A Dry Cell Audio Stage Valve

* * *

With the Output of a Storage Battery Valve
RADIOTRON UX 120

Characteristics:

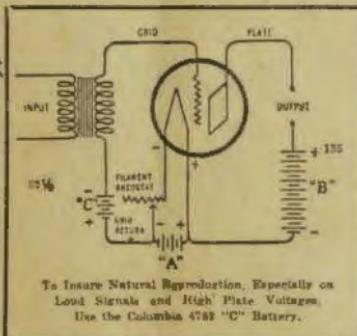

Filament Terminal Volts	3
Filament Consumption125 amps
Plate Voltage	135

The new dry cell Radiotron UX120 is for use exclusively in the last stage of audio-amplification.

The Radiotron UX120 was designed to give greater Loudspeaker clarity and volume without distortion.

**Obtainable
at
all Radio
Dealers**

* * *

To obtain the full advantage of power valves, a higher plate voltage than is customary should be employed. This in turn calls for greater grid or "C" battery voltage for the correct operation of the valves. It is essential that a grid or "C" battery be used with power valves, as otherwise their consumption of plate current is so great as to exhaust the high tension battery rapidly.

**Columbia 22½ Volt. Bias
Battery
No. 4768**

This battery can be used as a "C" battery, or as a "B" battery in portable sets. It is especially designed for Bias work in conjunction with power valves UX-120, UX-171, and others. Provided with four screw terminals, giving negative voltage of 4½, 18½, and 23½. Of horizontal dimensions, it measures 4½-10 inches long by 2½-16 inches wide and 2½ inches high. Weight, 1lb. 6oz.

PRICE 12/- each

The Trade Now GETS What It Always— WANTED !

Harringtons New Premises. This modern building, which is conveniently situated at 213 Clarence Street, Sydney, comprises six floors, and is to be used exclusively to administer the wholesale business.

Up to the present time wholesale buyers of Radio supplies have had to complete their stocks by going from one warehouse to another.

But now Harringtons Ltd. have specially equipped a modern six storey warehouse at 213 Clarence Street. Here you can obtain absolutely **EVERYTHING** in Radio.

Have your whole order attended to by the one house. You will save money because of lesser freight charges and Harringtons liberal discounts. You will save worry by making one house responsible for the immediate despatch of your order. You will have the convenience of running only one account.

WIRELESS WEEKLY

VOL. II. No. 2.

FRIDAY, 21st OCTOBER, 1927.

Sectional Broadcasting.

THE political fight in New South Wales could not be complete without radio. Broadcasting was brought to the aid of the parties. One station broadcasted a speech from each of the leaders, and left it at that, but two other class B stations gave their listeners quite a surfeit of political addresses.

That arrangement of things was quite satisfactory. The class A station gave only one speech from each party leader, and thus not only did not over do it, but also gave each party an equal chance to get its views on the air. The class B stations, on the other hand, are not under the same obligation to listeners generally. No revenue from listeners' licence fees is paid to that class of station, and, consequently, the general body of listeners have no real complaint.

If we must have programmes for a section or sections of the general public, then the station to provide the programme should not be a class A station. The second class of stations apparently was legislated for so as to enable that kind of publicity, propaganda or advertisement to be given. The policy of a class A station, so it appears to the writer, should be to provide a comprehensive service of general utility. No broadcaster can hope to please everybody, but a reasonable attempt can be made, as is being made now by stations like 3LO, Melbourne.

In this connection, it is interesting to note the American idea of broadcasting service, as set out by the National Broadcasting Company. In a recent announcement the freedom of broadcasting was defined as follows:—

(1) Public interest must determine the availability of every feature put on the air by the National Broadcasting Company. This must be reflected in the quality of the sponsored programmes in the character of the speakers, and in the subject of their remarks.

(2) No political, racial, or religious lines must be drawn in allotting the facilities of the National Broadcasting Company.

(3) In order to maintain broadcasting upon the highest possible plane, and to protect the interests of listeners, the National Broadcasting Company must retain the right at all times to select the programme features broadcast by its originating stations.

(4) While maintaining the principle of free speech by radio, the duty devolves upon the National Broadcasting Company of obeying the laws of the United States.

The conditions of control and financing in the United States are, of course, different from ours, but the principle quoted above is of special interest.

Catching Up with the Wireless World.

By R. E. CORDER.

"IS YOUR STATION WORKING?" is the familiar question to the switchboard operator of any large station, and on being told that the station is on the air, the reply comes, "Oh, it must be my set then; thanks!"

THE LATEST MEMBER of the 72L Birthday League is Mr. J. R. Worsley, of Margate, Tasmania, who qualified by maintaining the Mothercraft Home for a period of half-an-hour on his 80th birthday—Wednesday, October 12th, 1927.

AT THE KING'S HALL, Hunter Street, on Wednesday, November 2, at 8 p.m., two motion pictures on wireless, accompanied by a lecture, will be given by the Listeners' League of New South Wales.

The first of the two films will trace the development of communication from the fire blanket signalling of the American Indian to the intricacies of modern radio, and the latter half will show the hidden points of a radio set in a simple manner. In the second film to be presented, will be shown the construction of a modern dry cell radio battery in all its phases.

There will be a small charge made for admission.

THE NIGHT OF SATURDAY, THE 1st October, marked the first severe thunderstorm of the season in Brisbane.

Listeners who were tuned in to 4QG on this night would perhaps wonder at the station closing down so suddenly and without intimation. This action was taken to ensure the safety of the very delicate, and also costly part of the apparatus, from any damage which may have been occasioned by the discharge of static electricity (which accumulates in the aerial during such severe storms), through the transmitting apparatus to earth.

With the coming of the summer months, many repetitions of Saturday night's conditions may be expected.

TIT FOR TAT.

The amateurs have one thing on us—"listeners-in," they can talk back to the fellow to whom they are listening. Oh, well—it's just as well—just as well!

SAY IT WITH—

New Suburbanite: "Two packages of flower seeds."

Clerk: "Anything else, madam?"

New Suburbanite: "Perhaps you better give me a couple of radio bulbs; George always raves about them."

* * * * *

POUNDS OR AMPS?

Radio Fan: "What is the charge for this battery?"

Battery Expert: "One and a half volts."

Radio Fan: "How much is that in Australian money?"

ODE TO 3LO.

The following Ode on 3LO's Third Birthday was read by the Announcer, Mr. Dudley, on October 13th, 1927, at 8.45 p.m., and will be read with interest by all those to whom the larger outlook has an appeal:

Shoot round the world, thrice happy babe,
Strangling the serpents of mischance,
And with serial astrolabe
Lead on the stars in joyous dance.
Three times have now the rolling years
Confirmed thee on thy spacious throne,
The music of the jocund spheres,
Is mingled daily with thine own.
And which is human, which divine,
The earthier and the heavenly parts,
Have crossed alike the ethereal line
That once divided human hearts.
There's none so poor nor distant now
In outer darkness needs to grope,
Thrice happy 3LO, for thou
Canst make the whole wide world
thy scope.
Shoot round the world, thou happy voice,
For thus Australia shall advance,
And through the station of her choice
Shall pipe while all the nations dance.

E.P.

THERE are 4,403 free wireless licences granted to blind persons in Great Britain. Apart from this number a total of 2,234,985 broadcast receiving licences were issued in Great Britain up to June 30 last.

UNCLE RADIO AND KING ELECTRON (well known as bedtime story tellers at 5CL) are travelling through South Australia visiting country schools. During their trip they are making notes on the possibilities of broadcasting and television for educational purposes.

A LICENCE has been issued to a company known as the British East African Broadcasting Company for the purpose of wireless broadcasting in Kenya and the erection of a short wave station at Nairobi. The company is also using the Empiradio service for a direct commercial telegraphic service to London.

A WET EARTH.—It has to be done. One must have an efficient earth. So two bottles of perfectly good beer were poured into the ground on the top of a sun-baked hill on a scorching day.

It happened this way.

In order to establish communication between the starting and finishing points in the Hill Climb, a sub-event in the recent R.A.C.Q. Reliability Contest, and to enable a special electric timing arrangement to function, a good earth connection was necessary.

A piece of pipe was driven into the ground, but this did not prove satisfactory, as the ground was so dry. The 4QG representative who travelled with the party asked for some water to pour on the ground, but as none was forthcoming, he suggested pouring some of the refreshments down the pipe.

On the sunbaked hill, under a clear sky and amidst clouds of dust, it was hard to do it, but after two bottles of beer had been ceremoniously poured on the surface of the earth, the telephone and electric control worked perfectly.

A Great New Short Wave Field Opening in U.S.A.

(By Carl H. Butman)

By Courtesy of Burgess Battery Co.

ENTERPRISING amateur receiving-set builders and some few who have purchased short-wave sets, are finding new fields for their other explorations. There is a lot of entertainment on the air that many of us have been missing. It is very much worth while, for the stations which transmit programmes on the short waves, below the broadcast band, are unaffected by other programmes not being interfered with as are the regular broadcasting stations in the congested band lying between 200 and 545 metres or 550 and 1600 kilocycles.

There are at least 36 broadcasting stations offering short-wave programmes to-day under experimental licences. Some of them are well-known like WJZ, which uses its regularly instead of 2XAE, its experimental designation, also WGY, which operates under eight experimental calls commencing with the figure 2 indicative of the second radio district; WBZ, the Springfield, Mass., Station, using the experimenting call of which is 1XAE and KDKA, which has two short-wave transmitters 8XK and 8XP.

Most of these stations are offering the short-wave fans the same programmes put out on their regular broadcast transmitters, a simultaneous broadcast being effected for relay purposes, but others are producing special programmes for listeners here and abroad. The chief reason for such transmission is to experiment with new broadcast possibilities and to increase the range of the stations, it having been found that such transmission travels to far greater distances, yet is received quite as clearly and with less interference than the programmes on the regular broadcast channels. If listeners can pick up our programmes in England, France, Belgium, Germany, Africa, South America and even New Zealand, and Australia, it seems that most of us are neglecting our opportunities, when all that is required is a new receiver. Commercial built short-wave sets covering 10 to 200 metres are available in modern radio supply stores and so also are the parts for assembling receivers to cover the short waves which carry radiophone entertainment.

Unfortunately the specific channels used by each station for these broad-

cast programmes are not known to the Department of Commerce, for they are licensed to carry on radiophone experiments on one of several channels running from 26.3 to 109 metres. Most of the well-known stations are understood to be operating on the five relay broadcast bands as follows: 26.3 to 27.3 metres; 30 to 33.1 metres; 52.6 to 54.5 metres; 60 to 66.3 metres and 105 to 109 metres.

Thirty-six broadcasting stations known to be offering programmes on the short-waves or high-frequencies are listed below. A new official list is now being prepared by the Department of Commerce Radio Section for early publication. These stations are listed as experimental stations, used chiefly for relay broadcasting on channels between 26.3 and 109 metres or 11,400 and 2750 keys. They are designated by the initial letters X and located to districts by the figure which precedes the letters.

Nine stations have portable transmitters which are used for picking up programmes outside the stations and broadcasting for rebroadcasting on the main transmitters on their normal channels.

KDKA, 8XK and 8XP, Westinghouse Electric and Mfg. Co., Pittsburgh, Pa.

WGY, (eight calls), 2XAC, D, E, F, G, H, K and W, General Elec. Co., Schenectady, New York.

WBZ, 1XAE, Westinghouse Co., Springfield, Mass.

WHAM, 8XAC, Stromberg Carlson Tel. Mfg. Co., Rochester, N.Y.

WABC, 2XE, Atlantic Broadcasting Co., Richmond Hill, N.Y.

WEEL, 1XAG and 1XAF, Edison Electric Illuminating Co., Boston, Mass.

WJZ, Radio Corporation of America, Bound Brook, N.J.

WRAH, 1XY, Booth Radio Labs., Tilton, N.H.

WRNY, 2XAL, Experimenter Pub. Co., Cortland, N.J.

WOR, 2XAQ, Bamberger Co., Newark, N.J.

WRMU, 2XAO, Yacht "Mu 1," Grebe Co., of New York.

WAAM, 2XBA, WAAM Inc., Newark, N.J.

KJES, 6XAR, J. Brunton and Sons Co., San Francisco, Calif.

KFWB, 6XBR, Warner Bros., Motion Picture Studios Portable, Los Angeles, Calif.

KNX, 6XA, Los Angeles Express, Los Angeles, Calif.

KFSG, 6XBA, Air Fan Radio Corp., Los Angeles, Calif.

KHJ, 6XAU, Times-Mirror Co., Los Angeles, Calif.

KFWL, 6XAK, F. W. Morse, Chicago, Calif.

KFQZ, 6XAL, L. E. Taft, Hollywood, Calif., Portable.

KFVD, 6XBX, McWhinnie Elec. Co., Venice, Calif.

KNRC, 6XAF, Clarence B. Jansen, Portable.

KGGM, 6XAI, Los Angeles Radio Club, Los Angeles, Calif.

KFQU, 6XBH, W. E. Riker, Holy City, Calif., Portable.

WRAH, 1XAA, Stanley N. Read, Portable, Providence, R.I.

KFBC, 6XBE, W. K. Arbill, San Diego, Calif.

KRLO, 6XAN, Freeman Lan, Los Angeles, Calif.

KJR, 7XC, 7XO, Northwest Radio Service, Seattle, Wash., Portable.

KWJJ, 7XAO, Wilbur Jernan, Inc., Portland, Oregon.

KFPY, 7XAB, Symons Investment Co., Spokane, Wash., Portable.

WEAO, 2XJ, Ohio State Univ., Columbus, Ohio,

WLW, 8XAL, Crosley Radio Corp., Harrison, Ohio.

WHK, 8XF, The Radio Air Services Corp., Cleveland, Ohio, Portable.

WNAL, 8XAB, R. J. Bowell, Omaha, Nebraska, Portable.

KOIL, 8XU, Mora Motor Oil Co., Council Bluffs, Iowa.

3XK is the experimental call of the C. Francis Jenkins radio laboratories at Washington, D.C.

3XN is the Bell Telephone Laboratory call at Whippoor, N.J.

(We would appreciate advice from anyone hearing any of these stations.—Editor.)

The Safety Valve

Readers are urged to express their opinion on matters pertaining to broadcasting. If you have some grievance, if you have some constructive criticism to offer, here is your chance for expression—your safety valve. The editor assumes no responsibility for statements made by readers, and published on this page, or opinions of correspondents do not represent our editorial policies or beliefs. Anonymous letters are not considered.

HIGH CHARGES.

Dear Sir.—I have read "Dealers" letter ("W.W." 14/10/27) expressing better wireless conditions, and I think more correspondence on this subject is needed, and needed badly, for, I think, it rests with every person interested in wireless to assist in this direction. It is ridiculous to think that in such a progressive country as this that such high fees are charged for wireless dealing and listening-in, for wireless is an established necessity, as our telegraph and postal system. Going back in history we find that high charges were made for delivery of letters, and people found various means of avoiding payment, and still get the desired message, much the same as the wireless "pirates" of the present day. When the penny postage was introduced the result was an instant success, and history has proved itself in other directions. To encourage wireless is to eliminate or reduce the high charges for wireless dealing and listening-in, for the loss sustained in one direction would be a gain in another, as thousands more would be interested in wireless, and pirates would be fewer.

INTERESTED READER.
Pymont.

RELIABLE.

Dear Sir.—Some time ago, if you remember, you sent me a "Wireless Weekly" dated October 29, 1926, with the circuit of the Old Reliable in to build in answer to a letter I sent you. With the aid of the above mentioned circuit and a little alteration I built the set and am able to tune in the following stations, 4QG, 2FC, 2BI, 2GB, 2UE, 3LO, 3AB, 5CL, 5DN, 1YA, 2YA, 3YA, 7ZL, JOAK, the two latter phones only. Is this remarkable for a three valve receiver, or is it just an ordinary performance? There is a station I can faintly hear on the phones, but cannot get his call number; the time I get this station is between 1.30 a.m. and 2 a.m. Could you tell me what the station is, my dial reading 35?

Maryborough. E. A. BOULTER.

U.S.S.R. SOLVED.

Dear Sir.—The mysterious letters announced in English from Russian station, and heard by Mr. H. Kelsick, of Cessnock ("W.W." 14/10/27) can be explained in a few words.

U.S.S.R. stands for "United Socialist Soviet Republics," the official designation of modern Russia. Many people are under the impression that the letters represent United States of Soviet Russia, but this is not the case.

Should Mr. Kelsick, or any other amateur, listen-in to PCJJ, Holland, on Wednesday or Friday mornings between 5 and 7 o'clock (local time), will they kindly inform me if the international language, Esperanto, is used from that station. I desire the information for record purposes, and would appreciate any advice.

Yours, etc.,
F. T. SIMON.
Randwick.

SHORT WAVE WORK.

Dear Sir.—I have built the short wave receiver that was published in the "Wireless Weekly" some time ago, and have been getting good results from it. I can get many long distance stations on it, including PCJJ (Holland) at good strength, and also a station in Essex, England. The latter was not too clear, and I could not quite catch what he was saying, only Hello, Hello, station, Essex 2GU. New Zealand came in at good strength, as did 5DB Adelaide, and 7KY Tasmania. The two latter stations I could not quite hear the call signs, but it sounded like 5DB and 7KY.

I am using one detector and two audio valves. The coils are 22 q. enamelled wire on a 21in. former. Aeriel Coil 3. Primary 4 or 5. Secondary 6 turns. These coils give me the best results. I am using .0005 Var. condenser, var. dial, Philips A409 detector and one audio and B406 last audio valves.

2YU could be heard plainly all over the house, and it was a treat to hear it, as the static was fairly bad on the ordinary wave band. Am using Ampion speaker, type AR114.

For the ordinary wave band I use 4s Pra, and a 65 turn see coils and cat splined reception. I take 3 turn coil off end and switch the aerial on to the .00025 Var. condenser, then on to the Pri. coil. This way I get better reception than on the three coils. Tuning it with the .0005 condenser.

On the speaker, Sydney, Melbourne and Brisbane stations can be heard clearly 300 yards off, which, I think, is very good.

Yours, etc.,
A. T. WEBB, Jnr.
North Lismore.

MORSE AGAIN.

Dear Sir.—In reply to I. Samassa ("W.W." 7/10/27), re the Morse interference complained of by Mr. S. P. Lloyd. I live about a quarter of a mile from an amateur station in Bellevue Hill, and for this last three or four weeks I have been annoyed by his Morse signals. He seems to make a practice of starting his code just when the A class stations start their evening sessions. Two weeks ago it was so bad that it was almost impossible to get either 2BI or 2FC clearly. His code was on top, jamming it all; in fact, I had to give it up, trying to listen in. I have a friend living close by with a five valve set, and only last Saturday he complained of the same thing.

I might mention that this station was complained about some time ago.

Yours, etc.,
Double Bay. A.E.

MYSTERY STATION.

Dear Sir.—Might I ask through your valuable paper if any reader can tell me what station I picked up to-night (Sunday, October 9).

The wave length is somewhere about 40 metres and announcements in a foreign language. The items included a long speech (also foreign), male and female vocal items, also stringed instruments, all of which came in at full loud speaker strength with three valves (clearer and lower than 2AQ).

Yours, etc.,
Queensland. E. N. PREAVES.

Joe Aronson's famous symphonists at 3LO busy working out effects for new dance numbers.

Running Description of Cup by 3LO and 2FC

RACING IN THE AIR.

THE Cup—a signal for enjoyment for so many thousands (including bookmakers)—is a season of woe and lamentation to broadcasting companies. There is so much to see to, so many chances of slipping, so many extra thousands listening in and judging the pleasures of a wireless set on the way the descriptions of the classic races come over the air, that a station sees the end of a Spring Meeting with relief. This year, 2FC is going to re-broadcast 3LO's description of the Melbourne Cup, with some more of the most important races. This re-broadcasting by an inter-State station is an excellent thing. Some few weeks ago, I urged greater co-operation in this respect. It is pleasant to see that it is being done, and in a reciprocal way. Three nights recently 2FC picked up the band of the 3LO studio, and Sydney people danced to music over 500 air miles distant.

Co-operation along these lines will save a good deal of money, for many ways of utilising items in common will suggest themselves as time goes on. Broadcasting need not be made a cut-throat business.

RADIO PLAYS.

NOW that the competition for radio plays has been decided, there should be at least a score of clever, interesting plays available for transmission in the near future.

The competition was widely taken up and among the three prize-winners, and those whose plays were very highly commended were a New South Wales woman, Tasmanian and West Australians, proving how widespread was the interest in the contest.

The prizes have been awarded to the following:

First: Mrs. May Murphy, David-street, Northcote (Victoria).

Second: Miss Helen Armstrong, Clear Hills, Dunning (N.S.W.).

Third: Mr. Jack Curlett, Railway Avenue, East Caulfield (Victoria).

Over a dozen received warm commendation from the judges, a proof that the winning trio should be worth listening to. It will be interesting to hear how far the winners have developed a new technique, or if they have followed the old stage conventions.

ARMISTICE DAY FIXTURES.

WE are approaching one of the most solemn ceremonials of the year. No day is quite like Armistice Day, not even Anzac Day itself, for the greater includes the less, and the Armistice Day exercises are Empire-wide in their significance. Broadcasting has come to widen the scope of the ceremonies, so that hundreds of thousands may take part in them by listening to the metropolitan ceremonies. This year, in addition to the usual services on Parliament House steps, Melbourne, is to have two ceremonials of great importance. One of these is the laying of the foundation stone of the great projected War Memorial in the Domain. This great building destined to become our most significant temple has been long in materialising. The stones to be laid on Armistice Day will signalise its commencement.

The other service is that to mark the laying of the Foundation Stone of the War Memorial of the Melbourne Grammar School. This will be done in the afternoon, after the bigger event.

What is Trickle Charging?

By C. M. WYNNE, Director of Exports, Fansteel Products Inc.

This method of charging storage batteries is not only confined to radio—it has been adopted in other fields.

TRICKLE charging means the system in which a battery is kept on continuous (trickle) charge from a charger that is connected in turn to an AC power line. To put it another way, in trickle charging, power is supplied to the apparatus to be operated through a battery from an alternating current source. The charger is permanently connected to this AC line on the one hand and to a storage battery on the other. The charger rectifies the alternating current into direct current and charges the battery at a low rate. The rectified direct current is stored in a battery and is used to operate the apparatus. Since the charger is always turned on, it automatically replaces any current used by the battery in operation and keeps the battery always at full charge. Trickle charging, then, simply takes alternating current, converts it into direct current by means of the charger, and stores and holds in reserve this direct current by means of the battery.

As a source of economy and unfailing, uniform power, trickle charging "A" storage batteries for radio reception has become almost universal practice, wherever electric alternating current is available.

Trickle charging undoubtedly lengthens the life of storage batteries compared with the heavy duty charging so prevalent in the past. However, for an occasional emergency that may arise, or for the charging of car batteries, trickle chargers are now so constructed that by detaching and reattaching one wire they may be converted into heavy duty chargers by the novice.

The many types of chargers on the market give more or less satisfaction, therefore the deciding factor in the selection of a charger should be its cost of operation and upkeep. The majority of chargers utilize cartridges or tubes as the rectifying element; these elements are guaranteed for approximately 1,000 hours, when they have to be replaced, making them nearly as expensive as the old style dry cell batteries. There are chargers on the market, however, that utilize a mineral element as a rectifier, such as "tantalum." As this mineral is practically indestructible, these chargers last indefinitely and the cost of upkeep is consequently very low.

The man who buys his first set of three to five tubes also buys a storage

battery, and to him the cost of battery charging is of paramount interest, but it is not long before he exchanges his old set for one of more power and then enters the question of eliminators or power supply units that combine within themselves an "A" or an "A" and "B" supply without extra chargers.

Again comes the question of permanency and operating costs. The "A" eliminator, a self-contained unit, eliminating "A" battery charger, and wet or dry "B" batteries is unquestionably the most economical for any receiver of five or more tubes.

However, the mineral rectifier is given preference for its economy, absence of all noise or hum, its uniform operation, and lasting qualities; there are not tubes or cartridges to replace. The addition of water four or five times a year is all that is required.

Radio set manufacturers have gradually reduced the number of controls on receivers from four and three to the present one and two. As this re-

duction was made in response to public demand it seems inconsistent for eliminator manufacturers to place one or two controls on their units.

While it is true that the many different sets require filament current ranging from 45 to 250 volt, the desirable eliminator is that which automatically supplies the exact voltage required without regulation. It is folly to take controls off the receiver and place them on the eliminator; nothing is gained by such a move.

Most people know of trickle charging only in radio, the demand for which has increased to an extent that is little short of phenomenal. Over 200,000 trickle chargers of one make alone were sold for radio operation the first season they were put on the market. Yet trickle charging is rapidly becoming standard in many industries. The same advantages of economy and reliability that has made trickle charging such a success in radio makes it necessary in other fields.

Loop Aerial Will Eliminate Interference

IN some locations it is almost impossible to separate stations with a sufficient degree of selectivity so that the programme from one may be enjoyed without having another one in the background. As conditions have changed considerably within the last year, many sets which functioned perfectly a few years ago now lack the selectivity to separate stations working on wave lengths of only a few meters difference.

There are several things we can do to the old set to correct this condition. If only one station is causing interference the addition of a low loss wave trap will minimise its broadness. If a number of stations overlap, then the use of a combination of wave traps or a loop will be necessary. A combination of wave traps would require the use of a coil windings are separated then the loop connection should be made to the other end of the secondary.

By throwing the switch to the proper side the antenna or loop may be used. The switch may be mounted within the cabinet or on the back.

Loops Require Many Valves.

Low powered sets of only a few tubes will not work well with a loop, and due to their insensitivity will require an antenna for best results. Multistage sets of three tuned or untuned stages will work well on a loop. Of course, we will not get the pickup of an antenna, but we will certainly get greater selectivity. By using the new 300A type detector tube some of the decreased pickup of the loop will be compensated for by the added efficiency of this sensitive tube. Due to its directional properties, the loop will aid in reducing interference, not only from overlapping stations, but also from static, much of which originates in the south and will be at a minimum when the loop is pointed east and west.

If the set still tunes broad after the loop is connected, it is probably due to induction between it and the antenna, and the antenna should then be grounded. When the antenna is used for receiving, it should be in its normal position, that is, connected to the set instead of grounded.

It's All in the Air

THE MELBOURNE CUP and other events will be described by "Newbury" and broadcast by 3LO, Melbourne, on Tuesday, November 1st.

THREE DAYS Ballarat Festa broadcasting by 3LO, Melbourne; Grand concert, November 9th. Grand ball, November 10th. Annual show, November 10th. Community singing, November 11th.

"**THE TWO YACABON'ES**," David Burt and Carlton Fay are back in Sydney, and 2FC listeners will welcome their old favorites. They will add to the enjoyment of the programme on Saturday night, 29th October.

"**CASTLES IN THE AIR**": How many did Rowena Ronald build, we wonder, and contrary to the usual fate of these structures, how well hers have materialised. 2FC will take excerpts from this attractive musical comedy on Friday evening, 28th October.

CHRISTIAN HELLEMANN has been appointed organist at Christ Church, St. Laurence. Mr. Hellermann is a regular 2FC artist, and his recitals will be broadcast by that station. The first of the new series will be held between 3 and 4 on the afternoon of Thursday, 27th October.

THE PRESIDENT, National Rose Society, Mr. T. A. Stewart, will broadcast a talk on roses from the studio of 3LO, Melbourne, and on Wednesday, October 26th, at 3 p.m. The opening by the Lord Mayor, Sir Stephen Morell, speech of the Annual Rose Show will be broadcast from the Masonic Hall.

"**AND THE MORE WE ARE TOGETHER . . .**": What does that remind you of? Why "Radio Revellers," of course: it's their anthem. The Chief Reveller, Laurence Halbert, is busy rehearsing his party for their appearance at 2FC Studio on the evening of Saturday, 29th October. All the old hands will be on deck—Shirley Cooke, Charles Lawrence, Harrison White, and Wally Baynes, and to give an extra zip to the evening's entertainment Rus Garling will give a running description of some of the events at the Speedway Royal.

ON THURSDAY, October 27th, at 3 p.m., his Excellency the Governor-General, Lord Stonehaven, will open the new Presbyterian Girls' College at Geelong. The speeches will be broadcast by 3LO, Melbourne.

LINDLEY EVANS is back again, after conducting examinations at Wollongong. He assured us this is the very last of his wanderings for some time, and we are very glad, for there is no more popular artist at 2FC. He will be in the Studio on 30th October.

THE SPEECHES at the reception to his Excellency, the Governor, Lord Somers, at Shepparton, at 11 a.m. on Wednesday, 26th October, to be followed by the opening by his Excellency of the Shepparton Show, will be broadcast by 3LO.

THE RIGHT HONORABLE L. C. AMERY, Secretary of State for the Dominions, who is visiting Australia, will broadcast from the studio of 3LO on Sunday evening, October 30, and on Monday evening October 31, the speeches at the State dinner at Parliament House will be broadcast.

"**HIS LITTLE BAT AND BALL**": How to wield the willow, and the noble art of leather hunting—this valuable instruction will be offered to 2FC listeners, on Friday (28th) afternoon, when a running description of the big match to be held at the Sydney Cricket Ground—N.S.W. v. New Zealand—will be given.

BEETHOVEN'S DELIGHTFUL opera "Fidelio" will be produced by the Melba Conservatorium Opera Society, Bartleman's Male Choir, and the Melbourne Symphony Orchestra, under the direction of Mr. Fritz Hart, and broadcast by 3LO, Melbourne, on Wednesday evening, October 26th.

RENE BIRKETT will give a recital in the King's Hall on Wednesday, 26th October. This clever young artist is from the studio of S. Vort Jansson, noted violinist, and proud possessor of some of the finest old fiddles in the world. Listeners to 2FC will have an opportunity of hearing selected items from the recital.

Coming Features in the Broadcasting Programs

DESCRIPTIONS of the events at the Associated Public Schools combined sports by Mr. Wallace Shand will be broadcast by 3LO, Melbourne, from the Melbourne Cricket Ground, on Friday, October 28th.

ON THURSDAY, OCTOBER 27th, at 7.45 p.m., a talk by Marie Burke will be broadcast from her dressing-room at the Theatre Royal, where "The Whole Town's Talking" is now being produced by J. C. Williamson, Ltd.

THE FOUNDATION STONE of the Memorial Chapel, Xavier College, Kew, will be laid by His Grace The Most Reverend Dr. Mannix, on Sunday, October 30th, at 3 p.m., and the speeches at the ceremony will be broadcast by 3LO, Melbourne.

Senya Sharokov "The White Army Tenor of the Don Cossacks" who is singing at the Studio of 3LO.

"MUSIC WEEK," shortly to be held in Brisbane, will, no doubt, have a far-reaching and educative effect on the minds of the broadcast listening public, as well as those who attend the recitals, as arrangements have been made for the broadcasting by 4QG of some part each evening of the big musical rally.

ST. LUKE'S HOSPITAL, DARLINGHURST: The opening of St. Luke's Hospital on Friday afternoon last, 21st inst., by His Honor Justice Street, Chief Justice of N.S.W., was broadcast by 2FC. Mr. A. M. Hemmings, Chairman of the Board of Directors, opened the proceedings and presented the key to Justice Street. His Honor then addressed the large gathering, and declared the Hospital open. The dedication service was conducted by the Right Reverend Gerard Addington D'Arcy Irvine, Bishop Coadjutor of N.S.W.

"MIKE-ROPHONE": We have been asked to publish to-day what is perhaps the most unusual wedding announcement ever encountered. We have not received the information on unimpeachable authority, and frankly we are inclined to suspect one of two jealous "Mikes" at 2FC who are in league against "Old Bill." In short, we are asked to advise our readers that "The Wedding of Mike" is to be solemnised in the 2FU Studio to-night, 28th October. We feel we want to offer him our congratulations and good wishes, but we cannot wholly reconcile ourselves to this drastic change. So readers, listen to 2FC on "Mike's" wedding night, and let us know if he really did get married, will you?

FRESH FROM THEIR triumphs at South Street Competitions, Ballarat, comes the Malvern Symphony Orchestra, to Studio 3LO Melbourne, and listeners will be glad to hear that this clever body of musicians not only carried all before them, but they earned a special word or two of praise from the adjudicator, Mr. Fritz Hart. When it is realised that the standard set by South Street for all classes of entries, orchestral items in particular, is very high, the success of the Malvern Symphony Orchestra is all the more praiseworthy. A feature of their programme from Studio 3LO Melbourne, will be the test pieces which carried them on to honour and glory at Ballarat, also some special selections from little known works, that have not been broadcast previously.

THE NUMBER of licensed wireless listeners in Germany increased during March by 51,664 to 1,635,728. This figure is, of course, still considerably behind that of Great Britain.

THE LIGHT FANTASTIC: Merry devotees of the most graceful and diverting exercise in the world have been well pleased with the dance bands which have been heard from 2FC Studios lately. A different band has appeared each night, under the direction of such capable men as Cyril Coy, Hal Vane, Ced Morrison, Ken Stubbs and F. Perry. To this attractive list will be added the Ambassadors Orchestra, which gave its first performance through 2FC on Saturday last, 22nd October. In future this orchestra will be heard three nights each week—Tuesday, Thursday and Saturday.

AS MAY BE READILY imagined, the mail bag of Mr. Maurice Dudley, the popular Announcer from Studio 3LO Melbourne, is always very full, but he confesses to a particular weakness for extreme youth and old age, and his most welcome correspondents are the kiddies that write to him telling him about their pets, and the old people who write, especially after an old time night has been staged from the Studio, lamenting the departure of the "dear old days." One very youthful admirer wrote, "I was going to send you some poppies, but I fell in the nettles as I was trying to pick them, but I'll send you a piece of my birthday cake instead!"

THE SPECIAL attention of listeners is drawn to the fact that on October 30th, at 8.0 p.m., an exceedingly interesting concert will be broadcast from the Capitol Theatre by Studio 3LO Melbourne. The concert, which is to aid the Lord Mayor's Fund, will be one of the finest ever presented in Melbourne, and, on the orchestral side, The Melbourne Symphony Orchestra, Capitol Theatre Orchestra, and Collingwood Citizens' Band, will combine in such well known Overtures as "1812" and "William Tell."

MELBOURNE CUP: Nirvana of the aristocrats of the turf, takes on, if possible, added interest this year, by virtue of the fact that not only will Australians on their native soil hear the description of the famous race, but those far from the land, also, who will benefit by the dual transmission which 2FC have arranged. The broadcast will be carried out on a low wave length, as well as the usual 442 metres. Overseas listeners will, therefore, have an equal sporting chance of favorable reception.

SPECIAL STAFF FOR COUNTRY. A special staff is employed by 3LO to carry out these country broadcasts. Recently at Geelong, no less than three different events had to be put on the air during one afternoon. This necessitated the use of 3 sets of apparatus, and required the attendance of three Engineers, and four expert describers. Often it happens that relays are broadcast on several consecutive days from the same provincial city.

ARTHUR APPLEYEY BENEFIT CONCERT: It is to be held at the Conservatorium Hall on the evening of Monday, 31st October. Items from this Testimonial concert to be tendered to Mr. Appleby, well known Sydney teacher of singing, who is unfortunately incapacitated for further professional work, will be broadcast by Station 2FC, to whom exclusive broadcasting rights have been given.

EMPIRE BROADCAST: Cable advices from London state that one of the outstanding features of the 2FC Empire broadcast programme, was the clarity with which the message delivered to Australian artists in England by Mr. Alfred O'Shea, was received in the British Isles. Mr. O'Shea sent short messages of greeting to each of the following:—Peter Dawson, Harold Williams, Roy Arne new, Fred Collier, Florence Austral, Essie Ackland, Reginald Morphy, Malcolm McEachern, Harold Stevens, Arthur Benjamin, Brown Mummary, Ross Alba, Ethel Osborne, John Amadio, Elsy Treweek. The same cable stated that Mr. O'Shea's subsequent song—"Aria from La Boheme"—was perfectly received on the other side.

The following is an extract from a letter received from J. C. Williams, Kottayam, Travancore, S. India, in connection with the first Empire programme broadcast by 2FC on the 4th and 5th September:

"I must congratulate you on your Perth and Sydney stations' Empire broadcast on 325 metres on the 3rd and 4th of this month. I received both these stations and was especially pleased with 2FC's announcer. He has, in my opinion, a most wonderful voice, and I dubbed him on his announcement on Sunday, the 4th September, as "the man with a silver voice." Messrs. Farmer and Co. are also to be congratulated as the prime movers. The striking of the Sydney Town Clock of 4 a.m. was equally as loud and clear as that of the Ceylon Colombo Town Clock. Regarding 2FC, I shall be ever so grateful if you will please drop me a post-card on receipt of this letter informing me of the days and time (your Sydney time) of 2FC's short wave transmission."

Do You Observe Battery Etiquette?

In connection with the forming of wood insulated batteries, in particular, constant potential charging methods are impractical. This method of charging is also impractical for the general run of radio batteries that are being returned by the customers for recharge.

Radio batteries are discharged at low rates over long periods of time and, as a result, gradually accumulate sulphate, deep in the pores of the plates. The customer very seldom charges his battery completely, with the result that this deep seated sulphate is accumulated to the point where eventually just the bare surface of the plate is in action.

A battery in this condition may be placed on the line for a short time, as the customer is in the habit of doing, and the voltage will rise to two volts a cell, or thereabouts, which the customer considers sufficient and the battery is then taken off charge and placed in service, with the result that almost immediately there is a noticeable drop in voltage and in a day or two at the most the battery is inoperative.

Charge at Low Rates.

This battery requires a reforming charge, which must be given at a low rate over a long period of time. It is evident, then, that if a battery in this condition should be placed on the constant potential system, very serious damage would immediately result. The plates, in fact, might be totally ruined in a very few hours.

In place of constant potential, some series line such as a Tungar or Colco set should be available for charging. This charging should, of course, be done at not more than the rates indicated on the instruction card accompanying the battery.

The customer should be carefully sold on the idea that the long period of time necessary on the line is made necessary because of the periodical undercharging that has been given to the battery.

The charging rate of any particular battery is fixed, but it is capable of resisting the pressure of voltage delivered by the generator or other charger.

This is, of course, dependent on the degree to which the battery is discharged, its age, internal condition and its temperature when put on charge.

Then the voltage of the generator must be regulated to take care of any battery in an operative condition. An inoperative battery would show up immediately by taking an excessive amount of current on con-

A few simple rules that will help to prolong battery life

stant potential and should be removed from this and placed on the series lines at once. This is assuming, of course, that all batteries are immediately placed on constant potential when received by the service station.

Much better practice would be to make it a rule that all radio batteries should go immediately to the series line and under no circumstances should be placed on the constant potential.

The reason for this is that, as outlined above, the average radio battery has deep seated sulphate, which necessitates a very slow rate of charge to prevent serious damage.

This slow charging at a low rate cannot be accomplished on constant potential and for this reason, if for no other, the battery should go directly to the series lines.

A radio battery that has been out in service must be treated as though it were an unfilled wood battery being given the initial charge.

Radio batteries should be placed on charge at the specified normal rate or less and this rate continued until the voltage and gravity show no perceptible rise over two periods of five hours each. Do not depend on memory—write down the readings at each period.

Temperature Important.

Naturally, during this period, the temperature should be frequently checked and the charge interrupted if at any time the temperature should exceed 110 degrees Fahrenheit.

Further precaution should be taken with any battery in which the gravity rises much above 1.300. Such a battery should immediately be taken off the line and emptied of all solution. It should then be refilled with a very dilute electrolyte in the value of about 1.150 to 1.200 by 1.250 specific gravity.

The charge should then be resumed and continued until, as noted above, the gravity and voltage stop rising over two five hour periods.

The battery should again be emptied of all solution and refilled with fresh electrolyte of approximate 1.2290 specific gravity.

This will give a uniform reading throughout the battery. The excessive acid will have been removed from the plates and any impurities that may have been introduced into

the battery will also have been removed in the changing of electrolyte.

This practice is to be recommended where a customer has had a B battery that may have been charged frequently, but shows a tendency to drop in voltage very rapidly with very little drop in gravity.

A battery in this condition might best be dumped immediately and refilled with low gravity electrolyte and then treated as above outlined.

Should a battery be charged over a long period of time with a gravity much above 1.300, there is a strong probability that antimony will be deposited on the surface of the negative plate, with the result that self-discharge will be set up in the battery and its performance will be very unsatisfactory.

This again is a reason why the above outlined method is advisable when treating radio batteries.

Although all of these points deal particularly with B batteries, the practice should also be followed in the case of A batteries, where necessary.

A batteries, however, seldom get into quite so serious a condition as the B batteries, due to the fact that they are more frequently charged and are charged at higher rates. Then, too, they are worked harder and all in all, they keep in a much more active condition.

Batteries that have been filled with excessive gravities of electrolyte and batteries that have not had the proper forming will most certainly give unsatisfactory performance in the hands of the customer with the result that much dissatisfaction will be shown and considerable service will be necessary which otherwise a service station will not be called upon to render.

RUSSO AND BRADFORD: Having but recently returned from their tour of India and the Far East, Signor Ubaldo Russo and Miss Lynda Bradford are shortly to broadcast from Studio 3LO, where their operatic duets and solos are sure to be greatly enjoyed.

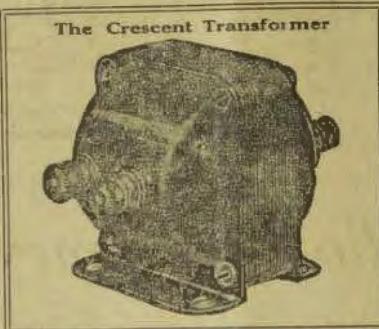

Both the Signor and Miss Bradford express themselves delighted at the reception they are getting from vaudeville patrons, and say they consider it a wonderful tribute to the Old Music, and the real appreciation of the average person for this type of melody, for they have altered their programme very little to that given during their tour of India—but have kept it to the same high standard.

Adding Audio Frequency Amplification to Your Present Receiver

A CONSIDERABLE number of readers have written us recently requesting information on how to add 1, 2, and 3 stages of audio frequency amplification to the existing set. There are many different means open to the radio constructor of today, and it is the object of this article to discuss these different means in their entirety.

The purpose of audio frequency amplification hardly need be discussed here, but for the benefit of the absolute beginner a brief note may be made. Over and over again have many people desired a little more volume from their sets, and to do this it is necessary to add audio frequency amplification, or as it is known in Great Britain, note magnification. This system increases the volume of signal strength after it is rectified by the detector and should not be confused with radio frequency amplification, which is used for the purpose of building up the strength of incoming energy before it is detected.

That there are certain sounds in existence which cannot be heard by the human ear is a known fact, and these sounds are known as being of a high frequency, so high that the human ear cannot respond to them. For the sake of this explanation, let it be understood that sound is generated by means of vibration. These sounds are conveyed through the atmosphere to the ear, by means of what are known as sound waves. They differ entirely in most respects from radio waves, their characteristics being altogether

dissimilar. It is not our wish to go into a deep technical discussion on this subject, but suffice it for the moment to say that any energy of a frequency above approx. 10,000 cycles per second cannot be heard by the human ear unless some form of step down or rectification takes place.

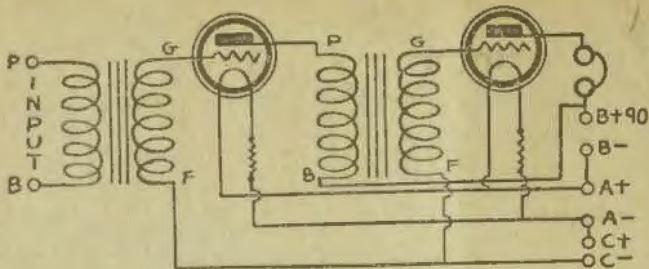

The purpose of the detector in any set is to rectify the radio or high frequency energy to such limits that the ear can respond to the vibrations by virtue of the headphones or the loud speaker. Now the average one valve receiver is not sufficiently strong enough to work a loud speaker, the exception being, of course, some form of reflex receiver where, although only one valve is used, the output of more than one valve is gained. This brings us to the point of realising that it requires generally more than one valve to produce loud speaker strength, so it is necessary that an additional valve or valves should be used. Now these valves must be added after the detector valve which renders signals audible to the human ear, hence the term audio frequency amplification.

There are 3 popular forms of this amplification, namely, transformer coupled, resistance coupled and impedance coupled. The first mentioned method is the most popular of all, and is, therefore, more common and better known to the average person than either of the other two methods.

Some people claim that transformer coupled audio frequency amplification, while it gives good volume loses

greatly in purity of signal strength; in fact, it causes a certain amount of distortion. This may or may not be true, but where it is found that distortion is present there is usually a reason for it. To-day now that there are such a number of special purpose valves available to the home constructor, distortion should be a thing of the past. The claims made for resistance couplings are known to most receivers of this method proclaim that there is nothing to equal it for purity.

Resistance coupling, or as it is frequently known, resistance-capacity coupling, is a method of connecting valves of a resistance amplifier in cascade by means of resistances. A high resistance of the same order as the internal impedance of the valve is connected between the positive terminal of the B battery, and the plate of each valve. The signal oscillations which have been amplified by any one valve flow through the plate resistance of that valve, and in consequence an oscillating potential is set up across the resistance. This potential is applied to the grid of the next valve in the series, through the medium of a grid condenser, which allows the oscillations to pass, but prevents the B battery voltage from reaching the grid. A grid leak is connected between the grid and the negative end of the filament in order that the grid shall not accumulate too large a negative charge, and render the valve inoperative. This gives equal amplification for all audio frequencies and is thus conducive to distortionless amplification.

Like most other things in radio, quite a lot depends on the quality of apparatus used. Not only does this apply to the resistances, but also does it apply to the transformers used. The manufacturers the world over are today producing a well constructed, high quality audio transformer, the use of which in the average receiver in conjunction with the correct valves, B and C battery voltages, insures good quality reception.

Now, just how many audio stages can be added, is a question which crops up in the minds of most people, sooner or later. In answer to this, let it be known that it is not wise to use more than two stages of transformer coupled amplification, as it will be found in practice that a third stage of this form produces howls and screams, rendering its function ineffectual. But not so with resistance amplification. Here it is always advisable to use three stages, in order that good volume is produced. On the average, three stages of resistance coupling yield much the same output as two stages of transformer coupling, the same applying to impedance coupling.

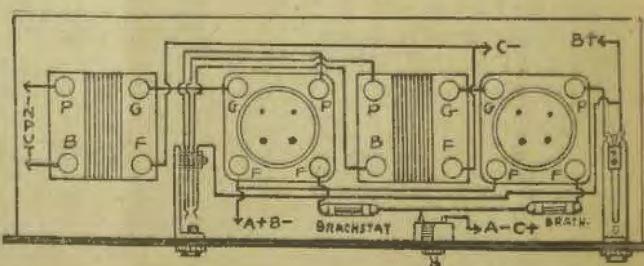

Now the choice of correct voltages and valves is of considerable importance, there are special valves to-day, for resistance amplification, and also for audio amplification, whether impedance or transformer coupled. Resistance coupled valves should be of the order of 20,000 to 35,000 ohms impedance, and it is necessary that a high plate voltage be used, anything from 120 to 200 volts is advisable as the plate voltage in this instance, and most manufacturers produce a valve with suitable characteristics, notable amongst these valves being the Radiotron UX240, the Cossor Point One, R.C. Valve, and the Osram BE5B Valve. The Phillips' A330 and A423 are two other well-known valves, which will render satisfactory service in a resistance amplifier.

In transformer coupled amplification there is a wide choice of valves. Almost everyone knows the standard Radiotron UX201A, which is a very good general purpose valve, and is eminently suited for this method. So also will be found similar valves in the Osram, Cossor, Mullard and Phillips range, all of these manufacturers also making a last stage valve known as a power valve. There is quite considerable misconception with regard to power valves. A goodly number of folks think that if they put a power valve in the last stage of audio, louder, sweeter and better volume should result. So it should, provided other factors are considered. The other factors are correct value of B and C battery, and this is generally overlooked so that there are some disappointed people owning power valves wondering why they laid out the money for such an article.

This brings us to a most important point. In every valve packet will be found a slip, giving particulars of the valve it contains. On this slip is such information as the correct battery voltages for best results, and it must be borne in mind that the maker knows what he is talking about, and it is, therefore, necessary that the user should follow out his instructions. Taking a Radiotron UX120, which is a last stage power valve, it

will be found that the B battery required is 135 volts and the grid battery 22 volts. It, therefore, follows that to get the best from this valve, these voltages must be applied, and in actual practice it will be found useless to apply any smaller voltages. The Radiotron UX171 is another valve designed to operate loud speaker of low impedance at considerable volume, with a minimum of distortion, that is to say, it is intended for use in the last audio stage only. In this instance the plate voltage varies from 90 to 180 volts and the negative grid base bias from 16.5 to 40.5 volts. These two valves are instances of examples in order that the reader should understand that a power valve should be fed properly and not starved, and should be used only for the purpose for which it has been designed. One cannot touch on the subject of audio amplification without referring to the latest type of power valve and their characteristics. Incidentally, it may be worth while mentioning here, that should any reader have mislaid instruction slip for his present valve a note to this effect to the agent for the valves in this country will bring him a booklet giving him all information that is required.

Now coming to the question of how many stages of audio amplification are required to produce loud speaker work, the answer to this depends on just what form of receiver the audio stages have to be used in conjunction with. If a well designed one valve receiver is giving splendid earphone reception, then one good stage of transformer coupled audio amplification will give moderately good loud speaker strength, provided, of course, the location of the receiver is not too far from the broadcasting station. Anywhere within 25 miles of broadcasting stations fairly good loud speaker results will be had on one stage of audio following the detector valve, but for the sake of reserve and in order to have plenty of volume, two stages are always advisable.

If there is one stage already equipped in the set, then the addition of an extra stage will be found beneficial if louder signals are required. Suppose, for example, it is decided to add one stage after the detector valve thereby making the receiver a two valve set. The following materials will be required:—

1 Audio Frequency Transformer, 5 to 1 ratio.

1 Valve Socket.

1 S.C. Jack.

1 Amperite or Brachstat.

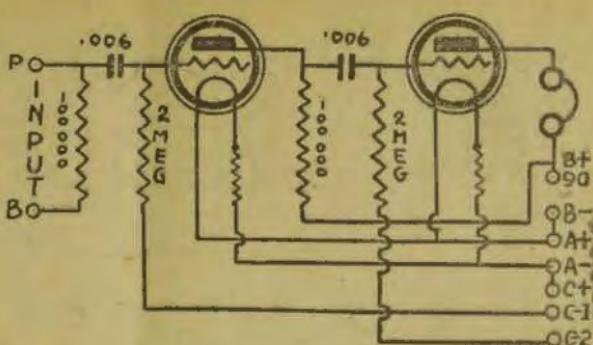

1 Baseboard.

1 Panel (optional).

Although a 5 to 1 ratio transformer is specified, any other ratio will be found unsatisfactory, provided it is of a good quality and has generous sized core. Quite a lot depends on the transformer. It is never prudent to choose a transformer simply because it is cheap; always procure well-known standard lines and don't take chances with unknown brands.

In the list of parts will be found mention of an Amperite or Brachstat. The purpose of this article is to control the filament current on the valve and dispenses with the necessity for a rheostat. In supplying this filament current to the valve the adjustment is not critical, and a filament ballast suited for the valve proposed to be used will suit the purpose admirably and will also save much space, dispensing entirely with the necessity for a panel.

Mount the transformer, valve socket and filament ballast on the baseboard, and if desired the single circuit jack into which may be plugged the loud speaker. This jack may be dispensed with and two terminals substituted. Place the socket right along side of the secondary terminals of a transformer and the filament valves close to one F terminal

of the valve socket. Begin the wiring now.

At this stage it may be worth noting that some of the English made transformers are marked differently to the American made. Here is a comparison of the markings, and this will relieve the minds of quite a number of enthusiasts:—

American.	English.
P	I.P.
B	O.P.
G	I.S.
F	O.B.

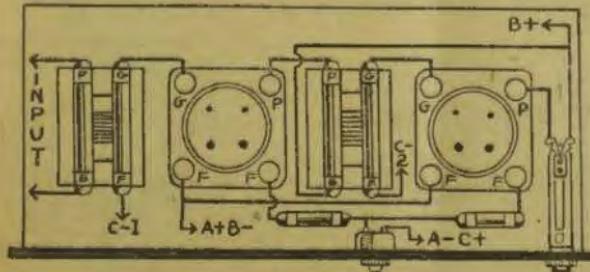

The primary may be reversed in each instance, provided the secondary is reversed, so don't be afraid if these marking do not correspond with comparisons that may have been published elsewhere.

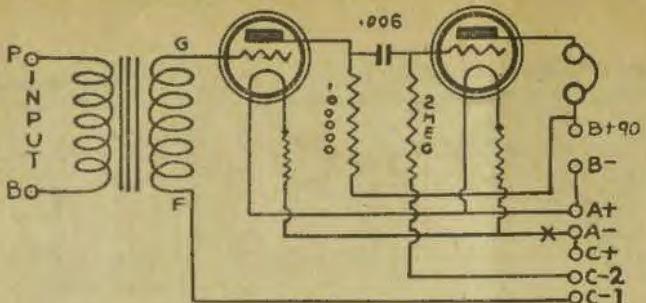

The wiring is very simple indeed, so simple, in fact, that there is hardly any need for a written description, the writer feeling quite certain that everyone will be able to follow the back of panel wiring diagram, which is reproduced here. Note that the C battery has been included, this being a distinct advantage inasmuch

as not only does it save the B battery current, it also increases the volume in a marked extent.

To connect this unit to the existing set, is a matter of a moment. These flexible leads which are clearly marked A, B, and C battery, negative and positive respectively, are to be connected to the different batteries. If a crystal receiver is in use, then it is necessary for the constructor to obtain three batteries, as well as the valve. For certain valves dry cells may be used as an A battery, but be sure to ask your dealer of a correct size to be used with the valve you intend to employ. The B battery should be round about 90 volts, as this will give much more volume than any lower value. The C battery incidentally may be from 45 to 90 volts according to the valve chosen. Connect the batteries correctly, then insert the valve in its socket. Join P of the audio transformer to one telephone terminal of the crystal set, and connect the other telephone terminal of the crystal set to B of the audio transformer, thus are the two units connected. Plug the 'phones into the jack, or if terminals are used, connect the phones to the terminals of the amplifying unit. Press the battery switch on to the on position, then tune in with the crystal receiver. A considerable increase in volume will be noted, when compared with what you have been used to heretofore.

Certainly, you can hardly expect to operate a loud speaker from a crystal plus one stage of audio, unless, of course, the owner is living very close to a very high powered broadcasting station. But as mentioned previously when this one stage of audio is connected to a single valve set, reasonably good loud speaker results will be available, provided the location is within 25 miles of a broadcasting station.

To link up to a single valve receiver may require a little more thought. Note carefully that if only one B battery is employed in the one valve set, it is essential if the best volume is desired to procure another battery bringing the B battery power up to approx. 90 volts by joining the B batteries in series. To join the B batteries in series, all that is necessary is to connect the positive terminal of one B battery to the negative terminal of the other B battery. Leave the B battery connections for the one valve receiver as they were before any alteration took place, but into the last B positive terminal, that is, the 90 volt terminal, connect the B positive lead from the jack.

Now connect up the C battery by joining to the negative terminal that flexible lead which comes from F of the transformer, and connect the positive of the C battery direct to the negative of the A battery. Examine your one valve set for a moment, and notice if the positive A is connected to the negative B. If such is the case, then notice if the rheostat is in the negative lead or in the positive lead. From your conclusion, connect up the flexible wires governing your A battery. If the rheostat is in the negative lead, then join to the negative of the A battery that wire which comes from the filament ballast, and join to the positive of the A battery that wire which comes from the filament terminal of the valve socket of the audio unit. Again it is necessary to connect the primary of the transformer across the telephone connection of the one valve receiver, just as has been described already for the crystal set.

Tune in with the one valve receiver as you have been used to, then you will notice a much greater volume than before. If you can lay the telephones on the table and standing two or three feet away can hear what is going on in the earphones, then you can depend that a loud speaker can be hooked on to give moderately good re-

sults. It is interesting to note that no tuning is necessary in the added unit for one need not fear further complications.

If there is already one stage of audio in the existing receiver, then it will be found necessary to substitute a lower ratio transformer for the higher ratio specified, unless, of course, a power valve is intended to be used in the second stage, where it may be found advisable to have the lower ratio transformer in the first stage, followed by the higher ratio in the second stage. More about this later. The method of connecting this one stage of audio to the two valve set is just the same as has been described before, but if on tuning in the receiver a high pitched whistle is heard permeating the whole of the reception, then reverse the primary connections of the audio transformer in the added unit, and it will be noticed that this effect will entirely disappear, giving a most remarkable volume, and making it possible for the very weak stations to be built up considerably in volume.

The valve used in the audio unit should be of the same voltage as that used in the detector or in any other portion of the set, and the unit, if needs be, may be housed at the back of the cabinet or inside of the cabinet itself if there is room for it. Very little ingenuity will be required to find a home for this addition, which need occupy only very little space indeed.

If the constructor desired a two-valve audio amplifier, the particulars are here for him. Look at the drawings of the two valve amplifier unit and there will be found on the back of panel diagram, or as it should be known the wiring diagram a double circuit jack, which permits the speaker to be plugged into one audio stage if desired. The connections for this are clearly marked. It hardly needs any elaboration on the writer's part to describe the construction of

this amplifier, as after all, it is purely a repetition of the one stage already described, and the methods of connections are entirely as before.

But one word regarding the use of a power valve in the last audio stage will not be out of place here. If one of the power valves or super power valves are used, as have already been stated, a very high plate voltage is necessary in order that the best may be had from the valve. It is certainly injudicious to allow this heavy plate battery to flow through the windings of the speaker, as it is very probable that some damage may be done to the speaker. To overcome this possibility, a slight alteration from the wiring and circuit diagram should be resorted to. Here's how to do it.

From the plate lead of the last valve take a connection to one side of a 50 or a 25 Henry audio frequency choke. To this same connection join one side of a 4 mfd. fixed condenser, the other side of which take to one side of the loud speaker jack, the other side of which is connected to the A negative terminal on the terminal board. The open end of the choke should now be connected to a separate B battery tapping, which should be joined to the maximum B voltage intended to be used. This little refinement is certainly worth while, and may be applied to all audio frequency circuits as a means of protecting the windings of the loud speaker.

Again it must be stressed that it is never wise employing more than two stages of standard transformer coupled audio frequency amplification. There is quite sufficient volume from a 2 stage amplifier to satisfy the needs of the average person. If three stages of audio amplification are sought, then turn to resistance coupling, where 3 stages can be used comfortably, but bear in mind that the resultant volume is only comparable with two stages of transformer audio.

Resistance coupling is certainly becoming more popular every day, now that B battery eliminators may be had to supply the heavy voltage demanded by this form of amplification. Looking at the circuit diagram there will be found that there is a coupling condenser between the plate of one valve and the grid of the ensuing valve. This coupling condenser may vary in size from .006 mfd. up to .01 mfd., it is really not critical. The B battery is fed to the plates of each valve by means of a fixed resistor of the order of from 50,000 to 100,000 ohms. In order to prevent excessive charges of the grids of the amplifying valves, each valve is equipped with a two megohm leak which is

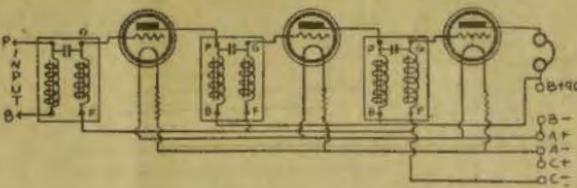

certainly effective for stabilising the whole system. The parts for a two stage resistance coupled amplifier are as follows:-

- 2 100,000 ohms. fixed resistors.
- 2 2 megohm fixed resistors.
- 2 .006 fixed condensers.
- 2 sets of double clips on basis.
- 2 valve sockets.
- 2 Amperites or Brachstnts.
- Usual baseboard, battery switch, etc. etc.

The method of layout is clearly seen in the drawings and the means of connecting to the existing sets is certainly very easy. If desired varying plate voltages may be added, further particulars of this type of amplifier may be had from "Wireless Weekly" of the 12th August, 1927. For those who desire, there will be found different kits of resistance coupled units all complete ready to be assembled, or even it is possible to obtain completely assembled three stage resistance amplifier.

It is possible to combine transformer and resistance coupled methods of amplification to suit the constructor's own requirements. Some people prefer to use this system by placing the transformer stage first with the resistance stage afterwards. Again many would rather have the resistance stage first, all about a transformer stage. It is really a matter of choice, but reproduced here will be found diagrams showing the construction of one transformer and one resistance coupled stage. Some few years ago this system was popularised in this country by "Insulator," who described a unit similar to this and named it "Dulcie." Early readers will remember it.

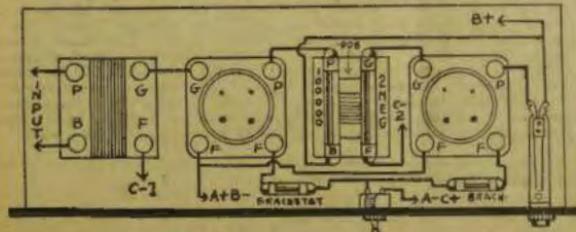

Lastly, we come to the subject of impedance coupled amplifiers. The most effective system of this, is the double impedance type, and here again it is necessary to employ three stages of this idea to get the output of two stages of transformer coupled, and also will it be found necessary to use a high value of B battery. There is

no question whatever that double impedance is very close to the ideal from the point of view of purity and of the reproduction of all under tones and over tones. The writer recently constructed three stages of this method and found it certainly very satisfactory. The kit used was a well-known F.M.C. double impedance kit and the natural tone was so charming that it was always a pleasure to listen in.

These are the three systems very much in evidence to day. Without wishing to draw comparison on their utility, it is felt that there is sufficient data for the constructor to build his own unit to suit his own purpose. Granted the unit is satisfactorily built and that the owner possesses a reasonably good loud speaker and that he pays attention to the correct valves and batteries, much pleasure can be had with loud speaker reception. And do not forget that the loud speaker itself plays a most important part, so choose one which is good and which will last.

Lastly, an excellent volume control may be had by connecting a Centralab potentiometer of, say, 500,000 ohms, resistance across the secondary of the first audio transformer, or if preferred, Macurone Tone Purifier may be shunted across the secondary of the last audio transformer. Both these systems are good, the Macurone Tone Purifier acting not so much as a volume control, as its name implies, but as a tone purifier, eliminating all raucous noises which may be generated in the set.

Safeguarding the Valve.

Dr. Fixit's Radio Talk for 5CL

THE base of a vacuum tube fits the corresponding socket in just one way—the correct way. Nevertheless, there is an ever-present danger of connecting batteries or wiring in such manner that "B" battery current will be applied to tube filaments, with explosive consequences. Even a slipping screwdriver or pliers may inadvertently divert "B" battery current through tube filaments, rendering the tubes useless. Hence the exercise of due caution. Always disconnect the batteries when working on the radio receiver. In connecting batteries to this radio receiver, connect the "A" battery first. Then turn on the rheostats or operate the switch, and note if the filaments light. If they do, the connections are correct, and the other batteries may be connected. If not, check up on the wiring. This procedure prevents placing the "B" batteries where they do not belong, and also detects fault set wiring before expensive damage can be done.

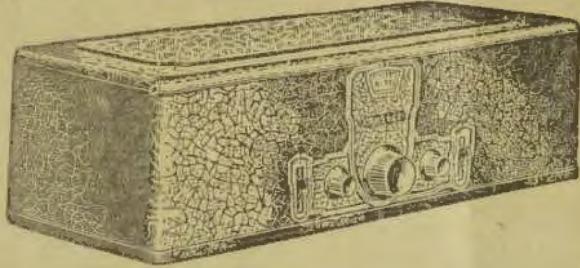

In the home-made radio receiver or the receiver being remodelled or repaired, it is well to take no chances with burnt-out tubes. To this end, a 40 watt, 110-volt lamp should be placed in the "B" lead. The resistance of the lamp will prevent excessive amperage from passing through the filaments of the vacuum tubes if the "B" battery should be incorrectly connected. Furthermore, it will detect a short-circuit in the wiring, since the lamp will light up. However, because of its resistance, the lamp should be removed or shorted for normal operation. A still better plan is to place a radiotron UV-877 in the "B" lead. This radiotron is a protective lamp designed as a safety valve to prevent damage to vacuum tubes or transformers in the event of incorrect connections or short circuits. It introduces protective high resistance only while abnormal conditions exist, so it may be left in circuit.

A Section for the Trade

5,000 SETS A DAY.

Five thousand Radio Receivers complete every day is a very tall order, but this is the average number of sets which are being produced daily by the Crosley Radio Corporation, which is claimed to be the world's largest manufacturer of Radio receivers.

the Crosley Corporation of the "Die Casting" process for the mass production of the variable condensers incorporated in their receivers is an example. For this purpose a battery of ten machines has been installed in the modern six-storey addition to the Crosley plant. A novel machine

The Crosley Bondbox Receiver.

receivers. In addition to sets, this Company manufactures Power Supply Units, Loud Speakers, and many other parts which are well-known throughout the world. The whole process of manufacture is based upon mass production methods, and the man responsible for the growth of this colossal organisation is Powell Crosley, Junr., founder and president of the Crosley Radio Corporation.

The Crosley Corporation has specialised for years in the perfecting of suitable machinery and the training of skilled personnel to reach their ideal of turning out receivers which are at once highly efficient, extremely attractive, yet with rugged strength and extremely reasonable price. Many people are under the impression that because an article sells for a reasonable price it is necessarily cheap or inferior, but in the case of the Crosley Radios, Power Units, and Speakers, it is the policy of the Corporation to put only the very best material and engineering ability into its products, the moderate marketing price being made possible through high efficiency in producing them in large quantities. Vast sums of money have had to be expended to install the special equipment required, not to mention personnel, for the proper functioning of such a detailed mass production system calls for an extremely skilled group of executives and intermediate subordinates to properly direct the activities of the several thousands of workers engaged. Many of the machines in use for the production of the various parts are the result of study and solution of intricate problems. The utilisation by

employed is an automatic tempering or hardening furnace heated by electricity and used for hardening the steel magnet segments in the Crosley Musiconic Loud Speaker. There are many other novel machines for speeding production of the parts required to make up complete radio receivers, etc. After all of the required parts are complete they enter the conveyor belt assembly and wiring line where they are in continuous process until the finished product in the shape of a Radio receiver or other article, emerges from the final inspection and test booths for packing and shipping to the distributor.

Cincinnati, the pioneer centre of Radio Broadcasting, may well be proud to number such a modern plant among her numerous industries. The Crosley Corporation also operates Station WLW, which recently broadcast the Dempsey-Tunney fight, and is frequently heard in Australia on 50 metres. International Radio Co., Ltd. are local agents for Crosley products.

ONE NIGHT recently, a well-known local listener to 4QG wished to know if all were well with the transmitter. He complained of a certain amount of distortion which he called "fuzziness." As everything was quite normal at the station, this distortion was explained to him as being no doubt occasioned by the discharges of static electricity (which was collecting in his aerial due to the heavy thunderstorm then prevailing) through his receiver to earth, thereby spoiling his usually clear reception.

NEW SETS.

A new entrant in the field of radio set manufacturers, is New System Telephones Pty. Ltd., who are now engaged in the manufacture of De Luxe New System 5, 6, 7, and 8 Valve Models, the five valve model selling for £49/10/-, complete with Burgess "B" and Phileco "A" batteries, loud speaker and all other accessories. There are no dials on the receivers, and the dual drum control makes the tuning infinitely simple. To one side of the drum control are the dial markings, together with the call signs of the various stations, and on the other appear the wavelengths in their natural order.

The set is constructed on a cast aluminium chassis, having absolute rigidity, and eliminating the possibility of the displacement of parts. We demonstrated a five valve model on local broadcasting, to our entire satisfaction, and have no hesitation in endorsing this new receiver.

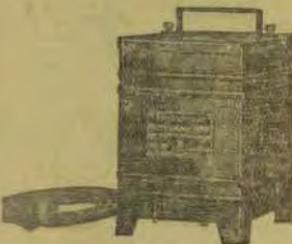

There are certain territories still open for agents, who are advised to write to New System Telephones Pty., Ltd., for further particulars.

EMMCO RADIO HANDBOOK.

The 1927 edition of the "Emmco Radio Handbook" far surpasses the handbook which was produced by that Company last year. It contains 32 pages, together with an art cover printed in two colors, and with most attractive designs, front and back. There is a full detailed list of Australian and New Zealand Radio call signs, including Broadcasting Stations A and B class, Amateur Transmitters, special call signs, etc. There also appears a world list of short wave stations in addition to a chart showing the comparative differences in time of various points in different parts of the world. There are circuits of Reinarz Receivers, Brown-Drakes, Short Waves, Neurodynes, Super Heterodynes, etc., besides a number of circuits illustrating the method of hooking up A.B.C. eliminators to them. The rest of the book is devoted mainly to a description of the many Emmco parts, including several new lines which are just now appearing on the market. There is also an illustration of the new Emmco factory, which is just nearing completion, and which will have a total plant and equipment to the value of over £200,000. The book throughout is excellently printed, and distinctly informative, so much so, that we recommend all Radio enthusiasts to procure a copy. It is supplied free to users of Emmco products.

NEW A. AND B. CHARGER.

The Rectigon, a new type of A. and B. Charger, has now made its appearance on the market. The Radio enthusiast will certainly be strongly impressed with the simplicity of this latest type of charger, which, besides having no moving parts, comprises a considerably reduced number of parts. It is a charger of the bulb type, which means that there are no moving or vibrating contacts, no acids or other chemicals. There is no danger in case of a failure of the power supply, the batteries cannot discharge, and, as soon as the line voltage is restored, the charger will automatically resume

operation. It is essentially an economical job, because of its low first cost and practical elimination of upkeep expense. The bulb is the only part requiring renewal, and its life is exceptionally long and uniform. The charger is started by simply turning on a snap switch and adjusting the dial switch to obtain the proper current for the number of batteries being charged. It is contained in a case of sheet steel finished in glossy maroon—an attractive and hard wearing apparatus. Manufactured by the Westinghouse Electric International Company and every phase of its performance is therefore guaranteed by Westinghouse experience. Weighs approximately 151 pounds. Measures 6in. x 5½in. x 8 inches high. Distributors, Amalgamated Wireless Australia, Ltd.

EMMCO, CLYDE.

Mr. H. J. Hopgood, managing director of Manufacturers' Products Pty., Ltd., left for Melbourne last week, and is at present busily engaged in furthering the interests of Emmco, Clyde, and other lines that his company represents. He reports very good business in the southern States, and many new licenses. On returning to Sydney he is leaving almost immediately for New Zealand, in which country he will make an extensive tour for the purpose of pushing sales.

More DX With Proper Grid Bias.

IT is not too much to say that ease and smoothness of regeneration control in a receiver consisting of a valve detector, especially when followed by audio amplification, may account for the difference between being able to receive a distant station at good strength and not being able to hear its signals at all. Such devices as geared dials, or even the use of capacity controlled regenerative circuits, may help a great deal in this respect, but unless the operating characteristics of the valve itself are such as to permit a gradual approach to the oscillation point the full sensitivity possible cannot be obtained. This condition may best be brought about by careful adjustment of the values of the applied B battery voltages, and particularly by choosing a suitable leak and working potential for the grid, as well as by using a regenerative coil of correct inductance.

It is usual to connect the lower end of the grid leak to the positive side of the A battery, in order that positive voltage equal to that of the battery may be applied with respect to the negative end of the filament. It is quite possible that this may be excessive, and, in the case of a tube where the grid current starts early (i.e., before the grid becomes appreciably positive), it may be preferable, from the point of view of smoothness of regeneration control, to keep its potential at zero, or, at any rate, only slightly positive, without seriously impairing its rectifying properties.

The effect of connecting the lower end of the leak to various points of the filament circuit should be tried. Provided that the controlling rheostat is in the positive filament, we have the choice of negative filament, positive filament and positive battery.

If a finer control of grid potential is desired, a separate biasing battery of dry cells may be used, or, better, a potentiometer connected across the filament or A battery leads. The latter arrangement is to be preferred, and the general idea should be to work with the least amount of positive voltage consistent with good detection and smooth regeneration control, remembering also that an excessively positive grid will cause an unnecessary drain on the plate battery.

A NEW WIRELESS set that dispenses with batteries and accumulators has been perfected.

How about one that dispenses with had programmes?

3LO Melbourne and Research.

I HAVE just been reading an interesting pamphlet by Mr. Cherry, the Research Physicist at the Melbourne University, on "Signal Strength Measurements of 3LO."

Few people who put on their headphones, or turn on the loud speaker, realise that to give them the pleasure of a programme, a tremendous deal of research and experiment are necessary.

3LO Melbourne maintains a staff of radio experts, whose care are problems of "fading" and the like, which must be solved to make broadcasting 100 per cent. efficient.

Special Grant.

To obtain the best advice on the matter, 3LO Melbourne gives the sum of £500 to the University for Radio Research annually. In the University are two renowned physicists, Professor Laby and Mr. Cherry, and these two men have been doing important work on measuring the signal strength of 3LO Melbourne. The practical value of the work lay in getting knowledge through which "fading" could be located and attacked.

For their work they used a measuring set so constructed that it could be dismantled and transported from place to place on the carrier of a motor-cycle, to be set up afresh at different places in the field. The scientists point out that it will soon become necessary to give signals of a specified intensity. A very high signal strength has two disadvantages. The first is high cost; the second is its interference with signals from other, and particularly remote stations.

On the other hand, a weak signal will not be audible above the "noise level." This phrase is used to indicate the mean field intensity of natural and artificial electrical disturbances which interfere with reception. The sufficiency of a signal depends on the ratio of its intensity to that of the noise. No measurements of this "noise level" in Melbourne have been made. Day and night measurements of this were made for a year in England and America before the establishment of trans-Atlantic telephone, in order to determine the signal intensity.

There is a ratio between high frequencies and "noise level," and the study of this will have important bearing on broadcasting. It appears, so far, that in Australia, a short wave will have a higher ratio of signal to noise than a long wave, assuming signal strength in each is equal.

The experiments in signal measurement by these two scientists will continue at greater distances.

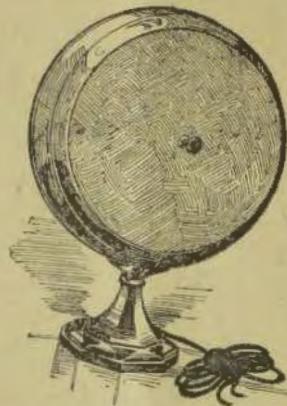

LOUD SPEAKERS OF MERIT

Install a Loud Speaker on your Set, and let all the family hear the programme. We have the finest assortment of Loud Speakers at prices ranging from 23/6 to £21/-.

BROADCASTING PROGRAMMES for the COMING WEEK

Friday, Oct. 28
2FC, SYDNEY.

Farmer's Broadcasting Service.
Wave Length, 442 Metres.

EARLY MORNING SESSION.—7 to 8 a.m.

MORNING SESSION.

- 7.0 a.m.—"Big Ben" and announcements.
- 7.45 a.m.—Studio music.
- 7.48 a.m.—"Sydney Morning Herald" news service.
- 8.00 a.m.—Studio music.
- 8.04 a.m.—A Hearing.
- 8.45 a.m.—Studio music.
- 9.00 a.m.—"Big Ben".
- Marching music for school children.
- 11.45 a.m.—A.P.A. and Reuters' Cable Services.
- 11.50 a.m.—Studio music.
- 11.55 a.m.—Talk on Home Cooking and Recipes by Mrs. Ruth Furst.
- 11.58 a.m.—Cricket Descriptions.
- NOTE.—At approx. 11.50 a.m.—from the Sydney Cricket Ground—a full description of the Cricket Match, N.S.W. versus N.Z. S.L., which team has just returned from its successful tour of the "Old Country."

MIDDAY SESSION.

- 12 noon.—"Big Ben" and announcements.
- 12.45 p.m.—Stock Exchange, first call.
- 12.55 p.m.—Official weather forecast, rainfall.
- 12.58 p.m.—Summary of "Sydney Morning Herald" news service.
- Rugby wireless news.
- 12.35 p.m.—Studio music.
- 12.38 p.m.—Marching music for school children.
- 12.40 p.m.—Margot Lasson, soprano; "Observation" (Copland).
- 12.45 p.m.—The Oak Hall Instrumental Trio.
- 12.55 p.m.—Studio music.
- 1 p.m.—"Big Ben". Weather intelligence.
- 1.2 p.m.—"Evening News"; midday news service.
- Producers' Distributing Society's Report.
- 1.25 p.m.—The Oak Hall Instrumental Trio.
- 1.28 p.m.—Stock Exchange, second call.
- 1.30 p.m.—Marching music for school children.
- 1.45 p.m.—Mayors' Letters, soprano: "I Love the Moon" (Rubena).
- 1.48 p.m.—Studio music.
- 1.50 p.m.—The Oak Hall Instrumental Trio.
- 2 p.m.—"Big Ben." Close down.

AFTERNOON SESSION.

- 2 p.m.—"Big Ben" and announcements.
- 2.5 p.m.—From the Sydney Cricket Ground: A complete description of the Cricket Match N.S.W. versus New Zealand "Eleven," which has just returned from its successful tour of the "Old Country."
- During cricket intervals the following musical items will be given:
- 3.00 p.m.—Marching music for the school children.
- 3.45 p.m.—From Farmer's Tea Rooms: Frank Rotham, baritone: "Tommy Lad" (Mackenzie). "For I Evermore" (Sanderson).

From Farmer's Tea Rooms at 4 p.m. and 4.45 p.m.:—

- Perse Rutter, soprano;
- (a) "Cari Me" (Rousse);
- (b) "Peter Jones" (Caruso).
- During cricket intervals from the Studio—
- Metta Mulkerin, soprano;
- (a) "Ave Maria" (Chopin);
- (b) "Rose in the Bush" (Foster).
- Will Bowes, banjo;
- (a) "Chumleigh Fair" (Holliday);
- (b) "The Loving Smile of Sister Kind" (Gounod).

4.45 p.m.—Stock Exchange third call.

4.45 p.m.—Studio music, interspersed with cricket results.

5 p.m.—"Big Ben." Close down.

EARLY EVENING SESSION.

- 5.45 p.m.—The Children of Zion.
- 5.45 p.m.—"The Happy Man" (also to the children).
- 6.00 p.m.—Story time for the young folk.
- 6.05 p.m.—Studio music.
- 6.10 p.m.—Stock market news.
- 6.15 p.m.—"Big Ben".
- Dalgety's market reports (wool, wheat and stock).
- 7.0 p.m.—Fruit and vegetable markets.
- 7.10 p.m.—Weather and shipping news.
- 7.15 p.m.—Evening News; late news service.

NIGHT SESSION.

- 7.55 p.m.—Programme announcements.
- 7.55 p.m.—Cecil Monk, violinist.
- 7.45 p.m.—Al. Goss, Scotch comedian: "Scotch Burlesque" (Langstrach).
- 7.53 p.m.—Mabel Ratchelin, soprano;
- (a) "Absence" (Cowell);
- (b) "One Spring Morning" (Revoir).
- 8 p.m.—"Big Ben".
- A Theatrical Transmission.
- 8 p.m.—"Big Ben".
- Cecil Monk, violinist.

NEW SOUTH WALES "A" AND "E" CLASS BROADCASTING STATIONS.

- 2FC—Farmer's Broadcasting Station, Ltd., Sydney, wavelength 442 metres, power 100 watts.
- 2BL—Broadcaster's Ltd., Sydney, wavelength 353 metres, power 100 watts.
- 2BL—Theosophical Broadcasting Station, Ltd., Sydney, wavelength 316 metres, power 200 watts.
- 2YK—Trades and Labor Council, Sydney, wavelength 280 metres, power 150 watts.
- 2UW—Big Band, Sydney, wavelength 267 metres, power 100 watts.
- 2MK—Mechanics Arms, Balmain, wavelength 275 metres, power 250 watts.
- 2UE—Electrical Utilities Supply Co., Sydney, wavelength 293 metres, power 250 watts.
- 2UE—Burton Electric Co., Sydney, wavelength 314 metres, 100 watts.
- 2BD—H. A. Douglas, Newcastle, wavelength, 288 metres, 100 watts.

9.10 p.m.—Mabel Ratchelin, soprano;

- (a) "Up Above" (Caruso);
- (b) "Ring Out the Old Month's Days" (Caruso);
- (c) "My Cousin" (Caruso);
- (d) "Wife in my Life" (Lafont);
- (e) "Vance Drew Girl" (Blair).

9.25 p.m.—From the Conservatorium Ball, Sydney, from the "Vocal Recital, arranged by Mr. Caladine's Ball";

"Slow Movement from Concerto in D" (Haydn).

Mr. Cedric Ashton.

9.30 p.m.—"Prelude in D Minor" (Bach).

9.30 p.m.—"Ode in Union with the Planets" (Hawthorn).

9.35 p.m.—"Song from the Faerie" (Ward and Windle, English entertainers).

9.35 p.m.—Frank McEachern, baritone.

10.00 p.m.—Harriett White, band leader.

10.00 p.m.—Wm. and Windle, English entertainers.

10.15 p.m.—Frank McEachern, baritone.

10.30 p.m.—Harriett White, band leader.

10.30 p.m.—Wm. and Windle, English entertainers.

Late weather forecast.

10.30 p.m.—The 2PC Studio Dance Band will play until 11.30 p.m.

10.35 p.m.—Late news and commentaries.

11 p.m.—"Big Ben". Dance music.

11.30 p.m.—National Anthem.

Close down.

2BL, SYDNEY.

Broadcaster's Ltd.

Wave Length, 353 Metres.

Friday

EARLY MORNING SESSION.

7 a.m. to 8 a.m.

MORNING SESSION.

- 10.30 a.m.—G.P.O. clock and chimes.
- 10.40 a.m.—Programmes from the Studio.
- 10.45 a.m.—News from the "Daily Telegraph" Pictorial.
- 10.50 a.m.—Musical programmes from the Studio.
- 11 a.m.—G.P.O. clock and chimes.
- 11.3 a.m.—Musical programmes from the Studio.
- 11.45 a.m.—Talk on "Croupet," by Miss Gwen Varley, Broadcaster's women's sports authority.
- Social news. Reply to correspondents by Mr. J. Jordan.
- Talk on "Sweet Madding" by Ericilla.
- 12 noon.—G.P.O. clock and chimes.
- Special news forecast, and weather report.
- 12.3 p.m.—Brunswick Panatope Musical Society.
- 12.15 p.m.—Information, Mail, shopping and post directory.
- 12.15 p.m.—Boats in call by wireless.
- 12.20 p.m.—Fruit market report.
- 12.25 p.m.—Vegetable market report.
- 12.30 p.m.—London metal market report.
- 12.35 p.m.—Dairy and farm produce market report.

12.30 p.m.—G.P.O. clock and chimes.
Forage market report.

The complete morning service will be relayed from St. John's Anglican Cathedral.

FROM ST. JOHN'S CATHEDRAL—

11 a.m.—Morning Service.

12.30 p.m.—Close down.

Your Choice of Articles

WHAT DO YOU KNOW about broadcasting? Has it struck you that there are a thousand and one things going on in the broadcasting world, of which you are not aware until somebody tells you about them, weeks after they have happened? For instance, do you understand how vital is the question of Empire Broadcasting? Do you know what is being done about it, when it is likely to occur, and whether you will be able to listen-in to London? Do you know what the broadcasters are doing to give us better broadcasting, or whether it is possible to effect improvements in the existing scheme of broadcasting?

THESE ARE SUBJECTS which are of direct importance to every broadcast listener, and it is as well to know what well-known authorities have to say upon them.

THE OCTOBER ISSUE of "RADIO" deals with these matters, and with dozens of other subjects, each one of which presents some new angle of broadcasting or set building.

Here are some of the articles appearing in the October "RADIO":—

MAJOR W. T. CONDER. Director of SLO, contributes an article on **PRO-GRAMMES**, in which he supplies a complete answer to the critics who complain about broadcasting. Major Conder is an authority, and anyone reading this article will gain an entirely new impression of broadcasting.

SUPER POWER, RELAY STATIONS, OR BOTH? J. Garrick Eisenberg, an official of the Radio Corporation of America and formerly of the General Electric Company and United States Navy, is an impartial critic of the Australian Broadcasting situation. As an engineer of note, he discusses the technical advantages of certain suggestions. As a practical commercial man he sums up the possible results of his proposals. As an enthusiastic Radio fan he writes directly to the broadcast listener, and places before him a concrete article that everyone can understand and appreciate.

WHAT IS MIKE FRIGHT? Is it an acute attack of nervousness when first facing the Microphone, or is it a particular disability affecting those of a temperamental nature? Such well-known people as Scott Alexander, Alfred Cunningham, George Gee, etc., give you their impressions upon this absorbing subject.

EMPIRE BROADCASTING. J. E. Graham, an Australian in London, visits Gerald Marcuse, the famous English amateur, who is carrying out preliminary experiments in Empire Broadcasting, and tells us just what manner of man is Marcuse, and what he is doing.

FOR THE HOME SET Constructor there is a variety of articles which cannot fail to appeal.

THE SOLODYNE. Full constructional details of this famous long distance receiver, which has already proved so popular in Australia. This article presents some entirely new and advanced features.

THE SIMPLICITY ONE VALVE RECEIVER.

THE CHAMPION SIX. The combination of sensitivity, selectivity and purity is the feature of this Receiver. Transformer plus resistance coupled audio frequency gives purity. A separate regenerator valve supplies the reaction energy—an interesting departure from the ordinary. Full constructional details.

THE DESIGN AND CONSTRUCTION OF SMALL POWER TRANSFORMERS AND FILTER CHOKES, by J. G. Reed.

CRYSTAL CONTROL AND ZEPPELINS AERIALS, by W. E. Coxon. In addition to being the Technical Director of GWF, Mr. Coxon is an enthusiastic experimenter of high repute, and his article covers the question of this type of aerial thoroughly.

THE THREE VALVE REINARTZ RECEIVER. An inexpensive short wave receiver, etc., etc.

£25/10/-

"THE BANDBOX"

A Phenomenal Crosley Radio Receiver for the Complete Enjoyment of the 1927-28 Radio Season.

Here are the seven big things which represent Radio's greatest advancements brought together by Crosley and stamped with the experience, mass production method and leadership of the Crosley organization. No wonder a smiling radio world proclaims the "Bandbox" as the unprecedented price of £25/10/-, Crosley's paramount achievement.

THE BANDBOX IS SHIELDED.

Radio coils are surrounded by magnetic fields similar in every respect to the magnetic field around the earth that moves the needle of a compass, but around radio coils these fields make互相 of themselves by feeding back on each other. Heretofore, it has been customary to make inefficient coils with inefficient fields to prevent such feeding back. The Crosley Bandbox incorporates copper shields around each coil to prevent such feeding back. The coils consequently can be made and are very much more efficient. The amplification of the receiver is therefore much higher; the sensitivity is greatly increased. Condensers are also completely shielded from each other in separate metal compartments. Hitherto only very high-priced sets have enjoyed this super-radio advantage.

THERE IS NO OSCILLATION.

The Bandbox employs completely balanced or neutralized stages to prevent oscillation, instead of the common form of lesser method. Coalty to be sure, but extremely necessary in achieving such results as are obtained by this marvel of radio reception. **THE BANDBOX.**

FOR SHARPNESS—THE ACUMINATORS.

"Bandbox" accumulators enable "fishers" for distant stations to bring them in loud and clear. As powerful transmitters magnify distant voices, accumulators increase the volume of far-away signals so they seem like local programmes.

SEND FOR OUR FREE CATALOGUE.

VOLUME CONTROL.

This is another big "Bandbox" feature, which permits full brass band power for those who want their drama noise strong and loud. The others, it cuts volume down to a soft and gentle murmur, without distortion.

ILLUMINATED DIAL.

A Master, Sliding Selector has an illuminated dial for easy reading in shadowed corners. A single knob permits full tuning for ordinary reception of local, year-by and super-powered stations.

INSTALLATIONS SIMPLIFIED.

A series cable containing varivacuum, rubber-covered leads, makes installation and hookup easy for the average owner. No waiting for the radio service man should the batteries be changed.

EASILY ADAPTED TO CONSOLES.

Simply remove screws in associations and in base of lift-off metal case. Console now stands ready for installation in Concrete Cabinet. Operating in Concrete Cabinet permits instant start in operation. Radiotube sections in place, and Presto! the console radio is complete.

Trickle Charging began with Balkite

and Balkite still leads in popularity, service and number in use

Trickle charging, now the most convenient and most popular of all means of charging your radio "A" battery, was not possible until the development of the Balkite Trickle Charger. For Balkite was the first charger that could be connected permanently to your "A" battery and the light socket. It was the first charger that kept the battery always fully charged. And Balkite was the first charger that converted your battery into a complete power unit supplying "A" current from the light socket.

To-day there are over 400,000 Balkite Trickle Chargers in use. Just as it was first in making trickle charging possible, Balkite has always been first in popularity and number in use. Balkite is the standard trickle charger, tried and proved by use in the hands of its thousands of owners.

Like all Balkite Radio Power Units, this charger is a permanent

piece of equipment. It has no tubes and nothing to replace or renew. It is noiseless in operation and can usually be used during reception. It is very compact and small, and its current consumption is very low.

The Balkite Trickle Charger can be used as a trickle charger with any 6-volt radio "A" battery. Thus used it keeps your battery always at full power and in effect converts it into a light socket "A" power supply. With 4-volt batteries it can be used as an intermittent charger of the usual type. Or as a trickle charger if a resistance is added. Charging rate is approximately 1 ampere.

Add a Balkite Trickle Charger to your "A" battery. Know the convenience of permanent silent "A" power from the light socket always.

Balkite Trickle Charger. Over 400,000 in use. Charging Rate, about 15 amperes. As a Trickle Charger automatically keeps your "A" battery fully charged.
Price £3/10/-
Balkite Type Eliminator. By this means you can acquire silent permanent "A" Current from the light socket. Over 150,000 in use.

MODEL W for up to 5 valves ... £11/10/-
MODEL X for large sets ... £16/15/-

The right to the use of Tantilene in Balkite is the exclusive property of the Farinell Products Company Inc., under their Australian Patent No. 19888/24.

The Famous Balkite B Eliminator

Absolutely in a Class by Itself.

Model W up to 5 Valves **£11/10/-** Model X for large Sets **£16/15/-**

A Revolution in Reception

CLARITONE LOUDSPEAKER

Until you've actually heard the true to nature rendition of the Claritone you've never heard just how well your set can perform. A Claritone Loud Speaker will revolutionise your reception . . . bring the broadcasters more vividly near . . . true to nature! The Claritone range of models is moderately priced, and may be seen at most leading radio supply stores, or at the

PERMANENT POWER

The EMMCO "B" BATTERY ELIMINATOR is not a substitute for "B" Batteries. It is vastly superior to batteries—far more dependable, far more efficient, far more economical. Requires no batteries of any character. Never discharged. Never runs down. Gives even, constant, unfailing current—without slightest noise. Always ready for constant and continued use. Not affected by disuse. Trouble-proof. On when "on" and off when "off." Induces full, clear-toned reception. Costs practically nothing to operate. Moderate in price. Quickly pays for itself by abolishing expense of periodical replacing dry batteries. Compact, convenient. The most satisfactory and scientific "B" current supply. Saves money, time, and trouble. Attractive in appearance. See one at your dealers.

Emmco Super Power Eliminator

Illustrated above.

Constructed particularly for supplying high tension current for multi-valve sets. It delivers 85 milliamperes at 180/200 volts, and is supplied with a Raytheon B.H. tube. It is especially adapted for the current and voltages of Australian Electric A.C. Lighting Mains and rectifies both halves of the A.C. Cycle. Adaptable for all valves. The Emmco Super Power "B" Eliminator has a special output control for varying A.C. voltages from 180/240 volts.

Enclosed in a neat metal case, with Bakelite top, the whole measuring 18½ x 9½ x 6½, weight 23-lbs., and complete with cord and attachment plug, attractive aluminium base, Bakelite top and well insulated.

Price, £12/12/-

Kit of Transformer and Chokes in separate aluminium frame 86/10/-

Emmco "B" Battery Eliminator *Illustrated at Right.*

Especially designed for supplying high tension current to sets employing any type or make of valves, up to a maximum of five. Like the Super Power Eliminator, it is especially designed for Australian Electric A.C. Lighting Mains, and rectifies both halves of the A.C. cycle. Several thousand of these Eliminators have been sold and are in successful operation throughout Australia and New Zealand. This Eliminator is supplied for both 230/240 and 200/220 volts.

A scientifically made job, sturdy built, in a neat metal case, with Bakelite top. Compact, 8½-in. x 5-in. x 8½-in., weight 14½-lbs., and complete with cord and attachment plug. Hand-somely finished case, Bakelite top, complete with cord and plug.

Price, £10/10/-

Kit, containing Transformer and Chokes, in one aluminium frame 86/10/-

Valves with the Wonderful P.M. Filament

THE wonderful P.M. Filament offers you three times more for your money. It is so tough that even after 1,000 hours' life it can be tied in knots and cannot be broken except by the very roughest handling—*real safety against accident.*

There is more strength in the P.M. Filament. It has up to 3 times greater length and up to $\frac{1}{4}$ times greater emission than an ordinary filament. *This is where the P.M. Filament gives you real value.*

Another big point, the P.M. Filament requires only one-tenth ampere giving *7 times the life to each of your accumulators.*

For great economy, great life and great results secure the valves with

THE WONDERFUL P.M. FILAMENT.
 MULLARD P.M. VALVES are British made,
 "By British."

For 2-volt accumulators.

P.M.1 H.F.	0.1 amp. 12/6
P.M.1 A. (Resist Cap.)	0.1 amp. 12/6
P.M.1 (Power)	0.1 amp. 12/6
For 4-volt accumulators or 3 dry cells.	
P.M.1 (General Purpose)	0.1 amp. 15/6
P.M.1 A. (Resist Cap.)	0.1 amp. 15/6
P.M.1 (Power)	0.1 amp. 15/6

For 6-volt accumulators or 5 dry cells.

P.M.1 (General Purpose)	0.1 amp. 15/6
P.M.1 A. (Resist Cap.)	0.1 amp. 15/6

P.M.1 (Power)

MAXIMUM

range and selectivity, from possible loss and ease of manipulation under all conditions, minutely accurate construction and handsome appearance—such is the STERLING "Straight-Eight." To ensure absolute perfection of quality, the law of reaction has been avoided, sensitivity and selectivity having been obtained by increasing the number of valves. The first five valves are High Frequency Amplifiers, the sixth a Detector and the last two Low Frequency Amplifiers. Even from distant stations the volume is more than sufficient for any ordinary type of loud speaker.

The instrument is contained in a handsome lock-up cabinet, with space for housing the F.T. Rectifiers.

SYDNEY

How to Win the Cup

The wild-eyed man whispered: "Between us we can win the Melbourne Cup! All I need is a small Burgess battery."

"Quite so!" said the manager of New System Telephones Pty., Ltd., as his hand stole nervously toward a heavy ruler. "Tell me all about it."

First, glancing around cautiously, the visitor explained:

"At the Gungahlin meeting the winning horse had a small battery tickling him. Now I can borrow a mare called Radio and fit a Burgess battery on to her. If an ordinary battery can win the Gungahlin Shield, a Burgess should pick up the Melbourne Cup in a canter."

Reaching the ruler, the manager felt safer—"It wouldn't work! The Burgess is a dry cell battery, and there are too many dry cells already in the Cup!"

Angrily Wild Eyes interrupted:

"But you know that a Burgess never fades away and has a Chrome finish. Well, that's the very goods for a Cup winner!"

"Besides, I tried it out when I was keeping a pub at Coolumandra. A chap asked me how to make his balky horse start. I gave him an old Burgess battery and told him to tie it on behind the horse's ears."

"Five minutes later the man with the balky horse reeled in and lay across the bar—'Fix a blanky battery behind my ears, matey. I've got to catch that horse!'

"If a Burgess battery can fly over the North Pole and hop across the Pacific, it ought—"

The door opened and a warden walked in and tapped the cup winner on the shoulder:

"Here, Sam, your radio set's spark-
ing again. Come out and fix it!"*

Thurs., Nov. 3 2FC, SYDNEY

EARLY MORNING SESSION—7 to 8 a.m.

Your radio set may be likened to the human body. The battery equipment is its heart and its life blood, the current which the battery delivers. And no more than on anything else, the efficiency of your set depends on its heart.

Tale Batteries deliver an abolutely steady, smooth current. They actually recuperate during periods of rest, and when they are fully charged, more efficient, and they cost less per radio hour.

If you have any difficulty in obtaining **Tale Batteries**, write to

Atkins Maclean, Ltd.
Equitable Building
350 George Street, Sydney

"There's a Tale Battery for every battery need."

made to run the full race!

Any sprinter can start well, but it takes a stayer to win in a long run.

It's the same with batteries. The power to stick is the thing to look for—never-failing power over a long period of service. Millions buy Burgess Chrome batteries for this reason. They keep going long after others flag and fail.

Chrome

Chrome—the great preservative used in finest leather, metals and paints, is also used and patented in Burgess Batteries. It gives them unusual staying power.

 Close down.

Distant Stations Made Clear!

Two things are necessary for long distance reception—a good receiver and the finest battery.

If your set is good for distance a Philco will back it to the farthest limit.

A Philco gives just that extra power—with-out ripple or noise—that doubles the volume of selective sets and brings in distant stations loud and clear.

Crystal-clear indicators show the exact position of discharge in a Philco "B" Battery.

Given an average usage of two hours per night, a recharge every three or four months keeps a Philco always fresh as new.

See the super-powerful 83X Philco at the nearest high-class dealer's.

MORNING SESSION.

10 a.m.—"Big Ben" and programme announcements.

Read what Mr. MacLurcan says about the "D.J. SUPER-SIX"

Messrs. David Jones Ltd.,
 Radio Department,
 22 York Street, SYDNEY.

Dear Sirs,

I have carried out some tests with your Six-valve "King" Neutrodyne wireless set with very good results.

The volume obtained from Interstate stations was all that could be desired and was equal to that obtained with any set that I have so far tested. The tone quality was very pleasing, and the single dial tuning made the set delightfully easy to handle.

Only a short aerial was used during the test—15 feet high and 60 feet long.

I am,

Yours faithfully,

Chas. MacLurcan

A.M.I.R.E.

The "D.J. Super-Six" is supplied complete with the highest grade accessories—speaker, valves, aerial equipment—everything ready to instal. Cash Price ... £45

Or you may take delivery on payment of £4/10/- deposit—the balance to be paid in 52 weekly instalments of 17/3.

DAVID JONES'

First and Last Cost

Remember! Quality components mean satisfaction with only one cost.

Cheap unreliable components mean dissatisfaction, with ultimate replacement and additional cost.

KEOGH RADIO SUPPLIES

40a PARK STREET

(Between Castlereagh and Pitt Streets)

Open till 9 p.m. Fridays

10.5 a.m.—Studio music.
 10.15 a.m.—"Sydney Morning Herald" news service.
 10.30 a.m.—Studio music.
 10.35 a.m.—A talk by the EFC Racing Commissioner.
 10.40 a.m.—Studio music.
 11 a.m.—"Big Ben," Studio music.
 11.15 a.m.—A.P.C. and Bouvier's Cable Services.
 11.30 a.m.—Studio music.
 11.35 a.m.—A Talk on Gardening, by Mr. G. J. Lockyer ("Bedroot").
 11.30 a.m.—Close down.

MIDDAY AND AFTERNOON SESSIONS.

12 noon—"Big Ben" and programme announcements.
 12.15 p.m.—Stock Exchange, first call.
 12.3 p.m.—Studio music.
 12.45 p.m.—"Sydney Morning Herald" news service.
 12.55 p.m.—Rugby wireless news.
 1.15 p.m.—Studio music.

NOTE: Direct from the R.R.C. Racecourse: Events in the racing will be described by the EFC Racing Commissioner.

1.30 p.m.—"Big Ben," Weather intelligence.
 1.35 p.m.—"Evening News" midday news service.

1.50 p.m.—Studio music.

NOTE: Direct from Melbourne: Results of the last day of the V.R.C. Meeting at Flemington will be relayed.

During the interval of racing descriptions and results, musical items will be given, including:

The Crystal Palace Theatre Orchestra, Sydney, and
 From the Studio:

Harry White, novelty pianist.

Shirley Cooke, soprano.

4.30 p.m.—A complete resume of the day's sporting events.

5 p.m.—"Big Ben." Close down.

EARLY EVENING SESSION.

5.45 p.m.—The Chinese of EFC.
 5.47 p.m.—The "Hello Man" talks to the children.

6.30 p.m.—Story time for the young folk.

6.40 p.m.—Studio music.

7 p.m.—"Big Ben," Weather intelligence.

7.30 p.m.—"Evening News" late news service.

NIGHT SESSION.

7.30 p.m.—Programme announcements.

7.35 p.m.—Lynn Smith, pianoforte and saxophone solos.

7.45 p.m.—Gwendy Fimister, soprano.

(a) "Rose Softly Blooming" (Spohr).
 (b) "Four Ducks on a Pond" (Needham).

7.52 p.m.—The Congress Band:

(a) March, "Entr'acte" (Jaskiewicz).
 (b) Selection, "Songs of Happiness" (Kirk).

8 p.m.—"Big Ben."

Lawrence Mazuray, baritone.

8.4 p.m.—The Congress Band:

(a) "Meditation" ("Angelus") (Pascal).
 (b) Cornet solo, "Abide with Me" (Liddell) (with band accompaniment).

Soldier, Bandsman T. Smith.

8.14 p.m.—Descriptions from the Speedway Royal.

8.20 p.m.—From the Studio:

Gwendy Fimister, soprano.

"O Ship of My Delight" (Phillips).

8.23 p.m.—The Congress Band:

(a) Selection, "English Melodies".
 (b) March, "Boston" (Collett).

8.32 p.m.—**NOTE:** The Speeches will be broadcast from the dinner tendered to Mr. Avery, Minister of Supply, by the Governor of New South Wales.

8.30 p.m.—From the Studio:

Lawrence Mazuray, baritone.

Last weather forecast.

9.34 p.m.—The Congress Band:

(a) Selection, "Souls Awakening" (Dell).
 (b) March, "Fly Away."

9.46 p.m.—Gwendy Fimister, soprano:

"A Song Remembered" (Compton).

9.50 p.m.—Descriptions from the Speedway Royal.

9.56 p.m.—From the Studio:

Lynn Smith, piano and saxophone solos.

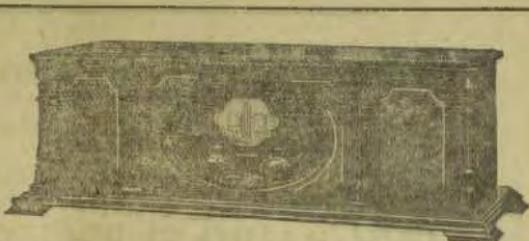

- 18.4 p.m.—Descriptions from the Speedway Royal.
 19.10 p.m.—From the Studio: Laurence Macaulay, tenor.
 19.18 p.m.—Dance Music, interspersed with musical items from the Studio.
 19.27 p.m.—Late news and announcements.
 21.15 p.m.—"Big Ben."
 Other music until 21.45, interspersed with musical numbers from the Studio.
 21.45 p.m.—National Anthem.
 Close down.

3LO, MELBOURNE.

Saturday.

MORNING SESSION.

- 11.45 a.m.—JOHNSTON'S STUDIO BOYS:
 March: "Saint Sulpice."
 Overture: "Semiramide."
 12.10 a.m.—ANITA BHAWA, soprano:
 Priscilla: "We've Got a Screen."
 12.17 a.m.—JOHNSTON'S STUDIO BOYS:
 Waltz: "Vanity Fair."
 12.25 a.m.—JACK O'MAGAN and BOB HELDRETH:
 "Harmonica."
 12.32 a.m.—JOHNSTON'S STUDIO BOYS:
 Selection: "Hi There."
 12.45 a.m.—MICHAEL CONNOLLY, baritone:
 "Trotting to the Fair" (D. V. Stanford);
 "The Hills of Donegal" (Wilfred Sanderson).
 12.54 a.m.—JOHNSTON'S STUDIO BOYS:
 Fox-trot: "A Lark in Spain."
 Musical: "The Well."
 12 noon—MELBOURNE OBSERVATORY
 TIME SIGNAL: Broadcast offices received by the Australian Mines and Metals Association from the London Stock Exchange this day. British official wireless news from Rugby, Reuter's and The Australian Press Association cables. "Argus" news service.
 12.20 p.m.—STUDIO QUARTETTE:
 "Juliet Suite" (Rousseau-Motte).
 12.30 p.m.—ELLA RIDDELL, contralto:
 "Ball Columbia" (Stravoi);
 "Hansie O' Mine" (McKenzie Marloch),
 12.37 p.m.—Stock Exchange information.
 12.40 p.m.—JOHNSTON'S STUDIO BOYS:
 Cornet Solo: "Australia."
 Solos: J. Robertson.
 12.47 p.m.—AGNES FORTUNE, Piano Solo:
 Selected.
 12.55 p.m.—MICHAEL CONNOLLY, baritone:
 "Waikiki Pol" (Alfred Hill);
 "Father O' Flynn" (C. V. Stanford).
 1 p.m.—MELBOURNE OBSERVATORY
 TIME SIGNAL.
 1.15 p.m.—Description of Ballarat Blister, one mile V.R.D. FLEMINGTON, by "Nobby," of the "Argus."
 1.45 p.m.—STUDIO QUARTETTE:
 "The Kingdom of the Flowers" (Ringbelen);
 Valetta: "A Morning Greeting" (Oehmmer).
 1.52 p.m.—Meteorological information.
 Shipping information. Weather forecast for Victoria, Tasmania, South Australia, and New South Wales. Ocean forecasts. River reports for Victoria, Tasmania, South Australia, and New South Wales.
 1.57 p.m.—JOHNSTON'S STUDIO BOYS:
 Della Cossar, Soprano:
 "The Tit-Larks."
 1.58 p.m.—ELLA RIDDELL, contralto:
 "I will wait One" (Collegiate Clark);
 "My Heart's Desire" (Constance Clark).
 1.59 p.m.—TASMIN TIERNAN, Cello:
 "Robin Adair."

for ALL reception

A Five Valve Receiver

Farmer's now offer a most handsome decorative model of the new 5 Valve Receiver, in genuine laminated figured American Walnut, inlaid with Burr Walnut. This exclusive model has a single dial control, and each stage is totally protected with aluminium shields. Supplied with high-grade accessories and loud speaker, and erected in any suburban area, free of charge £52/10/-

For Weak Batteries

Balkite Trickle Charger, at 4 amps., prevents sulphating and buckling and need never be disconnected, the accumulator being charged whilst operating receiver. The operating maintenance is practically nil. Price .. £3/10/-

"B" Battery Eliminator

Philip's "B" Battery Eliminator, does away with "B" batteries. For those desirous of an inexhaustible "B" battery supply, this instrument is invaluable. Has milliamperc output of 55 millamps, with absolutely no hum. Price £8/15/-

Wireless in Schools.

By "Hermen."

THE peculiar contribution of radio to education has been recognised by no less a body than the National Association of Schoolmasters of Great Britain, which has just published officially a pamphlet report of the Birmingham Association of Schoolmasters, Lord Burnham, proprietor of the "Daily Telegraph," says in his foreword: "Combined with the proper agencies of personal influence, of book learning and of practical instruction, broadcasting will certainly enlarge the whole world of primary teaching and, perchance, give it a finer and more lasting quality."

The report, as Mr. Temple says in "The Journal of Education," does not err on the side of rashness. It admits that only actual experience can settle the question as to whether children can take in most from the voice or the printed page, and which makes the most lasting impression. That is the issue always being argued at all universities, whether it is best to go to lectures or to stay at home and read. With children, radio talks, should, it is safe to say, be followed by questions, and possibly by written work, as with all other oral lessons.

The talks on "Current Topics," "Musical Appreciation" and other general subjects given from SLO on Thursday afternoons are so designed that they can be used as material for the teacher to work on by using the ideas presented for essay work, and "fixing" them by question and comment.

Special attention is being paid by D.G. Melbourne, to these Educational talks. The directors of that station have always strongly advocated the adoption of wireless as an educational help, especially in schools removed from the great centres of learning, and have voluntarily blazed the trail by providing these weekly sessions, which are conducted by an educationist of undoubted standing and are now widely availed of throughout the country.

NATURAL DEVELOPMENT.

The Directors of SLO Melbourne do not look upon these decentralised transmissions as particularly novel or enterprising, but as a natural development of broadcasting, and the fulfilment of their obligations to provide listeners with the most comprehensive service possible. To provide this great country service, SLO relies mainly upon telephone land lines for relaying, but it happens sometimes that one is not available. This does not deter SLO Melbourne, whose engineers have constructed a portable transmitter, which can be erected at the location, whether it be on land or sea at a moment's notice.

Readers' Queries Answered Here.**QUERIES**

Will readers kindly note that all technical queries are answered through the columns of Wireless Weekly. There is no occasion to send either stamp or addressed envelope. The only condition is that the number of questions be limited to four. We unfortunately cannot deal with technical queries by telephone or by personal callers.

T.M.G.A. (STRATFIELD)—Q. 1: I have purchased two TAB. 10 volt rechargeable cells. Please tell me where they can be bought.

A: Call on Latimer Wireless Supplies Ltd., 153, Chancery Street, London.

NEUTRODYNE (UNFIELD)—Q. 1: I am building the Neutrodyne described in Section "RADIO" and I am installing an eliminator that does not provide a separate R.F. coupling, could I join the R.F. and the A.F. valves to the one terminal on the eliminator? I desire to keep the simplicity in the heterodyne cabinet as far as possible?

A: Yes, it is necessary to connect the R.F. and A.F. valves to the one tap, or if preferred you can link the R.F. and the detector valve to the detector tapping. Try both ways. It is always wise to keep the eliminator two to three feet away from the receiver. Try for yourself.

W.W.M. (KOGARAH)—Q. 1: Will you please tell me how to wind the coils for the Kinks Two Valver?

A: On a three-inch former wire ten turns as a primary, half-inch inch away start winding on a turn of turns. The relation consists of 25 turns commenced 1½ in. away from the end of the secondary. The wire may be 32 gauge D.C.C.

Q. 2: Would 150 turns of 24 D.C.C. wires as the L.tin. former make an efficient choke?

A: Yes.

H.H.R. (WEST WYALONG)—Q. 1: I have built the Hardness Two Valve Radio Receiver and get satisfactory results at this distance. Will it be possible to replace the last power for a power valve?

A: I should not advise this.

Q. 2: Would Cossor or Midland two-roll power valve be suitable?

A: No, but one or two of them.

K.P. (LAWRENCE)—Q. 1: Now that radio is on us, may I suggest that you give us an article on conversion of ordinary four or five valve receivers from outside social arrangements to loop aerials.

You may have given an article on this matter before. However, this would be an opportune time for a repetition.

You have just told us something about making a loop, now how about telling us how to make it fit our ordinary receivers?

A: Yours is a very good suggestion and will be attended to in the near future. Many thanks.

C.S.J. (DOUBLE BAY)—Q. 1: Could you tell me if I can substitute hexagonal cells for the R.F. transformer in the "Kinks" 2-valve set? And, as what number of turns may they consist of?

A: See reply to W.W.M. (Kogarah).

V.F.N. (RICHMOND RIVER)—Q. 1: Could former wound coils be used in the PI Series circuit instead of unsightly coils outside on front of the panels?

A: Yes. Use a vario-coupler which you can wind yourself. The aerial coil may consist of 50 turns of 24 gauge wire on the 3-in. former and the reaction coil 49 turns on the former. Gordon makes the frame vario coupler, and any advertiser in our journal can supply you with these parts.

SOLODYNE (RAY)—Q. 1: Will you describe how to terminate a loop aerial to the microphone receiver?

A: Remove the Q connection from the first screen, and also the F connection from this screen, and substitute the frame aerial screen over these two points.

J.W.M. (EAST KEMPSPEY)—Q. 1: Were I to add one stage of audio amplification to the rice neutrodyne, would it bring interference stations on a loud speaker?

A: Yes; it certainly should.

G.P.V. (ARTHURVILLE)—Q. 1: How many units does it take to fully charge a 6 volt 30 ampere hour accumulator?

A: This all depends on the charger you use and how far run down the battery is, when it is put on charge. It is impossible to answer this.

CHUM (YARRAMAN CREEK, Q.—Q. 1: If I install a wave trap on my three valve receiver, would it cut out static?

A: Not unfortunately, it would not. The purpose of a wave trap is to eliminate the interference from a broadcasting station which is operating close to the wave-length of the station which you desire to receive.

Q. 2: Does a wave trap cut down volume? A: It is frequently used, but you have no need for a wave trap in your vicinity.

Q. 3: If lightning struck my aerial, would it jump the gap in the lightning arrester, or would it travel through the set and burst the valves?

A: You are cheerful. I am afraid that if lightning did strike your aerial there would only be a smid of copper in the air, where the aerial once had been. The purpose of a lightning arrester is to provide a path to earth for any static energy collected by the aerial. Do not be afraid of lightning striking your aerial, as it is very seldom such a thing has happened since aerials were first thought of.

A.J.G.H. (MURGARAH)—This subject will be dealt with shortly.

B.E.Y. (GORDON)—You may have to install a wave-trap if the scheme suggested in the Rice Neutrodyne is not effective. A five valve neutrodyne is a very good hill-round receiver.

R.G. (BRUNSWICK)—We have completely sold out of this issue.

A.L.H.U. (GLEBE)—I would rather see you with your serial about 75 feet overall. A 400 valve thiomagnet will suit your purpose.

A.F. (BALMAIN)—Certainly make your antenna permanent. Have you tried reversing the connections on the 20 turns portion of the coil?

G.H.C. (LEICHHARDT)—Raise or lower your antenna until the best charging rate is obtained. You can find this easily by connecting the output leads of the rectifier in a glass of water, and when connected to the electric mains, the negative lead will bubble much more than the positive lead. The position of the aluminum which gives the greatest bubbling is the correct charging rate.

E.W. (GLEN INNES)—The De Forest D.L. 7 valve is a power valve consuming $\frac{1}{2}$ an amp. at 6 volts. The D.L. 8 consumes $\frac{1}{2}$ an amp. at 3 volts.

M.F.G. (SEACLIFFE, S.A.)—Probably there is some open circuit in your receiver, to test the continuity, paying particular at-

All Readers' Queries Answered—continued.

tension to the contacts of the valve sockets, and incidentally note that the filament of the valves are not leaning on the grid. It is evident that the detector circuit is at fault, so it behoves you to test carefully, not overlooking the grid leak, which may be faulty, again reverse the primary connections on one audio transformer, to eliminate the squeal you speak of. Probably again, the primary of the first audio transformer has broken down.

E.G.R. (DEXLEY).—It is not practicable.

H.A. (ENMORE).—I will deal with this matter in article form very shortly. See "RADIO," 18/4/27.

L.A.K.E. (GOODMAH). Q.—Use A.A.C. as detector and B as a Neutrodyne aerial. The H.F. choke must be dispensed with if a good quality audio transformer is used. If a decent vehicle is used, this is an indication that an H.F. choke is necessary.

B.B. (UNDERCLIFFE).—See W. Harry White, Coburg and Pitt Street, mentioning this paper.

Q. 2: Would amperites be to advantage using UX129 dry cell valves?

A.: Yes, most decidedly.

F.G.W. (NEUTRAL BAY).—Q. 1: Re Rice Neutrodyne, could the coils mentioned as being wound on 3-inch diameter formers be wound on 2-in. diameter formers; if so, what gauge

of wire and how many turns do you suggest?

A.: On a 2-in. diameter former wind 90 turns, using No. 20 gauge wire.

C.M. (MARRICKVILLE).—You will find the information you seek in this issue.

T.P.S. (BURWOOD).—See this week's paper.

F.G. (WENTWORTH FALLS).—See October "Radio."

A.M. (TYMPLE).—Leave your coils as they are, but pay attention to the correct handling of your rheostat. A wave trap would certainly help you.

W.J.C. (ARMIDALE).—You probably have a high resistance earth. Look carefully to the B battery supply in your detector valve, and you may find it wise to substitute a .001 grid condenser of the present size. Use a 5-mic. leak. Regards.

L.R. (WARWICK).—Yes, by all means build the 3 valve Relays.

R.J.E. (BURWOOD).—Call at this office. I will be very happy to see you.

V.S. (COORAN).—Thanks. We have taken your advice.

J.F.E. (MORTDALE).—I have no record of any previous letter from you.

W.M.T. (WEST CROYDON, S.A.).—It is very difficult to diagnose a complaint of your type without seeing the set. Probably one or the components may have gone wrong. Test the continuity.

F.D. (MANLY).—Use D.E. & H.F. valves in the radio stage.

E.R.H. (BROKEN HILL).—Don't attempt to use a 3 coil holder in this receiver.

H.C. (WARWICK).—You would really be better off with two accumulators, although your own suggestion will suit for a few occasions.

J.D. (CASTLE HILL).—Install a wave-trap, and leave your condensers as they are. Transformer A.

H.J. (MANLY).—I have no idea what it was.

V.W.B. (NORTH SYDNEY).—Circuit Q.E.

PUZZLED (SUMMER HILL).—Use a .0003 Condenser in series with your aerial.

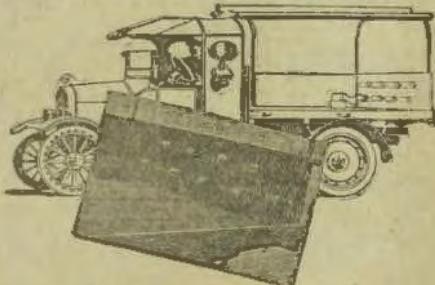

E.S.A. (CRESSNOCK).—Install a Macleanian Tone Purifier. You are evidently overdriving your rheostat.

R.D. (BRISBANE).—You are fired up in this issue.

L.S.H. (SHEFFIELD, T.).—It is very difficult to give an accurate table of capacities for a given number of plates with variable condensers to lay, as the makers of each brand have different cross-section areas of plates and different dielectric constants.

G.W. (COORANGONG).—Many thanks for your suggestion, for I am afraid to be impracticable.

C.W.H. (KOGARAH).—400 turns No. 20 gauge enamel wire wound on 1-in. former will make a satisfactory R.F. Choke.

EIGHT "LOTUS" Valve Holders fitted with large power valves, and fixed to tailboard of Ford Motor Lorry, driven over rough roads for 30 miles, survived the test.

At the finish, each spring was as it started—perfect. No damage or looseness at connection of leg socket and spring—no valve loose from the holder. Both were electrically perfect all the way.

Fit the "LOTUS" to your set, and protect your valves.

Lotus Valve Holder,	
3/8 each.	
Lotus Valve Holder,	
with Grid Leak, 6/8 each.	
Lotus Valve Holder,	
with Terminals, 3/8 each.
