Printed Circuit Assemblies . . .**

# RMC *Wedg-Loc* DISCAPS

RMC "Wedg-Loc" DISCAPS are designed specifically to cut assembly time on all types of electronic equipment using printed circuits.

The exclusive wedge design of the leads on these new type DISCAPS locks them firmly in place on printed circuits . . . eliminates their falling out during production line operations . . . insures a uniform connection with a minimum amount of solder.

Available in capacities between 2 MMF and 20,000 MMF in temperature compensating, by-pass and stable capacity types, "Wedg-Loc" DISCAPS will provide worthwhile economies on printed circuit assembly. Suggested hole size for "Wedg-Loc" DISCAPS is a .062 square hole.

MARCH, 1955

**FRONT COVER:** 43rd ANNUAL IRE CONVENTION being held in New York City, March 21-24, is once again the focal event of the radio-TV-electronic industries. Aerial photograph looking north from lower Manhattan shows location of Waldorf-Astoria and Belmont Plaza Hotels, where convention headquarters and technical sessions are held, in midtown area. IRE headquarters are a short distance north, bordering Central Park. Kingsbridge Armory and Kingsbridge Palace, scene of exhibits and technical sessions, are located in the Bronx. More than 40,000 are expected to attend. For complete convention information, see page 88.

**2 Million Auto Radios**

E. K. Foster, vice pres. Bendix Aviation Corp., announces that his firm has been awarded continuance of Ford auto radio business to include 1956 models. They have made 2 million sets to date. Here's what was needed for manufacture:

Number of parts	364,000,000
Weight of parts	24,000,000 lbs.
Total continuous work time	3 years
Number of solder joints	176,000,000
Number of connections	280,000,000
Length of hookup wire	3,640 miles
End-to-end distance, all sets	332 miles
Number of rivets	60,000,000
Number of tubes	12,000,000
Number of screws	42,000,000
Length of wire for vibrators and output transformers (two in each receiver)	1,520,000 miles

**Germanium Diodes**

Approximately 13,250,000 point-contact germanium diodes valued at \$9,400,000 were sold in 1954. Of this number approximately 7,000,000 were sold for use in entertainment equipment. It is estimated that 8% were sold for replacement purposes.

**Lower Shipping Costs**

West Coast manufacturers are looking into consolidated shipping possibilities for small freight shipments weighing between 5 and 72 lbs. Such consolidation avoids high parcel post rates and permits minimum freight rates. Here's how they figure:

SAN FRANCISCO AREA				
Weight	Via P. P. 8th Zone	Via Freight	Via Consol	SAVE At Least
10	1.95	6.00	1.00	.95
20	3.75	6.00	1.80	1.95
30	5.70	6.00	2.60	3.10
40	7.50	6.00	3.40	2.60
50	—	6.00	4.20	1.80
60	—	6.00	5.00	1.00
70	—	6.00	5.80	.20

LOS ANGELES AREA				
Weight	Via P. P. 8th Zone	Via Freight	Via Consol	SAVE At Least
10	1.95	6.00	.93	1.02
20	3.75	6.00	1.66	2.09
30	5.70	6.00	2.59	1.38
40	7.50	6.00	3.12	.88
50	—	6.00	3.85	2.15
60	—	6.00	4.58	1.48
70	—	6.00	5.31	.69

**1955 Resistor Markets (Est.)**

Composition	
1.5 billion units	\$35 million
Deposited Carbon Film	
30 million units	\$ 4 million
Wirewound (all types)	
40 million units	\$55 million

**Electronic Industry Figures**

The Los Angeles Chamber of Commerce, in their "Report on the Electronic Industry" revised to January 1, 1955 have included the following data summarizing the status of the industry in the metropolitan area for 1954:

Number of firms manufacturing electronic equipment, components and material	440
Number of plant locations	502
Number of products manufactured	172
Total square feet of plant facilities	9,750,281
Number of employees	69,637
Annual Industry Payroll	\$283,000,000*
Number of firms doing research and development work	203
Number of engineering and design firms	23
Number of service and testing firms	43

**INDUSTRY BILLING**

Dollar Billing (000 omitted)	1941, 47,000	1943, 95,000
	1953, 750,000	1954, 842,000

Estimated 1956—1,000,000,000

\* Estimated

**GOVERNMENT ELECTRONIC CONTRACT AWARDS**

# PROOF OF PERFORMANCE

from **500 WATTS**  
through to  
**50 KILOWATTS**

COMPARE TV *Proven*  
TRANSMITTER OPERATING  
CHARACTERISTICS...

and you  
will  
prefer

**S-E**

**1** 50 KW PLUS

With S-E's 50 KW VHF transmitter you get 50 KW PLUS on any channel, including 13. Actual test results quoted from a "PROOF OF PERFORMANCE" test conducted by a leading consulting engineer prove that an S-E 50 KW transmitter will deliver approximately 56 KW peak

"SUFFICIENT DRIVING POWER IS AVAILABLE SO THAT EACH HALF OF THE FINAL AMPLIFIER IS CAPABLE OF DELIVERING ALMOST 28 KW PEAK."\*

\*The final stage of an S-E 50 KW transmitter consists of two 25 KW diplexed amplifiers.

The above is a direct quote from a "PROOF OF PERFORMANCE" report made by a leading Consulting Engineering firm† on an S-E equipped station — page 4, paragraph 2.

†Name available upon request.

power. Yet the very same transmitter can be run within specifications at power outputs as low as 30 KW or at whatever power level is needed to conform to your authorized ERP.

## 2 SUPERLATIVE MONOCHROME QUALITY

Standard Electronics VHF transmitters and amplifiers assure full compliance with FCC requirements plus a wide margin of safety... proof that with S-E transmitters and amplifiers you get the best. Sharp, high-end channel cutoff and conformity to bandwidth specs are shown in the curve to the right, copied from a "PROOF OF PERFORMANCE."

Point-by-point Curve Taken from Actual "PROOF OF PERFORMANCE" as reported by a Leading Consulting Engineer.

## FULL COMPLIANCE WITH FCC COLOR REQUIREMENTS

S-E transmitters and amplifiers have such high monochrome quality because the color quality is also exceptionally good. Designed for color, S-E transmitters have never used the back porch clamping technique. Curve shows excellent band width assuring full response up to 4.2 mc. FCC requirements pertaining to amplitude vs. frequency response for the system can easily be met, as S-E transmitting equipment uses but a very small part of the variation allowed. For proof that S-E transmitters and amplifiers will transmit superlative color signals . . . for proof of essential linearity . . . see stair-step patterns showing input signal and linearity of output signal through the transmitter and broad band amplifier stages, recorded directly from the oscilloscope. No S-E transmitter in service has had to be modified to meet color specifications . . . ability to handle color is engineered into every S-E transmitter.

Pattern Taken Directly from Oscilloscope Showing Input To The Transmitter.

Pattern Taken Directly from Oscilloscope Showing Linearity of Transmitter and Broad Band Amplifier Stages.

## 4 AURAL TRANSMITTER EXCEEDS REQUIREMENTS

Quoting from "PROOF OF PERFORMANCE" report: — "AM hum and noise level of —53.4 db exceeds the —50 db requirement . . . The FM noise level of the entire system was —56 db and —61db for the transmitter alone — which complies with —55 db Commission requirements."

## 5 SUMMARY

"The equipment was found to comply with the Commission's requirements."

## 6 TUBE LIFE

Although not included in the "PROOF OF PERFORMANCE" report or covered by FCC specifications, any discussion of PROOF of S-E transmitter and amplifier PERFORMANCE would be incomplete without mention of a final-tube expectancy of 5000 hours and more! The Chief Engineer of a large S-E equipped station states: "We didn't change our tube budget when we changed from a competitive make 5 KW transmitter to an S-E

50 KW transmitter. At the end of the year, we still had a substantial amount of money left over in our budget." . . . and this in spite of a 10-fold increase in transmitter power!!

## RELIABLE SERVICE

Although the FCC similarly does not set up standards on service, a valid "PROOF OF PERFORMANCE" must inevitably rest on service to the customer after the equipment is installed. The Chief Engineer of another S-E equipped station is quoted as saying: "In the case of The Standard Electronics Corporation, I would say that their equipment is only exceeded by the splendid cooperation and service we are getting from them."

*Compare* every make of transmitter before you decide!

Catalog and specification sheets are available, or ask for a personal demonstration of S-E transmitters and amplifiers. Write, wire or phone Standard Electronics.

**CIRCULATION NOW 27,000**

An increase of 5,000, effective with the January 1955 issue, provides greater penetration of plants, stations and laboratories in the primary markets of the industry—Manufacturing, Broadcasting and Armed Forces procurement.

These are the markets with greatest buying power and greatest expansion, industrially and geographically.

The circulation of TELE-TECH is increasing in two ways:

- 1—Growth of TELE-TECH's Unit Coverage of top-ranking engineers—the magazine's basic readership, preselected for complimentary subscriptions.
- 2—Making paid subscriptions available to other engineers in research, design, production, operation and maintenance.

Although currently effective, the increased circulation cannot appear in audit statements until the first half of 1955 is audited.

### THE ELECTRONIC INDUSTRIES DIRECTORY

Published annually as an integral section of TELE-TECH in June

This is why  
the printed circuit  
was invented!

You hold the secret of success in printed circuits if you specify Copper-Clad Phenolite by National.

This is a scientifically compounded laminate possessing *all* the properties and characteristics demanded for the job. Among these are high dielectric and mechanical strength, resistance to heat, moisture, solvents, oils, acids, alkalis. It is light in weight—can be machined, punched, sawed, drilled.

Let us show you how Copper-Clad Phenolite can give you less complex systems at lower cost.

TACKLE YOUR PRINTED CIRCUIT DESIGN JOB WITH THIS HELPFUL GUIDE

*This brochure will definitely help you in your job of achieving miniaturization, automation. Complete coverage of basic technical facts and design data related to applied printed circuitry. Methods of producing printed circuits, and economic aspects of design are treated in detail. Write Dept. K-3 for your free, personal copy. Ask for "Mechanize Your Wiring..."*

# Spotlighting Standardization!

## hermetically-sealed terminations and miniature closures\*

● **MULTIPLE HEADERS**— Strain-free, vacuum tight headers featuring cushioned glass construction. Silicone treated for maximum dielectric strength and tin dipped for easy soldering.

● **SEALED TERMINALS**— These E-I terminals offer high thermal shock resistance and feature cushioned glass construction. Available in many economical preferred types and special designs.

● **OCTAL HEADERS**— Both plug-in and multiple types feature a new principle of hermetic sealing. Solid metal blanks afford maximum rigidity and mechanical strength.

● **E-I END SEALS**— Completely strain-free. Provide a permanent hermetic seal. For condensers, resistors and other tubular-type components. Available in many standard types.

● **COMPRESSION TYPE HEADERS**— Super rugged, practically indestructible and absolutely rigid. Exclusive E-I process affords increased resistance to shock and vibration.

● **LUG-TYPE, LEAD-THRU INSULATORS**— Compression sealed, super rugged. For applications requiring voltage ratings from 2000 to 4000 (rms.)— transformers, "bath-tub" condensers, etc.

● **MINIATURE CLOSURES**— For transistors and other components requiring hermetic sealing. Square, rectangular and round cases. Supplied in E-I standard types or custom designs to specifications.

● **COLOR-CODED TERMINALS**— Featuring glass inserts with permanent coloring in the glass. All types offered in standard, easily-identified RMA color codes.

\*PATENT PENDING  
ALL RIGHTS RESERVED

AVAILABLE IN A  
WIDE RANGE OF  
STANDARD TYPES TO  
ECONOMICALLY MEET  
SPECIAL REQUIREMENTS!

Economical E-I standardized hermetically-sealed terminations and miniature closures are available to meet almost any electronic application. Samples and recommendations on your particular needs will be supplied promptly on receipt of your data. Call or write for complete E-I catalogs, today!

# How your telephone call asks directions... and gets quick answers

*Perforated steel cards, which give directions to the Long Distance dial telephone system, are easy to keep up to date. New information is clipped (1) and punched (2) by hand on a cardboard template. This guides the punch-press that perforates a steel card (3), and the two are checked (4). The new card is put into service in the card translator (5).*

When the Bell System's latest dial equipment receives orders to connect your telephone with another in a distant city, it must find—quickly and automatically—the best route.

Route information is supplied in code—as holes punched on steel cards. When a call comes in, the dial system selects the appropriate card, then reads it by means of light beams and photo-transistors. Should the preferred route be in use the system looks up an alternate route.

It is a simple matter to keep thousands of cards up to date when new switching points are added or routing patterns are changed to improve service. New cards are quickly and easily punched with the latest information to replace out-of-date cards.

This efficient, flexible way of keeping your dial system up to the minute was devised by switching engineers of Bell Telephone Laboratories, who are continually searching for ways to improve service and to lower costs. Right now most of the Long Distance dialing is done by operators, but research is hastening the day when you will be able to dial directly to other telephones all over the nation.

## BELL TELEPHONE LABORATORIES

*Improving telephone service for America provides careers for  
creative men in scientific and technical fields.*

# From Original Engineering...

From Original Engineering... and from its half-century of specialized skills and experience, Machlett once again creates new criteria of electron tube performance for high power electronics.

Machlett is first again to offer significant, original design for high power triodes. It was six years ago that Machlett perfected a heavy duty power tube series—the first from any manufacturer. Accepted at once by equipment manufacturers, now universally used, these tubes were also *paid the compliment of imitation.*

## With the New Machlett Triodes COSTS GO DOWN

Because filament power is reduced—  
up to 60% (enough, in many cases, to pay for the tube).

Because tube life is longer—  
increases of over 100%, compared to conventional types.

Because maintenance is cut—  
replacement minimized; cleaning simplified.

Because handling costs are low—  
weight down 60 to 70% for air cooled types.

## With the New Machlett Triodes PERFORMANCE GOES UP

Because plate and grid ratings are higher—  
broader range of operation is possible.

Because safety margins are usefully increased—  
for thermal, mechanical and electrical ratings.

Because lead inductances are very low—  
circuit parasitics are reduced by as much as 10-to-1.

Because transconductance is high—  
plate efficiency is increased, grid drive reduced,  
stable performance assured over broadest loading range.

The above tubes portray progressive evolution in electron tube design. Left, Type 892, uses long, high inductance electrode leads and large glass envelope—a design now over 35 years old. Center, Machlett developed, electrical equivalent, industrial ML-5668, has stronger, less inductive internal structures, short glass envelope and sturdier seals, thicker anode with double heat dissipation capacity. Right, most modern tube, Machlett's new ML-6422, uses cylindrical electrode supports for lowest inductance, great stability; large contact area terminals for great seal strength; close-spaced, precisely-aligned electrodes for low drive and high efficiency; thick-wall anode for cool tube operation, high overload capacity; stress-free thoriated-tungsten filament for high load current, low heating power, and longer life.

And Your First Cost is Only One Postcard—that's all it takes to write Machlett Laboratories for the full story of these premium design, rugged, coaxial triodes. Learn now what to expect of a modern power triode.

**MACHLETT LABORATORIES, INC.**  
1063 Hope Street, Springdale, Connecticut

# New Performance Criteria

**1955**

**Available only from Machlett Laboratories:** Eight new rugged coaxial terminal triodes, with thoriated-tungsten filaments, and incorporating every proven design and production advance made by Machlett in its heavy duty electron tube experience.

Power Output.....	5-10kW	10-15kW	15-20kW	25-40kW	25-50kW
Water Cooled.....	ML-6420	ML-6422	ML-6424		ML-6426

## Electronic Cooling System In Pioneer Developments

Heralding radically new electronic developments, RCA Chairman of the Board Brig. Gen. David Sarnoff has unveiled several experimental devices expected to have considerable impact on our way of living in the coming years. These include a music synthesizer (technical details on pages 68 and 80) capable of generating any sound, an electronic light amplifier with amplification better than 20-to-1, and an all-electronic cooling system for use in refrigerators and air conditioners.

The cooling system operates noiselessly without any moving parts, motors or compressors. The principle of operation is based on the "Peltier effect" discovered more than 120 years ago, by which passage of an electric current through the junction of two dissimilar materials produces a cooling or heating effect in the region of the junction, depending on the direction of the current. Until recently this has been just a scientific curiosity because materials capable of producing sufficiently low temperatures for practical use were lacking. New knowledge provided by recent studies of solid-state physics have provided some answers.

Nils Lindenblad of RCA Labs. inspects electronic cooling system believed to be first of its kind to achieve practical freezing temperatures. Operation is based on "Peltier effect," described on page 110

In the electronic cooling system, a series of junctions made of alloys of copper and zinc surround a container. For the present a mechanical pump is used to circulate water for removal of heat from the apparatus, but a means is being worked out to pump the water electronically. In one unit 6 oz. of ice froze.

## Automatic Tetrode Transistor Production

A machine that can automatically carry out a series of more than 15 steps in making n-p-n tetrode junction transistors has been developed by Bell Labs. The device, familiarly known as Mr. Meticulous will do the following in less than a minute:

Examine a hair-thin bar of germanium or silicon for electrical characteristics; accept or reject it; weld a fine gold wire to a critical point (the 1/10,000 in. thick center p-layer) with an accuracy of 1/20,000 in.; connect this wire to the leads; flip the bar over to repeat the operation; and run a series of tests.

The location of p-layer, and welding the gold wires to it, are extremely important. In hand assembly, improper lead attachment has been a prime cause for rejects.

The machine locates the p-layer by attaching a dc source in series with the bar. By shining light on the bar, current is made to flow. The gold wire, with a bias on it, is placed in contact with the bar and moved along it toward the p-layer in 50-microinch steps.

When the wire touches the p-layer, the unit acts as a transistor, and the current through the bar falls, indicating the location of the center layer. The wire is moved along the p-layer in 50 microinch steps to determine its width, moved back, and then welded by an electrical surge.

The importance of tetrode transistors lies in the fact that they can operate at very high frequencies. (For technical details, see Nov. 1952

## Compact Aircraft Radar

A compact and highly sensitive airborne radar set which can receive information from distances up to 200 miles is undergoing tests by Braniff International Airways, which has installed the unit aboard one of its DC-6 commercial airliners. The equipment, developed by Allen B. Du Mont Labs., is designed to warn pilots of dangerous terrain, hazardous weather, and for use as a navigation aid. The radar unit, designated Type APS 42 B, has already been successfully used in military transport planes, and the Navy's new Lockheed Constellations are being equipped with the unit.

It contains six basic units weighing about 200 lbs. total, including

Azimuth and range Indicator of DuMont's new airborne radar installed in pilot's compartment

the antenna, receiver-transmitter, control unit, sync unit, and two azimuth-range indicators. The system meets MIL-I-6181 for r-f interference, operates at X-band (9375 mc) with a nominal power of 40 kw, and has a scan angle of 120° or 240° for nose mounts. Pulse characteristics for search are 800 pps, 0.75 μsec.; for long range and weather, 200 pps, 3.5 μsec.; and for beacon operation, 300 pps, 2.35 μsec.

issue of TELE-TECH & ELECTRONIC INDUSTRIES, page 38.)

For more information on the machine, turn to page 140 of this issue.

## As We Go To Press . . . (Continued)

Curtiss-Wright's new ultrasonic parts washing machine cleans metal objects such as fuze movements and delicate foils. Objects immersed in solvent solution have grime loosened by cavitation and degassing. Power output of 800 kc units range from 200 to 10,000 watts. Either quartz or magnetostrictive transducers are employed. Cost of ultrasonic generator and head is about \$1250

### Flexible Tubular Waveguide

A new and radically different medium for transmitting television and telephone conversations over long distances which has been used successfully in experiments has been announced by Bell Telephone Laboratories. The new medium, a long

Newest look in telephone and TV transmission is experimental long distance waveguide, made of flexible copper, two in. in diameter

distance waveguide, is markedly different from modern cable or radio relay systems—it uses hollow metallic tubes roughly two inches in diameter.

Waveguides made of solid metal tubing—roughly like a metal water pipe—have been widely used for some time for short distances. It would be possible to use these solid metal tubes for long distances if they

were perfectly straight, but this is impractical. The new long distance waveguide is also a hollow tube, but it is constructed under pressure—and wrapped inside a flexible outer coating which holds the coiled wire in place.

Experiments indicate that both the solid tube type waveguide and the new coiled wire or "helical" type of waveguide can be used together in communications systems, the first for short distances and the latter for long distances.

Although this new form of transmission is still in the experimental

BTL engineer tests transmission through long distance waveguides of various sizes at Holmdel, N. J. A two-in. diameter was found to be the best size for new flexible hollow tube

### Curtiss-Wright Enters Industrial Electronic Field

Curtiss-Wright has demonstrated a new line of commercially available electronic equipment for industrial, medical, laboratory and nuclear applications. Included are:

- An 800 KC ultrasonic washing machine;
- A combined scaler and ratemeter for use with various counter tubes;
- An industrial TV system with a super iconoscope capable of electronic zooming;
- A harmonic eliminator for producing pure sine wave 60 CPS power;
- An ultrasonic drill for cutting hard materials;
- Two non-destructive ultrasonic flaw detectors;
- An infra-red night viewing or "black light" system;
- A beta gauge for automatic production control;
- A 26.8 MC dielectric heater.

Most of the devices are manufactured under license of the German firm, Frieseke & Hoepfner.

stage, a recent long distance test was made at Holmdel in a copper pipe 500 feet long. Engineers bounced signals back and forth in the tube for distances of 40 miles. They calculated that in comparison, the same waves could have traveled only 12 miles in a coaxial cable with the same loss in strength. The carrier frequency for the new waveguide is about 50,000 megacycles.

### New Airliner Radar

New airborne radar, developed especially for airline use, is going into its first regular commercial service aboard a Panagra (Pan American-Grace Airways) DC-6B operating between the United States and South America. The airline announced it had received the first three X-band RDR-1 radar sets built by the Bendix Aviation Corporation for its fleet of new Douglas DC-7B's, and was using one unit to replace the APS-42A radar (a military version) which it had been operating on its South American routes under actual flight and weather conditions since last April. Lighter, more practical and simpler to operate than the APS-42A, the RDR-1 provides the pilot with a clear picture of the weather up to 150 miles ahead when flying at night or on instruments, and spots the exact location of storms.

### Standardized Fuses

For some time Bussmann Mfg. Co., St. Louis, Mo. and Littelfuse Inc., Des Plaines, Ill. have worked cooperatively to establish a new standard in fuse clips and fuses for electronic equipment. The complete data on this new fuse series will be published soon. Meanwhile, briefly and in general, the fuse electrical sizes will range up to 10 amperes. Different sized post-type holders and fuses have been assigned to each electrical value, and ear tabs on the fuse metal end-caps are made to act as keys. Thus in practice it will be possible to replace a blown fuse with only one size larger or lower than the prescribed electrical value. The Underwriters Labs. have approved the new standard and it is expected that manufacturers will be able to effect substantial design economies through its use.

### RETMA Submits Radiation Report

The Radio-Electronics-Television Manufacturers Association has filed its comments with the FCC on the Commission's consideration of an amendment to Part 15 of the rules governing restricted radiation devices. The comments, submitted by the Association's Director of the Engineering Dept., W. R. G. Baker, contained the reports and recommendations of seven technical task forces. These include: #1, TV receivers; #2, carrier current equipment; #3, fixed and mobile equipment; #4, community antennas; #5, radio receivers; #6, test equipment and miscellaneous; and #7, transmitters.

The TV receiver task force found that RETMA oscillator radiation limits for VHF (50  $\mu\text{v}/\text{m}$  for low VHF band, 150  $\mu\text{v}/\text{m}$  for high VHF band, with linear interpolation between) have been met by manufacturers without serious added cost to the chassis, and recommends that all sets made after June 30, 1955 meet this limit. At UHF it was found that few, if any, manufacturers were meeting the 500  $\mu\text{v}/\text{m}$  oscillator radiation limit, and that difficulties encountered included lack of a suitable antenna isolation circuit, and problems of correlating various measurements. The task force recommended that the 500  $\mu\text{v}/\text{m}$  maximum limit be met by all UHF receivers made after Dec. 31, 1956, with linear interpolation between upper VHF band and UHF.

\* Impedance ratio is fixed, 1250:1 for SSO-1, 1:50 for SSO-3. Any impedance between the values shown may be employed.

## SUBOUNCER (WIDE RANGE) AUDIO UNITS

Standard for the industry for 15 yrs., these units provide 30-20,000 cycle response in a case 7/8 dia. x 1-3/16 high. Weight 1 oz.

### TYPICAL ITEMS

Application	Pri. Imp	Sec. Imp
Mlke, pickup or line to 1 grid	50, 200/250, 500/600	50,000
Single plate to 1 grid	15,000	60,000
Single plate to 2 grids, D.C. in Pri.	15,000	95,000
Single plate to line, D.C. in Pri.	15,000	50, 200/250, 500/600
Push pull plates to line	30,000 ohms plate to plate	50, 200/250, 500/600
Mixing and matching	50, 200/250	50, 200/250, 500/600
Reactor, 300 Hys.—no D.C.; 50 Hys.—3 MA. D.C., 6000 ohms		

## HERMETIC VARIABLE INDUCTORS

These inductors provide high Q from 50 - 10,000 cycles with exceptional stability. Wide inductance range (10-1) in an extremely compact case 25/32 x 1-1/8 x 1-3/16 . . . Weight 2 oz.

### TYPICAL ITEMS

TYPE No.	Min. Hys.	Mean Hys.	Max. Hys.	DC Ma

Capsule summaries of important happenings in affairs of equipment and component manufacturers

**ADMIRAL CORP.** has licensed **RADIO CORP. OF AMERICA** for five years under patents for radio, TV, and automation equipment and has been licensed by RCA for the same period for patents in TV and radio broadcast receiving sets.

**AIR REDUCTION SALES CO.**, Div. of **AIR REDUCTION CO. INC.**, New York, N. Y. has produced a 20-minute, color-sound movie on tungsten inert-gas arc welding, titled "Nothing But The Best."

**AIRTRON, INC.**, Linden, N. J. has signed a license agreement to manufacture microwave ferrite elements and ferrite-containing microwave devices with **HUGHES AIRCRAFT CO.**, Culver City, Calif.

**ALTEC SERVICE CORP.** will sell public address systems made by **ALTEC LANSING** to commercial users throughout the U. S. Distribution will be made through **GRAY-BAR ELECTRIC**.

**AMERICAN STANDARDS ASSOCIATION**, New York, N. Y., reports that there are 1440 American standards in use in the U. S. Vice Admiral George F. Hussey, USN (ret.), managing director, states that 200 committees are now working on standards projects.

**CARVIN INDUSTRIES, INC.**, Columbus, Ind., has formed an electronics products division to specialize in subcontract work on military and industrial projects. Glenn W. Thompson, pres., has announced that Leo W. Burns has been named sales manager of the division.

**AVION INSTRUMENT CORP.**, Paramus, N. J. will relocate in Riverdale, Md. as part of the long range expansion plan of its parent company, **ACF Industries, Inc.** The site is now occupied by the **ACF Engineering and Research Div.**

**BECKMAN INSTRUMENTS, INC.**, Fullerton, Calif. has acquired **SPECIALIZED INSTRUMENTS CORP.**, and **SPINCO SERVICE CO.**, of Belmont, Calif. The acquired companies will be known as the **SPINCO DIV. OF BECKMAN INSTRUMENTS, INC.** with headquarters at Belmont.

**ECLIPSE-PIONEER DIV., BENDIX AVIATION CORP.**, announces that the PB-10A automatic pilots with "flight path control," designed and built by the division, will be installed in the Vickers Viscount airliners to be placed in service in 1955.

**BLONDER-TONGUE LABS., INC.** of Westfield, N. J., has fully equipped and staffed its second plant near Newark, N. J., to handle additional manufacturing space.

**BRUSH ELECTRONICS CO. DIV. OF CLEVITE CORP.** has executed, with **ERIE RESISTOR CORP.**, a license agreement with **GULTON MFG. CORP.** and **GLENCO CORP.** under which **GULTON** will make, use and sell barium titanate elements in the phono pickup and accelerometer fields.

**BUD RADIO, INC.** has purchased a new building in Cleveland, Ohio, which will add 30,000 sq. ft. of space to the present facility.

**S. W. CALDWELL LTD.** has purchased a building at 443 Jarvis St., Toronto, Ont., Can., to house expanded production and office facilities.

**CBS-COLUMBIA DIV. OF COLUMBIA BROADCASTING SYSTEM** will manufacture closed circuit industrial color TV equipment in addition to making TV and radio receivers, specialized defense items and industrial electronics apparatus.

**COLLINS RADIO CO.** of Cedar Rapids, Ia., will manufacture 224 VHF receivers and transmitters for use by **UNITED AIR LINES** for installation this summer.

**ELECTRODATA CORP.** of 717 N. Lake Ave., Pasadena 6, Calif., has delivered three complete "Datatron" high-speed electronic data processing machines to **LAND AIR INC.**, Dayton, Ohio, **ALLSTATE INSURANCE CO.**, Skokie, Ill., and **ARMA CORP.**, Seattle, Wash.

**ELECTRO TEC CORP.**, S. Hackensack, N. J., has been granted a patent covering its process for the manufacture of precision slip ring and commutator assemblies.

**GENERAL ELECTRIC CO.** has opened a "Systems Center" for its Heavy Military Electronic Equipment Dept. in Syracuse, N. Y.

**GENERAL ELECTRIC CO.**, Syracuse, N. Y. has revealed a radar cathode ray tube that enables ships to "see" 50 miles ahead and 30 miles behind. The tube was installed by GE in navigational radar sets now in use on Navy cargo vessels.

**GENERAL INSTRUMENT CORP.**, Elizabeth, N. J. has added a new \$1,500,000 radio-TV-electronics plant to its five factories in the U. S. and Canada. It is adaptable to either civil or military production.

**GERMANIUM PRODUCTS CORP.**, 25 Cornelison Ave., Jersey City 5, N. J., has cut transistor prices up to 40 and 50% on some types.

**G. M. GIANNINI & CO., INC.** of Pasadena, Calif. and E. Orange, N. J., has established Sales and Field Engineering Offices at 8 S. Michigan Ave., Chicago, Ill.

**GUDEMAN CO.**, electronic components manufacturer has moved its Sunnyvale, Calif., plant to a new building at 190 Commercial St.

**GYROMECHANISMS, INC.**, gyroscope and potentiometer producers, has acquired a building opposite its Halesite, Long Island, plant that will house the design and engineering staffs and increase production facilities 20%.

**HAMILTON WATCH CO.** has acquired the outstanding shares of the **HATHAWAY INSTRUMENT CO.**, Denver, Colo., producers of electronic electro-mechanical instruments. Mr. Claude M. Hathaway will continue as president.

**HEPPNER MFG. CO.**, Round Lake, Ill., is building a new section to be occupied by the enlarged tool, die and punch press department.

**INTERNATIONAL RECTIFIER CORP.**, El Segundo, Calif., has announced a 5 to 10% price increase on selenium rectifiers made necessary by a 20% increase in selenium cost.

**KETAY INSTRUMENT CORP.**, has merged with **NORDEN LABORATORIES CORP.** The major executives of the combined companies are Morris F. Ketay, pres., Paul W. Adams, exec. vice-pres., Benjamin Gross, board chairman.

**KETAY INSTRUMENT CORP.** has leased a 20,000 sq. ft. plant in New York City to expand its construction of aircraft instruments.

**LINK AVIATION, INC.** has purchased a new plant in Binghamton, N. Y., thus adding 2 buildings to its present facilities.

**MAGNECRAFT ELECTRIC CO.** has moved to its new plant at 3352 W. Grand Ave., Chicago 51, Ill.

**MICRO SWITCH DIV. OF MINNEAPOLIS-HONEYWELL REGULATOR CO.** has opened a new assembly plant in Independence, Ia., to expand its production of mercury switches and snap-acting switch products.

**MICRO SWITCH DIV. OF MINNEAPOLIS-HONEYWELL REGULATOR CO.** has established new sales offices in Phoenix, Ariz.; Charlotte, N. C.; and Denver, Colo.

**MOTOROLA, INC.**, Chicago, Ill., is negotiating to acquire an 18-acre tract in Phoenix, Ariz., according to Paul V. Galvin, pres., on which to construct facilities for engineering and light manufacturing that would accommodate 400 to 500 people.

**PHILO CORP.**, Government & Industrial Div., has been awarded a "Sidewinder" guided missile contract by the Bureau of Ordnance.

**PRECISION RADIATION INSTRUMENTS, INC.** has removed its facilities to 4223 W. Jefferson Blvd., Los Angeles, Calif. The company's sales offices will remain at 2235 S. La Brea Ave.

**RADIO CORP. OF AMERICA** has been licensed by **INTERNATIONAL TELEPHONE & TELEGRAPH CORP.** for commercial radio apparatus and tubes.

**RADIO CORP. OF AMERICA** will merchandise broadcast antenna towers manufactured by **DRESSER-IDECO CO.** of 875 Michigan Ave., Columbus 8, Ohio, to RCA Specifications. Under this arrangement broadcasters will be able to purchase a complete package of TV broadcast equipment.

**ENGINEERING PRODUCTS DIV., RADIO CORP. OF AMERICA**, Camden, N. J., has completed the 478-mile microwave radio system line linking the key compressor stations of the **EL PASO NATURAL GAS CO.**, El Paso, Texas

**THE 1955 NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS** has appointed Dr. H. S. Seifert to the subcommittee on rocket engines and Dr. James C. Fletcher to the committee on stability and control. Both scientists are with the senior staff of the **RAMO-WOOLDRIDGE CORP.**, Los Angeles, Calif.

**RYAN AERONAUTICAL CO.**, San Diego, Calif., will build the mid-section of the fuselage of the Air Force's Boeing KC-135 jet tanker-transport, the prototype of which reached 550 miles/hr. on its first flight July 15, 1954.

**STANDARD ELECTRONICS CORP.**, Newark, N. J., subsidiary of **CLAUDE NEON, INC.**, has announced a new unit-engineered kit for converting RCA-TT5A water-cooled TV transmitters to air-cooled operation.

**SUPEREX ELECTRONICS CORP.** has moved its offices and factory to a larger building at 4-6 Radford Place, Yonkers, N. Y.

**SYLVANIA ELECTRIC PRODUCTS INC.** plans to establish a company-wide Data Processing Center for which it has contracted to lease a "Univac" electronic computing system from **REMINGTON RAND, INC.**

**SYLVANIA ELECTRIC PRODUCTS INC.** has established its 9th operating division, the Electronic Systems Div. at 175 Great Arrow Ave., Buffalo, N. Y. Henry Lehne is general manager of the new division.

**SYLVANIA ELECTRIC PRODUCTS INC.** has begun manufacturing operations in the TV picture tube plant in Hatboro, Pa., formerly owned by **NATIONAL UNION ELECTRIC CORP.** David K. Elwell is plant manager.

**TEKTRONIX, INC.**, Chicago, Ill., has opened a replacement parts, maintenance information and field engineering office that will be headed by George Edens, formerly of the company's Syracuse field office.

**THOMPSON PRODUCTS, INC.**, makers of aircraft and electronic parts, is planning a \$5,000,000 study center east of the Tapco plant, Euclid, Ohio. The first two units will be started by fall, 1955.

**TRANS-AMERICAN PRECISION INSTRUMENT CORP.** of Flushing, N. Y., has become the **INSTRUMENT DIV. OF STERLING PRECISION INSTRUMENT CORP.** No change took place in executive personnel.

**YARDNEY ELECTRIC CORP.** has organized a new Applications Consultation Dept. offering free engineering advice on battery or portable power source problems. Address inquiries to Applications Consultation Dept., 40-46 Leonard St., New York 13, N. Y.

**ARNOLD**

*YOUR ONLY SOURCE*

of a Complete Line of **MAGNETIC MATERIALS**

**TECHNICAL DATA ON  
ARNOLD PRODUCTS... Write  
for your copy.**

**Bulletin GC-106** . . . General information on all Arnold magnetic materials: permanent magnets, tape-wound and powder cores, etc.

**Bulletin TC-101 A** . . . "Properties of Deltamax, 4-79 Mo-Permalloy and Supermalloy"—28 pages of technical data on Arnold Tape-Wound Cores.

**Bulletin PC-104** . . . "Molybdenum Permalloy Powder Cores"—16 pages, complete technical data.

**Bulletin SC-107** . . . "Arnold Silectron Cores"—52 pages of valuable data, covering a complete range of core shapes, sizes, tape gauges, etc.

**ADDRESS DEPT. 1-53**

Arnold products include all grades of Alnico permanent magnets (cast and sintered) . . . tape-wound cores of high-permeability alloys, such as Deltamax, Permalloy and Supermalloy . . . types "C" and "E" cut cores of Silectron in any size or weight range from a fraction of an ounce to hundreds of pounds (50 lbs. max. on 12-mil C cores); also round, square and rectangular Silectron cores . . . powdered Mo-Permalloy cores . . . Cunife, Vicalloy, Permendur and other magnetic materials. Special magnetic components can be produced to meet your specific requirements; and such products as powder cores, tape-wound cores, and C and E cores are carried in stock in a wide range of standard sizes for immediate delivery. Many sizes of cast and sintered Alnico magnets also are stocked.

In other words, Arnold magnetic materials can answer *any* requirement you may have. It is the *only* complete line in the industry; and in addition, Arnold maintains complete control over every production step from raw materials to finished products. Such a source can bring you advantages in long experience and undivided responsibility, and in unequalled facilities for quality production and control. • *Let us supply your needs.*

# Radar Target Discrimination Improved 100%

U. S. Navy Photo

## with the new PHILCO 1N263 Crystal Diode

### FEATURES

- Superior detection ability.
- Greatly improved noise figure over previous types.
- Reversible for use in balanced mixer circuits.
- 20° higher range in ambient operating temperatures.
- Controlled processing . . . rigid testing assures uniform diode characteristics . . .

The greatest mixer crystal advance in over 15 years! Philco's intensive program to reduce noise in radar front ends brings you this new "X" band diode, the 1N263. Now the noise figure is improved 2 to 3 db over the performance of ordinary crystals . . . equivalent in over-all performance to a power increase of 100%.

The 1N263 is a hermetically sealed point-contact germanium diode, designed to withstand environmental testing far beyond present military specifications. Maximum ambient operating temperatures have been increased 20° C over present mixer diode ratings to reach 90° C.

This new Philco diode will, with minor circuit modifications, operate in present radar systems. It is the only diode that can be reversed for use in either side of a balanced circuit. Now in production and available. For complete information write Philco Dept. T.

# New Products of the Month

Capsule summaries of latest electronic developments provide handy reference for engineers in the market for new equipment and components

**MAGNETIC RESOLVER**, Series 1800, is a fast response unit offered by John Oster Mfg. Co., Avionic Div., Racine, Wis. especially suited for driving circular sweep radar presentations. Rotor and stator inductance values can be supplied held within  $\pm 3\%$  (Ask for A-2-31)

**AC "VOLTECTOR,"** produced by Hivolt Ltd., 34a, Pottery Lane, Portland Rd., London, W. 11, can detect the presence of ac current without contact with the conductor. Unaffected by ordinary insulations, but cannot penetrate earthed metal sheathing. (Ask for A-2-32)

**K-BAND RF HEADS**, made by Vectron, Inc., 408 Main St., Waltham 54, Mass., are complete microwave tuning units that include an r-f assembly and a K-Band mixer. Designed for use with the Vectron SA25 microwave spectrum analyzer. (Ask for A-2-33)

**LOW RESISTANCE BRIDGE**, Model 604, by Shasta Div., Beckman Instruments, Inc., 1432 Nevin Ave., Richmond, Calif., provides means for checking low resistances (10 $\Omega$  to 10K $\Omega$ ) to a high degree of accuracy (0.25%). Three full scale ranges. (Ask for A-2-34)

**"VECTORLYZER,"** made by Advance Electronics, Co., Inc., 451 Highland Ave., Passaic, N.J. measures vector sum or difference of two voltages, imaginary and real components of an unknown voltage in terms of a reference voltage, etc. (Ask for A-2-26)

**GUN-BOMB-ROCKET SIGHT TESTER**, Model 519, announced by Telectro Industries Corp., 35-18 37th St., Long Island City 1, N.Y. tests gyro computing gun sights and facilitates data compilation to indicate the sight operating characteristics. (Ask for A-2-12)

**GAS DETECTOR**. A precision electronic unit Model GG/102 produced by Bristol Engineering Corp., Beaver Dam Rd. and Oak Lane, Bristol, Pa. makes quantitative measurements of gas concentrations in certain mixtures of gas and air and some types of combustible gas. (Ask for A-2-13)

**RECTIFIER TUBE**, NL-616, by National Electronics, Inc., Geneva, Ill., is rated at 2.5 amps dc and 30 amps peak current. Gas and mercury filled for quick starting and long life. Filament voltage 2.5 amps. Filament current, 9 amps. (Ask for A-3-11)

**PRESSURE TRANSDUCER**. A dual-element air flow differential instrument announced by Technology Instrument Corp., Acton, Mass., has a linear potentiometer resistance ratio vs. pressure within 5%. Wt., 1.3 lbs. (Ask for A-3-12)

**SCALER AND RATEMETER** made by Electronics Div., Curtiss-Wright Corp., Wood-Ridge, N.J. can be used with Geiger-Muller counter tubes, proportional counters, and scintillation counters. Adjustable from 300 to 3,000 v. Maximum counting speed, 200,000 impulses/second. Counts 3,999,999 pulses. (Ask for A-3-13)

**DIPLEXER**, Type 5411-A, by Television Transmitter Dept., Allen B. Du Mont Laboratories, Inc., 1500 Main Ave., Clifton, N.J. will handle the total aural and visual power for any TV transmitter from 5 kw to 50 kw. (Ask for A-3-14)

**TUBELESS POWER SUPPLY**, Model 312, is a dc/ac power supply for life testing racks, computers, experimental equipment, etc., made by Electronic Research Associates, Inc., P.O. Box 29, Caldwell, N.J. Input, 100-125 v. 60 CPS. Output, 0-3/30/300 v dc, or 0-130 v ac variable. (Ask for A-3-15)

**ELECTRONIC GENERATOR**, Model 1420-B, for development or production testing has frequency range internal oscillator, 50-6,000 CPS, with external oscillator, 25-20 kc. Power output 300 va. Communication Measurements Lab. Inc., 350 Leland Ave., Plainfield, N.J. (Ask for A-3-16)

**RADAR PRESSURIZING TEST SET**. Model RR-10260-B is a fully-contained, semi-automatic unit made by Lear, Inc., Lear-Romec Div., Elyria, O. Set for 60 in. Hg absolute, a pressure switch controls the low pressure shut-off. (Ask for A-3-17)

**MAGNETIC AMPLIFIER**, an improved version of the "Moto Mag," by Keystone Products Co., 904 23rd St., Union City 2, N.J. is available in six standard models. Designed for remote control devices, computers, positioning servos, etc. (Ask for A-3-18)

**CERAMIC POWER RESISTORS**, Types R31, R32, R34, and R36 "Castohm" cast units, expand the line of lightweight, high-temperature resistors made by Shallcross Mfg., Co. Collingdale, Pa., to MIL-R-10566 specifications. (Ask for A-3-25)

**COIL IMPREGNANTS**. Three new coil impregnants announced by Insl-X Sales Co., 26 Rittenhouse Place, Ardmore, Pa., "Acrylic base A-107," "Insl-X E-67," and "Insl-X Q-101, have a wide range of physical and electrical characteristics. (Ask for A-3-26)

**RELAYS**. New current and voltage sensing relays of the thermal type announced by G-V Controls, Inc., 28 Hollywood Plaza, East Orange, N.J. are hermetically sealed with outside screw-adjustable operating points. (Ask for A-3-27)

**SHOCK MOUNTED CRT**. "Edge-Lit" engraved calibration scales in the CRT bezel and rubber shock mount assys by Jan Hardware Mfg., Co., Inc., 75 N. 11th St., Brooklyn 11, N.Y. are lighted by bulbs inside instruments. (Ask for A-3-28)

**TAPE CUTTER-SPLICER**, Model TS-4DLX, added to the line of Robins Industries Corp., 82-09 251 St., Bellerose 26, N.Y. makes splices in 5 seconds without aid of other equipment. Supplied complete with plastic dust cover (Ask for A-3-29)

**THERMOCOUPLE TRANSFER SWITCHES** announced by Daven Co., 191 Central Ave., Newark 4, N.J. have a contact resistance of less than 0.004 ohms and will vary not more than  $\pm 0.0003$  ohms for the life of the unit. (Ask for A-3-23)

**HIGH TEMPERATURE RECTIFIERS** with larger cells to size 5 x 6 in., announced by Semi-Conductor Div., of Radio Receptor Co., 251 West 19th St., New York 11, N.Y. operate without derating at 125°C. Life span 500 hrs. (Ask for A-3-24)

**MAGNETIC TAPE RECORDER**. New addition to the line of Davies Lab., Inc., 4705 Queensbury Rd., Riverdale, Md., Series 550 for airborne use, is completely self-contained in 2 units 7 in. wide by 7- $\frac{3}{4}$  in. long. (Ask for A-3-30)

**MINIATURE VARIABLE INDUCTORS**, both shielded and unshielded, made by Levinthal Electronic Products, Inc., 2612 Fair Oaks Ave., Redwood City, Calif., are available as Style A Type 1, in 10 standard values from 56  $\mu$ h to 1.8 mh. (Ask for A-3-31)

**TELEPHONE SYSTEM**, P-A-X, by Automatic Electric Co., 1033 W. Van Buren St., Chicago 7, Ill., comprised of standard telephone equipment, is offered for private ownership to control telephone and operating costs. (Ask for A-3-32)

**REMOTE CONTROL UNIT**, Type MCA-902-A/B, by the Mobile Communications Dept. of Allen B. DuMont Labs., 1500 Main Ave., Clifton, N.J., for two-way mobile radio systems enables the advantageous location of a base station and desk operation. (Ask for A-3-33)

**MOTOR**. Permanent magnetic dc unit, announced by El Ray Motor Co., North Hollywood, Calif., designed to drive switches, cams, servos, etc., has a 1- $\frac{1}{8}$  in. diam. Length, 2- $\frac{7}{8}$  in. Gear case diam 1- $\frac{1}{2}$  in. Wt., 5- $\frac{1}{2}$  oz. (Ask for A-3-35)

**BOBBIN WINDER**, Model 212-AM, offered by Geo. Stevens Mfg. Co., Inc., Pulaski Rd. at Peterson, Chicago 30, Ill. has a finger tip, instantaneous wire guide return. Winds all types of random wound bobbin coils, solenoids, repeater coils, etc. (Ask for A-3-21)

**IMPEDANCE BRIDGE**, Model 250-DA, is an accurate wide range instrument designed for the measurement of resistance, capacitance, inductance, dissipation factors, and storage factors. Made by Electro-Measurements, Inc., 4312 S. E. Stark St., Portland, Ore. (Ask for A-3-22)

**LEAD SULPHIDE CELL**, CE 705, is a new photo-conductive unit announced by Continental Electric Co., Geneva, Ill. that is being used in the IBM Type 702 electronic data processing machine to detect the beginning and the end of the magnetic tape. (Ask for A-3-19)

**VOLTAGE RATIO COMPARATOR**, Model 592, made by Telectro Industries Corp., 35-18 37th St., Long Island City 1, N.Y. is used to set accurate voltage ratios, both ac and dc by a calibrated voltage divider network and a zero-center microammeter. (Ask for A-3-20)

**FASTENER AND SPACER**, a new latch-type "Speed Clip" by Tinnerman Products, Inc., P.O. Box 6688, Cleveland 1, O., provides a positive, vibration-proof attachment of printed circuit boards to radio chassis that can be made by hand. (Ask for A-3-34)

**POTENTIOMETERS**. Eight models of 970 series wire-wound potentiometers announced by General Radio Co., 275 Massachusetts Ave., Cambridge 39, Mass. have power ratings from 2 to 20 w. at 40 C. and 17 stock resistance values from 2 to 500,000 ohms. (Ask for A-3-36)

**GEIGER COUNTER-ASSAYER** that enables field assay of radioactive substance has a claimed range up to 12,000 counts/min. Made by Hoffman Laboratories, Inc., 3761 S. Hill St., Los Angeles 7, Calif. (Ask for A-3-37)

**MOUNTING CONTROLS**, series 47 twisted-tab type, announced by Clarostat Mfg., Co., Dover, N.H. are available with or without power switches. Save time, labor and material. (Ask for A-3-38)

**CERAMIC CAPACITORS** for color TV receivers, available at Hi-Q Div. Aerovox Corp., Olean, N.Y. are rated at a working voltage of 30 KVDC, or a test voltage of 50 KVDC for 1 min. (Ask for A-3-39)

**VACUUM GAUGE**. A new single-station thermocouple gauge with printed circuit, Type TG-029, has been announced by Consolidated Vacuum Corp., subsidiary of Consolidated Engineering Corp., 1775 Mt. Read Blvd., Rochester 3, N.Y. (Ask for A-3-42)

**WINDER** for small toroid coils finished to a  $\frac{1}{8}$  in. inner diameter has been developed by Electro Devices Co., Inc., 463 Commercial St., Boston, Mass. Measures only 9 $\frac{1}{2}$  in. in length. No. 30 to No. 40 wire sizes. (Ask for A-3-43)

**"VERSTROL,"** by Assembly Products, Inc., Chesterland, O., detects minute changes of current or voltage while indicating their magnitude and trips relays as a result of these changes. No vacuum tubes. Contact is in meter relay. (Ask for A-3-44)

**TRANSFORMERS**. Line to speaker matching transformers for commercial sound systems using 70 v. distribution techniques have been recently developed by Electronic Communication Equipment Co., 1249 W. Loyola Ave., Chicago 26, Ill. Three sizes available. (Ask for A-3-41)

Capsule summaries of latest electronic developments provide handy reference for engineers in the market for new equipment and components

**"MICAPS,"** a new line of mica capacitors, produced by Micamold Radio Corp., 1087 Flushing Ave., Brooklyn 37, N. Y., are encapsulated and hermetically sealed by dip coating. Smaller than molded types. (Ask for A-3-76)

**LUBRICANT.** A new silicone fluid, developed by Westinghouse Materials Engineering Dept., E. Pittsburgh, Pa., has passed thermal stability and viscometric tests ranging from -65° to 500°F. (Ask for A-3-77)

**RELAY,** Type 8AC, developed by Phillips Control Corp., Joliet, Ill., has self-contained rectifier, thereby eliminates exterior wiring and requires less space. (Ask for A-3-78)

**RATE GYRO,** Model 36128, announced by G. M. Giannini & Co., Inc., 918 E. Green St., Pasadena 1, Calif., weighs less than 1½ lbs. Diam. 2.0 in., 2.68 in. long. Rotor develops 1,500,000 gm cm<sup>2</sup>/sec. (Ask for A-3-79)

**MAGNET WIRE** insulated with "Alkanex," a thin-film, polyester-type developed by the G-E Research Lab., is available in round sizes No. 13 Awg. through No. 26 Awg. at Construction Materials Div., General Electric Co., Bridgeport 2, Conn. (Ask for A-3-80)

**PANEL METER.** A new unit that indicates the ratio of two direct currents is being produced by Thomas A. Edison, Inc., Instrument Div., West Orange, N. J. Handles 50 ma in either coil. (Ask for A-3-81)

**TRANSMITTER.** A new type of AM radio broadcast unit is a 50-kw maximum power "Ampliphase" type announced by Radio Corp. of America, Engineering Products Div., Camden, N. J. Requires half the space of comparable equipment. (Ask for A-3-82)

**SLOTTED LINE,** Type 874-LBA, operating over the range from below 300 to 5,000 MC, announced by General Radio Co., 275 Massachusetts Ave., Cambridge 39, Mass., is for measuring impedance, standing wave ratio, and attenuation. (Ask for A-3-83)

**LONG PLAYING TAPE,** called "Irish" LP No. 600 by ORRadio Industries, Inc., Opelika, Ala., because it provides to 6 hrs. playing time at 1½ in./sec. Dual track. On 1 mil acetate or 1 mil "Mylar." (Ask for A-3-84)

**COPPER CLAD RESISTORS,** fixed-composition, Types GM and HM, when mounted on steel panels 4 in. sq., 0.050 in. thick, with ambient temp. of 70°C, have continuous ratings of 3 and 4 w., respectively. By Allen-Bradley Co., 136 Greenfield Ave., Milwaukee 4, Wis. (Ask for A-3-85)

**COAXIAL DIALS,** the SR series "Duodial" turns counting units, designed for use with the A7 series "Hellpot" can be used with any rotating component with a ½ in. diam. shaft. Made by Helipot Corp., 916 Meridian Ave., S. Pasadena, Calif. (Ask for A-3-86)

**VARIABLE CAPACITOR.** A new miniature unit announced by Radio Condenser Co., Camden 3, N. J., for transistorized radio receivers. Is the smallest in the company's line. (Ask for A-3-87)

**ELAPSED TIME METER,** announced by the Instrument Div., Roller-Smith Corp., Bethlehem, Pa., is available in 2½ and 3½ in. sealed and "Bakelite" cases. Dimensions conform with MIL specs. (Ask for A-3-88)

**PACKAGING DEVICE,** announced by Vitramon, Inc., Box 544, Bridgeport 1, Conn., releases capacitors as required when holder card is bent. Eight cards fit into standard carton without packing. (Ask for A-3-85)

**SOLDERING IRON,** called "Esico Luger" by The Electric Soldering Iron Co., Inc., Deep River, Conn., has fast-heating tip. Lessens fatigue and speeds spot welding. Actuated by one to three fingers. (Ask for A-3-46)

**OHMMETER,** Model LRO, announced by Industrial Instruments, Inc., Cedar Grove, N. J., has ±1% of full-scale reading accuracy. Ranges, 0.1, 1.0 and 10 ohm full-scale reading. Powered by 1½ v. standard flashlight battery. (Ask for A-3-47)

**THYRATRON.** A new 3.2 amp dc thyatron has been developed by National Electronics, Inc., Geneva, Ill. Designated NL-730. The gas and mercury vapor unit is rated at 2.5 filament volts, 12 amps filament current. (Ask for A-3-48)

**STANDARD SLIP RING** and spring-loaded brush contact assys. Available in 10 combinations, 4 micro finish, with 1, 2, 3, 4 silver graphite brush contacts per ring as desired. Ring diam. 1½ x 1 in. I.D. Electro-Development Co., 14701 Keswick St., Van Nuys, Calif. (Ask for A-3-49)

**SHIELDING BEADS** to provide decoupling in circuit wiring have been announced by Ferroxcube Corp. of America, 233 E. Bridge St., Saugerties, N. Y. Made of ferrite material. (Ask for A-3-50)

**FREQUENCY STANDARD,** 400 and 500 cps., announced by American Time Products, Inc., 580 Fifth Ave., New York 36, N.Y., is in an octal-based 1½ in. diam. x 4½ in. housing. Transistor operated. (Ask for A-3-51)

**COIL FORM,** made of "Polypenco" Q-200.5 styrene copolymer, supplied by Polymer Corp. of Pa., Reading, Pa., is responsible for accuracy and sensitivity of the new electromagnetic delay lines developed by Helipot Corp., S. Pasadena, Calif. (Ask for A-3-52)

**BATWING ANTENNAS** for VHF TV broadcasting stations announced by General Electric Co., Syracuse, N. Y., use ¾ in. "Styroflex" feed lines, and new junction boxes and cable grounding. Thirteen new units conform to new RETMA 50 ohm input impedance standard. (Ask for A-3-53)

**RELAY,** series 805 dc 32 pole, is now available at Guardian Electric Mfg. Co., 1627 Walnut St., Chicago, Ill. Can connect 32 electrical circuits simultaneously. Weight, less than 5 oz. (Ask for A-3-54)

**ROTARY CONVERTER.** The analog-digital "Digitometer" has been added to the ultra low torque servo components line of Electro-Mec Laboratory, Inc., 21-09 43rd Ave., Long Island City 1, N. Y. Type 15 has a shaft torque of 0.15 oz. (Ask for A-3-55)

**QUARTZ CRYSTALS,** CR-38/U and CR-50/U, announced by Cryco, Inc., 1138 Mission St., S. Pasadena, Calif., have frequency ranges of 16-100 kc, load capacities of 20µmf, frequency tolerances of 0.012%. Temperature range, -40° to +70°C. Meet MIL-C-3098A. (Ask for A-3-56)

**"TENSOLITE" HOOK-WIRE,** announced by Tensolite Insulated Wire Co., Inc., 196 Main St. Tarrytown, N. Y., features an extruded "Teflon" insulation to resist abrasion and wide-range temperature variation from -90° to +250°C. (Ask for A-3-60)

**GENERATING PLANT,** Model 75 HR a new 75 kw, 93.75 kva gasoline driven unit has been announced by D. W. Onan & Sons, Inc., Minneapolis 14, Minn., for heavy duty and standby service. (Ask for A-3-59)

**MORE TECHNICAL INFORMATION** describing the new products presented here may be obtained by writing on company letterhead to **New Products Editor, TELE-TECH & ELECTRONIC INDUSTRIES, 480 Lexington Ave., New York 17, N.Y., listing numbers given at end of each item of interest. Please mention title of position held.**

**SEALED TERMINALS,** with compression type threaded end seals, for use on condensers, capacitors, and similar components, supplement the regular line of Electrical Industries, 44 Summer Ave., Newark 4, N. J. (Ask for A-3-58)

**TRANSMISSION FILTER,** the first made from germanium for infrared application, introduces a series of optical products made from transistor materials to be placed on the market by Baird Associates, Inc., 33 University Rd., Cambridge, Mass. (Ask for A-3-57)

**PLUG-IN UNITS,** power supplies, load relays, and automatic interrupters, announced by Assembly Products Inc., Chesterland, O., are being redesigned to further simplify the assembly of meter-relay controls. (Ask for A-3-61)

**GENERATOR TYPE 240-A,** a new multi-purpose precise signal source announced by Boonton Radio Corp., Boonton, N. J., has a frequency range from 4.5 to 120 MC continuously tunable in 5 ranges. Accuracy, ±1%. (Ask for A-3-64)

**CATHODE-RAY OSCILLOGRAPH,** Type 340, announced by the Instrument Div., Allen B. Du Mont Labs., 760 Bloomfield Ave., Clifton, N. J., features identical X and Y amplifiers with identical frequency response from dc to 30% down at 100 kc. (Ask for A-3-65)

**BASIC ANTENNA TOWERS** for TV broadcasting stations in 7 basic lattice-type designs were announced as available by the Engineering Products Div., Radio Corp. of America, Camden, N. J. (Ask for A-3-66)

**WAVEGUIDE,** Type ARA-136, has been developed for use with C-band or X-band commercial airborne weather penetration radar by Airtron, Inc., Linden, N. J. Flexible double ridge type. (Ask for A-3-67)

**POLYETHYLENE CONTAINERS,** called "Polyvials," for shipping and storing small electronic units and parts, have been announced by Olympic Plastics Co., Inc., 215 E. Washington Blvd., Los Angeles 15, Calif. (Ask for A-3-68)

**"TORSYNATOR,"** a new remote positioning device has a potentiometer for a sender and a low-inertia motor for a receiver. Designed by Air-Marine Motors, Inc., 369 Bayview Ave., Amityville, L. I., N. Y., to replace servo-mechanisms in some applications. (Ask for A-3-69)

**TUNER,** developed for noise and field intensity meter, Model NF-105, covers the range from 150 kc to 20 megacycles, announced by Empire Devices Products Corp., 38-15 Bell Blvd., Bayside, L. I., N. Y. (Ask for A-3-70)

**TESTER,** automatic Hi-Pot Model A., announced by Industrial Test Equipment Co., 55 E. 11th St., New York 3, N. Y., tests in sequence the dielectric strength between any 10 conductors and indicates the locations of breakdowns. (Ask for A-3-71)

**NETWORKS,** hermetically sealed resistance and resistance-capacitance units, announced by The Daven Co., Dept. RE, 191 Central Ave., Newark 4, N. J., can be supplied with resistance values to ±0.02%. (Ask for A-3-72)

**VACUUM RELAY,** Type R5-E, designed for pulse network, antenna transfer, and guided missile applications, is the smallest produced by Jennings Radio Mfg. Corp., P.O. Box 1278, San Jose 8, Calif. 3 in. long, 2 in. in diam. (Ask for A-3-73)

**MORE NEWS on page 32**

**IMPROVED  
FOR OUTSTANDING PERFORMANCE  
AND APPLICATION**

**TORKRITE TUBING**  
in foreground, enlarged  
to show detail

★ ★ ★  
**TORKRITE  
POSSESSES MANY  
ADVANTAGES**

Torkrite affords unmatched recycling ability. After a maximum diameter core has been recycled in a given form a reasonable number of times, a minimum diameter core can be inserted and measured at 1" oz. approximately.

Torkrite has no hole or perforation through the tube wall. This eliminates the possibility of cement leakage locking the core or cores.

Torkrite permits use of lower torque as it is completely free of stripping pressure.

With Torkrite, torque does not increase after winding, as the heavier wall acts to prevent collapse and core bind.

Improved new Torkrite is now available in various diameter tubes. Lengths from 3/4" to 3-1/8" are made to fit 8-32, 10-32, 1/4-28 and 5/16-24 cores.

at the  
Radio Engineering Show  
in New York City  
March 21-24.

**C L E V E L I T E\***  
**LAMINATED PAPER BASE PHENOLIC TUBING**

In seven specific grades, Clevelite is one of the finest and most complete lines of tubing available to the electronic and electrical industries.

Grade	Application
Grade E	...Improved post-cure fabrication and stapling
Grade EX	...Special grade for TV yoke sleeves
Grade EE	...Improved general purpose
Grade EEX	...Superior electrical and moisture absorption properties
Grade EEE	...Critical electrical and high voltage application
Grade XAX	...Special grade for government phenolic specifications
Grade SLF	...Special for very thin wall tubing having less than .010 wall

High performance factors, uniformity and inherent ability to hold to close tolerances, make Clevelite outstanding for Coil Forms, Collars, Bushings, Spacers and Cores.

Competent Research and Engineering facilities are always available to aid in solving those tough and stubborn design and fabrication problems. May we help you?

## STACKPOLE Fixed RESISTORS

... dependable, easy-to-solder molded composition types  
Stackpole 1/2-, 1- and 2-watt resistors not only meet exacting performance standards, but save assembly time thanks to their highly-tinned, easily-soldered leads.  
**MIL-R-11A TYPES**—in styles RC20, RC30, RC31, and RC42 available. Write for data on all MIL types.

## STACKPOLE Variable RESISTORS

with versatile switching

Single, ganged and concentric shaft dual types in smallest sizes consistent with real dependability offer long, and trouble-free performance for today's requirements. Gold plated "ring spring" contactors assure low noise level. A complete array of unique midjet line switches offers practically any desired switching arrangement, with types for both civilian and military use.

# New!

### Tab-mounting Bakelite shaft control

Just right for rear-of-chassis or concealed front panel controls in TV receivers... especially in high voltage circuits. Measures only 0.894" in diameter, yet handles a full .5-watt. Write for data on Stackpole Type LR-6.

AVAILABLE THROUGH PARTS DISTRIBUTORS! For name of nearest distributor stocking Stackpole resistors, switches and "EE" iron cores write: Distributors' Division, Stackpole Carbon Co., 26 Rittenhouse Place, Ardmore, Pa.

... A dependable source of reliable components for over 30 years

## STACKPOLE Composition CAPACITORS

Cost-saving, low-value, fixed types

Originated by Stackpole, these tiny units not only represent the simplest, most inexpensive capacitor design yet produced—but likewise have characteristics that make them more desirable than larger, more costly capacitors for many uses. 47 standard types, 0.1 to 10.0 mmf. Write for Stackpole GA Capacitor Bulletin.

## STACKPOLE Iron CORES

... to match any electrical or mechanical specification  
Pioneers in modern iron core development, Stackpole offers practically any desired style and with assured uniformity of both electrical and mechanical characteristics.

Write for Iron Core Bulletin.  
New "EE" Engineered Economy Cores  
... standardized to meet 80% of all requirements at low cost.  
Write for data on any type.

**STACKPOLE**  
*Ceramag*® **CORES**  
(Ferromagnetic)

**for real uniformity!** Wherever ferromagnetic cores are used, Stackpole Ceramag Cores have set the quality standards. But proved superiority in essential characteristics is only part of the story. Even more important is the fact that Stackpole Ceramag core characteristics are maintained with remarkable uniformity regardless of size, shape or production quantity. *The sample matches your specification "on the nose"—and each production unit is exactly like the sample!* Write for Ceramag Bulletin RC-9A including details on available grades and latest characteristic curves.

**STACKPOLE**  
Molded **COIL FORMS**

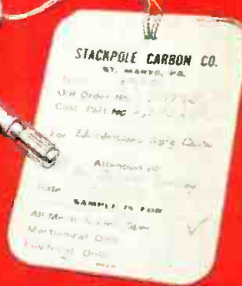

**Cut Assembly Costs!**

Reduce coil sizes and cut assembly costs with simplified point-to-point wiring and fewer soldered connections. Over 35 new types available in phenolic, iron, or phenolic with iron center sections. Axial or "hairpin" leads. Write for complete specifications on all types.

**STACKPOLE**  
Slide **SWITCHES**

**... the economy switches of 1001 uses!**  
Over 20 types of these inexpensive little Stackpole slide switches cover just about every mechanical and electrical switching requirement for radio and television equipment, small motors, appliances, electrical toys, instruments, etc. For complete details, write for Stackpole Switch Bulletin RC-9B.

**Engineering Samples are proof of the pudding!**

Engineering samples of standard Stackpole components are available to quantity users. Send details of your requirement for recommendation by Stackpole engineers.

ELECTRONIC COMPONENTS DIVISION  
**STACKPOLE CARBON COMPANY, St. Marys, Pa.**

# NEW TECH DATA for Engineers

Resumes of new catalogs and bulletins offered this month by manufacturers to interested readers

## Pulse Generators

A six-page, loose leaf folder, prepared by Burroughs Corp., Electronics Instruments Div., Philadelphia 7, Pa., gives the ABC's of pulse testing and describes three precision pulse generators made by Burroughs. (Ask for B-3-43)

## Dynamic Microphones

A 4-page brochure released by Frank L. Capps & Co., Inc., 20 Addison Place, Valley Stream, N.Y., describes the company's line of dynamic and condenser microphones. (Ask for B-3-44)

## Terminals and Printed Circuits

"USECO" terminals, terminal boards, and etched and printed circuits are described in a new 8-page bulletin offered by U.S. Engineering Co., 521 Commercial St., Glendale 3, Calif. The bulletins also illustrate production methods and detail quality control. (Ask for B-3-45)

## Capacitors

Hi-Q div., Aerovox Corp., New Bedford, Mass. has issued a 24-page catalog that illustrates, and gives performance characteristics and engineering data covering the company's range of ceramic capacitors, plate assemblies, etc. (Ask for B-3-46)

## Magnetic Recording Heads

Stancil-Hoffman Corp., 921 North Highland Ave., Los Angeles 38, Calif. have released an informal discussion of magnetic recording heads. Covers considerations of basic design and gives curves and factors in associated electronics. Ten cents in postage. (Ask for B-3-47)

## Hysteresis Synchronous Motors

Nineteen models of hysteresis synchronous motors for high fidelity recording and reproducing equipment are described in catalog No 403-2 with specifications, wiring diagrams, mounting details, etc. Issued by Technical Development Corp., 4060 Ince Blvd., Culver City, Calif. (Ask for B-3-31)

## Transducers

"Instrument Notes No. 28," released by Statham Laboratories, Inc., 12401 W. Olympic Blvd., Los Angeles 64, Calif. presents an article by Arthur T. Snyder, Boeing Airplane Co., entitled "A New System for Monitoring the Over-all Transduction Ratio for Analog Recording Channels Employing Bridge Type Transducers." Available on request (Ask for B-3-32)

## Control Board

The "Handbook on Modern Stage Lighting Control" is available at the Lumi-Tron Div., Metropolitan Electric Mfg., Co., 2250 Steinway St., Long Island City 5, N.Y. (Ask for B-3-33)

## Frequency Counter

A new bulletin on the DS-6100 electronic frequency counter, issued by Detetron Corp., 5420 Vineland Ave., North Hollywood, Calif., illustrates the instrument and gives characteristics and technical data. (Ask for B-3-34)

## Test Instruments

The Shasta Div., Beckman Instruments, Inc., 1432 Nevin Ave., Richmond, Calif., announces a brochure describing its new line of electronic test instrumentation that includes vacuum tube voltmeters, oscillators, square wave generators, bridges, power supplies, wide band amplifiers, etc. (Ask for B-3-35)

## Telemetry System

Bulletin No. EA-8, released by Control Corp., 718 Central Ave., Minneapolis 14, Minn., describes the TM-15 high speed telemetry system which can be operated over microwave, telephone lines, or carrier current to meter volts, amperes, watts, VARS, power factors, pressures and flows, etc. (Ask for B-3-36)

## Data Recording Equipment

Bulletin 54-D, released by The Davies Laboratories, Inc., 4705 Queensbury Rd., Riverdale, Md., illustrates, describes, and presents technical data covering the Models 530 and 540 magnetic tape recorders. (Ask for B-3-37)

## Switchboards

GEA-6168, available at Advertising and Sales Promotion, General Electric Co., Plainville, Conn., consisting of 24 color pages, describes various types of stage lighting switchboards. Special specification sheets are included in a pocket. (Ask for B-3-38)

## Generator

A data sheet released by Decade Instrument Co., Box 153, Caldwell, N.J., describes the "Sweepalator," a combined signal and sweep generator and the "Decalator," Model B, crystal-controlled signal generator. Specifications are given for both instruments. (Ask for B-3-39)

## Arbors

Precision Paper Tube Co., 2035 W. Charleston St., Chicago 47, Ill., has issued a listing of over 2,000 coil forms in all shapes, sizes, I.D.'s and O.D.'s with technical data and other engineering information. Write to Dept. TTN. (Ask for B-3-40)

## Instruments

Catalog No. 354, prepared by J-B-T Instruments, Inc., 441 Chapel St., New Haven 8, Conn. illustrates and technically describes the variety of meters, testers, switches, indicators, etc., that are produced by the company. Available at D. F. Tobias & Co., 30 Church St., New York 7, N.Y. (Ask for B-3-11)

## Components

The 60-page, two-color Catalog 55W presents complete data and outline drawings covering the 3 to 75 KMC waveguide components made by Microwave Associates, 22 Cummington St., Boston, Mass. (Ask for B-3-12)

## Electric Plants and Engines

"Power Points Digest," Vol. 10, No. 6, illustrates and interestingly presents electric plants and engines made by D. W. Onan & Sons, Inc., Minneapolis 14, Minn. and their application to Civil Defense. Available without charge. (Ask for B-3-13)

## Instruments

A summary released by Kay Electric Co., Maple Ave., Pine Brook, N. J. gives a brief description of each company instrument or accessory with its price and suggests that, for more details and specifications, interested readers write for the complete 1954-55 free catalog. (Ask for B-3-14)

## Casting Resin

Technical Bulletin No. 7-2-8, issued by Emerson & Cuming, Inc., 869 Washington St., Canton, Mass. presents the properties of "Stycast" 2340 M, a two-part casting resin that requires no catalyst. (Ask for B-3-15)

## Pilot Lights

Form L-157, obtainable by writing to R. E. Greene, Dialight Corp., 60 Stewart Ave., Brooklyn 37, N.Y. describes subminiature pilot lights of the one-terminal type for use on grounded circuits with T-1½ bulbs having midget flange type bases. (Ask for B-3-16)

## TV Information Package

A package that provides technical specifications, prices, and other pertinent information, available at TV Transmitter Dept., Allen B. Du Mont Labs, Inc., 1500 Main Ave., Clifton, N.J. to broadcasters, engineers, and consultants, includes a 36-page book depicting four studio color system layouts, a 20-page brochure describing the operation of Du Mont's color and monochrome multi-scanners, and a separate 10-page color equipment price list. (Ask for B-3-19)

## Networks

White Instrument Laboratories, 203 Riverside Dr., Austin 4, Texas, has released Bulletin 500 covering the standard types 501 and 502 twin-T networks. (Ask for B-3-17)

## Electronic Gauger System

Application data sheet 102, issued by the Technical Information Service, Helipot Corp., 916 Meridian Ave., S. Pasadena, Calif., describes and illustrates principles of operation, equipment, and circuitry of a telemetering system and use of "Helipot" precision potentiometers. (Ask for B-3-18)

## Felt

Ingalls Electronics Co., 30 West Putnam Ave., Greenwich, Conn., have released an interesting 4-page brochure that illustrates and describes the electronic applications of two new products—acoustical felt and latex impregnated felt. (Ask for B-3-26)

## Potentiometers

Bulletin D54-1, issued by Markite Corp., 155 Waverly Place, New York 14, N.Y., gives design features, typical performance data, and application advantages of Types 2234 and 2235 rectilinear-motion potentiometers. (Ask for B-3-27)

## Transformers

Custom specification of transformers is greatly simplified for the design engineer and the purchaser by the 20-page catalog issued by General Transformer Company, 18240 Harwood Ave., Homewood, Ill. Illustrates "Prototypes" covering the complete range of applications. (Ask for B-3-28)

## Mounts

"Barry Product Digest," a 4-page illustrated brochure announced by Barry Corp., Dept. P., 1000 Pleasant St., Watertown, Mass., shows all company standard isolators including miniature shock and vibration mounts. Also, it lists technical articles on shock and vibration. Available to engineers on request. (Ask for B-3-29)

## Deflection Yoke Winder

A catalog page by Geo. Stevens Mfg. Co., Inc., Pulaski Rd. at Peterson, Chicago 30, Ill., illustrates and describes the new Model YW series deflection yoke winder. Gives complete technical data on winding motion, coil types, etc. (Ask for B-3-30)

## Panel Instruments

"Electrical Measurements," Vol. 21, No. 10, lists and details the complete line of panel instruments with accuracies as high as 0.25 of 1% in dc sensitivities that are made by Sensitive Research Instrument Corp., 9-11 Elm Ave., Mt. Vernon, N.Y. (Ask for B-3-42)

## RF Coaxial Cables

Catalog W1, issued by American Phenolic Corp., 1830 South 54th Ave., Chicago 50, Ill., is a new, separate 34-page publication that illustrates and presents the electrical characteristics of "Amphenol" r-f coaxial cables and transmission lines, and the physical properties of associated jackets, insulations, and conductors. Described, too, are the advantages of the "Amphenol" RF Connector Folders. Catalog R1 illustrates and presents technical data and dimensional drawings covering the company's "Blue Ribbon" connectors. (Ask for B-3-41)

## Towers

The numerous variables involved in tower construction are presented in literature issued by Tower Structures, Inc., Gregg St., Lodi, N.J. (Ask for B-3-22)

## OBTAIN THESE BULLETINS

described here by writing on company letterhead to Bulletins Editor, TELE-TECH & ELECTRONIC INDUSTRIES, 480 Lexington Ave., New York 17, N.Y., listing numbers given at end of each item of interest. Please mention title of position held.

**THE ONLY COMPLETE LINE FOR ALL COLOR TV APPLICATIONS**

1. SIZES—"dime size" to 2 1/2" diameter.
2. WATTAGES—2/10 watt to 4 watt.
3. TYPES—carbon and wirewound with and without attached switch.
4. MOUNTINGS—conventional bushing, twist ear and snap-in bracket for printed circuits.

5. TERMINAL STYLES—for conventional soldering, printed circuits and wire wrap.
6. COMBINATIONS—an endless variety of tandems, both single and dual shaft.

**A CTS control can be tailored to your specific requirement.**

**FURTHER DETAILS ON OTHER SIDE**

High voltage control for focus applications. Rated up to 5,000 volts DC across end terminals and 2 1/2 watts depending on total resistance. Will operate up to 15,000 volts DC above ground when mounted on insulated panel. CTS type 85.

Miniature 3/4" "dime size" composition control. Conserves panel space at price comparable to larger size bushing mounted controls. CTS type 70.

1 1/8" diameter composition control for applications where ratings up to 3/4 watt required. CTS type 35.

Concentric shaft tandem control with conventional bushing mounting. Designed for front panel dual knob applications, such as contrast and volume. Available in various combinations of composition or wirewound front and rear sections with or without on-off switch attached to rear section. CTS type GC-C252-45 with wirewound front section, composition rear section and on-off switch illustrated.

Ear mounted two watt wirewound available with or without center tap. CTS type P-254 with tap illustrated.

Ear mounted composition control. Simply twist two ears for rigid mounting. Eliminates bushing and mounting hardware. Available with shafts for knob operation or for preset applications with insulated or metal shaft. CTS type P45 with metal shaft illustrated.

Four watt wirewound control available with or without center tap. CTS type 27 with tap illustrated.

**Higher Wattage Carbon Controls With Exceptional Stability Available**

- **ONE WATT:** Entire 4 series 15/16" diameter line available with 90 series special one watt military resistance elements.
- **TWO WATT:** Entire 3 series 1 1/8" diameter line available with 95 series special two watt military resistance elements.

Ear mounted tandem for preset applications. Combines panel space saving features of a concentric tandem with the economy of an ear mounted unit. Available in various combinations of composition or wirewound front and rear sections. CTS type P-C2-45 with composition front and rear sections illustrated.

## THE ONLY COMPLETE LINE FOR ALL COLOR TV APPLICATIONS

CTS also makes a complete line of controls for military, black and white TV, radio and other commercial applications. Consultation without obligation available for all your control applications. Write for complete catalog TODAY.

*Specialists in Precision Mass Production of Variable Resistors • Founded 1896*

Sylvania "600 ma" Tubes

99.7 proof\*

FOR SERIES-STRING TV

\* In a 15-tube series string, analysis proved that 99.7% of all probable combinations of Sylvania types operated within 2% of the heater-current design center. Sylvania's tight heater-current limit is one of the most important contributions to tube performance for series string operation.

Best for Set Designers  
In 4 big ways

Sylvania pioneered the development of "600 ma" series string tubes to make possible the cost, space and weight saving features of series-string TV design. And Sylvania gives you these important advantages to insure dependable set performance.

**1. Less heater voltage variations**—as a result of Sylvania's 99.7 proof tolerances on heater current, fluctuations in line voltage have less harmful effect on heater voltage. Steady-state heater voltage distribution is improved.

**2. Less heater burn-outs**—Rated heater warm-up time of approximately 11 seconds provides control of thermal characteristics. Voltage surges are alleviated.

**3. Less time for normal set operation**—Thermal control permits the use of a series resistor instead of a

thermistor. Receiver reaches normal operation in less than half the time.

**4. More uniformity**—Because Sylvania makes everything but the bulb, quality is controlled from raw materials straight through to finished product.

Get the full story on the use of series-string tubes in TV sets by writing for this handy wall-chart brochure on the complete line of Sylvania "600 ma" tubes.

**All Sylvania TV PICTURE TUBES now have heaters specially controlled for series string operation!**

Regulated Klystron  
Power Supply

Tube Mount  
and Pad

Standing Wave Amplifier

Slotted Section  
and Probe

#### FXR Type Z816A

##### Regulated Klystron Power Supply

Beam: 300 to 500 V. up to 65 MA.  
Reflector: 0 to 600 V.  
Metered voltages and beam current.  
Modulation: Square wave and sawtooth  
(sync. and external modulation jacks)

#### FXR Type X763A Tube Mount

Mounts 2K25 Klystron (Tube incl.)  
Built-in 15 DB variable waveguide attenuator  
Frequency Range: 8,500 to 9,600 MC/S

#### FXR Type X105A Slotted Section

Friction Drive  
CM vernier scale  
Special narrow tapered slot  
Precision broached waveguide (1" x 1/2")  
Built-in fixed-tuned probe with  
radiation suppression  
Frequency Range: 8,200 to 12,400 MC/S  
1N23B Crystal supplied

#### FXR Type B810A Standing Wave Amplifier

Standard FXR Precision Component  
VSWR Ranges: 1 to 3, 3 to 10, 10 to 30,  
30 to 100  
Modulation Range: Wide band 300 to 4,000 CPS  
Narrow band 1,000 ± 50 CPS  
Metered Bolometer Bias: 3.5 to 9 MA.  
Separate output jack (from cathode follower)  
Calibrated Meter Scale: VSWR, DB, MA.

Other information available upon request.

#### COMPLETE BASIC EQUIPMENT

For measurements in the "X" band frequency range.

MICROWAVE VALUE is packed into this FXR engineered package of companion instruments . . . made for each other, and priced right for budget minded schools and industry. The versatile Power Supply and Modulator unit drives the Klystron. The variable Buffer Attenuator controls power into the Slotted Section, where a sensitive fixed tuned Crystal Detector supplies the signal to a Standing Wave Amplifier. You get one well-integrated package for all purposes, and all these fine value-packed test instruments for one low price. Individual instruments are also available separately. Be sure to see them at the show. Delivery from stock.

the **SOLID** impregnant  
**DURANITE\***

Aerovox Type P88N

**MOULDED TUBULAR PAPER CAPACITORS**

Molded paper tubulars may look alike. But there are differences—internally. Duranites are different, because of their solid impregnant, Aerolene, for solidly and permanently imbedded sections. Duranites also feature:

- New molded blue casing—fire-resistant, rugged, permanent and attractive.
- Pigtail leads centered and firmly imbedded. Won't work loose or pull out.
- Exceptional immunity to moisture penetration. Up to 100° C operating temperatures.
- Excellent performance characteristics—Insulation Resistance; Power Factor vs. Temperature; Temperature-Capacitance; etc. Accompanying curves are typical.
- And smaller physical sizes for bigger tubular jobs. Voltage ratings of 200 to 1600 D.C.W.

**LITERATURE ON REQUEST:**

Get the technical details and compare Duranites with all other molded tubulars. Let us quote on any and all your capacitor requirements.

**TELE-TIPS**

**EXPLOSIVE** disconnects for opening as many as 100 circuits without shorting have been developed by Beckman & Whitley, San Carlos, Calif. The primers are fired by a 3-volt, 1-amp, surge, severing two securing screws.

**TV-ELECTRONIC** service technicians are being honored by a nationally promoted week (March 7-12) sponsored by RCA, and a special month (April 19-May 19) sponsored by GE. It's a wonderful idea. Now how about a special period for the engineers who made the whole business possible in the first place?

**EFFICIENCY** is the word for a device now on the market which solves two problems for engineers who have the headache of writing necessary reports. It's a pencil with a built-in tube containing a supply of aspirin.

**BATTERIES** play an often unrecognized vital role in the success of high speed experiments. For example, the Yardney Silvercels in the rocket sled that skidded to a stop from 632 mph in 1.5 seconds had to withstand a 35g force without damage. Similar requirements govern for guided missiles and torpedoes.

**FCC** authorizations now cover the use of over 700,000 transmitters, and there are about 850,000 commercial radio operators and more than 120,000 amateur radio operators holding permits. The Bell System provides over 5,000,000 telephone circuit-miles by microwave relay, and 54,000 miles of broadband channels for TV.

**AUTOMATION** receives an extra boost with the publication of a 74-page booklet by Armour Research Foundation under Air Force sponsorship. It's entitled, "A Catalog of Devices Useful in Automatic Data Reduction," and serves as a clearing house for government agencies and industry using automatic devices.

**COMPILATION** of descriptive data on almost 900 test equipments in 2300 pages constituting three volumes has been announced by Carl L. Frederick & Associates, 4630 Montgomery Ave., Bethesda 14, Md. The

## HERMETICALLY-SEALED GENERAL-PURPOSE RELAY

TYPE FC-6 (6 D.T. Contacts)

Withstands 0 to 2,000  
cycles vibration to 30G

Withstands up to 60 G shock without  
contact opening, 2,000 ft.-lbs. with-  
out contact transfer or damage.

Designed to exceed MIL-R-5757B and  
to meet MIL-R-25018 (USAF) and  
MS24115 (USAF) specifications.

Available for both 85°C and 125°C  
ambient Nominal coil voltage 26.5  
volts DC.

...and priced materially  
lower than existing relays in its  
class!

Far superior in performance and durability to pre-  
vious types, the new Dunco FC-6 hermetically-  
sealed general-purpose relay is priced materially  
lower.

Designed from a background of 5 years experi-  
ence with the Dunco 220XFX100, the FC-6 offers far  
greater simplicity in its moving parts; easier con-  
struction and adjustment; extreme rigidity for high  
vibration and shock; high contact pressures; low  
contact bounce; plenty of contact over-travel; and  
complete absence of internal gaseous materials  
which might cause contact unreliability.

Vibration resistance of 0 to 2,000 cycles up to  
30 G's is attained . . . a heretofore unheard of per-  
formance for relays of this class.

Throughout, the Dunco FC-6 incorporates safety  
factors that make it ideally suited for difficult appli-  
cations, even in low-energy circuits.

Write, wire or 'phone for Dunco FC-6 Relay Data  
Bulletin L2406 giving complete specifications.

## You can see and examine all types of Truscon Towers in full operation in Youngstown.

A tower is one piece of equipment no salesman can bring to you. He can't demonstrate its features in your office. Fortunately, you can get all the advantages of on-the-job demonstration simply by visiting Youngstown. You can get the facts to help you buy on proof. And, you can inspect Truscon's design and fabricating facilities at the same time.

You'll be able to see and examine:

1. A 150-foot self-supporting tower for AM broadcasting.
2. Four 400-foot self-supporting towers in directional array for AM broadcasting.
3. Six 350-foot self-supporting towers in directional array for AM broadcasting with one supporting an FM antenna.
4. A 539-foot self-supporting tower sustaining both an FM and a TV antenna.
5. A 1000-foot guyed tower with TV antenna.

Next time business takes you near Youngstown, make it a point to see all these Truscon Towers. Contact the Radio Tower Sales Department to let us know when you're coming.

## 8 hours and

### **AMAZING CONVERSION WITH DU MONT MULTI-SCANNER**

Right now it is possible to have the very finest monochrome reproduction of film, slides, and opaques and still be assured that you will be ready for color whenever you want it—at minimum cost. The DuMont Multi-Scanner is *the* proved system—proved in over 50 television stations across the nation, many of which have already converted to color without the usual equipment obsolescence and expense.

*\*without  
alignment  
headaches!*

**\$4000 later!**

The Du Mont color Multi-Scanner completely eliminates critical, costly alignment procedures associated with multiple-tube pickups. Conversion of each monochrome film unit is accomplished by mere substitution of a completely packaged sub-assembly as well as two additional video amplifiers and power supplies. Light source and all other associated equipment remain exactly as in monochrome operation. Conversion can be completed in eight hours at an expense of approximately \$4000.

## TELE-TIPS

(Continued from page 38)

result of an Air Force research project, "Electronics Test Equipment Data Sheets" is available for \$100.00.

2500 KW diesel generating unit made by Worthington Corp. for the Navy's Jim Creek radio station is reportedly the largest single unit yet employed for this class of service.

SPACE SPOTTER TV is one of the latest achievements of industrial television. RCA reports that its "TV Eye" is being used in an Oakland, Calif., parking lot to direct motorists to vacancies on the lot.

"KILOCYCLE KOPS" is the name dubbed on FCC field monitoring crews. In one case they cooperated with Narragansett Park Racetrack officials and local police to scan a crowd and locate the person with a concealed transmitter who was sending the identity of the horse breaking to the front first to bet-placing confederates at the pari-mutuel windows. Convictions were obtained on two counts. In another case, while monitoring for interference in Portland, Ore., a mobile unit observed a strange signal which it traced to an apartment house. It turned out to be a homemade shortwave receiver which had been discarded for two years, but unknown to the owner, he had neglected to disconnect the set or turn off the power switch. The fellow's still wondering about two year's worth of electric bills.

VENTRICULAR FIBRILLATION, or off-rhythm weak heart beats incapable of moving sufficient blood, is often the result of electrical shock, and artificial respiration may not be able to bring the victim around. In hospitals, when fibrillation occurs, it is the practice to induce a spasm by applying 120 volts, 60 cycles, 1.5 amps, with electrodes directly to the heart to shock it back into normal rhythm. A similar technique is being developed for field use, using engine, battery-motor or propellant-turbo driven generators, or a transformer, to supply a current applied to the skin of the chest and flowing to an electrode near one foot. Instantaneous generator starting is one of the key problems since even a few minutes deprivation of blood flow can be fatal.

"Chester" says—

Connect it with Chester—the wiring that lasts!

## “OUR BEST PORTABLE RECORDER YET”

says Richard Parks, Asst. Chief Engineer, ABC, San Francisco

“This new Ampex 600 really fills a need. We like it. It’s light. It’s compact. And its fidelity and timing accuracy leave nothing to be desired. Now no matter how important the program material, we can send the 600 out after it. The results that come back are as good as we could have recorded inside our studio on Ampex 350s. For program protection the 600’s third head is an excellent feature. The engineer monitors as he records. There’s no guesswork. The recording is always right.”

“The photo shows Bill Adams, our farm reporter. He has made extensive use of the 600 for farm interviews.”

### NOW THERE'S AN AMPEX FOR EVERY BROADCAST NEED

The new 600 completes the Ampex line. In any station it's an ideal portable, and for many it's an all purpose machine. The Ampex 600 fits limited space and limited budgets, but does an unlimited job. Base price is \$498. In portable case it's \$545. The Ampex 620, a portable amplifier-speaker unit in matching case is a superb quality monitoring unit, usable inside or out; price is \$149.50.

The Ampex 350 is the versatile broadcast studio machine. It has a remote control plug-in, two speeds, 10½-inch reels, easy editing and quick accessibility for service. Its durability defies time and hard usage.

*Bulletins on the low cost Ampex 600, the versatile 350, the 450 eight-hour reproducer and the Ampex Tape Duplicator are available on request. Write today to Dept. U-1881*

## Tape Stickness

Editors, TELE-TECH:

In the November 1954 issue of TELE-TECH & ELECTRONIC INDUSTRIES, there appears an item by Talmadge R. England entitled "Tape Stickness" which states in effect that "Squeal on playback often results after the heads have had 100 or so tapes run across them becoming so smooth that the intermolecular forces between the head and tape material is actually sufficient to stop the machine or break the tape," and as a remedy: "Lightly burnish the heads with crocus cloth and follow with a thorough cleaning with carbon tetrachloride."

Such treatment of magnetic heads will almost certainly result in damage, possibly irreparable, certainly expensive. Tape squeal on playback is, in most instances, due to lack of lubricant on the tape itself. Many valuable tapes were prepared, in the earlier days of magnetic recording, on tape without lubricant, and some more recent tape has appeared to lose its lubricant with a great deal of use. The remedy adopted by many recording companies is to transfer the material from old to new tape, and to discard the unlubricated tape. Under no circumstances should heads be polished with any abrasive, and we recommend that carbon tetrachloride be avoided for cleaning purposes, preferring alcohol or Audio Devices' head cleaning solvent.

Walter T. Selsted  
Chief Engineer

Ampex Corporation  
Redwood City, Calif.

## Tube Selection

Editors, TELE-TECH:

I was pleased to read in your January issue all the thoughtful comments on my article, "Tube Selection Increases Signal Capacity of TV Receivers," published in the October, 1954 issue.

First, let me state that I agree in principle with Mr. A. K. Wright of Tung-Sol Electric when he succinctly says of tube selection, "I'm agin it."

I, too, am against making tube selection a crutch for poor design, but let us just as succinctly review the facts of the case. The title and content of my article indicates that a tube selection process will increase the signal capacity of a receiver; but if the replacement tube

Those who know

know *Hycon*

## LEADER

*in guided missile test instrumentation*

Hycon is one of the nation's most important factors in the production of "GO NO-GO" test and ground support equipment for missile programs. A pioneer in test and check-out, Hycon builds instruments which "flight test" missiles automatically in a matter of minutes.

IF YOU ARE QUALIFIED IN THE ELECTRONICS OR PHOTOGRAPHIC FIELDS, HYCON OFFERS PROGRESSIVE OPPORTUNITIES. CONTACT THE EMPLOYMENT MANAGER, HYCON MFG. COMPANY, BOX N, PASADENA 15, CALIFORNIA.

# Hycon Mfg. Company

"Where Accuracy Counts"

ORDNANCE • ELECTRONICS • AERIAL SURVEYS • AERIAL CAMERAS

is not selected, then normal variations are obtained in signal capacity. The operation of the set does not depend on selection.

Tube selection as a partial answer to the signal handling problem is not new. Many of our better known manufacturers have employed selection at one time or another. It is not uncommon to find an RF or (gain-controlled) IF tube in a TV receiver that is color-coded, indicating that the tube has been selected. The recent appearance of two tube types, the 6CF6 and the 6DC6 (which are simply selected 6CB6's) is an admission of the problem.

Due to increased station power, TV receivers are required to handle a greater range of signal; but with the substantial variations in gain-control in available IF and RF tubes, all TV circuit designers are plagued by the problem of designing receivers to handle the greater signal strength variations without increasing receiver cost.

Some of those commenting on my article related experiences with tube selection where the yield was extremely small or where specially-stabilized tubes were used. Their experiences are very interesting but are not relative to this selection process.

But lo and behold! The answer to the problem of reliable gain-control tubes in TV receivers is indicated by several of the correspondents: That is, the development of a new tube type that will be more suitable for gain-control and will be more uniform than the tubes now available to TV set designers.

Robert G. Horner,  
Project Engineer

TV Engineering Department  
CBS—Columbia  
Long Island City, N. Y.

Editors, TELE-TECH:

The correspondence on "Tube Selection" published in your January issue is most interesting and expresses very clearly the many objections to the practice. Let me say at the very outset that I too am strongly opposed to tube selection, but at the same time I feel that this may be an opportune moment to restate some of the reasons why it sometimes becomes necessary.

In the early days of radio, the fact that a receiver performed at all was ample justification for its existence and measurements of any kind were the exception. As the art progressed however, performance measurements became more common until now—

(Continued on page 136)

QUALITY TEST INSTRUMENTS  
FOR TOMORROW'S REQUIREMENTS

When you visit the I.R.E. National Convention in New York, be sure to stop at the HYCON booth. You'll see instruments actually ahead of today's test needs... ready for tomorrow's circuitry. All are applicable to and meet the exacting requirements of radio engineering's newest field... color TV.

## MODEL 615 DIGITAL VTVM

This is the widely heralded new Hycon VTVM which gives direct readings, without interpolation. Features 1% accuracy (DC and ohms); 1 millivolt sensitivity; illuminated digital scale with decimal point and polarity sign. Has 12 ranges (AC, DC, ohms) and frequency response (with auxiliary probes) to 250 MC.

## MODEL 617 3" OSCILLOSCOPE

Designed specifically for color TV and research laboratory requirements... provides undistorted trace from edge to edge on a special flat 3" CRT. Features high deflection sensitivity (.01 v/in. rms); 4.5 MC vertical bandpass, flat within  $\pm 1$  db; internal 5% calibrating voltage. Small, lightweight... but accurate enough for the most exacting work.

... and a new instrument to be shown for the very first time...

## MODEL 622 5" OSCILLOSCOPE

Rugged enough for field and plant use but an instrument of true laboratory caliber... automatic triggered sweep... calibrating voltage accurate to  $\pm 3\%$  electronically regulated power supplies.

IF YOU ARE QUALIFIED IN THE ELECTRONICS OR PHOTOGRAPHIC FIELDS, HYCON OFFERS PROGRESSIVE OPPORTUNITIES. CONTACT EMPLOYMENT-MANAGER, HYCON MFG. COMPANY, BOX N, PASADENA 15, CALIFORNIA

*...this new Houston-Fearless*  
**MICROWAVE PARABOLA**  
*operates completely by*  
**REMOTE CONTROL!**

**T**here's no need to climb an icy tower in zero weather, wind or rain to position this new Houston-Fearless Remote Control Microwave Parabola. It's all done from the remote control panel (shown below) right in the station.

This Houston-Fearless Parabola can be mounted anywhere within 1500 ft. (or more, if required) of the transmitter. It rotates 370° in azimuth and tilts 15° up and 30° down. Large dials on the remote control panel, calibrated in degrees, show the exact position. It is driven by 1/6 HP motors producing a torque of 10,500 inch pounds @ 1 RPM, sufficient to operate under severe icing conditions. Magnetic brakes prevent override when Parabola is stopped at any exact position. Designed to operate in the open without protection, it will withstand a wind velocity of 120 mph. Motors and rotating shafts run on sealed, anti-friction bearings and require no lubrication during the life of the unit. Here is complete dependability and freedom from servicing where it really counts. Send for catalog and complete information.

IDEAL FOR PRINTED CIRCUITS. Meets all Humidity, Temperature and Electrical Requirements of MIL-C-5 Specifications. El Menco's Dur-Mica DM15 establishes a "new dimension" in capacitor performance with ranges from 1 to 390 mmf. at 500vDCw and 1 to 510 mmf. at 300vDCw. A new, tougher phenolic casing provides temperature co-efficient and stability equal to or better than characteristic F in all but the lowest capacity values . . . efficient operation at temperatures as high as 125°C. El Menco's Dur-Mica DM15 can be used in a variety of transistor circuits and other miniature electronic equipment in military and civilian applications.

Sells for Less than the famous El Menco CM-15 — Provides Economy of Size with Maximum Performance and Widest Application.

phastron the NEW LOOK in

# "555" metal-cased MULTIMETERS

POCKET SIZE WITH A 4 7/8" LENGTH SCALE

## WE LEAVE IT TO YOU

WOULD YOU BUY A PLASTIC-CASED WRIST WATCH . . .

if you could buy the finest movement in a magnetically shielded metal case?

Phastron, world famous manufacturer of ENVIRONMENT FREE PRECISION AIRCRAFT EQUIPMENT for Military and Industrial uses introduces a new concept in Multimeters. This magnetically shielded, metal-cased "555" compares with plastic-cased multimeters as a fine watch in a precious metal case would compare with a plastic wrist watch.

The shielded, shatterproof and anti-magnetic case insures continued accuracy and integrity of this instrument for years to come.

Phastron "555" Multimeter incorporates more ranges, including AC current, greater visibility, simplified and functional controls and the greatest value offered to date.

See the Phastron "555", note its many outstanding features, its beautiful satin chrome case, its compactness and light weight, and you will know why

# BELL SYSTEM'S NEWEST TELEPHONE DEVELOPMENTS

use **RAYTHEON**  
filamentary  
subminiature  
tubes

The Bell System's new telephone answering set and new telephone for "hands-free" and conference use naturally require tubes of the utmost reliability. Raytheon Filamentary Subminiature Tubes qualified only after undergoing a long series of exacting tests by both Bell and Raytheon.

Low microphonics, low power requirements, high efficiency, long life and, above all, supreme reliability characterize the Raytheon Tubes in these newest telephone developments.

It will pay you to find out what Raytheon Filamentary Subminiatures can do to better the performance, convenience and economy of *your* electronic equipment.

*Excellence in Electronics*

**RAYTHEON MANUFACTURING COMPANY**  
Receiving Tube Division — Home Office: 55 Chapel St., Newton 38, Mass. Bigelow 4-2500  
For application information write or call the Home Office or: 4935 West Fullerton Avenue, Chicago 39, Illinois, National 2-2770  
589 Fifth Avenue, New York 17, New York, PLazo 9-3900 • 622 South La Brea Ave., Los Angeles 36, California, VEbster 8-2851

RAYTHEON MAKES ALL THESE:  
RELIABLE SUBMINIATURE AND MINIATURE TUBES • SEMICONDUCTOR DIODES AND TRANSISTORS • NUCLEONIC TUBES • MICROWAVE TUBES • RECEIVING AND PICTURE TUBES

COME IN AND TALK OVER THESE TUBES WITH US AT THE I.R.E. SHOW

**TELEPHONE ANSWERING.** When you aren't there, the automatic telephone answering set takes over, delivers previously dictated message in your voice, records caller's reply and plays it back to you at your convenience.

**"HANDS-FREE" TALKING.** Telephone set base has a built-in microphone — you talk without picking up handset. Tiny desk speaker amplifies the distant voice so that several persons in a group can listen to the conversation. For privacy, you lift the receiver, automatically shutting off the microphone and speaker. Small amplifier, not visible in the picture, furnishes power.

**RAYTHEON FLAT PRESS Subminiature Tubes** are the tubes with the **SEAL OF RELIABILITY** — the longer glass to metal seal that gives you these important advantages:

- Glass heated only once — no button, low glass strain, no lead burning
- Reentrant seal eliminates breakage from short bends
- Leads completely tinned right to glass
- Flat press with in-line leads for easier socketing, easier wiring, adaptability to printed circuits

*Reliable, long-lived Raytheon Subminiature Tubes in these Bell equipments, illustrated above, were tested for dependable, trouble-free service over long periods.*

## COMMERCIAL CONSTRUCTION AT COMPETITIVE PRICES

## Good-ALL SERAMELITE Capacitors MODELS 620S and 621S

... combine the excellent electric characteristics of "MYLAR" with the superior humidity resistance properties of "Seramelites" to produce a completely new capacitor for exacting applications at reasonable prices.

These competitively priced new miniature capacitors closely approximate the performance of expensive hermetically sealed units. They are designed to cover the entire capacitance and voltage range.

### CHARACTERISTICS:

- Insulation resistance 20,000 megohm-microfarads
- Power Factor is Less than 1%
- Operating Temperature -55° C to +125° C
- Generally smaller than RETMA Standards
- Tolerances as close as 1/2 of 1%

### CONSTRUCTION FEATURES:

- Tubular Ceramic Enclosure
- New Plastic End Seal
- Inserted Tab or Extended Foil
- Miracle X Impregnated

### OTHER GOOD-ALL "MYLAR" CAPACITORS

FILM-X (Hermetically Sealed) • MARBELITE (Plastic Impregnated Paper Tube)

*Available for printed circuit or other applications in all mounting styles.  
Built to your specifications.*

We will have our complete line of Capacitors at the  
**I.R.E. SHOW, Booth 75** at Kingsbridge Palace.

the  
**First**  
 transistorized  
 consumer  
 product

**... uses TI transistors!**

Using four high gain Texas Instruments transistors, the world's first transistorized consumer product — a high performance pocket size radio — is now available on the retail market! Priced under \$50, the world's smallest commercial radio receiver (manufactured by Regency of Indianapolis) achieves better performance than many much larger conventional sets. To produce the specially designed transistors used in this superb little instrument, TI has developed advanced manufacturing techniques that assure uniformly high product quality as well as mass production quantities. With the transistor radio already a real-

ity, the multi-million dollar consumer market is ready and waiting for still more transistorized products. Don't delay your own product development for lack of suitable low cost, high performance transistors. In designing transistorized products, depend on transistors from Texas Instruments, a leading supplier of transistors for a variety of commercial and military applications. Producing the industry's widest range of semiconductor devices — silicon or germanium; diodes or transistors — Texas Instruments is your most *experienced* source of supply for dependable semiconductor products.

\* With four Texas Instruments grown junction n-p-n germanium low cost, high gain transistors, the Regency radio achieves power gains of 32 decibels in each intermediate-frequency stage and 37 decibels in the audio stage. One transistor is used as a combination mixer-oscillator, two as intermediate-frequency amplifiers, and one as an audio amplifier. Output transformer also TI manufactured.

**TYPICAL USES**

SPEED GRIPS are applied by hand on this automobile floor pan.

Front seat grab handle of car is ready to receive bolts in final assembly.

SPEED GRIPS furnish a firm, sturdy attachment for television chassis mounting.

## How to Cut Costs 75%... with Tinnerman SPEED GRIPS®!

Assembly and material costs cut from 12 cents to less than 3 cents—a saving of 75% on just one fastening application! That's the Tinnerman SPEED NUT Savings Story for the Automatic Radio Manufacturing Company, Boston, on its CUSTOM-BUILT AUTO RADIO LINE.

SPEED GRIP Nut Retainers replaced hard-to-fabricate tapped holes and weld-type nuts as the mounting fasteners on each set. SPEED GRIPS are quickly and easily snapped into square punched holes. No special tools or skills needed! Flat Type SPEED NUTS also provide a vibration-proof attachment of speaker to baffle.

And here's a "temper-saver" for the man who installs the radio in his car. SPEED GRIPS have "mechanical hands" that hold the nut in bolt-receiving position for blind location attachments. What's more, they "float" to compensate for any misalignment in mounting holes.

There are more than 8,000 shapes and sizes of SPEED NUT brand fasteners to help you save assembly time, material costs and handling. Write today for your "SPEED NUT Savings Stories" booklet of typical Tinnerman savings to industry.

**THE NAME THAT GUARANTEES *Quality* IN MOLDED RESISTORS**

When you specify Bradleyunits for your radio, electronic, or television circuits you are "playing safe" with your reputation as an electronic engineer . . . because Bradleyunits are ultra-conservatively rated.

All Bradleyunits are rated at 70C ambient temperature . . . not at the usual 40C. They do not exhibit erratic resistance changes nor do they open circuit. They will operate at full rating for 1,000 hours with less than 6 per cent resistance change. Bradleyunits require no wax impregnation to pass salt water im-

mersion tests. Their differentially tempered leads prevent sharp bends near the body of the Bradleyunit. In every way, Bradleyunits are a QUALITY product . . . trouble free, accurate, and always dependable.

Let us send you our latest technical data sheets.

# 12,800 TO 50,000 MC

integrated equipment for

## Extremely High Frequencies

SIGNAL GENERATORS

SIGNAL SOURCES

SPECTRUM ANALYZERS

Now, Polarad has applied its advanced engineering techniques to produce fully self-contained microwave test equipment for use in the Extremely High Frequency region—12,800 to 50,000 MC.

This new line of Signal Generators, Signal Sources, and Spectrum Analyzers is designed to save engineering manhours in the laboratory and on production lines—obviating experimental test set-ups.

The Extremely High Frequency Polarad Signal Generator, for example, furnishes monitored power output as well as measures external signal strength and frequency.

Highest accuracy and reliability of operation are assured by careful engineering and the use of highest quality components. For complete information write to your nearest Polarad representative or directly to the factory.

## Something in Common

*No single tool...  
not even  
a hairpin...  
works best  
for all applications.  
This is  
true of  
diodes, too.*

The Hughes line of semiconductor devices is multiplying swiftly. It comprises several different categories and numbers more than two hundred separate RETMA, JAN, and special diode types. This means that you can now spell out requirements for a diode in terms of your particular circuit application. And it means that one or more types in the extensive Hughes line will most probably match those requirements with *just the right* characteristics.

Greater selectivity is one of the results of the vigorous and continuing Hughes program of research and devel-

opment—a program aimed directly at satisfying anticipated industrial and military requirements. At the same time, your assurance of better quality and thorough dependability in *all* Hughes semiconductors is maintained. So, when you need diodes with High Temperature . . . High Forward Conductance . . . Computer Type . . . High Back Resistance . . . JAN-Approved . . . General Purpose, or other special characteristics, be sure to ask about Hughes Diodes. The chances are that you will find just the one you want.

### At the IRE Show

*We will be displaying samples of our famous GERMANIUM POINT-CONTACT DIODES, as well as the new GOLD JUNCTION and SILICON JUNCTION series. You will want to inspect the operating demonstration of light beam voice transmission system, with circuitry featuring our latest types of NPN fused junction transistors and photocells. So come in to Booths 753-5-7 and pay us a visit. You will be most cordially welcome.*

## “Better than pushing buttons...”

A quick flick of the thumb... it's on "RUN." At any speed, another flick stops the tape. Fast forward and reverse are just as simple. What's more, it can be fully operated from a remote position with the same easy "joy stick control."

In a final test session, the engineering team responsible for the design and production of the new Berlant Automatic Recorder BAR-1 was highly gratified with the final analysis and performance of the new machine. Meeting with Bert Berlant, president of Berlant Associates, they put the new recorder through a series of rigorous tests. They found the new automatic control fool-proof.

Tested under actual working conditions, the new "joy stick control"

marks a new advance in the art of magnetic recording. It is an exclusive feature which has been added to all the outstanding advantages of the Berlant Broadcast Recorder BR-1.

The new Berlant Automatic meets every requirement of the recording studio, radio station or industrial application. Its provision for five heads (three are standard) permits both single and dual track operation. The BAR-1 also includes an A-B test fader which allows metering between incoming signal and playback without transients or clicks.

And these additional requested features: Hysteresis synchronous direct drive with 99.8% timing accuracy. Instantaneous *Reeloks*. Automatic cut-off. Tape tension arms. Adjustable

bias. Simplified cueing and editing.

All of the above are what 382 different engineers asked for in a questionnaire before work was started. We considered the man in the figure department, too. He wants dependability and low maintenance cost... at the right price! We've given it to him.

# Multiple Unit Carbon Controls — in *New Cost-* *Saving Design*

Resistance values: 250 ohms to 10 megohms, in a variety of tapers.

Shaft: Hex phenolic, with slotted end; lengths — zero up to  $\frac{7}{8}$ " FMS in  $\frac{1}{8}$ " increments.

Rear view shows simple, rugged design, with resistance wafer attached directly to phenolic panel.

Parts distributors in all major cities stock Mallory standard components for your convenience.

Serving Industry with These Products:

Electromechanical—Resistors • Switches • Television Tuners • Vibrators  
Electrochemical—Capacitors • Rectifiers • Mercury Batteries  
Metallurgical—Contacts • Special Metals and Ceramics • Welding Materials

A COMPLETELY new type of carbon control just developed by Mallory offers opportunities for important savings in your production. Available in single, dual and triple units, this model features a unique strip-type phenolic panel construction that is particularly applicable to TV alignment controls.

## SAVES PRODUCTION TIME . . .

A dual or triple unit can be mounted in no more time than your assemblers now need for a single control.

## REDUCES COMPONENT COST . . .

The new simplified design makes it possible for Mallory to produce multiple units at costs materially lower than that for a corresponding number of conventional single controls.

## FLEXIBLE DESIGN . . .

This unique design offers many adaptations . . . at low cost. Phenolic hex shaft with screw driver slot makes for ready adjustability and is supplied in  $\frac{1}{8}$ " increments of zero to  $\frac{7}{8}$ " FMS. Terminals can be solder lugs or wire wrap solderless type. Mounting arrangement can be holes for riveting or twist tabs. Resistances cover the range from 250 ohms to 10 megohms, with rotational stop provision.

Minimum spacing of shafts . . .  $1\frac{1}{2}$ " between centers . . . is identical with that required for single controls. You can install the new units as direct replacements in many existing chassis and mounting plate designs. Special center spacings can, of course, be supplied.

Plan to take advantage of these new economies in the equipment you are now designing . . . and investigate the possibilities for using them in the products you are now manufacturing. For technical details, and for engineering assistance by Mallory specialists, write or call Mallory today.

Expect more . . . Get more from

# NEW

## 900 to 2000 Mc Oscillator

Type 1218-A  
UHF Unit Oscillator  
complete with patch cord  
and connectors, \$465.00

The latest addition to the line of G-R Unit Instruments is the Type 1218-A UHF Unit Oscillator . . . a well designed, well-engineered signal source which provides high power at ultra-high frequencies, and costs much less than existing u-h-f generators.

This instrument is remarkably versatile. It can be modulated with either square waves or pulses. Its frequency can be adjusted accurately in slight increments at any point over its wide range. It is a general-purpose, thoroughly shielded source of power for use in laboratory or field. It is useful not only for driving slotted lines and the Admittance Meter but also for exciting antennas for field-strength measurements, and for high-frequency research and development work on pulse-type equipment of all kinds.

The Oscillator is designed to work with the many other G-R Unit Instruments — Oscillators, Amplifiers, Null Detectors, Pulse Generators, High-Frequency Detectors, Crystal-Controlled Oscillators, Power Supplies — to form a wide variety of flexible, economical measuring systems. These “building blocks” provide, without frills, the most in performance at lowest cost.

WE SELL DIRECT—Prices are net, FOB Cambridge or West Concord, Mass.

**CIRCUIT:** Grid-separation triode oscillator uses Type 5675 UHF Pencil Tube. Line sections with sliding contacts used to tune plate and cathode.

**FREQUENCY RANGE:** 900-2000 Mc.

**HIGH UHF OUTPUT POWER:** Continuously adjustable from low values to minimum of 200 milliwatts into 50-ohm load.

**FREQUENCY CALIBRATION:** Direct reading to 1% with slow-motion drive.

**INCREMENTAL FREQUENCY CONTROL:** (cannot be seen in photo).

**FREQUENCY DRIFT:** Not over 0.1% per day.

**MODULATION:** Many kinds of external modulation can be applied: Sinusoidal amplitude modulation, pulse modulation and square-wave modulation from about 100 to 5000 cps.

**AUTOMATIC CONTROL:** Voltages can be inserted in series with the plate to hold the amplitude constant as frequency is varied. Voltages also can be inserted in series with the grid for electronic control of frequency.

**LOW NOISE:** f-m noise due to vibration and microphonics is unusually low. Rectifier and filter for the heater voltage are built in to reduce modulation by the power-line frequency.

**POWER SUPPLY REQUIRED:** Type 1203-A Unit Power Supply (\$40) for operation from 115-volt, 50-60 cycle power. The Type 1202-A Unit Vibrator Power Supply (\$125) for operation in the field from 6 or 12-volt storage battery.

**ACCESSORIES:** Type 1217-A Unit Pulser for direct pulse modulation.

Type 1000-P7 Balanced Modulator for amplitude modulation up to 100% with negligible fm and pulsing with fast rise time and short duration.

Type 874 Coaxial Elements such as adaptors, attenuators, filters, voltmeters, mixers.

Type 1750-A and 1263-A Sweep Drive and Amplitude-Regulated Power Supply for automatic sweeping over the oscillator frequency range.

Type 480-P7UI Panel for mounting Type 1218-A UHF Oscillator in standard laboratory relay rack.

Types 1217-A \$225, 1000-P7 \$225, 480-P7UI \$14, and 874 Coaxial Elements are available from stock for immediate shipment. Types 1750-A and 1263-A will be available shortly.

# A **SNAP** FOR WIRING BOARD ASSEMBLIES

## **NEW** Sprague Type 28D Push-Lok\* Electrolytic Capacitors Give Fast, Fool-Proof Mounting

**H**ERE'S THE BEST APPROACH yet to electrolytic capacitors for printed wiring board assemblies.

It's Sprague's new Type 28D Push-Lok Electrolytic. Just insert the connecting lugs through the slots in the wiring board, and the capacitor is held securely in place until the chassis is ready for dip soldering . . . so securely that solder gaps are eliminated. Spring action of the Push-Lok lugs is strong enough to hold relatively heavy capacitors in place, even when the board is carried sideways, or upside-down on a conveyor. Tab connections are always in close contact with the printed conductors. Yet, unlike other designs, no secondary operations are required for this fast and secure mounting.

*Other advantages include:*

**Fool-Proof Positioning**—A Push-Lok can only be inserted the right way. A wide index terminal is provided in the mounting ring to index the assembly on the chassis or other surface if desired.

**The Ability to Print Wiring Boards on Both Sides**—Shoulders on the Push-Lok lugs plus additional prongs keep the capacitors clear of the chassis.

**Safety**—Circular shield conforms with suggestions of Underwriters' Laboratories, Inc. Tools cannot be inserted easily between the bottom of the capacitor and the chassis.

FOR COMPLETE INFORMATION on these new Type 28D Push-Lok electrolytic capacitors, write for Engineering Bulletin to Sprague Electric Co., 233 Marshall Street, North Adams, Massachusetts.

*\*Push-Lok is a Trademark of the Sprague Electric Company*

Sprague, on request, will provide you with complete application engineering service for optimum results in the use of electrolytic capacitors.

### Bonus For Inefficiency

Estimating the cost of an electronic research or production job is not easy. In commercial operations, when a company finds a better means for executing a project, it usually results in a well deserved increase in profits. In other words, there is a strong incentive for efficiency.

Unfortunately, this is often not the case with government contracts. As a matter of fact, the amount of profit may increase in direct proportion to a firm's inefficiency!

Take the cost-plus-fixed-percentage contract for example. At times this might be necessary when a new development is being pioneered and no satisfactory criteria exist for cost determination. But in the case where some dollar yardstick does exist, the company which spends the most can come up with the highest total bill—and consequently the greatest profit.

Now take the more common situation of the fixed-cost government contract with redetermination clause. In this case it is to the company's benefit to spend as much money on the project as it can—up to the contract ceiling—to keep its profits up. There is no incentive for increasing efficiency, as there is in commercial operations, because the manufacturer does not share in the saving of a reduced contract cost.

The whole problem of finding the best procurement means is rather intricate, complicated by such factors as renegotiation clauses which limit profits. It should be noted that an incentive-type contract does exist, but it is infrequently employed.

No matter how you slice it, government contracts generally do not offer any incentive to improve efficiency and reduce costs. This is unfair to the producer with know-how and to the taxpayer.

Consequently we urge the broader utilization of incentive arrangements which provide for a sliding profit scale—profits going up as the contracting company reduces cost through greater efficiencies. Let's get rid of the bonus for inefficiency!

### Allocation Sniping

In recent weeks two incidents of what we call "Allocation Sniping" have come into the news. The first, which involved the desire of the military to acquire the use of television channels 2 to 6, fortunately turned out to be only a rumor. The second, however, is factual and has been formally presented to the FCC. This involves a petition by the National Association of Manufacturers to be permitted to operate on unused portions of the FM broadcasting band. (See page 174 for addi-

tional details.) We make no comment on the pros or cons of either of these issues at this time. The important thing to note however is that apparently there is no vehicle in the existing frequency allocation procedures which enables allocations to keep pace with the times.

Fifteen years ago, VHF-TV frequencies were of very little interest to the Navy because the equipment available was not particularly efficient due to the state of the art at the time. Commercial TV of course changed all this and the VHF frequencies are now highly prized for long range ship-to-ship or ship-to-shore communication. FM sound broadcasting failed to make strong inroads into AM-served areas and so today we have relatively idle frequencies in FM allocations while mobile industries and special industrial services desperately seek more frequencies to operate on.

It would seem that with the electronic industries still expanding we can expect more allocation sniping from time to time unless measures are taken to increase allocation efficiency. Such measures might be: a) services which have been allocated frequencies being required to make consistent use of those bands (this means military as well as civilian), b) making frequencies allocated to services subject to periodic function reviews. Where the service rendered could be better accomplished with different frequencies and more modern equipment, the initiation of planned obsolescence program to retire old equipment and recover frequencies would benefit.

### Electronic Press Days

The Los Angeles Chamber of Commerce, through its Electronics Committee headed by Les Hoffman, recently held its first "Electronic Press Day." Purpose of the meeting was to inform members of the local and national consumer and trade publications as to the type and scope of electronic manufacturing in the Southern California area. (See page 160 for more detailed information.)

We believe that meetings of this type are good for all concerned and that other cities with substantial numbers of electronic manufacturers might well follow suit. Such meetings give the press an "awareness" of important electronic activities in their locality and provide a substantial reference point on which to evaluate either national news or news from other localities. The personal contacts arising out of such meetings can become important "two-way" information streets. Finally, through municipal sponsorship, such meetings also tie industry and government closer together and act to promote the civic pride of local citizens.

# RADARSCOPE

Revealing important developments and trends throughout the spectrum for radio, TV and electronic research, manufacturing and operation

**MULTI-COLOR RADAR**, mentioned in these pages last May has been demonstrated for the U. S. Navy by Chromatic TV Labs. Utilizing a modified version of the single-gun Chromatron color TV picture tube, the new radar indicator offers a number of advantages for safety aids and military tactical operations. This includes easy information identification of stationary and moving targets by differentiating separate color displays.

**HOUSEHOLD ELECTRONIC CLOCKS** will be placed on the market by General Electric, probably late this year. The new timekeeper is of the synchronous type, and does not require any cord connection to an electrical outlet. Operational details have not been revealed, but it is believed that electromagnetically induced signals are amplified in the clock to drive the hands.

**TOP AIR FORCE** officers smile wryly at the difficulty of obtaining technically qualified personnel to enlist. Said one, "It's ironic. Industry offers better pay to attract these men away from us. And it's Air Force contract money that enables them to do it."

## ELECTRONIC MUSIC SYNTHESIZER

Dr. Harry F. Olson at the keyboard and Herbert Belar at the control panel of the new electronic music synthesizer developed at the David Sarnoff Research Center of RCA. The machine, capable of duplicating or originating any sound, receives its instructions from a keyboard with the following control functions: four keys for frequency, three for multiplying and dividing frequencies, four for harmonics, three for attack and decay, and four for amplitude. A duplicate channel of 17 keys provides for portamento and other musical variations. See details on page 80

**AC-DC TELEVISION** receivers show excellent promise. Emerson has already announced a 17-inch model for \$149.95.

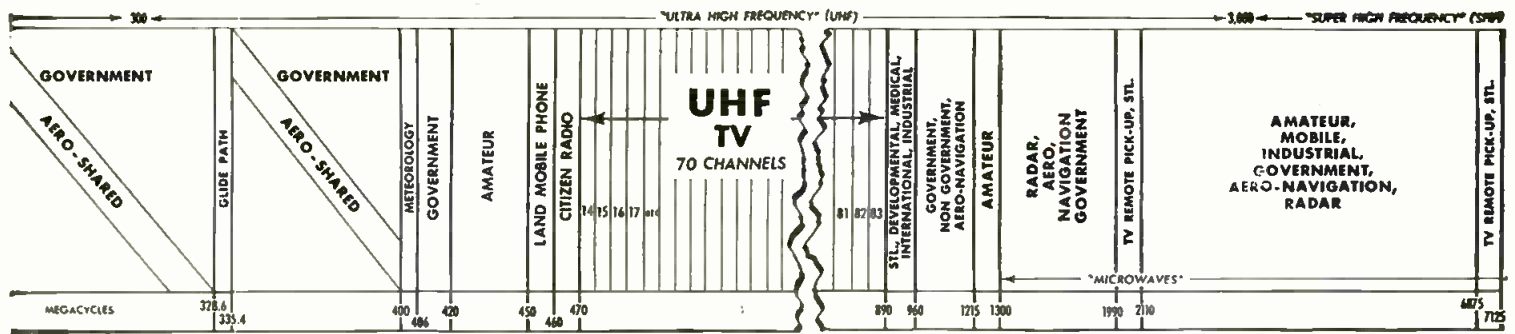

**BIG MICA STRIKE** in North Carolina by Minerals Processing Co. points up increasing attention being focused on this critical material. Depending on quality, the sheeted mica sells for about \$18 to \$70 per pound. Over 90% of the 15,000,000 pounds of the high quality grade used for electronic and electrical equipment in the U. S. is imported, mostly from India, Brazil and Canada. The government is attempting to further synthetic mica production. Mica substitutions, such as special glass, are undergoing intensive development.

**IMPORTERS** of foreign made radio sets have received stern warning from FCC that such units had better conform to radiation requirements expected to be adopted. Compliance will probably make these receivers considerably more expensive.

**COLOR TV** broadcast technique described by GE engineer is reported to assure sharp monochrome pictures on home b-w receivers when program is telecast in color. It also simplifies color registration for the studio engineer. The new method makes possible the studio pickup of a separate black-and-white image, to which the color picture is added, instead of previous methods of superimposing red, green and blue pictures to form the b-w picture. A sequential color camera is employed.

## ELECTROENCEPHALOGRAPHY

**BRAIN WAVE** measurements employed in encephalography (EEG) have proven quite valuable in diagnosing neurological ills. Since the first recordings were made in 1924, the characteristic electrical behavior of normal and abnormal brains has been extensively catalogued. According to Arthur D. Little's *Industrial Bulletin*, there are several hundred laboratories in the U. S. specializing in this technique. By attaching electrodes to the scalp, the electrical impulses traveling around the brain's nerve loops may be recorded on a strip chart or examined with a multi-cathode-ray tube wave analyzer. Although many frequencies appear, the major types are alpha waves (8 through 13 cps) which occur in 85% of normal adults, and beta waves (18 through 30 cps) which are less regular than alpha. The EEG for normal adolescents is about the same as for normal adults, but there is less constancy of pattern, and it is more adaptable to change under stimulus. The EEG for the newborn is formless, developing into slow delta rhythms during the first year. Normal alpha frequencies and voltages are developed by age 14, and beta rhythms by

16. Improved equipment and techniques promise a growing understanding of brain workings during the coming years.

### COLOR-TV

**EMPHASIZING** the growing application of color TV for medical and industrial uses, Dr. Alfred N. Goldsmith described techniques for remote diagnosis at a recent meeting of the Armed Forces Institute of Pathology. At this meeting RCA demonstrated in a closed circuit hook-up how a doctor in Philadelphia had human tissue examined through a microscope by pathologists in Baltimore and Washington. At about the same time, Peter Goldmark, President of CBS Labs., demonstrated a microscope-color-TV system which projects pictures on a 6-ft. screen with magnifications of 15,000. Both for medical practice and medical education, electronic devices are slated to play an increasingly vital role.

### AUDIO

**RADICALLY NEW** development in audio—the electronic music synthesizer—has been demonstrated by RCA. Although not yet ready for mass production, the synthesizer has very clearly opened fabulous new horizons in sound production techniques. The function of the instrument is basically two-fold: to synthesize familiar sounds, and to create an unlimited range of tone variations. It has a capacity for originating endless varieties of rhythms, including the duplication of any sound and the origination of sounds never before heard. A year was required to build the machine, at a cost of about \$25,000, and another year for developing means for using it. In operation, pressing the keys produces perforations in a paper roll, which feeds its message to the synthesizer. The machine sends the desired sound to a stylus which makes the recording on a disc. At present the machine can produce the tones of one musical instrument at a time, so separate recordings are made and then combined to form a complete orchestral selection. The synthesizer's ability to duplicate a person's voice offers possibilities for psychological warfare. Among many other applications are the rejuvenation of old recordings.

### COMPONENTS & DESIGN

**LARGE REDUCTION** in engineering time and costs of selecting proper components for electronic equipment are claimed for a mechanized system for storing and searching engineering data. Details of this system, entitled the Electronic Component Information Center

(ECIC), are contained in a research report (PB111548) recently made available to industry by the U. S. Department of Commerce's Office of Technical Services, Washington 25, D. C., for \$4.25. This report of research by Battelle Memorial Institute under Air Force contract describes the elements of a machine-sorted punched-card system for recording, searching, and tabulating data on any electronic component. Its importance is pointed up by the fact that proper selection of the most reliable and effective components is often the most costly and difficult step in the development of complex electronic systems.

### FLAT TV TUBE FOR AIRCRAFT

TV picture tube, consisting of a transparent phosphor screen sandwiched between flat plates, has been developed by the West Coast Electronics Div. of Willys Motors. It is only 3 in. thick and is capable of operating with 2000 line definition. An electron beam is injected in a field-free region along a horizontal edge, bent vertically at a desired point by the voltage on one of the transverse vertical deflection plates, and then bent again to the charged phosphor screen by one of the transparent horizontal deflection plates. The tube, using only electrostatic principles, is expected to be used in Navy aircraft instrument panels in 1958, and will enable pilots to see geographical features, altitude, speed and similar data right in front of them without interfering with vision.

# Evaluation of Radar Sea Clutter

Understanding of statistical properties of disturbed ocean surface sheds light on design requirements for military search radar

**ABSTRACT.** Sea echo, or sea clutter, is a term used to denote radar reflection and scattering associated with the wind-disturbed surface of the sea. To date the precise relationship between the clutter and the sea surface is not completely understood. This lack of understanding is, at least in part, due to the lack of a satisfactory statistical model of the sea surface. This paper will emphasize recent work on the statistical properties of a wind-disturbed water surface with the view of helping electronic engineers better understand the sea clutter problem.

By ALLEN H. SCHOOLEY  
Superintendent  
Electronics Div.  
Naval Research Lab.  
Washington 20, D.C.

THE surface of a large body of water is seldom calm. Wind, rain, earthquakes, fish, ships, currents, and tides are all elements that cause the surface of the sea to be rough and undulating. For most purposes, however, only the wind need be considered as the surface disturbing element.

The state of the wind-swept sea surface is important in radar operation. A radar operator looking for a target sometimes finds that energy scattered back from a rough sea surface (sea clutter) overrides and obliterates echoes from the desired target. In other words, it is often sea clutter, rather than system noise, that determines the maximum radar detection range for a particular target. It is evident, therefore, that the relationship between sea state and sea clutter is of considerable practical importance. It is also an interesting scientific riddle that has not yet been satisfactorily solved.

The following two phenomenological radar equations are introduced to serve as the basis for further discussion.<sup>1, 2</sup>

$$\bar{P}_r = \frac{P_t G^2 \lambda^2 \Phi \tau c \sec \Theta}{2(4\pi)^3 R^3} \sigma^\circ \quad (\Theta \text{ small}) \quad (1)$$

$$\bar{P}_r = \frac{P_t G^2 \lambda^2 \Phi}{(4\pi)^3 R^2 \sin \Theta} \sigma^\circ \quad (\Theta \text{ large}) \quad (2)$$

where  $\bar{P}_r$  = Received sea echo power averaged over many pulse periods

- $P_t$  = Transmitted peak power
- $G$  = Power gain of the antenna
- $\lambda$  = Wavelength
- $R$  = Range to target
- $\Phi$  = Azimuthal antenna beamwidth which is approximately equal to angle subtended by the one way half-power points of the antenna pattern
- $\Theta$  = Vertical antenna beamwidth
- $\tau$  = Pulse length
- $\Theta$  = The depression angle of the axis of the beam with respect to the horizontal
- $c$  = Velocity of radio propagation
- $\sigma^\circ$  = The average radar cross section of sea clutter per unit area of the sea surface

Eq. (1) is valid for  $\Theta < \tan^{-1} 2 \Theta R / \tau c$  and Eq. (2) is valid for  $\Theta > \tan^{-1} 2 \Theta R / \tau c$ .

All of the factors in Eqs. (1) and (2) except  $\sigma^\circ$ , can be controlled and measured for a particular radar under particular conditions. If this is done  $\sigma^\circ$  can be calculated for the conditions considered. This has been done in a very preliminary way by several investigators and this work is summarized in reference 2. It turns

Fig. 1: Mean slope and standard deviation curves for wind-disturbed water surface

Fig. 3: Mean curvature and standard deviation curves for a wind-disturbed water surface

Fig. 4: Mean wave height chart in terms of wind velocity and duration, showing minimum fetch lines

Fig. 2: Profile of a water wave created by a 16-knot wind in a small water windtunnel

out that  $\sigma^\circ$  is a complicated function of so many variables that it is probably impractical to make enough field measurements to establish its complete quantitative nature experimentally. This is made more evident by noting the principal variables upon which  $\sigma^\circ$  depends. It has been found that

$$\sigma^\circ = f(\Theta, \lambda, P, S) \quad (3)$$

where  $\sigma^\circ$ ,  $\Theta$ , and  $\lambda$  have been defined previously and where

- $f_1$  = An unknown function
- P = The angle of polarization
- S = The sea state

All of the variables of Eq. (3), except S, can be measured in a reasonably straightforward manner. Thus, the nature of S must be important in unlocking the secret of radar sea-clutter.

#### Wind-Disturbed Water Surface

In the past it has been customary to give descriptive terms to various sea states such as calm, smooth, slight, moderate, rough, very rough, high, and to associate significant wave heights and lengths with each sea state. It is the heights of the large waves that become important to the designers, crews and passengers of ships, and the builders of breakwaters and docks. Radar sea clutter, on the other hand, is quite sensitive to the smaller waves. It has been observed that sea clutter is more severe under conditions of a sharp choppy sea caused by local winds than when the sea is glassy with a heavy swell caused by a distant storm. Thus, a quite sophisticated description of the sea state or sea surface is needed in order to relate it to sea clutter.

Unlike electromagnetic waves in free space the velocity of propagation of water waves is not a constant. For isolated deep water waves where the ratio of height to wavelength is less than 1/100, the

wave form is sinusoidal and the velocity of propagation varies with wavelength.<sup>3</sup> Waves of moderate height (ratio of height to wavelength of between 1/100 and 1/25), have a nearly trochoidal shape. For large waves (ratio of height to wavelength of greater than 1/25), the troughs are wider and flatter and the crests narrower and steeper than the trochoidal shape. Instability and breaking of the tops of the waves occur at height-to-length ratios in the region of 1/10 to 1/7. The velocity of water wave propagation increases slightly as the ratio of length to height becomes a larger number. Actually a wind-disturbed water surface is usually a more or less random composite of waves coming from various directions with various heights, shapes, and wavelengths depending upon the action of local and distant winds. Any satisfactory description of the surface therefore must be given in statistical form. It may be assumed that the target causing radar sea clutter is made up of a large number of individual scatterers that are facets of the sea surface having random slopes, sizes, and heights. It is the sum of the noncoherent scattering back to the radar from these facets that produces sea clutter. Thus, per-

haps one needs to be able to describe the surface of the sea in terms of the statistical distribution of scatterer slope, size, and height. Once having such a statistical description of the sea surface it may be possible, with sufficient mathematical ingenuity, to relate the gross effect of the sea surface to the production of radar sea clutter.

#### Maximum Slopes

Hulburt<sup>4</sup> used pictures of sunlight reflected from the facets of the water surface to estimate the maximum slopes of these facets. Cox and Munk,<sup>5</sup> and Schooley<sup>6</sup> have made studies relating the distribution of water surface slopes to local wind velocity. Cox and Munk analyzed pictures taken from aircraft of the sun's reflection from the surface of the Pacific Ocean. Schooley's data were derived from flash pictures of the surface of the Anacostia River. Fig. 1 shows smoothed data taken from both of these references. As a first approximation it is assumed that the distribution of water surface slopes is a normal distribution with a mean value of zero. The dispersion around this mean value increases as the local wind velocity increases beyond a certain thresh-

(Continued on page 118)

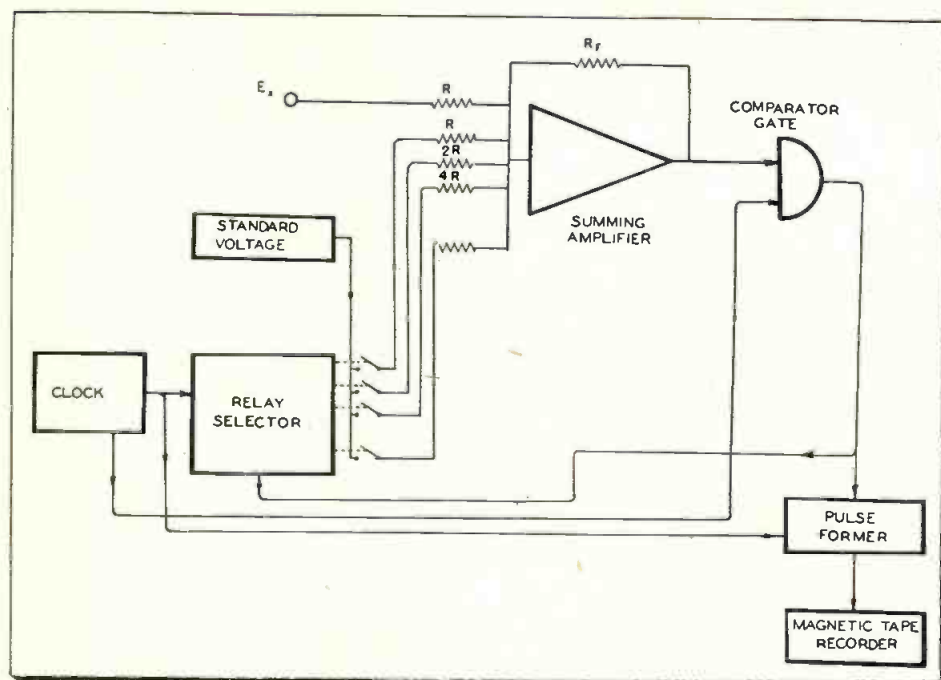

Fig. 1: Block diagram showing system operation of single-channel encoder

## Analog transducer output is converted to digital form for subsequent automatic computation

IN recording engineering data for subsequent automatic computation, it is advantageous to have these data recorded in digital form. Accuracies of approximately 0.1% may be easily achieved through the use of digital methods. This encoder was designed for recording digitally the output of analog transducers used in rocket-motor tests.

The major characteristics of the encoder are as follows: There are two input channels, each with a sampling rate of 40 complete measurements per second and an input range of 0—1 v. Accuracy of the encoder is  $\pm 0.1\%$  as output is described by 10 binary digits. Through the use of contact-modulated amplifiers, the input range may be lowered to 0 to 10 mv. This sensitivity is required for use with most input transducers.

Digitized data at the encoder output are recorded on a single-channel magnetic tape and are later transferred to printed tabular form or punched cards by the transcriber unit of the data-handling system.

The transcriber unit reads the tape at a rate slow enough to allow print-out operations and card punching and tabulates separately the information from the two input channels.<sup>1</sup>

### Analog-To-Digital

Several methods for converting continuously varying voltages from the analog to the digital form are in

common use.<sup>2,3</sup> Certain elements are essential in analog-to-digital converters. One such element is a reference voltage with which the input signal may be compared. Another is a comparator device which is capable of detecting coincidence between the magnitude of the input voltage and the reference voltage to the degree of accuracy desired.

Two general methods of varying reference voltage are frequently used. In one—the linear-sweep method—the reference voltage is varied continuously and smoothly as a linear function of time. In the other, incremental changes in standard voltage are made permitting successive comparisons between the standard and the unknown. When this method is used, the standard is held constant during each comparison period.

### Encoding Method

Any point in the interval 0 to 1 may be described by a binary number

$$a_1 a_2 a_3 \dots a_n = a_1 \frac{1}{2} + a_2 \frac{1}{2^2} + a_3 \frac{1}{2^3} + \dots + a_n \frac{1}{2^n}$$

The  $a$  values are limited to either 0 or 1. In the relay encoder the binary coefficients refer also to the position of the relay contacts in the encoder, 1 representing a closed relay and 0 an open relay. As  $n$  becomes large,

the sum of the terms on the right approaches 1, when  $a_n$  equals 1. The series shown may be extended to include any number of terms; however, in a physical situation the limit of significant terms is imposed by the accuracy of measurement required or the noise level of the comparator. A point within the interval 0—1 v. may be described uniquely through the following sequence of operations: The binary coefficient  $a_1$  is assumed to have the value 1, and the first term is subtracted from the unknown voltage. If the difference is positive, the value 1 is retained for  $a_1$ , whereas if the difference is negative, the  $a_1$  is made equal to 0. Next the value of the coefficient  $a_2$  is assumed to be 1, and the second term is subtracted from the residue of the preceding operation. The value of  $a_2$  is determined as either 0 or 1 as before, depending on the sign of the new difference. In a similar manner, the unknown is compared with the sum of all terms of the series. The subtraction operation is realized by adding negative increments of voltage to the positive input voltages.

As these operations are performed, the binary-number equivalent of the unknown voltage is generated serially by the comparison operation. This same binary number may also be obtained in parallel form by noting the position of the relay contacts at the end of the sampling period. This parallel output provides a convenient way of displaying the binary-number output visually.

### Operation Of Encoder

In describing the operation of the encoder, it is convenient to follow the block diagram in Fig. 1, which shows the functional units for one channel. Trigger pulses from the clock close relays which introduce voltages into the comparator. The first relay to be closed (which cor-

# Encoder for General Instrumentation

responds to the most significant digit) adds a voltage at the comparator input which requires a positive analog input signal greater than +0.5 volt to prevent release of the relay. Likewise, the second relay adds an increment requiring greater than +0.25 volt to prevent its release. All the other digits are evaluated using the same scheme. It is assumed that input voltage does not change during the sampling period.

This discrimination between positive and negative sums of the series is the function of the comparator gate. Output of the comparator gate consists of reset pulses indicating 0 and blank spaces which represent 1. The complement of the reset pulses is formed and made ready for recording in the pulse-former circuit. The serial binary numbers are recorded on the tape, and the occurrence of a pulse of either polarity provides timing information for the transcriber.

## Timing Pulses

Since the time scale on the digitized record depends on a knowledge of the sampling rate of the encoder, an electromechanical tuning fork is used to control the frequency of the timing pulses. These timing pulses determine the closing time of the relays which introduce standard voltage increments into the summing amplifier. A second pulse which is displaced by one-half of a comparison period serves as a reset pulse when passed by the comparison gate. Thus the comparison operation is delayed until after the relay is fully closed.

The timing scheme for operation of the two-channel encoder is shown in Fig. 2. Output digits from the two channels of the encoder are inter-

Fig. 4: Timing scheme for comparator gate

Fig. 5: Two-channel prototype encoder

laced in recording them on the magnetic tape. Thus the respective measurements on the two channels coincide in time. Additional pulses are interlaced with those of the two information channels and identify the group. At the end of a group of 30 pulses, a blank space equal to one digit period is left to separate the

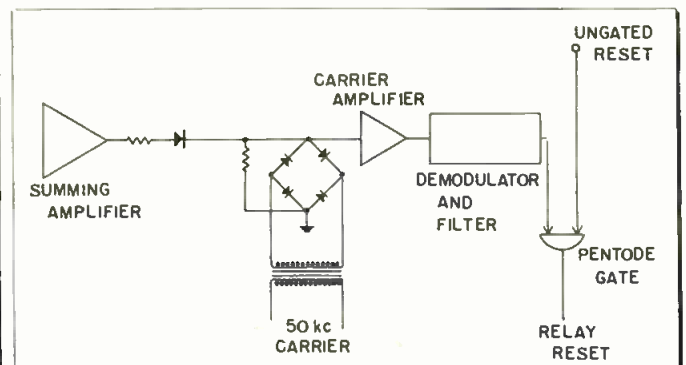

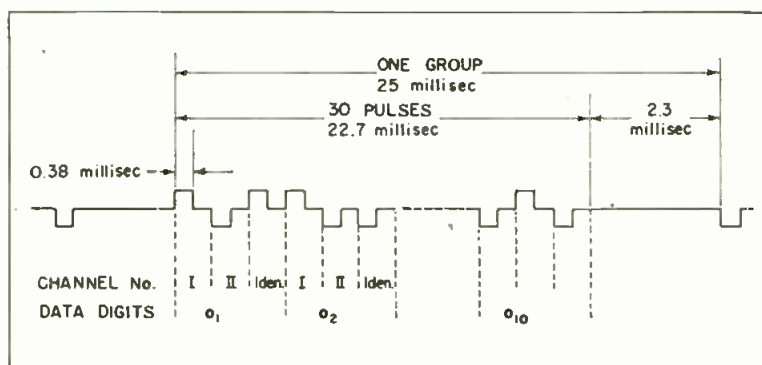

pulse groups representing complete samples.

## Single-Track Advantage

For a two-channel instrument, the single-track tape recorder could have been replaced by a dual-track recorder with simplification of the transcriber circuitry. However, the single-track recorder has the advantage that the number of input channels may be increased with a minimum change in circuitry. To be useful in field recording an encoder should accept a large number of inputs and should have a simple method of data storage. For this reason a single-channel magnetic tape was used, and recordings may be made at tape speeds of 15 or 20 in./sec. Approximately 90 pulses/in. are recorded at a tape speed of 15 in./sec. This density of pulse recording is easily realized and utilizes well-known, pulse-recording techniques.<sup>4</sup>

Time division between channels is accomplished by a three-tube thyatron ring<sup>5</sup> which distributes pulses between two information channels and the identification numbers which are interspersed. All of these timing pulses for the two-channel encoder are generated by the clock circuitry. The cathode-coupled thyatron ring which acts as channel commutator operates at a rate of 1320 pulses/sec. Ring trigger pulses for the various channels are formed from the leading edge of signals at the plates of the thyatron ring. Plates of the thyatrons are connected to diode "and" gates<sup>6</sup> so that a reset pulse is passed to the comparator gate of the proper channel. After each 10 digits, an interval equal to the duration of 1 digit is left for readout and reset-

# Stabilizing Transistors

By employing direct-coupled feedback methods of stabilization, usable temperature operating ranges of transistors are extended as much as 40° C. ambient

By SOL SHERR and THEODORE KWAP

General Precision Laboratory Inc., Pleasantville, N. Y.

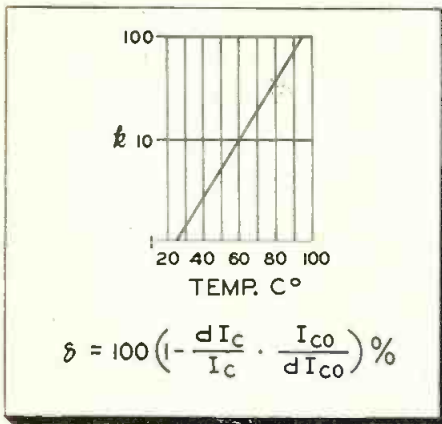

Fig. 1: Increase with temperature is linear

Fig. 2: Junction temperature rises with  $I_c$

A MAJOR problem of transistor circuit design is stabilization of transistor characteristics and operating points against temperature variation. This problem has been given a good deal of attention, and several methods have been proposed as possible solutions.<sup>1, 2, 3, 4, 5, 6, 7</sup> The two basic approaches are, first, immersion of the device in a temperature controlled system and, second, application of direct coupled feedback to control the runaway action of the transistor collector current. The temperature control method is usually costly as to size and weight, and may also put electrical limitations on the design. This paper will limit itself to direct-coupled feedback methods as applied to the stabilization problem.

The feedback method has been treated to some extent in other articles.<sup>1, 2, 3</sup> However, in the writers'

opinion, insufficient emphasis has been placed on the improvements in temperature range and stability of operation to be achieved by stabilization; nor has it been adequately stressed that lack of stabilization severely limits the utility of transistor circuits and increases the danger of failure. Thus, schemes for achieving stability by this means have been described and analyzed,<sup>1, 2, 3</sup> but this combination of insufficient advantages, and lack of convincing experimental data has tended to restrict general appreciation of the values of stabilization. This article attempts to help correct this situation. It presents two relatively unpublicized methods for stabilizing operating points, independently developed by the authors as well as several other workers in this field. By utilizing these methods, the temperature operating range of transistors normally rated at a maximum of 40°C to 50°C ambient can be extended to at least 80°C ambient, while some types rated at 75°C have been operated over 115°C in stabilized circuits. The methods are usable in many different circuit configurations, and appear to offer reasonable life expectancy even at elevated temperatures. Circuits embodying these methods have been subjected to a complete analysis, and design equations have been derived.

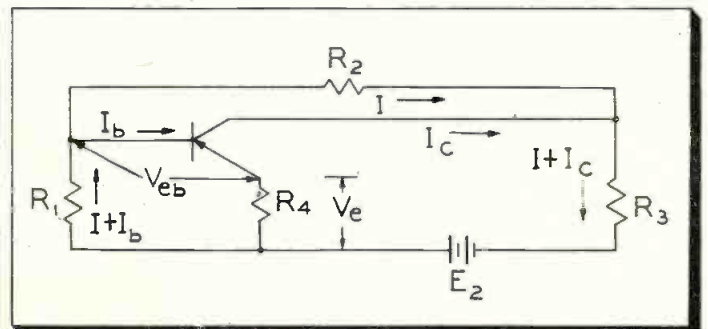

A major cause of temperature instability in transistor operation is

the change in collector saturation current,  $I_{c0}$ , with temperature. A commonly quoted rule for diffused junction transistors is that  $I_{c0}$  will double for approximately every 11°C of junction temperature change. Fig. 1 is a graph of this variation. This  $I_{c0}$  variation produces a regenerative bias voltage from base to emitter, which causes  $I_e$  and  $I_c$  to increase. As  $I_c$  increases, the junction temperature increases. Fig. 2 shows the increase in junction temperature due to the dissipation at this point. This change causes a further increase in  $I_{c0}$  until at some comparatively low temperature the action becomes runaway and destroys the transistor. Previous to complete failure, there is a drastic change in parameter characteristics due to the change in  $I_e$ , and an extreme shift in operating points as a result of this action. Eqs. 8 and 9 are in the same form as Eqs. 4 and 5 for the previous circuit, and may similarly be used as design equations for this circuit.

## Typical Application

As a special form of the general case described in Eq. 8, if  $R_1 = \infty$ ,  $R_3 = R_L$  and  $R_4 = 0$ , stabilization may be achieved by the use of only one additional resistor, namely  $R_2$ , where  $R_L$  is the load resistor. When this choice is possible, the method of stabilization described here is most attractive as to simplicity and minimum power dissipation.

Fig. 3: (l) 2-battery method for controlling the regenerative effect. Fig. 4: (r) 1-battery feedback method employing emitter bias

# Against Temperature Variations

A sample design will be done to show the general method in designing a stabilization circuit. The design will be done on the circuit configuration shown in Fig. 4. The data given is:

- Transistor type—Raytheon CK 721
- B voltage—45 v.
- A. C. gain required —  $G = 70$
- Max. input signal (peak to peak) = .06 v.
- Max. temperature (ambient) = 75°C

The first step is to choose an operating point. In this case the operating point will be  $I_c = 2$  ma,  $V_c = -6$  v. The manufacturers curves will give the values of  $r_c$ ,  $r_b$  and  $r_e$  knowing the value of  $I_c$ . For 2 ma Raytheon specifies  $r_b = 350$  ohms,  $r_e = 20$  ohms,  $r_c = 0.7$  megohms,  $\alpha = .975$ . The value of  $I_{co}$  should be measured on the transistor to be used.  $I_{co} = 12 \mu\text{a}$ .

$$\therefore R_L = G [r_c + r_b (1 - \alpha)]$$

$$= \frac{70 [20 + 8.75]}{.975}$$

$$R_L = 2K$$

Knowing the operating point and the  $R_L$  it is now possible to draw the load line as shown in Fig. 8.

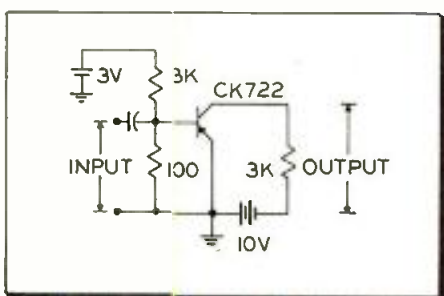

$$\frac{I_{c1}}{V_c} = \frac{1}{R_L}$$

$$I_{c1} = \frac{V_c}{R_L} = \frac{6}{2 \times 10^3} = 3 \text{ ma}$$

$\therefore$  When  $V_c = 0$ ,  $I_c = 2 + 3 = 5$  ma  
or  $V_c + I_c R_L = 6 + 4 = 10$  v.

After drawing the load line on the collector characteristic curve the maximum collector swing is marked off. For this design 2.1 v. above and below the operating point are marked. Since  $I_c$  will increase with temperature, the amount that  $I_c$  may be permitted to increase without distorting the output signal is noted. In this case the allowable increase in  $I_c$  is 1 ma.

Fig. 5: 2-battery temperature stabilized ckt

The next step is to calculate the value of  $\Delta I_{co}$  which will occur. The transistor dissipation must also be calculated since this heat will add to the ambient temperature and give the true junction temperature. In this design the dissipation is

$$3 \times 10^{-3} \times 4.0 = 12 \text{ mw.}$$

The junction temperature rise curve is shown in Fig. 2.

The junction temperature therefore is  $75^\circ + T_R = 75^\circ + 2.5^\circ = 77.5^\circ\text{C}$ .

Using Fig. 3 with the new junction temperature gives  $\Delta I_{co}$ .

$$\Delta I_{co} = I_{coT^\circ} - I_{co25^\circ}$$

$$I_{co} = 349 - 12 = 337 \mu\text{a.}$$

$$\Delta I_{co} = \frac{1 \times 10^{-3}}{.337 \times 10^{-3}} = 2.96$$

$$I_o = I_{co} \rho + \frac{E (\rho - 1)}{R_2}$$

solving for  $R_2$

$$R_2 = \frac{E (\rho - 1)}{(I_c - I_{co} \rho)}$$

$$= \frac{45 (2.96 - 1)}{.975 (2 \times 10^{-3} - 12 \times 10^{-6} \times 2.96)}$$

$$R_2 = 47K$$

$I$  flowing through  $R_2$  is

$$I = \frac{V_o + I_c R_L}{R_2} = \frac{5 + 4}{47 \times 10^3} = .212 \text{ ma}$$

$$I_T = I_c + I = 2.212 \text{ ma}$$

$$I_T R_3 + I_o R_4 = E - V_o - I_c R_L = 35 \text{ v.}$$

$$I_T R_3 = 35 - I_o R_4$$

Choose a value for  $R_4$  and calculate  $R_3$ .

Let  $R_4 = 1500$  ohms

$$\therefore R_3 = \frac{35 - 3}{2.2 \times 10^{-3}} = 17.6K$$

$$R_1 \approx \frac{I_o R_4}{I + I_b} = \frac{2.2 \times 10^{-3} \times 1.5 \times 10^3}{(.2 + .25) 10^{-3}}$$

$$= \frac{3.3}{.45} = 7.3K$$

The resultant stability percentage, is 98.2 and the dissipation in the stabilization circuit components is .088 watts. Increases in the stability percentage can be achieved at the cost of greater component dissipation and higher battery voltage. The requirements of the individual circuit will determine whether stability or dissipation is of most importance.

1 \* BEFORE HEAT TEST  
2 \* AFTER HEAT TEST

The actual circuits on which measurements were made are shown in Fig. 5, 6, and 7. The values were chosen to permit operation at recommended operating points with reasonable values of battery-voltage and dissipation in the stabilizing resistors. The circuit of Fig. 7 was used as a control circuit since the minimum of stabilization exists in this circuit. This can be shown by substituting  $R_3 = R_4 = 0$  in Eq. 8, resulting in

$$\rho = \frac{R_2 (R_1 + b) + R_1 b}{R_2 [R_1 (1 - \alpha) + b] + R_1 b}$$

If  $R_1 (1 - \alpha) \gg b$  and  $R_2 R_1 \gg R_1 b$ , this

$$\text{reduces to } \rho = \frac{1}{1 - \alpha}$$

which is the inherent stabilization of the transistors.

Tests were performed on a number of transistors from nine manufacturers. Representative results are shown on Table 1. Measured results are in good conformance with theory

and the resultant stabilization factors gave excellent performance over the temperature range.

This is the design equation which permits us to predict the amount of stabilization which may be achieved for various combinations of circuit components.

### Emitter Current

It is also of interest to know to what extent variability in  $I_e$  is controlled by this circuit. For this case differentiate Eq. 3 giving

$$\frac{dI_e}{dI_{CO}} = \frac{R_1 R_2 + R_1 R_3 - b (R_1 + R_2 + R_3)}{R_1 R_3} \quad (5)$$

This equation may be used to determine the stabilization against changes in  $I_e$  which may exist from transistor to transistor.

Another form of this circuit which permits operation with only one battery is shown in Fig. 4. The circuit equations are

$$I_{CO} [R_1 R_2 + R_1 R_3] \quad (6)$$

$$I_e = \frac{+(R_4 + b) (R_1 + R_2 + R_3) + R_1 E_2}{(1 - \alpha) R_1 R_2 + R_1 R_3 + (R_4 + b) (R_1 + R_2 + R_3)}$$

$$I_e = \frac{R_1 R_2 + R_1 R_3 + (R_4 + b) (R_1 + R_2 + R_3) - R_1 E_2}{R_1 R_2}$$

The dependence of  $I_e$  on  $I_{CO}$  is again found by differentiating Eq. 6 giving as the first stabilization equation

$$\frac{dI_e}{dI_{CO}} = \frac{R_1 R_2 + R_1 R_3 + (R_4 + b) (R_1 + R_2 + R_3)}{(1 - \alpha) R_1 R_2 + R_1 R_3 + (R_4 + b) (R_1 + R_2 + R_3)}$$

In addition the second stabilization equation is found by differentiating Eq. 7, giving

$$\frac{dI_e}{dI_{CO}} = \frac{R_1 R_2 + R_1 R_3 + (R_4 + b) (R_1 + R_2 + R_3)}{R_1 R_2}$$

To assist in assessing the extent of this effect, we define the percentage stability as

$$S = 100 \left( 1 - \frac{dI_e}{dI_{CO}} \times \frac{I_e}{I_{CO}} \right) \% \quad (1)$$

This expresses the stability in terms of the ratio of the fractional change in  $I_e$  to the fractional change in  $I_{CO}$ . It is similar in form to the equation for power supply regulation which utilizes the ratio of the fractional change in output voltage to the fractional change in input voltage as a criterion of performance. The particular form used in Eq. 1 is convenient because if both fractional changes are equal,  $S = 0\%$ , and if the fractional change in  $I_e$  is 0,  $S = 100\%$ . Both these results are in logical conformance with what we require the stabilization equation to express.

### Circuit Analysis

A circuit for controlling the regenerative effect described above is shown in Fig. 3. The circuit equations are

$$I_{CO} [R_1 R_2 + R_1 R_3 - b (R_1 + R_2 + R_3) - \alpha [E_2 R_1 - E_1 (R_1 + R_3)]] \quad (2)$$

$$I_e = \frac{R_1 R_2 + R_1 R_3 - b (R_1 + R_2 + R_3) + R_1 E_2 - E_1 (R_2 + R_3)}{R_1 R_2}$$

$$\text{where } b = \frac{V_{eb}}{I_e} = r_e - \frac{I_b r_b}{I_e}$$

(Continued on page 145)

# Parabolic Reflector for Sound Recording

**An inexpensive parabolic, of the type in use for UHF transmission, provides the directivity necessary for recording under field conditions**

By **F. ALTON EVEREST**  
Associate Director  
Moody Institute of Science,  
11428 Santa Monica Blvd.,  
W. Los Angeles 25, Calif.

THE first attempt to record bird songs with the family tape recorder and a non-directional microphone is usually a sad disappointment. Through such experiments we come to appreciate that the ear is actually a highly directional transducer when attention is focused on the desired sound and mental discrimination against the background noise is brought into play. This attention factor in hearing achieves directive results that can be duplicated electronically or acoustically only with very elaborate gear. However, as we will see here, acceptable results can be obtained with a standard tape recorder, an inexpensive pre-amplifier, and a simple parabolic reflector. (See Fig. 1.)

The equipment to be described has been put to good use in recording of bird songs, animal sounds, and miscellaneous sound effects for use with scientific motion pictures.

## Design Considerations

As portability was an important factor, planning pivoted around the use of a light-weight tape recorder—a Stencil-Hoffman Minitape. To take advantage of the extra sensitivity possible due to the directivity of the parabolic, a pre-amplifier was needed. And, as constant headphone monitoring was desired, to determine when the recorder should be started and stopped, a simple two-stage monitoring amplifier was also incorporated.

The key to the extra efficiency is, of course, the parabolic reflector. The types presently in use for UHF radio transmitting and receiving are admirably suited to this work.

Dimensions are important. The di-

Fig. 1: Author recording jungle bird sounds

ameter must be of the order of a wavelength or greater to be effective. In the parabolic shown in the photographs, the diameter is 44 in. This means that the diameter is  $\lambda/2$  at 300 cps and for higher frequencies the situation improves. Sound pressure at the microphone diaphragm is increased by the fact that all parallel rays of sound approaching the parabolic are brought together at the focal point. (See Fig. 4) These various components add in phase and drive the pressure-operated microphone harder than would be the case without the reflector. The greater the diameter, the greater this effect, as long as the sound arrives in parallel rays.

The depth of the parabolic influ-

# Design of Twin Tee

How to derive optimum circuit for amplifier utilized in feedback control and similar systems

Fig. 1: Feedback amplifier block diagram

Fig. 2: (a-l, b-r) Twin tee amplitude response

Fig. 3: (a-l, b-r) Response and gain characteristics of practical tuned amplifier circuits

By DR. C. J. SAVANT, Jr.  
C. A. SAVANT &  
R. F. DESTABELLE  
North American Aviation, Inc.  
12214 Lakewood Blvd.  
Downey, Calif.

IN feedback control system design, the need often arises for a low frequency tuned amplifier. In the interests of weight and size reduction, considerable effort has been directed toward resistor-capacitor methods of tuning amplifiers. A number of recent papers<sup>1,2</sup> have demonstrated rapid methods of design of R-C parallel Tee Notch networks. This article presents the results of an effort to determine an optimum tuned amplifier using parallel tee networks.

In order to understand the operation, consider the familiar block diagram shown in Fig. 1. The error voltage at the input of the amplifier is given by

$$\epsilon = e_{in} - f(\omega) e_o \quad (1)$$

where  $f(\omega)$  is the transfer function ( $e_o/e_{in}$  ratio as a function of frequency) of the feedback path. In the case considered here  $f(\omega)$  is the transfer function of the parallel tee network as a function of frequency. The overall gain of the system is easily calculated to be

$$e_o/e_{in} = k / (1 + k f(\omega)) \quad (2)$$

For the condition that  $K$  is large compared to unity, Eq. 2 can be simplified to the following:

$$e_o/e_{in} = 1/f(\omega) \quad (3)$$

The function  $f(\omega)$  for a twin tee network is shown in the sketch of

C. J. Savant

C. A. Savant

R. F. Destabelle

Fig. 2a. The transfer function of the amplifier with a twin tee in the feedback loop, given by Eq. 3, is the reciprocal of 2a, which when plotted resembles the sketch of Fig. 2b. Notice that although the response of Fig. 2a drops to zero at  $\omega_0$ , the response of  $e_o/e_{in}$  rises only to a finite value, since near  $f(\omega) = 0$  the unity in the denominator of Eq. 2 cannot be neglected, and hence at  $f(\omega) = 0$ .

$$e_o/e_{in} = K \quad (4)$$

Hence the amplifier has now been made frequency sensitive having the

selection properties of an LC tuned amplifier.

### Limiting Factors

The above derivation is somewhat oversimplified because it was assumed that  $K$ , the gain of the amplifier, is frequency independent. Actually, there are three factors which must be considered:

- 1) The frequency response of the amplifier with no twin tee.
- 2) Loading of last stage of the amplifier by the input imped-

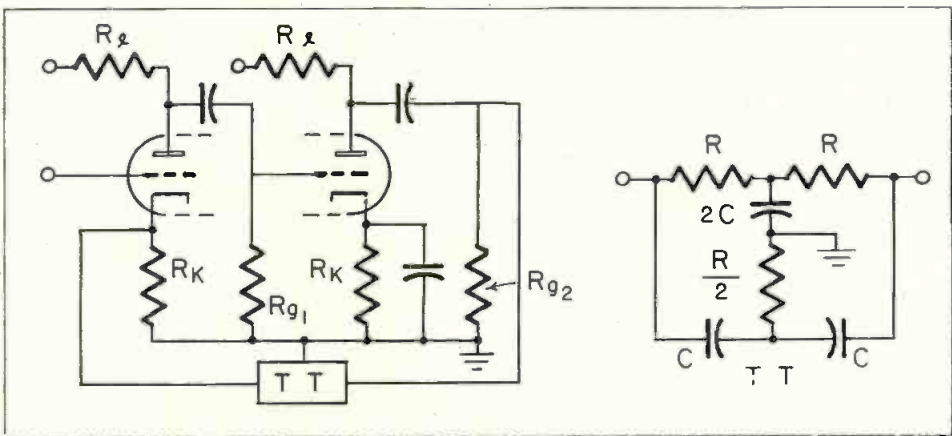

Fig. 4: Comparisons of three basic circuit types. See Figs. 5-7, and Tables 1-2

Fig. 5: Practical circuits A<sub>1</sub>, A<sub>2</sub> and A<sub>3</sub>. Latter two variations use high-mu triodes

# Tuned Amplifiers

ance of the twin tee.

3) The loading of the output of the twin tee by the cathode resistor of the first stage.

Item 1 is significant because it implies that the amplifier must have good gain at the "tuned" frequency. The fact that the amplifier itself will drop off at a higher and lower frequency will only further improve the system when a twin tee is used for tuning.

Statement 2 indicates the possibility of amplifier loading at frequencies above  $\omega_0$  of the twin tee. Consider circuit A, where the twin tee is connected from the plate of the output tube to the cathode resistor of the input tube. At high frequencies the load impedance of the output tube is approximately  $R_k + 2/j\omega C$ . Compared to the plate load of the output tube,  $R_k$  is small and for frequencies several octaves above the tuned frequency, the reactive portion of the impedance becomes small. Hence at higher frequencies the amplifier becomes more heavily loaded, and the gain is reduced. Here again, the tuning is only improved by this situation.

The impedance level of the twin tee should be selected so that the output tube is not loaded for frequencies less than  $\omega_0$ .

### Output Loading

The effect of output loading of a twin tee (Item 3) can be derived analytically.<sup>1,2</sup> Practically, when the cathode resistor is small compared to the impedance of the network, the circuit no longer exhibits the same symmetric response, (Fig. 3a.) Hence the resulting overall gain of the tuned amplifier is distorted as shown in Fig. 3b. At frequencies  $\omega_0$ , the twin tee with output load resembles a voltage divider. For example in the limit, at dc, the impedance is simply the series resistance,  $2R$ .

The three circuit variations shown in Fig. 4 were considered. Although one circuit proved superior to the others, the results of all circuits are tabulated for comparison purposes with additional data supplied for the optimum circuit.

The physical circuit features for the systems of Fig. 4 can be summarized by the circuit diagrams of Figs. 5, 6 and 7. The values are given in Table I. Circuit A<sub>1</sub>, uses a medium  $\mu$  twin triode (2C51). Circuit A<sub>2</sub> uses a high  $\mu$  twin triode (12AX7). Cir-

## Tuned Amplifiers (Continued)

Fig. 8: Normalized response for high- $\mu$  triodes

Fig. 9: Normalized response for low- $\mu$  triodes

cuits  $A_2$  and  $A_3$  are equivalent except for the network resistance.

In the interest of obtaining a wide spread of design information, the optimum circuit ( $A_3$ ) was plotted for both high and low  $\mu$  twin triodes, and with impedance levels of 0.1 and 1.0 and 10 times the plate resistance of the tube. The amplitude response for the cases considered is shown on Figs. 8 and 9.

### Conclusions

Referring to Figs. 8 and 9, it is seen that although the peak gain is sacrificed, higher  $Q$  is obtained with the lower impedance twin tees. The main factors involved are the loading of the last stage by the input impedance of the twin tee and the loading of the twin tee by the input impedance of the first stage.

The  $10 R_p$  curve has poor tuning at frequencies less than  $\omega_0$  because very little voltage is fed back, since the parallel tee impedance is large compared to the cathode resistor of the first stage. At frequencies above  $\omega_0$ , the tuning is normal. The lower impedance twin tees have a higher  $Q$ . This is principally due to amplifier loading for frequencies above  $\omega_0$ . Below  $\omega_0$ , the lower impedance twin tees provide good tuning because there is sufficient voltage fed back to lessen the amplifier gain.

In order to operate with only a reasonable loss of gain, and yet to provide good tuning, it is apparent that the impedance level equal to the plate resistance ( $r_p$ ) of the tube is an optimum.

The circuit of Fig. 5 demonstrates the optimum twin tee tuned amplifier, with the design parameters given in Table I and the response shown on Fig. 8 and 9. On the basis (Continued on page 114)

## A New Music Synthesizer

AN engineering description of RCA's new electronic music synthesizer was delivered to the recent 1955 AIEE Winter Meeting in New York by Dr. Harry F. Olson, head of RCA's Acoustical Lab. Dr. Olson is codesigner of this new unit along with Herbert Belar, also of RCA's Princeton Research Laboratories.

Dr. Olson prefaced his description of the equipment with an analysis of sound waves and their technical characteristics. The properties of sound he itemized as frequency, intensity, growth, decay, duration, portamento, timbre and vibrato. (See Fig. 1.) In order to faithfully

reproduce a given tone, all of these characteristics must be known. The synthesizer, through its electronic circuitry, can vary the combination

of these values in such a way as to reproduce any known musical sound. It can also produce sounds which (Continued on page 112)

Fig. 1: Essential parts of the electronic music synthesizer. Complete system consists of 2 such channels; while one feeds a signal to the cutter the other is forming the next tone. Not shown in the diagram are the 5 relay trees which control the individual stages and a volume control and tone control

Practical ways of improving station operation and efficiency

Simple transmitter house-to-tower telephone line aids maintenance work

## Taped Announcer

D. W. COLTRANE, Chief Engineer, KCOL, Fort Collins, Colo.

HERE, at KCOL, we use what we call an "Automatic tape" to provide a second voice for the spots on the early morning shift. It is done by means of the switch shown in the diagram. Whenever the announcer is ready for the spot, he presses a "momentary make" switch which is located beside his mike switch, starting the Magnecorder. After the spot is through the machine runs 4 seconds and stops, automatically. It is then cued for the next spot.

The night announcer recorded the spots the same way. He pressed the start button, read the spot, then waited 4 seconds till the machine stopped. He pushed the start button again and read the next spot. We have a meter in the audio input line so that the morning operator can maintain the audio level on playback the same as the evening operator maintained it while recording. This assures the proper voltage being applied to the 2050 grid both times to maintain the proper cues. The 10,000 ohm pot across the secondary of the input transformer will do the same thing and marks may be made on the dial to note the correct positions.

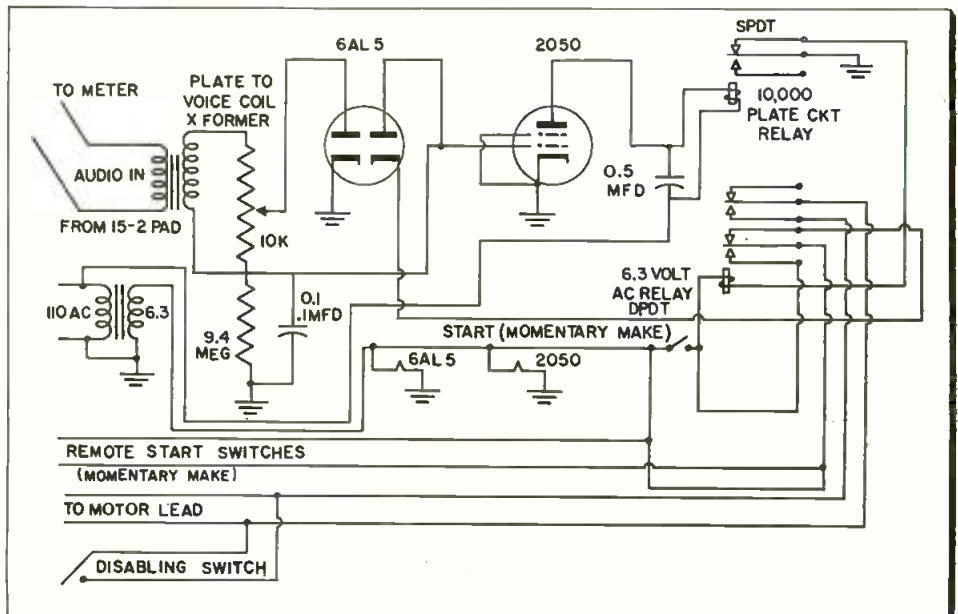

Connection is made to the forward motor of the Magnecorder only. The machine is loaded and turned on, then to start it the start

switch is pushed. A disabling switch is provided to permit normal operation of the recorder. Whenever the "Automatic" is not operating, bias for the 2050 is obtained by rectifying voltage from the 6.3 volt transformer. When it is in operation the bias is obtained by rectifying the audio. When the audio ceases the 0.1 mfd condenser discharges through the 9.4 megohm resistor. After 4 seconds the bias is low enough, the 2050 fires and activates the plate relay, breaking the 6.3 volt relay circuit, in turn stopping the recorder.

Polarity of the line voltage must be observed because one side of the line is grounded to the unit.

The audio is obtained from the 16 ohm output of the amplifier. If the input level is maintained properly, no difficulty should be experienced. Since the amplifier is across the program line continuously, the tubes should be checked often for noise, hum and distortion.

Automatic "taped announcer" circuit provides second voice for spots

## Transmitter House Tower Telephone

LAWRENCE L. PRADO, JR., Chief Engineer, WPEP, Taunton, Mass.

MEMORIES of younger days and the tin can and string type of telephone deserve credit for this idea!

Those needing a telephone between the transmitter house and tower enclosure for assistance in balancing diode rectifier units or other maintenance and repair work may find the following diagram very helpful.

## Random Pulse Noise Generator

C. FRANK CORDARO, Chief Engineer, WKAP, Allentown, Pa.

OCCASIONALLY the need for a random non-uniform noise generator is necessary as a test instrument for special purposes. The included schematic details an inexpensive noise generator, which we have found more than adequate for its purpose, and in use for many years.

The diagram consists basically of five neon relaxation oscillator circuits in parallel. The output of the oscillators are fed thru  $R_o$ , the output load resistor.

Although the components of each oscillator are labeled the same, no

# Transient Response

**Effects of attenuation and cascading in narrowband frequency-modulation systems studied. Results shed light on communications "ring" picture**

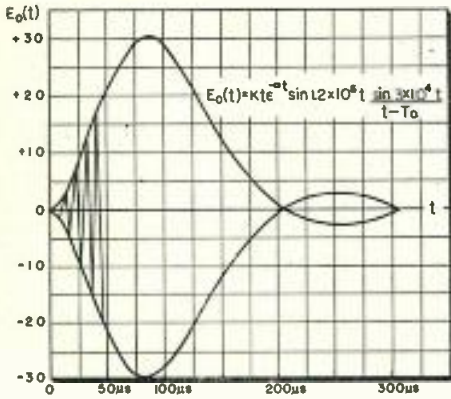

Fig. 1: Transient response to unit impulse

By **STANLEY P. LAPIN**  
and  
**JEROME J. SURAN\***  
Communications & Electronics Div.  
Motorola, Inc.  
4545 Augusta Blvd.  
Chicago 51, Ill.

**I**MULSE noise in radio receivers, such as that produced by automobile ignition systems, is related to the transient response of the selective networks in the receiver. The transient response of the band-pass circuits usually encountered is quite complex, and most attempts at theoretical evaluation of such networks meet with little success, particularly in the case of relatively narrowband FM communication receivers.

The transient response of com-

\* Mr. Suran is presently with General Electric Co., Syracuse, N.Y.

plex band pass networks is commonly referred to as a "ring" picture. This is due to the general appearance of the response, which may be described as a decaying, amplitude-modulated, sine wave. A general equation for such a response may be approximated by:<sup>1</sup>

$$(1) e(t) = Kt^n e^{-at} \frac{\sin^m(\beta t + \theta)}{(t - \delta)^m} \sin(\omega t)$$

where  $e(t)$  is the instantaneous voltage of the response at time  $t$ ,  $\beta$  is approximately  $2\pi$  times the bandwidth of the selective circuits,  $\omega$  is the center frequency of the band pass,  $e$  is the base of the natural logarithm, and  $K$ ,  $n$ ,  $a$ ,  $m$ ,  $\theta$ , and  $\delta$  are all constants determined by the circuit. A typical curve calculated from equation (1), is given in Fig 1.

Narrow-band superheterodyne receivers generally achieve their i-f selectivity in one of two ways. The most prevalent method has been the

use of multiple L-C sections which are isolated from each other by means of unilateral vacuum tube amplifiers (in a distributed filter-amplifier circuit). The second method is through the use of cascaded L-C sections in a lumped-circuit filter, such as the Permakey filter (see Fig. 2) used in Motorola two-way radio equipment. A question exists as to the effect of the unilateral property of the amplifier tubes in the distributed filter on the transient response of the entire selective network. Most attempts to answer this question on a theoretical, analytical basis, using the actual selective circuitry as the object of analysis, result in expressions which are too complex for easy solution.

## Transfer Function

In general theoretical terms, however, the transfer function of any linear four terminal network can be represented by some function of fre-

Fig. 3: (I) R-C high-pass filter.

Fig. 4: (Far left) R-C high-pass filter frequency response.

Fig. 5: (below) R-C high-pass filter transient response

# in NBFM Receivers

quency,  $H(\omega)$ . Once this function is known, the output response of the network to any desired input signal can be determined. In particular, the transient response to a pulse can be determined. There is *only* one attenuation and phase shift curve for a given input.

In addition, for the types of networks usually encountered in practice, which may be defined as minimum-phase shift networks, there exists *only* one phase shift curve for a given attenuation curve.

Therefore, any two linear, minimum phase-shift networks, which have the same  $H(\omega)$ , will have the same attenuation and phase shift curves and also the same transient response for a given input, regardless of the interior of the network. Conversely, any two networks having the same attenuation curves will have the same  $H(\omega)$ , and therefore, the same transient responses.

Actual transient responses can be calculated for the simpler networks easily. Fig. 3 shows the circuit of an  $n$ -section, cascaded, isolated, R-C high pass filter, and Fig. 4 shows the frequency response of one, two, three, and four sections of this filter. The calculated transient response of this circuit to a unit step is given as:<sup>2</sup>

$$(2)c(t) = e^{-\frac{t}{RC}} \sum_{k=0}^{n-1} \frac{(-1)^k (n-1)!}{(n-1-k)! (k!)^2} \left(\frac{t}{RC}\right)^k$$

where  $e(t)$  is the instantaneous output voltage at time  $t$ ,  $R$  and  $C$  are the values of the components in the circuit, and  $n$  is the number of sections. Equation (2) is plotted for  $n=1, 2, 3$ , and  $4$  in Fig. 5. It can be noted that:

- as  $n$  increases, the time for the first zero crossing to occur decreases,
- as  $n$  increases, the maximum amplitude of the waves between the first and second zero crossings (and between successive zero crossings) increases.
- The number of zero crossings is equal to  $n-1$ .
- As  $n$  is increased, successive waveforms look approximately more and more alike.

If the circuit had been of the band-pass type, the type of response shown in Fig. 5 could be considered as half the envelope of an amplitude-modulated sine wave whose frequency would be at the energy center of the pass band, and the familiar ring pattern would result. It would be noted that the isolating tubes of Fig. 2 did not prevent the ringing.

## Network Function

In the calculation of the response of cascaded, isolated circuits, the network function,  $H_1(\omega)$ , of one such circuit, is raised to the  $n$ th power, where  $n$  is the number of circuits. In a properly designed and

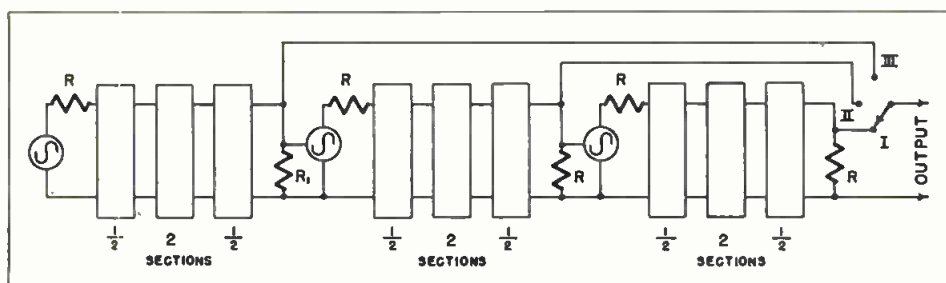

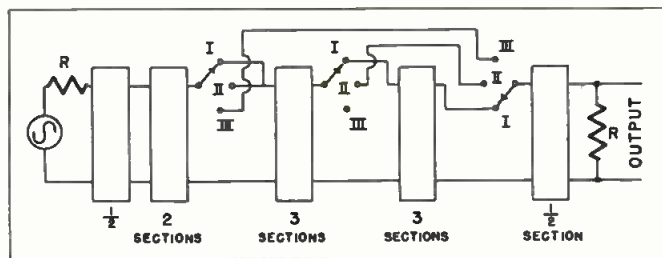

Fig. 2: "Permakay" lumped circuit filter

properly matched lumped filter, the same procedure is followed—that is, if  $H_1(\omega)$  is the response of one section,  $H_1(\omega)^n$  is the response of  $n$  identical sections. Proper termination consists of matching the filter to its image impedance at all frequencies. In practice, filters are usually terminated in a resistor having a value equal to the image impedance at the center frequency. This results in a mismatch at the ends of the filters at other frequencies. However, in a long filter (i.e.— $n$  large), the effects of this mismatch become very small, due to the insertion losses of the large number of sections. This becomes evident upon comparison, for a long filter, of a measured attenuation curve with a calculated curve based on perfect matching. Therefore, the same results can be expected, approximately, when the number of filter sections is increased, as when the number of cascaded isolated circuits is increased.

To experimentally investigate the problem of "ringing" in lumped selective networks, two filters were constructed, using derived sections calculated from classical filter theory. The first of these is a nine section filter, constructed with a three gang switch such that: in posi-

Fig. 6a: (1) Nine-section filter. Fig. 6b: (below) Similar filter with isolating amplifier tubes. Fig. 7: (far right) Filter attenuation curves

## Transient Response (Continued)

tion I, the full nine section filter is measured; in position II, a six section filter is measured; in position III, a three section filter is measured. This arrangement is shown in Fig. 6(A). The second filter is similar to the first, except that isolating, amplifier tubes are placed after three full sections and after six full sections (see Fig. 6B), with three measurement positions provided: position I, after nine sections; position II, after six sections; and position III, after three sections.

Relative attenuation curves of the two filters for the three switch positions are given in Fig. 7.

It can be noticed that the attenuation curves of both types of filters are almost identical.

The various filters were each excited with two different pulses, oscilloscopic photographs of which are shown in Figures 8 and 9. The outputs of the filters are shown in the succeeding figures, all having a sweep base with 10 divisions equal to 500 microseconds. In each case, the top picture shows the response to the shorter pulse of Fig. 8, and the

bottom picture shows the response to the longer pulse of Fig. 9.

Figs. 10 and 11 show the outputs of the filters in position I (nine-section filters). It should be noted that the responses from both filters are very similar, even though one of these filters contains isolating amplifiers. The slight difference in transient responses may be attributed to the slight difference in attenuation curves, as shown in Fig. 7A.

Figs. 12 and 13 show the outputs of the filters in position II (six-section filters). It again should be noted that the two responses are similar, and, in addition, only minor differences exist between these six section responses and the full nine section responses (Figs. 10 and 11).

### Conclusions

Figs. 14 and 15 show the outputs of the filters in position III (three-section filters). Here again, the two responses are similar to each other. However, although there is some similarity between these three-section responses and the six-section responses (Figs. 12 and 13) the

change is much greater than the difference between the six and nine section filters.

From the theoretical considerations and the experimental results, the following conclusions may be drawn:

- a) Transient or ring response is purely a function of the attenuation curve in a linear minimum-phase network, and if one of these curves is known, the other can be derived. This is independent of what makes up the circuit.
- b) The use of cascaded circuits separated by amplifier tubes does not substantially change the transient response from that of directly cascaded circuits, assuming the two attenuation curves are approximately the same.
- c) Increasing the number of sections in a selective circuit has less and less effect on the transient response as the number gets larger and larger.

# Noise Measurements on Telephone Circuits

**Comparison made of instruments and terms employed.  
Utilization of transmission measuring set outlined**

By  
**H. C. FRANKE**  
Bell Telephone  
Labs., 463 West  
St., New York 14,  
N.Y.

THE evaluation of telephone circuit performance for speech transmission involves many parameters which have a direct relation to the transmission quality. One of the more important factors generally considered is the transmission impairment caused by the amplitude-frequency characteristic of the noise existing on the telephone circuit. Over the years the engineering profession has devised various methods by which this noise can be measured. These methods, although yielding comparable results, are difficult to interpret in many cases. Hence, in this discussion, it is proposed to show a comparison of noise quantities and terms which are currently used. No attempt is made to analyze the underlying principles upon which these quantities are based. However, it is expected that the comparisons given will result in a better understanding of this subject among engineers.

## Measuring Instruments

Two types of instruments are in general use for noise measurements. One of these instruments is known as the Western Electric 2B Noise Measuring Set; this is used for noise measurements of voice-frequency circuits. Although this instrument is capable of single frequency measurements, it is generally not used for this purpose. The other instrument is a type of noise meter commonly referred to as a transmission measuring set; this has some char-

acteristics comparable to those of the 2B set but it is calibrated to an entirely different reference. Such a test set can be used for either noise or single frequency power measurements as well as for the measurement of harmonic distortion. An instrument of this type found in many laboratories is known as the 12A Transmission Measuring Set manufactured by the Daven Company.

Initially in this article a comparison will be made of the quantities

power at various magnitudes expressed in dbm and the corresponding values obtained on the 2B set and on the TMS. It is assumed that the instruments were calibrated properly in accordance with the instruction books.

The values in the table refer to the "corrected" reading of the 2B set after a calibration constant referred to in the instruction book has been added to the combined attenuator and meter readings.

The terms 144 weighting and F1A weighting take into account the relative interfering effects of different noise frequencies on a telephone line when a telephone set using the 144 type or the HA-1 type telephone receiver, respectively, is employed. Weighting is the artificial adjustment of measurements in order to account for factors which, in normal use of the device, would otherwise be different from conditions during measurement. For example, background noise measurements may be weighted by applying factors or by introducing networks to reduce measured values in inverse ratio to their interfering effect.

Fig. 1: Line weightings for telephone message circuit noise. Response curves are based on corrected values (using instruction book calibration constant) for WE 2B set

measured with the two types of instruments, where a test power, sometimes referred to as test tone, of 1000 cps is applied to the input of each set. The magnitude of the test signal is expressed in dbm-db with reference to 1 mw. Table I shows the relations between this test

The reference power for readings in dbRN (db above reference noise) is a 100 cps calibrating power of one micro-microwatt ( $10^{-12}$  watt or 90 db below 1 mw). The reference point for readings in dba (db adjusted) is obtained by making an adjustment to the  $10^{-12}$  watt reference for equal

# Telephone Circuits (Continued)

transmission impairment due to noise for the two different types of telephone sets.<sup>2</sup> The results of listening tests made on a number of common kinds of noise to determine the transmission impairment have indicated that the zero calibration point for noise measured in dba should be a 1000 cps power 5 db above 10<sup>-12</sup> watts or -85 dbm. Fig. 1 shows the 144 weighting characteristics and the F1A weighting characteristics in these relative positions.

It will be noted from Table I that on 1000 cps power the 2B set reads 5 db less with F1A weighting expressed in dba than with 144 weighting expressed in dbRN.

A transmission measuring set (TMS) calibrated at 1000 cps will read power correctly when used to measure a 1000 cps test power regardless of the weighting characteristic. However, if the TMS has a frequency characteristic deliberately introduced by weighting other than flat and is calibrated at 1000 cps, then readings at other frequencies will not be correct readings of power in terms of dbm.

A transmission measuring set equipped with 144 frequency weighting can be used to measure any single frequency or other steady noise in terms of dbRN. With the set calibrated to read 0 dbm for 1 mw of 1000 cps power, the noise ex-

**TABLE 1:**  
1000 CPS Test Power

1000 CPS dbm	2B Set		TMS dbm**
	dba (F1A wtg)	dbRN (144 wtg)	
0	85	90	0
-10	75	80	-10
-20	65	70	-20
-30	55	60	-30
-40	45	50	-40
-50	35	40	-50
-60	25	30	-60
-70	15	20	-70
-80	5	10	-80
-90	-5	0	-90

With 1000 CPS test power applied to the input of the test set, this table shows the relation between corrected\* values in dba or dbRN measured with a 2B Noise Measuring Set and values measured in dbm with a Transmission Measuring Set.

\*The corrected value refers to the reading on the instrument (attenuator and meter reading) and the calibration constant as shown in the 2B set instruction book.

\*\*This relation will hold at 1000 CPS for any weighting if the TMS is calibrated at 1000 CPS.

**TABLE 2:**  
Thermal Type Noise In a 3 KC Band

(1) Noise dbm	(2) 2B Set		(4)	(5) TMS	(6)	(7) **Signal-to-Noise Ratio-db		
	dba	dbRN	(F1A wtg)	(144 wtg)	(Flat wtg)	2B Set or TMS		
						(F1A wtg)	(144 wtg)	(Flat wtg)
0	82	82	-3	-8	0	3	8	0
-10	72	72	-13	-18	-10	13	18	10
-20	62	62	-23	-28	-20	23	28	20
-30	52	52	-33	-38	-30	33	38	30
-40	42	42	-43	-48	-40	43	48	40
-50	32	32	-53	-58	-50	53	58	50
-60	22	22	-63	-68	-60	63	68	60
-70	12	12	-73	-78	-70	73	78	70
-80	2	2	-83	-88	-80	83	88	80

With thermal type noise uniformly distributed in a 3 KC band applied to the input of the test set, this table shows the relation between corrected\* values in dba or dbRN measured with a 2B Noise Measuring Set and values in dbm measured with a Transmission Measuring Set. Values of Signal-to-Noise Ratio are also indicated.

\*The corrected value refers to the calibration constant in the 2B set instruction book.

\*\*It is understood that the test signal and noise are both measured at the same point in the circuit and in this table it is assumed that at the point of measurement the signal is 1 mw or 0 dbm at 1000 CPS.

pressed in dbRN is 90 added to the TMS reading. For example, a reading of -40 dbm on the TMS is equivalent to 90-40 or 50 dbRN.

Similarly when a transmission measuring set which has F1A frequency weighting and has been calibrated to read 0 dbm for 1 mw of 1000 cps power, is used to measure any single-frequency or other steady noise, the reading can be expressed in dba by adding 85. For example, if the TMS reading is -40 dbm, the noise is 85-40 or 45 dba.

Thus, when the "noise" referred to in the preceding two paragraphs is 1000-cycle "noise" or a 1000 cps test power, its value in terms of dbRN (144 weighting) is 90 db greater than its value in dbm; and its value in dba (F1A weighting) is 85 db greater than its value in terms of dbm. These relationships are shown in Table 1.

### Thermal Noise

Table 2 shows a comparison of measurements made when thermal noise, flat over a 3 kc band, is applied to the several weightings of the two types of measuring sets. Column 1 gives the magnitude of the noise power expressed in dbm as would be measured on a reference instrument, such as a thermocouple type meter. The corresponding noise values expressed in dba and dbRN obtained with the 2B set are indi-

cated in columns 2 and 3 for noise inputs from 0 to -80 dbm. The noise values measured on a transmission measuring set calibrated in dbm with F1A, 144 and flat weighting are shown in columns 4, 5 and 6.

With noises of types other than a 1000-cps sine-wave or a 3 kc band of thermal noise, the relations between readings with different weightings would necessarily be different from those shown in Table 1 or 2. For example, a pure 200-cps noise would read about 37 db greater on flat weighting than it would on 144 weighting. This would be true, whether the measuring means was a 2B set or a TMS. A pure 200-cps noise would read about 27 db greater on flat weighting than it would on F1A weighting. The reason for these differences is because of the difference in the interfering effects of the noise in different types of telephone sets.<sup>2</sup>

### Signal-to-Noise

The last three columns in Table 2 indicate the signal-to-noise ratio which is the ratio of the magnitude of the signal to that of the noise expressed in db. In the table, the signal is taken as a 1 mw test power of 1000 cps and the noise consists of thermal noise measured in the absence of the signal power. Both measurements are made at the same point in the circuit and with the

same type of instrument.

As seen in Table 2, the numerical value of the signal-to-noise ratio, for a given signal and a given noise, depends on the frequency weighting with which the signal and the noise are measured. For example, the table shows that with a signal of 1mw at 1000 cps and a fluctuation noise of -50 dbm, the signal-to-noise ratio is 50 db with flat weighting, or 53 db with F1A weighting, or 58 db with 144 weighting. The table also shows that with a given weighting, the signal-to-noise ratio is the same whether the measuring instrument is a 2B set or a transmission measuring set.

The signal-to-noise ratio is obtained from two measurements, one of signal and the other of noise. (If

# Reliable Connections

By R. GEORGE ROESCH, President  
The Eraser Co.  
Syracuse, N.Y.

UNFORTUNATELY, there is no satisfactory definition of the term "quality" with regard to wire stripping and wire preparation. However, there are several precautions which may be exercised during production to insure high reliability of electrical connections.

A prime point to keep in mind is that cut or nicked strands of wire resulting from careless removal of insulation cause poor connections, and possibly major damage when subjected to vibration.

In the case of coaxial cable, the proper amount of braid wire must be stripped from the cable for the correct fit and/or impedance match to the connector. If too little is stripped, then the contact may not seat in the

connector. If too much, then an adequate contact to the braid may not occur. Likewise, if loose ends are present in the connector, there is a possibility of one of these causing a short. Even though one may not damage strands of wire, it has been found that should some strands of insulation remain on the wire, they will vaporize, and thus prevent a satisfactory soldered connection or even a good tinning job, if the wires are tinned prior to soldering.

To illustrate the practical aspects of making reliable connections, consider the following example of operator instructions for fabricating the input and output ends of a delay line.

## Input-End Fabrication

1. Without nicking or otherwise damaging the underlying ground
- (Continued on page 157)

TABLE 3:

### Correction for determining signal in the presence of noise

9	-0.6

the magnitude of the signal is partially masked by noise, its value is obtained as described later). The point at which these two measurements are made need not be a point where the test power is 1mw. For example, assume that the magnitude of the test power obtained with the 2B set with F1A weighting is 76 dba (equivalent to -9 dbm from Table 1) and the magnitude of the noise at the same point is 29 dba; the signal-to-noise ratio is 47 db (76-29) with F1A weighting. If this noise is thermal noise as has been assumed, it will also read 29 dbRN with 144 weighting (Table 2), but the 1000 cps test power will read 81 dbRN with 144 weighting (Table 1); so that with 144 weighting the signal-to-noise ratio is 52 db (81-29).

Similarly with a TMS using the values assumed above, the test power would read -9 dbm, and the noise with F1A weighting would

## TELEMETRY & REMOTE CONTROL—I

**SYMPOSIUM: SOME PROBLEMS ASSOCIATED WITH TELEMETERING AND REMOTE CONTROL OF A SPACE STATION**

Chairman: J. Gordon Vaeth, Office of Naval

Waldorf's Grand Ballroom. Arthur V. Loughren will be the principal speaker at this meeting.

The technical program includes the following papers:

### Monday, March 21, P.M.

#### INSTRUMENTATION—I

Chairman: P. S. Christaldi, Allen B. DuMont Labs., Inc., Instrumentation Division, 760 Bloomfield Ave., Clifton, N. J.

Direct-Reading Instrument for the Measurement of RMS Pulse Jitter, Jesse J. Taub, and Charles I. Smith, Material Lab., New York Naval Shipyard, Brooklyn 1, N. Y.

An Automatic Sonic Spectrum Analyzer and Curve Tracer, Edward F. Feldman, Panoramic Radio Prods. Inc., 10 S. Second Ave., Mt. Vernon, N. Y.

A Simplified Method for the Measurement of Highly Linear Sawtooth Waveforms, Sherwood King, University of Tennessee, Knoxville, Tenn.

The Diagraph, a Direct-Reading Instrument for Graphic Presentation of Complex Impedances and Admittances, Richard C. Hess, Federal Telephone and Radio Co., 100 Kingsland Ave., Clifton, N. J.

Measurement of Parameters that Determine Front Edge Response of Pulse Transformers, Isidore Bady, Signal Corps Engineering Lab., Ft. Monmouth, N. J.

#### ANTENNAS & PROPAGATION—I—ANTENNAS

Chairman: John V. N. Granger, Head, Radio Systems Lab., Stanford Research Institute, Stanford, Calif.

Efficiency of Surface Wave Excitation, Alan F. Kay, Technical Research Group, 56 West 45 St., New York, N. Y. and Francis J. Zucker, Air Force Cambridge Research Center, 230 Albany St., Cambridge 39, Mass.

Serrated Waveguide: Theory and Experiment, R. S. Elliott and K. C. Kelly, Hughes Research & Development Labs., Hughes Aircraft Co., Culver City, Calif.

Properties of a Radiating Discontinuity on a Corrugated Surface Transmission Line, M. J. Ehrlich and I. K. Williams, Microwave Radiation Co., Inc., 3312 Pacific Ave., Venice, Calif.

Symmetrical Microwave Lenses, C. Goatley and C. F. Parker, Melpar, Inc., 452 Swann Ave., Alexandria, Va.

Lens and Feed System for Volumetric Scanning GCA Antenna, G. D. M. Peeler and W. F. Gabriel, Microwave Antennas & Components Branch, Electronics Div., Naval Research Lab., Washington 25, D. C.

#### MOBILE COMMUNICATIONS

Chairman: Daniel E. Noble, Vice President,

View of exhibits at Kingsbridge Armory during last year's convention

**M**ARCH 21 will mark the beginning of another record-breaking four-day IRE National Convention. New York City's Waldorf-Astoria and Belmont-Plaza hotels will provide eight session halls this year for the presentation of the majority of the 251 scheduled technical papers. Additional facilities for the presentation of two simultaneous technical sessions will be provided at the Kingsbridge Armory in the Bronx. A total of 55 sessions, topping last year's figure of 51, will be held in the eight meeting halls between March 21 and 24.

Exhibits of the Radio Engineering Show, formerly located at Grand Central Palace, will be housed at the Kingsbridge Armory and the nearby Kingsbridge Palace. Attendance is expected to surpass 1954's record of 39,302 and it is reported that 704 exhibits, better than a 13% increase over last year, will be erected on the four-acre floor of the armory.

The convention's social program will be initiated by a "get-together" cocktail party on March 21 in the Grand Ballroom of the Waldorf-Astoria. Two evenings later, the Grand Ballroom will be the scene of the Annual Banquet, at which Gen. Matthew Ridgway, Chief of Staff, U. S. Army, will deliver the major address.

Dr. John R. Pierce, of the Bell Telephone Laboratories, has been renamed Editor of the Proceedings of IRE for 1955. John D. Ryder will formally assume the presidency of the Institute at the Convention's opening meeting on March 21st at 10:30 A.M., also to be held in the

Fig. 1: (l) Series transformer-oscillator feed. Fig. 2: (r) Equivalent circuit

## Extremely low-loss transformer assures high rejection of unbalanced signal while changing antenna impedance for optimum noise figure

ONE of the most important parts of a VHF tuner is the input circuit which consists of either a balun or of an r-f transformer followed by a resonant circuit.

The input circuit must provide 1) the proper transformation of the antenna impedance for the optimum Noise Factor, 2) selectivity, 3) must assure as high a rejection as possible of unbalanced signal and 4) must transform the symmetrical signal received from the antenna twin line into the asymmetrical signal needed for the excitation of the grid of the amplifier tube.

At the same time it must be as lossless as possible because any loss in the input circuit deteriorates the NF of the tuner.

The main disadvantage of baluns is their relatively high price. Transformers are much cheaper.

Transformers may be used in parallel or in series with the input oscillating circuit. In the first case, a high impedance level secondary is required. Many difficulties are connected with such a secondary because of the distributed capacity and self-resonance of the winding. It is much easier to design a transformer for series connection, because in this case the secondary winding consists of only a few (2-5) turns so that its self-resonance lies far above the VHF frequency range.

If the transformer feeds the oscillating circuit in series, as represented in Fig. 1, the equivalent circuit is that shown in Fig. 2. Z is the impedance looking into the secondary of the transformer when the primary is loaded with the resistance R = 300 ohms

Thus:

$$Z = R + jX = j\omega L_2 + \frac{\omega^2 M^2}{R + j\omega L_1} = j\omega L_2 + \frac{\omega^2 M^2 R}{R^2 + \omega^2 L_1^2} - \frac{\omega^2 M^2 j\omega L_1}{R^2 + \omega^2 L_1^2}$$

where:  $L_2$  is the inductance of the secondary winding.

$L_1$  is the inductance of the primary winding.

M is the mutual inductance between the primary and secondary windings.

$\omega = 2\pi f$  where  $f$  is the frequency

R is the signal generator's internal resistance.

Hence: 
$$R = \frac{\omega^2 M^2 R}{R^2 + \omega^2 L_1^2} \quad (1)$$

and 
$$X = \omega L_2 - \frac{\omega L_1 \omega^2 M^2}{R^2 + \omega^2 L_1^2} \quad (2)$$

Y is the series damping resistance of the equivalent input resonant circuit. The equivalent parallel damping resistance (see Fig. 3)  $R_g$  is:

$$R_g = \frac{1}{\omega^2 C_0^2 R} \quad (3)$$

where  $C_0$  is the tuning capacity plus all stray capacities.

For best NF  $R_g$  must satisfy the relation:

$$R_{g_{opt}} = \sqrt{R_{eq} R_\tau \beta} = \frac{1}{\omega} \sqrt{\frac{A}{g_m}} \quad (4)$$

where  $R_{eq}$  is the equivalent noise resistance  $R_{eq} = \frac{2.5}{g_m}$

$R_\tau$  is the transit time damping resistance  $R_\tau = A_1/\omega^2$

$\beta = 5$  is a constant

A and  $A_1$  are constants with respect to  $\omega$

For zero vswr in the antenna line or for constant vswr on all channels it must be:

$$R_g = A_2 R_t = \frac{A_3}{\omega^2} \quad (5)$$

where  $A_2$  and  $A_3$  are constants.

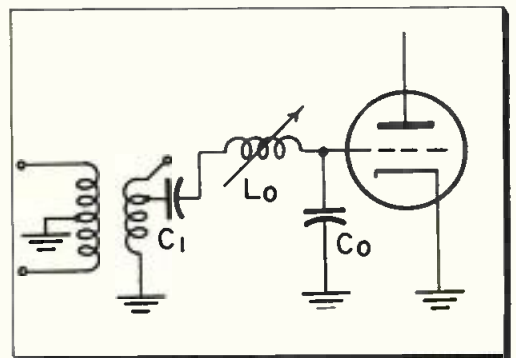

If the condition (4) is satisfied on all channels, then:

$$VSWR = \frac{R_\tau}{R_{g_{opt}}} = \frac{A_1}{\omega^2} \frac{\omega}{\frac{1}{\omega} \sqrt{\frac{A}{g_m}}} = \frac{A_4}{\omega}$$

Since  $R_\tau > R_{g_{opt}}$

for the VHF channels and type of tubes, this relation shows that if the optimum NF condition is satisfied, the match improves with increasing of the channel frequency.

Fig. 3: (l) Equivalent input with  $R_g$  parallel damping. Fig. 4: (r) Inserting  $C_1$  in series

# Low-Noise TV Tuner Inputs

The bandwidth of the input circuit is:

$$\Delta\omega = \frac{\omega_o}{Q} = \frac{\omega_o (1/R_g + 1/R_i)}{\omega_o C_o} = \frac{1}{C_o} \frac{1}{R_g + R_i}$$

If the condition (4) for optimum NF is satisfied

$$\Delta\omega = \frac{1}{C_o} \left( \omega \sqrt{\frac{g_m}{A}} + \frac{\omega^2}{A_1} \right)$$

Thus  $\Delta\omega$  increases faster than linearly with the frequency.

Returning to the expression (1), two cases have to be considered:

$$R > \omega L_1 \text{ and } R < \omega L_1 \quad (6)$$

The first condition  $R > \omega L_1$  can easily be realized because the smaller  $L_1$  is, the fewer are the troubles due to the self-resonance of the coil. In this case  $R$  becomes:

$$R = \frac{\omega^2 M^2 R}{R^2} = \frac{\omega^2 M^2}{R} \text{ and } R_g = \frac{R}{\omega^4 C_o^2 M^2} \quad (7)$$

Thus  $R_g$  varies with the fourth degree of  $\omega$  so that the transformer cannot cover more than one channel. Such a transformer can be, and is, used in the turret tuners where each channel has its own transformer. In this case (of the turret tuner with the wire wound coils) there is no necessity for the iron core. The mutual inductance

$$M = K \sqrt{L_1 L_2}$$

can be made sufficiently large by coupling the primary of the input transformer to the entire tuning inductance  $L_o$ .

If

$$R < \omega L_1$$

$$R = \frac{\omega^2 M^2 R}{\omega^2 L_1^2} = K^2 \frac{L_2}{L_1} R \quad (8)$$

and

$$R_g = \frac{L_1}{\omega^2 C_o^2 K^2 R} = \frac{A_s}{\omega^2}$$

As one can see,  $R_g$  satisfies condition 5 for constant vsWR but not condition 4. If we are going to employ the series feeding transformer, the only way of approaching condition (4), which is that necessary for the optimum NF, is to use two secondary

windings or a taped secondary. In this case the low frequency channels (2 to 6) are fed by the secondary having more turns, while for the high frequency channels (7 to 13), we physically switch in another secondary which has fewer turns.

On the lowest channel (Ch. 2) where  $\omega L_1$  is usually equal to or even smaller than  $R_g$ , rapidly decreases, thus undercoupling the antenna.

Finally, Eq. 2 in the case of  $R < \omega L_o$  becomes:

$$X = \omega L_2 - \omega K^2 L_2 = \omega L_2 (L - K^2)$$

On the high frequency channels this equivalent inductance, together with the stray inductance of the leads, can become so high as to prohibit the use of any additional coil necessary for the tuning.

In order to reduce the inductance  $L_2 (1 - K^2)$  the coupling  $K$  has to be kept as tight as possible (therefore the necessity to use the powdered iron core) and the inductance  $L_2$  as low as possible. Having the turns ratio determined by Eqs. 3, 4 and 8, which must be satisfied in order to obtain the best NF, the only way of reducing  $L_2$  is to reduce  $L_1$ . That is why  $L_1$  is usually too small on Ch. 2. In actual cases, however, both of these measures (increasing of  $K$  and keeping  $L_2$  as low as possible) are usually insufficient. The designer therefore is compelled to insert in series with the high channels secondary winding, a capacitor  $C_1$  as shown in Fig. 4. This capacitor reduces the effective capacity of the circuit.

It should be noted that the capacity  $C_1$  does not change the condition of optimum NF, i.e., it does not change the antenna transformed impedance seen from the grid. In fact, if the equivalent parallel damping resistor across the entire circuit is  $R_{gr}$ , then the equivalent parallel damping resistor  $R_g$  across the capacity  $C_o$  is:

$$R_g = R_{gr} \left( \frac{C_1}{C_1 + C_o} \right)^2$$

and since

$$R_{gr} = \frac{1}{R \left( \frac{C_1 C_o}{C_1 + C_o} \right)^2 \omega^2}$$

we have

$$R_g = \frac{1}{R \omega^2 C_o^2}, \text{ as in Eq. 3}$$

Fig. 5: Crosswound primary increases rejection

Fig. 6: Transmission line equivalence

Fig. 7: Graphic presentation of Eq. 10

Fig. 8: Graphic presentation of Eq. 10

In other words, a transformer designed to satisfy condition 4 without the series capacitor  $C_1$ , still satisfies the optimum noise condition if  $C_1$  of any value is used. The use of the series capacitor however, has the desirable effect of increasing the selectivity of the input circuit. Thus, the main considerations in the antenna transformer design are:

It must be wound on a powdered iron core and the inductance of the primary winding must satisfy, on Ch. 2, the relation

$$\omega L_1 \cong R \quad (9)$$

From the point of view of the performance on Ch. 2, it were better to have  $\omega L_1 > R$ , but the necessity to

# Photoetched Microwave Transmission

**Design and fabrication techniques for strip type lines, transitions and test equipment open new horizons for light weight construction. Relative merits of parallel and tri-plate types evaluated**

Fig. 12: Tri-plate transition

Fig. 13: Early tri-plate fabrication of line

Part One of this two-part article, published in the Feb. 1955 issue, describes the basic characteristics and construction of tri-plate lines.

Before components could be readily designed in photoetched Tri-plate transmission line, it was apparent that a reliable slotted line, free from all leakage and modes other than the Tri-plate mode, would have to be designed. Such an equipment was made by constructing a long section of Tri-plate slotted line and etching one of the outer conductors completely away in the central portion, as is shown in Fig. 7.

This line was then encased in a machined metal housing with a tapered slot in its top surface, the top surface then serving as the missing outer conductor of the Tri-plate line. With the line completely encased in the housing, parallel plate mode is entirely suppressed. The housing, containing the Tri-plate line, is then bolted to a Hewlett Packard type 809B carriage with probe. In use, smooth reliable standing wave patterns were obtained with this slotted line up to frequencies of about 7000 mc. Above this frequency erratic results were obtained because of the unwelcome introduction of the wave-

by **NORMAN R. WILD**  
Sanders Associates  
Nashua, N.H.

guide  $TE_{1,0}$  mode. This problem was solved by moving the side walls of the slotted line casing closer in toward the center conductor until they were below cutoff for dielectric filled waveguide propagation at the highest operating frequency desired.

### Matched Loads and Attenuators

Matched loads and fixed pad type attenuators were constructed using resistor tape. To make a load, the tape was cut with a pair of scissors to give the desired taper for a good match and then sandwiched between the dielectric sheets so that its resistive surface was in contact with the center strip of the Tri-plate transmission line. Loads consisting of 3 in. length of 100 ohm/square tape have been constructed which have a VSWR under 1.05 over a 10% band centered at 4200 mc. Such a load, assembled and unassembled, is shown in Fig. 8. Note the use of rivets.

Fixed attenuators were made simply by selecting a length of tape with the appropriate resistance value to give the attenuation desired and tapering both of its ends to obtain a good match. Variable attenuators were also constructed using resistive cards cut in the shape of a cam to give the desired attenuation taper. These cards were fastened to a shaft, and as the shaft rotated, a varying amount of the resistive cam was superimposed over the center strip of the Tri-plate line in a slightly hollowed out area in one of the dielectric slabs which form a part of the Tri-plate sandwich.

The resistor tape used for making loads and attenuators in Tri-plate is most convenient for use with strip microwave transmission lines. It can, for example, be cut with scissors, has a thickness of only 4 or 5 mils which makes it convenient for sandwiching between dielectric sheets, and is relatively inexpensive.

### Directional Couplers

Directional couplers have been designed to give various coupling values. A typical directional coupler consisting of two stubs spaced  $\frac{1}{4}\lambda$  apart, capacitively coupled to the main line and directly coupled to the mixing line, is shown in Fig. 9.

This particular coupler has a 20 db coupling and 18 db directivity at 4200 mc for very small gap spacings, once again illustrating the extremely rapid

Fig. 14: Phase shift of  $L/\lambda_L$  for open stub

Fig. 17: (r) Tri-plate hybrid ring with crystal holders. (a) Assembled and (b) Internal view

field decay obtained with Tri-plate line.

Fig. 10 illustrates a series stub used as an impedance matching device, and shows the change in  $Z/Z_0$  plotted in VSWR as  $a/\lambda$  is increased from 0 to  $0.64\lambda$  for various values of  $b/\lambda$ . Note that as "a" approaches  $\lambda/2$ , all of the curves exhibit the properties of a series resonant circuit. This illustrates the compatibility of this line's performance with theory, and also demonstrates the capabilities of the slotted line previously discussed.

Measurements taken on an open circuited shunt stub are recorded in Fig. 11. The stub has the same characteristic impedance as the main

transmission line. The curves illustrate the change in VSWR as the stub length is varied over  $0.7\lambda$ . The dotted curve is corrected for line attenuation. Fig. 14 depicts phase shift variations with changes in the normalized stub length.

A Smith Chart plot of admittance as the stub length increases from 0 to  $0.48\lambda$  would demonstrate that the open circuited shunt stub is indeed a pure susceptance.

A single shunt stub tuner consisting of an upper plate containing a stationary stub, a spacer, a rotary stub and a lower plate was constructed, and from this evolved the double shunt stub tuner. The double shunt stub is essentially the same as the single unit except that its ele-

ments are in duplicate. Fig. 15 is an exploded view of a single shunt stub tuner.

While these stub tuners operate on the principle of a continuous short circuit, it is obvious that the same design can be adapted to an open circuited stub tuner. Successful phase shifters have also been built utilizing the same operating principles as the single and double shunt stub tuners.

A Type N coax to Tri-plate adaptor constructed from a standard UG58A/U panel plug is shown in Fig. 16. The mounting flange of the plug is fastened to one of the outer plates of the Tri-plate line by means of screws which also serve as short-

## Ultrasonics for Sandpaper Production

By PAUL W. JOY  
The Carborundum Co.  
Niagara Falls, N. Y.

SANDPAPER and abrasive cloth are fast becoming the most versatile and skillful tools of industry. There is one machine, for example, employing abrasive belts that can be positioned to within such accurate limits that a sheet of newspaper passing through it will have the newsprint erased and still emerge as an undamaged sheet of paper!

Operations conducted in Carborundum's Making Department are typical of the use of modern instrumentation in a quality control program. Here, the paper or cloth belt is coated with adhesive, has the proper weight of abrasive grain added and is dried to the correct moisture content.

There are three major variables that influence the final quality of material leaving this department. These are: (1) thickness and characteristics of cloth or paper base material; (2) characteristics and amount of adhesive applied, and (3)

Fig. 1: Ultrasonic generator and electronic-pneumatic controller provide continuous correction

the weight of grain picked up. Since the first—base material thickness and characteristics—are already established when the material reaches our plant, our quality control activities must be concentrated on the remaining two—adhesive and weight of grain picked up.

Viscosity of the adhesive quite understandably has a pronounced effect on the third variable, weight of

grain picked up, and for this reason offers the first logical point of attack to the quality control problem.

Although initially adhesive is mixed to the correct viscosity in the kettle that supplies the "making machine," it will not, unless continuously corrected, remain at this viscosity.

The adhesive is continuously re-

# Variable-Mu Twin

The wide variations in signal strength which characterizes airborne communications calls for an r-f amplifier with low inherent high-order distortion and low noise figure

By R. E. MOE, Manager-Engrg. Receiving Tube Sub-Dept.  
G.E. Tube Dept. Owensboro, Ky.

Fig. 1: Variable-mu twin triode Z-2159 (6L-6386)

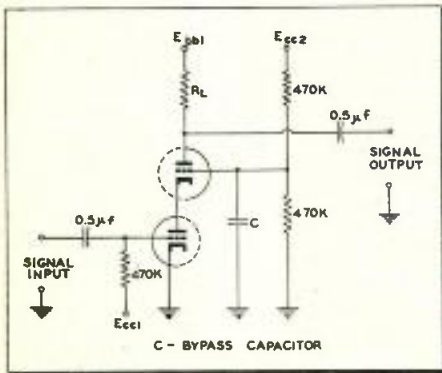

Fig. 2: Fixed-divider type cascode circuit

THE problem of overload and the necessity of automatic gain control of pentode r-f amplifiers has been with us since about 1932, when the first variable-mu tubes were introduced for that purpose. Later, it was found that excessive nonlinearity near cut-off resulted in modulation of the desired signal by an adjacent undesired signal. Recently, a third effect has become prominent, involving harmonics of the difference frequency between two large signals causing multiple side-frequencies and resulting in interference with weak signals on adjacent channels. With the use of narrow band FM transmission and reception, the first two effects are practically negligible, but the third still remains.

## Signal Strengths Vary

Since this problem is particularly severe in airborne communication receivers, where there are many closely spaced channels and a likelihood of wide variation in signal strengths, especially in duplex operation, this phase of the problem will be used as an example. Specifically, the General Electric Co. was requested by Aeronautical Radio, Inc., to develop and produce a reliable successor to the 9003, a miniature, variable-mu, high transconductance pentode, which at that time was the

best candidate from the standpoint of gain and input loading. In construction, it is somewhat similar to the 6AK5, except for the variable-mu grid.

Examination of the existing difficulties in making the tube reliable brought to light the fact that as increasing bias cut off conduction through the normally-spaced grid turns, all of the conduction, particularly to the screen, came from the widely spaced areas of the number 1 grid. Since the net screen current then decreased, the series screen dropping impedance would allow its voltage to rise and the screen turns immediately facing the open areas of the number 1 grid would greatly exceed their normal dissipation and become red-hot. It might have been possible to specify fixed screen voltage operation, but this would require a stiff bleeder, resulting in an uneconomical waste of dc power. Besides, the use of series screen operation was a common practice to improve AGC characteristics and extend the cut-off region.

## Cascode Circuitry

From a practical standpoint, it appeared that an entirely new approach would be more desirable, and with this in mind, the tube designer began to search for ways of increasing the power dissipation characteristics of the screen. Happily, at this time, cascode r-f circuits for TV were coming into wide use, and a very obvious answer suggested itself. Why not use an entire plate, and eliminate the screen? And although no one had ever considered the possibility of a variable-mu triode, much less two of them in cascode, it seemed worth trying, and some sample tubes were put together.

Amazingly enough, the first samples had excellent characteristics in a fixed-divider type of circuit (Fig. 2) as both halves were contributing to the variation in transconductance.

Also, an additional advantage is found in the use of this arrangement in that the screen current normally drawn in a conventional pentode amplifier is reduced in this case to the negligible current drawn by the bleeder used to establish the positive bias on the control grid of the No. 2 section of the twin triode.

At this point, it would be well to pause and examine the requirements for an ideal r-f amplifier from the stand point of the various undesired cross-modulation products. Reference to Terman's *Radio Engineers'*

Fig. 3: (top) Z-2159 vs. existing types. Fig. 4: (below) Excellent response at 1.0 v input

# Triode for Airborne Receivers

*Handbook* (p. 466) reveals that the prime requirement is absence of harmonics above the second in the transfer characteristic. The easiest way to determine whether this has been achieved is to plot the transconductance as a function of bias on semi-log paper, as any departure from a straight line with a slope of two indicates other than the desired pure square law function. Another way is to measure the third harmonic content in the output, as this is almost the entire source of these inter-modulation products, as has been shown in the literature.

From both of these standpoints, the first lot of experimental tubes showed very desirable characteristics (Fig. 5).

## Triode Advantages

In comparison with these results, similar data on the 9003 and 5749/6BA6W are plotted in Fig. 3 and Fig. 4. It can be seen that the double triode is superior over most of the region. Transconductance figures are all quite similar, but input loading on the triode seems to be more favorable and, of course, the inherent noise level is considerably better, as found in the conventional cascode circuitry used in recent television tuners, particularly when neutralization is used.

The final test, however, is whether performance in an actual receiver bears out the predicted improvements. These data are more difficult to obtain. In most cases, it is almost impossible to separate tube performance from the other factors like AGC

Fig. 5: (l) Log plot of transconductance vs. bias.

Fig. 6: (r) Characteristic curves—single section

characteristics, input circuit selectivity, cross-modulation in succeeding stages, etc. Suffice it to say that sufficient improvement has been demonstrated to warrant the development and introduction of such a type, but that specific performance figures are a function of the particular receiver specifications and operating conditions.

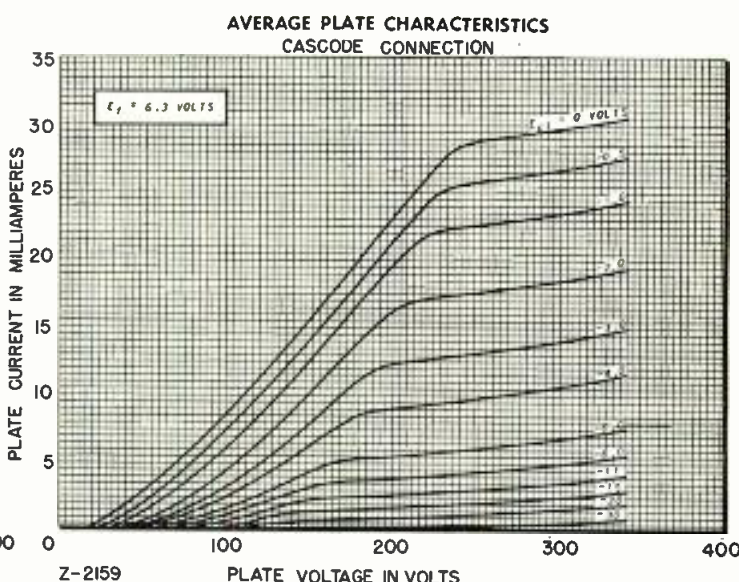

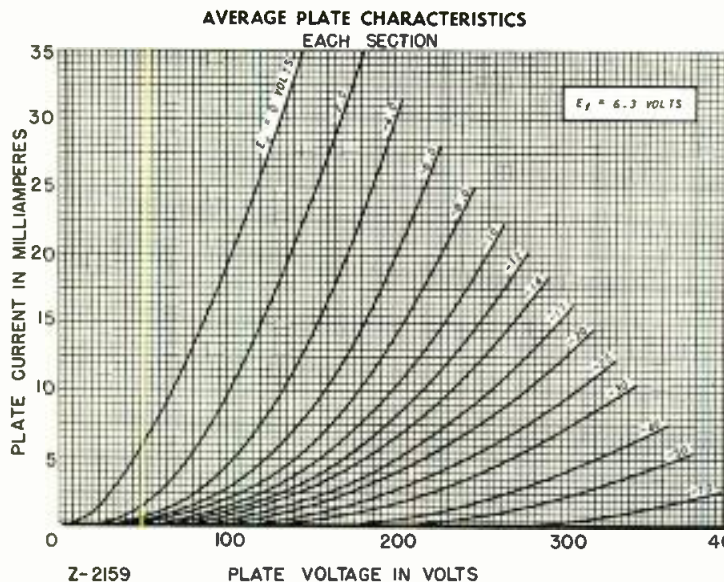

In addition to the above primary application, there should be many other circuit problems which can be solved by the use of a tube with these characteristics. One such might be in volume expander or compressor circuits where minimum distortion is required at all levels of bias coming from the audio AGC. This, of course, requires that the two triode sections be operated in push-pull in order to cancel the second harmonic arising from the square law characteristic. The inherently low level of third harmonic is then the only remaining distortion.

Complete characteristic curves, as well as typical operating parameters, are shown in Fig. 6, 7 and 8. It will be seen from examination of the physical structure of the tube (Fig. 1) that it is similar to the 5670 high-transconductance medium-mu twin triode except for the variable-pitch grid.

In conclusion, we have described a new variable-mu twin triode for cascode operation in AGC-operated r-f amplifier circuits. It should be superior to any existing pentodes in such applications because of low inherent high-order distortion, high gain and low noise figure. It is designed and built with the features of the other special types in the high-reliability series for minimum failures under severe operating conditions, such as airborne communication receiver applications.

This paper was presented at the National Electronics Conference, Oct. 1954, held in Chicago.

# How to Plan for Color

Part Two  
of Three Parts

# Television Broadcasting

**Practical three-step sequence provides for logical expansion of facilities from handling network programs, slides and films, to live studio originations**

By L. E. ANDERSON & W. O. HADLOCK

Engineering Products Dept., Radio Corp. of America, Camden, N.J.

## PLAN #2 EQUIPMENT FOR 16MM, 35MM COLOR FILM AND 2"x2" SLIDES

For many stations the second step will be the addition of plan #2 facilities. This will enable these stations to telecast their own color film and slides, to insert station breaks

### PLAN #2 EQUIPMENT

#### COLOR BAR AND LOCAL ORIGATION EQUIPMENT

Qty.	Description
1	Color Frequency Standard
1	Burst Flag Generator
1	Type 580-D Power Supply
1	*Type TG-2A Studio Sync Generator (includes Dot and Grating outputs)
1	Sync Generator Changeover Switch
2	Type BR84 Cabinet Racks
1	Type WA-1D Color Bar Generator
1	**TX-1B Colorplexer
1	Aperture Compensator for TX-1B†
1	Type 580-D Power Supply for TX-1B
1	Test Meter
1	Changeover Switch Remote Control Panel
1	TA-3A Video Distribution Amplifier
1	TA-4A Video Distribution Amplifier
1	580-D Power Supply (for Dist. Amps.)

\*An existing TG-1A Sync Generator may be modified for color. (MI-40405 Modification Kit available)

\*\*Note that two colorplexers are included in plan #2, one under "Color Bar Equipment," the other under "Film." Use of two is recommended so that (a) bar output is available for system checking without shutting down film operation (b) an automatic emergency spare is always available.

†Addition of this unit in plan #2 allows use of colorplexer in system as an emergency spare for film and/or live operation.

in color and to sell "spots" to local and national advertisers. Color slide programs are relatively easy to make up since 35mm color transparencies can be used as slides. Slides and films occupy a good share of the present day monochrome program schedule and with the advent of color this may increase. Commercials on short film strips and 16mm color films can be used once the plan #2 equipment is installed.

The equipment furnished in plan #2 consists mainly of (a) *Color Bar and Local Origination Equipment* including Color Bar Generator, Burst Flag Generator, TB-2A Sync Generator and Colorplexer—plus (b) the TK-26A "3-Vidicon" Color Film and Slide System. Both of these groups of equipment will be described in detail. See Fig. 7.

Two colorplexers are included in plan #2, one under "Color Bar Equipment," the other under "Film."

Use of two is recommended so that (a) bar output is available for system checking without having to shut down film operation (b) an automatic emergency spare is always available.

The inclusion of the aperture compensator in plan #2 with color bar allows use of the "test" colorplexer in the system as an emergency spare for film and/or live operation.

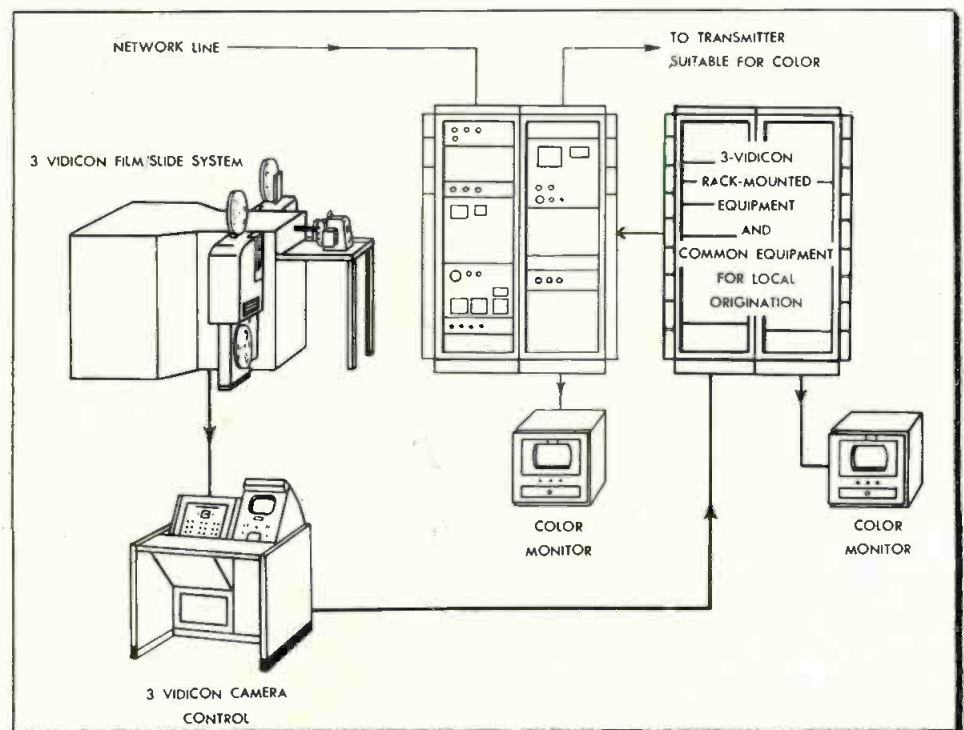

When a station decides to start color programming (whether film, slides or live) the "color bar and local origination equipment" must be installed in order to generate color sync and picture signals locally. This same equipment is also used in plan #3 and does not require duplication when adding live camera facilities.

In order to familiarize and train station personnel in advance with

color TV equipment and principles, some stations may wish to install the color bar generator and local origination equipment well ahead of the film and live camera facilities. The color bar origination equipment of plan #2 provides a stable and inexpensive system for the production of color signals. While this signal does not constitute anything which could be used during a normal program period, it certainly has enormous utility value in testing and measuring of studio and transmitter systems while at the same time providing a means of familiarizing operation personnel with color principles and equipment.

Before installing any equipment, some additional space must be provided for the two extra equipment racks of plan #2, thus making a total of four (see Fig. 8). The total

Fig. 8: Four major equipment racks and color monitors for Plan #2 station

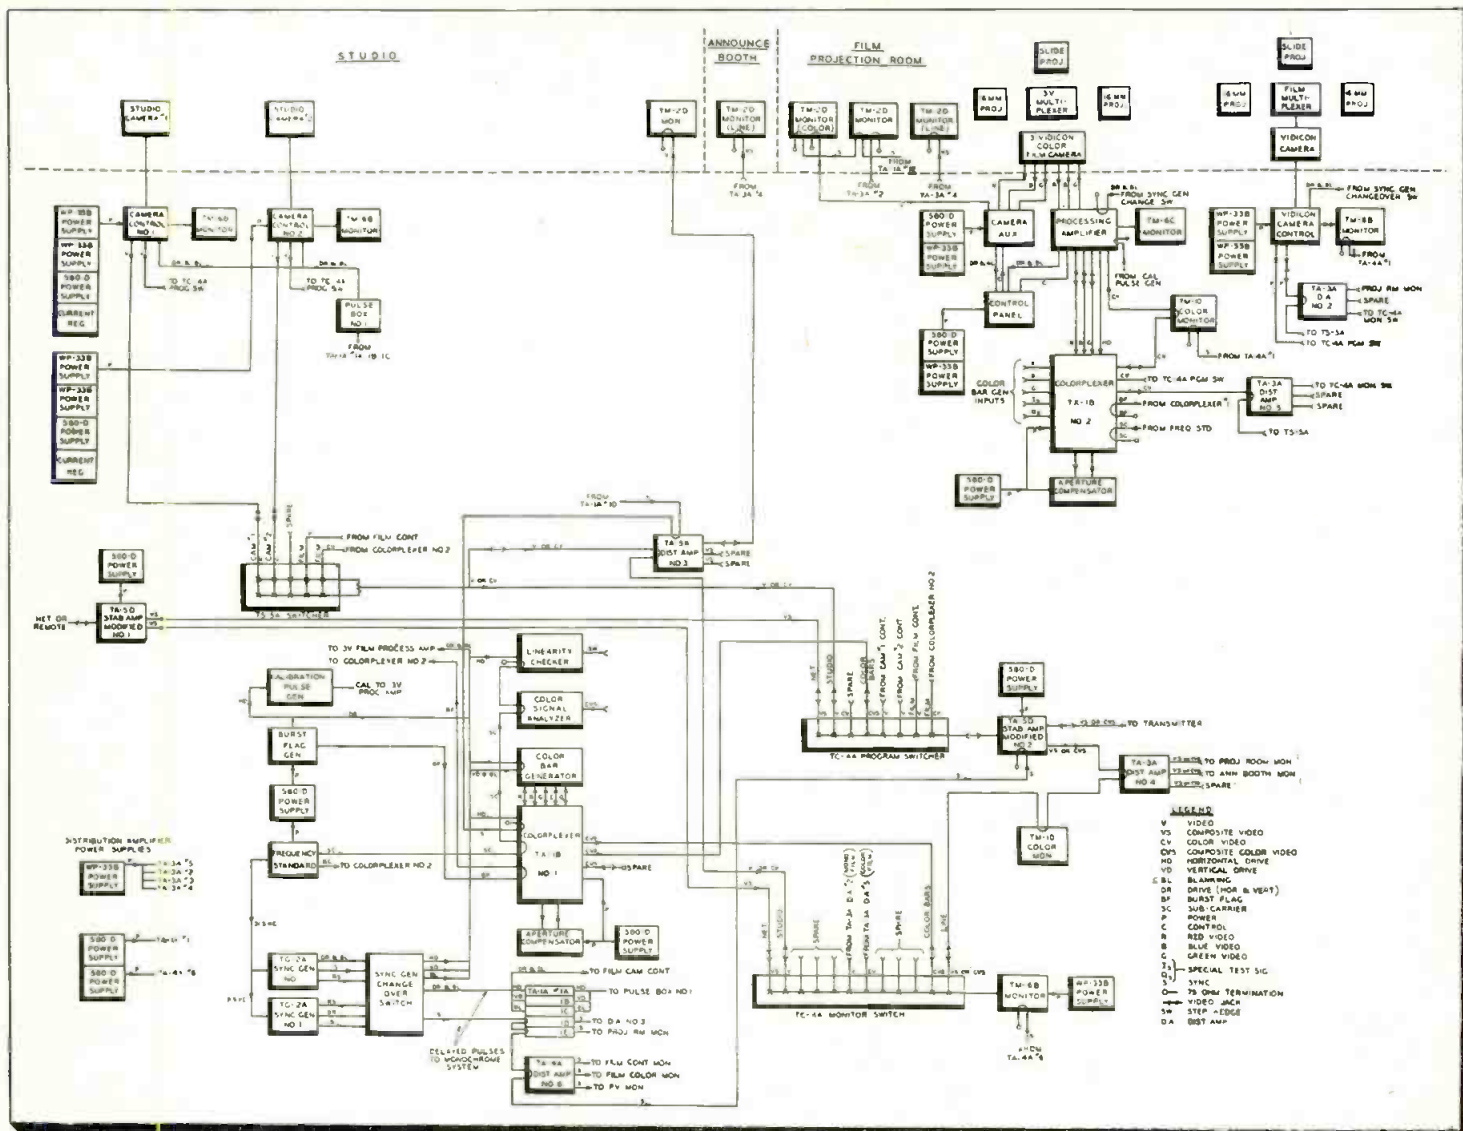

Fig. 7: Equipment and system arrangement employed in Plan #2 color TV broadcasting installation providing for film and slide organizations

space for the four racks is 7 ft. x 20 in. An approximate minimum space of 12 ft. x 14 ft. is needed for the Vidicon film and slide equipment including 16 mm projectors.

### COLOR BAR AND LOCAL ORIGATION EQUIPMENT

As pointed out briefly, the color bar and local origination equipment provides the basic elements of a color system when the step to local origination is made. Since the colorplexer is the heart of any color TV system and the bar generator provides the simplest of all color signals, this equipment is a prerequisite in the step to full local origination. In addition the color bar signal can be used as an on-the-air signal during periods when regular commercial transmission is not in progress so that servicemen may utilize this signal for the alignment of color receiver. The function of various items of origination equipment supplied are described here and are not covered again under plan #3.

The RCA WA-1D color bar generator produces various combina-

tions of color bars. It has five output channels—green, red, blue, I and Q. These outputs are fed to corresponding inputs on the RCA TX-1B colorplexer (Fig. 9). The matrixing section of the colorplexer combines these signals and feeds them to the I and Q modulators at the proper polarity and amplitude to produce a colorplexed bar signal at the output of the colorplexer. The colorplexer also has inputs for color signal sources such as a live camera or three vidicon film chain. A switch on the colorplexer enables the operator to switch between the live or film camera and the bar generator. It is customary to loop the bar signals from the bar generator to each colorplexer used in the system so that only one bar generator is necessary regardless of how many color signal sources are available. The test pattern from the color bar generator can be used most effectively by viewers in their homes as well as by station engineers and servicemen. In order to adjust his set for best color balance, the viewer merely has to adjust the color or chroma control

until the color bars in the top row are vivid and pleasing to the eye. Then he must adjust the phase or hue control to achieve the best yellow hue in the second bar from the left. If the hue control is out of adjustment on one side or the other, the yellow bar will appear either greenish or too orange. If the yellow bar is set properly in this way, all the other colors should normally fall into correct adjustment.

The color frequency standard, MI-40201, provides the color synchronizing information necessary for proper color operation. The subcarrier output of the frequency standard is fed to each colorplexer where it is modulated with the chroma information. Another output from the frequency standard is used to synchronize the sync generator to the frequency standard. The frequency of this output is the subcarrier frequency divided by 455/2. This frequency has been selected to eliminate cross-talk between the horizontal scanning frequency and the color subcarrier.

The burst flag generator, MI-

# Color Television (Continued)

Fig. 9: Colorplexer combines r-g-b signals to form encoded color signal for transmission

40202, is used for keying in the color subcarrier burst. Its output consists of a series of horizontal pulses which key the burst of subcarrier onto the back porch of the blanking signal in the colorplexer. Those pulses are suppressed during the vertical synchronizing interval so that no burst is keyed in at this time.

**TG-2A sync generator**—color sync signals differ from monochrome sync signals in one major respect. This is that they have a “burst” of subcarrier frequency (3.58 mc) superimposed on the “back porch” of the horizontal sync pulse. This “burst” is supplied by a burst flag generator, as shown in Fig. 7 and described above.

A minor difference in color sync signals is that they are controlled by the subcarrier oscillator (rather than the 60-cycle supply). The thermostatically controlled 3.58 mc oscilla-

tor is contained in the color frequency standard. Divider circuits fed from this oscillator develop a 31.5 kc signal which is used to drive the sync generator.

The TG-2A sync generator has been designed especially for color operation with the color frequency standard. The outputs of the frequency standard go directly to the TG-2A. It is possible to modify the TG-1A sync generator for color operation by means of modification kit, MI-40405. This kit contains all of the necessary parts and a complete set of instructions for making this modification. It is not considered good practice to use one TG-1A for both setups, since changing over from monochrome to color, or vice versa, would cause a break in the sync signals fed the receiver. However, both station sync generators can be modified, thus providing an emergency spare for either type operation.

## TK-26A EQUIPMENT

**TK-26A “3-V” color film and slide equipment**—as mentioned briefly before, the RCA 3-vidicon color film and slide system is a complete package of equipment which provides both film and slide facilities. See Fig. 10.

The film and slide camera outputs of the vidicon system (consisting of R, G & B) are combined with the sub-carrier into composite signals. The colorplexer previously mentioned performs this function as follows: (1) it cross-mixes the R, G, and B signals to form the luminance

(or monochrome) signal and the two chrominance signals and (2) it multiplexes these signals with the sub-carrier to produce a composite color signal suitable for feeding the transmitter.

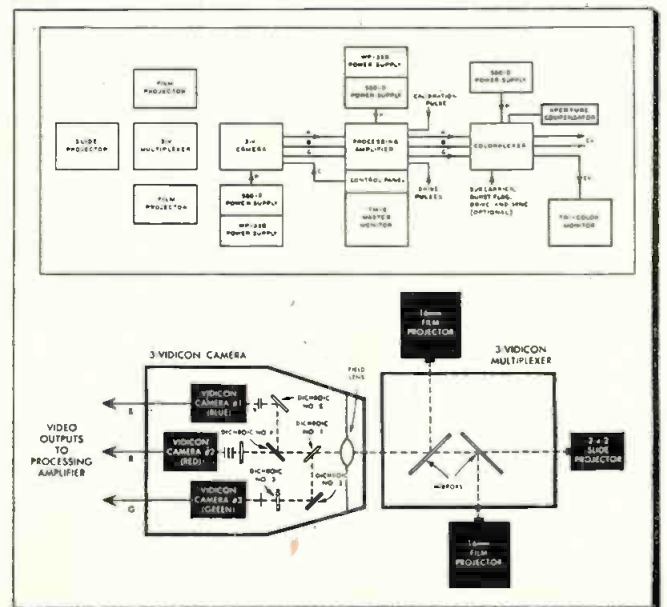

The TP-12 multiplexer for plan #2 film system offers a selection of 16mm and 35mm color films as well as 2 x 2 in. color slides to be used as color program material. Many of the excellent design features of present monochrome vidicon techniques have been incorporated in this 3-vidicon color film system to obtain greatest reliability and color picture quality.

The high resolution and maximum stability of the vidicon tube is retained in this 3-vidicon system. Gamma is ideal—needs virtually no correction; while color fidelity approaches the high quality standards set by RCA’s color studio camera. Use of the vidicon tube also provides a very high signal-to-noise ratio in both the color and the compatible monochrome picture. This feature is particularly important, especially in the first few years of color operation when color programs will be viewed on a great number of monochrome sets.

The Vidicon System includes the “3-V” film chain, TP-12 multiplexer, two 16mm film projectors, dual disc slide projector. These equipments making up the system are described below.

The RCA TK-26A color film camera employs three RCA 6326 vidicon tubes, one for each of the primary colors of the color film being transmitted. These vidicons “look” at a real image produced by the projector and reflected by the multiplexer  
(Continued on page 186)

## No. 30 — Tank Circuit Design

By  
**JOSEPH F.  
SODARO**  
California  
Registered  
Engineer,  
3895 Main Street  
Culver City, Calif.

THE inductance and capacitance values in a tank circuit of reasonably high  $Q$  give inductive reactance and capacitive reactance which are equal at the operating frequency. The network is a resistive load when resonated in this way as seen by the r-f amplifier tube. The condition of reasonably high  $Q$  is met by loaded circuit  $Q$  values of 10 to 20 which are generally used in practice. The tank circuit functions as a reservoir. It supplies power throughout the r-f cycle although the plate current flow is limited to a fraction of this cycle duration in class B and C amplifiers. Extremely low  $Q$  tends to distort the waveshape by limiting the storage capacity of the tank. As a result the output waveshape seriously deviates from a sine wave during the latter part of the cycle. At the same time harmonic attenuation and plate circuit efficiency is reduced. On the other hand extremely high  $Q$  values attenuate high audio frequency sidebands since the tank then becomes a highly selective r-f filter. Also, circuit losses become high unless very high- $Q$  tank coils or resonant lines are used.

### Diagram Terms

A simplified diagram for a triode r-f amplifier is shown in Fig. 1. In the tank circuit  $R_L$  represents the resistance of the inductor while  $r$  represents the resistance of the load reflected by the coupling system into the tank circuit. The load may be the following amplifier, transmission line, or antenna. It is assumed that the reflected load is entirely resistive. It is assumed, also, that there is no resistance in the capacitor branch of the tank circuit.

The  $Q$  for the inductor is the ratio of the inductive reactance to  $R_L$ .

This  $Q$  should be made as large as possible. In other words the best coil should be used for the power involved. On the other hand, the loaded tank circuit  $Q$  should range from 10 to 20 as pointed out above. The figure of merit for a tank circuit is the change in  $Q$  from no load to full load divided by the no load  $Q$  expressed in percent. Thus, if a tank has a no load  $Q$  of 200 and a full load  $Q$  of 10 the ratio is  $(200-10)/200$  or 0.95 or 95%.

In addition to the full load  $Q$ , the design procedure requires the selection of the load into which the tube

Fig. 1: Simple triode r-f amplifier circuit

must work. This depends upon the power which the tube is to deliver and the plate voltage. The optimum load value for a given tube can be (Continued on page 155)

Fig. 2: Nomograph for determining r-f tank circuit characteristics

# Previews of IRE Exhibitors'

Useful descriptive summaries enable readers to determine what-to-look-for

## Booth 54-56 Control Intervalometer

The Type T249 intervalometer is an automatic control for programming events in selectable sequences initiated by a single enabling impulse. A 28 v. enabling impulse produces a rapid se-

quence of 28 v. pulses, each to a separate terminal. Pulse length and spacing is determined by customer specification. The "MK" version spacing is 7 msec. Each impulse is 10 msec. long. Accuracy is to 1 msec. Overall timing accuracy is  $\pm 10\%$ . Hermetically sealed. Fits a standard type mounting tray. PSC Applied Research Limited, 1500 O'Connor Drive, Toronto, Can.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-28)

## Booth 581-583 Miniature Blower

Model R, Type 201, high-pressure miniature blower is especially designed for cooling a gyrator in a pressurized waveguide system. Part of a new line of Model R, single-stage, radial blowers

with high pressure-to-volume ratios. Moves 7 CFM against 6 in. WC. Either 1 or 3 phase, 400 cps. Total weight less than 2 lbs. Rotron Manufacturing Co., Schoonmaker Lane, Woodstock, N. Y.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-25)

## Booth 10 Flight Recorder

The Model R1021-D recorder is a ten 1% or 210 "on-off" channel fixed stylus recorder. Designed primarily as an airborne instrument, the unit is particularly adaptable to digital recording and/

or "on-off" information. Gives a large number of channels on a 5-in. width chart. Direct writing. Easily read. Requires no chart processing. Capable of automatic data reduction and digital recording. Writes on "Teledeltos" electro-sensitive paper; 100-ft. length. Size 10 x 10 x 10 in. Wt., 40 lbs. Radiation Inc., Melbourne, Fla. TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-22)

## Booth 342-344 Power Supply

The Model 450 D voltage regulated power supply features two identical regulated dc outputs, that can be used separately or in series, and one unregulated filament supply. Each of the dc outputs is continuously variable from 0 to 150 v. and delivers from 0 to 75 ma. In the range 0-150 v, the output voltage variation is less than 0.1 v. for

both line fluctuations from 105-125 v. and load variations from min. to max. current. Ripple voltage is less than 3 mv. Kepco Laboratories, 131-38 Sanford Ave., Flushing 55, N. Y.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-23)

## Booth 206-208 Drum Recorder

The Model 700 magnetic tape seismic drum recorder is a specialized geophysics instrument for obtaining optimum seismic information. The standard machine furnishes 26 recording channels—

24 geophones, 1 timing, 1 utility. Broad-band flat frequency response— $1\frac{1}{2}$  to 300 cps/sec. Over 45 db signal-to-noise ratio, over 50 db from 20 to 300 cps. Less than 1% overall harmonic data distortion. Replaceable 4 x 40 $\frac{1}{4}$  in. tape for each shot. Operates from 12 v. battery. Ampex Corp., 934 Charter St., Redwood City, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-27)

## Booth 676 Luneberg Lens

The 18-in. Luneberg lens produces a plane of electromagnetic energy wave emitted from a point source on its surface, or conversely focuses an incident plane wave to a point. One application is wide angle scanning by the movement of a small feed horn when the lens is stationary rather than by the movement of a reflector. Made of low-loss "Eccofoam PS," the maximum dis-

sipation factor is 0.0002. The lens core dielectric constant is  $2.0 \pm 0.02$ , each shell decreasing it by an increment of 0.10. Emerson & Cuming, Inc., 869 Washington St., Canton, Mass.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-29)

# New Electronic Products

beforehand. Additional reviews will be published in Tele-Tech's April IRE issue

## Booth 80 Backward Wave Oscillators

Backward wave, or voltage tunable microwave oscillator tubes are constructed with an r-f structure that has an internal feedback mechanism controlled by voltage applied to the elec-

tron beam. Entirely electronic, there is no inertia or wear. Hence, the tube can be operated at high sweep rates without effect on its life. Tubes are glass constructed, and all low output level models employ a helical r-f structure. Roger White Electron Devices, Inc., Route 17 & Erie R.R., Ramsey, N.J.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-26)

## Booth 222 Tape Recording System

The series 550 recording system, developed to meet the requirements of airborne data recording in a minimum space, has a total volume of less than 1/2 cu. ft., including the remote control box. The equipment operates over a temperature range of 0.20°C to +55°C; down to -55°C can be obtained by use of an automatic electric blanket. Meets vibration requirements of MIL-E-

5272A, Procedure I. System comprises a recorder and space for electronic plug-units, a power supply, and an optional remote control box. The Davies Laboratories, Inc., 4705 Queensbury Rd., Riverdale, Md.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-31)

## Booth 481 Wideband Oscilloscope

The Model 320 wideband oscilloscope, a general purpose high-gain instrument, features identical horizontal and vertical amplifiers which enable frequency phase shift indication up to the

video frequencies. Adapted to phase shift measurements in color TV. Frequency on both amplifiers, flat from 10 cps to 5 mc within 1 db. Rise time less than 0.1 μsecs. Overshoot, negligible. Deflection sensitivity, 35 mv RMS/in. deflection on both amplifiers. Calibrating voltage, self-contained, 0.106 v. RMS. Crosby Laboratories, Inc., P.O. Box 233, Hicksville, N.Y.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-30)

## Booth 129-131 Oscilloscopes

Type 532 of the new 530 Series is a dc to 5 MC oscilloscope with a sweep range of 0.2 μsec/cm to 12 sec/cm and 4 kv accelerating potential. Type 533 of the series is a decoupled oscilloscope with a vertical-amplifier rise-time of 0.012 μsec at a basic sensitivity of 0.1 v/cm, sweep range of 0.02 μsec/cm to 12 sec/cm, and 10 kv accelerating potential. Designed for extreme wide-band applications. Both types have Type 53 Series plug-in preamplifiers. Tektronix, Inc., P.O. Box 831, Portland 7, Ore.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-24)

## Booth 756-758 Potentiometer

Used as computers, non-linear potentiometers position a miniature destroyer and bomber within broad parameters of range and altitude. "Helipot" precision potentiometers translate range and altitude into voltages  $r$  and  $h$ . Their outputs are amplified and fed to non-linear unit which solves the equation,  $r = 2e^2 h \sin 4\theta$  with great accuracy. Helipot Corporation, 916 Meridian Ave., S. Pasadena, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-33)

## Booth 760 Voltmeter

AC voltage readings accurate to 0.5% over the frequency range of 50 to 2,000 cps are obtained with the expanded scale panel voltmeter. Use of a thermal bridge permits indication of a narrow

voltage range. The scale is expanded about a given normal voltage that can be as low as 6.25 v. with a span of ±0.25 v. or as high as 230 v. with a span of ±30 v. A line of 3 1/2 in. and 4 1/2 in. diam. models is supplemented by square (3 1/2 in.) and rectangular (4 x 6 in.) models. Beckman Instruments, Inc., Arga Div., 220 Pasadena Ave., S. Pasadena, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES (Ask for 3-32)

## Booth 428 Multimeter

The "555" metal-cased, pocket-size multimeter offers 43 unduplicated, self-contained ranges with accuracies of 3% dc, 4% ac, and measures dc volts from 1.5 to 1,500 v at 20,000 ohms/v, ac, and ac volts from 1.5 to 1,500 v at 2,000 ohms/v, dc. Current from 50 μa to 15 amps, ac. Current from 1.5 ma to 15 amps. Decibels from -10 to +50. Re-

sistance from 0.25 ohms to 10 megohms. Ranges established in 3 to 1 steps. Has only two jacks. Measures 4 5/8 x 6 1/8 x 2 1/8 in. Phaostron Co., 151 Pasadena Ave., South Pasadena, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-13)

# IRE New Products

## Booth 580

## Power Rectifiers

Announced silicon power rectifiers are capable of continuous operation at an ambient temperature of 125°C. Their high forward conductance and ex-

tremely low leakage current allow operation at efficiencies up to 98%. Designed for conduction cooling. Save size and weight. Both magnetic amplifier and power supply applications are available. As the units exhibit no forward aging effects, compensating networks are unnecessary. **Transitron Electronic Corp.**, 403 Main St., Melrose, Mass.—**TELE-TECH & ELECTRONIC INDUSTRIES.** (Ask for 3-36)

## Booth 397-494-495

## Capacitors

Available in types CY60, CY65, and CY70, new medium-power glass capacitors electrically replace mica capacitor

types CM45 to CY70. Generally the equivalent ratings of glass capacitors occupy less volume than their mica counterparts. The new capacitors are formed of alternate layers of glass and foil, sealed under heat and pressure to form a self-supporting monolithic unit. Further encasing is not needed. Performance is a function of the dielectric properties of the glass. **Corning Glass Works**, Newton St., Corning, N. Y.—**TELE-TECH & ELECTRONIC INDUSTRIES.** (Ask for 3-37)

## Booth 389-391

## Labels and Dispensers

Announced is a new combination oil and heat resistant, pressure-sensitive label that adheres firmly to oily and greasy surfaces. Also announced, is the

"55" fully automatic, self-regulating dispenser that releases labels either singly or in multiples. The model "H" label dispenser is manually operated and dispenses labels singly or in multiples. **Avery Adhesive Label Corp.**, 1616 S. California Ave., Monrovia, Calif.—**TELE-TECH & ELECTRONIC INDUSTRIES.** (Ask for 3-35)

## Booth 666-668

## Tuning Control

The Model TL-1 "Trak" tuning lock keeps frequency-shift code receivers tuned accurately to an incoming frequency at all times. The unit is applicable to variable-tuned or crystal

controlled receivers. The tuning lock includes a control chassis and a separate electrically-controlled capacitor connected to the tuning circuit of the receiver. Draws 90 w. of ac power. **C. G. S. Laboratories**, 391 Ludlow St., Stamford, Conn.—**TELE-TECH & ELECTRONIC INDUSTRIES.** (Ask for 3-34)

## MORE TECHNICAL INFORMATION

describing the new products presented here may be obtained by writing on company letterhead to New Products Editor, **TELE-TECH & ELECTRONIC INDUSTRIES**, 480 Lexington Ave., New York 17, N.Y., listing numbers given at end of each item of interest. Please mention title of position held.

## Booth 242-244-246

## Marker Generator

A crystal-positioned instrument, the "Ultra-Marker," designed for use with a sweeping oscillator, develops an ac-

curate oscilloscope display marker signal at all UHF sound and picture frequencies covered by an associated sweeping oscillator. A switching system eliminates all but every fourth set of channel markers and enables the use of less accurately calibrated sweep generators. The instrument is enclosed, with regulated power supply, in a functionally designed steel cabinet. **Kay Electric Co.**, 14 Maple Ave., Pine Brook, N. J.—**TELE-TECH & ELECTRONIC INDUSTRIES.** (Ask for 3-38)

## Booth 542-544

## Electromagnet

The V-4004 electromagnet has two fixed energizing coils with adjustable poles and changeable pole caps. By a

simple adjustment of each pole, any air-cap width can be made up to 4.3 in. Cylindrical, conical, and specially shaped pole caps provide a wide choice of flux patterns. Despite the small size of the magnet, a gap field flux density of as high as 28,600 gauss can be attained. Especially suited for general laboratory needs that require precise magnetic field. **Special Products Div., Varian Associates**, 611 Hansen Way, Palo Alto, Calif.—**TELE-TECH & ELECTRONIC INDUSTRIES.** (Ask for 3-39)

... automatically made, therefore made with precision metal and insulation components. CINCH automatically assembled parts assure the uniformity and quality mandatory for use in AUTOMATION in the end users equipment.

Adequate and unequaled facilities have advanced CINCH to the foremost producer of low loss Mica components in production quantity.

## FOR OVER A QUARTER OF A CENTURY ... PRODUCER OF THE STANDARD ELECTRONIC COMPONENT

CINCH molded general purpose connectors, from three to fifty contacts or more, are designed and made of materials as desired and necessary to meet application requirements. They are available in low loss mica for chassis mounting or assembled with cap for cable applications. Terminals gold or silver plated.

Cinch components available at leading electronic jobbers—everywhere.

# WASHINGTON

## *News Letter*

Latest Radio and Communications News Developments Summarized by TELE-TECH's Washington Bureau

**SENATE PROBE**—Under the chairmanship of Democratic Senator Magnuson of Washington, the Senate Interstate Commerce Committee plans to embark into an investigation of the economic plight of television stations in multiple-station markets, principally UHF but also VHF. One remedy, the Senators spearheading the study feel, may be tax relief for TV sets. Subscription television is another subject on the Senate investigations agenda. The Senate Committee which received \$200,000 for the industry emphasized its goal was a nationwide system of television "operating in the atmosphere of healthy competition."

**INTERCONNECTION RATES**—Another significant avenue of investigation by Senator Magnuson and his committee will be into the telephone interconnection rates for television, although it is recognized that the telephone system has made tremendous contributions to the advancement of nationwide video in its facilities for network program transmission. Senator Magnuson noted that in the past two years there had been a mounting number of complaints from TV licensees on the high costs of interconnection together with "an inadequacy of service to cities which do not lie athwart transcontinental cable and microwave lines." The Senate Committee asserted there should be a careful review of "what seems to be inadequate regulation by FCC" of these rates.

**DEFENSE OUTLAYS**—While the 1956 government budget which starts next July 1 as submitted by President Eisenhower gave no details of the electronics-radio expenditures for national defense, an analysis of the 1224-page document showed that the Air Force and the Navy are seeking increased appropriations for procurement of new equipment and of components and parts for maintenance of present facilities. The Air Force program calls for \$594,236,000 for procurement of electronics and communications equipment as well as \$603 million for guided missiles where electronics is the major expenditure, and these two programs are \$370 million above the expenditures for the current fiscal year. The Navy planned more than \$106 million for air carrier and fleet communications and electronics procurement and maintenance, \$40 million more than this fiscal period.

**FCC BROADCAST-TV COSTS OFF**—Even though the FCC budget proposal due to pay increases is slightly higher—\$6,704,500 than the current allotment of \$6,699,300—the decrease in the work backlog on

broadcasting and television station applications caused a reduction in funds for this FCC activity. Safety and mobile radio services continued to record increased work for the FCC with an estimated total of 180,000 stations in this field which includes aviation, marine, police and industrial mobile and microwave communications for the upcoming fiscal year starting next July 1. This would mean a gain of 20,000 over the current fiscal period.

**SPLIT RADIO CHANNEL**—Aimed at relieving the tight frequency situation in mobile radio services, the FCC in a long-awaited move recently issued proposed rules which would reduce the spacing between present channels allocated to these services in the 25-50 and 152-162 megacycle bands. Comments from the mobile radio services on the plan are due March 28. Separation in the 25-50 mc band would be 20 kc between channels compared with the present 40 kc and in the 152-162 mc band it would be 15 kc compared with the existing 60 kc while there would be provision for geographic spacing of adjacent channels. The vote was 3 to 2 with dissenting commissioners Bartley and Lee stressing the need for a general allocation proceeding which would survey spectrum occupancy by the government.

**FM BROADCAST BAND**—The FCC was recently asked by the National Association of Manufacturers radio committee to consider the allocation of around 700 new mobile radio channels in the unused portion of the FM broadcasting space for the growing manufacturers' radio service. The NAM group cited that its plan was designed not to interfere with any existing FM broadcasting operations. The opening of the 700 channels, it was stressed, was not only to provide additional channels for the manufacturers' radio service but a wealth of channels for other mobile radio services. At the same time as it filed its proposal with the FCC, the NAM distributed copies of its plan to all other mobile radio organizations.

**STANDBY PRIORITIES SYSTEM**—Preliminary work on a standby system of public message service priorities, similar to those administered by the Board of War Communications in World War II, has been launched by the FCC under a proposed delegation of authority from the Office of Defense Mobilization.

has

**New 3-Vidicon Film Chain, 2 Projectors  
Added to Color TV Equipment Available**  
**TELECASTING • RESEARCH • PRODUCTION • EDUCATIONAL**

GPL has designed, developed and put into commercial production triple-Vidicon telecine equipment with no limitation on the amount of light really needed for color film. The 3-Vidicon chain is compact, reliable, and precision balanced for color fidelity. Built for tomorrow's color, it has none of the light limitations inherent in the flying spot.

For commercial work, or research and test, GPL announces two new telecine projectors, in both 16 mm and 35 mm size. These projectors incorporate GPL color research, plus all the mechanical reliability and precision parts of the famous Simplex line.

The new film chain and projectors supplement the full line of GPL-Wickes color TV signal generating and test equipment for telecasting, research, production and educational work. **COLOR CONSULTATION SERVICE**

Color equipment is available in complete packages for station conversion, or individual units to your needs. Specifications on request.

*The GPL-Wickes equipment available for prompt delivery includes:*

- INTERLACE SIGNAL GENERATOR
- COLOR BAR GENERATORS
- COLOR CODER
- CONVERGENCE DOT GENERATOR
- MULTI-BURST GENERATOR
- AMPLITUDE LINEARITY TESTER
- VIDEO DISTRIBUTION AMPLIFIERS
- PULSE DISTRIBUTION AMPLIFIER
- REGULATED POWER SUPPLYS
- VECTOR DISPLAY EQUIPMENT
- ENVELOPE DELAY TRACER
- COLOR VIDEO MONITOR
- PHASE CORRECTION NETWORKS
- CROSSOVER FILTER

# Announcing

Like all Adlake relays, these new "Mighty Midget" relays require no maintenance whatever . . . are quiet and chatterless . . . free from explosion hazard. Dust, dirt, moisture and temperature changes can't affect their operation. Mercury-to-mercury contact gives ideal snap action, with no burning, pitting or sticking.

# the new Adlake

## "Mighty Midget"

with the revolutionary **MOLDED** coil!

This phantom view and operational sketches show the simple, dependable operating principle of the Adlake "Mighty Midget" Relay.

You expect the very latest from the company that originated the mercury plunger-type relays—and here *is* the very latest! It's the Adlake No. 1140, with molded coil in epoxy resin. That neat red coil is exclusive with Adlake, and gives these advantages:

- Better heat radiation
- Absolutely moisture proof
- Tested by 4 to 5 million operations at maximum capacity
- Guaranteed against coil failure—forever

This new molded coil "Mighty Midget" is the newest reason why

it'll pay you to use Adlake mercury relays

DE-ENERGIZED

ENERGIZED

**DE-ENERGIZED** Plunger P is floating in mercury M. External circuit is open because main body of mercury M is below lip of ceramic cup CC.

**ENERGIZED** Coil C pulls plunger P down into mercury M. Mercury thus displaced completely covers ceramic cup CC filled with mercury. This establishes mercury-to-mercury contact between electrodes E and EE.

THE **Adams & Westlake** COMPANY

Established 1857 • Elkhart, Indiana • New York • Chicago  
the original and largest manufacturers of mercury plunger-type relays

# IRE New Products

## Booth 458-460

### Oscilloscope

The professional laboratory oscilloscope, Model 770, a late development in the field, has the following specifications: frequency range, vertical ampli-

fier, dc to 5 mc, 3 db down, with band width switch in wide position; dc to 2.5 mc, 3 db down, with band width switch in narrow position, better than standard IRE roll-off characteristics. Horizontal amplifier, dc to 500 kc, 3 db down. Sweep circuit oscillator, 2 cps to 30 kc. Fixed sweep frequencies, 30 cps and 7,875 cps. The Hickok Electrical Instrument Co., 10514 DuPont Ave., Cleveland 8, O.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-42)

## Booth 759

### Telephone Relay

The SQ series single-coil telephone relay is available in 1 to 5 amp contact ratings in contact combinations from SPST to 6 PDT, with a maximum sensitivity of 15 mw per pole in the DPDT

combination. This is an optimum combination, withstanding 10G's vibration from 10 to 500 cps. When power is increased to 40 mw per pole, vibration resistance rises to 30 G's. Sensitivity and vibration resistance decrease with added contact combinations and the same power. Advance Electric & Relay Co., 2435 N. Naomi St., Burbank, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-43)

## Booth 84

### Pumps

A new line of oil diffusion and booster pumps employing the "Ring Jet" increase pumping capacity over the critical pressure ranges. The 16-in. dif-

fusion pump exhausts 11,000 cfm at a pressure of 1 micron. Replacing the conventional jet cone with a ring of jets enables some models to increase pumping speed as much as 50% over conventional pumps. F. J. Stokes Machine Co., Inc., 5500 Tabor Rd., Philadelphia 20, Pa.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-44)

## Booth 854

### Centering Device

Tilt-open slip-on design of a centering device for assembling TV sets in production has been announced. It fits

instantly over the tube's neck. A gentle squeeze tilts open the device which is adjustable from 0 to 18 gauss. A distortion-free beam is assured by uniformity of field. Heppner Manufacturing Co., P.O. Box 612, Round Lake, Ill.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-41)

## MORE TECHNICAL INFORMATION

describing the new products presented here may be obtained by writing on company letterhead to New Products Editor, TELE-TECH & ELECTRONIC INDUSTRIES, 480 Lexington Ave., New York 17, N.Y., listing numbers given at end of each item of interest. Please mention title of position held.

## Booth 174-196

### Lighthouse Tube

A miniaturized 2 $\frac{5}{8}$  in. long metal and ceramic tube, GL-6442, enables pulsed power applications up to 4,000 mc. Peak power output at 3,500 mc is 2.0 kw.

Mechanical structure features a strong grid flange for rigid mounting. Coplanar design affords greater resistance to shock and vibration. Operates in commercial service up to 175°C seal temperature. Large-area silver plated terminals. Designed for beacons, low-power radar, microwave relays, navigation, special test equipment, etc. General Electric Co., Schenectady 5, N. Y.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-45)

## Booth 251-253-255

### Speed Controls

"Variac" motor speed controls are now obtainable without cabinets and switching. Stripped-down models ranging from  $\frac{1}{4}$  hp. to 1 $\frac{1}{2}$  hp. are available in this form. All parts except the "Variac" speed control element are

mounted on a metal chassis with connections brought out to a terminal strip. Only the "Variac" and switches need be at the control point. The motor speed controls are for operating dc shunt or compound motors from ac power lines. General Radio Co., 275 Massachusetts Ave., Cambridge 39, Mass.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-40)

Electron photo microscope's view of conventional oxide coating used by many long play tapes. (Artist's conception.)

Similar enlarged view showing exclusive oxide dispersion method developed by "Scotch" Brand for new Extra Play Tape.

**SEE**

**the difference . . .**  
**then hear the difference . . .**

You'll notice the difference at once—the way revolutionary "Scotch" Brand Extra Play Tape outperforms ordinary long play tapes with old-fashioned, *full-depth* oxide coatings. There's a crisper tone, higher fidelity on "Scotch" Brand . . . and a generous 3 db. boost in the high frequency range.

The secret of "Scotch" Brand's superiority? It's the completely new oxide dispersion process. By laying carefully filtered, fine-grain particles in a

neat, orderly pattern, "Scotch" Brand is able to produce a super-sensitive magnetic recording surface that contains the same amount of oxide as conventional tapes, yet is 50% thinner. That's important to remember when buying tape. Because recording experts are aware that a thinner, more potent oxide coating is essential for improved results with long play magnetic tapes.

Ask for "Scotch" Brand Extra Play Tape *today!*

MODEL S-12-B

USES ONLY 7"  
OF STANDARD  
RELAY RACK

ANOTHER EXAMPLE OF **Waterman** PIONEERING...

The S-12-B RAKSCOPE is a rack mounted, JANized (Gov't Model No. OS-11) version of the famous WATERMAN S-11-A POCKETSCOPE, with the addition of a triggered sweep and a special calibrating circuit for rapid frequency comparisons. The entire oscilloscope is built to occupy but seven inches when mounted in a standard relay rack. The vertical and horizontal amplifiers are identical, having sensitivities of 0.05 Volt rms/inch and frequency responses which are flat within -2 db from DC to 200 KC. These features permit observation of low frequency phenomena without undesirable trace bounce. The sweep rate is continuously variable from 5 cycles to 50 KC in either the triggered or repetitive mode with synchronization polarity optional. The return trace is blanked. Because provisions are made for applying input signals from the rear, as well as the front, the S-12-B is the ideal combination, systems monitor and trouble-shooting oscilloscope. Investigate the multiple applications of this instrument as an integral part of your "rack mounted" projects.

## The Peltier Effect

THE recently announced electronic cooling system (see page 13) utilizes the Peltier effect to obtain its cooling action. In this effect, electricity passing through a junction produces the cooling.

To understand how this operates, consider first the thermoelectric action known as the Seebeck effect, illustrated in sketch A. Here two metals, say copper and iron, are joined to form two junctions. Junction 1 is heated, causing thermal agitation which transfers electrons at the hot junction from the iron to the copper. The net result is an emf acting around the circuit in the direction of copper to iron at the hot junction.

The Peltier effect shown in sketch B is similar to the Seebeck effect, except that an external electrical source produces a temperature differential between two junctions, in-

Demonstration of (A) Seebeck and (B) Peltier effects. Current actually cools junction 1'

stead of using external heat to cause the temperature differential which produces the emf.

Current passing through junction 1' requires heat to be supplied to maintain these conditions, as junction 1 did in the Seebeck effect. Since no external heat source is available, the necessary heat is absorbed from the metals themselves in the neighborhood of junction 1', producing a temperature drop in this region.

At junction 2' the current flow from iron to copper, or in other words the electron transfer from copper to iron is in the more difficult direction, so work has to be done, heating junction 2'.

In a commercial cooling system, possibly using different metals, junction 1' would be in the freezing unit, while junction 2' would have its heat removed by moving air or water.

# EXTEND Your Microwave Horizons

## WITH VARIAN HIGH-POWER KLYSTRONS

V-42  
LENGTH: 60 INCHES

With the new series V-42 and VA-800 high power transmitter klystrons, point-to-point **microwave propagation beyond-the-horizon is a reality.**

You can now design and engineer microwave systems for long distance relay communication . . . because Varian — who has supplied the most reliable and highest power klystrons for UHF-TV — now brings you the same proved performance and economy of operation for communication service.

Varian's multi-resonator amplifiers provide you with continuous power output up to 15 kw . . . power gains up to 40 db . . . in the 500, 1000, 2000 and 7000 mc frequency bands . . . for TV-relay, and fixed telephone or telemetering in common carrier service, industrial service or control service.

### V-42 Series Warranted for 3000 Hours of Service

Each V-42 and VA-800 tube incorporates Varian's exclusive built-in tuning circuits which give you proven reliability as well as simplicity of installation, operation and use.

### For Radars, Beacons and Relay Communication

Varian has a complete line of high power amplifier klystrons for CW and pulsed operation.

VA-80B	V-70	V-82	V-24B	V-42 series	VA-800 series

## Music Synthesizer

(Continued from page 80)

are unknown, those which cannot be duplicated by any existing instruments. This ability leads to "electronic engineer's" compositions totally unlike any previous musical renditions. The tones can be made "perfect"—without discord—since the accuracy of the synthesizer, frequency-wise, is in the order of 1 part in  $10^4$ . This extraordinary musical accuracy, Dr. Olson pointed out, is a mixed blessing. In order to create "natural" sounding reproductions, noise and discordant tones must be inserted to lend "presence" to the composition. The synthesizer actually incorporates a gas tube noise generator to create this effect.

To reproduce any given tone, then, the synthesizer must be able to: 1) generate any fundamental frequency within the audio range, 2) produce a tone with any overtone structure, 3) produce a tone having any growth-, duration-, or decay-time characteristic, 4) produce a vibrato—a change in amplitude or frequency modulation, 5) produce a portamento—a glide from one frequency to another, 6) change the overtone structure of the tone at any time, 7) change the intensity of the tone 0-120 db, 8) provide a deviation from the regular.

The fundamental frequencies (ranging from 30 to 15000 cps) are provided by 12 tuning fork oscillators. Relay trees select the frequencies to be amplified, and a series of filters, resonators and growth, duration and decay controls provide the waveshape and overtone structure desired.

Control over the complete operation is provided by a punched paper record not unlike the old "player piano" rolls. The perforations control the enumerated operations above. Geared to the paper record through a flexible shaft type coupling is a turntable on which is recorded the musical sound being formed by the synthesizer. The phonograph industry, Dr. Olson pointed out, would probably be the first to benefit from this equipment.

At the present state of the art, it is taking approximately 2 to 3 weeks to reproduce an average length selection. The basic arranging and tone analysis is being done by trained musicians.

In an experiment conducted to determine the fidelity of the synthesizer, as detected by the human ear, two piano selections were recorded by four prominent artists, Iturbi,

Fig. 2: Complex characteristics of a sound. Portamento is provided by frequency glider.

Rubinstein, Horowitz and Pennario, and a violin selection was recorded by Fritz Kreisler. These recordings were mixed on a magnetic tape with a synthesizer version of the same pieces and played to a number of people. Expressed statistically, it can be said with 70% certainty that only 1 person in 4 can distinguish which performance is "live."

## Curtiss-Wright Expands

Roy T. Hurley, President and Chairman of Curtiss-Wright Corp. has announced today that its engineering program for 1955 is the largest in the history of the corporation. This program will be under the direction of E. M. Powers, as Vice President in charge of engineering and research.

The corporation announced the formation of a research division under the management of Kenneth Campbell.

## CAMRAS AWARDED MEDAL

Marvin Camras (center) of Armour Research Foundation is shown receiving the John Scott Medal from G. Curtis Pritchard at the opening session of the Winter General Meeting of AIEE in New York. Mr. Camras was awarded the medal, "For the invention of the method and means of obtaining distortion free magnetic recordings through high frequency bias." RCA's Brig. Gen. David Sarnoff is at left.

here's why you get  
**EXTRA LENGTH**

*plus*

**EXTRA  
STRENGTH**

with **LR audiotape** on **Mylar** polyester film

**N**OW YOU can get the *extra length* that many tape recording applications require, without any sacrifice in strength or durability. For the new Type LR Audiotape, made on 1-mil "Mylar," actually has greater impact, tensile and tear strength than even the conventional plastic-base tape of 50% greater thickness.

And because "Mylar" withstands extreme temperatures and is virtually immune to humidity, LR Audiotape stands up longer under the most severe conditions of use and storage.

This Longer Recording Audiotape is now available in 900, 1800 and 3600-ft. reels. Audio also offers a complete standard line of Audiotape on "Mylar," in 1, 1½ and 2-mil base thickness. Test it—compare it with any other tape on the market. In *performance* and *durability*, it speaks for itself!

**HOME RECORDISTS — CHURCH RECORDISTS:**

Enter Audio Devices' **BIG PRIZE CONTESTS** for the best articles on "How I Use My Tape Recorder."

**WIN** a V-M "tape-o-matic" recorder, plus \$100 cash, plus 20 7-inch reels of Audiotape. Ten other valuable awards, too!

Contest closes April 1, 1955. See your Audiotape dealer, or write to Audio Devices today for complete details. There's nothing to buy!

Table I TESTS AT 75°F, 50% RELATIVE HUMIDITY

	Yield Strength	Breaking Strength
1 mil Acetate	3.7 lb.	3.9 lb.
0.9 mil "Mylar"	4.2 lb.	7.6 lb.
1.45 mil Acetate	5.0 lb.	5.5 lb.

Table II TESTS AT 75°F, 90% RELATIVE HUMIDITY

	Yield Strength	Breaking Strength
1 mil Acetate	1.8 lb.	2.5 lb.
0.9 mil "Mylar"	4.1 lb.	7.6 lb.
1.45 mil Acetate	3.0 lb.	4.1 lb.

The above test data, taken under conditions of both winter and summer humidity, show the marked superiority of 1-mil "Mylar," not only over the thin cellulose acetate base, but over the standard 1.45-mil acetate as well.

## Cues for Broadcasters

(Continued from page 81)

two resistors or capacitors have the same finite value. Nor do any two neon bulbs have the same finite striking voltage. It is because of this fact that each of the individual oscillators produce a pulse independently and non-uniformly spaced in time from its neighbor. The result-

Random pulse noise generator

ant wave forms across the output load resistor are completely sporadic and random. At no instant of time interval does the wave form repeat itself in a previous cyclic voltage wave form, due to the irregularity and mixture of the oscillator outputs, thus providing an excellent source of noise generation.

R 1 is a voltage adjustment rheostat to vary the rate of random pulse output.

## Tuned Amplifiers

(Continued from page 80)

of these curves, the designer should have no difficulty in choosing the circuit which fits most closely his particular application.

## IRE Appoints Officers For 1955

The IRE Board of Directors has appointed 6 members to the Board for 1955. Reappointed as Treasurer of the IRE was W. R. G. Baker, Vice President of General Electric Co. Haraden Pratt was appointed to his 13th term as IRE Secretary, and John R. Pierce, Director of Electronics Research, Bell Telephone Labs. was reappointed Editor. Also appointed to the Board as Directors were Alfred N. Goldsmith, consulting engineer and Editor Emeritus of the IRE; A. V. Loughren, Director of Research, Hazeltine Corp., and Executive Vice Pres. Hazeltine Research, Inc.; and Howard Vollum, President, Tektronix, Inc.

# MICROWAVE MULTI-PULSE SPECTRUM SELECTOR

for use with Polarad  
Spectrum Analyzers

The Polarad Multi-Pulse Spectrum Selector increases the versatility of Polarad Spectrum Analyzers by displaying and allowing selection for analysis a specific train of microwave pulses as well as any one pulse in the train.

Model  
SD-1

It will select and gate a group of pulses up to 100  $\mu\text{sec.}$  in length; is designed to work with fast, narrow pulses; and can be adjusted to gate any pulse including the first at zero time. Special circuitry discriminates automatically once pulses have been selected. The Model SD-1 has been designed to operate with all Polarad Spectrum Analyzers at any of the frequencies they will accept.

- Completely self-powered portable unit.
- High intensity, flat-face CRT for accurate display with:
  - Continuously variable sweep widths; 10 to 100  $\mu\text{sec.}$
  - Continuously variable gate widths for pulse selection; 0.2 to 10  $\mu\text{sec.}$
  - Continuously variable gate delays for pulse selection; 0 to 100  $\mu\text{sec.}$
  - Automatic gating of spectrum analyzer during time of pulse consideration.
  - Intensified gates (brightening) to facilitate manual pulse selection.
  - Triggered sweep on first pulse in any train. No sweep in absence of signal.

### SPECIFICATIONS:

Maximum Pulse Train Time.....100  $\mu\text{sec.}$   
 Pulse Rise Time.....05  $\mu\text{sec.}$  or Less  
 Minimum Pulse Separation.....1  $\mu\text{sec.}$   
 Repetition Rate.....10 — 10,000 pps.  
 Minimum Pulse Width.....1  $\mu\text{sec.}$   
 Input Power.....95 to 130 volts,  
 50/60 cps., 350 watts

# PORTABLE DIRECT READING SPECTRUM ANALYZER

10 TO 44,000 mcs

5 RF HEADS

UNI-DIAL TUNING

MODEL TSA

Now, a new Polarad spectrum analyzer only 21 inches high that covers the entire frequency range 10 to 44,000 mcs with 5 interchangeable RF tuning heads. The model TSA operates simply—single dial frequency control—with utmost frequency stability. It provides highest accuracy, and reliability for observation and true evaluation of performance over the entire RF spectrum—saving engineering manhours.

This instrument is designed for maximum utility and versatility in the laboratory and on the production line providing an easy-to-read 5 inch CRT display of the RF spectrum.

**Model No. Equipment**

 Model STU-2A...RF Tuning Unit 910-4,560 mc.  
 Model STU-3A...RF Tuning Unit 4,370-22,000 mc.  
 Model STU-4....RF Tuning Unit 21,800-33,000 mc.  
 Model STU-5....RF Tuning Unit 33,000-44,000 mc.

**SPECIFICATIONS:**

Frequency Range: 10 mc to 44,000 mc.  
 Frequency Accuracy: 1%  
 Resolution: 25 kc.  
 Frequency Dispersion: Electronically controlled, continually adjustable from 400 kc to 28 mc per one screen diameter (horizontal expansion to 20 kc per inch)

Input Impedance: 50 ohms—nominal

\*Sensitivity:  
 STU-1 10-400 mcs —89 dbm  
 400-1000 mcs —84 dbm  
 STU-2A 910-2,200 mcs —87 dbm  
 1,980-4,560 mcs —77 dbm  
 STU-3A 4,370-10,920 mcs —75 dbm  
 8,900-22,000 mcs —60 dbm  
 STU-4 21,800-33,000 mcs —55 dbm  
 STU-5 33,000-44,000 mcs —45 dbm  
 Overall Gain: 120 db

Attenuation:  
 \*\*RF Internal 100 db continuously variable IF 60 db continuously variable

Input Power: 400 Watts  
 \*Minimum Discernible Signal  
 \*\*STU-1, STU-2A, STU-3A

The model TSA Spectrum Analyzer has these exclusive Polarad design and operating features:

- Single frequency control with direct reading dial. No klystron modes to set. Tuning dial accuracy 1%.
- Five interchangeable RF tuning units for the entire frequency range 10 to 44,000 mcs.
- Temperature compensation of Klystron Oscillator.
- Swept IF provides 400 kc to 25 mc display independent of RF frequency setting.
- Internal RF attenuator.\*
- Frequency marker for measuring frequency differences from 100 kc to 25 mc.

# New Electronic Products

## MINIATURE RELAYS

The new sub-miniature "CPL" series has been announced for applications where size, sensitivity, and low and high temperatures are major factors. The units are hermetically sealed and

are  $\frac{3}{4} \times \frac{15}{16} \times 1\frac{3}{8}$  in. in size and weigh 1.0 oz. Available in SPDT (CPL-1) and DPDT (CPL-2) with contacting ratings to 5 amps resistive at 28 VDC-115 VAC or 3 amps inductive. Temperature range is 55° to +125°. Vibration, 15 G's through 500 cps. Shock, 50 G's. Operational life is in excess of 1 million cps under 1 amp resistive load. Pacific Relays, Inc., 6819 Melrose Ave., Los Angeles 38, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-10)

## SIGNAL CABLE

A new filament type air dielectric semi-flexible, aluminum-sheathed coaxial cable is now available with the inner solid copper conductor supported coaxially within the aluminum tube outer conductor by a polyethylene helix. Known as "Spirafil," the new cable is recommended where low attenuation, good frequency response, and freedom

from radiation are desirable. (Catalog material available.) Developed standard fittings are available at accessory manufacturers. Phelps Dodge Copper Products Corp., 49 Wall St., New York 5, N. Y.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-11)

## COLOR ANALYZER

The CPA-1 color test instrument is designed to analyze the chrominance components of composite video signals. Compares phase of chrominance components with respect to reference sub-

carrier, or between any two portions of the color signal. Measures phase delay from 0 to 360 degrees. Facilitates alignment of color coders. Checks accuracy of color signal. Complete equipment includes a phase shifter, a color signal demodulator, and a regulated power supply. Wickes Engineering and Construction Co., 12th St. and Ferry Ave., Camden 4, N. J.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-12)

## PULSE TRANSFORMERS

Two types of miniature pulse transformers have been especially designed for triggering and counting circuits, dc isolation, inversion pulse shaping, and pulse transmission circuits. One group, 1C, 2C, and 3C, has its core and coil assembly mounted within a metal housing with multiple terminal header plates of improved glass-seal type. The

other group, 1E, 2E, and 3E, has its core encapsulated and sealed within a molded improved epoxy resin. Both groups pass MIL T-27 specifications. Acne Electric Corp., 1375 West Jefferson Blvd., Los Angeles, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-46)

## TAPE RESISTORS

Type RTW tape resistors can be used and tested without curing new plate resistors each time one is changed, since the metal terminal can be soldered to a Project Tinkertoy type wafer with a

fired-on circuit pattern. The RTW is  $\frac{1}{2}$  in. long by 0.110 to 0.150 in. wide, max. and available in resistances from 39 ohms to 4.7 megohms. Temperature coefficient within characteristic F. specification MIL-R-11A. Type RNP, precured units, have overall length of 1.3 in. and 0.4 in. leads. Hansen Electronics Co., 7117 $\frac{1}{2}$  Santa Monica Blvd., Los Angeles 46, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-14)

## POTENTIOMETER

"Baroresistors," pressure-activated potentiometers, maintain their accuracy while being subjected to  $\pm 10$  G vibration to 500 cps, in accordance with the requirements of MIL-E-5272A, Par. 4.7.1. Models are also available for operation under vibrations of  $\pm 25$  G from 0 to 2,000 cps for missile use. New developments in coil-winding techniques have improved measurement accuracy

approximately two times over that formerly available. Can be supplied in ranges from 14.7 to 60 psi. Vacuum sealed. Trans-Sonics, Inc., Bedford Airport, Bedford, Mass.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-15)

**EXCLUSIVE!**

**Carter DUOVOLT GENEMOTORS**

**DC to AC  
CONVERTERS**

Operate recording and audio equipment from 6 to 415 volts DC.

**CHANGE-A-VOLT  
DYNAMOTORS**

Adapt 6 volt mobile radio to 12 volt cars.

**INDUCTOR  
ALTERNATORS**

Provide 400 to 800 cycle AC from DC input.

**NEW 6/12 DYNAMOTOR POWER FOR 60 WATT  
144-176 MC MOBILE RADIO TRANSMITTERS**

Now, Carter engineering solves the 6/12 volt change-over problem in mobile radio installations. For, with Carter 6/12 v. DUOVOLT power, standard communications equipment can be used in ANY automobile . . . in NEW CARS with 12 volt batteries or older models with 6 volt circuits.

To everyone who buys, sells, uses or services mobile radio, it's good sense to specify DUOVOLT power. Then, you're sure of 6/12 versatility combined with the proven dependability of rotary dynamotor power.

Carter 6/12 v. DUOVOLT genemotors draw minimum current, operate at high efficiency. Low r.p.m. speed makes for longer life, cuts maintenance cost. Five models provide adequate capacity for even the most powerful 60 watt sets. Backed by 23 years experience in mobile radio power.

**ROTARY POWER  
IS BEST**

In modern screw-drive tow-boats, smooth ROTARY power has long since displaced the vibrating pulsations of the paddle wheel, just like dependable ROTARY power has proven best for mobile radio.

**Radar Sea Clutter**

(Continued from page 71)

old. The threshold is caused by the fact that a certain wind velocity must be reached before water waves are formed. This threshold velocity is not constant but varies with surface contamination and air turbulence. The insert in Fig. 1 is to help in visualizing the significance of the  $\pm \sigma$  curves.

Fig. 1 shows the  $+\sigma$  and  $-\sigma$  standard deviation curves when looking upwind and downwind. Although not shown in Fig. 1, it is known that the distribution is skewed slightly because the surface slopes are slightly greater looking upwind than looking downwind. This may be observed qualitatively in Fig. 2 which shows waves in a transparent water wind tunnel where the wind is blowing from left to right. References 5 and 6 also show that the  $\sigma$  values for the cross wind case are somewhat less than shown in Fig. 1.

**Curvature Distribution**

Fig. 3 shows data by Schooley<sup>8</sup> giving the distribution of curvature of the wave facets as a function of local wind velocity. This data was the result of optical studies made using a small water windtunnel. Curvature is used instead of the ambiguous concept of facet size. Facet size has no real meaning because the wind-disturbed water surface has only infinitesimal perfectly flat areas. The concept of curvature is introduced to convey the amount of departure from flatness. It is interesting to note that here is again demonstrated a rather definite threshold of wind velocity that is necessary to create water waves.

Wind waves grow in height with increased wind velocity, increased time the wind has been blowing, and increased distance over the water that the wind has blown. The latter distance is called the "fetch." Fig. 4, adapted from references 3 and 9, shows the approximate mean wave height for various wind velocities and wind durations. There are also shown dashed lines representing the minimum fetch necessary to give the indicated mean wave heights. The  $+\sigma$  and  $-\sigma$  dispersion curves are not shown in Fig. 4 in order to avoid confusion. The wave height dispersion is about one foot for a mean wave height of 2 feet. The dispersion is about 2.5 feet for a mean wave height of five feet. For a mean wave height of 10 feet

(Continued on page 128)

... That's Where Hermetic Kills Sputter "Bugs" in Transistor Housing Bases—

We have used *all glass* in the internally exposed area of our No. 1619 Transistor Base. This all-glass construction prevents contamination of a transistor wafer when closure is made after mounting. Had we left this area as *metal*... your "buttoning-up" operation would float solder and flux right in under the wafer. When this occurs, the possibility of contamination or degradation of the wafer is raised, and with results that are difficult to predict.

Hermetic's specialist-engineers can help you avoid trouble in all your hermetic sealing problems. Why not draw upon their knowledge and skill?... it covers the full range of matched glass or VAC-TITE\* hermetic sealing for the most advanced components.

Write us about your problem, and for your copy of our latest addition to the "Encyclopedia Hermetica." You'll find it most complete and up-to-date.

\*Vac-Tite is Hermetic's new vacuum-proof, compression construction glass-to-metal seal.

FIRST AND FOREMOST IN MINIATURIZATION

**NEW STUDIO SYNC GENERATOR TG-2A** (Field Generator is Type 5-12A). Combines sync generator, dot generator, Genlock, grating generator, regulated power supply—on a single chassis. Automatic Changeover Switch MI-26289 (illustrated) is a companion unit for convenient switching between two sync generators.

**NEW COLOR FREQUENCY STANDARD MI-40201**. Source of 3.58 mc color subcarrier used with sync generator to complete synchronizing function for color operation. A counter chain is included to provide means for locking the sync generator to the color subcarrier.

**NEW COLOR STABILIZING AMPLIFIER TA-7B**. In the studio, it performs all normal Stabilizing Amplifier functions—plus improved operation with the Genlock. At transmitter, it provides the white stretch required for color operation. Corrects frequency response for transmission losses.

**NEW PULSE DISTRIBUTION AMPLIFIER TA-4A**. Regenerates degraded pulse signals. Restores rise time. Removes overshoots and spikes. Eliminates hum, surges, tilt. Provides sending-end termination for better long-line performance.

**NEW COLORPLEXER TX-1B** combines on a single chassis all circuits needed to produce a composite color signal from color primary signals of the live camera, film camera, or color bar generator. New design features improved stability and retrace blanking.

**NEW VIDEO SWITCHER MI-26277**. Ideal for monitor switching in announce booth, projection room, program consoles . . . wherever monitors may be located. The inexpensive means for modernizing your present switching installation.

# 9

## NEW TV EQUIPMENT ...for better monochrome and color

Illustrated here are a few of RCA's new, improved video designs for monochrome *and* color operation — from the most comprehensive line of television equipment in the industry.

Engineered in accordance with the best television practice, these units are designed for progressive TV stations looking for new ways to keep picture quality "up-to-the-minute." They offer improved operating efficiency and economy. They save as much as  $\frac{2}{3}$  the rack space of previous designs.

RCA improved Video Equipments are already in operation in well-known TV stations throughout the country — on both monochrome *and* color. For complete information on the entire line, call your RCA Broadcast Sales Representative. In Canada, write RCA Victor, Ltd., Montreal.

Free technical folders on RCA Video units. Simply tell your RCA Broadcast Sales Representative the number (listed below).

**RADIO CORPORATION of AMERICA**  
ENGINEERING PRODUCTS DIVISION CAMDEN, N.J.

**NEW BURST FLAG GENERATOR, MI-40202A.** Generates keying pulse for injecting subcarrier bursts into Colorplexer. Burst position, burst width, keying pulse amplitude are adjustable with high accuracy. A "must" equipment . . . and a companion to the RCA Color Frequency Standard.

**NEW VIDEO DISTRIBUTION AMPLIFIER TA-3A.** Feeds up to 3 low-impedance lines from single high- or low-impedance source. Has extended low- and high-frequency response. 40-db isolation between output lines. Excellent linearity and gain characteristics. TA-3A is good for color.

**NEW COLOR STRIPE GENERATOR WA-8A.** Enables you to transmit color test signals along with regular monochrome signal. Useful for receiver adjustment throughout the program day. The inexpensive "must" for TV stations planning color.

## Parabolic Reflector

(Continued from page 77)

ences the second of the two helpful characteristics of such a reflector, the reduction of background noise by the physical shielding of the microphone from interfering sounds originating behind the reflector. The deeper the parabolic, the more the microphone is shielded from interfering sounds. It is therefore apparent that the parabolic reflector can help the signal-to-noise ratio in two ways, by increasing the signal, and by reducing the noise.

The shape of the reflector is described by the equation for a parabola,  $y^2 = kx$ . The selection of the value of the constant  $k$  determines the flatness or depth of the parabola which influences the degree of shielding from unwanted sounds the reflector will afford the microphone. A family of parabolas showing values of  $k$  from 1 to 50 is shown in Fig. 2. The parabolic reflector we

Fig. 4: Parallel rays entering parabola

have used is described by a value of  $k = 25$ . A value of  $k = 12$  has been used by others with satisfaction.

For structural strength of the reflector, it is desirable to have a rolled edge. This gives great rigidity with insignificant increase in weight. The aluminum used was 0.064 in. thick, although rigidity is the controlling factor. To reduce the inevitable resonant effect, the back was covered with several coats of automobile undercoat, until tapping the reflector yielded only a dull thud. Without such deadening, winds or slight shocks would elicit a ringing at its resonant frequency.

The gain at the high frequencies is higher than at the mid-frequency region when the microphone diaphragm is on the axis exactly at the focal point. Moving the microphone slightly from the focal point discriminates against the highs and thus the response can be flattened by a slight defocusing.

The directivity, of course, is a function of frequency. At the very

# COLOR TV

**ONLY TELECHROME MAKES THEM ALL**

**COMPLETE FACILITIES FOR TV STATIONS, MANUFACTURERS & LABORATORIES**

Finest color film chains, colorplexing, transmitting, analyzing, monitoring, testing equipment.

**617-BR AUTOMATIC BALANCE CONTROL FOR ALL COLORPLEXERS**

(Regardless of Manufacture)

An ingenious circuit locks the entire encoding equipment in balance within 20 seconds after being turned on. Thereafter balance is held under even the most difficult operating conditions.

**609-ER AUTOMATIC BALANCE CONTROLLED COLORPLEXER**

The only colorplexer which incorporates Automatic Balance Control. Eliminates all drift problem. Colorplexer automatically and instantaneously in balance at all times.

**700-A 3V COLOR FILM CHAIN**

Finest in quality, lowest in price. 3V provides greatest latitude in selection of color films. Designed specifically for broadcast application, requires little space. Multiplexes 35 or 16mm film, slides, opaques.

**1073-A SINE-SQUARED SQUARE WAVE GENERATOR**

Newest test unit produces new type of wave forms for testing any part or all of a TV or pulse system for amplitude and phase characteristics. "Go-No-Go" indication simplicity.

**1601-AR CHROMASCOPE**

Signal Certification Equipment. Accurately measures the performance alignment, and phase errors of color TV equipment. Presents on a cathode ray screen a continuous polar plot of the phase and amplitudes of all colors in a composite color video signal. Capable of a .2° accuracy with 1604-AR phase magnifier.

**1604-AR PHASE MAGNIFIER**

Expanded phase indicator of a signal for measurements of differential phase to .2° or better accuracy of chroma frequencies.

**302-AR DRIVE GENERATOR**

Small, portable, inexpensive unit. Provides horizontal blanking, horizontal sync, vertical drive and burst flag for driving most signal generating equipment where standard sync is not available.

**1071-AR WINDOW GEN.**

**OSCILLOSCOPE CAMERA MODEL 1521-A**

**VIDEO TRANSMISSION TEST EQUIPMENT**

Provides stairstep, window and multiburst signals. Now in wide use by the leading TV stations, networks and common carriers. Checks video facilities for color and monochrome. Polaroid camera recordings.

**1047-BR STAIR STEP GEN.**

**1070-BR MULTI-BURST FREQUENCY GEN.**

**636-B CHROMALYZER**

Portable Precision Color Bar Generator for checking color broadcast studio and transmission facilities, receivers and monitors. Can be tied into a system. Provides complete composite color signals at 100 or 75% chroma.

**1603-AR PHASE SLOPE (ENVELOPE DELAY) CURVE TRACER**

Instantaneous scope or meter reading of the envelope delay and amplitude characteristics of any network, video amplifier, or systems. Precise-time saving. Has separate transmitter and receiver units which allow one way or loop measurements.

**DELIVERY 30 DAYS**

Literature on these and more than 150 additional instruments for color TV by TELECHROME are available on request.

*you can rely on ARC Test Equipment!*

Unerring precision is yours in the ARC Type H-14 Signal Generator! For either pre-flight or bench checks, this instrument tests *all* ARC Omni and Localizer Receivers with vital accuracy and speed. The H-14 clears one unit or a complete squadron . . . in under sixty seconds!

Checking up to 24 omni courses, to-from and flag-alarm operation, omni course sensitivity, calibration accuracy and left-center-right on localizer, the versatile H-14 also may be used to transmit voice instructions to pilots along with test signals.

ARC supplies the watchdog H-16 Standard Course Checker for *exact* course accuracy and phase measurement checks on the H-14, or any other omni signal generator. Both instruments available from factory only. Write for literature.

## Parabolic Reflector

(Continued from page 122)

low frequencies, say 100 cps, the reflector is so small compared to the wavelength that the device is essentially non-directional. At higher frequencies the system is quite directional. A 44-in. parabolic at 4000 cps would be 6 db down at approximately 30° off the axis.

Though the crystal microphone normally supplied with the Minitape is well suited for domestic voice recording, the basic element of a crystal microphone is subject to both heat and moisture so we have found it advisable to use dynamic microphones in warm, humid climates. It is true that there are new ceramic microphones now available as well as crystal microphones, which will withstand much higher temperatures. The crystal microphone, being a capacitive device, will permit fairly long cable leads providing the capacitance of the cable is not too high. It is to be noted that on long cable lengths there is no frequency discrimination because of the capacitance, but there is an attenuation of the overall signal. It is also for this reason that the dynamic microphones lend themselves better to field use.

The pre-amplifier utilizes a single stage built around a type 1U5 pentode. (See Fig. 3.) Transformer-coupled input allows proper matching for both crystal and dynamic microphones. A two-stage monitoring amplifier drives a pair of headphones which enable the operator to hear what is being picked up without turning the recorder on. The usual operation would call for much listening and selection, but only a small amount of actual recording. The headphone level is also an indication of proper recording level. Adjusting the volume control for comfortable headphone level feeds proper signal level to the Minitape recorder also.

Pre-amplifier power is supplied by self-contained batteries. Power for the three 50 ma. filaments and the pilot lamp is supplied by two standard size flashlight cells connected in parallel and supplying 210 ma. Plate power is supplied by two 67½ v. Burgess XX45 batteries in series.

The 1U5 tube in the pre-amplifier should be carefully selected to minimize noise and microphonics. The filamentary type of tube is, of course, not the best in this position, but we found that a moderate amount of selection brought the noise level down to within a very few db of

# Sylvania Power Transistors...

...now with **increased ratings**

dissipate 2½ watts in free air,  
have low thermal inertia

NEW Sylvania design developments achieve low thermal inertia and increased ratings in the Sylvania Power Transistors 2N68 and 2N95. Dissipation of 2½ watts in free air reflects a full watt increase over previous ratings. Power dissipation up to 5 watts is possible with an external heat sink.

With Sylvania's new design heat is conducted quickly away from active elements. Resulting low thermal inertia improves performance stability over a wider range of operating temperatures. Operated as a Class A amplifier the 2N68 or 2N95 provides a minimum power gain of 20 db.

## Radar Sea Clutter

(Continued from page 128)

face ( $\sigma^\circ$ ) for various vertical angles of a microwave antenna beam ( $\Theta$ ). Sea clutter actually fluctuates rapidly and irregularly. The average curve shown is quite speculative and is based on data from reference 2 and incomplete unpublished Naval Research Laboratory data. The  $\Theta = 90^\circ$  point corresponds to an airborne radar looking directly down towards the water surface (See Eq. 2). The two  $\Theta = 0^\circ$  points correspond to a very low altitude radar looking towards the horizon (See Eq. 1). The left  $-0^\circ$  point is for a low altitude radar looking downwind and the right  $+0^\circ$  point is for the upwind case. The figure shows  $\sigma^\circ$  to tend to level off in the region between  $\pm 15^\circ$  and  $\pm 45^\circ$ . However, the upwind region appears to be 5 db to 10 db higher than the downwind region. Examination of a wave profile, such as that shown in Fig. 2, leads one to feel that there should be more energy scattered back when looking upwind than when looking downwind due to the greater slopes in the upwind direction.

In Fig. 5 it is evident that  $\sigma^\circ$  tends to become very small at  $\pm 0^\circ$  is approached as would be expected because of the surface null created by cancellation of the direct and reflected waves at the water surface. It is in this region where sea swell, caused by distant winds, may enter to bring the chop, caused by local winds, up out of the surface null and into the radar beam.

The maximum value of  $\sigma^\circ$  is reached in the region around  $90^\circ$ . With very calm water, where there is specular reflection from a large area, it is possible for  $\sigma^\circ$  to be considerably greater than unity. The width of the build-up portion of the curve in the region around  $90^\circ$  is less for low wind velocities and greater for high winds. Fig. 5 is roughly correct for a horizontally-polarized, three-centimeter-wavelength radar looking at a water surface disturbed by a 15-knot wind. A 20-knot wind might move the solid portion of the curve about 5 db higher and possibly lower the peak by about the same amount. The solid portion of the curve for a 10-centimeter radar would lie perhaps roughly 5 db lower than the 3-centimeter case under the same wind conditions. For a quite calm sea, horizontal polarization gives less sea clutter than vertical polarization. As the wind velocity increases, the difference becomes less marked, particularly for angles

# MICROWAVE ANTENNA SYSTEMS?

## Prodelin "Job Packaging"

is the COMPLETE ANSWER

Supply Prodelin with only your specifications, and Prodelin will deliver a complete antenna system — *systemized* to your particular job, with *matched components* and *installation-ready* at your site, when you need it!

### ANTENNA SYSTEMS AND TOWERS ANTENNAS:

- Parabolic (dipole feed) • Off-set Feed (harn feed) • Cavity Fed Corner • Horn • Yagi • Colinear

### ANTENNA ACCESSORIES:

- Pipe, Tower & Star Mounts • De-icing Kits

### COAX:

- Line • Couplings • Elbows • Fittings • Adapters • Assemblies • Hangers • Dehydrators

### TOWERS:

- Semi-Portable All Aluminum.

## Radars Sea Clutter

(Continued from page 128)

greater than a few degrees.

The rather meager data given on the general nature of radar sea clutter itself are brought together here in hope that it will stimulate theoreticians and experimentalists to solve the riddle of the interrelationship. Ament<sup>10, 12</sup> and Eckart<sup>11</sup> have made initial contributions in this field. However, the magnitude of the problem yet to be done is well summarized by Ament, who says, "The problem of calculating the electromagnetic effect of surface roughness is one of combining solutions of Maxwell's equations with a statistical description of the rough surface. For the sea surface, there currently appears to be no statistical description sufficiently detailed to explain certain radio and radar measurements. In addition no mathematical method is currently available for predicting the effect of any statistically described sea on radio propagation."

## Microwave Accelerator

High Voltage Engineering Corp., manufacturer of Van de Graaff particle accelerators, has claimed the first microwave linear accelerator offered commercially. The initial model is a radiation-producing machine designed especially for operation in the 4 to 7-million volt range.

\* Pulse ratings many times CW ratings are available on most Eimac klystrons.

## Eimac amplifier klystrons are performance proved in extended range UHF and microwave communications systems

Eimac amplifier klystrons, performance proved in high power extended range microwave communications systems, now cover the spectrum from 225-3000mc. The Eimac 3K50,000L series, with 10kw/CW power output, power gains of over 1000 times, over 40% operational efficiency, long life and reliability, are typical of Eimac high power UHF klystrons. Of copper and ceramic construction, Eimac klystrons offer wide range tuning and easy

input and output coupling through the use of external resonant cavities which leave the vacuum system free of RF circuitry. Light weight, allowing easy installation and maintenance, plus simplified design, minimizing production and stockpiling problems, make Eimac klystrons more practical and economical than any other.

See the klystrons selected to pioneer high power extended range microwave communications systems by visiting the Eimac booths, 549-551, at the I.R.E. show in New York March 21-24. Management and Engineering representatives will be on hand to discuss Eimac tubes and their application.

## DELAY LINE

Model DL0390-200LTC ultra stable delay line has a maximum overall delay drift of less than  $\pm 0.15\%$  over a temperature range of  $-65^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ . Developed for guided missiles, the unit

has found wide application in encoders and decoders. The delay line is a 100 section lumped constant type with an overall delay of 200  $\mu\text{sec}$ , tapped every 2  $\mu\text{sec}$ , with a rise time of 6  $\mu\text{sec}$ . Characteristic impedance is 390 ohms. DC attenuation, 0.12 db/section. Pulse attenuation, 0.14 db/section. Package size,  $7\frac{1}{4} \times 4\frac{5}{8} \times 1\frac{1}{2}$  in. Epsco, Inc., 588 Commonwealth Ave., Boston 15, Mass.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-16)

## JUNCTION DIODES

Silicon junction diodes with high forward conductance and very high back resistance of the order of 100,000 ohms have been announced. The first 8 types of a proposed line of such units includes Types HD6001, HD6002, and HD6003, previously announced, plus the new types HD6005 through HD6009. All types have an ambient operating range from

$-80^{\circ}$  to  $200^{\circ}\text{C}$ . Dimensions: glass body, 0.265 by 0.103 in. max. Specification sheets available on request. Hughes Aircraft Co., Semiconductor Div., Florence Ave. at Teale St., Culver City, Calif.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-17)

## COIL WINDINGS

Molded from the new epoxy resins, electrical coil windings have been announced that are impervious to water, oils, dust, acids, alkali solutions, and water base hydraulic fluids. Withstand

a 200 megohm leakage test. The high dielectric value of 1800 v/mil enables high voltage applications to be miniaturized. DeLuxe Coils, 1304 First St., Wabash, Ind.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-18)

## HERMETIC TERMINALS

The "Nicote" metallized coating process enables reduction of metal oxides in a controlled atmosphere which fuses the ceramic body and the base metal banding of alumina hermetic terminals

and allows use of high temperature solders, such as eutectic silver-copper alloy. The manufacturer's standard alumina body, satisfactory for use up to  $2,000^{\circ}\text{F}$ ., has the high thermal shock resistance and mechanical strength inherent in high grade alumina. Sales engineering by Lundey Associates, Waltham 54, Mass., for Frenchtown Porcelain Co., Frenchtown, N. J.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-19)

## MORE TECHNICAL INFORMATION

describing the new products presented here may be obtained by writing on company letterhead to New Products Editor, TELE-TECH & ELECTRONIC INDUSTRIES, 480 Lexington Ave., New York 17, N.Y., listing numbers given at end of each item of interest. Please mention title of position held.

## TAPE READERS

The series FR-300 paper tape readers read one or more standard perforated tapes at rates up to 60 characters/second. Model FR-350 is used for simultaneous and synchronous reading of two

perforated paper tapes of 5, 6, or 7 levels. Model FR-310 enables reading 5, 6, 7, or 8 level tapes. Solenoid-driven for speeds up to 20 characters/second. Motor-clutch driven for speeds to 60 characters/second. Also, without drive. FR-350 is suited to dual functional control; FR-350 for data inputs, remote controls, etc. Soroban Engineering, Inc., Box 117, Melbourne, Fla.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-20)

## MINIATURE MOTORS

Type SC sub-miniature motors, either 400 or 60 cps ac, are for applications where size, weight, and high performance are governing factors. Protection for military environmental specifications has been considered in the design. Can be wound single, 2 phase, or 3 phase, and furnished as an induction or as a hysteresis motor. Further, units can be furnished with a concentric spur

gear reducer. For specific applications, details should be submitted for final design determination to Yale J. Holt, Globe Industries, Inc., 1784 Stanley Ave., Dayton, O.—TELE-TECH & ELECTRONIC INDUSTRIES. (Ask for 3-21)

(Continued from page 47)

days, particularly in the industrial electronic field it is common practice to specify tolerances of  $\pm 5\%$  on the overall performance specifications of an instrument using forty or fifty tubes and several hundred other components.

Considering first components such as resistors and capacitors, the standard tolerance is  $\pm 20\%$ , while tolerances of  $\pm 10\%$  and  $\pm 5\%$  can be obtained at extra cost (in a typical case relative costs are in the ratio 14: 17: 35 respectively). Thus a component with a tolerance of  $\pm 10\%$  is readily available at a reasonable cost. Moreover, experience indicates that in the case of resistors and capacitors bought directly from the manufacturer, the distribution curve is reasonably symmetrical about the nominal value for quantities of 1,000 pieces or even less, so that in a circuit employing a number of similar components in cascaded stages, the deviations tend to average out.

In the case of tubes however, the situation is very different. One has to go to a premium tube so as to get a tolerance of  $\pm 20\%$  on transconductance for example and here the cost ratio between standard and premium tubes averages something like 1:3.5, a very substantial difference. Moreover, the nature of the product is such that a given production batch of tubes will tend to be reasonably uniform about a given value for a single characteristic, while the next batch may center around an entirely different value.

Consider the case of a five-stage, wide-band amplifier using pentodes with a nominal transconductance of 5,200 micromhos throughout with plate loads of 500 ohms. If all the tubes have a transconductance of 5,200 micromhos, the amplifier gain will be 119. Assuming all tubes to be 20% low, the gain will be 41, while tubes 20% high give a total gain of 286. From the point of view of the tube manufacturer and also from the standpoint of good engineering practice, one should of course design the amplifier with seven stages and use negative feedback to take up variations in transconductance. This solution however means an increase of 40% in power consumption, heat dissipation size and weight, and in some cases could mean the difference between convection cooling and forced air cooling, in which case the addition of a blower means restriction of power line frequency to 50-60 c/s or 400 c/s or else the use of an expensive

# HERE'S HOW -

... dependable **BUSS FUSES** help  
protect the Product and your Reputation

BUSS fuses are made to protect — not to blow needlessly. A sensitive electronic device tests every BUSS fuse normally used by the Electronic Industries. Any fuse not correctly calibrated, properly constructed and right in all physical dimensions is automatically rejected.

This careful testing is your assurance that BUSS fuses will open and protect equipment against damage when there is trouble on the circuit. If a poorly made fuse doesn't open when it should on an electrical fault, something else will burn out.

BUSS fuses also safeguard your good-will by eliminating needless blows. A useless shutdown caused by a faulty fuse blowing when trouble doesn't exist can be most irritating to your customer. It could jolt his confidence in you.

Surely it is wise to rely on fuses that help you avoid troubles by offering dependable protection under all service conditions.

Then, why not be sure your buying and stock records specify BUSS and FUSETRON fuses . . . you'll find it convenient to use BUSS as the one source for all your fuse needs.

Makers of a complete line of fuses for home, farm, commercial, electronic and industrial use.

## A COMPLETE LINE OF RESEARCH INSTRUMENTS COVERING FREQUENCIES UP TO 90,000 MC!

What new miracles are waiting to be found in the virtually unexplored microwave region above 40,000 MC? Scientists have begun to seek the answer to this question — and hints of some important discoveries are in the wind.

Here, for the first time, is a complete line of accurate, dependable microwave equipment, which features specially engineered instruments for these UPPER FREQUENCY RANGES, as well as lower ranges!

Standing wave detectors, precision attenuators, phase shifters, tuners, crystal mounts, wavemeters, horns, terminations, couplers — every type of instrument generally used for more conventional frequencies from 2.6 to 18 KMC — are now available in continuous coverage up to 90 KMC. D-B Crystal Multipliers produce required frequencies when above the range of currently available tubes.

## Letters

(Continued from page 136)

D.C. blower plus a rectifier. Remember too, that this extra cost is in addition to the cost of premium tubes to ensure a tolerance of  $\pm 20\%$  on transconductance! Under these conditions it is scarcely surprising that in some cases a design engineer decides to select tubes rather than take the ideal solution which may very easily double his production costs and price him out of the market.

It seems to me that problem is primarily one for the tube manufacturer to solve. Either he must learn how to control his manufacturing processes more closely so that tube tolerances conform to the standards which apply to other components and do so for a comparable price differential, or else he must select his output in such a way that in a batch of 1,000 tubes, say, given characteristic values must be distributed symmetrically about the nominal value so that a small user can be reasonably sure of getting the right average. As things are at present, there seems to be no alternative to some tube selection, and the main difference seems to be whether it should be done by the tube manufacturer or by the equipment manufacturer.

A. W. Russell

Market Research Engineer

**FEATURES:**

**Signal Generator:**  
CW, Square Wave, FM or pulse mod. fr, 15.5 to 17.0 Kmc.

**Power Monitor:**  
Measures Signal power 15 to 17.5 Kmc. Accuracy  $\pm 2$  db full range.

**Maximum Average Power:**  
1 watt, 25°C and 60% relative humidity.

**Wavemeter:**  
15.0 to 17.5 Kmc, accurate to 0.03% at 25°C temps.

**Spectrum Analyzer:**  
15.5 to 17.0 Kmc displayed on 3" CRT.

**Size:** 17" x 10½" x 13"

**Weight:** 45 lbs.

**KEARFOTT'S NEW  
FOUR-FUNCTION  
PACKAGED  
K<sub>U</sub> BAND  
TEST SET**

MODEL W-509

Available in K<sub>U</sub>, C, and X Bands

**Portable-modular — complete**

Tests signal strength, spectra, power and frequency from a single chassis unit. One warm-up period, one switch to activate signal generator, power monitor, wavemeter and spectrum analyzer.

Also analyzes bandwidth characteristics, and supplies square wave modulated signal for use in standing wave measurements. Each test unit mounted on separate plug-in sub-chassis for maintenance ease. Special plug-in test units can be ordered. Combination package means lower first cost than separate units.

**Kearfott K<sub>U</sub> Band Microwave Components**

Bends, twists, T's, loads, attenuators, crystal mount and many other K<sub>U</sub> Band microwave components are available at Kearfott. Silver-plated brass or aluminum to rigid specifications. Special assemblies such as rotary joints, etc., may be designed in this band. Kearfott Microwave Equipment also now available in all standard bands. Custom items to your blueprints or ours. *Send today for information on Kearfott Microwave Equipment.*

**TETRODE TRANSISTORS**

Bell Labs. scientist R. P. Riesz observes automatic production of tetrode transistors by newly developed machine, dubbed "Mr. Meticulous," originated by R. L. Wallace. Inset shows transistor, with wires attached to 1/10,000 in. thick center p-layer, compared to the edge of a dime. Sketch indicates construction, with p-layer enlarged for illustrative purposes. For operational details, see page 13.

**Electronic Ticket Agent**

High speed electronic and mechanical equipment is credited with making the Pennsylvania RR's new ticket office at 30th St. Phila. the fastest, most efficient railroad sales and reservations sales center in the world.

Through the facsimile network which links the central branch with six other PRR offices in the Phila. area, all orders

Agent inserts metal matrix in "Ticketeer" which produces rail ticket by facsimile reproduction

placed in these branches are immediately recorded in the central branch so that an up-to-the minute record is available. Tickets for the reserved space are transmitted back through the facsimile link to the point in the network where they are to be picked up.

In all, the central office utilizes 26 facsimile machines, 20 microfilm units and 17 "Ticketeer" machines.

## Special TV Tower designed by **BLAW-KNOX** houses automatic elevator

When WWJ-TV, Detroit, wanted an automatic elevator in their new tower, Blaw-Knox went to work on the design of the tower . . . in close cooperation with the manufacturers of both the elevator and the control system.

The result is this tremendous triangular tower . . . 14 feet on each side, 1063 feet high and weighing 265 tons . . . with special structural features to rigidly support both the 102 foot antenna and the automatic elevator.

Ready accessibility to any part of the tower up to the 980 foot level is provided by special design, completely enclosed automatic elevator. It can be stopped by the operator at any level by means of low frequency inductive carrier control. In addition an auxiliary pushbutton station, located at the lower landing, permits manual control at that point. The two controls are interlocked so that only one can be operated at a time. A telephone provides ground-to-car communication.

The advanced design and fabrication of this tower for WWJ-TV typifies the kind of service which Blaw-Knox offers you . . . to meet *your* specific requirements.

For more complete information on all types of Blaw-Knox Antenna Towers, write or phone for your copy of Bulletin No. 2417. Or send us your inquiry for prompt service, specifying height of tower and type of antenna.

# Do You Need This CAPACITY TO PRODUCE FINISHED WIRE LEADS

- measured and cut in 2½ to 45-ft. lengths?
- insulation stripped one or both ends to 8½ in.?
- up to 1800 pieces per hour in 10-ft. lengths?

## Completed Automatically on Artos Model CS-10

Now you can get high production of insulated wire leads... accurately measured, cut in lengths up to 45 ft., and stripped at one or both ends. Leads are finished complete and collected in one fast, automatic cycle.

This Artos machine will handle wire, cord and cable up to No. 10 stranded or No. 12 solid. Consistently uniform results are ob-

tained without cutting strands or nicking solid wire. Insulation may be stripped from 2 in. up to 8½ in. at one end and 6½ in. at the other. You can also slit parallel cord or remove the outer jacket on SJ appliance cords.

Inexperienced help can handle an Artos without trouble. Set-ups are quickly changed for different cut lengths and stripped lengths.

### Other Artos Machines

The complete line of Artos automatic wire cutting and stripping machines will handle *cut lengths* from 1 in. to 60 ft., *stripped lengths* to 6½ in. at one end and 8½ in. at the other, *wire from* No. 12 to No. 000 gauge, and up to 3600 pieces per hour. Ask for recommendations on your problems.

## Data Encoder

(Continued from page 73)

ting of relays. During this period the reset pulse is blanked out so that no pulse is passed through the comparator gate. Throughout the encoder, pulse outputs which are used to drive parallel combinations of elements are shaped by blocking oscillators. The blocking oscillator provides a low-impedance output with a standard pulse amplitude and width and assures proper triggering of circuits which follow.

### Comparator

Precision of this digital voltage converter is limited by the accuracy of the standard comparison voltage and also by the sensitivity and stability of the comparator device. A standard cell reference is used to maintain required accuracy of this comparison voltage, and the comparator has the following major characteristics:

1. The comparator gate passes pulses when the potential of the summing junction is negative and rejects all signals of opposite polarity regardless of amplitude.

2. Comparison sensitivity is sufficient to detect a 1 mv positive signal referred to the input of the summing amplifier.

3. Response time of the comparator is approximately 0.5 msec. and easily allows operation at the sampling rate of 40 per sec.

4. Offset and drift of the comparison circuit are less than 0.1% of full scale, or 1 mv referred to the input. The comparator device which meets these specifications is shown in Fig. 3.

Basically the comparator which is shown in Fig. 3 consists of a wide-band, chopper-stabilized summing amplifier<sup>7</sup> which adds negative reference voltages to a positive input voltage. This amplifier has an overall gain of 100 and a flat frequency response from 0—10,000 cps. Still further amplification of the sum of the input and the standard voltage is necessary before reliable operation of a gating tube may be obtained. To accomplish such reliability, a two-stage carrier type of amplifier is placed between the summing amplifier and the reset pulse gate. A bridge type of modulator<sup>8</sup> consisting of four germanium diodes modulates the 50 kc carrier which is then amplified and later demodulated. The output of the carrier amplifier is a dc voltage applied to the grid of a gate tube which passes reset pulses when a relay is to be reset. Within its linear region, the

# Selection of Tube Sockets Simplified!

## Standardization saves time and extra expense!

These Johnson tube sockets do triple duty! Duty as Standard, Industrial, or Military models. Johnson's new tube socket standardization program now makes it possible to order special industrial and military sockets as well as standard commercial types from stock. Also, through standardization, small run set-up charges are avoided, and sockets ordered to special specifications can in many cases be furnished at lower cost by substituting an equal or higher quality socket from the standardized specifications listed below:

**Standard:** Commercial grade for general requirements. Bases, glazed porcelain or L4 steatite. Cushion washers, fungus resistant glass base melamine.

**Industrial:** Higher quality with glazed steatite bases, DC200 treated, phosphor bronze or beryllium copper contacts .0005 silver plated. Aluminum retaining shells or shields are Iridite #14 treated. Glass base melamine cushion washers, fungus resistant.

**Military:** Top quality to meet all military requirements. Bases L4 or better glazed steatite, DC200 treated. Phosphor bronze or beryllium copper contacts, heavy silver plated. Fungus resistant glass base melamine cushion washers. Solder terminal ends hot tin dipped. Retaining shell brass .0003 nickel plated. Aluminum shields or shield bases Iridite #14 treated. Threaded hardware .0002 nickel plated, unthreaded hardware .0003 nickel plated. Entire socket protected for 200 hour salt spray.

For further information on Johnson Tube Sockets, write for the new Johnson General Products Catalog #975.

## Data Encoder

(Continued from page 142)

gain of this amplifier is approximately 50.

A germanium diode in series with the ring modulator passes only positive signals from the output of the summing amplifier. An increment of 1 mv at the input to the summing amplifier corresponds to a change of 0.1 v at the output of the summing amplifier and to a change of approximately 5 v at the grid of the pentode gate.

The output of this comparator consists of a series of reset pulses which are generated as shown in Fig. 4 and which occur one-half of a digit period after relay closure. The top line shows the voltage at the grid of the gate tube, and the lower line, the resulting reset pulses. Corresponding binary-number output is shown on the last line.

### Relay Selector Circuit

A ring circuit employing eleven thyratron stages supplies pulses necessary for relay operation and reset pulse gating, thus controlling the sequence of relay operations. Through a series of diode "and" gates, a reset pulse which is passed by the comparator gate influences only the relay which represents the digit under consideration. This reset pulse, when present, changes the state of a bistable multivibrator which in turn releases the relay. Relay current is supplied by a high-voltage supply with resistance in series so that essentially constant current is applied to the relay winding. Since the relay windings are highly inductive, the large initial voltage is desirable for rapid operation.

Fig. 5 shows the experimental two-channel encoder. Although systems of similar accuracy are available commercially, the sampling speed is too slow for use in rocket-motor instrumentation testing where tests are of short duration and a large number of points must be recorded. The encoder, together with the transcriber, provides a field recorder and an automatic-data-handling system capable of supplying engineering data of increased accuracy in a form which is easily handled by digital computing equipment.

## Stabilizing Transistors

(Continued from page 76)

The dependence of  $I_c$  on  $I_{c0}$  is obtained by differentiating Eq. 2 giving

$$\frac{dI_c}{dI_{c0}} = \frac{R_1 R_2 + R_1 R_3 - b(R_1 + R_2 + R_3)}{(1 - \alpha) R_1 R_2 + R_1 R_3 - b(R_1 + R_2 + R_3)} \quad (4)$$

Two of five transistors used in evaluating Fig. 7 data did not recover after the test while three others had 50% higher  $I_{c0}$  readings at room temperature after the test. At this point Fig. 7 data was considered valid and no further transistors were subjected to such rigorous treatment. In all 80 transistors were tested including several silicon types which were operated to 125°C and 150°C with gains stabilized to better than 3 db over the temperature range. Table 2 gives the complete performance data on all transistors tested, including the effect of the temperature range on parameters. We may conclude from this table that different performance characteristics may be expected from different manufacturers insofar as temperature range is concerned. These data are presented as applicable only to those transistors actually tested, and are not necessarily characteristic of all transistors made by the manufacturers, or of those made after the dates on which the transistor used in these measurements were manufactured. All transistors used in this investigation were received prior to June, 1954. The failure point for all transistors was considered to be the point at which the gain was down 3 db from the room temperature value. Of all the transistors tested, none failed to operate successfully over a much wider range than when unstabilized and with results in good conformance with predicted performance. Several units with  $I_{c0}$  below 2.5  $\mu$ a were operable up to 115°C with less than 3 db gain change. The silicon transistors had  $I_{c0}$  values well below 1  $\mu$ a and could have been used at 80°C with no stabilization. However, for operation to 125°C and 150°C some stabilization was necessary for reliable performance.

### 200 Hr. Life Test

As a final test of the efficiency of the stabilization, several Raytheon CK 722's, in the circuit shown in Fig. 6, operating with  $I_{c0.25^\circ} = 2$  ma and  $I_{c0.25^\circ} = 6$   $\mu$ a, were subjected to temperatures ranging between 75°

# Ruggedized and aged

## "RELIABLE" DOUBLE TRIODE

The "Reliable" version of the 2C51 and 5670

Do you have an aircraft or industrial application that requires utmost dependability in increasing or controlling alternating voltages or powers . . . in changing electrical energy from one frequency to another . . . or in generating an alternating voltage?

If so, specify the Red Bank RETMA 6385 "Reliable" Double Triode. For it is specially ruggedized to perform at top efficiency longer, even under operating conditions of severe shock and vibration. And, as further assurance of its extra reliability, each RETMA 6385 is factory-aged with a 45-hour run-in under various overload, vibration and shock conditions, such as it might meet on the job.

Whether you need tubes as amplifiers, mixers, or oscillators, it will pay you to investigate the superior, longer-lasting performance qualities of the Bendix Red Bank RETMA 6385.

Michigan-Wisconsin Pipeline Company

## Assures power for repeater stations with **ONAN** Standby Electric Plants

Microwave radio handles communications for the Michigan-Wisconsin pipeline which carries natural gas from Texas fields throughout Wisconsin and Michigan.

Of the 60 repeater stations in the system, 53 are unattended and are equipped with Onan Standby Electric Plants and Onan Automatic Line Transfer Controls. When commercial power is interrupted, the Onan plants start automatically and supply power for operating microwave equipment.

Most of the Onan units are Model 305CK electric plants of 3,500-watt capacity. This model, together with the Onan 5 and 10KW "CW" electric plants have built-in advantages for microwave standby service. They are air-cooled, extremely compact, and dependable.

If you have a problem in standby power, write our sales engineers. Onan builds electric plants for every need . . . from 400 to 75,000 watts.

Onan Model 305CK shown installed in the repeater station at Waukesha, Wisconsin. Bottled gas is used for fuel.

### NEW AUTOMATIC MICROWAVE LINE TRANSFER CONTROL

This new control facilitates testing of all control components as well as the engine generator set. Momentary contact switch transfers load from commercial power to the generating plant with only 1/10th second interruption. Generator can be exercised by itself if desired. Control incorporates time-delay starting, stopping. Voltage sensitive relays, both on the commercial line and on generator output, assure correct voltage before transferring load.

## Stabilizing Transistors

(Continued from page 145)

to 80°C for a period of 200 hrs. No significant loss in gain was measured over the time period nor did the  $I_c$  increase any more than the calculated amount of 0.43 ma from the 25°C value. The transistors had an  $I_{c025^\circ}$  after being subjected to this test of 4-5  $\mu$ a. This decrease may be due to the dry out of the transistors during the test thus increasing the leakage resistance. In any event, no deterioration in transistor characteristics was noted during or after the performance of this test. In addition, 6 Germanium Products type 2517 were subjected to a 200 hr. heat test at temperatures above 80°C with a loss in gain of less than 3 db. These results give promise of extended operation at elevated temperatures if the stabilization methods described above are employed. It was found necessary to make  $R_L$  very much less than  $r_c$  to maintain constant gain at 80°C for this length of time. This design minimizes the effect of unstabilized changes in  $r_c$  due to high temperatures and still permits gains in the order of 100 from one transistor.

### Conclusion

These results show that it is possible to extend the operating ambient temperature range of transistors by significant amounts, and for usable periods of time through the use of either version of this circuit. The one battery version offers certain advantages, in terms of improved performance and the saving of one battery, at the cost of a small increase in power dissipated in the stabilizing resistances. The majority of the tests were performed with this circuit. Similar results were obtained on a number of transistors of different types and manufacturers. Indeed the method is generally applicable to all types and will insure uniformity of performance.

**New!**

**"P" TYPE  
ENCAPSULATED  
RESISTORS**

**Stable... Small...  
Light-weight...**

Shallcross "P" Type Encapsulated Resistors are ideal for installation where stability, dependability, and minimum size and weight are a must. These radically new resistors offer the performance advantages of hermetically-sealed steatite resistors at less cost.

Because of the unique Shallcross method of encapsulating windings, "P" type resistors have greater maximum resistances, longer leakage paths, and higher wattage ratings.

Shallcross "P" type resistors are available in six MIL-R-93A lug-type styles and five axial lead styles with wattage ratings ranging from .500 to 3.5 watts. All styles meet and exceed JAN-R-93A, Characteristic A.

Complete information on sizes, ratings, and test results of Shallcross "P" type precision wirewound resistors is available in Engineering Bulletin L-30. Write for your copy today.

**SHALLCROSS MANUFACTURING CO.**

**Transmission Lines**

(Continued from page 93)

ing pins, and its center conductor is soldered to the center strip of the Tri-plate line.

**Hybrid Ring and Crystal Holder**

A balanced mixer consisting of a hybrid ring with crystal holder circuits etched on two of the complementary arms is shown in Fig. 17. The crystals are standard cartridge type 1N23B's. By cutting off the tips of these crystals and placing them in their holders with the disc at the end of the ceramic in contact with the center strip of the Tri-plate line, an appreciable reduction in frequency sensitivity was realized.

Tests using matched crystals and equal DC loads revealed an input VSWR of less than 1.23 for this hybrid ring over the 4100 to 4500 mc frequency range, and a minimum isolation of 39 db between the out-of-phase arms. VSWR and coupling measurements on a Tri-plate hybrid ring are shown below.

Frequency MC	INPUT VSWR	RELATIVE POWER			
		P <sub>1</sub>	P <sub>2</sub>	P <sub>3</sub>	P <sub>4</sub>
4100	1.19	0db	-3.2db	-44db	-3.1db
4300	1.09	0db	-3.1db	-49db	-3.1db
4500	1.23	0db	-3.1db	-39db	-3.2db

**Gyrators and Resonators**

It is a simple matter to construct gyrators and resonators in Tri-plate transmission lines. Fig. 18 illustrates a gyrator coupled to a Tri-plate line.

Inside the cylinder shown in the illustration is a central core of ferrite. This is surrounded by polyfoam which is enclosed in a thin dielectric casing. A metal cover encases the entire cylinder. Cylinder diameter is selected so that only TE<sub>1-1</sub> fields are excited.

The two outside surfaces of the Tri-plate line are shorted to the outside metal cover of the cylinder, while the center strip of the Tri-plate is helically wound through several turns inside the dielectric casing.

With this arrangement, phase shifting can be accomplished through the influence of external magnetic fields. By removing the ferrite core, cutting the cylinder to the correct length, and capping its ends, the unit can be made to function as a resonator for use with Tri-plate transmission lines.

**S-band Generator**

The S-band signal generator demonstrates the practicability of con-

structuring functional microwave test equipments in Tri-plate with an ease and economy which are unattainable when using conventional waveguide techniques. The equipment consists of a 726C klystron which series-feeds, through a coax-to-Tri-plate transition in series with a flap attenuator, through a Tri-plate-to-coax transition as a useful output. The output signal is sampled by a 20 db stub type directional coupler which feeds into a matched bolometer.

For sponsoring studies which have led to the development of the techniques and equipments discussed, grateful acknowledgment is made to the following: Bureau of Aeronautics, Industrial Planning Div.; Cambridge Air Force Research Center; National Bureau of Standards.

### Stearns Elected S-F Council Chairman

The San Francisco Council of the West Coast Electronic Manufacturers Association has elected H. Myrl Stearns chairman for 1955. Stearns is executive vice-president of Varian Associates. Elected to the position of vice-chairman of the 180-company electronics association was Winfield G. Wagener, director of technical services for Eitel-McCullough. Calvin K. Townsend, vice-president and general manager of Jennings Radio Manufacturing Corp. was elected secretary-treasurer. New directors of the association for 1955 are John A. Chartz, vice-president and general manager of Dalmo Victor Co.; J. J. Halloran, vice-president and chief engineer of Electro Engineering Work; George I. Long, executive vice-president and general manager of Ampex Corp.; and Douglas C. Strain, president and general manager of Electro-Measurements, Inc.

### TV IN JAPAN

JOKR-TV personnel pose with Philco and Nissho representatives upon completion of new Philco TV film installation at JOKR-TV, Tokyo. Shown are (l to r): Messrs. **NEW** Printed Circuit

## TRI-PLATE\* microwave variable attenuator

WITH DIRECT COAX LINE CONNECTIONS

The TRI-PLATE variable attenuator makes use of a movable resistive card sandwiched within a new type of printed circuit transmission line. Its features are:

- **Wide Frequency Range** 1,000 mc to 6,000 mc.
- **Maximum Attenuation** Linear function of frequency (20 db at 4000 mc).
- **Insertion Loss** less than 2 db over entire frequency range.
- **Maximum VSWR** less than 1.25 at 4000 mc.
- **Direct Reading** calibrated in db at 3, 4, and 5 KMC. Has standard type N connectors.
- **Universal Mounting** convenient for panel mounting or simple bench set-up.
- **Shielded TRI-PLATE Construction** over 70 db isolation to external radiation.
- **Dimensions** — 5" x 5" x 1/4"      ● **Weight** — 8 ounces

Low cost **\$65.00** each in sample quantities.

# FOR HELLISHLY HIGH TEMPERATURES

## Bradley Rectifiers now available for continuous operation at 150° C

"Hellishly High" is used in a comparative sense, of course. But the fact remains: Bradley's SS series of high-vacuum processed Selenium Rectifiers was developed to perform as rated at ambient temperatures of 150° C.

Life tests have passed 4200 hours at 150° C without any indication of cell deterioration. The units undergoing tests comprise four Bradley SS series R-cells, experimentally rated at 13 volts, operating with an a-c input of 52 volts under a resistive load of 50 milliamperes. Available cell sizes range from 3/16" diameter to 5" x 6" plates.

*Our representative will be glad to discuss the application of Bradley High Temperature Rectifiers to your application. Curves showing test results are available upon request. Please write for them.*

## Sandpaper Production

(Continued from page 93)

circulated, flowing by gravity from the machine vat to a Moyno pump which returns it to the adhesive kettle. Over a period of time, diluent evaporates from the adhesive in the open vat and the viscosity of the solution increases.

Along with this increased viscosity comes a change in adhesive qualities so that in order to maintain the correct grain weight of the finished product it would be necessary to slow down the machine. It is extremely important to prevent such viscosity change because a variation of one-half pound of adhesive pick-up in one ream of abrasive paper can cause the entire lot to be scrapped.

### Continuous Correction

Since the making machines run at a rather high speed, spot checking of viscosity with periodic corrective measures obviously was not an economically satisfactory answer to our

Fig. 2: Diaphragm operated valve controls diluent supply to the adhesive flow line

problem. Between checking periods, a considerable quantity of off-quality material could be produced. This, of course, would mean rejected material with accompanying financial loss.

Some means of continuous measurement and corrective action was needed. The Bendix Ultra-Viscoson (see Fig. 1), which utilizes an electronic circular chart pneumatic controller developed by Minneapolis-Honeywell, supplied the answer. In this system a probe is inserted into the adhesive flow line downstream from the pump. This probe, resembling in size and shape the bulb of an industrial pressure-type thermometer, produces ultrasonic waves and measures the energy required to cause layers of the adhesive to slip back and forth over one another as the result of these

waves. Since this energy is proportional to the viscosity of the material, an electronic computer makes necessary calculations and supplies an indication of the viscosity, at the same time transmitting to the electronic recording controller a continuous dc signal which constitutes a measure of viscosity.

Controlled air from the recording instrument positions a  $\frac{1}{8}$  in. diaphragm operated valve (Fig. 2) in a line that supplies diluent to the adhesive flow line just upstream from the pump suction. This location insures thorough mixing with the adhesive before the mixture flows past the viscosity sensing probe. When the adhesive tends to "go heavy," the instrument automatically adds just enough diluent to return the viscosity to the correct value. Although maintenance of product quality and uniformity was the primary reason for the installation of these control units, additional benefits that have resulted are a saving in operators' time and a saving in the amount of adhesive used.

### **RCA Reduces Color-TV Tube Prices**

An immediate reduction in the price of the 21-in. color television picture tube from \$175 to \$100 has been announced. The reduction is made possible by manufacturing techniques recently achieved which permit substantial economies in the production of the tube.

RCA placed its 21-in. color tube into commercial production, and began deliveries to television set manufacturers, during November, 1954. This tube provides a viewing area of 255 square in., approximately 25% greater than the viewing area of any color tubes now available. All metal round construction, in addition to its inherent manufacturing advantages, continues to offer a 25% weight saving over competitive color tubes. This weight saving is important in receiver design and in transportation costs.

### **1955 "Radio's Master" Available Now**

The 19th edition of "Radio's Master" for 1954-55, is now available according to United Catalog Publishers, 106-110 Lafayette St., New York 13, N.Y. This buying guide of TV-electronic parts and equipment contains 1440 pages, and lists the products of some 350 manufacturers. Publisher's price is \$6.50, but it may be obtained from local parts distributors for as low as \$1.95.

Hughes-equipped Convair F-102 all-weather interceptor

*The time was never more opportune than now for becoming associated with the field of advanced electronics. Because of military emphasis this is the most rapidly growing and promising sphere of endeavor for the young electrical engineer or physicist.*

Since 1948 Hughes Research and Development Laboratories have been engaged in an expanding program for design, development and manufacture of highly complex radar fire control systems for fighter and interceptor aircraft. This requires Hughes technical advisors in the field to serve companies and military agencies employing the equipment.

As one of these field engineers you will become familiar with the entire systems involved, including the most advanced electronic computers. With this advantage you will be ideally situated to broaden your experience and learning more quickly for future application to advanced electronics activity in either the military or the commercial field.

Positions are available in the continental United States for married and single men under 35 years of age. Overseas assignments are open to single men only.

## Telephone Circuits

(Continued from page 87)

read  $-56$  dbm (equivalent to 29 dba from Table 2). These readings would result in a signal-to-noise ratio of  $47[-9-(-56)]$  with F1A weighting. With 144 weighting the signal would read the same but the noise would be  $-61$  dbm which will give a signal-to-noise ratio of  $52[-9-(-61)]$  with 144 weighting.

If the signal-to-noise ratio for either F1A or 144 weighting is known, the magnitude of the noise can be obtained from Table 2. Consider first a point in the circuit where the magnitude of the test power is 0 dbm or 1 mw. For a signal-to-noise ratio of 47 db with F1A weighting at a point where the signal power is 0 dbm, the noise reading on a TMS with F1A weighting is  $-47$  dbm. For a signal-to-noise ratio of 47 db with 144 weighting, at a point where the signal is 0 dbm, the noise reading on a TMS with 144 weighting is  $-47$  dbm.

With the 2B set the following values are obtained. For a signal-to-noise ratio of 47 db with F1A weighting, at a point where the signal is 0 dbm, from Table 1 the signal reads 85 dba; hence the noise is  $85-47=38$  dba. For a signal-to-noise ratio of 52 db with 144 weighting, where the signal is 0 dbm, the signal reads 90 dbRN; hence the noise is  $90-52=38$  dbRN.

### Correction

To obtain the noise at a point where the signal power is other than 1 mw or 0 dbm, a correction must be applied. As an example, at a point where the signal power is  $-9$  dbm, the corresponding noise for the values assumed above would be  $(38-9)$  or 29 dba or dbRN.

In the above discussion it has been assumed that the signal was read in the absence of noise. If the two readings, signal and noise, differ by more than 10 db, the magnitude of the signal can be considered the true value for practical purposes. In cases where these two quantities differ by less than 10 db, the magnitude of the signal (actually signal plus noise) measurement will require correction in order to ascertain the magnitude of the signal alone. This correction in db can be found in Table 3.

Assume that the measurement of the signal (actually signal plus noise) on a TMS is  $-5$  dbm and the noise at the same point in the absence of signal measures  $-7$  dbm. Column 1 of Table 3 shows the difference in db between the combined

signal and noise measurement and the noise measurement alone, corresponding to the two measurements assumed above. For a difference of 2db between the two measurements, the correction to be applied to the signal plus noise reading is shown in column 2 of Table 3 or -4.3 db. The magnitude of the signal alone would be -5, -4.3 or -9.3 dbm.

As the difference between the measurements of the combined signal and noise and the noise alone approaches zero, the determination of the signal becomes less accurate until this difference becomes zero at which point the signal is indeterminate.

### Tuner Inputs

(Continued from page 91)

keep  $L_1$  as small as possible makes the relation (9) a good compromise. The secondary should have two windings, one for low channels (2 to 6), the other for high channels (7 to 13), both coupled to the primary as tightly as possible. The number of turns of the secondary windings is determined by Eqs. 3, 4, and 8.

In order to increase the rejection of the unbalanced signal, the primary must be cross-wound as shown in Fig. 5. For the same reason, the secondary should be wound on the "cold" end of the primary in order to reduce the capacitive coupling.

#### Transmission Line

This is the information obtained considering the transformer as a lumped circuit. Actually, however, the transformer is not a lumped circuit. Its cross-wound primary is a transmission line because the two halves of it, wound in opposite directions, possess a certain inductance per unit length and certain mutual distributed capacity. This transmission line is shorted at the center tap. As any transmission line, the primary of the transformer has multiple resonances. This can easily be proven by a grid-dip meter. The lowest frequency of resonance is found when the primary winding of the transformer is open. Shorting the primary, another resonance at more than twice this higher frequency can easily be seen. The resonances of higher order can not always be

## electronics trends to Airdesign

# FOR TRANSFORMER ENGINEERING

Among the "new and revolutionary" developments popping up every day, transformers may seem pretty static. But not to engineers at Airdesign.

Here you'll find transformer design experts applying the newest principles and materials—many of them not yet common knowledge—to improve transformer performance or to solve unique design problems. And backing up their efforts are Airdesign's skilled production people completely equipped for transformer manufacture of all types up to 5KVA.

Whether your needs involve ordinary power or audio transformers—or more complex items such as pulse transformers and ultra-sonic transformers—Airdesign engineers can supply you with the most up-to-date units of superior quality . . . when you need them. Call Airdesign for your next transformer order and see.

# **DU MONT** specifies **AIC** **REVERBERATION UNITS** *for its new TELE-CENTER*

"For better service to our many clients, Du Mont's new Tele-Center, after full tests, has chosen Model 42A Reverberation Units for all Control Rooms," says Robert F. Bigwood, Manager of General Engineering Dept. at the Du Mont Tele-Center, New York City.

Model 42A Reverberation Unit simulates reverberation of a room of any size, using a magnetic tape loop system with SEVEN HEADS. Switching heads produces various special effects as well as natural reverberation.

The unit features built-in variable equalization for special effects; continuously adjustable reverberation time; and no pressure pads—resulting in better tape motion and reduced head wear. Size is 17½ x 19".

### Tuner Inputs

(Continued from page 153)

detected on a small transformer, but can easily be seen in a transformer of larger dimensions.

Using the transmission line terminology, the first resonance may be called  $\lambda/4$  resonance, the second  $\lambda/2$  resonance, etc. These resonances change the performance of the transformer appreciably at various frequencies producing unexpected changes of the antenna transformed impedance  $r$ . Referring to Fig. 6, if AC is the line representing the primary of the transformer and BC is the loop coupled to it and representing the secondary winding, then the voltage induced in the secondary is proportional to the line voltage  $V_B$  at the point B.

$$V_B = V_A \frac{\sin \beta X}{\sin \beta l}$$

where  $V_A$  is the line voltage at A

$$V_A = E \frac{jK_T \tan \beta l}{R + jK_T \tan \beta l}$$

where: R is the internal resistance of the generator feeding the transformer.

E is the open-circuit voltage of the generator.

K is the surge impedance of the antenna line ( $K=R$ ).

$K_T = \sqrt{\frac{L_1}{C_p}}$  is the surge impedance of the primary winding considered as a line.

$C_p$  is the low frequency capacity between the two halves of the primary.

Thus  $|V_B| = E \frac{\tan \beta l \sin \beta X}{\sqrt{\left(\frac{R}{K_T}\right)^2 + \tan^2 \beta l \sin^2 \beta l}}$  (10)

Fig. 7 shows graphically Eq. 10 for  $\frac{R}{K_T} = 2$  and three different values of  $X/l$ .  $K_T = 3$

Fig. 8 shows the same equation for  $X/l = 1$  and three values of  $R/K_T$ .

The transformed antenna impedance  $\gamma$  varies with the square of these graphs because the available power  $K_1^2 E_B^2 / 4r$  at the output of the transformer has to remain constant and equal to the available power of the generator.  $K_1$  is the degree of coupling of the loop to the line.

The graphs of Figs. 7 and 8 give only a qualitative picture of the variation of the secondary voltage with frequency because of many simplifying assumptions taken in deriving Eq. 10.

Nevertheless the four crosses indicate the results obtained by meas-

urement of the antenna transformed impedance on Chs. 2, 6, 7, and 13. The ordinates of the four points are the square roots of the measured impedances.

Thus the following information can be added to that obtained from the study of the transformer as a lumped circuit:

1) It is desirable to keep

$$K_r, \text{ which is equal to } \sqrt{\frac{L_1}{C_0}}$$

as high as possible.

2) It is important to keep the second resonance considerably higher than the Ch. 13 frequency. Both of these requirements are favored by the cores of higher permeability. Such cores, however, usually have higher losses at high frequencies. Thus, the core to be used need not be made of the material best qualified for upper frequency limit of the range (200 MC). Materials with more losses at the upper VHF frequency limit, but of higher permeability, can give better results.

In conclusion, some typical results are shown which can be expected from a TV tuner with a wide band antenna input transformer and 6BQ7 tube as a cascade r-f amplifier.

NF of unbalanced signal

ch. (2 to 6) 5-6 db-26 db or better

ch. (7 to 13) 7-8 db-22 db or better

## Tank Circuit

(Continued from page 99)

obtained from a tube manual or directly from the tube manufacturer. From these quantities the required inductive reactance (or capacitive reactance which is equal) can be calculated. Finally, the effective and peak voltages across the tank circuit can be determined from the power output and plate load.

To facilitate this procedure, the calculator shown in Fig. 2 has been designed. To use this calculator, locate the value of load on the R scale and Q on the Q scale. Join these points with a straight line and read reactance at the intersection of this line with the X scale. From this value and the operating frequency determine L and C on a reactance nomograph. Construct a second straight line from R to the output power on the P scale. Read the peak tank circuit voltage at the intersection of this line with the E scale. Multiply this reading by 0.707 to obtain the tank circuit RMS voltage, if required.

This procedure can be reversed. Thus, select the power delivered from the tube on the P scale and

# ROTARY ARMATURE

## IR 207 RELAYS by NORTH

A subminiature rotary armature relay designed for a variety of airborne and guided missile applications where reliable operation in severe environment is required.

1. Two form C contacts rated at 2 amps, 30 volts, DC resistive.
2. Low capacity between contacts and ground.
3. The standard IR 207 relay meets the reliability requirements under MIL-R-5757B.
4. For critical applications where more reliability is required than is provided under MIL-R-5757B, North's "Special High Reliability" hermetically sealed relays are now available.

I.R.E. SHOW

**Tank Circuit**

(Continued from page 155)

peak voltage on the E scale. (Peak voltage is approximately 0.8 or 0.9 of the plate supply voltage. For instance when using a 1000 v. supply, peak tank voltage may be estimated as 850 v.) Draw a line through these points and extend the line until it reaches the R scale. At this point read the required tube load in ohms. From this point draw a second straight line to the chosen Q value on the Q scale. Read the required inductive or capacitive reactance in ohms on the X scale. Determine L and C on the reactance chart using this value and the operating frequency.

As an example design a 500 watt tank circuit which presents 3000 ohms to the amplifier tube. Select a Q of 15. From 3000 on the R scale to 15 on the Q scale construct a straight line. Read 200 ohms at the intersection of this line with the X scale. Compute L and C on a reactance chart. From 3000 on the R scale to 500 on the P scale construct a second straight line. Estimate 1700 peak volts at the intersection of this line with the E scale.

This procedure applies to any single-ended Class B or C amplifier including grounded-grid amplifiers. It also applies to push-pull or other split-stator tapped-coil tank. However, the capacitance of each condenser section in the push-pull tank is one-half the calculated value.

The nomograph solves the following equations:

$$X_L = R/Q \quad (1)$$

$$E_{\text{peak}} = \sqrt{2PX_LQ} \quad (2)$$

In which R = Resonant tank circuit resistance

Q = Full-load tank circuit Q

$X_L$  = Inductive branch reactance

$E_{\text{peak}}$  = Peak voltage across the tuned tank

P = Tube power output

**WCEMA PLAQUE**

At the annual WCEMA party, Noel E. Porter (l) 1955 WESCON Chairman, presented Heckert L. Parker, upon his retirement, a plaque of appreciation for his many years of service. Mr. and Mrs. Winfield G. Wagener look on. Mr. Wagener is President of WCEMA.

## Reliable Connections

(Continued from page 87)

braid in any way, carefully remove a  $\frac{1}{8}$  in. length of cable jacket and unwind and cut off the exposed cotton yarn binding. Carefully spread apart the projecting ground braid and apply a counter-clockwise wrapping of  $\frac{1}{2}$  in. cellulose acetate adhesive tape to the underlying teflon tape to keep it tightly in place during subsequent steps in the fabrication procedure, as shown at (a). This is important in that accidental displacement of the teflon tape ruins the termination and necessitates cutting off the spoiled end and starting again from the beginning.

2. Unweave the projecting strands of ground braid by combing or by some other convenient method and lay them back over the outside of a split cone-shaped ferrule of cold rolled steel, parallel to each other as shown at (b). The ferrule supports the strands as they are carefully presented to a motor-driven fine-wire scratch wheel for removal of the Formex insulation as the end of the line is slowly rotated about its own axis.

3. Remove the split ferrule, lay the strands back over the cable jacket without touching the cleaned surface of the copper, and bind tightly in place with two turns of #18 solid tinned copper wire, as shown at (c). Solder the strands of braid to the encircling #18 wire, *all the way around* with rosin-core solder.

### Acetate Tape

4. Next, cut off  $\frac{3}{8}$  in. of the remaining portion of the acetate tape wrapped cable core protruding from the braid by rolling it on a flat surface under a sharp knife, as shown at (d). The knife must be held exactly at right angles to the rolling axis of the cable, or the cut will not meet after one turn, but will spiral to one side or the other, and a ragged uneven end will result. Do not remove the remaining acetate tape wrapping.

5. From the remaining  $\frac{1}{8}$  in. of core protruding from the braid, carefully fish out the end of the #40 winding and pull out enough of the wire so that the end of the winding shows through the translucent teflon tape no more than approximately  $\frac{1}{32}$  in. beyond the ground braid as shown at (e). Leave 2 in. of the pulled out wire in place; cut off and discard the rest.

6. Stake and solder a 4 in. length of #18 solid tinned copper wire into the slot of a #5-40 x  $\frac{1}{4}$  in. brass fillister head machine screw, with

# It pays to specify AMPERITE DELAY RELAYS and BALLAST REGULATORS

... they're finest

... cost less!

STANDARD

T9 BULB

## Thermostatic DELAY RELAYS

**MOST COMPACT, HERMETICALLY SEALED**

Provide delays ranging from 2 to 150 seconds.

- Actuated by a heater, they operate on A.C., D.C., or Pulsating Current.
- *Hermetically sealed.* Not affected by altitude, moisture, or other climate changes.
- Circuits: SPST only — normally open or normally closed.

Amperite Thermostatic Delay Relays are compensated for ambient temperature changes from  $-55^{\circ}$  to  $+70^{\circ}$ C. Heaters consume approximately 2 W. and may be operated continuously. The units are most compact, rugged, explosion-proof, long-lived, and — inexpensive!

MINIATURE

TYPES: Standard Radio Octal, and 9-Pin Miniature.

**PROBLEM? Send for Bulletin No. TR-81**

Also — a new line of Amperite Differential Relays — may be used for automatic overload, over-voltage, under-voltage or under-current protection.

## BALLAST REGULATORS

- Amperite Regulators are designed to keep the current in a circuit *automatically regulated* at a definite value (for example, 0.5 amp).
- For currents of 60 ma. to 5 amps. Operates on A.C., D.C., Pulsating Current.
- Hermetically sealed, light, compact, and most inexpensive.

Amperite Regulators are the simplest, most effective method for obtaining *automatic regulation* of current or voltage. *Hermetically sealed*, they are not affected by changes in altitude, ambient temperature ( $-55^{\circ}$  to  $+90^{\circ}$ C), or humidity. Rugged; no moving parts; changed as easily as a radio tube.

## Reliable Connections

(Continued from page 157)

$\frac{1}{8}$  in. of the wire extending from the slot and bent down approximately  $60^\circ$ , as shown at (f).

7. Screw the machine screw all the way into the center hole of the saran tubing, wind two turns of the #40 wire around the bent down tip to anchor it, carefully remove the Formex insulation with X-Var stripping liquid (WARNING: Avoid getting X-Var on any part of the cable, braid, or windings. Use a clean piece of solvent-moistened cloth or tissue for each wiping and discard.) to a point not less than  $\frac{1}{4}$  in. from the anchoring turns, thoroughly clean off all traces of the X-Var with a clean cloth or tissue moistened with alcohol, and wrap six or more turns of the cleaned wire around the bent down tip.

8. Grip the head of the machine screw firmly in a copper-jawed clamp or vise to prevent heating of the screw and damaging of the saran tubing, and solder the turns of #40 wire in place with rosin-core solder. Overheating of the saran tubing may weaken the tubing and will cause formation of corrosive products that may attack the wire. After slipping 3 in. lengths of spaghetti over each of the leads, the input-end of the delay line should appear exactly as shown at (g).

### Output-End Fabrication

Experience will dictate just how long a piece of line must be cut from the reel to allow sufficient surplus for fabrication of the input-end, calibration of the line to the desired delay time by cutting off short pieces from the output-end of the line, and fabrication of the output-end.

Calibration of the delay line and fabrication of the output-end are as follows:

1. The completed input-end of the line is connected to a test equipment set-up, such as used for pulse-testing new lines, and the 0.1-usec input pulse and its reflection from the unterminated output-end observed simultaneously on a synchroscope. Knowing the sweep speed of the scope and the desired delay time, the distances between the observed pulses can be calculated. Short pieces are then cut off from the output-end of the line.

2. The output-end of the delay line is prepared exactly as described for the input-end, except that paragraphs -2- and -3- are omitted and the Formex insulated braid is combed out and laid back over the

## IDENTICAL AMPLIFICATION

*for perfect performance*

Precision measurement of phase shift is practically distortion free in the CROSBY Wideband Oscilloscope, Model 320. Identical horizontal and vertical amplifiers allow phase shift indication for frequencies up to 5 megacycles.

A deflection sensitivity of 35 millivolts RMS per inch, on both amplifiers, makes the Model 320 ideally suited for use in laboratories requiring accurate phase shift evaluation.

A general purpose, high-gain instrument particularly adapted to color television measurements. An Oscilloscope designed by engineers for use by engineers.

jacket and held in place with several turns of 1/4 in. black electrical adhesive tape. Do not remove Formex insulation from the strands at the output-end, otherwise mutual coupling of shorted turns formed by the braid will destroy the transmission characteristics of the line.

3. The final step consists of applying 300 volts dc between the input and ground leads for several seconds as a preliminary insulation test, taping up the completed ends with 1/4 in. black electrical tape in a neat workmanlike manner as shown at (h), and then repeating the insulation test.

### Electronic Depth Sounder

A new electronic depth sounder, for charting the bottoms of lakes, rivers, and shoal waters, has been announced by Raytheon Mfg. Co. Called the DE 119, it weighs only 40 pounds, and is powered by a standard, 6 V. storage battery which will operate the equipment for eight hours. On the face of the case, a glass window reveals the chart paper which can be operated at three

"Fathometer" depth sounder utilizes echo effect to chart river bottoms and locate schools of fish. It weighs 40 lbs., is battery powered

speeds 12, 30 or 60 in./hr. The instrument is highly accurate over its entire range from zero to 240 feet of depth, readable in four phases.

The DE 119 is claimed to be the smallest and lightest ever developed. It sells for \$1185 F.O.B. Waltham, Mass. The transducer, which generates the ultrasonic signal and "listens" for its echo, is lowered over the side on the end of a short pipe. It is held a foot or two below the surface of the water. The sound signal travels through the water until it strikes the bottom, then returns in the form of an echo. The sensitive transducer picks up the echo, and the equipment converts the time interval automatically into a reading of feet or fathoms.

# KLEINS

TO **SPEED**

## YOUR PRODUCTION

You just can't beat Klein pliers for smooth, easy operation—for steady dependability whatever your production job. That's because Kleins are quality made of finest tool steel, precision fitted—individually tested. Handles fit the hand to perfection—knives shear through toughest wire with ease.

And now the Klein plier selection is bigger than ever—in standard size patterns—in new compact patterns specially designed for intricate wiring and cutting in confined space. Available with or without a flexible steel leaf spring.

### NEW SMALL PATTERNS

209-5L compact oblique cutting plier

307-5 1/2L extremely slim long nose plier

203-6-SCP-L needle nose plier

## Electronic Press Day

**L**AST month the Electronics Committee of the Los Angeles Chamber of Commerce held its first "press" day, purpose of which was to present a complete picture of local Electronic Industries for both local and national, trade and consumer press.

The coupling of civic or municipal and industrial interests was quite successful with ten speakers presenting the subject in an all morning session.

### Electronic Outlook

R. C. Fuller, Chairman, made the introductory remarks and Dr. A. M. Zarem followed with an overall review on the Electronic Outlook for 1955. He defined electronic equipment as being built to detect, measure, analyze, compute, store, control or convey information or intelligence. In this respect, it fulfills the type of activity engaged in by human beings, which combines their sensory and intellectual mechanisms with their muscle to accomplish tasks. He divided the industries into five basic parts as 1. radar; 2. computers; 3. research and development, including guided missiles; 4. radio-TV; 5. components. Individual speakers then gave detailed information on each of these activities.

For example, Les Hoffman of Hoffman Electronics Corp. speaking on Radio and TV in Southern California said that 250,000 television sets would be sold in the area during 1955 and that he expected color television to play an important sales role in the latter part of 1956. L. D. Callihan, Gilfillan Bros., Inc. reported that the eight prime radar system manufacturers do a combined dollar volume of \$335 million and that they depend on more than 1000 subcontractors for \$200 million of vital components. He predicted that by 1960 the total volume would swell to more than a billion dollars annually.

Speaking on the growth and future prospects of the component parts industries, Paul H. Tartak, Pres., Electronic Industries, Inc., said that there are now approximately 95 component manufacturers in the area. Of this number approximately 20% are engaged in production of various types of transformers. There still is need for basic components producers in the West.

S. F. Arn, Packard Bell Co., reporting of research and development said that the airframe manufacturers expected their staffs of some 6000 electronic engineers to double by

# WANTED

for Murder...

CANCER is the cruelest enemy of all. No other disease brings so much suffering to Americans of all ages.

YET—though 23 million living Americans will die of cancer, at present rates—there is reason for hope. Thousands are being cured, who once would have been hopeless cases. Thousands more can have their suffering eased, their lives prolonged. And every day, we come closer to the final goal of cancer research: a sure and certain cure for all cancer.

THESE THINGS have all been helped by your donations to the American Cancer Society. This year, please be especially generous!

Cancer  
MAN'S CRUELEST ENEMY  
Strike back—Give  
AMERICAN CANCER SOCIETY

1960. In addition to airframe manufacturers, some 203 electronic companies are engaged in significant R&D work. M. V. Kiebert of Convair-Pomona reviewed basic aspects of guided missiles and indicated the direction of R&D in this activity. C. J. Breitwieser, Vice President, Lear Inc., reviewed the needs of R&D in fields of automation, audio devices, industrial instrumentation, atomic energy, communication and semi-conductive devices. J. R. Bradburn, president, ElectroData Corp. pointed out that about one fourth of the nation's data processing equipment manufacturers are located in metropolitan Los Angeles. About 35% of their dollars is for purchased or subcontracted parts and assemblies. He expects this industry segment to expand eight-fold by 1960.

Julian K. Sprague, President of Sprague Electric Co. delivered the luncheon address at which time he noted that the West Coast now has about 75% of the instrumentation industry. This is due in part to the relatively great number of small firms specializing in the solution of design and assembly problems. The great majority of these firms have less than 100 employees and annual sales of under one million dollars. Mr. Sprague traced the continuing growth pattern of Western Electronic Industries in the fields of military and entertainment electronics. The fact that 60% of annual WESCON exhibitors were eastern manufacturers is further evidence that this rich market with its expanding population has been recognized.

### Truscon Anniversary

America's broadcasting towers are getting so tall that the 1,000-footers may soon be "just average," Truscon Steel Div. of Republic Steel Corp., suggested as it ticked off its own 20th anniversary as one of the pioneer fabricators of such structures. In those 20 years, C. B. McGehee, General Manager of Sales, estimated the company has produced more than 900 towers. Placed one atop another, the total would reach to a height of 48 miles. Television's special broadcasting requirements are largely responsible for the skyscraping trend, Mr. McGehee said.

### New Lab Announced

Donald R. Larimer, Pres. of General Crystal Co., Burlington, Wis., has announced the formation of Northern Engineering Labs. as an affiliate of his company.

SINCE 1915 LEADERS IN AUTOMATIC CONTROL

## GYROS at 10-G acceleration

Possible  
acceleration  
force 10-G

The gyroscope in a missile guidance system must be able to withstand acceleration forces up to 10 G's in any direction. This gyroscope, designed and developed by the Guided Missile Development Division of the U. S. Army and the Ford Instrument Company, will function under this acceleration. Tests have shown these gyros to be accurate to 1/50° per hour drift, or better.

For forty years, Ford has been building gyroscopes, at first for navigation devices, later for stabilization in many fire control problems. Ford designed and manufactured gyros have been in the stabilization systems of heavy battleship guns, in missiles and torpedoes and in delicate airborne instruments. Stable platforms and guidance systems have been outstanding achievements of Ford Instrument Company engineers.

Since 1915, the engineers at Ford Instrument Company have specialized in such equipment as computers, controls, and servo-mechanisms in hydraulics, electronics, mechanics and magnetics for the Armed Forces and for industry. If you have problems in any of these fields, it will pay you to discuss them with Ford engineers.

**TERMALINE  
 COAXIAL LOAD RESISTORS**

50 ohms DC to 4000 mc—5 watts to 2500 watts

The constant resistance (Low VSWR) of the  
 TERMALINE resistor make it the ideal dummy  
 load and standard resistor at UHF and VHF.  
 Design is such that normal reactance is put to  
 work producing a pure resistance over an  
 extremely wide frequency range. Acting as a  
 "bottomless pit" for RF energy, thousands of  
 TERMALINE units are in daily use in high  
 frequency applications.

Model	Cont. Power Rating	Input Connector
80F	5 watts	UG-23B/U
80M	5 watts	UG-21B/U
80A	20 watts	UG-23B/U
81	50 watts	UG-23B/U
81B	80 watts	UG-23B/U
82	500 watts	} Adaptor to fit UG- 21B/U supplied
82A	500 watts	
82C	2500 watts	

Adaptors or cable assemblies for standard  
 coaxial line available.

ALL TERMALINE units, except Model 82C, are  
 self-cooled. Substantial quantity discounts.

LITERATURE UPON REQUEST

Size 3 3/8" x 3/4" dia.

MODEL 80F FEMALE

MODEL 80M MALE

MODEL 82

VERY HANDY in lab and pro-  
 duction test. At signal generator  
 levels and below 5 watts, this is  
 the last word for low VSWR.

6" x 8 1/2" x 17"

# PROVED the BEST...

Day after day and year after year these two ALTEC LANSING microphones serve broadcast studios and public address systems throughout the world. Through consistent performance of the highest quality the ALTEC 639 and the ALTEC 633 have proved themselves under all sorts of conditions and for every purpose. These two famous Western Electric microphones which have been manufactured by Altec Lansing since 1949 are, truly, the reliable standbys, the best in their field.

**The ALTEC 639** Microphones are ideal for broadcast and public address. These cardioid microphones use a combination of ribbon and dynamic pressure elements to provide the best possible pickup under varying, difficult conditions. High quality three-way (639A) and six-way (639B) directivity patterns are quickly selected by a simple screw adjustment. Impedance: 40 ohms. Power output level: -56 dbm. Frequency response: 40-10,000 cps.

**The ALTEC 633** is the world-famous "salt shaker" microphone. This rugged, dependable high-quality microphone for public address, sound distribution systems or broadcasting affords non-directional and, with 8B attachment, semi-directional performance. One of the most popular microphones ever made. Frequency response: 40-12,000 cps. Impedance: (633A) 30 ohms, (633C) 30, 150/250 ohms. Power output level: -58 dbm.

Altec Lansing manufactures a wide range of microphones, each designed for special needs, each an outstanding example of the superior engineering and superlative craftsmanship which have given Altec Lansing the reputation for the very best in professional sound.

## INDEXING TURNTABLES OF EVERY DESCRIPTION

Eisler is considered a pioneer of indexing mechanisms. Has designed and built turntables for over 50 years. Indexing range from 1 to 400 RPM. Eisler indexing turntables have been adopted as standard for over 33 years by some of the largest firms in the U.S.A. Use Eisler indexing machines as the basis and you can add parts for your own production. Hundreds of Eisler indexing machines are in daily use all over the world.

### Resistors that went to pot

Here's a trick question so easy you'll probably think we're stupid for asking it. The fact is, it's one of those questions with only one answer; so we know nobody will get it wrong. Ready?

"Which can you pick up faster—a hundred beans in a bag or a hundred loose beans?"

See what we mean?

Change the word *beans* to *resistors*, and the word *bag* to *pot*, and you'd wonder why it took a bunch of smart electronics engineers so long to find the answer.

Well, I-T-E isn't one to look a customer in the mouth. So when a leading manufacturer asked us how he could cut his resistor costs and assembly time, we replied (so fast he was still holding his empty hands wide apart in the air), "Pot them, of course."

Then, to relieve his embarrassment, we explained, "We mean you take those resistors you're now putting into your equipment one at a time, and bury them in blocks of resin with just the leads sticking out. That keeps moisture out, protects them from damage, and makes sure they're always in the right order. No matter how late the poor little working girl has been out the night before, she's always sure of getting the right size resistors into the set."

For the sake of brevity here, we won't harangue about all the money this idea saved in greater efficiency, quicker assembly, fewer rejects, and all that.

Potting these resistors for this customer was an idea I-T-E supplied as a regular part of its service to customers. We're not out of ideas—not by a long shot. And we've got several thousand miles of resistor wire just waiting for your order. Write for the new 6-page Bulletin R-5501. I-T-E Circuit Breaker Company, Resistor Division, 19th & Hamilton Sts., Phila. 30, Pa.

I-T-E CIRCUIT BREAKER COMPANY  
Resistor Division

# Don't call any cutting job "impossible"

... until you've investigated the  
**"AIRBRASIVE"  
PROCESS**

Ideal for abrading resistance elements on printed circuits.

### See it at the IRE SHOW

The "Airbrasive" Unit will be demonstrated at the Show. Bring your parts and try it out on them.

BOOTH 707  
Airborne Ave.

- Cool, fast and shockless action. Ability to cut through wafer-thin sections of hard, brittle materials. A range of controlled cutting effects including drilling, notching, etching, scoring and accurate removal of deposited surface coatings. These are a few of the features that make the "Airbrasive" process ideal for jobs which can't be handled by conventional methods.
- It will pay you to investigate this unique and versatile process. We'll be glad to conduct tests on your samples or arrange a demonstration at either our New York or California office.
- For complete information write for Bulletin 5411.

#### ELECTRONIC DEVICES—III—CATHODE RAY TYPE TUBES

Chairman: Russell R. Law, CBS-Hytron.

# For PRINTED CIRCUITS by the THOUSANDS

Select **METHODE** for Quality in Quantity on these circuit types:

★ Single Side Conductor Panels — for Economy and Simplicity in Auto-sembly and dip soldering . . .

★ Two Sided Conductor Panels — For Compactness in applications requiring miniaturization and involving relatively few feed thru connections.

★ "Plated Through" Conductor Panels — For the complex circuit requiring a large number of feed thru connections with conductive holes to permit circuit cross-overs.

Well integrated facilities and a department specialized and experienced on custom tooled volume applications assures performance and satisfaction consistent with Methode's record in serving high production users.

#### Or by the Hundreds with "QUAD-KARDS"

Where the designer wishes uniformity and simplicity in assemblies which will be used in small quantities where custom printed circuit tooling would be uneconomical, pre-tooled QUAD-KARDS can be furnished in standard 2" square segments with (or without) conductors printed to specifications. Quad-Kards have standard hole punchings for tube sockets, transformers and condensers plus a grid pattern of .050" diameter holes on 1/4" centers. Undesired holes are omitted and the conductor pattern printed to the customer's layout. "Quad-Kards" may be abutted, angled or stacked during incorporation into finished assemblies. Details on request.

**METHODE Manufacturing Corp.**

2021 West Churchill Street • Chicago 47, Illinois

Geared to produce Plastic and Metal Electronic Components

*Kanthal DR resistance wire*  
**SAVES YOU UP TO 50% because...**

... it is lighter in weight (more feet per pound), and the per pound price is low. Total savings approximately 50%.

... Kanthal DR improves the performance of resistors and precision equipment. Its electrical resistivity is high — 812 ohms per circular mil foot — its temperature coefficient is low ( $\pm 0.00002^\circ\text{C}$  between  $-50^\circ$  and  $+150^\circ\text{C}$ ), and it has a low thermal EMF to copper.

Available in fine gages and all types of insulation.

**Cunningham**  
 ESTABLISHED 1838

**crossbar**

A truly superior switch for MASTER CONTROL AND MONITOR SWITCHING OF AUDIO & VIDEO CIRCUITS

Also COMPUTERS • TELEMETERING TELEPHONY • DELAY LINES ETC.

**Advantages**

- Extreme flexibility
- Fast quiet switching
- Crosstalk down 60 Db at 10 MC
- Any group of setups may be held intact while setting up others
- Provision for spot or remote control
- Strapwiring eliminated
- Excellent HF characteristics
- Palladium contacts
- Reduced cost
- Compact design, small size
- Low operating power—2.5 watts
- Simple "package" installation

- Individual magnets at each cross-over.
- Maximum, six conductors per circuit.
- Life-tested to 100 million operations.

# COMPACT PORTABLE IMPROVES & SIMPLIFIES REMOTE OPERATIONS

It's a breeze to set up and operate this remarkable single-package amplifier. G.E. designed it for extreme portability. *Total weight with batteries just 35 pounds.* Forget about assembling and handling a bulky group of amplifier units... go on location with the BA-6-B!

### Note This Package Of Plus Quality Features:

- Built-in 400 cycle tone generator eliminates "woofing" time... speeds level checks (an original G-E development).
- Special cue circuit yields 30 db gain between phonline and headset with line key in cue position—eliminates need of second line for cue circuit.
- Low level output permits feeding program to any associated sound system.
- AC or battery operation solves power failure problems.

## NAM Files For 700 New Communication Channels in FM Broadcast Band

The National Association of Manufacturers' Committee on Manufacturers Radio Use last month, filed a plan with the FCC looking toward the creation of a manufacturers radio service and the establishment of 700 new frequency channels for communication purposes to be taken from the FM broadcast frequency band with no disturbance to present broadcasting operations. The petition contemplates the shared use of unassigned FM broadcast frequencies by the new manufacturers service as well as all present safety and industrial radio services in a plan leaving existing broadcast stations untouched and providing for any possible growth in the broadcasting operations.

The manufacturers' committee explained that, while the plan is "primarily designed to satisfy the increasing need for radio use by manufacturers," it "paves the way for expansion of radio use by all safety and industrial services." The document will be distributed to all mobile radio user organizations as soon as possible, NAM said.

A summary of the NAM petition pointed out that "The plan destroys the myth current in many quarters that there is a shortage of frequencies. It shows the way toward creating a minimum of 700 new channels for communication purposes.

"Present FM broadcasting will not be disturbed since assignments will be made only on a non-interference basis. The FCC has previously adopted such a sharing plan in connection with the safety services which are considered much more important in the public interest than the entertainment bands."

The statement explained that the country's manufacturers "are presently included in a catchall group of diverse radio users known as the special industrial services," and the number of stations in this group has increased 800% in the past five years, while the number of FM broadcast stations has declined 25%." It declared that "Manufacturers of products such as steel, battleships, planes, tanks and other heavy equipment are hampered by their present allocations in the special industrial radio service," since the "general rules regulating all users in this service are not compatible with the growth of radio in manufacturing plants."

The petition was prepared under the supervision of Committee Chairman Victor G. Reis, of the Bethle-

## "Univac" File Available

The new Univac File-Computer, featuring the introduction of fast random access and multiplex monitoring to standard electronic data processing systems, has been announced for delivery this year by Remington Rand Inc. In practical terms, this means that the inventory, cost, or other figures on any item right up to a specific moment may be had by pressing a key; unsorted data can be processed completely in a single high-speed program; and all input media—paper or magnetic tape, 80- or 90-column punched cards, 10-key devices or typewriters—may be used.

## NBC chooses Century again!

Recently, WRCA-TV in its first all-color studio in New York installed the C-1 Board, Century's all-electronic light system. Now, KRCA-TV elects Century to furnish all of its lighting equipment and C-1 electronic dimmer and switchboard (the largest in the world) for its first all-color T-V studio located in Burbank, California.

## Dubilier Awarded Medal

The Cooper Union Alumni Association designated William Dubilier, founder of the Cornell-Dubilier Electric Corp., to receive the first annual award of the Gano Dunn medal. Established this year, the

William Dubilier

medal is awarded annually to an alumnus of Cooper Union for outstanding professional achievement. Mr. Dubilier was selected from thousands of distinguished Cooper Union men to be the first recipient.

## Subscription TV Battle

Zenith's request that the FCC issue immediate authorization of subscription TV has been followed up by a series of opposition petitions and heated exchanges of letters. NARTB requested that FCC follow customary regulatory procedure rather than approve subscription TV immediately. Commander E. F. McDonald, Jr., President of Zenith, charged that Harold E. Fellows, NARTB President, acted without the authority of the Association membership, and that the NARTB request would scuttle fee TV. NARTB denies this. At about the same time, the Joint Committee on Toll-TV, which includes a group of theater owners opposed to subscription TV, filed a petition opposing Zenith's request. Cmdr. McDonald said that the theater interests were trying to stifle a competitor.

## Purchasing Agents Elect

The Purchasing Agents Association has elected officers for 1955. They are: President, H. M. Munson, Bendix Radio; Vice President, S. Oser, Tech-Master; Treasurer, M. A. Schneiderman, Olympic Radio; Corresponding Secretary, B. Trinboli, CBS-Columbia; Recording Secretary, S. Woolfson, Emerson. All East Coast electronic purchasing agents are eligible for membership.

Booths 400, 401, 500, Production Rd.

Reps for precision electrical indicating instruments manufactured by long established firm, are needed in two areas. The first comprises N. Dakota, S. Dakota, Nebraska, Minnesota, Iowa, N. Wisconsin. The second is composed of Alabama, Georgia, Tennessee and Kentucky. (Ask for R-3-1)

Manufacturer of precision electro-mechanical equipment seeks additional contract sales representatives in U.S. except in New England and Eastern seaboard south through District of Columbia. (Ask for R-3-2).

Precision potentiometers are offered for representation in Texas, Arizona, Nevada and California. Also Eastern Canada, Alaska and Hawaii. (Ask for R-3-3)

Representatives for precision test equipment are needed in West Va. and District of Columbia. (Ask for R-3-4)

Jack D. Bruce has become sales rep. for Mathia Klein & Sons, Chicago tool mfr., in the East Central states.

Tom Hunter, Sr., 4410 Irving Park, Chicago, Ill., has become factory representative in Illinois, Ia., S. Wis. and Gary, and Michigan City, Ind. for Cinema Engineering Co. Div. of Aero-vox Corp.

Russell G. Ragon has become Sales Rep for Industrial Div. of J. M. Ney Co. of Hartford, Conn. Mr. Ragon makes his headquarters in St. Paul, Minn. and will cover the territory of Ia., Minn. and Wis.

Charles A. Hansen has established his own manufacturers' rep firm in Los Angeles, Calif. He was formerly distributor sales manager of Gramer-Halldorson Transformer Corp., Chicago, Ill.

Andrew H. Baxter, 412 Albee Bldg., Washington, D.C. has been appointed sales rep for Richardson-Allen Corp. of College Point, L.I. in the territory of Dist. of Columbia, Md. and Va.

Joseph Spring, whose offices are at 254 W. 35th St., New York, N.Y. has been appointed to represent Crescent Industries Inc., Chicago, Ill. in the Greater New York area.

R. C. Nordstrom & Co., 580 N. Woodward Ave., Birmingham, Mich. have been named to represent Tobe Deutschmann Corp. in Michigan, excluding the Upper Peninsula.

The Carl H. Schmidt Co. 2405 West McNichols Rd., Detroit 21, Mich. has been appointed sales agents by the Jelliff Mfg. Corp., Southport, Conn. The organization will concentrate on alloy resistance wires, wire-wound precision electrical and electronic components, heating elements, etc., in Michigan, and Toledo, O.

Robert L. Iversen has become associated with Allen Woods of 3403 Broadway, Chicago 13, Ill. Mr. Woods is Sales Engineer for Stackpole Carbon Co. and United Transformer Co.

Edward Hoffman of St. Paul, Minn. has been appointed sales representative for Erie Resistor Corp. and will represent the Electronic Div. in Minn. and N. & S. Dakota.

Louis A. Garten, formerly Sales Mgr. of Kay Electric Co. has announced the opening of offices at 25 Valley Rd., Montclair, N.J. and will represent manufacturers in the areas of L.I., N.Y.C., Westchester, N.J., and eastern Pa. The firm now represents Airborne Instruments Lab., Inc., Detectron Co., Edin Co., Inc., Federal Telephone & Radio Co. Instrument Div., Kepco Labs., Inc., Lavoie Labs., Inc., Rutherford Electronics Co. and Technology Instrument Corp. (Instruments).

Gawler-Knoop Co., Roseland, N. J., with offices in Wyncote, Pa. and Silver Spring, Md., has been appointed to represent Offner Electronics, Inc. Chicago, Ill., in Greater N. Y., the eastern half of Pa., Va., N.J., Md., Del., and the District of Columbia. Representation in western Pa., Ohio, and Mich., will be handled by J. R. Dannemiller Associates, Cleveland, O. who have offices in Detroit, Mich., and Dayton, O.

George Davis, of the George Davis Sales Co., and past president of the Los Angeles Chapter of the Representatives, now heads the board of governors according to an announcement by W. Bert Knight, president.

### NE Reps Directory

The newly published Directory of the New England Chapter of "The Representatives" lists the names and product categories of manufacturers handled by member reps. Copies are available from Henry P. Segel, 131 Newbury St., Boston 16, Mass.

### CONSTRUCTION FOR NEELY

Norman B. Neely (l), Pres. and Robert L. Boniface, Gen. Mgr. Neely Enterprises Inc., L.A. Reps, flank Vance Young, Supt. for Bibb, Remmen and Bibb contractors. They are discussing plans for new \$250,000 headquarters building being built on historic Campo de Cahuenga site. Completion is expected in April 1955.

## "Automated" Production

An "automated" production machine capable of effecting important time-and-cost savings has been developed by RCA for its own use, as well as for sale to the general industry according to T. D. Smith, Vice President and General Manager, RCA Engineering Products Div.

The new machine is designed to "trigger" punches of virtually any pattern of holes for components in electronic printed-circuit panels. The machine is expected to sell for around \$14,500, and in addition to this standard model, RCA also will make custom versions to customer specifications.

Operation is by a glass-based cloth tape into which 'master' holes are punched to produce any combination of component holes in

This push-button machine triggers punches for any combination of holes for printed circuit panel components. Punched tape determines hole pattern. Machine punches up to 12000 holes/min.

printed-circuit panels. Under actual production conditions, the "automated" machine demonstrated two principal advantages:

1. Important cost savings over conventional drill and punch-die methods. In a typical example, in quantities of over 1,000, punching of printed-circuit boards by the automated machine cost an average of five cents each compared with \$1.73 and \$1.10, respectively for punching boards by drill and punch-die methods. Tool costs for the tape-operated unit are less than \$30 for the completed standard tape, compared with hundreds of dollars required by conventional equipment for dies and templates.

2. Valuable saving in time. Conservative estimates of tool-up time required for punch-die and drill equipment are one month and one week respectively. It takes only about four hours to "tool" or prepare the tape for the RCA automated machine, and only three minutes to install the prepared tape.

## MINIATURE PULSE TRANSFORMERS

The wealth of experience that Acme Electric engineers have gained in more than 37 years of transformer designing, becomes apparent in the performance and high quality construction of this line of Miniature Pulse Transformers. Send us your specifications.

SEVEN LEAGUES AHEAD

3-918

# SUBMINIATURE RELAY—Plus!

ACTUAL SIZE

**Compact . . . Rugged . . .  
Light weight . . .  
6 PDT arrangement**

All these features are achieved by the use of an extremely efficient rotary motor, precision built with hydrogen annealed parts.

**COMPACT**—One inch diameter, with 1-5/16" long enclosure.

**HEIGHT**—above chassis, is only 1.216 inches.

**RUGGED**—Withstands operational shock of 50 G's and operational vibration of 5-500 C.P.S. at 10 G's. Altitude to 70,000 feet. Ambient temperature range of -65° C to +125° C.

**LIGHT WEIGHT**—Only 2.6 ounces (even with mountings interchangeable with larger relays of other manufacture).

Tests of production relays, under USAF supervision, have proven that this relay meets or exceeds the requirements of MIL-R-5757B.

Contacts are rated at 3 amperes, non-inductive, at 26.5 V.D.C. or 115 V.A.C., 60 to 400 CPS.

Coil resistance values range from 6 ohms to 14,000 ohms. Relay pictured above has 1-9/16" mounting centers but can be supplied with other mounting styles requiring less chassis space.

Other standard contact arrangements are 2 PDT, 3 PDT and 4 PDT. All are available in the plug-in construction.

## JET PROPULSION LABORATORY

CALIFORNIA  
INSTITUTE OF  
TECHNOLOGY

Active in all phases  
of electronics and physics  
related to guided missiles  
and jet propulsion.

The nation's foremost  
guided-missile research  
and development  
facility, established in  
1940, offers excep-  
tional opportunity for  
engineers and research  
scientists in the fields  
of guidance and con-  
trol, information theory,  
computers, electro-  
mechanical devices, in-  
strumentation, and  
related aspects of elec-  
tronic research. The  
Laboratory offers an  
ideal blend of aca-  
demic and industrial  
environments and main-  
tains a high level of  
technical competence.  
Attractive salaries are  
offered.

A brochure describing  
opportunities and activities  
at the Laboratory will be  
sent upon request.

## PERSONAL

Nello Coda has been promoted to Chief Engineer of the Electronics Div. of Erie Resistor Corp., Erie, Pa. Before this promotion Mr. Coda was Chief Electrical Engineer for the firm.

Dr. George L. Haller has become Mgr. of the Laboratories Dept. of General Electric Co.'s Electronics Div. Prior to this appointment Dr. Haller was dean of the College of Chemistry and Physics at Pennsylvania State Univ.

G. L. Haller

W. Firestone

Dr. William Firestone has been advanced to the newly created position of Assistant Chief Engineer of the Research Dept. of Motorola's Communications and Electronics Div. He also continues in his present position as head of the Advanced Investigation section of the Research Dept.

A. C. Boss has been named chief field engineer of the Television and Broadcast Receiver Div. of Bendix Aviation Corp. He has been on the Bendix staff for 8 years, his most recent position being supervisor of television test and inspection.

Conrad E. DeHorn has been appointed Chief Engineer and Director of Quality Control of Crest Transformer Corp. N. Chicago, Ill.

Percy Halpert has been appointed engineering director of aeronautical equipment at the Sperry Gyroscope Co., Great Neck, N. Y. He succeeds O. E. Esval, who has been named vice-president and chief engineer of Sperry Corporation's Wright Machinery Co., Durham, N. C.

Otto K. Weltin has been appointed assistant director of Cook Research Laboratories, Skokie, Ill., Division of Cook Electric Co., Chicago, Ill. Charles E. Durkee has been appointed head of the radar and communications section.

Theodore C. Gams has been appointed Director of Research at N. J. Electronics Corp. of Kenilworth, N. J.

Armand F. DuFresne has been named to the newly created post of chief product engineer at Consolidated Engineering Corp., Pasadena, Calif. He will head a new product engineering department.

## PIPELINE TO PRECISION

**MODEL WWVR**

A receiver of the instrument class which is setting a new standard for the reception and presentation of the world's finest standards of time and frequency as broadcast by the National Bureau of Standards from WWV and WWVH.

The fundamental use of this receiver is in the calibration of local equipment to the accuracy of these primary time and frequency standards.

This time saving instrument incorporates all the latest techniques for clear reception. A glance at the front panel will at once show the ease of operation and instant availability of the desired Radio and Audio frequencies.

Model WWVR allows the operator full use of the world's finest primary standards of frequency and time. All frequencies broadcast from WWV (or WWVH) are accurate to one part in fifty million. This instrument in your laboratory will truly give you a . . .

### PRIVATE PIPELINE TO PRECISION

#### —Specifications—

**SENSITIVITY**—Better than 1 microvolt on all frequencies.

**SELECTIVITY**—Less than 18 KC for -60db, 2.5 KC for -3db.

**FREQUENCIES**—Choice of three RF front ends delivered with receiver, 2.5, 5, 10, 15, 20 or 25 mc.

**SMALL IN SIZE**—Standard 5 1/4" relay rock panel.

**DOUBLE CONVERSION**—First IF amplifier at 2 MC, crystal converter to 60 KC second IF amplifier.

**FRONT END**—Four tuned circuits at the signal frequency for maximum sensitivity and image rejection.

**AGC and AVC**—AGC system provides constant RF input to second detector. AVC system independently controls audio resulting in constant output on tones.

**INDIVIDUAL INPUTS**—Three individual inputs for tuned antennas plus one common input for broad-band antenna. Balanced 300 ohm or unbalanced 72 ohm input.

Send for complete specifications,  
prices and delivery schedule.

Lawrence J. Perenic has been named Manager of the Electronics Dept. at U. S. Testing Co., Hoboken, N. J. Mr. Perenic supervises the electronic services of the company.

L. J. Perenic

A. M. Skellett

Dr. A. Melvin Skellett is the new director of color television tube planning and development for Tung-Sol Electric Inc., Newark, N. J. Dr. Skellett holds a patent for a radial beam tube used in military equipment and industrial instruments.

Sam Hyman has been appointed to the newly created position of Chief Commercial Engineer at Permoflux Corp., Chicago, Ill., Walter Padgett replaces him as Chief Engineer.

Floyd Reid has become development engineer of ORRadio Industries, Inc., Opelika, Ala. Following World War II, and later service with Link Aviation, Mr. Reid developed an electronic laminating machine in his own corporation.

Dr. Gordon K. Teal, assistant vice-president, Texas Instruments, Inc., Dallas, Texas, has been appointed head of the research division where he will have charge of TI research in many phases of electronics and geophysics.

G. K. Teal

A. E. Abel

A. E. Abel has been made director of engineering and research for Bendix Aviation Corp., Baltimore, Md. He succeeds Arthur C. Omberg who has been promoted to assistant general manager of the Bendix Missile Section (Products Div.) Mishawaka, Ind.

Dr. Rudolph G. E. Hutter, formerly manager of the physical electronics branch, has been appointed manager of the Physics Laboratory of Sylvania Electronic Products Inc., New York, N. Y. Harry H. Martin succeeds Ned J. Marandino as manager of the TV set assembly plant at Batavia, N. Y.

## Color Television

(Continued from page 98)

to a field lens in the camera. By use of a separate lens at each camera and appropriate choice of dichroics and color shaping filters, each camera sees only the red, the green, or the blue component of the color image (see diagram of Fig. 11).

The three identical vidicon camera sub-chassis are located together with the light-splitting optics in the front portion of the optical assembly. Mechanical alignment of the three sub-chassis is easily achieved by thumb-screw adjustment. The "in line" arrangement of the camera sub-chassis also simplifies this initial set-up. Final precise registration is easily achieved electronically, and once registered, there is excellent stability of registration. In day-to-day operation, only minor touch-up of controls will be necessary.

### CAMERA CONTROL

Camera control—The 3-vidicon camera control units may be conveniently mounted in two control housings. The control position includes (1) a TM-6C master monitor mounted in a 13-in. console housing, and (2) a 19-inch master console housing, in which the camera control panel and the processing amplifier may be mounted (see Fig. 12). The 19-in. housing accommodates a 19 in. camera control panel in the indented desk section and the processing amplifier in the top sloping portion of the console. To complete the control function, a TM-10B color monitor is needed. This may be suspended either from the wall or ceiling or set upon the flat top of the master console housing as space requirements dictate.

Several alternative arrangements will make themselves apparent to stations who wish to integrate their color and monochrome equipment or are otherwise limited by space. For example, all of the 3-vidicon color film control equipment may be rack mounted. In this case a rack mounted control desk and accessory kit, MI-40415, is available to provide desk space at the rack location. Here it is recommended that the TM-10B color monitor be mounted in an adjoining rack at approximately the level of the monochrome TM-6C master monitor. Another alternative is to place the TM-6C in its accessory field case, MI-26521-A, and set this on the flat top of the master console housing. The TM-10B color monitor may be conveniently located nearby.

Corning Metallized Glass Enclosures like these are used for hermetically sealing rectifiers, resistors and capacitors.

## How to protect delicate components from moisture, mold, dirt, thermal shock

You've got to safeguard delicate components so they can stand up under rough and tumble operating conditions.

Encapsulate sensitive components in rugged Corning Metallized Glass Tubes and you give them stamina they otherwise lack.

You protect them in a hermetic seal from moisture. You keep out dust and dirt. You prevent moulds and fungi from settling on them.

When assembled with metal end caps, Corning Metallized Glass Enclosures can take sudden temperature changes—from as much as 275° C. to ice water. And they are not affected by atmospheric changes.

The protection of metallized glass enclosures is permanent. Bond strength for metallizing used on enclosure tubes has been measured at 1500 to 2000 pounds per square inch. Because the glass is transparent, you can see inside the tubes to check the conditions of components. The electrical characteristics of the glass are excellent.

You can get metallized glass enclosures in a variety of sizes. We'll be happy to send you a descriptive catalog sheet telling you more about them. Or, if you have some specific problems metallized glass enclosures might help you solve, we'll be pleased to work with you. Write, wire or phone us.

Miniature, compact, powerful, custom-built and quality controlled motors, characterized by high output and high efficiency. Designed as components for precision airborne accessory equipment, Globe Motors meet all military requirements. Speed governors, gear reducers, radio noise filters, electromagnetic clutches, brakes, etc., are available as standard assemblies. D. C. Motors can be made for various voltage applications ranging from 6 to 100V, and from 5,000 to 22,000 R.P.M. and with power output from 1/100 H.P., and up to 1/50 H.P. dependent on frame size. A.C. Motors, 400 C.P.S. Hysteresis-Synchronous type, can be made for voltage applications up to 115V, with power output up to 1/200 H.P. for 4-pole types, and up to 1/100 H.P. for 2-pole types. Single phase capacitor-run or two phase windings available. A.C. Motors, 60 C.P.S. also available.

Let Globe's complete engineering facilities investigate and resolve your motor problems. WRITE FOR COMPLETE INFORMATION TODAY!

## Measure Noise- Check Performance

### IN MICROWAVE SYSTEMS

**KAY**  
MICROWAVE  
*Mega-Nodes*

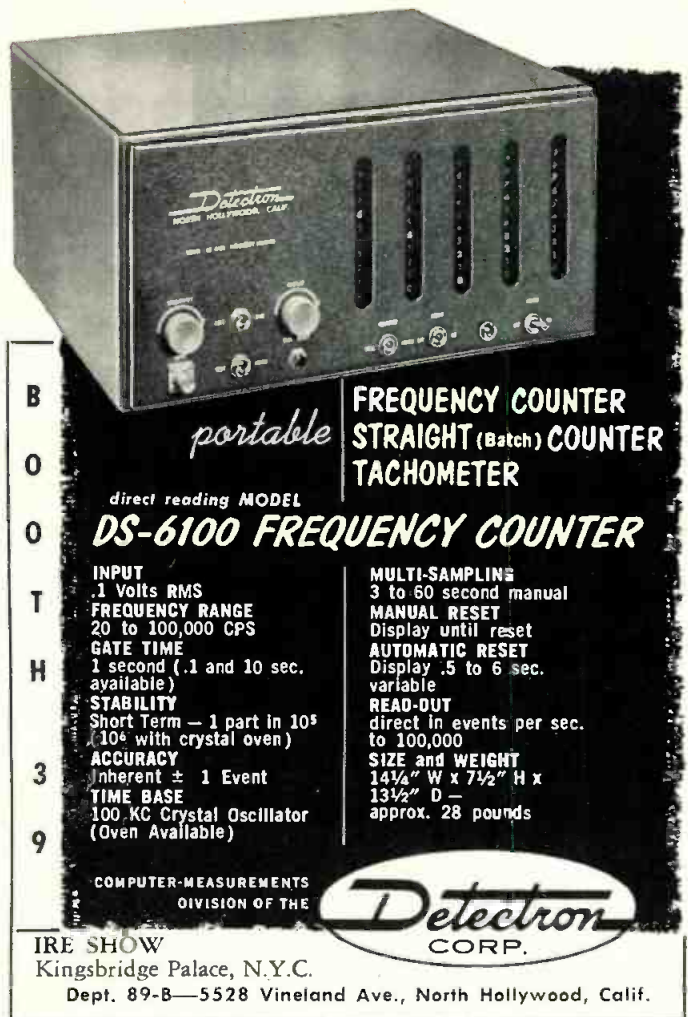

Employing radiated monochromatic light, the eight waveguide sizes of KAY *Mega-Nodes* provide primary standards covering the microwave spectrum. Useful for measurement of noise figures and receiver gain and sensitivity, and for the calibration of standard signal sources, they also provide a fast and simple check on the performance of radar and other microwave systems. Available in the following waveguide sizes to cover the range of 1200-1400 mc and 2600-40,000 mc:

RG-69/U, RG-48/U, RG-49/U, RG-50/U,  
RG-51/U, RG-52/U, RG-91/U, RG-53/U

Available with fluorescent or inert gas (argon or neon) tubes. Noise output fluorescent tubes 15.8 db  $\pm$  .25db  
• Noise output argon gas tubes 15.2 db  $\pm$  .1 db. • Noise output neon tubes 18.0 db  $\pm$  .5 db • Noise output of inert gas tubes, independent of operating temperature.

Scientific recording now accomplished by Alfax Paper, where previously photography had seemed necessary.

New Alfax Paper — in which electricity is the ink — makes possible simple, uncomplicated recorders that operate unattended, get great amounts of related information compactly with high accuracy. Alfax paper is different—non-toxic, stable in storage, requires little current yet cannot overload, records at slow or high speeds, does not smudge or transfer.

See the Alfax Paper and Engineering Co. IRE Show Booth No. 191 or write Westboro, Massachusetts.

Helix recording simplified by new "assemble yourself" recorders.

New horizons in graphic recording opened up by Alfax Paper — electricity is the ink — now can be explored quickly with these Alden adjustable helix recorders and components.

See the Alden Electronic and Impulse Recording Equipment Co. IRE Booth No. 189 or write Westboro, Mass.

## Color Television

(Continued from page 186)

ing amplifier mounted in the control console has incorporated many space saving features. For instance, a monitor auxiliary circuit as part of the processing amplifier provides for precise electronic switching of the video signals to be monitored on the TM-6C. The processing amplifier performs a great number of functions previously requiring several other units. Integration of these electrical functions in a single unit results in a simple, space-conserving, low cost system. Use of this design allows set-up time to be substantially reduced and requires fewer video operators and control room engineers for programming. Hence considerable savings in operating costs can be realized. A large reduction in power required as well as increased tube life due to ex-

Fig. 12: Master console, including camera control panel and processing amplifier units

tremely conservative operation of tubes further reduce costs, at the same time improving performance and overall quality.

The basic circuit elements in the processing amplifier are three plug-in video amplifiers which perform the following functions: cable compensation, video amplification, blanking insertion, shading insertion, feedback clamping, linear clipping, gamma correction and output amplification.

A fourth plug-in unit serves as the video section of an electronic switcher which is an integral part of the main chassis. The switcher, used with master monitor, TM-6C, provides an individual or combined presentation of red, blue and green video.

Rack equipment—all the units normally housed in the master console—master monitor, control panel and processing amplifier may be

rack mounted. To complete the camera chain, a colorplexer, an aperture compensator, and a set of power supplies (two WP-33B's and three 580-D's) also mount in standard 84-inch cabinet racks. A color monitor is also included in the chain and can be rack mounted or placed in a cabinet at a convenient location.

### 3-V MULTIPLEXER

*3-vidicon multiplexer*—this multiplexer, TP-12, provides the optical system required to project a number of film sources into a single 3-vidicon camera input. Using mirrors, the multiplexer provides for two film projectors (16mm or 35mm) and a single 2 x 2" dual-disc slide projector. Selection of any of the film sources can be remotely controlled. Each of the two mirrors in the multiplexer is hinged so that they will fold out of the way as required (see the block diagram on these pages). The movement is electrically activated so that the proper operating combination can be obtained by projector controls. The image from any of the projectors can thus be relayed to the field lens in 3-vidicon camera.

*Film and slide projectors*—in color film reproduction the TK-26A 3-vidicon film camera system utilizes the excellent storage characteristic of the vidicon tube. This allows operation with intermittent type film projectors with which most television operators are already familiar. Use of the intermittent type projector means that, while the sync generator is phased from the color sub-carrier crystal as required in a color system, the projectors can operate directly from the power line and be synchronized with it. It is necessary, however, to modify these projectors for long application. The RCA TP-6BC professional projectors, however, can be used in the 3-vidicon system without modification since the long application feature has been incorporated in its design.

*Monitors*—A color and a monochrome monitor are furnished in plan #2 equipment for monitoring the Vidicon film and slide camera operation. The master monitor is necessary in order to properly set the separate R, G, and B channels. The TM-10B color monitor is, of course, essential in checking the output of the system.

**Radio Engineering Show**  
**1955 IRE NATIONAL CONVENTION**  
 New York City... March 21-24

\*Kingsbridge Armory, Airborne Avenue

The coil form with the highest resistivity of any resinated product. Custom fabrication to your exact specification assures correct dimensions to within the most critical tolerances.

We will furnish—without charge—a pilot production run of custom-made embossed forms to fit your particular application.

Get full information on Use of Threaded Tubes, Threaded Iron Cores VS. Torque Control.

**VARIABLE  
ATTENUATOR**

... A revolutionary design in attenuators!

- PROOF against SHOCK—MOISTURE—TEMPERATURE.
- Withstands ambient temperatures of  $-40^{\circ}\text{C}$ . to  $+70^{\circ}\text{C}$ .; 95% humidity.
- Resistive elements are accurate, non-inductive, wire-wound and hermetically sealed in a special tough plastic compound.
- Greater power dissipation.
- Switch surface flat and smooth... easy to clean, BRUSHES CANNOT TRIP, exceptionally long life.
- QUIET... extremely low switch noise level... ideal audio mixer controls.
- "Lubricated for life" bearings.
- Stock types available with "LADDER," "T," "H," "L," and potentiometer configurations up to 32 steps.

Send for Bulletin A-2 for specifications and prices.

Howard S. Gleason has been appointed Mgr. of Automation Research at Stromberg-Carlson Co., Rochester, N.Y. The Automation Research Group is a newly formed one for research in the field of automation.

Kimball A. Reyher has been named Radio Merchandise Mgr. of Westinghouse TV-Radio Div. in Metuchen, N.J.

Lawrence LaPatka has become Division Mgr. of Burroughs Corp. Electronic Instruments Div., Philadelphia, Pa. He was previously division sales manager.

L. LaPatka

G. Dean

Gordon Dean, former Chairman of the U. S. Atomic Energy Commission, has been elected to the board of directors of Kety Instrument Corp. Mr. Dean is Chairman of the Board of Nuclear Science and Engineering Corp., a Kety affiliate.

New appointments at Philco Corp. include that of Joseph A. Lagore to the post of Vice-Pres., Mfg. and James D. McLean to Vice Pres., Sales of the Govt. and Industrial Div. Mr. Lagore was formerly Gen. Mgr. in charge of Operations and Mr. McLean was General Sales Mgr. at this division.

J. A. Lagore

J. D. McLean

Robert C. Scott, who has been a member of the Du Mont organization since 1948, has been made general sales manager of the Cathode-ray Tube Div., of Allen B. Du Mont Labs., Clifton, N. J. He will have complete responsibility for the sale and merchandising of TV picture tubes.

## Variable Test VOLTAGE MEGOHMMETER by FREED

### A New Companion to the Industry Accepted 1020-B MEGOHMMETER

The Freed Type 1620 is a versatile insulation resistance measurement instrument with a continuously variable DC test potential from 50 to 1000 volts.

Components such as transformers, condensers, motors, printed circuits, cables and insulation material can be tested at their rated voltage and above, for safety factor.

- RESISTANCE — 0.1 megohms to 4,000,000 megohms.
- VOLTAGE — variable, 50 - 1000 volts.
- ACCURATE — plus or minus 5% on all ranges.
- SIMPLE — for use by unskilled operators.
- SAFE — high voltage relay controlled.

BROOKLYN (RIDGEWOOD) 27, N.Y.

(Continued from page 194)

Charles M. Green has succeeded to the presidency of Sperry Gyroscope Co. Div. of Sperry Corp., following retirement of Preston R. Bassett who will continue as vice president of the parent company. Mr. Green has been executive v.p. and general manager since 1945.

C. M. Green

P. R. Bassett

Harold M. Zimmerman has been named director of CBS-Columbia, TV, radio and electronics apparatus division of Columbia Broadcasting System. He will report to Mr. Will James, director of operations. Previously, Mr. Zimmerman was in charge of procurement for engineering products at Radio Corp. of America.

Milton Binstock has been appointed vice-president and director of sales at Sheldon Electric Co., division of Allied Electric Products Inc., Irvington, N. J. Frank Ferdinand has been made sales manager.

Dr. Anthony Moos, general manager of the Patterson-Moos Division, Jamaica, N. Y., has been made vice-president of Universal Winding Co., Providence, R. I. Universal acquired the division in July 1954.

New appointments at Permoflux Corp., Chicago, Ill., include R. S. Fenton, V. Pres. in charge of sales and engineering; Frank Newberg, Mgr. of Manufacturing, and Edward Watermulder, administrative mgr.

Robert G. Lynch has been promoted to the newly-created position of assistant regional mgr. for equipment sales in the Eastern Region for Sylvania Electric Products Inc. He will be located at the company's regional office in Chicago, Ill.

David W. Potter has been named sales manager of the Components Div. of Federal Telephone & Radio Co., Clifton, N. J., division of I.T. & T.

R. J. Studders has been appointed manager of magnetic products engineering at Carboly Dept. of General Electric.

## Precision AND Accuracy GIANNINI Potentiometers

SOME OUTSTANDING EXAMPLES:

**SPIRALPOT**  
85175A  
Models 85171A  
85172A  
85173A

Slide-wire, infinite resolution, low noise. Resistances 2 to 2500 ohms. Linearities  $\pm 0.1\%$  to  $\pm 0.025\%$ . 1 to 40 turns.

**MICROTORQUE**  
Model 85111

Extremely low torque (.003 oz. in.). Resolution to .06%, 1" dia. x 1.31"; shaft 0.031", dia. 1.63 watts (average). Resistance: 250 to 25,000 ohms; 12 wiring types. Linearity:  $\pm 0.5\%$  or  $\pm 0.25\%$ .

**MINIGANG**  
Model 85193

Rugged—small; resolution to .06%, 1.125" dia. up to six sections; 2 watts per section. Resistances: 130 to 70,000 ohms. Linearities:  $\pm 0.5\%$  or  $\pm 0.25\%$ .

**RECTIPOT**  
Model 8620

Linear motion, rigid metal case; 1" dia. one or two elements; strokes from 0.1" to 6.0". Resistances from 400 ohms/in. to 15,000 ohms/in.; taps available.

**UNIVERSAL  
GANGPOT**  
Model 85197

1 to 12 sections; 2" dia. Resistances 360 to 200,000 ohms per section. Linearities:  $\pm 0.3\%$  to  $\pm 0.15\%$ ; sleeve or ball bearings; sections phaseable 360°; solid shaft, anodized aluminum case.

**DAVEN  
TRANSMISSION  
MEASURING SET  
TYPE 12-A**

**For Measuring the  
Characteristics  
of Microwave  
Relay Systems**

See Daven's Booth at the I.R.E. Show  
543 & 545 Components Avenue

This unit provides the necessary information on transmission characteristics for the installation of terminal equipment, for the maintenance of terminal equipment, and for the field service of transmission lines and terminal equipment for microwave relay systems.

In one portable unit for efficient field use are combined the functions which normally would be performed by a separate Vacuum Tube Voltmeter, Audio Oscillator and Equalization Filters.

This unit has filters for providing response curves for accurate indication of 144, F1A or flat transmission lines. The 12-A also has provision for measurement of harmonic distortion and has its own self-contained low distortion 1000 cycle oscillator with variable amplitude.

The amplifier of the 12-A provides range levels from plus 20 to minus 80 DBM in calibrated steps of 10 Db. The associated meter is calibrated in 0.5 Db steps. The dynamic characteristics of the indicating meter are such that its response approximates the speed of appreciation of sounds by the ear.

This unit has line blocking capacitors for use across central battery and dial telephone lines.

**KEEP AHEAD WITH YOUR EQUIPMENT DESIGNS**

**RCA UHF "PENCIL" TYPES**  
 ... for superior efficiency  
 in UHF communications.

**... Choose RCA  
 Industrial  
 Receiving-  
 Type  
 Tubes**

**RCA PREMIUM TYPES**  
 ... for added reliability  
 in industrial and  
 military environments.

**RCA COMPUTER TYPES**  
 ... for dependable,  
 uninterrupted use in  
 computer applications.

**A LOW-NOISE TYPES**  
 ... for low-noise  
 operation in critical  
 audio applications.

**RCA "SPECIAL REDS"**  
 ... for exceptional uniformity,  
 stability, dependability, and  
 minimum life of 10,000 hours.

**RCA VR's and THYRATRONS**  
 ... for stability and dependability  
 in control circuits.

To help get your share of the enormous market potential in the expanding industrial and communications fields, RCA research and manufacturing facilities bring you this important family of industrial receiving-type tubes. The line offers you a wide latitude in designing "industrial type" circuits—and, of course, offers you the famous RCA standard of performance.

See the array of RCA Tubes, Semiconductor Devices, Components, and Test Equipment ... at the IRE Show—Booths 151 to 155
