YEARS OF RADIO

A PRIMEDIA Publication

ANY SOURCE TO ANY FADER!

THE AUDIOARTS ENGINEERING D-16 IT LOOKS EXPENSIVE — BUT IT'S NOT!

THIS NEW RADIO CONSOLE from Audioarts combines the benefits of a ROUTER and an AUDIO CONSOLE into one COST-EFFECTIVE digital package, letting you route any input to any fader or to any monitor feed, with all sources clearly shown in bright LED dot matrix displays right above the faders and monitor level controls.

A COMPACT TABLETOP DESIGN, the D-16 has the features you need: both analog and digital PROGRAM and AUDITION stereo outputs, 2 MONO analog outputs, 14 input faders plus 2 caller faders, 4 mic preamps, control room and studio monitoring, built-in cue and headphone amps (with concealed headphone jack) — even four internally generated mix-minus outputs!

WITH 24-BIT A/D and D/A inputs and outputs and sample rate converters on every AES digital input, the D-16 will work with virtually any digital source gear you have. It can run your source machines too (up to eight of them) — all opto-isolated. Its DSP DIGITAL METERING simultaneously displays VU columns and peak hold fullscale digital so you can be assured of pristine performance. Its powerful caller tools generate mix-minuses automatically, and you can program any of its four MXM outputs to be pre or post fader.

And with Wheatstone's extensive digital background and reputation you can be assured that the D-16 is a great console!

ON THE COVER:

Telephone codecs make easy work of point-to-point audio distribution, and they're smarter than ever before. Cover design by Michael J. Knust.

You'll find
"Dielectric
quality"
all over
this tower.

Literally.

"From base to beacon" –

that's the scope of products and services we provide at Dielectric. It's also the primary reason why we are the world leader in Digital Broadcast Technology.

We have the capability to do the job, the resources to do it right, and the experience to complete it on-time and on-budget. Put Dielectric to work on your next project and experience excellence from base to beacon...and everywhere in between.

THE WORLD'S 1st

STEREO POTS

AUDIO CODEC

Hear it at NAB Booth N3034

Introducing the all new iMix G3

iMix G3 features a brand new super charged DSP platform that combines studio mixing power and new POTS/ISDN, GSM and data codec capabilities never before offered in a 16 x 9" sized remote mixer at such a low price.

The world's first 15kHz stereo POTS audio codec can deliver live stereo remotes or stereo studio links over dual POTS lines. A new Dual Mono feature also enables the use of one 15kHz POTS channel for main program and the second 15kHz POTS channel for a range of on-board IFB including production/engineering talkback and live on-air callers. You can even send your broadcast program to two locations.

A miniature expansion slot accepts a range of new hardware modules to suit individual remote applications such as GSM to landline for wireless remotes, Stereo/Mono ISDN, Stereo or Dual Mono POTS plus new IFB and front panel controlled live on-air caller facilities.

The on-board six input digital mixer can be easily configured for non-technical users or as a fully featured studio mixer including on-off channel buttons, cue, intercom, telephone caller control, LAN/RS232 interfaces and one button control of local and remote control relay inputs "and" outputs. You can even adjust your remote talent's audio input levels from the studio to ensure their levels are always perfect.

An optional Digital Router software kit will allow any of the six audio inputs to be routed to any audio output, giving you the tools to create a powerful and flexible studio environment in the field. iMix G3 will also connect to your existing Comrex* or Musicam* POTS codecs

One bad apple

On the eve of NAB2004, I am making the final preparations for my week-long stay in Las Vegas to focus on our industry's biggest event. For the staff of *Radio* magazine, the work involved in preparing for a four-day convention starts in January. We devote space in the March and April issues to the convention. We compile a weekly e-mail newsletter for several weeks leading up to the convention. The NAB convention fills our days as we review new product announcements, exhibitor news and session highlights.

But once the April issue is sent to the printer, we're still not finished. Our pre-convention work is done, but now we have to focus on our activities during the convention and make plans for the convention review after it's all done. This is a lot of effort for four days of the year.

So, now I look ahead to what this year's convention will bring. In preparation, I try to determine what the big item of discussion on the convention floor will be.

Will it be IBOC? Perhaps. The FCC is allowing the use of separate antennas with an STA. Several manufactur-

ers have provided peeks into their new products. Several sessions are devoted to the technology. It doesn't take any special insight to know that IBOC will once again be an important topic. However, this is a familiar topic and I don't expect a great deal of new discussion.

Will it be RBDS? Also a strong candidate. The recent explosion of RBDS installations is generating interest in the 10-year-old technology. RBDS provides information that satellite radio listeners have learned to expect. Meanwhile, some consumers are confused by the technology, thinking that it is digital radio. Regardless, transmitting RBDS today is an analog step that can be adapted for IBOC tomorrow, so it will also be heard regularly in discussions.

Unfortunately for us, the big topics this

year will likely not focus directly on technology. Consolidation will return as a frequent topic for aisle banter, but it won't be the star.

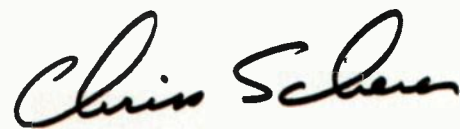

The big topic this year will be indecency, thanks to the FCC and the consumer media that keep feeding this monster. It's amazing how a little skin during a primetime broadcast can become a point of obsession for so many bureaucrats. Is this by any chance an election year? Because decency is tempered by opinion, there is no easy answer here, which is why the debate will rage on and on.

I am pleased that Congress plans to increase the fines for airing indecent material. Not only will the licensees have to pay more, the performers will also be held financially responsible. AFTRA opposes this action, stating that it will limit free speech. AFTRA also states that on-air personalities are forced into airing indecent material because of programming decisions. Sorry, I don't buy that. No one writes the script that forces a show host to say certain words. In the end, an individual's own sense of decency should take over before airing a potentially offensive bit. Likewise, we shouldn't expect to hear children's programming on an adult-oriented morning show.

The debate over decency standards cannot be resolved through legislation or FCC rules. There is too much opinion involved. Parents that are concerned about their children being exposed to indecent material need to take positive action. Supervise the children's access to questionable material. Teach the children what is decent. While out of place in the family-oriented telecast, the incident during the Super Bowl was tame compared to what is readily available online or on cable.

While the decency issue goes on, there is a technology angle to be considered. Now that stations are walking on eggshells to ensure that their programs are clean, the lowly profanity delay has risen to a renewed level of importance. So while the chit-chat turns to rhetoric, watch the rejuvenated interest in the technology of delaying an audio stream.

I guess there is a technology angle after all.

GET IN ON THE ACTION

Delivering the sound of the finish line to listeners around the world is as simple as pressing a button. The Comrex Matrix, equipped with our optional GSM Module, combines an integrated mobile phone and an advanced Comrex codec to deliver broadcast quality 7kHz audio over standard cellular connections (15kHz over POTS).

The results? Your listeners hear the sweat pouring off the winner – the sound of a skin-of-the-teeth victory with detail that's unprecedented.

Grab your audience by their ears and give them the full experience – not just a story.

Doing a remote? Put Comrex on the line.

Concerning combiners

By John Battison, P.E., technical editor, RF

Until the advent of FM, combiners were rarely required. After FM was introduced, the need for a method of feeding two or more FM frequencies into a single FM antenna developed. AM operation had already made it obvious that antenna-originated signals from an adjacent station could feed back into the final stage of a transmitter and produce internal cross modulation. Unfortunately, much shorter wavelength of FM transmissions requires critical spacing in terms of electrical degrees when establishing a filter system.

Figure 1. The general layout and connections for a typical combiner.

In the old days, there were few diplexed radio stations. As vertical real estate became more valuable, and stations started locating two or more AM transmitters on the same tower, i.e. multiplexing.

The components used for AM multiplexing are inductors and capacitors, which are finite in size and power handling ability and susceptible to external influences when operated at higher frequencies. The lower frequency of AM operation means that lumped components can be

used, and adjustment is less critical than for the FM band. Hand capacity has less effect, and adjustment is simpler, although it must be just as precise.

Evolution of terms and usage

As FM operation increased, stations needed a method of combining two FM outputs into a single FM antenna. The shorter wavelength of FM means that spacing between individual components must be measured in terms of wavelength or electrical degrees. In some cases, coaxial cable is not suitable because the electrical length required is less than the distance between the units. To overcome this problem multiple cavity units were developed using common interior walls. The actual connection between each cavity is a hole in the common wall. This obviates the need for coaxial cable connections with possible electrical length and space problems.

The combiner bears no physical resemblance to the LC combinations found in AM filters. In fact, most combiners look like metal tanks with coaxial cables attached. Combiners form an unusual tuned circuit consisting of a cavity with one or more loops or probes connected to the coaxial cable. A cavity may be circular or rectangular. When the cavity is excited by the desired RF frequency a tuning rod system or probe is adjusted to tune the cavity to resonance.

A cavity resonator can oscillate in many different modes. The major mode is obtained by adjustment of the fine-tuning probe as the cavity is tuned to resonance. The mechanism of a cavity resonator can be compared to an LC circuit using small values of inductive and capacitive reactance with the internal surfaces of the cavity acting as the LC units.

Although cross-coupled bandpass filters have replaced notch filters, it is important to know how a notch filter functions. Its purpose is to prevent an undesired signal from passing. It has a similar effect to a series-resonant LC circuit that is used in AM diplexing. Notice that the notch

Figure 2. An integrated notch filter and bandpass filter design.

Make your stations sound better

Announcers tell us, "I'm doing my best shows ever!" after they get Scott Studios' SS32.

Stations sound smoother and tighter, with all the songs, spots and sweepers digitally on hard drives, played instantly with a finger on the touchscreen. SS32 was designed by announcers so it's the most intuitive, most user-friendly and most popular digital air studio.

In fact, more U.S. radio stations have Scott Studios' systems than the second and third ranked vendors combined!

Simple and paper-free

Your scheduled spots, songs, promos and live scripts appear in your air studios automatically from traffic, music and copy computers. Six *Start* buttons at the left play your program log. Your announcers can rearrange events by touching any "cart" label, then touching any other log location for an instant move. Or touch the *Log* button to edit any part of the schedule.

24/7 Technical Support: 888-SCOTT-411

8 8 8 4 3 8 7 2 6 8
1-888-GET-SCOTT

Color coded labels

Scheduled events have legible labels with titles, artists, years, trivia, intros, lengths, endings, advertiser names, outcues and announcer initials. They are color coded by category. The pie chart at the bottom of the screen counts down intros and endings at 60, 45, 30, and each of the last 15 seconds.

Instant Play cuts at any time

On the right, 30 sets of Hot Keys (each with up to 30 keys and rotating up to 100 cuts) start anything on the spur of the moment. Instant Play buttons gracefully fade out with a second touch. Hot Keys show lengths, count down as they play and can be reprogrammed in a second or two.

SS32 has several screen layouts and graphic styles so each user can tailor their own display. By adding a second touchscreen, you get twice as many simultaneous functions from the one SS32.

Hour

Stack

A B C D E F G H I J K L M N O P Q R S T U V W * Y *

The world's fastest requests

When you touch the *Songs* button in the lower right corner of the main SS32 screen (on the previous page), you activate this Wall of Carts touchscreen with all your songs online! Whatever's on the air, plus the next five events, are always visible at the left. Touch the tune you want and it plays instantly. Or you can *Stack* several songs to be added to your playlist wherever you want.

You can jump immediately to the title, artist, length, year or category you want by touching the desired display's button, then first few letters of the song name on the alphabet at the bottom of the screen. Songs are displayed any five ways you want.

Each song shows the date and hour it last played, along with when it's scheduled to play next.

Songs and other recordings can be restricted to appropriate days and dayparts. Unauthorized selections don't even show up on the Cart Wall. You can prohibit changes or require a password for changes on a shift-by-shift basis.

A total of ten user-defined Cart Walls are provided for songs, spots, jingles, sound effects, comedy bits, promos and other categories. They can play immediately or be added to the log.

Hear it before you air it

With Scott's SS32 digital audio, the same song, spot and any recording can be on the air and auditioned in all your studios at the same time. Simply touch *Preview* and any label to listen to the start or end of that song or spot in your cue speaker.

Experience is the Best Teacher...

Scott Studios has the Most Experience

It's a fact: More stations pick Scott Studios' air studio systems than the second and third ranked vendors combined.

Of the 25 largest broadcasters, 24 use Scott digital audio systems, including Infinity, Cox, ABC/Disney, Entercom, Citadel, Radio One, Cumulus, Univision, Emmis, Spanish, Journal and more.

KPWR (FM), Los Angeles, and Big Boy won Marconi Awards for Major Market Station and Air Personality of the Year. Emmis uses SS32 at KPWR (FM) and KZLA (FM), Los Angeles; WKQK (FM) Q-101, Chicago; KSHE (FM), St. Louis; and 11 more.

Dozens of Infinity/CBS stations use Scott Studios' systems, including legendary 50 kW KMOX (AM), St. Louis; KILT-AM-FM, Houston and clusters in Phoenix, Denver, Cleveland, Austin and Kansas City.

Brother Jon Rivers, long-time host of "Powerline" and "20: The Countdown Magazine"

uses his Scott SS32 daily on his nationwide K-Love morning show. Jon is shown with his wife and co-host Sheri Rivers and recording artist Jaci Velasquez.

Here's Cox's WMMO FM air studio, using Computer Concepts' Maestro and EpiCenter for all digital audio. Cox stations use Maestro almost exclusively.

Citadel is a 200 station chain that standardizes on Scott systems. SS32 is shown here in use at WTRX, Flint, Michigan.

Spanish Broadcast uses Scott SS32 in New York, Los Angeles, Chicago, and Miami, where WCMQ-FM's Barbie Simons and Susy Leman are pictured.

Radio One uses 62 Scott and Computer Concepts' systems in all of its 22 major markets. This SS32 is on-the-air at WHHH (FM), Indianapolis.

Live copy on screen

Your studio *can* be paperless! Live tags, promos, contest copy, music trivia, winner and request lists can be read or edited on your Scott SS32 screen. Copy can have security codes to prevent unauthorized changes.

Copy can also come in from news, copy or office computers.

Fingertip log editing

Another paper-free feature of SS32 is the ability to edit anything on available logs. Touch any event, then *clear* (delete) or *copy* and where you want it to go. There's also a *swap* function and *manual insert* (by keyboard).

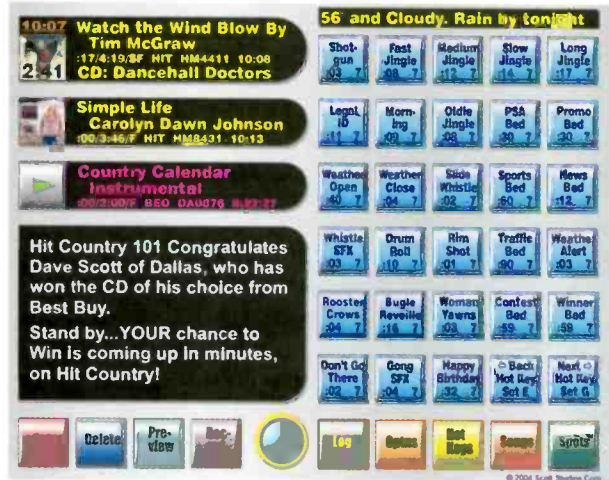

Fast phones

Every time a jock answers the phone, it's auto-recorded. No need to start, stop or make labels (unless you want to).

Editing and airing great phones is as quick as a flash! Scott Studios' visual waveform editing lets you "rock reels" and "scrub" audio to hear and see edit points clearly. Pick out the best parts of phone calls for pacing and interest.

Recordings can be labeled as any cut number, category and name. Out-cue and start/end date/time can be entered. Play new cuts right away or put them in the log to play later.

Scott's *Make Good* button jumps to missed spots or songs at a touch. Log changes are password protected with different restrictions for each shift, category, function and user. Logs can be viewed or edited from any computer.

Jocks can see any 15 events to back announce music sweeps and promote upcoming songs. The on-air event can show at the top, middle or bottom of the log.

You get printouts showing everything that airs, with details when changes are made. You get clear discrepancy reports. Scott works with all traffic and billing or music computers for accurate billing and automatic reconciliation or affidavits.

Total Audio Control

Scott's *Live Mode* lets announcers assign each recording to a specific "cart deck" player with its own console fader. Every event can be started manually or our Auto-Segue can start the next event for you.

Logged cuts come automatically into the "on deck" area at the bottom. By touching that label and then the desired deck, the jock assigns each cut.

Auto-Segue has a fail-safe to prevent dead air if a needed event isn't manually loaded in time. Recordings can be moved to play from any fader.

SS32 Has More Features, Flexibility, Power

Production you already know

You save time because Scott *eliminates dubbing*. SS32 uploads spots in seconds from Adobe Audition, Cool Edit, Vegas, Sadie, Audicy, WAVE, MPEG II, MP3, Cart Chunk, apt-X and most other digital systems. Spots, actualities and songs can be recorded—and played—in any Windows PC.

With nobody back at the studio, SS32 can air wireless PDA actualities for remotes, news, sports or weather.

Perfect timing

Scott Studios' Stretch and Squeeze gives you exact 30 and 60 second spots for network spot substitutions—without voices sounding funny or any pitch shift.

Remotes by Internet

Scott Studios gives you money-making, public relations and public service opportunities to run remotes on short notice. SS32 works with a wireless PDA from anywhere. With a wireless laptop, you can adjust SS32 levels, play requests, fine-tune your log and read live copy—without a board operator.

Invincible

Scott is radio's leader in reliability and redundancy. Invincible includes a hot standby SS32 with hands-free auto-transfer. It's one reason why so many stations in New York, Chicago, Los Angeles, Houston, Dallas and other high billing markets choose Scott.

Within your budget

You choose: industrial or desktop computers. SS32 works with *any* hardware. You pay only for software features you'll use, so Scott systems are in *your* price range.

The best CD ripper

Save music dubbing time and improve your audio quality with Scott's TLC CD Ripper. It transfers five minute songs to hard drive in 15 to 20 seconds with direct digital quality!

Pre-dubbed music

Your startup library can already be on the hard drive when your SS32 arrives. Ask for details.

Website and HD Radio displays

SS32 sends your on-air song title and artist—even ad text or news and weather—to new digital radios. Your Internet site can also display album covers and trivia.

Start right

Scott Studios makes it easy for you to hit the ground running. We send a training technician to teach Scott School at your station. We spend a week working closely with your people. New customers tell us they're happier and more comfortable with SS32 within the first hour than they ever were with another digital system after years.

Stay right

You benefit from the *best training* and *toll-free phone support* from our large staff of experienced radio people. 24/7 help is as close as your phone.

SS32 is Best, Live or Voice Tracked

Power users prefer SS32

Scott's optional second touchscreen lets announcers respond as fast as they can think. Every function is at their fingertips all the time. They can read live copy, edit phone calls, modify logs and play anything from the Cart Walls.

Seamless console interface

Most modern consoles can remote start most SS32 events. SS32 can control many console functions, simplifying shifts and helping jocks.

Voice Tracker®

Broadcasters repeatedly tell us that our Voice Tracker is their "secret weapon." Their stations sound better and save money. They overcome most problems they formerly had with announcers.

Every SS32 perfectly plays all recordings made in any Scott Voice Tracker, whether built-in to SS32, production, or added to an Internet computer.

Scott's Voice Tracker works "wet." The announcer records while hearing song endings, segues and song beginnings in headphones. Timing, levels, delivery and content can be perfect. It shows the time when a track will air, along with when each hour will end with logged music.

Scott also offers inexpensive "dry" Show Recorder software. Your announcer sees your music schedule but hears only his own voice while recording. Log and voice track transfers are automatic.

Voice/Music Synchronizer

You also get Scott Studios' exclusive Voice/Music Synchronizer. Every Voice Track can link to any adjacent song. If there's any reason the song doesn't play, a generic line by the same announcer substitutes automatically. He won't talk about one song but play another.

Segue editor

You can fine-tune timing and levels to perfection. Both SS32 and Scott's Voice Tracker give you complete control over music, announcer, sweeper and jingle transitions without any re-recording.

Distant City Voice Tracker

Nobody does it better than Scott Studios! With DSL or faster Internet, heads and tails of songs are automatically delivered to the distant city announcer's headphones. Music libraries don't have to be duplicated or manually copied. Finished voicers transfer and air with no staff attention.

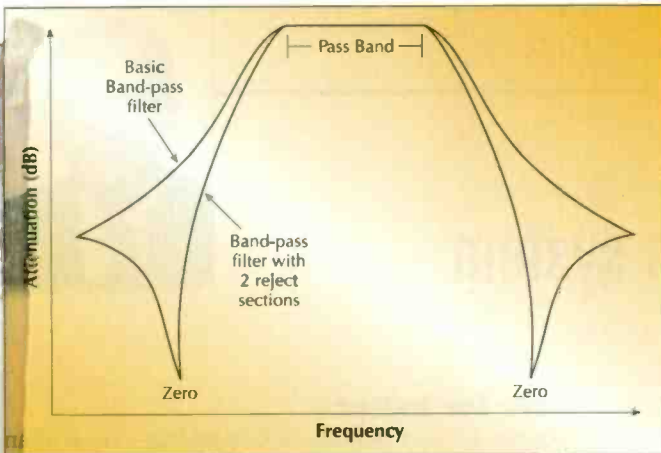

Figure 3. Improved response to a bandpass filter with the notch filter added.

filter is connected from the transmission line to ground. Its job is exactly what its name implies: to remove, or notch out, the undesired frequency.

Because of the need to observe correct system electrical degree spacing between cavities, and also sometimes for convenience, combiners are often constructed as integrated units consisting of two or more cavities. When this is done a rectangular iris, or opening, is made in the common wall of the cavity.

Cavities may be regarded as sections of coaxial cable whose size is determined by the need to obtain the

Figure 4. By adding a feedback circuit, the bandpass is improved as is the group delay.

optimum impedance of about 77Ω and avoid excessive power loss. In a cavity of 48" by 24" the tuning probe may be 3" to 6" in diameter, depending on the power level, and extend as much as 30" into the cavity.

Getting better

As bandpass filters became more popular composite notch filter and bandpass units were developed. The notch filter is formed as part of the total cavity structure with a cavity opening directly into the first section of bandpass filter. Any undesired signals that reach this bandpass filter are taken care of by the notch filters if necessary. Insertion loss and size increase with added BP sections.

Figure 3 shows a desired bandpass characteristic curve and the impact of notch filters at each end. Full bandpass utilization has become increasingly important as the FM signal becomes more complex and broader. A formerly unconsidered factor is known as group delay. The finite time required to pass through a filter increases with distance from the center frequency. Excessive group delay

will introduce distortion.

To reduce insertion losses, improve bandpass operation and reduce size, the cross-coupling shown in Figure 4 has mainly replaced the simple bandpass filter. A lower power feedback coaxial line is connected between the first and last bandpass cavities. This provides a parallel transmission path that is tuned to cancel out unwanted frequencies at each end of the filter. This results in a bandpass characteristic that does not introduce excessive group delay and is similar to the one shown

in figure 2 without using notch filters.

The input and output loops have to handle the full transmitter power. Smaller, low-power loops are also mounted in the input and output cavities. These form part of the feedback circuit and are connected by the small coaxial cable.

New tower notification system

By Harry Martin

The FCC has adopted a Tower Construction Notification System that is intended to help guide broadcasters through the often difficult process of determining whether the site selected for a new tower is, in fact, taboo because of any number of historic, cultural or Indian tribal considerations.

The voluntary system facilitates review of proposed tower sites and alerts new tower proponents if their proposed construction might be affected by the site's proximity to sites of historic, cultural or Indian tribal religious significance.

The new system is not intended to supplant the government-to-government consultation process with federally recognized tribes. That process is mandated by the National Historic Preservation Act (NHPA). Nor does the new process alter the FCC's antenna structure registration process. Rather, the new process provides a tool to assist tower companies (and others, including broadcasters, who find themselves involved in the tower construction process) in ensuring that their proposed construction complies with all applicable federal, state, local and tribal rules. The FCC reviews proposed tower construction under the NHPA.

The system allows anyone proposing to build a tower to submit an electronic notification to the Commission about the proposed construction. The Commission will then provide this information to the relevant entities on a weekly (by e-mail) or monthly (by mail) basis. Those entities may then submit responses back to the Commission, and the Commission will forward those responses back to the notifier. Information regarding any proposed tower construction site nationwide will be sent to every tribe unless a tribe asks the FCC to limit notifications to a specific geographic area. Each State Historic Preservation Office will receive notifications relating to proposed tower construction at locations in their own state and any adjacent states.

More for better

Despite the fact that the FCC is adding—rather than cutting—a middleman, the new system (in theory) should help abbreviate the often lengthy historic preservation review process. The system streamlines the process, providing one-stop shopping for tower proponents: They provide the FCC with the notification, and the Commission then handles the dissemination of that information to organizations that might be affected by the proposed construction. This replaces the alternative, hit-and-miss system in which would-be tower builders attempt to identify and contact all parties that might hold an interest in the historic, religious or cultural value of its proposed site. The FCC's new clearinghouse method should reduce the time committed to review, and broadcasters may therefore reduce the time, effort and money invested in a tower construction project.

Note that this new system is voluntary. You are not required to submit notification of a proposed tower if you don't want to. But whether or not you do provide a notification, you will be required to comply with the NHPA, even if you are not aware of any sites near the proposed tower that might be of any historic or cultural or tribal religious significance. So while the new system is not a free pass around the statutory obligations relating to the protection of certain culturally significant sites, it may help unsuspecting tower proponents avoid the unpleasant surprise of learning that their construction cannot proceed as planned because of NHPA-related concerns.

To use the notification system, turn your browser to <http://wireless.fcc.gov/outreach/notification/> and click on the notify button. You will then be prompted to provide an FCC registration number (FRN) and associated password, after which you will be required to provide information about yourself and your proposed tower construction.

Martin is an attorney with Fletcher, Heald & Hildreth, PLC, Arlington, VA. E-mail martin@fhhlaw.com.

Dateline:

Radio stations in Michigan and Ohio must file their renewal applications on or before June 1, 2004. Renewals must include the Ownership Report (Form 323 or 323-E) and the EEO Program Report (FCC Form 396).

Also on June 1, stations in Illinois and Wisconsin must begin their pre-filing renewal announcements.

"State of the art technology
in digital consoles and routers
for radio and TV"

BC2000 D Digital Console

- Cost effective and flexible design.
- Multipoint intercommunication and easy multi-studio management capabilities.
- Flexible inputs and outputs allocated to faders.
- Design adaptable to digital and analog environments with all basic broadcasting functions built-in.
- Enhanced interconnectivity between engines through MADI multi-channel links.
- Modular surface control with motorized faders; positions stored on pages.

BC2000 D Router

The same router used by the BC 2000D console works as a stand-alone router, with 2048 inputs and outputs, summing and processing, with a scalable and modular architecture.

For more information on the BC 2000D Digital Console visit our Web Page

AEQ also offers excellent communications and audio equipment

- Stationary and portable ISDN audio codecs and telephone hybrids.
- Advanced multi-channel talk show system.
- Multiplexers, analogue mixing consoles, AD converters, monitors and digital commentary system for large sport events.

The alphabet soup of **Codecs**

What better way
to get connectivity
from the field or
outside location?

The term codec describes the function of encoding and decoding audio to pass through a defined data path. In radio, this term carries a more specific meaning to include the system used to send and receive audio as well as the encoding algorithm, interface and connection schemes. The first applications of a codec in radio were hardware devices for Switched 56 and ISDN service. Despite the more general use of the term codec to mean a coding algorithm, such as Layer III, G.722 or Apt-x, in radio we continue to apply it to the entire transmission system and not just the algorithm. It's easier to call the device a codec instead of a switched or fixed communications service interface for bidirectional, fixed-bandwidth transmission links with an audio encoder/decoder to accommodate the limitations of the transmission medium.

While the industry will continue to use the terms in their already-defined uses, for clarity here we'll refer to a codec as

the complete transmission device and the coding method as an algorithm or an encoder.

Codec usage in radio has become second nature. When they were first introduced, codecs were magical devices that were difficult for non-technical people to understand. Today there are few challenges remaining when providing a high-quality audio

Resource Guide

A sample of available codecs

While the Resource Guide is far from a complete list, it should provide enough basic information to help you get started.

The Telos Systems Zephyr Xstream ISDN transceiver includes MPEG AAC (Advanced Audio

Coding), low-delay AAC-LD, Layer II and Layer III coding algorithms. An Ethernet port allows for streaming over IP and also networked remote control. It is available in a rack-mount version, rack-mount version with mixer (MX) or portable version with mixer (MXP). V.35/x21, Ethernet-only or ISDN-only options are also available. The mixer version adds a four-channel stereo mixer. The portable version provides the mixer as well and also adds a rugged, road-ready portable chassis. The mic inputs feature selectable AGC/limiter processing presets from Omnia.

Also from Telos Systems:
Zephyr Xport POTS/ISDN codec

216-241-7225
www.telos-systems.com

The Comrex Matrix handles POTS, ISDN and wireless in one package. Available in a studio (rackmount) version and a portable version, it delivers

15kHz full-duplex audio on a single, standard telephone line via an integrated V.34 modem and is compatible with the Comrex Bluebox, Hotline and Vector codecs. It provides ISDN operation using ISO/MPEG Layer III or G.722 via an optional module. With the optional GSM module, up to 7kHz of audio can be transmitted via a wireless provider. The software is flash upgradeable through a multi-purpose dataport. A rechargeable NiMH battery kit is available.

Also from Comrex:

The Nexus and Envoy ISDN codecs, and the Bluebox and Vector POTS codecs.

"If you can think it, Logitek can do it."

WKDF / WGFX Studio Console Configurations

Two Logitek Audio Engines, with a total of eight IO24A cards (up to 96 analog inputs and 96 analog outputs), five IO8D cards (up to 40 stereo digital inputs and 40 stereo digital outputs), and network cards providing fibre optic connections between Engines

- 24 mix-minus buses available per studio
- Supervisor software for complete control of fader assignments/router functions
- Custom scripting provided by Logitek to pass audio and control from the Numix to other studios in the facility that have old analog boards
- vRoute "virtual" router controllers

WKDF: 1 Numix-12 Console w/12 fully assignable faders, access to 8 stereo buses

WGFX: 1 ROC-5 Console, 1 ROC-10 Console, 1 RTE-3 Router Controller

"The limitations of average consoles and routers just don't apply."

–Cameron Adkins, Citadel Broadcasting, Nashville, Tennessee

Take what you know about the average audio router and console and throw out the normal limitations. The Logitek Audio Engine not only can accommodate any input or output standard, analog or digital, but automatically handles all remote machine control functions within the engine and routes those functions to whatever room or control surface at the same time. *This is not your father's router!*

With Logitek at the heart of this facility, I am most proud of what it has allowed me to accomplish here. The Logitek system has taken away the boundaries of the traditional project and allowed me to be a better engineer.

connection from one point to another. What was once a struggle to create the necessary connection has become routine. If a POTS line or ISDN is available, it's easy. If an Internet connection is all that's available, it can be done with a little more effort. Some stations are even finding success with Wi-Fi and other less-proven connection methods.

The MDO AudioTX Communicator runs on Windows 98 and above and uses any standard sound card. The unit can be used with a laptop and connects to all major ISDN audio codecs. The software will automatically detect the codec on the other end and reconfigure itself. The system can communicate via IP or over private leased lines. The software supports a single BRI and communicates via MPEG 2 and MPEG 3 in mono/stereo/joint stereo modes, G.722 and G.711.

Also from MDO: AudioTX Capture ISDN call recorder, AudioTX POTS

+44 121 256 0200
www.audlotx.com

In any outside broadcast or remote setup, simplicity is the key. The operation of the current codecs is slightly more involved than placing a telephone call.

Some configuration of the units is necessary, but even these steps can usually be handled by the least-technical people. Most codecs provide a way to store common settings for instant recall. Instead of manually entering various numbers and selecting types of service, the user can select a setting with an obvious name, such as *City Amphitheater*, and be done. Once the unit is connected, the user dials a number or enters an address, which can also be stored in a phonebook for simple recall.

In addition, many units auto negotiate, meaning that they

A line of streaming audio codecs with three models, all are ISO/MPEG standards Layer II and Layer III fully compliant, with two models also TCP/IP and UDP addressable over the Internet.

Orban Opticodec technology meets the needs of anybody moving audio over the Internet, and of individuals working in radio and TV broadcast, and in voice, music and other audio-on-demand environments. Opticodec reduces the bandwidth required to transmit audio between the source and remote, studio or other TCP/IP, UDP or ISDN receiver location.

Prophet Systems

Introducing

content

ContentCheck is an advanced content delay system tailored for today's anti-obscenity climate.

Now you can record, listen and edit your programs while they are happening, tailoring the programs to your audience, market and timeslot. With over 60 minutes of user configurable delay, you now have the power to edit even more than 7-20 seconds of content, so you can remove the whole joke, bit or segment

from the show and still have the show sound professional. Non-destructive editing enables you to keep the show for audit purposes.

- ✓ Configurable for either compressed or uncompressed operation
- ✓ Works with most automation systems
- ✓ Over 60 minutes of user configurable delay
- ✓ Can also be used for logging delayed and non-delayed dayparts

Buying a digital automation system doesn't have to be complicated and expensive. Isn't it time to upgrade your old system to a Prophet?

sense the equipment on the far end and make the necessary changes in configuration settings. This eliminates the additional effort in set up.

Many functions and overall operation are now universal between codecs as well. Non-technical users have accepted the technology and have become familiar with the concept. Like other technology introductions, initial use may be awkward, but in time becomes simple to use. In many cases, casual users are able to use the technology without much difficulty.

From start to finish

When codecs were first introduced, their specific function required specific hardware. The inner workings of a hardware-based codec have software inside of them, but the software/hardware marriage is optimized for the unit's function. The hardware approach is common in many devices used around the station, and it works well.

Software designs rely on a robust operating system and associated hardware. In a purely hardware package, this can be controlled. The IT side has improved to make software-based codecs practical, as we have seen in other developing technologies. To make it all work, interface hardware—a sound card and necessary modems, terminal adapters or NICs—is required.

Given the proliferation of PCs everywhere, applying the function to a software design was inevitable, and there are several companies today that offer software-based codecs. The software approach can merge the various elements into a single interface for seamless operation of the various components.

The software-based designs provide the same complete system as the hardware designs, but it is eas-

The alphabet soup of Codecs

The golden age of wireless—remotes, that is

By Tom Hartnett

Ten years ago, the word cell phone was defined by a clear set of technical protocols. The word meant an analog modulated two-way radio operating in a band around 900MHz. A cell phone can still be defined this way, although it's getting harder to find them.

Personal communication service

PCS, or digital cellular (2G), was a response to the increased demand for portable phones. Contrary to what digital cellular companies would have you believe, the advantage in PCS is really theirs, as it allows them to crowd many more phone calls into their frequency allotments. Most of us use 2G phones today. Around 1994, a new band was opened at nearly double the frequency (1,900MHz). Three distinct digital modulation techniques are defined for this band. TDMA was adopted by a few North American operators due to its easy conversion from analog cellular. GSM, although similar technically, was an international standard that defined a larger feature set and became popular worldwide. CDMA, based on an entirely different (and arguably more advanced) modulation scheme was chosen by some operators. So the band became a mix of different, incompatible digital protocols. Table 1 shows the national players and their respective digital technologies. Note that with the exception of Nextel, TDMA is in its sunset years.

Real-time challenges

To provide anything better than cell-phone quality audio over these networks, broadcasters must use a data service rather than the voice service provided by the network. Because these were designed for e-mail and Web-serving applications, this is especially challenging. GSM and

The alphabet soup of Codecs

CDMA providers each offer packet-based, high-speed Internet connections (GPRS and 1X respectively), but due to factors such as latency, asymmetry and dynamic allocation, they haven't proven suitable for real-time transfer. They can be useful in non-real-time audio file transfer. So broadcasters must rely on connection-oriented circuit-switched data (CSD) services.

A wireless CSD network can be considered a chain of three distinct links. The first is the actual radio link between the

mobile phone or codec with an integrated phone and the local cell tower. The second link exists inside the network cloud and comprises the trunks that transfer data between the cell tower and a modem pool owned by the wireless provider and residing somewhere in the network. The final link is an analog telephone connection between this modem pool and the modem at the studio. For broadcasters purposes, this would be contained within a studio codec. Obviously, data must move smoothly through each of these links to support real-time audio applications.

CDMA has a problem here. Comrex's testing shows CDMA CSD connections to be packet-based within the network cloud, providing many data stalls and bursts along the chain. This means that unless we want to add many seconds of delay in smoothing buffers, CDMA isn't a candidate for real-time. This leaves GSM.

GSM has its own challenges. The available data rate on GSM is low (9.6kb/s) and requires powerful audio algorithms to provide wideband audio. As an example, the Comrex GSM algorithm reduces

EXPECT MORE FROM YOUR AM TRANSMITTER

Made in USA

Armstrong Transmitter X-1000B

1KW HD Radio® ready AM Transmitter for under \$10K

Built with dual hot-swappable 600 Watt RF modules capable of 150% modulation, X-1000B can bring that major market sound to your radio station. Engineered with the latest technological innovations, X-1000B offers high reliability, built-in redundancy and it is HD Radio® ready.

Best of all, our customers tell us that the money they save running the X-1000B pays for itself with savings in electricity and

maintenance costs over an older transmitter ...and as a bonus they get exceptional reliability and that major market sound for free.

But, don't take our word for it. Talk to our customers already on-the-air with the X-1000B. Call or email for a users list and decide for yourself why owning this transmitter is a no-brainer.

Tel 315-673-1269 / sales@armstrongtx.com / www.armstrongtx.com

® HD Radio is a registered trade mark of iBiquity Digital Corporation.

FMX-30B - SON OF THE THOROUGHbred

As with all thoroughbred lineages there are great expectations for the next generation. The Armstrong FMX -30B exciter exceeds those expectations.

We've refined our workhorse FMX-30 exciter to create a sleek new look and added new features like automatic power control

and an auto-selecting AC Voltage circuit to ensure the excellent reputation enjoyed by this line of FM exciters.

Frequency change is as effortless as tuning your car radio and the FMX-30B is remote control ready. The FMX-30B is perfect as a main exciter or multiple station back up.

XLINK - THE NEW GENERATION OF STLs

XLink is Armstrong's new generation of field proven STL systems. This microprocessor controlled system is frequency agile and requires no tuning across the entire STL band.

It has improved sensitivity and better selectivity than the earlier models. Front

panel LCD display provides easy control and monitoring of system parameters.

The XLink is a perfect platform for your digital conversion as they quickly interface with Armstrong's DX Series of Digital encoders and decoders.

Tel 315-673-1269 / sales@armstrongtx.com / www.armstrongtx.com

The alphabet soup of Codecs

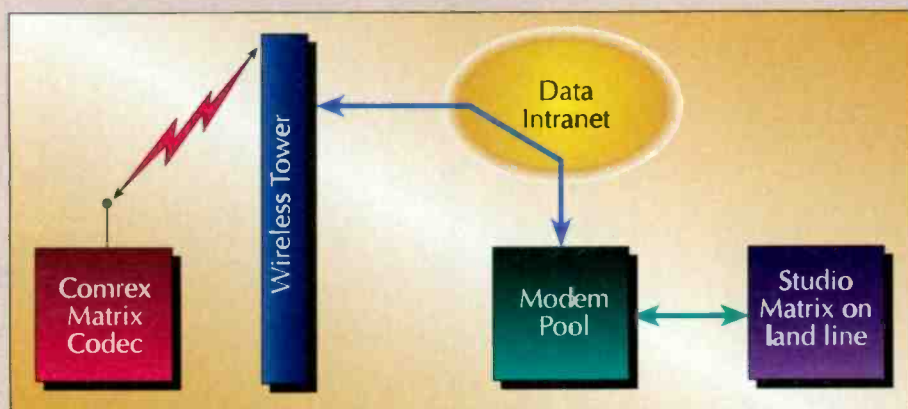

Figure 1. A CSD network will typically have three links.

data by a factor of 30:1 to achieve this. But GSM does indeed provide a steady stream of data from point A to B, so it's the best choice for remote broadcasts.

Can you hear me now?

As anyone with a mobile phone knows, cellular service is prone to fades and dropouts, so it's important to have reasonable expectations in performance. Our experience so far with GSM has been surprisingly good, with many broadcasts able to maintain stable operation for several hours. Comrex has even experimented with units in moving cars, boats and trains with reasonable results (although we can't recommend you move your morning show to your news van). The main issue we see is interference with other mobile phones, so we recommend avoiding traffic jams and other areas with high cell-phone usage.

What's on the horizon for Verizon and the others?

The deployment of third-generation wireless service (3G) has been predicted for many years. The technology promises an incredible amount of digital throughput, as well as infrastructure to support multi-media services (like real time audio). Deployment has slowed due to lack of a killer app and upgrade costs, but tests are underway in a few cities. While this network certainly holds hope for remote broadcasts, what is standardized and what is deployed are often different things. For example, in

several countries where 3G is available, the only point-to-point high speed data offerings are the videophone service. Perhaps concerned about network capacity, carriers have chosen not to allow generic access to the high-speed data channel yet. Because broadcast applications can't dictate which offerings a wireless company will provide (and our killer apps

often differ from the general public), GSM networks remain the best choice for making cell phones sound good. But we continue to keep an eye on new technology deployment in the hopes of making wireless remotes sound even better.

Hartnett is technical director of Comrex.

FACILITY SHOWCASE

Digital magic

in
**Music
City**

By Tracy Pennington, CSRE CBNT,
and Dan Goodman, CBNT

The music matters, but so does
the commitment to the community
and to the station employees.

Music City

Being involved in the building of a true showcase facility is an opportunity that few engineers ever realize in their careers. In early 2003, Cumulus Media purchased two radio stations (WWTN-FM and WSM-FM) from Gaylord Entertainment to add to the existing Cumulus Nashville cluster of WRQQ-FM, WQK-FM and WNPL-FM. This created the need to incorporate the new stations into the existing group as quickly and efficiently as possible. The company decided to completely rebuild the facility, using the latest technology to accommodate the various needs of the stations involved and build Nashville's top radio facility. The result is a facility that revolves around Wheatstone's Bridge Router and G series consoles, where any source is available in any studio.

This is Music City, USA, where live music plays a big part of each of the stations in the cluster, so a

The air studio of WNPL, Blazin' 106.7.

The Super Talk 99.7 WTN control room.

live performance/TV studio was incorporated as part of the overall design.

With the facility's needs identified, the process of making it happen presented a challenge. The existing cluster was located in a 27,000 square-foot, two-floor facility. The entire first floor was used for the three studios, production rooms, management offices and sales bullpen. The second floor was empty and had previously housed *Billboard* magazine. Because the building was occupied, the challenge was to move the sales and management teams into temporary off-site locations while ensuring they had e-mail, fax, phone, traffic and Internet access. Once the staff was moved, the second floor was demolished and new studios for all the stations were built. Then the station on-air operations were moved upstairs so demolition of the first floor could begin.

Thank You, Cumulus

for selecting Scott Studios SS32 as your digital audio systems for your new studios in Nashville!

Also, thank you Emmis, Cox, Citadel, Spanish Broadcasting, Radio One, Entercom, Journal, Infinity, West Virginia Radio, several other recent Cumulus clusters including Eugene, Fayetteville, Flint, Montgomery, Mobile, Davenport, Youngstown and others...plus Nassau, Saga, Piedmont, McDonald, Border Media, Sheridan, Shepherd, American General Media, Triad, Sinclair, Inner City, Quantum, Millennium, Mortensen, Crawford, South Central, Mapleton, Max Media, WMTW, Bristol, Wheeler...and many others I don't mean to forget...they'll be so mad...but thank you...thank you again...

Music City

Once this was completed, the two new properties were relocated to the new building and the sales and management teams returned. In the meantime, satellite dishes were moved, STL paths were established, IT was planned and the engineering staff tended to the day-to-day engineering duties. Sounds simple, right?

Another view of the Super Talk 99.7 WTN control room.

Step inside

The rooms are laid out in pods of two studios with a room in between, an office for the program director and a show-prep space for the talent. The rooms between the studios are used for a talk-talent room, a phone screening room and a DJ mix room, depending on the formats of the surrounding stations. A fully-functioning news room, four production studios, a rack room and a large live performance studio were also built.

The rack room is 400-square-feet with storefront windows consisting of 19 Middle Atlantic racks that house the processing, microwave, satellite and phone equipment as well as the CPUs for the Scott Studios automation system, editing and Internet access for all of the studios. We use Avocent for KVM extension. In a unique situation, the Avaya IP Office phone system will break out all of the BRIs and POTS lines for the studios' Telos 2x12 phone systems. PRIs feed the Avaya and the Avaya outputs 80 BRI circuits for complete digital connectivity to the studios. These BRIs feed all studio telco audio as well as all the ISDN codecs. This system is separate, but networked to the master Avaya system for office use. By using a PRI/BRI/IP approach to communications we can effectively change the number of lines allocated to studios as needed without ordering new lines from the phone company. The IP capability of the system allows us a great deal of flexibility, such as providing a phone set at a remote to answer the request lines with an Internet connection.

A large work area and the chief engineer's office are

Radius-Xo ... studio furniture

the most **POPULAR** furniture lines ever...

FLEXIBLE AUDIO LINKS FROM MUSICAM USA

for STL, Point to Point, Point to Multipoint

For mission-critical audio transmission, nothing beats TEAM™ and SuperLink™. Both give you these advantages:

- Connect directly to T1 or E1 transmission lines
- Support multiple channels of program audio, data and contact closures
- Linear PCM or encoded audio with multiple algorithms
- Streaming audio
- Automatic backup via ISDN

A variety of hot-swappable Function Modules lets you design a system that meets your needs today, and then expand it for tomorrow.

When you have audio to send, TEAM and SuperLink are the rugged, solid and flexible way to go. Call us, or your MUSICAM USA Distributor, with your application requirements.

SuperLink rear panel configured for bi-directional T1 program transmission with automatic ISDN backup.

Music City

located in the rack room as well. The punch blocks are made by Krone. Audio cable to the studios is Gepco 24-pair AES-3 cable (552624GSC). Audio cabling between the racks is Belden Brilliance 1800B AES-3. Two 24-pair CAT-5 cables run the logic between the rack room and each of the studios. For voice and data, there are 12 CAT-5 cables run to each studio from a Hellermann Tyton color-coded patch field. However, almost all of the studio audio is routed through fiber.

Local source equipment, such as mics and CD players, connect to a Wheatstone Bridge satellite cage in each studio. Each cage connects to the rack room via fiber. This eliminates large quantities of trunk cable and further shields the studios from grounding and surge issues. We used six-strand multi-mode fiber. Coaxial cables are extended to each studio via a patch bay in one of the racks for cable/satellite TV, Internet and security cameras.

Taking control

The consoles and routing system are furnished by Wheatstone. The on-air and production studios use G-5 digital consoles, and the Performance Studio has a D-9 digital 32-channel console with multiple buses. All of the consoles are connected via fiber and CAT-5 and are on their own network

The rack room is behind a glass wall facing into the hallway.

administered via software by a dedicated PC in the rack.

The routing system is a Wheatstone Bridge router that provides the capability to route any source to any destination in the facility including the Performance Studio. This allows us to route the Performance Studio feed to any station at any time.

The Performance Studio is designed for live artist performances, TV simulcasts of our talk programming, and it serves as a studio for recording jingles.

With our Nashville location, there are plenty of country music artists that are glad to come in and perform. Because of this, we wanted to build something that was the right fit for that community. The room is equipped with Whirlwind patch panels for instrument direct input, video and data. There are three panels located in separate locations inside the studio. All patch jacks are routed through a digital patch bay in the studio control room.

All of the studios and production rooms are equipped with Scott Studios Automation. Voice tracking for any station can be done from every room so there shouldn't be any waiting time to voice track, which eliminates the frequent congestion of a voice-track room that hinders other clusters.

Meet the team

All of the wiring integration was handled by Studio-works Broadcast Design Group of Portland, OR. Voice and Data integration was completed by Skyline Communications of Indianapolis. The building construction was supervised by R.C. Matthews Construction and Pan-American Electric of Nashville. The architectural design was by KPS of Atlanta. The studio furniture was built by European Cabinetry of Atlanta. Gary Kline, CSRE CBNT, Cumulus corporate director of engineering, oversaw the corporate interests and real estate matters.

Most Cumulus facility installations now place the rack room behind a glass wall to provide an easy view of the equipment, which is impressive to non-technical visitors.

It is amazing—even magical—how the entire project just seemed to come together so quickly, especially toward the end of the project. Strict adherence to timelines and a team effort ensured

AudioTX Communicator Software ISDN and IP Network audio codec for Windows 98/NT/2000/Me/XP ● Uses Standard Sound and ISDN cards

● Connects to all MPEG 2, MPEG 3 and G.722 codecs

● Ideal for Studio or On-the-road use in a Laptop

ISDN &

£500 \$725 €795

IP AUDIO CODEC

AudioTX Communicator is big on audio quality, reliability and ease of use - but low on price.

As an ISDN codec, Communicator offers MPEG 2, MPEG 3 and G.722 coding plus G.711 telephony and is compatible with virtually all other manufacturers' units for outside broadcasts, studio links, voice-over work, reporting and news-gathering.

As an IP-based codec, Communicator works over any IP-based network - from Ethernet to ATM or a Satellite link, Leased-line connections or even over the internet using ADSL, DSL, Cable Modem or other high speed connection

All you need to get connected is a standard Sound card and an ISDN card installed in your PC or Laptop, plus AudioTX Communicator.

By Alex Kosiorek

BURN

The Compact Disc Recordable (CD-R) remains the most common optical media format used in audio/radio production environments. Ever since the CD-R became common as a storage medium for digital audio and data, questions and opinions have addressed which brands and types of CD-R are best, the optimum speed to burn a disc, as well as appropriate ways to label and care for the disc. These concerns are actually increasing as optical media evolves along with the plethora of drives available in the marketplace.

For some, this subject may seem a little mundane. You may have used one type of optical media for ages and haven't had a problem. Or you plan to purchase the least expensive media available, unaware of the variables of optical media. Up until a year ago, I consistently used the same brand media and burned at the same speed without a hitch. I based my choices on research published a few years prior, tempered by personal experience. Then, I encountered problems that I hadn't seen before and was stuck with a hundred-plus CD-Rs with audible errors when played on consumer players. After some research, I found that the composition of the CD-R I was accustomed to had been altered.

With the increasing number of optical formats, faster drives and combination drives on the market, the demand for higher speed media has risen, and media manufacturers have produced optical media to accommodate, making it crucial to monitor the optical media stock you purchase for valued audio productions and archival usage—even if you haven't changed brands.

Faster, faster

With higher speed media, manufacturers have changed the data-recording layer of a CD-R. The data layer of a CD-R is different from that of commercially released pressed/molded CDs and CD-RWs in respects to their composition. A standard CD has a read-only data layer made up of a molded aluminum substrate. CD-RWs data-recording layer is made up of a rewritable phase changing metal alloy. With the CD-R, this layer is made up of an organic photosensitive dye, which can be changed only once by the writing laser of a compact disc recorder. This organic dye will degrade over a long period of time. This degradation can be accelerated considerably by

improper care and storage—eventually making the disc unusable.

This raises the question: What is the best way to determine the best disc for a specific application? First, one of the main variables that comes into play is the type of CD-R recorder being used. There are basically two types of drives: stand-alone CD recorders that record in real time (1x) and internal/external computer drives that burn at multiple speeds. Choose wisely when purchasing CD-R media and ensure that the media type is formulated specifically for that drive type.

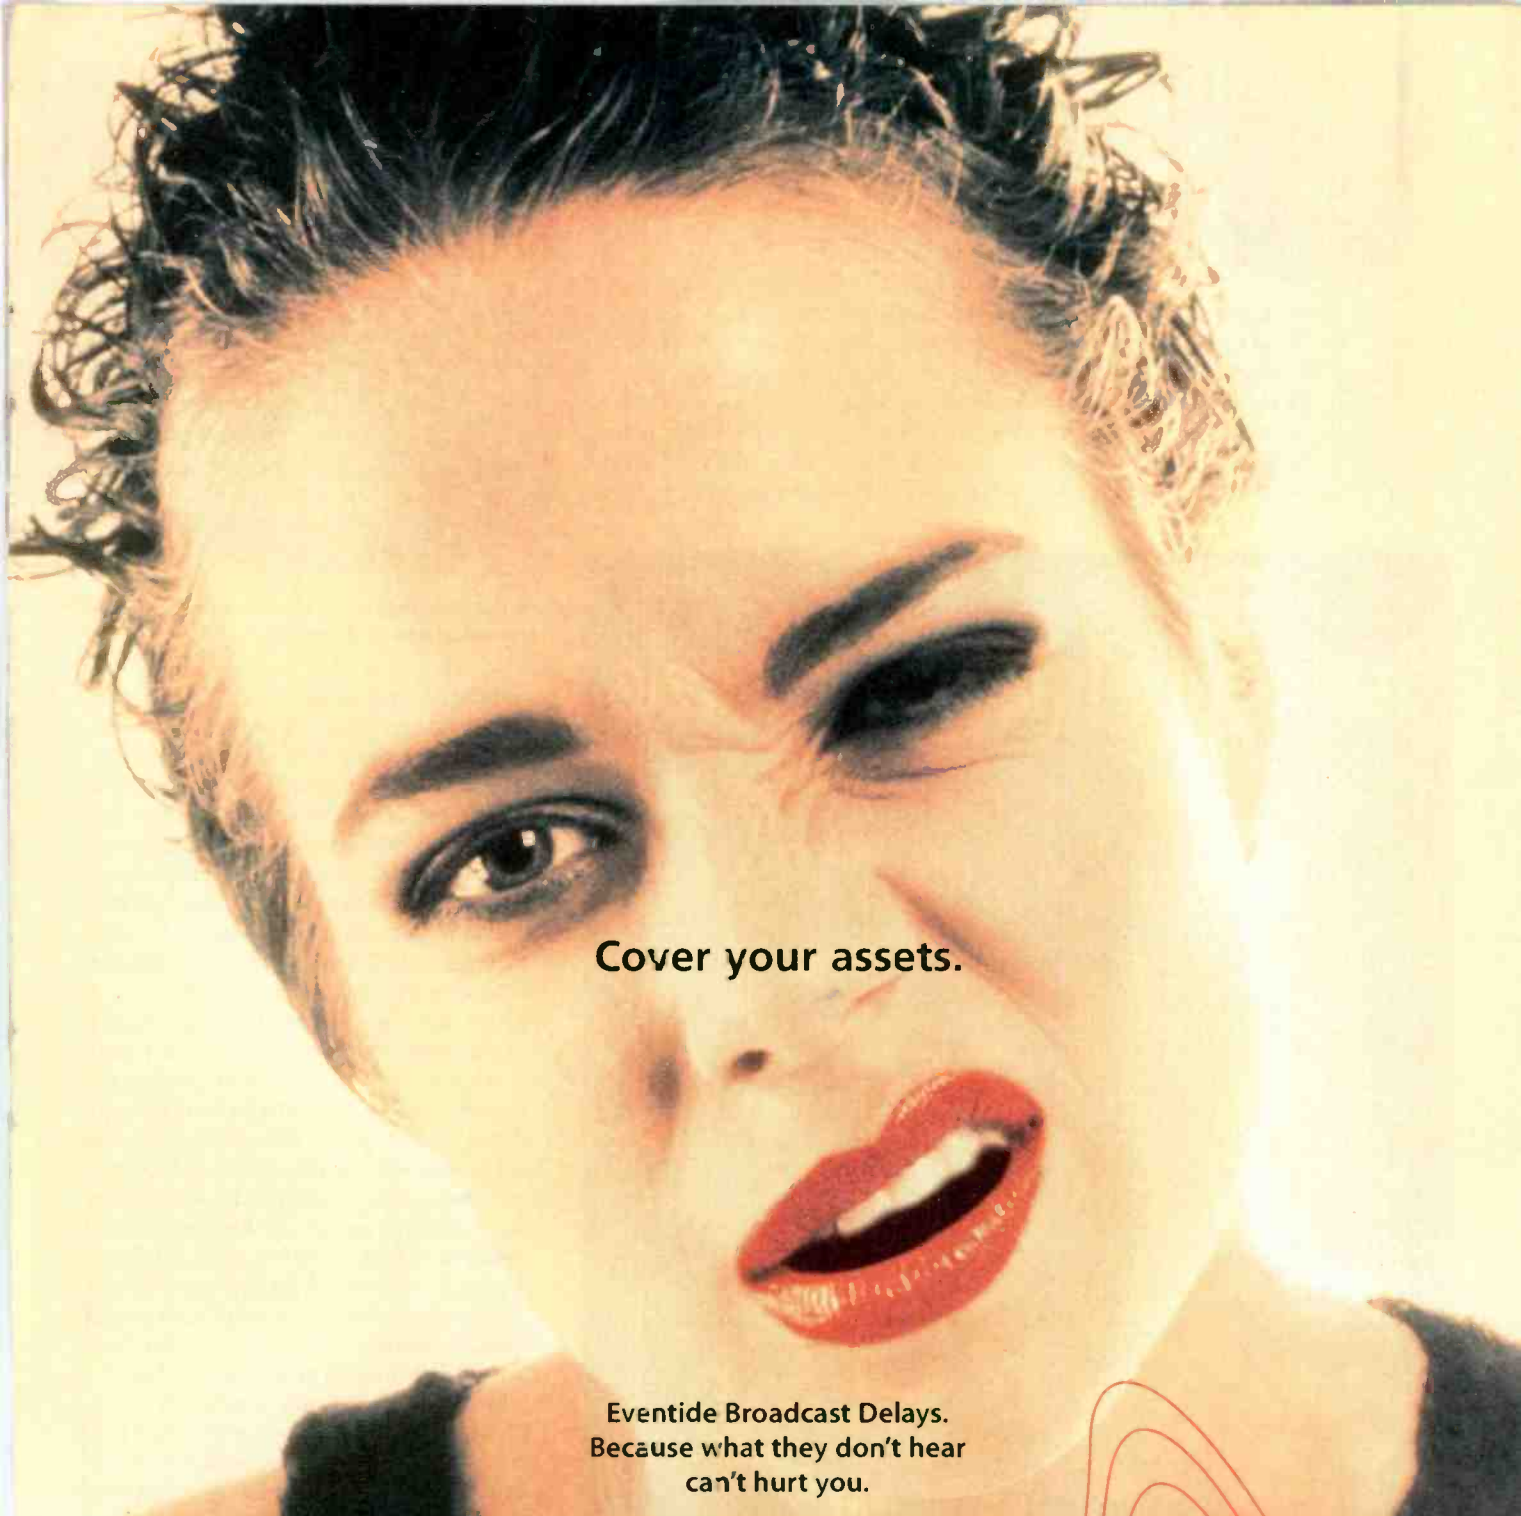

Recordable discs used in a stand-alone recorder should be formulated specifically for slower burn speeds. A disc that is labeled high speed compatible or 1x to 48x is highly unlikely to be formulated for slow burn speeds. Many users of stand-alone audio CD recorders have problems when using media formulated for speed ratings in excess of 24x or 32x. Even if the higher speed-rated disc records and finalizes appropriately in the stand-alone CD recorder, considerable amounts of errors may exist on these discs such that they are unplayable in certain players or the playability may deteriorate over time.

Also, because stand-alone recorders use lower-powered lasers than that of multi-speed computer counterparts, using higher speed-rated discs strain these units, which can reduce component life. Where does one find these lower speed discs? Various manufacturers have them available, many labeling them as music CD-R or audio CD-R. Verbatim produces them under these names as well as Digital Vinyl. Be careful, however, because some of these discs have high-speed ratings. It will take a little investigation to find the lower-speed discs, but a general rule of thumb is: the lower the speed rating the better, and if you see a speed rating higher than 32x, the discs are not formulated for slower speeds.

With computer drives that burn at variable speeds, especially new drives that can burn as fast as 52x, determining the best disc and burn speed becomes more difficult. With all the different types of discs available, there isn't a specific speed that will always produce the best result. Results will vary from one drive model to another, with different media, and in some cases even with different drive firmware. There are several dedicated test tools that evaluate media performance, made by companies such as Clover Systems and Stageteck, easily costing \$5,000 or more. However, there are affordable and practical methods that can help.

Careful evaluation

The first step in evaluating media for a particular high-speed CD recorder, is to read the manual or manufacturer's website to see if specific brands of media are recommended. Ideally, in those cases, the manufacturer has tested the media and tuned the unit for satisfactory results. Be careful, however, of who the manufacturers,

MAXIMUM BURN

or anyone else for that matter, suggests. Most of the media commonly found in big box consumer stores are made by a wide variety of other media manufacturers. Fuji, Imation, Maxell, Memorex, Sony and TDK are several that do not make their own optical media. Those brands are made by CMC Magnetics, MAM-A (formerly Mitsui), Prodisc, Ritek, Taiyo Yuden and lesser-known manufacturers. Even though another manufacturer makes the media, it may not be made to the same tolerances as if it were branded with their own name on the package. In several cases, especially with generic discs, the lowest bidder will create the media, thus the actual manufacturer and quality can change

A CD identifier program will reveal the true manufacturer of the media.

without notice. To determine who makes the media you are using, download a CD identifier or CD info application, which can be found and downloaded through a Web search. A CD identifier will tell you the manufacturer of the disc, as well as organic dye configuration, and other information. Again, buyer beware, some lesser-known media manufacturers can produce a disc that can fool a CD Identifier to indicate that it is made by a major manufacturer.

If you purchase the media recommended by the optical drive manufacturer, and burn at or below one-third of the drive's maximum rated burn speed (i.e. 4x to 16x in a 48x-rated drive), your chances for having problems will be low. For valuable audio productions, use name-brand media from manufacturers that make their own media. Key manufacturers of media include MAM-A, Ritek, SKC, Taiyo Yuden, and Verbatim Data Life Plus (Mitsubishi Chemical). Stay away from generic discs or those that are store-name branded. This is especially true for critical applications.

To determine the best media and burn speeds further, there are some basic tests you can perform. To do so, buy small quantities of quality name brand media. Take the small quantity of CD-Rs you bought and record onto them at different burn speeds (using increments of 4x if possible) with the software and hardware you commonly use, producing playable audio discs. When burning the discs, ensure that the only variable changing is the burn speed. This may be difficult to specify, depending on your application. Easy CD Creator, for example, allows you to select a specific burn speed, but in many cases, you will see the burn speed fluctuate as you increase the requested burn speed. Use the same files and software version for each test. Also, use lengthy audio files that will consume the majority of the CD-R's capacity.

Flushing Away Your Audio Quality?

Swishing and swirling audio is the sad result of bit rate reduction combined with the wrong processing. Unless all sources, storage media and transmission systems are linear the audio will be bit rate reduced at least once, probably several times. Each pass generates more artifacts. Lower quality processing, multiband compression, limiting and clipping can make those artifacts even more apparent. But level control is still essential.

Introducing the new Compellor® 320D - the world standard AGC is now available with both digital and analog i/o. For almost two decades the Compellor has sustained its unrivaled reputation for 'invisible' operation. The same cleanliness of circuitry and intelligence of processing algorithms that make it 'invisible' also make it perfect for processing in the digital domain. The Compellor will not 'unmask' the masking from upstream reductions and it will feed a signal that will sail through downstream reductions.

The 320D fits any plant from all digital to all analog and anywhere in between. Perfect for all HD applications, the Compellor 320D will help keep your great audio great at a price that won't wipe you out.

The NEW ApheX Model 320D Compellor - 2 Channel Compressor/Leveler with Digital and Analog I/O

MAXIMUM BURN

Also note that when producing these discs, it is important that you create playable audio, not data discs, for two reasons. First, audio discs use a different type of error correction than data discs. Second, audio discs are the main type used in our production environments.

Critical efforts

Whenever you are testing or making a critical CD-R (especially one for archival storage or for replication),

burn the discs in disc-at-once mode instead of track-at-once mode method, which is available in many audio and duplication applications. Disc-at-once mode will burn the disc in its entirety without switching the writing laser off. Track-at-once will burn each track separately; switching the write laser on and off. Track-at-once produces errors on the disc, often rectified on playback via error correction. In addition, track-at-once discs do not conform to the Red Book specifications (the standard for audio CDs), thus making them incompatible with various players and not excepted by various duplication facilities.

Another thing to avoid is creating errors when labeling a disc. Do not use a ballpoint pen or an alcohol-based pen. Because the data-

recording layer of a CD-R is located close to the top (label side) of the disc, ballpoint pens can scratch and damage that data layer. Alcohol based pens can dissolve the disc coating, causing data loss. Use a water-soluble ink pen instead. Several media distributors have CD marking pens available. Other precautions include keeping media away from sunlight/ultraviolet light, heat and moisture.

There are several applications that can assist when testing discs. The most thorough program, allowing for evaluation of media, is Plectools Professional by Plector (www.plector.com). Its one drawback is that the testing functions of this program only work with Plector's Plexwriter Premium drive and with its upcoming DVD+/-RW/CD-RW drive model PX-712A. Note that the Plexwriter Premium drive is affordable and highly rated among audio recording and mastering engineers, Nero/Ahead Software and others. Some other useful tools include those listed below.

Useful tools

- CD Speed, an application from Nero/Ahead Software is a free download www.cdspeed2000.com
- CD/DVD Diagnostic from Infinadyne www.infinadyne.com
- Exact Audio Copy www.exactaudiocopy.de

Among Plectools Professional test functions are those that check for C1 (or sometimes referred to as BLER), C2 and CU errors, along with jitter and beta tests (checking the symmetry of the pits and lands of a disc). C1 errors are commonly found on a disc. However, high amounts of these errors can create uncorrectable errors when the discs' playability decreases. The same holds true for C2 errors, however, these along with CU errors (which are more critical) shouldn't exist on a newly burned disc. CD Speed also checks for C1 and C2 errors, but only if the drive supports these test functions. The other useful feature from Plectools is the jitter

Considered by many to be the industry leader.
Broadcast Professionals can count on RadioSoft for fast, accurate radio mapping.

The lower burn speed (at right) shows better jitter and beta level performance than the higher speed (above).

and beta tests. Jitter and beta allow fine tuning to find which burn speeds are best for the media and drive.

I performed these tests using recommended media on a wide variety of computers/drives in our production studios and at home. A greater amount of errors occurred on older drives and inexpensive OEM drives. When using recommended media on newer drives, C1 errors were low and all other errors nonexistent. It was the jitter and beta tests that were most revealing. A lower jitter level (seen in blue) and consistent unwavering beta level (in red) are preferred. For

instance, test results show that the best jitter and beta levels using Verbatim Data Life Plus 48x 74-minute Inkjet Printable Media, burned using Nero 6, in a Plextor PX-708A, in our particular computer configuration is at 8x and 16x. I have observed higher jitter or wavering beta levels at other burn speeds.

Notice the same media used in Rimage Amigo II duplicator produces poor results in this test. These discs produced audible errors when played in certain consumer players.

Another useful, simple test available on Plextools, CD Speed and Exact Audio Copy is the ability to perform a Digital Audio Extraction (DAE) with a basic error report. DAE is a process of extracting the audio from a disc and then saving that audio onto a computer's hard drive in various formats (WAV, MP3). Each program checks, reports and can correct errors while extracting the audio in a slightly different fashion. However, a general rule of thumb is that a DAE of a newly-created disc should report no errors. Users should perform these tests on more than one computer/drive, or at least perform the tests on a different optical drive from the one that the disc was originally created on.

The last of the mentioned programs, CD/DVD Diagnostic offers a unique method to check for errors. It performs what the program calls a readability test. During this test, the program basically disables many

NAGRA ARES-II

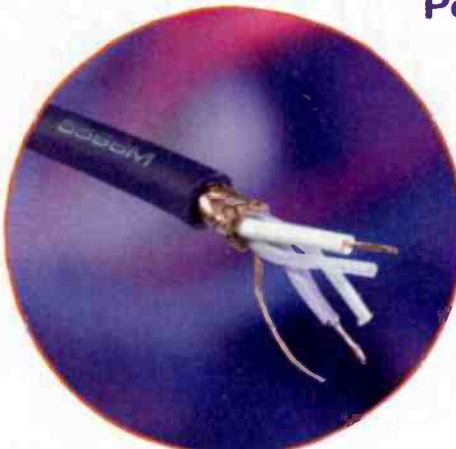

The NAGRA ARES-II records mono/stereo PCM linear or compressed files onto PCMCIA ATA or Compact Flash cards. Linear recording up to 48kHz (stereo) and compressed recording up to 384kb/s (stereo). The unit offers a built-in speaker, separate line and headphone outputs, powering option for 48V Phantom microphones, line input, and auto record function. Operation made simple with 4 sets of settings templates.

MAXIMUM BURN

of the data recovering methods normally used by the reading drive. It then reports on what is called soft and hard errors. Soft errors are those that the reading drive normally would correct without informing the computer. Hard errors are those that may be recovered from if additional reads of the disc are made. CD/DVD Diagnostic and its more expensive counterpart CD/DVD Inspector provide a statistical model of the tests performed to determine if a disc is good or bad. Following the instructions of the program, I found on that newly created discs burned at speeds between 4x and 16x produced little or no errors whatsoever. Soft errors did occur with a discs burned at 32x and above on certain burners, indicating that faster burn speeds produce read errors in various drives. Also, the Rimage-created disc noted previously as having higher jitter levels also produced higher amounts of soft errors using this program.

Because of the multitude of variables with CD-R media, drives and ancillary components, the complexity of determining the best media and drive combinations increases. Performing these tests can be an educational experience. The optical media arena is changing and expanding. However, there are some basic affordable test tools now available to help maintain this equation. Overall,

The same media from the charts on page 53 shows poor results when used in the Rimage duplicator.

the following guidelines will produce the best results:

- Purchase media formulated for your drive and application.
- Use higher rated drives.
- Be cognizant of how the discs are created.
- Burn discs using the lower 1/3 of the drives writing ability.
- Label and care for your discs appropriately.

By taking these measures, your CD-R masters should last a considerable length of time and be able to be read by a wide variety of players.

Kosiorek is the audio recording and mastering engineer at the Corbett Studio at WGUC-FM, Cincinnati.

NEW!

PREVENT LIGHTNING DAMAGE! IMPROVE RELIABILITY! STAY ON THE AIR!

NEW! PowerClamp surge suppressors prevent lightning-induced AC spikes and surges from damaging your equipment!

PowerClamp virtually eliminates the transients, surges, and waveform distortions that cause transmitter and studio gear failures, computer lockups, and unexplainable malfunctions.

PowerClamp will protect your investment and keep you on the air!

Burning Up Your Money On Engineering Databases & Maintenance fees?

Let **rfSoftware** show you how to put out the *fire!*

rfInvestigator

rfInvestigator is one of the *most* flexible programs of its type. An extensive suite of tools enables you to find opportunities overlooked by less adaptable programs. FCC contours, Longley-Rice coverage, interference analysis, and automatic DA design are just a few of the advanced tools available.

rfInvestigator is *twice* the program at *half* the cost!

PL-SERVER

This advanced module allows you to create path-loss files for propagation analysis in rfInvestigator. Save money over and over again!

DB-BUILDER

Db-Builder is a "behind-the-scenes" utility program that downloads data from the FCC website and creates rfSoftware databases for our various products. With Db-Builder you will *never buy* another database!

rfSoftware, Inc.
communications solutions

Visit www.rfsoftware.com today!

Training classes available call 352-336-7223 for information.

rfInvestigator LIGHT

rfInvestigator-Light gives you the power of rfInvestigator for only a *fraction* of the cost. Now single station owners and smaller engineering offices can have an *affordable* tool for serious exploration of station upgrades and *much* more.

rfProfiler LIGHT

rfProfiler-light gives you a *serious* STL path analysis tool that includes a link budget calculator, terrain roughness calculations and a handy units converter. *Registered copies* receive tech support, four blocks of 3-second terrain data plus additional features. *Download a copy today!*

rfDetective FREE!

rfDetective-FM is an engineering tool to help you comply with FCC 73.207 rules when applying for a new commercial FM broadcast station or making changes to an existing one. It allows you to search its database of FM stations and applications based on the FCC's CDBS. *Download Yours Today!*

It's Zephyr's 10th Birthday

What clients are saying about Zephyr Xport and Zephyr Xstream:

"We do a lot of remotes... we use Zephyr Xports for about half of our remote broadcasts. My remote tech tells me 'It doesn't retrain or drop. The connection is very stable.'"

Vic Jester, Market DoE, Radio One, Atlanta

"We sent stereo music and two presenter microphones into the Zephyr Xstream and applied basic limiting using the built-in processor — the mixer is very flexible and easily configurable, making it simple to set up in the field."

Alex Lakey, Chief Engineer, Virgin Radio

"Xport's audio quality is outstanding. The *aacPlus* algorithm provides great fidelity... Every hit, the metal sticks hitting each other, conversations from the field, all were reproduced with great clarity over the POTS line."

Michael Black, GM, WEOS, Geneva, New York

"I was wary of using a compressed link, but the Zephyr Xstream's AAC algorithm is incredible. The on-air audio is the best we've ever had."

James Turville, Chief Engineer, WAY-FM Media Group

"We were out in the mud [at the Bonnaroo Music Festival] and the phone line had been run over by a thousand cars. But the Zephyr Xport worked great!"

Jake Glanz, Engineer, Sirius Satellite Radio

"Zephyr Xstream is in a class of its own, the only codec really worth having for main broadcast ISDN."

More gems from MIB

By Kari Taylor

So many new products to see at NAB2004, yet so little time. Don't wait until you arrive at the convention to decide what you need to see, many of them are right here in our follow-up of product peeks and hidden gems of NAB2004.

On-air control surface **Wheatstone** **Booth N2802**

Generation 8: This control surface offers four faders dedicated to call-in segments to provide error-free interface to four callers or remotes, each with independent caller feed, independent fader feed, user-select-

able talkback communication and adjacent channel linking. A dedicated LCD display screen keeps the operator informed and in control. One CAT-5 cable conveys all the control from this surface to the company's Bridge System. Users can bring any system audio source (inputs or mixes) to any console fader or monitor pot. Set destinations for mixes, aux sends and mix-minus feeds to anywhere in the facility. The surface can store and name switch and fader settings for each operator's task and recall them by spinning an encoder and pressing a take button.

252-638-7000; fax 252-637-1285

www.wheatstone.com; sales@wheatstone.com

S-8: The 8" monitor is a two-way, bi-amplified monitor with dual high-precision internal amplifiers that deliver a total of 120W RMS. The speaker offers a 1" waveguide-loaded silk-dome tweeter that provides smooth, non-fatiguing high end. Rear-panel controls allow for acoustic tailoring with low-frequency boost and high frequency cut and boost switches. Inputs include 1/4" TRS/XLR balanced and RCA unbalanced. All rear-panel controls and connections are recessed into an amplifier panel. The front panel includes separate power and clipping LEDs.

Audio workstation **Mackie**

Booth SL5913

dxB*200 and **dxB*400:** The two units share the same basic architecture and footprint. Both feature dual touch-screen interfaces, 96kHz operation, on-board automation and effects, 25 100mm Penny+Giles faders configurable I/O card cage and a Firewire I/O card option for streaming to desktop or laptop computers. Both are compatible with select VST plug-ins and both integrate Mackie Control Universal functionality for controlling Pro Tools and Logic. The dXB*400, features a 96 x 96 channel I/O matrix and 72 channels of EQ and dynamics at 96kHz. The unit is also equipped with more advanced surround sound functionality that includes 24 buses, flexible panning assignment and complete surround monitoring features.

Studio monitor **Tapco** **Booth SL5913**

Audio adapters
Audioscience
Booth N405

ASI5000: There are initially three products in this series. The ASI5044 provides four stereo inputs and outputs in balanced analog and AES/EBU digital formats. A digital-only version, the ASI5041, has four AES/EBU inputs and outputs and the ASI5042 has balanced analog I/O only. With the ASI5042 and ASI5044, the analog interface is balanced and uses 24-bit oversampling converters that support sample rates from 32kHz to 192kHz. Low noise analog circuitry delivers more than 100dB of dynamic range with THD+N better than 0.002 percent. The transformer coupled AES/EBU interface on the ASI5041 and ASI5044 can operate at rates from 32kHz to 192kHz. The card's sample clock can be synchronized to any of the four AES/EBU inputs. A 200MHz on board DSP provides 12 play streams and eight record streams coupled to a mixer that allows any playstream or physical input to be mixed to any physical output or routed to any record stream.

Dual-transmission audio processor

Omnia Audio

Booth N1416

Omnia-5EX HD: Paired parallel processing paths, one optimized for conventional broadcasting and the other for DAB, webcasting and satellite systems, route processed audio from the multiband mixer section to discrete output stages. The FM section receives distortion-controlled final limiting with pre-emphasis, and an upper-frequency response of 15kHz. The DAB section features a program-adaptive look-ahead limiter and user-selectable frequency response up to 20kHz. New processing algorithms provide clear processing for solo voices and instruments. Bass management controls, with two bass limiter functions, tight and girth, allow users fine control over low frequency processing. Dynamic bass limiter algorithms can change waveform characteristics based on frequency, resulting in deeper bass on smaller speakers.

216-241-3343; fax 216-241-4103

www.omniaaudio.com; info@omniaaudio.com

Open-air headphones
Sennheiser Electronics

Booth N2812

HD 650: Based on the design of the HD 600, these dynamic open-air headphones combine a flat frequency response (10Hz to 39.5kHz, 0dB to -10dB) with natural dynamics. This model features an enhanced bass response and includes an upgraded cable and reduced distortion in the high frequencies, making it useful for editing and mastering applications. Additional features of this unit include matched transducers with tight tolerances (± 1 dB), computer-optimized magnet systems for minimizing harmonic and intermodulation distortion, lightweight aluminum voice coils to ensure accuracy and fast transient response and Neodymium ferrous magnet systems for high efficiency.

860-434-9190; fax 860-434-1759

Voice processor

Symetrix

Booth N1610

Air Tools 6200: This dual-channel, DSP-driven voice processor can handle signal processing of microphone or line-level signals in dual-mono or stereo. Processing blocks are editable from the front panel or from a Windows-based GUI accessed via USB or Ethernet ports, and changes are stored in any of the 1,024 onboard preset locations. Processes include filtering, parametric equalization, compression, de-essing, gating and room simulation. The processor also supports Homer Link, an interconnect protocol that makes it compatible with the Studio Matrix system.

Wireless microphone system Sennheiser Electronics

Booth N2812

Evolution Wireless G2: This second-generation mic offers broader switching bandwidth (3MHz), which in turn creates 1,440 channels available to the user. The bodypack transmitters and mobile receivers have been reduced in size by about 30 percent. The scan function automatically searches for free channels, and the system features intuitive user menu and large backlit displays. The unit also offers a new battery concept. The body-pack transmitters and mobile receivers are powered by two AA cells to ensure a longer operating time and stable RF performance. In addition, a powerful rechargeable battery pack, the BA 2015, is now available for the hand-held transmitter, the bodypack transmitter, the plug-on transmitter and the mobile receiver.

www.sennheiserusa.com; lit@sennheiserusa.com

Wall cabinet Middle Atlantic Products

Booth SL2180

DWR series: This wall-mount cabinet features the Tool-Free Quick-Mount System, permitting easy and quick mounting of the center section to the backpan on the job site. Additional enhancements to the redesigned DWR series include cable management advancements, a new 24" usable depth and optional granite gray powder coat. Advanced cable management capabilities are also an integral feature of the series, which comes in usable depths of 15", 20" and an additional new 24". Two pairs of fully adjustable rackrails can be recessed to allow cable managers to be rack mounted. The series features lacing points throughout the center section and knockout universal connector panels on the backpan that can accommodate BNC, XLR and other connectors.

973-839-1011; fax 973-839-1976; www.middleatlantic.com; sales@middleatlantic.com

Data management system Broadcast Electronics

Booth N1902

Audiovault RBDS: A software-based management system for advanced data services, this system includes data content management and encoding, and it can be adopted for IBOC applications. A traffic announcement function allows a station to cause RBDS radios to pause a listener's CD or cassette in favor of radio programming so that the listener will tune into a station's traffic announcements. The system will also show the alternative frequency function of RBDS that allows a listener driving out of a particular FM station's geographic reach to be automatically tuned to the station's secondary frequency in a nearby geographic region. The RBDS system comprises of content management, at the individual station via a local server on the station LAN, or for multiple stations/clusters via a central server.

Audio workstation

Tascam/Teac

Professional

Booth N2418

2488 Portastudio: This four-track, 24-bit, 36-channel workstation offers a capacious hard drive, powerful signal processing and built-in CD-RW drive. The recording and mixing workstation runs 24 tracks at 24-bits/44.1kHz. Eight inputs can be simultaneously recorded into the inputs. Twenty physical faders control the mixdown channels; each channel has three-band EQ and access to three built-in effects processors. A 40GB internal hard disk gives the user ample space for up to 32 24-track songs and virtual tracks for comping. Plus the 2488 has a USB 2.0 port for back-up via computer. Loop effect provides reverb, delay, chorus and more on an aux send and return.

Energy storage system Active Power Booth C1217

Clean Source DC: This line of battery-free energy storage systems has been enhanced to include expanded power levels and incorporate several changes in the evolving product line. The models provide tightly regulated, adjustable dc voltage to replace or augment batteries configured with uninterruptible power supply (UPS) systems

backing up critical applications in the 100kW to 2,000kW power ranges. These systems are available with unit power ratings of 100, 140, 200, 250, 425 and 500kW, and can be paralleled in combinations up to 2000kW. They accept an input float voltage from 400Vdc to 600Vdc to supply a charging current of 15A to 100A per flywheel.

Armstrong Transmitter**

Booth N706

X Link STL system: An analog STL system, the X Link is a 10W system that replaces the FML10 system. The transmitter and receiver feature microprocessor control that evolves the FML10 to a user-friendly menu driven system. Frequency, power output, signal strength and all metered parameters are available on the front panel LCD display and via remote control. The system's receiver is more sensitive making it useful for long STL paths. This system interfaces easily with the company's two and four channel digital converters to allow a station to add digital audio to the analog platform. The transmitter and receiver operate on 24Vdc, 110Vac or 220Vac.

**Tube mics
Pearl Microphone Labs**

Booth N1300

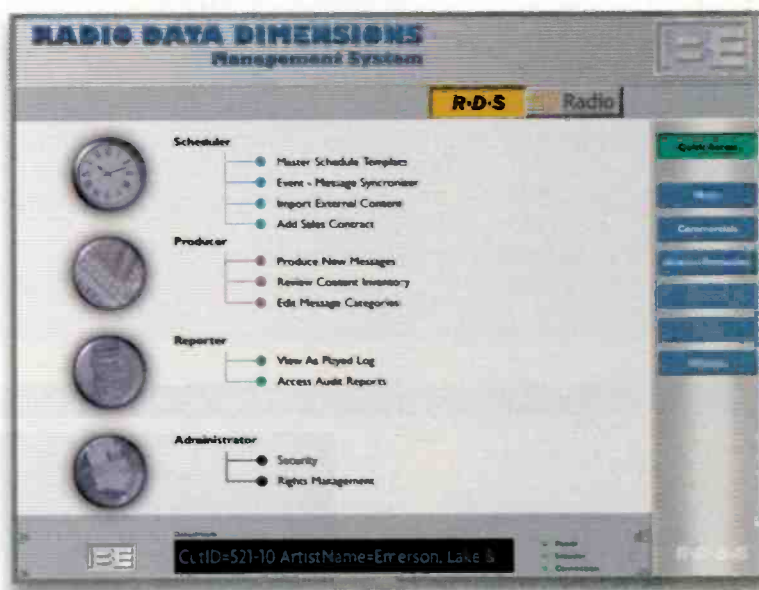

CT40 and DT40: These tube microphones combine the classic Pearl rectangular dual capsule and quality Nuvistor vacuum tube resulting in a flat, warm sound. The CT40 has a fixed cardioid pattern while the DT40 can be configured for five patterns to accommodate a variety of recording situations. Both models are supplied with flight case, power supply, cable and shock-mount. Specifications of these mics include a sensitivity of 28mV/Pa; frequency response from 20Hz to 25kHz; and an impedance of 200Ω.

**Radio Data Dimensions:
Making radio read and write.**

If you're not taking advantage of RDS on your analog FM channel, you may be losing listeners and revenue. BE's Radio Data Dimensions simplifies feeding your station's branding, title and artist information, sponsorship and promotional messages, Amber Alerts, and more. Increase income and listener loyalty using text messages with traffic, weather, or even gas prices from third-party providers. Part of BE's Total Radio Program and Data Integration, Radio Data Dimensions puts you in control of today's RDS and tomorrow's HD Radio opportunities in one integrated management suite.

Contact BE to put your data to work for you.

Compact Flash recorder Marantz

Booth N3026

PMS670: This solid-state recorder offers a one-touch digital audio recording capability of more than 70 hours on 1GB Compact Flash cards. The unit can record in linear PCM and compressed MP3, MP2 and BWF audio formats using 40 assignable audio-quality settings. The recorder features a non-stop record function with four hours of battery life and includes an EDL marking system for creating new files on the fly during recording, providing easy file selection during playback. The system offers variable bit-rate recording with user-adjustable sampling rates from 16kHz to 48kHz. The recorder includes a USB connection that allows it to be linked to a PC or Mac for easy file transfer.

Modular digital console Studer

Booth N700

On-Air 3000: This console is aimed at the mid-to-upper segment of the radio market. The console's operating concept now includes color GUI screens. The system is a modular design and uses the new fanless S-Core DSP engine. The standard fader module is comprised of six channel strips. As many as eight modules may be fitted to provide a maximum console size of 48 faders. Layout options range from an engineer-operated continuity console to a single-fader panel for announcer and newsroom use or a PC-operated system with no physical desk controls. The console offers three main stereo mix buses and an audition facility, four stereo aux buses, 16 mix-minus sends configurable as auxes and three independent studio monitoring/talkback circuits, including two PFL circuits for split desk operation. Individual channels are each equipped with four-band parametric EQ, full dynamics, de-esser, HPF and input/output routing.

Internet transmitter monitoring

Burk Technology

Booth N3702

ARC-16 Web interface: Providing Web-based control and monitoring for the ARC-16 transmitter remote control system, all connected ARC-16 units can be linked to a single Web interface to allow site control from a standard Web browser on any networked PC. LAN/WAN capability provides users the means to control their sites via their local network, the company intranet or from anywhere using the Internet. The Web interface also sends alarm notifications by e-mail or SMS to any e-mail-enabled device. The interface needs only one serial connection to the ARC-16 for Web-based control of all connected units, and the connection from the Web interface to the system may be direct or via a full-time modem. This allows the user to install the system at the transmitter site, at the studio location or anywhere an Ethernet connection is available.

HD Radio:
Guaranteed.

This year, you might implement HD Radio. Or you may upgrade your analog plant and go HD Radio later. Either way, you want to buy confidently, without the risks of rapid obsolescence or unpredictable expenses. That's why BE makes this guarantee: Any AM or FM transmitter you buy from BE today will be compatible with your future HD Radio plans. And you'll get a firm price quote, valid for three years, on BE HD Radio gear.

Choosing BE today will serve you well into the future.

BCM 104 High Resolution
Broadcast Microphone

Think Of It As A Stealth Fighter For Your Voice

Introducing the BCM 104
Broadcast Mic from Neumann

Neumann has been doing a lot of listening lately. We've been listening to the radio, and what we've heard is that the world really does need a better broadcast mic. A much better one. Introducing the first Neumann mic built expressly for broadcast applications. Our new BCM 104 is a condenser mic that can handle any talent that's thrown at it, and make it shine. And best of all, it does it at a price that's broadcaster friendly.

Gain the clear advantage - grab the new Neumann BCM 104, and discover what a difference Neumann can make for your voice.

Field Report

www.beradio.com

RFSoftware RFinvestigator

By Don Mussell

Throughout the years, I have filed hundreds of FCC applications. In the old days (20+ years ago) I had to use whatever tools I could piece together to perform the allocation studies, find open channels, plot the terrain graphs, create contour maps and crunch the numbers. It took several days to do all of the calculations and obtain the

studies, which needed timely license and application data from the FCC reference room. That meant gathering the data by hand in person or using a Washington, DC, service to gather, copy and mail the countless paper files required to provide a detailed and timely source for the study.

Those old days are gone. There are some powerful software tools now available that do most everything that is required to search for new allocations, and also provide the ability to modify and upgrade any existing AM or FM station.

I was given the opportunity to evaluate the RFinvestigator 2.0 suite of programs, and it is an impressive package. Included under the hood of this powerful set of programs are a group of software tools that can be used to complete commercial and non-commercial channel allocation searches. All of the tools I need are here, including open channel searches and studies, contour maps, automatic directional antenna pattern design, terrain profiling and other helpful features. In short, everything that I need to gather, analyze and prepare the data for FCC applications for clients is right here at my fingertips.

By purchasing the optional DB-Builder, I can download the FCC database from the FCC website myself and use it directly with the programs. This alone pays for itself quickly because the FCC downloads don't cost anything.

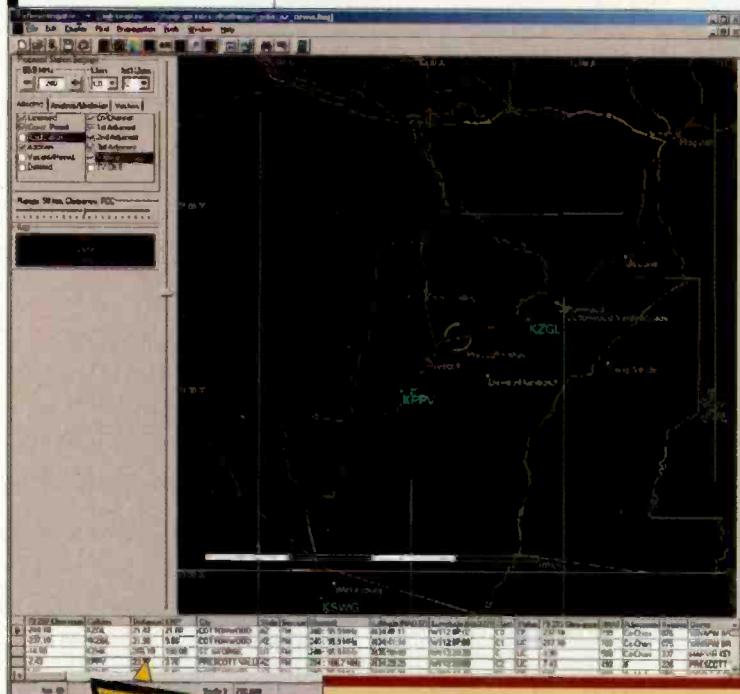

Making it easy

To test the program, I used my 2.4GHz PC notebook and the supplied CD from the company. The program comes with a short movie that explains a typical set of tasks for the program and provides a glimpse at some of the features. The manual is helpful as well, and after a few minutes the

software was loaded and configured. I was ready to try my hand at an FM class upgrade for one of my commercial FM clients. For the most part, the program suite is fairly intuitive and easy to follow. After a few more minutes, I had the station of interest up on the screen, and the open allocation spacings around the station were plainly in view. A couple more mouse clicks and I had an answer for the upgrade question. The answer was yes, but the station would require contour protection and a directional antenna. This might take some time, I thought. But a few more mouse clicks and something I thought impossible was created before my eyes. A directional antenna

pattern meeting FCC rules concerning minimum two-degree variation and power levels was finished and waiting for my inspection before I could even begin to think about all of the calculations needed to do it by hand.

As a test, I decided to try moving one of my client's stations to an adjacent site to determine if the situation would be better or worse from a coverage and interference basis. Once again, I found it fairly easy to compare

Performance at a glance

- Analyzes STL microwave paths
- Calculates population within contours and contour overlaps
- Includes 30-second terrain data
- Three-second terrain data is available
- Antenna pattern tool to design DAs
- Performs free-space and Longley-Rice path loss calculations

topographic maps, and then sometimes a few weeks more if there was a complicated set of protections to be figured into the mix. Non-commercial applications were even more difficult, because those applications required spacing and contour interference

To help determine potential new tower sites, existing tower and transmitter site locations can be quickly mapped.

the sites using the array of tools available within the program. By examining the sites using the Terrain Profiler, I determined that the alternate site had a problem with terrain blocking the signal from full line-of-sight coverage to the city of license. To confirm my results, a mouse click provided a color terrain view that confirmed the size and locations of the hills that would be a problem.

So not only did I quickly figure out a way to upgrade the station, but I also saved valuable time in researching the viability of the alternate site, and all without having to switch between different programs and operating platforms.

In thinking about finding a site for another client to relocate, a new tower would need to be constructed. With another mouse click, the software showed the locations of all the nearby AM broadcast

Editor's note: Field Reports are an exclusive Radio magazine feature for radio broadcasters. Each report is prepared by well-qualified staff at a radio station, production facility or consulting company.

These reports are performed by the industry, for the industry. Manufacturer support is limited to providing loan equipment and to aiding the author if requested.

It is the responsibility of Radio magazine to publish the results of any device tested, positive or negative. No report should be considered an endorsement or disapproval by Radio magazine.

towers, which was handy for determining if a collocation was possible, or if the new tower would be close enough to an existing AM broadcast tower to require a de-tuning network to be added. In short, every time I came up with a seemingly difficult question,

the software seemed to have the answer ready and waiting.

It is obvious that the company has brought some considerable

The Terrain Profiler provides an easy view of the relative terrain between two points.

engineering expertise and experience to this set of programs. Much of what I am used to doing, even with the assistance of various software programs I have on hand, was made faster and easier to accomplish using the RF Investigator. For the serious allocation consultant, or the group engineer or owner seeking to maximize the facilities of any station, the RF Investigator is a fully-loaded and powerful tool to accomplish everything needed to get the most out of any facility.

I only wish I had this wonderful suite of programs to use back when I was doing applications and studies by hand.

Mussell is a consulting engineer in Bonny Doon, CA.

TDM Data Solutions EAScriber Pro

By Kirk Chestnut, CSRE

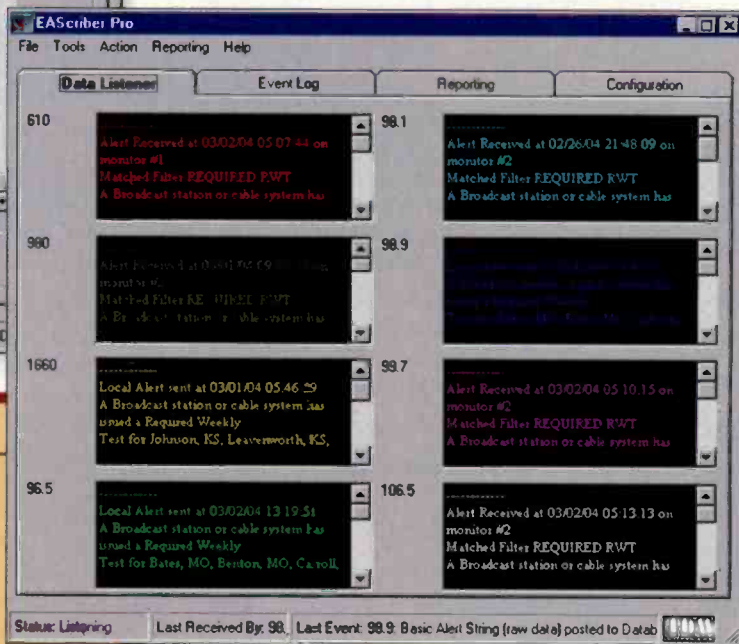

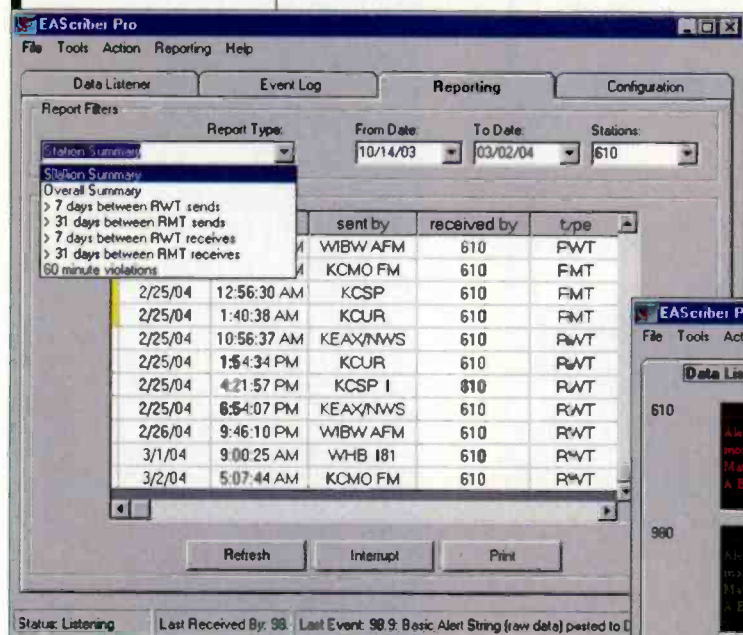

Weather warnings have been pouring into the studios all night about as fast as the falling rain outside. The air staff braces for another round of storms while you try to restore power to a transmitter knocked out by lightning. It's about this time you realize that those tiny rolls of paper in the EAS decoders won't last much longer. The last

data from third-party EAS equipment and stores it as a Microsoft Access database file or as a text log. Equipped with a modest computer running Windows and a multi-port serial card, it is possible to monitor as many as eight EAS decoders. Once the data is captured, the worries of manual logging or replacing printer rolls disappear.

Any Pentium-class computer will do the job. Station clusters with more than two decoders will need to consider the purchase of a multi-port serial card. TDM can supply the needed hardware if necessary.

The base price for EAScriber Pro covers one EAS decoder. Discount prices apply for use with three or more decoders. TDM provides basic software support free of charge. An annual software maintenance fee of 40 percent per year guarantees upgrades and off-site support. Compared to the level and frequency of FCC fines for EAS non-compliance, I found that the purchase price more than justified any potential fine.

Performance at a glance

- Real time EAS activity database logging
- Monitor as many as eight stations
- Redundant file logging system
- Helps to improve compliance with Part 11 EAS regulations
- Database easily integrates with a website
- Reporting feature for creating reports filtered by date and station ID

thing you need to worry about could also be the most critical. Wouldn't it be nice to have all of your EAS equipment logging to a computer?

EAScriber Pro from TDM Data Solutions addresses this problem. EAScriber takes

Put into use

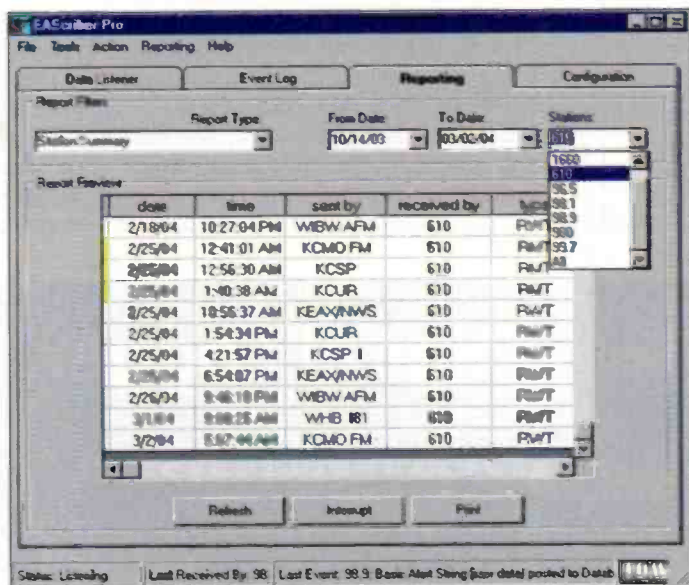

EAScriber is a snap to install. Plug in the serial cards and attach the serial cables to each EAS decoder. Install the serial card drivers and then install the EAScriber software; it's that simple. The program provides four easy to navigate panels for data listening, event logging, reporting and configuration.

The data listening page displays the text output from each decoder in real-time. This information is identical to the printer output. One can view activity simultaneously from as many as eight decoders on this panel.

The event log page shows the raw EAS text as received from each decoder as well as operational notes inserted by EAScriber Pro. Once the log has been reviewed, you may write the log to a file. This provides a means for that regular weekly chief operator review. Log files are named using the date the file was saved.

The reporting page allows the user to customize reports by station, time frame or missed tests. Filtered reports can be generated showing required weekly tests (RWT) sent and received with more than seven days elapsed between tests. The same is true with the 31-day required monthly test (RMT) interval as well as a 60-minute RMT relay violation.

The configuration page manages data port configuration and labeling. The user enters station call letters associated with each respective port as well as the data baud rate. A configuration option is available for the Sage Multi Station Relay Panel system where multiple stations use the same decoder. The system is TCP/IP configurable where RS-232 is not practical.

The reporting features can customize reports by station, time frame or missed tests.

Out of the box

The hardest part of the installation process was getting the data from each air studio to the central equipment room where the logging computer was located. We stretch the limits of RS-232 on a regular basis around the building with runs of 100' or more. To boot, the RF in our facility can create a lot of problems so we run all of our

serial data through shielded CAT-5 cable.

The logging computer we use is a 333MHz Pentium II running Windows 98. The multi-port serial card, which we purchased from TDM, is a RocketPort eight-port PCI card. This computer is connected to our network so files can be shared among the engineering group. We can back up these files to external storage media.

Ours was a perfect application for this product. We manage eight radio stations under one roof, so you can imagine the mounds of paper we would go through just to stay compliant with FCC rules. Situated in tornado alley, Kansas City sees its share of severe weather each year. Invariably, a single storm event will generate enough EAS activity to run a roll of paper dry before the night is over. I'm lucky to get the air staff to take an interest in knowing EAS operations let alone training them to feed a new roll of paper in those little printers.

Once everything was installed, we began testing communications between the computer and the decoder by cycling power on the decoders one at a time. Almost without fail the system worked flawlessly. In a couple of cases, communication was established once I corrected my own wiring mistakes.

Because the computer now logs every move the EAS decoders made, we have deactivated the printers. This made us realize how dependent some of our board ops were on the paper printouts. The whirring noise of the printer was their cue that something was up that demanded their attention. It has

The #1 Selling Digital Logger in Radio

& the most Innovative Automation System on the market,

all at the OMT Technologies booth at NAB!

iMediaLogger

The HOTTEST profanity and indecency Tool for your Station

It's the original, and the number one selling digital logger on the planet - brought to you by the company that invented iMediaTouch, the world's first broadcast automation system.

Used in stations and radio groups all over the country, including all of the top 10 markets, this award-winning product allows you to:

- Simultaneously record up to 12 stereo/mono audio sources
- Supports multiple compression formats
 - MP2, MP3, Windows Media Audio, Real Audio and PCM
- On one record input, create four recordings
 - Example: 24/7 log, mic skim, best of shows and an Internet stream
- Schedule time or closure based recordings
- Remotely configure and manage your iMediaLogger system on LAN/WAN
- Records audio files compatible with all major automation systems

iMediaTouch

Connecting Radio Groups through Superior Technology

New innovative live assist features, stellar satellite interfacing, non-proprietary architecture, great console interfaces and now, a very affordable price make iMediaTouch the most advanced On Air system for any format, any size, or any broadcast duster. The iMediaTouch system is known for its ability to run, and run and run without constant engineering supervision or IT management.

Provide your station with the future of radio automation with iMediaTouch's four proven modules: On-Air, Production, Logtools and Voice Tracking.

Upgrading? iMediaTouch gives your station ease of transition from any current automation system!

Come see an array of new features added to our already popular iMediaTouch 2.0!

The Original. The Standard. The Innovator.

become a case of solving one problem but creating another. Now we use strobe lights to alert the operator to the most serious EAS events, however other means are in the works to give the operator a visual cue to an EAS alert like storm watches and warnings.

For years, we've talked about the tapeless studio. Now we are moving toward the paperless studio. The final crowning achievement will be the development of an EAS pop-up screen for the board op's Internet computer. This will give our board ops the information they need without the extra paper storage.

Chestnut is an engineer with Entercom Kansas City.

The configuration page manages data port configuration and labeling.

INNKEEPER PBX

IT'S A 'KEEPER!

INNKEEPER PBX easily converts your multi-line PBX type telephone system into a professional, affordable talk show console. Simply connect between your telephone handset and the phone base. So simple, anyone can do it.

Winner of Radio World's 2003 Cool Stuff Award.

MONITORING TO THE POWER OF 8.

The ultimate audio monitoring card. Times eight. AudioScience makes broadcast monitoring easier than ever with the amazing ASI8702/8703 6-channel tuner adapter boards. Monitor, log, verify ads and identify content on 8 audio channels simultaneously from just about any source: AM, FM, even TV (ASI8703). An onboard 225MHz DSP processes the audio and routes it out thru DB-9 and 50-pin connectors. Drivers for Windows 2000, XP and Linux are available. Custom configurations available. Call us at +1-302-324-5333 or go to www.audioscience.com.

An **MPEG** *of a different color*

By Oliver Kunz

Low bit-rate audio coding is an enabling technology for a number of applications like digital radio, mobile multimedia applications and Internet streaming (Web radio).

The limited overall bandwidth available for a digital transmission system makes it desirable to use a low bit rate per channel to distribute the audio in the given transmission data rate. Therefore, system designers have to use highly efficient perceptual audio codecs, such as MP3 or AAC, at low bit-rates.

In Internet streaming applications, the connection bandwidth that can be established between the

Web radio server and the listener's client application depends on the listener's connection to the Internet. In many cases today, people use POTS modems or ISDN lines with a fairly limited data rate; lower than the rate that would be desirable to produce an appealing audio quality by means of conventional perceptual audio codecs. Even with connections to the Internet through high-bandwidth connections such as DSL, the ever-present congestion on the Internet limits the connection bit-rate that can be used in a stable manner over a longer time period.

In mobile communications, the situation is similar to the digital radio scenario. Because the overall bandwidth available for all services in a certain geographic area (a network cell) is limited, the system operator has to take measures to allow as many users as

How
SBR
stands out in a crowd

possible in that network cell to access mobile communication services in parallel. For commercial reasons, the network operators have to ensure that they use their available spectrum as efficiently as possible by means of speech and audio codecs. Considering the effect that the advent of multimedia services has on the data rate demands in mobile communication systems, it becomes apparent that even with G3 phone technology, cellular networks will have to use perceptual codecs at a fairly low data rate.

The technical challenge

Using perceptual codecs at low bit rates, however, is not without its downside. State-of-the-art perceptual audio codecs achieve CD-quality or transparent audio quality at a bit-rate of about 128kb/s (about 12:1 compression). Below 128kb/s, the perceived audio quality of most of these codecs begins to degrade significantly. The codecs either start to reduce the audio bandwidth and to modify the stereo image, or they introduce annoying coding artifacts resulting from a shortage of bits in the attempt to represent the complete audio bandwidth. Both ways of modifying the perceived sound can be considered unacceptable above a certain level. At 64kb/s for instance, MP3 would offer an audio bandwidth of about

An **MPEG** of a different color

10kHz or introduce a fair amount of coding artifacts. Each of these factors severely affects the listening experience.

The technical solution

Spectral Band Replication (SBR) is a newer audio coding enhancement tool. It offers the possibility to improve the performance of low bit-rate audio and speech codecs by increasing the audio bandwidth at a given bit-rate or by improving coding efficiency at a given quality level.

SBR can increase the limited audio bandwidth that a conventional perceptual codec offers at low bit-rates, so that it equals or exceeds analog FM audio bandwidth (15kHz). SBR can also improve the performance of narrow-band speech codecs, offering the broadcaster speech-only channels with 12kHz audio bandwidth used, for example, in

Audio bandwidth limiting is common in many forms of audio transmission.

multilingual broadcasting. As most speech codecs are bandwidth limited, SBR is important not only for improving speech quality, but also for improving speech intelligibility and speech comprehension. SBR is mainly a post-process, although some pre-processing is performed in the encoder to guide the decoding process.

From a technical point of view, SBR is a method for highly efficient coding of high frequencies in audio compression algorithms. When used in conjunction with SBR, the underlying coder is only responsible for transmitting the lower part of the spectrum. The higher frequencies are generated by the SBR decoder, which is mainly a post-process following the conventional waveform decoder. Instead of transmitting the spectrum, SBR reconstructs the higher frequencies in the decoder based on an analysis of the lower frequencies transmitted in the underlying coder. To ensure an accurate reconstruction, some guidance information is transmitted in the encoded bit stream at a low data rate.

The reconstruction is efficient for harmonic as well as for noise-like components, and allows for proper shaping in the time domain as well as in the frequency domain. As a result, SBR allows full bandwidth audio coding at very low data rates, thus offering a significantly increased compression efficiency compared to the core coder.

The performance

SBR can enhance the efficiency of perceptual audio codecs by about 30 percent in the medium to low bit-rate range. The exact level of improvement that SBR can offer also depends on the underlying codec. For instance, using SBR in conjunction with MP3 can achieve a quality at 64kb/s stereo that compares to conventional MP3 at a bit rate of more than 100kb/s stereo. SBR can be used with mono and stereo as well as with multichannel audio. SBR offers maximum efficiency in the bit-rate range where the underlying codec itself is able to encode audio signals with an acceptable level of coding artifacts at a limited audio bandwidth.

Currently in the process of standardization, Enhanced AACPlus will further reduce bit rates and increase audio quality for bandwidth-constrained channels for bit rates as low as 20kb/s to 32kb/s.

Applications

The Digital Radio Mondiale (DRM) consortium has defined a global standard for digital radio in the short- and medium-wave frequencies. These frequencies are currently used for low-quality, wide-range radio transmissions, mostly by large global broadcasters like BBC

SBR restores the high-frequency content that was removed to accommodate the encoding path.

World Service, Radio France International, Voice of America and Deutsche Welle. The transmission channel characteristics and the current channel spacing, which will be maintained in the digital system for reasons of co-existence in the transition period, do not allow a high data rate, making this system a good candidate for the use of SBR. Within the DRM system, SBR is used in connection with AAC.

XM Satellite Radio began using a customized AAC Plus audio encoding algorithm with neural audio optimization in April 2002. AAC Plus combines the AAC algorithm with SBR technology. AAC Plus is commercially available for Internet streaming applications, and it is used by Telos, Orban and RealNetworks.

The audio encoding algorithm used by Ibiquity for IBOC is called HDC, which combines Ibiquity's proprietary encoder with SBR.

At the end of 2003, mobile network operators launched the first services to download songs to mobile phones, using AAC Plus. These

providers include mmO2, Vodafone, and SK Telecom.

A combination of MP3 and SBR in a backwards compatible way, MP3 Pro has been integrated into the existing MP3 market. Conventional MP3 players can still render a useful output from an MP3

Pro bit stream, while MP3 Pro players can decode the added information. The performance of MP3 Pro is significantly higher than that of MP3. MP3 Pro at 64kb/s performs better than MP3 at 96kb/s, offering the user a convenient way to improve the storage efficiency of his portable player. MP3 Pro will also be able to improve the fidelity at 128kb/s, allowing true CD-quality storage and replay. At the lower bit rates used for streaming applications today, MP3 Pro will help to increase the audio bandwidth of the compressed signal, giving it a substantial subjective quality boost over current streaming formats. 🎧

FET condenser mic Brauner Microphones

Phantom C: A fixed cardioid, phantom-powered FET mic, this product offers 8dBa self noise, 28mV/Pa cardioid sensitivity and 142dB max SPL at 0.5 percent THD. Complete with carry case and shock mount, this mic is targeted at on-air and voice-over applications.

Compact power amplifiers Crown Audio

I-Tech Series: Each amplifier in this series occupies 2RU of space and weighs less than 28lbs. The units feature a Class I switching output design to deliver power while generating a fraction of the heat of conventional designs. The power supply delivers full

power regardless of ac mains voltage from 120V to 277V and from 50Hz to 60Hz. Power factor correction allows these units to draw current from the mains efficiently, providing more power from a single 20A breaker. The front panel provides an LCD display and menu-based system with full amplifier diagnostics. AES/EBU digital audio inputs are standard, along with balanced analog XLR inputs and passive-through outputs.

STL receiver filters Integrated Microwave

Cavity bandpass filters: These filters are narrow bandpass cavity filters for 900MHz STL receivers. Designed as pre-selector filters, these cavities offer low loss, steep skirts and a rugged housing. Typical uses include rejection of other STL signals, paging services and cell phone noise. Each filter is sold pretuned to the user's exact STL frequency. Ultimate rejection is better than 80dB.

RF connectors Pomona Electronics

BNC: These space-saving connectors are designed for specific applications such as cross-connect panels requiring multiple BNC connections. The 6700/01BNC within-series adapters have nickel-plated brass bodies with gold-plated center contact pins and sockets with a PTFE insulator. The connectors permit parallel routing of cables, horizontally or vertically, for well-organized cable dressings with less stress on conductors. They also offer a 50W impedance, zero to 4GHz frequency response, a voltage of 500V and insulation resistance of 5,000MΩ minimum. The 6717/18/19 coaxial 50W connectors with adapters come with white valox or metal cases, nickel-plated brass bodies with gold-plated center contact pins and sockets with a PTFE insulator. Users can mount two BNC connectors in the same PCB space that was required by one. The voltage is 500V and insulation resistance of 5,000MΩ maximum and it offers a shock og 50G, vibration 20G from 80 to 2000Hz.

Acoustic treatment Realtraps

Microtraps: This product is 2' x 4' and 1" thick, making them lighter than the company's Minitraps while occupying less space. A dual-layer membrane enhances its low frequency absorption. Like the original Minitraps, these are made with rigid fiberglass and metal, so they have a Class A fire rating and can be installed in public venues.

860-210-1870; fax ; www.realtraps.com; sales@realtraps.com

Disk editor SAW Studio

Saw Studio Version 3.6b: The latest version of this product features slower mixer settings and a scrolling-adjustment mode to be less sensitive to small mouse changes. This results in an overall feeling of more control. The SRP/Rec latch operation has been enhanced to automatically detect a marked area and override the latch function for auto punch-in at the marked area. Also, the SRP punch-in code has been adjusted to help eliminate record buffer overruns under certain conditions on certain systems.

Midfield monitors Adam Professional Audio

S2.5 and S2.5-A Nearfield: The high frequencies in these monitors are reproduced by the A.R.T. tweeter, a transducer that squeezes air in and out in a 4:1 ratio instead of pushing it in a piston-like 1:1 ratio. The woofer has an 8" diameter and uses a Hexacone diaphragm. Its diaphragm is 3mm thick and consists of a honeycomb core that is coated with Kevlar on both sides.

These monitors are useful for small to medium control rooms and production or broadcast studios. In its active version, it has a control panel on the front that carries a stand-by switch, as well as tweeter level and shelving filter controls to adapt to different room acoustics.

Structure security alert

Resonant Results

Tower Watcher. This security alert system protects a site from liability, base jumpers, damage, intruders and vandals. The unit detects movement and activates a remote control system. It is a structure security alert with a large-object detector. It monitors tower activity and features a remote-control interface, along with universal mounting.

The system is on duty 24 hours a day, seven days a week.

608-839-3950; fax 608-839-3949; www.resonantresults.com

Talkback monitor Coleman Audio

TB4: The TB4 has four stereo inputs and two alternate speaker outputs that are all balanced on XLR connectors. The control room signal path is passive and uses a stepped attenuator that tracks to 0.05dB for level to the speakers. There is also a balanced stereo cue input and output on 1/4" RTS jacks with a master level control for the headphone amplifier feed. The remote talkback mic is connected with a 12' cable and has a separate level control. The engineer headphone output can select the main signal or the cue signal.

516-334-7109; fax 516-344-1420; www.colemanaudio.com

Plug-ins Sound Toys

Ultra FX: Featuring eight plug-ins, the first to be released is Filter Freak. This is a digital plug-in that captures the sound of analog filtering. Built around a steep 48dB per octave analog modeling filter, nearly any filter character and sound can be created. Some modulation features of this product include programmable rhythmic filtering, triggered envelopes and tempo-controlled LFOs. The unit supports Digidesign's HTDM, RTAS and Audiosuite plug-in formats and Pro Tools HD, LE and Mix systems. The Phase Mistress plug-in combines the warmth of analog phasing with tempo-locked modulation and programmable LFOs. This plug-in's features include true stereo output, programmable modulation modes, MIDI tempo synchronization for remix and dance music, the ability to design sweep shapes for infinite variations of filter sweep effects and adjustable control of the intensity and depth of the phasing effect.

Music scheduling software Micropower

Powergold: This 32-bit Windows music scheduling system can handle simultaneous, multi-user access, and it supports Novel networks, Windows 95/98/ME/NT/2000 networks or peer-to-peer networks with or without Windows NT. The software allows the user to share songs from one central music database. Users can create a music schedule in one database and send it to other databases in the company. Each station then has the ability to automatically merge user-defined portions of that schedule into its own schedule. Open and edit in multiple windows at the same time, such as the schedule editor, the music library and the clocks. Rotate and schedule non-music events with the same power and control as song scheduling from one piece of software.

Amplifiers Crest Audio

ST series: Designed for use in live and fixed installations, this series of amplifiers offers a resonant mode power supply. This technology results in an amplifier sounding like one with a classic linear power supply, without the size, weight and thermal waste. Long-term reliability and efficiency is improved, plus a 20dB lower noise floor is achieved. The amplifiers are built with large storage capacitors in the power supply that

contribute to solid low-frequency performance. Topping off at 1,000 WPC at 4Ω, the largest model, the ST2000, weighs 24lbs. in 2RU. All ST series amplifiers have a frequency response of 10Hz to 20kHz.

Noise filter Drawmer

bandwidth to the highest frequency of input audio. A nine-segment LED shows the high frequency cut off of this auto filter. The unit also offers a downward expander section used to reduce as much as 40dB of broadband noise during momentary silences in the program. When the program begins, the expander release restores full gain. The attack time of the expander is self-setting and the release times are variable with a five-segment LED gain reduction meter. Other features include an overall bypass switch, rumble filter bypass, separate expander bypass and variable filter bypass, plus a stereo link switch. Inputs and outputs are -10dB (1/4-inch unbalanced) and +4dB (XLR balanced) so outputs from -10dB tape machines can be de-noised and converted to +4dB.

Monitor NHThiPro

M-20: This near- and mid-field monitor features a flat, wide baffle across the tweeter and a narrower baffle surrounding the woofer, providing more even dispersion and enhanced imaging over an extended listening

area. There are no parallel surfaces inside the M-20's cabinet, so internal standing waves remain random, affording an improved overall midrange frequency response of 45Hz to 20kHz ± 1.5 dB. The monitor is sold by the channel, and includes a 250W monaural control amplifier that fits in a single rack space. The amp features boundary compensation, listening distance proximity and switchable input sensitivity as well as a diagnostics window to display the average power output, heat sink temperature and line voltage.

Media transfer Teksouth

IQ Light Speed: Designed to provide high speed and secure transfer of media and broadcast data, this system allows the user to transfer files seven to 39 times faster over the Internet or local networks. The system integrates extendable encryption and proprietary algorithms to achieve reduction in media transfer times. This product can transfer all types of media files while managing the security and bandwidth limitations implicit to FTP and VPNs. It allows transmission of multiple compressed, encrypted files asynchronously, with built-in resiliency. This product has an automatic restart (fail over) feature that leads to high fault tolerance. When there is an unexpected interruption of the media transfer, there is a restart of the transfer from the point of communication failure.

Portable digital audio recorder Core Sound

PD Audio-CF: Rather than being a single piece of hardware, this system is produced with inexpensive hardware and software components the user can select to assemble a compact recorder. The centerpiece of the PD Audio system is the PD Audio-CF, a Type I Compact Flash S/PDIF interface with optical and coaxial inputs. The unit can be mounted in PDA hosts that run Windows CE, PocketPC or Linux, or used with laptop and desktop computers running Linux, Windows 2000 or Windows XP. The PDA-based PD Audio operates on rechargeable batteries and can quickly transfer audio data to a laptop/desktop computer via removable solid-state memory cards, removable PC card hard drives, CF card hard disk drives, high capacity external 2.5" hard drives using the PC card interface, SD cards and via wired and wireless LAN.

Satellite receiver Proffline

TRS: The Transline TRS, DVB audio receiver demodulates a single-channel and multi-channel-per-carrier DVB transport stream to the stereo audio output and data output

and was developed for closed network broadcasting applications. An AES/EBU digital audio output, ASI output and X.21 MPEG audio output extends the functionality toward full digital transport and remultiplexing of the transport stream in DVB or DAB without decoding and re-encoding artifacts. The wide symbol rate from 256kb/s to 30Mb/s allows for single carrier per channel and multi-carrier per channel operation. The receiver supports MPEG Layer 2 and Layer 3, analog and digital audio output, X.21 and ASI output.

Interactive media service Yes Networks

Yes: With more than 1,000 radio stations tracking more than two million songs per week in every genre of music, listeners can now identify, interact with and purchase the music playing on the radio, as well as the products and services associated with their favorite songs and performers. By adding two lines of programming code, a station can provide its listeners an easy-to-use tool for identifying songs playing on the air and buying the CD, merchandise and concert tickets. The service works by monitoring radio stations across the country. Using digital fingerprints of each song, the technology identifies the pattern of a song as it plays, matches it against its database and within seconds, presents the name of the song and links directly to the products and services associated with it.

Backup system Tunetracker Systems

Tunebacker: Tunebacker is a double-redundant backup system consisting of two removable hard drives, allowing radio stations to keep one drive attached, to accept daily backups, while the other drive is kept stored in a fireproof box or other safe location. The new system, which is intended for use with the Tune Tracker Radio Automation System, works completely automated and requires no user intervention once installed, other than to swap drives once a week.

Experience Exceptional Quality, Reliability and Service! Experience Armstrong Transmitter!

FM 30000 TX

Our single tube high power FM transmitters offer you exceptional quality and affordable prices.

Built for the "real world" environment, these RF workhorses offer long term reliability and features not found in any other single tube transmitter available.

Features include:

- 1/4 Wave Grounded Grid PA.
- Fiber Optic PA Arc Detection.
- PA Temperature Protection.
- Advanced Control System with remote computer interface and auto log.
- More internal status sensors than any other transmitter.
- CD Quality Audio. (AES/EBU optional)
- Available from 15KW to 35KW. Combined systems to 60KW.

Armstrong Transmitter ... the best RF products, the best around-the-clock support, and the best prices ... because you deserve nothing less!

Reader Feedback

www.beradio.com

AM longevity

Having read the Reader Feedback section in the January issue of *Radio* magazine, I must wholeheartedly agree with Jim Jenkins. AM radio is far from dead, despite what the million dollar so-called consultants may tell us. I know of many AM stations, like the former WBYM, that made a very good profit by playing country music with real jocks 18 hours a day. The key to AM radio is to not

treat it like a joke to begin with. Thinking that no one listens to AM is flat wrong. The aforementioned station won many listeners from the FM offerings out there by being community-minded and just by getting back to the basics of old-fashioned radio.

Corporate radio is ruining this business. So many good stations have been destroyed by taking on new corporate owners, such as WCMS in Virginia Beach. Despite being the oldest continuous country station in the world, it has been reduced to automation

only, and even its very high ratings didn't stop the suits from tearing it apart. How I long for private radio ownership to return in this country.

David R. Lyons
fmr, production director, WBYM
Carrollton, VA

I'd like to second Jim Jenkins' letter in the January issue of *Radio* magazine. A "consultant" is all too often the trendy guy-du-jour who uses your watch to tell you what time it is, and then walks off with it. After 38 years in radio, I have observed that most stations in most situations would be better off spending the money they allocate for consultants, to hiring the best people they

can and letting them do their jobs, rather than retaining some off-premises guy to second-guess their own people.

As far as digital goes, the critical issue is whether the listener and sponsor will see enough benefit, net of the serious technical complications that the IBOC system apparently presents, to justify purchase of relatively expensive new radios. The consensus seems to be, at least so far, "almost certainly not." The average listener who wants to hear a few tunes and the traffic and weather on the way to work or who wants to check out Rush or Paul Harvey doesn't care about technology. He just wants a little information or entertainment that sounds acceptably good.

Again, I agree with Jim: as an industry, our shortfall isn't technological; it's programming—starting with some of the vile stuff that's generating so much unnecessary controversy these days. That's where we should be focusing our attention, rather than trying to fix audience problems by simply buying some new box for the chief engineer to install.

Robert C. Savage
owner, general manager
WYSL-AM 1040
Avon, NY

IBOC shmi-boc, I'm not convinced yet

I am careful about panning new ideas. There are some smart folk out there that have created an amazing day and age with digital dexterity. Still, IBOC worries me on a number of levels, some of which I cannot quite put my finger on. With roughly 20 stations as a contractor, the first problem in developing a working understanding of IBOC is time; there ain't any and I don't think I'm unique. I don't think I largely care about that, yet, even with my first small-market hybrid transmitter install coming up within a week or two. The hybrid is a handsome, 40 percent efficient box with enough bundled connectors to remind me of my first Heathkit. It came with lots of manuals, including a 100-page schematic book in large format. A 1.5kW TPO will require about 10kW of utility service. I'm sure it will work even though I swear the factory tried to hide Serial No. 1 on the nameplate.

I don't care about fully understanding the box because there will never be any field repair applied to it at the discrete component level. From a small and medium market perspective, my concerns go past this.

I am old enough to have witnessed the migration from AM to FM, then back to AM when, once again, we all discovered that what created listeners was creative programming (e.g. AM talk radio). So, the serviceable but relative low fidelity AM medium has no trouble reigning king when it is

comments?

radio@primediabusiness.com

programmed well. The lesson is that the modulation method is important but it is not the key to success. The migration to digital, by any method, is axiomatic; it is going to happen. But I submit that the necessity of IBOC is secondary to the sheer technical momentum and some questionable thinking that is driving it forward.

The hype about digital quality strikes me as non sequitur, promising audio bandwidth I cannot hear from program sourcing that can barely reach analog's 15kHz bandwidth as it is. Is this a solution looking for a problem? It will be consumed by listeners largely in a mobile environment, which is not exactly a quality listening room. Optionally, it will be in the office on a clock radio that falls short of a Bose. Sure, some folks will ultimately listen on their home digital receiver system, assuming they are not using the DVD at the time.

Many programmers now drool over the ability to further destroy the dynamic range because it can now be done so well, digitally. And they will want to do it with MP3 source material, re-encoded into an editor for real-time analog recording into a compressed WAV or MPEG2 automation so it can be played through an analog console feeding an Apt-x STL. With any luck, the AES out will then get re-encoded by the new digital processor AES input, come out at yet another rate where it can then achieve final conversion to 44.1kHz at the exciter AES input. This is a real scenario.

Without fail, when I try to explain why this might not be a good idea, the conversation stops immediately with a blank stare from the audience. During the silence, I am tempted to ask, "Is anyone home?" With any luck he will respond with by saying, "But, it's digital! It has to be good!" Right.

We're all on the same page; we are all going for quality with this mess and now we are going to add IBOC to further this aim.

This is less likely in the major markets where there is money and where the additional data capacity of IBOC when analog finally disappears might actually be profitable. In small and medium markets where current analog and/or digital subcarriers are a vast wasteland as it is, one can be assured that today's small-market corporate bean counters, who have never seen a transmitter, will always select the lowest common denominator when it comes to operational quality. So, please don't insult my intelligence by suggesting adding IBOC to this is a necessity. Try something else.

The development of digital studio LAN source routing, uncompressed digital STLs and companion processors has, in its own right, done tremendous good in improving the radio facility, providing the station starts with something other than MP3 or MP4 sources. From there, I'm not so sure, and editorialists can do me a favor: quit telling me how wonderful IBOC is. Start telling me how wonderful it could be if only stations would do it correctly. And teach me how in as few a words as possible. Remember, I'm a

EYE ON IBOC

contractor. I don't have time but I have fooled myself into thinking I'm intelligent. Don't stop with me. The guy to whom you really have to get is the corporate bean counter and I don't know anyone who likes the thought of that job.

Be very concerned about solid-state IBOC obsolescence. In 2001, I retired a low-efficiency 1990 solid-state FM when its modules could no longer be repaired. After puckering over the cost of a full refit, the choice was clear. It was more practical to put in a decent 1985 tube transmitter. It cost less, runs better and the power bill went down. This problem now affects

THE DAW BUYERS GUIDE

A free online guide to digital audio workstations, hardware & software packages, tapeless recorders and DAW controllers, with a searchable database of 200+ products.

<http://SYPHAonline.com>

perfectly good analog FM exciters, IPAs and consoles. My crystal ball is boiling with images of \$30,000 solid-state IBOC refits for Class A stations, that create a seizure in the manager's office.

I managed stations for 20 years until I returned to engineering. As a contract engineer I am very much an oxymoron but consider it might give me a little different perspective than the technical purist.

When the subject of IBOC on a small-market station is raised, I ask, "How will this purchase go to your bottom line as a startup operation? You can always add digital, later." Those blank stares really spook me.

IBOC comes with the anvil of high capital cost with a license that looks suspiciously similar to a BMI/ASCAP contract. Do you think the licensor will really care about you when the introductory deal is over? Sure it will. I have this horrible image of someone showing up with a miner's hat digging for the bottom line. In a small market, that could require alchemy,

creating gold out of nothing. In the pending install, the licensee is now puckering a little suggesting that the STL might be Internet streaming.

What made me think that this might happen? But, that hybrid sure is pretty.

*Richard J. Boekeloo
owner
DB Broadcast Services
Brunswick, GA*

Variation on a theme

Besides the big cost to stations and listeners, which really does little for the audio quality, FM IBOC is not really IBOC, but puts digital data on the two adjacent channels. This has already resulted in complaints from listeners. And the audio time delay of the system is another headache. I have already said that I will not install it. The big ones to gain are the equipment manufacturers.

*Stanley Swanson
KBNL, Laredo, TX
sswanson@hcjb.org*

The on-channel and adjacent-channel debate resurfaces from time to time. It's true that the data is placed on either edge of the analog signal, but because it borders the center channel and occupies nearly the same spectral

NEW! CircuitWerkes Telephone Solutions

The TelTap - Manual Telephone Coupler & Passive Tap Interface

The The TelTap is a versatile and inexpensive telephone coupler. Once connected to a standard RJ-11 plug, the you have a choice of seizing the phone line or just tapping the line. The TelTap can be used to either send or receive audio regardless of which mode is selected. A ring LED indicates the presence of an incoming call. The TelTap lists for just \$89.00.

The Telco-6 - Ringer Relay

Calls come in, you get relay outputs. It's that simple. Accepts up to six independent telephone lines. Each incoming ring closes the associated relay. Each relay has two sets of form "c" contacts. Relays stay steady on during rings. All interface connections on screw terminals.

For complete information about all of our products, including downloadable tech manuals, brochures and pricing for all of our products, visit our website at www.circuitwerkes.com.

CircuitWerkes, Inc. - 2805 NW 6th Street, Gainesville, Florida 32609, USA. 352-335-6555

mask, it is considered on-channel. The ongoing efforts to call it an in-band adjacent-channel channel (IBAC) technology will not change it.

The system audio delay has been discussed as well. Stations that want to adopt IBOC will need to make some changes to deal with the inability to monitor directly off the air. System delays from digital processing, digital STLs and remote feeds have been introducing small amounts of delay for some time. If a station is going to install IBOC technology, it will have to account for the system delay and build it into the overall costs.

Opinions on IBOC vary greatly and cover the extremes of support and opposition. We at Radio magazine follow the developments closely and report on what is happening, but the final decision to install the technology or ignore it is up to individual stations.

The AES-302 Digital Audio Switcher/Distribution System

- Two Input Switcher*
- Automatic or Manual Switching*
- Optional Silence Sensor*
- Status Monitor with Memory*
- Front Panel Headphone Jack*
- High Quality 24 bit 96 KHz D/A Converter*

Introducing the next generation digital audio switcher from BDI. Now you can have complete confidence in your signal path with the AES-302. Feed main and back up AES streams to the inputs and the selected feed is routed to four digital outputs and an analog stereo output. If a fault occurs, the automatic switcher selects the alternate feed. There is extensive front panel error and operational status and a headphone jack for confidence monitoring. The AES-302 has a remote control interface for easy attachment to remote control systems. The AES-302 is future proof too. The digital components mount to a plug in pc board which can be upgraded in the future should digital audio standards be enhanced or your requirements change. Call your local broadcast equipment dealer to order. Call us or visit our website for detailed information.

Shaping radio today and tomorrow

By Kari Taylor, associate editor

Do you remember?

The Sound Technology 1500A was a microprocessor-controlled audio measurement test system. According to an ad in 1981, the unit was conceived to be the ultimate precision test instrument for tape recorder analysis. It was designed around advanced microprocessor hardware, and showed the user "the whole story on an integral CRT with adjustment cursor."

Applications of the system included tape recorder mechanical and electronic performance checks; thorough phono cartridge analysis; one-

third octave spectral analysis; acoustical room analysis, including mic and loud-speaker measurements;

evaluation of audio quality for VTRs; and research and development for the audio tape manufacturer.

Sample and Hold The shape of radio today

Radio continues to be a popular medium.

That was Then

Forty years ago this month, the first official meeting of the Society of Broadcast Engineers came to order. After writing an editorial suggesting the formation of a new organization and then later running application form in *Broadcast Engineering* magazine, John Battison convened the first official meeting of the Institute of Broadcast Engineers (IBE) at the NAB convention on April 5, 1964.

They voted at the first meeting to change the name to the Society of Broadcast Engineers. Battison became the organization's first president.

On the occasion of the SBE's 40th anniversary, Battison reminisced, "The Society of Broadcast Engineers was conceived in my office in Washington, DC, in 1961. It was born in 1964 in The Willard Room C in the Chicago Hilton, courtesy of NAB, and today, on its 40th birthday, it is a strong and hearty force in broadcast engineering thanks to the members who followed after me."

The SBE will commemorate its 40th anniversary during the membership meeting on April 20 at NAB2004.

GENERATION-8: The On-Air Control Surface for High-Traffic Studios

Quality is Easy to Identify with stainless steel construction, easy servicing, and a clean yet compact layout.

The POWER of a Network Surface with the FEEL of a Traditional Console!

ONE CAT-5 WIRE conveys all the control from this surface to Wheatstone's Bridge System. You can bring any system source (inputs or mixes) to any console fader or monitor pot (source visibility software controlled). You can set destinations for mixes, aux sends and MXMs to anywhere in your facility. For example, you could allow (or software disallow) your news console to go to your on-air chain, or feed any mix desired to a talent or remote position.

THIS MAJOR MARKET CONSOLE can handle all the call-ins and remotes you'll encounter. Four faders dedicated specifically to phone segments provide errorfree interface to four callers or remotes, each with independent caller and fader feeds, user

selectable talkback communication and adjacent channel linking. A dedicated LCD display screen keeps the operator informed and in control.

YOU CAN STORE AND NAME switch and fader settings for each operator's task and recall them by simply spinning an encoder and hitting a TAKE button. And like our larger G-9, the G-8 has 12 user programmable switches for salvos and intercoms plus additional programmable TALK buttons for IFB functions. And with full color LCD display screens the operator will know for certain that his signal is clean, his sources correct, and his preset signal is ready and waiting. *The G-8 has the layout and features to let your operators work fast and accurately!*

D-8000

Digital Radio Console

ADVANCED TECHNOLOGY! WHEATSTONE'S fourth generation digital console has what you need: dual-domain input modules that accept both analog and digital sources; built-in router integration with 8-character displays; a choice of features like auxiliary sends, equalization, dynamics control and event memory/recall—all without the aid of an external computer. The D-8000 is an all-modular design with no active components mounted inside. And best of all, it uses Wheatstone's exclusive VDIP® setup software, letting you easily configure individual console modules, logic modes and automatic functions. **Contact Wheatstone—the digital audio people!**
