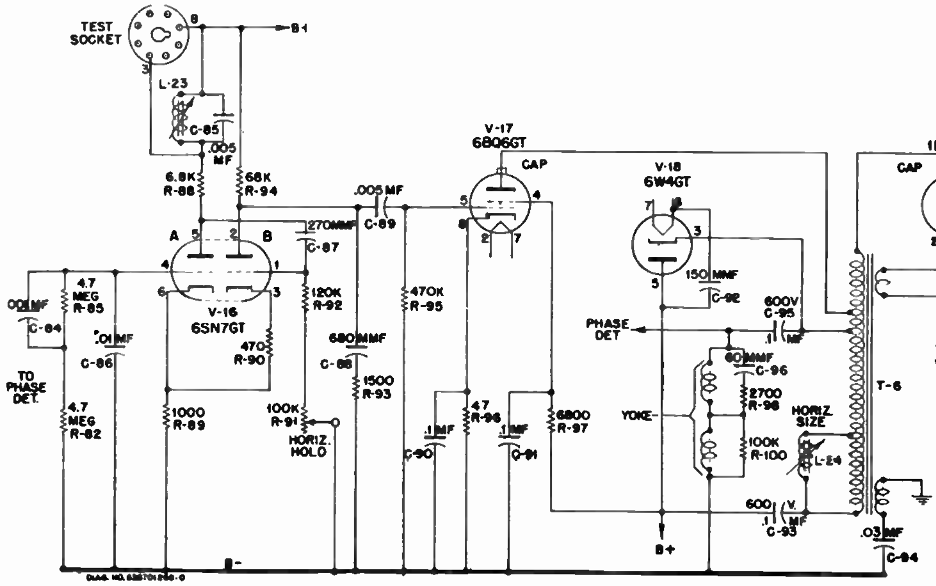

FIGURE 20. SIMPLIFIED SCHEMATIC OF HORIZONTAL SCANNING & HV SYSTEM

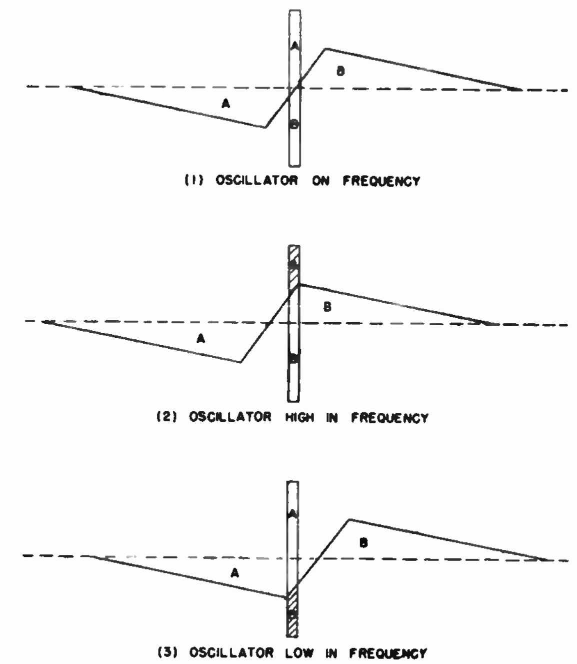

FIGURE 21. WAVEFORMS AT PHASE DETECTOR

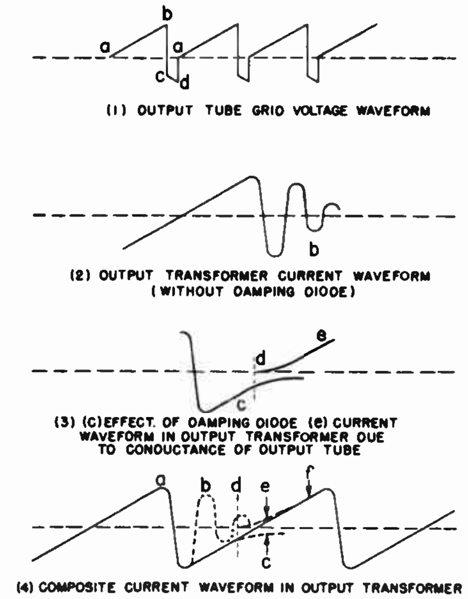

FIGURE 22. WAVEFORMS IN HORIZONTAL SCANNING SYSTEM

It can be seen that if this grid is returned to a point which varies in potential with frequency of the multivibrator, it would be possible to make this variation a means of frequency control. Assume that the grid of "A" in Figure 20 is made more positive. This causes the bias of "B" to increase because of the increased drop across the common cathode resistor R-89. Capacitor C-87 will then discharge for a longer time before "B" conducts, thereby decreasing the frequency of oscillation. If the grid were made more negative, the bias across the common cathode resistor would be less and C-87 would discharge for less time before "B" started to conduct, thereby increasing the frequency.

Figure 18 is a simplified schematic of the clipper and phase detector circuits. The phase detector V-15 (6AL5) is so connected that a comparison of the phase of the incoming sync pulses and a sawtooth derived from the horizontal output system is made. A positive sync pulse from the plate of the 2nd clipper V-12 (6SN7) is fed thru C-83 (.001) to the plate of diode "A" of V-15. A negative sync pulse from the cathode of V-12 is applied thru C-68 (.001) to the cathode of diode "B" of V-15. A sawtooth, derived from the integration of a pulse in the horizontal output circuit, at the yoke by the integrating network, composed of R-86 (150K), R-87 (150K), and C-82 (.005), is applied to the cathode of diode "A" and the plate of diode "B", which are tied together and returned to B- thru R-83 (15K). The load for diodes "A" and "B" consists of resistors R-84 (100K) and R-81 (100K) whose junction returns to the high side of the grid resistor R-82 of the first horizontal multivibrator tube V-16 (6SN7). The voltage applied to the two diodes will be a function of the amplitude of the sawtooth, the amplitude of the sync pulses and the phase relationship between the pulses and the sawtooth.

If the sawtooth, whose phase and frequency are a function of the multivibrator's phase and frequency, is operating in the middle of the lock-in range, the sync pulse will occur in the center of the retrace time. See Figure 21(1). The sync pulses have an amplitude of from 6 to 8 volts while the sawtooth amplitude is about two volts. The RC time constant in the pulse input circuit to the diodes is long enough to maintain an average pulse voltage of 6 to 8 volts for two or three horizontal lines, which means that in the "on" frequency condition shown in Figure 21(1), the diodes conduct only on the pulses and since these are equal in amplitude and develop voltages of opposite polarity across R-82 in the first multivibrator grid circuit, as shown in Figure 18, no control voltage is applied to the grid of V-16.

If the oscillator tends to increase in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(2) exists at the diodes. The phase of the sawtooth has now shifted so that at the same instant that the pulse is applied to the plate of diode "A" the positive saw is also applied to its cathode, so that only the shaded portion of the pulse causes conduction of diode "A". Diode "B", however, still conducts on the total amplitude of the negative pulse applied to its cathode aided by the positive saw applied to its plate at the same time. Since current flow thru diode "A" makes the grid end of R-82 negative, with respect to B-, the decreased current flow, caused by the sawtooth voltage bucking the pulse voltage at diode "A", results in a more positive voltage across R-82, applying a more positive voltage to the grid of V-16 which, as we have seen, results in decreasing the oscillator's frequency.

If the oscillator tends to decrease in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(3) exists at the diodes. At the same instant that the negative pulse is applied to the cathode of diode "B", the negative saw is applied to its plate so that only the shaded portion of the pulse causes conduction. Diode "A", however, conducts on the full amplitude of the positive pulse applied to its plate, aided by the negative saw applied to its cathode at the same time. Since current flow thru diode "B" makes the grid end of R-82 positive, with respect to B-, the decreased current thru diode "B" results in applying a more negative voltage to the grid of V-16 which, as we have seen, results in increasing the oscillator frequency. C-84, R-85 and C-86 provide two time constant filters which are necessary to obtain "fly-wheel" action of this AFC sync circuit.

The Horizontal Output System

The combination sawtooth and pulse waveform developed across C-88 (680) and R-93 (1500) by the multivibrator circuit, is fed to the grid of the horizontal output tube V-17 (6BQ6). Figure 20 is a simplified schematic of the horizontal output system. It will be noted that in this system an auto-transformer is used. In the horizontal scan, it is necessary that retrace be completed in about 7 microseconds. In order to accomplish reversal of current in the inductance of the output transformer and the yoke in this short a time, it is necessary to make this circuit resonant at such a frequency that the half cycle time will equal 7 microseconds because only by shock exciting such a circuit into oscillation will retrace be accomplished in the time allowed. This circuit is made resonant by the inductance of the output transformer and yoke, the distributed capacity and the tube capacity. Bearing this in mind, the operation can be explained as follows. Referring to Figure 22(1), assume that the voltage on the grid of the output tube is increasing, point "a". The grid is now being made less negative and the output tube starts to draw current which is supplied from B plus thru the damping diode. When point "b" is reached on the grid voltage waveform, the output tube is suddenly cut off because its grid has been made highly negative (point "c" on the grid voltage waveform). With the tube cut off, the resonant plate load is undamped and the circuit is shocked into oscillation. The reversal of current through the output inductance produces a positive voltage pulse which makes the cathode of the damping diode (V-18) positive, with respect to its plate; therefore, it cannot conduct. C-92 (100) is placed across the diode to provide a low impedance for the oscillatory current. If the damping diode V-18 were not present, this oscillation would continue and current would flow in the output transformer as shown in Figure 22(2). In order to insure a linear trace, however, this oscillation must be stopped and the damping diode serves this purpose. When the current nears its maximum negative value, the polarity and amplitude of the voltage pulse on the damping diode is such that its plate becomes positive, with respect to its cathode, so that the tube conducts heavily and loads the circuit sufficiently to prevent continuation of the oscillation. The current then follows the decay curve shown at "c" in Figure 22(3). At the time ["d" in Figure 22(3)] the voltage at the grid of the output tube has become less than cut off [point "a" in Figure 22(1)], the tube again demands current. The rising current in the tube results in superimposing the waveform "e" of Figure 22(3) on the current flow already in the output transformer due to the decaying current which resulted from the damped oscillation. Combination of these two currents results in the linear trace current indicated at "f" in Figure 22(4), which is a composite waveform of the entire action. During the peak conduction of the damping diode, C-93 (.1) charges and its polarity is such that when the output tube calls for current the charge on the condenser will be in series with the B plus supply so that the voltage at the output tube plate is raised from the 250 volt B plus supply to about 475 volts by this so-called "bootstrap" voltage. When the grid voltage waveform of the output tube again reaches point "b" of Figure 22(1), the tube is cut off and another cycle starts.

In order to properly match the yoke inductance to the required output inductance for the tube, the yoke is connected to a tap on the winding which effectively makes an auto-transformer of this section. The positive pulse of voltage at this tap is coupled to the yoke thru C-95 (.1) and results in a sawtooth of current thru the yoke. It will be remembered that a portion of this pulse is also fed to the phase detector for the AFC action thru R-86 and R-87.

The small additional winding, one terminal of which is connected to chassis while the other terminal is connected to B- thru C-94 (.03) is used to cancel the pulse of voltage which is placed on the chassis by induction from the output transformer. By connecting this winding in such a way as to place a pulse of suitable amplitude on the chassis 180° out of phase with the induced voltage, cancellation of the induced voltage will take place.

High Voltage

To take advantage of the large voltage pulse developed across the output inductance by the heavy current flow caused by the retrace oscillation, the plate winding is made the primary of an auto-transformer whose step-up ratio is such as to develop pulses of about 14 kv at its high end. These pulses are rectified by V-19 (1B3) and the resulting DC is applied to the second anode of the picture tube. The filament voltage for the 1B3 rectifier is obtained from an additional winding on the output transformer.

Controls

L-23 is the coil of the sine wave generating circuit in the horizontal multivibrator circuit and should be tuned to 15,750 cycles as explained in the service instructions.

R-91 is the horizontal hold control which can be adjusted for correct frequency operation of the multivibrator.

L-24, paralleling a small portion of the output choke controls, to a small degree, the inductance of the choke and acts as a size control.

Transformers

Ref. No.	Part Number	Description
T-1	24K792578	Mixer IF: less cores & mtg nuts
T-2	24B792585	3rd IF: less core, clip, & colored leads
T-3	24B790125	Ratio Detector: includes cores & clips; less shield can
T-4	25B790686	Audio output
T-5	25B792168	Vertical output
T-6	24K700588	High voltage transformer: complete.
T-7	25B700137 or 25B791793	Filament transformer
T-8	25B790140	Filament isolating transformer (for V-18)

Tubes

Ref. No.	Part Number	Description
V-1	6CB6	RF Amplifier
V-2	12AT7	Mixer-Oscillator
V-3	6AU6	1st IF Amplifier
V-4	6AU6	2nd IF Amplifier
V-5	6AG5	3rd IF Amplifier
V-6	6AL5	Video Detector
V-7	6AH6	Video Amplifier
V-8	6AU6	Audio Driver-Limiter
V-9	6AL5	Ratio Detector
V-10	6J5GT	Audio Amplifier
V-11	6V6GT	Audio Output
V-12	6SN7GT	1st & 2nd Clippers
V-13	6J5GT	Vertical Sweep Generator
V-14	25L6GT	Vertical Sweep Generator
V-15	6AL5	Phase Detector
V-16	6SN7GT	Horizontal Oscillator
V-17	6BQ6GT	Horizontal Output & HV Generator
V-18	6W4GT	Damping Diode
V-19	1B3GT	High Voltage Rectifier
V-20	14BP4 or 14CP4	Picture Tube: 14" rectangular

TUNING UNIT - TT-13

Ref. No.	Part Number	Description
	1X700100	TT-13 Tuning Unit: complete with station selector switch, fine tuning trimmer, and the following components:
C-3	21K478234	Capacitor, molded: 8 mmf 500V
C-10	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-16	21K400173	Capacitor, molded: 10 mmf 500V (temperature compensating)
C-29	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
L-2	24C792764	Coil, antenna: channels 2 thru 6; includes L-2A thru L-2E (L-2F thru L-2L are part of switch)
L-3	24K790536	Coil, RF: channels 2 thru 6; includes L-3A thru L-3E (L-3F thru L-3L are part of switch)
L-4	24C700114	Coil, oscillator: channels 2 thru 6; includes L-4A thru L-4E (L-4F thru L-4L are part of switch)
L-4M	24K700115	Coil, oscillator: channel 10
L-7	24K700116	Coil, oscillator: channel 13
L-33	24K792765	Coil, antenna primary: low frequency (includes L-33A, L-33B & L-33C)
R-106	6R6069	Resistor: 2200 10% 1/2W
	42K790136	Clip, spring (on collar)
	43K700725	Collar, spring (on end of fine tuning shaft)
	47K700726	Shaft, fine tuning

CHASSIS PARTS - MECHANICAL

Part No.	Description
7K700153	Bracket, coil mtg (Horizontal size) .....
7A700196	Bracket, focus coil mtg (straight bracket across top of focus coil) ....
7B700194	Bracket, focus coil mtg (forked bracket housing focus coil) ....
7A791965	Bracket, interlock safety (on chassis rear)
7B700515	Bracket, mask mounting ....
1X700504	Bracket, picture tube rear support: with grounding spring & anode lead insulator (large rear support bracket) ....
7A792568	Bracket, yoke adjustment (adjustable bracket housing yoke) ....
35K700532	Bumper, rubber (between picture tube & rear support bracket) ....
35A700603	Bumper, rubber (used only on 24C792171 deflection coil) ....
38B792486	Button, plug (for hole next to focus control) ....
42K471342	Cap, plate (for high voltage rectifier).
42A701441	Cap, plate (for 6BQ6) ....
42A700147	Clamp, lead retainer (on high volt rect filament leads) ....
42B70721	Clip, coil mtg (T-3 secondary) .....
42A76244	Clip, coil retainer (L-23) ....
42A72609	Clip, grounding (V-10 tube shield grounding) ....
42K792034	Connector, 2nd anode: complete with lead
39K17396	Contact, pin terminal (on spkr leads)
46A478242	Core, brass, & screw (T-2) ....
46K791756	Core, brass, & screw (L-11 & L-15)......
46A470310	Core, iron, & screw (T-1 primary, L-18 & L-20) ....
46K480256	Core, iron, & screw (T-1 secondary, L-12)
46A70023	Core, iron, & screw (T-3 primary & L-14)
46A470302	Core, iron, & screw (T-3 secondary).....
46K471143	Core, iron, & screw (L-23) ....
46A700090	Core, iron: with slide adjustment (L-24)
15B791111	Cover, test socket ....
35K792757	Cushion, focus coil: rubber (around tube neck) ....
5K470916	Grommet, insulating: 3/16" hole .....
5K792031	Grommet, insulating: 9/32" hole (for 2nd anode lead) ....
5A790684	Grommet, rubber (V-14 & V-16 socket mtg) ....
14A791787	Insulator, anode lead: armite (dresses 2nd anode lead from chassis) ....
14A780184	Insulator, antenna lead (under antenna lead terminal strip) ....
14K87179	Insulator, coil (in ratio detector can) ....
9K471267	Insulator, electrolytic mtg: 4-lug; impregnated ....
14K791892	Insulator, shield (in T-2 can) ......
4S7666	Lockwasher, external: #6; cad pl (R-103 receptacle mtg).................
4S7657	Lockwasher, external: #8; cad pl (48B791694 selenium rect mtg) ...
4S7655	Lockwasher, internal: 3/8; cad pl (contrast & station selector switch mtg) ....
4S2640	Lockwasher, internal: 1/2"; thin; cad pl (mounts lower focus coil mtg bracket) ....
4S7650	Lockwasher, internal: #6; cad pl (48B700074 & 48B700139 selenium rect mtg) ....
4S7688	Lockwasher, int-ext: 1/4"; cad pl (on eccentric screw) ....
4S9751	Lockwasher, int-ext: #8; cad pl (yoke adj bracket mtg) ....
29R5239	Lug, soldering: #8 HT ....
2A470049	Nut, coil & core mtg (T-1, T-2, L-11, L-12, L-14, L-15, L-18 & L-20) ......
2K791404	Nut, coil & core mtg (L-24) ....
4S7022	Nut, hex: 1/4-20 x 7/16; cad pl (on eccentric screw) ....
2S7004	Nut, hex: 3/8-32 x 9/16; cad pl (contrast & station selector switch mtg) ......
2S7005	Nut, hex: 6-32 x 1/4 stl; cad pl (48B700074 & 48B700139 selenium rect mtg) ....
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (48B791694 selenium rectifier mtg)
2S7050	Nut, hex: palnut; 6-32 (T-2 shield mtg) ....
2S7051	Nut, hex: palnut; 3/8-32 x 9/16; cad pl (rear control mtg) ....
2A790191	Nut, special: cad pl (mounts three ceramic trimmers) ....
2S70703	Nut, palnut: special; (T-3 primary)..
35K792182	Pad, cushion: sponge rubber (long pad at bottom of picture tube) ....
35K700166	Pad, cushion: sponge rubber (pad on top of picture tube) ....
64K791818	Plate, chassis cover: cop pl (removable plate on chassis side) ....
64A700185	Plate, cover
64K792464	Plate, socket cover (covers unused socket hole next to 6BQ6) ....
28K471323	Plug, line cord: 2-pin; waxe' (power plug on chassis rear) ....
9A22367	Receptacle: 5-prong (speaker receptacle).
5S8497	Rivet: .088 x 1/8 stl; pol nkl (V-1, V-2, & V-5 socket mtg) ....
5S7770	Rivet: .088 x 5/32 stl; pol nkl (mounts ant terminal strip & insulator)...
5S2815	Rivet: .088 x 7/32 stl; pol nkl (9K780442 & 9K484167 socket mtg) ....
5S7707	Rivet: .122 x 5/32 stl; pol nkl (9K471270 socket & terminal strip mtg) .....
5S7701	Rivet: .122 x 3/16 stl; pol nkl (R-103 receptacle mtg) ....
5S7703	Rivet: .122 x 7/32 stl; pol nkl (electrolytic insulator mtg) ....
5S7700	Rivet: .122 x 1/4 stl; pol nkl (power plug mtg) ....
5S7728	Rivet: .122 x 5/16 stl; pol nkl (V-19 socket mtg) ....
5S6846	Rivet: .145 x 5/32 stl; pol nkl (cover plate mtg) ....
5S6842	Rivet: .145 x 7/32 stl; pol nkl (audio & vertical output transformer mtg) .
5K71246	Rivet: shoulder; nkl pl (V-14 & V-16 socket mtg) ....
3A700198	Screw, eccentric: cad pl (lower focus coil mtg bracket) ....
3S490354	Screw, machine: 6-32 x 5/8 slotted hex head; cad pl (adjustment screw for C-6 & C-12 trimmers) ....
3S490822	Screw, machine: 6-32 x 1; slotted hex head; cad pl (adjustment screw for C-14 trimmer) ....
3S490459	Screw, machine: 6-32 x 1-1/8 slotted round head; brass (secures HV transformer plates) ....
3S488195	Screw, machine: 6-32 x 2 plain hex head; cad pl (48B700074 selenium rectifier mtg) ....
3S400051	Screw, machine: 6-32 x 2-1/2 plain hex head; cad pl (48B700139 selenium rectifier mtg) ....
3S7163	Screw, machine: 8-32 x 1/4 plain hex head; cad pl (mounts bracket for V-19 mtg plate) ....
3S490642	Screw, machine: 10-32 x 1-1/2 plain hex head; cad pl (mounts top picture tube retainer strap) ....
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (T-7 transformer mtg) ....
3S7467	Screw, sheet metal: #8 x 3/8 PKZ plain hex head; cad pl (T-8 transformer mtg) ....
3A470369	Screw, thumb: cad pl (deflection yoke adj) ....
26K485936	Shield, coil (ratio detector) ....
1X792785	Shield, coil: with spade bolts (T-2 can).
26A26283	Shield, tube (for glass 6J5 audio amp)..
26A90301	Shield, tube; miniature (V-5) ....
26A790508	Shield, video: cad pl (shields video amp from HV transformer) ....
9A792167	Socket, tube: miniature; 7-prong (V-1)...
9K780442	Socket, tube: miniature; 7-prong (V-3, V-4 & V-6) ....
9K484167	Socket, tube: miniature; 7-prong (V-7, V-8, V-9 & V-15) ....
9A471343	Socket, tube: miniature; tan molded (V-5)
9K484816	Socket, tube: noval; molded (V-2) ....

INDEX

GENERAL INFORMATION

RECEIVER MODEL BREAKDOWN

Model	Type of Set	Chassis Used
14T3	Table, molded plastic: walnut	TS-114

CHASSIS - Television chassis TS-114 contains 20 tubes plus a 14" rectangular picture tube. The picture, sound, and scanning circuits, together with a full-wave rectifier, are contained on a single chassis.

TUNING RANGE - Channels 2 through 13

IF FREQUENCY -

Channels 2, 3, 4, 5, 6, 11, 12 & 13: sound - 21.9 mc
picture - 26.4 mc

Channels 7, 8, 9 & 10: sound - 27.3 mc
picture - 22.8 mc

ANTENNA - TA-6 "Bilt-In-Tenna". Provision for connection of an external antenna.

ANTENNA IMPEDANCE - 300 ohms

POWER SUPPLY - 117 volts, 60 cycle AC current only

POWER CONSUMPTION - 205 watts

AUDIO OUTPUT - 4 watts

CHASSIS TUBE COMPLEMENT

Ref. No.	Tube	Function
V-1	6CB6	RF Amplifier
V-2	12AT7	Mixer-Oscillator
V-3	6AU6	1st IF Amplifier
V-4	6AU6	2nd IF Amplifier
V-5	6AG5	3rd IF Amplifier
V-6	6AL5	Video Detector
V-7	6AH6	Video Amplifier
V-8	6AU6	Audio Driver-Limiter
V-9	6AL5	Ratio Detector
V-10	6J5GT	Audio Amplifier
V-11	6V6GT	Audio Output
V-12	6SN7GT	1st & 2nd Clippers
V-13	6SN7GT	Vertical Sweep Generator
V-14	6W6GT	Vertical Sweep Output
V-15	6AL5	Phase Detector
V-16	6SN7GT	Horizontal Oscillator
V-17	6BQ6GT	Horizontal Output & High Voltage Generator
V-18	6W4GT	Damping Diode
V-19	1B3GT	High Voltage Rectifier
V-20	14BP4 or 14CP4	Picture Tube: rectangular
V-21	5U4G	Low Voltage Rectifier

HIGH VOLTAGE WARNING

Operation of this receiver, outside its cabinet or with covers removed, involves a shock hazard from the power supplies. No work should be attempted on this receiver by anyone not thoroughly familiar with the precautions necessary when working on high voltage equipment.

CATHODE RAY PICTURE TUBE HANDLING PRECAUTIONS

Extreme care must be used in handling the picture tube. This tube is highly evacuated and, due to its large size, is subjected to a considerable atmospheric pressure. The handler should wear safety goggles and gloves for protection. Avoid nicking or scratching the glass by rough contact with other objects.

Before removing glass tubes, discharge the capacitor formed by the inner and outer aquadag coatings on the tube by shorting the anode contact on the side of the tube to the outer surface with a well insulated piece of wire.

INSTALLATION AND OPERATING INSTRUCTIONS

RECEIVER LOCATION

The receiver may be placed anywhere in the room, but for greatest satisfaction it should be located:

1. Away from any bright light that may fall directly on the screen or be reflected from it; this includes windows and lamps. Some illumination in the room, off to one side, is desirable, however, to prevent eyestrain.

2. To provide comfortable viewing and ease of operation.

3. At lease one-inch away from a wall to allow for cabinet ventilation. This is very important.

ANTENNAS

The choice of a television antenna depends entirely on the location of the receiver with respect to all television station transmitting antennas in the area. Maximum pick-up is obtained when the receiving antenna is directly in line of sight with the transmitting antenna.

"Bilt-In-Tenna." All receivers using the TS-114 series television chassis are equipped with the Motorola "Bilt-In-Tenna", mounted inside the cabinet, for use in good signal areas.

When this antenna is used, the following precautions should be observed for best reception:

1. In order to get maximum performance and satisfactory pictures from the "Bilt-In-Tenna", ample signals from the television station must be present at the location of the receiver. Normally, the strength of the signals will vary throughout the room in which the receiver is located. For this reason, better pictures will be obtained if the receiver is tried in all possible locations in the viewing room and is then placed where the clearest pictures are received from all stations. Avoid large metallic objects, such as radiators, metal panels, etc.

2. Lamps, vases and metallic objects, when placed on top of the receiver, may affect the efficiency of the "Bilt-In-Tenna".

Indoor Antenna. If additional pick-up is necessary an indoor antenna, placed on or near the receiver, may be used. The antenna should be rotated and the arms should be adjusted for the best signal, with no ghosts or reflections. Normally, the arms should be extended on the low channels (2-6) and telescoped on the high channels (7-13).

Outdoor Antenna. The Motorola "Bilt-In-Tenna" or the indoor type antenna will give satisfactory reception in strong signal areas; but, if the receiver is located in a fringe or weak signal area, an outdoor antenna is recommended.

In areas free of obstructions and reflections, within reasonable proximity to television transmitters, a dipole and reflector will prove satisfactory. Since such an antenna has a relatively small band coverage, a special antenna covering all twelve television channels should be used if it is desired to receive stations on channels of widely separated frequencies.

Location of the antenna should be decided from the standpoint of maximum signal pick-up. In general, the antenna should be broadside to the transmitting antenna and should be as high as possible. If a reflector is used, the antenna should be oriented so that the driven element is closest to the station and the reflector farthest away.

Locating the antenna and lead-in as far away as possible from highways, hospitals, doctors' offices, electrical machinery, etc., will help to reduce noise pick-up from such sources. Also, it is desirable to keep the antenna at least six feet away from other antennas, metal roofs, gutters, or other metal objects to prevent unwanted reflections and shielding.

Lead-In. Since the TS-114 chassis is designed for 300 ohm input, the standard 300 ohm twin lead line should be used for connecting the outside antenna to the receiver. Twisting the line one complete turn per foot of running length helps to reduce noise pick-up on the line. The lead-in should be supported on stand-off insulators and kept tight enough to prevent mechanical damage through swaying. Avoid running the lead-in close to metal gutters, iron standpipes, etc.

In areas of very strong signals, or where severe local electrical interference is encountered, 300 ohm shielded twin lead is recommended. The shield braid should be grounded.

An approved lightning arrestor should be used.

RECEIVER ANTENNA CONNECTION

The antenna lead-in to the receiver is connected to the two screws of the terminal strip on the rear of the cabinet. Disconnect the "Bilt-In-Tenna" leads from the terminal strip before attaching an external antenna lead-in. Sometimes, reversing the lead-in connections at the receiver may improve picture quality and overall performance.

OPERATING CONTROLS

There are two dual controls, consisting of a small and a large knob each, on the front panel of the receiver. The function of each control is marked on the front panel, the "circle" indicating the large knob, and the "dot" indicating the small knob. See Figure 1 for front panel control functions.

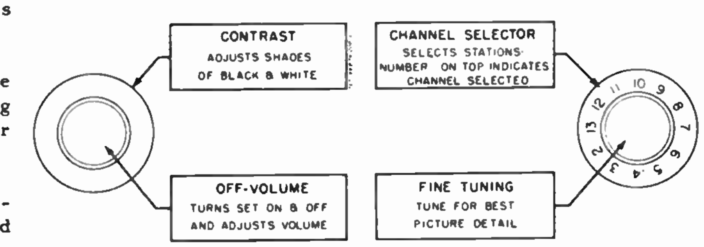

FIGURE 1. OPERATING CONTROLS

©John F. Rider

World Radio History

SERVICE ADJUSTMENT CONTROLS

The receiver is completely adjusted at the factory, so normally none other than the front panel control operating instructions need be followed in putting the receiver in operation. However, to provide for any misadjustment of the service controls, due to handling, the following instructions are in order. See Figure 2 for location of the service adjustment controls.

FOCUS CONTROL

The FOCUS control should be adjusted until the fine horizontal line structure of the raster is clearly visible over the picture area. The control should be tuned through the correct point several times so that optimum focus is obtained.

CENTERING

By means of a lever extending from the focus coil, thru the rear screen, the focus coil can be shifted to center the picture in its mask.

VERTICAL SIZE AND VERTICAL LINEARITY

Adjust the VERTICAL SIZE control until the picture fills the mask vertically. Adjust the VERTICAL LINEARITY control for best overall vertical linearity. Adjustment of the VERTICAL SIZE control will require a readjustment of the VERTICAL LINEARITY control and possibly of the vertical hold control. Center picture with the centering lever on the focus coil.

HORIZONTAL SIZE

Adjust the HORIZONTAL SIZE lever until the picture fills the mask horizontally. Center picture with the centering lever.

HORIZONTAL HOLD ADJUSTMENT

The HORIZONTAL HOLD control should have a sync range of approximately 180°. If the control is too critical, adjust as follows:

1. Short out HORIZONTAL OSCILLATOR coil L-23. This may be done with the chassis in the cabinet by shorting pins 3 and 8 of the test socket on chassis rear.
2. With the centering lever, move the picture to the left so that the right edge of the raster can be seen. Adjust the HORIZONTAL HOLD control to about the middle of its range and note the width of the blanking pulse. (The blanking pulse appears as a gray bar at the right edge of the picture).
3. Remove short from HORIZONTAL OSCILLATOR coil.
4. Adjust HORIZONTAL OSCILLATOR coil until the same amount of blanking pulse can be seen as was noted in step 2.

VERTICAL HOLD ADJUSTMENT

Adjust the VERTICAL HOLD control for the center of the vertical sync lock-in range.

BRIGHTNESS

Adjust the BRIGHTNESS control, in combination with the CONTRAST control for the most pleasing picture. Keep the brilliance slightly below maximum, however, in order to protect the fluorescent screen of the picture tube and to prevent poor picture detail.

ADJUSTMENT OF ION TRAP

Under conditions of rough shipment, it is possible for the ion trap to become misaligned. To prevent serious damage to the picture tube, the following method of adjustment should be used. See Figure 3.

The magnet should be placed on the neck of the tube in the direction indicated by the marking on the magnet (usually an arrow which points toward the picture tube screen) so that the stronger magnet of the double magnet type or the only magnet in the single magnet type, is positioned over the internal pole pieces which are mounted on the gun structure. Adjust the brightness control for low intensity and move the magnet a short distance forward and backward at the same time rotating it to obtain the brightest raster. If, in obtaining the brightest raster, the ion trap magnet has to be moved more than 1/4" from the gun pole pieces, the magnet is probably weak and a new magnet should be tried. Never correct for a shadowed raster with the ion trap magnet if such correction results in decreased brightness. The ion trap magnet must always be adjusted for maximum brightness and, if shadows occur at this setting, they should be eliminated by adjusting the focus and deflection coils as explained under "Focus Coil and Deflection Yoke Adjustment".

CAUTION: Keep brightness control at low intensity until ion trap is properly set.

A mirror placed in front of the receiver will aid in making this adjustment.

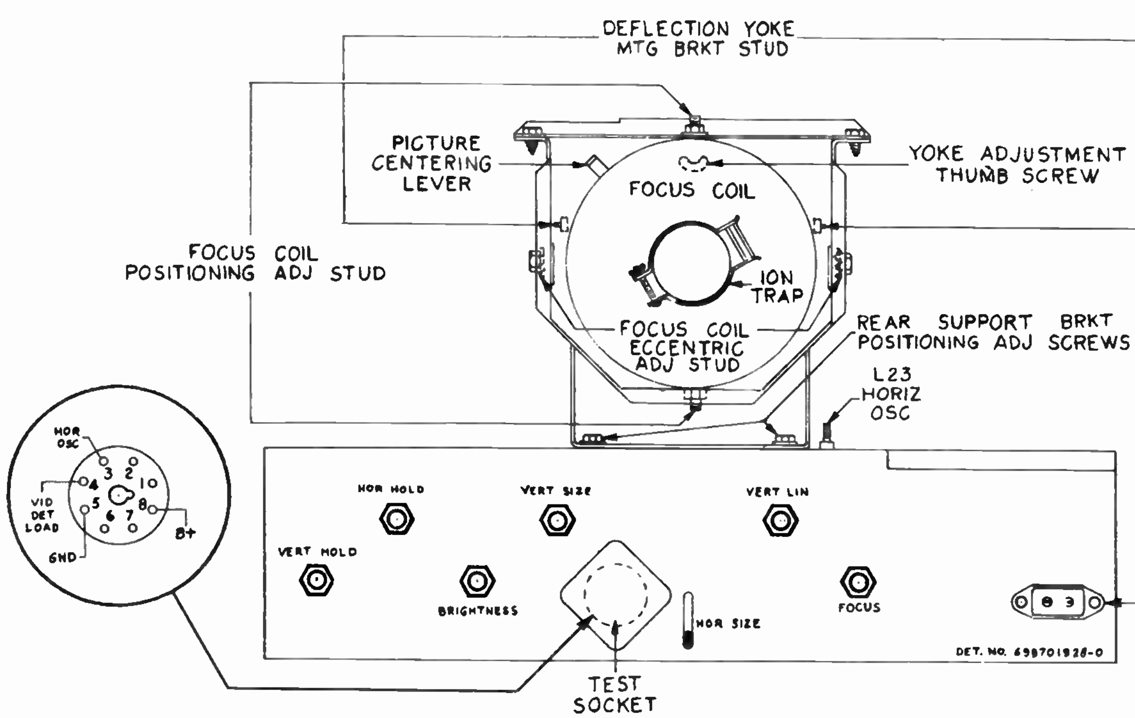

FIGURE 2. SERVICE ADJUSTMENT CONTROLS

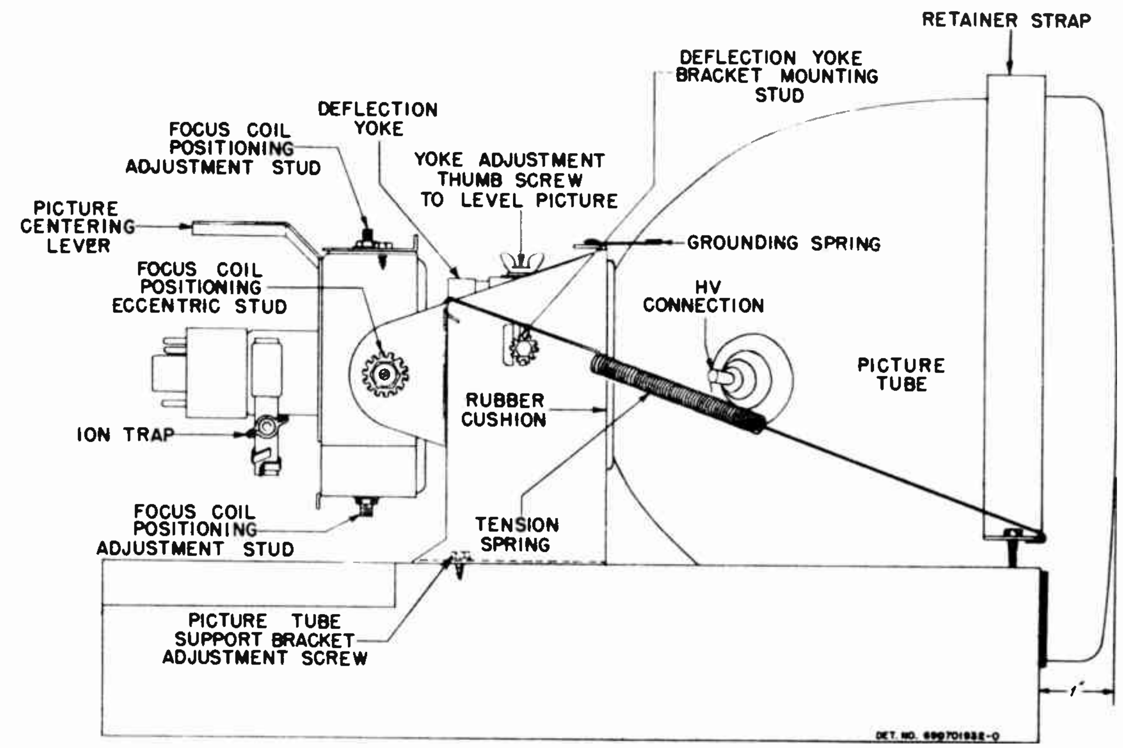

FIGURE 3. PICTURE TUBE ADJUSTMENT LOCATIONS

DEFLECTION YOKE ADJUSTMENT

If the deflection yoke shifts, the picture will be tilted. To correct, loosen the thumbscrew on top of the deflection yoke and rotate yoke until the picture is straight. Before tightening the thumbscrew, make certain that the deflection yoke is as far forward as possible.

If the yoke support and the picture tube have shifted in transit or, if for any reason, these parts have been removed and replaced, it is best to do a complete job of repositioning. See Figure 3. The starting point is the position of the picture tube. It should be adjusted so that the distance from the center of the tube face to the front edge of the chassis is 1". The clamp on the front of the tube should then be tightened. The picture tube rear support bracket positioning adjustment screws should be loose enough to permit sliding the bracket forward until the rubber cushion fits snugly up against the flare of the tube. Loosen the yoke adjustment thumbscrew and push the yoke up against the flare of the tube. CAUTION: Do not use force in sliding the bracket up. If too much force is used, a strain will be placed on the neck of the tube when the support bracket positioning adjustment screws are tightened. Also, the yoke may be forced out of position. The opening in the yoke should be concentric with the neck of the tube.

FOCUS COIL ADJUSTMENT

The focus coil should be positioned so that it is spaced 1/4" from the deflection yoke when parallel with the yoke. The opening in the yoke should be concentric with the neck of the tube. The spacing should be adjusted before the front of the picture tube is clamped down, because it is necessary to remove the tube to change the position of the focus coil. Its position is changed by choice of location of the coil mounting studs in the scalloped holes on the top and bottom of the coil mounting bracket. The opening in the coil can be made concentric with the neck of the tube by loosening the nuts on the studs which support the focus coil bracket and turning the studs with a screwdriver in the slots provided. The studs are eccentric and move the coil both vertically and horizontally. They should be used only to center the neck of the tube in the opening of the coil.

TEST SOCKET

A test socket is provided on the rear of the chassis which allows adjustment of the horizontal oscillator and checking of sensitivity without removing chassis from cabinet. See Figure 2 for socket connections.

World Radio History

ALIGNMENT

GENERAL

The chassis should be mounted on angle iron brackets (Motorola Part No. 7X700210) so that all connections and adjustments may be made easily.

Since the power cord circuit is broken by the interlock when the cabinet back is removed, it will be necessary to obtain an extra power cord with the female interlock receptacle in order to make a power connection to the receiver. Order Motorola Part No. 30B470756.

ORDER OF ALIGNMENT

A complete receiver alignment can be most conveniently performed in the following order:

1. Audio Take-Off & Ratio Detector
2. 4.5 Mc Trap
3. IF Coils & Mixer Transformer
4. Osc & RF Sections

AUDIO TAKE-OFF & RATIO DETECTOR ALIGNMENT

Equipment Required:

AM Signal Generator: (Optional) Accurately calibrated at 4.5 mc

Adjustable output

DC Meter: Low range electronic voltmeter

Procedure:

Refer to Figure 4 for location of adjustments.

1. If possible, it is desirable to align the audio section from an actual station signal, since the 4.5 mc alignment frequency will be exact. The fine tuning trimmer should be turned off the station slightly, to prevent overloading the ratio detector.
2. If a signal generator is used, tune it accurately to 4.5 mc, and adjust the output to approximately 10,000 microvolts. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to chassis. The following applies whether the station signal or signal generator is used.
3. From either side of capacitor C-52 (10 mf), connect an electronic voltmeter to chassis decoupled thru 10K ohms.
4. Set the contrast control for maximum gain (fully clockwise).
5. Peak L-20 for maximum reading on meter.
6. Peak T-3 primary (top core) for maximum reading on meter.
7. Move the meter and decoupling resistor from C-52 to junction of R-41 (33K) and lead to volume control.
8. Adjust T-3 secondary (bottom core) for zero response on 2.5V scale of meter. This corresponds to the cross-over point on the FM detector curve.

If desired, the symmetry of the curve may be checked by tuning the signal generator 25 kc above and below 4.5 mc and noting the plus and minus voltage produced, reversing the meter connections as necessary. For proper balance of the ratio detector system, the voltage in each direction should be approximately equal. If not, check the tuning of L-20 and the primary and secondary of T-3, the ratio detector. If necessary, replace the ratio detector tube V-9 (6AL5). It is desirable to calibrate the generator on a station signal. This may be done by nulling the secondary on a station signal and then connecting the generator and tuning it to produce the same null without touching the trimmers in the set.

NOTE: As the adjustments are brought to resonance, it is advisable to reduce signal generator output to prevent overloading.

With a 10,000 microvolt signal into the grid of the video amplifier tube, with the contrast control turned fully clockwise, and the focus control at center of its range, the voltage read from one side of capacitor C-52 should be greater than 5.0V.

4.5 MC TRAP ALIGNMENT

1. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to chassis.
2. Connect the voltmeter and germanium crystal rectifier, as shown in Figure 5, between the cathode of the picture tube (yellow lead) and chassis. Use the lowest voltage scale on the meter.
3. With the signal generator accurately set at 4.5 mc and maximum output, adjust trap L-18 for minimum reading on the meter.

IF AMPLIFIER ALIGNMENT

Equipment Required:

IF Sweep Generator meeting the following requirements:

18 to 30 mc, approximately 12 mc sweep width. Output constant and adjustable to at least .1 volt maximum with accurately calibrated, adjustable markers.

Cathode Ray Oscilloscope: preferably one with a calibrated input attenuator.

NOTE: If there is no built-in marker in the sweep generator, loosely couple the output of an accurately calibrated AM signal generator to the IF strip. At all times, keep the marker output low enough to prevent the marker from distorting the response curve.

If a wide band scope is used, the marker will be more distinct if a capacitor of 100 to 1000 mmf is placed across the scope input. Use the smallest size possible, since too large a value will affect the shape of the curve.

Procedure:

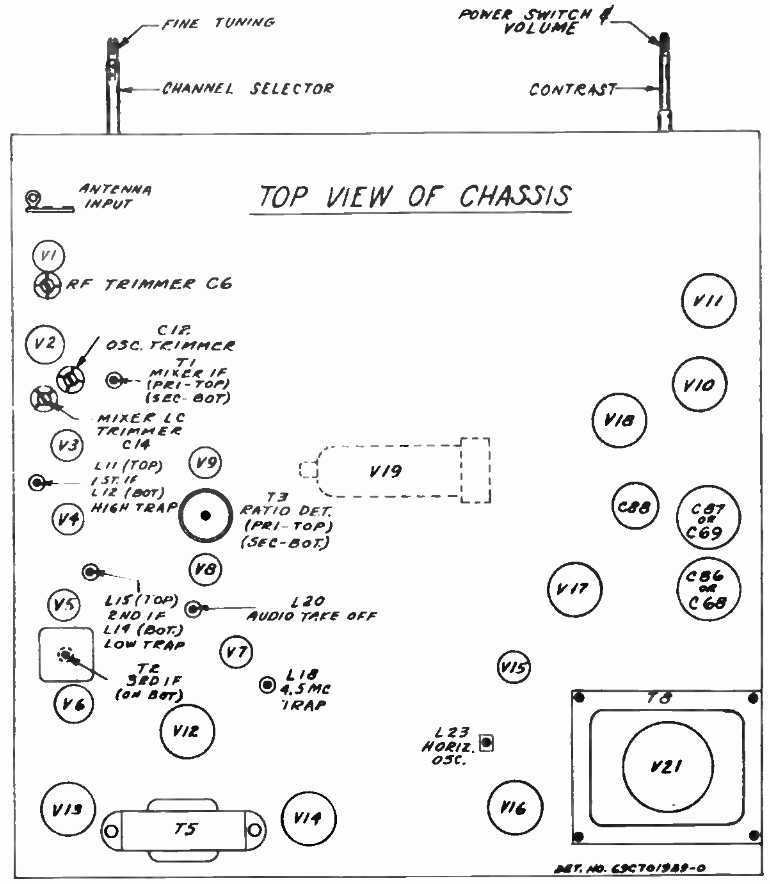
1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket to eliminate horizontal pick-up in the oscilloscope. Replace 6BQ6 tube with dummy load of 2500 ohms 25 watts connected from B plus side of fuse to chassis.
2. By means of an external battery, apply a negative 3.0 volt bias from the bottom of the 1st IF tube grid resistor R-13 (6800) to chassis.
3. Using leads as short as possible, connect the hot side of the sweep generator to the grid (pin 1) of the 1st IF tube V-3 (6AU6) through a 5000 mmf capacitor (do not use the loose or "spraying" method of coupling). The low side is connected to chassis. Set the center frequency of the sweep to about 24.6 mc and adjust initially for a sweep deviation of approximately 12 mc. However, a sweep of from 8 to 10 mc may be found better for overall alignment.
4. Using R-26 (100K) as a decoupling resistor, connect the scope to pin 4 of test socket. If a stronger output is desired, connect the scope between the picture tube cathode and chassis. The curve seen at this position will be the reverse of the polarity shown in Figure 6.
5. Set the contrast control at minimum.

NOTE: If a distorted or unstable picture is seen on the the oscilloscope during alignment, it may be necessary to stop the oscillator by disconnecting resistor R-9 (1500) from the plate (pin 6) of the oscillator tube V-2B (12AT7), or by substituting another tube with pin 6 removed.

CAUTION:
1. Do not reduce the oscilloscope gain and increase signal input so that the top of the curve is flattened, due to limiting in the video or scope amplifiers.
2. The dress of plate & grid components in the IF affects tuning. Do not move indiscriminately.
3. On the IF coils and on the traps, the resonance point will be found at two settings of the slug. The correct setting is the one which is found with the greater part of the adjusting screw out of the coil.

NOTE: The 1st & 2nd IF traps are tuned from bottom of chassis, while IF cores are adjusted from the top.

6. Tune the low frequency trap L-14, located on the 2nd IF coil, for maximum attenuation on the curve at 21.9 mc.
7. Tune the high frequency trap L-12 located on the 1st IF coil for maximum attenuation on the curve at 27.3 mc.
8. Adjust the 1st IF coil, L-11, to place a 26.6 mc marker on the high side of the response curve 60% down



NO.	TYPE	FUNCTION
V1	6CB6	RF AMP.

FIGURE 4. TUBE AND ALIGNMENT ADJUSTMENT LOCATIONS

©John F. Rider

World Radio History

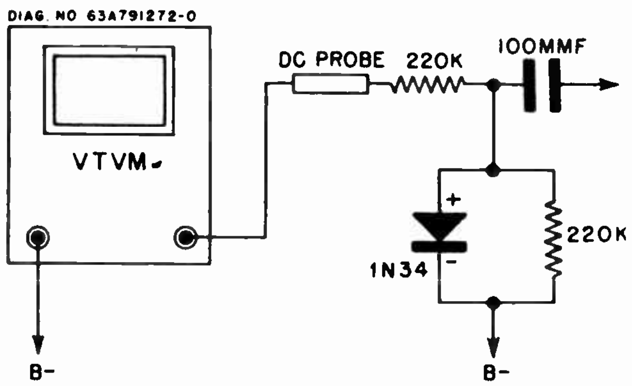

FIGURE 5.
ELECTRONIC VOLTMETER CONNECTIONS

from maximum response. See Figure 6.

9. Adjust the 2nd IF coil, L-15, to place a 22.7 mc marker on the low side of the response curve 60% down from maximum response.

10. Adjust the 3rd IF plate transformer, T-2, to provide a flat top or symmetrical response curve.

11. Reset the traps (steps 6 & 7) and again check the IF for proper response.

NOTE: It is suggested that the bias be removed for accurate resetting of the traps.

12. With bias applied, connect the sweep between the grid (pin 2) of the mixer tube V-2A (12AT7) and chassis.

13. Disconnect the trimmer, C-14, in LC circuit in the grid of the mixer tube, or short the trimmer through a 10,000 mmf ceramic disc type to chassis.

14. Bring both cores of the mixer transformer, T-1, simultaneously from the outside towards the center. The half-way markers should be 26.4 mc and 22.9 mc. (Figure 7).

NOTE: In aligning the three IF coils, each coil is adjusted individually, but when adjusting the primary and secondary of the mixer transformer, the adjustments should be made simultaneously. The important point to keep in mind is to obtain a flat response curve with as much gain as possible. The sides of the curve should be straight and as steep as possible. Simultaneous adjusting of the primary and secondary is the easiest way to obtain this result. The transformer by itself is, in effect, tuned for the same pass band as the three staggered circuits. See Figure 7. The only difference in the overall waveform should be that the sides of the overall wave are steeper. Constant use of the 50% markers (22.9 mc and 26.4 mc) should be resorted to, since it is absolutely necessary to obtain the proper curve. A slight dip (not exceeding 10%) is permissible in the mixer transformer response curve.

BANDWIDTH

The bandwidth may be determined by connecting an AM generator to the mixer grid. With the generator frequency at 24.6 mc, adjust the output for 1 volt reading on a VTVM

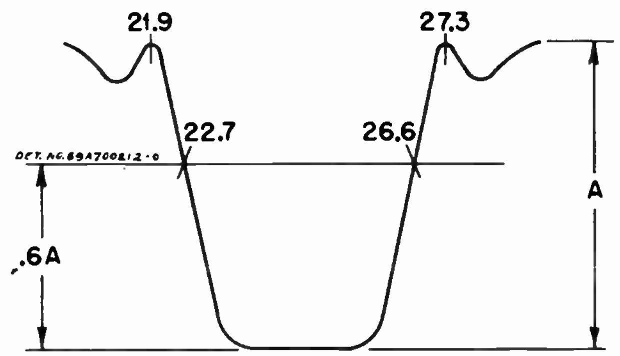

FIGURE 6. IF RESPONSE CURVE

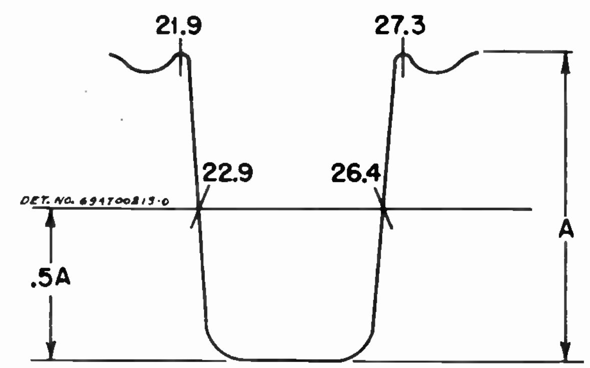

FIGURE 7. OVERALL RESPONSE CURVE FROM MIXER

connected at the plate (pin 2) of the video detector tube V-6 (6AL5) and chassis. Double the output of the generator. Now, by tuning either side of 24.6 mc and noting the frequencies at which the VTVM again reads 1 volt, the 6 db bandwidth points are indicated.

REGENERATION CHECK

After the above IF and mixer transformer alignment has been made, a check for regeneration in the IF amplifier should be made. This is done by removing the battery bias and observing the output response curve on the oscilloscope, as taken between the picture tube cathode and chassis. The bandwidth may change with the bias removed but should not change more than 0.2 mc. Set the contrast control to maximum gain. Decrease the input until the output signal shows a marked decrease. Any regeneration present will be indicated by sharp peaks on the overall response curve. The oscillator should be stopped, as described above, during this procedure.

CAUTION: Do not inject too much marker signal.

MIXER LC ADJUSTMENT

Reconnect bias removed for regeneration check. Replace trimmer C-14 in LC circuit of mixer grid or remove 10,000 mmf ceramic between trimmer and chassis. Adjust the trimmer so it is tuned to the center of the mixer response curve. This is indicated by observing the effect of the LC circuit on the mixer response. Increasing the capacity of the trimmer and bringing the LC circuit from above the IF range into the IF range, it will be noted that the mixer curve will pull down on the high side, then straighten out as the LC circuit approaches the middle of the range, and pull down on the low side as the LC circuit approaches the low end of the IF range. The proper tuning point is that point at which the mixer curve straightens out. In effect, the LC circuit is similar to a jack coil when it is within the IF range.

CAUTION: Tuning the LC circuit very low will cause oscillation.

IF SENSITIVITY MEASUREMENTS

IF Stages Only

1. Remove the battery bias from the 1st IF tube grid.

2. Connect an AM signal generator, set at 24.6 mc thru a blocking capacitor of 5000 mmf, between grid (pin 1) of the 1st IF tube V-3 (6AU6) and chassis.

3. Connect an electronic voltmeter across the video detector load resistor R-28 (5600). Both leads from the meter should be decoupled with 100K ohm resistors.

4. Set the contrast control for maximum sensitivity.

5. Stop the oscillator tube by disconnecting resistor R-9 (1500) from the plate (pin 6) of the tube V-2B (12AT7) or by substituting another tube with pin 6 removed.

6. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 700 microvolts.

Mixer & IF Stages

The preliminary preparations are the same as for checking the sensitivity of the IF stages except:

1. Connect the AM signal generator, set at 24.6 mc, through a 5000 mmf capacitor, between the grid (pin 2) of the mixer tube V-2A (12AT7) and chassis.

2. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 125 microvolts.

OSCILLATOR, ANTENNA AND RF ALIGNMENT

NOTE: The IF must be aligned before the RF section can be properly phased.

Equipment Required:

Sweep Generator: Frequency range 40-220 mc; 10 mc sweep width
Output constant and adjustable
Adjustable markers (markers should be calibrated occasionally by checking against an accurate signal generator).

Oscilloscope: Preferably one with a calibrated input attenuator.

Signal Generator: Frequency range 40 to 220 mc
Accurately calibrated
AM modulated, 400 cycle

FREQUENCY CHART

Chan	Frequency	Picture	Sound	Oscillator
2	54-60	55.25	59.75	81.65
3	60-66	61.25	65.75	87.65
4	66-72	67.25	71.75	93.65
5	76-82	77.25	81.75	103.65
6	82-88	83.25	87.75	109.65
7	174-180	175.25	179.75	152.45
8	180-186	181.25	185.75	158.45
9	186-192	187.25	191.75	164.45
10	192-198	193.25	197.75	170.45
11	198-204	199.25	203.75	225.65
12	204-210	205.25	209.75	231.65
13	210-216	211.25	215.75	237.65

ANTENNA & RF ALIGNMENT PROCEDURE

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket and replace with a dummy load of 2500 ohms 25 watts connected from B plus side of fuse to chassis. Stop the oscillator by disconnecting R-9 (1500) from plate (pin 6) of V-2B (12AT7).

2. Connect the sweep generator across the antenna terminals on the chassis with the antenna lead-in removed. The line from the sweep generator should be as short as possible.

3. Connect the oscilloscope through a decoupling resistor of 150,000 ohms, between the cathode (pin 3) of the mixer tube V-2 (12AT7) and chassis.

4. Short out the AGC circuit with a clip lead from the AGC bus to chassis.

5. Refer to Figure 4 for the RF trimmer location and to Figure 9 for the locations of the antenna and RF coils. The frequency chart listed previously gives the channel and alignment frequencies.

6. The antenna coils are tuned to the video carrier frequency and the RF coils are tuned to the sound carriers. Figure 10 shows the shape of the curve which should appear on the scope for channels 2-6 and Figure 11 the curves for channels 7-13.

7. Turn the station selector switch to channel 10. Set the center frequency of the sweep generator to the center frequency of channel 10 (195 mc).

8. Adjust ceramic trimmer, C-6, so that picture and sound markers are as in Figure 11.

9. Check channels 7 to 13 for proper response and, if necessary, tune the coil L-6. These coils may be tuned by spreading them to decrease inductance or compressing them to increase their inductance. See Figure 9 for location of coils. This will have more effect on channels 10 to 13 than 7 to 9. If L-6 is adjusted, it may be necessary to readjust RF trimmer C-6, and recheck the high channels.

NOTE: As the bandwidth of the high channels is very broad, a slight variation is permissible.

10. Move bandswitch to channel 6.

11. With the center frequency of sweep generator at the center frequency of channel 6 (85 mc), introduce markers corresponding to sound and picture carriers and compare with curve of Figure 10.

World Radio History

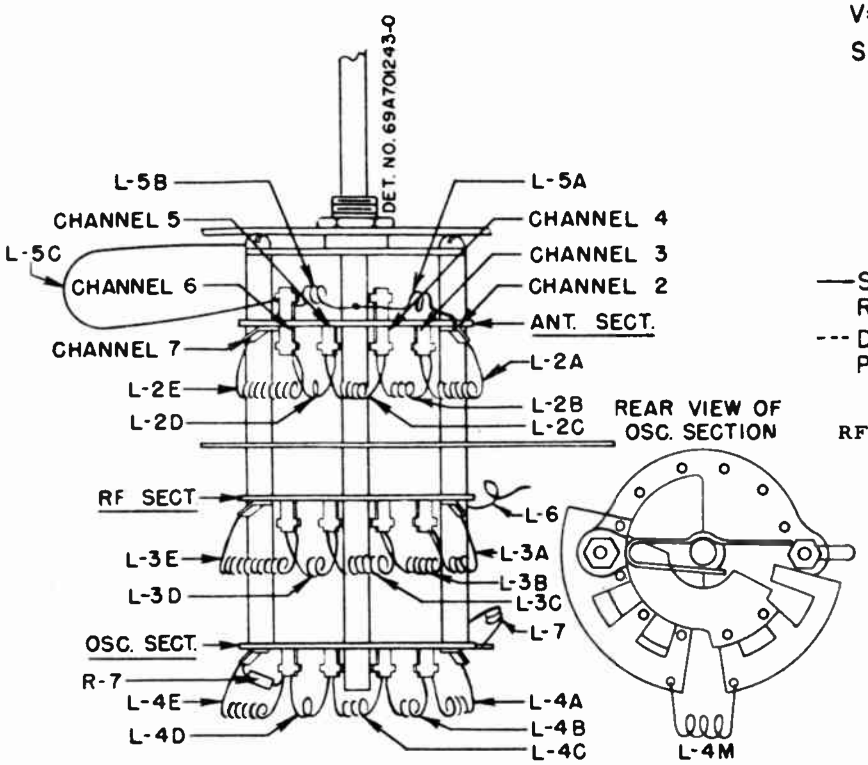

FIGURE 9. ANTENNA, RF AND OSCILLATOR COIL LOCATIONS

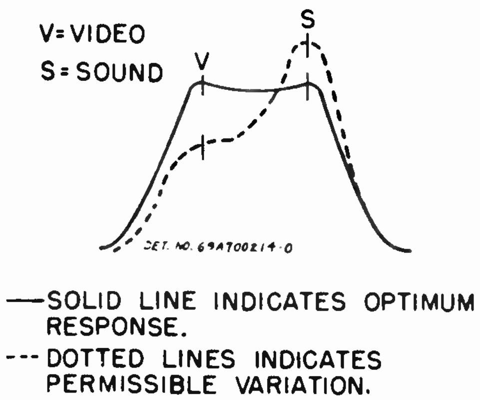

FIGURE 10.
RF RESPONSE CURVES CHANNELS 2-6

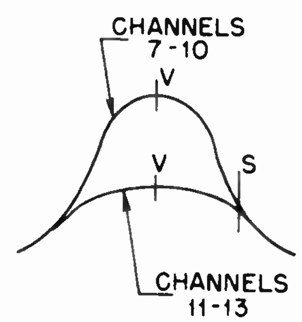

FIGURE 11.
RF RESPONSE CURVES CHANNELS 7-13

NOTE: A convenient method of determining whether a coil is tuned correctly is to insert a brass or iron slug into the coil. Brass decreases and iron increases the inductance.

12. After channel 6 has been aligned, progress downward through channel 2.

CAUTION: Make certain the station selector switch is on the correct channel before checking bandpass.

OSCILLATOR ADJUSTMENT

1. Put oscillator back in circuit.

2. Remove the short from the AGC circuit and apply a -3 volt battery bias to the AGC bus.

3. Move the scope to the test socket on the chassis rear with the high side connected to pin 4 and the low side to pin 5 (chassis).

4. Set the contrast control at minimum (counterclockwise).

5. Remove the fine tuning knob and turn shaft until the slot is in a horizontal position. This represents the mid-capacity position.

6. Turn station selector switch to channel 12.

7. Set the sweep generator on channel 12 with a center frequency of 207 mc and at least a 12 mc sweep. Keep the output low enough to show no evidence of limiting in the overall response curve.

NOTE: Before aligning the oscillator section, make certain the 3.3 microhenry choke (L-8) in the mixer grid is dressed away from the 2 mmf capacitor (C-16) tied to the same grid.

8. Introduce a marker corresponding to the sound carrier of channel 12 (209.75 mc).

9. Adjust oscillator ceramic trimmer so that the sound marker falls into the 21.9 mc trap dip in the response curve.

10. Turn generator and station selector to channel 9 with the fine tuning shaft slot still in the horizontal position.

11. Spread or compress the 3-turn coil located in the center of the oscillator plate (L-4M, Figure 9) so that the sound marker for channel 9 falls into the 27.3 mc trap dip in the response curve. As the oscillator is tuned below the carrier on channels 7, 8, 9 & 10, the 27.3 mc trap will be in the same position as the 21.9 mc trap in step 9.

12. Repeat steps 6, 7, 8 & 9.

13. Turn generator and station selector to channel 13.

14. Turn fine tuning trimmer so that the sound marker for channel 13 falls into the 21.9 mc trap dip of response curve. The slot in the fine tuning shaft should not have moved more than 30° from the horizontal position to accomplish this (each number on the station selector knob represents 30°).

15. If more than a 30° change in fine tuning trimmer was needed in step 14, adjust channel 13 oscillator coil (L-7) by spreading or compressing until the 30° requirement is met.

NOTE: Each adjustment of channel 13 oscillator coil (L-7) will necessitate a rechecking of the oscillator trimmer on channel 12 as per steps 6, 7, 8 & 9.

16. Check channels 12, 11, 10, 9, 8, and 7 by noting whether the fine tuning trimmer can drop the sound marker for each channel in the trap dip by a 30° rotation. If one of the channels does not meet the 30° requirement, a compromise must be made by resetting channel 9 or 12, whichever is closer to the channel in question.

Example: 1) If channel 11 does not meet the 30° requirement, return station selector and generator to channel 12 and tune ceramic trimmer toward channel 11 (trimmer frequencies lowered by tightening screw). This will tend to move channel 12 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Do not adjust trimmer any more than is necessary to get the channel in question back within the 30° requirement.

Example: 2) If channel 10 does not meet the 30° requirement, move station selector and generator to channel 9 and tune the 3-turn coil (L-4M, Figure 9) toward channel 10 (coil freq raised by spreading turns.) This will also tend to move channel 9 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Again, do not adjust the coil any more than is necessary to bring the channel in question back within the 30° requirement.

17. Turn sweep generator and station selector switch to channel 6.

18. Adjust channel 6 oscillator coil (L-4E, Figure 9) so that the sound marker for channel 6 falls into the 21.9 mc trap dip with the fine tuning trimmer at mid-capacity (shaft slot in horizontal position). Always spread or compress channel 6 oscillator coil in units of 3 turns. Compressing turns will move curve toward sound marker, while spreading will move curve toward video marker.

IMPORTANT: Since the coils are in series, the proper alignment of channel 6 will simplify the phasing of the channels to follow.

19. Adjust channels 5 and 4 so that the sound marker for each channel falls into the 21.9 mc trap dip in the curve with the fine tuning trimmer set no more than 15° from mid-capacity.

20. Channels 3 and 2 should be adjusted so that the sound marker falls into the 21.9 mc trap dip with the fine tuning trimmer within 15° of maximum capacity.

OVERALL RECEIVER SENSITIVITY MEASUREMENT

An overall measurement of sensitivity is made as follows:

1. Connect an AM signal generator to the input terminals of the receiver chassis after removing the short 300 ohm lead which connects to the antenna input strip on the back of the cabinet. To match the generator to the receiver input, a resistor matching network should be used. In the case of a generator with a 50 ohm output impedance, for example, place a 100 ohm resistor in series with the output terminal of the generator and a 150 ohm resistor in series with the ground terminal.

2. From cathode of picture tube to chassis, connect a calibrated oscilloscope.

NOTE: To calibrate scope, connect it across 6.3 volt filament supply. The peak-to-peak amplitude on the screen will then be approximately 18V (6.3 x 2.8).

3. Set contrast control for maximum sensitivity.

4. Tune signal generator to the video carrier frequency of the channel being checked. Generator signal should be 30% modulated at 400 cycles. The signal from the generator to produce 20 volts peak-to-peak at picture tube cathode should be less than 25 microvolts on channels 2 to 6 and less than 75 microvolts on channels 7 to 13.

CIRCUIT DESCRIPTION

Chassis TS-114 and TS-115 are electrically identical except for the Vertical Sweep Generator (V-13). The TS-114 uses a 6SN7GT instead of the 12AU7 of the TS-115. This change necessitated changing grid resistor R-63 from 330K to 100K. The circuit description of the TS-115, as found in the TS-115 Service Manual will, therefore, apply also to the TS-114 except for the differences noted above.

C-89	8R9810	Paper: .25 mf 100V

Fuses

Ref. No.	Part No.	Description
F-1	65A700851	Fuse, 1/4 amp: glass tubular; with leads

Coils

Ref. No.	Part No.	Description
L-1 thru L-9	-	See Tuner Parts List
L-10	24K790035	RF choke: molded; 5.6 microhenries
L-11	24B701343	1st IF: complete with LC trap, core, & mtg nut
L-12		Trap (part of L-11)
L-13	24K790035	RF choke: molded: 5.6 microhenries
L-14		Trap (part of L-15)
L-15	24K701344	2nd IF: complete with LC trap, core, & mtg nut
L-16	24K792771	RF choke: yellow dot
L-17	24K792771	RF choke: yellow dot
L-18	24B792735	4.5 mc trap: less core & mtg nut
L-19	24K701652	Compensating coil: blk dot (wound on R-36)
L-20	24A470159	Audio take-off: less core and mtg nut
L-21	24K701651	Compensating coil: grn dot (wound on R-32)
L-22	24K701512	Focus coil
L-23	24K790059	Horizontal Oscillator: less core & clip
L-24	24K701139 or 24K701136 or 24K701141 or 24K701138 or 24K701142	Deflection yoke: complete
L-25	-	See Tuner Parts List
L-26	24K790145	RF choke: molded; 0.47 microhenries
L-27	24K701349	Horizontal size coil: less core & mtg nut

Speakers

Ref. No.	Part No.	Description
LS-1	50C701808	Speaker: 5" electrodynamic; 3.2 ohm voice coil; 100 ohm field (hot)

Resistors

Ref. No.	Part No.	Description
R-1 thru R-12	-	See Tuner Parts List
R-13	6R6428	6800 10% 1/2W
R-14	6R5550	47 10% 1/2W
R-15	6R2036	33 10% 1/2W

R-84	6R2122	4.7 meg 20% 1/2W
R-85	6R6428	6800 10% 1/2W
R-86	6R6229	1000 10% 1/2W
R-87	6R3949	470 20% 1/2W
R-88	6R5631	120,000 10% 1/2W
R-89	18A791574	Horizontal hold control: carbon; 100,000 1/4W
R-90	6R6074	68,000 10% 1/2W
R-91	6R6038	1500 10% 1/2W
R-92	6R6032	470,000 20% 1/2W
R-93	6R5583	47 10% 1W
R-94	6R5690	6800 10% 2W
R-95	6R5721	150,000 10% 1W
R-96	6R5721	150,000 10% 1W
R-97	6R5577	2700 10% 1/2W (in deflection yoke)
R-98	6R6328	100,000 10% 1W (in deflection yoke)
R-99	17K701353	Wire wound: 1500 10% 15W

Transformers

Ref. No.	Part No.	Description
T-1	-	See Tuner Parts List
T-2	24B792585	3rd IF: less core, mtg nut, & colored leads
T-3	24B790125	Ratio detector: complete less shield can
T-4	25B790686	Audio output
T-5	25K701143	Vertical output
T-6	24C701134	High voltage transformer
T-7	25B790140	Filament isolation transformer (for V-18)
T-8	25C700161 or 25K700882 or 25C700169 or 25C701025	Power transformer

Tubes

Ref. No.	Part No.	Description
V-1	6CB6	RF Amplifier
V-2	12AT7	Mixer-Oscillator
V-3	6AU6	1st IF Amplifier
V-4	6AU6	2nd IF Amplifier
V-5	6AG5	3rd IF Amplifier
V-6	6AL5	Video Detector
V-7	6AH6 or 6CB6	Video Amplifier
V-8	6AU6	Audio Driver-Limiter
V-9	6AL5	Ratio Detector
V-10	6J5	Audio Amplifier
V-11	6V6	Audio Output
V-12	6SN7GT	1st & 2nd Clipper
V-13	6SN7GT	Vertical Sweep Generator
V-14	6W6	Vertical Sweep Output
V-15	6AL5	Phase Detector
V-16	6SN7GT	Horizontal Oscillator
V-17	6BQ6GT	Horizontal Output & Hi-Voltage Generator
V-18	6W4GT	Damping Diode
V-19	1B3GT	Hi-Voltage Rectifier
V-20	14BP4 or 14CP4	Picture Tube: 14" Rectangular
V-21	5U4G	Low Voltage Rectifier

TUNER - MODEL TT-16

Ref. No.	Part No.	Description
	1X701444	TT-16 Tuner: complete with tubes
C-1	21K478234	Molded: 8 mmf
C-2	21K77375	Ceramic tubular: 220 mmf 500V
C-3	21A470789	Ceramic disc: 5000 mmf 450V
C-4	21K77375	Ceramic tubular: 220 mmf 500V
C-5	21K470322	Molded: 20 mmf 500V
C-6	1X701662	Trimmer, ceramic: .5-3 mmf; with screw & mtg nut
C-7	21A701029	Ceramic disc: 1500 mmf
C-8	21A701029	Ceramic disc: 1500 mmf
C-9	21K482726	Ceramic disc: 10,000 mmf 450V
C-10	21K482726	Ceramic disc: 10,000 mmf 450V
C-11		Fine Tuning Trimmer (part of switch)
C-12	1X701662	Trimmer, ceramic: .5-3 mmf; with screw & mtg nut
C-13	21K482726	Ceramic disc: 10,000 mmf 450V
C-14	1X792784	Trimmer, ceramic: 3-13 mmf; with screw and mtg nut
C-15	21K400050	Molded: 10 mmf 500V
C-16	21K478280	Molded: 2 mmf 500V
C-17	21K478234	Molded: 8 mmf 500V
C-18	21A470789	Ceramic disc: 5000 mmf 450V
C-19	21K77375	Ceramic tubular: 220 mmf 500V
C-20	21K478280	Molded: 2 mmf 500V
C-21	21A470789	Ceramic disc: 5000 mmf 450V
C-22	21A470789	Ceramic disc: 5000 mmf 450V
L-1	24A790033	Antenna impedance matching coil
L-2	24C792764	Antenna coil: channels 2 thru 6; includes L-2A thru L-2E (high channel coils are part of switch).
L-3	24K790536	RF coil: channels 2 thru 6; includes L-3A thru L-3E (high channel coils are part of switch).
L-4	24C700114	Oscillator coil: channels 2 thru 6; includes L-4A thru L-4E (high channel coils are part of switch)
L-4M	24K700115	Oscillator coil: channel 10
L-5	24K792765	Antenna primary: low frequency includes L-5A, L-5B, & L-5C
L-6	24K701839	RF coil: channel 13
L-7	24K700116	Oscillator coil: channel 13
L-8	24K792577	RF choke: molded; 3.3 microhenries.
L-9	24K780128	RF choke: molded; 2.2 microhenries.
L-25	24K790145	RF choke: molded; 0.47 microhenries
R-1	6R6397	22,000
R-2	6R6048	47,000 10% 1/2W
R-3	6R5614	56 10% 1/2W
R-4	6R2036	33 10% 1/2W
R-5	6R6229	1000 10% 1/2W
R-6	6R5659	3900 10% 1/2W
R-7	6R6069	2200 10% 1/2W
R-8	6R6320	10,000 10% 1/2W
R-9	6R6038	1500 10% 1/2W
R-10	6R6117	5600 10% 1/2W
R-11	6R6393	1200 10% 1/2W
R-12	6R6080	4700 10% 1/2W
T-1	24K701135	Mixer IF: less cores & mtg nuts

NOTE: Tuner mechanical parts are included in following list.

CHASSIS TS-114 MECHANICAL PARTS

Part No.	Description
7A791965	Bracket, interlock safety
7A701393	Bracket, transformer cut-out: large (beneath 25C700161 or 25K700882 power trans)
7A701396	Bracket, transformer cut-out: small (beneath 25C700169 or 25C701025 power trans)
1X701407	Bracket, rear tube support: with tube grounding spring
7A792568	Bracket, yoke adjustment (across top of defl yoke)
7B700194	Bracket, focus coil mtg: bottom ("U" bracket around focus coil)
35K700532	Bumper, rubber (circular bumper in large rear support brkt)
7A700196	Bracket, focus coil mtg: top (across top of focus coil)
7K700153	Bracket, coil mtg (L-27 mtg)
42A72609	Clip, grounding (V-10 tube shield)
35K792757	Cushion, focus coil (between coil & tube)
39K17396	Contact, pin terminal (in spkr receptacle
42K701443	Cap, plate: with lead (for 6BQ6)
15B791111	Cover, test socket
42A700147	Clamp, lead retainer (on hi-volt rect filament leads)
42K471342	Cap, plate (hi-volt rect)
46A470302	Core, iron, & screw (T-3 secondary)
42B70721	Clip, coil mtg (T-3 secondary)
46A70023	Core, iron, & screw (T-3 primary, L-14)
46A478242	Core, brass, & screw (T-2)
46K791756	Core, brass, & screw (L-11 & L-15)
46K480256	Core, iron & screw (L-12 & T-1 secondary)
46A470310	Core, iron, & screw (L-18, L-20, & T-1 primary)
46K471143	Core, iron, & screw (L-23)
42A76244	Clip, coil retainer (L-23)
46A700090	Core, iron, & screw (L-27)
5A790684	Grommet, tube socket (V-14 & V-16 socket mtg)
14A780184	Insulator, antenna lead (insulates 300 ohms line from chassis)
14K791892	Insulator, coil (in T-2 can)
14K87179	Insulator, coil (in T-3 can)
4S7655	Lockwasher, internal: 3/8; cad pl (front controls mtg)
4S9751	Lockwasher, int-ext: #8; cad pl (T-8 & focus coil mtg)
4S2640	Lockwasher, internal: 1/2 thin; cad pl (mounts bottom focus coil mtg brkt).
4S7688	Lockwasher, int-ext: 1/4; cad pl (mounts bottom focus coil mtg brkt).
2A790191	Nut: special: cad pl (mounts ceramic trimmers)
2A791404	Nut, coil & core mtg (L-27)
2A470049	Nut, coil & core mtg (T-1, T-2, L-11, L-12, L-14, L-15, L-18, & L-20)
2B70703	Nut, palnut; special (T-3 primary coil mtg)
2S7093	Nut, hex: palnut; 6-32 x 1/4 cad pl (T-2 shield mtg)
2S7022	Nut, hex: 1/4-20 x 7/16; cad pl (mounts bottom focus coil mtg brkt
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (T-8 & focus coil mtg)
2S7051	Nut, hex: palnut; 3/8-32 x 9/16; cad pl (rear controls mtg)
2S7004	Nut, hex: 3/8-32 x 9/16; cad pl (front controls mtg)
64A700690	Plate, electrolytic mtg (when 3 electrolytics used)
28K471323	Plug, line cord: 2-pin; waxed
64K700748	Plate, socket cover (covers unused hole when only two electrolytics are used)
64A700745	Plate, transformer cover (beneath 24C700161 & 25K700882 power trans)
35K701379	Pad, cushion (under picture tube)
35K700166	Pad, cushion (on picture tube retainer strap)
64B701162	Plate, chassis cover (removable plate on chassis side)
9a54664	Receptacle, female (test jack)
5S7770	Rivet: .088 x 5/32 stl; pol nkl (V-2 socket mtg)
5S7728	Rivet: .122 x 5/16 stl; pol nkl (V-19 socket mtg)
9A22367	Receptacle: 5-prong (spkr receptacle)
5S7703	Rivet: .122 x 7/32 stl; pol nkl (pix tube grounding spring mtg)
5S6842	Rivet: .145 x 5/32 stl; pol nkl (mounts T-4 & T-5)
5S7700	Rivet: .122 x 1/4 stl; pol nkl (line cord mtg)
5K71246	Rivet, shoulder: nkl pl (V-14 & V-16 socket mtg)
5S2815	Rivet: .088 x 7/32 stl; pol nkl (9K780442 & 9K484167 socket mtg)
5S8497	Rivet: .088 x 1/8 stl; pol nkl (V-1 & V-5 socket mtg)
5S7707	Rivet: .122 x 5/32 stl; pol nkl (mounts 9K471270 socket & terminal strips)
3S490822	Screw, machine: 6-32 x 1 slotted hex head; cad pl (ceramic trimmer adj)
3S490508	Screw, sheet metal: #6 x 3/4 PKA plain hex head; cad pl
3S7467	Screw, sheet metal: #8 x 3/8 PKA plain hex head; cad pl (T-7 mtg)
3S7163	Screw, machine: 8-32 x 1/4 plain hex head; cad pl (yoke adj. bracket mtg)
3A700198	Screw, eccentric: cad pl (mounts bottom focus coil mtg brkt)
3A470369	Screw, thumb: cad pl (yoke adjustment)
3S7467	Screw, sheet metal: #8 x 3/8 PKZ plain hex head; cad pl (mounts top focus coil mtg brkt)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (test socket cover mtg)
3S8146	Screw, sheet metal: #8 x 1 PKZ plain hex head; cad pl (tube retainer strap mtg)
3S490459	Screw, machine: 6-32 x 1 1/8 slotted round hex head; brass (secures hi-volt trans plates)
26A26283	Shield, tube (for glass 6J5 audio amp)
26A90301	Shield, tube: miniature
42C701181	Strap, tube retainer: with pl (around picture tube front)
41A471379	Spring, tension (picture tube support)
26B700835	Shield, IF (between audio & video IF strips)
26C701345	Shield, tuner chassis
31K4573	Strip, terminal: 3 ins #3 gnd; 1/2" spacing
9A480274	Socket, tube: octal; molded (hi-volt rect)
31A791613	Strip, terminal: special (on hi-volt trans)
41A70705	Spring, coil (T-3)

MODEL 14T3 CABINET PARTS

Part No.	Description
1X792494	Bracket, window mtg: with pad
16B700099	Board, baffle: with grille cloth
35A790097	Bumper, rubber: with bushing (cabinet feet)
1X701529	Back cover: complete with picture tube rear cover, antenna recept mtg plage, antenna support bracket, centering adjustment cover, and line cord
7A701358	Bracket, antenna support
16F701061	Cabinet, table model: molded plastic; walnut; less window & grille cloth
42A792502	Clip, mask retainer
1X701527	Cover, chassis bottom with hi-volt insulator
15K700596	Cover, picture tube rear (on back cover).
30B470756	Cord, line: with plug & receptacle
15K792068	Cover, centering adjustment: rubber (on back cover)
5S3139	Eyelet: .202 x .475 brs; ant cap (on back cover)
14B792069	Insulator, high voltage (on bottom cover)
36A485457	Knob, control (hold controls on chassis rear)
36C700732	Knob, control: brn (fine tuning & off-volume)
36K700734	Knob, control (contrast)
36C700733	Knob, control (station selector)
4S7651	Lockwasher, internal: #8; cad pl (spkr mtg)
4S7650	Lockwasher, internal: #6; cad pl (hi-volt insulator mtg)
1X701526	Mask, picture tube: with retainer clips.
2S7003	Nut, hex: 8-32 x 5/16 (spkr mtg)
35K700799	Pad, cushion (window mtg)
35K792501	Pad, cushion (on window mtg brkt)
35K471282	Pad, asbestos
64A792052	Plate, antenna receptacle mtg
5K791856	Rivet, shoulder: annealed (line cord mtg)
5S7751	Rivet: .122 x 1/4 stl; ant cop (mounts ant recept mtg plate)
5S7703	Rivet: .122 x 7/32 stl; ant cop (picture tube rear cover mtg)
5S1683	Rivet: .122 x 3/16 brs; pol nkl (mask clip mtg)
5S7706	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
3S488098	Screw, sheet metal: #8 x 3/8 type 25 plain hex head; cad pl (window mtg)
3K791825	Screw, insulated head: statuary bronze (spkr mtg)
3S7467	Screw, sheet metal: #8 x 3/8 PKZ plain hex head; cad pl (mask mtg)
3S400220	Screw, sheet metal: #10 x 3/4 PKA plain hex head; cad pl (bottom cover mtg)
3S8126	Screw, sheet metal: #8 x 1 1/4 PKA plain hex head; cad pl (cabinet feet mtg)
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acron head; ant cop (back cover mtg)
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acron head; ant cop (back cover mtg)
35A701524	Strip, antenna support: chip board (supports"Bilt-in-Tenna")
3S2957	Screw, machine: 8-32 x 1/2 plain hex
4K780040	Washer, felt (under control knobs)
4S7566	Washer, flat (3/8 x 5/32 x .033 stl; cad pl
4S7629	Washer, flat: 1/2 x 3/16 x .048 stl; cad pl (bottom cover mtg)
4S1720	Washer, flat: 3/8 x .156 x .030 stl; cad pl (mask mtg)
4S1767	Washer, flat: 5/16 x .130 x .025 brs; pol nkl (mask clip mtg)
61C701152	Window, picture tube: rectangular.

BILT-IN-TENNA MODEL TA-6

Part No.	Description
1X791900	TA-6 Single Loop Antenna: complete
21R2763	Capacitor, mica: 6 mmf 300V
21R2764	Capacitor, mica: 18 mmf 300V
24A791748	Coil, antenna loading (on terminal strip)
24A791989	Coil, high frequency compensating
29A791608	Lug, spade
31K34326	Strip, terminal: 2 ins, #3 gnd; 3/8" spacing

INDEX

GENERAL INFORMATION

RECEIVER MODEL BREAKDOWN CHART

Model	Type of Set	TV Chassis Used
16K2	Console, red-brn mahogany	TS-74
16K2B	Console, limed oak	TS-74

TV CHASSIS - Television chassis TS-74 contains 19 tubes plus a 16" picture tube. The picture, sound, and scanning circuits, together with a selenium rectifier, voltage doubler "B" supply, are contained on a single chassis.

TV TUNING RANGE - Channels 2 through 13

TV IF FREQ - Channels 2 to 6: sound - 21.9 mc
picture - 26.4 mc
Channels 7 to 13: sound - 27.3 mc
picture - 22.8 mc

NOTE: In late chassis, using TT-14 tuner, channels 11, 12, and 13: sound 21.9 mc, picture 26.4 mc

ANTENNAS - TV: console; TA-4 "Bilt-In-Tenna". Provision for connection of an external antenna

TV ANTENNA IMPEDANCE - 300 ohms

POWER SUPPLY - 117 volts, 60 cycle AC current only

POWER CONSUMPTION - TV: 170 watts

TV AUDIO OUTPUT - 4 watts

TV CHASSIS TUBE COMPLEMENT

Ref. No.	Tube	Function
V-1	6CB6	RF Amplifier
V-2	12AT7	Mixer-Oscillator
V-3	6AU6	1st IF Amplifier
V-4	6AU6	2nd IF Amplifier
V-5	6AG5	3rd IF Amplifier
V-6	6AL5	Video Detector
V-7	6AH6	Video Amplifier
V-8	6AU6	Audio Driver-Limiter
V-9	6AL5	Ratio Detector
V-10	6J5GT	Audio Amplifier
V-11	6V6GT	Audio Output

(TV Chassis Tube Complement - cont'd)

Ref. No.	Tube	Function
V-12	6SN7GT	1st & 2nd Clippers

V-16	6SN7GT	Horizontal Oscillator
V-17	6BQ6GT	Horizontal Output & High Voltage Generator
V-18	6W4GT	Damping Diode
V-19	1B3GT	High Voltage Rectifier
V-20	16GP4	Picture Tube

HIGH VOLTAGE WARNING

Operation of this receiver, outside its cabinet or with covers removed, involves a shock hazard from the power supplies. No work should be attempted on this receiver by anyone not thoroughly familiar with the precautions necessary when working on high voltage equipment.

CATHODE RAY PICTURE TUBE HANDLING PRECAUTIONS

Extreme care must be used in handling the picture tube. The tube is highly evacuated and, due to its large size, is subjected to a considerable atmospheric pressure. The handler should wear safety goggles and gloves for protection. Avoid nicking or scratching the glass by rough contact with other objects.

INSTALLATION AND OPERATING INSTRUCTIONS

RECEIVER LOCATION

The receiver may be placed anywhere in the room, but for greatest satisfaction it should be located:

1. Away from any bright light that may fall directly on the screen or be reflected from it; this includes windows and lamps. Some illumination in the room, off to one side is desirable, however, to prevent eyestrain.

2. To provide comfortable viewing and ease of operation.

3. At least one-inch away from a wall to allow for cabinet ventilation. This is very important.

ANTENNAS

The choice of television antenna depends entirely on the location of the receiver with respect to all television station transmitting antennas in the area. Maximum pick-up is obtained when the receiving antenna is directly in line of sight with the transmitting antenna.

"Bilt-In-Tenna". All receivers using the TS-74 series television chassis are equipped with the Motorola "Bilt-In-Tenna", mounted inside the cabinet, for use in good signal areas.

When this antenna is used, the following precautions should be observed for best reception:

1. In order to get maximum performance and satisfactory pictures from the "Bilt-In-Tenna", ample signals from the television station must be present at the location of the receivers. Normally, the strength of the signals will vary throughout the room in which the receiver is located. For this reason, better pictures will be obtained if the receiver is tried in all possible locations in the viewing room and is then placed where the clearest pictures are received from all stations. Avoid large metallic objects, such as radiators, metal panels, etc.

2. Lamps, vases and metallic objects, when placed on top of the receiver, may affect the efficiency of the "Bilt-In-Tenna".

Indoor Antenna. If additional pick-up is necessary, an indoor antenna, placed on or near the receiver, may be used. The antenna should be rotated and the arms should be adjusted for the best signal, with no ghosts or reflections. Normally, the arms should be extended on the low channels (2-6) and telescoped on the high channels (7-13).

Outdoor Antenna. The Motorola "Bilt-In-Tenna" or the indoor type antenna will give satisfactory reception in strong signal areas; but, if the receiver is located in a fringe or weak signal area, an outdoor antenna is recommended.

In areas free of obstructions and reflections, within reasonable proximity to television transmitters, a dipole and reflector will prove satisfactory. Since such an antenna has a relatively small band coverage, a special antenna covering all twelve television channels should be used if it is desired to receive stations on channels of widely separated frequencies.

Location of the antenna should be decided from the standpoint of maximum signal pick-up. In general, the antenna should be broadside to the transmitting antenna and should be as high as possible. If a reflector is used, the antenna should be oriented so that the driver element is closest to the station and the reflector farthest away.

Locating the antenna and lead-in as far away as possible from highways, hospitals, doctors' offices, electrical machinery, etc., will help to reduce noise pick-up from such sources. Also, it is desirable to keep the antenna at least six feet away from other antennas, metal roofs, gutters, or other metal objects to prevent unwanted reflections and shielding.

Lead-In. Since the TS-74 chassis is designed for 300 ohm input, the standard 300 ohm twin lead line should be used for connecting the outside antenna to the receiver. Twisting the line one complete turn per foot of running length helps to reduce noise pick-up on the line. The lead-in should be supported on stand-off insulators and kept tight enough to prevent mechanical damage through swaying. Avoid running the lead-in close to metal gutters, iron standpipes, etc.

In areas of very strong signals, or where severe local electrical interference is encountered, 300 ohm shielded twin lead is recommended. The shield braid should be grounded.

An approved lightning arrestor should be used.

RECEIVER ANTENNA CONNECTION

The antenna lead-in to the television receiver is connected to the two screws of the terminal strip on the rear of the cabinet. Disconnect the "Bilt-In-Tenna" leads from the terminal strip before attaching an external antenna lead-in. Sometimes reversing the lead-in connections at the receiver may improve picture quality and overall performance.

OPERATING CONTROLS

There are two dual controls, consisting of a small and a large knob each, on the front panel of the receiver. The function of each control is marked on the front panel; the "circle" indicating the large knob, and the "dot" indicating the small knob. See Figure 1 for front panel control functions.

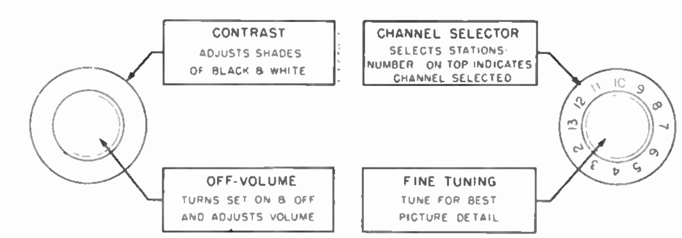

FIGURE 1. OPERATING CONTROLS

©John F. Rider

World Radio History

SERVICE ADJUSTMENT CONTROLS

The receiver is completely adjusted at the factory, so normally none other than the front panel control operating instructions need be followed in putting the receiver in operation. However, to provide for any misadjustment of the service controls, due to handling, the following instructions are in order. See Figure 2 for location of the service adjustment controls.

FOCUS CONTROL

The FOCUS control should be adjusted until the fine horizontal line structure of the raster is clearly visible over the picture area. The control should be tuned through the correct point several times so that optimum focus is obtained.

CENTERING

By means of a lever extending from the focus coil, thru the rear screen, the focus coil can be shifted to center the picture in its mask.

VERTICAL SIZE AND VERTICAL LINEARITY

Adjust the VERTICAL SIZE control until the picture fills the mask vertically. Adjust the VERTICAL LINEARITY control for best overall vertical linearity. Adjustment of the VERTICAL SIZE control will require a readjustment of the VERTICAL LINEARITY control and possibly of the VERTICAL HOLD control. Center picture with the centering lever on the focus coil.

HORIZONTAL SIZE

Adjust the HORIZONTAL SIZE lever until the picture fills the mask horizontally. Center picture with the centering lever.

HORIZONTAL HOLD ADJUSTMENT

The HORIZONTAL HOLD control should have a sync range of approximately 180°. If the control is too critical, adjust as follows:

1. Short out HORIZONTAL OSCILLATOR coil L-23. This may be done with the chassis in the cabinet by shorting pins 3 & 8 of the test socket on chassis rear.
2. With the centering lever, move the picture to the left so that the right edge of the raster can be seen. Adjust the HORIZONTAL HOLD control to about the middle of its range and note the width of the blanking pulse. (The blanking pulse appears as a gray bar at the right edge of the picture).
3. Remove short from HORIZONTAL OSCILLATOR coil.
4. Adjust HORIZONTAL OSCILLATOR coil until the same amount of blanking pulse can be seen as was noted in step 2.

VERTICAL HOLD ADJUSTMENT

Adjust the VERTICAL HOLD control for the center of the vertical sync lock-in range.

BRIGHTNESS

Adjust the BRIGHTNESS control, in combination with the CONTRAST control for the most pleasing picture. Keep the brilliance slightly below maximum, however, in order to protect the fluorescent screen of the picture tube and to prevent poor picture detail.

ADJUSTMENT OF ION TRAP

Under conditions of rough shipment, it is possible for the ion trap to become misaligned. To prevent serious damage to the picture tube, the following method of adjustment should be used. See Figure 3.

The magnet should be placed on the neck of the tube in the direction indicated by the marking on the magnet (usually an arrow which points toward the picture tube screen) so that the stronger magnet of the double magnet type or the only magnet in the single magnet type is positioned over the internal pole pieces which are mounted on the gun structure. Adjust the BRIGHTNESS control for low intensity and move the magnet a short distance forward and backward at the same time rotating it to obtain the brightest raster. If, in obtaining the brightest raster, the ion trap magnet has to be moved more than 1/4" from the gun pole pieces, the magnet is probably weak and a new magnet should be tried. Never correct for a shadowed raster with the ion trap magnet if such correction results in decreased brightness. The ion trap magnet must always be adjusted for maximum brightness and if shadows occur at this setting, they should be eliminated by adjusting the focus and deflection coils as explained under "Focus Coil and Deflection Yoke Adjustment".

CAUTION: Keep brightness control at low intensity until ion trap is properly set.

A mirror placed in front of the receiver will aid in making this adjustment.

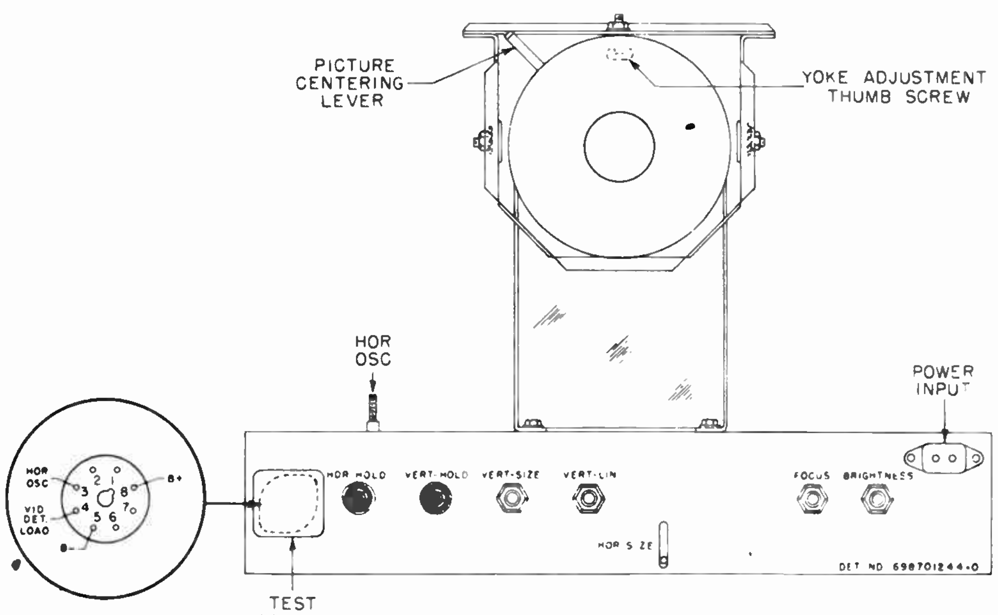

FIGURE 2. SERVICE ADJUSTMENT CONTROLS

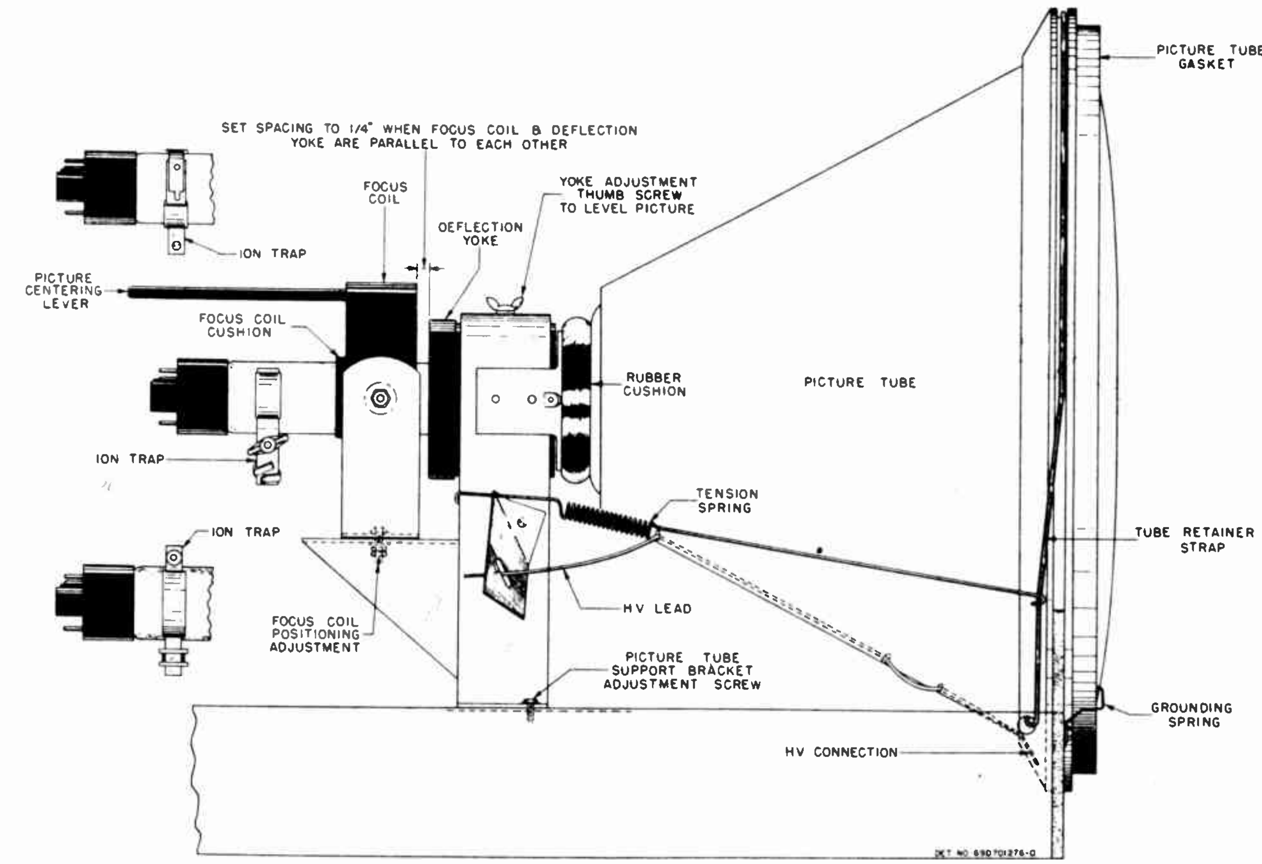

FIGURE 3. PICTURE TUBE ADJUSTMENT LOCATIONS

DEFLECTION YOKE ADJUSTMENT

If the deflection yoke shifts, the picture will be tilted. To correct, loosen the thumbscrew on top of the deflection yoke and rotate yoke until the picture is straight. Before tightening the thumbscrew, make certain that the deflection yoke is as far forward as possible.

If the yoke support and the picture tube have shifted in transit or, if for any reason these parts have been removed and replaced, it is best to do a complete job of repositioning. See Figure 3. The starting point is the position of the picture tube. This is fixed by the front tube mounting. The picture tube rear support bracket positioning adjustment screws should be loose enough to permit sliding the bracket forward until the rubber cushion fits snugly up against the flare of the tube. CAUTION: Do not use force in sliding the bracket up. If too much force is used, a strain will be placed on the neck of the tube when the support bracket positioning adjustment screws are tightened. Also the yoke may be forced out of position. The opening in the yoke should be concentric with the neck of the tube.

FOCUS COIL

The focus coil bracket positioning screw nuts should now be loosened and the focus coil bracket moved up so that when the focus coil is parallel with the deflection yoke the space between them is 1/4". In tightening the focus coil bracket positioning screw nuts, tighten the first one so that the spring washers will have enough tension to hold the bracket firmly, but not so tightly as to cause difficulty in making picture centering adjustment. Then tighten the second nut to act as a lock to prevent loosening of the tension.

TEST SOCKET

A test socket is provided on the rear of the chassis which allows adjustment of the horizontal oscillator and checking of sensitivity without removing chassis from cabinet. See Figure 2 for socket connections.

©John F. Rider

World Radio History

ALIGNMENT

GENERAL

The chassis should be mounted on angle iron brackets (Motorola Part No. 7X700210) so that all connections and adjustments may be made easily.

Since the power cord circuit is broken by the interlock when the cabinet back is removed, it will be necessary to obtain an extra power cord with the female interlock receptacle in order to make a power connection to the receiver. Order Motorola Part No. 30B470756.

It is recommended that an isolation transformer be used between the receiver and the AC line whenever any test equipment is attached to the chassis. This precaution is especially important if grounded test equipment is used. NEVER GROUND THE RECEIVER CHASSIS DURING TESTING OPERATIONS OR INSTALLATION UNLESS AN ISOLATION TRANSFORMER IS USED.

ORDER OF ALIGNMENT

A complete receiver alignment can be most conveniently performed in the following order:

1. Audio Take-Off & Ratio Detector
2. 4.5 Mc Trap
3. IF Coils & Mixer Transformer
4. Osc & RF Sections

AUDIO TAKE-OFF & RATIO DETECTOR ALIGNMENT

Equipment Required:

AM Signal Generator: (Optional)	Accurately calibrated at 4.5 mc Adjustable output
DC Meter:	Low range electronic voltmeter

Procedure:

Refer to Figure 4 for location of adjustments.

1. If possible, it is desirable to align the audio section from an actual station signal, since the 4.5 mc alignment frequency will be exact. The fine tuning trimmer should be turned off the station slightly, to prevent overloading the ratio detector.

2. If a signal generator is used, tune it accurately to 4.5 mc, and adjust the output to approximately 10,000 microvolts. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to B-. The following applies whether the station signal or signal generator is used.

3. From either side of capacitor C-60 (10 mf), connect an electronic voltmeter to B- decoupled thru 10K ohms.

4. Set the contrast control for maximum gain (fully clockwise).

5. Peak L-20 for maximum reading on meter.

6. Peak T-3 primary (top core) for maximum reading on meter.

7. Move the meter and decoupling resistor from C-60 to junction of R-44 (33K) and lead to volume control.

8. Adjust T-3 secondary (bottom core) for zero response on 2.5V scale of meter. This corresponds to the cross-over point on the FM detector curve. If desired, the symmetry of the curve may be checked by tuning the signal generator 25 Kc above and below 4.5 mc and noting the plus and minus voltage produced, reversing the meter connections as necessary. For proper balance of the ratio detector system, the voltage in each direction should be approximately equal. If not, check the tuning of L-20 and the primary & secondary of T-3, the ratio detector. If necessary, replace the ratio detector tube V-9 (6AL5). It is desirable to calibrate the generator on a station signal. This may be done by nulling the secondary on a station signal and then connecting the generator and tuning it to produce the same null without touching the trimmers in the set.

NOTE: As the adjustments are brought to resonance, it is advisable to reduce signal generator output to prevent overloading.

With a 10,000 microvolt signal into the grid of the video amplifier tube, with the contrast control turned fully clockwise, and the focus control at center of its range, the voltage read from one side of capacitor C-60 should be greater than 5.0V.

4.5 MC TRAP ALIGNMENT

1. Connect the high side of the signal generator through a 1000 mmf capacitor to the grid (pin 1) of the video amplifier tube V-7 (6AH6), and the low side to B-.

2. Connect the voltmeter and germanium crystal rectifier, as shown in Figure 5, between the cathode of the picture tube (yellow lead) and B-. Use the lowest voltage scale on the meter.

3. With the signal generator accurately set at 4.5 mc and maximum output, adjust trap L-18 for minimum reading on the meter.

IF AMPLIFIER ALIGNMENT

Equipment Required:

IF Sweep Generator meeting the following requirements:

18 to 30 mc, approximately 12 mc sweep width. Output constant and adjustable to at least .1 volt maximum with accurately calibrated, adjustable markers.

Cathode Ray Oscilloscope: preferably one with a calibrated input attenuator.

NOTE: If there is no built-in marker in the sweep generator, loosely couple the output of an accurately calibrated AM signal generator to the IF strip. At all times, keep the marker output low enough to prevent the marker from distorting the response curve.

If a wide band scope is used, the marker will be more distinct if a capacitor of 100 to 1000 mmf is placed across the scope input. Use the smallest size possible, since too large a value will affect the shape of the curve.

Procedure:

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket to eliminate horizontal pick-up in the oscilloscope.

2. By means of an external battery, apply a negative 3.0 volt bias from the bottom of the 1st IF tube grid resistor R-9 (6800) to B-.

3. Using leads as short as possible, connect the hot side of the sweep generator to the grid (pin 1) of the 1st IF tube V-3 (6AU6) through a 5000 mmf capacitor (do not use the loose or "spraying" method of coupling). The low side is connected to B-. Set the center frequency of the sweep to about 24.6 mc and adjust initially for a sweep deviation of approximately 12 mc. However, a sweep of from 8 to 10 mc may be found better for overall alignment.

4. Using R-27 (100K) as a decoupling resistor, connect the scope between the top of the detector load resistor R-26 (5600) and B-. If a stronger output is required, connect the scope between the picture tube cathode and B-. The curve seen at this position will be the reverse of the polarity shown in Figure 6.

5. Set the contrast control at minimum.

NOTE: If a distorted or unstable picture is seen on the oscilloscope during alignment, it may be necessary to stop the oscillator by disconnecting resistor R-10 (1000) from the plate (pin 6) of the oscillator tube V-2B (12AT7), or by substituting another tube with pin 6 removed.

CAUTION:

1. Do not reduce the oscilloscope gain and increase signal input so that the top of the curve is flattened, due to limiting in the video or scope amplifiers.

2. The dress of plate & grid components in the IF affects tuning. Do not move indiscriminately.

3. On the IF coils and on the traps, the resonance point will be found at two settings of the slug. The correct setting is the one which is found with the greater part of the adjusting screw out of the coil.

NOTE: The 1st & 2nd IF traps are tuned from bottom of chassis, while IF cores are adjusted from the top.

6. Tune the low frequency trap L-14, located on the 2nd IF coil, for maximum attenuation on the curve at 21.9 mc.

7. Tune the high frequency trap L-12, located on the 1st IF coil, for maximum attenuation on the curve at 27.3 mc.

8. Adjust the 1st IF coil, L-11, to place a 26.6 mc marker on the high side of the response curve 60% down from maximum response. See Figure 6.

9. Adjust the 2nd IF coil, L-15, to place a 22.7 mc marker on the low side of the response curve 60% down from maximum response.

10. Adjust the 3rd IF plate transformer T-2 to provide a flat top or symmetrical response curve.

11. Reset the traps (steps 6 & 7) and again check the IF for proper response.

NOTE: It is suggested that the bias be removed for accurate resetting of the traps.

12. With bias applied, connect the sweep between the grid (pin 2) of the mixer tube V-2A (12AT7) and B-.

13. Disconnect the trimmer, C-14, in LC circuit in the grid of the mixer tube, or short the trimmer through a 10,000 mmf ceramic disc type to B-.

14. Bring both cores of the mixer transformer, T-1, simultaneously from the outside towards the center. The half-way markers should be 26.4 mc and 22.9 mc. See Figure 7.

NOTE: In aligning the three IF coils, each coil is adjusted individually, but when adjusting the primary and secondary of the mixer transformer, the adjustments should be made simultaneously. The important point to keep in mind is to obtain a flat response curve with as much gain as possible. The sides of the curve should be straight and as steep as possible. Simultaneous adjusting of the primary and secondary is the easiest way to obtain this result. The transformer by itself is, in effect, tuned for the same pass band as the three staggered circuits. See Figure 7. The only difference in the overall waveform should be that the sides of overall wave are steeper. Constant use of the 50% markers (22.9 mc & 26.4 mc) should be resorted to, since it is absolutely necessary to obtain the proper curve. A slight dip (not exceeding 10%) is permissible in the mixer transformer response curve.

BANDWIDTH

The bandwidth may be determined by connecting an AM generator to the mixer grid. With the generator frequency at 24.6 mc, adjust the output for 1 volt reading on a VTVM connected at the plate (pin 2) of the video detector tube V-6 (6AL5) and B-. Double the output of the generator. Now by tuning either side of 24.6 mc and noting the frequencies at which the VTVM again reads 1 volt, the 6 db bandwidth points are indicated.

REGENERATION CHECK

After the above IF and mixer transformer alignment has been made, a check for regeneration in the IF amplifier strip should be made. This is done by removing the battery bias and observing the output response curve on the oscilloscope, as taken between the picture tube cathode and B-. The bandwidth may change with the bias removed but should not change more than 0.2 mc. Set the contrast control to maximum gain. Decrease the input until the output signal shows a marked decrease. Any regeneration present will be indicated by sharp peaks on the overall response curve. The oscillator should be stopped, as described above, during this procedure.

CAUTION: Do not inject too much marker signal.

place trimmer C-14 in LC circuit of mixer grid or remove 10,000 mmf ceramic between trimmer and B-. Adjust the trimmer so it is tuned to the center of the mixer response curve. This is indicated by observing the effect of the LC circuit on the mixer response. Increasing the capacity of the trimmer and bringing the LC circuit from above the IF range into the IF range, it will be noted that the mixer curve will pull down on the high side, then straighten out as the LC circuit approaches the middle of the range, and pull down on the low side as the LC circuit approaches the low end of the IF range. The proper tuning point is that point at which the mixer curve straightens out. In effect, the LC circuit is similar to a jack coil when it is within the IF range.

CAUTION: Tuning the LC circuit very low will cause oscillation.

IF SENSITIVITY MEASUREMENTS

IF Stages Only

1. Remove the battery bias from 1st IF tube grid.

2. Connect an AM signal generator, set at 24.6 mc, through a blocking capacitor of 5000 mmf, between B- and the grid (pin 1) of the 1st IF tube V-3 (6AU6).

3. Connect an electronic voltmeter across the video detector load resistor R-26 (5600). Both leads from the meter should be decoupled with 100K ohm resistors.

4. Set the contrast control for maximum sensitivity.

5. Stop the oscillator tube by disconnecting resistor R-10 (1000) from the plate (pin 6) of tube V-2B (12AT7) or by substituting another tube with pin 6 removed.

6. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 700 microvolts.

Mixer & IF Stages

The preliminary preparations are the same as for checking the sensitivity of the IF stages except:

1. Connect the AM signal generator, set at 24.6 mc, through a 5000 mmf capacitor, between B- and the grid (pin 2) of the mixer tube V-2A (12AT7).

2. The signal required to produce 1 volt (negative) above contact potential on the meter should be less than 125 microvolts.

OSCILLATOR, ANTENNA AND RF ALIGNMENT

NOTE: The IF must be aligned before the RF section can be properly phased.

Equipment Required:

Sweep Generator: Frequency range 40-220 mc; 10 mc sweep width
Output constant and adjustable
Adjustable markers (markers should be calibrated occasionally by checking against an accurate signal generator).

Oscilloscope: Preferably one with a calibrated input attenuator.

Signal Generator: Frequency range 40 to 220 mc
Accurately calibrated
AM modulated, 400 cycle

FREQUENCY CHART

Chan	Frequency	Picture	Sound	Oscillator

(* in later sets)

ANTENNA & RF ALIGNMENT PROCEDURE

1. Remove high voltage generator tube V-17 (6BQ6GT) from its socket and stop the oscillator by disconnecting R-10 (1000) from plate (pin 6) of V-2B (12AT7).

2. Connect the sweep generator across the antenna terminals on the chassis with the antenna lead-in removed. The line from the sweep generator should be as short as possible.

3. Connect the oscilloscope through a decoupling resistor of 150,000 ohms, between the cathode (pin 3) of the mixer tube V-2 (12AT7) and B-.

4. Short out the AGC circuit with a clip lead from the AGC bus to B-.

5. Refer to Figure 4 for the RF trimmer location and to Figure 9 for the locations of the antenna and RF coils. The frequency chart listed previously gives the channel and alignment frequencies.

6. The antenna coils are tuned to the video carrier frequency and the RF coils are tuned to the sound carriers. Figure 10 shows the shape of the curve which should appear on the scope for channels 2-6 and Figure 11 the curves for channels 7-13.

7. Turn the station selector switch to channel 10. Set the center frequency of the sweep generator to the center frequency of channel 10 (195 mc).

8. Adjust ceramic trimmer, C-6, so that picture and sound markers are as in Figure 11.

9. Check channels 7 to 13 for proper response and, if necessary, tune the coil L-6. These coils may be tuned by spreading them to decrease inductance or compressing them to increase their inductance. See Figure 9 for location of coils. This will have more effect on channels 10 to 13 than 7 to 9. If L-6 is adjusted, it may be necessary to readjust RF trimmer C-6, and recheck the high channels.

NOTE: As the bandwidth of the high channels is very broad, a slight variation is permissible as shown in Figure 11.

10. Move bandswitch to channel 6.

11. With center frequency of sweep generator at the center frequency of channel 6 (85 mc) introduce markers corresponding to sound and picture carriers and compare with curve of Figure 10.

NOTE: A convenient method of determining whether a coil is tuned correctly is to insert a brass or iron slug into the coil. Brass decreases and iron increases the inductance.

12. After channel 6 has been aligned, progress downward through channel 2.

CAUTION: Make certain the station selector switch is on the correct channel before checking band pass.

OSCILLATOR ADJUSTMENT

1. Put oscillator back in circuit.

2. Remove the short from the AGC circuit and apply -3 volt battery bias to AGC.

3. Move the oscilloscope to the video detector output. To provide decoupling, it is best to connect to the low side of R-27 (100K) which is connected thru chokes L-32 and L-16 to the plate (pin 2) of the detector tube V-6 (6AL5).

4. Turn station selector switch to channel 10.

5. Set the contrast control at minimum (counterclockwise).

6. Set the center frequency of the sweep generator to 195 mc and keep the output low enough to show no evidence of limiting in the overall response curve.

7. Introduce a marker corresponding to the sound carrier of channel 10 (197.75 mc).

8. With the fine tuning trimmer at mid-capacity, adjust the oscillator trimmer, C-12, to move the response to the point where the sound marker drops into the trap on the high side of the curve.

9. Check channels 7 to 13 to note whether the sound marker will drop into the trap on the sound side of the response with the fine tuning trimmer within plus or minus 22-1/2 degrees of mid-capacity. If this is not possible, adjust L-7. This coil has more effect on channels 10 to 13 than 7 to 9. It may have to be adjusted to obtain proper tracking on the high channels.

10. Move to channel 6 and progress downward through channel 2, spreading or compressing the coil sections to make the sound marker drop into the trap on the low side with the fine tuning trimmer within 22-1/2 degrees of mid-setting (each number on the station selector switch knob represents 30 degrees).

NOTE: Overall response should be substantially flat and of proper bandwidth.

REVISED OSCILLATOR ADJUSTMENT

Following is the oscillator alignment procedure for the revised tuners appearing in later production TS-74 chassis. Where formerly the oscillator was tuned beneath the carrier on all high channels, it has been raised above the carrier on channels 11, 12, and 13. This places the oscillator outside the TV spectrum on all high channels and, therefore, eliminates the possibility of its interfering with neighboring television receivers.

The new tuner may be identified by the additional coil in the oscillator section. The new coil is across the cut-out section of the stamped plate on the oscillator deck (see Figure 9). In addition, the switch shaft is color coded (red for TS-74 chassis).

OSCILLATOR ADJUSTMENT

NOTE: The Antenna & RF Alignment Procedure is the same as in previous TS-74 chassis. The oscillator adjustment is revised as follows.

1. Put oscillator back in circuit.

2. Remove the short from the AGC circuit and apply a -3 volt battery bias to the AGC bus.

3. Move the scope to the test socket on the chassis rear with the high side connected to pin 4 and the low side to pin 5 (B-).

4. Set the contrast control at minimum (counterclockwise).

5. Remove the fine tuning knob and turn shaft until the slot is in a horizontal position. This represents the mid-capacity position.

6. Turn station selector switch to channel 12.

7. Set the sweep generator on channel 12 with a center frequency of 207 mc and at least a 12 mc sweep. Keep the output low enough to show no evidence of limiting in the overall response curve.

NOTE: Before aligning the oscillator section, make certain the 3.3 microhenry choke in the mixer grid is dressed away from the 2 mmf capacitor tied to the same grid.

8. Introduce a marker corresponding to the sound carrier of channel 12 (209.75 mc).

9. Adjust oscillator ceramic trimmer so that the sound marker falls into the 21.9 mc trap dip in the response curve.

10. Turn generator and station selector to channel 9 with the fine tuning shaft slot still in the horizontal position.

11. Spread or compress the 3-turn coil located in the center of the oscillator plate (L-4M, Figure 9) so that the sound marker for channel 9 falls into the 27.3 mc trap dip in the response curve. As the oscillator is tuned below the carrier on channels 7, 8, 9 & 10, the 27.3 mc trap will be in the same position as the 21.9 mc trap in step 9.

12. Repeat steps 6, 7, 8 & 9.

13. Turn generator and station selector to channel 13.

14. Turn fine tuning trimmer so that the sound marker for channel 13 falls into the 21.9 mc trap dip of response curve. The slot in the fine tuning shaft should not have moved more than 30 degrees from the horizontal position to accomplish this (each number on the station selector knob represents 30 degrees).

15. If more than a 30 degree change in fine tuning trimmer was needed in step 14, adjust channel 13 oscillator coil (L-7) by spreading or compressing until the 30 degree requirement is met.

NOTE: Each adjustment of channel 13 oscillator coil (L-7) will necessitate a rechecking of the oscillator trimmer on channel 12 as per steps 6, 7, 8 & 9.

16. Check channels 12, 11, 10, 9, 8, and 7 by noting whether the fine tuning trimmer can drop the sound marker for each channel in the trap dip by a 30 degree rotation. If one of the channels does not meet the 30 degree requirements, a compromise must be made by resetting channel 9 or 12, whichever is closer to the channel in question.

Example: 1) If channel 11 does not meet the 30 degree requirement, return station selector and generator to channel 12 and tune ceramic trimmer toward channel 11 (trimmer fre-

©John F. Rider
World Radio History

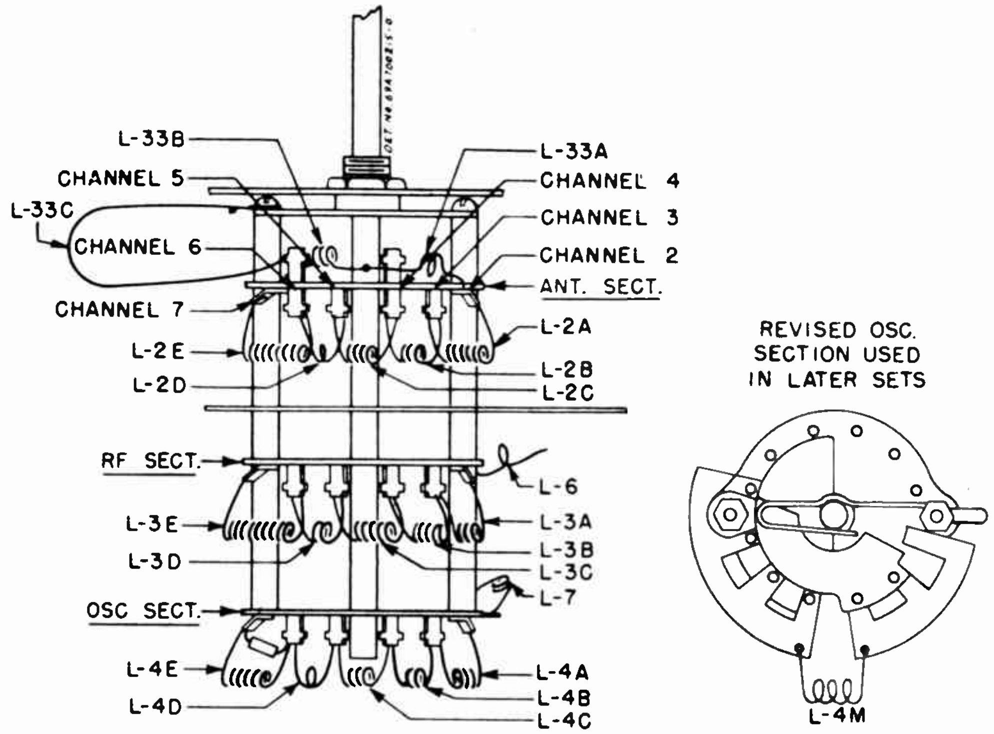

FIGURE 9. ANTENNA, RF AND OSCILLATOR COIL LOCATIONS

quencies lowered by tightening screw). This will tend to move channel 12 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Do not adjust trimmer any more than is necessary to get the channel in question back within the 30 degree requirement.

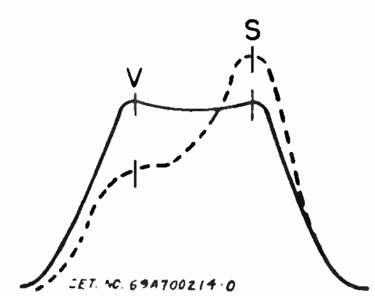
2) If channel 10 does not meet the 30 degree requirement, move station selector and generator to channel 9 and tune the 3-turn coil (L-4M, Figure 9) toward channel 10 (coil frequency raised by spreading turns). This will also tend to move channel 9 sound marker out of the trap dip, but this can be compensated for by the fine tuning trimmer. Again, do not adjust the coil any more than is necessary to bring the channel in question back within the 30 degree requirement.

17. Turn sweep generator and station selector switch to channel 6.

18. Adjust channel 6 oscillator coil (L-4E, Figure 9) so that the sound marker for channel 6 falls into the 21.9 mc trap dip with the fine tuning trimmer at mid-capacity (shaft slot in horizontal position). Always spread or compress channel #6 oscillator coil in units of 3 turns. Compressing turns will move curve toward sound marker, while spreading will move curve toward video marker.

IMPORTANT: Since the coils are in series, the proper alignment of channel 6 will simplify the phasing of the channels to follow.

19. Adjust channels 5 and 4 so that the sound marker for each channel falls into the 21.9 mc trap dip in the



—SOLID LINE INDICATES OPTIMUM RESPONSE.

--- DOTTED LINES INDICATES PERMISSIBLE VARIATION.

FIGURE 10. RF RESPONSE CURVES - CHANNELS 2-6

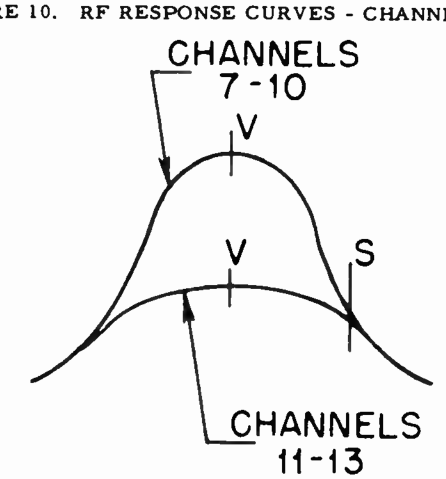


FIGURE 11.
RF RESPONSE CURVES - CHANNELS 7-10 & 11-13

curve with the fine tuning trimmer set no more than 15° from mid-capacity.

20. Channels 3 and 2 should be adjusted so that the sound marker falls into the 21.9 mc trap dip with the fine tuning trimmer within 15° of maximum capacity.

OVERALL RECEIVER SENSITIVITY MEASUREMENT

An overall measurement of sensitivity is made as follows:

1. Connect an AM signal generator to the input terminals of the receiver chassis after removing the short 300 ohm lead which connects to the antenna input strip on the back of the cabinet. To match the generator to the receiver input, a resistor matching network should be used. In the case of a generator with a 50 ohm output impedance, for example, place a 100 ohm resistor in series with the output terminal of the generator and a 150 ohm resistor in series with the ground terminal.

2. From cathode of picture tube to B-, connect a calibrated oscilloscope.

NOTE: To calibrate scope, connect it across 6.3 volt filament supply. The peak-to-peak amplitude on the screen will then be approximately 18V (6.3 x 2.8).

3. Set contrast control for maximum sensitivity.

4. Tune signal generator to the video carrier frequency of the channel being checked. Generator signal should be 30% modulated at 400 cycles. The signal from the generator to produce 20 volts peak-to-peak at picture tube cathode should be less than 25 microvolts on channels 2 to 6 and less than 75 microvolts on channels 7 to 13.

CIRCUIT DESCRIPTION

LOW VOLTAGE POWER SUPPLY

The low voltage power supply (Figure 12) provides plate voltage for all tubes except the high voltage applied to the second anode of the picture tube. The heater transformers supply heater voltage to all tubes except the HV rectifier, which is energized by the horizontal sweep current.

One low voltage secondary of T-8, the step-down filament transformer, supplies filament voltage to all tubes except the audio driver-limiter (V-8), the vertical output tube (V-14), and the horizontal damping diode (V-18). Since the damping diode (V-18) develops a high voltage pulse at its cathode, and its cathode is tied to the filament to prevent breakdown in the tube, it is necessary to provide a separate, low capacity, well-insulated transformer (T-7) to heat this filament. The vertical output tube V-14 (25L6GT) requires a 25 volt filament supply and, hence, is provided with a separate 25 volt tap on the transformer. In earlier production chassis, the audio driver-limiter (V-8) had its cathode connected to a B plus point of about 120 volts. In order to keep the heater to cathode difference of potential low, it was necessary to provide a separate filament winding for this tube. This tube's cathode is now returned to B- but, since the separate winding is still supplied on present production transformers, it is still used for V-8.

The B plus plate supply uses a voltage doubler. R-104 is a limiting resistor to protect the rectifiers from initial current surges and also serves as a fuse in case of B plus shorts. When the polarity of the applied 117 volt AC is such as to make the side of the line connected to R-104 negative, E-2 will conduct and charge C-106 (300 mmf) to peak line voltage. On the next alternation, E-1 will conduct and the voltage applied to it is now the peak line voltage plus the peak charge stored in C-106. This results in a charge of about 260 volts on C-63C (200 mf). The speaker field is used as a filter choke. The focus coil and the resistor network, which controls the current thru it, act also as a voltage divider to supply plate and screen voltages to several tubes, as shown in Figure 12.

Another voltage divider from B plus to B-, consisting of R-76 (1 meg) and the potentiometer, R-77 (1 meg) provides a variable bias on the cathode of the picture tube, to serve as a brightness control.

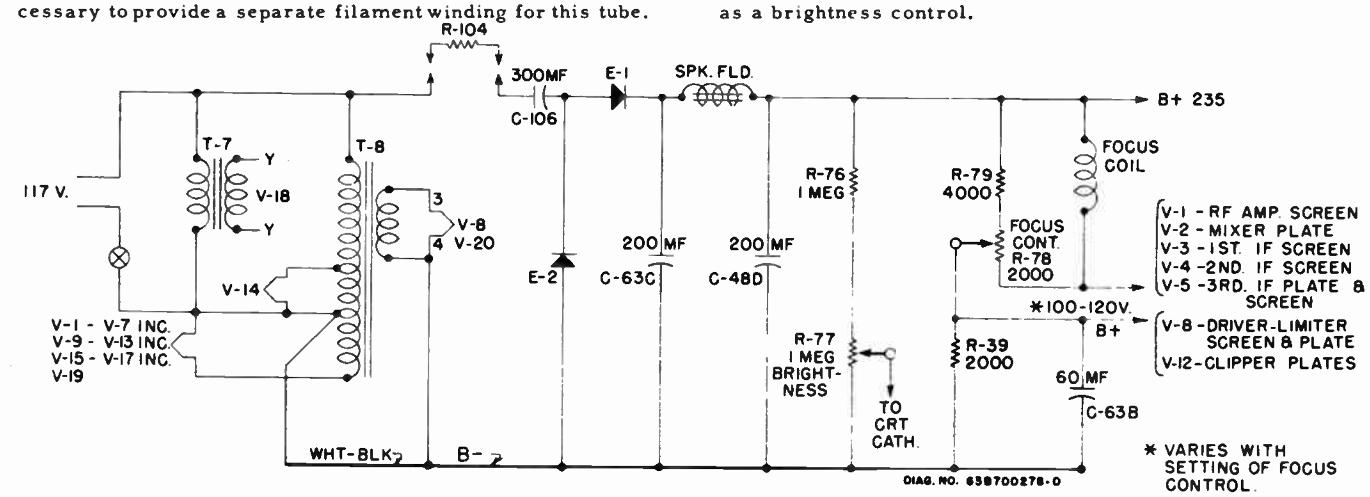

FIGURE 12. SIMPLIFIED SCHEMATIC OF HEATER AND LOW VOLTAGE POWER SUPPLY

World Radio History

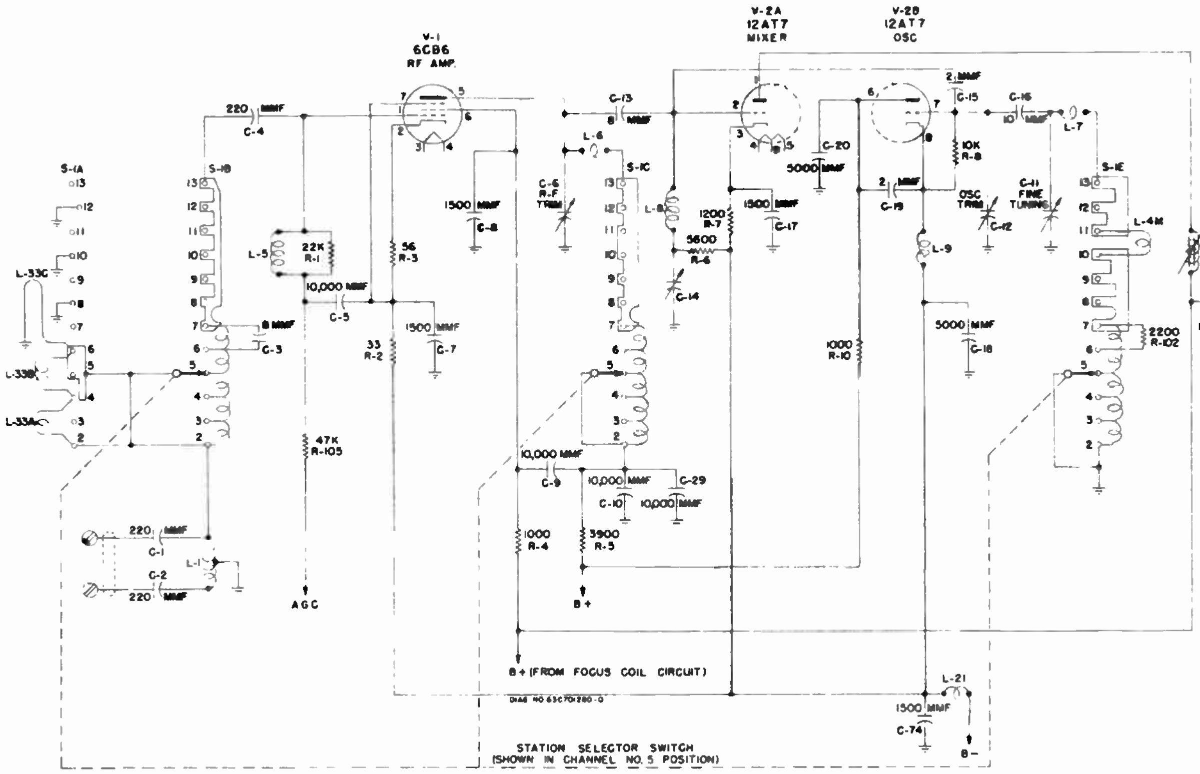

FIGURE 13. SIMPLIFIED SCHEMATIC OF RF TUNER

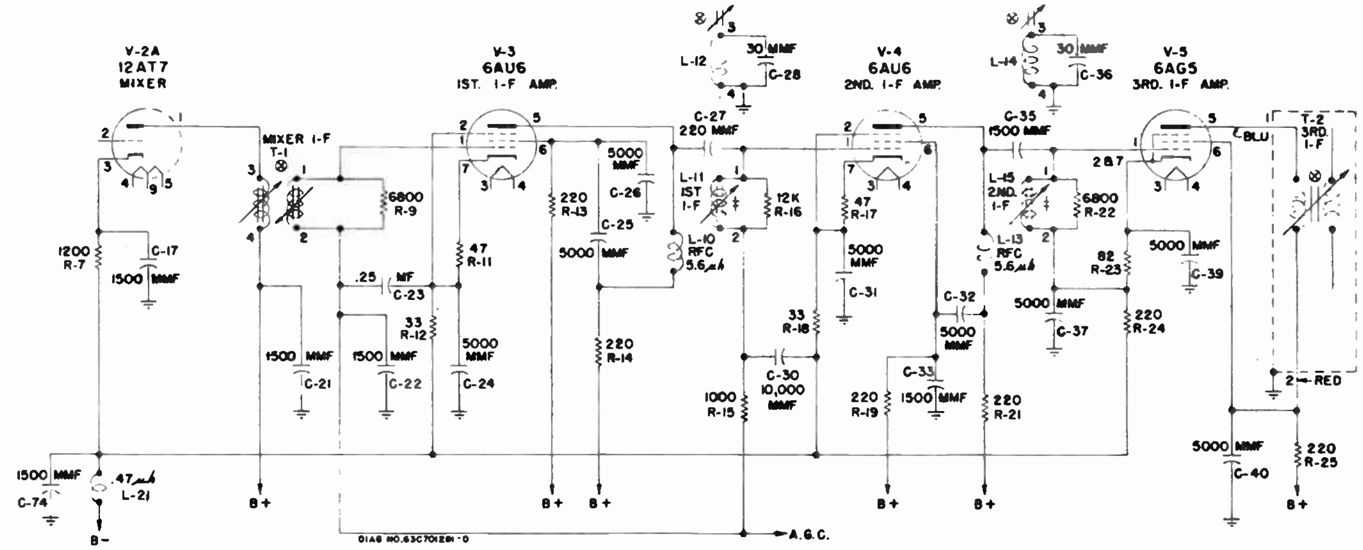

FIGURE 14. SIMPLIFIED SCHEMATIC OF IF AMPLIFIER

THE RF TUNER

Antenna Input

Figure 13 is a simplified schematic of the tuner.

The antenna input coil, L-1, couples the balanced line to the single ended input circuit for the RF tube, V-1. Optimum antenna coupling for all channels is obtained by the coupling coils L-33A, L-33B, L-33C, and the coupling leads on channel positions 8, 10 and 12 of switch wafer S-1A. These can be considered the primary of the antenna transformer. The secondary, or tuned grid circuit, includes also the continuous, tapped coil mounted on wafer S-1B for the low channels (2-6) and the stamped metal plate in series with the coil for the high channels (7-13). The purpose of the antenna coil, coupling leads, and the secondary circuit, is to match the 300 ohm impedance of the transmission line from the antenna to the input impedance of the RF amplifier grid circuit and to tune this circuit for the channel selected. Referring to Figure 13, it will be seen that the switch, in progressing from channel 2 to channel 13, shorts out the unused portion of the secondary winding or stamped metal plate. The bandwidth of channels 7 thru 13 is about 8 mc. The stamped metal plate is carefully designed so that with this bandwidth no adjustment is needed on the high channels. The individual coil sections on the low channels, however, may be tuned by spreading or compressing them as outlined in the alignment procedure.

RF Amplifier

The grid of the RF amplifier V-1 (6CB6) is returned to the AGC bus thru L-5 and a bypass capacity (C-5). The plate load of this tube consists of another tapped coil for the low channels and a stamped metal plate for the high channels mounted, in this case, on switch wafer S-1C. Here again, the switch progressively shorts out the unused sections of the inductance in tuning from channel 2 to 13. In this case, however, a trimmer C-6 and a choke L-6 are provided to center the high channel response while the low channel coils may be tuned by expansion or compression.

The Mixer

The mixer uses 1/2 of V-2 (12AT7). C-13 (8 mmf) couples the RF amplifier output to the mixer grid. Oscillator injection is accomplished by C-15 (2 mmf). L-8 and C-14 form a series resonant circuit tuned to the center of the IF response, to prevent interaction between the IF and the mixer input.

The Oscillator

The oscillator uses the other half of V-2 (12AT7) in a Colpitts circuit. Here again, the tuning inductance consists of the tapped coil for the low channels and the stamped metal plate for the high channels mounted on wafer S-1E. L-7 and C-12 are provided to set the center frequency on the high channels while the low channels are aligned by spreading or compressing the individual coil sections. C-11 is provided as a fine tuning control for customer use. The oscillator operates above the RF on the low channels and below the RF on the high channels except that in later production the circuit was modified to avoid interference by operating the oscillator on the high side for channels 11, 12 and 13.

THE IF AMPLIFIER

The IF amplifier uses two 6AU6 tubes and one 6AG5 tube. Figure 14 is the schematic of the IF amplifier. T-1 couples the mixer plate to the first IF grid. Coupling between primary and secondary, which are individually slug-tuned, is fixed and is designed for proper bandwidth. The plate choke L-10, of the 1st IF tube V-3 (6AU6), is coupled to the grid coil, L-11, of the 2nd IF tube V-4 (6AU6) thru C-27 (220 mmf). At IF frequencies, the impedance of C-27 is negligible and for all practical purposes, L-10 and L-11 can be considered as being in parallel, L-11 being slug tuned. A similar method is used between the 2nd and 3rd IF tubes. The 3rd IF plate is coupled to the detector by T-2, a unity coupled transformer. The IF circuits are stagger-tuned for proper bandwidth as explained in the Alignment Instructions. L-12 and L-14 are separately tuned trap windings on IF coil forms L-11 and L-15, respectively. Together with C-28 and C-36, they form absorption type trap circuits which steepen the high and low skirts of the IF response for better picture quality and to stabilize the audio response with intercarrier sound.

Decoupling has been used not only in the plate supply and AGC circuits, but also in the filament circuits to prevent regeneration.

THE VIDEO DETECTOR

One-half of V-6 (6AL5) is used as the video detector. Figure 15 is a schematic of the video detector. Since for noise limiting purposes it is desirable to apply a signal with negative going sync pulses to the grid of the video amplifier, the detector load R-26 (5600) is placed in the plate circuit of the diode. L-16, L-32 and C-42, form a low pass filter to keep IF frequencies off the grid of the video amplifier.

Since this chassis operates on the intercarrier sound system, the detector heterodynes the video and sound IF frequencies, and produces the 4.5 mc beat frequency which becomes the new audio IF frequency. The negative DC voltage developed at the high side of the detector load R-26 (5600) will be a function of carrier level. This voltage is fed to the AGC bus thru R-28 (1.5 meg) and controls the gain of the RF and 1st and 2nd IF amplifiers.

THE VIDEO AMPLIFIER

The video amplifier V-7 (6AH6) not only amplifies the video signal but also the 4.5 megacycle audio IF beat. Figure 16 is a schematic of the video amplifier. In its plate circuit, this beat is separated from the video signal and fed to the grid circuit of the audio driver-limiter tube V-8 (6AU6) by C-49 (2.2 mmf) and L-20, the sound take-off coil. The 4.5 mc trap, L-18 and C-50, is a parallel resonant circuit which, when properly tuned, offers a high impedance to this frequency, to prevent its reaching the picture tube.

By applying a negative signal to the grid of the video amplifier, a noise limiting action is achieved because noise pulses of amplitude greater than the sync level will drive the tube to cut off and, therefore, will not be present in the plate circuit. Since a single video amplifier tube is used, the signal at its plate will be positive and, as might be expected, is used to modulate the cathode of the picture tube rather than the grid, because the blanking pulses must cut the picture tube off and the polarity of the video information must be such that dark picture elements result in making the grid more negative with respect to the cathode.

L-17 and L-19 are peaking coils to extend the high frequency response of the amplifier. The contrast control, R-31A, is placed in the cathode circuit of the video amplifier and controls the bias and, therefore, the gain of this tube. The network of resistors and condensers across taps on the contrast control decreases degeneration at the higher fre-

SIMPLIFIED SCHEMATIC OF VIDEO AMPLIFIER

quencies and, therefore, helps to extend the high frequency response. The composite video signal is fed to the picture tube cathode thru coupling condenser C-81 (.1).

THE AGC

The negative DC voltage developed across the detector load resistor, R-26 (5600), is the AGC voltage. It will be noted that the low side of this resistor is connected to the arm of the contrast control potentiometer, R-31A. R-30 (47) is shunted across the arm of the contrast control and B-. In weak signal areas, this arrangement results in a delay in the AGC action. For a weak signal, minimum bias is desired on the video amplifier, therefore, the arm of the contrast control will be closest to the cathode end of the potentiometer. Because R-30 is then shunted across the entire contrast control, most of the plate current will flow thru it and develop a positive voltage of approximately one volt at the arm with respect to B-. Since the low side of the detector load is tied to this positive voltage, no AGC voltage will develop until the signal is strong enough to overcome this positive voltage and, therefore, no AGC bias is applied to the controlled tubes under weak signal conditions. In a strong signal area, however, where the arm of the contrast control approaches the B- end of the control, R-30 is shorted out and full AGC voltage is developed.

THE AUDIO SYSTEM

The audio system employs a driver-limiter, V-8 (6AU6); a ratio detector V-9 (6AL5); a first audio amplifier, V-10 (6J5), and an audio output tube, V-11 (6V6). Figure 17 is a schematic of the audio system. The driver-limiter is operated at low plate and screen voltages to act as a partial limiter to minimize any amplitude modulation. A conventional ratio detector and audio amplifier are used.

THE CLIPPER

The clipper uses a 6SN7GT tube. The clipper schematic is shown in Figure 18. The composite video signal with positive going sync is applied thru R-56 (10K) and C-66 (.005) to the grid of the first clipper from the plate circuit of the video amplifier. Under no signal conditions, the tube is unbiased. The positive signal, however, will cause the tube to draw grid current and the voltage drop across R-55 (1 meg), negative at the grid, will charge C-66 to such a value that only the most positive part of the signal, which is the sync pulse, will cause plate current to flow. Therefore, the video information and the blanking pulses are clipped off and only the sync pulses, now negative in polarity, appear in the plate circuit. The second clipper is so biased that the peaks of the sync pulses will drive the tube to cut off, which results in squared pulses of positive polarity in the plate circuit of this tube. A slight increase in sync pulse amplitude is obtained by a small positive voltage applied to the grid of the 2nd clipper by R-106 (390K).

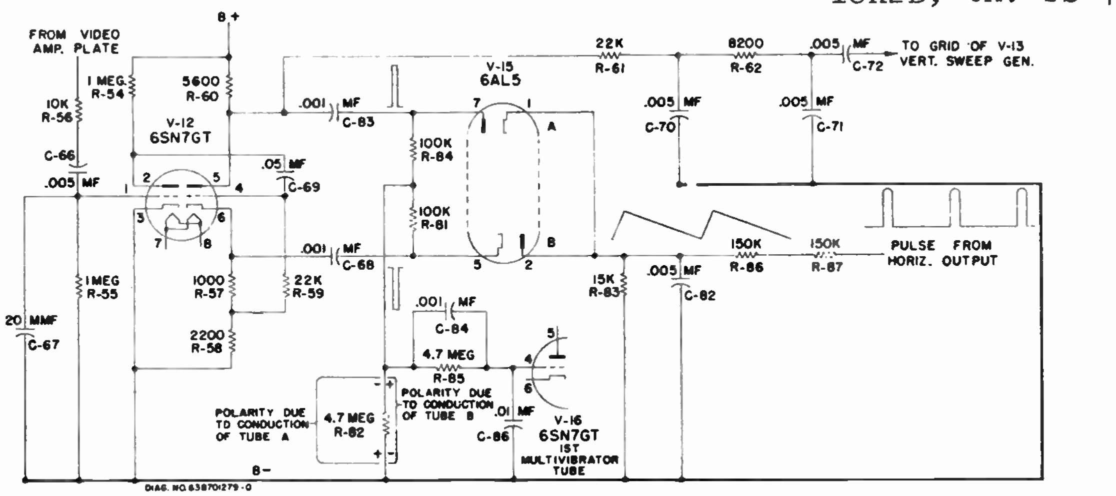

FIGURE 18. SIMPLIFIED SCHEMATIC OF CLIPPERS & PHASE DETECTOR

THE VERTICAL SCANNING SYSTEM

Figure 19 is a schematic of the Vertical Scanning System.

The integrating network, shown in Figure 18, composed of R-61, C-70, R-62, and C-71, changes the vertical group of sync pulses into a single pulse of suitable amplitude to trigger the vertical oscillator. The vertical oscillator is an asymmetrical multivibrator using two tubes V-13 (6J5) and V-14 (25L6). V-14 also serves as the output tube.

A multivibrator can be considered as a resistance coupled amplifier in which the output of the second tube is coupled back to the input of the first tube. V-13 is the automatic switch which charges and discharges the sawtooth forming condenser C-75 (.05), connected in its plate circuit. The circuit components of the multivibrator are chosen so that V-13's conductance period is about 7% of the entire cycle, to insure that retrace time of the scan will have the proper relationship with the trace time. This circuit is modified from the conventional resistance coupled multivibrator in that the plate of the output stage, which is also the second multivibrator tube, has a fairly large value of inductance, introduced by the output transformer stepping up the yoke inductance. When the tube is cut off, a positive pulse of several hundred volts is developed across this inductance. A portion of this pulse, obtained by means of the feedback network R-73, R-74, R-75 and C-78, C-79 and C-80, is used to cause the discharge tube V-13 to go into heavy conduction.

For the purposes of explaining the circuit action, assume that a time has been reached in the cycle when the trace period is almost completed. During this trace period V-13 is cut off and V-14 is conducting. C-73 has been discharging thru the grid resistors of V-13, R-63 (680K) and R-64 (the vertical hold control) and resistors R-75 and R-74. This discharge circuit makes the grid end of R-63 negative and biases the tube beyond cut-off. When the energy stored in the condenser has decreased sufficiently, the grid of V-13 reaches the threshold of conductance and the tube begins to draw current. Condenser C-76, which has been charged to nearly the B plus voltage, now starts to discharge thru V-13 and R-69 (3.3 meg) and this discharge current makes the grid end of R-69 negative tending to cut off V-14, and initiates the retrace. With the sudden change of plate current in V-14 developed across the plate inductance, a positive pulse is applied to the grid of V-13 through the feedback network,

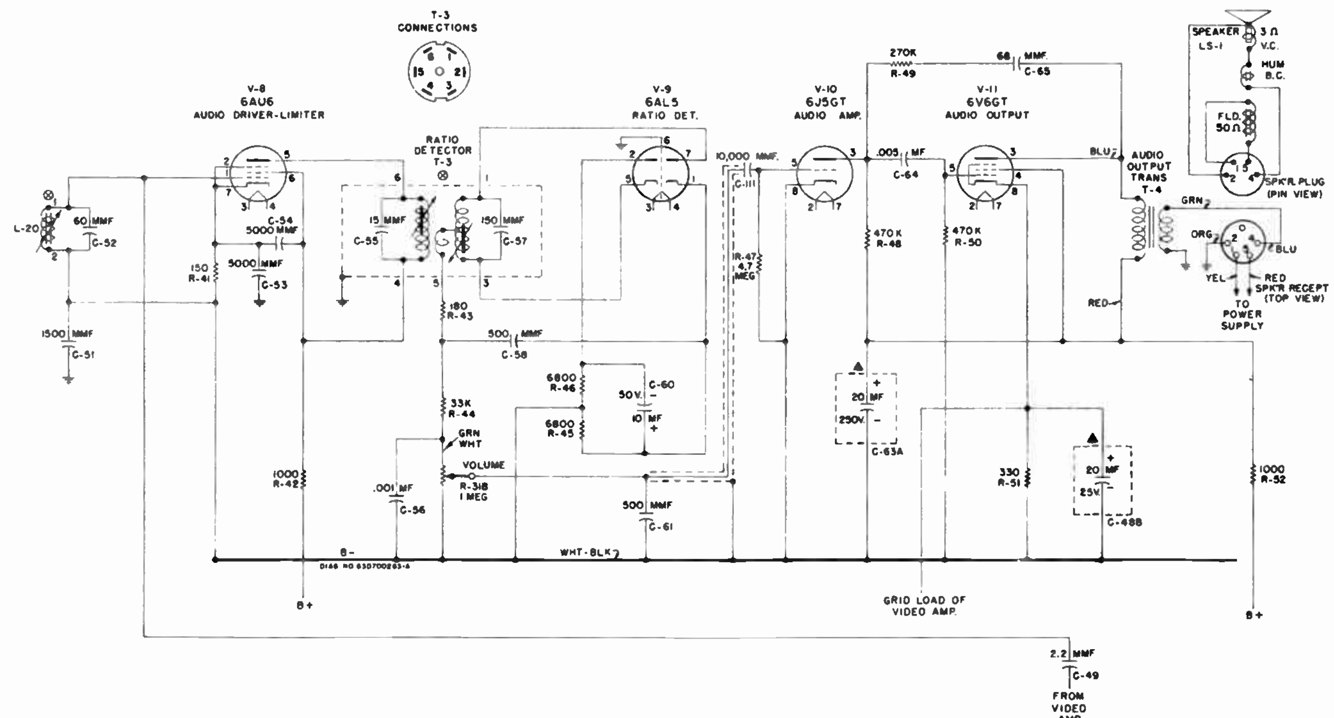

FIGURE 17. SIMPLIFIED SCHEMATIC OF AUDIO SYSTEM

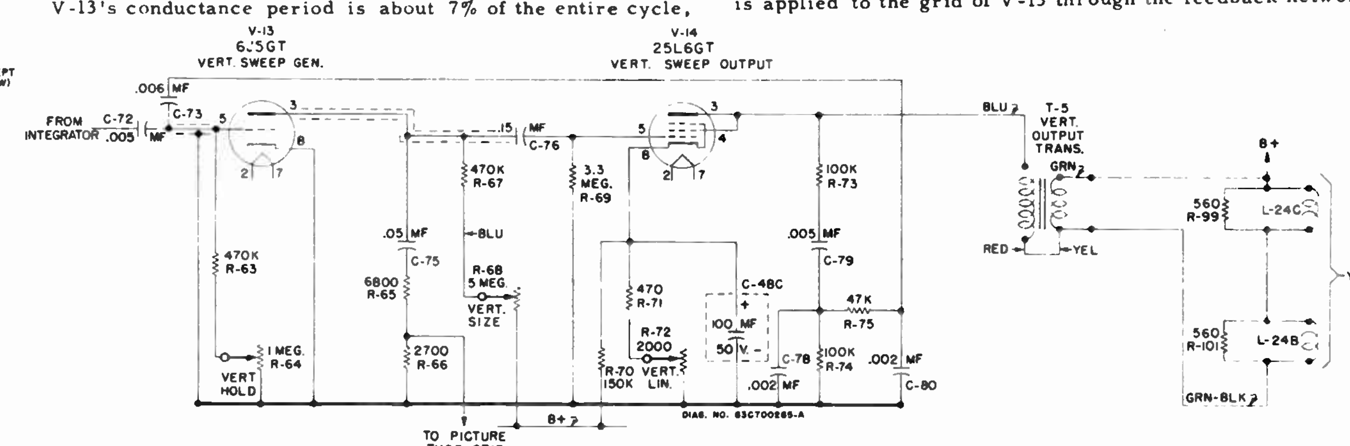

FIGURE 19. SIMPLIFIED SCHEMATIC OF VERTICAL SCANNING SYSTEM

©John F. Rider

driving this tube into heavy conduction. C-75 will then discharge thru V-13. The voltage developed at the plate of V-13 will be the combination sawtooth and pulse voltage shown in Figure 22(1). The pulse is formed by the peaking resistors R-65 and R-66. When V-13 goes into conduction, the voltage at the plate of V-13 drops suddenly to a value determined by the relationship of the plate resistance of V-13 to the total resistance in the discharge circuit of C-75, which consists of R-65, R-66 and the plate resistance of V-13. After this initial instant, the charge on C-75 decreases, causing the voltage decrease at the plate shown between points "c" and "d" of Figure 22(1). When the positive pulse on the grid of V-13 has decreased to the value where the negative charge on C-73 becomes operative and cuts off V-13, the voltage on the plate of V-13 and, correspondingly, on the grid of V-14, rises quickly to point "a" on the curve, the start of the trace.

The negative pulse shown between point "b" and "a" of Figure 22(1) acting on the grid of V-14, tends to cut the tube off and raises its plate resistance to the larger value required to dissipate the energy in the plate circuit inductance during the short retrace period.

Since the plate circuit of the vertical output stage V-14 has inductance, and as the time constant of an inductive circuit decreases with an increase of resistance, just the opposite of an RC circuit, the increase in plate resistance of the tube is used to obtain the short time constant circuit required for proper retrace time.

By returning the grid of the picture tube to the junction of the two peaking resistors, R-65 and R-66, a negative pulse of suitable amplitude to cut the picture tube off during retrace is obtained, resulting in elimination of retrace lines on the screen.

The feedback network to the grid of V-13 also serves to filter out horizontal pulses which are present in the plate of V-14 due to coupling in the yoke and which are coupled to the plate thru the output transformer. The windings of the vertical output transformer are connected series opposing, which reduces the step-down ratio and, hence, the inductance in the plate of V-14 in order to shorten the retrace time.

The controls found in this circuit are:

1. The Vertical Hold Control R-64 (1 meg). This control varies the resistance in the discharge circuit of C-73 (.006) and, hence, provides a means of varying the frequency of the multivibrator. In practice, this control is adjusted so that the incoming positive sync pulses, which are of constant amplitude, will fire the tube in exact synchronization with the transmitting station's vertical scan.

2. The Vertical Size Control R-68 (5 meg). This control varies the charging current into C-75 (.05) and, hence, the amplitude of the voltage developed across it. Variation of this voltage varies the drive on the grid of V-14 and controls vertical size.

3. Vertical Linearity R-72 (2000). This control, by bleeder action thru resistor R-70 (150K) and the output tube's plate current, sets the bias and determines the tube's operating point on its plate current curve. Since this curve is not linear, some distortion can be introduced to counteract any non-linearity in the sawtooth grid voltage.

Since all of these controls are also in the multivibrator circuit and have an effect also on its frequency, there will be some interaction between them. Usually readjustment of size or linearity will require readjustment of the hold control.

HORIZONTAL SCANNING SYSTEM

The horizontal scanning system comprises a phase detector V-15 (6AL5), a cathode coupled multivibrator V-16 (6SN7), the output tube V-17 (6BQ6) and a damping diode V-18 (6W4). Figure 20 is a simplified schematic of this system.

The Horizontal Oscillator

In order to see how the phase detector automatically corrects for multivibrator frequency change, it will be necessary to understand how the correction voltage affects the multivibrator. It will be noted that this circuit differs from the vertical multivibrator in that only one coupling condenser is used but that the two tubes have a common cathode resistor. This arrangement is known as a cathode coupled multivibrator.

The operation is as follows. Assume that the trace period is almost completed. At this time, tube "A" is conducting, tube "B" is cut off. C-87 is discharging thru tube "A", R-92 (150K) and R-91 (the hold control). The discharge current of C-87 is still high enough to keep the grid of tube "B" negative and cut off. Bias is being applied to both tubes by current flow thru R-89 (1000) the common cathode resistor. When the energy stored in C-87 is reduced to the point where its discharge current no longer holds the grid of tube "B" below conductance, tube "B" starts to pass current and this current causes a greater voltage drop across R-89, the common cathode resistor, which increases the bias on tube "A" reducing its plate current. The resulting increase in voltage at the plate of tube "A" begins to charge C-87 and this charging current applies positive voltage to the grid of tube "B". The resulting heavier conduction of tube "B" develops a pulse of voltage across R-89 which cuts tube "A" off and results in a positive pulse at the plate of tube "A" which throws tube "B" into heavy conduction. This allows C-88, the saw-forming condenser to discharge thru tube "B" and R-93. When C-87 becomes charged, the charging current thru R-92 and R-91 decreases and the positive voltage on the grid, which has far exceeded the bias developed across R-89, is reduced. This results in reducing the plate current thru tube "B" and, therefore, the bias applied to tube "A" by the voltage drop across R-89. Tube "A" starts to conduct and condenser C-87 starts to discharge, cutting tube "B" off. C-88 begins to charge, starting the next trace.

L-23 and C-85 in the plate circuit of tube "A", form a resonant circuit which is tuned to the horizontal frequency (15, 750 cps). The 15, 750 cycle sine wave generated by this circuit, if properly phased, will insure that the positive pulse at the plate of tube "A", which throws tube "B" into conduction, will be more frequency stable.

C-88 and R-93, the peaking resistor, will produce the same combination pulse and sawtooth voltage shown in Figure 22(1). This action was explained in the vertical circuit.

The Phase Detector

The foregoing explanation is based on the assumption that tube "A's" grid is returned to a fixed potential point. It can be seen that if this grid is returned to a point which varies in potential with frequency of the multivibrator, it would be possible to make this variation a means of frequency control. Assume that the grid of "A" in Figure 20 is made more positive. This causes the bias of "B" to increase because of the increased drop across the common cathode resistor R-89. Capacitor C-87 will then discharge for a longer time before "B" conducts, thereby decreasing the frequency of oscillation. If the grid were made more negative, the bias across the common cathode resistor would be less and C-87 would discharge for less time before "B" started to conduct,

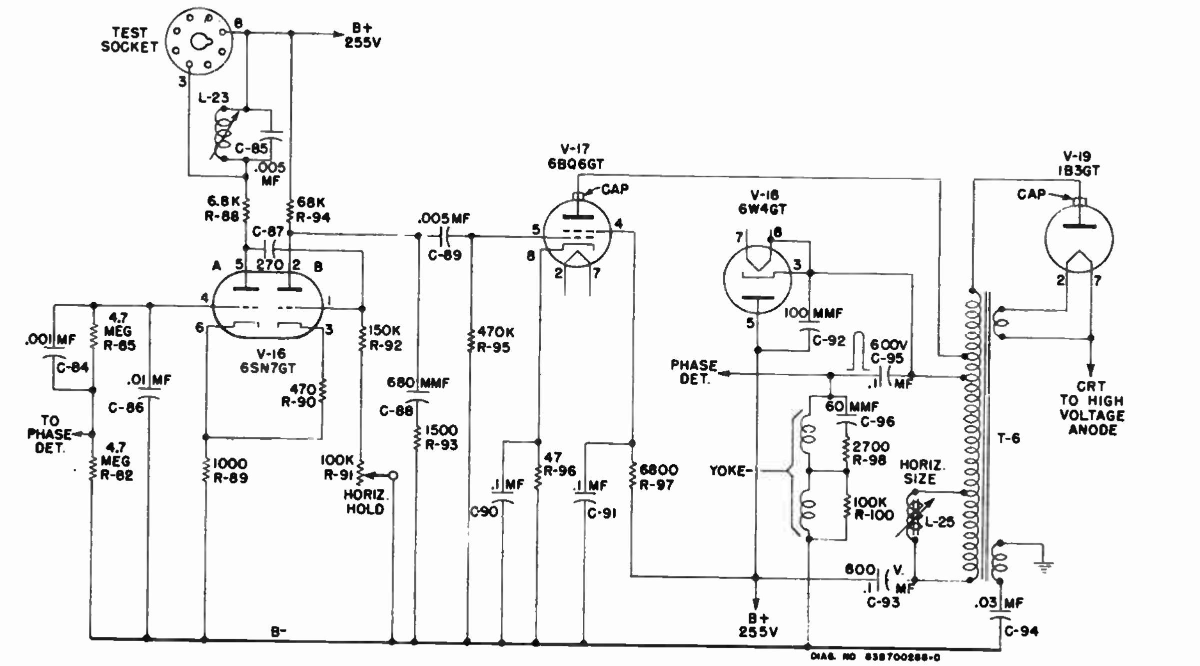

FIGURE 20. SIMPLIFIED SCHEMATIC OF HORIZONTAL SCANNING & HV SYSTEM

thereby increasing the frequency.

Figure 18 is a simplified schematic of the clipper and phase detector circuits. The phase detector V-15 (6AL5) is so connected that a comparison of the phase of the incoming sync pulses and a sawtooth derived from the horizontal output system is made. A positive sync pulse from the plate of the 2nd clipper V-12 (6SN7) is fed thru C-83 (.001) to the plate of diode "A" of V-15. A negative sync pulse from the cathode of V-12 is applied thru C-68 (.001) to the cathode of diode "B" of V-15. A sawtooth, derived from the integration of a pulse in the horizontal output circuit, at the yoke, by the integrating network, composed of R-86 (150K), R-87 (150K), and C-82 (.005) is applied to the cathode of diode "A" and the plate of diode "B", which are tied together and returned to B- thru R-83 (15K). The load for diodes "A" and "B" consists of resistors R-84 (100K) and R-81 (100K) whose junction returns to the high side of the grid resistor R-82 of the first horizontal multivibrator tube V-16 (6SN7). The voltage applied to the two diodes will be a function of the amplitude of the sawtooth, the amplitude of the sync pulses and the phase relationship between the pulses and the sawtooth.

If the sawtooth, whose phase and frequency are a function of the multivibrator's phase and frequency, is operating in the middle of the lock-in range, the sync pulse will occur in the center of the retrace time. See Figure 21(1). The sync pulses have an amplitude of from 6 to 8 volts while the sawtooth amplitude is about two volts. The RC time constant in the pulse input circuit to the diodes is long enough to maintain an average pulse voltage of 6 to 8 volts for two or three horizontal lines, which means that in the "on frequency" condition shown in Figure 21(1), the diodes conduct only on the pulses and since these are equal in amplitude and develop voltages of opposite polarity across R-82 in the first multivibrator grid circuit as shown in Figure 18, no control voltage is applied to the grid of V-16.

If the oscillator tends to increase in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(2) exists at the diodes. The phase of the sawtooth has now shifted so that at the same instant that the pulse is applied to the plate of diode "A" the positive saw is also applied to its cathode, so that only the shaded portion of the pulse causes conduction of diode "A". Diode "B", however, still conducts on the total amplitude of the negative pulse applied to its cathode aided by the positive saw applied to its plate at the same time. Since current flow thru diode "A" makes the grid end of R-82 negative, with respect to B-, the decreased current flow caused by the sawtooth voltage bucking the pulse voltage at diode "A" results in a more positive voltage across R-82 applying a more positive voltage to the grid of V-16 which, as we have seen, results in decreasing the oscillator's frequency.

If the oscillator tends to decrease in frequency, with respect to the sync pulses, the phase relationship shown in Figure 21(3) exists at the diodes. At the same instant that the negative pulse is applied to the cathode of diode "B", the negative saw is applied to its plate so that only the shaded portion of the pulse causes conduction. Diode "A", however, conducts on the full amplitude of the positive pulse applied to its plate aided by the negative saw applied to its cathode at the same time. Since current flow thru diode "B" makes the grid end of R-82 positive, with respect to B-, the decreased current thru diode "B" results in applying a more negative voltage to the grid of V-16 which, as we have seen, results in increasing the oscillator frequency. C-84, R-85 and C-86 provide two time constant filters which are necessary to obtain "fly-wheel" action of this AFC sync circuit.

The Horizontal Output System

The combination sawtooth and pulse waveform developed across C-88 (680) and R-93 (1500) by the multivibrator circuit, is fed to the grid of the horizontal output tube V-17 (6BQ6). Figure 20 is a simplified schematic of the horizontal output system. It will be noted that in this system an auto-transformer is used. In the horizontal scan, it is necessary that retrace be completed in about 7 microseconds. In order to accomplish reversal of current in the inductance of the output transformer and the yoke in this short a time, it is necessary to make this circuit resonant at such a frequency that the half-cycle time will equal 7 microseconds, because only by shock exciting such a circuit into oscillation will retrace be accomplished in the time allowed. The cir-

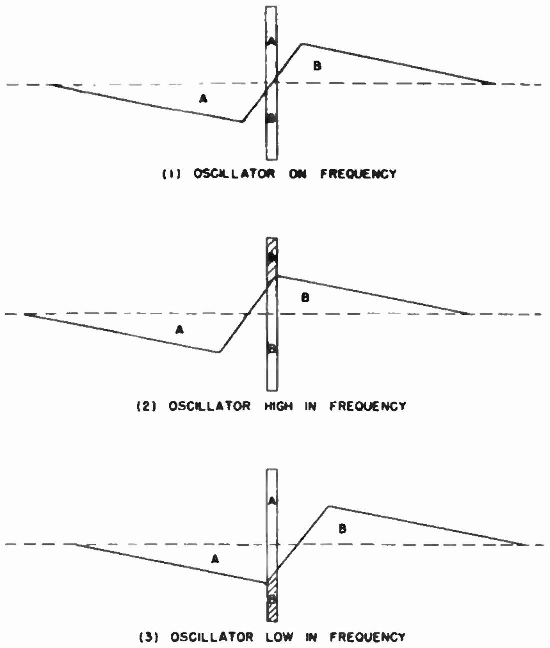

FIGURE 21. WAVEFORMS AT PHASE DETECTOR

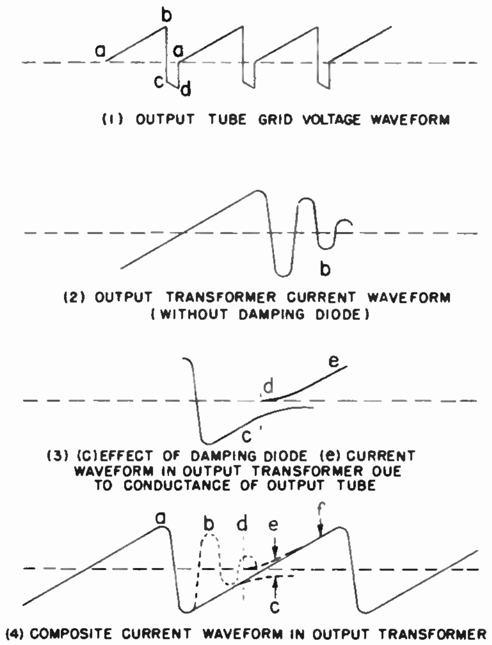

FIGURE 22. WAVEFORMS IN HORIZONTAL SCANNING SYSTEM

cuit is made resonant by the inductance of the output transformer and yoke, the distributed capacity and the tube capacity. Bearing this in mind, the operation can be explained as follows. Referring to Figure 22(1), assume that the voltage on the grid of the output tube is increasing, point "a". The grid is now being made less negative and the output tube starts to draw current which is supplied from B plus thru the damping diode. When point "b" is reached on the grid voltage waveform, the output tube is suddenly cut off because its grid has been made highly negative, (point "c" on the grid voltage waveform). With the tube cut off, the resonant plate load is undamped and the circuit is shocked into oscillation. The reversal of current through the output inductance produces a positive voltage pulse which makes the cathode of the damping diode (V-18) positive, with respect to its plate; therefore, it cannot conduct. C-92 (100 mmf) is placed across the diode to provide a low impedance for the oscillatory current. If the damping diode V-18 were not present, this oscillation would continue and current would flow in the output transformer as shown in Figure 22(2). In order to insure a linear trace, however, this oscillation must be stopped and the damping diode serves this purpose. When the current nears its maximum negative value, the polarity and amplitude of the voltage pulse on the damping diode is such that its plate becomes positive, with respect to its cathode, so that the tube conducts heavily and loads the circuit sufficiently to prevent continuation of the oscillation. The current then follows the decay curve shown at "c" in Figure 22(3). At the time "d" in Figure 22(3) the voltage at the grid of the output tube has become less than cut off [point "a" in Figure 22(1)] and the tube again demands current. The rising current in the tube results in superimposing the waveform "e" of Figure 22(3) on the current flow already in the output transformer due to the decaying current which resulted from the damped oscillation. Combination of these two currents results in the linear trace current indicated at "f" in Figure 22(4), which is a composite waveform of the entire action. During the peak conduction of the damping diode, C-93 (.1) charges and its polarity is such that when the output tube calls for current the charge on the condenser will be in series with the B plus supply so that the voltage at the output tube plate is raised from the 250 volt B plus supply to about 475 volts by this so-called "bootstrap" voltage. When the grid voltage waveform of the output tube again reaches point "b" of Figure 22(1), the tube is cut off and another cycle starts.

In order to properly match the yoke inductance to the required output inductance for the tube, the yoke is connected to a tap on the winding which effectively makes an auto-transformer of this section. The positive pulse of voltage at this tap is coupled to the yoke thru C-95 (.1) and results in a sawtooth of current thru the yoke. It will be remembered that a portion of this pulse is also fed to the phase detector for the AFC action thru R-86 and R-87.

The small additional winding, one terminal of which is connected to chassis while the other terminal is connected to B- thru C-94 (.03), is used to cancel the pulse of voltage which is placed on the chassis by induction from the output transformer. By connecting this winding in such a way as to place a pulse of suitable amplitude on the chassis 180 degrees out of phase with the induced voltage, cancellation of the induced voltage will take place.

High Voltage

To take advantage of the large voltage pulse developed across the output inductance by the heavy current flow caused by the retrace oscillation, the plate winding is made the primary of an auto-transformer whose step-up ratio is such as to develop pulses of about 14 Kv at its high end. These pulses are rectified by V-19 (1B3) and the resulting DC is applied to the second anode of the picture tube. The filament voltage for the 1B3 rectifier is obtained from an additional winding on the output transformer.

Controls

L-23 is the coil of the sine wave generating circuit in the horizontal multivibrator circuit and should be tuned to 15,750 cycles as explained in the service instructions.

R-91 is the horizontal hold control which can be adjusted for correct frequency operation of the multivibrator.

L-25, paralleling a small portion of the output choke controls, to a small degree, the inductance of the choke and acts as a size control.

TUNERS

Model TT-12 Tuning Unit

Ref. No.	Part No.	Description
	1X792770	TT-12 Tuning Unit: complete with station selector switch, fine tuning trimmer, and the following components:
C-3	21K478234	Capacitor, molded: 8 mmf 500V
C-9	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-10	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-15	21K478280	Capacitor, molded: 2 mmf 500V (temp. comp.)
C-16	21K470322	Capacitor, molded: 20 mmf 500V (temp. comp.)
C-29	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
L-2	24C792764	Coil, antenna: channels 2 thru 6; includes L-2A thru L-2E; L-2F thru L-2L are part of switch
L-3	24K790536	Coil, RF: channels 2 thru 6; includes L-3A thru L-3E
L-4	24K790537	Coil, oscillator: channels 2 thru 6; includes L-4A thru L-4E; L-4F thru L-4L are part of switch
L-7	24K790606	Coil, oscillator: channel 13
L-33	24K792765	Coil, antenna primary: low freq; includes L-33A, L-33B & L-33C
R-5	6R5659	Resistor: 3900 10% 1/2W
	43K700725	Collar, spring (on end of fine tuning shaft)
	42K790136	Clip, spring (on collar)
	42K700726	Shaft, fine tuning

Model TT-14 Tuning Unit

(The TT-14 is the revised tuning unit which places the oscillator above the carrier on the three high channels instead of below as in the TT-12. It can be distinguished from the TT-12 by the extra coil across the cut-out on the oscillator deck of the switch.)

Ref. No.	Part No.	Description
	1X700132	TT-14 tuning unit: complete with station selector switch, fine tuning trimmer, and the following components:
C-3	21K478234	Capacitor, molded: 8 mmf 500V
C-10	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
C-16	21K400173	Capacitor, molded: 10 mmf 500V (temp. comp.)
C-29	21K482726	Capacitor, ceramic disc: 10,000 mmf 450V
L-2	24C792764	Coil, antenna: channels 2 thru 6; includes L-2A thru L-2E; L-2F thru L-2L are part of switch
L-3	24K790536	Coil, RF: channels 2 thru 6; includes L-3A thru L-3E; L-3F thru L-3L are part of switch
L-4	24C700114	Coil, oscillator: channels 2 thru 6; includes L-4A thru L-4E; L-4F thru L-4L are part of switch
L-4M	24K700115	Coil, oscillator: channel 10
L-7	24K700116	Coil, oscillator: channel 13
L-33	24K792765	Coil, antenna primary: low frequency; includes L-33A, L-33B & L-33C
R-102	6R6069	Resistor: 2200 10% 1/2W
	43K700725	Collar, spring (on end of fine tuning shaft)
	42K790136	Clip, spring (on collar)
	42K700726	Shaft, fine tuning

CHASSIS PARTS - MECHANICAL

Part Number	Description
37K790951	Band, rubber (around picture tube gasket)
7K485464	Bracket, chassis mtg (on sides of chassis)
7K700153	Bracket, coil mtg: cad pl (horizontal size coil)
7A792468	Bracket, deflection coil mtg: cop pl ("L" brackets at base of deflection coil assembly)
7B792807	Bracket, deflection coil mtg (arched bracket housing defl yoke)
7B792191	Bracket, focus coil: cop pl (focus coil retainer)
7B791707	Bracket, focus coil mtg: cad pl (supports focus coil bracket)
7A791965	Bracket, interlock safety; cad pl
7A791967	Bracket, reinforcing: cad pl (brace between legs of 7B792807 brkt)
7C792737	Bracket, yoke cushion mtg: cad pl
7A791956	Bracket, strap mtg (mounts retainer strap tightening screw)
38B792486	Button, plug (for 25/64" hole next to focus control)
30A790948	Cable, high voltage (2nd anode lead).
42K471342	Cap, plate (high-volt rectifier)
42A5480	Cap, plate (6BQ6)
42A700147	Clamp, lead retainer (on V-19 fil leads)
42B70721	Clip, coil mounting (T-3 secondary)
42A76244	Clip, coil retainer (L-23)
42A72609	Clip, tube shield grounding (V-10)
39A790979	Contact, high voltage lead (connects high voltage lead to picture tube)
39K17396	Contact, pin terminal (speaker receptacle)

©John F. Rider
World Radio History

Part Number	Description
46K791756	Core, brass & screw (L-11 & L-15)
46A478242	Core, brass & screw (T-2)
46A470310	Core, iron & screw (T-1 primary, L-18 & L-20)
46K480256	Core, iron & screw (T-1 secondary, L-12).
46A70023	Core, iron & screw (T-3 primary, L-14)
46A470302	Core, iron & screw (T-3 secondary)
46K471143	Core, iron & screw (L-23)
46A700090	Core, iron: with slide adjustment (L-25).
15B791111	Cover, test socket
35A792756	Cushion, focus coil
35B792739	Cushion, yoke mtg
32D790946	Gasket, picture tube mtg: plastic (around picture tube front)
5K470916	Grommet, insulating: 3/16" hole
5A790684	Grommet, rubber (V-14 & V-16 socket mtg)
14A791787	Insulator, anode lead (dresses high voltage lead from chassis)
14A780184	Insulator, antenna lead (under input terminal strip)
14K87179	Insulator, coil (in ratio detector can)
9K471267	Insulator, electrolytic mtg: 4-lug; impregnated
13K791892	Insulator, shield (in T-2 can)
4S7657	Lockwasher, external: #8; cad pl (48B791694 selenium rectifier mtg).
4S7652	Lockwasher, external: #10; cad pl (picture tube retainer strap mtg)..
4S7655	Lockwasher, internal: 3/8; cad pl (mounts front controls)
4S7650	Lockwasher, internal: #6; cad pl (48B700074 & 48B700139 selenium rect mtg)
4S9751	Lockwasher, internal-external: #8; cad pl (focus coil mtg)
29R5242	Lug, soldering: #6L; HT (on hi-voltage capacitor)
29R5239	Lug, soldering: #8 HT
13D790936	Mask, picture tube
2A470049	Nut, coil & core mtg (L-11, L-12, L-14, L-15, T-2, T-1, L-20 & L-18)
2A791404	Nut, coil & core mtg (L-25)
2S7005	Nut, hex: 6-32 x 1/4; cad pl (Hi-Volt capacitor mtg)
2S7003	Nut, hex: 8-32 x 5/16 stl; cad pl (focus coil mtg)
2S7004	Nut, hex: 3/8-32 x 9/16 stl; cad pl (station selector & cont-vol mtg)
2S7051	Nut, hex palnut: 3/8-32 x 9/16; cad pl (rear controls mtg)
2S7050	Nut, hex palnut: 6-32 (T-2 can mtg).
2B70703	Nut, palnut: special (T-3 primary core mtg)
2A790191	Nut, special: cad pl (mounts ceramic trimmers)
35K700799	Pad, cushion (inside mask when Rauland picture tube used)
64K791818	Plate, chassis cover: cop pl (removable plate on chassis side)
64D791722	Plate, front tube support: fibre (supports picture tube front)
64K792464	Plate, socket cover (covers unused socket hole next to V-17)
28A790978	Plug, high voltage lead (plugs in high voltage receptacle)
28K471323	Plug, line cord: 2-pin (power input)
9A22367	Receptacle, 5-prong (on spkr leads)
9A790977	Receptacle, HV lead: plastic (insulates hi-volt lead from chassis)
5S8497	Rivet: .088 x 1/8 stl; white nkl (V-1, V-2, V-5 socket mtg)
5S7770	Rivet: .088 x 5/32 stl; pol nkl (ant terminal strip mtg)
5S2815	Rivet: .088 x 7/32 stl; pol nkl (mounts 9K780442 and 9K484167 socket)
5S7707	Rivet: .122 x 5/32 stl; pol nkl (mounts 9K471270 socket)
5S7701	Rivet: .122 x 3/16 stl; pol nkl (R-104 receptacle mtg)

Part Number	Description
5S7700	Rivet: .122 x 1/4 stl; pol nkl (line cord plug mtg)
5S7703	Rivet: .122 x 7/32 stl; pol nkl (electrolytic wafer mtg)
5S7728	Rivet: .122 x 5/16 stl; pol nkl (HV rect socket mtg)
5S6846	Rivet: .145 x 5/32 stl; pol nkl (vert & audio output transformer mtg)
5K71246	Rivet, shoulder: nkl pl (V-14 & V-16 socket mtg)
3S490354	Screw, machine: 6-32 x 5/8 slotted hex head; cad pl (C-6 & C-12 trimmer adj)
3S490822	Screw, machine: 6-32 x 1" slotted hex head; cad pl (C-14 trimmer adj)
3S490459	Screw, machine: 6-32 x 1-1/8 slotted round head; brass (fastens high volt transformer plates together)
3S488195	Screw, machine: 6-32 x 2 plain hex head; cad pl (48B700074 selenium rect. mtg)
3S7163	Screw, machine: 8-32 x 1/4 plain hex head (high volt rect mtg plate & T-6 mtg)
3S7257	Screw, machine: 8-32 x 5/8 plain Hex head (mounts focus coil bracket)
3S490642	Screw, machine: 10-32 x 1-1/2 plain hex head; cad pl (picture tube retainer strap mtg)
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head: cad pl (fil trans mtg)
3S3397	Screw, sheet metal: #8 x 5/16 PKZ plain hex head; cad pl (chassis mtg brkts)
3S7467	Screw, sheet metal: #8 x 3/8 PKZ plain hex head; cad pl (isolating trans mtg)
3S7512	Screw, sheet metal: #8 x 1/2 PKZ plain hex head; cad pl (picture tube front support plate mtg)
3S8153	Screw, sheet metal: #8 x 3/4 PKA plain hex head; cad pl (mounts strap mtg brkt)
3K790107	Screw, thumb: 8-32; cad pl (defl yoke adj)
1X792785	Shield, coil: with spade bolts (T-2 shield)
26K485936	Shield, coil (ratio detector)
26K700067	Shield, picture tube: plastic (around metal cone)
26A26283	Shield, tube (for V-10 when glass 6J5 used)
26A90301	Shield, tube: miniature (V-5)
26A790508	Shield, video: cad pl (shields video amp from HV trans)
9K700040	Socket, picture tube: 5-pin; with leads..
9K780442	Socket, tube: miniature (V-3, V-4 & V-6).
9K484167	Socket, tube: miniature 7-prong (V-7, V-8, V-9, & V-15)
9A792167	Socket, tube: miniature: 7-prong (V-1)...
9A471343	Socket, tube: miniature; tan molded (V-5)
9K484816	Socket, tube: noval; molded (V-2)
9A790685	Socket, tube: octal (V-14 & V-16)
9A480274	Socket, tube: octal; molded (high volt rectifier)
9K471270	Socket, tube: octal; molded (all octal sockets but V-14, V-16 & V-19)
41A70705	Spring, coil (ratio det)
41A700143	Spring, compression (L-25)
41A791727	Spring, grounding (grounds window to chassis)
41A790942	Spring, insert (receptacle for high voltage plug)
41K791768	Spring, tension (picture tube support)
42A791958	Strap, tube retainer: cop pl (secures picture tube front)
31A700082	Strip, contact (receptacle for plug-in resistor)
31A700077	Strip, terminal (R-104 mtg)
31A791613	Strip, terminal: special (on HV transformer)
31A21990	Strip, terminal: 2-screw (on antenna cable)

Part Number	Description
24A792821	Trap, ion: PM; with collar
or	
24A792827	Trap, ion: PM; with collar
1X791850	Tube mtg plate: with mounting bracket and socket (HV rectifier mtg plate)
4S7569	Washer, flat: 5/16 x .145 x .027; cad pl (V-14 & V-16 socket mtg)
4S490366	Washer, flat: 3/8 x .156 x .125 stl; cad pl (48B700074 & 48B700139 selenium rect mtg)
4S7562	Washer, flat: 7/16 x .187 x .033 stl; cad pl (focus coil brkt mtg)
4S1722	Washer, flat: 7/16 x .187 x .048 stl; cad pl (picture tube front support plate mtg)
4S7596	Washer, flat: 1/2 x .195 x .067 stl; (defl yoke mtg brkts)
4K470939	Washer, insulating: 3/8 x .136 x .062 (electrolytic mtg)
4A77577	Washer, insulating (horizontal size coil mtg)
4A791447	Washer, insulating (isolating fil trans mtg)
4K790132	Washer, spring (focus coil mtg)
61C790865	Window, picture tube: 16"; safety glass

INSULATING COMPOUNDS

Part Number	Description
11M490423	Coating, hi-volt insulating: red-brn (on hi-volt rectifier socket)
11M490387	Wax, biwax (on hi-volt trans.)
31K76184	Strip, terminal: 2 ins #1 gnd; 3/8" spacing
31A21990	Strip, terminal: 2-screw (on antenna cable)
31A792450	Strip, terminal: 2 ins #3 mtg 3/8" spacing
31K471564	Strip, terminal: 3 ins #2 gnd; 3/8" spacing
31K51511	Strip, terminal: 3 ins #3 gnd; 3/8" spacing
31K471565	Strip, terminal 3 ins #4 gnd; 3/8" spacing
31K37494	Strip, terminal: 4 ins #3 gnd; 3/8" spacing
31A790122	Strip, terminal: 4 ins #3 gnd; 1/2" spacing
31K22174	Strip, terminal: 4 ins #4 mtg; 3/8" spacing
31A780089	Strip, terminal: 4 ins #5 gnd; 3/8" spacing
31K26658	Strip, terminal: 5 ins #3 gnd; 3/8" spacing
31K90046	Strip, terminal: 5 ins #4 gnd; 3/8" spacing
31A791402	Strip, terminal: 6 ins #4 gnd; 3/8" spacing
31A780091	Strip, terminal: 6 ins #5 gnd; 3/8" spacing

MODEL 16K2 CABINET PARTS

Part Number	Description
1X700172	Back Cover Assembly: complete with line cord, picture tube rear cover, and centering adjustment cover
13K792792	Bezel, picture tube (window frame)
16F700006	Cabinet, console: red-brn mahog; less bezel
13K700008	Cloth, grille: negre
30B470756	Cord, line: with plug & receptacle
15K792068	Cover, centering adjustment: rubber (on back cover)
1X792546	Cover, chassis bottom: with high voltage insulator
15B790987	Cover, picture tube rear (on back cover).
5S3139	Eyelet: .202 x .475 brass (on back cover)
14B792069	Insulator, high voltage (on chassis bottom cover)

Part Number	Description
14B700174	Insulator, picture tube base (in picture tube rear cover)
36B790505	Knob, control (contrast)
36B790506	Knob, control (station selector)
36K792078	Knob, control: wal-mahog (fine tuning & off-volume)
36A485457	Knob, control: black (hold controls on chassis rear)
4S7650	Lockwasher: #6 int; cad pl (hi-volt insulator mtg)
4S7657	Lockwasher: #8 ext; cad pl (spkr mtg)
4S2639	Lockwasher, internal-external: 5/16; cad pl (chassis mtg)
62K790672	Logotype: "Motorola"; brass pl
13A790824	Medallion ("M" on grille cloth)
2S7003	Nut, hex: 8-32 x 5/16 steel; cad pl (spkr mtg)
2S7007	Nut, hex: 8-32 x 1/4; cad pl (spkr mtg)
2S7022	Nut, hex: 1/4-20 x 7/16 steel; cad pl (chassis mtg)
5S7751	Rivet: .122 x 1/8 stl; pol nkl (hi-volt insulator mtg)
5S7706	Rivet: .122 x 1/4 stl; ant cop (picture tube rear cover mtg)
5K790011	Rivet, shoulder: annealed (line cord plug)
3S2226	Screw, machine: 1/4-20 x 1-1/4 plain hex head; stl; cad pl (chassis mtg)
3S7205	Screw, machine: 8-32 x 1/4 slotted lock hex head; cad pl
3S7374	Screw, machine: 8-32 x 5/16 plain hex head; cad pl (Bezel mtg)
3S7536	Screw, sheet metal: #6 x 3/8 PKA slotted acorn head; ant cop finish (back cover mtg)
3S7509	Screw, sheet metal: #6 x 5/8 PKA slotted acorn head; ant cop finish (back cover mtg)
3S490819	Screw, sheet metal: #6 x 7/8 PKA slotted acorn head; ant cop (back cover mtg).
3S488298	Screw, sheet metal: #8 x 1/4 PKZ slotted hex head; cad pl (back cover mtg)
3S8153	Screw, sheet metal: #8 x 3/4 PKA plain hex head; cad pl (bottom cover mtg)..
3K653	Screw, speaker mtg
35A791581	Strip, lead (dresses leads to side of cabinet)
4K780040	Washer, felt (under control knobs)
4S1720	Washer, flat: 3/8 x .156 x .030 steel; cad pl (line cord mtg)
4S488234	Washer, flat: 7/8 x 3/8 x .060 stl; cad pl (chassis mtg)
4S7562	Washer, flat: 7/16 x .187 x .033 steel; cad pl (speaker mtg)
4S7629	Washer, flat: 1/2 x 3/16 x .048 stl; cad pl (bottom cover mtg)
4S7563	Washer, flat: 5/8 x .203 x .033 stl; cad pl (bezel mtg)

MODEL 16K2B CABINET PARTS - Same as 16K2 except:

Part Number	Description
16K700007	Cabinet, console: limed oak
13K791084	Cloth, grille: blonde
36K792079	Knob, control: tan (fine tuning & off-volume)

BILT-IN-TENNAS

MODEL TA-4 TELEVISION DOUBLE LOOP BILT-IN-TENNA

Part Number	Description
1X791759	TA-4 Television Double Loop Antenna: complete (Bilt-In-Tenna)
21K70720	Capacitor, molded: 5 mmf 500V
21R6593	Capacitor, mica: 15 mmf 300V
24A791771	Coil, antenna loading
31K471564	Strip, terminal: 3 ins #2 gnd; 3/8" spacing

SPECIFICATIONS

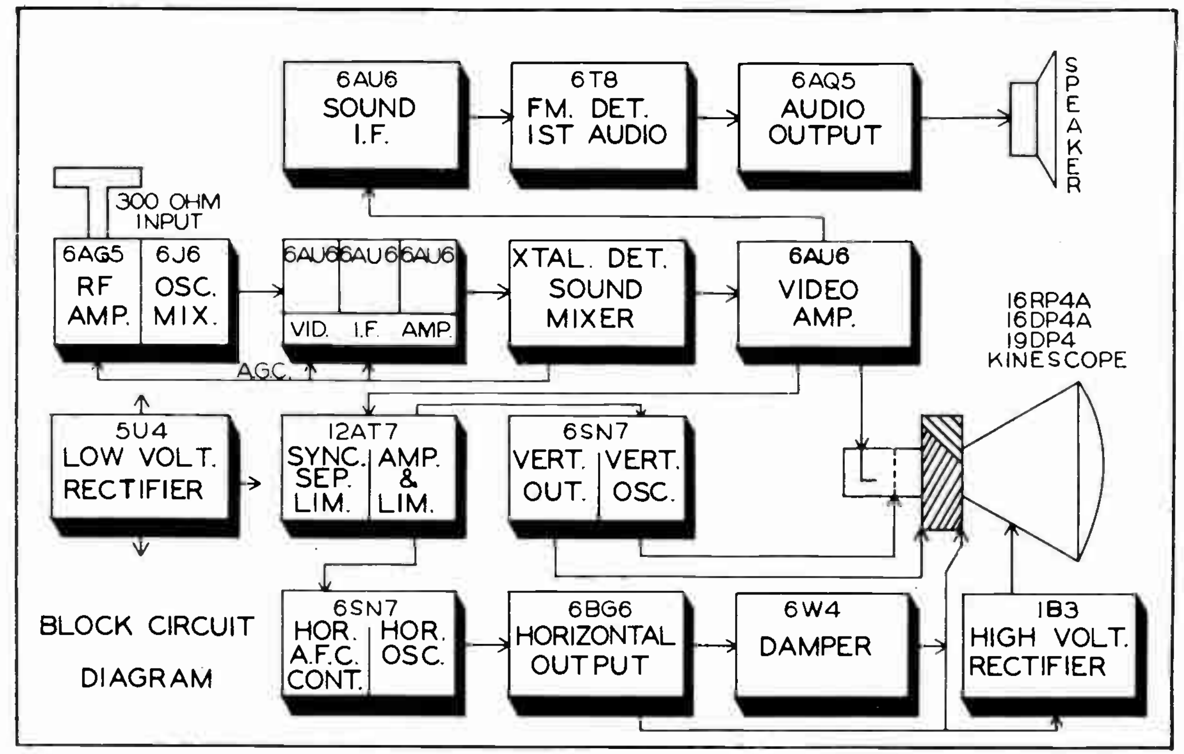
OPERATING VOLTAGE - 105 to 125 Volts - 60 Cycles.
CHANNEL COVERAGE - 2 to 13 inclusive.
POWER CONSUMPTION - 160 Watts.
AUDIO POWER OUTPUT - 1.5 Watts undistorted - Maximum 2.5 Watts.
LOUDSPEAKER - 5" - 8" - 10" - depending on cabinet.
VOICE COIL - 3.2 ohms - 400 cycles.
RECEIVER INPUT - 300 ohms balanced - 72 ohms unbalanced.

OTHER ADVANTAGES ARE - One-knob picture control - Very High Frequency tuner assembly - R.F. stage on all bands - Snap-in antenna and oscillator coils - Electronic coupled oscillator and mixer - Built-in all-channel antenna - Synchroguide type of AFC - "EYE SAVER" picture tube - Alnico Five P.M. speaker - Inter-carrier picture and sound - High fidelity FM sound - Improved fly-back high voltage supply for picture tube - Four I.F. coils - Isolated filament winding for important audio tubes - I.F. plate voltage regulation - Very moderate temperature rise - Convenient service adjustments - All wood cabinets Anti-glare picture mask - Safety glass protection.

HIGH VOLTAGE WARNING

The danger accompanying shock is always present when the receiver is operated outside the cabinet or when the rear cover is removed from the cabinet. Only a person familiar with the precautions to be observed when working with high-voltage equipment should service this receiver.

BLOCK CIRCUIT DIAGRAM



INSTALLATION INSTRUCTIONS

UNPACKING THE TV

1. Place the carton on the floor in an upside down position with the large red arrows downward.

2. Break the carton seals and fold back all flaps over the sides.

3. Give the carton a 1/4 turn, resting it on the MUNTZ side.

4. Support the TV set with one hand on the open end and 1/4 roll the carton, preventing the flaps from moving beneath the set.

5. Lift the carton free from the television set. It will then be resting on the filler and in perfect condition without damage to the knobs or cabinet.

TO PREPARE THE RECEIVER FOR OPERATION

MUNTZ Television sets leave the factory with the chassis bolted tight to the cabinet, but not in proper position. This is done to prevent breakage of the picture tube in transit.

1. Remove the back of the cabinet.

2. Inspect the face of the CRT and the glass window for dust or smudges. If the face of the CRT or the inside of the glass window is smudged, it will be necessary to remove the chassis to clean the smudged surface.

3. Loosen the 4 chassis mounting bolts (table model, beneath the set; consolette style, beneath the shelf) and push the chassis forward in the cabinet until the picture tube rests snugly against the mask.

4. Tighten the mounting bolts securely.

5. Check the adjusting screws of the deflection yoke. The rubber cushion at the front of the yoke must rest tight against the curved surface of the picture tube. If the cushion is not tight against the tube loosen the 4 bolts at the base of the yoke and push the entire yoke assembly forward until the rubber cushion is tight against the CRT. See Fig. No. 1, Point B.

CABINET TV ANTENNAS

Coming forth from the side of the chassis near the rear antenna terminals are red and blue wires tipped with spade lugs. A third wire runs across the inside top of the cabinet and down the cabinet side, terminating near the red and blue wires. It also is tipped with a spade lug. These three wires can be connected in various two-wire combinations to the two antenna terminals. Fasten in a combination that will give the best picture reception on all channels.

If the built-in antenna provides good reception no outside antenna is required, but never hesitate to recommend an outside aerial wherever necessary.

If an outside antenna is desirable, disconnect the built-in antenna wires. Cover the ends with tape and dress in such a position that they do not touch the chassis.

TO CHECK OPERATION OF RECEIVER

All MUNTZ TV sets are adjusted during the final test procedure at the factory, but will

require an adjusting and touch-up job in the customer's home at the time of installation.

1. Connect the AC plug (105 - 125 volts) to a 60 cycle wall socket. Turn the TV set on and allow a 10 minute warm-up period.
2. Advance the volume control 1/2 turn to the right.
3. Turn the channel selector knob to a local station.
4. Turn the picture control to the right until the screen of the picture tube is illuminated. The set should now operate, picture and sound, with the following provisions: (a) a station operating on the air, (b) the oscillator adjustment tuned to the station, (see paragraph "Oscillator Alignment") and (c) tube and service adjustments are not too far out of alignment.

PICTURE TUBE ADJUSTMENTS

The picture tube adjustments are on the neck of the picture tube. They work in conjunction with the service controls and need a touch-up job in the customer's home at time of installation. Function of these controls is as follows:

ION TRAP

Before giving the proper instructions for Ion Trap adjustment, we must call to your attention the seriousness of a mis-adjusted trap.

Improper positioning of the magnet may result in circular areas of discoloration developing on the screen of the tube, thus injuring the picture screen, even though the ions developed in the cathode section of the tube have been properly "trapped." When the magnet is not in the correct position, the electron beam, instead of going through the aperture in the anode disc, bombards the edge of the opening. The heat thus produced vaporizes the metal of the 2nd anode disc, releasing gases which have a harmful effect on the operation of the tube. Some of this vaporized material is deposited on the screen of the tube, causing darkened areas in the center of the screen.

Since it is possible to destroy a picture tube with a mis-adjusted ion trap in a matter of seconds, it should be the first adjustment when the set is turned on and the last adjustment before restoring the back of the cabinet.

TO PROPERLY ADJUST AN ION TRAP DO THE FOLLOWING:

Move the trap assembly back and forth with a slight rotary motion; adjust for maximum brightness of the screen. Reduce the brilliance control until the pattern is barely visible and again adjust ion trap for maximum brightness - at all times keeping the trap as far back on the neck of the picture tube as possible (over or behind flags). Fig. No. 1, Point A.

The ion-adjustment MUST BE RESET AFTER EVERY MOVEMENT OF THE FOCUS COIL OR FOCUS ADJUSTMENT.

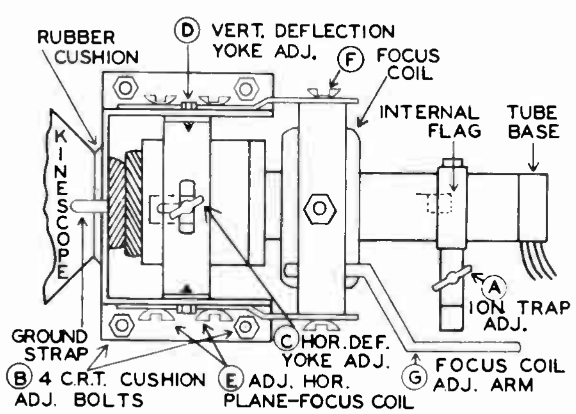
Never move the ION TRAP to remove a SHADOW from the edge of the raster as by so doing the intensity of the raster is decreased. In such a case the shadow should have been eliminated by moving the deflection coil forward and then re-adjusting the focus coil, focus adjustments, and finally the ion trap. The ion trap should always be in the position to give MAXIMUM raster brilliance.

Too much care cannot be taken in making the ion trap magnet adjustment. Remember the picture tube is still the most expensive part of the TV receiver. Take a little extra time and check the ion trap setting carefully.

CATHODE RAY TUBE CUSHION

The rubber cushion must fit snugly against the flare of the cathode ray tube in order that the rear of the tube will be supported firmly. Loosen the 4 cushion adjusting bolts and press the entire assembly forward. Fig. No. 1, Point B.

VIEW OF C.R.T.-PICTURE TUBE ADJUSTMENTS



NOTE: The 4 nuts "E" on Fig. No. 1 are welded positions on the 19" model and not adjustable.

FIG. NO. 1

CATHODE RAY TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves should be worn at all times when handling the cathode ray tube. The tube should not be handled in the vicinity of any person not so equipped. When handling the cathode ray tube, always keep it away from the body.

The cathode ray tube bulb, due to its large surface area and high vacuum contained within, is subjected to high air pressure. More than ordinary care is required to prevent shattering the tube. The large end of the bulb, particularly the rim of the viewing surface, must not be struck, scratched, or subjected to more than moderate pressure at any time. If the tube sticks or fails to slip smoothly into place during replacement, remove the tube and determine the cause of the trouble - - DO NOT FORCE THE TUBE.

VERTICAL DEFLECTION YOKE ADJUSTMENT. The vertical deflection yoke adjustment is made by raising or lowering the metal strap which supports the horizontal deflection yoke. To raise or lower this assembly loosen the two P.K.screws and float the yoke coils around the neck of the picture tube. Adjust in a way to avoid all binding action. Fig. No. 1, Point D.

THE HORIZONTAL DEFLECTION YOKE ADJUSTMENT controls the angle of the picture with respect to the horizontal. If the picture is not squared in the picture mask, loosen the wing nut and move it to the left or right so as to rotate the deflection yoke. The picture will tilt to the left or right with the deflection yoke rotation. After the picture is square in the mask and before tightening the wing nut, press the entire coil forward as far as possible to the flare of the picture tube. Fig. No. 1, Point C.

FOCUS COIL: To protect the neck of the picture tube during transit, a cardboard band is put inside the focus coil. The purpose of the focus coil is to center the picture on the screen in its entirety with the best possible line detail. Adjust the 4 wing bolts (Fig. No.1 - Point E) to centralize the focus coil on the neck of the picture tube. To properly position the coil along the neck of the picture tube, adjustments as shown in Fig. No. 1 - Point F are provided. Before adjusting these, set the focus control Fig. No. 3 at midpoint. Now move the coil back and forth along the neck of the tube for best line detail at the edges of the picture. Reset the focus control for best line detail in center of picture. In general, the focus coil should be positioned as far forward as consistent with good line detail. The focus coil adjusting arm "G" extends through the back of the cabinet. It has a universal joint action for a final touch-up of picture centering. A final setting of all the focus coil adjustments will deliver a picture with straight horizontal and vertical lines and have good over-all detail. Reset Ion Trap.

PICTURE CENTERING LEVER. If the picture is not centered in the mask or shadows appear at one corner, it will be necessary to adjust the focus coil by moving the "picture centering lever" which extends through the backboard of the set. See Fig. No. 1A. The picture centering lever is welded to the focus coil. It has a universal joint action capable of easily centering the picture to the proper position. ALWAYS RESET THE FOCUS CONTROL AFTER MOVING THE CENTERING LEVER.

BACK OF CABINET

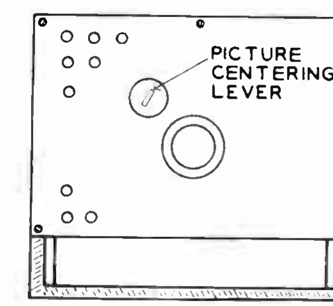


FIG. NO. 1A

DESCRIPTIVE OPERATION OF SERVICE CONTROLS

FRONT CHASSIS SERVICE ADJUSTMENTS

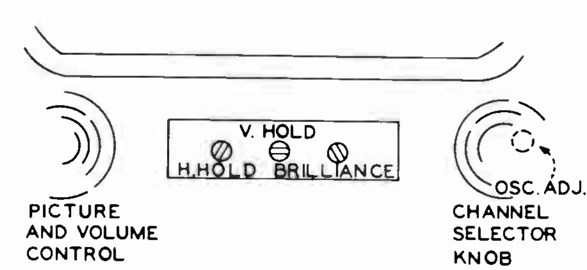

FIG. NO. 2

The most necessary service controls are conveniently located under the MUNTZ TV name plate on the front of the set between the two knobs. To remove this panel place the fingertips on both ends and pull gently toward you. On the back of the panel you have just removed is a diagram naming the controls in their order.

V. HOLD: The vertical hold control locks the picture into position on the surface of the picture tube so that it no longer moves up or down. Fig. No. 2.

BRILLIANCE: The brilliance control must be adjusted simultaneously with the front panel picture control. Too much brilliance will have the same effect as too little contrast, making it advisable to strike a proper balance between the picture control and the brilliance control. They are to be adjusted when the set is installed and should receive consideration on every service call. See Fig. No. 2.

H. HOLD: This control locks the circuits of the receiver in horizontal synchronization with the transmitting station. If heavy diagonal lines run across the picture, moving the control will snap the picture into view. Fig. No. 2.

Like photography, the final setting of the brilliance control should be left at a point where the picture displays a really dark black, a very brilliant white, and many shades of grey. Fig. No. 2.

OSCILLATOR ALIGNMENT

An important adjustment that must be made in the customer's home at time of installation, is the oscillator alignment tuning slug adjustment. While they are accurately set at the factory, a touch-up job is necessary to bring the TV set exactly in tune with the local stations.

The tuning slugs may be reached through an opening located behind the channel selector knob. Fig. No. 2.

(a) Turn the TV set on and allow a 10 minute warm-up period.

(b) Set the channel selector to the desired station on the air in your locale.

©John F. Rider

World Radio History

(c) Turn up the volume control and picture control to a normal operating position.

(d) The TV station on the air is better suited for making the oscillator adjustment than a signal generator.

(e) Use a non-metallic screw driver so the coil inductance will not be affected.

(f) Tune adjusting slug for most efficient COMPROMISE of both sound and picture.

CAUTION: Take care that the oscillator slug is not screwed in beyond its thread limitations as it will drop into the oscillator coil, which will necessitate the removal of the coil from the drum assembly so that the threads may again be engaged. This amounts to a good deal of work. To prevent this, always start by turning the adjusting screw in a counterclockwise direction.

REAR CHASSIS SERVICE ADJUSTMENTS

The remainder of the service controls are found on the back of the chassis and can be seen just below the back plate of the cabinet. See Fig. No. 3.

REAR VIEW OF CHASSIS

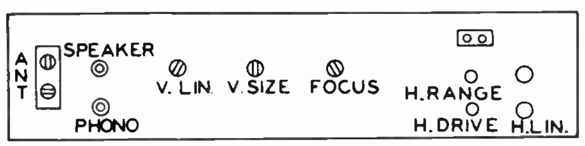

FIG. NO. 3

V. LINEARITY: The vertical linearity control gives the proper vertical proportions to the picture. Movement of the control affects the top half of the picture much more than the lower half. For this reason the V. Linearity and the V. Size must be adjusted simultaneously for proper proportions of picture height. Fig. No. 3.

V. SIZE: This control changes the overall picture height. When adjusted to correct height, the picture should extend for approximately 1/4 inch beyond the edge of the picture tube mask so that the top and bottom edges of the picture are not visible. Fig. No. 3.

FOCUS: The focus control clarifies line detail throughout the entire picture. It works in conjunction with the focus coil. Watch the center of the test pattern for sharp detail when moving this adjustment. Stop movement of control at point of optimum. Readjust Ion Trap.

H. DRIVE: (C65B) Adjustment expands and contracts the picture from midpoint to the left. CAUTION: Trimmer screw will fall out if turned too far to the left.

H. LINEARITY: (L13) Adjustment expands and contracts the picture from midpoint to the right. Alternate readjustment of C65B and L13 will obtain good horizontal linearity. When good horizontal linearity is accomplished and the proper setting of controls V. LIN. and V. SIZE is completed the test pattern circle should appear round. NOTE: If a white vertical line appears on the left side of the picture, it can generally be eliminated by adjustment of the horizontal drive. In some cases a compromise adjustment for linearity must be made to eliminate the white line.

All the stations do not send perfect linear pictures at all times. It is suggested, when making the linearity size and centering adjustments, to check the stations on the air and make your adjustments to fit all stations as well as possible.

H. RANGE: For particulars, read the HORIZONTAL OSC. SET-UP PROCEDURE.

PHONO JACK

When using a phono attachment the picture control must be turned completely counterclockwise. Move the station selector to an unused channel. The volume control of the receiver now acts as the volume control for the phono unit.

During the history of production on the TV17A chassis the phono jacks were not always connected. If you desire to use this part follow the wiring as given on the schematic diagram. The phono wire must be shielded with Part No. PR-0174.

HORIZONTAL OSC. SET-UP PROCEDURE - SYNCHROGUIDE CIRCUIT

CHECKING NEED FOR HORIZ. OSC. ADJUSTMENT

Tune in a good signal (preferably a test pattern) and allow receiver to warm up for a few minutes. When the Horiz. Osc. adjustments are properly set, the horiz. hold control will act as per the following: Rotate the horiz. hold control (beneath MUNTZ name plate) fully counterclockwise. The picture should remain in horiz. sync., but fall out of sync. if the channel selector is moved off channel, then back to channel. This action is correct with the H. HOLD fully counterclockwise.

Slowly rotate H. HOLD control in a clockwise direction. The number of diagonal blanking bars will gradually decrease, until only 3 or 4 diagonal blanking bars can be seen. At this point slight additional rotation will snap the picture into sync. The point where the picture falls into sync. should occur when the H. HOLD control is approximately 45 degrees from full counterclockwise position.

Further rotation of control should find the picture falling out of sync. in the opposite direction at about 45 degrees from the extreme CLOCKWISE position. In this position it should fall out of sync. without rotation of selector control.

If the horiz. osc. does not fill the above requirements, readjustment of these circuits is in order and can usually be done in the customer's home by re-adjustment of the H. HOLD control, the TOP HORIZ. SLUG, H. RANGE, and H. DRIVE TRIMMERS set to positions that fill the above requirements. If these conditions cannot be obtained the slug beneath the chassis needs adjustment. Follow procedure listed under "Complete Alignment of Horizontal Oscillator".

COMPLETE ALIGNMENT OF HORIZONTAL OSCILLATOR (AFC)

1. Tune in known good signal (test pattern) and adjust contrast control well below an over-contrast condition.

2. Turn both HORIZ. OSC. SLUGS out of coil can #LO-0035 (T6) as far as possible.

CAUTION: For manufacturing convenience both of the osc. adjustments are within the can #LO-0035. If slugs are turned too far in, then a coupled condition is reached which is undesirable.

3. Pre-set H. RANGE trimmer 1/8 turn out from full "in" position. Through adjustment of the H. HOLD, H. RANGE, and TOP H. OSC. SLUG cause picture to sync.

4. Connect scope having a 10 mmf. condenser in series with the vertical lead to Point C (Fig. No. 4). Adjust bottom H. OSC. SLUG, KEEPING PICTURE SYNCED AT ALL TIMES, until broad and sharp peaks are of equal height. (Fig. No. 4A). Remove scope.

5. Set H. HOLD to extreme clockwise position - adjust TOP H. OSC. SLUG until complete raster starts to move across screen.

BENEATH CHASSIS

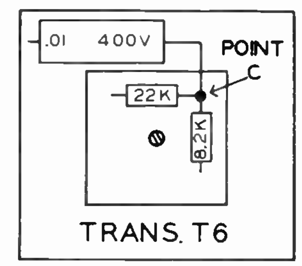

FIG. NO. 4

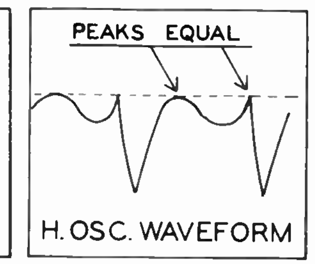

FIG. NO. 4A

6. Re-set H. HOLD to extreme counterclockwise position. Then force picture to drop out of sync. by snapping channel selector off, then on, station.

7. Slowly rotate H. HOLD control clockwise until the point is reached where it will snap into sync.

8. While repeating step No. 6 as required, re-adjust the H. RANGE trimmer and the TOP H. OSC. SLUG until a condition is reached wherein there appears 3 or 4 diagonal bars just before the picture snaps into sync.

CAUTION: The H. RANGE trimmer and the TOP H. OSC. SLUG are interactive and there are numerous combinations of adjustments where the picture will sync. but only ONE combination where the 3 or 4 diagonal bars appear just before snapping into sync.

9. Now recheck the clockwise position of H.HOLD control. Picture should fall out of sync. during the last 45 degrees of rotation. If not, slightly readjust the TOP H. HOLD SLUG only until this condition is reached.

10. Repeat any of the above steps as necessary until Horiz. Hold Control conforms to specifications as required in paragraph, "Checking need for H. Osc. Adjustment".

PARTS LIST

Give Part Number, Description and Chassis Number which is located on the rear of the chassis you are working on.

Ground Clip (min. tube)	PR-0168
Shield (min. tube)	PR-0169

ELIMINATION OF AUDIO BUZZ

Hum or buzz and interference should be given consideration when the set is first installed, and the proper antenna system used to minimize interference effects.

The following is a list of causes which determine a 60 cycle buzz or hum in TV sets that use the popular intercarrier sound system. Reduce the buzz or hum to a minimum by doing the following steps in succession, when a complaint is encountered.

1. Buzz is most commonly due to improper tuning of the receiver controls. CORRECTION: Properly instruct customer in operation of picture control knob. It must be kept well below an over-contrast position.

2. Buzz may be the result of improperly adjusted oscillator coil slug (beneath the channel selector knob). CORRECTION: Properly follow instructions given in Service Manual under the topic "Oscillator Alignment" on page 5.

2a. If it is evidenced in the picture that the oscillator slug will not properly tune in the station, then the oscillator pad C9 in the tuner is out of alignment. Instructions for re-setting the pad C9 trimmer "K" are given in this Manual page 9 under "Oscillator Alignment" chart.

2b. There are times when the TV stations are responsible for Buzz since they transmit it with the picture in the form of over-modulation or phase shift. This can be determined by comparison (after adjustment of oscillator slugs) simply by turning to another transmitting station with a pure signal.

3. Hum may be due to mis-alignment of the ratio detector secondary tuning slug (adjust "G"). CORRECTION: Tune in a well known good station, with picture control normal, and volume control turned down to where station can just be heard and hum is evident. Use a non-metallic screwdriver and adjust slug to best fidelity in audio signal, which will reduce hum to a minimum. The primary ratio detector slug is beneath the chassis. It can be adjusted in the same manner as the top slug but must be tuned to maximum signal. However, the primary slug is not critical and hum should not be as apparent in slight misadjustment.

4. Buzz is also caused by overloading of the video stages due to a very strong television signal. Insertion of an attenuation pad between the transmission line and the receiver should decrease the incoming signal to normal level.

5. Other faults in the receiver which may cause buzz or hum are mis-alignment of the video I.F. stages and changes in component values such as resistors and electrolytic condensers.

6. In early production of the 17A series a BLUE covered mfd. 50 Volt condenser was used beneath the 6T8 socket. Some BLUE condensers have two faults; one is an open condition, the other a high power factor. Hold a good condenser across the BLUE one in the TV. If the hum is reduced by all means put in the good condenser and take out the offender.

7. A caution to all repairmen. Here we wish to seriously call to the attention of all repairmen that all connecting wires are routed by the Engineering and Production departments for the best possible over-all results. When probing for trouble do not reposition wires beneath a TV set. When so doing, you bring inferior reception to the home of the customer, often without realizing it, causing repeated service calls and sometimes the trouble is never found. The practice of moving wires ruins the product we so proudly represent.

8. Some people will continue to over-contrast a picture regardless of consequences and have hum as the result. This will cause repeated service calls. Place a resistor in series with the contrast control and eliminate the complaint. The value should be somewhere between 100 and 400 ohms, depending on the amount of pick-up in antenna. Do this work only under unusual circumstances.

ALIGNMENT INSTRUCTIONS

A 22,000 ohm isolation resistor, for scope or VT meter, is provided beneath the chassis at point "E" Figure No. 5.

			57.50	55.25 59.75	2			

OSCILLATOR ALIGNMENT

Restore 1st I.F. tube V7 to its socket. If the oscillator seems to be off frequency approximately the same amount for a majority of the channels, it is possible to correct them in one step, using adjustment "K" Fig. No. 5. Before adjusting "K" move each individual channel oscillator slug (they are reached through a hole at the right of the channel switch shaft), and observe the curve. It should be noted that this is an all-channel oscillator circuit adjustment and should not be adjusted for any individual channel.

INSTALLATION, OPERATION AND SERVICE DATA

Model M34 Cabinet Style Console
TV Chassis—TV17A4
Radio Chassis—8FM34
Record Player Chassis—100

LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts; 60 Cycles, Alternating Current (AC) only.

POWER CONSUMPTION INCLUDING RECORD CHANGER: 115 Watts.

TUNING RANGE:

Broadcast Band: 540 to 1650 Kilocycles (182 to 555 Meters)
F-M Band: 87.5 to 108.5 Megacycles (2.7 to 3.4 Meters)

During the alignment procedure all adjustments should be made under the following conditions:

(A) Line voltage set at 117 Volts AC.

(B) Volume control at maximum position.

(C) Tone control set at extreme left position (Treble).

(D) Minimum input from the signal generator. This procedure should be adhered to, otherwise adjustments will be broad, due to the action of the automatic volume control.

TUBES: The Tubes used, and their functions, are as follows:

12AT7	R-F Amplifier and Mixer (F-M)
6BE6	A-M Converter and F-M Oscillator
6BA6	1st I-F Amplifier (A-M & F-M)
6BA6	2nd I-F Amplifier (F-M)
6AL5	F-M Detector
6AV6	A-M Detector, A.V.C. and Audio Amp.
6V6GT	Beam Power Amplifier
5Y3GT	Rectifier

RECORD CHANGER: Webster Chicago Model 100, See Pages RCD.CH.21-1 through RCD.CH.21-10.

Notes:
1 - Turn Volume Control Fully Clockwise.
2 - Maintain Signal Input Low Enough To Have Less Than 2 Volts Across Meters.
3 - Unless Otherwise Noted, Connect Low Side Of Signal Generator To Chassis.
4 - Unless Otherwise Noted, Set Variable Condenser To Minimum Capacity (Max. Freq.)
5 - Use Proper Tool For Small I.F. Trans. Adjustments - I.E., .150 Dia. Bakelite With Blade .075 Thick.
6 - Maintain 60 Cycle Line Voltage At Approx. 117 Volts.

©John F. Rider

World Radio History

The position of the fuse from beneath the chassis is being moved to up inside the high voltage compartment. The fuse may now be reached by simply removing the inter-lock assembly.

The practice of holding a screw driver close to the high voltage winding of the high voltage transformer should be discontinued. This was done by men in the field to see if the high voltage winding was working, but this is what takes place. A light corona condition exists between the high voltage winding and the screw driver blade. The corona breaks down the insulation on the high voltage winding (although it cannot be seen by eye) and a week or two later the transformer must be changed. TO TEST THIS PART, USE A CONTINUITY METER AND CHECK BETWEEN TERMINALS 1-2 AND 2-3.

The following parts are to be used only in the #TV17A7 chassis, all other parts are the same as in the main parts list:

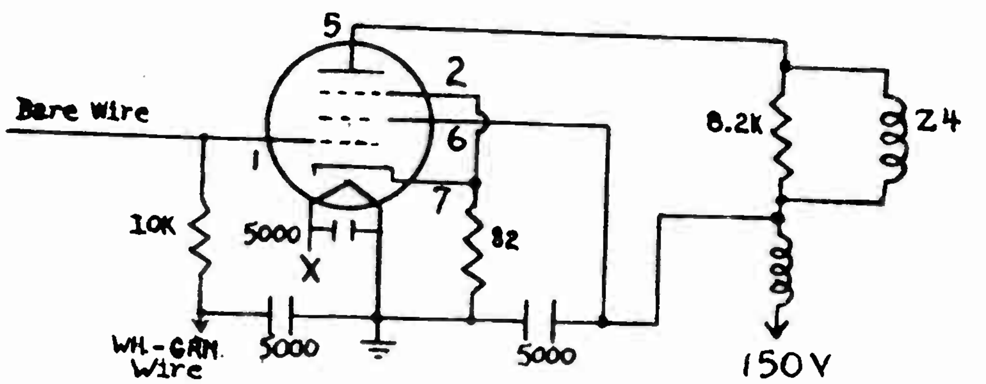
THE FOLLOWING CHANGES MAY BE FOUND IN CHASSIS MODELS #17A2 - #17A3 - #17A4 - #17A7. THEY BRING THE ATTACHED DIAGRAM UP-TO-DATE.

On Chassis Models #17A4 - #17A7, an 820 ohm resistor 2 watt is in parallel with R12 focus circuit; in other words, only used on the 19" and 20" tubes.

This schematic pertains to the chassis employing a 6AG5, 6BC5, 6CB6, instead of a 6AU6 as the 1st I.F. Amp.

1ST I.F. AMP.



This schematic pertains to the chassis employing a 6F8G tube instead of a 12AT7 Sync. Separator.

6F8G

MODELS M30, Ch. TV16A1; M31, Ch. TV16A2; M31R, M32, Ch. TV16A3, Early: M31, Ch. TV17A2; M31R, M32, M32R, Ch. TV17A3; M33, M34, Ch. TV17A4; Ch. TV17A4A

With reference to MUNTZ chassis models 16A or 17A early series.

COMPLAINT No. 1: Fold over at bottom of raster.
" No. 2: Lack of vertical height.
" No. 3: Pear shaped test pattern.

Any one of these three conditions can exist in the wax impregnated transformer. In getting the feel of doing the following work, we suggest you use a TV with a waxed transformer.

PARTS AFFECTED - Vertical output transformers part numbers TO-0018 A, B, or TO-0023, A, B, C.

TOOLS NECESSARY - Pair of Vise gripping pliers of the type generally used in garage work having unusual squeezing power.

TECHNICAL - The technical reason for these difficulties is the variations in the tiny air gap between the I & E section of the laminated core, and you may adjust this gap by doing the following. Late chassis models 17A have a fixed gap.

OPERATION: Tune in a test pattern, use a crayon pencil and mark a reference line at the top and bottom of the test pattern. The results of your work can then be easily observed.
To correct complaints No. 1 and No. 2, squeeze and compress the laminations very tightly, particularly at the sides of the channel shell container to permanently hold the laminations a little closer together. (tight stack) See Fig. A. Squeeze at positions A and B. After every adjustment, observe the test pattern and correct V. Height and V. Linearity control settings. Repeat above until best results are obtained.

To correct complaint No. 3, it will be necessary to unsolder the wires and remove the transformer from the chassis. Place a heavy weight beneath the transformer and rap the transformer with a hammer as shown in Fig. B, position C. This will reduce the air gap between the I & E lamination stack.

Another way, is to place the transformer in a bench vise and squeeze it. Fig. D. Restore the transformer to the chassis by means of 6-32 by 1-4" nuts and bolts and lock washers. Before tightening, place a piece of light stiff cardboard (such as used on back of a paper tablet) between the transformer and the chassis pan. When tightening the bolts, the little piece of cardboard will act as a buttress and permanently hold the I & E stack tightly together.

#1. Adding resistor R83 to the circuit permits us to use filter condensers with a working voltage of 450 volts instead of 500 volts. The 450 volt condensers are more commonly used in the industry and therefore easier to produce.

IMPORTANT: When you have an occasion to use a 450 volt filter condenser for repair purposes on a chassis that previously had 500 volt filter condenser, be sure to add the resistor R83.

#2. As a temporary deviation due to the scarcity of No. 6AU6 tubes on the market, for the next 5000 chassis the factory will use a No. 6AG5 tube in place of a No. 6AU6 at the 1st I.F. Amplifier stage. When they are in the chassis, the tube layout sticker will be changed accordingly. The I.F. curve will maintain its usual shape in marker positions. A slight improvement will be noticeable in I.F. sensitivity amounting to about 2db. Otherwise everything is equal. We have drawn an (x) on the wire necessary to eliminate when the No. 6AG5 tube is present. In other words, we have removed the buss ground wire from pin #2 to ground when installing the 6AG5 tube. You will remember, the 6AG5 tube has pin #2 & pin #7 connected internally.

#3. This pertains only to chassis Models 17A4 and 17A4A which are the 19" round glass picture tube chassis. Across resistor R12 (820 ohm 2 watts) is soldered a 2nd (820 ohm 2 watts) resistor R84 in parallel. So doing improves the focus on the 19" model.

#4. Isolation resistors R30-R32 & R35 (old schematic) will be replaced with choke coils L14-L15 and L16 and in production in the near future. Please watch for them. The new choke coil looks like a resistor as it is housed in the resistor type of coating. The DC resistance will measure .3 ohms. The part number for this choke is LC-0054-1 and is a 1 microhenry choke.

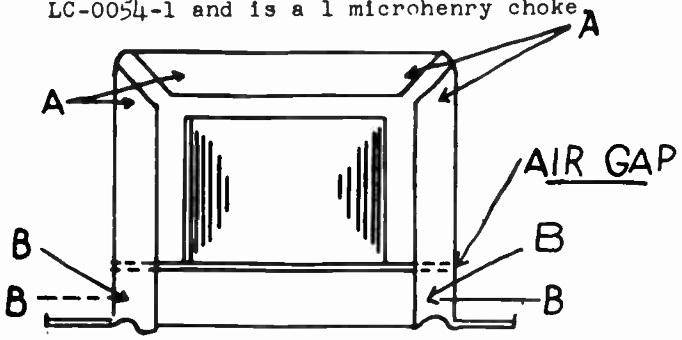

FIG-A

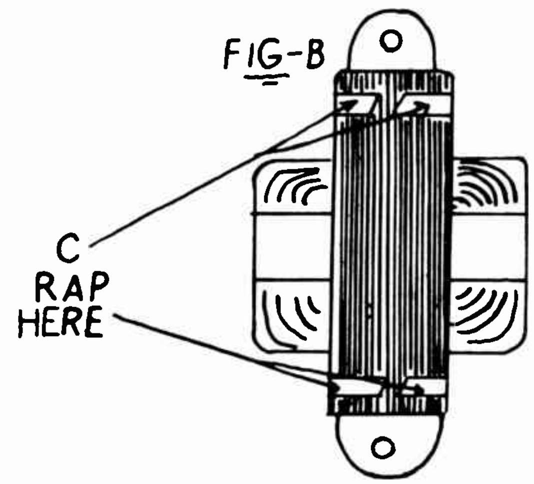
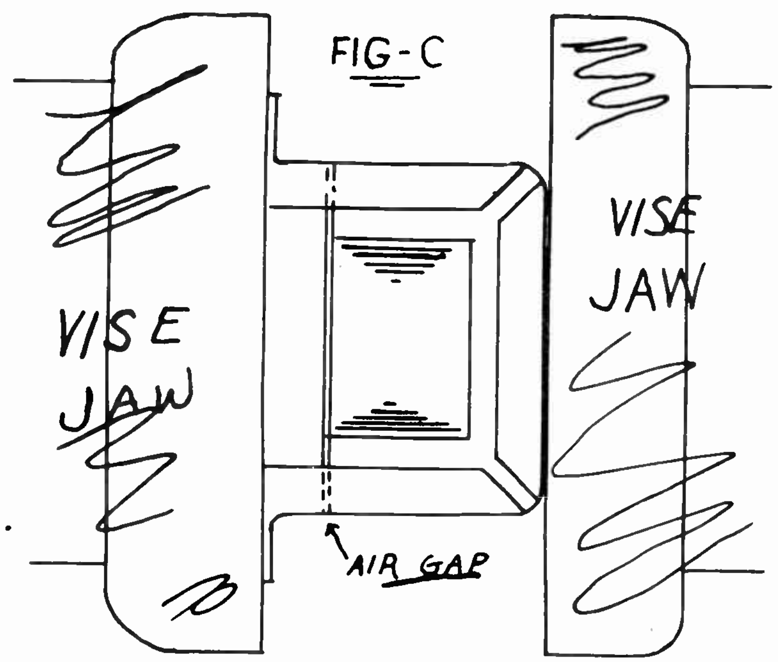
FIG-B





IMPROVED HORIZONTAL STABILITY

A change in parts placement took place in chassis models
17A2 above serial number 41,369
17A3 above serial number 52,256
17A4 above serial number 57,135

The 2 Watt resistor R12 in series with the focus control has been moved away from beneath the transformer T6 (Horiz. Osc. AFC) and away from the .01 mfd. condenser C62. Heat radiated from the resistor was rising into the condenser and Horizontal oscillator coil - affecting the stability of those parts.

Early production receivers may be modified by moving the resistor as shown in the following sketch.

MODEL PT 300

SERVICE NOTES

MODEL PT200 "THE IRVINGTON" — CHASSIS PT200 — MODEL PT300 "THE MT. VERNON"

The NORELCO console television receivers MODEL PT200 and MODEL PT300 employ a television chassis of the most advanced design, in conjunction with the new MODEL 170 NORELCO PROTELGRAM TELEVISION SYSTEM. 19 tubes, 3 rectifiers, 1 picture tube and 1 germanium diode are used.

SPECIFICATIONS

PICTURE	13½" x 18" (235 Square inches) with rounded corners, on a flat, translucent screen.
INPUT IMPEDANCE	300 ohm - balanced.
FREQUENCIES	IF-21.25 Mc., Intercarrier sound - 4.5 Mc.
POWER SUPPLY	The High Voltage for the anode of the 3NP4 picture tube is obtained from a Norelco H.V. Unit Model 170B.
PROTECTION CIRCUIT	To prevent accidental damage to the screen of the 3NP4 picture tube in the event of deflection circuit failure, a special protection circuit is incorporated in the chassis. (See sheet 3)
OPERATING VOLTAGE	110-120 volts, 60 cycles
MAX. POWER CONSUMPTION	225 Watts
MAX. AUDIO POWER	3.0 Watts
SPEAKER	8" PM
TUNING RANGE	Commercial television channels 2-13, inclusive.

TUBE COMPLEMENT

V1	RF Amplifier	6AG5
V2	Oscillator - Mixer	6J6
V3	1st IF	6CB6
V4	2nd IF	6CB6
V5	3rd IF	6CB6

	F2	Horizontal Deflection Protection, .25 amp.	

CIRCUIT DESCRIPTION

The PT200 television receiver chassis employs a balanced 300 ohm antenna input circuit. The 6AG5 RF stage is inductively coupled to the 6J6 mixer. Tuning of the RF amplifier and mixer grid circuit is accomplished be means of capacitor and coil switching using a turret-type tuner. (for RF alignment see sheet)

A three-stage network IF amplifier using 6CB6 tubes amplifies both sound and video signals. The video detector is a 6AL5 diode with the other section used as an automatic gain control (AGC) rectifier. The AGC voltage is applied to the RF amplifier and to the first two IF stages. The video amplifier uses a 6AG7 with a variable cathode resistor serving as a contrast control. The contrast control setting also determines the amount of automatic gain control voltage applied to the preceeding stages.

The 4.5 Mc. intercarrier sound signal is taken off the plate of the 6AG7 video amplifier and applied to a 6BC5 ratio detector driver. The triode section of this tube is used as the first audio amplifier and a 6AQ5 tube is used as the audio output amplifier.

DC restoration and sync clipping is accomplished in the picture tube grid by means of one diode- connected section of a 6SN7. The other triode section of this tube is used as a sync signal phase inverter which supplies the two phases of sync signal requires to operate a 6AL5 horizontal phase detector. This horizontal phase detector compares the horizontal sync signal with a pulse obtained from the horizontal output transformer and produces a suitable DC control voltage to provide automatic frequency . . . . control of the Potter type horizontal oscillator which uses a 12AU7 or 6SN7 tube. The horizontal oscillator uses a 12AU7 or 6SN7 tube. The horizontal oscillator and saw generator is coupled to a 6BG6 horizontal output stage and an output transformer. A 6W4 horizontal damper tube is employed. A 6SN7 serves as a vertical oscillator and amplifier in a stabilized blocking tube oscillator.

The low-voltage power supply uses a 5U4 rectifier tube. The focus coil is in series with the low-voltage power supply with a suitable shunting resistor as a focus control. The power supply transformer primary is fused and interlocked.

PROTECTION CIRCUIT

Incorporated in the chassis is a protection circuit to prevent line or spot burns on the face of the 3NP4 tube caused by failure of the horizontal or vertical deflection circuits. One half of V10-6SN7 or 12AU7 is used as a horizontal sweep failure protector and the other half is used as a vertical sweep failure protector .

The horizontal protection circuit uses the same pulse employed for horizontal comparison in the horizontal phase detector 6AL5. This pulse is driven into the grid of the triode sections of a 12AU7 or 6SN7 (V10). The pulse time constant is so arranged that as long as the driving pulse is present, the tube conducts.

The plate circuit is connected to the low side of a brightness potentiometer (R39) which, while the tube conducts, acts as a series resistor of approximately 12,000 ohms. When the pulse is removed (horizontal oscillator failure) the tube fails to conduct and presents an infinite resistance, allowing the brightness voltage to go up to 150 volts thus biasing the tube resulting in no beam current.

A 1N34 germanium diode acts as a peak rectifier on the secondary side of the vertical output transformer producing approximately 25 volts used to bias beyond cutoff the other triode section of V 10.

The plate section of this tube is connected in parallel with the 2nd section of the horizontal sweep oscillator tube V17 - 6SN7. When a vertical signal is present, the protection tube presents an infinite impedance across the horizontal sweep oscillator and has no effect on its oscillation. It the event of a vertical failure, there is no negative voltage on the grid of the protection tube. The tube then conducts and acts as a shunt resistor of approximately 5,000 ohms connected in parallel with the horizontal sweep oscillator. This stops the horizontal sweep oscillator and thus throws the horizontal sweep failure protector tube into operation as explained above.

DESCRIPTION OF THE PROTELGRAM UNITS

HIGH VOLTAGE POWER SUPPLY (170B)

This unit supplies the 25 Kv required for the anode of the 3NP4 tube. Overall outer dimensions are: 7-1/8" x 5-3/4" x 9" high, except for the flat mounting feet. The weight of the unit is 5 lbs. The unit is very stable and has regulation characteristics matched to the requirements of the 3NP4. It is shielded.

©John F. Rider

World Radio History

DESCRIPTION OF THE CIRCUIT

The tubes employed are:

1) 1 - 6L6G Oscillator
2) 2 - 1B3GT Rectifiers
3) 1 - 6V6GT Regulator

The 6L6G operates as a normal continuous oscillator at a frequency of approximately 28 kc. The plate winding of the oscillator forms a section of an auto-transformer winding which steps up the oscillator output voltage to the order of 12.5 Kv peak. The two 1B3GT rectifiers are used in a voltage-doubling arrangement so that the output voltage at no load with the regulator tube in operation is about 24.5 Kv and drops to 23.5 Kv at 200 Microamperes.

The output voltage regulator tube is a type 6V6GT. Its plate and screen are electrically connected, and are supplied from an additional winding on the high voltage transformer. Bias on its grid is dependent on the amount of beam current drawn by the 3NP4, since it is developed across a 300,000 ohm resistor in series with the plate of one of the 1B3GT tubes. The regulator operates as a variable load on the oscillator. Higher beam current generates higher negative bias on the regulator tube. Therefore it absorbs less power, so that the output voltage of the oscillator/voltage doubler system tends to remain more nearly constant.

R8 300 K ±5% .5W
R9 1.5 M ±20% 1W

VOLTAGES MEASURED WITH V.T.V.M. WITH RESPECT TO B- AT NORMAL PICTURE CURRENT OF (90 μ AMPS.)

PROTELGRAM
HIGH VOLTAGE POWER SUPPLY
170-B

As the regulator tube approaches cutoff, its effect continues to decrease until the output voltage of the system begins to follow an unregulated curve, and the output voltage starts to fall. This arrangement provides a safety device for the 3NP4 which prevents injury due to severe overloads at high voltage, forms a protection against external short circuit, and also reduces the shock hazard to personnel. There is also a protective resistor in series with the anode lead at the connector. This has a value of 1.5 megohm.

Extreme care, however, must be exercised when working on the high voltage circuits. A good practice when working with such circuits is to keep one hand in a pocket while working only with the other.

3NP4 CATHODE-RAY TUBE

GENERAL CHARACTERISTICS **SPECIFICATIONS**

ELECTRICAL

Heater Voltage:	6.3 volts
Heater Current:	0.30 amperes
Focusing Method:	Electromagnetic
Deflecting Method:	Electromagnetic
Maximum Deflection Angle	42°
Gun:	Triode
Phosphor:	No. 4 aluminized
Fluorescence:	White 6000° - 8000° Kelvin
Persistence:	Medium

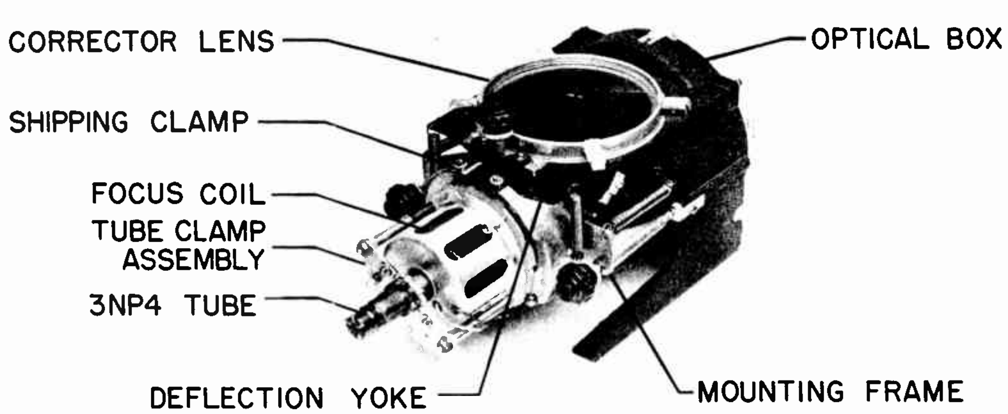
OPTICAL UNIT AND TUBE MOUNT

TUBE MOUNT

The Tube Mount includes the Focus Coil, the Deflection Yoke and the Tube Clamp Assembly.



The Focus Coil used in the PT200 receiver has a DC resistance of 290 ohms ± 10% and a nominal current of 125 milliamperes. The Tube Mount is assembled to the Optical Box by means of the Mounting Frame which contains the 3 adjustments used for mechanical focusing. These adjustments should be made when the set is installed and when the 3NP4 Picture Tube is replaced. They are described under "Installation Instructions" on sheet 8.

OPTICAL UNIT

This unit contains a concave mirror, a flat mirror and a corrector lens. These elements are precisely assembled at the factory and no attempt should be made to adjust or replace them in the field. The corrector lens should be cleaned with a soft rag.

PROTELGRAM CONNECTIONS

The following socket and plug and jack connections are provided for easy connection of the Protelgram units to the chassis:

J2 - 3NP4 Picture Tube Socket.

1.	Red	Grid	
2.	Yellow	Heater	6.3 volts, 0.30 amps.
3.	Blue	Spark Trap	ground
4.	Black	Heater	ground
5.	Green	Cathode	

J5 - 170B H. V. Power Supply Connections

1-5	Jumper		
2.	Black	Ground	
3.	Yellow	B minus	
4.	Red	B plus	350 V.
5.	Brown	Filament	6.3 V.A.C.

J6 - Deflection Yoke and Focus Coil

1.	Yellow	Focus Coil
2.	Red	Focus Coil
3.	Orange-Black	Horiz. Deflection Yoke
4-6	Jumper	
5.	Orange-White	Horiz. Deflection Yoke
7.	Blue-White	Vert. Deflection Yoke-ground
8.	Blue-Black	Vert. Deflection Yoke

INSTALLATION INSTRUCTIONS

HIGH VOLTAGE WARNING: The back of the receiver is equipped with an interlocking power cord which removes power from the set when the back is removed. Operation of the receiver outside its cabinet or with the back removed involves a shock hazard. Therefore no work should be attempted on the receiver by anyone who is not familiar with the precautions necessary when working on high-voltage equipment.

1. SERVICE ADJUSTMENTS: The service adjustments are readily accessible by removing the grillecloth panel, which is held in place by bullet catches. The panel can be easily removed by a slight pull at the top.

2. REMOVAL OF SHIPPING CLAMP AND OPTICAL ADJUSTMENTS:

a) Remove the speaker baffle. This is held in place by 2 wing nuts which can be reached through the back of the cabinet.
b) The Optical Box is located directly behind the speaker baffle. To prevent accidental damage during transit a red shipping clamp is attached to the optical box. Remove this shipping clamp by unscrewing 4 screws holding it. Keep the clamp and screws for possible future use in shipment.
c) Connect AC line to outlet.

©John F. Rider

World Radio History

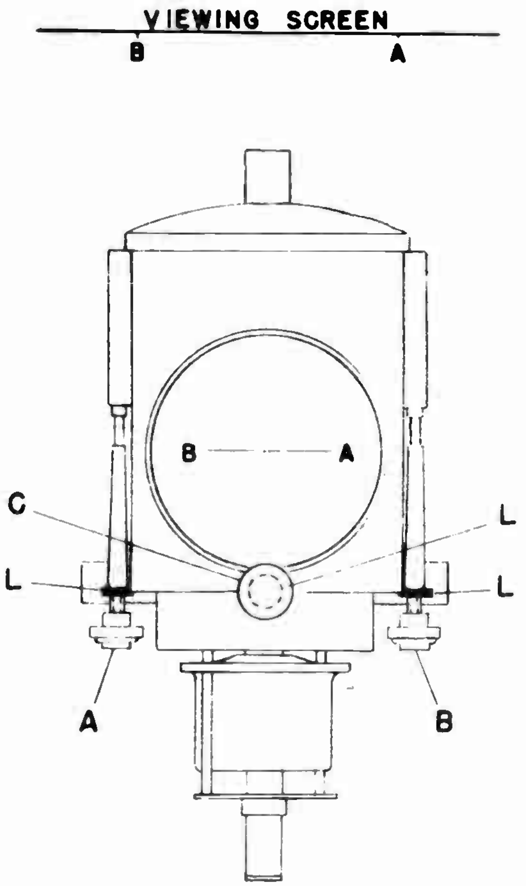


DIAGRAM 1

WARNING: This receiver is designed for use on 105 to 125 volt 60 cycles, alternating current (A.C.) only. Do not connect to direct current (D.C.). If in doubt about the type of current available check with your local Electric Power Company.

d) Connect antenna leads to antenna binding posts.
e) Tune in a signal.
f) Turn contrast control on the front of the cabinet to the extreme left position.
g) Turn brightness control on the service panel to the extreme right.
h) Adjust focus control on the front of the cabinet.
i) Examine retrace lines and raster for sharpness of focus. If the entire area of the screen is not sharply in focus, proceed as follows:

1) Loosen 3 locking nuts "L" (Diagram 1)
2) Focus the raster lines on the right side of the screen by adjusting the knob on the left side of the Optical Box - marked "A" on diagram.
3) Focus the raster lines on the left side of the screen by adjusting the knob on the right side of the optical box marked "B" on the diagram.
4) Repeat operation (b) and (c) if necessary until each side of the picture is sharply in focus.
5) Focus the raster lines on the top and bottom of the screen by adjusting the knob on the top of the optical box - marked "C" on the diagram.

j) Tighten 3 locking nuts "L" (If picture cannot be centered on the screen see further detailed information regarding adjustment of the Protelgram System sheet 14).

3. Make any necessary linearity and size adjustments by means of the service controls.

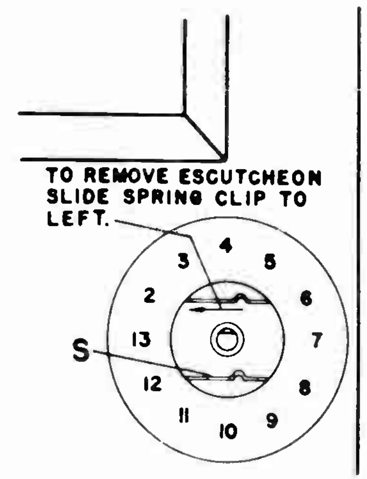
4. BRIGHTNESS LEVEL SETTING:

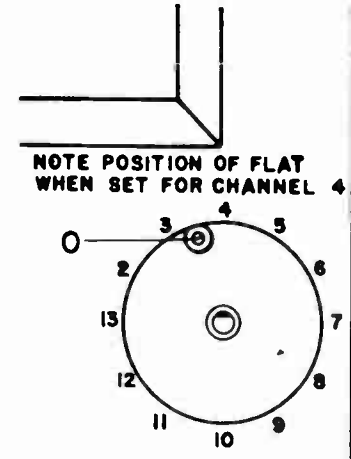
a) Set channel selector between channel.
b) Turn contrast control on the front of the cabinet to the extreme left position.
c) Turn brightness control on service panel to extreme left position and gradually turn to the right until the raster lines are just visible on the screen.

5. CHANNEL SELECTOR ADJUSTMENTS:

After allowing 15 minutes for the receiver to warm-up, adjust the tuner oscillator as follows:

a) Remove the channel selector and fine tuning knobs and the channel indicator plate.
b) Leave the fine tuner at mid-position.
c) Turn the channel selector to each channel and adjust the oscillator "O" using a non-metallic alignment screw driver with a 1/8" blade. Turn this screw to the right until the 4.5 Mc. interference is seen on the screen (a fine herringbone pattern). Then gradually turn back the screw until this interference disappears.
d) After the tuner oscillator has been adjusted for each channel, replace the channel indicator plate and the channel selector knob and fine tuning knob.





ALIGNMENT PROCEDURE

REFERENCES: Circuit Diagram
Component Parts Location Label

EQUIPMENT:
1. Sweep generator, 23.5 mc. center frequency, 10 mc. sweep width.
2. Marker generator, 21.25 mc., 22.0 mc, and 25.75 mc.
3. Crystal oscillator, variable output, 4.5 mc. unmodulated.
4. Oscilloscope.
5. 20,000 ohm per volt meter.

NOTE: Follow the instructions in these Service Notes regarding location of test points for alignment, for taking voltage measurements, or in making oscilloscope waveform analysis. Do not connect test equipment across other points unless you are thoroughly familiar with the circuit wiring and points at which high voltages are present.

REMOVAL OF CHASSIS:
To remove chassis from cabinet proceed as follows:

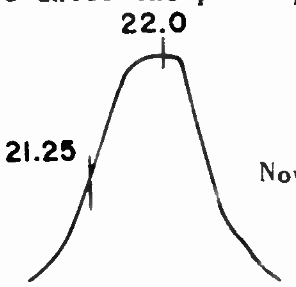
1) Remove lower back cover.
2) Remove 2 screws holding chassis slides in place.
IMPORTANT 3) Remove 2 screws near volume control which hold the control mounting strip to the cabinet front panel.
4) Remove 6BG6 tube (V18).
5) Disconnect plugs from J5 and J6 which connect the Protelgram HV unit and Deflection Yoke and Focus Coil to the chassis.
6) Remove tube socket from the 3NP4 (V8) tube.
7) Slide out the chassis on the mounting rails provided.

PROCEDURE VIDEO IF
1. Connect oscilloscope to J1 (test point).
2. Move turner between channels to disconnect coils.
3. Connect a 3 volt bias battery between ground and junction of R21 and C20.

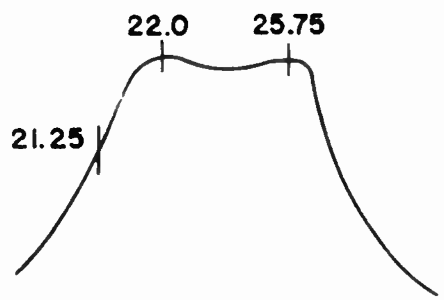
©John F. Rider

World Radio History

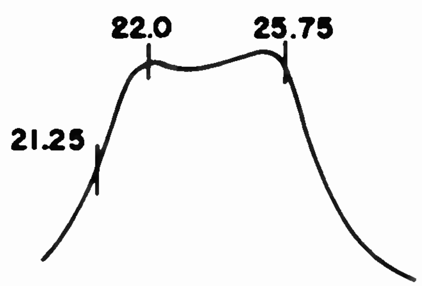
4. Connect sweep generator, capacitively decoupled with 1000 uuf., to Pin 1 of V5. Turn the slug on L17 until it is centered in the coil (this narrows the band pass of this stage). Adjust L16 and L12 until the pass appears as below.



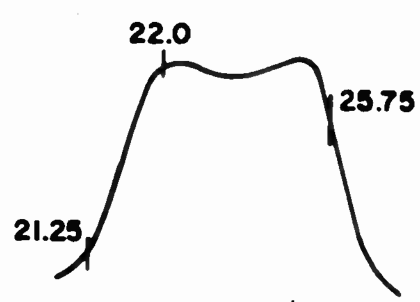
Now adjust L17 until pass is as pictured.



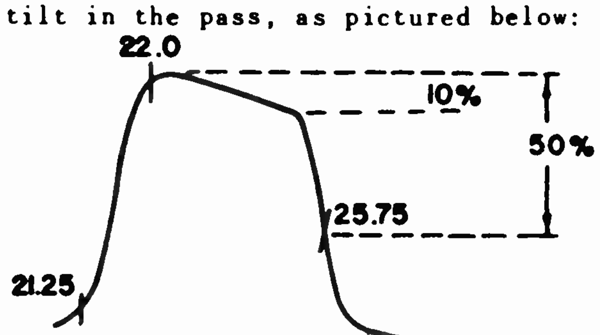
5. Move sweep generator to Pin 1 of V4. Adjust L13 until pass balances, adjust L15 until pass balances. When properly adjusted, pass will look as pictured below.



6. Move sweep generator to Pin 1 of V3. Adjust L9 and L11 as in above step. Pass will now be as pictured.



7. Move sweep generator to test point on tuner (can be located as a loop of wire between V1 and V2 on top of tuner chassis.) Adjust L8 (square can on tuner) until the pass rocks through a tilt and leave adjusted with a 10% tilt in the pass, as pictured below:



The video I.F. is now correctly aligned.

PROCEDURE INTERCARRIER SOUND SYSTEM

1. Connect voltmeter set on 10 volt scale across C46, observing polarity.
2. Insert 4.5 mc. generator, capacitively decoupled, in J1.
3. Reduce signal so that voltmeter reads a maximum of 3.0 volts, and continue to reduce as adjustments are made so as not to exceed this value.
4. Adjust in the order given, the following transformer slugs for maximum output:
   a) Bottom slug T3.
   b) L23
   c) Top slug T3.
5. Repeat to insure accurate setting.

Intercarrier sound system is now properly aligned.

RMA-No.541 117v.60cy.,200w

NORELCO TELEVISION RECEIVERS
PT200-PT300

NOTES :-

1. UNLESS OTHERWISE SPECIFIED - CAPACITOR VALUES ARE IN µµF, RESISTOR VALUES ARE IN OHMS AND RESISTORS ARE 1/2 WATT COMPOSITION, TOL. ± 10%.
2. ABBREVIATIONS - K=1000 OHMS, M=1,000,000 OHMS, CAPACITORS BEARING ± ARE ELECTROLYTIC.
3. SOCKET VOLTAGES WERE MEASURED WITH A 20,000 OHM PER VOLT METER TO CHASSIS USING A 3.9K ISOLATING RESISTOR AT THE PROBE, WITH NO SIGNAL AND CONTRAST SET TO MINIMUM.
4. WAVEFORMS WERE TAKEN WITH SIGNAL APPLIED AND CONTRAST SET FOR NORMAL VIEWING.
5. ARROWS ON POTENTIOMETERS INDICATE CLOCKWISE DIRECTION.

ELIMINATION OF AUDIO BUZZ

Under certain conditions a buzz may be heard in the sound. This may be caused by:

a) Mis-adjustment of the fine tuning control. This control should be tuned for most clearly defined picture with best sound. If no definite sound peak is obtainable with rotation of the fine tuning control, it may be necessary to adjust the tuner oscillator (See Channel Selector Adjustments - sheet 9)

b) Contrast Control too far clockwise thus overloading the Video Amplifier.

c) Misalignment of the Intercarrier Sound System. If this condition exists it may be corrected by the following procedure:

1) Connect VTVM across R55. Observe polarity.
2) Set VTVM on 10 volts scale and tune in channel.
3) Make the following adjustments for maximum voltage in the order stated:

a) Adjust slug L23 for maximum voltage.
b) Adjust bottom slug of T3 for maximum voltage.
c) Adjust top slug of T3 for maximum.
d) Repeat these adjustments.

d) Overloading of the video stages due to a very strong television signal. Such a strong signal can be attenuated by shunting a 10-100 ohm resistor across the secondary of the tuner antenna coil. This is the snap-in type and can be easily removed.

NOTE: Station buzz may be due to the transmission of a non-standard picture signal by the station. This condition is usually momentary.

DRESSING GRID LEAD TO 3NP4 PICTURE TUBE SOCKET

When attaching the socket to the 3NP4 Picture Tube, the Red-Grid lead should be dressed at least 1 inch away from the other leads in the J2 cable.

3NP4 TUBE INSTALLATION AND POSITIONING ADJUSTMENTS

(A) 1.- Loosen the 3 screws "M" which hold the Tube Mount to the Optical Box (Diagram A).
2.- Turn the Tube Mount clockwise until the 3 cutouts clear the screws "M".
3.- Pull out the Tube Mount.

NOTE: This operation should be done with care to prevent the tube from hitting the 45-degree Plane Mirror.

(B) 1.- Loosen the Tube Clamp Screw "J" (Diagram A).
2.- Insert the 3NP4 tube through the Deflection Yoke keeping the glass Anode Cup down (opposite the word "top" on the Tube Mount).

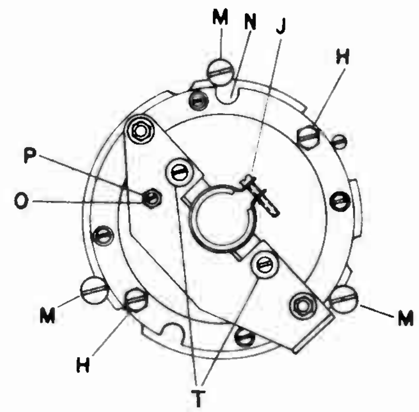

DIAGRAM A

NOTE: The fiber light shield and neoprene band packed with the 3NP4 tube should not be used with the Model 170 Tube Mount described here.

3.- Push the tube as far as it will go into the Deflection Yoke and tighten the screw "J" in the Tube Clamp. The Clamp should be tight enough to prevent the Tube from moving out of the Deflection Yoke. Be sure that the 2 spring clips from the Deflection Yoke make firm contact with the aquadag coating on the 3NP4 Tube.
4.- If the Tube neck is not centered in the Focus Coil, loosen the 2 screws "T", center the neck in the Focus Coil and retighten 2 screws "T",

CAUTION: In this operation or in any subsequent operation, do not hold the Tube Mount assembly by grasping the Deflection Yoke. This can result in breaking the cantilever-supported yoke form.

(C) 1.- Insert the H.V. Cable Connector in the glass Anode Cup on the tube. Be sure that the Connector is making good contact with the metal button in the Anode Cup.
2.- Tighten the plastic clamp around the neoprene Cable Connector. Carefully insert the Tube Mount in the Optical Box. Be sure that the Tube correctly enters the dust shield and clears the opening in the 45-degree Plane Mirror. It is essential that the position of the Tube in the Tube Mount is not disturbed. The Tube must remain firmly seated in the Deflection Yoke.
3.- Turn the Tube Mount counter-clockwise until the slot "N" is on line with the top screw "M" (Diagram A). (Be sure that the bottom edge of the Tube Mount is seated in the milled sections at the bottom of the Optical Box.)
4.- Tighten the 3 screws "M".
5.- Connect the Tube Socket to the Tube. While doing this, hold the neck so as to avoid pushing the Tube out of its position in the Deflection Yoke.
6.- If the edges of the projected picture are not in line with the edges of the viewing screen, loosen 3 "M" screws and rotate the Tube Mount slightly to the right or to the left of the above-mentioned position. Retighten 3 "M" screws.

NOTE: Be sure to dress the red (grid) lead in the J2 Cable to the 3NP4 Tube Socket at least 1" away from the rest of the leads in this cable.

(D) ELECTRICAL ADJUSTMENTS

1.- Properly tune receiver to transmitted test pattern. Look down into Optical Box at pattern reflected from 45-degree mirror.
2.- Adjust electrical controls of receiver to obtain normal and properly focused pattern on tube face as described under Installation Instructions.
3.- Adjust size of pattern and center so that each corner just touches edge of tube face as shown on Diagram C
4.- If the picture cannot be centered by means of the receiver centering controls, proceed as follows: (see Diagram A)

a) Loosen the locking nut "O" and loosen the screw "P" which locks the Focus Coil in position.
b) Adjust the 2 screws "H" until the pattern is properly centered on the tube face.

©John F. Rider

World Radio History

c) Tighten the screw "P" and the locking nut "O".

To make the following adjustments, look at the projected pattern on the viewing screen. When the screen is in a cabinet it may be more convenient to cover the outside of the screen with a piece of dark paper or cardboard so that the pattern can be seen from the inside of the cabinet.

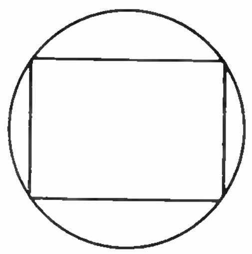

DIAGRAM C

(E) CENTERING PATTERN ON VIEWING SCREEN

1.- Loosen 3 bolts "R" (Diagram B).
2.- Center the projected picture on the viewing screen by adjusting the 3 screws "S".
3.- Tighten 3 bolts "R".

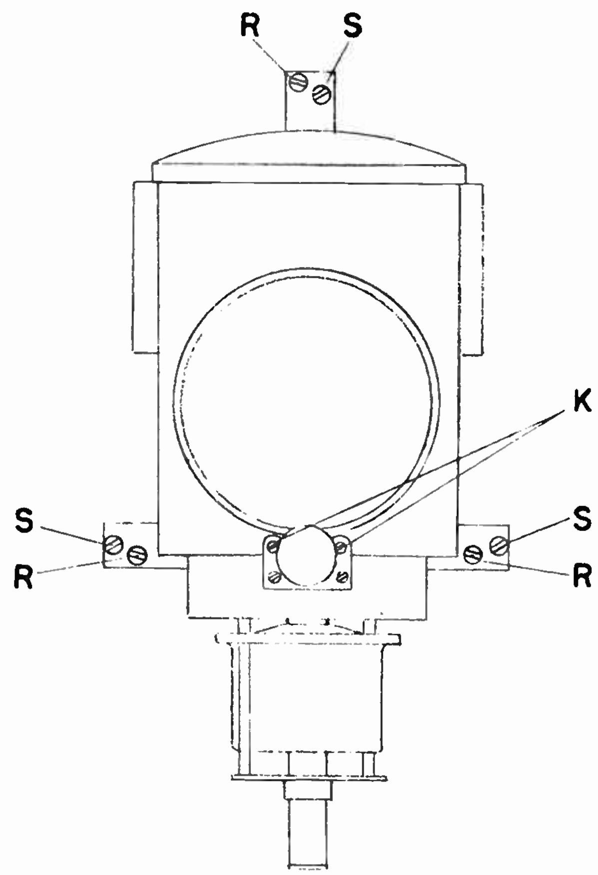

DIAGRAM B

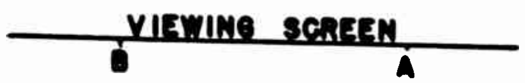

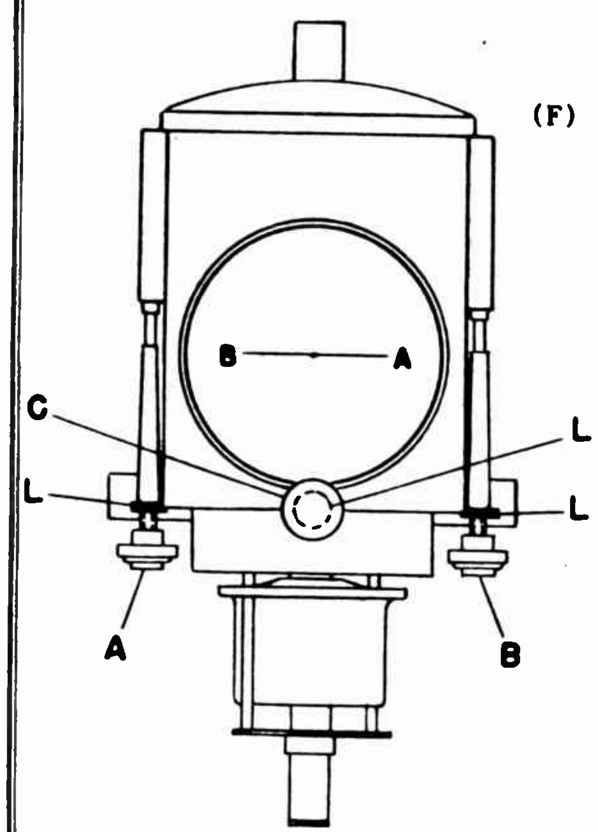

DIAGRAM D

(F) FOCUSING

Before making these adjustments, be sure to remove the 4 screws "K" (Diagram B) which secure the red shipping clamp to the Optical Box.

1.- DIAGRAM D

a) Loosen the 3 locking nuts "L".
b) Adjust the electrical focus on the receiver.
c) Focus a point "A" on the right side of a horizontal line through the center of the pattern on the viewing screen - by adjusting the knob "A".
d) Focus a point "B" on the left side of a horizontal line through the center of the pattern on the viewing screen - by adjusting the knob "B".
e) Repeat operations c, d alternately until points A and B are both in focus.
f) Focus a vertical line through the center of the pattern on the viewing screen - by adjusting the knob "C".
g) Hand-tighten the 3 locking nuts "L".

(G) 1.- If necessary, clear the top of the Corrector Lens with a soft cloth.
2.- When a black shroud is provided, tie it around the Corrector Lens being sure that it does not encroach the light path.

SERVICE HINTS

TROUBLE	CHECK
Dead Receiver	a) Be sure that power is being delivered to the receiver. b) Check interlock. c) Check fuse F1 d) Check V13 e) Check low-voltage rectifier tube 5U4G f) Check filter capacitors C39, 40, 41
Low B Plus Voltage	a) Check low-voltage rectifier tube 5U4G b) Check filter capacitors C39, 40, 41
No Raster	a) Check V17, V18, V19 b) Check plate lead dress on V18 c) Check fuse F2 d) Check T7 e) Check C81 f) Check L24, 25 g) Check Protelgram H.V. Supply 170B h) Defective focus control i) C89 open j) Check jack J6 and plug k) Check leads to Protelgram tailpiece l) Check V16, T5, T6, C72, C73, R90
No Sync	a) Check V9, V60, R28 and associated circuit components. b) Check V1 and V3 for gassy condition
No Vertical Sync	a) Check V16, C72, C74 and associated circuit components. b) Check V1 and V3 for gassy condition
No Horizontal Sync	a) Check V15, V17, V18, V9, and associated circuit components.
No Sound or Picture	a) Make complete check of tuner and IF circuits b) Check V1, V2, V3, V4, V5, V6, V7.
Sound But No Picture	a) Check 3NP4 picture tube, V7, V9, V10 and associated circuit components. b) Protelgram H.V. Unit

©John F. Rider

Picture But No Sound	**a) V11, V12, V13, and associated circuit components.** **b) Loudspeaker**
Poor Horizontal Linearity	**a) V17, V18, V19 and adjustment of L25.**
Poor Vertical Linearity	**a) Check V16, C77, R89, R90**
Insufficient Horizontal Size	**a) Check for low line voltage** **b) Check for low B plus voltage** **c) Check V14, V17, V18, V19, C68, C84 and associated circuit components.**
Insufficient Vertical Size	**a) Check V16 and associated circuit components** **b) Check Protelgram Deflection Yoke**

PARTS LIST

When ordering parts, give the model number of the receiver, the description of the parts and their code number.

RESISTORS

PART NO.	DESCRIPTION	CIRCUIT SYMBOL
2-5	Resistor, 1.8K, ± 10% tolerance, ½ W, composition	R44
2-6	Resistor, 2.2K, ± 10% tolerance, ½ W, composition	R112
2-9	Resistor, 6.8K, ± 10% tolerance, ½ W, composition	R24, R117
2-11	Resistor, 47K, ± 10% tolerance, ½ W, composition	R34, R59, R81
2-12	Resistor, 100K, ± 10% tolerance, ½ W, composition	R41, R48, R61, R69, R70, R86, R98
2-13	Resistor, 3.3K, ± 10% tolerance, ½ W, composition	R74
2-14	Resistor, 470K, ± 10% tolerance, ½ W, composition	R52, R54, R64, R76, R93, R94
2-16	Resistor, 1 meg. ± 10% tolerance, ½ W, composition	R21, R33, R68, R83, R84

INDEX

SERVICE DATA

OLYMPIC TELEVISION RECEIVERS MODELS 752, 753, 755, 764, 766, 767 & 769

These models are twenty tube direct viewing television receivers differing essentially in size of speaker and styling of cabinet.

Models 764 and 767 are provided with a sensitivity switch and a phono-TV switch with phonojack.

Models 766 and 769 in addition to the TV chassis, have a three speed record changer and a separately powered FM-AM chassis. For circuit diagram and alignment data on the FM-AM chassis refer to Olympic's instruction manual IB-2354.

NOTE: Both 16" and 17" rectangular glass picture tubes are used on the above models. They require different mechanical mountings and mask and therefore are not interchangeable. When replacing tubes in service use identical tube sizes.

Electrical and Mechanical Specifications

Radio Frequency Ranges

Channel Number	Channel Freq. MC	Picture Carrier Freq. MC	Sound Carrier Freq. MC	Receiver RF Osc Freq. MC

ALIGNMENT

Equipment Required

1) RF signal generator to provide the following accurate frequencies. If the accuracy of the generator frequencies is not known, some type of crystal calibrator should be utilized to check the correct settings of the RF generator for each particular frequency.

(a) 4.5 MC Video Amplifier Trap

(b) IF Frequencies

21.25 MC	Sound IF, Sound Discriminator and Sound Traps
22.25 MC	Converter Coil
22.5 MC	Marker Frequency
23.0 MC	First Pix IF Coil
26.5 MC	Second Pix IF Coil
25.0 MC	Third Pix IF Coil
25.75 MC	Picture Carrier Marker

(c) RF Frequencies

Channel Number	Picture Carrier Freq. MC	Sound Carrier Freq. MC
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(d) Output on these ranges should be adjustable and capable of providing at least .1 volt.

2) Electronic Voltmeter
3) Cathode Ray Oscilloscope, 3" minimum screen
4) RF Sweep Generator, meeting the following requirements:

(a) Frequency Ranges
18 to 30 MC., 1 MC. sweep width
40 to 90 MC., 10 MC. sweep width
170 to225 MC., 10 MC. sweep width

(b) Output adjustable to .1 volt.

The chassis may be removed from the cabinet with the kinescope tube in place and servicing and alignment work can be accomplished without removing the kinescope tube. This work is most conveniently performed by placing the chassis on its left side (power supply cage resting on work bench) and the controls facing the operator.

To remove chassis from cabinet remove
(1) Line cord from power outlet
(2) Masonite back
(3) Antenna Lead-in from terminal posts
(4) Speaker plug from rear of chassis
(5) Knobs from front of cabinet
(6) Four mounting screws and washers from bottom of cabinet

In sliding chassis out of cabinet be careful that the kinescope tube does not strike against cabinet or any other obstruction.

Order of Alignment

When complete receiver alignment is necessary it should be performed in the following sequence.

(1) Pix IF Traps
(2) Sound IF Transformers
(3) Sound Discriminator
(4) Pix IF Coils
(5) Retouch Pix IF Transformers
(6) 4.5 MC Trap

After removing chassis from cabinet, connect power and speaker plugs.

If a local station is not operating on channel #9 set the tuner to this channel, turn on power switch and proceed as follows: (If #9 is a local station channel use channel #8 or #10).

Picture I-F Trap Adjustment

Insert 100,000 ohm resistor in series with hot lead of electronic voltmeter and connect to Pin #7 of V11 with meter range switch set to lowest scale and observing polarity for negative readings.

Couple hot lead of RF SignalGenerator to converter tube V2 by means of a loop consisting of two turns of insulated hook-up wire. Connect ground lead of RF Signal Generator to chassis.

Note: If the converter tube V2 is shielded - remove shield.

Set the generator frequency accurately to 21.25 MC, and adjust L7 cathode sound trap (see tube and trimmer layout drawing) for minimum reading on voltmeter.

By means of a clip lead, short circuit condenser C26 on cathode trap.

Increase generator output to maximum (recheck 21.25 MC generator setting) and adjust L5 for minimum reading of voltmeter.

Sound IF Transformer Adjustment

Change hot lead connection of electronic voltmeter (with 100,000 ohm resistor connected in series) to terminal marked "C" of sound discriminator transformer. Reduce output of the signal generator to give approximately 2 volts reading on voltmeter scale.

Adjust L1 and L2 for maximum reading.

Sound Discriminator Adjustment

Change hot lead connection of voltmeter to pin #1 of V5 and adjust L3 for zero reading on voltmeter. This zero setting is very critical and the adjustment must be made with extreme care.

Repeat adjustments for L2 and L3 in the same manner indicated above.

©John F. Rider

World Radio History

Pix IF Coil Adjustment

Connect hot lead of voltmeter to pin #7 of V11 and adjust the following slugs for maximum output at frequencies indicated:

L301	22.25 MC
L4 (Bottom of can)	23.0 MC
L6	26.5 MC
L8	25.0 MC

If oscillation occurs during alignment, temporarily lower frequency of L8 by turning screw clockwise until screw projects approximately ¼". After properly adjusting L301, L4 & L6 then set L8 to proper frequency. Oscillation is evidenced by high reading on voltmeter (-10v to -20v) with signal generator OFF and no signal coming in through the antenna terminals.

Retouch Pix IF Transformer Adjustment

Disconnect RF signal generator leads and connect hot lead of sweep generator to coupling loop on converter tube and ground lead to chassis.

Connect vertical input terminal of oscilloscope to pin #7 of V11 (Pix Dectector) and connect ground lead of scope to chassis.

Connect 1½ V flashlight battery with positive terminal to chassis and negative terminal to #2 pin of V11.

Set tuner to channel 9 unless local station is operating on this frequency, in which case an adjacent channel should be used.

Set sweep generator frequency to IF sweep on the 20 to 30 MC range.

Adjust sweep generator output to produce a curve on the scope which is approximately 2/3 of the screen diameter.

Loosely couple output of RF signal generator to hot lead of sweep generator and set frequency of RF signal generator to 25.75 MC (marker).

Curve shown on scope should be similar to the standard response curve shown below. For proper setting of the pix carrier the 25.75 MC marker should appear on the curve at a point approximately 50% to 60% of the vertical height of the curve.

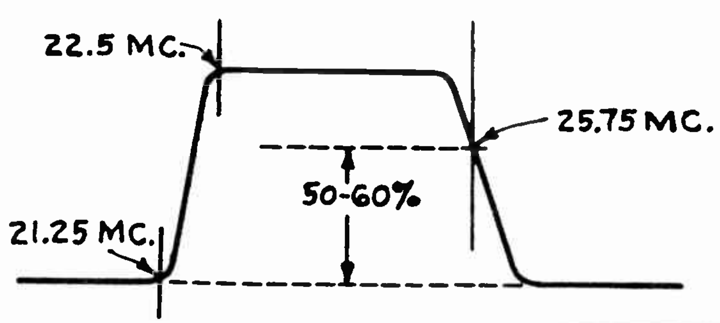
To obtain this setting retouch L6 and L8.

Reset RF signal generator frequency to 22.5 MC and retouch L301 and L4 for correct positioning of marker on shoulder of curve.

The curve may now be flat topped by retouching L8 & L4.

Recheck setting of 25.75 MC marker to make sure that position has not shifted on curve.

Disconnect bias battery.



Note: If the curve cannot be made to appear as above due to a local station or other interference, or multiple markers appear, remove (V1) 6BC5 RF tube from tuner.

Tuner Adjustments for Models using Tuner Part #CL-2262

Note: Before making a complete tuner adjustment it is essential that the Sound I.F. and discriminator circuits be aligned at their proper frequencies as described above. WHEN CHANGING THE CONVERTER TUBE IT IS NECESSARY TO REALIGN THE OSCILLATOR ADJUSTMENT ON ALL CHANNELS WITH THE V2 TUBE SHIELD IN PLACE.

RF and Converter Alignment

1) Set channel selector switch to #12
2) Connect oscilloscope through 10,000 ohms to test point on tuner (bare tinned copper loop wire located between V1 and V2)
3) Set fine tuning control at approximate mid-point of its tuning range. Temporarily connect jumper wire from pin #7 of V11 to chassis.
4) Feed Sweep generator into antenna terminals, sweeping channel 12.
5) Adjust C301, C302, and C304 for flat top response curve. Check picture and sound carrier markers corresponding to frequencies shown on Page 2 for all respective channels.
6) Remove jumper from pin #7 of V11 to chassis.

Oscillator Alignment

1) Set channel selector switch to #12
2) Connect signal generator to one antenna terminal and ground. Set to sound carrier frequency 209.75 MC.
3) Connect electronic voltmeter to pin #1 of V5 (6AL5) sound discriminator.
4) Adjust C303 for zero reading on electronic voltmeter between a positive and negative peak.
5) Check all channels for zero reading on voltmeter. It is usually not necessary to make any further adjustments. If it is found necessary to touch up the oscillator coils, the following procedure should be observed.

Oscillator Coil Touch-up

(a) Center fine tuning control, as described in Note A below.
(b) Place a non-metallic screwdriver through opening, and adjust oscillator coil on channel 12 (L312)
(c) Turn channel selector switch to channel 13 and adjust L313.
(d) This adjustment can be repeated for all channels or if necessary on any single channel.

ADJUSTMENTS

Ion Trap Magnet Adjustment:

Turn the brightness control fully clockwise and the contrast control fully counter-clockwise. Adjust the ion trap magnet by moving it forward or backward and at the same time rotating it slightly around the neck of the kinescope until the raster on the screen is brightest. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust focus control until the line structure of the raster is clearly visible (sharp). Readjust the ion trap magnet again for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

©John F. Rider

World Radio History

Focus Coil Adjustments:

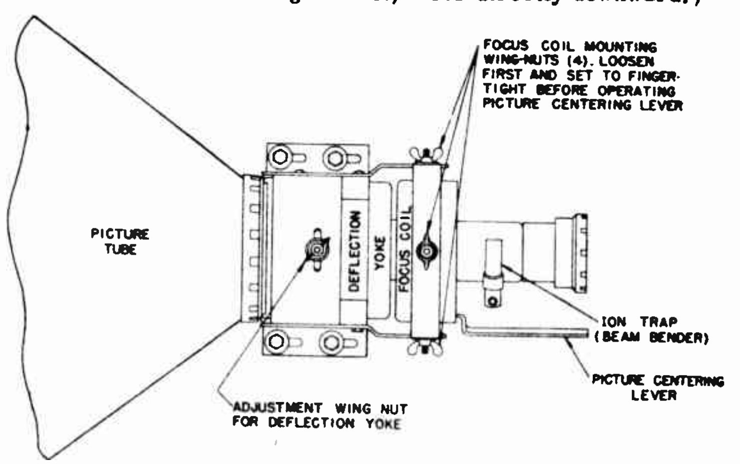
The focus coil is mounted within a frame to permit movement about its horizontal and vertical axis. The four wing nuts holding the focus coil to the frame are tightened at the factory to prevent movement during shipment. Upon installation of the receiver these wing nuts should be loosened and then adjusted finger tight. Centering of the picture within the mask is accomplished by gently moving the lever welded to the focus coil up and down or from left to right until the entire raster or picture is visible on the screen.

Deflection Yoke Adjustment:

If the lines of the raster are not horizontal or squared with the picture mask, loosen the deflection yoke adjustment screw and rotate the deflection yoke until this condition is obtained, and retighten the yoke adjustment screw.

If neck shadow is evident or the corners of the raster are dark, the deflection yoke must be moved forward as far as possible and the wing screw retightened. After observing that the picture tube is brought forward as far as possible to rest against the two tube stop brackets, loosen the four screws holding the rear tube support bracket to the chassis and move the entire bracket forward so that the rubber cup presses firmly against the cone of the picture tube. Where an additional reinforcing bracket is used to hold the rear tube support to the high voltage power supply cage it will be necessary to remove the power supply cover and remove the mounting screws in the bracket prior to making the above adjustment. After the rear tube support bracket has been properly adjusted and the screws retightened the reinforcing bracket can be reassembled using another set of mounting holes on the side of the power supply cage which will maintain a firm pressure of the rubber cup against the cone of the picture tube.

Note A - The mid-point of the fine tuning range is attained when the point of the bakelite cam (which is attached to the fine tuning control) faces directly downward.)



Check of Horizontal Oscillator Alignment

(Any adjustments or check of horizontal oscillator alignment should be made after a fifteen to thirty minute chassis warm-up period.)

Obtain a test pattern and turn the horizontal hold control to the extreme clockwise position. The picture should remain in synchronization or shift slightly to the right with the blanking bar becoming visible. The blanking bar may be unstable and move from side to side. Turn hold control counter-clockwise and the picture should remain in synchronization unless the signal is weak and in which case 3 or 4 bars may be seen sloping downward to the left.

If the receiver behaves in this manner and the test pattern is normal and stable, the horizontal oscillator is properly adjusted. Skip the "Adjustment of Horizontal Oscillator" and proceed with Height and Vertical Linearity adjustments.

Horizontal Oscillator

The horizontal oscillator is adjusted at the factory to provide the wave shape shown on the following page and normally can be adjusted by means of the horizontal frequency threaded brass screw (L16) at rear of chassis, and by means of the horizontal lock trimmer (C57).

(a) Turning the horizontal lock trimmer (C57) clockwise decreases the range of the horizontal hold control, and turning the trimmer counter-clockwise increases the range of the hold control. Normal setting is about one turn counter-clockwise from the tight position. In "Fringe" or weak signal areas the trimmer may be set two turns counter-clockwise from the tight position resulting in somewhat better range on the hold control.

(b) Turning the horizontal frequency screw (L16) clockwise lowers the frequency, (bars sloping downward to left). Turning the screw counter-clockwise increases frequency (bars sloping downward to right).

Adjustment of Horizontal Oscillator (with the use of an oscilloscope)

1) Allow set to warm up to operating temperature. Select station operating normally.
2) Connect vertical input lead of oscilloscope to terminal "C" of horizontal oscillator transformer (TR-2294) and ground oscilloscope to chassis. Set frequency of scope to approximately 5 KC.
3) Set horizontal lock trimmer (C57) one turn from tight.
4) Short terminals "C" & "D" on TR-2294 by means of clip lead.
5) **Set horizontal hold control at maximum clockwise rotation.**
6) **Adjust horizontal frequency screw (L16) until picture falls into sync. Then turn screw slightly counter-clockwise until blanking bar shows, or three or four bars show sloping downward to right.**
7) **Remove short from terminals "C" & "D" of TR-2294 and adjust screw (L17) at terminal end of TR-2294 (under chassis) until wave shape as observed on scope is like that shown in sketch.**

NOTE: Due to variations in oscilloscope input characteristics it may be necessary to insert a 50,000 ohm resistor in the vertical input lead. This will prevent the loading of the scope from affecting the frequency of the horizontal circuit.

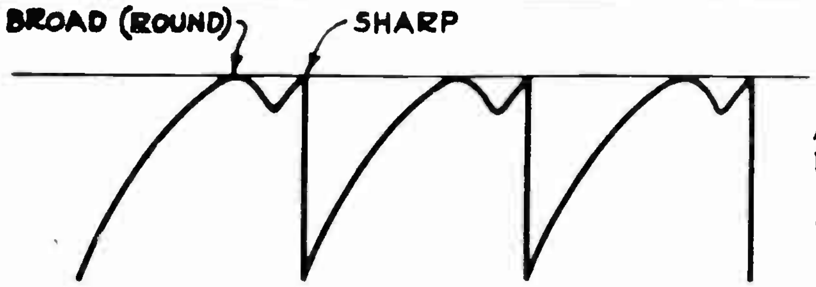
8) Some further adjustment of horizontal frequency screw (L16) may be necessary to keep picture in sync while L17 is being adjusted for proper wave shape.
9) Remove scope from terminal "C".
10) Turn horizontal hold control through entire range. Picture should remain in sync except in clockwise position when "blanking bar" will appear, or two or three bars will show sloping downward to the right.
11) If picture falls out at left or condition described in "10" is not obtained, adjust horizontal frequency screw (L16) slightly. Observe paragraphs "a" & "b" under "Horizontal Oscillator"

NOTE: Some manufacturers types of 6SN7GT may perform better than others in the horizontal oscillator socket and excessive drift of the horizontal oscillator circuit may be caused by a weak or defective 6SN7GT tube.

After the horizontal oscillator circuit has been adjusted in the manner outlined above, any subsequent touch-up may be made with the horizontal frequency screw L16.

Caution: It is important that the picture be centered in the mask properly with the horizontal hold control in the mid-position, otherwise the set user may attempt to center the picture by means of the hold control. Under this condition the control may be on "edge" and impulse noise or change of camera will cause the picture to fall out of synchronization.

World Radio History



ADJUST L17 FOR EQUAL HEIGHTS OF ROUND AND SHARP PORTIONS OF PULSE.

Height and Vertical Linearity Adjustments:

Adjust the height control until the picture fills the mask vertically. Adjust vertical linearity until the test pattern is symmetrical from top to bottom.

Adjustment of one control will require readjustment of the other. Then adjust focus coil lever to align the picture within the mask.

Width, Drive and Horizontal Linearity:

Turn the width control L19 (accessible through a hole in the rear of chassis) clockwise until the picture fills the entire width of the tube. Adjust the trimmer "horizontal drive" C67 (rear of chassis) to give the best degree of brightness and linearity. Adjust the horizontal linearity control L18 (rear of chassis) for best linearity of the right half of the picture. Readjust the width control until the picture fills the mask and again adjust the focus coil lever to align the picture within the mask.

NOTE: It is advisable to adjust both the height and width of the picture to a size slightly larger than the mask opening so that during periods of low line voltage or subsequent aging of tubes adequate deflection to fill the mask opening is obtained.

IMPORTANT:

The horizontal oscillator frequency must be checked for proper range of horizontal hold control after any adjustment of horizontal drive (C67) and horizontal lock (C57) trimmers. Some interaction is present between these trimmers and any adjustment of either one will usually require resetting of the horizontal frequency adjustment screw (L16).

FOCUS:

Adjust the focus control for maximum definition of the vertical wedge of the test pattern and uniform focus over face of picture tube.

Sensitivity Switch (Used only on Models 764 & 767) 762,

A two-position switch is provided at the rear of the chassis for increasing the gain of the receiver which may be required for proper operation in fringe areas. Where sound and picture reception is weak with the sensitivity switch set in LOCAL position, switching to "FRINGE" position will improve the performance of the receiver.

Phono-Television Switch (Used only on Models 764 & 767)

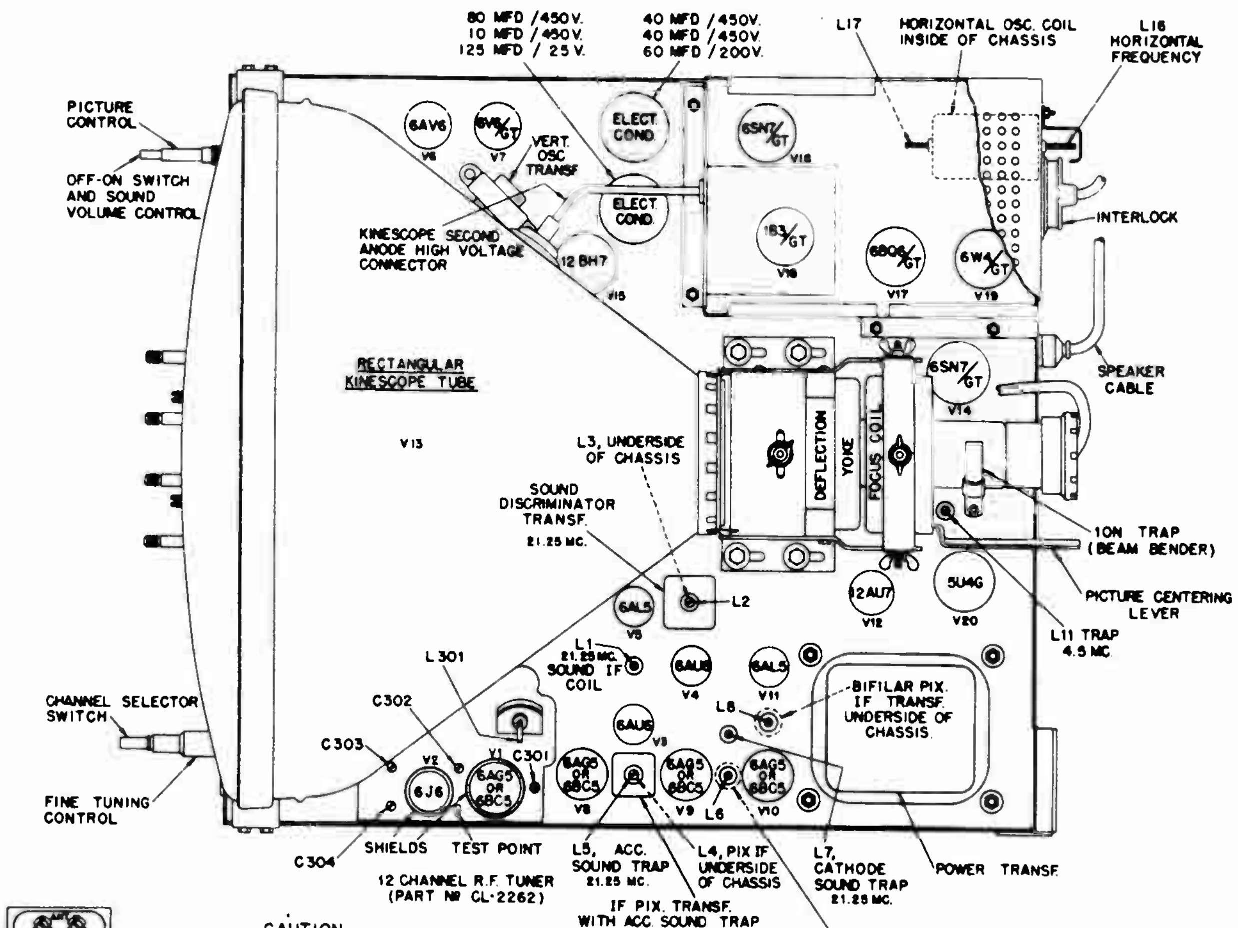
A two-position slide switch is provided at the rear of the chassis together with a pick-up socket for plug-in of an external record changer.

Built-In Antenna

All models are equipped with a built-in antenna which will provide satisfactory reception in many locations. In areas of weak reception an outside antenna will substantially improve the performance of the receiver. An antenna post is provided at the rear of the chassis and is accessible through the opening in the masonite back to permit the connection of an outside aerial. The built-in antenna is normally connected to the antenna posts and must be disconnected when attaching the outside aerial. To prevent the lead-in wires of the built-in antenna from contacting chassis parts and tubes it is recommended that the lead-in wire be folded and held in place by tape or a rubber band. In some cases reception can be improved by changing the location of the receiver in the room.

Note: The text in this manual applies to television receivers wired in accordance with enclosed schematic diagram DG-2346-1.

TUBE AND TRIMMER LAYOUT



CAUTION

DO NOT USE ON DIRECT CURRENT (D.C.). DISCONNECT LINE CORD FROM POWER OUTLET BEFORE REMOVING CHASSIS FROM CABINET.

ALL 700 SERIES RECEIVERS

MODELS 752, 752U, 753, 753U, 755, 755U, 764, 764U, 766, 766U, 767, 769

Trouble: Fuse blows on line voltage surge, etc. resulting in small picture, fold over on both sides and damping bars.
Remedy: Remove fuse from present circuit and then remove green lead from terminal #1 on TR-2293 horizontal output transformer and connect to #8. Connect fuse between #8 and #1. Remove yellow wire from #8 and connect to #7. Dress fuse away from high voltage terminals.

Trouble: Insufficient width.
Remedy: Connect an .05-400 volt condenser across width control (terminals #5 and #6 on transformer). In severe cases of low line voltage, etc. a .1-400 condenser may be used. Change 6BQ6GT.

Trouble: Vertical retrace lines visible at low contrast. May be due to low transmitter sync level, or variations in picture tube characteristics.
Remedy: Connect .05-600 volt condenser from green lead of vertical output transformer (TR-2189) to yellow lead (pin #11 V13 Kinescope). These leads run to adjacent tie points on terminal strip near vertical output transformer.

Trouble: Beat interference, hash in picture or sound, or separation of sound and picture on high band. Oscillation in sound I.F.
Remedy: Ground cathode resistor (R1 150 ohms) directly to center shield of V3 socket 1st sound IF amplifier, instead of terminal strip ground. Connect 1500 mmf ceramic condenser between pin #7 cathode and socket center shield. Check alignment of sound IF, sound traps, and distriminator.

SUBJECT: Modifications and Notes Applying to Models 752, 753, 755, 764, 766 and 767. Refer to schematic drawing DG-2346-1. All references to changes and symbol numbers in this service bulletin are with respect to Olympic's schematic wiring diagrams supplied with Instruction Manual IB-2405.

1. Tube Changes
Due to the critical shortage of 12AU7 tubes, the first and second video amplifier V12 will at times be replaced by a 6SN7GT tube. Due to inability to obtain adequate supplies of 12BH7 tubes, the vertical oscillator tube V15 is now being replaced by a 6SN7GT and all further production will use the latter type of tube.

2. Circuit Change
Condenser No. C18 .01/600 volts is being returned to the 6V6 screen, pin #4 instead of ground to reduce possibility of voltage breakdown.
Resistor No. R50, 6.8 Meg. going to the vertical hold control is not being used in all sets. It is often eliminated for better range of the vertical hold control.

3. Horizontal Tearing (Defective Parts)
If tearing occurs, especially in fringe areas resulting in a distorted picture, when contrast control is advanced, check for a short, leaky or open .05 condenser (C37) and low capacity in 220 MMF mica condenser (C38).

4. Color Converter
A color converter socket is now being wired in on the rear of the chassis for use with color converters -- when available.

5. Underwriters' Changes
In accordance with U/L requirements, a 120,000 ohm 1 watt resistor is being placed across condenser C48 in the primary of the power transformer -- connecting one side of the A.C. line to ground.

6. Picture Width
To increase picture width for low line voltage areas, a .05/600 W.V. paper condenser is now used on all models across terminals 5 and 6 of the flyback transformer TR-2293.

7. Vertical Height
To improve vertical height, try replacing the vertical output tube V15 which may be either a 6SN7GT or a 12BH7. As noted in paragraph one, both 6SN7GT and 12BH7 have been used in V15 socket.
Due to resistor shortages, R55 and R56, 3300 ohms each respectively in series have been replaced on some receivers by one 6500 ohm 5 watt wire wound resistor. To obtain increased height where R55 and R56 are used, short out either one of them. Where a 6500 ohm resistor is used, shunt another 6500 ohm 2 to 5 watt resistor across the present one or replace it by a 3300 ohm 2 watt resistor.

8. Width Control
Due to the scarcity of power transformers, Olympic Part No. TR-1966, it has been necessary to substitute another specification TR-1688 giving slightly lower B+ voltages. On all models where TR-1688 have been substituted and to secure sufficient width, the width control has been removed from the circuit by connecting both width control leads to terminal #1 of the 6BQ6GT tube. (V17 socket).
If it is necessary to reduce the width of the picture, restore connections of the width control by re-wiring to terminals 5 and 6 of the flyback transformer.

9. Vacuum Tubes
It appears that component parts manufacturers standards have been appreciably lowered lately. Therefore -- always check tubes first in case of performance and operation troubles. Some manufacturers types are better than others especially in 6BQ6 and 6SN7 types.

10. Resistors
Because of the critical shortage of this item, we and other manufacturers are compelled to develop new sources of supply even using resistors of foreign manufacture. While foreign resistors are properly rated as to wattage and resistance, the majority of them are of the un-insulated type. In production, these resistors are dressed away from contact with other parts. Transportation shock may cause them to shift, causing shorts. In case of trouble, check for short circuits and re-dress resistors so that they do not touch adjacent parts or components.

11. Horizontal Tearing (Modification)
When tearing of picture occurs at high or medium contrast control setting, R36 1000 ohm should be reduced to 700 or 800 ohms. When tearing or distortion occurs at low contrast setting R36 is too low and should be increased to 1200 ohms.

BULLETIN NO. 51-4

SUBJECT: Insufficient height and width in areas of low line voltage. Models 752, 753, 755, 764, 766 and 767.

Production Changes Starting November 24, 1950

Pix Width: R76 56,000 ohm 1 watt resistor changed to 22,000 ohm ±20% 1 watt.

Pix Height: R55 and R56 3,300 ohm 2 watt, (actually 6500 ohm 10 watt in production) replaced by one 3300 ohm 2 watt. A parallel resistor combination may be used as an equivalent of a 3300 ohm 2 watt resistor.

World Radio History

NOTE:-For Service Data of Television Ch. for Model DX-621, See Volume 5, Pages 5-1 through 5-7.

Frequency Range: A.M. 535-1700 kc. and F.M. 88-108 mc.

Power Requirement: 105-125 Volts a-c 60 cycles

Power Consumption: Receiver on a-m: 95 watts. Receiver with Record Changer: 115 watts

IMPORTANT NOTICE:

This AM-FM-TV receiver and automatic 3-speed record changer console is for use on alternating current ONLY and should never be used on direct current.

Before operating the radio receiver and record changer it will be necessary to remove the two shipping screws (which are identified with tags) holding radio receiver to its mounting board and loosen the three record changer mounting screws completely as described in separate accompanying Record Changer Instruction Sheet.

This instrument is equipped with two separate chassis; one a 10 tube (including rectifier) AM-FM chassis and another a 20 tube (including rectifiers) television chassis. Built-in antennas are provided for both the AM and FM-TV sections of the receiver which will provide satisfactory reception under normal operating conditions. For AM reception an outside antenna will seldom be required whereas on FM-TV the use of an outside antenna will generally improve the quality of reception.

AM-FM RECEIVER CONTROLS: (see separate folder for television controls and operation)

The AM-FM receiver has four control knobs marked according to their function, and reading from left to right as follows:

1. VOLUME 2. OFF-ON-TONE 3. FM-AM-PH-TV 4. TUNING

NOTE: The power switches for operating the television and radio sections of this instrument are interconnected and therefore it is necessary that the power switch of the unit which is not in operation be turned to the "OFF" position.

TUNING:

To place receiver in operation turn the OFF-ON knob clockwise until a click is heard. The tubes require a warm-up period of about one-half minute before the set is ready to function.

A.M.

For AM reception turn FM-AM-PH-TV knob to the position where AM faces the indicator dot. The tuning knob should now be turned until the dial pointer is at the frequency of the desired station. Use part of dial calibrated from 55 to 170. Dial numbers are converted to kilocycles by adding one zero. For example, 70 on the dial is 700 kilocycles. With volume control set to LOW volume level turn the station selector knob until the desired station is received loudest. Now adjust volume to the desired level and the tone control to the desired tone. DO NOT USE TUNING KNOB TO ADJUST VOLUME BY TUNING OFF STATION AS THIS WILL RESULT IN POOR TONE QUALITY.

F.M.

As supplied, the built-in television antenna is connected to both the TV and FM section of the receiver. Where no outside television aerial is used this arrangement will in most cases assure satisfactory FM reception. Where an outside television aerial is used, this internal connection will automatically connect the FM section to the outside aerial and no additional FM antenna should be required. Where an independent FM aerial is desired the connecting line between the television receiver and the radio receiver should be disconnected on both ends and the aerial connected to the post on the rear of the radio receiver marked "FM-Dipole."

For FM reception turn FM-AM-PH-TV knob to the position FM facing indicator dot. Use the part of the dial calibrated in megacycles and channel numbers and tune carefully at medium volume level to the desired station. The tuning is done by the same knob as on AM. It is important to tune accurately to the center of the station as incorrect tuning will result in poor tone quality. The correct tuning point is the position of loudest response.

Tone and volume may be adjusted by the same two knobs as for AM reception.

NOTE: When operating this console as a Radio Receiver be sure that the motor switch on the record changer is in the OFF position.

RECORD CHANGER OPERATION:

To operate the record changer, turn the FM-AM-PH-TV knob so that PH faces indicator dot, leave the "OFF-ON" knob in the "ON" position and adjust volume and tone with the same knob as used in receiver operation.

TELEVISION RECEPTION:

To use the television receiver on this instrument it is IMPORTANT that the FM-AM-PH-TV knob be set in the position where TV faces indicator dot. If this is not observed the sound section of the television receiver will be inoperative. For instructions how to use television receiver read the separate instructions accompanying this instrument.

SERVICE AND ALIGNMENT INSTRUCTIONS

To remove the chassis from the console, it is first necessary to disconnect all plugs and sockets between the rear of the receiver chassis, the speaker, the television set and the record changer, respectively. Then remove the four knobs and the four screws holding the chassis to its mounting panel. (On Model 766 it will also be necessary to remove the wood screw holding the broadcast loop to the side of the cabinet.)

CAUTION: WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION IN WHICH THE CHANGER MECHANISM WILL NOT BE DAMAGED.

ALIGNMENT:

Equipment Required: Modulated a-m, r-f signal generator; modulated f-m signal generator covering the range from 88 to 108 megacycles; vacuum tube voltmeter; output meter; insulated screw driver; radiation loop (1 turn of about 6" to 8" diameter of #12 or #14 wire connected across output of signal generator and placed parallel to receiver loop about 8" or 10" away); one .1 mfd 400 volt condenser; two 150 ohm resistors.

With the receiver removed from the cabinet, connect output meter, or vacuum tube voltmeter and signal generator as indicated in the alignment procedure chart and keeping the output of the generator as low as possible, proceed exactly in the sequence as shown on the chart.

Before aligning, close the variable condenser fully counter-clockwise (plates fully closed) and check that pointer coincides with the reference line on the dial.

LIST OF ILLUSTRATIONS

Figure 1

Model 2801-TV

Model 2801-TV, shown in figure 1, is a console television — AM-FM radio — phonograph combination. It employs 23 tubes plus 4 rectifiers and a 16-inch rectangular picture tube using electro-magnetic deflection.

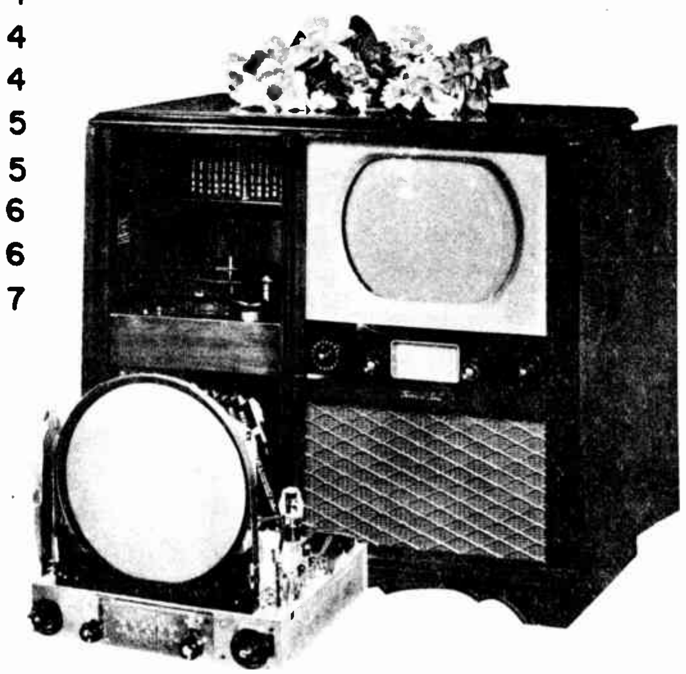

Figure 2

Model 2801A-TV

Model 2801A-TV, shown in Figure 2, is the same as the 2801-TV with the exception that it employs a 16-inch round picture tube.

Cabinet styling is in walnut, mohogany, blonde oak, and maple.

GENERAL INFORMATION

Two chassis comprise the overall chassis assembly: the television chassis and the AM-FM chassis. The audio amplifier and power supply contained in the television chassis, serves both chassis.

Both models feature the Webster Model 100-11 three-speed automatic record changer. Service Instructions pertaining to this unit will accompany this service manual.

SPECIFICATIONS

OVERALL DIMENSIONS:

Height	38¼"
Width	40⅛"
Depth	23⅜"
Shipping Weight	250 Lbs.

TUNING FREQUENCY RANGE:

Television	All 12 channels currently alloted to the Pacific Coast Area; channels 2 to 13 inclusive (54 to 88 MC and 176 to 216 MC).
FM	88 to 108 MC
AM	540 to 1620 KC

INTERMEDIATE FREQUENCIES:

Television Sound Carrier	20.5 MC
Television Picture Carrier	25.0 MC
Frequency Modulation	10.7 MC
Standard Broadcast	455 KC

ELECTRICAL RATING:

Line Voltage	110-120 volts
Power Consumption @ 115 volts	
Radio — Phono	98 watts
Television	210 watts

ELECTRICAL POWER OUTPUT: (Maximum)

Television	2.0 watts
FM	3.0 watts
AM	2.5 watts
Phonograph	2.5 watts

LOUDSPEAKER:

Type	Permanent Magnet
Outside Cone Diameter	12"
Voice Coil Impedance	3.2 ohms @ 400 C.P.S.
Magnet Rating	6.8 Oz. Alnico V

RECEIVING ANTENNA INPUT IMPEDANCE:
300 ohms balanced

VIDEO RESPONSE:
3.5 MC band width

FOCUS:
Electro-Magnetic

SWEEP DEFLECTION:
Electro-Magnetic (70 degree)

SCANNING:
525 lines interlaced

HORIZONTAL SCANNING FREQUENCY:
15,750 C.P.S.

VERTICAL SCANNING FREQUENCY:
60 C.P.S.

PICTURE REPETITION RATE:
30 C.P.S.

PICTURE SIZE:

	Rectangular	Round
Width	13 27/32"	14½"
Height	10 7/16"	11"

TUBE COMPLEMENT:

Television

No.	Tube	Function
V-1	6AU6	Sound I-F Driver
V-2	6AL5	Television Ratio Detector
V-3	6AV6	1st Audio Amplifier
V-4	6V6-GT	Power Amplifier
V-5	6AU6	1st Pix I-F Amplifier
V-6	6AU6	2nd Pix I-F Amplifier
V-7	6AU6	3rd Pix I-F Amplifier
V-8	6AL5	Pix Detector, A.G.C.
V-9	12AU7	1st & 2nd Video Amplifier
V-10	12AU7	Sync. Amplifier, Sync. Separator & D.C. Restorer
V-11	6AL5	A.F.C. Discriminator
V-12	6SN7-GT	Horizontal Oscillator
V-13	6J5	Horizontal Discharge
V-14	6CD6-G	Horizontal Output
V-15	1B3-GT	High Voltage Rectifier
V-16	1B3-GT	High Voltage Rectifier
V-17	6SN7-GT	Vertical Oscillator & Discharge
V-18	6S4	Vertical Output
V-19	6U4-GT	Damper
V-20	5U4-G	Low Voltage Rectifier
V-21	16TP4	16" Rectangular Picture Tube (2801-TV)
V-21	16GP4	16" Round Picture Tube (2801A-TV)
*V-22	6AG5	R-F Amplifier
*V-23	6J6	R-F Oscillator, Converter

AM—FM RADIO

No.	Tube	Function
V-24	6BE6	AM Converter, FM Oscillator
V-25	6BA6	I-F Amplifier
V-26	6AU6	FM Driver, AM Detector
V-27	6AL5	FM Ratio Detector
V-28	12AT7	FM R-F Converter

*V-22 and V-23 are contained in the television R-F tuner.

When replacing tubes, refer to tube layout label on rear of cabinet.

INSTALLATION INSTRUCTIONS

The usual installation adjustments may be accomplished quite conveniently without removing the chassis or the cabinet back.

CAUTION!!

The metal shell of the picture tube contained in Model 2801A-TV carries the second anode voltage which is in excess of 13,000 volts. Unless it is absolutely necessary, it is recommended that the high voltage lead be disconnected and temporarily insulated during alignment or servicing procedure. WHEN THE TUBE IS CONNECTED, MAKE CERTAIN THAT ANY PORTION OF THE BODY, METAL OBJECTS, TEST LEADS, ETC., ARE AT LEAST ONE INCH AWAY FROM THE SHELL AT ALL TIMES.

When disconnecting the high voltage clip, remove the remaining charge by shorting it to the chassis.

©John F. Rider

World Radio History

PICTURE TUBE ADJUSTMENTS:

The following picture tube adjustments should be checked upon installation or whenever the receiver is serviced. *(See Figure 3.)*

Focus Coil, Horizontal and Vertical Centering and Ion Trap Adjustments:

1. Set Brightness Control at its approximate mid-point and slowly adjust ion trap backward and forward and rotate around neck of tube until maximum brightness is noted. *MAKE CERTAIN BRIGHTNESS CONTROL IS NOT SET BEYOND MID-POSITION UNTIL ION TRAP IS PROPERLY ADJUSTED. CONTRARY PROCEDURE MAY RESULT IN SERIOUS DAMAGE TO PICTURE TUBE.*
2. Adjust Focus Control for proper picture focus.
3. Adjust Focus Coil centering screws until raster is centered vertically and horizontally.
4. Recheck ion trap adjustment.

If, for any reason, it becomes necessary to remove the focus coil, it must be replaced so that the center hole is mechanically centered with respect to the neck of the picture tube. Then adjust it backward and forward so that picture focus is reached with the focus control at its approximate mid-point. Following this, center the raster as previously outlined.

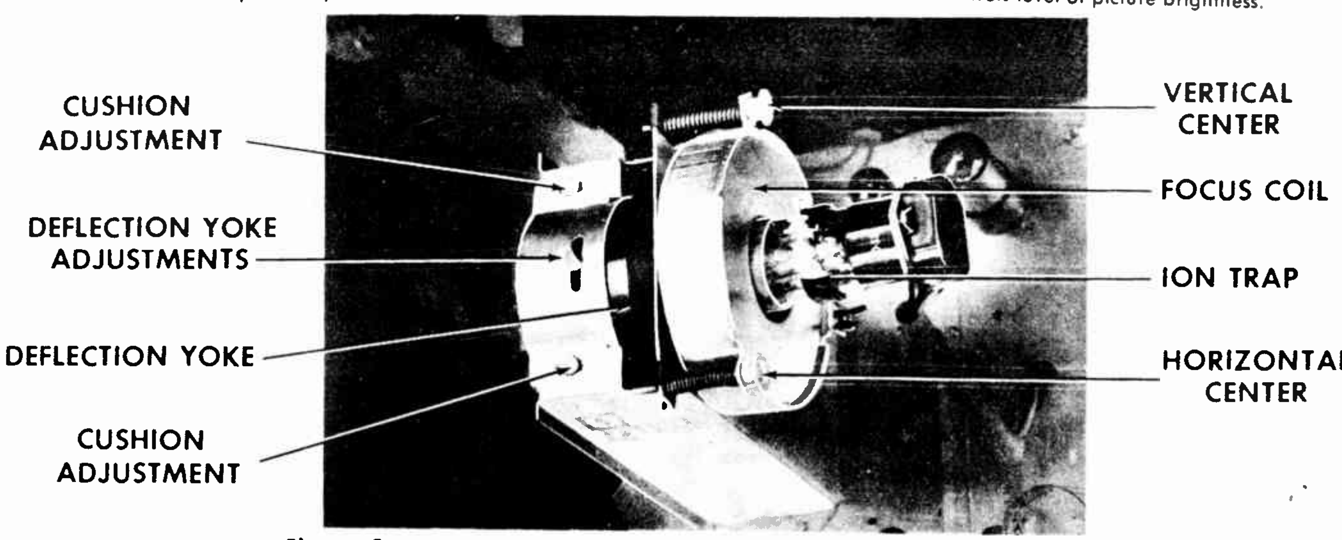

Figure 3
Picture Tube Yoke Assembly

Deflection Yoke Adjustment:

1. Loosen deflection yoke thumb screw adjustment and adjust until the raster is square with the picture tube frame.
2. Tighten screw.

INSTRUCTIONS FOR REPLACING PICTURE TUBE:

The round (2801A-TV) and rectangular (2801-TV) picture tubes employ different mounting methods, consequently, the manner of replacement varies:

RECTANGULAR (2801-TV)

1. Loosen tube protecting strap bolts.
2. Remove tube socket, ion trap and polyvinyl sleeve.
3. Disconnect high voltage lead.
4. Carefully slide tube forward out of yoke assembly and place it on a bench face down. A soft cloth or felt should be used to protect the face of the tube.
5. Replace tube by reversing the foregoing procedure.

ROUND (2801A-TV)

1. Disconnect picture tube socket.
2. Remove ion trap and polyvinyl sleeve.
3. Remove four screws securing picture tube cradle to chassis.
4. Loosen tube protecting strap.
5. Disconnect high voltage lead by sliding connecting clip downward on protecting strap.
6. Remove picture tube by sliding it forward out of yoke assembly. AVOID NECK OF TUBE STRIKING YOKE ASSEMBLY.
7. Place tube on bench face down. Tube face should be protected by a felt or soft cloth.
8. Replace tube by reversing the foregoing procedure.

CAUTION!!

USE GOGGLES OR A MASK AND GLOVES TO HANDLE TUBE. DO NOT SCRATCH, STRIKE OR EXERT MORE THAN MODERATE PRESSURE ON TUBE.

NOTE: It is suggested the picture tube plexiglas lens be cleaned with a soft, damp cloth or chamois whenever the chassis is removed from the cabinet.

NON-OPERATING CONTROLS AND ADJUSTMENTS:

CONTROL	ACTION
Focus	Adjust sharpness of raster lines.
Brightness	Controls level of picture brightness.
Vertical Hold	Pulls picture into vertical sync.
Height	Control top to bottom dimensions of raster.
Vertical Linearity	Controls relative proporations of upper, central and lower portions of raster.

ADJUSTMENT	ACTION
Horizontal Hold	Adjusts horizontal oscillator to pull picture into horizontal sync.
Horizontal Drive	Adjusts maximum raster width without crowding right side of raster.
Width	Adjusts width of raster.
Horizontal Linearity	Adjusts relative proporations of horizontal scan to central portions of raster.

For obvious reasons, it is preferable that these controls be adjusted while observing a station test pattern.

Prior to undertaking the following adjustments, the Focus, Brightness, Contrast and Fine Tuning Controls should be set at their normal operating position.

Height, Vertical Linearity and Vertical Hold Adjustments:

1. Set Vertical Hold Control to sync. picture vertically.
2. Adjust Height Control until pattern fills frame from top to bottom.
3. Adjust Vertical Linearity Control until top, central and lower portions of the picture are symmetrical.

Width, Horizontal Linearity, Horizontal Hold and Horizontal Drive Adjustments:

1. Set Horizontal Hold Adjustment to sync. picture horizontally.
2. Momentarily remove signal by switching off channel then back.
3. Repeat Step 1 if picture does not hold sync.
4. Repeat Steps 1, 2 and 3 until picture remains in constant sync.
5. Turn Horizontal Linearity and Horizontal Drive Adjustments alternately until left, central and right portions of picture are in proportion.
6. Turn Width Adjustment until picture fills frame horizontally.
7. Recheck Steps 1, 2, 3 and 4.

FINAL INSTALLATION INSTRUCTIONS:

When the receiver is ready for actual operation in the customer's home the following should be observed.

1. If at all possible, the instrument should be located so that excessive light does not fall on the picture tube face and cause annoying reflections from the plexiglas mask.
2. To insure adequate ventilation, place instrument at least two inches from the wall.
3. Extreme care should be taken in the type, location and orientation of the antenna so that the best possible reception is obtained. All Packard-Bell television receivers are equipped with Packard-Bell's exclusive "Teletenna." This built-in antenna system will deliver satisfactory results in areas where a strong signal prevails. In locations, however, where reflections are usually encountered and the signal is down, an outside antenna should be installed.

SPECIAL SERVICING INFORMATION TELEVISION

BLOCK CIRCUIT DIAGRAM (TELEVISION):

The block circuit diagram as shown in Figure 15 will enable service personnel to follow the signal through the receiver in a logival manner, thereby assisting in isolating circuit deficiencies.

CRITICAL LEAD DRESS:

In the event parts are replaced, refer to Figure 20 for proper lead dress. Particular attention should be accorded the following:

1. Do not displace components in the Pix I-F Circuit. Should it become necessary to replace parts in this section of the circuit it is strongly advised that alignment be checked following the changes.
2. Dress high voltage leads up and away from the chassis.
3. If replacement of parts in the high voltage circuit becomes necessary, solder joints must be rounded and free from sharp corners.

PRODUCTION MODIFICATIONS:

The following production modifications, effected after early production runs, do not appear on the schematic diagram.

1. Two changes should be noted on all 2801A-TV receivers:
   a. C-50 (.01 Mfd. 600 volt capacitor) becomes a .003 Mfd. 600 volt capacitor.
   b. Add 200 Mmf. ceramic, 2500 volt capacitor in parallel with C-49.
2. A 470 ohm, 2 watt carbon resistor was added in parallel with L-15, Width Coil.
3. In later production runs, the above was changed to a 500 ohm, 5 watt wire wound resistor.

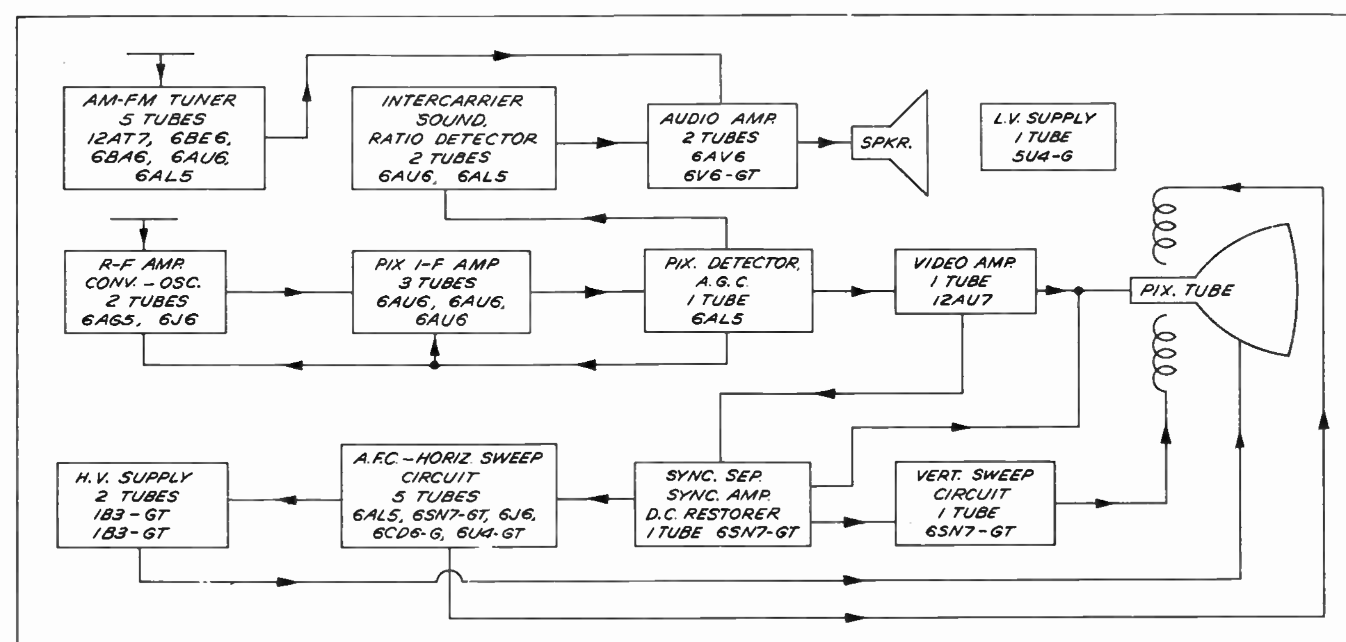

Figure 15
Block Circuit Diagram

©John F. Rider

World Radio History

SOCKET VOLTAGES — TELEVISION:

The socket voltages as shown in Figure 16 were measured under the following conditions:

1. Selector Switch in TV position.
2. No Signal.
3. Brightness and Contrast Controls minimum.
4. All voltages shown are positive D.C. and were measured from socket contacts to chassis unless otherwise noted.
5. Voltage readings are subject to a 10% variation.
6. ~~D.C. voltages measured with a vacuum tube voltmeter.~~
7. Voltage readings on the following tubes are subject to a wide variation since they are dependent on the setting of closely related controls.

V-17 (6SN7-GT)	. .	Vertical Hold
V-9 (12AU7)	. . .	Contrast
V-17 (6SN7-GT)	. .	Height
V-18 (6S4)	. . .	Vertical Linearity

8. A.C. Voltages measured with a 1,000 ohms per volt A.C. meter.
9. The voltages shown on V-1 (6AU6) and V-4 (6V6-GT) are readings taken from socket contacts to chassis. However, since V-4 functions as a voltage divider as well as a power amplifier, the cathode and filament are tied directly to the B plus. Hence, in order to measure the true operating voltages of these tubes, connect the common terminal of the voltmeter to the cathode pin of V-4.

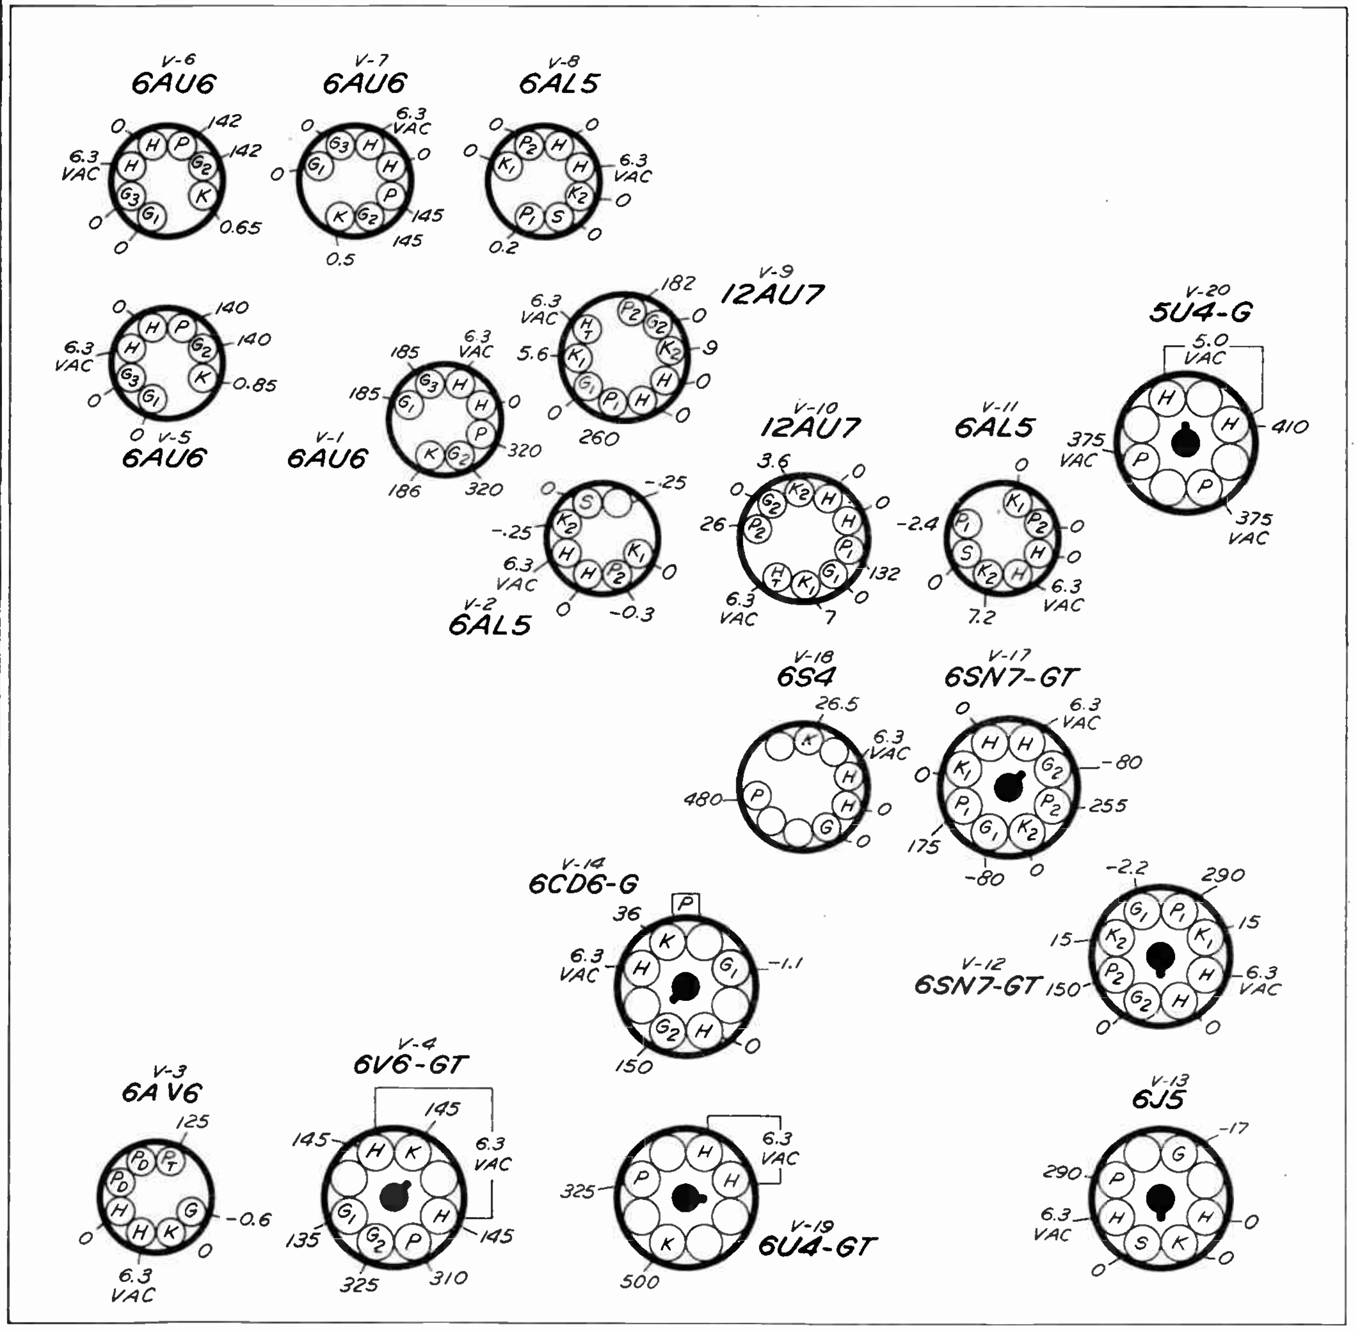

Figure 16
Socket Voltages—Television

HIGH VOLTAGF WARNING

The Pix tube second anode voltage is in excess of 13 KV. Only personnel familiar with high voltage handling procedure should undertake servicing the chassis once it has been removed from the cabinet. DO NOT, AT ANY TIME, WORK ON THE CHASSIS WITH THE RECEIVER CURRENT ON AND THE HIGH VOLTAGE COVER REMOVED.

ISOLATING TROUBLE BY PICTURE TUBE OBSERVATION:

Very often, circuit deficiencies may be isolated by observing certain visible characteristics present on the picture tube. The following are hypothetical cases of trouble and the probable source.

No Raster on Picture Tube:

1. Incorrect adjustment of ion trap magnet. (See "*Picture Tube Adjustments.*")
2. V-14, V-15, V-16 defective; check voltages and associated circuit components.
3. No high voltage; check high voltage winding of T-3.
4. V-12, V-13 defective; check voltages and associated circuit components.
5. V-19 defective; check voltages and associated circuit components.
6. Defective picture tube or picture tube socket.

Sound and Raster but no Picture:

1. Open video peaking coils.

Picture Stable but Poor Resolution:

1. V-8, V-9, V-10 defective; check voltages and associated circuit components.
2. Check Focus Control for proper adjustment.
3. R-F or I-F circuits improperly aligned.

Picture Jitter:

1. If regular sections of the left of picture are displaced, V-14 may be defective: check voltages.
2. Check for loose connections or noise.

Weak Raster:

1. Low B plus or line voltage.
2. V-14, V-15, V-16 defective; check voltages.
3. Check filter capacitors. Check value of R-74, R-75.

Picture Will Not Hold Horizontal Sync:

1. V-11 defective; check voltages and associated circuit components.
2. L-12 improperly aligned. (See "*Non-Operating Control Adjustments.*")
3. L-12 defective.

Poor Horizontal Linearity:

1. Horizontal Linearity Control improperly adjusted.
2. T-4 defective.
3. V-14, V-19 defective; check voltages.

Poor Vertical Linearity:

1. Incorrect adjustment of R-70 (Vertical Linearity Control.)
2. T-4 defective.

No Horizontal Deflection:

1. Horizontal Deflection Coils open (L-16).

No Vertical Deflection:

1. V-18 inoperative; check voltages and associated circuit components.
2. Vertical Deflection Coils open (L-13).

Non-Symmetrical Raster:

1. Check Focus Coil and Ion Trap adjustments.
2. Defective yoke assembly.
3. Check Vertical and Horizontal Linearity adjustments.

Picture but no Sound:

1. V-1, V-2, V-3, V-4 defective; check voltages and associated circuit components.
2. T-1 or speaker voice coil open.

TELEVISION ALIGNMENT PROCEDURE

GENERAL INSTRUCTIONS:

Television alignment is divided into five sections.

1. Picture I-F Alignment (Preliminary).
2. Inter-Carrier Sound and Ratio Detector Alignment.
3. Picture I-F Alignment (Final).
4. R-F Oscillator Alignment.
5. R-F Tuner Alignment — Oscillator, Converter and R-F Amplifier.

In the event complete alignment is necessary, it should be done in the foregoing order.

Location of trimmers and test points called out in the step by step alignment instructions that follow are shown in Figures 19 & 20. They are also shown in the schematic diagram.

Alignment of the 4.5 MC trap at the input of the video amplifier requires an R-F vacuum tube voltmeter. If such is not available, a Germanium *Diode Detector (Crystal)* may be connected in series with the positive probe of a conventional D.C. vacuum tube voltmeter. This type crystal is available at all radio supply houses at a nominal cost.

In several instances, alignment instructions call for a "loose coupling" to the converter or R-F oscillator tube by a marker or sweep generator. This is accomplished by wrapping several turns of fairly heavy wire (#14 or #16 insulated copper) around the glass envelope of the tube and connecting the generators to one end.

The service technician must bear in mind that the alignment as herein outlined is somewhat similar to the original factory alignment which is done with the receiver almost completely out of adjustment. Generally speaking, such a condition would rarely be encountered in the field. Field adjustments are usually confined to "touch-up" adjustments.

This is particlarly true in the case of the picture I-F alignment. It will be noted in the instructions that follow, that the picture I-F alignment is divided into two sections: one (preliminary) utilizes the conventional "meter alignment"; the other (final) an oscilloscope alignment. The meter alignment, principally because of its speed advantages, is used where the circuit is completely out of adjustment. It brings the I-F response curve reasonably close to its desired proportions. It cannot, however, as experience has proven, deliver the proper curve with the required accuracy (See Figure 17.) Thus, to attain the desired curve, it is necessary to use an oscilloscope for final detailed adjustments.

Normally, the service technician will find that oscilloscope alignment will prove sufficient where picture I-F alignment is indicated. In any case, it is strongly recommended that the I-F response curve be carefully analyzed before proceeding with adjustments of any nature.

R-F FREQUENCY RANGES:

Channel Number	Channel Freq. MC	Pix Carrier Freq. MC	Sound Carrier Freq. MC	Receiver R-F Osc. Freq. MC
2	54-60	55.25	59.75	80.25
3	60-66	61.25	65.75	86.25
4	66-72	67.25	71.75	92.25
5	76-82	77.25	81.75	102.25
6	82-88	83.25	87.75	108.25
7	174-180	175.25	179.75	200.25
8	180-186	181.25	185.75	206.25
9	186-192	187.25	191.75	212.25
10	192-198	193.25	197.75	218.25
11	198-204	199.25	203.75	224.25
12	204-210	205.25	209.75	230.25
13	210-216	211.25	215.75	236.25

1. PICTURE I-F ALIGNMENT (PRELIMINARY):

a. Connect marker generator to antenna terminals. Set VTVM to minus 3 volt scale and connect to "Point D" and ground.

b. Set marker generator to 21.8 MC and adjust S-5 to 21.8 MC observing VTVM for maximum output. It may be necessary to set the marker generator output at maximum in order to detect any reading on the VTVM. However, once it is evident that the correct signal is present, reduce the output accordingly.

©John F. Rider

World Radio History

c. Set marker generator to 24.0 MC and, following the procedure outlined in the preceeding step, adjust S-20 1st Pix I-F.

d. Set marker generator to 23.0 MC and adjust S-21, 2nd Pix I-F, as above.

e. Set marker generator to 21.8 MC and adjust S-22, 3rd Pix I-F, as above.

2. INTER-CARRIER SOUND, RATIO DETECTOR AND 4.5 MC TRAP ALIGNMENT:

a. Connect marker generator to "Point D" and ground and set to 4.5 MC (exact) maximum output.

b. Connect R-F vacuum tube voltmeter to "Point E" and ground. If such a meter is not available, connect Germanium Diode Detector (Crystal) in series with positive probe of D.C. vacuum tube voltmeter. Connect negative probe to ground.

c. Adjust S-23 for minimum reading on VTVM.

d. Connect VTVM to "Point A" and ground.

e. Adjust S-1, Sound I-F Driver, to 4.5 MC observing VTVM for maximum output.

f. Adjust S-2, Ratio Detector Primary, to 4.5 MC, observing VTVM for maximum output.

g. Connect VTVM to "Points A & B" (negative probe to "Point A").

h. Adjust S-3, Ratio Detector Secondary to zero, between positive and negative peaks.

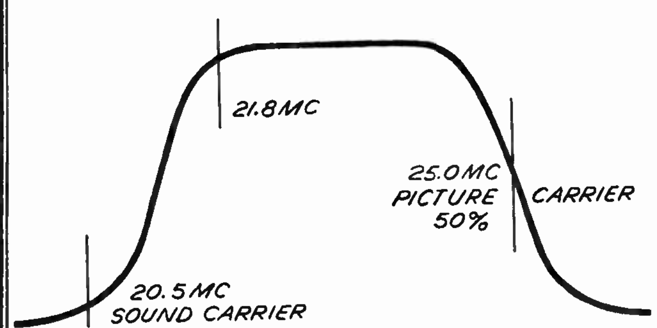

Figure 17
I-F Response Curve

3. PICTURE I-F ALIGNMENT (FINAL):

a. Remove converter tube shield and loosely couple sweep generator to converter tube. Connect marker generator to antenna terminals. Connect oscilloscope to "Point D".

*b. Set sweep generator to center picture I-F frequency, sweep 10 MC. Set marker generators to provide markers at 21.8 MC and 25.0 MC.

c. Observe and analyze the response curve obtained on the oscilloscope; compare it with the curve as shown in Figure 17. In all probability, the two will not be alike. This indicates that the Picture I-F adjustments must be retouched. Careful study of the curve and the position of the markers thereon will indicate which adjustments are in need of attention.

1. The curve should be essentially flat-topped.
2. The picture carrier, 25.0 MC, should be at the 50% response point.
3. The 21.8 MC marker should be at approximately 100% response.

The most important point to consider in making final I-F adjustments is to get the picture carrier at the 50% response point. If the picture carrier operates too high on the curve, there will be a loss of picture detail.

If the picture carrier operates too low on the curve, loss of low frequency video response will result and loss of picture brightness, of blanking and of sync will occur.

* *NOTE—To provide two markers simultaneously would require two marker generators. If two are not available, one is sufficient. Simply observe the position of the markers one at a time.*

SPECIAL PIX I-F ALIGNMENT FOR WEAK SIGNALS OR "FRINGE AREAS."

In order to gain added sensitivity, necessary in some "fringe areas", it is recommended that the Picture I-F be aligned as shown in Figure 18.

It will be noted that the band width has been reduced to approximately 2.5 MC. This reduction in band width will result in some loss of horizontal resolution, which with inadequate signal strength, would be lacking in any case. Consequently, the resultant loss in resolution is more than compensated by the increased sensitivity.

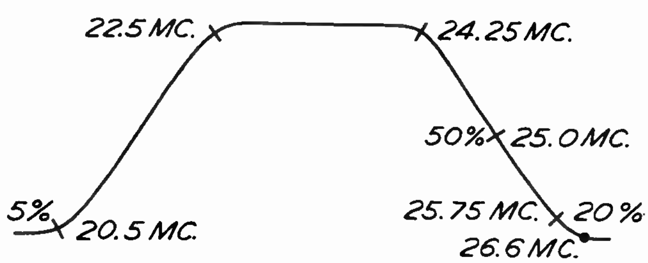

Figure 18
"Fringe Area"
I-F Response Curve

4. R-F OSCILLATOR ALIGNMENT:

It has been noted that the majority of service technicians prefer to align the channel oscillator slugs by ear and observing the picture quality thereby eliminating the use of a marker generator and a vacuum tube voltmeter. While it is true, this method is not 100% accurate, it has proven to be more than satisfactory.

Since this receiver employs inter-carrier sound, the oscillator slug is not tuned to the maximum sound level. It is tuned for maximum picture quality. The sound will be slightly below maximum at this point.

Make certain Fine Tuning Control is set at its approximate mid-point during these adjustments.

In the event it is desired, for example, if the receiver is being aligned at such a time when all stations are off the air, the following method which employs a heterodyne frequency meter may be used.

a. Turn Selector to channel 13 and set Fine Tuning Control at its approximate mid-point.

b. Loosely couple heterodyne frequency meter to the R-F oscillator tube. Set meter to 236.25 MC (receiver R-F oscillator frequency, channel 13).

c. Adjust channel 13 oscillator slug observing heterodyne frequency meter for zero beat.

d. Follow the above procedure on all channels, making certain the heterodyne frequency meter is set to the receiver R-F oscillator frequency corresponding to the channel being adjusted. (See *"R-F Frequency Ranges."*)

5. R-F TUNER ALIGNMENT (CONVERTER, OSCILLATOR & R-F AMPLIFIER):

With the exception of S-5, converter I-F trimmer, no field adjustments should be necessary where the R-F Tuner is concerned. However, in the remote event these trimmers, S-4A, S-4B, S-18 and S-19, should be found out of adjustment, the following is the correct procedure for readjusting them.

a. Oscillator Alignment:

Align the oscillator by adjusting S-19 in the manner prescribed for adjusting the channel oscillator slugs (.See *"R-F Oscillator Alignment — heterodyne frequency meter"*.)

b. R-F and Mixer Alignment:

1. Turn Selector to Channel 12 and set Fine Tuning Control at its approximate mid-point.
2. Connect oscilloscope to "Point C."
3. Feed sweep generator into antenna terminals sweeping channel 12.
4. Adjust S-4A, S-4B and S-18 alternately, observing oscilloscope for the following.
   a. Response curve should be essentially flat-topped.
   b. Check position of sound and picture carrier markers on all channels; they should not be more than 3 DB down from the top of the curve
   c. At 6 DB down, the band width should not be more than 11 MC.

ALIGNMENT PROCEDURE AM & FM

AM ALIGNMENT — consists of the steps outlined in the AM Alignment Chart. Make certain each step is done with a minimum input signal. Connect AC voltmeter to speaker voice coil.

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer grid & ground	455 KC	540 KC	S-34, 35, 38 & 39
2	Mixer grid & ground	1620 KC	1620 KC	S-29 to 1620 KC
3	Test Loop	1500 KC	1500 KC	S-28
4	Repeat Steps 2 & 3			
5	Check Stationizing. Slide pointer on string if stations are uniformly off in one direction.			

FM ALIGNMENT — consists of the steps outlined in the FM Alignment Chart.

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	CONNECT VOLTMETER TO	ADJUST FOR MAX. OUTPUT
1	FM Conv. grid	10.7 MC	88 MC	Point F	* S-40, 41 36, 37 33, 32
2	Adjust S-11 for zero center			Points F & G	
3	Repeat Steps 1 & 2				
*4	FM Ant. terminals	108 MC	108 MC	Point F	S-30, 31

*NOTE — If the dial does not "track" properly after adjusting S-30 and S-31, it is quite probable that the turns on the R-F and oscillator coils have been disturbed. These turns are spaced properly at the factory and, normally, will require no further adjustment. However, should the occasion arise, spread the turns to increase the frequency and collapse the turns to decrease the frequency. Naturally, S-30 and S-31 must be rechecked should this be found necessary.

*Adjust trimmers in sequence shown.

RECORD CHANGER: Webster Model 100, See Pgs. RCD.CH.21-1 to RCD.CH.21-10.

TELEVISION SCHEMATIC

R-F TUNER PARTS LIST:

The following R-F Tuner parts are listed for reference purposes only. With the exception of the channel coil assemblies mounted in the turret, the tuner is usually replaceable as a unit.

It will be noted that in the event it becomes necessary to replace any one of the channel coil assemblies, it may be accomplished by merely removing the defective assembly by hand and installing the replacement in the same manner. When ordering these units, state number of channel and coil desired (Antenna and R-F or Oscillator).

	CAPACITORS,
C-12, 16, 18, 22	Trimmer, .5 to 3 Mmf.
C-13	Ceramic, 5 Mmf.
C-14	Tubular, .01 Mfd. 600 volt
C-15	Ceramic, 120 Mmf.
C-17	Ceramic, 100 Mmf.
C-19	Ceramic, 20 Mmf.
C-20, 24	Ceramic, 10 Mmf.

INDEX

INTRODUCTION

The Philco 12-Position Turret Tuner consists of a turret having 12 aerial-r-f snap-in coils and 12 mixer-oscillator snap-in coils. As the turret is rotated, the terminals of the appropriate aerial-r-f and mixer-oscillator coils are brought into contact with the two contact panels which provide connections to the aerial, r-f, mixer, and oscillator circuits.

This type of channel switch insures the low contact resistance and inductance which is so essential to high-frequency reception. A 6AG5 tube is used as an r-f amplifier, and a 6J6 is used as an oscillator-mixer. The tuner is built into a well-shielded subchassis, thereby providing high gain with stability.

The aerial input circuit is designed for 300-ohm line, balanced to ground, or unbalanced 72-ohm line.

SERVICING

The majority of the electrical parts of the 12-Position Turret Tuner can be replaced with the Tuner in the receiver chassis. The parts are made accessible by removing the component cover plate.

REMOVING THE TURRET

Refer to figure 1, exploded view of Turret Tuner.

1. Remove the bracket holding the rotor of the fine-tuning condenser.
2. Remove the rotor of the fine-tuning condenser.
3. Remove the pressure spring and fiber washer.
4. Remove the two turret-securing springs.
5. Remove the turret.

When replacing the turret, reverse the procedure given below, then index the turret as directed under TURRET INDEX ADJUSTMENT.

REMOVING THE 12-POSITION TURRET TUNER FROM THE CHASSIS

1. Unsolder the connecting wires, recording their connections.
2. Remove the four screws holding the turret-tuner mounting bracket.
3. Remove the three screws securing the turret tuner to the mounting bracket, then remove the tuner from the mounting bracket.

The turret tuner should be replaced in the chassis by reversing the procedure given above.

REPLACING THE CONTACT-PANEL ASSEMBLY

1. Carefully unsolder all the connections to the contact panels, recording their connections.
2. Remove the two screws holding the contact panel.
3. Using a heavy-duty soldering iron, unsolder the solder bonding between the contact-panel assembly and the tuner.
4. Remove the contact-panel assembly by spreading the end of the tuner slightly, and pulling the assembly outward.
5. Install the new contact-panel assembly by reversing the procedure given above.

TURRET INDEX ADJUSTMENT

The position of the turret index spring (item 8 in figure 1) determines the indexing of the turret, and should be adjusted to obtain proper indexing. To adjust, loosen the index-spring holding screw, and move the spring upward or downward until the snap-in coils are making maximum contact with the contacts on the contact-panel assembly. Tighten the holding screw.

LUBRICATION

Proper lubrication of the Philco 12-Position Turret Tuner is an important part of the servicing of the unit. Remember that too much lubrication can be as detrimental as too little. It is very important that only the points shown in figure 1 be lubricated.

Use a good grade of light grease, such as Philco Special Lubricant, Part No. 45-8611.

TUBE REPLACEMENT

Whenever a tube is replaced, it is suggested that several be tried, to obtain a tube which has interelectrode capacitance similar to the original tube, to avoid changing the tuner alignment. The picture quality and oscillator fine-tuning range should be observed while selecting tubes.

If a tube having similar interelectrode capacitance cannot be obtained, the Turret Tuner should be aligned.

10. Stator plate, fine-tuning condenser
11. Washer, rotor pressure

TURRET TUNER ALIGNMENT

When the Tuner has been serviced, or when a suitable replacement tube cannot be obtained, as described under TUBE REPLACEMENT, the Turret Tuner should be aligned according to the procedure given below.

Equipment Required

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008, or the equivalent equipment.
2. Aerial-matching dummy; see figure 2. These resistors should be of carbon-composition construction, and should be chosen from a group, to obtain values close to those indicated.

Procedure

1. Remove the Channel 10 aerial-r-f coil, and turn the Channel Selector to Channel 10.
2. Short the v-i-f output lead of the tuner to ground.
3. Connect the vertical input of the oscilloscope to the tuner test jack, J1-T; refer to figure 4.
4. Remove the component cover plate, and connect the alignment generator to the grid of the r-f tube, pin 1 (terminal 7 of the contact-panel assembly).
5. Set the FM generator to the frequency of Channel 10 (195 mc.), ± 6 mc. deviation.
6. Set the AM generator (unmodulated) to 192 mc. and 198 mc., respectively, and observe the marker pips on the response curve.
7. Tune C8-T and C3-T (see figure 4) to obtain maximum and symmetrical response.
8. Disconnect the alignment generator, then replace the Channel 10 aerial-r-f coil and the component cover plate.

World Radio History

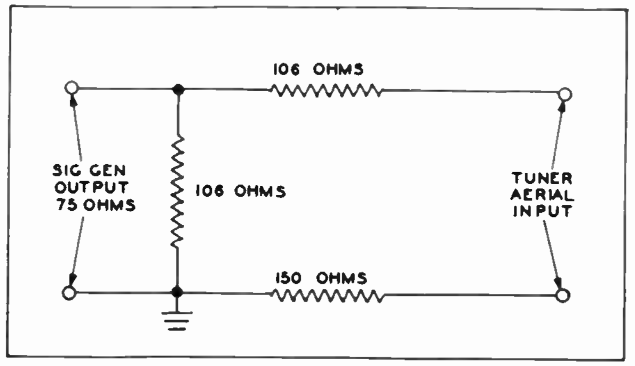

Figure 2. Aerial-Matching Dummy

9. Connect the alignment generator to the aerial input terminal board through the aerial-matching dummy.

10. Tune C2-T (see figure 4) for maximum and symmetrical response within the limits shown in figure 3.

NOTE: The tuner response on any one of the 12 channels should fall within the limits shown in figure 3.

11. Remove the short from the tuner v-i-f output lead.

12. Remove the input of the oscilloscope from J1-T, and connect it to pin 3 of the FM TEST jack. Set the AM marker generator (unmodulated) to 197.75 mc. Use low signal-generator output, and high oscilloscope gain, and adjust C11-T for minimum indication on the oscilloscope.

REPLACEMENT PARTS LIST

The 12-Position Turret Tuner is repairable in the field. Only the individual replaceable components will be accepted under warranty.

At present, there are two types of 12-Position Turret Tuners used in production.

Type 1 has the channel numbers stamped on the snap-in coils in black and red. Part numbers 76-5411 or 76-5411-2 may be stamped on the assembly.

Type 2 has the channel numbers stamped on the snap-in coils in green, with the letter "F" following the number. The contacts on the snap-in coil are on a raised section, and the contacts on the contact panel are kidney-shaped. Part numbers 76-5411-1, 76-5411-3, or 76-5411-4 may be stamped on the assembly.

Parts carrying the same part numbers under type 1 and 2 in the following list are directly interchangeable.

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory parts. Also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation will either be unchanged or improved. When ordering replacements, use only the "Service Part No."

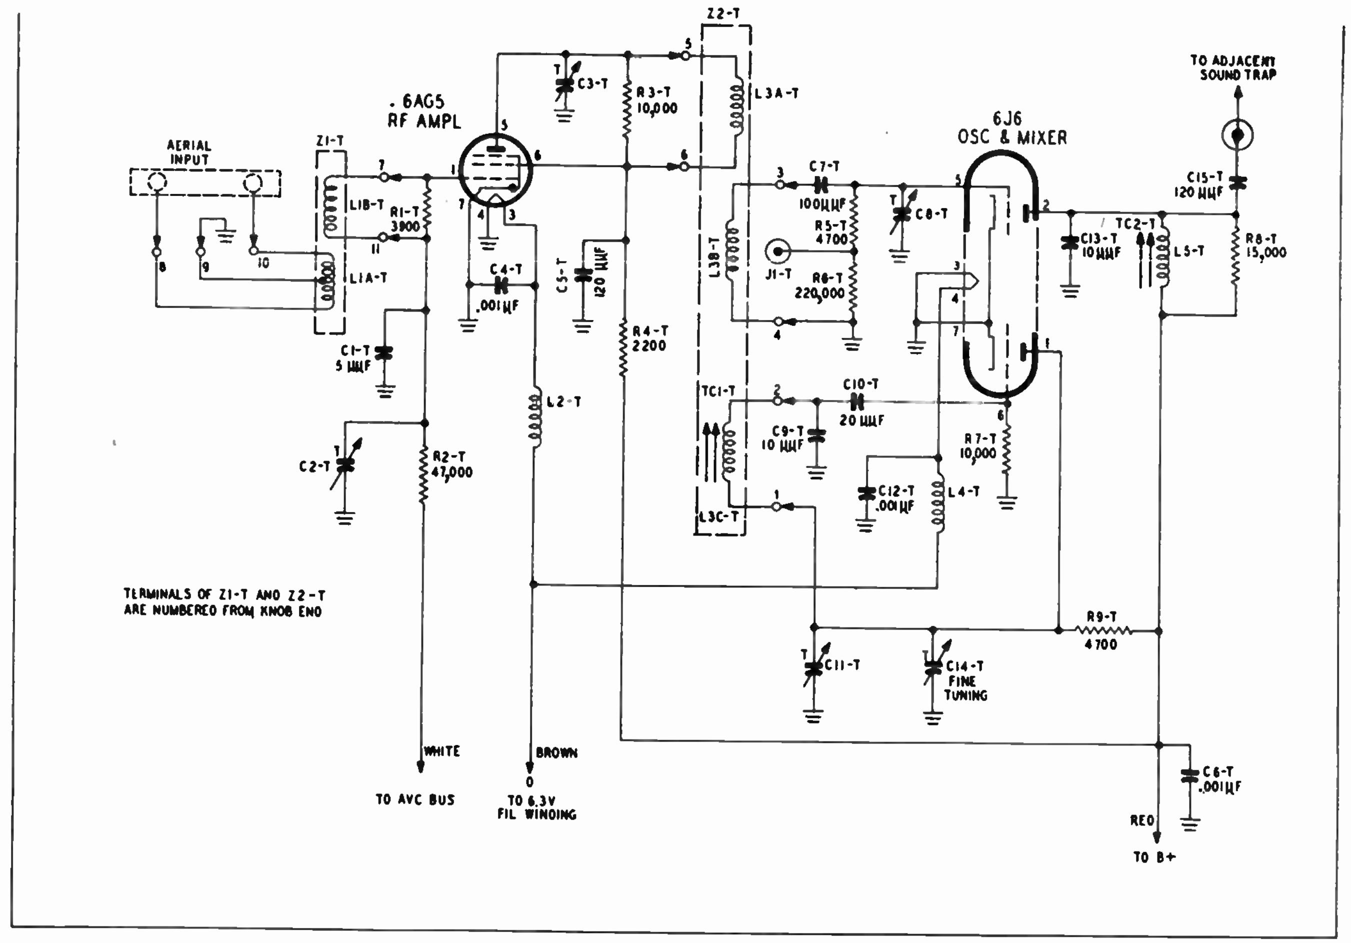

Figure 5. Schematic Diagram of 12-Position Turret Tuner TP9-512

TUBE REPLACEMENT

Whenever a tube is replaced, it is suggested that, if possible, several be tried, to obtain a tube which has interelectrode capacitance similar to the original tube, to avoid changing the tuner alignment. The picture quality and oscillator fine-tuning range should be observed while selecting tubes.

CHECKING OSCILLATOR INJECTION VOLTAGE

After a tuner has been serviced, the performance of the oscillator should be determined by checking the level of the oscillator voltage that is injected into the mixer. The procedure is as follows:

1. Connect a vacuum-tube voltmeter to the grid of the mixer tube, with a 1-megohm resistor in series with the probe.
2. Tuning through Channels 2 to 6, the voltage should be at least –2 volts.
3. Tuning through Channels 7 to 13, the voltage should be at least –1 volt.

If the voltage indications are below the minimum values given above, the oscillator and mixer stages should be checked.

TURRET TUNER, PART NO. 76-5411-SERIES

The detailed service information given in manual PR-1803 applies to this tuner, together with the information contained in this manual.

Since the printing of PR-1803, the following changes have been made in this tuner:

1. To prevent the oscillator voltage from appearing in the first v-i-f grid circuit, the mixer plate coil was tapped, as shown in figure 1.

©John F. Rider

World Radio History

The part number of the mixer coil, L5-T, given in PR-1803, is for the tapped type. The part number of the earlier type is 45-1711. These coils are not interchangeable, because of the effect of the mixer plate load on the mixer grid tuning; therefore, before procuring a replacement coil, it should be determined by inspection which type is used. In conjunction with the change in the mixer plate coil, an additional decoupling network was installed in the plate circuit of the mixer. This is also shown in figure 1.

2. An additional 100-$\mu\mu f$. filament by-pass condenser was added, between ground and the junction of L2-7 and L4-7. The part number is 30-1224-1.

3. In later production of some turret tuners, C1-T fixed trimmer and C2-T trimmer were replaced by a single trimmer having a capacitance equal to these two in parallel. The part number of this new trimmer is 45-1710. Tuners having this change are identified by the absence of the fixed trimmer across C2-T.

4. The use of the turret tuner in new models necessitated different shaft lengths for the turret and fine-tuning rotor. The part numbers of the turrets and rotors for various models are given below, along with the part numbers of the complete replacement turret tuners.

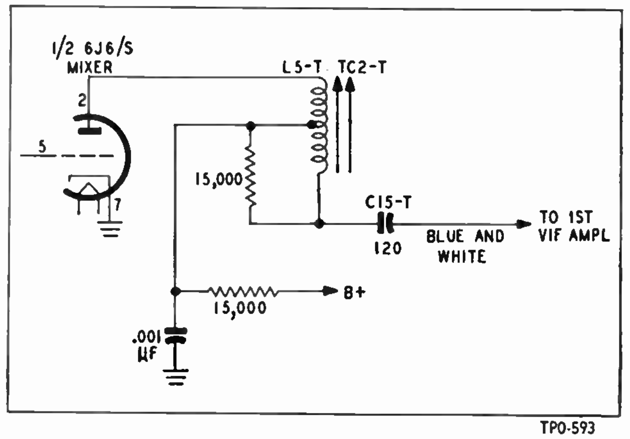

Figure 1. Changes in Mixer Plate Circuit, Turret Tuner, Part No. 76-5411-Series

WAFER-SWITCH TUNERS

The table below gives the part numbers of the Wafer-Switch Tuners used in various Philco Television Receivers, and also the part numbers of the complete replacement tuners.

Wafer-Switch Tuner Part No.	Used in Models	Replacement Tuner (complete)
76-4402	49-702	76-4402-7
76-4402-5	50-T1443, Code 122	76-4402-7
76-4402-6	50-T1400, 50-T1401, 50-T1402, 50-T1403, 50-T1404, 50-T1406, 50-T1430, and 50-T1104, Code 123	*76-5433-1
76-4402-7	50-T702, Code 122	76-4402-7
76-5433	50-T1400, 50-T1401, 50-T1402, 50-T1403, 50-T1404, 50-T1406, and 50-T1430	*76-5433-1
76-5433-1	50-T1400, 50-T1401, 50-T1402, 50-T1403, 50-T1404, 50-T1406, and 50-T1432	76-5433-1

*Used in conjunction with mounting bracket kit, Part No. 45-9591, when substituted for 76-4402-6 or 76-5433.

WAFER-SWITCH TUNER, PART NO. 76-4402-SERIES

The components of this tuner are made accessible by removing the tuner from the chassis, and then removing the perforated cover.

CLEANING AND LUBRICATION

Erratic operation or noise may be caused by dirty wafer-switch contacts, in which case, the contacts should be cleaned and lubricated. Clean the contacts carefully with a contact cleaning fluid, and lubricate with a contact lubricant, such as Philco All Purpose Lubricator, Part No. 45-2806. Remember that too much lubrication can be as detrimental as too little. Lubricate only the switch contacts.

PARTS REPLACEMENT

The parts given in the following list are those which are readily accessible, and which may be replaced without disturbing the tuning of any individual channels; however, the over-all alignment should be checked after servicing.

IMPORTANT! The lead dress and lead lengths of some components are critical. When replacing components, duplicate the original wiring as closely as possible.

WAFER-SWITCH TUNER, PART NO. 76-5433-SERIES

The components of this tuner are made accessible by removing the tuner from the chassis, and then removing the perforated cover.

CLEANING AND LUBRICATION

Refer to the information given above for the Part No. 77-4402-series tuner.

PARTS REPLACEMENT

The parts given in the following list are those which are readily accessible, and which may be replaced without disturbing the tuning of any individual channels; however, the over-all alignment should be checked after servicing. All parts are interchangeable in these tuners, except as noted.

IMPORTANT! The lead dress and lead lengths of some components are critical. When replacing components, duplicate the original wiring as closely as possible.

TUNER ALIGNMENT

After the tuner has been serviced, or if it is necessary to use a replacement tube that does not exactly meet the requirements described under TUBE REPLACEMENT, the tuner alignment should be checked. If realignment is necessary, it should be done according to the procedure given below.

The alignment may be made satisfactorily with the tuner out of the receiver chassis, by using an external power supply. This power-supply circuit may be similar to that shown in figure 2. If desired, B batteries and a 6.3-volt filament transformer may be used, or a television receiver may be conveniently set up to supply power to the tuner. In all cases, there should be good bonding between the alignment generator and the tuner. This may be done by placing the generator and tuner on a metal plate.

EQUIPMENT REQUIRED

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008, or the equivalent equipment.

2. Aerial-matching dummy; see figure 3. These resistors should be of carbon-composition construction, and should be chosen from a group to obtain values close to those indicated.

3. A power supply, as described above.

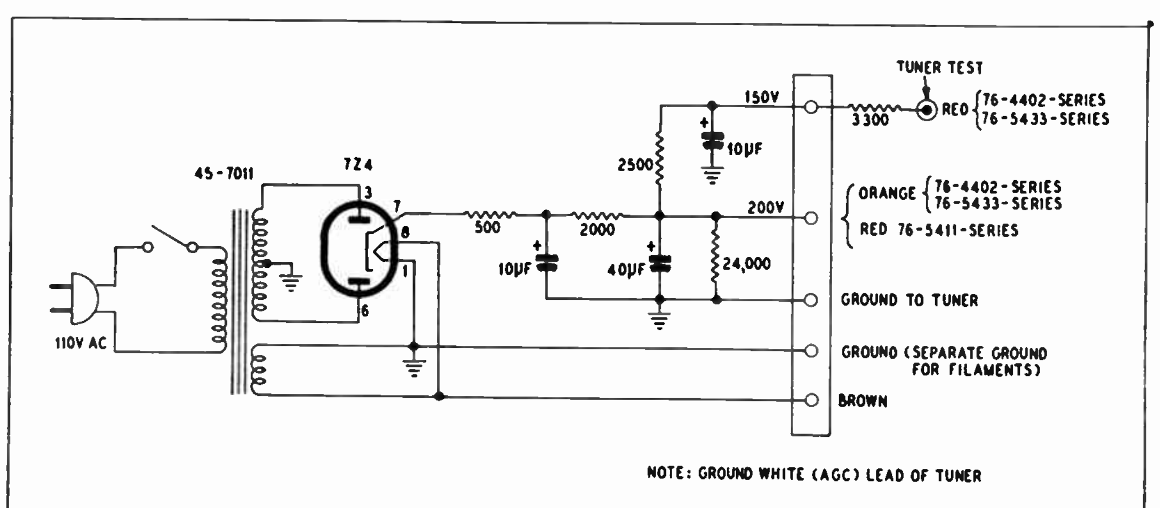

Figure 2. Power Supply for Tuner Alignment with Tuner Removed from Receiver Chassis

TP9-512B

Figure 5. Tuner Response Limits for the Twelve Television Channels

TURRET TUNER, PART NO. 76-5411-SERIES

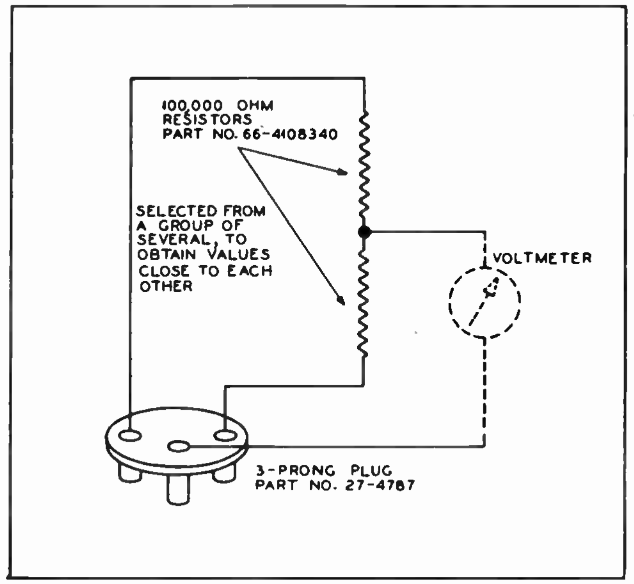
For the detailed alignment procedure, refer to manual PR-1803, and include corrections and additions as follows:

1. All references to figure 3 should read "figure 2."
2. All references to figure 4 should read "figure 3."
3. All references to figure 5 should read "figure 4."
4. In step 2 of the alignment procedure, the v-i-f output lead should be connected to ground through a 470-ohm resistor.
5. Delete step 12, and replace by the following: C11-T is used to compensate for differences in the inter-electrode capacitance of 6J6/S tubes. If the range of the FINE TUNING control is incorrect on all channels, due to replacement of the 6J6/S tube, C11-T should be adjusted for best sound while receiving a high channel station. If the tuner is out of the chassis, or if repairs have been made, C11-T should be set midway in its range, and each oscillator core should be adjusted.
6. In reference to the adjustment of C8-T, C3-T, and C2-T on Channel 10, if there is one station in the local area which is weak, these adjustments may be made on that channel, to improve the response, provided that the response on the other channels is not sacrificed too much.

Local-Oscillator Adjustments

When making the tuner alignment with the tuner in the receiver chassis, the local oscillator tuning cores should be adjusted as follows:

1. Remove the chassis from the cabinet.
2. Connect a 20,000-ohms-per-volt voltmeter to the FM TEST jack, J3, using the FM TEST jack adapter shown in figure 6.



TP9-656-1

Figure 6. FM TEST Jack Adapter

3. Turn the CHANNEL SELECTOR to Channel 2.
4. Set the FINE TUNING control to the middle of its range.
5. Connect an accurately calibrated AM signal generator (unmodulated) to the aerial input of the receiver, and set the generator to the sound-carrier frequency of Channel 2. See table of TELEVISION CARRIER AND OSCILLATOR FREQUENCIES.
6. Adjust the oscillator tuning core for a zero reading on the voltmeter.
7. Repeat the above steps for Channels 3 through 13, in order.

When making the tuner alignment with the tuner out of the receiver chassis (using a separate power supply, as described previously), the local oscillator tuning cores should be adjusted as follows:

1. Connect the oscilloscope to J1-T. If the signal-generator output or the scope gain is insufficient, a larger beat indication may be had by connecting a 3300-ohm resistor in series with the red lead, then connecting the oscilloscope to the junction of the red lead and the 3300-ohm resistor.
2. Set the CHANNEL SELECTOR to Channel 2.
3. Set the FINE TUNING control to the center of its range.
4. Connect an accurately calibrated AM signal generator (unmodulated) to the aerial input.
5. Set the signal-generator to the oscillator frequency for Channel 2. See table of TELEVISION CARRIER AND OSCILLATOR FREQUENCIES.
6. Adjust the Channel 2 oscillator tuning core for zero-beat indication on the oscilloscope.
7. Repeat the above steps for Channels 3 through 13. In each case, use the appropriate signal-generator setting and CHANNEL SELECTOR setting, and adjust the proper oscillator tuning core for the channel.

WAFER-SWITCH TUNER, PART NO. 76-4402-SERIES

Local-Oscillator Adjustments

When making the tuner alignment with the tuner in the receiver chassis, adjust the local oscillator tuning cores according to the first procedure given under LOCAL-OSCILLATOR ADJUSTMENTS for the Turret Tuner, Part No. 76-5411-Series.

When making the tuner alignment with the tuner out of the receiver chassis (using a separate power supply, as described previously), the local oscillator tuning cores should be adjusted as follows:

1. Connect the oscilloscope to the tuner test point at the 150-volt output of the power supply (see figure 2).
2. Follow steps 2 through 7 of the second procedure given under LOCAL-OSCILLATOR ADJUSTMENTS for the Turret Tuner, Part No. 76-5411-Series.

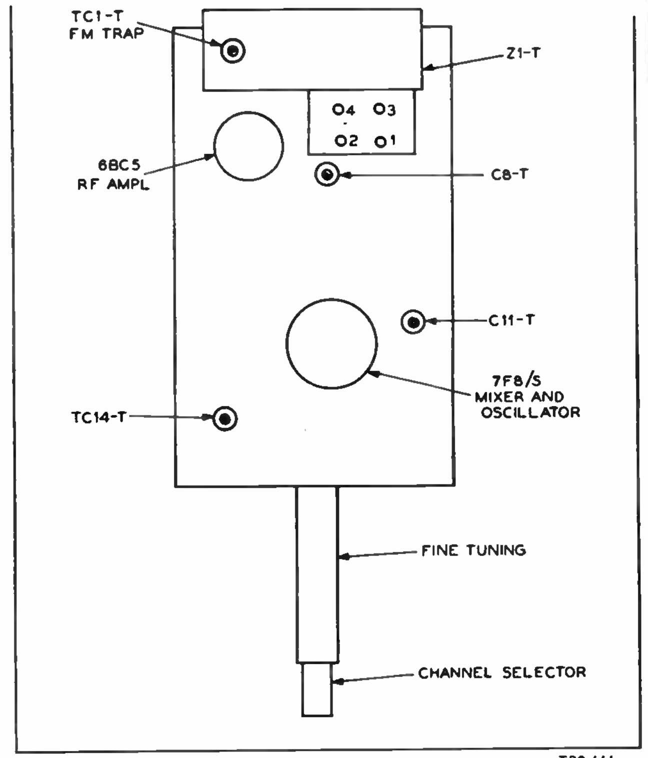
Bandwidth and R-F Response Adjustments

This information supersedes the procedures given in manuals PR-1672, PR-1771, and PR-1793. Trimmer locations are shown in figure 7. The alignment procedure for bandwidth and r-f response is as follows:

1. Turn the CHANNEL SELECTOR to Channel 2, and remove the 1st v-i-f tube. Connect a 470-ohm resistor from the green (v-i-f output) lead to ground. If the alignment is being made with the tuner out of the receiver chassis (using a separate power supply, as described previously), ground the white (a-g-c) wire.
2. Connect the vertical input of the oscilloscope to the tuner test jack, J2, or if using a separate power supply, to the red lead on the tuner side of a 3300-ohm resistor, as shown in figure 2.
3. Connect the outputs of the AM and FM signal generators to the aerial input leadin through the aerial-matching network; see figure 3.

NOTE: In cases where an installation uses two aerials, and the single leadin has been clipped off, it is necessary to connect the signal generator to the appropriate aerial-input terminals of J1.

4. Set the FM signal generator for Channel 2 (55 mc.), with sufficient sweep to give the complete response curve.
5. Establish the channel limits by using the AM signal generator (unmodulated) to produce marker pips on the response curve; set the generator first to 54 mc., then to 60 mc.
6. Adjust C3 and C20 for symmetrical response within the channel limits. See figure 5.
7. Check the response on Channels 3 through 13, using the appropriate sweep and marker frequencies. See table of TELEVISION CARRIER AND OSCILLATOR FREQUENCIES. If the response is consistently out of the proper bandpass in one direction, C3



TP9-666

Figure 7. Wafer-Switch Tuner, Part No. 76-5433-Series, Top View, Showing Trimmer Locations

and C20 should be readjusted to obtain the best compromise response on all of the channels used in the local area; these adjustments may be made to accommodate the weakest station, provided that the performance on the other channels is not sacrificed too much.

8. Turn the CHANNEL SELECTOR to Channel 6.
9. Set the FM signal generator to 85 mc., with sufficient sweep to give the complete response curve. Establish the channel limits by means of appropriate marker signals from the AM signal generator.
10. Adjust C17 for maximum output and symmetry of curve.
11. Check the response on Channel 2, and readjust C17 to obtain the best response on low channel stations in the local area.
12. Turn the CHANNEL SELECTOR to Channel 13.
13. Set the FM signal generator to 213 mc., with sufficient sweep to give the complete response curve. Establish the channel limits by means of appropriate marker signals from the AM signal generator.
14. Adjust C18 for maximum output and symmetry of curve.
15. Check the response on Channel 7, and readjust C18 to obtain the best response on high channel stations in the local area.
16. Recheck the local-oscillator adjustments.

World Radio History

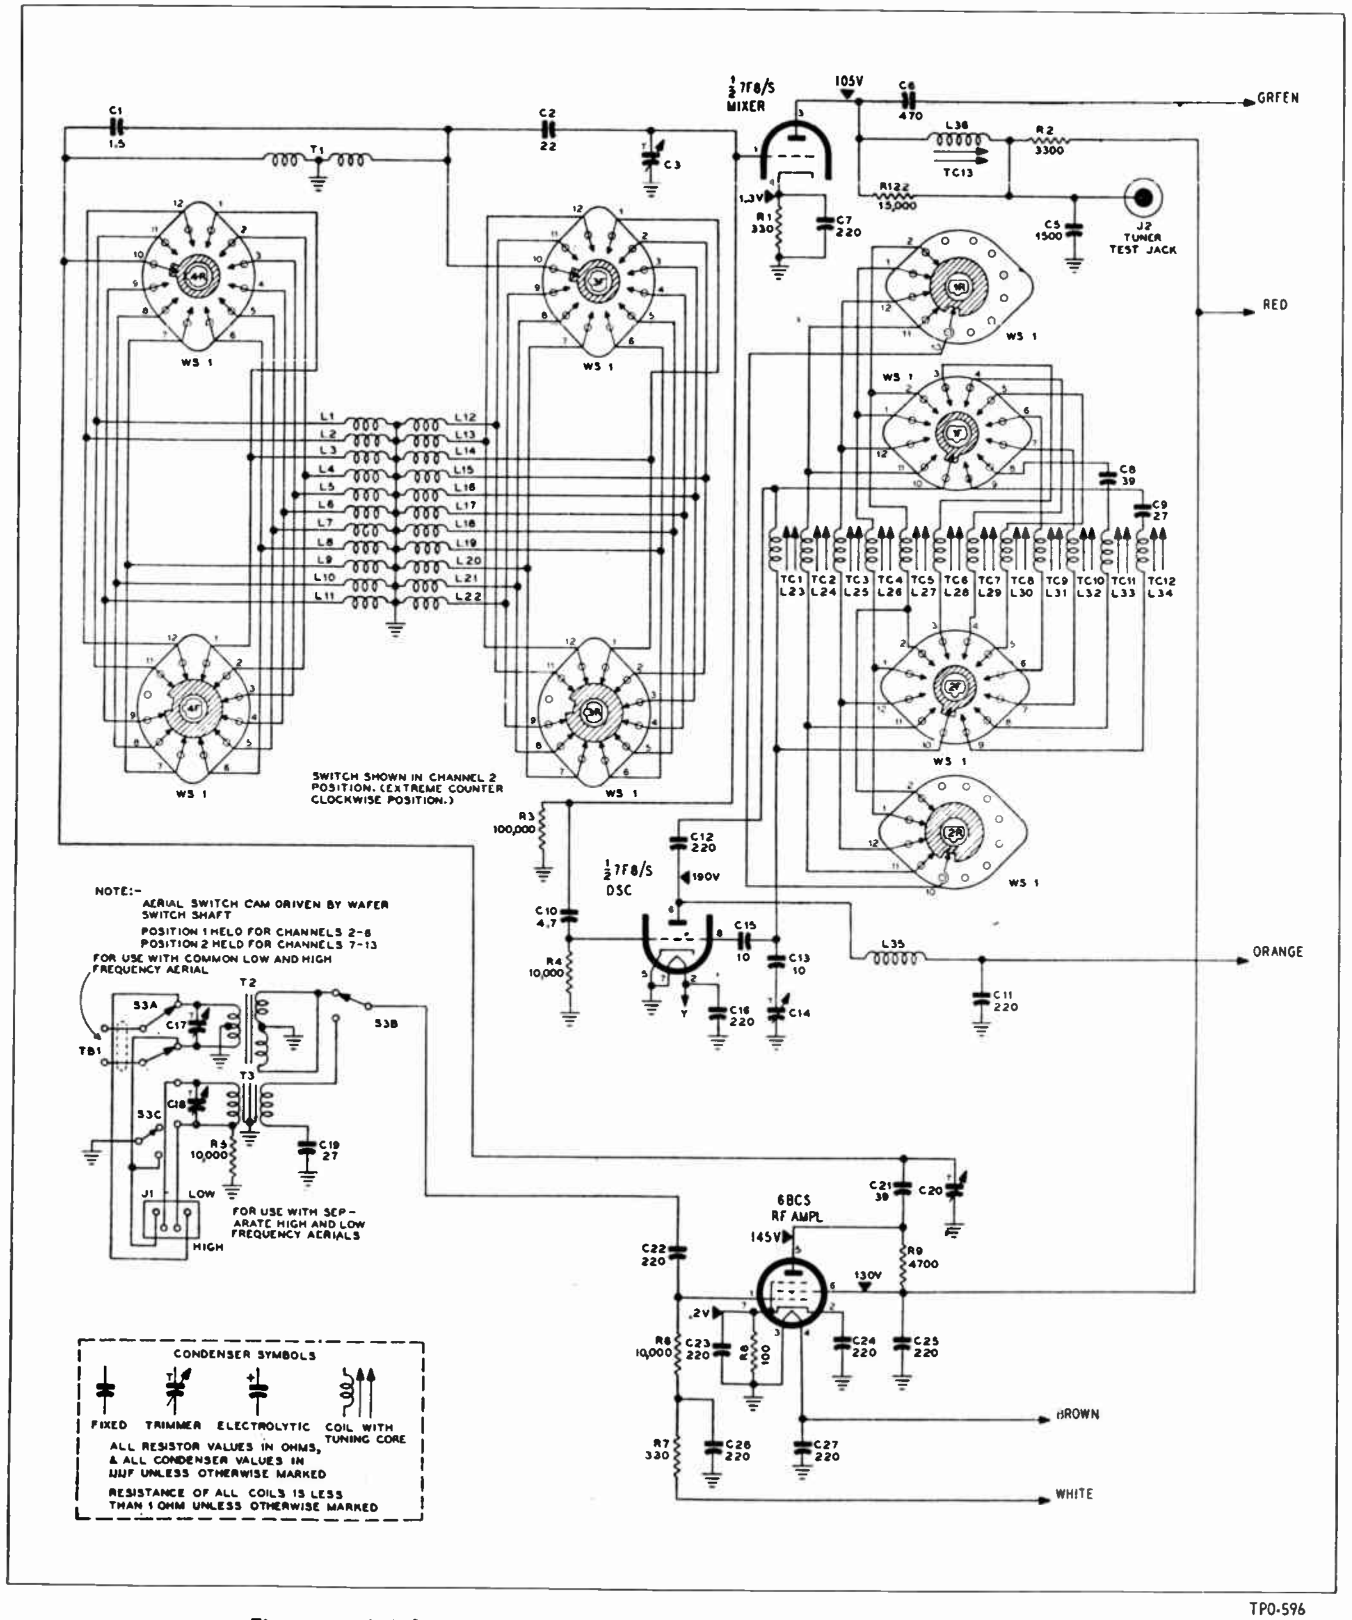

Figure 8. Wafer-Switch Tuner, Part No. 76-4402-Series, Schematic Diagram

WAFER-SWITCH TUNER PART NO. 76-5433-SERIES

Local-Oscillator Adjustments

When making the tuner alignment with the tuner in the receiver chassis, adjust the local oscillator tuning cores according to the first procedure given under LOCAL-OSCILLATOR ADJUSTMENTS for the Turret Tuner, Part No. 76-5411-Series.

When making the tuner alignment with the tuner out of the receiver chassis (using a separate power supply, as described previously), the local oscillator tuning cores should be adjusted as follows:

1. Connect the oscilloscope to the tuner test point at the 150-volt output of the power supply (see figure 2).

2. Follow steps 2 through 7 of the second procedure given under LOCAL-OSCILLATOR ADJUSTMENTS for the Turret Tuner, Part No. 76-5411-Series.

Bandwidth and R-F Response Adjustments

This information supersedes the procedures given in manuals PR-1823 and PR-1844. Trimmer locations are shown in figure 7. The alignment procedure for bandwidth and r-f response is as follows:

1. Connect the outputs of the AM and FM signal generators through the aerial-matching network (figure 3) to terminals 1 and 2 of Z1-T. Terminals 3 and 4 of Z1-T should be connected together, for a 300-ohm input.

2. Connect a 3300-ohm resistor in series with the 150-volt (red) B+ lead to R9-T. Connect the vertical input of the oscilloscope to the junction of the 3300-ohm resistor and R9-T. When making the tuner alignment with the tuner out of the receiver chassis (using a separate power supply), connect the oscilloscope to the tuner test point at the 150-volt output of the power supply (see figure 2).

3. Turn the CHANNEL SELECTOR to Channel 10, and remove the 1st v-i-f tube. If the alignment is being made with the tuner out of the receiver chassis, ground the white (a-g-c) wire. Connect a 470-ohm resistor from the green (v-i-f output) lead to ground.

4. Set the FM signal generator to 195 mc., with sufficient sweep to give the complete response curve.

5. Set the AM signal generator (unmodulated) to produce marker pips at the video and sound carriers for Channel 10.

6. Adjust C8-T and C11-T for maximum symmetrical response within Channel 10. If there is one weak station in the local area, the adjustment of C8-T and C11-T may be made on that channel, to improve the response provided that the response on other channels is not sacrificed too much.

World Radio History

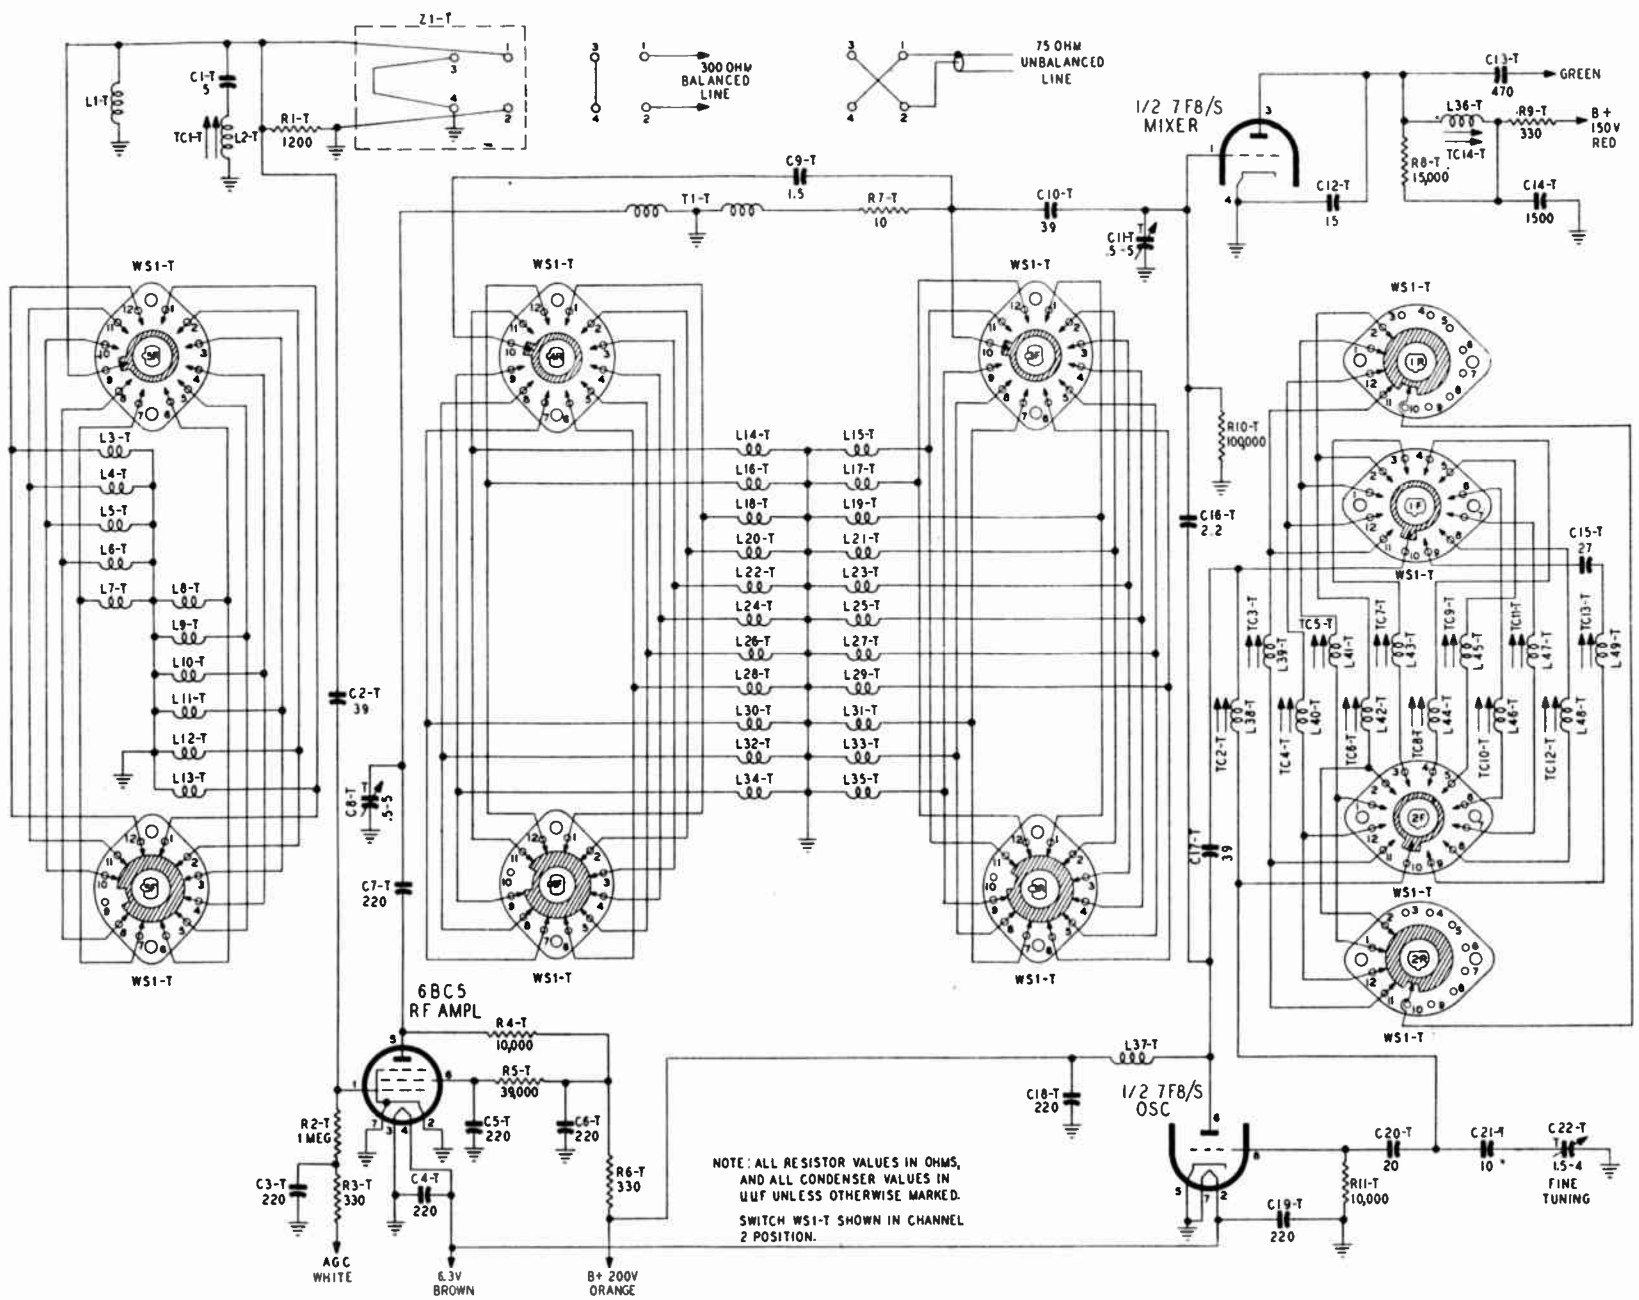

Figure 9. Wafer-Switch Tuner, Part No. 76-5433-Series, Schematic Diagram

ALL MODELS USING 76-5411 SERIES TURRET TUNER

Reduction of Modulation Hum

Modulation hum in the reception of high-frequency channels may be reduced by adding an additional 100-$\mu\mu$f. filament by-pass condenser (Part No. 30-1224-1). This condenser should be wired from the junction of L2-T and L4-T to ground. Physically, the condenser should be connected between the terminal holding the filament feed wire and the adjacent ground knock-out.

With the tuner in the chassis, the parts are made accessible by simply removing about half of the snap-in coils.

Part No. 76-5433 — Series Tuner — Additional Replacement Part

The FINE TUNING condenser for the above tuners is available for replacement purposes. The part number is 31-6517-1. This condenser is made accessible by first moving L38-T (Channel 2) and L39-T (Channel 3) oscillator coils. This may be done by compressing the coil mounting clips, then carefully pushing the coil back into the tuner, out of the way.

SUBSTITUTING PART NO. 76-5433-1 TUNERS FOR PART NO. 76-4402-6 AND PART NO. 76-5433 TUNERS

Tuner Part No. 76-5433-1 is built only to be shock-mounted; therefore, when using it to replace other tuners, mounting brackets are required. These brackets, including installation instructions, may be ordered by Part No. 45-9591.

INDEX

SPECIFICATIONS

Philco Television Receiver Model 50-702, Code 122, is an 18-tube superheterodyne table model with a mahogany-finished cabinet.

CHANNEL TUNING

The channel selector is the 12-position type, with provision for fine tuning on each of the 12 television channels.

AERIALS

Provisions are made for connecting a common aerial for high-band and low-band or for connecting separate high-band and low-band aerials.

AUDIO

Audio output, 2.5 watts; 5-inch electrodynamic speaker, with 3.2-ohm voice-coil impedance at 400 cycles.

INTERMEDIATE FREQUENCIES

Video Carrier: 26.6 megacycles.
Sound carrier: 22.1 megacycles.

ELECTRICAL

Operating voltage, 110—120 volts, 60 cycles, a.c.; power consumption, 125 watts. Power supplies (two): 300 volts d.c. at 200 ma.; 5000 volts d.c. at 2 ma.

VACUUM TUBES (18)

TP-7008

MODEL 50-702, CODE 122

CIRCUIT DESCRIPTION

GENERAL

Philco Model 50-702, Code 122, is a seven-inch table model television receiver. The channel selector is a twelve-position selector, with fine tuning effective on each channel. Provisions are made for connecting either a common high-frequency and low-frequency aerial or separate high-frequency and low-frequency aerials.

POWER-SUPPLY SECTION

The power-supply section contains two power supplies; one is a low-voltage supply, which employs two dry-disc rectifiers connected as voltage doublers, and the other is a high-voltage supply, which employs an oscillator type of high-voltage source.

SOUND SECTION

The sound signal is taken off the third video-i-f stage and fed to the sound-i-f stages, which employ one 6BA6 tube and one 6AU6 tube. The diode section of a 7X7 tube is used as an FM sound detector; the triode section of the 7X7 functions as an audio amplifier. A 7B5 tube is used as an audio output tube.

VIDEO SECTION

The video section employs three 6AG5 tubes as i-f amplifiers, one half of a 12AU7 tube as a video detector and a-g-c rectifier, the other half of the tube as a video amplifier, and one half of another 12AU7 as a video output tube.

RADIO-FREQUENCY SECTION

The radio-frequency section employs one 6AG5 tube as a radio-frequency amplifier; one half of a 7F8 tube is used as an oscillator, and the other one half as a mixer.

SWEEP SECTION

The sync section employs one half of a 7F7 tube as a sync separator, and the other half as a sync amplifier. The vertical-sweep section comprises a conventional vertical-sweep circuit using one half of a 12AU7 as an oscillator and discharge tube, and one 7F7 as a push-pull output tube.

The horizontal-sweep circuit consists basically of a free-running blocking-oscillator sweep generator and incorporates automatic frequency control to lock in the circuit.

Figure 1 shows a simplified diagram. The sweep-generating circuit consists of L63 with C93 and C94 in series. These condensers are charged from B plus through L63, and are discharged, at the end of the sweep, by the conduction of the blocking-oscillator tube.

The repetition rate of the oscillator is determined by the time required to discharge C92 to the value at which the grid will conduct. It is possible to control the frequency of this oscillator by changing the time constants of the grid circuit (consisting of R94, R95, and C92) or by applying a small voltage to the grid circuit, thus changing the time required for C92 to discharge to a given value.

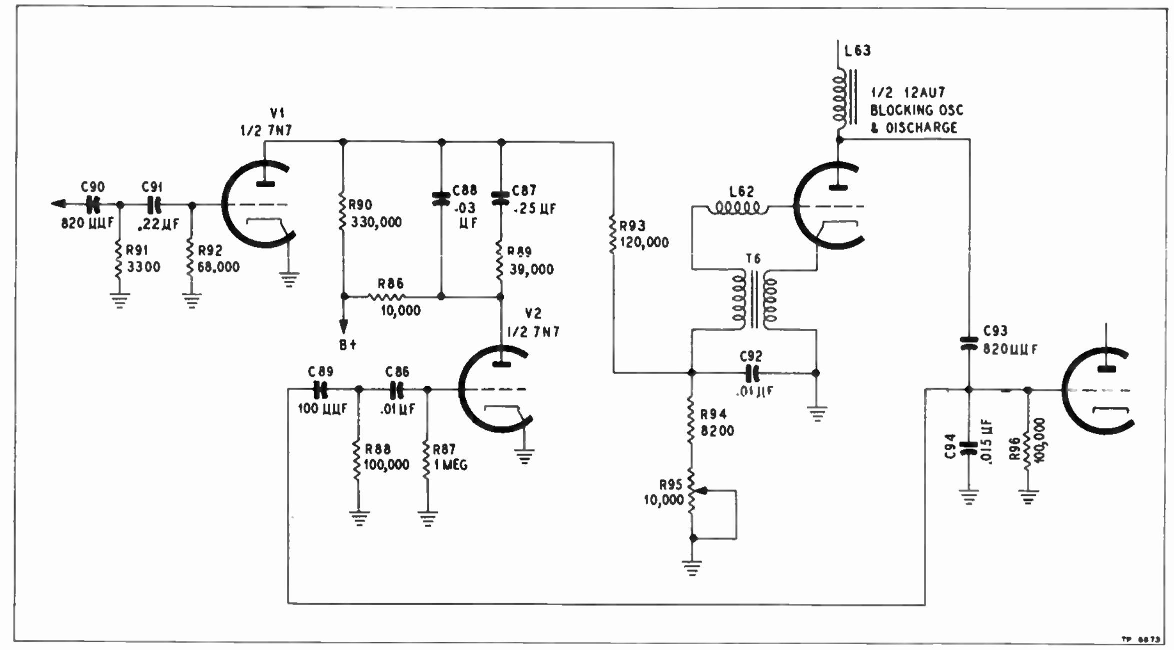

Figure 1. Simplified Schematic Diagram, Horizontal Sweep Control Circuit

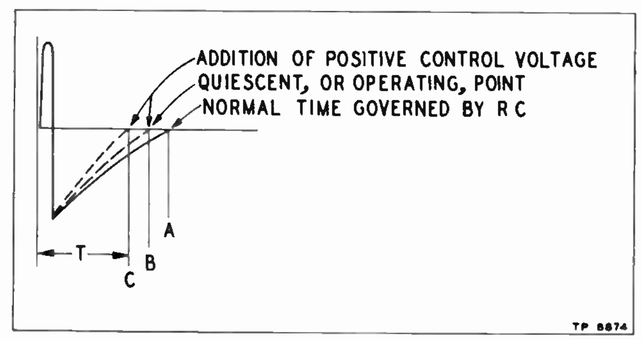

Figure 2. Blocking Oscillator Waveforms, Showing Effects of Control Voltage

Figure 2 shows waveforms at the grid of the blocking oscillator tube. The solid curve (A) shows how the waveform would appear if no control voltage were used. Curve B shows how the introduction of positive control voltage reduces the time required for the discharge of C92, thereby increasing the repetition rate. If an operating point is chosen so as to utilize an intermediate value of control voltage (Curve C), an *increase* in the control voltage will *increase* the repetition rate, and a *decrease* in the voltage will *decrease* the repetition rate. By making the level of the control voltage dependent upon the phase relationship between the incoming sync pulses and the horizontal sawtooth voltages, the oscillator circuit can be made to fall into sync, and to remain substantially independent of noise impulses.

To obtain the control voltage, the incoming positive sync pulses are applied, through a differentiating network (C90 and R91), to V1 and a portion of the horizontal sweep output, taken from the junction of C93 and C94, is passed through a differentiating network (C89 and R88) and applied to V2. C86 and R87 are used to maintain grid-leak bias for V2.

C91 and R92 are used to obtain grid-leak bias for V1, and the values are chosen to maintain grid cutoff between sync pulses.

Referring to figure 3, it can be seen that, the larger the plate current drawn by V1, the greater the drop across R90, and the lower the voltage at X, hence, the lower the voltage at Vc. Conversely, if the current drawn by V1 is decreased, the lower the voltage drop across R90, and higher the voltage at X and Vc.

The plate voltage of V1 contains d.c. with the differentiated sawtooth superimposed upon it. The average value of the plate current is determined by the phase relationship between the sync pulse and the sawtooth voltage. If the repetition rate of the blocking oscillator tends to become lower, a phase relationship similar to that shown in figure 4A appears. The sync pulses drive the grid positive at the instants when the plate voltage is low, resulting in low average plate current. This low plate current reduces the voltage drop across R90, increasing the positive voltage at points X and Vc, and increasing the repetition rate of the oscillator. Conversely, if the repetition rate tends to become higher, a phase relationship similar to that shown in figure 4B appears. The sync pulses drive the grid positive at the instants when the plate voltage is high, resulting in a higher average plate current. This increase in the plate current causes an increased drop across R90, lowering the voltage at points X and Vc, and causing the repetition rate to decrease.

©John F. Rider

World Radio History

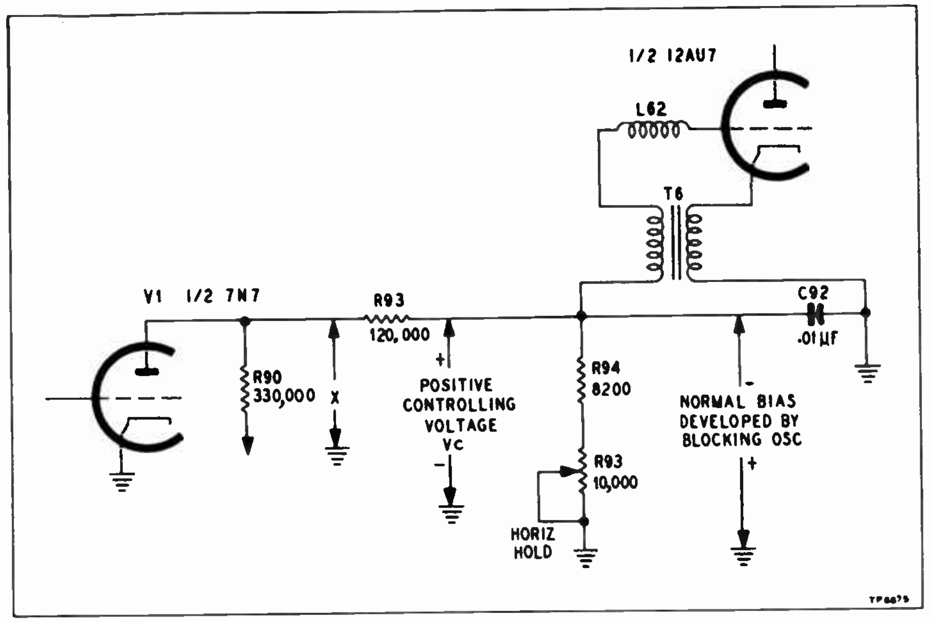

Figure 3. Breakdown Diagram of Control Circuit

Figure 4C shows the quiescent, or operating, condition. A tendency to change frequency in either direction will develop a change in the correcting voltage, to keep the oscillator in sync.

Two filter networks, as shown in figure 5, are used to filter out noise that might be present along with the sync voltages.

AERIAL CONNECTIONS

The aerial-input circuit has provisions for either single-aerial or dual-aerial installation. The receiver is normally wired for single-aerial installation; in this case, the aerial leadin is connected to the two-terminal board, TB1, which is mounted at the left-hand rear corner of the chassis (facing the rear of the chassis).

To adapt the receiver for dual-aerial operation, it is only necessary to clip the parallel conductor extending from TB1 into the tuner chassis (cut as close to the tuner chassis as possible); this prevents the length of parallel conductor from acting as a trap on the higher-frequency channels. Using plug Part No. 27-4788, connect the low-frequency aerial leadin to the two widely spaced pins, and the high-frequency aerial leadin to the two closely spaced pins. Insert the plug into the aerial-input receptacle, J1, which is located near the 7F8 tube.

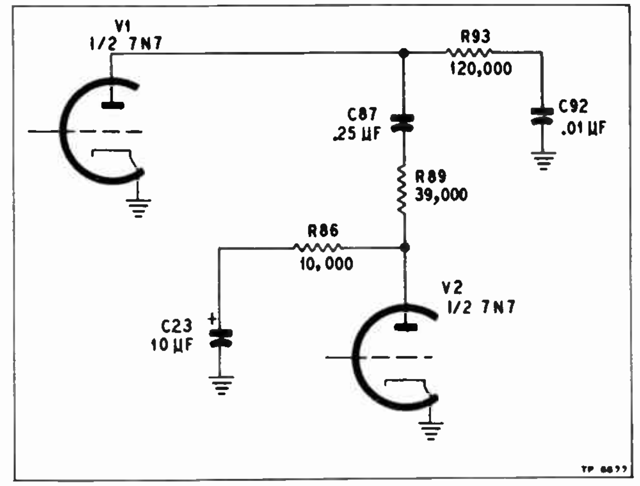

Figure 5. Filter Circuits

The aerial-input circuit is switched by means of a cam-operated switch, S2. The cam is operated by the shaft of the station-selector switch, and is so constructed that it places the switch in one position for Channels 2 through 6, and in another position for Channels 7 through 13. The action of S2 is as follows:

SINGLE-AERIAL OPERATION

1. Connects the aerial to the primary of the low-frequency aerial-input transformer, T3, or the high-frequency aerial-input transformer, T4, depending upon the channel selected.
2. Connects the control grid of the r-f amplifier to the proper secondary of either aerial-input transformer, depending upon the channel selected.
3. Grounds the primary winding of low-frequency aerial-input transformer when the high-frequency aerial input transformer is in use.

DUAL-AERIAL OPERATION

1. Connects the control grid of the r-f amplifier to the proper secondary of either aerial-input transformer, depending upon the channel selected.
2. Grounds the primary winding of the low-frequency aerial-input transformer when the high-frequency aerial-input transformer is in use.
3. The separate aerial leadins are permanently connected to the primaries of their respective transformers; therefore, no switching of the primaries is required.

ALIGNMENT PROCEDURE

TEST EQUIPMENT REQUIRED FOR ALIGNMENT

The following test equipment is recommended for aligning the receiver:

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008; this instrument has the following features:

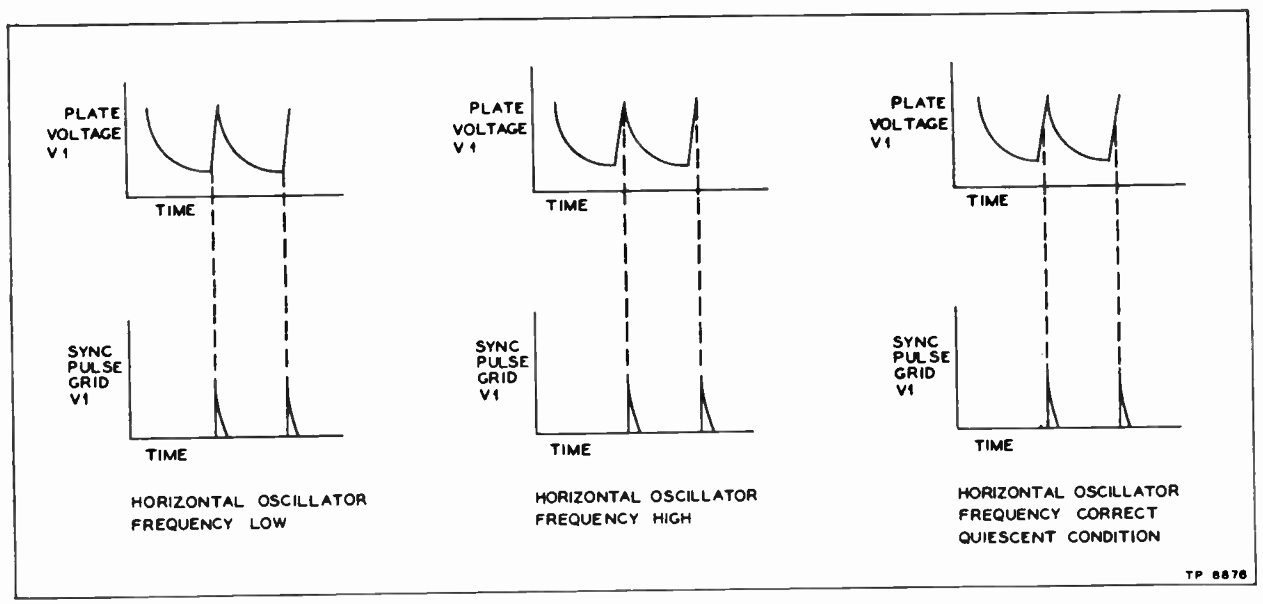

Figure 4. Sawtooth and Sync Relationships

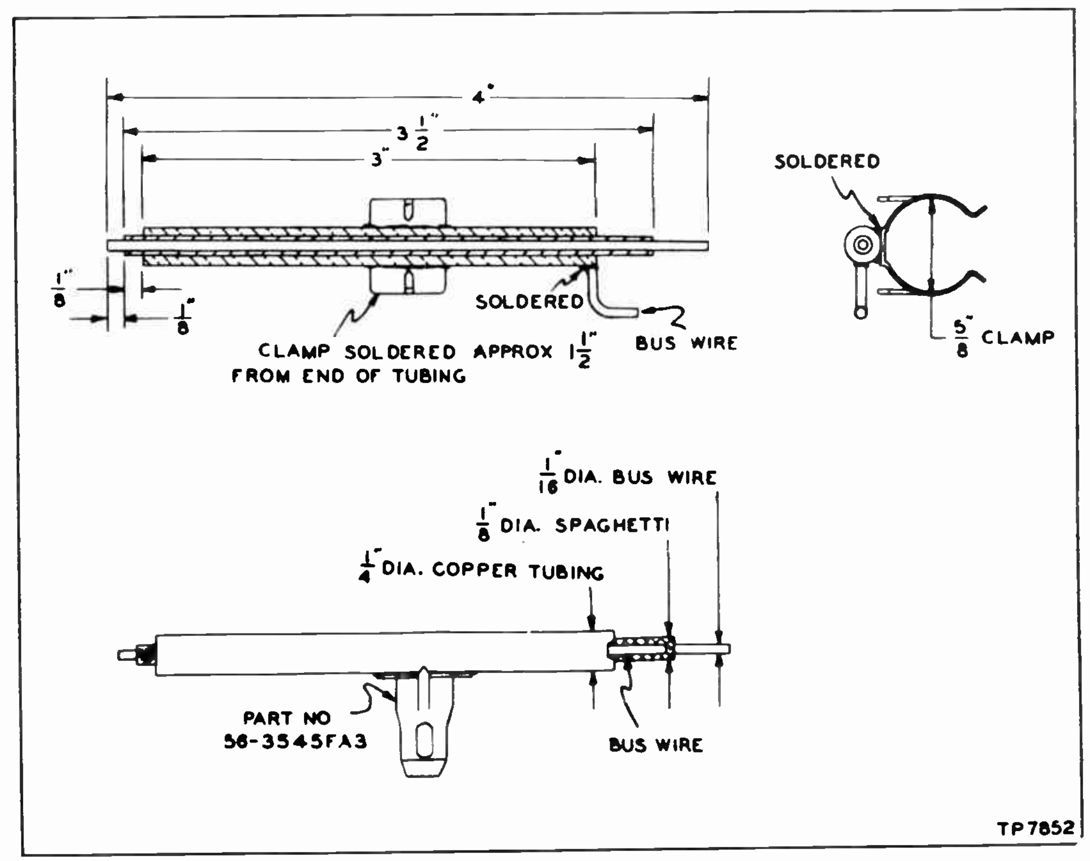

Figure 6. I-F Jig

©John F. Rider

World Radio History

a. FM signal generator with ranges of 4—120 mc. and 144—260 mc., with a maximum deviation of 15 mc.
b. AM (marker) signal generator with ranges of 3.2—7.5 Mc., 6.4—15 mc., 14.5—36 mc., 69—125 mc., and 138—250 mc.
c. Built-in oscilloscope with sensitivity of 25 millivolts, 3-inch cathode-ray tube, and crosshatch screen.

2. D-c vacuum-tube voltmeter or 20,000-ohms-per-volt voltmeter.
3. If separate signal generators and oscilloscope are used, these instruments should have the following characteristics:
   a. FM signal generator—Deviation: ±4 mc.; center-frequency range: 20 mc. to 30 mc.; sweep-sync output with either built-in or separate phase corrector.
   b. AM signal generator—Carrier-frequency range, 20 mc. to 30 mc.; dial should be suitable for setting and resetting accurately to frequencies specified in ALIGNMENT CHART.
   c. Oscilloscope—Calibrated; vertical sensitivity of 1 volt (peak-to-peak) per inch, or better.

NOTE: When using a separate AM r-f signal generator to obtain a marker "pip," couple the output lead of this generator to the output lead of the FM generator, using just sufficient coupling to obtain a suitable pip.

ALIGNMENT JIGS

The following jigs are recommended for correctly coupling the signal generators to the various circuits where input signals are required for alignment.

I-F JIG

Figure 6 shows a jig which is recommended for coupling the signal generator to the various i-f grids. The following parts are necessary for the construction of this jig.

1. 3-inch length of 1/4-inch-diameter tubing.
2. 3½-inch length of 1/8-inch-diameter spaghetti.
3. 4-inch length of #12 or #14 bus wire.
4. Clamp, Philco Part No. 56-3545FA3.

To construct this jig, follow the procedure given below:

1. Insert the spaghetti into the tubing. Allow 1/8 inch to extend from one end of the tubing.
2. Insert the bus wire into the spaghetti. Allow 1/8 inch to extend from one end of the spaghetti.
3. Crimp one end of the tubing, to secure the spaghetti and bus wire.
4. Solder the clamp to the middle of the tubing.
5. If Model 7008 Visual Alignment Generator is used, solder a short piece of bus wire to the tubing, to provide a convenient ground connection for the output-cable terminating box.

The connections to the video-i-f amplifier grids are accessible from the top of the chassis through small holes near the tube shields. To use the jig, slide the clamp over the tube shield, and insert the probe end of the jig into the hole; adjust the height to insure good contact with the grid connection.

MIXER JIG (See figure 7)

Parts required

1 piece of 1/4-inch-diameter copper tubing, 1½ inches long.
1 piece of 1/8-inch-diameter spaghetti, 1¾ inches long.
1 piece of heavy bus wire, 2½ inches long.
1 piece of flat metal, ¾ inch wide, 2 inches long, and 1/32 inch thick.

Procedure:

Drill a 1/4 inch hole in one end of the metal piece. With a grindstone or file, taper the other end. Insert the copper tubing into the hole drilled in the metal piece, and solder the tubing so that one end is flush with the surface of the metal strip. Insert the spaghetti into the tubing, and fasten with glue. Allow some spaghetti to extend from each end. Insert the bus wire into the spaghetti. Solder the ground connection to the side of the tubing.

How to Use the Mixer Alignment Jig

Looking at the chassis from the side with the operating controls to the left, two holes will be seen on the side of the r-f tuner. The top hole is opposite the plate of C3, which connects directly to the mixer grid. Scratch an

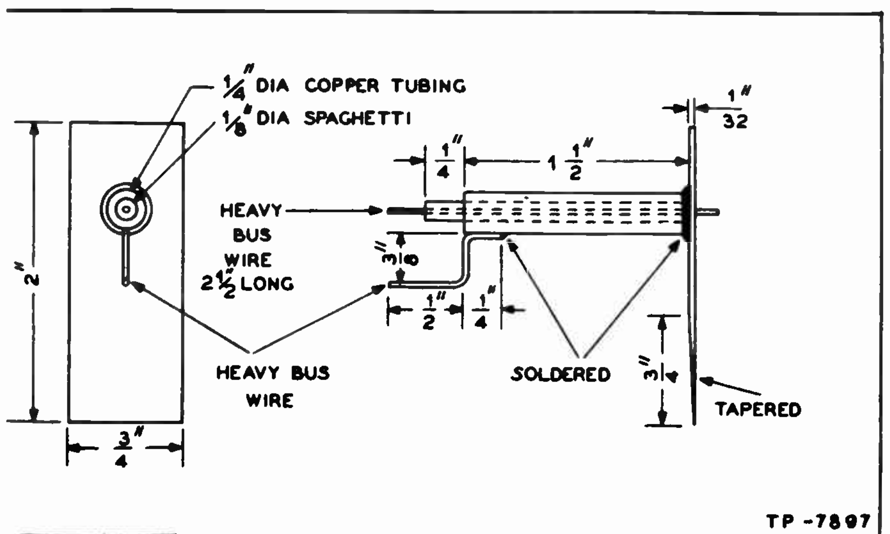

Figure 7. Mixer Jig

ALIGNMENT CHART

STEP	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR CONNECTION	SIGNAL-GENERATOR SETTING	ADJUST
1	Connect vertical input of scope to ALIGN TEST jack J4.	Connect output of AM generator through i-f jig to grid (pin 1) of 3rd v-i-f amplifier.	22.1 mc. (modulated).	TC13 and TC22 for minimum indication.
2	Connect vertical input of scope to FM detector jack J3 (see Note 1).	Connect outputs of AM and FM generators through i-f jig to grid (pin 1) of 3rd v-i-f amplifier.	FM generator to 22.1 mc., with ± 4 mc. deviation; AM generator (modulated) to 22.1 mc.	TC15 for minimum amount of AM indication (see Note 2). TC14 for symmetrical pattern within limits shown by curves in figure 8.
3	Same as step 2.	Same as step 2.	FM generator to 22.1 mc., with ± 4 mc. deviation; AM generator off.	C27A and C27B for maximum peaks and symmetrical pattern.
4	Same as step 1.	Same as step 2.	FM generator to 25 mc., with ± 4 mc. AM generator (unmodulated) to 26.6 mc., to produce marker pip on response curve.	TC21 for curve 1.
5	Same as step 1.	Connect outputs of AM and FM generators through i-f jig to grid (pin 1) of 2nd v-i-f amplifier.	FM generator to 25 mc., with ± 4 mc. deviation. AM generator (unmodulated) to 24.5 mc., to produce marker pip on response curve.	TC20 for curve 2.
6	Same as step 1.	Connect outputs of AM and FM generators through i-f jig to grid (pin 1) of 1st v-i-f amplifier.	FM generator to 25 mc., with ± 4 mc. deviation. AM generator (unmodulated) to 24.5 mc., to produce marker pip on response curve.	TC 19 for curve 3.
7	Same as step 1.	Connect output of AM generator through mixer jig to grid (pin 1) of mixer tube.	AM generator (modulated) to 28.1 mc.	TC17 for minimum indication.
8	Same as step 1.	Connect outputs of AM and FM generators through mixer jig to grid (pin 1) of mixer tube.	FM generator to 25 mc. with ± 4 mc. deviation. AM generator (unmodulated) to 23.6 mc., 24.25 mc., 26.25 mc., and 26.6 mc., to produce marker pips on response curve.	Channel selector to Channel 2. TC16 and TC18 for curve 4. It may be necessary to readjust TC21, TC20, and TC19 to obtain this curve.

FINAL I-F CHECK

STEP	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR CONNECTION	SIGNAL-GENERATOR SETTING	ADJUST
9	Connect vertical input of scope to ALIGN TEST jack J4. Connect a v.t.v.m. (0-10v. scale) to FM detector jack J3. Use adapter shown in figure 12.	Same as step 1.	AM generator (modulated) to 22.1 mc.	When indication on scope is minimum, the v.t.v.m. should read zero. If this reading is not zero, adjust TC15. If this reading requires more than one-half turn, repeat step 2.

©John F. Rider
World Radio History

index mark on the chassis at the center of the top hole, and scratch an index mark on the metal piece at the center of the tubing. Insert the tapered end of the metal strip between the r-f tuner and the chassis, and push down until the index marks coincide. Push the bus wire in gently until it makes contact with the plate of C3. Connect the "hot" lead of the signal generator to the center bus wire, and connect the ground lead of the signal generator to the outside bus wire.

GENERAL

WARNING—Dangerous potentials are present in the receiver when it is operating, and for a short time after it has been turned off.

The intermediate frequencies are 22.1 mc. for the sound channel and 26.6 mc. for the video channel. Alignment of circuits operating at these high frequencies requires careful workmanship and good equipment. The following precautions must be observed:

1. The top of the work bench must be metallic, and the test equipment and television-receiver chassis must make good metal-to-metal contact with the bench top.
2. In order to gain access to the i-f adjustments, it is necessary to remove the picture tube from its holder, as follows:
   a. Remove the chassis from the cabinet.
   b. Disconnect the tube socket.
   c. Remove the screw that tightens the clamp around the front of the tube.
   d. Slide the tube out of the holder.

NOTE: The tube socket should be reconnected before the receiver is turned on.

3. During the alignment, the signal-generator output should be attenuated to keep the output indication below 2 volts, peak-to-peak.
4. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.
5. Set the receiver controls as follows:
   a. OFF-ON-VOLUME control fully clockwise.
   b. CONTRAST control fully clockwise. (When starting the alignment, it may be necessary to retard the CONTRAST control slightly, to prevent regeneration.)
   c. BRIGHTNESS control to give a dim raster.

NOTES

1. The scope should be connected to pin 1 of J3.
2. The AM signal will appear as a series of sine waves superimposed on the discriminator curve.

ALIGNMENT OF TUNER

The r-f tuner is aligned at the factory and normally needs no adjustment other than the fine tuning. However, under certain conditions such as the replacement of tubes, it may be necessary to touch up the adjustments. The procedure for making these adjustments is as follows:

EQUIPMENT

1. 7008 Philco Visual Alignment Generator, or equivalent.

PROCEDURE

1. Set the tuner to Channel 2.
2. Connect the outputs of the AM and FM generators to the aerial terminal board, TB1 (see NOTE below).

2A. Connect the vertical input of the oscilloscope to the tuner test jack, J2.

3. Set the FM output for Channel 2—55 mc., with ± 4 mc. deviation.
4. Set the AM (unmodulated) output to 54 mc. and 60 mc., to produce marker pips on the response curve.
5. Short out the 1st i-f coil; this can be done from the top of the tuner, by inserting a piece of solder into the hole that is adjacent to the i-f adjusting trimmer TC16. Allow the solder to make contact with the chassis and the lug located under the hole.
6. Adjust C10 for band width, as shown in figure 10. (The permissible limits of the band pass lie between 6 mc. and 14 mc., at 70% amplitude.)
7. Set the tuner to Channel 6.
8. Set the FM output to 85 mc., with ± 4 mc. deviation.
9. Adjust C4 for maximum output and symmetry of curve.
10. Set the tuner to Channel 13.
11. Set the FM output to 213 mc., with ± 4 mc. deviation.
12. Adjust C5 and C3 for maximum output and symmetry of curve.

NOTE: The generator should be connected to the aerial-input terminals through a matching network, shown in figure 11. These resistors should be chosen from a group to obtain values close to those indicated. In cases where an installation uses two aerials, it will be necessary to connect the generator to the low-frequency aerial-input terminals of J1.

ADJUSTING LOCAL OSCILLATOR

1. Remove the chassis from the cabinet.
2. Connect a 20,000-ohms-per-volt voltmeter to the FM detector jack, J3, using the adapter shown in figure 12.
3. Turn the channel selector to Channel 2.
4. Adjust the FINE TUNING control to the middle of its range.
5. Connect an accurately calibrated AM signal generator to the aerial-input terminals of the receiver, and tune the generator to the sound-carrier frequency of Channel 2.
6. Tune the oscillator core for zero reading on the voltmeter.
7. Repeat the above steps for Channels 3 through 13, in order.

WAVEFORMS AND VOLTAGES

A calibrated test oscilloscope is required for viewing and measuring the waveforms.

For viewing the waveforms in the vertical sync and sweep circuits, adjust the oscilloscope sweep for 30 c.p.s. (half the vertical-sweep rate). For viewing the waveforms in the horizontal sync and sweep circuits, adjust the oscilloscope sweep for 7875 c.p.s. (half the horizontal-sweep rate).

The waveforms in the chart are sized for clarity and are not intended to illustrate relative amplitudes. Approximate peak-to-peak voltages are given for each waveform. The peak-to-peak voltages in the sync circuits are the values obtained with approximately one volt, peak-to-peak, at the VIDEO TEST jack, J4, when the controls are set to give a normal picture.

Sync and Sweep Waveforms

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the receiver will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

In the event of failure of any component in the tuner, other than tubes, the entire tuner is to be exchanged through your Philco Distributor. Only tuners found to be defective by the Philco Distributor will be accepted for exchange.

The part number of the r-f tuner assembly is 76-4402-7.

Reference Symbol	Description	Service Part No.
C1	Condenser, d-c blocking, 1.5 μμf.	Part of 76-4402-7

World Radio History

Failure of Condenser C81

Failure of condenser C81 in Models 50-T702 may be caused by operating these receivers when the vertical-output tube is removed. When this tube is removed, there is no voltage drop across resistors R77 and R78. This causes the voltage applied to condenser C81 to exceed the normal value and may result in the failure of this condenser.

Dim Picture

A dim picture in Models 50-T702 may result from leaky d-c blocking condensers to the deflection plates of the picture tube or by faulty high-voltage filter condensers. Whenever a dim picture is encountered, condensers C83, C84, C95, C96, C100 and C101 should be checked for leakage.

World Radio History

PRE-PRODUCTION CHANGES

These changes were made between the time the manual was printed and the time the first production started. A 330-ohm resistor and a 220-$\mu\mu f$. by-pass condenser connected in parallel were added between the cathode (pin 4) of the 7F8 mixer and ground.

R1 was changed to 10,000 ohms.

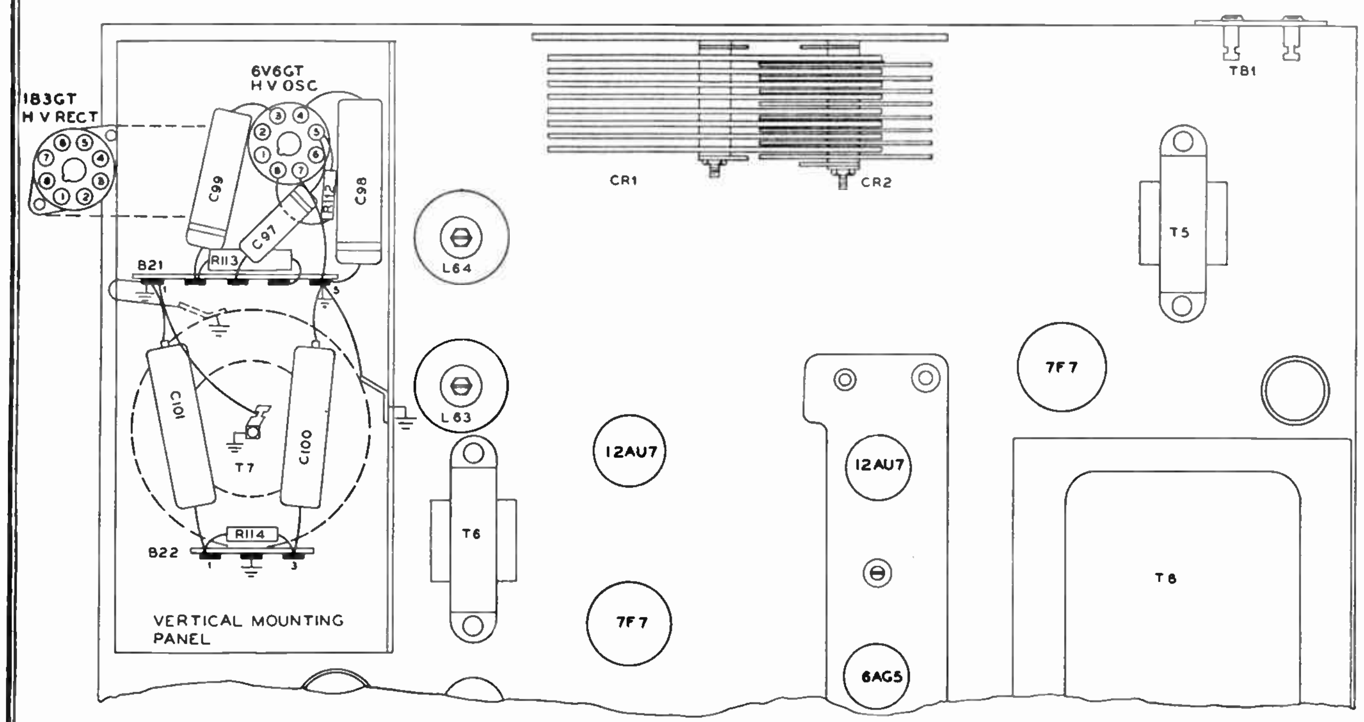
R7 was changed to 4700 ohms.

A 220-$\mu\mu f$. condenser was added between the cathode (pin 4) of the 6AG5 r-f tube and ground.

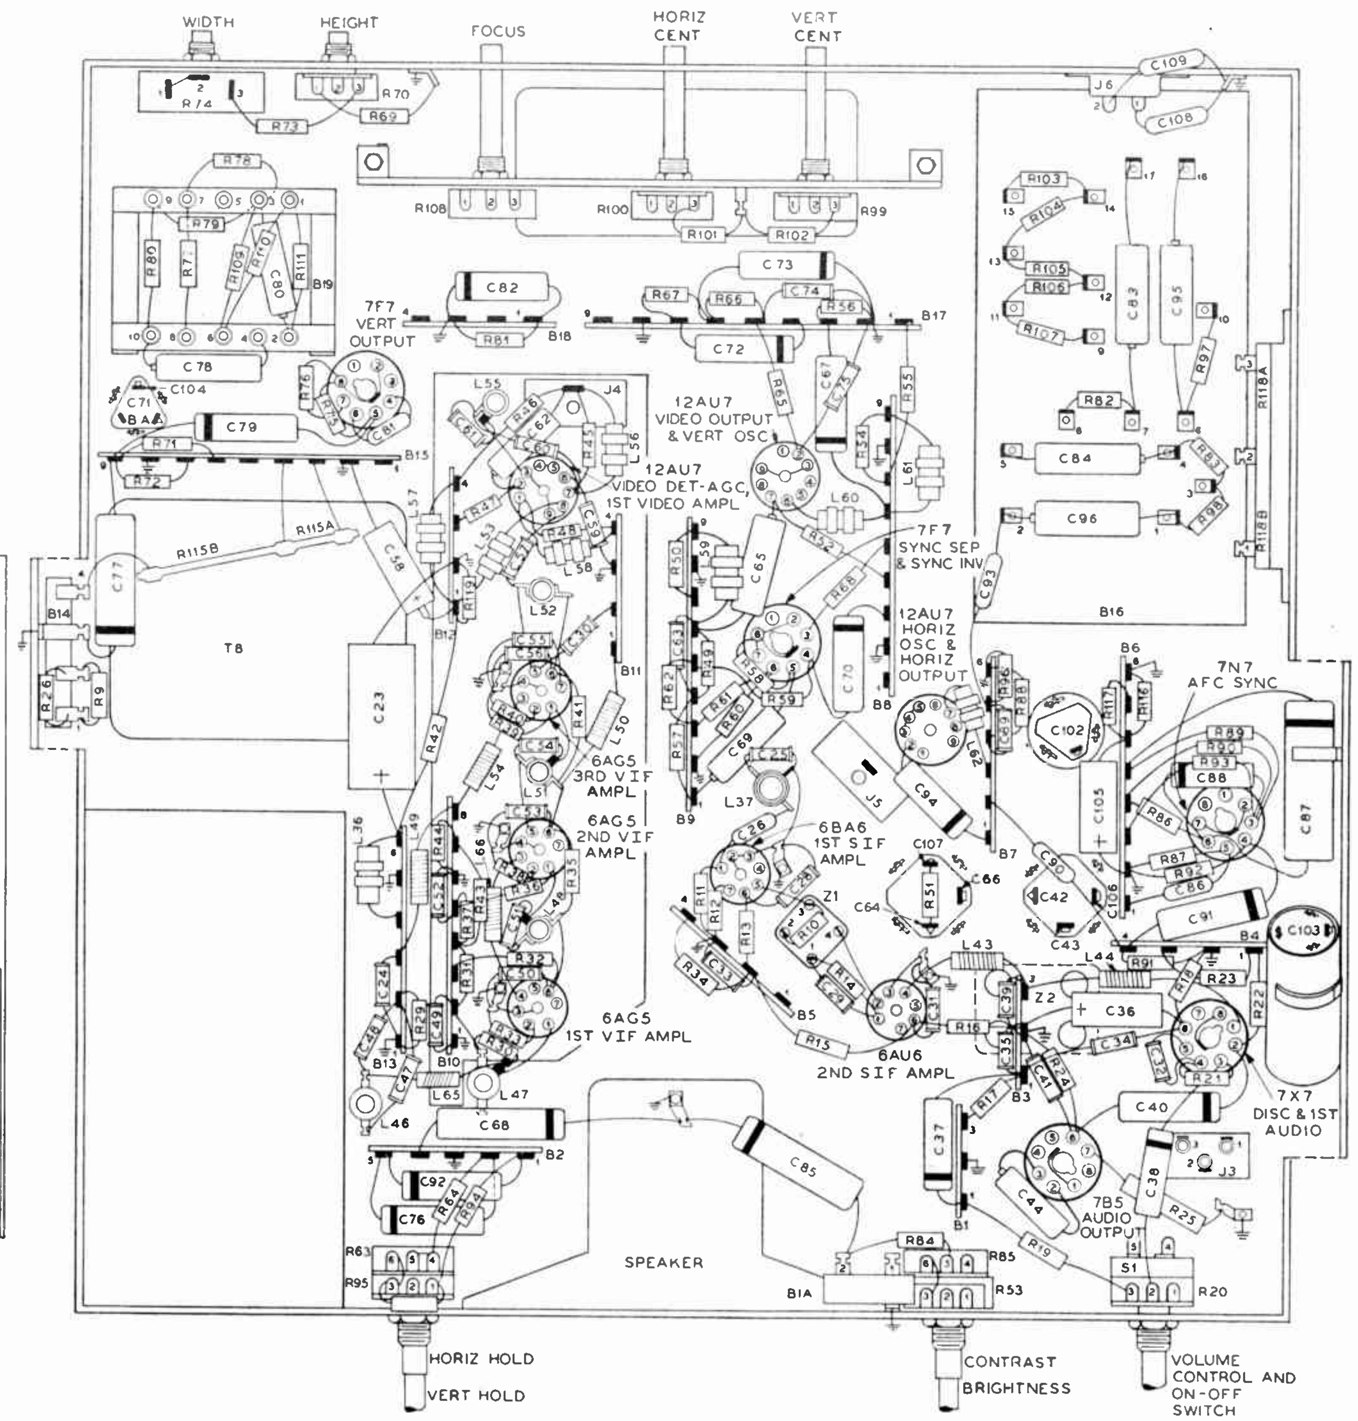
L35 was removed.

PRODUCTION CHANGES

RUN NO.	DESCRIPTION OF CHANGE	NEW OR ADDED PART NO.	OLD OR REMOVED PART NO.	REASON FOR CHANGE
2	R54 changed to a 2-watt resistor.	66-2565340*	66-2564340	To provide for high line voltages.
2	R51 changed to a 1-watt resistor.	66-2474340*	66-2478340	To provide for high line voltages.
2	R26 and R9 replaced with a 5100-ohm, 5-watt resistor.	33-1335-18	66-3108340 and 66-3128340	To provide for high line voltages.
2	C82 changed to .0047 μf.	30-4661-2	45-3500-17	To use a low-leakage condenser.
2	C87 changed to .22 μf.	30-4650-49	61-0120	To use a low-leakage condenser.



Model 50-702, Code 122, Partial Top View, Showing Vertical Mounting Panel TP-9243



Model 50-702, Code 122, Bottom View TP-9242

CORRECTION IN ALIGNMENT PROCEDURE

The last sentence of the note should read:

In cases where an installation uses two aerials, it will be necessary to connect the generator to the appropriate aerial-input terminals of J1.

CORRECTIONS AND ADDITIONS TO REPLACEMENT PARTS LIST

C24 should be: Condenser, r-f by-pass, 1500 $\mu\mu f$., Part No. 62-215001011

L36 should be: Choke, plate, Part No. 33-5565-4

R63 should be: Resistor, potentiometer, VERT. HOLD control, 100,000 ohms, Part No. 33-5563-2

R108 should be: Resistor, potentiometer, FOCUS control, 3 megohms, Part No. 33-5565-4

T5 should be: Transformer, vertical oscillator, Part No. 32-8304-3

T6 should be: Transformer, horizontal oscillator, Part No. 32-8307-3

Z2 should be: Transformer, FM detector, Part No. 32-4317

Cabinet should be: 50-702, Part No. 10733

Hollow shaft is part of tuner, and is not replaceable. Should be part of 76-4402-7

NOTE:- For additional information, See Model 50-T1105, Pages 5-1 to 5-6.

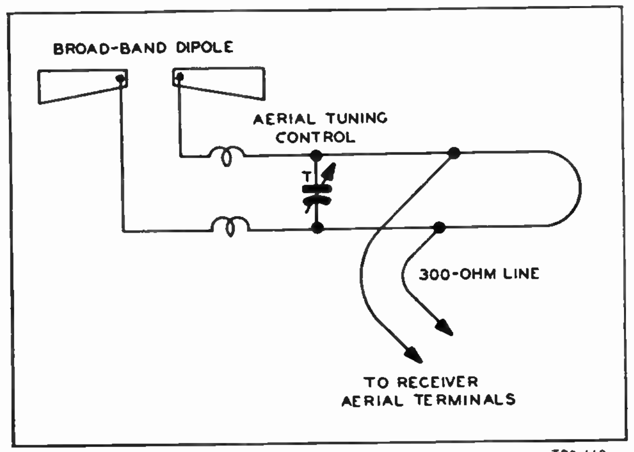

Figure 1. Built-In Aerial and Aerial Tuning Network

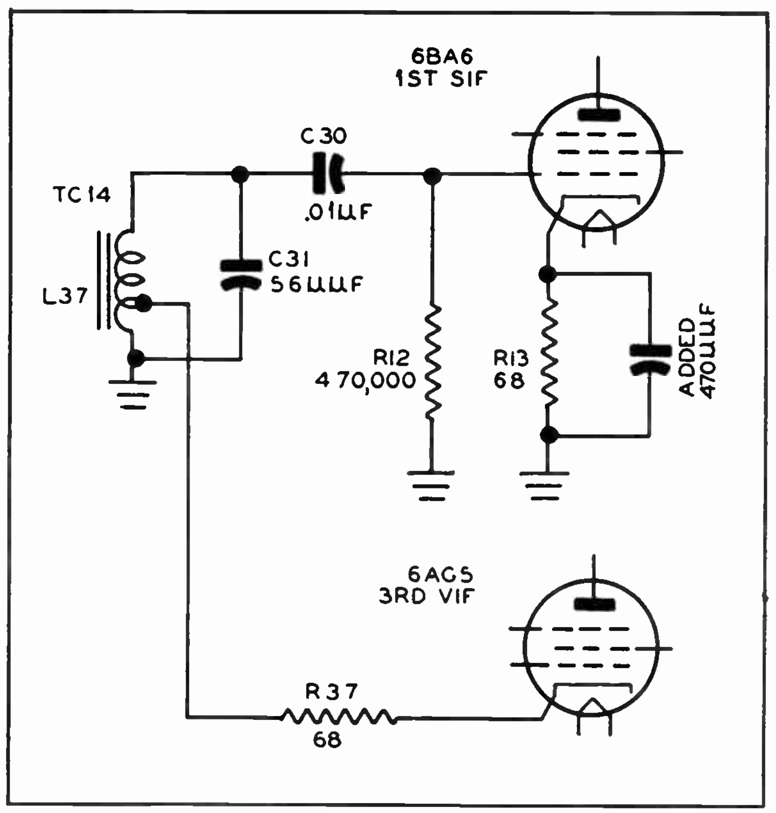

Figure 2. Change in Sound-I-F Take-off

MODEL 50-T1104, CODE 121, and MODEL 50-T1104, CODE 122

Philco Models 50-T1104, Code 121, and 50-T1104, Code 122, are table-type television receivers in plastic cabinets. Model 50-T1104, Code 122, incorporates a built-in aerial, and also has provisions for the connection of an external aerial, if necessary. The chassis of both codes are identical to the chassis of Philco Model 50-T1105, Code 121.

The built-in aerial of Model 50-T1104, Code 122, consists of a broad-band dipole of metal foil, mounted inside the cabinet on the top, and a tuning and impedance-matching network. This aerial covers all channels, and is tuned for each channel by adjusting the AERIAL TUNING control, which is located on the front of the Receiver near the top of the cabinet. Figure 1 shows the schematic diagram of the new aerial and aerial-tuning network.

A 300-ohm line couples the tuning network to the aerial terminals of the Receiver. This line is disconnected from the aerial terminals when an external aerial is used.

For additional service information pertaining to Models 50-T1104, Code 121, and 50-T1104, Code 122, refer to Philco Service Manual PR-1771, which covers Models 50-T1105 and 50-T1106, and to the information in this manual, which supplements PR-1771. However, the Miscellaneous section of the Replacement Parts List in PR-1771 does not apply to Models 50-T1104, Code 121, and 50-T1104, Code 122. The following list of miscellaneous items should be used.

WARNING: Before removing the chassis, it will be necessary to remove the built-in dipole aerial, to prevent it from being damaged. Proceed as follows:

1. Loosen the setscrew in the AERIAL TUNING knob, using a 1/16" hex wrench, Philco Part No. 45-9270.
2. Remove the two nuts holding the rear of the aerial in place.
3. Free the two brackets from the screws, and draw the aerial toward the rear until the shaft is free of the hole.
4. Loosen the two screws holding the aerial transmission line to the aerial terminal.
5. Remove the chassis in the usual manner.

PRE-PRODUCTION and PRODUCTION CHANGES

PRE-PRODUCTION CHANGES

NOTE: The following changes should be considered when referring to Philco Service Manual PR-1771. These changes which were made in the design of the sets were effective beginning with first production.

DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.
Tone circuit, consisting of 47,000-ohm resistor (R127) and .0047-μf. condenser (C110), added in series between tap of VOLUME control and ground.		66-3478340 45-3505-56
Sound i-f take-off point moved from plate of third video-i-f amplifier to cathode of same stage. C29 removed. First sound-i-f autotransformer changed. 470-$\mu\mu f$. condenser (C111) added in parallel with R13. See figure 2. (This change was incorporated into first production of Model 50-T1105 only.)	C29, 30-1224-30 L37, 32-4373-1	62-147001001 32-4303-1
22,000-ohm resistor (R128) added across primary of Z1 in Model 50-T1106 only.		66-3228340
130-volt B+ lead from pin 8 of audio-output tube disconnected from junction of S2A, R14, and R11, and connected to junction of L45, C54, and R11.		
R10 disconnected from junction of L45, C54, and R11, and connected to screen (pin 6) of first video-i-f amplifier.		
Lead between junction of R30 and R7 and junction of C59 and R23 removed. Junction of R30 and R7 connected to junction of R33 and R34.		
1500-$\mu\mu f$. condenser (C112) added between junction of R30 and R7 and ground.		62-215001011
Resistor R39 changed to 15,000 ohms.	66-3478340	66-3158340
1500-$\mu\mu f$. condenser (C113) added in parallel with C4.		62-215001011
1500-$\mu\mu f$. condenser (C114) added in parallel with C27.		62-215001011
1500-$\mu\mu f$. condenser (C115) added in parallel with C11.		62-215001011
Condenser C28 disconnected from junction of L35 and R67, and ungrounded end connected to junction of R67 and R68.		
Connections to 7N7 sync preamplifier and sync separator changed so that pin numbers are as follows: Plate, sync preamplifier 3 Plate, sync separator 6 Grid, sync preamplifier 4 Grid, sync separator 5 Cathode, sync preamplifier 2 Cathode, sync separator 7		
Resistor R96 changed to 82,000 ohms.	66-4108340	66-3828340
Resistor R101 changed to 120,000 ohms.	66-4108340	66-4128340
Condenser C104 removed. TELEVISION terminal of S2B disconnected from junction of R82 and R109, and connected to pin 3 of horizontal-output tube.	30-2417-1	
Additional section of S2 connected so that, in PHONO position, the junction of C40 and C41 is connected to the ungrounded end of C45. The TELEVISION terminal of this section of the switch is left open.		
Connection to FM TEST jack J3 changed so that: 1. Pin 1 is grounded 2. Pin 2 is connected to ungrounded (negative) end of C42. 3. Pin 3 is connected to junction of C40 and C41.		
This change necessitates a corresponding change to the connections of the FM TEST jack adaptor shown in figure 4 of PR-1771. The FM TEST jack adaptor should be constructed as shown in figure 3 of this bulletin. The 100,000-ohm resistors used for this adaptor should be selected from a group, to obtain values as close to each other as possible. In the I-F ALIGNMENT CHART, all references to connecting the oscilloscope to pin 1 of J3 should be disregarded, and the oscilloscope should be connected to pin 3 instead.		

PRODUCTION CHANGES

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
2	FM detector (7X7) shielded.		Shield-mounting clip, 56-1567-1. Tube shield, 56-2731.	To eliminate harmonic beat.
2	R-f choke added in series with ungrounded lead to filament of FM detector (7X7).		32-4112-15	To eliminate harmonic beat.
2*	Sound-i-f take-off point moved from plate of third video-i-f amplifier to cathode of same stage. C29 removed. First sound-i-f autotransformer changed. 470-$\mu\mu f$. condenser added in parallel with R13. R128 removed. See figure 2.	C29, 30-1224-30 L37, 32-4373-1 R128, 66-3228340	62-147001001 32-4303-1	To improve padding.
3	R118 changed to 15,000 ohms.	66-3188340	66-3158340	To improve adjacent-sound attenuation.
4	Ground connection of C31 is changed to same ground connection that grounds L37.			Improve sound-i-f stability.

* This change was incorporated in first production of Model 50-T1105 and Run 2 of Model 50-T1106.

World Radio History

CORRECTION TO SERVICE MANUAL PR-1771

On page 11 of Service Manual PR-1771, the trimmer symbolized C14 in figure 9 should be symbolized C20.

The following corrections should be made to the Replacement Parts List:

Reference Symbol	Published Part No.	Correct Part No.
C29	62-056409001	30-1224-30
L37	32-4302	32-4373-1
R119	66-21518340	66-2508340

In the Miscellaneous Section of the Replacement Parts List, "Nut, wing, adjusting bracket" should be "Bolt, wing, adjusting bracket, Part No. W2547FA3".

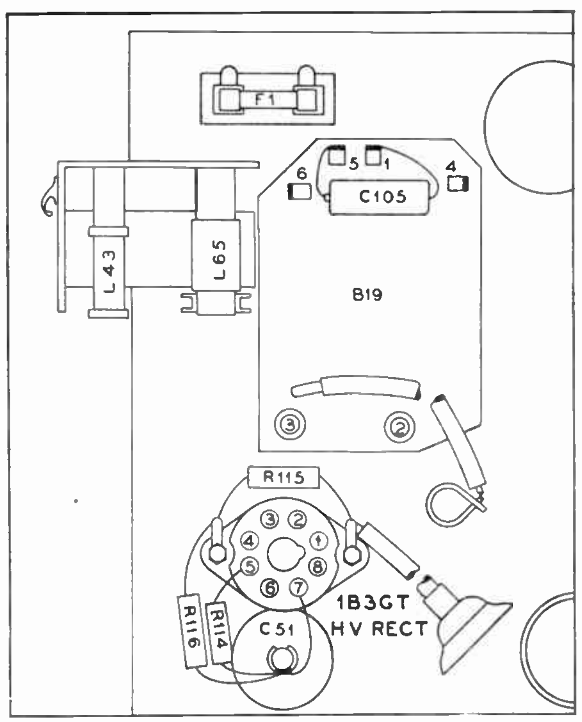

Figure 4. Partial Top View, Models 50-T1104, Code 121, 50-T1104, Code 122, 50-T1105, and 50-T1106, Showing Components Mounted on Top of Chassis

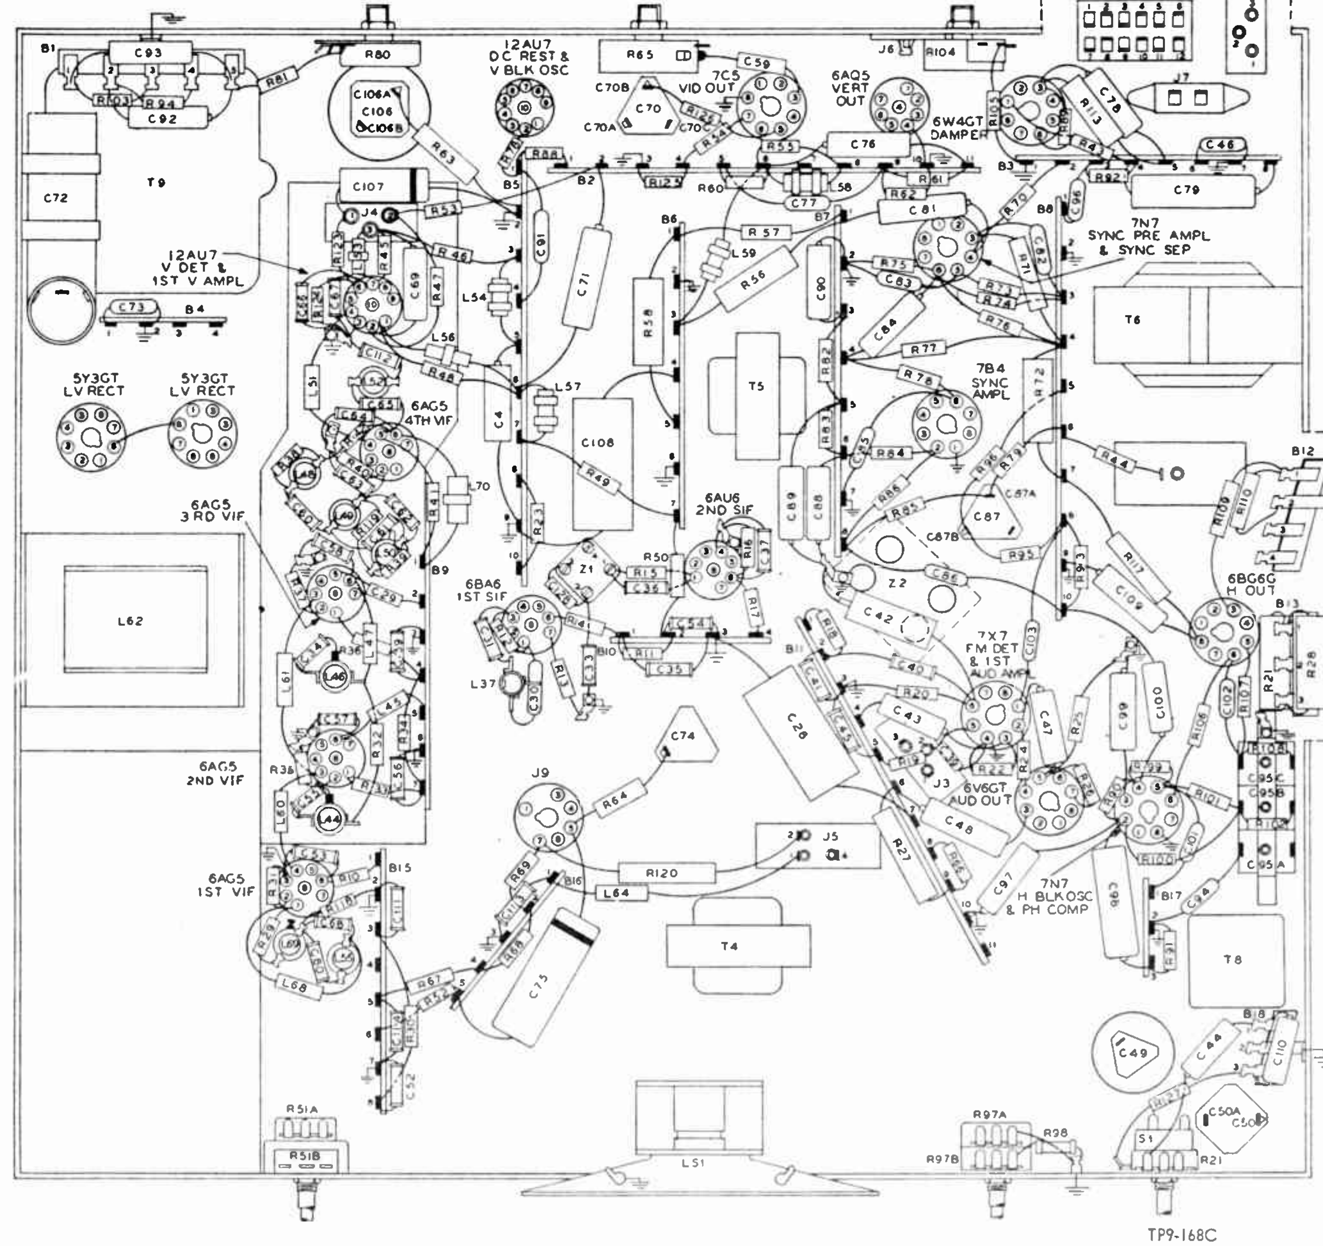

Figure 5. Bottom View, Models 50-T1104, Code 121, 50-T1104, Code 122, 50-T1105, and 50-T1106, Showing Locations of Components

MODELS 50-T1104; 50-T1105; 50-T1106

Connecting Television Booster TB2

In the above models, the cathode and filament circuits of the 6V6GT audio-output tube are 130 volts above ground. Therefore, the octal-power adapter for Television Booster TB2 is not applicable to these models. A special 3-prong socket is incorporated into the top of the chassis, near the speaker, to supply booster power. Plug and Cable Assembly, Part No. 41-3942, should be used to connect the booster to this socket.

MODELS 50-T1104, CODE 122, AND 50-T1105, CODE 122 — BUILT-IN AERIAL LEAD DRESS

In some cases, improper performance of the built-in aerial may be traced to the way the lead from the built-in aerial to the aerial-input terminals is dressed. This lead should be kept away from the end of the dipole element nearest the power transformer, and dressed so that it is entirely in the clear.

CORRECTIONS TO SERVICE MANUAL PR-1793

1. FM TEST jack J3 should be wired as shown in figure 1.
2. In the schematic diagram, the video-output screen by-pass condenser, C108, should be deleted.
3. In figure 2 of PR-1793, the wording "PLUG IS SHOWN WITH PRONGS POINTING AWAY" should read "PRONG-END VIEW."
4. The PHONO switch, S2, should be wired as shown in figure 2.
5. The caption for figure 10 should read "Philco Television Receiver Models 50-T1400; 50-T1402; 50-T1104, Code 123; Complete Schematic Diagram."
6. Pins 2 and 7 of the high-voltage rectifier tube should be reversed.
7. The following changes should be made in the part numbers in the Replacement Parts List:

Reference Symbol or Description	Published Part No.	New or Correct Part No.
C43	30-4650-56	45-3505-56
C48	30-4650-91	45-3505-91
C71	30-4650-49	45-3505-49
C78	30-4650-49	45-3505-49
C104	62-215001001	62-215001011
C108	62-215001001	62-215001011
L37	32-4302-3	32-4303-2
R21	33-5586-16	33-5564-4
R51	33-5563-22	33-5563-10

Knob, BRIGHTNESS control (50-T1400)	54-4999-3	54-4699-3
Knob, CHANNEL SELECTOR (50-T1400)	56-6596-3FCP	56-6596-3
Screw, window rail	1W25201FA3	1W25201

All references to 76-4402-9 (the tuner unit) should read 76-4402-6.

PREPRODUCTION CHANGES IN MODELS 50-T1400 AND 50-T1402

The following changes were made in Models 50-T1400 and 50-T1402 between the time of printing of Service Manual PR-1793 and the time of first production of Models 50-T1400 and 50-T1402:

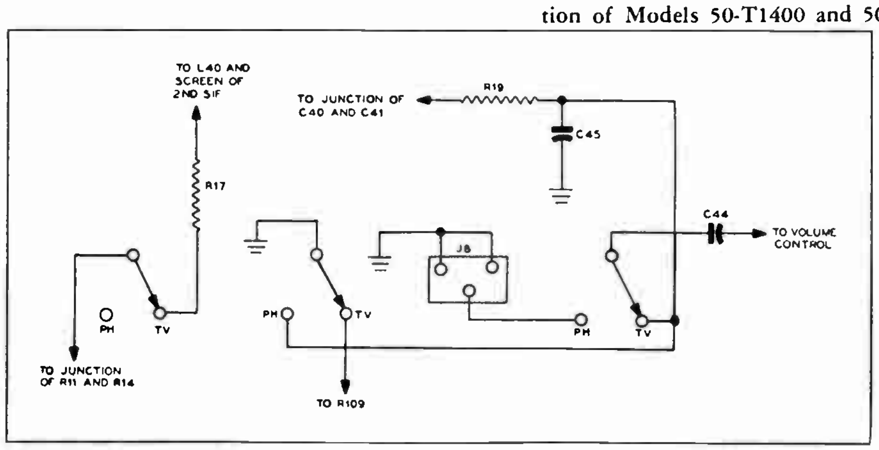

Figure 2. Preproduction Connections to Phono Switch, Models 50-T1400; 50-T1402; 50-T1104, Code 123

DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.
L55 changed to different coil.	32-4234-4	32-4234-8
R118 changed from 5100 ohms to 5600 ohms.	66-2518340	66-2568340
C68 and C80 changed from 18 $\mu\mu f$. to 51 $\mu\mu f$.	60-00185317	30-1224-62
100-$\mu\mu f$. condenser (C115) added between screen (pin 8) of horizontal-output tube and secondary tap of T7.		60-10105407
Lead to screen (pin 8) of horizontal-output tube removed. Pin 8 reconnected to pin 8 of T7 through a 250-microhenry choke (L72) and a 4700-ohm resistor (R127) in series.		32-4143-7 66-2475340

NOTE:- For additional information, See Philco Model 50-T1400, Pgs. 4-27 to 4-34

DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.
R121 removed. R28 changed from 10,000 ohms to 5000 ohms.	33-1335-47	33-3435-30
R94 changed from 6800 ohms to 5100 ohms.	66-2688340	66-2518240
L68 removed; L69 connected across R29.	32-4112-15	
470-ohm resistor, R128, added in series with lead between C6 and junction of L55 and C68.		66-1478340
R116 removed. R115 connected to junction of R114 and C51.	66-4685340	
J8 and S2 removed. Leads to S2 rewired so that connections are same as when S2 was switched to TELEVISION position. R109 removed. Cathode (pin 3) of horizontal-output tube grounded.	27-6126 42-1893-1 66-2105340	
Ungrounded end of C28 disconnected and reconnected to junction of R67 and R68.		
1500-$\mu\mu f$. condenser (C117) added in parallel with C27.		62-215001011

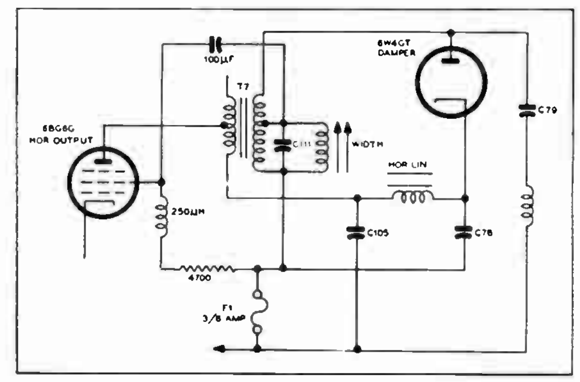

Figure 3. Location of Fuse, Runs 1F, 2F, and 3F of Models 50-T1400 and 50-T1402

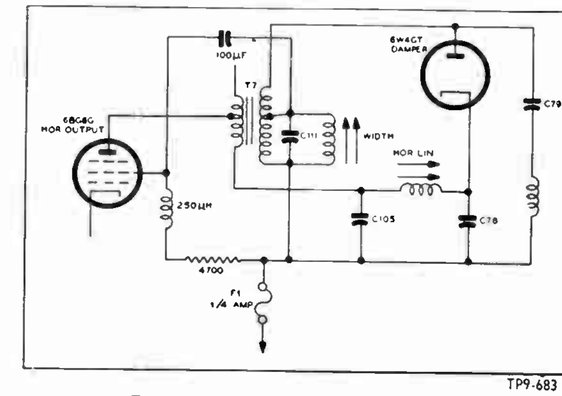

Figure 4. Location of Fuse, Run 4 of Models 50-T1400 and 50-T1402

PREPRODUCTION CHANGES IN MODEL 50-T1104, CODE 123

The following changes were made in Model 50-T1104, Code 123, between the time of printing of Service Manual PR-1793 and the time of first production of Model 50-T1104, Code 123:

DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.
470-ohm resistor (R128) added in series with lead between C6 and junction of L55 and C68.		66-1478340
2.2-$\mu\mu f$. condenser (C116) added between ground and junction of C6 and R128.		30-1221-4
C111 removed.	45-3505-60	
C79 changed from .15 μf. to .47 μf.	45-3505-48	61-0133
R121 removed. R28 changed from 10,000 ohms to 5000 ohms.	33-1335-47	33-3435-30
R108 changed from 270,000 ohms to 390,000 ohms.	66-4278340	66-4398340
R72 changed from 5100 ohms to 1500 ohms.	33-5546-28	66-2155340
1500-$\mu\mu f$. condenser (C117) added in parallel with C27.		62-215001011

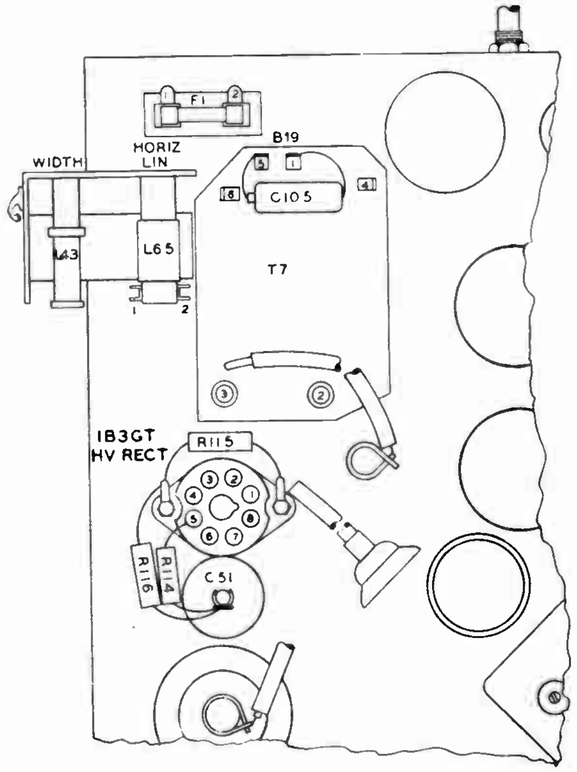

Figure 6. Partial Top View of Models 50-T1104, Code 123, Showing Components Located in High-Voltage Cage

PRODUCTION CHANGES IN MODELS 50-T1400 AND 50-T1402

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
2	2.2-µµf. condenser added between ground and junction of C6 and R128.		30-1221-4	To center tuning of first video-i-f transformer.
2Z and 3	Arm of HEIGHT control disconnected and re-wired to junction of R89 and R96.			To improve vertical linearity.
1F	F1 removed from position shown in service manual, and rewired as shown in figure 3. This run does not include the changes made in runs 2, 2Z, or 3.			To provide increased protection.
2F	F1 removed from position shown in service manual, and rewired as shown in figure 3. This run includes the changes made in run 2, but does not include the change made in runs 2Z and 3.			To provide increased protection.
3F	F1 removed from position shown in service manual, and rewired as shown in figure 3. This run includes the changes made in runs 2, 2Z, and 3.			To provide increased protection.
4	F1 rewired as shown in figure 4. Value changed from 3/8 ampere to 1/4 ampere.	45-2656-10	45-2656-8	To reduce a-c current through fuse.
5	330-ohm resistor added in series with lead between ungrounded (negative end) of C42 and junction of R20 and pin 2.		66-1338340	To reduce harmonic beat.
5	Lead from junction of R19 and pin 3 of J3 disconnected from junction of C40 and C41. C41 removed. C40 connected across R20.	62-215001011		To reduce harmonic beat.

PRODUCTION CHANGES IN MODELS 50-T1400 AND 50-T1402 (Cont.)

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
5	150-µµf. condenser added between ground and junction of R18 and R19.		60-10155407	To reduce harmonic beat.
5	10,000-ohm resistor added across R56 and R57.		66-3104340	To improve video response.
5	R49 changed from 4700 ohms to 3900 ohms.	66-2478340	66-2398340	To improve video response.
5	R54 changed from 100 ohms to 10 ohms.	66-1108340	66-0108340	To improve video response.
5	R44 changed from 5600 ohms to 2200 ohms.	66-2568340	66-2228340	To improve video response.
5	L53 changed from 150 microhenries to 40 microhenries.	32-4143	32-4143-1	To improve video response.
5	R46 changed from 3300 ohms to 2400 ohms.	66-2338340	66-2258340'	To improve video response.
5	R58 changed from 1500 ohms to 1000 ohms.	66-2158340	66-2108340	To improve video response.

PRODUCTION CHANGES IN MODEL 50-T1104, CODE 123

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
2	J8 and S2 removed. Leads to S2 rewired so that connections are same as when S2 was switched to TELEVISION position. R109 removed. Cathode (pin 3) of horizontal output tube grounded.	27-6126 42-1893-1 66-2105340		
3	.0022-μf. condenser, 470-ohm resistor, and 600-microhenry choke connected in parallel, and added in series with lead between pin 4 of T7 and pin 5 of damper tube.		45-3505-54 66-1475340 32-4264-1	To eliminate Barkhausen oscillations.
4	L55 changed to different coil.	32-4234-4	32-4234-8	To improve picture quality.
4	R118 changed from 5100 ohms to 5600 ohms.	66-2518340	66-2568340	To improve picture quality.
4	C68 and C80 changed from 18 $\mu\mu f$. to 51 $\mu\mu f$.	60-00185317	30-1224-62	To improve picture quality.

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	REASON FOR CHANGE
4	L70 removed. R41 connected between plate (pin 5) and screen (pin 8) of 4th v-i-f tube.	32-4143-1	To improve lead dress.

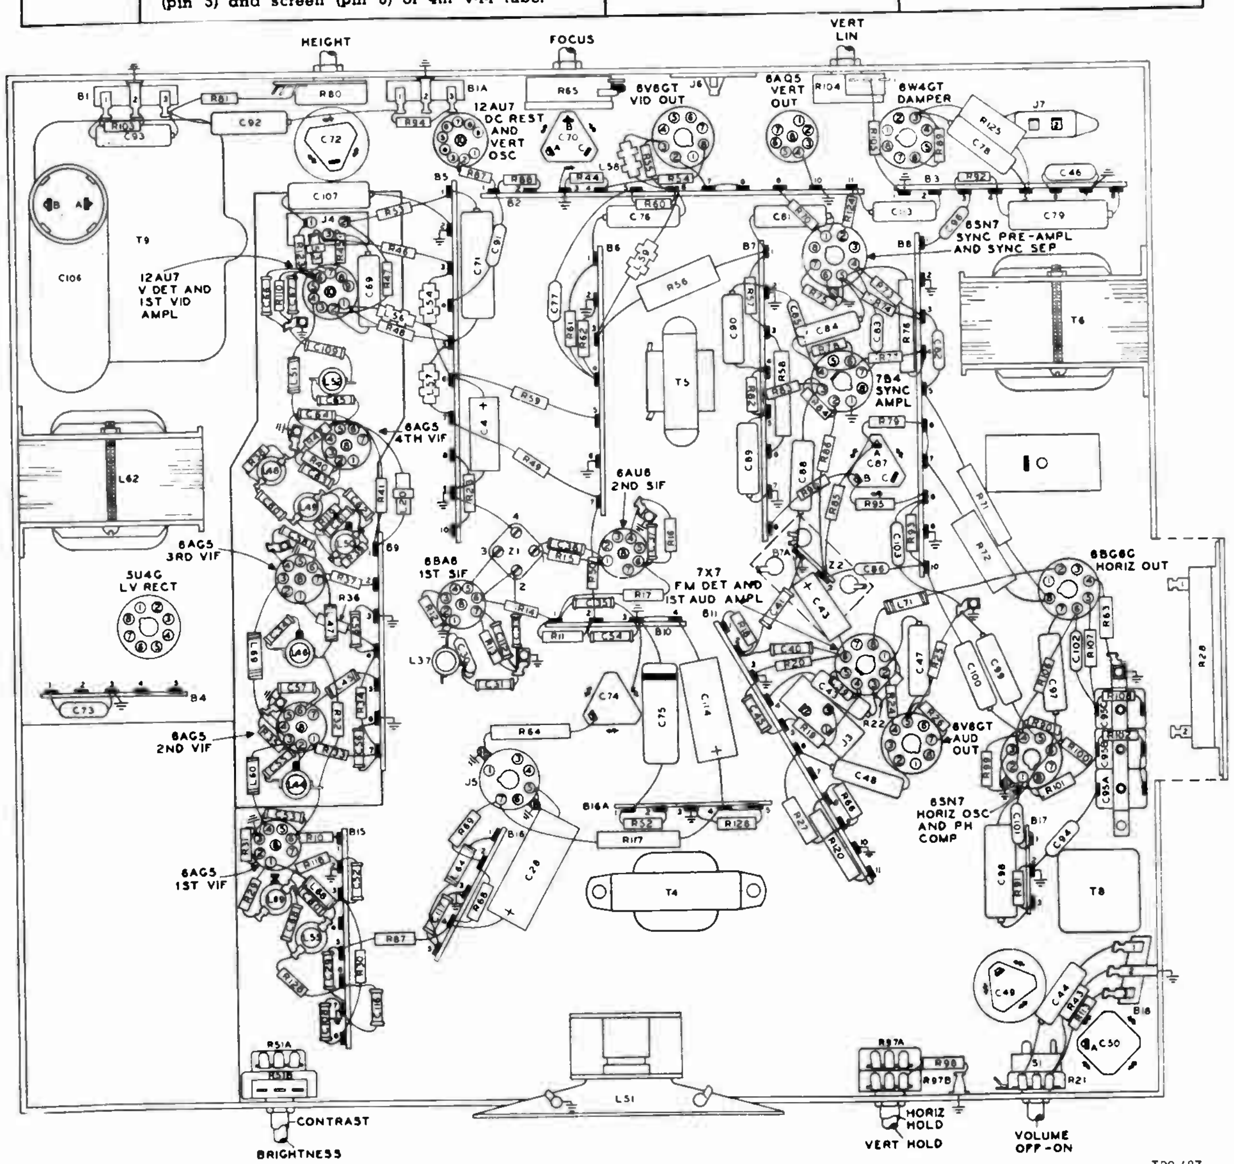

Figure 8. Bottom View of Model 50-T1104, Code 123, Showing Locations of Components

PHILCO TELEVISION RECEIVER MODELS 50-T1401 AND 50-T1430

The chassis of Philco Models 50-T1401 and 50-T1430 are the same as that used in Model 50-T1400. Model 50-T1401 is a table model with a wrap-around mahogany cabinet. Model 50-T1430 is a console model with a modern-style mahogany cabinet. Both models incorporate a 12-inch picture tube, a wide mask, and a built-in aerial.

For service information pertaining to Models 50-T1401 and 50-T1430, refer to Philco Service Manual PR-1793, which covers Models 50-T1400, 50-T1402, and 50-T1104, Code 123, and to the supplementary information in this bulletin. However, the miscellaneous section of the Replacement Parts List in PR-1793 does not apply to Models 50-T1401 and 50-T1430 because of the difference in the cabinets. For miscellaneous parts, therefore, refer to the miscellaneous section of the following Replacement Parts List for Models 50-T1400, 50-T1401, 50-T1402, and 50-T1430 (All Run 5).

L23 to L34	Coils, oscillator	Part of 76-4402-6
L35	Coil, plate choke	Part of 76-4402-6
L36	Coil, mixer plate tank	Part of 76-4402-6
L37	Coil, 1st sound i-f autotransformer	32-4303-2
L53	Coil, series peaking, 40 microhenries	32-4143-1
L55	Coil, adjacent-channel trap	32-4[illegible]
L54	Coil, shunt peaking, 250 microhenries	32-4143-7
R1	Resistor, cathode bias, 330 ohms	Part of 76-4402-6
R2	Resistor, loading, 3300 ohms	Part of 76-4402-6
R3	Resistor, grid return, 100,000 ohms	Part of 76-4402-6
R4	Resistor, grid return, 10,000 ohms	Part of 76-4402-6
R5	Resistor, loading, 10,000 ohms	Part of 76-4402-6
R6	Resistor, grid return, 330 ohms	Part of 76-4402-6
R7	Resistor, a-v-c filter, 10,000 ohms	Part of 76-4402-6
R8	Resistor, cathode bias, 100 ohms	Part of 76-4402-6
R3	Resistor, plate load, 4700 ohms	Part of 76-4402-6
R20	Resistor, bleeder, 5000 ohms	33-3435-30
R44	Resistor, voltage divider, 2200 ohms	66-2228340*
R46	Resistor, video-detector load, 2400 ohms	66-2248340*
R49	Resistor, plate load, 3900 ohms	66-2398340*
R51	Potentiometer assembly, dual, 5000 ohms-100,000 ohms	33-5533-10
R51A	Potentiometer, BRIGHTNESS control, 100,000 ohms	Part of R51
R51B	Potentiometer, CONTRAST control, 5,000 ohms	Part of R51
R54	Resistor, cathode bias, 10 ohms	66-0108340*
R58	Resistor, l-f compensation, 1000 ohms	66-2108340*
R94	Resistor, vertical shaping, 5100 ohms	66-2519240*
R97	Potentiometer assembly, dual, 50,000 ohms-1 megohm	33-5563-6
R97A	Potentiometer, VERT. HOLD control, 1 megohm	Part of R97
R97B	Potentiometer, HORIZ. HOLD control, 50,000 ohms	Part of R97
R118	Resistor, terminating, 5600 ohms	66-2568340*
R119	Resistor, terminating, 5100 ohms	66-2508340*
R127	Resistor, screen dropping, 4700 ohms	66-2475340*
R128	Resistor, r-f filter, 470 ohms	66-1478340*
R129	Resistor, beat suppressor, 330 ohms	66-1338340*
R130	Resistor, plate-load shunt, 10,000 ohms	66-3104340*
S3	Switch, band	Part of 76-4402-6
S3A	Switch, aerial	Part of S3
S3B	Switch, aerial transformer	Part of S3
S3C	Switch aerial grounding	Part of S3
T1	Transformer, r-f	Part of 76-4402-6
T2	Transformer, l-f aerial	Part of 76-4402-6
T3	Transformer, h-f aerial	Part of 76-4402-6
TC1 to TC13	Tuning cores	Part of 76-4402-6
WS1	Wafer-switch-and plate assembly	Part of 76-4402-6
Z2	Transformer, FM detector	32-4217-2

MODEL 50-T1104, CODE 123 (RUN 4)

C79	Condenser, d-c blocking, .47 μf.	61-0133
L73	Coil, filter, 600 μh.	32-4264-1
R72	Resistor, decoupling, 1,500 ohms, 5w	66-2155340*
R119	Resistor, terminating, 5800 ohms	66-2568340*
R131	Resistor, damping	66-1475340*

World Radio History

PRODUCTION CHANGES IN MODELS 50-T1400; 50-T1401; 50-T1402; 50-T1430

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
6	R94 changed from 5100 ohms to 5600 ohms.	66-2518340	66-2568340	To reduce vertical foldover.
6	R66 changed from 180 ohms to 100 ohms.	66-1184340	66-1104340	To center range of FOCUS control.
7*	L72, C111, and C115 removed. Screen (pin 8) of horizontal-output tube connected through R127 to secondary tap of T7. L43 changed to improved type width coil.	32-4143-7 45-3505-60 60-10105407 32-4419	32-4419-2	To improve horizontal deflection.
7*	R108 changed from 270,000 ohms to 180,000 ohms.	66-4278340	66-4188340	To improve horizontal deflection.

* Other runs incorporating this change have "Y" stamped after the run number.

MODELS 50-T1400, 50-T1401, 50-T1402, 50-T1430

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
X	"X" after run numbers 1 through 7 indicates that a short wire jumper is connected across R67.			To improve performance with low line voltage.
8	R67 removed. R68 connected to junction 66-2564340 of L35 and C11.			To improve performance with low line voltage.
7A or 9	Tuner No. 76-4402-6 replaced with Tapered-Line Tuner No. 76-5433. R29 changed from 15,000 ohms to 10,000 ohms. R68 changed from 56,000 ohms to 1000 ohms. R69 changed from 56,000 ohms to 6200 ohms.	76-4402-6 66-3158340 (2) 66-2568340	76-5433 66-3108340 66-2108340 33-1335-19	To incorporate new tuner.
10	C91 changed from .0082 μf. to .015 μf.. R87 removed. Pin 2 of vertical-blocking-oscillator tube connected to junction of C91 and R88. R88 changed from 820,000 ohms to 470,000 ohms. R94 changed from 5100 ohms to 6800 ohms.	61-0174 66-3108340 66-4828340 66-2518340	30-4651-8 66-4478340 66-2688340	To reduce vertical foldover.

PHILCO TELEVISION RECEIVER MODELS 50-T1403, 50-T1404, AND 50-T1406

The chassis of Philco Models 50-T1403, 50-T1404, and 50-T1406 are similar to that used in Model 50-T1400. All are table models with different type cabinets. Model 50-T1403 has a functional-style walnut cabinet; Model 50-T1404 has a modern-style mahogany cabinet; and Model 50-T1406 is housed in a Georgian-style cabinet with mahogany finish. All three models incorporate a 12-inch picture tube, a wide mask, and a built-in aerial.

For service information pertaining to the above models, refer to Philco Service Manual PR-1793, which covers Models 50-T1400, 50-T1402, and 50-T1104, Code 123. The production changes for Model 50-T1400 also apply to Models 50-T1403, 50-T1404, and 50-T1406. However, the Miscellaneous section of the Replacement Parts List in PR-1793 does not apply to these models, because of the difference in cabinets. Therefore, the following list of miscellaneous items should be used.

MISCELLANEOUS

Description	Service Part No.
Cabinet (50-T1403)	10785-4
Cabinet (50-T1404)	10795
Cabinet (50-T1406)	10783-1
Cabinet Hardware and Parts	
Back-and-cup assembly (50-T1403)	76-5406-2
Back-and-cup assembly (50-T1404)	76-5406-6

Tuner assembly, complete	76-5433

PHILCO TELEVISION RECEIVER MODELS 50-T1402, 50-T1406, 50-T1432, ALL CODE 122

The chassis of the above models are similar to that used in Model 50-T1400, Code 121, Run 13, except that these models use Philco 12-position turret tuner, Part No. 76-5411-3, and have minor circuit changes, as follows:

1. The B+ line from the tuner is connected through a 10,000-ohm resistor, Part No. 66-3104340, instead of through R67, R68, and R69.
2. C28 is connected between ground and the junction of the tuner B+ lead and the added 10,000-ohm resistor.
3. An r-f choke, Part No. 32-4112-11, is added, in series with the filament lead to the tuner.
4. A 1500-$\mu\mu f$. condenser, Part No. 62-215001011, is connected between ground and the junction of the tuner filament lead and the added r-f choke.

Model 50-T1402, Code 122, and 50-T1406, Code 122, are table models. Model 50-T1432, Code 122, is a console model. Model 50-T1432, Code 122, uses a 10-inch speaker, Part No. 36-1610-6, which is mounted in the cabinet.

Models 50-T1402, Code 122, and 50-T1432, Code 122, have modern-style mahogany-finish cabinets. Model 50-T1406, Code 122, has a Georgian-style cabinet with mahogany finish.

For service information pertaining to the above models, refer to Philco Service Manual PR-1793, which covers Models 50-T1400, 50-T1402, and 50-T1104, Code 123. For service information pertaining to the tuner, refer to Service Manual PR-1803. A list of replacement parts covering the miscellaneous items used in these models is given below.

Description	Service Part No.
Cabinet (50-T1402, Code 122)	10776-3
Cabinet (50-T1406, Code 122)	10783-1
Cabinet (50-T1432, Code 122)	10794
Cabinet Hardware and Parts	
Back-and-cup assembly (50-T1402, Code 122)	76-5406
Back-and-cup assembly (50-T1406, Code 122)	76-5406-4
Back assembly (50-T1432, Code 122)	76-5717
Brace, picture tube, 1 13/16" x 4⅜" (50-T1402, Code 122, and 50-T1406, Code 122)	56-5581-26FA3
Brace, picture tube, 1 13/16" x 6¼" (50-T1402, Code 122)	56-5581-27FA3
Brace, picture tube, 1 15/16" x 5 15/16" (50-T1406, Code 122)	56-5581-33FA3
Brace, picture tube, 2⅛" x 6½" (50-T1432, Code 122)	56-5581-41FA3
Brace, picture tube, 2" x 7 13/16" (50-T1432, Code 122)	56-7754FA3
Cup, back (50-T1432, Code 122)	56-5171-6FJ31
Escutcheon (50-T1402, Code 122, 50-T1432, Code 122)	56-7854
Knob, AERIAL TUNING control	54-4750
Knob, BRIGHTNESS control (50-T1402, Code 122)	54-4699-3
Knob, BRIGHTNESS control (50-T1406, Code 122, 50-T1432, Code 122)	54-4699
Knob, CHANNEL SELECTOR (50-T1402, Code 122)	56-6596-3FCP
Knob, CHANNEL SELECTOR (50-T1406, Code 122, 50-T1432, Code 122)	56-6596-6FCP
Knob, CONTRAST control (50-T1402, Code 122)	54-4703-2
Knob, CONTRAST control (50-T1406, Code 122, 50-T1432, Code 122)	54-4707
Knob, FINE TUNING control (50-T1402, Code 122)	54-4662-1
Knob, FINE TUNING control (50-T1406, Code 122, 50-T1432, Code 122)	54-4662-2
Knob, HORIZ. HOLD control (50-T1402, Code 122)	54-4707-2
Knob, HORIZ. HOLD control (50-T-1406, Code 122, 50-T1432, Code 122)	54-4707
Knob, VERT. HOLD control (50-T1402, Code 122)	54-4699-3
Knob, VERT. HOLD control (50-T1406, Code 122, 50-T1432, Code 122)	54-4699
Knob, VOLUME control (50-T1402, Code 122)	54-4703-2
Knob, VOLUME control (50-T1406, Code 122, 50-T1432, Code 122)	54-4703
Shaft, aerial-tuning control (50-T1402, Code 122)	54-4747-6
Shaft, aerial-tuning control (50-T1406, Code 122, 50-T1432, Code 122)	54-4747-9
Window (50-T1402, Code 122)	54-7983
Window (50-T1406, Code 122)	54-8068
Window (50-T1432, Code 122)	54-7943-8
Cable assembly, high voltage	41-3771-2
Cable assembly, picture tube	41-3772-2
Insulator, high voltage	54-7573-5
Insulator, standoff	54-7309-6
Mounting-frame assembly, picture tube	76-3938
Shield, Loktal tube	56-2731
Shield, miniature tube	56-5629FA3
Socket, Loktal tube	27-6207

MODELS 50-T1400, 50-T1401, 50-T1402, 50-T1403, 50-T1404, 50-T1406, AND 50-T1430, ALL CODE 121

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
W	"W" stamped after run number indicates that R101 is changed from 82,000 ohms to 68,000 ohms.	66-3828340	66-3688340	To extend range of horizontal-oscillator tank circuit.
V	"V" stamped after run number indicates that R101 is 82,000 ohms, and that an 860,000-ohm resistor is added, across it.		66-4828340	To extend range of horizontal-oscillator tank circuit.
11	Tuner unit shock-mounted.			To reduce microphonics.
11	R69 changed from 6200 ohms to 5100 ohms.	33-1335-19	33-1335-18	To increase tuner B+ voltage.
12	C83 changed from 22 μμf. to 12 μμf.	62-022009001	30-1223-2	To improve interlace and reduce jitters.
13	T9 changed to transformer with hum shield.	32-8411-1	32-8423-2	To reduce picture weave.

PRODUCTION CHANGES

MODELS 50-T1400, 50-T1401, 50-T1402, 50-T1403, 50-T1404, 50-T1406, AND 50-T1430, ALL CODE 121

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
14	C101, 270 μμf., changed to 220 μμf.	60-10275407*	60-10225317*	To center range of horiz. osc. coil slug.
15	L43 (width coil) changed.	32-4419-2	32-4419-3	To increase width.
16	1B3 socket and wiring changed. Wiring removed from pin 5 and placed on pin 4.	27-6174-5	27-6174-7	To prevent shorting of components due to internal connections on pins 1, 3, and 5 of some 1B3GT tubes.
17	Extensive changes were made in physical location of sound detector parts.			To reduce harmonic beat.
18	R130 removed. R56, 2500 ohms, changed to 1800 ohms.	66-3108340* *33-1335-87	66-2185340*	
19	Vertical-output transformer (T6) changed to smaller size.	32-8405	32-8425-1 (For replacement purposes, use 32-8405*.)	
20	Fuse added, in series with ground lead of filament winding of power transformer.		Length of #26 copper wire.	To provide protection against filament shorts.
21	820-μμf. condenser added, to screen of horizontal output tube (6BG6G).		60-10825001*	To reduce parasitic oscillation in 6BG6G tube.
22	B supply fuse changed to 1/2-amp. delayed-action type, and wired in series with B-lead of power transformer.	45-2656-8	45-2656-17 (1/2 amp. delayed action.)	To provide additional protection.

*The part number given for R56 (2500-ohm plate load resistor) in the Service Manual is incorrect. The correct part number is 33-1335-87.

MODELS 50-T1400, 50-T1402, 50-T1403, 50-T1404, AND 50-T1406, ALL CODE 122

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
2	1B3 socket and wiring changed. Wiring removed from pin 5 and placed on pin 4.	27-6174-5	27-6174-7	To prevent shorting of components due to internal connection on pins 1, 3, and 5 of some 1B3GT tubes.
3	R130 removed. R56, 2500 ohms, changed to 1800 ohms.	66-3108340* *33-1335-87	66-2185340*	
4	Vertical-output transformer (T6) changed to smaller size.	32-8405	32-8425-1 (For replacement purposes, use 32-8405*.)	
5	Fuse added, in series with ground lead of filament winding of power transformer.		Length of #26 copper wire.	To provide protection against filament shorts.
6	820-μμf. condenser added, to screen of horizontal output tube (6BG6G).		60-10825001*	To reduce parasitic oscillation in 6BG6G tube.

*The part number given for R56 (2500-ohm plate load resistor) in the Service Manual is incorrect. The correct part number is 33-1335-87.

MODEL 50-T1432, CODE 122

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
6	Fuse added, in series with ground lead of filament winding of power transformer.		Length of #26 copper wire.	To provide protection against filament shorts.

MODEL 50-T1104, CODE 123

Correction to Parts List

The correct part number of the back-and-cup assembly used in the above model is 76-4605.

Model	Cabinet Part No.	Window Part No.
50-T1400	10785-3	54-4755
50-T1401	10784-3	54-4755

MODEL 50-T1400

Tables

To make the 50-T1400 cabinet fit properly into the table, either the front or rear cabinet feet should be removed.

MODELS 50-T1104, CODE 123; 50-T1400 SERIES

Horizontal Sync and Drive Padder Identification

Future production of the above models will not have the horizontal sync and drive padder function stamped adjacent to the padder.

The relative position of the padders will remain the same, and the applicable service manual should be referred to for the specific location.

MODELS 50-T1400, 50-T1401

New Cabinets

The cabinets for the above models have been changed so that the oscillator tuning cores may be adjusted with the chassis in the cabinet. This may now be done by simply removing the CHANNEL SELECTOR and FINE TUNING knobs. A physical change was also made in the windows.

CORRECTIONS TO MODELS 50-T1400, 50-T1402, AND 50-T1104, CODE 123

The corrections given below should be made to the Replacement Parts List.

The horizontal-output transformer for the above models has been changed. The new part numbers are given below:

Model	New Transformer Part No.
50-T1104 through 50-T1432	32-8437
50-T1476 through 50-T1482; 50-T1484	32-8421-2

The above transformer should be used for all replacements in these models.

CORRECTIONS

The corrections given below should be made to the Replacement Parts List for Models 50-T1400, 50-T1401, 50-T1402, and 50-T1430 (all Run 5).

Description	Published Part No.	New or Correct Part No.
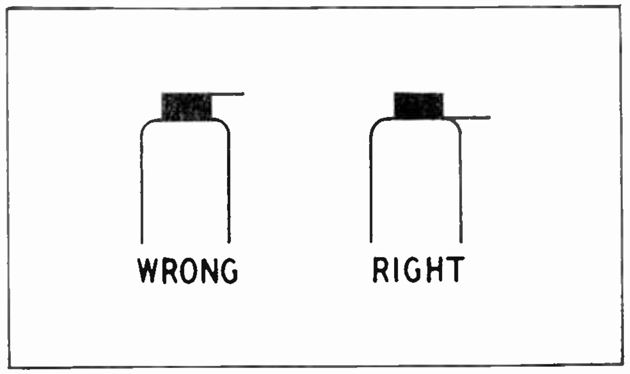
Item 9—Knob, CHANNEL SELECTOR	56-6596-1	56-6596-3

MODELS 50-T1104, CODE 123, 50-T1400, 50-T1401, 50-T1402, 50-T1403, 50-T1404, 50-T1406, 50-T1430, AND 50-T1432—PLACEMENT OF 1B3GT ANODE CAP

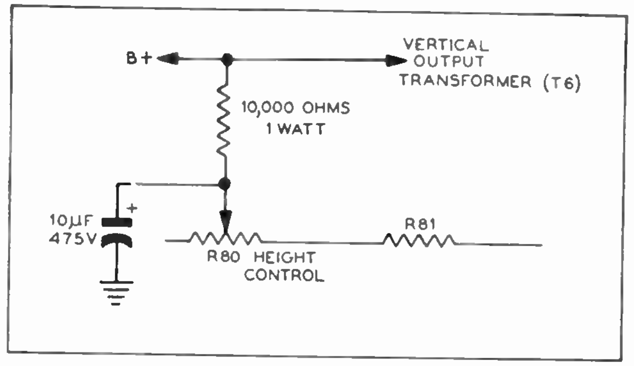
It is possible to place the anode cap on the 1B3GT tube, in the above Receivers, so that it is too close to the top of the high-voltage cage. When placing the anode cap on the tube, make sure that it is placed as illustrated below.



Placement of 1B3GT Anode Cap

MODEL 50-T1400 SERIES, RUNS 1 AND 2 — REDUCTION OF VERTICAL JITTER

Vertical jitter in the picture due to line voltage fluctuations in the above models may be greatly reduced or eliminated, in the special cases where necessary, by adding an extra filter network to the B supply feeding the vertical oscillator and discharge tube. This network consists of a 10,000-ohm resistor and a 10-μf. condenser.



Addition of Filter Network, Model 50-T1400 Series, Runs 1 and 2

MODEL 50-T1400 SERIES PREVENTING HORIZONTAL-SYNC TEAR AT MINIMUM CONTRAST CONTROL SETTING

Horizontal tear at the top of the picture may be caused by a horizontal damper lead radiating energy into the sync separator circuit.

The effect of this radiation may be reduced by redressing these leads (refer to figure 7, page 5, of Service Bulletin 49T3, PR-1822) as follows:

Redress the blue lead on B3-3 to the mounting jack of the high-voltage condenser, under C46, and under T6 to the condenser mounting jack. This wire connects C51 to C79, and radiates some horizontal output signal to the lead connected from B3-2 to B8-3, which is in the sync separator grid circuit. Also redress this wire (from B3-2 to B8-3) on the 6SN7GT side of B8, under R76 to B8-3.

Model 50-T1400 Series, 50-T1404 and 50-T1105 Correction of Part Number

The correct part number of C74, the 500-$\mu\mu f$., 25-volt filter condenser across the 15-ohm resistor in the negative return of the low-voltage power supply, is 30-2570-40.

Model 50-T1403 Additional Replacement Part

A securing clip for the oscillator adjustment cover escutcheon plate is now available for replacement purposes. The part number is 1W57058FA22. It is referred to as a speed clip.

World Radio History

NOTE:- For additional information, See Model 50-T1404, Code 1403, Pages 5-7 to 5-16.

PRODUCTION CHANGES IN MODELS 50-T1404, CODE 123, AND 50-T1406, CODE 123; 50-T1404, 50-T1406, AND 50-T1432, ALL CODE 124

Corrections to Service Manual

1. Figure 5, page 6, caption should read, "Top View of Chassis (without Tuner), etc."

2. Figure 6, page 7, caption should read, "Top View of Chassis, Showing Locations of Adjustments."

3. The Bandpass and R-F Response Adjustment Procedure for Tapered Line Tuner (Code 123), page 12, is superseded by the following procedure (refer to PR-1858 for complete tuner information):

1. Connect the outputs of the AM and FM signal generators through the aerial-matching network (figure 1) to terminals 1 and 2 of Z1-T. Terminals 3 and 4 of Z1-T should be connected together, for a 300-ohm input.

2. Connect a 3300-ohm resistor in series with the 150-volt (red) B+ lead to R9-T. Connect the vertical input of the oscilloscope to the junction of the 3300-ohm resistor and R9-T.

3. Turn the CHANNEL SELECTOR to Channel 10, and remove the 1st v-i-f tube. Connect a 470-ohm resistor from the v-i-f output (green) lead to ground.

4. Set the FM signal generator to 195 mc., with sufficient sweep to give the complete response curve.

5. Set the AM signal generator (unmodulated) to produce marker pips at the video and sound carriers for Channel 10.

6. Adjust C8-T and C11-T for maximum symmetrical response within Channel 10. If there is one weak station in the local area, the adjustment of C8-T and C11-T may be made on that channel, to improve its performance, provided that the response on other channels is not sacrificed too much.

4. The Bandpass and R-F Response Adjustment Procedure for 12-Position Turret Tuner (Code 124), page 13, step 2, should read, "Short the v-i-f output lead of the tuner to ground through a 470-ohm resistor."

5. The connection of C15-T and L17-T, R10-T should be interchanged in figure 13, page 13.

6. In figure 14, pages 16 and 17, terminal 4 of the tapered line input terminals should be grounded.

7. In figure 14, pages 16 and 17, the connections to pins 1 and 3 of the 6T8 (Code 124) should be reversed.

8. In figure 14, pages 16 and 17, the value of R94 should be 82,000 ohms.

9. In figure 14, pages 16 and 17, and in the Replacement Parts List, the values of R3-T and R2-T should be interchanged.

10. In figure 14, the peak-to-peak voltage on the grid of the 6BG6G tube should be 35v.

11. The correct part number of C24 is 62-01049001.

12. The correct part number of R26 is 33-5563-22.

PRODUCTION CHANGES IN MODELS 50-T1404, CODE 123, AND 50-T1406, CODE 123

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	NEW OR ADDED PART NO.	REASON FOR CHANGE
2	R85 changed to 1.5 megohms.	66-5108340	66-5158340	To center range of VERT. HOLD control.
3	R68 removed. Pin 6 of video output tube was connected directly to the 135-volt source.	66-2565340		To simplify wiring.
4	L17 and R24 removed. Plate of 1st video amplifier was connected directly to L18.	32-4143-14 66-3158340		To improve video response.

TPO-368

MODEL 50-T1403

The chassis used in the above models is similar to the chassis used in Models 50-T1404 and 50-T1406, Code 123. The differences are as follows:

1. A 7N7 tube is used in place of a 6SN7GT in the vertical-sweep-output stage.
2. A 7N7 tube is used in place of a 6SN7GT as a phase comparer and horizontal oscillator.
3. The 7N7 phase comparer and horizontal-oscillator tube is shock-mounted.
4. The phase comparer and horizontal-oscillator circuits are changed, as shown in figure 3.
5. The 47,000-ohm loading resistor (R116) across the video detector series peaking coil (L15) is removed.
6. The series peaking coil (L17) in the plate circuit of the 1st video amplifier is removed, and the plate is connected directly to the shunt peaking coil (L18).
7. The 1-megohm resistor (R85) shunting the VERT. HOLD control is changed to 1.5 megohms.
8. The B supply for Philco Television Booster Model TB-2, on pin 6 of the video-output tube, is obtained directly from the 135-volt bus.

For complete service information on Models 50-T1403, 50-T1404, and 50-T1406, all Code 125, refer to this supplement, and to Service Manual PR-1844, covering Models 50-T1404, Code 123, and 50-T1406, Code 123; Models 50-T1404, 50-T1406, and 50-T1432, all Code 124.

HORIZONTAL-SWEEP ADJUSTMENTS

The changes made in the horizontal-sweep circuit necessitate a new adjustment procedure, which is given below.

The range of the horizontal-hold control potentiometer is sufficient to compensate for normal variations in the frequency of the horizontal oscillator, and no other adjustments are ordinarily required. However, if the tube or other components are replaced in the horizontal-oscillator circuit, it may be necessary to make the following adjustments, to obtain proper synchronism and deflection:

1. Preset the adjustments as follows:
   a. Lockin trimmer, C65A, one turn counterclockwise from the maximum clockwise position. See figure 1.
   b. Stabilizing core, TC-15, maximum counterclockwise.
   c. Drive trimmer, C65C, 1 turn counterclockwise from the maximum clockwise position.
   d. HORIZ. HOLD control, center of its range.
2. Tune in a station, and adjust TC12 until the picture is brought into sync.
3. Connect an oscilloscope to pin 3 of the HOR. OSC. TEST socket, J6, and adjust the scope sweep until two complete cycles of the pattern are stationary.

©John F. Rider

World Radio History

4. Adjust the stabilizing core, TC15, until the two peaks (see figure 2) are of equal amplitude, readjusting TC12, if necessary, to keep the picture in sync.
5. Connect the oscilloscope to pin 1 of J6.
6. Adjust the drive trimmer, C65C, to obtain 8600 volts on the picture-tube second anode, with the BRIGHTNESS control fully counterclockwise, or the picture-tube second-anode lead disconnected. The second-anode voltage should be measured with a Philco Electronic Circuit Master, Model 7001, or an equivalent instrument which has 100-megohm input resistance. Readjust TC15, if necessary, to keep the picture in sync. If a meter capable of reading high voltage is not available, the horizontal drive may be adjusted as follows: Starting with C65C in the preset position, turn counterclockwise until variation of the BRIGHTNESS control just affects the horizontal linearity of the picture.
7. Turn the HORIZ. HOLD control maximum clockwise. Adjust TC12 so that the blanking bar appears at the left edge of the picture.
8. Turn the HORIZ. HOLD control counterclockwise until the picture comes in, then goes out of sync. Then turn the HORIZ. HOLD control slowly clockwise again, counting the number of black bars sloping down to the left before the picture pulls into sync. If there are more than 3½ bars, turn the lockin trimmer, C65A, slightly clockwise; if there are less than 2½ bars, turn C65A slightly counterclockwise. If the Receiver does not lose sync when the HORIZ. HOLD control is maximum counterclockwise, remove the signal momentarily.
9. Repeat steps 7 and 8 until the picture pulls into sync when from 2½ to 3½ bars appear, sloping down to the left.
10. Turn the HORIZ. HOLD control maximum clockwise. Adjust TC12 to obtain between 4 and 6 bars, sloping down to the right.
11. Turn the HORIZ. HOLD control slowly counterclockwise, and note whether the picture goes in and out of sync again. Now, turn the HORIZ. HOLD control slowly clockwise until the picture comes into sync. If this sequence is not obtained, repeat steps 7, 8, 9, and 10.

REPLACEMENT PARTS LIST

A supplementary parts list for Models 50-T1403, 50-T1404, and 50-T1406, all Code 125, is given below. A part identified by † has the same function as in Code 123, but its value is different.

A part that has been added in Code 125 is identified by Δ, and has a new symbol. All other parts have the same symbols, values, and functions as in Code 123, and are repeated in this list for convenience in the use of the supplementary schematic diagram.

In any case where a part is not used in Code 125, or where its function is changed, the original symbol is not used, and, therefore, is not listed.

NOTE: Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory parts. Also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

Reference Symbol	Description	Service Part No.

PREPRODUCTION AND PRODUCTION CHANGES IN MODELS 50-T1403, 50-T1404, AND 50-T1406, ALL CODE 125

Corrections to Service Manual (PR-1846)

1. Delete step 5 of Horizontal-Sweep Adjustment.
2. The correct part number of the horizontal-blocking-oscillator transformer, T7, is 32-4470-3.
3. For corrections to Tuner Alignment Procedure, see Corrections to Service Manual (PR-1844).

PREPRODUCTION CHANGES

The following changes were made between the printing of PR-1846 and first production.

1. Resistor R118 was changed to 390,000 ohms, Part No. 66-4394240*.
2. Condenser C83 was changed to .001 μf., Part No. 45-3505-52.
3. The blocking condenser (C71) in the horizontal-output circuit was rewired as shown in figure 1.

PRODUCTION CHANGES

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	NEW OR ADDED PART NO.	REASON FOR CHANGE
2	R108 changed to 56,000 ohms. C73 changed to 390 μμf.	66-3824240 60-10685401	66-3564240 30-1220-35	To increase width and reduce interaction between width and linearity controls.
3	C67 increased in voltage rating.	60-00105407	30-1224	To reduce possibility of breakdown.
4	Video amplifier, sync take-off point, and sync separator changed as shown in figure 2.	Refer to following Parts List.	Refer to following Parts List.	To improve sync performance, and to improve picture quality with weak signal input.
4Z	A 33-μμf. condenser was added, across R32, and L19 was shorted out.		62-033009001	An inductive resistor was used for R32 (see note below.)
5 and 4X	R32 changed to 2000 ohms, non-inductive. The 33-μμf. condenser and the short across L19 were removed.	62-03330001		Circuit changed to use non-inductive resistor.
6	C74 changed to .0047 μf.	60-01825401	45-3505-90	To reduce parasitic oscillations in the 6BG6G.
7	A 680,000-ohm resistor was added, in series with R113.		66-4684340*	To increase width, and reduce squeeze on right side.

NOTE: When Part No. 33-1335-94 (220 ohms, non-inductive) is used as a replacement, the circuit should be wired as shown in figure 2.

CIRCUIT DESCRIPTION

Philco Model 50-T1443, Code 122, is a consolette-type television receiver employing a 12-inch picture tube and a built-in aerial. Provision is made for the connection of an external record player.

The built-in aerial is mounted inside the cabinet, on the top. This aerial consists of a broad-band dipole of metal foil and a tuning and impedance-matching network. The aerial covers all channels, and is tuned for each channel by adjusting the AERIAL TUNING control located on the front of the receiver, near the top of the cabinet.

A 300-ohm line couples the tuning network to the aerial input terminals of TB1. This line may be disconnected from the aerial terminals so that an external aerial may be used, if required.

The radio-frequency section is built on a sub-chassis, and incorporates a 6AG5 tube as an r-f amplifier and a 7F8 tube as a mixer and oscillator.

Four 6AG5 tubes are used as video-i-f amplifiers, and a 6AL5 tube is used as a video detector and a-v-c rectifier. The rectified video signal is amplified by a 6AU6 video-amplifier stage and a 7C5 video-output stage.

The sound-i-f signal is taken from the cathode of the third video-i-f stage, and further amplification is obtained with a 6BA6 and a 6AU6. A 6AL5 tube is used as an FM detector, and a 6AU6 tube is employed as an audio amplifier, which drives a 6K6GT audio-output stage. Pin 6 of the socket for the audio-output tube supplies 160 volts which may be used for Philco Television Booster TB-2.

A portion of the composite video signal is taken from the video-output stage and is amplified by a sync pre-amplifier. A sync separator separates the sync pulses from the rest of the composite video signal. Another amplifier inverts these pulses to a positive polarity. The vertical-sync pulses are separated from the horizontal-sync pulses in an integrating network, and are applied to the grid of the vertical-blocking oscillator to control its frequency. The horizontal-sync pulses are applied to the grid of the phase comparer.

The vertical-sweep circuit consists of a conventional blocking oscillator and vertical output stage.

Horizontal-sweep voltage is generated by a blocking oscillator, the frequency of which is determined by the phase relationships of the horizontal-sync pulses and the horizontal sawtooth at the phase-comparer grid. A 6BG6G amplifies the horizontal sweep voltage, which is applied across a 6W4GT damper tube to the horizontal deflection coils.

Two 1B3GT rectifier tubes are used as a voltage doubler, to supply high voltage for the second anode of the picture tube. A 5U4G and a 7Z4 are employed as full-wave rectifiers, to supply plate and screen voltages for the entire chassis.

A 5-ampere fuse in the a-c power input and a 3.8-ampere B+ protective fuse are located in the high-voltage cage.

EXTERNAL-AERIAL CONNECTIONS

The external-aerial input circuit has provisions for either a single-aerial or a dual-aerial installation. For single external aerial installations, the aerial leadin is connected to the two-terminal terminal board, TB1, which is mounted at the left-hand rear corner of the chassis (facing the rear of the chassis).

To adapt the receiver for external dual-aerial operation, it is only necessary to clip the parallel conductor extending from TB1 into the tuner chassis (cut as close to the tuner chassis as possible); this prevents the length of parallel conductor from acting as a trap on the higher frequency channels. Using plug Part No. 27-4788, connect the low-frequency-aerial leadin to the two widely spaced pins, and the high-frequency-aerial leadin to the two closely spaced pins. Insert the plug into the aerial input receptacle, J1, which is located near the 7F8 tube.

The aerial input circuit is switched by means of a cam-operated switch, S2. The cam is operated by the shaft of the station-selector switch, and is so constructed that it places the switch in one position for Channels 2 through 6, and in another position for channels 7 through 13.

HORIZONTAL HOLD ADJUSTMENT

Ordinarily, the range of the HORIZ. HOLD control potentiometer is sufficient to compensate for normal variations and provide horizontal hold control. If, for some reason, such as replacement of tubes or components, it becomes necessary to make further hold adjustments, the following procedure is recommended:

1. Preset the adjustments as follows:
   a. Lockin trimmer C98A ½ turn counterclockwise from the maximum clockwise position.
   b. Range trimmer C98B 1½ turns counterclockwise from the maximum clockwise position.
   c. HORIZ. HOLD control to approximate center of its range.
2. Tune in a station, and adjust TC26 until the picture is brought into sync.
3. Adjust the CONTRAST control for normal contrast.
4. Turn the HORIZ. HOLD control fully clockwise.
5. Adjust TC26 until 8 to 10 stationary bars appear, sloping downward from the left side of the picture tube. If this cannot be accomplished, turn C98B another full turn counterclockwise, and repeat this step.
6. Turn the HORIZ. HOLD control counterclockwise until the picture is brought into sync; continue to rotate this control until the picture falls out of sync. In some cases, the picture will not go out of sync, even though the HORIZ. HOLD control is turned to its extreme counterclockwise position. If this is the case, momentarily short the aerial terminals. When the picture reappears, it will be out of sync.
7. Slowly turn the HORIZ. HOLD control clockwise, and note the change in the number of blanking bars appearing on the picture tube. The number of bars should decrease as sync is approached. Just before the picture falls into sync, there should be 3½ to 4½ bars sloping upward from the left side of the picture tube. If there are more than 4½ bars, turn C98A another ¼ turn clockwise, and repeat steps 4, 5, 6, and 7. If there are less than 3½ bars, turn C98A another ¼ turn counterclockwise, and repeat steps 4, 5, 6 and 7.

DEFLECT. CONTROL ADJUSTMENT

The DEFLECT. control, R128, is adjusted for optimum performance of the horizontal-sweep circuits, and normally requires no adjustment. If tubes or components in the horizontal-sweep circuit are replaced, however, it may be necessary to adjust the DEFLECT. control to obtain sufficient width.

REPLACEMENT OF 7F8 MIXER-OSCILLATOR TUBE

Whenever it becomes necessary to replace the 7F8 mixer-oscillator tube, several different tubes should be tried until one is found that will permit the FINE TUNING control to be set near the center of its range when the high-frequency channels are properly tuned. Otherwise it will be necessary to remove the chassis, whenever the tube is replaced, and adjust the oscillator tuning cores as directed in the R-F-TUNER ALIGNMENT procedure.

World Radio History

WAVEFORMS OF SYNC and SWEEP CIRCUITS

The waveforms in figure 1 are sized for clarity, and are not intended to illustrate relative amplitudes. Approximate peak-to-peak voltages are given in each case. These voltages are the approximate values when the CONTRAST control is adjusted to give 35 volts peak-to-peak, at the grid of the picture tube, and when all other controls are in their normal positions.

For viewing waveforms in the vertical sync and sweep circuits, adjust the oscilloscope sweep to 30 c.p.s. (one-half the vertical-sweep rate).

For viewing waveforms in the horizontal sync and sweep circuits, adjust the oscilloscope sweep to 7875 c.p.s. (one-half the horizontal sweep rate).

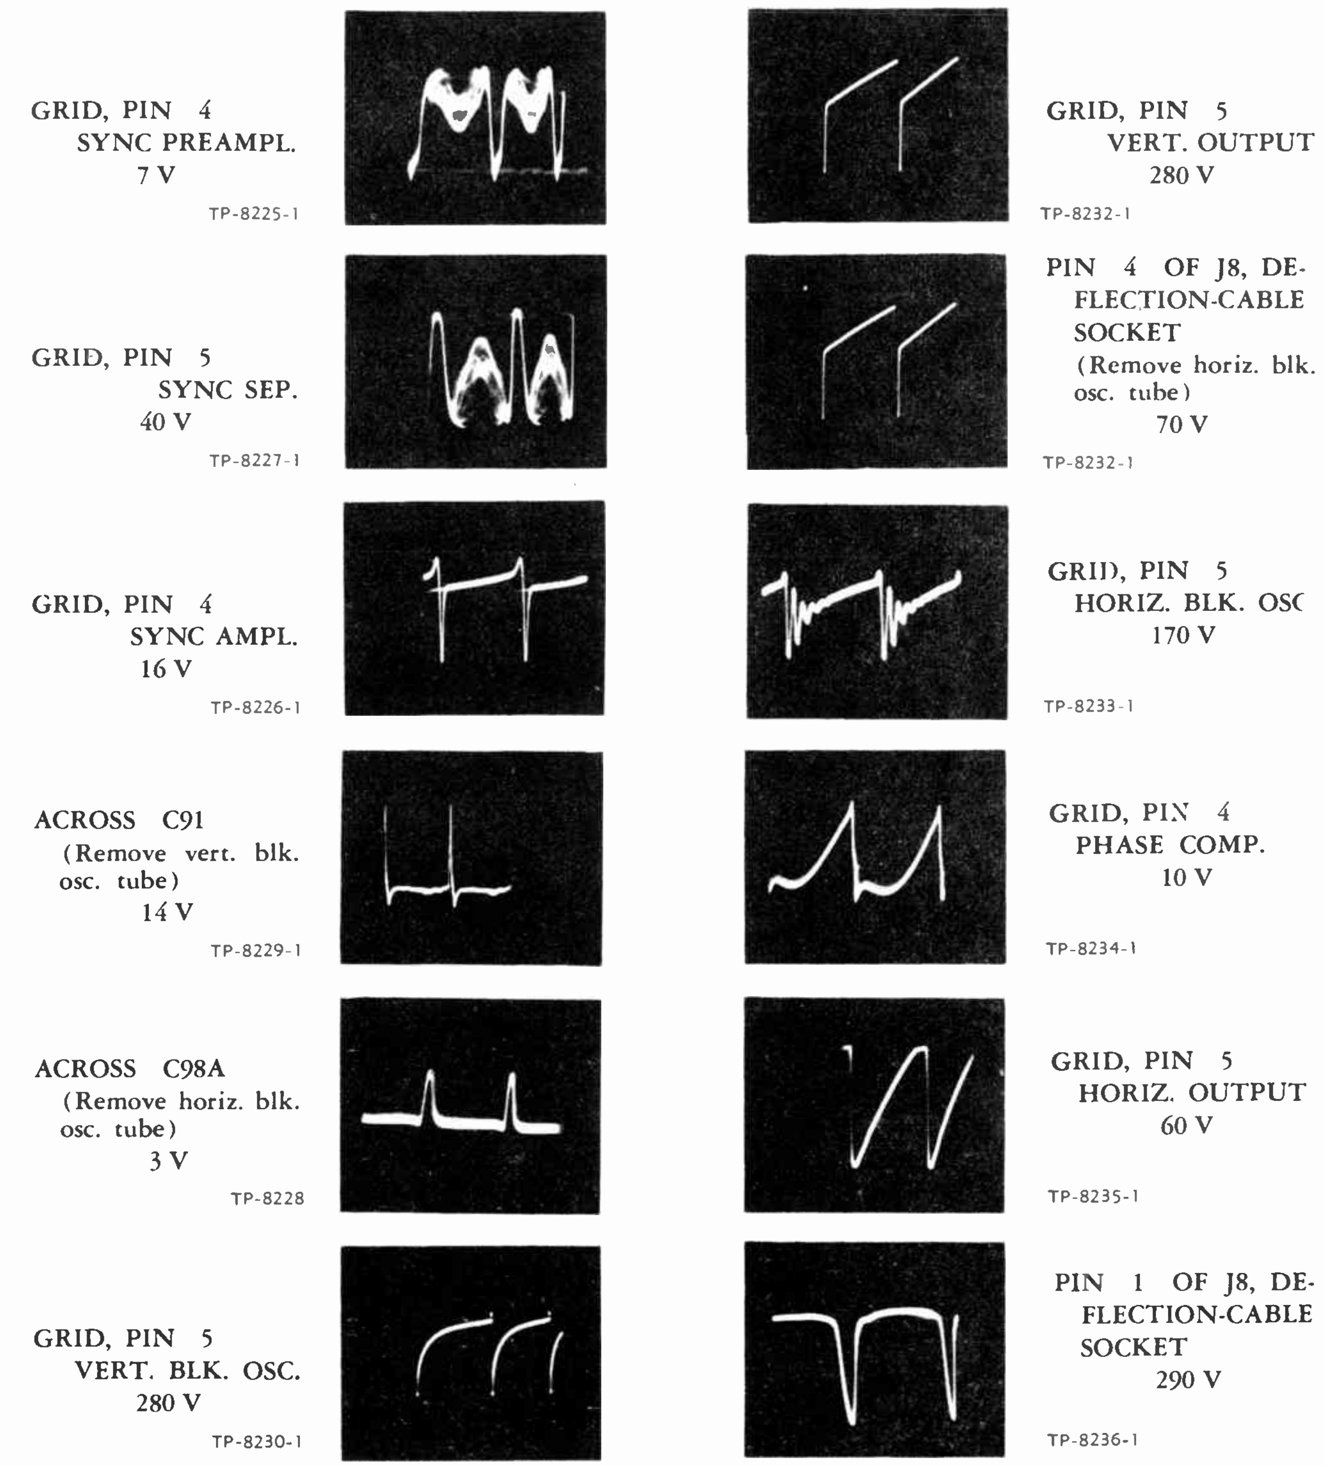

Figure 1. Sync and Sweep Waveforms

ALIGNMENT

WARNING! Dangerous potentials are present in the receiver when it is operating and for a short time after it has been turned off.

I-F ALIGNMENT

GENERAL

The intermediate frequencies for the receiver are 22.1 mc. for the sound channel and 26.6 mc. for the video channel. Alignment of circuits operating at these high frequencies requires careful workmanship and good equipment. The following precautions must be observed:

1. The top of the work bench must be metallic, and the test equipment and receiver chassis must make a good metal-to-metal contact with the bench top.

2. Never disconnect the picture tube, picture-tube yoke, or speaker while the receiver is turned on.

3. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.

4. When aligning the receiver, it is possible to achieve optimum adjustment of all tuning cores when the tops of the adjusting screws are approximately ¼ inch above the coil mounts, and also when the tops of the adjusting screws are approximately ¾ inch above the coil mounts. The tuning cores should be adjusted so that the tops of the adjusting screws are approximately ¾ inch above the coil mounts.

TEST EQUIPMENT REQUIRED

The following test equipment is recommended for aligning the i-f stages of the receiver:

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008, or equivalent.

2. A vacuum-tube voltmeter or a 20,000-ohms-per-volt voltmeter.

If separate signal generators and oscilloscope are used in place of Model 7008, these instruments should have the following characteristics:

FM Signal Generator
Deviation: ± 4 mc.
Center-frequency range: 20 mc. to 30 mc.
Sweep-sync output with either built-in or separate phase corrector.

AM Signal Generator
Carrier-frequency ranges: 4.5 mc. and 20 mc. to 30 mc.
Dial: Suitable for setting and resetting accurately to the frequencies specified in the I-F ALIGNMENT CHART.

Oscilloscope
Calibrated.
Vertical sensitivity: 1 volt (peak-to-peak) per inch, or better.

When using a separate AM r-f signal generator to obtain marker pips, couple the output lead of this generator to the output lead of the FM signal generator, using just sufficient coupling to obtain a suitable marker pip.

JIGS REQUIRED

Mixer Jig

Figure 2 shows a jig that is recommended for coupling the signal generator to the mixer grid, to provide short connections and good grounding. The following parts are necessary for the construction of this jig:

1. Hairpin (commonly called "bobby pin"), straight type, approximately 1¾ inches long.

2. 1-inch length of ⅛-inch-diameter spaghetti.

3. 2-inch length of No. 12 or No. 13 bus wire.

Referring to figure 2, construct the jig as follows:

1. File the enamel from the inside of the prongs of the hairpin (point B).

2. Bend the tips of the prongs (point A) out at a slight angle.

3. Form the prongs at a point ⅜ inch from the tips as shown at point B.

4. Slightly pinch the end of the hairpin at point C.

I-F ALIGNMENT CHART

STEP	SIGNAL-GENERATOR CONNECTION	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR SETTING	ADJUSTMENT INSTRUCTIONS
1	Connect output of AM signal generator through i-f jig to grid (pin 1) of 4th video-i-f tube.	Connect vertical input of oscilloscope through ALIGN TEST jack adaptor (figure 4) to ALIGN TEST jack J4.	Set AM signal generator (modulated) to 25.5 mc.	Adjust TC21 for maximum indication on oscilloscope.
2	Connect output of AM signal generator through i-f jig to grid (pin 1) of 3rd video-i-f tube.	Same as step 1.	Set AM signal generator (modulated) to 24.5 mc.	Adjust TC20 for maximum indication on oscilloscope.
3	Same as step 2.	Same as step 1.	Set AM signal generator (modulated) to 25 mc.	Adjust TC18 for maximum indication on oscilloscope.
4	Connect output of AM signal generator through i-f jig to grid (pin 1) of 2nd video-i-f tube.	Same as step 1.	Set AM signal generator (modulated) to 26.6 mc.	Adjust TC17 for maximum indication on oscilloscope.
5	Connect output of AM signal generator through i-f jig to grid (pin 1) of 1st video-i-f tube.	Same as step 1.	Set AM signal generator (modulated) to 23.25 mc.	Adjust TC16 for maximum indication on oscilloscope.
6	Connect output of AM signal generator through mixer jig to grid (pin 1) of mixer tube.	Same as step 1.	Set AM signal generator (modulated) to 28.1 mc. (See Note 1.)	Turn CHANNEL SELECTOR to Channel 3. Adjust TC14 for minimum indication on oscilloscope.
7	Same as step 6.	Same as step 1.	Set AM signal generator (modulated) to 22.1 mc. (See Note 1.)	Turn CHANNEL SELECTOR to Channel 3. Adjust TC23 for minimum indication on oscilloscope. If no minimum is apparent, turn TC23 counterclockwise until the response increases rapidly. Turn TC23 clockwise to the point just before the response increases; then adjust TC19 for minimum indication on oscilloscope.
8	Same as step 6.	Same as step 1.	Set AM signal generator (modulated) to 24.25 mc.	Adjust TC13 for maximum indication on oscilloscope
9	Connect outputs of AM and FM signal generators through mixer jig to grid (pin 1) of mixer tube.	Same as step 1.	Set FM signal generator to 25 mc., ± 4 mc. deviation. Set AM signal generator (unmodulated) to 23.25 mc., 23.5 mc., 25.75 mc., and 26.6 mc., as required, to produce marker pips.	Turn CHANNEL SELECTOR to Channel 3. Adjust TC15 for response curve within limits of curve in figure 5. It may be necessary to readjust TC13, TC15, TC16, TC17, TC20, TC18, and TC21 in order to obtain this curve. (See Note 2.)

5. File the enamel from the end of the hairpin at point C.

6. Slip the spaghetti over the hairpin.

7. Bend the bus wire as shown at point D.

Looking at the chassis from the side, with the operating controls to the left, two holes will be seen on the side of the r-f tuner. The top hole is opposite the plate of C13, which connects directly to the mixer grid.

To use the jig, insert the prong end into the hole opposite C13 until it snaps over the trimmer plate.

Loosen the self-tapping screw which holds the front end of the tuner shield. Slip the hook end of the bus wire under the screw head and retighten screw. Connect the ground lead of the signal generator to the short length of bus wire, and the hot lead to the end of the hairpin.

I-F Jig

It is recommended that Philco I-F Alignment Jig, Part No. 45-1670, be used to couple the signal generator to the various video-i-f grids. The connections to these grids are accessible from the top of the chassis through small holes near the tube shields. To use the jig, slip the clamp over the tube shield, and insert the probe end into the hole. Slide the jig downward until good contact is made with the grid connection. Philco Cable, Part No. 45-1635, provides a convenient method of connecting the signal generator to the i-f jig.

I-F ALIGNMENT PROCEDURE

Before proceeding with the i-f alignment, the following preliminary instructions should be observed:

1. Insert a 10,000-ohm resistor in series with the oscilloscope lead.

2. If additional attenuation of the marker signal is required when using Visual Alignment Generator Model 7008, insert a 10,000-ohm resistor in series with the output lead.

3. Preset the television-receiver controls as follows:
   a. CONTRAST control fully counterclockwise.
   b. VOLUME control for an audible signal.
   c. BRIGHTNESS control to give a dim raster.
   d. FINE TUNING control to the center of its range.

4. Preset the television-receiver tuning cores and trimmer condensers as follows:
   a. C115A and C115B fully clockwise.
   b. TC15 fully counterclockwise.
   c. TC19, TC18, and TC23 until the top of the adjusting screw is approximately ⅝ inch from the top of the coil mount.

5. During alignment, attenuate the signal-generator output to keep the output at the ALIGN TEST jack below 2 volts, peak-to-peak, and the output at the FM TEST jack below .5 volt, peak-to-peak.

The i-f stages of the receiver should be aligned according to the instructions given in the I-F ALIGNMENT CHART.

World Radio History

I-F ALIGNMENT CHART (Cont.)

STEP	SIGNAL-GENERATOR CONNECTION	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR SETTING	ADJUSTMENT INSTRUCTIONS
10	Same as step 9.	Connect vertical input of oscilloscope to pin 3 of FM TEST jack J3.	Set FM signal generator to 22.1 mc., ± 1 mc. deviation. Set AM signal generator (modulated) to 22.1 mc.	Adjust C115A and C115B slightly counterclockwise until indication is observed on oscilloscope.
11	Same as step 9.	Same as step 10.	Same as step 10.	Adjust TC25 for minimum amount of AM indication. (See Note 3.) Adjust TC24 for symmetrical pattern (equal peaks) within limits of curve in figure 6.
12	Connect output of FM signal generator through mixer jig to grid (pin 1) of mixer tube.	Same as step 10.	Set FM signal generator to 22.1 mc., ± 1 mc. deviation.	Adjust C115A and C115B for maximum peaks and symmetry of pattern
13	Connect output of AM signal generator through mixer jig to grid (pin 1) of mixer tube.	Connect vertical input of oscilloscope through ALIGN TEST jack adaptor (figure 4) to ALIGN TEST jack J4. Connect v.t.v.m. (0—10-volt range) through FM TEST jack adaptor (figure 7) to FM TEST jack J3.	Set AM signal generator (modulated) to 22.1 mc. (minimum indication on oscilloscope).	When indication on oscilloscope is minimum, v.t.v.m reading should be zero. If reading is not zero, adjust TC25. If adjustment requires more than one-half turn, repeat step 11.
14	Connect output of AM signal generator to pin 3 of ALIGN TEST jack J4.	Connect vertical input of oscilloscope across the d-c-restorer load resistor R47.	Set AM signal generator (modulated) for a strong 4.5-mc. output.	Adjust TC22 for minimum indication on oscilloscope.

NOTE 1: When adjusting TC14, TC23, and TC19, the vertical gain control of the oscilloscope should be set at maximum, and the input signal should be as low as possible.

NOTE 2: If readjustment of the tuning cores is necessary to obtain a response curve within the limits of figure 5, the following information may be used to find the adjustment required:
- TC15 affects the position of the carrier and the high-frequency slope.
- TC13 affects the low-frequency slope.
- TC16 affects the amplitude and low-frequency slope.
- TC17 affects the band width and carrier setting.
- TC20 affects the flat-top response.
- TC18 affects the amplitude of the high-frequency slope.
- TC21 affects the high-frequency slope.
- TC14, TC19, and TC23 should not be readjusted.

NOTE 3: The AM signal will appear as a series of sine waves superimposed on the FM-detector curve.

R-F TUNER ALIGNMENT

GENERAL

The r-f tuner is aligned at the factory and normally needs no adjustment other than fine tuning. However, under certain conditions, such as the replacement of tubes, it may be necessary to touch up the adjustments.

TEST EQUIPMENT REQUIRED

The following test equipment is recommended for aligning the tuner:

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008, or equivalent.
2. A vacuum-tube voltmeter o- a 20,000-ohms-per-volt voltmeter.

If separate signal generators and oscilloscope are used in place of Model 7008, these instruments should have the following characteristics:

FM Signal Generator
- Deviation: ± 7 mc.
- Center-frequency ranges: 50 mc. to 64 mc. and 206 mc. to 220 mc.
- Sweep-sync output with either built-in or separate phase corrector.

AM Signal Generator
- Carrier-frequency range: 50 mc. to 220 mc.
- Dial: Suitable for setting and resetting accurately to frequencies between 50 mc. and 220 mc.

Oscilloscope
- Calibrated
- Vertical sensitivity: 1 volt (peak-to-peak) per inch, or better.

TUNER ALIGNMENT PROCEDURE

For aligning the tuner, the outputs of the signal generators should be connected to the aerial input terminals, through the matching network shown in figure 8. The resistors should be chosen carefully to obtain values close to those indicated. In cases where an installation uses two aerials, it will be necessary to connect the signal generators to the appropriate aerial input terminals of J1.

To adjust the band width and r-f response of the tuner, proceed as follows:

1. Connect the outputs of the AM and FM signal generators through the aerial-matching network (figure 8) to the appropriate aerial input terminals for Channel 2.
2. Connect the oscilloscope to the TUNER TEST jack, J2.
3. Turn the CHANNEL SELECTOR to Channel 2.
4. Insert a piece of solder into the hole that is adjacent to tuning core TC13. Allow the solder to make contact with the chassis and the lug located under the hole.
5. Set the FM signal generator to 55 mc., ± 7 mc. deviation.
6. Set the AM signal generator (unmodulated) to 54 mc. and 60 mc., as required, to produce marker pips on the response curve.
7. Adjust C114 for a band width of 6 mc. to 14 mc. between the two points that are 70% of the maximum amplitude of the response curve. (See figure 9.)
8. Turn the CHANNEL SELECTOR to Channel 6.
9. Set the FM signal generator to 85 mc., ± 7 mc. deviation.
10. Adjust C1 for maximum output and symmetry of curve.
11. Turn the CHANNEL SELECTOR to Channel 13.
12. Set the FM signal generator to 213 mc., ± 7 mc. deviation.
13. Adjust C2 and C13 for maximum output and symmetry of curve.

The local oscillator should be adjusted as follows:

1. Connect the voltmeter through the FM TEST jack adaptor (figure 7) to the FM TEST jack.
2. Set the CHANNEL SELECTOR to Channel 2.
3. Set the FINE TUNING control to the center of its range.
4. Connect an accurately-calibrated AM signal generator through the aerial-matching network (figure 8) to the aerial input terminals, and set the signal generator to the sound-carrier frequency of Channel 2.
5. Adjust the oscillator tuning core for Channel 2 until a zero reading is obtained on the voltmeter.
6. Repeat the above steps for Channels 3 through 13. In each case use the appropriate signal-generator setting and CHANNEL SELECTOR setting, and adjust the oscillator tuning core for the proper channel.

C70	Condenser, electrolytic, 4-section	30-2570-10
C70A	Condenser, decoupling, 10 µf., 475v	Part of C70
C70B	Condenser, screen by-pass, 10 µf., 475v	Part of C70
C70C	Condenser, l-f compensating, 10 µf., 475v	Part of C70
C71	Condenser, fixed trimmer, 56 µµf.	62-056409001*
C72	Condenser, d-c blocking, .1 µf.	45-3505-47*
C73	Condenser, cathode by-pass, .5 µf.	61-0137*
C74	Condenser, d-c blocking, .047 µf.	45-3505-28*
C75	Condenser, d-c blocking, .0047 µf.	45-3505-56*
C76	Condenser, line filter, .01 µf.	45-3505-41*
C77	Condenser, line filter, .01 µf.	45-3505-41*
C78	Condenser, electrolytic, input filter, 30 µf., 475v	30-2568-19
C79	Condenser, electrolytic, input filter, 30 µf., 475v	30-2568-19
C80	Condenser, electrolytic 4-section	30-2570-8*
C80A	Condenser, filter, 40 µf., 475v	Part of C80
C80B	Condenser, decoupling, 10 µf., 475v	Part of C80
C80C	Condenser, filter, 20 µf., 475v	Part of C80
C81	Condenser, bias filter, .1 µf.	45-3505-36*
C82	Condenser, d-c blocking, .047 µf.	45-3505-45*
C83	Condenser, d-c blocking, 330 µµf.	60-10335407*
C84	Condenser, video filter, 22 µµf.	62-022009001*
C85	Condenser, electrolytic, 3-section	30-2570-13
C85A	Condenser, decoupling, 10 µf., 475v	Part of C85
C85B	Condenser, decoupling, 10 µf., 475v	Part of C85
C85C	Condenser, decoupling, 10 µf., 475v	Part of C85
C86	Condenser, d-c blocking .047 µf.	61-0122*
C87	Condenser, video filter, 220 µµf.	62-122001001*
C88	Condenser, cathode by-pass, .082 µf.	30-4651-3
C89	Condenser, integrating, .0022 µf.	45-3505-54*
C90	Condenser, integrating, .0047 µf.	45-3505-56*
C91	Condenser, integrating, .0047 µf.	45-3505-56*
C92	Condenser, electrolytic, 3-section	30-2570-16*
C92A	Condenser, decoupling, 10 µf., 450v	Part of C92
C92B	Condenser, decoupling, 10 µf., 450v	Part of C92
C92C	Condenser, cathode by-pass, 40 µf., 50v	Part of C92
C93	Condenser, d-c blocking .0047 µf.	45-3505-56*
C94	Condenser, sweep charging, .068 µf.	45-3501*
C95	Condenser, d-c blocking, .1 µf.	45-3505-47*

Reference Symbol	Description	Service Part No.
C96	Condenser, d-c blocking, 150 µµf.	60-10155407*
C97	Condenser, voltage divider, 180 µµf.	30-1220-30*
C98	Condenser, 3-section trimmer	31-6477-2
C98A	Condenser, horizontal lock-in	Part of C98
C98B	Condenser, horizontal-oscillator range	Part of C98
C99	Condenser, d-c blocking, .0022 µf.	45-3505-54*
C100	Condenser, plate by-pass, .047 µf.	45-3505-45*
C101	Condenser, cathode by-pass, .02 µf.	61-6108*
C102	Condenser, filter, .22 µf.	45-3505-49*
C103	Condenser, horizontal feedback, 5 µµf.	60-90505007*
C104	Condenser, d-c blocking, 270 µµf.	60-10275407*
C105	Condenser, sweep charging, 1500 µµf.	60-20155314*
C106	Condenser, d-c blocking, 390 µµf.	60-10395407*
C107	Condenser, screen by-pass, .047 µf.	45-3505-62*
C108	Condenser, horizontal shaping, .047 µf.	45-3505-62*
C109	Condenser, horizontal shaping, .047 µf.	45-3505-62*
C110	Condenser, d-c blocking, .47 µf.	61-0133*
C111	Condenser, d-c blocking, 500 µµf.	30-1229-2
C112	Condenser, voltage doubling, 500 µµf.	30-1229-2
C113	Condenser, voltage doubling, 500 µµf.	30-1229-2
C114	Condenser, r-f plate trimmer	Part of 76-4402-5
C115A	Condenser, primary trimmer	Part of Z1
C115B	Condenser, secondary trimmer	Part of Z1
C116	Condenser, filament by-pass, 1500 µµf.	62-215001011*
C117	Condenser, filter, .0022 µf.	45-3505-54*
C118	Condenser, shaping, .047 µf.	45-3505-62*
C119	Condenser, AERIAL TUNING control	31-6518
C120	Condenser, cathode by-pass, 470 µµf.	Part of 76-4402-5
F1	Fuse, a-c line, 5 amperes	45-2656-11
F2	Fuse, B+ protective, 5/8 ampere	45-2656-10
J1	Socket, aerial input	Part of 76-4402-5
J2	Jack, TUNER TEST	Part of 76-4402-5
J3	Jack, FM TEST	27-6126
J4	Jack, ALIGN TEST	27-3772-6
J5	Socket, speaker	27-6214-1
J6	Jack, phono input	27-6126
J7	Socket, power	27-6240
J8	Socket, deflection cable	27-6180
J9	Socket and cable ass'y, picture tube	41-3860-1
L1 through L11	Coil, r-f plate	Part of 76-4402-5
L12 through L22	Coil, mixer grid	Part of 76-4402-5
L23 through L34	Coil, oscillator tank	Part of 76-4402-5
L35	Coil, r-f choke	Part of 76-4402-5
L36	Coil, 1st sound-i-f autotransformer	32-4303
L37	Coil, primary	Part of Z1
L38	Coil, secondary	Part of Z1
L39	Coil, primary	Part of Z2
L40	Coil, tertiary	Part of Z2
L41	Coil, secondary	Part of Z2
L42	Coil, r-f choke	32-4112-15
L43	Coil, HORIZ. LIN.	32-4211
L44	Coil, mixer-plate tank	Part of 76-4402-5
L45	Coil, adjacent-sound trap	32-4234-4
L46	Coil, 1st v-i-f grid tank	32-4233-4
L47	Coil, 1st v-i-f plate tank	32-4359
L48	Coil, 2nd v-i-f plate tank	32-4359
L49	Coil, 3rd v-i-f plate tank	32-4234-1
L50	Coil, accompanying-sound trap	32-4233-7
L51	Coil, 4th v-i-f grid tank	32-4233-2
L52	Coil, 4th v-i-f tank	32-4234-1
L53	Coil, series peaking	32-4143
L54	Coil, 4.5-mc. trap	32-4155
L55	Coil, shunt peaking	32-4143-2
L56	Coil, series peaking	32-4143
L57	Coil, B+ isolating	32-4112-11
L58	Coil, B+ isolating	32-4112-11

Reference Symbol	Description	Service Part No.
L59	Coil, r-f choke	32-4112-15
L60	Coil, r-f choke	32-4112-15
L61	Coil, r-f choke	32-4112-15
L62	Coil, filter choke	32-8399
L63	Coil, filter choke	32-8355-1
L64	Coil, focus	Part of Z3
L65	Coil, vertical deflection	Part of Z4
L66	Coil, horizontal deflection	Part of Z4
L67	Coil, WIDTH	32-4419-1
L68	Coil, r-f choke	32-4112-11
L69	Coil, series peaking, 40 µh.	32-4143
L70	Coil, r-f choke	32-4112-15
L71	Coil, r-f choke	32-4112-11
LS1	Speaker, p-m	36-1629-2
PL1	Plug, power	27-6240
PL2	Plug, speaker	27-4788
PL3	Plug-and-cable assembly, deflection	41-3860
R1	Resistor, aerial loading, 10,000 ohms	Part of 76-4402-5
R2	Resistor, grid return, 330 ohms	Part of 76-4402-5
R3	Resistor, a-v-c decoupling, 10,000 ohms	Part of 76-4402-5
R4	Resistor, cathode bias, 100 ohms	Part of 76-4402-5
R5	Resistor, plate feeding, 3300 ohms	Part of 76-4402-5
R6	Resistor, loading, 6800 ohms	Part of 76-4402-5
R7	Resistor, grid return, 100,000 ohms	Part of 76-4402-5
R8	Resistor, grid return, 10,000 ohms	Part of 76-4402-5
R9	Resistor, damping, 15,000 ohms	Part of 76-4402-5
R10	Resistor, decoupling, 3300 ohms	Part of 76-4402-5
R11	Resistor, terminating, 15,000 ohms	66-3158340*
R12	Resistor, damping, 15,000 ohms	66-3158340*
R13	Resistor, a-v-c decoupling, 3300 ohms	66-2338340*
R14	Resistor, cathode bias, 68 ohms	66-0688340*
R15	Resistor, B+ decoupling, 330 ohms	66-1338340*
R16	Resistor, grid return, 5600 ohms	66-2568340*
R17	Resistor, a-v-c decoupling, 3300 ohms	66-2338340*
R18	Resistor, cathode bias, 120 ohms	66-1128340*
R19	Resistor, grid return, 5600 ohms	66-2568340*
R20	Resistor, a-v-c decoupling, 3300 ohms	66-2338340*
R21	Resistor, cathode bias, 68 ohms	66-0688340*
R22	Resistor, damping, 5600 ohms	66-2568340*
R23	Resistor, terminating, 5100 ohms	66-2518340*
R24	Resistor, cathode bias, 100 ohms	66-1108340*
R25	Resistor, plate feed, 5600 ohms	66-2568340*
R26	Resistor, B+ decoupling, 1000 ohms	66-2108340*
R27	Resistor, r-f decoupling, 27,000 ohms	66-3278340*
R28	Resistor, a-v-c load, 120,000 ohms	66-4128340*
R29	Resistor, video-detector load, 3300 ohms	66-2338340*
R30	Resistor, grid return, 1 megohm	66-5108340*
R31	Resistor, cathode bias, 120 ohms	66-1124340*
R32	Resistor, damping, 47,000 ohms	66-3478340*
R33	Resistor, screen dropping, 10,000 ohms	66-3104340*
R34	Resistor, plate load, 2700 ohms	66-2274340*
R35	Resistor, grid return, 470,000 ohms	66-4478340*
R36	Resistor, limiting, 47 ohms	66-0478340*
R37	Potentiometer, BRIGHTNESS control, 100,000 ohms	33-5539-43
R38	Resistor, limiting, 100,000 ohms	66-4108340*
R39	Resistor, screen dropping, 68,000 ohms	66-3684340*
R40	Resistor, plate load, 2500 ohms	33-1335-87
R41	Resistor, plate load, 470 ohms	66-1474340*
R42	Resistor, B+ decoupling, 10,000 ohms	66-3105340*
R43	Resistor, l-f compensation, 1000 ohms	66-2104340*
R44	Resistor, damping, 27,000 ohms	66-3278340*
R45	Resistor, isolating, 10,000 ohms	66-3108340*
R46	Resistor, grid return, 470,000 ohms	66-4478340*
R47	Resistor, d-c restorer load, 1 megohm	66-5108340*
R48	Resistor, a-v-c filter, 10,000 ohms	66-3108340*
R49	Resistor, grid return, 470,000 ohms	66-4478340*
R50	Resistor, cathode bias, 68 ohms	66-0688340*
R51	Resistor, bleeder, 18,000 ohms, 10 watts	33-1335-85

Reference Symbol	Description	Service Part No.
R52	Resistor, B+ decoupling, 1000 ohms	66-2108340*
R53	Resistor, B+ decoupling, 330 ohms	66-1338340*
R54	Resistor, grid return, 68,000 ohms	66-3688340*
R55	Resistor, voltage divider, 22,000 ohms	66-3228340*
R56	Resistor, B+ dropping, 10,000 ohms	66-3108340*
R57	Resistor, decoupling, 47 ohms	66-0478340*
R58	Resistor, filament dropping, 4.7 ohms	66-9478340*
R59	Resistor, bass compensating, 47,000 ohms	66-3478340*
R60	Resistor, decoupling, 10,000 ohms	66-3108340*
R61	Resistor, detector load, 47,000 ohms	66-3478340*
R62	Potentiometer, VOLUME control, 2 megohms, tapped at 1 megohm	33-5564-1
R63	Resistor, grid return, 4.7 megohms	66-5478340*
R64	Resistor, screen dropping, 560,000 ohms	66-4564340*
R65	Resistor, plate load, 47,000 ohms	66-3474340*
R66	Resistor, grid return, 1 megohm	66-5108340*
R67	Resistor, cathode bias, 560 ohms	66-1564340*
R68	Resistor, B+ decoupling, 1900 ohms	33-3435-15
R69	Resistor, limiting, 56 ohms	66-0568340*
R70	Resistor, voltage divider, 220,000 ohms	66-4224340*
R71	Potentiometer, FOCUS control, 500 ohms	33-5547-5
R72	Resistor, bias divider, 12 ohms	66-0125340*
R73	Resistor, bias divider, 12 ohms	66-0125340*
R74	Resistor, bias filter, 47,000 ohms	66-3478340*
R75	Resistor, B+ dropping, 5600 ohms	66-2564340*
R76	Resistor, B+ dropping, 5600 ohms	66-2564340*
R77	Resistor, B+ dropping, 5600 ohms	66-2564340*
R78	Resistor, B+ decoupling, 270 ohms	66-1274340*
R79	Resistor, grid return, 470,000 ohms	66-4478340*
R80	Resistor, plate load, 10,000 ohms	66-3104340*
R81	Resistor, B+ decoupling, 5100 ohms	33-1335-18
R82	Resistor, grid return, 4.7 megohms	66-5478340
R83	Resistor, video filter, 10,000 ohms	66-3108340*
R84	Resistor, voltage divider, 3300 ohms	66-2338340*
R85	Resistor, voltage divider, 6800 ohms	66-2688340*
R86	Resistor, plate load, 56,000 ohms	66-3564340
R87	Resistor, decoupling, 100,000 ohms	66-4108340*
R88	Resistor, integrating, 8200 ohms	66-2828340*
R89	Resistor, integrating, 8200 ohms	66-2828340*
R90	Resistor, integrating, 22,000 ohms	66-3228340*
R91	Resistor, limiting, 1 megohm	66-5108340*
R92	Potentiometer assembly, dual	33-5563-3
R92A	Potentiometer, VERT. HOLD control, 1 megohm	
R92B	Potentiometer, HORIZ. HOLD. control, 50,000 ohms	
R93	Resistor, limiting, 100,000 ohms	66-4108340*
R94	Resistor, grid limiting, 68,000 ohms	66-3688340*
R95	Resistor, grid limiting, 10,000 ohms	66-3108340*
R96	Potentiometer, HEIGHT control, 2.5 megohms	33-5565-10
R97	Resistor, limiting, 10,000 ohms	66-3108340*
R98	Resistor, sweep charging, 470,000 ohms	66-4474340*
R99	Resistor, sweep shaping, 3900 ohms	66-2398340*
R100	Resistor, grid return, 2.2 megohms	66-4228340*
R101	Resistor, limiting, 1000 ohms	66-2108340*
R102	Potentiometer, VERT. LIN. control, 5000 ohms	33-5546-10
R103	Resistor, damping, 1000 ohms	Part of Z4
R104	Resistor, damping, 1000 ohms	Part of Z4
R105	Resistor, grid return, 1 megohm	66-5108340*
R106	Resistor, video filter, 4700 ohms	66-2478340*
R107	Resistor, cathode bias, 1200 ohms	66-2124340*
R108	Resistor, plate load, 10,000 ohms	66-3108340*
R109	Resistor, plate load, 3900 ohms	66-2398340*
R110	Resistor, B+ decoupling, 33,000 ohms	66-3334340*
R111	Resistor, grid return, 560,000 ohms	66-4568340*
R112	Resistor, filter, 8200 ohms	66-2828340*
R113	Resistor, filter, 180,000 ohms	66-4188340*
R114	Resistor, grid return, 100,000 ohms	66-4108340*
R115	Resistor, cathode return, 100,000 ohms	66-4108340*
R116	Resistor, grid filter, 3.3 megohms	66-5338340

MODEL 50-T1443, Code 122

REPLACEMENT PARTS LIST (Cont.)

Reference Symbol	Description	Service Part No.
R117	Resistor, damping, 10,000 ohms	66-3108340*
R118	Resistor, sweep charging, 68,000 ohms	66-3688340*
R119	Resistor, sweep feedback, 220,000 ohms	66-4228340*
R12C	Resistor, sweep feedback, 560,000 ohms	66-4568340*
R121	Resistor, B+ decoupling, 10,000 ohms	66-3108340*
R122	Resistor, voltage divider, 82,000 ohms	66-3824340*
R123	Resistor, tempeiature compensating, 42,000 ohms	33-1342-2
R124	Resistor, parasitic suppressor, 100 ohms	66-1108340*
R125	Resistor, grid return, 330,000 ohms	66-4334340*
R126	Resistor, cathode bias, 100 ohms	66-1105340*
R127	Resistor, screen dropping, 3900 ohms	66-2395340*
R128	Potentiometer, DEFLECT. control, 10,000 ohms	33-5546-18
R129	Resistor, diode return, 2 megohms	33-1338
R130	Resistor, isolating, 1000 ohms	66-2108340*
R131	Resistor, damping, 15,000 ohms	66-3158340*
R132	Resistor, shaping, 820,000 ohms	66-4828340*
R133	Resistor, decoupling, 3300 ohms	66-2338340*
R134	Resistor, cathode bias, 330 ohms	Part of 76-4402-5
R135	Resistor, beat suppressor, 330 ohms	66-1338340*
R136	Potentiometer, CONTRAST control 2000 ohms	33-5546-33
S1	Switch, power OFF-ON	Part of R62
S2	Switch, aerial	Part of 76-4402-5
S2A	Switch, aerial primary	Part of S2
S2B	Switch, aerial grounding	Part of S2
S2C	Switch, aerial secondary	Part of S2
S3	Switch, PHONO-TELEVISION	42-1893-1
S3A	Switch, audio switching	Part of S3
S3B	Switch, sweep disabling	Part of S3
T1	Transformer, l-f aerial input	Part of 76-4402-5
T2	Transformer, h-f aerial input	Part of 76-4402-5
T3	Transformer, r-f	Part of 76-4402-5
T4	Transformer, power	32-8391
T5	Transformer, audio output	32-8356
T6	Transformer, vertical blocking oscillator	32-8304-3
T7	Transformer, horizontal blocking oscillator	32-4367
T8	Transformer, horizontal-sweep output	32-8398-1
T9	Transformer, vertical-sweep output	32-8405-1
TB1	Terminal board, aerial input	Part of 76-4402-5
TC1 through TC12	Tuning core, oscillator	Part of 76-4402-5
TC13	Tuning core	Part of L44
TC14	Tuning core	Part of L45
TC15	Tuning core	Part of L46
TC16	Tuning core	Part of L47
TC17	Tuning core	Part of L48
TC18	Tuning core	Part of L49
TC19	Tuning core	Part of L50
TC20	Tuning core	Part of L51
TC21	Tuning core	Part of L52
TC22	Tuning core	Part of L54
TC23	Tuning core	Part of L36
TC24	Tuning core	Part of L39
TC25	Tuning core	Part of L41
TC26	Tuning core	Part of T7
TC27	Tuning core	Part of L67
TC28	Tuning core	Part of L43
TL1	Transformer assembly, line	Part of Z5
W1	Line-cord-and-plug assembly	41-3865

Philco Model 50-T1443, Code 123, is a consolette-type television receiver with a 12-inch picture tube, a wide mask, and a built-in aerial. Provision is made for the connection of an external aerial, if required. For service information on this model, use Philco Service Manual PR-1774 in conjunction with this supplement.

The cabinet, built-in aerial, and aerial-tuning network of Model 50-T1443, Code 123, are identical to those of Model 50-T1443, Code 122. The chassis is similar to the chassis of Model 50-T1443, Code 122, but has a different tuner unit and minor circuit changes. The schematic diagram of the new tuner unit is shown in figure 2. Other circuit differences between the two codes are as follows:

1. R133 is changed from 3300 ohms to 330 ohms, Part No. 66-1338340.

2. A 470-$\mu\mu f$. condenser, Part No. 62-147001001, is added between the a-v-c lead to the tuner and ground.

3. C80B, R75, R76, and R77 are removed.

4. Pin 6 of the audio-output tube is connected to pin 4 instead of the 150-volt B+ supply. This connection supplies a higher voltage at pin 6 for Philco Booster TB-2.

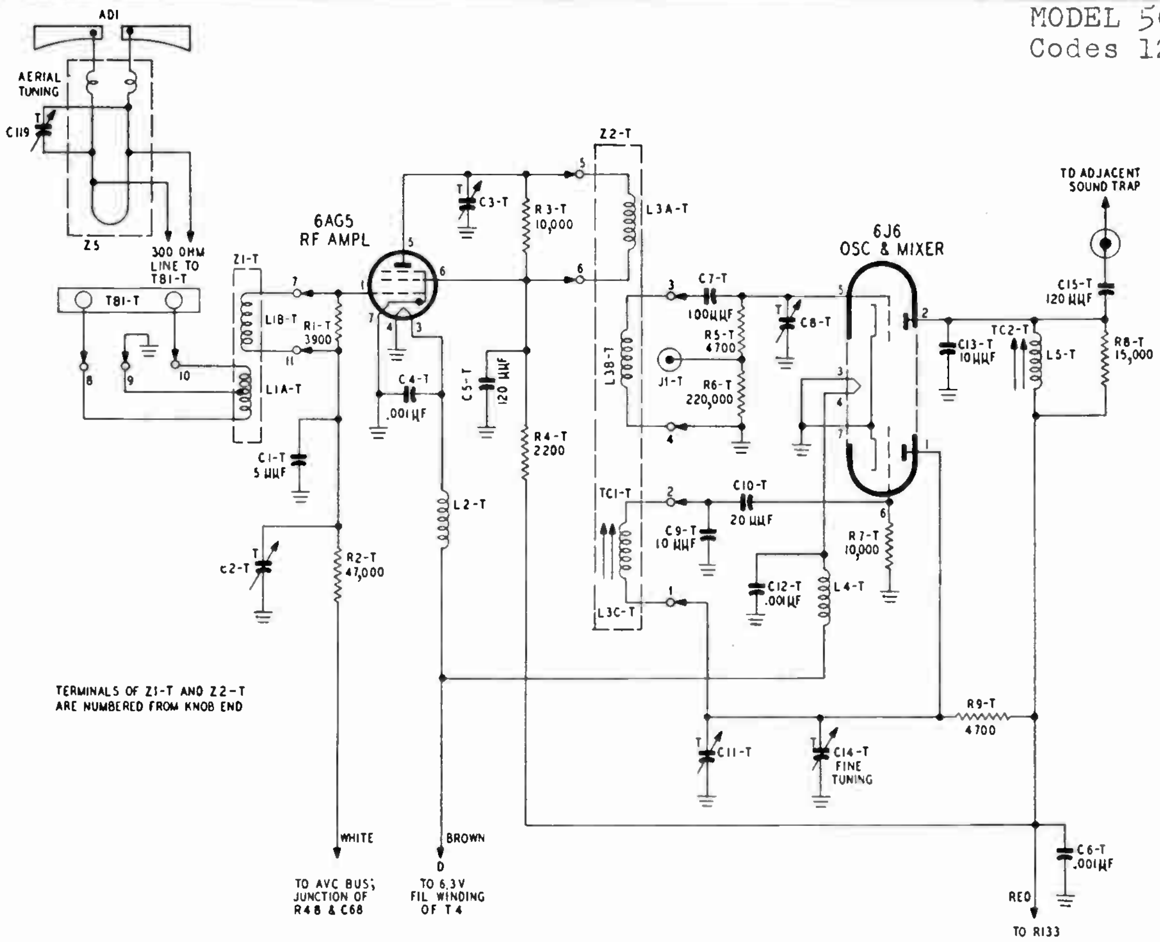

Figure 2. Tuner Unit for Model 50-T1443, Code 123, Schematic Diagram

CHECKING AND ADJUSTING THE BUILT-IN-AERIAL TUNING NETWORK

By rotating the AERIAL TUNING control, it should be possible to tune the built-in aerial system to resonance with the video carrier frequency of each channel except Channel 6. For Channel 6 a resonant condition should be approached.

To check the built-in aerial system, use the following procedure:

1. Connect a dipole through a 72-ohm coaxial cable to the output of an AM signal generator having a band range that covers the television channels.

2. Connect a 20,000-ohms-per-volt voltmeter to pin 3 of the ALIGN TEST jack, J4.

3. Set the CHANNEL SELECTOR to Channel 2, and the FINE TUNING control to the middle of its range.

4. Place the dipole near the back of the receiver, and set the signal generator for a modulated output at the video carrier frequency of Channel 2. Adjust the signal-generator attenuator for an output that will just give an indication on the meter.

5. Turn the AERIAL TUNING control for a maximum reading on the voltmeter. When maximum reading is obtained, the AERIAL TUNING control should not be in either its maximum clockwise position or maximum counterclockwise position.

6. Repeat the above steps for Channels 3 through 13. For all channels, except Channel 6, peak readings should be obtained on the meter when the AERIAL TUNING control is set at positions other than its maximum clockwise or maximum counterclockwise position. For Channel 6, a peak reading should be approached.

If a peak reading cannot be obtained on each channel (except Channel 6) in the low-frequency band, the long section of the loop assembly, to which the 300-ohm line is attached, may be pushed together or bowed out to obtain peaking.

If a peak reading cannot be obtained on each channel in the high-frequency band, the two loops adjacent to the AERIAL TUNING condenser may be pushed toward each other or fanned out to obtain peaking.

After the above adjustments have been made, it still may not be possible to obtain peak meter readings when the AERIAL TUNING control is set at positions other than its maximum clockwise or maximum counterclockwise position. If this is the case, it is suggested that the AERIAL TUNING condenser be replaced.

LOCAL-OSCILLATOR ADJUSTMENT

The procedure for adjusting the local oscillator is as follows:

1. Turn the CHANNEL SELECTOR to Channel 2, and set the FINE TUNING control to the middle of its range.

©John F. Rider

World Radio History

2. Connect a 20,000-ohms-per-volt voltmeter, through the FM TEST jack adaptor (figure 7), to the FM TEST jack.

3. Connect an accurately calibrated AM signal generator to the aerial-input terminals of the receiver. Set the signal generator for a modulated signal at the frequency of the sound carrier of Channel 2.

4. Adjust the oscillator tuning core for zero reading on the voltmeter. The tuning cores may be adjusted, with the chassis in the cabinet, by removing the CHANNEL SELECTOR and FINE TUNING knobs and inserting a long thin screwdriver, such as Philco Part No. 45-6354-2, through the slot in the cabinet. DO NOT TURN THE TUNING CORE IN TOO FAR or it will be turned beyond the limit of the threads of the coil form and be lost.

5. Repeat steps 1 through 4 for Channels 3 through 13, in order.

REPLACING TUBES IN THE TUNER UNIT

Whenever it becomes necessary to replace a tube in the tuner unit, it is suggested that several be tried in order to obtain one which has similar interelectrode capacity, to prevent a change in tuner alignment. The picture quality and oscillator fine tuning range should be observed while selecting the tube.

ALIGNMENT

The tuner alignment procedure in PR-1774 is not applicable to Model 50-T1443, Code 123.

The i-f alignment procedure in PR-1774 is applicable to Model 50-T1443, Code 123, except for the following changes:

1. TC2-T should be adjusted wherever TC13 is mentioned.

2. The grid of the 6J6 mixer tube is pin 5 instead of pin 1.

3. C8-T connects directly to the mixer grid of Model 50-T1443, Code 123, and the mixer jig snaps over this trimmer. Shape the mixer jig, described in PR-1774, so that it fits C8-T, which is smaller in diameter than C13 in Model 50-T1443, Code 122.

TELEVISION CARRIER FREQUENCIES

CHANNEL	BAND WIDTH (mc.)	VIDEO CARRIER FREQUENCY (mc.)	SOUND CARRIER FREQUENCY (mc.)
2	54—60	55.25	59.75
3	60—66	61.25	65.75
4	66—72	67.25	71.75

PREPRODUCTION AND PRODUCTION CHANGES IN PHILCO MODELS 50-T1443, CODE 122; 50-T1443, CODE 123

CORRECTIONS TO SERVICE MANUAL PR-1774

1. In figure 4 of Service Manual PR-1774, the wording "PLUG IS SHOWN WITH THE PRONGS POINTING AWAY" should read "PRONG-END VIEW."

2. In the Replacement Parts List, the description for C85 should read "Condenser, electrolytic, 4-section." The Service Part No. should be 30-2570-10.

3. In the schematic diagram, the following changes should be made:

   a. R61 should be connected across C41 instead of between pins 5 and 7 of the FM detector.

   b. The reference symbol for the CONTRAST control should be R136 instead of R134.

   c. The power socket should be J7 instead of J1.

   d. The reference symbols for C32 and C35 should be reversed.

PREPRODUCTION CHANGE IN MODEL 50-T1443, CODE 123

Between the time of the printing of Service Manual PR-1800 and the time of first production of Model 50-T1443, Code 123, L71 was removed and reconnected in series with the lead between C15T and the junction of C21 and L45. The junction of C22 and L45 was then connected directly to pin 1 of the first video-i-f amplifier.

MODEL 50-T1443
Correction to Service Manual

TC19 and TC20, in the top view of the drawing on page 5, should be reversed.

MODELS 50-T1443, CODE 122; 50-T1443, CODE 123

Microphonics Due to Improper Unpacking

The above models may be microphonic if their chassis do not float freely on the chassis shock mounts. When the receiver is placed in operation, the chassis-mounting bolts should be loosened, and all chassis-packing strips should be removed.

PRODUCTION CHANGE IN MODEL 50-T1443, CODE 122

RUN NO.	DESCRIPTION OF CHANGE	REASON FOR CHANGE
1Z	In early production of run 1Z, the unused (triangle) section of C80 and the unused (half-moon) section of C85 were added in parallel across R51. In later production of run 1Z, the unused (triangle) section of C80 and the unused (square) section of C70 were added in parallel across R51.	To reduce vertical-sweep-generator feedback into B+ supply.

PRODUCTION CHANGES IN MODEL 50-T1443, CODE 123

RUN NO.	DESCRIPTION OF CHANGE	REASON FOR CHANGE
2	Pin 6 of audio-output tube disconnected from 160-volt B+ supply and reconnected to pin 4 of audio-output tube.	To supply higher B+ voltage for Philco Booster TB-2.
1Z 2Z 3	Two unused (triangle and plain) sections of C80 were connected in parallel across R51. Runs 2Z and 3 also incorporate the change made in run 2. Run 1Z does not incorporate the change made in run 2.	To reduce vertical-sweep-generator feedback into B+ supply.
4	C92B disconnected and replaced with unused (half-moon) section of C85.	To provide condenser with higher voltage rating in HEIGHT-control circuit.

CORRECTIONS AND CHANGES IN REPLACEMENT PART NUMBERS

MODEL 50-T1443, CODE 122

The following changes should be made in the Replacement Parts List

REFERENCE SYMBOL OR DESCRIPTION	PUBLISHED PART NO.	NEW OR CORRECT PART NO.
C81	45-3505-36	45-3505-30
C101	61-6108	61-0108
C105	60-20155314	60-20155014
J4	27-3772-6	27-6180
J8	27-6180	27-6174-4
J9	41-3860-1	41-3860
R23	66-2518340	66-2518240
R123	33-1342-2	33-1343-2
Frame, picture, blond	45-6547	45-6549
Hinges, knife (one pair)	56-5765-1	56-5765

50-T1443, CODE 122 AND 123
Correction of Part Number

Four-section electrolytic condenser, 40-20-10-10 $\mu f.$, all 475 working volts, used in the above models, should have the part number of 30-2570-41 instead of 30-2570-8.

MODEL 50-T1443, CODE 123
TB2 Booster Connections

Early production receivers of the above model did not have the audio-tube socket wired to supply B voltage to 41-3963 booster adaptor. If a booster is required in one of these receivers, pin 6 and pin 4 of the audio-output (6K6GT) tube should be wired together. It may be determined whether this jumper is necessary by taking a voltage reading from pin 6 to ground.

MODELS 50-T1443, ALL CODES
A-C Line Fuse Failure

Under certain operating conditions, the 5-ampere line fuse may blow, due to line surges, although the receiver may be operating normally.

Investigation has revealed that a 3.2-ampere, delayed-action fuse will provide the required protection, and will not blow when surges occur.

If the receiver blows the 3.2-ampere, delayed-action fuse, trouble-shoot the receiver before trying another fuse.

The Philco Part No. of the delayed-action fuse is 45-2656-14.

SUPPLEMENTARY ALIGNMENT INFORMATION FOR MODELS 50-T1443, CODE 123

When the video-i-f stages of the above models are being aligned, better results may be obtained if bias is applied to the a-v-c bus only during the adjustment of the tuning core of the mixer-plate coil and during the adjustments that affect the over-all video-response curve.

During alignment, the ALIGN TEST jack adapter, shown in the service manuals should not be used. The vertical input of the oscilloscope should be connected directly to pin 3 of the ALIGN TEST jack. When adjusting the tuning core of the mixer-plate coil and when making adjustments to obtain the over-all response curve, connect a short piece of wire between pins 1 and 2 of the ALIGN TEST jack. Such a jumper applies a bias of -3 volts to the a-v-c bus.

To facilitate connections to the ALIGN TEST jack, a 3-prong plug, Philco Part No. 27-4787, with a short wire soldered in each prong, may be used.

CIRCUIT DESCRIPTION

Philco Models 50-T1477, 50-T1478, 50-T1479, 50-T1481, and 50-T1482 are combination television receivers, AM-FM radios, and phonographs in console cabinets. The radio-television chassis of these models are similar. The cabinets differ from each other in styling and finish.

The phonograph section of Model 50-T1477 uses an M-12C Automatic Record Player designed with two tone arms and two turntable speeds, for use with long-playing and standard records. Refer to PR-1600 for complete service information on the M-12C Automatic Record Player. Provision is also made for the connection of an external phonograph having a turntable speed of 45 r.p.m. The phonograph section of the other four models employs an M-20 Automatic Record Player, which has three turntable speeds and accommodates all types of records. Refer to PR-1731 for complete service information on the M-20 Automatic Record Player.

All models feature a built-in television and FM-radio aerial, a built-in AM-radio aerial, a 12-inch picture tube, and a wide mask.

The television radio-frequency section is built on a subchassis, and incorporates a 6BC5 or 6AG5/S tube as an r-f amplifier and a 6J6 tube as a mixer and local oscillator. Refer to PR-1803 for complete service information on the 12-position turret tuner.

Four 6BC5 tubes are used as video-i-f amplifiers, and a 6AL5 tube is used as a video detector and a-v-c rectifier. The rectified video signal is amplified by a video amplifier using one section of a 12AU7, and a 7C5 video-output stage.

The television sound-i-f signal is taken from the cathode of the third video-i-f tube, and further amplification is obtained with a 6BA6 and 6AU6. A 6AL5 tube is used as an FM detector, and a 6AU6 tube is employed as an audio amplifier which drives a 6Y6G audio-output stage.

The television aerial also serves as an FM-radio aerial. A 6AU6 is used an an r-f amplifier for the FM-radio section, and a 12AT7 is used as a mixer and oscillator. The FM intermediate frequency is 22.1 mc.

The AM-radio aerial consists of a built-in loop. For the AM-radio section, a 6BE6 tube functions as a mixer and oscillator. The AM intermediate frequency is 455 kc.

A 7R7 is used as a detector and a-v-c rectifier for the AM signals, and as an i-f amplifier for both the AM and FM-radio sections. The FM i-f signal from this stage is coupled to the television first sound i-f amplifier, and the television sound section completes the FM-radio circuit. The detected AM signal from the detector section of the 7R7 is fed to the television first audio amplifier. This stage, together with the audio-output stage, completes the AM-radio circuit.

A portion of the composite video signal is taken from the video-output stage and is amplified by a sync preamplifier. A sync separator separates the sync pulses from the rest of the composite video signal. Another amplifier inverts these pulses to a positive polarity. The vertical-sync pulses are separated from the horizontal-sync pulses in an integrating network, and are applied to the grid of the vertical-blocking oscillator to control its frequency. The horizontal-sync pulses are applied to the grid of the phase comparer.

The vertical-sweep circuit consists of a conventional blocking oscillator and vertical-output stage.

Horizontal-sweep voltage is generated by a blocking oscillator, the frequency of which is determined by the phase relationships of the horizontal-sync pulses and the horizontal sawtooth at the phase comparer grid. A 6BG6G amplifies the horizontal sweep which is applied across a 6W4GT damper tube to the horizontal deflection coils.

A 1B3GT tube is used as a high-voltage rectifier to supply high voltage for the second anode of the picture tube. A 5U4G and a 5Y3GT supply plate and screen voltages for the entire chassis.

CONNECTING PHILCO BOOSTER TB-2

Provisions are made for connecting Philco Television Booster, Model TB-2.

Plug the booster power adapter (Philco Part No. 41-3963) into the audio output tube socket. Then plug the 6Y6G into the adapter. Pin 6 of the audio output socket is used as a tie point to supply the B-plus voltage to the booster. Pins 2 and 7 furnish the filament power and B-minus connection.

BUILT-IN TELEVISION AERIAL

The built-in television aerial consists of a broad-band dipole of metal foil, mounted inside the cabinet on the top, and a tuning and impedance-matching network. This aerial covers all channels, and is tuned for each channel by adjusting the AERIAL TUNING control located on the front of the receiver, near the top of the cabinet.

A 300-ohm line couples the tuning network to the aerial-input terminals of TB1. This line should be disconnected from the aerial terminals so that an external aerial may be used if required.

HORIZONTAL HOLD ADJUSTMENT

Ordinarily, the range of the HORIZ. HOLD control potentiometer is sufficient to compensate for normal variations and provide horizontal hold control. If, for some reason, such as replacement of tubes or components, it becomes necessary to make further hold adjustments, the following procedure is recommended:

1. Preset the adjustments as follows:
   a. Lockin trimmer C80A—½ turn counterclockwise from the maximum clockwise position.
   b. Range trimmer C80B—1½ turns counterclockwise from the maximum clockwise position.
   c. Drive trimmer C80C two turns counterclockwise from the maximum clockwise position.
   d. HORIZ. HOLD control to approximate center of its range.

2. Tune in a station, and adjust TC14 until the picture is brought into sync.

3. Adjust the CONTRAST control for normal contrast.

4. Turn the HORIZ. HOLD control fully clockwise.

5. Adjust TC14 until 8 to 10 stationary bars appear, sloping downward from the left side of the picture tube. If this cannot be accomplished, turn C80B another full turn counterclockwise, and repeat this step.

6. Turn the HORIZ. HOLD control counterclockwise until the picture is brought into sync; continue to rotate this control until the picture falls out of

©John F. Rider

World Radio History

sync. In some cases, the picture will not go out of sync, even though the HORIZ. HOLD control is turned to its extreme counterclockwise position. If this is the case, momentarily short the aerial terminals. When the picture reappears, it will be out of sync.

7. Slowly turn the HORIZ. HOLD control clockwise, and note the change in the number of blanking bars appearing on the picture tube. The number of bars should decrease as sync is approached. Just before the picture falls into sync, there should be 3½ to 4½ bars sloping upward from the left side of the picture tube. If there are more than 4½ bars, turn C80A another ¼ turn clockwise, and repeat steps 4, 5, 6, and 7. If there are less than 3½ bars, turn C80A another ¼ turn counterclockwise, and repeat steps 4, 5, 6, and 7.

CHECKING AND ADJUSTING THE BUILT-IN-AERIAL TUNING NETWORK

By rotating the AERIAL TUNING control, it should be possible to tune the built-in aerial system to resonance with the video carrier frequency of each channel except Channel 6. For Channel 6 a resonant condition should be approached.

To check the built-in aerial system follow the procedure given below:

1. Connect a dipole through a 72-ohm coaxial cable to the output of an AM signal generator which has a band range covering the television channels.

2. Connect a 20,000-ohms-per-volt voltmeter to pin 3 of the ALIGN TEST jack, J5.

3. Set the CHANNEL SELECTOR to Channel 2, and the FINE TUNING control to the middle of its range.

4. Place the dipole near the back of the receiver, and set the signal generator for a modulated output at the video carrier frequency of Channel 2. Adjust the signal-generator attenuator for an output that will just give an indication on the meter.

5. Turn the AERIAL TUNING control for a maximum reading on the voltmeter. When maximum reading is obtained, the AERIAL TUNING control should not be in either its maximum clockwise or maximum counterclockwise position.

6. Repeat the above steps for Channels 3 through 13. For all channels, except Channel 6, maximum readings should be obtained on the meter when the AERIAL TUNING control is set at positions other than its maximum clockwise or maximum counterclockwise position. For Channel 6, a peak reading should be approached.

If a peak reading cannot be obtained on each channel (except Channel 6) in the low-frequency band, the long section of the loop assembly, to which the 300-ohm line is attached, may be pushed together or bowed out to obtain peaking.

If a peak reading cannot be obtained on each channel in the high-frequency band, the two loops adjacent to the AERIAL TUNING condenser may be pushed toward each other or fanned out to obtain peaking.

After the above adjustments have been made, it still may not be possible to obtain maximum meter readings when the AERIAL TUNING control is set at positions other than its maximum clockwise or maximum counterclockwise position. If this is the case, it is suggested that the AERIAL TUNING condenser be replaced.

TELEVISION CARRIER FREQUENCIES

CHANNEL	CHANNEL LIMITS (mc.)	VIDEO CARRIER FREQUENCY (mc.)	SOUND CARRIER FREQUENCY (mc.)
2	54—60	55.25	59.75
3	60—66	61.25	65.75
4	66—72	67.25	71.75
5	76—82	77.25	81.75
6	82—88	83.25	87.75
7	174—180	175.25	179.75
8	180—186	181.25	185.75
9	186—192	187.25	191.75
10	192—198	193.25	197.75
11	198—204	199.25	203.75
12	204—210	205.25	209.75
13	210—216	211.25	215.75

TELEVISION ALIGNMENT

WARNING! Dangerous potentials are present in the receiver when it is operating and for a short time after it has been turned off.

TELEVISION I-F ALIGNMENT

GENERAL

The intermediate frequencies for the television receiver are 22.1 mc. for the sound channel and 26.6 mc. for the video channel. Alignment of circuits operating at these high frequencies requires careful workmanship and good equipment. The following precautions must be observed:

1. The top of the work bench must be metallic, and the test equipment and television-receiver chassis must make a good metal-to-metal contact with the bench top.

2. Never disconnect the picture tube, picture-tube yoke, or speaker while the receiver is turned on.

3. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.

4. When aligning the receiver, it is possible to achieve optimum adjustment of all tuning cores when the tops of the adjusting screws are approximately ¼ inch above the coil mounts, and also when the tops of the adjusting screws are approximately ¾ inch above the coil mounts. The tuning cores should be adjusted so that the tops of the adjusting screws are approximately ¾ inch above the coil mounts.

TEST EQUIPMENT REQUIRED FOR TELEVISION I-F ALIGNMENT

The following test equipment is recommended for aligning the television i-f stages of the receiver:

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008, or equivalent equipment.

2. A vacuum-tube voltmeter or a 20,000-ohms-per-volt voltmeter.

If separate signal generators and oscilloscope are used in place of Model 7008, these instruments should have the following characteristics:

FM signal generator
- Deviation: ± 4 mc.
- Center-frequency range: 20 mc. to 30 mc.
- Sweep-sync output with either built-in or separate phase corrector.

AM signal generator
- Carrier-frequency range: 20 mc. to 30 mc.
- Dial: Suitable for setting and resetting accurately to the frequencies specified in the TELEVISION I-F ALIGNMENT CHART.

Oscilloscope
- Calibrated.
- Vertical sensitivity: 1 volt (peak-to-peak) per inch, or better.

When using a separate AM r-f signal generator to obtain marker pips, couple the output lead of this generator to the output lead of the FM signal generator, using just sufficient coupling to obtain a suitable marker pip.

JIGS REQUIRED FOR TELEVISION I-F ALIGNMENT

I-F Jig

It is recommended that Philco I-F Alignment Jig, Part No. 45-1670, be used to couple the signal generator to the various video-i-f grids. The connections to these grids are available from the top of the chassis through small holes near the tube shields. To use this jig, slip the clamp over the shield, insert the probe end into the hole, and slide the jig downward until a good contact is made with the grid connection.

In order to use the jig on the first video-i-f tube, it is necessary to remove the dial-light shield plate. Philco Cable, Part No. 45-1635, provides a convenient method of connecting the signal generator to the jig.

Mixer Jig

Figure 1 shows a jig that is recommended for coupling the signal generator to the mixer grid to provide short connections and good grounding. This jig is simply constructed from a straight-type hairpin (commonly called "bobbie pin"), a 1-inch length of ⅛-inch diameter spaghetti, and a short length of No. 14 bus wire.

Referring to figure 1, construct this jig as follows:

1. File the enamel from the inside of the prongs and from the end of the hairpin.

2. Bend the tips of the hairpin out at a slight angle and form the prongs at a point ⅜ inch from the tips as shown in figure 1.

3. Slightly pinch the end together and slip the spaghetti over the hairpin.

4. Bend the bus wire as shown in figure 1.

When the chassis is viewed from the side with the operating controls to the left, two holes will be seen on the side of the r-f tuner. The top hole is opposite the plate of C7 which connects directly to the mixer grid.

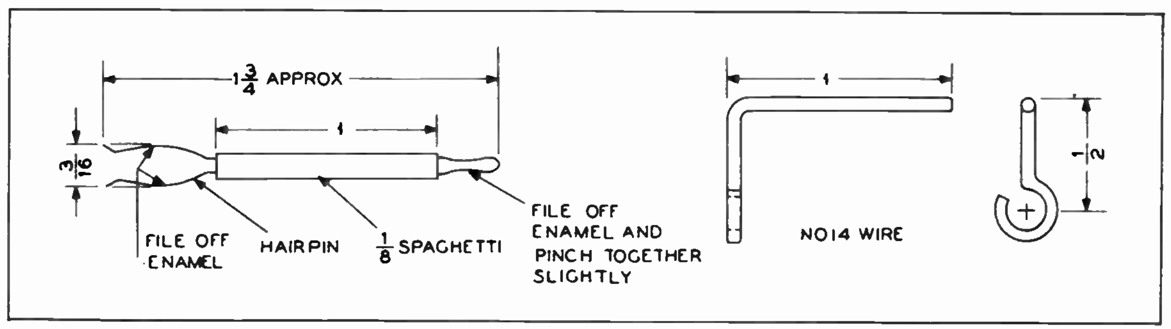

Figure 1. Mixer Jig

©John F. Rider

World Radio History

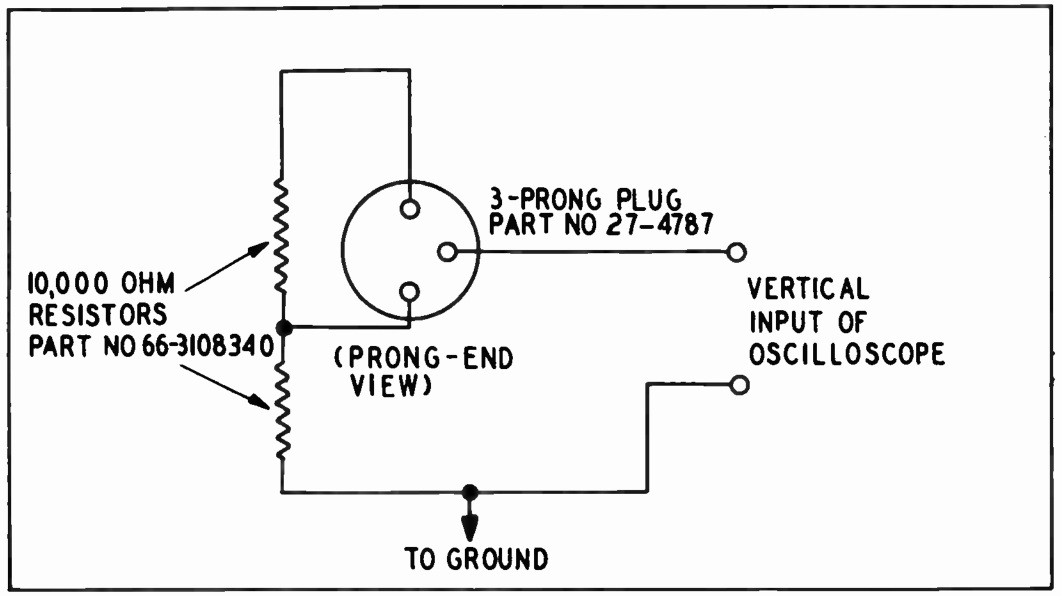

Figure 2. ALIGN TEST Jack Adaptor

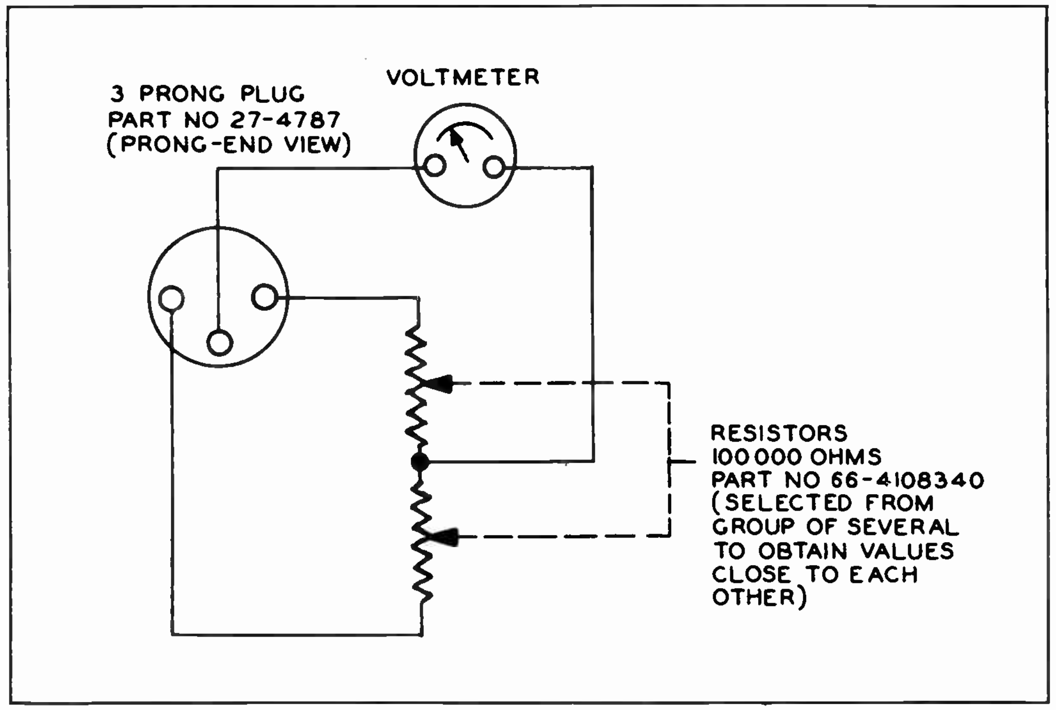

Figure 3. FM TEST Jack Adaptor

To use this jig, insert the prong end into the hole opposite C7 until it snaps over the trimmer plate. Loosen the self-tapping screw which holds the front end of the tuner component cover plate. Slip the hook end of the bus wire under the screw head, and tighten the screw. Connect the ground lead of the signal generator to the bus wire, and the "hot" lead to the end of the hairpin.

TELEVISION I-F ALIGNMENT PROCEDURE

Before proceeding with the television i-f alignment, the following preliminary instructions should be observed.

1. Insert a 10,000-ohm resistor in series with the oscilloscope lead.

2. If additional attenuation of the marker signal is required when using Visual Alignment Generator Model 7008, insert a 10,000-ohm resistor in series with the output lead.

3. Preset the television controls as follows:
   a. CONTRAST control fully counterclockwise.
   b. VOLUME control for an audible signal.
   c. BRIGHTNESS control to give a dim raster.
   d. FINE TUNING control to the center of its range.

4. Preset the tuning cores and trimmer condensers as follows:
   a. C21A and C21B fully clockwise.
   b. TC4 fully counterclockwise.
   c. TC7, TC8, and TC3 so that the top of the adjusting screw is approximately ⅝ inch from the top of the coil mount.

5. During alignment, attenuate the signal-generator output to keep the output at the ALIGN TEST jack below 2 volts, peak-to-peak, and the output at the FM TEST jack below .5 volt, peak-to-peak.

6. During the v-i-f and s-i-f alignment, index the turret tuner between channels.

The television i-f stages of the receiver should be aligned according to the instructions given in the TELEVISION I-F ALIGNMENT CHART.

TELEVISION I-F ALIGNMENT CHART

STEP	SIGNAL-GENERATOR CONNECTION	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR SETTING	ADJUSTMENT INSTRUCTIONS
1	Connect output of AM signal generator through i-f jig to grid (pin 1) of 4th video-i-f tube.	Connect vertical input of oscilloscope through ALIGN TEST jack adapter (figure 2) to ALIGN TEST jack J5.	Set AM signal generator (modulated) to 25.5 mc.	Adjust TC10 for maximum indication on oscilloscope.
2	Connect output of AM signal generator through i-f jig to grid (pin 1) of 3rd video-i-f tube.	Same as step 1.	Set AM signal generator (modulated) to 24.5 mc.	Adjust TC9 for maximum indication on oscilloscope.
3	Same as step 2.	Same as step 1.	Set AM signal generator (modulated) to 25 mc.	Adjust TC7 for maximum indication on oscilloscope.
4	Connect output of AM signal generator through i-f jig to grid (pin 1) of 2nd video-i-f tube.	Same as step 1.	Set AM signal generator (modulated) to 26.6 mc.	Adjust TC6 for maximum indication on oscilloscope.
5	Connect output of AM signal generator through i-f jig to grid (pin 1) of 1st video-i-f tube.	Same as step 1.	Set AM signal generator (modulated) to 23.25 mc.	Adjust TC5 for maximum indication on oscilloscope.
6	Connect output of AM signal generator through mixer jig to grid (pin 5) of mixer tube.	Same as step 1.	Set AM signal generator (modulated) to 28.1 mc. (See Note 1.)	Adjust TC3 for minimum indication on oscilloscope.
7	Same as step 6.	Same as step 1.	Set AM signal generator (modulated) to 22.1 mc. (See Note 1.)	Adjust TC11 for minimum indication on oscilloscope. If no minimum is apparent, turn TC11 counterclockwise until the response increases rapidly. Turn TC11 clockwise to the point just before the response increases; then adjust TC8 for minimum indication on oscilloscope.
8	Same as step 6.	Same as step 1.	Set AM signal generator (modulated) to 24.25 mc.	Adjust TC2 for maximum indication on oscilloscope.

TELEVISION I-F ALIGNMENT (Cont.)

STEP	SIGNAL-GENERATOR CONNECTION	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR SETTING	ADJUSTMENT INSTRUCTIONS
9	Connect outputs of AM and FM signal generators through mixer jig to grid (pin 5) of mixer tube.	Same as step 1.	Set FM signal generator to 25 mc., ±4-mc. deviation. Set AM signal generator (unmodulated) to 23.25 mc., 23.5 mc., 25.75 mc., and 26.6 mc., as required to produce marker pips.	Adjust TC4 for response curve within limits of curve in figure 4. It may be necessary to readjust TC2, TC4, TC5, TC6, TC7, TC9, and TC10 in order to obtain this curve. (See Note 2.)
10	Same as step 9.	Connect vertical input of oscilloscope to pin 1 of FM TEST jack J3.	Set FM signal generator to 22.1 mc., ±1-mc. deviation. Set AM signal generator (modulated) to 22.1 mc.	Adjust C21A and C21B slightly counterclockwise until indication is observed on oscilloscope.
11	Same as step 9.	Same as step 10.	Same as step 10.	Adjust TC13 for minimum amount of AM indication. (See Note 3.) Adjust TC12 for symmetrical pattern (equal peaks) within limits of curve in figure 5.
12	Connect output of FM signal generator through mixer jig to grid (pin 5) of mixer tube.	Same as step 10.	Set FM signal generator to 22.1 mc., ±1-mc. deviation.	Adjust C21A and C21B for maximum peaks and symmetry of pattern.
13	Connect output of AM signal generator through mixer jig to grid (pin 5) of mixer tube.	Connect vertical input of oscilloscope through ALIGN TEST jack adapter (figure 2) to ALIGN TEST jack J5. Connect v.t.v.m. (0—10-volt range) through FM TEST jack adapter (figure 3) to FM TEST jack J3.	Set AM signal generator (modulated) to 22.1 mc. (minimum indication on oscilloscope).	When indication on oscilloscope is minimum, v-t-v-m reading should be zero. If reading is not zero, adjust TC12. If adjustment requires more than one half turn, repeat step 11.

NOTE 1: When adjusting TC3, TC11, and TC8, the vertical gain of the oscilloscope should be high and the input signal should be as weak as possible.

NOTE 2: If readjustment of the tuning cores is necessary to obtain a response curve within the limits of figure 4, the following information may be used to find the adjustment required:

- TC2 affects the low-frequency slope.
- TC4 affects the high-frequency slope.
- TC5 affects the amplitude and low-frequency slope.
- TC6 affects the bandwidth and carrier position.
- TC7 affects the amplitude of the high-frequency slope.
- TC9 affects the flat-top response.
- TC10 affects the high-frequency slope.
- TC3, TC11, and TC8 should not be readjusted.

NOTE 3: The AM signal will appear as a series of sine waves superimposed on the FM-detector curve.

WAVEFORMS OF SYNC AND SWEEP CIRCUITS

The waveforms in figure 7 are sized for clarity, and are not intended to illustrate relative amplitudes. Approximate peak-to-peak voltages are given under the waveforms in each case. These voltages are the approximate values when the CONTRAST control is adjusted to give 30 volts, peak-to-peak, at the grid of the picture tube, and when all other controls are in their normal positions.

For viewing waveforms in the vertical sync and sweep circuits, adjust the oscilloscope sweep to 30 c.p.s. (one-half the vertical-sweep rate).

For viewing waveforms in the horizontal sync and sweep circuits, adjust the oscilloscope sweep to 7875 c.p.s. (one-half the horizontal sweep rate).

RADIO ALIGNMENT

GENERAL

The television section should be properly aligned before the radio alignment is made. When complete AM and FM alignment of the radio is necessary, the AM section should be aligned first. If AM alignment is not required, FM alignment alone may be made after the television-i-f stages have been aligned.

Before starting the radio alignment, allow the receiver and test equipment to warm up for 15 minutes.

TEST EQUIPMENT REQUIRED FOR RADIO ALIGNMENT

The following equipment is recommended for aligning the AM-FM radio section:

1. Philco Precision Visual Alignment Generator, Model 7008, or equivalent equipment.

2. A vacuum-tube voltmeter or a 20,000-ohms-per-volt voltmeter.

RADIO ALIGNMENT PROCEDURE

Before proceeding with the radio alignment, the following preliminary instructions should be observed.

1. Insert a .1-µf. condenser in series with the signal-generator lead.

2. Preset the VOLUME control fully clockwise. Set switch WS1 to AM during AM-radio alignment, and to FM during FM-radio alignment.

3. During alignment of the AM radio, attenuate the signal generator to keep the output indication below 5.0 volts, peak-to-peak. During alignment of the FM radio, attenuate the signal generator to keep the output at the FM TEST jack below .5 volt, peak-to-peak.

4. For radio alignment use a non-metallic alignment tool.

The radio section should be aligned according to the instructions given in the AM-RADIO ALIGNMENT CHART and the FM-RADIO ALIGNMENT CHART.

AM-RADIO ALIGNMENT CHART

STEP	SIGNAL-GENERATOR CONNECTION	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR SETTING	RADIO-DIAL SETTING	ADJUSTMENT INSTRUCTIONS
1	Connect AM signal generator through .1-µf. condenser to grid (pin 1) of AM mixer tube.	Connect vertical input of oscilloscope to widely spaced terminals of speaker socket J4.	Set AM signal generator (modulated) to 455 kc.	540 kc.	Adjust TC20* and TC18* for maximum indication on oscilloscope.
2	Connect AM signal generator through .1-µf. condenser to primary winding of T7.	Same as step 1.	Set AM signal generator (modulated) to 1620 kc.	1620 kc. (See figure 9.)	Adjust C136 for maximum indication on oscilloscope.
3	Same as step 2. (See Note below.)	Same as step 1.	Set AM signal generator (modulated) to 1500 kc.	Tune receiver to signal.	Adjust C135 for maximum indication on oscilloscope.

NOTE: The final adjustment of C135 should be made with the chassis in the cabinet and the loop connected. The signal from the signal generator should be coupled by means of a radiating loop. This radiating loop should be made up of six to eight turns of insulated wire in approximately a 6-inch-diameter loop. Connect the signal-generator output to the loop and place this loop near the receiver loop.

* TC18 and TC20 consist of two tuning cores each. Make adjustments from both top and bottom of chassis.

FM-RADIO ALIGNMENT CHART

STEP	SIGNAL-GENERATOR CONNECTION	OUTPUT-INDICATOR CONNECTION	SIGNAL-GENERATOR SETTING	RADIO-DIAL SETTING	ADJUSTMENT INSTRUCTIONS
1	Connect FM signal generator through .1-µf. condenser across C105B.	Connect vertical input of oscilloscope to pin 1 of FM TEST jack J3.	Set FM signal generator to 22.1 mc., ± 1-mc. deviation.	Gang fully closed.	Adjust TC19* and TC17* for maximum peaks and symmetry of pattern.
2	Connect FM signal generator through .1-µf. condenser to aerial input terminals of TB1.	Same as step 1.	Set FM signal generator to 105 mc., ± 1-mc. deviation.	105 mc. (See figure 9.)	Adjust C133, C132, and C134 for maximum peaks and symmetry of pattern.

C38	Condenser, 3-section filter	30-2570-16
C38A	Condenser, screen by-pass, 10 μf., 450v	Part of C38
C38B	Condenser, cathode by-pass, 40 μf., 50v	Part of C38
C38C	Condenser, filter, 10 μf., 450v	Part of C38
C39	Condenser, tone compensation, .015 μf.	45-3505-93*
C40	Condenser, a-v-c by-pass, 1500 μμf.	62-215001011*
C41	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C42	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C43	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C44	Condenser, d-c blocking, 470 μμf.	62-147001001*
C45	Condenser, a-v-c by-pass, 1500 μμf.	62-215001011*
C46	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C47	Condenser, r-f by-pass, 10 μμf.	62-010409001*
C48	Condenser, d-c blocking, 470 μμf.	62-147001001*
C49	Condenser, a-v-c by-pass, 1500 μμf.	62-215001011*
C50	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C51	Condenser, d-c blocking, 470 μμf.	62-147001001*
C52	Condenser, fixed trimmer, 51 μμf.	30-1224-2*
C53	Condenser, fixed trimmer, 51 μμf.	30-1224-2*
C54	Condenser, r-f by-pass, 10 μμf.	62-010409001*
C55	Condenser, cathode by-pass, 1500 μμf.	62-215001011*
C56	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C57	Condenser, d-c blocking, 470 μμf.	62-147001001*
C58	Condenser, d-c blocking, 100 μμf.	62-110009001*
C59	Condenser, a-v-c by-pass, 1500 μμf.	62-215001011*
C60	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C61	Condenser, r-f by-pass, 10 μμf.	62-010409001*
C62	Condenser, d-c blocking, .047 μf.	45-3505-45*
C63	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C64	Condenser, d-c blocking, .22 μf.	45-3505-49*
C65	Condenser, 4-section filter	30-2570-10
C65A	Condenser, l-f compensation, 10 μf., 475v	Part of C65
C65B	Condenser, decoupling, 10 μf., 475v	Part of C65
C65C	Condenser, decoupling, 10 μf., 475v	Part of C65
C65D	Condenser, decoupling, 10 μf., 475v	Part of C65
C66	Condenser, cathode by-pass, .5 μf.	45-3500-4*
C67	Condenser, 3-section filter	30-2570-16
C67A	Condenser, screen by-pass, 10 μf., 475v	Part of C67
C67B	Condenser, l-f compensation, 10 μf., 475v	Part of C67
C68	Condenser, d-c blocking, .047 μf.	45-3505-62*
C69	Condenser, d-c blocking, 680 μμf.	60-10685401*
C70	Condenser, line filter, .01 μf.	45-3505-58*
C71	Condenser, line filter, .01 μf.	45-3505-58*
C72	Condenser, input filter, 30 μf., 475v	30-2568-19
C73	Condenser, input filter, 30 μf., 475v	30-2568-19
C74	Condenser, 4-section filter	30-2570-8
C74A	Condenser, filter, 40 μf., 475v	Part of C74
C74B	Condenser, filter, 10 μf., 475v	Part of C74
C74C	Condenser, filter, 20 μf., 475v	Part of C74
C74D	Condenser, cathode by-pass, 10 μf.	Part of C74
C75	Condenser, bias filter, .1 μf.	45-3505-47*
C76	Condenser, video filter, 220 μμf.	62-122001001*
C77	Condenser, d-c blocking, .047 μf.	45-3505-62*
C78	Condenser, d-c blocking, 150 μμf.	60-10155407*
C79	Condenser, voltage divider, 180 μμf.	30-1220-30*
C80	Condenser, 3-section trimmer	31-6477-2
C80A	Condenser, lock-in trimmer	Part of C80
C80B	Condenser, horizontal-oscillator-range trimmer	Part of C80
C80C	Condenser, drive trimmer	Part of C80
C81	Condenser, d-c blocking, .0022 μf.	45-3505-54*
C82	Condenser, cathode by-pass, .022 μf.	45-3505-43*
C83	Condenser, filter, .22 μf.	45-3505-49*
C84	Condenser, plate by-pass, .047 μf.	45-3505-45*
C85	Condenser, d-c blocking, 270 μμf.	60-10275407*
C86	Condenser, sweep charging, 1500 μμf.	62-215001011*
C87	Condenser, d-c blocking, 390 μμf.	60-10395407*
C88	Condenser, screen by-pass, .047 μf.	45-3505-62*
C89	Condenser, horizontal shaping, .047 μf.	45-3505-62*
C90	Condenser, horizontal shaping, .082 μf.	61-0174*
C91	Condenser, d-c blocking, .15 μf.	45-3505-31*
C92	Condenser, high-voltage filter, 500 μμf.	30-1229-2*
C93	Condenser, d-c blocking, .047 μf.	45-3505-62*
C94	Condenser, d-c blocking, 330 μμf.	62-133001001*
C95	Condenser, d-c blocking, .0047 μf.	45-3505-56*
C96	Condenser, video filter, 22 μμf.	62-022009001*
C97	Condenser, integrating, .0022 μf.	45-3505-54*
C98	Condenser, integrating, .0047 μf.	45-3505-56*
C99	Condenser, integrating, .0047 μf.	45-3505-56*
C100	Condenser, a-v-c filter, 10 μf.	30-2417-1
C101	Condenser, d-c blocking, .015 μf.	45-3505-42*
C102	Condenser, sweep charging, .047 μf.	45-3505-62*
C103	Condenser, d-c blocking, .1 μf.	45-3505-47*
C104	Condenser, a-v-c filter, .05 μf.	61-0170*
C105	Condenser, 5-section tuning condenser	31-2743
C105A	Condenser, FM aerial tuning	Part of C105
C105B	Condenser, FM mixer tuning	Part of C105
C105C	Condenser, FM oscillator tuning	Part of C105
C105D	Condenser, AM aerial tuning	Part of C105
C105E	Condenser, AM oscillator tuning	Part of C105
C106	Condenser, d-c blocking, 100 μμf.	62-110009001*
C107	Condenser, r-f by-pass, 220 μμf.	62-122001001*

REPLACEMENT PARTS LIST (Cont.)

Reference Symbol	Description	Service Part No.
C108	Condenser, cathode by-pass, 100 μμf.	62-110009001*
C109	Condenser, screen by-pass, 100 μμf.	62-110009001*
C110	Condenser, r-f by-pass, 100 μμf.	62-110009001*
C111	Condenser, FM oscillator injection, 100 μμf.	62-110009001*
C112	Condenser, r-f by-pass, 51 μμf.	30-1224-2*
C113	Condenser, d-c blocking, 100 μμf.	62-110009001*
C114	Condenser, r-f by-pass, 100 μμf.	62-110009001*
C115	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C116A	Condenser, fixed trimmer	Part of Z5
C116B	Condenser, fixed trimmer	Part of Z5
C117A	Condenser, fixed trimmer	Part of Z6
C117B	Condenser, fixed trimmer	Part of Z6
C118	Condenser, d-c blocking, 51 μμf.	30-1224-2*
C119	Condenser, screen by-pass, .05 μf.	61-0170*
C120	Condenser, r-f by-pass, .05 μf.	61-0170*
C121	Condenser, a-v-c filter, .01 μf.	45-3505-41*
C122	Condenser, r-f by-pass, 1500 μμf.	62-215001011*
C123	Condenser, screen by-pass, .006 μf.	45-3500-7*
C124A	Condenser, fixed trimmer	Part of Z7
C124B	Condenser, fixed trimmer	Part of Z7
C125A	Condenser, fixed trimmer	Part of Z8
C125B	Condenser, fixed trimmer	Part of Z8
C125C	Condenser, r-f by-pass	Part of Z8
C125D	Condenser, r-f by-pass	Part of Z8
C126	Condenser, r-f by-pass, 1500 μμf.	60-215001011*
C127	Condenser, r-f by-pass, .05 μf.	61-0170*
C128	Condenser, d-c blocking, 10 μμf.	62-010009011*
C129	Condenser, AERIAL TUNING	31-6518
C130	Condenser, horizontal-sweep feedback, 5 μμf.	60-90505007*
C131	Condenser, blocking, .47 μf. (49-1477)	45-3500-4
C132	Condenser, FM aerial trimmer	Part of C105
C133	Condenser, FM mixer trimmer	Part of C105
C134	Condenser, FM oscillator trimmer	31-6511
C135	Condenser, AM aerial trimmer	Part of C105
C136	Condenser, AM oscillator trimmer	Part of C105
C137	Condenser, d-c blocking, 100 μμf.	62-110009001*
C138	Condenser, r-f by-pass, 1500 μμf.	60-215001011*
C139	Condenser, r-f by-pass, 1500 μμf.	60-215001011*
C140	Condenser, audio developing, .01 μf.	45-3505-41*
F1	Fuse, B-plus protective, ¼ ampere	45-2656-8
I1	Lamp, dial	34-2039
I2	Lamp, bin	27-6233-47
J1	Socket, TUNER TEST	Part of 76-5411-3
J2	Socket, PHONO	27-6126
J3	Jack, FM TEST	27-6126
J4	Socket, speaker	27-6214-1
J5	Jack, ALIGN TEST	27-6126
J6	Socket, bin lamp and phono motor power (50-T1478, 50-T1479, 50-T1481, 50-T1482)	27-6233-47
J7	Jack, external phono (50-T1477)	27-6186
J8	Jack, M-12C phono (50-T1477)	27-6126
J9	Socket, a-c interlock	27-6240
L1	Coil, aerial input	Part of Z1
L2	Coil, r-f grid	Part of Z1
L3	Coil, r-f plate	Part of Z2
L4	Coil, mixer grid	Part of Z2
L5	Coil, oscillator	Part of Z2
L6	Coil, r-f choke	Part of 76-5411-3
L7	Coil, mixer plate tank	Part of 76-5411-3
L8	Coil, r-f choke	32-4112-11
L9	Coil, adjacent sound trap	32-4234-8
L10	Coil, 1st v-i-f grid tank	32-4233-4
L11	Coil, 1st v-i-f plate tank	32-4359
L12	Coil, r-f choke	32-4112-11
L13	Coil, r-f choke	32-4112-11
L14	Coil, r-f choke	32-4112-11
L15	Coil, r-f choke	32-4112-11
L16	Coil, 2nd v-i-f plate tank	32-4359
L17	Coil, 3rd v-i-f plate tank	32-4234-1
L18	Coil, accompanying sound trap	32-4233-7
L19	Coil, 4th v-i-f grid tank	32-4233-2
L20	Coil, r-f choke	32-4112-11
L21	Coil, r-f choke	32-4112-11

Reference Symbol	Description	Service Part No.
L22	Coil, 4th v-i-f tank	32-4234-1
L23	Coil, r-f choke	32-4112-11
L24	Coil, shunt peaking, 250 microhenries	32-4143-7
L25	Coil, series peaking, 40 microhenries	32-4143-1
L26	Coil, series peaking, 250 microhenries	32-4143-7
L27	Coil, shunt peaking, 250 microhenries	32-4143-7
L28	Coil, series peaking, 180 microhenries	32-4143-5
L29	Coil, shunt peaking, 180 microhenries	32-4143-5
L30	Coil, 1st sound autotransformer	32-4303
L31	Coil, 2nd sound primary	Part of Z3
L32	Coil, 2nd sound secondary	Part of Z3
L33	Coil, FM-detector primary	Part of Z4
L34	Coil, FM-detector tertiary	Part of Z4
L35	Coil, FM detector secondary	Part of Z4
L36	Coil, isolating, 40 microhenries	32-4143-1
L37	Coil, r-f choke	32-4112-11
L38	Coil, filter choke	32-8399
L39	Coil, filter choke	32-8355-1
L40	Coil, focus	Part of Z9
L41	Coil, vertical deflection	Part of Z10
L42	Coil, horizontal deflection	Part of Z10
L43	Coil, width	32-4419
L44	Coil, HORIZ. LIN.	32-4211-1
L45	Coil, FM aerial	32-4382
L46	Coil, r-f choke	32-4112-11
L47	Coil, FM-mixer grid tank	32-4383
L48	Coil, FM oscillator	32-4384
L49	Coil, r-f choke	32-4061-2
L50A	Coil, 1st FM i-f primary	Part of Z5
L50B	Coil, 1st FM i-f secondary	Part of Z5
L51A	Coil, 1st AM i-f primary	Part of Z6
L51B	Coil, 1st AM i-f secondary	Part of Z6
L52A	Coil, 2nd FM i-f primary	Part of Z7
L52B	Coil, 2nd FM i-f secondary	Part of Z7
L53A	Coil, 2nd AM i-f primary	Part of Z8
L53B	Coil, 2nd AM i-f secondary	Part of Z8
L54	Coil, AM oscillator	32-4153-2
L55	Coil, AM-aerial primary	Part of T7
L56	Coil, AM-aerial secondary	Part of T7
L57	Coil, r-f choke	32-4112-11
LA1	Loop, AM aerial (50-T1477)	32-4394-7
LA1	Loop, AM aerial (50-T1478, 50-T1479, 50-T1481, 50-T1482)	32-4394-6
LS1	Speaker, p.m., 10-inch	36-1610-5
PL1	Plug, a-c interlock	Part of W1
PL2	Plug, speaker	27-4788
PL3	Plug, bin-lamp and phono-motor power (50-T1478, 50-T1479, 50-T1481, 50-T1482)	27-4785-10
PL4	Plug and cable assembly, phono-switch box (50-T1477)	41-3868-5
R1	Resistor, aerial damping, 3900 ohms	66-2398340*
R2	Resistor, a-v-c decoupling, 47,000 ohms	66-3478340*
R3	Resistor, damping, 10,000 ohms	66-3108340*
R4	Resistor, decoupling, 2200 ohms	66-2228340*
R5	Resistor, grid return, 4700 ohms	66-2478340*
R6	Resistor, grid return, 220,000 ohms	66-4228340*
R7	Resistor, grid bias, 10,000 ohms	66-3108340*
R8	Resistor, plate feed, 4700 ohms	66-2478340*
R9	Resistor, damping, 15,000 ohms	66-3158340*
R10	Resistor, terminating, 5600 ohms	66-2568340*
R11	Resistor, damping, 15,000 ohms	66-3158340*
R12	Resistor, a-v-c decoupling, 3300 ohms	66-2338340*
R13	Resistor, cathode bias, 68 ohms	66-0688340*
R14	Resistor, decoupling, 330 ohms	66-1338340*
R15	Resistor, grid return, 5600 ohms	66-2568340*
R16	Resistor, a-v-c decoupling, 3300 ohms	66-2338340*
R17	Resistor, cathode bias, 120 ohms	66-1128340*
R18	Resistor, grid return, 5600 ohms	66-2568340*
R19	Resistor, a-v-c decoupling, 3300 ohms	66-2338340*
R20	Resistor, cathode bias, 68 ohms	66-0688340*
R21	Resistor, damping, 5600 ohms	66-2568340*
R22	Resistor, terminating, 5100 ohms	66-2508340*
R23	Resistor, damping, 15,000 ohms	66-3158340*
R24	Resistor, cathode bias, 100 ohms	66-1108340*
R25	Resistor, decoupling, 1000 ohms	66-2108340*
R26	Resistor, plate feed, 5600 ohms	66-2568340*
R27	Resistor, a-v-c load, 120,000 ohms	66-4128340*

Reference Symbol	Description	Service Part No.
R28	Resistor, r-f filter, 27,000 ohms	66-3278340*
R29	Resistor, a-v-c filter, 10,000 ohms	66-3108340*
R30	Resistor, load, 10,000 ohms	66-3108340*
R31	Resistor, diode load, 3300 ohms	66-2338340*
R32	Resistor, grid return, 1 megohm	66-5108340*
R33	Resistor, decoupling, 1000 ohms	66-2108340*
R34	Resistor, voltage divider, 150,000 ohms	66-4158340*
R35	Resistor, damping, 15,000 ohms	66-3158340*
R36	Resistor, plate load, 3900 ohms	66-2394340*
R37	Resistor, l-f compensation, 4700 ohms	66-2474340
R38	Potentiometer ass'y., dual, 100,000 ohms and 2500 ohms	33-5563-19
R38A	Potentiometer, BRIGHTNESS control, 100,000 ohms	Part of R38
R38B	Potentiometer, CONTRAST control, 2500 ohms	Part of R38
R39	Resistor, limiting, 100,000 ohms	66-4108340*
R40	Resistor, grid return, 330,000 ohms	66-4338340*
R41	Resistor, limiting, 10 ohms	66-0108340*
R42	Resistor, voltage divider, 47,000 ohms	66-3478340*
R43	Resistor, l-f compensation, 1000 ohms	66-2104340*
R44	Resistor, damping, 15,000 ohms	66-3158340*
R45	Resistor, plate load, 2500 ohms	33-1335-87
R46	Resistor, plate load, 560 ohms	66-1565340*
R47	Resistor, isolating, 10,000 ohms	66-3108340*
R48	Resistor, grid return, 470,000 ohms	66-4478340*
R49	Resistor, diode load, 1 megohm	66-5108340*
R50	Resistor, grid return, 470,000 ohms	66-4478340*
R51	Resistor, cathode bias, 68 ohms	66-0688340*
R52	Resistor, decoupling, 330 ohms	66-1334340*
R53	Resistor, dropping, 1000 ohms	66-2104340*
R54	Resistor, grid return, 68,000 ohms	66-3688340*
R55	Resistor, voltage divider, 22,000 ohms	66-3224340*
R56	Resistor, dropping, 10,000 ohms	66-3104340*
R57	Resistor, filament dropping, 4.7 ohms	66-9478340*
R58	Resistor, isolating, 47 ohms	66-0478340*
R59	Resistor, tone compensating, 10,000 ohms	66-3108340*
R60	Resistor, tone compensating, 82,000 ohms	66-3828340*
R61	Resistor, detector load, 47,000 ohms	66-3478340*
R62	Potentiometer and switch assembly, dual, 2 megohms and 4 megohms	33-5563-21
R62A	Potentiometer, VOLUME control, 2 megohms (tapped 1 megohm)	Part of R62
R62B	Potentiometer, TONE control, 4 megohms	Part of R62
R63	Resistor, grid return, 8.2 megohms	66-5828340*
R64	Resistor, voltage divider, 470,000 ohms	66-4474340*
R65	Resistor, screen dropping, 470,000 ohms	66-4474340*
R66	Resistor, plate load, 150,000 ohms	66-4154340*
R67	Resistor, grid return, 470,000 ohms	66-4478340*
R68	Resistor, cathode bias, 270 ohms	66-1275340*
R69	Resistor, screen dropping, 10,000 ohms	66-3108340*
R70	Resistor, voltage divider, 820 ohms	66-1824340*
R71	Resistor, voltgae divider, 10 ohms	66-0104340*
R72	Resistor, bleeder, 3300 ohms	66-2338340*
R73	Resistor, 2-section, 5000 ohms and 2750 ohms	33-3435-25
R73A	Resistor, filter, 5000 ohms	Part of R73
R73B	Resistor, decoupling, 2750 ohms	Part of R73
R74	Resistor, limiting, 65 ohms	33-1335-92
R75	Potentiometer, FOCUS control, 200 ohms	33-5546-13
R76	Resistor, decoupling, 330 ohms	66-1334340*
R77	Resistor, bias filter, 47,000 ohms	66-3478340*
R78	Resistor, bias, 12 ohms	66-0125340*
R79	Resistor, dropping, 47,000 ohms	66-3474340*
R80	Resistor, grid return, 470,000 ohms	66-4478340*
R81	Resistor, plate load, 10,000 ohms	66-3104340*
R82	Resistor, decoupling, 5100 ohms	33-1335-18
R83	Resistor, compensating, 180,000 ohms	66-4188340*
R84	Resistor, grid return, 4.7 megohms	66-5478340*
R85	Resistor, voltage divider, 10,000 ohms	66-3104340*
R86	Resistor, video filter, 10,000 ohms	66-3108340*
R87	Resistor, plate load, 56,000 ohms	66-3564340*
R88	Resistor, integrating, 22,000 ohms	66-3228340*
R89	Resistor, integrating, 8200 ohms	66-2828340*
R90	Resistor, integrating, 8200 ohms	66-2828340*
R91	Potentiometer, HEIGHT control, 2.5 megohms	33-5565-10

Reference Symbol	Description	Service Part No.
R92	Resistor, sweep charging, 470,000 ohms	66-4474340*
R93	Resistor, limiting, 10,000 ohms	66-3108340*
R94	Resistor, limiting, 1 megohm	66-5108340*
R95	Potentiometer ass'y., dual, 1 megohm and 50,000 ohms	33-5563-20
R95A	Potentiometer, VERTICAL HOLD control, 1 megohm	Part of R95
R95B	Potentiometer, HORIZONTAL HOLD control, 50,000 ohms	Part of R95
R96	Resistor, shunt, 1 megohm	66-5108340*
R97	Resistor, sweep shaping, 6800 ohms	66-2688340*
R98	Resistor, grid return, 2.2 megohms	66-5228340*

Socket, 9-pin miniature tube	27-6203-5
Socket, 6J6 miniature tube	27-6203-1
Socket, octal tube	27-6174
Socket, 1B3GT octal tube	27-6174-5
Spring, dial cord	28-8751FA1
Strap, AM-FM tuner subchassis grounding	76-5472-1
Tuner-unit assembly	76-5411-3**

** Refer to PR-1803 for complete service information on Philco 12-position tuner.

Inoperative FM

In some cases, failure of FM reception is caused by blocking of the FM oscillator. One cause of oscillator blocking is improper lead dress. If this condition is encountered, the following components should be checked:

Model	Component	Dress
50-T1477 to 50-T1482	C4	Down against the chassis.
50-T1477 to 50-T1482	Green lead between L5 and pin 2 of the 12AT7.	Down against the chassis.

MODELS 50-T1478, 50-T1482
AM-FM Television Phono Switch

At present, there are two types of the above switch used in these models. Electrically, they are the same. The difference is in their mechanical structure. One has a three-section wafer, and the other has a four-section wafer. The part number of the three-section-wafer switch is 42-1915, which is given in the service manuals. The part number for the four-section-wafer switch is 42-1891.

Whenever replacement of this switch is necessary, use the type of switch that was originally in the receiver.

New Channel Selector Knob

An improved channel selector knob, made of die-cast metal, is available for replacement purposes. The part number of this knob is 56-7807FCP. This improved knob will be used in future production

MODELS 50-T1477 TO 50-T1482

The following changes should be made in the Replacement Parts List:

Reference Symbol	Description	Published Part No.	Correct Part No.
C128	Condenser, 10 μμf.	62-010009011	62-010009001
I2	Lamp, bin	27-6233-47	34-2064
R22	Resistor, 5100 ohms	66-2508340	66-2503340*
R41	Resistor, 10 ohms	66-0108340	66-0103340*
R63	Resistor, 8.2 megohms	66-5828340	66-5823340*
R140	Resistor, 10 ohms	66-0108340	66-0103340*
R142	Resistor, 10 ohms	66-0108340	66-0103340*

On page 10, the right-hand and left-hand column of waveform photographs should be interchanged.

In step 10 of the Television I-F Alignment Chart, the OUTPUT INDICATOR CONNECTION should read: "Connect vertical input of oscilloscope to pin 3 of FM TEST jack J3."

MODELS 50-T1477, 50-T1478, 50-T1479, 50-T1481, AND 50-T1482

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
1Z and 2	R118 changed from 120,000 ohms to 100,000 ohms.	66-4128340	66-4108340	To center HORIZ. HOLD control.
3	C88 removed.	45-3505-62		To increase width.
	R123 changed from 10,000 ohms to 4700 ohms.	66-3105340	66-2475340	
	R119 changed from 120,000 ohms to 56,000 ohms.	66-4124340	66-3564340	
	R121 changed from 100 ohms to 10,000 ohms.	66-1108340	66-3568340	
	L43 changed.	32-4419	32-4419-2	
	.022-μf. condenser added, across L43.		45-3505-60	
3Y and 4	R118 changed from 100,000 ohms to 82,000 ohms.	66-4108340	66-3828340	To center HORIZ. HOLD control.

Model 50-T1481 — New Part

A new fiberboard baffle-and-cloth assembly is available for the above model. Its part number is 40-7860-1, and it may be used as a direct replacement for the old type baffle and cloth.

MODELS 50-T1476 THROUGH 50-T1482; 50-T1484—NEW HORIZONTAL-OUTPUT TRANSFORMER

The horizontal-output transformer for the above models has been changed. The new part numbers are given below:

Model	New Transformer Part No.
50-T1104 through 50-T1432	32-8437
50-T1476 through 50-T1482; 50-T1484	32-8421-2

The above transformer should be used for all replacements in these models.

MODELS 50-T1476, 50-T1477, 50-T1478, 50-T1479, 50-T1481, 50-T1482, AND 50-T1484

RUN NO.	DESCRIPTION OF CHANGE	REMOVED PART NO.	ADDED PART NO.	REASON FOR CHANGE
5	L43 (width coil) changed.	32-4419-2	32-4419-3	To increase width.
6	1B3 socket and wiring changed. Wiring removed from pin 5 and placed on pin 4.	27-6174-5	27-6174-7	To prevent shorting of components due to internal connections on pins 1, 3, and 5 of some 1B3GT tubes.
7	Fuse added in series with ground lead of filament winding of power transformer.		Length of #26 copper wire.	To provide protection against filament shorts.
8	Vertical-output transformer changed to smaller size.	32-8405-1	32-8425 (For replacement purposes, use 32-8405*.)	

PHILCO TELEVISION-RADIO-PHONOGRAPH

MODELS 50-T1476 AND 50-T1484

The chassis of Philco Models 50-T1476 and 50-T1484 are similar to the one used in Models 50-T1477, 50-T1478, 50-T1479, 50-T1481, and 50-T1482, the difference being in the cabinet style.

All of the above models incorporate a 12-inch picture tube, a wide mask, a built-in aerial, and an M-20 automatic record changer which has three turntable speeds, for playing 33-1/3, 45, and 78 r.p.m. records.

For service information pertaining to Models 50-T1476 and 50-T1484, refer to Philco Service Manual PR-1787 and to the supplementary information in this bulletin. All of the production changes given for Models 50-T1477, 50-T1478, 50-T1479, 50-T1481, and 50-T1482 also apply to Models 50-T1476 and 50-T1484. However, the miscellaneous section of the Replacement Parts List in PR-1787 does not apply to Models 50-T1476 and 50-T1484, because of the difference in cabinets. For miscellaneous parts, therefore, refer to the following miscellaneous Replacement Parts List.

MODELS TV-127, 164, 167A, 191
12 1/2, 16 and 19 Inch Television and
Complete FM Radio

ELECTRICAL SPECIFICATIONS

POWER SUPPLY RATING
TV-127 - 185 watts on TV and 85 watts on FM
TV-164, TV-167A and TV-191 - 230 watts on TV and 105 watts on FM

AUDIO POWER OUTPUT RATING
TV-127 - 2.2 watts
TV-164, TV-167A and TV-191 - 2.5 watts

LOUDSPEAKER
TV-127 - 6"
TV-164 - 8", TV-167A and TV-191 - 12"
Voice Coil Impedance - 3.2 ohms at 400 cycles

RECEIVER ANTENNA INPUT IMPEDANCE
300 ohms balanced

TUBE COMPLEMENT See Figure 1.

TUNING RANGE
FM - 88-108 mc.
TV - Channels 2 - 6 (54-88 mc.)
Channels 7 -13 (174-216 mc.)

ALIGNMENT DATA

Picture Carrier Frequency	25.75 mc.
Accompanying Sound Trap	21.25 mc.
Adjacent Sound Trap	27.25 mc.
Sound I.F. Frequency	4.5 mc.
FM First I.F. Frequency	10.7 mc.
FM Second I.F. Frequency	4.5 mc.
FM Second Oscillator Frequency	15.2 mc.
Sound Ratio Detector Band Width	225 kc. (between peaks)
Video Response	to 4.0 mc.

FOCUS - Permanent Magnet

SWEEP DEFLECTION - Electromagnetic

OPERATING CONTROLS - See Figure 1

NON-OPERATING CONTROLS - See Figure 1

PHONO INPUT
High Impedance
Plug - Type PL55 or equivalent

TV FRONT END

The TV front end is a separate sub-chassis of the receiver. Mounted on this chassis are the RF amplifier, converter and oscillator, bandswitch, all RF and oscillator coils and the converter plate. Referring to the schematic diagram, it will be noticed that there are three double triodes available in the front end. One section of each triode is used for high band tuning, and the other section of each triode is used for low band tuning. The switching comprises a changeover in the B+ and antenna coils. The two bands are otherwise completely independent.

With the chassis inverted and the tuning dials facing the operator, all components on the left side of the front end are associated with the low band and all components associated with the high band are located on the right side WITH THE EXCEPTION OF THE LOW AND HIGH BAND ANTENNA COILS WHICH ARE INVERTED IN THEIR LOCATION. The antenna terminates in a band-pass transformer for the low or high band respectively and is switched to the proper transformer when the bandswitch is set to the desired band. The trimmer T3 adjusts the high band circuit. Tuning in the plate circuit of the RF amplifier and grid circuit of the converter is accomplished through a band-pass transformer which is continuously tuned by means of the 3-gang variable condensers located on the top of the chassis directly above their respective coils. The low band interstage transformer is aligned by iron slug S2. The high band interstage transformer is aligned by iron slug S4 and trimmers T4 and T5. The RF oscillators are of the tickler feedback type, tuned over the bands by means of the rear sections of the variable condensers. The low band oscillator is adjusted by brass slug S1 and trimmer T2 and the high band oscillator by brass slug S3 and trimmer T6. The converter plate circuit, common to the low and high band, consists of an RF choke in parallel with the converter coil S5 which is mounted at the rear of the front end sub-chassis.

PICTURE I.F. AMPLIFIER AND DETECTOR

The picture I.F. amplifier is of the conventional stagger tuned type, with four stages of I.F. amplification. In order to obtain proper band-pass characteristics, the picture I.F. coils are tuned as follows:

1. Converter coil - 23.8 Mc (iron slug S5)
2. First picture I.F. coil - 25.6 Mc (iron slug S6)
3. Second picture I.F. coil - 22.2 Mc (iron slug S7)
4. Third picture I.F. coil - 22.0 Mc (iron slug S8)
5. Fourth picture I.F. coil - 25.4 Mc (iron slug S9)

To align the I.F. system, the coils are peaked to the specified frequency with an unmodulated signal generator, The over-all I.F. response is then observed by use of the sweep generator and oscilloscope.

TRAP CIRCUIT

In order to avoid sound carrier interference in the picture, 2 sound traps are incorporated. They are tuned by iron slug S10 to a frequency of 21.25 Mc and by iron slug S21 to a frequency of 27.25 Mc to absorb excessive sound energy.

PICTURE SOUND DETECTOR

The detector is a germanium crystal rectifier (1N60) and is obtained in Video Detector Can Assembly 279-63.

SOUND SYSTEM

The sound channel operates on the intercarrier principle. The output of the second detector contains a 4.5 Mc component which is frequency modul-

©John F. Rider

World Radio History

ated with the sound, and is amplified by the 6CB6 Video amplifier and the 6AU6 Ratio detector driver. A 6AL5 Ratio detector demodulates the 4.5 Mc F.M. sound signal and feeds the two stage audio amplifier. A 4.5 Mc trap (79-85) is placed in the plate circuit of the video amplifier to prevent FM interference in the picture, and to raise the gain of the Video amplifier for 4.5 Mc. Provision is made for the connection of a record player for phonograph reproduction.

VIDEO AMPLIFIER, CONTRAST CONTROL AND A.G.C.

The single stage video amplifier uses a 6CB6 tube which provides a video amplification of approximately 25 times and has a flat frequency response up to 4 mc.

The contrast control is part of the A.G.C. system. It provides either a positive or a negative voltage which is placed in series with the developed A.G.C. voltage. When rotated in a clockwise direction, the series potential becomes more positive and tends to increase the signal output of the second detector. This action is particularly beneficial for weak signals because it counteracts the contact potential of the I.F. tubes.

DC RESTORER

Since the video amplifier is an AC amplifier, the DC component of the video signal that represents the average illumination of the original scene will not be passed. Unless this DC component is restored, difficulty will be experienced in maintaining proper scene illumination. For any given scene, this average illumination could be set properly by the brightness control. However, a change of scene would probably necessitate resetting this control. The DC restorer accomplishes this setting automatically, thus assuring proper picture illumination at all time.

SYNC. AMPLIFIER AND CLIPPER

The single stage sync. clipper amplifier separates the synchronizing information from the composite video signal signal and delivers well limited, amplified sync. pulses. The composite signal from the video amplifier is fed into a 6AU6 amplifier with the sync. pulses going in the positive direction. The grid and cathode of the 6AU6 act as peak rectifier. Thus a peak DC voltage equal to the composite video signal appears across the grid resistor keeping this tube biased off between sync. pulses. As soon as a new sync. pulse arrives, the grid will conduct and the sync pulse will appear amplified in the plate circuit. The video signal which follows the sync. pulse does not appear in the plate circuit since the sync. pulse has moved the grid potential to cut off again. Thus the video and blanking pulses are removed and only the sync. pulses appear at the sync. clipper plate.

VERTICAL SYNC. AMPLIFIER

The sync. pulses appearing at the sync. clipper plate are negative in polarity. One half of a 12AU7 acting as an amplifier and in conjunction with an integrating network effectively extracts the vertical synchronizing signal and feeds vertical sync. pulses of positive polarity to the vertical oscillator.

VERTICAL OSCILLATOR AND AMPLIFIER

The function of these circuits is to provide a sawtooth of current of the proper frequency and phase to perform the vertical scanning for the picture tube.

1. In models TV-164, TV-167A, and TV-191 a 6C4 tube with its associated components form a blocking oscillator and discharge circuit. The voltage present at the plate of this tube is of the shape required to produce a sawtooth of current in the vertical deflection coil. This voltage is coupled to a 6S4 tube which amplifies it and supplies a sufficient amount of power to the vertical deflection coil.

2. In the Model TV-127 one-half of a 6SN7 tube with its associated components form a blocking oscillator and discharge circuit. The other half of the 6SN7 is used in the same manner as the 6S4 in the 16" and 19" models.

PHASE INVERTER AND HORIZONTAL DETECTOR

The horizontal phase detector (6AL5) is a dual diode in a circuit which produces a DC output voltage which is proportional to the phase displacement between two input voltages.

The composite sync. signal is split in phase by the 12AU7 phase inverter and the resultant signals (nearly equal and 180° out of phase) comprise one of the input voltages to the phase detector. The other input voltage is taken from a tap on the horizontal output transformer. This peaked sawtooth voltage is shifted in phase and properly shaped by an RC network before being applied as the other input voltage to the phase detector.

The DC output voltage which is proportional to the phase displacement between the two input voltages, namely, the sync. pulses and the output sawtooth voltage, appears at the junction of the two 100K ohm resistors. A 4.7 megohm resistor is connected from this point to ground to provide a DC return for the horizontal sweep oscillator grid circuit. A conventional AFC filter consisting of the 470K ohm resistor in parallel with an 0.005 mfd. condenser in series with an 0.05 mfd. condenser is used. The voltage appearing across the 0.05 mfd. condenser is then the filtered control voltage which is applied to the horizontal sweep oscillator.

HORIZONTAL SWEEP OSCILLOSCOPE

The horizontal sweep oscillator has been developed to realize the characteristics which are most desirable for this purpose. The circuit shown is a stabilized cathode coupled miltivibrator, which combines the sensitivity of the multivibrator with the stability of the sine wave oscillator. The circuit is essentially a sine wave oscillator with good stability, but the resistor in series with the tuned circuit adds an impulse component which provides the desired rapid return time, and in conjunction with the other circuit constants, provides the proper control sensitivity both for the DC applied to the first grid for AFC, and with change in resistance in the second grid circuit for the manual control. Figure 4 shows the wave shape appearing at the plate of the first section of the oscillator.

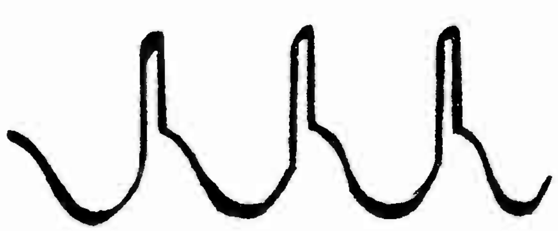

Figure 4 - Wave Shape at Plate of Horizontal Oscillator.

To place the circuit in operation, the 50K ohm horizontal hold control should be set in the center of its range and the variable inductor (part #72-66) adjusted until the picture is properly synchronized.

World Radio History

HORIZONTAL OUTPUT AND HIGH VOLTAGE SUPPLY

The horizontal output amplifier (6CD6G) and "flyback" type power supply uses standard components and is conventional except that no electrical centering means is provided. Centering of the raster is accomplished by manipulating the mechanical adjustments of the focus magnet and ion magnet. The correct centering procedure is outlined in the OPERATING INSTRUCTIONS booklet.

The function of the output tube (6CD6G) is to supply sufficient current of the proper waveform to the horizontal deflection coil in order to provide horizontal scanning for the cathode ray tube. The function of the damper tube (6W4GT) is to stop oscillation and thus help provide a linear trace. It also recovers some of the energy from the yoke kickback and uses it to help supply additional power to the horizontal and vertical sweep circuits.

The width of the picture is controlled by adjusting slug S22 which varies the amount of inductance shunted across a portion of the secondary of the horizontal output transformer. Clockwise rotation of the adjustment increases picture width.

Adjustment of the horizontal drive control located on the rear apron of the chassis determines otpimum linearity and maximum high voltage and, therefore, crispness of picture. Before setting Horizontal Size, advance Drive Control until white vertical lines appear near the center of picture. Then turn back slightly to make lines disappear. The Horizontal Size of the picture should now be set by use of the Horizontal Size Control.

After changing tubes or re-locating the receiver in different location, the Horizontal Size may have to be readjusted due to change in tube characteristics or line voltage, it is always advisable to readjust the Drive Control as mentioned above to maintain maximum high voltage.

Rotation of the horizontal linearity control, S20, will affect the center portion of the picture and should be adjusted for best horizontal linearity as follows:

A.) Rotate slug in counter-clockwise direction until it is completely out of the coil.
B.) Slowly rotate slug in clockwise direction until good linearity is indicated by observation of the test pattern.

NOTE: If this operation is carried too far, a second point will be noticed where, apparently, good linearity is obtained. With this setting however, the center of the picture is distorted and therefore the adjustment should not be left in this position. The correct setting is the one where good linearity is obtained with the slug in the "out" position.

The high voltage power supply is a "kickback" type where the power is obtained from the energy stored in the deflection inductances during each horizontal scan. When the 6CD6G plate current is cut off by the incoming pulse, a pulse appears on the primary of the output transformer due to the collapsing field in the deflection coil. This pulse of voltage is stepped up, rectified by a voltage doubler, filtered, and applied to the second anode of the picture tube.

LOW VOLTAGE POWER SUPPLY

Although the low voltage power supply is a conventional circuit delivering about 360 volts at 200 ma. in Models TV-164, TV-167A, and TV-191 and 300 volts at 190 ma. on Model TV-127, the voltage distribution circuit through the receiver is unique. Those circuits which operate at lower voltages are connected in series with each other and placed across the higher voltage required for other circuits. The RF-IF cathodes return to chassis and the plates and screens are at +140 volts. The cathode of the audio power amplifier is returned to +140 volts. This tube then operates on the difference between +140 and +360 volts or +220 volts on Models TV-164, TV-167A and TV-191. On Model TV-127, the tube operates on the difference between +140 and +300 volts or plus 160 volts. Resistance is added in series with the audio output tube plate circuit which, together with the 20 mfd. condenser returned to the cathode, acts as a filter to keep its current variations from modulating the B supply voltage.

The audio output tube also operates as a series regulator tube to maintain the +140 volts relatively constant. Because its grid is connected to a divider running from +360 volts (300 volts for Model TV-127) to ground, any change in the +140 volts, due to current variations in the RF-IF circuits, changes the effective grid - cathode voltage of the audio output tube thereby providing a substantial amount of automatic voltage regulation.

FM TUNER

The FM tuner section of this receiver consists of a 6BA6 RF amplifier, a 6BE6 first converter and a 12AT7 second converter. The RF and first converter stages are conventional and produce an intermediate frequency of 10.7 mc. at the output of the first converter. The second converter is a dual triode, one section operating as a mixer and the other section operating as an oscillator. The 10.7 mc. IF tube of the first converter is heterodyned with a fixed oscillator operating at 15.2 mc. in the mixer triode section. The 15.2 mc. signal is generated in the oscillator section of the 12AT7 tube. The difference frequency of 4.5 mc. appears in the mixer plate and is coupled into the video detector. From this point the signal is handled in the same manner as the sound component.of the TV signal.

ALIGNMENT PROCEDURE

TEST EQUIPMENT

To properly service this receiver, it is necessary that the following test equipment be available:

1. RF Sweep Generator - Frequency ranges:
   a) 20 to 27 Mc. b) 50 to 90 Mc. (at least 10 Mc. sweep width)
   c) 170 to 225 Mc. (at least 10 Mc. sweep width)
   Output must be adjustable to a maximum of 1 volt.

2. Cathode Ray Oscilloscope
   Preferably one with a wide band vertical deflection, an input calibrating source and a low capacity probe.

3. Signal Generator to provide frequencies in the following ranges:
   a) 4.4 to 4.5 Mc. b) 10.7 Mc c) 20 to 27 Mc.
   d) 52 to 90 Mc. e) 88 to 108 Mc. f) 172 to 219 Mc.

4. Vacuum Tube Voltmeter and High Voltage Multiplier Probe for use with this meter to permit measurements up to 15,000 volts.

ADJUSTMENTS REQUIRED (Refer to Figure 1 for location of alignment adjustments)

Front end - Normally only the RF oscillator coils will require the attention of the service technician. All other circuits are very broad and will therefore only rarely require readjustment. If a realignment should

©John F. Rider

World Radio History

be needed, only those thoroughly familiar with very high frequencies and sweep generators should attempt it. The oscillator coil adjustments are critical and may be affected by a tube change. Low band, as well as high band oscillator, are aligned by a trimmer and padder like a normal AM receiver.

A.) Low Band

Switch band selector to the low band, engage variable condenser completely. Then, tune slug S1 until the frequency of the oscillator equals 80 Mc. Disengage variable condenser completely and adjust trimmer T2 for an oscillator frequency of 110 Mc. Repeat this procedure several times to check accuracy.

B.) High Band

Throw the band selector switch to high band. Engage the variable condenser fully and adjust slug S3 until the oscillator frequency equals 200 Mc. Disengage condenser completely and adjust trimmer T6 to an oscillator frequency of 239 Mc. Repeat procedure several times.

The detailed alignment procedure which follows is intended primarily as a discussion of the method used, precautions to be taken and the reasons for these precautions. Then, for more convenient reference during alignment, a tabulation of the method is given. All the information necessary for alignment is given in the table. However, alignment by the table should not be attempted before reading the detailed instructions.

ORDER OF ALIGNMENT

When a complete receiver alignment is necessary, it should be performed in the following order:

A.) Align ratio detector as indicated in alignment table at 4.5 Mc.
B.) Set 4.5 Mc. trap with slug S11.
C.) Align all I.F. transformers following procedure and table.
D.) Set sound traps to 21.25 Mc. with slug S10 and to 27.25 with slug S21.
E.) Retouch picture I.F. transformers for full band width as per alignment procedure in table.
F.) Align FM section as per alignment procedure in table.
G.) Connect receiver to an antenna and tune for a test pattern if possible.
H.) Pay special attention to the proper setting of the HORIZONTAL HOLD CONTROL. It is not enough to set the HORIZONTAL HOLD CONTROL at the time of instellation to "hold" a picture. The setting should be checked for "pull-in". To make this check, the TUNING CONTROL should be tuned rapidly on and off a station. Find the point of adjustment for the HORIZONTAL HOLD CONTROL, where the picture will fall into frame, without hesitation.
I.) Adjust other size and hold controls as outlined in OPERATING INSTRUCTIONS booklet.
J.) Adjust FM trap slug S11 for minimum FM interference in picture.

PICTURE I.F. OSCILLATION

If the receiver is badly misaligned and two or more of the I.F. coils are tuned to the same frequency, or if the sound traps are not set properly, the receiver may fall into I.F. oscillatorn. I.F. oscillation shows up as a voltage in excess of a few tenths of a volt at the picture detector load resistor. If such a condition is encountered, it is sometimes possible to stop oscillation by adjusting the coils approximately by setting the adjustment screws to be nearly equal to those of another receiver known to be in proper alignment.

There is little likelihood of any oscillation occurring if the 21.25 Mc. trap (adjusted by slug S10) is at its proper frequency, and the third picture I.F. (slug S3) is set at 21.6 Mc. or lower. If oscillation persists, check for open by-pass condenser in I.F. strip.

RATIO DETECTOR ALIGNMENT

Set the signal generator for approximately 1 volt output at 4.5 Mc. and connect it to the grid of the ratio detector driver. To align the primary of the Ratio Detector, connect the vacuum tube voltmeter to pin No. 2 of the 6AL5 and tune S13 for maximum negative voltage. To balance the secondary of the ratio detector, connect the vacuum tube voltmeter from the phono input jack to ground. Adjust S14. It will be found that it is possible to produce a positive or negative voltage depending on this adjustment. Obviously, to pass from a positive to a negative voltage, the voltage must go through zero. S14 should be adjusted for zero output. It is possible to use any television station for this alignment since the difference between the frequency of the picture and the sound carrier is 4.5 mc.

SOUND I.F. ALIGNMENT

Connect the signal generator to terminal #4 of the video detector assembly and maintain it at 4.5 Mc. Connect the vacuum tube voltmeter to pin No. 2 of the 6AL5 Ratio Detector and adjust slug S12 for maximum DC reading. Reduce output of signal generator to a very low lev 1 and readjust S12.

ALIGNMENT CHART

FUNCTION	NOTES	CONNECT R.F. SIGNAL GENERATOR To:	CONNECT OUTPUT INDICATOR (V.T.V.M.) TO:	SET SIGNAL GENERATOR TO: (MC.)	ADJUST	OUTPUT INDICATIONS
1) Video I.F. Spot Frequency Alignment	Switch to TV Channels 2-6 --- Contrast Control to Maximum --- Remove 12AT7 Oscillator Tube	Low Band Mixer Grid (Pin #7)	Terminal #4 of Video Detector Coil Assembly	23.8	S5	Maximum on V.T.V.M.

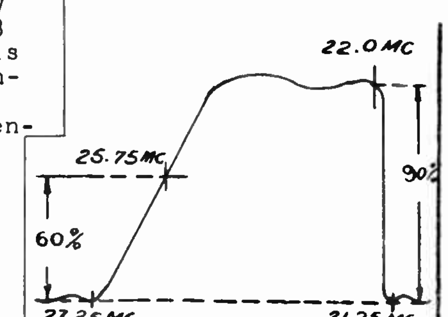
FUNCTION	NOTES	CONNECT R.F. SIGNAL GENERATOR TO:	CONNECT OUTPUT INDICATOR (V.T.V.M.) TO:	SET R.F. SIGNAL GENERATOR and DIAL POINTER TO:	ADJUST	OUTPUT INDICATION
3) FM RF Alignment	Switch to FM ---- Contrast Control to Maximum ---- Before Aligning Check Zero Set of FM Dial Pointer	Antenna Terminals Through 2 150 ohm Resistors (Dummy)	Pin #2 of 6AL5 Ratio Detector	90 MC.	Oscillator Disc (P1) and R.F. Padder P2	Maximum on V.T.V.M
				Set Generator to 106MC. and locate Signal on FM Dial. Note amount of error.	Set Tuner Pointer to the other side of 106 MC. by 1/2 the Error Found. Then Adjust T8.	Maximum to V.T.V.M.
			106 MC.	Oscillator Disc (P1)	Oscillator Disc (P1) and Antenna Trimmer (T7)	Maximum on V.T.V.M.
				Recheck Calibration at 90 MC. If Necessary, Repeat.		

FUNCTION	CONNECT SWEEP GENERATOR TO:	CONNECT R.F. SIGNAL GENERATOR TO:	SET R.F. SIGNAL GENERATOR TO:	CONNECT SCOPE TO:	ADJUSTMENTS
4) VIDEO I.F. SWEEP ALIGNMENT	Loosely coupled to 12AT7 mixer tube by means of a metal sleeve 1" wide. A miniature tube shield may be used. NOTE: Switch to Channels 2-6	Loosely coupled to Sweep Generator Output Cable.	Signal Generator is used as marker. Set from 20-28 Mc. as needed for markers.	Terminal #4 of Video Detector Coil Assembly 279-63 (Scope is synchronized to Sweep Generator.)	Adjust S5, S6, S7, S8 and S9 (as needed) to give following response curve:



NOTE: Keep input signal at low level to avoid overloading. Keep contrast control at center setting.

SERVICE SUGGESTIONS

I. NO RASTER ON C.R.T. - SOUND NORMAL

A.) IF ALSO NO HIGH VOLTAGE

1. Check 1/4 amp. fuse. Before replacing blown fuse check the following:-

a.) Deflection yoke coils - check for grounded windings and shorts between Vertical and Horizontal windings.
b.) Defective horizontal output transformer.
c.) Defective 6CD6G, 1B3GT's or 6W4GT.
d.) Shorted yoke series condenser.
e.) Shorted Boost filter electrolytic

2. Check 6SN7GT horizontal oscillator tube and associated circuit components. No horizontal drive.
3. Check 500 mmfd. high voltage filter capacitors.
4. Open high voltage filter resistor.

B.) IF HIGH VOLTAGE IS NORMAL

1. Ion trap magnet set incorrectly or reversed.
2. Defective C.R.T.
3. Wrong operating voltages at C.R.T. socket.
4. Check setting of brightness control.

II. NO VERTICAL DEFLECTION

1.) Check 6C4 (6SN7 in TV-127) vertical oscillator and associated circuit components.
2.) Check 6S4 (6SN7 in TV-127) vertical amplifier and associated circuit components.
3.) Check vertical deflection coils.
4.) Check vertical output transformer.
5.) Check for B+ supply voltage.

III. POOR VERTICAL LINEARITY

1.) If adjustments do not correct, change 6C4 and/or 6S4 vertical sweep tubes. (6SN7 in TV-127)
2.) Low B+ supply voltage.
3.) Defective vertical output transformer.

IV. UNSTABLE VERTICAL HOLD (JITTER)

1.) If adjustments do not correct, change 6C4 and/or 6S4 vertical sweep tubes. (6SN7 in TV-127)
2.) Check as in sections II and III for intermittent operation.
3.) Check 4700 mmfd. vertical oscillator grid capacitor.
4.) Excessive external noise conditions combined with weak signals due to poor reception or misalignment.
5.) Contrast control operated at excessive level.
6.) Excessive input signal causing overload. Attenuate antenna input.
7.) Check for loose connections or noisy tubes.

V. NO VERTICAL SYNC. (ROLLING)

1.) Check 1/2 12AU7 vertical sync. amplifier, and associated components.
2.) Check components associated with timer grid (pin 4) of 6SN7 vert. oscillator.

©John F. Rider

World Radio History

VI. TRAPEZOIDAL OR NON-SYMMETRICAL RASTER

1.) Improper setting of focus magnet or ion trap magnet. This will also cause shading at the sides or corners of the raster.
2.) Defective yoke.
3.) Defective C.R.T.
4.) Defective focus magnet.

VII. POOR HORIZONTAL LINEARITY

1.) If adjustments do not correct, change 6SN7GT, 6CD6G or 6W4GT tubes in horizontal sweep circuit.
2.) Horizontal output transformer defective.
3.) Defective deflection yoke.
4.) Check horizontal linearity control associated components.
5.) Broken slug inside linearity coil.
6.) Check circuit components coupling 6SN7GT horizontal oscillator tube to 6CD6G.
7.) Check D.C. operating voltages at tube sockets.
8.) Raster may be off center due to:
   a.) Focus magnet set wrong.
   b.) Shorted or leaky .25 mfd. capacitor returning horizontal deflection coil to B+.

VIII. NO HORIZONTAL SYNC. (PICTURE TEARING)

1.) S19 improperly adjusted - readjust for sync. with horizontal hold control at center of rotation.
2.) Check 1/2 12AU7 phase inverter and 6AL5 phase detector tubes and associated circuit components.
3.) Horizontal output transformer defective.
4.) Check horizontal oscillator coil, part #72-66.
5.) Check tubes and components in horizontal oscillator circuit. Check D.C. operating voltages.
6.) Dress C.R.T. cathode lead (yellow) away from deflection yoke cable. If too near, will cause horizontal jitter.

IX. NO HORIZONTAL OR VERTICAL SYNC. (SIGNAL NORMAL AT C.R.T.)

1.) Check 6AU6 sync. clipper and associated circuit components.
2.) Check 1/2 6AL5 D.C. restorer.
3.) Check 1N60 germanium crystal video detector.
4.) Defective deflection yoke.
5.) Defective 100 mfd., 25 V. cathode by-pass capacitor on 6S4. (6SN7 in TV-127)

X. RASTER AND SIGNAL ON C.R.T. BUT NO SOUND

1.) Check 6AU6 ratio detector driver, 6AL5 ratio detector and audio amplifier tubes and circuit components.
2.) Check shielded audio leads for grounds.
3.) Defective loudspeaker.
4.) Check phono input jack for bad contacts.

XI. SOUND DISTORTED

1.) Sheck alignment and balance of ratio detector.
2.) Check operating bias on 6AQ5 tube (at 117 volt A.C. line and with no signal, should be between 6 and 10 volts).
3.) Defective audio tubes.
4.) Defective loudspeaker.

XII. HUM OR BUZZ IN SOUND-VOLUME CONTROL MINIMUM

1.) Dress .05 mfd. coupling condenser to 6AT6 grid away from high band oscillator coil.
2.) Check main power supply filter capacitors.
3.) Check 80 mfd., 150V., 6AQ5 cathode by-pass capacitors.

XIII. PICTURE STABLE - POOR RESOLUTION

1.) Check video detector coil assembly and 1N60 germanium crystal.
2.) Check 6CB6 Video Amplifier tube.
3.) Check peaking coils in video amplifier.
4.) Check alignment of 4.5 Mc. trap.
5.) Check setting of focus magnet.
6.) Defective C.R.T.
7.) R.F. - I.F. circuits improperly aligned.

XIV. PICTURE SMEARY, TRAILERS

1.) Video amplifier overloaded by excessive input. Reduce contrast control setting.
   NOTE: In strong signal areas, excessive input at the antenna terminals will produce smear, picture jitter, etc. An attenuator network at the antenna terminals will remedy this condition.
2.) Check for open 500 microhenry choke (75-26) in video detector can.
3.) Check video coupling capacitors and grid resistors.

XV. RASTER BUT NO SOUND, PICTURE OR SYNC.

1.) Defective antenna or transmission line.
2.) R.F. oscillator not operating or off frequency.
3.) R.F. unit completely inoperative. Check tubes and voltages.
4.) I.F. section inoperative. Check tubes and voltages.
5.) Check video detector coil assembly and crystal.
6.) Video amplifier inoperative. Check tubes and voltages.

XVI. PICTURE AND SOUND NOT TUNING TOGETHER

1.) Complete realignment.
2.) Extremely weak signal conditions due to location or poor antenna.
3.) Set being tuned improperly.

XVII. DIFFICULTY IN TUNING ACCOMPANIED BY BUZZ

1.) Check alignment of 21.25 mc. trap (S10)
2.) Check ratio detector alignment.
3.) Complete realignment.
4.) Weak or poor signal conditions due to location or antenna.
5.) Everything normal, but set is being tuned improperly.
6.) Contrast control turned up too far, overloading video amplifier.

Model TC168
Walnut, Mahogany or Oak

GENERAL DESCRIPTION

Models T164, TC165, TC166, TC167 and TC168 receivers employ twenty-one tubes plus two rectifiers and a 16GP4 kinescope. The receivers are identical except for cabinets, jewel lights and speakers. A phono input jack is provided to permit the use of an external record player.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE ...... 146 square inches on a 16GP4 kinescope

R-F FREQUENCY RANGES
All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
Fine Tuning Range..±250 kc. on chan. 2, ±650 kc. on chan. 13
Picture Carrier Frequency .... 25.75 mc.
Sound Carrier Frequency .... 21.25 mc.

CHASSIS DESIGNATIONS
KCS40 .... In Model T164
KCS40A .... In Models TC165, TC166, TC167, TC168

LOUDSPEAKERS
KCS40 .... (92580-3W) 8" PM Dynamic, 3.2 ohms
KCS40A .... (92569-10W) 12" PM Dynamic, 3.2 ohms

POWER SUPPLY RATING ...... 115 volts, 60 cycles, 250 watts

AUDIO POWER OUTPUT RATING .... 3.5 watts max.

RECEIVER ANTENNA INPUT IMPEDANCE
Choice: 300 ohms balanced or 72 ohms unbalanced.

RCA TUBE COMPLEMENT

	Tube Used	Function

HIGH VOLTAGE WARNING

OPERATION OF THIS RECEIVER OUTSIDE THE CABINET OR WITH THE COVERS REMOVED INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WORK ON THE RECEIVER SHOULD NOT BE ATTEMPTED BY ANYONE WHO IS NOT THOROUGHLY FAMILIAR WITH THE PRECAUTIONS NECESSARY WHEN WORKING ON HIGH-VOLTAGE EQUIPMENT. DO NOT OPERATE THE RECEIVER WITH THE HIGH-VOLTAGE COMPARTMENT SHIELD REMOVED.

KINESCOPE HANDLING PRECAUTIONS

DO NOT REMOVE OR HANDLE THE KINESCOPE IN ANY MANNER UNLESS SHATTERPROOF GOGGLES AND HEAVY GLOVES ARE WORN. PEOPLE NOT SO EQUIPPED SHOULD BE KEPT AWAY WHILE HANDLING KINESCOPES. KEEP THE KINESCOPE AWAY FROM THE BODY WHILE HANDLING.

The kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For this reason, kinescopes must be handled with more care than ordinary receiving tubes.

The large end of the kinescope bulb — particularly that part at the rim of the viewing surface — must not be struck, scratched or subjected to more than moderate pressure at any time. In installation, if the tube sticks or fails to slip smoothly into its socket, or deflecting yoke, investigate and remove the cause of the trouble. Do not force the tube. Refer to the Receiver Installation section for detailed instructions on kinescope installation. All RCA replacement kinescopes are shipped in special cartons and should be left in the cartons until ready for installation in the receiver. Keep the carton for possible future use.

©John F. Rider

World Radio History

OPERATING INSTRUCTIONS

The following adjustments are necessary when turning the receiver on for the first time:

1. See that the TV-PH switch on the rear apron is in the "TV" position.

2. Turn the receiver "ON" and advance the SOUND VOLUME control to approximately mid-position.

3. Set the STATION SELECTOR to the desired channel.

4. Adjust the FINE TUNING control for best sound fidelity and the SOUND VOLUME control for suitable volume.

5. Turn the BRIGHTNESS control fully counter-clockwise, then clockwise until a light pattern appears on the screen.

6. Adjust the VERTICAL hold control until the pattern stops vertical movement.

7. Adjust the HORIZONTAL hold control until a picture is obtained and centered.

8. Turn the BRIGHTNESS control counter-clockwise until the retrace lines just disappear.

9. Adjust the PICTURE control for suitable picture contrast.

10. After the receiver has been on for some time, it may be necessary to readjust the FINE TUNING control slightly for improved sound fidelity.

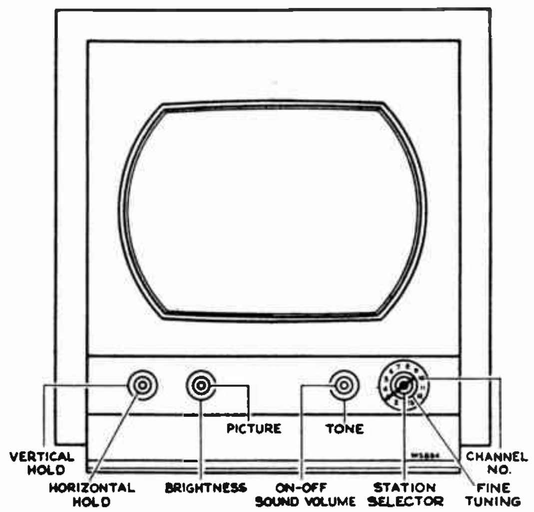

Figure 1—Receiver Operating Controls

11. In switching from one station to another, it may be necessary to repeat steps 4, 8 and 9.

12. When the set is turned on again after an idle period, it should not be necessary to repeat the adjustments if the positions of the controls have not been changed. If any adjustment is necessary, step number 4 is generally sufficient.

13. If the positions of the controls have been changed, it may be necessary to repeat steps 2 through 9.

14. To use the instrument with a record player, plug the record-player output cable into the PHONO jack on the rear apron, and set the TV-PH switch on "PH." Set the TV-PH switch back to TV on completion of the record program.

INSTALLATION INSTRUCTIONS

These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

UNPACKING.—To unpack the T164, tear open the carton flaps, pick up the receiver from under the bottom of the cabinet, and lift it out of the shipping carton.

The receiver may now be placed on a stand, table or other appropriate support. If a table or piece of furniture other than the regular stand is used for support, care must be taken to see that the receiver is sitting on the cabinet feet. If the bottom of the cabinet is permitted to touch a table top, the table could become badly scratched.

To unpack the console receivers, turn the shipping carton on its side and tear open the carton bottom flaps. Fold the flaps up along the side of the carton and turn the carton back up. Lift the carton up and off the cabinet.

To remove the skid attached to the bottom of the console cabinets, take off the nuts from the two bolts that hold the cabinet on the skid. With a man at each end of the cabinet, lift the cabinet off the skid.

Take off the cabinet back. The operating control knobs are packed in a bag which is tied on top of the chassis. Remove the bag and install the knobs on the proper control shafts.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the high voltage lead clip is in place between the rim of the kinescope and the kinescope mask.

Connect the antenna transmission line to the receiver antenna terminals. Plug the receiver power cord into a 115 volt a-c power source. Turn the receiver power switch to the "on" position, the brightness control fully clockwise, and the picture control counter-clockwise.

WARNING. — The high voltage supply in this receiver delivers 12,000 volts! A.C. interlocks are provided at the back of the set so that when the back is removed — so is the power.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 2, and with the part number on magnet towards the rear of the chassis. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest

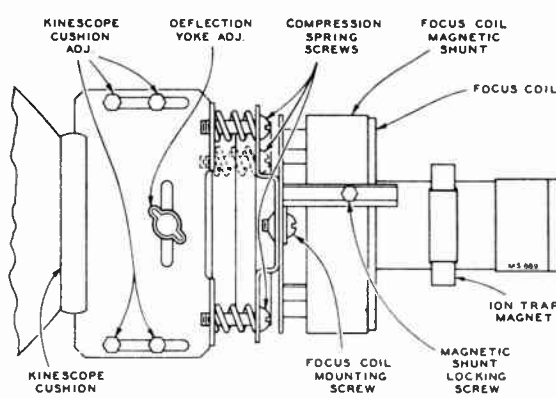

Figure 2—Yoke and Focus Coil Adjustments

raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the focus control (R191 on the chassis rear apron) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches of this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. See steps 3 through 9 of the receiver operating instructions.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC threshold control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R138 on the rear apron (see Figure 3) clockwise until the set operates normally and the picture can be synced.

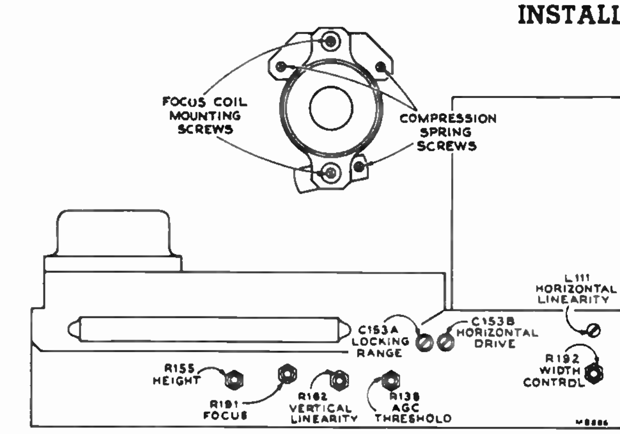

Figure 3—Rear Chassis Adjustments

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Usually the picture will remain in sync. Turn the control clockwise slowly. If the picture did fall out of sync upon removal of the signal, the number of diagonal black bars will be gradually reduced and when only 2 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. The picture should remain in sync for approximately 180 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should be out of sync and should show 1 vertical or diagonal black bar in the raster.

If the receiver passes the foregoing checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Coil Adjustment."

ALIGNMENT OF HORIZONTAL OSCILLATOR. — If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 180 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments:

Horizontal Frequency Adjustment.—Turn the T109 sine wave core (on the outside of the apron) all the way out of the coil.

Set the locking range trimmer C153A one-half turn out from maximum capacity.

Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and turn the frequency wave core of T109 under the chassis until the picture syncs and the sync bar just begins to move into the picture.

Note.—Occasionally, a tube may be found which does not respond to this alignment procedure since it may not be possible to sync the picture by means of the frequency core when the sine wave core is all the way out of the coil. Yet, the tube may work perfectly well when the circuit is properly aligned. In such a case, it may be necessary to turn the sine wave core in slightly, and readjust the frequency core to obtain sync.

Turn the sine wave core of T109 in until the blanking bar begins to move off to the left of the picture. Alternately turn the sine wave core in and the frequency out, keeping the picture in sync and the blanking bar showing in the picture.

Continue alternate adjustments until the picture falls from sync into a parasitic oscillation as indicated by a non-synchronized pattern which flickers in width and centering with possibly a light ragged vertical bar through the center of the screen.

Turn the sine wave core out ½ turn. Adjust the frequency core in until the picture is in sync and horizontal blanking appears as a vertical bar in the picture.

Check of Pull-in Range.—Turn the horizontal hold control fully counter-clockwise. Connect a 270K ohm resistor across C156. Momentarily switch off channel and back; the picture will then be out of sync. Turn the hold control clockwise slowly and observe the minimum number of bars obtained just before the picture pulls into sync.

The picture should snap in from two complete blanking bars. If two bars are not obtained, turn the locking range trimmer C153A in to obtain less bars or out to obtain more bars.

If C153A was adjusted, remove the 270K resistor, turn the horizontal hold control fully clockwise and adjust the T109 frequency core until horizontal blanking appears as a vertical bar in the synced picture. Then repeat the entire check of pull-in range to this point.

Repeat the adjustments under "Check of Pull-in Range" until the conditions specified are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If the oscillator does not hold sync properly at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 11.

FOCUS COIL ADJUSTMENTS.—The focus coil should be adjusted so that there is approximately one-quarter inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus coil. This spacing gives best average focus over the face of the tube. The axis of the hole through the focus coil should be parallel with the axis of the kinescope neck.

The focus coil is provided with a magnetic shunt in the form of a metal sleeve as shown in Figure 2. If the receiver focuses with the focus control near the end of its range, loosen the shunt locking screw and slide the shunt backward or forward until focus occurs in the center range of the focus control.

CENTERING ADJUSTMENT. — No electrical centering controls are provided. Centering is obtained by loosening the two focus coil mounting screws and sliding the coil up or down or from side to side. If the focus coil was appreciably changed in position or if a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by sliding the coil. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In extreme cases it may be necessary to adjust one or more of the three focus coil compression spring screws to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive counter-clockwise as far as possible without losing tension on trimmer.

Set the width control to minimum picture width.

Turn the horizontal linearity coil out until appreciable loss in width occurs, then in until nearly maximum width and the best linearity is obtained. Do not run the core in beyond the point of maximum linearity change, as the current drawn by the 6BG6G then becomes excessive.

Adjust the width control for the proper picture width.

Readjust linearity, but again not beyond the point of maximum linearity change. If necessary adjust the drive control for best linearity.

If at very high line voltage, the picture width is excessive even with the width control set at minimum, turn the linearity coil out to obtain the proper width. On high line voltage, excessive width generally will be accompanied by good linearity, without retouching the drive.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

FOCUS.—Adjust the focus control (R191 on chassis rear apron) for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R155 on chassis rear apron) until the picture fills the mask vertically. Adjust vertical linearity (R162 on rear apron) until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust the focus coil to align the picture with the mask.

Check to see that the cushion and yoke thumbscrews and the focus coil mounting screws are tight.

World Radio History

INSTALLATION INSTRUCTIONS

AGC THRESHOLD CONTROL.—The AGC threshold control R138 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC threshold control, tune in a strong signal, sync the picture and turn the picture control to the maximum clockwise position. Turn the brightness control counter-clockwise until the vertical retrace lines are just invisible. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R138. If the picture requires an appreciable portion of a second to reappear, R138 should be readjusted.

Set the picture control at the maximum clockwise position. Turn R138 fully clockwise. The top one-half inch of the picture may be bent slightly. This should be disregarded. Turn R138 counter clockwise until there is a very, very slight bend or change of bend in the top one-half inch of the picture. Then turn R138 clockwise just sufficiently to remove this bend or change of bend.

If the signal is very weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R138 counter-clockwise until the snow in the picture becomes more pronounced, then clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far counter-clockwise on a weak signal, then the receiver may overload when a strong signal is received.

CHECK OF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 10. The adjustments for channels 2 through 5 and 7 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis and channel 6 adjustment is in the kinescope well. See Figures 8 and 9 for their location.

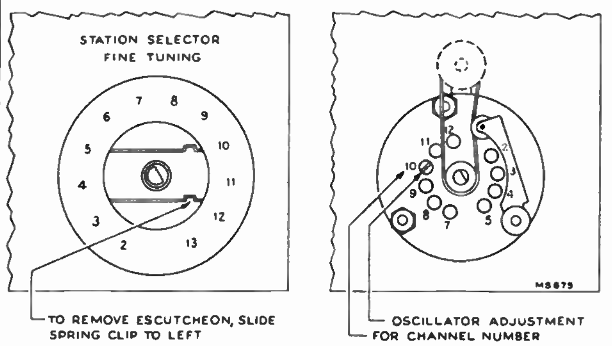

Figure 1—R-F Oscillator Adjustments

Replace the cabinet back and make sure that the screws are tight in order to prevent rattling at high volume.

WEAK SIGNAL AREA OPERATION.—Since the vast majority of receivers are sold in strong signal areas, the chassis are aligned to produce the cleanest pictures in those areas. However, if the receiver is to be operated in a weak signal area, better performance can be obtained by "peaking" the r-f unit.

To peak the r-f unit in these receivers, disconnect the 390-ohm resistor R14 which is on top of the r-f unit chassis. Adjust L66 to obtain the best possible picture on the weakest low channel station received.

If the peaked receiver is subsequently taken to a strong signal area, the resistor R14 should be connected in place and L66 adjusted for "flat" response on the low channels.

CHASSIS REMOVAL.—To remove the chassis from the cabinet for repair or installation of a new kinescope, remove the control knobs, the cabinet back, unplug the speaker cable, the kinescope socket, the antenna cable, the pilot light cable, the yoke and focus coil cable. Remove the yoke frame grounding strap and the interlock switch. Take out the six chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet.

KINESCOPE HANDLING PRECAUTION.—Do not install, remove, or handle the kinescope in any manner, unless shatterproof goggles and heavy gloves are worn. People not so equipped should be kept away while handling the kinescope. Keep the kinescope away from the body while handling.

To remove the kinescope from the cabinet, take out the four screws and one wing screw which hold the yoke frame to the cabinet. Remove the kinescope, the yoke frame with yoke and focus coil as an assembly.

INSTALLATION OF KINESCOPE.—Handle this tube by the metal rim at the edge of the screen. Do not cover the glass bell of the tube with fingermarks as it will produce leakage paths which may interfere with reception. If this portion of the tube has inadvertently been handled, wipe it clean with a soft cloth moistened with "dry" carbon tetrachloride.

Wipe the kinescope screen surface and front panel safety glass clean of all dust and fingermarks with a soft cloth moistened with "Windex" or similar cleaning agent.

Turn the tube so that the key on the base of the tube will be down and insert the neck of the kinescope through the deflection and focus coils. If the tube sticks, or fails to slip into place smoothly, investigate and remove the cause of the trouble. Do not force the tube.

Replace the kinescope and yoke frame assembly in the cabinet. Insert the four screws and wing screw and tighten.

Slip the kinescope as far forward as possible. Slide the kinescope cushion firmly up against the flare of the tube and tighten the adjustment wing screws. Slide the deflection yoke as far forward as possible. If this is not done, difficulty will be encountered in adjusting the ion trap magnet and focus coil because of shadows on the corner of the raster.

Slide the chassis into the cabinet, then insert and tighten the six chassis bolts.

Slip the ion trap magnet over the neck of the kinescope.

Connect the kinescope socket to the tube base and slip the high voltage lead clip between the rim of the kinescope and the mask.

Reconnect all other cables. Do not forget to replace the yoke frame grounding strap. Perform the entire set-up procedure beginning with Ion Trap Magnet Adjustment.

ANTENNAS.—The finest television receiver built may be said to be only as good as the antenna design and installation. It is therefore important to select the proper antenna to suit local conditions, to install it properly and orient it correctly.

RCA Television Antenna, type No. 225A1 is designed for reception of all twelve television channels. The antenna uses the 300-ohm RCA "Bright Picture" television transmission line. The antenna, a dipole with reflector, is unidirectional on channels two through six. When used on these channels the maximum signal is obtained when the antenna rods are broadside toward the transmitting antenna, with the antenna element between the reflector and the transmitting antenna.

When operated on channels seven through thirteen (174 to 216 Mc), the antenna has side lobes. On these channels, the maximum signal will be obtained when the antenna is rotated approximately 35 degrees in either direction from its broadside position toward the transmitting antenna. In many instances this effect may not cause any difficulties and it may be possible to make a compromise orientation which will permit satisfactory reception on all high and low channels. In some instances, however, this will not be the case due to reflections or to insufficient signal strength from one or more stations.

RCA antenna type 204A1 is available for use in locations in which it is desirable to eliminate side lobes and to have the antennas 7-13 directivity the same as its 2-6 directivity.

For use in cases where it is desirable to have adjustable 7-13 directivity different from 2-6, RCA antenna type 206A1 is provided.

In weak signal areas it is possible to "stack" the type 204A1 antenna to obtain increased signal strength by employing one type 204A1 antenna and one type 208A1 stacking kit.

CABINET ANTENNA.—A cabinet antenna is provided which may be employed in strong signal areas in which no reflections are experienced. The antenna leads are brought out near the receiver antenna terminal board.

World Radio History

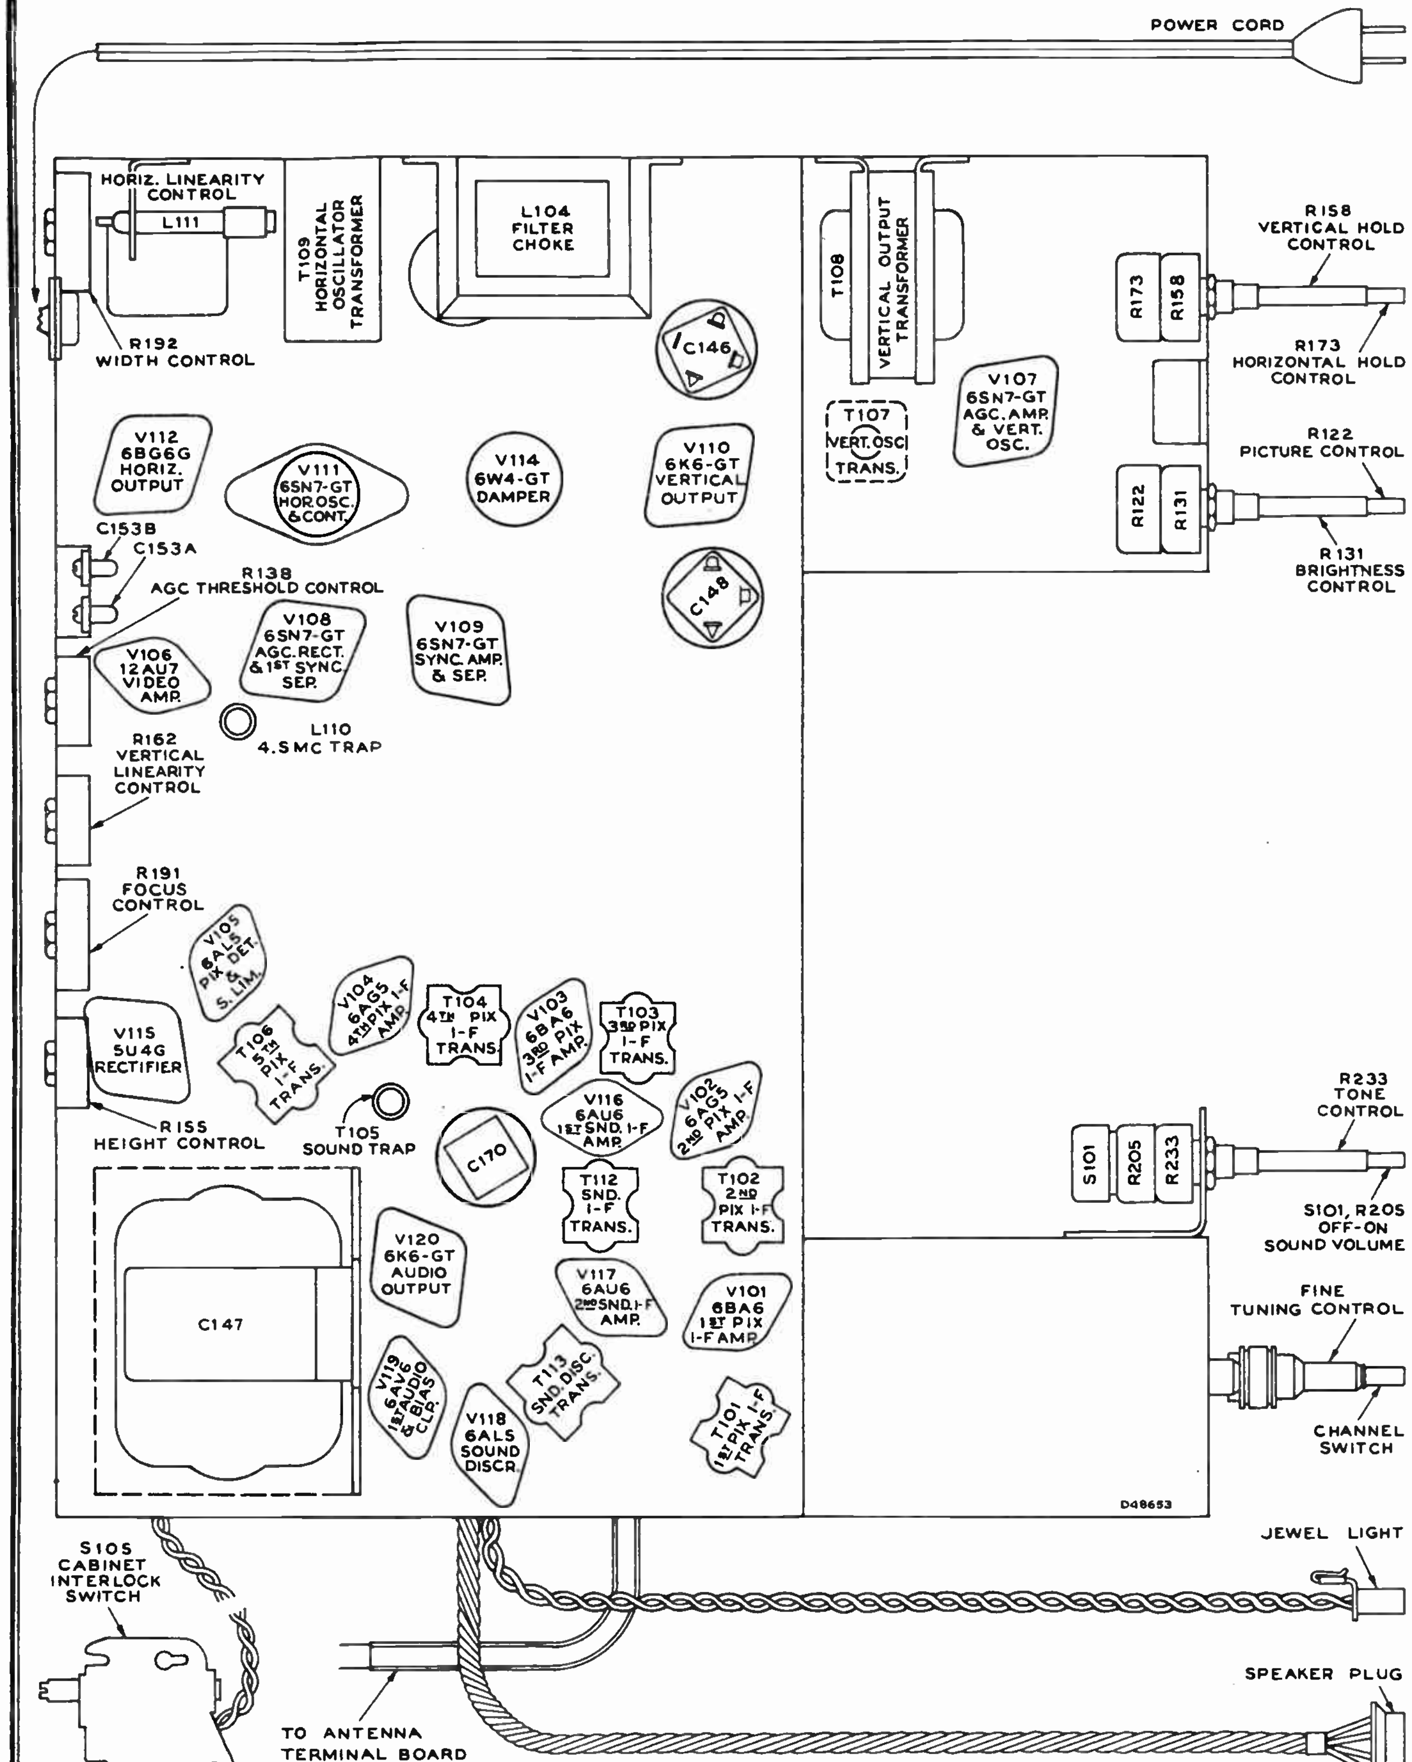

Figure 6—Chassis Bottom View

ALIGNMENT PROCEDURE

TEST EQUIPMENT. — To service properly the television chassis of this receiver, it is recommended that the following test equipment be available:

R-F Sweep Generator meeting the following requirements:

(a) Frequency Ranges
20 to 30 mc., 1 mc. and 10 mc. sweep width
50 to 90 mc., 10 mc. sweep width
170 to 225 mc., 10 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

Cathode-Ray Oscilloscope. — For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response, and should be capable of passing a 60-cycle square wave without appreciable distortion. While this requirement is not met by many commercial instruments, RCA Oscilloscopes, types WO-55A, WO-58A, WO-79A, and WO-60C fill the requirement and any of these may be employed.

For video and sync waveform observations, the oscilloscope must have excellent frequency and phase response from 10 cycles to at least two megacycles in all positions of the gain control. The RCA types WO-58A and WO-79A are ideally suited for this purpose.

Signal Generator to provide the following frequencies with crystal accuracy.

(a) Intermediate frequencies
19.75 mc. adjacent channel picture trap
21.25 mc. sound i-f and sound traps
22.05 and 24.75 mc. conv. and first pix i-f trans.
25.9 mc. second picture i-f transformer
24.6 mc. fourth picture i-f transformer
22.0 mc. third picture i-f transformer
22.5 mc. fifth picture i-f transformer
25.75 mc. picture carrier
27.25 mc. adjacent channel sound trap

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(c) Output on these ranges should be adjustable and at least .1 volt maximum.

Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

Electronic Voltmeter of Junior "VoltOhmyst" type and a high voltage multiplier probe for use with this meter to permit measurements up to 15 kv.

Service Precautions. — If possible, the chassis should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, it would be a great convenience to have a set of yoke, focus coil, kinescope socket, high voltage and speaker extension cables.

CAUTION: Do not short the kinescope second-anode lead. Its short circuit current represents a considerable overload on the high voltage rectifier V113.

Adjustments Required. — Normally, only the r-f oscillator line will require the attention of the service technician. All other circuits are either broad or very stable and hence will seldom require readjustment.

The oscillator line is relatively non-critical. When oscillator tubes are changed, in all probability it will be necessary to adjust only C6 in order to bring the entire line into adjustment.

ORDER OF ALIGNMENT. — When a complete receiver alignment is necessary, it can be most conveniently performed in the following order:

(1) Sound discriminator
(2) Sound i-f transformers
(3) Picture i-f traps
(4) Picture i-f transformers
(5) R-F and converter lines
(6) R-F oscillator line
(7) 4.5 mc. video trap
(8) Sensitivity check

SOUND DISCRIMINATOR ALIGNMENT. — Set the signal generator for approximately .1 volt output at 21.25 mc. and connect it to the second sound i-f grid.

Detune T113 secondary (bottom).

Set the "VoltOhmyst" on the 3-volt scale.

Connect the meter, in series with a 1-megohm resistor, to the junction of diode resistors R203 and R204.

Adjust the primary of T113 (top) for maximum output on the meter.

Connect the "VoltOhmyst" to the junction of C183 and R203. Adjust T113 secondary (bottom). It will be found that it is possible to produce a positive or negative voltage on the meter dependent upon this adjustment. Obviously to pass from a positive to a negative voltage, the voltage must go through zero. T113 (bottom) should be adjusted so that the meter indicates zero output as the voltage swings from positive to negative. This point will be called discriminator zero output.

Connect the sweep oscillator to the grid of the second sound i-f amplifier.

Adjust the sweep band width to approximately 1 mc. with the center frequency at approximately 21.25 mc. and with an output of approximately .1 volt.

Connect the oscilloscope to the junction of C183 and R203. The pattern obtained should be similar to that shown in Figure 12. If it is not, adjust T113 (top) until the waveform is symmetrical.

The peak-to-peak band width of the discriminator should be approximately 350 kc. and the trace should be linear from 21.175 mc. to 21.325 mc.

SOUND I-F ALIGNMENT. — Connect the sweep oscillator to the first sound i-f amplifier grid.

Connect the oscilloscope to the second sound i-f grid return (terminal A of T112) in series with a 33,000-ohm isolating resistor.

Insert a 21.25 mc. marker signal from the signal generator into the first sound i-f grid.

Adjust T112 (top and bottom) for maximum gain and symmetry about the 21.25 mc. marker. The pattern obtained should be similar to that shown in Figure 13.

The output level from the sweep should be set to produce approximately .3 volt peak-to-peak at the second sound i-f grid return when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

The band width at 70% response from the first sound i-f grid to the second i-f grid should be approximately 200 kc.

©John F. Rider

World Radio History

PICTURE I-F TRAP ADJUSTMENT. — Connect the "VoltOhmyst" to the junction of R135 and C190.

Remove the 6SN7GT AGC Amplifier tube V107. Connect a 250,000-ohm potentiometer between pins 5 and 6 of the V107 socket. Adjust the potentiometer until the "VoltOhmyst" reads approximately −12 volts.

Set the channel switch to the blank position between channels number 2 and 13.

Connect the "VoltOhmyst" across the picture detector load resistor R119. Under this condition, both leads of the meter are at approximately −120 volts. In making this connection, care should be taken not to touch the case of the meter or to permit the meter case to become grounded.

Connect the output of the signal generator to the grid of the converter tube V2. To do this, remove the tube from the socket and fashion a clip by twisting one end of a small piece of wire around pin number 1. Replace the tube in the socket leaving the end of the wire protruding from under the tube. Connect the signal generator to this wire through a 1,500 mmf capacitor keeping the leads as short as possible.

Set the generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for minimum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is exactly on frequency.

(1) 21.25 mc.—T103 (top)
(2) 21.25 mc.—T105 (top)
(3) 27.25 mc.—T102 (top)
(4) 27.25 mc.—T104 (top)
(5) 19.75 mc.—T106 (top)
(6) 19.75 mc.—T101 (top)

In the above transformers using threaded cores, it is possible to run the cores completely through the coils and secure two peaks or nulls. The correct position is with the cores in the outside ends of the coils. If the cores are not in the correct position, the coupling will be incorrect and it will be impossible to secure the correct response.

PICTURE I-F TRANSFORMER ADJUSTMENTS. — Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary to prevent overloading.

22.5 mc.—T106 (bottom)
24.6 mc.—T104 (bottom)
22.0 mc.—T103 (bottom)
25.9 mc.—T102 (bottom)

T1 and T101 are coupled by a link and in combination constitute an overcoupled transformer. The characteristics of such a transformer are such that it is impossible to adjust it to a single frequency.

To sweep align T1 and T101, connect a 330-ohm composition resistor across the primary coils of T102, T103, T104 and T106.

Connect the "VoltOhmyst" to the junction of R135 and C190. Adjust the 250,000-ohm variable resistor for −2.0 volts on the meter.

Connect the oscilloscope to the plate of the first video amplifier, pin 1 of V106.

Connect a sweep generator to the converter grid through a 1,500 mmf capacitor. Set the generator to sweep from 20.0 mc. to 30.0 mc. and adjust the output to provide a 4-volt peak-to-peak signal on the scope.

Connect the signal generator loosely to the converter grid and tune it to provide markers at 22.05 mc. and 24.75 mc.

Adjust T1 (top) and T101 (bottom) to obtain the response shown in Figure 14. The T1 core must penetrate to the terminal-board end of the coil in order to obtain the correct response.

Remove the 330-ohm resistors from across T102, T103, T104 and T106.

Adjust the 250,000-ohm potentiometer for a 15-volt peak-to-peak signal at the plate of the first video amplifier. The bias as measured by the "VoltOhmyst" should be −12 volts or less.

Observe and analyze the response curve obtained. The response will not be ideal and the i-f adjustments must be retouched in order to obtain the desired curve. See Figure 15.

On final adjustment the picture carrier marker must be at approximately 45% response. The curve must be approximately flat topped, with the 22.1 mc. marker at approximately 95% response and the 25.0 mc. marker below 90% response. A 26.5 mc. marker must fall between 5 and 10% response.

The most important consideration in making the i-f adjustments is to get the picture carrier at the 45% response point. If the picture carrier operates too low on the response curve, loss of low frequency video response, of picture brilliance, of blanking, and of sync may occur. If the picture carrier operates too high on the response curve, the picture becomes smeared. In making these adjustments, care should be taken to see that no two transformers are tuned to the same frequency as i-f oscillation may result.

Remove the converter tube and take off the clip to pin number 1. Replace the tube in the socket.

Picture I-F Oscillation. — If the receiver will operate without oscillating with the test equipment disconnected but breaks into oscillation or becomes unstable with the equipment connected, it may become necessary to establish a ground plane. Cover the test bench with a sheet of copper and set the chassis on the sheet. Set all the test equipment except the "VoltOhmyst" on the sheet and bond or bypass them to it. A Junior "VoltOhmyst" should not be bonded to the sheet since the negative test probe is not always connected to ground during alignment. If the receiver is badly misaligned and two or more of the i-f transformers are tuned to the same frequency, the receiver may fall into i-f oscillation. I-F oscillation shows up as a voltage across the picture detector load resistor that is unaffected by r-f signal input. If such a condition is encountered, it is sometimes possible to stop oscillation by adjusting the transformers approximately to frequency by setting the adjustment cores of T101, T102, T103, T104, T105 and T106 to be approximately equal to those of another receiver known to be in proper alignment. If this does not have the desired effect, it may now be possible to stop oscillation by increasing the grid bias. If so, it should then be possible to align the transformers by the usual method. Once aligned in this manner, the i-f amplifier should be stable with reduced bias.

If the oscillation cannot be stopped in the above manner, shunt the grids of the first three pix i-f amplifiers to ground with 1,000 mmf. capacitors. Connect the signal generator to the fourth pix i-f grid and align T106 to frequency. Progressively remove the shunt from each grid and align the plate coil of that stage to frequency.

If this does not stop the oscillation, the difficulty is not due to i-f misalignment as the i-f section is stable when properly aligned. Check all i-f by-pass condensers, transformer shunting resistors, tubes, socket voltages, etc.

ANTENNA, R-F AND CONVERTER LINE ADJUSTMENT. — In order to align the r-f tuner, it will first be necessary to set the channel-13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.

The channel-13 oscillator may be aligned by adjusting it to beat with a crystal-calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available. Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated.

If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, couple the meter probe loosely to the receiver oscillator.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier signal, connect the signal generator to the receiver antenna terminals. Connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203).

Set the receiver switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator.

Now that the channel-13 oscillator is set to frequency, we may proceed with the r-f alignment.

Connect the "VoltOhmyst" to the junction of R135 and L117. Adjust the 250K pot. for −3.5 volts on the meter.

Remove the first pix i-f amplifier tube V101.

Connect the oscilloscope to the test connection at R13 in the r-f tuning unit.

Connect the r-f sweep oscillator to the receiver antenna terminals. The method of connection depends upon the output impedance of the sweep. The P102 connections for 300-ohm balanced or 72-ohm single-ended input are shown in the circuit diagrams in Figure 78. If the sweep oscillator has a 50-ohm single-ended output, 300-ohm balanced output can be obtained by connecting as shown in Figure 7.

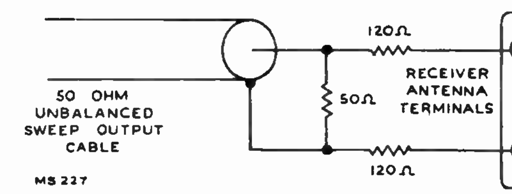

Figure 7—Unbalanced Sweep Cable Termination

Connect the signal generator loosely to the receiver antenna terminals.

Since channel 7 has the narrowest response of any of the high frequency channels, it should be adjusted first.

Set the receiver channel switch to channel 7.

Set the sweep oscillator to cover channel 7.

Insert markers of channel 7 picture carrier and sound carrier, 175.25 mc. and 179.75 mc.

Adjust C10 and C14 until the curve falls symmetrically between the sound and picture carrier markers. Adjust C11 to give the proper band width. Roughly peak L6 in conjunction with slight adjustments of C10 and C14 for a flat-topped response curve with the sound and picture carriers at 90% to 95% response points on this curve. See Figure 16, channel 7.

Switch to channel 12 and adjust L6 for maximum response and minimum top slope of the curve.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep oscillator and marker oscillator to each of these channels and observing the response obtained. See Figure 16 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response. If the markers do not fall within this requirement on one or more high frequency channels, since there are no individual channel adjustments, it will be necessary to readjust L6, C10, C11 and C14, and possibly compromise some channel slightly in order to get the markers up on other channels. Normally, however, no difficulty of this type should be experienced since the higher frequency channels are comparatively broad and the markers easily fall within the required range.

Channel 6 is next aligned in the same manner.

Set the receiver to channel 6.

Set the sweep oscillator to cover channel 6.

Set the marker oscillator to channel 6 picture and sound carrier frequencies.

Adjust L9, L13, L66, and C12 for an approximately flat-topped response curve located symmetrically between the markers. L9, L13 and L66 are the center frequency adjustments. C12 is the band-width adjustment

Check channels 5 down through channel 2 by switching the receiver, sweep oscillator and marker oscillator to each channel and observing the response obtained. In all cases, the markers should be above the 80% response point. If this is not the case, L9, L13, L66 and C12 should be retouched. On final adjustment, all channels must be within the 80% specification.

Disconnect the 250K pot., and replace V107 and V101.

Following an r-f alignment, the oscillator alignment must be checked.

R-F OSCILLATOR LINE ADJUSTMENT. — The r-f oscillator line may be aligned by adjusting it to beat with a crystal calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available.

Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated. If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, the calibration frequency listed under R-F Osc. Freq. must be available.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier frequency, the frequencies listed under Sound Carrier Freq. must be available.

Channel Number	Receiver R-F Osc. Freq. Mc.	R-F Sound Carrier Freq. Mc.	Channel Oscillator Adjustment
2	81	59.75	L24
3	87	65.75	L23
4	93	71.75	L22
5	103	81.75	L21
6	109	87.75	L31
7	201	179.75	L19
8	207	185.75	L18
9	213	191.75	L17
10	219	197.75	L16
11	225	203.75	L15
12	231	209.75	L14
13	237	215.75	C6

If the heterodyne frequency meter method is used, couple the meter probe loosely to the receiver oscillator.

If the r-f sound carrier method is used, connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203) and connect the signal generator to the receiver antenna terminals. The order of alignment remains the same regardless of which method is used.

If the r-f unit is removed from the receiver for service and is aligned separately, the shield over the bottom of the r-f unit must be in place when making adjustments.

Since the lower frequencies are obtained by adding steps of inductance, it is necessary to align channel 13 first and continue in reverse numerical order.

Set the receiver channel switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range while making the adjustment.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator. Oscillator adjustments L1 and L2 shown on the schematic are factory control adjustments and should not be touched in the field.

Switch the receiver to channel 12.

Set the frequency standard to the proper frequency as listed in the alignment table.

Adjust L14 for indications as above.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator trimmer for the speci-

©John F. Rider

ALIGNMENT PROCEDURE

fied indication. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control in the middle third of its range.

After the oscillator has been set on all channels, start back at channel 13 and recheck to make sure that all adjustments are correct.

AGC THRESHOLD ADJUSTMENT. — The AGC threshold adjustment can be made by the method outlined in the Installation Instructions. However, a more accurate adjustment can be obtained by the use of an oscilloscope.

Tune in a station and advance the picture control to the maximum clockwise position. Connect the low capacity probe from the oscilloscope to the plate of the first video amplifier, pin 1 of V106. Adjust the oscilloscope to observe the horizontal sync pulse.

Turn the AGC threshold control R138 fully clockwise, then slowly counter-clockwise. As the control is turned counter-clockwise, the receiver gain will increase slowly, increasing the size of the pattern on the oscilloscope. R138 should be turned counter-clockwise until the receiver begins to overload as indicated by clipping of the sync. The control should be left in the maximum gain position in which no clipping of sync is observed. See Figure 17 for proper waveforms.

HORIZONTAL OSCILLATOR ADJUSTMENT. — Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment requires the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Set the locking range trimmer one half turn out from maximum capacity. With a clip lead, short circuit the coil between terminals C and D of the horizontal oscillator transformer T109. Tune in a television station and sync the picture if possible.

A. — Turn the horizontal hold control R173 to the extreme clockwise position. Adjust the T109 Frequency Adjustment (under the chassis) so that the picture is just out of sync and the horizontal blanking appears in the picture as a vertical bar. The position of the bar is unimportant.

Note.—Occasionally a tube may be found which does not respond to step "A" above, since it may not be possible to sync the picture by means of the frequency core when the sine wave coil is shorted out. Yet, the tube may work perfectly well when the circuit is properly aligned. In such a case it may be necessary to remove the short then turn the sine wave core out then in until it is possible to obtain sync by adjustment of the frequency core.

B. — Turn the hold control approximately one-quarter of a turn from the extreme clockwise position and examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C153B, the width control R192 and the linearity control L111 until the picture is correct. If C153B was adjusted, repeat step "A" and note above.

Horizontal Oscillator Waveform Adjustment. — Remove the shorting clip from terminals C and D of T109. Turn the horizontal hold control to the extreme clockwise position. With a thin fibre screwdriver, if necessary, adjust the Oscillator Waveform Adjustment Core of T109 (on the outside of the chassis) until the horizontal blanking bar appears in the raster. The waveform adjustment core will sync the picture in two positions. The core should be in the position nearest the outside of the chassis.

A. — Connect the low capacity probe of an oscilloscope to terminal C of T109. Alternately adjust the waveform and frequency cores of T109 until the peak of the sine wave is equal in amplitude to the peak of the saw tooth, on the oscilloscope as shown in Figure 18, while maintaining the picture in synchronization. Then adjust the frequency core until horizontal blanking shows as a vertical bar in the picture.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Check of Oscillator Pull-in Range.—Set the horizontal hold control to the full counter-clockwise position.

Connect a 270K ohm resistor across C156.

Momentarily switch off channel and back. The picture will then be out of sync.

Turn the hold control clockwise slowly and observe the minimum number of bars obtained just before the picture pulls into sync. The picture should snap in from two complete blanking bars. If two bars are not obtained turn the locking range trimmer C153A in to obtain less bars or out to obtain more bars.

After adjustment of C153A, remove the 270K resistor, turn the horizontal hold control fully clockwise and readjust the frequency core of T109 until the picture is in sync and the horizontal blanking bar begins to move in the picture. Then repeat the entire "Check of Pull-in Range" procedure to this point. Repeat this procedure until two bar pull-in is obtained.

Turn the horizontal hold control to the maximum clockwise position. The picture should be just out of sync to the extent that the horizontal blanking bar appears as a single vertical or diagonal bar in the picture. Adjust the T109 Frequency Adjustment until this condition is fulfilled.

4.5 MC. VIDEO TRAP. — With a strong input from a station, detune the receiver from the correct fine tuning point. With a very short clip lead, short the trap winding of T103. Observe the picture for the appearance of a 4.5 mc. beat. If the beat appears in the picture, adjust L110 until the beat is eliminated.

SENSITIVITY CHECK. — A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES. — The response curves shown on page 14 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

ALIGNMENT TABLE. — Both methods of oscillator alignment are presented in the alignment table. The service technician may thereby choose the method to suit his test equipment.

ALIGNMENT TABLE

THE DETAILED ALIGNMENT PROCEDURE BEGINNING ON PAGE 8 SHOULD BE READ BEFORE ALIGNMENT BY USE OF THE TABLE IS ATTEMPTED.

SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnet reversed either front to back or top to bottom.

(2) V112 or V113 inoperative. Check waveforms on grids and plates.

(3) No high voltage — If horizontal deflection is operating as evidenced by the correct waveform on terminal 4 of J106, the trouble can be isolated to the 8016 circuit. Either the T110 high voltage winding is open, the 8016 tube is defective, its filament circuit is open, or C168 is shorted.

(4) V111 circuit inoperative — Refer to schematic and waveform chart.

(5) Damper tube (V114) inoperative.

(6) Defective kinescope.

(7) R131 open.

(8) No receiver plate voltage—filter capacitor shorted—bleeder or filter choke open.

NO VERTICAL DEFLECTION:

(1) V107B or V110 inoperative. Check voltage and waveforms on grids and plates.

(2) T107 or T108 open.

(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.

(2) V112 defective.

(3) Defective yoke.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V110.

(2) T107 or T108 transformer defective.

(3) V107B defective — check voltage and waveforms on grid and plate.

(4) C150, R164, C146B, C147C, C148-C or C166 defective.

(5) Low bias or plate voltage — check rectifiers and capacitors in supply circuits.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V112 or V114.

(2) T110 or L111 defective.

(3) C164 or C165 defective.

WRINKLES ON LEFT SIDE OF RASTER:

(1) C169 defective or incorrectly connected.

(2) C141 or C191 defective.

(3) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T109 incorrectly tuned.

(2) R172, R173 or R174 defective.

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER:

(1) Improper adjustment of focus coil or ion trap magnet.

(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) R-F oscillator off frequency.

(2) Sound i-f, discriminator or audio amplifier inoperative — check V116, V117, V118, V119, V120 and their socket voltages.

(3) T114 or C186 defective.

(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC threshold control R138 misadjusted.

(2) V105B, V107A, V108 or V109 inoperative. Check voltage and waveforms at their grids and plates.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V107B and associated circuits—C145, T107, etc.

(2) Integrating network inoperative—Check.

(3) R154, R155, R157, R158 or R159 defective.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T109 misadjusted—readjust as instructed on page 11.

(2) V111 inoperative—check socket voltages and waveforms.

(3) T109 defective.

(4) C134, C140, C146C, C153A, C154, C155, C156 or C157 defective.

(5) If horizontal speed is completely off and cannot be adjusted check C158, C159, R172, R173, R174, R179 and R182.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture i-f, detector or video amplifier inoperative — check V103, V104, V105 and V106 — check socket voltages.

(2) Bad contact to kinescope grid.

PICTURE STABLE BUT POOR RESOLUTION:

(1) V105A or V106 defective.

(2) Peaking coils defective — check for specified resistance.

(3) Make sure that the focus control operates on both sides of proper focus.

(4) R-F and I-F circuits misaligned.

PICTURE SMEAR:

(1) R-F or I-F circuits misaligned.

(2) Open peaking coil.

(3) This trouble can originate at the transmitter — check on another station.

PICTURE JITTER:

(1) AGC threshold control R138 misadjusted.

(2) If regular sections at the left picture are displaced change V112.

SERVICE SUGGESTIONS

(3) Vertical instability may be due to loose connections or noise.

(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.

(2) R-F oscillator off frequency.

(3) R-F unit inoperative — check V1, V2, V3.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.

(2) Replace V112.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) C169 defective.

(2) V114 defective.

PICTURE I-F RESPONSE. — At times it may be desirable to observe the individual i-f stage response. This can be achieved by the following method:

Shunt all i-f transformers and coils with a 330-ohm carbon resistor except the one whose response is to be observed.

Connect a wide band sweep generator to the converter grid and adjust it to sweep from 18 mc. to 30 mc.

Connect the oscilloscope across the picture detector load resistor and observe the overall response. The response obtained will be essentially that of the unshunted stage. The effects of the various traps are also visible on the stage response.

Figures 27 through 31 show the responses of the various stages obtained in the above manner. The curves shown are typical although some variation between receivers can be expected. Relative stage gain is not shown.

R-F UNIT WIRING DIAGRAM

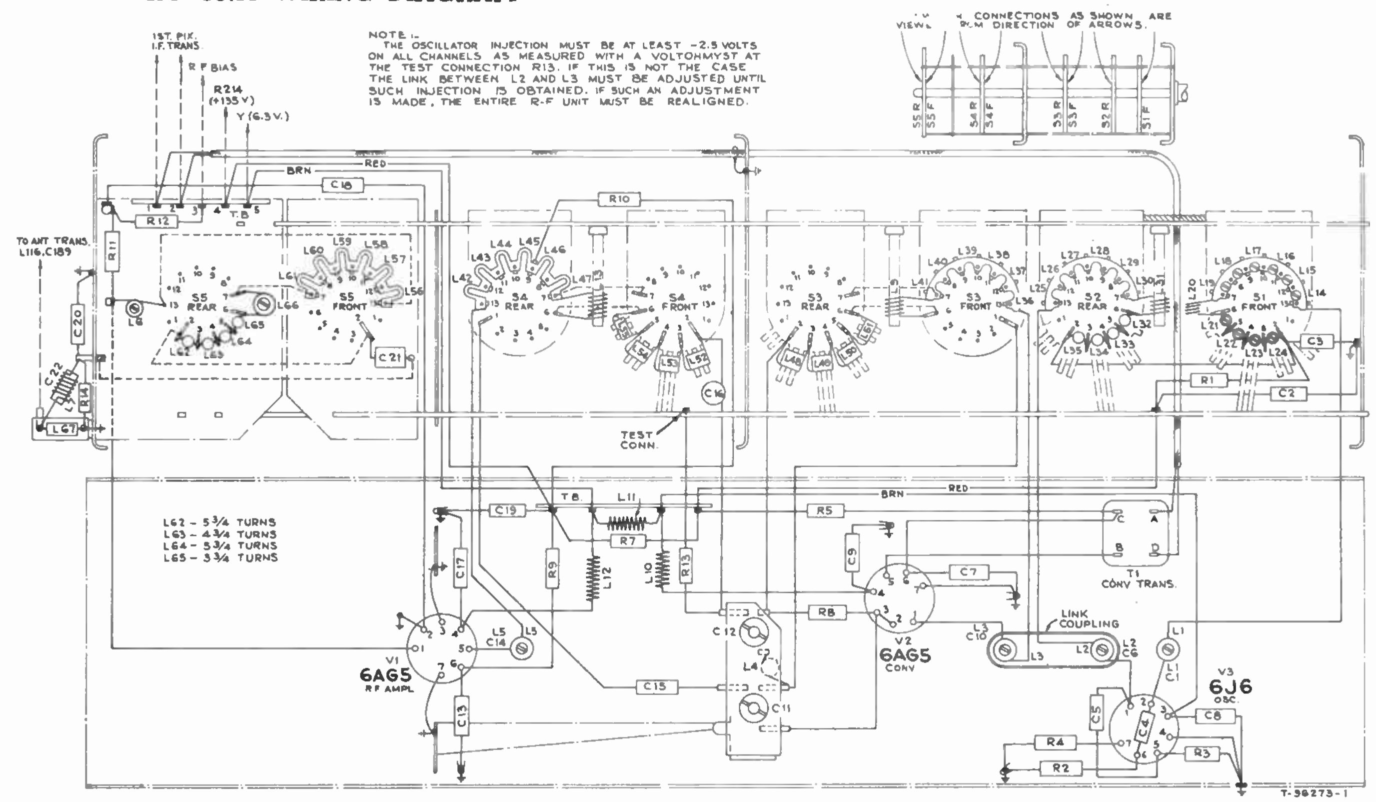

Figure 76—R-F Unit Wiring Diagram

CRITICAL LEAD DRESS:

1. The ground bus from pin 2 and the center shield of V117 socket should not be shortened or rerouted.
2. Do not change the dress of the filament leads or the by-pass capacitors in the picture or sound i-f circuits. The filament leads between V117, V118 and V119 should be down against the chassis and away from grid or plate leads.
3. If it is necessary to replace any of the 1500 mmf capacitors in the picture i-f circuit, the lead length must be kept as short as possible.
4. Picture i-f coupling capacitors C106, C111, C115 and C121 should be up and away from the chassis and should be clear of the pix i-f transformer adjustments by at least ¼ inch. If the dress of any of these capacitors is changed, the i-f alignment should be rechecked.
5. Dress black lead from terminal C of T106 down next to chassis.
6. Leads to L102 and L103 must be as short as possible.
7. Dress peaking coils L105, L106, L107 and L114 up and away from the chassis.
8. Dress C183 across tube pins 5 and 6 with leads not exceeding ⅜ inch.
9. Dress body of R215 as close to tube pin as possible.
10. Dress C129 and C130 up and away from the chassis.
11. Dress the yellow lead from the picture control away from the chassis and away from the volume-control leads. Dress the yellow lead from pin 8 of V106 away from the chassis.
12. Dress the green lead from pin 2 of V106 away from the chassis.
13. Dress R168, R176 and R178 up and away from the chassis.
14. The leads to the volume control should be dressed down against the chassis and away from V117 and V118.
15. Contact between the r-f oscillator frequency adjustment screws and the oscillator coils or channel switch eyelets must be avoided.
16. Dress three a-c leads to S101 under clamp and away from R211.
17. Dress black lead from power transformer and red lead from S102 to terminal board, on top side of four potentiometers.
18. Dress all leads from V115 to V122 on power transformer side of terminal board.
19. All solder joints in the high voltage section should be free of sharp edges.
20. The lead side of the V113 plate cap should be turned away from the fixed high voltage shield and the lead should be dressed away from all objects.
21. All leads under the horizontal plate in the high voltage section should be kept reasonably short and dressed away from the V113 corona ring.
22. The red-black lead from terminal 2 of the deflection yoke should be dressed around the green and yellow leads and away from the red lead. The loose end of the red-black wire should be heavily taped.

World Radio History

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition a 2200 microvolt test pattern signal was fed into the receiver, the picture was synced and the AGC threshold control was properly adjusted. The second condition was obtained by removing the antenna leads and short-circuiting the receiver antenna terminals. Voltages shown are as read with "Jr. VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles a-c. Symbol < means less than.

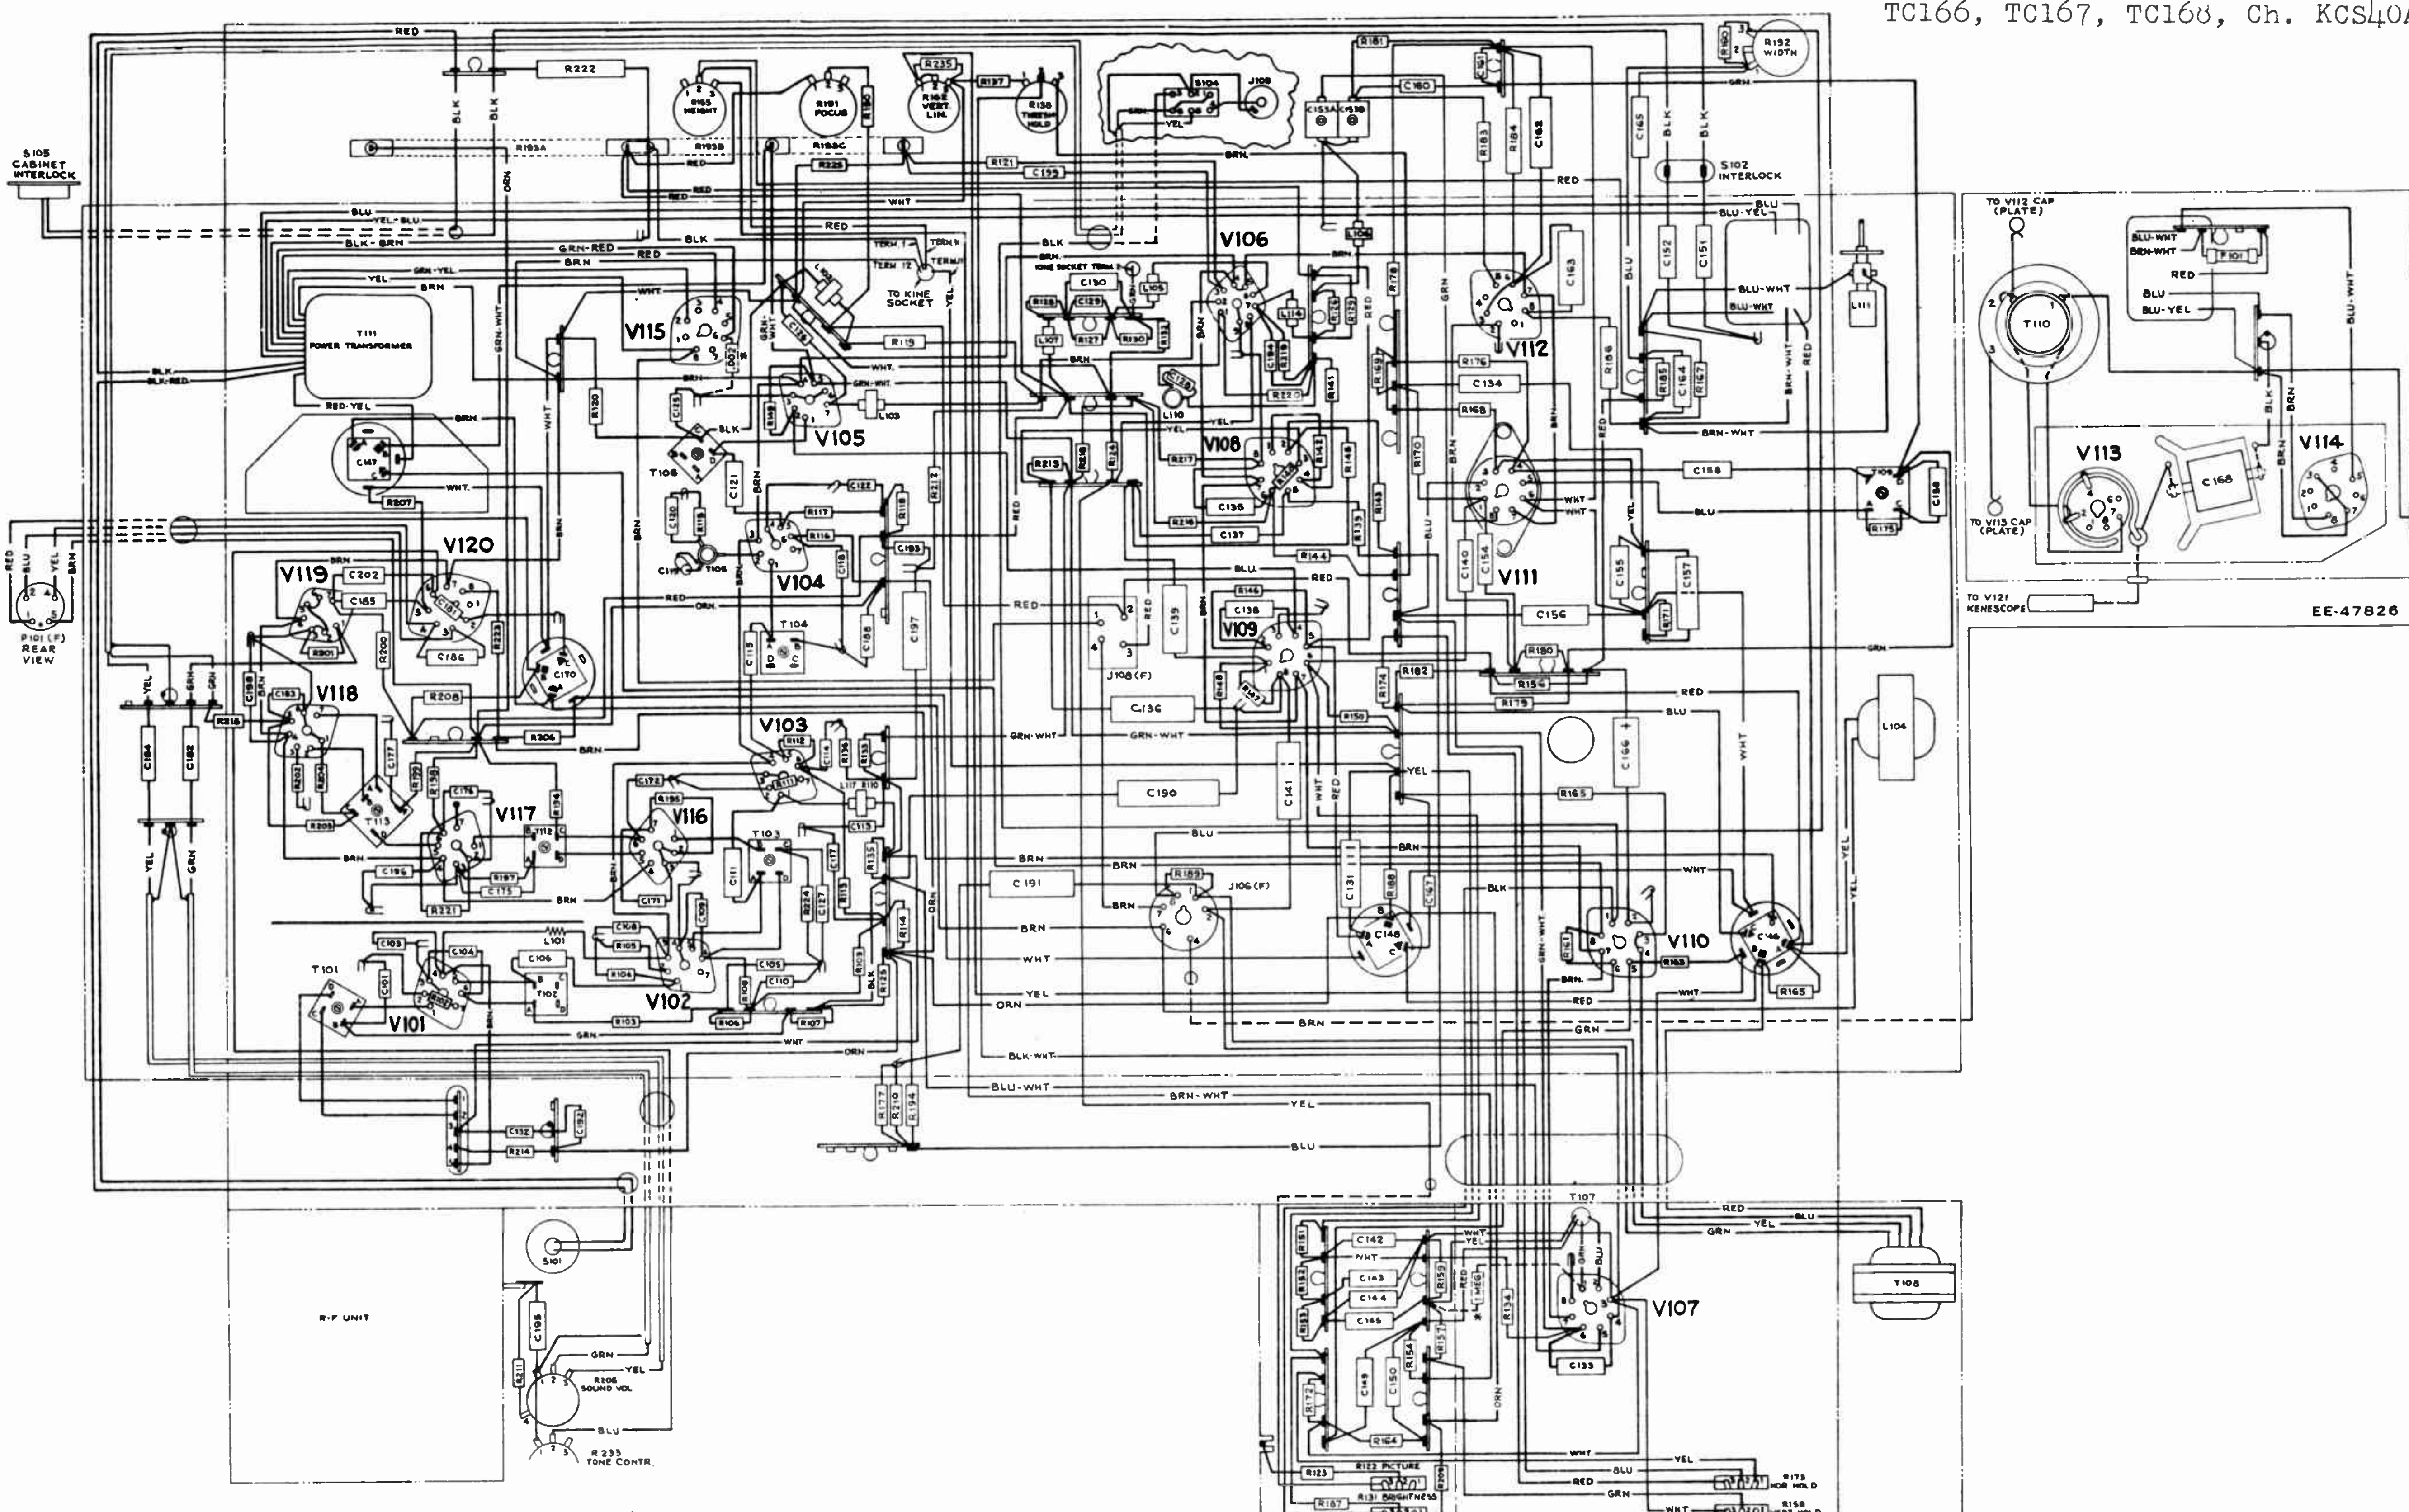
MODELS T164, Ch. KCS40; TC165, TC166, TC167, TC168, Ch. KCS40A



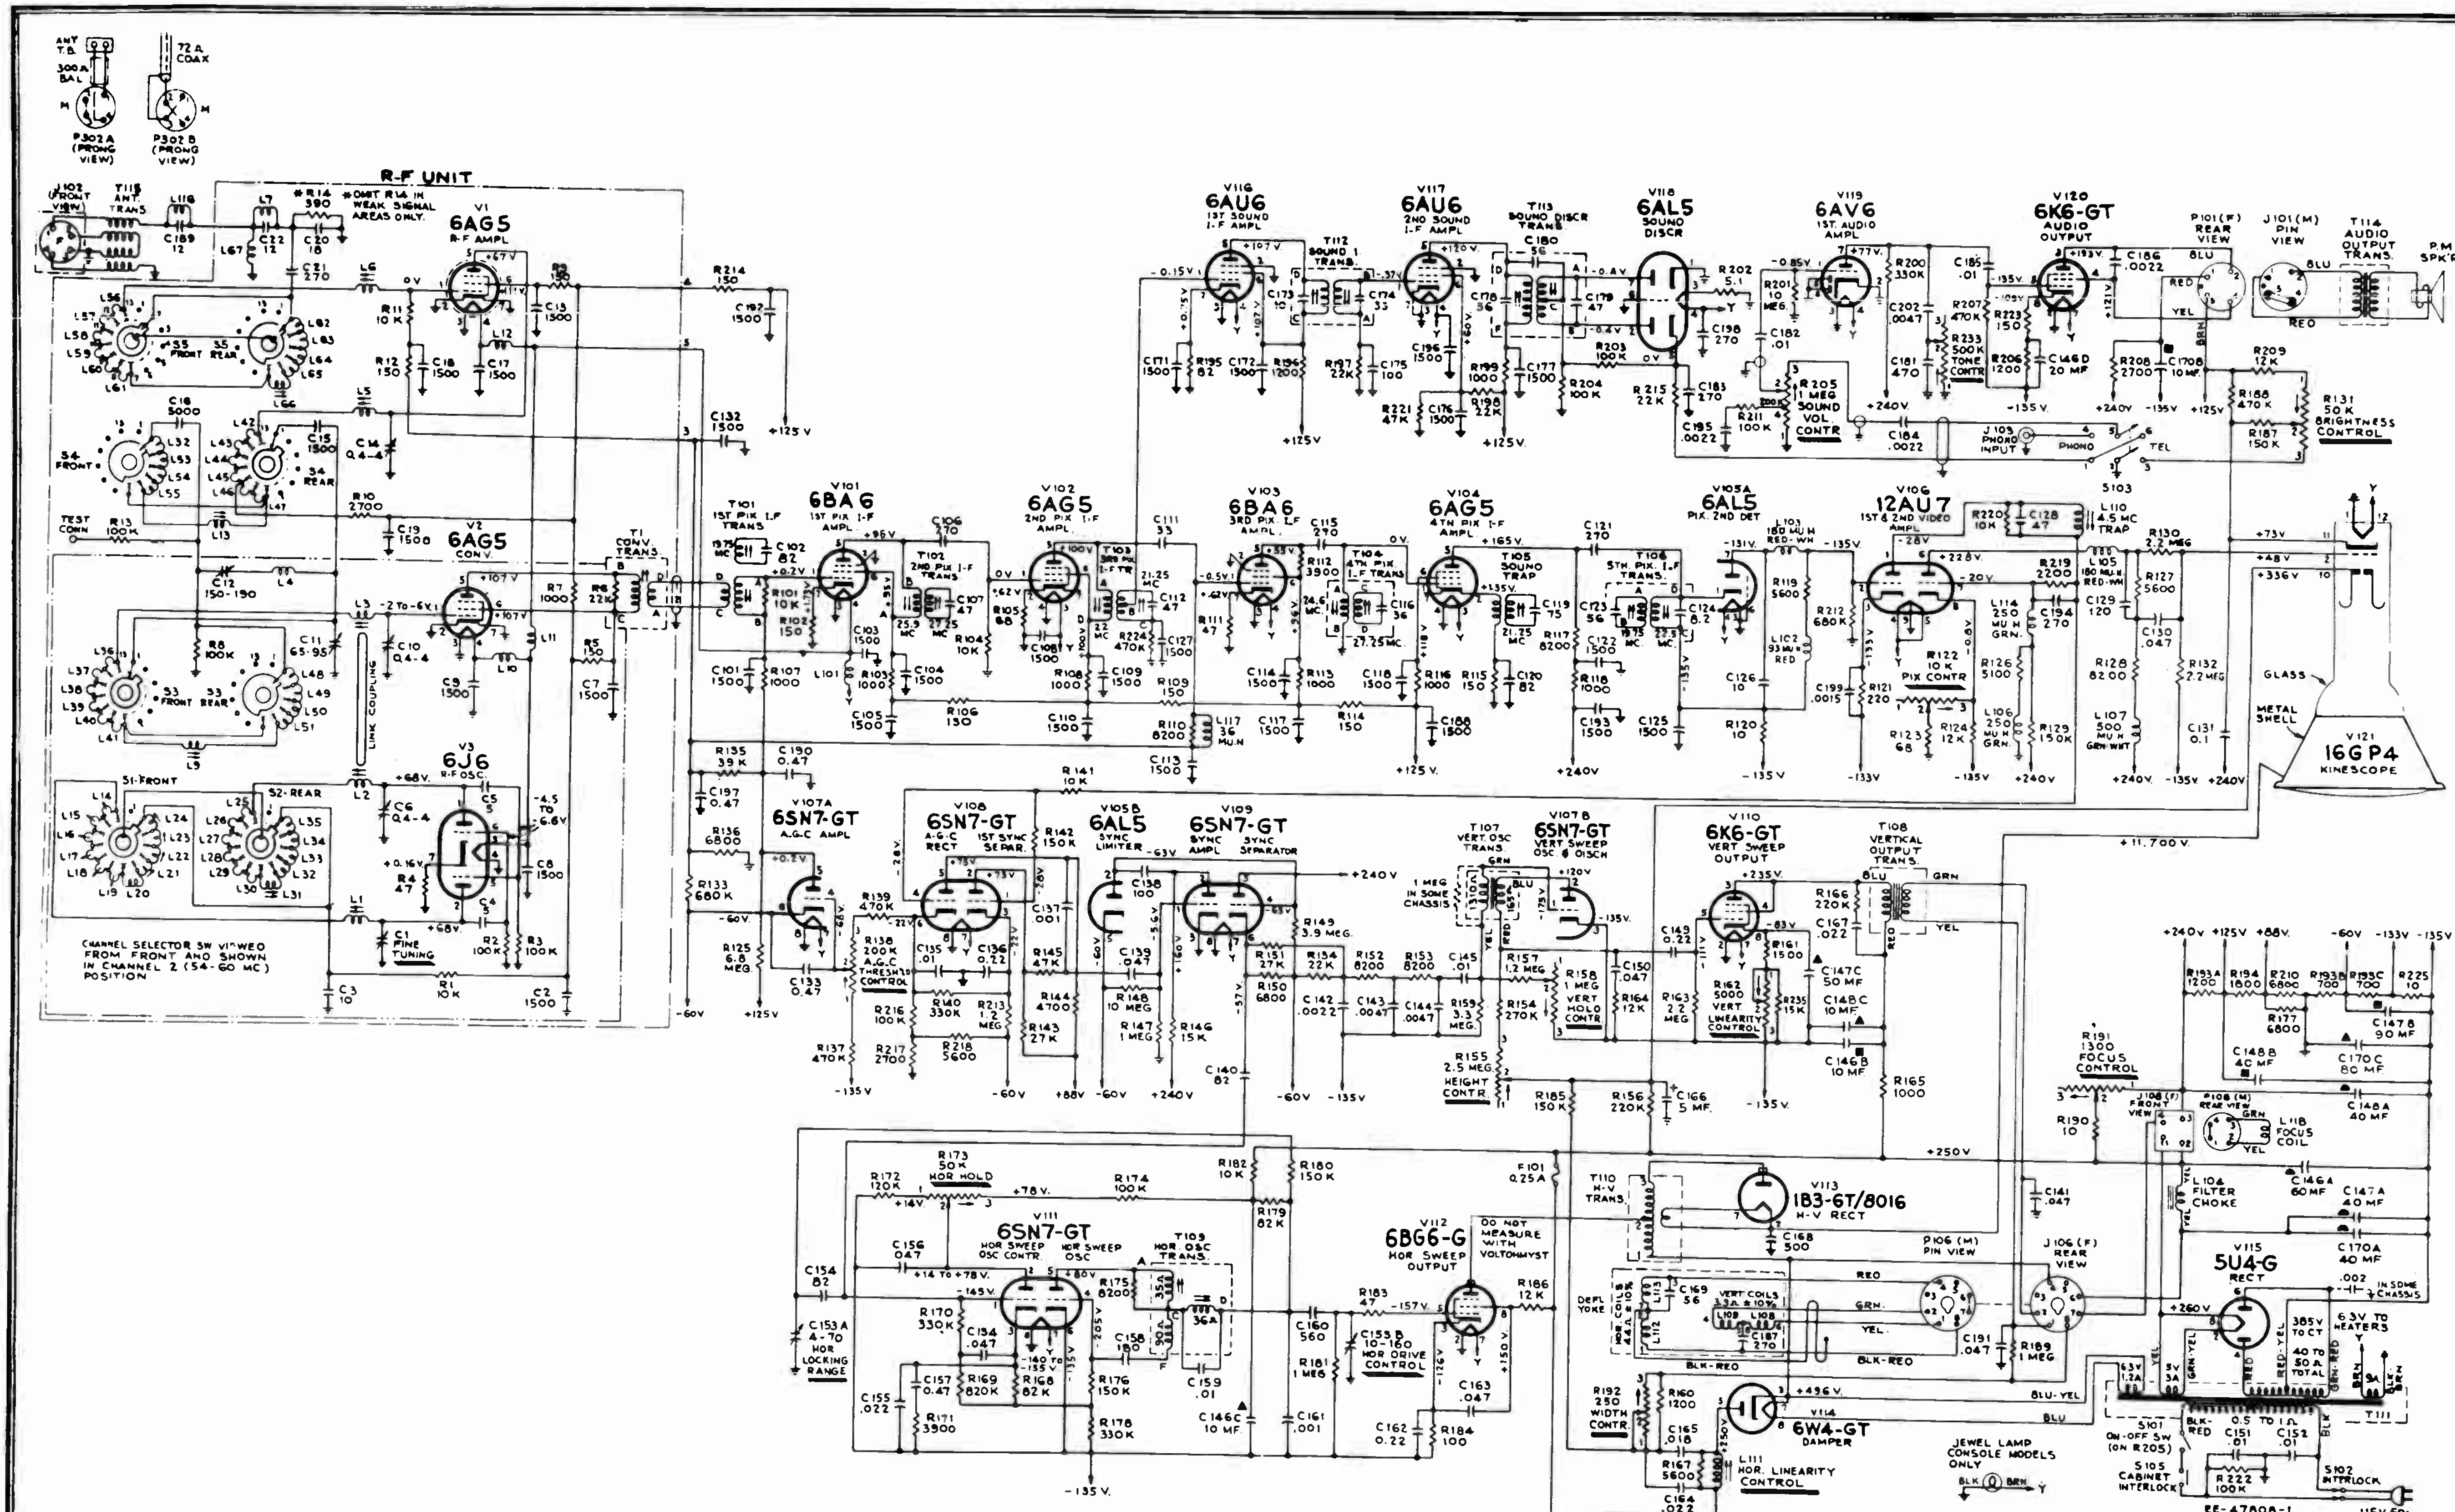
In some receivers, a four color ceramic capacitor color code is employed. It reads the same as the RMA color code except that the tolerance stripe is omitted.

If the coefficient stripe is silver, it indicates that the capacitor has a very large temperature coefficient and is to be employed for by-pass or other usages where a wide variation of capacity is unimportant. Silver striped capacitors are rated at 350 volts unless otherwise marked.

Figure 77—Chassis Wiring Diagram

©John F. Rider

World Radio History



All resistance values in ohms. K = 1000.
All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Coil resistance values less than 1 ohm are not shown.
Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

In some receivers, C141 was omitted.
In some receivers, R206 and R223 were 820 ohms.
In some receivers, R220 was 12K.

In some receivers, R121 was 39, R225 was 18, R128 was 6,800, R129 was 220K, L107 was 250 Muh and C199 was omitted.

In some receivers, R161 was 1,000 and R235 was omitted.
In some receivers, R160 and R167 were omitted.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	R-F UNIT ASSEMBLIES KRK 5B
73465	Belt—Drive belt
75069	Board—R-F unit power connection terminal board
75067	Bracket—Vertical bracket for holding r-f oscillator tube shield
73478	Cable—I-F transmission cable (W1)
73441	Cam—Fine tuning adjustment
74035	Capacitor—Ceramic, 5 mmf. (C4, C5)
53511	Capacitor—Ceramic, 10 mmf. (C3)
54207	Capacitor—Ceramic, 18 mmf. (C20)
73449	Capacitor—Ceramic trimmer comprising 1 section of 150-190 mmf. and 1 section of 65-95 mmf. (C11, C12)
73091	Capacitor—Ceramic, 270 mmf. (C21)
71501	Capacitor—Ceramic, 1,500 mmf. (C2, C7, C8, C9, C13, C15, C17, C18, C19)
73473	Capacitor—Ceramic, 5,000 mmf. (C16)
73460	Coil—R-F plate coil for channel 6 (L13)
73461	Coil—Rear section—Oscillator plate coil for channel 6 (L20)
73462	Coil—Coupling inductance coil (L4)
73475	Coil—Antenna filter shunt coil (C67)
73476	Coil—I-F trap (L7, C22)
73477	Coil—Choke coil (L10, L11, L12)
73874	Coil—Front section—Oscillator plate coil for channel 6 (L31)
74108	Coil—Fine tuning coil (1½ turns) with adjustable inductance core and capacitor stud (plunger adjustment) (L1, C1)
74109	Coil—Trimmer coil (1½ turns) with adjustable inductance core and capacitor stud (screw adjustment for oscillator section or converter section) (L2, L3, C6, C10)
74110	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f amplifier section (L5, C14)
73455	Core—Sliding core for fine tuning control trimmer
74187	Core—Adjustable core for coil L9
71493	Connector—Oscillator segment connector
73440	Detent—R-F unit detent mechanism and fibre shaft
71487	Form—Coil form for coil L31
73453	Form—Coil form assembly for L9, L13
73442	Link—Link assembly for fine tuning
71462	Loop—Oscillator to converter trimmer loop connector
73634	Nut—Speed nut for drive belt shield
73436	Plate—Front plate and bushing
73464	Pulley—Idler pulley
	Resistor—Fixed, composition: 47 ohms, ±20%, ½ watt (R4) 150 ohms, ±20%, ½ watt (R5, R9, R12) 390 ohms, ±10%, ½ watt (R14) 1,000 ohms, ±20%, ½ watt (R7) 2,700 ohms, ±10%, ½ watt (R10) 10,000 ohms, ±20%, ½ watt (R1, R11) 100,000 ohms, ±20%, ½ watt (R2, R3, R8, R13)
14343	Retainer—Channel selector shaft retaining ring
30340	Retainer—Retainer ring for fine tuning stud
70881	Screw—No. 4-40 x ¼" binder head screw for adjusting coils L14, L15, L16, L17, L18, L19
73640	Screw—No. 4-40 x ⅝" adjusting screw for L66

STOCK No.	DESCRIPTION
71475	Screw—No. 4-40 x 15/32" adjusting screw for coils L21, L22, L23, L24
74575	Screw—No. 4-40 x 17/32" adjusting screw for L6
73437	Shaft—Channel selector shaft complete with pawl and stud
73438	Shaft—Fine tuning control shaft and pulley
73439	Shaft—Actuating shaft for fine tuning control
75443	Shield—"U" shaped shield for bottom of r-f unit
72951	Shield—Metal tube shield for V3
73454	Shield—Metal shield for drive belt
73632	Shield—Metal tube shield for V1
71494	Socket—Tube socket, moulded, 7 prong, saddle mounted
73450	Socket—Tube socket, ceramic, 7 prong, bottom mounted
74576	Spacer—Insulating spacer for front plate (4 required)
75068	Spring—Retaining spring for r-f oscillator tube shield
73457	Spring—Return spring for fine tuning control core
74188	Spring—Retaining spring for adjustable core RCA 74187
74578	Spring—Retaining spring for adjusting screws RCA 73640 and RCA 74575
73468	Stator—Front oscillator section stator complete with rotor, segment, coils and adjusting screws (S1, L14, L15, L16, L17, L18, L19, L21, L22, L23, L24)
73469	Stator—Rear oscillator section stator complete with rotor, segment and coils (S2, L25, L26, L27, L28, L29, L30, L32, L33, L34, L35)
73633	Stator—Antenna stator complete with rotor and coils (S5, L6, L56, L57, L58, L59, L60, L61, L62, L63, L64, L65, L66, C21)
73470	Stator—Converter stator complete with rotor and coils (S3, L9, L36, L37, L38, L39, L40, L41, L48, L49, L50, L51)
73471	Stator—R-F amplifier stator complete with rotor and coils (S4, L13, L42, L43, L44, L45, L46, L47, L52, L53, L54, L55, C15, C16, R10)
73448	Transformer—Converter transformer (T1, R6)
73466	Washer—Insulating washer for front shield (1 set)
2917	Washer—"C" washer for channel selector shaft or fine tuning shaft and cam
	CHASSIS ASSEMBLIES KCS40 - T164 KCS40A - TC165, TC166, TC167, TC168
74946	Capacitor—Mica trimmer comprising 1 section of 4-70 mmf. and 1 section of 10-160 mmf. (C153A, C153B)
39604	Capacitor—Mica, 10 mmf. (C126)
74105	Capacitor—Mica, 33 mmf. (C111)
64062	Capacitor—Ceramic, 82 mmf. (C120)
73090	Capacitor—Mica, 82 mmf. (C140, C154)
39396	Capacitor—Ceramic, 100 mmf. (C175)
75060	Capacitor—Mica, 100 mmf. (C138)
73921	Capacitor—Ceramic, 120 mmf. (C129)
73102	Capacitor—Mica, 180 mmf. (C158)
73922	Capacitor—Ceramic, 270 mmf. (C183, C194, C198)
73091	Capacitor—Mica, 270 mmf. (C106, C115, C121)
39644	Capacitor—Mica, 470 mmf. (C181)

STOCK No.	DESCRIPTION
74947	Capacitor—Ceramic, 500 mmf., 20,000 volts (C168)
74250	Capacitor—Mica, 560 mmf. (C160)
71501	Capacitor—Ceramic, 1,500 mmf. (C101, C103, C104, C105, C108, C109, C110, C113, C114, C117, C118, C122, C125, C127, C132, C171, C172, C176, C177, C188, C192, C193, C196)
28417	Capacitor—Electrolytic, 5 mfd. 450 volts (C166)
71432	Capacitor—Electrolytic, comprising 2 sections of 40 mfd, 450 volts and 1 section of 10 mfd, 450 volts (C148A, C148B, C148C)
73582	Capacitor—Electrolytic, comprising 1 section of 40 mfd, 450 volts, 1 section of 10 mfd, 450 volts, and 1 section of 80 mfd, 200 volts (C170A, C170B, C170C)
73583	Capacitor—Electrolytic, comprising 1 section of 40 mfd, 450 volts, 1 section of 90 mfd, 150 volts and 1 section of 50 mfd, 150 volts (C147A, C147B, C147C)
73581	Capacitor—Electrolytic, comprising 1 section of 60 mfd, 450 volts, 2 sections of 10 mfd, 450 volts and 1 section of 20 mfd, 150 volts (C146A, C146B, C146C, C146D)
73801	Capacitor—Tubular, moulded paper, oil impregnated, .001 mfd, 1,000 volts (C137, C161)
73802	Capacitor—Tubular, paper, oil impregnated, .0015 mfd, 600 volts (C199)
73595	Capacitor—Tubular, paper, oil impregnated, .0022 mfd, 600 volts (C142, C184, C186, C195)
73920	Capacitor—Tubular, paper, oil impregnated, .0047 mfd, 600 volts (C143, C144, C202)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd, 400 volts (C135, C182)
73594	Capacitor—Tubular, moulded paper, oil impregnated, .01 mfd, 600 volts (C145, C159)
73565	Capacitor—Tubular, paper, oil impregnated, .01 mfd, 1,000 volts (C151, C152, C185)
74727	Capacitor—Tubular, paper, oil impregnated, .018 mfd, 1,000 volts (C165)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd, 400 volts (C155, C167)
73810	Capacitor—Tubular, paper, oil impregnated, .022 mfd, 1,000 volts (C164)
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd, 400 volts (C130, C134)
73592	Capacitor—Tubular, paper, oil impregnated, .047 mfd, 600 volts (C139, C156)
73597	Capacitor—Tubular, paper, oil impregnated, .047 mfd, 1,000 volts (C141, C150, C163, C191)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd, 600 volts (C131)
73794	Capacitor—Tubular, paper, oil impregnated, 0.22 mfd, 400 volts (C136, C162)
74957	Capacitor—Tubular, paper, oil impregnated, 0.22 mfd, 600 volts (C149)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd, 200 volts (C133, C157, C190, C197)
73154	Choke—Filter choke (L104)
71449	Coil—Horizontal linearity control coil (L111)
74983	Coil—Focus coil (L118, P108)
73477	Coil—Filament choke coil (L101)
74170	Coil—Peaking coil (36 muh) (L117, R110)
71527	Coil—Peaking coil (93 muh) (L102)
74214	Coil—Peaking coil (180 muh) (L103, L105)

STOCK No.	DESCRIPTION
71526	Coil—Peaking coil (250 muh) (L106, L114)
75252	Coil—Peaking coil (500 muh) (L107)
31027	Connector—4 contact female connector for focus coil (J108)
60942	Connector—8 contact female connector for deflection yoke (J106)
74594	Connector—Male connector for power cable
5040	Connector—4 contact female connector for speaker cable (P101)
74967	Connector—Anode connector
72734	Control—Horizontal and vertical hold control (R158, R173)
74047	Control—Brightness and picture control (R122, R131)
74048	Control—Volume control, tone control and power switch (R205, R233, S101)
71441	Control—Vertical linearity control (R162)
71440	Control—Height control (R155)
74597	Control—Focus control (R191)
74475	Control—AGC threshold control (R138)
74945	Control—Width control (R192)
71457	Cord—Power cord and plug
71437	Cover—Insulating cover for electrolytics Nos. 71432, 73581 and 73582
74956	Cushion—Rubber cushion for deflection yoke hood (2 required)
73600	Fuse—0.25 amps., 250 volts (F101)
71799	Grommet—Rubber grommet for horizontal yoke lead exit or 2nd anode lead exit
37396	Grommet—Rubber grommet for mounting ceramic tube socket
75445	Hood—Deflection yoke hood less rubber cushions
35787	Jack—Phono input jack (J103)
74953	Magnet—Ion trap magnet (P.M.)
18469	Plate—Bakelite mounting plate for electrolytics
75444	Plate—Bakelite plate complete with tube socket for high voltage rectifier
72067	Resistor—Wire wound, 5.1 ohms, ½ watt (R202)
18471	Resistor—Wire wound, 10 ohms, ½ watt (R190)
74955	Resistor—Voltage divider comprising 1 section of 1,200 ohms, 16 watts, and 2 sections of 700 ohms, 5½ watts (R193A, R193B, R193C)
	Resistor—Fixed, composition— 10 ohms, ±20%, ½ watt (R120) 10 ohms, ±10%, ½ watt (R225) 47 ohms, ±5%, ½ watt (R111) 47 ohms, ±20%, ½ watt (R183) 68 ohms, ±10%, ½ watt (R105) 68 ohms, ±20%, ½ watt (R123) 82 ohms, ±10%, ½ watt (R195) 100 ohms, ±10%, 2 watts (R184) 150 ohms, ±5%, ½ watt (R102) 150 ohms, ±10%, ½ watt (R115, R223) 150 ohms, ±20%, ½ watt (R106, R109, R114, R214) 220 ohms, ±10%, ½ watt (R121) 1,000 ohms, ±20%, ½ watt (R103, R107, R108, R113, R116, R118, R165, R199) 1,200 ohms, ±10%, ½ watt (R196) 1,200 ohms, ±10%, 1 watt (R160, R206) 1,500 ohms, ±10%, ½ watt (R161) 1,800 ohms, ±10%, 2 watts (R194) 2,200 ohms, ±10%, ½ watt (R219) 2,700 ohms, ±10%, ½ watt (R217) 2,700 ohms, ±10%, 2 watts (R208)

REPLACEMENT PARTS (Continued)

STOCK No.	DESCRIPTION
	3,900 ohms, ±5%, ½ watt (R112)
	3,900 ohms, ±10%, ½ watt (R171)
	4,700 ohms, ±10%, ½ watt (R144)
	5,100 ohms, ±5%, ½ watt (R126)
	5,600 ohms, ±5%, ½ watt (R119)
	5,600 ohms, ±10%, ½ watt (R218)
	5,600 ohms, ±10%, 1 watt (R127, R167)
	6,800 ohms, ±5%, ½ watt (R136)
	6,800 ohms, ±10%, ½ watt (R150)
	6,800 ohms, ±10%, 2 watts (R177, R210)
	8,200 ohms, ±5%, ½ watt (R175)
	8,200 ohms, ±10%, ½ watt (R152, R153)
	8,200 ohms, ±5%, 1 watt (R117, R128)
	10,000 ohms, ±5%, ½ watt (R104)
	10,000 ohms, ±10%, ½ watt (R141, R182, R220)
	12,000 ohms, ±5%, ½ watt (R164)
	12,000 ohms, ±10%, ½ watt (R209)
	12,000 ohms, ±10%, 1 watt (R186)
	12,000 ohms, ±10%, 2 watts (R124)
	15,000 ohms, ±10%, ½ watt (R235)
	15,000 ohms, ±10%, 1 watt (R146)
	22,000 ohms, ±10%, ½ watt (R134, R197)
	22,000 ohms, ±20%, ½ watt (R198, R215)
	27,000 ohms, ±10%, ½ watt (R143, R151)
	39,000 ohms, ±5%, ½ watt (R135)
	47,000 ohms, ±10%, ½ watt (R145)
	47,000 ohms, ±20%, ½ watt (R221)
	82,000 ohms, ±5%, 1 watt (R179)
	82,000 ohms, ±10%, 1 watt (R168)
	100,000 ohms, ±5%, ½ watt (R203, R204)
	100,000 ohms, ±10%, ½ watt (R211, R216)
	100,000 ohms, ±10%, 1 watt (R174)
	100,000 ohms, ±20%, 2 watts (R222)
	120,000 ohms, ±10%, 1 watt (R172)
	150,000 ohms, ±10%, ½ watt (R129, R180, R185, R187)
	150,000 ohms, ±20%, ½ watt (R142)
	150,000 ohms, ±5%, 1 watt (R176)
	220,000 ohms, ±10%, ½ watt (R156, R166)
	270,000 ohms, ±10%, ½ watt (R154)
	330,000 ohms, ±10%, ½ watt (R140, R170, R200)
	330,000 ohms, ±5%, 1 watt (R178)
	470,000 ohms, ±10%, ½ watt (R137, R139, R188, R224)
	470,000 ohms, ±20%, ½ watt (R207)
	680,000 ohms, ±10%, ½ watt (R133, R212)
	820,000 ohms, ±10%, ½ watt (R169)
	1 megohm, ±10%, ½ watt (R147, R181)
	1 megohm, ±20%, ½ watt (R189)
	1.2 megohm, ±5%, ½ watt (R157, R213)
	2.2 megohm, ±10%, ½ watt (R130, R132, R163)
	3.3 megohm, ±5%, ½ watt (R159)
	3.9 megohm, ±10%, ½ watt (R149)
	6.8 megohm, ±10%, ½ watt (R125)
	10 megohm, ±10%, ½ watt (R148)
	10 megohm, ±20%, ½ watt (R201)
74602	Screw—No. 10-32 x 1¾" cross recessed round head screw for focus coil adjustments (3 required)
74601	Screw—No. 8-32 x ⅜" cross recessed pan head screw for focus coil mounting (2 required)
71456	Screw—No. 8-32 x 7/16" wing screw for fastening support and bracket
75083	Screw—No. 8-32 wing screw for mounting deflection yoke
73584	Shield—Tube shield
74937	Sleeve—Rubber sleeve for focus coil
73117	Socket—Tube socket, 7 pin, miniature
72927	Socket—Tube socket, 9 pin, miniature.

STOCK No.	DESCRIPTION
31251	Socket—Tube socket, octal, wafer
73249	Socket—Tube socket, octal, ceramic
71508	Socket—Tube socket for 1B3GT/8016
74834	Socket—Kinescope socket
31364	Socket—Pilot lamp socket for KCS40A
74936	Spring—Suspension spring (coil type) for kinescope socket leads
74954	Spring—Compression spring for hood and yoke assembly (3 required)
74944	Support—Rubber support for 2nd anode lead
74948	Support—Bakelite supports (1 set) for mounting hi-voltage plate
46760	Switch—"TV - Phono" switch (S103)
74157	Switch—Cabinet interlock switch (S105)
73569	Transformer—Vertical oscillator transformer (T107)
74589	Transformer—First pix I-F transformer (T101, C102, R101)
74590	Transformer—Second pix I-F transformer (T102, C107)
74591	Transformer—Third pix I-F transformer (T103, C112)
74592	Transformer—Fourth pix I-F transformer (T104, C116)
73575	Transformer—Fifth pix I-F transformer (T106, C123, C124)
71424	Transformer—Sound I-F transformer (T112, C173, C174)
71427	Transformer—Sound discriminator transformer (T113, C178, C179, C180)
73576	Transformer—Horizontal ocscillator transformer (T109)
73578	Transformer—Antenna transformer complete with socket (T115, J102)
74949	Transformer—Power transformer, 115 volts, 60 cycles (T111)
74951	Transformer—High voltage transformer (T110)
74950	Transformer—Vertical output transformer (T108)
73577	Trap—4.5 mc trap (L110, C128)
71778	Trap—Sound trap (T105, C119)
73476	Trap—I-F trap (L116, C189)
74952	Yoke—Deflection yoke (L108, L109, L112, L113, C169, C187, P106)
	SPEAKER ASSEMBLIES FOR MODEL T164 92580-3 W RMA - 274 RL105C5
75023	Cap—Dust cap
75024	Cone—Cone and voice coil assembly
5039	Connector—4 contact male connector for speaker (J101)
75025	Gasket—Speaker cone gasket
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms) less output transformer and connector
75034	Transformer—Output transformer (T114)
	SPEAKER ASSEMBLIES FOR MODELS TC165, TC166, TC167, TC168 Stamped 92569-10W RL 111-16 RMA 274
13867	Cap—Dust cap
74901	Cone—Cone and voice coil assembly (3.2 ohms)

STOCK No.	DESCRIPTION
5039	Connector—4 contact male connector for speaker (J101)
75035	Speaker—12" P.M. speaker complete with cone and voice coil less output transformer and plug
75036	Transformer—Output transformer
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
74958	Back—Cabinet back for Model T164
75019	Back—Cabinet back for Model TC165
75026	Back—Cabinet back for Model TC166
74972	Back—Cabinet back for Model TC167
75020	Back—Cabinet back for Model TC168
72857	Board—"Ant" terminal board
71599	Bracket—Pilot lamp bracket for Models TC165, TC166, TC167, TC168
13103	Cap—Pilot lamp cap for Models TC165, TC166, TC167, TC168
71892	Catch—Bullet catch and strike for doors (1 set) (4 required for Model TC167 and 2 required for Model TC168)
X1917	Cloth—Grille cloth for mahogany or walnut instruments for Model T164
X1918	Cloth—Grille cloth for oak instruments for Model T164
X3074	Cloth—Grille cloth for mahogany or walnut instruments for Models TC165, and TC168, and maple instruments for Model TC168
X3089	Cloth—Grille cloth for oak instruments for Model TC165
X3088	Cloth—Grille cloth for mahogany or walnut instruments for Model TC167
X3101	Cloth—Grille cloth for mahogany and walnut instruments for Model TC166
X3090	Cloth—Grille cloth for oak instruments for Models TC166 and TC167
39153	Connector—4 contact male connector for antenna cable (P102)
30566	Connector—4 contact male connector, part of focus coil (P108)
35383	Connector—8 contact male connector, part of deflection yoke (P106)
74607	Decal—Control panel function decal for mahogany or walnut instruments
74608	Decal—Control panel function decal for oak or maple instruments
71984	Decal—Trade mark decal (RCA Victor) for Model T164
71768	Decal—Trade mark decal (RCA Victor) for Models TC167 and TC168
74809	Emblem—"RCA Victor" emblem

STOCK No.	DESCRIPTION
73642	Escutcheon—Channel marker escutcheon for mahogany or walnut instruments
73740	Escutcheon—Channel marker escutcheon for oak or maple instruments
72113	Foot—Rubber foot (4 required) for Model T164
74975	Glass—Safety glass for Model T164
74606	Glass—Safety glass for Models TC165, TC166, TC167 and TC168
37396	Grommet—Rubber grommet to mount speaker (4 required) for Models TC165, TC167 and TC168
73200	Hinge—Drop panel hinge (2 required) for Model T164
74308	Hinge—Cabinet door hinge (1 set) (4 required for Model TC167 and 2 required for Model TC168)
74959	Knob—Fine tuning knob—dark—for mahogany or walnut instruments (outer)
73995	Knob—Fine tuning knob—tan—for oak or maple instruments (outer)
74960	Knob—Channel selector knob—dark—for mahogany or walnut instruments (inner)
74961	Knob—Channel selector knob—tan—for oak or maple instruments (inner)
74962	Knob—Tone control, brightness control or vertical hold control knob—dark—for walnut or mahogany instruments (outer)
73999	Knob—Tone control, brightness control, or vertical hold control—tan—for oak or maple instruments (outer)
74963	Knob—Picture control, horizontal hold control or volume control and power switch knob—dark—for mahogany or walnut instruments (inner)
74001	Knob—Picture control, horizontal hold control or volume control and power switch knob—tan—for oak or maple instruments (inner)
11765	Lamp—Pilot lamp—Mazda 51—for Models TC165, TC166, TC167 and TC168
74162	Plate—Mounting plate for interlock switch
74450	Plate—Back plate for door pull (4 required) for Model TC167
74451	Pull—Door pull (4 required) for Model TC167
75021	Pull—Door pull (2 required) for Model TC168
74113	Screw—No. 8-32 x 1" trimit head screw for door pulls for Model TC167
74269	Screw—No. 8-32 x ¾" trimit head screw for door pull for Model TC168
73643	Spring—Spring clip for channel marker escutcheons
72845	Spring—Retaining spring for knobs Nos. 73995 and 74959
14270	Spring—Retaining spring for knobs Nos. 73999, 74960, 74961 and 74962
30330	Spring—Retaining spring for knobs Nos. 74001 and 74963
74966	Spring—Formed spring for kinescope masking panel (8 required)
72936	Stop—Door stop (2 required for Model TC167 and 1 required for Model TC168)
74161	Stud—Locating stud for back (2 required)

To obtain resistors for which no stock number is given, order by stating type, value of resistance, tolerance and wattage.

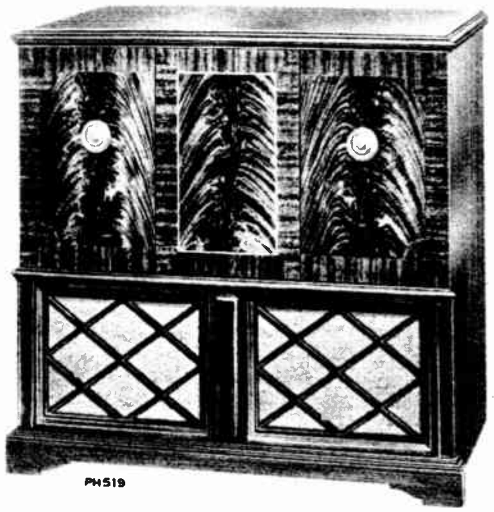
INDEX



Model TA128 — Walnut, Mahogany or Oak

GENERAL DESCRIPTION

Model TA128 television, AM-FM radio, phonograph combination employs twenty-six tubes plus two rectifiers and a 12LP4 kinescope. The radio tuner unit which feeds through the television audio system covers the AM and the FM broadcast bands. Two record changers are provided to play 33⅓, 45 and 78 RPM records.

Features of the television unit are full twelve channel coverage; FM sound system; improved picture brilliance; picture A-G-C; A-F-C horizontal hold; stabilized vertical hold; two stages of video amplification; noise saturation circuits; improved sync separator and clipper; four mc. band width for picture channel and reduced hazard high voltage supply.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE.........87 square inches on a 12LP4 kinescope

TELEVISION R-F FREQUENCY RANGE

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
Fine Tuning Range..±250 kc. on chan. 2, ±650 kc. on chan. 13
Picture Carrier Frequency ....25.75 mc.
Sound Carrier Frequency ....21.25 mc.

RADIO TUNING RANGE

Broadcast ....540-1,600 kc.
Frequency Modulation ....88-108 mc.
Intermediate Frequency—AM ....455 kc.
Intermediate Frequency—FM ....10.7 mc.

POWER SUPPLY RATING......115 volts, 60 cycles, 230 watts

AUDIO POWER OUTPUT RATING..............6 watts max.

CHASSIS DESIGNATIONS

Television Chassis KCS42A
Radio Chassis RK135D
33⅓/78 RPM Record Changer 960282
45 RPM Record Changer..............................RP168

Refer to Service Data 960282 or RP168 for information on the record changers.

LOUDSPEAKER 92569-8.................12 inch PM Dynamic
Voice Coil Impedance ....3.2 ohms at 400 cycles

WEIGHT

Chassis with Tubes in Cabinet.......................180 lbs.
Shipping Weight..................................207 lbs.

DIMENSIONS (inches)	Width	Height	Depth
Cabinet (outside)	36¼	34½	23½
Chassis (overall)	18⅝	17	18½

RECEIVER ANTENNA INPUT IMPEDANCE. 300 ohms balanced

If necessary, the television chassis may be fed separately from either a 300 ohm balanced line or a 72 ohm co-ax.

RCA TUBE COMPLEMENT

Tube Used	(Television Chassis)	Function
(1) RCA 6AG5		R-F Amplifier
(2) RCA 6AG5		Converter
(3) RCA 6J6		R-F Oscillator
(4) RCA 6AU6		1st Sound I-F Amplifier
(5) RCA 6AU6		2nd Sound I-F Amplifier
(6) RCA 6AL5		Sound Discriminator
(7) RCA 6AV6		1st Audio Amplifier
(8) RCA 6V6GT		Audio Output
(9) RCA 6BA6		1st Picture I-F Amplifier
(10) RCA 6AG5		2nd Picture I-F Amplifier
(11) RCA 6BA6		3rd Picture I-F Amplifier
(12) RCA 6AG5		4th Picture I-F Amplifier
(13) RCA 6AL5		Picture 2nd Detector & Sync Limiter
(14) RCA 12AU7		1st and 2nd Video Amplifier
(15) RCA 6SN7GT		AGC Amplifier & Vertical Sweep Osc.
(16) RCA 6SN7GT		AGC Rectifier & 1st Sync Separator
(17) RCA 6SN7GT		Sync Amplifier & 2nd Sync Separator
(18) RCA 6K6GT		Vertical Sweep Output
(19) RCA 6SN7GT		Horizontal Sweep Oscillator and Control
(20) RCA 6BG6G		Horizontal Sweep Output
(21) RCA 6W4GT		Damper
(22) RCA 1B3-GT/8016		High Voltage Rectifier
(23) RCA 5U4G		Power Supply Rectifier
(24) RCA 12LP4		Kinescope
	(Radio Tuner Chassis)	
(1) RCA 6J6		Mixer and Oscillator
(2) RCA 6BA6		I-F Amplifier
(3) RCA 6AU6		F-M Driver
(4) RCA 6AL5		Ratio Detector
(5) RCA 6BF6		AM Detector AVC and Phone Preamp.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE I-F FREQUENCIES

Picture Carrier Frequency ....25.75 mc.
Adjacent Channel Sound Trap ....27.25 mc.
Accompanying Sound Traps ....21.25 mc.
Adjacent Channel Picture Carrier Trap ....19.75 mc.

SOUND I-F FREQUENCIES

Sound Carrier Frequency ....21.25 mc.
Sound Discriminator Band Width between peaks........350 kc.

VIDEO RESPONSE ....To 4 mc.

FOCUS ....Magnetic

SWEEP DEFLECTION ....Magnetic

SCANNING ....Interlaced, 525 line

HORIZONTAL SCANNING FREQUENCY ....15,750 cps

VERTICAL SCANNING FREQUENCY ....60 cps

FRAME FREQUENCY (Picture Repetition Rate) ....30 cps

OPERATING CONTROLS (front panel)

Channel Selector }
Fine Tuning } ....Dual Control Knobs
Tone }
Sound Volume and On-Off Switch } ....Dual Control Knobs
Picture Horizontal Hold }
Picture Vertical Hold } ....Dual Control Knobs
Picture }
Brightness } ....Dual Control Knobs
Function Switch ....Single Control Knob
Radio Tuning ....Single Control Knob

NON-OPERATING CONTROLS

Horizontal Centering ....rear chassis adjustment
Vertical Centering ....rear chassis adjustment
Width ....rear chassis screwdriver adjustment
Width Selector Switch .....rear chassis screwdriver adjustment
Height ....rear chassis adjustment
Horizontal Linearity ....rear chassis screwdriver adjustment
Vertical Linearity ....rear chassis adjustment
Horizontal Drive ....rear chassis screwdriver adjustment
Horizontal Oscillator Frequency .....bottom chassis adjustment
Horizontal Oscillator Waveform ....side chassis adjustment
Focus ....rear chassis adjustment
Ion Trap Magnet ....top chassis adjustment
Deflection Coil ....top chassis wing nut adjustment
Focus Coil ....top chassis screwdriver adjustment

HIGH VOLTAGE WARNING

OPERATION OF THIS RECEIVER OUTSIDE THE CABINET OR WITH THE COVERS REMOVED, INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WORK ON THE RECEIVER SHOULD NOT BE ATTEMPTED BY ANYONE WHO IS NOT THOROUGHLY FAMILIAR WITH THE PRECAUTIONS NECESSARY WHEN WORKING ON HIGH VOLTAGE EQUIPMENT. DO NOT OPERATE THE RECEIVER WITH THE HIGH VOLTAGE COMPARTMENT SHIELD REMOVED.

KINESCOPE HANDLING PRECAUTIONS

DO NOT OPEN THE KINESCOPE SHIPPING CARTON, INSTALL, REMOVE OR HANDLE THE KINESCOPE IN ANY MANNER UNLESS SHATTERPROOF GOGGLES AND HEAVY GLOVES ARE WORN. PEOPLE NOT SO EQUIPPED SHOULD BE KEPT AWAY WHILE HANDLING KINESCOPES. KEEP THE KINESCOPE AWAY FROM THE BODY WHILE HANDLING.

The kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For these reasons, kinescopes must be handled with more care than ordinary receiving tubes.

The large end of the kinescope bulb—particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure at any time. In installation, if the tube sticks or fails to slip smoothly into its socket, or deflecting yoke, investigate and remove the cause of the trouble. Do not force the tube. Refer to the Receiver Installation section for detailed instructions on kinescope installation. All RCA kinescopes are shipped in special cartons and should be left in the cartons until ready for installation in the receiver. Keep the carton for possible future use.

©John F. Rider

World Radio History

OPERATING INSTRUCTIONS

The following adjustments are necessary when turning the receiver on for the first time.

1. Turn the radio FUNCTION switch to Tel.

2. Turn the receiver "ON" and advance the SOUND VOLUME control to approximately mid-position.

3. Set the STATION SELECTOR to the desired channel.

4. Adjust the FINE TUNING control for best sound fidelity and SOUND VOLUME for suitable volume.

5. Turn the BRIGHTNESS control fully counter-clockwise, then clockwise until a light pattern appears on the screen.

6. Adjust the VERTICAL hold control until the pattern stops vertical movement.

7. Adjust the HORIZONTAL hold control until a picture is obtained and centered.

8. Turn the BRIGHTNESS control counter-clockwise until the retrace lines just disappear.

9. Adjust the PICTURE control for suitable picture contrast.

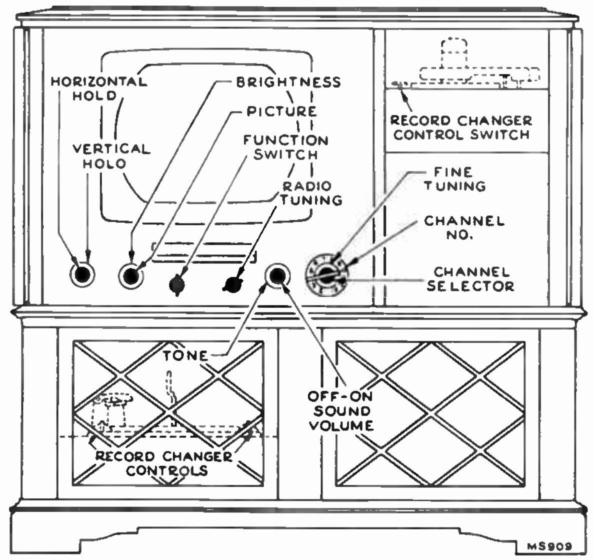

Figure 1—Receiver Operating Controls

10. After the receiver has been on for some time, it may be necessary to readjust the FINE TUNING control slightly for improved sound fidelity.

11. In switching from one station to another, it may be necessary to repeat steps numbers 4 and 9.

12. When the set is turned on again after an idle period, it should not be necessary to repeat the adjustments if the positions of the controls have not been changed. If any adjustment is necessary, step number 4 is generally sufficient.

13. If the positions of the controls have been changed, it may be necessary to repeat steps numbers 1 through 9.

14. For radio operation turn the FUNCTION switch to AM or FM and tune in station with the radio TUNING control.

15. For phono operation, turn the FUNCTION switch to PH for operation of the 33⅓/78 rpm record changer, or to XPH for operation of the 45 rpm record changer.

INSTALLATION INSTRUCTIONS

UNPACKING.—The TA128 receiver is packed complete with kinescope in a cardboard carton. To unpack, turn the shipping carton on its side and tear open the carton bottom flaps. Fold the flaps up along the side of the carton and turn the carton back up. Lift the carton up and off the cabinet.

A flat skid is attached to the bottom of the receiver cabinet which will permit the cabinet to be moved about without stressing the cabinet joints. To remove the skid, take off the nuts from the two bolts that hold the cabinet on the skid. With a man at each end of the cabinet, lift the cabinet off the skid.

The operating control knobs are packed in a bag and tied to a cabinet back rail. Remove the bag and install the knobs on the proper control shafts.

From the rear of the cabinet remove the single wood screw which holds the RP168 record changer drawer in the closed position. Slide the drawer out. From the top of the changer, remove the three filler plugs from over the motorboard mounting screws. Loosen these three screws to permit removal of two wooden shipping strips under the edge of the motorboard. Tighten the screws just enough to keep the motorboard springs from rattling and replace the filler plugs.

Remove the bracket which holds the 960282 changer drawer in the closed position. Open the drawer and from the front of the cabinet remove all of the changer packing material. Take out the two shipping screws from the changer motorboard. Insert two plugs from the bag with knobs into the holes in the motorboard.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the high voltage lead is attached to the kinescope second anode connector socket on the bell of the tube.

Connect the antenna transmission line to the receiver antenna terminals.

Plug the receiver power cord into a 115 volt a-c power source. Turn the receiver power switch to the "on" position, the function switch to "tel," the brightness control three-quarters clockwise, and the picture control counter-clockwise.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 2. Starting from

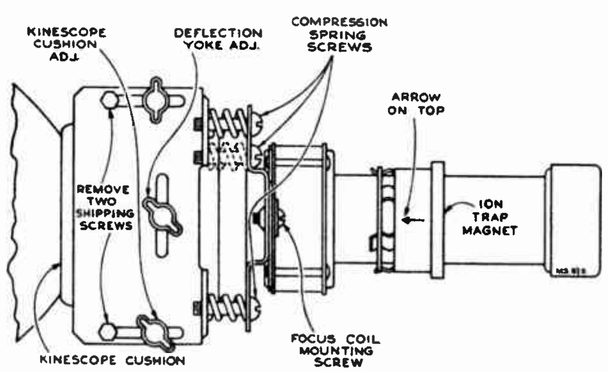

Figure 2—Yoke and Focus Coil Adjustments

this position adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the focus control (R191 on the chassis rear apron) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

INSTALLATION INSTRUCTIONS

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. See steps 3 through 9 of the receiver operating instructions.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC threshold control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R138 on the rear apron (see Figure 3) clockwise until the set operates normally and the picture can be synced.

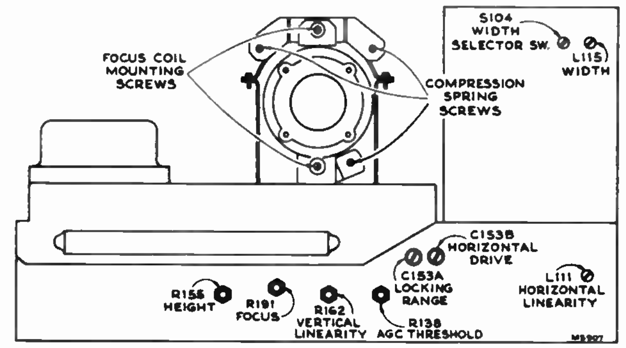

Figure 3—Rear Chassis Adjustments

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull in should occur when the control is approximately 90 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should be out of sync and should show 1 vertical or diagonal black bar in the raster.

If the receiver passes the foregoing checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Coil Adjustments."

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments:

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T109 horizontal frequency adjustment (under the chassis) until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster.

Horizontal Lock in Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 3 bars are present, adjust C153A slightly counter-clockwise. Turn the picture control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 11. For field purposes paragraph "A" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS COIL ADJUSTMENTS.—The focus coil should be adjusted so that there is approximately ¼ inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus coil. This spacing gives best average focus over the face of the tube. However, it may be necessary to change this distance slightly in order to compensate for small differences in strength of the permanent magnets in the coil. If the receiver focuses with the focus control towards the clockwise end of its range, the focus coil should be moved toward the yoke and if focus is obtained towards the counter-clockwise end of the control, the coil should be moved away from the yoke. In order to prevent the beam from striking the neck of the kinescope, it is important that the axis of the hole through the focus coil should be kept in accurate alignment with the axis of the neck of the kinescope.

CENTERING ADJUSTMENTS.—Centering is obtained by loosening the two focus coil mounting screws and sliding the coil up or down or from side to side. If a corner of the raster is shadowed, check the position of the ion trap magnet. In extreme cases it may be necessary to adjust one or more of the focus coil compression screws to eliminate a corner shadow.

Recheck the position of the ion trap magnet to insure that maximum brilliance is obtained.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage, hence the brightest and best focused picture, turn the horizontal drive control counter-clockwise until the left side of the picture begins to stretch.

Adjust the horizontal linearity control L111 to provide best linearity. Adjust the width control until the picture just fills the mask.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

FOCUS.—Adjust the focus control (R191 on chassis rear apron) for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R155 on chassis rear apron) until the picture fills the mask vertically. Adjust vertical linearity (R162 on rear apron), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

CHECK TO SEE THAT THE CUSHION AND YOKE THUMB-SCREWS AND THE FOCUS COIL MOUNTING SCREWS ARE TIGHT.

AGC THRESHOLD CONTROL.—The AGC threshold control R138 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal, sync the picture and turn the picture control to the maximum clockwise position. Turn the brightness control counter-clockwise until the vertical retrace lines are just invisible. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R138. If the picture requires an appreciable portion of a second to reappear, R138 should be readjusted.

©John F. Rider

World Radio History

INSTALLATION INSTRUCTIONS

Set the picture control at the maximum clockwise position. Turn R138 fully clockwise. The top one-half inch of the picture may be bent slightly. This should be disregarded. Turn R138 counter-clockwise until there is a very, very slight bend or change of bend in the top one-half inch of the picture. Then turn R138 clockwise just sufficiently to remove this bend or change of bend.

If the signal is very weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R138 counter-clockwise until the snow in the picture becomes more pronounced, then clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far counter-clockwise on a weak signal, then the receiver may overload when a strong signal is received.

CHECK OF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 10. The adjustments for channels 2 through 5 and 7 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis and channel 6 adjustment is in the kinescope well. See Figures 9 and 10 for their location.

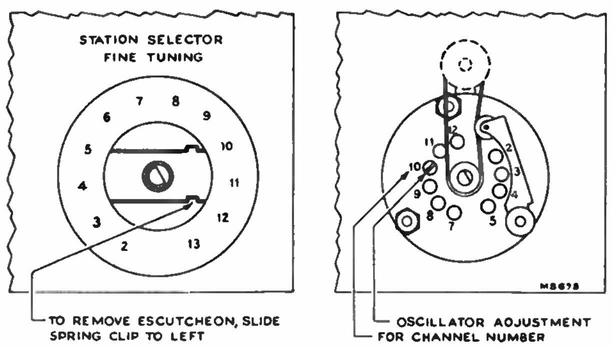

Figure 4—R-F Oscillator Adjustments

RECORD CHANGER OPERATION.—Turn the receiver function switch to each phono position and check each record player for proper operation.

RADIO OPERATION.—Turn the receiver function switch to AM and FM positions and check the radio for proper operation. Tune in a station of known frequency. If the dial pointer does not point to the correct spot on the dial, slip the dial pointer on the dial cord until the proper indication is obtained.

Replace the cabinet back and make sure that the screws are tight in order to prevent rattling at high volume.

WEAK SIGNAL AREA OPERATION.—Since the vast majority of receivers are sold in strong signal areas, the chassis are aligned to produce the cleanest pictures in those areas. However, if the receiver is to be operated in a weak signal area, better performance can be obtained by "peaking" the r-f unit.

To peak the r-f unit in these receivers, disconnect the 390 ohm resistor which is on top of the r-f unit chassis. Adjust L66 to obtain the best possible picture on the weakest low channel station received. By this action, the r-f gain is increased 50% at the expense of r-f bandwidth and an improvement in the weak signal picture results.

If the peaked receiver is subsequently taken to a strong signal area, the resistor R14 should be connected in place and L66 adjusted for "flat" response on the low channels.

CHASSIS REMOVAL.—To remove the chassis from the cabinet for repair or installation of a new kinescope, remove the back and the knobs, unplug all cables and remove the chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet. The kinescope is held on the chassis by means of a special strap, so that the chassis and the kinescope can be handled together, as a unit.

KINESCOPE HANDLING PRECAUTION.—Do not install, remove, or handle the kinescope in any manner, unless shatter-proof goggles and heavy gloves are worn. People not so equipped should be kept away while handling the kinescope. Keep the kinescope away from the body while handling.

To remove the kinescope, remove the kinescope socket, the ion-trap magnet, and the second-anode connector. Loosen the cross-recessed head screw on the kinescope strap, as shown in Figure 6. Withdraw the kinescope toward the front of the chassis.

INSTALLATION OF KINESCOPE.—Slide the kinescope cushion toward the rear of the chassis. Loosen the deflection yoke adjustment, slide the yoke toward the rear of the chassis and tighten.

The kinescope second anode contact is a recessed metal well in the side of the bulb. The tube must be installed so that this contact is up but rotated approximately 30 degrees toward the high-voltage compartment.

Insert the neck of the kinescope through the deflection and focus coils. If the tube sticks, or fails to slip into place smoothly, investigate and remove the cause of the trouble. Do not force the tube.

Slip the ion trap magnet assembly over the neck of the kinescope.

Connect the kinescope socket to the tube base.

Connect the high voltage lead to the kinescope second anode socket.

Wipe the kinescope screen surface and front panel safety glass clean of all dust and finger marks.

Tighten the cross-recessed head screw on the kinescope strap.

As may be seen by inspection, the radio dial lights and dial pointer are attached to the cabinet front panel. The dial cord is attached to the receiver chassis. The method of attachment may be seen in Figure 5.

Slide the dial pointer to the stop on the high frequency end of the dial. Turn the radio tuning shaft until the gang is completely unmeshed.

Slide the chassis into the cabinet until there is sufficient slack in the pilot light cable, then attach the pilot light sockets to the pilot light bracket.

Insert the chassis to its proper position, then install the six chassis bolts and tighten. Loosen the kinescope strap from the rear of the chassis. Push the kinescope forward until the face of the tube is against the mask. Push the yoke cushion forward against the kinescope flare, then tighten the cushion adjusting screws. Push the yoke forward and tighten. Tighten the kinescope strap. Replace the control knobs.

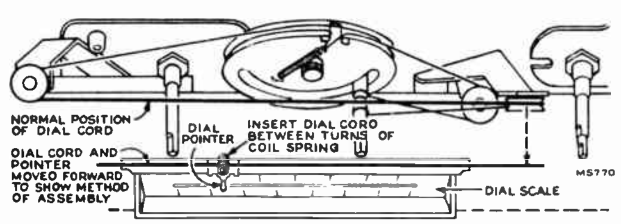

Figure 5—Dial Cord and Pointer Assembly

To hook up the dial pointer, reach over the television chassis to the radio and press the dial cord well into the coil spring.

Turn the set on and to radio position to see that the dial lighting is correct. If it is not, adjust the dial lights and shields. Tune in a station of known calibration and check the dial calibration.

Perform the entire television set-up procedure beginning with Ion Trap Magnet Adjustment.

CABINET ANTENNA.—A cabinet antenna is provided which may be employed in strong signal areas in which no reflections are experienced. The antenna leads are brought out near the receiver antenna terminals.

The link on the antenna terminal board on the back of the cabinet is for use in case it is desirable to connect a separate "A" band antenna.

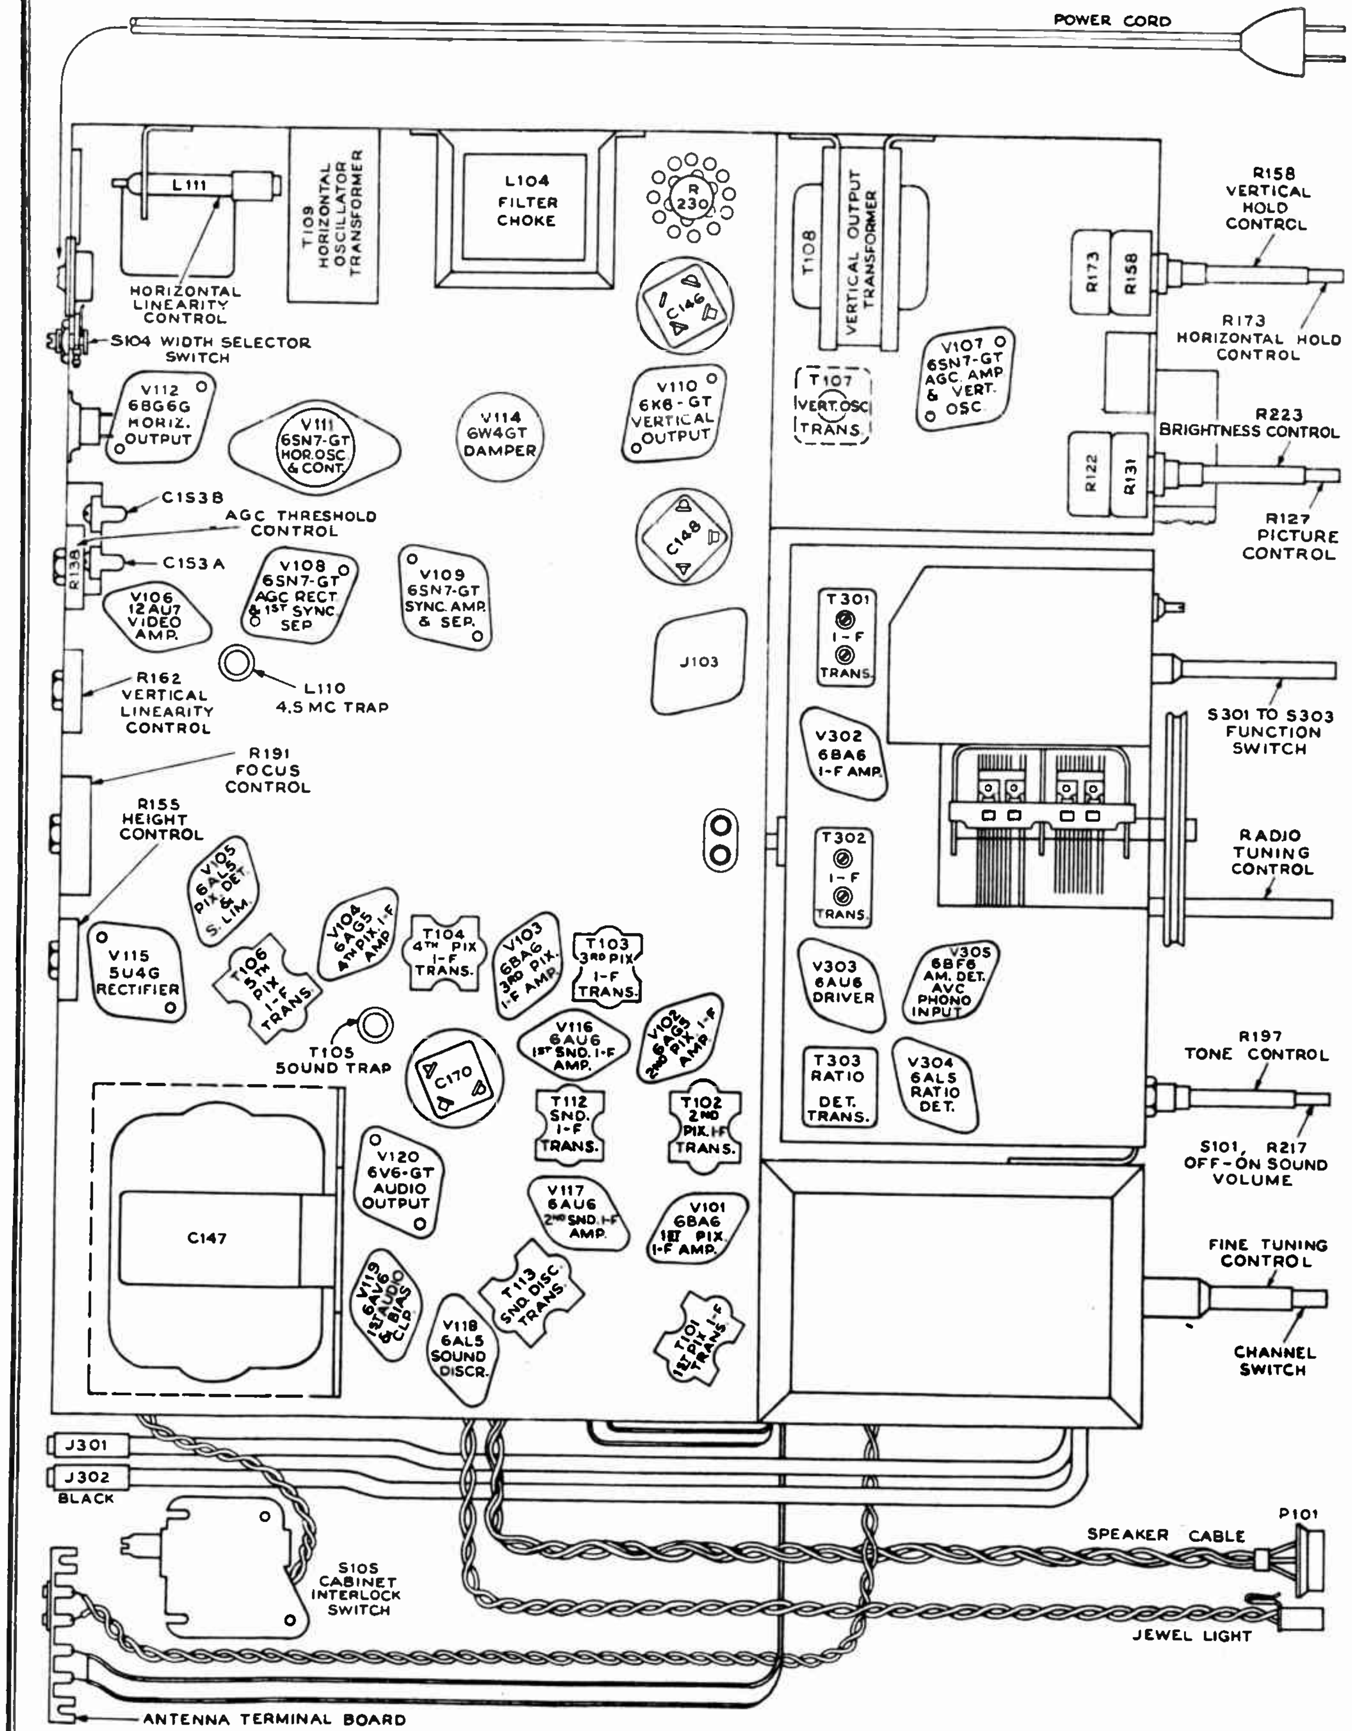

Figure 7—Chassis Bottom View

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To service properly the television chassis of this receiver, it is recommended that the following test equipment be available:

R-F Sweep Generator meeting the following requirements:

(a) Frequency Ranges

20 to 30 mc., 1 mc. and 10 mc. sweep width
50 to 90 mc., 10 mc. sweep width
170 to 225 mc., 10 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

Cathode-Ray Oscilloscope.—For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response and should be capable of passing a 60-cycle square wave without appreciable distortion. While this requirement is not met by many commercial instruments, RCA Oscilloscopes, types WO-55A, WO-58A, WO-79A, and WO-60C fill the requirement and any of these may be employed.

For video and sync waveform observations, the oscilloscope must have excellent frequency and phase response from 10 cycles to at least two megacycles in all positions of the gain control. The RCA types WO-58A and WO-79A are ideally suited for this purpose.

Signal Generator to provide the following frequencies with crystal accuracy.

(a) Intermediate frequencies

19.75 mc. adjacent channel picture trap
21.25 mc. sound i-f and sound traps
22.05 and 24.75 mc. conv. and first pix i-f trans.
25.9 mc. second picture i-f transformer
24.6 mc. fourth picture i-f transformer
22.0 mc. third picture i-f transformer
22.5 mc. fifth picture i-f transformer
25.75 mc. picture carrier
27.25 mc. adjacent channel sound trap

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(c) Output on these ranges should be adjustable and at least .1 volt maximum.

Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

Electronic Voltmeter of Junior "VoltOhmyst" type and a high voltage multiplier probe for use with this meter to permit measurements up to 10 kv.

Service Precautions.—If possible, the chassis should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, make sure the kinescope retaining strap is secure, and the yoke cushion is up firmly against the flare of the tube.

CAUTION: Do not short the kinescope second-anode lead. Its short circuit current is approximately 3 ma. This represents approximately 9 watts dissipation and a considerable overload on the high-voltage filter resistor R189.

Adjustments Required.—Normally, only the r-f oscillator line will require the attention of the service technician. All other circuits are either broad or very stable and hence will seldom require re-adjustment.

The oscillator line is relatively non-critical. When oscillator tubes are changed, in all probability it will be necessary to adjust only C6 in order to bring the entire line into adjustment.

ORDER OF ALIGNMENT.—When a complete receiver alignment is necessary, it can be most conveniently performed in the following order:

(1) Sound discriminator
(2) Sound i-f transformers
(3) Picture i-f traps
(4) Picture i-f transformers
(5) R-F and converter lines
(6) R-F oscillator line
(7) 4.5 mc. video trap
(8) Sensitivity check

SOUND DISCRIMINATOR ALIGNMENT.—Set the signal generator for approximately .1 volt output at 21.25 mc. and connect it to the second sound i-f grid.

Detune T113 secondary (bottom).

Set the "VoltOhmyst" on the 3-volt scale.

Connect the meter, in series with a one-megohm resistor, to the junction of diode resistors R203 and R204.

Adjust the primary of T113 (top) for maximum output on the meter.

Connect the "VoltOhmyst" to the junction of C183 and R203. Adjust T113 secondary (bottom). It will be found that it is possible to produce a positive or negative voltage on the meter dependent upon this adjustment. Obviously to pass from a positive to a negative voltage, the voltage must go through zero. T113 (bottom) should be adjusted so that the meter indicates zero output as the voltage swings from positive to negative. This point will be called discriminator zero output.

Connect the sweep oscillator to the grid of the second sound i-f amplifier.

Adjust the sweep band width to approximately 1 mc. with the center frequency at approximately 21.25 mc. and with an output of approximately .1 volt.

Connect the oscilloscope to the junction of C183 and R203. The pattern obtained should be similar to that shown in Figure 13. If it is not, adjust T113 (top) until the wave form is symmetrical.

The peak to peak band width of the discriminator should be approximately 350 kc. and the trace should be linear from 21.175 mc. to 21.325 mc.

SOUND I-F ALIGNMENT.—Connect the sweep oscillator to the first sound i-f amplifier grid.

Connect the oscilloscope to the second sound i-f grid return (terminal A of T112) in series with a 33,000-ohm isolating resistor.

Insert a 21.25 mc. marker signal from the signal generator into the first sound i-f grid.

Adjust T112 (top and bottom) for maximum gain and symmetry about the 21.25 mc. marker. The pattern obtained should be similar to that shown in Figure 14.

The output level from the sweep should be set to produce approximately .3 volt peak-to-peak at the second sound i-f grid return when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

The band width at 70% response from the first sound i-f grid to the second i-f grid should be approx. 200 kc.

©John F. Rider

World Radio History

PICTURE I-F TRAP ADJUSTMENT.—Connect the "VoltOhmyst" to the junction of R135 and C190.

Remove the 6SN7GT AGC Amplifier tube V107. Connect a 250,000-ohm potentiometer between pins 5 and 6 of the V107 socket. Adjust the potentiometer until the "VoltOhmyst" reads approximately –12 volts.

Set the channel switch to the blank position between channels numbers 2 and 13.

Connect the "VoltOhmyst" across the picture detector load resistor R119. Under this condition, both leads of the meter are at approximately –12C volts. In making this connection, care should be taken not to touch the case of the meter or to permit the meter case to become grounded.

Connect the output of the signal generator to the grid of the converter tube V2. To do this, remove the tube from the socket and fashion a clip by twisting one end of a small piece of wire around pin number 1. Replace the tube in the socket leaving the end of the wire protruding from under the tube. Connect the signal generator to this wire through a 1,500 mmf capacitor keeping the leads as short as possible.

Set the generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for minimum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is exactly on frequency.

(1) 21.25 mc.—T103 (top)	(4) 27.25 mc.—T104 (top)
(2) 21.25 mc.—T105 (top)	(5) 19.75 mc.—T106 (top)
(3) 27.25 mc.—T102 (top)	(6) 19.75 mc.—T101 (top)

In the above transformers using threaded cores, it is possible to run the cores completely through the coils and secure two peaks or nulls. The correct position is with the cores in the outside ends of the coils. If the cores are not in the correct position, the coupling will be incorrect and it will be impossible to secure the correct response.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary to prevent overloading.

22.5 mc.—T106 (bottom)
24.6 mc.—T104 (bottom)
22.0 mc.—T103 (bottom)
25.9 mc.—T102 (bottom)

T1 and T101 are coupled by a link and in combination constitute an overcoupled transformer. The characteristics of such a transformer are such that it is impossible to adjust it to a single frequency.

To sweep align T1 and T101, connect a 330-ohm composition resistor across the primary coils of T102, T103, T104 and T106.

Connect the "VoltOhmyst" to the junction of R135 and C190. Adjust the 250,000-ohm variable resistor for 2.0 volts on the meter.

Connect the oscilloscope to the plate of the first video amplifier, pin 1 of V106.

Connect a sweep generator to the converter grid through a 1,500 mmf capacitor. Set the generator to sweep from 20.0 mc. to 30.0 mc. and adjust the output to provide a 4-volt peak-to-peak signal on the scope.

Connect the signal generator loosely to the converter grid and tune it to provide markers at 22.05 mc. and 24.75 mc.

Adjust T1 (top) and T101 (bottom) to obtain the response shown in Figure 15. The T1 core must penetrate to the terminal-board end of the coil in order to obtain the correct response.

Remove the 330 ohm resistors from across T102, T103, T104 and T106.

Adjust the 250,000 ohm potentiometer for a 15-volt peak-to-peak signal at the plate of the first video amplifier. The bias as measured by the "VoltOhmyst" should be 12 volts or less.

Observe and analyze the response curve obtained. The response will not be ideal and the i-f adjustments must be retouched in order to obtain the desired curve. See Figure 16.

On final adjustment the picture carrier marker must be at approximately 45% response. The curve must be approximately flat topped, with the 22.1 mc. marker at approximately 95% response and the 25.0 mc. marker below 90% response. A 26.5 mc. marker must fall between 5 and 10% response.

The most important consideration in making the i-f adjustments is to get the picture carrier at the 45% response point. If the picture carrier operates too low on the response curve, loss of low frequency video response, of picture brilliance, of blanking, and of sync may occur. If the picture carrier operates too high on the response curve, the picture becomes smeared. In making these adjustments, care should be taken to see that no two transformers are tuned to the same frequency as i-f oscillation may result.

Remove the converter tube and take off the clip to pin number 1. Replace the tube in the socket.

Picture I-F Oscillation. If the receiver will operate without oscillating with the test equipment disconnected but breaks into oscillation or becomes unstable with the equipment connected, it may become necessary to establish a ground plane. Cover the test bench with a sheet of copper and set the chassis on the sheet. Set all the test equipment except the "VoltOhmyst" on the sheet and bond or bypass them to it. A Junior "VoltOhmyst" should not be bonded to the sheet since the negative test probe is not always connected to ground during alignment. If the receiver is badly misaligned and two or more of the i-f transformers are tuned to the same frequency, the receiver may fall into i-f oscillation. I-F oscillation shows up as a voltage across the picture detector load resistor that is unaffected by r-f signal input. If such a condition is encountered, it is sometimes possible to stop oscillation by adjusting the transformers approximately to frequency by setting the adjustment cores of T101, T102, T103, T104, T105 and T106 to be approximately equal to those of another receiver known to be in proper alignment. If this does not have the desired effect, it may now be possible to stop oscillation by increasing the grid bias. If so, it should then be possible to align the transformers by the usual method. Once aligned in this manner, the i-f amplifier should be stable with reduced bias.

If the oscillation cannot be stopped in the above manner, shunt the grids of the first three pix i-f amplifiers to ground with 1,000 mmf capacitors. Connect the signal generator to the fourth pix i-f grid and align T106 to frequency. Progressively remove the shunt from each grid and align the plate coil of that stage to frequency.

If this does not stop the oscillation, the difficulty is not due to i-f misalignment as the i-f section is stable when properly aligned. Check all i-f by-pass condensers, transformer shunting resistors, tubes, socket voltages, etc.

ANTENNA, R-F AND CONVERTER LINE ADJUSTMENT.—In order to align the r-f tuner, it will first be necessary to set the channel-13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.

The channel-13 oscillator may be aligned by adjusting it to beat with a crystal-calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available. Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated.

If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, couple the meter probe loosely to the receiver oscillator.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier signal, connect the signal generator to the receiver antenna terminals. Connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203).

Set the receiver switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator.

Now that the channel-13 oscillator is set to frequency, we may proceed with the r-f alignment.

Connect the "VoltOhmyst" to the junction of R135 and C197. Adjust the 250K pot. for –3.5 volts on the meter.

Remove the first pix i-f amplifier tube V101.

Connect the oscilloscope to the test connection at R13 in the r-f tuning unit.

Connect the r-f sweep oscillator to the receiver antenna terminals. The method of connection depends upon the output impedance of the sweep. The P102 connections for 300-ohm balanced or 72-ohm single-ended input are shown in the circuit diagram in Figure 74. If the sweep oscillator has a 50-ohm single-ended output, 300-ohm balanced output can be obtained by connecting as shown in Figure 8.

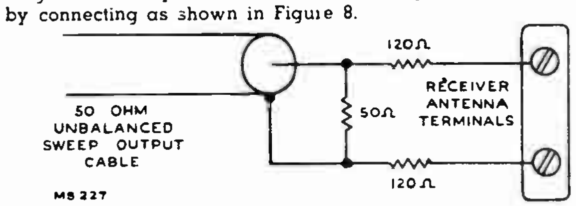

Figure 8—Unbalanced Sweep Cable Termination

Connect the signal generator loosely to the receiver antenna terminals.

Since channel 7 has the narrowest response of any of the high frequency channels, it should be adjusted first.

Set the receiver channel switch to channel 7.

Set the sweep oscillator to cover channel 7.

Insert markers of channel 7 picture carrier and sound carrier, 175.25 mc. and 179.75 mc.

Adjust C10 and C14 until the curve falls symmetrically between the sound and picture carrier markers. Adjust C11 to give the proper bandwidth. Roughly peak L6 in conjunction with slight adjustments of C10 and C14 for a flat-topped response curve with the sound and picture carriers at 90% to 95% response points on this curve. See Figure 17, channel 7.

Switch to channel 12 and adjust L6 for maximum response and minimum top slope of the curve.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep oscillator and marker oscillator to each of these channels and observing the response obtained. See Figure 17 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response. If the markers do not fall within this requirement on one or more high frequency channels, since there are no individual channel adjustments, it will be necessary to readjust L6, C10, C11 and C14, and possibly compromise some channel slightly in order to get the markers up on other channels. Normally, however, no difficulty of this type should be experienced since the higher frequency channels are comparatively broad and the markers easily fall within the required range.

Channel 6 is next aligned in the same manner.

Set the receiver to channel 6.

Set the sweep oscillator to cover channel 6.

Set the marker oscillator to channel 6 picture and sound carrier frequencies.

Adjust L9, L13, L66, and C12 for an approximately flat-topped response curve located symmetrically between the markers. L9, L13 and L66 are the center frequency adjustments. C12 is the band-width adjustment.

Check channels 5 down through channel 2 by switching the receiver, sweep oscillator and marker oscillator to each channel and observing the response obtained. In all cases, the markers should be above the 80% response point. If this is not the case, L9, L13, L66 and C12 should be retouched. On final adjustment, all channels must be within the 80% specification.

Disconnect the 250K pot., and replace V107 and V101.

Following an r-f alignment, the oscillator alignment must be checked.

R-F OSCILLATOR LINE ADJUSTMENT.—The r-f oscillator line may be aligned by adjusting it to beat with a crystal calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available.

Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated. If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, the calibration frequency listed under R-F Osc. Freq. must be available.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier frequency, the frequencies listed under Sound Carrier Freq. must be available.

Channel Number	Receiver R-F Osc. Freq. Mc.	R-F Sound Carrier Freq. Mc.	Channel Oscillator Adjustment
2	81	59.75	L24
3	87	65.75	L23
4	93	71.75	L22
5	103	81.75	L21
6	109	87.75	L31
7	201	179.75	L19
8	207	185.75	L18
9	213	191.75	L17
10	219	197.75	L16
11	225	203.75	L15
12	231	209.75	L14
13	237	215.75	C6

If the heterodyne frequency meter method is used, couple the meter probe loosely to the receiver oscillator.

If the r-f sound carrier method is used, connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203) and connect the signal generator to the receiver antenna terminals. The order of alignment remains the same regardless of which method is used.

If the r-f unit is removed from the receiver for service and is aligned separately, the shield over the bottom of the r-f unit must be in place when making adjustments.

Since lower frequencies are obtained by adding steps of inductance, it is necessary to align channel 13 first and continue in reverse numerical order.

Set the receiver channel switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range while making the adjustment.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator. Oscillator adjustments L1 and L2 shown on the schematic are factory control adjustments and should not be touched in the field.

Switch the receiver to channel 12.

Set the frequency standard to the proper frequency as listed in the alignment table.

Adjust L14 for indications as above.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator trimmer for the speci-

ALIGNMENT PROCEDURE

fied indication. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control in the middle third of its range.

After the oscillator has been set on all channels, start back at channel 13 and recheck to make sure that all adjustments are correct.

AGC THRESHOLD ADJUSTMENT.—The AGC threshold adjustment can be made by the method outlined in the Installation Instructions. However, a more accurate adjustment can be obtained by the use of an oscilloscope.

Tune in a station and advance the picture control to the maximum clockwise position. Connect the low capacity probe from the oscilloscope to the plate of the first video amplifier, pin 1 of V106. Adjust the oscilloscope to observe the horizontal sync pulse.

Turn the AGC threshold control R138 fully clockwise, then slowly counter-clockwise. As the control is turned counter-clockwise, the receiver gain will increase slowly, increasing the size of the pattern on the oscilloscope. R138 should be turned counter-clockwise until the receiver begins to overload as indicated by clipping of the sync. The control should be left in the maximum gain position in which no clipping of sync is observed. See Figure 18 for proper waveforms.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment requires the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—With a clip lead, short circuit the coil between terminals C and D of the horizontal oscillator transformer T109. Tune in a television station and sync the picture if possible.

A.—Turn the horizontal hold control R173 to the extreme clockwise position. Adjust the T109 Frequency Adjustment (under the chassis) so that the picture is just out of sync and the horizontal blanking appears in the picture as a vertical bar. The position of the bar is unimportant.

B.—Turn the hold control approximately one quarter of a turn from the extreme clockwise position and examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C153B, the width control L115 and the linearity control L111 until the picture is correct. If C153B was adjusted, repeat step A above.

Horizontal Locking Range Adjustment.—Turn the horizontal hold control fully counter-clockwise. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 9 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 7 bars are present, adjust C153A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat the procedure until 7 to 9 bars are present.

Horizontal Oscillator Waveform Adjustment.—Remove the shorting clip from terminals C and D of T109. Turn the horizontal hold control to the extreme clockwise position. With a thin fibre screwdriver, adjust the Oscillator Waveform Adjustment Core of T109 (on the outside of the chassis) until the horizontal blanking bar appears in the raster.

A.—Connect the low capacity probe of an oscilloscope to terminal C of T109. Turn the horizontal hold control one quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 19. Adjust the Oscillator Waveform Adjustment Core of T109 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Check of Horizontal Oscillator Adjustments.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 3 bars are present, adjust C153A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. The picture should be just out of sync to the extent that the horizontal blanking bar appears as a single vertical or diagonal bar in the picture. Adjust the T109 Frequency Adjustment until this condition is fulfilled.

4.5 MC VIDEO TRAP.—With a strong input from a station, detune the receiver from the correct fine tuning point. With a very short clip lead, short the trap winding of T103. Observe the picture for the appearance of a 4.5 mc. beat. If the beat appears in the picture, adjust L110 until the beat is eliminated.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES.—The response curves shown on page 14 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

ALIGNMENT TABLE.—Both methods of oscillator alignment are presented in the alignment table. The service technician may thereby choose the method to suit his test equipment.

ALIGNMENT TABLE

48	Repeat steps 36 through 47 as a check.								
	AGC THRESHOLD ADJUSTMENT								
49	Not used		Not used		Pin 1, V106	Not used	Tune in station, turn pix control clockwise. Adjust R138 for max. gain without clipping sync on scope.		Fig. 11 Fig. 18
	HORIZONTAL OSCILLATOR ADJUSTMENT								
50	Short circuit terminals C and D of T109. Tune in a station.								
51	Turn hold control fully clockwise. Adjust T109 Frequency Adjustment until horizontal blanking bar appears in the picture.								
52	Turn hold control 1/4 turn from clockwise to sync picture. Adjust width (L115), linearity (L111) and drive (C153B) controls until picture is correct. Repeat step 51.								
53	Turn hold control fully counter-clockwise. Momentarily remove signal. Turn hold control slowly clockwise. Note least number of bars before pull-in. Adjust Locking Range Control (C153A) for 7 to 9 bar pull-in.								
54	Remove clip from terminals C and D of T109. Turn hold control fully clockwise. Adjust T109 Oscillator Waveform Adjustment until horizontal blanking bar appears in picture.								
55	Connect low capacity probe of oscilloscope to terminal C of T109. Turn hold control 1/4 turn from clockwise. Adjust T109 Oscillator Waveform Adjustment until broad and sharp peaks of wave on oscilloscope are same height. Keep picture in sync with hold control during adjustment. Remove oscilloscope.								
56	Turn hold control fully counter-clockwise. Momentarily remove signal. Turn hold control slowly clockwise. Note least number of bars before pull-in. Adjust Locking Range Control (C153A) for 3 bar pull-in.								
57	Turn hold control fully clockwise. Adjust T109 Freq. Adjustment until horizontal blanking appears as single vertical or diagonal bar in pix.								
	4.5 MC VIDEO TRAP ADJUSTMENT								
58	Tune in a strong station. Short T103 trap. If a 4.5 mc. beat appears in picture adjust 4.5 mc. trap (L110) until beat is eliminated.								
	SENSITIVITY CHECK								
59	Connect antenna to receiver through attenuator pad to provide weak signal. Compare the picture and sound obtained to that obtained on other receivers under the same conditions.

RADIO ALIGNMENT PROCEDURE

If any lead dressing is necessary, it should be done before aligning the receiver. When making a complete alignment follow the table below in sequence. If only a portion of the circuit is to be aligned select the portion required and follow with the remaining steps in the section. Any adjustments made on the 455 kc. I-F's make it necessary to adjust the 10.7 mc. I-F's.

"AM" R-F—I-F ALIGNMENT

Test-Oscillator.—For all alignment operations, connect low side of the test-osc. to the receiver chassis, and keep the osc. output as low as possible to avoid a-v-c action. Output Meter.—Connect the meter across the speaker voice coil, and turn the receiver volume control to max.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
1	Antenna terminal in series with .01 mfd.	455 kc. Modulated	AM	Low Freq. end of Dial	†Top and bot. cores of T301 and T302. (For max. voltage across voice coil.)
2	Ant. terminal through dummy ant. of 200 mmfs.	1,620 kc.	AM	Min. capacity	Osc. C308 for maximum output.
3		1,400 kc.	AM	Tune to signal	Ant. C304 for maximum output.
4		600 kc.	AM	600 kc.	Osc. L306 and Ant. L303.
5	Repeat steps 2, 3 and 4 for maximum output.				

† Use alternate loading. Connect an 18,000-ohm resistor across the primary to load the plate winding while the grid winding of the same transformer is being peaked. Then load the grid winding with the 18,000-ohm resistor while the plate winding is being peaked.

RATIO DETECTOR ALIGNMENT

Connect probe of "VoltOhmyst" to negative side of C328 and low side to chassis. Connect output meter across speaker voice coil.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Radio Dial Tuned to—	Adjust
6	Pin No. 1 of 6AU6 (V303) in series with .01 mfd.	10.7 mc. 30% AM Modulated	FM	———	Top of T303 for maximum DC on "VoltOhmyst."
7	Pin No. 1 of 6AU6 (V303) in series with .01 mfd.		FM	———	Bottom of T303 for minimum audio output on meter.
8	Repeat steps 6 and 7 as necessary making final adjustment with r-f input level set to give approximately 3.0 volts d-c on "VoltOhmyst."				

"FM" R-F—I-F ALIGNMENT

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Radio Dial Tuned to—	Adjust
9	Terminal 3 of S301-2 rear through 270 ohms.	10.7 mc.	FM	88 mc.	*T301 and T302 for max. with r-f input set to give −3 volts on "VoltOhmyst."
10	Terminal 3 of S301-2 rear through 270 ohms.	106 mc.	FM	106 mc.	Set C302 to max. capacity. Squeeze L307 and adjust C302 for maximum.
11	Terminal 3 of S301-2 rear through 270 ohms.	90 mc.	FM	Tune to signal	Squeeze L301 and rock gang for maximum output.
12	Repeat steps 10 and 11 as required.				

* Use a 680-ohm resistor to load the plate winding while the grid winding of the same transformer is being peaked. Then the grid winding is loaded with 680-ohm resistor while the plate winding is being peaked.

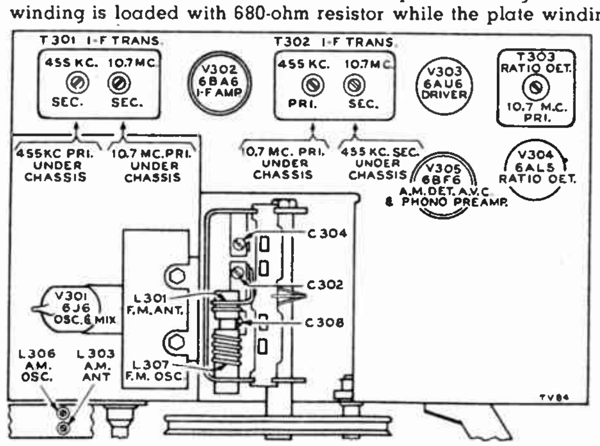

Figure 20—Chassis, Top View, Showing Adjustments

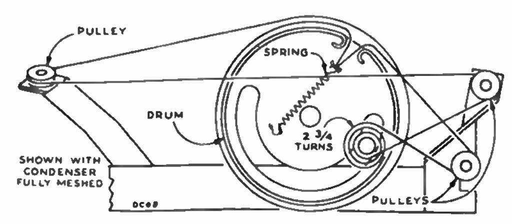

Figure 21—Dial and Drive Cord Assembly

CRITICAL LEAD DRESS:

1. Ground lead on pin 2 of V302 and V303 should be dressed down flat on chassis.
2. Dual .005 mfd. capacitors and diode filter should be dressed to clear the bottom of the cabinet.
3. Dress C329 across V302 sockets with short and direct leads.
4. Dress V302 plate lead from pin 5 down to the chassis.
5. Dress AVC lead from R321 to switch down to chassis and against back of gang mounting plate.
6. Dress lead from pin 6 of V305 down to chassis and against back of gang mounting plate.
7. Dress AVC lead from 1st I-F to switch against chassis and against gang mounting plate.
8. Dress lead from switch to pin 1 of V301 against plate supporting gang.
9. Dress all insulated F-M leads down to chassis.
10. Connect C309 with short lead to pin 6 of V301 keeping body of cap away from plate lead and switch terminals.
11. The coupling between L301 and L307 should be adjusted to give proper injection voltage to the mixer grid. This has been found to be correct when the distance between adjacent end turns is 3/4" to 7/16" measured at top of the form.
12. Dress cabled leads away from antenna transmission lines.
13. Dress all uninsulated bus wire so as to avoid short circuits.

SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnets reversed either front to back or top to bottom; front magnet incorrectly oriented.

(2) V112 or V113 inoperative. Check waveforms on grids and plates.

(3) No high voltage—If horizontal deflection is operating as evidenced by the correct waveform on terminal 4 of horizontal output transformer, the trouble can be isolated to the 8016 circuit. Either the T110 high voltage winding is open, the 8016 tube is defective, its filament circuit is open, C168 is shorted, or R187 or R189 are open.

(4) V111 circuit inoperative—Refer to schematic and waveform chart.

(5) Damper tube (V114) inoperative.

(6) Defective kinescope.

(7) R131 open.

(8) No receiver plate voltage—filter capacitor shorted—bleeder or filter choke open.

NO VERTICAL DEFLECTION:

(1) V107B or V110 inoperative. Check voltage and waveforms on grids and plates.

(2) T107 or T108 open.

(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.

(2) V112 defective.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V110.

(2) Vertical output transformer defective.

(3) V107B defective—check voltage and waveforms on grid and plate.

(4) C150, R164, C147B or C148C defective.

(5) Low bias or plate voltage—check rectifiers and capacitors in supply circuits.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V112 or V114.

(2) T110 or L111 defective.

(3) C164 or C165 defective.

WRINKLES ON LEFT SIDE OF RASTER:

(1) R166, R167 or C169 defective.

(2) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T109 incorrectly tuned.

(2) R172, R173 or R174 defective.

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER:

(1) Improper adjustment of focus coil or ion trap magnet.

(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) R-F oscillator off frequency.

(2) Sound i-f, discriminator or audio amplifier inoperative—check V116, V117, V118, V119, V120 and their socket voltages.

(3) T114 or C186 defective.

(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC threshold control R138 misadjusted.

(2) V105B, V107A, V108 or V109 inoperative. Check voltage and waveforms at their grids and plates.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V107B and associated circuit—C145, T107, etc.

(2) Integrating network inoperative—Check.

(3) R154, R155, R157, R158 or R159 defective.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T109 misadjusted—readjust as instructed on page 11.

(2) V111 inoperative—check socket voltages and waveforms.

(3) T109 defective.

(4) C140, C153A, C154, C155, C156, C157 or C166 defective.

(5) If horizontal speed is completely off and cannot be adjusted check C158, C159, R172, R173, R174, R179 and R182.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture i-f, detector or video amplifier inoperative—check V103, V104, V105 and V106—check socket voltages.

(2) Bad contact to kinescope grid.

PICTURE STABLE BUT POOR RESOLUTION:

(1) V105A or V106 defective.

(2) Peaking coils defective—check for specified resistance.

(3) Make sure that the focus control operates on both sides of proper focus.

(4) R-F and I-F circuits misaligned.

PICTURE SMEAR:

(1) R-F or I-F circuits misaligned.

(2) Open peaking coil.

(3) This trouble can originate at the transmitter—check on another station.

PICTURE JITTER:

(1) AGC threshold control R138 misadjusted.

(2) If regular sections at the left picture are displaced change V112.

©John F. Rider

World Radio History

SERVICE SUGGESTIONS

(3) Vertical instability may be due to loose connections or noise.

(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.

(2) R-F oscillator off frequency.

(3) R-F unit inoperative—check V1, V2, V3.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.

(2) Replace V112.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) C169 defective.

(2) V114 defective.

PICTURE I-F RESPONSE.—At times it may be desirable to observe the individual i-f stage response. This can be achieved by the following method:

Shunt all i-f transformers and coils with a 330-ohm carbon resistor except the one whose response is to be observed.

Connect a wide band sweep generator to the converter grid and adjust it to sweep from 18 mc. to 30 mc.

Connect the oscilloscope across the picture detector load resistor and observe the overall response. The response obtained will be essentially that of the unshunted stage. The effects of the various traps are also visible on the stage response.

Figures 22 through 26 show the responses of the various stages obtained in the above manner. The curves shown are typical although some variation between receivers can be expected. Relative stage gain is not shown.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition a 2200 microvolt test pattern signal was fed into the receiver, the picture was synced and the AGC threshold control was properly adjusted. The second condition was obtained by removing the antenna leads and short-circuiting the receiver antenna terminals. Voltages shown are as read with "Jr. VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles a-c.

RADIO CHASSIS WIRING DIAGRAM

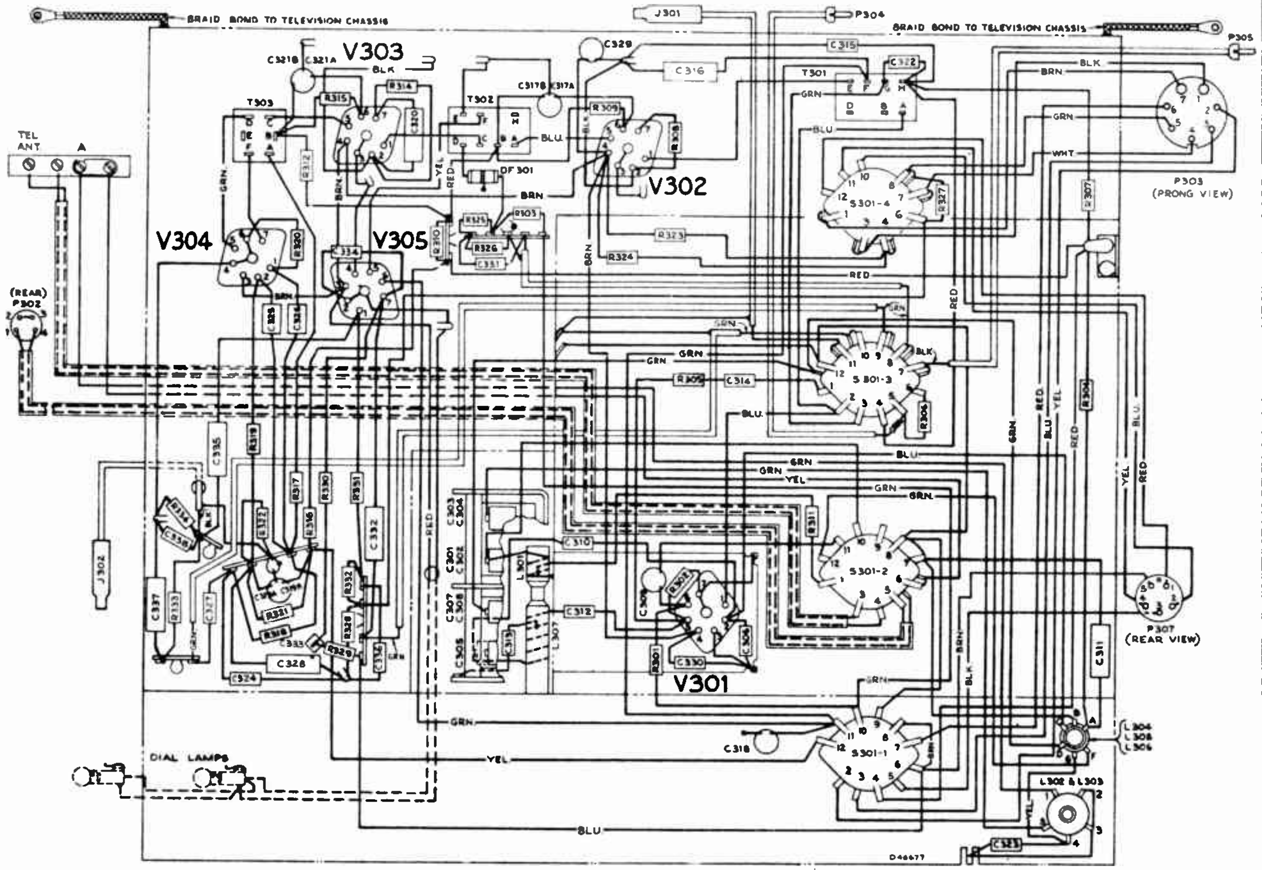

Figure 71—Radio Chassis Wiring Diagram (RK135D)

TELEVISION CRITICAL LEAD DRESS

1. The ground bus from pin 2 and the center shield of V117 socket should not be shortened or rerouted.
2. Do not change the dress of the filament leads or the by-pass capacitors in the picture or sound i-f circuits. The filament leads between V117, V118 and V119 should be down against the chassis and away from grid or plate leads.
3. If it is necessary to replace any of the 1500 mmf capacitors in the picture i-f circuit, the lead length must be kept as short as possible.
4. Picture i-f coupling capacitors C106, C111, C115 and C121 should be up and away from the chassis and should be clear of the pix i-f transformer adjustments by at least ¼ inch. If the dress of any of these capacitors is changed, the i-f alignment should be rechecked.
5. Leads to L102 and L103 must be as short as possible.
6. Dress peaking coils L105, L106 and L107 up and away from the chassis.
7. Dress C183 across tube pins 5 and 6 with leads not exceeding ⅜ inch.
8. Dress C129 and C130 up and away from the chassis.
9. Dress the yellow lead from the picture control away from the chassis and away from the volume-control leads. Dress the yellow lead from pin 8 of V106 away from the chassis.
10. Dress the green lead from pin 2 of V106 away from the chassis.
11. Dress R168, R169, R170, R176 and R178 up and away from the chassis.
12. The leads to the volume control should be dressed down against the chassis and away from V117 and V118.
13. Contact between the r-f oscillator frequency adjustment screws and the oscillator coils or channel switch eyelets must be avoided.
14. Dress leads from L115 (width control coil) away from the transformer frame.
15. Dress T110 winding leads as shown in Figure 72.

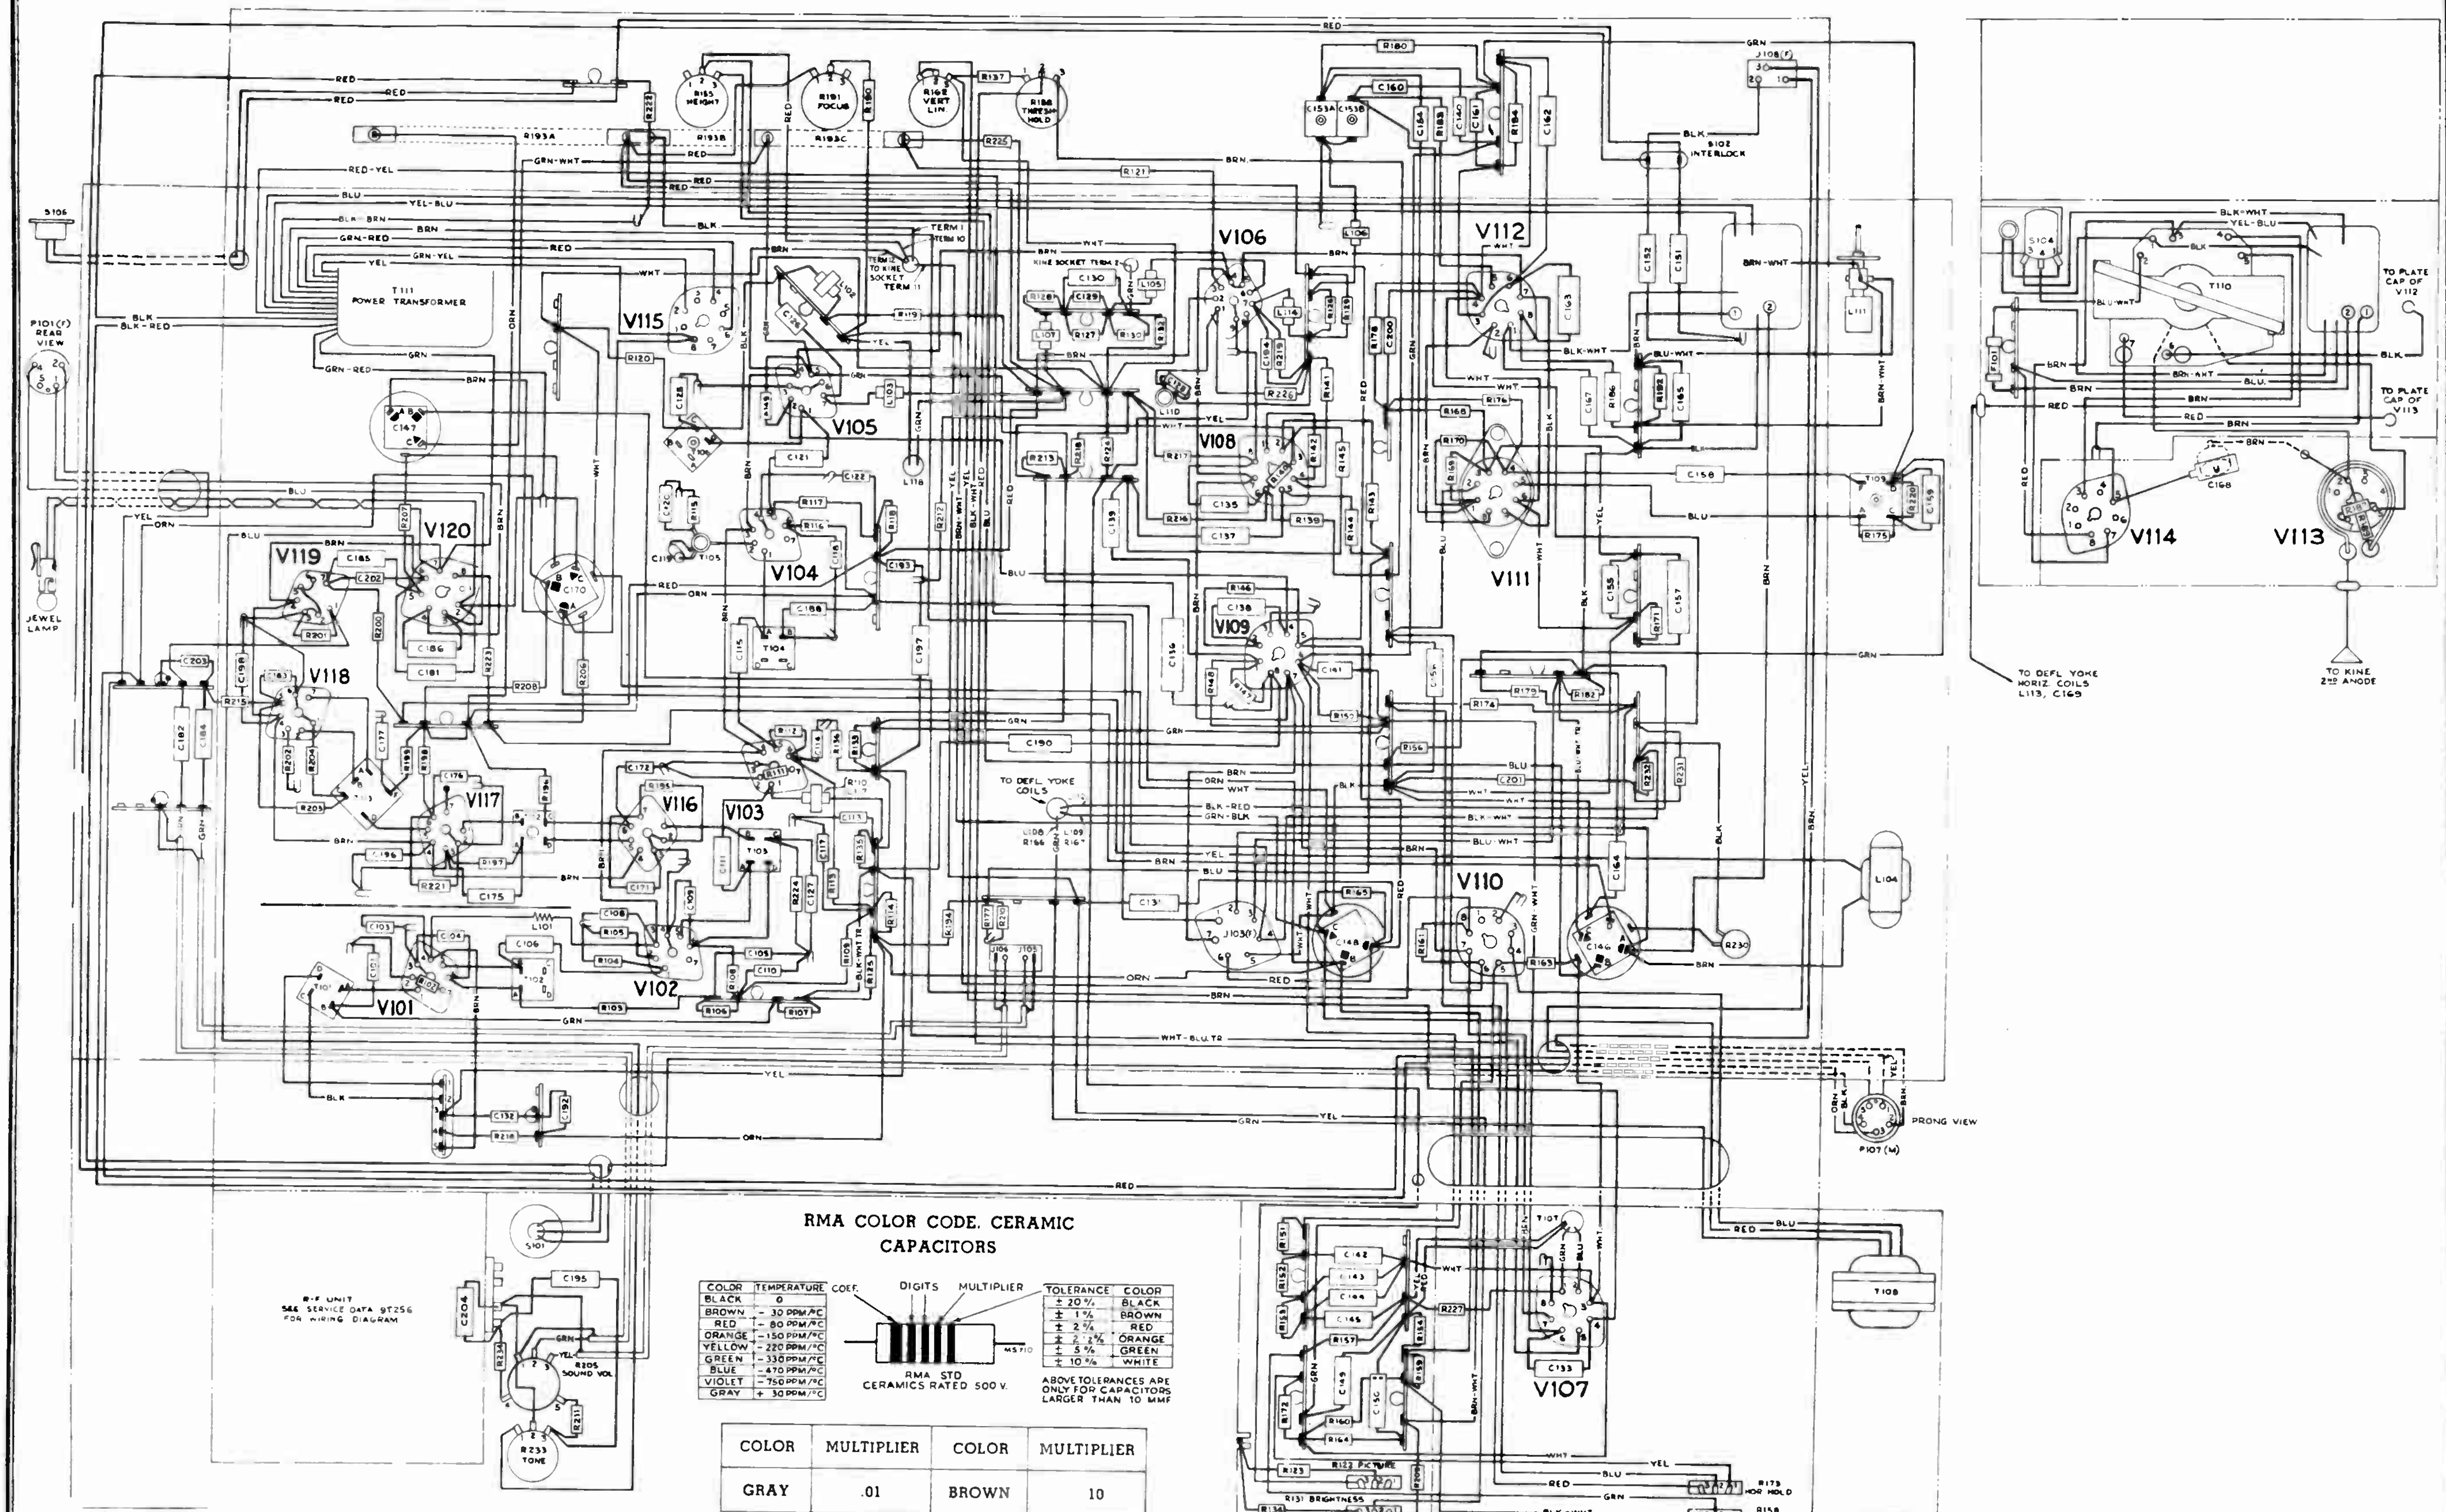
TELEVISION CHASSIS WIRING DIAGRAM

MODEL TA128, Ch. KCS42A



RMA COLOR CODE. CERAMIC CAPACITORS

COLOR	TEMPERATURE COEF.
BLACK	0
BROWN	- 30 PPM/°C
RED	- 80 PPM/°C
ORANGE	-150 PPM/°C
YELLOW	- 220 PPM/°C
GREEN	- 330 PPM/°C
BLUE	- 470 PPM/°C
VIOLET	- 750 PPM/°C
GRAY	+ 30 PPM/°C

DIGITS MULTIPLIER

RMA STD
CERAMICS RATED 500 V.

TOLERANCE	COLOR
± 20 %	BLACK
± 1 %	BROWN
± 2 %	RED
± 2 ½ %	ORANGE
± 5 %	GREEN
± 10 %	WHITE

ABOVE TOLERANCES ARE ONLY FOR CAPACITORS LARGER THAN 10 MMF

COLOR	MULTIPLIER	COLOR	MULTIPLIER
GRAY	.01	BROWN	10
WHITE	.1	RED	100
BLACK	1.	ORANGE	1,000

In some receivers, a four color ceramic capacitor color code is employed. It reads the same as the RMA color code except that the tolerance stripe is omitted.

If the coefficient stripe is silver, it indicates that the capacitor has a very large temperature coefficient and is to be employed for by-pass or other usages where a wide variation of capacity is unimportant. Silver striped capacitors are rated at 350 volts unless otherwise marked.

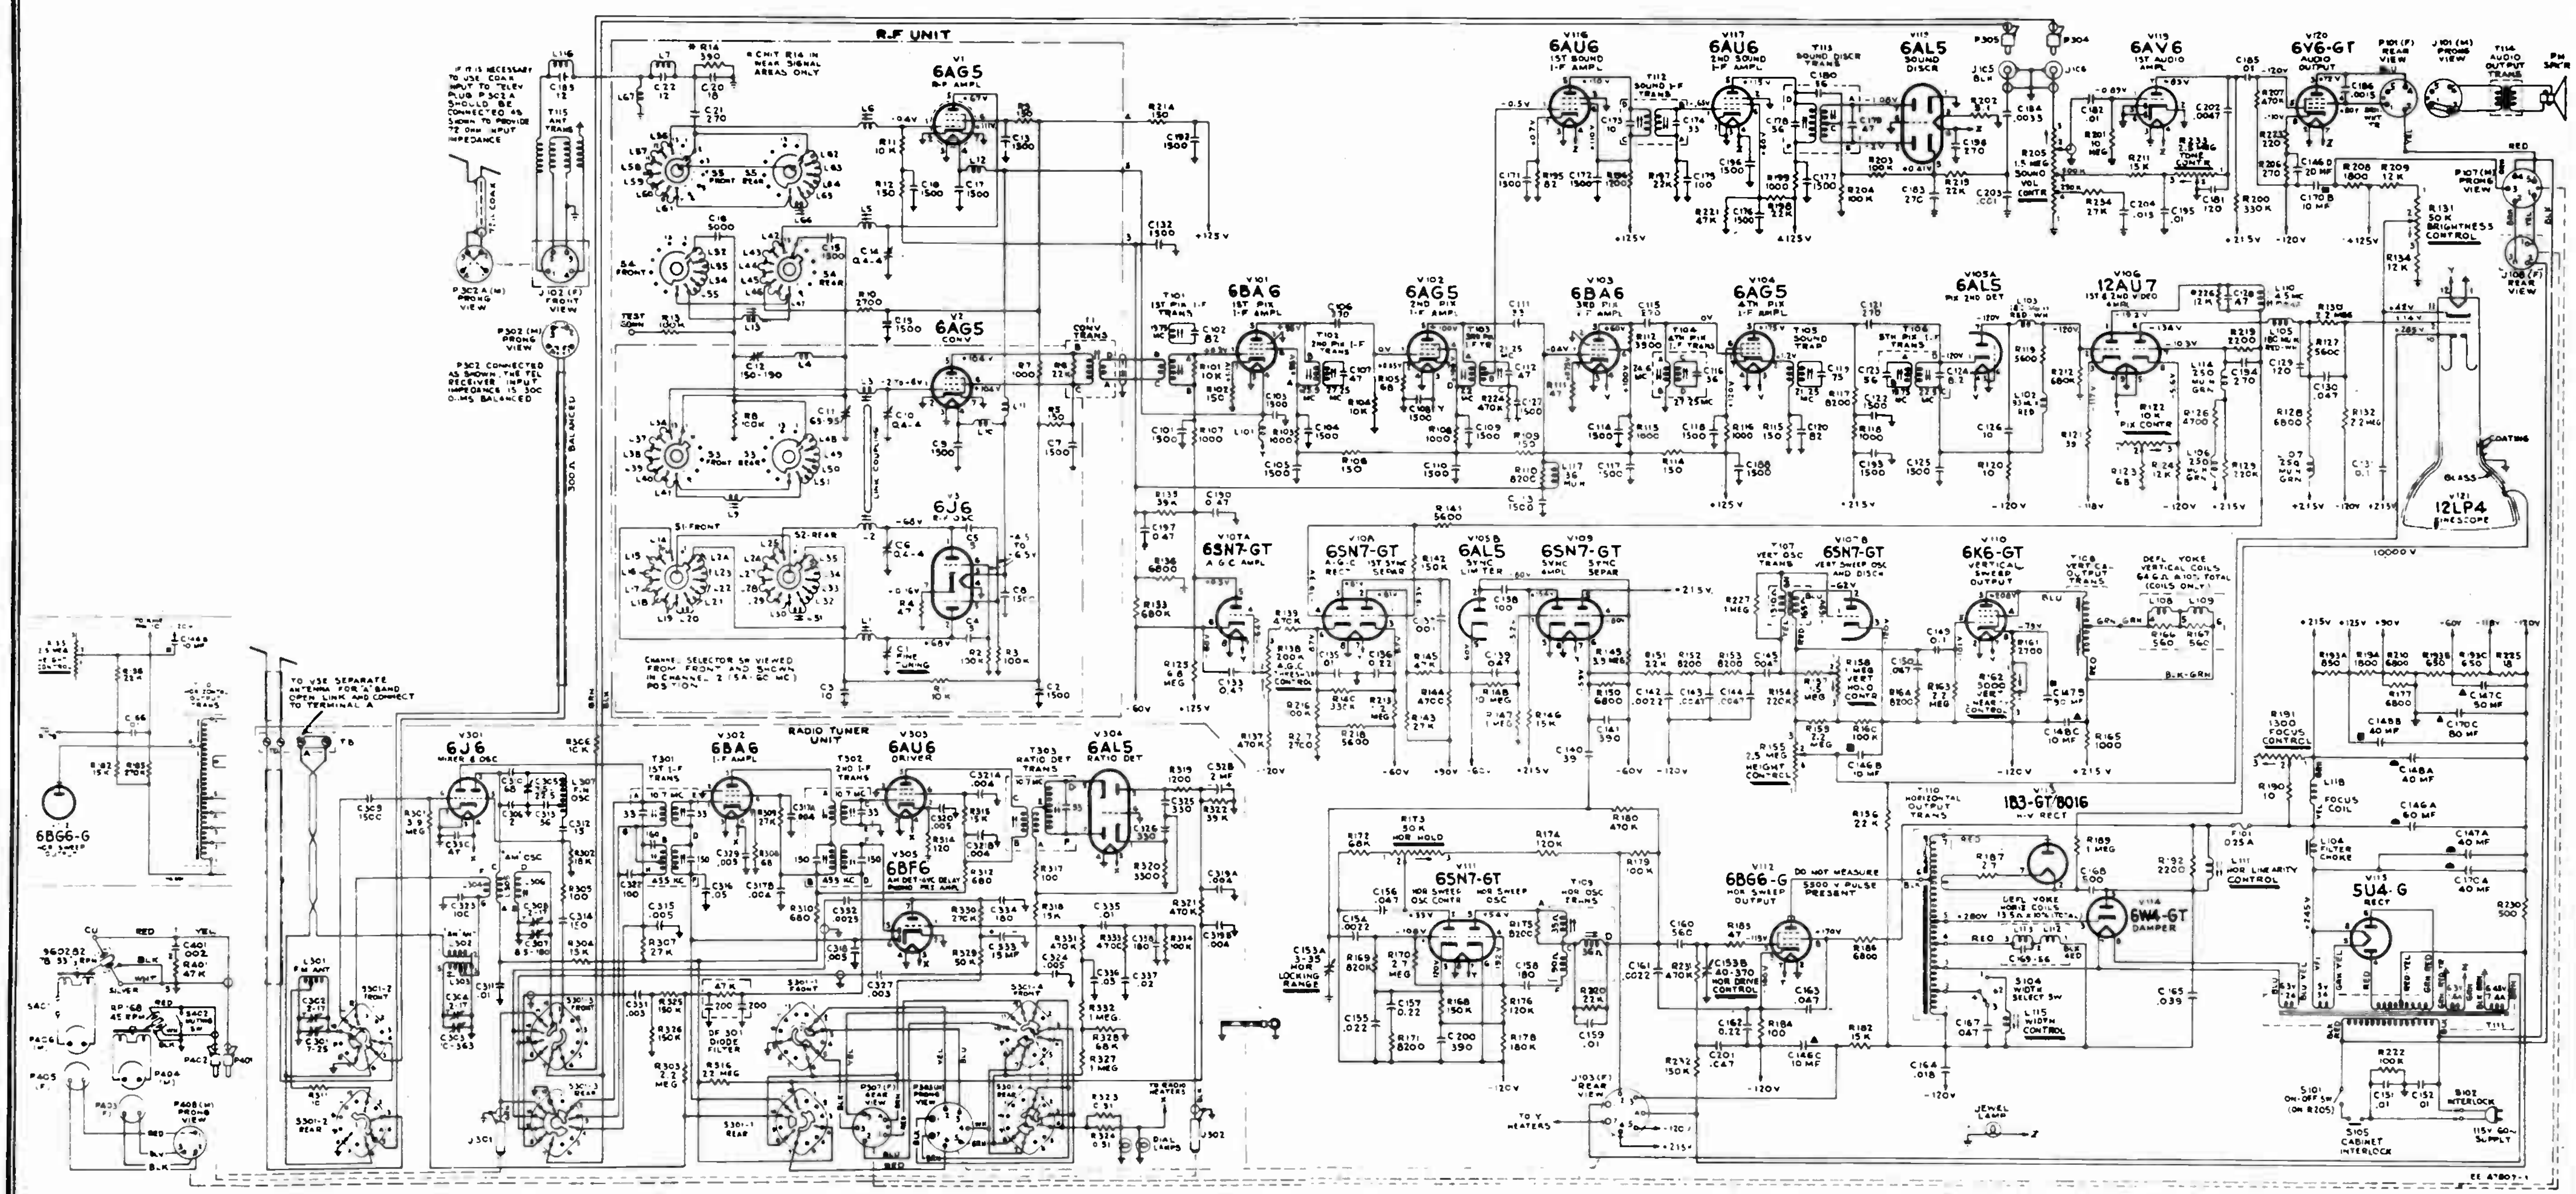
CIRCUIT SCHEMATIC DIAGRAM



Function switch S301 viewed from front and shown in Number 1 (maximum counterclockwise position).
Switch position 1—Television.

Switch position 2—AM.
Switch position 3—FM.
Switch position 4—Phono 45 RPM.
Switch position 5—Phono 78 RPM.

All resistance values in ohms. K = 1,000
All capacitance values less than 1 in MF and above 1 in MMF unless noted

Coil resistance values less than 1 ohm are not shown.
Direction of arrows at controls indicates clockwise rotation.

In some receivers, substitutions have caused changes in component lead color codes, in electrolytic capacitor values and their lug identification markings.

All voltages measured with "VoltOhmyst," no signal input with 117 v. a-c supply with the pix control fully clockwise and the brightness control set for average brightness.

The deflection circuits must be connected as shown above for powdered iron core yokes. The partial schematic insert shows the method of connection employed in early production receivers which employed an iron wire wrap yoke.

Figure 74—Circuit Schematic Diagram

RECORD CHANGER: Model RP168C, See pages RCD.CH.19-1 through RCD.CH.19-8.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	RF UNIT ASSEMBLIES KRK5
73465	Belt—Drive belt
75069	Board—R-F unit power connection terminal board
75067	Bracket—Vertical bracket for holding r-f oscillator tube shield
73478	Cable—I-F transmission cable (W1)
73441	Cam—Fine tuning adjustment
74035	Capacitor—Ceramic, 5 mmf. (C4, C5)
53511	Capacitor—Ceramic, 10 mmf. (C3)
54207	Capacitor—Ceramic, 18 mmf. (C20)
73449	Capacitor—Ceramic trimmer comprising 1 section of 150-190 mmf. and 1 section of 65-95 mmf. (C11, C12)
73091	Capacitor—Ceramic, 270 mmf. (C21)
71501	Capacitor—Ceramic, 1500 mmf. (C2, C7, C8, C9, C13, C15, C17, C18, C19)
73473	Capacitor—Ceramic, 5000 mmf. (C16)
73460	Coil—R-F plate coil for channel 6 (L13)
73461	Coil—Rear section—Oscillator plate coil for channel 6 (L20)
73462	Coil—Coupling inductance coil (L4)
73475	Coil—Antenna filter shunt coil (C67)
73476	Coil—I-F trap (L7, C22)
73477	Coil—Choke coil (L10, L11, L12)
73874	Coil—Front section—Oscillator plate coil for channel 6 (L31)
74108	Coil—Fine tuning coil (1½ turns) with adjustable inductance core and capacitor stud (plunger adjustment) (L1, C1)
74109	Coil—Trimmer coil (1½ turns) with adjustable inductance core and capacitor stud (screw adjustment for oscillator section or converter section) (L2, L3, C6, C10)
74110	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f amplifier section (L5, C14)
73455	Core—Sliding core for fine tuning control trimmer
74187	Core—Adjustable core for coil L9
71493	Connector—Oscillator segment connector
73440	Detent—R-F unit detent mechanism and fibre shaft
71487	Form—Coil form for coil L31
73453	Form—Coil form assembly for L9, L13
73442	Link—Link assembly for fine tuning
71462	Loop—Oscillator to converter trimmer loop connector
73634	Nut—Speed nut for drive belt shield
73436	Plate—Front plate and bushing
73464	Pulley—Idler pulley
	Resistor—Fixed, composition:
	47 ohms, ±20%, ½ watt (R4)
	150 ohms, ±20%, ½ watt (R5, R9, R12)
	390 ohms, ±10%, ½ watt (R14)
	1000 ohms, ±20%, ½ watt (R7)
	2700 ohms, ±10%, ½ watt (R10)
	10,000 ohms, ±20%, ½ watt (R1, R11)
	100,000 ohms, ±20%, ½ watt (R2, R3, R8, R13)
14343	Retainer—Channel selector shaft retaining ring
30340	Retainer—Retainer ring for fine tuning stud
70881	Screw—No. 4-40 x ¼" binder head screw for adjusting coils L14, L15, L16, L17, L18, L19
73640	Screw—No. 4-40 x ⅝" adjusting screw for L66
71475	Screw—No. 4-40 x 15/32" adjusting screw for coils L21, L22, L23, L24
74575	Screw—No. 4-40 x 17/32" adjusting screw for L6
73437	Shaft—Channel selector shaft complete with pawl and stud
73438	Shaft—Fine tuning control shaft and pulley
73439	Shaft—Actuating shaft for fine tuning control
75443	Shield—"U" shape shield for bottom of r-f unit
72951	Shield—Metal tube shield for V3
73454	Shield—Metal shield for drive belt
73632	Shield—Metal tube shield for V1
71494	Socket—Tube socket, moulded, 7 prong, saddle mounted
73450	Socket—Tube socket, ceramic, 7 prong, bottom mounted
74576	Spacer—Insulating spacer for front plate (4 required)
73457	Spring—Return spring for fine tuning control core
74188	Spring—Retaining spring for adjustable core RCA 74187
75058	Spring—Retaining spring for r-f oscillator tube shield
74578	Spring—Retaining spring for adjusting screws RCA 73640 and RCA 74575
73468	Stator—Front oscillator section stator complete with rotor, segment, coils and adjusting screws (S1, L14, L15, L16, L17, L18, L19, L21, L22, L23, L24)
73469	Stator—Rear oscillator section stator complete with rotor, segment, coils (S2, L25, L26, L27, L28, L29, L30, L32, L33, L34, L35)
73633	Stator—Antenna stator complete with rotor and coils (S5, L6, L56, L57, L58, L59, L60, L61, L62, L63, L64, L65, L66, C21)
73470	Stator—Converter stator complete with rotor and coils (S3, L9, L36, L37, L38, L39, L40, L41, L48, L49, L50, L51)
73471	Stator—R-F amplifier stator complete with rotor and coils (S4, L13, L42, L43, L44, L45, L46, L47, L52, L53, L54, L55, C15, C16, R10)
75446	Stud—Capacitor stud—brass No. 4-40 x 13/16" with 3/64" screw driver slot for trimmer coils 74109 and 74110 uncoded or coded "ER"
75447	Stud—Capacitor stud—brass No. 4-40 x 13/16" with 3/64" screw driver slot for trimmer coils 74109 and 74110 coded numerically or "Hi Q"
73448	Transformer—Converter transformer (T1, R6)
73466	Washer—Insulating washer for front shield (1 set)
2917	Washer—"C" washer for channel selector shaft or fine tuning shaft and cam
	TELEVISION CHASSIS ASSEMBLIES KCS 42A
74593	Capacitor—Mica trimmer comprising 1 section of 3-35 mmf. and 1 section of 40-370 mmf. (C153A, C153B)
72615	Capacitor—Mica, 10 mmf. (C126)
74105	Capacitor—Mica, 33 mmf. (C111)
74726	Capacitor—Mica, 39 mmf. (C140)
64062	Capacitor—Ceramic, 82 mmf. (C120)
39396	Capacitor—Ceramic, 100 mmf. (C175)
75060	Capacitor—Mica, 100 mmf. (C138)
73921	Capacitor—Ceramic, 120 mmf. (C129)
39630	Capacitor—Mica, 120 mmf. (C181)
73102	Capacitor—Mica, 180 mmf. (C158)
73922	Capacitor—Ceramic, 270 mmf. (C183, C194, C198)
73091	Capacitor—Mica, 270 mmf. (C106, C115, C121)
68542	Capacitor—Mica, 390 mmf. (C141, C200)
74153	Capacitor—Ceramic, 500 mmf. 15,000 volts (C168)
74250	Capacitor—Mica, 560 mmf. (C160)
71501	Capacitor—Ceramic, 1500 mmf. (C101, C103, C104, C105, C108, C109, C110, C113, C114, C117, C118, C122, C125, C127, C132, C171, C172, C176, C177, C188, C192, C193, C196)
71432	Capacitor—Electrolytic, comprising 2 sections of 40 mfd., 450 volts and 1 section of 10 mfd., 450 volts (C148A, C148B, C148C)
73582	Capacitor—Electrolytic, comprising 1 section of 40 mfd., 450 volts, 1 section of 10 mfd., 450 volts and 1 section of 80 mfd., 200 volts (C170A, C170B, C170C)
73583	Capacitor—Electrolytic, comprising 1 section of 40 mfd., 450 volts, 1 section of 90 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C147A, C147B, C147C)
73581	Capacitor—Electrolytic, comprising 1 section of 60 mfd., 450 volts, 2 sections of 10 mfd., 450 volts and 1 section of 20 mfd., 150 volts (C146A, C146B, C146C, C146D)
73801	Capacitor—Tubular, paper, oil impregnated, .001 mfd., 600 volts (C137, C203)
73802	Capacitor—Tubular, paper, oil impregnated, .0015 mfd., 1000 volts (C186)
73595	Capacitor—Tubular, paper, oil impregnated, .0022 mfd., 600 volts (C142, C161)
73803	Capacitor—Tubular, moulded paper, .0022 mfd., 600 volts (C154)
73795	Capacitor—Tubular, paper, oil impregnated, .0033 mfd., 600 volts (C184)
73920	Capacitor—Tubular, paper, oil impregnated, .0047 mfd., 600 volts (C143, C144, C145, C202)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd., 400 volts (C135, C182, C195)
73594	Capacitor—Tubular, moulded paper, oil impregnated, .01 mfd., 600 volts (C159)
73565	Capacitor—Tubular, moulded paper, .01 mfd., 1000 volts (C151, C152, C185)
73797	Capacitor—Tubular, paper, oil impregnated, .015 mfd., 600 volts (C204)
74727	Capacitor—Tubular, moulded paper, oil impregnated, .018 mfd., 1000 volts (C164)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 400 volts (C155)
74728	Capacitor—Tubular, moulded paper, oil impregnated, .039 mfd., 1000 volts (C165)
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 400 volts (C130, C139, C201, C167)
73592	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 600 volts (C150, C156)
73597	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 1000 volts (C163)
73551	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 400 volts (C149)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 600 volts (C131)
73794	Capacitor—Tubular, paper, oil impregnated, 0.22 mfd., 200 volts (C136, C157, C162)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd., 200 volts (C133, C190, C197)
73154	Choke—Filter choke (L104)
74585	Coil—Focus coil (L118)
71449	Coil—Horizontal linearity control coil (L111)
71429	Coil—Width control coil (L115)
74170	Coil—Peaking coil (36 muh) (L117, R110)
71527	Coil—Peaking coil (93 muh) (L102)
74214	Coil—Peaking coil (180 muh) (L103, L105)
71526	Coil—Peaking coil (250 muh) (L106, L107, L114)
73477	Coil—Filament choke coil (L101)
72108	Connector—7 contact female connector (J103)
74594	Connector—2 contact male connector for power cord
72172	Connector—3 contact female connector for changers cable (J108)
5040	Connector—4 contact female connector for speaker cable (P101)
71789	Connector—Anode connector
71521	Connector—Hi-voltage capacitor connector
14786	Connector—5 contact male connector (P107)
72734	Control—Horizontal hold and vertical hold control (R158, R173)
74047	Control—Picture and brightness control (R122, R131)
74359	Control—Tone control, volume control and power switch (R205, R233, S101)
71441	Control—Vertical linearity control (R162)
71440	Control—Height control (R155)
74597	Control—Focus control (R191)
74475	Control—AGC threshold control (R138)
71457	Cord—Power cord and plug
71437	Cover—Insulating cover for electrolytics Nos. 71432, 73581 and 73582
73590	Cushion—Rubber cushion for deflection yoke hood (2 required)
74811	Cushion—Rubber cushion for kinescope mounting
73600	Fuse—0.25 amp. 250 volts (F101)
71799	Grommet—Rubber grommet for yoke horizontal lead exit
37396	Grommet—Rubber grommet for mounting ceramic tube socket (2 required)
74030	Grommet—Rubber grommet for mounting radio chassis (3 required)
74823	Magnet—Ion trap magnet
73587	Nut—Speed nut for mounting hi-voltage capacitor
18469	Plate—Bakelite mounting plate for electrolytics
33514	Receptacle—2 contact female receptacle for audio cable and switching cable (J105, J106)
74598	Resistor—Wire wound, 2.7 ohms, 1/3 watt (R187)
72067	Resistor—Wire wound, 5.1 ohms, ½ watt (R202)
18471	Resistor—Wire wound, 10 ohms, ½ watt (R190)
74043	Resistor—Wire wound, 500 ohms, 20 watts (R230)
73588	Resistor—Voltage divider, comprising 1 section of 850 ohms, 12 watts and 2 sections of 650 ohms, 6 watts (R193A, R193B, R193C)
	Resistor—Fixed, composition:
	10 ohms, ±20%, ½ watt (R120)
	18 ohms, ±10%, ½ watt (R225)
	39 ohms, ±10%, ½ watt (R120)
	47 ohms, ±5%, ½ watt (R111)
	47 ohms, ±20%, ½ watt (R183)
	68 ohms, ±10%, ½ watt (R105)
	68 ohms, ±20%, ½ watt (R123)
	82 ohms, ±10%, ½ watt (R195)
	100 ohms, ±10%, 2 watts (R184)
	150 ohms, ±5%, ½ watt (R102)
	150 ohms, ±10%, ½ watt (R115)
	150 ohms, ±20%, ½ watt (R106, R109, R114, R214)
	220 ohms, ±10%, 1 watt (R223)
	270 ohms, ±10%, 1 watt (R206)
	1000 ohms, ±20%, ½ watt (R103, R107, R108, R113, R116, R118, R165, R199)
	1200 ohms, ±10%, ½ watt (R196)
	1800 ohms, ±10%, 2 watts (R194, R208)
	2200 ohms, ±10%, ½ watt (R219)
	2200 ohms, ±10%, 1 watt (R192)
	2700 ohms, ±10%, ½ watt (R161, R217)
	3900 ohms, ±5%, ½ watt (R112)
	4700 ohms, ±5%, ½ watt (R126)
	4700 ohms, ±10%, ½ watt (R144)
	5600 ohms, ±5%, ½ watt (R119)
	5600 ohms, ±10%, ½ watt (R141, R218)
	5600 ohms, ±10%, 1 watt (R127)
	6800 ohms, ±5%, ½ watt (R136)
	6800 ohms, ±10%, ½ watt (R150)
	6800 ohms, ±5%, 1 watt (R128)
	6800 ohms, ±10%, 2 watts (R177, R186, R210)

74416	Screw—No. 10-32 x 1¾" cross recessed round head screw for kinescope retaining strap
71456	Screw—No. 8-32 wing screw for deflection yoke
74601	Screw—No. 8-32 x ⅜" cross recessed binder head screw for focus coil mounting (2 required)
74602	Screw—No. 10-32 x 1¼" cross recessed binder head screw for focus coil adjustment (3 required)
73584	Shield—Tube shield
74937	Sleeve—Rubber sleeve for focus coil
73117	Socket—Tube socket, 7 pin, miniature
72927	Socket—Tube socket, 9 pin, miniature
31251	Socket—Tube socket, octal, wafer
73249	Socket—Tube socket, octal, ceramic, plate mounted
71508	Socket—Tube socket for 1B3GT/8016
31364	Socket—Pilot lamp socket
74834	Socket—Kinescope tube socket
73586	Spring—Compression spring used under centering control screws (3 required)
74936	Spring—Suspension spring (coil type) for kinescope tube socket leads
74595	Spring—Anode lead spring
74893	Strap—Kinescope retaining strap
74596	Supports—Bakelite supports (1 set) for mounting hi-voltage rectifier tube mounting plate
74147	Switch—Width selector switch (S104)
74157	Switch—Cabinet interlock switch (S105)
74981	Transformer—Power transformer, 115 volt, 60 cycles (T111)
74587	Transformer—Vertical output transformer (T108)
73569	Transformer—Vertical oscillator transformer (T107)
74588	Transformer—Horizontal output and hi-voltage transformer (T110)
74589	Transformer—First pix, i-f transformer (T101, C102, R101)
74590	Transformer—Second pix, i-f transformer (T102, C107)
74591	Transformer—Third pix, i-f transformer (T103, C112)
74592	Transformer—Fourth pix, i-f transformer (T104, C116)
73575	Transformer—Fifth pix, i-f transformer (T106, C123, C124)
71424	Transformer—Sound i-f transformer (T112, C173, C174)
71427	Transformer—Sound discriminator transformer (T113, C178, C179, C180)
73576	Transformer—Horizontal oscillator transformer (T109)
73578	Transformer—Antenna transformer complete with socket and bracket (T115, J102)
73577	Trap—4.5 mc trap (L110, C128)
71778	Trap—Sound trap (T105, C119)

STOCK No.	DESCRIPTION
73476	Trap—I-F trap (L116, C189)
74262	Yoke—Deflection yoke (L108, L109, L112, L113, C169, R166, R167)
	RADIO CHASSIS ASSEMBLIES RK 135D
74039	Board—"Telv-Ant" terminal board (TB301)
74026	Bracket—Drive cord bracket complete with two pulleys —R.H.
74027	Bracket—Drive cord bracket complete with pulley—L.H.
74911	Cable—Shielded cable complete with female connector (W307, W311)
71105	Cable—Shielded cable complete with pin plug (W301, W302)
74017	Capacitor—Variable tuning capacitor (C301, C302, C303, C304, C305, C307, C308)
73866	Capacitor—Ceramic, 2 mmf. (C306)

39640	Capacitor—Mica, 330 mmf. (C325, C326)
73748	Capacitor—Ceramic, 1500 mmf. (C309)
74009	Capacitor—Ceramic, dual, 4000 mmf. (C317, C319, C321)
73473	Capacitor—Ceramic, 5000 mmf. (C318, C329)
73747	Capacitor—Electrolytic, 2 mfd., 50 volts (C328)
32223	Capacitor—Electrolytic, 15 mfd., 300 volts (C333)
70602	Capacitor—Tubular, paper, .0025 mfd., 400 volts (C332)
73961	Capacitor—Tubular, paper, .003 mfd., 200 volts (C327, C331)
71553	Capacitor—Tubular, paper, .005 mfd., 400 volts (C315, C320, C324)
71923	Capacitor—Tubular, paper, .01 mfd., 200 volts (C335)
71925	Capacitor—Tubular, paper, .01 mfd., 400 volts (C311)
71928	Capacitor—Tubular, paper, .02 mfd., 200 volts (C337)
72596	Capacitor—Tubular, paper, .05 mfd., 200 volts (C336)
74455	Capacitor—Tubular, paper, .05 mfd., 400 volts (C316)
74020	Coil—Antenna coil—AM (L302, L303)
73744	Coil—Oscillator coil—AM (L304, L305, L306)
74024	Coil—Antenna coil—FM (L301)
74025	Coil—Oscillator coil—FM (L307)
36395	Connector—7 contact male connector (P103)
12493	Connector—5 contact female connector (P107B)
39153	Connector—4 prong male connector (P102)
72953	Cord—Drive cord (approx. 42" overall)
74011	Filter—Diode filter, dual 200 mmf. and 47,000 ohms (DF301)
74023	Resistor—Wire wound, 0.51 ohms, 1 watt (R323, R324)
	Resistor—Fixed, composition:
	10 ohms, ±20%, ½ watt (R311)
	68 ohms, ±20%, ½ watt (R308)
	100 ohms, ±20%, ½ watt (R305, R317)
	120 ohms, ±10%, ½ watt (R314)
	680 ohms, ±20%, ½ watt (R310, R312)
	1200 ohms, ±5%, ½ watt (R319)
	3300 ohms, ±5%, ½ watt (R320)
	4700 ohms, ±10%, ½ watt (R333)
	10,000 ohms, ±20%, ½ watt (R306)
	15,000 ohms, ±10%, ½ watt (R304)
	15,000 ohms, ±20%, ½ watt (R315, R318)
	18,000 ohms, ±10%, ½ watt (R302)
	27,000 ohms, ±10%, ½ watt (R307, R309)
	39,000 ohms, ±10%, ½ watt (R322)
	68,000 ohms, ±10%, ½ watt (R328)

STOCK No.	DESCRIPTION
	100,000 ohms, ±10%, ½ watt (R334)
	150,000 ohms, ±10%, ½ watt (R325, R326, R329)
	270,000 ohms, ±10%, ½ watt (R330)
	470,000 ohms, ±10%, ½ watt (R331)
	470,000 ohms, ±20%, ½ watt (R321)
	1 megohm, ±10%, ½ watt (R327, R332)
	2.2 megohm, ±20%, ½ watt (R303)
	3.9 megohm, ±10%, ½ watt (R301)
	22 megohm, ±20%, ½ watt (R316)
74028	Shaft—Tuning knob shaft
73632	Shield—Tube shield
73117	Socket—Tube socket, 7 pin, miniature for V301, V304, V305
74179	Socket—Tube socket, 7 pin, miniature for V302, V303
31364	Socket—Dial lamp socket
74038	Spring—Drive cord spring
74894	Switch—Selector switch (S301)
73745	Transformer—First i-f transformer, dual (T301)
74019	Transformer—Second i-f transformer, dual (T302)
73743	Transformer—Ratio detector transformer (T303)
33726	Washer—"C" washer for tuning shaft (rear)
34457	Washer—Spring washer for tuning shaft (front)
74172	Washer—Fibre washer to prevent drive cord slippage
	SPEAKER ASSEMBLIES 92569-8W RL-111-10 RMA-#274
13867	Cap—Dust cap
74901	Cone—Cone complete with voice coil (3.2 ohms)
5039	Connector—4 prong male connector (J101)
74900	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms) less transformer and plug
74902	Transformer—Output transformer (T114)
	NOTE: If stamping in instruments does not agree with above speaker number, order replacement parts by referring to model number of instruments, number stamped on speaker and full description of part required.
	MISCELLANEOUS
74977	Back—Cabinet back
74054	Bracket—Dial lamp bracket (2 required)
71599	Bracket—Pilot lamp bracket
75041	Button—Plug button for shipping bolts holes in 33/78 changer motorboard (2 required)
72437	Cable—Shielded pickup cable complete with pin plug
13103	Cap—Pilot lamp cap
73803	Capacitor—Tubular, paper, .002 mfd., 400 volts (C402)
71892	Catch—Bullet catch and strike
X3074	Cloth—Grille cloth for mahogany or walnut instruments
X3090	Cloth—Grille cloth for oak instruments
14782	Connector—3 contact male connector for record changer power cable
30868	Connector—2 contact female connector for record changer power cable
74581	Cover—Mounting screw cover for 45 RPM changer (3 required)
71984	Decal—Trade mark decal (RCA Victor)
74273	Decal—Trade mark decal (Victrola)
74898	Decal—Control panel function decal for mahogany or walnut instruments
74899	Decal—Control panel function decal for oak instruments
74052	Dial—Dial scale and bezel
74891	Edging—Vinylite edging for metal mask

STOCK No.	DESCRIPTION
74674	Emblem—"RCA Victor" emblem
73642	Escutcheon—Channel marker escutcheon for mahogany or walnut instruments
73740	Escutcheon—Channel marker escutcheon for oak instruments
74755	Glass—Safety glass
37396	Grommet—Rubber grommet for speaker
74206	Grommet—Rubber grommet for mounting 33/78 record changer (4 required)
74308	Hinge—Door hinge (1 set) for L.H. or R.H. doors
73200	Hinge—Lower hinge for center door
70166	Hinge—Upper hinge for center door
74051	Indicator—Station selector indicator
74959	Knob—Fine tuning knob—dark—for mahogany or walnut instruments (outer)
73995	Knob—Fine tuning knob—tan—for oak instruments (outer)
74960	Knob—Channel selector knob—dark—for mahogany or walnut instruments (inner)
74961	Knob—Channel selector knob—tan—for oak instruments (inner)
74962	Knob—Vertical hold control, brightness control or tone control knob—dark—for mahogany or walnut instruments (outer)
73999	Knob—Vertical hold control, brightness control or tone control knob—tan—for oak instruments (outer)
74978	Knob—Tuning or selector switch knob—dark—for mahogany or walnut instruments
74979	Knob—Tuning or selector switch knob—tan—for oak instruments
74963	Knob—Horizontal hold control, picture control or volume control and power switch knob—dark—for mahogany instruments (inner)
74001	Knob—Horizontal hold control, picture control or volume control and power switch knob—tan—for oak instruments (inner)
11765	Lamp—Dial or pilot lamp—Mazda 51
74208	Nut—Tee nut to mount 45 RPM changer (3 required)
74162	Plate—Mounting plate for interlock switch
75037	Pull—Door pull
	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ watt (R402)
74582	Screw—No. 8-32 x 1¾" special head screw to mount 45 RPM changer (3 required)
75038	Screw—No. 8-32 x ½" trimit head cross-recessed screw for door pull
74736	Slide—Record changer tray slide mechanism
74050	Slide—Station indicator slide
73643	Spring—Spring clip for channel marker escutcheon
72845	Spring—Retaining spring for knobs No. 73995 and No. 74959
14270	Spring—Retaining spring for knobs Nos. 73999, 74960, 74961, 74962
30330	Spring—Retaining spring for knobs Nos. 74001 and 74963
74055	Spring—Spring clip for dial and bezel assembly (2 required)
74421	Spring—Conical spring to mount 45 RPM changer—upper —R.H. (1 required)
74422	Spring—Conical spring to mount 45 RPM changer—upper —L.H. (2 required)
74423	Spring—Conical spring to mount 45 RPM changer—lower —(3 required)
75040	Spring—Mounting spring for 33/78 RPM record changer (4 required)
72936	Stop—Door stop
74161	Stud—Locating stud for back cover (2 required)

To obtain resistors for which no stock number is given, order by stating type, value of resistance, tolerance and wattage.

INDEX

GENERAL DESCRIPTION

Model TA129 receiver employs twenty-six tubes plus three rectifiers and a 12LP4 kinescope.

The television receiver is provided with Electronic Magnifier deflection circuits by which the center portion of the picture may be enlarged to fill the screen. Choice of picture coverage is made by operation of a remote switch.

The radio tuner unit which feeds through the television audio system covers the AM and the FM broadcast bands.

Two record changers are provided to play 45 and 78/33⅓ RPM records.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE............... 87 square inches on a 12LP4 kinescope

TELEVISION R-F FREQUENCY RANGE

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
Fine Tuning Range....±250 kc. on chan. 2, ±650 kc. on chan. 13
Picture Carrier Frequency ....25.75 mc.
Sound Carrier Frequency ....21.25 mc.

RADIO TUNING RANGE

Broadcast ....540-1,600 kc.
Frequency Modulation ....88-108 mc.
Intermediate Frequency—AM ....455 kc.
Intermediate Frequency—FM ....10.7 mc.

POWER SUPPLY RATING ....115 volts, 60 cycles, 300 watts

AUDIO POWER OUTPUT RATING ....6 watts max.

CHASSIS DESIGNATIONS

Television Chassis KCS41A-1
Radio Chassis RK135D
78/33⅓ RPM Record Changer 960282
45 RPM Record Changer RP168C
Refer to Service Data 960282 or RP168 for information on the record changers.

LOUDSPEAKER—92569-8 (RL111-10) ....12 inch PM Dynamic

Voice Coil Impedance ....3.2 ohms at 400 cycles

WEIGHT

Chassis with Tubes in Cabinet ....183 lbs.
Shipping Weight ....221 lbs.

DIMENSIONS (inches)	Width	Height	Depth
Cabinet (outside)	37	38¾	22¾
Chassis (Overall)	19⅜	12¼	20¼

RECEIVER ANTENNA INPUT IMPEDANCE....300 ohms balanced

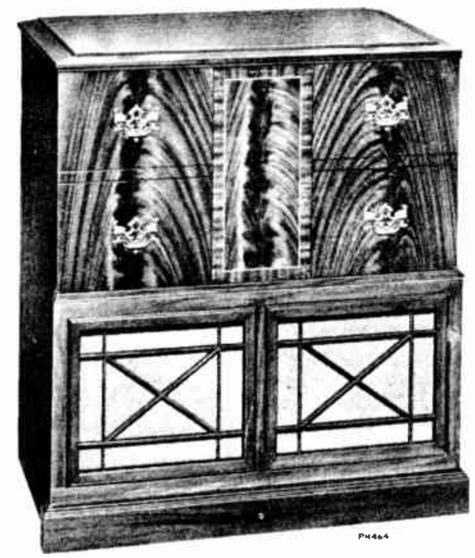
If necessary, the television chassis may be fed separately from either a 300 ohm balanced line or a 72 ohm co-ax.

RCA TUBE COMPLEMENT

	Tube Used	Function
(1)	RCA 6AG5	R-F Amplifier
(2)	RCA 6AG5	Converter
(3)	RCA 6J6	R-F Oscillator
(4)	RCA 6AU6	1st Sound I-F Amplifier
(5)	RCA 6AU6	2nd Sound I-F Amplifier
(6)	RCA 6AL5	Sound Discriminator
(7)	RCA 6AV6	1st Audio Amplifier
(8)	RCA 6V6GT	Audio Output
(9)	RCA 6BA6	1st Picture I-F Amplifier
(10)	RCA 6AG5	2nd Picture I-F Amplifier
(11)	RCA 6BA6	3rd Picture I-F Amplifier
(12)	RCA 6AG5	4th Picture I-F Amplifier
(13)	RCA 6AL5	Picture 2nd Detector & Sync Limiter
(14)	RCA 12AU7	1st and 2nd Video Amplifier
(15)	RCA 6SN7GT	AGC Amplifier & Vertical Sweep Osc.
(16)	RCA 6SN7GT	AGC Rectifier & 1st Sync Separator
(17)	RCA 6SN7GT	Sync Amplifier & 2nd Sync Separator
(18)	RCA 6K6GT	Vertical Sweep Output
(19)	RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(20)	RCA 6BG6G	Horizontal Sweep Output
(21)	RCA 6W4GT	Damper
(22)	RCA 1B3-GT/8016	High Voltage Rectifier
(23)	RCA 5U4G	Power Supply Rectifier (2 tubes)
(24)	RCA 12LP4	Kinescope

(Radio Tuner Chassis)

	Tube Used	Function
(1)	RCA 6J6	Mixer and Oscillator
(2)	RCA 6BA6	I-F Amplifier
(3)	RCA 6AU6	F-M Driver
(4)	RCA 6AL5	Ratio Detector
(5)	RCA 6BF6	AM Detector AVC



Model TA129 Walnut, Mahogany or Oak

PICTURE I-F FREQUENCIES

Picture Carrier Frequency ....25.75 mc.
Adjacent Channel Sound Trap ....27.25 mc.
Accompanying Sound Traps ....21.25 mc.
Adjacent Channel Picture Carrier Trap ....19.75 mc.

SOUND I-F FREQUENCIES

Sound Carrier Frequency ....21.25 mc.
Sound Discriminator Band Width between peaks ....350 kc.

VIDEO RESPONSE..To 4 mc.

FOCUS..Magnetic

SWEEP DEFLECTION ....Magnetic

SCANNING..Interlaced, 525 line

HORIZONTAL SCANNING FREQUENCY.....................15,750 cps

VERTICAL SCANNING FREQUENCY ....60 cps

FRAME FREQUENCY (Picture Repetition Rate)...................30 cps

OPERATING CONTROLS (front panel)

Channel Selector / Fine Tuning ....Dual Control Knobs
Tone / Sound Volume and On-Off Switch ....Dual Control Knobs
Picture Horizontal Hold / Picture Vertical Hold ....Dual Control Knobs
Picture / Brightness ....Dual Control Knobs
Function Switch ....Single Control Knob
Radio Tuning ....Single Control Knob

NON-OPERATING CONTROLS

Horizontal Centering ....rear chassis adjustment
Vertical Centering ....rear chassis adjustment
Shunt Width Coil ....rear chassis screwdriver adjustments
Series Width Coil ....rear chassis screwdriver adjustment
Expanded Width Coil ....rear chassis screwdriver adjustment
Width Selector Switch ....rear chassis screwdriver adjustment
Height ....rear chassis adjustment
Horizontal Linearity ....rear chassis screwdriver adjustment
Vertical Linearity ....rear chassis adjustment
Horizontal Drive ....rear chassis screwdriver adjustment
Horizontal Oscillator Frequency ....bottom chassis adjustment
Horizontal Oscillator Waveform ....side chassis adjustment
Focus ....rear chassis adjustment
Ion Trap Magnet ....top chassis adjustment
Deflection Coil ....top chassis wing nut adjustment
Focus Coil ....top chassis screwdriver adjustment

HIGH VOLTAGE WARNING

OPERATION OF THIS RECEIVER OUTSIDE THE CABINET OR WITH THE COVERS REMOVED, INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WORK ON THE RECEIVER SHOULD NOT BE ATTEMPTED BY ANYONE WHO IS NOT THOROUGHLY FAMILIAR WITH THE PRECAUTIONS NECESSARY WHEN WORKING ON HIGH VOLTAGE EQUIPMENT. DO NOT OPERATE THE RECEIVER WITH THE HIGH VOLTAGE COMPARTMENT SHIELD REMOVED.

KINESCOPE HANDLING PRECAUTIONS

DO NOT OPEN THE KINESCOPE SHIPPING CARTON, INSTALL, REMOVE OR HANDLE THE KINESCOPE IN ANY MANNER UNLESS SHATTERPROOF GOGGLES, AND HEAVY GLOVES ARE WORN. PEOPLE NOT SO EQUIPPED SHOULD BE KEPT AWAY WHILE HANDLING KINESCOPES. KEEP THE KINESCOPE AWAY FROM THE BODY WHILE HANDLING.

The kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For these reasons, kinescopes must be handled with more care than ordinary receiving tubes.

The large end of the kinescope bulb—particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure at any time. In installation, if the tube sticks or fails to slip smoothly into its socket, or deflecting yoke, investigate and remove the cause of the trouble. Do not force the tube. Refer to the Receiver Installation section for detailed instructions on kinescope installation. All RCA kinescopes are shipped in special cartons and should be left in the cartons until ready for installation in the receiver. Keep the carton for possible future use.

World Radio History

OPERATING INSTRUCTIONS

The following adjustments are necessary when turning the receiver on for the first time.

1. Turn the radio FUNCTION switch to Tel.

2. Turn the receiver "ON" and advance the SOUND VOLUME control to approximately mid-position.

3. Set the STATION SELECTOR to the desired channel.

4. Adjust the FINE TUNING control for best sound fidelity and SOUND VOLUME for suitable volume

5. Turn the BRIGHTNESS control fully counterclockwise, then clockwise until a light pattern appears on the screen.

6. Adjust the VERTICAL hold control until the pattern stops vertical movement.

7. Adjust the HORIZONTAL hold control until a picture is obtained and centered.

8. Turn the BRIGHTNESS control counterclockwise until the retrace lines just disappear.

9. Adjust the PICTURE control for suitable picture contrast.

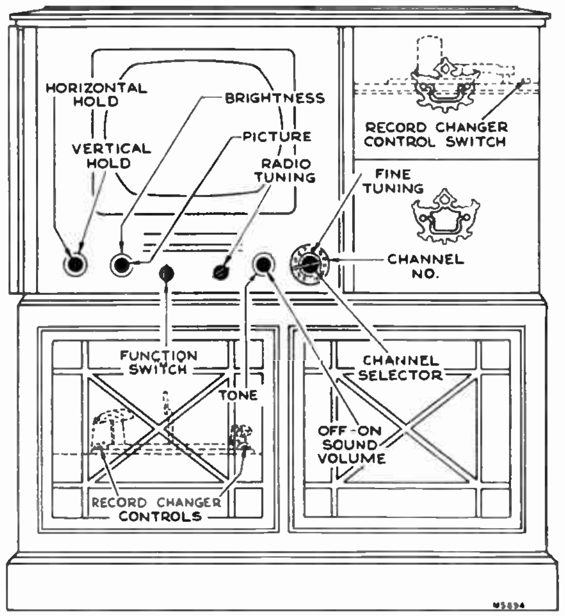

Figure 1—Receiver Operating Controls

10. After the receiver has been on for some time, it may be necessary to readjust the FINE TUNING control slightly for improved sound fidelity.

11. In switching from one station to another, it may be necessary to repeat steps numbers 4 and 9.

12. To operate the Electric Magnifier, push the button on the remote cable.

13. When the set is turned on again after an idle period, it should not be necessary to repeat adjustments if the positions of the controls have not been changed. If any adjustment is necessary, step number 4 is generally sufficient.

14. If the positions of the controls have been changed, it may be necessary to repeat steps numbers 1 through 9.

15. For radio operation turn the FUNCTION switch to AM or FM and tune in station with the radio TUNING control.

16. For phono. operation, turn the function switch to PH for operation of the 78 rpm changer or to XPH for operation of the 45 rpm changer.

INSTALLATION INSTRUCTIONS

UNPACKING.—The TA129 receiver is packed complete with kinescope in a cardboard carton. To unpack, turn the shipping carton on its side and tear open the carton bottom flaps. Fold the flaps up along the side of the carton and turn the carton back up. Lift the carton up and off the cabinet.

A flat skid is attached to the bottom of the receiver cabinet which will permit the cabinet to be moved about without stressing the cabinet joints. To remove the skid, take off the nuts from the two bolts that hold the cabinet on the skid. With a man at each end of the cabinet, lift the cabinet off the skid.

The operating control knobs are packed in a paper bag and tied to a crossmember in back of the cabinet. Remove the bag and install the knobs on the proper control shafts.

From the rear of the cabinet remove the red bracket which holds the RP168C record changer drawer in the closed position. Slide the drawer out. From the top of the changer, remove the three filler plugs from over the motorboard mounting screws. Loosen these three screws just enough to permit removal of two wooden shipping strips under the edge of the motorboard. Tighten the screws just enough to keep the motorboard springs from rattling and replace the filler plugs.

Remove the red bracket which holds the 960282 changer drawer in the closed position. Open the drawer and from the top of the changer. Remove the two shipping screws from the record changer motorboard. Insert two plugs from the bag of knobs into the holes in the motorboard.

Remove the television compartment back.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the high voltage lead is attached to the kinescope second anode connector socket on the bell of the tube.

Connect the antenna transmission line to the receiver antenna terminals.

Plug the receiver power cord into a 115 volt a-c power source. Turn the power switch to the "on" position, the function switch to Tel, the brightness control three-quarters clockwise, and picture control counterclockwise.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 2. Starting from this position immediately adjust the magnet by moving

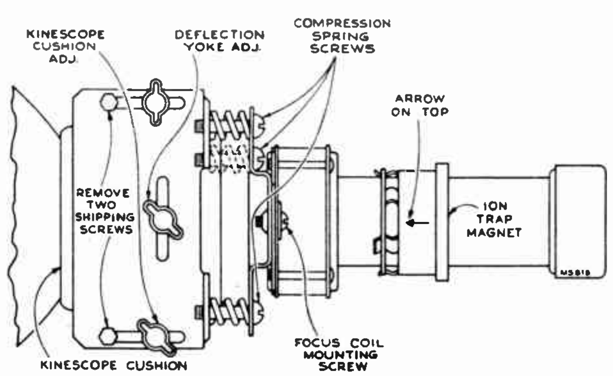

Figure 2—Yoke and Focus Coil Adjustments

it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the focus control (R191 on the chassis rear apron) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. See steps 3 through 9 of the receiver operating instructions.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC threshold control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R138 on the rear apron (see Figure 3) clockwise until the set operates normally and the picture can be synced.

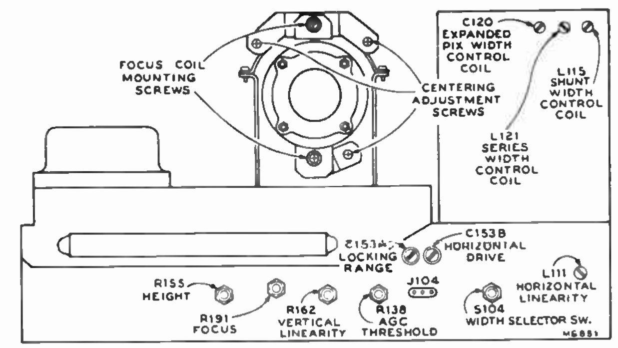

Figure 3—Rear Chassis Adjustments

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull in should occur when the control is approximately 90 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should be out of sync and should show 1 vertical or diagonal black bar in the raster.

If the receiver passes the foregoing checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Coil Adjustments."

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments:

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T109 horizontal frequency adjustment (under the chassis) until the picture is just out of sync and the horizontal blanking appears as a vertical or disagonal black bar in the raster.

Horizontal Lock in Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 3 bars are present, adjust C153A slightly counter-clockwise. Turn the picture control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull in point. Repeat this procedure until 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 11. For field purposes paragraph "A" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS COIL ADJUSTMENTS.—The focus coil should be adjusted so that there is approximately ¼ inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus coil. This spacing gives best average focus over the face of the tube. However, it may be necessary to change this distance slightly in order to compensate for small differences in strength of the permanent magnets in the coil. In order to prevent the beam from striking the neck of the kinescope, it is important that the axis of the hole through the focus coil should be kept in accurate alignment with the axis of the neck of the kinescope.

CENTERING ADJUSTMENTS.—Centering is obtained by loosening the two focus coil mounting screws and sliding the coil up or down or from side to side. If a corner of the raster is shadowed, check the position of the ion trap magnet. Slightly reposition it to eliminate the shadow and recenter the picture by sliding the coil. In extreme cases it may be necessary to adjust one or more of the focus coil compression screws to eliminate a corner shadow.

Recheck the position of the ion trap magnet to insure that maximum brilliance is obtained. It is important that the kinescope not be operated with the ion trap magnet adjusted for less than maximum brightness. To do so may cause injury to the tube.

PICTURE SIZE AND LINEARITY.—Connect the "Electronic Magnifier" switch to its socket on the rear apron of the chassis. Set the switch to the large (expanded) picture position. Set the Expanded Width Selector Switch S104 to the counter-clockwise position and adjust the Expanded Width Control L120 so that the test pattern outer circle normally tangent to the top of the picture is now tangent to the side of the picture. (If the width is not sufficient, set the Expanded Width Selector Switch to the center or the clockwise end position.) Adjust the Horizontal Drive and the Horizontal Linearity Control until the pattern is symmetrical from left to right. In general, the core of the Linearity Control Coil should be between ½ to all the way out of the coil.

Set the "Electronic Magnifier" switch to the normal size position. Observe to see if the picture width is correct. If it is not, adjust either the Series Width Control Coil L121, or the Shunt Width Control Coil L115 until the picture is the correct width. If the Series Width Coil core is out too far, the picture will "ring" on the left half. This ring will be shown as one or more faint light or dark vertical bars somewhere on the left half of the picture with resulting poor horizontal linearity.

When the proper width is obtained, switch to the expanded picture position, wait for a few seconds then switch back to the normal position. Observe if the top of the picture immediately assumes its final position or if it takes several seconds to come to a stop. If the picture requires more than a second to become still, adjust the core of L115 or L121 in and the other out while maintaining the proper width. Repeat the above test and observe if the picture immediately comes to rest when switched to the normal size position. Continue to adjust L115 and L121 until this condition is satisfied and the picture is the proper width. Observe the picture horizontal linearity and if necessary retouch Horizontal Drive, Linearity and Width Controls L115 and L121.

With the "Electronic Magnifier" switch in normal position, adjust the Height (R155) and the Vertical Linearity control (R162) as usual in order to obtain good vertical linearity. In addition, if difficulty is experienced in obtaining good vertical linearity at the top one-half inch of the picture, slightly adjust the Vertical Peaking Control L119.

Switch to the expanded picture position and note if the proper aspect ratio is obtained. If not, adjust L112 and/or S104.

World Radio History

INSTALLATION INSTRUCTIONS

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

FOCUS.—Adjust the focus control (R191 on chassis rear apron) for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

AGC THRESHOLD CONTROL. The AGC threshold control R138 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal, sync the picture and turn the picture control to the maximum clockwise position. Turn the brightness control counter-clockwise until the vertical retrace lines are just invisible. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R138. If the picture requires an appreciable portion of a second to reappear, R138 should be readjusted.

Set the picture control at the maximum clockwise position. Turn R138 fully clockwise. The top one-half inch of the picture may be bent slightly. This should be disregarded. Turn R138 counter-clockwise until there is a very, very slight bend or change of bend in the top one-half inch of the picture. Then turn R138 clockwise just sufficiently to remove this bend or change of bend.

If the signal is very weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R138 counter-clockwise until the snow in the picture becomes more pronounced, then clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far counter-clockwise on a weak signal, then the receiver may overload when a strong signal is received.

CHECK OF R-F OSCILLATOR ADJUSTMENTS. Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 10. The adjustments for channels 2 through 5 and 7 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis and channel 6 adjustment is in the kinescope well. See Figures 9 and 10 for their location.

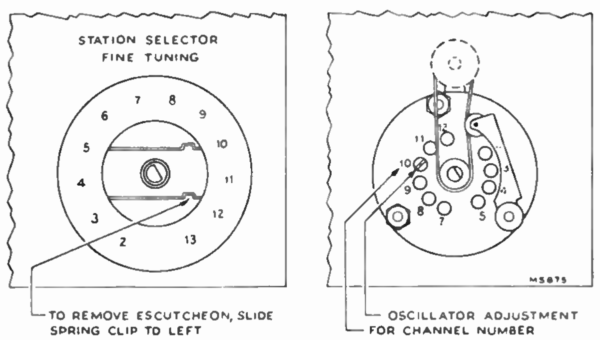

Figure 4—R-F Oscillator Adjustments

Replace the cabinet back and make sure that the screws are tight in order to prevent rattling at high volume.

WEAK SIGNAL AREA OPERATION.—Since the vast majority of receivers are sold in strong signal areas, the chassis are aligned to produce the cleanest pictures in those areas. However, if the receiver is to be operated in a weak signal area, better performance can be obtained by "peaking" the r-f unit.

To peak the r-f unit in these receivers, disconnect the 390 ohm resistor which is on top of the r-f unit chassis. Adjust L66 to obtain the best possible picture on the weakest low channel station received.

If the peaked receiver is subsequently taken to a strong signal area, the resistor R14 should be connected in place and L66 adjusted for "flat" response on the low channels.

CHASSIS REMOVAL. To remove the chassis from the cabinet for repair or installation of a new kinescope, remove the back and the knobs, unplug all cables and remove the chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet. The kinescope is held on the chassis by means of a special strap, so that the chassis and the kinescope can be handled together, as a unit.

KINESCOPE HANDLING PRECAUTION.—Do not install, remove, or handle the kinescope in any manner, unless shatterproof goggles and heavy gloves are worn. People not so equipped should be kept away while handling the kinescope. Keep the kinescope away from the body while handling.

To remove the kinescope, remove the kinescope socket, the ion-trap magnet, and the second-anode connector. Loosen the cross-recessed head screw on the kinescope strap. Withdraw the kinescope toward the front of the chassis.

INSTALLATION OF KINESCOPE.—Slide the kinescope cushion toward the rear of the chassis. Loosen the deflection yoke adjustment, slide the yoke toward the rear of the chassis and tighten.

The kinescope second anode contact is a recessed metal well in the side of the bulb. The tube must be installed so that this contact is up but rotated approximately 30 degrees toward the high-voltage compartment.

Insert the neck of the kinescope through the deflection and focus coils. If the tube sticks, or fails to slip into place smoothly, investigate and remove the cause of the trouble. Do not force the tube.

Slip the ion trap magnet assembly over the neck of the kinescope.

Connect the kinescope socket to the tube base.

Connect the high voltage lead to the kinescope second anode socket.

Wipe the kinescope screen surface and front panel safety glass clean of all dust and finger marks.

As may be seen by inspection, the radio dial lights and dial pointer are attached to the cabinet front panel. The dial cord is attached to the receiver chassis. The method of attachment may be seen in Figure 5.

Slide the dial pointer to the stop on the high frequency end of the dial. Turn the radio tuning shaft until the gang is completely unmeshed.

To replace the chassis in the cabinet, first tighten the cross recessed head screw on the kinescope strap. Slide the chassis into the cabinet until there is sufficient slack in the pilot light cable then attach the pilot light sockets to the pilot light bracket.

Insert the chassis to its proper position, then install the six chassis bolts and tighten. Loosen the kinescope strap from the rear of the chassis. Push the kinescope forward until the face of the tube is against the mask. Push the yoke cushion forward against the kinescope flare then tighten the cushion adjusting screws. Push the yoke forward and tighten Tighten the kinescope strap. Replace the control knobs.

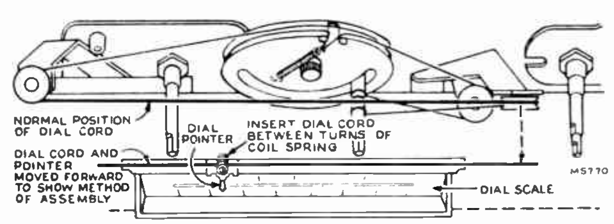

Figure 5—Dial Cord and Pointer Assembly

To hook up the dial pointer, reach over the television chassis to the radio and press the dial cord well into the coil spring.

Turn the set on and to radio position to see that the dial lighting is correct. If it is not, adjust the dial lights and shields. Tune in a station of known frequency and check the dial calibration.

CABINET ANTENNA. A cabinet antenna is provided which may be employed in strong signal areas in which no reflections are experienced. The antenna leads are brought out near the receiver antenna terminal board.

The link on the antenna terminal board is for use in case it is desirable to connect a separate "A" band antenna.

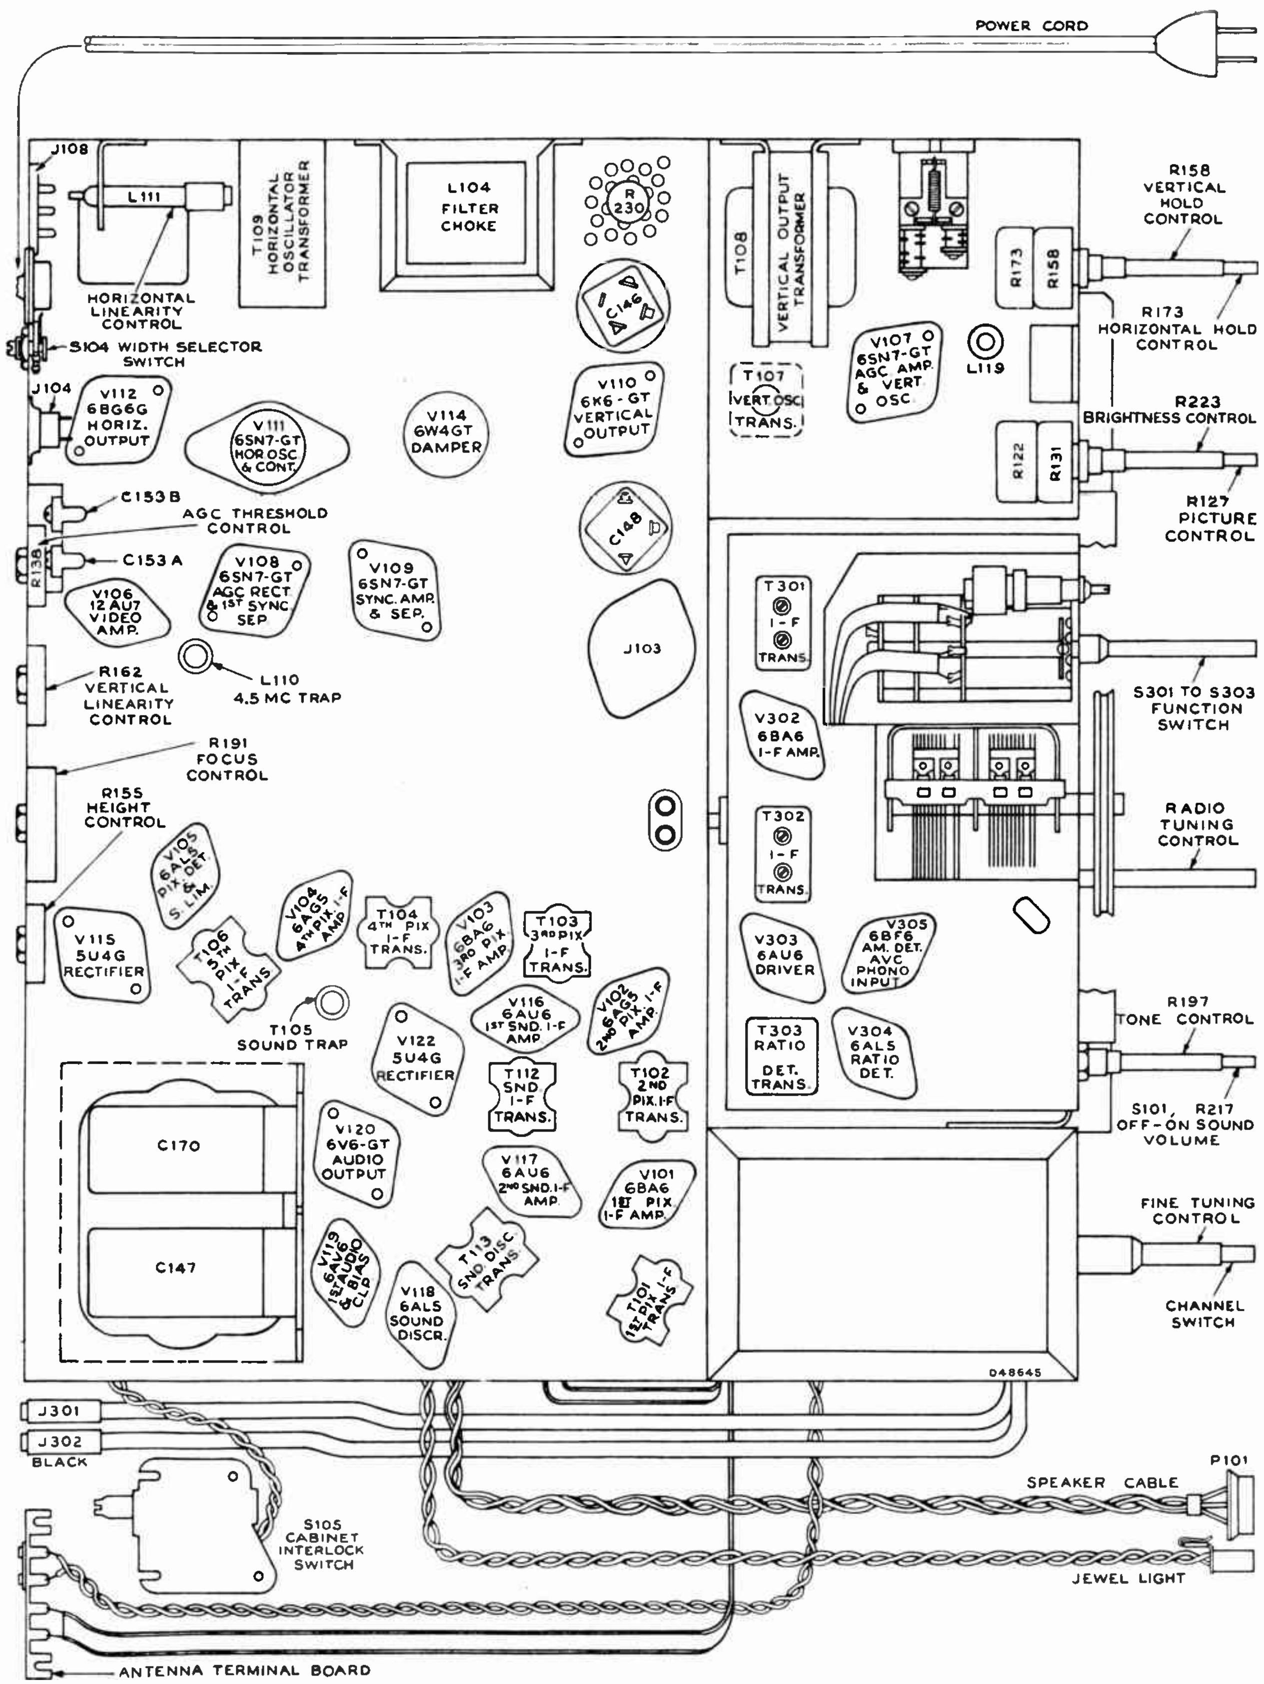

Figure 7—Chassis Bottom View

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To service properly the television chassis of this receiver, it is recommended that the following test equipment be available.

R-F Sweep Generator meeting the following requirements:

(a) Frequency Ranges

20 to 30 mc., 1 mc. and 10 mc. sweep width
50 to 90 mc., 10 mc. sweep width
170 to 225 mc., 10 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

Cathode-Ray Oscilloscope.—For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response, and should be capable of passing a 60-cycle square wave without appreciable distortion. While this requirement is not met by many commercial instruments, RCA Oscilloscopes, types WO-55A, WO-58A, WO-79A, and WO-60C fill the requirement and any of these may be employed.

For video and sync waveform observations, the oscilloscope must have excellent frequency and phase response from 10 cycles to at least two megacycles in all positions of the gain control. The RCA types WO-58A and WO-79A are ideally suited for this purpose.

Signal Generator to provide the following frequencies with crystal accuracy.

(a) Intermediate frequencies

19.75 mc. adjacent channel picture trap
21.25 mc. sound i-f and sound traps
22.05 and 24.75 mc. conv. and first pix i-f trans.
25.9 mc. second picture i-f transformer
24.6 mc. fourth picture i-f transformer
22.0 mc. third picture i-f transformer
22.5 mc. fifth picture i-f transformer
25.75 mc. picture carrier
27.25 mc. adjacent channel sound trap

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(c) Output on these ranges should be adjustable and at least .1 volt maximum.

Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

Electronic Voltmeter of Junior "VoltOhmyst" type and a high voltage multiplier probe for use with this meter to permit measurements up to 10 kv.

Service Precautions.—If possible, the chassis should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, make sure the kinescope retaining strap is secure, and the yoke cushion is up firmly against the flare of the tube.

CAUTION: Do not short the kinescope second-anode lead. Its short circuit current is approximately 3 ma. This represents approximately 9 watts dissipation and a considerable overload on the high-voltage filter resistor R189.

Adjustments Required.—Normally, only the r-f oscillator line will require the attention of the service technician. All other circuits are either broad or very stable and hence will seldom require re-adjustment.

The oscillator line is relatively non-critical. When oscillator tubes are changed, in all probability it will be necessary to adjust only C6 in order to bring the entire line into adjustment.

ORDER OF ALIGNMENT.—When a complete receiver alignment is necessary, it can be most conveniently performed in the following order:

(1) Sound discriminator
(2) Sound i-f transformers
(3) Picture i-f traps
(4) Picture i-f transformers
(5) R-F and converter lines
(6) R-F oscillator line
(7) 4.5 mc. video trap
(8) Sensitivity check

SOUND DISCRIMINATOR ALIGNMENT.—Set the signal generator for approximately .1 volt output at 21.25 mc. and connect it to the second sound i-f grid.

Detune T113 secondary (bottom).

Set the "VoltOhmyst" on the 3-volt scale.

Connect the meter, in series with a one-megohm resistor, to the junction of diode resistors R203 and R204.

Adjust the primary of T113 (top) for maximum output on the meter.

Connect the "VoltOhmyst" to the junction of C183 and R203. Adjust T113 secondary (bottom). It will be found that it is possible to produce a positive or negative voltage on the meter dependent upon this adjustment. Obviously to pass from a positive to a negative voltage, the voltage must go through zero. T113 (bottom) should be adjusted so that the meter indicates zero output as the voltage swings from positive to negative. This point will be called discriminator zero output.

Connect the sweep oscillator to the grid of the second sound i-f amplifier.

Adjust the sweep band width to approximately 1 mc. with the center frequency at approximately 21.25 mc. and with an output of approximately .1 volt.

Connect the oscilloscope to the junction of C183 and R203. The pattern obtained should be similar to that shown in Figure 13. If it is not, adjust T113 (top) until the wave form is symmetrical.

The peak to peak band width of the discriminator should be approximately 350 kc. and the trace should be linear from 21.175 mc. to 21.325 mc.

SOUND I-F ALIGNMENT.—Connect the sweep oscillator to the first sound i-f amplifier grid.

Connect the oscilloscope to the second sound i-f grid return (terminal A of T112) in series with a 33,000-ohm isolating resistor.

Insert a 21.25 mc. marker signal from the signal generator into the first sound i-f grid.

Adjust T112 (top and bottom) for maximum gain and symmetry about the 21.25 mc. marker. The pattern obtained should be similar to that shown in Figure 14.

The output level from the sweep should be set to produce approximately .3 volt peak-to-peak at the second sound i-f grid return when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

The band width at 70% response from the first sound i-f grid to the second i-f grid should be approximately 200 kc.

©John F. Rider

World Radio History

ALIGNMENT PROCEDURE

PICTURE I-F TRAP ADJUSTMENT.—Connect the "VoltOhmyst" to the junction of R135 and C190.

Remove the 6SN7GT AGC Amplifier tube V107. Connect a 250,000 ohm potentiometer between pins 5 and 6 of the V107 socket. Adjust the potentiometer until the "VoltOhmyst" reads approximately −12 volts.

Set the channel switch to the blank position between channels number 2 and 13.

Connect the "VoltOhmyst" across the picture detector load resistor R119. Under this condition, both leads of the meter are at approximately −120 volts. In making this connection, care should be taken not to touch the case of the meter or to permit the meter case to become grounded.

Connect the output of the signal generator to the grid of the converter tube V2. To do this, remove the tube from the socket and fashion a clip by twisting one end of a small piece of wire around pin number 1. Replace the tube in the socket leaving the end of the wire protruding from under the tube. Connect the signal generator to this wire through a 1,500 mmf capacitor keeping the leads as short as possible.

Set the generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for minimum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is exactly on frequency.

(1) 21.25 mc.—T103 (top)
(2) 21.25 mc.—T105 (top)
(3) 27.25 mc.—T102 (top)
(4) 27.25 mc.—T104 (top)
(5) 19.75 mc.—T106 (top)
(6) 19.75 mc.—T101 (top)

In the above transformers using threaded cores, it is possible to run the cores completely through the coils and secure two peaks or nulls. The correct position is with the cores in the outside ends of the coils. If the cores are not in the correct position, the coupling will be incorrect and it will be impossible to secure the correct response.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary to prevent overloading.

22.5 mc.—T106 (bottom)
24.6 mc.—T104 (bottom)
22.0 mc.—T103 (bottom)
25.9 mc.—T102 (bottom)

T1 and T101 are coupled by a link and in combination constitute an overcoupled transformer. The characteristics of such a transformer are such that it is impossible to adjust it to a single frequency.

To sweep align T1 and T101, connect a 330-ohm composition resistor across the primary coils of T102, T103, T104 and T106.

Connect the "VoltOhmyst" to the junction of R135 and C190. Adjust the 250,000-ohm variable resistor for −2.0 volts on the meter.

Connect the oscilloscope to the plate of the first video amplifier, pin 1 of V106.

Connect a sweep generator to the converter grid through a 1,500 mmf capacitor. Set the generator to sweep from 20.0 mc. to 30.0 mc. and adjust the output to provide a 4-volt peak-to-peak signal on the scope.

Connect the signal generator loosely to the converter grid and tune it to provide markers at 22.05 mc. and 24.75 mc.

Adjust T1 (top) and T101 (bottom) to obtain the response shown in Figure 15. The T1 core must penetrate to the terminal-board end of the coil in order to obtain the correct response.

Remove the 330-ohm resistors from across T102, T103, T104 and T106.

Adjust the 250,000-ohm potentiometer for a 15-volt peak-to-peak signal at the plate of the first video amplifier. The bias as measured by the "VoltOhmyst" should be −12.0 volts or less.

Observe and analyze the response curve obtained. The response will not be ideal and the i-f adjustments must be retouched in order to obtain the desired curve. See Figure 16.

On final adjustment the picture carrier marker must be at approximately 45% response. The curve must be approximately flat topped, with the 22.1 mc. marker at approximately 95% response and the 25.0 mc. marker below 90% response. A 26.5 mc. marker must fall between 5 and 10% response.

The most important consideration in making the i-f adjustments is to get the picture carrier at the 45% response point. If the picture carrier operates too low on the response curve, loss of low frequency video response, of picture brilliance, of blanking, and of sync may occur. If the picture carrier operates too high on the response curve, the picture becomes smeared. In making these adjustments, care should be taken to see that no two transformers are tuned to the same frequency as i-f oscillation may result.

Remove the converter tube and take off the clip to pin number 1. Replace the tube in the socket.

Picture I-F Oscillation. If the receiver will operate without oscillating with the test equipment disconnected but breaks into oscillation or becomes unstable with the equipment connected, it may become necessary to establish a ground plane. Cover the test bench with a sheet of copper and set the chassis on the sheet. Set all the test equipment except the "VoltOhmyst" on the sheet and bond or bypass them to it. A Junior "VoltOhmyst" should not be bonded to the sheet since the negative test probe is not always connected to ground during alignment. If the receiver is badly misaligned and two or more of the i-f transformers are tuned to the same frequency, the receiver may fall into i-f oscillation. I-F oscillation shows up as a voltage across the picture detector load resistor that is unaffected by r-f signal input. If such a condition is encountered, it is sometimes possible to stop oscillation by adjusting the transformers approximately to frequency by setting the adjustment cores of T101, T102, T103, T104, T105 and T106 to be approximately equal to those of another receiver known to be in proper alignment. If this does not have the desired effect, it may now be possible to stop oscillation by increasing the grid bias. If so, it should then be possible to align the transformers by the usual method. Once aligned in this manner, the i-f amplifier should be stable with reduced bias.

If the oscillation cannot be stopped in the above manner, shunt the grids of the first three pix i-f amplifiers to ground with 1,000 mmf. capacitors. Connect the signal generator to the fourth pix i-f grid and align T106 to frequency. Progressively remove the shunt from each grid and align the plate coil of that stage to frequency.

If this does not stop the oscillation, the difficulty is not due to i-f misalignment as the i-f section is stable when properly aligned. Check all i-f by-pass condensers, transformer shunting resistors, tubes, socket voltages, etc.

ANTENNA, R-F AND CONVERTER LINE ADJUSTMENT.—In order to align the r-f tuner, it will first be necessary to set the channel-13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.

The channel-13 oscillator may be aligned by adjusting it to beat with a crystal-calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available. Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated.

If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, couple the meter probe loosely to the receiver oscillator.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier signal, connect the signal generator to the receiver antenna terminals. Connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203).

Set the receiver switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator.

Now that the channel-13 oscillator is set to frequency, we may proceed with the r-f alignment.

Connect the "VoltOhmyst" to the junction of R135 and C197. Adjust the 250K pot. for −3.5 volts on the meter.

Remove the first pix i-f amplifier tube V101.

Connect the oscilloscope to the test connection at R13 in the r-f tuning unit.

Connect the r-f sweep oscillator to the receiver antenna terminals. The method of connection depends upon the output impedance of the sweep. The P102 connections for 300-ohm balanced or 72-ohm single-ended input are shown in the circuit diagram in Figure 74. If the sweep oscillator has a 50-ohm single-ended output, 300-ohm balanced output can be obtained by connecting as shown in Figure 8.

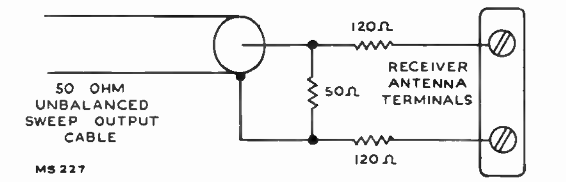

Figure 8—Unbalanced Sweep Cable Termination

Connect the signal generator loosely to the receiver antenna terminals.

Since channel 7 has the narrowest response of any of the high frequency channels, it should be adjusted first.

Set the receiver channel switch to channel 7.

Set the sweep oscillator to cover channel 7.

Insert markers of channel 7 picture carrier and sound carrier, 175.25 mc. and 179.75 mc.

Adjust C10 and C14 until the curve falls symmetrically between the sound and picture carrier markers. Adjust C11 to give the proper bandwidth. Roughly peak L6 in conjunction with slight adjustments of C10 and C14 for a flat-topped response curve with the sound and picture carriers at 90% to 95% response points on this curve. See Figure 17, channel 7.

Switch to channel 12 and adjust L6 for maximum response and minimum top slope of the curve.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep oscillator and marker oscillator to each of these channels and observing the response obtained. See Figure 17 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response. If the markers do not fall within this requirement on one or more high frequency channels, since there are no individual channel adjustments, it will be necessary to readjust L6, C10, C11 and C14, and possibly compromise some channel slightly in order to get the markers up on other channels. Normally, however, no difficulty of this type should be experienced since the higher frequency channels are comparatively broad and the markers easily fall within the required range.

Channel 6 is next aligned in the same manner.

Set the receiver to channel 6.

Set the sweep oscillator to cover channel 6.

Set the marker oscillator to channel 6 picture and sound carrier frequencies.

Adjust L9, L13, L66, and C12 for an approximately flat-topped response curve located symmetrically between the markers. L9, L13 and L66 are the center frequency adjustments. C12 is the band-width adjustment.

Check channels 5 down through channel 2 by switching the receiver, sweep oscillator and marker oscillator to each channel and observing the response obtained. In all cases, the markers should be above the 80% response point. If this is not the case, L9, L13, L66 and C12 should be retouched. On final adjustment, all channels must be within the 80% specification.

Disconnect the 250K pot., and replace V107 and V101.

Following an r-f alignment, the oscillator alignment must be checked.

R-F OSCILLATOR LINE ADJUSTMENT. The r-f oscillator line may be aligned by adjusting it to beat with a crystal calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available.

Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated. If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, the calibration frequency listed under R-F Osc. Freq. must be available.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier frequency, the frequencies listed under Sound Carrier Freq. must be available.

Channel Number	Receiver R-F Osc. Freq. Mc.	R-F Sound Carrier Freq. Mc.	Channel Oscillator Adjustment
2	81	59.75	L24
3	87	65.75	L23
4	93	71.75	L22
5	103	81.75	L21
6	109	87.75	L31
7	201	179.75	L19
8	207	185.75	L18
9	213	191.75	L17
10	219	197.75	L16
11	225	203.75	L15
12	231	209.75	L14
13	237	215.75	C6

If the heterodyne frequency meter method is used, couple the meter probe loosely to the receiver oscillator.

If the r-f sound carrier method is used, connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203) and connect the signal generator to the receiver antenna terminals. The order of alignment remains the same regardless of which method is used.

If the r-f unit is removed from the receiver for service and is aligned separately, the shield over the bottom of the r-f unit must be in place when making adjustments.

Since lower frequencies are obtained by adding steps of inductance, it is necessary to align channel 13 first and continue in reverse numerical order.

Set the receiver channel switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range while making the adjustment.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator. Oscillator adjustments L1 and L2 shown on the schematic are factory control adjustments and should not be touched in the field.

Switch the receiver to channel 12.

Set the frequency standard to the proper frequency as listed in the alignment table.

Adjust L14 for indications as above.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator trimmer for the speci-

©John F. Rider

World Radio History

fied indication. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control in the middle third of its range.

After the oscillator has been set on all channels, start back at channel 13 and recheck to make sure that all adjustments are correct.

AGC THRESHOLD ADJUSTMENT.—The AGC threshold adjustment can be made by the method outlined in the Installation Instructions. However, a more accurate adjustment can be obtained by the use of an oscilloscope.

Tune in a station and advance the picture control to the maximum clockwise position. Connect the low capacity probe from the oscilloscope to the plate of the first video amplifier, pin 1 of V106. Adjust the oscilloscope to observe the horizontal sync pulse.

Turn the AGC threshold control R138 fully clockwise, then slowly counter-clockwise. As the control is turned counter-clockwise, the receiver gain will increase slowly, increasing the size of the pattern on the oscilloscope. R138 should be turned counter-clockwise until the receiver begins to overload as indicated by clipping of the sync. The control should be left in the maximum gain position in which no clipping of sync is observed. See Figure 18 for proper waveforms.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally, the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment requires the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—With a clip lead, short circuit the coil between terminals C and D of the horizontal oscillator transformer T109. Tune in a television station and sync the picture if possible.

A.—Turn the horizontal hold control R173 to the extreme clockwise position. Adjust the T109 Frequency Adjustment (under the chassis) so that the picture is just out of sync and the horizontal blanking appears in the picture as a vertical bar. The position of the bar is unimportant.

B.—Turn the hold control approximately one quarter of a turn from the extreme clockwise position and examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C153B, the width controls, and the linearity control L111 as outlined on page 4 until the picture is correct. If C153B was adjusted, repeat step A above.

Horizontal Locking Range Adjustment.—Turn the horizontal hold control fully counter-clockwise. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 9 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 7 bars are present, adjust C153A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat the procedure until 7 to 9 bars are present.

Horizontal Oscillator Waveform Adjustment.—Remove the shorting clip from terminals C and D of T109. Turn the horizontal hold control to the extreme clockwise position. With a thin fibre screwdriver, adjust the Oscillator Waveform Adjustment Core of T109 (on the outside of the chassis) until the horizontal blanking bar appears in the raster.

ALIGNMENT PROCEDURE

A.—Connect the low capacity probe of an oscilloscope to terminal C of T109. Turn the horizontal hold control one quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 19. Adjust the Oscillator Waveform Adjustment Core of T109 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Check of Horizontal Oscillator Adjustments.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 3 bars are present, adjust C153A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. The picture should be just out of sync to the extent that the horizontal blanking bar appears as a single vertical or diagonal bar in the picture. Adjust the T109 Frequency Adjustment until this condition is fulfilled.

4.5 MC VIDEO TRAP.—With a strong input from a station, detune the receiver from the correct fine tuning point. With a very short clip lead, short the trap winding of T103. Observe the picture for the appearance of a 4.5 mc. beat. If the beat appears in the picture, adjust L110 until the beat is eliminated.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES.—The response curves shown on page 14 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

ALIGNMENT TABLE.—Both methods of oscillator alignment are presented in the alignment table. The service technician may thereby choose the method to suit his test equipment.

World Radio History

RADIO ALIGNMENT PROCEDURE

If any lead dressing is necessary, it should be done before aligning the receiver. When making a complete alignment follow the table below in sequence. If only a portion of the circuit is to be aligned select the portion required and follow with the remaining steps in the section. Any adjustments made on the 455 kc. I-F's make it necessary to adjust the 10.7 mc. I-F's.

"AM" R-F—I-F ALIGNMENT

Test-Oscillator.—For all alignment operations, connect low side of the test-osc. to the receiver chassis, and keep the osc. output as low as possible to avoid a-v-c action. **Output Meter.**—Connect the meter across the speaker voice coil, and turn the receiver volume control to max.

Steps	Connect the High Side of the Test. Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
1	Antenna terminal in series with .01 mfd.	455 kc. Modulated	AM	Low Freq. end of Dial	†Top and bot. cores of T301 and T302. (For max. voltage across voice coil.)
2	Ant. terminal through dummy ant. of 200 mmfs.	1,620 kc.	AM	Min. capacity	Osc. C308 for maximum output.
3		1,400 kc.	AM	Tune to signal	Ant. C304 for maximum output.
4		600 kc.	AM	600 kc.	Osc. L306 and Ant. L303.
5	Repeat steps 2, 3 and 4 for maximum output.				

† Use alternate loading. Connect an 18,000-ohm resistor across the primary to load the plate winding while the grid winding of the same transformer is being peaked. Then load the grid winding with the 18,000-ohm resistor while the plate winding is being peaked.

RATIO DETECTOR ALIGNMENT

Connect probe of "VoltOhmyst" to negative side of C328 and low side to chassis. Connect output meter across speaker voice coil.

Steps	Connect the High side of the Test. Osc. to—	Tune Test Osc. to—	Function Switch	Radio Dial Tuned to—	Adjust
6	Pin No. 1 of 6AU6 (V303) in series with .01 mfd.	10.7 mc. 30% AM Modulated	FM	———	Top of T303 for maximum DC on "VoltOhmyst."
7	Pin No. 1 of 6AU6 (V303) in series with .01 mfd.		FM	———	Bottom of T303 for minimum audio output on meter.
8	Repeat steps 6 and 7 as necessary making final adjustment with r-f input level set to give approximately −3.0 volts d-c on "VoltOhmyst."				

"FM" R-F—I-F ALIGNMENT

Steps	Connect the High Side of the Test. Osc. to—	Tune Test Osc. to—	Function Switch	Radio Dial Tuned to—	Adjust
9	Terminal 3 of S301-2 rear through 270 ohms.	10.7 mc.	FM	88 mc.	*T301 and T302 for max. with r-f input set to give −3 volts on "VoltOhmyst."
10	Terminal 3 of S301-2 rear through 270 ohms.	106 mc	FM	106 mc.	Set C302 to max. capacity. Squeeze L307 and adjust C302 for maximum.
11	Terminal 3 of S301-2 rear through 270 ohms.	90 mc.	FM	Tune to signal	Squeeze L301 and rock gang for maximum output.
12	Repeat steps 10 and 11 as required.				

* Use a 680-ohm resistor to load the plate winding while the grid winding of the same transformer is being peaked. Then the grid winding is loaded with 680-ohm resistor while the plate winding is being peaked.

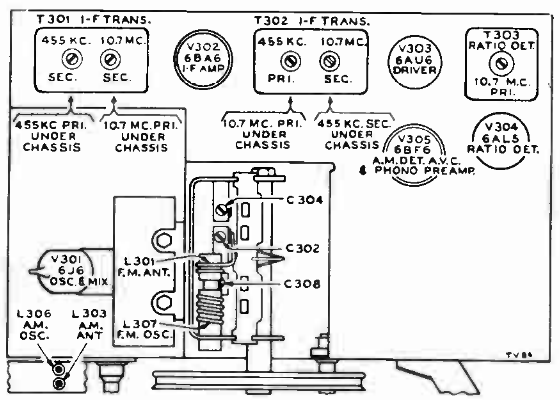

Figure 20—Chassis, Top View, Showing Adjustments

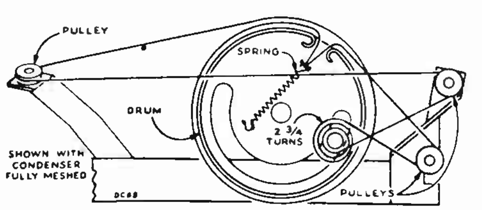

Figure 21—Dial and Drive Cord Assembly

CRITICAL LEAD DRESS:

1. Ground lead on pin 2 of V302 and V303 should be dressed down flat on chassis.
2. Dual .005 mfd. capacitors and diode filter should be dressed to clear the bottom of the cabinet.
3. Dress C329 across V302 sockets with short and direct leads.
4. Dress V302 plate lead from pin 5 down to the chassis.
5. Dress AVC lead from R321 to switch down to chassis and against back of gang mounting plate.
6. Dress lead from pin 6 of V305 down to chassis and against back of gang mounting plate.
7. Dress AVC lead from 1st I-F to switch against chassis and against gang mounting plate.
8. Dress lead from switch to pin 1 of V301 against plate supporting gang.
9. Dress all insulated F-M leads down to chassis.
10. Connect C309 with short lead to pin 6 of V301 keeping body of cap away from plate lead and switch terminals.
11. The coupling between L301 and L307 should be adjusted to give proper injection voltage to the mixer grid. This has been found to be correct when the distance between adjacent end turns is 3/8" to 7/16" measured at top of the form.
12. Dress cabled leads away from antenna transmission lines.
13. Dress all uninsulated bus wire so as to avoid short circuits.

SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnets reversed either front to back or top to bottom; front magnet incorrectly oriented.

(2) V112 or V113 inoperative. Check waveforms on grids and plates.

(3) No high voltage—If horizontal deflection is operating as evidenced by the correct waveform on terminal 4 of horizontal output transformer, the trouble can be isolated to the 8016 circuit. Either the T110 high voltage winding is open, the 8016 tube is defective, its filament circuit is open, C168 is shorted, or R187 or R189 are open.

(4) V111 circuit inoperative—Refer to schematic and waveform chart.

(5) Damper tube (V114) inoperative.

(6) Defective kinescope.

(7) R131 open.

(8) No receiver plate voltage—filter capacitor shorted—bleeder or filter choke open.

NO VERTICAL DEFLECTION:

(1) V107B or V110 inoperative. Check voltage and waveforms on grids and plates.

(2) T107 or T108 open.

(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.

(2) V112 defective.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V110.

(2) Vertical output transformer defective.

(3) V107B defective—check voltage and waveforms on grid and plate.

(4) C150, R164, C147B or C148-C defective.

(5) Low bias or plate voltage—check rectifiers and capacitors in supply circuits.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V112 or V114.

(2) T110 or L111 defective.

(3) C164 or C165 defective.

WRINKLES ON LEFT SIDE OF RASTER:

(1) R166, R167 or C169 defective.

(2) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T109 incorrectly tuned.

(2) R172, R173 or R174 defective.

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER:

(1) Improper adjustment of focus coil or ion trap magnet.

(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) R-F oscillator off frequency.

(2) Sound i-f, discriminator or audio amplifier inoperative—check V116, V117, V118, V119, V120 and their socket voltages.

(3) T114 or C186 defective.

(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC threshold control R138 misadjusted.

(2) V105B, V107A, V108 or V109 inoperative. Check voltage and waveforms at their grids and plates.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V107B and associated circuit—C145, T107, etc.

(2) Integrating network inoperative—Check.

(3) R154, R155, R157, R158 or R159 defective.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T109 misadjusted—readjust as instructed on page 11.

(2) V111 inoperative—check socket voltage and waveforms.

(3) T109 defective.

(4) C140, C153A, C154, C155, C156, C157 or C166 defective.

(5) If horizontal speed is completely off and cannot be adjusted check C158, C159, R172, R173, R174, R179 and R182.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture i-f, detector or video amplifier inoperative—check V103, V104, V105 and V106—check socket voltages.

(2) Bad contact to kinescope grid.

PICTURE STABLE BUT POOR RESOLUTION:

(1) V105A or V106 defective.

(2) Peaking coils defective—check for specified resistance.

(3) Make sure that the focus control operates on both sides of proper focus.

(4) R-F and I-F circuits misaligned.

PICTURE SMEAR:

(1) R-F or I-F circuits misaligned.

(2) Open peaking coil.

(3) This trouble can originate at the transmitter—check on another station.

PICTURE JITTER:

(1) AGC threshold control R138 misadjusted.

(2) If regular sections at the left picture are displaced change V112.

World Radio History

SERVICE SUGGESTIONS

(3) Vertical instability may be due to loose connections or noise.

(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.

(2) R-F oscillator off frequency.

(3) R-F unit inoperative—check V1, V2, V3.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.

(2) Replace V112.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) C169 defective.

(2) V114 defective.

PICTURE I-F RESPONSE.—At times it may be desirable to observe the individual i-f stage response. This can be achieved by the following method:

Shunt all i-f transformers and coils with a 330-ohm carbon resistor except the one whose response is to be observed.

Connect a wide band sweep generator to the converter grid and adjust it to sweep from 18 mc. to 30 mc.

Connect the oscilloscope across the picture detector load resistor and observe the overall response. The response obtained will be essentially that of the unshunted stage. The effects of the various traps are also visible on the stage response.

Figures 22 through 26 show the responses of the various stages obtained in the above manner. The curves shown are typical although some variation between receivers can be expected. Relative stage gain is not shown.

World Radio History

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition a 2200 microvolt test pattern signal was fed into the receiver, the picture was synced and the AGC threshold control was properly adjusted. The second condition was obtained by removing the antenna leads and short-circuiting the receiver antenna terminals. Voltages shown are as read with "Jr. VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles a-c.

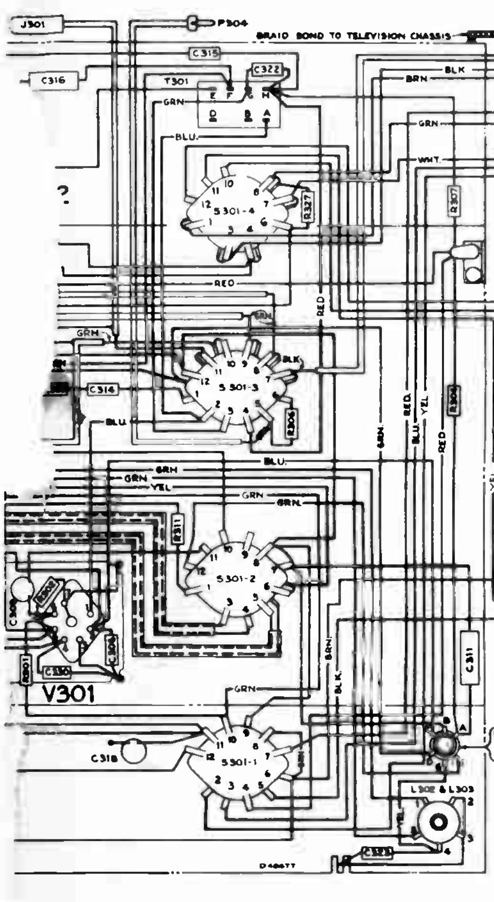
RING DIAGRAM



iring Diagram (RK135D)

TELEVISION CRITICAL LEAD DRESS

1. The ground bus from pin 2 and the center shield of V117 socket should not be shortened or rerouted.
2. Do not change the dress of the filament leads or the by-pass capacitors in the picture or sound i-f circuits. The filament leads between V117, V118 and V119 should be down against the chassis and away from grid or plate leads.
3. If it is necessary to replace any of the 1500 mmf capacitors in the picture i-f circuit, the lead length must be kept as short as possible.
4. Picture i-f coupling capacitors C106, C111, C115 and C121 should be up and away from the chassis and should be clear of the pix i-f transformer adjustments by at least ¼ inch. If the dress of any of these capacitors is changed, the i-f alignment should be rechecked.
5. Leads to L102 and L103 must be as short as possible.
6. Dress peaking coils L105, L106 and L107 up and away from the chassis.
7. Dress C183 across tube pins 5 and 6 with leads not exceeding ⅜ inch.
8. Dress C129 and C130 up and away from the chassis.
9. Dress the yellow lead from the picture control away from the chassis and away from the volume-control leads. Dress the yellow lead from pin 8 of V106 away from the chassis.
10. Dress the green lead from pin 2 of V106 away from the chassis.
11. Dress R169, R169, R170, R176 and R178 up and away from the chassis.
12. The leads to the volume control should be dressed down against the chassis and away from V117 and V118.
13. Contact between the r-f oscillator frequency adjustment screws and the oscillator coils or channel switch eyelets must be avoided.
14. Dress leads from the width control coils away from the transformer frame.
15. Dress T110 winding leads as shown in Figure 72.

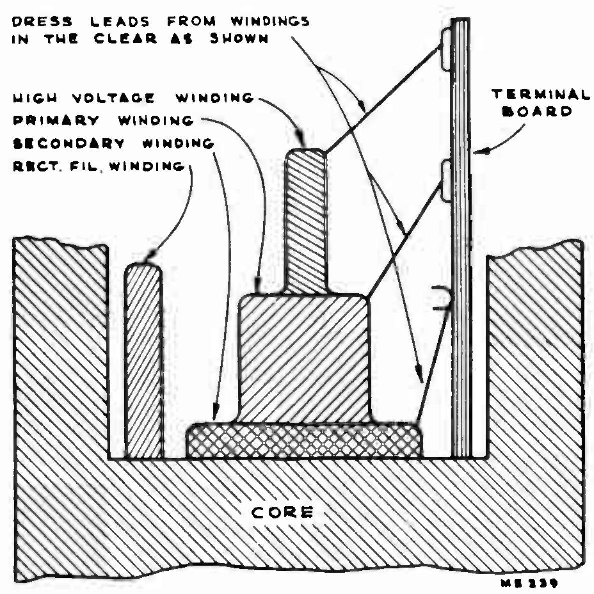


Figure 72—T110 Lead Dress

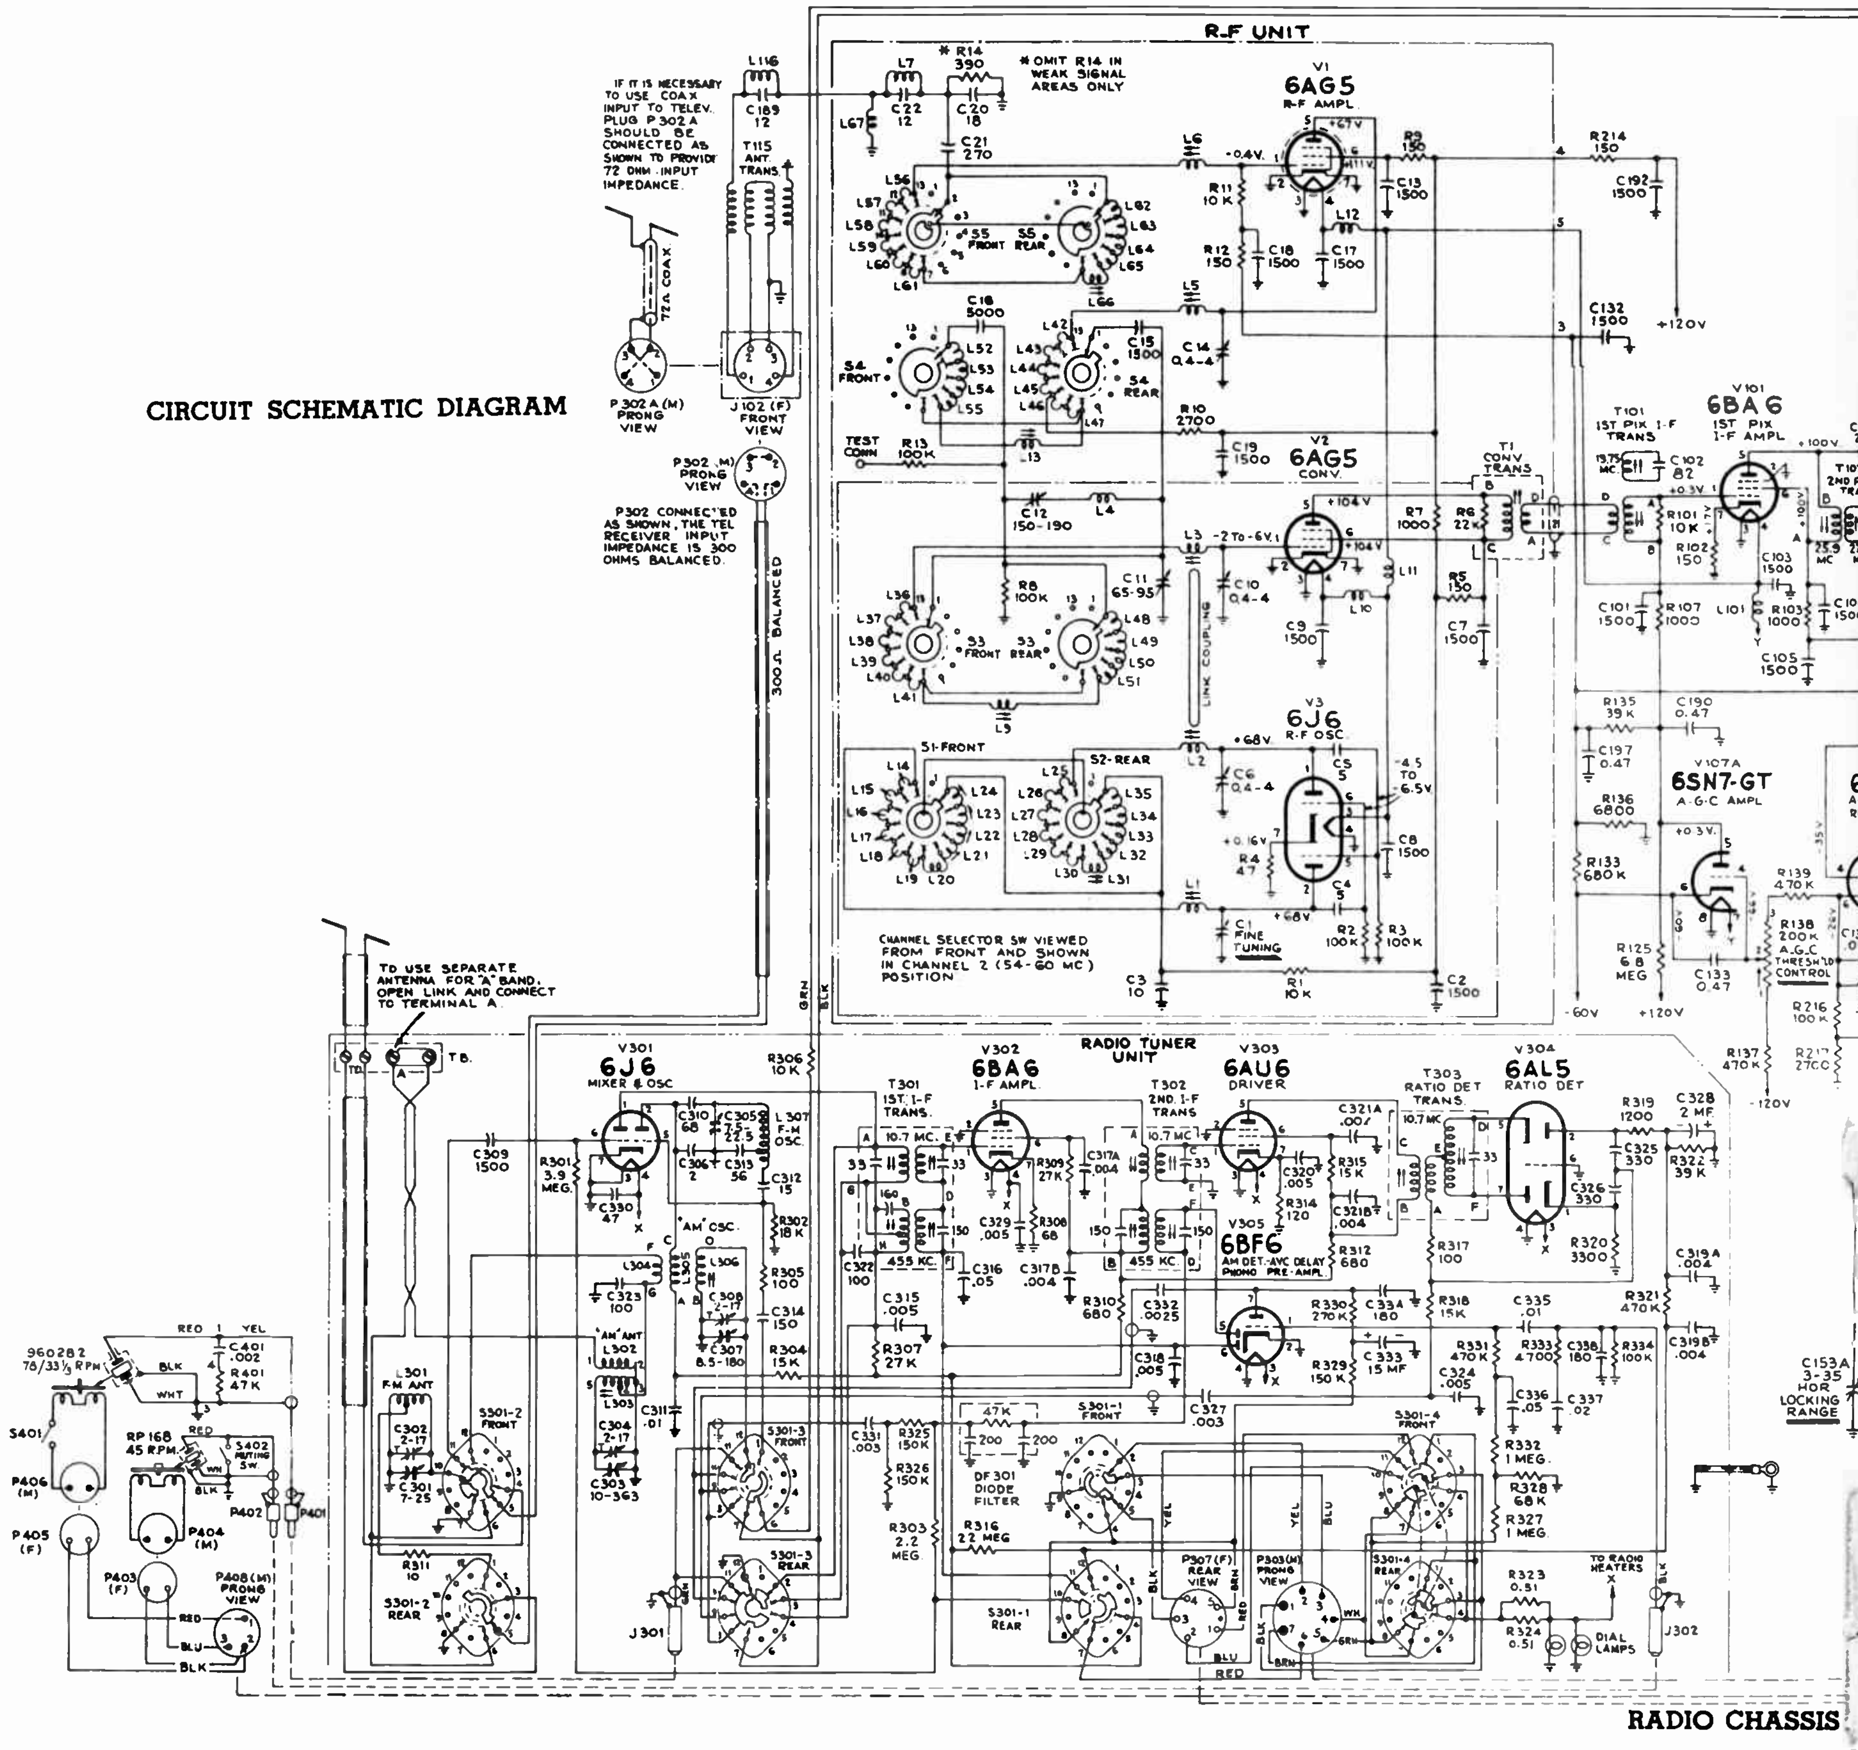
World Radio History

CIRCUIT SCHEMATIC DIAGRAM



Function switch S301 viewed from front and shown in Number 1 (maximum counterclockwise position).

Switch position 1—Television.
Switch position 2—AM.
Switch position 3—FM.
Switch position 4—Phono 45 RPM.
Switch position 5—Phono 78 RPM.

All resistance values in ohms. K = 1,000.
All capacitance values less than 1 in MF and above 1 in MMF unless noted.

Coil resistance values less than 1 ohm are not shown.
Direction of arrows at controls indicates clockwise rotation.

In some receivers, substitutions have caused changes in component lead color codes, in electrolytic capacitor values and their lug identification markings.

All voltages measured with "VoltOhmyst," no signal input with 117 v. a-c supply with the pix control fully clockwise and the brightness control set for average brightness.

In some sets, R227 was omitted.

Some chassis marked KCS41B were employed in this model. C184 was .01, a 1 meg resistor was added across the RP168 mute switch and R401 was 18K.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	RF UNIT ASSEMBLIES KRK 5
73465	Belt—Drive belt
75069	Board—R-F unit power connection terminal board
75067	Bracket—Vertical bracket for r-f oscillator shield
73478	Cable—I-F transmission cable (W1)
73441	Cam—Fine tuning adjustment
74035	Capacitor—Ceramic, 5 mmf. (C4, C5)
53511	Capacitor—Ceramic, 10 mmf. (C3)
54297	Capacitor—Ceramic, 18 mmf. (C20)
73443	Capacitor—Ceramic trimmer comprising 1 section of 150-190 mmf. and 1 section of 65-95 mmf. (C11, C12)
73091	Capacitor—Ceramic, 270 mmf. (C21)
71501	Capacitor—Ceramic, 1500 mmf. (C2, C7, C8, C9, C13, C15, C17, C18, C19)
73473	Capacitor—Ceramic, 5000 mmf. (C16)
73460	Coil—R-F plate coil for channel 6 (L13)
73461	Coil—Rear section—Oscillator plate coil for channel 6 (L20)
73462	Coil—Coupling inductance coil (L4)
73475	Coil—Antenna filter shunt coil (C67)
73476	Coil—I-F trap (L7, C22)
73477	Coil—Choke coil (L10, L11, L12)
73874	Coil—Front section—Oscillator plate coil for channel 6 (L31)
74108	Coil—Fine tuning coil (1½ turns) with adjustable inductance core and capacitor stud (plunger adjustment) (L1, C1)
74109	Coil—Trimmer coil (1½ turns) with adjustable inductance core and capacitor stud (screw adjustment for oscillator section or converter section) (L2, L3, C6, C10)
74110	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f amplifier section (L5, C14)
71493	Connector—Oscillator segment connector
73455	Core—Sliding core for fine tuning control trimmer
74187	Core—Adjustable core for coil L9
73440	Detent—R-F unit detent mechanism and fibre shaft
71487	Form—Coil form for coil L31
73453	Form—Coil form assembly for L9, L13
73412	Link—Link assembly for fine tuning
71462	Loop—Osc. to converter trimmer loop connector
73634	Nut—Speed nut for drive belt shield
73436	Plate—Front plate and bushing
73464	Pulley—Idler pulley
	Resistor—Fixed, composition:
	47 ohms, ±20%, ½ watt (R4)
	150 ohms, ±20%, ½ watt (R5, R9, R12)
	390 ohms, ±10%, ½ watt (R14)
	1000 ohms, ±20%, ½ watt (R7)
	2700 ohms, ±10%, ½ watt (R10)
	10,000 ohms, ±20%, ½ watt (R1, R11)
	100,000 ohms, ±20%, ½ watt (R2, R3, R8, R13)
14343	Retainer—Channel selector shaft retaining ring
30340	Retainer—Retainer ring for fine tuning stud
70881	Screw—#4-40 x ¼" binder head screw for adjusting coils L14, L15, L16, L17, L18, L19
73640	Screw—#4-40 x ⅝" adjusting screw for L66
71475	Screw—#4-40 x 15/32" adjusting screw for coils L21, L22, L23, L24
74575	Screw—#4-40 x 17/32" adjusting screw for L6
73437	Shaft—Channel selector shaft complete with pawl and stud
73438	Shaft—Fine tuning control shaft and pulley
73439	Shaft—Actuating shaft for fine tuning control
75443	Shield—"U" shape shield for bottom of r-f unit
72951	Shield—Metal tube shield for V3
73454	Shield—Metal shield for drive belt
73632	Shield—Metal tube shield for V1
71494	Socket—Tube socket, moulded, 7 prong, saddle mounted
73450	Socket—Tube socket, ceramic, 7 prong, bottom mounted
74576	Spacer—Insulating spacer for front plate (4 reqd.)
73457	Spring—Return spring for fine tuning control core

STOCK No.	DESCRIPTION
74188	Spring—Retaining spring for adjustable core RCA 74187
74578	Spring—Retaining spring for adjusting screws 73640 and RCA 74575
*75068	Spring—Retaining spring for r-f oscillator tube shield
73468	Stator—Front oscillator section stator complete with rotor, segment, coils and adjusting screws (S1, L14, L15, L16, L17, L18, L19, L21, L22, L23, L24)
73469	Stator—Rear oscillator section stator complete with rotor, segment and coils (S2, L25, L26, L27, L28, L29, L30, L32, L33, L34, L35)
73633	Stator—Antenna stator complete with rotor and coils (S5, L6, L56, L57, L58, L59, L60, L61, L62, L63, L64, L65, L66, C21)
73470	Stator—Converter stator complete with rotor and coils (S3, L9, L36, L37, L38, L39, L40, L41, L48, L49, L50, L51)
73471	Stator—R-F amplifier stator complete with rotor and coils (S4, L13, L42, L43, L44, L45, L46, L47, L52, L53, L54, L55, C15, C16, R10)
75446	Stud—Capacitor stud—brass #4-40 x 13/16" with [illegible] screw driver slot for trimmer coils 74109 and 74110 uncoded or coded "ER"
75447	Stud—Capacitor stud—brass #4-40 x 13/16" with [illegible] screw driver slot for trimmer coils 74109 and 74110 coded numerically or "Hi Q"
73448	Transformer—Converter transformer (T1, R6)
73466	Washer—Insulating washer for front shield (1 set)
2917	Washer—"C" washer for channel selector shaft or fine tuning shaft and cam
	TELEVISION CHASSIS ASSEMBLIES KCS 41A
74593	Capacitor—Mica trimmer comprising 1 section of 3-35 mmf. and 1 section of 40-370 mmf. (C153A, C153B)
39604	Capacitor—Mica, 10 mmf. (C126)
74105	Capacitor—Mica, 33 mmf. (C111)
74726	Capacitor—Mica, 39 mmf. (C140)
64062	Capacitor—Ceramic, 82 mmf. (C120)
39396	Capacitor—Ceramic, 100 mmf. (C175)
39628	Capacitor—Mica, 100 mmf. (C138)
73921	Capacitor—Ceramic, 120 mmf. (C129)
39630	Capacitor—Mica, 120 mmf. (C181)
73102	Capacitor—Mica, 180 mmf. (C158)
73922	Capacitor—Ceramic, 270 mmf. (C183, C194, C198)
73091	Capacitor—Mica, 270 mmf. (C106, C115, C121)
39640	Capacitor—Mica, 330 mmf. (C187)
39642	Capacitor—Mica, 390 mmf. (C141, C200)
74153	Capacitor—Hi-voltage, 500 mmf., 15 kv (C168)
74250	Capacitor—Mica, 560 mmf. (C160)
71501	Capacitor—Ceramic, 1500 mmf. (C101, C103, C104, C105, C108, C109, C110, C113, C114, C117, C118, C122, C125, C127, C132, C171, C172, C176, C177, C188, C192, C193, C196)
71432	Capacitor—Electrolytic comprising 2 sections of 40 mfd. 450 volts and 1 section of 10 mfd. 450 volts (C148A, C148B, C148C)
73582	Capacitor—Electrolytic comprising 1 section of 40 mfd. 450 volts, 1 section of 10 mfd. 450 volts and 1 section of 80 mfd. 200 volts (C170A, C170B, C170C)
73583	Capacitor—Electrolytic comprising 1 section of 40 mfd. 450 volts, 1 section of 90 mfd. 150 volts, and 1 section of 50 mfd. 150 volts (C147A, C147B, C147C)
73581	Capacitor—Electrolytic comprising 1 section of 60 mfd. 450 volts, 2 sections of 10 mfd. 450 volts, and 1 section of 20 mfd. 150 volts (C146A, C146B, C146C, C146D)
73801	Capacitor—Tubular, paper, oil impregnated, .001 mfd. 600 volts (C137,C203)
73802	Capacitor—Tubular, paper, oil impregnated, .0015 mfd. 1000 volts (C186)
73595	Capacitor—Tubular, paper, oil impregnated, .0022 mfd. 600 volts (C142, C154, C161)

STOCK No.	DESCRIPTION
73795	Capacitor—Tubular, paper, oil impregnated, .0033 mfd. 600 volts (C184)
73920	Capacitor—Tubular, paper, oil impregnated, .0047 mfd. 600 volts (C143, C144, C145, C202)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd. 400 volts (C135, C166, C167, C182, C195)
73565	Capacitor—Tubular, moulded paper, .01 mfd. 1000 volts (C151, C152, C185)
73594	Capacitor—Tubular, moulded paper, oil impregnated, .01 mfd. 600 volts (C159)
73797	Capacitor—Tubular, paper, oil impregnated, .015 mfd. 600 volts (C204)
74727	Capacitor—Tubular, moulded paper, oil impregnated, .018 mfd. 1000 volts (C164)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd. 400 volts (C155)
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd. 400 volts (C130, C139, C201)
73592	Capacitor—Tubular, moulded paper, oil impregnated, .047 mfd. 600 volts (C150, C156)
73597	Capacitor—Tubular, paper, oil impregnated, .047 mfd. 1000 volts (C163)
73815	Capacitor—Tubular, moulded paper, oil impregnated, .068 mfd. 1000 volts (C165)
73551	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd. 400 volts (C149)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd. 600 volts (C131)
73794	Capacitor—Tubular, paper, oil impregnated, 0.22 mfd. 400 volts (C136, C157, C162)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd. 200 volts (C133, C190, C197)
73154	Choke—Filter choke (L104)
74585	Coil—Focus coil (L118)
71449	Coil—Horizontal linearity control coil (L111)
71429	Coil—Width control coil (L115, L120)
74877	Coil—Vertical peaking coil (L119)
74878	Coil—Series width coil (L121)
74170	Coil—Peaking coil (36 muh) (L117, R110)
71527	Coil—Peaking coil (93 muh) (L102)
74214	Coil—Peaking coil (180 muh) (L103, L105)
71526	Coil—Peaking coil (250 muh) (L106, L107, L114)
73477	Coil—Filament choke coil (L101)
74879	Connector—2 contact (polarized) female connector for electronic magnifier cable (J104)
72108	Connector—7 contact female connector (J103)
74594	Connector—2 contact male connector for power cord
72172	Connector—3 contact female connector (J108)
5040	Connector—4 contact female connector for speaker cable (P101)
71789	Connector—Anode connector
71521	Connector—Hi-voltage capacitor connector
14786	Connector—5 contact male connector (P107)
72734	Control—Horizontal and vertical hold control (R158, R173)
74047	Control—Brightness and picture control (R122, R131)
74359	Control—Tone control, volume control and power switch (R205, R233, S101)
71441	Control—Vertical linearity control (R162)
71440	Control—Height control (R155)
74597	Control—Focus control (R191)
74475	Control—AGC threshold control (R138)
71457	Cord—Power cord and plug
71437	Cover—Insulating cover for electrolytics #71432 and 73581
74811	Cushion—Rubber cushion for kinescope mounting
73590	Cushion—Rubber cushion for deflection yoke hood (2 required)
73600	Fuse—0.25 amp., 250 volts (F101)
71799	Grommet—Rubber grommet for yoke horizontal lead exit
37396	Grommet—Rubber grommet for mounting ceramic tube socket (2 required)
74030	Grommet—Rubber grommet for mounting radio chassis (3 required)

STOCK No.	DESCRIPTION
72283	Grommet—Rubber grommet for mounting relay (2 required)
74148	Magnet—Ion trap magnet (P.M. type)
73587	Nut—Speed nut to mount hi-voltage capacitor
18469	Plate—Bakelite mounting plate for electrolytics
33514	Receptacle—2 contact female receptacle for audio cable and switching cable (J105, J106)
74873	Relay—Electronic magnifier relay (K101)
72633	Resistor—Wire wound, 4.7 ohms, ½ watt (R187)
72067	Resistor—Wire wound, 5.1 ohms, ½ watt (R202)
18471	Resistor—Wire wound, 10 ohms, ½ watt (R190)
74049	Resistor—Wire wound, 500 ohms, 20 watts (R230)
73588	Resistor—Voltage divider, comprising 1 section of 850 ohms, 12 watts and 2 sections of 650 ohms, 6 watts (R193A, R193B, R193C)
	Resistor—Fixed, composition:
	10 ohms, ±20%, ½ watt (R120)
	18 ohms, ±10%, ½ watt (R225)
	39 ohms, ±10%, ½ watt (R121)
	47 ohms, ±5%, ½ watt (R111)
	47 ohms, ±20%, ½ watt (R183)
	68 ohms, ±10%, ½ watt (R105)
	68 ohms, ±20%, ½ watt (R123)
	82 ohms, ±10%, ½ watt (R195)
	100 ohms, ±10%, 2 watts (R184)
	150 ohms, ±5%, ½ watt (R102)
	150 ohms, ±10%, ½ watt (R115)
	150 ohms, ±20%, ½ watt (R106, R109, R114, R214)
	220 ohms, ±10%, 1 watt (R223)
	270 ohms, ±10%, 1 watt (R206)
	1000 ohms, ±20%, ½ watt (R103, R107, R108, R113, R116, R118, R165, R199)
	1200 ohms, ±10%, ½ watt (R196)
	1800 ohms, ±10%, 2 watts (R194, R208)
	2200 ohms, ±10%, ½ watt (R219)
	2200 ohms, ±10%, 1 watt (R161, R192)
	2700 ohms, ±10%, ½ watt (R217)
	3900 ohms, ±5%, ½ watt (R112)
	4700 ohms, ±5%, ½ watt (R126)
	4700 ohms, ±10%, ½ watt (R144)
	5600 ohms, ±5%, ½ watt (R119)
	5600 ohms, ±10%, ½ watt (R141, R218)
	5600 ohms, ±10%, 1 watt (R127)
	6800 ohms, ±5%, ½ watt (R136)
	6800 ohms, ±10%, ½ watt (R150)
	6800 ohms, ±5%, 1 watt (R128)
	6800 ohms, ±10%, 2 watts (R177, R210)
	8200 ohms, ±5%, ½ watt (R164, R175)
	8200 ohms, ±10%, ½ watt (R152, R153, R171)
	8200 ohms, ±5%, 1 watt (R117)
	8200 ohms, ±10%, 2 watts (R186)
	10,000 ohms, ±5%, ½ watt (R104)
	10,000 ohms, ±10%, ½ watt (R188)
	12,000 ohms, ±10%, ½ watt (R134, R209, R226)
	12,000 ohms, ±10%, 2 watts (R124)
	15,000 ohms, ±10%, ½ watt (R211)
	15,000 ohms, ±10%, 1 watt (R146)
	18,000 ohms, ±10%, 1 watt (R182)
	22,000 ohms, ±10%, ½ watt (R151, R156, R197, R220)
	22,000 ohms, ±20%, ½ watt (R198, R215)
	27,000 ohms, ±10%, ½ watt (R143, R234)
	39,000 ohms, ±5%, ½ watt (R135)
	47,000 ohms, ±10%, ½ watt (R145)
	47,000 ohms, ±20%, ½ watt (R221)
	68,000 ohms, ±10%, ½ watt (R172)
	82,000 ohms, ±10%, 1 watt (R179)
	100,000 ohms, ±5%, ½ watt (R203, R204)
	100,000 ohms, ±10%, ½ watt (R160, R216)
	100,000 ohms, ±20%, 1 watt (R222)
	120,000 ohms, ±5%, 1 watt (R176)
	120,000 ohms, ±10%, 1 watt (R174)
	150,000 ohms, ±10%, ½ watt (R168)
	150,000 ohms, ±20%, ½ watt (R142)
	180,000 ohms, ±10%, ½ watt (R232)
	180,000 ohms, ±5%, 1 watt (R178)
	220,000 ohms, ±10%, ½ watt (R129, R154, R181)

REPLACEMENT PARTS (Continued)

STOCK No.	DESCRIPTION
	270,000 ohms, ±10%, ½ watt (R185)
	330,000 ohms, ±10%, ½ watt (R140, R200)
	470,000 ohms, ±10%, ½ watt (R137, R139, R224, R180)
	470,000 ohms, ±20%, ½ watt (R207)
	560,000 ohms, ±10%, ½ watt (R212)
	680,000 ohms, ±10%, ½ watt (R133)
	820,000 ohms, ±5%, ½ watt (R169)
	1 megohm, ±10%, ½ watt (R147)
	1 megohm, ±20%, 1 watt (R189, R227)
	1.2 megohm, ±5%, ½ watt (R123)
	1.5 megohm, ±5%, ½ watt (R157)
	2.2 megohm, ±10%, ½ watt (R130, R132, R159, R163)
	2.7 megohm, ±5%, 1 watt (R170)
	3.9 megohm, ±10%, ½ watt (R149)
	6.8 megohm, ±10%, ½ watt (R125)
	10 megohm, ±10%, ½ watt (R148)
	10 megohm, ±20%, ½ watt (R201)
74416	Screw—#10-32 x 1¾" cross recessed round head screw for kinescope retaining strap
71456	Screw—#8-32 wing screw for deflection yoke
74601	Screw—#8-32 x ⅜" cross recessed binder head screw for focus coil mounting (2 required)
74602	Screw—#10-32 x 1¼" cross recessed binder head screw for focus coil adjustment (3 required)
73584	Shield—Tube shield
74937	Sleeve—Rubber sleeve for focus coil
73117	Socket—Tube socket, 7 pin, miniature
72927	Socket—Tube socket, 9 pin, miniature
31251	Socket—Tube socket, octal, wafer
73249	Socket—Tube socket, octal, ceramic, plate mounted
71508	Socket—Tube socket for 8016
74834	Socket—Kinescope socket
31364	Socket—Pilot lamp socket
73586	Spring—Compression spring used under centering control screws (3 required)
74595	Spring—Anode lead spring
74936	Spring—Suspension spring for kinescope tube socket leads
74893	Strap—Kinescope retaining strap
74596	Support—Bakelite supports (1 set) for mounting hi-voltage rectifier tube mounting plate
74872	Switch—Width selector switch (S104)
74157	Switch—Interlock switch (S105)
74892	Transformer—Power transformer 115 volt (T111)
74875	Transformer—Vertical cutout transformer (T108)
73569	Transformer—Vertical oscillator transformer (T107)
74588	Transformer—Horizontal output and hi-voltage transformer (T110)
74589	Transformer—First pix. i-f transformer (T101, C102, R101)
74590	Transformer—Second pix. i-f transformer (T102, C107)
74591	Transformer—Third pix. i-f transformer (T103, C112)
74592	Transformer—Fourth pix. i-f transformer (T104, C116)
73575	Transformer—Fifth pix. i-f transformer (T106, C123, C124)
71424	Transformer—Sound i-f transformer (T112, C173, C174)
71427	Transformer—Sound discriminator transformer (T113, C178, C179, C180)
73576	Transformer—Horizontal oscillator transformer (T109)
73578	Transformer—Antenna transformer complete with socket and bracket (T115, J102)
73577	Trap—4.5 mc trap (L110, C128)
71778	Trap—Sound trap (T105, C119)
73476	Trap—I-F trap (L116, C189)
74262	Yoke—Deflection yoke (L108, L109, L112, L113, C169, R166, R167)

STOCK No.	DESCRIPTION
	RADIO CHASSIS ASSEMBLIES
	RK 135D
74039	Board—"Telv-Ant" terminal board (TB301)
74026	Bracket—Drive cord bracket complete with two pulleys—R.H.
74027	Bracket—Drive cord bracket complete with pulley—L.H.
74911	Cable—Shielded cable complete with female connector (W307, W311)
71105	Cable—Shielded cable complete with pin plug (W301, W302)
74017	Capacitor—Variable tuning capacitor (C301, C302, C303, C304, C305, C307, C308)
73866	Capacitor—Ceramic, 2 mmf. (C306)
39044	Capacitor—Ceramic, 15 mmf. (C312)
39042	Capacitor—Ceramic, 47 mmf. (C330)
73867	Capacitor—Ceramic, 56 mmf. (C313)
33379	Capacitor—Ceramic, 68 mmf. (C310)
39396	Capacitor—Ceramic, 100 mmf. (C322, C323)
48125	Capacitor—Ceramic, 150 mmf. (C314)
71922	Capacitor—Ceramic, 180 mmf. (C334, C338)
39640	Capacitor—Mica, 330 mmf. (C325, C326)
73748	Capacitor—Ceramic, 1500 mmf. (C309)
74009	Capacitor—Ceramic, dual, 4000 mmf. (C317, C319, C321)
73473	Capacitor—Ceramic, 5000 mmf. (C318, C329)
73747	Capacitor—Electrolytic, 2 mfd. 50 volts (C328)
32223	Capacitor—Electrolytic, 15 mfd. 300 volts (C333)
70602	Capacitor—Tubular, paper, .0025 mfd. 400 volts (C332)
73961	Capacitor—Tubular, paper, .003 mfd. 200 volts (C327, C331)
71553	Capacitor—Tubular, paper, .005 mfd. 400 volts (C315, C320, C324)
71923	Capacitor—Tubular, paper, .01 mfd. 200 volts (C335)
71925	Capacitor—Tubular, paper, .01 mfd. 400 volts (C311)
71928	Capacitor—Tubular, paper, .02 mfd. 200 volts (C337)
72596	Capacitor—Tubular, paper, .05 mfd. 200 volts (C336)
74455	Capacitor—Tubular, paper, .05 mfd. 400 volts (C316)
74020	Coil—Antenna coil—A.M. (L302, L303)
73744	Coil—Oscillator coil—A.M. (L304, L305, L306)
74024	Coil—Antenna coil—F.M. (L301)
74025	Coil—Oscillator coil—F.M. (L307)
36395	Connector—7 contact male connector (P103)
12493	Connector—5 contact female connector (P107B)
39153	Connector—4 prong male connector (P102)
72953	Cord—Drive cord (approximately 42" overall)
74011	Filter—Diode filter, dual 200 mmf. and 47,000 ohms (DF301)
74023	Resistor—Wire wound, 0.51 ohms, 1 watt (R323, R324)
	Resistor—Fixed, composition:
	10 ohms, ±20%, ½ watt (R311)
	68 ohms, ±20%, ½ watt (R308)
	100 ohms, ±20%, ½ watt (R305, R317)
	120 ohms, ±10%, ½ watt (R314)
	680 ohms, ±20%, ½ watt (R310, R312)
	1200 ohms, ±5%, ½ watt (R319)
	3300 ohms, ±5%, ½ watt (R320)
	4700 ohms, ±10%, ½ watt (R333)
	10,000 ohms, ±20%, ½ watt (R306)
	15,000 ohms, ±10%, ½ watt (R304)
	15,000 ohms, ±20%, ½ watt (R315, R318)
	18,000 ohms, ±10%, ½ watt (R302)
	27,000 ohms, ±10%, ½ watt (R307, R309)
	39,000 ohms, ±10%, ½ watt (R322)
	68,000 ohms, ±10%, ½ watt (R328)
	100,000 ohms, ±10%, ½ watt (R334)
	150,000 ohms, ±10%, ½ watt (R325, R326, R329)
	270,000 ohms, ±10%, ½ watt (R330)
	470,000 ohms, ±10%, ½ watt (R331)

STOCK No.	DESCRIPTION
	470,000 ohms, ±20%, ½ watt (R321)
	1 megohm, ±10%, ½ watt (R327, R332)
	2.2 megohm, ±20%, ½ watt (R303)
	3.9 megohm, ±10%, ½ watt (R301)
	22 megohm, ±20%, ½ watt (R316)
74028	Shaft—Tuning knob shaft
73632	Shield—Tube shield
73117	Socket—Tube socket, 7 pin, miniature for V301, V304, V305
74179	Socket—Tube socket, 7 pin, miniature for V302, V303
31364	Socket—Dial lamp socket
74038	Spring—Drive cord spring
74894	Switch—Selector switch (S301)
73745	Transformer—First i-f transformer dual (T301)
74019	Transformer—Second i-f transformer dual (T302)
73743	Transformer—Ratio detector transformer (T303)
33726	Washer—"C" washer for tuning shaft (rear)
34457	Washer—Spring washer for tuning shaft (front)
74172	Washer—Fibre washer to prevent drive cord slippage
	SPEAKER ASSEMBLIES
	92569-8W
	RL-111-10
	RMA-#274
13867	Cap—Dust cap
74901	Cone—Cone complete with voice coil (3.2 ohms)
5039	Connector—4 prong male connector (J101)
74900	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms) less transformer and plug
74902	Transformer—Audio output transformer (T114)
	NOTE: If stamping in instruments does not agree with above speaker number, order replacement parts by referring to model number of instruments, number stamped on speaker and full description of part required.
	MISCELLANEOUS
74895	Back—Cabinet back
74054	Bracket—Dial lamp bracket
71599	Bracket—Pilot lamp bracket
75041	Button—Plug button for shipping bolts holes in 33/78 RPM changer (2 required)
72437	Cable—Shielded pickup cable complete with pin plug for 45 RPM changer
74296	Cable—Shielded pickup cable complete with pin plug for 33/78 RPM changer
13103	Cap—Pilot lamp cap
73803	Capacitor—Tubular, paper, .002 mfd. 400 volts
74883	Case—Plastic case and bottom cover for electronic magnifier switch
71892	Catch—Bullet catch and strike for doors (3 required)
X3067	Cloth—Grille cloth for mahogany or walnut instruments
X3090	Cloth—Grille cloth for oak instruments
74882	Connector—3 contact male connector for electronic magnifier cable
14782	Connector—3 contact male connector for record changer power cable
30868	Connector—2 contact female connector for record changer power cable
74581	Cover—Mounting screw cover for 45 RPM changer (3 required)
74891	Cushion—Vinylite cushion (edging) for masking panel
74898	Decal—Control panel function decal for mahogany or walnut instruments
74899	Decal—Control panel function decal for oak instruments
71984	Decal—Trade mark decal (RCA Victor)

STOCK No.	DESCRIPTION
74273	Decal—Trade mark decal (Victrola)
74052	Dial—Dial scale and bezel
74809	Emblem—"RCA Victor" emblem
73642	Escutcheon—Channel marker escutcheon for mahogany or walnut instruments
73740	Escutcheon—Channel marker escutcheon for oak instruments
74755	Glass—Safety glass
37396	Grommet—Rubber grommet for mounting speaker
74206	Grommet—Rubber grommet for mounting 33/78 RPM changer (4 required)
74308	Hinge—Television compartment door hinge (1 set)
74896	Hinge—Record storage compartment door hinge (1 set)
70166	Hinge—Speaker compartment door hinge—upper
73200	Hinge—Speaker compartment door hinge—lower
74051	Indicator—Station selector indicator
74959	Knob—Fine tuning knob—dark—for mahogany or walnut instruments (outer)
73995	Knob—Fine tuning knob—tan—for oak instruments (outer)
74960	Knob—Channel selector knob—dark—for mahogany or walnut instruments (inner)
74961	Knob—Channel selector knob—tan—for oak instruments (inner)
74962	Knob—Vertical hold control, brightness control or tone control knob—dark—for mahogany or walnut instruments (outer)
73999	Knob—Vertical hold control, brightness control or tone control knob—tan—for oak instruments (outer)
74978	Knob—Radio tuning or selector switch knob—dark—for mahogany or walnut instruments
74979	Knob—Radio tuning or selector switch knob—tan—for oak instruments
74963	Knob—Horizontal hold control, picture control or volume control and power switch knob—dark—for mahogany or walnut instruments (inner)
74001	Knob—Horizontal hold control, picture control or volume control and power switch knob—tan—for oak instruments (inner)
11765	Lamp—Dial or pilot lamp, Mazda 51
74208	Nut—Tee nut to mount 45 RPM changer (3 required)
74162	Plate—Mounting plate for interlock switch
74897	Pull—Door pull (4 required)
	Resistor—Fixed, composition:
	47,000 ohms, ±10%, ½ watt
74582	Screw—#8-32 x 1¾", special head screw to mount 45 RPM changer (3 required)
74269	Screw—#8-32 x ¾" trimit head screw for door pull (2 required for each pull)
74050	Slide—Station indicator slide
74835	Slide—Slide mechanism for 45 RMP drawer
74736	Slide—Slide mechanism for 33/78 RPM drawer
73643	Spring—Spring clip for channel marker escutcheon
72845	Spring—Retaining spring for knobs #73995 and 74959
14270	Spring—Retaining spring for knobs #73999, 74960, 74961, 74962, 74978 and 74979
30330	Spring—Retaining spring for knobs #74001 and 74963
74055	Spring—Spring clip for dial and bezel assembly (2 required)
74421	Spring—Conical spring to mount 45 RPM changer—upper—R.H. (1 required)
74422	Spring—Conical spring to mount 45 RPM changer—upper—L.H. (2 required)
74423	Spring—Conical spring to mount 45 RPM changer—lower (3 required)
75040	Spring—Mounting spring for 33/78 RPM changer (4 required)
74161	Stud—Locating stud for back cover
74881	Switch—Electronic magnifier switch

To obtain resistors for which no stock number is given, order by stating type, value of resistance, tolerance and wattage.

INDEX

Model TA169
Walnut, Mahogany or Oak

GENERAL DESCRIPTION

Model TA169 is a "16 inch" television, AM-FM radio phonograph combination. The receiver employs thirty tubes plus three rectifiers and a 16GP4 kinescope. Two record changers are provided to play 33⅓, 45 and 78 RPM records.

Features of the television unit are full twelve channel coverage; FM sound system: improved picture brilliance; picture A-G-C; A-F-C horizontal hold; stabilized vertical hold; two stages of video amplification; noise saturation circuits; improved sync separator and clipper; four mc. band width for picture channel and reduced hazard high voltage supply.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE .... 146 square inches on a 16GP4 kinescope

TELEVISION R-F FREQUENCY RANGE

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
Fine Tuning Range .. ±250 kc. on chan. 2, ±650 kc. on chan. 13
Picture Carrier Frequency .... 25.75 mc.
Sound Carrier Frequency .... 21.25 mc.

RADIO TUNING RANGE

Broadcast .... 540-1,600 kc.
Frequency Modulation .... 88-108 mc.
Intermediate Frequency—AM .... 455 kc.
Intermediate Frequency—FM .... 10.7 mc.

POWER SUPPLY RATING ...... 115 volts, 60 cycles, 270 watts

AUDIO POWER OUTPUT RATING .... 10 watts max.

CHASSIS DESIGNATIONS

Television Chassis KCS43
Radio Chassis RK135D
33⅓/78 RPM Record Changer 960285
45 RPM Record Changer RP168C
Refer to Service Data 960285 or RP168 for information on the record changers.

LOUDSPEAKER 92569-5 .... 12 inch PM Dynamic
Voice Coil Impedance .... 3.2 ohms at 400 cycles

WEIGHT

Chassis with Tubes in Cabinet .... 190 lbs.
Shipping Weight .... 230 lbs.

DIMENSIONS (inches)	Width	Height	Depth
Cabinet (outside)	37¾	39	23½
Chassis (overall)	19¼	11	18½

RECEIVER ANTENNA INPUT IMPEDANCE. 300 ohms balanced

If necessary, the television chassis may be fed separately from either a 300 ohm balanced line or a 72 ohm co-ax.

RCA TUBE COMPLEMENT

Tube Used	(Television Chassis) Function
(1) RCA 6AG5	R-F Amplifier
(2) RCA 6AG5	Converter
(3) RCA 6J6	R-F Oscillator
(4) RCA 6AU6	1st Sound I-F Amplifier
(5) RCA 6AU6	2nd Sound I-F Amplifier
(6) RCA 6AL5	Sound Discriminator
(7) RCA 12AX7	Audio Amplifier and Phase Inverter
(8) RCA 6V6GT	Audio Output (2 tubes)
(9) RCA 6BA6	1st Picture I-F Amplifier
(10) RCA 6AG5	2nd Picture I-F Amplifier
(11) RCA 6BA6	3rd Picture I-F Amplifier
(12) RCA 6AG5	4th Picture I-F Amplifier
(13) RCA 6AL5	Picture 2nd Detector & Sync Limiter
(14) RCA 12AU7	1st and 2nd Video Amplifier
(15) RCA 6SN7GT	AGC Amplifier & Vertical Sweep Osc.
(16) RCA 6SN7GT	AGC Rectifier & 1st Sync Separator
(17) RCA 6SN7GT	Sync Amplifier & 2nd Sync Separator
(18) RCA 6K6GT	Vertical Sweep Output
(19) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(20) RCA 6BG6G	Horizontal Sweep Output
(21) RCA 6W4GT	Damper
(22) RCA 1B3-GT/8016	High Voltage Rectifier
(23) RCA 5U4G	Power Supply Rectifier (2 tubes)
(24) RCA 16GP4	Kinescope

(Radio Tuner Chassis)

(1) RCA 6J6	Mixer and Oscillator
(2) RCA 6BA6	I-F Amplifier
(3) RCA 6AU6	F-M Driver
(4) RCA 6AL5	Ratio Detector
(5) RCA 6BF6	AM Detector AVC and Phone Preamp.

OPERATING CONTROLS (front panel)

Channel Selector, Fine Tuning .... Dual Control Knobs
Tone, Sound Volume and On-Off Switch .... Dual Control Knobs
Picture Horizontal Hold, Picture Vertical Hold .... Dual Control Knobs
Picture, Brightness .... Dual Control Knobs
Function Switch .... Single Control Knob
Radio Tuning .... Single Control Knob

NON-OPERATING CONTROLS

Centering .... cabinet adjustment
Width .... rear chassis adjustment
Height .... rear chassis adjustment
Horizontal Linearity .... rear chassis screwdriver adjustment
Vertical Linearity .... rear chassis adjustment
Horizontal Drive .... rear chassis screwdriver adjustment
Horizontal Oscillator Frequency ..... bottom chassis adjustment
Horizontal Oscillator Waveform .... side chassis adjustment
Focus .... rear chassis adjustment
Ion Trap Magnet .... cabinet adjustment
Deflection Coil .... cabinet adjustment
Focus Coil .... cabinet adjustment

PICTURE I-F FREQUENCIES

Picture Carrier Frequency .... 25.75 mc.
Adjacent Channel Sound Trap .... 27.25 mc.
Accompanying Sound Traps .... 21.25 mc.
Adjacent Channel Picture Carrier Trap .... 19.75 mc.

SOUND I-F FREQUENCIES

Sound Carrier Frequency .... 21.25 mc.
Sound Discriminator Band Width between peaks .... 350 kc.

VIDEO RESPONSE .... To 4 mc.

FOCUS .... Magnetic

SWEEP DEFLECTION .... Magnetic

SCANNING .... Interlaced, 525 line

HORIZONTAL SCANNING FREQUENCY .... 15,750 cps

VERTICAL SCANNING FREQUENCY .... 60 cps

FRAME FREQUENCY (Picture Repetition Rate) .... 30 cps

HIGH VOLTAGE WARNING

OPERATION OF THIS RECEIVER OUTSIDE THE CABINET OR WITH THE COVERS REMOVED, INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WORK ON THE RECEIVER SHOULD NOT BE ATTEMPTED BY ANYONE WHO IS NOT THOROUGHLY FAMILIAR WITH THE PRECAUTIONS NECESSARY WHEN WORKING ON HIGH VOLTAGE EQUIPMENT. DO NOT OPERATE THE RECEIVER WITH THE HIGH VOLTAGE COMPARTMENT SHIELD REMOVED.

KINESCOPE HANDLING PRECAUTIONS

DO NOT OPEN THE KINESCOPE SHIPPING CARTON, INSTALL, REMOVE OR HANDLE THE KINESCOPE IN ANY MANNER UNLESS SHATTERPROOF GOGGLES, AND HEAVY GLOVES ARE WORN. PEOPLE NOT SO EQUIPPED SHOULD BE KEPT AWAY WHILE HANDLING KINESCOPES. KEEP THE KINESCOPE AWAY FROM THE BODY WHILE HANDLING.

The kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For these reasons, kinescopes must be handled with more care than ordinary receiving tubes.

The large end of the kinescope bulb—particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure at any time. In installation, if the tube sticks or fails to slip smoothly into its socket, or deflecting yoke, investigate and remove the cause of the trouble. Do not force the tube. Refer to the Receiver Installation Section for detailed instructions on kinescope installation. All RCA kinescopes are shipped in special cartons and should be left in the cartons until ready for installation in the receiver. Keep the carton for posible future use.

©John F. Rider

World Radio History

OPERATING INSTRUCTIONS

The following adjustments are necessary when turning the receiver on for the first time.

1. Turn the radio FUNCTION switch to Tel.

2. Turn the receiver "ON" and advance the SOUND VOLUME control to approximately mid-position.

3. Set the STATION SELECTOR to the desired channel.

4. Adjust the FINE TUNING control for best sound fidelity and SOUND VOLUME for suitable volume.

5. Turn the BRIGHTNESS control fully counter-clockwise, then clockwise until a light pattern appears on the screen.

6. Adjust the VERTICAL hold control until the pattern stops vertical movement.

7. Adjust the HORIZONTAL hold control until a picture is obtained and centered.

8. Turn the BRIGHTNESS control counter-clockwise until the retrace lines just disappear.

9. Adjust the PICTURE control for suitable picture contrast.

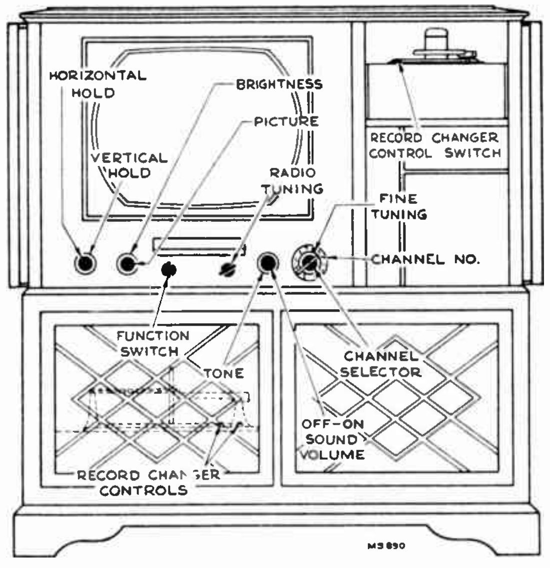

Figure 1—Receiver Operating Controls

10. After the receiver has been on for some time, it may be necessary to readjust the FINE TUNING control slightly for improved sound fidelity.

11. In switching from one station to another, it may be necessary to repeat steps numbers 4 and 9.

12. When the set is turned on again after an idle period, it should not be necessary to repeat the adjustments if the positions of the controls have not been changed. If any adjustment is necessary, step number 4 is generally sufficient.

13. If the positions of the controls have been changed, it may be necessary to repeat steps numbers 1 through 9.

14. For radio operation turn the FUNCTION switch to AM or FM and tune in station with the radio TUNING control.

15. For phono operation, turn the FUNCTION switch to PH for operation of the 33⅓/78 rpm record changer, or to XPH for operation of the 45 rpm record changer.

INSTALLATION INSTRUCTIONS

UNPACKING.—The TA169 receiver is packed complete with kinescope in a cardboard carton. To unpack, turn the shipping carton on its side and tear open the carton bottom flaps. Fold the flaps up along the side of the carton and turn the carton back up. Lift the carton up and off the cabinet.

A flat skid is attached to the bottom of the receiver cabinet which will permit the cabinet to be moved about without stressing the cabinet joints. To remove the skid, take off the nuts from the two bolts that hold the cabinet on the skid. With a man at each end of the cabinet, lift the cabinet off the skid.

The operating control knobs are packed in a bag and tied to a cabinet back rail. Remove the bag and install the knobs on the proper control shafts.

From the rear of the cabinet remove the single wood screw which holds the RP168C record changer drawer in the closed position. Slide the drawer out. From the top of the changer, remove the three filler plugs from over the motorboard mounting screws. Loosen these three screws to permit removal of two wooden shipping strips under the edge of the motorboard. Tighten the screws just enough to keep the motorboard springs from rattling and replace the filler plugs.

Remove the two red brackets which hold the 960285 changer drawer in the closed position. Open the drawer and untie the cord over the turntable. Fold the cardboard away from the spindle. Lift the turntable off the spindle. Remove the rubber band holding the drive wheel. Screw the front and back shipping screws under the turntable down tight. Pull out the cardboard under the motorboard. Push the drive wheel towards the spindle and slip the turntable down into place. The motorboard should then be free floating.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the high voltage lead is connected in place between the rim of the kinescope and the kinescope mask.

WARNING.—The high voltage supply in this receiver delivers 12,000 volts! A.C. interlocks are provided at the back of the set so that when the back is removed so is the power.

ANTENNA AND POWER CONNECTIONS.—Connect the leads from the antenna to the receiver antenna terminals.

Make sure that the receiver power switch is in the off position. Plug the receiver power cord into a 115 volt, 60 cycle a-c outlet.

Turn the power switch to the "on" position, the brightness control three-quarters clockwise, and picture control fully counter-clockwise.

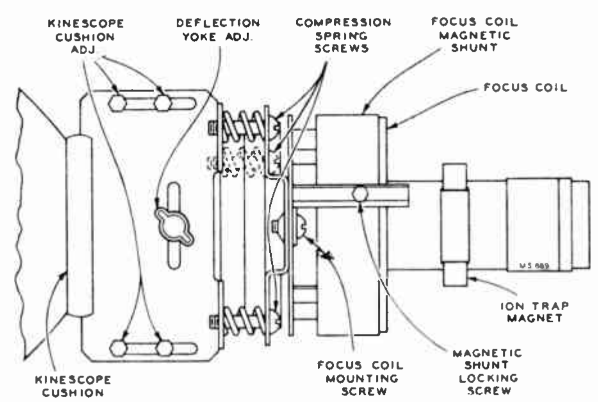

Figure 2—Yoke and Focus Coil Adjustments

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 2. Starting from this position adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the focus control (R191 on the chassis rear apron) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. See steps 3 through 9 of the receiver operating instructions.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC threshold control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R138 on the rear apron (see Figure 3) clockwise until the set operates normally and the picture can be synced.

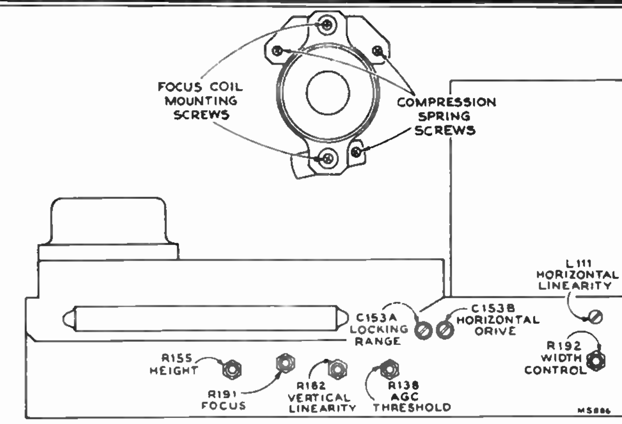

Figure 3—Rear Chassis Adjustments

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Usually the picture will remain in sync. Turn the control clockwise slowly. If the picture did fall out of sync upon removal of the signal, the number of diagonal black bars will be gradually reduced and when only 2 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. The picture should remain in sync for approximately 180 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should be out of sync and should show 1 vertical or diagonal black bar in the raster.

If the receiver passes the foregoing checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Coil Adjustments."

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 180 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments:

Horizontal Frequency Adjustment.—Turn the T109 sine wave core (on the outside of the apron) all the way out of the coil.

Set the locking range trimmer C153A one-half turn out from maximum capacity.

Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and turn the frequency wave core of T109 under the chassis until the picture syncs and the sync bar just begins to move into the picture.

NOTE.—Occasionally, a tube may be found which does not respond to this alignment procedure since it may not be possible to sync the picture by means of the frequency core when the sine wave core is all the way out of the coil. Yet, the tube may work perfectly well when the circuit is properly aligned. In such a case, it may be necessary to turn the sine wave core in slightly, and readjust the frequency core to obtain sync.

Turn the sine wave core of T109 in until the blanking bar begins to move off to the left of the picture. Alternately turn the sine wave core in and the frequency out, keeping the picture in sync and the blanking bar showing in the picture.

Continue alternate adjustments until the picture falls from sync into a parasitic oscillation as indicated by a non-synchronized pattern which flickers in width and centering with possibly a light ragged vertical bar through the center of the screen.

Turn the sine wave core out ½ turn. Adjust the frequency core in until the picture is in sync and horizontal blanking appears as a vertical bar in the picture.

Check of Pull-in Range.—Turn the horizontal hold control fully counter-clockwise. Connect a 270K ohm resistor across C156. Momentarily switch off channel and back; the picture will then be out of sync. Turn the hold control clockwise slowly and observe the minimum number of bars obtained just before the picture pulls into sync.

The picture should snap in from two complete blanking bars. If two bars are not obtained, turn the locking range trimmer C153A in to obtain less bars or out to obtain more bars.

If C153A was adjusted, remove the 270K resistor, turn the horizontal hold control fully clockwise and adjust the T109 frequency core until horizontal blanking appears as a vertical bar in the synced picture. Then repeat the entire check of pull-in range to this point.

Repeat the adjustments under "Check of Pull-in Range" until the conditions specified are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If the oscillator does not hold sync properly at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 11.

FOCUS COIL ADJUSTMENTS.—The focus coil should be adjusted so that there is approximately one-quarter inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus coil. This spacing gives best average focus over the face of the tube. The axis of the hole through the focus coil should be parallel with the axis of the kinescope neck. The focus coil is provided with a magnetic shunt in the form of a metal sleeve. If the receiver focuses with the focus control at or near the end of its range, loosen the shunt locking screw and slide the shunt forward or backward until focus is obtained with the focus control in the middle of its range.

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is obtained by loosening the two focus coil mounting screws and sliding the coil up or down or from side to side. If the focus coil was appreciably changed in position or if a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by sliding the coil. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In extreme cases it may be necessary to adjust one or more of the three focus coil compression spring screws to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive counter-clockwise as far as possible without losing tension on trimmer.

Set the width control to minimum picture width.

Turn the horizontal linearity coil out until appreciable loss in width occurs, then in until nearly maximum width and the best linearity is obtained. Do not run the core in beyond the point of maximum linearity change, as the current drawn by the 6BG6G then becomes excessive.

Adjust the width control for the proper picture width.

Readjust linearity, but again not beyond the point of maximum linearity change. If necessary adjust the drive control for best linearity.

If at very high line voltage, the picture width is excessive even with the width control set at minimum, turn the linearity coil out to obtain the proper width. On high line voltage, excessive width generally will be accompanied by good linearity, without retouching the drive.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

FOCUS.—Adjust the focus control (R191 on chassis rear apron) for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R155 on chassis rear apron) until the picture fills the mask vertically. Adjust vertical linearity (R162 on rear apron) until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust the focus coil to align the picture with the mask.

Check to see that the cushion and yoke thumbscrews and the focus coil mounting screws are tight.

AGC THRESHOLD CONTROL.—The AGC threshold control R138 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC threshold control, tune

©John F. Rider
World Radio History

INSTALLATION INSTRUCTIONS

in a strong signal, sync the picture and turn the picture control to the maximum clockwise position. Turn the brightness control counter-clockwise until the vertical retrace lines are just invisible. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R138. If the picture requires an appreciable portion of a second to reappear, R138 should be readjusted.

Set the picture control at the maximum clockwise position. Turn R138 fully clockwise. The top one-half inch of the picture may be bent slightly. This should be disregarded. Turn R138 counter-clockwise until there is a very, very slight bend or change of bend in the top one-half inch of the picture. Then turn R138 clockwise just sufficiently to remove this bend or change of bend.

If the signal is very weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R138 counter-clockwise until the snow in the picture becomes more pronounced, then clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far counter-clockwise on a weak signal, then the receiver may overload when a strong signal is received.

CHECK OF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 10. The adjustments for channels 2 through 5 and 7 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis and channel 6 adjustment is in the kinescope well. See Figures 9 and 10 for their location.

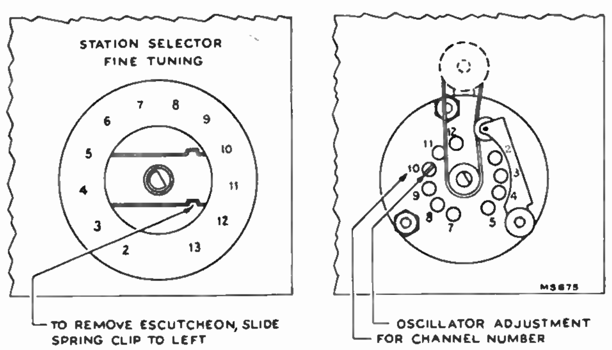

Figure 4—R-F Oscillator Adjustments

RADIO OPERATION.—Turn the receiver function switch to AM and FM positions and check the radio for proper operation. Tune in a station of known frequency. If the dial pointer does not point to the correct spot on the dial, slip the dial pointer on the dial cord until the proper indication is obtained.

RECORD CHANGER OPERATION.—Turn the receiver function switch to each phono position and check each record player for proper operation.

Replace the cabinet back and make sure that the screws are tight in order to prevent rattling at high volume.

WEAK SIGNAL AREA OPERATION.—Since the vast majority of receivers are sold in strong signal areas, the chassis are aligned to produce the cleanest pictures in those areas. However, if the receiver is to be operated in a weak signal area, better performance can be obtained by "peaking" the r-f unit.

To peak the r-f unit in these receivers, disconnect the 390 ohm resistor R14 which is on top of the r-f unit chassis. Adjust L66 to obtain the best possible picture on the weakest low channel station received.

If the peaked receiver is subsequently taken to a strong signal area, the resistor R14 should be connected in place and L66 adjusted for "flat" response on the low channels.

CHASSIS REMOVAL.—To remove the chassis from the cabinet for repair or installation of a new kinescope, remove the control knobs, the cabinet back, unplug the speaker cable, the kinescope socket, the antenna cable, the pilot light cable, the yoke and focus coil cable. Remove the yoke frame grounding strap and the interlock switch. Take out the six chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet.

KINESCOPE HANDLING PRECAUTION.—Do not install, remove, or handle the kinescope in any manner, unless shatter-proof goggles and heavy gloves are worn. People not so equipped should be kept away while handling the kinescope. Keep the kinescope away from the body while handling.

To remove the kinescope from the cabinet, take out the four screws and one wing screw which hold the yoke frame to the cabinet. Remove the kinescope, the yoke frame with yoke and focus coil as an assembly.

INSTALLATION OF KINESCOPE.—Handle this tube by the metal rim at the edge of the screen. Do not cover the glass bell of the tube with fingermarks as it will produce leakage paths which may interfere with reception. If this portion of the tube has inadvertently been handled, wipe it clean with a soft cloth moistened with "dry" carbon tetrachloride.

Wipe the kinescope screen surface and front panel safety glass clean of all dust and fingermarks with a soft cloth moistened with "Windex" or similar cleaning agent.

Turn the tube so that the key on the base of the tube will be down and insert the neck of the kinescope through the deflection and focus coils. If the tube sticks, or fails to slip into place smoothly, investigate and remove the cause of the trouble. Do not force the tube.

Replace the kinescope and yoke frame assembly in the cabinet. Insert the four screws and wing screw and tighten.

Slip the kinescope as far forward as possible. Slide the kinescope cushion firmly up against the flare of the tube and tighten the adjustment locking screws. Slide the deflection yoke as far forward as possible and tighten. If this is not done, difficulty will be encountered in adjusting the ion trap magnet and focus coil because of shadows on the corner of the raster.

Slide the chassis into the cabinet, then insert and tighten the six chassis bolts.

Slip the ion trap magnet over the neck of the kinescope.

Connect the kinescope socket to the tube base and slip the high voltage lead clip between the rim of the kinescope and the mask.

Reconnect all other cables. Do not forget to replace the yoke frame grounding strap.

As may be seen by inspection, the radio dial lights and dial pointer are attached to the cabinet front panel. The dial cord is attached to the receiver chassis. The method of attachment may be seen in Figure 5.

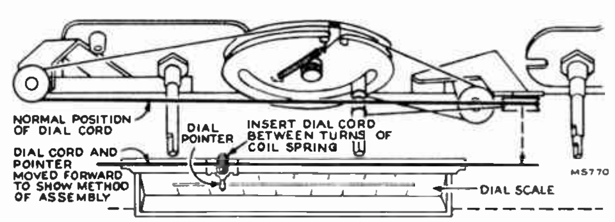

Figure 5—Dial Cord and Pointer Assembly

Reach over the television chassis to the radio and slip the radio pilot lights on the cabinet pilot light brackets.

To hook up the dial pointer, turn the tuning shaft until the gang is fully meshed. Slip the dial pointer to the low frequency end of the dial and press the dial cord well into the coil spring.

Turn the set on and to radio position to see that the dial lighting is correct. If it is not, adjust the dial lights and shields. Tune in a station of known calibration and check the dial calibration.

Perform the entire television set-up procedure beginning with Ion Trap Magnet Adjustment.

CABINET ANTENNA.—A cabinet antenna is provided for use in strong signal areas in which no reflections are experienced. The leads from the antenna are brought out near the receiver antenna terminal board. To connect the cabinet antenna, attach the leads to the terminal board. If reception is satisfactory, no other antenna is necessary. However, if reception is unsatisfactory, it will be necessary to employ an outdoor antenna or an indoor antenna which can be oriented.

ALIGNMENT PROCEDURE

TEST EQUIPMENT. — To properly service the television chassis of this receiver, it is recommended that the following test equipment be available:

R-F Sweep Generator meeting the following requirements:

(a) Frequency Ranges

20 to 30 mc., 1 mc. and 10 mc. sweep width
50 to 90 mc., 10 mc. sweep width
170 to 225 mc., 10 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

Cathode-Ray Oscilloscope. — For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response, and should be capable of passing a 60-cycle square wave without appreciable distortion. While this requirement is not met by many commercial instruments, RCA Oscilloscopes, types WO-55A, WO-58A, WO-79A, and WO-60C fill the requirement and any of these may be employed.

For video and sync waveform observations, the oscilloscope must have excellent frequency and phase response from 10 cycles to at least two megacycles in all positions of the gain control. The RCA types WO-58A and WO-79A are ideally suited for this purpose.

Signal Generator to provide the following frequencies with crystal accuracy.

(a) Intermediate frequencies

19.75 mc. adjacent channel picture trap
21.25 mc. sound i-f and sound traps
22.05 and 24.75 mc. conv. and first pix i-f trans.
25.9 mc. second picture i-f transformer
24.6 mc. fourth picture i-f transformer
22.0 mc. third picture i-f transformer
22.5 mc. fifth picture i-f transformer
25.75 mc. picture carrier
27.25 mc. adjacent channel sound trap

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

Electronic Voltmeter of Junior "VoltOhmyst" type and a high voltage multiplier probe for use with this meter to permit measurements up to 15 kv.

Service Precautions. — If possible, the chassis should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, it would be a great convenience to have a set of yoke, focus coil, kinescope socket, high voltage and speaker extension cables.

CAUTION: Do not short the kinescope second anode lead. Its short circuit current represents a considerable overload on the high voltage rectifier V113.

Adjustments Required. — Normally, only the r-f oscillator line will require the attention of the service technician. All other circuits are either broad or very stable and hence will seldom require readjustment.

The oscillator line is relatively non critical. When oscillator tubes are changed, in all probability it will be necessary to adjust only C6 in order to bring the entire line into adjustment.

ORDER OF ALIGNMENT. — When a complete receiver alignment is necessary, it can be most conveniently performed in the following order:

(1) Sound discriminator
(2) Sound i-f transformers
(3) Picture i-f traps
(4) Picture i-f transformers
(5) R-F and converter lines
(6) R-F oscillator line
(7) 4.5 mc. video trap
(8) Sensitivity check

SOUND DISCRIMINATOR ALIGNMENT. — Set the signal generator for approximately .1 volt output at 21.25 mc. and connect it to the second sound i-f grid.

Detune T113 secondary (bottom).

Set the "VoltOhmyst" on the 10 volt scale.

Connect the meter in series with a one megohm resistor to the junction of diode resistors R203 and R204.

Adjust the primary of T113 (top) for maximum output on the meter.

Connect the "VoltOhmyst" to the junction of C183 and R203. Adjust T113 secondary (bottom). It will be found that it is possible to produce a positive or negative voltage on the meter dependent upon this adjustment. Obviously to pass from a positive to a negative voltage, the voltage must go through zero. T113 (bottom) should be adjusted so that the meter indicates zero output as the voltage swings from positive to negative. This point will be called discriminator zero output.

Connect the sweep oscillator to the grid of the second sound i-f amplifier.

Adjust the sweep band width to approximately 1 mc. with the center frequency at approximately 21.25 mc. and with an output of approximately .1 volt.

Connect the oscilloscope to the junction of C183 and R203. The pattern obtained should be similar to that shown in Figure 13. If it is not, adjust the T113 (top) until the waveform is symmetrical.

The peak-to-peak band width of the discriminator should be approximately 350 kc. and it should be linear from 21.175 mc. to 21.325 mc.

SOUND I-F ALIGNMENT. — Connect the sweep oscillator to the first sound i-f amplifier grid.

Connect the oscilloscope to the second sound i-f grid return (terminal A T112) in series with a 33,000 ohm isolating resistor.

Insert a 21.25 mc. marker signal from the signal generator into the second sound i-f grid.

Adjust T112 (top and bottom) for maximum gain and symmetry about the 21.25 mc. marker. The pattern obtained should be similar to that shown in Figure 14.

The output level from the sweep should be set to produce approximately .3 volt peak-to-peak at the second sound i-f grid return when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

©John F. Rider

World Radio History

ALIGNMENT PROCEDURE

The band width at 70% response from the first sound i-f grid to the second i-f grid should be approximately 200 kc.

PICTURE I-F TRAP ADJUSTMENT. — Connect the "VoltOhmyst" to the junction of R135 and C190.

Remove the 6SN7GT AGC Amplifier tube V107. Connect a 250,000 ohm potentiometer between pins 5 and 6 of the V107 socket. Adjust the potentiometer until the "VoltOhmyst" reads approximately −12 volts.

Set the channel switch to the blank position between channel numbers 2 and 13.

Connect the "VoltOhmyst" across the picture detector load resistor R119. Under this condition, both leads of the meter are at approximately −120 volts. In making this measurement, care should be taken not to touch the case of the meter or to permit the meter case to become grounded.

Connect the output of the signal generator to the grid of the converter tube V2. To do this, remove the tube from the socket and fashion a clip by twisting one end of a small piece of wire around pin number 1. Replace the tube in the socket leaving the end of the wire protruding from under the tube. Connect the signal generator to this wire through a 1,500 mmf capacitor keeping the leads as short as possible.

Set the generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for minimum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is exactly on frequency.

(1) 21.25 mc.—T103 (top)	(4) 27.25 mc.—T104 (top)
(2) 21.25 mc.—T105 (top)	(5) 19.75 mc.—T106 (top)
(3) 27.25 mc.—T102 (top)	(6) 19.75 mc.—T101 (top)

In the above transformers using threaded cores, it is possible to run the cores completely through the coils and secure two peaks or nulls. The correct position is with the cores in the outside ends of the coils. If the cores are not in the correct position, the coupling will be incorrect and it will be impossible to secure the correct response.

PICTURE I-F TRANSFORMER ADJUSTMENTS. — Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary to prevent overloading.

22.5 mc.—T106 (bottom)
24.6 mc.—T104 (bottom)
22.0 mc.—T103 (bottom)
25.9 mc.—T102 (bottom)

T1 and T101 are coupled by a link and in combination constitute an overcoupled transformer. The characteristics of such a transformer are such that it is impossible to adjust it to a single frequency.

To sweep align T1 and T101, connect a 330 ohm composition resistor across the primary coils of T102, T103, T104 and T106.

Connect the "VoltOhmyst" to the junction of R135 and C190. Adjust the 250,000 ohm potentiometer for −2.0 volts on the meter.

Connect the oscilloscope to the plate of the first video amplifier, pin 1 of V106.

Connect a sweep generator to the converter grid through a 1,500 mmf capacitor. Set the generator to sweep from 20.0 mc. to 30.0 mc. and adjust the output to provide a 4 volt peak-to-peak signal on the scope.

Connect the signal generator loosely to the converter grid and adjust to provide markers at 22.05 mc. and 24.75 mc.

Adjust T1 (top) and T101 (bottom) to obtain the response shown in Figure 15. The T1 core must penetrate to the terminal board end of the coil in order to obtain the correct response.

Remove the 330 ohm resistors from across T102, T103, T104 and T106.

Adjust the 250,000 ohm potentiometer for a 15 volt peak-to-peak signal at the plate of the first video amplifier. The bias as measured by the "VoltOhmyst" should be −12 volts or less.

Observe and analyze the response curve obtained. The response will not be ideal and the i-f adjustments must be retouched in order to obtain the desired curve. See Figure 16.

On final adjustment the picture carrier marker must be at approximately 45% response. The curve must be approximately flat topped, with the 22.1 mc. marker at approximately 95% response, the 25.0 mc. marker below 90% and the 26.5 mc. marker at 5% to 10% on the response curve.

The most important consideration in making the i-f adjustments is to get the picture carrier at the 45% response point. If the picture carrier operates too low on the response curve, loss of low frequency video response, of picture brilliance, of blanking, and of sync may occur. If the picture carrier operates too high on the response curve, the picture becomes smeared. In making these adjustments, care should be taken that no two transformers are tuned to the same frequency as i-f oscillation may result.

Remove the converter tube and take off the clip to pin number 1. Replace the tube in the socket.

Picture I-F Oscillation. — If the receiver will operate without oscillating with the test equipment disconnected but breaks into oscillation or becomes unstable with the equipment connected, it may become necessary to establish a ground plane. Cover the test bench with a sheet of copper and set the chassis on the sheet. Set all the test equipment except the "VoltOhmyst" on the sheet and bond or bypass them to it. A Junior "VoltOhmyst" should not be bonded to the sheet since the negative test probe is not always connected to ground during alignment.

If the receiver is badly misaligned and two or more of the i-f transformers are tuned to the same frequency, the receiver may fall into i-f oscillation. I-F oscillation shows up as a voltage across the picture detector load resistor that is unaffected by r-f signal input. If such a condition is encountered, it is sometimes possible to stop oscillation by increasing the grid bias. If so, it should then be possible to align the transformers by the usual method. Once aligned in this manner, the i-f should be stable with reduced bias.

If the oscillation cannot be stopped in the above manner, shunt the grids of the first three pix i-f amplifiers to ground with 1,000 mmf. capacitors. Connect the signal generator to the fourth pix i-f grid and align T106 to frequency. Progressively remove the shunt from each grid and align the plate coil of that stage to frequency.

If this does not stop the oscillation, the difficulty is not due to i-f misalignment as the i-f section is stable when properly aligned. Check all i-f by-pass condensers, transformer shunting resistors, tubes, socket voltages, etc.

ANTENNA, R-F AND CONVERTER LINE ADJUSTMENT.— In order to align the r-f tuner, it will first be necessary to set the channel 13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.

The channel 13 oscillator may be aligned by adjusting it to beat with a crystal calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available. Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated.

If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, couple the meter probe loosely to the receiver oscillator.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier signal, connect the signal generator to the receiver antenna terminals. Connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203).

Set the receiver channel switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range while making the adjustment.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator.

Now that the channel 13 oscillator is set to frequency, we may procede with the r-f alignment.

Remove the first pix i-f amplifier tube V101.

Connect the oscilloscope to the test connection at R13 in the r-f tuning unit.

Connect the "VoltOhmyst" to the junction of R135 and C197. Adjust the bias potentiometer for −3.5 volts on the meter.

Connect the r-f sweep oscillator to the receiver antenna terminals. The method of connection depends upon the output impedance of the sweep. The P102 connection for 300 ohm balanced or 72 ohm single-ended input are shown in the circuit diagram in Figure 73. If the sweep oscillator has a 50 ohm single-ended output, 300 ohm balanced output can be obtained by connecting as shown in Figure 8.

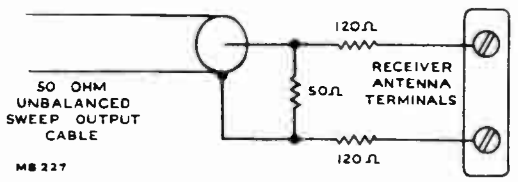

Figure 8—Unbalanced Sweep Cable Termination

Connect the signal generator loosely to the receiver antenna terminals.

Since channel 7 has the narrowest response of any of the high frequency channels, it should be adjusted first.

Set the receiver channel switch to channel 7.

Set the sweep oscillator to cover channel 7.

Insert markers of channel 7 picture carrier and sound carrier 175.25 mc. and 179.75 mc.

Adjust C10 and C14 until the curve falls symmetrically between the sound and picture carrier markers. Adjust C11 to give the proper bandwidth. Roughly peak L6 in conjunction with slight adjustments of C10 and C14 for a flat-topped, response curve with the sound and picture carriers at 90% to 95% response points on this curve. See Figure 17, channel 7.

Switch to channel 12 and adjust L6 for maximum response and minimum top slope of the curve.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep oscillator and marker oscillator to each of these channels and observe the response obtained. See Figure 17 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response. If the markers do not fall within this requirement on one or more high frequency channels, since there are no individual channel adjustments, it will be necessary to readjust L6, C10, C11 and C14, and possibly compromise some channel slightly in order to get the markers up on other channels. Normally, however, no difficulty of this type should be experienced since the higher frequency channels become comparatively broad and the markers easily fall within the required range.

Channel 6 is next aligned in the same manner.

Set the receiver to channel 6.

Set the sweep oscillator to cover channel 6.

Set the marker oscillator to channel 6 picture and sound carrier frequencies.

Adjust L9, L13, L66 and C12, for an approximately flat-topped response curve located symmetrically between the markers. L9, L13 and L66 are the center frequency adjustments. C12 is the band width adjustment.

Check channels 5 down through channel 2 by switching the receiver, sweep oscillator and marker oscillator to each channel and observing the response obtained. In all cases, the markers should be above the 80% response point. If this is not the case, L9, L13, L66 and C12 should be retouched. On final adjustment, all channels must be within the 80% specification.

Disconnect the bias pot. and replace V107. Replace V101.

Following an r-f alignment, the oscillator alignment must be checked.

R-F OSCILLATOR LINE ADJUSTMENT. — The r-f oscillator line may be aligned by adjusting it to beat with a crystal calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available.

Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated. If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, the calibration frequency listed under R-F Osc. Freq. must be available.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier frequency, the frequencies listed under Sound Carrier Freq. must be available.

Channel Number	Receiver R-F Osc. Freq. Mc.	R-F Sound Carrier Freq. Mc.	Channel Oscillator Adjustment
2	81	59.75	L24
3	87	65.75	L23
4	93	71.75	L22
5	103	81.75	L21
6	109	87.75	L31
7	201	179.75	L19
8	207	185.75	L18
9	213	191.75	L17
10	219	197.75	L16
11	225	203.75	L15
12	231	209.75	L14
13	237	215.75	C6

If the heterodyne frequency meter method is used, couple the meter probe loosely to the receiver oscillator.

If the r-f sound carrier method is used, connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203).

Connect the signal generator to the receiver antenna terminals. The order of alignment remains the same regardless of which method is used.

If the r-f unit is removed from the receiver for service and is aligned separately the shield over the bottom of the r-f unit must be in place when making adjustments.

Since lower frequencies are obtained by adding steps of inductance, it is necessary to align channel 13 first and continue in reverse numerical order.

Set the receiver channel switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range while making the adjustment.

Adjust C6 for an audible beat on the heterodyne frequency, meter or zero voltage from sound discriminator. Oscillator adjustments L1 and L2 shown on the schematic are factory control adjustments and should not be touched in the field.

Switch the receiver to channel 12.

Set the frequency standard to the proper frequency as listed in the alignment table.

Adjust L14 for indications as above.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator trimmer for the speci-

©John F. Rider

World Radio History

ALIGNMENT PROCEDURE

fied indication. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control in the middle third of its range.

After the oscillator has been set on all channels, start back at channel 13 and recheck to make sure that all adjustments are correct.

AGC THRESHOLD ADJUSTMENT. — The AGC threshold adjustment can be made by the method outlined in the Installation Instructions. However, a more accurate adjustment can be obtained by the use of an oscilloscope.

Tune in a station and advance the picture control to the maximum clockwise position. Connect the low capacity probe from the oscilloscope to the plate of the first video amplifier. Adjust the oscilloscope to observe the horizontal sync pulse.

Turn the AGC threshold control R138 fully clockwise, then slowly counterclockwise. As the control is turned counterclockwise, the receiver gain will increase slowly, increasing the size of the pattern on the oscilloscope. R138 should be turned counterclockwise until the receiver begins to overload as indicated by clipping of the sync. The control should be left in the maximum gain position in which no clipping of sync is observed. See Figure 18 for proper waveforms.

HORIZONTAL OSCILLATOR ADJUSTMENT. — Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment requires the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Set the locking range trimmer one half turn out from maximum capacity. With a clip lead, short circuit the coil between terminals C and D of the horizontal oscillator transformer T109. Tune in a television station and sync the picture if possible.

A. — Turn the horizontal hold control R173 to the extreme clockwise position. Adjust the T109 Frequency Adjustment (under the chassis) so that the picture is just out of sync and the horizontal blanking appears in the picture as a vertical bar. The position of the bar is unimportant.

Note.—Occasionally a tube may be found which does not respond to step "A" above, since it may not be possible to sync the picture by means of the frequency core when the sine wave coil is shorted out. Yet, the tube may work perfectly well when the circuit is properly aligned. In such a case, it may be necessary to remove the short then turn the sine wave core out then in until it is possible to obtain sync by adjustment of the frequency core.

B. — Turn the hold control approximately one-quarter of a turn from the extreme clockwise position and examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C153B, the width control R192 and the linearity control L111 until the picture is correct. If C153B was adjusted, repeat step "A" and note above.

Horizontal Oscillator Waveform Adjustment. — Remove the shorting clip from terminals C and D of T109. Turn the horizontal hold control to the extreme clockwise position. With a thin fibre screwdriver, if necessary, adjust the Oscillator Waveform Adjustment Core of T109 (on the outside of the chassis) until the horizontal blanking bar appears in the raster. The waveform adjustment core will sync the picture in two positions. The core should be in the position nearest the outside of the chassis.

A. Connect the low capacity probe of an oscilloscope to terminal C of T109. Alternately adjust the waveform and frequency cores of T109 until the peak of the sine wave is equal in amplitude to the peak of the saw tooth, on the oscilloscope as shown in Figure 19, while maintaining the picture in synchronization. Then adjust the frequency core until horizontal blanking shows as a vertical bar in the picture.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Check of Oscillator Pull-in Range. — Set the horizontal hold control to the full counter-clockwise position.

Connect a 270K ohm resistor across C156.

Momentarily switch off channel and back. The picture will then be out of sync.

Turn the hold control clockwise slowly and observe the minimum number of bars obtained just before the picture pulls into sync. The picture should snap in from two complete blanking bars. If two bars are not obtained turn the locking range trimmer C153A in to obtain less bars or out to obtain more bars.

After adjustment of C153A, remove the 270K resistor, turn the horizontal hold control fully clockwise and readjust the frequency core of T109 until the picture is in sync and the horizontal blanking bar begins to move in the picture. Then repeat the entire "Check of Pull-in Range" procedure to this point. Repeat this procedure until two bar pull-in is obtained.

Turn the horizontal hold control to the maximum clockwise position. The picture should be just out of sync to the extent that the horizontal blanking bar appears as a single vertical or diagonal bar in the picture. Adjust the T109 Frequency Adjustment until this condition is fulfilled.

4.5 MC. VIDEO TRAP ADJUSTMENT. — Tune in a strong input from a station, and with a very short clip lead, short the trap winding of T103. Observe the picture for the appearance of a 4.5 mc. beat. If the beat appears in the picture, adjust L110 until the beat is eliminated or minimized.

SENSITIVITY CHECK. — A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES. — The response curves shown on page 14 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

ALIGNMENT TABLE. — Both methods of oscillator alignment are presented in the alignment table. The service technician may thereby choose the method to suit his test equipment.

45	"	71.75	"	93	"	"	Rec. on chan. 4	L22 as above	"
46	"	65.75	"	87	"	"	Rec. on chan. 3	L23 as above	"
47	"	59.75	"	81	"	"	Rec. on chan. 2	L24 as above	"
48	Repeat steps 36 through 47 as a check.								
	AGC THRESHOLD ADJUSTMENT								
49	Not used		Not used		Pin 1, V106	Not used	Tune in station, turn pix control clockwise. Adjust R138 for max. gain without clipping sync on scope		Fig. 11 Fig. 18
	HORIZONTAL OSCILLATOR ADJUSTMENT								
50	Short circuit terminals C and D of T109. Tune in a station. Set locking range trimmer C153A ½ turn out from maximum.								
51	Turn hold control fully clockwise. Adjust T109 Frequency Adjustment until horizontal blanking bar appears in the picture.								
52	Turn hold control ¼ turn from clockwise to sync picture. Adjust width (R192), linearity (L111) and drive (C153B) controls until picture is correct. Repeat step 51, then proceed with step 53.								
53	Remove clip from terminals C and D of T109. Turn hold control fully clockwise. Adjust T109 Oscillator Waveform Adjustment until horizontal blanking bar appears in picture with core in outer of two possible positions.								
54	Connect low capacity probe of oscilloscope to terminal C of T109. Alternately adjust T109 Oscillator Waveform Adjustment and frequency adjustment until broad and sharp peaks of wave on oscilloscope are same height while keeping picture in sync. Remove oscilloscope.								
55	Connect a 270K resistor across C156. Turn hold control fully counter-clockwise. Momentarily remove signal. Turn hold control slowly clockwise. Note least number of bars before pull-in. Adjust Locking Range Control (C153A) for 2 bar pull-in.								
56	Turn hold control fully clockwise. Adjust T109 Freq. Adjustment until horizontal blanking appears as single vertical or diagonal bar in pix.								
	4.5 MC VIDEO TRAP ADJUSTMENT								
57	Tune in a strong station. Short T103 trap. If a 4.5 mc. beat appears in picture adjust 4.5 mc. trap (L110) until beat is eliminated.								
	SENSITIVITY CHECK								
58	Connect antenna to receiver through attenuator pad to provide weak signal. Compare the picture and sound obtained to that obtained on other receivers under the same conditions.								

©John F. Rider

World Radio History

RADIO ALIGNMENT PROCEDURE

If any lead dressing is necessary, it should be done before aligning the receiver. When making a complete alignment follow the table below in sequence. If only a portion of the circuit is to be aligned select the portion required and follow with the remaining steps in the section. Any adjustments made on the 455 kc. I-F's make it necessary to adjust the 10.7 mc. I-F's.

"AM" R-F—I-F ALIGNMENT

Test-Oscillator.—For all alignment operations, connect low side of the test-osc. to the receiver chassis, and keep the osc. output as low as possible to avoid a-v-c action. Output Meter.—Connect the meter across the speaker voice coil, and turn the receiver volume control to max.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
1	Antenna terminal in series with .01 mfd.	455 kc. Modulated	AM	Low Freq. end of Dial	†Top and bot. cores of T301 and T302. (For max. voltage across voice coil.)
2	Ant. terminal through dummy ant. of 200 mmfs.	1,620 kc.	AM	Min. capacity	Osc. C308 for maximum output.
3		1,400 kc.	AM	Tune to signal	Ant. C304 for maximum output.
4		600 kc.	AM	600 kc.	Osc. L306 and Ant. L303.
5	Repeat steps 2, 3 and 4 for maximum output.				

† Use alternate loading. Connect an 18,000-ohm resistor across the primary to load the plate winding while the grid winding of the same transformer is being peaked. Then load the grid winding with the 18,000-ohm resistor while the plate winding is being peaked.

RATIO DETECTOR ALIGNMENT

Connect probe of "VoltOhmyst" to negative side of C328 and low side to chassis. Connect output meter across speaker voice coil.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Radio Dial Tuned to—	Adjust
6	Pin No. 1 of 6AU6 (V303) in series with .01 mfd.	10.7 mc. 30% AM Modulated	FM	———	Top of T303 for maximum DC on "VoltOhmyst."
7	Pin No. 1 of 6AU6 (V303) in series with .01 mfd.		FM	———	Bottom of T303 for minimum audio output on meter.
8	Repeat steps 6 and 7 as necessary making final adjustment with r-f input level set to give approximately −3.0 volts d-c on "VoltOhmyst."				

"FM" R-F—I-F ALIGNMENT

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Radio Dial Tuned to—	Adjust
9	Terminal 3 of S301-2 rear through 270 ohms.	10.7 mc.	FM	88 mc.	*T301 and T302 for max. with r-f input set to give −3 volts on "VoltOhmyst."
10	Terminal 3 of S301-2 rear through 270 ohms.	106 mc.	FM	106 mc.	Set C302 to max. capacity. Squeeze L307 and adjust C302 for maximum.
11	Terminal 3 of S301-2 rear through 270 ohms.	90 mc.	FM	Tune to signal	Squeeze L301 and rock gang for maximum output.
12	Repeat steps 10 and 11 as required.				

* Use a 680-ohm resistor to load the plate winding while the grid winding of the same transformer is being peaked. Then the grid winding is loaded with 680-ohm resistor while the plate winding is being peaked.

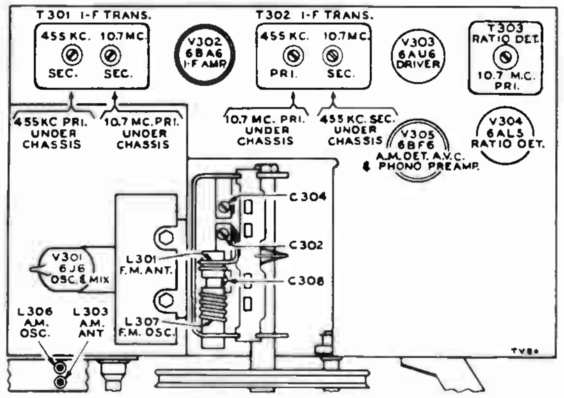

Figure 20—Chassis, Top View, Showing Adjustments

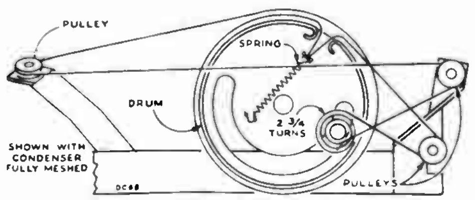

Figure 21—Dial and Drive Cord Assembly

CRITICAL LEAD DRESS:

1. Ground lead on pin 2 of V302 and V303 should be dressed down flat on chassis.
2. Dual .005 mfd. capacitors and diode filter should be dressed to clear the bottom of the cabinet.
3. Dress C329 across V302 sockets with short and direct leads.
4. Dress V302 plate lead from pin 5 down to the chassis.
5. Dress AVC lead from R321 to switch down to chassis and against back of gang mounting plate.
6. Dress lead from pin 6 of V305 down to chassis and against back of gang mounting plate.
7. Dress AVC lead from 1st I-F to switch against chassis and against gang mounting plate.
8. Dress lead from switch to pin 1 of V301 against plate supporting gang.
9. Dress all insulated F-M leads down to chassis.
10. Connect C309 with short lead to pin 6 of V301 keeping body of cap away from plate lead and switch terminals.
11. The coupling between L301 and L307 should be adjusted to give proper injection voltage to the mixer grid. This has been found to be correct when the distance between adjacent end turns is 3/8" to 7/16" measured at top of the form.
12. Dress cabled leads away from antenna transmission lines.
13. Dress all uninsulated bus wire so as to avoid short circuits.

SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnets reversed either front to back or top to bottom.

(2) V112 or V113 inoperative. Check waveforms on grids and plates.

(3) No high voltage—If horizontal deflection is operating as evidenced by the correct waveform on terminal 4 of J106, the trouble can be isolated to the 8016 circuit. Either the T110 high voltage winding is open, the 8016 tube is defective, its filament circuit is open, or C168 is shorted.

(4) V111 circuit inoperative—Refer to schematic and waveform chart.

(5) Damper tube (V114) inoperative.

(6) Defective kinescope.

(7) R131 open.

(8) No receiver plate voltage—filter capacitor shorted—bleeder or filter choke open.

NO VERTICAL DEFLECTION:

(1) V107B or V110 inoperative. Check voltage and waveforms on grids and plates.

(2) T107 or T108 open.

(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.

(2) V112 defective.

(3) Defective yoke.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V110.

(2) T107 or T108 transformer defective.

(3) V107B defective—check voltage and waveforms on grid and plate.

(4) C150, R164, C146B, C147C, C148C or C166 defective.

(5) Low bias or plate voltage—check rectifiers and capacitors in supply circuits.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V112 or V114.

(2) T110 or L111 defective.

(3) C164 or C165 defective.

WRINKLES ON LEFT SIDE OF RASTER:

(1) C169 defective or incorrectly connected.

(2) C141 or C191 defective.

(3) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T109 incorrectly tuned.

(2) R172, R173 or R174 defective.

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER:

(1) Improper adjustment of focus coil or ion trap magnet.

(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) R-F oscillator off frequency.

(2) Sound i-f, discriminator or audio amplifier inoperative—check V116, V117, V118, V119, V120 and their socket voltages.

(3) T114 defective.

(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC threshold control R138 misadjusted.

(2) V105B, V107A, V108 or V109 inoperative. Check voltage and waveforms at their grids and plates.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V107B and associated circuit—C145, T107, etc.

(2) Integrating network inoperative—Check.

(3) R154, R155, R157, R158 or R159 defective.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T109 misadjusted—readjust as instructed on page 11.

(2) V111 inoperative—check socket voltages and waveforms.

(3) T109 defective.

(4) C134, C140, C146C, C153A, C154, C155, C156 or C157 defective.

(5) If horizontal speed is completely off and cannot be adjusted check C158, C159, R172, R173, R174, R179 and R182.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture i-f, detector or video amplifier inoperative—check V103, V104, V105 and V106—check socket voltages.

(2) Bad contact to kinescope grid.

PICTURE STABLE BUT POOR RESOLUTION:

(1) V105A or V106 defective.

(2) Peaking coils defective—check for specified resistance.

(3) Make sure that the focus control operates on both sides of proper focus.

(4) R-F and I-F circuits misaligned.

PICURE SMEAR:

(1) R-F or I-F circuits misaligned.

(2) Open peaking coil.

(3) This trouble can originate at the transmitter—check on another station.

PICTURE JITTER:

(1) AGC threshold control R138 misadjusted.

(2) If regular sections at the left picture are displaced change V112.

World Radio History

SERVICE SUGGESTIONS

(3) Vertical instability may be due to loose connections or noise.

(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.

(2) R-F oscillator off frequency.

(3) R-F unit inoperative—check V1, V2, V3.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.

(2) Replace V112.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) C169 defective.

(2) V114 defective.

PICTURE I-F RESPONSE.—At times it may be desirable to observe the individual i-f stage response. This can be achieved by the following method:

Shunt all i-f transformers and coils with a 330-ohm carbon resistor except the one whose response is to be observed.

Connect a wide band sweep generator to the converter grid and adjust it to sweep from 18 mc. to 30 mc.

Connect the oscilloscope across the picture detector load resistor and observe the overall response. The response obtained will be essentially that of the unshunted stage. The effects of the various traps are also visible on the stage response.

Figures 22 through 26 show the responses of the various stages obtained in the above manner. The curves shown are typical although some variation between receivers can be expected. Relative stage gain is not shown.

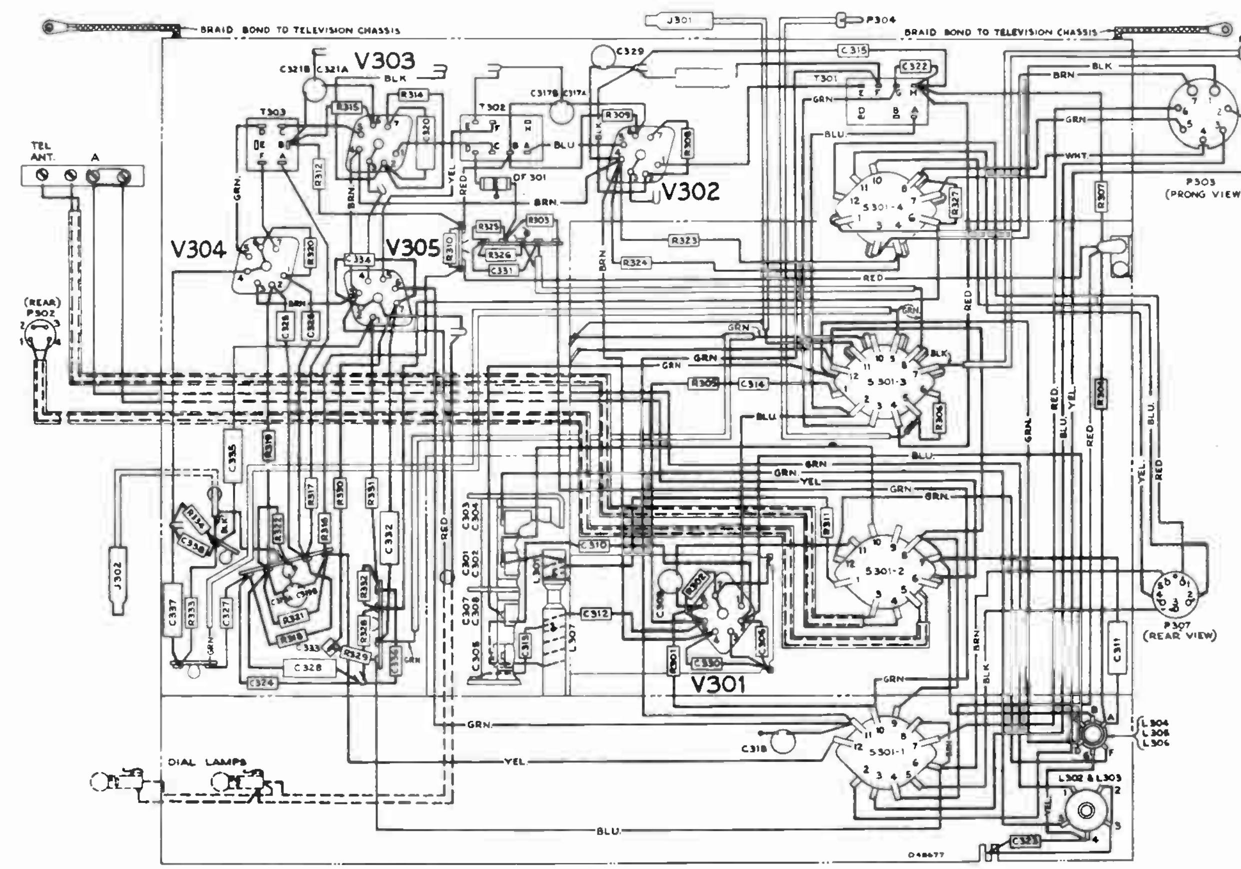

Figure 71—Radio Chassis Wiring Diagram (RK135D)

TELEVISION CRITICAL LEAD DRESS

1. The ground bus from pin 2 and the center shield of V117 socket should not be shortened or rerouted.
2. Do not change the dress of the filament leads or the bypass capacitors in the picture or sound i-f circuits. The filament leads between V117, V118 and V119 should be down against the chassis and away from grid or plate leads.
3. If it is necessary to replace any of the 1500 mmf capacitors in the picture i-f circuit, the lead length must be kept as short as possible.
4. Picture i-f coupling capacitors C106, C111, C115 and C121 should be up and away from the chassis and should be clear of the pix i-f transformer adjustments by at least ¼ inch. If the dress of any of these capacitors is changed, the i-f alignment should be rechecked.
5. Dress black lead from terminal C of T106 down next to chassis.
6. Leads to L102 and L103 must be as short as possible.
7. Dress peaking coils L105, L106 and L107 up and away from the chassis.
8. Dress C183 across tube pins 5 and 6 with leads not exceeding ⅜ inch.
9. Dress body of R215 as close to tube pin as possible.
10. Dress C129 and C130 up and away from the chassis.
11. Dress the yellow lead from the picture control away from the chassis and away from the volume-control leads. Dress the yellow lead from pin 8 of V106 away from the chassis.
12. Dress the green lead from pin 2 of V106 away from the chassis.
13. Dress R168, R169, R170, R176 and R178 up and away from the chassis.
14. The leads to the volume control should be dressed down against the chassis and away from V117 and V118.
15. Contact between the r-f oscillator frequency adjustment screws and the oscillator coils or channel switch eyelets must be avoided.
16. Dress three a-c leads to S101 under clamp and away from R211.
17. Dress black lead from power transformer and red lead from S102 to terminal board, on top of four potentiometers.
18. Dress all leads from V115 to V122 on power transformer side of terminal board.
19. Dress all leads away from R230.
20. Dress brown and yellow leads of phono motor cable under R165 and under C201.
21. All solder joints in the high voltage section should be free of sharp edges.
22. The lead side of the V113 plate cap should be turned away from the fixed high voltage shield.
23. All leads under the horizontal plate in the high voltage section should be kept reasonably short and dressed away from the V113 corona ring.

World Radio History

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition a 2200 microvolt test pattern signal was fed into the receiver, the picture was synced and the AGC threshold control was properly adjusted. The second condition was obtained by removing the antenna leads and short-circuiting the receiver antenna terminals. Voltages shown are as read with "Jr. VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles a-c. Symbol < means less than.

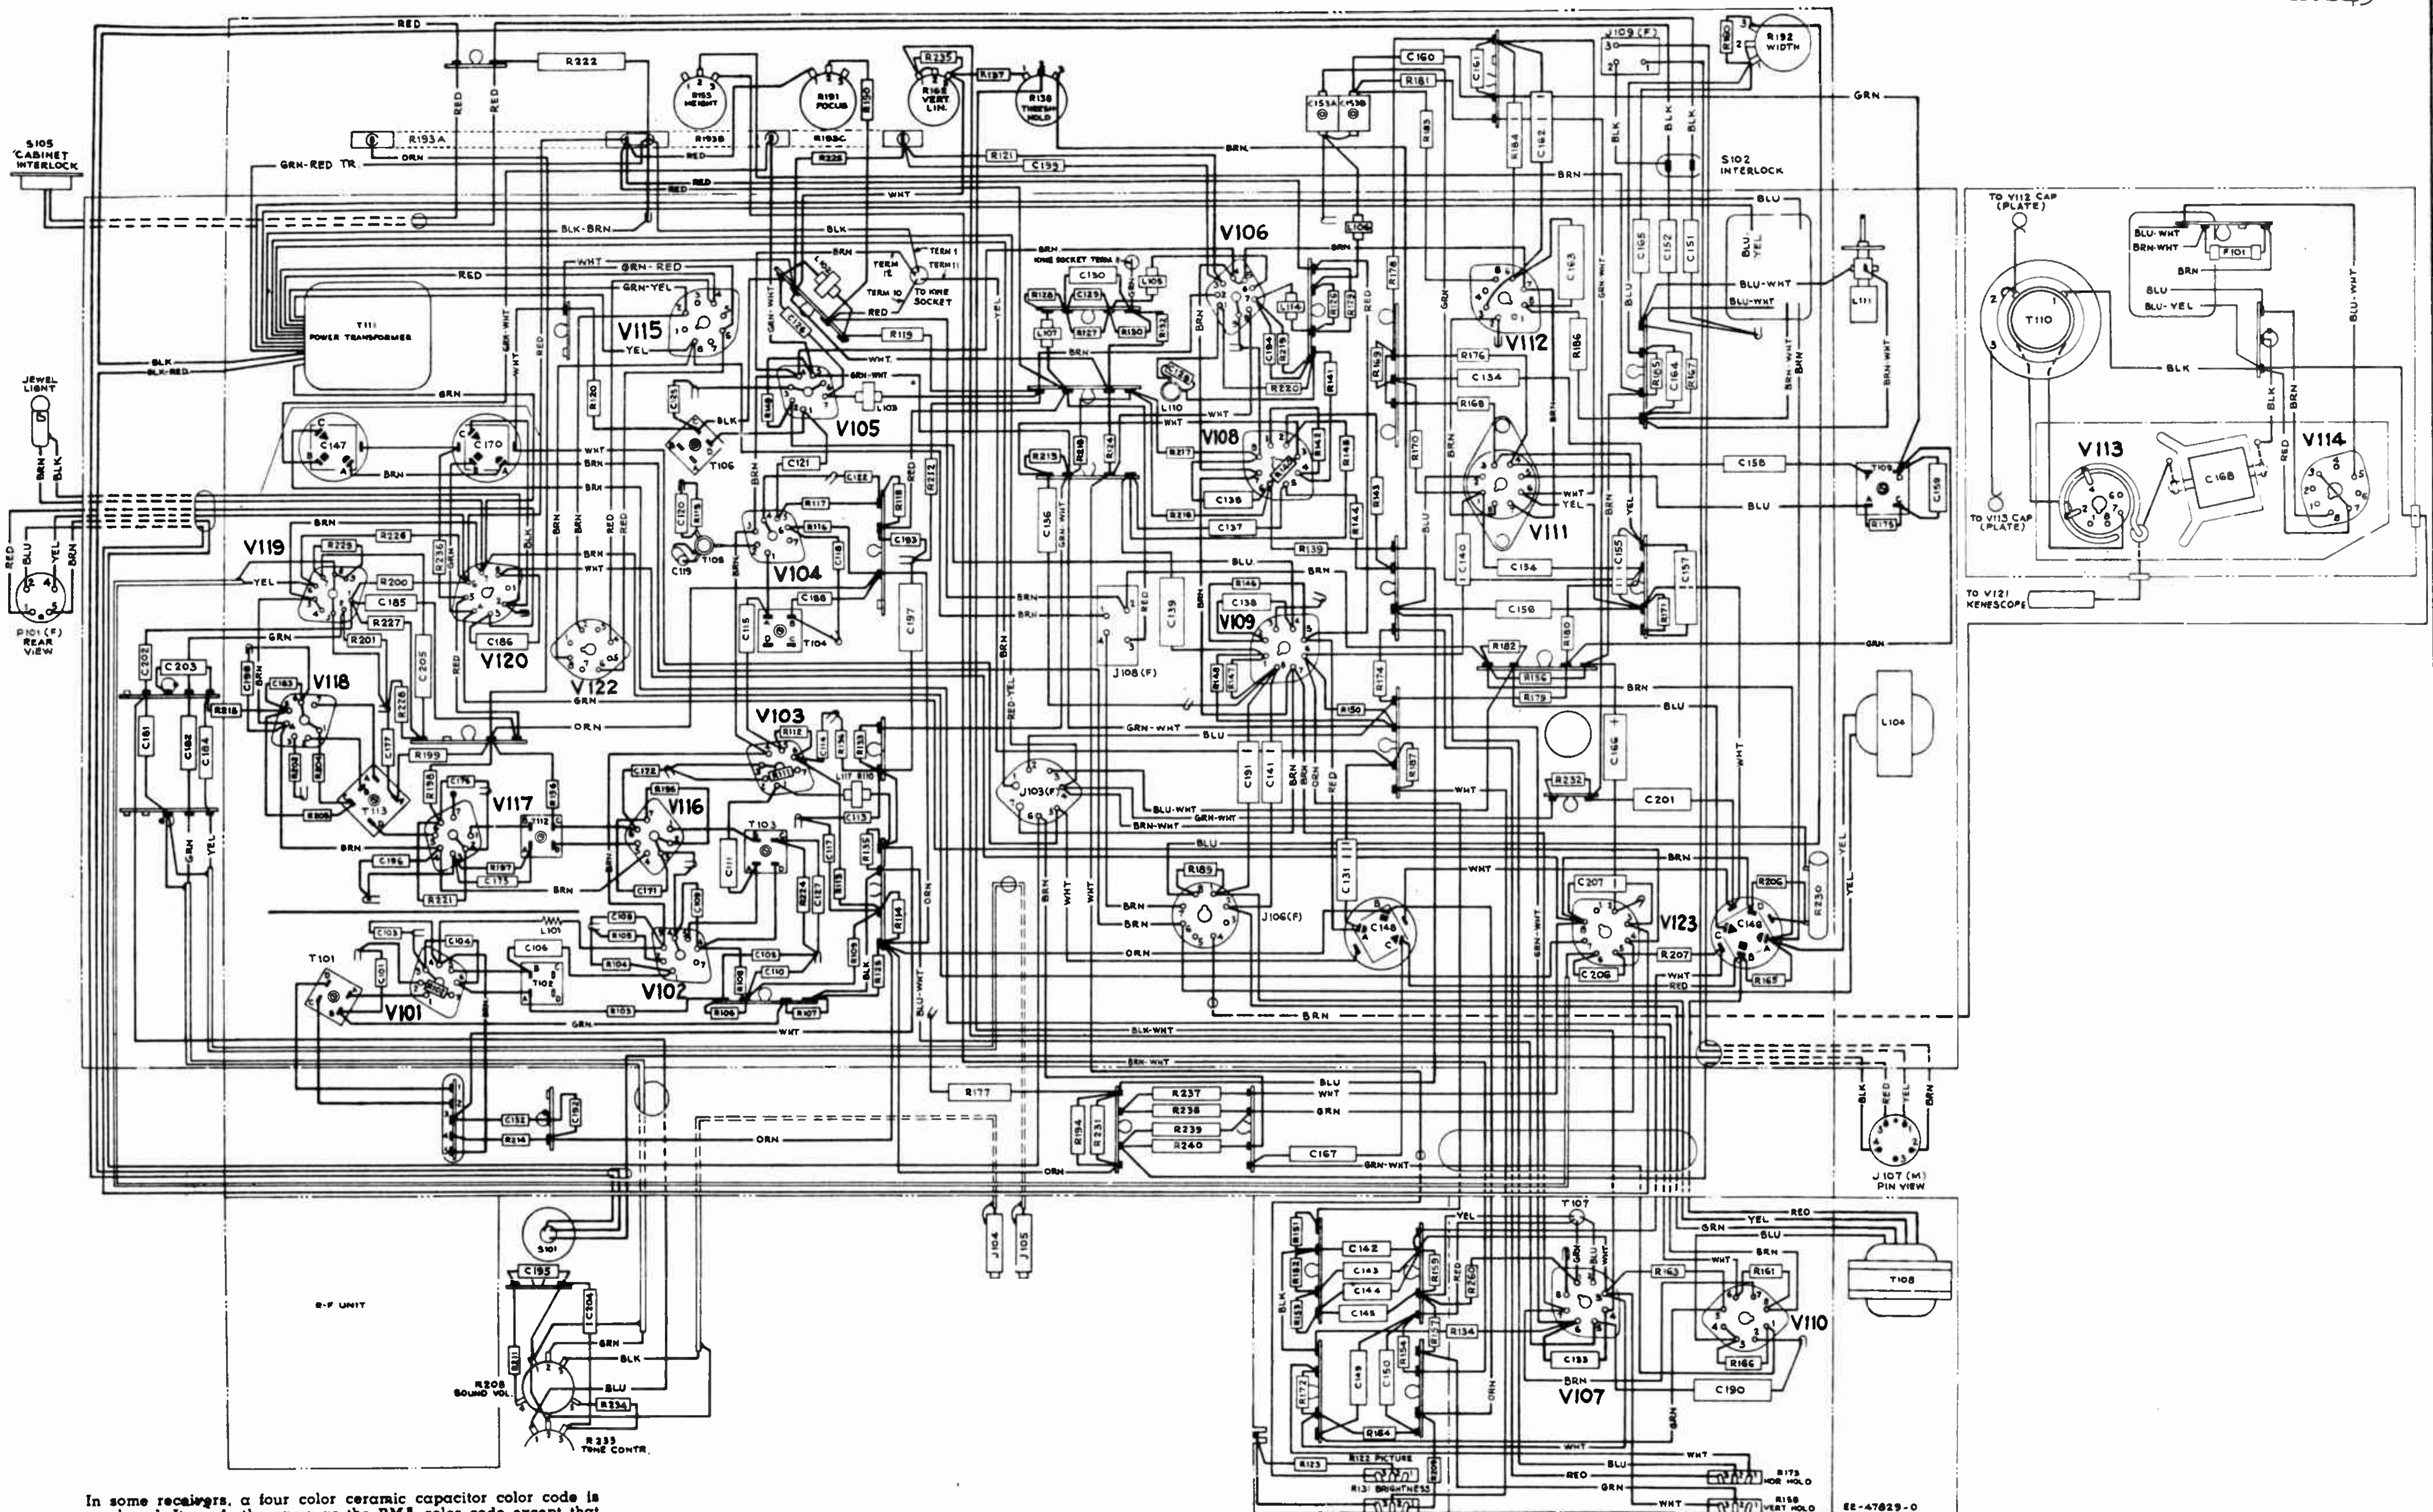
TELEVISION CHASSIS WIRING DIAGRAM



In some receivers, a four color ceramic capacitor color code is employed. It reads the same as the RMA color code except that the tolerance stripe is omitted.

If the coefficient stripe is silver, it indicates that the capacitor has a very large temperature coefficient and is to be employed for bypass or other usages where a wide variation of capacity is unimportant. Silver striped capacitors are rated at 350 volts unless otherwise marked.

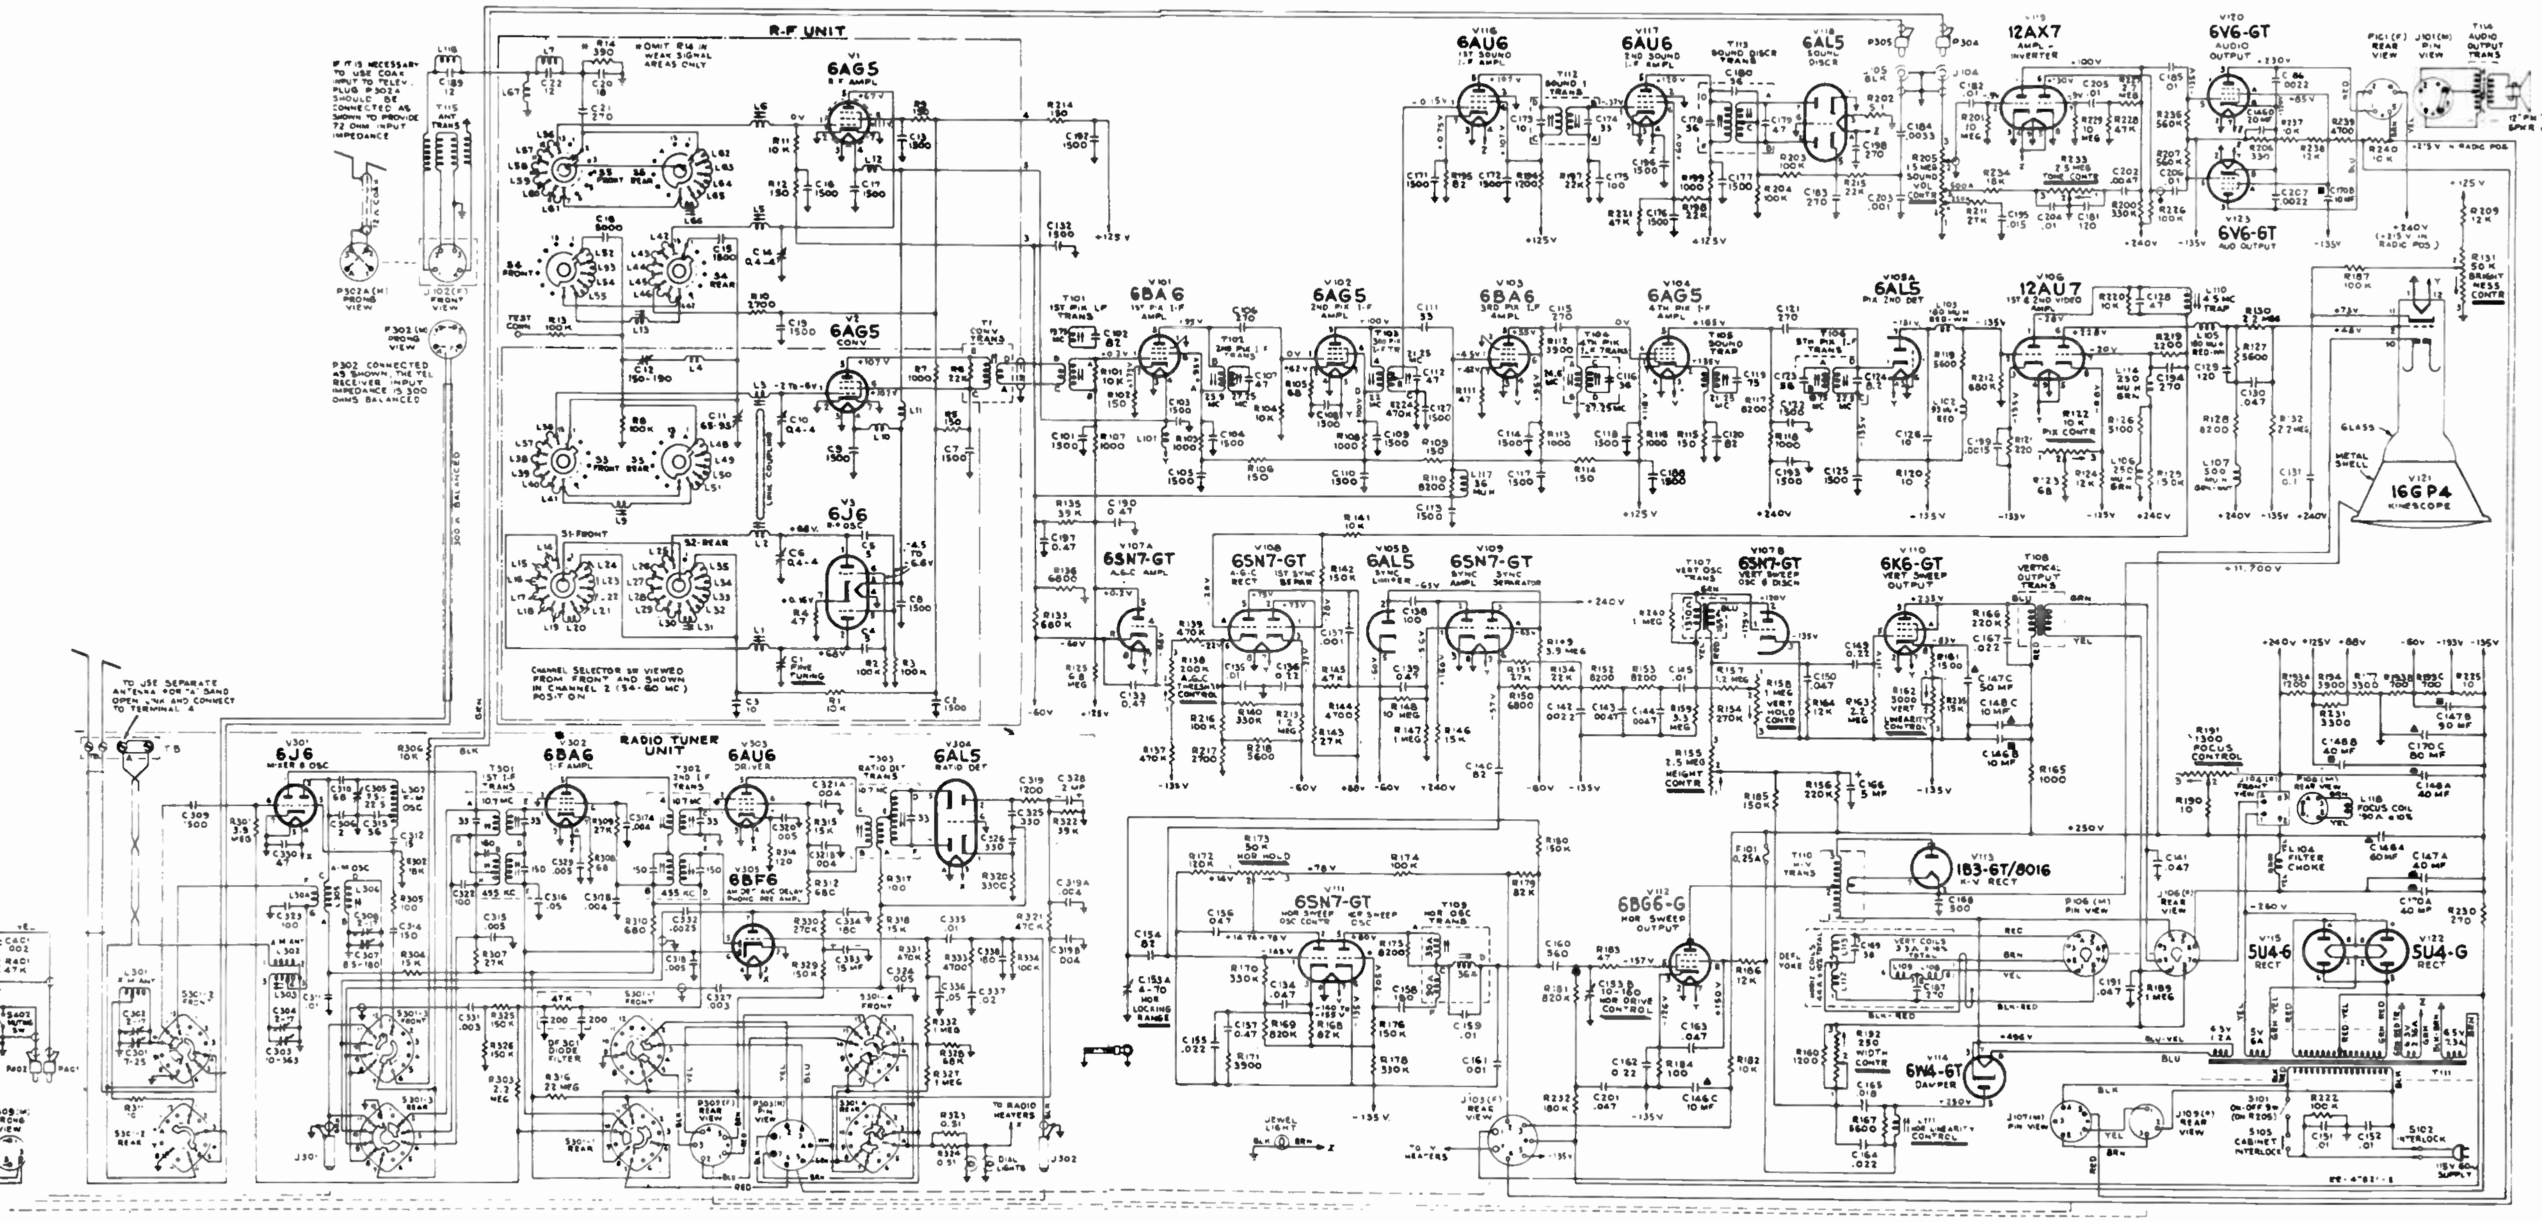
CIRCUIT SCHEMATIC DIAGRAM



Function switch S301 viewed from front and shown in Number 1 (maximum counterclockwise position).
Switch position 1—Television.

Switch position 2—AM.
Switch position 3—FM.
Switch position 4—Phono 45 RPM.
Switch position 5—Phono 78 RPM.

All resistance values in ohms. K = 1,000.
All capacitance values less than 1 in MF and above 1 in MMF unless noted.

Coil resistance values less than 1 ohm are not shown.
Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst," no signal input with 117 v. a-c supply with the pix control fully clockwise and the brightness control set for average brightness.

In some receivers, C141 was omitted.
In some receivers, R220 was 12 K.
In some receivers, R121 was 39, R225 was 18, R128 was 6,800, R129 was 220 K, L107 was 250 Muh. and C199 was omitted.

In some receivers, R161 was 1,000 and R235 was omitted.
In some receivers, R160 and R167 were omitted.

In some receivers, R187 was 150 K and R188 470 K was connected from V121-11 to +125 V and V121-10 was connected to the junction of R156 and C166.
In some receivers, R260 was omitted.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	R-F UNIT ASSEMBLIES KRK 5B
73465	Belt—Drive belt
75069	Board—R-F unit power connection terminal board (5 contact)
75067	Bracket—Vertical bracket for holding r-f oscillator tube shield
73478	Cable—I-F transmission cable (W1)
73441	Cam—Fine tuning adjustment
74035	Capacitor—Ceramic, 5 mmf. (C4, C5)
53511	Capacitor—Ceramic, 10 mmf. (C3)
54207	Capacitor—Ceramic, 18 mmf. (C20)
73449	Capacitor—Ceramic trimmer, comprising 1 section of 150-190 mmf. and 1 section of 65-95 mmf. (C11, C12)
73091	Capacitor—Ceramic, 270 mmf. (C21)
71501	Capacitor—Ceramic, 1,500 mmf. (C2, C7, C8, C9, C13, C15, C17, C18, C19)
73473	Capacitor—Ceramic, 5,000 mmf. (C16)
73460	Coil—R-F plate coil for channel 6 (L13)
73461	Coil—Rear section—Oscillator plate coil for channel 6 (L20)
73462	Coil—Coupling inductance coil (L4)
73475	Coil—Antenna filter shunt coil (C67)
73476	Coil—I-F trap (L7, C22)
73477	Coil—Choke coil (L10, L11, L12)
73874	Coil—Front section—Oscillator plate coil for channel 6 (L31)
74108	Coil—Fine tuning coil (1½ turns) with adjustable inductance core and capacitor stud (plunger adjustment) (L1, C1)
74109	Coil—Trimmer coil (1½ turns) with adjustable inductance core and capacitor stud (screw adjustment for oscillator section or converter section) (L2, L3, C6, C10)
74110	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f amplifier section (L5, C14)
71493	Connector—Oscillator segment connector
73455	Core—Sliding core for fine tuning control trimmer
74187	Core—Adjustable core for coil L9
73440	Detent—R-F unit detent mechanism and fibre shaft
71487	Form—Coil form for coil L31
73453	Form—Coil form assembly for L9, L13
73442	Link—Link assembly for fine tuning
71462	Loop—Oscillator to converter trimmer loop connector
73634	Nut—Speed nut for drive belt shield
73436	Plate—Front plate and bushing
73464	Pulley—Idler pulley
	Resistor—Fixed, composition:
	47 ohms, ±20%, ½ watt (R4)
	150 ohms, ±20%, ½ watt (R5, R9, R12)
	390 ohms, ±10%, ½ watt (R14)
	1,000 ohms, ±20%, ½ watt (R7)
	2,700 ohms, ±10%, ½ watt (R10)
	10,000 ohms, ±20%, ½ watt (R1, R11)
	100,000 ohms, ±20%, ½ watt (R2, R3, R8, R13)
14343	Retainer—Channel selector shaft retaining ring
30340	Retainer—Retainer ring for fine tuning stud
70881	Screw—No. 4-40 x ¼"-binder head screw for adjusting coils L14, L15, L16, L17, L18, L19
73640	Screw—No. 4-40 x ⅝" adjusting screw for L66
71475	Screw—No. 4-40 x 15 32" adjusting screw for coils L21, L22, L23, L24
74575	Screw—No. 4-40 x 17 32" adjusting screw for L6
73437	Shaft—Channel selector shaft complete with pawl and stud
73438	Shaft—Fine tuning control shaft and pulley
73439	Shaft—Actuating shaft for fine tuning control
75443	Shield—"U" shape shield for bottom of r-f unit
72951	Shield—Metal tube shield for V3
73454	Shield—Metal shield for drive belt
73632	Shield—Metal tube shield for V1
71494	Socket—Tube socket, moulded, 7 prong, saddle mounted
73450	Socket—Tube socket, ceramic, 7 prong, bottom mounted
74576	Spacer—Insulating spacer for front plate (4 required)
73457	Spring—Return spring for fine tuning control core
74188	Spring—Retaining spring for adjustable core RCA 74187
74578	Spring—Retaining spring for adjusting screws RCA 73640 and RCA 74575
75068	Spring—Retaining spring for R-F oscillator tube shield
73468	Stator—Front oscillator section stator complete with rotor, segment, coils and adjusting screws (S1, L14, L15, L16, L17, L18, L19, L21, L22, L23, L24)
73469	Stator—Rear oscillator section stator complete with rotor, segment and coils (S2, L25, L26, L27, L28, L29, L30, L32, L33, L34, L35)
73633	Stator—Antenna stator complete with rotor and coils (S5, L6, L56, L57, L58, L59, L60, L61, L62, L63, L64, L65, L66, C21)
73470	Stator—Converter stator complete with rotor and coils (S3, L9, L36, L37, L38, L39, L40, L41, L48, L49, L50, L51)
73471	Stator—R-F amplifier stator complete with fotor and coils (S4, L13, L42, L43, L44, L45, L46, L47, L52, L53, L54, L55, C15, C16, R10)
75446	Stud—Capacitor stud — brass, No. 4-40 x 13/16" with 3 64" screwdriver slot for trimmer coils 74109 and 74110, uncoded or coded "ER"
75447	Stud—Capacitor stud — brass, No. 4-40 x 13/16" with 3 64" screwdriver slot for trimmer coils 74109 and 74110, coded numerically or "Hi Q"
73448	Transformer—Converter transformer (T1, R6)
73466	Washer—Insulating washer for front shield (1 set)
2917	Washer—"C" washer for channel selector shaft or fine tuning shaft and cam
	CHASSIS ASSEMBLIES KCS 43
*75086	Bracket—Mounting bracket (upper) for focus coil
*75087	Bracket—Mounting bracket (lower) for focus coil
74911	Cable—Shielded cable complete with female connector (W101, W103, J104, J105)
74946	Capacitor—Mica trimmer, comprising 1 section of 4-70 mmf. and 1 section of 10-160 mmf. (C153A, C153B)
39604	Capacitor—Mica, 10 mmf. (C126)
74105	Capacitor—Mica, 33 mmf. (C111)
64062	Capacitor—Ceramic, 82 mmf. (C120)
73090	Capacitor—Mica, 82 mmf. (C140, C154)
39396	Capacitor—Ceramic, 100 mmf. (C175)
75060	Capacitor—Mica, 100 mmf. (C138)
73921	Capacitor—Ceramic, 120 mmf. (C129)
39630	Capacitor—Mica, 120 mmf. (C181)
73102	Capacitor—Mica, 180 mmf. (C158)
73091	Capacitor—Mica, 270 mmf. (C106, C115, C121)
73922	Capacitor—Ceramic, 270 mmf. (C183, C194, C198)
74947	Capacitor—Ceramic, 500 mmf., 20,000 volts (C168)
74250	Capacitor—Mica, 560 mmf. (C160)
71501	Capacitor—Ceramic, 1,500 mmf. (C101, C103, C104, C105, C108, C109, C110, C113, C114, C117, C118, C122, C125, C127, C132, C171, C172, C176, C177, C188, C192, C193, C196)
28417	Capacitor—Electrolytic, 5 mfd., 450 volts (C166)
73582	Capacitor—Electrolytic, comprising 1 section of 40 mfd., 450 volts, and 1 section of 10 mfd., 450 volts, and 1 section of 80 mfd., 200 volts (C170A, C170B, C170C)
73583	Capacitor—Electrolytic, comprising 1 section of 40 mfd., 450 volts, 1 section of 90 mfd., 150 volts, and 1 section of 50 mfd., 150 volts (C147A, C147B, C147C)
71432	Capacitor—Electrolytic, comprising 2 sections of 40 mfd., 450 volts, and 1 section of 10 mfd., 450 volts (C148A, C148B, C148C)
73581	Capacitor—Electrolytic, comprising 1 section of 60 mfd., 450 volts, 2 sections of 10 mfd., 450 volts, and 1 section of 20 mfd., 150 volts (C146A, C146B, C146C, C146D)
73801	Capacitor—Tubular, moulded paper, oil impregnated, .001 mfd., 1,000 volts (C137, C161, C203)
73802	Capacitor—Tubular, paper, oil impregnated, .0015 mfd., 600 volts (C199)
73595	Capacitor—Tubular, paper, oil impregnated, .0022 mfd., 600 volts (C142)
73803	Capacitor—Tubular, paper, oil impregnated, .0022 mfd., 1,000 volts (C186, C207)
73795	Capacitor—Tubular, paper, oil impregnated, .0033 mfd., 600 volts (C184)
73920	Capacitor—Tubular, paper, oil impregnated, .0047 mfd., 600 volts (C143, C144, C202)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd., 400 volts (C135, C182, C204)
73594	Capacitor—Tubular, paper, oil impregnated, .01 mfd., 600 volts (C145, C159, C205)
73565	Capacitor—Tubular, paper, oil impregnated, .01 mfd., 1,000 volts (C151, C152, C185, C206)
73797	Capacitor—Tubular, paper, oil impregnated, .015 mfd., 600 volts (C195)
74727	Capacitor—Tubular, paper, oil impregnated, .018 mfd., 1,000 volts (C165)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 1,000 volts (C155, C164, C167)
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 400 volts (C130, C134, C201)
73592	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 600 volts (C139, C156)
73597	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 1,000 volts (C141, C150, C163, C191)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 600 volts (C131)
73794	Capacitor—Tubular, paper, oil impregnated, 0.22 mfd., 200 volts (C136, C162)
74957	Capacitor—Tubular, paper, oil impregnated, 0.22 mfd., 600 volts (C149)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd., 200 volts (C133, C157, C190, C197)
73154	Choke—Filter choke (L104)
74983	Coil—Focus coil (L118, P108)
71449	Coil—Horizontal linearity control coil (L111)
73477	Coil—Filament choke coil (L101)
74170	Coil—Peaking coil (36 muh) (L117, R110)
71527	Coil—Peaking coil (93 muh) (L102)
74214	Coil—Peaking coil (180 muh) (L103, L105)
71526	Coil—Peaking coil (250 muh) (L106, L114)
75252	Coil—Peaking coil (500 muh) (L107)
72172	Connector—3 contact female connector (J107A)
31027	Connector—4 contact female connector for focus coil leads (J108)
72108	Connector—7 contact female connector (J103)
74594	Connector—Male connector for power cable
60942	Connector—8 contact female connector for deflection yoke leads (J106)
30568	Connector—4 contact male connector—part of focus coil (P108)
35383	Connector—8 contact male connector—part of deflection yoke (P106)
*74967	Connector—Anode connector
5040	Connector—4 contact female connector for speaker cable (P101)
14786	Connector—5 contact male connector for motor switching cable (J107B)
72734	Control—Horizontal and vertical hold control (R158, R173)
74047	Control—Picture and brightness control (R122, R131)
74359	Control—Tone control, volume control and power switch (R205, R233, S101)
71441	Control—Vertical linearity control (R162)
71440	Control—Height control (R155)
74597	Control—Focus control (R191)
74475	Control—AGC threshold control (R138)
74945	Control—Width control (R192)
71457	Cord—Power cord and plug
71437	Cover—Insulating cover for electrolytics No. 71432 and No. 73581
74956	Cushion—Rubber cushion for yoke hood (2 required)
73600	Fuse—0.25 amp., 250 volts (F101)
71799	Grommet—Rubber grommet for yoke horizontal lead exit
37396	Grommet—Rubber grommet for mounting ceramic tube socket (2 required)
74030	Grommet—Rubber grommet for mounting radio chassis
75445	Hood—Deflection yoke hood less rubber cushions
74953	Magnet—Ion trap magnet (PM type)
18469	Plate—Bakelite mounting plate for electrolytics
75444	Plate—Bakelite plate complete with tube sockets for high voltage rectifier
72067	Resistor—Wire wound, 5.1 ohms, ½ watt (R202)
18471	Resistor—Wire wound, 10 ohms, ½ watt (R190)
*75085	Resistor—Wire wound, 270 ohms, 20 watts (R230)
74955	Resistor—Voltage divider, comprising 1 section of 1,200 ohms, 16 watts and 2 sections of 700 ohms, 5½ watts (C193A, C193B, C193C)
48207	Resistor—Wire wound, 3,300 ohms, 10 watts (R177)
	Resistor—Fixed, composition:
	10 ohms, ±20%, ½ watt (R120)
	10 ohms, ±10%, ½ watt (R225)
	47 ohms, ±5%, ½ watt (R111)
	47 ohms, ±20%, ½ watt (R183)
	68 ohms, ±10%, ½ watt (R105)
	68 ohms, ±20%, ½ watt (R123)
	82 ohms, ±10%, ½ watt (R195)
	100 ohms, ±10%, 2 watts (R184)
	150 ohms, ±5%, ½ watt (R102)
	150 ohms, ±10%, ½ watt (R115)
	150 ohms, ±20%, ½ watt (R106, R109, R114, R214)
	220 ohms, ±10%, ½ watt (R121)
	330 ohms, ±10%, 2 watts (R206)
	1,000 ohms, ±20%, ½ watt (R103, R107, R108, R113, R116, R118, R165, R199)
	1,200 ohms, ±10%, 1 watt (R160)
	1,200 ohms, ±10%, ½ watt (R196)
	1,500 ohms, ±10%, ½ watt (R161)
	2,200 ohms, ±10%, ½ watt (R219)
	2,700 ohms, ±10%, ½ watt (R217)
	3,300 ohms, ±10%, 2 watts (R231)
	3,900 ohms, ±5%, ½ watt (R112)
	3,900 ohms, ±10%, ½ watt (R171)
	3,900 ohms, ±10%, 2 watts (R194)
	4,700 ohms, ±10%, ½ watt (R144)
	4,700 ohms, ±10%, 2 watts (R239)
	5,100 ohms, ±5%, ½ watt (R126)
	5,600 ohms, ±5%, ½ watt (R119)
	5,600 ohms, ±10%, ½ watt (R218)
	5,600 ohms, ±10%, 1 watt (R127, R167)
	6,800 ohms, ±5%, ½ watt (R136)
	6,800 ohms, ±10%, ½ watt (R150)
	8,200 ohms, ±5%, ½ watt (R175)
	8,200 ohms, ±10%, ½ watt (R152, R153)
	8,200 ohms, ±5%, 1 watt (R117, R128)
	10,000 ohms, ±5%, ½ watt (R104)
	10,000 ohms, ±10%, ½ watt (R141, R182, R220)
	10,000 ohms, ±10%, 2 watts (R237, R240)
	12,000 ohms, ±5%, ½ watt (R164)
	12,000 ohms, ±10%, ½ watt (R209)
	12,000 ohms, ±10%, 1 watt (R186)
	12,000 ohms, ±10%, 2 watts (R124, R238)
	15,000 ohms, ±10%, 1 watt (R146)
	15,000 ohms, ±10%, ½ watt (R235)
	18,000 ohms, ±10%, ½ watt (R234)
	22,000 ohms, ±10%, ½ watt (R134, R197)
	22,000 ohms, ±20%, ½ watt (R198, R215)
	27,000 ohms, ±10%, ½ watt (R143, R151, R211)
	39,000 ohms, ±5%, ½ watt (R135)
	47,000 ohms, ±5%, ½ watt (R228)
	47,000 ohms, ±10%, ½ watt (R145)
	47,000 ohms, ±20%, ½ watt (R221)

REPLACEMENT PARTS (Continued)

STOCK No.	DESCRIPTION
	82,000 ohms, ±5%, 1 watt (R179)
	82,000 ohms, ±10%, 1 watt (R168)
	100,000 ohms, ±5%, ½ watt (R203, R204)
	100,000 ohms, ±10%, ½ watt (R216, R226)
	100,000 ohms, ±10%, 1 watt (R174)
	100,000 ohms, ±20%, 2 watts (R222)
	120,000 ohms, ±10%, 1 watt (R172)
	150,000 ohms, ±10%, ½ watt (R129, R180, R185, R187)
	150,000 ohms, ±20%, ½ watt (R142)
	150,000 ohms, ±5%, 1 watt (R176)
	180,000 ohms, ±10%, ½ watt (R232)
	220,000 ohms, ±10%, ½ watt (R138, R166)
	270,000 ohms, ±10%, ½ watt (R154)
	330,000 ohms, ±10%, ½ watt (R140, R170, R200)
	330,000 ohms, ±5%, 1 watt (R178)
	470,000 ohms, ±10%, ½ watt (R137, R139, R188, R224)
	560,000 ohms, ±10%, ½ watt (R207, R236)
	680,000 ohms, ±10%, ½ watt (R133, R212)
	820,000 ohms, ±10%, ½ watt (R169, R181)
	1 megohm, ±10%, ½ watt (R147)
	1 megohm, ±20%, ½ watt (R189)
	1.2 megohm, ±5%, ½ watt (R157, R213)
	2.2 megohm, ±10%, ½ watt (R130, R132, R163)
	2.7 megohm, ±5%, 1 watt (R227)
	3.3 megohm, ±5%, ½ watt (R159)
	3.9 megohm, ±10%, ½ watt (R149)
	6.8 megohm, ±10%, ½ watt (R125)
	10 megohm, ±10%, ½ watt (R148)
	10 megohm, ±20%, ½ watt (R201, R229)
74602	Screw—No. 10-32 x 1¾" cross recessed round head screw for focus coil adjustments (3 required)
*75083	Screw—No. 8-32 x ¼" wing screw for deflection yoke mounting
74601	Screw—No. 8-32 x ⅜" cross recessed pan head screw for focus coil mounting (2 required)
73584	Shield—Tube shield
74937	Sleeve—Rubber sleeve for focus coil
73117	Socket—Tube socket, 7 pin, miniature
72927	Socket—Tube socket, 9 pin, miniature
31251	Socket—Tube socket, octal
73249	Socket—Tube socket, octal, ceramic, plate mounted
71508	Socket—Tube socket, 8 contact for 1B3 GT, 8016
74834	Socket—Kinescope socket
31364	Socket—Pilot lamp socket
74954	Spring—Compression spring used under centering control screws (3 required)
74936	Spring—Suspension spring (coil type) for kinescope socket leads
74944	Support—Rubber support for 2nd anode lead
74948	Support—Bakelite support (1 set) for mounting hi-voltage plate
74157	Switch—Cabinet interlock switch (S105)
*75084	Transformer—Power transformer, 115 volts, 60 cycles (T111)
74950	Transformer—Vertical output transformer (T108)
73569	Transformer—Vertical oscillator transformer (T107)
74951	Transformer—Hi-voltage transformer (T110)
74589	Transformer—First pix, i-f transformer (T101, C102, R101)
74590	Transformer—Second pix, i-f transformer (T102, C107)
74591	Transformer—Third pix, i-f transformer (T103, C112)
74592	Transformer—Fourth pix, i-f transformer (T104, C116)
73575	Transformer—Fifth pix, i-f transformer (T106, C123, C124)
71424	Transformer—Sound i-f transformer (T112, C173, C174)
71427	Transformer—Sound discriminator transformer (T113, C178, C179, C180)

STOCK No.	DESCRIPTION
73576	Transformer—Horizontal oscillator transformer (T109)
73578	Transformer—Antenna transformer complete with socket (T115, J102)
73577	Trap—4.5 mc trap (L110, C128)
71778	Trap—Sound trap (T105, C119)
73476	Trap—I-F trap (L116, C189)
74952	Yoke—Deflection yoke (L108, L109, L112, L113, C169, C187, P106)
	RADIO CHASSIS ASSEMBLIES RK 135 D
74039	Board—"Telv-Ant" terminal board (TB301)
74026	Bracket—Drive cord bracket complete with two pulleys—R.H.
74027	Bracket—Drive cord bracket complete with pulley—L.H.
74911	Cable—Shielded cable complete with female connector (W307, W311)
71105	Cable—Shielded cable complete with pin plug (W301, W302)
74017	Capacitor—Variable tuning capacitor (C301, C302, C303, C304, C305, C307, C308)
73866	Capacitor—Ceramic, 2 mmf. (C306)
39044	Capacitor—Ceramic, 15 mmf. (C312)
39042	Capacitor—Ceramic, 47 mmf. (C330)
73867	Capacitor—Ceramic, 56 mmf. (C313)
33379	Capacitor—Ceramic, 68 mmf. (C310)
39396	Capacitor—Ceramic, 100 mmf. (C322, C323)
48125	Capacitor—Ceramic, 150 mmf. (C314)
71922	Capacitor—Ceramic, 180 mmf. (C334, C338)
39640	Capacitor—Mica, 330 mmf. (C325, C326)
73748	Capacitor—Ceramic, 1,500 mmf. (C309)
74009	Capacitor—Ceramic, dual, 4,000 mmf. (C317, C319, C321)
73473	Capacitor—Ceramic, 5,000 mmf. (C318, C329)
73747	Capacitor—Electrolytic, 2 mfd., 50 volts (C328)
32223	Capacitor—Electrolytic, 15 mfd., 300 volts (C333)
70602	Capacitor—Tubular, paper, .0025 mfd., 400 volts (C332)
73961	Capacitor—Tubular, paper, .003 mfd., 200 volts (C327, C331)
71553	Capacitor—Tubular, paper, .005 mfd., 400 volts (C315, C320, C324)
71923	Capacitor—Tubular, paper, .01 mfd., 200 volts (C335)
71925	Capacitor—Tubular, paper, .01 mfd., 400 volts (C311)
71929	Capacitor—Tubular, paper, .02 mfd., 200 volts (C337)
72596	Capacitor—Tubular, paper, .05 mfd., 200 volts (C336)
74455	Capacitor—Tubular, paper, .05 mfd., 400 volts (C316)
74020	Coil—A-M antenna coil (L302, L303)
73744	Coil—A-M oscillator coil (L304, L305, L306)
74024	Coil—F-M antenna coil (L301)
74025	Coil—F-M oscillator coil (L307)
36395	Connector—7 contact male connector (P103)
12493	Connector—5 contact female connector (P107B)
39153	Connector—4 prong male connector (P102)
72953	Cord—Drive cord (approx. 42" overall)
74011	Filter—Diode filter, dual, 200 mmf. and 47,000 ohms (DF 301)
74023	Resistor—Wire wound, 0.51 ohms, 1 watt (R323, R324)
	Resistor—Fixed, composition:
	10 ohms, ±20%, ½ watt (R311)
	68 ohms, ±20%, ½ watt (R308)
	100 ohms, ±20%, ½ watt (R305, R317)
	120 ohms, ±10%, ½ watt (R314)
	680 ohms, ±20%, ½ watt (R310, R312)
	1,200 ohms, ±5%, ½ watt (R319)
	3,300 ohms, ±5%, ½ watt (R320)
	4,700 ohms, ±10%, ½ watt (R333)
	10,000 ohms, ±20%, ½ watt (R306)

STOCK No.	DESCRIPTION
	15,000 ohms, ±10%, ½ watt (R304)
	15,000 ohms, ±20%, ½ watt (R315, R318)
	18,000 ohms, ±10%, ½ watt (R302)
	27,000 ohms, ±10%, ½ watt (R307, R309)
	39,000 ohms, ±10%, ½ watt (R322)
	68,000 ohms, ±10%, ½ watt (R328)
	100,000 ohms, ±10%, ½ watt (R334)
	150,000 ohms, ±10%, ½ watt (R325, R326, R329)
	270,000 ohms, ±10%, ½ watt (R330)
	470,000 ohms, ±10%, ½ watt (R331)
	470,000 ohms, ±20%, ½ watt (R321)
	1 megohm, ±10%, ½ watt (R327, R332)
	2.2 megohm, ±20%, ½ watt (R303)
	3.9 megohm, ±10%, ½ watt (R301)
	22 megohm, ±20%, ½ watt (R316)
74028	Shaft—Tuning knob shaft
73632	Shield—Tube shield
73117	Socket—Tube socket, 7 pin, miniature for V301, V304, V305
74179	Socket—Tube socket, 7 pin, miniature for V302, V303
31364	Socket—Dial lamp socket
74038	Spring—Drive cord spring
74894	Switch—Selector switch (S301)
73745	Transformer—First i-f transformer, dual (T301)
74019	Transformer—Second i-f transformer, dual (T302)
73743	Transformer—Ratio detector transformer (T303)
33726	Washer—"C" washer for tuning shaft
34457	Washer—Spring washer for tuning shaft (front)
74172	Washer—Fibre washer to prevent drive cord slippage
	SPEAKER ASSEMBLIES 92569-5 W RL 111-8 RMA 274
13867	Cap—Dust cap
74901	Cone—Cone and voice coil assembly (3.2 ohms)
5039	Connector—4 contact male connector (J101)
73636	Transformer—Output transformer (T114)
73635	Speaker—12" P.M. speaker complete with cone and voice coil less output transformer and plug
	NOTE:—If stamping in instruments does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
75102	Back—Cabinet back
71054	Bracket—Dial lamp bracket (2 required)
71599	Bracket—Pilot lamp bracket
74296	Cable—Shielded pickup cable complete with pin plug for 45 RPM changer
72437	Cable—Shielded pickup cable complete with pin plug for 33 78 RPM changer
13103	Cap—Pilot lamp cap
73803	Capacitor—Tubular, paper, .002 mfd., 400 volts (C401)
71892	Catch—Bullet catch and strike for doors (3 required)
X3092	Cloth—Grille cloth for mahogany or walnut cabinets
X3090	Cloth—Grille cloth for oak cabinets
30868	Connector—2 contact female connector for 45 RPM motor extension cable
30870	Connector—2 contact male connector for 45 RPM motor extension cable
14782	Connector—3 contact male connector for record changer power cable
74581	Cover—Mounting screw cover for 45 RPM changer

STOCK No.	DESCRIPTION
74273	Decal—Trade mark decal (Victrola)
74898	Decal—Control panel function decal for mahogany or walnut instruments
74899	Decal—Control panel function decal for oak instruments
74052	Dial—Dial scale and bezel assembly
74809	Emblem—"RCA Victor" emblem
73642	Escutcheon—Channel marker escutcheon for mahogany or walnut instruments
73740	Escutcheon—Channel marker escutcheon for oak instruments
74606	Glass—Safety glass
37396	Grommet—Rubber grommet to mount speaker (4 required)
74308	Hinge—Cabinet door hinges (1 set) for RH or LH door
70166	Hinge—Cabinet door hinge for center door—upper
73200	Hinge—Cabinet door hinge for center door—lower
74051	Indicator—Station selector indicator
74959	Knob—Fine tuning knob — maroon — for mahogany or walnut instruments (outer)
73995	Knob—Fine tuning knob—tan—for oak instruments (outer)
74960	Knob—Channel selector knob—maroon—for mahogany or walnut instruments (inner)
74961	Knob—Channel selector knob—tan—for oak instruments (inner)
74962	Knob—Vertical hold control, brightness control or tone control knob—maroon—for mahogany or walnut instruments (outer)
73999	Knob—Vertical hold control, brightness control or tone control knob—tan—for oak instruments (outer)
74978	Knob—Tuning or selector switch knob—maroon—for mahogany or walnut instruments
74979	Knob—Tuning or selector switch knob—tan—for oak instruments
74963	Knob—Horizontal hold control, picture control or volume control and power switch knob—maroon—for mahogany or walnut instruments
74001	Knob—Horizontal hold control, picture control or volume control and power switch knob—tan—for oak instruments (inner)
11765	Lamp—Dial or pilot lamp—Mazda 51
74208	Nut—Tee nut to mount 45 RPM changer (3 required)
74162	Plate—Mounting plate for cabinet interlock switch
75037	Pull—Door pull
	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ watt (R401)
74582	Screw—No. 8-32 x 1¾" special screw to mount 45 RPM changer (3 required)
74156	Screw—No. 8-32 x 7 16" wing screw for deflection yoke and focus coil support and bracket
75038	Screw—No. 8-32 x ½" trimit head screw for door pull
74050	Slide—Station indicator slide
71736	Slide—Slide mechanism for changer carriages
74055	Spring—Spring clip for dial and bezel assembly (2 required)
72845	Spring—Retaining spring for knobs No. 73995 and No. 74959
14270	Spring—Retaining spring for knobs 73999, 74960, 74961 and 74962
30330	Spring—Retaining spring for knobs 74001 and 74963
73643	Spring—Spring clip for channel marker escutcheon
74421	Spring—Conical spring to mount 45 RPM changer—upper—R.H. (1 required)
74422	Spring—Conical spring to mount 45 RPM changer—upper L.H. (2 required)
74423	Spring—Conical spring to mount 45 RPM changer—lower—(3 required)
74956	Spring—Formed spring for kinescope masking panel (8 required)
72936	Stop—Door stop
74161	Stud—Locating stud for back cover (2 required)
75146	Washer—"C" washer for mounting 33 78 RPM changer (2 required)

To obtain resistors for which no stock number is given, order by stating type, value of resistance, tolerance and wattage.

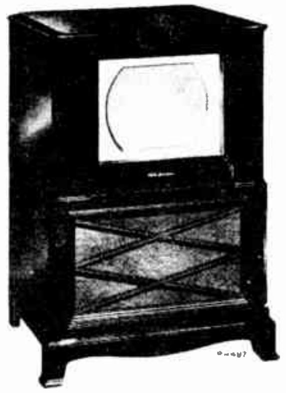
World Radio History

INDEX

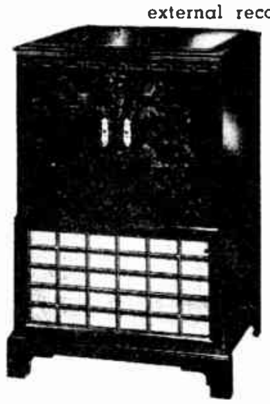
GENERAL DESCRIPTION

Models TC124, TC125, and TC127 are twelve and one-half inch television receivers and are electrically identical except for cabinets. The kinescopes are shipped in place in the cabinet. These receivers employ twenty-one tubes plus two rectifiers and a 12LP4 kinescope.

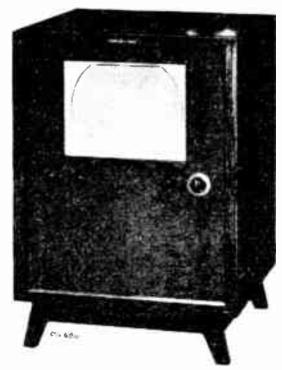
Features of the television unit are full twelve channel coverage; FM sound system; improved picture brilliance; picture A-G-C; A-F-C horizontal hold; stabilized vertical hold; two stages of video amplification; noise saturation circuits; improved sync separator and clipper; four mc. band width for picture channel and reduced hazard high voltage supply. An auxiliary audio input jack is provided to permit the use of an external record playing attachment.



Model TC125
Walnut, Mahogany or Oak



Model TC127
Walnut, Mahogany or Oak



Model TC124
Walnut, Mahogany or Oak

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE ....87 square inches on a 12LP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
Fine Tuning Range..±250 kc. on chan. 2, ±650 kc. on chan. 13
Picture Carrier Frequency ....25.75 mc.
Sound Carrier Frequency ....21.25 mc.

VIDEO RESPONSE ....To 4 mc.

SWEEP DEFLECTION ....Magnetic

FOCUS ....Magnetic

POWER SUPPLY RATING ....115 volts, 60 cycles, 230 watts

AUDIO POWER OUTPUT RATING ....2.6 watts max.

LOUDSPEAKERS—92569-7 ....12" PM Dynamic, 2.2 ohms

CHASSIS DESIGNATION KCS34B

DIMENSIONS (inches)	Width	Height	Depth
Cabinet (outside) TC124	22 7/8	33 1/4	20 1/2
Cabinet (outside) TC125	25 1/4	36 1/4	21 1/4
Cabinet (outside) TC127	25 3/8	36 1/2	22 5/8
Chassis Assembly (overall)	19 1/2	14	20

WEIGHT

Chassis with Tubes in Cabinet	TC124	103 lbs.
	TC125	100 lbs.
	TC127	110 lbs.
Shipping Weight	TC124	125 lbs.
	TC125	122 lbs.
	TC127	133 lbs.

RECEIVER ANTENNA INPUT IMPEDANCE

Choice: 300 ohms balanced or 72 ohms unbalanced.

RCA TUBE COMPLEMENT

	Tube Used	Function
(1)	RCA 6AG5	R-F Amplifier
(2)	RCA 6AG5	Converter
(3)	RCA 6J6	R-F Oscillator
(4)	RCA 6AU6	1st Sound I-F Amplifier
(5)	RCA 6AU6	2nd Sound I-F Amplifier
(6)	RCA 6AL5	Sound Discriminator
(7)	RCA 6AV6	1st Audio Amplifier
(8)	RCA 6K6GT	Audio Output
(9)	RCA 6BA6	1st Picture I-F Amplifier
(10)	RCA 6AG5	2nd Picture I-F Amplifier
(11)	RCA 6BA6	3rd Picture I-F Amplifier
(12)	RCA 6AG5	4th Picture I-F Amplifier
(13)	RCA 6AL5	Picture 2nd Detector and Sync Limiter
(14)	RCA 12AU7	1st and 2nd Video Amplifier
(15)	RCA 6SN7GT	AGC Amplifier and Vertical Sweep Oscillator
(16)	RCA 6SN7GT	AGC Rectifier and 1st Sync Separator
(17)	RCA 6SN7GT	Sync Amplifier and 2nd Sync Separator
(18)	RCA 6K6GT	Vertical Sweep Output
(19)	RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(20)	RCA 6BG6G	Horizontal Sweep Output
(21)	RCA 6W4GT	Damper
(22)	RCA 1B3-GT 8016	High Voltage Rectifier
(23)	RCA 5U4G	Power Supply Rectifier
(24)	RCA 12LP4	Kinescope

PICTURE INTERMEDIATE FREQUENCIES

Picture Carrier Frequency ....25.75 Mc.
Adjacent Channel Sound Trap ....27.25 Mc.
Accompanying Sound Traps ....21.25 Mc.
Adjacent Channel Picture Carrier Trap ....19.75 Mc.

SOUND INTERMEDIATE FREQUENCIES

Sound Carrier Frequency ....21.25 Mc.
Sound Discriminator Band Width between peaks ....350 kc

VIDEO RESPONSE ....To 4 Mc.

FOCUS ....Magnetic

SWEEP DEFLECTION ....Magnetic

SCANNING ....Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY ....15,750 cps

VERTICAL SWEEP FREQUENCY ....60 cps

FRAME FREQUENCY (Picture Repetition Rate) ....30 cps

OPERATING CONTROLS (front panel)

Channel Selector / Fine Tuning	Dual Control Knobs
Picture / Brightness	Dual Control Knobs
Picture Horizontal Hold / Picture Vertical Hold	Dual Control Knobs
Sound Volume and On-Off Switch	Single Control Knob

NON-OPERATING CONTROLS (not including r-f & i-f adjustments)

Horizontal Centering	top chassis screwdriver adjustment
Vertical Centering	top chassis screwdriver adjustment
Width	rear chassis screwdriver adjustment
Width Selector Switch	rear chassis adjustment
Height	rear chassis adjustment
Horizontal Linearity	rear chassis screwdriver adjustment
Vertical Linearity	rear chassis adjustment
Horizontal Drive	rear chassis screwdriver adjustment
Horizontal Osc. Freq.	bottom chassis adjustment
Horizontal Osc. Waveform	side chassis adjustment
Horizontal Locking Range	rear chassis adjustment
Focus	rear chassis adjustment
Ion Trap Magnet	top chassis adjustment
Deflection Coil	top chassis wing nut adjustment
AGC Threshold Control	rear chassis adjustment

OPERATING INSTRUCTIONS

The following adjustments are necessary when turning the receiver on for the first time:

1. See that the TV-PH switch on the rear apron is in the "TV" position.

2. Turn the receiver "ON" and advance the SOUND VOLUME control to approximately mid-position.

3. Set the STATION SELECTOR to the desired channel.

4. Adjust the FINE TUNING control for best sound fidelity and the SOUND VOLUME control for suitable volume.

5. Turn the BRIGHTNESS control fully counter-clockwise, then clockwise until a light pattern appears on the screen.

6. Adjust the VERTICAL hold control until the pattern stops vertical movement.

7. Adjust the HORIZONTAL hold control until a picture is obtained and centered.

8. Turn the BRIGHTNESS control counter-clockwise until the retrace lines just disappear.

9. Adjust the PICTURE control for suitable picture contrast.

10. After the receiver has been on for some time, it may be necessary to readjust the FINE TUNING control slightly for improved sound fidelity.

11. In switching from one station to another, it may be necessary to repeat steps 4, 8 and 9.

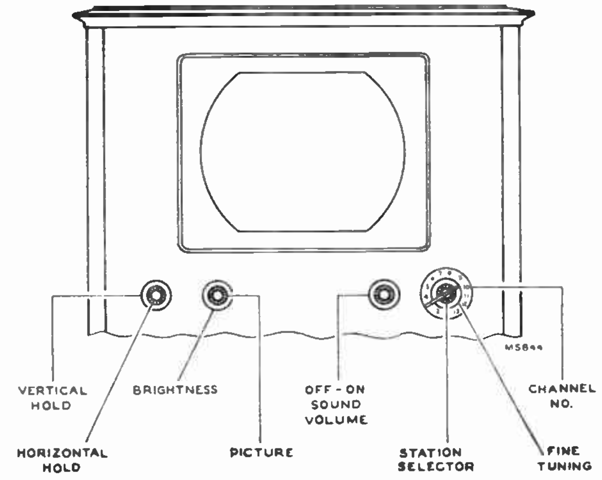


Figure 1—Receiver Operating Controls

12. When the set is turned on again after an idle period, it should not be necessary to repeat the adjustments if the positions of the controls have not been changed. If any adjustment is necessary, step number 4 is generally sufficient.

13. If the positions of the controls have been changed, it may be necessary to repeat steps 2 through 9.

14. To use the instrument with a record player, plug the record-player output cable into the PHONO jack on the rear apron, and set the TV-PH switch on "PH." Set the TV-PH switch back to TV on completion of the record program.

INSTALLATION INSTRUCTIONS

Models TC124, TC125 and TC127 receivers are shipped complete in one carton with the kinescope in place in the cabinet.

UNPACKING.—To unpack, turn the shipping carton on its side and tear open the carton bottom flaps. Fold the flaps up along the side of the carton and turn the carton back up. Lift the carton up and off the cabinet.

Remove the cabinet back grille. Take off the two nuts on the bolts holding the cabinet on the skid. With a man on each side of the cabinet, lift the receiver up and off the skid.

Remove the protective cardboard shield from the 5U4G rectifier. Remove all shipping material.

Remove the envelope containing the control knobs and install them on the proper control shafts.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the high voltage lead is attached to the kinescope second anode connector socket on the bell of the tube.

ANTENNA AND POWER CONNECTIONS.—Connect the leads from the antenna to the receiver antenna terminals.

Make sure that the receiver power switch is in the off position. Plug the receiver power cord into a 115 volt 60 cycle a-c outlet.

©John F. Rider

World Radio History

INSTALLATION INSTRUCTIONS

WARNING.—The high voltage supply in this receiver delivers 10,000 volts! A.C. interlocks are provided at the back of the set so that when the back is removed—so is the power.

Turn the power switch to the "on" position, the brightness control three-quarters clockwise, and picture control fully counter-clockwise.

ION TRAP MAGNET ADJUSTMENT.—Immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust the focus control (R191 on the chassis rear apron) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

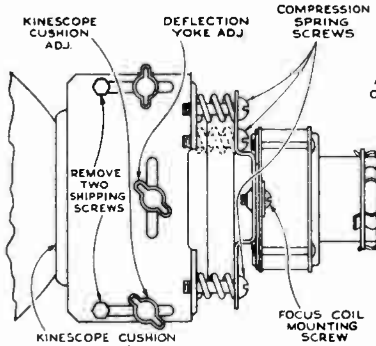

Figure 2—Yoke and Focus Coil Adjustments

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. See steps 3 through 9 of the receiver operating instructions.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC threshold control is misadjusted, and the receiver overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R138 (on the rear of the chassis, see Figure 3) clockwise until the set operates normally and the picture can be synced.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counterclockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull-in should occur when the control is approximately 90 degrees from the extreme counterclockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should be out of sync and should show 1 vertical or diagonal black bar in the raster.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Coil Adjustment."

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counterclockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T109 horizontal frequency adjustment (under the chassis) until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster.

Horizontal Lock in Range Adjustment.—Set the horizontal hold control to the full counterclockwise position. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 3 bars are present adjust C153A slightly counterclockwise. Turn the picture control counterclockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 68. For field purposes paragraph "A" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS COIL ADJUSTMENTS.—The focus coil should be adjusted so that there is approximately one-quarter inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus coil. This spacing gives best average focus over the face of the tube. However, it may be necessary to change this distance slightly in order to compensate for small differences in strength of the permanent magnets in the coil. If the receiver focuses with the focus control at or near the clockwise end of its range, the focus coil should be moved toward the yoke and if focus is obtained at or near the counterclockwise end of the control, the coil should be moved away from the yoke.

The axis of the hole through the focus coil should be parallel with the axis of the kinescope neck.

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is obtained by loosening the two focus coil mounting screws and sliding the coil up or down or from side to side. If the focus coil was appreciably changed in position or if a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by sliding the coil. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In extreme cases it may be necessary to adjust one or more of the three focus coil compression spring screws to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjust the horizontal drive control C153B to give a picture of maximum width within the limits of good linearity. Adjust the horizontal linearity control L111 to provide best linearity. Adjust the width control until the picture just fills the mask.

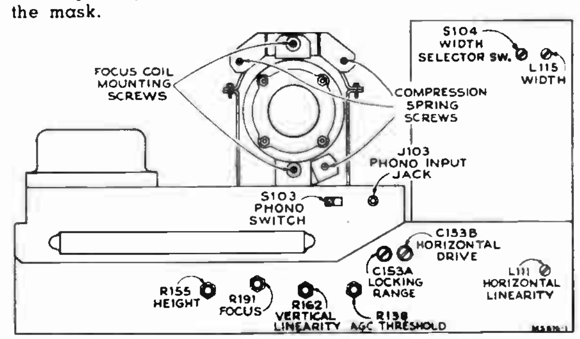

Figure 3—Rear Chassis Adjustments

A width control coil and a width selector switch are provided. With the switch in position 1 (fully counterclockwise), adjust the width coil until the picture fills the mask. On low line voltages it may not be possible to get sufficient width by adjustment of the width coil. In this case turn the width selector switch clockwise to position 2. In this position the width coil is disconnected, and adjustment of the width coil will have no effect. For still greater width, turn the width selector switch fully clockwise to position 3. In this position, the high voltage is reduced slightly thus permitting greater deflection.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R155 on chassis rear apron) until the picture fills the mask vertically. Adjust vertical linearity (R162 on rear apron), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus control (R191 on chassis rear apron) for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

In some cases it may be possible to improve focus by a slight reposition of the ion trap magnet while staying within the range of maximum brightness.

Check to see that the cushion and yoke thumbscrews and the focus coil mounting screws are tight.

AGC THRESHOLD CONTROL.—The AGC threshold control R138 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal, sync the picture and turn the picture control to the maximum clockwise position. Turn the brightness control counterclockwise until the vertical retrace lines are just invisible. Momentarily remove the signal by switching off channel then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R138. If the picture requires an appreciable portion of a second to reappear, R138 should be readjusted.

Set the picture control at the maximum clockwise position. Turn R138 fully clockwise. The top one-half inch of the picture may be bent slightly. This should be disregarded. Turn R138 counterclockwise until there is a very, very slight bend or change of bend in the top one-half inch of the picture. Then turn R138 clockwise just sufficiently to remove this bend or change of bend.

If the signal is very weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R138 counterclockwise until the snow in the picture becomes more pronounced, then clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far counterclockwise on a weak signal, then the receiver may overload when a strong signal is received.

Replace the cabinet back and make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

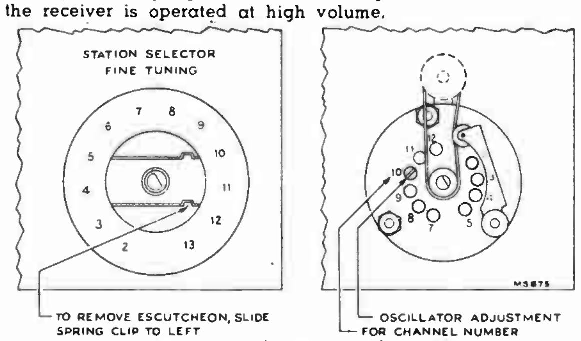

Figure 4—R-F Oscillator Adjustments

CHECK OF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 10. The adjustments for channels 2 through 5 and 7 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis and channel 6 adjustment is in the kinescope well. See Figures 8 and 9 for their location.

CHASSIS REMOVAL.—To remove the chassis for repair or installation of a new kinescope, remove the cabinet back and the control knobs, unplug the speaker cable, and remove the six chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet. The kinescope is held on the chassis by means of a special strap, so that the chassis and the kinescope can be handled together, as a unit.

To remove the kinescope, remove the kinescope socket, the ion-trap magnet, and the second-anode connector. Loosen the cross-recessed head screw on the kinescope strap. Withdraw the kinescope toward the front of the chassis.

INSTALLATION OF KINESCOPE.—The kinescope second anode contact is a recessed metal well in the side of the bulb. The tube must be installed so that this contact is up but rotated approximately 30 degrees toward the high-voltage compartment.

Insert the neck of the kinescope through the deflection and focus coils. If the tube sticks, or fails to slip into place smoothly, investigate and remove the cause of the trouble. Do not force the tube.

Slide the kinescope cushion toward the rear of the chassis. Loosen the deflection yoke adjustment, slide the yoke toward the rear of the chassis and tighten.

Slip the ion trap magnet assembly over the neck of the kinescope.

Connect the kinescope socket to the tube base.

Connect the high voltage lead to the kinescope second anode socket.

Wipe the kinescope screen surface and front panel safety glass clean of all dust and finger marks.

To replace the chassis in the cabinet, first tighten the cross-recessed head screw on the kinescope strap. Slide the chassis into the cabinet, then insert and tighten the six chassis bolts. Loosen the kinescope strap from the rear of the cabinet. Push the kinescope forward until the face of the tube is against the mask. Push the yoke cushion forward against the kinescope flare, then tighten the cushion adjusting screws. Tighten the kinescope strap. Then replace the knobs, and the cabinet back.

WEAK SIGNAL AREA OPERATION.—Since the vast majority of receivers are sold in strong signal areas the chassis are aligned to produce the cleanest pictures in those areas. However, if the receiver is to be operated in a weak signal area, better performance can be obtained by "peaking" the r-f unit.

To peak the r-f unit in these receivers, disconnect R14, the 390 ohm resistor which is on top of the r-f unit chassis. Adjust L66 to obtain the best possible picture on the weakest low channel station received. By this action, the r-f gain is increased 50% at the expense of r-f bandwidth and an improvement in the weak signal picture results.

If the peaked receiver is subsequently taken to a strong signal area, the resistor R14 should be connected in place and L66 adjusted for "flat" response on the low channels.

ANTENNAS.—The finest television receiver built may be said to be only as good as the antenna design and installation. It is therefore important to select the proper antenna to suit the particular local conditions, to install it properly and orient it correctly.

RCA Television Antenna, type No. 225A1 is designed for reception of all twelve television channels. The antenna uses the 300-ohm RCA "Bright Picture" television transmission line. The antenna, a dipole with reflector, is unidirectional on channels two through six. When used on these channels, the maximum signal is obtained when the antenna rods are broadside toward the transmitting antenna, with the antenna element between the reflector and the transmitting antenna.

If two or more stations are available between channels two and six and the two stations are in different directions, it may be possible to make a compromise orientation which will provide a satisfactory signal on all such channels.

When operated on channels seven through thirteen (174 to 216 Mc), the antenna has side lobes. On these channels, the maximum signal will be obtained when the antenna is rotated approximately 35 degrees in either direction from its broadside position toward the transmitting antenna. In many instances this effect may not cause any difficulties and it may be possible to make a compromise orientation which will permit satisfactory reception on all high and low channels. In some instances, however, this will not be the case due to reflections or to insufficient signal strength from one or more stations.

RCA antennas type 204A1 is available for use in locations in which it is desirable to eliminate side lobes and to have the antennas 7-13 directivity the same as 2-6 directivity.

For use in cases where it is desirable to have adjustable 7-13 directivity different from 2-6, RCA antenna type 206A1 is provided.

If it is impossible to obtain satisfactory results on one or more channels, it may become necessary either to provide means for tuning the antenna when switching channels or to install a separate antenna for one or more channels and to switch antennas when switching channels.

In weak signal areas it is possible to "stack" the type 204A1 antenna to obtain increased signal strength by employing one type 204A1 antenna and one type 208A1 stacking kit.

REFLECTIONS.—Multiple images sometimes known as echoes or ghosts, are caused by the signal arriving at the antenna by two or more routes. The second or subsequent image occurs when a signal arrives at the antenna after being reflected off a building, a hill or other object. In severe cases of reflections, even the sound may be distorted. In less severe cases, reflections may occur that are not noticeable as reflections but that will instead cause a loss of definition in the picture.

Depending upon the circumstances, it may be possible to eliminate the reflections by rotating the antenna or by moving it to a new location. In extreme cases, it may be impossible to eliminate the reflection.

CABINET ANTENNA.—A cabinet antenna is provided in these receivers and the leads are brought out near the antenna terminal board. The cabinet antenna may be employed in place of the outdoor antenna in areas where the signals are strong and no reflections are experienced.

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of this receiver, it is recommended that the following test equipment be available:

R-F Sweep Generator meeting the following requirements:

(a) Frequency Ranges
20 to 30 mc., 1 mc. and 10 mc. sweep width
50 to 90 mc., 10 mc. sweep width
170 to 225 mc., 10 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

Cathode-Ray Oscilloscope.—For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response, and should be capable of passing a 60-cycle square wave without appreciable distortion. While this requirement is not met by many commercial instruments, RCA Oscilloscopes, types WO-55A, WO-58A, WO-79A, and WO-60C fill the requirement and any of these may be employed.

For video and sync waveform observations, the oscilloscope must have excellent frequency and phase response from 10 cycles to at least two megacycles in all positions of the gain control. The RCA types WO-58A and WO-79A are ideally suited for this purpose.

Signal Generator to provide the following frequencies with crystal accuracy.

(a) Intermediate frequencies
19.75 mc. adjacent channel picture trap
21.25 mc. sound i-f and sound traps
22.05 and 24.75 mc. conv. and first pix i-f trans.
25.9 mc. second picture i-f transformer
24.6 mc. fourth picture i-f transformer
22.0 mc. third picture i-f transformer
22.5 mc. fifth picture i-f transformer
25.75 mc. picture carrier
27.25 mc. adjacent channel sound trap

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

Electronic Voltmeter of Junior "VoltOhmyst" type and a high voltage multiplier probe for use with this meter to permit measurements up to 10 kv.

Service Precautions.—If possible, the chassis should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, make sure the kinescope retaining strap is secure, and the yoke cushion is up firmly against the flare of the tube.

CAUTION: Do not short the kinescope second anode lead. Its short circuit current is approximately 3 ma. This represents approximately 9 watts dissipation and a considerable overload on the high voltage filter resistor R189.

Adjustments Required.—Normally, only the r-f oscillator line will require the attention of the service technician. All other circuits are either broad or very stable and hence will seldom require readjustment.

The oscillator line is relatively non critical. When oscillator tubes are changed, in all probability it will be necessary to adjust only C6 in order to bring the entire line into adjustment.

ORDER OF ALIGNMENT.—When a complete receiver alignment is necessary, it can be most conveniently performed in the following order:

(1) Sound discriminator
(2) Sound i-f transformers
(3) Picture i-f traps
(4) Picture i-f transformers
(5) R-F and converter lines
(6) R-F oscillator line
(7) 4.5 mc. video trap
(8) Sensitivity check

SOUND DISCRIMINATOR ALIGNMENT.—Set the signal generator for approximately .1 volt output at 21.25 mc. and connect it to the second sound i-f grid.

Detune T113 secondary (bottom).

Set the "VoltOhmyst" on the 10 volt scale.

Connect the meter in series with a one megohm resistor to the junction of diode resistors R203 and R204.

Adjust the primary of T113 (top) for maximum output on the meter.

Connect the "VoltOhmyst" to the junction of C183 and R203. Adjust T113 secondary (bottom). It will be found that it is possible to produce a positive or negative voltage on the meter dependent upon this adjustment. Obviously to pass from a positive to a negative voltage, the voltage must go through zero. T113 (bottom) should be adjusted so that the meter indicates zero output as the voltage swings from positive to negative. This point will be called discriminator zero output.

Connect the sweep oscillator to the grid of the second sound i-f amplifier.

Adjust the sweep band width to approximately 1 mc. with the center frequency at approximately 21.25 mc. and with an output of approximately .1 volt.

Connect the oscilloscope to the junction of C183 and R203. The pattern obtained should be similar to that shown in Figure 12. If it is not, adjust the T113 (top) until the waveform is symmetrical.

The peak-to-peak band width of the discriminator should be approximately 350 kc. and it should be linear from 21.175 mc. to 21.325 mc.

SOUND I-F ALIGNMENT.—Connect the sweep oscillator to the first sound i-f amplifier grid.

Connect the oscilloscope to the second sound i-f grid return (terminal A T112) in series with a 33,000 ohm isolating resistor.

Insert a 21.25 mc. marker signal from the signal generator into the second sound i-f grid.

Adjust T112 (top and bottom) for maximum gain and symmetry about the 21.25 mc. marker. The pattern obtained should be similar to that shown in Figure 13.

The output level from the sweep should be set to produce approximately .3 volt peak-to-peak at the second sound i-f grid return when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

The band width at 70% response from the first sound i-f grid to the second i-f grid should be approximately 200 kc.

PICTURE I-F TRAP ADJUSTMENT.—Connect the "VoltOhmyst" to the junction of R135 and C190.

Remove the 6SN7GT AGC Amplifier tube V107. Connect a 250,000 ohm potentiometer between pins 5 and 6 of the V107 socket. Adjust the potentiometer until the "VoltOhmyst" reads approximately −12.0 volts.

Set the channel switch to the blank position between channel numbers 2 and 13.

Connect the "VoltOhmyst" across the picture detector load resistor R119. Under this condition, both leads of the meter are at approximately −120 volts. In making this measurement, care should be taken not to touch the case of the meter or to permit the meter case to become grounded.

Connect the output of the signal generator to the grid of the converter tube V2. To do this, remove the tube from the socket and fashion a clip by twisting one end of a small piece of wire around pin number 1. Replace the tube in the socket leaving the end of the wire protruding from under the tube. Connect the signal generator to this wire through a 1,500 mmf. capacitor keeping the leads as short as possible.

Set the generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for minimum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is exactly on frequency.

(1) 21.25 mc.—T103 (top)
(2) 21.25 mc.—T105 (top)
(3) 27.25 mc.—T102 (top)
(4) 27.25 mc.—T104 (top)
(5) 19.75 mc.—T106 (top)
(6) 19.75 mc.—T101 (top)

In the above transformers using threaded cores, it is possible to run the cores completely through the coils and secure two peaks or nulls. The correct position is with the cores in the outside ends of the coils. If the cores are not in the correct position, the coupling will be incorrect and it will be impossible to secure the correct response.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary to prevent overloading.

22.5 mc.—T106 (bottom)
24.6 mc.—T104 (bottom)
22.0 mc.—T103 (bottom)
25.9 mc.—T102 (bottom)

T1 and T101 are coupled by a link and in combination constitute an overcoupled transformer. The characteristics of such a transformer are such that it is impossible to adjust it to a single frequency.

To sweep align T1 and T101, connect a 330 ohm composition resistor across the primary coils of T102, T103, T104 and T106.

Connect the "VoltOhmyst" to the junction of R135 and C190. Adjust the 250,000 ohm potentiometer for −2.0 volts on the meter.

Connect the oscilloscope to the plate of the first video amplifier, pin 1 of V106.

Connect a sweep generator to the converter grid through a 1,500 mmf. capacitor. Set the generator to sweep from 20.0 mc. to 30.0 mc. and adjust the output to provide a 4 volt peak-to-peak signal on the scope.

Connect the signal generator loosely to the converter grid and adjust to provide markers at 22.05 mc. and 24.75 mc.

Adjust T1 (top) and T101 (bottom) to obtain the response shown in Figure 14. The T1 core must penetrate to the terminal board end of the coil in order to obtain the correct response.

Remove the 330 ohm resistors from across T102, T103, T104 and T106.

Adjust the 250,000 ohm potentiometer for a 15 volt peak-to-peak signal at the plate of the first video amplifier. The bias as measured by the "VoltOhmyst" should be −12 volts or less.

Observe and analyze the response curve obtained. The response will not be ideal and the i-f adjustments must be retouched in order to obtain the desired curve. See Figure 15.

On final adjustment the picture carrier marker must be at approximately 45% response. The curve must be approximately flat topped, with the 22.1 mc. marker at approximately 95% response, the 25.0 mc. marker below 90% and the 26.5 mc. marker at 5% to 10% on the response curve.

The most important consideration in making the i-f adjustments is to get the picture carrier at the 45% response point. If the picture carrier operates too low on the response curve, loss of low frequency video response, of picture brilliance, of blanking, and of sync may occur. If the picture carrier operates too high on the response curve, the picture becomes smeared. In making these adjustments, care should be taken that no two transformers are tuned to the same frequency as i-f oscillation may result.

Remove the converter tube and take off the clip to pin number 1. Replace the tube in the socket.

Picture I-F Oscillation.—If the receiver will operate without oscillating with the test equipment disconnected but breaks into oscillation or becomes unstable with the equipment connected, it may become necessary to establish a ground plane. Cover the test bench with a sheet of copper and set the chassis on the sheet. Set all the test equipment except the "VoltOhmyst" on the sheet and bond or bypass them to it. A Junior "VoltOhmyst" should not be bonded to the sheet since the negative test probe is not always connected to ground during alignment.

If the receiver is badly misaligned and two or more of the i-f transformers are tuned to the same frequency, the receiver may fall into i-f oscillation. I-F oscillation shows up as a voltage across the picture detector load resistor that is unaffected by r-f signal input. If such a condition is encountered, it is sometimes possible to stop oscillation by increasing the grid bias. If so, it should then be possible to align the transformers by the usual method. Once aligned in this manner, the i-f should be stable with reduced bias.

If the oscillation cannot be stopped in the above manner, shunt the grids of the first three pix i-f amplifiers to ground with 1,000 mmf. capacitors. Connect the signal generator to the fourth pix i-f grid and align T106 to frequency. Progressively remove the shunt from each grid and align the plate coil of that stage to frequency.

If this does not stop the oscillation, the difficulty is not due to i-f misalignment as the i-f section is stable when properly aligned. Check all i-f by-pass condensers, transformer shunting resistors, tubes, socket voltages, etc.

ANTENNA, R-F AND CONVERTER LINE ADJUSTMENT.—In order to align the r-f tuner, it will first be necessary to set the channel 13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.

The channel 13 oscillator may be aligned by adjusting it to beat with a crystal calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available. Regardless of which method of oscillator alignment is used, the frequency standard must be crystal controlled or calibrated.

If the receiver oscillator is to be adjusted by the heterodyne freqenecy meter method, couple the meter probe loosely to the receiver oscillator.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier signal, connect the signal generator to the receiver antenna terminals. Connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203).

Set the receiver channel switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

©John F. Rider

World Radio History

ALIGNMENT PROCEDURE

Set the fine tuning control to the middle of its range while making the adjustment.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator.

Now that the channel 13 oscillator is set to frequency, we may proceed with the r-f alignment.

Remove the first pix i-f amplifier tube V101.

Connect the oscilloscope to the test connection at R13 in the r-f tuning unit.

Connect the "VoltOhmyst" to the junction of R135 and L117. Adjust the bias potentiometer for −3.5 volts on the meter.

Connect the r-f sweep oscillator to the receiver antenna terminals. The method of connection depends upon the output impedance of the sweep. The P102 connection for 300 ohm balanced or 72 ohm single-ended input are shown in the circuit diagram in Figure 79. If the sweep oscillator has a 50 ohm single-ended output, 300 ohm balanced output can be obtained by connecting as shown in Figure 7.

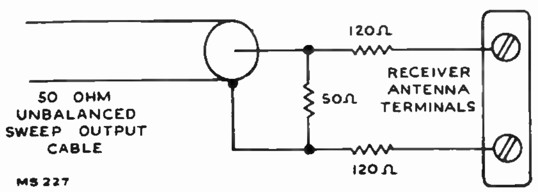

Figure 7—Unbalanced Sweep Cable Termination

Connect the signal generator loosely to the receiver antenna terminals.

Since channel 7 has the narrowest response of any of the high frequency channels, it should be adjusted first.

Set the receiver channel switch to channel 7.

Set the sweep oscillator to cover channel 7.

Insert markers of channel 7 picture carrier and sound carrier 175.25 mc. and 179.75 mc.

Adjust C10 and C14 until the curve falls symmetrically between the sound and picture carrier markers. Adjust C11 to give the proper bandwidth. Roughly peak L6 in conjunction with slight adjustments of C10 and C14 for a flat-topped, response curve with the sound and picture carriers at 90% to 95% response points on this curve. See Figure 16, channel 7.

Switch to channel 12 and adjust L6 for maximum response and minimum top slope of the curve.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep oscillator and marker oscillator to each of these channels and observe the response obtained. See Figure 16 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response. If the markers do not fall within this requirement on one or more high frequency channels, since there are no individual channel adjustments, it will be necessary to readjust L6, C10, C11 and C14, and possibly compromise some channel slightly in order to get the markers up on other channels. Normally, however, no difficulty of this type should be experienced since the higher frequency channels become comparatively broad and the markers easily fall within the required range.

Channel 6 is next aligned in the same manner.

Set the receiver to channel 6.

Set the sweep oscillator to cover channel 6.

Set the marker oscillator to channel 6 picture and sound carrier frequencies.

Adjust L9, L13, L66 and C12, for an approximately flat-topped response curve located symmetrically between the markers. L9, L13 and L66 are the center frequency adjustments. C12 is the band width adjustment.

Check channels 5 down through channel 2 by switching the receiver, sweep oscillator and marker oscillator to each channel and observing the response obtained. In all cases, the markers should be above the 80% response point. If this is not the case, L9, L13, L66 and C12 should be retouched. On final adjustment, all channels must be within the 80% specification.

Disconnect the bias pot. and replace V107. Replace V101.

Following an r-f alignment, the oscillator alignment must be checked.

R-F OSCILLATOR LINE ADJUSTMENT.—The r-f oscillator line may be aligned by adjusting it to beat with a crystal calibrated heterodyne frequency meter, or by feeding a signal into the receiver at the r-f sound carrier frequency and adjusting the oscillator for zero output from the sound discriminator. In this latter case the sound discriminator must first have been aligned to exact frequency. Either method of adjustment will produce the same results. The method used will depend upon the type of test equipment available.

Regardless of which method of oscillator alignment is used the frequency standard must be crystal controlled or calibrated. If the receiver oscillator is to be adjusted by the heterodyne frequency meter method, the calibration frequency listed under R-F Osc. Freq. must be available.

If the receiver oscillator is adjusted by feeding in the r-f sound carrier frequency, the frequencies listed under Sound Carrier Freq. must be available.

Channel Number	Receiver R-F Osc. Freq. Mc.	R-F Sound Carrier Freq. Mc.	Channel Oscillator Adjustment
2	81	59.75	L24
3	87	65.75	L23
4	93	71.75	L22
5	103	81.75	L21
6	109	87.75	L31
7	201	179.75	L19
8	207	185.75	L18
9	213	191.75	L17
10	219	197.75	L16
11	225	203.75	L15
12	231	209.75	L14
13	237	215.75	C6

If the heterodyne frequency meter method is used, couple the meter probe loosely to the receiver oscillator.

If the r-f sound carrier method is used, connect the "VoltOhmyst" to the sound discriminator output (junction of C183 and R203).

Connect the signal generator to the receiver antenna terminals. The order of alignment remains the same regardless of which method is used.

If the r-f unit is removed from the receiver for service and is aligned separately the shield over the bottom of the r-f unit must be in place when making adjustments.

Since lower frequencies are obtained by adding steps of inductance, it is necessary to align channel 13 first and continue in reverse numerical order.

Set the receiver channel switch to 13.

Adjust the frequency standard to the correct frequency (237 mc. for heterodyne frequency meter or 215.75 mc. for the signal generator).

Set the fine tuning control to the middle of its range while making the adjustment.

Adjust C6 for an audible beat on the heterodyne frequency meter or zero voltage from sound discriminator. Oscillator adjustments L1 and L2 shown on the schematic are factory control adjustments and should not be touched in the field.

Switch the receiver to channel 12.

Set the frequency standard to the proper frequency as listed in the alignment table.

Adjust L14 for indications as above.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator trimmer for the specified indication. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control in the middle third of its range.

After the oscillator has been set on all channels, start back at channel 13 and recheck to make sure that all adjustments are correct.

AGC THRESHOLD ADJUSTMENT.—The AGC threshold adjustment can be made by the method outlined in the Installation Instructions. However, a more accurate adjustment can be obtained by the use of an oscilloscope.

Tune in a station and advance the picture control to the maximum clockwise position. Connect the low capacity probe from the oscilloscope to the plate of the first video amplifier. Adjust the oscilloscope to observe the horizontal sync pulse.

Turn the AGC threshold control R138 fully clockwise, then slowly counterclockwise. As the control is turned counterclockwise, the receiver gain will increase slowly, increasing the size of the pattern on the oscilloscope. R138 should be turned counterclockwise until the receiver begins to overload as indicated by clipping of the sync. The control should be left in the maximum gain position in which no clipping of sync is observed. See Figure 17 for proper waveforms.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment requires the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—With a clip lead, short circuit the coil between terminals C and D of the horizontal oscillator transformer T109. Tune in a television station and sync the picture if possible.

A.—Turn the horizontal hold control R173 to the extreme clockwise position. Adjust the T109 Frequency Adjustment (under the chassis) so that the picture is just out of sync and the horizontal blanking appears in the picture as a vertical bar. The position of the bar is unimportant.

B.—Turn the hold control approximately one quarter of a turn from the extreme clockwise position and examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C153B, the width control L115 and the linearity control L111 until the picture is correct. If C153B, L115 or L111 were adjusted, repeat step A above.

Horizontal Locking Range Adjustment.—Turn the horizontal hold control fully counterclockwise. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 9 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 7 bars are present, adjust C153A slightly counterclockwise. Turn the horizontal hold control counterclockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 7 to 9 bars are present.

Horizontal Oscillator Waveform Adjustment.—Remove the shorting clip from terminals C and D of T109. Turn the horizontal hold control to the extreme clockwise position. With a thin fibre screwdriver, adjust the Oscillator Waveform Adjustment Core of T109 (on the outside of the chassis) until the horizontal blanking bar appears in the raster.

A.—Connect the low capacity probe of an oscilloscope to terminal C of T109. Turn the horizontal hold control one quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as drawn in Figure 18. Adjust the Oscillator Waveform Adjustment Core of T109 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Check of Horizontal Oscillator Adjustments.—Set the horizontal hold control to the full counterclockwise position. Momentarily remove the signal by switching off channel then back. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C153A slightly clockwise. If less than 3 bars are present, adjust C153A slightly counterclockwise. Turn the horizontal hold control counterclockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until bars are present.

Turn the horizontal hold control to the maximum clockwise position. The picture should be just out of sync to the extent that the horizontal blanking bar appears as a single vertical or diagonal bar in the picture. Adjust the T109 Frequency Adjustment until this condition is fulfilled.

4.5 MC. VIDEO TRAP ADJUSTMENT.—Tune in a strong input from a station, and with a very short clip lead, short the trap winding of T103. Observe the picture for the appearance of a 4.5 mc. beat. If the beat appears in the picture, adjust L110 until the beat is eliminated or minimized.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to conduct the pad.

RESPONSE CURVES.—The response curves shown on page 14 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

ALIGNMENT TABLE.—Both methods of oscillator alignment are presented in the alignment table. The service technician may thereby choose the method to suit his test equipment.

50	Short circuit terminals C and D of T109. Tune in a station.
51	Turn hold control fully clockwise. Adjust T109 Frequency Adjustment until horizontal blanking bar appears in the picture.
52	Turn hold control ¼ turn from clockwise to sync picture. Adjust width (L115), linearity (L111) and drive (C153B) controls until picture is correct. Repeat step 51.
53	Turn hold control fully counterclockwise. Momentarily remove signal. Turn hold control slowly clockwise. Note least number of bars before pull-in. Adjust Locking Range Control (C153A) for 7 to 9 bar pull-in.
54	Remove clip from terminals C and D of T109. Turn hold control fully clockwise. Adjust T109 Oscillator Waveform Adjustment until horizontal blanking bar appears in picture.
55	Connect low capacity probe of oscilloscope to terminal C of T109. Turn hold control ¼ turn from clockwise. Adjust T109 Oscillator Waveform Adjustment until broad and sharp peaks of wave on oscilloscope are same height. Keep picture in sync with hold control during adjustment. Remove oscilloscope.
56	Turn hold control fully counterclockwise. Momentarily remove signal. Turn hold control slowly clockwise. Note least number of bars before pull-in. Adjust Locking Range Control (C153A) for 3 bar pull-in.
57	Turn hold control fully clockwise. Adjust T109 Freq. Adjustment until horizontal blanking appears as single vertical or diagonal bar in pix.

4.5 MC VIDEO TRAP ADJUSTMENT

58	Tune in a strong station. Short the trap winding of T103. If a 4.5 mc beat appears in picture adjust L110 until beat is eliminated.

SENSITIVITY CHECK

59	Connect antenna to receiver through attenuator pad to provide weak signal. Compare the picture and sound obtained to that obtained on other receivers under the same conditions.

TELEVISION SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults.

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet—Magnets reversed either front to back or top to bottom, front magnet incorrectly oriented.

(2) V112 or V113 inoperative—check voltage and waveform on grids and plates.

(3) No high voltage—If horizontal deflection is operating as evidenced by the correct waveform on terminal 4 of horizontal output transformer, the trouble can be isolated to the 8016 circuit. Either the T110 high voltage winding is open, the 8016 tube is defective, its filament circuit is open, C168 is shorted or R187 or R189 open.

(4) V111 circuit inoperative—Refer to schematic and waveform chart.

(5) Damper tube (V114) inoperative.

(6) Defective kinescope.

(7) R131 open.

(8) No receiver plate voltage—filter capacitor or filter choke shorted—bleeder or filter choke open.

NO VERTICAL DEFLECTION:

(1) V107B or V110 inoperative—check voltage and waveforms on grids and plates.

(2) T107 or T108 open.

(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.

(2) V112 defective.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V110.

(2) Vertical output transformer defective.

(3) V107B defective—check voltage and waveforms on grid and plate.

(4) C150, R164, C147B or C148C defective.

(5) Low bias or plate voltage—check rectifiers and capacitors in supply circuits.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V112 or V114.

(2) T110 or L111 defective.

(3) C164 or C165 defective.

WRINKLES ON LEFT SIDE OF RASTER:

(1) R166, R167 or C169 defective.

(2) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T109 incorrectly tuned.

(2) R172, R173 or R174 defective.

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER:

(1) Improper adjustment of focus coil or ion trap magnet.

(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) R-F oscillator off frequency.

(2) Sound i-f, discriminator or audio amplifier inoperative—check V116, V117, V118, V119, V120 and their socket voltages.

(3) T114 or C186 defective.

(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC threshold control R138 misadjusted.

(2) V105A, V107A, V108 or V109 inoperative—check voltage and waveforms at their grids and plates.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V107B and associated circuit—C145, T107, etc.

(2) Integrating network inoperative—check.

(3) R154, R155, R157, R158 or R159 defective.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T109 misadjusted—readjust as instructed on page 11.

(2) V111 inoperative—check socket voltages and waveforms.

(3) T109 defective.

(4) C140, C153A, C154, C155, C157, C161 or C200 defective.

(5) If horizontal speed is completely off and cannot be adjusted check C158, C159, R172, R173, R174, R179 and R182.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture i-f, detector or video amplifier inoperative—check V103, V104, V105 and V106—check socket voltages.

(2) Bad contact to kinescope grid.

PICTURE STABLE BUT POOR RESOLUTION:

(1) V105A or V106 defective.

(2) Peaking coils defective—check for specified resistance.

(3) Make sure that the focus control operates on both sides of proper focus.

(4) R-F and I-F circuits misaligned.

PICTURE SMEAR:

(1) R-F or I-F circuits misaligned.

(2) Open peaking coil.

(3) This trouble can originate at the transmitter—check on another station.

PICTURE JITTER:

(1) AGC threshold control R138 misadjusted.

(2) If regular sections at the left picture are displaced change V112.

©John F. Rider

World Radio History

TELEVISION SERVICE SUGGESTIONS

(3) Vertical instability may be due to loose connections or noise.

(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.

(2) R-F oscillator off frequency.

(3) R-F unit inoperative—check V1, V2, V3.

PICTURE I-F RESPONSE.—At times it may be desirable to observe the individual i-f stage response. This can be achieved by the following method:

Shunt all i-f transformers and coils with a 330 ohm carbon resistor except the one whose response is to be observed.

Connect a wide band sweep generator to the converter grid and adjust it to sweep from 18 mc. to 30 mc.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.

(2) Replace V112.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) C169 defective.

(2) V114 defective.

Connect the oscilloscope across the picture detector load resistor and observe the overall response. The response obtained will be essentially that of the unshunted stage. The effects of the various traps are also visible on the stage response.

Figures 27 through 31 show the response of the various stages obtained in the above manner. The curves shown are typical although some variation between receivers can be expected. Relative stage gain is not shown.

KINESCOPE HANDLING PRECAUTIONS

DO NOT OPEN THE KINESCOPE SHIPPING CARTON, INSTALL, REMOVE OR HANDLE THE KINESCOPE IN ANY MANNER UNLESS SHATTERPROOF GOGGLES, AND HEAVY GLOVES ARE WORN. PEOPLE NOT SO EQUIPPED SHOULD BE KEPT AWAY WHILE HANDLING KINESCOPES. KEEP THE KINESCOPE AWAY FROM THE BODY WHILE HANDLING.

The kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For this reason, kinescopes must be handled with more care than ordinary receiving tubes.

The large end of the kinescope bulb particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure at any time. In installation, if the tube sticks or fails to slip smoothly into its socket, or deflecting yoke, investigate and remove the cause of the trouble. Do not force the tube. Refer to the Receiver Installation section for detailed instructions on kinescope installation. All RCA kinescopes are shipped in special cartons and should be left in the cartons until ready for installation in the receiver. Keep the carton for possible future use.

R-F UNIT WIRING DIAGRAM

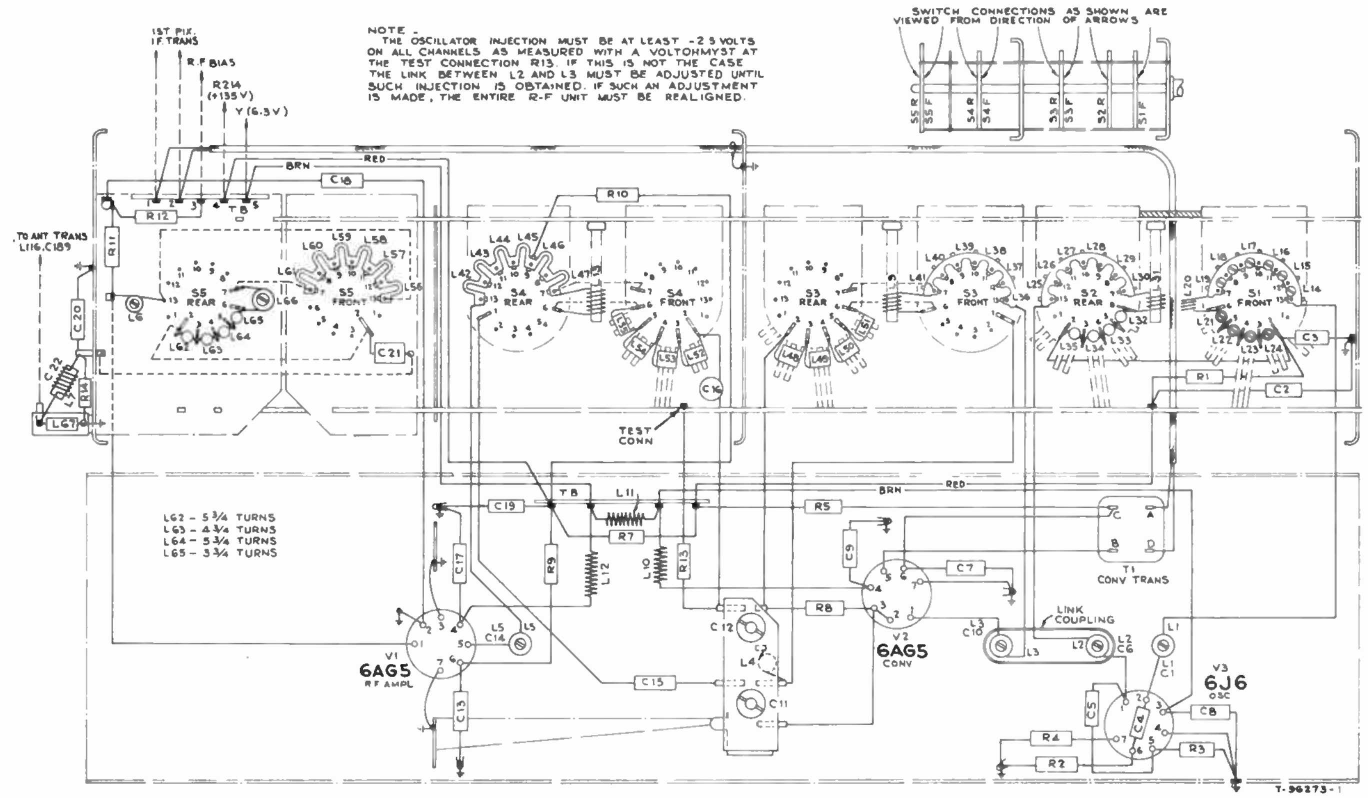

Figure 76—R-F Unit Wiring Diagram

CRITICAL LEAD DRESS:

1. The ground bus from pin 2 and the center shield of V117 socket should not be shortened or rerouted.
2. Do not change the dress of the filament leads or the by-pass capacitors in the picture or sound i-f circuits. The filament leads between V117, V118 and V119 should be down against the chassis and away from grid or plate leads.
3. If it is necessary to replace any of the 1500 mmf capacitors in the picture i-f circuit, the lead length must be kept as short as possible.
4. Picture i-f coupling capacitors C106, C111, C115 and C121 should be up and away from the chassis and should be clear of the pix i-f transformer adjustments by at least ¼ inch. If the dress of any of these capacitors is changed, the i-f alignment should be rechecked.
5. Leads to L102 and L103 must be as short as possible.
6. Dress peaking coils L105, L106 and L107 up and away from the chassis.
7. Dress C183 across tube pins 5 and 6 with leads not exceeding ⅜ inch.
8. Dress C129 and C130 up and away from the chassis.
9. Dress the yellow lead from the picture control away from the chassis and away from the volume-control leads. Dress the yellow lead from pin 8 of V106 away from the chassis.
10. Dress the green lead from pin 2 of V106 away from the chassis.
11. Dress R168, R169, R170, R176 and R178 up and away from the chassis.
12. The leads to the volume control should be dressed down against the chassis and away from V117 and V118.
13. Contact between the r-f oscillator frequency adjustment screws and the oscillator coils or channel switch eyelets must be voided.
14. Dress leads from L115 (width control coil) away from the transformer frame.
15. Dress T110 winding leads as shown in Figure 77.

Figure 77—T110 Lead Dress

World Radio History

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 2200 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC threshold control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with "Jr. VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

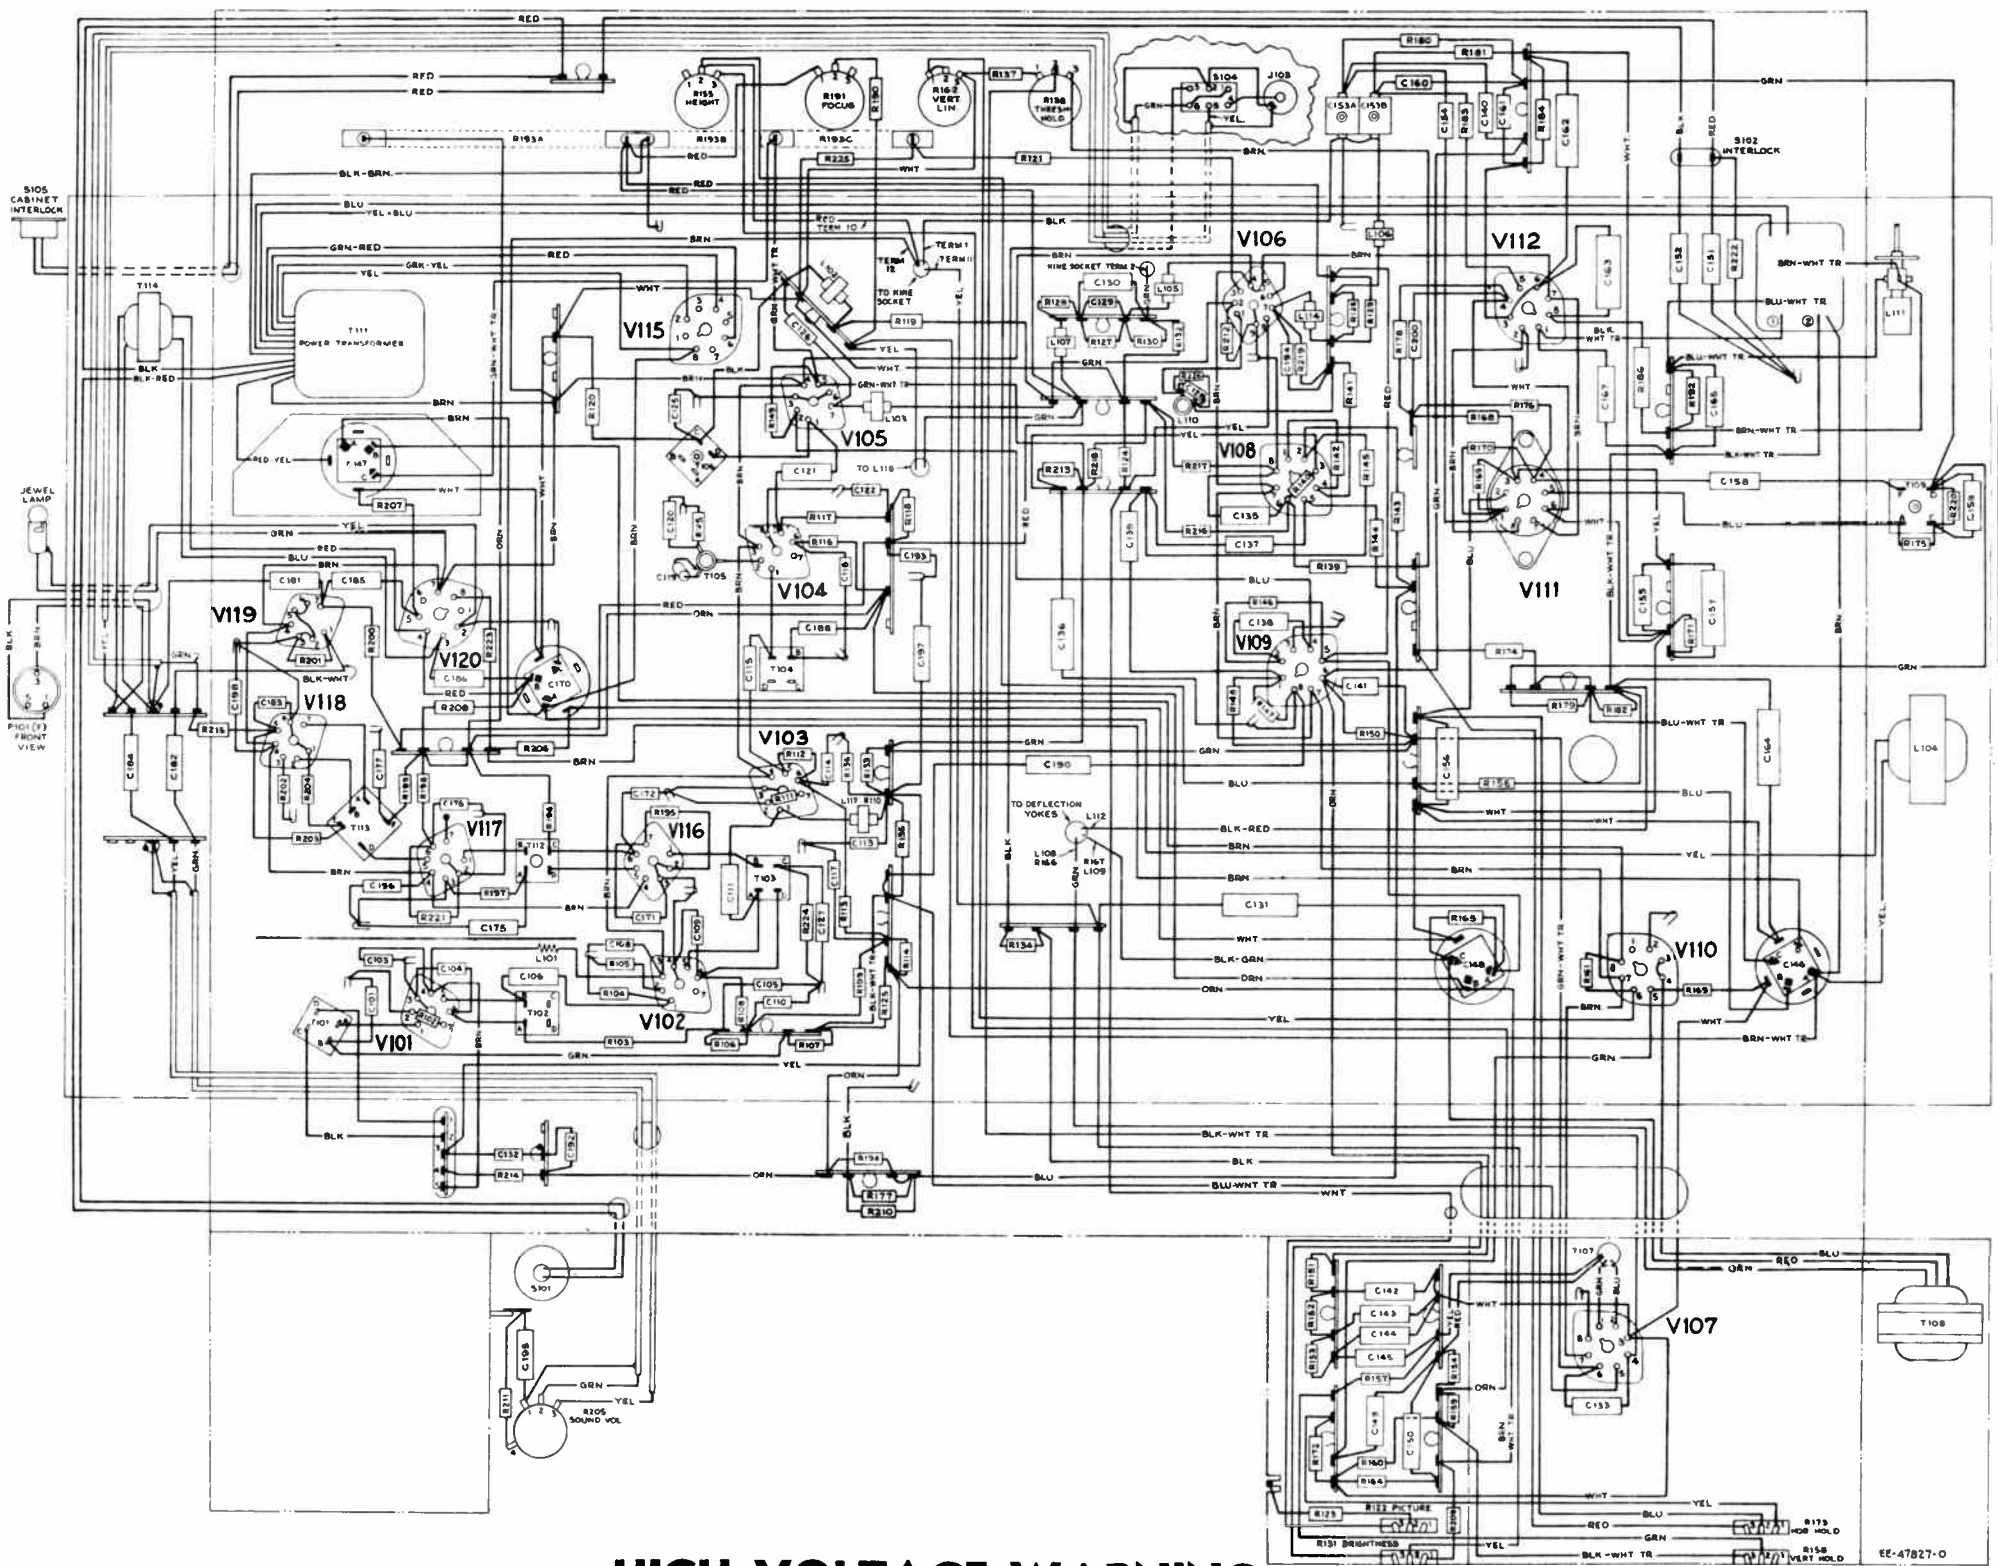
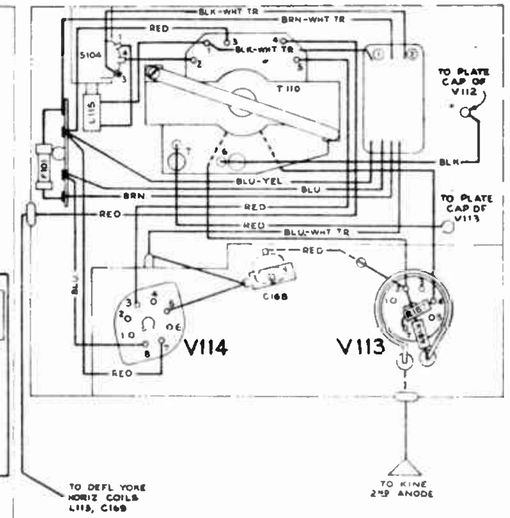
World Radio History





In some receivers, a four color ceramic capacitor color code is employed. It reads the same as the RMA color code except that the tolerance stripe is omitted. If the coefficient stripe is silver, it indicates that the capacitor has a very large temperature coefficient and is to be employed for bypass or other usages where a wide variation of capacity is unimportant. Silver striped capacitors are rated at 350 volts unless otherwise marked.

CHASSIS WIRING DIAGRAM

HIGH VOLTAGE WARNING

OPERATION OF THIS RECEIVER OUTSIDE THE CABINET OR WITH THE COVERS REMOVED, INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WORK ON THE RECEIVER SHOULD NOT BE ATTEMPTED BY ANYONE WHO IS NOT THOROUGHLY FAMILIAR WITH THE PRECAUTIONS NECESSARY WHEN WORKING ON HIGH VOLTAGE EQUIPMENT. DO NOT OPERATE THE RECEIVER WITH THE HIGH VOLTAGE COMPARTMENT SHIELD REMOVED.

MODELS TC124, TC125, TC127, Ch. KCS34B

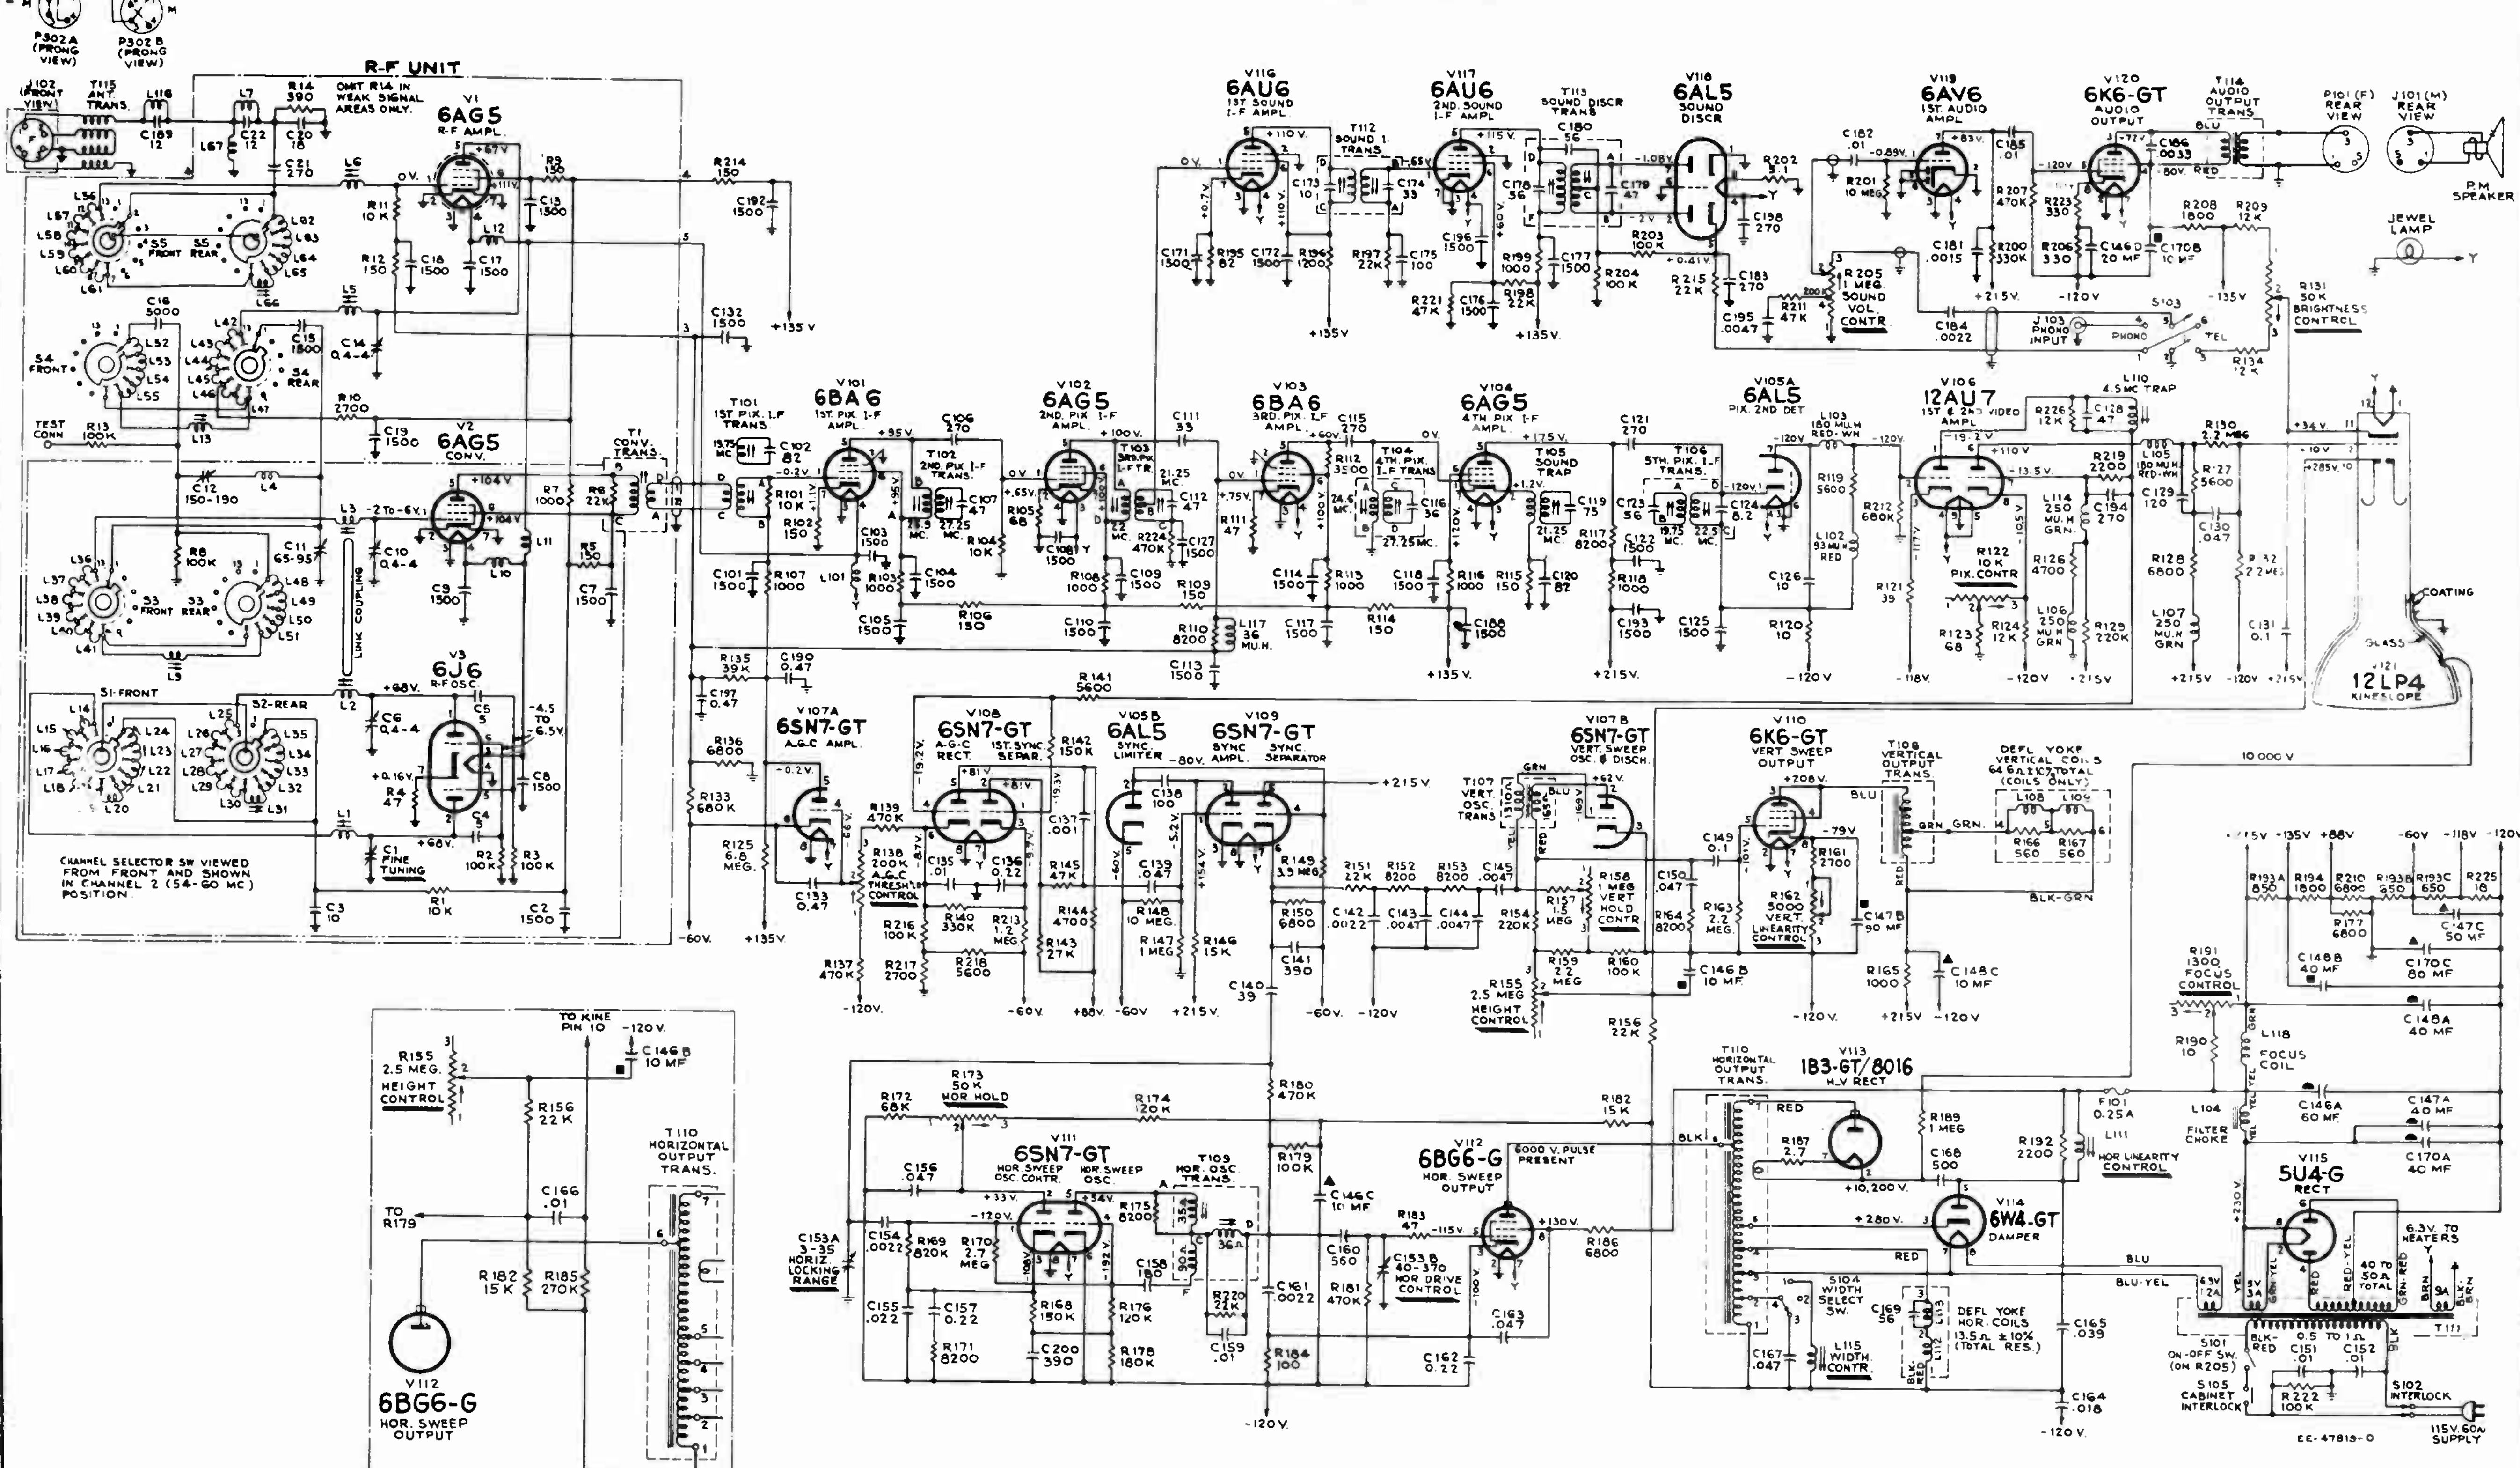
CIRCUIT SCHEMATIC DIAGRAM



All resistance values in ohms. K = 1000. All capacitance values less than 1 in MF and above 1 MMF unless otherwise noted.
Coil resistance values less than 1 ohm are not shown.

Direction of arrows at controls indicates clockwise rotation.
In some receivers, substitutions have caused changes in component lead color codes, in electrolytic capacitor values and their lug identification markings.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.
Some early receivers were connected as shown in the partial schematic.

The deflection circuits must be connected as shown above for powdered iron core yokes.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	RF UNIT ASSEMBLIES
	KRK 5
73465	Belt—Drive belt
75069	Board—R-F unit power connection terminal board (5 contact)
75067	Bracket—Vertical bracket for holding r-f oscillator tube shield
73478	Cable—I-F transmission cable (W1)
73441	Cam—Fine tuning adjustment
74035	Capacitor—Ceramic, 5 mmf. (C4, C5)
53511	Capacitor—Ceramic, 10 mmf. (C3)
54207	Capacitor—Ceramic, 18 mmf. (C20)
73449	Capacitor—Ceramic trimmer comprising 1 section of 150-190 mmf. and 1 section of 65-95 mmf. (C11, C12)
73091	Capacitor—Ceramic, 270 mmf. (C21)
71501	Capacitor—Ceramic, 1500 mmf. (C2, C7, C8, C9, C13, C15, C17, C18, C19)
73473	Capacitor—Ceramic, 5000 mmf. (C16)
73460	Coil—R-F plate coil for channel 6 (L13)
73461	Coil—Rear section—Oscillator plate coil for channel 6 (L20)
73462	Coil—Coupling inductance coil (L4)
73475	Coil—Antenna filter shunt coil (C67)
73476	Coil—I-F trap (L7, C22)
73477	Coil—Choke coil (L10, L11, L12)
73874	Coil—Front section—Oscillator plate coil for channel 6 (L31)
74108	Coil—Fine tuning coil (1½ turns) with adjustable inductance core and capacitor stud (plunger adjustment) (L1, C1)
74109	Coil—Trimmer coil (1½ turns) with adjustable inductance core and capacitor stud (screw adjustment for oscillator section or converter section) (L2, L3, C6, C10)
74110	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f amplifier section (L5, C14)
73455	Core—Sliding core for fine tuning control trimmer
74187	Core—Adjustable core for coil L9
71493	Connector—Oscillator segment connector
73440	Detent—R-F unit detent mechanism and fibre shaft
71487	Form—Coil form for coil L31
73453	Form—Coil form assembly for L9, L13
73442	Link—Link assembly for fine tuning
71462	Loop—Oscillator to converter trimmer loop connector
73634	Nut—Speed nut for drive belt shield
73436	Plate—Front plate and bushing
73464	Pulley—Idler pulley
	Resistor—Fixed, composition:—
	47 ohms, ±20%, ½ watt (R4)
	150 ohms, ±20%, ½ watt (R5, R9, R12)
	390 ohms, ±10%, ½ watt (R14)
	1000 ohms, ±20%, ½ watt (R7)
	2700 ohms, ±10%, ½ watt (R10)
	10,000 ohms, ±20%, ½ watt (R1, R11)
	100,000 ohms, ±20%, ½ watt (R2, R3, R8, R13)
14343	Retainer—Channel selector shaft retaining ring
30340	Retainer—Retainer ring for fine tuning stud
70881	Screw—#4-40 x ¼" binder head screw for adjusting coils L14, L15, L16, L17, L18, L19

STOCK No.	DESCRIPTION
73640	Screw—#4-40 x ⅜" adjusting screw for L66
71475	Screw—#4-40 x 15/32" adjusting screw for coils L21, L22, L23, L24
74575	Screw—#4-40 x 17/32" adjusting screw for L6
73437	Shaft—Channel selector shaft complete with pawl and stud
73438	Shaft—Fine tuning control shaft and pulley
73439	Shaft—Actuating shaft for fine tuning control
72951	Shield—Metal tube shield for V3
73454	Shield—Metal shield for drive belt
73632	Shield—Metal tube shield for V1
75443	Shield "U" shaped shield for bottom of r-f unit.
71494	Socket—Tube socket, moulded, 7 prong, saddle mounted
73450	Socket—Tube socket, ceramic, 7 prong, bottom mounted
74576	Spacer—Insulating spacer for front plate (4 req'd)
73457	Spring—Return spring for fine tuning control core
74188	Spring—Retaining spring for adjustable core RCA 74187
74578	Spring—Retaining spring for adjusting screw RCA 73460 and 74575
75068	Spring—Retaining spring for r-f oscillator tube shield
73468	Stator—Front oscillator section stator complete with rotor, segment, coils and adjusting screws (S1, L14, L15, L16, L17, L18, L19, L21, L22, L23, L24)
73469	Stator—Rear oscillator section stator complete with rotor, segment, and coils (S2, L25, L26, L27, L28, L29, L30, L32, L33, L34, L35)
73633	Stator—Antenna stator complete with rotor and coils (S5, L6, L56, L57, L58, L59, L60, L61, L62, L63, L64, L65, L66, C21)
73470	Stator—Converter stator complete with rotor and coils (S3, L9, L36, L37, L38, L39, L40, L41, L48, L49, L50, L51)
73471	Stator—R-F amplifier stator complete with rotor and coils (S4, L13, L42, L43, L44, L45, L46, L47, L52, L53, L54, L55, C15, C16, R10)
73448	Transformer—Converter transformer (T1, R6)
73466	Washer—Insulating washer for front shield (1 set)
2917	Washer—"C" washer for channel selector shaft or fine tuning shaft and cam
	CHASSIS ASSEMBLIES
	KCS 34B
74593	Capacitor—Mica trimmer comprising 1 section of 3-35 mmf. and 1 section of 40-370 mmf. (C153A, C153B)
74153	Capacitor—Hi-voltage 500 mmf., 15,000 volts (C168)
72615	Capacitor—Mica, 10 mmf. (C126)
74105	Capacitor—Mica, 33 mmf. (C111)
74726	Capacitor—Mica, 39 mmf. (C140)
64062	Capacitor—Ceramic, 82 mmf. (C120)
39396	Capacitor—Ceramic, 100 mmf. (C175)
75060	Capacitor—Mica, 100 mmf. (1000 volts) (C138)
73921	Capacitor—Ceramic, 120 mmf. (C129)
73102	Capacitor—Mica, 180 mmf. (C158)
73922	Capacitor—Ceramic, 270 mmf. (C183, C194, C198)
73091	Capacitor—Mica, 270 mmf. (C106, C115, C121)
68542	Capacitor—Mica, 390 mmf. (C141, C200)

STOCK No.	DESCRIPTION
74250	Capacitor—Mica, 560 mmf. (C160)
71501	Capacitor—Ceramic, 1500 mmf. (C101, C103, C104, C105, C108, C109, C110, C113, C114, C117, C118, C122, C125, C127, C132, C171, C172, C176, C177, C188, C192, C193, C196)
71432	Capacitor—Electrolytic comprising 2 sections of 40 mfd. 450 volts and 1 section of 10 mfd. 450 volts (C148A, C148B, C148C)
73582	Capacitor—Electrolytic comprising 1 section of 40 mfd. 450 volts, 2 sections of 10 mfd. 450 volts and 1 section of 80 mfd. 200 volts (C170A, C170B, C170C)
73583	Capacitor—Electrolytic comprising 1 section of 40 mfd. 450 volts, 1 section of 90 mfd. 150 volts and 1 section of 50 mfd. 150 volts (C147A, C147B, C147C)
73581	Capacitor—Electrolytic comprising 1 section of 60 mfd. 450 volts, 2 sections of 10 mfd. 450 volts and 1 section of 20 mfd. 150 volts (C146A, C146B, C146C, C146D)
73801	Capacitor—Tubular, paper, oil impregnated, .001 mfd. 600 volts (C137)
73802	Capacitor—Tubular, paper, oil impregnated, .0015 mfd. 600 volts (C181)
73595	Capacitor—Tubular, moulded paper, oil impregnated, .0022 mfd. 600 volts (C142, C154, C161, C184)
73795	Capacitor—Tubular, paper, oil impregnated, .0033 mfd. 600 volts (C186)
73920	Capacitor—Tubular, moulded paper, oil impregnated, .0047 mfd. 600 volts (C143, C144, C145, C195)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd. 400 volts (C135, C182)
73594	Capacitor—Tubular, moulded paper, oil impregnated, .01 mfd. 600 volts (C159)
73565	Capacitor—Tubular, paper, oil impregnated, .01 mfd. 1000 volts (C151, C152, C185)
74727	Capacitor—Tubular, moulded paper, oil impregnated, .018 mfd. 1000 volts (C164)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd. 400 volts (C155)
74728	Capacitor—Tubular, moulded paper, oil impregnated, .039 mfd. 1000 volts (C165)
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd. 400 volts (C130, C139, C167)
73592	Capacitor—Tubular, moulded paper, oil impregnated, .047 mfd. 600 volts (C150, C156)
73597	Capacitor—Tubular, paper, oil impregnated, .047 mfd. 1000 volts (C163)
73551	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd. 400 volts (C149)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd. 600 volts (C131)
73794	Capacitor—Tubular, paper, oil impregnated, 0.22 mfd. 400 volts (C136, C157, C162)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd. 200 volts (C133, C190, C197)
73154	Choke—Filter choke (L104)
74585	Coil—Focus coil (L118)
71429	Coil—Width control coil (L115)
71449	Coil—Horizontal linearity control coil (L111)
74170	Coil—Peaking coil (36 muh) (L117, R110)
71527	Coil—Peaking coil (93 muh) (L102)
74214	Coil—Peaking coil (180 muh) (L103, L105)

STOCK No.	DESCRIPTION
71526	Coil—Peaking coil (250 muh) (L106, L107, L114)
73477	Coil—Filament choke coil (L101)
74594	Connector—2 contact male connector for power cable
5119	Connector—3 contact female connector for speaker cable
71789	Connector—Anode connector
71521	Connector—Hi-voltage capacitor connector
35787	Connector—Phono input connector (J103)
72734	Control—Horizontal and vertical hold control (R158, R173)
74047	Control—Brightness and picture control (R122, R131)
38408	Control—Sound volume control and power switch (R205, S101)
71441	Control—Vertical linearity control (R162)
71440	Control—Height control (R155)
74597	Control—Focus control (R191)
74475	Control—AGC threshold control (R138)
71457	Cord—Power cord and plug
71437	Cover—Insulating cover for electrolytics #71432, 73581 and 73582
74811	Cushion—Rubber cushion for kinescope mounting
73590	Cushion—Rubber cushion for deflection yoke hood (2 req'd)
73600	Fuse—0.25 amp. 250 volts (F101)
71799	Grommet—Rubber grommet for yoke horizontal lead exit
37398	Grommet—Rubber grommet for mounting ceramic tube socket (2 required)
74823	Magnet—Ion trap magnet (P.M. type)
73587	Nut—Speed nut to mount hi-voltage capacitor
18469	Plate—Bakelite mounting plate for electrolytics
73588	Resistor—Voltage divider comprising 1 section of 850 ohms, and 2 sections of 650 ohms, 6 watts (R193A, R193B, R193C)
74598	Resistor—Wire wound, 2.7 ohms, 1/3 watt (R187)
72067	Resistor—Wire wound, 5.1 ohms, ½ watt (R202)
18471	Resistor—Wire wound, 10 ohms, ½ watt (R190)
	Resistor—Fixed, composition:—
	10 ohms, ±20%, ½ watt (R120)
	18 ohms, ±10%, ½ watt (R225)
	39 ohms, ±10%, ½ watt (R121)
	47 ohms, ±5%, ½ watt (R111)
	47 ohms, ±20%, ½ watt (R183)
	68 ohms, ±10%, ½ watt (R105)
	68 ohms, ±20%, ½ watt (R123)
	82 ohms, ±10%, ½ watt (R195)
	100 ohms, ±10%, 2 watts (R184)
	150 ohms, ±5%, ½ watt (R102)
	150 ohms, ±10%, ½ watt (R115)
	150 ohms, ±20%, ½ watt (R106, R109, R114, R214)
	330 ohms, ±10%, ½ watt (R206, R223)
	1000 ohms, ±20%, ½ watt (R103, R107, R108, R113, R116, R118, R165, R199)
	1200 ohms, ±10%, ½ watt (R196)
	1800 ohms, ±10%, 2 watts (R194, R208)
	2200 ohms, ±10%, ½ watt (R219)

REPLACEMENT PARTS (Continued)

STOCK No.	DESCRIPTION
	2200 ohms, ±10%, 1 watt (R192)
	2700 ohms, ±10%, ½ watt (R161, R217)
	3900 ohms, ±5%, ½ watt (R112)
	4700 ohms, ±5%, ½ watt (R126)
	4700 ohms, ±10%, ½ watt (R144)
	5600 ohms, ±5%, ½ watt (R119)
	5600 ohms, ±10%, ½ watt (R141, R218)
	5600 ohms, ±10%, 1 watt (R127)
	6800 ohms, ±5%, ½ watt (R136)
	6800 ohms, ±10%, ½ watt (R150)
	6800 ohms, ±5%, 1 watt (R128)
	6800 ohms, ±10%, 2 watts (R177, R186, R210)
	8200 ohms, ±5%, ½ watt (R164, R175)
	8200 ohms, ±10%, ½ watt (R152, R153, R171)
	8200 ohms, ±5%, 1 watt (R117)
	10,000 ohms, ±5%, ½ watt (R104)
	12,000 ohms, ±10%, ½ watt (R134, R209, R226)
	12,000 ohms, ±10%, 2 watts (R124)
	15,000 ohms, ±10%, ½ watt (R182)
	15,000 ohms, ±10%, 1 watt (R146)
	22,000 ohms, ±10%, ½ watt (R151, R156, R197, R220)
	22,000 ohms, ±20%, ½ watt (R215)
	27,000 ohms, ±10%, ½ watt (R143)
	39,000 ohms, ±5%, ½ watt (R135)
	47,000 ohms, ±10%, ½ watt (R145, R211)
	47,000 ohms, ±10%, ½ watt (R221)
	68,000 ohms, ±10%, ½ watt (R172)
	100,000 ohms, ±5%, ½ watt (R203, R204)
	100,000 ohms, ±10%, ½ watt (R160, R216)
	100,000 ohms, ±10%, 1 watt (R179)
	100,000 ohms, ±20%, 1 watt (R222)
	120,000 ohms, ±5%, 1 watt (R176)
	120,000 ohms, ±10%, 1 watt (R174)
	150,000 ohms, ±10%, ½ watt (R168)
	150,000 ohms, ±20%, ½ watt (R142)
	180,000 ohms, ±5%, 1 watt (R178)
	220,000 ohms, ±10%, ½ watt (R129, R154)
	330,000 ohms, ±10%, ½ watt (R140, R200)
	470,000 ohms, ±10%, ½ watt (R137, R139, R180, R224)
	470,000 ohms, ±20%, ½ watt (R207)
	680,000 ohms, ±10%, ½ watt (R133, R212)
	820,000 ohms, ±5%, ½ watt (R169)
	1 megohm, ±10%, ½ watt (R147, R181)
	1 megohm, ±20%, 1 watt (R189)
	1.2 megohms, ±5%, ½ watt (R213)
	1.5 megohms, ±5%, ½ watt (R157)
	2.2 megohms, ±10%, ½ watt (R130, R132, R159, R163)
	2.7 megohms, ±5%, 1 watt (R170)
	3.9 megohms, ±10%, ½ watt (R149)
	6.8 megohms, ±10%, ½ watt (R125)

STOCK No.	DESCRIPTION
	10 megohms, ±10%, ½ watt (R148)
	10 megohms, ±20%, ½ watt (R201)
74416	Screw—#10-32 x 1¾" cross recessed round head screw for kinescope retaining strap
74601	Screw—#8-32 x ⅜" cross recessed binder head screw for focus coil mounting (2 required)
74602	Screw—#10-32 x 1¾" cross recessed round head screw for focus coil adjustment (3 required)
71456	Screw—#8-32 x 7/16" wing screw for deflection yoke mounting
75083	Screw—#8-32 x 1/4" wing screw for deflection yoke mounting
73584	Shield—Tube shield
74937	Sleeve—Rubber sleeve for focus coil
73117	Socket—Tube socket, 7 pin, miniature
72927	Socket—Tube socket, 9 pin, miniature
31251	Socket—Tube socket, octal, wafer
73249	Socket—Tube socket, octal ceramic, plate mounted
71508	Socket—Tube socket for 8016
74834	Socket—Kinescope socket
31364	Socket—Pilot lamp socket
73586	Spring—Compression spring used under centering control screws (3 required)
74595	Spring—Anode lead spring
74936	Spring—Suspension spring (coil type) for kinescope tube socket leads
74810	Strap—Kinescope retaining strap
74596	Support—Bakelite supports (1 set) for mounting hi-voltage rectifier tube mounting plate
46760	Switch—"TV-Phono" switch (S103)
74157	Switch—Interlock switch
74147	Switch—Width selector switch (S104)
73569	Transformer—Vertical oscillator transformer (T107)
71419	Transformer—Sound output transformer (T114)
74589	Transformer—First pix. i-f transformer (T101, C102, R101)
74590	Transformer—Second pix. i-f transformer (T102, C107)
74591	Transformer—Third pix. i-f transformer (T103, C112)
74592	Transformer—Fourth pix. i-f transformer (T104, C116)
73575	Transformer—Fifth pix. i-f transformer (T106, C123, C124)
71424	Transformer—Sound i-f transformer (T112, C173, C174)
71427	Transformer—Sound discriminator transformer (T113, C178, C179, C180)
73576	Transformer—Horizontal oscillator transformer (T109)
73578	Transformer—Antenna transformer complete with socket (T115, J102)
74586	Transformer—Power transformer, 115 volt, 60 cycle (T111)
74587	Transformer—Vertical output transformer (T108)
74588	Transformer—Horizontal output and hi-voltage transformer (T110)
73577	Trap—4.5 mc. trap (L110, C128)
71778	Trap—Sound trap (T105, C119)
73476	Trap—I-F trap (L116, C189)
71420	Yoke—Deflection yoke (L108, L109, L112, L113, C169, R166, R167)

STOCK No.	DESCRIPTION
	SPEAKER ASSEMBLIES
	92569-7W
	RL111-9
	RMA-274
13867	Cap—Dust cap
74901	Cone—Cone and voice coil assembly
5118	Plug—3-prong male plug for speaker
73635	Speaker—12" PM speaker complete with cone and voice coil less plug
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instruments, number stamped on speaker and full description of part required.
	MISCELLANEOUS
74982	Back—Cabinet back for Model TC124
74968	Back—Cabinet back for Model TC125 and Model TC127
72857	Board—"Ant" terminal board
71599	Bracket—Pilot lamp bracket
13103	Cap—Pilot lamp cap
71892	Catch—Bullet catch and strike for doors (2 required) for Model TC127
X3092	Cloth—Grille cloth for mahogany or walnut instruments for Model TC124
X3093	Cloth—Grille cloth for oak instruments for Model TC124
X3094	Cloth—Grille cloth for mahogany or walnut instruments for Model TC125
X3089	Cloth—Grille cloth for oak instruments for Model TC125
X3074	Cloth—Grille cloth for mahogany or walnut instruments for Model TC127
X3075	Cloth—Grille cloth for oak instruments for Model TC127
39153	Connector—4-contact male connector for antenna cable
74891	Cushion—Vinylite cushion for metal kinescope mask
74731	Decal—Control panel function decal for mahogany or walnut instruments
74732	Decal—Control panel function decal for oak instruments
71768	Decal—Trade mark decal for Model TC127
74809	Emblem—"RCA Victor" emblem
73642	Escutcheon—Channel marker escutcheon for mahogany or walnut instruments
73740	Escutcheon—Channel marker escutcheon for oak instruments
74755	Glass—Safety glass for Models TC124 and TC127
74989	Glass—Safety glass for Model TC125
37396	Grommet—Rubber grommet for speaker mounting (4 required)
74308	Hinge—Cabinet door hinge (1 set) (2 required) for Model TC127

STOCK No.	DESCRIPTION
74959	Knob—Fine tuning control knob—dark—(outer) for mahogany or walnut instruments—Models TC125 and TC127
73995	Knob—Fine tuning control knob—tan—(outer) for oak instruments
75027	Knob—Fine tuning control knob—chocolate brown—(outer) for mahogany or walnut instruments—Model TC124
74960	Knob—Channel selector knob—dark—(inner) for mahogany and walnut instruments—Models TC125 and TC127
74961	Knob—Channel selector knob—tan—(inner) for oak instruments
75028	Knob—Channel selector knob—chocolate brown—(inner) for mahogany or walnut instruments for Model TC124
74962	Knob—Brightness control or vertical hold control knob—dark—(outer) for mahogany or walnut instruments—Models TC125 and TC127
73999	Knob—Brightness control or vertical hold control knob—tan—(outer) for oak instruments
75029	Knob—Brightness control or vertical hold control knob—chocolate brown—(outer) for mahogany or walnut instruments for Model TC124
74969	Knob—Volume control and power switch knob—dark—for mahogany or walnut instruments for Models TC125 and TC127
74003	Knob—Volume control and power switch knob—tan—for oak instruments
75030	Knob—Volume control and power switch knob—chocolate brown—for mahogany or walnut instruments for Model TC124
74963	Knob—Picture control or horizontal hold control knob—dark—(inner) for mahogany or walnut instruments—Models TC125 and TC127
74001	Knob—Picture control or horizontal hold control knob—tan—(inner) for oak instruments
75031	Knob—Picture control or horizontal hold control knob—chocolate brown—(inner) for mahogany or walnut instruments for Model TC124
11765	Lamp—Pilot lamp—Mazda 51
74730	Nail—Decorative head nail for grille bars (4 required) for Model TC127
74162	Plate—Mounting plate for interlock switch
74971	Plate—Back plate for door pulls (2 required) for Model TC127
74970	Pull—Cabinet door pull (2 required) for Model TC127
74113	Screw—#8-32 x 1" trimit head screw for door pulls for Model TC127
72845	Spring—Retaining spring for knobs #73995, 74959 and 75027
14270	Spring—Retaining spring for knobs #73999, 74003, 74960, 74961, 74962, 74969, 75028, 75029 and 75030
30330	Spring—Retaining spring for knobs #74001, 74963 and 75031
73643	Spring—Spring clip for channel marker escutcheon
72936	Stop—Door stop for Model TC127
74161	Stud—Locating stud for back covers

To obtain resistors for which no stock number is given, order by stating type, value of resistance, tolerance and wattage.

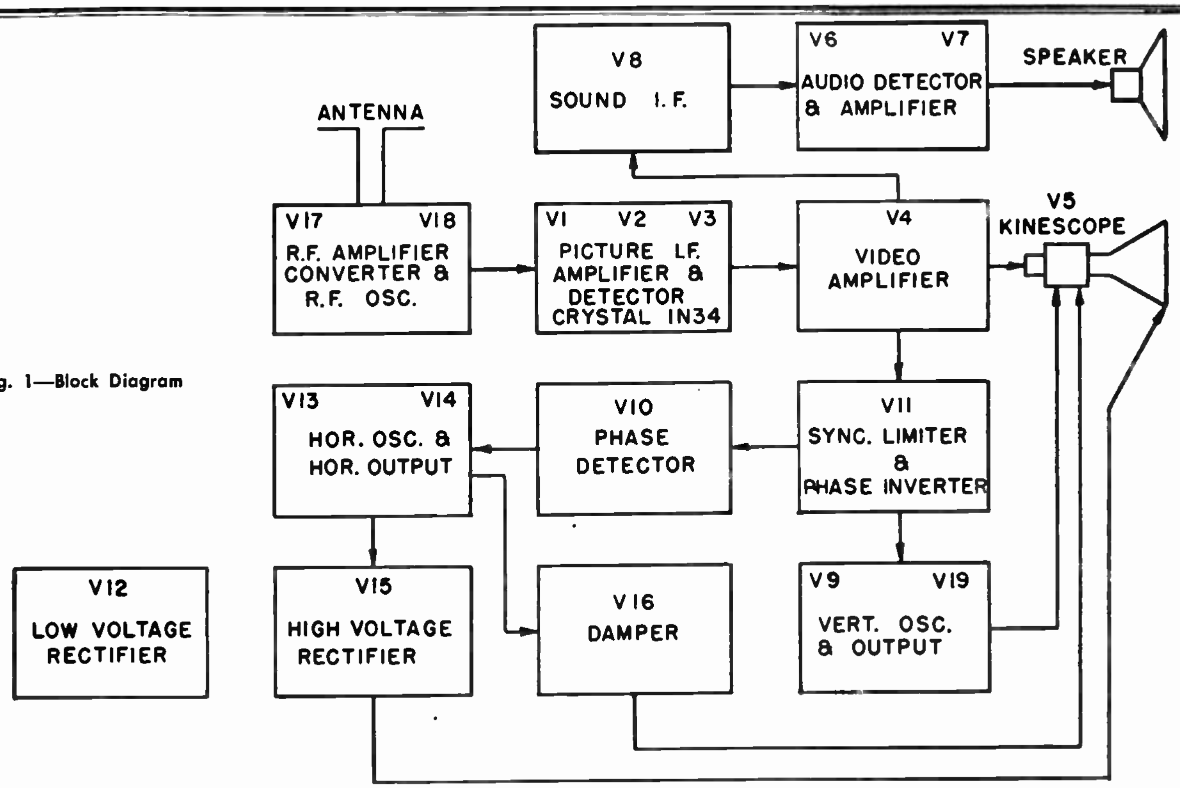

Fig. 1—Block Diagram

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 Volts AC 60 Cycles Only
Power Consumption	230 Watts
Power Output	3.5 Watts Maximum 2 Watts Undistorted
Antenna Input Impedance	300 Ohms Balanced
Picture Area	130 Square Inch
Tuning Range	12 Channel
Loud Speaker	PM Dynamic
Voice Coil Impedance	3.2 Ohms 400 Cycles
Video Response	to 3.5 MC
Focus	Magnetic
Sweep Deflection	Magnetic
Scanning	Interlaced, 525 Line
Horizontal Scanning Frequency	15,750 CPS
Vertical Scanning Frequency	60 CPS
Frame Frequency	30 CPS

THIS RECEIVER CONTAINS THE FOLLOWING:

Symbol	Type	Function
V1	6CB6	1st I.F. Amplifier
V2	6CB6	2nd I.F. Amplifier
V3	6CB6	3rd I.F. Amplifier
V4	6AH6	Video Amplifier
V5		Kinescope
V6	6AQ5	Audio Output
V7	6T8	FM Detector and 1st Audio
V8	6AU6	Sound I.F.
V9	6SN7GT	Vertical blocking oscillator
V10	6AL5	Phase detector
V11	12AU7	Sync limiter and DC restorer
V13	6SN7GT	Horizontal oscillator
V14	6CD6	Horizontal output
V16	6W4	Diode damper
V17	6AG5 or 6BC5	R.F. Amplifier
V18	6J6	Oscillator and Mixer
V19	6S4	Vertical Output
V12	5U4G	Low Voltage Rectifier
V15	1B3	High Voltage Rectifier

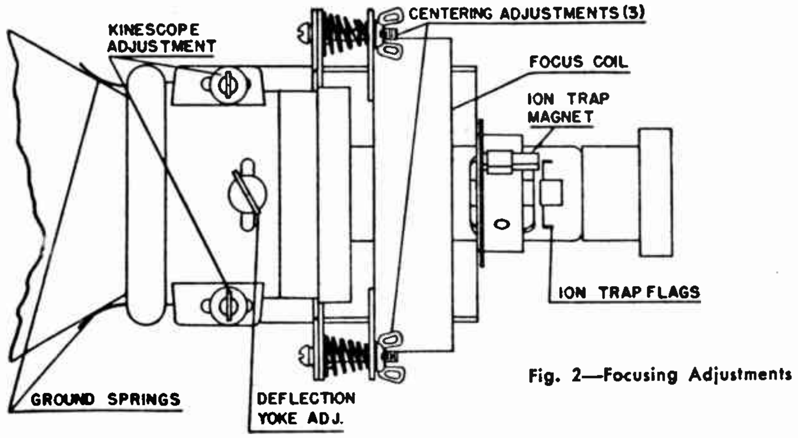

Fig. 2—Focusing Adjustments

NON-OPERATING CONTROLS
(Rear of Chassis)

Brilliance	R20
Vertical Linearity	R35
Vertical Hold	R42
Height	R39
Focus	R58
Horizontal Hold	R66
Width Control (H.V. cage)	L11
Horizontal Drive	C56
Horizontal Osc. Coil (H.V. cage)	L10
Horizontal Linearity	L13
Focus Coil	Wing nut adjustment
Deflection Coils	Wing nut adjustment
Ion trap magnet	

Turn on the set and tune to a channel on which a station is operating.

1. Adjust the Horizontal Hold (R66) to the center of its rotation. With the control in this position adjust the Horizonal Oscillator coil (L10) until a picture appears. If no raster or pattern appears on the screen, leave R66 in the center position and continue with the following instructions until a raster does appear then return for this adjustment.

2. Advance the Brilliance control (R20) in a clockwise direction until a raster appears. Allow this to remain in a clock wise position whether a raster appears or not.

3. Adjust the ion trap magnet for maximum brightness by moving it forward or backward along the neck of the picture tube, rotating it about the neck of the tube at the same time. The Brilliance should then be reduced to a suitable level by means of control R20.

4. Adjust the Vertical Hold control (R42) until the test pattern remains stationary. The Contrast (R16, front panel) and Brilliance (R20) should then be adjusted for normal picture contrast.

5. At this point the Focus control (R58) should be adjusted for the sharpest horizontal lines at the center of the pattern.

6. Adjust the Height control (R39) until the proper height is attained. Adjustment of this control may effect the Vertical Hold (R42), in which case, that control will have to be re-adjusted to maintain a stationary pattern.

7. The Vertical Linearity (R35) control should be adjusted to give maximum linearity in the upper portion of the raster.

8. Adjust the Horizontal Drive (C56) until a white vertical line appears on the left side of the screen. Then reduce the drive by turning the trimmer clockwise until this line just disappears. This can best be seen at reduced contrast. Now adjust the Horizontal Linearity (L13) control for best linearity.

9. Loosen the wing-nut on top of the yoke housing and square the pattern with the screen escutcheon by rotating the yoke. Be sure that the yoke is pushed as far forward as possible.

10. Adjusl the focus coil to center the picture by turning the three wing-nuts on the coil mounting bolts.

11. The Width control (L11) is a screw-driver adjustment located on top of the high voltage cage. The width is increased by turning this control in a clockwise direction.

World Radio History

SERVICE SUGGESTIONS

NO RASTER ON KINESCOPE—If raster cannot be obtained, check below for possible causes.

1. Ion trap magnet adjustment is incorrect.
2. Check .25 amp. fuse in plate circuit of V14.
3. No high voltage — check V14 (6CD6) and V15 (1B3-GT) tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct waveform measured on terminal 4 of horizontal output transformer (T9), the trouble can be isolated to the high voltage rectifier circuit (V15). Either the high voltage winding (between red and blue leads) on T9 is open, tube V15 is defective or its filament circuit is open.
4. Damper tube V16 (6W4) defective. Plate voltage supply for V14 (6CD6) horizontal output tube is obtained through the damper tube. Check tube and heater winding on power transformer (T7).
5. Defective kinescope. Heater open, cathode return circuit open.
6. No plate voltage. Electrolytic capacitor shorted. All B voltages are accessible for measurement underneath the chassis.

HORIZONTAL DEFLECTION ONLY—If only horizontal deflection is obtained as evidenced by a straight line across the face of the kinescope, it can be caused by the following:

1. Vertical oscillator V9 (6SN7-GT) inoperative. Check voltages on grid and plate.
2. Vertical output transformer (T5) open.
3. Yoke vertical coils (L7) open.
4. Vertical blocking transformer (T6) open or shorted.
5. Vertical output tube V19 (6S4) defective.

POOR VERTICAL LINEARITY—If adjustment of the vertical height and linearity controls will not correct this condition, any of the following may be the cause:

1. Vertical output transformer (T5), capacitors C30, C31, C32, or resistor R38.
2. V9 (6SN7GT) defective; check voltages.
3. Low plate and bias voltages. Check rectifier tube and capacitors in B supply.

POOR HORIZONTAL LINEARITY—Check the following:

1. V14 (6CD6) screen voltage.
2. Horizontal drive (C56) for incorrect adjustment.
3. Horizontal output tube V14 (6CD6).
4. Damper tube V16 (6W4).

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER — Check for:

1. Improper adjustment of focus coil or ion trap magnet.
2. Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER—This condition can be caused by incorrect adjustment of the horizontal drive C56.

SMALL RASTER—This condition can be caused by:

1. Low B or line voltage.
2. Insufficient output from horizontal output tube (V14) (6CD6). Replace tube.
3. Insufficient output from vertical output tube V19 (6S4) or V9 (6SN7GT). Replace tube.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND —This condition can be caused by:

1. No signal on kinescope cathode. Check for open coupling condenser C13.
2. Bad contact to kinescope or lead to socket broken.

SIGNAL APPEARS ON KINESCOPE CATHODE BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE HORIZONTALLY AND VERTICALLY—A condition of this nature can be caused by:

1. Defective sync limiter V11 (12AU7) or phase detector V10 (6AL5).
2. If tubes are O.K. check voltages and associated circuits.

SIGNAL ON KINESCOPE CATHODE AND HORIZONTAL SYNC ONLY—Check:

1. Vertical integrating network capacitors C31, C34, C35, and resistors R44, R45, R46.

PICTURE STABLE BUT WITH POOR RESOLUTION — If the picture resolution is not up to standard, it may be caused by any of the following:

1. Defective picture detector (crystal 1N34) or video amplifier V4 (6AH6).
2. Open video peaking coil. Check coils L1, L2, L3, L4 and L5 for continuity. Note that L3 and L5 have shunting resistors. L4 is 4.5 MC trap.
3. Leakage in V4 (6AH6) grid capacitor C11, or C13 on V5 (kinescope).

If the above components are not found to be defective, check the following:

A. Check all potentials in video circuits.

B. Check the kinescope grid for poor or dirty contacts.

C. Check adjustment of focus control R48. It should be effective on either side of proper focus.

D. Check and re-align if necessary, the picture I.F. and the local oscillator.

E. Check for proper coils in turret switch.

PICTURE SMEAR:

1. Normally, smear can be attributed to phase shift at the low frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits.
2. This trouble can also originate at the transmitter. Check reception from another station.

PICTURE JITTER:

1. Vertical instability may be due to loose connections or noise received with the signal.
2. Horizontal instability may be due to unstable transmitted sync or to noise.

ALIGNMENT TABLE

DISCRIMINATOR AND SOUND I-F ALIGNMENT

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Sweep Generator to	Sweep Gen. Freq. Mc.	Connect Oscilloscope to	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust	Refer to
1	Video Grid (pin 1, V-4)	4.5 .1 volt output	Not used		Not used	Pin 2 V-7	Meter on 10 volt scale	T4 (bottom) and L6 for max. on meter. L4 for min.	Figs. 5
2	Video Grid (pin 1, V-4)	4.5 .1 volt output	Not used		Not used	See Note 1	Meter on 3 volt scale	T4 (top) for zero on meter	
3	Not used		Video Grid (pin 1, V-4)	4.5 center 1 mc .1 volt output	Discriminator output (Junction R28-R39)	Not used	Check for symmetrical response waveform (positive and negative). If not equal, adjust T4 (bottom) until they are equal. See Note 2.		Fig. 5

NOTE 1: Connect two 100 K resistors in series. Connect one end to pin 2 of V-7 (6T8) and the other end to ground. Connect the hot side of the VTVM to center of the two 100 K resistors and ground side to junction of R29 (150 ohms) and R28 (47 K ohms).

NOTE 2: The peak to peak band width at the discriminator should be approximately 300 KC and should be linear from 4.425 MC to 4.575 MC.

ALIGNMENT PROCEDURE

I-F ADJUSTMENTS

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust	Refer to
4	Wire loop (top of tuner between V17 and V18)	24.6	Junction R13 and L2	Set station selector between channels; meter on 3 volt scale	T3 (top) maximum	Fig. 5

OSCILLATOR ADJUSTMENT

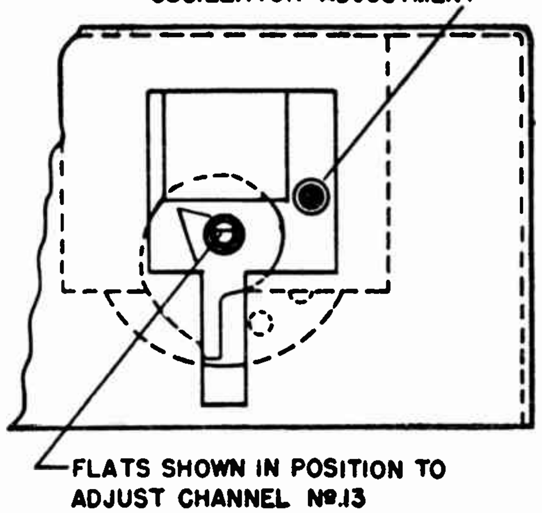

Fig. 6—Oscillator Adjustment

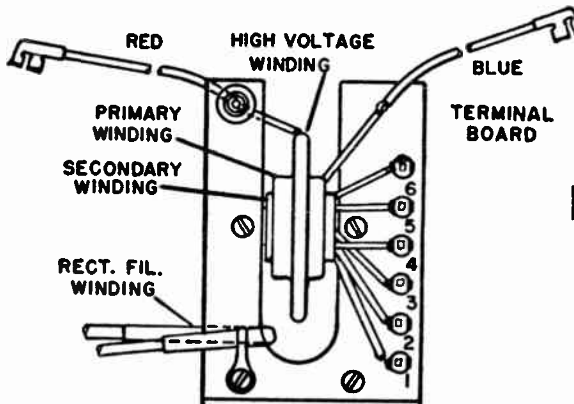

Fig. 7—High Voltage Transformer Winding Leads

ALIGNMENT PROCEDURE

TEST EQUIPMENT—To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency range: 4 to 5 MC; 1 MC sweep width.
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies:

(Output on these ranges should be adjustable and at least .1 volt max.)

(a) Intermediate frequencies:
4.5 MC Sound I.F.
21.25 MC Trap (L14)
22.2 MC 1st I.F. (L15)
25.6 MC 2nd I.F. (T1)
23.3 MC 3rd I.F. (T2)
24.6 MC 4th I.F. (T3)

(b) Radio frequencies:

Channel Number	Picture Carrier Freq. Mc	Sound Carrier Freq. Mc
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 10 kilovolts.

SERVICE PRECAUTIONS—To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back and the three chassis mounting bolts (bottom of cabinet). The chassis should normally be serviced without the kinescope. However, if it is necessary to view the raster during servicing, turn the chassis on its side, with the power transformer and high voltage cage down. In this position the chassis is self-balancing, and all controls and components are readily accessible for adjustment or measurement.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis.

SENSITIVITY CHECK—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through an attenuator pad of the type shown in figure 9. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position.

Only carbon type resistors should be used to construct the attenuator pad. Since many of the low value moulded resistors generally available are of wire wound construction, it is advisable to break and examine one of each type of resistor used in order to determine its construction.

OSCILLATOR ADJUSTMENT—The oscillator slug for each channel can be adjusted by removing the chassis from the cabinet. Use only an insulated alignment tool. When adjusting the slugs to be sure that the fine tuning control is at the mid-capacity position (tip pointing down, as illustrated in Fig. 6).

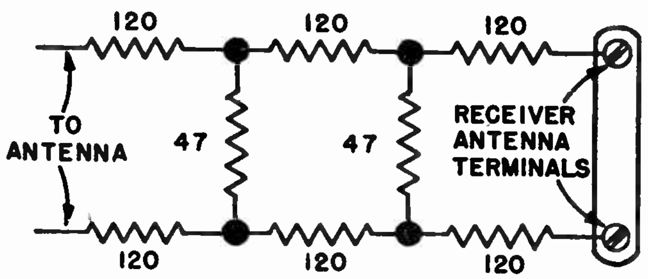

Fig. 9—Attenuator Pad

REPLACEMENT PARTS LIST FOR MODELS 616, 6161 & 1116

When ordering parts, specify part number, model number and any other pertinent information.

Ref. No.	Part Number	Description
		CAPACITORS
C1, C2, C4, C5, C7, C8, C20, C21, C24	16-177	Capacitor, ceramic; 5000 mmfd.
C3, C13, C16	16-188	Capacitor, tubular; .2-400 v. 85° C
C6, C26, C42, C43, C44, C49	18-295	Capacitor, electrolytic; 100 mfd. 200 v. 40-40 mfd. 450 v.
C9	15-196	Capacitor, ceramic; 100 mmfd.
C10	15-223	Capacitor, ceramic; 10 mmfd.
C11, C17, C39	16-189	Capacitor, tubular; .05-400 v. 85° C
C12	15-232	Capacitor, ceramic; 120 mmfd.
C14	18-276	Capacitor, electrolytic; 20 mfd. 450 v.
C15	18-299	Capacitor, electrolytic; 40 mfd. 250 v.
C18, C40	18-292	Capacitor, electrolytic; 4 mfd. 50 v.
C19, C47	15-200	Capacitor, mica; 470 mmfd.
C22	15-228	Capacitor, ceramic; 2000 mmfd.
C23	15-230	Capacitor, mica; 220 mmfd.
C25	15-222	Capacitor, ceramic; 5 mmfd.
C27	16-212	Capacitor, tubular; .2-600 v. 85° C
C28, C50, C54	16-208	Capacitor, tubular; .1-600 v. 85° C
C29, C32, C52, C57	16-193	Capacitor, tubular; .05-600 v. 85° C
C30	16-211	Capacitor, tubular; .0047-600 v. 85° C
C31, C34	16-209	Capacitor, tubular; .006-600 v. 85° C
C33	16-190	Capacitor, tubular; .005-600 v. 85° C
C35	16-198	Capacitor, tubular; .002-600 v. 85° C
C36, C37	15-220	Capacitor, ceramic; 1000 mmfd.
C38, C45	16-201	Capacitor, tubular; .01-600 v. 85° C
C41	15-210	Capacitor, ceramic; 33 mmfd.
C46	15-226	Capacitor, silver mica; 330 mmfd.
C48	15-231	Capacitor, mica; 390 mmfd.
C51	16-213	Capacitor, tubular; .03-600 v. 85° C
C53	15-233	Capacitor, mica; 50 mmfd. 800 v.
C55	18-293	Capacitor, electrolytic; 8 mfd. 500 v.
C56	20-145	Capacitor, trimmer; HORIZONTAL DRIVE

World Radio History

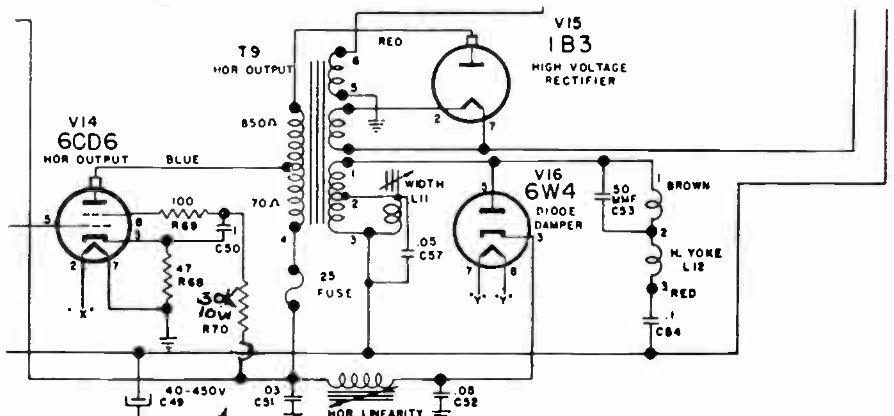
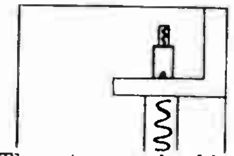
The following improvements are suggested to be incorporated in existing models 616, 6161 and 1116 rectangular tube chassis.
1. Substitute 30,000 (30K) ohm resistors in place of a single 15,000 ohm resistor now in use, as shown below.
2. Dress the AC choke on 1st video I.F. away from any sharp edges on the I.F. shield.
3. Dress the High Voltage lead to the anode connection away from the 5U4 tube.
4. Dress the blue plate lead to the 6CD6 tube away from the width coil.
5. Check all magnets and replace double magnet with single magnet on all bent gun tubes.
6. It has come to our attention that many of these units had been misadjusted as to the setting of the horizontal drive screw in the field by various technicians. The following is an outline of the procedure which must be properly adhered to, to gain the utmost from this unit.
a. The horizontal drive screw should be tightened and then turned counter clockwise until the white bar appears on the screen. When this bar appears the screw should then be turned clockwise approximately 1/4" of a turn until this bar disappears. Once this setting is achieved, the horizontal drive screw should not be touched to adjust the linearity or width. The width coil and the linearity coil which are located on the chassis will be adequate to make any such adjustments.

IT IS IMPERATIVE THAT THIS HORIZONTAL DRIVE SCREW IS NOT TO BE USED TO ADJUST THE LINEARITY OR WIDTH.



NOTE CHANGE

SUBJECT: REPLACEMENT OF HIGH VOLTAGE TRANSFORMER T-9 (80-263)
The following are the methods proposed to substitute the new type transformer for the old in models 616, 6161, and 1116.
1. Present transformer to be removed from the chassis, disconnecting all leads.
2. The screen resistor on 6CD6 (R70) to be removed from chassis.
3. Place black lead from unmarked terminal to the same point where the previous black lead was connected.
4. Place green lead from lug #6 to same point as previous green lead was connected. (Pin 6 of 6CD6).
5. Place orange lead from lug #7 to same point as previous orange lead B+ supply.
6. Place red lead from lug #4 to pin #5 on 6W4 only. (remove wire from yoke previously connected to pin #5 and place on empty pin #4 on 6W4)
7. Place white and black lead from lug #5 to the pin #4 (6W4) on which you had previously connected the red wire from yoke.
8. Install a resistor (82,000 to 100,000 ohm 3 w) from the boosted B supply (yellow lead coming out from the fuse to the terminal strip) to the screen on the 6CD6 (before the 100 ohm resistor) pin 1 being used as a tie point.
9. Place a 470,000 1/2 w resistor across the 8 mfd. 500 volt condenser (C55) on the vertical height control.
10. It is extremely important that the width coil bracket be mounted with the base of the bracket placed down in the high voltage compartment as shown:



to give you longer leads. The top winding is to be soldered to lug #6. The bottom winding to lug #7. Be extremely careful to dress these leads away from the blue plate of the 6CD6 and the Carona ring.
11. Place yellow lead from lug #1 to the fuse.

ALTERNATE TUBES FOR VIDEO AMPLIFIER STAGE

The 6AH6 Video Amplifier tube (V4) may be replaced by either a 6AC7 or a 6CB6. When either tube substitution is made, coils L3 and L5 must be changed as well as the socket wiring. When the 6CB6 is used, resistor R15 must be changed in addition to the coil. The 6AC7 requires a tube socket change.

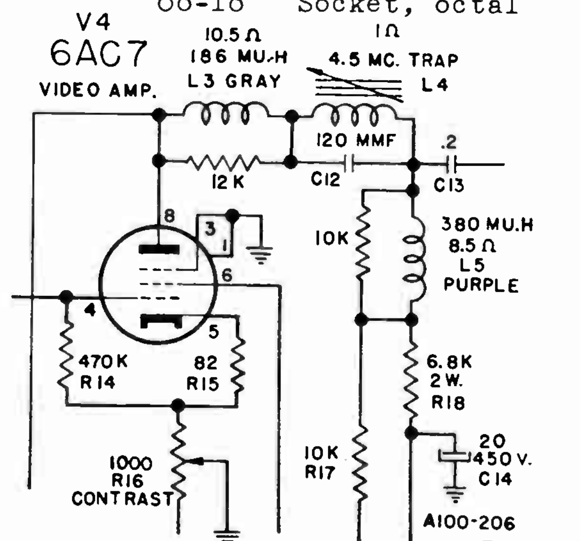
SUBSTITUTION OF THE 6AC7

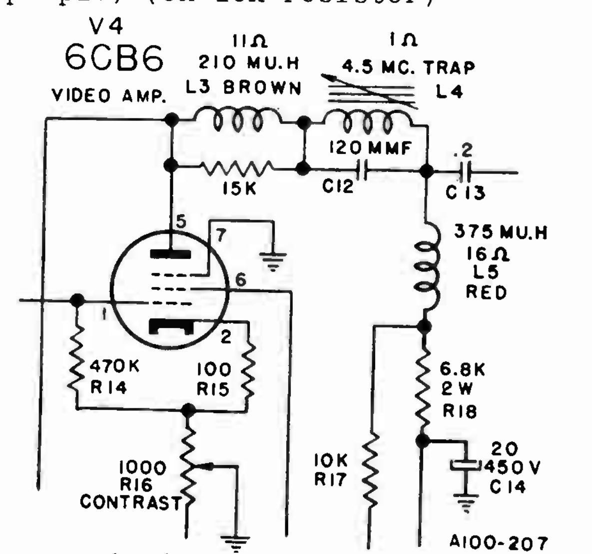
Remove:

L3	10-559	Coil, peaking, 230 uh (black)(on 18K resistor)
L5	10-548	Coil, peaking, 650 uh (white) (on 10K resistor)
	68-49	Socket, miniature, 7 pin

Add:

L3	10-566	Coil, peaking, 186 uh (gray) (on 12K resistor)
L5	10-565	Coil, peaking, 380 uh (purple) (on 10K resistor)
	68-18	Socket, octal





SUBSTITUTION OF THE 6CB6

Remove:

L3	10-559	Coil, peaking, 230 uh (black) (on 18K resistor)
L5	10-548	Coil, peaking, 650 uh (white) (on 10K resistor)
R15	60-776	Resistor, carbon, 100 ohm, 1/2 w. 10%

Add:

L3	10-567	Coil, peaking, 210 uh (brown) (on 15K resistor)
L5	10-558	Coil, peaking. 375 uh (red)
R15	60-752	Resistor, carbon. 100 ohm, 1/2 w. 10%

ALTERNATE TUBES FOR No. 3 I F STAGE

The 6CB6 I F Amplifier Tube may be replaced by a 6AG5. When this substitution is made, the ground connection on pin 7 of the socket will be removed.

INDEX

GENERAL DESCRIPTION

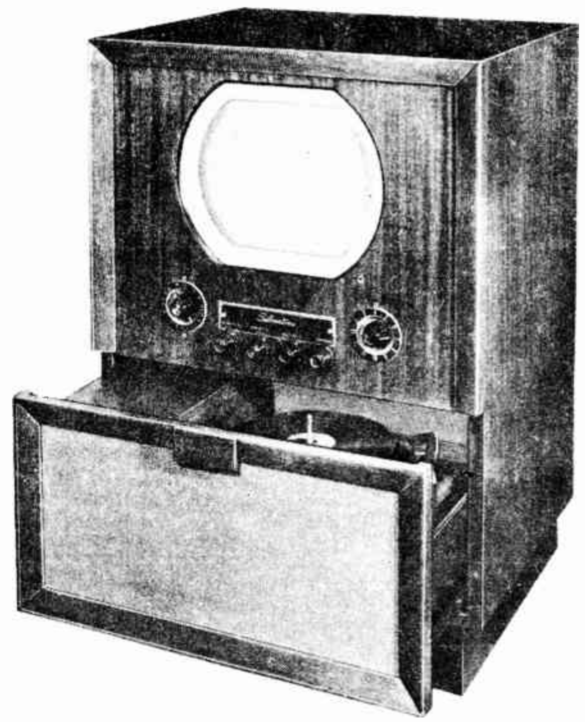
The information contained in this service RL covers the catalog 133 except for the record changer. Refer to 57 RL 539 for service information on the 100.211-20 intermix model record changer.

The catalog 133 is a combination, a console type television using Chassis 100.107, AM-FM radio using Chassis 100.043 and record changer 100.211-20. Television Chassis 100.107 utilizes twenty-two tubes solely for reproduction of the visual and aural portions of the television broadcast. The AM-FM tuner chassis 100.043 employs 5 tubes in specially designed, high sensitivity AM-FM receiver circuits. A heavy duty transformer and three rectifiers tubes, located on the 101.107 chassis, provide power for operation of all stages.

The circuit features of this receiver include a high gain R. F. tuner which is noted for its stability and rugged mechanical construction, an intercarrier sound system which is free from distortion normally caused by oscillator drift, automatic frequency control of horizontal sync system, "keyed" automatic gain control, and retrace line suppression. Exceptional sensitivity is achieved by a thoroughly stable and A.G.C. controlled R. F. amplifier and four stages of I. F. amplification followed by a two stage broad-band video amplifier. Another important feature is the compactly designed and tunable built-in antenna.

Remarkable picture stability and immunity to external interference are achieved by use of the new "keyed"type of A.G.C. system which also minimizes the "flutter"effect caused by passing airplanes.

Suppression of retrace lines by an ingenious circuit arrangement further contributes to ease operation of the receiver. This highly desirable performance feature permits a wide variety of picture brightness and contrast control settings without appearance of retrace lines.



Another feature provides for illumination of indicator lights to indicate the section of the receiver that is in use. The light above the channel number escutcheon is illuminated when receiver is being used for TV operation. When using the AM radio, a light below the dial scale turns on and when the FM radio is in use the light above the dial scale will glow. Another light located at the base of cabinet is always on whenever any part of the receiver is in use and is the only one lit when the record changer is being used.

Orderly and well spaced arrangement of all components on a generously proportioned chassis pan permits easy access to all circuits for measurements and analysis.

SPECIFICATIONS

POWER REQUIREMENTS

117 Volts 60 Cycles
Television-------------------------- 220 Watts
AM-FM Radio------------------------ 145 Watts
Phonograph------------------------- 160 Watts

FREQUENCY RANGE

Television---channels 2 through 13. For channel frequencies, see table on page 3.

Radio
Standard Broadcast (AM)--------- 540-1600 KC.
Frequency Modulation (FM)------- 88-108 MC.

PICTURE SIZE

Height	Width (at widest point)	Viewing Area (sq. inches)
9"	11"	91.6

SPEAKER

Type	Size	V.C. Imped.
P.M. Dynamic	6"x 9"	3.2 ohms

ANTENNA INPUT IMPEDANCE

72 ohms

BUILT-IN ANTENNA

High "Q" dipole with tunable matching stub.

R. F. TUNER

Fixed coil and selector switch type construction. All components are easily accessible for servicing

"KEYED" AUTOMATIC GAIN CONTROL

Outstanding new development; minimizes "airplane flutter"; reduces contrast variation when changing from one channel to another; increases immunity of sync system to external interference.

INTERMEDIATE FREQUENCIES

AM Sound-------------------------- 455 Kc.
FM Sound-------------------------- 10.7 Mc.
TV Sound Carrier------------------ 22.25 Mc.
Picture Carrier-------------------- 26.75 Mc.

I. F. SYSTEM

AM--- One stage (two tuned transformers)
FM--- Two stage (three tuned transformers)
TV --- Four stage (stagger tuner) for composite signal and two additional stages for intercarrier sound.

HORIZONTAL SYNCHRONIZATION

Automatic frequency control and "keyed" A.G.C. provide excellent picture stability and noise immunity.

VIDEO AMPLIFIER

Two Stage — broad band.

RETRACE LINE SUPPRESSOR

Eliminates retrace lines thruout the normal range of picture brightness and contrast.

FOCUS	DEFLECTION
Magnetic	Magnetic

HIGH VOLTAGE POWER SUPPLY

"Fly-back"type. Completely enclosed in a shielded compartment. Removal of H. V. compartment cover automatically opens interlock to disconnect receiver power cord.

SENSITIVITY

Antenna to Picture Tube Grid Sensitivity—To make this measurement, connect negative terminal of $1\frac{1}{2}$ volt battery to A.G.C. line, and positive terminal of battery to chassis. Also, set Contrast control to maximum clockwise position. Connect an A.C. vacuum-tube voltmeter betwen picture tube grid and ground, and place a .005 microfarad condenser across the same points.

Inject R. F. signal (modulated 30% at 400 cycles)at antenna terminals, using signal whose frequency corresponds to the center frequency of the selected channel, and adjust Fine Tuning control for maximum output. Generator must be connected to antenna terminals with a 22 ohm carbon resistor in high side lead to simulate proper impedance match.

Input signal required to produce standard output of 7.07 volts A. C. (r.m.s.) at picture tube grid is indicated in the following table. Since a fixed bias of $1\frac{1}{2}$ volts has been applied to the A.G.C. system in order to provide a reference level for these measurements, it will be understood that the sensitivities specified here are not intended to indicate the full capability of the receiver, but merely serve as a convenient basis for determining proper operation.

Low Band	Average — 25 microvolts	Range — 10 to 40 microvolts
High Band	Average — 40 microvolts	Range — 20 to 80 microvolts

Detector to Picture Tube Grid Sensitivity — To make this measurement, remove 6AU6, 4th Video I. F. tube (V - 10) and set Contrast contol to maximum clockwise position. Inject a 400 cycle (audio) signal across 6800 ohm video detector load resistor. In order to produce the standard output of 7.07 volts A C. (r.m.s.) at the picture tube grid, the input signal at the detector load resistor will be approximately .07 volts A. C An A. C. vacuum-tube voltmeter must be used for these voltage measurements.

Television Sound System Sensitivity —Inject 4.5 megacycle frequency modulated signal (400 cycle modulation with $7\frac{1}{2}$ Kc. deviation) across video detector load resistor and measure output at speaker voice coil. An input of 2200 microvolts will produce approximately 500 milliwatts or 1.26 volts across speaker voice coil.

A.M. Sound System Sensitivity —Inject a 1000 Kc. signal (modulated 30% at 400 cycles) at (high side) connection lug on antenna section of gang condenser Connect generator to this point through a .01 microfarad condenser. Tune receiver to 1000 Kc. signal. An input of 75 microvolts will produce approximately 500 milliwatts or 1.26 volts across the speaker voice coil.

F.M. Sound System Sensitivity—Inject a 98 megacycle frequency modulated signal (400 cycle modulation with $22\frac{1}{2}$ Kc. deviation) at pin 8 of 12AT7, F.M. R.F. Amplifier tube (V-26). Connect generator to this point through a 300 ohm resistor. Tune receiver to 98 Mc. signal. An input of 35 microvolts will produce approximately 500 milliwatts or 1.26 volts across speaker voice coil.

CIRCUIT DESCRIPTION

This receiver is a complete home entertainment unit featuring television, AM and FM reception and equipped with a three-speed intermix record changer capable of playing all of the latest type records now on the market.

The television chassis (100.107) incorporates 24 tubes (including three rectifiers), plus a $12\frac{1}{2}$" cathode-ray tube (type 12LP4), and the auxiliary AM-FM tuner chassis (100.043) contains 5 additional tubes. Electrical connections of the AM-FM tuner to the TV chassis are effected by a 3 prong plug for the power supply and a single prong plug for output to the audio system of the TV chassis.

Selection of the desired type of reception is accomplished by properly positioning the Band Switch. This switch is composed of two separate sections, joined by a lever and link assembly. One switch section is located in the TV chassis and the other section is in the AM-FM tuner. The section in the TV chassis switches B+ and filament voltages, and also switches the audio amplifier on the TV chassis into the appropriate circuit. The section in the AM-FM tuner switches circuits in that tuner for either AM or FM reception.

With the Band Switch in the "TV" position, B+ voltage is applied to all tubes and filament voltage to only those tubes in the TV chassis.

With the Band Switch in the PHONO position, filament voltage is applied to all tubes in the TV chassis only, with the exception of the 6AG5 R.F. Amplifier tube (V-5), 6J6 Mixer-Oscillator tube (V-6), and 6BG6G Horizontal Scanning Output tube (V-20). Certain B+ voltages have been removed from circuits in the TV chassis and the input of the audio amplifier circuit is switched to the output of the record changer.

With the Band Switch in the "AM" position, filament voltage is applied to all tubes in the AM-FM tuner and all tubes in the TV chassis with the exception of the 6AG5 R.F. Amplifier tube (V-5), 6J6 Mixer-Oscillator tube (V-6), and 6BG6G Horizontal Scanning Output tube (V-20). B+ voltages have been removed from certain circuits in the TV chassis and plate voltage is applied effectively to only those tubes or sections of tubes in the AM-FM tuner used for AM operation.

With the Band Switch in the "FM" position, filament voltages are the same as with Band Switch in "AM" position. Certain B+ voltages have been removed from circuits in the TV chassis and plate voltage is applied to all tubes in the AM-FM tuner.

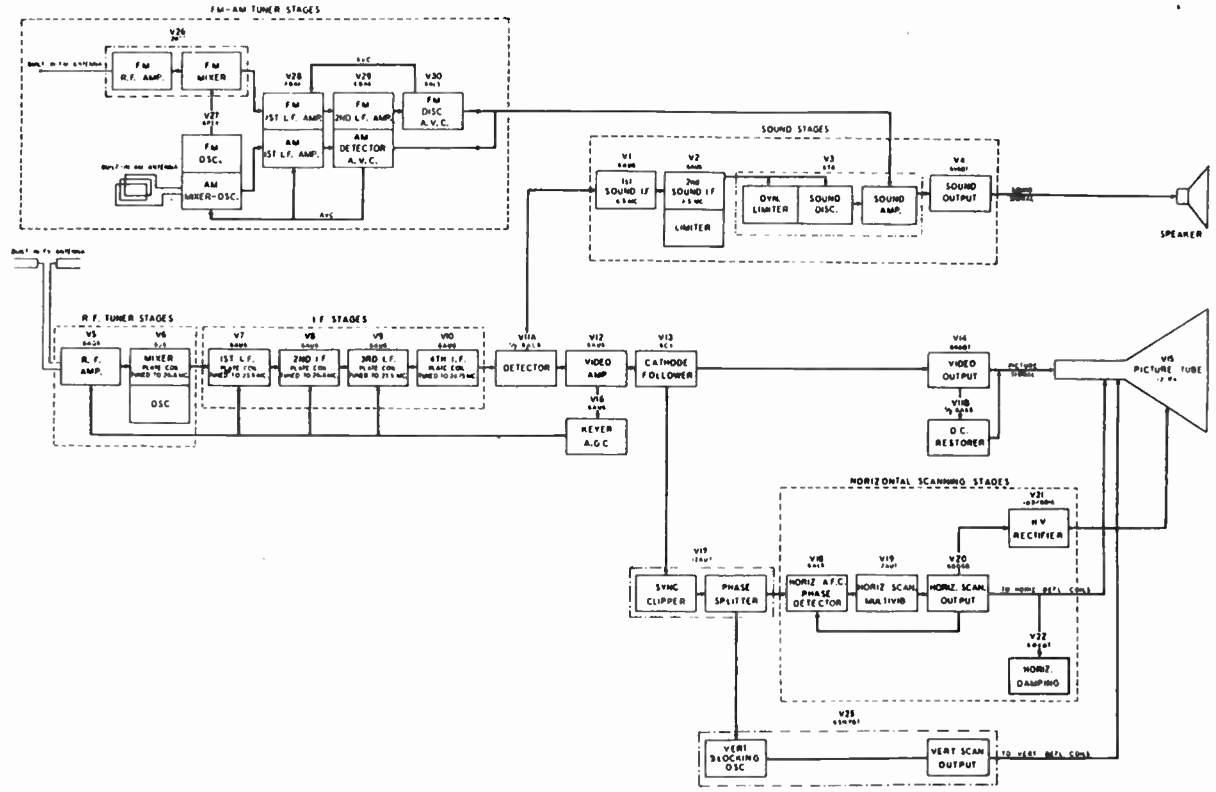

FIG. 1 BLOCK DIAGRAM

CIRCUIT DESCRIPTION — AM-FM TUNER

This tuner utilizes all 5 tubes for reception of standard FM broadcast signals and 3 tubes for reception of AM signals.

FM RADIO CIRCUIT

With the Band Switch set to the "FM" position, the received frequency modulated signal is fed into the cathode of one triode section of the 12AT7 tube (V-26A) which acts as a grounded grid F.M. R.F. Amplifier. The other triode section of this tube (V-26B) is used for the FM Mixer and its grid circuit is tuned by one section of the gang condenser. The second, third, and fourth grids of the 6BE6 (V-27) are now tied together and this tube is utilized as a triode for the FM oscillator circuit. The FM signal is then fed through 2 transformer-coupled 6BA6 I.F. Amplifiers (V-28 and V-29) which provide good overall selectivity and ease of tuning. A 6AL5 tube (V-30) is used in a ratio type FM discriminator circuit and this stage also provides A.V.C. voltage which is applied to the grid of the first I.F. Amplifier stage. Audio voltage developed in the discriminator stage is fed to the audio socket on the TV chassis. A section of the Band Switch in the TV chassis injects the audio signal across the Volume control. The triode section of the 6T8 (V-3) acts as a Sound Amplifier and is coupled to a 6V6GT (V-4) sound output tube. This stage drives a 6"x 9" P.M. dynamic speaker.

AM RADIO CIRCUIT

When the receiver is set for "AM" reception, the amplitude modulated signal received by the built-in low impedance loop antenna is coupled to the third

©John F. Rider

World Radio History

grid of the 6BE6 tube (V-27) through a tuned antenna coupling coil. This tube acts as a Mixer-Oscillator for AM operation, the oscillator section being of the modified Hartley type. The I.F. signal is then fed through one stage of transformer-coupled I.F. amplification using a 6BA6 tube (V-28). The grid and cathode of the second 6BA6 (V-29) are used as a diode for AM detection and development of A.V.C. voltage. A.V.C. is applied to the mixer grid and the grid of the I.F. amplifier stage. Audio voltage developed across the detector load resistor #400 is fed to the audio system in the TV chassis where it is amplified in the same manner as was the detected FM signal.

CIRCUIT DESCRIPTION — TV CHASSIS

R. F. CIRCUITS

This television receiver is equipped with a built-in antenna which is capable of providing satisfactory television reception in areas of adequate signal strength and where reflected signals do not present an abnormal problem. The antenna has been designed so that it may be tuned through the entire television broadcast band by means of a trimmer condenser placed at the end of a stub in the built-in antenna transmission line. An antenna terminal strip provides a ready means of connection of transmission line from an outdoor antenna, if that type of installation is used.

The inductance and amount of coupling of the antenna input coils is changed by switch sections #282A, B, C and D as the Channel Selector switch is rotated in order to maintain a constant input impedance to the receiver of 72 ohms. This provides maximum energy transfer to the R. F. amplifier stage, particularly when interconnection between an outdoor antenna and the antenna terminal strip is made with coaxial cable of the 72 ohm type.

A type 6AG5 tube (V-5) is used for R.F. amplification and the plate circuit of this stage is tuned by varying its inductance. When the Channel Selector Switch is in the channel 2 position, twelve R.F. coils are connected in series, but each time the Channel Selector is advanced to the next channel higher in frequency, one coil is shorted out by switch section #282F.

A similar tuning arrangement is used in the grid circuit of the mixer stage, which utilizes one triode section of a 6J6 tube (V-6B). The other half of the 6J6 (V-6A) is connected as a modified Hartley oscillator which injects oscillator voltage into the mixer stage thru capacity coupling between adjacent terminals of switch sections #282G and #282J. Oscillator tuning is accomplished in the same manner as R.F. plate and mixer grid tuning, with the addition of a fine tuning control condenser in the oscillator plate circuit.

COMPOSITE PICTURE AND SOUND IF CIRCUITS

The I.F. picture and sound signals are taken off at the plate of the mixer stage and pass thru 4 stages of wide-band I.F. amplification using four type 6AU6 tubes (V-7, V-8, V-9, and V-10). A stagger-tuned I.F. system is utilized in this receiver and correct response is obtained by properly positioning the slugs in five plate coils. A sound trap is located in the cathode circuit of the 1st I.F. amplifier stage (coil #103 and condenser #105) and is used to correctly shape the response curve at the sound I.F. carrier frequency.

All I.F. stages contain plate and grid decoupling networks to prevent interaction between stages, and all cathode resistors are unbypassed to improve stability of the I.F. system.

DETECTOR CIRCUIT

Both picture and sound I.F. signals are injected at the cathode of one diode section of a 6AL5 tube (V-11A). This stage detects the video signal and develops a negative-going video voltage across the detector load resistor #139. It also acts as a converter in producing the 4.5 Mc. difference frequency between the 26.75 Mc. video carrier and the 22.25 Mc. sound carrier.

VIDEO CIRCUITS

The video detector output is directly coupled to the grid of the 1st wide-band Video Amplifier, which uses a 6AU6 tube (V-12). This stage amplifies the composite video signal and also acts as a noise limiter. Noise peaks on the negative-going video signal drive the 6AU6 beyond cutoff, and are therefore not present in the plate circuit of this stage.

The composite video signal is coupled to the grid of a 6C4 (V-13) connected as a Cathode Follower. The output is taken off the cathode of this stage and provides a more stable sync signal for control of the horizontal and vertical sweep circuits.

A second stage of wide-band video amplification provides a video signal of sufficient strength to drive the 12LP4 picture tube grid. The Contrast control is located in the cathode circuit of the 6K6GT (V-14) video output stage and effectively regulates the amount of degeneration of this stage.

KEYED A.G.C. CIRCUIT

The plate of the 6AU6 Keyer A.G.C. tube (V-16) returns to ground thru a winding of the Width coil #225 and the A.G.C. load resistor #151, thus plate voltage is applied to this tube only during a horizontal output pulse. During the interval of this pulse, an amount of plate current will flow thru the keyer tube determined by the grid voltage being applied to the tube. Since the grid is directly coupled to the 1st video amplifier plate circuit, the negative voltage developed across the A.G.C. load resistor during keyer tube conduction will vary directly with the amplitude of the signal across the video detector load resistor #139. The time constant of the A.G.C. filter network is approximately .01 seconds, which is high enough to compensate for signal strength fluctuation or "beating" action caused by passing aircraft.

Noise immunity of the circuit is further improved by keeping the grid of the keyer tube biased beyond cutoff at all times except during a positive-going sync pulse.

Filtered A.G.C. voltage is used to control the gain of the R.F. amplifier stage and the first three I.F. amplifier stages.

D.C. RESTORER CIRCUIT

The output of the 1st Video Amplifier contains both a.c. and d.c. components of the composite video signal, but a.c. coupling between this stage and the cathode follower stage results in a loss of the d.c. component. Restoration of this d.c. component must be accomplished just before the video signal is fed into the picture tube in order to maintain the black elements of the picture at a constant level.
