SICHERHEIT UND ERSTE HILFE

SICHERHEIT

Durch Entfernen von Gehäuseteilen, Abschirmungen etc. werden stromführende Teile freigelegt. Aus diesem Grunde müssen die folgenden Sicherheitsvorschriften unbedingt beachtet werden:

1. **Eingriffe in ein Gerät**
dürfen nur von Fachpersonal vorgenommen werden.

2. **Vor Entfernen von Gehäuseteilen:**
Gerät ausschalten und vom Netz trennen.

3. **Bei geöffnetem Gerät:**
- Netzteil- oder Motorkondensatoren mit einem passenden Widerstand entladen.
- Bauteile grosser Leistung, wie Leistungstransistoren und -widerstände sowie Magnetspulen und Wickelmotoren erst nach dem Abkühlen berühren.

4. **Servicearbeiten bei geöffnetem, unter Spannung stehendem Gerät:**
- Keine blanken Schaltungsteile berühren
- Isolierte Werkzeuge verwenden
- Metallene Halbleitergehäuse nicht berühren, da sie hohe Spannungen aufweisen können.

ERSTE HILFE (bei Stromunfällen)

1. **Bei einem Stromunfall die betroffene Person raschmöglichst vom Strom trennen:**
- Durch Ausschalten des Gerätes
- Ausziehen oder Unterbrechen der Netzzuleitung
- Betroffene Personen mit isoliertem Material (Holz, Kunstoff) von der Gefahrenquelle wegstossen
- Nach einem Stromunfall sollte immer ein Arzt aufgesucht werden.

ACHTUNG
EINE UNTER SPANNUNG STEHENDE PERSON DARF NICHT BERÜHRT WERDEN, SIE KÖNNEN DABEI SELBST ELEKTRISIERT WERDEN!

2. **Bei Bewusstlosigkeit des Verunfallten:**
- Puls kontrollieren,
- bei ausgesetzter Atmung künstlich beatmen,
- Seitenlagerung des Verunfallten und Arzt verständigen.

SAFETY AND FIRST AID

SAFETY

There are no user serviceable components inside the equipment, live parts are laid open when removing protective covers and shieldings. It is essential therefore to ensure that the subsequent safety rules are strictly observed when performing service work or repairs.

1. **Servicing of electronic equipment**
must be performed by qualified personnel only.

2. **Before removing covers:**
Switch off the equipment and unplug the mains cable.

3. **When the equipment is open:**
- Discharge power supply- and motor capacitors through a suitable resistor.
- Components, that carry heavy electrical loads, such as power transistors and resistors as well as solenoid coils and motors should not be touched before a cooling off interval, as a precaution to avoid burns.

4. **Servicing unprotected and operating equipment:**
- Never touch bare wires or circuitry
- Use insulated tools only
- Never touch metal semiconductor cases because they may carry high voltages.

FIRST AID (in case of electric shock)

1. **Separate the person as quickly as possible from the electric power source:**
- by switching off the equipment,
- unplugging or disconnecting the mains cable,
- pushing the person away from the power source by using dry insulating material (such as wood or plastic).
- After having sustained an electric shock, always consult a doctor.

WARNING:
DO NOT TOUCH THE PERSON OR HIS CLOTHING BEFORE POWER IS TURNED OFF, OTHERWISE YOU STAND THE RISK OF SUSTAINING AN ELECTRIC SHOCK AS WELL!

2. **If the person is unconscious**
- Check the pulse,
- reanimate the person if respiration is poor,
- lay the body down and turn it to one side, call for a doctor immediately.

SÉCURITÉ ET PREMIERS SECOURS

SÉCURITÉ

Si les couvercles de protection sont enlevés, les parties de l'appareil qui sont sous tension ne sont plus protégées. Il est donc d'une nécessitée absolue de suivre les instructions suivantes:

1. **Les interventions dans les appareils électriques**
doivent être faites uniquement que par du personnel qualifié

2. **Avant d'enlever les couvercles de protection:**
Couper l'interrupteur principal et débrancher le câble secteur.

3. **Après avoir enlevé les couvercles de protection:**
- Les condensateurs de l'alimentation et des moteurs doivent être déchargés à l'aide d'une résistance appropriée.
- Il est prudent de laisser refroidir les composants de haute puissance, par ex.: transistors de puissance, résistances de puissances de même que des électroaimants et les moteurs de bobinage.

4. **S'il faut que l'appareil soit sous tension pendent les réglages internes:**
- Ne jamais toucher les circuits non isolés
- Travailler seulement avec des outils isolés

PREMIERS SECOURS (en cas d'électrocution)

1. **Si la personne est dans l'impossibilité de se libérer:**
- Couper l'interrupteur principal
- Couper le courant
- Repousser la personne de l'appareil à l'aide d'un objet en matière non conductrice (matière plastique ou boîs)
- Après une électrocution, consulter un médecin.

ATTENTION
NE JAMAIS TOUCHER UNE PERSONNE QUI EST SOUS TENSION, SOUS PEINE DE SUBIR ÉGALEMENT UNE ÉLECTROCUTION

2. **En cas de perte de connaissance de la personne électrocutée:**
- Controller le pouls
- Si nécessaire, pratiquer la respiration artificielle
- Mettre l'accidenté sur le coté latérale et consulter un médecin.

KORRIGENDA

Notieren Sie bitte die untenstehenden Korrekturen an den angegebenen Stellen im Buch und beachten Sie die Hinweise auf die in Kapitel 9 aufgeführten neuen Elektronik-Baugruppen. Diese Blätter können bei Bedarf in den Kapiteln 5 - 7 an den betreffenden Stellen eingereiht werden.

CORRECTIONS

Please note the corrections below at the indicated places in the manual, and take notice of the references to the new electronic assemblies which are listed in Section 9. These sheets can be inserted at the corresponding places of Sections 5...7, if required.

CORRECTIONS

Veuillez noter les corrections dans le livre aux places nommées ici, et aussi les circuits électroniques neufs placés dans la Section 9 et indiqués ici. Ces feuilles peuvent, selon les besoins, être insérées à leurs places respectives dans les sections 5 à 7.

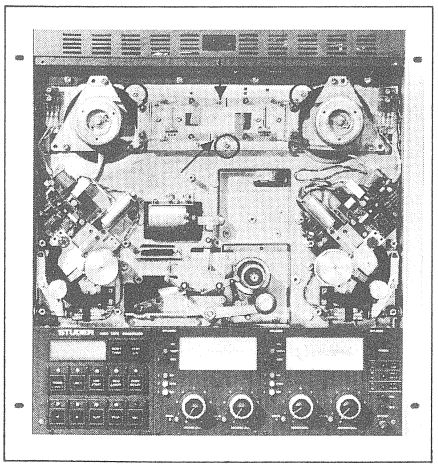
P. 3/18 D, E, F

4. Abschnitt:
- Leichter Druck auf die beiden Bremshebel (Pfeile) löst die Bremsen so weit, dass das Bremschassis vorsichtig abgehoben werden kann.

4th paragraph:
- Press lightly on the two brake levers (arrows) to release the brakes to the point where the brake chassis can be carefully lifted.

4ième paragraphe:
- Une légère pression sur les deux leviers de freinage (flèches) détend les freins se telle sorte que le chassis des freins puisse être soulevé avec soin.



P. 3/41 D, E, F

Der folgende Abschnitt ersetzt den 4. Abschnitt:

- Spulenkern von L1 im Uhrzeigersinn vorsichtig bis zum Anschlag eindrehen. Von dieser Position aus den Spulenkern 2 volle Umdrehungen im Gegenuhrzeigersinn zurückdrehen. Oszilloskop an TP1 des Tonmotor-Steuerungsprints anschliessen (Frequenz ca. 6 MHz). Das Signal darf nicht verschwinden, wenn die Isolation der beiden verdrillten Litzen zum kapazitiven Abtaster berührt wird.

The following paragraph replaces the 4. paragraph:

- Carefully turn the tuning core of L1 to the clockwise stop. Starting from this position, turn the core two complete turns counterclockwise. Connect oscilloscope to TP1 of the capstan motor control (Frequency approx. 6 MHz). The signal should not disappear when touching the insulation of the two twisted stranded wires that lead to the capacitive sensor.

Le 4ième paragraphe est remplacé par le suivant:

- Tourner soigneusement le noyau d'accord au sens des aiguilles d'une montre jusq'à l'arrêt. De cette position, tourner le noyau 2 tours au sens inverse des aiguilles d'une montre. Raccorder l'oscilloscope à TP1 de la commande du moteur de cabestan (fréquence env. 6 MHz). Le signal ne doit pas disparaître lorsqu'on touche l'isolation des deux câbles torsadés du capteur capacitif.

New or modified components for 1.820.780-82:
- C5: 10 µF, 59.26.2100 .
- C8, C9: 33 pF, 59.34.2330 .
- Y1: 4.9152 MHz, 89.01.0560 .

MP UNIT A810 PCB 1.820.780-82 (page 5/51) -> 1.810.780-20 (page 5/51):
- Same circuit, new software 40/85 .

MP UNIT A810 PCB 1.810.780-20 (page 5/51) -> 1.810.780-21 (page 5/51):
- Same circuit, new software 25/86 .

P. 5/69 D, E, F

SERIAL REMOTE CONTROLLER 1.810.751-00 (page 5/69) -> 1.810.751-81 (page 9/5)
Modifications on PCB:
- Cut conductor between IC3, pins9/10 .
- Make new connection from IC2, pin8 to IC3 pin9.

SERIAL REMOTE CONTROLLER 1.810.751-81 (page 9/5) -> 1.810.751-82 (page 9/5)
New components:
- R33 2.2 kΩ, 57.11.4222, from IC4 pin9 to ground.

P. 6/6 D, E, F

Correct designation of connectors P5 and P6:
- P5: Tape tension sensor right
- P6: Tape tension sensor Left.

P. 6/7 D, E, F

D24, BAV20, not used.

SPOOLING MOTOR CONTROLLER 1.810.760-81 (page 6/7) -> 1.810.760-82 (page 9/7)
New components:
- L3, from connection point ACA-125 (red) to fuse F1.

P. 6/8 D, E, F

Correct designation of connectors P5 and P6:
- P5: Tape tension sensor right
- P6: Tape tension sensor Left.

P. 6/9 D, E, F

TAPE TENSION SENSOR PCB LEFT 1.810.730-82 GRP27 "ESE":

SECTION 1 GENERAL REFERENCES page

1. GENERAL REFERENCES

1.1 QUICK-REFERENCE DISCRIPTION

By virtue of its compact and highly rigid construction, its inherent system flexibility, and the superior operating convenience achieved by the microprocessor control system, the STUDER A810 tape recorder is universally suited for applications in broadcarsting or television, for use in studios or on OB vans, in theaters, film studios, and scientific institutes.

Some of its outstanding features include:

- Highly rigid, die-cast aluminium alloy chassises for tape transport, headblock assembly, pressure roller assembly, and other assemblies.
- Manually manipulatable head shield above record and reproduce heads; can stay closed during spooling.
- Capstan motor servo control with quartz-conrolled reference and capacitive sensing tacho system for highly accurate tape speeds.
- Gentle tape handling is ensured by electronically controlled tape tension, servo-controlled AC spooling motors, and non-contacting tape tension sensors. Pulse-width-modulated spooling motor control minimizes power dissipation and requires no separate heat sinking.
- Accurate electronic tape timer with real-time display; photoelectric scanning of guide roller rotation by opto switches.
- Convenient editing: four spooling speeds; the high end of the reproduce frequency response is de-emphasized for speaker protection; tape lift during spooling can be defeated either by pressing a button or mechanically by shifting the pressure roller.
  Blocked tape tension sensors and decreased braking torque in STOP mode.
  A tape marker and built-in tape scissors are available as options.
- Monitor speaker built into tape transport cover (except console versions with penthouse where the monitor speaker is built into the panel)

The high system flexibility means that a suitable A810 version is available for any type of application:

- Standard types in mono, 2-channel or stereo versions, with or without VU-meter panel.
- Operates in any position from horizontal to vertical, suited for 19" rack or console mounting. Available as a box-mounted model with removable lid or portable model with lateral handles or wooden side panels with handles.
- LS versions:
  3 Tape speeds (3.75 - 7.5 - 15 ips) selectable with front-panel rotary switch. Time code operation not possible at 3.75 ips.
- HS versions:
  4 Tape speeds (3.75 - 7.5 - 15 - 30 ips) selectable with front-panel rotary switch. Time code operation not possible at 3.75 ips.

- Inputs and outputs balanced and floating, available with or without input/output transformers.
- Switch for NAB or CCIR equalization (7.5 and 15 ips).
- Tape bias switch for two tape formulations with different calibration data.

- Sync facility, zerolocator, and 4-address transferlocator (autolocator) included as standard features.
- Output selector buttons: INP (input), REP (reproduce) and SYNC.
- VU-meter panel with SAFE/READY switch, record and reproduce level controls, buttons for bypassing the level controls (calibrated, with line level).
  Internally switchable level meter: VU or PPM indication.
- Selectable line voltage: 100, 120, 140, 200, 220, 240 VAC ±10%, 50...60 Hz.
- Terminals for connecting fader start, parallel remote control and varispeed control.

The following features are available as options:

- For synchronizing: time code system for 2-channel models; code channel as third track between the stereo audio channels.
- Mono/stereo switch for stereo and 2-channel recorder.
- Test generator (60, 125 Hz, 1, 10, 16 kHz).
- Remote controller to serial interface: for storing (e.g. on tape) audio parameters for quick audio setup or for operation in conjunction with a terminal (RS 232 interface).

Maximum operating convenience due to microprocessor control:

- The last operating state of the recorder is preserved when power is switched off: tape counter, locator addresses, audio parameters, speed, mono/-stereo or tape A/B and NAB/CCIR.
- If a channel controller exists, the audio signal is automatically switched to REPRO and SAVE when power is switched on again.
- Drop-in activated by pressing only the REC button in reproduce mode or by pressing PLAY and REC (depending on internal programming).
- Drop-out from record mode by pressing the PLAY key.
- Reduced spooling speed: the full spooling speed (approx. 10 m/s) can be switched down to 7, 4 or 1 m/s.
- Zerolocator: automatic search of tape address (timer reading) 00:00.
- Transferlocator LOC 1 ... LOC 4: for storing and automatic searching 4 different tape addresses. Stored addresses can be displayed without executing the actual search command.
- Soft keys: the following internally programmable functions can be assigned to the keys LOC 2 ... LOC 4:
  LOC START (search last PLAY address)
  LIFTER (defeats tape lift during spooling)
  FADER (local command keys disabled, only fader start possible)
  TAPE DUMP (dump edit mode, take-up motor is switched off)
  REM CONTR (local command keys disabled, operation only with remote control)
  CODE READY (enables recording on time code channel)
  These keys feature special recesses for attaching self-adhesive function labels.

- Audio setup via microprocessor. The following audio parameters can be programmed with the keys accessible from the front below the operator panel (NAB and CCIR equalization each for two types of tape):
  Reproduction / Sync: LEVEL, TREBLE, BASS, EQUALIZATION
  Recording: LEVEL, TREBLE, BIAS, EQUALIZATION
  Resolution 256 steps each, hexadecimal format on tape timer display.
  The audio parameters remain stored even after the recorder has been switched off. They can also be saved by copying them through the serial remote port to an external storage medium from where they can subsequently be reloaded; this means that automatic and reproducible audio set-up of the A810 is possible.

- Internal confidence test system with error diagnostics for the main functions:
  Automatic check for correct functioning when the recorder is switched on; a subset of the test is periodically repeated.

1.2 STANDARD VERSIONS

A810-1 FULL-TRACK VERSIONS

A810-1
Article No. 60.118.10110

Portable recorder for 6.25 mm tape. Full-track. Audio channel control (INPUT/-SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-1 HS
Article No. 60.118.10111

Portable recorder for 6.25 mm tape. Full-track. Audio channel control (INPUT/-SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-1 VU
Article No. 60.118.10120

Portable recorder for 6.25 mm tape. Full-track. VU-meter including audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-1 VU HS
Article No. 60.118.10121

Portable recorder for 6.25 mm tape. Full-track. VU-meter including audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-1 VUK
Article No. 60.118.10130

Recorder for 6.25 mm tape. Full-track. VU-meter including audio channel control (INPUT/SYNC/REPRO/READY/SAFE) and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-1 VUK HS
Article No. 60.118.10131

Recorder for 6.25 mm tape. Full-track. VU-meter including audio channel control (INPUT/SYNC/REPRO/READY/SAFE) and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-0.75 STEREO VERSIONS

A810-0.75
Article No. 60.118.10210

Portable recorder for 6.25 mm tape. Stereo, 0.75 mm track separation. Full-track erase head. Audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-0.75 HS
Article No. 60.118.10220

Portable recorder for 6.25 mm tape. Stereo, 0.75 mm track separation. Full-track erase head. Audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-0.75 VU
Article No. 60.118.10230

Portable recorder for 6.25 mm tape. Stereo, 0.75 mm track separation. Overlapping erasure. VU-meter including channel control (INPUT/SYNC/REPRO/-READY/SAFE). Built-in monitor speaker. Chassis version.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-0.75 VU HS
Article No. 60.118.10240

Portable recorder for 6.25 mm tape. Stereo, 0.75 mm track separation. Overlapping erasure. VU-meter including channel control (INPUT/SYNC/REPRO/-READY/SAFE). Built-in monitor speaker. Chassis version.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-0.75 VUK
Article No. 60.118.10250

Recorder for 6.25 mm tape. Stereo, 0.75 mm track separation. Overlapping erasure. VU-meter including channel control (INPUT/SYNC/REPRO/READY/SAFE) and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-0.75 VUK HS
Article No. 60.118.10260

Recorder for 6.25 mm tape. Stereo, 0.75 mm track separation. Overlapping erasure. VU-meter including channel control (INPUT/SYNC/REPRO/READY/SAFE) and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-2/2 TWO-TRACK VERSIONS

A810-2/2
Article No. 60.118.10310

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation, overlapping erasure. Audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker.
Chassis version.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-2/2 HS
Article No. 60.118.10311

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation, overlapping erasure. Audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-2/2 VU
Article No. 60.118.10320

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation, overlapping erasure. VU-meter incl. channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-2/2 VU HS
Article No. 60.118.10330

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation, overlapping erasure. VU-meter incl. channel control (INPUT/SYNC/REPRO/READY/SAFE). Built-in monitor speaker. Chassis version.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-2/2 VUK
Article No. 60.118.10340

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation, overlapping erasure. VU-meter incl. channel control (INPUT/SYNC/REPRO/READY/SAFE) and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Three tape speeds 3.75 - 7.5 - 15 ips selectable with front-panel rotary switch.

A810-2/2 VUK HS
Article No. 60.118.10350

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation, overlapping erasure. VU-meter incl. channel control (INPUT/SYNC/REPRO/READY/SAFE) and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Four tape speeds 3.75 - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.

A810-2 TC TWO-TRACK VERSIONS WITH TIME CODE

A810-2 TC
Article No. 60.118.10410

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation. Audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Code channel control by means of programmable key (READY/SAFE). Built-in monitor speaker. Chassis version.
Three tape speeds 3.75* - 7.5 - 15 ips selectable with front-panel rotary switch.
* Time code operation not possible at 3.75 ips!

A810-2 TC HS
Article No. 60.118.10411

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation. Audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Code channel control by means of programmable key (READY/SAFE). Built-in monitor speaker.
Chassis version.
Four tape speeds 3.75* - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.
* Time code operation not possible at 3.75 ips!

A810-2 TC VU
Article No. 60.118.10420

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation. VU-meter including audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Code channel control by means of programmable key (READY/SAFE). Built-in monitor speaker.
Chassis version.
Three tape speeds 3.75* - 7.5 - 15 ips selectable with front-panel rotary switch.
* Time code operation not possible at 3.75 ips!

A810-2 TC VU HS
Article No. 60.118.10421

Portable recorder for 6.25 mm tape. Two-track, 2mm track separation. VU-meter including audio channel control (INPUT/SYNC/REPRO/READY/SAFE). Code channel control by means of programmable key (READY/SAFE). Built-in monitor speaker.
Chassis version.
Four tape speeds 3.75* - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.
* Time code operation not possible at 3.75 ips!

A810-2 TC VUK
Article No. 60.118.10430

Recorder for 6.25 mm tape. Two-track, 2mm track separation. VU-meter including audio channel control, code channel control (INPUT/SYNC/REPRO/READY/SAFE), and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Three tape speeds 3.75* - 7.5 - 15 ips selectable with front-panel rotary switch.
* Time code operation not possible at 3.75 ips!

A810-2 TC VUK HS
Article No. 60.118.10431

Recorder for 6.25 mm tape. Two-track, 2mm track separation. VU-meter including audio channel control, code channel control (INPUT/SYNC/REPRO/READY/SAFE), and monitor speaker built into external panel. Recorder prepared for installation in console with penthouse.
Four tape speeds 3.75* - 7.5 - 15 - 30 ips selectable with front-panel rotary switch.
* Time code operation not possible at 3.75 ips!

1.3 OPTIONS

Varispeed

- For chassis and portable versions: part No. 20.810.871.00. Not possible for recorders with 2 VU-meters!
  Filler panel (1 module, part No. 1.810.002.04) included.

- For console versions: part No. 20.810.872.00.

Channel control

For separate control of the second audio channel on A810.0.75 recorders, or separate control of the time code channel on A810-2 TC recorders with TIME CODE READ/WRITE UNIT 1.810.724 and LC display part No. 20.810.933.00.

For separate control of the time code channel on A810-2 TC recorders with TIME CODE READ/WRITE UNIT 1.820.721.81/82/83/84 and LED indicator part No. 20.810.934.00.

A filler panel (1 module, part No. 1.810.002.04) must be ordered separately for the A810-2 TC.

Tape scissors, marking device

Tape scissors, part No. 20.810.891.00.

Marking device, part No. 20.810.892.00

Tape scissors and marking device, part No. 20.810.893.00.

Mono/stereo switch, test generator

Mono/stereo switch, part No. 20.810.902.00.

Test generator, part No. 20.810.903.00 (for full-track and 2-channel recorders).

Mono/stereo switch and test generator, part No. 20.810.903.00 (for recorders with mono/stereo selector).
Only possible with software release 13/83 or later.

Interface for serial remote control

Printed circuit board 1.810.751.00 and cable harness with connectors, part No. 20.810.881.00.

Control for noise reduction system

- For chassis and portable versions, part No. 20.810.943.00

- For console versions, part No. 20.810.944.00.

1.4 ACCESSORIES

Supplied accessories
(Part No. 20.020.302.25)

Allen key 2.0 mm	1 pc.	(Part No. 26.06.1020)
Allen key 4.0 mm	1 pc.	(Part No. 26.06.1040)
Stud driver 3.0 mm	1 pc.	(Part No. 10.258.003.10)
Stud driver 2.5 mm	1 pc.	(Part No. 10.258.003.09)
Microfuse 500 mA, 5x20 mm	5 pcs.	(Part No. 51.01.0114)
Microfuse 1.6 A, 5x20 mm	5 pcs.	(Part No. 51.01.0119)
Microfuse 3.15 A, 5x20 mm	5 pcs.	(Part No. 51.01.0122)
Microfuse 5.0 A, 5x20 mm	5 pcs.	(Part No. 51.01.0124)
NAB adapter	2 pcs.	(Part No. 89.01.0354)
Power cord, 2.5 m, 3x1 mm2 EU-plug	1 pc.	(Part No. 10.223.001.01)
Spare bulb for VU meter	2 pcs.	(Part No. 51.02.0144)
Conversion kit parallel remote control	connector 1 pc.	(Part No. 1.810.071.00)

Console

Any chassis version of the tape recorder can be installed in the basic console version. It is equipped with lockable casters. Height: 840 mm. Part No. 1.038.880.00.
In addition the following items must be ordered:

- Rack base, Part No. 1.038.890.00 (for installing the synchronizer and/or noise reduction system),

and

- Rear cover plate, part No. 1.038.885.00 (no ext. VU panel), or
- Rear cover plate with shelf for tapes, etc. part No. 1.038.884.00 or
- Low penthouse, part No. 1.038.886.00 (ext. VU panel), or
- High penthouse, part No. 1.038.888.00 (ext. VU panel and synchronizer control panel).

Wooden side panels

A set of wooden side panels with hinged handles is available as a complete set, part No. 1.810.077.00.

Handles for chassis versions

A set of handles (not hinged) is available for the A810 chassis versions, part No. 1.810.075.00.

Tape transport remote control

The tape transport remote control 1.328.200.81 in the desk-top housing, with a 15 m cable, supports the remote control of all tape deck functions, including

- Decreasing the spooling speed (in 3 steps below the standard speed)
- RECAP (fast rewind for as long as key is held down, then PLAY)
- LOC 1 (storing and automatic search of a tape address)
- LIFTER (defeats tape lift during spooling)
- VARISPEED (with external TTL signal)

Adapter for self-supporting pancake

A reel flange (adapter) part No. 1.013.046.00 is required for flangeless hubs (DIN 45 515).

Extension board

Part No. 1.820.799.00, used in conjunction with alignments on audio and logic assemblies.

REVOX tape splicing kit

Comprises a professional cutting and splicing block, a cutting blade, splicing tabs, and a wax pencil; kit No. 10.030.452.40.

STUDER cleaning kit in carrying case

Comprises 1 bottle of soundhead cleaner, 1 bottle of aluminite cleaner, lint-free nonwoven fleece, one buckskin, kit No. 10.496.010.00.

- Soundhead cleaner, replacement bottle Part No. 10.496.021.00
- Soundhead cleaner, 1 liter Part No. 10.496.022.00
- Aluminite cleaner, replacement bottle Part No. 10.496.025.00
- Aluminite cleaner, 1 liter Part No. 10.496.026.00

Aluminium case for A810

Three types of aluminium carrying cases are available:

- Aluminium case for transporting a portable A810 equipped with wooden side panels: Part No. 10.386.001.03.
- Aluminium case for transporting an A810 chassis version: Part No. 10.368.002.04.
- Aluminum case for installing an A810 chassis version: Part No. 10.386.001.01.

  The recorder can be put into operation after the cover and the rear panel have been removed.

  Kit No. 1.810.076.00 is required for installing the chassis version into the carrying case 10.386.001.01.

Cover for portable version

Wooden cover, protects headblock and tape guidance elements during transport. Two 26.5 cm ciné or 10.5" NAB reels can be stored in the cover; or DIN spindles and cables can be accommodated by rescrewing the three-pronged adapter.

Tool case

- Part No. 20.020.001.06 (220 V version)
- Part No. 20.020.001.56 (110 V version)

Comprises:

1 Set of hexagon-socket-screw keys, spare fuses, replacement lamps, small parts, 1 extension board, 1 demagnetizing choke, various screwdrivers, various pliers, one pair of tweezers, cylindrical flashlight, soldering iron (WELLER) with holder, spring dynamometers, various open-end wrenches, screwdriver for recessed-head screws (PHILLIPS), cleaning material, gauges for adjusting the tape tension sensors, etc.

Additional manuals

- Operating and service instructions, ENGLISH, No. 10.23.5211 (Ed. 1185)
- Operating and service instructions, FRENCH, No. 10.23.5221 (Ed. 1285)
- Operating and service instructions, GERMAN, No. 10.23.2961 (Ed. 1185)
- Operating instructions, ENGLISH, No. 10.23.2951
- Operating instructions, FRENCH, No. 10.23.5230
- Operating instructions, GERMAN, No. 10.23.2941

1.5 TECHNICAL SPECIFICATIONS

These specifications apply for operation in horizontal position

Tape speeds:

Type HS:
30 - 15 - 7.5 - 3.75 ips
(76.2 - 38.1 - 19.05 - 9.525 cm/s)

Type LS (standard programming):
15 - 7.5 - 3.75 ips
(38.1 - 19.05 - 9.525 cm/s)

Variable speed (with varispeed option):
±7 semitones from nominal speed

Tape speed deviation:

max. ± 0.2% from nominal speed

Tape slip:

max. 0.1%

Tape reels:

NAB, EIA (CINE), DIN
max. diameter 11.1 " (282 mm)
max. reel capacity 3280 ft. (1000 m) with professional-quality tape
(tape thickness: 50 um)

Tape width:

1/4 " (6.3 mm)

Wow and flutter:

Peak weighted according to DIN 45507 or IEC Publ. 386, ambient temperature 68° F (20° C)

30 ips	15 ips	7.5 ips	3.75 ips
(76.2 cm/s)	(38.1 cm/s)	(19.05 cm/s)	(9.525 cm/s)
max. 0.04%	max. 0.05%	max. 0.07%	max. 0.12%

Start time:

max. 0.5 s for 15 ips and 1000 m tape on DIN hub or
730 m tape on NAB reel
(to attain double value of flutter specification)

Tape timer:

5-digit LCD displays hours, minutes and seconds for all tape speeds
counts past zero with leading negative sign.
Range: 1 h 59 min 59 s to -1 h 59 min 59 s
or
5-digit LED display, same as LCD except:
Range: 9 h 59 min 59 s to -59 min 59 s
Time code level indicated with LED behind last seconds position.

Winding time:

approx. 150 s for 1000 m tape; approx. 120 s for 730 m tape.

Stopping time from spooling:

max. 3 s

Tape tension:

Reproduce and record:
0.75 N (75 p) nominal, adjustable ±0.15 N (±15 p)

Spooling:
0.75 N (75 p) nominal, adjustable 0.4 - 1.0 N (40 - 100 p)

Peak tape tension for start, stop, and reversal of spooling direction:
6 N (600 p) nominal, adjustable 3 - 6 N (300 - 600 p)

Inputs:

Balanced and floating
Impedance ≥ 10 kΩ, 30 Hz ... 20 kHz

Input level:

- Nominal input level relative to reference magnetic flux:
  +6, +10, +14, +16 dBm; internally programmable
- Nominal input level relative to operating level (according to NAB):
  0, +4, +8, +10 dBm; internally programmable
  (internal adjustment range of the magnetic flux with above input levels: 100 - 1000 nWb/m)

Recorders with VU-meter panel and input/output level controls:
max. 10 dB increase in input sensitivity with input level control in uncalibrated mode.

Maximum input level:
- with input transformer: +24 dBm
- without input transformer: +28 dBm (+26 dBm, if the nominal input level relative to operating level is set to 0/6 dBm)

Outputs:

balanced and floating, with output transformer
Impedance ≤ 50 Ω, 30 Hz ... 20 kHz
Load ≥ 200 Ω
or
electronically balanced, without output transformer
Impedance ≤ 30 Ω, 30 Hz ... 20 kHz
Load ≥ 200 Ω.

Output level:

- nominal output level relative to reference magnetic flux:
  +6, +10, +14, +16 dBm; internally programmable
- nominal output level relative to operating level (according to NAB):
  0, +4, +8, +10 dBm; internally programmable
  (internal adjustment range of reproduce gain for operating magnetic flux of 100 - 1000 nWb/m)

Recorders with VU-meter panel and input/output level controls:
max. 10 dB increase in reproduce gain with output level control in uncalibrated mode.
Maximum output level:
- with output transformer: +24 dBm (load ≥ 200 Ω)
- without output transformer:
  - balanced load ≥ 200 Ω: +26 dBm
  - unbalanced load ≥ 200 Ω: +24 dBm
  - balanced load ≥ 600 Ω: +30 dBm (+26 dBm, if the nominal output level relative to operating level is set to 0/6 dBm)
  - unbalanced load ≥ 600 Ω: +24 dBm

Equalizations:

NAB and CCIR, switch-selectable

Equalization time constants:

	30 ips (76.2 cm/s)	15 ips (38.1 cm/s)	7.5 ips (19.05 cm/s)	3.75 ips (9.525 cm/s)
AES:	17.5/ω us	CCIR: 35/ω us	70/ω us	90/3180 us
AES:	17.5/ω us	NAB: 50/3180 us	50/3180 us	90/3180 us

Frequency response:

Record-reproduce:

	30 ips (76.2 cm/s)	15 ips (38.1 cm/s)	7.5 ips (19.05 cm/s)	3.75 ips (9.525 cm/s)
±2 dB:	40 Hz ... 22 kHz	30 Hz ... 20 kHz	30 Hz ... 16 kHz	30 Hz ... 10 kHz
±1 dB:	40 Hz ... 20 kHz	30 Hz ... 18 kHz	30 Hz ... 12 kHz	30 Hz ... 8 kHz

Reproduction from record head (SYNC reproduction)
- Amplifier programmed for "narrow band":

	30 ips (76.2 cm/s)	15 ips (38.1 cm/s)	7.5 ips (19.05 cm/s)	3.75 ips (9.525 cm/s)
±2 dB:	60 Hz ... 12 kHz	30 Hz ... 12 kHz	30 Hz ... 8 kHz	----------

- Amplifier programmed for "wide band":

	30 ips (76.2 cm/s)	15 ips (38.1 cm/s)	7.5 ips (19.05 cm/s)	3.75 ips (9.525 cm/s)
±2 dB:	60 Hz ... 20 kHz	30 Hz ... 18 kHz	30 Hz ... 12 kHz	----------

Signal-to-noise ratios:

CCIR {Equalization according to CCIR (AES at 30 ips), measured with tape AGFA PER 528, BASF LGR 50, or aequivalent type}

	30 ips (76.2cm/s)	15 ips (38.1cm/s)	7.5 ips (19.05cm/s)	3.75 ips (9.525cm/s)
Full track (320 nWb/m) track width 6.3 mm (1/4")				
- Linear, RMS, 30 Hz - 20 kHz	63 dB	61 dB	61 dB	57 dB
- Quasi-peak, weighted according to CCIR 468-1 (DIN 45405)	54 dB	52.5 dB	51 dB	50 dB
- RMS value, A weighted according to DIN 45633 as per IEC Publ. 179	68 dB	67 dB	65 dB	62 dB
Stereo (510 nWb/m) track width 2.75 mm				
- Linear, RMS, 30 Hz - 20 kHz	65 dB	63 dB	62 dB	57 dB
- Quasi-peak, weighted according to CCIR 468-1 (DIN 45405)	55.5 dB	54 dB	52.5 dB	51 dB
- RMS value, A weighted according to DIN 45633 as per IEC Publ. 179	69 dB	67 dB	65 dB	62 dB

(Record-reproduce, 1 kHz, measured with tape SCOTCH 3M 226)

NAB:	30 ips (76.2cm/s) 400 nWb/m	15 ips (38.1cm/s) 510 nWb/m	7.5 ips (19.05cm/s) 510 nWb/m	3.75 ips (9.525cm/s) 510 nWb/m
Full track:	≤ 0.5%	≤ 0.5%	≤ 0.5%	≤ 0.5%
Stereo/2-track:	≤ 0.5%	≤ 0.5%	≤ 0.5%	≤ 0.5%

Cross-talk attenuation: (at 1 kHz, according to DIN 45521)

Stereo recorders: ≥ 55 dB
Two track recorders: ≥ 65 dB

Erase efficiency: (at 1 kHz and 510 nWb/m, 15 ips)

Stereo recorders with full-track erase head: ≥ 80 dB
Two-track recorders with overlapping erase head: ≥ 75 dB

Erase and bias frequency:

153.6 kHz for all tape speeds

VU-meter:

Switchable between VU indication (according to IEC recommendation 268, Part 10, Section 4) and PPM (peak programme meter) (according to IEC recommendation 268, Part 10, Section 3, except for 24,1, scale division).

Power supply (line voltage selector):

100 V, 120 V, 140 V, 200 V, 220 V, 240 V; ±10% ; 50 or 60 Hz

Power consumption:

Stop: 80 W
Recording on 2 channels: 160 W
Spooling: 190 W
Peak tape tension during spooling: 240 W

Disturbed operation: (transient line voltage failure)

Operating status unaffected by line voltage failures up to 100 ms.

Ambient temperatures:

50° F ... 104° F (+10° C ... +40° C)

Relative humidity:

20% ... 90%, non-condensing

Safety standard:

according to IEC recommendation, publication 65, degree of protection I (line filter, power switch, power fuse, power transformer and line voltage selector conform to type I and II).

Weight: (portable version)

Net: 30 kg ... 31 kg, depending on configuration
Gross: 34 kg ... 35 kg, depending on configuration (air freight)
52 kg ... 53 kg, depending on configuration (sea freight)

Technical data of the time code channel

The time code channel conforms to IEC publication 461, DIN 45511, Part 7.

Track width/location:

0.38 mm, center of tape

Code format:

SMPTE/EBU 80 bits address code (selectable 24 / 25 / 29.97 / 30 frames/second)

Tape speeds:

30 - 15 - 7.5 ips
(76.2 - 38.1 - 19.05 cm/s)

Magnetic flux of time code track:

CCIR: 729 nWb/m pp ±3 dB

Time code channel input:

Balanced and floating, with transformer
Input impedance ≥10 kΩ

Input level:

nom.: 500 mV pp
min.: 150 mV pp
max.: 4.0 V pp

Time code channel output:

Balanced and floating, with transformer
Output impedance ≤40 Ω

Output level:

2 V pp, Load impedance ≥ 200 Ω

Cross-talk attenuation code channel to audio:

≥ 90 dB for all components of the time code signal, relative to 510 nWb/m magnetic flux of sound track.

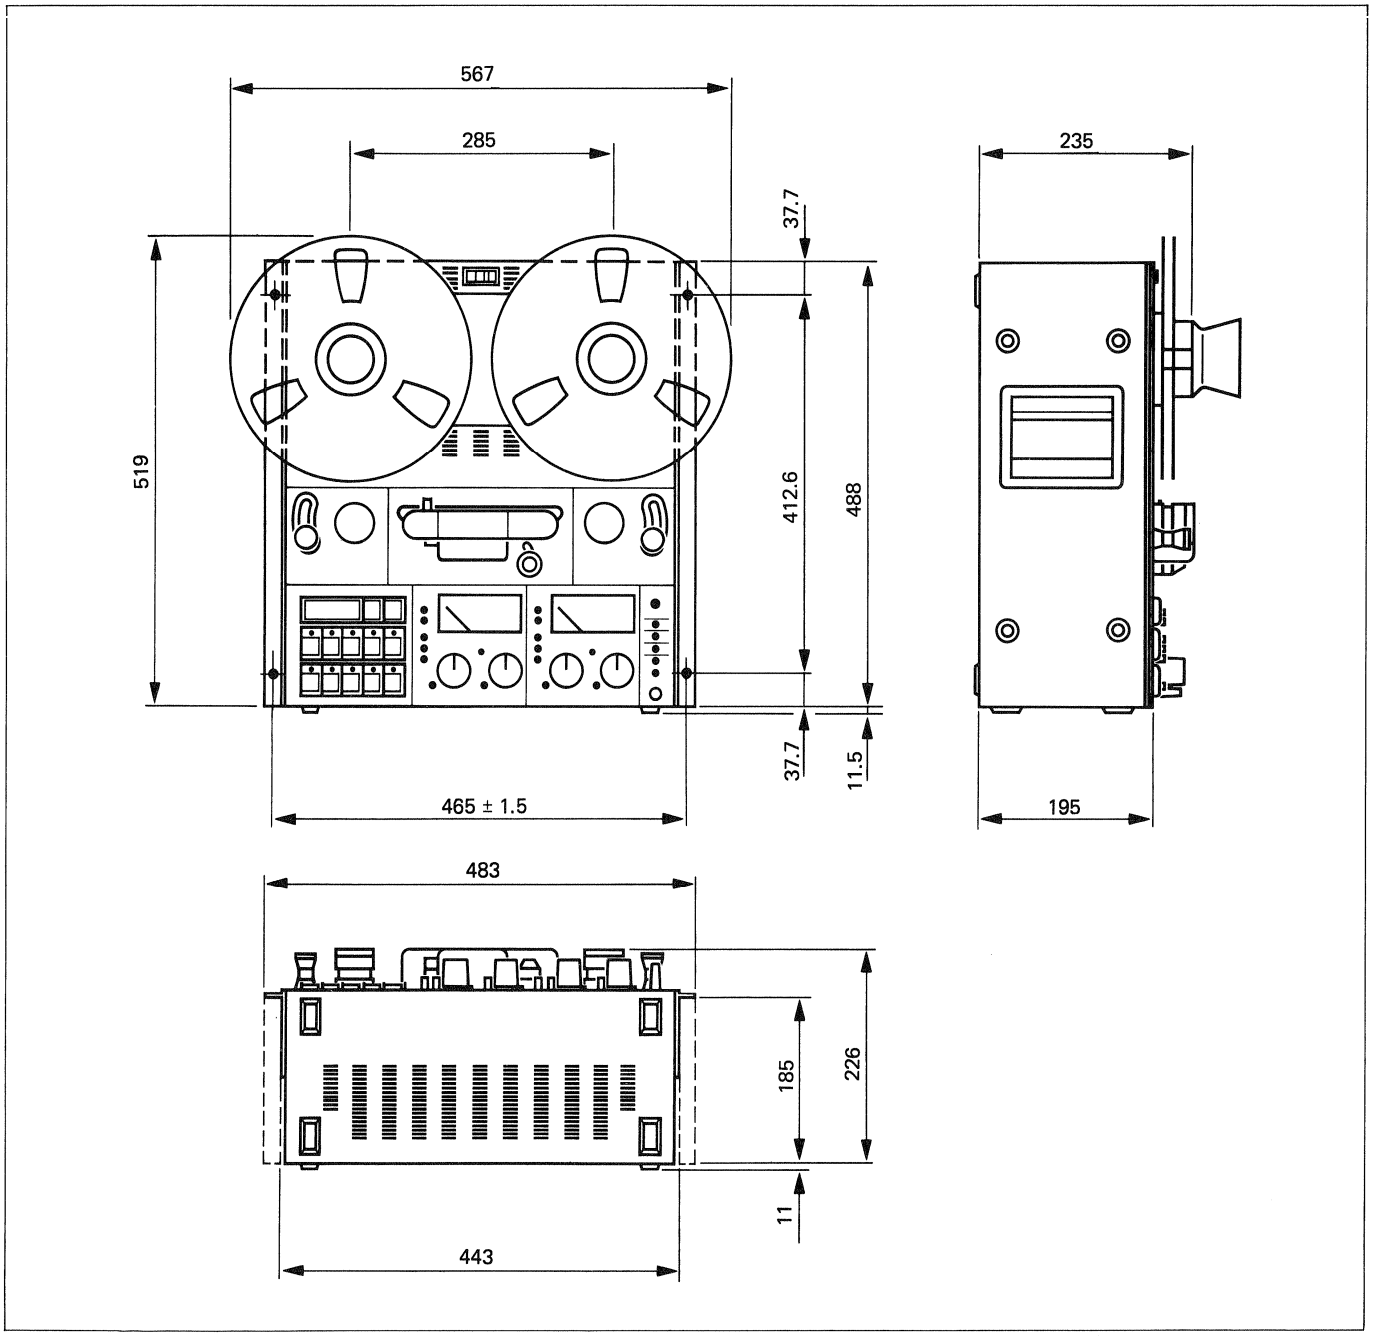
Coincidence error between code track and audio:
{With tape travel time compensation electronics (TIME CODE DELAY UNIT) enabled}

max. 4 ms at 15 ips

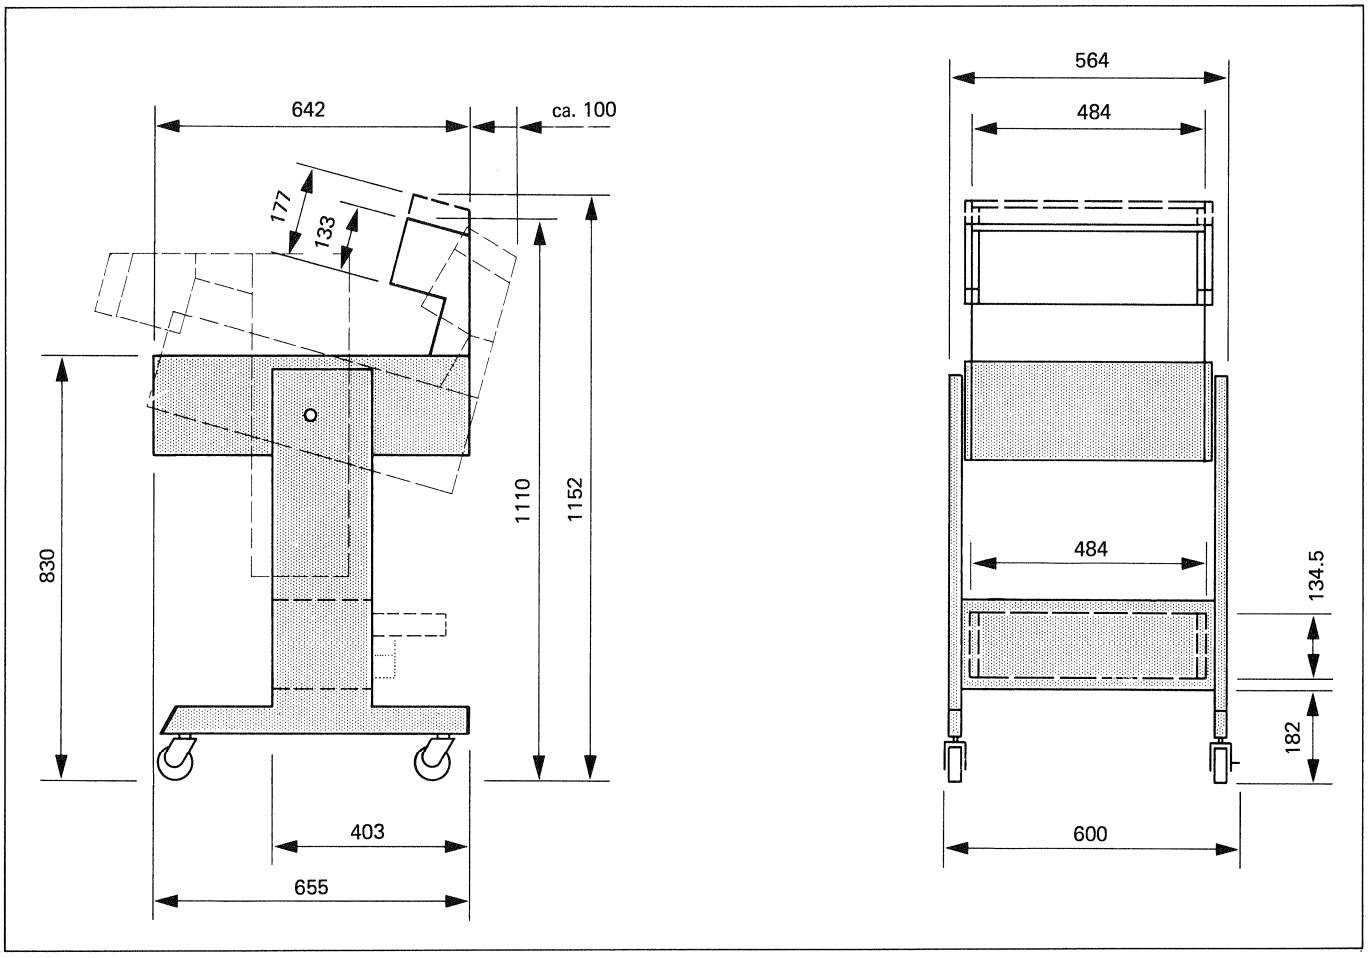
switchable tape travel time compensation for:
- coincident time code and audio channel recording and reproducing, resp., at 24 / 25 / 29.97 / 30 frames/second
- M15A-TC compatible time code and audio channel recording and reproducing, resp., at 24 / 25 / 29.97 / 30 frames/second

1.5.1 Dimensions

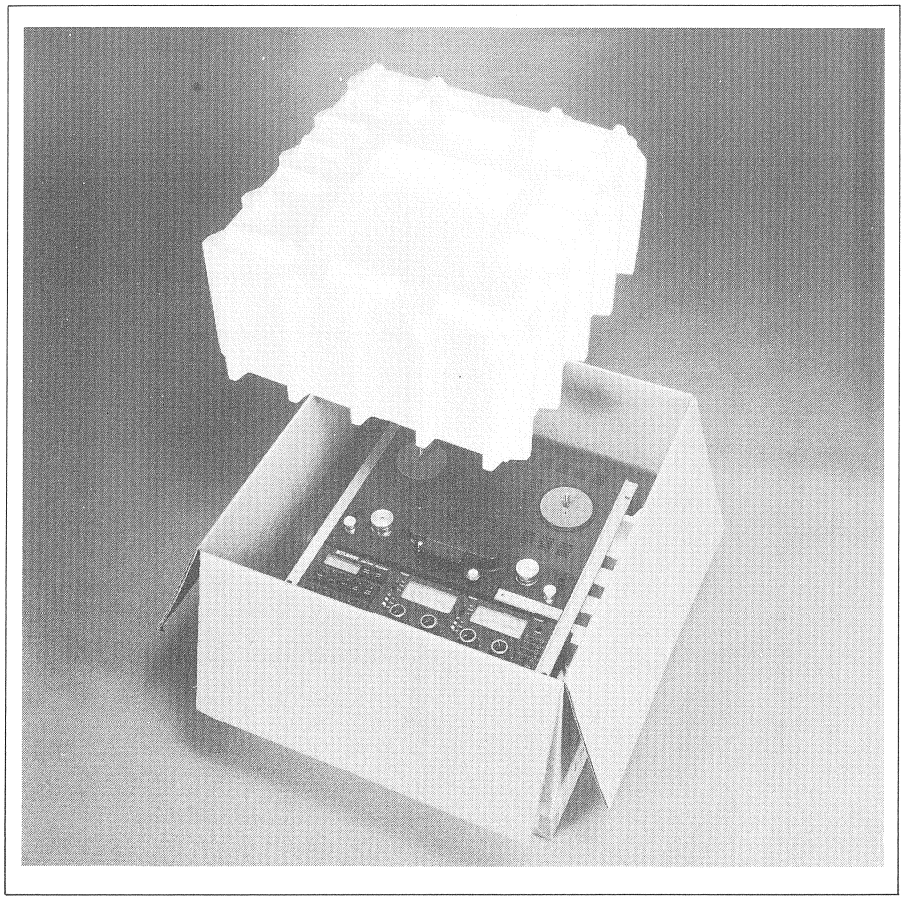
A810



Console of A810



1.5.2 Packing



Air freight

A810, portable version:
Carton 64 x 62 x 46 cm
Gross weight, depending on configuration: 34 kg to 35 kg

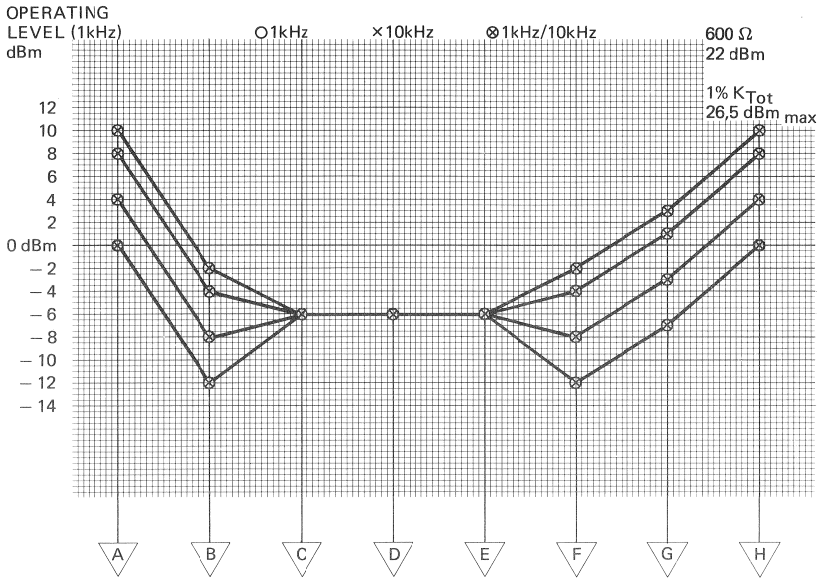
A810, console version:
Carton 64 x 62 x 46 cm
Gross weight, depending on configuration: 34 kg to 35 kg
Console (and possibly VU-meter panel):
Carton 102 x 74 x 38 cm
Gross weight, depending on configuration: 39 kg to 46 kg

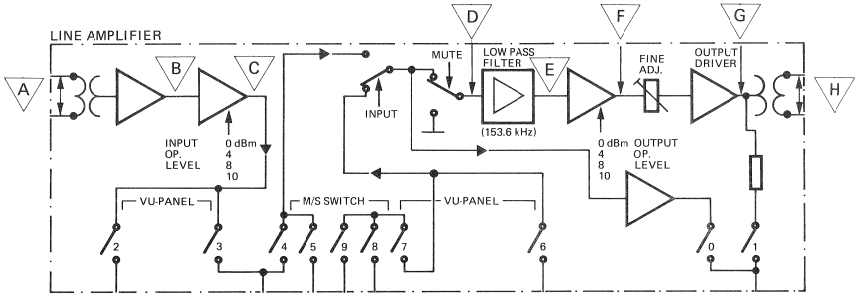
Ocean freight

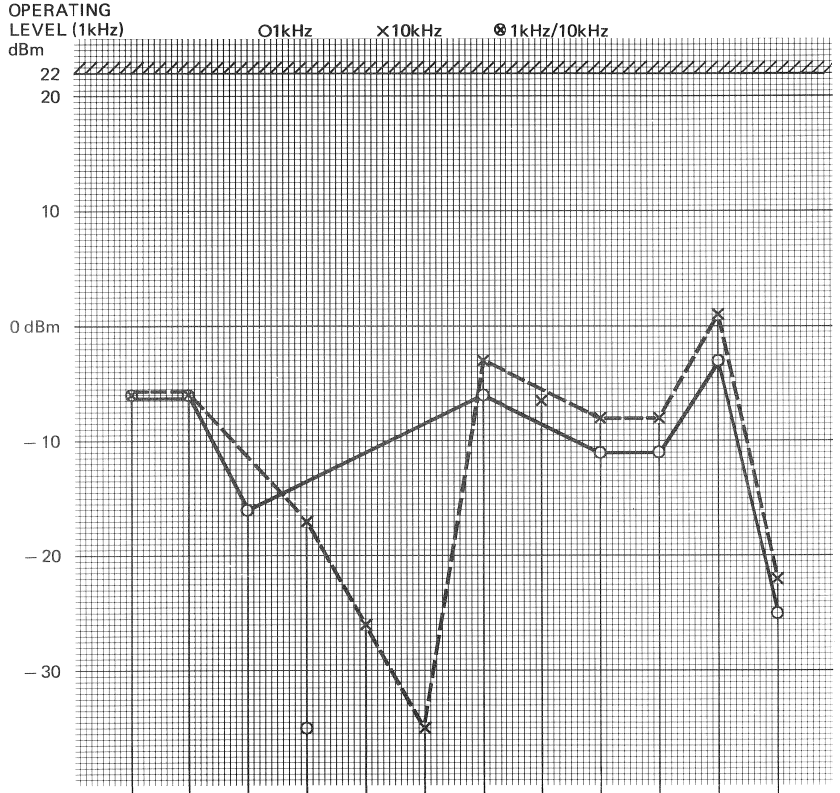
A810, portable version:
Box 82 x 78 x 72 cm
Gross weight, depending on configuration: 52 kg to 53 kg

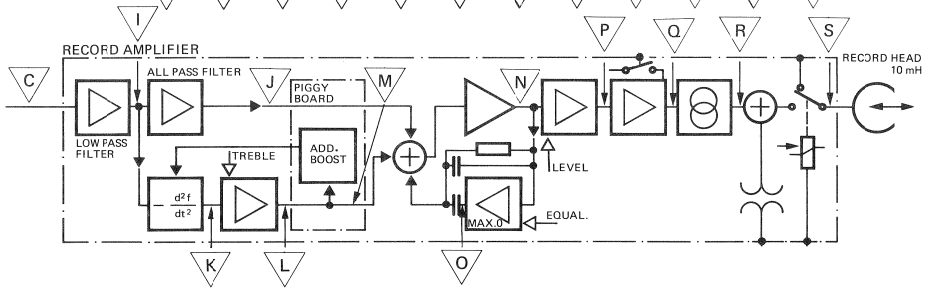
A810 console version:
Box 82 x 78 x 72 cm
Gross weight, depending on configuration: 52 kg to 53 kg
Console (and possibly VU-meter panel):
Box 110 x 82 x 46 cm
Gross weight, depending on configuration: 57 kg to 72 kg

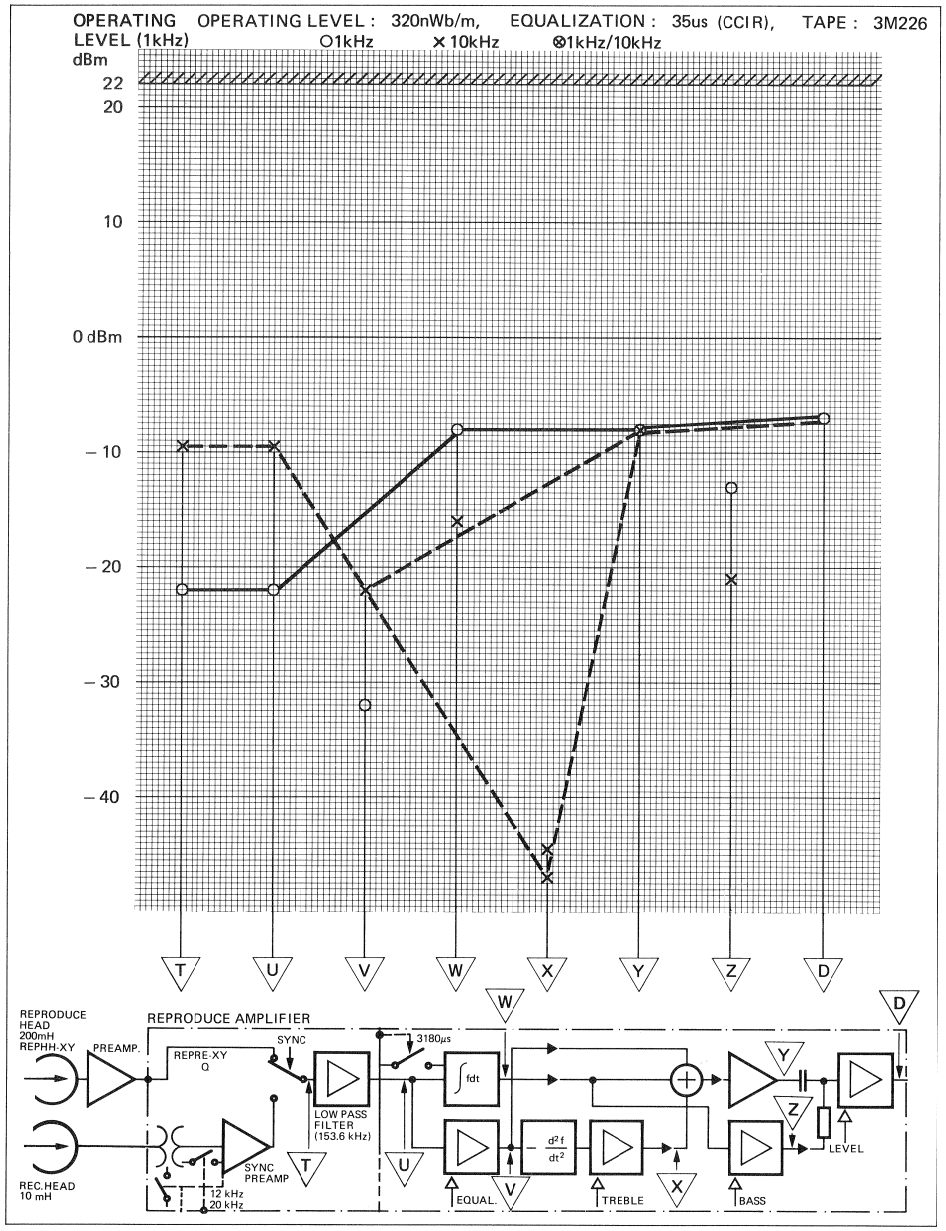
1.5.3 Level diagrams











1.6 STANDARD CALIBRATION VALUES

The numbers in the following table represent hexadecimal values, i.e. they are in the same format as the numbers appearing on the tape timer display when the corresponding calibrations are performed. These values refer to 2mm - 2-channel recorders, reference level (operating level) 320 nWb/m (or 257 nWb/m at 3.75 ips), tape type 3M 226.

Speed	Mode	Equal.	Level	Treble	Bass	Equal.
3.75	REPRO		82	70	90	95
3.75	RECORD		26	B0	30	BB
3.75	SYNC		00	00	00	00
7.5	REPRO	CCIR	66	39	80	87
7.5	RECORD	CCIR	30	A0	3E	75
7.5	SYNC	CCIR	62	50	96	87
7.5	REPRO	NAB	66	39	80	61
7.5	RECORD	NAB	30	A0	3E	99
7.5	SYNC	NAB	62	50	96	61
15	REPRO	CCIR	66	30	6A	44
15	RECORD	CCIR	30	54	46	BA

30	SYNC		62	50	60	26
Speed	Mode	Equal.	Level	Treble	Bass	Equal.

1.7 MAINTENANCE HINTS FOR THE SERVICE PERSONNEL

1.7.1 Abbreviations

A	assembly
ANT	antenna
B	bulb
BA	battery, accumulator
BR	optocoupler (bulb --> LDR)
C	capacitor
D	diode, DIAC
DL	LED
DLQ	optocoupler (LED --> phototransistor)
DLR	optocoupler (LED --> LDR)
DLZ	LED array, 7 segment display
DP	photodiode
DZ	rectifier
E	electronic part
EF	headphones
F	fuse
FL	filter
H	head (sound-, erase-)
HC	hybrid circuit (thick/thin film)
HE	hall element
IC	integrated circuit
J	jack (female)
JS	jumper
K	relay, contactor
L	inductor
LS	loudspeaker
M	motor
ME	meter
MIC	microphone
MP	mechanial part
P	plug (male)
PU	pick up
Q	transistor, FET, thyristor, TRIAC
QP	phototransistor
QPZ	phototransistor array
R	resistor
RP	light depending resistor (LDR)
RT	temperature sensitive resistor
RZ	resistor array
S	switch
T	transformer
TL	delay line
TP	test point
W	wire, stranded wire
X	socket, holder
XB	lamp socket
XF	fuse holder
XIC	IC-socket
Y	quartz, piezoelectric element
Z	network, array

These abbreviations may be combined (max. 3 characters).

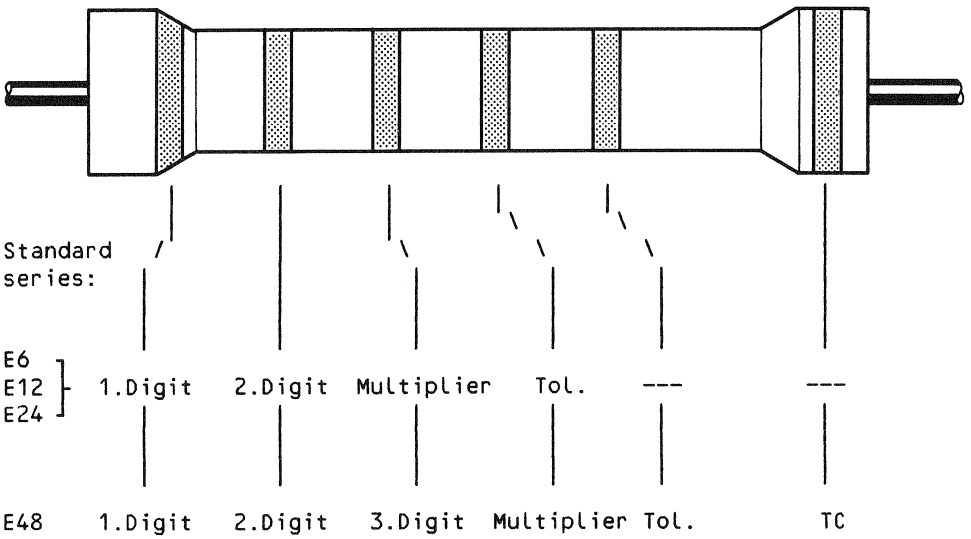
1.7.2 Powers of ten

Name	Abbreviation	Value
Tera-	T	10**12
Giga-	G	10**9
Mega-	M	10**6
Kilo-	k	10**3
Milli-	m	10**-3
Mikro-	µ	10**-6
Nano-	n (mµ#)	10**-9
Pico-	p (µµ#)	10**-12
Femto-	f	10**-15

frequently used in the United States

1.7.3 Code letters and colors

Resistors



Color	Digit	Multiplier	Tolerance	Temp.-coefficient
gold	-	0,01	5 %	-
silver	-	0,1	10 %	-
black	0	1	-	-
brown	1	10	1 %	100 * 10 ** -6 / K
red	2	100	2 %	50 * 10 ** -6 / K ##
orange	3	1 k	-	15 * 10 ** -6 / K
yellow	4	10 k	-	25 * 10 ** -6 / K
green	5	100 k	0,5 %	-
blue	6	1 M	0,25 %	-
violet	7	10 M	0,1 %	-
grey	8	-	-	-
white	9	-	-	-

either no mark for temperature coefficient, or red

Capacitors

The tolerance category is sometimes specified by a letter after the rated capacitance.

D = 0,5 %
F = 1 %
G = 2 %
J = 5 %
K = 10 %
M = 20 %

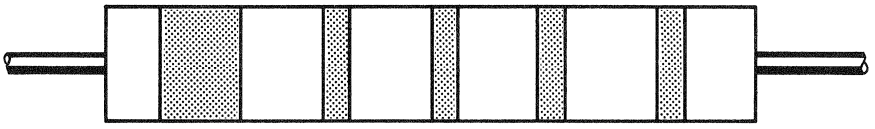
Inductors, transformers

Molded RF coils

A wide silver-colored ring and 4 thin, differently colored rings identify molded RF coils. The wide silver ring indicates the start of the counting direction. The second, third, and fourth ring indicate the inductance in micro Henry (µH), where two of the three rings represent the numeric value, the third one either a multiplier or the decimal point. In the latter case it has a golden color. The fifth ring identifies the tolerance in percent (±).

Color	Digit	Multiplier	Tolerance
black	0	1	-
brown	1	10	1 %
red	2	100	2 %
orange	3	10**3	-
yellow	4	10**4	-
green	5	10**5	0,5 %
blue	6	10**6	-
violet	7	10**7	-
grey	8	10**8	-
white	9	10**9	-
gold	,	-	5 %
silver	-	-	10 %
any (nat).	-	-	20 %

Examples:



silver	gold*	brown	green	silver	= 0,15 µH 10%
silver	red	gold*	violet	---	= 2,7 µH 20%
silver	grey	red	brown**	gold	= 820 µH 5%

* Decimal point
** Multiplier

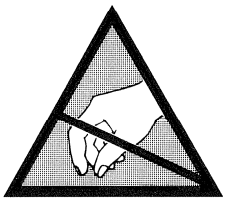
Inductors, transformers on ferrite cores

Inductors and transformers on ferrite cores are marked with three colored dots (for color codes, refer to the table in the section "Resistors", the two left-hand columns). These dots represent the last three digits of the STUDER standard number, the largest of them identifying the start. The first digits of the standard number (1.022.---) are always the same.

E.g.: Driver Transformer, 150 kHz.
Standard number: 1.022.211
Color code: red (large dot), brown, brown

Terminal 1 of the winding form is usually identified by a lobe; if not the winding form features a yellow dot near terminal No. 1.

1.7.4 Electrostatically sensitive semiconductor devices "ESE"



MOS (Metal oxide semiconductor) devices are very sensitive to electrostatic charges. The following precautions should, therefore, be observed:

1. Electrostatically sensitive semiconductor devices and assemblies ("ESE") are stored and shipped in protective packing material. This protective packing is identified with the label illustrated above.

2. Strictly avoid contact of the connector pins with plastic bags and foils or other statically chargeable materials.

3. Ensure that your wrist is grounded before touching the connector pins.

4. Use a grounded, conductive plastic pad as a work surface.

5. Never unplug or insert printed circuit boards while the equipment is under power! The equipment must have been switched off for at least 5 seconds before any PCBs are pulled out or inserted!

SECTION 2 INSTALLATION, PUTTING INTO OPERATION, QUICK-REFERENCE DESCRIPTION

2. INSTALLATION, PUTTING INTO OPERATION, QUICK-REFERENCE DESCRIPTION

2.1 UNPACKING AND TESTING

The A810 tape recorder is shipped in special packing material that protects the unit from damage in transit. Unpack the recorder carefully to avoid marring the equipment surfaces.

Compare the content with the packing slip to ensure that the equipment is complete. Save the original packing material since it provides the best protection for your recorder for subsequent shipment.

Examine the complete content for possible transit damage. The forwarding company and the nearest STUDER dealer should be notified immediately in the event of damage.

2.2 PLACE OF INSTALLATION

The A810 tape recorder should preferably be installed in a dust-free location with adequate ambient ventilation. The technical specifications of the recorder are valid for an ambient air temperature range of 10 to 40°C. The relative humidity should be between 50% and 90% (noncondensing).

The recorder must not be placed in close proximity to strong electromagnetic fields. General sources of such interference are: strong load fluctuations on adjacent power lines, high-power transformers, elevator motors, as well as nearby radio and television transmitters.

Install the recorder in a location where there is sufficient clearance around it so that the cooling air can circulate freely. The minimum clearance at the ventilating louvers is 15 mm, at the lateral heatsinks 10 mm.

2.3 INSTALLING THE TAPE RECORDER

The equipment specificatitions are guaranteed for any operating position between vertical and horizontal.

2.3.1 Portable versions

After unpacking and visual inspection, the recorder can be installed in the desired place without further mechanical preparations.

2.3.2 Installation into console

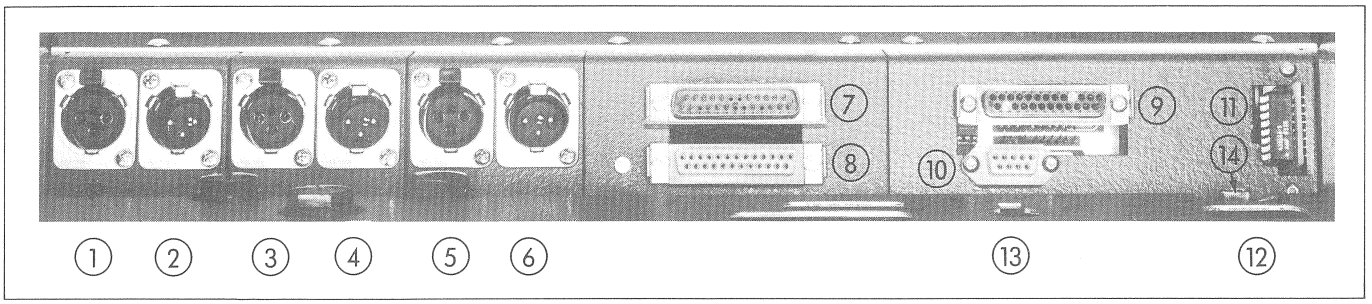
Procedure:

- Position console horizontally.
- Remove front panel of the console (4 screws M4, hexagon-socket-screw key 2.5 mm).
- Carefully slide recorder in from the front and secure with 4 slotted-head screws M6.
- Reinstall cover.

Consoles with penthouse:

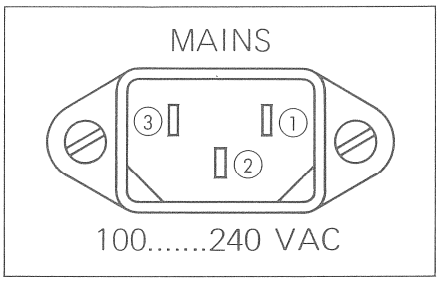
- Guide cable harness and flat cable of the panel from the top through the penthouse.
- Secure panel with 4 slotted-head screws M6.
- Position console vertically (maintenance position). The connector panel of the tape recorder becomes accessible. Plug in cable harness and flat cable (two 25-pin connectors).

2.4 CONNECTOR PANEL



(1) Audio input CH1
(2) Audio output CH1
(3) Audio input CH2
(4) Audio output CH2
(5) Time code channel input
(6) Time code channel output
(7) Connector for VU panel (audio)
(8) Connector for VU panel
(9) Connector for parallel remote control
(10) Connector for serial remote control
(11) Address board
(12) AC power inlet
(13) Voltage selector
(14) Ground socket

2.4.1 AC Power, voltage selector



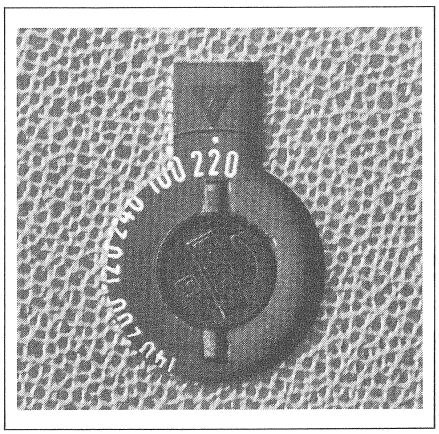
No. 1 Phase
No. 2 Ground
No. 3 Neutral

CAUTION
Before the recorder is connected for the first time, verify that the setting of the voltage selector on the rear panel of the recorder matches the local line voltage.

One of the following lines voltages can be selected:
100, 120, 140, 200, 220, 240 VAC

Remove the power fuse before changing the voltage selector setting. Check the rating of the fuse before you reinstall it:

100 ... 140 VAC: T 3.15 A SLOW
200 ... 240 VAC: T 1.6 A SLOW

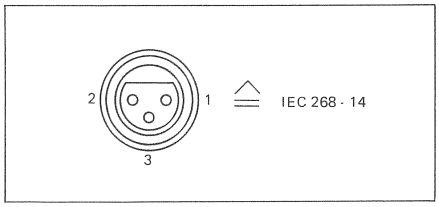


2.4.2 Line input

The balanced inputs are terminated on XLR-type sockets conforming to the IEC recommendation 268-14.

No. 1 Audio ground
No. 2 A-line (hot)
No. 3 B-line (cold)

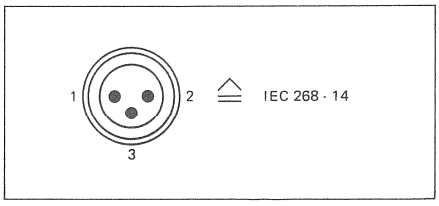
(The A line is hot if the recorder is connected to an unbalanced source.)



2.4.3 Line output

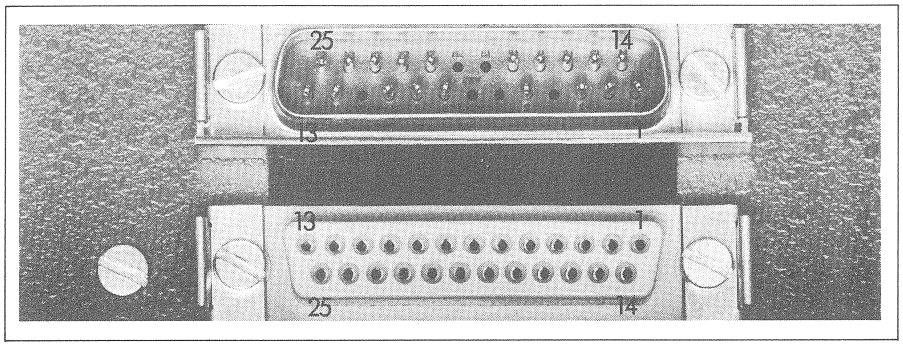
The balanced outputs are terminated on XLR-type jacks conforming to the IEC recommendation 268-14.

No. 1 Audio ground
No. 2 A-line (hot)
No. 3 B-line (cold)



2.4.4 Connectors for VU-meter panel

Two 25-pin connectors (subminiature, type D) are used for connecting the external VU-meter panel.



Signal names of connector GR 34 (audio, male):

2.4.5 Remote control connectors

Socket for parallel remote control

A 25-pin connector (subminiature, type D) is used for connecting the parallel remote control which offers the following facilities:

- Remote control of the tape transport functions with feedback
- Storing and automatic searching of the address LOC 1
- Varispeed control
- Fader start control in reproduce mode
- Cancellation of the tape lift (only nonlocking push button)

Connector set (screw-type)	Part No. 20.020.303.06
Connector set (bayonet type)	Part No. 20.020.303.17
Conversion kit (from screw-type to bayonet type or vice versa, for one connector	Part No. 1.810.071.00

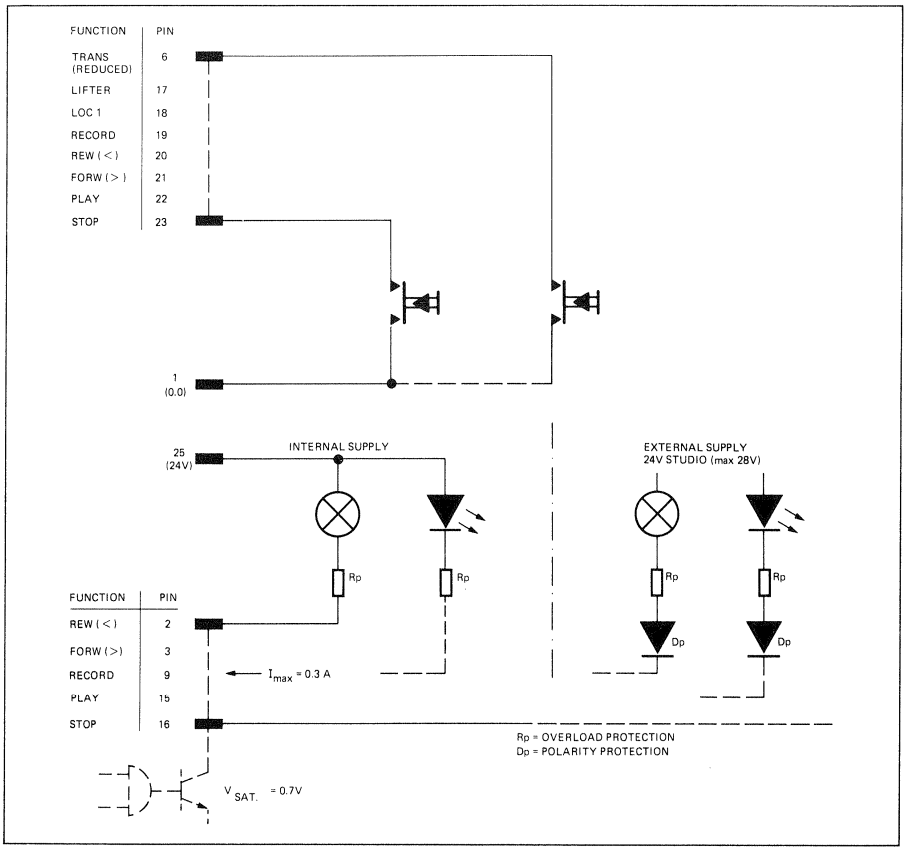
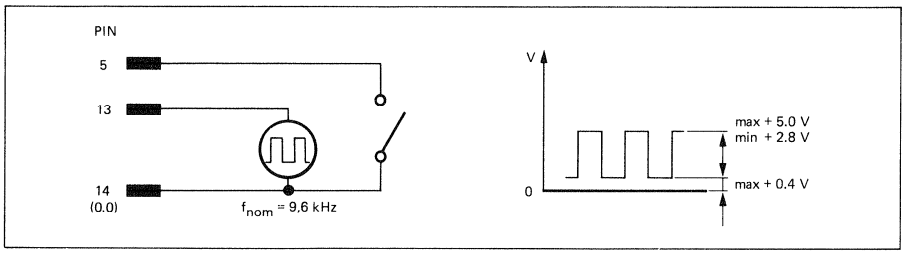
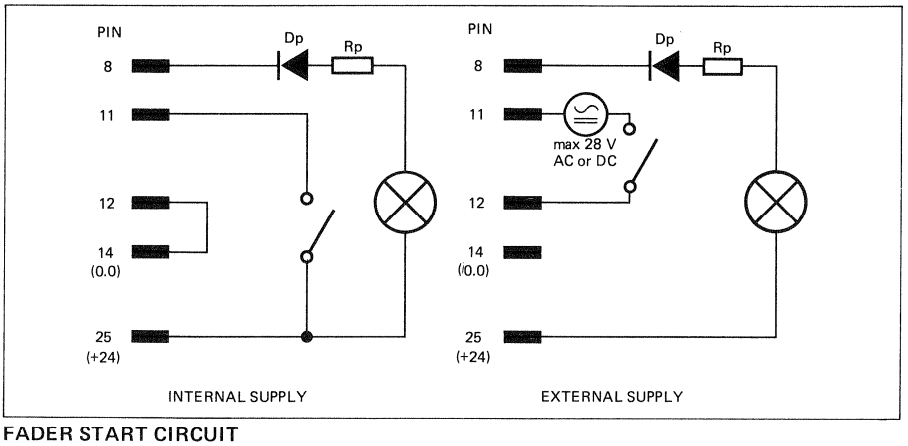
Note:
If light bulbs are used as acknowledgement lamps, their inrush current should not exceed 0.3 A!



REMOTE CONTROL CIRCUIT



VARISPEED CONTROL

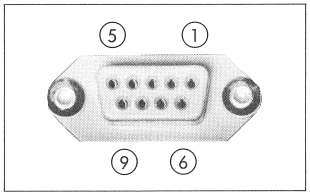


FADER START CIRCUIT

Socket for serial remote control

The serial remote control connector (9-pin, subminiature type D) can be used to connect a tape recorder for saving the stored audio parameters or a terminal equipped with an RS 232 interface. The signal assignment corresponds to the EIA recommendation 449.
For change-over refer to Section 4.2.9.

Connector set (screw-type) Part No. 20.020.303.07
Connector set (bayonet type) Part No. 20.020.303.09
Conversion kit (from screw-type to bayonet type or vice versa, for one connector Part No. 1.810.071.00



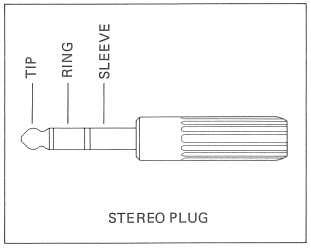
Signal names of serial remote control connector GR 22 (female):
01 SHIELD
02 SNDATA
03 RCCOMM
04 STUBUS1
05 N.C.
06 STUBUS2
07 SNCOMM
08 RCVDATA
09 GND

Pins for transferring the audio parameters:
1, 4, 6

Pins for RS 232 interface connection:
2, 3, 7, 8, 9

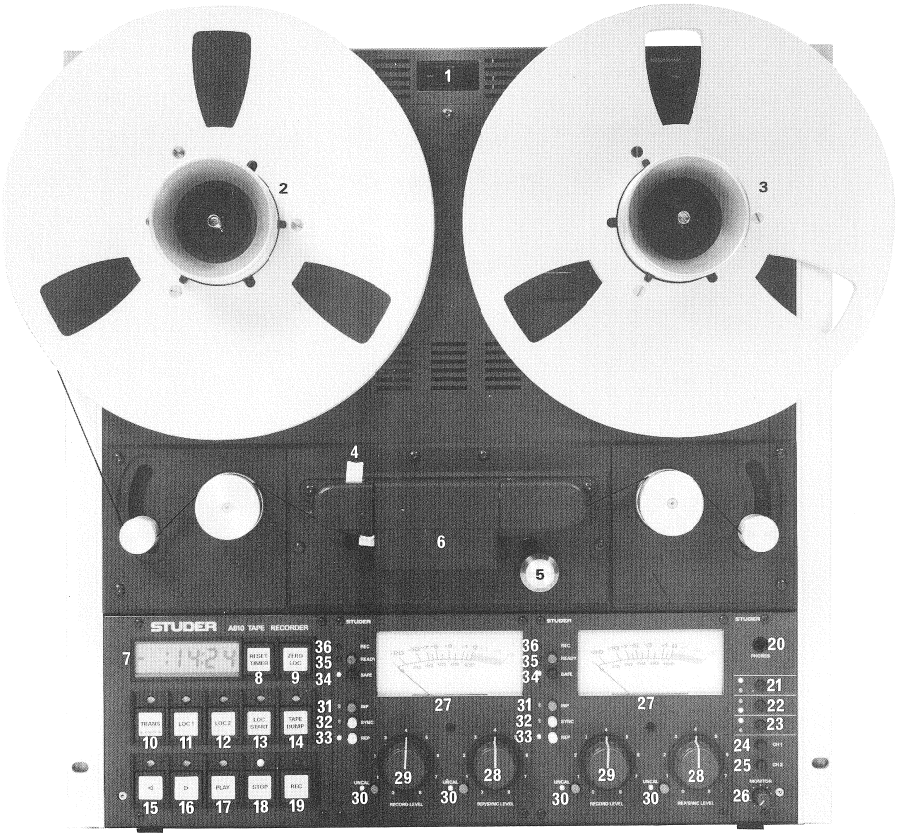
2.4.6 Headphones socket

TIP = left
RING = right
SLEEVE = Ground



2.5 OPERATING INSTRUCTIONS

2.5.1 Controls



(1) Power switch ON/OFF
(2) Left-hand spindle (supply motor)
(3) Right-hand spindle /take-up motor)
(4) Tape lift slider
(5) Pressure roller: For easier editing can be manually shifted toward the capstan during spooling.
(6) Head shield, can be closed or opened manually.
(7) Tape timer display, 4 1/2 positions (LCD) or 5 positions (LED) with leading negative sign.
(8) RESET TIMER: Reset key for (7).
(9) ZERO LOCATOR: Initiates automatic search of tape address 00.00.
(10) TRANS <REDUCED>: multifunction key. Pressed together with LOC 1 ... LOC 4: the current tape address is stored; pressed together with one of the spooling keys during fast wind: reduces the spooling speed in three steps; pressed together with ZERO LOC: the operating hours (actual transport operation time) are displayed.
(11) LOC 1: automatic search of the address stored with (10). The locate address is displayed while this button is pressed.
(12) LOC 2: same as LOC 1
Or
LOC START: Automatic search of the tape address at which the play or the record function was last entered from STOP or spooling mode.
Or
LIFTER: Defeating the tape lift during spooling (internally programmable as a momentary or flip-flop push button).
Or
FADER: Change-over key for fader start. Disables local keyboard.
Or
TAPE DUMP: dump edit mode, right-hand spooling motor is switched off.
(13) LOC 3: same as LOC 1
Or
LOC START, LIFTER, FADER, TAPE DUMP
Or
REM CONTR: Selector switch for parallel remote control. Local keyboard is disabled.
(14) LOC 4: same as LOC 1
Or
LOC START, LIFTER, FADER, TAPE DUMP, REM CONTR
Or
CODE READY: recording on time code channel enabled.
(15) < Rewind key.
(16) > Fast forward key
4 spooling speeds: if TRANS <REDUCED> is pressed in conjunction with < or >, the recorder switches to the next lower spooling speed. When activated in STOP or PLAY mode: after pressing < or >, the recorder starts spooling at the lowest speed (1 m/s). Can be cancelled with TRANS, STOP or PLAY.
(17) PLAY: activates reproduce mode.
(18) STOP: has priority over all tape transport commands. Enables recorder for fader start. If STOP is pressed in conjunction with LOC START or LOC 1...4, the stored locator addresses are displayed.
(19) REC: record key; only effective together with PLAY. Drop-in (internally programmable): in play mode it is possible to switch directly to recording by pressing REC.
(20) PHONES: headphones socket (stereo). Volume not adjustable. Internal monitor muted.
(21) CCIR/NAB: selector switch for equalization at 7.5 or 15 ips.
(22) MONO/STEREO: selector switch for mono or stereo mode, or changeover to different tape type TAPE A / TAPE B
(23) 15 ips / 7.5 ips (or other combination): selector switch for tape speed; or rotary switch for three or four tape speeds (located above CCIR/NAB switch).
(24) CH 1: connects channel 1 to the monitor speaker.
(25) CH 2: connects channel 2 to the monitor speaker.
It is possible to connect both channels to the monitor speaker.
(26) MONITOR: volume control for monitor speaker.
(27) Output meter: VU or PPM indication, internally selectable.
(28) REPRO/SYNC LEVEL: level controller for reproduce or sync output signal.
(29) RECORD LEVEL: level controller for input signal (to be recorded).
(30) UNCAL: activates the level controller. In OFF position: calibrated line level.

Output selector switches:

(31) INP: Input signal
(32) SYNC: Sync signal
(33) REP: Reproduce signal

Track mode selector switches:

(34) SAFE: recording on channel disabled.
(35) READY: Recording on channel enabled.
(36) REC lamp: Record pilot lamp, lights up after PLAY and REC have been pressed.

2.5.2 Power switch

CAUTION!
Before switching on the recorder, check that the setting of the AC voltage selector on the back of the recorder matches the local line voltage.

If the setting of AC voltage selector is changed, also check the rating of the power fuse.

The power switch is located at the top edge of the tape transport cover. The recorder is switched on by shifting the switch handle to the right (–). To switch the recorder off, shift the switch handle to the left (O).

When power is switched on, the previously active operating state is activated and indicated.
Exceptions: The recorder is always switched to STOP mode. If it is equipped with a SAFE/READY switch always SAFE and REPRO are activated.
The microprocessor automatically performs a confidence test of the main functions when power is switched on.

2.5.3 Tape timer display

The tape timer display consists either of a 4 1/2 position liquid crystal display (LCD) or a 5 position LED display. It indicates the actual tape position in hours, minutes, and seconds independent of the selected tape speed. Numbers smaller than zero are identified by a negative sign.
Display range: –1 h 59 min 59 s to 1 h 59 min 59 s (LCD version)
– 59 min 59 s to 9 h 59 min 59 s (LED version)
Fractional seconds are rounded to the nearest second.

When power is switched on, some random numbers appear, followed by a date (calendar week and year). This is the release date of the microprocessor software (program). After five seconds the tape address is displayed which was active before the last power off.

On time code versions equipped with the LED tape timer display and with the new time code amplifier 1.820.721-81/82/83/84, the far right decimal point turns on when a code signal is available at the input or is being read from the tape (depending on the position of the INP/SYNC/REP selector switch).

Should a malfunction be detected in the recorder operation, this will be indicated by an alphabetic/numeric combination.

Examples of tape timer readings:

1:01:56 (LCD) or 1.01.56 (LED) indicates the last active tape address recorder ready.
:01:56 Upper display limit has been exceeded (LCD),
– :01:56 Lower display limit has been exceeded (LCD),
H.01.56 Upper display limit has been exceeded (LED),
L.01.56 Lower display limit has been exceeded (LED),recorder ready
0.35.56. In PLAY mode the last decimal point is on = time code on tape.
EE 01 (LCD) or EEE01 (LED): stored information has been lost. Refer to DEGRADED OPERATION, Section 2.7.

2.5.4 Pilot lamps

Any number of pilot lamps as well as READY or REC can briefly turn on after the microprocessor has been started. The recording function is electronically disabled during this sequence. The following pilot lamps (LEDs) turn on to indicate the current operating status of the tape recorder:

STOP: Stop function is active. If this LED flashes, both tape tension sensor are in their end positions (no tape present or threaded loosely).

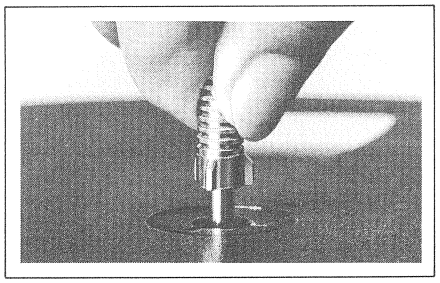
CCIR or NAB: indicates the type of equalization selected.

STEREO or MONO
or on recorders without mono/stereo selector switch,
TAPE A or TAPE B: tape type selector.

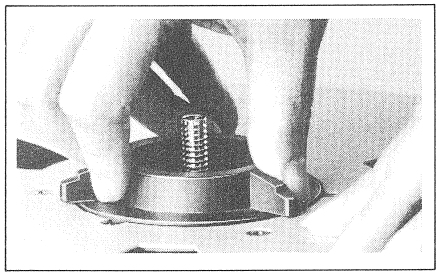
Depending on the recorder configuration the following may also be illuminated:
- Tape speed: e.g. 15 or 7.5 ips
- Output meters
- On track selector: SAFE
- On output selector: selected output (INP, SYNC or REC)
- UNCAL (if selected).

2.5.5 Mounting the tape

Three-pronged reel with flange:
(DIN 45514, 45517)
Mount full reel on the left-hand spindle, the empty reel on the right-hand spindle. Pull out three-pronged guide and lock it with a 60° rotation.

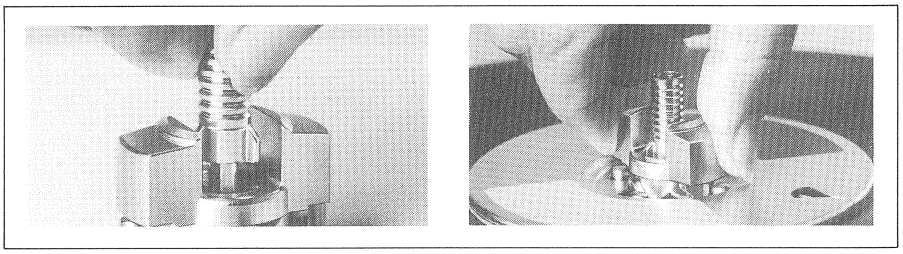


NAB reel:
Mount NAB adapters on spindles and lock three-pronged guides.
Mount NAB tape reel (or NAB hub if self-supporting pancake is used) on the adapter and rotate top section of adapter clockwise until it locks in place.



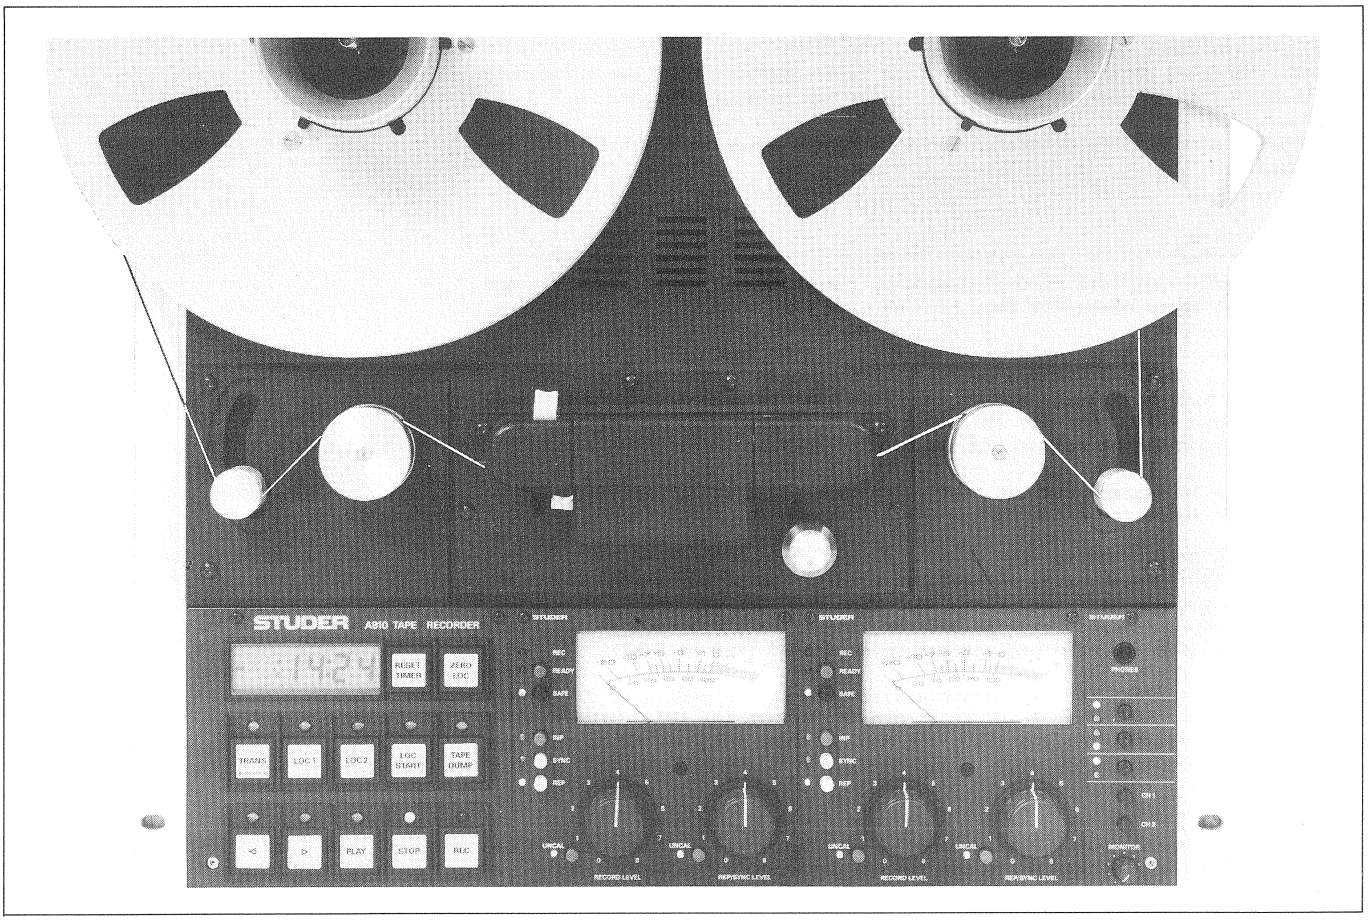
Self-supporting pancake:
(According to DIN 45515)
Set pancake platters on spindles, engage the two driving lugs of the platter into the holes of the spindle and lock three-pronged guide.

Mount full pancake on the left-hand side, lift flap and rotate it by 90° until it rests on the guide pins. Repeat preceding steps for mounting a pancake platter and an empty hub on the right-hand side.



Threading the tape:

IMPORTANT:
The head shield must be lifted off the soundheads before threading the tape.



Thread tape according to illustration. The leading tape and is placed on the right-hand reel and secured with a few counterclockwise rotations. Tapes with a transparent leader should be wound forward to the start of the oxide coating. Set tape timer to zero by pressing RESET TIMER.
Lower shield to cover soundheads.

2.5.6 Tape speeds

Three or four tape speeds are available in the following versions:

- Low-speed (LS) version (with 4-pole tacho motor):
  3.75 / 7.5 / and 15 ips

- Four-speed version (with 2-pole tacho motor):
  3.75 / 7.5 / 15 / and 30 ips

(The speed is selected on the rotary switch). The pilot lamp "PLL CAPSTAN" turns on as soon as the tacho motor has attained the nominal speed.

On older versions with two-speed panel, any two speeds (3.75 / 7.5 / 15 / 30 ips) can be selected by means of DIL switches. The speed is changed over by pressing the corresponding button.

2.5.7 Play mode

The recorder is switched to play mode either with the local PLAY key, a remote control key or a fader start device, and the lamp above the PLAY key turns on.

The play mode can be cancelled by pressing the STOP button.

If PLAY is pressed while a recording is in progress, the recorder switches to reproduction without delay.
If PLAY is pressed during spooling, a STOP is triggered (PLAY lamp turns on); PLAY is activated as soon as the nominal speed has been attained.

The spooling mode or an autolocator function can be selected directly from the PLAY function.

2.5.8 Recording

The machine is put into recording mode by simultaneously pressing PLAY and REC. The lamps above these two keys turn on.

The record function is cancelled by pressing the STOP key.

If PLAY and REC are pressed during spooling, the recorder enters stop mode (the lamps above PLAY, REC and STOP turn on). Recording mode is automatically activated as soon as the nominal tape speed is reached.

It is possible to switch from the record function directly to spooling mode or an autolocator function.

Recorders with SAFE/READY switch:
Recording on corresponding channel can be disabled by pressing the SAFE button. The yellow SAFE lamp turns on. When PLAY and REC are subsequently pressed, the tape transport starts, however, the signals recorded on the track protected with SAFE are retained and can be monitored (REP or SYNC).

Recording on a channel is only possible after the corresponding READY button has been pressed. The green READY lamp turns on. When the record function is activated by pressing PLAY and REC, the red REC lamp turns on to signal that recording is in progress.

The SAFE function can be enabled for either channel while a recording is in progress. To reenable recording on this channel, the READY button must first be pressed. After the READY lamp turns on, either the PLAY and REC key or only REC key must be pressed, depending on the internal programming.

On 2-channel recorders, the internal programming determines whether this feature works on both channels in parallel or separately for each channel.

Drop-out from record mode:

Click-free changeover from the record function to playback or sync reproduction is possible by pressing the the PLAY key. Depending on the internal programming the erase and record head are switched off concurrently, or the record head switches off with a speed-dependent delay in such a way that the two soundheads drop out at exactly the same tape address. If the recording function is terminated with STOP, both soundheads are always switched off concurrently.

Drop-in:

Click-free change-over from reproduction to sync reproduction or recording is possible. Two methods can be implemented through internal programming: PLAY and REC must be pressed concurrently or the recording function is activated by REC alone (prerequisite: the machine is already in play mode!).
Depending on the internal programming, the erase head and the recording head are either switched off concurrently or the recording head switches off with a speed-dependent delay so that the drop-in occurs exactly at the same location.

Overlapping drop-in "FADE IN/FADE OUT" (mechanical):

If e.g. an applaus is to be faded in at the end of a production, the tape can be lifted off the erase head with the tape lift slider (4). The machine is susequently started in record mode. When the slider is slowly released, the tape contacts the record head first, i.e. the new modulation is added to the existing signals (e.g. music selection). After the music selection has faded away, the tape lift slider is released completely so that the tape comes in contact with the erase head. Unwanted noise will be eliminated and only the applaus is recorded.

2.5.9 Sync reproduction

Sync reproduction mode is entered by pressing the SYNC button. In this mode, the tape induces an audio signal in the recording. This signal is amplified and equalized in the reproduce amplifier.
Accurate drop in is possible since there is no speed-dependent offset between the record and the reproduce head.

The bandwidth for sync reproduction is limited to approx. 12 kHz. For special mixdowns it is possible to extend the bandwidth to 20 kHz with the aid of a jumper (refer to Section 4.2.9). At frequencies above 12 kHz, strong cross talk from the audio channel to the sync reproduction channel must, however, be expected.

Sync preselection:

A channel that has been switched to recording mode cannot be switched to sync reproduction. If the SYNC button is pressed during a recording, the output of the corresponding channel is connected to the input (INP). This channel is automatically switched to sync reproduction when the recording mode is cancelled (PLAY, SAFE, STOP).

2.5.10 Spooling mode

Rewinding is activated by pressing the < key; fast forward by pressing the > key. The corresponding pilot lamp turns on.

The spooling function is cancelled by pressing the STOP key.

Direct change-over from rewind to fast forward and vice versa or from reproduction or recording to spooling is possible.

It is possible to switch from spooling mode directly to recording or reproduction. The pilot lamp of the selected function turns on, the tape is braked, and the new function is activated as soon as the tape travels at the nominal speed.

Decreasing the spooling speed:

The search for a specified tape address can be made easier by decreasing the spooling speed from 10 m/s (standard) to 7, 4, or 1 m/s.
This is accomplished by pressing TRANS <REDUCED>, followed by one of the spooling keys.
TRANS <REDUCED> is active as long as the corresponding pilot lamp is on.

Example:

In order to decrease the maximum spooling speed to 1 m/s, the keys are pressed in the following order: TRANS <REDUCED> and 3 times < or >.

The slowest spooling speed can be activated directly from STOP or PLAY: press TRANS <REDUCED> an the corresponding spooling key.

Spooling at full speed can be resumed by pressing TRANS (or STOP or PLAY).

Tape Lift:

The tape is automatically lifted during spooling in order to minimize wear on the soundheads.

If the beginning or the end of a recording is to be searched, the pressure roller cover can be pressed manually against the capstan but the pressure roller cannot, however, touch the capstan. As a consequence, the tape lift pins are retracted, the tape is pushed against the heads and the modulation becomes audible.

The tape lift pins can be retracted electrically by pressing the LIFTER key (internally programmable as a momentary or flip-flop key).

2.5.11 Stop mode

The STOP key has top priority and cancels other operating modes such as reproduction, recording, spooling, and autolocator. After this key has been pressed, the STOP pilot lamp turns on and tape breaking is initiated.

When the tape has come to a stop, the breaking torque is automatically decreased and the tape tension sensor are locked. This makes it easier to shift the tape for editing purposes.

Any new operating mode entered during braking will be stored and immediately activated when the nominal speed has been attained.

The STOP key can also be pressed in conjunction with locator keys to read out the locator addresses.

2.5.12 Autolocator

The following modes are supported by the autolocator function:

- ZERO LOC: Zerolocator. This key initiates a rewind (or fast forward) to the tape address corresponding to the timer reading 00:00.
- LOC START (programmable): this key activates a fast rewind (or forward wind) to the tape address at which play or record was last activated from STOP.
- LOC 1 ... LOC 4 (programmable): Transferlocator. Up to four tape addresses can be stored and automatically searched in spooling mode by pressing one of these keys.

Programming:
Search desired tape address and press the TRANS key when the approximate position has been reached. The address can be stored as long as the TRANS pilot lamp is on.

As soon as the exact position has been found, press one of the keys LOC 1 ... LOC 4. The TRANS pilot lamps turns off to acknowledge that the address has been transferred into memory. The TRANS key must be pressed again before a new address can be stored.

The stored address can be read out:
Either by pressing the corresponding LOC key again after the search has been completed or by holding down the STOP key, followed by the corresponding LOC key.

Play Preselection
If the PLAY key is pressed while a locate function is in progress (ZERO LOC, LOC START, LOC 1 ... 4), the recorder switches automatically to reproduction after the corresponding tape address has been found. Recording mode (REC) cannot be preselected.

All locate addresses are retained in memory even after the recorder has been switched off.

CAUTION!
Since the stored tape address relate to the tape timer content, undesirable offset will occur if the RESET TIMER key is pressed unintentionally!

2.5.13 Dump editing

The right-hand spooling motor is switched off in dump edit mode and unusable tape segments can be played into the waste basket.
When the TAPE DUMP key (inernally programmable) is pressed, the recorder switches to reproduction but the take-up motor is switched off.

In TAPE DUMP mode the tape must be pulled gently to the right until the pinch roller presses the tape against the capstan.
The TAPE DUMP function can be cancelled by pressing one of the command keys (e.g. STOP) or by pressing TAPE DUMP a second time.

2.5.14 Monitor

The monitor speaker of portable or chassis versions is built into the tape transport cover.
The key CH 1 connects channel 1, CH 2 connects channel 2 to the monitor speaker. If both keys are pressed, channel 1 and channel 2 are mixed in the monitor amplifier. The monitor speaker always reproduces the signal from the selected output (INP/SYNC/REP).
The volume can be adjusted with the MONITOR control.
The monitor speaker of three- and four-speed panel versions is muted in fader start mode.

The monitor speaker of console models is built into the console panel. Reproduction or input can be activated with the REPRO/INPUT selector switch (the signal is tapped before the corresponding level controllers).
Channel 1 (CH 1), channel 1+2 (CH 1 + 2) or channel 2 (CH 2) can be monitored.
The volume is adjusted with the MONITOR control.
No automatic muting of the monitor speaker is possible in fader start mode.

2.5.15 Tape timer

The electronic tape timer always displays the real time in hours, minutes, and seconds, regardless of the selected nominal tape speed.
The display capacity is -1 h 59 min 59 s to 1 h 59 min 59 s (for the LCD version) or -59 min 59 s to 9 h 59 min 59 s (LED version).

Values outside the display capacity are indicated without the hours digit on the LCD version, e.g. :56:20 or - :03:10; an "H" appears on the LED version in place of the hours if the value is too high or an "L" if the value is too low for indication, e.g. H.56.20 or L.03.10.

Fractional seconds are rounded up or down.

The tape timer stops automatically when the end of the tape is reached, if the tape tears, or in dump edit mode (TAPE DUMP).

The timer can be reset to 00.00 by pressing the RESET TIMER key.

On time code versions equipped with the LED tape timer display and with the new time code amplifier 1.820.721-81/82/83/84, the far right decimal point turns on when a code signal is available at the input or is being read from the tape (depending on the position of the INP/SYNC/REP selector switch).

2.5.16 VU-meter panel

The level meter can be internally switched to function as a peak program meter (PPM) or a VU-meter.

UNCAL: When this button is pressed, the corresponding level control is activated and the pilot lamp turns on.

When the UNCAL button is released, the level control is bypassed and the input or the output level is set to line level.

Output selector:
INP: Connects the input signal of the recorder to the output and to the VU-meter.

SYNC: Connects the sync signal to the output and the VU-meter. This mode can be preselected for the record function.

REP: Connects the reproduce signal to the output and the VU-meter.

Source/tape monitoring can be conveniently activated during recording by pressing the INP and REP buttons.

The INP, SYNC, and REP buttons always cancel each other.

In 2-channel models, the operating procedure is determined by the internal programming, i.e. it affects either both channels together or each individual channel.

2.5.17 Remote controls

The tape recorder can be started remotely in play mode with the aid of the fader start circuit.
The following functions can be activated remotely from the parallel remote control: reproduction, recording, spooling, stop, LOC 1, and LIFTER (defeating the tape lift during spooling).

a) Operation with programmable keys FADER and/or REM CONTR:
When one of these keys is pressed, the corresponding pilot lamp turns on, the local keyboard is disabled.

If FADER or REM CONTR is pressed a second time, the local keys are reactivated and the pilot lamps turn off. The fader start switch and the remote control switch are disabled in this condition.

b) Operation without FADER and/or REM CONTR keys:
The fader start circuit is only enabled if the recorder is in STOP mode. The remote control keys and the local keys have equal priority.

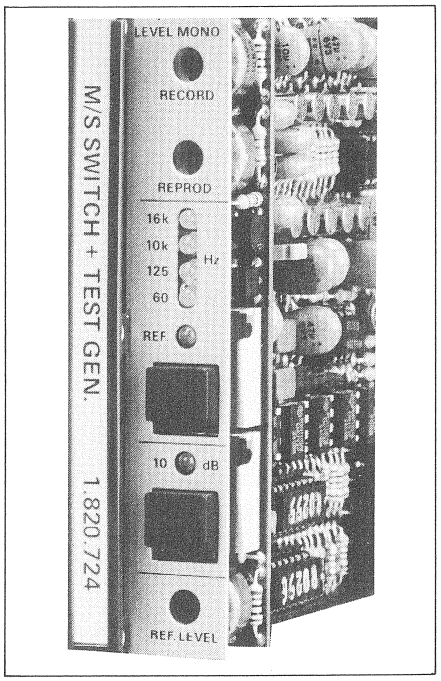
2.5.18 Mono-Stereo switch (option)

Stereo models can be equipped with a mono/stereo switch. The last operating mode in effect will be automatically reestablished and indicated after the recorder is switched on.

The MONO/STEREO button is a flip-flop switch, i.e. it changes from mono to stereo or vice versa. This switch can be actuated in any operating mode.

If the mono/stereo module is not installed, the corresponding pilot lamps STEREO and MONO remain dark.

2.5.19 Mono/stereo switch with test generator (option)



The test generator is switched on by pressing the upper button (REF pilot lamp turns on, i.e., the reference frequency, normally 1 kHz, is selected). The following switch settings can be established by repetitive pressing of this button:
- 60 Hz - 125 Hz - REF - 10 kHz - 16 kHz - OFF - 60 Hz - etc.

With the lower button the generator level can be switched over from nominal level to nominal level -10 dB. If -10 dB is selected, the gain in the reproduce branch of the mono/stereo switch is automatically boosted by 10 dB; this means that the reference value of the VU-meter display is again 0 dB for measurements with tape.
The lower button is only enabled if the test generator has previously been switched on with the upper button. After switching the generator off and on again with the upper button always nominal level is present at its output.

2.5.20 Time code channel (option)

On recorders with 2 mm guard track without built-in time code operating panel, the time code channel is always controlled (INP/SYNC/REP switch) in parallel with the two audio channels.

In 2-track versions without built-in time code operating unit, the time code channel (INP/SYNC/REP) is always controlled in parallel with audio channel 1. For exaple if sync reproduction is to be achieved for audio channel 2, audio channel 1 will have also to be switched to sync reproduction.

Time code recording

On recorders without built-in time code operating unit, press the (internally programmable) CODE READ key (pilot lamp turns on). Recording can subsequently be started by pressing PLAY and REC. If recording is already in progress, time code recording is activated by pressing CODE READY and REC + PLAY. (CODE READY pilot lamp flashes).

On recorders equipped with a time code operating unit, press the READY button (READY lamp turns on) and start the machine in record mode by pressing PLAY and REC. If recording is already in progress, press READY and REC + PLAY.

Time code reproduction

Press REP or SYNC and start recorder in reproduce mode with PLAY.

2.5.21 Varispeed control (option)

The varispeed control is activated either with the built-in VARISPEED button or the VARISPEED remote control key. With an external reference frequency of 9600 Hz, the tape speed corresponds to the selected nominal speed (3.75; 7.5; 15; or 30 ips). The tape speed can be varied by ±7 semitones by increasing or decreasing the external generator frequency (+50% / -33%).

The pilot lamp of the nominal frequency turns on as soon as the capstan motor is in synchronism with the external reference frequency.

The drop-in/drop-out sequence (refer to 2.5.8) is fixed and depends on the nominal speed which means that no matching is executed in varispeed mode!

2.6 EDITING, SPLICING

2.6.1 Procedure for searching a tape address

Easy and quick searching of a specified tape address were basic criteria in the design of the A810 tape recorder:

- Four spooling speeds are available for accurate and fast search of the desired tape address.
- For cueing in spooling mode, the automatic tape lift can be manual defeated by pressing the LIFTER key or by pressing against the cover of the pressure roller.
- Unusable tape segments can be played ito the waste basket in PLAY mode (programmable TAPE DUMP key).
- The autolocator function enables accurate search of the desired tape addresses at any tape speed.
- The tape tension sensors are locked in STOP mode and the braking torque is decreased: this makes it easier to shift the tape by hand and to cut it. The locking force of the sensors was selected so (500 p or 5 N) that the tape will not be damaged in the event of jerky movement.

Caution:
If the tape marker is used and for physical cutting of the tape, the recorder must be switched from sync reproduction to normal reproduction by pressing the REP buttons.

Searching a tape location with spooling:
If the desired tape position is approximately known (e.g. the beginning or the end of a program), it can be approached with the spooling function. The maximum tape speed can be reduced during spooling to 7, 4, or 1 m/s by pressing TRANS <REDUCED> and < or > (also refer to Section 2.5.10!).

Press LIFTER key or push pressure roller cover with your hand against the capstan so that the tape lift pins are retracted behind the soundheads and the modulation can be cued. Avoid contact with the rubber pinch roller!

As soon as the cue point is reached, the tape can be accurately positioned by repetitively pressing < and >. Press STOP and bring the tape into the exact cutting position by carefully rotating the two reel flanges by hand.

Search with PLAY:
If certain segments with unknown locations are to be cut out of a program, they can be searched with normal PLAY mode. When one of these segments has been located, press the STOP key and position the tape into the correct cutting position by carefully rotating the two reel flanges by hand.

If longer tape segments are to be eliminated, switch the recorder to dump edit mode (internally programmable) by pressing the TAPE DUMP key. The right-hand spooling motor will be switched off and the tape is played into the waste basket on the right-hand side.

The functions spooling, autolocator, remote control, and fader start are disabled while the dump edit mode is active (refer to Section 2.5.13).

Search with autolocator:
(Also refer to 2.5.12)
The tape address 00.00 can be automatically searched with the ZERO-LOC key.

The start of a program is automatically stored in memory and can be automatically searched with the internally programmable LOC START button, provided the recording was not interrupted.

While a program is being recorded, 1 to 4 tape addresses can be stored directly, depending on the internal programming, by pressing TRANS and LOC 1 (...4).

When the corresponding LOC button is pressed, the desired tape address is automatically searched; the exact editing position can now be adjusted by hand.

2.6.2 Cutting the tape

The following features have been provided, for easy cutting and splicing of the tape:

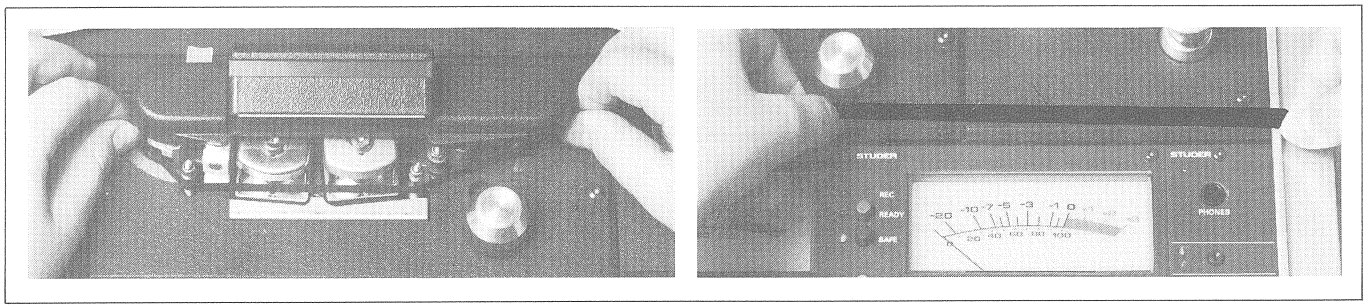
- A tape marker and scissors built into the headblock are available as options.
- Built-in splicing block with a cutting groove below the right-hand guide roller.
  The distance from the right-hand index finger stop of the head shield to the reproduce head is the same as the distance from the right-hand splicing block stop to the cutting groove.
- A tape loosely inserted after splicing will be automatically and correctly drawn in when the PLAY key or one of the spooling keys are pressed.

The tape can be cut once the correct splicing point has been established. This is accomplished by one of the procedures outlined below:

Cutting at the reproduce head
Lift the tape lightly off the reproduce head with antimagnetic scissors and cut it exactly at the gap (center of the head face) at an angle of 45°. A special cut-out is located to the right of the reproduce head so that the scissors can be inserted for lifting the tape.

Marking the tape
Mark the center of the reproduce head face on the tape with the aid of a marker (option) or a soft pencil. Now draw the tape away from the soundhead and cut it at an angle of 45°.

Splicing block with cutting groove



With thumb and index finger of each hand, pick up the tape on the right- and the left-hand side of the head shield and pull it out gently. Without letting the tape slip out of your hand, insert it into the splicing block in such a manner that the index finger of your right hand barely touches the edge of the block. The cutting position is now exactly over the cutting groove and the tape can be cut with a razor blade.

Built-in tape scissors (option)
Mark the cutting position of the tape with the marker or a soft pencil or memorize the location from the printing on the back. Carefully rotate the right-hand spindle (take-up direction) to advance the cutting position to the scissors. The tape is cut by pushing the scissors button.

2.6.3 Splicing the tape

The splicing block with the cutting goove is located below the right-hand guide roller.
The two tape segments are placed into the splicing block with the printed side facing up. Join the two ends (without overlapping) and secure them with a pice of splicing tape (approx. 3/4" (20 mm) long, 1/4" wide).

After the splicing operation the tape is reinserted and tensioned.

2.7 DEGRADED OPERATION

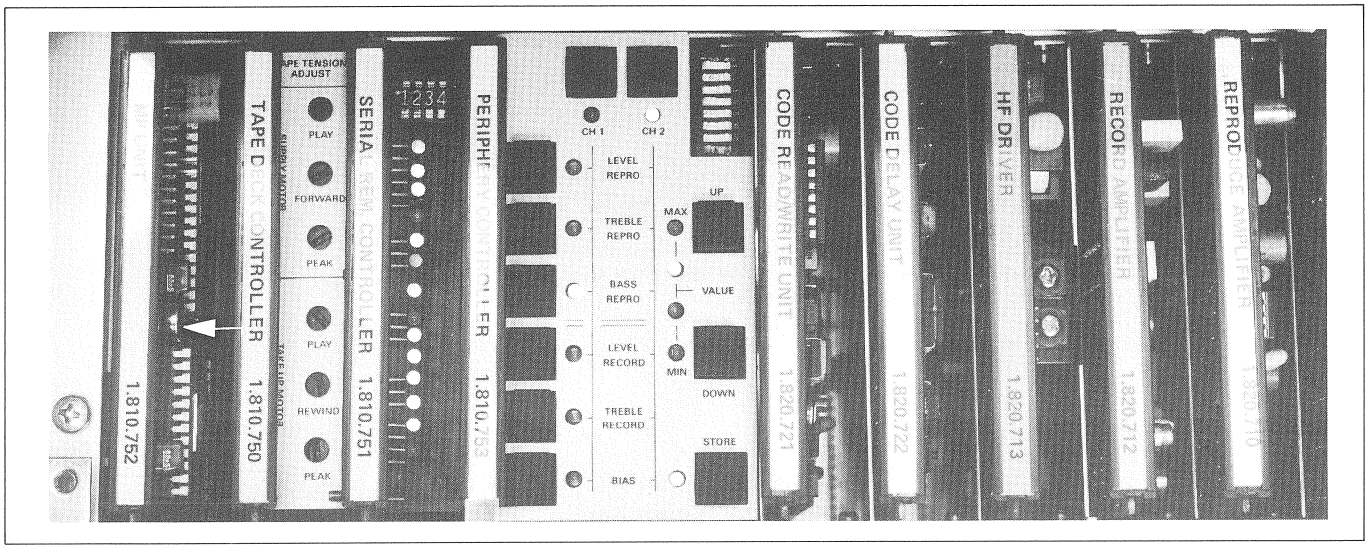
This Section describes the extent to which the A810 tape recorder can be operated in the event of a malfunction in one of the assemblies.

"Degraded operation" is not possible if
- One or serveral supply voltages are failing
- If the control for the spooling motors or the capstan motor is defective.

Important:
A defective tape recorder should only be operated in emergencies and be forwarded to an authorized service location as soon as possible.

Should one of the following error messages appear when the recorder is switched on (except EE 01, EE 02, and EE 03 on the LC display or EEE01, EEE02, and EEE03 on the LED display; refer to 2.7.1!), switch the recorder off, wait a few seconds, and switch it on again. If the error message disappears, normal operation can be resumed (the error may have been caused by fluctuations or transients in the line voltage during the initialization of the microprocessor).

Normal operation may also be restored by reinitializing the microprocessor by pressing the RESET key located below the lower front panel on the circuit board MP UNIT 1.810.752/1.820.780.



Error messages can be cleard by pressing TRANS <REDUCED> and STOP, however they may reappear after a certain time.

2.7.1 Error messages appearing on the tape timer display

EE 01 (LCD) or EEE01 (LED):
Data error in RAM; is only displayed when the recorder is switched on or after a RESET.
To keep the recorder operational, the standard audio parameters permanently stored in the machine program are loaded into the amplifiers.
Record and reproduce mode are still possible, however minor deviatins from the guaranteed technical data may occur because of the changed audio parameters.
A test recording should be made.
Also check the stored locate addresses.
The tape recorder must eventually be recalibrated or the audio parameters stored on tape must be reloaded. (Refer to Section 4.2.)

EE 02 (LCD) or EEE02 (LED):
Occurs only during calibration. Refer to 4.2.1.7.

EE 03 (LCD) or EEE03 (LED):
A data error has been detected during the cyclic testing of the RAM. Same effect and remedy as for EE 01!

Important:
The error messages EE(E)01, EE(E)02 and EE(E)03 are cleared after the recorder is switched OFF and ON or after RESET. It should be remembered, however, that the standard audio parameters will be loaded!

EE 04 (LCD) or EEE04 (LED):

EE 05 (LCD) or EEE05 (LED):
Failure of a supply voltage. No operation is possible. Check the secondary fuses and the supply voltages. Exception: failure of the 5.6 V supply.

EE 06 (LCD) or EEE06 (LED):
Error in the transmission of data when reading saved audio parameters from tape. Repeat the read operation (refer to 4.2.7).

EE 07 (LCD) or EEE07 (LED):
Error in the transmission of data when saving audio parameters on tape. Repeat save operation (refer to 4.2.7).

EE 08 (LCD) or EEE08 (LED):
Error in the comparison of the saved audio parameters with the data stored in RAM (refer to 4.2.7).

EE 13 (LCD) or EEE13 (LED):
External VU panel not plugged in or jumper on BUS CONNECTOR PCB set to "EXTERN" rather than "INTERN" (refer to Section 4.2.9.8).

EE 14 (LCD) or EEE14 (LED):
Master panel not plugged in (BUS CONNECTOR BOARD).

EE 15 (LCD) or EEE15 (LED):
Data transmission error (in conjunction with serial remote port).

EE C1 (LCD) or EEEC1 (LED):
Failure in audio channel 1. Recording on channel 1 is inhibited by the microprocessor. Reproduction of channel 1 or recording and reproduction on channel 2 are still possible.

EE C2 (LCD) or EEEC2 (LED):
Failure in audio channel 2. Recording on channel 2 is inhibited by the microprocessor. Reproduction of channel 2 as well as recording and reproduction on channel 1 are still possible.

EE C3 Time code channel defective.

EE Ei (LCD) or EEEEi (LED):
(i = 1, 2, 3, or 4) data error in one of the EPROMs 1, 2, 3, or 4. Further operation of the recorder is not possible if this error occurs during the power-on sequence of the recorder.
If the error occurs after the recorder has been switched on: mount a tape (with trivial content). Check functions such as play, record (also the SAFE function!) and spooling. Check braking action (loop formation!).
The recorder can be put into operation if no apparent problem is found, however the service agency should be notified as soon as possible.

OTHER MESSAGES OF THE TAPE TIMER DISPLAY

bO bO (LCD) or bObOb (LED):
This value is displayed while the audio parameters are being read from tape.

bb bb (LCD) or bbbbb (LED):
Acknowledgment for correct reading of the audio parameters from tape. All data have been stored in RAM.

CO CO (LCD) or COCOC (LED):
This value is displayed while the audio parameters are being saved on tape.

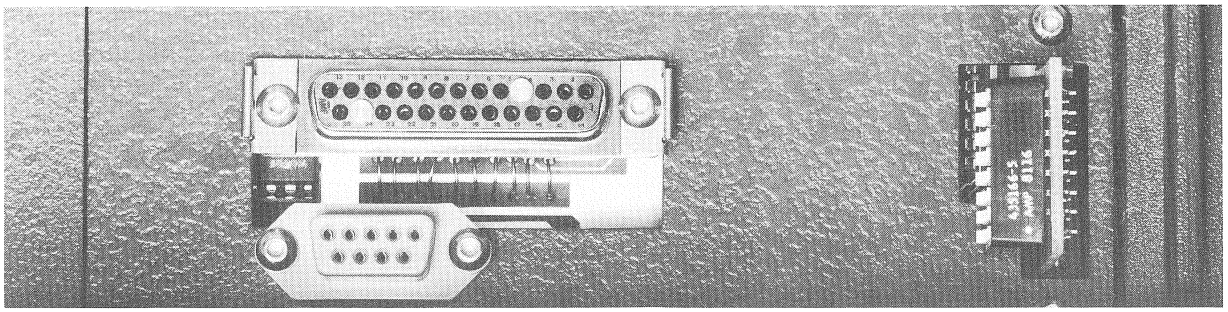
CC CC (LCD) or CCCCC (LED):
Acknowledgment for correct copying of the audio parameters to tape. All audio data have been recorded thrice.

dO dO (LCD) or dOdOd (LED):
This value is displayed while the audio parameters stored on tape are being compared for verification purposes with the data stored in RAM.

dd dd (LCD) or ddddd (LED):
Acknowledgment that the audio parameters recorded on tape have been successfully compared with the data stored in RAM.

2.8 OPERATION WITH SERIAL REMOTE CONTROLLER

With the latest version of the serial remote controller (1.810.751), the recorder can be interfaced to a terminal (RS 232) and the audio parameters can be saved on tape.
Changeover between RS 232 and parameter saving is effected with the program switches on the address PCB.



2.8.1 Data protection

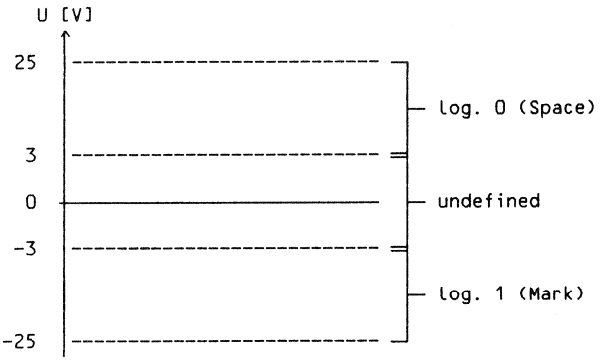
The audio parameters stored in RAM can be copied to magnetic tape via the 9-pin connector for serial remote control, or new audio parameters can be loaded into the recorder (refer to Sections 4.2.7 and 4.2.8).

2.8.2 RS 232 interface

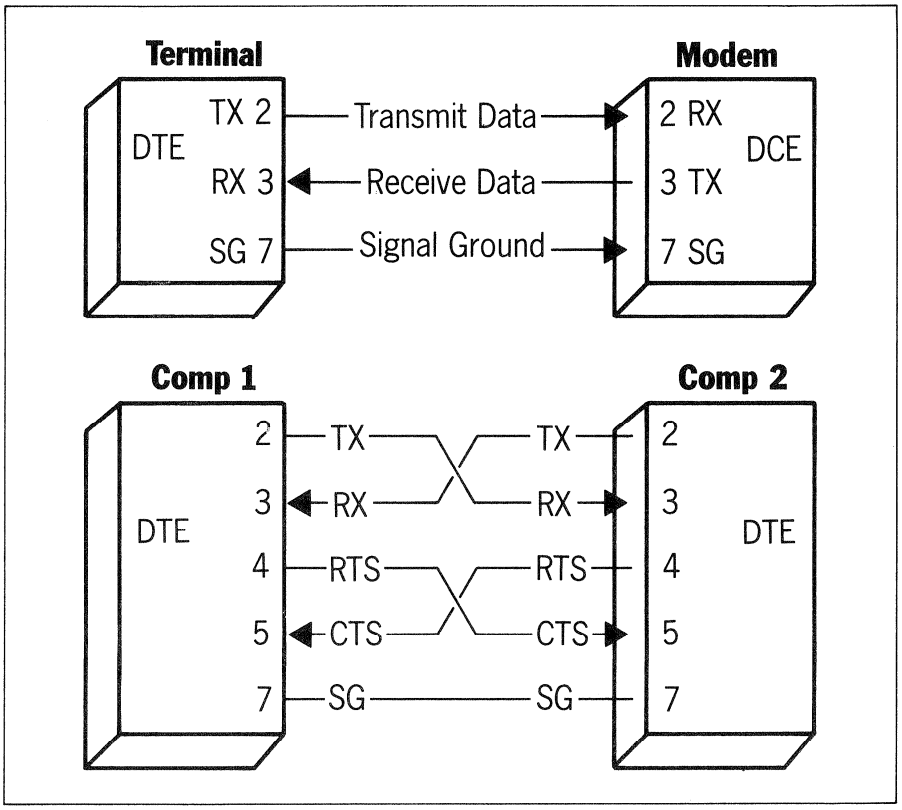
The term "RS 232" defines a link between a "terminal" and a "modem". The corresponding standards also define:

- electrical characteristics (level, lines),
- mechanical characteristics (connectors)
- signal descriptions and
- standard connections

The interface is capable of transmitting data at speeds up to 20 kbit/s and over cables with a length of up to 15 m.
The signal levels are defined as follows:



The 25-pin connector can accommodate various interface structures, however, the full pin assignment is rarely used today. Modern systems frequently use minimum structures for the terminal-modem and terminal-terminal connection respectively as illustrated in the next Figure.



All extensions (e.g. baud rate, code, synchronous/asynchronous connection, number of start/stop bits, parity, hardware/software handshake) are defined by the corresponding manufacturer.

Serial remote controller of the A810

The serial interface (remote controller) of the A810 recorder uses a 9-pin connector according to SMPTE in place of the 25-pin connector. The user can thus decide by means of an adapter cable whether the unit is to function as a terminal or as a modem.

Recorder 9-pole		Terminal 25-pole		Modem 25-pole	
Signal	Pin No.	Signal	Pin No.	Signal	Pin No.
SNDATA	2	Trans. Data	2	Trans. Data	3
RCVDATA	8	Rec. Data	3	Rec. Data	2
GROUND	9	Sig. Ground	7	Sig. Ground	7

No additional handshake lines are used. A software handshake (X ON / X OFF protocol) is implemented for all baud rates, but only necessary for 9.6 kbaud.

X ON = 0001 0001 (ASCII DC 1) = continue

X OFF = 0001 0011 (ASCII DC 3) = stop

When the recorder receives an X OFF it can still transmit up to two characters. After the recorder itself has transmitted X OFF it can still receive 5 characters without losing a command.
The transmitted data string contains:

- 1 start bit
- 8 data bits
- 1 stop bit (no parity)

The following baud rates can be set: 300, 1200, or 9600.
Only data in ASCII character format will be accepted.

Putting the ASCII serial remote controller 1.810.751 into operation

Set up the computer or terminal as follows:

- 1 Start bit, 8 data bits, 1 stop bit (no parity bit), baud rate 300, 1200, or 9600. Echo mode yes or no. Set handshake lines CTS and RTS to low.

SERIAL REMOTE CONTROLLER 1.810.751:

- This PCB contains the receiver and driver for the Studer interface for audio parameter saving as well as the receiver and driver for the RS 232 interface. It is possible to select between these two functions by means of the jumper JS1 as follows:
  - Manual (position X)
    Changeover with DIL switch 2 of the switch assembly SZ 1,
    ON: Studer interface for data protection
    OFF: RS 232
    or
  - automatic (position H)
    Automatic changeover is not implemented in the software up to and including release 13/83 which means that the position X has to be used.
- Plug in the circuit board, switch on the LED monitor display with DIL switch 1: both LEDs RX and TX turn on.
- Set DIL switch 2 to the OFF position for changeover to RS 232.
- Connect the computer or terminal via the adapter cable to the 9-pin RS 232 sockets. If the link is in order, the RX and TX LED turn off.
- On the address board plugged into the rear of the recorder, program the same baud rate as used for the computer or terminal.

Addr. Board Switch	1	2	3	4	5	6	7	8
9600 Bd with echo	0	0	0	0	0	0	0	0
9600 Bd without echo	1	0	0	0	0	0	0	0
1200 Bd with echo	0	0	0	0	0	0	1	0
1200 Bd without echo	1	0	0	0	0	0	1	0
300 Bd with echo	1	1	0	0	0	0	0	1
300 Bd without echo	1	0	0	0	0	0	0	1

ON = 1

- The following message appears on the screen after a reset (power OFF plus power ON):

A810

The desired commands (refer to command list below) can now be entered via the terminal keyboard. The commands are not executed until the carriage return key (ENTER or LINE FEED) is pressed.

Instruction set

Order (_ = blank)	Meaning	in soft-ware since
LCD	Local keyboard disabled	46 82
LCE	Local keyboard enabled	46 82
STP	Stop	46 82
RWD	Rewind	46 82
FWD	Wind forward	46 82
PLY	Play (reproduce)	46 82
REC	Record	46 82
TPL	Tension loosely threaded tape ("tape load")	46 82
LOC_<address>	Locate to <(-)hh(:)( )(/)mm(:)( )(/)ss>	46 82
LMV_<counter reading>	Locate on move roll counter reading <xxxxxx>, (3 bytes HEX)	46 82
STM_<address>	Set tapetimer to <(-)hh(:)( )(/)mm(:)( )(/)ss>	46 82
SHS	Set higher capstan speed	46 82
SLS	Set lower capstan speed	46 82
SMN	Set Mono/Stereo-switch to MONO	46 82
SST	Set Mono/Stereo-switch to STEREO	46 82
SNB	Set equalization to NAB	46 82
SCR	Set equalization to CCIR	46 82
SVS	Set VARISPEED mode	46 82
CVS	Clear VARISPEED mode	46 82
SRH	Set REHEARSAL mode	46 82
CRH	Clear REHEARSAL mode	46 82
DST	Display the status of the recorder on terminal (clear with CNTL X); possible with MP UNIT 1.820.780 only!	13 83
REA_{i}	Channel i READY (i = 1, 2, or 3)	46 82
SAF_{i}	Channel i SAFE (i = 1, 2, or 3)	46 82
INP_{i}	Channel i INPUT (i = 1, 2, or 3)	46 82
SYN_{i}	Channel i SYNC (i = 1, 2, or 3)	46 82
REP_{i}	Channel i REPRO (i = 1, 2, or 3)	46 82
MTN_{i}	Channel i MUTE (i = 1 or 2)	46 82
MTF_{i}	Channel i MUTE off (i = 1 or 2)	46 82
TDN	Time Code Delay on	46 82
TDF	Time Code Delay off (bypassed)	46 82

Instruction set (continued)

Order (_ = blank)	Meaning	in soft -ware since
SAP_<i,j,k>	Set D/A converter <j>, channel <i>, to <k> (i = 1 or 2; j = 0: LEVEL REPRO 1: TREBLE REPRO 2: BASS REPRO 3: EQUALISATION REPRO 4: LEVEL RECORD 5: TREBLE RECORD 6: BIAS 7: EQUALISATION RECORD; k = 2 digits HEX, corresponds to the two least significant digits of the counter display in audio adjust mode)	46 82
SMA_<Address>	Set machine address to <XXXXXX> (6 Digits HEX)	40 85
SCK_<time>	Set clock to <hh(:)( )(/)mm(:)( )(/)ss>	46 82
ST?	Request for status	46 82
TM?	Request for tape counter	46 82
CL?	Request for clock	46 82
PR?	Request if pressure roller engageable (Y=yes, N=no)	46 82
CS?	Request if capstan sync (Y=sync, N=not sync)	46 82
NS?	Request for nominal speed (0 = 3.75 ips; 1 = 7.5 ips; 2 = 15 ips; 3 = 30 ips)	46 82
TH?	Request for Time Code source (0 = left head; 1 = right head wide; 2 = right head narrow; 3 = Line Input)	46 82
MV?	Request for move roll counter reading (3 Bytes HEX)	46 82
AP?_<i,j>	Request for audio parameters channel <i>, D/A converter <j> (i = 1 or 2; j = 0: LEVEL REPRO 1: TREBLE REPRO 2: BASS REPRO 3: EQUALISATION REPRO 4: LEVEL RECORD 5: TREBLE RECORD 6: BIAS 7: EQUALISATION RECORD; Recorder replies with 2 digit HEX number)	46 82
MA?	Request for machine address	40 85
MAN	Muting all channels on	40 85
MAF	Muting all channels off	40 85
	SPECIAL ORDERS:	
D_108_26E	Display RAM content on terminal (see examples)	46 82
UAP_<HEX Addr, Data>	Update audio parameters (see examples)	46 82
P_108_26E	Display RAM content on terminal in MOTOROLA EXORCISER format (see examples)	46 82
L	Reload audio parameters from terminal to recorder in MOTOROLA EXORCISER format	46 82

The above list of orders is not complete and will be enlarged as required.

Examples:

FWD = Fast forward

LOC_-01:43:00 = Autolocator to Address - 1.43.00

SAF_3 = Time code channnel SAFE (recording inhibited)

AP?_1_4_XX = Request for audio parameters channel 1, D/A converter 4 (LEVEL RECORD); XX = hexadecimal reply of the recorder (e.g. A9)

SAP_1_4_A3 = Set audio parameters channel 1, D/A converter 4 (LEVEL RECORD); new value A3 (old value A9 from the foregoing example will be overwritten!)
CAUTION !!! All other parameters such as SYNC or REPRO, tape speed, tape type, equalisation, must be selected at the recorder itself.

D_108_26E = All audio parameters are displayed on the terminal in hexadecimal format, e.g.:

```
      0  1  2  3  4  5  6  7  8  9  A  B  C  D  E  F
0100 xx xx xx xx xx xx xx xx 82 70 90 95 26 B0 30 BB  ...'........&00;
0110 00 00 00 00 66 39 80 87 30 A0 3E 75 62 50 96 87  .....9..0 >..P..
0120 66 39 80 61 .. .. .. .. .. ..
0130 .. .. .. .. .. ..
```

The address of a parameter can be computed as a decimal value by means of the formula below (and must be subsequently translated to a hexa-decimal value!):

```
RADR = ARAM-12 + IDAC + ISYNC*8 + CCAB*12 + SPEED*24 + CHNL*72 +
       TAPE*144
```

whereby:
- RADR = Address of the parameter (in decimal form)
- ARAM = 264 (108 hex), start address of parameter range in the RAM
- IDAC = 0 for LEVEL REPRO
  = 1 for TREBLE REPRO
  = 2 for BASS REPRO
  = 3 for EQUALISATION REPRO
  = 4 for LEVEL RECORD
  = 5 for TREBLE RECORD
  = 6 for BIAS RECORD
  = 7 for EQUALISATION RECORD
- ISYNC = 0 for REPRO MODE
  = 1 for SYNC MODE
- CCAB = 0 for CCIR equalization (automatically = 0 @ 30 ips)
  = 1 for NAB equalizaton (automatically = 1 @ 3.75 ips)
- SPEED = 0 for 3.75 ips (9.5 cm/s)
  = 1 for 7.5 ips (19 cm/s)
  = 2 for 15 ips (38 cm/s)
  = 3 for 30 ips (76 cm/s)
- CHNL = 0 for channel 1
  = 1 for channel 2
- TAPE = 1 for tape sort A
  = 0 for tape sort B

The address of TREBLE REPRO, SYNC, NAB, 38 cm/s, channel 1, tape sort A, is thus computed as follows:
264-12 + 1 + 1*8 + 1*12 + 2*24 + 0*72 + 1*144 = 465 = 01D1 (hex)

UAP_01D1_5C = Update above audio parameter to 5C

P_108_26E = All audio parameters are displayed on the terminal in hexadecimal form in the MOTOROLA EXORCISER format. This format results in more reliable data transmission because possible errors can be recognized from the CHECKSUM.

```
                Same example as above:
S11B01088270909526B030BB0000000006639808730A03E75625096870B

 | |   |                                               └—Data
 | |   |
 | |   └—Address (hex)
 | |
 | └—BYTE COUNT, number of bytes incl. address and CHECKSUM (hex)
 |
 └—for: HEADER RECORD=S0, DATA RECORD=S1, END RECORD=S9
```

2.9 DAILY CARE

Daily care is limited to cleaning the soundheads, the capstan shaft, and the tape guidance elements.

Dust and oxide particles from the magnetic tape coating accumulate principally on the soundheads and the tape guides. In record mode this can cause so-called drop-outs.

Cleaning should be performed daily or more frequently if contamination is visible.

We recommend the STUDER cleaning kit (part No. 10.496.010.00) for this purpose. This kit contains all utensils necessary for cleaning the tape recorder as well as a sound head cleaning fluid and aluminite cleaner.

<u>Procedure</u>

Moisten the yellow piece of cloth with the head cleaning fluid and clean all tape guidance elements. Then wipe the cleaned parts with a dry section of the yellow rag.
Coarse accumulations in the grooves of the right-hand time code head can be removed with a hard brush, the bristles of which have been shortened to approx. 5 mm.

<u>Cleaning the capstan shaft</u>

Clean the rotating capstan shaft with the aid of the yellow piece of cloth and some cleaning fluid.

The capstan shaft normally does not turn when no tape is threaded and if the jumper JS2 (on CAPSTAN MOTOR CONTROL PCB) is in the CAPSTAN SHUT OFF position. In this case the left-hand tape tension sensor is to be lifted lightly by hand; the capstan motor runs until the recorder is switched off or one of the tape command keys (except STOP) is pressed.

<u>Important</u>

Ensure that no cleaning fluid runs into the capstan shaft bearing. The cleaning fluid can also damage the transparent panels of the VU-meters.

<u>Cleaning the scrape flutter roller</u>

For easy cleaning of the scrape flutter roller we recommend to thread an old piece of tape and to insert it behind the left-hand tape lifter. Press PLAY and clean the scrape flutter roller with a felt stick.

SECTION 3 POWER SUPPLY, TAPE TRANSPORT CONTROL page

3. POWER SUPPLY, TAPE TRANSPORT CONTROL

3.1 FUNCTIONAL DESCRIPTION

3.1.1 Power supply

Line voltages:

100, 120, 140, 200, 220, 240 V ±10%, 50 ... 60 Hz

Internal supply voltages
+5.6; +15; −15; +24 V; all stabilized
125 VAC for spooling motor control
130 VAC for controlling the 4-pole capstan motor or
140 VAC for controlling the 2-pole capstan motor

Power supply unit
The line voltage is taken from the 3-pin AC inlet (GR 01) through the 2-pole power switch (GR 02), the line filter (GR 03), an the line voltage selector with the primary fuse (GR 04) tc the power transformer (GR 05).

The secondary side of the power transformer supplies the following voltages:
25.6 V; 35.2 V; 130 V; 125 V; 10 V (spare).

The 25.6 V and the 35.2 V are rectified and smoothed (GR 06). All stabilized voltages are generated on the stabilizer board (GR 07) from these two rectified voltages:
25.6 VAC: +5.6 V, +24 V;
35.2 VAC: +15 V; −15 V.

The +5.6 V for the microprocessor are generated by a switching regulator with pulse width modulation. The output current is limited to approximately 7 A.

Voltage regulators with fixed settings generate the +24 V and the ±15 V. The circuit for the ±15 V has been designed so that the currents flowing through the two regulators are identical.

A stabilized voltage that rises inadmissibly because of a defect, will be automatically short-circuited. If the current limiter of the corresponding voltage regulator is defective, the corresponding secondary fuse blows. The connected assemblies are, therefore, protected from consequential damage.

Should one of the stabilized voltages fail, the microprocessor attemps to switch the recorder from any operating mode to STOP and SAFE, if this is still possible.

The line voltage is monitored. The logic state of the recorder is unaffected by transient line voltage failures of less than 80 ms. For longer failures,the recorder automatically enters STOP and SAFE mode before being switched off.

3.1.2 MP Unit GR 20 EL 01

1.810.752/1.820.780

The MPU logic converts the input commands into logic signals for the control; it stores the audio parameters, the locate addresses, and, whenever the recorder is switched off, also the momentary operating status. The clock frequency of the microprocessor is also the central control for the recorder timings: Capstan motor control, switched spooling motor output stage, audio, time code.

Bus and select lines connect the:
- Tape deck controller
- Audio controller
- Command unit
- Serial remote controller

The TTL MPU bus features 8 data lines and 3 address lines as well as separate select lines to the individual controllers.

Microprocessor

The MC 6803 is a bidirectional, bus-oriented 8-bit parallel microprocessor with 16 address bits. It is implemented in NMOS technology, is TTL compatible, and requires only one supply voltage (+5 V). Seven different addressing methods are possible and its internal instruction set comprises 72 commands. The internal 128 byte RAM is not required for this application and is ignored by the program. External memory up to 64 K can be addressed with the 16 address bits.

In the implemented operating mode (EXPANDED MULTIPLEXED MODE No. 2), PORT 3 functions as a time-division multiplex address/data bus.

The internal clock frequency is 1.2288 MHz which is derived by dividing the external quartz frequency of 4.9152 MHz by four.

The clock frequency is further divided down to the following frequencies:
- :4 = 307.2 kHz (reference frequency for the HF driver, erase and bias frequency)
- :16 = 76.8 kHz (clock frequency for spooling motor output stage)
- :120 = 9.6 kHz (reference frequency for capstan motor control).

External memories

The external memories comprise 4 x 4K PROM and 2K RAM (1.810.752) or 3 x 8K PROM and 2K RAM (1.820.780) respectively plus a rechargeable buffer battery. The battery is charged by the +5.6 supply voltage and feeds the RAM when the recorder is switched off.

The complete machine program is stored in PROM. The audio data, the tape timer information, the selected functions, the locate addresses, and the tape transport status are stored in RAM.

RESET

The RESET input fulfils two functions:

- Correct initialization of the microprocessor during the power-on sequence; the RESET input must be kept below 0.8 V until the supply voltage V/CC has reached at least 4.75 V so that the internal clock generator can stabilize itself during this time.

- If the microprocessor functions incorrectly, it is reinitialized either automatically or with switch S2, and the program is restarted.

INTERRUPT

An interrupt routine is initiated if a line voltage failure is detected by the power supply (T-PWRON = 0). The current instruction is completed before the program branches to the interrupt routine. The operating condition at the time of the interrupt is stored in the RAM and a STOP command is automatically transmitted to the tape transport after 80 ms. If the line voltage returns before the 80 ms have elapsed, the INTERRUPT routine is cancelled and normal program execution continues.

The new version of the MPU board 1.820.780 supports the following additional features:
- Either LED or LCD tape timer display (selectable with jumper on TAPE DECK CONTROLLER).
- Automatic MUTING during spooling.
- Displaying the equipment status on the connected terminal (with the DST command).

3.1.3 TAPE DECK CONTROLLER GR20 EL02

1.810.750

The TAPE DECK CONTROLLER is responsible for transmitting the commands from the microprocessor to the tape transport and for reporting the tape transport status to the CPU. It fulfils the following functions:
- Setpoint input for spooling motor control with 2 x 3 trimmer potentiometers. Control of tape transport solenoids (brake, 3 x EDIT, pressure and tape lift).
- Reading in tape transport status.
- Data for capstan motor control.
- Interpretation of tape move sensor.
- Supply voltage monitoring.
- Monitoring the limit switches of the tape tension sensors (torn tape!).

3.1.4 BUS CONVERTER GR 20 EL 05

1.810.754

TTL/CMOS bus converter (CMOS bus with 8 data bits and 4 address bits). Interface to audio section; transmits only data from microprocessor to audio section (WRITE only).

The audio parameters transmitted by the MPU are written into the audio amplifier through the TTL data bus, the bus converter, and the CMOS bus:
- Input and output level 0, 4, 8 or 10 dBm
- Change-over INP, SYNC, REP
- MUTE
- Equalization 3180 µs
- Erase current
- Drop-in or drop-out

The following alignments are performed by digital/analog converters (256-step attenuators):
- Reproduce level
- Reproduce frequency response (treble, bass)
- Reproduce equalization
- Record level
- Record frequency response (treble)
- Record equalization
- Bias current

The bus converter essentially consists of an interface circuit PIA (PERIPHERAL INTERFACE ADAPTER) and subsequent TTL/CMOS converters.

3.1.5 PERIPHERY CONTROLLER GR 20 EL 04

1.810.753

The PERIPHERY CONTROLLER is the interface to the serial TTL bus (1 serial data bit per peripheral unit; 3 address bits; 1 READ SELECT line and 1 WRITE SELECT line).

Data, address and READ/WRITE select lines connect the following units:
- Audio controller keyboard; device for inputting audio parameters.
- Channel control unit CH1; keys and status indicator lamps channel 1.
- Channel control unit CH2; keys and status indicator lamps channel 2.
- Channel control unit CH3; push buttons and status indicator lamps for time code channel.
- Master panel; push buttons and status indicator lamps for tape speed, mono-stereo switch (or tape bias selector), and CCIR/NAB equalization.
- Remote interface; interface to parallel remote control.

The PERIPHERY CONTROLLER essentially consists of the interface circuit PIA (PERIPHERAL INTERFACE ADAPTER).

Input device for audio parameters (1.810.755):
Comprises 11 keys, 13 status indicator lamps (LED), and 8 code switches. The audio parameters programmed with the keys are acknowledged with status indicator lamps. The code switches are used for:
- Changing over the erase current for full-track, 2-track, and 2-track with time code, as well as timing for drop-in and drop-out offset.
- Selecting the erase current for full-track, 2-track, and 2-track with time code.
- Operating the track mode and output selectors individually for each channel or in parallel for both channels.
- Setting the line level for inputs and outputs.
- Same audio parameters for CCIR and NAB equalization.
- Enabling automatic muting (AUTO MUTE) of the outputs during spooling.
- Enable the input device.

Audio command bus:
The information of the track mode selectors (SAFE/READY), the SAFE/READY switch of the time code channel, the output selector (INP, SYNC, REC) as well as the switches of the master panel are transmitted to the MPU through the audio command bus, the PIA, and the MPU TTL bus.

Remote interface GR 23 (1.810.738):
The interface of the parallel remote control is connected through the audio command bus to the PIA of the PERIPHERY CONTROLLER.

The following functions can be controlled remotely by this unit:
Reproduce, record, spooling, stop, fader start, TRANS <REDUCED> (all with status indication); as well as LOC 1, LIFTER (tape lift defeat), and varispeed mode.

Address board (option):
Six code switches are available for entering an address so that several units can be operated on a serial bus. Two additional code switches have been provided for setting the baud rate of the serial interface: 300, 1200, and 9600 (factory setting).

3.1.6 COMMAND UNIT GR 21

1.810.300/1.810.303

Comprises 12 (Hall) keys and the tape timer display (1.810.300: LCD, 4 1/2 positions; 1.810.303: LED, 5 positions) with leading negative sign. Status indicator lamps for keys (without RESET TIMER and ZERO LOC).

Twenty code switches are located on the bottom of the COMMAND UNIT:
- Standard selector for time code (film, Europe, USA black/white, USA colored NTSC)
- Code track type STUDER or PILOT (1.2" offset)
- LIFTER button, momentary or flip-flop button
- Drop-in sequence
- Drop-out sequence
- Tape type "A" or "B" at low speed
- Tape type "A" or "B" at high speed
- Selection of the two or changeover between three/four tape speeds
- Drop-in directly from PLAY by pressing REC key
- Reprogramming the LOC 2, LOC 3, LOC 4 keys

Refer to Section 4.2.9.

The COMMAND UNIT is connected to the microprocessor unit through the MPU bus.

Tape timer display
1.810.736/1.810.768

The display (1.810.736: LCD, 4 1/2 positions; 1.810.768: LED, 5 positions) with leading negative sign is controlled by the MPU through the MPU bus. It displays either the momentary tape address or an error message (in the event of a malfunction in the recorder). The audio parameters entered from the keyboard are displayed in hexadecimal format.

On time code versions equipped with the new time code amplifier 1.820.721/81/82/83/84, the far right decimal point of the LED tape timer display turns on when a code signal is available at the input or is being read from tape (depending on the setting of the INP/SYNC/REP selector).

3.1.7 SERIAL REMOTE CONTROLLER GR 20 EL 03

1.810.751

Interface for serial remote control
- Connection to a terminal
- Data saving on tape
- Expanded test system

Saving the audio parameters on tape

The audio parameters stored in RAM can be copied to tape through the 9-pin serial remote control connector. Pins 4 and 6 of the 9-pin connector must be liked with the RECORD input of the tape recorder. Also refer to Section 4.2.7.

The stored audio parameters can be compared with the RAM content or be reloaded into the RAM by connecting the 9-pin serial remote connector to the REPRODUCE output of the tape recorder. Also refer to Sections 4.2.7 and 4.2.8.

RS 232 terminals

Connector pins 2, 3, 7, 8, and 9 are required for connecting an external terminal equipped with an RS 232 interface. SNDATA is the send line, RCVDATA the receive line.

The two status indicator lamps SEND and RECEIVE indicate whether the microprocessor is sending data to or receiving from the serial interface.

DEBUG display
1.810.757

The DEBUG display equipped with LEDs indicates the status of the data bus, the address bus, and the 3 select lines.
The setting of a code switch determines whether the WRITE or the READ signals of the MPU bus are displayed.

3.1.8 Capstan motor control GR 26

1.810.761.00/81, 1.810.766.00

A 2nd order PLL (PHASE LOCKED LOOP) circuit permits phase-locked synchronization of the capstan speed with the internal or external reference frequency.

A capacitive sensor detects the movement of a toothed ring that is rigidly coupled to the capstan shaft. The change in the capacitance of the sensor causes a frequency modulation at the input of the capstan motor control. The signal is demodulated in an FM demodulator; the resulting voltage is converted to a square-wave signal that is proportional to the frequency of the capstan speed, and constitutes the actual value of the closed loop.

The 9.6 kHz reference frequency which is divided down by a ratio that depends on the selected nominal frequency, constitutes the reference value of the closed loop. The control signal is developped in a phase comparator from the actual value and the reference value, and the capstan lock indication and acknowledgement is generated.

The capstan motor is a maintenance-free AC motor that is supplied by the fuse-protected 130 VAC of the power transformer. The motor current flows into a bridge rectifier and as a pulsating DC current through the control transistor and back into the transformer winding.

DC braking is initiated when the recorder is switched from high to low speed or if rapid speed reduction occurs in varispeed mode.

3.1.9 Spooling motor control GR 24

1.810.760

The switched spooling motor control with pulse-width modulation is arranged on a single circuit board. This module ensures low-loss control of the spooling motors and accurate tape tension in any operating mode as well as four different spooling speeds.

The pulse-width modulator processes the analog signals AN-RFTTL/R (REFERENCE TAPE TENSION LEFT/RIGHT = reference value) from the TAPE DECK CONTROLLER and AN-TTL/R (TAPE TENSION LEFT/RIGHT = actual value) from the tape tension sensors. Comparison of the reference value to the actual value yields analog control signals (AL/AR) which are proportional to the required motor power.

Limiting the spooling speed:
The signal T-CLK-1 of the tape move sensor (square-wave signal with frequency proportional to the tape speed) is converted by a pulse shaper operating with double-edge interpolation into a pulse train of doubled frequency. A pulse of constant width is formed from each edge of T-CLK-1. A DC voltage (B) proportional to the tape speed is generated in a low-pass filter (actual value).
The two reference speed bits of T-TPSPD-1/2 are converted in a D/A converter into a DC voltage. This voltage can be adjusted with a trimmer potentiometer determines the maximum spooling speed (reference value). The signals DL/DR are formed by comparing the reference value to the actual value. These lower the control voltage AL or AR when the preset spooling speed is reached and decrease the driving of the output stage. The signals AN-RFTTL/R determine through differential stages which of the motors (take-up motor) requires reduced driving.

The clock frequency TD-CLK (from the MPU) is 76.8 kHz; noise voltages are eliminated through a Schmitt trigger after which the frequency is taken to a generator which converts the square-wave voltage into a delta voltage. This voltage (E) which is fully balanced relative to neutral is taken to the two modulators and converted by these to pulses of variable width. The pulse width is proportional to the magnitude of the control voltage AL, AR; the maximum width (cyclic duration factor = ED) is 95% and is a function of the amplitude of the (adjustable) delta voltage. If the c.d.f (ED) is less than 2%, the pulses become so small that the spooling motors are no longer driven.
The control pulses are taken to the FETs of the output stage through Schmitt triggers, driver stages, and isolating transformers.

The output stage is supplied directly by the 125 VAC of the power transformer. The 50 ... 60 Hz AC voltage is taken through a fuse to the bridge rectifiers and switched on and off by the NMOS power FETs with a frequency of 76.8 kHz. The motor windings and the storage choke L act as a load. This circuit arrangement has the effect that a pulsating DC current continues to flow through the power FET. This current is switched by the control pulses. The wider the control pulses, the higher the switched power and thus the motor output.

At the instant the current is switched off, the magnetic fiels in the storage choke collapses. As a result, a voltage with inverse polarity is induced in the choke. This voltage is eliminated by the current flowing through the free-wheeling diodes, the commutation circuit, and the motor. The commutation circuit ensures that no dangerous voltage spikes occur.

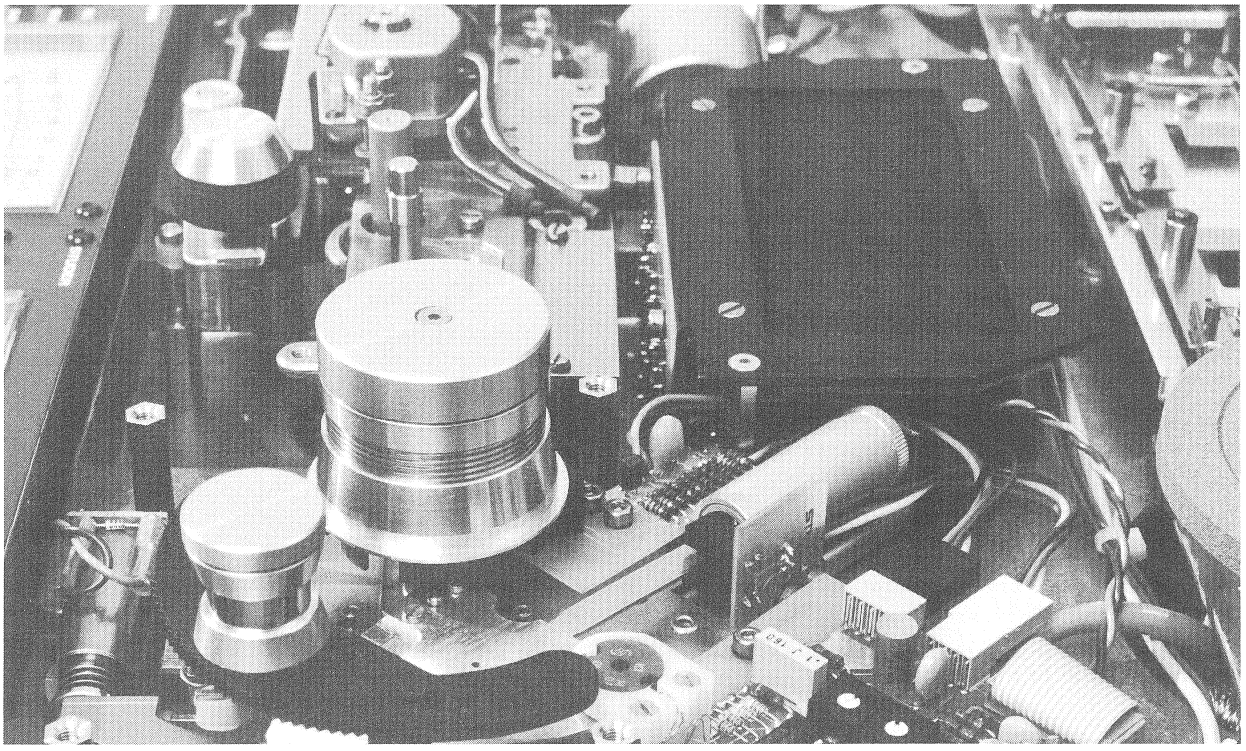
3.1.10 Tape tension sensors GR 27, GR 28

1.810.728/730

The tape tension sensors comprise:
- Sensor arm with inductive position sensor
- Non-contacting end-of-tape sensor

The tape tension sensor consists of an oscillator circuit, a decoupling circuit, and a screening plate that is mechanically connected to the sensor arm. The movement of the sensor arm causes a change in the coupling of the two circuits, and an electrical image of the sensor arm deflection becomes available at the output (signal AN-TTL/R).

The sensor arm is coupled to the piston of a dash pot between which an infrared light barrier is located. The sensor arm interrupts the light beam when it leaves its neutral position. The light barrier responds either when the end of the tape is reached or if the tape tears (signal T-TENDL/R).



3.1.11 Tape move sensor GR 28 EL 05

1.810.731

The tape move sensor consists of two infrared light barriers and a toothed ring that is coupled to the right-hand guide roller. Two square-wave signals offset by 90° are output (10 pulses per revolution or 16 Hz at 7.5 ips). The following information is extracted (TAPE DECK CONTROLLER) from these square-wave signals:
- Tape timer display
- Tape speed (for spooling motor control)
- Direction of tape travel

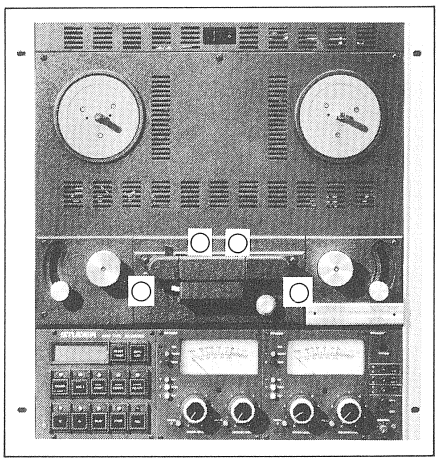
3.2 REMOVING THE TAPE TRANSPORT ASSEMBLIES

3.2.1 Covers

WARNING
DISCONNECT POWER CORD BEFORE REMOVING ANY HOUSING COVERS!

The designations of the covers refer to the recorder in upright position.

Headblock cover



- Unscrew cover of pressure roller (without tools) and remove roller.
- Unfasten 4 screws M4 (hexagon-socket-screw key 2.5 mm)

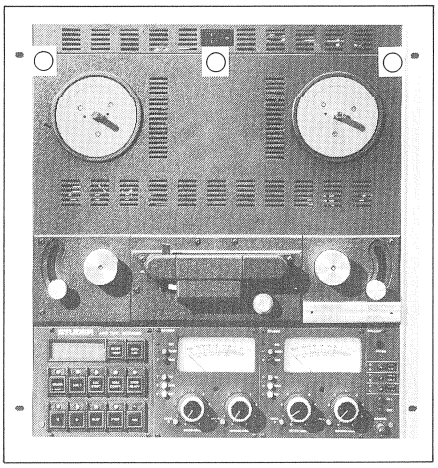
Head cover

Only the head cover needs to be removed when alingning the azimuth of the soundheads.

- Unfasten 2 screws M4 (hexagon-socket-screw key 2.5 mm) on the left and the right of the head shield.

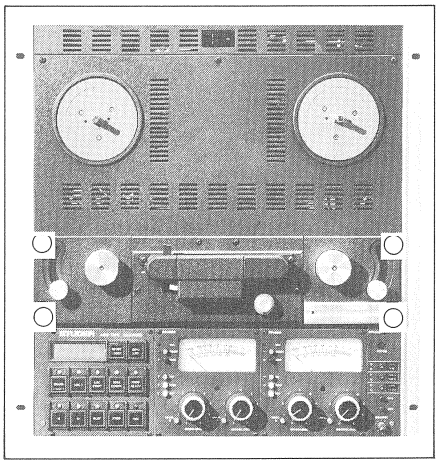
- When reassembling ensure that the conductors leading to the heads are not pinched (especially in time code versions).

Tape transport cover



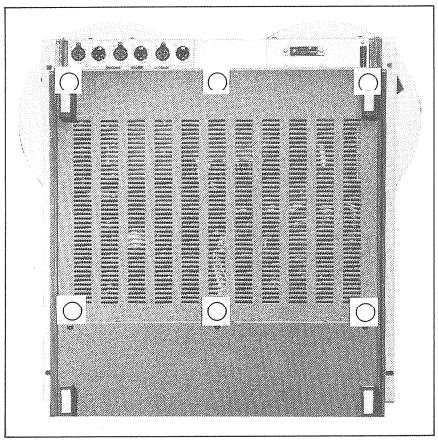
- Unfasten 3 screws M4 (hexagon-socket-screw key 2.5 mm).
- Lift off tape transport cover.

Cover of the tape tension sensor



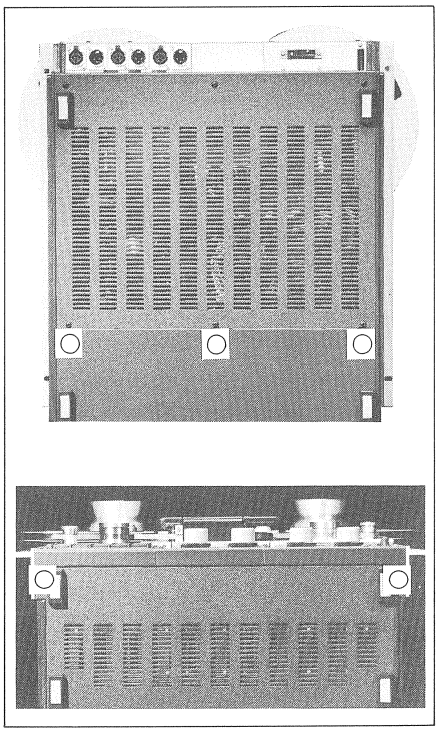
- Remove headblock cover.
- Unscrew cover of guide roller (without tools) and remove roller.
- Unfasten two screws M4 (hexagon-socket-screw key 2.5 mm).
- Remove cover.

Rear cover, upper



- Unfasten 6 screws M4 (hexagon-socket-screw key 2.5 mm).
- Remove rear cover.

Rear cover, lower

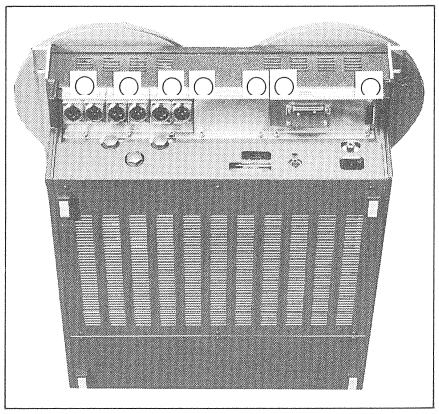


CAUTION

This cover should only be removed by trained maintenance engineers because it exposes the basis board with the CMOS bus!

- Unfasten 5 screws M4 (hexagon-socket-screw key 2.5 mm).
- Remove rear cover.

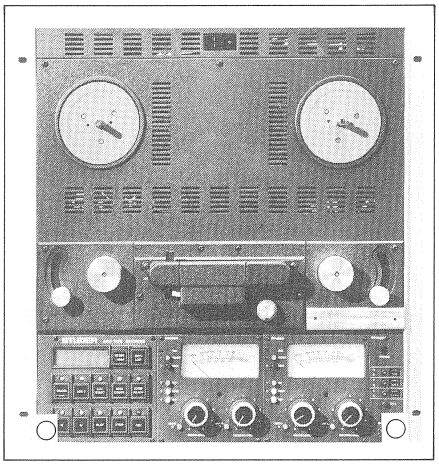
Top cover



Remove this cover only if the power switch or the power supply unit needs to be dismantled!

- Unfasten 7 screws M4 (hexagon-socket-screw key 2.5 mm).
- lightly raise cover and slide it out toward the back.

Panel flap

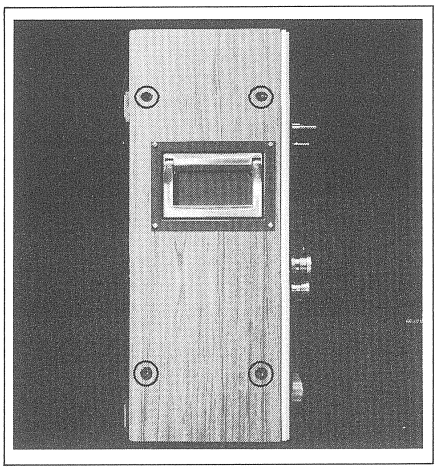


- The panel flap can be opened and locked in two positions by loosening the two captive special screws (hexagon-socket-screw key 2.5 mm). The flap is released lightly upward on the support (on the right-hand side of the flap). Securae the flap with your left hand to prevent it from slamming shut.

Important: If the marking stamp is still installed, it must be removed before the panel is folded up.

- Each of the panel modules is secured to the panel flap with two or four screws M3 (hexagon-socket-screw key 2 mm).

Wooden side panels

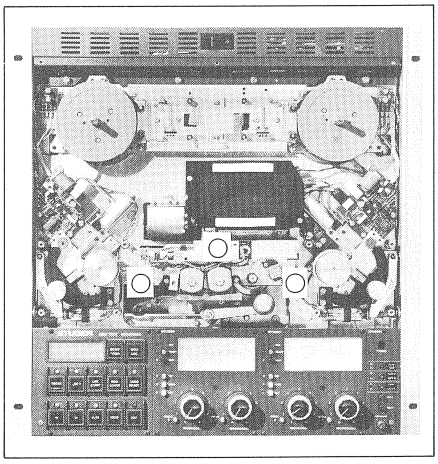


- Unfasten 2 screws M5 x 20 and 2 screws M5 x 35 (hexagon-socket-screw key 4 mm).
- Remove side panels.

3.2.2 Headblock

- Remove cover of headblock assembly (3.2.1.)

CAUTION
To prevent inadmissible magnetization of soundheads, switch the recorder off before removing or installing the headblock!



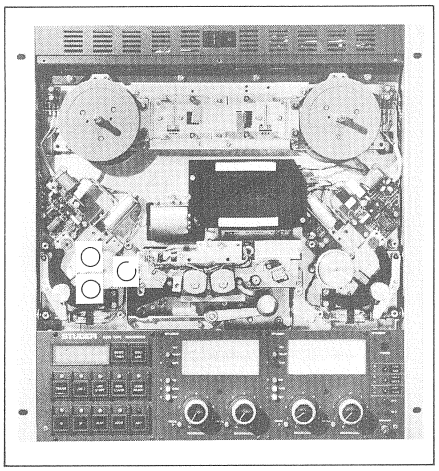
- Unfasten 3 screws M4 (hexagon-socket-screw key 3 mm).
- Carefully slide out headblock assembly so that the capstan shaft will not be damaged.
- Do not turn headblock upside down, otherwise the 3 screws fall out.

3.2.3 Tape tension sensors

- Remove covers of headblock, tape transport, and tape tension sensors as well as upper rear cover as described in Section 3.2.1.

Left-hand tape tension sensor

- Unplug the flat cable labeled TAPE TENSION LEFT at the top connector of the spooling motor control board.
- Pull off two stranded connecting wires (grn, vio) of the EDIT solenoid.

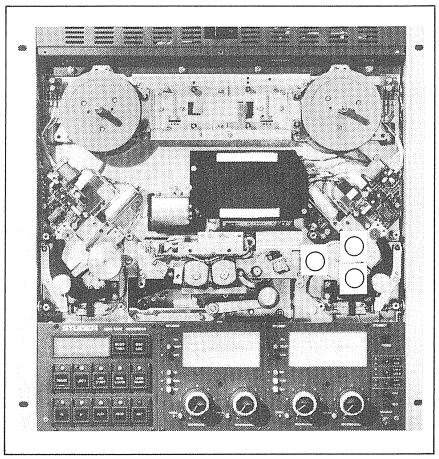


- Unfasten 3 screws M3 (hexagon-socket-screw key 2.5 mm), lightly lift tape tension sensor and guide flat cable carefully through the tape transport chassis.
- Remove tape tension sensor.
- Do not place tape tension sensor upside down, otherwise the 3 screws fall out.

When reinstalling, ensure that:

- Polarity of EDIT solenoid connections is not confused (vio = +).
- Flat cable is plugged into the upper connector (relative to machine in upright position) on the spooling motor control board.

Right-hand tape tension sensor
- Unplug the flat cable labeled TAPE TENSION RIGHT at the lower connector of the spooling motor control board.
- Pull off two stranded connecting wires (grn, vio) of the EDIT solenoid.
- Remove cable duct covers and guide out the flat cable.

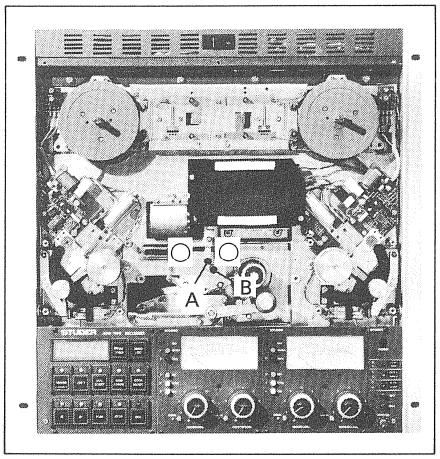


- Unfasten 3 screws M3 (hexagon-socket-screw key 2.5 mm), lightly lift tape tension sensor and carefully guide flat cable out through the tape transport chassis.
- Remove tape tension sensor.
- Do not place tape tension sensor upside down, otherwise the 3 screws fall out.

When reinstalling ensure that:
- Polarity of EDIT solenoid connections is not confused (vio = +).
- Flat cable is plugged into the lower connector (relative to the upright machine) on the spooling motor control board.

3.2.4 Tape lift assembly

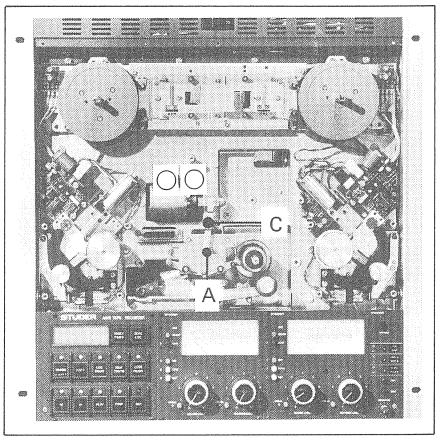
Lifter assembly
- Remove headblock cover (3.2.1) and headblock (3.2.2).
- Unhook return spring on pressure arm.



- Unfasten 2 screws M3 (hexagon-socket-screw key 2.5 mm).
- Slide lifter assembly out toward the left while simultaneously disengaging the plastic lug at the pressure arm pin.

- When reinstalling ensure that the coupling pin (A) is located to the left of the roller (B).

Lifter solenoid
- Remove monitor unit (3.2.11) if installed.

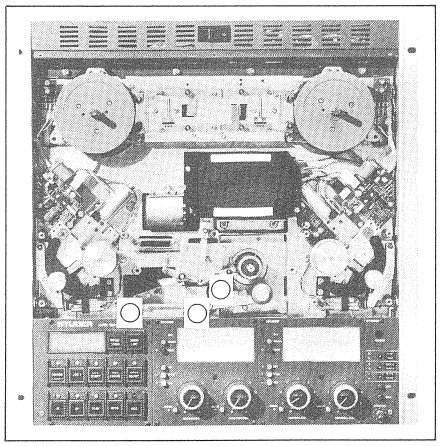


- Remove circlip (C).
- Lift lever (A).
- Unfasten 2 screws M4 (hexagon-socket-screw key 3 mm), draw out solenoid from the front.
  Do not tilt solenoid, otherwise the armature drops out.
- Pull off 2 stranded connecting wires (wht, vio).

- When reinstalling ensure that polarity of connections is not confused (vio = +).

3.2.5 Pressure roller assembly

- Remove headblock cover, headblock and upper rear cover (3.2.1).
- Remove tape lift assembly.
- Pull of 2 stranded connecting wires (gry, vio) of the pressure solenoid.
- Unhook return spring at pressure arm.



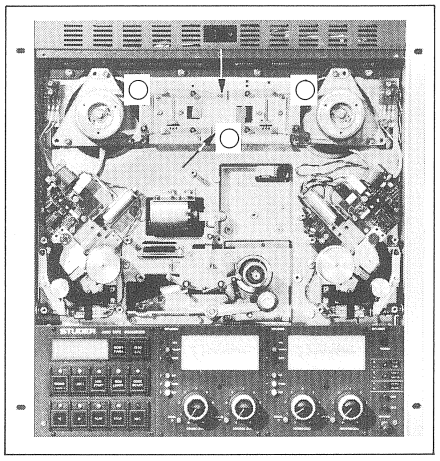
- Unfasten 3 screws M4 (hexagon-socket-screw key 3 mm).
- Carefully draw pressure unit out toward the front.

When reinstelling ensure that:
- The pin on the pressure arm is seated into the plastic lug.
- The polarity of the pressure solenoid connections is not confused (vio = +).

3.2.6 Tape brakes

The recorder must be positioned horizontally in order to remove the brakes!

- Remove tape transport cover (3.2.1).
- Remove reel supports, 3 screws M3 each (recessed head).



- Unfasten 3 screws M3 (hexagon-socket-screw key 2.5 mm).
- Press lightly on the two brake levers (arrow) to release the brakes to the point where the brake chassis can be carefully lifted.

CAUTION
Ensure that the brake bands are not kinked and avoid touching the contact surface with your fingers!
Kinked brake tapes must be replaced. Clean contaminated tapes with ethanol!

- Pull off connecting wires of EDIT solenoid (grn, vio) and brake solenoid (brn, vio).

- When reinstalling ensure that the polarity is correct (vio = +).

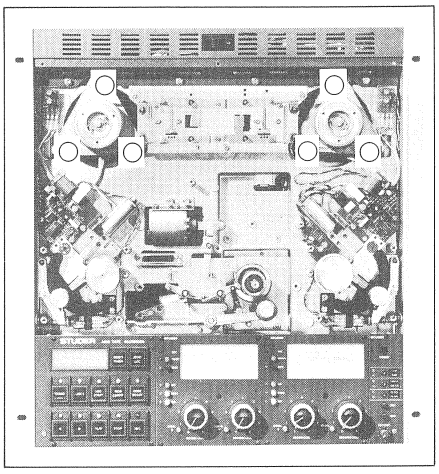
IMPORTANT
The brakes require readjustment after the brake chassis has been installed (3.3.1).

3.2.7 Spooling motors

Position the recorder horizontally in order to remove the spooling motors!

- Remove tape transport cover (3.2.1).
- Remove brake chassis (3.2.6).
- Pull off 4 stranded leads on each connecting board.

Note: The sequence of the wires is not always the same to minimize hum-field interference. Please note sequence before disconnecting!

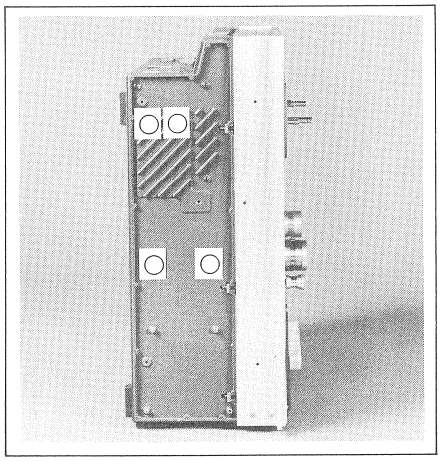


- Unfasten 3 screws M4 each (hexagon-socket-screw key 3 mm).
- Lift out motor toward the top without touching the brake roller.

3.2.8 Spooling motor control

Remove the complete assembly if fuse F1 (T 1.6 A SLOW) on the spooling motor control board requires replacement.

- Remove rear upper panel and left-hand wooden side panel if installed (3.2.1).

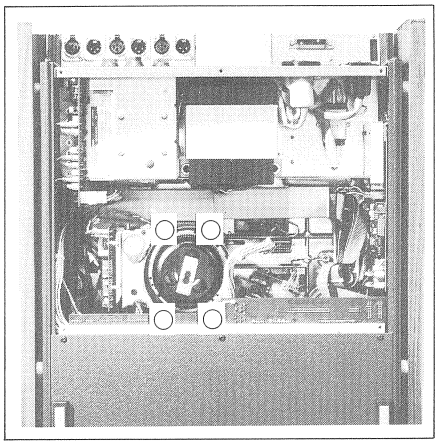


- Unfasten 4 screws (hexagon-socket-screw 3 mm). The stranded connecting leads of the motor control PCB are long enough so that they need not be disconnected for replacing the fuse.
- Unscrew shock protection element (2 x M3, hexagon-socket-screw key 2.5 mm).

3.2.9 Capstan motor

Remove the complete assembly if the fuse F1 (T 500 mA SLOW) on the capstan motor control board requires replacement.

- Remove upper rear panel (3.2.1).
- Unplug flat cable CAPSTAN CTR (on basis board, second connector from the right).
- Open cable duct, guide out flat cable.
- Lift shock protection element off the lower power transformer terminals.
- Pull off 2 blue stranded wires (power transformer terminals 10 and 19 for the 4-pole capstan motor, 12 and 17 for the 2-pole capstan motor).



- Unfasten 4 screws (hexagon-socket-screw key 3 mm) (the lower two screws are accessible through holes in the basis board).
- Draw capstan unit (ground capstan shaft) carefully toward the rear.
- Remove shock protection (2 x M3, hexagon-socket-screw key 2.5 mm).

- Proceed carefully when reinstalling to ensure that the capstan shaft will not be damaged.
- No specific polarity (!) is required when reconnecting the two blue stranded wires (terminals 10 and 19 or 12 and 17 on the power transformer).

3.2.10 Power supply unit

- Remove upper rear panel, top cover and if installed also the wooden side panels (3.2.1).
- Unplug connecting leads on power switch.
- Unscrew all connector panels or filler panels (7 x M4, heaxagon-socket-screws 3 mm).
- Remove stabilizer board (multipoint connector and 6 stranded connecting leads, from top to bottom: blu, red, org, brn, yel, grn), 2 screws M4 (hexagon-socket-screw 3 mm) on the right-hand side panel.
- Unscrew spooling motor control PCB, 4 x M4 (hexagon-socket-screws 3 mm) on the left-hand side panel. The connecting leads are long enough; do not detach them.
- Lift shock protection of the lower power transformer terminals, detach 2 x stranded blu (terminals 10 and 19 or 12 and 17 respectively, stranded blk (terminal 14), and stranded red (terminal 15) connecting lead.
- Unfasten 6 mounting screws M4 (hexagon-socket-screw key 2.5 mm, 3 each on the left and on the right side wall). Hold power supply unit so that it will not drop into the recorder.
- Carefully slide power supply unit out through the rear until the two rear mounting holes in the side walls are aligned with the two front tapped holes in the power supply; then secure the power supply temporarily with 2 of the mounting screws.
- Disconnect leads on the two phase-shift capacitors (terminals on each from the top or No. 2: org, bottom terminal or No. 1: brn).
- Unfasten temporary mounting screws and remove power supply unit toward the top.

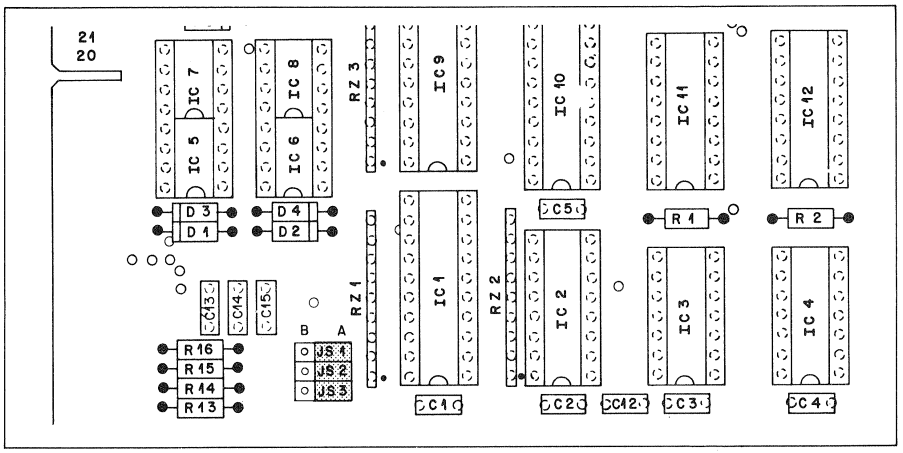
- When reinstalling, ensure that the stranded connecting leads of the phase-shift capacitors are not pinched.
- No specific polarity (!) is required for the two blue stranded connecting wires (power transformer terminals 10 and 19 or 12 and 17).

3.2.11 Monitor unit

- Unfasten rear upper panel and tape transport cover (3.2.1).
- Unplug monitor terminal (on basis board, second connector from the left).
- Open cable duct, guide out monitor cable harness.
- Unfasten 2 screws M3 (hexagon-socket-screw key 2 mm), remove monitor unit, and carefully guide cable harness out of the tape transport chassis.

3.3 MECHANICAL ADJUSTMENTS

Note:
Jumper JS 3 of the TAPE DECK CONTROLLER must be removed for making the following adjustments. As a result, the monitoring functions (tape tension, tape movement, etc.) are interrupted to prevent triggering of stop commands if deviations from the reference values occur because of the adjustment work.



3.3.1 Tape brakes

Inadequate maintenance or incorrect adjustment of the tape brakes can lead to tape tangles or torn tapes. Check in regular intervals that the braking action is smooth and that no loops are formed even when the diameters of the two pancakes differ widely. Check brake bands for wear and contamination.

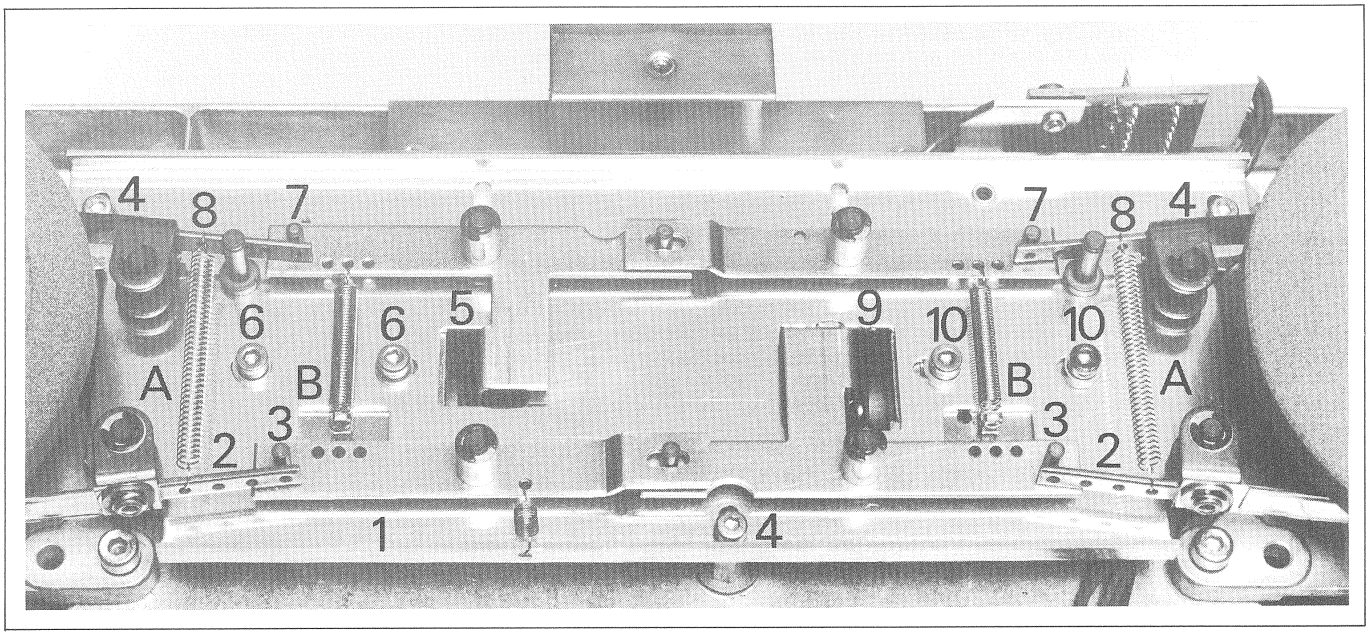
The tape brakes are self-adjusting: the braking action remains constant over wide ranges even with varying friction coefficients.

Preparatory steps
Remove tape transport cover; remove covers of the tape tension sensors. Detach 3-pin connector of the end-of-tape sensor in the left-hand tape tension sensor.

The brake bands and the brake linings must be absolutely clean and free of grease. Contaminated brakes bands and brake linings can be cleaned with ethanol. Avoid touching them after they have been cleaned.
The brake bands should be free of kinks. Contact with the brake lining along their full width is required.

When replacing the brake drum ensure that there is no residual glue on the new brake drum.
Should the braking action be insufficient after the brake bands have been replaced, they can be roughened with SCOTCH pot cleaning pads.

The braking deceleration can be adjusted by hooking the brake springs into three different positions. Refer to picture below with springs (A) in the maximum position, springs (B) in the middle position.



Basic adjustment of the brake chassis

Switch tape recorder off.

Shift brake chassis (1) so that the distance between the two brake levers (2) and the lifting pin (3) is approx. 1 mm. Secure the setting with three hexagon-socket-head cap screws (4) (key size 2.5 mm). Ensure that the chassis is only shifted parallel. Switch recorder on.

Check that the two brake systems are released simultaneously by the two lifting pins. Should this not be the case, check that the spooling motors are positioned correctly. If minor differences still remain they can be corrected by lightly bending the levers (2).

Adjusting the EDIT solenoid

The edit solenoid {5} must be energized for adjusting it: connect power cord and switch power on.

The two fixing screws {6} (hexagon-socket 2.5 mm) of the solenoid {5} should be shifted in such a way that a clearance of approximately 1 mm is obtained between the lifting pin {7} and the brake lever {8}. The lever {2} must contact the pin {3}.

Retighten the two fixing screws {6}.

Adjust the brake solenoid

Also detach the 3-pin connector on the right-hand tape tension sensor! The PLAY key must be pressed (brakes released) for adjusting the brake solenoid.

Unfasten the two mounting screws (10) (hexagon-socket-screw key 2.5 mm) of the brake solenoid (9) and shift it so that the tip of the lever (2) travels 2 to 3 mm between the neutral position and released brake. Retighten the two mounting screws (10).
The two spooling motors should rotate freely when the brake system is released. Both brake levers should lift in parallel.

Correct functioning of the brakes can be checked by brief forward and backward rotation of the spindles (power switched off).

Measuring the braking torques

Switch recorder on (STOP lamp illuminated for measuring the EDIT braking torque).

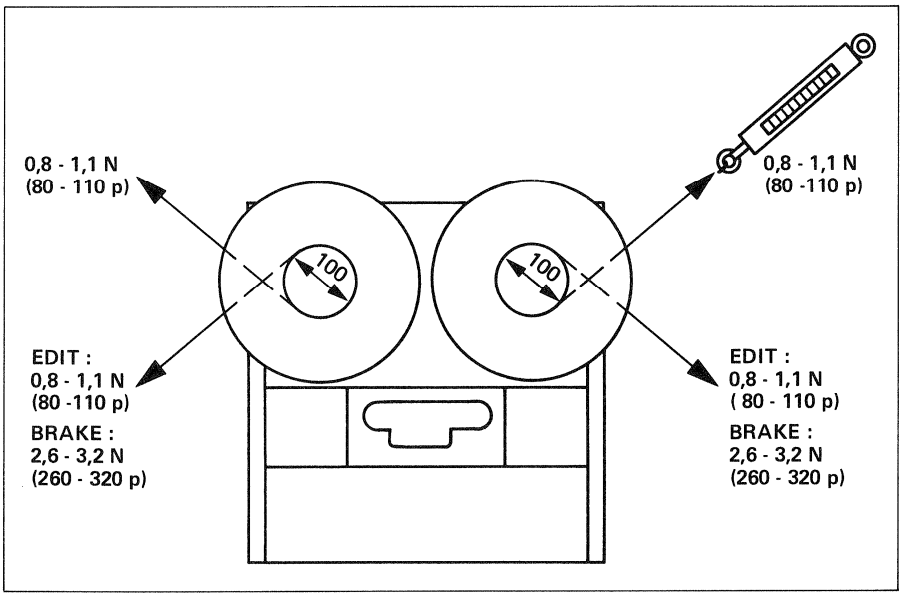
Mount an empty reel with a hub diameter of approx. 100 mm that contains approximately 2 to 3 m of tape in the take-up or supply direction.

Hook spring dynamometer (0 ... 5 N) into leading end of tape and pull gradually forward (in direction of the arrow).

The EDIT braking torque should measure 0.8 to 1.1 N (80 ... 110 p) in the take-up or the supply direction. Correction is possible with spring (A).

Reconnect the 3-pin connectors of the tape-end sensors of both tape tension sensors before measuring the braking torque.

The tape tension sensors must be in their neutral position.
The braking torque in the supply direction should measure 2.6 to 3.2 N (260 ... 320 p). The difference in braking torque between the left and the right side should not exceed 0.5 N (50 p).
Correction is possible with spring "B".



3.3.2 Pressure unit

The pinch roller arm is actuated by a solenoid. The pinch roller force is determined by a built-in spring.

Adjusting the pinch roller force

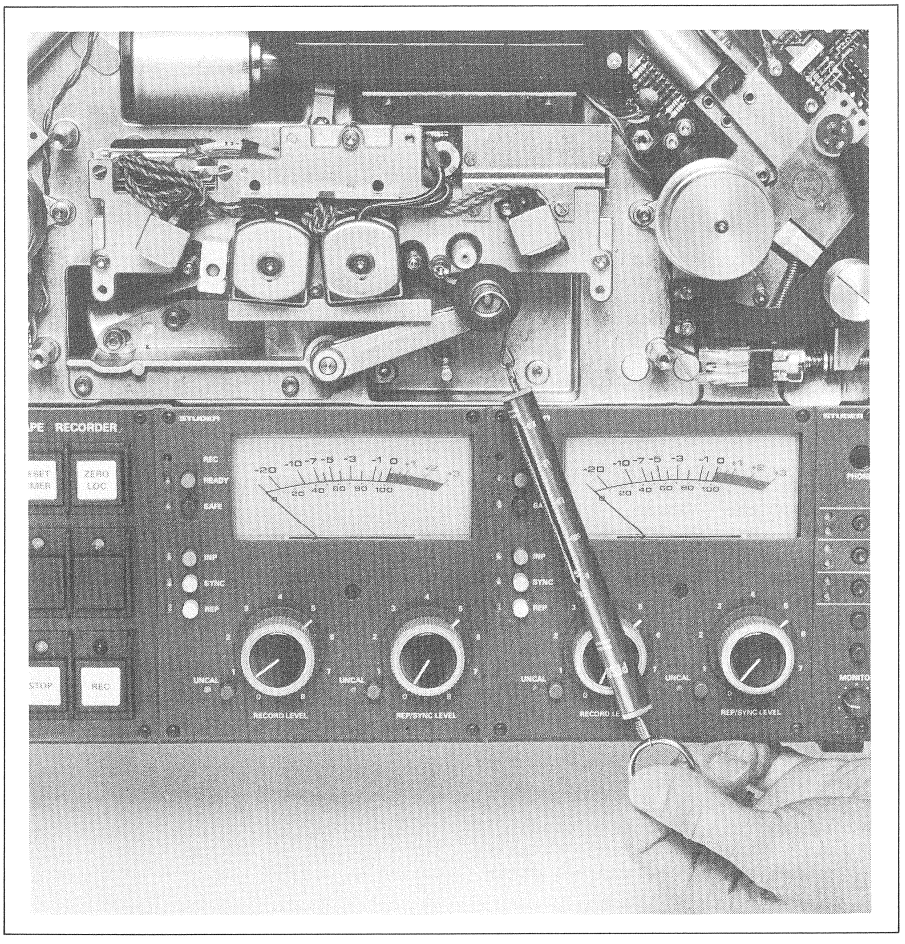
Switch recorder off. Remove tape transport cover and pinch roller cover; detach the 3-pin connectors of the two tape tension sensors. Fasten a piece of nylon string to the pinch roller shaft and hook spring dynamometer 0 ... 20 N (0...2 kp) into a loop of the string.

Switch recorder on. Select PLAY. Pull spring dynamometer perpendicularly to the pinch roller arm until the arm lifts off the capstan shaft.
The spring dynamometer should give a reading of 8...10 N (800...1000 p).
Should the spring force be stronger or weaker, loosen 2 fixing screws of the pinch roller solenoid (hexagon-socket 3 mm) by a few turns and slightly shift the pinch roller solenoid until the desired spring force is attained. Re-tighten the screws of the pinch roller solenoid.

Ensure that the arm returns smoothly to the neutral position. Should this not be the case, the solenoid may be twisted.

Check:

Remove jumper JS3 on TAPE DECK CONTROLLER. With your index finger lightly press the pinch roller arm against the capstan shaft so that the pinch roller just starts to turn.
Press PLAY key: the pinch roller arm should visibly move another small amount toward the capstan shaft. This means that the pinch roller solenoid functions correctly so that only the tension spring in the solenoid plunger provides the coupling between the pinch roller arm and the solenoid plunger (no mechanical contact between the two).
Check this play by repeatedly pressing STOP and PLAY.
The pinch roller force must be increased if no visible play exists.

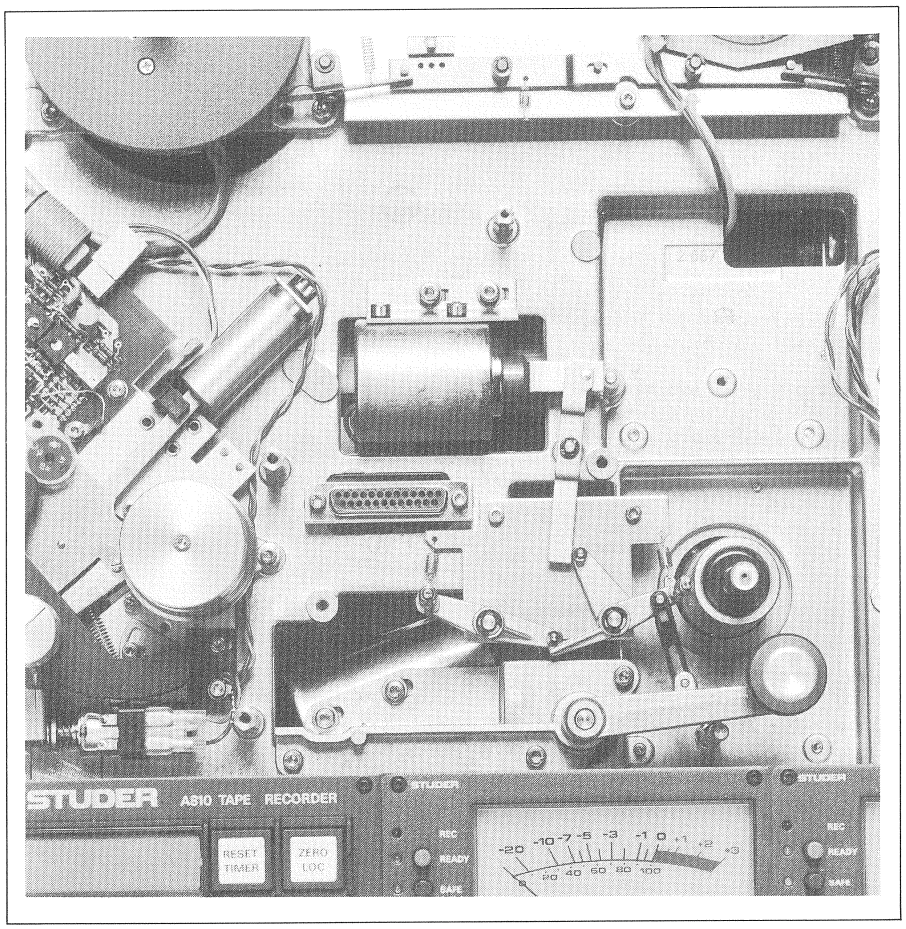


3.3.3 Tape lift

During spooling, the two tape lift pins are moved by the tape lift solenoid so that the tape no longer contacts the face of the soundheads. This prevents unnecessary wear of the soundheads.

Preparatory steps

Switch recorder off.



Adjusting the tape lift solenoid

Mount tape (reel diameter 18 cm) and switch recorder on.

Press one of the spooling keys.
Push pressure roller by hand against the capstan up to the stop position. The tape should contact neither the pressure roller nor the capstan. Should this still be the case, loosen the two mounting screws (hexagon-socket-screw key 3 mm) of the tape lift solenoid. Press one of the spooling keys and shift tape lift solenoid slightly to the left. Retighten mounting screws and repeat check.

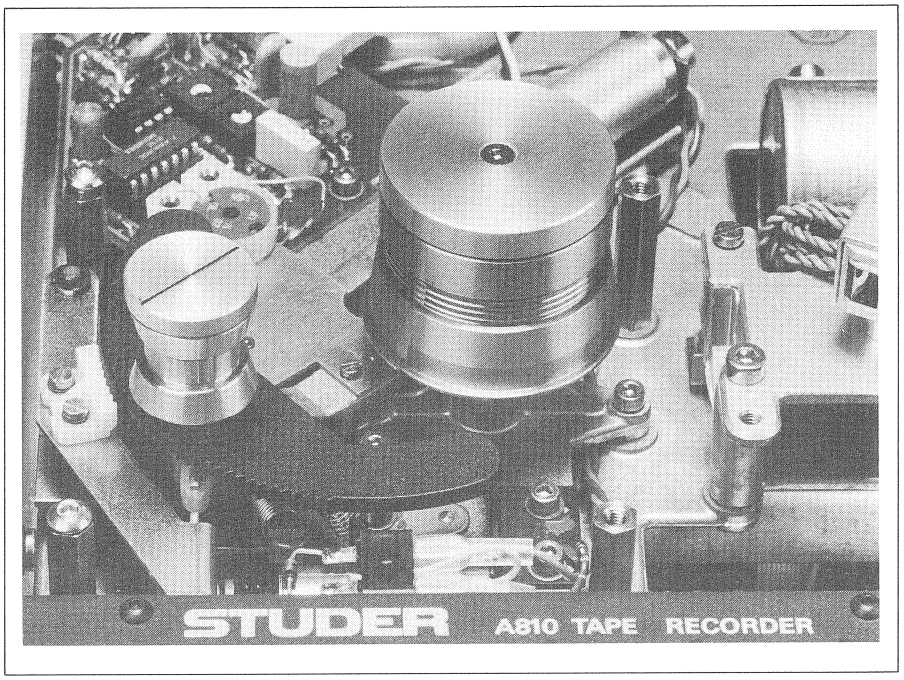
- Important: On recorders equipped with a time code read head, the lifter solenoid must be adjusted in such a way that the lifting pin lifts the tape approximately 1 mm off the capstan shaft. The tape may touch the pinch roller when the latter is manually pressed to the stop position.

When the lifter solenoid is de-energized, the left-hand lifting pin must contact neither the scrape flutter roller nor the erase head.

Press STOP key and check that the armature movement is not restricted; if necessary loosen one mounting screw of the tape lift solenoid and slightly twist solenoid, until the armature moves freely. Retighten the mounting screw.

3.3.4 Tape tension sensors

Note
The illustrations always refer to the left-hand tape tension sensor.



Checking the mechanical functions

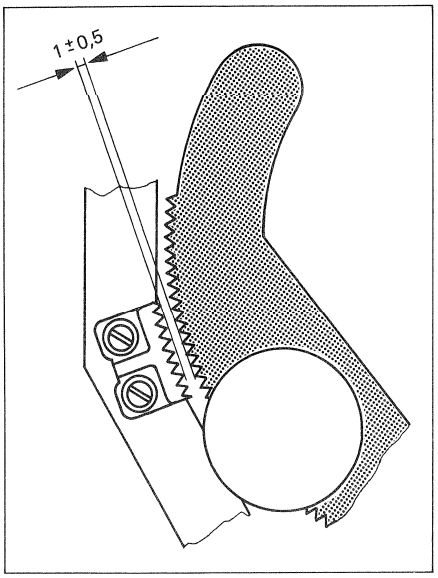
Mobility of bearing and dash pot:
Manually push the tape tension sensor from its neutral position to the end stop. No grinding or rattling noise should be audible. The protective flap should not touch anywhere; the tape tension spring and the stop spring should not touch any other parts.

Damping:
Check the continuous and immediate damping in tension direction and also the function of the non-return valve in the dash pot cylinder.
A replacement dash pot requires no adjustments since these have been made at the factory.

CAUTION:
Ensure that the cylinder base is not twisted when installing the dash pot!

Checking the tape travel:
With the tape tension sensor installed and a tape mounted, visually check the tape travel (height adjustment) in PLAY mode on the idler roller and on the small guide roller.

EDIT solenoid

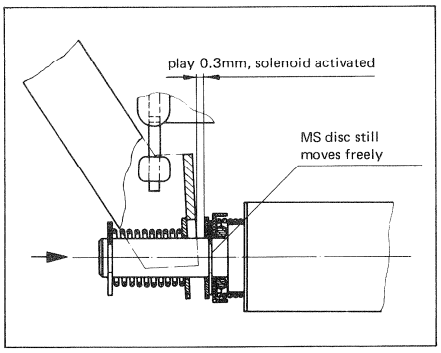


With the EDIT solenoid in the neutral position, the gear segment must be adjusted so that the teeth mesh correctly and parallel into the serration of the toothed disc (slot cover).

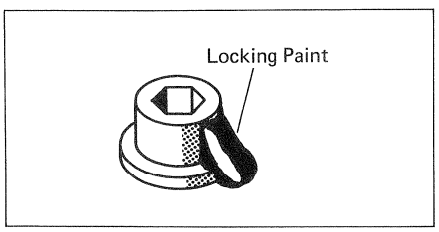
The distance between the tips of the teeth of the gear segment and the toothed disc must be 1 mm ±0.5 mm throughout the entire rotating range of the tape tension sensor.

Adjusting the EDIT solenoid:

CAUTION: Shift the solenoid only parallel to the base plate!



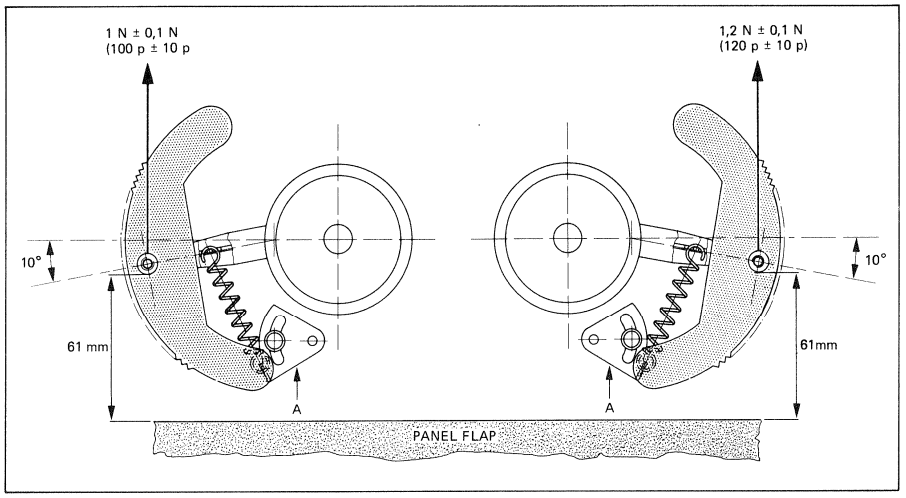
Press the solenoid plunger with your finger to the stop position.
Unfasten the two hexagon-socket-head screws (2.5 mm) and shift the solenoid in parallel until the Ms disc still moves freely (corresponds approximately to the play shown in the drawing).
Retighten the two screws and secure them laterally with locking paint.



Adjusting the tape tension spring

Switch recorder off. Remove guide roller, reinstall cover. Mount tape tension alignment gauge, hook spring dynamometer to the shaft and pull parallel to the lateral edge of the tape recorder.

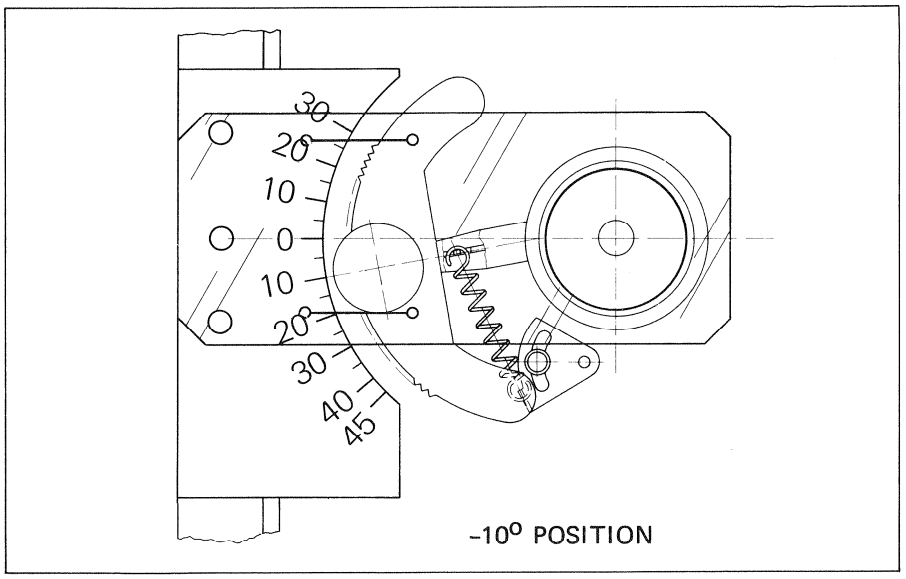
The tape tension spring is adjusted with the turnbuckle {A}. Please note that the left-hand tape tension sensor is to be adjusted to a value of 1 N ± 0.1 N (100 p ± 10 p), the right-hand tape tension sensor to 1.2 N ± 0.1 N (120 p ± 10 p) when the tape tension sensors are deflected to -10° (corresponds to the cover touching the lower line of the gauge).



The measurement may only be taken in the wind-up direction because of the hysteresis of the spring dynamometer!

After the adjustment has been made, tighten the screw of the turnbuckle and secure it with locking paint.

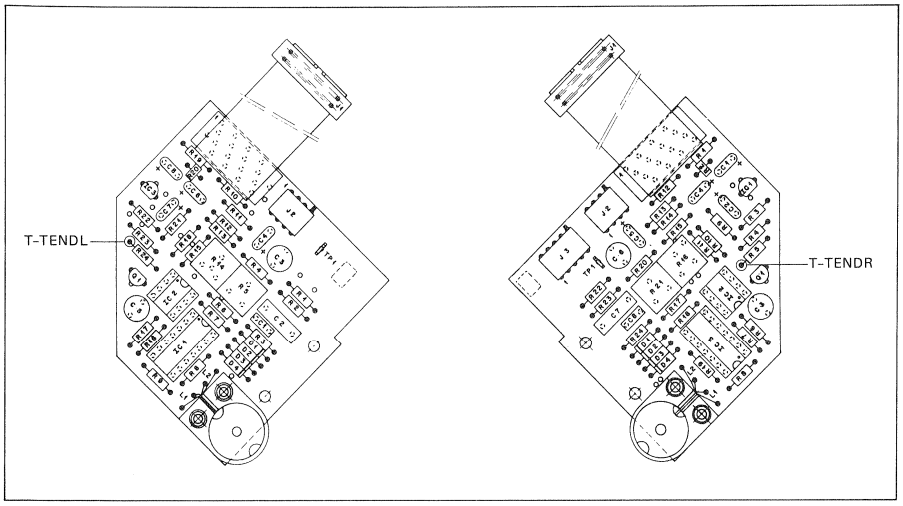
Gauges with scale division in degrees for adjusting the tape tension can be ordered under the part number 10.010.001.15.



End-of-tape sensor
(Circuit board on the dash pot)

Switch recorder on.

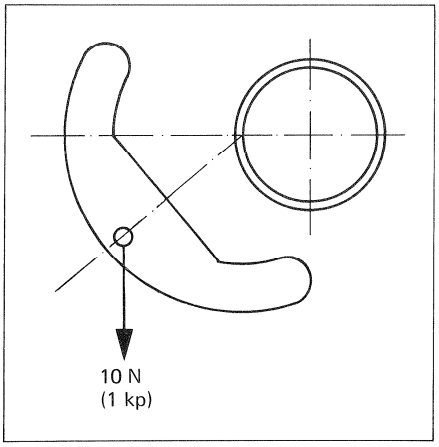
Move arm of tape tension sensor approx. 2 to 2.5 mm from its end stop and adjust limit switch PCB so that the signal T-TENDL (left-hand tape tension sensor) or T-TENDR (right-hand tape tension sensor) just switches to logic 1 (HIGH).



Pretension arm with spring dynamometer (10 N ±1 N or 1 kp ±100 p). The signal T-TEND should remain at logic 0 (LOW).

Tighten adjusting screw and secure it with locking paint.

Reinstall guide roller.
For electrical adjustments of the tape tension sensors refer to Section 3.4!



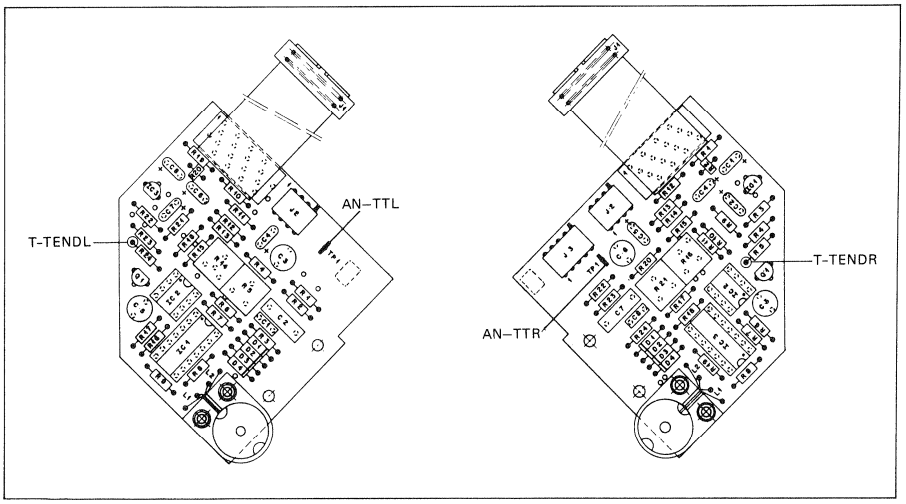
IMPORTANT
Reinstall jumper JS3 on TAPE DECK CONTROLLER!

Adjusting the dash pot:

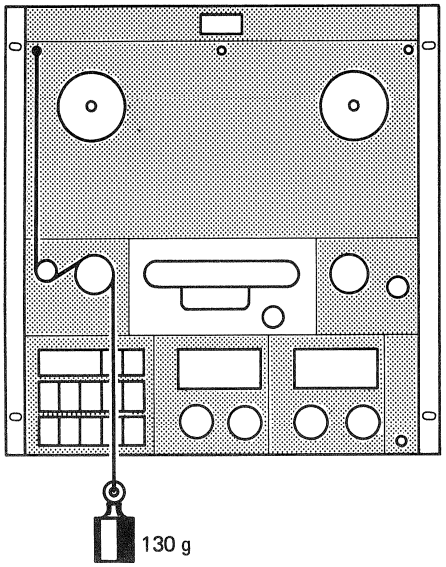
Before adjusting the dash pot check or adjust the tape tension spring and the electrical alignment of the tape tension sensor (3.4.2)!

The following adjustments of the damping action refer to the left-hand tape tension sensor; deviations for the right-hand tape tension sensor are indicated in brackets!

- Remove cover of the tape transport and the tape tension sensors; turn the top left and right mounting screws of the tape transport cover 2 to 3 turns into the corresponding tapped hole. Place recorder upright on the edge of the work bench so that the front panel is flush with the edge of the bench.
- Calibrate oscilloscope in the DC setting (DC voltage coupling) so, that the voltage readings 0.0 V and +2.4 V fall on the scale lines on the bottom and the top edge of the screen. Adjust sweep rate to 0.1 s per scale division, trigger input to "EXTERN" and "positive slope".
- Connect oscilloscope to TP1 (TP1) of the tape tension sensor, signal AN-TTL (AN-TTR), trigger input of oscilloscope at T-TENDL (T-TENDR), as shown in diagram.



- Tie a loop into both ends of an approximately 1 m long piece of tape. Hook one loop into the left-hand (right-hand) screw of the tape transport cover, thread tape vertically down around the idler roller of the tape tension sensor and the guide roller, then further vertically down. Hook a weight of 130 g (part No. 10.010.001.19) into the second loop (refer to diagram).



- Remove TAPE DECK CONTROLLER PCB.
- Switch recorder on.
- Manually press guide roller of the tape tension sensor against the lower stop (neutral position) and relax it. The curve appearing on the screen should intersect with the calibrated 2.4 V line at 0.6 s ±0.1 s (1.0 s ±0.1 s).
  Should this not be the case, the remedy depends on the type of dash pot:

- Dash pot with hole in the cylinder base:
  Rotate cylinder until the specified damping is attained.

- Dash pot with grub screw:
  Turn grub screw (hexagon-socket-head key 1.5 mm) until the specified damping is attained (turning in the grub screw increases the damping action).

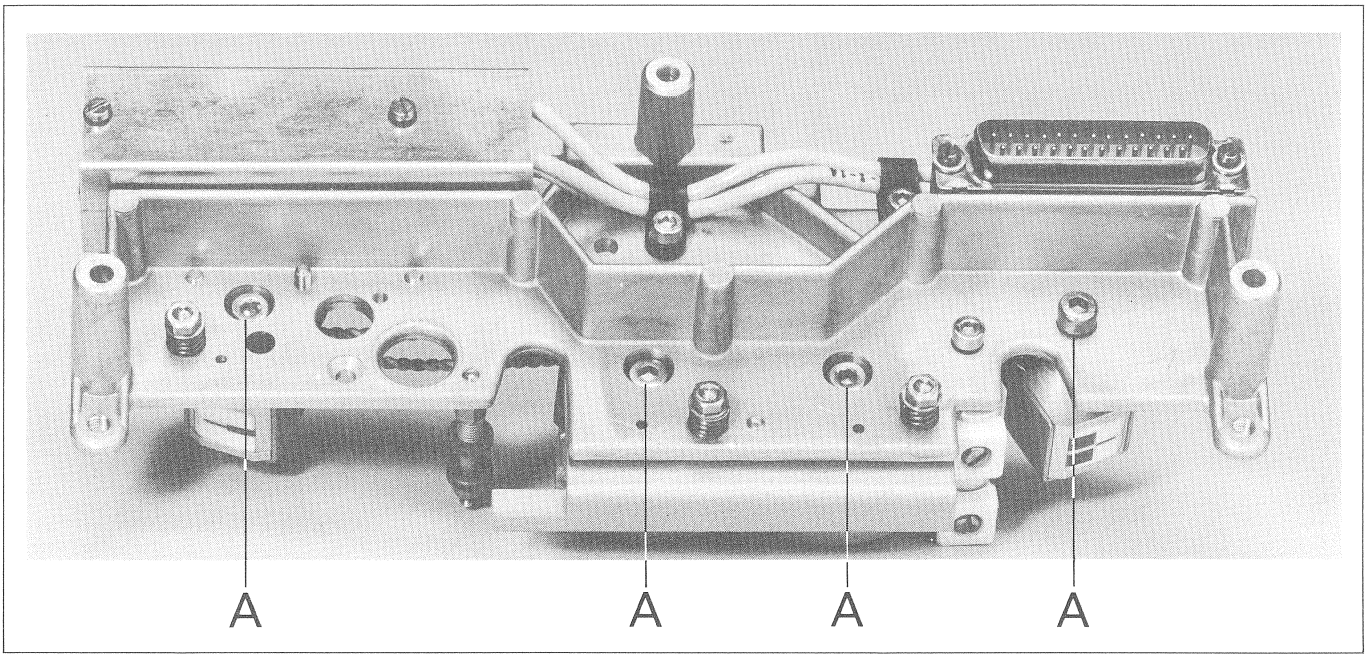
- Dash pot with adjustable nozzle:
  Loosen locknut (wrench size 5.5 mm). Turn hexagon screw of nozzle (wrench size 5.5 mm) until the specified damping is attained (turning in the nozzle screw increases the damping action). Secure nozzle screw with locknut.

- Switch recorder off.
- Reinsert TAPE DECK CONTROLLER PCB.

3.3.5 Headblock

CAUTION
To avoid inadmissible magnetization of the soundheads, switch the recorder off before removing or installing the headblock!

Replacing the soundheads
Remove headblock cover (4 hexagon-socket-head cap screws, 2.5 mm).
Remove headblock after the 3 hexagon-socket-head cap screws (3 mm) have been unfastend.
The soundheads can be removed after the hexagon-socket-head cap screw (A), accessible from below, have been unfastened.

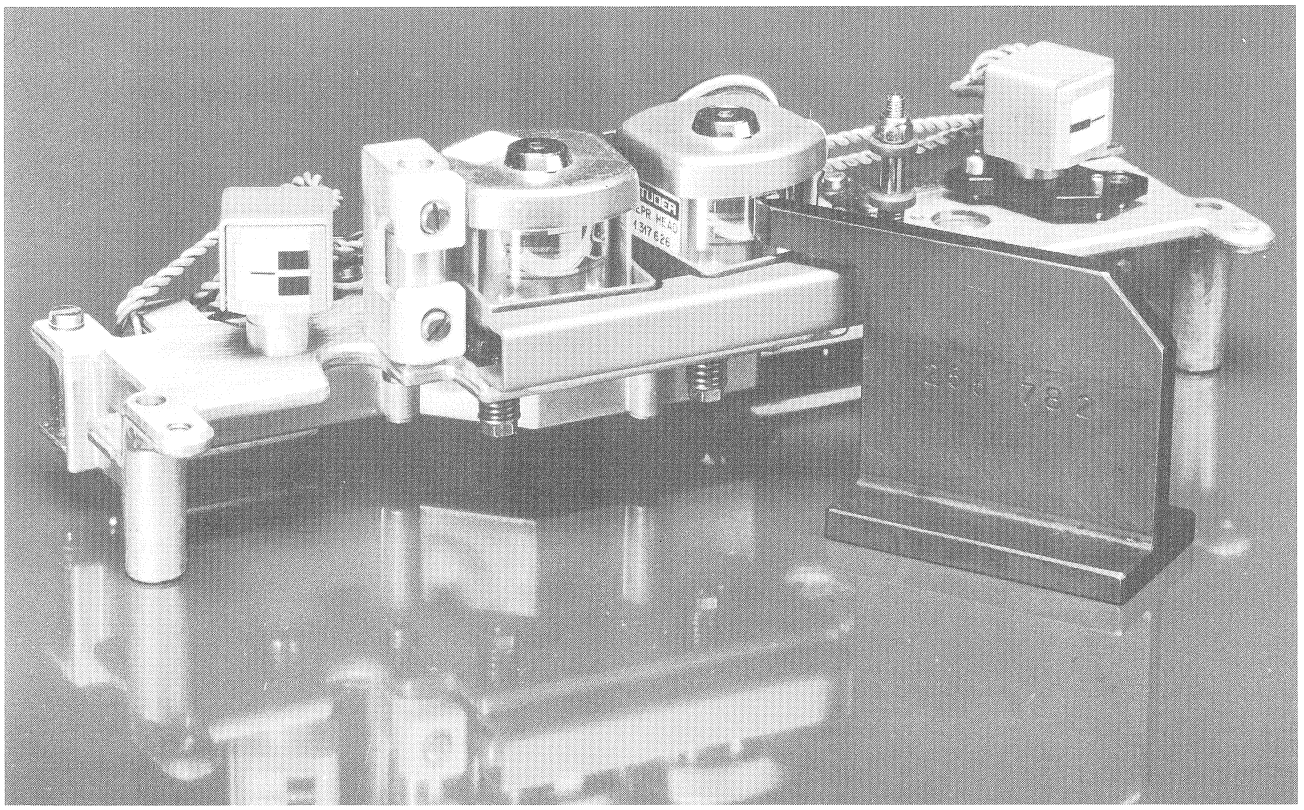


IMPORTANT

Do not shift the black azimuth alignment plate when replacing a soundhead. The distance between the head support and the head face is milled to the exact same dimensions. Adjustment of the head azimuth should, therefore, be unnecessary.

After the soundhead has been replaced, check with the tape path alignment gauge (part No. 10.010.001.17) that the head face is perpendicular and that the azimuth is correct.

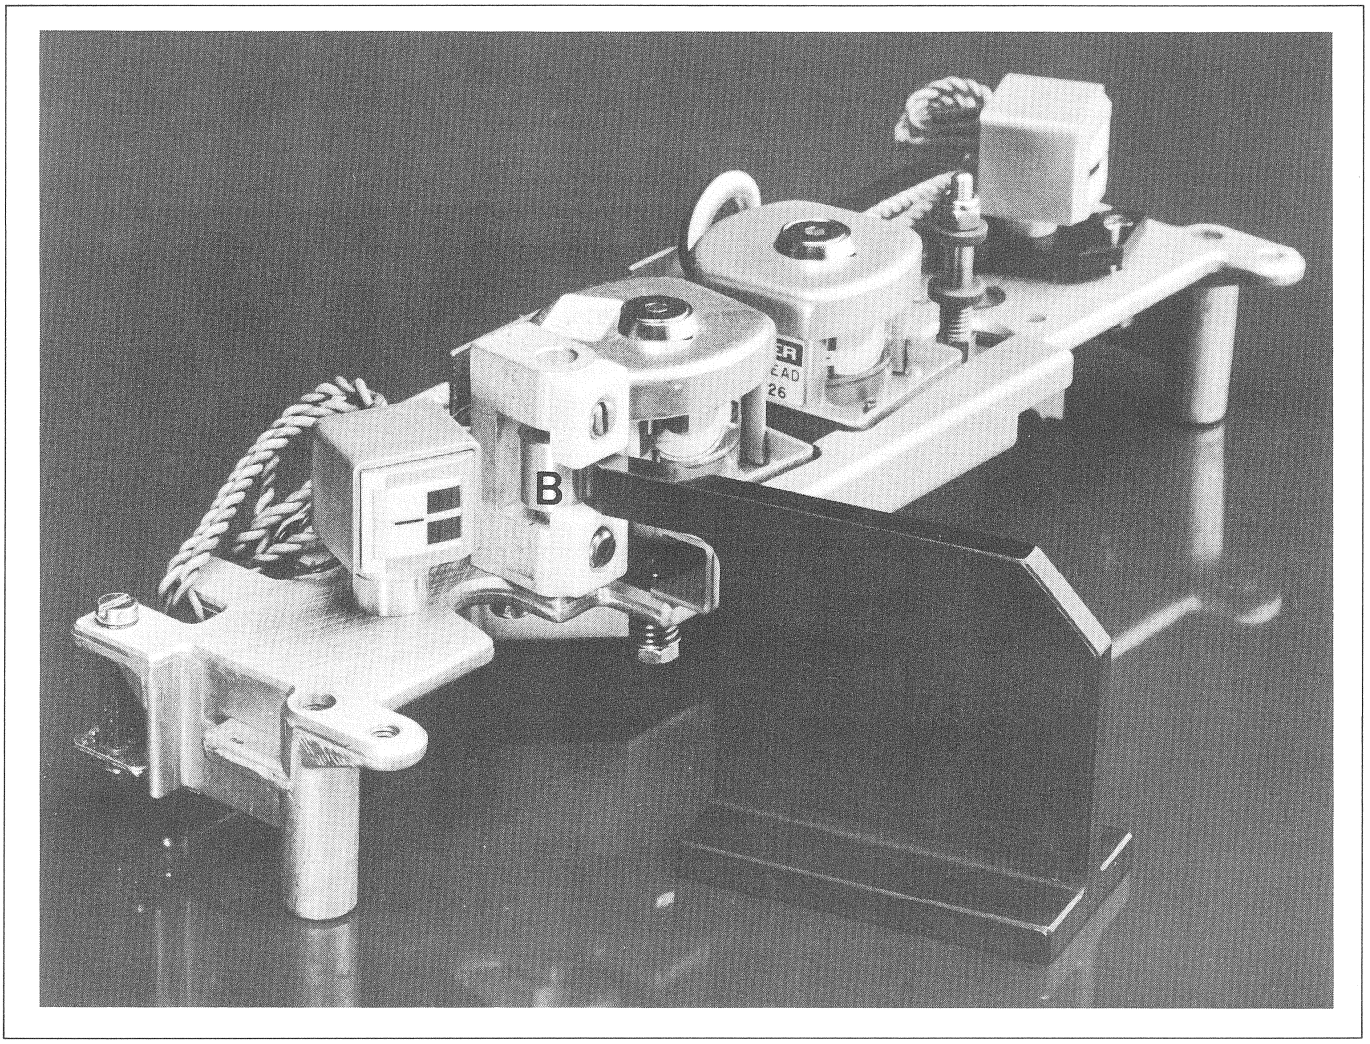
For this check, the headblock and the gauge should be placed on a leveling block or in an emergency on a flat glass plate.



The azimuth alignment is described in Section 4.2.

Tape guidance

Check tape guidance {B} with the tape path alignment gauge (part No. 10.010.001.16). Adjust the height of the ceramic parts with a screwdriver for slotted-head screws.



Anti-scrape flutter roller

The anti-scrape flutter roller can be removed after unfastening the 3 mm hexagon-socket-head cap screw accessible from below.

It is not necessary to check the height of the anti-scrape flutter roller after the roller has been replaced because this adjustment was made by the factory.

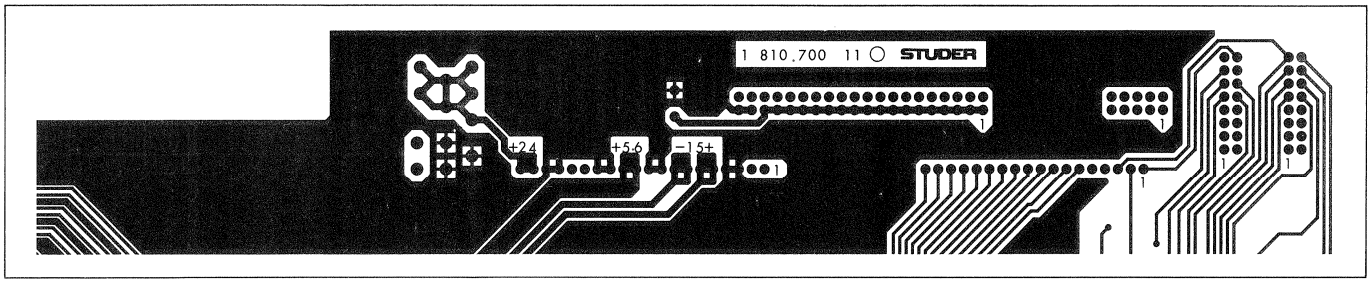
The mounting support for the anti-scrape flutter roller must be positioned parallel to the record head, otherwise insufficient space remains for the left-hand tape lift pin.

Check with the tape path alignment gauge (part No. 10.010.001.16) that the anti-scrape flutter roller is perpendicular on all sides.

3.4 ELECTRICAL ADJUSTMENTS

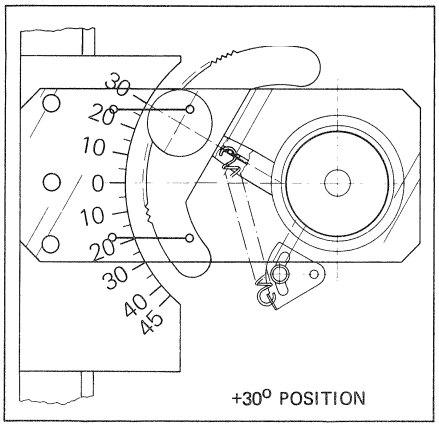
3.4.1 Checking the supply voltages

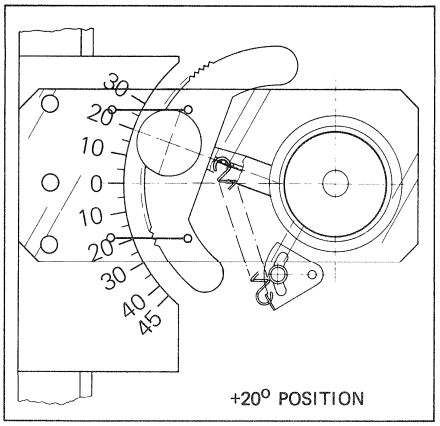
Remove upper rear panel (3.2.1). Four test points are marked on the basis board: +24 V, +15 V, -15 V, +5.6 V. The maximum deviation is ±100 mV for each. The +5.6 V can be adjusted with the trimmer potentiometer that is accessible from the rear on the stabilizer board.

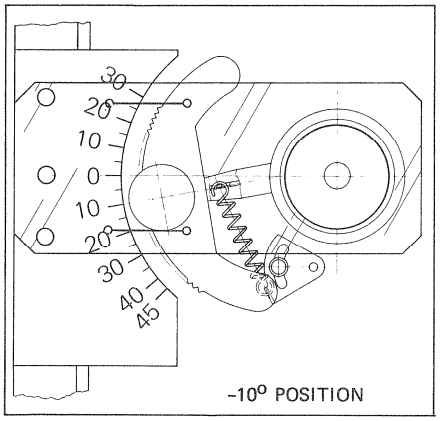


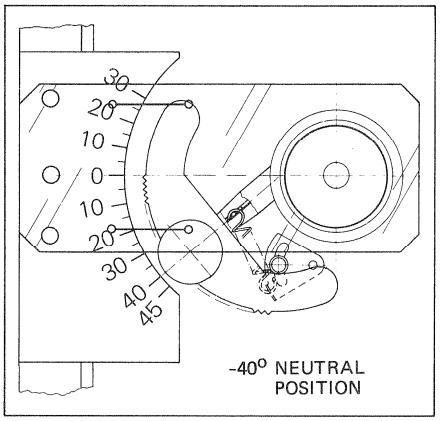
3.4.2 Tape tension sensors

Do not make any electrical adjustments to the tape tension sensors unless the basic mechanical adjustments according to Section 3.3 have been performed.









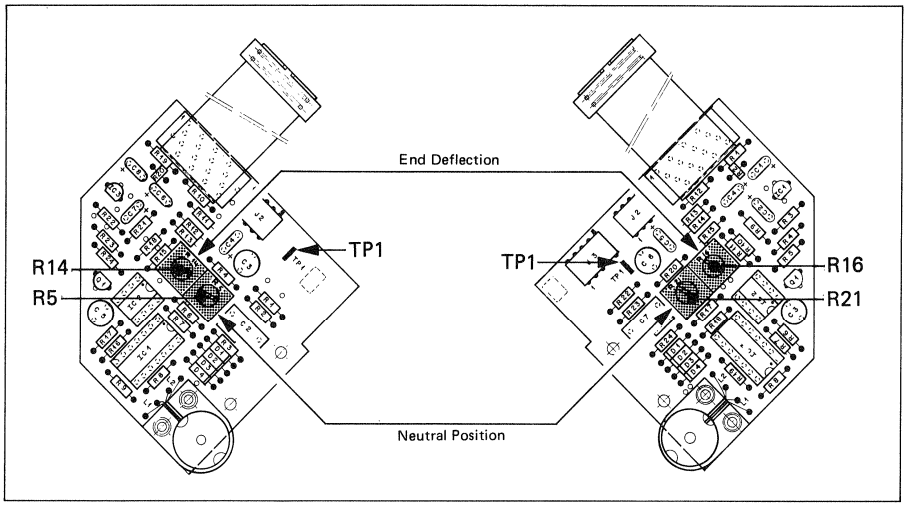
Neutral position:
With the tape tension sensors in neutral position, adjust the signals AN-TTL or AN-TTR (each on TP1 of the corresponding tape tension sensor) with R5 or R21 respectively to

0 V ± 50 mV

Max. deflection
The signals AN-TTL and AN-TTR (each measured on TP 1 of the corresponding tape tension sensor) are adjusted with R14 or R16 respectively to

4 V ± 50 mV

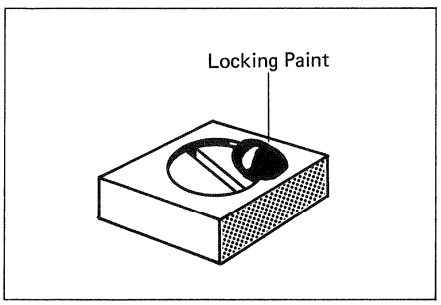
with the tape tension sensors in the 30° position (top edge of roller is flush with the top edge of the alignment gauge).



Neutral position:
Check and readjust if necessary; AN-TTL/R = 0 V ±50 mV.

Max. deflection:
Check and readjust if necessary; AN-TTL/R = 4 V ±50 mV.

Secure the setting of the trimmer potentiometers with a dab of locking paint (diam. 2 mm) after the adjustments have been made.



CAUTION:
Leave slots of trimmer potentiometers open.

3.4.3 Tape move sensor

Checking the TTL signals.

	CLOCKWISE	COUNTER–CLOCKWISE	TAPE DECK CONTROLLER
T-CLK 1			PIN 1
T-CLK 2			PIN 2

10 pulses per revolution.

Checking the tape counter:
The tape counter should increment and decrement correctly in all tape transport functions.
Manually stop the right-hand guide roller in PLAY mode. The tape counter should no longer increment and the recorder should enter the STOP function.
If not: check that the jumper JS3 on the TAPE DECK CONTROLLER is in the correct position.

3.4.4 Tape-end sensor

Switch recorder on, tape transport in STOP mode.
Both tape tension sensors in their neutral position. The EDIT solenoid of the brake chassis should drop out and the status lamp of the STOP key should flash.

Move left-hand tape tension sensor out of its neutral position. The EDIT solenoid of the brake chassis should pick up, the tape tension sensors should engage, and the STOP lamp should light up continuosly. Restore the tape tension sensor to the neutral position and perform the same check with the right-hand tape tension sensor.

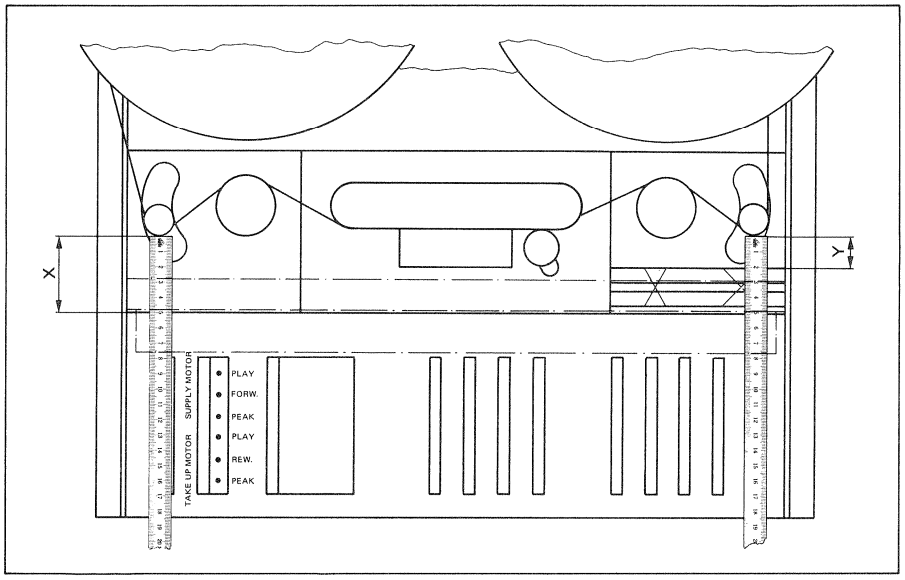
3.4.5 Tape tension adjustments

Remove jumper JS3 on the TAPE DECK CONTROLLER PCB or plug it into position B.

PLAY tape tension

Mount the alignment gauges on the two tape tension sensors and mount a reel of tape (hub diameter 100 mm). Spool forward to the middle of the tape, select PLAY, and adjust the two trimmer potentiometers "PLAY" of the TAPE DECK CONTROLLER in such a way that both tape tension sensors are in the -10° position.

The adjustments can also be made with a measuring rod when the machine is flat on a bench and the hinged panel cover is open: the measuring rod can be pushed in below the hinged panel cover. On the left-hand tape tension sensor the distance between the bottom edge of the guide roller and the bottom edge of the tape tension sensor cover should be 50 mm (X); on the right-hand tape tension sensor the distance between the bottom edge of the guide roller and the top edge of the splicing rail should be 22 mm (Y).



Back tension

Press fast forward > and adjust the left-hand tape tension sensor to -10° by means of the "FORWARD" trimmer potentiometer on the TAPE DECK CONTROLLER. Press rewind < and adjust the right-hand tape tension sensor to -10° by means of the "REWIND" trimmer potentiometer on the TAPE DECK CONTROLLER. Or use the measuring rod for adjusting the back tension analogously to the PLAY tape tension.

Peak tape tension

Rewind the tape to the beginning (right-hand hub diameter 100 mm). Manually keep the left-hand reel from turning and press fast forward >. Adjust the right-hand tape tension sensor to +20° by means of the "TAKE UP PEAK" potentiometer on the TAPE DECK CONTROLLER; or use the measuring rod, analogously to the adjustment of the PLAY tape tension, distance Y = 42 mm.

Spool tape forward to the end (left-hand hub diameter 100 mm). Manually keep the right-hand reel from turning and press rewind. Adjust the left-hand tape tension sensor to +20° by means of the "SUPPLY PEAK" potentiometer on the TAPE DECK CONTROLLER; or use the measuring rod, analogously to the adjustment of the PLAY tape tension, distance X = 70 mm.

Check measurements

Check PLAY tape tension with tentelometer. Insert tentelometer between the supply reel and the left-hand guide roller or the right-hand guide roller and the take-up reel.

Desired values: left: 0.6 ... 0.7 N (60 ... 70 p)
right: 0.8 ... 0.9 N (80 ... 90 p)

Important: The difference between the left-hand and right-hand tape tension must be 0.2 N (20 p)!

Should these values not be attained, the tape tension spring must be readjusted with the turnbuckle {A} (refer to Section 3.3.4, page 3/29).

After these adjustments have been made, the adjusting screw of the turnbuckle must be tightened and secured with a drop of locking paint.

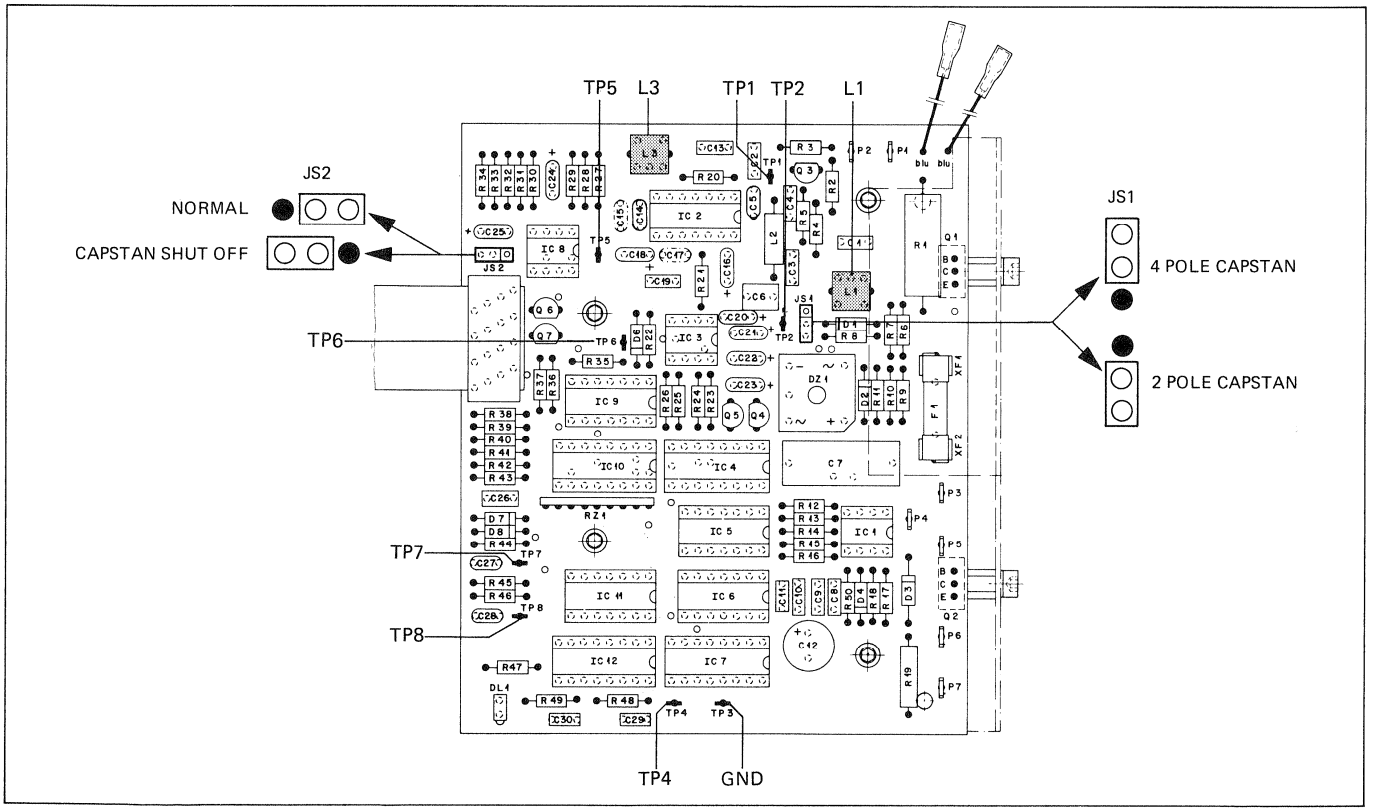
Reinsert jumper JS3 on the TAPE DECK CONTROLLER PCB.

3.4.6 Capstan motor control

CAUTION

Ensure that proper electrical insulation and excellent thermal contact with the heatsink bracket is achieved when replacing the power transistors (Q1, Q2). Mica washers coated on both sides with heat-conduction paste are, therefore, essential! After installation check insulation with continuity tester or ohmmeter!

The capstan motor control requires realignment after the capstan motor or the capstan motor control has been replaced.
Completely remove capstan motor together with capstan motor control (3.2.9), do not disconnect connectors (flat cable, 2 blue stranded wires to the power transformer).



Adjustments

- Position jumper JS2 on capstan motor control so that the capstan motor switches off for TAPE OUT (CAPSTAN SHUT OFF).
- Bring both tape tension sensors into their neutral position.
- Switch recorder on, capstan motor should not rotate.
- Connect oscilloscope to TP1 of the capstan motor control, adjust signal with L1 to approx. 5.5 MHz ±500 kHz. The signal should not disappear when touching the insulation of the two twisted stranded wires that lead to the capacitive sensor.
- Move tape tension sensors out of their neutral position (or change the setting of jumper JS2 if this is preferred) so that the capstan motor rotates (capstan lock indicator on MASTER PANEL and LED DL1 on the capstan motor control board turn on as soon as the motor has reached nominal speed).
- Connect oscilloscope to TP5. Adjust audio signal (1600 Hz at 38 cm/s) with L3 for maximum amplitude (400 mV p/p ±200 mV p/p).

Check measurements

- TP7: square-wave signal, same frequency as signal on TP5, cyclic duty factor approx. 50%.
- TP8: reference signal from microprocessor; short positive pulses. Only available when motor is running!
- TP4: output signal of phase comparator; cyclic duty factor approx. 50% when motor is running without load, i.e. pressure roller not engaged. If capstan motor too fast: LOW, if too slow: HIGH.
- TP2: DC signal, mean value of signal on TP4. Approx. 7 ... 8 VDC when motor operates without load.

Excanging the capstan motor or the capstan motor control

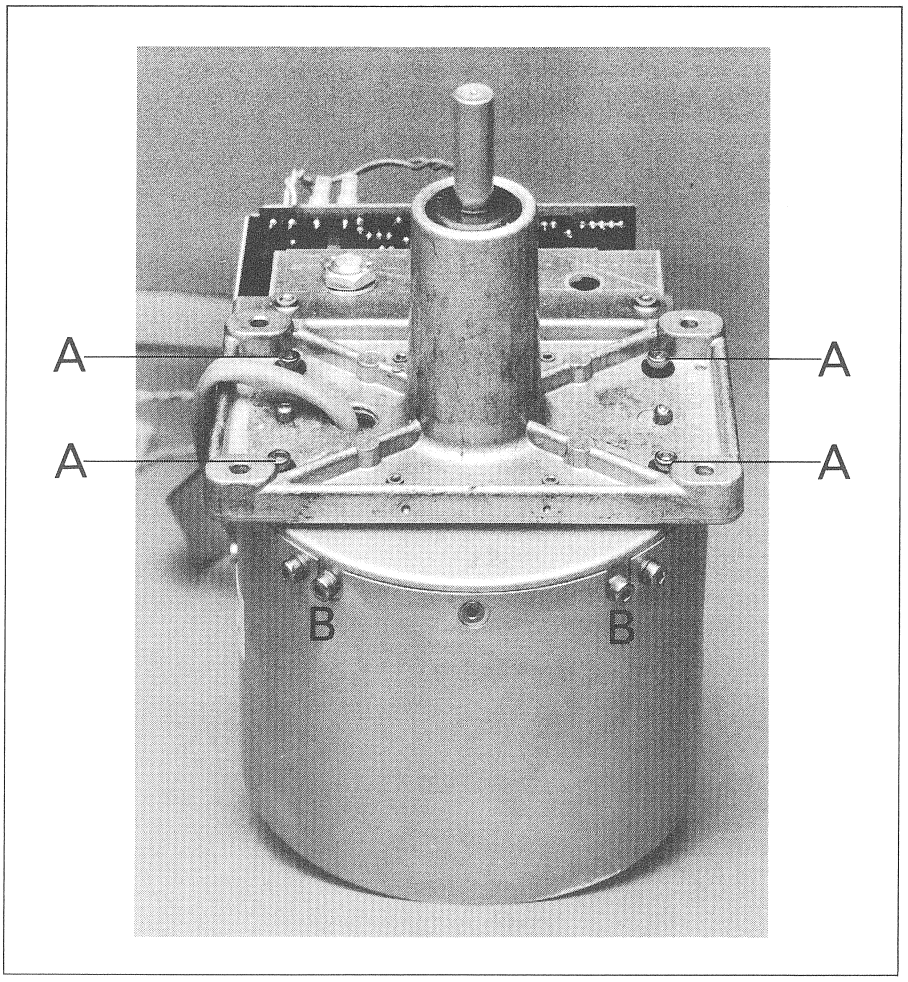
- The capstan motor control 1.810.761 is designed for operation with an integral capacitive sensor, the control 1.810.766 for operation with a split capacitive sensor.

  If a capstan motor with integral sensor is replaced by one with a split sensor, the control board 1.810.761 should be replaced by a control board 1.810.766. It is not recommanded to operate the motor with split sensor in conjunction with board 1.810.761, although this is not impossible (capstan lock problems can occur when the motor runs without load, i.e. pressure roller not engaged).
  Both terminals of the capacitive sensor must be connected to P1 of the capstan motor PCB, and P2 to the chassis ground.
  It is not possible to operate the capstan motor with integral sensor in conjunction with the capstan motor control 1.810.766.
- If a 4-pole motor is replaced by a 2-pole motor, change the setting of jumper JS1 on the capstan motor control. Unplug the power transformer leads (2 x blu) from terminals 10 and 19 and connect them to terminals 12 and 17, and interconnect power transformer terminals 10 and 11 as well as 18 and 19. An additional screening plate 1.810.001.05 as well as 4 screws 21.53.0354 and lockwashers 24.16.1030 are required because the 2-pole motor has a stronger stray field. This screening plate is installed between the capstan motor and the amplifier cage and must be secured to the existing 4 hexagon bolts.
- The phase shift capacitor must be changed from 4.5 µF (part No. 59.99.0452) for 4-pole capstan motors to 8 µF (part No. 59.14.6809) for 2-pole capstan motors.

Centering the capacitive sensor

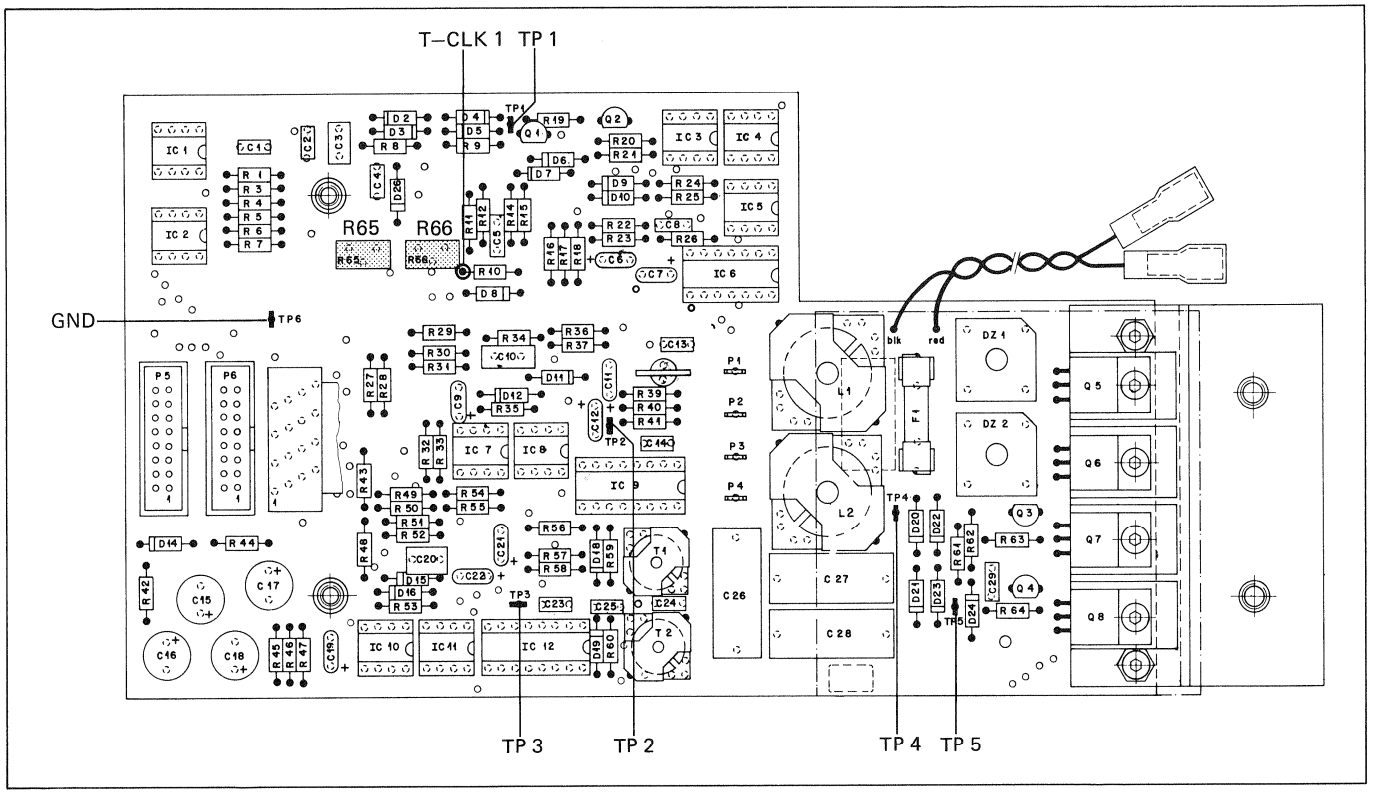
Remove the capstan motor but leave it connected to the machine for adjusting the capacitive sensor. The ring sensor can be adjusted with the two screws (B) after the four screws (A) have been lightly loosened. Connect oscilloscope to TP5 of the capstan motor control and adjust to minimum amplitude modulation (in practical terms: definition of the curve minima and maxima as sharp as possible).

Subsequently retighten the four screws (A) and secure all 6 screws with a dab of locking paint (ensure that no paint flows into the hexagon socket head!).



3.4.7 Spooling motor control

- Switch recorder off.
- Remove spooling motor control (3.2.8) and unscrew shock protection.
- Disconnect the two twisted stranded wires (0 V, blk; 130 V, red) on the power transformer terminals.
- Do not disconnect the leads of the spooling motors (P1 ... P4)! When the spooling motor control operates without load, C27 and L1 or C28 and L2 are resonant circuits through which high currents may flow!



- Switch recorder on, connect oscilloscope to TP1. Balanced delta signal, 76 kHz, 10 V p/p. The DC component on TP1 should not exceed +150 mV.
- Switch recorder off, pull IC10 out of its base; interconnect terminals 7 and 8 on the base of IC10 with a piece of wire. Switch recorder on, connect oscilloscope to TP3, and measure cyclic duty factor of the square-wave voltage. *Adjust to 95% with R65. Switch recorder off, reinsert IC10 into its* socket.
- Perform the same measurements analogously with IC7 and TP2. If the cyclic duty factor on TP2 is greater than 95%, decrease it to 95% with R65.
- Switch recorder off. Reconnect power transformer leads (blk terminal 14, red terminal 15). Replace fuse F1 by a power resistor 100 Ω, > 10 W (part No. 1.010.001.14). Remove jumper JS3 on the TAPE DECK CONTROLLER PCB or plug it into position B. Mount tape, switch recorder on, and select PLAY mode.

CAUTION: Dangerous voltages are present on the spooling motor control board!

- Connect oscilloscope to TP4. A switched signal is measured that has a sinusoidal envelope curve. If the signal is unbalanced or if it has a DC component, this is caused by a defective commutating circuit (around Q3, 4, 7, 8).

CAUTION: If the measurements are made in the commutating circuit, replace fuse F1 by a series resistor (100 ohm) in order to prevent damage to the circuit!

- Connect oscilloscope to TP5 and perform the same measurements as above.
- After correct functioning has been ascertained, repeat the above 2 measurements without the series resistor (fuse F1 reinserted).
- Connect frequency counter to the terminal of R10 that is located nearer to the trimmer potentiometer R66 (signal T-CLK1). Select slowest spooling speed (STOP, TRANS <REDUCED> and < or >). Adjust frequency with R66 to approx. 85 Hz (or any other value if desired).
- Check with the other spooling speeds: STOP, < or >, TRANS <REDUCED> and < or >; frequency approx. 440 ... 470 Hz. Press < or >; frequency approx. 190 ... 210 Hz.
- Reinsert jumper JS3 on TAPE DECK CONTROLLER.

3.5 CIRCUIT DESCRIPTIONS

3.5.1 Power supply

Line voltages:
100, 120, 140, 200, 220, 240 V ±10%, 50 ... 60 Hz

Internal supply voltages
+5.6; +15; -15; +24; all stabilized
125 VAC for spooling motor control
130 VAC for 4-pole capstan motor control or
140 VAC for 2-pole capstan motor control

The line voltage is taken from the 3-pin power inlet (GR 01) through the 2-pole power switch (GR 02), the line filter (GR 03), the line voltage selector with the primary fuse (GR 04) to the power transformer (GR 05).

The secondary side of the power transformer supplies the following voltages: 25.6 V; 35.2 V; 130 V; 125 V; 10 V.

The 25.6 V and the 35.2 V are rectified and smoothed (GR 06) and produce the stabilized voltages +5.6 V, +24 V and ±15 V on the stabilizer circuit board (GR 07).

3.5.2 STABILIZER GR 07

+5.6 V Stabilizer
The supply voltage for the microprocessor is generated by a switching regulator with pulse width modulation. The controlling element is IC6 (regulating pulse width modulator) with built-in reference voltage source, oscillator, error amplifier, and current limiting circuit. The output of IC6 controls the two power transistors Q4 and Q3. The circuit elements Q6, 9, 10, 12, and 13 switch the regulator off as soon as the input voltage drops below approx. 8 V in order to prevent destruction of the series transistor Q4 because of instabilities. The output voltage can be adjusted to 5.6 V with R69.

Triac Q11 short-circuits the output (current limiter of the controller responds; if the latter is defective the 25.6 VAC fuse F1 blows), if the output voltage rises above approximately 7 V because of a defect in the circuit.
The output current is limited to approximately 7 A. R58 is the current measuring resistor.

24 V Stabilizer
The +24 V are created from the rectified 25.6 VAC by IC3 which is a voltage regulator with a fixed setting.

±15 V Stabilizer
The ±15 V are produced from the rectified 35.2 VAC by means of the voltage regulators with fixed setting IC1, IC2. The output currents of the two regulators are identical.
Should a defect occur that causes an increase in the output voltages, the triac Q5 short-circuits the output (the current limiter of the controllers responds; if the latter are defective the 35.2 VAC fuse F2 blows).

Monitoring the supply voltages

The circuit with IC4 monitors the availability of the stabilized supply voltages. If one of the voltages fails or drops below approx. 70% of the nominal value, the signal T-SUPVON becomes 0. This sets up an interrupt in the microprocessor and tape braking is activated immediately. At the time the recorder is switched on, the signal T-SUPVON must be 1 before the microprocessor enables the functions of the tape recorder.

Monitoring the line voltage

Line voltage failures of less than 80 ms do not influence the logic state of the recorder. Correct switching to STOP mode is ensured for longer failures.

A pulsating DC voltage is tapped on the 25.6 V rectifier (ACB-25.6 and STABIN-6). C12 in the circuit with IC5 is charged by R34, R27 and periodically discharged by the pulsating DC voltage. As soon as a half-wave is missing (10 ms at 50 Hz, 8.33 ms at 60 Hz), the signal T-PWRON becomes 0 and sets up an interrupt in the microprocessor and tape braking is automatically initiated after 80 ms.

3.5.3 MP UNIT GR 20 EL 01

1.810.752/1.820.780 [specifications that differ for 1.820.780 are indicated in brackets]

The MPU logic processes the entered commands into logical signals and stores the audio parameters, locate addresses, and, when the recorder is switched off, also the last operating state. The operating time of the tape transport can be read out on the operating hours meter.

The clock frequency of the microprocessor is also the central timing source for the recorder:
Capstan motor control, switched spooling motor output stage, audio, time code.

Bus and select lines lead to:
- Tape deck controller
- Audio controller
- Command unit
- Serial remote controller

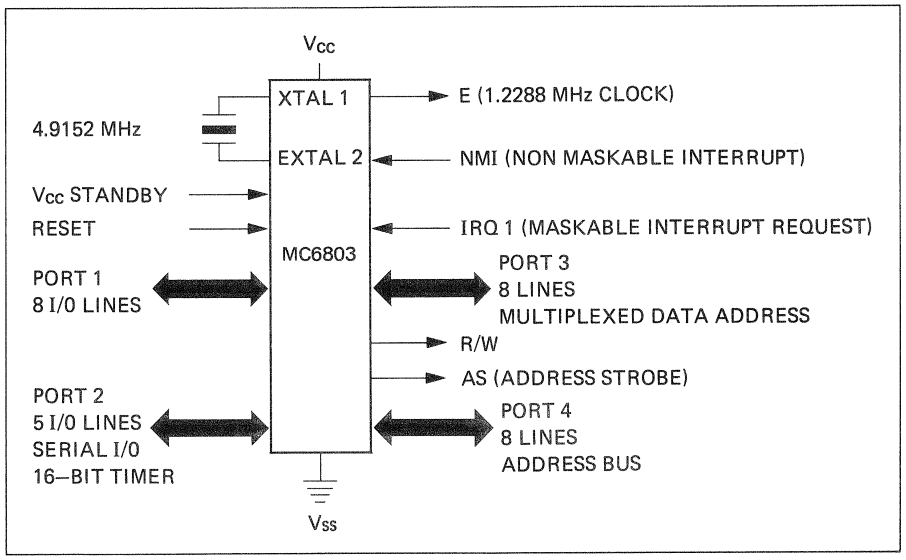
The TTL MPU bus features 8 data and 3 address lines as well as separate select lines to the individual controllers.

Microprocessor

The MC 6803 is a bidirectional, bus-oriented 8-bit parallel microprocessor with 16 address bits. It is implemented in NMOS technology, is TTL compatible, and requires only one supply voltage (+5 V).
Seven different addressing methods are possible and its internal command register can decode 72 commands.

The internal 128 byte RAM is not used for the present application and is ignored by the program. Up to 64 K external memory can be addressed with the 16 address bits.

In the operating mode selected (EXPANDED MULTIPLEXED MODE No.2), PORT 3 (lines P30 ... P37) operate as a time-division address/data bus.



The internal clock frequency is 1.2288 MHz which is derived from the 4.9152 MHz quartz frequency by dividing it by 4.

External memories

The external memories comprise 16K PROM (IC3 ... IC6) and 2K RAM (IC2) [24K PROM (IC8, IC10, IC12, IC14) and 2K RAM (IC6)] as well as a recargeable buffer battery BA1. The battery is charged by the +5.6 supply voltage and feeds the RAM when the recorder is switched off.

The complete machine program is stored in PROM. The RAM stores the audio data, the tape timer information, the selected command, the locate address, and the tape transport status. The R/W signal (READ/WRITE) determines wether data is sent from the microprocessor to the RAM (WRITE) or is received from the RAM (READ).

IC14 [IC11] (OCTAL TRANSPORT LATCH WITH 3-STATE OUTPUTS) is the address interface for PORT 3 (Address bits 0 ... 7) and is controlled by AS (ADDRESS STROBE).
When E = 0 and AS = 1, PORT 3 is an address bus; with E = 1 and AS = 0 it is a data bus.

In contrast to address bits 0 ... 11 which are primarily used for addressing the memories and for the address bus of the tape recorder, address bits 12 ... 14 in IC10 (1-OF-8 DECODER/MULTIPLEXER) [address bits 12 ... 15 in IC9 (1-OF-16 DECODER/DEMULTIPLEXER)] generate the information for the selected lines of the PROMs and the controllers.

IC1 [IC3] (OCTAL BUS TRANSCEIVER WITH 3-STATE OUTPUTS) establishes the connection to the 8-bit MPU data bus. IC7 [IC2] (OCTAL BUFFER/LINE DRIVER) places the address and select bits on the MPU address/select bus. IC1 [IC3] is controlled by R/W, address bits 11, 14, 15 and the MPU clock [R/W, address bits 14, 15 and the MPU clock]. IC7 is controlled by address bits 11, 14, 15 [IC2 by address bits 14, 15].

The clock frequency of 1.2288 MHz is divided down in IC13 [IC5] (DUAL DECADE COUNTER) to the following frequencies:
:4 = 307.2 kHz (reference frequency for HF driver, erase and bias frequency)
:16 = 76.8 kHz (clock frequency for spooling motor output stage)
:128 = 9.6 kHz (reference frequency for capstan motor control)

RESET

The RESET input fulfils two functions:

- Clean initialization during power-on of the microprocessor; the RESET input must be kept below 0.8 V until the supply voltage V/CC has reached at least 4.75 V so that the internal clock generator (Clock) can stabilize during this time.
- If the microprocessor does not function correctly, reinitialization is performed either with switch S1 or automatically, and the program is restarted. An automatic RESET is initiated if no tape timer scan occurs within approx. 20 ms (also refer to 3.5.4 TAPE DECK CONTROLLER).

During the power-on sequence, the RESET input must be kept low for at least 8 cycles of the internal clock frequency (min. 6.5 µs). The program counter is loaded with the last two addresses (FFFE, FFFF) during this time. The program starts with the first instruction two cycles after a positive voltage (log. "1") is available on the RESET input.

INTERRUPT

An INTERRUPT routine is initiated if a line voltage failure is detected by the power supply (T-NM [T-PWRON] = 0). The current instruction is completed before the INTERRUPT routine starts. The momentary operating status is stored in RAM and a STOP command is output to the TAPE DECK CONTROLLER after 80 ms. If the line voltage failure is shorter than 80 ms, the INTERRUPT routine is cancelled and normal program execution continues.

Only the NMI (NON-MASKABLE INTERRUPT) rather than the T-IRQ (MASKABLE INTERRUPT REQUEST) is used.

T-TX (send line) and T-RX (receive line) lead to the serial interface.

The output P20 is taken via IC8 (IC4) as the signal T-DRVENB to the serial remote controller and switches the latter's output on.

The new version of the MPU board 1.820.780 supports the following additional features:

- Either LED OR LCD tape timer display (selectable with jumper on the TAPE DECK CONTROLLER)
- Automatic MUTING during spooling operations.
- Display of the recorder status on the connected terminal (with DST command).

3.5.4 TAPE DECK CONTROLLER GR 20 EL 02

1.810.750

Set point generator for spooling motor control with 2 x 3 trimmer potentiometers. Controls the tape deck solenoids (brake, 3 x EDIT, pinch roller, and tape lifter).
Reading the tape deck status.
Data for capstan motor control.
Interpreting the tape move sensor signals.

Spooling motor control GR 24

Analog servo loop comprising: tape tension sensors GR 27/GR 28, spooling motors GR 09/GR 10, motor control with pulse-width modulation (clock frequency supplied by MPU).

The TAPE DECK CONTROLLER supplies the following information:
Set point for tape tension left and right (analog) for PLAY, spooling and PEAK. Reduced spooling speed (2 bits each for tape speed and spooling speed). Transmitting the tape movement and direction to the MPU. Driving the solenoids.

Capstan motor control GR 26

2nd order phase-locked loop (PLL), quartz reference 9.6 kHz from MPU, speed change-over through frequency division.

Capacitive tacho sensing. DC braking when switching to low speed or in vari-speed mode.

4-pole capstan motor for 3.75, 7.5, 15 ips
2-pole capstan motor for (3.75), 7.5, 15, 30 ips

Tape move sensor GR 28 EL 05

The tape move sensor supplies two square-wave voltages (T-CLK1, T-CLK2) that are offset by 90°. Their frequency is proportional to the tape speed. The diameter of the guide roller has been dimensioned so (37.9 mm) that a tape speed of 3.75 ips results for a frequency of 8 Hz. The following pulse rates are thus obtained:
3.75 ips: 8 pulses/sec.
7.5 ips: 16 pulses/sec.
15 ips: 32 pulses/sec.
30 ips: 64 pulses/sec.
The signal T-CLK1 is buffered and is available as TO-CLK on pin 7 of the connector for the parallel remote control.

	CLOCKWISE	COUNTER–CLOCKWISE	TAPE DECK CONTROLLER
T - CLK 1			PIN 1
T - CLK 2			PIN 2

From the 90° offset square-wave signals of the tape move sensor, direction-dependent pulse trains are formed via IC2, IC3, IC4 which are stored in the two binary counters IC11, IC12 (max. 255 pulses). The counter outputs are connected through a buffer/driver (IC10) to the data bus. The microprocessor requests a tape timer scan in intervals of 20 ms and receives the data bits available on the data outputs of IC10.

An address decoder IC13 (1-OF-8 DECODER/DEMULTIPLEXER) decodes the address output by the microprocessor when the signal T-TDSTR (TAPE DECK CONTROLLER STROBE) is 0. The data outputs of IC10 are enabled with T-RW (PROCESSOR READ/WRITE) = 1, and the microprocessor receives the stored data.

The following logic status must exist on the address decoder so that the microprocessor can receive the content of the tape timer:
T-TDSTR = 0
T-RW = 1
T-ADRX = 0
T-ADRY = 0
T-ADRZ = 1
TDOR4-R thus becomes 0 and enables the buffer/driver IC10.

Microprocessor data (commands) are transmitted with T-RW = 0.

The following logic states must exist on the address decoder so that the microprocessor can reset the binary counters:
T-TDSTR = 0
T-RW = 0
T-ADRX = 0
T-ADRY = 0
T-ADRZ = 1
TDO4-W thus becomes 0 and resets the counters IC11, IC12.

IC14 (OCTAL D-TYPE FLIP-FLOP) with the address TDO7-W = 0 decodes the commands that have been output by the microprocessor through the data bus for the spooling motor control such as:
Play, fast forward, rewind, and stop, as well as 2 information bits for the spooling speed:

Tape speed	max.	7	4	1	m/s
T-TPSPD1	0	1	0	1	
T-TPSPD2	0	0	1	1	

Both bits are reset to 0 (10 m/s) by switching off TRANS or with STOP and PLAY.

IC9 with the address TDO6-W = 0 decodes the commands output by the microprocessor for the six tape transport solenoids (control through open-collector drivers IC5 ... IC8) and the information for the capstan motor control:
T-CAPON = 0 (capstan motor control on)
T-REFSEL = 0 (capstan motor controlled by external reference frequency; 9.6 kH corresponds to the nominal speed set with the 2 bits T-SPDSL1, T-SPDSL2).
T-SPDSL1, 2 determine the tape speed:

Tape speed	30	15	7.5	3.75	ips
T-SPDSL1	0	0	1	1	
T-SPDSL2	0	1	1	0	

Through the buffer/driver IC1 with the address TDO5-R = 0, the following information is received by the microprocessor in addition to the tape travel direction:
T-SUPVON (supply voltage monitoring, "1" = all on)
T-SYNCAP (capstan motor speed, "0" = syncronous running)
T-TENDL/R (limit switch of tape tension sensors, "0" = neutral position)

The multivibrator IC18 monitors the correct functioning of the microprocessor: the tape timer is scanned in intervals of approx. 20 ms with the address TDO4-R = 0. The same signal is also used to trigger the monostable multivibrator IC18. If no timer scan occurs, the output 2Q of IC18 switches the signal T-RESET to "0". This causes a RESET in the microprocessor, i.e. the program is restarted.
Through the output 1Q of IC18, the RESET pulse also resets the two 8-way D-flip-flops IC9 and IC14 and the machine is switched to STOP mode.

3.5.5 BUS CONVERTER GR 20 EL 05

1.810.754

TTL/CMOS bus converter, (CMOS bus with 8 data and 4 address bits). Interface for audio section, transmits only data from the microprocessor to the audio section ("WRITE" only).
The audio parameters output by the MPU are written into the audio amplifiers through the TTL data bus, the bus converter and the CMOS bus.

- With 8-way D-flip flop:
  Input and output level 0, 4, 8, or 10 dBm
  Change-over INP, SYNC, REP
  Muting MUTE
  Equalization 3180 µs
  Erase current
  Drop-in or drop-out

- With 8-bit digital/analog converter (256 step attenuator):
  Reproduce level
  Reproduce frequency response (treble, bass)
  Reproduce equalization
  Record level
  Record frequency response (treble)
  Record equalization
  Bias current

The bus converter essentially consists of the interface circuit IC5 (PERIPHERAL INTERFACE ADAPTER = PIA) and the CMOS bus drivers IC4, 5, 8.

MPU signals to the PIA:
- Data bits: T-DATA-0 ... T-DATA-7 (MPU bus TTL).
- T-ENB: MPU clock frequency, 1.2288 MHz.
- T-RW: The data transmitted by the MPU can placed on the CMOS bus by the PIA when READ/WRITE = 0.
- T-RESET: all register bits of the PIA are set to 0 when this signal is = 0.
- T-ACSTR: (AUDIO CONTROLLER STROBE) = 0 and T-ADR-Z = 0 enable the PIA.
- T-ADR-X and T-ADR-Y address the internal registers of the PIA.

Output signals of the PIA:
- CA-DATA 0 ... CA-DATA 7: 8-bit CMOS data bus.
- CA-ADR-R, S, T, U: 4-bit CMOS address bus.
- CA-CHS01, 02, TC: channel selection 1, 2, and time code channel.
- CA-MONO: mono/stereo switch ("0" = mono).

Stand-by signals (TTL) from: CH1, CH2, time code (recording) and mono/stereo switch are transmitted through IC1 (3-STATE HEX BUFFER) to the PIA and received by the microprocessor.

3.5.6 PERIPHERY CONTROLLER GR 20 EL 04

1.810.753

The PERIPHERY CONTROLLER is the interface to the serial TTL bus (1 serial data bit per peripheral device; 3 address bits; 1 READ SELECT line, and 1 WRITE SELECT line).

Bus and address lines lead to the following units:
- Audio controller keyboard; input section for audio parameters.
- Channel control unit CH1; keys and status indicator lamps, channel 1.
- Channel control unit CH2; keys and status indicator lamps, channel 2.
- Channel control unit CH3; keys and status indicator lamps, time code channel.
- Master panel; keys and status indicator lamps for tape speed, mono/stereo switch (or tape type selector), and CCIR/NAB equalization.
- Remote interface; interface to parallel remote control.

The periphery controller essentially consists of an interface circuit (PERIPHERY INTERFACE ADAPTER = PIA).

MPU signals transmitted to PIA:
- Data bits: T-DATA-0 ... T-DATA-7 (MPU bus TTL).
- T-ENB: MPU clock frequency, 1.2288 MHz.
- T-RW: The data sent by the MPU can be placed on the serial TTL bus with READ/WRITE = 0; with READ/WRITE = 1 the MPU can receice data bits from the PIA.
- T-RESET: all register bits of the PIA are set to 0 when this signal is = 0.
- T-ACSTR: (AUDIO CONTROLLER STROBE) = 0 and T-ADR-Z = 1 enable the PIA.
- T-ADR-X and T-ADR-Y address the internal registers of the PIA.

Peripheral lines of the PIA:
- Seven (+ 1 spare) serial I/O data lines (channel controls, master panel, remote interface).
- DATA ENB (OUTPUT).
- DT JMP, DT ACK1, 2; data lines of the input unit for the audio parameters (INPUT).
- A, B, C; address lines (OUTPUT).
- READ, WRITE.

Input section for audio parameters (1.810.755):
The input section comprises 11 keys, 13 inductor lamps, and 8 code switches. The audio parameters are programmed with the keys, the indicator LEDs are used for status indication. The code switches fulfil the following functions:

1, 2: Changeover of the erase current for full-track, 2-track, and 2-track with time code, as well as delay time for sequential drop-in and drop-out.
3: Implementing the track and output selection individually for each audio channel or for both channels in parallel.
4: Spare
5, 6: Setting the line levels for inputs and outputs.
7: The same audio parameters apply to CCIR and NAB equalization if this switch is set.
8: Enables the input section.

The 11 keys are connected via IC3, 4 (8-INPUT MULTIPLEXER to the serial TTL bus.
Example: when the STORE button is pressed, the input D4 (IC4, PIN 5) changes to 0. In order to transmit this information to the line DT ACK2, the address bits must be A = 0, B = 0, C = 1, and READ = 0. As a result DT ACK 2 changes to 0 and IC4 is activated.
T-RW must also be set to 1 so that the microprocessor can receive this information from the PIA.

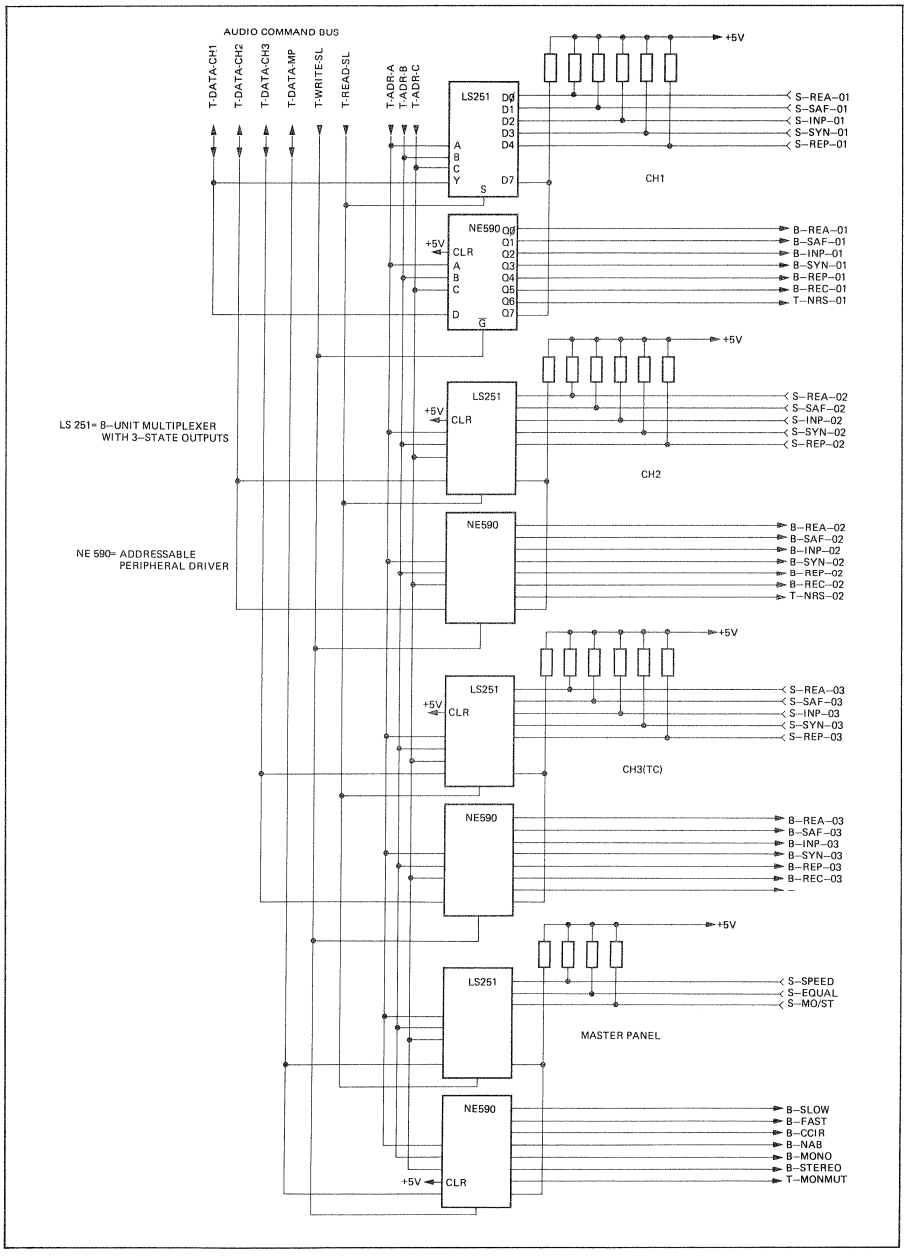
The pilot lamps are controlled via IC7, IC8 (ADDRESSABLE PERIPHERAL DRIVER). To acknowledge the STORE command, for example, T-RW must be 0 (PIA transmits data sent by the MPU); DT ACK2 must be 1 on the data input D (IC8, PIN 13).
The STORE lamp is turned on with WRITE = 0 and the address bits A = 0, B = 1, C = 0. IC7, IC8 have open-collector Darlington outputs.
When WRITE = 1, the output states of IC 7, IC 8 remain latched. The pilot lamp is switched off with the address A = 0, B = 1, C = 0 and WRITE = 0, as well as DT ACK2 = 0.

The code switches are connected through IC5 (8-INPUT MULTIPLEXER WITH 3-STATE OUTPUT) to the serial TTL bus.

Example: S8 must be switched on for programming the audio parameters (S-AKBENA = 0). To enable transfer of this information to the line DT JMP, the address bits must be A = 1, B = 1, C = 1, and READ = 0, resulting in DT JMP = 0.

Audio command bus:
The peripheral device lines of PIA are connected through IC2 (OCTAL BUS TRANSCEIVER) to the bidirectional audio data bus. The address lines are connected through IC1 (OCTAL BUFFER/LINE DRIVER WITH 3-STATE OUTPUT) to the audio address bus.

The MPU receives the information of the track mode selectors (SAFE/READY), the SAFE/READY switch of the time code channel, the output selectors (INP, SYNC, REC), as well as the switches of the master panel through the audio command bus, the PIA, and the MPU-TTL bus.
The switches are connected through multiplexers (8-INPUT MULTIPLEXER WITH 3-STATE OUTPUT) to the corresponding bus lines.
The MPU sends the commands for the status indicator lamps through the MPU TTL bus, the PIAs, and the audio command bus to the lamp drivers (ADDRESSABLE PERIPHERAL DRIVER).



Remote interface GR 23 (1.810.738):
The interface of the parallel remote control is connected to the PIA of the periphery controller via the audio command bus. The corresponding data lines are T-DT-RP1, 2. The data line DT-SJM is connected to IC9 (8-INPUT MULTIPLEXER WITH 3-STATE OUTPUT). The inputs of IC9 are programmed by SZ1/1...8 and transmit the address (SZ1/1...6) required when several machines are operated on a serial bus; the two remaining inputs 7 and 8 determine the baud rate for the data transmission (300, 1200, or 9600). The address board is plugged in from the back of the recorder into J2 of the remote interface.

The remote control keys are connected to the data bus T-DT-RP1 via IC8 (8-INPUT MULTIPLEXER WITH 3-STATE OUTPUT). When the PLAY remote control key is pressed, for example, the input D2 changes to 0. With the address T-ADR-A, B, C, = 0 and T-READ-SL = 0, the output T-DT-RP1 changes to 1.

The feedback lamps are switched on via T-DT-RP1 and IC5 (8-BIT ADDRESSABLE LATCH). When the PLAY command is accepted, the data bit T-DT-RP1 = 1 is transmitted with the address T-ADR-A, B, C = 0, 1, 0, and T-WRITE-SL = 0. As a result the output Q2 of IC5 changes to 1 and switches on the PLAY pilot lamp via the open-collector driver IC2. The lamp remains on until the data bit T-DT-RP1 = 0 is transmitted via the PIA with the address T-ADR-A, B, C = 0, 1, 0, and T-WRITE-SL = 0.

The signals SR-VARSP (varispeed on) and SR-TRANS and SR-REM-DIS (disable remote control) are connected to the data line T-DT-RP2 via IC7 (8-INPUT MULTIPLEXER WITH 3-STATE OUTPUT).
SR-REM-DIS is not wired on the 25-pin REMOTE CONTROL connector.

The fader start circuit is connected through a rectifier bridge with D1 ... D4 to the optocoupler IC1. The ouput transistor of IC1 controls input D6 of IC8. The fader start circuit can be powered either externally from the mixing console or by the internal supply of the tape recorder (+24 V on connector pin 25).

3.5.7 COMMAND UNIT GR 21

1.810.300/1.810.303

12 (Hall) keys and display (1.810.300: 4 1/2 position LCD; 1.810.303: 5-position LED) with leading negative sign. Status indicator lamps for all keys (except RESET, TIMER and ZERO-LOC).

Twenty code switches are located on the underside of the command unit:
- Standard selection for time code (film, TV Europe, TV USA black/withe, TV USA color NTSC).
- Code track audio and time code without offset (1,2" offset)
- LIFTER (momentary or flip-flop button)
- Record drop-in sequence
- Record drop-out sequence
- Tape type "A" or "B" at slow speed
- Tape type "A" or "B" at high speed
- Mono/stereo selector or tape type selector
- Tape speed selection
- Drop-in directly from PLAY with REC
- Reprogramming of LOC 2, LOC 3, LOC 4 keys.

Also refer to Section 4.2.9.

The command unit is connected to the microprocessor through the MPU bus.
The 12 keys and the 20 code switches are arranged in four groups. Each group is connected to the data bus by a buffer/driver IC2, 3, 6, 7 (OCTAL BUFFER-/LINE DRIVER WITH 3-STATE OUTPUTS).
Two 8-bit registers IC4, 5 turn on the 10 status indicator lamps (LED) through driver stages.

If signal T-CUSTR (COMMAND UNIT STOBE) = 0, the address decoder IC1 (1-OF-8 DECODER/DEMULTIPLEXER) decodes the address sent by the microprocessor through the address bus (in intervals of approx. 20 ms). Data (activated keys) can be received from the microprocessor with T-RW (PROCESSOR'S READ/WRITE) = 1, and the data output by the MPU (status indicator lamps, display) are processed with T-RW = 0.

Example of a command transmission:
T-RW = 1; address bits T-ADR-X, Y, Z are 1, 0, 1. T-SL5 is, therefore, 0 and enables IC2 (OCTAL BUFFER/LINE DRIVER WITH 3-STATE OUTPUTS). If the PLAY key is pressed, then T-DATA-2 = 0.
As soon as the microprocessor has accepted the PLAY command it transmits the address 1, 0, 1 and T-DATA-2 = 1; with T-RW = 0, T-SL2 becomes 0 and enables the 8-bit register IC4. The available data bit T-DATA-2 = 1 is transferred into the register with the rising edge of T-SL2. B-PLAY is switched on through the driver stage IC2. It remains on until the switch-off command (T-DATA-2 = 0, T-RW = 0, T-ADR-X, Y, Z = 1, 0, 1) arrives.

Tape timer display (LCD version)

The 4 1/2 position liquid crystal display with leading negative sign is controlled by the three address bits T-ADR-X, Y, Z as well as T-CUSTR and the 8 data bits. The address decoder of the command unit also requires the signal T-SL1.

The digits are selected with T-ADR-X, Y, Z; the segments with T-DATA-0, 1, 2, 3. If both T-ADR-Z and T-CUSTR are low, the available data are read in; if one of the two signals changes to high, the stored data are written on the outputs. The display decoder/driver for four digits with built-in oscillator (approx. 60 Hz) is implemented in CMOS-LSI technology and can directly select the four digits of the LC display.

The data T-DATA-4, 5, 6, 7 are read into the 4-bit D-flip-flop IC2 during the rising edge of T-SL1. They define the two colons, the leading negative sign and the digit 1 (hour).

Display example: -:43:10 (-43 minutes, 10 seconds)

DISPLAY	ADDRESS Z Y X	DATA BITS 7 6 5 4 3 2 1 0
- : :	1 0 0	1 0 1 1 X X X X
4	0 0 0	X X X X 0 1 0 0
3	0 1 0	X X X X 0 0 1 1
1	0 0 1	X X X X 0 0 0 1
0	0 1 1	X X X X 0 0 0 0

X = "dont care"

The control frequency of the LC display can be varied by changing the rating of the capacitor C1 on the DISPLAY BOARD 1.810.736 in order to optimize the contrast of the display to various viewing angles.
The rating selected for C1 has been optimized to a horizontally installed machine (perpendiculary and lightly slanted viewing from the front). For other applications, the rating of C1 should be determined empirically, however 220 pF should not be exceeded.

Tape timer display (LED version)
(Only applicable in conjunction with the new MPU board 1.820.780).

This 5-position LED display with leading negative sign is controlled by the tree address bits T-ADR-X, Y, Z as well as T-CUSTR, T-RW, T-MODESL and the data bits T-DATA-0 ... 3 and T-DATA-7.

The digits are selected with T-ADR-X, Y, Z; the segment with T-DATA-0, 1, 2, 3, and 7. The 8-position display decoder/multiplexer/driver IC1 is implemented in CMOS technology and directly controls the five 7-segment LED displays.

Display example: -.43.10 (-43 minutes, 10 seconds)

DIGIT	ADDRESS Z Y X	T-MODESL	DATA BITS 7	3 2 1 0
-.	1 0 0	0	0	1 0 1 0
4	0 1 1	0	1	0 1 0 0
3.	0 1 0	0	0	0 0 1 1
1	0 0 1	0	1	0 0 0 1
0	0 0 0	0	1	0 0 0 0

On time code versions equipped with the new time code amplifier 1.820.721.81/82/83/84, the far right decimal point of the LED display turns on when a code signal is available at the input or is being read from tape (depending on the position of the INP/SYNC/REP selector).

3.5.8 SERIAL REMOTE CONTROLLER GR 20 EL 03

1.810.751

Interface for serial remote control
- Audio parameter saving on tape
- Connection to a terminal
- Expanded test system

Copying data on tape

The audio parameters stored in RAM can be copied for backup purposes to a tape via the 9-pin connector of the serial remote controller. Pins 4 and 6 of the 9-pin connector must be connected to the RECORD input of the tape recorder (or an external cassette recorder). Also refer to Section 4.2.7.

When the 9-pin connector is plugged into the REPRODUCE output of the tape machine (or the cassette recorder), the stored data can be read back into the RAM. Also refer to Section 4.2.8.

The transmit line T-TX of the microprocessor is connected to IC1 (QUAD LINE DRIVER with 3-STATE OUTPUTS). The output of the latter is enabled by the signal T-DRVENB = 1. The balanced output of the line driver is connected to the output terminals via an isolating transformer.

When no data are transmitted, the signal T-DRVENB is 0, and the output of IC5 has high impedance.

The receive path leads from the connector terminals via the transformer to the line receiver "A" of IC4 (Quad RS 422/423 LINE RECEIVER WITH 3-STATE OUTPUT). The output of the latter is connected to the microprocessor via the receive line T-RX. The internal hysteresis improves the signal-to-noise ratio of IC4.

RS 232 connector pins

The connector pins 2, 3, 7, 8, and 9 are used for connecting an external terminal equipped with an RS 232 interface. SNDATA is the transmit line. The line driver "A" of IC3 (QUAD LINE DRIVER) processes the transmit signal (T-TX) of the microprocessor. RCVDATA is the receive line. The receive signal is taken via the line driver "B" of IC4 to the receive line T-RX of the microprocessor.

DEBUG display
The LEDs of the DEBUG display indicate the status of the data bus, the address bus, and the three selector lines.
T-RW and switch 4 (WRITE/READ) decide whether the WRITE or the READ signals of the MPU bus are to be represented.
IC7 and IC8 (OCTAL D-TYPE FLIP-FLOP WITH 3-STATE OUTPUTS) control the LEDs via driver circuits. The STROBE signals of the SELECT lines together with the T-RW time the IC5 and IC7. The representation of the STROBE signals (40 ns) is delayed by IC9 (HEX INVERTER) in order to compensate the clock preparation delay (IC8).
The DEBUG display can be switched ON/OFF with switch 1.

The two pilot lamps SEND and RECEIVE indicate whether or not data are transmitted on the T-TX and T-RX lines.

3.5.9 CAPSTAN MOTOR CONTROL GR 26

PLL control loop of the second order.
A toothed ring coupled to the capstan shaft induces capacitive changes in the tacho sensor (GR 26, EL 06). This variable capacitance determines the frequency of an HF oscillator with Q3. The change in capacitance causes a frequency modulation of the oscillator signal which is demodulated in IC2 (FM-IF AMPLIFIER AND DEMODULATOR). The AF voltage, the frequency of which is proportional to the capstan speed, is shaped into a square-wave signal and constitutes the actual value of the control loop.

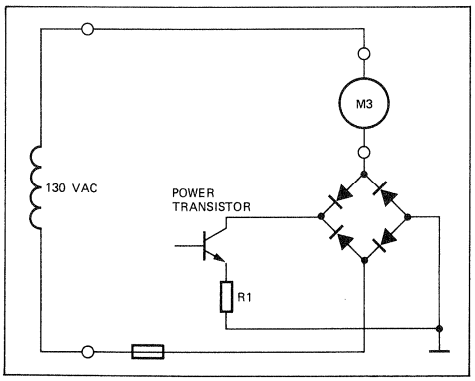
The reference is prepared by dividing the 9.6 kHz reference frequency of the microprocessor. The reference frequency T-REFINT is divided in IC 4 (PROGRAMMABLE DIVIDE-BY-N COUNTER) TO 3200, 1600, 800 OR 400 Hz, depending on the selected tape speed (corresponds to 30, 15, 7.5, and 3.75 ips respectively. The dividing ratio is determined by the signals T-SPSL1 and T-SPSL2:

RATIO OF DIVISION	:3	:6	:12	:24
T-SPSL1	0	0	1	1
T-SPSL2	0	1	1	0

IC10 converts the TTL level to CMOS level.

The actual value and the reference value are compared in a phase comparator circuit (IC5/2, IC6, and IC7). A control signal results on the output of IC7 (PARALLEL-IN / PARALLEL-OUT SHIFT REGISTER). This signal is taken through a low-pass filter to IC1/1, an integrator, and IC1/2.
The speed signals T-SPSL1, 2 influence the control caracteristic via Q4, Q5.

The output signal of IC1/2 controls the motor transistor Q1. The motor current flows from the 130 VAC (4-pole capstan) or 140 VAC (2-pole capstan) transformer winding through the capstan motor winding, the rectifier bridge DZ1, and in the form of a pulsating DC current through the motor transistor Q1.
The voltage drop at R1 is an image of the motor current.



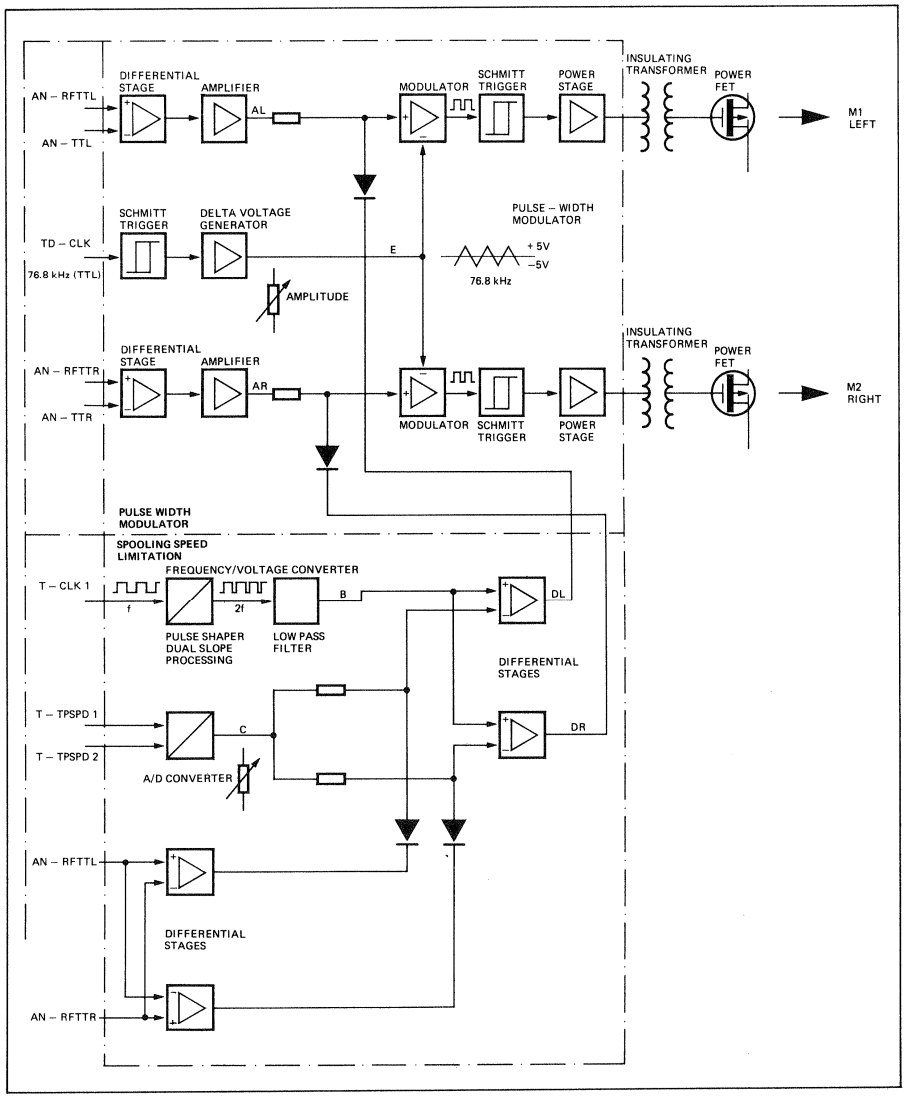
DC braking is activated when switching to a lower tape speed or if fast speed reduction is initiated by the varispeed control. The brake transitor Q2 is controlled through IC3; a pulsating DC current flows from the auxiliary phase through D3, Q2, and R19.
The circuit with IC12/2 (RETRIGGERABLE / RESETABLE MONOSTABLE MULTIVIBRATOR) and Q6 enables Q2 only if the speed is reduced through T-SPSL1, 2 or T-REFEXT.

Through IC12/1, the control signal on the output of IC7 controls the status indicator lamp DL1 and the signal T-SYNCAP which informs the microprocessor that the capstan lock has been achieved.

3.5.10 SPOOLING MOTOR CONTROL GR 24

The operating frequency of the switched spooling motor control is 76.8 kHz. This frequency is obtained by dividing the microprocessor clock frequency.

The 125 V, 50...60 Hz spooling motor voltage is switched on and off with the clock frequency. The generated motor output depends on the width of the ON pulses.



Pulse width modulator:
From the signals AN-TTL (AN-TTR) (actual tape tension) and AN-RFTTL (AN-RFTTR) (reference tape tension), a differential signal is created that is amplified in IC7/2 (IC10/2).

A Schmitt trigger (IC 2) removes noise from the TD-CLK signal (76.8 kHz) that has been derived from the microprocessor clock frequency, and the signal is subsequently taken to a triangular-wave generator (IC1, Q1, Q2, D2...D5). The triangular-wave generator converts the 76.8 kHz square-wave voltage to a delta voltage that is symmetrical relative to zero and which has the same frequency. The amplitude of this voltage can be adjusted with R65.

In the pulse width modulator IC8 (IC11), the delta signal is modulated with the differential signal (AN-RFTT - AN-TT). With the differential signal (AN-RFTT - AN-TT), control pulses are formed through an additional Schmitt trigger IC9/1 (IC12/1) and the power stage IC9/2 ... 6 (IC12/2 ... 6). These signals are of proportional duration, i.e. a large differential signal results in wide control pulses or high motor output.

The amplified differential signal (AN-RFTTL - AN-TTL or AN-RFTTR - AN-TTR) is clamped with diodes D15 and D12 or D16 to 4.3 V + 0.7 V = 5 V. The amplitide of the delta voltage is adjusted so that the cyclic duty factor of the control pulses does not exceed 95%.

Limiting the spooling speed:
The spooling speed can be reduced from the maximum speed (approx. 10 m/s) to 7, 4, or 1 m/s by pressing TRANS <REDUCED> and one of the spooling keys.

The spooling speed is maintained exactly at the selected value by reducing the duty factor of the control pulses (motor output!).

The speed information is supplied by the tape move sensor coupled to the right-hand guide roller. The square-wave T-CLK1 is converted by a pulse shaper with two-edge interpolation IC6/1, 2 into a pulse train of doubled frequency, i.e. a pulse of constant width is formed from each edge of T-CLK1.

A low-pass filter C7/R22/C6 converts these pulses to a DC voltage that is proportional to the tape speed (actual value). This voltage is applied to the differential stages IC3/1, 2.

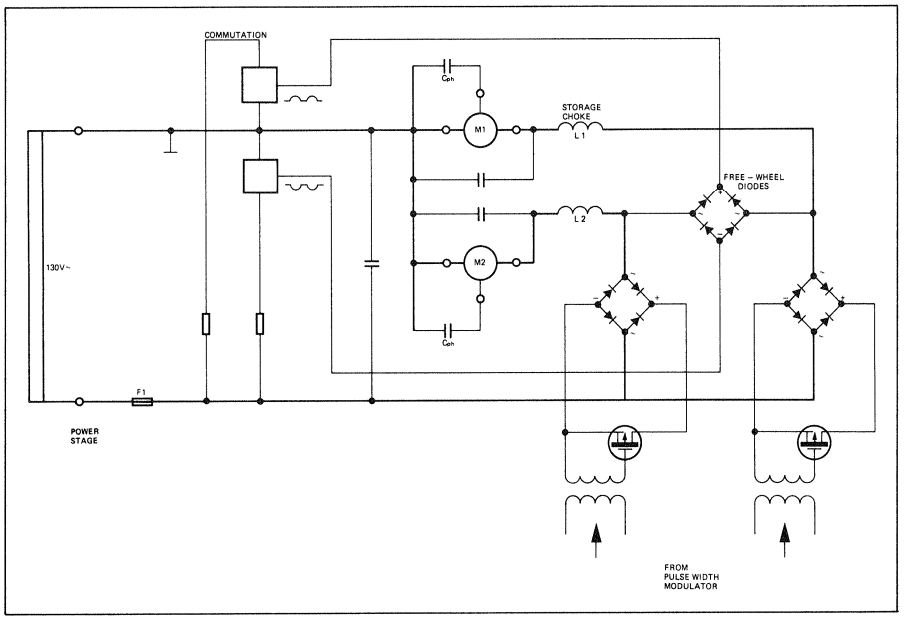
The two signals T-TPSD1, T-TPSD2 determine the spooling speed. They are converted into a DC voltage (reference value of the spooling speed) by the digital/analog converter IC5. The reference value is adjustable with R66 and is taken through R14, R15 to the differential stage IC3/1, 2.

The signals AN-RFTTL, AN-RFTTR (tape tension reference value) determine through the differential stages IC4/1, IC4/2 the motor (take-up side) for which the driving must be reduced.

The output signals of the differential stages IC3/1 and IC3/2 limit the differential signals (AN-RFTTL - AN-TTL or AN-RFTTR - AN-TTR respectively) and directly influence the width of the control pulses.

Spooling motor output stage:
The spooling motor output stage is supplied directly from the 125 VAC voltage of the power transformer. This AC voltage is taken via fuse F1 to the rectifier bridges DZ1, DZ2. The variable-width control pulses are taken via T1, T2 to the NMOS power FETs Q6, Q5.
These FETs are switched on and off with a frequency of 76.8 kHz and supply the spooling motors with a current, the mean value of which is proportional to the ON ratio (pulse width) of the FETs.
This arrangement with rectifier bridges ensures that the current switched on and off by the FETs always flows in the same direction (pulsating DC current) even though the polarity of the 125 V motor voltage changes.

The motor current flows through the storage chokes L1, L2 and the spooling motors back into the transformer winding.
A magnetic field is built up in the storage chokes L1, L2 while FETs are switched on. This field is eliminated at the moment the FETs are switched off, thereby inducing in the choke a voltage of inverse polarity. This voltage causes a current to flow through the free-wheeling diodes D20 ... D23, the commutator circuit, and the motor winding. The commutator circuit with Q3, Q7 (for the negative half-wave) and Q4, Q8 (for the positive half-wave) shape this free-wheeling current so, that no dangerous voltage spikes can occur, i.e. also the free-wheeling current is a DC current that pulsates with the frequency of the line voltage.



3.5.11 TAPE TENSION SENSORS GR 27, GR 28

IC 1/1 and IC 1/2 together with C5, R16, and R17 constitute the oscillator that operates with a frequency of approximately 833 kHz. The oscillator signal is amplified and induces a pulsating magnetic field. Depending on the tape tension sensor, the decoupling coil L2 is attenuated more or less by the screening plate connected to the sensor arm. The bridge D1 ... D2 rectifies the output signal of L2. The signal is amplified in IC2/1 and IC2/2 and noise voltages are eliminated. The signal AN-TTL/R is adjusted with R5 to 0 ± 50 mV (no deflection) and with R14 to +4 V ± 50 mV (+30° deflection).

3.5.12 TAPE MOVE SENSOR GR 28, EL 05

The 10 teeth of the serrated ring interrupt the two light barriers DLQ 1 and DLQ 2 for when the right-hand guide roller is rotating. As a result they switch Q1 and Q2 on and off.
The light barriers are arranged so that the output signals (T-CLK1 and T-CLK2) are offset by 90°.

3.5.13 TAPE END SENSOR GR 27, EL 04, GR 28 EL 06

When the tape end sensor is in the neutral position, the light barrier (GR 27, EL 04 or GR 28, EL 06) is switched on and the output signal T-TENDL/R = 0.

4.1 CIRCUIT DESCRIPTIONS

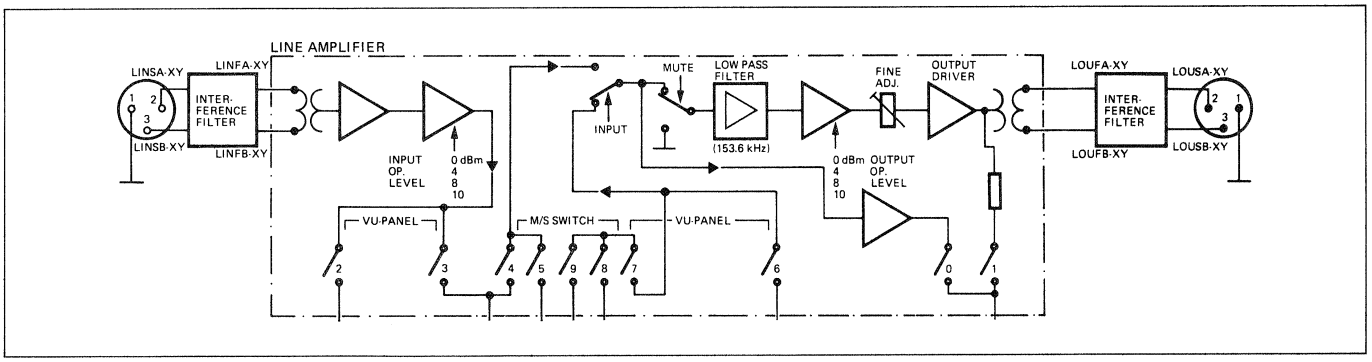
The audio section comprises:
- LINE AMPLIFIER
- REPRODUCE AMPLIFIER
- MONO/STEREO SWITCH (Option)
- RECORD AMPLIFIER
- HF DRIVER
- CODE READ/WRITE UNIT and CODE DELAY UNIT (Option)

It also includes the following peripheral assemblies:
- Headblock
- Level meters
- Monitor amplifier
- Record level control
- Reproduce level control

} depending on version

4.1.1 Line amplifier GR 20 EL 11, EL 16, input and output terminals

1.820.714 (with input/output transformer)



The following settings are made by the microprocessor through an 8-way D-flip-flop (IC1):

CA-DATA0 ... 3 switches the line level of the input and output to 0, 4, 8, or 10 dBm.
CA-DATA4 switchover from INP to REP/SYNC.
CA-DATA5 muting of line output.
CA-DATA6 switches the reproduce amplifier from REP to SYNC.
CA-DATA7 switches NAB equalization (3180 µs) on.

The flip-flop transfers the data available on the D-inputs to the Q-outputs with the rising edge of the clock pulse.

The input signal is taken from the input connector through a noise filter to the line amplifier. The noise filter prevents high-frequency voltages generated by nearby transmitters from entering into the tape recorder through the connecting cable.

Noise frequencies are eliminated by a low-pass filter ahead of the input transformer.
The input amplifier with IC3/1 is followed by the trimmer potentiometer R51 with which the manufacturing tolerances of the input transformer are compensated. The gain factor of IC3/2 is switched to the desired line level by the flip-flop outputs and Q1, Q2, and Q3.
Switch S1 matches the line amplifier to the corresponding recorder configuration: with or without VU-meter panel or mono/stereo switch.

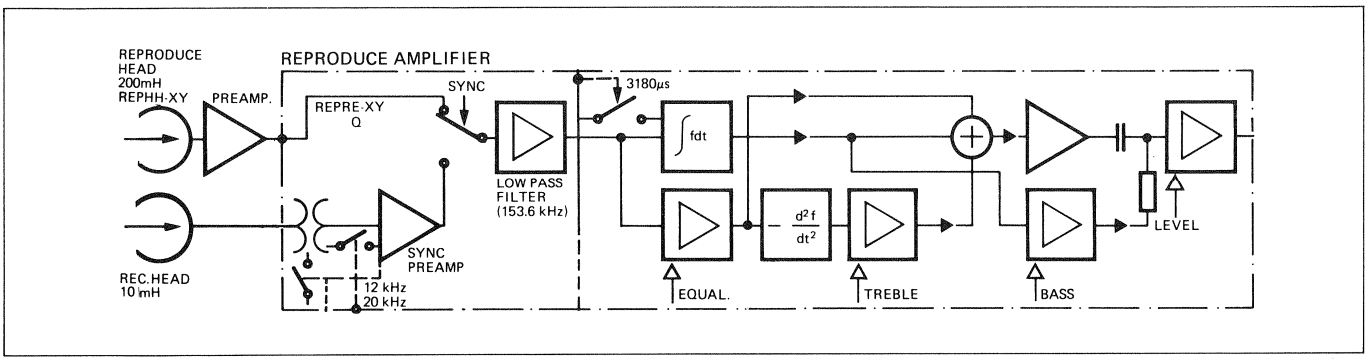
IC4, IC5 and IC7 switch the line amplifier output from INP to REP/SYNC; IC2, IC6, and IC8 mute the output.
The input selector/muting switch is followed by a low-pass filter with IC10/1. This filter is adjusted with trimmer C22 to maximum attenuation of the 153.6 kHz erase frequency. The gain of IC10/2 is switched to the desired line level by the flip-flop outputs and Q6, Q7, and Q8.

Fine-adjustment of the output level is made with R84. IC9/2 drives the complementary output transistors. The signal is taken to the output socket through a line balance transformer and an additional interface filter.

The signal for the headphones socket and the internal monitor amplifier is tapped before the transformer. The level meters are supplied by the balanced output signal.
The headphones/monitor signal can be switched to the output of IC9/1 with JS0 and JS1 of S1. In this case the monitor level is not affected by the line level adjustment and the muting of the output.

4.1.2 Reproduce amplifier GR 20 EL 10, EL 15; preamplifier in headblock

1.820.710



A reproduce preamplifier 1.810.710/711 (GR 32 EL 2) is located between the reproduce head and the reproduce amplifier. This preamplifier which is mounted directly on the headblock (GR 32) produces a gain of approx. 30 dB. Q1 and Q4 are low-noise transistors; IC1 is a low-noise compensated dual opamp. The preamplifier is linear up to approx. 25 kHz.
The preamplifier is only switched on when both supply voltages (± 15 V) are present (D1, Q2). This prevents current from flowing through the head winding and hence magnetizing of the reproduce head if one of the supply voltages is missing.
Cross talk between the two channels is adjusted to the minimum with trimmer potentiometer R14.

The reproduce signal is taken through screened lines to the reproduce amplifier.
The reproduce amplifier is designed so that it can process either the reproduce signal or the sync reproduce signal. The input signal is switched over from normal reproduction to sync reproduction by the signal CA-SYN-01 (-02) trough IC10 and the FET switches IC5 and IC6. The sync signal is conducted through the input transformer T1 and the sync amplifier with Q1, Q2, and IC7/2. The bandwidth of the sync amplifier can be switched over from 12 kHz to approx. 20 kHz by means of a jumper; however, strong cross talk is to be expected between the record and the sync reproduce channel on 2-channel recorders.

The reproduce signal is taken through a low-pass filter with IC14/2. This filter is adjusted with trimmer C31 to maximum attenuation of the 153.6 kHz erase frequency.

The signal CA-EQL-01 (-02) switches the 3180 µs time constant (IC14/1) through IC9 and FET switch IC4.

A signal of the auxiliary path (inverting, two-fold differentiating circuit) is added to the signal of the main path (integrator with IC14/1) for phase-linear gap loss correction of the reproduce amplifier.

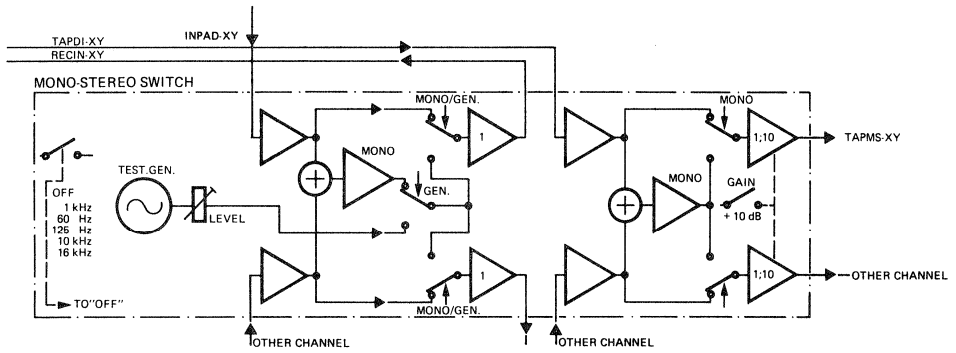
The equalization time constant is set with IC16, IC15/1; the reproduce frequency response is set with IC13, IC15/2 (treble) and IC8, IC7/1 (bass). The parameters stored in RAM are transmitted from the MPU to the corresponding 256-step attenuators.

The reproduce level (resolution 256 steps) is set with IC11, IC12/2.

IC2 (DUAL BINARY TO 1-OF-4 DECODER/DEMULTIPLEXER) decodes the address of the corresponding digital/analog converters IC8, 11, 13, or 16 from the address lines of the CMOS bus (CA-ADR-R, -S, -T, -U), and enables the D/A converters for data transmission.

4.1.3 Mono/stereo switch GR 20 EL 12 (Option)

1.820.720/724



The mono/stereo switch processes the two input signals and the two reproduce signals in separate branches.

The input signals INPAD-01, 02 are taken with internal reference level 0 dBm from the outputs of the two line amplifiers to the mono/stereo switch. The signals buffered by the impedance transformer IC3/1, 3/2 are taken in stereo mode directly to IC6/1, 6/2. In mono mode they are added with resistors R42 and R37 and amplified in IC25/1. The level of the mono signal is matched by R205. Mono/stereo switching is initiated by IC19 (PROM) and comparators IC13/1, 16/2 with the aid of FET switches.
The operating mode is selected with jumper JS2: mono signal INPAD-01 + INPAD-02 or INPAD-01 only.
The signals RECIN-01, 02 which are taken with internal reference level to the record and line amplifiers are developped from the output signals of IC6/1 and IC6/2.

The reproduce signals TAPDI-01, 02 are taken from the reproduce amplifiers to the inputs of the impedance transformers IC10/1, 10/2 after which they are decoupled and added with R81 and R80 to a mono signal. The mono signal is amplified in IC31/1; the level can be adjusted with R206. FET switches are used for change-over between mono and stereo.
The operating mode is selected with jumper JS3; the mono signal can either be connected to channel 1 + 2 (TAPMS-01, 02) or tó channel 1 only (TAPMS-01).
The signals TAPMS-01, 02 are taken to the output stages of the line amplifiers.

TEST GENERATOR
(1.820.724 only)

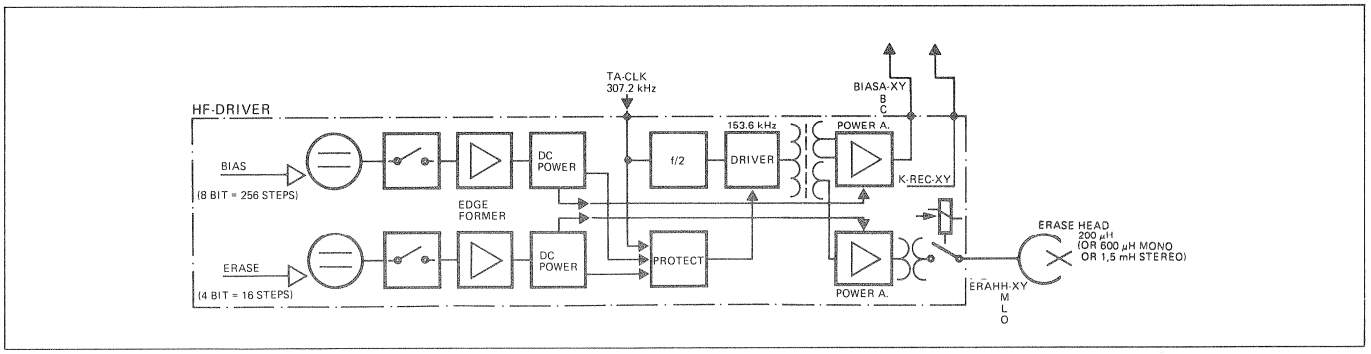
The test frequencies are generated by the function generator IC2. The balance is adjusted with R8, the sine shape with R20. The frequencies are switched over by IC20 (PROM) and Q1 ... Q5. The frequency generator is switched on by pressing the FREQUENCY button (REF status indicator lamp turns on, i.e. reference frequency, normally 1 kHz, has been selected). Each subsequent pressing of this button switches the frequency as follows:
- 60 Hz - 125 Hz - REF - 10 kHz - 16 kHz - OFF - REF - 60 Hz - etc.

The generator level (nominal level or nominal level -10 dB) can be selected with the LEVEL button. (When -10 dB is selected, the gain in the reproduce branch of the mono/stereo switch is automatically increased by 10 dB; the reference value of the VU-meter is thus again 0 dB when calibrating with tape).
The LEVEL button is only enabled after the test generator has previously been switched on with the FREQUENCY button.

The output signal of the function generator is taken through IC31/2 and IC25/2 to the mono branch. The output signals of IC7/1, 23/2 determine whether the input signals (INPAD-01, 02) or the test signal is input to the record amplifiers (RECIN-01, 02). FET switches are used for change-over.
The generator level is set with R208.
The operating instructions for the test generator can be found in Section 2.5.19.

4.1.4 HF driver GR 20 EL 08, EL 13

1.820.713



The erase and the bias current are prepared on the HF driver.

The microprocessor quartz reference TA-CLK with 307.2 kHz is divided in IC3 (DUAL JK NEGATIVE EDGE-TRIGGERED FLIP-FLOP) to 153.6 kHz. The outputs of the IC are connected to the HF driver IC11.
The erase and bias output stages are controlled by the windings of transformer T2.

The DC supply voltage for the erase current is defined with IC1 (OCTAL D-TYPE FLIP-FLOP) and IC6/2 (in 16 steps; data lines CA-DATA-0 ... 3). The DC supply voltage for the bias current is defined by the 256-step attenuator IC2 according to the parameters stored in RAM.
IC1 also decodes the commands for switching on the erase and the bias current. CA-SAFE = 0 enables IC1.

The DC voltage level defined by the microprocessor are switched on or off by Q1 (erase current). IC9/1 or IC10/1 respectively shape the on or off edge in such a way that clickfree "soft" drop-in and drop-out is achieved. IC9, Q13, and IC10, Q12 supply the DC currents for the corresponding power output stages. These DC currents are proportional to the required output currents. Q11 or Q10 respectively monitor these currents and switch the HF driver IC11 off through D12 and comparator IC8/1 if an overload occurs.

The clock signal (IC3, pin 9) is monitored ; if it is missing or corrupted, the HF driver is also switched off by IC8/1.

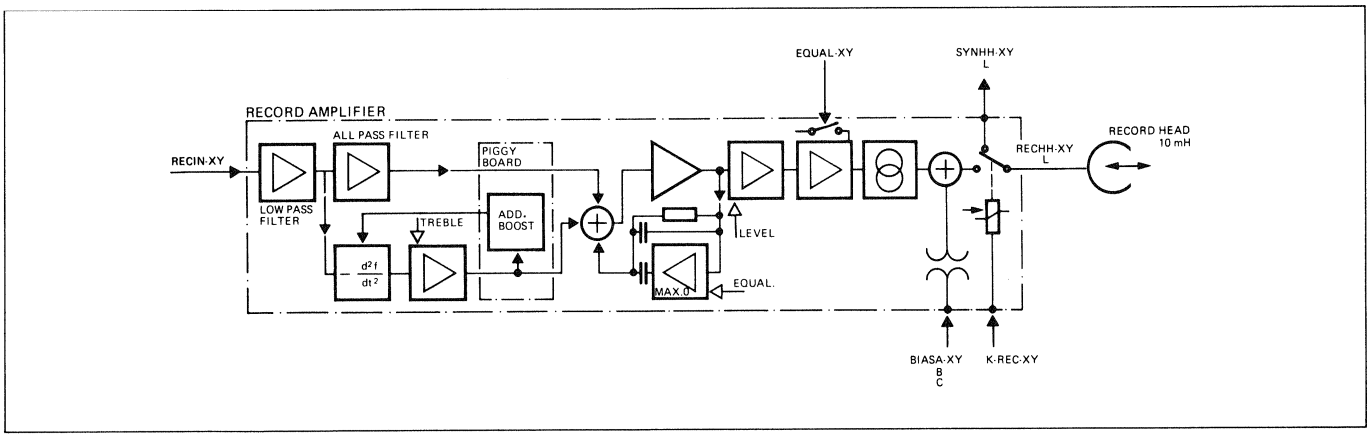
The stand-by signal TA-ACT-01 (-02) is connected through by IC8/2 in order to signal to the microprocessor the operating status of channel 1 or 2. TA-ACT checks that the record amplifier is inserted in the recorder.

The erase current is amplified by Q5 and Q8 and conducted through T1 to the output.
IC7, IC4, and relay K1 switch the erase current on or off.

The bias current is amplified by Q3 and Q4 and taken to the output.

4.1.5 Record amplifier GR 20 EL 09, EL 14

1.820.712



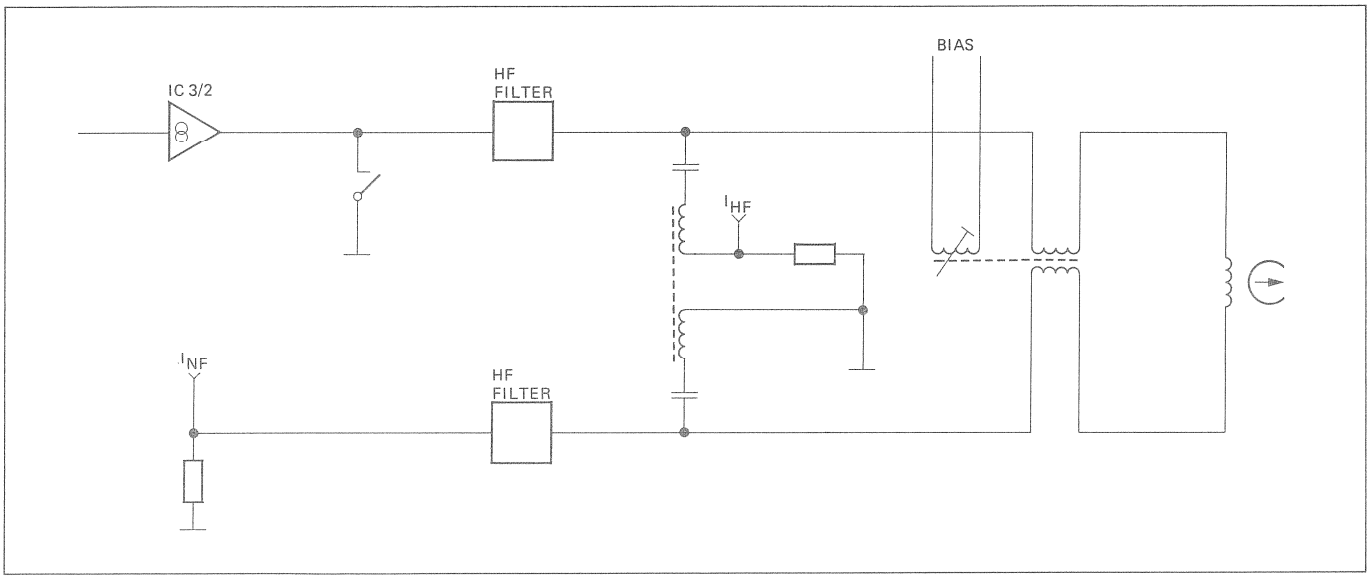
The audio signal RECIN-01 (-02) arriving from the line amplifier is conducted through a low-pass filter with IC7/1. The low-pass filter is designed for maximum attenuation of the 153.6 kHz erase frequency.

The treble losses caused by the air gap in the record head are compensated by a phase-linear correction section. The inverting, two-fold differentiating circuit (IC10) is followed by the final control element for the treble setting IC8, IC9/1 (record frequency response). A portion of the audio signal is mixed as a positive feedback through the plug-in ADAPTATION BOARD into the input of IC10/2 in order to improve the sharpness of the treble correction. The added components of the corrected recording signal are amplified by IC9/2.

The equalization time constant is set by IC5, IC6/1, the recorder level with IC3, IC6/2. The audio parameters stored in RAM are transmitted by the MPU to the corresponding 256-step attenuators.

The 3180 µs time constant is set by the FET switch IC2 with EQUAL-01 (-02).

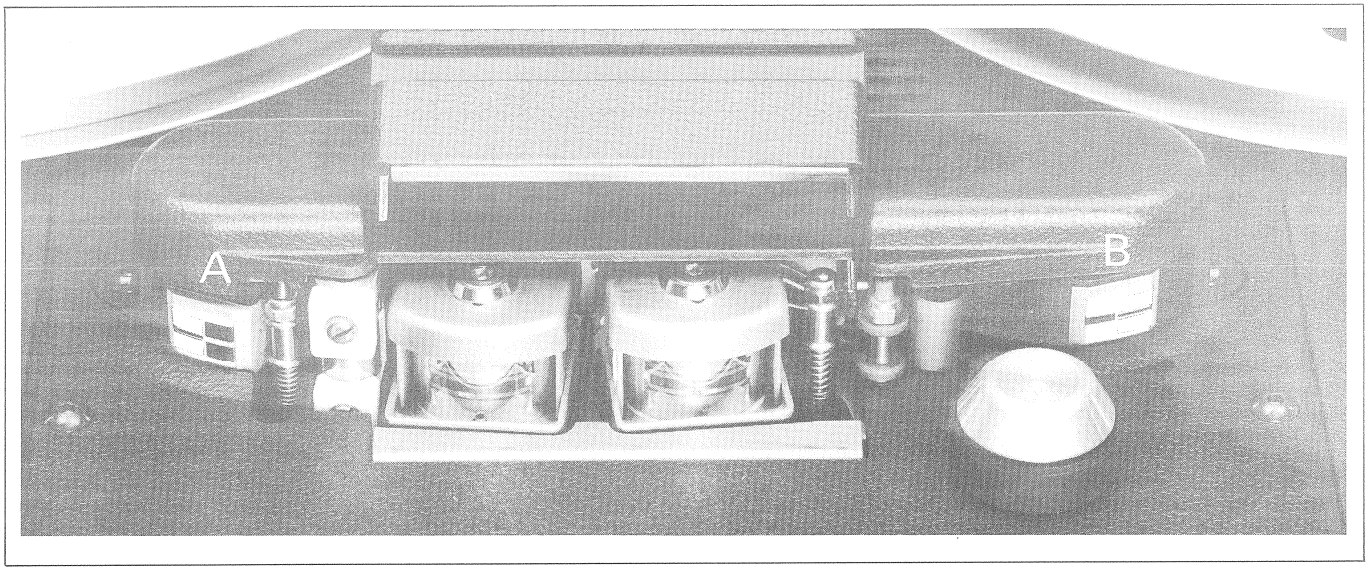
The record signal is taken to the opamp IC4/2 which functions as a current source.
The signal AFCSW-01 (-02) (AUDIO FREQUENCY CURRENT SWITCH) connects the record current through Q1. The record and bias current are added through T1. The two RF filters with L3 and L4 prevent strew-in of the bias frequency into the other circuit components. The bias current is drained through the series-resonant circuit with L2; a closed bias circuit is thus formed by the two windings of T1 and the winding of the record head.



4.1.6 Time code channel

General

Two-channel recorders can be equipped with the time code option. The 0.38 mm wide code track is arranged between the two audio tracks. The time code signal (80 bits according to SMPTE) is recorded through biphase modulation with bias. The tape flux is 729 nWb/m peak-to-peak ±3 dB.

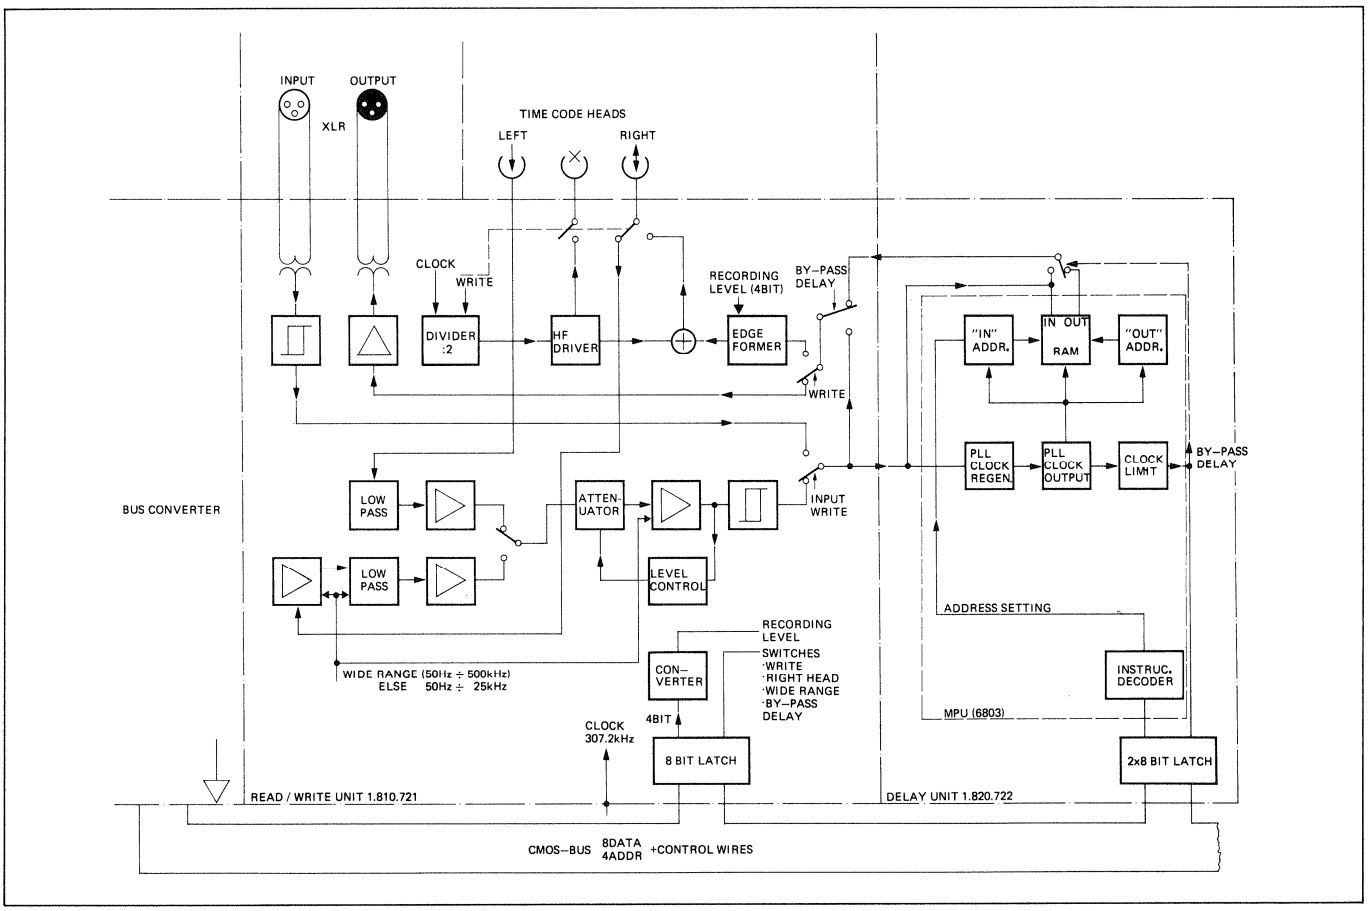


A reproduce (read) head is integrated in the audio erase head {A}. This head "reads" during audio reproduction/recording and slow forward editing. A second time code head is arranged on the far right side of the headblock {B} and is a combined erase/reproduce/record head (read/write head).
This head "reads" during spooling and slow reverse editing and is responsible for recording the time code signals.

CODE READ/WRITE UNIT GR 20 EL 06
1.820.721.81/82/83/84

Time code reproduction:
The signal REPHH-TC, REPHL-TC of the left-hand code head (active during audio reproduction or recording) is input to a low-pass filter/amplifier IC15/1. The low-pass filter suppresses the 153.6 kHz erase frequency (cross-talk between audio erase frequency and time code reproduction). The signal RECHH-TC, RECHL-TC of the right-hand code head is taken to a low-pass filter-/amplifier IC12, IC16. The bandwidth of the filter is automatically switched over with Q7. The bandwidth is wide for spooling and narrow for slow reverse editing.

The outputs of the two filter/amplifiers (signal of the left-hand or right-hand code head) are connected by FET switches Q10, Q11 to the limiter (IC13, changeover switch IC4/2, IC11, IC14, Q9). Even at variable reading speeds (spooling) this limiter supplies a constant-level output signal that is converted to a square-wave signal in a Schmitt trigger (IC6/1, IC10, IC7). Either directly or via the CODE DELAY UNIT (jumper JS2 or changeover switch IC4/1), the time code reproduce signal is taken to the line output amplifier IC2, the line balance transformer T2, and as the signal LOUFA-TC, LOUFB-TC to the balanced and floating output connector.



Time code recording:
The recording signal LINFA-TC, LINFB-TC is taken via the balanced and floating input connector, the input transformer T1 and the changeover switch IC4/2 to a Schmitt trigger (IC6/1, IC10, IC7) and via the CODE DELAY UNIT.

The output signal of the CODE DELAY UNIT is connected with changeover switch IC4/3 to the input of the record amplifier. The edges are shaped with Q5, IC9 in such a way that a trapezoidal recording signal is obtained.

The TA-CLK signal from the MPU is divided in IC8 from 307.2 kHz to 153.6 kHz and converted to an erase and a bias current signal in the RF amplifier IC5. The erase current is decoupled via T3 and taken as the signal ERAHH-TC, ERAHL-TC via screened lines to the erase head. The bias current from the secondary winding of T3 is added to the trapezoidal recording signal via the trimmer capacitor C9. The changeover relay K1 determines, whether the combination head is to function as a reproduce or record head. The output signal RECHH-TC, RECHL-TC is taken via screened lines to the combination head.

The following settings are made by the MPU via the CMOS bus (via 8-way flip-flop IC1, address decoder IC3):
- Recording level (4 bits, of which three are used), adjustable with R2 (7.5 ips), R8 (15 ips), and R10 (30 ips)
- Recording (CA-WRTTC = 1)
- Slow reverse editing, right-hand code head, narrow-band (CA-RS2TC = 1)
- Spooling, right-hand code head, wide-band (CA-RS1TC = 1)
- Bypassing the DELAY UNIT (CA-BPDTC = 1)
- INPUT, input signal to output (CA-RS1TC = CA-RS2TC = CA-BPDTC = 1)

For bias and level adjustment refer to Section 4.2.6.

CODE DELAY UNIT GR 20 EL 07
1.820.722

The CODE DELAY UNIT delays the time code signal in such a way that the audio and the time code signals on the tape coincide, i.e. the head spacing is automatically compensated.

A second microprocessor (IC2) (6803) performs this function.

A PLL (PHASE LOCKED LOOP) with clock regeneration is implemented by software.

The external memory of the microprocessor comprises 2K PROM (IC18) and 8K RAM (IC14). 8192 half-bits = 51 frames can be stored in the RAM.

Data from the MPU (1.810.752 or 1.820.780 respectively) are transmitted through the TTL bus, the bus converter, and the CMOS bus to two 8-bit latches IC8, IC9 of the DELAY UNIT and specify:
- Required delay
- Direction of tape travel
- Bypass command

Delay accuracy: ± 1/4 bit.

4.2 CALIBRATION

The audio parameters are copied from RAM and loaded into the registers of the audio amplifiers each time the recorder is switched on, after a microprocessor reset, or when changing the tape speed, the tape type, or the equalization.

When new parameters are entered through the keyboard or through the serial interface, the old parameters stored in the RAM and in the registers of the audio amplifiers are overwritten with the new data.

If the parameters in the RAM are destroyed, the standard parameters are automatically loaded from the PROM. Also refer to Section 2.7.

4.2.1 Introduction

4.2.1.1 General

On recorders equipped with a tape marker, remove the latter (plug-in unit!) before opening the panel flap.

It is assumed that the all mechanical adjustments of the recorder to be calibrated are correct (especially with respect to tape tension and tape guidance).

The soundheads and the tape guidance elements should be cleaned and demagnetized before the recorder is calibrated.

The calibrating steps should always be performed in the following order:

REPRODUCTION:
Tape speed FAST
- Level
- Azimuth alignment of the reproduce head*
- Frequency response

Tape speed SLOW
- Level
- Azimuth alignment of the reproduce head*
- Frequency response

* Minor deviations between the various speeds can occur, depending on the type of calibration tape used. Should this be the case, align the azimuth to the preferred studio speed.

RECORDING:
Tape speed 7.5 or 15 ips (or preferred studio speed)
- Record level preadjustment
- Azimuth alignment of the record head
- Bias
- Record level
- Frequency response

Tape speed 3.75 or 30 ips (or 2nd speed)
- Record level preadjustment
- Bias
- Record level
- Frequency response

SYNC REPRODUCTION
The following adjustments can be made for the three tape speeds 7.5 ips, 15 ips, and 30 ips:
- Level
- Frequency response

Sync operation is not calibrated for the tape speed 3.75 ips. (all parameters at 00).

4.2.1.2 Level

Applies to VU-meter lead of 6 dB!

0 dBm = 0.775 V

OPERATING LEVEL dBm		PEAK RECORDING LEVEL dBm
0	=	6
4	=	10
8	=	14
10	=	16

4.2.1.3 Equalizations

Equalization networks have been built into the reproduce paths for correcting the frequency response.
The attack points are referred to as transition frequencies and transition time constants ($1/2\pi f$) and have been standardized by various organizations (IEC, NAB, AES, CCIR).

TAPE SPEED	TRANSITION FREQUENCIES, LOW; HIGH (TRANSITION TIME CONSTANTS)		
	IEC-1968	NAB-1965	NAB-1975
3.75 ips 9.53 cm/s	50 Hz; 1800 Hz (3180 µs; 90 µs)	50 Hz; 1800 Hz (3180 µs; 90 µs)	- (-)
7.5 ips 19.05 cm/s	0 Hz; 2240 Hz (∞; 70 µs)	50 Hz; 3150 Hz (3180 µs; 50 µs)	0 Hz; 3150 Hz (∞; 50 µs)
15.0 ips 38.10 cm/s	0 Hz; 4500 Hz (∞; 35 µs)	50 Hz; 3150 Hz (3180 µs; 50 µs)	- (-)
30.0 ips 76.2 cm/s	0 Hz; 9000 Hz (∞; 17.5 µs)	AES-1971 0 Hz; 9000 Hz (∞; 17.5 µs)	- (-)

4.2.1.4 Magnetic reference flux

A tape recorded with reference level should produce operating level on the output in play mode.

The following standard settings are made at the factory:

NAB OPERATING LEVEL (0 VU) nWb/m	CCIR PEAK RECORDING LEVEL (+6 VU) nWb/m
250 (200 @ 7.5, 3.75 ips)	510 (400 @ 3.75 ips)

4.2.1.5 Calibration tapes

Calibration tapes are used for aligning the reproduce path of tape recorders. Such tapes are magnetized across their full width. A separate tape is used for each speed.

CAUTION
To prevent unintentional erasure of valuable tapes, all channels should be switched to SAFE while adjustments are being made! On recorders without SAFE button, set the two channel switches JS01 and J02 of the PERIPHERY CONTROLLER to 0. (Also refer to Section 4.2.9.2).

Calibration tapes are divided into the following test sections:

Reference level test section:
(Reference flux = 320 nWb/m for 7.5, 15, and 30 ips, 257 nWb/m for 3.75 ips) should produce operating level on the output in play mode.
The output level is adjusted to the required operating level during the reproduction of this test section that has a length of approx. 60 to 180 s.
NAB calibration tapes with a reference flux of 200 nWb/m should yield an output level of -4 VU (reference level -10 dB).

Reference frequencies: 333 Hz or 500 Hz at 3.75 ips, 1 kHz at 7.5 ips through 30 ips (there are also NAB calibration tapes with a reference frequency of 700 Hz).

Azimuth alignment test section:
For adjusting the vertical alignment of the reproduce head gap. This test section is divided into a short segment containing the reference frequency (for coarse adustment) and a long segment with 10 kHz for fine-adjustment.
NAB calibration tapes may be formatted differently. The level of this section is normally 10 dB below the operating level.

The head is aligned to maximum output voltage with the azimuth adjustment screw.
Important: If significant changes in the reproduce head azimuth are made, other voltage maxima with lower levels occur!

With correct equalization of the reproduce amplifier, the reproduce level is identical for recordings with reference frequency and with 10 (8; 16) kHz.

Frequency response test section:
For determining and adjusting the reproduce response at specific frequencies. NAB calibration tapes exist that contain frequencies other than those listed in the following table.

REFERENCE TAPE	CCIR				NAB			
TAPE SPEED cm/s; ips	9.5	19	38	76	3.75	7.5	15	30 (AES)
REFERENCE LEVEL SECTION: REF. FREQUENCY REF. FLUX nWb/m	333 Hz 257	1 kHz 320			500 Hz 200	1 kHz (700 Hz) 200		
AZIMUTH ALIGNMENT SECTION: (-10 dB)	333 Hz 10 kHz	1 kHz 10 kHz			250 Hz 4 kHz 8 kHz	500 Hz (700 Hz) 8 kHz 16 kHz		
FREQUENCY RESPONSE SECTION: (CCIR: -20 dB) (NAB: -10 dB)	333 Hz 31.5 40 63 125 250 500 1 kHz 2 4 6.3 8 10 12.5 14 16 333 Hz	1 kHz 31.5 Hz 40 63 125 250 500 1 kHz 2 4 6.3 8 10 12.5 14 16 18 1 kHz			31.5 Hz 63 125 250 500 1 kHz 2 4 5 6.3 8 10 500 Hz	31.5 Hz 63 125 250 500 1 kHz 2 4 8 10 12.5 16 20 1 kHz		

4.2.1.6 Preparatory steps

Set all code switches of the PERIPHERY CONTROLLER to the correct setting (refer to Section 4.2.9.2!) before starting with the calibration.

Line level:
Adjust required level:

OPERATING LEVEL	PEAK RECORDING LEVEL	JS 5	JS 6
0 dBm	6 dBm	0	0
4 dBm	10 dBm	1	0
8 dBm	14 dBm	0	1
10 dBm	16 dBm	1	1

If a different value is desired:
Select next value and calibrate the line level with the level adjustments outlined below.

Checking the output level and the VU-meter:
Connect AF generator to the line input of channel 1 and feed in 1 kHz with operating level.
Connect AF millivoltmeter to line output channel 1 and load the output with 600 Ω (standard) or 200 Ω (minimum).

Switch recorder on and press the INP button of channel 1 and 2. Release all UNCAL buttons (calibrated level).

Adjust ouput level to operating level with the line amplifier trimmer accessible from the front.

Checking the VU-meter indication:
- VU indication: Operating level should result in a reading of 0 VU.
- PPM indication: Operating level should result in a reading of -6 (0 for reference level).

Correct the VU-meter reading with the trimmer potentiometer located on the back of the VU-meter amplifier.

On stereo recorders repeat the check for channel 2 in the same sequence.

Equalization:

Select the required equalization on the master panel (CCIR or NAB).

If the same calibration data (level, frequency response, bias) are desired for both types of equalization, proceed as follows:
- Select preferred equalization (master panel).
- Adjust and check all audio parameters according to the instructions.
- Set code switch 7: JS 7 = 1.
- Read out and reload all previously entered parameters. The same parameters are now stored for both equalizations.

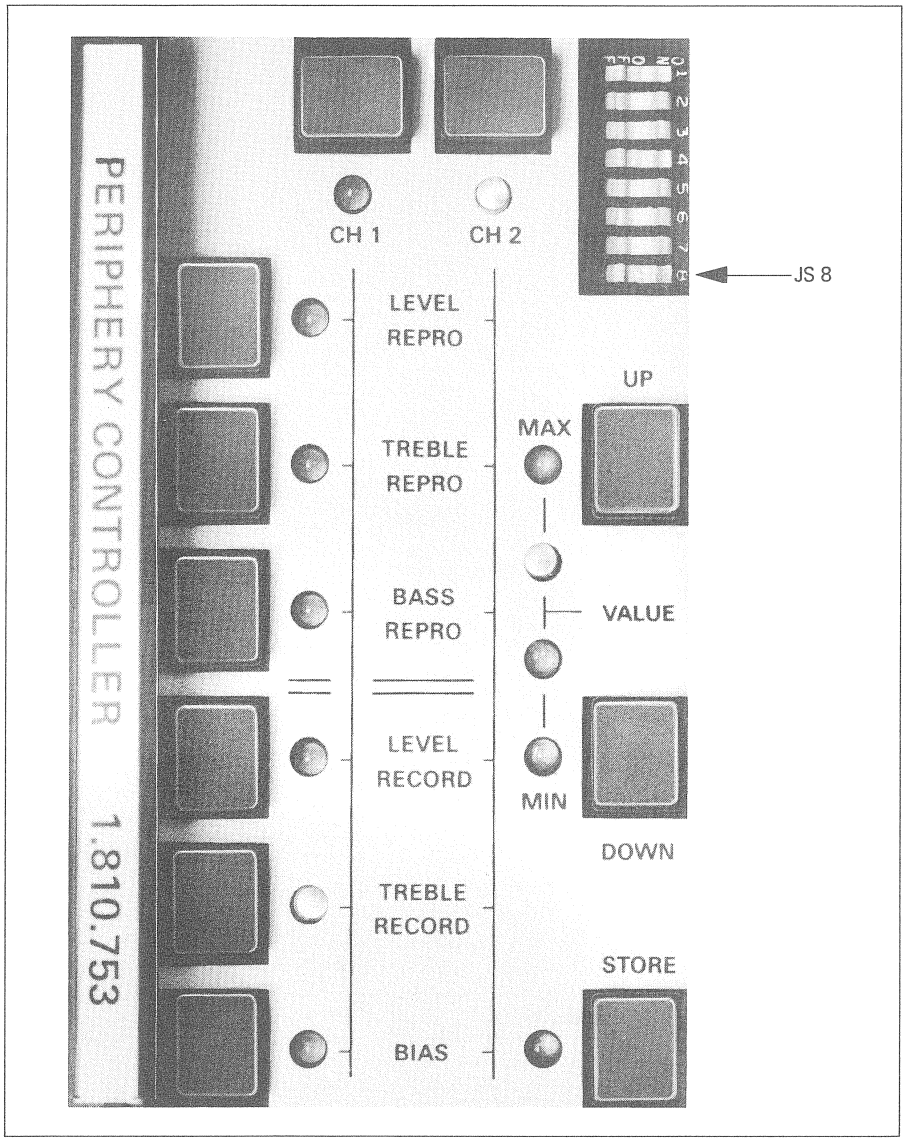
The equalization time constants can be changed selectively for special situations. In this case it is essential to set the code switch 7 to the off position (JS 7 = 0)!

Tape type

Set tape type selector to the desired position or program it according to 4.2.9.1.

NOTE: Repeat the reproduce and record adjustments step-by-step for the second tape formulation.

4.2.1.7 Input keyboard



Set code switch 8 on: JS 8 = 1.

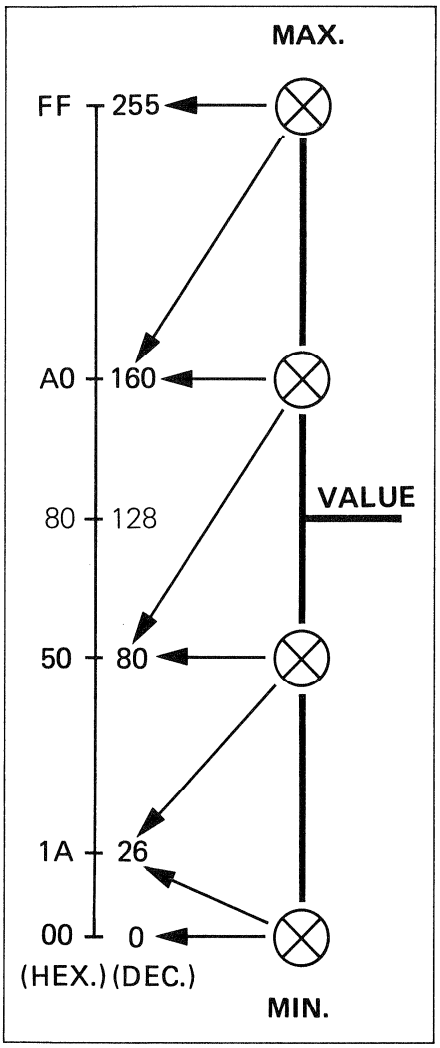
If, for example, the reproduce level of channel 1 is to be adjusted, it is necessary to first press CH1 and then LEVEL REPRO. The corresponding pilot lamps turn on and the tape timer display indicates e.g. AA 83 (LCD version) or AAA83 (LED version).

- AA(A) for audio alignment
- 83 specifies in hexadecimal format the number of steps from the completely closed reproduce level controller (131 decimal).

Readout of programmed value

The gain range of the various amplifiers can be adjusted in 255 steps between 0 and the maximum (corresponds to 256 discrete values).
Compared with a potentiometer, these 256 values correspond to the range between the cw and ccw stops.

The programmed value is indicated on the tape timer display. To conserve space it is displayed in hexadecimal format (00 for 0 and FF for 255).
A coarse reading can be obtained from the 4 indicator lamps (VALUE) on the input section.



When the maximum value FF (255) is reached, the MAX lamp flashes, when 00 is reached, the MIN lamp flashes.

Examples of hexadecimal numbers:

DECIMAL :	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
HEXADECIMAL :	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

HEXADECIMAL	DECIMAL	% of FF (or 255, resp.)
1A	26	10
33	51	20
4D	77	30
66	102	40
80	128	50
99	153	60
B3	179	70
CC	204	80
E6	230	90

IMPORTANT

The hexadecimal values displayed should indicate to the user the range in which the corresponding amplifier is operating. No voltages can be derived from these numbers!

Modifying the parameters

Each time the UP key is pressed, the gain increases by 1/256th. It is decreased by 1/256th by pressing the DOWN key.

The UP or DOWN keys have the same effect as turning a potentiometer clockwise or counterclockwise.

If the UP or DOWN key are pressed continuously, the gain is varied in consecutive steps.

Example:

Push	Display
	AA(A)3C
UP	AA(A)3D
UP	AA(A)3E
UP	AA(A)3F
UP	AA(A)40
UP	AA(A)41
DOWN	AA(A)40
DOWN	AA(A)3F

In contrast to the adjustment with potentiometers, the original value stored in RAM can be reproduced exactly at any time by simply pressing the corresponding parameter key (e.g. LEVEL REPRO).

Storing the parameters

When the desired value has been reached (e.g. operating level 10 dBm = 2.5 V) it can be stored in RAM.
Press STORE key: the STORE indicator lamp turns on briefly to acknowledge that the parameter has been stored.

The hexadecimal values representing the amplifier setting can be entered on a log for comparison purposes.

Example:

A810 No.: 5 EQUALIZATION: NAB		TAPE SPEED 15. ips		7.5. ips		REMARKS
		CH1	CH2	CH1	CH2	
REPRO	LEVEL	7E	7Ø	8Ø	7A	1) 6.3 kHz : - 1 dB
	TREBLE	A1 1)	9C	9F	9D	2) 125 Hz : + 1 dB
	BASS	85	77 2)	79	7D	
	EQUAL.	44	44	87	87	
RECORD	LEVEL	8E	8C	9Ø	7F	
	TREBLE	83	79	7A	7E	
	BASS	88	9Ø	8Ø	8B	
	EQUAL.	BA	BA	82	82	
SYNC	LEVEL	73	75	84	8A	
	TREBLE	AØ	98	9C	9F	
	BASS	6B	6A	59	61	
	EQUAL.	44	44	87	87	

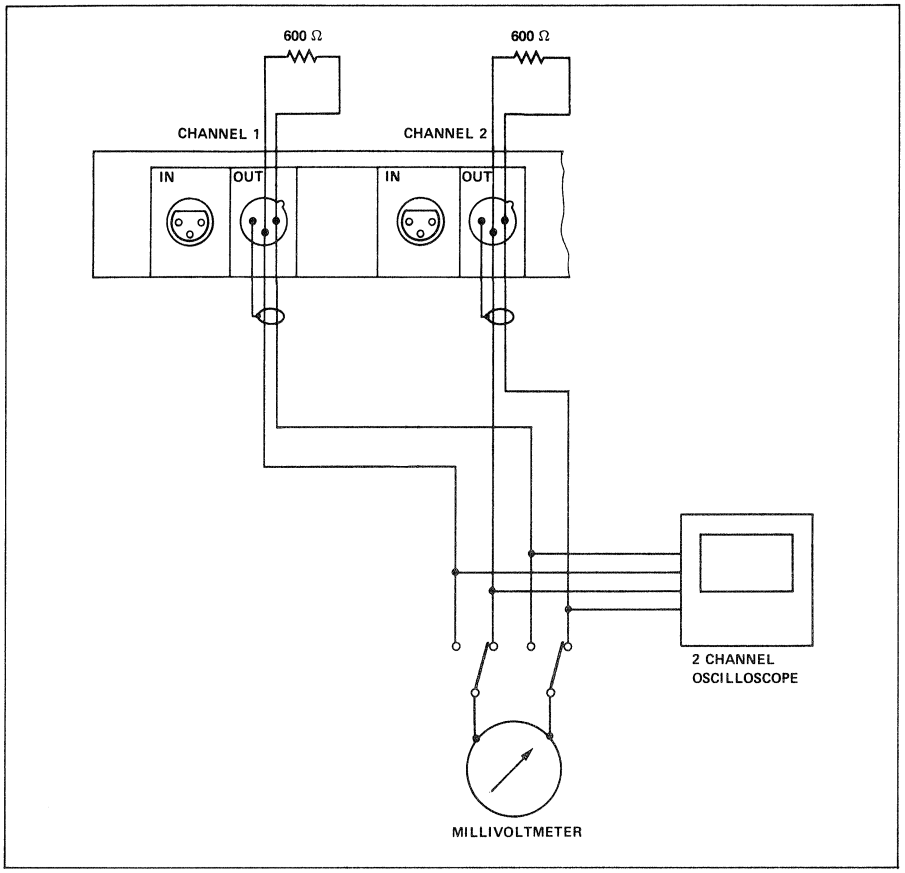
ERROR MESSAGE EE02 (LCD) or EEE02 (LED)

If the error message EE(E)02 appears during calibration, an error has probably occurred in the RAM or in its supply.

When the machine is switched off and on the next time, the parameters stored in PROM are automatically read.
"Degraded operation" is possible (refer to Section 2.7).
The recorder should be checked out by the nearest service agency as soon as possible.

4.2.2 Reproduce adjustments

4.2.2.1 Preparatory steps



Connect AF millivoltmeter to line output channel 1. Load the line outputs for all measurements with 600 Ω (or 200 Ω, resp.).
Switch recorder on.
Select high tape speed.
Press SAFE and REP buttons of channels 1 and 2. Release all UNCAL buttons (calibrated level).
Mount calibration tape of the corresponding equalization and speed, and spool forward to the "REFERENCE LEVEL" section.

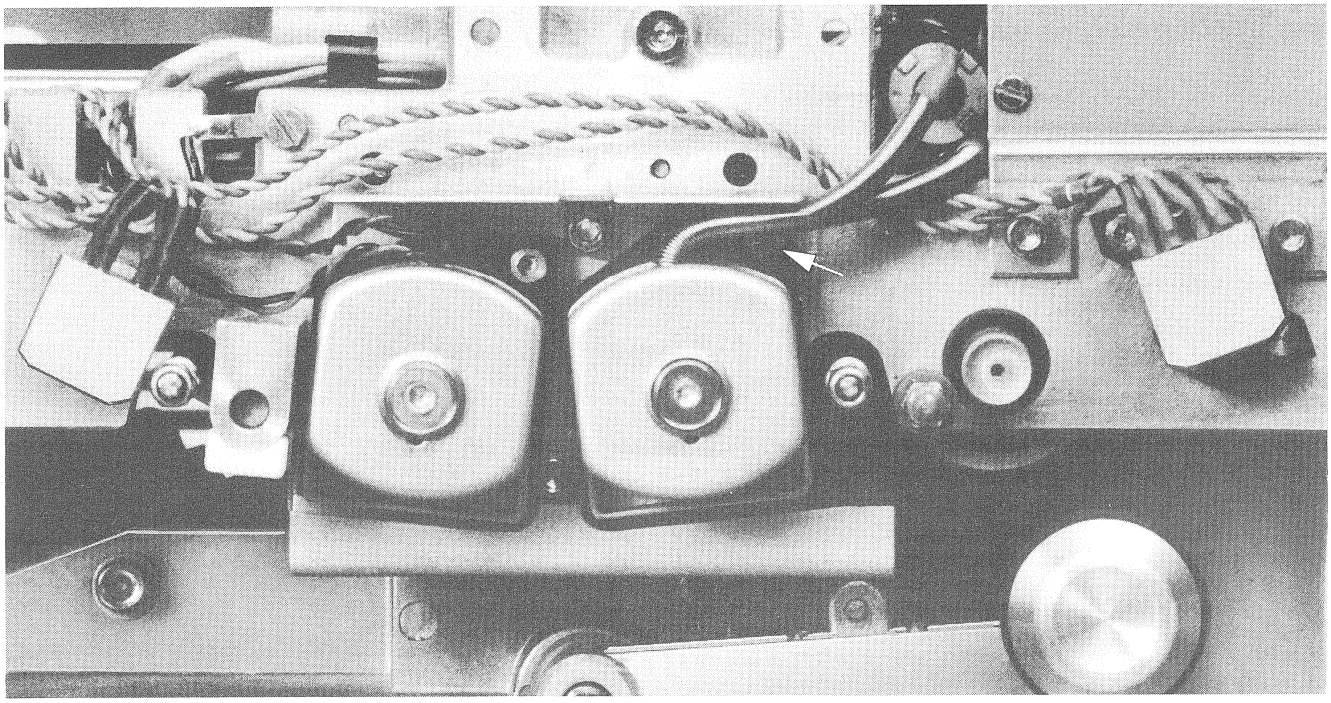
4.2.2.2 Reproduce level adjustment

Press CH 1 and LEVEL REPRO on the input keyboard.
Start recorder in play mode.
Read out reproduce level and adjust it to the desired line level by pressing the UP or DOWN key.
Press STORE.

On stereo recorders, connect the millivoltmeter to line ouput channel 2. Press CH2 and LEVEL REPRO. Adjust to the desired line level by pressing UP or DOWN.
Press STORE.

4.2.2.3 Azimuth alignment of the reproduce head

Spool calibration tape forward to the "AZIMUTH ALIGNMENT" section. The level of this section is approx. 10 dB below that of the reference level section.
Connect millivoltmeter to line output channel 1.
Start recorder in play mode.



The coarse adjustment is made during the reproduction of the reference frequency. The fine adjustment is made during the reproduction with 10 kHz (8 or 16 kHz).
The alignment of the reproduce head is varied with the azimuth adjustment screw until the maximum output voltage and simultaneously the lowest level fluctuations are attained.

Stereo recorders are subsequently adjusted for minimum phase difference of the output signal, between channel 1 and 2 with the aid of an oscilloscope and by further correction with the azimuth adjustment screw of the reproduce head.

Important:
Always adjust to maximum level first and then to minimum phase difference!

Checking the level:
Rewind calibration tape to "REFERENCE LEVEL" section and start recorder in play mode. Check level of channels 1 and 2 and correct if necessary:
- CH1 (CH2), LEVEL REPRO
- UP or DOWN
- STORE.

4.2.2.4 Frequency response adjustment

Spool calibration tape forward to "TREBLE FREQUENCY RESPONSE" test section (16 kHz for 30 ips, 14 kHz for 15 ips, 12.5 kHz for 7.5 ips). The level of this section is approx. 20 dB (CCIR) below that of the reference level section. Connect millivoltmeter to line ouput channel 1.

Press CH1 and TREBLE REPRO on input keyboard.
Start recorder in play mode.
Adjust to optimum frequency response with UP or DOWN.
Press STORE.

On stereo recorders, connect the millivoltmeter to line output channel 2. Press CH2 and TREBLE REPRO. Adjust to optimum frequency response with UP or DOWN.
Press STORE.

Rewind calibration tape to "FREQUENCY RESPONSE 63 Hz" test section. The level of this section is approx. 20 dB lower than that of the reference level section.
Connect millivoltmeter to line output channel 1.

Press CH1 and BASS REPRO on input keyboard.
Start recorder in play mode.
Adjust for optimum frequency response with UP or DOWN.
Press STORE.

On stereo recorders connect millivoltmeter to line output channel 2. Press CH2 and BASS REPRO. Adjust for optimum frequency response with UP or DOWN.
Press STORE.

Note:
Strong fringing effects can occur at low frequencies if mono calibration tapes are used for the reproduce adjustment of stereo recorders. To ensure that a linear reproduce frequency response is attained, the reproduce adjustment of the bass frequencies must either be repeated with the record adjustment or if no record adjustments are planned, a calibration tape with correct track separation should be used!

The reproduce frequency response can be adjusted for special situations by slightly varying the time constant of the reproduce equalization.
This is accomplished as follows:

- Set program switch 7 off: JS7 = 0.
- Press CH1 (CH2).
- Hold down TRANS <REDUCED> continuously.
- Press TREBLE REPRO and release both keys. TREBLE REPRO status indicator lamp flashes.
- The time constant can be increased by pressing UP, i.e. the transition frequency is shifted toward the lower frequencies.
- The time constant can be decreased by pressing DOWN, i.e. the transition frequency is shifted toward the higher frequencies.
- Press STORE.

THEORETICAL EQUALIZATION ADJUSTMENTS

TIME CONSTANT (µS)	TRANSITION FREQ. ±3 dB (kHz)	REPRODUCE HEX. VALUE
120	1.326	E5
90	1.768	A3
70	2.273	87
50	3.150	61
35	4.547	44
17.5	9.094	26

4.2.2.5 Adjustments for other tape speeds

The instructions in 4.2.2.2 through 4.2.2.4 are basically applicable for adjusting the other tape speeds (SLOW):

- Select slower tape speed
- Changeover equalization and tape type, if necessary
- Mount corresponding calibration tape.

Exceptions:

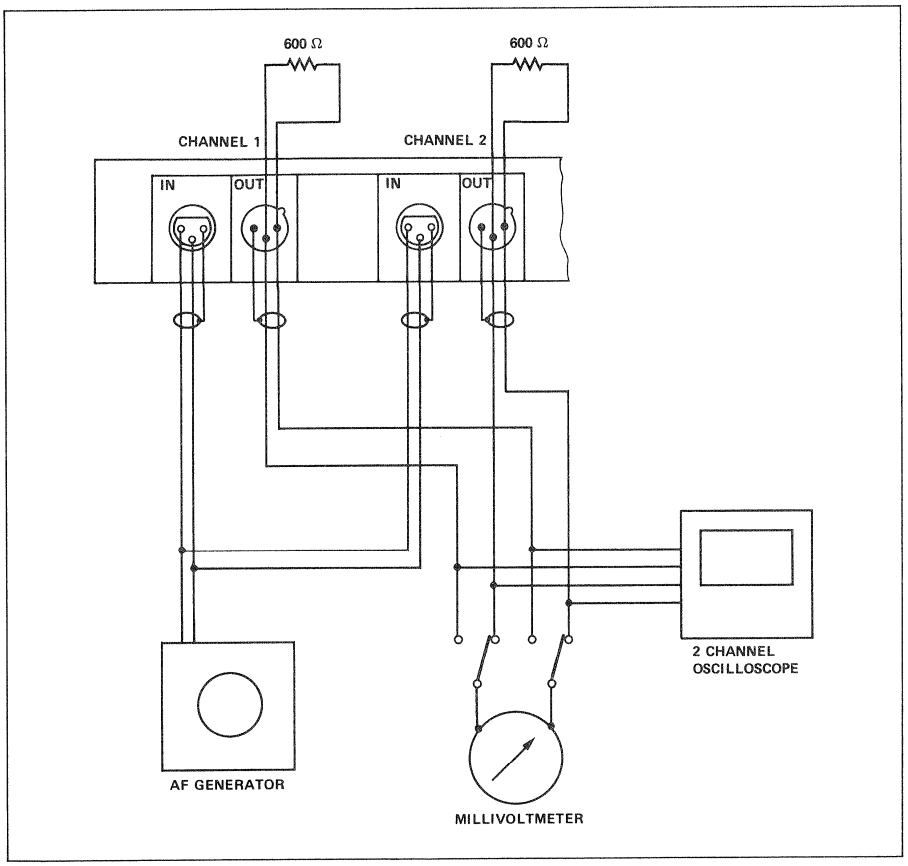
The reproduce frequency response is calibrated with different frequencies, depending on the tape speed:

ips	ADJUSTMENT FOR TREBLE REPRO kHz	ADJUSTMENT FOR BASS REPRO Hz
3.75	8	63
7.5	12.5	63
15	14	63
30	16	63

4.2.3 Record Adjustments

4.2.3.1 Preparatory steps

Mount new (or practically new) unrecorded tape.



Connect AF generator with 1 kHz and line level to line input channel 1 (channels 1 + 2 on stereo models) and connect millivoltmeter to line output channel 1. A reference frequency of 700 Hz can be applied when aligning to NAB standards.
Switch recorder on and press READY and REP buttons of channels 1 and 2. Release all UNCAL buttons (calibrated line level). Select tape speed 7.5 ips or preferred studio speed.

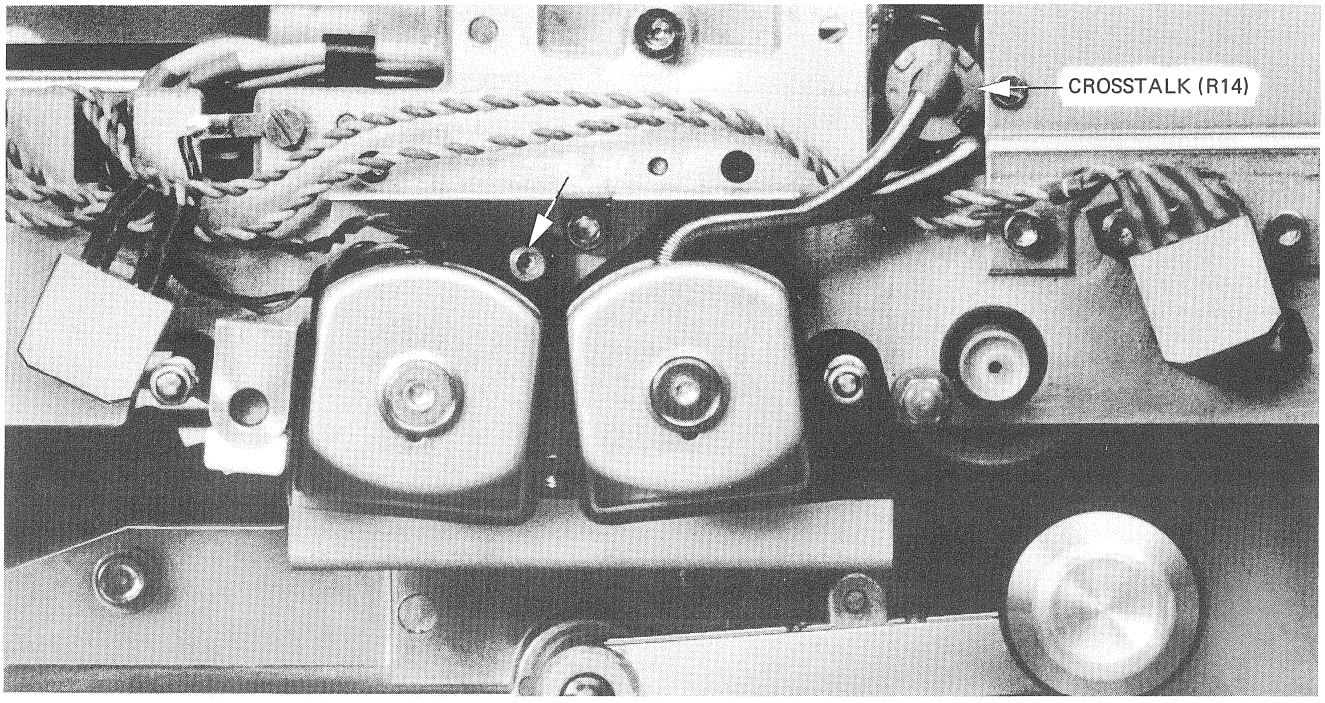
4.2.3.2 Record level preadjustment

Press CH1 and LEVEL RECORD on input keyboard.
Recall output level and press UP or DOWN key for adjusting to line level.
Press STORE.

On stereo recorders connect millivoltmeter to line ouput channel 2. Press CH2 and LEVEL RECORD keys. Adjust output to line level by pressing UP or DOWN.
Press STORE.

4.2.3.3 Aligning the azimuth of the record head

Set AF generator to 10 kHz and decrease level by 20 dB.
Connect millivoltmeter to line output channel 1.
Start machine in record mode.

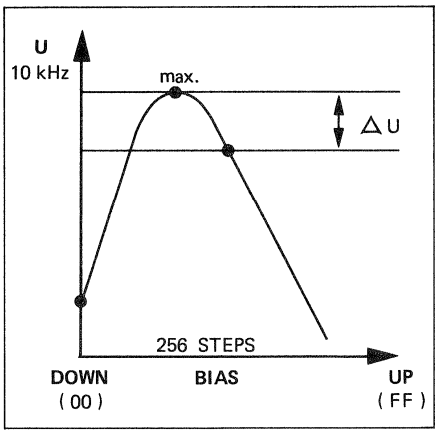


Correct the azimuth of the record head by turning the azimuth alignment screw until the highest ouput voltage and simultaneously the lowest level fluctuations are attained.

If significant correction of the azimuth alignment was necessary, repeat the record level preadjustment (Section 4.2.3.2)!

4.2.3.4 Bias adjustment

Set AF generator to 10 kHz and the level 20 dB below line level.
Connect millivoltmeter to line output channel 1.
Press CH1 and BIAS on input keyboard.
Start machine in record mode.
Continue to press DOWN key until the MIN lamp flashes.
Search the maximum output voltage with UP and write down this value.
Continue with UP until the value ΔU (dB) specified in the BIAS table is reached. This value depends on the tape formulation and the tape speed!



Refer to BIAS table at the end of this Section!
Press STORE.

On stereo recorders connect the millivoltmeter to line output channel 2. Press CH2 and BIAS. Adjust bias in the same way as described for channel 1.
Press STORE.

4.2.3.5 Azimuth alignment STEREO

Stereo recorders are adjusted for minimum phase difference of the output signals on channels 1 and 2 by carefully turning the azimuth alignment screw of the record head.

4.2.3.6 Record level adjustment

Set AF generator to 1 kHz (700 Hz) and operating level.
Connect millivoltmeter to line output channel 1.
Press CH1 and LEVEL RECORED on input keyboard.
Start machine in record mode.
Adjust to line level by pressing UP or DOWN.
Press STORE.

On stereo recorders connect the millivoltmeter to line output channel 2. Press CH2 and LEVEL RECORD. Adjust output level to line level with UP or DOWN.
Press STORE.

4.2.3.7 Frequency response adjustment

Set AF generator to line level -20 dB.
Connect millivoltmeter to line output channel 1.
Press CH1 and TREBLE RECORD on input keyboard.
Start machine in record mode.
Adjust to optimum frequency response (upward of 1 kHz) by pressing UP or DOWN.

Press BASS REPRO key and adjust to optimum frequency response (up to 1 kHz) by pressing UP or DOWN.
Press STORE.

Stereo recorders:
Connect millivoltmeter to line output channel 2.
Press CH2 and TREBLE RECORD on input keyboard.
Start machine in record mode.
Adjust to optimum frequency response (upward of 1 kHz) by pressing UP or DOWN.
Press STORE.
Press BASS REPRO key and adjust to optimum frequency response (up to 1 kHz) by pressing UP or DOWN.
Press STORE.

In special situations it is possible to correct the over-all frequency response by slightly shifting the time constant of the record equalization.
This is accomplished as follows:
- Set code switch 7 to off position: JS7 = 0.
- Press CH1 (CH2).
- Hold down TRANS <REDUCED>.
- Press TREBLE RECORD and release both keys. The TREBLE RECORD lamp flashes.
- The time constant can be decreased by pressing UP, i.e. the transition frequency is shifted toward the higher frequencies.
- The time constant can be increased by pressing DOWN, i.e. the transition frequency is shifted toward the lower frequencies.
- Press STORE.

THEORETICAL EQUALIZATION ADJUSTMENTS		
TIME CONSTANT (µS)	TRANSITION FREQ. ±3 dB (kHz)	RECORD HEX. VALUE
120	1.326	0E
90	1.768	4C
70	2.273	75
50	3.150	82
35	4.547	BA
17.5	9.094	DE

4.2.3.8 Cross talk adjustment (2-channel and stereo models only)

Connect AF generator (line level, 1 kHz) to line input channel 1 and connect millivoltmeter to line output channel 2. Switch both channels to READY and start machine in record mode.
Adjust to minimum cross talk with the aid of the CROSS TALK potentiometer (preamplifier on the headblock, R14, illustrated in Section 4.2.3.3).
Repeat the same measurement with interchanged channels. If pronounced differences occur, an optimum value has to be found for both channels.

4.2.4 Sync adjustments

Because sync reproduction is not supported for 3.75 ips, all parameters should be left at 00 for this speed.

4.2.4.1 Preparatory steps

Switch recorder off and wait 5 seconds.
Set jumper on REPRODUCE AMPLIFIER to NARROW (or to WIDE if wider frequency response is desired). Also refer to 4.2.9.4.

Connect millivoltmeter to line output channel 1.
Switch recorder on.
Select tape speed, tape type, and equalization.
Press SAFE and SYNC buttons of channels 1 and 2.
Release all UNCAL buttons (calibrated level).
Mount calibration tape of the corresponding speed and spool forward to the "REFERENCE LEVEL" section.

4.2.4.2 Sync reproduce level adjustment

Press CH1 and LEVEL REPRO on the input keyboard.
Start recorder in play mode.
Read out sync reproduce level and adjust it to the desired line level by pressing the UP or DOWN key.
Press STORE.

On stereo recorders, connect the millivoltmeter to line output channel 2.
Press CH2 and LEVEL REPRO. Adjust to the desired line level by pressing the UP or DOWN key.
Press STORE.

4.2.4.3 Frequency response adjustment

Spool calibration tape forward to the "FREQUENCY RESPONSE" section. The level of this section is approx. 10 dB below that of the reference level section.
Connect millivoltmeter to channel 1.

Press CH1 and TREBLE REPRO on input keyboard.
Start recorder in play mode.

TAPE SPEED ips	TREBLE FREQ. RESP. (TREBLE SYNC)
7.5	8 kHz
15	12.5 kHz
30	12.5 kHz

Adjust for optimum frequency response by pressing UP or DOWN.
Press STORE.

On stereo recorders, connect millivoltmeter to line output channel 2. Press CH2 and TREBLE REPRO. Adjust to optimum frequency response by pressing UP or DOWN.
Press STORE.

Rewind calibration tape to test section "FREQUENCY RESPONSE 63 Hz". The level of this section is approx. 10 dB below that of the reference level section.
Connect millivoltmeter to line output channel 1.

Press CH1 and BASS REPRO on input keyboard.
Start recorder in play mode.
Adjust to optimum frequency response by pressing UP or DOWN.
Press STORE.

On stereo recorders connect the millivoltmeter to line output channel 2. Press CH2 and BASS REPRO. Adjust to optimum frequency response by pressing UP or DOWN.
Press STORE.

Note:
Strong fringing effects can occur at low frequencies if mono calibration tapes are used for the sync reproduce adjustments of stereo recorders.
To ensure that a linear sync reproduce frequency response is attained, a calibration tape with correct track separation should be used!

The sync reproduce frequency response can be adjusted for special situations by slightly varying the time constant of the sync reproduce equalization.
This is accomplished as follows:
- Set program switch 7 off: JS7 = 0.
- Press CH1 (CH2).
- Hold down TRANS <REDUCED> continuously.
- Press TREBLE REPRO and release both keys. TREBLE REPRO status indicator lamp flashes.
- The time constant can be increased by pressing UP, i.e. the transition frequency is shifted toward the lower frequencies.
- The time constant can be decreased by pressing DOWN, i.e. the transition frequency is shifted toward the higher frequencies.
- Press STORE.

THEORETICAL EQUALIZATION ADJUSTMENTS		
TIME CONSTANT (µS)	TRANSITION FREQ. ±3 dB (kHz)	SYNC REPRO HEX. VALUE
120	1.326	E5
90	1.768	A3
70	2.273	87
50	3.150	61
35	4.547	44
17.5	9.094	26

4.2.4.4 Adjustments for the other tape speeds

The instructions in 4.2.4.2 through 4.2.4.3 are basically applicable for adjusting the other tape speeds (SLOW):
- Select corresponding tape speed
- Changeover equalization and tape type, if necessary
- Mount corresponding calibration tape.

4.2.5 Time code reproduction

Basically no electrical alignments are necessary for time code reproduction.

The alignments are limited to the mechanical adjustment of the left-hand and right-hand code heads. These are only necessary if the code heads have been replaced. The TC head alignment gauge kit (part No. 10.010.001.28) should be available. Accurate alignment of the heads is absolutely essential because of the narrow width of the code track (0.38 mm).

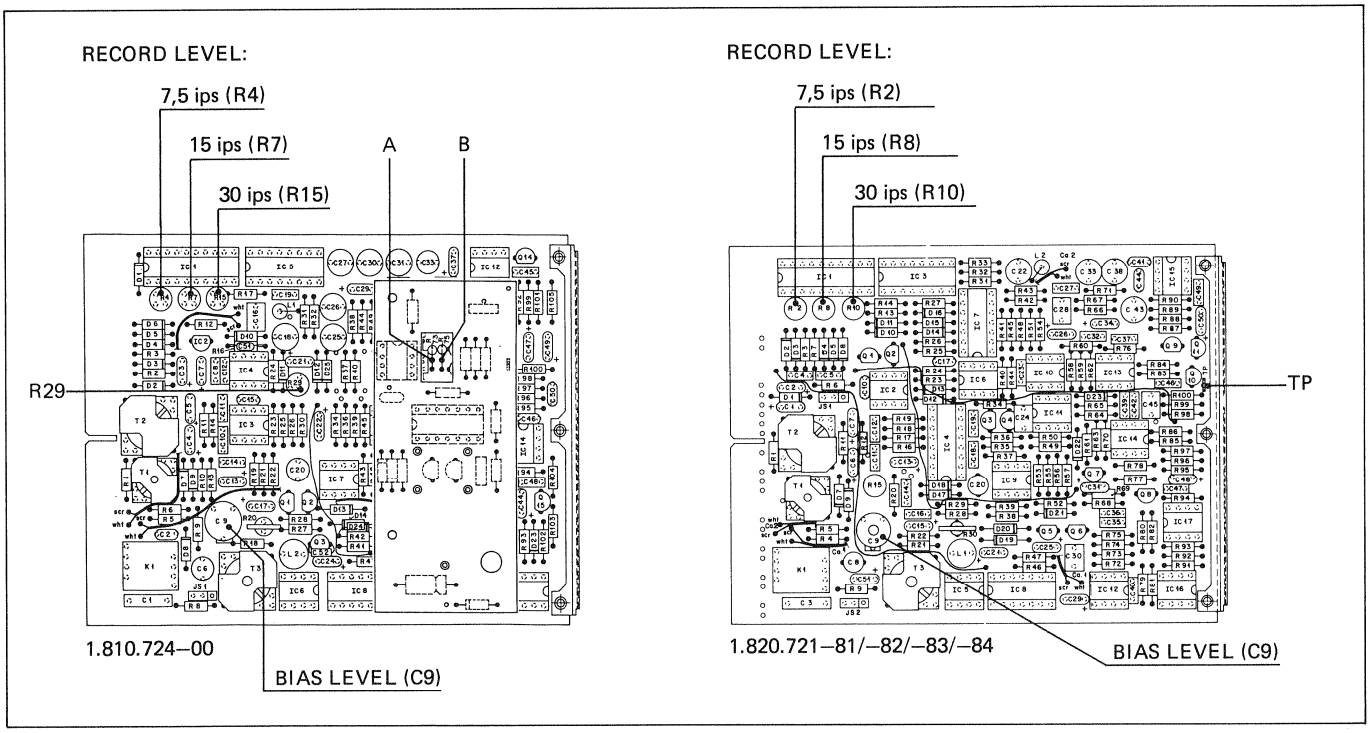
4.2.5.1 Preparatory steps

Check soundheads for contamination and clean them, if necessary. With the aid of a reference tape (in preparation) the height of the head can be adjusted in such a way that the maximum reproduce level is attained.
For this purpose it is necessary to mount the CODE READ/WRITE amplifier on an extender board (part No. 1.820.799.00).

CAUTION
Switch recorder off and wait at least 5 seconds before unplugging or inserting any printed circuit boards!

Time code reproduction in spooling mode is not feasible as long as the CODE READ/WRITE UNIT is mounted on the extender board!

The reproduce signal is measured before the limiter on the test point (B for PCB 1.820.721-00 and 1.810.724-00, or TP for PCB 1.820-721.81/82/83/84), preferably with an oscilloscope; the ground lead of the oscilloscope probe is to be connected to terminal 21 of the extender board.



Mount time code reference tape, recording inhibited (SAFE).
Start recorder in play mode.

4.2.5.2 Checking the height of the heads

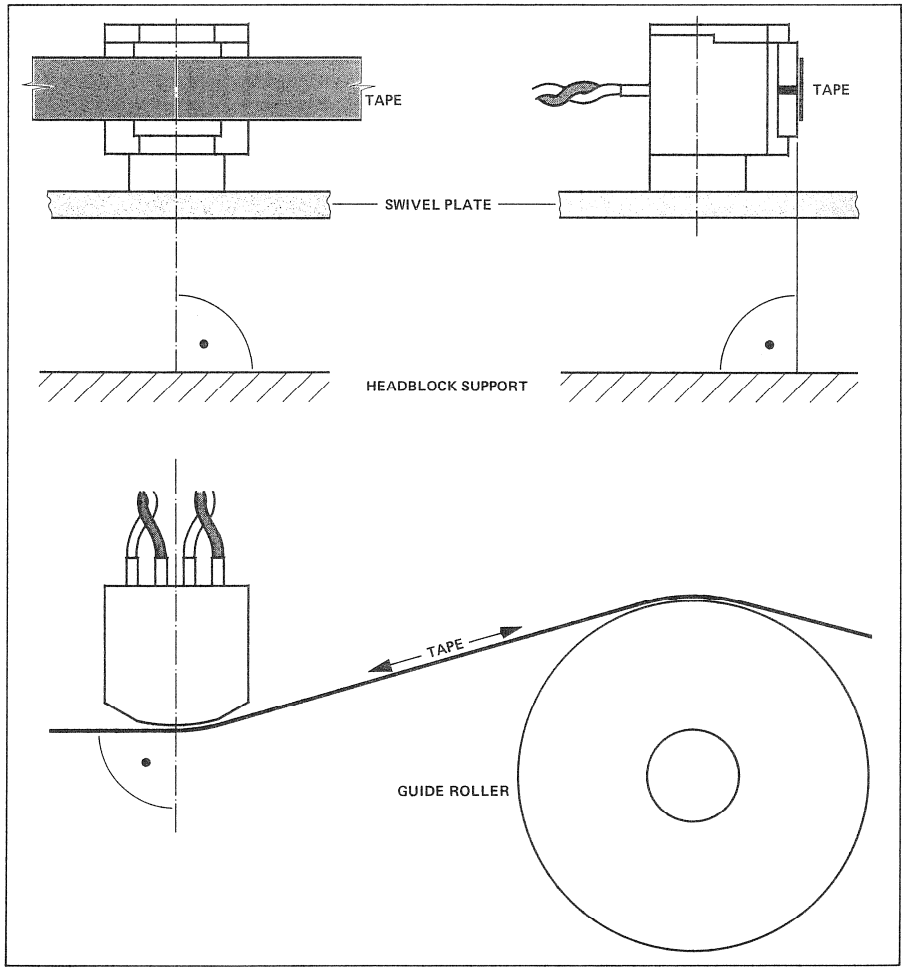
ONLY NECESSARY IF THE TIME CODE HEADS HAVE BEEN REPLACED!

First check the head height visually, then measure the voltage on test point B or TP.
On the left of the left-hand code head (audio erase head) alternately press with your finger slightly from the top and the bottom against the tape edge. The height is correct if the voltage decreases in both cases while the tape is being pressed.

Switch the recorder with TRANS <REDUCED> and < to the lowest tape speed and measure the voltage on test point B or TP. On the right of the right-hand code head (combination head) alternately press with your finger slightly from the top and the bottom against the tape edge. The height is correct if the voltage decreases in both cases while the tape is being pressed.
Should the measured voltage increase when the tape is pressed, it is necessary to correct the height of the head as follows:
at the left-hand code head with the aid of shims (0.1 mm, part No. 1.062.210.08),
at the right-hand code head by shifting the swivel plate.

4.2.5.3 Tape guidance

The right-hand time code head (combination head) must be positioned perpendicularly to the tape path. Lateral tilt or forward/backward inclination detected after the height alignment must be corrected by adjusting the swivel plate.
TC head alignment gauge kit, Part No. 10.010.001.28.
Recheck the height adjustment, if necessary!



4.2.6 Time code recording

4.2.6.1 Preparatory steps

The record alignments can be made either with a time code signal or a square-wave signal. The square-wave signal offers the advantage that the image on the oscilloscope is stationary. However, it also means that the CODE DELAY UNIT must be removed and the jumper JS2 on the CODE READ/WRITE UNIT be changed to the "BYPASS" position.
Mount CODE READ/WRITE PCB on the extender board.

CAUTION
Switch recorder off and wait at least 5 seconds before unplugging or inserting any printed circuit boards! Time code reproduction in spooling mode is not feasible as long as the CODE READ/WRITE UNIT is mounted on the extender board!

Adjusting the input sensitivity
(only possible for 1.820.721.81/82/83/84)

Switch recorder on.
Set trigger level for time code line input:
- Connect square-wave generator (frequency 1 kHz) or time code generator to the time code line input. The output voltage of the generator should be the lowest voltage at which the line input and the code level pilot lamp should respond. (Factory setting: 0.5 Vpp, minimum input voltage approx. 150 mVpp).
- Turn trimmer potentiometer R15 on the CODE READ/WRITE UNIT clockwise until the CODE LEVEL lamp just turns on.

Setting the reference for the limiter
(only possible for 1.810.724)

Switch recorder to STOP.
With a digital voltmeter adjust for a voltage of -7.0 V (± 0.5 V) DC on test point TP A (R73 refer to drawing in 4.2.5.1) of the CODE READ/WRITE UNIT with the aid of potentiometer R29.

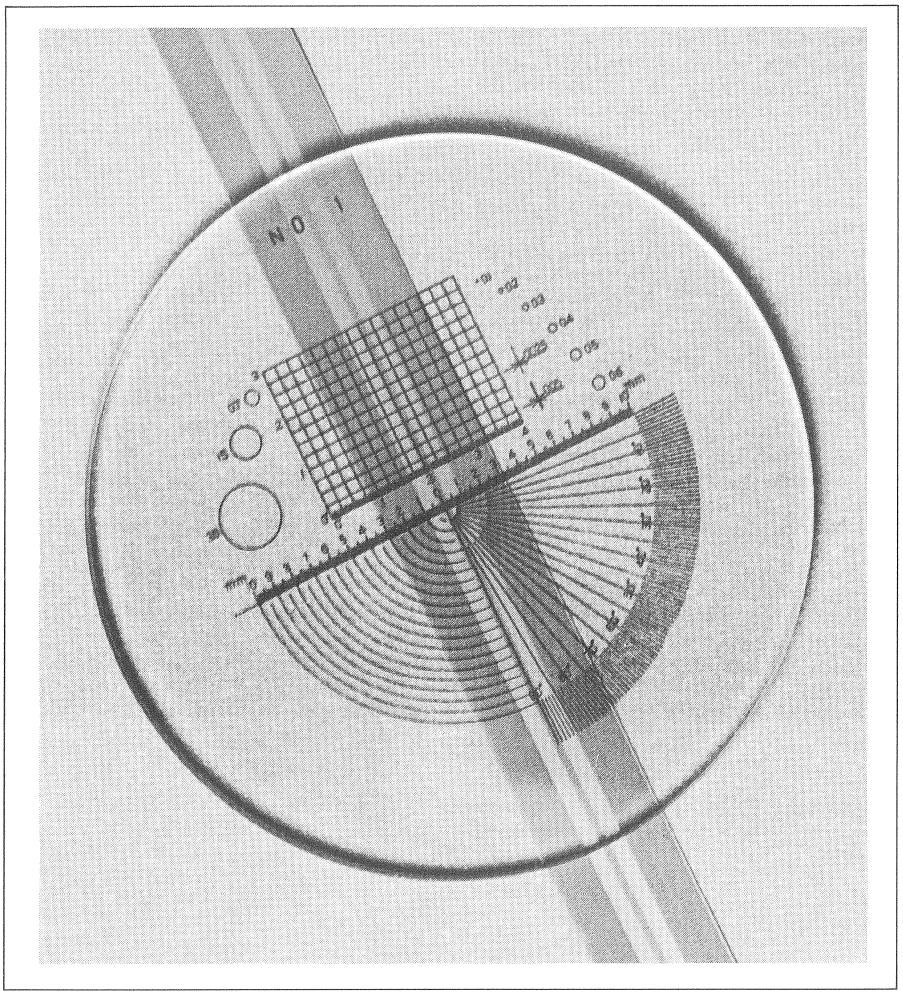
4.2.6.2 Adjusting the height of the right-hand code head (combination head)

- Mount practically new, unrecorded tape.
- Set bias trimmer C9 to its center position.
- Open record level trimmer clockwise by 1/3 of its travel (approx. 90°).

7.5 ips 19 cm/s	15 ips 38 cm/s	30 ips 76 cm/s	PCB
R4	R7	R15	1.820.721-00 1.810.724-00
R2	R8	R10	1.820.721-81 1.820.721-84

- Remove CODE DELAY UNIT, change jumper (JS1 for PCB 1.820.721-00 and 1.810.724-00, or JS2 for PCB 1.820-721-81/-82/-83/-84) on the CODE READ-/WRITE UNIT to the "BYPASS" position (if not already done)
- Select tape speed 15 ips.
- Connect square-wave generator 2 Vpp, 1 kHz, to all three line inputs and produce and recording of approximately 10 to 20 seconds duration.
- Spray iron oxide (MAGNETIC IRON OXIDE made by AEROSOLS INTERNATIONAL LTD., Part No. 10.555.001.00) onto a few centimeters of the recorded tape, coated side facing up.
- After the tape has dried measure the symmetry of the tracks with the aid of a measuring magnifier (Part No. 10.258.006.00). Correct the azimuth of the head if the deviation exceeds ±0.05 mm. Repeat recording and measurement until the specified symmetry is attained.

- To ensure the perpendicularity of the record head relative to the tape, the swivel plate may only be shifted symmetrically. Note the degree division of the hexagon-socket-screw key in the gauge set.
- The gauge 10.010.001.28 is absolutely essential for this alignment!



After the height alignment has been completed it is necessary to check the tape travel (4.2.5.3).

4.2.6.3 Preparatory steps

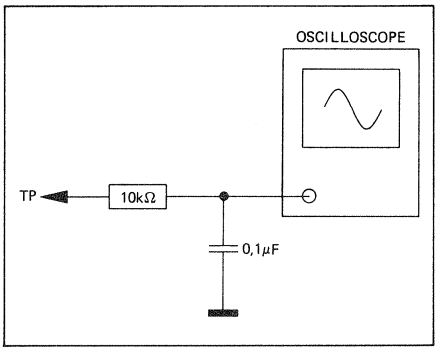
Press time code SAFE button (audio recording inhibited = SAFE).

Connect oscilloscope to test point B or TP. The ground lead of the oscilloscope probe is to be connected to terminal 21 of the extender board.
Mount time code reference tape (in preparation), wind forward to the 2nd part (time code, 729 nWb/m pp), switch recorder to PLAY, and measure the signal amplitude (peak-to-peak) with the oscilloscope on test point B or TP respectively.
Write down the measurement result.
(For standard values see below):

Standard value	PCB
700 mVpp	1.820.721-00
250 mVpp	1.810.724-00
180 - 300 mVpp	1.820.721-81/-84

If no time code reference tape is available, this measurement can be made by way of expedient by using a full-track audio calibration tape. Proceed as follows:

- Connect oscilloscope via an RC element to test point B or TP as illustrated in the diagram below.



- Play level tone 1 kHz, measure signal amplitude (peak-to-peak), write down measured value.
- Multiply measured value with factor
  k = 1.3 if test tape with a flux of 200 nWb/m is used,
  k = 0.81 if test tape with a flux of 320 nWb/m is used
  in order to obtain the time code reproduce level (peak-to-peak) for a tape flux of 729 nWb/m.
- Write down computed value.

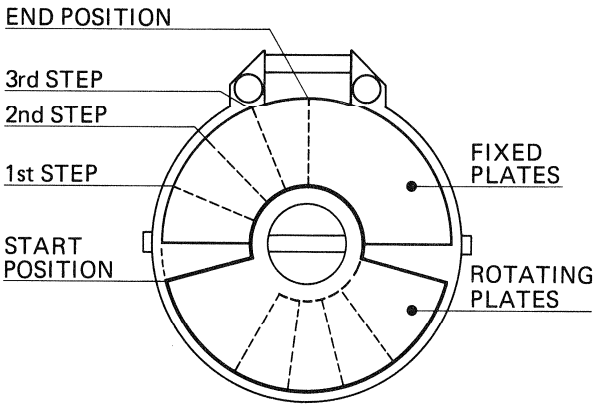
Mount practically new, unrecorded tape.
Press time code READY button.

4.2.6.4 Bias adjustment

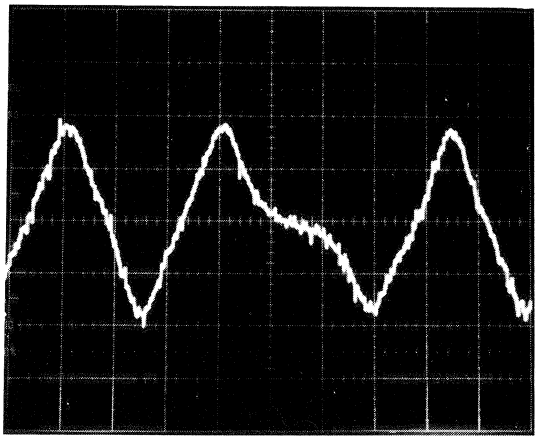
- Set bias trimmer C9 to minimum capacitance.
- Open the record trimmer clockwise by 1/3 of the travel (approximately 90°).

7.5 ips 19 cm/s	15 ips 38 cm/s	30 ips 76 cm/s	PCB
R4	R7	R15	1.820.721-00 1.810.724-00
R2	R8	R10	1.820.721-81 1.820.721-84

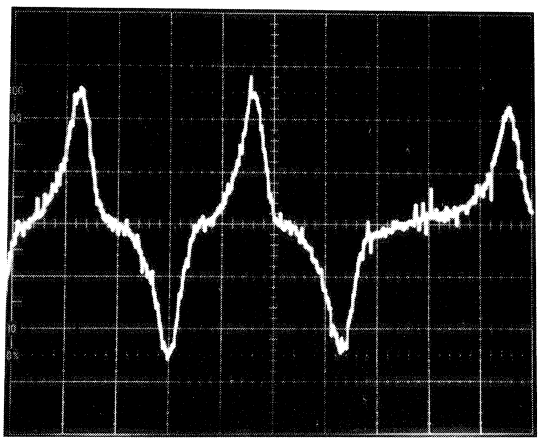
- Connect square-wave generator (frequency 1 kHz) or time code generator with approximately 2 Vpp to the time code line input; CODE DELAY UNIT removed. JS1 or JS2 on CODE READ/WRITE UNIT in "BYPASS" position.
- Start machine in record mode. During the recording gradually increase the capacitance of C9 in intervals of 10 seconds until the rotor is plunged in by approximately 90°. In this way a recording is produced with different bias values.



- Rewind to the beginning of the tape.
- Connect oscilloscope to test point B or TP, connect ground lead of the oscilloscope probe to terminal 21 of the extender board.
- Start recorder in PLAY mode.
- During the PLAY function check the position in which the greatest output amplitude is attained.
- Set C9 back to this position.
- Restart the recorder in PLAY mode, vary the setting of C9 in small steps near the previously found position.
- Determine the optimum setting of C9 i.e. the maximum amplitude and steepest signal edges by repeated experiments.



BAD



EXCELLENT

VERTICAL DEFLECTION : 0,2V/DIV.
TIME BASE : 0,2ms/DIV.

4.2.6.5 Record level adjustment

The record level is adjusted with the trimmer potentiometer for the corresponding speed in such a way that the reproduce level measured and noted in 4.2.6.3 is available on test point B and TP respectively.

7.5 ips 19 cm/s	15 ips 38 cm/s	30 ips 76 cm/s	PCB
R4	R7	R15	1.820.721-00 1.810.724-00
R2	R8	R10	1.820.721-81 1.820.721-84

PROCEDURE (for each tape speed):

- Mount new or practically new, unrecorded tape.
- Connect oscilloscope to test point B or TP respectively (ground to terminal 21 of the extender board).
- Start machine in RECORD mode, record during 20 seconds a square-wave signal with approx. 2 Vpp, 1 kHz (CODE DELAY UNIT removed, JS2 {JS1 for PCB 1.820.721-00 and 1.810.724-00} on the CODE READ/WRITE UNIT in "BYPASS" position, or record time code.
- Rewind to the start of the recording, start recorder in PLAY mode. The voltage on test point B and TP respectively should be the same as the value determined in 4.2.6.3.
- If this value is not attained, slightly vary the potentiometer setting of the corresponding speed.
- Repeat the foregoing procedure several times until this value is attained.

4.2.6.6 Checking the head gap position, reproduce

- Reinstall the CODE DELAY UNIT. Set jumper JS1 or JS2 respectively of the CODE READ/WRITE UNIT to the "NORMAL" position.
- Set DIL switch 0 (below operator panel) to the "NO OFFSET" position.
- Set DIL switches 1 and 2 (below operator panel) in accordance with the desired time code standard.
- Connect time code line output and line output of one of the two audio channels to the MASTER input or SLAVE input respectively of a synchronizer STUDER TLS4000 (or a time code reader with offset indication possibility).
- Mount time code reference tape (in preparation), spool to the first section (full-track time code), and start recorder in PLAY mode, speed 15 ips.
- Measure the offset between the audio channel and the time code channel.
- The offset should not exceed 2 ms (for 30 ips), 4 ms (for 15 ips) or 8 ms (for 7.5 ips). Should these values be exceeded, the offset can be reduced by turning the left-hand combination head.
- After this adjustment it is necessary to check the erase attenuation of the audio channels! A compromise may possibly have to be made between maximum erase attenuation and minimum time code offset.

If no equipment is available for measuring the offset, it may be assumed that the offset is smaller than 2 ms (for 30 ips), 4 ms (for 15 ips), or 8 ms (for 7.5 ips) if the erase attenuation is adequate and the record and the reproduce head gaps are adjusted correctly.

4.2.6.7 Checking the head gap position, via tape

- Connect time code generator in parallel to an audio channel and to the time code channel. Make a recording of about one minute duration.
- Rewind to the beginning of the recording and measure the offset between the audio channel and the time code channel with the same device as described in 4.2.6.6.
- The offset should not exceed 2 ms (30 ips), 4 ms (15 ips), or 8 ms (7.5 ips). If these values are exceeded, the offset can be reduced by turning the right-hand combination head.

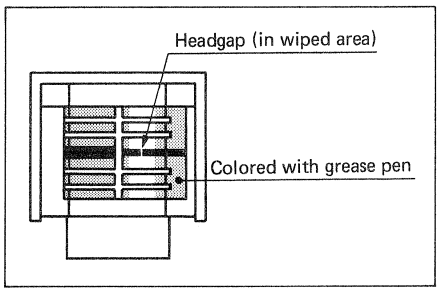
IMPORTANT:
After a correction of the right-hand combination head (time code record head) it is necessary to make a new recording for checking the head gap position!
The tape must touch the head face approximately symmetrically, it should not be drawn across one of the edges!

4.2.6.8 Checking the time code reproduction in spooling mode

- Install CODE DELAY UNIT, set jumper JS1 or JS2 respectively to the "NORMAL" position. Set jumpers JS1 or JS2 to the "BYPASS" position if no code delay unit exists.
- Install CODE READ/WRITE UNIT without extender board.
- Connect time code generator to the TC line output.
- Select tape speed 7.5 ips
- Make a recording of about 10 minutes duration.
- Connect time code reader to TC line output
- Switch recorder to spooling. The recorded time code should be read correctly in both directions at maximum spooling speed!
- If the time code is not read correctly (too many drop-outs), the right-hand code head should be cleaned or possibly realigned. (The lifter may also have to be readjusted).

Cleaning the right-hand time code head:
- Remove the contamination in the grooves with the aid of a hard brush and clean the head with soundhead cleaner.

Checking the headface of the right-hand time code head
- Color the right-hand half of the right-hand time code head with a grease pen (Part No. 10.401.001.01).
- Move out the tape lifter by hand and press one of the spooling keys. Check the headface after approximately 1 to 2 minutes. The headgap should be in the wiped area.
  Should this not be the case, check the lifter alignment according to 3.3.3 or possibly shift the time code head sightly at the expense of the delay unit (offset measurement).



Important:
In spooling mode the CODE DELAY UNIT is automatically bypassed, i.e. the spooling offset is inherently greater than the specified value (max. 8 ms at 7.5 ips), regardless of whether the delay unit is installed or not!

4.2.7 External storage of the audio parameters

(only possible with serial remote control 1.810.751.00)

The content of the RAM can be copied for back-up purpose to an external medium, e.g. an audio tape. The data can also be recorded on an audio tape on the machine of wich the audio parameters are to be saved. A special command is available for comparing the data on tape with the RAM content in order to verify correct transmission.
In the following instructions we use the term SAVE for the process of copying the parameters from the RAM of the recorder to an external medium, the term VERIFY for the process of comparing the externally stored data with the content of the RAM in the recorder, and the term LOAD for the process of transferring the externally stored parameters into the RAM of the recorder.

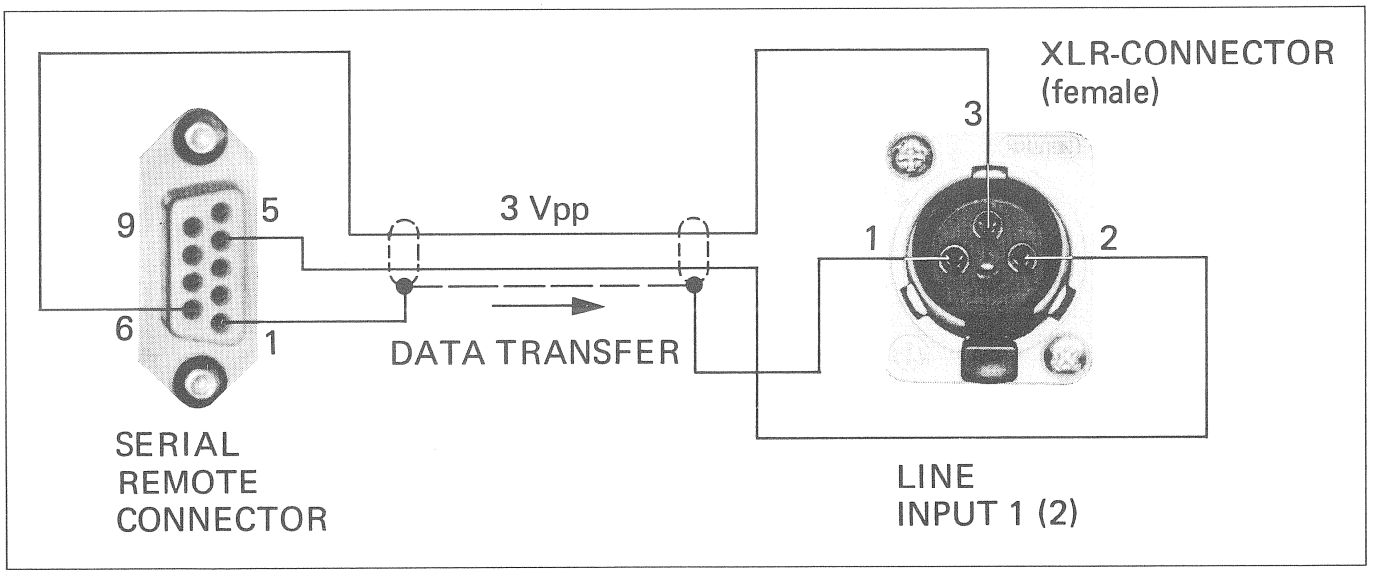
4.2.7.1 Principle of saving the audio parameters

When the recorder receives the "SAVE" command, the microprocessor serially transmits all stored audio parameters to connector pins 4 and 6 of the 9-pin remote control connector. These terminals are balanced and floating. The level is approx. 3 V pp. A parallel load resistor can be connected between terminals 4 and 6 (50 Ω correspond to approx. 2 V pp) in order to match the output level.

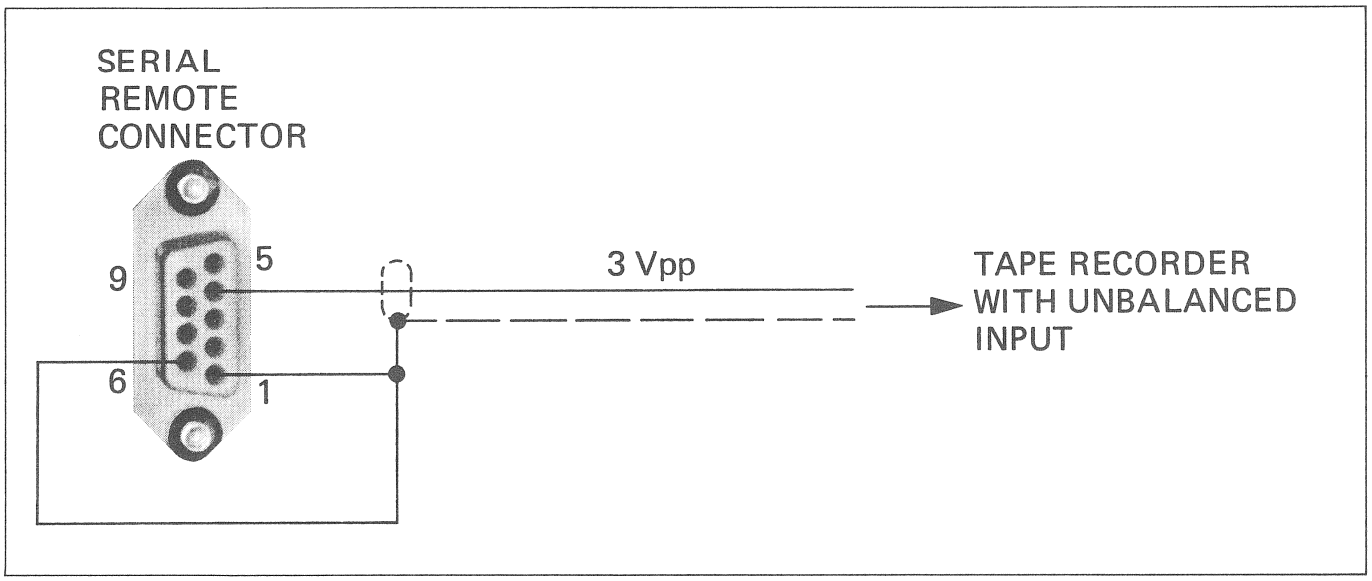
For safety reasons, three complete copies of the data are transmitted (one correct copy is sufficient for reading in the data). The complete task takes approximately 30 seconds. During the SAVE process the message CO CO (LCD) or COCOC (LED) appears on the tape timer display. The end of the task is indicated by the message CC CC (LCD) or CCCCC (LED) on the tape timer display.

The integrity of the audio parameters saved on tape can be checked with the "VERIFY" command. During verification the message dO dO (LCD) or dOdOd (LED) appears on the tape timer display. If the data have been transmitted correctly, the message dd dd (LCD) or ddddd (LED) is displayed; in case of an error the message EE 08 (LCD) or EEE08 (LED) appears.

4.2.7.2 Connecting the recorder to the remote control connector



Unbalanced connection:
Lines 1 and 6 of the 9-pin connector are to be interconnected.



4.2.7.3 Preparatory steps

SAVE & VERIFY

The address board 1.810.739 (accessible from the back of the recorder) is to be programmed as follows:

- DIL switches 1 through 7 in "OFF" position
- DIL switch 8 in "ON" position
- Press MPU reset (on MP UNIT PCB 1.810.752/1.820.780) or switch recorder OFF and ON again.
- Select desired tape speed.
- Mount tape of the corresponding length (minimum recording time 30 seconds).
- Release UNCAL buttons (calibrated line level).
- Press READY button of the desired recording channel; even if the audio parameters are saved on a second recorder, a tape must nevertheless be mounted on the recorder whose parameters are to be saved, but the SAFE buttons are to be pressed.
- Plug data transmission cable into the serial remote connector and an audio input.

Note: Do not short-circuit the input and output of the same recorder via the data transmission cable.

4.2.7.4 Saving the audio parameters

Start the second machine (if any) in record mode.
Then start the recorder whose parameters are to be saved also in record mode (always press REC first, followed by PLAY, otherwise the machine starts in VERIFY or READ mode!)

- Display shows CO CO (LCD) or COCOC (LED) during the save process.
- After the data have been recorded (3 identical copies) the message CC CC (LCD) or CCCCC (LED) appears on the display.

If the message EE 07 (LCD) or EEE07 (LED) appears during the save process, an internal error has occurred in the data transmission, possibly because of a transient power failure. The save process has to be repeated.

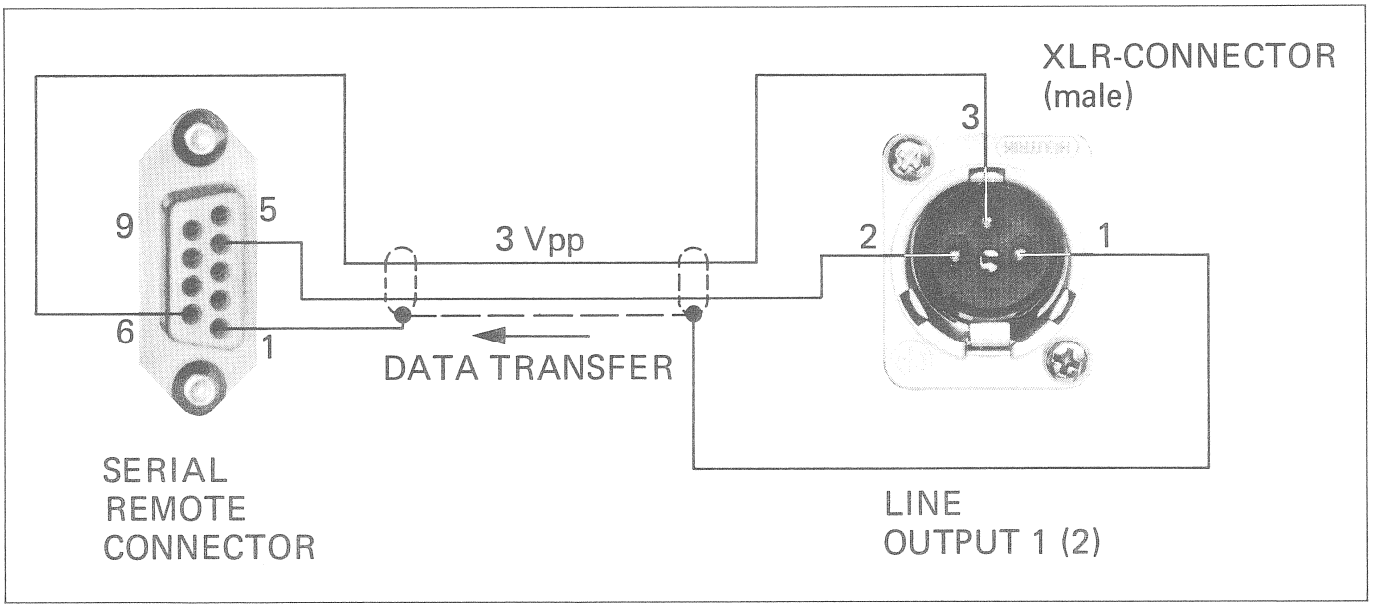
4.2.7.5 Verification

The audio parameters saved on tape can be checked without influencing the RAM data:

- Switch settings on address board 1.810.739 as described in 4.2.7.3.
- Plug data transmission cable into the serial remote control connector and the LINE OUTPUT socket.

Note: If the other XLR connector of the data transmission cable is still in the LINE INPUT socket, it must first be unplugged.

Rewind tape with the saved audio parameters to the beginning.



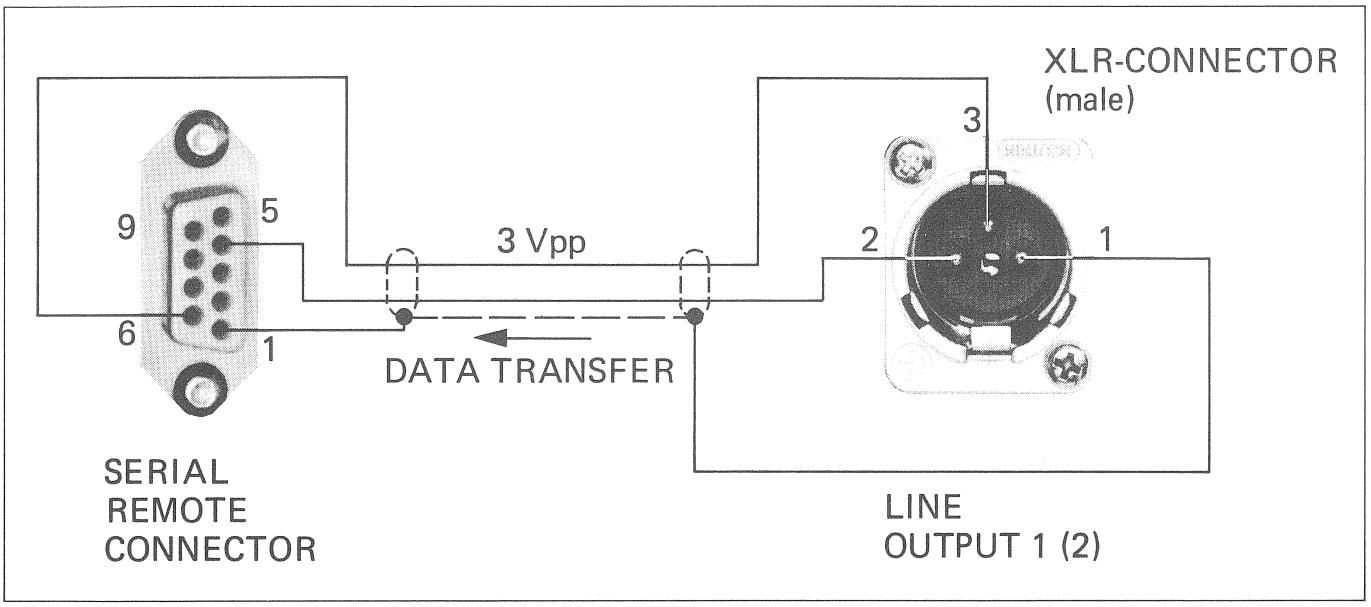
- Press PLAY key and also start the second recorder (if any) in PLAY mode.
- The display indicated d0 d0 (LCD) or d0d0d (LED) during the verification process.

If EE(E)08 appears, the stored data are corrupted. Check the second and possibly the third copy.

Reasons for incorrect data recording or reproduction:
- Wiring error with hum injection;
- Strong wow and flutter;
- Missing treble reproduction (treble control closed);
- Error in software 13/83 with LED display;
- Tape with data belonging to another machine has been mounted.

4.2.8 Reading in the audio parameters through the serial remote interface

4.2.8.1 Connecting the recorder to the remote control connector



4.2.8.2 Preparatory steps

The address board 1.810.739 (accessible on the rear of the recorder) is to be programmed as follows:

- DIL switches 1 through 6 in "ON" position
- DIL switch 7 in "OFF" position
- DIL switch 8 in "ON" position

- Press MPU reset (on MP-UNIT PCB 1.810.752/1.820.780).
- Select tape speed.

Mount tape with the saved audio parameters (even if a second recorder is used, a tape must be mounted on the recorder that is reading the data so that the PLAY function can be enabled).

Caution

It is also possible to record data with SAVE & LOAD by starting the machine in record mode. However, the data stored in RAM can be destroyed if the recorder is unintentionally started in play mode rather than record mode and if the microprocessor by coincidence detects a valid label.

4.2.8.3 Loading the audio parameters

- Plug data transmission cable into the serial remote connector and into the LINE INPUT socket.

Caution: The other XLR connector must not be plugged into the LINE INPUT!

- Press PLAY key and start the second machine (if any) in PLAY mode.
- The display indicates bO bO (LCD) or bObOb (LED) during the loading of the audio parameters.
- When the data are loaded correctly into the RAM (without drop-out) the message bb bb (LCD) or bbbbb (LED) appears on the tape timer display.

If the microprocessor detects incorrect data, the message EE(E)06 is displayed, and the standard audio parameters held in the PROM are automatically transferred into RAM. In this case it is necessary to repeat the loading process.

- Restore the DIL switches on the address board 1.810.739 to their normal position, otherwise the next PLAY command will clear the memory (the recorder expects new audio parameters from tape).
- Press MPU reset on MP UNIT PCB 1.810.752/1.820.780 or switch the recorder OFF and ON again.

4.2.9 Programming the operating parameters

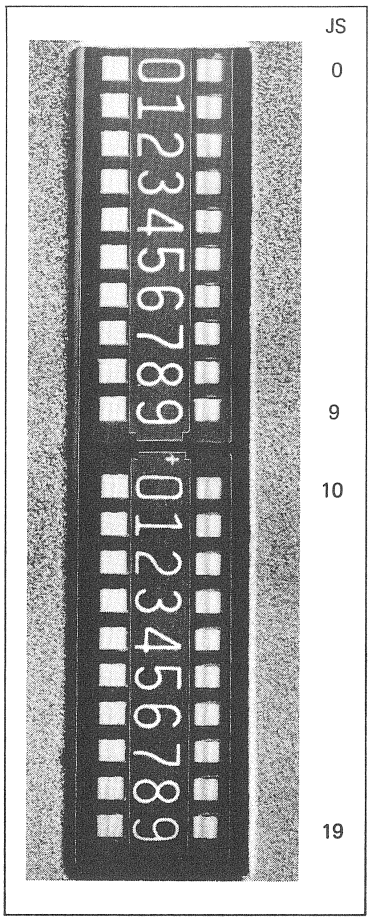
4.2.9.1 Code switches of the COMMAND UNIT

A microprocessor RESET must be initiated after the operating parameters have been changed with the code switches. Press RESET key of the MP UNIT or turn the power switch off and on again.

The 20 code switches JS 0 ... JS 19 are accessible on the rear of the COMMAND UNIT (lower front panel open).

JS 0 ... JS 2: Time code mode

MODE	FRAMES/s	JS 1	JS 2	JS 0
FILM STANDARD	24	0	0	
TV EURO STANDARD	25	0	1	
TV US STANDARD B/W	30	1	1	
TV US STANDARD COLOR	29.97	1	0	
Coincident audio/TC recording and reproduction		X	X	0
M15A-TC compatible recording and reproduction (1.2" (30 mm) offset)		X	X	1



JS 3: LIFTER button

JS 3 = 0 ——> programmed as momentary button
JS 3 = 1 ——> programmed as flip-flop button

JS 4, JS 5: Drop-in / drop-out

The time offset of the drop-in can be disabled with JS 5 = 1 (erase and record head switch on concurrently).
The time offset of the drop-out can be disabled with JS 4 = 1 (erase and record head switch off concurrently).

JS 6 ... JS 8: Tape type selection

The A810 recorder can be calibrated for two different tape formulations. The manner of changeover for tape type "A" or "B" can be selected with the three code switches JS 6, 7, and 8.

TAPE TYPE	TAPE SPEED	JS 6	JS 7	JS 8
"A"	SLOW (3.75 / 7.5 ips)	1	X	0
"B"	SLOW (3.75 / 7.5 ips)	1	X	1
"A"	FAST (15 / 30 ips)	1	0	X
"B"	FAST (15 / 30 ips)	1	1	X
If the tape recorder is not equipped with a mono/stereo switch, the pushbuttons on the master panel can be reprogrammed as a tape type selector:				
TAPE TYPE SELECTOR		0	NO EFFECT!	
MONO/STEREO SWITCH		1	X	X

JS 9 ... JS 11: Tape speed

LS version with 2-speed panel:
Two of three different tape speeds can be programmed:
SLOW and FAST.
LS version with 3-speed panel:
The three lower speeds (3.75 - 7.5 - 15 ips) can be selected with the rotary switch on the master panel. The DIL switches JS9 through JS11 must be set to the "OFF" position.
HS versions:
All tape speeds can be selected with the rotary switch on the MASTER panel. JS9 through JS11 must be set to the "OFF" position!

The following tape speeds can be selected, depending on the capstan motor version:
3.75 7.5 15 30 ips
9.53 19.05 38.1 76.2 cm/s

TAPE SPEED SLOW (ips)	TAPE SPEED FAST (ips)	JS 9	JS 10	JS 11	CAPSTAN (No. of poles)	REMARK
3.75	7.5	0	0	1	4	
3.75	15	0	1	0	4	
7.5	15	1	0	0	4	STANDARD
15	30	1	1	1	2	special VERSIONS
4 SPEED VERSION		0	0	0	2	STANDARD FOR HS VERSIONS
3 SPEED VERSION		0	0	0	4	STANDARD FOR LS VERSIONS

JS 12: Drop-in

JS 12 = 0 ——> Drop-in with REC (provided recorder is already in PLAY mode).
JS 12 = 1 ——> Drop-in with PLAY + REC.

JS 13 ... JS 19: Programmable keys

The three function keys on the right of TRANS and LOC1 can be programmed with the DIL switches JS13 through JS19. For explanations of the possible functions refer to Section 1.2.

					CODE SWITCHES JS: 13	14	15	16	17	18	19
TRANS	LOC 1	LOC 2	LOC 3	LOC 4	0	0	0	0	0	0	0
TRANS	LOC 1	LOC 2	LOC 3	LOCST	0	1	0	0	0	0	1
TRANS	LOC 1	LOC 2	LOC 3	LIFTER	0	1	0	0	0	1	0
TRANS	LOC 1	LOC 2	LOC 3	FADER	0	1	0	0	0	1	1
TRANS	LOC 1	LOC 2	LOC 3	TAPDMP	0	1	0	0	1	0	0
TRANS	LOC 1	LOC 2	LOC 3	REMCTR	0	1	0	0	1	0	1
TRANS	LOC 1	LOC 2	LOC 3	CODREA	0	1	0	0	1	1	0
TRANS	LOC 1	LOC 2	LOCST	LIFTER	1	0	0	0	0	0	1
TRANS	LOC 1	LOC 2	LOCST	FADER	1	0	0	0	0	1	0
TRANS	LOC 1	LOC 2	LOCST	TAPDMP	1	0	0	0	0	1	1
TRANS	LOC 1	LOC 2	LOCST	REMCTR	1	0	0	0	1	0	0
TRANS	LOC 1	LOC 2	LOCST	CODREA	1	0	0	0	1	0	1
TRANS	LOC 1	LOC 2	LIFTER	FADER	1	0	0	0	1	1	0
TRANS	LOC 1	LOC 2	LIFTER	TAPDMP	1	0	0	0	1	1	1
TRANS	LOC 1	LOC 2	LIFTER	REMCTR	1	0	0	1	0	0	0

TRANS	LOC 1	FADER	TAPDMP	REMCTR	1	1	1	0	0	0	1
TRANS	LOC 1	FADER	TAPDMP	CODREA	1	1	1	0	0	1	0
TRANS	LOC 1	FADER	REMCTR	CODREA	1	1	1	0	0	1	1
TRANS	LOC 1	TAPDMP	REMCTR	CODREA	1	1	1	0	1	0	0

4.2.9.2 Code switches PERIPHERY CONTROLLER

The code switch JS 8 must be in the "ON" position before data is entered with the code switches JS 1 ... 7!

JS 1, JS 2: Erase head

The type of erase head is programmed as follows:

ERASE HEAD	JS 1	JS 2
FULL TRACK	1	0
TWO TRACK	0	1
WITH TIME CODE TRACK	1	1
NO RECORD	0	0

JS 3: Channel control on 2-channel recorders:

The SAFE, READY, INP, SYNC, REC buttons can be programmed to control the channels individually or in parallel:

JS 3 = 0 ——> INDIVIDUAL
JS 3 = 1 ——> PARALLEL

JS 4: Automatic muting during spooling (AUTO MUTE):

When MUTE is activated, the output is muted for 0.5 s when the function is changed from STOP to PLAY or REC.
When the STOP command is given in PLAY or REC mode, the output is muted until the blocking of the tape tension sensors is in effect.

On recorders equipped with the MPU 1.810.752:

JS 4 = SPARE (not used)

On recorders with the MPU UNIT 1.820.780:

JS 4 = 0 ——> AUTO MUTE off
JS 4 = 1 ——> AUTO MUTE on

JS 5, JS 6: Line level

The following line levels (operating level = peak level -6 dB) can be programmed for the inputs and outputs of the recorder:

LINE LEVEL	JS 5	JS 6
0 dBm	0	0
4 dBm	1	0
8 dBm	0	1
10 dBm	1	1

JS 7: CCIR/NAB equalization

JS 7 = 0 ——> Different audio parameters (bias, level, frequency response) for CCIR and NAB.
JS 7 = 1 ——> Identical audio parameters for CCIR and NAB.

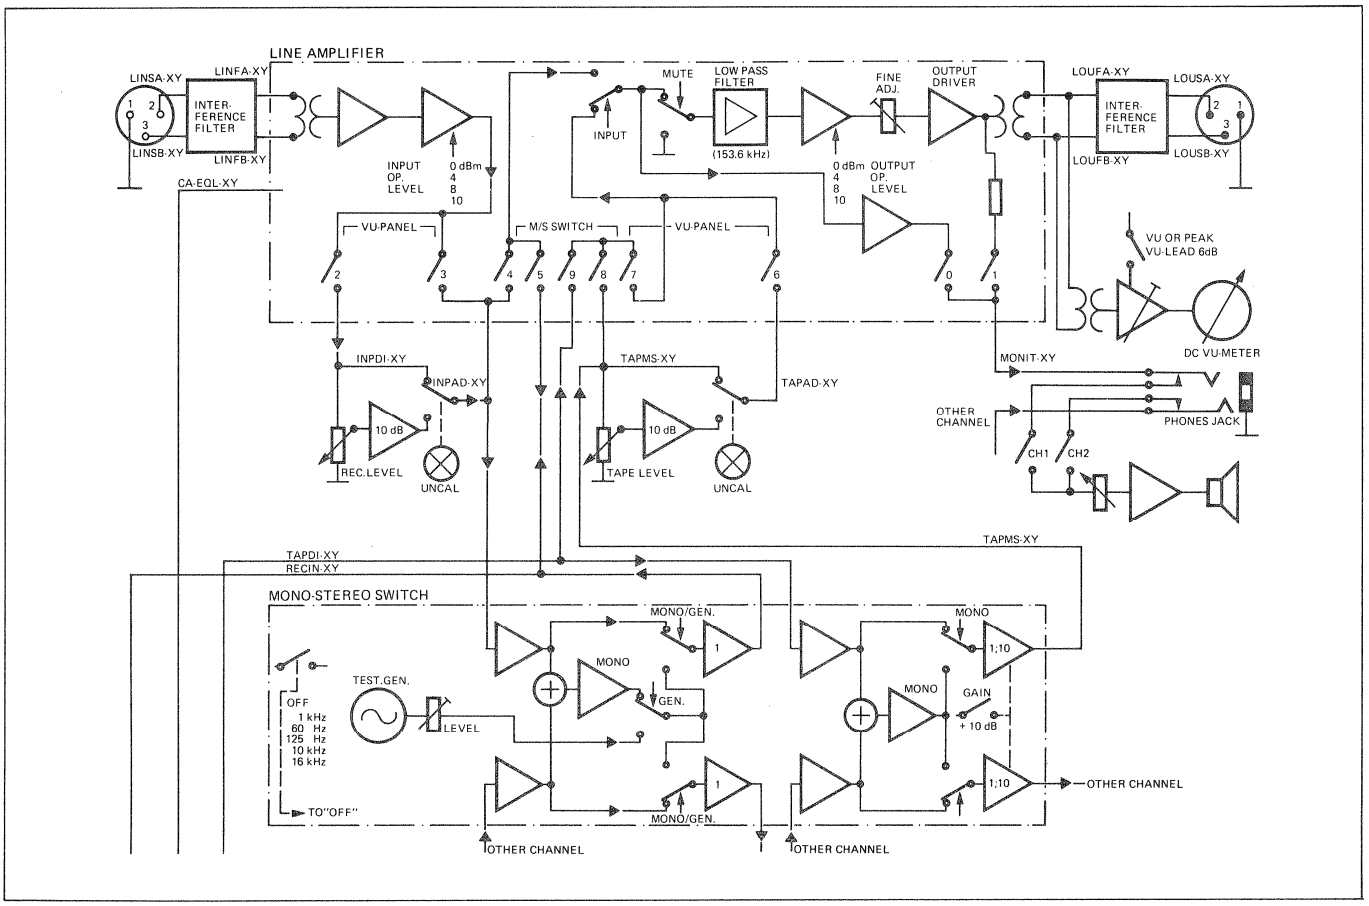
This code switch must be set before the other audio parameters are programmed; it has no effect on previously stored parameters!

Important:
Because of the limited RAM capacity, only one equalization type can be stored for the two tape speeds 3.75 and 7.5 ips. Different levels, treble, bass, equalization, and bias for NAB and CCIR cannot be stored for these tape speeds.

JS 8: input keyboard for audio parameters

JS 8 = 0 —> Keyboard off, no scanning of program switches JS 1 ... 7 and no adjustment of the audio parameters possible.
JS 8 = 1 —> Keyboard on, scanning of program switches JS 1 ... 7

4.2.9.3 Code switches LINE AMPLIFIER



JS 0, JS 1: Connection of internal monitor and headphones output

Only possible for monitor speaker installed in recorder (below tape transport cover). Not applicable to VUK versions.

Connection to output amplifier:
JS 0 = 0
JS 1 = 1

Connection before muting:
JS 0 = 1
JS 1 = 0

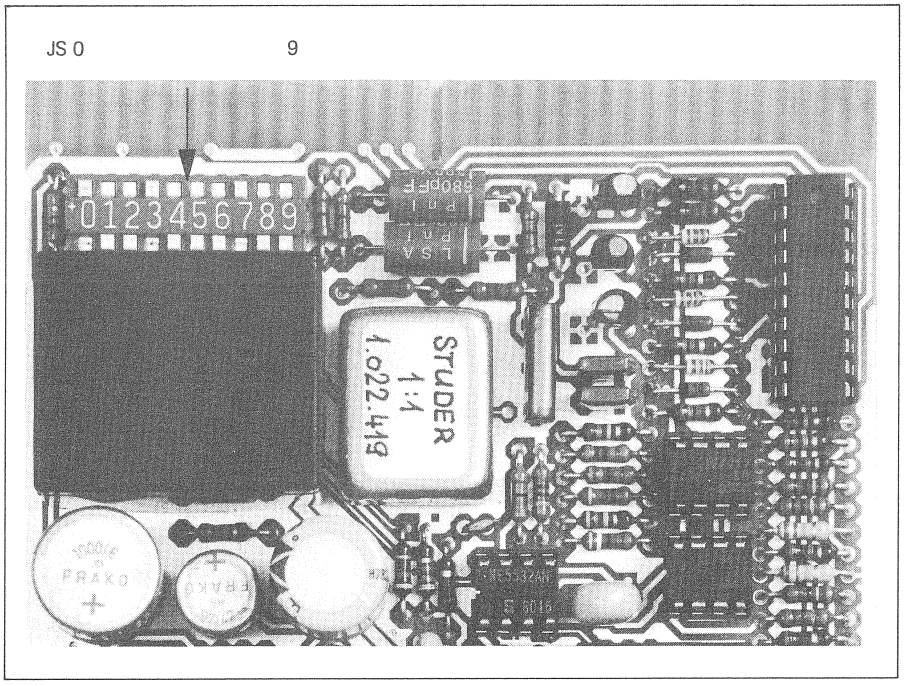
Monitor and headphones disabled:
JS 0 = 0
JS 1 = 0

JS 2 ... JS 9: VU-meter panel, mono/stereo switch:

The DIL switches JS2 through JS9 are to be set in accordance with the recorder configuration.

EQUIPMENT	CODE SWITCHES JS: 2	3	4	5	6	7	8	9
NO VU PANEL, NO M/S SWITCH	0	1	1	1	0	1	0	1
WITH VU PANEL, NO M/S SWITCH	1	0	1	1	1	0	1	1
NO VU PANEL, WITH M/S SWITCH	0	1	0*	1*	0	1	1	0
WITH VU PANEL, WITH M/S SWITCH	1	0	0*	1*	1	0	0	0

* This switch position means that RECIN output of the mono/stereo switch can be heard when the output selector is in the INP position; if the input signal of the mono/stereo switch is to be tapped, set JS 4 = 1 and JS 5 = 0.



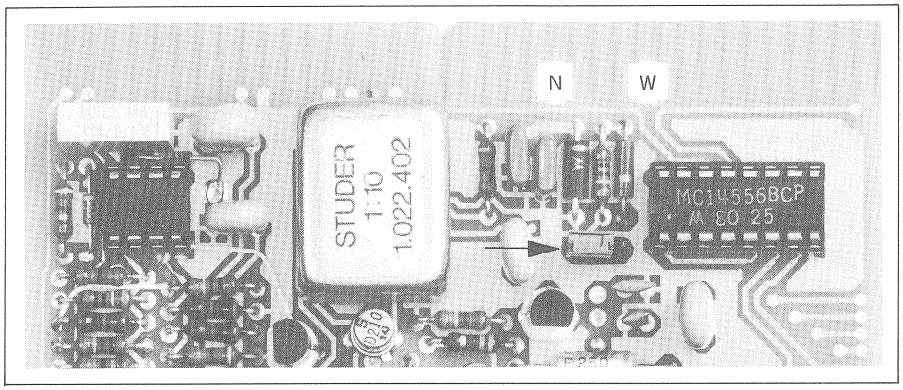
Note:

On recorders equipped with a mono/stereo switch, code switch 6 of the COMMAND UNIT must be JS 6 = 1!

4.2.9.4 Jumper REPRODUCE AMPLIFIER

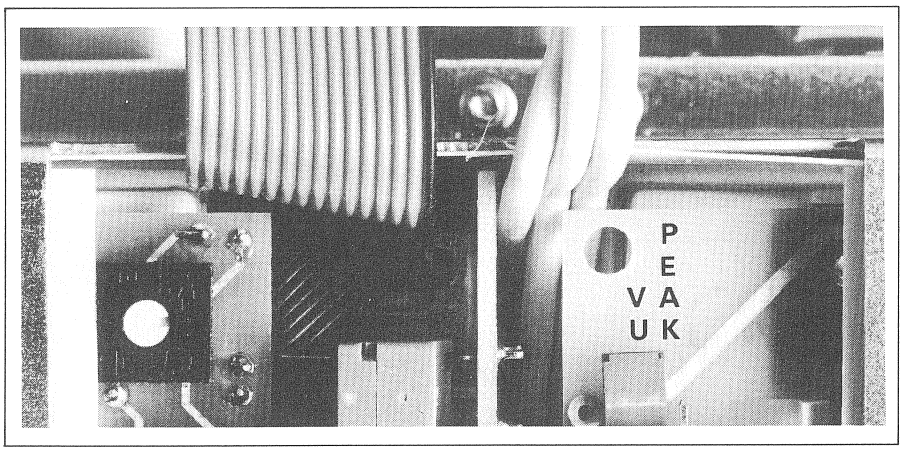
The sync reproduce frequency response can be switched over from 12 kHz to 20 kHz.

Note:
Strong cross talk between the record channel and the sync reproduce channel is to be expected above 12 kHz.



4.2.9.5 Jumper VU-meter amplifier

The indication mode can be selected separately for each meter (VU or PPM) with the jumper on the back of the VU-meter panel.



VU-indication according to IEC recommendation 268, Part 10, Section 4.

Peak program (PPM) indication according to IEC recommendation 268, Part 10, Section 3 (except 24, 1, scale division).

On console versions it is necessary to remove the VU-meter by unfastening the 4 mounting screws (front).

4.2.9.6 Jumper and code switches SERIAL REMOTE CONTROLLER

The jumper on the SERIAL REMOTE CONTROLLER must be in the "X" position on recorders equipped with the MP UNIT 1.810.752 or with the MP UNIT 1.820.780 and for software release date up to 13/83; for the MP UNIT 1.820.780, and software release date 40/85 or later, it must be in the "H" position.

JS 1 = 0 ——> BUS DISPLAY off
JS 1 = 1 ——> BUS DISPLAY on

For MP UNIT 1.810.752 and for MP UNIT 1.820.780 with software release date up to 13/83:

JS 2 = 0 ——> RS 232
JS 2 = 1 ——> saving data on tape

For MP UNIT 1.820.780 and software date 40/85 and later:

JS 2 = SPARE (not used, automatic switch-over)

JS 3 = SPARE (not used)

JS 4 = 0 ——> BUS DISPLAY indicates WRITE signals
JS 4 = 1 ——> BUS DISPLAY indicates READ signals

The code switches JS 5 ... 8 select the assemblies of which the status is to be indicated on the BUS display.

JS 5 = 0 ——> Status of COMMAND UNIT suppressed
JS 5 = 1 ——> Status of COMMAND UNIT on BUS DISPLAY

JS 6 = 0 ——> Status of TAPE DECK CONTROLLER suppressed
JS 6 = 1 ——> Status of TAPE DECK CONTROLLER on BUS DISPLAY

JS 7 = 0 ——> Status of PERIPHERY CONTROLLER suppressed
JS 7 = 1 ——> Status of PERIPHERY CONTROLLER on BUS DISPLAY

JS 8 = SPARE (not used)

4.2.9.7 Code switches SERIAL INTERFACE

A microprocessor RESET must be initiated after the operating parameters are changed with the code switches of the SERIAL INTERFACE.
Press RESET button of the MP UNIT or turn the power switch off and on again.

The code switches are accessible on the rear of the recorder (on the ADDRESS BOARD).

JS 1 ... JS 6:

- Operation with STUDIO bus (JS 7 = 1, JS 8 = 1; see below!):
  JS 1 ... JS 6 = any setting (device address)

- Operation with terminal (RS 232; JS 7 and JS 8 see below!):
  JS 1 ... JS 6 ≠ 100000: ECHO MODE = each character is transmitted back to the terminal
  JS 1 ... JS 6 = 100000: no ECHO MODE

  (≠ —> not=)

- Saving data (JS 7 = 0, JS 8 = 1; see below!):
  JS 1 ... JS 6 = 000000: SAVE & VERIFY, data to be saved on tape and verified
  JS 1 ... JS 6 = 111111: SAVE & LOAD, data to be saved on tape and loaded

JS 7, JS 8: Baud rate

ADDR. BOARD SWITCH	1	2	3	4	5	6	7	8	
9600 Bd with ECHO	0	0	0	0	0	0	0	0	
9600 Bd without ECHO	1	0	0	0	0	0	0	0	
1200 Bd with ECHO	0	0	0	0	0	0	1	0	
1200 Bd without ECHO	1	0	0	0	0	0	1	0	
1200 Bd SAVE & VERIFY	0	0	0	0	0	0	0	1	data saving
1200 Bd SAVE & LOAD	1	1	1	1	1	1	0	1	data saving
300 Bd with ECHO *	1	1	0	0	0	0	0	1	
300 Bd without ECHO *	1	0	0	0	0	0	0	1	

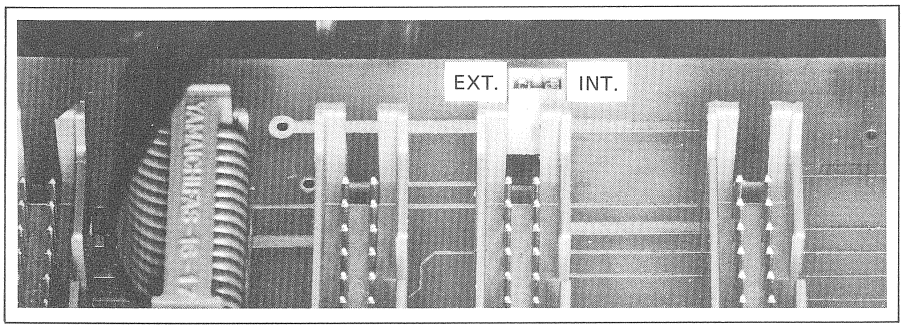
*DIL 1 ... 6 must be neither 000000 nor 111111 !

4.2.9.8 VU-meter panel internal or external

A jumper on the BUS CONNECTOR board defines whether an internal or external panel is used.

Access to this circuit board is gained by removing the rear panel of the recorder (disconnect power plug before removing the rear panel!).

The jumper must be in the INTERN position if neither a VU-meter panel nor a channel control unit is used!

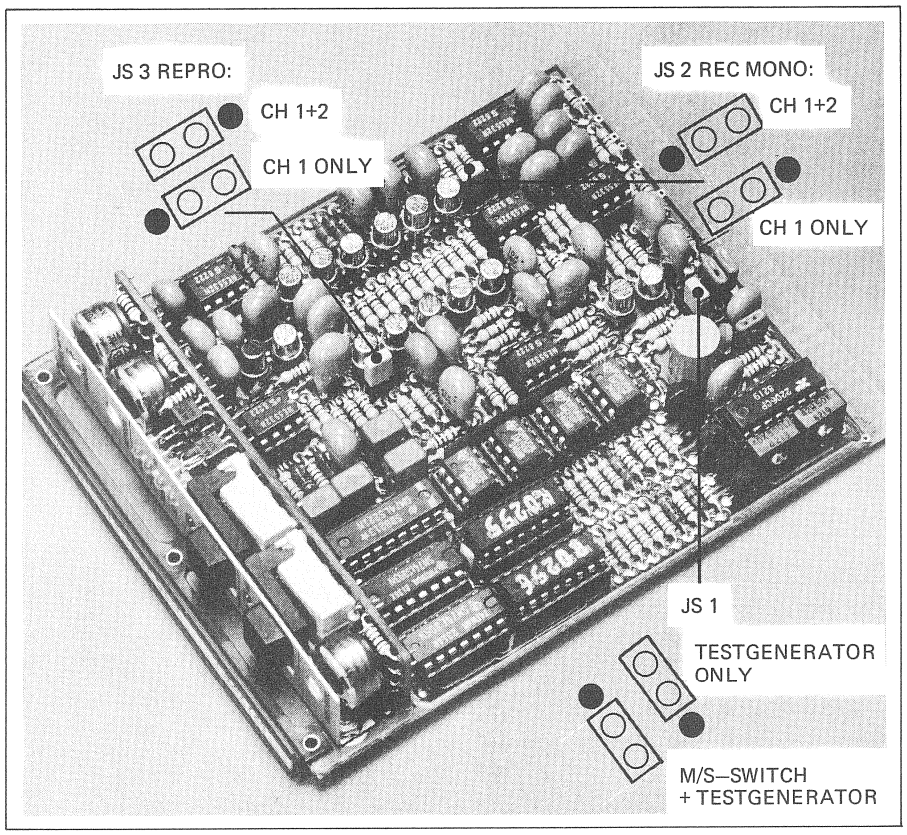


4.2.9.9 Jumpers MONO/STEREO SWITCH and/or TEST GENERATOR

Recorders equipped with a test generator but without mono/stereo switch require the electronics of the mono/stereo switch. In this case the signal TA-ACTMO must be pulled to ground with jumper JS 1. Operation without mono/stereo switch is simulated to the microprocessor so that the mono/stereo switch will not be accessed.

The record mode is defined by jumper JS 2: mono signals are either from the input of channel 1 only or the sum of the inputs channel 1 + 2.

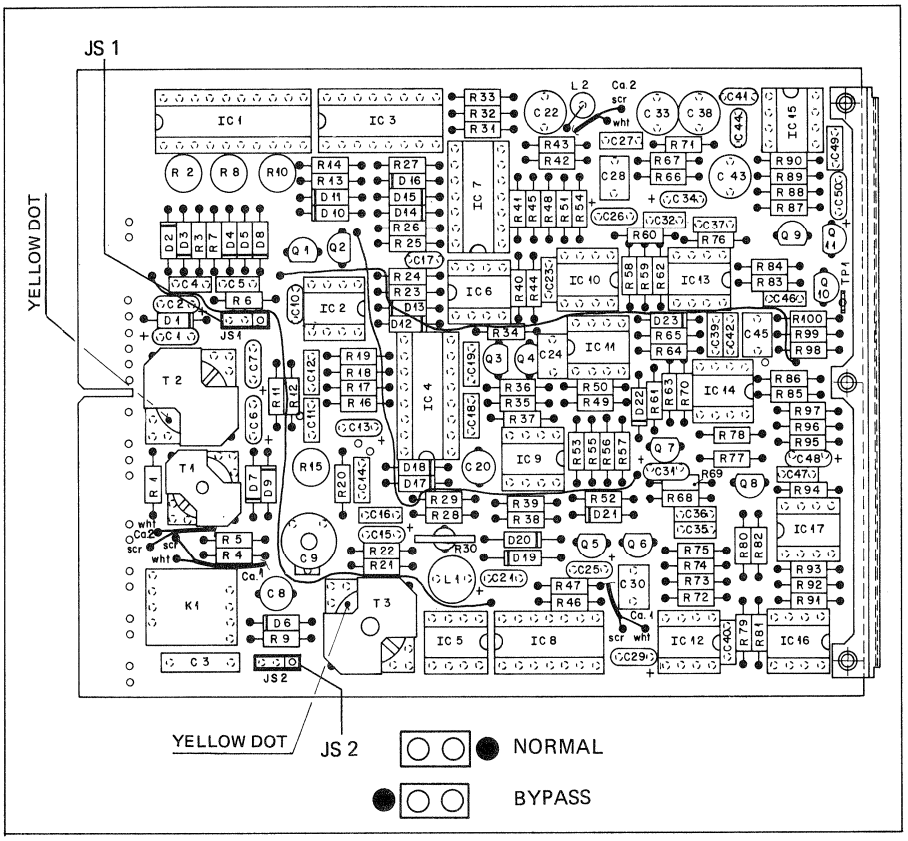
The reproduce mode is defined by jumper JS 3: The aggregat signal of channels 1 + 2 can either be placed on channel 1 or to channels 1 and 2.



4.2.9.10 Jumpers TIME CODE READ/WRITE UNIT

The CODE LEVEL LED can be disabled with jumper JS1.

If the code channel is operated without the CODE DELAY UNIT 1.820.722, the delay input and output must be interconnected. This can be done via the serial remote controller, if configured (2.8.3) or with the jumper JS2 on the CODE READ/WRITE amplifier. In the second case the CODE DELAY UNIT must not be installed!

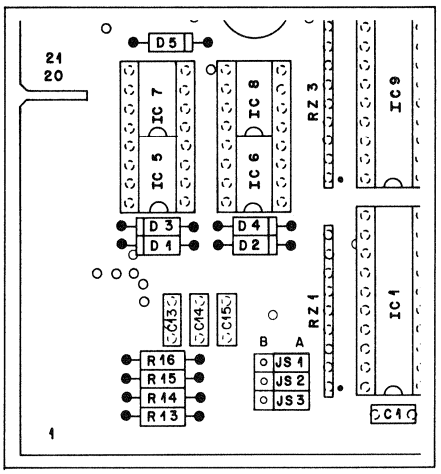


4.2.9.11 Jumpers TAPE DECK CONTROLLER

The jumper JS 1 is not used (SPARE).

The microprocessor controls the display decoder differently, depending on whether a liquid crystal (LCD) or LED tape timer display is installed. This changeover is effected with jumper JS2 (JS2 inserted {position A}: LCD display, JS 2 removed {or in position B}: LED display).

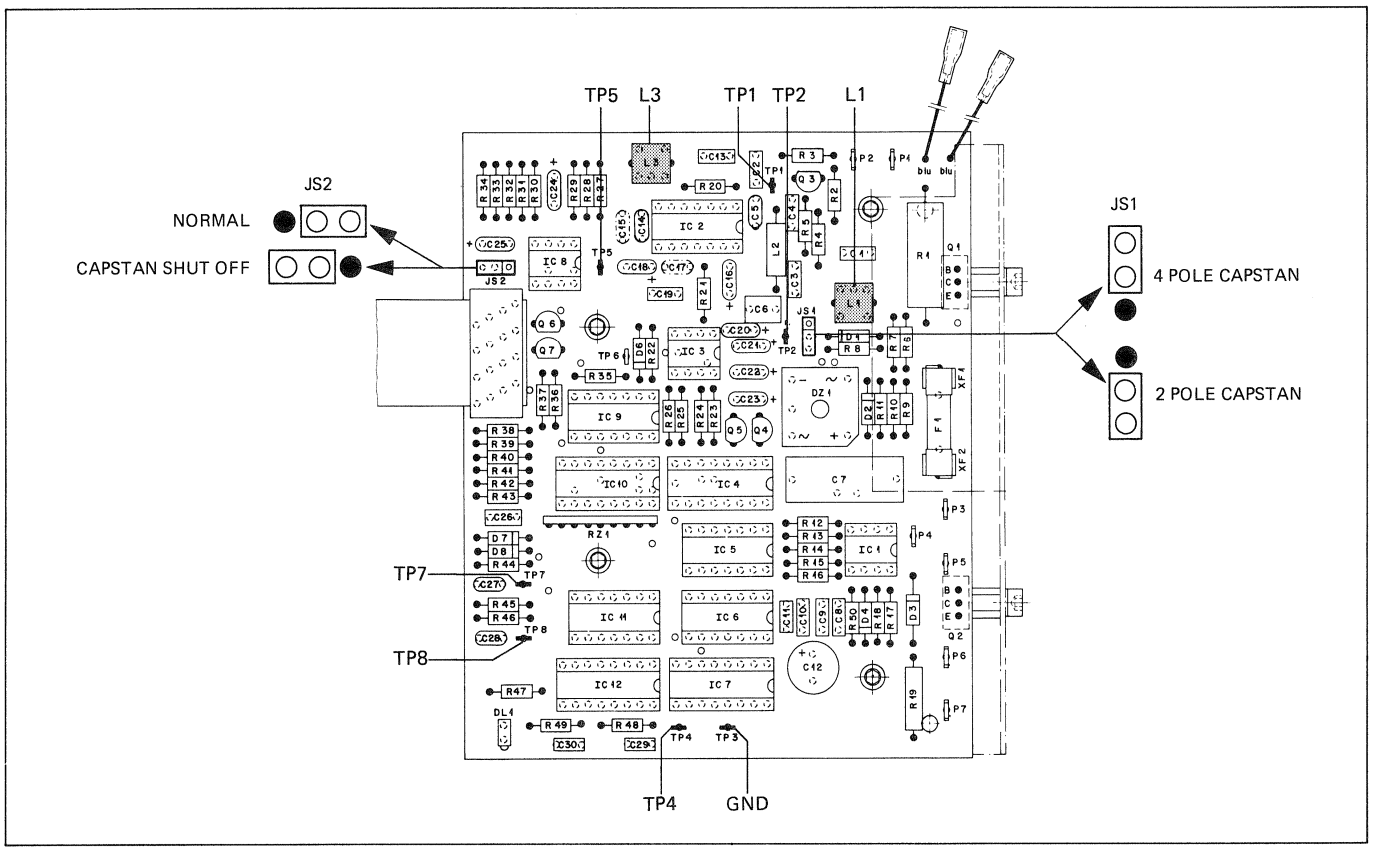
If jumper JS 3 is not inserted (or in position B), various tape transport monitoring functions are suppressed (necessary for mechanical transport adjustments according to Section 3.3).



4.2.9.12 Jumpers CAPSTAN MOTOR CONTROL

JS 1: This jumper matches the control time constant for the 2-pole or 4-pole capstan motor.

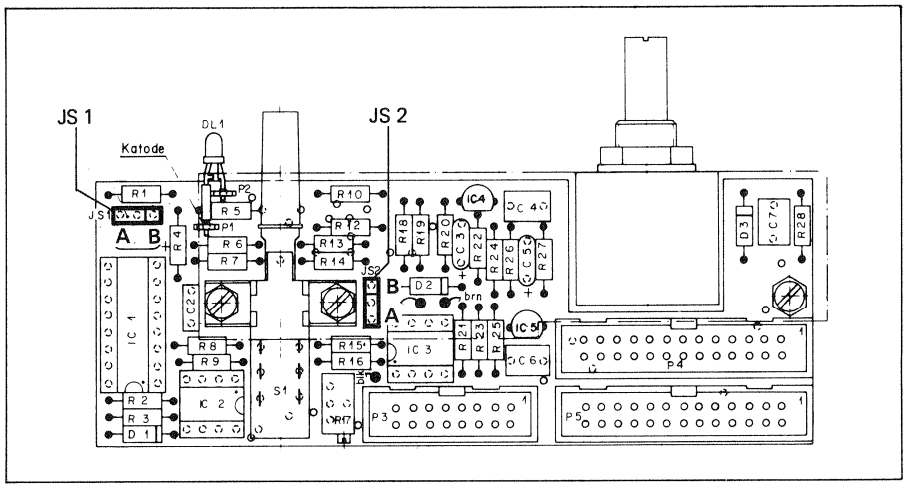
JS 2: This jumper programs the capstan motor to switch off after TAPE OUT (no tape threaded or tape torn) in order to protect the bearings from unnecessary wear.



4.2.9.13 Jumpers VARISPEED CONTROL

JS 1: Position A: for operation with B67 recorder
Position B: for operation with A810/A812 recorder

JS 2: Position A: DL1 turns on when switch S1 is in "ON" position.
Position B: DL1 turns only on when the capstan speed corresponds to the selected nominal speed.
(Not possible on A810 because no feedback available).



4.2.9.14 Jumpers TAPE TRANSPORT REMOTE CONTROL

1.328.200

Standard varispeed operation with external control frequency via BNC socket

Jumper positions:

1.328.201.00	1.328.201.81	Position
JS 3	JS 1	A
JS 1	JS 2	A
JS 2	JS 3	B

For varispeed mode press the varispeed key or the tape deck remote control: the yellow LED is on.
- The control frequency fed into the BNC socket varies the tape speed (9.6 kHz for nominal speed).
- When no control frequency is available on the BNC socket, the capstan motor slowly decelerates to a standstill when the varispeed button is pressed.

Varispeed operation in conjunction with integrated varispeed module
1.810.330.81 (option 20.810.871.00 or 20.810.872.00)

1. Setting (standard)

Jumper positions:

1.328.201.00	1.328.201.81	Position
JS 3	JS 1	A
JS 1	JS 2	A
JS 2	JS 3	B

On the integrated varispeed module 1.810.330.81 the varispeed button must be pressed (red LED is on).

For varispeed operation press the varispeed key of the tape deck remote control, the yellow LED turns on and the speed preset on the integrated varispeed module 1.810.330.81 is implemented. If the varispeed button is pressed a second time, the capstan is reset to the nominal speed.

Note:
Also on the integrated varispeed module 1.810.330.81 it is possible to change over between varispeed mode and normal mode, regardless of the varispeed key position of the tape deck remote control!

- If the varispeed key on the integrated varispeed module is not pressed (red LED off), the capstan motor slowly decelerates to a standstill when the varispeed button of the tape deck remote control is pressed.

If a control frequency is also available on the BNC socket (9.6 kHz for nominal speed), the following functions are possible:

1) Integrated varispeed module 1.810.330.81 switched off (red LED off). The tape speed is determined by the external control frequency when the varispeed button of the tape deck remote control is pressed.
2) Varispeed key of the tape deck remote control not pressed (yellow LED off). When the varispeed key of the integrated varispeed module 1.810.330.81 is pressed (red LED on), the tape speed is determined by the potentiometer setting.

Important:
If both keys are activated simultaneously (on the varispeed module and on the remote control), the two signals are mixed which means that an illegal condition results!

2. setting (without external control frequency):

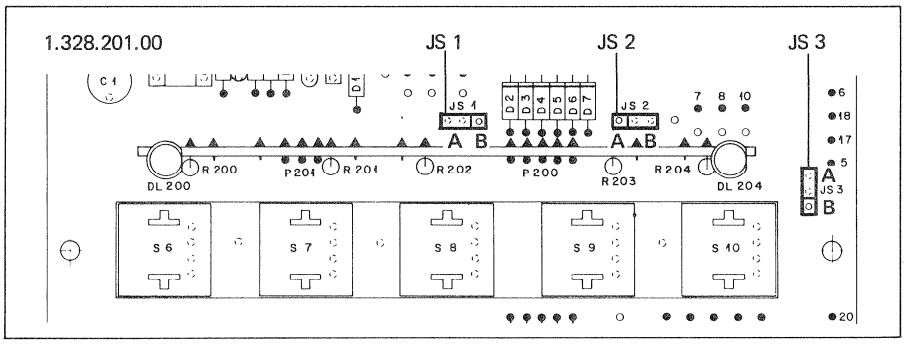
Jumper positions:

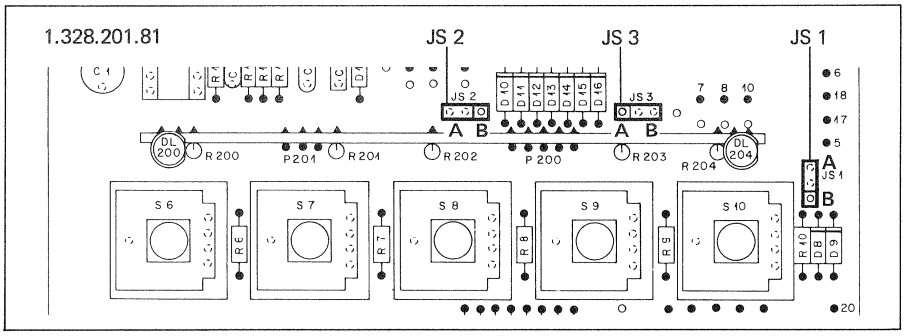
1.328.201.00	1.328.201.81	Position
JS 3	JS 1	B
JS 1	JS 2	B
JS 2	JS 3	A

When the varispeed button of the integrated module is pressed, the yellow varispeed LED of the integrated varispeed module turns on regardless of the own push button position. The LED indicates the availability of an external capstan frequency (from the integrated varispeed module 1.810.330.81). The recorder runs with the speed defined by the potentiometer setting.
If the varispeed key of the remote control unit is pressed, the recorder switches back to the nominal speed.

From this moment the varispeed key of the tape deck remote control has the following function:

- When this key is held down, the recorder switches to the speed set with the integrated varispeed module
- When this key is released, the recorder switches back to the nominal speed.





BIAS ADJUSTMENTS

Type of tape	ΔU [dB]			
	9,5 cm/s 3.75 ips	19 cm/s 7.5 ips	38 cm/s 15 ips	76 cm/s 30 ips

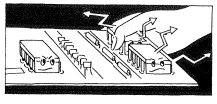
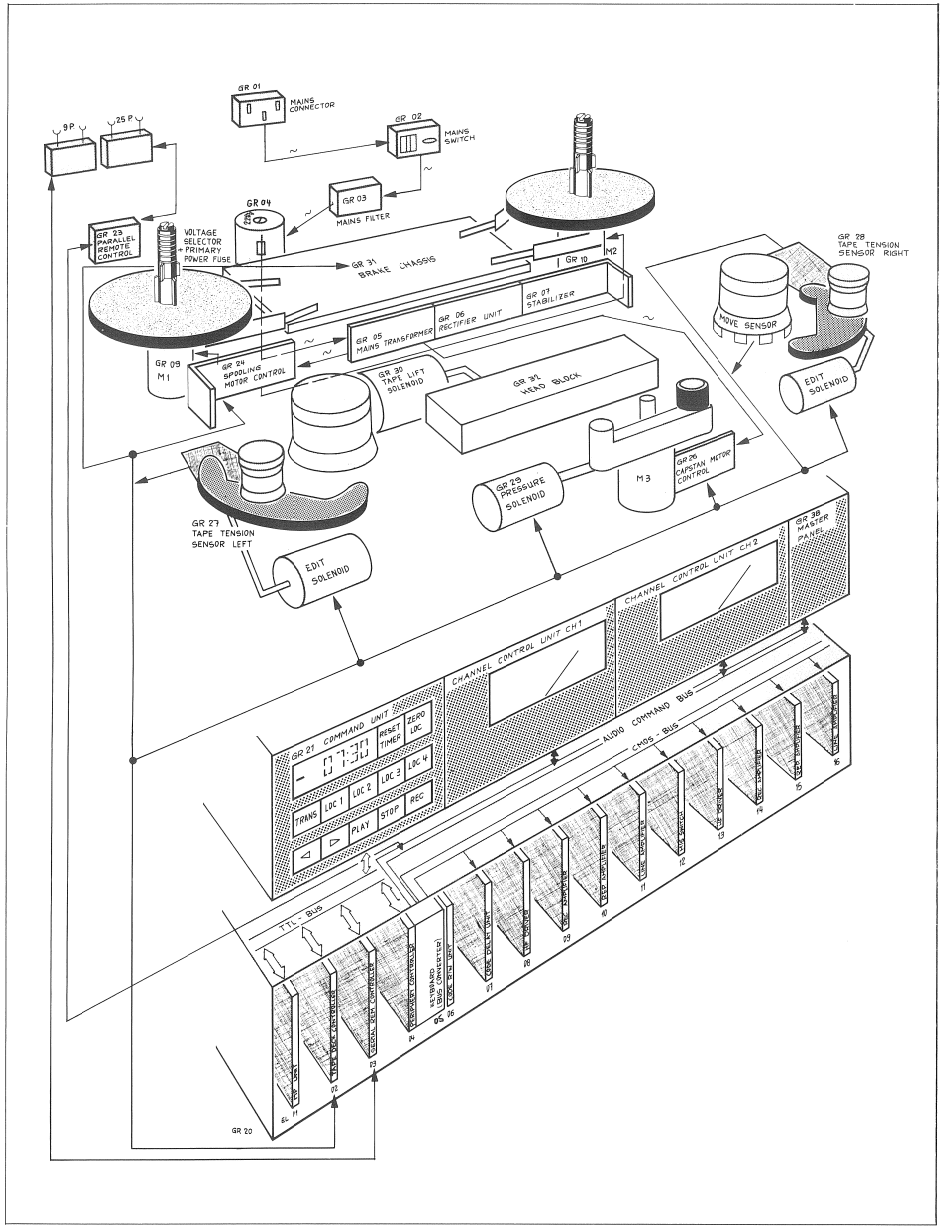
SECTION 5 GENERAL DIAGRAMS (Power supply and control logic)

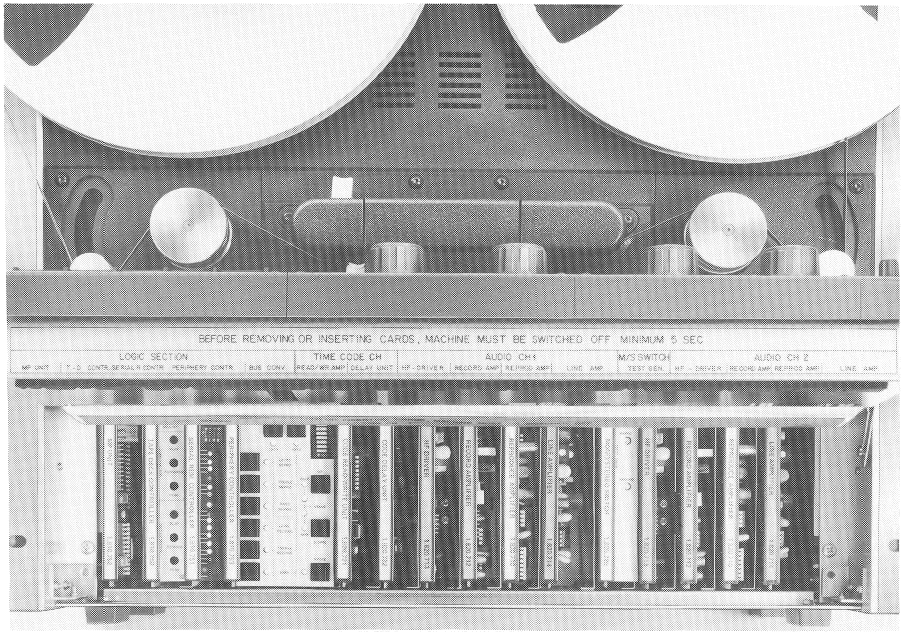
5.5 GENERAL DIAGRAMS

ALL PCBs MARKED WITH THIS SIGN ▲ CONTAIN COMPONENTS SENSITIVE TO STATIC CHARGES.
PLEASE, REFER TO PREFACE BEFORE YOU REMOVE THESE BOARDS.



SURVEY OF GROUPS





5.1 WIRING

Wiring diagrams for equipment with complex electronic circuits are difficult to follow and can lead to misinterpretations. Our documentation is, therefore, based on computer wiring lists. They give complete information on each electrical connection within the equipment.

To make the documentation more understandable, the power supply, the controls, the tape transport control, and the audio section have been split into groups (GR) and the groups into elements (EL) and connecting points (PT).

The signals are referred to by names that have been constructed from various abbreviations and from which the corresponding function can be recognized.

5.1.1 Groups

The electrical hardware of the A810 recorder is subdivided into 37 groups (GR). These groups are interconnected by cables and connectors that are identified with the corresponding group number. The group arrangement and the main interconnections are listed in the survey of groups (fold-out page on the left) and the block diagram (Section 5/33).

5.1.2 Elements, connecting points

Groups that comprise multiple PCBs or other elements are subdiveded into elements (EL). The connecting points (PT) are located on the elements.

5.1.3
Main connection types

Type	Description	STUDER No.
	Connector, D-type, crimp:	
A	contact pin, for thin stranded wires	54.02.0451
AA	contact pin, for heavy stranded wires	54.02.0455
B	contact socket, for thin stranded wires	54.02.0450
BB	contact socket, for heavy stranded wires	54.02.0454
	CIS connector:	
C	contact socket	54.01.0402
D	contact pin	54.01.0401
	MOLEX connector:	
F	contact socket, for thin stranded wires	54.02.0412
FF	contact socket, for heavy stranded wires	54.02.0413
G	Solder hook	29.21.6002
H	Wire/stranded wire, tinned (6 mm)	--.--.----
I	Connector, D-type, crimp, contact pin	54.02.1112
	Flat connector AMP FASTON, crimp, 0.8 * 6.3 mm:	
JM	contact, female, for thin stranded wire	54.02.0337
J	contact, female, for heavy stranded wire	54.02.0332
JJ	contact, female, for very heavy stranded wire	54.02.0338
K	Wire/stranded wire, stripped 8mm, tinned 1mm	--.--.----
L	Wire/stranded wire, tinned 4mm	--.--.----
M	MOLEX contact pin, for thin stranded wire	54.02.0411
MM	MOLEX contact pin, for heavy stranded wire	54.02.0410
MY	AMP flat connector (blade)	54.02.0344
N	CIS connector, contact pin	54.01.0225
O	Contact spring to EURO card connector strip	54.01.0376
	PCB contact strip:	
P	contact strip, for thin stranded wire	54.06.4512
PP	contact spring, for heavy stranded wire	54.06.4510
Q	Socket strip, contact socket	54.01.0451
R	Connector, D-type, crimp, contact socket	54.02.1111
S	Wire/stranded wire, stripped 4mm and tinned	--.--.----
T	TERMI-POINT connector on WIRE WRAP post	--.--.----
U	Detent-spring solder contact, crimp	54.03.0201
UU	detent-spring solder contact, crimp	54.34.6002
V	Contact, female, for heavy stranded wire	54.02.0432
VV	contact, female, for thin stranded wire	54.02.0474
W	Wrapped	--.--.----
	Flat connector AMP FASTON, crimp, 0.5 * 2.8 mm:	
X	contact, female, for thin stranded wire	54.02.0325
XX	contact, female, for heavy stranded wire	54.02.0329
	Flat connector AMP FASTON, crimp, 0.8 * 2.8 mm:	
Y	contact, female, for thin stranded wire	54.02.0326
YY	contact, female, for heavy stranded wire	54.02.0327
Z	Not tinned	--.--.----

5.1.4
Wire labeling, color scheme

The most important leads of the wiring are labeled. Two numbers can be found on the end of each wire: these specify the element of the group and the corresponding connecting point.

Example:

Tape move sensor GR 28, EL 05. Conductor color: orange. This wire carries the identification 5 - 4. This means that the orange wire is connected to point 04 of element 05.

Color scheme

0	black	(blk)
1	brown	(brn)
2	red	(red)
3	orange	(org)
4	yellow	(yel)
5	green	(grn)
6	blue	(blu)
7	violet	(vio)
8	grey	(gry)
9	white	(wht)
-	uncolored	(unc)

5.1.5
Explanations to LOCATION PIN LIST

This list is arranged by group. If the group number or group designation is known, further information can be found by consulting this list.
If only the signal name is known, consult the SIGNAL WIRE LIST (refer to 5.1.6 or 5.5).

The LOCATION PIN LIST is arranged by group number from GR 01 to GR 91.

Example: (refer to Section 5/17, LOCATION PIN LIST p. 17)

```
GR: 28   1.810.728.00                           <---  GROUP

5.1.6
Explanations to SIGNAL WIRE LIST

This list is arranged by signal name. If the signal name is known, further information can be obtained by consulting this list. If only the group designation or the group number are known, consult the LOCATION PIN LIST (refer to 5.1.5 or 5.4).

The SIGNAL WIRE LIST is arranged in alphabetic order by signal name (the signal names of the neutrals and the supply voltages are at the top of this list).

The signal names are listed in the first column which also specifies the color. The second and third columns specify the connecting point of the corresponding group and element on which the signal is available.

Example (refer to Section 5/29, SIGNAL WIRE LIST, p. 40)

SIG.NAME	COLOR	TYPE	GR	EL	PT	S	DESCRIPTION OF ELEMENT	
•••								
•••								
•••								
T-CLK2			20	02	02		CONN. TAPE DECK CONTROLLER	J02
			20	20	16		CONN. SPOOLING MOTOR CONTR.	P01
			24	01	16		FROM GR 20, EL 20	
			24	03	14		CONN. TAPE TENS. UNIT, RIGHT	J03
			28	01	14		FROM GR 24, EL 03	J01
	3	N	28	04	04		CONN. MOVE SENSOR	J03
	3	U	28	05	04		MOVE SENSOR	WIRE FIELD
•••								
•••								
•••								

Signal name:
T-CLK2

Color:
3 (orange)

Connection type:
U (detent spring solder contact), soldered directly into wiring matrix of MOVE SENSOR

Signal path:
The signal is conducted from
MOVE SENSOR, wiring matrix, (GR 28, EL 05, PT 04)
with a CIS connector (connection type N) to
GR 28, EL 04, PT 04 (TAPE TENSION BOARD RIGHT), on this board to
GR 28, EL 01, PT 14 (solder terminal for flat cable)
through the flat cable to
GR 24, EL 03, PT 14 (SPOOLING MOTOR CONTROL, flat-cable connector)
etc.

5.2 SIGNAL NAMES

(T = TTL, C = CMOS)

+ 0.0	0	
0.0 VCU	0	
+ 5.6	0	
+ 5V-LED	0	
+110.0	0	
+15.0	0	
+24.0	0	
-15.0	0	
ACA	0	AC supply voltage, pole A
ACAF	0	AC supply voltage after fuse
ACB	0	AC supply voltage, pole B
ACC	0	AC supply voltage, pole C (C=medium)
ACM	0	Motor AC voltage
AFCSW-XY	0	Audio frequency current switch, 1 @ record current on
AN-POT	0	DC Varispeed control
AN-RFTTL	0	Reference tape tension, left (analog)
AN-RFTTR	0	Reference tape tension, right (analog)
AN-TACHO	0	Tacho sensor capstan motor
AN-TTL	0	Tape tension, left (analog)
AN-TTR	0	Tape tension, right (analog)

SERIAL REMOTE CONTROLLER 1.810.751-81/-82 GR20 EL3
- BUS DISPLAY PCB 1.810.757-00

MODIFICATION -00 -> -81:
- CUT CONDUCTOR FROM IC3 PIN9 TO PIN10.
- INSERT CONNECTION FROM IC2 PIN 9 TOR IC3 PIN9.

MODIFICATION -81 -> 82:
- ADDITIONAL: R33, 2.2 kΩ, 57.11.4222, FROM IC 4 PIN9 TO GND.

Replaces CAPSTAN MOTOR CONTROL 1.810.766.00 for improved
Reliability of the power stages and no latch-up of IC1

(01) 20.12.88 Improved synchronizing performance on low speeds.
(02) 26.06.89 Improved input voltage range of IC1.
(03) 30.08.89 Prevents severe CMOS-IC-Failure on Power-on.

(01) 83.03.22 Improved stability of the oneshot against switches's bounce.
C 42 added, C 201, C 202, R 218, R 219 changed.
Part Nr. of RZ 1 has been changed.

(02) 84.01.16 Improved stability of the 10db stage against ringing.
C 43 and C44 added.

(03) 85.05.28 Improved temperatur stability of power on reset circuit.

Note 1 – Contact pin: Studer 54.01.0020, Berg 75 160-102-36
Bridge: Studer 54.01.0021, Philips 2422 024 88003

Note 2 – 50 kOhm Potentiometer lin., 10%
Bourns Nr. 3386 M-1-503
Digitrim Nr. 361 50K / 525.640 10%

Note 3 – 500 Ohm Potentiometer lin., 10%
Bourns Nr. 3386 X-1-501
Spectrol Nr. 63 X 501 T010

Note 4 – 10 kOhm Potentiometer lin., 20%
Allen Bradley Nr. YR 103 M

Note 5 – 2 kOhm Potentiometer lin., 20%
Allen Bradley Nr. YR 202 M

Note 6 – 8 x 100 kOhm Network, 5%
Elektrohm Nr. C 09 x 100 KJ
Ineltro Nr. R 88 100K 5%

Note 7 – Switch Serie DIGITAST, Manufacturer Schadow/ITT
Knob SRHKL, Manufacturer Schadow/ITT, Studer Nr. 55.15.0510

Ce=Ceramic, El=Electrolytic, Sal=Solid aluminium, PP=Polypropylen, PETP=Polyesterfilm

MANUFACTURER: Ex=Exar, ITT=Intermetall, Mot=Motorola, NS=National Semiconductors, Ph=Philips, Ra=Raytheon, Ses=Sescosem, Sie=Siemens, Sig=Sigmatics, St=Studer, Six=Siliconix, Tf=Telefunken, Ti=Texas Instruments.

SECTION 8 ERSATZTEILE/SPARE PARTS

WARNUNG

Netzteil und Teile des Laufwerkes fuehren gefaehrliche Spannungen. Trotz des vorhandenen Beruehrungsschutzes innerhalb des Geraetes wird nach Entfernen der Geraeteverschalungen vorsichtiges Hantieren empfohlen. Vor dem Ausbau von Baugruppen ist der Netzstecker zu ziehen.

Um eine unzulaessige Magnetisierung der Tonkoepfe zu vermeiden, muss das Geraet vor dem Entfernen des Kopftraegers ausgeschaltet werden!

Das Geraet muss mindestens 5 Sekunden ausgeschaltet sein, bevor Printplatten ausgezogen oder eingesteckt werden!

Hinweis

Die Ausbauanleitungen beziehen sich auf das **stehende** Geraet.

CAUTION

Power supply and parts of the tape transport carry dangerous voltages. In spite of protections against contact inside the tape recorder, careful handling is recommended after having removed the covers. Before removing any subassembly, disconnect the mains plug.

To avoid inadmissible magnetisation of the sound heads, switch the recorder off before removing the head block.

The recorder has to be switched off for at least 5 seconds before any printed circuit boards are removed or inserted!

Note

The disassembly instructions are referred to with the recorder in **upright** position.

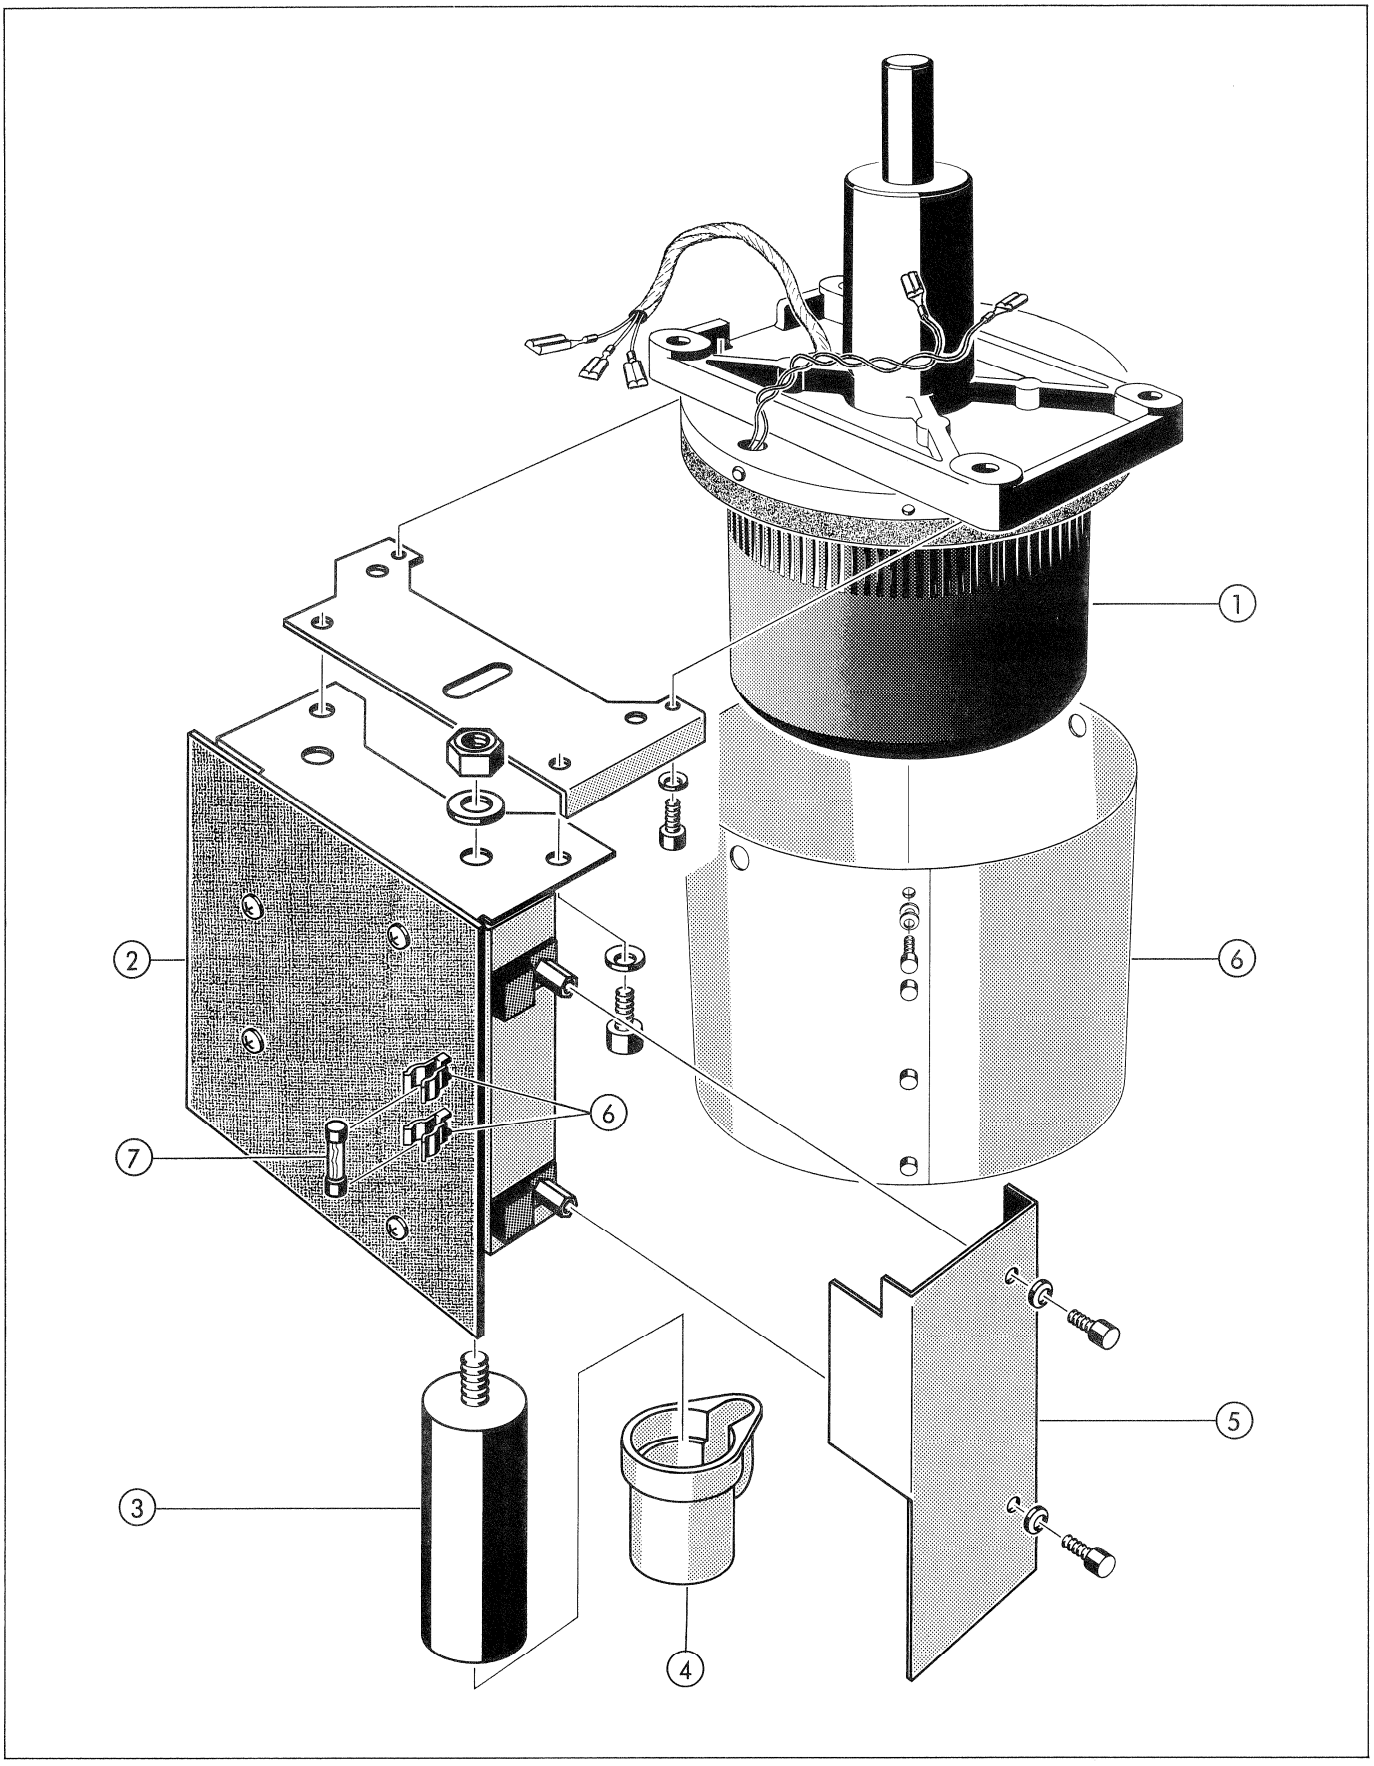
TONMOTOR
CAPSTAN MOTOR



8.10
TONMOTOR
CAPSTAN MOTOR

ACHTUNG

Nach dem Wechsel von Tonmotor oder Tonmotorsteuerung muss die Tonmotor-Steuerung abgeglichen werden! Siehe Kapitel 3.4.6 .

CAUTION

When the capstan motor or the capstan motor control have been replaced, the capstan motor control has to be aligned! See section 3.4.6 .

SI 95 / 86 D/E
A810 Software 4085

Einleitung

Die Software 40/85 für die A810 ist erhältlich.
Diese neue Software bietet einen erweiterten Bedienungskomfort, ebenso wurden einige Mängel der Software 13/83 behoben.

Introduction:

The software 40/85 is now available. This software offers an improved operating comfort. Some shortcomings of the software 13/83 are also removed.

Wichtig. für TLS 4000 Benützer

Wird die A810 mit der neuen Software 4085 in einem Synchronisationskomplex mit dem STUDER Synchronisator TLS 4000 betrieben, so muss auch auf dem Interface Print 1.812.120 die Software (alt R5491-2) durch R5491-3 ersetzt werden.

Important. for users of the TLS 4000

When using the A810 with the new Software 4085 in a synchronizer system together with the STUDER synchronizer TLS 4000, the old software (R5491-2) of the interface PCB 1.812.120 must be replaced by R5491-3.

Achtung:

Bei Pilot-Ausführung der A810 funktioniert die automatische Umschaltung Bandsorte A / Bandsorte B beim Kopfträgeraustausch mit der Software 40/85 nicht mehr.
Es wird eine neue spezielle Software für die A810 Pilotversion erhältlich sein.

Please note:

The automatic changeover from tape sort A to tape sort B by exchanging the headblock of the A810 pilot versions, does not function anymore with software 40/85.
A new special software for all A810 pilot versions will be released.

Wichtig:

Alle A810 Tonbandgeräte, die mit der Mikroprozessor-Karte 1.820.780 bestückt sind, können mit dieser Software bestückt werden. Hardware Aenderungen müssen keine ausgeführt werden, es genügt, wenn die drei EPROMS ersetzt werden.

Important:

All A810 tape recorders equipped with the microprocessor PCB 1.820.780 allow the use of the new software. There are no hardware modifications necessary - just replace the three EPROM's only.

Umrüstarbeiten:

Es müssen nur die EPROM's ersetzt werden. Dadurch erhält die MPU Karte eine neue Bezeichung: 1.810.780.20 (Hardware -20).EPROM R5212-0 wird ersetzt durch R5212-1.
EPROM R5213-0 wird ersetzt durch R5213-1.
EPROM R5214-0 wird ersetzt durch R5214-1.

Modification instructions:

Replace the three EPROM's. With this change, the MPU-PCB receives a new designation: 1.810.780.20 (Hardware - 20). Replace EPROM R5212-0 by R5212-1.
Replace EPROM R5213-0 by R5213-1.
Replace EPROM R5214-0 by R5214-1.

Wichtig:

Beim Austausch können die Audio-Daten verloren gehen. Daher nach Möglichkeit Daten auf Band abspeichern. Ebenso kann der RAM-interne Betriebsstundenzähler rückgesetzt werden.

Softwarebereinigung:

Unter anderem wurden folgende Mängel der Software 1383 behoben:

- Während der Faderstart Funktion wird die A810 beim Bandausfädeln nicht mehr blockiert.

- Bei Geräten mit LED Display können die auf Band abgespeicherten Audioparameter wieder mit dem RAM-Inhalt verglichen werden.

- Verschiedene unzulängliche Mute-Funktionen wurden bereinigt.

- Drop-in / Drop-out Zeiten wurden korrigiert.

Bedienungsänderungen und neue Funktionen der Software 4085 :

1. Falls beim Einschalten des Gerätes kein Band aufgelegt ist, blinkt die LED der Stop-Taste für ca. 10 Sekunden, nachher erlischt sie. Beim Drücken der STOP-Taste beginnt die LED erneut für ca. 10 Sekunden zu blinken.

   LED für Stop:

   dunkel oder blinkt = Kein Band eingelegt oder Bandende

   permanent hell = Band eingelegt ohne Schlaufe

Important:

Care must be taken that the Audio - parameters do not get lost when exchanging the EPROM's. Therefore, store the parameters on tape. The RAM-internal elapsed time counter may also get reset to zero.

Software modifications:

The following shortcomings of the software 1383 have been removed:

- If the tape runs out during faderstart operation, the tape transport does not block anymore.

- On tape recorders equipped with LED-Display it is possible to verify the audio parameters stored on tape with the contents of the RAM again.

- Various mute functions have been corrected.

- Drop in / Drop out times have been corrected.

Operating changes and new functions of the software 4085:

1. If in power on mode no tape is loaded, the LED of the STOP button flashes for approx. 10 seconds, afterwards it extinguishes. When pressing the STOP button, the LED flashes again for approx. 10 sec.

   LED for STOP:

   extinguished or flashing = tape out or tape end

   permanently turned on = tape threaded and tension arms in operating position.

2. Der Aufnahme Befehl wird vom Laufwerk nicht akzeptiert, wenn alle safe / ready Schalter auf Position SAFE stehen. (Die rote LED über der Laufwerkfunktionstaste REC leuchtet nicht, analog zu A820).

3. Umschalten der Bandgeschwindigkeit während der Aufnahme setzt die A810 in STOP und der Kanalselektor bleibt auf READY Position.

4. Während der Parkierphase des Zero- oder Adresslocators, kann der Aufnahmebefehl vorgewählt werden. Falls kein Kanalselektor auf READY steht, wird nach der Parkierphase der Record Befehl aufgehoben und das Laufwerk startet in Wiedergabe.

5. Die Funktionstasten am Masterpanel (CCIR/NAB, TAPE A / TAPE B oder MONO/STEREO-Umschaltung) sind gegen unbeabsichtigtes Betätigen gesichert worden.

   Die Umschaltung erfolgt nur durch Drücken der STOP-Taste und gleichzeitiges Betätigen der entsprechenden Umschalttaste am Masterpanel.

6. Im reduziertem Wickelgeschwindigkeitsmodus sind die LOC-Tasten für die Locate Funktion gesperrt. Beim Drücken der LOC-Tasten wird lediglich der Zählerstand abgespeichert.

7. Band einziehen nach dem Schneiden:

   Sind beide Bandsensoren in Ruheposition, kann das Band durch Drücken der Tasten $>$ oder $<$ auf den entsprechenden Spulenteller eingezogen werden.

2. The tape transport does not accept the record command anymore when all safe / ready switches are in position SAFE. (The red LED above the REC-button of the command unit does not light up anymore, similar to A820).

3. While the A810 is in record mode, a speed change causes the machine to STOP and the channel selector remains in ready mode.

4. During the parking mode of the zero- or address locator, it is possible to preselect the record command. If none of the channel selectors is in ready mode, the record command gets canncelled as soon as the tape transport has reached the parking point and the machine starts in play mode.

5. The push button of the master-panel (CCIR/NAB, TAPE A / TAPE B or MONO/STEREO-switches) have been protected against unintentional operation.

   Any changeover occurs only when pressing the STOP button and pressing additionally the required push button of the master panel.

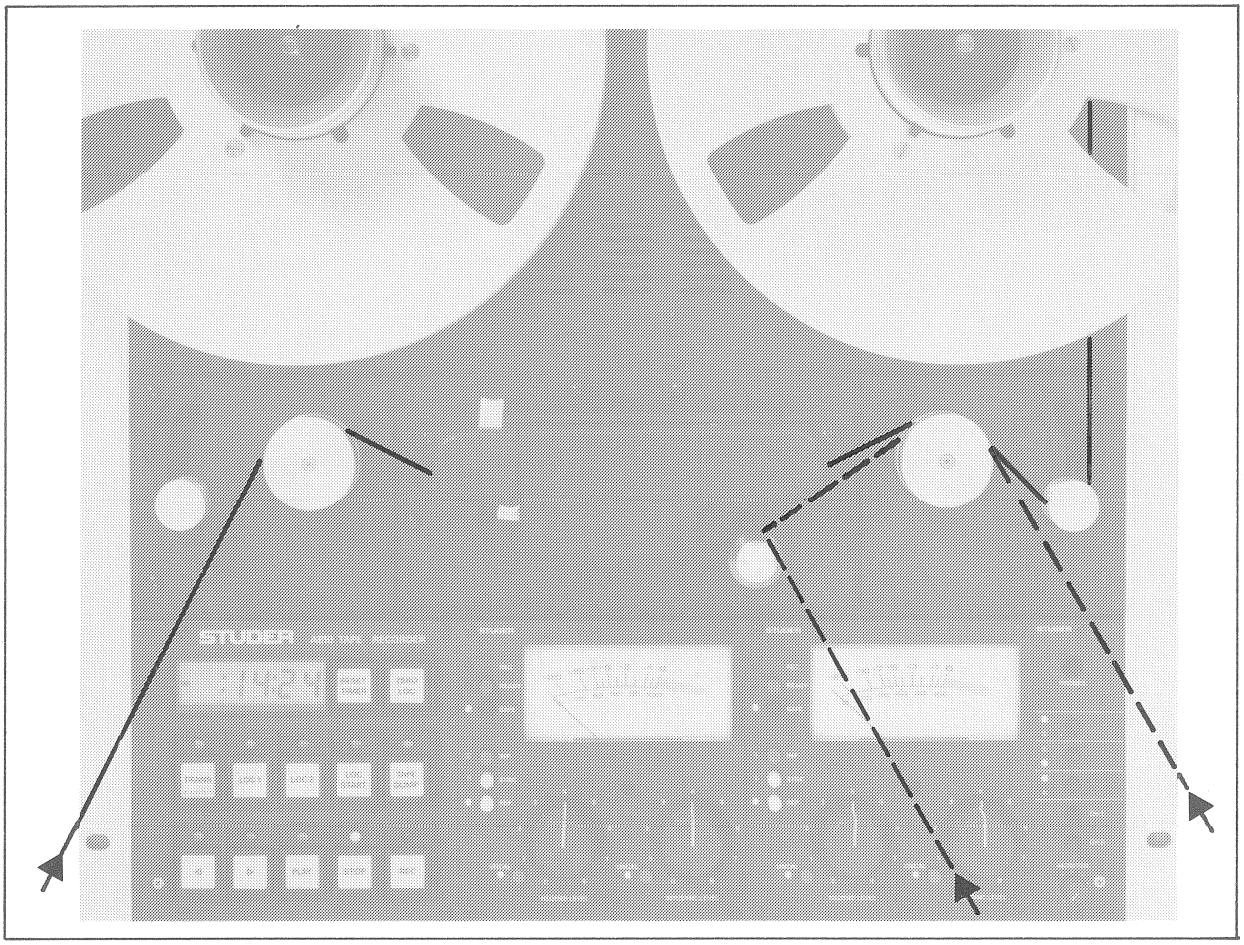
6. The LOC-push buttons are disabled for the locate function during the reduced wind mode.
   When pressing any address LOC push button, only the counter position will be stored.

7. Pull up the tape after cutting:

   It is possible to pull up (wind) the tape on to the corresponding tape reel when pressing the push button $>$ or $<$ if both tape tension sensors are in restposition.

Band über die linke oder rechte Umlenkrolle führen (je nach Einzugrichtung), sodass Kopfkontakt besteht.(Siehe Bild.)
Die Einzugsgeschwindigkeit kann durch den Fingerdruck auf das Band kontrolliert werden.

Guide the tape over the left or right hand guide roller (depending on the pull up direction) so that it remains in contact with the heads. (See drawing).
The speed of the pull up mode can be controlled by finger pressure on the tape.



8. Bei Zeitcode Geräten:

Beim Umschalten von einer beliebigen Geschwindigkeit auf 3 3/4 ips wird der Zeitcode-Kanal automatisch auf SAFE und auf INPUT umgeschaltet.
Beim Zurückschalten auf eine beliebige andere Geschwindigkeit wird der Zeitcode-Kanal auf SAFE belassen und nimmt den zuvor angewählten Status: REP, SYNC oder INPUT wieder an.

8. Time code tape recorders:

When changing from any speed to 3 3/4 ips, the time code channel changes automatically to SAFE and INPUT mode.

When changing back to any other speed, the time code channel remains in SAFE mode and the previous status returns: REP, SYNC or INPUT.

9. Zeitcode lesen:

Im Schnellwickel Modus wird der Zeitcode jetzt immer vom rechten Kopf gelesen und die Delay unit wird überbrückt, (by pass) unabhängig von der Wickelgeschwindigkeit.
Dadurch werden die Lifter beim Umtasten der Schnellwickelrichtung nicht mehr aktiviert.

10. Auf der Laufwerkfernsteuerung 1.328.200 kann die LOC 1 Taste als LOC-START-Taste oder zurück als LOC 1 Taste umprogrammiert werden.

Umprogrammieren der LOC 1 Taste auf LOC-START:

TRANS und LOC 1 Taste drücken und gleichzeitig noch die PLAY Taste drücken. Die LOC 1 Taste der Laufwerksteuerung ist somit LOC-START-Taste. Wird die Taste aktiviert, leuchtet auf der geräteinternen Bedieneinheit die LOC-START LED. (Funktion wird im RAM eingelesen somit bleibt sie auch nach dem Ausschalten des Gerätes erhalten.

Umprogrammieren von LOC-START zurück auf LOC 1:

TRANS und LOC-START-Tasten drücken und gleichzeitig STOP-Taste drücken. Somit ist die LOC-START Taste wieder LOC 1-Taste. Beim Aktivieren der LOC 1 Taste leuchtet auf der maschineninternen Bedieneinheit die LOC 1 LED.

11. Der Brückenstecker JS 1 auf dem Tape deck controller PCB 1.810.750 hat neu folgende Funktion:

Brückenstecker JS 1 eingesetzt oder in POS. A:

Falls eine Laufwerktaste auf TAPE DUMP (Papierkorbbetrieb) programmiert ist, wird beim Drücken der Taste TAPE DUMP sofort der Papierkorbbetrieb aktiviert.

9. Time code reading:

The time code reading in fast wind is no longer depending on the wind speed, i.e the time code will always be read by the right hand TC-head and the delay unit is by- passed.
For this reason the tape lifters are not moved anymore when changing wind direction.

10. On the tape transport remote control 1.328.200, the LOC 1 push button function can be changed into LOC-START and vica versa.

Programming of the LOC 1 push button to LOC-START:

Press TRANS and LOC 1 push buttons together and at the same time the PLAY-key. Now the LOC 1 push button activates the LOC-START function. When pressing this push button, the LOC-START LED of the internal command unit lights up. (The function is stored in the RAM, therefore, the function remains stored even after power off.

Programming the LOC-START function back to LOC 1:

Press TRANS and LOC-START push button together and in addition the STOP-push button. Now the LOC-START push button is again LOC 1. When pressing this push button the LOC 1 LED of the internal command unit lights up.

11. The jumper JS 1 on the tape deck controller PCB 1.810.750 has the following new function:

Jumper JS 1 inserted or in POS.A:

If one of the tape transport push buttons is programmed to TAPE DUMP, the tape dump function will be activated when pressing the TAPE DUMP key.

Brückenstecker JS 1 entfernt oder in POS. B:

Falls eine Laufwerktaste auf TAPE DUMP (Papierkorbbetrieb) programmiert ist, wird das Laufwerk für den Papierkorbbetrieb vorbereitet. Durch Drücken der Taste PLAY wird die Funktion Papierkorbbetrieb ausgeführt.

Jumper JS 1 removed or in POS. B:

If one of the tape transport push buttons is programmed to TAPE DUMP, the tape dump function will be preselected when pressing the TAPE DUMP key. When pressing the PLAY push button the tape dump function is on.

12. Der Brückenstecker JS 5 auf der Mikro-Prozessor PCB 1.820.780 erhält folgende Funktion.

Brückenstecker JS 5 eingesetzt:

Normal Betrieb

Brückenstecker JS 5 entfernt:

Das Audio Eingangssignal wird direkt auf den Ausgang geschaltet

Diese Funktion wird nur benötigt, um das Potentiometer auf dem Linienverstärker 1.820.714 oder 1.820.715 abzugleichen, wenn keine Kanalselektoren in der A810 eingebaut sind.

12. The jumper JS 5 on the micro processor PCB 1.820.780 has the following new function:

Jumper JS 5 inserted:

Normal operation

Jumper JS 5 removed:

The audio input signal switches directly to the output

This function is just used to align the pot. meter on the line amplifier PCB 1.820.714 or 1.820.715 if no channel selectors are installed in the A810.

13. Brückenstecker JS 1 auf der seriellen Schnittstelle 1.810.752.00:

Der Brückenstecker JS 1 kann jetzt auf Position "H" umgesteckt werden. Dadurch verliert der DIL-Schalter 2 auf der oberen DIL-Schalter Reihe seine Funktion.
Das Gerät erkennt somit selbstständig, ob die RS 232 Schnittstelle aktiviert werden soll, oder ob die Audioparameter auf Band abgespeichert werden sollen. Die Erkennung erfolgt softwaremässig anhand der gesetzten DIL-Schalterposition des Adressprints 1.810.739 und wird über das Busswitch-Signal (T-BUSSW) umgeschaltet.

13. Jumper JS 1 on the serial remote control PCB 1.810.752.00:

Now the jumper JS 1 can be put into POS. "H". Thereby, the DIL-switch 2 on the upper row becomes inactive.

The tape recorder recognizes independently whether the RS 232 port has to be enabled or if the audio parameter has to be stored on the tape. The recognition is activated by software according to the DIL-switch positions of the addressboard 1.810.739 and is switched with the busswitch signal (T-BUSSW).

14. Folgende neue Befehle sind über die RS 232 implementiert worden:

14. Following new RS 232 commands have been implemented:

SMA _xxxxxx-	Setzen der Maschinenadresse via RS 232 auf (xxxxxx) (6 Nummern HEX)	SMA _xxxxxx-	Set machine address to (xxxxxx) (6 digit HEX) via RS 232
MA? =	Abfragen der Maschinenadresse, welche oben gesetzt wurde.	MA? =	Request for the above set machine address
MAN =	Beide Kanäle stumm (mute) geschaltet.	MAN =	Mute for both channels
MAF =	Entriegelung der Stummschaltung (mute) beider Audiokanäle.	MAF =	Mute off for both channels

SI 99/86 D/E
A810 Software 25/86

Completition to Software 40/85
SI 95/86 D/E

Einleitung

Die Software 25/86 wurde ab Serie Nr.5001 eingesetzt und löst die Software 40/85 sowie 13/83 ab.

Die neue Software 25/86 wurde notwendig, da mit der Software 40/85 die automatische Umschaltung Bandsorte A / Bandsorte B bei der A810 Spezial-Ausführung "Pilotton" beim Kopfträger-Austausch nicht mehr funktionierte. Ebenso konnten einige Mängel der Software 40/85 behoben werden.

Introduction:

Software 25/86 is factory installed from serial no. 5001 onwards and replaces the software 40/85 as well as 13/83.

The new software became necessary because with software 40/85 the automatic changeover between Tape sort A and Tape sort B of the A810 Special Pilot-Version was not effective anymore when exchanging the headblock. Some shortcomings of the software 40/85 have also been eliminated.

Wichtig für TLS 4000 Benützer:

Wird die A810 mit der neuen Software 25/86 in einem Synchronisationskomplex mit dem STUDER Synchronisator TLS 4000 betrieben, so muss auch auf dem Interface Print 1.812.120 die Software (alt R5491-2 oder R5491-3) durch R5491-4 ersetzt werden.

Im Hinblick auf die Betriebssicherheit des Synchronisations-Systems, empfehlen wir allen TLS 4000 - Benützern die neue A810 - Maschinen-Software (25/86) zu verwenden.

Siehe auch Software-Kombinationstabelle.

Important for users of TLS 4000

When using the A810 with the new software 25/86 in a synchronizer system together with the STUDER synchronizer TLS 4000, the old software (R5491-2 or R5491-3) of the interface PCB 1.812.120 must be replaced by R5491-4.

To ensure reliable operation of the synchronizer-system we recommend to all TLS 4000 users to up-grade A810 Software to 25/86.

See also Software-Combination table.

Wichtig:

Alle A810 Tonbandgeräte, die mit der Mikroprozessor-Karte 1.820.780 oder 1.810.780.20 bestückt sind, können mit dieser Software bestückt werden.

Um bei dem Mikroprozessor-Print 1.820.780.81 oder 1.820.780.82 (MPU-Karte 1.820.780.12) sicher zu sein, dass der Mikroprozessor in allen Fällen richtig aufstartet, muss die MPU-reset Zeit auf 100ms verlängert werden.

Dazu muss der Kondensator C5(0,47µF) auf der Mikroprozessor-Karte 1.820.780.12 auf 10µF (59.26.2100) geändert werden (siehe Belegungsplan).

Important:

All A810 tape recorders equipped with the microprocessor PCB 1.820.780 or 1.810.780.20 allow the use of the new software.

To make sure that the microprocessor with the MPU PCB 1.820.780.81 and 1.820.780.82 (Layout 1.820.780.12) starts up smoothly in all cases, the MPU reset time must be lengthened to 100ms.

Therefore, capacitor C5 (0,47 µF) of the microprocessor board layout 1.820.780.12 has to be changed to 10 µF 59.26.2100 (see layout).

MPU-Prints mit der Bezeichnung 1.820.780.00 und 1.810.780.20 sind von dieser Aenderung nicht betroffen.

Sonst müssen keine Hardware Aenderungen ausgeführt werden, es genügt, wenn die drei EPROMS ersetzt werden.

This change is not required on MPU PCB's labelled 1.820.780.00 and 1.810.780.20.

No other hardware modifications are necessary - it is sufficient to replace the three EPROM's only.

Umrüstarbeiten:

Es müssen nur die EPROM's ersetzt werden. Dadurch erhält die MPU Karte eine neue Bezeichnung: 1.810.780.21 (Hardware -20).

EPROM R 5212-0 (13/83) oder IC 10 (40/85) 1.810.999.20 wird ersetzt durch IC 10 (25/86) 1.810.999.21.

EPROM R 5213-0 (13/83) oder IC 12 (40/85) 1.810.999.20 wird ersetzt durch IC 12 (25/86) 1.810.999.21.

EPROM R 5214-0 (13/83) oder IC 14 (40/85) 1.810.999.20 wird ersetzt durch IC 14 (25/86) 1.810.999.21.

Modification instructions:

Replace the three EPROM's. With this change, the MPU-PCB receives a new designation: 1.810.780.21 (Hardware - 20).

Replace EPROM R 5212-0 (13/83) or IC 10 (40/85) 1.810.999.20 by IC 10 (25/86) 1.810.999.21.

Replace EPROM R 5213-0 (13/83) or IC 12 (40/85) 1.810.999.20 by IC 12 (25/86) 1.810.999.21.

Replace EPROM R 5214-0 (13/83) or IC 14 (40/85) 1.810.999.20 by IC 14 (25/86) 1.810.999.21.

Wichtig:

Beim Austausch können die Audio-Daten verloren gehen. Daher nach Möglichkeit Daten auf Band abspeichern. Ebenso kann der RAM-interne Betriebsstundenzähler rückgesetzt werden.

Important:

Care must be taken that the Audio-parameters do not get lost when exchanging the EPROM's. Therefore, store the parameters on tape. The RAM-internal elapsed time counter may also be reset to zero.

Softwarebereinigung:

Unter anderem wurden folgende Mängel der Software 40/85 behoben:
- Der (Software) Betriebsstundenzähler ist nicht mehr flüchtig.
- Wird der Aufnahmebefehl während dem Bandauslauf permanent gedrückt, so bleiben die Audiokanäle in Stop nicht mehr auf Ready-Record hängen.

Software modifications:

The following shortcomings of the software 40/85 have been eliminated:
- The (software) elapsed counter content does not disappear anymore.
- If the record command is permanently pressed, even in the moment when the tape is running out of the tape transport, the audio channels do not remain in Ready-Record mode anymore after stop mode has been achieved.

Bedienungsänderungen und neue Funktionen der Software 25/86

Die Software 25/86 offeriert dieselben neuen Funktionen die bereits in der Software 40/85 implementiert sind.
Deshalb können die Bedienungsänderungen und die neuen Funktionen vollumfänglich der SI 95/86 entnommen werden.

Abweichend von SI 95/86 sind nur folgende zwei Punkte:

1) Seite 1 Mitte:

Achtung:

~~Bei Pilot-Ausführung der A810 funktioniert die automatische Umschaltung Bandsorte A / Bandsorte B beim Kopfträgeraustausch mit der Software 40/85 nicht mehr.
Es wird eine neue spezielle Software für die A810 Pilotversion erhältlich sein.~~

Dieser Abschnitt ist nicht mehr gültig.

2) Seite 3 § 5:

5. Die Funktionstasten am Masterpanel (CCIR/NAB, TAPE A / TAPE B oder MONO/STEREO-Umschaltung) sind gegen unbeabsichtigtes Betätigen gesichert worden.

   Die Umschaltung erfolgt nur durch Drücken der STOP-Taste und gleichzeitiges Betätigen der entsprechenden Umschalttaste am Masterpanel.

   Diese Funktion ist jetzt mit einem Jumper auf dem Masterpanel anwählbar.

Operating changes and new functions of software 25/86

Software 25/86 offers the same new features which are already implemented in software 40/85.
Therefore, all the operating changes and new function can be read in SI 95/86.

Differing from SI 95/86 are only the following two paragraphs:

1) Page 1 center:

Please note:

~~The automatic changeover from tape sort A to tape sort B by exchanging the headblock of the A810 pilot versions, does not function anymore with software 40/85.
A new special software for all A810 pilot versions will be released.~~

This paragraph is no longer valid.

2) Page 3 § 5:

5. The push button of the masterpanel CCIR/NAB, TAPE A / TAPE B or MONO/STEREO-switches) have been protected against unintentional operation.

   Changeover occurs only when pressing the STOP button while pressing simultaneously the required push button of the master panel.

   This function is now selectable by a jumper on the Masterpanel.

a) Masterpanel 1.810.310.00/81
(2 Geschwindigkeits-Version)

Der Jumper JS2 auf dem Master-Control PCB 1.810.733.00 hat neu folgende Funktion:

JS2 in POS A = Funktionstasten verriegelt mit Stop-Taste

JS2 in POS B = Funktionstasten direkt schaltbar

b) Masterpanel 1.810.312.00
(3 Speed)
Masterpanel 1.810.305.00
(4 Speed)

Der Jumper JS1 auf dem Master-Control PCB 1.810.765.00 hat neu folgende Funktion:

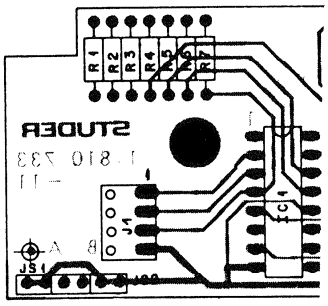
JS1 in POS A = Funktionstasten verriegelt mit Stop-Taste

JS1 in POS B = Funktionstasten direkt schaltbar

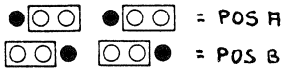
Wichtig:

Damit bei der A810 Pilot-Ausführung die automatische Umschaltung Tape A / Tape B möglich ist, muss der Jumper in Position B stehen.

MASTER CONTROL PCB 1.810.733–00



JS1 JS2



a) Masterpanel 1.810.310.00/81
(2 Speed-Version)

The jumper JS2 on the Master-Control PCB 1.810.733.00 has the following new function:

JS2 in POS A = Function change-over locked with Stop-Key

JS2 in POS B = Function change-over directly switchable

b) Masterpanel 1.810.312.00
(3 Speed)
Masterpanel 1.810.305.00
(4 Speed)

The jumper JS1 on the Master-control PCB 1.810.765.00 has now the following function:

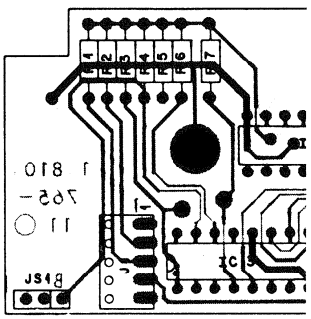
JS1 in POS A = Function change-over locked with Stop-Key

JS1 in POS B = Function change-over direct switchable.

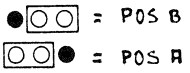
Important:

In order to make possible an automatic changeover from Tape A to Tape B in the A810 Pilot version (or vice versa) the jumper must be in position B.

MASTER CONTROL PCB 4 SPEED 1.810.765–00



JS1



A810 Software { matched to / Anpassung an } TLS 4000

The different Software - conditions of the A810 require also different Software (SW) for the TLS 4000 Interface.

Mit den verschiedenen Software - Ständen der A810 werden auch verschiedene TLS 4000 Interface - Software (SW) notwendig.

STUDER REGENSDORF ZÜRICH	Benennung: MP UNIT WITH SOFTWARE	Nummer: 1.820.780.-82

Software A810 01/88

Bestellnummer 20.100.810.01
Order number 20.100.810.01

SI 116/88 D/E

Einleitung

- Die neue Software 01/88 ermöglicht Zeitcode Aufnahme- und Wiedergabe bei 3 3/4 ips (9,5 cm/s).

- Das Drop-in, drop-out timing wurde ebenfalls optimiert, um im Synchronisationsbetrieb (mit TLS 4000) ein nahtloses, unhörbares Aneinanderfügen der Aufnahmesequenzen zu garantieren.

- Es wurden gleichzeitig Aufkleber erstellt, welche die Funktion der Jumpers (Brückenstecker) erklärt.

- Die Software 01/88 sorgt auch für eine optimale Anpassung an die beiden neuen OPTIONEN parallele Kanalfernsteuerungs-Interface für VUK- (20.810.900.00) und NICHT VUK (20.810.901.00) Versionen.

- Einige kleine Mängel der vorgängigen Software 25/86 konnten behoben werden.

WICHTIG FUER TLS 4000 BENUETZER

Aus der Software-Kombinationstabelle auf der letzten Seite dieser SI sind die aktuellen Software-Kombinationen ersichtlich.

Introduction

- The new software 01/88 makes time code recording and reproduction at 3 3/4 ips (9,5 cm/s) possible as well.

- The drop-in and drop-out timing has been optimized to ensure gapless inaudible insertions when working with a synchronizer system such as the TLS 4000.

- Labels to explain the jumper-functions are also provided.

- The software 01/88 offers optimal matching to the two new OPTIONS Parallel channel control interface for VUK- (20.810.901.00) and NON VUK 20.810.900.00) versions.

- Some minor shortcomings of the software 25/86 are also eliminated.

IMPORTANT FOR USERS OF THE TLS 4000

For the latest software combinations refer to the software combination table on the last page of this SI.

Der Software-Umrüstsatz 20.100.810.01 enthält

1 x Software 01/88	1.810.999.22
1 x Schild Index 22	1.810.780.01
1 x Schild für MPU	1.810.780.02
1 x Schild für Masterpanel	1.810.090.63
1 x Schild für progr. Tabelle	1.810.090.64
1 x SI 116/88	10.85.6010

Die Software 01/88 wurde bei allen A810 Tonbandgeräten ab Tonbandgeräten Serienr. 6885 serienmässig eingebaut.

The software up-date kit 20.100.810.01 contains

1 x Software 01/88	1.810.999.22
1 x Label Index 22	1.810.780.01
1 x Label for MPU PCB	1.810.780.02
1 x Label for Masterpanel	1.810.090.63
1 x Label for progr. table	1.810.090.64
1 x SI 116/88	10.85.6010

The software 01/88 is factory installed in all A810 tape recorders from serial no. 6885 onwards.

Anwendung

Alle A810 Tonbandgeräte bestückt mit den unten aufgelisteten Printplatten oder Softwareanzeigen können ohne Hardware-Aenderungen auf den neuestens Softwarestand aufgerüstet werden.

Software	Printplatte
13/83	1.820.780.00 1.820.780.81 1.820.780.82
40/85	1.810.780.20
25/86	1.810.780.21

Application

The new software is suitable for all A810 tape recorders equipped with the below listed printed circuit boards or software status displays. A hardware modification is not required.

Software	PC-Boards
13/83	1.820.780.00 1.820.780.81 1.820.780.82
40/85	1.810.780.20
25/86	1.810.780.21

Bitte beachten

Geräte mit Software 07/83 (MPU Print 1.810.752.00) können nur durch Ersetzen der MPU-Karte auf die Software 01/88 aufgerüstet werden.

Bestellnummer für MPU-Karte mit Software 01/88: 1.810.780.22.

Please note

For tape recorders still equipped with software 07/83 (MPU PCB 1.810.752.00) the MPU-PCB needs to be exchanged.

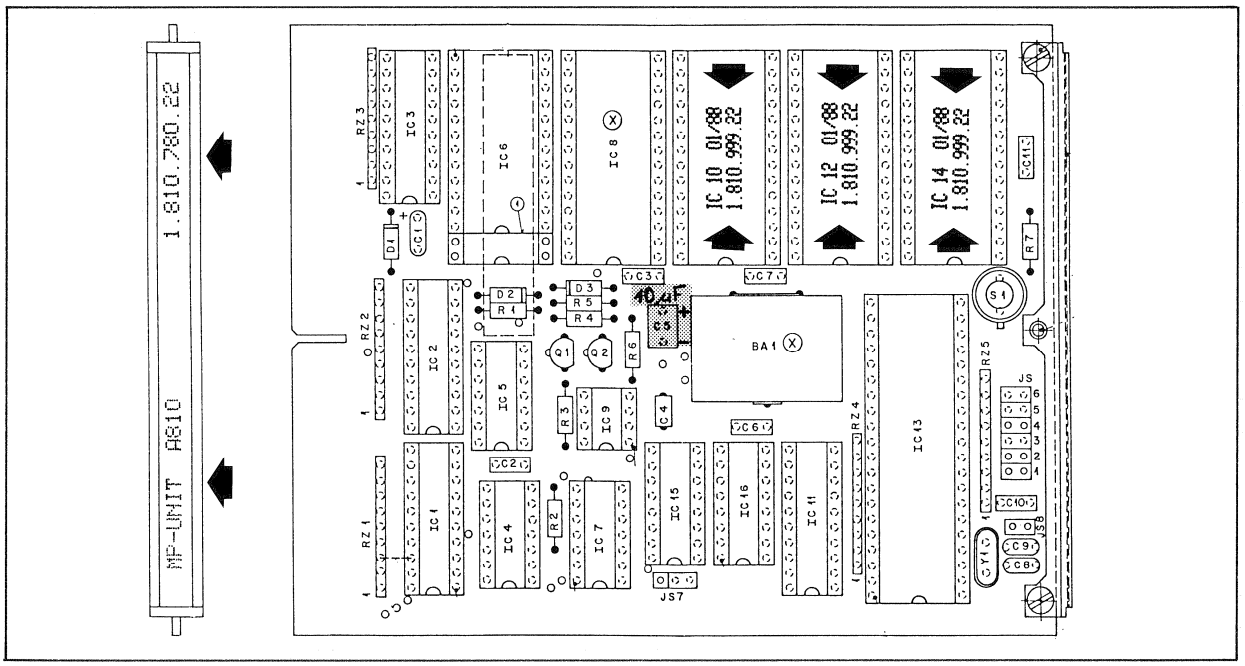
Order number for MPU PCB with software 01/88: 1.810.780.22.

Umrüstarbeiten

Es müssen nur die drei EPROM's und der Bezeichnungsstreifen 1.810.780.22 auf der der MPU-Karte ersetzt werden. Siehe Bestückungsplan unten.

Modification instructions

Only the three EPROM's and the designation label 1.810.780.22 on the MPU PCB need to be replaced. See layout below.

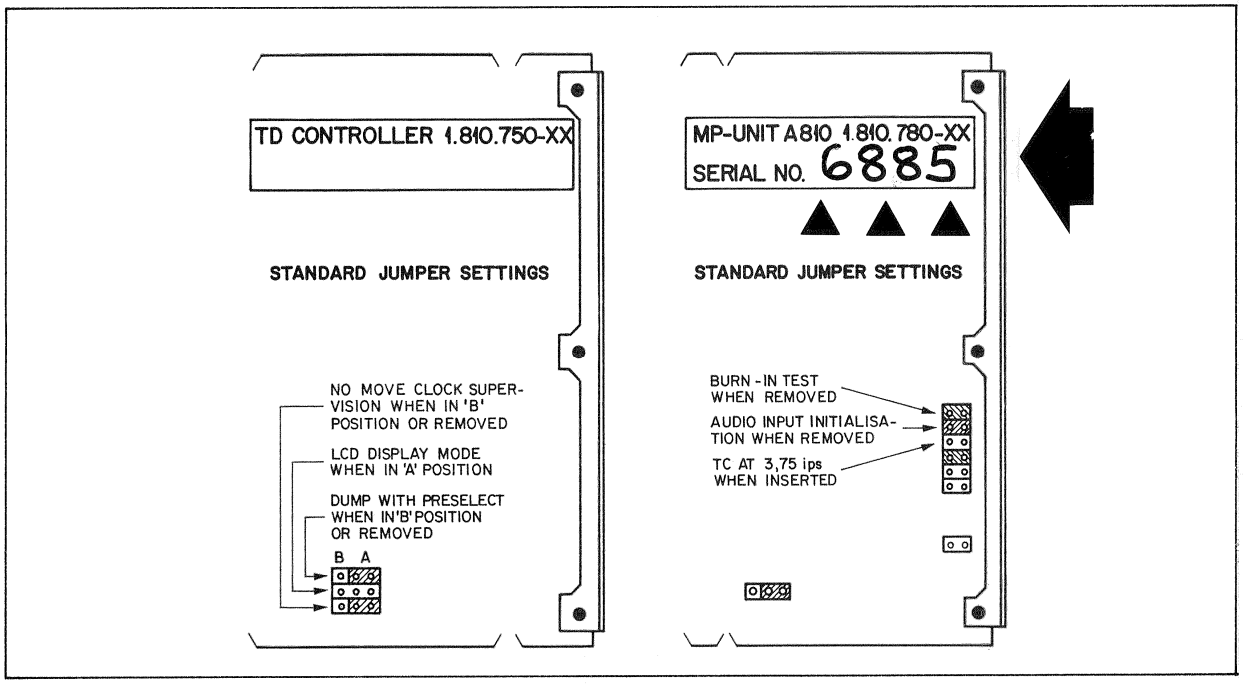


Auf diesem MPU Bestückungsplan muss C5 10 µF (59.26.2100) betragen.

Anschliessend die Serienummer der A810 auf dem Brückenstecker-Bezeichnungsschild 1.810.780.02 eintragen und Kleber an der Rückseite der MPU-Karte aufkleben.
Siehe Aufkleber Beispiel unten:

Check that C5 on this MPU-layout is 10 µF (59.26.2100).

Write the serial number of the A810 on to the jumper setting label 1.810.780.02 and stick it to the rear side of the MPU PCB.
See label example below:



Wichtig

Beim Austausch der EPROM's können die Audio Daten verloren gehen. Daher nach Möglichkeit Daten auf Band abspeichern. Ebenso kann der RAM-interne Betriebsstundenzähler rückgegesetzt werden.

Sollten nach dem Software-Wechsel unerwartete Zustände auftreten, (wie z.B. Aussteigen aus der Aufnahme nach einigen Minuten Betrieb mit Anzeige EEEC1 oder EEEC2), so ist das RAM auf der MPU Karte zu löschen. Dazu RAM (IC 6) herausnehmen und die beiden Anschlussreihen mit einem Schraubenzieher kurzschliessen.
Dabei ist es unerlässlich, dass die Audioparameter vorher ausgelesen werden, ansonsten die Maschine neu eingemessen werden muss.

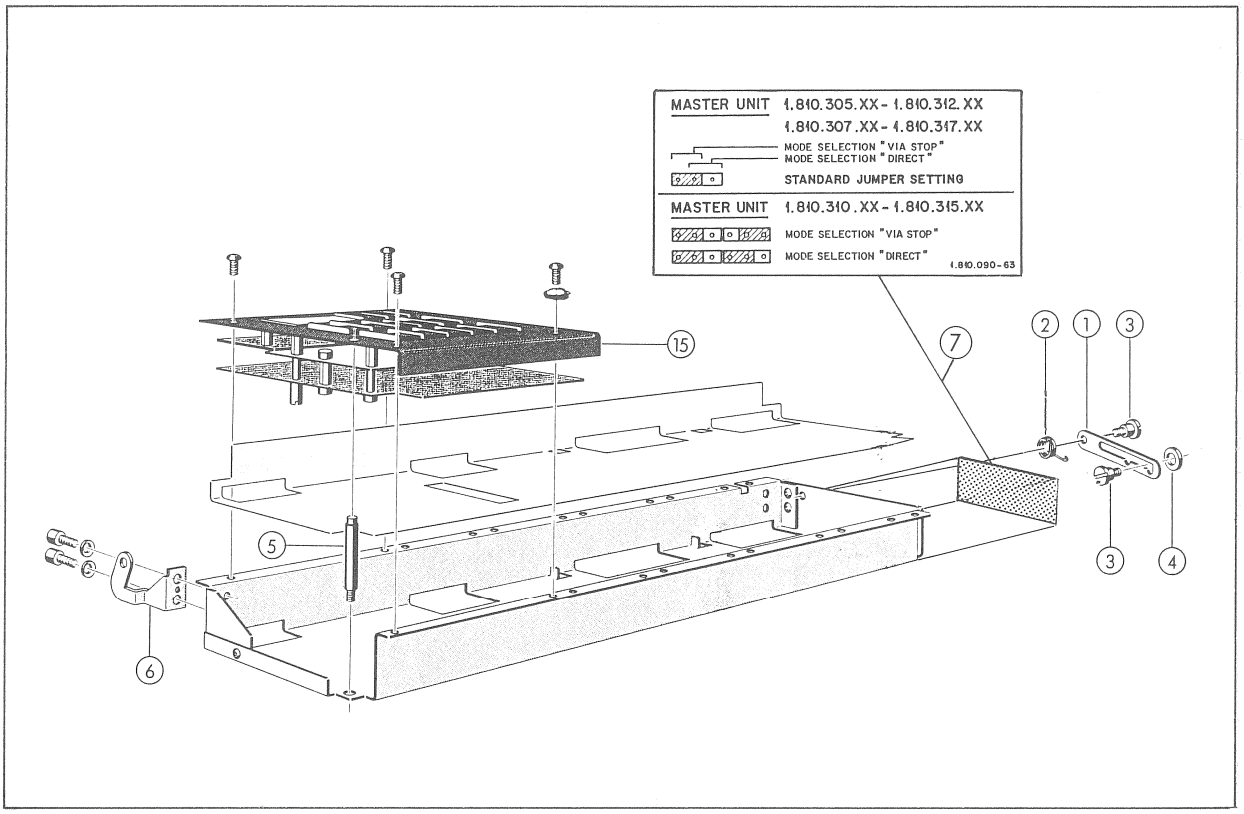
Important

Care must be taken to make sure the Audioparameters do not get lost when exchanging the EPROM's. Therefore, store the parameters on tape. The RAM-internal elapsed time counter may also become reset to zero.

If the tape recorder shows unexpected conditions after the software change (as i.e. drop out of record mode after a few minutes in operation and the display indicates EEEC1 or EEEC2) erase the RAM on the MPU PCB. For this remove the RAM (IC 6) and short circuit both rows of connection pins with a screwdriver.
Before doing this it is necessary that the audioparameters are saved on tape, otherwise the tape recorders will have to be realigned.

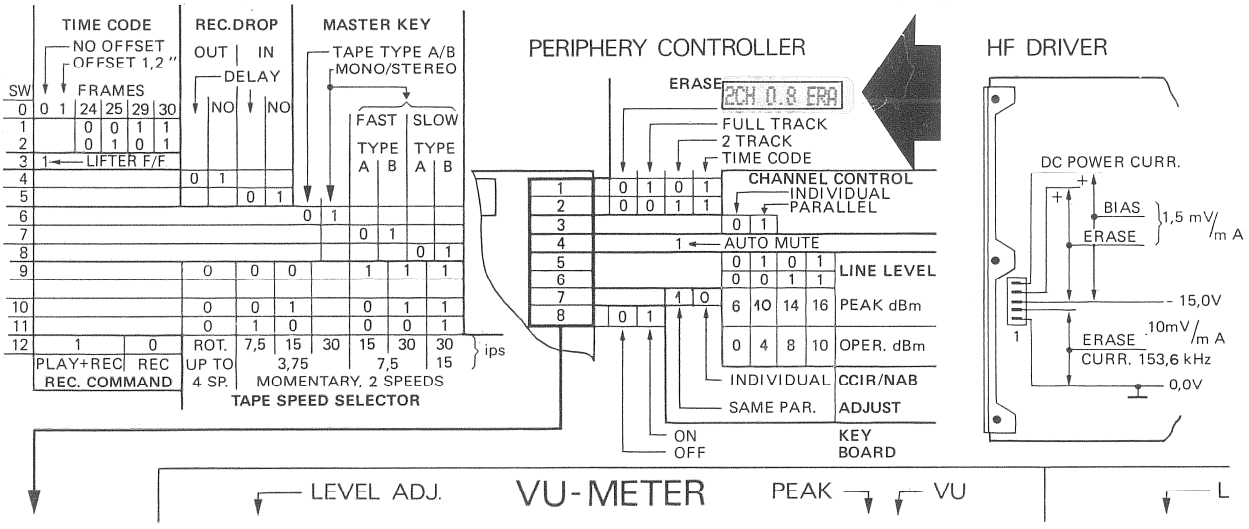
Bedienpanel aufklappen und Kleber ⑦ (1.810.090.63) für die Brückenstekkerpositionen auf dem Masterpanel auf der rechten Seite vom Bedienpanel aufkleben.

Open command unit panel and stick the label ⑦ (1.810.090.63) for the jumper settings of the masterpanel onto the right hand side of the command unit panel.



Zusatzkleber 1.810.090.64 für die DIL-Schalter auf dem PERIPHERY CONTROLLER auf die grosse Programmiertabelle aufkleben.

Attach the additional label 1.810.090.64 for the DIL-switch settings of the PERIPERY-CONTROLLER onto the large programming table.



Software Aenderungen

1. Zeitcode Aufnahme-Wiedergabe bei 3 3/4 ips

   Um die Zeitcode Aufnahme/Wiedergabe bei 3 3/4 ips zu aktivieren, muss der Brückenstecker JS 4 auf der MPU-Karte 1.810.780.22 eingesteckt werden.

   Dabei ist zu beachten, dass das Potentiometer R2 auf dem Zeitcode-Print 1.820.721.XX für die Zeitcode-Aufnahmepegeleinstellung bei 7 1/2 ips dadurch auch für 3 3/4 ips eingesetzt wird.
   Eine individuelle Pegeleinstellung für 3 3/4 ips und 7 1/2 ips ist daher nicht möglich.
   Eventuell muss der Pegel für 3 3/4 ips TC-Aufzeichnung leicht optimiert werden. (Einstellung siehe Serviceanleitung Sektion 4/27).

2. Verbessertes Drop-in, Drop-out timing

   Verbesserung der Verzögerungszeiten für den Aufnahme-Ein- und Ausstieg (Drop-in, Drop-out), um ein nahtloses, unhörbares Aneinanderfügen einzelner Aufnahmesequenzen zu gewährleisten.

3. Ergänzung der Löschkopf Varianten

   Wird bei A810 NICHT ZEITCODE Geräten beim Löschvorgang keine Zeitcode-Löschung gewünscht, so muss der 2 Kanal Löschkopf mit 0,8 mm Spurtrennung 1.116.814.00 eingesetzt werden.

   Für die entsprechende Löschstromvorgabe und das korrekte drop-in drop-out timing für diese Löschkopfvariante, musste die Software angepasst werden.
   Beide DIL-Schalter 1 und 2 auf dem Periphery Controller müssen dafür auf Null stehen.

Software modifications

1. Time code recording and playback at 3 3/4 ips

   To activate time code recording and playback at 3 3/4 ips, insert the jumper JS 4 on the MPU PCB 1.810.780.22.

   Please note that the potentiometer R2 on the time code read/write unit 1.820.721.XX for aligning the time code record level at 7 1/2 ips is used to set the TC-level at 3 3/4 ips as well.
   An individual level setting for 3 3/4 ips and 7 1/2 ips is not possible therefore.
   Most probably the TC recording level for 3 3/4 ips needs to be optimized. (For readjustment refer to Service manual section 4/27).

2. Improved drop-in, drop-out timing

   Improved drop-in, drop-out timing to ensure gapless, inaudible inserts.

3. Supplementary Info for erasehead versions

   To avoid time code erasure on A810 NON-TIME CODE versions, a special 2 track erase head with 0,8 mm track spacing 1.116.814.00 is required.

   For correct erase current and correct drop-in, drop-out timing the software has to be matched to this erasehead configuration.

   Set the two DIL-switches 1 and 2 of the periphery controller to zero for this erasehead configuration.

Bitte beachten

Mit der Software 01/88 entfällt somit die Position NO RECORD. Für "Master safe" müssen daher entweder beide Aufnahmeverstärker oder beide HF-Treiber ausgesteckt werden.

4. Blinkende LED's in Rehearse

Bei der Schnittprobe-Funktion "Rehearse" (Befehl SRH der seriellen Schnittstelle) blinkt die PLAY LED (bzw. PLAY und REC).

5. Neue LOC-START Philosophie

Es werden nur noch definierte PLAY- (bzw. RECORD) Uebergänge im Loc-start-Speicher eingelesen, d.h. nur Wiedergabe und Aufnahmestarts aus Bandstillstand (Stop) werden abgespeichert.

6. FADER Bereitschaftsanzeige

Das Signal BR-FAD am Anschluss 8 des parallelen Fernsteueranschlusses zeigt mit der Software 01/88 die Faderstart Bereitschaft an, d.h. wenn ein Faderstart möglich ist, ist dieses Signal Low (0V) und kann somit mittels einer Lampe oder LED anzeigen, dass die A810 den Wiedergabe-Startbefehl beim Oeffnen des Faders annimmt.

7. Bedieneinheit ausschalten

Vom Print Parallel Remote Controller 1.810.738.00 aus kann wahlweise die Bedieneinheit oder die externe Fernsteuerung abgeschaltet werden.

Durch Anlegen von 0 V an die Kathode von D20 auf dem Parallel Remote Controller Print 1.810.738 wird die Befehlseingabe der externen Fernsteuerung verhindert.

Please note

With the software 01/88 the position NO RECORD is inapplicable.
For Master-safe remove either both record amplifier PCB or both HF-Driver PCB.

4. Flashing LED's in rehearse mode

In rehearse mode (command SRH of the serial remote control) the PLAY-LED (resp. PLAY and REC) flashes.

5. New LOC-START philosophy

Only "genuine" start positions will be stored in the Loc-start memory, i.e. only when the PLAY (resp. RECORD) start happens out of tape stand still (stop).

6. Indication of FADER READY

With software 01/88 the signal BR-FAD on pin 8 of the parallel remote control socket indicates the fader ready mode, i.e. when faderstart mode is possible the signal BR-FAD is low (0V). Thus a bulb or LED connected to this signal indicates that the A810 will accept the Play command when opening the fader.

7. Disabling the command unit

From the parallel remote controller PCB 1.810.738.00 it is possible to disable the internal command unit or the external remote control alternatively.

To disable the commands from the external remote control, apply 0V to the cathode of D20 on the parallel remote controller PCB 1.810.738.

D24 an Widerstandsnetzwerk RZ1/ RZ2 anschliessen. Durch Anlegen von 0 V an die Kathode von D24 wird die Befehlseingabe der Geräteinternen Bedieneinheit verhindert.
Siehe Schema unten.

To disable the commands of the internal command unit, connect a diode D24 to the resistor network RZ1 / RZ2 and apply OV to cathode of this diode.
See circuit diagram below.

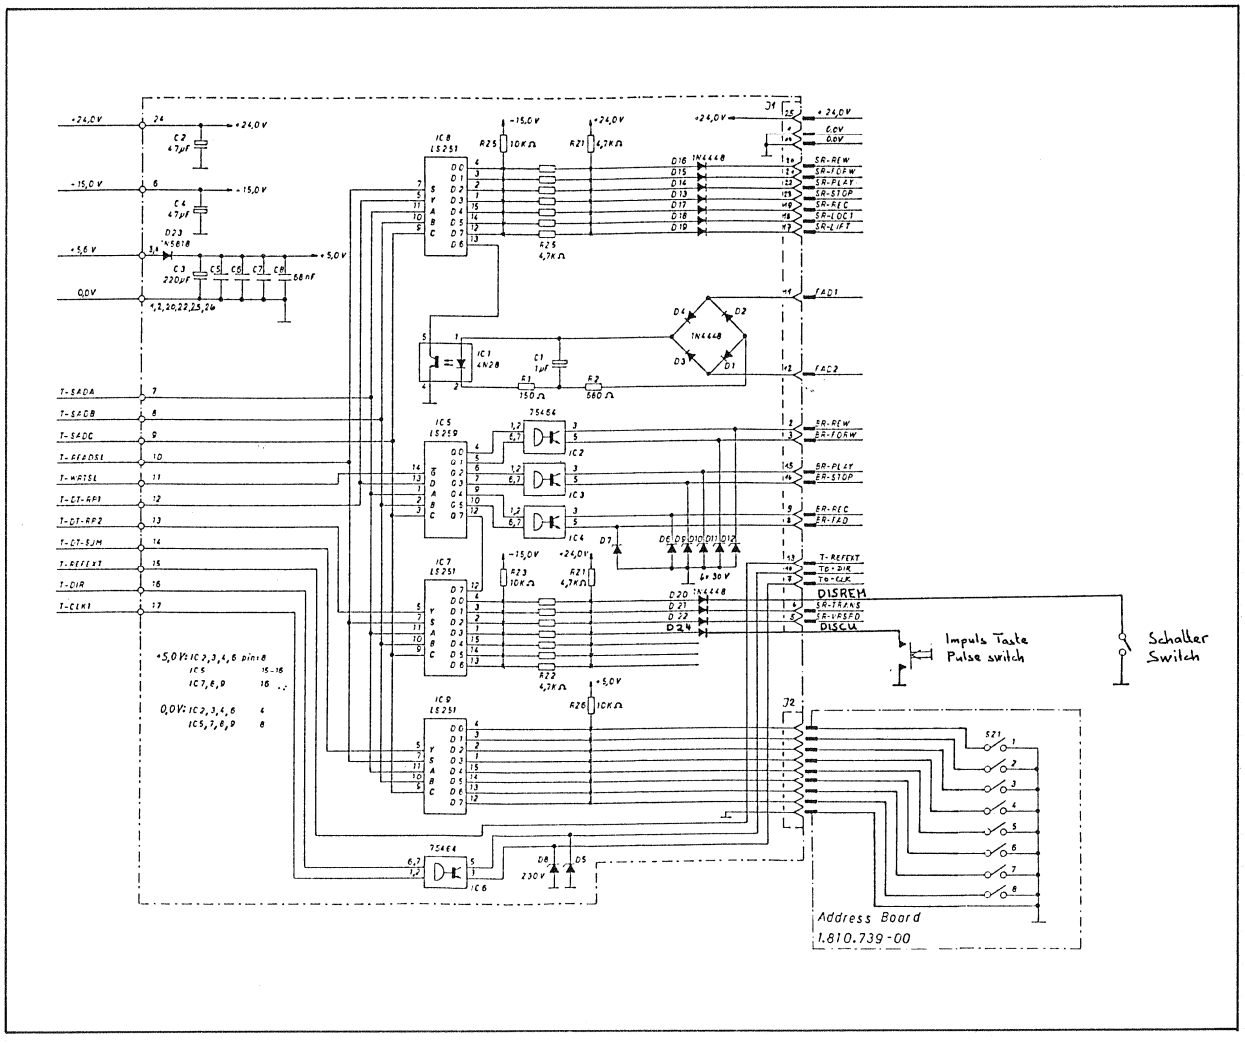
Bitte beachten

Diese Signale sind nicht auf den parallelen Fernsteueranschluss gelegt.
Soll zum Beispiel die Abschaltung der Bedieneinheit Geräte extern erfolgen, so muss ein zusätzlicher Draht verwendet werden.

Please note

These signals are not available on the parallel remote control socket.
For example: To disable the command unit from an external device an additional wire will be required.

PARALLEL REMOTE CONTROLLER PCB 1.810.738–00 GR23 ADDRESS PCB 1.810.739–00



8. Anpassung an die Kanalfernsteuerung

Die Software musste den Optionen "Parallele Fernsteuerungs-Interface für VUK- (20.810.901.00) und NICHT VUK-Versionen (20.810.900.00)" insofern angepasst werden, damit bei eingeschalteter Kanalfernsteuerung (21.328.260.00) der angewählte Funktionsstatus beim Einschalten der A810 eingelesen wird.

9. Anpassung der Standard Entzerrungsparametern

Die Parameters für die Zeitkonstanten der Entzerrung und der Einstellung der Höhen wurde in der Software dem aktuellen Stand angeglichen.

CCIR

Wiedergabeentzerrung 3 3/4 ips:	AB
Aufnahmehöhen 3 3/4 ips:	90

NAB

Aufnahmehöhen 15 ips:	39
Sync Höhen 15 ips:	AO
Aufnahmehöhen 7 1/2 ips:	39
Sync Höhen 7 1/2 ips:	AO
Wiedergabeenentzerrung 7 1/2 ips:	6D
Aufnahmehöhen 3 3/4 ips:	90
Wiedergabeentzerrung 3 3/4 ips:	AB

10. Neue Statusanzeige

Wird bei einem LOCATE-Befehl mit Aufnahmevorwahl über die RS 232 der Status-(ST?) während der Lockierphase abgefragt, so erscheint als Rückmeldung nicht mehr 12 (Locate + Play), sondern 13 = LOCATE + RECORD.
Ebenso erscheint bei der Dauer-Status-Abfrage (DST) die Rückmeldung LOC + REC.

8. Matching to the channel remote control

The software had to be matched to the options "parallel remote control interface for VUK- (20.810.901.00) and NON VUK-versions (20.810.900.00)" for correct initialization of the push-button selected functional status of the channel remote controller (21.328.260.00) when powering the A810 tape recorder while the channel remote controller is switched on.

9. Matching of the standard equalization parameters

With the new software, the parameters of the time constants for equalization and the treble adjustment are matched to the newest status.

CCIR

Reproduce equalization 3 3/4 ips:	AB
Record treble 3 3/4 ips:	90

NAB

Record treble 15 ips:	39
Sync treble 15 ips:	AO
Record treble 7 1/2 ips:	39
Sync treble 7 1/2 ips:	AO
Reproduce equalization 7 1/2 ips:	6D
Record treble 3 3/4 ips	90
Reproduce equalization 3 3/4 ips	AB

10. New status information

The status information request (ST?) via RS 232 during the search mode of a LOCATE command with record preselected, changed from 12 (locate + play) to 13 = LOCATE + RECORD.
Furthermore the status information LOC + REC is displayed also with permanent status request DST.

11. Direkter Zugriff zu den DAC's ohne Abspeicherung.

Mit dem Befehl PAP über die RS 232 können für den aktuellen Betriebszustand Daten direkt in die digital / analog Converters (C-MOS Attenuators) eingeschrieben werden, ohne die im RAM abgespeicherten Daten zu verändern.

Befehlseingabe

PAP_i,j,xx

- xx = HEX Zahl
- j = D/A Converter
- i = Kanal (1 oder 2)
- _ _ = Abstand (Blank)

j: 0 = Pegel Repro / Sync
1 = Höhen Repro / Sync
2 = Bass Repro / Sync
3 = Entzerrung Repro / Sync
4 = Pegel Aufnahme
5 = Höhen Aufnahme
6 = Vormagnetisierung
7 = Entzerrung Aufnahme

Beispiel einer Befehlseingabe

PAP 1,0,00 Enter

- HEX-Wert 00
- Pegel Wiedergabe
- Kanal 1

Steht das Gerät auf REPRO, so wird dadurch der Wiedergabepegel von Kanal 1 auf 00 (Null) gesetzt. Kanal 1 ist somit stumm.

11. Direct access to the DAC's without store

The command PAP via RS 232 permits to enter Data direct into the digital / analog converters (C-MOS attenuators) without influencing the Data stored in the RAM, for the selected operational status.

Command input

PAP_i,j,xx

- xx = HEX Number
- j = D/A Converter
- i = Channel (1 or 2)
- _ _ = Blank

j: 0 = Level Repro / Sync
1 = Treble Repro / Sync
2 = Bass Repro / Sync
3 = Equalization Repro / Sync
4 = Level Record
5 = Treble Record
6 = Bias
7 = Equalization Record

Example for a command input

PAP 1,0,00 Enter

- HEX-value 00
- Level Repro
- Channel 1

Is the tape recorder switched to REPRO, the reproduce level of channel 1 will be set to 00 (zero), therefore, channel 1 is muted.

12. Software-Bereinigungen

- Fehler Rückmeldungen auf der LED-Anzeige werden jetzt immer mit EEE .... angezeigt, PPP Informationen sind somit nicht mehr möglich.

- Keine Aufhebung mehr von der Funktion "Auto mute" (Stummschaltung), wenn während dem Wickeln die Geschwindigkeit umgeschaltet wird.

13. Aufnahmeschlaufe

Mit dem Jumper JS6 auf der MPU-Karte (Burn-in mode) kann ein Aufnahmeschlaufbetrieb für Dauerlauf- und Testzwecke gesetzt werden.

Jumper JS6 eingesetzt: Normaler Betrieb der Maschine.

Jumper JS6 entfernt:
Maschine verhält sich wie folgt:

Beim Einschalten des Gerätes wird der Bandzähler auf 00:00:00 gesetzt und das Display zeigt EEEbb zur Information , dass der Aufnahmeschlaufenbetrieb aktiviert wurde und das Gerät geht bis zur Zieladresse in den Aufnahmebetrieb. Dann wird auf 00:00:00 zurückgespult und der Aufnahmevorgang wiederholt sich unendlich (Zieladressen siehe unten).

Soll anstelle der Daueranzeige EEEbb, der Zählerstand sichtbar werden, so muss die Taste TRANS und gleichzeitig die Taste STOP gedrückt werden.
Da dadurch das Laufwerk in Stop geht, muss anschliessend eine Laufwerkfunktionstaste (<, >, Play oder Rec) gedrückt werden, um den Schlaufenbetrieb wieder zu aktivieren.

Die Schlaufenlängen sind fest in der Software eingegeben und können extern nicht verändert werden.

12. Software corrections

- Fault indications on the LED-Display are now always shown with EEE ..., PPP-indications are no longer possible.

- No longer a disabling of the function "auto mute" by changing the speed during a fast wind mode.

13. Record Loop

The jumper JS6 on the MPU-PCB (Burn-in mode) enables a record-loop for endurance test-mode (soak testing).

For normal operation the jumper JS6 must be inserted.

If the jumper JS6 is removed the tape recorder reacts as follows:

When switching the tape recorder on, the tape counter resets to 00:00:00 and the display shows EEEbb to indicate that the record loop is activated. Afterwards the tape recorder starts in the record mode up to the target address, then the recorder rewinds to counter position 00:00:00. Now the recording mode will be repeated endlessly. (Target addresses see below).

To display the counter position instead of the permanent display EEEbb, press push button TRANS and STOP simultaneously.
Because this causes the tape transport to enter the stop mode, an operating mode (i.e. <, >, Play or Rec) has to be selected to reactivate the loop mode.

The length of the loops have been defined in the software and therefore, cannot be changed by the user.

Die Schlaufenlängen betragen:

ca. 8 Minuten bei 9,5 cm/s
ca. 4 Minuten bei 19 cm/s
ca. 2 Minuten bei 38 cm/s
ca. 1 Minute bei 76 cm/s

Achtung wichtig:

Die Schlaufe erfolgt immer in Aufnahme d.h. der Löschvorgang ist immer aktiviert, selbst wenn die Safe-Ready-Schalter auf safe stehen, oder gar wenn das externe VU-Meter-Panel nicht angeschlossen ist.

14. A810 Software Anpassungstabelle an das TLS 4000

Siehe nächste Seite.

Achtung

Auf der Laufwerkfernsteuerung kann durch den Softwarewechsel die Funktion der LOC-Taste geändert haben. Zuordnung der gewünschten Funktion durch folgende Programmierung:

Auf der Laufwerkfernsteuerung kann die LOC 1 Taste als LOC-START-Taste oder zurück als LOC 1 Taste umprogrammiert werden.

Umprogrammieren der LOC 1 Taste auf LOC-START:

TRANS und LOC 1 Taste drücken und gleichzeitig noch die PLAY Taste drücken. Die LOC 1 Taste der Laufwerksteuerung ist somit LOC-START-Taste. Wird die Taste aktiviert, leuchtet auf der geräteinternen Bedieneinheit die LOC-START LED. (Funktion wird im RAM eingelesen somit bleibt sie auch nach dem Ausschalten des Gerätes enthalten).

Umprogrammieren von LOC-START zurück auf LOC 1:

TRANS und LOC-START-Tasten drücken und gleichzeitig STOP-Taste drücken. Somit ist die LOC-START Taste wieder LOC 1-Taste. Beim Aktivieren der LOC 1 Taste leuchtet auf der maschinenintern Bedieneinheit die LOC 1 LED.

The length of the loops are:

approx. 8 minutes for 3 3/4 ips
approx. 4 minutes for 7 1/2 ips
approx. 2 minutes for 15 ips
approx. 1 minute for 30 ips

Attention important:

The loop-mode is always in Record i.e. the erase mode is always activated, even if the ready-safe switches are in position safe or even if the external VU-meter panel is not connected.

14. A810 Software-matching table to the TLS 4000

See next page.

Please note

In case the LOC-key on the tape transport remote control has changed its function due the software change reprogram the required function according to the following instructions:

On the tape transport remote control the LOC 1 push button function can be changed into LOC-START and vica versa.

Programming of the LOC 1 push button to LOC-START:

Press TRANS and LOC 1 push buttons together and at the same time the PLAY-key. Now the LOC 1 push button activates the LOC-START function. When pressing this push button, the LOC-START LED of the internal command unit lights up. (The function is stored in the RAM, therefore, the function remains stored even after power off).

Programming the LOC-START function back to LOC 1:

Press TRANS and LOC-START push buttons together and in addition the STOP-push button. Now the LOC-START push button is again LOC 1. When pressing this push button the LOC 1 LED of the internal command unit lights up.

A810 SOFTWARE — MATCHED / ANPASSUNG AN — TLS 4000

The different Software conditions of the A810 requires also different Software (SW) for the TLS 4000 Interfaces.
Mit den verschiedenen Software-Ständen der A810 werden auch verschiedene TLS 4000 Interfaces Software (SW) notwendig.
