KT

MICRO TRAINING FOR COMPUTER USERS

6 Micro courses

Which would you like to attend?

Digitus is running a number of courses to train users and potential users in the basic skills of micro-computing. Conducted at our Central London Workshop, the courses provide hands-on experience of microcomputers, demonstrations of working systems and tutorials on your particular needs.

INTRODUCTION TO MICROCOMPUTERS

One day's concentrated information on microcomputing aimed at the potential user in small and large organisations. A practical course which includes business applications of micros, guidelines on selecting microcomputer systems and an introduction to programming.

FUNDAMENTALS OF PROGRAMMING IN BASIC

A two day course designed to teach the first principals of programming in BASIC. Aimed at those with some understanding of micros who want to learn how to instruct their computer to perform tasks.

IMPROVE YOUR BASIC

A two day course for those who have learned Basic from hands-on experience and want to brush up their BASIC techniques and learn some timesaving software tools.

Training for Computer Professionals
Course in: Micro Technology for Management • Local Area Networks • Micros for Computer Professionals.
Courses are run at the Workshop or on site. Telephone or write for details.

WORDSTAR WORDPROCESSING

A one day course for people who want to learn the fundamentals of wordprocessing. Uses the popular Wordstar wordprocessing package available on most CP/M micros and teaches by hands-on use.

DATASTAR INFORMATION MANAGEMENT

The DataStar data entry, retrieval and management system is a powerful aid which enables the educated user and computer professional to build information systems economically and rapidly.

Micro Technology Workshop Set in 8,500 sq.ft in Central London, the Workshop is a few minutes from Covent Garden, Trafalgar Square, Charing Cross, Embankment and Waterloo stations. Specialist areas include: Personal Computers, Technical Systems, Business Systems, 16 bit and Local Network Systems, Bookstore and Training Rooms.

Booking and Fees Courses 1 to 8 £95 per day plus VAT. Courses 9 to 16 £125 per day plus VAT payable 14 days prior to starting date. YOU SAVE £10 per day BY BOOKING MORE THAN ONE DAYS TRAINING AT ONE TIME

MICRO-PRO SOFTWARE TOOLS

In addition to Wordstar, Micro-Pro Inc have produced a variety of aids to improve productivity in offices and systems departments. This one day course includes: Mail-Merge linked to Wordstar • Supersort sorting utility • CalcStar rows and columns manipulation • DataStar information manager • harnessing the 'Star' products together.

All courses provide access to an extensive range of micro hardware, software and expertise.
Note: Wordstar and DataStar are registered trademarks of Micro-Pro Inc.

Cover photography: John Mason

FEATURES

ADA — A BRIEF ENCOUNTER 118
Mike Parr discusses the Ada programming language.

AN INTELLIGENCE TEST FOR COMPUTERS? 134
Bev Mason introduces an interesting calculus program.

DATABASE COMPARISON 140

Kathy Lang compares notes.

READ ALL ABOUT IT! 154

Steve Mann takes a look at the proliferation of Spectrum books.

PCW MANHUNT 156

The final part of PCW's exhausting competition.

ADVANCE TO THE FORE! 169

A full report on the 3rd European Micro-computer Chess Championship from Anthony Harrington.

GOING UP

With great reluctance we have to announce that as from next month your monthly dose of micro mania will cost you 10p more. That's right — from January, PCW's cover price will be 85p. Considering that we've held the price at 75p for nearly two years now, we hope you'll not be too outraged by this increase, which has been forced on us by rising costs.

Founder Angelo Zgorelec; Managing Editor Dick Pountain; Editor Peter Rodwell; Programs Editor Maggie Burton; Sub Editor Steve Mann; Consultant Editor David Tebbutt; Art Editor Phoebe Creswell-Evans; Design Assistants Rick Gadsby, Safu-Maria Gilbert, Jonathan Sellers; Typesetting Jane Hamnell, Patrick Dineen; Publishing Manager Fiona Collier; Group Advertisement Director John Cade; Advertisement Manager Patrick Dolan; Assistant Advertisement Manager Peter Goldstein; Sales Executive Jan Martin; Micromart Gaye Collins; Advertisement Assistant Priscilla Senior; Advertisement Production Robert Buggs.

BENCHTESTS & REVIEWS

BRIT PRINTER TAKES ON THE JAPS 110
Peter Rodwell reviews the all-British Walters 100 dot-matrix printer.

EPSON HX-20 112
Dick Pountain peeks inside Epson's hand-held computer.

PLUTO POWER! 126
A review of IO Research's powerful graphics board from Joe Whelan.

COMPUTER SCRABBLE 144
Maggie Burton looks at the finer points of Little Genius's Apple Scrabble game.

THE EDUCATIONAL COMPUTER? 148
Mike Curtis tries out Motorola's MC68000 educational board.

REGULARS

NEWSPRINT 94
What's going on in the micro world — and what isn't.

CTUK! NEWS 104
More from the nation's computer literacy project.

BANKS' STATEMENT 107
Martin Banks muses on chip manufacture.

CALCULATOR CORNER 131
A complex arithmetic program for the Sharp PC1211.

COMMUNICATIONS 138
Your chance to moan, whinge, complain — congratulate even!

SCREENPLAY 145
Dick Olney plays games on the TRS-80 Color Computer.

TJ'S WORKSHOP 157
This month's batch of micro tips.

COMPUTER ANSWERS 162
Sheridan Williams and his gang of experts solve your problems.

PCW SUB SET 165
Another collection of useful Assembler routines.

BRAIN DUMP 167
Editor Rodwell reports on his trip to Japan.

SUBSCRIPTIONS 168
This month's reason to buy a subscription to *PCW*.

NEWCOMERS START HERE 174
PCW's intro to computing.

DIRECT ACCESS 175
With In Store, Diary Data, Transaction File, User Group Index, ACC News, Network News and CTUK! Contacts.

PROGRAMS 186
A mixed bag of readers' software.

LEISURE LINES 203
Another teaser to throw your mental processes into total confusion.

BLUDNERS 203
Every magazine makes mistakes — only *PCW* is daft enough to admit them!

BACK ISSUES 204
Your chance to find out what was in last month's *PCW*.

CHIP CHAT 296
More slanderous industry invective.

HOW TO USE YOUR EPSON WITHOUT WASTING COMPUTER TIME

SERIAL 8K
£125 + VAT

Your computer is capable of sending data at thousands of characters per second but the Epson can only print 80/100 characters per second.

This means your computer is forced to wait for the printer to finish one line before it can send the next. A waste of valuable time.

THE NEW MICROBUFFER ACCEPTS DATA AS FAST AS YOUR COMPUTER CAN SEND IT

Microbuffer stores the data in its own memory buffer and then takes control of the printer. This frees your computer for more productive functions.

PARALLEL OR SERIAL

Microbuffer model MBK-16K is a Centronics - compatible parallel interface with 16,384 bytes of on-board RAM for data buffering.

The MBS-8K is a full featured RS232C serial interface with both hardware and software (x-On/X-Off) handshaking, baud rates from 300 to 19,000 and an 8,192 byte RAM buffer.

SIMPLY PLUG IT IN

Either model fits the existing auxiliary interface connector inside the Epson MX80, MX80 F/T or MX100 without modification, and is compatible with standard Epson cables and printer control software.

PARALLEL
£125 + VAT

Only available from NORTHAMBER - call your local stockist and get him to order one for you today (he can get 24 hour delivery) - AND GET THE MOST FROM YOUR HOST

Southampton House 192-206 York Road
Battersea London SW11 3SA

ATTENTION... THIS IS YOUR COMPUTER SPEAKING!

Science Fiction has already become a reality. With the DGC TALKER speech synthesizer your computer can now do the talking for itself. By making use of the DGC TALKER developed in The Netherlands an unlimited vocabulary can be composed. The necessary memory space is approx. 10 bytes per second of speech.

Model 01/02

Can be connected directly to the following computer systems: TRS 80 model 1 and III, LNW 80 and Video Genius.
Price £ 120,- plus VAT.

Model 03

The DGC TALKER model 03 can be controlled by any parallel interface. The configuration is standard Centronics compatible. The cable configuration can be connected directly to the following computer systems: Commodore, Vic 20, Pet.
Price £ 110,- plus VAT.

Model 04

The DGC TALKER model 04 is supplied as an insert card, of which the configuration is compatible with Apple expansion slots.

This model can be connected to Apple 2, ITT 20-20 and Pearcom.
Price £ 104,- plus VAT.

The models 01, 02 and 03 have a built-in power supply for 220/240V.

Model 04 uses the power supply of the computer system.

All TALKERS have a built-in LF amplifier and the only item neces-

sary is a loudspeaker.

The DGC TALKER is supplied with V.O.S. (Voice Operating System).

This makes it possible to expand programs written in BASIC

by speech. By using the V.O.S. the application of speech in programs becomes just as simple as the use of the screen.

ZAND 80/PM MEDICAL PHYSIOLOGICAL MICROCOMPUTER FOR

*** DIAGNOSIS * THERAPY * CONTINUOUS MONITORING * RESEARCH ETC.**

ZAND 80/PM
Medical Physiological Microcomputer

★ Two in one - a professional business Microcomputer plus a Medical Physiological Microcomputer

★ Continuous Real Time display of original signals for ECG, PULSE, FINGER PULSE and RESPIRATION - All four channel display simultaneously for easy comparison

★ Continuous Calculated Mode of display for all four channels above - displays all calculations such as heart beat per minute, pulse transit time, breathing cycles per minute etc.

★ 760K of floppy disc storage for storing the calculated data for later plotting

★ 512 x 512 high resolution graphics and 8 bit A/D converter

★ 96K RAM

★ Quality amplifier with auto gain/offset

★ 15 in. high resolution, long persistent Green Monitor - tiltable & moveable (up-down, side ways)

★ Supplied complete with all hardware inc. ECG electrodes, finger pulse button, radial pulse strap, respiration belt and all software

★ Simple to use - no special training necessary - fully menu driven software

Original Real Time display of ECG, PULSE, FINGER PULSE and RESPIRATION

FAST 100CPS DOT MATRIX PRINTER/PLOTTER FASTER THAN MX801
BETTER GRAPHICS THAN OKI B2A!

The Most Advanced Low Cost Printer Outstanding Graphics, Print Quality & Performance

Recommended Price £399 + VAT

COMPAS PASCAL

Fast. Compact. Interactive. COMPAS Pascal for your Z-80 based CP/M micro.

COMPAS is an interactive Pascal system for use on any Z-80 based microcomputer with CP/M*.

COMPAS is incredibly compact - In a single 16K byte program, COMPAS includes a native machine code compiler, an advanced onscreen editor, and all necessary run-time routines! This leaves you more free memory and disk space than any other Pascal system.

COMPAS compiles a large subset of Standard Pascal directly into native Z-80 machine code, at a speed of up to 5000 lines per minute on a 4 MHz system! And a program written in COMPAS is 5 to 25 times faster than the same program in BASIC.

All major features of Pascal are supported by COMPAS, including INTEGERS, REALs with 11.5 significant digits, ARRAYS, RECORDs with variants, FILEs, and recursive PROCEDUREs and FUNCTIONs. Furthermore, many extensions are offered to give increased versatility, for instance STRINGs, random access data files, structured constants, in-line machine code, logical I/O devices, bit/byte manipulation, and program chaining with common variables.

Gemini Microcomputers

UK distributor:

Gemini Microcomputers Ltd.
Oakfield Corner, Sycamore Road
Amersham, Bucks HP6 5EQ

PolyData

Overseas distributor:

Poly-Data microcenter ApS
Strandboulevarden 63
DK-2100 Copenhagen O
Tel: 45 * 1 42 07 05

COMPAS is highly interactive. On finding an error during compilation, the compiler automatically invokes the on-screen editor and moves the cursor to the point of error, ready for immediate editing and recompilation.

COMPAS was designed with speed, efficiency, and ease of use in mind. COMPAS brings you the power of Pascal combined with fast compilation, high-speed execution, and easy editing and debugging. Let COMPAS show you the direct course to programming power.

Price £ 120.00 excluding VAT.

Dealer and OEM enquires welcome.

* COMPAS is currently available in Gemini, Superbrain, RML 380Z, Apple II 16-sector (SoftCard), and IBM 3740 8" disk formats. More formats are being implemented.

Please send me details of the COMPAS Pascal package.

SPECTRUM

**We won't be
be beaten on
price!**

SPECTRUM is a rapidly expanding group of independent retailers who specialise in selling home computers. Our group policy is simple - **WE WON'T BE BEATEN ON PRICE!** - our **BULK BUYING** ensures this. We select and buy the best and pass the savings on to **YOU**, the customer. We **GUARANTEE** that if you find an item currently advertised and in stock at another dealer and at a better price than ours - **WE WILL MATCH THAT PRICE ON THE SPOT.**

**Only trained personnel
at Spectrum!**

We believe that our product 'know-how' is crucial to you the customer. That's why in every one of our centres you'll find fully trained personnel, who have been trained by the importers or distributors themselves - so we know and understand the products we sell and can help every customer even the complete beginner. At SPECTRUM we find the **RIGHT** equipment to suit your needs. Handling over sealed boxes is not our line - our service includes 'hands-on' experience that we pass on to **YOU.**

After Sales care

SPECTRUM service centres will ensure that should your machine 'go-down' we will get it running again as quickly as possible. We also offer extended warranties at reasonable prices too! - ask your SPECTRUM HOME COMPUTER CENTRE for full details.

COMPUTER DEALERS!
 (or prospective Computer Dealers!)

If you would like to know more about becoming a SPECTRUM APPOINTED DEALER on an exclusive area basis, please contact MIKE STERN or ALAN WARREN on (07073) 34761
 Spectrum (U.K.) Ltd., Burrowfield, Welwyn Garden City, Herts.

MAIL ORDER

When it comes to MAIL ORDER our service is FAST! with SECURICOR DELIVERY to anywhere in the British Isles. - Ask your nearest SPECTRUM dealer for further details at time of ordering.

Up to £1000 INSTANT CREDIT with a SPECTRUM CHARGECARD

With a SPECTRUM CHARGECARD you choose the credit limit to suit YOU. e.g. a monthly payment of £10 gives you £200 credit. Ask your nearest SPECTRUM COMPUTER CENTRE for written details on how to apply for your SPECTRUM CHARGECARD - NOW!
 (Typical APR 30.6%)

V.A.T.

You will see that we quote our prices both including VAT and excluding VAT - no hidden 15% to suddenly up-lift your bill but also making our prices easier to compare with our competitors.

Not all stores carry every advertised item, please phone before making a journey — Prices correct at time of going to press E. & O.E.

Jupiter ACE

The Jupiter Ace personal computer runs in FORTH, an easily understood language, typically four times as compact and ten times as fast as BASIC. Before the Ace all personal computers used BASIC and FORTH was only available to a privileged few.

The Jupiter Ace also features a full-size moving-key keyboard, high-resolution graphics, sound, floating point arithmetic, a fast and reliable cassette interface and 3K of RAM.

If you own a personal computer you will be aware of the limitations of BASIC. You know how slowly your programs run and how quickly your computer's memory gets filled. The Jupiter Ace is your answer.

If you already know FORTH, the Jupiter Ace closely follows the FORTH 79 standard with extensions for floating point, sound and cassette. It has a unique and remarkable editor that allows you to list and alter words that have been previously compiled into the dictionary. This avoids the need to store screens of source, allowing the dictionary itself to be saved on cassette. Comprehensive error checking removes the worry of accidentally crashing your programs.

All inclusive price

For **£89.95** you receive your Jupiter Ace, a mains adaptor, all the leads needed to connect to most cassette recorders and T.V.s (colour or black and white), a software catalogue and a manual.

The manual is a complete introduction to the world of personal computing and a course in FORTH programming on the Ace.

Even if you are a complete newcomer to computers, the manual will guide you step by step from first principles to confident programming.

The price includes postage, packing and V.A.T.

The Jupiter Ace is backed by a full 12 month warranty.

Available soon

Plug-on parallel printer interface.

For around £20.00 this will connect your Jupiter Ace to anything from high-speed dot matrix to letter-quality daisy wheel printers.

Plug-on 16K Memory Expansion

For around £30.00 you will increase the memory of your Jupiter Ace to 19K giving you instant access to enormous amounts of information.

Software

A catalogue will be sent with every machine, and includes, initially, programs for education and entertainment.

FORTH Finishes First!

Speed Comparison Chart showing times in seconds to perform one thousand operations.

Type of Operation	Jupiter Ace	BBC Micro	Vic 20	Spectrum	ZX81
Empty loop	0.12	0.67	1.3	4.2	17.7
Print a number	7.5	13.5	26	19	430
Print a character	0.62	1.3	3.1	7.5	24
Add two numbers	0.45	1.4	5.5	7.5	28
Multiply two numbers	0.9	1.6	6.5	7.5	32

Because of the difficulty in devising exactly equivalent programs, these measurements should only be taken as a guide.

"The Ace is an excellent way of using FORTH"

Popular Computing Weekly

"FORTH is an easy language"

Byte

only £89.95

Designed by Jupiter Cantab

Computer Designers Steven Vickers and Richard Altwasser played a major role in creating the ZX Spectrum and then formed Jupiter Cantab to develop advanced ideas in personal computing. The Ace is the result, another all-British computer to lead the world.

Technical Information

Hardware

Z80A running at 3.25 MHz.
8K bytes ROM
3K bytes RAM

Keyboard

40 Moving-key keyboard with auto repeat on every key and Caps Lock.

Screen

Memory mapped 32 column x 24 line flicker-free display with upper and lower case ascii character set.

Graphics

Chunky graphics (64 x 46 pixels) may be plotted, unplotted or over-plotted (XOR operation). Also, the entire character set (128 characters and their video inverses) may be redefined allowing intricate shapes to be drawn with a resolution equivalent to 256 x 192 pixels.

Control Structures

IF-ELSE-THEN, DO-LOOP, DO-+LOOP, BEGIN-WHILE-REPEAT, BEGIN-UNTIL, all may be mixed and nested to any depth.

Cassette

Programs and data in the compact dictionary format may be saved, verified, loaded and merged. Blocks of memory can be saved, verified, loaded and relocated. All tape files are named. Running at 1500 baud, the Ace will connect to most portable tape recorders.

Expansion Port

Contains D.C. power rails and full Z80 Address, data and control signals. May be used to connect extra memory and other peripherals. IN and OUT words allow port-based peripherals to be addressed.

Data Structures

Integer, Floating point and String data may be held as constants, variables or arrays with multiple dimensions and mixed data types. There are no restrictions on names.

Sound

Internal loudspeaker may be programmed to operate over the entire audio spectrum.

In Schools Teachers already know how quickly children take to computing, and the Jupiter Ace is an ideal introduction. FORTH is an easy and important language to learn and by making learning fun, the Ace can help to teach science, music and many other subjects.

In Laboratories For monitoring and controlling experiments, the Jupiter Ace has many advantages. The language is perfect, even the Jodrell Bank Radio Telescope is controlled in FORTH. The Ace expansion port enables it to be interfaced to almost anything, and the built in quartz timer allows experiments to run all weekend.

At Home The Jupiter Ace is powerful enough to play games as complex as Chess and with sound and high resolution graphics, action games written in FORTH will stretch your reaction speeds to their limits.

In the Office Stock control, Accounts and Financial forecasts are all possible on the Jupiter Ace. With a printer and extra memory attached you can do word processing as well.

"FORTH is very flexible"

"FORTH is compact"

Electronics and computing

"FORTH is in general very much faster than BASIC"

Computing Today

Programming in FORTH

Programming in FORTH

FORTH programs are constructed without line-numbers, as words which are defined in terms of other words that already exist. Consider the following definition of the word STARS. Comments are in parenthesis and have no action.

```
: STARS      (: starts word definition)
  " *** "    (print 3 asterisks)
  200 100 BEEP (play a note for
              100 mSecs)
;
```

The semi colon at the end finishes the word definition. Now, whenever you say STARS the computer will print out 3 asterisks and sound a short tone. (Notice how the word BEEP comes after the numbers it uses, 200 and 100. This characteristic occurs throughout FORTH so that you write, for instance, 28 76 + instead of 28 + 76.)

The Jupiter Ace already has 140 FORTH words defined in ROM.

The Jupiter Ace is available only by mail order. Please allow up to 28 days for delivery.

Send cheque or postal order with the form to:—

ANYTHING IBM CAN DO...

It's 16 BIT. It's IBM PC compatible. And it's here now!

Icarus have a new personal computer manufactured by Columbia Data Systems of the USA complete with its own software and hardware. It will also run all software and hardware produced for the IBM PC.

At first glance, this machine may bear a certain resemblance to its mentor.

That's before you switch it on.

What a performance!

Appearances can be deceptive as a look at the credentials of the Columbia PC machine will tell you.

Operating system software is MS-DOS® or CP/M 86®.

Its 16 BIT 8088 hardware configuration provides 128 K RAM with parity, two RS-232 serial ports, Centronics parallel printer port, DMA controller, eight levels of interrupt, dual floppy disc system with one megabyte storage,

Winchester interface and eight expansion slots.

Not bad for the standard version.

Examine your options

Columbia like to leave your options wide open. So they've included 256K RAM boards, 8087 arithmetic co-processor for high speed math functions, dual RS-232/RS-422 boards, and a Winchester disc based system.

The Columbia PC's expansion capability can easily accommodate just about any imaginable hardware configuration including one megabyte RAM and 10 megabyte disc.

It's here now

And you know the other great thing about the Columbia PC? It's here now. Available off the shelf. And Icarus have a nationwide dealer network waiting to start deliveries.

For further details, or if you would like to become a dealer yourself, contact

ON THE ONE HAND A 32BIT PROCESSOR AND 16BIT SYSTEM

ON THE OTHER FULL 8BIT COMPATIBILITY

Imagine a microcomputer system which offers all the exciting prospects of full 16 Bit technology to come; but isn't too proud to admit that your existing 8 Bit Software has many years of useful life ahead. So it incorporates the new, high performance MC68000 16 Bit, 8 MHz processor, and an integral software selectable Z80A processor.

And that is the only concession that the new Cromemco 16 Bit System needs to make.

Its use of the MC68000 processor adds new found freedoms to microcomputer systems development. To start with it is fast. Benchmark tests showed it four times as fast as the Z80A, and twice as fast as the PDP11*. It offers superb software performance without having to resort to expensive memory management techniques. The 1000 plus instruction set offers the widest options for producing compact efficient code. Its 32 Bit Architecture offers full 16MByte direct memory addressing. It all adds up to the promise of larger, more efficient software programs, executed in a highly controlled and managed environment.

But it takes Cromemco to put promise on the path to reality. So to support MC68000 processing power there is a new concept in memory cards, full S100 and IEEE 696 compatibility, and a new software library based on 16 Bit Code to optimise the new found processing power.

The Memory Storage comes in single 256K or 512K cards with built in error detection and correction. That gives a full 4MByte of high speed memory in a Cromemco 16Bit System 3, with internal space to spare. The S100 and IEEE 696 compatibility offers the widest possible options in add-on facilities and interface requirements.

The new software library is comprehensive. There is a 16 Bit version of the proven Cromix Multiuser operating system, (now it will support up to 18 users or tasks). There is a new Fortran 77,

designed for creating larger programs in a science/engineering/research environment, and COBOL, PASCAL and 'C', a Structured BASIC, and a 68000 Assembler.

Overall the Cromemco 16 Bit Systems extend the existing boundaries of microcomputer application. In particular, they offer the Scientist and Engineer the opportunity to dramatically reduce the cost of performing the complex mathematical functions required in multi dimensional design, simulation and analytic processes. What was once mainframe capability and became mini is now decidedly Cromemco Microcomputer capability.

But without professional assistance along the way, the path from promise to reality is fraught with obstacles. Comart are Cromemco's longest standing, most experienced distributor in the UK. A five year partnership in this industry, is a lifetime in others.

So with Cromemco's dual processor and Comart support, you won't have to write off the past to step on forward into the future.

comart

FMS 80 the double decker...

If you want to go places with data management, catch the FMS double decker, the proven, best selling data base manager for CP/M computers. What other system can offer the sheer power and ease of use to beginners AND experienced users:

DOWNSTAIRS...

where the comfort, security and cool efficiency of FMS-81 carries you through your application. Its powerful FMS engine delivers:

- Fully MENU driven, with menu generation
- User defined SCREEN layouts, with multiple pages
- Powerful REPORT generation including totals and averages
- User defined and standard HELP facilities
- Powerful QUERY facility including partial key search
- Up to 255 characters per field; alpha, decimal and variable
- Up to 255 fields per record
- Multiple INDEXes, each up to 250 characters
- Unlimited SORTing and SELECTION criteria including AND/OR definitions.

Quite a package, and when it comes to standing room only, you can always move...

UPSTAIRS...

for a wider view and space to reach out into exciting new applications, FMS-82 provides the top deck other data base systems can't carry. Now, only the sky's the limit with:

- Extended File Maintenance (EFM) programming language enables greater customisation and total flexibility
- Multiple file processing, up to 19 files open at one time
- Direct drive to screen and printer
- Easy generation of data files with access to/from other systems
- Direct access to the SHELL, the FMS engine, enabling full system integration and customisation
- Enhanced REPORT generator with full maths processing

that leaves the other data base systems standing

Don't delay, get a ticket now and leave the others behind - call us now for more details on the FMS HOTLINE. Or, complete and send off the coupon for more information. We know you'll be impressed!

Also now available under CP/M-86 on IBM PC Sirius Victor 9000

Value - MicroValue - Micro

Computers are our business

As the interest in micro computers increases, magazines like this are attracting an increasing number of readers who are new to the computer market, so we have felt it worthwhile to explain what MicroValue is and who we are.

We do not sell washing machines, cameras, videos or records. Unlike many of our recent competitors, we have been in the computer business for many years and have fully experienced staff, able to give you the advice you need whether you just have an interest in personal computers or whether you wish to buy a relatively sophisticated system for your business needs.

We are all independent enterprises who have grouped together to form MicroValue. This gives us the benefit of increased buying power, which we can in turn pass on to you, our customer. We can also pool our extensive experience in a wide range of computer-related activities, allowing us to give you the best advice.

We are not in business just to sell you the machines and a 13 amp plug. We are prepared to work with you after your purchase to make sure that you obtain the maximum benefit from the marvellous opportunities being offered as micro computers come within the grasp of many small businesses. At the other end of the scale, we are all computer enthusiasts and are delighted to introduce newcomers to the variety of machines under £200 that make an inexpensive, but fascinating, introduction to the world of computers.

So, look through the following pages as a sample of what we have to offer and then visit your local MicroValue Dealer with complete confidence that you will get sympathetic and expert advice.

Computers are our business. Not washing machines, not cameras, not videos; so we depend upon you and we promise you the personal attention that you need.

MULTIBOARD

GM813 - CPU/64K RAM Board

- ★ 4 MHz Z80A CPU
- ★ 64K Dynamic RAM
- ★ RS232 Serial Interface
- ★ Two 8-Bit I/O Ports
- ★ 1200 Baud Cassette Interface
- ★ Extended and Page Addressing Modes

£258⁷⁵
(£225 + VAT)

The Gemini GM813 is a new 80-BUS compatible CPU card incorporating 64K dynamic RAM and utilising the powerful Z80A microprocessor running at 4MHz. Extended addressing and page mode facilities allow for future memory expansion up to 2 megabytes. Input and output capabilities include both programmable serial and parallel interfaces - RS232, 1200 baud CUTS cassette interface and the Z80A PIO. When used with the GM812 video card, the GM813's unique RP/M monitor allows the creation of cassette or EPROM based programs or files which are upwards compatible with a disk based CP/M system.

GM811 - CPU Board

- ★ 4MHz Z80A CPU
- ★ Four 'Byte-wide' Memory Sockets
- ★ Two 8-Bit Input/Output Ports
- ★ 8 Bit Input Port
- ★ RS232 Serial Interface
- ★ 1200 Baud CUTS Cassette Interface

£143⁷⁵
(each inc. VAT)

GM812 - IVC Board

- ★ 80x25 Display Format
- ★ On-board Z80A Microprocessor
- ★ Buffered Keyboard Input
- ★ Programmable Character Generator
- ★ 160x75 Pixel Graphics
- ★ Light Pen Input

GM809 - FDC Board

- ★ Disk Controller Board
- ★ Single/double density
- ★ Single/double sided
- ★ 8" or 5.25" Drives

Other boards available in the Multiboard range:

GM802	64K Dynamic RAM Board	£143.75 inc. VAT
GM803	EPROM/ROM Board	£ 74.75 inc. VAT
GM816	MULTI-I/O Board	£143.75 inc. VAT
MP826	32K Static RAM Board	£212.75 inc. VAT
PLUTO	Colour Graphics Board	£458.85 inc. VAT

£115 (£100 + VAT)

NASCOM 2 KIT
£258^{·75} (£225 + VAT)

Built & Tested
£327^{·75} (£285 + VAT)

80x25 Video for nascom

Nascom owners can now have a professional 80x25 Video display by using the Gemini G812 Intelligent Video Card with on-board Z80A. This card does not occupy system memory space and provides over 50 user controllable functions including prog character set, fully compatible with Gemini G805 and G815/809 Disk Systems. Software supplied on Gemini system disks. Built and tested.

£92 (£80 + VAT)

Disk System for Gemini & nascom

GM809 - full Nas-Bus floppy disk controller card - drives up to 4 drives - optional 8" expansion - **£143.75 inc. VAT.** **GM815** - Double density disk system.

With a thousand in daily use, the Gemini Disk system is now the standard for Nascom and Gemini Multiboard systems. Single or twin drive configurations are available, giving 350K storage per drive. The CP/M 2.2 package available supports on-screen editing with either the normal Nascom or Gemini IVC screens, parallel or serial printers and auto single-double density selection. An optional alternative to CP/M is available for Nascom owners wishing to support existing software. Called POLYDOS 2, it includes an editor and assembler and extends the Nascom BASIC to include disk commands.

Single drive system
(G809, G815/1)
£517^{·50} (£450 + VAT)

CP/M 2.2 package (G513)
£115^{·00} (£100 + VAT)

Double drive system
(G809, G815/2)
£776^{·25} (£675 + VAT)

POLYDOS 2
£103^{·50} (£90 + VAT)

At last - a Winchester Drive for your Gemini / nascom System!

GM835 Winchester Drive Sub-system.

- ★ 5.4 Megabyte Formatted Capacity
- ★ Rodime Drive
- ★ Industry Standard SASI interface
- ★ Integral Controller and power supply

SOFTWARE

CP/M Software Compas

is totally different from other compiler based Pascal systems, as it allows you to create, edit, run, and debug Pascal programs in a highly interactive manner.

£138^{·00}
(inc. VAT)

'The Last One' is used in conjunction with Microsoft's MBASIC*. No knowledge of BASIC programming is required since all input is performed using question and answer routines written in plain English.

£379^{·50}
(inc. VAT)

*MBASIC - MicroValue Price - **£178.95 inc. VAT**

Gemini Software:

GEM PEN Text Editor **£51.75 inc. VAT**
GEM ZAP Assembler **£51.75 inc. VAT**
GEM DEBUG Debugging Utility **£34.50 inc. VAT**
WORDSTAR Word Processor **£247.25 inc. VAT**
GEM GRAPHIC Links with MBASIC **£40.25 inc. VAT**

VIZ:APL is a high level language system. It can be used to develop small programs faster and large programs in limited memory. The language can be enhanced almost indefinitely and the user's own operators and functions can be built up.

£293^{·25}
(inc. VAT)

A wide range of software for Nascom also available.

When ordering disks, please specify format.

You pay 10% down, then 10% per month for a further nine months (to nearest penny). Example: VIC20 Colour Computer. Cash Price £169.99. Credit terms: £16.99 down then £17 per month for nine months: Total £169.99. Credit quotations on request.

THE NEW COMMODORE 64

The incredible new computer from Commodore comes with 64K RAM fitted! Plus 16 colours, hi-res graphics, 320 x 200 pixels, 40 columns by 25 lines, Z80 micro processor can be added — that means you can run CP/M software, 8 independently movable Sprites with collision detection, and a sound generator with 3 voices, 4 wave-forms, envelope and filter to rival some dedicated music synthesisers. And all this at the most incredible price ever. (AF56L) Only £339.00

DRAGON 32

The amazing new British computer with a full-travel standard keyboard, a 16-bit microprocessor, 32K RAM fitted (expandable to 64K and later to 256K!), 9 colours, hi-res graphics and Microsoft extended colour BASIC (the very best BASIC to learn with). It can be used with virtually any ordinary cassette recorder, it has a printer interface (Centronics-type), joysticks are available and it's incredible value for money. (AF57M) Only £199.50

THE AMAZING ATARI COMPUTERS

4 Consoles Available:

EP4000 EMULATING PROGRAMMER

This EPROM programmer will accept most single and three rail eproms by simple rotary switch personality selection. Output to TV and monitor. Comprehensive 1/0 Ports - TTL and RS232 mA current Loop, parallel port, cassette 1/0, printer port and DMA. £545 + £8.00 Carr.

P4000 PRODUCTION PROGRAMMER

This unit offers simple and reliable programming of up to 8 EPROMS simultaneously. Self-check - blank check - program and verify sequence built in. £545 + £8.00 Carr. BP4 - TI Bi-polar Prom Programming module for EP4000. This module will program most TI devices and read equivalent devices from other manufacturers enabling copies to be made. £180 + £6.00 Carr.

SOFTY II INTELLIGENT PROGRAMMER

The complete micro processor development system for Engineers and Hobbyists. You can develop programs, debug, verify and commit to EPROMS or use in host computer by using softy as a romulator. Powerful editing facilities permit bytes, blocks of bytes changed, deleted or inserted and memory contents can be observed on ordinary TV. Accepts most +5v Eproms Softy II complete with PSU, TV Lead and Romulator lead £169

1EEE 24 way £5.50
 Centronix 36 way £5.50

MICRODOCTOR

This is not a logic analyser or an oscilloscope. It tests a microsystem and gives a printed reprint on RAM. ROM and 1/0 - it will print memory map, search for code, check dataline shorts and operates peripherals and even disassembles the ROM.
 Microdoctor complete with PSU, printer probe cable and two configuration board £295.

UV ERASERS

UV18 up to 6 Eproms £47.50
 UV140 up to 14 Eproms £61.50
 UV1T with Timer £60.00
 UV141 with Timer £78.00
 (Carr £2/eraser)
 All erasers are fitted with mains switches and safety interlocks.

MICROTIMER

6502 Based Programmable clock timer with
 * 224 switching times/week cycle
 * 24 hour 7 day timer
 * 4 independent switch outputs directly interfacing to thyristor/triacs
 * 6 digit 7 seg. display to indicate real time. ON/OFF and Reset times
 * Output to drive day of week switch and status LEDs
 Full details on request. Price for kit £57.00

FLOPPY DISC DRIVES

TEAC FD50A 5 1/4 in. 40 track drive housed in an attractive case with PSU.

Single Drive £190 + £5 carr.
 Double Drive £360 + £7 carr.

Interfaces for Apple II

- * 3.3 DOS CARD £48
- * RGB COLOUR CARD £120
- * 8 BIT A to D CARD £135
- * 8 BIT D to A CARD £135

Apple 11 Drive: This drive can handle data in both 13 and 16 sector formats. 143K can be stored over 25 tracks when using DOS 3.3. Drive complete with cable £270 + £5 carr.

CASSETTE RECORDER

Sanyo Computer Grade Recorder £24.00 + £1.50 carr.
 Cassette Leads £3.50
 Computer Cassette £0.50 each - £4.50 for 10.

RUGBY ATOMIC CLOCK

This Z80 micro controlled clock/calendar receives coded time data from NPL Rugby. The clock never needs to be reset. The facilities include 8 independent alarms and for each alarm there is a choice of melody or alternatively these can be used for electrical switching. A separate timer allows recording of up to 240 lap times without interrupting the count. Expansion facilities provided.
 Complete Kit £120 + £2.00 carr.
 Ready Built Unit £145 + £5.00 carr.
 Reprint of ETI articles at £1.00 + s.a.e.

MONITORS

BMC BM 1401 14" colour monitor RGB input 18MHZ bandwidth £240 plus £8 carr.
 SANYO 12" green monitor. Antiglare screen £99 plus £6 carriage.
 MICROVITEC 1431 M/S 14" Colour monitor RGB Input £269 plus £8 carr. RGB lead for BMC £8. Composite Videolead £3.50.

TRUE 16 bit!

Olivetti M20

The new Olivetti M20 provides everything the modern businessman is likely to need in a desktop computer

- * SPEED: fastest of 62 'Personal Computer World' Benchmark timings. Faster than Sirius and IBM
- * MEMORY EXPANSION: 128k up to 512k RAM
- * DISK STORAGE: Standard 320k or 640k floppies with optional 10MB hard disk (built-in)
- * BUSINESS SOFTWARE: Full Range. Integrated Accounts, Stock control, Payroll, or separate packages. Wordprocessing, Financial planning, Specific packages e.g. Solicitors accounts, Engineering design etc.
- * GRAPHICS: High resolution standard on all versions. About 3 times Apple II resolution for NO loss of user memory. Colour version available.
- * COMMUNICATIONS: Programmable RS232 interface built in plus parallel printer output, IEEE 488 option. Software available for IBM etc protocols, Videotex.
- * CP/M: Not an ideal 16 bit operating system but optionally available. Olivetti's PCOS system is supplied as standard and is faster and more powerful.
- * SERVICING: Direct from Olivetti Service Centres.
- * FINANCE: Lease or Rent through Olivetti Finance.
- * COMPETITIVE PRICING (Includes PCOS and MBasic 5.2):

M20S: 128k RAM, Single disk, monochrome:	£1895
M20D: 160K RAM, Dual disk, monochrome:	£2395
M20C: 160k RAM, Dual disk, 8 colour:	£3262

The background of the advertisement is a soft-focus image of numerous pink cherry blossoms. The flowers are in various stages of bloom, with some showing prominent stamens. The overall color palette is light and airy, with shades of pink and cream.

Peachtree is blossoming...

An open invitation to suppliers of
microcomputer hardware and software

Peachtree
Software™

AN **MSA** COMPANY

Attention dealers and systems suppliers of Altos, Apple, Commodore, IBM, ICL, Intertec, Rair, Sirius, Victor and other leading microcomputers.....

A Peachtree Software Partnership will safeguard your software reputation and improve profitability!

Peachtree software really works! We have established the largest installed user-base in the USA and a unique worldwide distribution and support network. We are the world leader in business management software. Our programs are simple to use. They have professional documentation and are utterly proven!

Team up with Peachtree

It's goodbye to software problems and loss of profit if you become a 'Peachtree Partner.' You will be free to concentrate on the marketing of your complete business solutions, secure in the knowledge that you have the best systems in the world to enhance your reputation.

You will be supported by professionals and all the resources of a world class organisation determined to stay at the top of the tree in micro software.

Now is the time to say 'YES'

This is your opportunity to apply for your Peachtree Partnership. We are spreading our roots, right across the country and deep into your marketplace.

Peachtree is now an established and powerful force in UK software.

We intend to tie in with the leading suppliers in every town. They will be our type of people - professional, experienced and commercially sound. Above all dedicated to success!

Bumper Harvest in '83

In the new year, Peachtree suppliers will see the most spectacular growth in their business. We intend to continue taking the micro business software market by storm. There will be no stopping us or those who choose to join us NOW.

act IMMEDIATELY

Complete the initial application form now. It will be treated in the strictest confidence and places you under no obligation.

Successful initial applications will bring a personal invitation to meet the Peachtree team and to negotiate your Peachtree Software Partnership.

"There's more to Peachtree than just a computer program"

JOHN HALE, MANAGING DIRECTOR OF PEACHTREE SOFTWARE INTERNATIONAL LTD.

"We are part of MSA, the world's largest company specialising in computer software products for large computers.

Together we make an unbeatable combination, guaranteeing you the best in software and support, now and in the future."

Peachtree Proven Programs

Peachtree Basic Accounting Systems

Purchase Ledger, Sales Ledger with Invoicing, Nominal Ledger, Inventory Management, Payroll.

Peachtree Business Management Systems

Purchase Ledger, Sales Ledger with Invoicing, Nominal Ledger, Costing Ledger, Inventory Management with Sales Order Processing, Payroll.

Peachtree Office Productivity Systems

Word Processing, Automatic Spelling Dictionary, Name and Address Management, Financial Modelling, Communications, Colour Graphics.

Peachtree programs run under Digital Research and Microsoft operating systems and they are written in Microsoft BASIC and Micro Focus CIS COBOL.

Peachtree Products are

- ★ Fully integrated. So your client can use all the information his system holds.
- ★ Totally modular. So your client can implement one system at a time.
- ★ Complete with professional documentation. Helping you to help your client.

Peachtree's commitment is to provide software products for the smallest business computers as well as the most powerful 16-bit multi-user micros with hard disk storage.

"Call me with your queries
on 0628 32711"

Ray Todd,
Peachtree Partnership Manager

Praise for Peachtree

"As an accountant and line manager with a wide experience of using systems, I consider Peachtree's product to be the best integrated business package I have found" VICTOR LINGARD

MANAGING DIRECTOR, DAEDALEAN CONSULTANTS

"We have the greatest confidence in Peachtree because Peachtree is continually investing in enhancing products, introducing new packages, providing the best support and backing our sales through its marketing campaigns" MALCOLM CHADWICK

MANAGING DIRECTOR, BUSINESS-LIKE SYSTEMS

"Not only have Peachtree products improved our sales by 25% but we have also developed a very good two-way relationship where we have input to Peachtree's plans for the future" STEVE JOHNSON

MANAGING DIRECTOR, JOHNSON MICROCOMPUTERS

Read this ad

You: "Darling, I've decided to buy a computer."

Her: "***++**??!!***@XX??££**??!!? off!"

You: "Yes, I know we could do with a new washing machine. But the new Dragon 32 Computer is much more important. It's the first computer actually designed for all the family - and it costs under £200!"

Her: "***++??!!@££??! fortune!"

You: "No, I'm not being selfish. Computers are for the whole family - and they're going to play a big part in the children's future."

Her: "Oh?"

From this point on, the conversation should follow more reasonable lines.

Allowing you to fully explain the many advantages of the new Dragon 32 family computer.

32K RAM FOR UNDER £200.*

For a start, the Dragon offers 32K RAM. Your wife may not understand that, so just tell her that the Dragon's capabilities are truly massive - at least twice as powerful as its competitors, with some features you won't find even in more expensive units. The Dragon will give you all the power you're likely to need, and more, to create your own programs - along with

an exciting range of software which can do anything from helping with kids' spelling and arithmetic to creating your own cartoons.

THE FIRST FAMILY COMPUTER.

All of which brings you nicely to the point where you tell your wife just how much fun the kids will have with the Dragon. How it will save her all that

*Television not included in price.

money on those Space Invader machines. How it will magically translate simple typed instructions into beautiful drawings and designs using set, line, circle, draw, scale, rotate and paint features, in up to 9 colours - and play and compose

to your wife.

SPECIFICATIONS

6809E MICROPROCESSOR. Pet, Apple, Atari 400, BBC Micro, and VIC 20 still have the less powerful 6502.

32K RAM (as standard). At least twice the power of similarly priced machines. Expandable to 64K RAM.

EXTENDED MICROSOFT COLOUR BASIC (as standard).
Featuring: ADVANCED GRAPHICS (set, line, circle, paint, print, draw, rotate and print using).
ADVANCED SOUND 5 octaves, 255 tones.
AUTOMATIC CASSETTE RECORDER CONTROL.
FULL EDITING with INSERT and DELETE.

9 COLOUR, 5 RESOLUTION DISPLAY.

USE WITH ANY U.H.F TV and/or separate P.A.L. monitor.

PROFESSIONAL QUALITY KEYBOARD.
Typewriter feel. Guaranteed for 20 million depressions.

PRINTER (Centronics parallel).

JOYSTICK CONTROL PORTS.

with 5 octaves of music. How it will engross your children in mind-boggling adventures in dungeons and caves without even getting their knees dirty. And the Dragon works with any U.H.F. TV

THEY'LL LEARN AS THEY PLAY.

And then you can casually point out that although the kids are having fun, they're also learning. And within a very short space of time, the whole family will be completely at home with programming - with computer language - with every aspect of how computers work. Which can't do their future prospects any harm at all.

BRILLIANTLY SIMPLE INSTRUCTION MANUAL.

The Dragon is made in Britain, designed with the help of British Universities. And it's also worth remembering

that the Dragon's instruction manual is clearer and easier to understand than any other homecomputers.

That its top-quality keyboard is as easy to use as a typewriter, and so well made it's guaranteed for twenty million depressions.

TAKE THE FAMILY DOWN THE HIGH STREET.

And if she still wants to know more, take her to see the Dragon 32. It'll soon be available in most good stores - or you can send the coupon for further details.

And if you're one of our many lady readers, please accept our apologies.

Perhaps you'd like to read this ad to your husband.

DRAGON 32 The first family computer.

To: Jean Webster, Dragon Data Ltd., Queensway, Swansea Industrial Estate, Swansea, Glamorgan SA5 4EH.
Tel: 0792 580651.

Please send me further information about the Dragon 32.

See our intelligent li
space conqueror and y
know why he's gree

TIME was when the Mekon had things all his own way. Highly intelligent, small, compact, manoeuvrable, he had no equal on our planet.

Then along came Durango, a reliable multi-tasking, multi-terminal, business system offering extraordinary performance, plus the ability to expand with you as your business grows. Complete with a wide range of business software packages.

Durango is contained in one neat compact, space-saving unit complete with a printer, VDU, processor and 15mb of disk. All of which occupies only fractionally more room than a typewriter and represents terrific value for money.

And, sorry Mekon, Durango also looks prettier. Proving that just because you're hard and ruthlessly efficient, you don't have to look it.

Contact us now

Sinclair ZX Spectrum

**16K or 48K RAM...
full-size moving-
key keyboard...
colour and sound...
high-resolution
graphics...**

**From only
£125!**

First, there was the world-beating Sinclair ZX80. The first personal computer for under £100.

Then, the ZX81. With up to 16K RAM available, and the ZX Printer. Giving more power and more flexibility. Together, they've sold over 500,000 so far, to make Sinclair world leaders in personal computing. And the ZX81 remains the ideal low-cost introduction to computing.

Now there's the ZX Spectrum! With up to 48K of RAM. A full-size moving-key keyboard. Vivid colour and sound. High-resolution graphics. And a low price that's unrivalled.

Professional power— personal computer price!

The ZX Spectrum incorporates all the proven features of the ZX81. But its new 16K BASIC ROM dramatically increases your computing power.

You have access to a range of 8 colours for foreground, background and border, together with a sound generator and high-resolution graphics.

You have the facility to support separate data files.

You have a choice of storage capacities (governed by the amount of RAM). 16K of RAM (which you can update later to 48K of RAM) or a massive 48K of RAM.

Yet the price of the Spectrum 16K is an amazing £125! Even the popular 48K version costs only £175!

You may decide to begin with the 16K version. If so, you can still return it later for an upgrade. The cost? Around £60.

Ready to use today, easy to expand tomorrow

Your ZX Spectrum comes with a mains adaptor and all the necessary leads to connect to most cassette recorders and TVs (colour or black and white).

Employing Sinclair BASIC (now used in over 500,000 computers worldwide) the ZX Spectrum comes complete with two manuals which together represent a detailed course in BASIC programming. Whether you're a beginner or a competent programmer, you'll find them both of immense help. Depending on your computer experience, you'll quickly be moving into the colourful world of ZX Spectrum professional-level computing.

There's no need to stop there. The ZX Printer—available now—is fully compatible with the ZX Spectrum. And later this year there will be Microdrives for massive amounts of extra on-line storage, plus an RS232/network interface board.

Key features of the Sinclair ZX Spectrum

- Full colour—8 colours each for foreground, background and border, plus flashing and brightness-intensity control.
- Sound—BEEP command with variable pitch and duration.
- Massive RAM—16K or 48K.
- Full-size moving-key keyboard—all keys at normal typewriter pitch, with repeat facility on each key.
- High-resolution—256 dots horizontally x 192 vertically, each individually addressable for true high-resolution graphics.
- ASCII character set—with upper- and lower-case characters.
- Teletext-compatible—user software can generate 40 characters per line or other settings.
- High speed LOAD & SAVE—16K in 100 seconds via cassette, with VERIFY & MERGE for programs and separate data files.
- Sinclair 16K extended BASIC—incorporating unique 'one-touch' keyword entry, syntax check, and report codes.

um

ZX Spectrum software on cassettes – available now

The first 21 software cassettes are now available directly from Sinclair. Produced by ICL and Psion, subjects include games, education, and business/household management. Galactic Invasion... Flight Simulation... Chess... History... Inventions... VU-CALC... VU-3D... 47 programs in all. There's something for everyone, and they all make full use of the Spectrum's colour, sound and graphics capabilities. You'll receive a detailed catalogue with your Spectrum.

RS232/network interface board

This interface, available later this year, will enable you to connect your ZX Spectrum to a whole host of printers, terminals and other computers.

The potential is enormous. And the astonishingly low price of only £20 is possible only because the operating systems are already designed into the ROM.

sinclair

Sinclair Research Ltd, Stanhope Road,
Camberley, Surrey GU15 3PS.
Tel: Camberley (0276) 685311.

The ZX Printer – available now

Designed exclusively for use with the Sinclair ZX range of computers, the printer offers ZX Spectrum owners the full ASCII character set – including lower-case characters and high-resolution graphics.

A special feature is COPY which prints out exactly what is on the whole TV screen without the need for further instructions. Printing speed is 50 characters per second, with 32 characters per line and 9 lines per vertical inch.

The ZX Printer connects to the rear of your ZX Spectrum. A roll of paper (65ft long and 4in wide) is supplied, along with full instructions. Further supplies of paper are available in packs of five rolls.

The ZX Microdrive – coming soon

The new Microdrives, designed especially for the ZX Spectrum, are set to change the face of personal computing.

Each Microdrive is capable of holding up to 100K bytes using a single interchangeable microfloppy.

The transfer rate is 16K bytes per second, with average access time of 3.5 seconds. And you'll be able to connect up to 8 ZX Microdrives to your ZX Spectrum.

All the BASIC commands required for the Microdrives are included on the Spectrum.

A remarkable breakthrough at a remarkable price. The Microdrives are available later this year, for around £50.

How to order your ZX Spectrum

BY PHONE – Access, Barclaycard or Trustcard holders can call 01-200 0200 for personal attention 24 hours a day, every day. BY FREEPOST – use the no-stamp needed coupon below. You can pay by cheque, postal order, Barclaycard,

Access or Trustcard.

EITHER WAY – please allow up to 28 days for delivery. And there's a 14-day money-back option, of course. We want you to be satisfied beyond doubt – and we have no doubt that you will be.

To: Sinclair Research, FREEPOST, Camberley, Surrey, GU15 3BR.				Order

Sinclair ZX Spectrum—technical data.

Dimensions

Width 233 mm
Depth 144 mm
Height 30 mm

CPU/memory

Z80A microprocessor running at 3.5 MHz.
16K-byte ROM containing BASIC interpreter and operating system.

16K-byte RAM (plus optional 32K-byte RAM on internal expansion board) or 48K-byte RAM.

Keyboard

40-moving-key keyboard with full upper and lower case with capitals lock feature. All BASIC words obtained by single keys, plus 16 graphics characters, 22 colour control codes, and 21 user-definable graphics characters. All keys have auto repeat.

Display

Memory-mapped display of 256 pixels x 192 pixels; plus one attribute byte per character square, defining one of eight foreground colours, one of eight background colours, normal or extra brightness and flashing or steady. Screen border colour also settable to one of eight colours. Will drive a PAL UHF colour TV set, or black and white set (which will give a scale of grey), on channel 36.

Sound

Internal loudspeaker can be operated over more than 10 octaves (actually 130 semitones) via basic BEEP command. Jack sockets at the rear of computer allow connections to external amplifier/speaker.

Graphics

Point, line, circle and arc drawing commands in high-resolution graphics.
16 pre-defined graphics characters plus 21 user-definable graphics characters. Also functions to yield character at a given position, attribute at a given position (colours, brightness and flash) and whether a given pixel is set. Text may be written on the screen on 24 lines of 32 characters. Text and graphics may be freely mixed.

Colours

Foreground and background colours, brightness and flashing are set by BASIC INK, PAPER, BRIGHT and FLASH commands. OVER may also be set, which performs an exclusive-or operation to overwrite any printing or plotting that is already on the screen. INVERSE will give inverse video printing. These six commands may be set globally to cover all further PRINT, PLOT, DRAW or CIRCLE commands, or locally within these commands to cover only the results of that command. They may also be set locally to cover text printed by an INPUT statement. Colour-control codes, which may be accessed from the keyboard, may be inserted into text or program listing, and when displayed will override the globally set colours until another control code is encountered. Brightness and flashing codes may be inserted into program or text, similarly. Colour-control codes in a program listing have no effect on its execution. Border colour is set by a BORDER command. The eight colours available are black, blue, red,

magenta, green, cyan, yellow and white. All eight colours may be present on the screen at once, with some areas flashing and others steady, and any area may be highlighted extra bright.

Screen

The screen is divided into two sections. The top section – normally the first 22 lines – displays the program listing or the results of program or command execution. The bottom section – normally the last 2 lines – shows the command or program line currently being entered, or the program line currently being edited. It also shows the report messages. Full editing facilities of cursor left, cursor right, insert and delete (with auto-repeat facility) are available over this line. The bottom section will expand to accept a current line of up to 22 lines.

Mathematical operations and functions

Arithmetic operations of +, -, X, ÷, and raise to a power. Mathematical functions of sine, cosine, tangent and their inverses; natural logs and exponentials; sign function, absolute value function, and integer function; square root function, random number generator, and pi.

Numbers are stored as five bytes of floating point binary – giving a range of $+3 \times 10^{-39}$ to $+7 \times 10^{38}$ accurate to 9½ decimal digits.

Binary numbers may be entered directly with the BIN function. =, >, <, >=, <= and <> may be used to compare string or arithmetic values or variables to yield 0 (false) or 1 (true). Logical operators AND, OR and NOT yield boolean results but will accept 0 (false) and any number (true).

User-definable functions are defined using DEF FN, and called using FN. They may take up to 26 numeric and 26 string arguments, and may yield string or numeric results.

There is a full DATA mechanism, using the commands READ, DATA and RESTORE.

A real-time clock is obtainable.

String operations and functions

Strings can be concatenated with +. String variables or values may be compared with =, >, <, >=, <=, <> to give boolean results. String functions are VAL, VAL\$, STR\$ and LEN. CHR\$ and CODE convert numbers to characters and vice versa, using the ASCII code.

A very powerful string slicing mechanism exists, using the form a\$(x TO y).

Variable names

Numeric – any string starting with a letter (upper and lower case are not distinguished between, and spaces are ignored).

String – A\$ to Z\$.

FOR-NEXT loops – A-Z.

Numeric arrays – A-Z.

String arrays – A\$ to Z\$.

Simple variables and arrays with the same name are allowed and distinguished between.

Arrays

Arrays may be multi-dimensional, with subscripts starting at 1. String arrays, technically character arrays, may have their last subscript omitted, yielding a string.

Expression evaluator

A full expression evaluator is called during program execution whenever an expression, constant or variable is encountered. This allows the use of expressions as arguments to GOTO, GOSUB, etc.

It also operates on commands allowing the ZX Spectrum to operate as a calculator.

Cassette interface

The ZX Spectrum incorporates an advanced cassette interface. A tone leader is recorded before the information to overcome the automatic recording level fluctuations of some tape recorders, and a Schmitt trigger is used to remove noise on playback.

All saved information is started with a header containing information as to its type, title, length and address information. Program, screens, blocks of memory, string and character arrays may all be saved separately.

Programs, blocks of memory and arrays may be verified after saving to confirm successful saving.

Programs and arrays may be merged from tape to combine them with the existing contents of memory. Where two line numbers or variables names coincide, the old one is overwritten.

Programs may be saved with a line number, where execution will start immediately on loading.

The cassette interface runs at 1500 baud, through two 3.5 mm jack plugs.

Expansion port

This has the full data, address and control buses from the Z80A, and is used to interface to the ZX Printer, the RS232 and NET interfaces and the ZX Microdrives.

IN and OUT commands give the I/O port equivalents of PEEK and POKE.

ZX81 compatibility

ZX81 BASIC is essentially a subset of ZX Spectrum BASIC. The differences are as follows.

FAST and SLOW: the ZX Spectrum operates at the speed of the ZX81 in FAST mode with the steady display of SLOW mode, and does not include these commands.

SCROLL: the ZX Spectrum scrolls automatically, asking the operator "scroll?" every time a screen is filled.

UNPLOT: the ZX Spectrum can unplot a pixel using PLOT OVER, and thus achieves unplot.

Character set: the ZX Spectrum uses the ASCII character set, as opposed to the ZX81 non-standard set.

ZX81 programs may be typed into the ZX Spectrum with very little change, but may of course now be considerably improved. The ZX Spectrum is fully compatible with the ZX Printer, which can now print out a full upper and lower case character set, and the high resolution graphics; using LLIST, LPRINT and COPY. ZX81 software cassettes and the ZX 16K RAM pack will not operate with the ZX Spectrum.

sinclair ZX Spectrum

**Imagine a totally portable computer
that slips into your briefcase, incorporating
an LCD screen, full typewriter keyboard,
printer and microcassette,
and runs on its own power supply for use anywhere.**

We did.

HX-20
PORTABLE COMPUTER

EPSON

Extraordinary product.
Exceptional quality.

Taking the computer a step further.

A computer small enough to fit into a briefcase yet with full size typewriter keyboard, LCD Virtual Screen, printer and microcassette facility actually built in.

Improbable. Until today.

Functions fantastic.

The HX-20 is a real computer, not a gimmicky toy. Or an extension of your calculator. Or just another desk top computer. It is a precision machine with 16k RAM which is optionally expandable to 32k and 32k ROM expandable to 64k, RS-232C and serial interfaces.

The full size ASCII typewriter keyboard and five programmable keys brings ten separate program functions to your fingertips.

The HX-20 can run on its own power supply for over 50 hours which can be easily recharged overnight, and has the ability to retain its memory in RAM even when switched off.

Virtual Screen keeps you in the picture.

The HX-20's LCD Screen is unique, keeping you in the picture by showing any 20 characters by 4 lines at a time. You can,

therefore, carry out word processing or data entry as if you are using a large screen.

Upper and lower case letters, numerals, punctuation marks and graphics are easily read by simply adjusting the viewing angle.

Print out. Built in.

A built-in 24 column dot matrix impact microprinter offers 42 LPM in a crisp, precise 5 x 7 matrix for perfect hard copies on plain paper. Every time.

And there's more. . . Bit addressable graphics allow you to design your own characters for full graphic capability, a cartridge ribbon, full ASCII character set including £ sign and enough international symbols for reproducing most Western languages.

Add-on capability.

Choose from a wide range of peripherals. Barcode readers, audio cassette for loading and saving programs, microcassette and ROM cartridges, and the world famous Epson dot matrix computer printers for quality-output . . . to name just a few.

Via acoustic couplers this superb machine can also be linked through the telephone to other computers:

Software and the hard facts.

The HX-20 uses a full extended version of Microsoft BASIC, with a 24 hour clock, date and alarm, string functions, and music generation. The interface options (with RS-232C and serial interfaces as standard) include a standard cassette, a ROM cartridge, plus a system bus that allows you to expand the RAM and ROM capabilities.

The HX-20.
The most complete portable computer available today.

Portability for Programability. Anywhere.

The HX-20 is light and totally portable for writing programs and manipulating data – virtually anywhere. (Just four nickel-cadmium batteries and a low power all-CMOS memory gives you a reliable power source during your travels.)

Back at the office you can dump your data or programs onto a cassette or into your main computer system.

Reliability through Research.

A computer coming from Epson has got to be good. After all we have been responsible for high quality precision manufacture since 1961. Just take a look at our impressive track record with the hugely successful Epson dot matrix printers.

So it follows that you can expect the same quality, the same reliability through our extensive research program prior to launching

any revolutionary new product. Now that product has arrived. The HX-20 is here today. From Epson. But it's got to be seen to be believed.

Clip the coupon below and return it to us – Freepost – no stamp required and we'll send you the complete list of HX-20 stockists by return.

If you would also like further details of how the HX-20 can be suited to your particular requirements simply include your area of business and any other relevant details separately or on the back of the freepost coupon.

To: Epson (UK) Limited,
Freepost, Wembley, Middlesex HA9 6BR

- Please send me your list of HX-20 stockists.
 I would like details of how Epson products can help my particular business. I have included further information separately/overleaf.

Specifications of HX-20

Dimensions and Ambient Conditions

Dimensions and Weight

1. Dimensions: 290mm wide
215.5mm deep
44mm high
2. Weight: Approx. 1.7 kg

Ambient Conditions

1. Temperature: 5°C to 35°C (operating)
5°C to 35°C (charging)
-5°C to 40°C (data storage) (RAM battery backup)
-20°C to 60°C (non-operating)
2. Relative humidity: 10% to 80% (operating, no condensation)
10% to 80% (non-operating, no condensation)
3. Shock resistance: 1 G for 1 ms maximum (operating)
4. Vibration resistance: 0.25G 55 Hz maximum (operating)

Power Supply (Nicc batteries)

1. Voltage: 4.5V to 6.0V (operating)
4.0V to 6.0V (data storage)
4.5V (low voltage detection)
2. Battery capacity: Approx. 1100 mA/H

AC Adaptor

1. Input voltage: AC 220V/240V ± 10%
2. Power consumption: 8W
3. Insulation resistance: 10Megohms between AC power supply and case
4. Insulation strength: Can withstand 1 kV applied between AC power supply and case for 1 minute or more

Microprinter (M-160)

1. Printing system: Dot impact (4 printing solenoids)
2. Printing format:
 - a. Total number of dots: 144 dots maximum/dot line
 - b. Number of characters per line: 24 maximum
(5 x 7 dots; character-to-character space 1 dot)
(6 characters/printing solenoid)
3. Printing speed:
 - a. 1 dot line: Approx. 150 ms (continuous printing)
 - b. 5 x 7 dot matrix (interline space 3 dots): Approx. 0.7 line/s (continuous printing)
42 lines per minute
4. Character size:
 - a. Dot spacing: 0.33mm horizontal
0.33mm vertical
 - b. 5 x 7 dot matrix: 1.7mm wide, 2.4mm high
5. Recording paper:
 - a. Kind: Plain paper
 - b. Paper width: 57.5 ± 0.5mm
 - c. Outside diameter: 50mm or less
 - d. Thickness: 0.07mm
 - e. Weight: 52.3 g/m² (45 kg/1000 sheets/1091 sheets x 788mm)
6. Paper feed: Automatic feed every dot line; with paper release
7. Inking:
 - a. Ribbon cartridge type: Automatic continuous feed during motor operation
 - b. Colour: Purple/Black
 - c. Dimensions: Approx. 91mm wide, 25mm deep, 7mm high
 - d. Life: Approx. 10,000 lines
 - e. Standard: ERC-09

Liquid Crystal Display

1. Text: Upper and lower case, numerals, symbols, graphic characters and more; 20 characters per line; 4 lines in total (20 x 4 = 80 characters)
2. Graphic: 120 dots (horizontal) x 32 dots (vertical) = 3840 dots
3. View angle adjustment: Adjustable with VIEW ANGLE density control

Keyboard

1. Key switches: Typewriter layout, full size. 68 keys (including 5 function keys and 13 special keys)
2. Others: Power on switch, VIEW ANGLE density control for LCD, and adjusting circuit built in

RS-232C Interface

1. Connector: DIN (8-pin) TCS 4480
2. Input and output levels: RS-232C standard
3. Transfer speed: 110, 150, 300, 600, 1200, 2400, 4800 bps (selectable by operator)

Serial Interface

1. Connector: DIN (5-pin) TCS 4450
2. Input and output levels: RS-232C standard
3. Transfer speed: 38, 150, 400, 600, 4800 bps (selectable by operator)

NEC turns 28 years of computer experience to your personal advantage.

It takes a great computer company to make a great personal computer. And from the start, NEC has been a pioneer in computer technology. In fact, we invented the all-semiconductor computer in 1959. Now, hundreds of innovations later, we've made it personal.

We present the PC-8000, a powerful and friendly business tool that can help you get more done in a day than you ever could before. It combines some of the most reliable hardware on the market with application packages designed to make the most of its unique features. In addition, the PC-8000 accepts popular CP/M® business software, making its possibilities virtually limitless.

The entire PC-8000 system is now available through better computer dealers across the country. And that means more than hardware. It means effective software, the finest documentation and extensive training to help you get the most from your personal computer. So why not turn our system to your personal advantage now.

THE GALAXY 1 COMPUTER

The cost effective solution to
your computer needs for only

£1,450*

The Galaxy 1 desk top computer system can be used in education, small business applications, word processing, stock control and a host of other environments. Our choice of CP/M as the operating system means that our customers can select a suitable application package from the widest possible range.

However, unlike our competitors, we supply not only the hardware but all the essential system software needed to start using the Galaxy 1 as soon as it is installed. We have adopted COMAL-80 as our standard language. This structured basic is rapidly gaining widespread acceptance and popularity especially in the education market, offering much greater flexibility and ease of use than existing Basics. We also supply a very powerful Z80 assembler/editor called GEM ZAP with GEM PEN, a compact but very powerful word processing package. The system software suite is completed with GEM DEBUG, a useful machine code program de-bugging utility.

Modular design means reliability and ease of maintenance. Unlike many other manufacturers Gemini offer a full one year warranty (except Disc heads which are guaranteed for 3 months). Our distributors carry a full range of replacement boards thereby facilitating a quick, efficient and cost effective back up customer service.

Features include:

- Twin Z80 Processors
- 64K Dynamic RAM
- 800 K Disc Based Storage
- 80x25 Screen Format
- Dual Printer Interfaces
- Modular Design
- CP/M 2.2 Operating system
- COMAL-80 - Structured Basic
- Z80 Editor/Assembler
- Text Editor & Formatter
- Program De-Bugging Utility

*Price is exclusive of
VAT and is for

LSI Computers Limited, one of Britain's most progressive and entrepreneurial computer manufacturers whose products have, in a relatively short space of time, captured a significant market share, and whose products have the potential to dominate in the demanding and constantly developing market of small business and personal computers, are expanding their Dealer network.

Through our OEM Division we are looking to appoint Dealers all over the U.K. for some very exceptional and technically advanced microcomputer products.

Massive Success

OEM business is very important to LSI, and we are dedicated to offering our next generation computers through our Dealer network. Using our reputation and financial strength, we are implementing a vigorous programme of research and development to secure the very latest technology and products for our Dealers. In an era of unparalleled growth and keen competition LSI are more than confident of maintaining their justifiable reputation for

Putting Britain back in front

Copse Road, St. John's, Woking, Surrey GU21 1SX Telex: 859592

Ring

technical innovation and achievement and their ability to provide the market with the right product at the right time and at the right price.

Our Dealer programme offers you the opportunities of higher sales of demanded products at excellent margins. There's an ambitious stock programme, full engineering and technical support facilities, and a substantial and exciting advertising and promotional programme already established - in all a package that we can rightfully predict will bring our Dealers massive success. The 8 bit System M-Three continues it's amazing success and it's complimentary partner, the eagerly awaited 16 bit, High performance micro, System M-Four is soon to be launched. In addition, we are able to offer our dealers attractive arrangements on a range of Daisy Wheel and Matrix printers. **And for the larger OEM, specially configured machines totally badge engineered in your own colour schemes.** All at amazing and highly competitive prices.

And that's not all, our exciting new, high performance, low cost word processing system, still under wraps for now, is to be launched in a very, very big way this Autumn.

Move Now!

Grasp this amazing opportunity to ensure your future prosperity. Act NOW - phone Laurie Bright on Woking (04862) 23411 today to discuss this fantastic offer in more detail - you could be just one phone call away from a long and prosperous partnership.

comart communicator

PROGRESS REPORT

...now the pedigree really shows

How has Comart's controlled, down to earth development strategy kept Communicator a firm favourite in the UK, and the leading candidate to reverse the tide of microcomputer imports?

New Range Additions The Communicator range has broadened to add a new 20 Megabyte 5" Winchester Hard Disk Drive System to the already well established 5 Megabyte and floppy diskette models. Another new system offers 8" floppy disk drives for compatibility of data transfer. With the associated tape and additional Winchester back up systems that adds up to eight basic models – all in the same neat, stackable, casing – all based on S100 bus construction to keep future options in memory, users, peripherals and interface requirements wide open.

New System Additions Communicator operating systems continue to broaden both in options and facilities. An improved CP/M offers enhanced diagnostics, for example, and auto boot from Hard Disk. These basic improvements are reflected in the now tried and tested Communicator multi-user MP/MI™, which also provides for full CP/M™ compatibility.

New Communications Options Communicator now offers CP/Net™ and RBTE communications protocols. Individual Communicator

Systems can now operate as Intelligent information terminals, integrated with either existing mainframe or mini computer installations, or be part of a shared resource or communications network.

New Range of Terminals Find out more about Comart's new smart VDU. It's a new advanced ergonomically designed unit. It has a 105 keyset detached keyboard, soft green phosphor tilt screen, and a low profile foot. It's a perfect complement to the Communicator in both styling and performance.

Some things don't change Communicator still has Comart's established dealer network and nationwide after sales service back up, supporting thousands of Communicators already at work throughout the UK.

And in the Future? Behind all these innovations are advanced programmes of research and development. Soon Comart will be bringing you 16 bit, multi processor and distributed processing systems. This is your guarantee that Communicator will continue to keep pace as microcomputer technology progresses.

To find out more about Communicator today, call us now on 0480 215005.

CP/M, MP/MI and CP/Net are all trademarks of Digital Research Inc.

£1,350*

The MIMI 802 is a supreme example of high quality British engineering. It is a truly professional microcomputer that really does meet all the criteria of a sophisticated business machine - at a price you can afford.

Our competitors expect you to make do with the basics and then buy expensive extras in order to fulfil your needs. The MIMI 802 has all the 'extras' as standard - so when you buy a MIMI you really are getting a microcomputer that will do the job from the outset.

The MIMI's operating system OS/M[†] is fully CP/M[‡] compatible so you have access to a very comprehensive range of software, extending from word processing to accounting.

During the next few months we will be announcing the availability of TROJAN - a major software innovation that totally simplifies the learning process and use of micros, and dramatically eases the creation of new applications programs. We are using it and generating applications software in record time - so we can guarantee its performance.

Don't settle for less... contact us or one of our dealers now.

Features include:

- Z80A at 4MHz
- 64K Dynamic RAM
- Integral D/S - D/D 5¼ ins floppy discs - 700Kb.
- Full RS232C and Centronics parallel ports.
- 96 Key ASCII keyboard - colour coded.
- 17 programmed function keys.
- Light pen socket.
- Elegant compact and light - 24 lbs.
- OS/M operating system - fully CP/M compatible.
- Disc format conversion facility.
- Wide range of software, utilities and languages.

And now with:

- Winchester disc option.
- Super high resolution graphics option* (802G-512 x 256 pixels).

NOW ALL OTHER MICROS ARE LESS THAN PERFECT

† OS/M is the trademark of Scifax Microsoftware.

‡ CP/M is the registered trademark of Digital Research Inc.

*Monitor extra, from £132. (Choice of orange or green display)
MIMI 802G (graphics version, as illustrated) £1495.

MIMI 802

MS™-DOS gives you the only complete set of software tools for 16-bit systems. Now. From Microsoft.

Systems and Applications. Now. The success of any microcomputer system depends on the amount of software available for it. And, the ease of writing more. Microsoft™ MS-DOS is the only single-user operating system fully supported by Microsoft's 16-bit languages: BASIC Interpreter, BASIC Compiler, COBOL, FORTRAN and Pascal. Plus, the Multi-Tool™ family of applications software... starting with the Multiplan™ electronic worksheet.

More software. Soon. IBM chose MS-DOS as the primary OS for the IBM® Personal Computer. Lifeboat Associates chose MS-DOS as the 16-bit, single-user DOS it will support. And Microsoft will continually introduce new applications and systems software for MS-DOS. The implication is clear: MS-DOS is going to be even better supported. Fast.

Easier conversion. MS-DOS was written to make conversion of CP/M-80® programs simple. Simpler, according to programmers, than conversion to CP/M-86™. Again, the implication is clear.

Better system features. MS-DOS offers features unavailable under either CP/M-80 or CP/M-86: device independent I/O, advanced error recovery, variable length records, and full program relocatability in order to take

MS, Multiplan, Multi-Tool, and Microsoft are trademarks of Microsoft Corporation. CP/M and CP/M-80 are registered trademarks of Digital Research, Inc. CP/M-86 is a trademark of Digital Research, Inc. IBM is a registered trademark of International Business Machines, Corp.

advantage of the extended addressing capabilities of the 8086 and 8088 microprocessors. And MS-DOS' descriptive error messages make it a user-friendly OS.

Leadership in microsystems. Microsoft led the industry into the 8-bit world when we put BASIC on the first microcomputer. Now, we're leading the industry into the 16-bit world with the first complete set of software tools for the 8086 and 8088 microprocessors. The MS-DOS operating system. Languages. Utilities. And, applications software.

Planning an OEM system? Return the coupon below for complete OEM information on MS-DOS and Microsoft's complete set of tools for 8086 systems. Can't wait? Call our OEM Accounts Manager.

Memotech's Memopak Range

Current Memopaks
16K
32K
64K
HRG
Centronics Interface

MEMOPAK 64K MEMORY EXTENSION
The 64K Memopak extends the memory of the ZX81 by 56K, and with the ZX81 gives 64K, which is neither switched nor paged and is directly addressable. The unit is user transparent and accepts commands such as 10 DIM A(9000).
Breakdown of memory areas...0-8K Sinclair ROM. 8-16K This area can be used to hold machine code for communication between programmes or peripherals. 16-64K A straight 48K for normal Basic use.

MEMOPAK 32K and 16K MEMORY EXTENSIONS
These two packs extend and complete the Memotech RAM range (for the time being!) A notable feature of the 32K pack is that it will run in tandem with the Sinclair 16K memory extension to give 48K RAM total.

MEMOPAK HIGH RES GRAPHICS PACK
HRG Main Features — • Fully programmable Hi-Res (192 x 248 pixels) • Video page is both memory and bit mapped and can be located anywhere in RAM. • Number of Video pages is limited only by RAM size (each takes about 6.2K RAM) • Instant Inverse video on/off gives flashing characters • Video pages can be superimposed • Video page access is similar to Basic plot/unplot commands • Contains 2K EPROM monitor with full range of graphics subroutines controlled by machine code or USR function

MEMOPAK CENTRONICS TYPE PARALLEL PRINTER INTERFACE
Main Features — • Interfaces ZX81 and parallel printers of the Centronics type • Enables use of a range of dot matrix and daisy wheel printers with ZX81 • Compatible with ZX81 Basic, prints from LLIST, LPRINT and COPY • Contains firmware to convert ZX81 characters to ASCII code • Gives lower-case characters from ZX81 inverse character set

- Compresses text or data to less than half size
- Backs up larger files by splitting onto multiple floppies, recreated when copied back

Price £75.00 + vat, post free in U.K.

CP/M Formats include ICL/RAIR, VECTOR, SUPERBRAIN/SIGNET, IMS, XEROX, NORTH STAR/COMART, TELEVIDEO, NEC, Z80-APPLE, OSBORNE, 8" IBM and others.

CLIP is a development of our E40 file compression utility, with many file handling features too. CLIP (Compressed Library Interchange Program) does all that the name implies. It takes care of most of the chores in building an ordered file library, and can make automatic notes of its own operations. For completeness, it handles uncompressed files too, so that the powerful file-handling capacity is available for every task. Use CLIP with all-floppy systems as well. CLIP your files and clip your costs.

One Expander Card for apple leads to another....

In fact it leads to many others! Joining the amazing success of our PAL Encoder Card, these four new expander cards all featuring the unique 'Digitek Safety Tab' are ready to plug straight into your Apple Computer.

PAL Colour Encoder Card £105 This amazing card with its on-board modulator, displays exceptional colour graphics to your TV.

16k Ramcard £91 Insert the card straight into slot 0, and increase the memory capability of your Apple without having to remove any memory chips.

Z80 Expansion Card £110 Installing the Z80 into your Apple gives you two systems in one, which enables you to run the popular CP/M operating system.

RS232 High Speed Serial Interface £72 The RS232 Interface Card incorporates 13 selectable Baud rates from 75 to 19,200.

Print-master Interface £79 The ultimate parallel interface for Apple to all popular dot matrix printers.

The PRINT-MASTER accepts Apple protocols, 15+ software commands and has on-board graphics dump capability to all popular graphics printers. No need to load clumsy software routines - it's all at your fingertips on the PRINT-MASTER - choice of inverse printing, double size picture, 90° picture rotation, many word processor type text commands, plus many more.

Apple is the trademark of Apple Computers Inc. Digitek and Print-master are the trademarks of Digitek (International) Ltd.

Dealer enquiries welcome

VICTOR 9000

VICTOR

VICTOR 9000

At last here's the real advance; a fully integrated computer that's fast enough, versatile enough and big enough for any business but small enough for a desk. That's the unique Victor 9000.

I want to know more about the Victor 9000.
(Clip coupon to letterhead.)

Name _____
Position _____

PCW/12/82

CONQUERING SUCCESS

Designed by Chuck Peddle, the genius behind some of the world's best known microsystems, the Victor 9000 is already a runaway success in the United States and Europe. Now it's in the U.K.

CONQUERING OPERATION

Very simple and made to be operated by non-computer personnel. Menu style step by step procedures and verbal prompts can enable anyone to use the Victor 9000.

CONQUERING PERFORMANCE

All the performance of a minicomputer only at micro size. 16 bit processing starting at 128Kb of RAM expanding up to 896Kb. That means large customer files, instant information, flexibility and integration of functions.

CONQUERING USER SUPPORT

DRG Business Machines, backed by its £600m parent company, are making certain that every Victor 9000 once installed, is fully supported. A nationwide network of the very best distributors means help is never more than a few minutes away.

CONQUERING OBSOLESCENCE

The Victor 9000 is designed to grow. From 1.2Mb to 10Mb. It'll communicate directly with other terminals, even other computers. It will change as your needs change. You'll probably never need to purchase another system.

CONQUERING PRICE

The Victor 9000 starts at around £2395. Or about £12 per week. The performance of a mini-computer at a micro price. There's nothing to beat the Victor 9000. See one in action and you will be conquered too.

CONQUERING SOFTWARE CHOICE

Four operating systems (two standard) and a wide variety of languages means that the choice and sources of software are almost unlimited – both for business and other purposes. Numerous accounting, specialist and scientific packages are already available including the unique Victorcalc and Victorwriter.

Clip the coupon or telephone (0934) 32525 or 415398 and we'll put you in touch with your local Victor distributor.

THE ALL CONQUERING BUSINESS SYSTEM.

TI's Home Computer. Unbeatable value. Unrivalled software.

When you choose a TI Home Computer you're choosing a "real" computer. A computer that can grow with you and your family. A computer that lets you play, invent, discover... that lets your imagination soar.

What makes this possible is our wide range of software. You'll find subjects as simple as "Early Reading" and as complex as "TMS 9900 Assembler Editor." Many of our programs are packaged in our unique Solid State Software™ Command Modules. Some have sound. Others have superb colour graphics. Simply plug them in and begin.

When you want to learn to

program for yourself, the TI 99/4A is ready too. TI BASIC is built in. The programming manual is easy to understand, easy to follow every step of the way. You will be amazed

to discover how much fun programming can be.

And when you're ready to expand your system, we're ready too. Our unique Peripheral Expansion System can house up to seven peripherals without extra cables or clutter. There is even a speech synthesiser that gives your computer a voice.

Sound impressive? Try the TI Home Computer for yourself at your nearest dealer. At around £200 you'll look no further.

TEXAS INSTRUMENTS

WHAT THE PROFESSIONALS LOOK FOR IN A HOME COMPUTER

Feature	Texas Instruments TI 99/4A
Microprocessor	TMS 9900 16 BIT
Graphics	16 colour, high resolution
Languages	TI-BASIC (built-in), extended BASIC, UCSD-PASCAL, TI-LOGO, Assembler
Memory	16K RAM standard—expandable to max ROM/RAM of 110K
Keyboard	Full size, standard typewriter style
Software	1000 programs to choose from worldwide
Solid State	Yes
Speech Capability	Yes

VIDEO GENIE and TRS80

THE ROM-VIDEO GENIE & TRS 80 (3 ROM Models)

Are you fed up of loading a lower case drive every time you switch on? — Want your name inside your computer — Better loading (TRS80) — Sick of bouncy keyboards-s!

You need our new ROM—simply remove old—plug in new.

- 1) Firmware driver for lower case
- 2) Security code displays—(your name & post code?)—up to 21 characters
- 3) Improved tape loading
- 4) Alleviates repeating characters (key-bounce)
- 5) Checks for feature ROMS

£14.95 + VAT + P&P (80p)

FEATURE ROMS £18.95 + VAT + P&P (80p)

A series of ROMS starting with FEATURE 'A'

- 1) Single keystroke commands
e.g. Shift A = Auto etc.
- 2) Flashing cursor (can be toggled on/off)
- 3) Repeating characters—with delay—(toggle)

- 4) Machine code monitor and editor
- 5) System load and save for backing up those system Programs —uses no RAM and so can deal with a FULL 16K program

NEW

FEATURE 'B'—extended basic

- 1) Merge—two basic programs to one
- 2) Renumber
- 3) Screen print
- 4) Various basic tools PLUS

Plug on for feature ROMS

Now you can simply plug on the back of your computer, insert ROM and away you go.

VG £29.95 inc. ROM A OR B + VAT + TRS80 £34.50 + VAT + P&P (80p)

48K RAM—internal

TRS80 & VG £43.50 + VAT + P&P (80p)

Plug in our modules. Connect three wires (VG) or five (TRS80). You are not required to piggyback chips. Keep your old RAM (or sell it!). Compatible with expansion.

LOWER CASE HARDWARE (VG & TRS80)

Unplug two IC's, plug in two modules, connect three wires—EASY! £19.00 + VAT + P&P

BOOKS

"Disassembled Handbook for TRS80"—A Self Teach—Series of Books—Written by Bob Richardson of New York. Very well received by U.S. Reviewers, **Essential** Reading for TRS80, Video Genie & Radio Hams.

- Vol. 1 Decoding the ROM & Calls, etc. **£6.45**
Vol. 2 Using Calls, to shorten programs, etc. **£8.75**
Vol. 3 D/A—AD, Spooling, etc. **£10.50**
Vol. 4 Teletype, Morse Techniques **14.50**
Vol. 5 Voice Systems **TBA**

+ Much else in each volume.

Various Books—Lists on application.

+ VG—Expansion—Disk Drives—Printers, etc. Details on application.

1. GENERAL OFFICE

ATP-80: Redwood Software	£270
Powerful British wordprocessor with exceptional features.	
Cardbox: Caxton Software	£155
A fast, impressive, simple to use card indexing system for computers.	
Datapen: Redwood Software	£150
A database where the forms can be designed using a wordprocessor. The base is used to manipulate data.	
Datastar: Micropro	£175
Excellent package for data entry, retrieval and update for microcomputers.	
Dbase II: Ashton Tate	£395
The most sophisticated database available on micros. Very fast and exceptionally powerful.	
DMS: Comsoft	£400
A fairly sophisticated database designed for the unskilled user. Links simply to Wordstar.	
Documate:	£95
A program for indexing books which have been typed in using Wordstar.	
Fileforce: Brand	£250
A very flexible and powerful British Database with some unique features.	
Indexer: TCL Software	£100
A book indexing program for professional indexers.	
Mail Merge: Micropro	£75
Mailing system and extra facilities for Wordstar.	
Spell: Software Tools Inc.	£45
A powerful proof corrector/spelling program with a virtual dictionary of 40,000. Wordstar can call it.	
Spellbinder: Lexisoft	£275
A powerful and popular wordprocessor, easier to use than Wordstar.	
Spellstar: Micropro	£125
Wordstar's spelling program.	
Wordstar: Micropro	£195
The 'Industry Standard Wordprocessor', includes many powerful text formatting and printing functions.	
Wordstar self instruction disk: MAC	£75
Help at all levels with Wordstar.	

2. BUSINESS AND ACCOUNTING

Purchase Ledger: TABS	£250
Includes Day book, Cashbook, Audit trail, Aged debtors analysis, VAT analysis and Reports. Links to Stock, Nominal and Job Costing.	
Sales Ledger: TABS	£250
Includes Day book, Cashbook, Audit trail, Aged debtors analysis, VAT returns and Reports. Links to Stock and Nominal.	
Nominal Ledger: TABS	£250
For up to 1000 accounts. Day book, analysis, Trial balance, all accounts and subtotals printed. Links to Sales, Purchase, Stock, Payroll and Job costing.	
Payroll: TABS	£250
For up to 1000 employees. Pre tax schemes, payslips, cheques, P45, P11, P60, P35. Analysis. Links to Job costing and Nominal.	
Bill of Materials/Stock: TABS	£250
Parts explosion to 10 levels. Up to 20 char ID for parts. Up	

to 99 parts per level, up to 10000 parts in an assembly. Forecasting Min re-order levels, re-order lead time, batch entry. Integrates with Sales, Purchase, Invoice and Sales Order modules.	
Job Costing: TABS	£250
Stand alone module with Job charging, time sheet input, transfer to/from stock, overhead calculation. Links to Purchase, Stock and Payroll.	
Modeller: TABS	£250
A spreadsheet analysis package which picks up data from your own ledgers.	
Word Processor: TABS	£125
Links to Sales, Purchase ledgers and mailing List.	
Sales Order processing, Management accounts, Invoice Compiler and firmware module: TABS	all £125
Bookkeeper: Mike Lewis	£350
A simple self-contained accounting system. Based on double entry book keeping leading to trial balance. Ideal for company that does not want full computerised ledger accounting.	
Business Software by Peachtree International	
Each Module:	£325
Payroll, Sales, Purchase, General Ledger and Inventory Management.	
Timerec: KSL	£350
Time recording package, originally for accountants. Carries forward transactions from one run to the next.	
Time Recording: Graffcom	£400
Excellent documented package which allows for job cost and analysis reports, update and deletion.	

3. PROFESSIONAL AND SCIENTIFIC

Scientific Subroutines: TCL Software	£495
A major breakthrough in software for micros in engineering and scientific applications. This is a library of Fortran routines which provides the theoretical analyst with a programming capability which embraces statistics, interpretation of functions, solution of systems of linear equations, matrix computation, integration, differentiation, solution of ordinary differential equations, numerical approximation, solution of non linear equations, least square optimisation, Fourier series evaluation and Fast Fourier transform analysis. More like the NAG library than anything else on micros.	
Sam: Software International	£280
A statistics package with all the usual routines, plus facility for handling missing variables	
Calcstar: Micropro	£120
Financial modelling package linked to Wordstar.	
Editroom	£275
Heat loss calculations for architects and engineers.	
Fastplan: Comshare	£395
An easy to use but very sophisticated financial modelling package.	
Microstat: Ecosoft	£180
The statistics package for micros. Powerful statistics plus a Data Management System for further manipulation.	
Microsurvey: Systematica	£1200
Astonishingly powerful package for survey analysis. Editor for cleaning data, checking ranges and logic. Three levels of hierarchy for data structure.	

Mu Simp/Mu Math: Microsoft	£149
Performs sophisticated mathematical functions whilst keeping track of all 611 digits.	
SNAP-Survey Analysis: Mercator	£650
Designed for use by non-computer staff. Includes questionnaire design & printing, data entry validation.	
Statpak: North West Analytical	£295
A statistics package for the analyst to manipulate and handle data in almost every conceivable manner.	
Supercalc: Sorcim	£180
CP/M improved version of Visicalc, the best selling spreadsheet analysis package.	
T/Maker:	£165
Screen-orientated visual calculating tool. Highly sophisticated and well suited to complex applications.	

4. BASIC

TCL DISK BASIC: TCL Software	£55
A compact but powerful 10K interpreter ideal for the beginner because of its ease of use and simple syntax.	
CBasic II: Software Systems	£75
Comprehensive commercially orientated Basic, ideal for business software.	
CB80: Compiler Systems	£315
Compiler for CBasic. Improves Cbasic programs 5 to 10 fold in terms of speed and ability.	
Basic 80: Microsoft	£170
The 'industry standard basic'. A good all purpose Basic with a large vocabulary of statements and functions.	
Basic Compiler: Microsoft	£200
Compiler for Basic 80 which allows run-times which are 3-10 times faster. Allows linking to Fortran and Cobol 80.	
Xbasic: Xitan Systems	£195
A new BASIC with many attractive features: mathematical accuracy, graphics routines for Hi-tech SID1 colour card.	

5. PASCAL

TCL Pascal CP/M: TCL Software	£120
This is a powerful, general purpose language suited both to beginners and experienced users. Ideal teaching tool.	
TCL Pascal Pet: TCL Software	£120
Specially designed for Commodore UK. Versions for 3032, 4032 and 8032 Pets.	

6. OTHER LANGUAGES

C-Compiler: BD Software	£75
This is a powerful, fast, compact, modular implementation and subset of Unix C.	
C-Compiler: Whitesmiths	£470
The ultimate in system software tools. Compiler output in A-Natural source. Supplied with A-Natural.	
C/80: Software Toolworks	£50
New 2.0 release includes full C structures, pointers and arrays all storage classes and data initialisation. One pass. C library.	
CIS Cobol: Microfocus	£425
Two versions available, compact and standard, both based on the ANSI 74 COBOL.	
Cobol 80: Microsoft	£145
Microsoft version of Cobol with relocatable object code.	

CP/M Systems

THE TUSCAN DESK TOP MICROCOMPUTER

crosystems

Comal: Metanic	£145	11. DEVELOPMENT AND UTILITY PROGRAMS	Sid: Digital Research	£55	
A good microcomputer version of this popular language.			8080 Symbolic Instruction Debugger which expands upon the features of the CP/M standard debugger.		
Forth: Laboratory Microsystems	£45/£100	Archive: de Galle	£100	Zsid: Digital Research	£65
A good version of Forth for CP/M machines. Two versions available, interger and floating point.		Compresses files to less than half size for compact disk storage.		Symbolic debugger for Z80 Instructions, with Z80 mnemonics.	
Fortran 80: Microsoft	£220	Compress: Mike Lewis	£29	Z80 Development Package: SD Systems	£55
Microsoft Fortran is comparable to large mainframe packages. Complies with ANSI stand FORTRAN X3.9-1966.		A package to compress Microsoft Basic 80 code. Makes it more compact on disk and reduces run-time.		Assembler plus editor. Produces rel code.	
Fortran: Supersoft	£180	Crash Patch: Elektrokonsult	£70		
Has Complex variable.		Powerful set of CP/M utilities. Includes Ddump and Dtest, Unera (unerase) and Ddup.		12. MISCELLANEOUS SOFTWARE	
Lisp 80: Software Toolworks	£42	UVMAC-Z80: Software Toolworks	£40	CP/M User Group:	
Lisp interpreter, offers over 75 built in functions including trace, file I/O and string operations.		Absolute macro Assembler for Z80.		A range of public domain software, available from TCL Software for disk and copy charge.	
Mu-Lisp:	£119	Text: Software Toolworks	£40	Time Tabling: K. Johnson	£40
Microcomputer implementation of Lisp programming language suitable for artificial intelligence applications.		Takes the output from a cheap editor and gives it the appearance of having passed through an expensive word processor.		Set of programs and a book to perform school timetabling.	
7. EDITORS		Despool:	£50	Typing Tutor: TCL Software	£35
		A utility program to permit simultaneous printing from text files while executing other programs.		Interactive tutor which uses the calculating power of the computer to assess and set exercises.	
Edit 80: Microsoft	£69	Diagnostics II: Supersoft	£65	Authoring: TCL Software	£30
Very fast random access text editor. An ideal product to use as a programming tool.		Utility for disk testing. Routines to check the VDU, printer, disk drives CPU and memory.		A small package designed to help non-programmers to write computer-aided programs.	
Text: Digital Research	£55	Disilog:	£55	Estate Agents: Mike Lewis Consultants	£800
Text formatter to create paginated, page numbered and justified copy from source text files.		Disk based disassembler.		Match and Mail for Estate agents.	
Wordmaster: Micropro	£75	Disk Doctor: Supersoft	£65	NEW PRODUCTS	
Comprehensive screen based text editor for programmers. Has superset of CP/M's ED commands, also similar to Wordstar.		A popular utility for disk repair.		Plink II: Phoenix Software	£195
8. APPLICATION TOOLS		DDump: Elektrokonsult	£35	Two pass link editor which supports arbitrarily complex overlay structures.	
		Dumps file and then reviews by track, sector or block. Possibly the best ever disk editing routine.		PL/1 80:	£325
Pearl III:	£295	Dtest: Elektrokonsult	£35	Application Programming language based on ANSI subset of the full PL/1.	
Produces application programs by allowing user to "converse" with the computer. Early program generator.		Tests and locks out corrupt areas on disk.		Pmate: Phoenix Software	£100
Qsort: Structured Systems	£89	Macro 80: Microsoft	£110	Full screen text editor with some unique features. Easy to learn and easy to use.	
Fast sort/merge for files with fixed record length.		8080/Z80 Macro Assembler, Relocatable, linkable output.		XASM-**: Avocet Systems Inc.	£115
Supersort: Micropro	£125	Forms II: Microfocus	£100	A cross assembler for 8080 and Z80 based micros which generates machine code for the Intel 8048 processor.	
Best commercial sort for fixed & variable length records merges data from several files, multiple keys etc.		IBM/CPM:	£135	XSM 8048	£130
9. OPERATING SYSTEMS		Allows the transfer of data between IBM and CP/M systems.		Accepts source code for 8048 and generates object code for 8048 to allow CP/M micros to be used as development tools.	
		Lynx: Avtek	£250	Ada: RR Software	£350
CP/M 2.2 Tuscan Version: Digital Research	£95	An overlay linker for creating executable programs from the rel files of Microsoft products. Best Fortran overlay.		A subset of the Ada programming language developed by the US Department of Defence.	
A version of this general-purpose operating system available fully configured for Tuscan users.		Mac: Digital Research	£73	Ada: Supersoft	£185
10. COMMUNICATIONS		8080 Macro assembler, with full Intel macro definitions.		Supersofts version of this highly structural language which is a direct descendent of Pascal.	
		RMAC: Digital Research	£120	Keele Codes (E40): Keele Codes Ltd	£100
Bisync-80:	£445	Utility for CB80.		A program which compresses files on disk by 40-50%, thus increasing disk space.	
Synchronous communications with any CPU or device that provides IBM support. Error checking.		Ratfor:	£42.50	Magic Wand: Peachtree	£250
BSTMS:	£125	A preprocessor for Fortran.		A popular, easy to use and highly sophisticated Word Processing package based around single stroke control keys.	
Intelligent terminal program for CP/M systems. Emulates a TTY when hooked up to a host computer.		Reformatter:	£140	Translators for 16 Bit Processors.	
BSTAM:	£125	Allows the transfer of data between CP/M and IBM and CP/M to DEC.		XLT-86	£90
Utility that permits two CP/M micros to communicate by RS232 or modem and telephone line.		Reclaim:	£50	Accepts 8 bit source code and translates it to source code for 8048.	
TTY: Systematica	£180	Helps to prevent loss of valuable data because of defective disk surfaces.		Trans-86	POA
A synchronous communication to other computers. Micro is an intelligent terminal, plus ability to download files.		Restore, Spool, Unspool, Qsub: FBN Software	£45	Similar to XLT-86 but for different machines.	
		A set of utilities with functions indicated by the names.		Act-86	POA
		Smartkey: FBN Software	£45		
		A package that can be used to redefine keys on the keyboard to represent one or a sequence of keys.			
		Smartprint: FBN Software	£45		
		The same as Smartkey but for the printer.			
		Supervyz: Epic Software	£65		
		A package for creating menu driven options, with messages and prompts, to help with CP/M and other software.			

& Software

MULTI-USER SYSTEMS

Our TS100 Series Card Cage system with CP/M or MP/M with up to four users – choice of video terminals and software compatible with TUSCAN. 5" or 8" drives or also available with Winchester. Contact our Sales Department for further details. Prices from £2302.

STAR RAIDERS™

NEW GAME. PRIVATE PROPERTY.

'Star Raiders' is the latest of Atari's video games to become available.

Since it is an ATARI® game we have exclusive rights to exercise all copyrights and other rights connected with 'Star Raiders.'

We lead the field in the development of video games. And it's due to our considerable investment of time and resources that our games have become so popular. And due also, of course, to the people who have enjoyed the games.

Unfortunately, however, some companies and individuals have been copying ATARI games, gaining profits at Atari's expense.

We must protect our investment so we can carry on investing in the development of new and better games.

So consider this a warning both to intentional pirates and to individuals unaware of the copyright laws.

Any manufacture, sale or other dealings in games which reproduce any of the copyrights in 'Star Raiders,' or any unlawful use of the name 'Star Raiders' (or imitation of it) is an infringement of Atari's rights.

Atari will protect these rights with vigorous action against all infringers. Regardless of what computer or other apparatus is used in playing infringing games.

We would also appreciate the co-operation of legitimate software developers in the protection of our property.

And if you happen to be selling a software product which performs a game similar to 'Star Raiders' (or any other ATARI game) please contact us immediately.

Write to the attention of: Graham Daubney, Atari International (UK) Inc., 185 Ealing Road, Alperton, Wembley, Middlesex.

ACT

pulsar

INDUSTRY-STANDARD 16-BIT BUSINESS SOFTWARE.

The new PULSAR business software is 16-bit software specially developed for new generation 16-bit personal computers.

It's inherently faster and more powerful than traditional 8-bit software.

The result: More and more business users are choosing PULSAR, making it one of the industry standards on 16-bit personal computers.

Only PULSAR meets the five key requirements for 16-bit business software:

PORTABILITY

PULSAR is primarily written in the BASIC portable language. So your investment in software is protected, regardless of how often you change your system.

PEDIGREE

PULSAR has been developed by ACT's own software engineers as a true 16-bit system. And ACT has more than 15 years experience in business software — computer bureaux using ACT programs produce more than 3 million statements every year and handle business applications

for more than 2000 companies. PULSAR incorporates many facilities that were previously available only on large mainframe computers.

INTEGRATION

ACT supplies integrated business software, linking every aspect of business accounting. Now with PULSAR, this integration is taken a stage further with word processing and business management tools able to share information and files with accounting applications.

USER-FRIENDLY

PULSAR is really easy to use. Documentation is to the highest standards in the industry, taking the operator step by step through the system. A simple question and answer routine on the computer screen prompts the user at every turn.

TOTAL SUPPORT

ACT is used to providing on-going support for its users. Not only is there a "hot-line" to resolve queries, but also a fully equipped training school open to all PULSAR users.

THE PULSAR RANGE...

PULSAR ACCOUNTING

- Pulsar Sales Ledger
- Pulsar Purchase Ledger
- Pulsar Nominal Ledger
- Pulsar Payroll

16 BIT - SOFTWARE
FOR 16 BIT
PERSONAL COMPUTERS

The ACT octagon encapsulates our philosophy of providing users with a single source for their computing solutions. ACT products include personal computers — network micro-computer systems — turnkey mini computers and a total range of services, including software development, computer field engineering, computer supplies, and a complete range of Bureau services.

The eight specialist ACT companies are each leaders in their field and are wholly owned by Applied Computer Techniques (Holdings) p.l.c., one of Britain's largest and most successful computer companies.

For more information on 16-bit Pulsar Software complete the coupon and post to ACT (Microsoft) Ltd., FREEPOST, Birmingham B16 8BR or phone 021-454 8585

THE 16-BIT PERSONAL COMPUTER

The ACT Sirius 1 is more than the UK's best-selling 16-bit personal computer. It is the only one with such a large choice of 16-bit software — business and scientific programs specially developed to take advantage of the high speed 16-bit Intel 8088 microprocessor at the heart of every Sirius.

Combine this faster and more powerful software with the advanced specifications of the Sirius 1 and you can see why more and more business users are choosing Sirius.

Because Sirius users have both the latest microcomputer technology and the powerful 16-bit software that takes full advantage of it.

Ergonomics plays a vital part in the design of ACT's Sirius 1. The screen tilts and swivels to suit the user and glare is eliminated.

The display is razor sharp, and the brilliance and contrast can be adjusted using keys on the low profile detachable keyboard.

UP TO 896 KBYTES RAM

128 Kbytes of RAM memory as standard easily upgraded to a massive 896 Kbytes ensures plenty of capacity for fully fledged business software and associated record files.

Within the basic system is 1.2 Mbytes of floppy disk storage, with 2.4 Mbytes double sided disks available as an option. More than any other comparable personal computer.

As a result, the Sirius is suitable from the start for large record processing applications. And with 5 and 10 Mbyte Winchester disk drives scheduled for early introduction, the Sirius can easily match your own organisation's growth.

SOFTWARE THAT TALKS BACK

And built into every Sirius is a revolutionary new concept: An audio decoder that can play back verbal messages and prompts under program instruction to assist the non-computer people to get acquainted with the software more quickly.

NEW 16-BIT SOFTWARE

All the big names in applications software are on the Sirius: ACT's Pulsar for accounting, WordStar for word processing, MicroModeller for financial modelling and SuperCalc the "spread sheet" program.

Plus the exciting SELECT, the only word processor that teaches you how to use it in less than 90 minutes.

And more than 100 top software companies are currently developing specialist software for every business and profession from the motor trade to solicitors.

The ACT octagon encapsulates our philosophy of providing users with a single source for their computing solutions.

ACT products include personal computers — network micro-computer systems — turnkey mini computers and a total range of services, including software development, computer field engineering, computer supplies, and a complete range of Bureau services.

The eight specialist ACT companies are each leaders in their field and are wholly owned by Applied Computer Techniques (Holdings) p.l.c., one of Britain's largest and most successful computer companies.

ACT Sirius 1

PERSONAL COMPUTER

Price £2,395

MORE LANGUAGES

The Sirius has more available programming languages than any newly-introduced personal computer. MicroSoft's BASIC 86, interpretative or compiled, CBASIC, a choice of several versions of COBOL, three different PASCAL's and a full scale FORTRAN.

The benefits? Programmers and software houses are making the Sirius their first choice computer for business software development.

Unlike other personal computers, the ACT Sirius 1 is delivered with the two industry standard operating systems at 16-bit level — MS-DOS and CP/M-86. Once again a guarantee now of the widest choice of off-the-shelf 16-bit software.

And further operating systems are under development. The much vaunted UNIX and a new system to support a low cost local area network.

COMMUNICATIONS

The Sirius is the ideal communications system, with two independent RS232 communications ports in addition to parallel and IEEE 488 ports. Available NOW are all the facilities required to communicate directly with large, mainframe computers.

Further backing is available by way of a dedicated Sirius Training Centre, run by ACT and open to all.

To support the product ACT has a truly professional network of systems dealers, hand picked for its knowledge of the business environment, enabling top quality support to always be close at hand.

ACT SIRIUS 1 — THE COMPLETE 16-bit personal computer.

FOUR NEW VIC ADD-ONS FROM ADDA

1. Light up with VicRel. VicRel is a control relay that plugs straight into the Vic user port to give simple, programmable switching of electrical apparatus in the home, office or factory. Its six relay outputs can control door locks, lamps, valves, tools, ventilators. And two inputs allow the Vic to read signals from external sources such as thermostats, push buttons or light activated switches. VicRel eliminates black boxes full of wires and represents one of the most exciting, value-for-money, firmware additions to any Vic computer system.

£28.95 INC VAT

2. Plot away with VicGraf. This cartridge allows you to explore the complicated equations and functions of graphs. The menu screen, activated by the Vic's special function keys, will automatically plot a graph, define new functions, calculate accurate values of an intersection, find the maxima and minima of a function. Simple editing allows you to check current functions and to change them. A necessary and attractive addition to any educational situation where graphs need to be explored.

£28.95 INC VAT

3. Crunch & Display with VicStat. A plug in cartridge that undertakes statistical calculations—such as Meanvalues, Standard deviations and Variances—and displays using single commands. Other one word commands allow you to draw vertical and horizontal bar charts,

to plot graphs, and to specify the scales and the colours used by these commands. It will also sort numeric and character strings. Finally, all or part of screen displays can be copied to the Vic Printer.

VicStat comes complete with a detailed operating guide.

£28.95 INC VAT

FORTH The VicForth plug-in cartridge, complete with 3K of additional memory, takes programming into new dimensions. As both an operating system and program development aid VicForth can speed up program writing and speed of operation. VicForth is based on fig-Forth and is almost identical to Pet Forth. It does however support the Vic cassette deck—an unusual feature. For those who do much programming a Vic Disk unit is suggested. VicForth provides several hundred one-word commands—listed in the detailed user guide—that can be added to.

£38.95 INC VAT

ADDA COMPUTERS

Why not spend Christmas with the Genie Family!

Our ingenious range of small computers, accessories and software make ideal gifts for 1st time buyers or committed hobbyists!

Genie I

Tried and trusted! - The Genie I is still one of Britain's best-selling small computers, with over 14,000 sold, and it's easy to see why! Software compatibility with Level 2 BASIC means there are literally 1000's of programs on the market ready to run on the Genie, including educational, leisure and small business applications. It's easy to expand, with a vast range of accessories to perform many functions - you only have to read this ad!

Genie I is the ideal computer for the first time buyer, to use at home, at school or at work. The simple BASIC language enables you to write your own programs with ease, and the Microsoft Extended BASIC offers many powerful extra features.

So, if you are not lucky enough to own a Genie I, or if you have a less powerful small computer and want to upgrade, go along to your local Genie dealer, or phone us for advice. It could be your first step into the enthralling world of microcomputers.

Genie II

Equally popular and totally reliable! - The Genie II is a breakthrough for small business computers. Harnessing all the advantages of the Genie I, including its low price, Genie II adapts perfectly to commercial functions with the addition of the following features:

★Numeric Keyboard ★Specific Business Commands ★Four User-Definable Function Keys ★Expandable via the same Genie peripherals ★Extension to BASIC.

Genie II is an ideal, first-entry, computer for the small business. Corner shops, professional practices and small manufacturers can all benefit from a Genie II business system. For further advice, see your local dealer, or contact us direct!

PRINTERS

The EG 3085 is quiet, fast and efficient. Printspeed is 100 characters per second and printing is bi-directional at 80 or 136 characters per line. Suitable for use with other systems, it has three typesstyles, adjustable pin or friction feed and single sheet or roll paper facilities. **£425 plus VAT.**

If you don't want to pay that much for a printer, consider the EG 603. It doesn't match the EG 3085 in certain areas, but you will still get 100 c.p.s. bi-directional, a range of character styles, forward and reverse feed and pin/friction feed, with 96 characters and 64 graphic patterns. **£235 plus VAT.**

BROTHER HR-1 Daisywheel Printer

You can now buy a superior daisywheel printer for a price only previously associated with dot matrix models.

The Brother HR is an enticing addition to your system. It has a print speed of 16 cps, range of 8 typefaces, and a choice of two models with either parallel or RS232 interfaces.

Reliability, durability and attractive appearance make the Brother HR-1 probably the best printer buy this Christmas!

£650 - VAT

EQUIPMENT COVERS

Beat the dirt, coffee spills and sticky fingers when your computer and monitor are not in use with these top quality black leather covers.

Genie CV1 **£5 plus VAT.**
12" monitors CV6 **£6.20 plus VAT.**
9" monitors CV3 **£4.20 plus VAT.**

GENIE MONITORS

Two good performance, low priced 12" monitors, either to match your Genie or compatible with a wide range of other systems. Good resolution and band width and, of course, they free your television set for the other type of programmes you like to watch!

The EG 100 12" in black & white costs **£69 plus VAT.**

The EG 101 12" with green phosphor is **£79 plus VAT.**

A.V.T. MONITORS

Available in 9" and 12" sizes, with white, green or amber display, Lowe A.V.T. monitors are sturdy, attractive, easy to operate and feature an easy view screen with smoked anti-glare display filter. Compatible with most popular micros on the market. From **£75 plus VAT.**

HIGH RESOLUTION GRAPHICS

Increase graphic resolution capabilities on your Genie seventy-three fold with the LE18 HI-RES unit. It offers bit image graphics of 73,728 points, a resolution of 384 x 192, and uses a separate 16K of video memory to achieve its resolution. Graphics are intermixable with text or existing pixel graphics, and animation, reverse video displays and use of programmable graphic characters are possible. **£86 plus VAT.**

TECHNICAL MANUALS

Full technical details of Genie Hardware (all you ever wanted to know about Genie).

Genie I/II Technical Manual **£10 - No VAT.**
Expander and accessories (EG3014) **£10 - No VAT.**

EXPANDER BOX

The updated EG 3014 expander box allows for up to four disk drives with optional double density. It connects to a printer, or RS 232 interface, or S100 cards. Not bad value at **£190 plus VAT (16K version)** or **£200 plus VAT (32K version)**

*The EG 3014 will work with TRS 80 by using the EG 3023 Tandy Adaptor.

DISK DRIVES

If you want fast, reliable program storage, true random access file handling and access to many computer languages, we can meet your needs. The EG 400T provides storage of up to 184320 bytes per floppy disk and comes complete and tested, in a stylish colour matched cabinet. **£220 plus VAT.**

The EG 401 AT offers dual disk drive with 368640 bytes of useable storage and comes complete with a power supply ready to connect to an expander box. **£365 plus VAT.**

DOUBLE DENSITY ADAPTOR

Allows the use of standard minidisk drives in double density, with virtually double the storage capacity. The EG 3021 is equally at home in the Genie or TRS-80 expander boxes.

A double density disk operating system will be needed, such as smallDOS provides. **£72 plus VAT.**

smallDOS

Powerful, yet reasonably priced, the Genie smallDOS contains 21 library commands, 7 utilities, LBASIC, disk basic and bags of information, including a reference manual and 40 page beginners guide to disk usage. **£35 plus VAT.**

BUSINESS SOFTWARE

Specifically written for the Genie II computer, with disks and a suite of packages from the renowned house TRIDATA. The suite includes SALES LEDGER, PURCHASE LEDGER, PAYROLL and STOCK CONTROL. Each package is a very reasonable **£175 plus VAT.** Full details on request.

LOWE electronics

Chesterfield Rd., Matlock,
Derbyshire DE4 5LE.

Tel: 0629 4995 Telex: 377482 Lowlec G

EG 3203 TANDY-BASHER

If you are a TANDY user, read on! The EG 3203 is bus converted to allow Genie peripherals to be used with Tandy Model I computers. **£18.40 plus VAT.** (Just in case there might be a few strange souls who want to convert in the opposite direction, there is the 50/40 converter which generates a Tandy compatible 40 way bus from a Genie.) **£34 plus VAT.**

FRED MUSIC SYNTHESISER

Beethoven might well roll over at this stereo music synthesiser, it can produce six simultaneous notes over the whole audio range and provide sound effects. FRED comes complete with a software compiler, full instructions and a demo tune. It is simply plugged onto the Genie 50 way bus and has two outputs for an audio amplifier. **£51 plus VAT.**

EG 3016 PARALLEL PRINTER INTERFACE

The EG 3016 is a simpler interface allowing a Centronics parallel compatible printer (EG 603, EG 3085) to be connected directly to the Genie keyboard without the need for an expander box. **£38 plus VAT.**

BUS EXTENDER

A most useful accessory, allows two bus using devices to be connected simultaneously to the Genie - when using the Hi Res and expander for instance. **£21 plus VAT.**

EP1, EP3

Genie I and Genie II have ROMS offering 13.5K BASIC are custom written extensions contained in EPROMs. You can change these as follows:

EP1 Adds all Genie I software facilities to other Genies, lower case driver, machine language monitor, renumber facility, keyboard repeat and screen print.

EP3 Has HI-RES driver software with 10 extra HI-RES commands which prevent need to load HI-RES software from tape. All at **£12 plus VAT.** For Video Genie Systems, the LE-19 connects direct to the Genie bus and allows one of these EPROMs to be fitted externally. **£26.50 plus VAT.**

SYSTEMS DESK

Even a compact modular computer system like the Genie benefits from being used on a custom designed system desk. The SD1 system desk is designed to accommodate a complete Genie System and has a special upper shelf to support the display monitor at the best level. The desk is flat packed for easy delivery and finished in attractive teak and charcoal colours. **£81.40 plus VAT.**

ONLY £199
inc VAT

Colour Genie is the latest piece of personal computer magic from Lowe Electronics. Remarkably compact in design, Colour Genie is a powerful piece of new technology which combines all the best features of the popular Genie I; 16K RAM, 16K BASIC ROM, and full size typewriter keyboard, with the addition of vivid colour, high resolution graphics, 3 channel sound and 40 x 24 screen format - a new dimension in home computing!

Put one in your living room, connect it to a standard colour T.V., and you will be amazed at the worlds that open up for you and your family!

For children and adults, Colour Genie provides an ideal introduction to computer programming. If you fancy a spot of intergalactic travel, or a battle for the planets, Genie will lay on the transport. When you get tired of the lads beating you at Space Invaders, you can always turn their attention to schoolwork. Genie makes that fun too! You can learn typing, a foreign language, or simply keep your household accounts in order.

Of course, Colour Genie is only one of a number of home computers you could consider buying, however, the £199 price tag gets rid of some of the opposition, as do the 64 present and 128 programmable graphic characters! 8 exciting colours leave a few more standing, and four function keys with a built in power supply put Colour Genie way out in front!

ACCESSORIES

Colour Genie can be supplemented by a large range of optional extras. There is an attractive matching cassette recorder on which to store your own programs, or play pre-recorded software. Joysticks are available for popular video games, and a position-detecting light pen to heighten your colour-graphic creations. If you want to put your machine to work in your business, it can be expanded by a 16K RAM card, and connected to a quality matrix printer via the printer interface and cable.

SOFTWARE

Colour Genie uses a Z80 central processing unit, and is fully programmable in Microsoft colour BASIC, the most popular home computer language in the Western World!

MUSIC

Colour Genie contains a FULL MUSIC SYNTHESISER, which will generate a remarkable range of musical sounds through your T.V. speaker, in a variety of pre-settable tempos.

I enclose 30p p & p for Genie Colour Brochure

FORTUNE

The Complete 32 Bit **Multi-User** Desktop
each

Minicomputer Performance at a Microcomputer Price

The FORTUNE 32:16 (TM) is the most powerful and unique microcomputer in its price range. This new system combines the power and computing capability of a minicomputer with the ease of use, convenience and price of a microcomputer. The FORTUNE 32:16 desktop microcomputer is designed for versatility and flexibility in the small to medium size business operation from a one person office to the department of a large corporation.

32:16

Compare these Characteristics

The FORTUNE is based on the most advanced microprocessor available – the Motorola MC68000. Its 32-bit architecture provides significantly higher performance than any other microprocessor in its price class.

Features include –

* MEMORY	256K – 1 MBYTE
* DISK CAPACITY	2.0 MB – 80 MB
* PROCESSOR	32 BIT*
* MULTI-USER	16 ADDITIONAL INTELLIGENT WORKSTATIONS
* LOCAL NETWORKING	ETHERNET
* COMMUNICATIONS	MICRO/MINI/MAINFRAME
* OPERATING SYSTEMS	UNIX & CP/M
* MULTI-TASKING	SEVERAL BUSINESS ACTIVITIES PROCESSED SIMULTANEOUSLY
* COLOUR GRAPHICS	HIGH RESOLUTION 1K x 1K

* 32 BIT Internal Address Bus 16 BIT External Data Bus.

Advanced Software

Of course all the features count for nothing if you don't have software and the right level of professional support. It comes with a large range of advanced software with commercial applications tailored to the equipment and allowing the user to learn while using the system rather than referring continuously to manuals to find out what the next instruction to the microcomputer should be. It couldn't be simpler and yet so powerful. No other computer has been launched with more comprehensive software than the FORTUNE 32:16. WE'RE READY FOR BUSINESS.

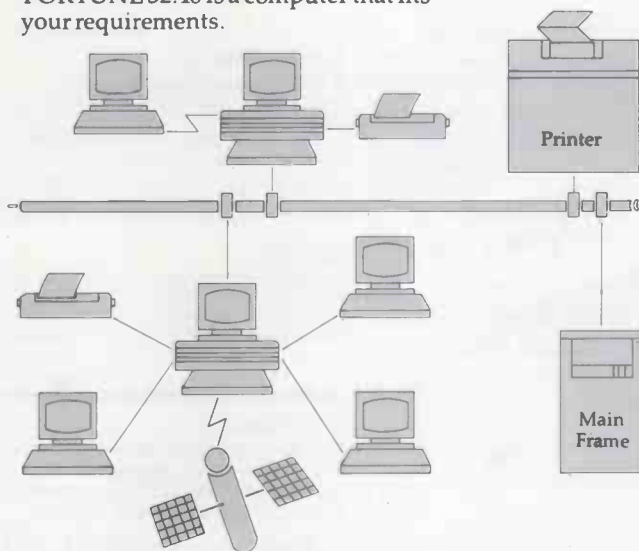

Designed with the User in Mind

The FORTUNE 32:16 is attractive in design, lightweight and easily portable. Ergonomics were a critical factor in dictating all design features. The anti-glare screen is razor sharp and can be swivelled or tilted for user convenience. Attention to detail is evident with the

keyboard in the choice of overall colour (to reduce eye fatigue), colour coding of various groups of keys (for easy visual identification), and the varying mounting angles of rows of keys (to reduce hand and arm fatigue).

For the Expanding Business

The FORTUNE 32:16 can easily and inexpensively be expanded from a single user to a multi-user operation, or expanded even further into a multi-system local network configuration by using standard ethernet (TM) designed by Xerox. In addition the FORTUNE 32:16 can support advanced data communications to other terminals, minicomputers and large corporate mainframes. The FORTUNE 32:16 is a computer that fits your requirements.

FORTUNE 32:16

The FORTUNE 32:16 is designed for quality and reliability, because downtime is one thing business can least afford. Every major component has been proven in tens of thousands of hours of on-line operation, and each individual unit undergoes comprehensive design, validation and production testing to assure trouble-free performance.

THE FORTUNE 32:16 IS BACKED BY FULL PROFESSIONAL SUPPORT AND TRAINING THROUGHOUT THE COUNTRY.

One Step Beyond

The combination of all these features makes the FORTUNE 32:16 the most unique and most powerful microcomputer available in today's marketplace.

The FORTUNE 32:16 is available now at your nearest authorised dealer.

Send the coupon today for more information, or call Reading (0734) 664111 for the name of your nearest supplier and see a demonstration without delay.

There is nothing to compare with it.

NORTH STAR ADVANTAGE

Advantage Desk-Top System inc. Keyboard, Graphics, Screen (Green), 64K Byte RAM, Z80A Processor, Serial Interface, Dual 350K Byte Diskette Drives and Busigraph Software 2195.00

Advantage Desk-Top System, as above except single 350K Diskette Drive + 5M Byte 5" Winchester Hard Disk 3095.00
Advantage upgrade to Intel 8088 Processor with 64KB Memory @ 320.00

PRICES EXCL. VAT

NORTH STAR ADVANTAGE

Two versatile desk top options to choose from featuring high quality business graphics with either 720Kb floppy or 5Mb hard disk storage.

From 2195.00 ex. VAT

NORTH STAR HORIZON

Horizon S100 Bus. Micro Computer inc. Z80A Processor, 64K Byte Memory, Dual 350K Byte Diskette Drives and DOS/BASIC 1995.00

COMART COMMUNICATOR

Clearly the most price competitive modular computer system on the market with built-in expandability - inside and out. **From 1895.00 ex. VAT**

COMART COMMUNICATOR Z80A MODULAR SYSTEMS

Comart CP100 'Communicator' Micro Computer: Z80A Processor, 64K Byte Memory, Dual 5 1/4" Floppy Diskette Drives each storing 390K Bytes of Data. Dual Serial and Parallel Ports. 10 Slot S100 Bus. CP/M Version 2 included 1895.00
Comart CP200 as CP100 except Dual 790K Byte Diskette Drives 2195.00
Comart CP500 as CP100 except one 790K Byte Diskette Drive and one 5" Winchester Drive having 4.8M Bytes of Formatted Data 2995.00
Comart CP520 as CP100 except one 790K Byte Diskette Drive and one 5" Winchester Drive having 19M Bytes of Formatted Data 3995.00

COMART COMMUNICATOR 8086 MODULAR SYSTEMS

Comart CP1100 Communicator Micro Computer: 6MHz 8086 Processor, 128K Byte Memory with Parity, Dual 5 1/4" Floppy Disk Drives each storing 390K Bytes. Dual Serial and Parallel Printer Ports. 10 Slot S100 Bus inc. CP/M86 2295.00
Comart CP1102 CP1100 with 256K Byte Memory 2445.00
Comart CP1200 as CP1100 except Dual 790K Byte Diskette Drives 2595.00
Comart CP1202 CP1200 with 256K Byte Memory 2745.00

PRICES EXCL. VAT

Comart CP1500 as CP1100 except Single 790K Byte Diskette Drive and Single 5" Winchester Hard Disk Drive having 4.8M Bytes of Formatted Data 3395.00

Comart CP1502 CP1500 with 256K Byte Memory 3545.00

Comart CP1520 As CP1500 except 5" Winchester Disk having 19M Bytes of Formatted Data 4395.00

Comart CP1522 CP1520 with 256K Byte Memory 4545.00

COMART MULTI USER CONFIGURATIONS

Comart CP500 / M CP500 Communicator System with 256K Byte Memory and 6 Serial Interfaces. Includes CP/M and MP/M11 3995.00

Comart CP520 / M CP520 Communicator System with 256K Byte Memory and 6 Serial Interfaces. Includes CP/M and MP/M11 4995.00

Comart CP1525M CP1520 Communicator with a total of 512K Byte Memory and 10 Serial Interfaces. Includes CP/M86 and MP/M86 5995.00

COMART SUBSYSTEMS

Comart CB200 Cartridge Tape Back-Up Subsystem for Hard Disk 2495.00
Comart HD200 8" Hard Disk (18M Byte) Subsystem (including HD10 Controller) 3895.00

Comart HD520 5" x 20M Byte Hard Disk Subsystem (requires HDCONT or can be added to a CP520 or CP1520) 1995.00

Comart HD522 Dual 20M Byte Winchester Hard Disk Subsystem (requires HDCONT) 3495.00

Comart HDCONT Winchester Disk Controller for 2, 20M Byte Drives 595.00

Comart FD800 8" Floppy Single Disk Drive Subsystem; Single Sided, Single Density IBM 3740 Compatible (requires C-IFDC) 995.00

Comart FD802 8" Floppy Dual Disk Drive Subsystem 1495.00

Comart MP/MSUB Hardware & Software to Upgrade Communicator to MP/M. Includes MP/M, two 48K Byte CRAM 48 Memory and 4SIO Serial Interface Card 1150.00

S100 BOARDS

Comart CRAM64 64K Byte Dynamic RAM with Bank Select 200.00

Comart CRAM48 48K Byte Dynamic RAM with Bank Select 180.00

Comart CRAM256 256K Byte Dynamic RAM with Parity, 8 and 16 Bit Data. IEEE696 Compatible. Also supports 8 Bit Bank Switching 550.00

Comart CRAM128 128K Dynamic RAM with Parity, 8 and 16 Bit Data, IEEE696 Compatible. Also supports 8 Bit Bank Switching 400.00

Comart C-CPU86 8086 Processor Card, with Dual Serial and Parallel Port. Monitor in 8K EPROM and 4K RAM 300.00

Comart PRESTAIID Viewdata Subsystem including Display Board, Modern and Software 690.00

Comart C-IFDC Intelligent Diskette Drive Controller with Z80A Processor 295.00

Comart C-CPU Z80A system Processor Board incl. 2 Serial/1 Parallel Port 200.00

Comart 4SIO 4 Channel Synch/Asynch Interface Board 250.00

Dual Systems CLK24 Battery Supported Real Time Calendar Disk 295.00

Dual Systems CMEM32 32K CMOS Battery Supported Memory 1195.00

Dual Systems CMEM16 16K CMOS Battery Supported Memory 895.00

CROMEMCO 68000/Z80A SUPER MICRO SYSTEMS

Cromemco CS1D2E System 1 including Dual 390K 5" Floppy Disks, DPU, MCU, 256MSU and 16 FDC Cards in 8 Slot S100 Card, Table Top Enclosure 3620.00

PRICES EXCL. VAT

Cromemco CS1D5E as CS1D2E but with 512 MSU 4280.00
Cromemco CS1HD2E System 1 including Single 390K 5" Floppy Disk, 5.5M Byte 5" Winchester Disk, DPU, MCU, 256MSU, 16FDC, WD12 5595.00
Cromemco CS1HD5E as CS1HD2E but with 512MSU 6255.00
Cromemco CS3D5E System 3 including Dual 1.2M Byte Floppy Disk Drives, 21 Slot Card Cage, DPU, MCU, 512MSU, 16FDC 6585.00
Cromemco CS3HD5E as CS3D5E but with 5" 5.5MB Winchester Disk and WD1 8230.00

CROMEMCO Z80 COMPUTER SYSTEMS

Cromemco CS-1H System One including Z80A Processor, 64K Memory, 390K Byte 5" Floppy, 5.5M Byte 5" Winchester Disk and VDU/Printer Interfaces 4595.00
Cromemco CS-1B Slot S100 Bus. Computer System One, with Z80A Processor, Dual 5" Diskette Drives, 64K Memory, VDU/Printer I/F 2630.00
Cromemco CS-2 21 Slot S100 Bus. Computer System Two, Z80A Processor, Dual 5" Diskette Drives, 64K Memory, VDU/Printer Interfaces (19" Rack Mount) 3095.00
Cromemco CS-3 21 Slot S100 Bus. Computer System Three: Z80A, 64K Memory, Dual High Speed 8" Diskette Drives (1.2M Byte each), VDU/Printer Interfaces (19" Rack Mount) 4495.00
Cromemco Z-2H 12 Slot S100 Bus. Hard Disk Computer System with Z80A Processor, Dual 5" Diskette Drives, 10M Byte Winchester Drive. 64K RAM & VDU/Printer Interfaces 6585.00
Cromemco Z-2H/GS Cromemco Graphics System based on Z-2H, together with additional Dual Ported 96K Byte Video Memory, High Resolution Graphics I/F and Bit Pad Interfaces CDS and SGS Software Included 8560.00

CROMEMCO GRAPHICS OPTION

Cromemco SD1 High Resolution (754 x 482) Colour Graphics Interface Board 595.00
Cromemco 48KTP 48K Byte Dual Port Graphics Memory 755.00

VDU'S & MONITORS

Comart WY100 Visual Display Terminal, Green Display, 24 x 80 and Status Lines. Detached 105 Key Keyboard with Numeric Pad, Function, Cursor and Editing Controls. Swivel and Tilt Display 675.00
Volkerkraig 4404 595.00
Volkerkraig 4404WS 695.00

 * All goods are new and include factory warranties.
 * No refunds on opened software.
 * Orders from Government Depts. & Colleges etc. welcome.
 * Leasing & HP facilities available - apply for written details.
 * Detailed prices available on request.

There are so many micro computers on the market that choosing the right one is far from easy.

And it isn't made any easier when you find them cheek by jowl with cameras, hi-fi and a host of other electrical equipment.

What you need is someone that is single minded. And that means us.

Byteshops are totally dedicated to micro computers. So not surprisingly, we can offer you a wider range because we sell nothing else.

Our prices are keener too. So are our staff. Each one is an expert who can make sure you get the computer that's exactly right for you - whether it's a £40 home micro or a £20,000 business system.

What's more we'll freely advise you on expanding or upgrading your system as your knowledge or your requirements grow. While our Microserve Centres offers service and maintenance on site at our shops.

After all, we are the UK's longest established microcomputer specialists. Come and see us soon.

MicroRAPPORT

The Relational Database System for Micro Computers

For more information, purchases or dealership terms contact: Peter Barnes, Database Products Group, Logica Limited, 64 Newman Street, London W1A 4SE Telephone: 01-637 9111

MicroRAPPORT is a proven Relational DBMS for CP/M* based microcomputers. It has an easy to use Interactive Query Language for retrieving data and formatting simple reports, a utility program for loading data and a powerful command interface for use within Fortran programs. It is a derivative of RAPPORT, the popular DBMS for mini and mainframe computers and is ideal for building applications of all kinds.

MicroRAPPORT can handle 16 data-base files holding up to 30 Megabytes of data. It is powerful, very efficient and proven on a wide range of machines. No application should be without it.

BBC MICRO INSTANT MACHINE CODE!

Yes, it's true. Instant machine code from a good subset of BBC BASIC. Type your BASIC program into your model B BBC Micro, trigger the compiler, and your program is changed almost instantaneously into superfast machine code. For £34.95 you get: Cassette version of the complete compiler (along with a version of the compiler for use with discs, ready for when you upgrade, the disc version being dubbed on the cassette after the cassette version); complete compiler listing; extensive documentation and instructions. The compiler was written by Jeremy Ruston.

THE BBC MICRO REVEALED

By Jeremy Ruston

'... destined to become the bible of all BBC microcomputer users. ...' (Personal Computing Today). If you've mastered the manual, then this book is for you. Just £7.95

LET YOUR BBC MICRO TEACH YOU TO PROGRAM

By Tim Hartnell

'... takes you further into the cloudy areas of the BBC machine than anything else I've yet seen. ...' (Computer and Video Games). If you're just starting out in the world of programming, then this book is the one for you. Forty complete programs, including Othello/Reversi, Piano and a host of dramatic graphic demos. Just £6.45

micro change ltd

computer systems and equipment

Microchange introduces a database system for the Sharp MZ80B Computer, an exceptional combination of efficiency and reliability. Use the database management system to develop your application software eg —

- *Insurance and assurance
- Estate agents
- Video shop
- *Stock control
- *Personal records
- Student records
- (*Working examples enclosed with package)

Benefit from master and chained records, second level indexing, use of codes, search and extract on up to 30 criterion with print display option, and many more excellent facilities.

RRP for microchange database system £400 excluding VAT

Special offer for complete system includes —
System hardware, CPM. M basic compiler. Plus database management system £2 465 excluding VAT

SPECIAL CHRISTMAS ZX MICROFAIR!

If you're interested
in exhibiting please
contact Mike Johnston

**Saturday 18th December at the
New Horticultural Hall,
Greycoat Street, London SW1.
One day - 10am to 6pm.**

Thinking of buying your
Christmas computer?
Looking for ZX hardware or software?
Want to meet local user-groups and ZX
enthusiasts?

Or just want an interesting day out?

Then call along on Saturday, 18th December for the **Christmas
Special MICROFAIR!**

It's full of Christmas Cheer — everything for the ZX81, ZX80 and
ZX SPECTRUM under one roof!

Meet a wide range of manufacturers of all types — talk to
interesting people — get advice — buy that last minute present.

There's plenty of room, there's a Bar if you get thirsty and a Buffet
if you're famished!

There's even a bring and buy sale so you'll be able to pick up a
bargain, and of course a complete showguide, available on the day.

Make a note of the date or
write for advanced tickets to
Mike Johnston, 71 Park Lane,
London N17 0HG (enclosing
a S.A.E.).

Admission charges are 75p
for adults or 50p for kids
(under 14). Please make
cheque, P.O. payable to ZX
Microfair.

Do it now and make sure of
a very happy ZX MAS!

SOFTWARE Try before you Buy

If you need software on a trial or short-term basis —
you need ATLANTA RENTALS.

Famous names in our huge library of software include all
Visicorp products, Micromodeller, Desktop/Plan,
Microfinesse, Microplanning, TABS, Padmade, Wordstar,
Cardbox, Format-80, dBase II etc, etc.

We also provide the hardware — Apple II and Apple III
and now the Sirius 1, plus top quality printers, monitors,
hard and floppy disk drives, sheet feeders, line plotters, and
all peripherals to complete the rental picture.

No capital expenditure, no membership nonsense,
and no waiting. Fixed charges, full support and
friendly people.

Guy Kewney delivers his monthly package of micronews.

Sage advice

A machine which runs programs 14 times faster than an Apple, costs £2,500, and bases itself on something that really is better than CP/M is the sort of machine which some of my colleagues are understandably excited about.

The makers are even more excited. 'More performance for £2,500 than any computer in history,' they say.

These voices, I would say, are the voices of people who love to write Pascal programs.

The Sage II, however, isn't quite as wonderful as they make it sound because the world, unlike my colleagues and the Sage people, does not (yet) understand the language Pascal, or the associated p-system 'foundation' of the Sage.

The Sage uses the powerful Motorola 68000 chip as its central processor. It runs (Sage says) 14 times as fast as a standard Apple II.

There are a lot of machines with that chip inside now, and they all share the high price tag.

What the Sage actually is a signpost. It shows that a computer doesn't have to be vastly expensive, or an imitation of a minicomputer, just because it has a Motorola 68000 processor inside it.

But what it actually is not is cheap.

The price at £2,500 doesn't include a display or keyboard, or printer, nor any usable software.

It does include the means of producing programs which you could then actually use, because it includes compilers for various languages.

The price of any computer is made up of two things — the purchase price of its components plus a profit margin on the one hand, and an extra amount to cover the costs of developing it on the other.

A Sage II computer consists of (hardware): a floppy disk, a circuit board with some chips on it, and some wires and plugs all in a box. The disk is better than some, and there are more chips inside than in some computers. But that said, the difference between this box and the next, in raw materials, is only a couple of hundred pounds.

For instance, the total cost

(in components) of a Sirius1 is around £500 — including two disks, screen and keyboard (and quite nice ones, too).

The Sage also includes (software): the UCSD p-system (version 4.1), plus the associated Pascal compiler, a Basic compiler, a Fortran compiler, a macro assembler, and a goodly package of utilities.

You could sell this package on the open market for more than £500 without raising an incredulous eyebrow.

But then again, the number of customers who would actually want that shopping bag full is rather limited to specialist programmers. For them, compilers are essential tools.

For the rest of us, compilers are what we expect the software supplier to use in writing 'real' software — accounts receivable, text processing, stock control, and Adventure Invaders.

And by the time you have bought those, you will find your bill for the complete system ending up very much the same as for a Sirius (or, for that matter, an Apple III — which proves something about the Apple III).

That sounds like a lack of enthusiasm: it isn't. It is just emphasising that we are talking about a system (working) which costs £3,500, and that this is not 'cheap'. In the context of a 'not cheap' computer, the software available is less than thin.

For accountants, things are rosy enough — several brands of integrated accounting software run on the p-system background. They include Systematics, Ormbeta and Jarman brands.

There is only one test editor that Sage's UK agent was able to tell us about: something called an ASE editor 'with sprinter text for matter for technical publications' — something sold by Sage's UK agent itself, TDI.

There are one or two Visicalc equivalents, there is a little comms software, and Micro Expert. And there are some database packages.

I suppose you think I'm making rather a fuss, but I'm still smarting from the injus-

tice of being accused (in print) of 'perpetuating the myth of a lack of software for the IBM PC'. And since IBM itself has so far refrained from releasing its micro over here because it happens to believe the same myth, and since the amount of software for the IBM is a veritable gold-mine compared with the stuff for the Sage there are real grounds for vehemence.

Now, a small surprise for you.

I think the Sage is nearly the greatest thing since sliced bratwurst.

The reason I like it is that it is the first reasonably priced machine to offer the incredible power of the 68000 in as single-user package.

What is the point, you may well ask, of having a 68000, which can solve your problem five times faster than any other chip, and then find some clown has stuck it in a box where it has to service four other people, all on the end of their own terminals, at the same time?

The point of doing that is (since you ask) that there are a bunch of ignorant lunatics who will buy such things, because they see multi-user minicomputers costing £15,000, and the multi-user micro at £8,000 looks like a bargain by comparison.

The Sage, however, (if I ever get one) will be mine, all mine, and nobody else can interrupt my processor and start searching through his silly database for a non-existent order just when I'm trying to do a big file-backup in a hurry.

Somebody out there put a sort of SuperWordStar on it. Please. TDI is in Bristol, and can be contacted on (0272) 742796.

UK Vector

The arrival of a UK based home office of American system builder Vector Graphic poses an interesting question: how long can 'mainframe' or S100 based microsystems continue to produce big revenues simply because they are cheaper than minicomputers?

Because its systems are not cheap (prices start at £3000 with virtually no software for office applications) each sale is both big-revenue and big-profit.

So the fact that Vector is now only six years old and is already a \$36 million operation makes it sound as though it is the micro world incarnate — fast-growing, forward-looking, high technology, micro revolution, and so on.

In fact, Vector produces

The reason this box doesn't look like much of a computer is that it isn't much of a computer. It's a bank window. Microperipheral Corporation in Washington State sells it for \$100, so that you can plug it into a television and a phone, and use it to transact business with your bank. It is rather like viewdata systems (Prestel, Telidon and so on) and it only works if your bank has equipment to receive the call.

According to Microperipheral Corporation, the box was presented to the recent 'Instant Teller' conference held by City National Bank in Phoenix, and was very favourably received by 90 banking institutions.

I don't want one myself, but I thought it worth noting, since people still do seem to imagine that our Prestel system somehow gives us a two-year lead over the rest of the world — and clearly, it doesn't.

The Vector 4: see 'UK Vector'

standard equipment (in the eyes of many there is no higher praise) that outperforms others by good engineering. It has added to its range by producing a system that runs 16-bit (IBM style) software.

And it provides 'big' systems by putting a lot of ordinary CP/M machines into one box, and making it look like a multi-user mini — because there are a lot of people out there who will buy such a thing, even if they really want a lot of ordinary CP/M machines.

The new company (Vector in Europe) has a new product (the Vector 4) which uses the same micro which runs the IBM and Sirius and DEC Rainbow machines — the Intel 8088.

It can run CP/M and CP/M-86, if it wants to. It looks good in an office. It is (to my mind) not underpriced, but not astonishingly overpriced, either — and in this world it looks like good value for money by comparison with a lot of systems.

But, the question is: can those other systems stay around for comparison? Can the run-of-the-mill S100 system compete with Rainbow and IBM designs, which are cheaper, more glamorously attractive, and carry the magic labels of their builders?

It's a question which doesn't concern Vector directly, but the other S100 system builders, all facing the same question: what can they offer the 'user with a bigger cheque-book' that can't be got cheaper on systems around £1,000; or how can they keep up with the marketing strengths of the big

IBM and DEC dealers?

My own opinion, for what it's worth, is that the multi-user market (both multi-processor and multi-taking systems) will continue to flourish, despite its obvious lack of fundamental logic, simply because the network world is dragging its feet.

And as long as it does, Vector will shine brightly by comparison.

Eventually, as with the big Vector systems, we can all link the machine of our choice into a chain of identical 'modes' on a network, rather than buying a central processor and attaching terminals to it.

It will be very interesting to see how the 'central box' approach is received in the market when that happens.

Vector in Britain is in Windsor, at Vector House, William Street, Windsor, Berks SL4 1BA; phone (07535 69375).

Prizes, prizes

There is no shortage of people offering prizes for software to do with education, is there?

There are usually only two reasons for doing this — either publicity, or simply the software itself.

In the case of Apple's Young Programmer of the Year contest (closes end January) the unusual prize of an Apple II with colour display is offered to the best program of 500 words (?) or less in length, written by somebody who doesn't turn 20 until 1983.

In the case of Micronet 800, the reason is software — the network wants to supply it to network subscribers

(that was the whole point of the network after all) to encourage them to join.

For Apple, the real prize is to prove that the machine is unusually suitable for educational work. 'Programs will be judged by a panel, looking for strong relevance to education,' says Apple.

It doesn't just want one program, either — there are 300 runner-up prizes, 50 of assorted books and software, plus (a dead giveaway) '250 copies of the book for programmers and users, *An Apple for the Teacher* published by Sigma'. There are 1000 wall posters printed already, 'suitable for educational establishments and shop premises', publicising the competition.

Both these groups are playing it straight: if you submit a program, you keep copyright and can negotiate it for a fee. Not everybody is quite so straightforward, and there have been competitions in the past where the entrants were merely providing the organiser with a mass of free software.

Apple is at the Education Department, Apple, Eastman Way, Hemel Hempstead, Herts HP2 7HQ. Micronet 800 can be contacted on Peterborough 265666.

A likely tale

I know it can't be done — but the idea of turning the Sinclair ZX Spectrum into a 'powerful nine octave electronic organ' so appeals to my sense of humour that I just had to pass it on.

The claim is by PDQ Software of Edenbridge, Kent. The product which performs this miracle is not (as you might suppose) a powerful amplifier, set of synthesisers and other audio hi-fi stuff, but a program.

What the program does is

to pick up your touch on a Spectrum key, and do the hard work of calculating a BEEP statement for you. It then BEEPs that note, displaying a picture of the note and the BEEP number on the screen.

With the program comes a keyboard overlay, so that you can see which note is on which key, and how to change octaves.

But not with the program (at £6, what do you expect?) is anything to make the Spectrum play more than one BEEP at a time, nor anything to guarantee that you will be able to hear the damn thing, anyway.

Spectsound (the name of the program) is worth buying for one thing alone, however: with it you get a BEEP chart. This converts notes to BEEP numbers, and vice versa.

Details by mail only: money or queries to Parsley Rye, Hilders Lane, Edenbridge, Kent TN8 6JU.

Beeb aids

At the moment, there is no program to run on the BBC Computer which helps you draw graphics, edit them, and move them around memory.

There is, in the meantime, a series of paper aids, with graph paper that helps you keep track of odd bits in memory.

There is also a flow-chart pad, symbol design pad, and a series of binders to keep them all in.

Details from Intastor Micro Aids, Freepost, Stroud, Glos GL6 1BR.

CP/M Fair

The idea of a CP/M Fair must be absolutely unique in the history of computing. It is going to happen, nonetheless,

This appalling grey photo shows a 'low cost object recognition system' using a BBC Microcomputer.

It is built by Digithurst, in Royston, near Cambridge, and here it is trying to prove that it can recognise the spanner which the television camera is focussing on, as a spanner.

The system also works with Pet and Apple hardware. Cost including software but excluding the central micro is around £2,000. Details and a better photo from Peter Kruger on Cambridge (0223) 208926.

in January in San Francisco. Previous gatherings of like-minded user groups have always centred on a language or a machine — and, mostly, the languages on one machine have been different enough from those on other machines to keep IBM users from discussing Cobol with Honeywell or ICL people.

CP/M, however, is an operating system which is not native to any one machine more than any other. The problems which CP/M software designers have vary from machine to machine, but still have more in common with each other than they have to distinguish them.

The scope of the show is enormous. Over 200 exhibition stands are planned, and these 'will show the full spectrum of application packages, development aids, microcomputers (how did they get in there?), peripherals, accessories, publications and services available to CP/M users.'

The strength of the show is at the same time its weakness.

The strength lies in the fact that this is an 'official' CP/M show, with Gary Kildall himself (the inventor and boss of Digital Research which sells it) plus people like Tony Gold, founder of the CP/M Users Groups and of Lifeboat Associates, and people like Adam Osborne, who swears by the system and sells a machine which runs it.

In other words, the people who can answer your questions will be there.

But the weakness lies in the fact that the dissidents will not be invited to speak. The organisers will claim that there is no point in having dissidents at workshops, where people are trying to get things done, not question the basis of why they need doing.

The organisers will therefore fail to consider ways of moving CP/M away from its dreadful limitations.

By limitations, I don't mean faults. Digital Research, at press time, was planning to announce a new version of CP/M itself, supposedly eliminating many of its known faults, but those faults aren't the important limitations.

Limitations of CP/M are all derived from paper. CP/M is a standard, and it assumes that you may want to talk to a CP/M machine from a remote teleprinter.

The effect of this is a catastrophe on a comparable level to what would happen to air transport if laws were passed insisting that aircraft should be capable of pulling trains through tunnels.

You can't say this, however, to a CP/M believer. To such a one, the fact that CP/M is a standard is all, and if the standard implies a lowest

common denominator, so be it.

Yet without this assumption, we would have had concurrent screens, because there would be nothing to stop them. We would have global, relational data structures, because you could look at them. We would have flexible screen formatting, we would eliminate dual terminals, we would have screen editors, and we would have soft keyboards and screens.

Anyway, that isn't what you will get at CP/M-83, which is the name of the exhibition and conference.

For what you will get, contact Digital Research, or Northeast Expositions Inc, which is contactable at 824 Boylston Street, Chestnut Hill, Mass 02167. Phone, if you like, (617) 739 2000.

The exhibition runs from January 21 to 23.

Wider VIC

Commodore is now preparing for the day when it stops selling the VIC-20, at £160 or so, and tries to make people buy the Commodore 64 at £300 or so — and of course there will be those who will still carry on wanting the VIC.

However, they will quickly come to realise that 23 characters spread across the width of a television screen are 23 very fat characters, and very hard to read.

Dutch firm Computer World (no relation to an American computer newspaper of the same name) has produced a little plug-in circuit which gives the VIC either 40 characters or 80 characters per line of screen. VIC users will be impressed.

However, since the add-on costs the best part of £150, it is possible that they will eventually come to wish they'd just bought the 64 right away.

Details from Holland at Hilvertsweg 99, 1214 JB Hilversum, phone (035) 12633.

From the horse's mouth

The next fifteen years, thinks Clive Sinclair, inventor of the ZX range of micros, are likely to be a turning point for our civilisation, when computers provide us with the means to real freedom.

Clive Sinclair is not just a rich man who sells cheap computers, but a fully paid-up high octane brain user (being head of British Mensa) and optimist or visionary.

As a consequence, the BBC2 television programme *Futures* felt he was a good person to put on display when they needed somebody to explain why the world might feel warmly welcoming towards microcomputers.

Clive felt that more people should grasp the fact that automation is our friend, and actually went so far as to suggest that a Golden Age might be just round the corner.

Not everybody will instantly recognise his vision as one of the Golden Age — at least, not at first, because the first prediction he made on the programme was that manufacturing jobs in Britain are going to drop still further. And unemployment, he said, will rise to at least seven million.

'Daunting this may be; disastrous, not,' he said. 'We do not need a manufacturing industry to be wealthy. The truth is that Britain is in the wrong part of the world to make conventional goods. I believe any products with a strong creative content can be made here profitably.'

In other words, we must become a nation of designers, and let the low-cost labour nations become producers, he thinks. 'We must turn from the products of the material to products of the mind; books, video-tapes, tv programmes, computer programs, design services, consultancy of all forms.'

In such ways, seven million jobs, creative, enjoyable and rewarding (and highly paid) jobs can be produced by the 1990s, he says.

Behind this (I think) dubious theory lies Clive's unstated belief that if people whose opinions are generally

valued (like himself) go around making encouraging noises, other people will be encouraged to start doing useful things. 'Laugh, and the world laughs with you,' in simple words.

Oddly, perhaps, I agree that things in Britain and Europe will get more golden rather than less (no doubt Clive is delighted to hear me say so) but not because of our creativity, nor the power of infectious giggling.

The vast majority of humanity is bitterly poor, living on the equivalent of a bowl of rice a day — and by comparison, even the poorest Westerner is an immensely rich person.

And while things may get, for a time, marginally worse, then (perhaps) marginally better from decade to decade, there is no obvious way for the poor nations to gain the sort of control over international finances which would give them our relative wealth.

In the end, of course, simple overcrowding can't be avoided, and simple starvation, already widespread, will become the norm, and eventually there will be a plague.

We, in our Golden Age, will send blankets, and will tut-tut over the difficulty of getting reliable sub-contractors to build cars and computers, in their low-wage economies, the way the rich always grumble about the problem of finding reliable

You have a quartz watch — so perhaps your Apple II should have one too. It'll also want the software needed to read the watch. The Micro Watch (a real-time clock card) and an Electronic Diary program which uses it, are both available from Glanmire Electronics, of Cork. Contact them on 128 Oliver Plunkett Street, Cork, or phone (Eire, remember) 021-500418.

Still Need Convincing?

SOFTWARE FACTSHEET

Product: CARDBOX	Type: CardIndex
Retail Price: £155	Machine: CP/M & MP/M
File Size: CP/M 8MB MP/M 16MB	Records: 65,500 maximum
Record Size: 1484 ch maximum	Fields: 26 maximum
Field Size: 1484 ch maximum	Index Limits: None

Notes: Allows complex searching using up to 99 separate criteria.
Widely available from distributors in USA, UK and Australia.

Published by Caxton Software Ltd of London.

The Critics Don't....

"Cardbox is your familiar, tried and trusted card index... with most of the features you have always wanted on your manual card index but couldn't have, because of the limitations of pieces of card."

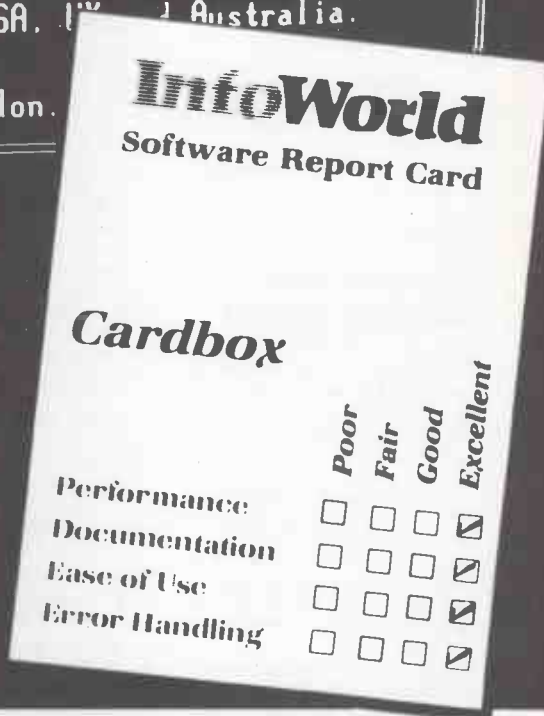

"Cardbox... succeeds extremely well. Its facilities for indexing and searching are good and very fast... the user image of the screen displays and the documentation are in the main excellent."

Personal Computer World, August 1982

"The interesting thing... is the display... Cardbox enables you to draw a form on the screen complete with headings."

"Cardbox is an excellent database manager... its versatility... and its ease of operation make it a useful program for home or business."

InfoWorld, September 13, 1982

Anyone can use Cardbox. It's a simple yet powerful electronic card indexing system. Easy to learn and easy to use, Cardbox is bringing real computer power to hundreds of new users.

Put yourself in a user's shoes:

- You wouldn't have to change your present working methods or think in computer terms. Cardbox talks to you in plain English.
- If you can do it with a card index you can do it better with Cardbox thanks to its sophisticated automatic cross-indexing.
- Up to 65,500 'cards' can be stored and they can be displayed, printed or passed to other programs in any number of alternative formats.
- Groups of 'cards' can be selected by any word in any field. Your choice can be refined by using up to 99 words in a single search.
- Information is easily added, changed, duplicated or deleted.

These are just a few of the reasons why the top British and American micro journals are convinced Cardbox is the ideal card index for CP/M users.

Cardbox - the ideal card index system for CP/M users

servants.

But the majority of humanity will continue in grinding poverty. The habits of the last three thousand years aren't about to end in a couple of decades just because of the microcomputer.

Unless, of course, it is the microcomputer that presses The Button.

Howzat?

An unusual claim to fame by a software writer: Microchat of Penistone in South Yorkshire is into cricket and rugby, producing the software which drives the Headingley scoreboards.

'We maintain we can write software for any application on virtually any machine,' they say — the scoreboards were controlled by a Hewlett Packard HP-85, and they did a marathon scoring system on an Apple for McEwan's Lager, and an insurance system, and a joinery job costing system.

Getting someone to write your own software is not normally a good idea on a micro, but if you must, I suppose these are unusual enough credentials to warrant a mention.

Microchat is on (0226) 765927.

Saving scrap

Horrible old Teletype printers, for which people used to pay nearly a thousand pounds because they were the cheapest sort of printers you could get, are nowadays sold as scrap.

For users of cheap Sinclair ZX machines, however, those romantic clanking ruins are worth salvaging from the scrap heap, and are usable to record things that the machine produces, on paper.

All that is needed is an interface — something to connect computer to printer.

The pattern laid out on the top of this cigarette-box size package is a sort of circuit layout, showing what the box can do for a Sinclair ZX Spectrum. Round the edge are colour-coded sockets into which wires can be wedged. They can be input analogue signals, output relay lines, switch input and output, and two I/O ports.

In other words, the DCP Interspec connects the Spectrum to other electronic equipment from automatic washing machines to pianolas. Details on Norwich (0603) 712482.

For £19.50, plus an additional £2.50 for a bit of software, this is now available from Sofstest, 10 Richmond Lane, Romsey, Hants SO5 8LA.

Market gardening

Despite the fuss that 16-bit machines are causing, software house Peachtree obviously thinks that it is more significant to be able to run its accounting programs on the Apple II for the first time, than on the CP/M-86 family.

At the moment, of course, the programs will probably run on any IBM Personal Computer you can get your hands on, but Peachtree isn't going to say that, for fear of offending IBM.

So the company refers coyly to 'CP/M-86 16-bit machines including the Sirius 1 and Victor 9000' (identical machines).

The programs are all written in Microsoft Basic. Details on Maidenhead (0628) 71011.

Comspeed

To anybody with a Commodore machine, the simple statement that Petspeed is now available on the Com-

This is the sort of picture you normally use a Tektronix screen to generate. Here, it is being done with an IBM Personal Computer on a screen and graphics tablet from Computer Displays Ltd.

It may give you something to do with an IBM PC (all you need is the PC!).

Agent is Riva Terminals: details on Woking (04862) 71001.

modore 64 is all this item has to say.

To the rest of the world, all one needs to add is that Petspeed compiles Basic programs into faster code which can run anything from twice as fast to 40 times as fast as the original code.

Details from Oxford Computer Systems on Woodstock (0993) 812700.

No sex, please

Possibly the idea of a program which plays selections of Robert Carrier's menu recommendations on a VIC 20 is a silly idea, but I don't see why former PCW publisher Felix Dennis had to get quite so hysterical about it.

A less silly idea, I think, is Ivan Berg's latest program for the machine: a transcription of the tests in Hans Eysenck's book *Know Your Own Personality*.

The machine asks all Eysenck's questions, and then plots the personality rating on three ways of reading personality.

Unfortunately, Berg has left out the two really interesting aspects of personality — social/political attitudes, and sexual attitudes.

'We didn't want it to be too long, and wanted to leave something out,' he said. 'Anyway, the sexual one was very explicit, asking questions about orgasms, and so on.'

I think it would make a great party piece, and I hope he brings out part two very soon.

He also does 'Know Your Own IQ' which may not tell you much about your brain, but will certainly make you good at doing IQ tests, if you're thinking of joining Clive in Mensa.

Micro mania

Help is coming to muscular dystrophy sufferers from Tandy in the form of a

national games competition to raise money for research into possible cures for the disease. Every Tandy store has been equipped with a TRS-80 Color running Tandy video pinball games and members of the public can pop into the store, pay 50p and attempt to reach the highest score in their region. All winners will receive a TRS-80 Color Computer as their prize and are invited to a national play-off at the *Which Computer?* Show on 18 January next year. The national winner will be presented with two disk drives and an extended software and memory pack, giving a prize worth over £1000.

Anyone (except, presumably, Tandy's employees) is entitled to have as many tries as they like at the game — the more the merrier, in fact, and all money raised will be donated to the Muscular Dystrophy Group. In addition there'll be well-known personalities promoting the venture throughout the country.

The first games were played at a press launch on 19 October and the competition will close on 8 December. Tandy is the first micro manufacturer to organise any kind of charity-based promotion and the competition is a first for the Muscular Dystrophy Group.

Accounting for taste

Quote: 'Although business software for microcomputers has been available for some time' (true) 'Padmede Computer Services has now developed a new system, which is designed to provide faster operation, more flexibility, and greater integration.'

Padmede said that. The software is accounting software, and the word

'integration' is a magic word when it comes to accounting software.

It runs on CP/M or MS-DOS operating systems.

Apart from that, all you can say is that it is available, and try to find out from a user what it is like, because there is no way of describing it in print. Details on Fleet (02514) 21892.

Quite separately, Mediatech has also announced a range of accounting programs called Accounting Plus, which were originally supplied on the Eagle Computer range.

It is probably the most comprehensive CP/M accounts package available on the UK marketplace,' says Mediatech, adding that modules cost £400 each except for the £600 payroll module.

Again, not much point in adding anything to their claims except the phone number: 01-903 4372.

Apple walker

The baby, the Apple and the teddy bear are all trying to make sure that the baby will be able to walk.

Apparently a few of us (human beings, not teddy bears) are born with dislocated hips. Normally, the only way to tell is to wait until we can't walk a couple of years later, and then wish we'd detected it at the time, because now you're stuck with painful operations, and not much chance of ever getting a normal hip.

The way to tell that you have dislocated hip joints is to listen. Unfortunately, doctors aren't very good at detecting the difference between the sounds made by a normal baby's hip and a dislocated hip.

Apples, however, can do the job.

The one in the photo is at the Musgrave Park Hospital in Ireland, and is produced with extra hardware and software to listen to joints clicking, by Medical and Scientific Computer Services Ltd of Lisburn, County Antrim.

Helping the very young: see 'Apple walker'

According to Robin Jelly, managing director of the company, the software took a few tries to get right.

'Data comes from the transducers attached to the baby, every 100 microseconds,' he says, 'and is analysed by a complex machine code inside the 48 Kbyte Apple.'

'The trouble was that originally the machine code program took 130 microseconds to run. It had to be "tuned" to get it faster. It now runs in 96 microseconds.'

After clinical trials, the equipment will be marketed around the world. Anybody interested should phone (08462) 77533, or write to the company at Altona Road, Lisburn, Co Antrim, N Ireland.

You don't get a free teddy bear, however.

Spreading the word

To the many people who use CP/M machines because they have to (because the software they want to use runs on a CP/M machine) it will seem strange that there are people who use it because they think it is wonderful.

Like all cranky religious sects, these people don't take criticism of their God kindly, and look forward to the spread of his Gospel into the next generation of machines.

These people will be delighted to hear that Euro-micro, a company which makes fairly expensive systems based on the old S100 standard circuit boards, has moved not only CP/M but its multi-user brother, MP/M, into the world of 16-bit processors.

It has produced a processor board which fits into the S100 box, and has two micro chips on it — the Intel 8085, and the 8086 — the 8086 being the full 16-bit chip of which IBM and Sirius use the chopped-down 8088 version.

This system starts at a mere £4000 for a single-user version with disks and display, so it clearly isn't the

Logic analysers made by Thandar enable computer designers to check out new microsystems; one of the customers who used the Thandar 2080 now reckons to have improved its design.

'It had disadvantages,' according to Dataman Designs. 'The output was solely to the screen, not to the printer, so only a small part of the data could be seen.' Also, no disassembler was available to turn the raw octal, hex or binary code into sense.

The system works with either Z80 or 6502 chips. Cost is around £2000. The photograph shows the new menu to control all the new features. Anybody who is not a computer designer, ignore it. Otherwise, contact Dataman on (0300) 20700.

price which makes it interesting.

What makes it interesting is a combination of things: first, the fact that (like the Digital Equipment Rainbow) it has both 8-bit and 16-bit processors together, and can tell which processor to apply to which task; and secondly, that it can actually run 8 and 16-bit programs simultaneously.

The software which makes this possible is a new version of Digital Research's CP/M family, MP/M-86.

There are those (and I agree with them) who say that putting multi-user software on a cheap micro is a silly idea. If you would like the argument in full, read Brain Dump; for now, it is enough to say that it is usually cleverer to get two cheap micros than to buy one expensive one and connect it to two display terminals for two users.

Despite the fact that it is a silly idea, it will continue as long as the minicomputer makers ask £20,000 for the smallest multi-user system they make, and make the smallest system less powerful than the average micro.

It is the recent past, the idea was even sillier, because MP/M was needed to do it, and MP/M could not be trusted.

On this system, however, you don't get MP/M, but its 16-bit relative, MP/M-86.

Euromicro's boss, Jim Wood, says that yes, he accepts that MP/M used to have its flaws, but no, MP/M-86 is a new product, reliable and to be trusted. Wood is actually a very honest man so, at the very

least, we can accept that if there do turn out to be flaws in the software, they are flaws he could not have known about.

The only thing that rather puzzles me is the use of the Intel 8085 chip, rather than the Zilog Z80, as the 8-bit processor.

To be sure, the 8085 chip can run a good deal of CP/M software — but if you are paying this sort of money for a 16-bit system, then surely the only reason for throwing in the 8-bit half is to make sure that the customer can keep any and all of his old CP/M programs. And while the Zilog chip can run most software that the 8085 can run, the opposite is less true, and the Zilog is, today, the better bet.

Euromicro is on 01-341 2447, and past fans will recognise that number as one which used to belong to Ithaca Intersystems. It is the same company, but Olivetti bought the US parent, and the name — they had to change the European name as a result.

Blowing up a storm

Anybody who has written a Basic program longer than 20 lines will have found, one day, that there are two instructions to GOTO 200, and they can't remember where the other one is, or that there are three GOSUB 3000s and one of them is line 450, but what of the other two?

On the Apple these people can now do a simple search for a string, using new soft-

ware called Gale, from MicroSparc.

Gale 'gives Applesoft programmers the ability to perform global searches and replacement of any specified character or characters throughout a program,' says the supplier in Lincoln, Massachusetts. 'Line by line editing allows you to make fast changes without recopying an entire line — you can delete characters, insert characters, compact a line by replacing PRINT statements with the equivalent (a question mark), enter lower case characters, and so on.'

Details on PO Box 325, Lincoln, Mass 01773, or try phoning (617) 259 9710.

Three card tricks

In the nicest possible way, the Director of Fair Trading has warned micro suppliers that a lot of their products look like a three-card trick to the public.

Marvels such as automatic checkout machines, automated shopping and banking, and viewdata catalogues, he says 'have potential benefits to offer'.

But: 'I put forward with some force a caution to the innovators that the new

electronic marvels may fail to gain public acceptance — a nice way of phrasing it — 'unless the shopper can plainly see that his or her interests have been safeguarded, and that the benefits do not accrue solely to the shopkeeper and the bank.'

The Director, Sir Gordon Borrie, offers this advice on what 'user friendliness' really means (not just chummy chat on the screen) in an OFT report on the effects of microelectronics on 'the consumer' — you and me.

The report, 'Microelectronics and Fair Trading', is available from the Distribution Unit, OFT, Room 600, Chancery House, Chancery Lane, London WC2A 1SP.

And nation shall speak unto nation...

Chinese micro users now have a machine which they can program in Basic — which, as the listing here shows, is quite a problem.

The word PRINT makes a lot of sense to English speakers, so it is quite sensible to use it in a programming language.

For the Chinese, however, it is daft. Ask the average Streatham computer club member to use the ideogram showing two waffles on top of a barbecue next to a three legged table with a minus sign floating over it, and it is possible that he would regard Basic as a daft language, too.

條列

```

20 方陣 A(20)
30 註解 ASSIGN A(I)
40 從 I = 1 到 20
50 A(I) = 5 * I + 2
60 下個 I
70 註解 PRINT A(I)
80 從 I = 1 到 20
90 顯示 A(I)
100 下個 I
    
```

The solution has been produced by a Taiwanese company called Multitech, which rather thinks it has an idea with world sales potential — because while a lot of people can write English, most prefer to write something else.

The Multitech micro, like Sinclair ZX machines, uses a single key to tell the computer to perform some Basic function.

But on the key, instead of PRINT, you get two waffles (etc, etc). Or in Italy, the appropriate Italian word. And on the screen, the same word appears in the listing.

The essential hardware for each language remains the same, says Multitech; just a plug-in cartridge changes the native spelling of Basic into the local tongue.

Presumably few people will rush for the Chinese one, but nonetheless, details are available: the address is just a bit more exotic than the run of the mill ones usually printed here. It is Multitech Industrial Corporation, 977 Min Shen E Road, Taipei, 105 Taiwan, ROC.

Soft Sirius

The Sirius is a lovely computer (it says in all the

reviews) because you, the user can change the shape of the letters on the screen. The screen is, they say, 'soft'.

Hands up all users who know how to do it, then?

All the rest of you will want Kuma's new character set editor, obviously. Details on Maidenhead (0628) 71778.

Making space

Programmers who earn their living at programming still include a large number of Cobol writers, who will now be able to buy an even better version of their favourite language for micros.

Micro Focus, the designer of CIS Cobol, has now released a new version which 'makes more user space available'.

The operating software which stays in the machine when it is running compiled CIS Cobol code is smaller, in other words.

It has also put new ribbons on: smaller and lighter manuals. The manuals, says the company, 'stand up independently when in use' which I think actually means they don't fall over (see picture) because they are supported from behind.

Worth every penny of £425. Details on 01 722 8843.

Apology

For some obscure reason, the price of the Oric 1 (page 85, Newsprint November) was printed as £499. It should, of course, have been £99.95 — our apologies to Oric Products and any readers who may have been misled.

Apple revamp

One of the most common phenomena in the micro industry seems to be the use of the Apple II as a base for all sorts of interesting add-ons and upgrades either to fit the Apple for use in a specialised environment or to give the machine state-of-the-art capabilities.

Perhaps the reason for the common use of the Apple as opposed to other machines from its era is that it displays

Swivel stands for desks aren't the sort of chip technology you pay to read about in this paper, but for people who have a machine which covers more than half the desk, they may be more important than semiconductor details.

These swivel stands are by Chasmood: they fasten to your desk, and let you slide the computer back and forward, as well as swivel it about.

Chasmood is on (0483) 577161, and they make no guarantees about the stability of your own desk with one of these fastened to the side.

THE OFFICE OF THE FUTURE TODAY

OR LEASE FOR ABOUT
£150 + VAT AND
£52 A MONTH +
VAT FOR 33 MONTHS

1 The heart of this office of the

future is the powerful new Osborne 1 portable computer, with 64k memory, two disc drives and a built-in monitor. The Osborne is linked to an Olivetti Praxis 30 11cps daisy-wheel printer/typewriter for printing your work

superbly. In addition you get a packet of software (sold elsewhere for up to £800) to make your office of the future into a word-processor or a financial planner.

3 The Olivetti Praxis 30 is a new style electronic typewriter with its own memory, automatic erase, and a double

keyboard which gives you 14 extra characters. Use your Praxis on its own as a prestige easy-to-use typewriter,

or plug it into your Osborne and use it as a high quality computer printer.

2 Your Osborne and Praxis are a remarkable combination. The machines are so portable you can carry them both home instead of working late. Plug them together slip the Wordstar/Mailmerge disc into the drive and you have a word-processor as good as costly dedicated systems. Change discs for Supercalc and you have the power of a dozen clerks for your budgets. Then Osborne types your work perfectly on Praxis.

O-COMPUTERS

A member of the C/WP Group
104-106 Rochester Row, London SW1
Telephone: 01-630 7575

This is the Philips Prospect, which Philips describes as a 'budget price start for word processing.'

It isn't a microcomputer, and Philips didn't say what the 'budget price' was. Not encouraging. However, Philips does add that the word processing side has been enhanced, because the system is 'equipped to perform the complex number of information management procedures traditionally associated with the Philips P5000 Series'.

Explain what 'tradition' actually means to someone on 01-636 6561, where you will find the publicity agent who handles business.

both simplicity and versatility. Equally likely as a reason is that many companies (and homes) bought the Apple when it was new and now want the capability of a modern computer without having to shell out for it. The Robocom Bit Stik is one example of this phenomenon.

To add to the legion of gizmos and widgets which stick on the end of an Apple come the XAD1 industrial control card from Xcalibur Computers of Northampton and the Apple with a special power supply from MC Computers of Newbury.

The XAD1 will permit the Apple to be used for measuring analogue or digital signals by providing four channels of 12-bit integrating A/D conversion. It provides a battery packed clock/calendar, contact energisation voltages on board and screw down terminations. There's also the four channels of isolated reed relay contact outputs to add to this list of extras. This card is, of course, designed for the scientific or industrial user as a controller. The real time clock ensures that any measurements are carried out at regular intervals.

This card costs less than £100 (we are not told how much less) and is provided with full documentation providing operation examples. Details from Xcalibur on 0604 21051.

MC Computers' special power supply Apple is a standard machine with a PSU built in which offers the ability to power the Apple from either AC or DC supplies. If both are connected the DC unit is trickled charged from the power

supply. If the AC source fails then the PSU switches to the DC source without interrupting the system at all. Power outputs are short circuit protected.

This special PSU is also being offered as an option within MC's butch repackaged Apple II for industrial use. MC Computers can be reached on 0635 44967.

Adventurous games

Influenced, probably, by Kit Williams' Masquerade quest for the golden hare comes a new trend in computer gaming. This is the idea of an adventure game with an ultimate solution leading to a big prize for the first person to crack it. Probably the best known one will by now be Pimania from Automata Cartography. The prize here is the Golden Sundial of Pi — a sculpture in gold and diamonds valued at £6000. Players have to find out where in time and space the sundial is hidden by travelling through a series of gates of Pi and following clues which are very often difficult to find — concealed in music and mixed up with red herrings, for instance. Now Artic Computing has jumped on this new bandwagon with a game called Krakit which carries a prize of at least £10,000 for the first person to solve 12 clues. Pimania will be launched by the time you read this — mid October — and Krakit will be launched on 1 November. Both games will run on the Spectrum and Krakit works on the ZX81 as well. Details of prices and

availability will be advertised shortly.

Artic has also produced a speaking chess game for the Spectrum. This is based on the company's original Chess game, ZXChess which is well known for its strong play. Voice Chess tells you its move, repeats yours and makes sarcastic and ambiguous comments on the state of play. It costs £9.95 and runs on the 48k machine. Maggie Burton

4MHz Sharp

If you'd like your MZ-80K to save and load programs twice as fast, run large programs at a much greater speed and still offer the choice between 2 and 4MHz processing speeds then John Bosco or Steve Oates should have the answer. At £45 their 4MHz board will offer all the above without affecting the MZ-80K's clock or sound. It comes with a red/green LED and switch to indicate which of the two speeds the machine is running at.

Details from John Bosco or Steve Oates on Leeds 520938 or Wakefield 279348. Incidentally, a version is also under development for the MZ-80A. Maggie Burton

Pro Digital

Prospero Software recently announced its decision to

make the Pro Pascal compiler available on the DEC range of personal computers, including the Rainbow. An agreement to this effect has recently been signed which will run initially for five years giving DEC worldwide marketing rights for Pro Pascal on its own computers. Pro Pascal will be included in DEC's classified software directory. Maggie Burton

Festival fun

Here in the bustling capital the GLC has branched out the tentacles of its efforts to promote cultural activity with a computer festival. This is because London is becoming increasingly aware of the micro revolution following the success of such ventures as those organised to mark IT year, the ALCC's annual computer fair and the growing number of computer shops, advice centres, clubs and workshops. The festival will run from 3-17 April next year and is London's first.

The festival will promote and publicise the activities of all relevant organisations offering help 'within the community'. It aims to spread knowledge and awareness of how information technology is used in everyday life and help people get in touch with organisations offering courses, advice and the like.

It will also provide some special events. One of these will be an exhibition from 14-16 April at the Central Hall, Westminster which will include the London Computer Fair. The Festival is being organised by a consortium of the ALCC, the National Computing Centre, City Tech, the North London Poly Computer Centre, ILEA's Computer Centre, the GLC and several London Boroughs.

Anyone who would like to run an event as a part of the festival, be included in its diary of events and promotion or who just wants to know more should contact the Secretary to the Consortium, GLC Central Computer Service, Room 431, County Hall, London SE1 or telephone 01-633 3348. Maggie Burton

C/WP HAS ITS WAY WITH THE DAISIES

£399 + VAT

If you want good quality print, clean and crisp as a lettuce leaf, you need a daisy wheel printer. But you pay for that quality. Or at least you did, until C/WP, which shrunk Apple prices (yes, still £499 + VAT while stocks last), had its way with the daisies. Now, thanks to C/WP you can afford the smartest print in town.

OLIVETTI PRAXIS 30, baby of our range, not only prints superbly from your computer, but doubles as a portable electric typewriter with automatic erase ribbon and 10

character memory. It's slow (11 character a second or around 5 minutes for an A4 page), but what quality. And what a price – only £399 + VAT. Others advertise the same printer for £480 + VAT.

£499 + VAT

The TEC STARWRITER is an even bigger bargain at just £499 + VAT. It prints bidirectionally and impeccably at 25 characters a second (just over 2 minutes a page) and responds to all the commands Wordstar throws its way. A really professional, heavy duty, thoroughly reliable daisy wheel, which has never been sold at such a low price.

For those who are only satisfied with the best, C/WP offer the QUME SPRINT 5 – the industry standard, normally sold for £1800 or more – for only £1295 + VAT. SPRINT 5 eats up your printing at 45 characters a second (about 75 seconds a page) with unbeatable quality, no fuss and not too

£1295 + VAT

ghastly a noise. Or if you prefer a printer with a keyboard, to use as a typewriter when you want, you can have a QUME SPRINT 9/35 KSR (35 cps) for the same low price, £1045 + VAT.

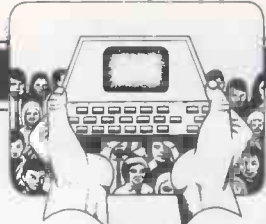

Take your pick of the daisies, and remember ours bloom the whole year long. Most dealers offer you only 90 days warranty on daisy wheel printers. C/WP thinks this unacceptable. All our equipment, including daisy wheel printers has a full year's guarantee covering parts and labour.

Maggie Burton chats about the PCW Show and all the latest news

Last month David just managed to slot in a brief mention of what CTUK! managed to do at the PCW Show. Well, thanks to John Bone, I've got quite a bit more to tell you this month. There were two ComputerTown stands this year (an increase of 100 percent on last year) and both were packed throughout the Show — one volunteer said it seemed as if every visitor to the Barbican had dropped by the stands.

Over 8000 leaflets were given out by those intrepid lads and lasses in a big effort to explain what CTUK! is and why it's still getting bigger. Two new 'Towns were promised by visitors to the stands and members of the public had some trouble working out what was actually being sold — a few did not believe that the use of the micros and all that advice was *really* free.

Many youngsters dragged their parents onto the stand to be 'talked around'. John tells me he was unable to beat the Scrabble micros (but so was I) and the signposting in the halls was found to be rather lacking — a few CTUKites did, however, perform the miracle of finding their way to the PCW lounge for a quick drink on the last day — a well-earned one judging by all the hard work that was done.

Some 15 micros were up and running on the stands and I've been asked to add to David's vote of thanks from last month by mentioning Dragon Data and the Newcastle and Notting Dale ITECs for their hardware loans. Several software houses supplied demonstration programs. Thanks also to CTs Romford, Ashford, Croydon, Dorchester and CTNE! (Gateshead), whose members gave up their spare time to man the stands. The ACC is also owed our gratitude as Vernon Quaintance and David Annal were more than helpful in getting the stands booked.

Lastly, but not leastly, for those living in the Thames TV area, the stands were filmed for a short computer series starting in November — watch out for it!

Now onto rather less festive news. Kent County Library has agreed to make space available in all its libraries where possible for CTUK!. Incidentally, you only really need about 12 square feet of floor space to run a small 'Town, so many of them will not be putting too great a demand on Kent's library space.

While still on the subject of libraries, Burton-on-Trent library has, it seems, decided not to allow CT Burton to use the library for nothing. This seems a shame as so much goodwill goes into running a 'Town and it would be nice to think this particular library committee could follow Kent's generous example. The reason for this is, apparently, that granting free use of library facilities would 'set a precedent among other clubs and societies'. What seems to have gone unheeded is that ComputerTown does not request any fees from those who attend, nor does it have any members as such — apart from those who run the 'Towns, whereas the trend among 'other clubs and societies' is to

charge subscriptions or attendance fees.

Chris Woodford of CT Burton is, in spite of the hassle, running a thriving 'Town. He's just started to produce a newsletter in his spare time and other ComputerTown organisers might like to consider this idea. However, there are one or two problems with this. There may be times when one person cannot produce a newsletter alone, for various reasons, and if only one 'Town is producing it money can become a bit of a problem. A syndicate of two, three or four 'Towns could produce a nicely put together newsletter for very little outlay and if it's readable to the absolute beginner it will draw a good response. Copies could be left at libraries or leisure centres or just given out to passers-by in the street. Burton's newsletter is packed with news on micro developments and ComputerTown activities and short articles related to micros — indeed, when you look at the amount crammed into a mere two pages, you wonder if they couldn't perhaps teach PCW a lesson or two on production economy! The letter also includes a quick glossary of all the jargon used within it which, although it's very brief, does introduce the reader to what it's all about.

The letter is, of course, not only applicable to Burton. It's relevant to CTUK! as a whole and contributions are invited for it. If you've got any news on what your 'Town is up to, then you can contact Chris at 31 Hopley Road, Anslow, Burton-on-Trent, Staffs DE13 9PY. If anyone has thought of the idea of producing a national CTUK! newsletter, Chris has thought of it already. He hasn't got the time to do it every month, and if he's to get it going he needs help from one or two others. David and myself would be happy to help in any way we can with production and layout.

Peter Kiff of CT Broadstairs held a special 'education day' on Saturday 10 October in Broadstairs Library for teachers and parents to come along and see how computers can be used in the classroom. This was very popular and fulfilled its purpose of attracting new people to the 'Town. CT Broadstairs is hoping the day will lead to bigger atten-

dance at future ComputerTown meetings. Displays included one of books, and there was a TV screen in the foyer to welcome visitors and tell them where to go. ZX81s, RML 380Zs, a BBC and a PET ran education-oriented software all day.

There have been several successful ComputerDays over the past two years and we'd like to hear about them all in future — in advance and afterwards. Next month we'll have a few ideas on ComputerDays to put forward. Watch this space!

The Prestel index of ComputerTowns has now been moved to another page. The number quoted in the October issue was a temporary page and the new location is page *800803#. Vernon Quaintance of the ACC is the man to contact if you find your 'Town is missing from the index. And a complete list of ComputerTowns will soon be on Rewtel — dial up and take a look if you've a modem or an acoustic coupler. The number is 0277 230959 from 6pm to 9am weekdays and all weekend.

To finish off, I'd like to send our warmest congratulations to Frank Fadipe — the ComputerWeek stalwart — on the birth of his son. We hope he'll grow up happy and healthy and have a bright future.

Computer Town UK! is an ever-growing network of computer literacy centres where members of the public are given free access to micro-computers, courtesy of those willing to volunteer their time and equipment. Computer Towns might be found anywhere — in a church hall, a library or perhaps a school after hours. The aim is to make computers enjoyable and non-threatening and, because Computer Town is entirely non-commercial, any kind of axe-available for those interested in setting up their own 'Towns: Write to CTUK!, 7 Collins Drive, Eastcoke, Middlesex HA4 9EL or 17 St George's Road, London NW11 0LU. Remember to enclose an A4 SAE for your reply. Please don't telephone PCW for information as CTUK! is entirely a spare-time activity.

'The game's up, Clegg! Your user group grassed on you.'

GOODBYE TO FLOPPIES C/WP INTRODUCES A HARD DISC FOR £995.

C/WP have done it again. We proudly announce the C/WP CONTOUR, a range of British-made high technology 5-inch Winchester discs at prices starting below £1000.

Suddenly your micro-computer has come of age. One little box, not much larger than a floppy disc drive, stores up to 21 million characters. That size costs £1995 and stores the equivalent of more than 160 floppy discs, or 35 full-length books. And in a maximum of around a fifth of a second the C/WP CONTOUR finds any piece of information your computer asks for.

C/WP CONTOUR is available now for your APPLE II, Pet, IBM Personal, Sirius, Superbrain and many other CP/M and S100 machines. On APPLE the C/WP CONTOUR supports DOS 3.3, Pascal and CP/M operating systems.

Write or telephone for full details of this great price breakthrough. Now you can afford the luxury of a Winchester.

A NEW BRITISH PRINTER TO BEAT THE WORLD!

THE NEW

WALTERS 120

UNBEATABLE VALUE!

- 80/132 column dot matrix printer
- 120 characters per second
- 9 wire ballistic, bi-directional logic seeking print head
- Plug-in interfaces:
Centronics Serial V24/RS 232C
20 mA current loop I.E.E.E. 488
- High Resolution and Block Graphics
- and more!

The Walters 120 sets new standards in quality and value for money in the dot matrix printer market.

Just check the specification and you'll find there's never been a better time to buy British!!

And the price -
an amazing

£395.00

(with centronics interface).

(Serial / 20mA current loop £25.00 extra, I.E.E.E. 488 £33.00 extra) All prices quoted exclude VAT

BANKS' STATEMENT

Martin Banks provides more punditry on chips and things

CHIPPERY AND RIVALRY

It is some time since I last wrote in any seriousness about chipperiness and things in this august magazine (*Late again, Banks: this is the December issue — Ed*), though it is a subject that is quite dear to my heart. So this month, given that something of interest has occurred in the semiconductor business, I am going to have a go.

In fact, I have in mind two distinct and separate subjects for this month and their only connection is the semiconductor industry, so I'm going to try to stick them together, with only a half-hearted attempt at finding a more cogent link between them.

The first is to do with marketing, and the application of the marketing ploys learned in the semiconductor industry to the personal computer business. The second is to do with the application of the technology of memories, in the form of firmware. No, this is not something that might prove of interest to Mary Whitehouse, but it is to do with the storage of software in hardware form, which to the gizmo-freak means ROMs, PROMs, and EPROMs.

The economies of semiconductor manufacture are those of many high technology, high capital cost products — it costs as much to produce one chip as it does a million of them. As there is more chance of selling a million — because a lower unit cost can be charged — than there is of selling one very expensive chip (the high price being to cover the high capital costs) then the semiconductor industry duly makes millions of them.

The drawback of this is that the chips themselves have to be of a type that users want to buy by the million, so, except in occasional circumstances, there is little profit in the semiconductor companies producing anything too far out of the ordinary.

Indeed, it is a general rule that uniqueness in chip design or manufacture is akin to the kiss of death. No self-respecting systems manufacturer is going to commit a new design to the production line when that product employs a type of chip that comes from just one manufacturer. Should that supplier go delinquent, which is a delightful American way of saying screw up on the supply of chips, then the whole production run, and the investment involved, can go down the Swanee.

So chip customers seek second sources, an alternate source of supply for the same part. The semiconductor companies now go to great lengths to ensure that such second sources are available to the customer, usually by licensing their 'rivals'.

Such 'second sourcing' has now come to the personal computer business, and it has come to Europe, not America. The particular deal in question specifically precludes our

American friends from taking advantage, as will be revealed.

At the beginning of this year, the observant among you would have noticed the arrival of the Sirius 1 system from the drawing board of one Chuck Peddle, father of both the PET and the 6502 microprocessor. The Sirius company was funded in its efforts to develop the machine by a deal in the USA with Victor Business Machines. By way of recompense, Victor took the rights to the US market for the machine, which is manufactured for them by Sirius. Both companies are allowed to sell into the other markets around the world.

Victor declined to call their version of the machine the Sirius. Instead, they called it the Victor 9000. Well, you might ask, what's in a name? — and for European customer that would indeed be true, because the customers are getting real and legal second sourcing.

Yes, the recent introduction into this country of the Victor 9000 means that the customer has the opportunity of making a choice in the purchase of a system. And, if it happens to be the Sirius/Victor system being considered, to go out and shop from alternative sources.

From the user's point of view this can only be a good thing, for it will give greater scope to these all-important subsidiaries — things like service, support, and specialist knowledge, as well as price and delivery — that all dealers should find it important to offer. If a dealer in one type of system seems poor, the chances are there will be a dealer in the other system not too far away.

This could, of course cause a problem for the dealers themselves, and even for the two importing companies: ACT for the Sirius, and DRG for the Victor. The latter is hoping to have 100 dealers

THE 2MB apple FROM

EICON
Research

Now you can boost your apple's on-line capacity up to 2 Mb with the Eicon FD8 8" floppy disk sub-system from ADC.

The FD8 is cost cutting alternative for those companies contemplating the switch to hard disks. Not only is it considerably lower in cost but also it allows almost instant access to 50Mb or more of data and enables disks to be written under DOS 3.3, UCSD Pascal and CP/M.

Its extremely reliable too. By employing digital data separation techniques Eicon have been able to provide double density operation with single density reliability. Thermal drift and periodic adjustments are a thing of the past.

For the complete story on this breakthrough in floppy disk technology contact ADC today, the main U.K. distributor for the Eicon FD8 system.

BANKS' STATEMENT

around the country and, according to them, some 60 percent of the dealers that have made an approach are existing Sirius dealers.

DRG has said that it has a working understanding with ACT, especially on such items as pricing, and is not against appointing dealers that already handle the ACT import. It will be interesting to see whether this understanding stands the test of business practice.

Having two sources for the same machine (the only differences are a slightly different keyboard and a resprayed box), especially when that machine looks like being extremely popular, can only be good for the customer.

And what is good for the customer forms the extremely tenuous link to the second theme for the month, which is all to do with firmware. Now this is the trick of loading commonly used software into a hardware form such as ROM or PROM. It is an idea that has both advantages and disadvantages, though its long-term potential as an aide to systems design, systems configuration, and user choice is considerable.

The reason I mention it this month is because of an announcement by Intel, the company that brought you the 8080 and the 8086 processors. As its 8088/8086 family looks like being the biggie in the 16-bit systems stakes, it being at the heart of the Sirius/Victor and the IBM PC among other machines, it is sensible for the company to look for

other related areas where it can turn an honest dollar.

Now, as already mentioned, the real application of the firmware idea is with commonly used software. This is because of the nature of semiconductor manufacturing, where volume production is king. Only with software that is fully debugged and in great demand does firmware really make sense.

In the 16-bit marketplace, such a target for firmware is an operating system, and it is one of these that Intel has selected. The one it has gone for is CP/M-86 from Digital Research, for which Intel has just taken out a licence.

It is now in the throes of finalising a new chip that will incorporate the operating system in silicon. To be called the 80150, the chip is intended for use with the 8086, 8088 and the latest Intel processor offering, the 80186.

The chip will contain Version 1.1 of CP/M-86, held in 16 kbytes of ROM, which will be accompanied on the chip by some important hardware functions needed by the operating system, such as timers and an interrupt controller.

The obvious market for such a chip is in the vast army of stand-alone systems currently being produced by the likes of Sirius/Victor and IBM. It makes a great deal of sense from everyone's point of view, for by having not only the operating system, but also some of the attendant chippery required for it, resident on a single chip, systems manufacturing costs will be brought down. It will also make the design of any new systems based on the Intel family that much easier, and therefore cheaper(?).

Not surprisingly, it will lock systems manufacturers even more tightly into the grip of Intel (and almost certainly its official second source suppliers), which will no doubt please the company.

For the user, this should mean not only cheaper systems. It should also give (in theory at least) more reliable systems, as the chip should be relatively bug-free, and certainly free from being corrupted as it might be in disk form. It also makes a system more user-friendly as the O/S becomes an integral part of the hardware, with the booting-up procedure totally transparent to the user.

It is also one more step along the road to the appearance of more general software in a firmware form. This could well include some complete applications packages that are popular and 'standardised', such as the 'Calc' programs and the word processing packages. Games packages will be (damn it, are) another target market for firmware. Other applications areas, for example accounting, may well be too complex and variable for such overall treatment, though it is likely that 'tailored' programs may be constructed out of ranges of utility packages and sub-routines that can be linked together.

System configuration could then become easy. The user could actually do it himself. . . perhaps. A system would be a processor, memory, and spare sockets into which the user popped whatever ROMs held the software needed. The ROM'ed O/S would do the rest.

BRIT PRINTER TAKES ON THE JAPS

Peter Rodwell tests a new British low-cost dot matrix printer aimed at a market currently dominated by the Japanese

When the micro scene first began to take off, one company dominated the small, low-cost dot matrix printer market — Centronics. In the last two years, this enviable position has been usurped by the Japanese; specifically Epson, whose printers are found not only with Epson labels on them but in a wide range of colours and cases with other people's tags stuck on.

Now a British company called Walters Microsystems has tackled Epson head on with its Walters 120 printer, with a price slap bang in the Epson range and a specification which, in some respects, is rather better than the best-selling Epson MX-80.

The most striking first impression of the Walters 120 is that it's built like the proverbial 'force-field latrine'. It weighs a hefty 12 kilos and is very solidly constructed — apparently one still functioned perfectly after being dropped down two flights of stairs, although I admit I didn't test this for myself! The machine is also rather larger than the MX-80, at 44 cm wide, 18 cm high and 33.5 cm deep.

The second impression one gets of the Walters is that, despite considerable amounts of soundproofing foam inside the case, it is rather noisier than the Epson, although future models will have even more thorough soundproofing, I'm told.

The Walters 120 has a 9-wire print head which sprints along at a claimed 120 characters per second. The standard typeface is a readable 10 characters per inch/80 chars per line but, by sending control codes to the printer, you can change to double width (40 chars per line) or condensed (132 chars per line).

There is, in fact, quite a range of control codes to do all the usual things like setting tabs and form lengths but Walters has included several less usual but extremely useful ones, including decimal tabbing to align numbers to either the decimal point or — for European uses — to a comma.

By far the most interesting facility, though, is the capability for the user to define up to 10 characters of his own by sending a stream of dot patterns. These are printed by sending another control code plus a letter in the range 'A' to 'J' (or 61H to 6AH) to select the particular character desired. I found this quite an easy operation to perform — both designing and printing, that is — and it's certainly a very useful feature, particularly if you have an application, such as in engineering, maths or science, which requires the use of special symbols. What could be pain, though, is trying to use these symbols from a word processing package.

The Walters 120 also has 64 predefined graphics symbols, activated by another control code, which would enable you to print forms and simple graphics designs. While the text characters are printed on a 9x9 matrix, graphic symbols use an 11x9 matrix, so the result looks quite good.

Setting up the Walters is very easy. The top lid lifts off completely and paper slides in through a slit at the bottom of the rear, keeping it clear of the power and data cables. You then simply push the paper in until it pops up in front of the print head and then pull it through to clip into the two tractor wheels. The lid can then be replaced.

Print head and Facit ribbon cartridge

The printer has four controls — power on/off at the back and three pushbuttons on the front in a small panel, with four LED indicators. These pushbuttons allow you to reset the machine from an error (such as paper out), take the printer off line altogether, and perform line and form feeds. A self-test function is built in but is activated by an internal switch — fiddly but fair enough as you don't need to use it often. One particularly useful feature is the ability to set the top of form position using these front-panel switches — you line feed the paper until it's at the top of a page then press the reset switch. On an Epson, you set the top of form by switching off and on again — top of form is wherever the paper is when you switch on.

The Walters 120 comes with Centronics parallel interface as standard and optional RS232 and IEEE-488 interfaces. You get a properly typeset 30-page manual which clearly explains everything you might ever need to know and even gives you a few blank pages at the back for your own notes. It takes standard Facit ribbon cartridges (life 1.5 million characters) which are easily available from most computer and office equipment suppliers.

On the whole, I felt the Walters 120 was very good value for money. It's solidly built and should withstand very heavy use (the printhead is rated at 400 million characters), although it lacks some of the Epson's features (particularly bold and double-strike printing). In particular, the user-defined characters feature should make it very useful for anyone with specialised applications demanding non-standard characters.

The robust Walters

"If you can buy a business computer package of the same quality at a lower price, I'll buy it for you!"

**Noel C. May, Managing Director
Transtec Computers.**

The Transtec Total Accounting Package costs just £2400 (ex. VAT) and includes . . .

The BC2 Computer

- ★ 800K usable disk storage
- ★ 64K of memory
- ★ 80X25 hi-res. green screen
- ★ CPM 2.2 operating system as standard
- ★ Detachable keyboard with 17 function keys and numeric pad
- ★ In-built facility to expand capacity at any time.

The Printer

An Olivetti DM 5050C heavy duty 80 cols. 100 CPS dot matrix printer with capacity to handle single sheet or continuous sprocket fed paper.

The Software

Complete "Business Desk" set of programs by Paxton incorporating Invoicing, Stock, Sales, Purchase and Nominal Ledgers - a fully integrated accounting software package.

Other financial modelling, word processing and data base packages available

at low all-in costs.

PERSONAL COMPUTER

EPSON HX20

THE ALL-IN-ONE PORTABLE

Dick Pountain Benchtests a remarkable new portable computer from one of Japan's most famous manufacturers

I said my piece on the future of hand-held computers in last month's review of the Hewlett-Packard HP75C and so will not take up space repeating it here. Suffice it to say that the subject of this review is the second general purpose fully portable microcomputer to reach the UK market; by general purpose I mean that it has the speed, memory and other facilities to take on tasks hitherto

reserved for mains-powered machines and is not limited to mathematically oriented problems.

The HX-20 is also the first computer to be seen here from Epson, the Japanese firm which has achieved a remarkable dominance of the micro printer market in the space of three years. Epson, which is owned by the giant Seiko watch firm, has sold

computers in Japan for some time but this is the first to be exported, and it will be followed soon by a series of desk-top CP/M machines.

Hardware

As delivered, the HX-20 is a self-contained battery-operated computer with 16k of non-volatile memory, a 32k

Side and rear views show various peripheral sockets and controls

Photography by John Mason

Basic in ROM and built in four-line display and printer.

The outward presentation of the HX-20 is very neat and very Japanese. The case is moulded in that metallised silver plastic which has become a trademark of Japanese consumer electrical goods; the moulding is robust and intricate with many embossed legends and removable panels. All the screws which hold the assembly together go into moulded-in brass collets rather than naked plastic.

The case is exactly A4 sized (the size of this page) and the depth tapers from an inch and a half at the front to two inches at the rear. As you will quickly grasp, this is not a pocket-sized machine nor, at 1.6kg, is it even 'hand-held' in the traditional sense; you would need to support it in a crooked arm. Epson is deliberately calling it 'portable' not 'hand-held', but I suspect that 'lap-held' is the way most people will use it in the absence of a table; it will, however, slip into an ordinary briefcase without trouble.

The display is a 20-character by 4-line LCD unit (Epson leads the world

in production of liquid crystal displays) which has no calculator type annunciators; it is treated exactly like a VDU screen of 120x32 dots. This screen is in fact only a 'window' onto a virtual screen whose size is user definable up to 255 characters by 255 lines and so can be scrolled in all four directions. A most unusual feature of the display is that the angle of view may be changed by adjusting a control on the side of the case; you sit in the position in which you want to use the machine and turn the knob until maximum contrast is achieved. Most previous LCDs can only really be viewed from square-on.

The keyboard is of standard ASCII layout and is not just good for a portable computer but good, full-stop. The keys are of low cushion shaped profile with recessed tops and have full-sized typewriter pitch, travel and a satisfying feel and feedback. The keyboard is fully debounced and appears to have a type-ahead buffer, which is useful as liquid crystal displays have a noticeable lag compared to a VDU. All the main keys have auto-repeat. TAB, CTRL and CAPS LOCK

keys are provided, though the latter regrettably has no indicator to show that it's engaged. There is no numeric keypad but a shift key called NUM will turn a block of the main board into one for data entry. Another shift key called GRPH produces block graphics and symbols. Editing keys include CLR/HOME, INS/DEL and four-way cursor movement, but irritatingly the latter is done by two keys, cursor up and down being shifted. Along the top of the main keyboard are five programmable function keys, the PAUSE and BREAK keys and a key called MENU of which more below. In short this is a keyboard, for the first time on a portable, upon which I'd be happy to type all day. My only real criticism is that the keys are mounted directly onto a PCB which bends slightly under pressure (like the early Acorn Atoms); it would feel more robust if more ribs were cast into the case bottom to support it.

To the left of the display sits the built-in miniature dot-matrix printer. This unit uses rolls of plain paper and ribbon cartridges which are perfect

EPSON HX20

Lilliputian copies of the MX-80 ones; the review machine had purple ink in it. The 2¼in paper accommodates 24 characters on a line and it can print the whole HX-20 set including the block graphics characters, as well as performing dot graphics. Operation is either under program control using LPRINT or manual, screen dumps being possible using CTRL and one of the function keys. The printer has its own on/off switch so that

programs which have printer output can be debugged without wasting paper; it also has a manual linefeed button.

Printing speed is not fast at around 40 lines/minute but is comparable to other units of this size, while the print quality is much better than electrostatic 'silver paper' printers. Paper rolls are spindle-less and merely drop into a cavity under a hinged trapdoor, while changing cartridges is a cinch. The plain paper rolls are a standard size and so many office calculator rolls should work. They think of everything.

A third type of output is revealed by

a grille just below the display. This conceals a piezoelectric beeper which is programmable for pitch and duration.

Around the sides of the case are various sockets for connecting peripherals. The back panel holds two RS232C ports which have different DIN-plug connectors. One is for communication with terminals, printers, other computers and modems at up to 4800 baud and has an 8-pin DIN socket. The other is for communicating with a TV or monitor via an adaptor, or to disk drives; it has a 5-pin DIN socket and a maximum transfer rate of 38,400 baud. At the left side is a parallel connector for the expansion RAM box, while at the right are mini-jack sockets for an external cassette recorder with remote control, and a bar-code reader. Finally, a socket next to the RS232 port allows an AC/DC power supply to be plugged in to recharge the NiCad batteries. These have a capacity of around 50 hours (they didn't need charging during this test) and take eight hours to charge; the computer can be used on the mains unit while they are charging but Epson warns not to use it this way once they are recharged as overcharging can shorten their life. I was rather surprised that the HX-20 doesn't auto-power down after a set interval as do most other battery-operated machines; best remember to switch it off.

The on/off switch is at the right hand side, as is the reset button; the latter is required only when a run-away program does not respond to the BREAK key or the on/off switch, which is only likely with machine-code programs. It does not perform a true cold start (which is done through software) and preserves all memory contents.

On a standard HX-20 the area to the right of the display is blank. It contains a dummy module which can be removed (using a very ingenious lever at the back) and replaced by either the optional microcassette drive or by ROM modules containing software. None of the latter were available for the test but the cassette drive was. This is a digital, not audio, device and uses standard microcassettes. It reads and writes at a fast 1300 baud and gets around 50k onto a 30 min tape. Although it has a tape speed of 2.4cm/s, which is the same as most pocket dictaphone recorders, Epson does not recommend swapping tapes between recorders. A really nice feature is the software tape counter which allows fast winding to the exact location of a program before loading; the tape position at any time can be read by a program. Using this feature cuts the time wasted searching tapes enormously and approaches the convenience of disk. The tape drive can be operated manually as well as under program control by pressing CTRL and the first function key. This turns all the function keys into tape deck controls, including one for zeroing the tape counter (which is displayed on the screen in this mode).

The ROM packs are unusual in that that they are accessed by a high-speed serial link and are treated, like other serial mass-storage, as a sequence of files rather than as part of the memory-map. They will be available in sizes from 8 to 32k.

Getting inside the case is quite easy and reveals some surprises. It is no sur-

Not sure what the warranty department would think of this treatment!

prise that the manufacturing techniques are 'state-of-the-art'. The design is highly modular (the printer comes away as a sub-unit by undoing two screws) and uses two circuit boards, one for the logic and one for the keyboard switches. These are interleaved with sheets of a curious flexible metallised card which doubles as insulation and RF shielding. All intercard connections are by FCPs (flexible printed connectors) which are held by ingenious sliding grippers rather than those precarious sockets used on the Spectrum; they can be refitted over and again without damage. An interesting little anecdote; after I took the HX-HX-20 to pieces for that 'squashed hedgehog' photograph, I reassembled it and the RAM contents were still intact! The 16k of on-board CMOS memory is in eight 16k chips while the ROM is in four 64kbit chips which are socketed; there is a spare socket for 8k of ROM expansion.

The architecture of the HX-20 is unorthodox, to say the least. It has two CPUs, which are related as master and slave. They are both 6301 CMOS devices of Epson's own manufacture and have 4k of mask ROM and 128 bytes of RAM on the chip; they are reputed to be code-compatible with the Motorola 6800. The master CPU controls memory, keyboard, display, clock and bar-code reader using the external ROM while the slave CPU controls the printer, cassette recorders, RS232 and high-speed serial ports and low-battery power-off function using its on-chip ROM. Most unusually, the two CPUs talk to each other by the 38,400 baud serial link rather than parallel. One consequence of this is that the memory map is, to say the least, complicated.

There are plenty of other oddities which space prevents me from describing; one I must mention is that both processors go into a 'sleep' state to save power when not being used and must be woken up when required. A glance at the Benchmark timings will show that they are by no means fast (50 percent slower than the HP75C) but are no disgrace.

The overall impression given by the HX-20 hardware is that here is a level of professionalism in design and manufacture which would give me nightmares were I an occidental computer manufacturer.

Firmware

The HX-20 operating system sits in ROM along with the Basic. Since all file handling for the cassette drives is done through Basic the operating system has very little to do with the user; it is responsible for the Menu selection function, managing the partitioned memory, cold and warm starting Basic (which includes setting the system clock) and responding to requests for manual control of the printer and cassette drive. Entry of machine code programs is done through a separate monitor which runs under the Menu function.

When you switch on the HX-20 the first response is always to present the menu on the display. The very first time you do it, it reads:
CTRL @ Initialize
1 MONITOR
2 BASIC

What this means is that to perform a cold start (which clears all memory contents and allows setting of the system clock) you must press CTRL @. Cold start also sets default values for user RAM size, amount of RAM file space and assigns 10 Basic keywords to the function keys. If you do this you will be prompted for the time and date; once you've entered these you will be returned to the above menu. You now have a choice of pressing the 2 key to enter Basic or 1 to enter the monitor.

Later on, when you have written some programs, up to five of these may be added to the menu so that they can be run immediately upon switching on the machine. The user RAM is divided into five partitions, called P1-P5, and each one may contain a separate program (or none). The partitioning is totally transparent to the user and you will only know it's happening if the total size of all your programs exceeds the total user RAM.

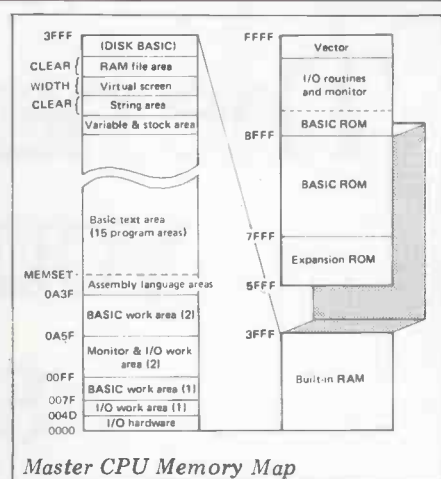

Unlike the Sharp and HP machines, there is no calculation mode; to perform calculations you must enter Basic and use PRINT 2+2, etc. Time and date can be displayed by pressing SHIFT and function key 1 from Basic but there is as far as I can discover no alarm function nor any of the sophisticated calendar functions of the HP75C; you can of course write your own alarm routine using the beeper.

Basic can be warm-started at any time (you must BREAK out of any running program) by pressing the Menu key; this returns the menu to the screen, and resets the default values for various system parameters such as the size of the screen but doesn't wipe out your programs. When you re-enter Basic, though, it is always into partition P1 no matter what you were in before warm start. In case you're wondering, no, you don't have to warm start to change program areas; that can be done from within Basic or even from within a program by the LOGIN x command which puts you into Px.

The monitor is quite a powerful program which has the ability to set breakpoints and change the contents of processor registers as well as the usual functions of dumping and changing blocks of memory and loading and saving binary files to tape. Coupled with the Basic MEMSET command which allows you to reserve space below Basic for machine code programs (the manual continually refers to them as 'Assembly Language' programs) this would be a very useful facility if only the instruction set were to be found anywhere in the documentation, which it isn't. If it is true that the processors are 6800-compatible this may not be a problem; I didn't have the time or the 6800 experience to find out.

One very neat feature of the monitor I should mention is the K command which lets you set up a 'boot' program which is automatically executed when power is switched on; if you wish it could be Basic itself so that you bypass the menu.

The amount of memory available to the user on the HX-20 is a whole story in itself. It depends not only on the setting of MEMSET but on space allocated for RAM files (see later) for strings, and on the size of the screen which you've defined. Of the 16k stan-

Master CPU Memory Map

dard memory, the bottom 2624 bytes are used by the system (so this is the minimum value for MEMSET) and the most which can be allocated to Basic programs is 13,398 bytes with a 20x4 screen and no string or RAM file space. On warm start the default memory size is 12,891 bytes; adding the expansion memory pack would give 29,275 free bytes so the HX's advantage over the HP785C is not quite so great as it first appears in this respect.

Although the business of controlling screen sizes and graphics modes is done from Basic I propose to deal with it here since the default values are set by the operating system.

There are two different screens available on the HX-20; a text screen and a dot-addressable graphics screen. There are two devices on which these screens can be displayed, namely the built-in LCD and an external TV or monitor. The text screen can be a 'virtual screen' bigger than the device, so that the physical device is a moveable window onto it. On the LCD both screens can be displayed superimposed on one another; on the TV you can show only one or the other but the graphics can be in colour. When you have picked the bones out of that lot you will realise that there is much to learn about the HX-20 screen, and I don't propose to teach you all of it here.

The size of the text screen is set by the WIDTH statement; for the LCD it can be up to 255x255 depending on available memory. For the external TV the limit is 40x37, of which the actual screen shows 32x6 lines. Since the TV adaptor was not available for test I'll concentrate on the LCD. When the cursor reaches the edge of the actual screen it 'drags' the window with it to the edge of the virtual screen. Alternatively you can move the window itself using control characters, in which case the cursor stays where it is. The cursor or the window can be sent to any point on the virtual screen using LOCATE or LOCATES x,y. It is possible to define margins round the actual screen so that that cursor starts to 'drag' the window before it reaches the edge; this makes life much easier as you can see if you're going to overwrite anything so the system defaults to a margin of four characters unless you tamper with it. In practice you soon get used to moving this window in two dimensions over a bigger screen and it becomes second nature. In Basic an excellent full screen editor is provided (with insertion and

The next best thing to your computer speaking Oxford English.

That's you being able to talk to it, easily and fluently, in its own computer language.

And now you can. Fast. Without any hassles.

Because now there's a new range of audio teaching packages that you can use in your own office. At your own speed.

Ideal for inexperienced users or non-programmers, each self-contained, self-teach package is written by ICL training experts.

The packages not only beat any other method for sheer convenience, but are surprisingly inexpensive. And they can be used to master operating and programming skills not just on ICL machines, but on a wide range of hardware.

CP/M 2.2 Introductory Training Package

Contents: Course Guide and 4 Audio Cassettes.

At the end of the course, which is made up of a number of sessions, you will confidently be able to load CP/M 2.2, create text files, look at files on the system, use filenames, Resident and Transient commands and handle most other CP/M facilities.

Microsoft Basic Training Package

Contents: Course Training Manual & Workbook, 2 Audio Cassettes, Floppy Disc (for ICL Personal Computer).

Provides 10 sessions backed by visual

material and exercises, covering Simple Programming, Arithmetic, Decisions & Flowcharts, Loops & Subroutines, Arrays, Data Handling, Graphics, etc.,

CIS COBOL Training Package

Contents: Course Manual, Coding Sheets, Layout Charts, 8 Audio Cassettes, Floppy Disc.

The 16 sessions of the course cover COBOL character set and data names, moving data, structured programming, code layout, initialisation, arithmetic verbs and COPY, and Forms II.

PASCAL Training Package

Contents: Comprehensively Indexed Course Manual and 6 Audio Cassettes.

This package is based on the Jensen and Wirth Report includes sessions covering Declarations and Statements, Typing, Subranges, IF, ELSE, Enumerated Types, Loops & Arrays, Literal Strings, Simplified I/O, Functions and files.

To find out more about ICL's audio training packages telephone Paul Hobbins on Windsor (07535) 51483 or order your package direct from ICL's Packaged Training

Distribution Centre at

EPSON HX20

deletion) so if you define a big enough virtual screen you can scroll upward through a listing or re-use commands previously entered. In doing this it pays to be careful that nothing else is lurking on the same line but off the screen!

The graphics screen is 120x32 dots for the LCD and 128x96 mono or 128x64 in four colours for the TV. If you use colour, however, a bizarre addressing mode prevails where there are 64 physical dots vertically but 96 addresses, so that either 0,0 or 0,1 will light the dot at 0,0 but only 0,2 will light 0,2 and so on alternately. Personally I never cared much for colour anyway, sniff. . .

Software

Epson's Basic (originally called MFBasic but now EBasic) is a pretty substantial implementation of the language. It is much more orthodox and Microsoft-like than HP's 75C Basic but lacks the latter's modular programming facilities.

To write a program, select Basic from the menu and then either write it in P1 which comes up automatically or LOGIN to one of the other areas. AUTO line numbering, DELETE and RENUMBER are all provided. To copy a program to another area use PCOPY x. If you wish your program to be added to the menu then TITLE it and it will automatically become the next item; the menu number is not necessarily the same as the P number but making a menu selection puts you into the right partition anyway. A program with a title cannot be NEWed or over-written until you give it a null title with TITLE "", which affords very valuable protection. STAT gives the title and size of a program and STAT ALL gives this for the whole lot and throws in the value of MEMSET and the RAMFILE space; a nice touch for homesick CP/M users. The function keys are easily set up by 'KEY number, "string"' and the assignments can be inspected with KEY LIST or KEY LLIST for hard copy.

Error messages are rather more terse than I would like, but at least they have some mnemonic value and are not mere numbers; eg, SN ERROR (syntax), PP ERROR (protected program). There are over 60 of them including the intriguing 'Unprintable error'!

The HX can handle decimal, hex and, surprisingly, octal integers plus single and double precision (16 digit) reals. Variable names are up to 255 chars with a whacking 16 significant which should be enough even for the purist. Full type conversion functions are provided, type being indicated by the suffixes %, !, # and \$. Arrays may have more than two dimensions.

The Boolean operators are remarkable for the inclusion of IMP(implication) and EQV(equivalence) in addition to the normal AND, OR, NOT and XOR.

Most of the rest is standard Microsoft, a single line DEF FN and IF... THEN... ELSE and the normal string functions including INSTR. INPUT is supplemented by LINE INPUT, which takes 255 characters without delimiters, and the unusual

INPUT\$ which reads a specified number of characters from the keyboard or a file and waits until they're all delivered. A powerful PRINT USING is supported to format numeric output. Error trapping by ON ERROR GOTO/GOSUB is included, too.

File handling is fairly orthodox, with a couple of nice flourishes such as LOF, a function which returns the byte length of an open file. The latest thinking on device independence has been implemented; files have a 'descriptor' in the format 'devicename:filename' (filename optional) and can be directed to another device by changing the name. Recognised devices are keyboard, screen, tapes, ROM packs, RS232 ports, and internal printer; floppy drives are not recognised as a new Disk Basic will be required to run them.

Program files may be saved in two forms — compressed binary or ASCII. All the files so far mentioned are sequential. Random files are supported in the form of RAM files. These sit in memory and can be written and read randomly by a program from any of the partitions as they occupy their own protected area. This area is set aside by issuing a CLEAR statement; as well as clearing numeric variables this can take parameters which set the amount of string and RAM file storage. Once allocated, individual files can be defined in this area using DEFFIL, which sets the record length and the offset in bytes from the beginning of the RAM file area of the first record. Data of any type may be mixed in one record. As RAM files do not have names it's up to you to keep track of what starts where; there are no absolute addresses to remember, only offsets. They are very handy for permanently storing look-up tables of much used constants or conversion factors as a means of passing parameters between programs.

Finally, while on the subject of storage, the cassette control statements are exceptional. TAPCNT is a system variable which keeps the tape counter reading. WIND xxx fast winds the tape to any given place xxx and MOTOR switches on or off an external cassette recorder. FILES will give a directory of the names and types of files on a tape, or any other storage device including a ROM pack.

The graphics commands are confined to PSET to plot a point, PRESET to unplot it and LINE to draw lines, plus a function POINT which tells if a given point is lit.

All considered, this is a very powerful Basic, biased if anything towards

business use. It will be immediately familiar to programmers used to MBASIC, which is no bad thing.

No applications software was supplied with the machine, which was one of the first final production models with export ROMs in this country.

Documentation

I was supplied with a Xeroxed copy of what looks like a fairly finalised user's manual and the technical manual. Both are excellent, somewhat to my disappointment as I have relied for several years on Japanese manuals to inject a little humour into otherwise turgid Benchtests. These really are different. For a start they're in English with only the very occasional hint they've been translated.

The user's manual starts with a straightforward and comprehensible account of the machine's features and how to get it running. This leads on to the main section on EBasic which is laid out in the same format as Microsoft's MBasic manual and is clear and comprehensive. There follows a good chapter on machine code programming (apart from the aforementioned absence of instruction set) and file handling. It ends with numerous appendices of character codes, control codes, error messages and an index by function of the Basic reserved words and functions. There is no alphabetic index to the whole manual, though.

The technical manual is remarkably detailed, going through all the hardware down to the signal and timing level and ending with full maintenance and repair instructions which are intended for the dealer and repair shop. If you're a hardware junkie make sure you get this manual as well as the user one.

To summarise, a quantum leap forward from the stereotype of inscrutable Japanese documentation.

Expansion

There is room for 8k more of ROM on the main board, which may be used for alternative language character sets. An expansion module which fits externally onto the left side of the machine contains 16k of RAM and a further 16k ROM.

ROM modules which fit in the place of the microcassette drive are somewhat different from ordinary ROM in that they are treated as file-oriented read-only mass storage.

A TV/monitor adaptor should be available by the time of the launch in November, and a bar code reader for

Language	EBasic

ADA— A BRIEF ENCOUNTER

The US Department of Defense is interested in Space Invaders of a rather more dangerous variety than we micro folks are used to. It has chosen Ada as the language to implement all future defence software. Mike Parr explains why. . .

Rarely does the design of a new programming language cause emotional discussion, but the introduction of Ada, the language selected by the US Department of Defense (DoD) is the exception. Basic, Forth and Pascal all have their critics, but the Ada debate is at a different level because of the sensitive area of its use — missile control, nuclear power plants, etc. Here I'll present a brief overview of the language, together with the arguments (sorry — discussions) on its value. I will attempt to be neutral!

History

In 1975 the US DoD decided to standardise on its programming language, and put out tenders for a language design to several firms. The winner was eventually called Ada (after Ada Lovelace, who worked with Babbage on an early mechanical computer). The language is based on Pascal, but has important additions to allow for real-time control, and to assist in the production of large software systems by teams of programmers. Because of the area of its use, the handling of errors is also vital — if your Space Invaders game crashes it is merely annoying, but if a fault occurs in a nearby nuclear power station you might be more concerned.

However, before criticising Ada, let's look at some features of the language.

What is Ada?

Fundamentally it is a Pascal-like language with these features:

Strong data typing.

Separately compilable 'modules'.

Facilities for the simultaneous execution of tasks.

(An explanation of this jargon will follow!)

However, Ada is more than just a language — it comes with a set of software tools collectively known as APSE (Ada Programming Support Environment), comprising editor, testing software, etc. In fact, APSE can handle all the paperwork associated with a project. Secondly, as Ada is a higher-level language than Pascal, it can be made use of at the program design stage, where one might have used pseudo-code or flowcharts. Certainly, a detailed study of Ada will affect the way you think about large programs, and the module and pro-

cedure facilities will encourage a 'divide and conquer' approach, making programs easy to read: after all, programs are read many times during development. (Forth fans please note!!)

The Ada attitude

Because Ada is intended for large programs, small examples are not always realistic — however it might be useful to approach the Ada way of thinking (on errors, reliability, etc) by criticising some fragments of MicroSoft Basic. Firstly:

```
10 IF F THEN 30
20 PRINT F * 3.142
```

These two lines have the following drawbacks:

The initial value of F is unclear (in fact it is zero).

F is rather meaningless — we would prefer longer names, eg, FLAG.

In Basic 1 (or -1 in some dialects) means 'true'. When F is zero, line 20 will be obeyed, and the missing line 30 will not produce an error.

In line 20 we multiply a logical (boolean) variable by a real number. What is the meaning of 'false'*3.142?

This brings out several points (bearing in mind that programs may be used in life-or-death situations) — ie, that incomplete programs should not be allowed to run, and that the type of each variable should be specified by the programmer to allow the compiler to reject misconceived operations. This feature, also present in Pascal and Algol 68, is called 'strong typing' and though it sounds like a good idea, is not popular among all programmers.

Now a subroutine to find the average value of the elements of an array:

```
1000 REM AVERAGING ROUTINE
1010 S = 0
1020 FOR I = 1 TO 100
1030 S = S + A(I)
1040 NEXT I
1050 AV = S/100
1060 RETURN
```

Again there are drawbacks:

The routine will only work on an array A, of size 100.

It also affects the value of I and S, which may be in use elsewhere in the program.

We may not want the user to have the power of editing the routine — it may be dangerous in certain environments.

These problems, present in Basic (and to some extent in Pascal) are all

overcome in Ada. Bearing in mind the 'safety first' approach, let's look at some areas of the language.

Control structures

Here at last is a fragment of Ada, illustrating the familiar FOR loop of Basic and Pascal —

```
SUM = 0 -- initial value
FOR INDEX IN 1 .. 100 LOOP
  SUM = SUM + A(INDEX);
END LOOP;
```

Upper or lower case characters can be used for variables or reserved words, but I'll stick to capitals to differentiate programs from commentary. The layout is similar to Pascal but note that comments are preceded by '--', and that a semi-colon must follow each complete statement.

As well as FOR, we have WHILE, as in:

```
WHILE X < 11 LOOP
  any statements
END WHILE;
or even more simply, an infinite loop —
LOOP
  any statements
END LOOP;
```

The idea of WHILE is that one collects together the terminating conditions at the head of the loop, though sometimes it is simpler to break out from the loop body; in recognition of this practical requirement, Ada provides an 'exit' statement as in:

```
LOOP
  EXIT WHEN X < 0.0001;
END LOOP
-- next statement
```

We may also use GOTO in such a situation.

As well as repetition, we need statements for selection, and Ada provides IF and CASE, each being more powerful than their Pascal counterpart. The form of an IF is —

```
IF condition THEN statements
ELSIF condition THEN statements
ELSIF condition THEN statements
etc
ELSE statements
END IF;
```

Note that this is one statement, *not* a series of nested IF's. You *could* choose to nest the statements by writing ELSE IF instead of ELSIF but each IF would need a matching END IF, which becomes clumsy.

The CASE statement at first sight seems similar to the IF, as in
CASE EXAM_MARK IS
WHEN 100 = >

```

3.7 million reasons why the Atari Home Computer is something to see. The display screen used with our computers is composed of 192 horizontal lines, each containing 320 dots. Delivering colour and luminosity instructions to each dot for a second requires 3.7 million cycles...a lot of work for the normal 6502 processor.

That's why the Atari computer has equipped its 6502 with its own electronic assistant. It's called ANTIC, and it handles all the display work, leaving the 6502 free to handle the rest. What this means to you is uncompromisingly spectacular display capabilities without loss of computer power needed to carry out the demands of your program.

That's a quality you just don't find in ordinary home computers. And it's one of the reasons some computer experts say that Atari computers are so far ahead of their time.

There's more...which is what you'd expect from Atari Language. The Atari Home Computer uses several programming languages to give the user maximum control of its extraordinary capabilities. PILOT, Microsoft BASIC and Atari BASIC are understood and spoken by the Atari computer. You'll also find our Assembler Editor cartridge indispensable for machine language programming.

Sound. An Atari computer has four sound generators, or voices, activated by a separate microchip. This leaves the principal micro-processor chips free to perform other tasks. And you can take full advantage of this capability which is designed for easy programming.

Change. Atari Home Computers have been designed to make change and expansion easy. The Atari computer has a modular operating system that can be easily replaced as new technology develops. If you need it, memory expansion requires no more than inserting additional RAM modules.* And the Atari ROM cartridge system also makes it easy to change languages. In short, your Atari computer won't become obsolete by future developments...because it already incorporates the future.

Sharing. To learn more about the amazing capabilities of Atari Home Computers, either visit your local dealer or fill in the coupon below.

ADA—A BRIEF ENCOUNTER

```
'write'
WHEN 80 .. 99 =>
  PUT ("GENIUS");
WHEN 60 .. 80 =>
  PUT ("GOOD");
WHEN 35 .. 59 =>
  PUT ("AVERAGE");
WHEN OTHERS => -- ie, default
  PUT ("UNCLASSIFIED");
END CASE;
```

Ada insists that we must cater for every possible value of the selecting item (ie, EXAM_MARK), and also that no two WHEN items include the same values. Moreover, Ada will check this before running the program. In fact, there is an error in my CASE example, because 80 has been specified in two options — the program would produce a compile-time error. You might feel that such a checking facility is impossible, but, to accomplish this, Ada will not allow you to use variables in a WHEN item because variables can be checked only at run-time. The point of all this red tape is a statement which will not inadvertently fall through to the following statement, and whose effect is not altered by re-ordering the WHEN list.

Finally, one overall point on CASE, IF, WHILE, and FOR is that the Pascal BEGIN/END scheme has been rejected in favour of more meaningful terminators — ie, END CASE, END IF and END LOOP.

Data types

This is a major part of Ada, and occupies about 30 pages of the reference manual. Because of this range, I'll examine the more novel features.

Initially, we have built-in types similar to Pascal, eg:

```
COUNT, I: INTEGER;
SUM: FLOAT = 1.0; -- and initialise
A: ARRAY (1 .. 100) OF INTEGER;
```

We may also form 'derived' types as in:

```
TYPE VOLTS IS NEW REAL;
TYPE AMPS IS NEW REAL;
X,Y: VOLTS = 0.0;
A,B: AMPS = 1.0;
and can now write statements such as
X = Y + 6.0;
```

```
A = A + B;
but not
X = A;
because the items are of different types.
```

The declaration of numeric types is worth looking at, as it is a considerable advance on Pascal. We can declare a limited range for an integer as in:

```
TYPE WEEKS IS RANGE 1 .. 52;
X: WEEKS;
```

but the novel point in Ada is to apply this to reals, and specify the range and precision:

```
TYPE FRED IS DIGITS 10
  RANGE -100000 .. 100000;
X,Y: FRED;
```

Here, we have said that, whatever the size of word on our computer, X and Y must be held to at least 10 digits of precision. Though Ada was not specifically aimed at numerical work, it provides better facilities than Basic, Fortran, or Pascal because programs will run on any machine, irrespective of the number of bits per word.

Arrays are defined in a similar manner to Pascal, but the actual size (within certain limits) can be left until run-time. Because array elements can be of any type (eg, character) and the size of arrays is flexible, we automatically have character strings; and because functions can return arrays as results, we can easily write powerful string functions. A simple example of procedure which prints out every element of an array of any size is:

```
PROCEDURE ARRAY_PRINT
(A:ARRAY) IS
FOR I IN A'FIRST .. A'LAST LOOP
  PUT (A(I));
END LOOP
END ARRAY-PRINT;
```

Here we have made use of the reserved words FIRST and LAST, which find out the actual limits of the array index.

Program units

An important requirement in a language is that it allows the programmer

a) to split large programs into smaller manageable chunks (eg, subroutines in Basic);

b) to incorporate standard library packages in a program;

c) to write packages which can be safely used by other programmers.

Most languages do not meet these requirements!

Ada provides us with enhanced Pascal-style procedures and functions, plus two types of module called 'packages' and 'tasks'. As usual, I'll concentrate on the differences from Pascal.

Firstly we can 'overload' (enhance the meaning of) the arithmetic operators. As an example, we could overload the '+' operator to perform matrix addition. Assuming that the type MATRIX has been defined as a two-dimensional array of any size, we can add corresponding elements by:

```
FUNCTION "+" (X,Y:MATRIX)
  RETURN MATRIX IS
SUM:MATRIX;
BEGIN
FOR I IN 1 .. X'LAST(1) LOOP
  FOR J IN X'LAST(2) LOOP
    SUM(I,J) := X(I,J) + Y(I,J);
  END LOOP;
END LOOP;
RETURN SUM; -- ie, the result
END "+";
```

and we may now use '+' to work on matrices.

The package

For safe programming, the Pascal rules on the scope of variables are inadequate

— ideally we want to provide a set of procedures for other users and also prevent the user from interfering with the internal workings. Consider a TV set — it is sealed up to keep out unskilled hands but can be manipulated to a limited extent by a set of controls on the front panel.

We can see why standard Pascal is unsafe by looking at an attempt to provide a set of 'turtle graphics' procedures. The requirement is to control the heading (angle A) of a

point on the screen by two procedures LEFT(N) and RIGHT(N), where N is any angle in degrees. We could try:

```
PROCEDURE LEFT (N:INTEGER);
VAR A:INTEGER
```

```
  Body of LEFT;
PROCEDURE RIGHT(N:INTEGER);
VAR A:INTEGER;
  Body of RIGHT;
```

Here, the programmer attempts to convey that variable A is 'private' to LEFT and RIGHT and must be updated only by these procedures. The problem is that as soon as the program exits from LEFT, all local variables (including A) are lost. In fact, such a variable needs to exist throughout the running of the program, and so must be declared at the outermost global level. Unfortunately, such variables can be accessed by any part of the program.

However, in Ada, we can declare a package, typically consisting of a set of procedures and data items, such that variables within it are inaccessible from outside the package, yet keep their value between procedure calls. For turtle graphics, we could write:

```
PACKAGE TURTLE IS
PROCEDURE LEFT(N:INTEGER);
PROCEDURE RIGHT (N:INTEGER);
END
PACKAGE BODY TURTLE IS
A:INTEGER;
-- followed by the body
-- of LEFT and RIGHT
END TURTLE;
```

Tasks

Many computing applications involve the simultaneous action of several tasks, such as writing to several VDUs at once, controlling a chemical reaction, or animating a Space Invaders game while detecting the player's move. Ada allows several tasks (similar in definition to a package) to be run together by high-level statements, whereas one is accus-

SOFTWARE FOR CP/M®

HIGH QUALITY SOFTWARE – WITH HIGH QUALITY SERVICE

★ **NEW! 16 BIT SOFTWARE** • Wordstar £280 • Mailmerg £150 (£380 with Wordstar)
• CBasic – 86 £195 • Emulator 80/86 £115 • Ascom – 86 £100 • XLT – 86 £90 •

WORDSTAR - Professional word processing software. On-screen formatting, wordwrap, pagination, line and character count on view. Micro-justification on daisy-wheel printer. Search and replace. Block/paragraph manipulation. External file read/write. Background printing during editing etc.	£250	MICROSOFT FORTRAN COMPILER	£225
MAIL-MERGE - Powerful Wordstar enhancement for file merging and document personalisation.	£65	MICROSOFT COBOL	£330
DATASTAR Screen orientated system for Data Entry, Retrieval and Updating.	£175	MAGSAM - Versatile easy to use Keyed File Management System for Microsoft Basic or CBASIC.	£130
SUPERSORT - Sort, merge and selection program.	£125	CIS - COBOL - ANSI' 74 implementation to full-level 1 standard. Supports random, indexed and sequential files, features for conversational working, screen control, interactive debugging, program segmentation etc.	£425
CONFIGURABLE BUSINESS SYSTEM (CBS) - Unique information management system with user definable files, powerful report generator, menu-driven for ease of use. No programming experience necessary!	£225	FORMS-2 - Automatic COBOL code generator for screen formats.	£100
ACCOUNTING PACKAGES by Median - Tec: PAYROLL, SALES, PURCHASE, NOMINAL Specially developed by UK software house to exacting specifications. Written in Microsoft Basic each package may be customised by end user, all are widely used. Ledgers are open item. Payroll caters for weekly and monthly pay.	£500 each	PASCAL-Z	£255
PROJECT COST CONTROL/JOB ACCOUNTING - A comprehensive set of programs to monitor budgets, account for expenditure and project completion etc. Ideally suited for contractors. Written in CBASIC-2.	£150	SUPERCALC FINANCIAL PLANNING SYSTEM	£165
STATISTICS PACKAGE - Over 25 routines including Regression & ANOVA	£100	CBASIC-2 - Extended Disk Basic pseudo compiler and run-time interpreter.	£75
MATHS PACKAGE - Over 40 easily used routines.	£100	THE FORMULA — unique system, report generator and database manager	£330
IBM - CP/M COMPATIBILITY - Powerful utility to transfer data to/from IBM machines in standard disk format.	£110	BSTAM - Telecomms facility for exchanging files between CP/M computers.	£110
MICROSOFT BASIC INTERPRETER	£155	ASCAM - Facility for communicating with other computers.	£95
MICROSOFT BASIC COMPILER	£205	TRANSFER - CP/M to CP/M file exchange - telecomms source code	£95
		MACRO 80 - Macro Assembler	£99
		CP/M 2.2 - Standard Version 8" Single Density.	£99

WINNING APPROVAL-

Through their powerful multi-processor operating systems Equinox professional microcomputers will grow and adapt in step with your Company.

Widely used in industry because of their proven power, reliability and expandability, Equinox systems are one of the few Government (CCTA) approved microcomputer systems with both CP/M and MICROCOBOL as standard.

And because they are specifically designed to grow and adapt with you, Equinox microsystems will win your approval, too.

EXPANDABLE

Equinox systems are not just simple desk-top, single-user machines, so they can expand both storage capacity and number of users, and

grow from single-user floppy based (5¼" or 8") to multi-user hard disc systems.

Through the S-100 bus structure, interfacing is possible to a wide range of component boards and interfaces, including PRESTEL/VIEWDATA, mainframe communication processors, floating point hardware, colour graphics cards, A/D and D/A etc. In fact, the large number of component boards manufactured for the S-100 make it the most interesting and versatile bus, around which to build your system.

POWERFUL

All this, plus two powerful multi-processor operating systems – TURBODOS (which will run your CP/M compatible software) and MICROCOBOL BOS/NET – make Equinox the systems for commercial

ADA—A BRIEF ENCOUNTER

tomed to dropping into assembly code to deal with interrupts, etc. In Ada, aside from a minimal amount of assembler which may be needed to address novel peripherals, the interrupt is treated as a low-level device that is hidden from the programmer by the language. Indeed, it is interesting to note that Ada, as well as allowing one processor to switch between several tasks in the conventional manner, will also allow the programming of systems in which each task has its own processor — ie, the program is distributed between several machines. In this area of real-time programming, potentially involving dangerous situations, it is realistic to expect errors, either within the programming system itself (eg, division by zero), or errors in results which can be detected by program. Bearing in mind that an error may be detected deep inside a series of nested procedure calls, Ada allows the programmer to specify an action to be taken when a particular 'exception' occurs, and also to control how many partially completed procedures are skipped before normal processing resumes.

...and

Yes, there's more. Particularly in the area of modules, data types, and input/output (provided by a set of procedures written in Ada), but if you want more detail, try one of the books listed below. However, bear in mind that it

will be some time before you will be able to run Ada on your micro.

The debate

'Coherent'; 'versatile'; 'unwieldy'; 'baroque'; 'almost impossible to implement'; 'unreliable'.

These phrases come from recent Ada articles in the computing press; the anti-Ada faction maintains that it has features grafted together to allow for any possible requirement, making it a very large language, difficult to understand and use. If the language is incomprehensible to most programmers, will the programs they produce be of poor quality? Well, the point about complexity is true — many programmers will find Ada difficult, so perhaps the choice of a Pascal-like subset might be appropriate. On the other hand, real-time systems are complicated in any language, so perhaps one which acknowledges their existence is an improvement. However, one of Ada's strongest opponents, Professor Hoare of Oxford University, says that it must never be used to implement large software systems because it is unreliable in the areas of error-handling and multi-tasking. Bearing in mind that the DoD has had several false alarms in recent years, such criticisms are indeed serious.

Where is Ada?

As Ada compilers are reputed to be six times larger than Pascal compilers, full

Ada is not likely to appear on today's typical micro system. Currently though one can purchase micro Ada subsets from the USA, and for Motorola 68000, DEC, and IBM 370 systems from Telesoft in the UK. York University is also well advanced towards a full Ada compiler.

The future

Will it catch on? Opinions differ, but it will have to overcome Cobol/Fortran inertia from industry — though some firms involved in real-time programming are keen. Ada subsets (eg, without the multi-tasking facilities) will become more widespread, competing with Pascal on CP/M systems.

Perhaps the personal computer language battle will end up being fought between Unix plus 'C', Pascal, Smalltalk, and Ada?

Further reading

The number of Ada books is increasing rapidly, so this is not an exhaustive list.

Programming With Ada by Wegner — published by Prentice Hall.

Ada — An Introduction by Ledgard — published by Springer-Verlag (also includes the Ada reference manual).

Problem Solving With Ada by Mayoh — published by Wiley (uses turtle graphics in many of the examples).

The Ada Programming Language by Pyle — published by Prentice Hall.

PLUTO POWER!

Add more muscle to your colour graphics with IO Research's Pluto board. Joe Whelan investigates.

As the cost of processors and RAM drops, we are likely to see more and more multiprocessor machines to be sold either as rack systems or as add-on units; the BBC machine is a good example of the latter. These multiprocessor machines will also tend to have dedicated processors, for such things as screen control (for example, the review system contains an 'Intelligent Video Controller' card with its own Z80A processor), which will have their own RAM, input/output ports and the ability to perform multi-tasking.

The uses to which these systems can be put are extremely varied and will tend to form a source of extremely powerful, small and yet relatively cheap computers: the new DEC Rainbow is a very good example, with 16-bit and 8-bit processors and running all CP/M software. The really interesting point for most micro users is that machines such as the ACT Sirius and the IBM Personal Computer don't have this nice facility, and so an add-on board must be made to contain the second processor, which means it may also be possible to link these optional boards up to other micros. A second processor would be extremely useful, if not a prerequisite: especially for the Sirius, Galaxy and many others which don't have colour graphics as standard.

The first British company to realise the impact that an add-on, 16-bit processor board dedicated to graphics would make is IO Research Ltd. IO has produced two options of the board — 'Pluto' and 'Baby Pluto', which is cheaper (because it contains less RAM) but is completely upgradable to a full Pluto. Both these cards can be further expanded by the addition of the palette board (see later).

Hardware

The board itself is a well-made 8in x 8in card, and connects to the host computer through an 80 BUS or NAS-BUS edge connector (80 pins). However, the manual gives the data for each of the lines, and so it can be connected

to any host computer which has two 8-bit parallel I/O ports (see Figure 1 for details). Any computer without this facility can be linked to the Pluto by direct connection to the bus: IO Research has at present connected the following machines up to a Pluto: Apple II, Sirius, PET, BBC, Gemini and IBM. The machine used for this review was a Gemini Galaxy 1 (which is based on the Gemini multiboard cards and contained the CPU/RAM/IO card, IVC card and disk controller card) which uses the 80 BUS system and hence allowed the Pluto board to be simply plugged in. The board can also be bought together with a case which will take all future expansions: this is necessary for all those machines which have a design criterion of good looks rather than expandability — such as the Sirius, which has virtually no room left inside the case for expansion. It will also accommodate the power supply, which is not a trivial matter seeing as the Pluto board alone draws a current of around 1.8 amps.

The processor on the board is a 16-bit Intel 8088 running at 6MHz, although there is also a faster 8MHz version which has just become available which gives a 60 percent increase in speed. This was addressing 4k of EPROM (although the board contained socketing for up to 32k of ROM) and 2k of static (8088 work space) plus 192k of dynamic RAM, consisting of three banks of 8x64k RAM chips, all 150 nS cycle time (the 8088 is capable of accessing over 16 megabytes of memory directly). All the chips on earlier versions of the board were socketed (as was the board under review); however, on later versions all chips bar the RAM and the CRT controller are soldered directly to the PCB: something more and more manufacturers seem to be keen on. On the review sample there were some jumper leads between a few of the chips. (I'm not certain of the exact functions of these jumpers but they appear to be used so as to allow for future expansions/options and to configure the

board for different systems.) The connection to the monitor was through a 20-pin plug; the output is for an RGB monitor or composite video signal — note the Pluto can be used on single-colour monitors but only the green plane can be displayed. The CRT controller is a Hitachi 46505SP and there are two oscillators, one of which is the Pluto system clock and the other being, presumably, the oscillator for the CRT controller (IO Research, after many enquiries, is planning to make this oscillator synchronised to an external source — eg, for television studio work). There is also a larger 50-pin connector which was for connection to the palette board which is due for release shortly. The quality of the colour generated is excellent and could only really be appreciated on a high-resolution colour monitor. All the input/output on the board is fully buffered to allow for easier control of the Pluto card by the host processor.

Software

The software is contained in the 4k EPROM, and is generally well thought out, and the commands are comprehensive and powerful, if sometimes complicated. Commands can be sent to the Pluto using any language that allows the addressing of specific output ports — for example, Basic, CBasic and machinecode: with Basic the Pluto will always beat the interpreter for speed and so no checking of the status of the Pluto board is required. However, when writing in machine code (and in CBasic when the command sent previously involved a complicated operation) the status must be checked. The memory is considered as a block which is 640 pixels wide and 800 pixels high. This is divided up into a number of 'partitions', the number of which can be varied by the user, which are 640 pixels wide and of variable height (see Figure 3). These partitions can be used for anything that normal memory is used for, such as data storage or program storage. However, the first two partitions (numbers 1 and 2) are used for the screen display and are predefined to be 640 pixels wide by 288 pixels high: these can be used for super-fast animation as one screen can be displayed while the other is being redrawn. The remaining partitions are capable of containing various symbol tables, eg, character sets, in addition to the predefined ASCII character set for text display which is stored on the onboard ROM: these are defined as an 8x10 matrix which, although good, is not up to the same definition as the Sirius: presumably the characters

1-4	GND
23	WAIT
26	IORQ (kept at 0)
28	WRITE STROBE
29	READ STROBE
30	DATA/STATUS SELECT
31-34	LOGIC 0 TO SELECT PLUTO
35-37	LOGIC 0 TO SELECT PLUTO (depends on set of linkages on board)
50-57	BI-DIRECTIONAL DATA BUS
75-78	+5 Volts

Note: all other signals are 80 BUS specific and are not required by the Pluto board

Fig 1 Interface connections for a non-80 BUS system

are defined in this way so as to make an 80 by 28 screen display.

The actual screen display is defined as a pixel matrix of 640 across by 288 high, with the origin at the top left hand corner. The memory is organised so that one pixel is defined by three bits (giving eight possible bit patterns); this allows the choice of one of eight colours per pixel and there are no restrictions on the arrangements of the various coloured pixels on the screen. In addition, with a small amount of laborious work, these pixels can be grouped to give the impression of other colours.

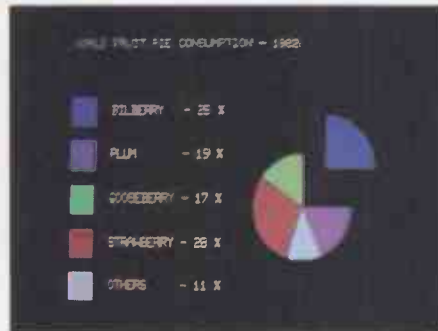

The commands for control of the screen are very comprehensive: see Figure 4 for the complete list and explanation of the commands. They contain procedures for move, move relative, draw, draw relative, plot point and plot point relative. Each of the relative commands is then subdivided into a long and a short version. The reason for this is that the commands are sent down to the Pluto board as one-byte codes. On receipt of the command code, Pluto will expect a fixed number of data bytes, depending on the command given (one word of warning here; the status port on the Pluto should be checked before sending data to the card as if any information, especially the command and first data bytes, is sent but not read the Pluto will wait for more data or misinterpret any future data). If the command is to move the 'current position pointer' (IO's word for an invisible cursor) relative to its present position, then the move may be either greater or smaller than 127: 127 if the move is positive but 128 if it is negative. If it's greater than 127/-128, two bytes will have to be sent to Pluto for both the X and the Y coordinates. This would mean a total of five bytes to be transmitted, as opposed to only three if the required move is less than 127 pixels in both the X and the Y directions. It may seem a little silly at first

to duplicate these commands, but when you realise that in order to send the data you have to calculate and then send it as two sets of low and high bytes it does save a lot of time using the 'short' instructions: hence it is usually much easier to send two 'move shorts' instead of one move. To tell the truth, I always found it much easier to use only absolute instructions because all the relative instructions, quite logically, require the bytes to be signed. It is possible to lighten the mental load when programming for the Pluto by using lines in your programme such as:

```
1000 N - 166
1010 Y - A * B
1020 OUT N, Y AND 255, Y/255
```

where N is the output port number, line 1010 sets a value for Y, and line 1020 sends low byte followed by high byte.

Pluto graphics

The commands for reading the colour value of a pixel are again divided into two and four-byte versions. There are fairly standard commands for colour definition, FCOL, CCOL, BCOL and TCOL. These stand for foreground colour, current colour, background colour and transparent colour respectively. The uses of these commands will be explained in more detail later.

There is a very powerful command for the manipulation of the above commands called 'STYLE'. This, in the simple graphics operations such as draw or plot, decides the method of laying the line, such that you AND, OR, XOR or REPLACE the line in memory: these are fairly standard functions, but none the less necessary. However 'STYLE' allows for various effects to be performed on other operations. The most useful of these 'other operations' is the ability to copy areas of rectangular memory (called Rasters). There are a number of Raster Ops which can be performed such as:

- 1) Set each pixel in the raster to a

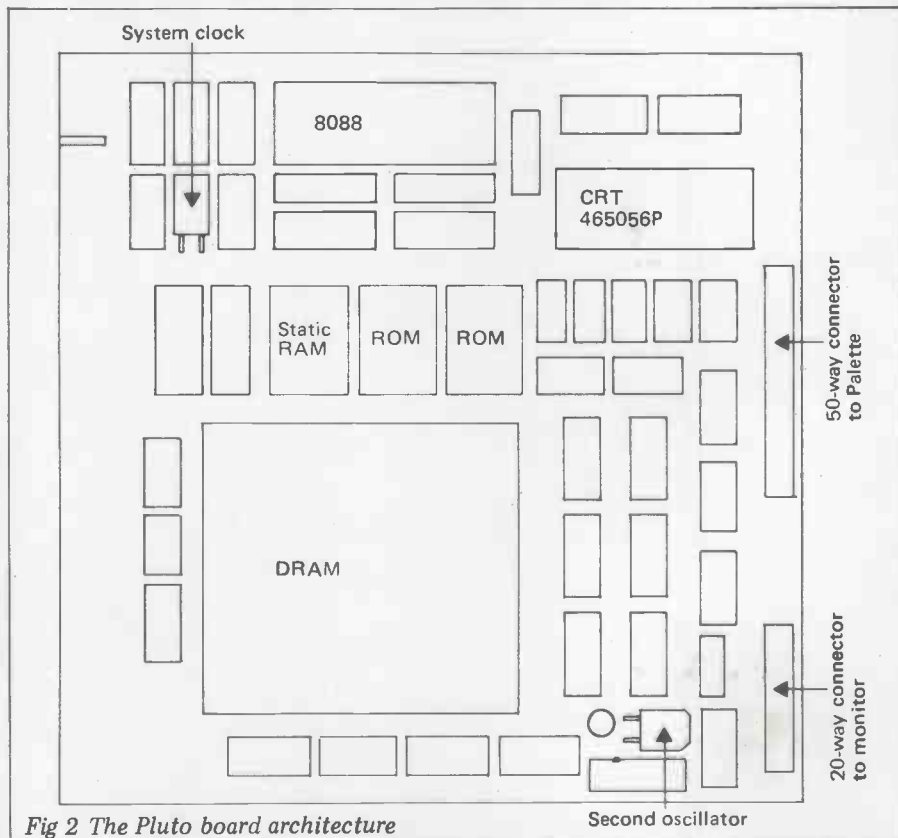

Fig 2 The Pluto board architecture

**“We will be flying at a height of 30,000 feet.
Our air speed will be 500 knots.
And there’s a fair chance we’re going to crash.”**

No smoking. Fasten your seat belt. You're about to take off in a 747. But on this flight you're the pilot.

You could hardly describe THORN EMI's 'Jumbo Jet Pilot' as simply another video game. It's more like a session in a flight simulator with life-like instrumentation and graphics.

Jumbo Jet Pilot, 16 K ROM, Cartridge.
5 skill levels, Performance rating.
Controls: Throttle, Ailerons, Elevators.
Undercarriage, Brakes, Stall Indicator.
Lights, Fuel, Longitude, Latitude.
Air Speed, Artificial Horizon, Altitude.
Pitch and Roll, Heading, Vertical
Speed, Map Reference and Grid.
Time Elapsed.

To cope you need to be alert. You should expect the unexpected. And you definitely shouldn't lower the undercarriage when your air speed is dropping and the horizon suddenly appears vertical!

On landing, your in-flight computer will assess your skills and give a 'performance rating'. If you manage to land that is.

'Jumbo Jet Pilot' is one of 21 challenging new home computer games from THORN EMI. It's pretty demanding. But our programs aren't all work and no play.

'River Rescue', 'Kickback', and 'Soccer,' are all-action games. 'Pool' and 'Darts' will suit armchair sportsmen.

And whilst budding Beethovens play the 'VIC Music Composer,' would-be Chancellors can work on their budgets with 'Home Financial Management'.

Darts.

Humpty Dumpty.

We also have educational puzzles for children that will puzzle adults at higher skill levels. But there's one simple idea behind all our titles; we've designed them for players who are bored with run-of-the-mill TV games.

Now, is that Heathrow ahead?
Or is it Hyde Park?

The world's greatest TV games

PROGRAMS FOR ATARI 400/800 (Trademark of Atari Inc. except where indicated).

PLUTO POWER!

particular colour; used to fill areas of screen with a colour or to clear the screen. This is a standard command called RECTFILL.

2) Copy one raster to another. This is the way Pluto draws characters on the screen, and scrolling must be done by copying one character raster to another raster any number of lines up or down the screen (giving fast or smooth scroll). These functions are done using the COPY command.

3) Invert (complement) the colour of each pixel within the raster — useful for inverting characters on the screen.

4) Copies one raster to another, but at the same time uses another raster to mask the pixels as they are copied, giving the masked pixels in the destination raster one of two colours. This is used for displaying the text, where the character definition is in the mask raster. Those bits set in the mask are set to FCOL in the destination and the remainder set to BCOL (the Pluto's character set is defined using one bit per pixel giving only two colours). Any of the colours can be accessed by use of the STYLE command. However, if desired, the characters can be defined by the user using three bits per pixel giving a character containing all possible eight colours.

5) Paint to a raster using a mask raster

Showing the flag

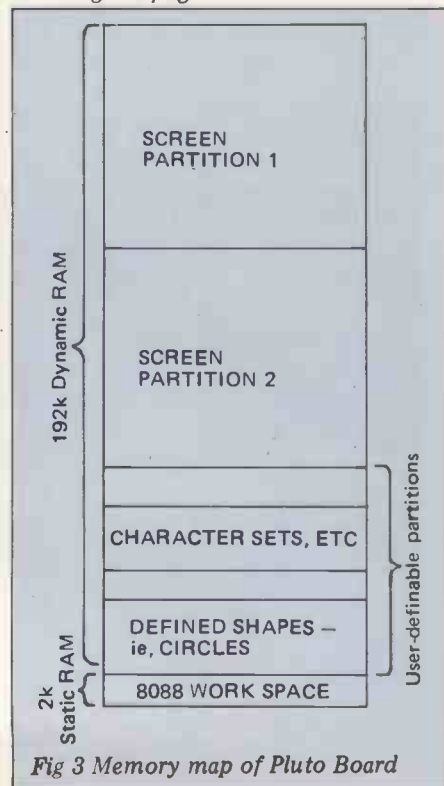

Fig 3 Memory map of Pluto Board

COMMAND (sent as 1 byte)	NUMBER OF PARAMETERS sent	NUMBER OF PARAMETERS received	OPERATION
CopySymbol	0	0	Prints symbol
Allocate partition	5	0	Sets number & size
Copy	14	0	Block copy function
CopyToSymbol	1	0	From block to symbol
Initialise	0	0	Set parameters
InquireBCOL	0	1	Get background colour
InquireCCOL	0	1	Get current colour
InquireCP	0	4	Get cursor position
InquireCDP	0	1	Returns num of screen partition being displayed
InquireSCP	0	1	Returns symbol table number
InquireCWP	0	1	Returns no of screen partition not displayed (current working partition)
InquireFCOL	0	1	Returns foreground colour
InquireSTATUS	0	1	Is Pluto ready?
InquireSTYLE	0	1	See review
InquireTCOL	0	1	Returns transparent colour
InquireWPROT	0	1	No of mask write-protected
LineRel	4	0	Draw line relative
LineRelShort	2	0	
LineTo	4	0	Draw line absolute
LoadMemory	4,*	0	Copy area of memory
LoadSymbol	1,*	0	Defines a symbol number & shape. All defining bytes are sent after command
MoveRel	4	0	Changes abs
MoveRelShort	2	0	Plots point at X,Y
MoveTo	4	0	
PlotAt	4	0	
PlotRel	4	0	
PlotRelShort	2	0	
Polyfill	0	0	Fills area of memory
ReadMemory	4	*	Outputs the byte contents of an area of specified memory
ReadPixel	4	1	Gets colour of pixel at point specified
ReadPixelRel	4	1	
ReadPixelRelShort	2	0	
ReadSymbol	1	*	Outputs bytes which define character
Rectfill	4	0	Fills a rectangular area of memory with colour specified by CCOL and STYLE
SetBCOL	1	0	Sets background colour
SetCCOL	1	0	Sets current colour for line-drawing, etc
SetFCOL	1	0	Sets foreground colour
SetCDP	1	0	(1 or 2) to define current display partition
SetCSP	1	0	Defines the partition which contains the characters in use
SetCWP	1	0	Defines the partition which is being worked on
SetStyle	1	0	Defines the function of this multi-purpose operation
SetTCOL	1	0	Defines the colour of the transparent mask used in COPY
SetWPROT	1	0	Allows for definition of a write-protected mask on any colour during a COPY operation

(*: the number of bytes depends on the amount of data required)

Other commands will be available with the new 8k version of the ROM

Fig 4 Commands available with present Pluto ROM

3-D Pluto pic

which defines the colour of the pixels to be changed, while any other pixels are left unchanged. This is where the TCOL function is used, as the transparent colour is the one which is filtered out during the copy.

The above functions are achieved

mainly using the COPY command. This one command requires no less than 14 data bytes to follow it; these include the partition identifiers and conditions for the destination and source rasters.

When using the card for writing text to the screen a number of options are available. Apart from those mentioned above for the alteration of colour and the copying of characters, the size of the actual symbol can be altered by defining your own character set. The size of the character depends only on your patience and the amount of free memory.

There is also a command for the filling in of large or small areas of memory. This is a COMPLEX POLYFILL function which flood-fills the area of memory specified up to a boundary which is assumed to be any colour other than that

GOTO page 201

PC-1211 COMPLEX ARITHMETIC

The new HP-15C, reviewed in this column in September, has built-in complex number arithmetic — probably for the first time on a programmable. It is quite possible, however, to program this feature on most machines, and the following is a particularly nice implementation for the Sharp PC1211 by John Kerr of Glasgow.

Dick Pountain

This program converts the 1211 into a calculator operating on complex numbers. It is run in the DEF mode. 'shft Z' creates storage space for up to 18 complex variables, labelled 'A' through 'R'. The assignment statements allowed have the general form

variable name (A...R) shft = operand enter operator enter operand enter operator enter ; ; ; ; operand enter enter

Operands are of two types. A type 1 operand is a variable name, which may be preceded by either or both of the monadic operators '—' and 'C'. These denote complex negation and conjugate respectively; eg, '—CF' represents minus the conjugate of F. A type 2 operand is a numerical input. Examples: $3-j4$ is entered as '3 shft J—4'; $5 \angle -53^\circ$ is entered as '5 shft K—53' (although the latter assumes DEGREE mode, the program will operate in any angle mode). Legal dyadic operators are '+', '—', '*', '/' and '^'. The first four of these represent complex addition, subtraction, multiplication and division. The fifth raises a complex number to a real power; it is followed by a special type of operand (a REAL operand), which is any arithmetic expression. Dyadic operators all have equal priority, and evaluation proceeds from left to right (there is no bracketing facility). Monadic operators have a higher priority and must not be followed by 'enter'.

Several types of prompt are used. These are:

- > Begin entry of calculation
- # For entry of an operand
- ? For entry of an operator, or final 'enter'
- J Rectangular notation; entry of second component
- < Polar notation; entry of second component

The calculation buffer has 32 stages. Type 1 operands and REAL operands occupy one stage; type 2 operands require two, as does the final operand in a calculation, regardless of its type. If the calculation is not terminated (by final 'enter') before this buffer is saturated, the computer automatically suspends input and calculates and displays an intermediate result. To continue the calculation, press 'enter' then input the next operator symbol. This continuation is also permitted when the partial result has been ordered manually.

Memory recall uses the defined program 'L' (for 'look'). For example, 'F shft L' brings the content of memory F to the display. Results are always expressed in rectangular notation, but a result displayed by a memory recall or assignment statement can be converted to polar form by 'shft SPC' (the internal representation of the number is unchanged by this operation). Press 'enter' to return to rectangular form.

Program 'L' also provides the effect of *assignment operators* as found in Algol: 'F shft L enter / enter G enter enter' performs the assignment $F=F/G$ and, in general, 'F shft L enter' is equivalent to 'F shft = F enter'.

Any of the 18 labels A...R may be used in the ordinary way, during calculations, to store REAL numbers. The corresponding complex space will no longer be accessible by its label, but its numerical pointer can be used instead; these pointers are 27 for A, 29 for B, etc. Thus '37 shft L', for example, will bring the value of complex memory F to the display. The calculation register (memories X and Y) is referred to by pointer value 24. On the LHS of an assignment statement it is used to display a calculation result without a destination; while on the RHS it can be used as any other type 1 operand, and has the interpretation 'result so far' — eg, used after '* enter', it squares the current value in the calculation register. NB: memory C should not be used for REAL storage as the operation of complex conjugation would be lost.

Four operations involving REAL storage are:

- Assign the real part of F to R: R=A(F) enter
- Assign the imaginary part to Q: Q=A(F+1) enter
- Assign the modulus of F to M: F shft L shft SPC M = U enter
- Assign the argument of F to A: A = V enter

Lexicon

- Variable names: A, B, C, ... R
27, 29, 31, ... 61
- Complex assignment symbol: shft =
- (Literals) $x + jy$: x shft J y
- $r \angle s$: 2 shft K s
- (Other operands) minus F: —F
- conjugate of F: CF
- conjugate of F: —CF
- (Complex dyadic operators)
- plus: +
- minus: —
- times: *
- divide: /
- power: ^
- Memory recall procedure: shft L
- Rectangular to polar: shft SPC
- Real part of F: A(F)
- Imaginary part of F: A(F+1)
- Modulus of F: U (after 'F shft L shft SPC')
- Argument of F: V (after 'F shft L shft SPC')

Evaluate the polynomial $P = A^4 + (2 + j3)A^3 - 4A^2 - (5 + j6)A + 7 - j8$, for the present value of $A(-1 - j8)$. The expression for P is rewritten in 'nested multiplication' form prior to entering the calculation, since the operators can then be obeyed in the order in which they appear:
 $P = (((A + 2 + j3)A - 4)A - (5 + j6))A + 7 - j8$.
 P shft = A enter + enter 2 shft J 3 enter * enter
 A enter — enter 4 shft J 0 enter * enter

CODE ENTERED	COMMENTS	DISPLAY
(DEF mode) DEGREE enter shft Z	Sets angle mode & pointers	
A shft = —1 shft J —8 enter enter	Assignment: A = —1—j8	—1 —8
B shft = 10 shft K 45 enter enter	Assignment: B = 10 \angle 45°	7.07.. 7.07..
C shft = A enter + enter B enter enter	The sum of A and B is stored in C	6.07..—0.92...
D shft = A enter * enter B enter enter	Product in D	49.49..—63.63..
E shft = A enter / enter B enter enter	This calculation assigns $\sqrt{(A/B+CD)}$ to E; note it has the form	—6.36...E—01 —6.36...E—01 —4.94...E—01
E shft = C enter * D enter + enter E enter ^ enter ½ enter enter	temp = A/B: E = (C*D+temp) ^½	19.18...—11.28...
F shft = —CA enter + enter CC enter * enter 1 shft J 2 enter enter	(—A + C) * (1+j2) where A = conjugate of A, etc, is assigned to F	21.21... 7.07...

Sample calculations

CALCULATOR CORNER

A enter — enter 5 shft J 6 enter * enter

A enter + enter 7 shft J — 8 enter enter

This calculation occupies 12 stages of the buffer: one each for the four occurrences of 'A', and two for each complex constant ('shft J'). The correct answer is $P = 2847 - j493$.

Memory use

A to R Pointers to complex variables
 S to Z Program working space
 A(27) to A(62) Complex variables (storage area)
 A(63) to A(126) 32-stage calculation buffer
 Remaining memory is entirely filled by the 624 steps of program.

Defined programs

shft Z Pointer initialisation routine
 shft = Used as assignment symbol, complex arithmetic
 shft J Numerical input, rectangular notation
 shft K Numerical input, polar notation
 shft L Data recall
 shft SPC Rectangular to polar conversion

NB: Program length is critical; add so much as one colon after a label and it will not work at all. Any addition to the program (such as making the 'complex calculator' program-mable) will entail a reduction in the size of the calculation buffer (reduce 'T=126' at lines 80 and 6). Conversely, T can

```
1: "+" U=-U: V=-V
2: "-" X=X-U: Y=Y-V: RETURN
3: "*" S=1: GOTO 5
4: "/" V=-V: S=UU+VV: IF S=0 BEEP 2: PRINT "DIV. BY ZERO": END
5: T=UY+VX: X=(UX-VY)/S: Y=T/S: RETURN
```

REAL: any arithmetical expression. VAR: name of a complex variable, A ... R.

PCW welcomes approaches from would-be writers, even those who may never have appeared in print before. In this game it is often those with practical experience who have important things to say so we don't mind too much if their prose is less than perfect. Providing that submissions have a sensible structure and follow a logical sequence, we can take care of the polishing. Here are some tips:

If the article is already written, simply send it in, making sure that your name, address and 'phone number appear on both the article and the covering letter. If you have submitted the same work to other magazines you

should tell us — it would be embarrassing (to say the least) if the same article appeared in more than one.

If you have an idea for an article or a series, write us a letter outlining your ideas. A one or two page synopsis giving the proposed structure, sequence and content will give us a sound basis for discussion. Please give us a daytime 'phone number if possible.

If you have nothing specific in mind but feel qualified to conduct case studies, Benchtests or whatever then drop us a line saying what you'd like to do and why you think you're qualified to do it. We're not particularly looking for strings of academic qualifications —

experience carries just as much weight.

Dick Pountain is always on the lookout for interesting calculator features and we wouldn't mind seeing one or two readers getting on their soapboxes but remember: even articles such as this need a structure.

Reading PCW will give you a good idea of the style we prefer. You may notice that we try to avoid pomposity at one extreme and flippancy at the other (except in 'Chip Chat', that is).

Finally, have a look through back issue indexes and try not to re-invent any wheels. Oh, we almost forgot — PCW does pay for all published work.

PLANNERCALC MICRO SOFTWARE

Quite simply, PlannerCalc is the best ©CP/M spreadsheet business planner on the market today.

What's more, its nearest rival costs three times as much.

So what exactly, do you get for your £39.00 (plus VAT)?

Well, unlike all other 'Calc' products it allows you to enter calculation rules in English. So it's much easier to use.

It uses the popular 'spreadsheet' approach, with a window that can be rolled in all directions.

Which means you can enter new figures or rules and immediately see their effects on everything else in the model.

It comes with the best manual on the market and it's suitable for most micros with a CP/M2.2 operating system, at least 64K of memory, a screen width of 80 characters and 2 floppy disc drives.

And, as your needs and demands grow you can move on to other more powerful packages like MasterPlanner, the next step up in the Comshare range.

MasterPlanner is totally integrated with

PlannerCalc and you simply carry on where you left off. To order PlannerCalc ask your local dealer or clip the coupon and enclose your cheque or credit details.

COMSHARE
Making the computer make sense.

To: Dept. PCW/12 Comshare Limited, 32/34 Great Peter Street, London SW1P 2DB.

Please send me _____ copies of PlannerCalc at £46.05 inc. VAT and p. & p. per copy, I enclose a cheque/postal order for £ _____ made payable to Comshare Limited.

Please debit my

ARTIFICIAL INTELLIGENCE

INTELLIGENCE TESTS FOR COMPUTERS?

Bev Mason explains how computers can tackle a standard intelligence test by using the calculus of finite differences

We are all familiar with the tests used to gauge intelligence, particularly with children, where the subject is asked, among other things, to deduce the next term in a sequence of numbers. For example, the given sequence might be 1, 4, 9, 16, — or 3, 5, 8, 12, —. In the first case the series is obviously a sequence of ascending squares, the next term being 25. In the second case, it is easily seen that the difference between successive terms increases by one at each step, and the next term is 17.

A less obvious sequence is —1, 1, 19, 65, —, where the next term is 151. Even when the answer, the next term, is known the relationship is by no means obvious. In this case, each term is derived by subtracting four times the square of the term *position* from twice the cube of the position and adding one, ie, the *third* term is equal to $2 \cdot 3^3 - 4 \cdot 3^2 + 1 = 19$.

It is interesting to pose the question 'Can a computer be programmed to do these intelligence tests?' When one considers the virtual infinity of relationships which can exist between successive terms of a sequence it would seem that the answer must be in the negative. How can one disassemble the mental processes involved in the 'casting around' for a possible relationship, in order to write a program? Also, if a computer can be programmed to accomplish these tests when computers are undeniably *not* intelligent, do the tests really warrant the name 'intelligence tests'?

Before delving further into these questions, let us say at the outset that a computer *can* be programmed to derive the next term in a sequence, or indeed the *n*th term, forward or backward, and also display the relationship between the terms. The short program at the end of this discussion does just these things. We shall see some further anomalies!

A simple sequence

Let us suppose a child is given the first sequence above, ie, 1, 4, 9, — and is asked to write in the next term. This looks like, and is, a sequence of squares, the next term being 16. So when the child puts a 10 on his paper he gets no marks and is considered to be little better than an idiot — perhaps unjustly, as we shall see.

It is necessary to examine the question more closely. We have become so familiar with this type of test that usually only the minimum is stated. Much has to be inferred or 'understood'.

The fact that the next term in a sequence of terms is requested indicates a count. What is really being stated is

$$y = 1 \ 4 \ 9$$

$$n = 1 \ 2 \ 3 \ 4 \ 5$$

and it is obvious that $y = n^2$ and the term for $n=4$ is 16; that for $n=5$ being 25 and so on. We could have been asked to fill in the *preceding* terms — ie, those corresponding to 0, —1, —2, etc.

$$y = 4 \ 1 \ 0 \ 1 \ 4 \ 9$$

$$n = -2 \ -1 \ 0 \ 1 \ 2 \ 3$$

The series extends to infinity both ways and the relationship $y = n^2$ holds true. However, *n* is nothing more than a count, simply marking the position of each term and there is nothing in the original question regarding the starting point of the count. In the above example *y* has a minimum value of 0 and it is convenient to zero the count at that point. Had the given terms been stated as 9, 16, 25, —, we could have written

$$y = 9 \ 16 \ 25 \ - \ -$$

$$n = 1 \ 2 \ 3 \ 4 \ 5$$

The next terms would still be 36 and 49 but *y* would certainly not equal n^2 . Common sense, or 'intelligence' would have told us to start the count with $n=3$ rather than $n=1$. But suppose that the given sequence had been a series of numbers with no immediately recognisable relationship. The zero point, in the absence of any guidance, would have to be positioned arbitrarily. Let us start a new count 'p' one position further along:

$$y = 1 \ 4 \ 9 \ -$$

$$n = 1 \ 2 \ 3 \ 4$$

$$p = 0 \ 1 \ 2 \ 3$$

Now $n = p + 1$. We can see that $y = n^2$ therefore $y = (p+1)^2$, which simplifies into $y = 1 + 2p + p^2$. This is not as immediately obvious as $y = n^2$ but is just as valid. When $p=3$, $y=16$, which comes as no surprise.

The child in our example, far from being an idiot, is in fact a genius of rare talent. He had spotted that the relationship between *y* and *p* is not only $y = 1 + 2p + p^2$ but also by $y = 1 + 4p^2 - p^3$. In the first case the term for $p=3$ would be 16 while in the second case it would be 10. In the absence of any guidance from the question he plumped

for the 'cleverer' answer and wrote '10'. Had the question sought the preceding term, the child would have written 6 and not 0.

It would seem then that not only can this type of intelligence test be correctly answered by an unintelligent computer, but it can also give a damaging and misleading assessment of a child's intelligence. Perhaps it would be more meaningful if, in addition to requesting the next term, the relationship used in arriving at that term should also be stated.

Before leaving this brilliant, misjudged and probably unbearable child let us not utterly condemn this intelligence test. The computer arrives at the answer by mathematical (arithmetic) means which can, as will be shown, be achieved by humans fairly simply with pencil and paper but not without (except in the easiest or trivial cases). Instead the human uses intuitive mental processes which are undoubtedly facets of intelligence which can be tested.

We shall see, with the aid of our program, that it does not matter in practice where the count is started, whether we count in ones, twos or twenty-threes, or whether the given sequence is three numbers or ten numbers long. It does not even matter if those numbers are generated randomly by our computer! We can still find a relationship between them and state the next (or for that matter the next but sixteenth) number in the sequence.

The 'other' calculus

All of the above is by way of being a lead into a small facet of a fascinating branch of mathematics known as the calculus of finite differences. (The non-mathematical reader need not worry. The remainder of the discussion contains only arithmetic and very elementary algebra.)

The more usual infinitesimal calculus deals with relationships between *continuously varying* quantities. It assumes that one variable changes by an infinitesimal amount and studies the effect on related variables. An elementary application is in the calculation of maxima and minima. Thus, given a relationship such as $y = 81/8x + x/2$, it can be shown that *y* will be at its lowest value when $x=4.5$. However, if *y* represents the number of hours needed for a

job to be done by x men, this method is of no great value. We cannot employ 4.5 men and there is no indication whether 4 men would be more economical than 5. Since we cannot have fractional men, nor negative men, their number x cannot be continuously variable and the methods of the infinitesimal calculus are not strictly applicable. Hence the calculus of finite differences.

Finite differences

In the 'normal' calculus briefly described above, the variable x is assumed to change by an infinitesimal amount

Dx to a value $(x + Dx)$. By subtracting the initial value x from the increased value $(x + Dx)$ we obtain the infinitesimal difference Dx . Since y depends on x it also will change, from y to $(y + Dy)$, and by taking the difference we can arrive at Dy . The calculus then studies the relationship between Dx and Dy or the ratio Dx/Dy , a process known as differentiation. In the same way that the process was applied to x and y , it can be applied to the quantities Dx and Dy and to successive differences: the process is then known as successive differentiation.

When x can assume only integer

values the difference between one value and the next can only be finite, and is invariably taken to be unity. The difference in x is therefore 1 and the corresponding difference in y is designated by the Greek capital letter Delta. We shall use the letter D . The process is known as differencing and, if continued, becomes successive differencing.

A series of cubes

By way of an example, consider the sequence of cubes:-

$$y = 0 \ 1 \ 8 \ 27 \ 64$$

$$x = 0 \ 1 \ 2 \ 3 \ 4$$

To start the process of differencing, set the work out in tabular form:

x	y	D	D^2	D^3	D^4
0	0				
		1			
1	1		6		
		7		6	
2	8		12		0
		19		6	
3	27		18		
		37			
4	64				

The column headed D is obtained by subtracting each value of y from the next higher value. In a similar way, the column headed D^2 (second difference, not $D \cdot D$) is obtained from the D values, and so on. The relationship between x and y is then given by the top figures in each column starting with the y column:

$$y = 0 + 1D + 6D^2 + 6D^3 \quad (A)$$

where

$$D = x/1,$$

$$D^2 = x(x-1)/(1 \cdot 2),$$

$$D^3 = x(x-1)(x-2)/(1 \cdot 2 \cdot 3),$$

$$D^n = x(x-1)(x-2) \dots (x-(n-1))/(1 \cdot 2 \cdot 3 \dots n).$$

Substituting these D values in equation (A) we get

$$y = x + 3x(x-1) + x(x-1)(x-2) \quad (B)$$

By substituting in this equation values of $x=0$ to 4 the original values of y are obtained, as are also those for $x=5$ ($y=125$), and for $x=-2$ ($y=-8$), etc. We know of course that in this example the equation (B) reduces to $y=x^3$.

The theory requires only that x should vary in equal steps. However, differencing is done on the basis that the independent variable varies by unit steps starting at zero. If x does not start at zero, or if it increases or decreases by equal amounts other than unity, it is necessary to introduce a further variable, say p , which does fulfill the necessary conditions. It is a simple matter to establish the relationship between x and p , eg:

y	5	7	12	21
x	13	20	27	34
p	0	1	2	3

y will be obtained as a function of p :
 $y = f(p)$ (C)

where $p = (x-13)/7$. If the value of y is sought for (say) $x=15$ it is only necessary to calculate the value $p=2/7$ and substitute in equation (C).

But what use is it?

Suppose we have obtained experimentally a series of values of y in relation to values of x . If the values of x vary in equal steps we can use the method outlined above to forecast values of y for other values of x . If the values of x are not equally spaced we can plot the points, join them with a smooth curve,

COMPSOFT'S

DMS

The ultimate in
Data Management Systems
for Microcomputers

Compsoft's DMS is everything you ever dreamed possible in computer software. Fast, efficient and reliable, DMS is the only complete integrated system for information management.

DMS needs no programming. Working in conversational English, this ingenious program is designed for Management, Clerical and Secretarial staff to use. You simply create your record layout, then DMS stores the records. It sorts and searches on multiple criteria, calculates, writes letters, and prints lists, reports and self-adhesive labels. As an extra bonus information from the records can be automatically merged with standard letters written by DMS itself or Wordstar.

You can extend your record keeping into a complete selective mailing service.

You can find out more about DMS from our brochures. We also have technical specifications and free guides to DMS dealing with Personnel, Client, Student, Stock or Library, Subscription, Club, Medical, Policy or Property Record, Job Costing, etc., etc.

DMS is available for most micro computers using the CP/M, MP/M, MSDOS or Commodore operating systems with hard or floppy disks. Every version contains the DMS letter writer as standard and costs £400 or less.

and read off y at standard intervals. The method will then forecast or extrapolate possible y values outside the graph. But remember, we get only a forecast, not a certainty.

Suppose our first four results were 0, 1, 8 and 27 as in the cube series above. If these were RUN in the program, the computer would correctly forecast 64 and 125 for $x=4$ and 5 respectively and print the relationship as $y=x^3$. However, suppose the value of y for $x=4$ were subsequently determined experimentally as 40 and not 64. On feeding the computer the sequence 0,1,8,27,40 it will reply correctly with $y=5$ for $x=5$ instead of $y=125$. The relationship will now be printed as $y=6x-11x^2+7x^3-x^4$. It can easily be seen that the sequence 0,1,8,27 can be followed by an infinity of different numbers of which 64 and 40 are but two.

Our child (I thought we had lost him) could have put any number he liked, positive or negative, after the sequence in his intelligence test, and proved that it was logically related to the earlier numbers.

In the 'conventional' calculus, the

opposite operation to differentiation is integration. One method of finding the integral of a mathematical expression is to plot the graph of the equation and measure, or calculate, the area between the curve and the x axis; Simpson's Rule is a method for calculating irregular areas. It is applied by dividing the area into equally spaced strips, measuring or calculating the length of each strip, and applying a simple formula. It can be programmed into home computers to perform the function of integration. The division of the area into finite steps or strips suggests the calculus of finite differences, and in fact Simpson's Rule and similar methods are derived from that calculus. However, the derivation of Simpson's Rule is too complex to be described here, but its application in computers to calculate definite integrals is simple.

The universe operates in a continuous and smooth fashion — eg, time and planetary motion — and the infinitesimal calculus has been universally applied. However, there are those who maintain that the calculus of finite differences offers a more practical picture since the world operates in a digital manner: a view which should be popular with computer people who can more easily appreciate things operating a 'bit' at a time. It is obvious that the number of men needed to do a job, or

the number of bricks required to build a house, must be integers. It is perhaps not so obvious that the 'smooth' speed of a car is related to the integer number of engine firing strokes per second: one cannot have a fraction of an explosion. Even the classic problem of water running into and out of a bath could be stated in terms of whole numbers of molecules.

When is a random number not?

When I asked my computer to generate four random numbers between 1 and 20 it replied with 8,2,5,17. I set them as a series:

$$y = 8 \ 2 \ 5 \ 17$$

$$x = 0 \ 1 \ 2 \ 3$$

and fed them into the program. The computer showed that the numbers are related to the expression $y = 8 - 10.5x + 4.5x^2$ and that the next number in the 'series' would be 38!

The program

The program is written in Microsoft Basic for use with the Z80 based Video-Genie computer. It occupies about 1.2k of memory, which could be reduced considerably by compression. In the absence of DIMension statements the size of the arrays D(N), E(N), X(N), Y(N) is automatically set to 10 and that of the array C(N,M) to 10*10. The program will therefore accept a sequence of up to ten numbers, as printed, and will require a further 0.8k of memory to RUN. This requirement can be reduced considerably by restricting the sizes of the sequence and of the arrays by including correspondingly suitable DIMension statements.

Lines 10-70 are self-explanatory

Line 80 determines the interval of finite differences between the x values.

Lines 120-170 calculate the differences between the successive y values, setting the differences as a new series of y values and repeating the process. The initial values of y and of the successive difference series are set into the array D(0) — D(N).

Line 180 establishes where x falls on the p scale, zero p falling on the first y value.

Lines 210-270 evaluate the successive terms of the relationship $y=f(x)$ and add them together to give the value of y .

As described above, the program deduces and evaluates expressions such as: $y=x+6x(x-1)/1*2+6x(x-1)(x-2)/(1*2*3)$

This expression is equivalent to the much more convenient and understandable form $y=x^3$. In writing a program to convert from one form to the other it is necessary to overcome the computer's inbuilt tendency to substitute numerical values for algebraic symbols. After all, the computer was designed to do arithmetic and not algebra.

Lines 300-560 are therefore a rather tedious way of reducing the first untidy algebraic forms into ascending power forms, and printing the result. If preferred, these lines could be replaced with a very much shorter version to print the relationship in the original untidy form. Note that Video-Genie language P[3 means P cubed.

COMMUNICATIONS

PCW welcomes correspondence from its readers but we must warn that it tends to be one way! Please be as brief as possible and add 'not for publication' if your letter is to be kept private. Please note that we are unable to give advice about the purchase of computers or other hardware/software — these questions must be addressed to Sheridan Williams (see 'Computer Answers' page). Address letters to: 'Communications', Personal Computer World, 62 Oxford Street, London W1A 2HG

Those factors again

In your May edition, a Mr Hunter asked how he might factor a large number. This drew a 'number' of well-meant but ill-informed replies to the effect that if (as suspected) Mr Hunter was looking for prime factors, it could take him about 10⁹ years.

In fact, recent progress in the application of number theory has increased the rate of testing for primality by a 'factor' of 10⁷. The products of 100-digit primes are no longer thought secure for encryption purposes.

Mr Hunter should contact Dr H W Lenstra (University of Amsterdam, tel 020-5259111), or even design his own method, based on the techniques described on p28 of ZX Computing Vol1 No 2, 1982.

Dr David Fisher, Cardiff

Fix wanted

I would be obliged if you could publish this letter as I am at present unable to obtain any advice locally. I have with me an Osborne 1 and Epson MX80 FT III which I consider to be excellent value for money. However I find that the 'Install' program is unable to make the best of configuring for my printer as Wordstar expects toggles where the Epson has separate control codes for turning on and off certain modes. Does anyone know how to Install for the Epson? Also, as an instructor in electronics I have to produce inserted graphs of sine waves, etc, in my notes. I have a Basic routine that prints them but it is very slow and cannot be patched to Wordstar... any ideas? I have a similar problem with calls in Basic as I don't know the best way to pass variables to the subroutine. What it is to be ignorant!!

It may not be commonly known that location 61281 contains the horizontal screen position during scroll and location 61282 the vertical screen position. It is necessary to divide the horizontal by 2, and there are offsets, but they allow a fantastic 3D space simulation with centralised aiming sights for those who like games. It is also much easier to poke direct to the screen RAM as per other

machines than to use the Osborne routine. Screen memory starts at 61440 as top left of normal screen. (A Basic listing is enclosed... rough and ready but gives a guide.)

Perhaps there is a users club in the UK who can find someone to act as a 'penpal' or should I say keyboardpal, as that is what I need here. I will be here for quite a while longer so the address above will hold good until Christmas at least.

Richard C. Ferryman, 208 Airport Hotel, P.O. Box 2012, Jeddah, Saudi Arabia

You are certainly not the only one with this Osborne/Epson problem Mr Ferryman. The fix is too involved to explain here, however it is documented in issue 1 and 2 of 'Portable Companion', the magazine put out by Osborne for its users. The first issue is free to all Osborne users, and subscriptions are available; Osborne UK will be sending you the relevant issues gratis — Ed'll Fix It.

Dots or brackets...

In response to your challenge (October 1982), I'd like to suggest a way of listing lists of lists of lists for Lisp without brackets. Logicians began using 'Dot Notation' before the inception of set theory. A century on, they are still ranting, enthusing and raving about how convenient and manageable this has turned out to be, and how clever they were to have thought of it.

Let's jump in at the profound end, with Mr Liardet's first example of Lisp data. Using dot notation, it looks something like this:
(SETQ PEOPLE ': BASIL
32 M . CYNTHIA 30 F
JOHN 28 M)

Here, the colon has the job of delimiting the scope of the quote mark — but see how clearly it divides the list assignment into destination and source. Whereas the action of the brackets is to bind elements together, dots act as element separators. They can be compared to ordinary prioritised infix operators: the more dots in a group, the lower the 'priority' of the separator, and the greater its scope (the size of chunk it governs in the list).

For a somewhat dramatic

illustration, consider next the definition of the function LENGTH:
(DE LENGTH . LIST :
COND : : EQ LIST NIL . 0
: : T : PLUS 1 :
LENGTH . CDR LIST)

If you don't think that makes the list structure a lot clearer, did you notice the printer's error in the original? There's an erroneous right parenthesis on the end of the second line.

Now to those lists of lists of lists. The simplest I can think of is a pair of pairs of pairs of atoms. Take your pick — brackets or dots?
(SETQ PAIRS '(((A B)(C D))
(E F)(G H))))
(SETQ PAIRS ':A B . C D :
E F . G H)

John Kerr, Glasgow

...Lisp or logo

Referring to Mr Kerr's letter suggesting that a Lisp interpreter would run faster if reserved words were to be tokenised and brackets removed, it must be made clear that to the interpreter a program, ie, a list, is represented as a set of linked pointers. The brackets are used to delimit lists only in the input/output routines. In Lisp not only are the reserved words tokenised, all words are! If Mr Kerr desires the elegance of Lisp without so many brackets, then I suggest he considers Logo which is Lisp-based and is friendlier in use. This leads me to my second point.

Mr Parr's Logo compiler written in Basic is an interesting program (though lamentably slow) but contains a bug which could confuse a beginner grappling with recursion. If a previously encountered function is again recognised by the compiler, the number of arguments is not fetched and at run time the function is called with wrong values. This occurs in the Branch program in the June 1982 Logo article. It can be fixed by changing line 9730 to read.
IF SY\$=PN\$(W) THEN
N=CP(N); RETURN
Ian A Stewart, Ealing

Spectrum bugs

Spectrum owners beware! There are at least two ROM bugs in my Spectrum, and presumably all others.

LET A\$='ab'+STR\$n+'cd' usually gives the correct

answer — eg, ab 12.3cd, but if 1)n/o the ab prefix is lost eg, 0.12cd.

Pause after INKEY\$ — generally the pause is reduced to zero, unless the pause is repeated (it works the second time).

Both these bugs can be irritating — and I would not be surprised if others crop up after I have used the computer more.

I have written to Sinclair about this, but have not (of course) received any reply. G G R Rutter, Woking

Thank you for your addition to the increasing number of Spectrum bugs, Mr Rutter. This machine certainly seems to have its share of idiosyncrasies — try hitting 'Caps Lock' or both shift keys together when the Spectrum gives a 'Scroll' prompt for a demonstration of one of the stranger bugs—Ed.

Safer downloading

Guy Kewney was right in his article 'Phone Foul-Up' in your October issue that transferring large amounts of data from one computer to another over the telephone lines 100 per cent correctly is a tricky business. There you are, having just transferred 12,000 characters down the line without the operator interrupting, only to find that the 1395th, the 6413th and the 11,999th are corrupted (except that you will never work up the energy to check them all — and doesn't that rather spoil the point anyway?).

That is why the Owl Micro-Communications telesoftware converter doesn't work that way! Prestel fortunately sends you one screen of data at a time. This is about 1000 characters. This is a reasonable number to expect to come down uncorrupted.

If it is corrupted, our program will notice because one of the characters will have a 'parity error'. We then use a useful Prestel command '*00' which asks for a repeat of the screen. Normally this repeat will be okay, but if necessary the program will try again and again until the screen arrives correctly.

We regularly bring down programs of 12,000 bytes reliably with our down-

loader in about five minutes. Perhaps Guy Kewney was using a 300 baud modem for it to take so long?

It seems to us that the CET telesoftware format (which our converter uses) is likely to be successful and appropriate for programs up to 20 kbytes in size, with someone watching the downloading to catch the very occasional snarl-up. For bigger programs or unattended operations, something more sophisticated is really needed.

As a final point, with all this interest in telesoftware, what about using the same system to transfer data? When will we see Visicalc data files on Prestel? There is no need for any technical changes, someone just needs to come along and use it. Mike Gardner, Owl Micro-Communications Ltd, Sawbridgeworth, Herts

Space defender

It is a shame that so much had to be left out of 'Brain Dump' in the October issue. In particular, I wish room could have been found to justify the dangerous use of a space as a mathematical symbol in GSB's arithmetic, since this can, as it does here, involve implicit axioms. It seems that the axioms should include (though one can't be sure):

space space = space
 space } = }
 } space = }
 } } = }
 space } = }
 } } = space

which are isomorphic to

0 or 0 = 0
 0 or 1 = 1
 1 or 0 = 1
 1 or 1 = 1
 NOT 0 = 1
 NOT 1 = 0
 respectively.

If this is so then GSB's arithmetic is nothing more than Boolean algebra and can hardly be said to be more fundamental.

Your article tries to allay the suspicion that *Laws of Form* is a crank book, and to encourage potential readers, but I must regretfully say 'Not convinced'. James Crrok, Cambridge

This is one of several letters from mathematicians who disapprove quite strongly of Spencer-Brown's work. His proof of the four-colour theorem is by no means accepted 'in the trade', and is as far as I know not officially published. Not being a professional mathematician, I do not feel threatened by the unorthodoxy of *Laws of Form*, nor do I feel that PCW readers are likely to come to much harm.

It is indeed a shame that so much had to be left out; I

obviously failed to make clear that 'space' is not a symbol, but precisely the space in which a cross stands. There is only one initial symbol, the cross, which indicates the marked state. The idea is certainly more fundamental than Boolean algebra, to the point where having to write it in ink on paper almost subverts its understanding. It may well be dangerous, but then so are flying and mountaineering. PS: Blackwells of Oxford have informed me that they are importing the book and it will be in stock soon —DP.

A use for VAL\$

Dave Tebbutt, reviewing the Sinclair ZX Spectrum in the June 82 issue of PCW, could not think of a use for VAL\$ — nor could I at the time.

It could be used if a string expression such as A\$ AND Q=0 occurred frequently in a program. The prologue would include LET Q\$= "A\$ AND Q=0" and the body of the program could then use VAL\$ Q\$ whenever the expression was needed. W E Thomson, Aldeburgh

Would be user group?

How's this for a thought? One is aware of the countless thousands awaiting delivery of mail order microcomputers and the need perhaps for some kind of club, whereby recognition of our common plight is secured and where we can air over various experiences.

In the case of the elusive Spectrum I suggest the wearing of a large lapel badge with an updatable number indicating the elapse in weeks since ordering — surrounded by stick-on stars representing the weeks since Sinclair cashed one's money without delivering.

In my own case I will sport a number 20 and seven stars. By the way — is this a record?

H R McCartan, Bracknell.

It might be... unless someone out there knows better? — Ed Rantzen

Dutch treat

Every Sunday evening, the Dutch radio transmits two computer programs in a sort of standardised Basic that can be understood by the operating system in most computers. The programs are sent in the listed form as purely ASCII characters, using 2400/1200 c/s as 1/0 indication, and transmitting 1200 bits per second. The time of the transmission is about 18.40 on MW 747 KHz.

I live five miles south of Copenhagen centre and have had success in receiving the

programs and transferring them to my computer (ABC 80) during the last three Sundays. As the distance from me to the transmitting station is about 400 miles, which is more than the distance to London, I think that this information will be of interest to you and your readers. The programs are in no way only beginners' stuff — programs as long as 10k have been sent.

Dutch radio has issued a booklet containing the protocol for the transmission system and translation programs for some of the most widespread computer types. You can get more information from Hans G Janssen, Hobby-scoop, Postbus 1200, 1200 BE Hilversum, The Netherlands. Frants Liisberg, Hvidovre, Denmark

What's up DOC...

We were interested to read, in your November issue, the letter — under the heading 'Horror DOC' — from Mr Kay of OCLC Europe. Presumably the spelling mistakes are not Mr Kay's fault (*Mea culpa* — *Sub Ed*) although the grammatical errors at the end of para 1 and in lines 2/3 of para 3 could be — 'I could only stand to read... Dear, oh dear! Most people read sitting down!'

However — his complaint is valid enough, even though it is a not unnatural consequence of the appallingly low standard of discipline and education which the Welfare State has managed to produce in the last 30 years or so.

When we started Moffat

Rose, we insisted on speaking and writing plain grammatical English with a minimal use of computer jargon. In writing our own programs, I was given the tedious and boring job of translating the verbiage into grammatical English. As we develop and improve a number of so-called standard programs, I have been appalled at the amount of muddled thought processes which appear in program manuals. Indeed, some of the paragraphs frequently make so little grammatical sense that even our computer staff find it difficult to understand what the author is trying to convey! A major problem is translating what is euphemistically referred to as 'Regional English' into plain, internationally understood English.

Aside from the above chore, we too believe that it is essential to provide a client with a disk-based self-teaching program which he can print if he wishes. In addition, we will modify it to include any points which a client may feel we have taken for granted.

This program is called Roseteach and is included free with systems which we supply. We do not supply hardware manufacturers' manuals, unless requested, as they tend to confuse the first-time or lay user. P Murray Lee, Moffat Rose Ltd

DATABASE COMPARISON THE STORY SO FAR

Kathy Lang pauses in her series of database evaluations to bring a comparison of the systems she's tested so far.

In this series so far I've looked at nine packages for managing files of information, ranging in complexity and price from Cardbox, a simple but powerful 'electronic card index' system running under CP/M and costing £155, to FMS-80, a complex and sophisticated system with its own programming language and costing (in its full version) £650. In this article I shall try to put together some of the qualitative information in a way which will make it easier to compare packages and also show the results of some Benchmarks to try and get some feel for comparative speed.

Benchmarks

It is important to remember when looking at the timings that these are only of value in comparing one package with another — they may not give any indication of how quickly a package will run on your system. The machine I used for the tests was a Sirius with 128k of memory and a Z80 processor card; all the tests on CP/M packages were run on the Z80 card under CP/M-80 with the exception of DMS, for which I used the native 8088 processor. I wouldn't expect that to make any significant difference when comparing DMS with the rest, as by far the major limiting factor in data management is disk access time, where the hardware is of course the same for both processors. Silicon Office runs only on the PET so to run those tests I borrowed a 80-column PET with two 500k disk drives.

The tests themselves were conducted using a test file of plain text data created by a Basic program. The purpose of this was to ensure a completely determined set of data identical to all the packages and relatively easy to transport to each system. The data file consisted of 1000 records containing seven fields and 46 characters, which were then imported into a file, where each record contained 21 fields, totalling 152 characters. This arrangement made it possible to test the package's agility at importing information from elsewhere and the efficiency of the storage methods (since part of each of the larger records could either be null or blank, depending on the file organisation). The tests were designed to cover

the major headings I've used in assessing each package. The results of each test are shown in a table under the relevant section, with an attempt at a qualitative assessment of the same facilities alongside. The purpose of the latter is to try to give some impression of the power and ease of use of the particular facility, as well as its speed.

Four of the packages I tried, Cardbox, Silicon Office, DBMSIII, and FMS-80, were able to read my file only if I wrote a special program (in any language, SO own, Basic, EFM respectively) for the purpose. DMS, dBaseII and Condor all had commands or procedures for the purpose, so a program wasn't needed. To import 'stranger' files into Aquila and Pearl requires a special one-off program which can be written only by its originators; apparently for Pearl this can be done only in the US. The Aquila writers agreed to do this for my tests but, unfortunately, neither their data file nor the new version of DBMS from Grama (Winter) arrived in time for this article, so I shall include those timing tests in a later article.

Data models

Most of the packages in this series call themselves 'data base management systems' but, unlike true DBMS, they are all basically single file systems. They thus do not vary tremendously in file organisation and methods of direct access to information. All hold their data either in linear files with indexes, or in relational files with or without indexes. (All that is meant by 'relational' here is that every field in the record is 'related' to every other, without any explicit hierarchy or network arrangement — in fact DBMS does use a kind of network to link records from different files together, but not within a single file.)

Five of the packages (Condor, dBaseII, DBMS, FMS-80 and Pearl) permit the linking of two or more files by keys, although the DBMS approach is rather unusual and requires more human intervention than the others. All the packages except Aquila, Cardbox and Condor use fixed length records and, with very minor exceptions, fixed length fields. Figure 1 shows the limit-

ations each package places on size of file, record, number of fields, number of records, etc.

Input and editing

All the packages require you to decide on at least an initial format for a data file before you can put information into it. I personally find the most satisfactory method of doing this is to 'paint' the format on the screen, in the way that most of the packages now permit (but not Aquila or DBMS). Some are easier to use than others — for instance, I found Silicon Office tricky because the start and end of field markers were very similar, and Cardbox's three-tier naming system I found very confusing. Once designed, and data inserted, the packages vary substantially in the ease with which you can add new fields. In Cardbox this is very easy; in dBaseII and Condor straightforward and in most of the others possible but more difficult and often slow. Figure 2 shows the time taken for each of the packages tested.

Reporting

Only Cardbox uses the same mechanism for designing printed reports and for screen formats. This method of 'painting' the format on the screen is great provided you can keep within the single screen space. The other systems require you to specify row and column positions for each field, heading, etc, with calculations to be performed where this is permitted. dBaseII is rather limited in its ability to display report formats, though whether many users would ever get past the complexity of design to actually use all the features FMS-80 provides I rather doubt.

Selection

It is, of course, very common to want to select records according to particular criteria and display or process them separately. I've used two measures of selection time: one uses two selection criteria and a simple sequential search (ie, no index is used), while the other uses an index and shows indexing as well as access time. Times for both tests

are shown in Figure 4. When comparing indexing time you should bear in mind the difference between dBaseII and Cardbox, which keep their indexes up to date as they go, and the others which only keep the index to the main key field up to date. You should also remember that both FMS-80 and DMS require you to set up a selection file first — you can't just ask for the selection and display in a single statement, and then modify your request in the light of the display. Condor is also rather inflexible, in that it creates a separate data file each time you request selection, even if you only want one or two records. In Silicon Office, you have to write a program for the kind of selection used in the tests (except when selecting on the key field), since the selection command does a sequential search of every field in every record in the file; my tests used a more discriminating method in a program, but it was still very slow.

Sorting

Here the packages vary considerably in whether you can, or need to, sort the whole data file, or whether sorting the indexes is sufficient to enable you to display records in a particular order. DMS probably has the best approach here: the data file is never sorted, but individual indexes may be created and sorted so that the records are displayed in any required order. In FMS-80 you may sort either data files or indexes, but creation and sorting of indexes are two distinct processes. dBaseII allows you to sort the data file if you need to — and you will if you want to select using non-unique keys and then display in key order. Cardbox doesn't have a sort feature, a curious omission in a package so oriented towards bibliographic and free-text applications — surely libraries need their records in author or title order? Figure 5 shows sort times with one 20-character field as the key. The figures shown are for sorting index only, data only, or both, as appropriate.

Adding single records to the file can be done directly — that is by specifying a key value, displaying the record on the screen and editing it there — in all the packages except Condor, which requires the creation of a transaction file which is applied without intervention from the keyboard. This is the approach which is recommended in FMS-80, but not enforced. Personally I think much of the point of an interactive system is lost if you have to think up possible problems in advance rather than being able to check errors as you go. A decent file-handling system should be able to make on-line updating sufficiently secure for the batch process to be unnecessary except in special circumstances. Figures for batch and for on-line updating are shown in Figure 3.

Indexing

Getting all the information in of course begs the question of how to get it out. All the packages (except Condor in its Levels 1 and 2 versions) have some methods of accessing particular records quickly, but they vary a lot in their power and flexibility. Silicon Office, DMS and FMS-80 require you to choose a primary key field and every record is indexed by that field. DMS and FMS-80

also allow you to create other indexes to permit fast access by more than one field but these are not kept up to date when the file is updated — you have to do this for yourself. dBaseII can keep up to seven indexes per file up to date 'on the fly'. These factors should be born in mind when looking at Figure 4, which shows the times for direct searching, since the indexing times are only significant if indexes have to be re-organised explicitly rather than being included as a (very small per record) overhead in the updating process. Cardbox is the most flexible of all in some respects, in that it permits indexing of all or any items (words) within fields

either automatically or on request from the person updating. However, once you have put data into a Cardbox file, if you decide later that you want to index a field which was previously not indexed, then this can be very tedious.

Screen display

Usually you can use the same features for designing a screen format for display and editing. Some packages, notably FMS-80, DMS, Cardbox and the later version of dBaseII, allow you to vary the formats so that some information is not displayed, or shown in different formats for different users. DBMS

Business Blueprint

THE VECTOR 4

From the small business to the large multi-national, Almarc provide one of the largest selections of quality business, scientific and industrial applications software available today, including:

Wordprocessing/Mailing, Financial Modelling, Solicitors Package, Financial & Arable Management, Printers Estimating/Costing, Phototypesetting/Wordprocessing Interface, Data Base Management, Estate Agents Package, Manufacturing Software, Critical Path Analysis, Motor Trade Package, Planning Application Monitoring, Estimating, Data Logging,

Graphics Packages, Business Accounting, Accounts Receivable/Payable, Payroll, Stock Control, Invoicing, Ordering, Purchase Control, Clothing Industry Software, Network & Resource Analysis, Job Costing, Insurance Brokers.

All available on probably the most advanced, 'New Generation', micro-computer system produced today.

The Vector 4, is an advanced 8/16 bit desk top computer. It allows you to take advantage of the existing 8 bit CP/M programs, while also providing 16 bit processing power. The future is built into the Vector 4, with its Z-80 and 8088 processors, 128K of main memory (expandable to 256K), 3 S-100 expansion slots and standard software facilities with high resolution graphics that are second to none. Floppy disc and hard disc systems are available.

At Almarc, we pride ourselves in our systems and our high level of customer support. We can offer back-up and training which is second to none, with 24 hour on site maintenance available in all areas.

DATABASE COMPARISON

(version III) allows you to 'tag' fields as protected for security reasons.

Calculations

Since Cardbox and Aquila handle only text data, they can't do calculations. All the others have some calculating facilities. Those in DMS and FMS-80 are quite powerful — except that you can't modify the order of execution of expressions with brackets! In terms of power and flexibility, dBaseII is easily the best of those I've looked at in this area. Figure 6 shows two tests on calculation. The first involves replacing one field in each record with a value derived from a calculation on another field in the same record. The second simply totals three accumulators to give the sum total of each of three variables.

Security

Important features are the ability to prevent unauthorised access to information, and to see what you've actually done in a session if something should go wrong. DMS and FMS-80 provide the most flexible approach to the first question, while DBMSIII has some comparable features. Looking at recovery

from error and detection of possible deliberate fraud, DMS provides a paper audit trail, though I couldn't find a way to store this on disk; dBaseII allows you to record in a file everything which takes place on the screen. Cardbox has an explicit Repair function should the data become corrupted in any way.

Tailoring

All the packages except Silicon Office and DBMS allow you to tailor the terminal interface to your requirements; SO comes already set up for the PET, and DBMS for whatever machine you've specified when ordering. Though some of the packages try to be helpful, this is still a very thorny area for anyone, especially the novice. I'd especially like to see every package make it possible to specify things like cursor movement codes by actually pressing the key concerned, then there's no mistake. Another essential feature is some confirmation that the tailoring has worked — before you leave the terminal definition part of the package. Also, the ability to edit an existing terminal definition, rather than starting from scratch, is another necessity. None of these packages did all these things.

As for tailoring the presentation of the package itself to your needs, this involves a sharp divide between the menu-driven packages and the command-driven systems. With the menu-driven approach, as used by DMS and Cardbox, if your application fits that method of working you're fine, otherwise you just have to fit yourself round the package.

Cardbox, particularly, would be even better if it had the ability to store search sequences for re-use, as Aquila does. In the command-driven packages like Condor, dBaseII and Silicon Office, you can set up files containing sequences of instructions to be executed as a group, including instructions for looping which give you the power of a programming language. You can use these features to construct menus of your own. Of the three, dBaseII is the most flexible, and the ability to call other 'programs' with parameter passing is very valuable.

FMS-80 combines these two approaches by providing menus for the simple things and a crude programming language for the more complex. However, unlike the other command-driven packages, the programming language is quite distinct in its syntax from the commands which execute FMS-80 procedures, and I found it quite difficult to use in anger — especially with the lack of comprehensible error messages. dBaseII is pretty unhelpful with its endless 'syntax error' messages, but FMS-80 often just stops and gives no clue as to why nothing has happened.

Relations with outside

Most packages allow you either to read files written by other programs, or to write files for other programs, or both. To do the Benchmarks I had to read an external file, and Figure 7 shows the timings for reading the file in, restructuring it to match my '21 field' format, and doing any necessary indexing.

Stability and reliability

One of the more cheering features of these reviews has been the level of reliability of most of the packages — there have been occasional glitches, but very few, and I haven't suffered any loss of data or programs during the running of the Benchmarks. In fact my complaints have been more the other way — that once you have started a process going, most packages prevent you from interrupting it in any way — so if you've made a mistake you've had it. FMS-80 takes the sensible line of asking for confirmation that you want to abort.

User image

Here I'm just going to touch on a few principles, because so much of this area is a matter of taste. Firstly, you need to know whether you prefer menu or command driven systems, and, if the former, whether your needs fit sufficiently one of the packages which only has menus, like DMS and Cardbox, or whether to go for a combined approach, like Condor, dBaseII and FMS-80. Whatever you decide, there is little substitute for giving the package a thorough road test yourself before you buy — though if the price is as low as £155, maybe you can afford to experiment anyway.

Consistency is, in my view, the most important element in the user image. You need to be able to generalise the way the package works, so that learning about one part makes it easier to use another. Personally, I found Cardbox,

COMPUTER SCRABBLE

Maggie Burton takes a look at a new game for the Apple II

Computer Scrabble, from Little Genius, is the first popular board game in the UK to be computerised under licence from its manufacturers, JW Spear & Sons who, naturally, own both copyright and trademark on the game. The package was originally devised by Peter Turcan of Turcan Research Systems Ltd as part of a PhD thesis on word structure and analysis. It runs on an Apple II with disks. Computer Scrabble was launched at the 5th PCW Show this year, with a contest for all-comers who wanted to put their wits against the highest level of the game.

Getting started

You begin by cold booting the Apple as usual and Scrabble loads straight away. The beginning of the program is a rather lengthy display of the name, who wrote it and who markets it — which, to be honest, I found rather annoying (simply because of its length) after loading it up a few times. A Scrabble board is then drawn on the screen along with an empty scoreboard and the computer proceeds to ask you exactly how you want the game played.

Options

The number of options is extensive, to say the least, I almost expected it to ask if I wanted it to sing, but it didn't go quite that far. Instead you can have one to four players in any combination of human and electronic, each one being assigned a name by the user for clarity. You can look at the computer's racks of letters if you want to and, if you couple this with a long delay in placing each letter in a turn, you can get a very good idea of what your electronic Thesaurus is up to.

One very useful provision is the allowance for a monochrome monitor. The game is really meant for use with a

colour TV/Monitor but if you only have black and white you need only specify this and the board changes, offering symbols to indicate the value of each square. Once you've learnt these it makes no difference at all to the game. The colour board is designed to look as much like the real Scrabble game as possible, using all the same colours in the same order.

You can also have sound effects if you want them. These don't make much difference to a game like Scrabble (unless you're the sensitive type and they spoil your game). Those provided here consist of short clicks each time the computer moves the cursor or places a letter. I did feel that the addition of a beep or something when each different turn came around would have made this option more complete.

The game

When you've answered all the questions about your game scenario you are instructed to turn over your disk and press 'Y' to load up the dictionary. I found the use of a double-sided disk rather unusual in a game but it works perfectly well. As soon as the dictionary is loaded up you go straight into play.

The dictionary contains 5000 words taken (with the expert help of Dr Alan Richter, a former British Scrabble champion) from Chambers'. I'm not being funny when I say it includes some very odd words indeed, at the same time rejecting words like 'mania' and 'cover'. It will, however, accept 'igloo', 'amen', 'loch' and 'ding'. I found this somewhat inconsistent ('igloo' contains as many vowels, for instance, as 'mania'), but it's fun all the same and it injects a healthy dose of character into the computer's play.

As an aside, I did discover (very easily) that you can cheat flagrantly without any difficulty at all. When it's

your turn, you type in your word under the board, press return and then use the keys 'I', 'J', 'K' and 'M' (their positions on the keyboard explain which directions they control) to position the cursor where you want the first letter of the word to be. After this, you press 'A' or 'D' for across or down and the computer tells you what the word would score. You then have the option of rejecting it if it's not high enough. You can, if you want, type in your whole rack, place it in a legal position and wait for the computer to challenge it as nonsense. I typed in 'ELIP-QOO' (score 96) and, when challenged, replied with 'ESC Y' which forces the computer to accept your decision as final. This is really only intended for words like 'mania' which are in Chambers' but not in the computer's dictionary. Words like this are not, fortunately, added to the computer's vocabulary.

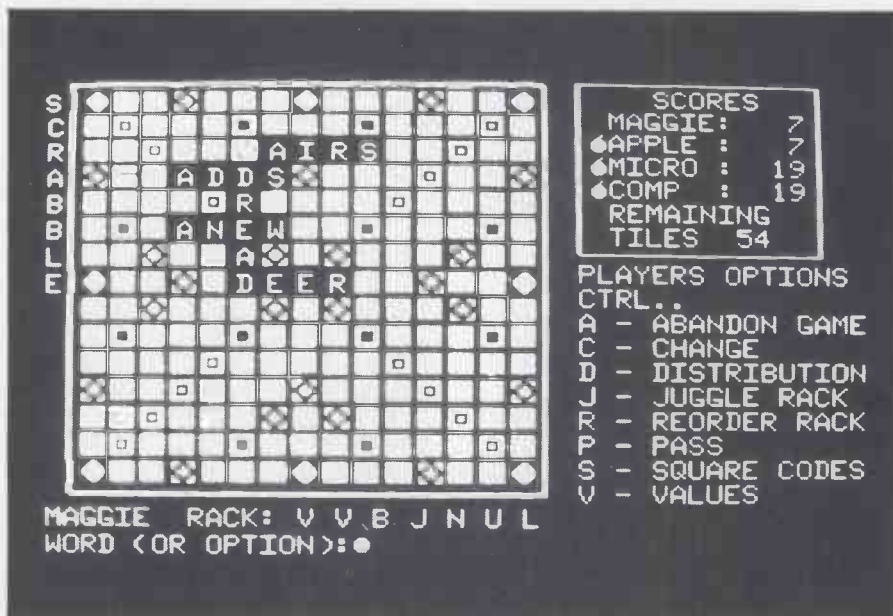

Another little tip is to make frequent use of the playing option which allows you to juggle your letters around. This can give a great deal of inspiration. The playing options are only available when it is your turn.

Conclusions

As I never normally play Scrabble I thought this game wouldn't be a particularly enjoyable one to review. To be honest, I was wrong. It's thoughtfully put together and fun to play — much more so, in fact, than playing Scrabble with people. The observation must here be made that I've never come across four people playing a game amicably sharing one keyboard — it's not the sort of thing you can pass around between turns. Our old friend the Apple II can play a demonic game and I only managed to beat it once on the hardest level (on which it scores an average of 300 points) although the lowest level of four is a fair challenge to the average adult. It's 'thinking' time is rather long but this only serves to make you feel at home. It takes about as long to make its moves as a talented player would which, coupled with some friendly humming and clicking of disk drives, makes for quite a homely game.

At £24.95 it'll make a fine Christmas present for a brainy son/daughter, although I do feel that the price will put it out of some people's range. Nevertheless, it's worth saving up for as it's the kind of game which lasts years rather than weeks. As it's not directly available from Little Genius their phone number is not included here. The game has been available to Apple dealers since September 9th and there should be several shops stocking it by now. Little Genius has plans to introduce versions of the game to run on other micros. Systems presently under technical review are: ZX Spectrum (which is the most probable second micro for this package), Atari, BBC Computer, TI99/4A, Dragon 32 and the Commodore 64. An 'advanced version' is also planned but details on this are as yet unavailable.

END

This is what the display looks like in the middle of a game. The board shows the symbols used with a monochrome monitor.

SCREENPLAY

Dick Olney looks at games for

the Tandy Color Computer.

The TRS-80 Color Computer has been around for about a year now — in fact Steve Withers Benchtested one of the first few machines in the country in the September '81 issue of *PCW*. The system I used included 16k RAM and extended Basic (which is essential for all the cassette games); this sells for £369 including VAT. All of Tandy's proprietary games come as plug-in ROM packs, but for all the others you'll need a good cassette deck. In addition many of the games use joysticks, which cost around £20 a pair.

The computer itself is a pleasant looking machine with the standard Radio Shack grey plastic casing. It has a calculator style keyboard whose keys give a reassuring click when depressed. Tandy Extended Colour Basic has four graphics modes and can produce eight different colours. Only four colours can be used at any one time, however, since the two relevant graphics modes operate under either one of two different colour sets. In addition, the highest resolution mode is two-colour only (black/green or black/buff). The powerful 6809 processor is certainly under-utilised in a system of this size, but the Color Computer can be expanded to 32k RAM and will take up to four mini-disk drives (153k each).

The worst aspect of this otherwise attractive set-up was the Japanese joysticks. The fire buttons rely on a thin

metal disk of a shape designed to complete a connection when pressure is applied. This disk is constantly losing its shape and hence its spring, rendering the button permanently active. The problem can be temporarily alleviated by carefully disassembling the whole unit and bending the metal back into an appropriate shape, but it re-occurs with relentless insistence. With a bit of imagination some other small metal object might prove more effective than the disk, but I can't help feeling that Tandy should have come to that conclusion already and acted upon it.

As if this wasn't bad enough, I managed to shear the stick itself away from its screw mounting whilst engrossed in a game of *Berserk* (see review). I admit that it is easy to be inadvertently heavy-handed on such occasions, but I've used a good many different joysticks over the past year and have never broken one before.

Tandy has insisted on retailing the Color Computer itself and, perhaps as a result of this, there are few

sources of external software in this country. This is a pity since Tandy's own selection of games is rather weak on the whole when compared with those I was supplied by Microdeal.

I should mention that I also got to borrow one of Tandy's new four colour plotters, designed to be used with this machine. Using a rotating barrel containing black, blue, red and green pens to produce text or graphics, it can easily be accessed with a Basic program to describe figures and diagrams on hard copy, with the only notable omission being a circle function. This impressive peripheral sells for a very reasonable £150, inc VAT.

On the whole the TRS-80 Color is a well designed machine (with plenty of attention given to minor essentials like a long video lead) although its price brings it in line with machines like the Atari 800, which are rather too pricey for the mainstream home games market. It's a pity that Tandy itself hasn't done more to encourage external software in this country (like stock it in their shops!), especially as I gather there's so much of it available Stateside. The home computer market in this country is changing rapidly, with more and more high street shops stocking popular models and my advice to Tandy is to adjust their marketing approach accordingly.

Game: Galax Attack
Supplier: Spectral Associates
Price: £8.00

This is, of course, yet another version of that infamous arcade game *Galaxian*. Four rows of three different shaped aliens sit above you *Space Invaders* style and swoop down in small groups; like *Berserk*, the titles are in colour and the actual play in black and white. The game is for one player who uses the right joystick for movement and firing. Personally I would have found the keyboard easier and I'm surprised that this isn't given as an option.

There is the opportunity to enter three initials at the outset of each game and the top five scores are displayed at the end. There is no skill level option, but play is fast and smooth and should

present a challenge to the most enthusiastic *Galaxian* freak.

Unfortunately the shoddy Tandy fire button is rather inadequate for a rapid fire game of this type and needs constant adjustment, which is very irritating. Nevertheless this is a reasonable copy of a classic game.

Game: Wildcatting
Supplier: Tandy
Price: £17.95

With Tandy's headquarters being in the heart of Texas, it's not altogether surprising that this new management game is based on the oil business. Up to four players can take part with their names being entered at the outset. As in all good games of this type each turn consists of several phases. First you choose where to drill your well by moving the cursor around a blank dark green screen. Movement can be achieved either by using the joysticks or with the cursor control keys (you specify which at the beginning). Having chosen a likely spot (by pressing the fire button/space bar) you are presented with a surveyor's report, giving you the probability of striking oil, the cost of drilling per

metre and the taxes you will pay each week (ie, turn).

At this point you must balance up the available information to decide whether to drill or not. Even with a high probability, the site may turn out to be a dry hole — and since a well will only produce income greater than its taxes for a limited period of time even a costly successful drilling can easily result in a significant loss. Choosing not to drill costs you nothing, but then you'll not make anything, either.

If you decide to go ahead you are presented with a simple but impressive picture of an oil tower, and a shaft driven into the ground by repeated depression of the fire button. Striking oil

SCREENPLAY

results in a roaring gusher, while failure is rewarded with a deep buzz. In the final phase you are shown a list of all the sites you have investigated with details of their original cost, weekly tax and projected earnings before the next turn. Those mines which you own are marked with a coloured square, and can be sold for one half of their original cost. The idea is to sell each mine before its income falls below the level of tax, and then hopefully end up with a net profit...

Each site which has been investigated

appears on the initial map as a square whose colour represents the oil probability. Since these colours tend to form a concentric pattern the most fruitful areas become more apparent as the game progresses. A game lasts for 13 turns (or weeks), at the end of which the entire map is displayed along with each player's balance sheet.

It is possible to accumulate scores (that is, game profit or loss) after several games, making for quite a lengthy competition. Wildcatting is not as complicated as it sounds though it is well

thought out and could provide hours of entertainment for the right audience; that being children of around seven to ten years old. Most adults would, I feel, tire of it quite quickly since it involves neither coordination nor any real intellectual challenge.

Game: Berserk
Supplier: Mark Data Products
Price: £19.00

A game for one or two players, Berserk is based on an increasingly familiar

scenario. Using the joysticks you control a character who can move and shoot in eight directions; his task is to roam a series of interconnecting rooms destroying hordes of insane and deadly robots. Touching any of the walls or obstacles, or being hit by robot fire, results in the loss of a man (each game consisting of the standard three tries); In addition you are being chased by 'evil Orville', a little smiling face, who can move through walls and will kill everything he touches while remaining impervious to your fire.

The robots become more numerous and deadly as the game progresses, though their shooting is completely random so they frequently destroy each other (for which you are accredited points). Berserk is a good arcade type

game, but is quite difficult to play, being responsible for the demise of the joystick I mentioned in the introduction. The graphics are excellent, though in highest resolution mode and thus black and white only (except the score card and intro which are in bright colours). As with many games for the Tandy, however, it's quite expensive as cassette games go.

Game: Dino Wars
Supplier: Tandy
Price: £17.95

I couldn't resist reviewing this one, even though it's been around some time now and I'm sure many readers have already seen it at exhibitions, etc, or own a copy if they happen to be

Tandy users. Joysticks are essential for this game, which is for two players. Each controls a dinosaur whose goal is to bite his opponent on the back of the neck. The dinosaurs roam a rather barren landscape with the odd cactus thrown in.

The creatures are brilliantly portrayed, though rather cumbersome to manipulate (added realism?), especially as it takes quite a while to get used to the perspective. When you have steered your dinosaur into a good position to attack, you press the fire button causing the beast's mouth to open (with a loud bloodcurdling roar). A successfully chewed victim falls to the ground with a few whimpers and a not particularly sickening thud.

Each player starts with 100 points and loses 20 for each wound received. Walking into a cactus also knocks five points from your score. The playing area continues off screen

with a wrap-around effect, and it is quite possible to do battle when neither dinosaur is actually visible! The cacti make this manoeuvre dangerous, however, since clearly it is impossible to avoid them.

When a player has no points left, his dinosaur retreats into the distance whimpering pathetically, and the game ends. Dino Wars has good graphics and excellent sound effects. It is hardly the most complex or stimulating of games, but is nevertheless an inspired piece of lunacy which will appeal to anyone with a sense of humour. I'm not sure, however, whether that appeal would be lasting enough to warrant paying out the twenty quid it'll cost you.

Game: Color Scarfman
Supplier: Cornsoft
Price: £11.95

Having been assured that software

copyright laws are much stricter in the States I can't help wondering how this American Pac-Man rip-off slipped through Atari's net. To add insult to injury, Scarfman is actually copyrighted by the Cornsoft Group in Indiana.

The standard maze takes up only two-thirds of the screen, with the score displayed at the bottom — a pity since it restricts the total playing area unnecessarily. There are five energy dots (plus signs in Scarfman) and five pursuers, who look like red laser bases. Either the joysticks or the keyboard can be used to control movement; and the maze remains the same throughout the game. The 'red monsters' remain vulnerable to gobbling for quite a long time in the first few games (they turn blue), giving

you plenty of time to clear areas of dots, but this decreases as the game progresses.

Scarfman is fast moving, giving good responses, but is very straightforward indeed and is probably the most uninspired Pacman copy that I've seen. Still it is the only version I know of for the Tandy Color, so if you want a version of Pacman for your machine I'd suggest you get in touch with Microdeal soon while it's still on the open market!

Game: Escape
Supplier: Tandys
Price: £8.00

The blurb about this game describes it as a 3D maze adventure and it is just that. The maze represents the top floor of a building on which you are trapped, and is depicted in classic 3D maze style — remember it's the graphics that are 3D not the maze itself. Colour is used well here to produce the most convincing

maze graphics that I've seen, with movement and turning being dealt with particularly well (the latter executed through the cursor control keys).

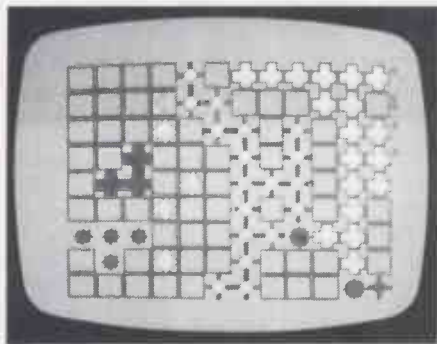

The only way to escape from the maze and thus solve the adventure is via an elevator, but attempts to use this without the right key result in you plummeting to certain death. Your task, therefore, is to investigate the various rooms and derive the necessary key from the clues contained therein. Most of these are presented as obscure riddles which should keep you guessing for many a long hour.

I have to admit I was sent the solution, which will shortly be made available to those who feel they would otherwise remain trapped forever. Without giving too much away I would offer a brief clue and a snippet of advice. Firstly remember that Microdeal is merely licensed to distribute this game, which was originally written by Colorsoft in the States. You should try to visit *all* the rooms before giving too much thought to the clues, since several

of them rely on each other for their meaning.

This is in a different format to the usual adventure, with no monsters to kill and no treasure or useful objects to pick up, and is of a type which I can see becoming immensely popular. Though one could hardly describe it as a 'graphics adventure' the incorporation of a maze is an excellent way to present this particular puzzle (it also has a very interesting use of sound). You'll need a bit of patience to find the solution, though there are a few fairly easy clues to quell your frustration. Bear in mind, however, that the game is rendered worthless as soon as you've convinced the elevator to work and thus — as with other adventures — it's difficult to assess the value for money of this game.

Game: Colour Space Traders
Supplier: Spectral Associates
Price: £8.00

Although this game certainly is in colour the graphics do not play a particularly important part and it seems strange that the fact should be stressed in its title. Up to four players can take part, and the game involves building up intergalactic shipping companies. At the beginning of each turn a nine by twelve grid of squares appears on the screen. Some of these contain stars, indicated by red circles. Five of the squares flash red and blue accompanied by an extremely irritating little tune. A triangular marker can be moved between the squares by pressing the space bar. When the M key is pressed an outpost is set up in the current position of the marker.

The positioning of outposts is a vital part of the game and can have a number of results. If it is in a square adjacent to a star, or another outpost (not diagonally) then a new company is formed, heralded by a noise like a factory hooter and a 'news bulletin'. A player responsible for setting up a company automatically owns five shares in it, which are worth \$100 for each square the company occupies or \$500 for each occupied share adjacent to a star. If an outpost is set up next to an existing company it becomes part of that company and adds to the value of its shares..

When two companies are joined by a new outpost, the one with the highest share value envelopes its neighbour. At

this point the holders of shares in the company which has been taken over are given half as many shares in the new company plus a cash bonus derived from the original share value. Up to five companies can exist at any one time and are denoted on the chart by various coloured symbols (you'll have to remember which symbol is which). In addition, if a company's share value rises above \$3,000 its shares are split two for one — that is, all players' holdings are doubled and the price is halved.

After setting up an outpost players are given the opportunity to buy shares in any of the existing companies, regardless who was responsible for their inception. The cash made available to do this depends on quantity and value of current holdings. Each game lasts for 48 turns and the winner is the player who ends up with the greatest stock value.

I managed to work out the mechanics of the game fairly quickly, but devising a realistic strategy proved rather more difficult. Building up the value of a company in which a reasonable number of shares are held will

increase the cash made available at the beginning of each turn. On the other hand, buying as many shares as possible in a small company while the shares are cheap, and then causing it to be taken over, yields high dividends in both share value and cash.

Space Traders is one of the most interesting games of its type I have played and is thoroughly recommended to anyone who likes this sort of thing. The considerations involved are subtle and complex enough to provide many interesting games, though it does take a while to master. I suggest it would prove rather too obtuse for very young players, and is probably best suited to a teenage or adult audience (compare 'Wildcatting' in this review). At this price, this game is almost certainly the best value for money I've seen on the TRS-80 Color, even though the program itself (written in Extended Basic) is fairly straightforward.

'It used to be notes up the chimney asking for train sets — now it's all printouts requesting expansion interfaces and floppy disk drives.'

LEARNING THE 68000

Mike Curtis checks out Motorola's powerful new MC68000 'Educational Computer'

Many years ago, more than I care to think about now, my first introduction to the world of microprocessors was a MEKD1 Motorola 6800 development system. It came on a 250 x 150cm board and, along with the 6800 processor, it contained a massive 256 bytes of RAM, 4 parallel ports and one serial port, and the notorious MIKBUG

ROM. Hooked up to a battered old ASR33 teletype it gave hours of enjoyment and education. It is surprising what you can do with 256 bytes! I have been a fan of Motorola processors ever since. The world has moved on a bit since then, and the latest offering from Motorola is the MC68000 Educational Computer; this comes in the form of a

265x165cm board and contains 32 kbytes of RAM, organised as 16k words of 16 bits, one parallel, two serial and one cassette port, and 16 kbytes of ROM containing the Tutor operating system.

It is interesting to note that, despite all the development that has gone on in the time between the introductions of these two products, one important feature remains exactly the same; the combination of the 14411 baud rate generator and 6850 ACIA to provide the serial ports. The 6850 is an excellent chip, though showing its age now, and it was probably included for economy; but a state of the art machine like this should have included a 16-bit component (with combined baud rate generator). The 6850 in fact occupies a full two words in the memory map as opposed to two bytes in an 8-bit system. To make matters even worse, Motorola has actually used Japanese versions of the 6850!

The 68000 itself is an impressive 64-pin chip — this board uses the 4MHz version but there are other variations going up to 12.5MHz. The slower version is used here because this board is not intended as the basis of a full scale computer system, but as a stand-alone educational system for those people and institutions who are interested in using a 68000 system and exploring the capabilities of the chip. The other major components on the board are a 68320 PIA to provide the parallel port (this is a 16-bit component), 16 4116s to provide the RAM and two 64 kbit ROMs. There is a lot of TTL — no ULAs here — and two push buttons; a black Reset, which re-performs system initialisation, and a red Abort, which simply returns control to the operating system leaving registers and memory intact. Connections to the board are by means of four edge connectors for the various ports and four 'banana' sockets for the power supply: ground, +5, +12 and -12 volts. The user must supply his own power supply and RS232 terminal which connects to port #1. There are jumpers provided to set the baud rate individually for the two RS232 ports. The manual makes it clear that the second RS232 port is intended for connection to a host computer on which software can be developed using a cross-assembler or cross-compiler and then downloaded onto the board itself. Cross-assemblers and compilers are available for a number of machines, notably DEC minis and Motorola's own 6800

A crowded board — but spotting the processor shouldn't be too difficult!

and 6809 systems. The board is well designed and of the high quality that you would expect from Motorola — it is a three layer board with one set of tracks sandwiched in the middle.

Informed opinion has backed the 68000 as the eventual winner in the 16-bit stakes, though in this country the Intel 8086 seems to have got a head start. We are only just getting the large systems such as the Wicat, which have been available in the States for some time. The 68000 is really a 32-bit processor, though it uses a 16-bit data bus — there is even a version with an 8-bit data bus, which seems to be rather restricting the capabilities of this powerful processor. I understand that there may well be a variant in the future with a full 32-bit data bus; one of those running at 12.5 MHz will be definitely worth at least an arm and a leg.

The 68000 breaks away from the Motorola tradition of accumulator, index registers and stack pointers to give 16 general purpose registers, though these are split into eight data registers, D0-D7, which are perhaps generalisations of the accumulator concept, and eight address registers, A0-A7, which are more like generalised index registers, with A7 and a parallel but normally inaccessible register A7' acting as stack pointers. Most operations can be performed on all 16 registers but, for example, byte operations cannot be performed on address registers, and data registers cannot be used in some forms of address modification. All registers (apart from the 16-bit condition code or status register) are 32-bit. Current versions of the 68000 do not support a 32-bit address bus, though this again may be a future development; however, the 24 bits available do give a possible address space of 16 megabytes, which should satisfy most people. The physical address bus in fact carries only 23 lines; this is because, although the 68000 will address individual bytes, memory access is always done using 16-bit words; the least significant address line A0 only exists internally within the processor and is used to refer to the individual bytes within a word once it is in a register.

Connection of an RS232 terminal is straightforward enough but there always seem to be problems with the supposedly standard interface; the data in and out lines 2 and 3 needed to be interchanged for my terminal to work and this particular interface needed the DTR handshaking signal from the terminal, which neither my own terminal nor the other ones I could obtain provide. It can be tied up to +5 volts, however, and after wasting some time with a jumper to ground the computer eventually sprang to life with the message 'TUTOR 1.2>'.
The Tutor operating system gives a comprehensive set of commands to examine and modify registers and memory, set and remove breakpoints, single step through programs and control the various elements of the system. When examining and modifying memory locations there is an assembler/disassembler option which allows programming directly in assembly language; the 68000 has a very comprehensive instruction set along with a great variety of addressing modes; consequently it is

not really practical to program directly in hex as can be done with most 8-bit processors. The minimum size for an instruction is eight bytes and many instructions need the full eight bytes! This is not a true assembler; it does not allow labels, so branching has to be done to absolute addresses, or the correct offset calculated, and there is only one directive 'DC.W' to set a one word data constant. However, it does make the task of programming much easier.

The assembler is a subset of Motorola's own standard assembler rather than a custom design for this board. This produces a couple of minor niggles: the assembly mnemonic has to be preceded by a space to indicate no label field, even though labels are not

allowed, and the assembler takes decimal as the default number representation with hex values preceded by a \$ sign, whereas the rest of the operating system takes hex as the default and decimal numbers have to be preceded by an & sign. This latter problem is eased somewhat by the provision of a DC (Data Convert) command which converts between decimal and hex, though it can still be irritating to have to quit in the middle of writing or running a program to convert from one to the other before restarting.

There is not sufficient space here to go into the details of the 68000 instruction set but there are a number of noteworthy features:

Most instructions can operate on bytes, words (16 bits) or long words (32

Command	Description
.A0—.A7	These commands without parameters will display the contents of one of the address registers; if a value or numerical expression is given as a parameter then the value is placed in the register.
.D0—.D7	Display or set the data registers.
.R0—.R7	Display or set the Program Counter.
.PC	Display or set the Program Counter.
.SR	Display or set the Status Register.
.SS	Display or set the Supervisor Stack Pointer.
.US	Display or set the User Stack Pointer.
BF a1 a2 w	Block Fill from address a1 to a2 with word w.
BM a1 a2 a3	Block Move the block from a1 to a2 to start at new address a3.
BR a1	Set a breakpoint at address a1. The option ;n will cause the breakpoint to be passed n times before a break occurs.
NOBR	Removes breakpoints.
BS a1 a2 d	Block Search the memory from a1 to a2 for data d, which may be a literal string or a numerical value. A numerical value may be masked by a bit pattern and there are byte, word and long word options (;B ;W or ;L).
BT a1 a2	Block Test of memory between a1 and a2.
DC e	Data Convert a numerical expression e.
DF	Display Formatted registers; this is done automatically when tracing or at breakpoints.
DU a1 a2	Dumps memory from a1 to a2 in Motorola S format. The DU may be followed by a port number — eg, D04 will dump through the cassette port.
GO a1	Executes a program starting at address a1.
GD a1	As GO but ignoring breakpoints.
GT a1	Commences program execution at the address in PC, setting a temporary breakpoint at a1.
HE	Help — gives a list of all commands.
LO	Loads S-formatted records; this may include a port number — eg, LO4 would be used to load a cassette tape, LO2 (the default) to download from a host.
MD a1 c	Memory Display a total of c bytes starting at a1. This will normally give hex and ASCII values but with the ;DI option it will disassemble giving hex and mnemonics.
MM a1	Memory Modify starting at address a1, locations can be left unchanged or modified. Normally as each location is dealt with it will automatically move on to the next; the order may be reversed by entering and the function is terminated by a full stop. The ;DI option may be used to enter data in assembly mnemonics and other options allow data in words and long words as well as odd addresses or even addresses only.
MS a1 d	Memory Set starting from address a1 with data d, which may be hex or an ASCII string.
OF	Displays the contents of the offset registers R0-R7.
PA	Printer Attach, copies all screen output to the Centronics printer port.
NOPA	Displays the printer.
PFn	Display or set characteristics for serial port n (1 or 2) — eg, number of start and stop bits.
RM	General register display and modify.
TM	Transparent mode connects the two serial ports together so the terminal communicates directly with the host.
TR	Trace, single steps through a program starting at the current PC value.
TT a1	Inserts a temporary breakpoint at address a1 and traces to that point.

LEARNING THE 68000

bits) by the addition of .B, .W or .L to the mnemonic, with word being the default in most cases.

Absolute addresses in instructions which refer to words or long words must (obviously) be even.

The MOVE instruction is a general purpose load and store instruction which takes the form 'MOVE source, destination', where source and destination may be registers or memory locations, or immediate values in the case of the source. Taking into account the different addressing modes this gives a staggering 12,288 different options in this one instruction.

Many of the addressing modes allow auto increment or decrement on an address register by 1, 2 or 4, thus allowing easy access to tables of bytes, words or long words.

The DBcc instruction (cc can be any of the usual conditions LE, LT, GT, etc), which takes the form DBcc Dn, r, will automatically decrement the data register Dn and perform a relative branch to r bytes from the current address where r is a 16-bit quantity. This gives a useful loop primitive.

There is no simple indexed addressing mode — instead there is a BASED mode where a 16-bit offset may be added to a base address in an address register; and a BASED INDEX mode where an 8-bit offset within the instruction may be combined with the contents of any of the 16 registers and the base address in one of the address registers. These give easy access to data structures other than arrays, such as linked lists.

There are MUL and DIV instructions which will multiply two 16-bit quantities to give a 32-bit result and divide a 32-bit quantity by a 16-bit divisor, giving a 16-bit result.

There are two particularly useful variations on the MOVE instruction; MOVEP, which can be used to move values to a peripheral interface, where by virtue of the absence of an A0 address line the registers within the interface chips will be only on even addresses; and MOVEM, which can be used to move multiple registers to a block of memory.

Some instructions have a short (.S) or long (.L) option, depending on

whether the full 24-bit addressing is used or a shortened 16-bit addressing. The use of the shortened form gives a more compact object code, and is especially useful for systems which are only using a maximum 64k address space. Some instructions using a small immediate value (three bits) can use a special form with a Q suffix which places the immediate value in the same word as the opcode — again saving space.

The 68000 chip can operate in two states, user and supervisor; there are some 'privileged' instructions which are effective only in supervisor state. This is to enable the processor to perform memory management functions as the heart of a multiprogramming system. The state is determined by the condition of some of the high order bits in the condition code register.

The 68000 has a comprehensive system of traps whereby most types of errors, such as trying to access non-existent memory, division by zero, or illegal opcodes, cause control to be passed through a number of vectors into the operating system. There is a TRAP instruction which causes a software trap to occur and this, rather than the more usual direct jumps or subroutine calls, is used to communicate between a user program and the operating system. Tutor uses exclusively TRAP #14 for this purpose, and by moving the appropriate function code into D7 calls can be made to a variety of operating system routines — to handle input/output, for example. The following sequence of instructions is necessary to return control to Tutor:

```
MOVE #K228,D7 (moves the immediate value 228 to D7)
TRAP #14
```

Other calls may require additional parameters to be placed in other registers.

The Tutor operating system incorporates eight pseudo registers, R0 to R7. These contain offset values which may be added to any address given in a command; thus assisting the development of position independent code. For example, the command MD 1000+R5 would give a memory dump starting at address hex 1000 plus the contents of R5, so if R5 contained 2000 the dump would start at hex 3000. R7 always

contains 0 and by default R0 is added to every address. If, for example, R0 contained 1000, the command .R0 0 would not set R0 to 0 as you might expect since the current value of R0 would be added on and would hence be unchanged; however, .R0+R7 would have the desired effect.

The Tutor commands shown in Table 1 take the general form: mnemonic <parameters> ; <options>

This comprehensive set of commands makes programming a relatively painless task; the trace and breakpoint functions help debugging, and the ability to single step through code, displaying the contents of registers and memory when appropriate and running quickly through sections of code which do not need to be examined in detail make this an ideal educational machine.

The short program in Figure 1 multiplies two 32-bit numbers by repeated addition, and illustrates some of the features of the language. It is entered after the command MM 1000;DI. The two arguments should be in D0 and D1, and the result will be in D2. The sequence of commands to run the program is;

```
.D0 n1
.D1 n2 (n1 and n2 are the two arguments)
GO 1000
.D2 (to display the results)
```

The documentation supplied with the Educational Computer is quite impressive, despite being a preliminary copy. Motorola's own book on the 68000 processor gives detailed explanations for all instructions and addressing modes as well as the instruction manual for the Educational Computer. It assumes a fair degree of knowledge already, but then this is not a system for absolute beginners. The only real lack was a source listing system, but I understand that copies are available free from Motorola when the user registration card is sent back.

The MC68000 Educational Computer does not set out to be either a stand-alone machine or the basis of a larger system. It sets out to provide, preferably when connected to a host computer, a suitable environment for learning about the 68000 and its instruction set. As such, it does its job admirably. It costs £510, which is not particularly cheap, so I would not expect queues of hobbyists waiting to get hold of the latest technology. There are, however, many companies and educational institutions for whom this will be a cheap and convenient way of educating people in the use of one of the most powerful processors around in preparation for the day when systems using this chip may well be as common as those using the 6502 today. It is also a useful tool for those wishing to learn a modern assembly language.

The MC68000 Educational Computer can be obtained from Thame Components Ltd, Thame Park Road, Thame, Oxon OX9 3XD; telephone 084 421 4561.

WE WISH YOU A MERRY CHRISTMAS. AND

The microcomputer is a Santa Claus machine that will speed up the world's productivity.

And end the recession forever.

Unfortunately, not all the machines on the market are up to this historic task. Fortunately,

there's the iotec 'iona', with 64K of available memory built-in.

It's expandable to an unbeatable 960K. And it has the unique, quick-start 'io' key that makes it easier to use than any other microcomputer.

OFFER YOU A PROSPEROUS NEW YEAR.

The 'iona' is also the only machine in its class to offer colour as standard.

All this intelligence comes gift-wrapped in a professionally-designed metal cabinet. Inside and out, it's the best microcomputer you can buy.

Contact us for the address of your nearest iotec dealer.

And have a very prosperous new year.

IOTECHNOLOGY PLC, 4 PLAYHOUSE YARD, BLACKFRIARS LANE,

READ ALL ABOUT IT!

Steve Mann casts an eye over the first batch of Spectrum instruction books

Let me start by saying that I received these items with a fair amount of cynicism. I was certain that there was a bit of bandwagon-jumping going on here. After all, the ZX81 had provided a very good living for all sorts of peripheral manufacturers and publishers and, with the launch of the Spectrum, I'm sure that publishing houses all over the country were calling meetings and saying, 'Look, there's obviously a market crying out for product here. We did okay with the ZX81 — let's tart up some of that material and get it out pronto before someone else cleans up.'

Don't get me wrong — I'm a whole-hearted devotee of the quick buck and, indeed, but for an overwhelming indolence, I would have been tempted to have been out there jostling in the marketplace myself. But, anyway, I was suspicious, and not predisposed to rave about any of the early Spectrum material.

In the event, I was pleasantly surprised. Although there may be nothing here that's astoundingly innovative, the standard, in most cases, is more than adequate. The speed in which these books appeared on the shelves is also indicative of the vast improvement in turn-around times in the publishing industry these days — much of this material has been available for some months now.

I was also impressed with the accuracy shown in the program listings. With very few exceptions, all the programs I tried ran first time, and what mistakes there were — a repeated program line in one instance, a GOTO 25000 instead of 2500 somewhere else — were obvious and easily amended.

So, anyway, let's assume for the sake of argument that you have actually received your Spectrum. You've waded your way through the sometimes incomprehensible, sometimes downright misleading Spectrum manual, and you want more. You want more program listings, and you want more hints and tips on how to get the most out of your new machine. What benefits are you likely to get from the material here?

The Cambridge Colour Collection — 20 Programs for the ZX Spectrum: written and published by Richard Francis Altwasser, £6.95.

First out of the stalls was Richard Altwasser, writer and publisher of *The Cambridge Colour Collection*. It's hardly surprising that Richard had a head start on the rest of the field — as one of the Spectrum designers he would be expected to know a little about the machine.

I must confess that a cursory examination of Richard's book seemed to confirm my worst fears about exploitation. A slim (64 pages), expensive (£6.95) little volume, it hardly seems to break any new ground. The 20 programs concentrate on tried and trusted old favourites like lunar lander

and Android Nim, and my first impressions were unfavourable, to say the least. Apparently there is a companion cassette, costing £2.95, with all the programs ready for immediate loading. I say 'apparently' because, despite two different promises of delivery, I have been conspicuously unsuccessful in getting my hands on one. So, showing remarkable devotion to duty, I spent several evenings and a weekend keying in the listings from the book.

So, at just fivepence under seven quid, what do you get for your money? As mentioned above, the programs do not inspire initial enthusiasm, and the notes to most of them are somewhat sketchy, rarely more than a couple of paragraphs. But, despite this, I feel the book is well worth investigating, especially if you are unsure of the graphics capabilities of your Spectrum. I feel that a large percentage of Spectrum users will be ZX81 freaks who have upgraded, and keying in these listings is a painless way of learning some of the new techniques necessary to get the most from their new toy. Altwasser has compacted his programs very neatly, and, although there are no specific programming hints here, each program illustrates some aspect of the Spectrum's potential. In addition, they're fun. Altwasser's robots in Android Nim squeak and gibber in a most satisfactory manner, then roll their eyes piteously as you wipe them from the screen. The damn program still beats me every time, but the visuals can't be faulted.

On a more serious note, there is a very useful character generator program for user-defined shapes. This differs from the one on Sinclair's free 'Horizons' cassette by giving you a display grid of 25 characters, so you can easily combine several different characters to make a large Space Invader-type graphic.

Also very useful is 'Notebook', which features a neat little machine code search routine and which, slightly

amended, is doing sterling service in the Mann household as a video index.

A bit on the expensive side, then, but if you just want a score of programs that aren't too demanding but will give you an idea of what the Spectrum can do, then this is probably for you.

Easy Programming for the ZX Spectrum by Ian Stewart and Robin Jones (Shiva, £5.95)

A strange one, this. Part of 'Shiva's friendly micro series', *Easy Programming* is by Ian Stewart and Robin Jones, authors of the bizarrely titled *PEEK, POKE, Byte and RAM* for the ZX81 — a name they disclaim responsibility for, incidentally, insisting it was 'foisted on us by our publicity man'. The authors describe this as being the Spectrum version of *PEEK, POKE* etc.

The preface says this is 'a gentle guide to Basic programming, programming style, colour, sound, moving graphics, high-resolution graphics, debugging, number-crunching and string-handling. When you've read this, the manual will be easy meat.' Okay, I'll go along with that. Everything's kept short and sweet, and there are indications of a healthily cynical attitude to computer manufacturers' claims — 'This is a feature of the way the Spectrum handles the display. (A bug which can't be fixed is called a "feature" in computing jargon.)'

The debugging sections are excellent; the program notes explain exactly how each program runs and give suggestions for improvements, and the authors are largely successful in their claim that 'lots of computer books give the impression they're trying to prove how clever their authors are. We're not doing that: everything here is very straightforward and basic.'

I was very impressed with the way the book is organised. The chapters are all kept to a sensible length, with

examples liberally scattered throughout and an extended program section, complete with notes, at the back. The sections on debugging are similarly dotted throughout the volume, and I would say the authors have succeeded in their stated aims. That said, I must also add that I found the appearance of the book spoilt by a selection of truly cringe-inducing cartoons — 'De Bugs' — which are distributed liberally throughout. It's probably something that's lacking in my sense of humour, but I found them twee and unfunny in the extreme. What's worse is that, for me at any rate, they detract from what is really a useful and well-put-together book.

Programming Your ZX Spectrum by Tim Hartnell and Dilwyn Jones (Interface Publications, £5.95)

Never reticent about coming forward, Tim Hartnell — the Barbara Cartland of the micro book industry — was off the mark with almost indecent haste with this weighty tome, written in conjunction with Dilwyn Jones. By 'Barbara Cartland' I don't mean to imply that Tim dresses up like a chocolate-box illustration (I don't know, though. . .), or that he pops thousands of vitamin pills daily, but, my God, is this man prolific! The author of books too numerous to mention here on the ZX81, the VIC-20, the BBC Computer, various guides to buying a computer, etc, this was his first for the Spectrum, although I notice he's come up with another one already — this time with the added attraction of a foreword by Clive Sinclair, which will no doubt add a certain air of authority to the volume.

This is a fat 230-pager, aimed at the beginner, and it progresses at a comfortable pace from basics ('Using the keyboard', 'The PRINT statement') through to some more advanced concepts and useful stuff like using the shifted cursor keys to give diagonal movement (excellent for games). Tim and Dilwyn do a good job of helping the beginner avoid the pitfalls encountered when writing programs, and the writing style is clear and undemanding. As is compulsory these days there's a section on structuring your programs, and — a nice touch, this one — a section on commands in other Basics and advice on how to achieve the same effects in the Sinclair dialect. There's also a collection of handy subroutines, covering things like partial screen clear, left and right scrolling, and aligning columns of numbers to the decimal point.

Along the way there's an exceedingly

naff Pacman-type game, and an astounding cock-up. 'Prime numbers are very easy to determine,' say Hartnell and Jones, then proceed to give a program to generate them and a sample print-out of the first 20. All well and good, but a touch more care in the proof-reading would surely have spotted that the program thinks 9 is prime!

I can't help thinking that the programs themselves do not do justice to the text that surrounds them. They are all the sort of thing that you might key in once to see what each one does, but which you will never return to later on. In an ideal world, the programs in *The Cambridge Collection* would be combined with the instruction given here. As it is, you'll either have to buy them both or use the techniques explained in this book to write your own — which is probably the best way of going about learning how to program, anyway.

A boon to the beginner, then — but don't expect too much from the example programs.

THE ZX SPECTRUM and how to get the most from it

The ZX Spectrum And How To Get The Most From It by Ian Sinclair (Granada, £5.95)

Ian Sinclair (no relation) aims at the same market as the Jones/Hartnell opus, but concentrates less on silly games and more on developing programming technique.

After the 'Introduction' and 'First Steps' chapters, the book is broken down into six main areas: 'Variables', 'Loops, repetitions and arrays', 'Data processing', 'Graphics', 'Sound' and 'Roll Your Own' — a nifty little section on writing your own programs.

I can't get too excited about this book, but then I can't knock it either. It does exactly what it sets out to do, competently if a little uninspiringly, and has some useful tips in its various appendices for aligning your tape recorder correctly, and modifying your recorder leads so that you don't have to unplug one of them when LOADING and SAVEing.

There must be a lot of people out there who don't want to play 'blob-chaser' games, and this book attempts to cater for those who would prefer to find out more about storing and accessing data, or who want to move on as quickly as possible to writing their own

programs. I found it worthy, if a little dull in its approach. My advice? Try before you buy.

Over The Spectrum — 30 Programs for the ZX Spectrum (Melbourne House, £6.95)

The final entrant in the Spectrum Stakes is Melbourne House's *Over the Spectrum* — and, for me, at least, it runs out the clear winner. Emphatically not a 'teach yourself programming' guide, *Over the Spectrum*, like Richard Altwasser's book, is simply a collection of programs, but unlike the *Cambridge Collection* each program has a detailed breakdown of exactly what happens when, and how it's all achieved.

The listings are not trivial, and care should be taken in keying them in, but the result is well worth the effort. The book is liberally illustrated, in colour, showing the screen display for almost all the programs contained therein — so you know what you are trying to achieve from the outset.

As a demonstration of what can be achieved using the Spectrum's user-defined characters, this book cannot be faulted — several of the programs require 50 or so user-defined characters — and, although it contains no programming hints as such, a diligent reader is going to learn a lot about the Spectrum by working his or her way through it.

Worthy of special mention are probably the slowest fruit machine you'll ever see — but, oh, those graphics! — and a sophisticated character generator which allows you to work on four characters at once, and allows things like mirror-images to be obtained at the touch of a key. There is also a neat little program to turn your Spectrum into an alarm clock, which I find myself using frequently — it would benefit from one of the external amplifiers produced to beef up the Spectrum's sound output, but I find that even the unmodified volume level produces an insistent BEEPing that should rouse you.

No author is credited for the book as a whole, but the bulk of the programs come from Beam Software, Clifford Ramshaw and Neil Streeter. Take a bow, gents — and give us more.

END

THE PCW £5000 MANHUNT

You should be pretty well fed up with looking at Pythagorean triangles by now. If you read the question properly you should have at least five answers to part three of the puzzle (and a lot more if you didn't!). What we neglected to tell you is that you need to find the *smallest* such triangle — ie, the one with the smallest perimeter.

Got it? Okay, you now have six numbers written down: three multi-digit ones and three single-digit ones. Take the multi-digit numbers and write them down one after the other in the order they were obtained. This gives you a nineteen-digit number.

Now cube it (accurately!).

Now you have a rather intimidating 57-digit number.

You also have the following text in enciphered form:

EYOMHDKLZ C20TLY3LDYZM04067E4B8ACA5

which contains the name, rank and phone number you're looking for.

Go to it! The three single-digit answers could help you if you knew how.

By the way, members of the KGB (and their relatives) are not eligible.

When you have it deciphered, ring the number and leave a message for this person on the answering machine (use his/her rank or you may give offence). The message is just the three single-digit numbers (to show you solved the puzzle and didn't get there by any devious dealings).

If you want the prize money, best leave your name and address as well.

Good luck — don't spend it all at once!

J J Clessa

Note: PCW staff will not enter into any telephone or other communication about this problem, so please don't bother them.

TJ's WORKSHOP

Our monthly pot-pourri of hardware and software tips for the popular micros. If you have a favourite tip to pass on, send it to 'TJ's Workshop', PCW, 62 Oxford Street, London W1A 2HG. Please keep your contributions as concise as possible. We will pay £5-£30 for any tips we publish.

SOFTWARE DRIVEN 2MHz/1MHz ATOM

I found A Clements' article on how to modify the Atom to run at 2 MHz extremely interesting.

I eagerly followed his instructions and was delighted to find that the 6502 did indeed run at 2 MHz. However, as pointed out, loading and saving programs necessitated switching the machine back to 1 MHz. A further drawback is that the machine locks up after being switched, thus requiring BREAK followed by OLD to restore the program.

This simple hardware modification uses the spare output line PC3 to switch from one speed to the other.

The modification necessitates cutting two tracks on the Atom circuit board. The first, on side 2, is the track from pin 10 of IC44, as described in Mr Clements' article. The second cut is on side 1 of the board. Locate and cut the link LK5 which connects pin 1 of PL4 output socket to pin 39 of IC31. The Atom board mods are then complete, except for the wire connections to the circuit shown in Figure 1.

The circuit was constructed on a small piece of Vero-board and mounted using two insulating washers on side 1 of the Atom board, just

below IC37/39 and above the keyboard connection for the BREAK key. The siting of the board is not critical and may be left to the constructor's own judgement. A 3/16in hole was drilled in the board in order to pass the insulated wire connections from the Vero circuit on side 1 to the Atom circuit connections on side 2.

Modifications complete, the machine should be switched on and should display 'Acorn Atom' as normal. If this is not the case, check that all connections have been made correctly and that both cuts in the tracks are clean. It will be necessary to carry out the RAM tests indicated by Mr Clements in order to ensure that the correct speed RAM chips have been used.

To switch from 1 MHz to 2 MHz, simply set bit 3 in

location Hex B002 — eg, !#B002=!#B002:FF08. The machine will now be running at 2 MHz and can be checked simply by typing CTRL G. If a high-pitched beep is heard instead of the usual low note, then success. If not, unset bit 3 and try again. If the note is still the same, check all wiring, etc. If it is a high beep, then the default speed at switch on is 2 MHz and you should swap the connections to pins 5 and 11 of the 74LS00 chip to change default speed to 1

MHz. Programs can now automatically control which speed they run at by setting or unsetting bit 3 of Port C, without the machine locking up.

One advantage of this method is that any commands to handle the cassette interface — ie, LOAD, SAVE, CAT — will automatically switch the machine back to 1 MHz. However, it will be necessary to reset the m/c to 2 MHz after saving or loading.

Fig 2

VIC TIP

Here's a useful tip for the Vic-20. Many Vic-20 owners will by now be familiar with the problems of using hi-res graphics with the 8k cartridge. Basic has to be shifted from \$1200 to \$2000 to make room for the user-defined graphics.

This is quite a simple operation if you know how to do it, but for the average user with only the Inane Computer Guide to consult, like myself a few months ago, it can seem like a formidable problem.

Here are the necessary commands:
POKE 32*256,0

POKE 44,32
NEW

The last line is very important as it saves you the bother of changing all the variable pointers just after 44 in the zero page.

Once you have typed in the commands, you will have about 8000 bytes left for Basic programs, which you can type in and save as normal.

Substituting a lower number for 32 in lines 1 and 2 will give you more memory for Basic and less for graphics.

Quentin Gore

UK101 RUBOUT

On the assembler/editor for the UK101, SHIFT/0 has to be used in order to rub out the previous character if a mistake is made when typing in a program. This can become very confusing.

Here is a patch that will allow the RUBOUT key to be used as it is in Basic. To accommodate the extra machine code, the pointer to the start of the source file must be altered by changing \$12C9 to \$B4. The JSR \$FCEA at \$1399 must be changed if a monitor other than NEWMON is being used.

David Hunter.

ATOM TEXT 'N' GRAPHICS

This program allows text, both upper and lower case, to be mixed with graphics on a graphics screen (Mode 4) — a facility long needed by Atom owners. It makes use of routines contained within the Acornsoft Word Pack word processing ROM which must be in the utilities ROM socket for the program to work.

The program is assembled in #2800 and uses 64 bytes. If floating point variables are to be used by the user program, line 70 must be changed to an alternative assembly address.

It is used as follows:

Once assembled and therefore RUNNING the user program, a LINK #2800 (or as 70 if altered) must be performed. This will clear the screen to mode 4 and a cursor will appear at the top left corner. This can most conveniently be achieved by incorporating the LINK instruction into the start of the user program. CLEAR 4 should not be used in the user program since it will erase the cursor.

The user program is then RUN as usual. When characters are required, a LINK #2809 (or assembly address +9, if line 70 is altered) will cause any character typed to appear on the screen at the current cursor position. Likewise, any character PRINTed by the user program will appear on the screen at the cursor position. Control L will cause an exit from the routine and return control to the rest of the user program.

The program operates as follows: Lines 110 to 140 alter the 'read character' and 'write character' addresses (#20A, #20B, #208, #209) to those required by the word processor.

The rest of the program reads characters typed in by the user and displays them at the current cursor position.

The cursor keys operate in the usual manner.

If 'control L' is typed, the routine will be left, and the user program returned to. If an alternative character is required as the exit command, line 164 should be altered to:
164 CMP @ASCII CODE
FOR DESIRED

CHARACTER.

To prevent the screen from scrolling if the bottom line is passed, the program (lines 180 to 200) continually monitors the contents of location #93, which is where the word processor stores the screen line number. 21 lines of text are possible (0 to #14). When the last line is reached, carriage return and line feed commands are ignored.

The other cause of scrolling is if a character is typed into the rightmost position on the bottom line; lines 300 to 320 watch for this and allow only left cursor, up cursor and delete commands

to be used once this point is reached.

Characters can be inserted anywhere on the screen, but care should be taken that a character does not over-write any required graphics. It should also be remembered that a space is a character and, if typed, will erase a small rectangular area of screen above the cursor.

SHARP CHARACTERS

The Sharp PC-1500 is pretty remote (ouch) from being a terminal, but it is still good TJ fodder. I have been delving into the inner workings of the machine, and have found a lot of interesting goodies. Here is a program to illustrate one of the most useful.

The Sharp generates displayed characters by software, and so (like the ZX81) the character generator is accessible to programs. It starts at 64672 (&FCA0) with the entry for the space character. Each entry consists of five bytes of dot column image which can be passed to GPRINT. The sixth column is always blank and consequently does not appear in the table.

With a bit of manipulation it is possible to print characters upside-down or back-to-front, but the most useful application of the table is for printing double-width characters, as in this demonstration program.

```

5 REM   DOUBLE WIDTH CHARS
10 WAIT 0
20 INPUT "STRING? ";A$
30 FOR I=1 TO LEN A$
40 A=ASC(MID$(A$,I,1))*5+&FC00
50 FOR J=0 TO 4
60 B=PEEK(A+J)
70 GPRINT B;B;
80 NEXT J
90 GPRINT "    ";
100 NEXT I
110 PAUSE
120 GOTO 20

```

The display annunciators (BUSY, RUN, etc) are memory mapped and appear at &764E and &764F. Sorting out which bit belongs to which symbol is left as an exercise for the reader, but beware — there is a surprise in store!

By the way, does anyone know what the OPN instruction does?

Malcolm Ray

SPECTRUM ERROR

One of the reasons a machine code user may want to display a message on the screen of a ZX Spectrum is that an error has been made somewhere. In many examples one of the Sinclair standard error codes could be used. For instance, in some assembler programs, an attempt to load a single register with a number above 255 could be met by report code 6 - 'Number too big' or report code B - 'Integer out of range', either of which can be followed by a line number and statement number of the programmer's choice.

The trick is to use a ROM subroutine at 0008h. The command RST 8 in a machine code program then gives a

return to Basic. The following byte should contain the number one less than the error code wanted, and addresses 5C45h and 5C46h should contain the low and high bytes of the line number. Address 5C47h contains the statement number.

For example:
LD HL, 1234 21 D2 04
LD (23621),HL 22 45 5C
LD A,5 3E 05
LD (23623),A 32 47 5C
RST 8 CF
18 12

The short program above will give the message: 'J Invalid I/O device 1234:5'.

But if you look in the Sinclair manual, only codes 0-0-9 and A-R are listed. What do other values give? Some very interesting reports. Error

```
1 REM.
10 POKE 23760,207
20 FOR n=0 TO 255
30 POKE 23761, n
40 PRINT USR 23760
50 NEXT n
```

T, for instance, is the Sinclair copyright message. Type in the accompanying six line program, REM statement included, and run it. You get error code 1. Type in NEXT N and press ENTER, and you get error code 2. Repeat this and you work your way through all 256 codes. I hope you can find some useful ones - good luck to your typing finger!

Bill Longley

BEEB STRING SEARCH

Here is a program that will fit in one function key on the BBC Micro. It will search through a Basic program, looking for a specific string (You INPUT it), and will report all line numbers at which it occurs. This is very useful in debugging long programs (eg, Adventures), where you have lost track of where certain procedures and variables are mentioned. NB: the program cannot search for Basic keywords as they are stored as token values. *KEY O"CLS:INPUT"
"Enter string"
N\$:P=PAGE+1:REPEAT:N=256*P?0+P?1:P=P+2:L=P?0:NL=P+L-2:P=P+1:IF INSTR(\$P,N\$) 0 THEN PRINT:N:P=NL:UNTIL P?0-&FF:END:ELSE P=NL:UNTIL P?0-&FF:END:M"

To execute a search press key 'f0' and enter the string you wish to search for when prompted. The program will reply by listing all the line numbers at which the string occurs.

While on the subject, there is a function key bug. The function keys can hold a maximum of only 255 characters (a good reason to use abbreviations for keywords). If you try to enter too many characters you will get a 'Bad key' error. What the computer does is to take the number of characters already in the key, add it to how many more you wish to put in, and if the answer is greater than 255 it reports an error. However, if you are re-defining a key it still adds the number of characters already in the key, even though they will be deleted. This may lead to a 'Bad key' error when in fact there is nothing actually wrong. The best way around this is to type *KEY N"" (where N is the number of the key you wish to define) before defining your key.

Ian C Brodie

BEEB BREAK

Did you know that the Break key on the BBC micro can be defined, just like the other 10 user definable keys?

I find this particularly useful for OLD ;M ;NLIST ;M

Philip Gigg

PET MOVEMENT

Nearly all PET 'movement' games which I have seen published in your magazine in the past two years use a method of movement a great deal slower than the method I use,

which to my knowledge I invented!

This makes use of PEEK (515), which gives the current key pressed and an array and can be adapted for various

types of movement - and no doubt for other machines also.

T H Ley

```
1 PRINT"♥":POKE33333,214

80 POKEC,32:C=C+X:POKEC,214:GOTO70
```

SPECTRUM SCREENMAP

Owners of the new Sinclair Spectrum may have discovered that the memory map for the screen is arranged in a very unconventional way.

The screen is divided into three sections each of eight character lines by 32 character columns. Each character is eight bytes deep. The first scan of 32 bytes is of the first byte of each character from the lines 0-7; then the second and so on. Which is repeated for lines 8-15 and 16-23... confused? Well, here is a short routine to unscramble the screen map for

conventional screen pokes. Y has the value 0-6143 (0-top right hand corner: 6143-bottom left hand corner). T contains the corresponding location in the screen map.

In return for this, could your readers advise me of a way of constructing a conventional screen map - ie, with the Scans arranged left to right, one line below the other.

(Name omitted! Please contact us.)

```
1000 LET T=INT(Y/2048)*2048
1010 LET Y=Y-INT(Y/2048)*2048
1020 LET T=T+INT(Y/256)*32
1030 LET Y=Y-INT(Y/256)*256
1040 LET T=T+INT(Y/32)*32
1050 LET Y=Y-INT(Y/32)*32
1060 LET T=T+Y+16384
```

BLUDNER

In September's PCW you published a letter from me under the title 'Appendectomy'. The published text contained two omissions which rendered it senseless.

It should have read
1) Load first program
2) PRINT ~ TOP-2 (note ~ sign omitted)
3) Then type *LOAD "second program name" XXXX where XXXX is the address that was printed in 2) [you omitted the XXXX and comment].

R Jewsbury

BEEB TAPE SALVAGE

In answer to many a BBC Micro owner's prayers I offer my own version of a tape salvage program. As many BBCers will know, the 0.1 operating system has two bugs in the cassette filing system. This program attempts to salvage a program which had block 0 corrupted due to one of these bugs. According to Acorn, this bug would corrupt, on average, block 0 of one program in 16.

There is now a well publicised m/c fix for both of these bugs but, alas, these have arrived too late for many users.

My program will attempt to read in as many Basic lines as possible, starting from any block number until the end of the program is reached. Errors in the format of the data coming from the tape

will simply mean a missing line of Basic which the user will have to re-enter but at least he/she will not have to retype 10k of program lost because the first block is unreadable.

The data bytes are detokenised as they are read from tape using the crunch subroutine in the Basic ROM converting single bytes to Basic keywords so that a check can be made of the lines coming in. However, I am detokenising all but the line number and the line length, and consequently characters within quotes and GOTO/GOSUB statements will appear to be incorrect when in fact they are okay.

I suggest that the m/c fixes are chained in before loading this program to ensure when you resave your

salvaged program you do not have to repeat this process unnecessarily.

To use the program type RUN and position your cassette to just before the program to be salvaged. The program will list to the screen as it is found on tape and is stored above this program in memory. When the end of the program is reached or ESCape is pressed the pro-

gram will reset PAGE to start of the salvaged program. Typing LIST will display the salvaged program which can be saved in the usual way.

If you are not satisfied with the salvaged program, type BREAK then OLD <CR> and repeat the process.

Paul Mudditt

UK ERROR LIST

Whilst programs are being written, errors often creep in. I have often wished that the computer would automatically list the incorrect line to speed debugging. This feature is especially useful to CEGMON/WEMON users with a full screen editor, since the editor could be called immediately rather than

after you have had to type LIST xxx.

The program requires alterations to two bytes in order to locate it anywhere in memory.

R Clarke

Anthony Harrington reports on the Third

European Microcomputer Chess Tournament

The Third European Microcomputer Chess Tournament, held at the Barbican Centre during the PCW Show, proved once again that computer chess is a thriving force.

Despite the fact that entry forms and invitations to the tournament went out later than usual — a consequence of PCW itself changing hands and of the withdrawal of David Levy from his accustomed role as tournament organiser — the event attracted a very strong field. There were 14 entries in all, though program failure in the case of two entrants meant that the number of programs involved turned out to be the same as last year, with 12 competing programs.

A seven round Swiss tournament is always an exciting affair, with something of a lottery about it. The basic rule is that players with the same number of wins (or losses) play against each other. The point of this is that the more you win, the harder it gets, since you're meeting people (programs in this case) who've done just as well as you have. If you lose, you have the consolation of being able to expect an easier game next round.

The final line-up included four commercial entries (programs or dedicated chess computers actually on sale to the public or which would be available before the end of the year) and four experimental entries from commercial companies. It might have been even stronger, but Fidelity, of Miami, whose Sensory Chess Challenger '9' is one of the strongest chess computers around, decided against entering a week before the start. (According to John Renaldo, Fidelity's marketing manager, the company was considering entering either a commercial model or an experimental entry or both.) The West German company Hegener and Glaser, which makes the Mephisto, also almost entered, but decided at the last moment that they didn't like Swiss tournaments and would concentrate instead on the US World Championships in March 1984.

One has to sympathise with commercial companies. They have a lot at stake as far as potential sales are concerned. And if their machine, for some reason, fails to win one of the top three placings in a tournament it is tempting for their managing directors to feel that the public will take the hint, and buy the machine which did better.

My own feeling here is that they would do better to compete. If they do feel their commercial model is a little delicate, there's no harm in entering an experimental entry. It would give their programmers a chance to test their ideas, and the results wouldn't affect their market share provided the name given to the experimental entry bore no relation to the market model.

Still, if one remembers that the commercial class in the World Championships, held at Lubeck-Travemunde, West Germany in September last year, consisted of only four entries, one of which withdrew after a few rounds, the commercial line up wasn't bad. And the amateur entries were excellent.

It is the amateur entries that make these events. Unburdened by the financial anxieties of the commercial entrants, the amateurs give the tournament its enthusiastic, convivial atmosphere. Whereas commercial competitors have a tendency to get a little grim at the board and to be sharp and short with opponents, the amateurs tone down the seriousness of it all — and are just as willing to laugh at the odd strange move generated by their own program as they are at their opponent's.

In all there were five amateur entries. From Hamburg, Dieter Steinwender, a computer science student, led a team of four German students with an entry called Micromurks, running on an Apple II. Also on an Apple II was White Knight (Mk 10), written by Martin Bryant. This, like Richard Lang's Cyrus II, running on an Osborne, was an improved version of a program entered into last year's PCW tournament. Mark Johnson and Dave Wilson, with Advance 2.4 and Jeff Cooper with Chess '86, also seasoned PCW tournament campaigners, completed the amateur turnout.

In passing, one should probably say that the 'amateur status' of several of these programmers simply means that they are not selling or about to sell their entry programs (though they might, if an offer came along). Johnson, Bryant and Lang are all employed by Intelligent Software, a company set up

by David Levy and Kevin O'Connell to write and market chess programs (and other 'intelligent' games).

In the experimental commercial class (programs which won't go before the public in their present form), there were two entries by SciSys, the Hong Kong based company whose machine, Mark V, won the Travemunde world championships. These were the Mark 5.01 Experimental and the President Turbo Experimental. The Austrian chess programmer Wim Rens, sponsored by the UK firm Microtrend, entered a program called Gambeit '86 and Intelligent Software put in an entry called Philidor.

The commercial section proper consisted of La Regence, a 'sensory-board' chess computer designed by Intelligent Software; another sensory-board machine, called Bogol, by the Hamburg company Omikron (a newcomer to the commercial chess machine market); Spectrum Chess, which runs on the ZX Spectrum, designed by Artic Computing, and an Irish entry, Conchess, another sensory board machine.

On the morning of 9 September the competitors assembled in the playing area in the Barbican Centre, set up their machines and programs and promptly experienced the first (and, thankfully, the last) major delay of the event. Someone had wired up a plug incorrectly and blew the fuse for that entire floor sector of the Barbican exhibition hall.

Bear in mind the fact that the tournament was part of the PCW Show, and hundreds of micro suppliers were putting the finishing touches to their stands while we were hunting for an electrician and you will get a fair picture of the start conditions.

That this was the only electrical problem of the tournament is due in no small part to Gould Electrical Division, Wrexham, who provided power smoothing boxes for every one of the microcomputers in the tournament at the shortest possible notice. The day before the tournament was due to start, the company which had promised to supply power smoothing equipment told us that it was having difficulty with its supplier and wouldn't be able to deliver a single piece of equipment.

We phoned Gould, and the managing director of the branch agreed to provide as much as we needed free of charge and to send a lorryload down in time

MICROCHESS TOURNAMENT REPORT

for the tournament the next day, which he duly did. The equipment did its job marvellously and not a single computer in the event had a moment's trouble from power surges or uneven current. Our thanks to Gould for its prompt action.

Play for the whole of this tournament was at the rate of two minutes a move, with the first time control at 30 moves in the first hour and then 23 moves in 46 minutes. This is a somewhat faster rate than is usual in tournament play, but it was forced on us by the tight closing hours of the exhibition. Doors opened for the players and exhibitors at 9.00am (10.00am for the public), and closed at 7.00pm. In order to get through two games a day, we had to limit each round to approximately 3½ hours.

Players were allowed a maximum of 30 minutes down time to rectify any program crashes, so the possible duration of each round was 4½ hours. Since the theoretical starting time for the morning round was 10.00am, and for the afternoon round 2.30pm, a little mental arithmetic will tell you it was a close squeeze fitting both rounds in. Because of the time pressure, it was decided to adjudicate all unfinished games at move 53. This set the tournament director, Stuart Reuben, some complicated adjudication problems in the course of the four days. Fortunately Stuart is a FIDE recognised arbitrator and has years of experience behind him, having directed events such as the Philips and Drew Tournament, the Lloyds Bank Masters, and many other chess competitions.

He was assisted by Peter Morrish, who also provided all the demonstration boards and chess sets at the tournament and did the draw for each round.

The draw and results for the first round were:

Advance 2.4	½ Philidor	½
Spectrum Chess	0 Cyrus II	1
La Regence	1 Chess '86	0
Gambeit '82	0 President Turbo	1
Conchess	1 Mk 5.01 Exp	0
Micromurks	0 White Knight	1
Bogol	0 (Default)	

This first round was characterised by two events that looked more like absences than things that would shape the tournament's outcome. Advance 2.4, running on a home constructed bit-slice machine, found itself playing the white side of what must be one of the most boring Benoni defences of all time. Philidor, the opposing program, constructed a blocked middle game in which the best either computer could think of doing was to shuffle rooks back and forth. The programmers read the papers while waiting for the inevitable draw by repetition. Fortunately Advance 2.4 went on to win the next five games in a row, in more aggressive fashion.

While this was going on, the Omikron team of Martin Suhl and Gerd Krey were busy missing the first round. Unfamiliar with London traffic, they'd made the mistake of taking a taxi from Oxford Street instead of a tube. Their program, Bogol went on to win four out of the remaining six games, and who knows, a win in this opening round might have seen them draw level for top commercial entry with La

Regence on 5 points.

Second round draw and results:

Cyrus II	(1)	½	Conchess	(1)	0
Pres Turbo	(1)	0	La Regence	(1)	1
White Knight	(1)	0	Advance 2.4	(½)	1
Philidor	(½)	0	Bogol	(0)	1
Mk 5.01 Exp	(0)	½	Micromurks	(0)	½
Chess '86	(0)	0	Gambeit '82	(0)	1
A N Other	(-)	½	Spectrum	(0)	½

As the keen-eyed will have noted, the tournament had 13 entrants at this stage, though it was soon reduced to even figures for most of the tournament. Chess '86 collapsed during its game against Gambeit '82 and Jeff Cooper only managed to rectify it in time for the final round. The day was exceptionally warm and the Barbican Centre was attracting record crowds. Computers don't like heat and several of them began to show their dislike. One of the SciSys entries, President Turbo, overheated in a complex middle game against La Regence. It was a miracle that the President Turbo started the tournament at all, as Andrew Page, the SciSys UK general manager, only received the module late the previous evening airmail from Hong Kong. Ideally, he would have liked a few weeks to test the program before the tournament, and we had to admire the competitive spirit that chose to enter rather than withdraw under such circumstances.

Round three draw and results:

La Regence	(2)	1	Cyrus II	(2)	0
Bogol	(1)	0	Advance 2.4	(1½)	1
Conchess	(1)	0	Pres Turbo	(1)	1
Gambeit '82	(1)	0	White Knight	(1)	1
Spectrum	(½)	0	Mk 5.01 Exp	(½)	1
Micromurks	(½)	0	Philidor	(½)	1

Richard Lang won last year's tournament and his program, Cyrus II, had looked good up to this point. But La Regence proved too strong. Dieter Steinwender and the German team were becoming very disappointed with their program, which was showing definite flaws.

Round four draw and results:

Advance 2.4	(2½)	1	La Regence	(3)	0
Cyrus II	(2)	1	Pres Turbo	(2)	0
White Knight	(2)	½	Mk 5.01 Exp	(1½)	½
Philidor	(1½)	1	Conchess	(1)	0
Bogol	(1)	1	Gambeit '82	(1)	0
Spectrum	(½)	1	Micromurks	(½)	0

This round produced one of the key games of the competition. La Regence put up a dour struggle against Advance 2.4 and the game went to the 53 move adjudication. But Advance 2.4 was two clear connected passed pawns up in a rook ending and Stuart Reuben had no hesitation in awarding it a win. No one knew it at this stage, but Cyrus II won its last game here, beating President Turbo on adjudication. Reuben had his work cut out in this round, for White Knight and the Mk 5.01 also had to be adjudicated. This last was a very complex position, which either computer could have mishandled with ease. A draw seemed the fairest conclusion.

Round five draw and results:

Advance 2.4	(3½)	1	Cyrus II	(3)	0
La Regence	(3)	1	White Knight	(2½)	0
Pres Turbo	(2)	1	Philidor	(2½)	0
Mk 5.01 Exp	(2)	0	Bogol	(2)	1
Gambeit '82	(1)	1	Spectrum	(1½)	0
Micromurks	(½)	½	Conchess	(½)	½

This round saw White Knight and Philidor falter and lose their way, though Mark Bryant with a final score of 3½ was still to finish strongly enough

to take the second amateur placing and a cheque for £50, while Philidor, on 4½, would take third place overall in the tournament.

Round six draw and results:

Pres Turbo	(3)	0	Advance 2.4	(4½)	1
Bogol	(3)	0	La Regence	(4)	1
Cyrus II	(3)	0	Mk 5.01 Exp	(2)	1
Conchess	(1½)	1	White Knight	(2½)	0
Philidor	(2½)	1	Spectrum	(1½)	0
Micromurks	(1)	1	Gambeit '82	(2)	0

The game against Bogol was a stiff test for David Levy's La Regence and it was not without its commercial appeal as well as its chess interest, for both these sensory board machines are due to be marketed before the end of this year.

After this loss, Martin Suhl was undecided whether he was pleased or displeased with his machine's performance. No obvious flaws had been detected and its three wins were very reasonable chess games. In retrospect, the two losses Bogol suffered turned out to be to the machines who came first and second overall, and after picking up another point in the final round, the German team went home smiling.

Philidor had an easy game against Spectrum, but Richard Turner of Artic Computing thought that the ZX program had held its own well against computers that were very much more powerful. It was only the cassette tape module program in the competition and this is one area where one can expect a greater number of entries next year. Advance 2.4 by this stage looked unstoppable, and it duly crushed President Turbo with a fine mating attack.

Round seven draw and results:

Mk 5.01 Exp	(3)	½	Advance 2.4	(5½)	½
La Regence	(5)	0	Philidor	(3½)	1
Bogol	(3)	1	Pres Turbo	(3)	0
Cyrus II	(3)	0	Micromurks	(2)	1
White Knight	(2½)	1	Spectrum	(1½)	0
Gambeit '82	(2)	1	Conchess	(2½)	0

This final round was full of surprises. The Mk 5.01 played a marvellous game against Advance 2.4, won material in the opening and looked set to force mate by move 26. But Advance 2.4 held on and although two rooks down managed to find a position where it could force perpetual check with its queen — the human equivalent of a 'swindle'.

On board two, meanwhile, the Intelligent Software entries finally came up against each other, and much to everyone's surprise, Philidor, which hadn't done much of note till then, chose that moment to play a complex, crafty game against the fancied La Regence and stopped its stable mate from winning 6 out of 7 games. So although the final round had started with the faint possibility of a tie for first place between La Regence and Advance 2.4 (if the former won while the latter lost), the gods decided otherwise and gave us a clean, clear winner.

Mike Johnson and Dave Wilson took away just about every prize on offer. They won the trophy for overall winner of the Third Microcomputer Chess Tournament, the trophy for the best amateur entry and a cheque for £150. La Regence was named as the best commercial entry in the tournament and Martin Bryant, as we said, collected a cheque for £50 for the second highest placed amateur entrant.

OUTGROWN YOUR APPLE ?

HAL Computers Extend The Apple's Capabilities

If your business or scientific application has outgrown your Apple's capability or if you have put off buying an Apple because you thought it couldn't meet your needs — think again.

HAL hard disc systems offer up to 20Mbytes of Winchester storage from as little as £1,750.

Capricorn

A complete subsystem in an attractive space saving cabinet, which holds either one or two drives a combination of standard disk drive and/or Winchester to give a capacity from 5Mbytes up to 20Mbytes formatted.

Capricorn works in conjunction with Apple's standard floppy disc drive for archiving purposes and offers really high capacity computing at an entry level price for cost conscious users.

For:
SUPERBRAIN,
S-100, APPLE II,
HEATH H89,
TRS-80.

Aquarius

As capacity increases with the professional user, so does the importance of a full back up facility. AQUARIUS is HAL's new answer to this problem. It combines a choice of Winchester capacities with a quarterback streaming tape drive which allows a full back-up file copy to cartridge tape in about six minutes with absolutely no user intervention.

The aluminium cabinet is styled to look good alongside Apple in the most professional user applications.

Prices start at £3299, for a ready to run system — the complete business solution to backup problems.

All HAL sub-systems come with a full twelve months parts and labour warranty.

All units are designed and manufactured by HAL in Britain and are complete with all instructions, technical literature and systems discs. The file handling software is written by our own in-house software team — if you need help it is always on hand via your local dealer or direct from the design team that conceived the system.

We use only the disc drives which we distribute exclusively into the U.K. computer industry in massive quantities over 20,000 units per annum sold. Our service department houses a formidable armoury of drive testing computers for pre-test, maintenance and burn in.

For more information and a demonstration contact either your nearest dealer or call us direct on our hot line 0252 517171.

HAL Computers Limited

PCW SUBSET

Starting this month, David Barrow, a regular contributor to the series, joins Alan Tootill in presenting more useful assembler-language subroutines. This is your chance to help build a library of general purpose routines, documented to the standards we have developed together in this series. You can contribute a Datasheet, improve or develop one already printed, or translate the implementation of a good idea from one processor to another. PCW will pay for those contributions that achieve Datasheet status. Contributions (for any of the popular processors) should be sent to Sub Set, PCW, 62 Oxford Street, London W1A 2HG.

6502 arithmetic

Vincent Fojut's last improvement to the 6502 arithmetic routines deals with SBAD46, the 32-bit binary-to-ASCII decimal conversion. There is only a small change in method from the original, printed in February 1982. To save a transfer of the Y to the X register just before label SBD5, the X register holds the number of digits and the Y register holds the bit count, instead of the other way round.

Remember that in 6502 code Sub Set routines have 16 bytes of zero-page RAM reserved for them, designated M0-MF in the mnemonics and ZZ in the machine code. For this suite of routines, the first accumulator is in M0-M3, the second in M4-M7, and the third in M8-MB. MC-MD points to ASCII strings, ME holds the sign of the product of the second and third accumulators, and MF is available as a temporary store.

```
SBD5:  PLA      ;pop digit off stack      68
      CLC      ;convert it            18
      ADC £$30 ;to ASCII              69 30
      STA (MC),Y ;and put into RAM    91 ZZ
      INY      ;increment RAM point   C8
      DEX      ;get next              CA
      BNE SBD5 ;digit, else          D0 F6
      LDA £13  ;load ASCII carriage return  A9 0D
      STA (MC),Y ;into RAM           91 ZZ
      RTS      ;return                60
```

It was Dennis May of London SE1 who did the original groundwork on these 6502 arithmetic routines. With Vincent's improvements and the accumulators rearranged to make the routines fit together better as a package, as suggested by another reader, we have some useful routines that, given enough zero-page RAM, can easily be adapted to cater for numbers of any size. I intend to use them to handle 72-bit binary numbers.

From one base to another

Dennis May has also sent

routines to convert ASCII encoded numbers in one base to ASCII encoded numbers in any other base from 2 to 36. In bases higher than 10, digits with values 10 to 35 are represented by the letters A to Z. There are three routines. The first, given here in Datasheet XBIN, converts ASCII to unsigned 32-bit binary. The second converts 32-bit binary to ASCII, and the third, using the first two, converts ASCII from one base to another. You might like to have a go yourself at the last two, before Dennis's versions are printed — probably in February. (Read on to see what happens in January.)

Datasheet

```
;=SBAD46 - 32-bit binary to ASCII-decimal conversion
;/CLASS: 2
;/TIME CRITICAL? no
;/DESCRIPTION: Converts a signed 32-bit binary number
to an ASCII-decimal string

Before any 6502 coders leave us, they might like to look at the Z80 routines that follow, because these are to be given next month in 6502 code. That's what happens in January — or part of it, anyway.

Send three and fourpence

So runs the amusingly illustrative (and, sadly, out of date) example of what can happen to information passed down the line. It is a problem of no mean consequence in computing, where the integrity of stored or transmitted data is of paramount importance and, naturally, there is a multitude of methods designed to deal with it. Some only indicate that an error has occurred while others can identify the error and thus allow for its correction.

John Kerr of Carmyle, Glasgow brings this important subject to the notice of Sub Set for the first time with the routines ECAL8 and EFIX8, which he says are based on the simplest method of data protection. John also sent ECAL6 and EFIX6, which cannot be included this month for

reasons of space, plus an improvement to June's RNDM which saves three bytes and 11 T-states.

ECAL8 produces an error correction byte (ECB) for each data block up to 31 bytes in length. The method could accommodate 32 bytes but, as the ECB is to be appended before transmission or storage, John sensibly sets a limit of 31 data bytes so that the total number of bits of data and ECB is not greater than 256.

The ECB is a parity coding formed by using a parity mask unique to each bit in the data block. The mask is simply the binary number of the position of the bit from bit 0 of the byte following the data. Thus the parity shown in each bit of the ECB is of those data bits which have the corresponding bit set in their position number. For example, bit 5 of the ninth byte from the end would have the position number and parity mask 01001101 where the highest five bits of the mask give the byte number from the end of the block and the lowest three bits give the position of the data bit in that byte. Its parity would be included in bits 0, 2, 3 and 6 of the ECB.

Datasheet

```

;=ECAL8 - calculate error correction byte
;CLASS: 1
;TIME CRITICAL?: no
;DESCRIPTION: calculates a one-bit error-correction byte
; (ecb) to be appended to a data block of 1
; to 31 bytes and subsequently used by the
; error detect/correct routine EFIX8
;ACTION: Abort if no. of bytes=0 or GTAN 31
; initialise mask to 8*(no of bytes)+7
; clear ecb
; for each byte in data block
; for each bit in current byte
; if bit is 1 then ecb←ecb XOR mask
; decrement mask

```

The error detection routine EFIX8 uses ECAL8 to mask, or bit position number, included in the parity of one calculate a new ECB for the received or retrieved data and exclusive-ORs this with the appended ECB to produce, a 'correction code' which is the

ECB (because the bit was set to '1') but not in the other (because the bit was reset to '0'). If none of the bits are inverted then the correction code will be zero. If error is indicated EFIX8 uses the code to isolate and re-invert the corrupt bit.

Datasheet

```

;=EFIX8 - detect and correct a one-bit error in data block
;CLASS: 1
;TIME CRITICAL?: no
;DESCRIPTION: examines a 1 to 31 byte data block with
; appended ecb and corrects a single bit error
;ACTION: abort if no of bytes=0 or >31
; calculate ecb of data block
; XOR with stored ecb to show any difference
; if no error then terminate
; else use highest five bits to point at corrupt byte
; terminating if error in stored ecb indicates
; a byte outside data block, use three lowest three
; bits to produce bit inversion mask and invert
; corrupt bit.
;SUBr DEPENDENCE: none
;INTERFACES: none
;INPUT: A=no of bytes excluding stored ecb
; HL points to first byte
;OUTPUT: C=no of bytes in block
; Cy reset: abort
; Cy set: N set: no correction made HL points to

POP BC ;restore B C1
RET ; C9

```

John warns that this method can only cope with at most one bit error in the data block and requires that the ECB be received intact. More than one error will not be detected as such and may result in EFIX8 actually inverting a correct bit. Given this limitation, however, the method is fast and is capable of correcting about 95 percent of errors in a system where the probability of bit error is less than 0.4 percent. It also has a very low redundancy figure of 3.125 percent for a 31-byte block.

Flag of convenience

I would like to draw your attention to the use of the N flag in EFIX8 to indicate whether a correction has been made or not. The N result is a consequence of the operation immediately prior to exit, and John obviously noticed this fact and used it for speed and shortness in the routine. But it is difficult to test, unlike Cy and Z, which both have a relative jump conditional on their status. Should a Class 1 routine use any flag for passing information or be limited to the easily tested Cy and Z flags?

Flags are also the subject of a letter from K P Leary of Chislehurst, who would like to see the convention Z = OK, NZ = Error used in Sub Set routines, as is used on the TRS-80. Apparently it makes for easier programming than the other way round. He also offers coding to complement the Z flag:

```
PUSH BC
PUSH AF
POP BC
BIT 6,C
POP BC
and the Sign and Parity flags:
PUSH BC
PUSH AF
POP BC
LD A,80H (LD A,+2
for Parity)
PUSH BC
POP AF
POP BC
```

8048 keyboard

Since we are touching on interfacing, here is a listing of some 8048 assembler code from Jim Chance of Birmingham. It uses port 1 (P1) to read and debounce a 4 x 4 matrix keyboard. Jim says the 8048 processor is much used commercially and can be found in many products; in, for example, the Tandy Quickprinter 1

BRAIN DUMP

Peter Rodwell reports on some of the lessons the British micro industry could learn from the Japanese

Mention the Japanese to most people in the micro world in this country and you get some interesting reactions: 'Well, they're very good at cameras and hi-fi but they'll never succeed with computers — they can't produce software, you know.' Or, 'If they were going to get serious about micros they'd have swamped us long ago — guess they're just a bit out of their depth.'

Next month I shall be reporting on my visit to the Tokyo Data Show in October and describing some of the vast wave of Japanese products which will be hitting our shores next year. This month, I'd just like to say a few words about the implications to the UK micro industry of the forthcoming invasion — and make no mistake about it, the Japanese are coming, and they're coming with all the professionalism and dedication which they have already applied to the motorcycle, hi-fi, camera and car markets in this country.

The most striking thing about the new Japanese products is their quality. Quite frankly, they make most British products look crude and utterly amateur by comparison. They are all superbly made examples of skilful production engineering, designed to be mass-produced efficiently and to work reliably. Forget the old chestnut about Japanese products being cheap because they're produced by slave labour — they're not; on average, Japanese factory workers seem to enjoy a standard

of living which is at least as high as their British counterparts and frequently higher.

The implications for British (and many American) hardware manufacturers are serious: boys, you'd better pull your socks up fast if you want to stay in this business. The time for good old British complacency is long past; just look at what happened to our hi-fi and motorcycle industries — the same will happen to you if you don't watch out! Even if you can match them on quality, the Japanese are set to fight with prices too — how many British manufacturers are efficient enough to produce a twin-disk, 8086-based, 128k machine with high-resolution graphics, good quality keyboard and a useful amount of applications software for just over £1000 end user price? Or a four-colour A4 plotter at under £90 (yes, ninety pounds) retail? Of course these are the Japanese domestic prices, but even after import duties and freight costs have been added and the price boosted a bit because the British market is traditionally over-priced, there's still a lot of leeway left with which to undercut the market. And don't think that these low domestic prices are gained at the expense of pre- and after-sales backup, either. Even the smallest Japanese computer shop makes the average British equivalent look shamefully pathetic.

Is there any hope at all for the

British micro industry, then, or should we all give up now and start selling (Japanese) video recorders instead? Fortunately, Britain has a hell of a lot to offer the Japanese, mostly in terms of software. Actually, the Japanese are quite good at writing software, but because they plan to hit a wide range of foreign markets virtually simultaneously, the Japanese realise they cannot possibly produce packages tailored to the diverse requirements of each market. They plan instead to commission local software houses to produce suitable packages for each of the various market areas and many of the people I spoke to in Tokyo were well aware of Britain's software expertise. Where we Brits fell down, they told me, was in our reluctance to simply get on a plane and sell our skills abroad — British companies were very noticeably absent from the Data Show.

The coming Japanese invasion will thus be good for our software industry if British software houses act quickly enough — but it has serious implications for our hardware manufacturers unless they can match the Japanese on quality and pricing, and do so very quickly. Regrettably, there will be those who will instead concentrate their efforts on bleating pleas for trade barriers — the barriers won't appear and those who waste time arguing for them instead of getting their acts together are unlikely to last long in this business.

SUBSCRIBE TO PCW

"JUST SKIMMED THE LAST THREE ISSUES AND FOUND THEM FASCINATING..."

Arthur C Clarke

It's amazing what goes on in the basement of *Personal Computer World*. Our erstwhile subscriptions manager, for example, engaging in correspondence with Arthur C Clarke! (For the uninitiated few, ACC is arguably one of the world's most visionary living individuals: a scientist, author of 2001: A SPACE ODYSSEY and 60 or so other works, originator of communications satellites, undersea explorer, etc, etc).

Mr Clarke tells us that he has an Apple II 'languishing in the lab. . . too busy to touch it for weeks'. Busy, apparently, completing SPACE ODYSSEY two ('my latest, last book!') on his Archie word processor (Archives III, 5 megabyte Winchester disk, Wordstar program) with which he is obviously deeply satisfied — 'I could no more imagine going back to a typewriter than to a slide rule. . . '.

We make no bones about our delight that Mr Clarke takes the trouble to write to us from his home in Sri Lanka and comment on *Personal Computer World* so favourably. As a subscriber to PCW, not only will you save a small fortune (see the rates below) but you can count yourself in august company. Remember that Clive Sinclair described PCW a short while ago as 'clearly one of the leading computer journals in the world'.

Well, that's always been our aim. And if it's true that a person is known by the company he keeps, you could do a great deal worse than fill in the coupon on the right hand side of this page. You won't even need to put a stamp on your envelope. . . unless you live in Sri Lanka, that is!

For a limited period only, here are the special offer rates for a subscription to Britain's largest selling microcomputer publication.

1 Year Subscription (U.K. only)	£11.50	(We will send you two free issues at the end of your subscription before reminding you to renew. You get 14 issues for the price of 12 issues if you subscribe now!)
2 Year Subscription (U.K. only)	£19.50	(You receive 24 issues, saving yourself £3.50 off the full current subscription price. Plus you protect yourself against future increases in cover prices and postal rates which will probably amount to a saving of £5.00 over the period.)
3 Year Subscription (U.K. only)	£29.50	(You receive 36 issues, saving yourself £5.00 off the full current subscription price. Plus you protect yourself against future increases in cover prices and postal rates which will probably amount to a saving of £7.00 over the period.)

PLUS

We have now arranged for special 'first-off-the-press' copies to be mailed direct to subscribers which will ensure that they arrive either on the same day or one or two days in advance of national distribution in the U.K.

PLUS

Existing subscribers can take advantage of any of the offers above. Just tick the 'this is an extension subscription' box on the coupon and enclose your payment. The additional copies will be added to your existing subscription automatically. You do not have to wait until it is time to renew (by which time this offer will probably have been withdrawn). Save money by extending your subscription today!

PLUS

We have completely reorganised our Subscriptions Department and any problems, change of address, special requests etc. etc. will be promptly dealt with by an extremely 'user-friendly' human being should you need to write to us.

PLUS

We send subscription copies of PCW in a tough polythene wrapper. It will reach you promptly every month, unfolded and in good condition.

PLUS

You can pay for your subscription to PCW by cheque, postal order or by using Barclaycard (Visa)/American Express or Access. And you don't even need a stamp for your envelope. Use the coupon on the right.

Why do more people read PCW than any other microcomputing magazine in Europe? Subscribe today!!

COMPUTER ANSWERS

Send your queries to: Sheridan Williams, 35 St Julian's Road, St Albans, Herts.
Please note that Sheridan can no longer answer questions on an individual basis, so please don't send an SAE with your query.

What's in a name?

I am considering selling software for my ZX81 but have a query about copyright. If I see a program working on a computer other than the ZX81, and I decide to write a program based on this idea, but using my own programming ideas, is it a breach of copyright if I sell the program?
G Smith, Aberystwyth, Dyfed.

This question is the subject of heated discussion at the moment with the recent threat by Atari to prosecute certain companies who are selling their own representations of Pacman. The question is, can you copyright an idea? If you rewrite a program for the ZX81 then it is very unlikely that it will bear any visual or programming similarity whatsoever, so theoretically you are home and dry. The only point to be careful of is the name, which may be copyrighted. Most companies are very reluctant to allow other companies to benefit from a good name that they have built up.
James Walsh

Forthcoming compiler

I own a 48k RAM ZX81 and have been reading with interest the articles on Forth which have been appearing in various periodicals recently.

I would be very grateful if you could advise me of an address from which I could obtain a Z80 assembly listing of a Forth compiler. I could of course write the I/O routines myself.

Christopher Marriott, Llandudno, Gwynedd

Forth seems to be a particularly popular language among ZX owners, so Artic Computing decided to write and market a Forth compiler. It is available on EPROM (which needs an extension board to plug into) or cassette, which can be LOADED in the normal way.

More details are available from this address: Artic Computing, 396 James Reckitt Avenue, Hull, HU80

OJA.

For the uninitiated, Forth is another programming language much faster than Basic, closer to the machine, and in some ways easier to learn.

It has such statements as DO-LOOP, BEGIN-WHILE-REPEAT and you can compile your own words. The first computer to use this language as standard is the Jupiter ace.

James Walsh

Cramming it in

One of the major uses I have for an Osborne 1 is the production of business letters using Wordstar. Although these letters are usually short (typically four or five lines) I keep running out of disk space, due to the limited (92k formatted) capacity of the Osborne's drives. Is there anything I can do about this, short of altering the hardware, with double density, or external drives?
Name and address supplied

Yes, there's a lot you can do.

1. Make sure you have all 92k available for text files (incidentally, that 92k is quite generous for single density single sided disks — about 70k would be more typical) by leaving all the Wordstar and other programs (such as PIP and STAT) on the disk on drive A, and having a blank (but formatted) disk on drive B: on entering Wordstar use the L option to log onto drive B;

2. Once you are happy with the final version of a text file, delete the corresponding .BAK file created by Wordstar. If you are not doing this already, this simple action will double your usable space.

3. The minimum file size on a CP/M 2.2 system such as the Osborne 1 is 2k. Obviously this will limit you to 46 files per disk, even if, as in your case the files are actually much smaller. (There is a further limitation in that the disk directory can only accept 64 entries, but this would only be significant with double-density disks.)

4. This limitation can be overcome by merging lots of your older text files into one bigger file, using either PIP, or the 'Control KR' function in Wordstar. If you use the latter you can arrange for each letter to start on a separate page, so they can be individually printed. If the start of each page includes the letter's reference you can find them in the file using 'Control QF'.

5. Keele Codes Ltd's utility suite 'E40' (See 'Cramming it in' on page 141 of the September 1982 PCW) compacts textfiles to approximately 40% of their original size, and now include special options to make it compatible with Wordstar. It is available in Osborne 1 disk format, and my copy came without undue delay.

If your letters were of up to 1k size, and you were not already using any of these ideas, you could get 23 letters (and 23 .BAK copies) on a whole disk. Deleting the .BAK copies would increase this to 46. Merging the letters into bigger files would give a capacity of up to 92. Compressing with 'E40' would increase this to some 230 — a tenfold potential increase.

P L McIlmoyle

Adaptable Sinclair?

What are the odds that the Sinclair Microdrives in some way can be adapted to other computers?

Which is the better of the Z80 and 6502 CPUs in terms of speed and execution repertoire?

Approximately how many times faster is a machine code program than one written in interpreted Basic?

What are the drawbacks in using 'pageing' to allow an 8 bit CPU to address more than 64k of memory?
Bo Nordlin, Sweden

Without knowing information that is not yet available, any comments on your first point must be no more than informed speculation. Certainly I would expect some type of 'converter boxes' to appear sooner or later, but whether these will come from Sinclair will depend on many factors, including, I would expect, the size of the potential market for these interfaces. There is a move afoot to standardise such 'microdrives' to ensure compatibility from make to make, but Sinclair has a reputation for producing unique products.

The Z80A micro-processor runs at 4 MHz and is thus definitely faster than the 6502. However, much depends on the design and components of the rest of the computer, and even more on the way languages such as Basic are implemented, so while machines with Z80 CPUs are usually faster than those with 6502s this need not be so. The instruction sets of the Z80 and 6502

each have their own devoted followers, and in many regards it is a question of 'horses for courses'. There is a very strong tendency for the Z80 (and related 8080 and 8085) CPUs to be used for business applications and the 6502/6809 to be used for hobbyist/games applications.

The Intel 8080 instruction set can be used also by the Zilog Z80 and the Intel 8085, thus providing interchangeability between programs on these three machines, so long as the extra Z80 instructions are not used.

It is very difficult to give a useful idea of the relative speeds of machine code compared with Basic, as so much depends on the programs in question, as to the number of loops, the amount of I/O, etc. However, a rough idea can be gained from the fact that a fully compiled 'native code' Basic program may well run some 10 to 20 times faster than an interpreted version. In suitable cases (eg, not much I/O) a skillfully written machine code program could improve on this by up to a further order of magnitude.

There are not many drawbacks to 'pageing', which is a useful and powerful technique. However, special memory boards are likely to be required, and special software to use them. There is inevitably some loss of speed due to the extra switching involved. Another snag is that different computers can use different systems of pageing so that the portability of programs written to run under CP/M may well be lost if they use this technique.

You should note that in microcomputers 'pageing' refers to switching from one 'bank' of RAM memory to another, while with mainframes the same word is often used to refer to a technique of dumping the whole contents of memory to disk, and loading a fresh set from disk. Microcomputer disk operations are not yet fast enough for this to be very useful.

P L McIlmoyle

Even KWICer

In September's 'Computer Answers' we were unable to help with 'KWIC query'. However I have just received a letter from P H Cathedral of Clwyd, N Wales helping somewhat (many thanks by the way). In case you can't find the original question, here it is:

I have seen a book index produced by a KeyWord

In Context (KWIC) program. Each main word was listed as part of the line of text in which it occurred and the whole index was ordered alphabetically.

Do you know of a KWIC program for a micro, or can you offer any hints for writing my own?
B Kat, Newcastle-upon-Tyne

You will find a program to suit your needs in *Software Tools in Pascal* by Kernighan and Planger, Addison-Wesley Publishing Co 1981. ISBN 0-201-10342-7, chapter 4, section 8, page 134 *et seq.*
 SW

NEC's question

I want to buy a micro to serve my university needs in maths and electrical engineering, and am thinking of the NEC PC 8001B. Initially I would buy the console and a 12W monitor. Could you comment on: whether or not the NEC is good enough for my needs; if the console will, with cassette storage, give me high resolution graphics without taking up too much of the 32k RAM; if I should go for NEC's own green monitor, a Hitachi black and white one, or Transtec or BMC green ones.

J Vella, Marsh, Rep of Malta

As always, when choosing between machines for a particular application it is helpful to set out a list of the essential features, and then the desirable ones. Comparison of the machine's specifications with this list will help in ensuring a correct decision.

From what you say in your letter I would expect that your list will include the ability to carry out arithmetic to a fairly high precision, and quite rapidly. Also you require a good graphics capability and the ability to handle text up to 80 characters per line.

The NEC 8001B incorporates a version of Basic which provides for double-precision floating point arithmetic, and the CPU is a Z80 equivalent running at 4 MHz, so both these needs should be met. As far as high resolution graphics is concerned, it all depends on what you mean by this. NEC claims a graphics resolution of 160 by 100 points. This should be just as achievable with cassette storage as with disks.

The question of monitors is partly a question of personal taste, and partly one of performance. Good reports are available of the resolution of up to 80 characters per line using both the NEC and the Hitachi monitors. So here the choice may be one of personal preference for green or black and white. For some

reason that is a mystery to me, my experience is that office staff tend to prefer green, while technical staff tend to prefer black and white. I am afraid I have no information on the other two monitors you mention.
P L McIlmoyle

Non-xray vision

In the October issue of *PCW* I asked if any reader knew the facts concerning the effects on vision of sitting very close to a colour TV/monitor for long periods. I was particularly concerned about X-rays.

I had many replies, and would like to thank the following for their comments: E H Kelly of Chester, A P Searle of Dulwich, Geoff Cox of Gillingham, A Camacho of St Albans and D J Gazely, the General Secretary of The Partially Sighted Society, for their interesting and helpful responses.

I print here with permission from The Partially Sighted Society an extract from their magazine *Oculus* (May/June '82 issue) which was vetted by one of their advisors, Dr Fergus Campbell MD, FRS of the Department of Physiology at Cambridge University.

'Television sets do not give out any sort of "ray" or other emission that can harm the eyes, even if the viewer's sight is defective and the screen is being viewed from close to. *Although some people may experience a heightened sensation of flicker when watching television from close quarters, which may be unpleasant, this can similarly do no actual harm to the eyes. (If the flicker is too unpleasant, it may be reduced by wearing an inexpensive pair of sunglasses.)

'In common with any other visual task, and providing the viewer does not have tunnel vision, moving closer to a television is the simplest of all ways to make the picture easier to see. Moving from ten feet away to a distance of two feet will magnify the picture five times.

'Close viewing like this cannot "strain" or otherwise damage the eyes in any way although the muscles within and around the eyeball, just like any other muscle in the body, may become more quickly tired in these circumstances. If this happens, closing the eyes and resting for a while should relieve any temporary discomfort. (Persistent headaches, or pain in the eye, should of course always receive prompt medical attention.)

*Reference: Terrana T, Merluzzi F and Guidici E 'Electromagnetic radiations

emitted by visual display units,' *Ergonomic Aspects of Visual Display Terminals* (eds: Grandjean E and Vigliani E; London: Taylor and Francis).

Of course, I have no way of checking this, so I publish the extract verbatim.

In return for their article they asked me to ask whether anyone is willing to donate a daisywheel printer compatible with their TRS-80 Level II to the society. If so please contact them on Draycott (03317) 3036.
 SW

Happily ever after?

Once upon a time there was a budding microcomputer enthusiast who bought a ZX81. He learnt how to program in Basic on this and was delighted. His main interest began to centre around games and other programs containing moving graphics and thus his ZX81 was no longer good enough. And so, he sold his ZX81 and looked for a better micro in the £300 - £400 range. 'Egad. . .', he cried as he saw the range to choose from.

As it happens, I have the same problem. I am tempted to buy the Sharp MZ-80K, but would really appreciate some advice on which micro to buy, plus some comments on the MZ-80K.
Mike Swift, Chester-le-Street, Co Durham.

The number of new 'colour/sound micros' in this and the slightly lower price bracket is increasing almost by the day. Probably the two main ones to look at are the Atari 400 at £319 and the BBC Model B Computer at £399. The Atari is available from Maplin and has probably the best range of games software for any micro in the world. For £319 you get 48k RAM, which is probably the most you will ever use. The BBC Model B has 32k RAM and 16 colour graphics. But you must remember that for really good hi-res graphics it

is necessary to use a purpose built monitor rather than a normal colour telly. A colour monitor may set you back another £200 or so. The main problem with the BBC computers is the waiting list, but they have recently been available directly from the address below (among others): Microage Electronics, 135 Hale Lane, Edgware, Middlesex. HA8 9QP. Tel: 01-959 7119.

As far as the MZ-80K is concerned, it doesn't have hi-res graphics or colour and has been overtaken by many of the new computers.
James Walsh

Fuller fun...?

I am the owner of a ZX81 and I am wondering if the Fuller Designs FD system keyboard/case plus a motherboard (so that I can add an interface port as well as the 16k RAM pack), is a good buy, or would I be better off getting a larger computer with 16k+RAM for hobby use?

N Cooney, Hertford, Cheshire

The Fuller FD System is a well made and nice looking keyboard and case for your ZX81, though it is reasonably expensive at £39.95. The motherboard is only £15.95, which is pretty good as far as motherboards go. If you can afford to buy another, more expensive computer then go ahead, but for the sake of a nice keyboard and interface port it does seem like a rather unnecessary expense.

Probably the most suitable computer for expansion in this way within the lower price bracket is the BBC Micro, which is £300 for a model A; quite a jump from £49.95. If your main priority is for a computer which has a better Basic and moderately more expansion possibilities then it is worth taking a look at the multitude of new computers which are emerging for around £200.
James Walsh

Dysan

The Highest Quality Diskettes For Your System.

Dysan diskettes, acknowledged to be the industry leader in quality and data integrity available for all these and other systems from HAL Computers, Dysan's key U.K. distributor.

How to increase the

Anyone with even a limited knowledge of home computers will instantly recognise the very large advantages of owning a Lynx.

And anyone who truly understands the considerable differences between home computers is likely to have spotted The Lynx a mile off.

With 48K of memory to start with, The Lynx far outweighs the majority of home computers on the market.

And it is precisely that size of memory

which makes The Lynx a superior animal in its field.

What's more, 48K of memory is not the end of its capacity, but merely the beginning.

Your Lynx can grow. To 96K, to 128K, or to 192K. All inboard.

All of a sudden your Lynx home computer has assumed the size of memory usually associated with business machines.

Its increased capacity will mean you can have an impressive word processor.

size of your memory.

Disk drives and printers, mono or colour monitors can be added on.

With an RS232 port, your Lynx home computer is compatible with a wide range of other manufacturers' equipment.

And CP/M® compatibility opens the door to a comprehensive selection of business software.

Furthermore, your Lynx home computer has high resolution colour graphics.

In other words, you are free to draw in all 8 colours anywhere on the screen.

For the full story about The Lynx home computer, write to Computers Ltd., 33a Bridge Street, Cambridge CB2 1UW and we'll send you a brochure and the name of your nearest stockist.

®CP/M is the registered trade mark of Digital Research Inc.

NEWCOMERS START HERE

This is our unique quick-reference guide, reprinted every month to help our readers pick their way through the most important pieces of (necessary) jargon found in PCW. While it's in no way totally comprehensive, we trust you'll find it a useful introduction. Happy microcomputing!

Welcome to the confusing world of the microcomputer. First of all, don't be fooled; there's nothing complicated about this business, it's just that we're surrounded by an immense amount of necessary jargon. Imagine if we had to continually say 'numbering system with a radix of 16 in which the letters A to F represent the values ten to 15' when instead we can simply say 'hex'. No doubt soon many of the words and phrases we are about to explain will eventually fall into common English usage. Until that time, **PCW** will be publishing this guide — every month.

We'll start by considering a microcomputer's functions and then examine the physical components necessary to implement these functions.

The microcomputer is capable of receiving information, processing it, storing the results or sending them somewhere else. All this information is called **data** and it comprises numbers, letters and special symbols which can be read by humans. Although the data is accepted and output by the computer in 'human' form, inside it's a different story — it must be held in the form of an electronic code. This code is called **binary** — a system of numbering which uses only 0s and 1s. Thus in most micros each character, number or symbol is represented by eight binary digits or bits as they are called, ranging from 00000000 to 11111111.

To simplify communication between computers, several standard coding systems exist, the most common being **ASCII** (American Standard Code for Information Interchange). As an example of this standard, the number five is represented as 00110101 — complicated for humans, but easy for the computer! This collection of eight bits is called a **byte** and computer freaks who spend a lot of time messing around with bits and bytes use a half-way human representation called **hex**. The hex equivalent of a byte is obtained by giving each half a single character code (0—9, A—F): 0=0000, 1=0001, 2=0010, 3=0011, 4=0100, 5=0101 E=1110 and F=1111. Our example of 5 is therefore 35 in hex. This makes it easier for humans to handle complicated collections of 0s and 1s. The machine detects these 0s and 1s by recognising different voltage levels.

The computer processes data by reshuffling, performing arithmetic on, or by comparing it with other data. It's the latter function that gives a computer its apparent 'intelligence' — the ability to make decisions and to act upon them. It has to be given a set of rules in order to do this and, once again, these rules are stored in **memory** as bytes. The rules are called **programs** and while they can be input in binary

or hex (**machine code programming**), the usual method is to have a special program which translates English or near-English into machine code. This speeds programming considerably; the nearer the programming language is to English, the faster the programming time. On the other hand, program execution speed tends to be slower.

The most common microcomputer language is **Basic**. Program instructions are typed in at the keyboard, to be coded and stored in the computer's memory. To run such a program the computer uses an **interpreter** which picks up each English-type instruction, translates it into machine code and then feeds it into the **processor** for execution. It has to do this each time the same instruction has to be executed.

Two strange words you will hear in connection with Basic are **PEEK** and **POKE**. They give the programmer access to the memory of the machine. It's possible to read (**PEEK**) the contents of a byte in the computer and to modify a byte (**POKE**).

Moving on to **hardware**, this means the physical components of a computer system as opposed to **software** — the programs needed to make the system work.

At the heart of a microcomputer system is the central processing unit (**CPU**), a single microprocessor chip with supporting devices such as **buffers**, which 'amplify' the CPU's signals for use by other components in the system. The packaged chips are either soldered directly to a printed circuit board (**PCB**) or are mounted in sockets.

In some microcomputers, the entire system is mounted on a single, large, PCB; in others a **bus system** is used, comprising a long PCB holding a number of interconnected sockets. Plugged into these are several smaller PCBs, each with a specific function — for instance, one card would hold the CPU and its support chips. The most widely-used bus system is called the **S100**.

The CPU needs memory in which to keep programs and data. Microcomputers generally have two types of memory, **RAM** (Random Access Memory) and **ROM** (Read Only Memory). The CPU can read information stored in RAM — and also put information into RAM. Two types of RAM exist — **static** and **dynamic**; all you really need know is that dynamic RAM uses less power and is less expensive than static, but it requires additional, complex, circuitry to make it work. Both types of RAM lose their contents when power is switched off, whereas ROM retains its contents permanently. Not surprisingly, manufacturers often store interpreters and the like in ROM. The CPU can only read the ROM's contents and cannot alter them in any way. You can buy special ROMs called **PROMs** (Programmable ROMs) and **EPROMs** (Erasable PROMs) which can be programmed using a special device; EPROMs can be erased using ultraviolet light.

Because RAM loses its contents when power is switched off, **cassettes** and **floppy disks** are used to save programs and data for later use. Audio-type tape recorders are often used by converting data to a series of audio tones and recording them; later the computer can listen to these same tones and re-convert them into data. Various methods are used for this, so a cassette recorded by one make of computer

won't necessarily work on another make. It takes a long time to record and play back information and it's difficult to locate one specific item among a whole mass of information on a cassette; therefore, to overcome these problems, **floppy disks** are used on more sophisticated systems.

A floppy disk is made of thin plastic, coated with a magnetic recording surface rather like that used on tape. The disk, in its protective envelope, is placed in a disk drive which rotates it and moves a **read/write head** across the disk's surface. The disk is divided into concentric rings called **tracks**, each of which is in turn subdivided into **sectors**. Using a program called a **disk operating system**, the computer keeps track of exactly where information is on the disk and it can get to any item of data by moving the head to the appropriate track and then waiting for the right sector to come round. Two methods are used to tell the computer where on a track each sector starts: **soft sectoring** where special signals are recorded on the surface and **hard sectoring** where holes are punched through the disk around the central hole, one per sector.

Half-way between cassettes and disks is the **stringy floppy** — a miniature continuous loop tape cartridge, faster than a cassette but cheaper than a disk system. **Hard disk** systems are also available for micro-computers; they store more information than floppy disks, are more reliable and information can be transferred to and from them much more quickly.

You, the user, must be able to communicate with the computer and the generally accepted minimum for this is the visual display unit (**VDU**), which looks like a TV screen with a typewriter-style **keyboard**; sometimes these are built into the system, sometimes they're separate. If you want a written record (**hard copy**) of the computer's output, you'll need a **printer**.

The computer can send out and receive information in two forms — **parallel** and **serial**. Parallel input/output (**I/O**) requires a series of wires to connect the computer to another device, such as a printer, and it sends out data a byte at a time, with a separate wire carrying each bit. Serial I/O involves sending data one bit at a time along a single piece of wire, with extra bits added to tell the receiving device when a byte is about to start and when it has finished. The speed that data is transmitted is referred to as the **baud rate** and, very roughly, the baud rate divided by ten equals the number of bytes being sent per second.

To ensure that both receiver and transmitter link up without any electrical horrors, standards exist for serial interfaces; the most common is **RS232** (or **V24**) while, for parallel interfaces to printers, the **Centronics** standard is popular.

Finally, a **modem** connects a computer, via a serial interface, to the telephone system allowing two computers with modems to exchange information. A modem must be wired into the telephone system and you need British Telecom's permission; instead you could use an **acoustic coupler**, which has two obscene-looking rubber cups into which the handset fits, and which has no electrical connection with the phone system — British Telecom isn't so uppity about the use of these.

PACKAGES

PCW's 'Packages' section is produced bi-monthly, alternating with our 'In Store' hardware guide. We have confined coverage to business packages which are available and supported at national level and which have been in use for at least six months in a minimum of five sites. Producers of packages which fall within these constraints should send details or updates to: Dick Olney, PCW, 14 Rathbone Place, London W1P 1DE.

The layout has been designed to allow you to discover which packages are available for the application you have in mind and to show you which packages are available for your computer if you already have a machine. In either case the code enables you to look up the supplier's name and telephone number in the table below. All details published are the latest made available - some may have changed since this issue went to press.

BERZERK*

NEW GAME. PRIVATE PROPERTY.

'Berzerk' is the latest of Atari's video games to become available.

Since it is an ATARI® game we have exclusive rights to exercise all copyrights and other rights connected with 'Berzerk.'

We lead the field in the development of video games. And it's due to our considerable investment of time and resources that our games have become so popular. And due also, of course, to the people who have enjoyed the games.

Unfortunately, however, some companies and individuals have been copying ATARI games, gaining profits at Atari's expense.

We must protect our investment so we can carry on investing in the development of new and better games.

So consider this a warning both to intentional pirates and to individuals unaware of the copyright laws.

Any manufacture, sale or other dealings in games which reproduce any of the copyrights in 'Berzerk', or any unlawful use of the name 'Berzerk' (or imitation of it) is an infringement of Atari's rights.

Atari will protect its rights by vigorous action against all infringers. Regardless of what computer or other apparatus is used in playing infringing games.

We would also appreciate the co-operation of legitimate software developers in the protection of our property.

And if you happen to be selling a software product which performs a game similar to 'Berzerk' (or any other ATARI game) please contact us immediately.

Write to the attention of: Graham Daubney, Atari International (UK) Inc., 185 Ealing Road, Alperton, Wembley, Middlesex.

ACC NEWS

Rupert Steele presents his monthly round-up of news from the Amateur Computer Club.

Well, did you enjoy the PCW Show this year? It was of course a great success — there were people every where and lots of exciting new products. Many thanks must go to PCW, as sponsors, and to Montbuild who do all the work, for a really first class job.

As is becoming a regular practice, the exhibition organisers set up a 'Clubs Area', where the computer clubs were given free stands,

administered via the ACC. This was also a great success, though a slight drawing error caused the club area to be smaller than was intended. Nevertheless, the clubs proved to be a major attraction and therefore show how an exhibition can be enhanced by having club stands. The administration of all this was expertly handled by ACC Secretary David Annal, who once again solved all the problems and

smoothed over all the difficulties. Many thanks to you David, and keep it up!

Apart from the various National User Groups, the ACC itself had a stand at the show, and this proved to be quite popular, since there was a PET animated graphics display running. Many thanks to David Annal and his co-authors for writing the 'film' — it was great! Also on that stand was the customary ACC clubs database, which we

used to put people in touch with their local clubs. Unfortunately, due to Peter Whittle, our leader and Chairman, being on holiday, we inadvertently ran an out-of-date copy of the database for the first two days. Sorry — we'll slap Peter's wrist shortly.

Also at the PCW Show was the Electronic Insight Micronet stand. This was the launch of their new Prestel subscription service, which

will be a closed user group, membership of which includes a very simple Prestel adaptor. The 8008 area which was discussed on last month's ACC News will be involved with this, and there seems to be a lot of scope for clubs to put up information on the Prestel system, as well as opportunities for telesoftware. Watch this space (and Electronics Insight, *800#) for more details.

As is becoming customary at the large exhibitions, there was a meeting of the National User groups and part of the ACC committee. I didn't make it myself 'cos I was talked into running the stand but it was apparently very constructive, both in terms of the discussion of the clubs area at this PCW Show and terms of the general policy of the ACC performing a liaison role as the national body for microcomputer enthusiasts. The meeting was felt to be quite useful as a means for the various groups to communicate, as well as the formal consideration of the role that the groups wished the ACC to play.

Anyway, many thanks again to PCW for an excellent show, and to 'Uncle' David Annal for his work.

Exhibition news

On Saturday and Sunday 11/12 December, there will be a Christmas Microfest 82 exhibition at the University of Manchester, Institute of Science and Technology (UMIST). There was a similar exhibition during the summer at UMIST, and this one promises to be even more of a success. The ACC will be there with our now-infamous database running; we are also going to be organising the club stands.

Also on Microfest is an ACC free seminar, 'Your micro on the dog and bone (or how to whistle at 300 baud)'. This will be an elementary discussion of data

communications, using the telephone network. So if Prestel makes you go *+++++* or if mailboxes makes you return to sender, then this talk is for you!

ACC things

ACCumulator now has a new editor. All material for inclusion in **ACCumulator** should be sent to Leon Heller, 8 Morris Walk, Newport Pagnell, Bucks, MK16 8QD. You don't know what **ACCumulator** is all about? Well, write to me and I'll tell you. Let's have lots of contributions flooding in to Leon.

One or two of you out there haven't renewed your ACC subscriptions: I suggest you pay up soon, or the boys will be round to chew your UARTS off. So you say you lost the form... well we have plenty to spare at the head office.

The ACC's new hobby is 'regionalisation'. The rules of the game are that you pick on some group of local computer clubs minding their own business, and you introduce them to each other and form an Association. This association then arranges club stands at exhibitions, joint events, speaker lists, etc, and the various clubs in the association generally help each other. The first regional association was the ALCC, and recently the ACC has set up a North Western group (Manchester area). We now want to extend the idea around the country, and I would be very grateful to hear from anybody running clubs around the country who wants to associate. I am in the process of setting up a 'West of London' association of computer clubs, which would cover the area bounded by London, Milton Keynes, Northampton, Oxford and round to Reading and possibly Guildford. Anyway, please

can we have some feedback on all this.

The ACC is also keen to help those setting up computer clubs, and I have a literature kit that may be of some help to club builders. Please, please make sure that you inform the ACC of the details of the club, as our database is widely recognised as the list of computer clubs, and your club will miss out on a lot of members and information if we don't know about you. It costs absolutely nothing for your group to be entered on the ACC database, apart from the cost of a stamp to write to Peter Whittle, 49 Bartlemas Road, Oxford OX4. Please also tell us about any errors or out-of-date information — quote the reference number on the top of your entry if possible.

Club bits

I have to report that there has been a military coup at OPeCC. A junta led by Major Gen Len Phelps has taken over control of the club while the previous leadership has been variously imprisoned or banished to the ACC committee (which is worse...?). All correspondence to the Chairman of the Revolutionary Council, Len Phelps, Southport Cottage, Sutton Courtenay, Abingdon OX14 4AN.

There is a flourishing computer club in Aylesbury, the Aylesbury Computer Club or ACC for short (I know the ACC is wonderful, but did they really have to name their club after us?). Contact: Ken Knight, 22 Mount Street, Aylesbury.

Also it's about time I gave a plug to the West London Personal Computer Club or WLPC for short. They meet on the first Tuesday of the month — ring Graham Brain on 01-997 8986 for more information.

Also wanting a plug is the Southampton Amateur Computer Club (SACC). It is

now five years old and has a membership of over 100. They are associated with a club in Fareham and Portsmouth. The SACC meets second Wednesday monthly at 7.30pm in the Medical Science Building, Bassett Crescent East, Southampton. More info is available from Paul Blitz, 'Gardenways', Chilworth Tower, Chilworth, Southampton (or phone Soton (0703) 766161).

Also brought to my notice is the 'Community Computing Network'. This is a national association of 'voluntary, community and trade union' computing groups. Their aims are similar to the ACC's, except that they are more interested in the specific area of community/trade union computer clubs, as opposed to the general kind that is the main part of the ACC's interest. In addition they have two aims that are *not* like the ACC's — namely:

- 1) To promote the socially responsible use of the new technology;
 - 2) To provide an education forum for groups interested in the implications of the new technology;
- so I suspect that you would only be welcome if you were ideologically sound. Anyway, if you are interested, contact The Community Computing Network, c/o CODA, 135a Mansfield Road, Nottingham NG1 3FQ.

If you have any queries about any of the information in ACC news, or wish to find out about the ACC, then please contact me: Rupert Steele, ACC Membership Secretary, St John's College, Oxford, OX1 3JP.

NB: You must put my name on the envelope, as the ACC is not associated with St John's College, which is where I happen to live.

TRANSACTION FILE

Readers will be pleased to know that, due to our clever layout ideas, the Transaction File is up-to-date and waiting cut down considerably. Ads are accepted only on the form below for a flat fee of £2.50. Please don't specify issues as we can't oblige. Ads cannot be repeated unless separate forms are sent in. We will only accept entries from non-commercial readers. Thank you for co-operating.

- * 16K ZX81 — PSU, leads, manual and 32 bit i/o board, (for sound, control, etc.) also software; QS DEF, ZXAS, Scramble, + more. Only £85.00 excellent condition, 2, Barton Rise, Chilton Polden, Bridgewater, Som. Tel. (0278) 722588 E/W Ends.
- * TRS80 Level 2 — 16k VDU cassette recorder manuals, dozens of games, adventures, utilities, scripsit, Edtasm, Tasmon, worth £850 accept £350 (includes delivery). Tel. Mr Williamson 0733 63141 ext. 570 during daytime.
- * ZX81 and 16k RAM — Also many m/code games including Asteroids, Defender. Plus book w/ over 40 programs, plus 5 issues of 'Sinclair User'. Will accept £80 ono. Telephone: Worktop 770887.
- * 48k Nascom2 — Gemini 64k/

- EROM cards. Romed, Zeap2.1, Nadsis, Debug, Ext-Basic. Colour. H.R.G. 4k 8 tape. 8Apsu. Vero case. Enormous software library. Eprom prog. £725.00. P. Smith, 23 Sandy Close, Petersfield GU31 4HF. 0730 4059.
- * Video Genie EG3003 — 16k hardly used, condition as new, £180 ono. Tel. 01-440 9498.
- * Knights super machine — code tape, includes free space invaders. (for Sharp MZ-80k) Excellent value the best at only £25 (worth nearly £40). Phone Mr Morris on Wrexham (0978) 365875 after 4pm.
- * PET 3032 — 32k. Toolkit, chip. Cassette recorder. Many program tapes, magazines and Pet manuals. All excellent condition. £400 ono. Near Wolverhampton. Tel. Codsall 2341.

- * UK101 8k RAM — cased with number pad, 300/600 baud switch, many programs, cassette and T.V. £300 ono. Will swap for 8k RAM small keyboard pet. Phone Welwyn Garden City 35949 after 4pm.
- * Apple II — plus single disk manuals, programs including database £925. Also Sharp MZ80k 120 programs. Documentation. Duvostore £325 Tel. Stratford upon Avon 298187 (Weekends).
- * Nascom-2 — 32k kenilworth case, 5 card expansion rack, Basiccomp sound board, software toolkit, Vortex (graphics), Assembler, £400 ono. Phone D. Keeling 051-709 0516 (daytime).
- * Superboard II... — 16k, two monitors, power supply, cased, 6-inch television, all leads, basic 5, Toolkit, enhanced screen, 12k

- Rom, manuals, newsletters, games, including invaders, Assembler Editor. £125 ono. Telephone: 01-897 0620.
- * Acorn Atom — 6k RAM, 8k RO ROM +PSU, Manual, leads, seven programme cassettes (educational and games). Ready to run. Ideal for learner. £90 ono (plus carriage). Nicholls, 01-670 8605 (evenings).
- * Sharp Mz80k — 48k RAM excellent condition £250 reason for sale upgrade Tel 0705 811760.
- * ZX81-1k, Sinc built, inc all leads and adaptor, original packing, manual and PSU. Exc condition. £40 tel: 01-883 0085, after 6pm.
- * Sharp MZ80k — 48k, excellent condition, (boxed) dust cover, £200 worth software inc. chess, adventures, forth and assembler. Green and blue screens £440. St. Albans 65580.

- * Tandy microprinter — electrostatic type. 80 column facility. 3 type sizes — electronics interface. Boxed 1 unused with roll of paper. Need money for discs. £100. Tel. 021-444 4954 evenings/weekends.
- * Apple II+ — 48k autostart ROM disc drive with controller, 9in Hitachi monitor, EPSON FX80/FT Epson interface, Applewriter, Microchess, Toolkit, manuals etc. £1,100 ono. Tel. 0226 297610 after 6pm. Reluctant sale!!
- * MZ-80k — +48k + £350 + £200 worth of games + forth fortran pas Pascal and super 5060 VM. Basic must sell soon: £350 ono (unwanted present). Tel. Frodsham 33978 after 4.00, anytime weekend.
- * MZ-80k Software — Frogger 8k long; 4A. Dcflight 2 player graphics game, 7k long £3.50 48k

TRANSACTION FILE

Adventure 20+ full screen pictures £5, 6k Disassembler £4. Mr G.W. Smith, 7, St Davids Grove, Birmingham B20 1BT.

* UK101 — 8k RAM, new monitor, cased, inc leads, manual and programs. 300/600 Baud, under 1 year old. £150 ono. Tel: 01-529 5325.

* Centronics 308 — Dot matrix printer with manual and some spares suit heavy duty application £320. Tel. Ely (0353) 778446 evenings.

* Seikoshu GP100 — graphic printer, as new £185. Tex Eprompt U.V. Eraser plus 2716 Eproms £20 Tel. Watford 48505 evenings/week ends.

* Atari VCS — inc five cartridges Combat, Space Invaders, Breakout, Lazer Blast, Asteroids, £150. ZX81 plus PSU and Casio FX501P, Library, interpack and master pack £100 ono. 01-556 0395.

PROGRAMS

PCW is interested in programs written in Basic, Pascal, Forth, Logo and Comal — all of which being languages we've covered in previous issues. Please supply your programs on disk or cassette with all necessary documentation (so we've got a good idea what it's about and how much memory it uses) and, if you can, a clear listing on plain white paper.

As all programs in PCW are checked either by a referee or by one of the editorial staff, it can take some time for a program to actually appear. If you don't hear from us within two months or so, it usually means your contribution is in the referee pipeline. It's essential to ensure that your program is fully debugged before you send it in — get a friend to try it out first — and all programs we publish are paid for at a regular rate. Send contributions to: Maggie Burton, PCW Programs, 62 Oxford Street, London W1A 2HG — and please enclose an SAE if you want material returned.

Getting competitive

This should keep you on your toes: to introduce a bit of healthy competition into 'Programs' a prize of £25 will be awarded to the writer of the 'Program of the Month'. This'll be on top of what would normally be paid for a program.

Any contribution sent in for 'Programs' will be eligible, including those I've had in the pipeline up to now. It'll be judged on several criteria — annotation, ideas and their implementation, use of a machine's facilities, user friendliness, originality and innovation.

From the January issue onwards the masterpieces chosen will be specially marked and I'll give an explanation as to why each program is chosen. Length won't matter — unless your program is actually too long to fit in — and all programming languages normally accepted are eligible. So if you've lost interest in that program you've been bashing away at for the past few weeks/months/years, Program of the Month should prove incentive enough to get it finished.

Lastly, I'll here remind readers that no correspondence whatever will be entered into regarding PCW's judgement on programs.

PET Firebird

by Michael Fok

There must be thousands of sticky-fingered, bug-eyed space game addicts who'll find this game keeps them happy over Christmas. It combines many of the dubious qualities of Asteroids, Space Invaders and Phoenix in a series of four little sub-games and it's even got a story behind it. Unfortunately the text in this listing could be improved by some discreet editing, but it's readable and easily absorbed.

The rather comprehensive instructions are entirely optional, as they're a separate program occupying almost 5k. If you don't feel like typing them in you can read them from the listing. The game itself takes up just over 7k. Both programs use machine code which

occupies the second cassette buffer and when the instructions have run the program exits, so to avoid keying-in twice (as you have to type NEW between instructions and game), save the instructions before you run them. Once you've typed NEW, run the game. Pressing key 'N' after running will prevent the 'STOP' key from being disabled — on a 'new ROM' PET.

In the first three stages of the game you can cheat by pressing 'C' (if you're the cheating type), but this won't actually make things much easier as you can't cheat on the fourth stage. Firebird will run on any PET. It was tested using Basic4 and Basic2.

Game

READY.

ATARI ATARI ATARI
ATARI BASIC - Learning by Using
 This new book is an "Action" Book. You do more than read it. Learn the intricacy of ATARI-BASIC through the short programs which are provided. The suggestions challenge you to change and write program routines. Yes, it's exciting - Many of the programs are appropriate for beginners as well as experienced computer users. (Screen Drawings, Special Sounds, Keys, Paddles + Joysticks, Specialized Screen Routines, Graphics and Sound, Peeks and Pokes and special stuff).
 Order-No. 164 \$9.95

ATARI Learning by Using - Book + cassette or disk
 This package includes the book No. 164 plus a cassette or disk (please specify) containing a variety of the programs which are listed in the book.
 Order-No. 7220 \$39.95

Games for the ATARI-Computer
 How to program your own games on the ATARI. Complete listings in BASIC and Machine Language of exciting games. Tricks and hints.
 Order-No. 162 \$7.95

GAME PACKAGE for the ATARI
 Book + cassette or disk
 Includes the book No. 162 plus cassette or disk (please specify) containing a variety of the programs listed in the book.
 Order-No. 7221 \$39.95

ATMONA-1
 Machine Language Monitor for the ATARI 400/800.
 This powerful monitor provides you with the firmware support that you need to get the most out of your powerful system, ATMONA-1 comes on a bootable cassette. No cartridges required. Disassemble, Memory Dump HEX + ASCII, Change Memory Locations, Blocktransfer, fill memory block, save and load machine language programs, start mach. Lang. Progr. (Printer optional).
 Comes with introductory article on how to program the ATARI computer in machine language. (Available also in ROM)
 Order-No. 7022 \$19.95

ATMONA-2 Superstepper
 A very powerful Tracer to explore the ATARI ROM/RAM area. Stop at previously selected address. Opcode or operand (cassette).
 Order-No. 7049 \$49.95

EDITOR/ASSEMBLER for ATARI 800, 32K or 48K RAM
 Extremely fast and powerful Editor/Assembler. (BK Sourcecode in about 5 seconds) Includes ATMONA-1.
 Order-No. 7098 \$49.95

MACRO-Assembler for ATARI 800, 48K RAM
 Please specify your system: RAM, disc or cassette.
 Order-No. 7099 \$89.00
 Add \$39.00 for cartridge version

Gunfight - For ATARI 400/800 16K RAM, needs two joysticks, animation and sound. (BK machine language).
 Order-No. 7207 \$19.95

Birth control with the ATARI (Knaus Ogino) Cass. or disk
 Order-No. 7222 \$29.95

Astrology and Biorhythm for ATARI (cass. or disk)
 Order-No. 7223 \$29.95

EPROM Cartridge KIT for ATARI
 Cartridge (bare board) with instructions (holds two 16K or two 32K EPROMs (2716,2532,2732)
 Order-No. 7224 \$19.95
 Order-No. 7043 complete \$29.95

Invoice Writing for small business with ATARI 400/800 16K RAM.
 Order-No. 7022, cass. \$29.95
 Order-No. 7200, disc. \$39.90

Mailing List No. 7213 \$24.95
 Inventory Contr. No.7215 \$24.95

NEW IATEX-1
 This new wordprocessor in machine language (BK) for all ATARI 400/800 computers offers the best price performance ever. 23 editor control commands, 17 formatting commands, dynamic formatting. Vertical and horizontal scrolling (up to 255 char. per line) include command on disk!
 Order-No. 7210 cassette \$29.95
 Order-No. 7211 disk \$39.95
 Order-No. 7212 cartridge \$79.80

Learn FORTH for the ATARI 400/800, cassette or disk
 Order-No. 7053 \$19.95

MICROMART

UK 101 SOFTWARE ON TAPE

from the guy who wrote "Le Passe Temps"

GALACTIC HITCHHIKER (8K). An adventure, all in machine code. A beauty! (£7.00)
SUPERTREK (8K). Sail boldly through the universe, zapping moving Klingons in real time. Superb graphics. (£7.00)
STARTREK (8K). The old favourite, beautifully presented. (£6.00)
LUNAR LANDER. A real challenge. You won't get down in less than 3 hours. (£3.00)
HANGMAN. Excellent graphics, P.E. said so! (£3.00)
BASIC TUTOR (8 x 4K). The only way to learn - at the keyboard. (£12.00)
LE PASSETEMPS. You NEED this, if you haven't already got it. (£3.00)
MAD MONK (8K). It's ready at last! A machine code adventure with some truly remarkable graphics, this programme is in a class by itself. (£9.50)
 These ORIGINAL PROGRAMS are compatible all 2K Monitors and are available for 16 x 48 and 32 x 48 displays (including enhanced Superboards).

HARDWARE

These kits are complete in every way: - Full socketed high quality PCB, all components, switches etc, plus performed cable assembly for easy interconnection to J1, or our...
MOTHERBOARD SYSTEM. Now you can add on all those extras easily. Provides eight, yes EIGHT, fully buffered J1 type sockets. (£19.50)
8K STATIC RAM BOARD (£39.50)
HISPEED CASSETTE INTERFACE. At last, a system that works. COMPLETELY RELIABLE 4000 baud (8000 with reasonable cassette) plus software for named file handling. A delight to use. (£19.50). For software in EPROM, add £6.00
VIDEO ENHANCEMENT. Switch selectable 16 x 48 or 32 x 48 displays without butchering your computer. (£19.50)
Monitor EPROMS re-blown to suit for just £2.50
8K EPROM BOARD (£19.50). A 2K Extended Monitor is available in EPROM for £12.00 plus, coming soon.
TOOLKIT in EPROM and BASIC V.
MONITOR BOARD. Plug into Monitor socket to provide switch selection of up to 4 EPROMS. (£9.50)
AVAILABLE SHORTLY: EPROM Programmer, PIA/ Sound Board, Analogue Board and something rather nice on the graphics side.

All inclusive
 Please add 15% V.A.T.

Write or phone for further details.

MERLIN (MICRO SYSTEMS) LTD.
 93 High St., Eton, Clevaland Tel: (0642) 454883.

nascom

Extension Basic £15 (£30 in ROM)
 Only 4K and adds the following to ROM BASIC: AUTO, BREAK, CALL, CHECK, COPY, DEC, DELAY, DELETE, EDIT, FIND, GET, HEX, IF..ELSE, INKEY, INLIN, LINE, PLOT, PRINT @, PUT, REPEAT..UNTIL, RENUMBER, REDUCE, VDU, SPEED, TEST, TRACE, WHILE..WEND, WRAP, XLIST, XREF.
Compression Assembler £12
 A full Z80 assembler which runs at 3000 lpm and compresses typical source to half the normal size to use less memory and speed up loading/saving. It is 8K and comes with a ZEAP conversion program.
Adventure Quest, Colossal Adventure, Dungeon Adventure
 Three great machine-code adventures, packed with puzzles & each with over 200 detailed locations. 16K version of any adventure: £7.90, 32K: £9.90.
Asteroids: Blast space rocks to smithereens £7.90
Galaxy Invaders: NEW! waves of varied aliens £5.90
Missile Defence: Stop the attacking missiles £7.90
Super Gulp: NEW! Clear mazes of gold (8K) £4.90

P&P / VAT included. Money back if not happy. Full documentation. (Nascom 1s need Nas-Sys/Cottis B.)

SPEECH INPUT FOR ANY COMPUTER

Hugely successful Speech Recognition System, complete with microphone, software and full instructions.

BUILT TESTED & GUARANTEED ONLY £49
 PLEASE STATE COMPUTER: UK101, SUPERBOARD, NASCOM2, ZX80/81, PET, TRS80, M280K, APPLE II

ZX80 ZX81

MUSIC SYNTHESISER + 16 LINE CONTROL PORT

Play 3-part music, sound effects, drums etc. Full control of attack, decay and frequency. Input/Output lines provide control and monitor facility for Home Security, Robot Control, Model Railway, etc. etc. Works with or without 16K RAM.
 Add keyboard to make a live performance polyphonic synthesiser! Full instructions/software included.

AMAZING VALUE AT ONLY £19.50 (KIT)
 £25.00 (BUILT)

COLOUR MODULATOR KIT £12
 RGB in, PAL/LUMF out BUILT £18
 UK101/NASCOM COLOUR GRAPHICS KIT £45
 Inc. Modulator. Still the best selling system! BUILT £60

Please add VAT at 15% to all prices.
 Barclay/Access orders accepted by telephone

The POWER BANK

system compatible sine wave output

Plug your microcomputer, VDU and Printer into the POWER BANK and forget about a disabling break in the electricity supply. This unit will continue to run your system in the event of a mains failure... WITH NO INTERRUPTIONS TO YOUR WORK!

Vital when running business. This unit will of course suppress MAINS SPIKES and SURGES. Batteries included (tested for life) 120 VA. and 250 VA. (output) units available

MICROMART

RGB COLOUR MONITOR only £99.95 (carr & vat)

We have on offer a limited quantity of 22" Colour Monitors with free isolating Transformers.
The VM22 Colour Monitor Features a 22" Mulard 110 degrees c. CRT and is designed to meet the high reliability and performance standards associated with the Games and Colour Graphics Industries.

For shipping purposes the CRT plus Scancoil assembly are separate from the chassis. The lugs of the CRT allow it to be mounted in a standard 22" Colour TV Cabinet or a unit of your own design. The unit is assembled by plugging the wires from the chassis to the tube, and soldering the input connector, power connector and isolating transformers.

A comprehensive Instruction sheet, and manual with circuit board diagrams will be supplied with each unit.

RAM BARGAINS

Limited Quantity of 22" RGB colour monitors with free isolating transformer. Send or ring for brochure.

*** HI-RESOLUTION GRAPHICS ***
A high resolution graphics board that gives a 64,000 dot (320 x 200) resolution. Versions available for any dynamic ram pet. BASIC 2.3.4, FAT40 & 80 columns. No soldering or track cutting required, supplied complete with fast GRAPHIX software in ROM and full fitting & operating instructions. £149.00

*** SUPER ROM-SELECTOR ***
A high quality printed circuit board giving 64K of utility ROM space, software selectable!!! Allows 16 x 4K ROMs/EPROMs to reside in the expansion area of your PET. One "POKE" enables any two ROMs at a time. Suitable for bank-switched software. £75.00

*** PET UPGRADES ***
WHILE-U-WAIT service! (Dynamic ram pets only.)
Memory expansion:- 8K - 32K. £59.90
16K - 32K. from £48.70
8K - 16K. £38.26

40 column (12" VDU only) to 80 column conversion.
40 to 80 column £89.00
40 to 80 column switchable (two machines in one!) £105.00
Full keyboard functions:- i.e. TAB,ESC,REPEAT,SCROLL up/down, define WINDOW, lower case/graphics mode & DELETE from/tocursor. All available in direct or program mode.

*** REPAIRS AND SERVICING ***
Fast and efficient repairs to all Commodore computers at reasonable prices. WHILE-U-WAIT service whenever possible.

Please add VAT to the prices shown at the current rate.

MICROMART

HISOFT PASCAL 4 INCREDIBLE SPEED INCREDIBLE PRICE

Hisoft are pleased to announce their latest Pascal compiler, the fastest and most powerful so far, at an amazingly low price. Hisoft Pascal 4 is an almost complete implementation of the Pascal language as given in the Pascal User Manual and Report (Jensen/Wirth) including POINTERS, RECORDS and (for disk systems) FILES. All major Pascal statements and data structures are supported together with many useful additions such as PEEK, POOK, USER, ADDR (returns the memory address of a variable) and, for tape.

The compiler produces Z80 object code directly (ie, no P-codes) and hence the resultant code runs very quickly indeed. Hisoft Pascal 4 requires only a 32K system in which to run (with plenty of room to spare) and can be supplied on cassette tape or 5 1/4" or 8" diskette to run under CP/M. The cassette tape version comes with its own tokenising editor and in a form which is easily adaptable to any Z80 system.

Hisoft Pascal 4 is a powerful and high quality piece of software which can be used for serious program development - we offer it at such a low price because we believe that such software is normally overpriced and out of reach of the individual.

Prices:

Special offer for Spectrum users Hisoft PASCAL 4 on tape	£25
HISOFT PASCAL 4 disk version (Nascom, Superbrain RTML380Z etc)	£40
ZDEV (a Z80 development system for Gemini G805 or G809 disk systems)	£45
NASCOM (a 4k NASCOM monitor)	£25
BAS12K (a 12K BASIC interpreter under NASCOM)	£20
NASGEN (a 3K Z80 assembler under NASCOM)	£15
NASDEM (a 2K Z80 disassembler under NASCOM)	£10

Send for more details from:

HISOFT,
60 Hallam Moor, Liden, SWINDON, SN3 6LS
Tel: (0793) 26616 (24hr telephone).

PROGRAMS

Teepee Textpro

by Mike O'Regan

This is the only program anyone's ever sent me for the TI99/4A. It's a word processor which works with the TI Thermal Printer, but if anyone wants to reconfigure it for use with a different printer the relevant lines to change are 1720, 1740 and 2630. Lines 1980, 2190, 2240 and 2630 should all have the '28' changed to suit the line length of any other printer. All the instructions you'll need to process your words of wisdom are contained within the program as a menu.

As listed it will print out 28 columns to match the screen. Control characters for upper case (^) and indent (>) are not included in the characters per line count.

One of its neat features is that it uses the TI99/4A's character redefinition

facilities and the Thermal Printer's ability to mimic the chosen character font. The characters used here are customised, offering lower case with true descenders. These can be obtained directly from the keyboard.

TeepeeTextpro does possess some minor limitations - which were deliberate in the interests of saving RAM. It doesn't offer automatic line wrap-around, block deletion or insertion or line length safeguards on edited lines. However, it does SAVE and LOAD your text to and from cassette at the press of a key.

For users of the TI99/4A this program will be useful as a rough word processor, although I couldn't see it being used for business letters and suchlike unless a more conventional printer were used.

```

MICROMART

software for SHARP MZ-80A and MZ-80K

- £5.95 — DUSTCOVERS**
for the A or K and the P6 and P3 printers. Blac. water-proof. A must for every Sharp owner.
- £12.95 — BRIDGE**
Complete 4-handed contract bridge — you against the computer. Full bidding, superb play, this is absolutely outstanding! Ruffs, finesse, slams, Blackwood — they're all there. You can even **WIN** or play a hand again; or define your own hands! Unbeatable value — you'll play this time and time again. Order now — you won't find this program anywhere else!
- £6.95 — FOOTBALL MANAGER**
Join the ranks of the riskiest profession of all! Your mission, to transform a pathetic team into league champions. Your only problems, injured players, insufficient cash, low gates, impatient directors and angry bank managers! Think you can cope? Then try this superb simulation... Before you try it for real!
- £6.95 — COSMIAD**
First Space Invaders, now Cosmiad! Watch out for the aliens peeling off to attack! Excellent.
- £6.50 — HEAD ON**
Basic/machine code arcade game. Gobble up dots, but avoid suicidal robot cars intent on your destruction! Very fast.
- COMPUTER ASSISTED LEARNING**
Whole range of superb programs. Send for details.

MZ-80K only — MOONLANDER £5.50, BIORHYTHM £4.98, BANK ACCOUNT £5.50. Many more

PRICES FULLY INCLUSIVE  Write or phone for full catalogue. Cash with order or ACCESS. Orders despatched by return.

- Programming Aids**
- UN-NEW:** If you typed NEW and lost your program without saving, UN-NEW will let you recover it. Price: £10.00
 - DUMP:** You just touch a single key and the entire screen is copied onto the printer. This can happen even while running a program. Price: £10.00
 - DISK UN-NEW 8050:** Recover any scratched program on your 8050. Price: £12.00
 - ASSEMBLER:** for the DR WATSON BOOK OF ASSEMBLY LANGUAGE PROGRAMMING. Price from £7.00
 - TINY BASIC COMPILER:** A true compiler that turns your BASIC programs into fast machine code programs. For old new 8080s. Price: £30.00
 - VIGIL:** Existing, new, game intensive language. Easy to learn with 60+ powerful commands. For all PETA. Also available for VIC. Price £30.00
- Hardware**
- CB2-Sound box:** de luxe Soundbox for Arcade's games with programming manual. Price: £17.50
 - TV Interface:** for both 40 and 80 col. PETA. Video out RF out for connection to home TV. Price: £35.00
 - Telephone Dialer:** use your PET to dial your telephone. Stores 40 names and phone numbers. More than one screen page of names and numbers possible. 40 names and numbers per page. Price: £25.00
 - AD100:** single board analogue to digital converter with on-board supply, 4-bit output port and drive program. Price: £85.00
 - AD200:** Behnert's analogue to digital converter assembled and ready for use. Comes complete with drive program and well documented handbook. Features include 8-bit output port, precision reference voltage, and many others. Price: £55.00
 - PET ROM WRITER:** now you can program DOS and other utilities into 2K and 4K EPROMS. Price £55.00
- Books**
- THE DR. WATSON BOOK OF ASSEMBLY LANGUAGE PROGRAMMING** for all PETA. Price: £10.00
 - THE DR. WATSON BOOK OF ASSEMBLY LANGUAGE PROGRAMMING** for VIC. Includes Assembler Cassette. Price: £17.00
 - PET MACHINE LANGUAGE GUIDE.** Price: £8.00
 - PET REVEALED.** Price: £10.00
 - LIBRARY OF PET SUBROUTINES.** Price: £10.00
 - THE VIC REVEALED.** Price: £10.00
- VIC Programs**
- BIG FISH:** 4 games on one cassette. Price £5.00 (8.5k)
 - STARTRK:** fighting in the galaxy. Price: £5.00 (8k & 8k)
 - DATABASE Retrieval System.** Price: £7.00 (8k & above)
 - HIDDEN CHARACTER GENERATOR.** Price: £7.00 (8k & above)
 - THE CYBER WARS.** Try to destroy them. Price: £7.00 (8.5k) (machine code)
 - VIC DEFENDER.** Destroy fighter ships. Price: £7.00 (3.5k (machine code))
- Prices and 125 VAT (except books) £9.50 p.p. £11.50 hardware only on all orders. Plus add £1.50 if you require Programming Aids on disk. Specify 30x40/40x40 or 80 format.*

COMPUTER CORRESPONDENCE COURSE

Learn to program a computer in the comfort of your own home using the latest Dragon micro with 32k of RAM and COLOUR GRAPHICS capability. The computer is yours to keep.

The course extends over a period of 10 weeks taking you from BEGINNERS BASIC to BUSINESS applications and DATABASE handling.

IMMEDIATE ENROLMENT
 Fee: £259« £3.40 p&p All inclusive
 For FURTHER DETAILS write enclosing SAE to:

INTRODUCING DATACLONE

The Specialists
in Software Duplication

DataClone is the first company in the UK established specifically for the duplication of data cassettes.

All other duplicating houses are audio orientated - only DataClone has a duplicating system designed from scratch purely to handle computer information.

The result?

Greatly improved reliability in data transfer rates from 300 to beyond 2400 baud - previously unattainable.

All formats catered for. Quantities from 100 to infinity.

Contact us now for brochure.

DataClone - the first specialist service for computer cassettes.

DATACLONE

1-7 Harewood Avenue,
London NW1 6LE

SHARP

C.P.E. are proud to announce *CPE DATABASE* One of the most sophisticated tape based programs currently available and designed specifically for MZ80K/A! Ideal for small business, clubs, personal use. Basic and machine-code give big system performance. FEATURES Alphabetic, Numeric & DATE types, Modify, block Copy/Delete/etc., Sort, Search (1-6 levels), Calculate, Cross-Field Total, flexible user-defined Printer Formats for reports (with headings) mailing lists etc. Loads data files at 10x normal speed! On cassette with 35 page manual £13.80 Manual only, £4 (refunded against program).

BASIC PLUS a popular program for 80K only. Offers Key-Repeat (incl cursor), Numeric-Pad, Syntax errors pinpointed & displayed, Single-Key, List Pause, Auto number, Link. On cassette, with comprehensive manual and printed key labels. Still only

Large SAE for further details. All prices are fully inclusive, please state machine when ordering and send cheques/P.O. to:

C P Electronics,
51 Fairholme Road,
Widlington, Manchester
M20 9SA.

Calling all
hobbyists,
schools, soft-
ware houses
and budding
programmers!

We would like
to hear from program writers who
would like to see their work pub-
lished on Prestel for everyone to
use. We'd like programs for most

micros - Apple, BBC, Commodore,
Tandy, Sinclair - to be included
in our database, 'Aladdin's Cave.

Of course, we are willing to pay for any
that we publish

If you are interested then please
contact us at: Aladdin's Cave,
Prestel Headquarters,
Telephone House, Temple Ave,
London EC4Y 0HL.

Prestel and the Prestel symbol are
trademarks of British Telecommunications.

ZX81

● CASSETTE 3 8 programs for 16K ZX81

STARSHIP 'TROJAN'

Repair your starship before disaster strikes. Hazards include asphyxiation, radiation, escaped biological specimens and plunging into a supernova.

STARTREK

With variable klingon mobility.
PRINCESS OF KRAAL
An adventure game.

BATTLE, KALABRIASZ, CUBE,
SECRET MESSAGES, MARTIAN
CRICKET.

(Martian cricket is 1st m/c game)

● CASSETTE 4 8 games for 16K

ZS-SCRAMBLE (m/c) with 3 stages.

GUNFIGHT (m/c) invaders (m/c)

GALAXY INVADERS (m/c)

Snakebite (m/c)

LIFE (m/c) 3D Tic-Tac-Toe

7 of the 8 games are in machine code for extra speed.

These cassettes cost £5 each.

Please write for Cassette 1&2 details.

On quality cassettes, by first class post

from

Michael Orwin, 26 Brownlow Rd.,

Willesden, London NW10 9QL

SHARPMZ80KUSERS EXTRA MEMORY

No more waiting while your cassettes are loading. Keep all your programs on our 32K EPROM storage board for instant access. Auto load facility allows your program to be up and running after switch on. Add any number of boards to your system. Many other interface boards now available for MZ80K and MZ80A, including Centronics and RS232 printer boards.

YOU need the PROXIMA GRAPHIC PLANNER

Don't be trapped into designing one graphic at a time on the VDU screen. Work on 2, 4 or up to 48 adjacent units with this quality-printed Graphic Planning Pad. Prepare your designs at home, on the train, at school or the office - anywhere.

£3.50
Introduction Price 80 Pages

- Full instructions
- Over 300 predesigned graphics to use or to spark your imagination
- Space to design over 2000 graphics of your own.
- All column values printed to aid coding
- Sample program to calculate values, POKE to memory and SAVE
- Written for Spectrum but invaluable for any computer with 8x8 user defined graphics
- All in all the best to be had.

Also available: ZX81/Spectrum BASIC coding sheets. Printed blue on quality paper for neat and precise program development. **£2.50 inc p&p per 100 sheets.**

SPECIAL OFFER:
PROXIMA GRAPHIC PLANNER PAD ~~£5.00~~ **£5.00**
PLUS 100 BASIC CODING SHEETS

Remittances to Proxima Centauri Ltd.

32K NASCOM ADVENTURE only £8.95

Now only £8.95 buys you entry to Colossal Cave in our complete full-spec version of the original classic main-frame Adventure. In our opinion, ours is simply the best Adventure for the Nascom -- no one else gives you the full unshortened authentic descriptions and messages, a complete 32k, all the genuine locations, helpful hints in the game, and lots more.

Using English words, explore a vast underground labyrinth of caves, twisty passages, and exotic rooms; outwit fierce enemies, collect all the many treasures, and become a Grand Master!

No one else gives you this -- but don't take our word for it -- buy it and see for yourself!

AMAZING PRICE REDUCTION!

Free P & P in UK. No VAT. Supplied on high quality cassette. Requires 32K RAM and NAS-SYS. Send order, stating tape format, or SAE for further details on this and our other programs, to: SYRATIS SOFTWARE, 23 Quantock Road, Bridgwater, Somerset.

BBC Micro & Car ?

Our new Fuel Monitor program will analyse your fuel consumption on your BBC Micro Model B. Simply note vehicle mileage and fuel added at each fill. Then run Fuel Monitor. Superb graphics give a complete fuel economy history at a glance. This can save £££'s by helping to OPTIMISE SERVICE INTERVALS CHECK ECONOMY MEASURES; FIND FAULTS, ETC.

Send cheque or PO for £9.50 for fully documented program or SAE for further details to:

EPSON HX20

Continued from page 117

stock control applications is also promised which will be HP compatible.

The RS232 interface can be used to attach a full-sized printer such as Epson's own MX-100 for which the protocols are built-in (though the interface is programmable to accommodate other devices). An acoustic coupler, the CX-20, will be available at launch, Telecom permitting, which will make the HX-20 into a powerful roving terminal for sales teams and the like.

Floppy disk drives are to be produced; twin 5¼in drives with 328k per drive. They will be controlled by the TV adaptor, but don't expect to see them before 1983.

An obvious question given the excellent keyboard is 'Can I word-process on it?' The answer is that Epson has commissioned a word-processing package called 'Correspondent' and a mailing list program called 'MList', both of which should be available on launch; unfortunately I couldn't get them in time for this test. 'Correspondent' will be distributed in ROM and Epson sounds quite excited about its capabilities. More than that I cannot tell you.

Other software products which Epson has in preparation are a spreadsheet program called 'Epsoncalc', a Sales Order package which takes orders, gives receipts and can communicate to the base computer, and 'Personal Office', which is a calendar/diary/alarm program

with card file style data storage facilities; this should close the gap with the HP75C referred to above.

A very interesting sounding package is 'DIY', which is claimed to allow businessmen to write their own software in plain English. Something along the line of Sord's PIPS perhaps, or maybe a program generator?

Conclusion

I feel rather shell shocked having reviewed the HX-20 so soon after the excellent HP75C. Both machines advance the art of portable computing beyond recognition — if in subtly different directions. The Epson is rather more like a conventional desk-top micro in its functioning than the HP is. It is aimed either at the business user who will buy ready made software on tape or in ROM packs, or at the owner-programmer who will write most of his/her own software. There is not much you can do with the naked machine — unlike the HP which has lots of 'super-calculator' firmware for the busy executive. On the other hand, the Epson is at least the equal of the HP in power and leaves it standing in the quality of its keyboard and the convenience of its built-in printer and tape drive. It is also very substantially cheaper.

When a decent word processing package can be had for it then writing on the train or aeroplane can become an affordable reality at last, even if you do have to take it home to print it. For journalists and for business letters 32k is quite enough memory for away-from-base use to be a practical proposition.

NEW QUALITY SOFTWARE FOR THE BBC MICRO

GALAXIANS (32K) £6.50
 Fast action version of the popular arcade game. 4 types of swooping Galaxians - 6 skill levels.

INVADERS (32K) £6.50
 Superb version of the old classic including 2 types of bomb-dropping spaceships. Increasing difficulty.

COMPASS LTD
 6 MARKET STREET
 STANDISH, LANCS

For tasks such as stock-control, sports result calculations, and sales records as well as general engineering and scientific work it is an excellent tool and an impressively well made one at that. Given Epson's marketing clout (how many computer shops do you know who don't sell Epson printers) I expect to see a lot of them about in 12 months' time and this also bodes well for a supply of third party software; from previous experience of Japanese firms I wouldn't expect a lot of software support from the manufacturer but Epson does seem to be trying to do things differently. The choice of a 6800 look-alike chip is rather unfortunate as it will definitely hinder the conversion of many existing programs but I expect it to open up whole new areas of application where this is not so relevant. I wouldn't mind finding one in my stocking, anyway.

PLUTO POWER!

Continued from page 130

used to fill in the area. This area can be of any complex shape (hence the name) and is filled in extremely quickly.

Documentation

The manual for the Pluto can only be described as sparse and consists of 17 pages, all printed on a dot matrix printer. It is generally badly written, especially from the point of view of a computer novice, and contains many typing errors. The comment which describes the attitude of the manual is 'Try it and see.' The only demonstration is given by a small sample program at the back which is written in Z80 machine code (and contains some bugs). I can only conclude that the manual was a provisional copy to be replaced later as it in no way matches the standards of the software and hardware.

Future developments

There seems to a very good development programme under way at IO Research which will soon bring out versions of the Pluto card to enable it, with the aid of a new version of the on-board software, to draw arcs, circles (and ellipses to allow for different aspect ratios), do simple polyfills (a very fast way of filling concave shapes), boundary

fill, simple boundary fill, 90-, 180- and 270-degree rotation during copy and a character polyfill.

There is now a function to allow the definition of a two-dimensional mask which is used when filling in a rectangle or complex polygon and allows the existing shape to be filled with the bit pattern in the mask which is smaller than the shape to be filled (ie, it propagates a shape throughout the area of memory). The best use of this function is the definition within the mask of a coloured bit pattern. This will give the visual appearance of a new set of colours/textures, depending on the bit pattern in the mask.

The new software has also been completely rewritten to increase the speed of all the functions dramatically. There will also be a facility to download your own programs to be run by the 16-bit processor on the Pluto board. There is also a simple debugging aid incorporated within the new software to allow you to set breakpoints and single step downloaded programs.

Then there's a version, which has just been released, that has interlace. This means that the beam on the screen performs one scan and then, instead of returning to the original position, does a second scan in between the lines already drawn. This will therefore give twice as much resolution on the screen (640 x 576) as the normal un-interlaced mode. However, in order to have this facility, one screen must be lost, hence losing the ability to have screen swit-

ching and therefore rapid animation (the screen partitions are redefined so that partition 1 handles the top half of the screen while 2 handles the bottom half of the screen). If animation is required the interlace can be switched off to return to the normal mode.

The 'Palette Board' will act like a large board into which a various number of RAM chips can be plugged. This means that the full complement of memory will be available to the 8088 and then, while keeping the resolution the same, all 24 bits (from the address line) can be used for the colours all of which can be displayed in any combination of 256 colours (one byte per pixel). However with the palette board you can no longer use a RGB monitor with TTL inputs. To obtain the full colour range you would have to use a RGB monitor equipped with analogue inputs; this is because the variations in colours can be obtained only by altering the input voltages to the individual colour inputs to the monitor through stepped increments of one two-hundred-and-fifty-sixth of the voltage swing (whereas a TTL colour monitor works on a binary input of 0 volts Low and 5 volts High). This requirement for very accurate stepping in voltages to obtain the gradations in colours is why the palette board will once again be available, like the Pluto card, in more than one option — eg, cheaper but fully upgradable systems. To complement the palette board IO is producing a 'frame grabber'. This is a piece of hardware which will enable a standard TV picture to be digitised and displayed from a TV camera or video recorder. This is an option that a lot of TV advertising companies have been after for a long time as it makes image processing very cheap.

Conclusions

The Pluto board seems an exciting development in the area of computer graphics for the micro market, although it can quite easily be used as an intelligent high resolution colour text/

graphics terminal emulating any protocol, such as Tectronix. The Pluto system should appeal to both the hobbyist (because of the system being available in so many upgradable versions and hence not damaging the pocket too much when starting off) and to the professional because of the vast amounts of colours and hardware options: IO Research is willing to do hardware interfaces (or supply details on how to do it), on request, for any machine. Just imagine it, a 16-million-colour high resolution graphics board with a 16-bit processor, all run from a ZX81! (Yes! They will do it.) The most critical comment about the Pluto card is the amount of time and program space taken up through sending all those command and data bytes; though this could not be described as a fault of the Pluto's. This problem can quite easily be overcome by writing a small interpreter program. In fact CCSOFT (the people who brought out the graphics software for the Mimi and the IVC card) are now bringing out a version to communicate to the Pluto board. This software should be able to be linked into a Basic program and hence make graphic operations much simpler.

It is without doubt a very versatile machine which, with all the development being planned, can only do well and is certainly capable of being extended even further.

Prices

Baby Pluto	£299
Pluto	£399
Boxed Pluto + interface	£599
Dble resolution (interlaced) option	£ 50
8 MHz option	£ 50
	(add VAT)

Note: IO Research will perform any of the upgrades free of charge; you need only pay for the parts.

We must extend our warm thanks to GJ Brain of Gradepoll Ltd, formerly Braintech, for loaning the Galaxy 1 and Pluto board.

DATABASE COMPARISON

Continued from page 143

dBaseII and Condor the easiest in that respect. Clarity and 'naturalness' is another important virtue, and another pretty subjective one, but there are some rules. For instance, I found the DMS menu — which for example uses

the letter 'C' as its prompt for Keyed access, and 'K' for another function — very confusing. I also found the Cardbox three-tier naming very confusing in an otherwise highly 'natural' package.

Finally, taking a look at the manual is always a good indicator of what the package is like. Every package should, I think, have a Tutorial Guide for beginners, a Reference Manual for experienced users and a Prompt Card for reminding people about particular command formats. The Cardbox manual is extremely good in all those areas, I

NEW PRODUCTS TO BE ANNOUNCED SOON.

thought; personally I also like the dBaseII approach of an initial manual written by an experienced user to complement the reference manual, with lots of examples — another must. The Silicon Office manual is also, I think very good.

Conclusions

I've tried throughout to view each package as having a niche in the market, and to think in terms of 'horses for courses' rather than plumping for just

one or two. I still think that's the right approach, and I hope this article will help you to make up your own mind about what's best for you.

I would like to thank the suppliers of all the packages and systems I've reviewed for their cooperation. I would also like to thank particularly all the staff at Westwood Computers in Birmingham (especially Neil and Wanda Weigel and Sue Alexander), and Keith Frewin and Simon McCarthy of Small Systems Engineering, for considerable help and support.

LEISURE LINES

by J J Clessa

Merry Christmas to all — here are two harder-than usual problems.

Quickie

What is special about the number 8,549,176,320?

No answers — no prizes.

Prize puzzle

A difficult puzzle this month, since it's Christmas and everyone will have extra leisure time to work at their micros.

Every odd number, except two, between 1 and 8999 is either a prime or the sum of a prime and twice a square.

Thus:

$$321 = 19 + 2 \cdot 1^2$$

$$27 = 19 + 2 \cdot 2^2$$

What are the two exceptions?

September prize puzzle

What a lot of coconuts — and what a lot of entries! Well over 300 replies were

received for this puzzle, which is a variation on an old chestnut. Answers received ranged from two coconuts (yes — two) to millions and millions.

The correct answer is 279,931 coconuts, which is the smallest positive solution. Although a solution by micro isn't too difficult, an analytical approach can also be used. Since -5 is clearly a solution, then adding or subtracting multiples of 6⁷ (six men, seven share-outs) to -5 gives all possible answers. Hence the smallest is -5 x 6⁷ which is 279,931.

The winning entry came from S Matcher of Havant. Congratulations, Mr Matcher, your prize will be with you forthwith — if not sooner.

By the way, remember *postcards* (or backs of envelopes) only. All other entries go straight into the bin — you have been warned.

BLUDNERS

In our review of Keele Codes' E40 data compression program in the September issue we gave out a phone number which is no longer appropriate. Keele Codes can be reached on 0782 629221.

A program named 'The Walls' appeared in the November issue with the end of one line missing. The last statement in line 4130 should read 'NEXT A'.

BACK ISSUES CENTRE

We have a complete selection of all available PCW back numbers in our flashy new Back Issues Centre in the West End of London, just half a minute's walk from Oxford Street (close to Tottenham Court Road tube station). Of course, you could order them from our excellent mail order service using the coupon below, but by visiting in person you save on postage costs. The Back Issues Centre also often has back numbers of PCW on sale which we cannot offer through the mail order service because of shortage of stock. Our receptionists will also be happy to sell you a set of binders to take your subscription. And there's a range of interesting computer books on sale as well. Drop by next time you're in the West End. We're open Monday to Friday, 10am to 6pm. The address is 14 Rathbone

Place, London W1P 1DE.
Come up and see us...
Mon - Fri
10am - 6pm
Saturday
11am - 6pm

CHANGE OF ADDRESS

Readers should note that all mail order subscriptions, binders and back issue enquiries must now be addressed to 55 Frith Street, London W1. However, for personal callers only, a selection of PCW back issues, binders, micro-computing books etc can be purchased from the shop at 14 Rathbone Place, London W1.

Any one issue £1.50; all additional issues £1.00 each. Benchtest special £1.80. Desktop Computing £2.25. Binders £3.95 each. All prices include post and package. *Overseas orders requiring Air Mail postage add £1.00 per copy. Cheques/P.O. payable to Computing Publications Ltd,

53/55 Frith Street, London W1A 2HG Please allow up to 3 weeks for delivery and don't forget to state your name and full address with your order. Please send me the following copies of PCW. I enclose a cheque/P.O. for £. . . Please tick appropriate boxes.

A must for anyone who wants to take their Spectrum to the limits – and beyond

The Spectrum Handbook

The Spectrum Handbook offers its readers the opportunity of harnessing the power of the most exciting micro of the decade – The ZX Spectrum. Dr Tim Langdell believes that the machine's wide-ranging potential should be available to all Spectrum owners – not just those with previous computing experience. His step-by-step introduction opens the world of the Spectrum to beginners, whilst the wealth of hints and tips, exciting programs and comprehensive machine-code and applications chapters makes the book essential reading for even the experienced programmer.

Contains more than 80 programs
224 pp £4.95 (paperback)

PERSONAL COMPUTER WORLD

BINDERS

AN EXPANDING BUSINESS!

We heard you!! The size of *Personal Computer World* has been growing at such a rate that our Mark II binders just couldn't keep pace. Twelve issues used to fit very comfortably into a binder, but now it's too much of a squeeze.

Enter our Mark III binder. Bigger and stronger. We've widened the spine to allow twelve issues room to breathe. We've added strength to the back of the binder to carry the additional weight. And we've done it without resorting to the metal rod system of binding magazines . . . a system which causes problems if the rods bend.

PCW Mk. III binders are still attractively bound with the logos of the magazine printed in gold on the front and spine. They keep your back issues of *PCW* in pristine condition and discourage other persons from 'borrowing' your copies. They lie completely flat, even when full, to allow ease of reading and reference. And they come mailed to you in a specially designed protective pack to guard against any over-enthusiasm on the part of the Post Office delivery system.

All in all, they represent exceptional value at £3.95. (A price below that charged by many competing magazines. Indeed, we know of several organisations who keep *all* their back issues of computing magazines in *PCW* binders because of their sturdy construction and their value for money. This is not a practise we can formally condone, but it's flattering nonetheless.) The price covers all postage, VAT and handling. Use the coupon below, or if you do not wish to deface your copy of *PCW*, send your order with remittance clearly written to the address indicated.

BUSINESS!

Reliable hardware alone is not enough

Today's micro-computers are extremely efficient business machines with large information storage capabilities and amazing computing speeds. However, the quality of the output is only as good as the software input. With a Toshiba T-200 micro-computer not only will you have a high quality computer but also you will have a range of software available to you that will meet virtually any business need from single and double entry book-keeping, invoicing, wages and salaries, inventories. Both in our own highly efficient Toshiba business BASIC and in the wealth of software available with CP/M.*

The T-200 has yet more trumps in its hand. It's well styled, manufactured by one of the world's most substantial technology operations with a heavy R and D commitment and a proven success in the home, office and industry.

When you buy a Toshiba T-200 you also get the finest back-up from the largest business equipment retailer in Europe with our own 120 outlets throughout the UK. So wherever you are back-up and help is not far away.

* CP/M is the trademark of Digital Research Inc.

SPORTING FORECASTS

Professor Frank George, one of the country's leading experts in forecasting techniques, has produced the following microcomputer programs based on his researches.

F4 FOOTBALL FORECAST

A pools forecasting program which uses stored team data to compute the expected result of each fixture.

POOLPERM

Produces full perms according to amount of stake and number of matches required.

H5 HORSE RACE FORECAST

A serious punter's aid to sensible betting. Data is entered from a sporting newspaper and the program produces betting recommendations.

A detailed instruction booklet accompanies each program. Versions are available for:

- APPLE II 32K
- PET 16K or 32K
- SHARP MZ80K
- TRS-80K 32K disk or 16K cassette
- VIDEO GENIE 32K disk or 16K cassette
- NEWBRAIN
- SINCLAIR ZX81 16K
- BBC 'B'
- SPECTRUM

Bureau of Information Science, Commerce House,
 High Street, Chalfont St. Giles, Buckinghamshire

Adding high resolution colour graphics to your Nascom or Gemini system need not cost more than £199.

Introducing the new **Microvector MV256** adding a high Resolution Colour Graphics capability to your **NASCOM** or **GEMINI** computer system.

- ★ High resolution display. 256 x 256 x 4 planes (16 colours).
- ★ High Quality PAL, UHF output with intercarrier sound facility.
- ★ 32k of display memory with flicker-free update (Outside of the host computers memory address space).
- ★ Composite B/W video 75 ohm output (16 grey levels).
- ★ Non-interlaced 50Hz CCIR 625 line display format.
- ★ Red, Blue & Green video 75 ohm outputs (sync. mixed on each) available on MV256B only.
- ★ Audio & light pen inputs.

The **MV256** uses the **Thomson EF365** graphics display processor to provide high level graphics functions in hardware.

- ★ Ultra fast vector and character generation give full animation capability (typ 800 000 pixels/sec, max 1300 000 pixels/sec).
- ★ Rectangle fill, clear screen and scan screen operations.
- ★ Selectable line types (continuous, dotted, dashed, dotted-dashed).
- ★ Host computer access to display memory via registers.
- ★ 96 ASCII character set. Programmable character sizes and orientations.
- ★ Comprehensive display status information.
- ★ Light pen control.
- ★ NMI interrupt generation (on board link option).

MV256A **£199** + VAT

MV256B **£220** + VAT

Both the **MV256A** and **MV256B** are supplied built and tested with comprehensive documentation and programming examples.

Colour Video monitor 12 inch 0.6 mm pitch tube, 9MHz Bandwidth, suitable for use with MV256.

Arfon Light pen, Plug in, compatible with Micro Vector board.

£199 + VAT

Apple is the Registered Trade Mark of Apple Inc.

No hassle 12 MONTH WARRANTY

NOT **just another Apple bit copier**

Put Locksmith back on the shelf! SNAPSHOT removes copy protection, and copies most programs that no bit copier can touch – including the bit copiers themselves!

SNAPSHOT will copy any program that runs on a 48K Apple II (except for programs that require a Z-80 card or that repeatedly access their own disc while running.) **For example, SNAPSHOT will copy every bit copier now sold in less time than it takes you to read this paragraph.** SNAPSHOT is a peripheral card that uses your language card* to interrupt a running program and dump the entire contents of 48K and registers to an unprotected backup disc.

Unlike bit copiers, SNAPSHOT requires no complex parameter changes or trial-and-error tedium. SNAPSHOT is also ideal for debugging your own programs or analysing others' programs. And SNAPSHOT can be used to temporarily suspend your work with one program while you use another program. For example, you could interrupt word-processing a letter to look up an address on a database, then resume processing the letter where you left off.

- Repeatedly interrupt and resume any program
- Full monitor capabilities to examine, modify, trace, single-step, or disassemble an interrupted program
- Copies from DOS 3.2 to DOS 3.3
- Faster and easier to use than any bit copier
- Lets you suspend work with one program while you use another
- Makes almost all previously unlistable programs listable.
- Permits transfer of almost all protected programs to hard disc or 8" disc as binary files. Puts several protected programs on one disc.

RAMEX and DIGITEK 16K RAM cards available!

Ring 01-900 0104

PRICE £95.00 from Dark Star Systems

Terms: Add 15% VAT. P&P included. Check with order, please. Postage £1 outside UK, £5 outside Europe. Dealer terms available. * Requires one drive and Apple, Microsoft, Ramex or Digitek language/RAM card. Other brands: specify when ordering.

The logo for Dark Star Systems is presented in a stylized, blocky font. The words "DARK STAR" are on the top line, with a sunburst icon replacing the letter "A" in "STAR". Below this, the word "SYSTEMS" is written in a similar font. The entire logo is contained within a dark, rounded rectangular border.

ATTENTION THE TRADE

Please write to us on your letter headed paper, and ask for our special trade prices and offers. If you are selling software OR hardware, you can give your products the ultimate in presentation by offering your personalised disks, disk envelopes, disk & document ring binders and of course a personalised Superluxe Disk Library. Ask for our Vendor Branding leaflet. Your colour PVC, printing and design makes your package professional.

SUPERBRAIN SOFTWARE 'DATAKING'

Here at last, 'DATAKING' is a POWERFUL yet SIMPLE to operate REPORT WRITER, for use with fixed length record files, such as those created by Wordstar & Datastar.

'DATAKING' will 'pull' ANY data from such records, and columnate the way YOU want it, with user defined headings, totals and averages.

'DATAKING' will also generate SELECTIVE REPORTS, by allowing the user to apply numerical limits to ANY data item within that file. FORWARDS, BACKWARDS, RESTART, PRINT, STOP-PRINT, CHANGE MODE & EXIT. DATAKING are only ever ONE or TWO buttons away ANYTIME.

'DATAKING' has no one-way dead-end roads.

'DATAKING' is ONLY available from DISKING INTERNATIONAL and its franchisees. Any other vendor in the U.K. is a pirate, and risks certain litigation.

DATAKING complete package £89.00
DATAKING User Manual only £10.00

DISKING SUPERLUXE DISK LIBRARY

Manufactured exclusively for us to our own design, the SDL keeps your valuable disks flat and dust-free, while at the same time allowing you instant visual selection of any single disk. The standard SDL holds 20 disks, while the SDLX holds 28 disks. The SDL may be updated to an SDLX retrospectively. They come individually boxed complete with instructions and self-adhesive spine labels.

SDL only ... £9.95 . SDLX only ... £11.95

NEW BOOKS from Prentice-Hall International

SuperCalc and VisiCalc books

The Power of SuperCalc

Robert Williams and Bruce Taylor

Seven step-by-step exercises are provided in this book to teach you how to use the broad range of capabilities that make SuperCalc one of the most powerful software programs available for personal computers. The book explains the use of SuperCalc features with specific application examples.

£7.95 120 pages 13-687301-4

The Power of VisiCalc: Volume 1

Robert Williams and Bruce Taylor

This companion volume to the Power of SuperCalc contains seven exercises that show you how to use VisiCalc to solve a wide range of problems. It explains how to take full advantage of VisiCalc commands and functions whatever your application.

£7.95 98 pages 13-687418-5

The Power of VisiCalc: Volume II

Five new exercises are included based on VisiCalc version 3.3. The exercises cover Accounts Payable, Payroll Reports, Sales Reports, Daily Inventory and Financial Forecasting.

£7.95 98 pages 13-687426-6

December publication

The VisiCalc Book: ATARI Edition

Donald Beil

Illustrated with a large number of practice problems, this book shows you how to make the most of VisiCalc on the ATARI. All examples have been prepared on the ATARI 800 using VisiCalc 1.74A. Among the many topics covered are capabilities, commands, built-in functions, recognizing, preventing and correcting errors, creating templates, documentation.

£11.95 312 pages 8359-8393-5

TRS-80 books

TRS-80 Color Computer Graphics

Don Inman with Dymax

Programs and exercises illustrate the detailed instructions given in this practical book. 16K Extended Color BASIC graphics features are covered for low, medium and high resolution graphics as well as the 64-by-32 mode implemented in the 4K Color BASIC machine.

£11.95 308 pages 8359-7864-8

TRS-80 Programs and Applications for the Color Computer

Alfred Baker

Numerous examples and program listings for games, colour, sound and music, educational and financial applications are provided in this introductory book.

£15.15 200 pages 8359-7870-2

Prices are correct at the time of going to press but may be subject to change.

TORCH... Puts the world at your fingertips.

WE CAN PUT YOUR PROGRAM HERE

IF YOU WRITE SOFTWARE THEN READ ON...

15 months ago we had written some excellent Games Software for the ZX-81, but when debugging was finally completed we realised that much of the work remained.

Who could we rely on for the effective marketing and production of our efforts?

Who would give our software the chance it deserved?

No company was really giving ZX Software the professional backup and production it deserved so we created Quicksilva to fulfill this role.

Now Quicksilva has developed a set of specific policies to match our beliefs about how a company of this kind should operate.

CUSTOMERS

The highest priority must be given to customer service — "QS customer relations are the best in this field."

SOFTWARE

A high standard must be maintained for all software — "QS reputation for innovative software is firmly established."

PRESENTATION

Should support and enhance the software — "QS policy is to use full colour reproductions of specially commissioned artworks to match the standards of the programs."

ADVERTISING

Needs to be accurate, informative, enjoyable, eye-catching and effective — See recent magazines.

PRODUCTION

Reliable and efficient duplication of cassettes is essential — "QS cassettes are produced by The Tape Duplicating Company Ltd., who have the expertise and equipment to do just that."

DISTRIBUTION

All avenues appropriate to the Software involved must be explored — "QS has over 200 retail outlets in this country alone and a substantial number in all the major overseas markets."

We now know that Quicksilva will give both of us the professional back-up and expertise our programs deserve. It has taken time and effort, and is very much a continually improving service; always we aim for that indefinable 'quality' that makes all the difference. We feel that now is the time to offer 'You' the same service that Quicksilva gives us.

So if you are a Software Author confronted with the same problems we had 15 months ago, let Quicksilva solve them for you and help you as it helped us.

Yours, Nick Lambert & John Hollis

Quicksilva is interested in quality software for the following personal computers — Spectrum — Atari — VIC 20 — B.B.C. — Atom — ZX81 — Electron — Dragon Quicksilva offers you on acceptance of your program:

25% royalties on all sales; the very best professional quality support for your programs;

full credits in advertising, brochures and on cassette for you as the author;

the opportunities and advantages that working with the leaders in the field offers.

Please contact us immediately to discuss this opportunity at

QUICKSILVA, 92 Northam Road, Southampton, Hants SO2 0PB

or ring our Special Authors' Hotline — Southampton (0703) 20169 Ext. 42 — and we will do our best to give you the answer you are looking for.

MICROAGE ELECTRONICS

BIG value in small printers

At Microage you can now get the very best value in microcomputer printers. We've selected only the best printers available so you can choose confidently, knowing you're getting the best value for money.

Interface Cables and paper supplied with all machines.

ONLY £189

The Incredible AP80

The AP80 is probably the world's LOWEST COST, compact 80-column graphic dot-matrix printer available.

It can produce single and double width characters and has the ability to produce any pattern through its dot-matrix capability.

The AP80's robust construction and its unique "unihammer" make it an extremely cost effective and efficient printer.

Its features include

80 Cols 30 cps ● Dot Matrix Unihammer action ● 96 ASCII standard characters ● Up to 8" paper width ● Upper and lower case ● Double width printing ● Standard interface: Centronics

The Amazing AP100

Big brother to the AP80 the AP100 is a wider more sophisticated version of the AP80 with a full graphics capability and the ability to take standard width computer stationery, the AP100 is an ideal choice for anyone with a microcomputer.

Its features include:

80 cols 30 cps ● Dot Matrix Unihammer action ● 116 ASCII standard characters ● Full graphics capability ● Up to 10" paper width ● Upper and lower case ● Double width printing ● Centronics interface: ● Friction feed.
Only £215.

Full Graphics

ONLY £390

80 CPS

The Outstanding MX80 FT Type 3

The MX80 is a flexible, high quality and extremely reliable graphic, dot matrix printer.

Its superb performance is due to a number of outstanding features. High resolution graphics, a wide range of type sizes, a quality 9 x 9 dot matrix head and up to 132 chars per line are just some of the exceptional features on this ideal printer for microcomputers. Only £390.

Specifications

132 cols 80 ● Logic-seeking, Bi-directional printing ● 9 x 9 Dot matrix printhead ● 96 ASCII standard chars with descenders ● Full graphics capability ● Several type sizes ● Automatic underlining ● Standard interface Centronics ●

This could be the hardest

£100

you'll

ever earn

At Open Computer Services we're so confident in the quality of our software packages that we throw down this challenge:

For every bug you find in our packages, we will give you £100.

To qualify, just buy any of these packages – payroll, sales ledger, purchase ledger, general accounting/nominal ledger – and if you detect a bug, send a report on the fault together with your name, address and licence number.

Sadly you may well find it difficult to detect any £100 bugs. But at least you can take some consolation from having acquired some very good software indeed.

Software systems for most 8 bit and 16 bit microcomputers including IBM Personal, Sirius and Xerox using CP/M and MS-DOS operating systems.

ALF

AD8088 PROCESSOR CARD WITH FTL

FTL is the easy way to speed up your Applesoft programs. You can run all your Applesoft programs with no changes, and without 'compiling' them. Plus, FTL doesn't reduce your available memory. The key is ALF's AD8088 Processor Card, which adds a fast, 16-bit computer to your Apple. FTL, the Formula Transfer Link, sends Applesoft formulas (*), (f, LOG, EXP, COS, SIN, TAN and ATN) to the card for fast processing and is also compatible with most compilers.

FTL is just one use for the powerful AD8088 Processor Card. There's a Multiple Event Timer (MET) for timing critical routines in your programs, with resolution to 50 uS for scientific applications. Coming soon are MS-DOS (the IBM Personal Computer's DOS), CP/M-86, and a fast 3-D high-res graphics card that connects through the AD-8088's versatile expansion port.

Function Strip

NEW FROM VIOEX

The Vioex Function Strip™ adds a whole new dimension to your Enhancer III™ Apple II™ Function Keys. Now you can have dedicated keys for your macro definitions. Program often used word processor commands, words or phrases into your Function Strip. Programmers will find it a significant aid to be able to delete often used commands and statements. Vioex™ users can define often used commands and file names for single keystroke ease of use.

The Vioex Function Strip is a low cost, versatile strip of pressure sensitive switches. The Function Strip adheres to the Apple II's lid - just above the keyboard - and connects to the Enhancer III's keyboard connector port. The Function Strip is completely compatible with keyboards connecting to the Apple II motherboard.
Suggested retail price: \$79.00

ITS HERE!

The new Commodore 64.
For £299 plus VAT you get
what nobody else can give
you at twice the price.

Even at twice the price you won't find the power of a Commodore 64 in any personal computer. After all the Commodore 64 has 64K of built in memory. And theres more!

Add the graphics; three dimensional objects that move over, under and behind one another. Add the 16 colours and high resolution. And add the 66 keyboard. Add all those things and you'll realise the technological breakthrough that the Commodore 64 represents.

Then check out the cost of CREAM and you'll realise maybe an even greater breakthrough. The price breakthrough.

A computer that's light
years ahead of its competi-
tion should have software
at least a few light years
ahead.

As we all know a computer is only as brilliant as the software you put into it.

That's why **RABBIT** has taken such pains to supply the best and only the best.

RABBIT SOFTWARE famed for its VIC20 software is pleased to announce two business packages for the Commodore 64.

Office Master

Three programs combined in a single package. A database Manager. An electronic calculator and a wordprocessor. All under the control of a simple to use but powerful command language.

Calc Master

Powerful mathematical problem solving planning and analysis tool, a package that allows users to plan budgets, forecasts etc, including "What if" analysis.

Both programs are disk based requiring the 1540, 4040, or 8050 disk drives.

Oh, by the way the Commodore 64 just so happens to be the most brilliant games machine you can buy.

And **RABBIT** are coming in strong here as well with lots of super exciting games that have all the sound resolution that can't be found anywhere else.

Buy our
£475*
Electronic Typewriter
and you have a
Daisy Wheel Printer
for your computer
absolutely FREE

The T/Printer 35 is a superb portable typewriter that also doubles as a computer printer. It's the first electronic typewriter that's truly portable (it weighs only 17 pounds and is supplied with an ABS carrying case) and has all the features you'd expect of an electronic office typewriter. Except price.

Features include self-correction, dual function 100 character keyboard, triple pitch (10, 12 and 15 characters per inch), up to 12 in. wide paper—all with excellent print quality. And with Olivetti reliability.

Best of all, when you're finished using it as a typewriter, it's all set to go to work as a word processing quality computer output printer.

That makes the T/Printer 35 about the most versatile and cost effective piece of equipment you can buy. You get all the advantages of having a daisy wheel printer *and* electronic typewriter in a compact unit. And at one low price of £475*, including carrying case.

**The T/Printer 35 costs £475 with Centronics compatible parallel interface. With RS-232C interface it costs £535. Prices listed are exclusive of VAT.*

Datarite Terminals Ltd
Caldare House
144-146 High Road
Chadwell Heath, Essex RM6 6NT
Tel: 01-590 1155

Buy our
£475*
Daisy Wheel Printer
for your computer
and you have an
Electronic Typewriter
absolutely FREE

The T/Printer 35 is the lightest weight and lowest cost daisy wheel printer you can buy for your computer. So it will fit within your budget and you can carry it wherever you take your micro. Yet it is tough enough to give years of reliable service. Interchangeable typefaces (standard Olivetti 100 character daisy wheels), variable pitch, multiple copies—all the features you would expect of more expensive word processing printers.

Yet the T/Printer 35 costs only £475 with parallel interface. Operating speed under computer control is approximately 120 words per minute of letter perfect output. What typist can equal that?

Then when you're finished using it as a computer printer, the T/Printer 35 is ready to go right on working as an electronic typewriter.

That's the dual-purpose T/Printer 35—the versatile computer printer that fits your budget.

Orders are shipped within the UK carriage-free. To order or for more information about the T/Printer 35:

Datarite Terminals Ltd
Caldare House
144-146 High Road
Chadwell Heath, Essex RM6 6NT

AGENTS THROUGHOUT THE UK AND OVERSEAS

MEMO
From the Chairmans Office

TO. Wes Powers.

Your design for the McCombo is a winner! Can you let me know what peripherals it will connect to. Can you assure me that it's easy to build up a system based on the McCombo that will suit everyone. Small businessman, office manager, educationalist etc. Remember the McCombo concept is to let the customer choose peripherals that suit his need, building up the system that he needs.

J.S.

With the hard disc option you get all the storage you need for mailing lists etc.

Costs around £1,000

OK Terminals. ADDS, DEC, Hazeltine, Kimtron, Lear Siegler, Televideo, Newbury, Lime etc etc. they're all compatible. The automatic band sensing in the McCombo means you just plug them directly into an RS232 and they will work instantly

Now. Printers. Anadex, Diablo, Epson, NEC, Okidata etc. etc. They're all centronics or RS232 based. Just plug 'em in. In fact the McCombo can easily run a dot-matrix for invoices etc and a daisy-wheel for word processing. The McCombo will link up with the latest electronic typewriters. Olivetti, Facit, Silver Reed etc for really low cost word processing.

For national and international communications all you need is a British Telecom modem. The McCombo can handle it.

Plotters etc. Again just plug into an RS232

PS. Must remind JJ that a McCombo and terminal can link up to ICL, IBM mainframes etc.

There's still a great deal of tape punches for telex preparation around. They'll connect easily to the McCombo as well.

British through and through.

The **McCombo**
(a Zytex product)
you couldn't plan it better

Zytex International Products Ltd
2 Ganton Street, LONDON W1V 1LJ
Telephone: 01-734 9462

Remember to mention it can run CP/M* the most widespread operating system in the world. All the software anyone can want available, straightaway.

London W4 4PH

MicroPlan from Bonsai.

The first easy-to-use electronic worksheet that's a true financial planning system.

MicroPlan is the most highly developed yet simple financial planning software because it combines real modelling features with an on-screen spreadsheet format.

MicroPlan has everything you need for advanced analysis yet is incredibly easy-to-learn and easy-to-use. You simply enter values into the worksheet and choose any of the powerful financial functions by selecting a number from a "menu" on the screen.

Only MicroPlan will let you calculate depreciation, analyse variances, amortise mortgages and consolidate multi-departmental budgets without the need to learn jargon.

If you need more power than the "calcs" but don't fancy the daunting prospect of a programming-like system, take a look at MicroPlan. MicroPlan can help solve your problems with push-button ease.

To order your copy of MicroPlan or a demo pack - or receive details of our next seminar and our 4-page brochure - give us a ring or return the coupon.

MicroPlan is compatible with Altos, Bonsai SM3000 & MU9000, Caltext, Cromemco, DEC VT-180 & Rainbow 100, Dynabite, HP-125, IBM Displaywriter & IBM Personal Computer, ICL Personal Computer, LSI M2, M3, M-Text & M4, NEC PC8000 & NEC APC, Rair, Sirius, TeleVideo, Vector Graphic, Wangwriter, Xerox 820 & 860 and most other microcomputers running CP/M or CP/M-86. CP/M-86 version requires CBASIC-86 runtime module.

You'll be glad you chose a personal computer with power enough to grow with your needs.

The ICL Personal Computer with power to grow as you need it.

Choosing the wrong personal computer can work out very costly, because though they grow to meet your needs, they just don't grow enough.

The new ICL Personal Computer gives you more.

It's a versatile, professional personal computer. It can start with a single Visual Display Unit, naturally, and it has a wide range of functions to meet your increasing requirements. And it can grow larger than most other personal computer systems, because its capacity for additional hardware is greater.

Starting at £2,895 with one VDU

The ICL Personal Computer provides a range of options enabling you to

have a system tailored to meet your changing needs.

For example, by adding a fixed-disc, you can have eight times the original storage capacity, and support up to 4 VDUs. And there is an extensive range of Personal Computer hardware.

Wide range of integrated accounts and other application software available, providing limitless possibilities.

So your secretary can do her word processing, you can do your forecasts, your accountant can do the invoicing, and your programmer can do his own thing, all at the same time.

That's what makes the ICL Personal Computer more than just a personal computer.

And because ICL is Europe's leading computer company, with thousands of satisfied users in over 80 countries worldwide, **we can offer ICL Trader Point service and maintenance back-up that's second to none.**

What more could you ask for, apart from a demonstration?

PLUTO

INTELLIGENT COLOUR GRAPHICS

Pluto provides YOUR machine with a high quality Colour Graphics Display.

Meet the Family:-

BABY PLUTO... 320(H) x 288(V) x 8 Colour. 96K bytes of memory to provide two full screen buffers.

PLUTO..... 640(H) x 288(V) x 8 Colour. 192K bytes of memory to provide two full screen buffers.

Double resolution option. 640(H) x 576(V) x 8 Colour. Software selectable between 288(V) & 576(V).

Start with Baby and then Upgrade!

Pluto uses the latest technology to provide unprecedented performance and reliability on a single PCB.

Pluto may be readily connected to most Computer Systems or plugged straight into an 80-BUS or NASBUS.

Look at what Pluto offers:-

- 16 bit Intel 8088 microprocessor.
- 192K bytes of dual-ported display memory for fast flicker-free screen updates. (*Outside the host address space*).
- Fast parallel I/O interface usable with ALMOST ANY COMPUTER.
- Operates from a single +5v supply. .

Here are just some of the high level functions that Pluto provides:-

- Fast vector draw – over 100,000 pixels/sec. Lines can be drawn using REPLACE, XOR, AND, OR functions.
- Built-in character set providing an 80 x 28 character display.
- User definable characters or symbols.
- Spare display memory with memory management facilities for allocating symbol storage space or workspace.
- Rectangle Fill and Copy using nine logic functions.
- Fast access to single pixels.
- Write protected memory planes during copy.
- Double buffered screen memory for animated displays.
- Complex polygon colour fill.

Pluto is also available as a boxed unit with integral power supply with cables and connectors and custom interface card for a range of machines:-

PET, APPLE, SIRIUS, NASCOM, GEMINI, RAIR, RML, S100 etc.

Our range of interfaces is being continuously expanded, please ask us for details of others including RS 232.

Pluto is expandable. Available very soon is an expansion board enabling **Pluto** to display 256 colours simultaneously from a very large palette for producing high quality shaded images.

Pluto prices:-

BABY PLUTO £299.00 plus VAT

PLUTO £399.00 plus VAT

BOXED PLUTO AND INTERFACE £599.00 plus VAT

DOUBLE RESOLUTION OPTION £50.00 plus VAT

8MHz PROCESSOR OPTION (40% speed improvement) £50.00 plus VAT

(Carriage £6.00 on boxed **Pluto**)

WHEN IT COMES TO MICROCOMPUTER SOFTWARE WE WROTE THE BOOK

How do you stay up-to-the-minute with the rapidly changing world of microcomputer software? Get the Lifeboat Catalogue.

The latest innovations The new Lifeboat Catalogue is packed with the latest state-of-the-art software. And if we publish a new program after the latest catalogue has gone to press, we enclose a flash bulletin in your copy.

The greatest selection

Because Lifeboat is the world's largest publisher of microcomputer software, our catalogue offers you the greatest selection of programs for business, professional and personal use. Our more than 200 programs range from the integrated accounting and professional practice systems to office tools for book-keepers and secretaries to sophisticated tools for programmers. Included are business systems, word processors, programming languages, database management systems, application tools and advanced system utilities.

We specialise in software that runs on most small business computers. Our more than 60 media formats, including floppy disks, data cartridges, magnetic tape and disk cartridges, support well over 100 different types of computer.

Get full service We give the crucial dimension of after-sales service and full support to everything we sell.

That includes:

- An update service for software and documentation.
- Telephone, telex and mail-order services in the London office and at overseas offices in the United States, France, Switzerland, West Germany and Japan.
- Subscriptions to Lifelines™, the monthly magazine that offers comparative reviews, tips, techniques, identified bugs and updates that keep you abreast of change.

Get It now Lifeboat now serves tens of thousands of satisfied customers with our breadth of up-to-date, fully tested, fully supported and competitively priced software.

You may not need all we offer, but we offer just what you need. After all, we wrote the book.

Don't let its size fool you.

If anything NewBrain is like the Tardis.

It may look small on the outside, but inside there's an awful lot going on.

It's got the kind of features you'd expect from one of the really big business micros, but at a price of £269.95 including VAT it won't give you any sleepless nights.

However, let the facts speak for themselves.

You get what you don't pay for.

NewBrain comes with 24K ROM and 32K RAM, most competitors expect you to make do with 16K RAM.

What's more you can expand all the way up to 2 Mbytes, a figure that wouldn't look out of place on a machine costing ten times as much.

We've also given you the choice of 256, 320, 512 and 640 x 250 screen resolution, whereas most only offer a maximum of 256 x 192.

Big enough for your business.

Although NewBrain is as easy as ABC to use (and child's-play to learn to use) this doesn't mean it's a toy.

Far from it.

It comes with ENHANCED ANSI BASIC, which should give you plenty to get your teeth into.

And it'll also take CP/M® so it speaks the same language as all the big business micros, and feels perfectly at home with their software.

NO OTHER MICRO HAS THIS MUCH POWER IN THIS MUCH SIZE FOR THIS MUCH MONEY.

So as a business machine it really comes into its own.

The video allows 40 or 80 characters per line with 25 or 30 lines per page, giving a very professional 2000 or 2400 characters display in all on TV and/or monitor. And the keyboard is full-sized so even if you're all fingers and thumbs you'll still be able to get to grips with NewBrain's excellent editing capabilities.

When it comes to business graphics, things couldn't be easier. With software capabilities that can handle graphs, charts and computer drawings you'll soon be up to things that used to be strictly for the big league.

Answers a growing need.

Although NewBrain, with its optional onboard display, is a truly portable micro, that doesn't stop it becoming the basis of a very powerful system.

The Store Expansion Modules come in packages containing 64K, 128K, 256K or 512K of RAM. So, hook up four of the 512K modules to your machine and you've got 2 Mbytes to play with. Another feature that'll come as a surprise are the two onboard V24 interfaces.

With the aid of the multiple V24 module this allows you to run up to 32 machines at once, all on the same peripherals, saving you a fortune on extras.

The range of peripherals on offer include dot matrix and daisy wheel printers, 9" 12" and 24" monitors plus 5 1/4" floppy disk drives (100 Kbytes and 1 Mbyte) and 5 1/4" Winchester drive (6-18 Mbytes).

As we said, this isn't a toy.

It doesn't stop here.

Here are a couple of extras that deserve a special mention.

The first, the Battery Module, means you won't be tied to a 13 amp socket. And, even more importantly, it means you don't have to worry about mains fluctuations wreaking havoc with your programs.

The ROM buffer module gives you a freedom of another sort.

Freedom to expand in a big way. It gives you additional ROM slots, for system software upgrades such as the Z80 Assembler and COMAL, 2 additional V24 ports, analogue ports and parallel ports.

From now on the sky's the limit.

Software that's hard to beat.

A lot of features you'd expect to find on software are actually built into NewBrain so you don't need to worry about screen editing, maths, BASIC and graphics.

However, if you're feeling practical you can always tackle household management, statistics and educational packages. And because NewBrain isn't all work and no play, there's the usual range of mind-bending games to while away spare time.

Waste no more time.

To get hold of NewBrain you need go no further than the coupon at the bottom of the page.

With your order we'll include a hefty instruction manual so you'll know where to start, and a list of peripherals, expansion modules, and software so you'll know where to go next.

© CP/M is the registered trade mark of Digital Research Inc.

Technical Specifications

The NewBrain is a fully specified professional computer built to the highest standards of engineering and reliability. Chosen by leading OEM suppliers. Designed to facilitate easy expansion for use with the CP/M operating system, and the addition of 5 1/4" flexible and Winchester disks, 12 green phosphor professional standard monitor, 80 cps professional quality dot matrix printer with pin addressable graphics.

Z80A cpu and COP 420M input/output microprocessors. 32K RAM expandable to 2 Mbytes. 29K ROM. Dual Cassette Ports. UHF TV port. CCITT Monitor Port Video 40/80 Character x 25/30 lines. 256, 320, 512, 640 x 250 Pixels. Expansion Port. V24 Bi-directional Port. V24 Printer Port. 16-character display (AD only).

Software: Enhanced BASIC (ANSI x 3.2/78) Independent Operating System (12 device drivers). Multi Page Screen Editor (32 Control Commands). Maths (10 Significant Figures). Graphics (Absolute & Relative Plotting, Line & Arc Drawing, Shading, 20 English Language Commands).

and if you decide to buy- the rental is free

The Software Rental Bank gives you the opportunity to evaluate software on your own machine, with your own data, before committing yourself to a purchase.

The Software Rental Bank offers a unique range of services.

- ★ Short-term rental of software packages and firmware products for 7, 14 or 28 days depending on your class of membership.
- ★ Free rental if you decide to purchase.
- ★ A really wide range of software and advice to help you make the right choice.
- ★ Access to the newest software available — a chance to simply 'taste' some of the latest and most controversial products.
- ★ Speedy service. Rent software by telephone or by mail — all the items on our *Software Asset Listing* are held in stock.
- ★ An advisory 'hot line' in case you have difficulty with a rented package.

The Bank is currently supporting the Apple II, Apple III and IBM-PC — other CP/M machines will be added to the Bank shortly.

Membership of the Bank

- ★ Full Membership costs £70 a year and allows you to rent up to £700 worth of software at any one time for 14 days.
- ★ Members periodically receive our *Software Asset Listing* which gives details of the packages available for rental. Members are encouraged to nominate new items for addition to our stock.
- ★ Larger organisations which may have microcomputers at a number of different locations can opt to join as Corporate Members.

To receive our brochure and software list phone Ruth Oliver on 0525-373440 or clip the coupon below.

100 FREE PROGRAMS

FROM SILICA SHOP — WITH EVERY PURCHASE OF AN

ATARI 400

800

ATARI PRICES REDUCED!

We at Silica Shop are pleased to announce some fantastic reductions in the prices of the Atari 400/800 personal computers. We believe that the Atari at its new price will become the U.K.'s most popular personal computer and have therefore set up the Silica Atari Users Club. This club already has a library of over 500 programs and with your purchase of a 400 or 800 computer we will give you the first 100 free of charge. There are also over 350 professionally written games and utility programs, some are listed below. Complete the reply coupon and we'll send you full details. Alternatively give us a ring on 01-301 1111 or 01-309 1111.

ATARI 400 with 16K **£199**

ATARI 400 with 32K **£248**

ATARI 800 with 16K **£449**

400/800 SOFTWARE & PERIPHERALS

Don't buy a T.V. game! Buy an Atari 400 personal computer and a game cartridge and that's all you'll need. Later on you can buy the Basic Programming cartridge (£35) and try your hand at programming using the easy to learn BASIC language. Or if you are interested in business applications, you can buy the Atari 800 + Disk Drive + Printer together with a selection of business packages.

Silica Shop have put together a full catalogue and price list giving details of all the peripherals as well as the extensive range of software that is now available for the Atari 400/800. The Atari is now one of the best supported personal computers. Send NOW for Silica Shop's catalogue and price list as well as details on our users club.

INNOVATIVE TRS 80-GENIE SOFTWARE

from the professionals

Penetrator is a superb arcade type space game with excellent graphics, challenging situations, training options — and much more! You will have to cope with radar attack, missiles, enemy paratroopers and other dangers.

You are in a single fighter plane as the sole survivor of a space fighter squadron, whose mission it is to invade enemy defences and to destroy their neutron bomb cache. The mission is highly dangerous and the enemy has installed extremely efficient defences around their neutron bomb stores. These are made up of four defence rings, each with its own special dangers. To get to the neutron bomb store you must penetrate all four. As you knock out defences you are awarded points; 10 for ground missiles, 100 for radar bases, 200 for defending paratroopers and 1000 for the first neutron bomb store. The game supports two players if required.

The game may be customised; a terrain editor is included in the package and in this way, the landscape, number and positions of the missiles and radar bases can be changed by the user. Excellent graphics and, of course, sound. Compatible with all Genies and the Model I and Model III TRS-80.

A fast moving arcade type space game. Full of action and plenty of surprises!

In some ways this is a similar game to Penetrator. We think it is slightly better, but tastes vary. The chief difference is that a "preview" of approaching enemy forces is shown at the top of the screen, rather in the same way as our Defend game. The aim of the game is to penetrate defences to obtain access to a neutron bomb. In order to do this you have to collect some incendiary star shells. This is done by way of a rather tricky manoeuvre, whereby one has to manoeuvre one's ship to sit on the star shell, rather like a hen hatching an egg. When the position is just right the star shell attaches itself to your ship.

To play Strike Force you will need skill, cunning, fast responses and a keen sense of strategy. Most people find it more taxing than Penetrator and the "preview" of advancing forces is certainly one of the key features of the game. It does, of course, have sound. Both Strike Force and Penetrator are published by Melbourne House, an Australian Company. Strike Force is compatible with all Genies and the Model I and Model III TRS-80.

PENETRATOR (Tape) £ 9.95
PENETRATOR (Disk) £12.95

STRIKE FORCE (Tape) £ 9.95
STRIKE FORCE (Disk) £12.95

V.A.T. included. Plus 75p P & P (either or both)

INNOVATIVE TRS 80-GENIE SOFTWARE

from the professionals

DATA-WRITER

Data-Writer is, for most microcomputers, a new concept in Database Management. It adapts techniques which have been known and used on mainframe computers for quite a long time. A "normal" microcomputer Database Management program constructs its file in a single plane and is probably more accurately described as a file handling system. All of the data written into each record is filed away on disk in the same place, and it is all recalled and acted upon by the computer as one chunk of data.

Data-Writer approaches Database Management in an entirely different manner in that, subject to one or two requirements, it is not concerned as to how the database came about or the form of it. Indeed, one of the most attractive features of the program is that the data itself can even be written on a word processor — not by Data-Writer at all. So far as we have been able to ascertain, any word processor may be used that writes a plain ASCII file. Certainly AJEDIT and Scripsit are supported. If you do not have a word processor, or do not wish to use it for the manufacture of your database, then there are sections in Data-Writer which in themselves constitute mini word processors and enable the user to manufacture a database very easily.

In the foregoing paragraph we use the words "word processors" in the plural, and this gives a clue to a rather important feature of Data-Writer. The whole concept of the software is that it is a Management program. A number of earlier databases have suffered very seriously from what the author no doubt thought was economic writing, in that if a section of a program (for instance the word processing section) is used by a number of sections, only one is included and is accessed by various sections. At first sight this might indeed appear to be economic writing and we suppose in fact it is, but the result is that the disks are continually thrashing around as access is made to them. Disk access is probably the slowest task that the CPU carries out and if it is done frequently it slows the program down very considerably. Many past Database Management programs have suffered from this deficiency. Data-Writer on the other hand has a mini word processor in each section of the program where it is needed. This has the great advantage of obviating the necessity for the drives to be thrashing around, but almost as importantly means that the format of the mini word processor can be changed for the various sections of the program, so that the best advantage can be made of it in each. Thus every section is entirely separate and gives a very high degree of efficiency and user friendliness.

There are very few restrictions with Data-Writer. The number of records which one can handle in any given database is, essentially, unrestricted although any that span disks would have to have different names. In any event as the Sort section of the program does have a restriction of sorting 4,500 records at a time, this effectively imposes a restriction on the length of the file if one intends to be able to sort it all at one time. The maximum number of fields permitted to a record is 20 and the maximum number of characters per field depends on whether you use the Entry section of Data-Writer to enter your data or whether you use a word processor. In the latter case the maximum number of characters per field is 240. In the former it is 35. The maximum number of characters per field label or title is 20.

Data-Writer has a very powerful mathematical section whereby many complex mathematical functions can be carried out on your data. Up to 20 equations may be defined per run. The section will have available 10 scratch pad memories for use and as the calculations are carried out in double precision they will be carried to 16 decimal places.

Data-Writer also contains a very powerful "Mail Merge" section. Almost any personalisation can be added to a letter or report, and once again the letter or report may be constructed either on the mini word processor provided in Data-Writer or by way of an external one. Indeed we should make it clear that this remark applies to all data manipulation in Data-Writer. In other words, a word processor may be used at any time when its functions would be helpful in Data-Writer. To return to the Mail Merge feature, Data-Writer supports up to 20 different insertions per letter or report and the form letter may be of any length up to 6,000 characters, which we believe is about two and a half A4 sheets.

The Sort is a two level one and supports the extraction of stipulated data from a field. It is what might be called of fair speed. The two key levels make it powerful but as the Select section is so good, the Sort does not get used as often as would be the case in other Databases.

Data-Writer is made up of 10 sections or sub-programs as follows:

Entry	Manage	Maths	Sort	Letters
Edit	Statistics	Select	Labels	Reports

We have already mentioned many of them, others such as Edit are self-explanatory. The Labels section enables you to create pretty well any form of label required, including the ability to have them printed up in a from one to four across format. The Letters section enables you to create a form letter in Data-Writer if you do not wish to use an external word processor. Statistics is a method for searching the database for errors, and as the title suggests, extracting essential statistics from it.

The important sections not yet touched upon are Manage and Select. Taking the latter first, this section enables you to create a sub-set of the database by selecting from the file contents. It is immensely powerful and supports nine equivalency relationships, such as "less than" or "greater than" etc. Furthermore, the two logical relationships AND and OR may be used freely. In this way one can Select from the database to pretty well any specification required. The Management section of the program enables the user to completely re-structure his database without having to Edit it manually. New fields may be added or old ones deleted. They may be re-arranged or even appended one field to another. Indeed, this can be taken even further in that the whole database may be merged or split as required.

The Reports section enables the user to write reports such as inventories, accounts, bibliographies, insurance coverage report, in fact an endless list of applications. Because the Report section contains its own Text Editor, the report contents and format can be controlled at will and literally an infinite number of formats may be adapted.

Data-Writer is one of the most powerful Database Management systems that we have seen available for a microcomputer and certainly is the most powerful that we have seen for the TRS-80 and Video Genie machines. Once the database has been manufactured, either by Data-Writer or a word processor, one has complete and utter control over it and the ability to manipulate any part of it; not only the ones mentioned above, but many others which we have not had the space to list. Data-Writer is compatible with the Model I and Model III Tandy machine, the original Video Genie, together with the Genie I and II. A version for the Model III Genie will be available shortly.

Data-Writer is Compiled Basic, hence its DOS compatibility is dependent upon the compatibility of the Microsoft Compiler. Due to Microsoft's disinterest in supporting any other DOS apart from TRSDOS and the non availability of a Tandy Model III Compiler, we recommend customers to use Data-Writer with TRSDOS or LDOS on the Model I and the proprietary DOS supplied on Data-Writer for the Model III. Other DOS's may well be compatible after patching and as we have said the criteria is whether they are compatible with the Microsoft Compiler.

Data-Writer — All Models . . . £78.00 + V.A.T. = £89.70
P & P . . . £1.25

TRS-80 & VIDEO GENIE SOFTWARE CATALOGUE £1.00 [refundable] plus £1 postage.

CONVERT YOUR ZX....

FULLER MICRO SYSTEMS ADD STYLE, POWER, VERSATILITY AND FULL TYPEWRITER KEYBOARD OPERATION TO ZX81 AND ZX SPECTRUM!

TURN YOUR ZX81 INTO THIS FOR ONLY...

FULLER FD42 SYSTEM NOW ONLY £29.95

FULLER MEMORY EXPANSION - a massive boost for your ZX81!

The basic ZX81 has only 1K of RAM - now you can add on an enormous 16K with our FD 16K Memory Module. FD 16K to mount on the back of ZX81 or Fuller Case.

£24.95 (plus 80p p & p)

FD 16K to fit inside Fuller Case, complete with RAM

adaptor board. £29.95 (plus 80p p & p)

FD 64K to fit inside case (incl RAM adaptor board) £69.95

FD 64K to mount on back of ZX81 or FULLER CASE £64.95

FULLER SOUND EXPANSION - a superb addition to your ZX Spectrum!

Clear, dynamic sound effects will really enhance your enjoyment of the new, exciting programs available for the sensational ZX Spectrum. Our new sound box comes complete with leads, volume control and loudspeaker. Just plug it into your MIC input, and it fits neatly onto the back of the Spectrum in a tough, plastic case.

JUST £6.95 (plus 80p p & p)

NEW! Programmable Sound Generator - adds exciting new sounds to the Spectrum range.

ONLY £19.95 (plus 80p p & p)

STOP PRESS! 16K Spectrum owners - upgrade to 48K with a Fuller Spectrum Upgrade Pack - complete with full assembly instructions. £34.95 (Inc p & p)

FULLER ZX Spectrum Software

So little software is available for the Spectrum, you could count on Fuller to be one of the first! Startrek, Flight Simulation and Death Star, all in attractively packaged cassette form.

£5.00 (plus 50p p & p)

FULLER FD42 SYSTEM - The ideal Christmas Gift for ZX81 users!

The ZX81 is easily Britain's best selling small computer, and now costs an incredibly low £49.95. To celebrate this event, we are offering our equally popular FD42 system at an even lower price than before! It converts your ZX81 into a sturdy, attractive and professional unit, with full sized typewriter keyboard.

NOW ONLY £29.95
(plus £2.50 p & p)

ITS EVEN CHEAPER IN KIT FORM!

FD42 Keyboard and Case Kit _____ **JUST £24.95**
(plus £2.50 p & p)

FD42 Keyboard Kit _____ **JUST £14.95**
(plus 80p p & p)

OR WHY NOT BUY A COMPLETE SYSTEM!

If you are not lucky enough to already own a ZX81, an FD42 System, including computer, from us, and make an even bigger saving! ZX81, FD42 Keyboard and Case with power supply, reset switch, leads and manual - True Value £79.95.

SPECIAL OFFER £69.95 (plus £2.50 p & p)

FULLER FD SYSTEM for ZX SPECTRUM

COMPLETE £39.95
(plus £2.50 p & p)

Now, the famous FULLER keyboard and case unit has been adapted for Britain's fastest selling colour computer - the amazing ZX Spectrum! It has the same high standard as the ZX81 unit, a tough plastic case encloses the keyboard, Spectrum P.C.B. and power supply. The Keyboard has 42 keys including all the Spectrum graphic characters printed on to them, the full travel key switches have gold plated contacts and guaranteed life of 10⁶ operations.

ITS SO EASY TO INSTALL! You simply unscrew the ZX P.C.B. from its case, screw it to the FD case, and plug in the keyboard. No soldering or technical knowledge required.

COMPLETE UNIT £39.95 (plus £2.50 p & p)

KIT FORM £33.95 (plus £2.50 p & p)

SPECTRUM MOTHERBOARD

Fits inside the Fuller case, allowing expansion to the ZX memory and I/O facilities.

2 SLOTS _____ **£15.95** (plus 80p p & p)

3 SLOTS _____ **£19.95** (plus 80p p & p)

SEPARATE SPECTRUM P.S.U.

9 volts DC at 2 amps.

Mains either 110v or 240v A.C. _____ **£5.95** (plus 80p p & p)

SPECTRUM PLUG PLANNER

A useful combination of 9v @ 2 amp power supply and three 13 amp sockets for computer and peripherals. Complete with 3 metres of cable and power jack

to fit Spectrum or ZX81. _____ **£18.95** (plus £1.00 p & p)

JOIN THE 16 BIT SUPER LEAGUE

TEAM MANAGER FMS 86

The World's Leading Data Management System. With Multi-File Access and Ultra Fast Data Entry and Retrieval. Unlimited Records, Single Pass Selection. Automatic Sort and Update, Prints to your own Format. Contains the EFM Program Generation Facility and lots of Other Features which make it the World's No 1. Described as a Rolls Royce at Rover Prices.

Hardware Team

- 1 Sirius 1 with 1.2 Mb disk storage. The U.K.'s biggest selling Business Micro.
 - 2 Sirius 1 with 2.4 Mb disk storage. Its Big Brother, two years early.
 - 3 Sirius 1 with Integral 10Mb Hard Disk. For Powerful Stand Alone or Future Network.
 - 4 IBM PC. In Basic or Upgraded Form. Lots of add-ons available direct from the USA.
 - 5 External Hard Disk. Sirius or Corvus.
 - 6 Printers. A Full Range of Daisy, Matrix Graphics and Colour Printers.
 - 7 Sirius 80 Cards. 4Mh or 6Mh available. Allows 8 or 16 bit programmes to be run.
 - 8 Mainframe Communications. Raven Technical have 100% success record - so far.
 - 9 Memory Expansion. From 128K up to a Massive 1Mb or RAM on the Sirius.
 - 10 Training, Technical Support and National Maintenance available from Raven.
 - 11 Networking, Colour, and Full Graphics on the Leading 16 bit Microcomputers.
- Sub. Slow Small 8 bit Systems.

Software Team

- 1 Pulsar. Full Accounting Software for General and Specialist Business Use.
 - 2 Milestone 86. The World's No 1 Critical Path Analysis Program.
 - 3 Micronet. The New Critical Path Program Written in the U.K. Very Friendly.
 - 4 Wordstar. The New Version of the World's Best Selling Program is Now Available.
 - 5 Datebook. Plan your Appointments and Personal Engagements with this New Package.
 - 6 Pulsar Supercalc. The Easy to Use but Immensely Powerful Spreadsheet System.
 - 7 Pulsar Multiplan. The New Spreadsheet System which has even more than Supercalc.
 - 8 Sirius-Dataflow. The easy to use Data Management System at Budget Prices.
 - 9 Sirius-Mailflow. The Mailing System which integrates with Dataflow for Fast, Easy, Cheap Mailshots.
 - 10 Financial Modelling. Choice of Two Superb Systems. Either Meets The Need of the Professional.
 - 11 Software Maintenance. Constant Update and New Improved Programs. Many Exclusive to Raven.
- Sub. Outdated Slow 8 bit Programs.

Together we're unbeatable.

GREAT GIFTS COME I

for the
VIC 20

Bug-Byte programs make ideal Christmas stocking fillers! If you have a friend, or member of the family, who already owns a ZX81, Spectrum, VIC, Atom or BBC Micro they will be thrilled by the gift of one of our beautifully packaged, exciting cassettes.

Whats more, Bug-Byte games are the best! Tens of thousands of contented customers testify to that, so do consistently hot reviews in the popular micro-press.

If your game isn't shown, don't worry, we probably have more quality programs for more machines than any other software house, and new ideas are constantly being generated by our young, enthusiastic team of skilled programmers.

WHERE TO BUY?—

Look for the sign!
Bug-Byte programs are AVAILABLE NOW from:
All Laskys Stores Nationwide.
Large branches of Boots and Curry's Micro-C, plus over 100 independent computer dealers.
If you can't find a Bug-Byte dealer near you – then fill in the coupon opposite and order direct by post – and receive your free copy of our 1983, 16 page, full colour brochure, it's packed with lots of enthralling games for the whole family.

BUG-BYTE SOFTWARE

Also for your VIC:
Backgammon
Another VIC in the Wall

All VIC Programs – £7.00 each
including post and packing

IN SMALL PACKAGES!

for the
SINCLAIR ZX 81
or
ZX SPECTRUM

BBC Micro

We have a large selection of programs for the BBC Micro (A and B models). Our new brochure gives a complete listing, so send for your free copy today! Also see our huge range of software for the ever-popular Acorn Atom!

MIRAGE

A NEW GENERATION OF DATA BASE

MIRAGE has been thought out on a human scale. Design and set-up of a Data Base take less than an hour.

MIRAGE offers just the right number of features to solve your business problems.

MIRAGE uses relational data management techniques to achieve unique flexibility.

MIRAGE can be accessed directly from your programs. Unlimited on-line addition, retrieval and modification of your informations.

MIRAGE has response time which will surprise you.

MIRAGE enables you to use normal, existing files. Its structure is easy to modify interactively.

MIRAGE main specifications and tools :

99 files of 65535 records.

Possibility to have 1 direct access key and 5 chained access keys per file.

Independance of data and pointers.

Multi-users possibility is under development.

For creation :

- DBSCHEMA, design tool
- DBUTIL, preparation tool

For Programming :

- DBPUT, to add a record
- DBGET, to read a record
- DBDELETE, to suppress a record

MIRAGE, is programmed entirely in PASCAL and is independent of any Operating System. Initially available under CP/M at £ 475 excl. VAT. Training and technical support on demand. **MIRAGE** is a product of DATASOFT International.

For additional information, please write to :

DATASOFT INTERNATIONAL 17, CARLISLE STREET, SOHO SQUARE, LONDON, W1V 6 PE

WHICH MICROCOMPUTER?

WHICH PRINTER?

WHICH SOFTWARE?

WHICH SERVICES?

WHICH COMPUTER?

WHICH WORD PROCESSOR?

Be sure you make the right decision

The computer or word processor you install in your business is going to be with you for a long time. So when you're buying a system, the last thing you can afford is a mistake.

The Which Computer? Show is for business people who believe in leaving nothing to chance.

Firstly, the show offers you the widest choice of equipment you'll find under one roof. Over 200 exhibitors will be there.

But then it helps you narrow down that choice until you've found the one system that matches your needs exactly.

At the Which Computer? Show you'll find computer experts who talk your language.

The National Computing Centre will be presenting special video briefings and you get a free NCC Questioner when you send for your tickets to help pinpoint what you're looking for before you leave.

Compare, discuss and get practical experience of the new technology. Then you can make your decision with confidence.

The show takes place at the National Exhibition Centre in Birmingham, easily reached by car or train. Car-parking is free. The dates are 18th-21st January 1983. Open from 10.00 am.

Simply clip out the coupon and send it to us at **Which Computer? Show, 232 Acton Lane, London W4 5DL. Phone: 01-747 3131 during office hours.**

Nobody under the age of 18 will be admitted.

GETTING THE MOST FROM YOUR MICRO?

These days, there seem to be new developments in micros every five minutes. How can you stay in touch? Which Micro & Software Review brings you all the most important news and the most interesting facts every month.

As well as our unique buyers guide to software packages (which is updated every month) we review software in depth. This month we explain how tele-software works and how you can use it with your equipment. There's full details of the new 'Adventure' game to run on Commodore plus two new games for Ataris and Sinclairs. Every month we tell you what's available, what's in the pipeline and what's right for you—over a range of software for home, business and school users.

We don't stint on hardware coverage either. Not only do we publish the most extensive buyers guide available (over 100 micros in detail) but we also publish reviews that really take machines apart. This month we run a giant test of the Lynx vs the Genie, and there's a 20 page pull-out supplement which

reviews the big ten micros in detail: ZX81, Spectrum, BBC A and B, Dragon, VIC, Atari 400 and 800, TI 994A, and the Atom.

Starting this month we're serialising the very funny book "Computer Bluff" which no-one else will be able to read until March next year.

Have you ever thought you could write for a computer magazine? Well, we give you the chance in a unique competition—with cash prizes. And there's another free-to-enter competition this month, from which you can win a new micro for Xmas.

December's a big issue. So make sure you pop into your newsagent—on November 15th and bag your copy.

THE A TO Z OF MICROS

WHICH MICRO? & SOFTWARE REVIEW

MicroShell™ conducts your CP/M™ computer with more power than ever before!

WHAT IS MICROSHELL?

MicroShell is a normal CP/M program which adds a powerful set of commands to all programs running under CP/M. MicroShell remains in your computer, out of the way to continue to process your commands.

WHAT WILL MICROSHELL DO?

All the normal CP/M commands, plus:

- Automatic Disk and User Management - No more copying all your programs to each disk you use and having directories filled with programs. With MicroShell you can work on a nice clean disk or in a separate user area and MicroShell will find your programs from another drive or user number automatically! You'll save time and precious disk space.
- Powerful Redirection Capability - You can send screen output to a file or to the printer. Or send printer output to a file. Or take program input from a file instead of the keyboard.
- Much More: Multiple commands on a line, more powerful and faster "submit" capability, and user-definable prompt.

DEALERS - MICROSHELL GIVES YOU:

- An interface to the computer that can be tailored to the user's level of experience.
- Automatic execution of an application program at startup.
- MicroShell can manage self-running demos to free up your salesmen from demonstrating software packages; have the software package sell itself!

WILL MICROSHELL RUN ON MY COMPUTER?

If your computer runs CP/M 2.2, that's all you need to run MicroShell. Most popular 8 and 5 inch disk formats available. And MicroShell runs on Apple-CP/M, and IBM PC with "Baby Blue"™

CP/M - TM Digital Research UNIX - TM Bell Labs, Wordstar - TM MicroPro, Baby Blue - TM XEDX
Microshell is a trademark of New Generation Systems, Inc.

GIVE ME SOME EXAMPLES!

- Run Wordstar™ (or your favorite word processor) from any disk drive or user area: MicroShell will automatically find the programs and overlays as they are needed.
- Wish you could save the screen from some program for later use or to edit in to a report? With MicroShell, you can! Just redirect the output into a file. Have a program that prints a report you want to save but it will only go to the printer? With MicroShell you can direct the printer output into a file.
- Tired of entering the same commands time after time into a program? Put them into a file and have MicroShell supply them to the program from the file.
- Want to do something else while a long program runs? Change MicroShell's prompt to sound the bell on your terminal.

SOFTWARE DEVELOPERS - MICROSHELL GIVES YOU:

- A powerful development environment with many UNIX™ features, and some that even UNIX doesn't have.
- MicroShell eases the part of software development we all dislike: documentation. With MicroShell, you can run your program and collect the output in a file.

... beat Sinclair at his own game!

'OLIGOPOLY'

"Oligopoly" is a development of the sort of business simulation game sometimes used in management training. It operates along the same lines but is in several ways more sophisticated and in every way more fun.

Each player runs a company which supplies the home computer market, developing new models, negotiating contracts for their manufacture and for the purchase of special components, buying advertising, engaging in price war and so on. It's all done on borrowed money which has to be paid for out of earnings. The winner is the player whose firm survives and accumulates the most profit.

Two to four players can take part and if you wish one of them can be the computer itself. It can assume the identity of whichever firm you would most like the chance of competing against on level terms — it's not easy to beat the computer but it can be done.

We have been looking out for a game of exceptional interest and originality with which to establish the reputation we mean to sustain as suppliers of a small range of selected quality software. "Oligopoly" had to be the one. It's easy to play and a lot of fun from the first attempt but for those who want to take it seriously there's plenty of scope to improve their performance through experience and by analysis (you can practise by playing alone against the computer). It's just the thing for a wet Christmas/New Year holiday.

"Oligopoly" has too many features to describe here. For full details complete the entries below and send this advertisement (you'll need an envelope but no stamp) to:

Cambridge Software, FREEPOST, 7 Green Street, Cambridge CB2 1BR

For early delivery of "Oligopoly" on cassette indicate which computer you want it for and enclose £5 cheque or PO.

THREE NEW REVOLUTIONARY CARDS FROM DIGITEK

SCREENMASTER 80

This new 80 column card is the most advanced available with features like: 9x10 matrix, 3 scrolling speeds, shift lock, user definable graphics, supports all Applesoft commands and Applewriter II. Well worth the £185 + VAT.

SUPER PRINTMASTER III & BUFFER MANAGEMENT

A totally new concept in printer cards, supporting both colour & B/W printers. It incorporates a unique buffering facility using Ram cards. Up to 16 x normal size graphics dump and pic rotation etc. Prices: £159 (B/W) or £179 (Colour) + VAT.

64K & 128K RAM-MASTER

These cards use the latest low power D RAM chips and can be used for high speed disk emulation in Basic, CP/M or Pascal. Visicalc Expand software available, can also be used as printer buffer with Super Printmaster III. PRICES: 64K £213 Or 128K £319+VAT.

SMITH CORONA TP-I DAISY WHEEL PRINTER

A microprocessor controlled high quality printer which delivers fully formed executive print at a speed of 120 words/min. Price £449+VAT.

MICROVITEC 14" COLOUR MONITOR

Besides offering a crystal clear display in either text, hi-res or low-res modes. It also includes the following features, 16 text colours, b/grd colours, 80 column card compatibility. A superb colour monitor for £264.00+VAT.

12" PRINCE MONITOR

Features 24 M/Hz bandwidth, giving a very clear display, and contained in a neat Apple compatible case, available with either Green or Amber screen. Well priced at £105+VAT.

PORTABLE ACOUSTIC COUPLERS

TYPICAL APPLICATIONS

- Networking computers
- Linking to electronic mail system (Euronet)
- Converting microcomputer to Viewdata (Prestel) receiver

KEY FEATURES

- Snap-fit acoustic link between standard telephone handset and terminal equipment
- Low cost
- Slimline design
- Lightweight and compact
- Specially designed acoustic chambers need no rubber seals.

PAC-M1: This acoustic modem provides a link between telephone line and Serial Data socket of a microcomputer, thus allowing conversion into a Prestel receiver and facilities for transfer of telesoftware programmes. £135 plus VAT, p&p.

PAC-M2: Specifically for fully interactive data communication at 300/300 Baud rate, this acoustic modem is designed for networking computers and for electronic mail system. It operates in an originate mode to the CCITT V21 standard and connects Serial Data via an RS232 socket. £135 plus VAT, p&p.

PAC-1: Provides an acoustic link between standard telephone handset and all types of Prestel and private Viewdata terminals, TV sets and adaptors. Powered by a single PP3 battery, this acoustic coupler allows Viewdata equipment to be used in office or home without a fixed BT socket. £85 plus VAT, p&p.

TECHNICAL APPROVAL

All products meet the British Telecom Technical Guide for acoustic coupling.

BBC Microcomputer or Acorn Atom

Acornsoft is the software division of Acorn Computers, designers and manufacturers, of the BBC Micro and Atom. We know better than anyone the capability of the machines, we know how to get the very best from the hardware. And we have produced a range of exciting games, exacting business and useful household software.

The Biggest Range Available

Acornsoft software ranges from authentic arcade games like Snapper to Algebraic Manipulation to Desk Diary to other languages like FORTH and LISP. Striking colour, amazing sound effects and powerful

graphics are all used to the full. And it does not stop there. There is a complete range of manuals, accessories and plug-in ROMs.

Free Brochures

Just clip the coupon or write to us and we will rush our catalogue absolutely free. Can't wait for the post ring 01-930 1614 now! Don't delay - do it today. Let Acornsoft help you get the best from our machine and open the doors to your imagination.

Acornsoft and Atom are registered trade marks of Acorn Computers Ltd.

BOOKS:

ATARI BASIC — Learning by Using

An excellent book for the beginner. Many short programs and learning exercises. All important features of the ATARI computers are described (screen drawings, special sounds, keys, paddles, joysticks, specialized screen routines, graphics, sound applications, peeks, pokes, and special stuff). Also suggestions are made that challenge you to change and write program routines.

Order #164 \$7.95

Games for the ATARI Computer

This book describes advanced programming techniques like player-missile-graphics and use of the hardware-registers. Contains many ready to run programs in BASIC and one called GUNFIGHT in machine language.

Order #162 \$7.95

Programming in 6502 Machine Language on your PET-CBM 2 complete Editor/Assemblers (Source code 3 hexdump + description plus a powerful machine language monitor (Hexdump)).

Order #166 \$19.95

How to program your ATARI in 6502 machine language Introduction to machine language for the BASIC programmer

Order #169 \$9.95

SOFTWARE IN BASIC FOR ATARI

Invoice Writing for Small Business

This program makes writing invoices easy. Store your products in DATA statements with order-number, description, and price. The program later retrieves the description and price matching to the entered order-number. The shipping cost and the discount may be calculated automatically depending on the quantity ordered or entered manually. The description to the program tells you how to change the program and adapt it to your own needs. Comes with a couple of invoice forms to write your first invoices on to it.

Order #7201 cassette version \$29.95
Order #7200 disk version \$39.95

Mailing List

This menu driven program allows the small business man to keep track of vendors and customers. You can search for a name or address of a certain town or for an address with a certain note. 50 addresses are put into one file.

Order #7212 cassette version \$19.95
Order #7213 disk version \$24.95

Inventory Control

This program is menu driven. It gives you the following options: read/store data, define items, entry editing, inventory maintenance (incoming-outgoing), reports. The products are stored with inventory number, manufacturer, reorder level, present level, code number, description.

Order #7214 cassette version \$19.95
Order #7215 disk version \$24.95

Programs from Book #164

The programs from book no. 164 on cassette. (Book included)

Order #7100 \$29.00

Game Package

Games on cassette. (Bomber, tennis, smart, cannon fodder, etc.)

Order #7216 \$9.95

Microcomputer Hardware Handbook (845 pages) Descriptions, pinouts and specifications of the most popular microprocessors and support chips. A MUST for the hardware buff.

Order-No. 29
\$14.95

Care and Feeding of the Commodore PET

Eight chapters exploring PET hardware. Includes repair and interfacing information. Programming tricks and schematics.

Order #150 \$9.95

Payment: check, money order, VISA, MASTER-CHARGE, Eurocheck.

Orders from outside* USA: add 15% shipping. CA residents add 6.5% tax

*VIC-20 is a registered trademark of Commodore

SOFTWARE IN MACHINE LANGUAGE for ATARI

ATMONA-1

This is a machine language monitor that provides you with the most important commands for programming in machine-language. Disassemble, dump (hex and ASCII), change memory location, block transfer, fill memory block, save and load machine-language programs, start programs. Printer option via three different interfaces.

Order #7022 cassette version \$19.95
Order #7023 disk version \$24.95
Order #7024 cartridge version \$59.00

ATMONA-2

This is a tracer (debugger) that lets you explore the ATARI RAM/ROM area. You can stop at previously selected address, opcode, or operand. Also very valuable in understanding the microprocessor. At each stop, all registers of the CPU may be changed. Includes ATMONA-1.

Order #7049 cassette version \$49.95
Order #7050 disk version \$54.00

ATMAS

Macro-Assembler for ATARI-800/48k. One of the most powerful editor assemblers on the market. Versatile editor with scrolling. Up to 17k of source-code. Very fast, translates 5k source-code in about 5 seconds. Source code can be saved on disk or cassette. (Includes ATMONA-1)

Order #7099 disk version \$89.00
Order #7999 cartridge version \$129.00

ATAS

Same as ATMAS but without macro-capability. Cassette-based.

Order #7098 32k RAM \$49.95
Order #7998 48k RAM \$49.95

ATEXT-1

This wordprocessor is an excellent buy for your money. It features screen oriented editing, scrolling, string search (even nested), left and right margin justification. Over 30 commands. Text can be saved on disk or cassette.

Order #7210 cassette version \$29.95
Order #7216 disk version \$34.95
Order #7217 cartridge version \$69.00

GUNFIGHT

This game (8k machine-language) needs two joysticks. Animation and sound. Two cowboys fight against each other. Comes on a bootable cassette.

Order #7207 \$19.95

FORTH for the ATARI

FORTH from Elcomp Publishing, Inc. is an extended Fig-Forth-version, Editor and I/O package included. Utility package includes decompiler, sector copy, Hex-dump (ASCII), ATARI Filehandling, total graphic and sound, joystick program and player missile. Extremely powerful!

Order #7055 disk \$39.95

Floating point package with trigonometric functions (0 - 90°).

Order #7230 disk \$29.95

Learn-FORTH from Elcomp Publishing, Inc.

A subset of Fig-Forth for the beginner. On disk (32k RAM) or on cassette (16k RAM).

Order #7053 \$19.95

Expansion boards for the APPLE II

The Custom Apple + Other Mysteries A complete guide to customizing the Apple Software and Hardware

Order-No. 680 \$24.95

We also stock the boards which are used in the book "The Custom Apple" (bareboards)

6522 I/O Board No. 605 \$39.00

EPROM Burner No. 607 \$49.00

8K EPROM/RAM Board No. 609 \$29.00

Prototyping board for the Apple II No. 604 \$29.00

Slot repeater board for the Apple II No. 606 \$49.00

Order twin boards and get the book free!

New, battery operable HP75 personal computer. Desk Top

HP75 is truly portable, measuring only 10" x 5" x 1¼" and weighing as little as 26oz. It's the first personal computer ever to be designed by Hewlett Packard and sold by Sumlock Bondain for both portability and desk top performance. A problem solver that is both inexpensive and easy to use.

On the desk top HP75 ties into a range of HP peripherals including full size printers, graphic plotters and compact 'briefcase peripherals'. Other HP computers too.

And when detached HP75 will function as a completely portable, battery operable computer.

HP75 has a built-in time clock. Plus a magnetic reader, mass storage system, logging up to 1.3k bytes per card.

Also from Sumlock Bondain

The New HP86 personal computer. Offering the fullest set of HP solutions in our lowest priced package.

NOW IN STOCK
HP75 and HP86
 Buy them now

Software available for HP75 and Sumlock Bondain includes general purpose solutions and applications such as investment and finance, statistics and math. With 'software pacs' for specific applications. Sumlock Bondain offers the full range of Hewlett Packard personal, professional computers for business and scientific use. From hand held models to powerful desk top machines.

Plus all compatible Software for communication between them.

For further details of HP75, HP86 or the complete Hewlett Packard range, simply clip the coupon today!

Accounting Business Systems

TABS

SOFTWARE.

THE FIRST CHOICE FOR SOLVING YOUR

BUSINESS PROBLEMS.

With intense competition existing between rival hardware companies, TABS software remains the largest selling accounting business software in the UK.

Few business applications are beyond the scope of this immensely popular, fully integrated, modular system which currently comprises: Sales Ledger, Purchase Ledger, Nominal Ledger, Job Costing, Stock Control, Payroll, Fast Data Entry, Sales Order Processing, Management Accounts, Invoice Compiler, Mail List, Word Processor.

Not only is the system designed to help with all the functions of a busy office but it is also designed to run on most micro-computers including the "new generation" 16 bit machines.

With over 2,500 installations and over 14,000 modules being run in the UK and overseas its unparalleled success has been due not only to the proven quality of the software but also to the friendly, unbiased advice that we give our visitors at our regular free seminars and demonstrations held throughout the country.

Further, great care is taken in training our Accredited Dealers and our end users so that when you choose TABS software you are also choosing a product which is fully supported both by your Accredited Dealer and by TABS own personnel.

To find out how the businessman's number one choice would help you and your business phone Andover (0264) 58933 or fill in the coupon.

Free London Demonstrations and Seminars are held at the World Trade Centre within a few minutes walk of Tower Hill tube station.

North Star's ADVANTAGE is easy to see.

The best value in microcomputing.

The North Star ADVANTAGE is the perfect low cost micro-computer for business or personal use. With 720Kb of floppy disk storage, or an optional 5Mb Winchester disk, the North Star ADVANTAGE offers the most memory in its price/performance class. And it comes with advanced business graphics software at no extra cost. You can look everywhere, but you won't find a better micro-computer for the money.

High performance computing and high performance software.

The North Star ADVANTAGE system offers high speed computing based on the Zilog Z80A® microprocessor, the most accepted 8-bit microprocessor in the world, plus an Intel 8035 auxiliary processor. 64Kb of RAM main memory delivers fast program execution, with an additional 20Kb of RAM for the graphic display. North Star provides graphics software com-

patible with CP/M® and HDOS operating systems and application packages, and most standard languages. There are thousands of CP/M compatible software programs available throughout the world. Or you can choose any of the North Star application

packages available for word processing, financial analysis, accounting and data base management.

Graphic displays for every need.

The free North Star ADVANTAGE BUSIGRAPH™ package makes it possible to generate line, bar, pie, and 3-dimensional charts, plus complex 3-dimensional forms. Reports can be transformed into impressive hard copy graphic displays in a matter of seconds.

Build a network of ADVANTAGES.

One North Star ADVANTAGE computer can be linked to other North Star ADVANTAGES by twisted pair cable using North Star's new network interface and software package. This allows you to have a low cost network of individual systems sharing the more expensive peripherals. This can be the first step toward fully automating an entire office or department.

Convenient design and service.

The North Star ADVANTAGE is a fully integrated micro-computer in an attractive, integrated enclosure. It provides high reliability and excellent operator comfort, plus straightforward servicing. For more information about the North Star ADVANTAGE, contact... North Star Computers Inc. Arabellastrasse 5/133 c, Postfach 810623, D-8000, Munich 81, Telephone (089) 91 83 58, Telex 521 5772 ibs

When your computer goes down will it be an inconvenience or a disaster?

Microcomputer systems form an indispensable part of our modern working life. Their power and convenience make it easy to forget just how complex they are – until they go wrong!

We hope you will have talked to us long before that happens. In a 'crisis', a fast reliable response is the only type of service you are going to accept.

microserve offers you a complete range of servicing, maintenance and repair plans. With our **microsure** maintenance contract, for example, we'll have a fully trained service engineer on your door step within hours. Other servicing plans include installation, workshop repair and system upgrades.

microserve are specialists in the maintenance and service of Cromemco, North Star and Comart Microcomputer systems.

We operate from service centres throughout the UK, with the technical support of one of the largest microcomputer groups in the country.

For more information, call us today on 0480 215005, or fill in and return the coupon below. It won't inconvenience us, but it might save you from a disaster!

To: microserve, Freepost, Little End Road, Eaton Socon, St Neots, Huntingdon, Cambridgeshire PE19 3BR.

**** THE NEW DBMS III (series III of the world's first 'task-robot-programs') ****
 **** FEATURES ****

MBasic & word-star compatible
 1400 character record sizes
 mathematical scratchpad
 record relational indexes
 translatable to any language
 User-definable reporting
 field protection/classification
 sorts 'alpha or numeric' any window
 either-or.same as.greater.smaller

32000 records per filename
 20 main/200 sub fields per record
 field and record related formulae
 'Jump-to' any of 32000 records per file
 random/binary/key/multiple field search
 'if-then' questioning
 file protection/password entry
 speed of 500 records per 20 seconds
 range match.not match.integer match

12 online file architectures
 240 fields using cross-referencing
 cross-record calculations
 'Jump-to' any record in 12 files
 User-definable files/field words/sizes
 endless 'either-or' matching
 formulate/recall on selection criteria
 12 interrogation question types
 short filing output/audit trails

ONE OF THOUSANDS OF DIFFERENT TASKS ON WHICH THIS PROGRAM MIGHT BE EMPLOYED

DBMS'S MACROS WORK FROM THE MOMENT YOU INSERT THE 'TASK DISK' IN THE COMPUTER'S DRIVE
 Simply design your file, give its fields your words, setup your report mask, and then enter your records. Switch to 'automatic drive' and formulate any task you wish the program to fulfill, the task is stored as

a macro. Take a copy of the program on another 'task disk' and from then on, the task disk will function without a single keystroke. Think of a number of such 'task disks' such as "stock-re-order reports"; "stock-valuation reports"; "sale-mail-shots"; "production-process-analysis"; "patient history analysis"; "research-analysis"; "budgetting"; "purchase/sales-analysis"; "personnel-file-analysis"; "vehicle-location control"; "librarian analysis"; "plus more?"

Last issue we showed an example of 'short-listing' of employees for a prospective job. Here is an example of a garage stock file and two reports it might generate.

The record may look like this
 1- record number (23)
 2- part number (fiat_grill 109)
 3- location (bin 44)
 4- cost price (29.00)
 5- selling price (38.00)
 6- minimum stock (5)
 7- maximum stock (12)
 8- current stock (3)
 9- manufacturer (Fiat motor company)
 10- on order (qty) (<9>)

One report might be: select??
 all records where the current stock is lower than the minimum stock
 When found, subtract current form maximum, and produce a printed list of the manufacturers name; part number; and re-order quantity
 Update the record in field 10 with the quantity ordered.

Another report might be: select??
 all records in the file; calculate the values of current stock multiplied by cost price for each record. Add the values together for every record at location London or Glasgow or Leeds and print a list of all such records showing stock values 'Individual' and for the specific locations

(next issue's example sale ledger)

DBMSII (WITHOUT MACROS) AND DBMS III ARE FULLY IMPLEMENTED UNDER CPM-86 (tm) AND MSDOS (tm) ie: <SIRIUS/VICTOR/IBM> DBMSII IS 395.00 (or 250.00 by mail order ex. training). DBMSIII IS 575.00 (or 295.00 by mail order ex training)

The sales/purchase order-book (95.00)**
Bankbook (95.pounds)**
Qasort/Qnsort (500 records/15 seconds) (95 pounds)

Each module is a set of 'task disks' designed for minimal learning curve. This software derives from modules of 'DBMS III' and runs reports without your secretary having to touch a single key.

Consider the advantages in these features. The user manual is contained in FIVE pages. All reports are generated by robot functions. Reliability tested (benchtest PCW June). Words in a network multi-user environment. Fast easy data entry. Files are re-organised and sorted automatically. Produced by the same people that originated 'BUSINESS', 'DBMS II', 'DB-CALC', 'AUTOLOAD AND RECOVER', 'ETC' and sold successfully over the past five years. Also see our advertisement page, the software above comes free with a system purchase. (excluding items marked ** and DBMS III)

THE G80/86 NETWORKS

Based upon one hard disk and multiplexor module the G80/86 networks feature full network sharing of data resources by adding different stations that may be as various as Sirius/Victor 9000/IBM/Superbrain/Pet/N'star/Sanyo. The low-cost startup of a network could be simply

1 hard-disk of 5 mbytes.	1 multiplexor	1-2 stations
2100.00	695.00	from 795.00

We also have a special 'spooler module' for routing output to either a printer or modem so that a number of terminals may share the resources of one printer, as well as be able to send files over the telephone at any time (day/night) to both store on the hard disk and print out as well.

Imagine a terminal at a remote site, being able to send/receive its files to/from the main network's hard disk/printer overnight to be examined and processed the next day. The commands are literal English. Like: (send file 'ledger' to port 'B' (the modem) at 11.30) only from G.W. Computers (the leaders in database)
call us on 01-636 8210 or 01-631 4818 and leave your address for our standard 'infopacks'

ZX SPECTRUM HARDWARE 24 line programmable Input/Output Port

This new port has been designed exclusively for the ZX Spectrum and utilises MOS technology to minimise bus loading.

The main features are:

- 3 x 8 bit ports
- Port mapped using IN and OUT commands
- 3 basic modes of operation
- Direct Bit Set/Reset capability
- Outputs capable of sourcing 1mA @ 1.5 volts
- Access via 3 x 16 pin DIL sockets and 28 way edge connector

The port is available fully built together with a set of detailed instructions and suggested control applications. The port can either be used with our new Motherboard thus allowing a further card to be used, or with a stackable connector. Either way, it means that Micro-Drives, Printers etc. will run happily with the port.

ZX Spectrum PPI Port	£16.50
ZX 2 Slot Motherboard	£16.95
ZX Stackable Connector	£5.50

The prices are inclusive of VAT but postage must be added at 70 pence for a single item (100 pence for 2 or more items).

New Spectrum Joystick with controller and driving software. £19.50p inc VAT.

SPECTRUM SOFTWARE SPECIALISTS

ALL OUR PROGRAMS ARE SPECIALLY WRITTEN
FOR THE SINCLAIR SPECTRUM IN MACHINE CODE

INSPECTOR (V2.0)

A MACHINE LANGUAGE MONITOR/UTILITY

- Ultra-fast response
- Full screen memory display and modification — Hex and ASCII with cursor control

- Debugging facilities — breakpoints and register display
- Full search facilities for bytes /words /strings.

- Call and jump to any machine code routine

Plus COMPREHENSIVE
20 PAGE MANUAL

- £6.50 each (inclusive)

SPECTROID STORM

AN ARCADE QUALITY GAME

- Superb quality graphics
- Full colour and sound
- Four different types of asteroid

- Two alien craft
- Two types of saucer
- Left and right rotate, thrust fire and hyperspace

- Full screen wrap around
- Bonus ships, high score table
- £5.50 each (inclusive)

A SPECIAL DEAL for software dealers

cp/m
software

CP/M is the registered trademark of Digital Research Inc.

Top Discounts ... on any quantity

Xitan Systems offer a comprehensive range of software products, with top discounts for registered dealers — regardless of the quantity or value of the order — as well as top-level service and support. Write or phone for our new Software Guide.

DIGITAL RESEARCH

All Digital Research products, including concurrent CP/M-86 for the IBM Personal Computer and CP/M Version 3.0 — the new 'fast as lightning' CP/M.

MicroPro

All MicroPro products, including Wordstar, Spellstar, Mailmerge, Datastar, Supersort, Calcstar etc.

Other Products

Products from most major manufacturers, including Ashton-Tate, Avocet, Bytesoft, Byrom, Ecosoft, MicroCal, Microfocus, Microsec, Sapphire and — of course — Xitan.

Xitan Systems are the systems software house and CP/M distributors of the Comart Group, and Main U.K. Distributors for Digital Research Inc. and MicroPro Inc.

CP/M 80 Software for popular micros

LANGUAGES

C COMPILER (Whitesmith's) £455/£25
This compiler conforms to the full UNIX version 7 implementation of the C language, which has more facilities than Pascal or BASIC and produces faster code.

RCC/80/C: CORAL 86 £825/30
The high level programming language designed by RRE for industrial and military command and control systems, implementing the complete CORAL 86 language as defined in BS 5905, except for the rarely used optional Fixed point feature. Comprehensive documentation is provided based on BS 5905. Compiler output is in assembler source form.

BASIC-80 (Microsoft) £175/NA
This is Microsoft Extended BASIC interpreter, version 5. It is a powerful, ANSI compatible disk BASIC with many features not found in PET BASIC, such as WHILE/WEND, chaining, variable length file records, double precision floating point, PRINT USING facility, error trapping, hexadecimal numbers and more.

BASIC COMPILER (Microsoft) £205/NA
This compiler is language compatible with the Microsoft version 5 interpreter but generates 8080/Z80 machine code, so that program execution is typically 3 to 10 times faster.

COBOL-80 (Microsoft) £375/£20
An ANSI 74 COBOL compiler producing relocatable modules compatible with FORTRAN-80 or MACRO-80 output. COBOL-80 has a complete ISAM facility and interactive screen handling.

CIS-COBOL (Microfocus) £425/£30
An ANSI 74 standard COBOL compiler full validated by U.S. Navy tests to ANSI level 1. The compiler also supports many features of level 2 including dynamic loading of COBOL modules and a full indexed sequential (ISAM) file.

FORTRAN-80 (Microsoft) £230/£20
The popular science and engineering language, complying with the ANSI '66 standard (except for the COMPLEX data type), with enhancements such as mixed mode arithmetic.

PASCAL/MT + £375/£20
A Pascal compiler meeting the ISO standard, with many enhancements including full string handling capability and random access files.

PRO PASCAL £190/£19
This Pascal Compiler implements the full proposed standard with improvement extensions such as random access files, strings and program segmentation. Pro Pascal is designed specifically for the Z80 and produces relocatable machine code which is very fast and compact. A linker and cross-reference generator are provided, and Pro Pascal object code may be used in READ only memory.

PL/I-80 (Digital Research) £325/NA
A general purpose application programming language giving mainframe capability for developing large-scale structured programs in a microcomputer environment.

DATA MANAGEMENT SYSTEMS

dBASE II £385.00
An interactive relational database management package with full screen formatting and its own fully structured high level command language. Interactive data entry and validation with WordStar-like commands. Allows you to develop application packages in days rather than months.

PERSONAL PEARL £190/NA
Allows custom application programs to be created using English Language interaction with the system. Includes Report and Help facilities and an independent data base manager. Also includes an interface to Supercalc.

TELECOMMUNICATIONS

BSTAM £115/NA
This telecommunications utility permits any type of CP/M file to be transferred to or from another computer also equipped with BSTAM. Transmission occurs at full speed with CRC error checking and automatic error recovery.

BSTMS £115/NA
An intelligent terminal program permitting communication with a mainframe computer.

WORD PROCESSING

WORDSTAR (MicroPro) £255/35
A powerful screen-oriented word processor designed for non-technical personnel. Text formatting is performed on the screen, so that what you see is what your print-out will look like. WORDSTAR's advanced facilities include justification, pagination, undercores, boldface, subscript and superscript, block movement of text.

MICROSPELL £165/NA
This is a spelling help program which scans through a document file stopping at each dubious word, offering correctly spelt alternatives and allowing you to correct the word with a keystroke.

NUMERIC PROBLEM SOLVING TOOLS

MICRO MODELLER £425/NA
The number one Financial Modelling and forecasting program.

STATPAK £260/£20
A professional statistics and probability package which can rapidly handle large files of data.

SYSTEM TOOLS

CROSS ASSEMBLER £95/£10
XASM 05, 09, 13, 0 48, 65, F8, 65, COPS 400 and 51
Cross assemblers for the Motorola 6505, Motorola 6809, RCA 1802, Intel 8048, Motorola 6800, Fairchild F8, MOS Technology 6502, National Semiconductor 400 and Intel 8051 families.

CP/M 80 for the Sirius

Sirius 80 Card

- Allows all standard CP/M 80 2.2 software to run without modification.
- The card simply plugs into any one of the four internal expansion slots and comes complete with a disk containing all the usual CP/M utilities.
- By typing a single command, the system can alternate between CP/M 80 and CP/M 86. Files generated under either CP/M are identical in structure, providing file compatibility between operating systems.
- The card also has a Corvus hard disk interface allowing the Corvus range of Winchester drives to plug directly into the SIRIUS.
- Z80 4 or 6 MHz with no wait states.
- 64K RAM
- Corvus hard disk interface.
- Multi-user with hard disk-
- Up to 64 Sirii can share 1 hard disk.

Sirius 80 card (4 MHz) £299.00
Sirius 80 card (6 MHz) £335.00

CP/M 80 for the PET

Softbox

Features:-

- CP/M version 2.2 with menu driven system configuration.
- Z80 CPU running at 4MHz with no wait states.
- 64K RAM
- Operates with any 2000, 3000, 4000 and 8000 series Commodore computer.
- Supports up to 8 Commodore 3040, 4040, or 8050 disk drives.
- Supports up to 4 Corvus hard disks of 6, 11, or 20 MBytes.
- RS232 serial interface with software-definable baud rates for use with a printer, modem or terminal.
- Diskette containing operating system with utilities.
- Comprehensive user manual.

A full range of CP/M languages and applications software on Commodore 8050 or 4040 format is available.

Price £495.00

CP/M 80 software is available on formats to suit most popular micros. Dealer enquiries welcomed.

CP/M is a registered trademark of Digital Research Corp.

SIMPLY THE BEST SOFTWARE IN THE WORLD

PORTABLE COMPUTERS

SHARP MEANS BUSINESS

PC-1500 COLOUR COMPUTER

Probably the most powerful pocket computer on earth

THE HARDWARE

The PC-1500 approaches the personal computer in ability, with 16K of ROM extended BASIC language and 3.5K RAM user memory, expandable to 11.5K, all maintained during power off and battery change. Up to 36 separate programs are immediately accessible and there are advanced programming capabilities with PEEK, POKE, CALL etc, 1 and 2 dimensional arrays and variable strings. There is a full range of text manipulation and the QWERTY typewriter-style keyboard offers upper and lower case letters on the 26 character LCD which doubles as a 1,092 point mini-graphic display with BASIC program control. A tone generator and clock, calendar, alarm and stopwatch functions are built in and, under BASIC control, can be incorporated in programs.

The CE-150 is a high resolution (500x200), 4-colour printer/plotter, with 8K bytes Graphics BASIC. The 9 type sizes allow a variable line length from 4 to 36 characters. The CE-150 can print virtually any drawing with full control of up/down, left and right printing. There are two cassette interfaces (for saving/loading) with remote control, allowing bulk storage.

The PC-1500 has a 50 hour battery life, with EA-150 mains adaptor option and the CE-150 has a built-in rechargeable battery and comes with EA-150.

PRICES, including VAT and FREE software voucher.

FANTASTIC VOYAGE

(ZX81 16K ONLY)

This real-time graphics adventure set inside the human body was written by a lecturer in anatomy. You are injected into the blood stream in your miniature submarine. Navigate the arteries, veins and heart to the brain, where a blood clot must be destroyed. Features a real vascular map. You will be attacked by lymphocytes which must be destroyed using arcade game type graphics. Everything you do uses up precious energy. Three display formats — a lateral and frontal body scan plus blood vessel name, a close-up scan and a laser-sight for fighting lymphocytes.

2 FOR £9.95,
3 FOR £13.95
(ANY MIX) INCLUSIVE**

ZX 16K BBC ZX81 — SPECTRUM — VIDEO GENIE — BBC A/B AWARI

- * The ancient African game of logic. It takes 2 minutes to learn the rules but far longer to master the tactics.
- * Select the 'Goat-herd' level of play and it's an addictive game for children (8plus) that exercises their minds — not their laser fingers.
- * Select the 'Witch-doctor' level and it's a threat to your sanity. We haven't beaten it and we wrote it!

ADVENTURE

- * Over 200 places to explore in this machine code game using advanced data compression techniques.
- * No random elements — you will need skill, cunning and a sense of humour as you explore caves, forest and castles.
- * Evade ruthless pursuers and overcome a host of obstacles.
- * Multiple word commands and single letter abbreviations.
- ** Buy both Awari and Adventure and enter the 'Foilcade Challenge' competition. Details with cassette or send SAE.

£1000 IN PRIZES

Presenting the CONCEPT-09

The new British micro computer system that brings together the processing power of the 6809 micro processor with the renowned FLEX operating system at a price as impressive as the performance.

ROMIK SOFTWARE

ROMIK PROMISE A
MINIMUM OF ONE NEW
GAME EVERY MONTH

24 Church Street, Slough, SL1 1PT. Telephone: Slough (STD0753) 71535

Britain's leading games software house are proud to announce our new range of exciting games & other software for the Vic 20. (Games for BBC, Dragon, Spectrum & Atari available soon).

ALL ACTION GAMES CARRY A FREE ENTRY TO NATIONWIDE COMPETITIONS WITH FANTASTIC PRIZES.

MARTIAN RAIDER

FOR UNEXPANDED VIC 20

Skim as close as you dare to the surface of the planet, devastating the Martian cities, destroying ammunition dumps (gaining more time), shooting down the grounds to air missiles and U.F.O.'s dodging or blasting the meteorites.

"A REAL ACTION SHOT OF THE GAME"

A MACHINE CODE ARCADE QUALITY GAME

AIR-SEA ATTACK

For expanded Vic 20 you can use 3K, 8K or 16K RAM

Can you pilot a modern jet fighter? Take off from your aircraft carrier and engage enemy aircraft in battle. Shoot them down and then drop your bombs on the enemy aircraft carrier. Watch out — the enemy fighter is trying to do the same! If he gets past your air defence you are left to defend your own carrier with sea-air missiles. You each have 3 jets.

"A REAL ACTION SHOT OF THE GAME"

A MACHINE CODE ARCADE QUALITY GAME.

SHARK ATTACK

FOR THE UNEXPANDED VIC 20

You are in shark infested waters after being thrown overboard from a pirate ship. Your only protection being an atomic net which you trail behind you trying to cover all the visible ocean and ensnare the sharks at the same time. Beware of stopping or covering your tracks for too long, if you do, then the sharks will escape and come after you. Watch out for the ever increasing deadly octopi (sometimes the sharks will eat part or all of one!)

"A REAL ACTION SHOT OF THE GAME"

A MACHINE CODE ARCADE QUALITY GAME.

MIND TWISTERS

For unexpanded Vic 20

Four games to stretch your brain. Blackjack, Decipher, Four Thought and Teaser are our computerised versions of very popular home games and will test your mental agility and skill for many a long hour.

BLACKJACK:
You start with £1,000, the objective being to break the bank, to do this you have to win (including your starting money) £20,000.
Instructions: You have to score nearer (but not over) 21 than the computer does. The computer deals your first card, you then place your bet and hit the return key. The computer then deals your second card. If you want another card hit the "C" key, if not hit the "S" key.
Points: Ace equals 1 or 11, Jack, Queen, King equal 10.
Scoring 21 points with 2 cards — you automatically win.
Draw — the computer wins.
Your kitty is automatically adjusted win or lose. If you lose all your kitty — game over.

DECIPHER:
You have to guess what combination of colours the computer has selected — to enter a colour just hit the colour button on the computer when you have entered your five choices of colour, the computer will display (A) Nothing at all equals None right, (B) Black or White Squares or Both — For every black square you will have a correct colour in the correct position, for every white square you will have a correct colour in the wrong position. If you cannot find the complete combination, it will be displayed when you have had twelve attempts.

FOUR THOUGHT:
You have to make a line of four squares — horizontally, vertically or diagonally BEFORE the computer does, taking turns to take a square (squares can only be placed at the bottom of the grid, or on top of another square). Keys: Hit the number key of the column you want your square dropped in then hit the return key.

TEASER:
The aim of the game is to score "15" BEFORE the computer does, using any combination of 3 boxes. If you cannot score "15" then you must try and stop the computer from doing so and force a draw. Keys: Hit the number key of the box you want (you can only select an empty box).

A MACHINE CODE ARCADE QUALITY GAME.

MULTISOUND SYNTHESIZER

FOR THE UNEXPANDED VIC 20

The Vic Multisound Synthesiser is very flexible and can be played in more ways than can ever be explained here, to create music and special effects. For example, create any tune, up to 255 notes (after following appropriate instructions), then press "F1" or "F3", then key "9" and enjoy the added effect. Now hit "plus", listen to the difference. For a surprise — hit "-" . Now add a melody over the top — hit key "8" then "7" — now play a melody, or experiment. *Have fun!*

A MACHINE CODE ARCADE QUALITY GAME.

SEA INVASION

Fight off the attacking sea creatures for as long as you can. Shoot the whale for a surprise score, watch out for the crabs, starfish and octopi.

"A REAL ACTION SHOT OF THE GAME"

A MACHINE CODE ARCADE QUALITY GAME.

MOONS OF JUPITER

You are the Commander of a fleet of destroyers looking on from the safety of a mother ship, you send in one destroyer at a time to blast a passage through the MOONS OF JUPITER. **Your destroyers have to dodge, and blast the UFOs. . . Watch out for the Gologs they can smash your destroyers, but you cannot harm them.**

A MACHINE CODE ARCADE QUALITY GAME.

SPACE ATTACK

Is a game of skill you as the pilot of an Inter galactic battleship have to fight your way through wave after wave of various alien spaceships.

A MACHINE CODE ARCADE QUALITY GAME.

Our games are available from all good home computer shops, including:-

Introducing Orchard Software — formerly Apple Orchard

with quality products for the Apple II and the IBM PC

PROTECT YOUR SOFTWARE INVESTMENT with Copy II Plus

Copy II Plus gives you the power to make back-up copies of most of the "protected" software packages currently available for the Apple II.

INSURANCE

With Copy II Plus you can protect your valuable software investment. Make back-up copies of Visicalc, DB Master, the Apple Special Delivery range, and many more; keep your originals safely locked away from the wear and tear of everyday use.

EASILY PAYS FOR ITSELF

While some software companies offer replacement of expensive damaged diskettes, many do not. With Copy II Plus you eliminate the time, expense, and worry of costly accidental damage to your valuable software.

THE FILER a new Apple Disk Utility

SAVE TIME

Fed up wasting valuable time waiting for disks to copy? With the FILER's fast and accurate copy program you can make completely reliable back-up copies of your disks in 35 seconds. The FILER is ideal for backing-up your data disks, and for copying all unprotected disks.

OTHER FEATURES

The FILER package also contains a disk drive speed check, a disk drive test, and a sophisticated file manager. Options include: Catalog with space on disk, Copy Files, Copy DOS, Delete, Lock and Unlock Files, and Change Booting Program (name and filetype).

£16

SCREENWRITER II

All the features you expect from a good word processor — global search and replace, insert and delete, text move, and complete formatting capabilities, plus:

- Upper and lower case text on screen with no extra hardware
- 70 col. display on screen with no extra hardware
- Form letters and mailing lists as a standard feature
- Handles documents up to 50 pages long
- Complete interface with The General Manager

£79

IBM PC SOFTWARE

As well as a full range of software for the Apple II, we now offer software for the IBM PC, including the Visicorp range, dBase II, Supercalc, the Apple-IBM connector from Alpha software, and many more.

Write for our full list of IBM PC software.

GraFORTH

The Apple Graphics Language

The Apple Graphics language from insoft — specially created to get the most out of the graphics capabilities of your Apple.

- draws 3D images in colour, at rates that make animation easy
- user defined character sets (any size, colour or typeface)
- text and graphics can be mixed on any part of the screen
- music can be included in programs
- excellent manual shows how to use the full capabilities of the system.

Ideal for entertainment software development, scientific and educational uses, and any application where sophisticated graphics are required.

Demo available for £4 (refunded if you buy).

£50

THE GENERAL MANAGER

The latest quality product from On-Line Systems, The General Manager is a true hierarchical database — not just a file manager. Use it for anything from a simple names and addresses file to a complex customer accounts system.

The General Manager offers all the features you expect from a database program, and more:—

- Hierarchical structure gives greater efficiency in data storage and retrieval.
- Retrieve information on several sort criteria, industry and/or searches.
- Full range of calculation abilities, including logical operators.
- The powerful data access commands provided by the Applesoft interface enable you to input or output data to and from Applesoft Files. Information can also be selected and written to text files.
- Data can be spread over 100 disks on 1-4 disk drives.
- Expand or change your database with no loss of data.

A demo disk costing £4 is available, describing these features in more detail.

£79

THE CROWN RANIER ONLY £795 + VAT

THE CROWN

The ideal home Daisy Printer/Type-writer up to 12 CPS — 6 extra Daisy Wheels available — 14 character correction — carbon ribbon — speed test — all the features you would expect of an electronic portable typewriter/printer. Centronic parallel — IEEE — RS 232

Only £320 + VAT & carriage at cost

FRIENDLY!
The Crown Ranier
is compatible
with
Apple II, III
Sirius
IBM
Superbrain
Televideo
Plus most
other machines

We offer a heavy duty daisy wheel printer/typewriter at the flick of a switch. This machine has the very latest linear motor — no cables or belts to break, stretch or wear. Beware of light weight, low cost machines, these can never give long term reliable service. THIS MACHINE WILL!!

Centronics or IEEE interface. Interchangeable daisy wheels — variable pitch — whole line memory. Easily copes with standard printed forms. Uses standard IBM ribbons and lift off correctors.

Perfection as a typewriter (used by local authorities). Perfection as a printer.

Ask your local computer or office equipment dealer for further information. EXSTOCK DELIVERY.

Business minded?

The Apple III helps you mind your own business. Whether you're a doctor, lawyer or business proprietor.

Simply because you don't need to

be a computer expert to put the power of an Apple III to work on your business. So you can do word processing, business planning, forecasting & graphics. On your terms. Without spending time and money coming to terms with a computer service.

Ask for a demonstration and we'll show you why it makes sense to buy an Apple personal computer for your business.

And keep it to yourself.

 **apple computer**

Increase your word power

Pound for pound, the Apple III is the most powerful personal computer you can buy.

Combine it with Apple Writer III™ software and you have the most powerful personal word processor you can buy.

Combine all the above with our Mail List Manager™ and you have the final word.

You can make letters, letter perfect. You can target your letters to the right regions and titles. And you can turn out thousands of personalized letters.

All at a price that's less than some dedicated word processors.

Come in for a demonstration.

You'll never be at a loss for words again.

ZX Spectrum

20 Programs £6.95

The ZX Spectrum has brought advanced computing power into your home, The Cambridge Colour Collection, a book of 20 programs, is all you need to make it come alive.

No experience required. Simply enter the programs from the book or load them from tape (£2.95 extra) and run.

Amazing effects. All programs are fully animated using hi-res graphics, colour and sound wherever possible.

Entirely original. None of these programs has ever been published before.

Proven Quality. The author already has 30,000 satisfied purchasers of his book of ZX81 programs.

Hours of entertainment

- **Lunar Landing.** Control the angle of descent and jet thrust to steer the lunar module to a safe landing on the moon's surface.
- **Maze.** Find your way out from the centre of a random maze.
- **Android Nim.** Play the Spectrum at the ancient game of Nim using creatures from outer-space.
- **Biorhythms.** Plot the cycles of your Emotional, Intellectual and Physical activity. Some would say this is not a game at all.

Improve your mind

- **Morse.** A complete morse-code training kit. This program will take a complete beginner to R.A.E. proficiency.
- **Maths.** Adjustable to various levels, this program is an invaluable aid to anyone trying to improve their arithmetic.

Run your life more efficiently

- **Home Accounts.** Keeping track of your finances with this easy-to-use program will enable you to see at a glance where the money goes and plan your spending more effectively.
- **Telephone Address Pad.** Instant access to many pages of information.
- **Calendar.** Displays a 3 month calendar past or future, ideal for planning or tracing past events.

JOYSTICKS

We are specialist manufacturers and distributors of joystick controls, ranging in price from £3.00 to £1,000. 20 years experience of design and production, and high volume sales on the UK and through 8 overseas distributors allow us to offer, often from stock, or otherwise within 2 to 3 weeks, a range of standard joysticks suitable for almost any application, from a TV game to a control for earthmoving equipment.

We have 3 ranges suitable for Microcomputers

- The J1, economical dual axis carbon track controls, with or without cases, switches, and cables.
 - The JS2, high quality all metal dual controls for any standard potentiometers (and in particular for plastic film potentiometers giving life of several million cycles).
 - The JS4 unique inductively coupled contactless joystick (with life of up to 10 million cycles total noise free outputs and infinite resolution).
- In addition we frequently build 1 off special joysticks such as triple axis with 3 additional knob controls, for underwater vehicle control, or 16 function units for walking talking puppets. We also design and tool plastic or metal cases, and a wide range of accessories of all sorts including weatherproofing gaiters and bezels.

Please contact us for all your joystick requirement — prices, delivery and quality will surprise you.

We regret that we are unable to handle enquiries from individuals — please contact your dealer or write to us to ask for a dealer list.

ZX81 MACHINE CODE ?

ZX.ASZMIC rom transforms ZX81 into an Assembly Language programming unit

o FULL-SCREEN EDITOR

Sixteen shift keys take you into a world with a word processor feel. A blink cursor moves at your command to control insertion, rubout, line or string deletion, auto-scroll & page flip up or down. Text block operations. Ultra-fast editing.

o MULTI-FILE SYSTEM

Declare as many files as you like, with any names you like, & they are automatically handled by the Operating System. Merge them, delete them, print, save & load them, & edit them by name. Superb flexibility with a simple but powerful system.

o TOTAL ASSEMBLER

Full Z80 mnemonics, unlimited length labels, ORG & EQU directives, proper assembly listings with errors flagged on screen or printer. Relocatable object code & options to facilitate cross-assembly. Interpretive immediate execution available.

o POWERFUL DEBUG

All the usual dump, modify, fill & copy commands; plus breakpoints, single stepping, context control, the convenience of interpretive execution mode, full use of the names in your program, Command Macros, autodump, and full operating system interface.

o HI-RES GRAPHICS

255 x 144 resolution under program control to give you truly convincing graphics. With the power & flexibility of assembler you can really use this high definition.

o MUCH, MUCH MORE

Repeat function on all keys. Double height titling on printer. Lots of extras. But more important than all these features, attractive though they are, is the fact that ZX.ASZMIC is an integrated development system in which everything fits together to give you a tool which can satisfy the professional programmer by simplifying all stages of the program development process. It is excellent for those who are taking the first steps into real programming but the more expert you become the better you realise just what ASZMIC can do for you. If you are at all interested in machine code it will be worth your while to find out more.

NEW
 Send for details of under-the-keyboard board for ASZMIC & BASIC.

The FLEX 9 Operating System for '6809' Based Micro-Computers.

This disk operating system is now the standard single user system for machines using the powerful '6809' micro.

Having many advantages over similar operating systems for other micro-computers, this system can now be run on many different '6809' based machines.

Furthermore, the Configurable Version is available for implementation on custom '6809' computers.

Programs written to run with this operating system are almost completely machine independent, thus allowing the easy transfer of software.

There is a wide range of software available for this system, some of which is listed below. Please send for our full list.

'6809' HARDWARE, RUNNING FLEX 9 OR OS-9.

CRYSTAL RESEARCH LTD

XTAL BASIC 3

A Z80 based Interpreter. Disc and Cassette versions including CP/M are available now or in the near future.

FEATURES

- 1 Has over 110 Commands and Functions and is user extendable.
- 2 **Xtal BASIC 3** incorporates its own editor that is independent of VDU or terminal being used but appears to have the facilities of the most sophisticated direct screen editing, in brief the editor contains the following:
Lines of 127 characters (can be extended up to 254)
Full on screen editing, up, down, left, right.
Auto insertion of lines.
HOME CURSOR, CLEAR SCREEN, DELETE LEFT, DELETE RIGHT, INSERT CHARACTER, ERASE WHOLELINE, ERASE TO END OF SCREEN, PRINT SCREEN CONTENTS TO PRINTER, and ABANDON LINE. A LINE EDIT MODE IS INCLUDED AS STANDARD.
- 3 Variables can be of any length. First five characters used to distinguish one variable from another. Multi-dim arrays, string arrays and integer arrays.
- 4 Full Tape and Disc file handling.
- 5 32 standard error messages and traps. Ability to trap **BREAK KEYS**. Error table is extendable.
- 6 Possible to run programs larger than memory capacity.
- 7 Special features allow transfers of programs from machine to machine.
- 8 **Xtal BASIC 3** is designed to be compatible with most available BASICS and a program is supplied for many BASIC to BASIC conversions.
- 9 The manual, consisting of over 100 pages, includes full description of the BASIC, sample programs, useful Machine Code Subroutines in Xtal BASIC 3, examples of extra commands and functions.
- 10 **SIZE 12K to 14K** depending on the System.
- 11 Available on **Cassette** and/or **Disc**. Please contact Crystal Research Ltd., for availability on your particular machine.
- 12 On Cassette **£40.00 + VAT** On Disc **£60.00 + VAT**
OEM and Manufacturers are invited to contact Crystal Research Ltd., for licence details.

For a happy Christmas

make sure you can use the computers you buy!

Your Atari Computer: A Guide to Atari 400/800 Personal Computers.

This is the most comprehensive guide to the Atari available today. It will teach you how to set up the Atari and program in BASIC; covers the sound and graphic capabilities in three detailed chapters, and contains extensive descriptions of the disk drive, printer and other peripherals for the Atari, along with step-by-step instructions for their use. Although written primarily for users with little programming experience, the book contains tables, charts and programming tips that will be very useful to the expert Atari user.

1982 450 pp £10.95

PET Personal Computer Guide (Osborne)

Based on the very popular PET/CBM Personal Computer Guide, this new book contains a wealth of information for the novice or professional alike, from tutorials in PET BASIC, to instructions for using the PET's highly advanced screen editor. Including all the recent PET products it covers all aspects of PET operation from programming and debugging to the use of peripherals. Organised for quick reference it also provides a summary of PET BASIC statements in alphabetical order, a chart of PET character codes, a 36 page memory map and useful references. Practical and easy to use, this book will help you to understand the capabilities of the PET, and be an essential guide for daily use of the machine.

1982 500 pp £11.50

CP/M User's Guide 2/e

No matter what kind of computer or version of CP/M you have, you'll find this brand new edition the most complete, accurate and up-to-date book on CP/M available today. Including a complete section on CP/M 86, it discusses all types of CP/M and their compatibility, provides sample screen displays to explain every operator command and computer response, discusses assembly language utilities, applications passages MP/M and much much more.

1982 284 pp £11.50

A FASCINATING INTRODUCTION TO PROGRAMMING

LOGO II MODEL B

The first implementation on the B.B.C. Microcomputer of the graphics language LOGO. This language is now popular in American schools as an ideal educational program. It can graphically demonstrate the ideas of defined procedures, sub-routines, loops and even recursive programming. LOGO II is a much improved version of our original LOGO program and now works in different screen modes and includes the ability to list or delete defined words. These may also be saved on tape. This program will give an excellent introduction to computers and LOGO language.

Disk Utilities for CP/M

**for
ANY
DISKETTE
FORMAT**

These general disk utilities work on ANY single user CP/M 2.x system, with ANY diskette size and format, and many hard disks. All are menu driven, and easy to use.

DDUMP makes it possible to examine and patch any byte on any sector, addressed by track and logical sector number — or addressed by allocation block number, both in HEX and ASCII format. May be used to study how CP/M allocates disk storage, to examine or repair a damaged disk and to recover lost data.

DTEST tests a disk for bad spots. Bad sectors are locked out from later use by CP/M by automatically collecting them in a -garbage- file. All errors are reported to printer and/or console. Reduces probability of later disk crashes. Indispensable for hard disks, as media cannot be replaced. Use DTEST before disk errors ruin your work!

DUSER enables you to have access from one user area (user number) to programs and/or files stored on other user areas, without having to keep duplicate copies of files on the disk. DUSER makes this possible by copying file entries from one user area to another, thus saving considerable disk storage space.

DDUP duplicates disks. It is independent of disk controller, drive, disk size and format. It only requires that source and destination disks are of the same format and density. It will also replace bad sectors on the source disk with blank sectors on the destination, thus enabling you to automatically recover (what can be recovered from) damaged files.

UNERA recovers accidentally ERASEd files.

Price: Only £19.95 each. All 5 together £69.95.
Complete set of 5 manuals: £12.00.
Specify format: 8" SS/SD, 5" HS Heath/Zenith or 5" Osborne disk. Include £5 per order for handling & shipping. VISA accepted.

Dealers/distributors inquiries invited.

Order from your dealer, **ELEKTROKONSULT AS**
or directly from: Konnerudgaten 3
N-3000 Drammen
NORWAY

CP/M is a trademark of Digital Research.

THE STAR

is pleased to announce that you may now obtain our products direct from the manufacturer.

PRO-DIS

— For the BBC Micro. The superb RAM resident Colour disassembler with Hex/ASCII memory dump, full and easy memory editing on all functions, and memory COPY facilities. Fits ANY BBC Micro. Don't fool around with toy disassemblers from the cowboys. This is from the authors of DISATOM! Please state 16K or 32K. £5.95

DISATOM

— the supremely comprehensive toolkit and disassembler for the ATOM. Look at this:

AULD — targetable OLD
COPY — areas of memory
DELETE — BASIC lines
DIR — directory
EXEC\$ — string in fn or cmdnd
HEADER — freeze top lines
HIGH — 1200 BAUD taping
LOW — 300 BAUD taping
ON ERROR — trap errors
PAGE — new text space
READ — reads DATA statement
RESTORE — reads DATA statement
RESTORE — move data pointer
TAPE — for really bad tapes
ZERO — all variables to zero

AUTO — line numbering
CURSOR — X+Y cursor control
DUMP — value of variables used
ERUN — run with error check
FINL — m/c code, assembler and BASIC
HELP — recover bad tapes
INKEY — a GET command
NUKE — really thorough NEW
OUT — RS232 output from cas socket
PULL — can exit FOR,GOSUB, DO loops
DATA — Data as a list in program
REN — line renumber
TONE — music, and out to tape too

MACHINE LEVEL FUNCTIONS:

Function
DISASSEMBLE — any area of memory, edit/modify directly as desired
HEX DUMP — any part of memory, with direct edit/modify
ASCII DUMP — any memory as its ASCII equivalents, with edit/modify
TRACE — any m/c code routine, setting all registers etc.
M/C DEVELOP — a command for high powered m/c code program writers

These m/c commands make the machine absolutely TRANSPARENT, and it is worth the time of even a novice to learn how to handle them. £19.95

FUSION

— a 17 page, covered manual with demo programs to help you join in the ATOM and DISATOM. £1.00

SOFTSWITCH

— a plug-in (no ribbon cables!) board for the A000 utility socket that allows 4x4K ROMs to be resident, each selectable from Keyboard or Program! Always come up on ROM 0, then you choose. Ideal with DISATOM in socket 0. Mechanically stable, and does not interfere with any other boards in the ATOM. £19.95

PRO-LOG

— An Analogue to Digital converter board for ATOM. 8 Inputs, allows 2 jpyctics with 4 fire buttons, or any other like combinations. Has many built-in software commands. Easy to fit, and gives you real games power. £40.00

Add 15% VAT. Make cheque/PO payable to FOCUSPLAN LTD. Send your orders to PROCYON, 57 Westgate, Cleckheaton, West Yorks, BD19 5HH. Trade Orders welcome.

OPEN FRAME MONITORS AVAILABLE FOR OEM'S

The 'PRINCE' of Monitors

offers better Monitoring.

24MHz Bandwidth - ensures a clear crisp display.

Available with P4 White P31 Green AND L1 ORANGE

Scan: 625 lines/50 Hz. Deflection: 110°. Active raster: 240x172mm. Bandwidth (3dB): 10 Hz-24 MHz (at 3dB points). Character display: 80 characters x 24 lines. Horizontal frequency: 15625 Hz ± 0.5 KHz. Vertical frequency: 50 Hz. Horizontal linearity: ± 3%. Vertical linearity: ± 2%. Geometric distortion: ± 1.5%. EHT (at zero beam current): 13kV ± 0.5kV. Power drain: 30 Watt approx. Voltage supply: 110V A.C. 50 Hz/220V A.C. - 50 Hz/240V A.C., 50Hz/± 10% upon request. Video input: 2 x BNC - or CINCH - or PL 259, (composite video) negative sync, input 0.5-4V p.p. across 75 Ohms. X-Ray radiation: conforms to I.E.C. Spec. No. 65. Overall dimensions: 320 x 270 x 265 mm. Weight: 7 Kg. approx. Ambient temperature: 0-45°C.

OTHER CROFTON PRODUCTS INCLUDE: Computer peripheral equipment, Frame grabber, Floppy disk drives, Floppy disks, Computer power supplies, C.C.T.V. monitors, Uncased monitors, Monitor P.C.B's., Cathode ray tubes, VHF/UHF modulators, Video switchers, Video distribution amplifiers, Camera housings, Pan and tilt units, Camera lens, Camera tubes, Printed circuit board service.

CHIP CHAT

The 'state of the art' in micro technology in the USA seems to be getting itself into more and more of a state. For instance, an ad spotted recently in an American micro mag boasts 'Now you can use computer technology to search the Bible on any subject.' You see, some redneck fundamentalist computer freaks have put the King James Bible onto disk and are supplying it with a piece of look-up software called (believe it or not) The Word processor. Going to the other extreme, an outfit calling itself The Software Co is advertising a game (at least, we think it's a game) called 'Sewers of Moscow' — with sound!...

While still on the subject of software trade names, the erstwhile editor of a certain other micro magazine, now a director of a software house, has christened his latest range of software 'Elephant Brand' — we wonder what colour it is (white, maybe?)... While labouring through the Transaction File recently, an anonymous member of PCW's staff

discovered an ad from one W Packman. We presume he's no relation, and would like to warn him that he's making illegal use of a patented trademark... An IT report was dropped onto Editor Rodwell's desk not so long ago, the first item of which was a paragraph about computerised lavatory flushes, of all things. Apparently one of Reckitt & Colman's R&D labs has (quote) 'an international selection of lavatories flushing 24 hours a day at the command of a computer'. These flushes are performed by pneumatic controls which 'compress months of normal household use... into weeks or even days'. No suggestion is given as to why exactly there is a need to wear out all these cosmopolitan khazis, but it could be that Reckitt & Colman will produce a 'superlav' down which micro industry rubbish might be forever flushed at the command of a Cray 1... Caxton directors Tebbutt and Barrow were recently in a certain rather posh London hotel for the

signing of their large deal with Osborne. Once names had been put to paper and all the bigwigs seen onto their plane, the aforementioned gentlemen decided to celebrate their new achievement with the most expensive cocktails on the tariff. They found their way to the bar, ordered their drinks, and then were told that alcohol was at that time not on sale to non-residents. Faced with the choice of waiting 25 minutes for a drink, going home for tea, or sipping fruit juice, they took the final option. Caxton's Card-box deal with Osborne was therefore celebrated with fruit punch — complete with the little umbrellas, mermaids and maraschino cherries... Ever heard of the Apolo II? No? Nor had we, but it's upset Apple Computers. It's like this: Sunrise Computers of Taiwan took it upon itself to manufacture an exact copy of the Apple II — even down to the external design and the contents of the EPROMs — which was, for a while, available through CAB Trading BV

in Holland. CAB Trading is, naturally, now forbidden to sell, exhibit, distribute or otherwise purvey this micro following a hearing in Amsterdam in which CAB's behaviour was held to be 'intolerable' and represented unfair competition to Apple. However, these legal proceedings seem to have gone a little far, as CAB is now also forbidden to use the words 'Apple II compatible' in its brochures and is also forbidden to use the trademark 'Apolo' in any respect as this 'constitutes a direct infringement of "Apple"'. Unfair's unfair, but the connection here seems a little obscure... For worried users of the VIC-20, we've heard from the top that, despite rumours to the contrary, the VIC will not be dropped in the wake of the Commodore 64. So if anyone tells you that the VIC-20 won't be on sale for much longer, you know what to do — tell them to VIC off...
