Cathode-ray tubes

Elcoma – Philips Electronic Components and Materials Division – embraces a world-wide group of companies operating under the following names:

IBRAPE
RTC
Miniwatt
Signetics
Mullard
VALVO
PHILIPS

Elcoma offers you a technological partnership in developing your systems to the full. A partnership to which we can bring

- world-wide production and marketing
- know-how
- systems approach
- continuity
- broad product line
- fundamental research
- leading technologies
- applications support
- quality

CATHODE-RAY TUBES

SELECTION GUIDE

SELECTION GUIDE CATHODE-RAY TUBES

preferred types

Monoaccelerator tubes

type*	standard phosphor	display area mm²	accelerator voltage V	deflection coefficient V/cm hor.	deflection coefficient V/cm vert.	line width mm	max. bandwidth MHz	heater current at 6,3 V mA	max. overall length mm	special features

GENERAL

LIST OF SYMBOLS

Symbols denoting electrodes and electrode connections

f	Heater
k	Cathode
g	Grid Grids are distinguished by means of an additional numeral; the electrode nearest to the cathode having the lowest number
x_1, x_2	Deflection plates intended for deflection in horizontal direction
y_1, y_2	Deflection plates intended for deflection in vertical direction Sectioned deflection plates are indicated by an additional decimal e.g. $y_{1.1}$ $y_{1.2}$ and $y_{2.1}$ $y_{2.2}$
m	External conductive coating
ℓ	Fluorescent screen
i.c.	Tube pin which must not be connected externally
n.c.	Tube pin which may be connected externally

Symbols denoting voltages

V	Symbol for voltage, followed by an index denoting the relevant electrode
V_f	Heater voltage (r.m.s. value)
V_p	Peak value of a voltage
$V_{(p-p)}$	Peak-to-peak value of a voltage

Symbols denoting currents

I	Symbol for current followed by an index denoting the relevant electrode
I_f	Heater current (r.m.s. value)

Symbols denoting powers

W_ℓ	Dissipation of the fluorescent screen
W_g	Grid dissipation

Symbols denoting capacitances

See IEC Publication 100.

Symbols denoting resistances

R	Symbol for resistance followed by an index for the relevant electrode pair. When only one index is given the second electrode is the cathode

When R is replaced by Z the "resistance" should read "impedance"

Symbols denoting various quantities

L	Luminance
f	Frequency
H	Magnetic field strength
M	Deflection coefficient
M_{sc}	Scan magnification
B	Bandwidth
l.w.	Line width
e	Eccentricity
t_p	Pulse duration

OPERATIONAL RECOMMENDATIONS

GENERAL

Unless otherwise stated the published data are typical values.

TYPICAL OPERATION

Under this heading in the data sheets, the conditions are given which result in the specified performance. This performance represents the best compromise for the intended applications of the tube.

LIMITING VALUES

Unless otherwise stated the tubes are rated according to the absolute maximum rating system.

Limiting values are in accordance with the applicable rating system as defined by IEC publication 134. Reference may be made to one of the following 3 rating systems.

Absolute maximum rating system. Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.
These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment components spread and variation, equipment control adjustment, load variations, signal variation, environmental conditions, and spread or variations in characteristics of the device under considerations and of all other electronic devices in the equipment.

Design-maximum rating system. Design-maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and throughout life, no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

* A bogey tube is a tube whose characteristics have the published nominal values for the type. A bogey tube for any particular application can be obtained by considering only those characteristics which are directly related to the application.

Design-centre rating system. Design-centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under average conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply-voltage variation, equipment component spread and variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations or spread in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design-centre value for the intended service is exceeded with a bogey electronic device* in equipment operating at the stated normal supply voltage.
If the tube data specify limiting values according to more than one rating system the circuit has to be designed so that none of these limiting values is exceeded under the relevant conditions.

In addition to the limiting values given in the individual data sheets the directives in the following paragraphs should be observed.

HEATER SUPPLY

The heater voltage must be within ± 7% of the nominal value when the supply voltage is at its nominal value, and when a tube having the published heater characteristics is employed. This figure is permissible only if the voltage variation is dependent upon more than one factor. In these circumstances the total tolerance may be taken as the square root of the sum of the squares of the individual deviations arising from the effect of the tolerances of the separate factors, providing none of these deviations exceeds ± 5%. Should the voltage variation depend on one factor only, the voltage variation must not exceed ± 5%.

For maximum cathode life it is recommended that the heater supply be stabilized at the nominal heater voltage. Any deviation from this heater voltage has a detrimental effect on tube performance and life, and should therefore be kept to a minimum. Such deviations may be caused by:

- mains voltage fluctuations;
- spread in the characteristics of components such as transformers, resistors, capacitors, etc.;
- spread in circuit adjustments;
- operational variations.

Cathode-ray tubes with a quick-heating cathode should not be used in series with other tubes.

CATHODE TO HEATER VOLTAGE

The voltage between cathode and heater should be as low as possible and never exceed the limiting values given in the data sheets of the individual tubes. Operation with the heater positive with respect to the cathode is not recommended.

In order to avoid excessive hum the a.c. component of the heater to cathode voltage should be as low as possible and never exceed 20 V r.m.s. (mains frequency). A d.c. connection should always be present between heater and cathode. Unless otherwise specified the maximum resistance should not exceed 1 MΩ; the maximum impedance at mains frequency should be less than 100 kΩ.

INTERMEDIATE ELECTRODES (between cathode and final accelerator)

In no circumstances should the tube be operated without a d.c. connection between each electrode and the cathode. The total effective impedance between each electrode and the cathode should be as low as possible and never exceed the published maximum value.

* A bogey tube is a tube whose characteristics have the published nominal values for the type. A bogey tube for any particular application can be obtained by considering only those characteristics which are directly related to the application.

ELECTRODE VOLTAGES

The reference point for electrode voltages is the cathode. For cathode drive service the reference point is grid 1.

Grid cut-off voltages

Values are given for the limits of grid cut-off voltage at the specified first accelerator voltage. The brightness control voltage should be arranged so that it can handle any tube within the limits shown, at the appropriate first accelerator voltage.

First accelerator voltage

The first accelerator electrode of a so-called unipotential lens provides independent focus and brightness controls by applying a fixed voltage. Care should be taken not to exceed the maximum and minimum limits for reasons of reliability and performance.

Focusing voltage

The focusing voltage (V_{g3}) should be adjusted to optimum spot size; the voltage may depend on the beam current.
For automatic pre-adjustment (autofocus) of oscilloscope tubes, ΔV_{g3} should be derived from the grid drive.

Astigmatism control voltage

To achieve optimum performance under all conditions it is desirable to apply a voltage for control of astigmatism (a difference in potential of this electrode and the y plates). The required range to cover any tube is given in the relevant data.

Deflection plate shield voltage

It is essential that the deflection plate shield voltage equals the mean y plate voltage.

Geometry control voltage

By varying the potential of the geometry control electrode, the necessary range of which is given in the relevant data, the occurrence of pin-cushion and barrel-pattern distortion can be controlled.

Deflection voltages

For optimum performance it is essential that true symmetrical voltages are applied. It should further be noted that the mean x and y-plate potentials must be equal. Moreover the deflection plate shield voltage, the mean astigmatism control voltage, if applicable the mean beam centring voltage and the geometry control voltage should also be equal to the mean x and y-plate potentials. If use is made of the full deflection capabilities of the tube, the deflection plates will intercept part of the electron beam near the edge of the scan. Therefore a low impedance deflection plate drive is necessary. (See also ELECTRODE CURRENTS AND CIRCUIT IMPEDANCES on the next page.)

Raster distortion and its determination

Limits of raster distortion are given for most tubes.

A graticule, consisting of concentric rectangles is aligned with the electrical x-axis of the tube. The edges of a raster will fall between these rectangles with optimum correction potentials applied.

Measuring procedure:
- Shift the x-trace to the centre of the graticule.
- Align horizontal centre line of graticule with the centre line of the x-trace.
- Shift x-trace vertically between upper and lower horizontal lines of graticule; the centre of the x-trace now will not fall outside the area bounded by the horizontal graticule lines.
- Without moving the graticule, switch to a vertical trace and shift this trace horizontally (left and right) between the pairs of vertical lines of the graticule; the centre of the y-trace will not fall outside the area bounded by the vertical graticule lines.
- Focus and astigmatism will be adjusted for optimum performance.
- Pattern geometry correction will be adjusted for optimum performance in the sense of minimizing simultaneously the deviation of the centre of x and y-trace respectively.

Linearity

Unless otherwise stated the linearity is defined as the sensitivity at a deflection of 75% of the useful scan with respect to deviations from the sensitivity at a deflection of 25% of the useful scan. These sensitivities will not differ by more than the indicated value.

Post deflection shield voltage

In order to optimize contrast in mesh tubes a fixed negative voltage with respect to the geometry control voltage should be applied. The range is given in the data.

Final accelerator voltage

Tubes with PDA are designed for a given range of final accelerator voltage to first accelerator voltage ratio. Operation at higher or lower ratios may result in changes in deflection uniformity, pattern distortion and useful scan.

High tension supply

In order to avoid damage to the screen it is important that a deflection voltage, e.g. the time base voltage, is applied prior to the high tension.

ELECTRODE CURRENTS AND CIRCUIT IMPEDANCES

In each electrode currents caused by interception of a part of the electron beam, leakage or secondary emission, may occur in both directions. For oscilloscope tubes currents up to 10 μA can be expected in the focusing electrode and the deflection plates. In addition, if use is made of the full deflection capabilities, each deflection plate may intercept up to 50% of the beam current.

For oscilloscope tubes with beam-limiting apertures, the grid 2 and/or grid 4 circuit impedance should be less than 10 kΩ.

For all tubes the control grid circuit resistance should be less than 1 MΩ.

CAPACITANCES

Unless otherwise stated the values given are nominal values measured at the contacts of a cold tube. The contacts and measuring leads are screened.

LINE WIDTH

The line width is measured with the shrinking raster method. Focusing and astigmatism voltages should be adjusted to minimize the horizontal and vertical trace widths simultaneously at the screen centre. The raster width should be reduced until the line structure is just discernible. This raster width, divided by the number of lines in the display, is the measure of the line width.

USEFUL SCREEN AREA (see tube alignment procedure)

This is the area on the inner side of the faceplate which is provided with phosphor and thus visible from the outside.

USEFUL SCAN AREA

This is the part of the useful screen area in which the specified performance applies.

LUMINESCENT SCREEN

To prevent permanent screen damage, care should be taken:

- not to operate the tube with a stationary picture at high beam currents for extended periods;
- not to operate the tube with a stationary or slowly moving spot except at extremely low beam currents.

MOUNTING

Unless otherwise stated the tubes can be mounted in any position. However, a tube should not be supported by the base alone or near the base region, and under no circumstances should the socket be allowed to support the tube.

The tube socket should not be rigidly mounted but should have flexible leads and be allowed to move freely. The mass of the mating socket with circuitry should not be more than 100 g; maximum permissible torque is 40 mNm.

Shielding

Oscilloscope tubes need a magnetic shielding for proper operation. Especially for types with an internal permanent magnetic lens system (IMC), a magnetic induction at the tube neck greater than 0,02 T (200 gauss), which corresponds to a magnetic field strength of $1,6 \times 10^4$ A/m, must be avoided.

HANDLING

Handling (or destroying) tubes should be done by qualified personnel.

The tubes are evacuated, which implies that mechanical damage must be avoided; care should be taken not to scratch or knock any part of the tube.

Remember when replacing or servicing a tube that a residual electrical charge may be carried by the final accelerator contact and also the external coating if not earthed. Before removing the tube from the equipment, earth the external coating and short the final accelerator contact to the coating.

TUBE ALIGNMENT PROCEDURE

FACEPLATE REFERENCE SYSTEM

The external surface of the faceplate defines the reference plane P.
Positioning of the faceplate is realized by accurate alignment of 3 reference points A, B and C on the adjacent sides X and Y, at a distance h behind plane P (see Figs 1 and 2).
The three reference points are realized by 3 bolts touching the faceplate and having a circular flat surface of 2 mm diameter, centred at distance h behind the plane P (see Fig. 2).

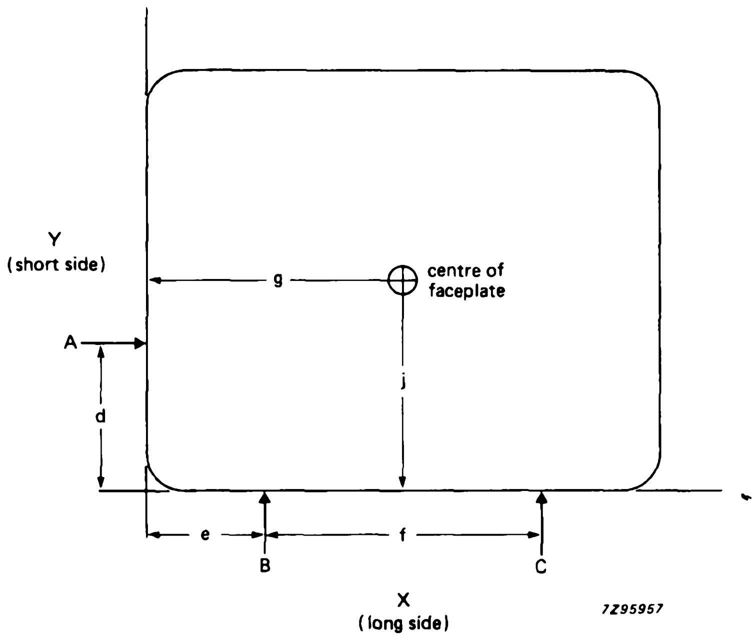

Fig. 1 Faceplate reference system (front view).

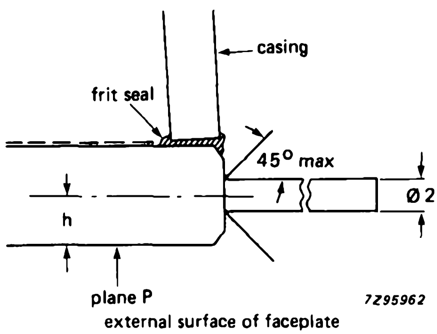

Fig. 2 Realization of reference points.

The centre of the faceplate is defined as the geometrical centre of the nominal rectangle of the faceplate aligned with respect to the reference points, that is, a point in plane P at distances g and j equal to one half of the nominal length and width of the faceplate (refer to Fig. 1).

The tube axis is defined as the line normal to plane P and through the centre of the faceplate. This axis serves as reference for bulb and neck alignment.

Table 1 Reference data for rectangular flat faced tubes

tube size cm	X** mm	Y** mm	d mm	e mm	f mm	g mm	j mm	h mm
7	70	46,5	15	15	40	35	23,25	1,0

18	142	118	35	21,5	100	71	59	3,25

* values in brackets are for D12-120 . ./ . .
** values given in these columns are nominal

USEFUL SCREEN AREA

The useful screen is that part of the inner side of the faceplate which is covered with phosphor and visible from outside (see note 1).

The useful screen area is a rectangle with minimum side length x and y, of which the corners are rounded off by 90° of a circle with typical radius r (refer to Table 2 and Fig. 3).

This rectangle is not necessarily aligned with the faceplate.

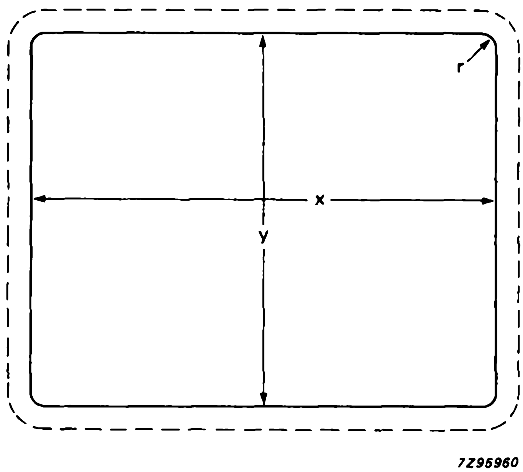

Fig. 3 Useful screen area.

Table 2 Useful screen area (not aligned; see note 2)

tube size cm	x (minimum) mm	y (minimum) mm	r (typical) mm
10	70	56	4
12	84	68	5
14	104	84	6
18	125	101	6

USEFUL SCREEN AREA (aligned to faceplate)

The aligned useful screen area is a rectangle with side length x and y, and corner radius r, positioned at specified distances a, b and c from the reference points on the faceplate (refer to Table 3 and Fig. 4).

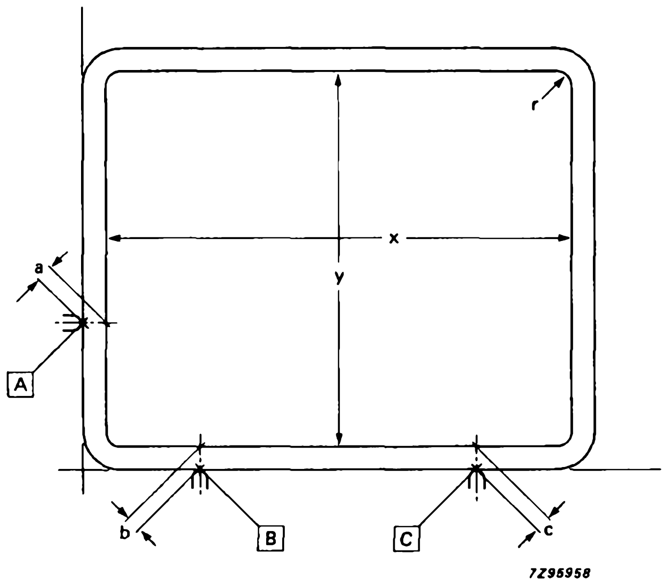

Fig. 4 Useful screen area (aligned to faceplate).

Table 3 Useful screen area (aligned to faceplate)

tube size cm	x mm	y mm	a mm	b mm	c mm	r (typical) mm
10	69	55	6,5	7	7	4
12	82	66	8	8	8	5
14	102	82	8	8	8	6
18	124	100	10	10	10	6

INTERNAL GRATICULE ALIGNMENT

Internal graticules will be aligned by using the faceplate reference system. Unless otherwise specified the tolerances as given in table 4 are applicable. For tubes with internal graticule, the graticule serves as reference for electrical alignment and useful screen area, in particular for the latter, a margin of width w and corner radius r may be specified as being useful screen area around the graticule.

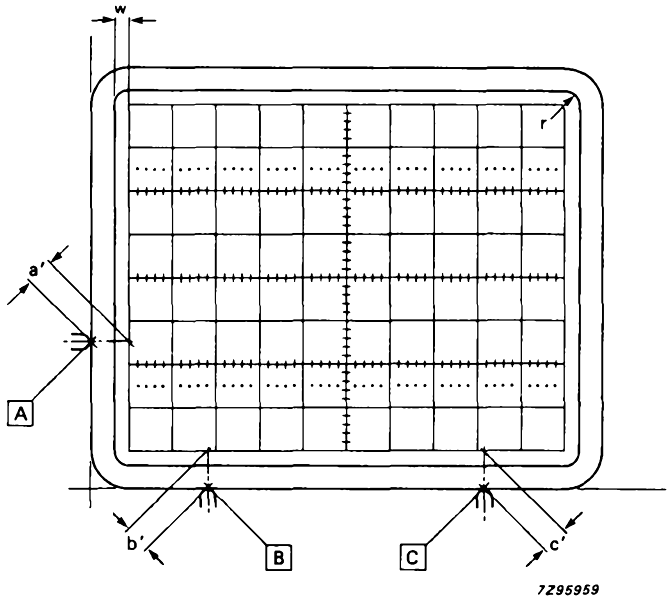

Fig. 5 Graticule alignment.

Table 4 Standard graticule alignment (see note 3)

screen size cm	graticule size mm	a' mm	b' mm	c' mm	b' - c' mm	r (typ.) mm	w (min.) mm
10	68 x 54,4	7,0 ± 0,4	7,3 ± 0,4	7,3 ± 0,4	0,25*	4	0,5
12	80 x 64	9,0 ± 0,5	9,0 ± 0,5	9,0 ± 0,5	0,25*	5	1,0
14	100 x 80	9,0 ± 0,5	9,0 ± 0,5	9,0 ± 0,5	0,30*	6	1,0
18	120 x 96	11,0 ± 0,5	11,0 ± 0,5	11,0 ± 0,5	0,35*	6	2,0

* The resultant values of b' - c' are maximum permissible deviations.

BULB AND NECK ALIGNMENT

Tolerances for bulb and neck alignment are specified in the plane P', at distance z from, and parallel to, the surface plane P of the faceplate. With the exception of the assemblies listed in Table 6, z is approximately 50 mm less than the nominal tube length including the socket (refer to Table 5 and Fig. 6).

Within plane P' the geometrical centre of the neck diameter will be within a circle of radius e' ("eccentricity") around the tube axis, as defined by the faceplate reference system.

Tubes with standard 51 mm diameter neck will fit into a circle of radius r' = e' + 26 mm, concentric with above axis and within plane P'.

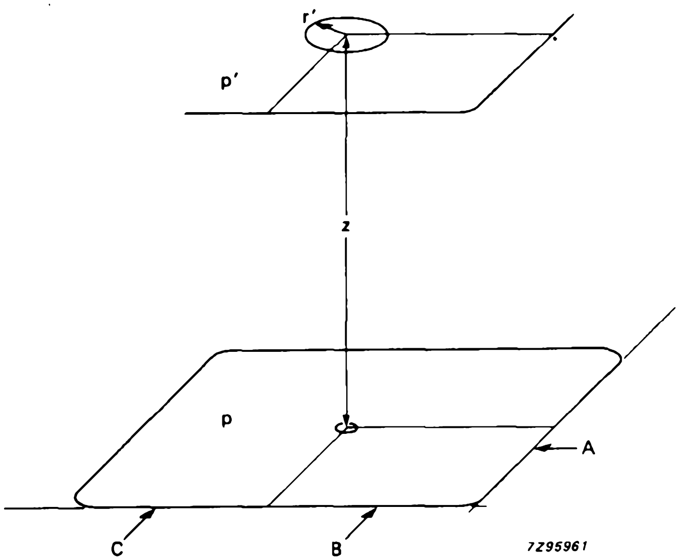

Fig. 6 Bulb and neck alignment.

Table 5 Bulb and neck alignment (see note 4)

tube size cm	z mm	e' %
10	L-50	1,7
12	L-50	1,3
14	L-50	1,1
18	L-50	1,3

Where:

L = typical length of the tubes, socket included (see data sheets for values).
e' = is expressed as a percentage of the typical seated height L of the tube (see note 5).

Table 6 Bulb and neck alignment (see note 4)

type family	z mm	e' mm
D7-22.	173	2,2
L14-131	391	4,2
L14-140	391	4,2
L14-150	398	4,2

NOTES

1. The useful screen may be larger than the useful scan, and that its area is defined as projected to the outside of the faceplate so that parallax is excluded.
2. The data for useful screen area (not aligned) as given in Table 2, is not valid for storage tubes, which includes the following types: L14-111GH/55, L14-131GH/55, L14-140GH/95 and L14-150GH/95.
3. Some special graticules have deviating dimensions, in this event table 4 is not valid.
4. The tables cover all tolerances of both tilt and displacement of faceplate-cone-neck assembly. The cone is sealed to the faceplate to "best visual fit" in accordance with overall tube dimensions and useful screen.
5. Seated height is the sealing-in length, that is, the distance of screen to sealing.

PHOTOMETRIC UNITS

S.I. photometric units

quantity	symbol	S.I. unit	remarks
luminous intensity	I	cd (candela)	
luminous flux	ϕ	lm (lumen)	
quantity of light	Q	lm · s	
luminance	L	cd/m^2	$1\ cd/m^2 = 1$ nit
luminous exitance	M	lm/m^2	formerly luminous emittance
illuminance	E	lx (lux)	formerly illumination

Other photometric units; conversion factors

1 stilb $= 1\ cd/cm^2 = 10^4\ cd/m^2 = 4\pi\ lumen/cm^2$

1 lambert $= \frac{1}{\pi}\ cd/cm^2 = \frac{10^4}{\pi}\ cd/m^2 = 4\ lumen/cm^2$

1 foot lambert $= \frac{1}{\pi}\ cd/ft^2 = 3{,}426\ cd/m^2$

1 foot candle $= 10{,}764$ lux

TYPE DESIGNATION

Pro Electron type designation code

The CRT type number begins with a single letter followed by two sets of digits, and ends with one or two letters.

The first letter indicates the prime application of the tube:

D : Oscilloscope tube, single trace

E : Oscilloscope tube, multiple trace

F : Radar display tube, direct view

L : Storage display tube

M : TV display tube for professional application, direct view

P : Display tube for professional application, projection

Q : Flying spot scanner tube

The first group of digits indicates the diameter or diagonal of the screen in cm.

The second group of digits is a two or three-figure serial number indicating a particular design or development.

The final group of letters indicates the properties of the phosphor screen (see section "Screen types").

For CRTs with internal graticule a suffix consisting of two or more figures follows the type designation, separated from it by an oblique stroke.

Example:

D14 – 372 GH/123

D	14	372	GH	123
oscilloscope tube, single trace	face diagonal	design number	screen phosphor	internal graticule

The phosphor information given in this section is based in general upon the original phosphor registration (TEPAC and/or PRO ELECTRON) and can be used as a selection guide. Slight differences may occur between the actual phosphor properties and the registered data.

Survey of applications and persistence of screens

D7-190GM	yellowish green	long

Useful screen diameter	min.	64	mm
Useful scan			
horizontal	min.	60	mm
vertical	min.	50	mm

The useful scan may be shifted vertically to a maximum of 4mm with respect to the geometric centre of the faceplate.

HEATING: Indirect by AC or DC; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	300	mA

MECHANICAL DATA

Dimensions in mm

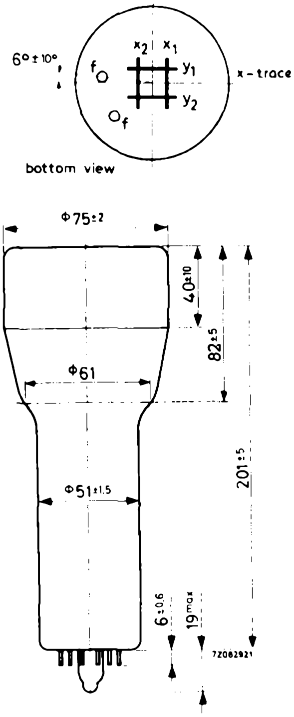

Fig. 1 Outlines.

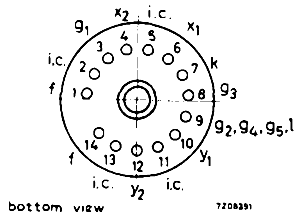

Fig. 2 Pin arrangement.

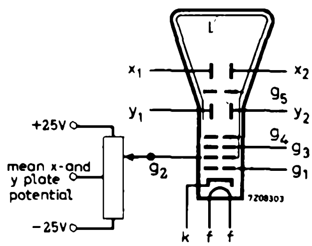

Fig. 3 Electrode configuration.

Mounting position: any

The tube should not be supported by the base alone and under no circumstances should the socket be allowed to support the tube.

Dimensions and connections

See also outline drawing

Overall length	max.	225	mm
Face diameter	max.	77	mm

Base 14 pin all glass

Net weight	approx.	260	g

Accessories

Socket (supplied with tube)	type	55566
Mu-metal shield	type	55534

CAPACITANCES

x_1 to all other elements except x_2	$C_{x1(x2)}$	4	pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	4	pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	3.5	pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	3	pF
x_1 to x_2	C_{x1x2}	1.6	pF
y_1 to y_2	C_{y1y2}	1.1	pF
Control grid to all other elements	C_{g1}	5.5	pF
Cathode to all other elements	C_k	4.0	pF

FOCUSING electrostatic

DEFLECTION double electrostatic see note 3

x plates symmetrical

y plates symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam, hence a low impedance deflection plate drive is desirable.

Angle between x and y traces $90 \pm 1^{\circ}$

LINE WIDTH see note 3

Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_\ell = 10\ \mu A$. 1)

Line width l.w. 0.28 mm

As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust V_{g1} for a beam current of approx. 10 μA and adjust V_{g3} and $V_{g2,g4,g5,\ell}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but no raster, the deflection plate voltages should be changed to
$V_{y1} = V_{y2} = 1000$ V; $V_{x1} = 300$ V; $V_{x2} = 700$ V, thus directing the total beam current to x2.
Measure the current on x_2 and adjust V_{g1} for $I_{x2} = 10\ \mu A$ (being the beam current I_ℓ)
c) set again for the conditions under a), without touching the V_{g1} control. Now a raster display with a true 10 μA screen current is achieved.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.

TYPICAL OPERATING CONDITIONS 3)

Accelerator voltage	$V_{g2,g4,g5,\ell}$		1000 V
Astigmatism control voltage	$\Delta V_{g2,g4,g5,\ell}$		± 25 V 1)
Focusing electrode voltage	V_{g3}		100 to 180 V
Control grid voltage for visual extinction of focused spot	V_{g1}	max.	−35 V
Grid drive for 10 μA screen current		approx.	10 V
Deflection coefficient, horizontal	M_x	 max.	29 V/cm 31 V/cm
vertical	M_y	 max.	11,5 V/cm 12,5 V/cm
Deviation of linearity of deflection		max.	1 % 2)
Geometry distortion		see note 4	
Useful scan, horizontal		min.	60 mm
vertical		min.	50 mm

LIMITING VALUES (Absolute max. rating system)

Accelerator	$V_{g2,g4,g5,\ell}$	max. min.	2200 V 900 V
Focusing electrode voltage	V_{g3}	max.	2200 V
Control grid voltage, negative	$-V_{g1}$	max. min.	200 V 0 V
Cathode to heater voltage	V_{kf} $-V_{kf}$	max. max.	125 V 125 V
Grid drive, average		max.	20 V
Screen dissipation	W_ℓ	max.	3 mW/cm²
Control grid circuit resistance	R_{g1}	max.	1 MΩ

1. All that will be necessary when putting the tube into operation is to adjust the astigmatism control voltage once for optimum spot shape in the screen centre. The control voltage will always be in the range stated, provided the mean x plate and certainly the mean y plate potential was made equal to $V_{g2,g4,g5,\ell}$ with zero astigmatism correction.
2. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
3. The mean x and certainly the mean y plate potential should be equal to $V_{g2,g4,g5,\ell}$ with astigmatism adjustment set to zero.
4. A graticule, consisting of concentric rectangles of 40 mm x 50 mm and 39,2 mm x 49 mm is aligned with the electrical x-axis of the tube. The edges of a raster will fall between these rectangles.

INSTRUMENT CATHODE-RAY TUBE

7 cm diameter flat-faced monoaccelerator oscilloscope tube with low heater consumption.

QUICK REFERENCE DATA

Accelerator voltage	$V_{g2, g4, g5\,(\ell)}$	1000	V
Display area		60 x 50	mm^2
Deflection coefficient			
horizontal	M_x	29	V/cm
vertical	M_y	11,5	V/cm

The D7—191 is equivalent to the type D7—190.. except for the following.

HEATING

Indirect by AC or DC; parallel supply

Heater voltage	V_f	6,3	V
Heater current	I_f	95	mA

LIMITING VALUES (Absolute maximum rating system)

Cathode to heater voltage				
positive	$V_{k/f}$	max.	100	V
negative	$-V_{k/f}$	max.	15	V

CAPACITANCES

Cathode to all other elements	C_k	2,3	pF

INSTRUMENT CATHODE-RAY TUBE

7 cm diagonal, rectangular flat faced mono accelerator oscilloscope tube primarily for use in inexpensive oscilloscopes and monitors. This tube features a low heater power consumption.

QUICK REFERENCE DATA

Accelerator voltage	$V_{g2, g4, g5(\ell)}$	1000	V
Display area		60 mm x 36	mm
Deflection coefficient			
horizontal	M_x	12,5	V/cm
vertical	M_y	20	V/cm

The D7–221GY is equivalent to the type D7–222GY except for the following.

HEATING

Indirect by a.c. or d.c. *

Heater voltage	V_f	6,3	V
Heater current	I_f	0,1	A

LIMITING VALUES (Absolute maximum rating system)

Cathode to heater voltage				
positive	V_{kf}	max.	100	V
negative	$-V_{kf}$	max.	15	V

CAPACITANCES

Cathode to all other elements	C_k	3	pF

* Not to be connected in series with other tubes.

INSTRUMENT CATHODE-RAY TUBE

7 cm diagonal, rectangular flat faced mono accelerator oscilloscope tube primarily for use in inexpensive oscilloscopes and monitors. This tube features a 1,5 W cathode with short warm-up time (quick-heating cathode).

QUICK REFERENCE DATA

Accelerator voltage	$V_{g2,\,g4,\,g5\,(\ell)}$	1000 V
Display area		60 mm x 36 mm
Deflection coefficient		
horizontal	M_x	12,5 V/cm
vertical	M_y	20 V/cm

OPTICAL DATA

Screen	
phosphor type	GY, colour green
persistence	medium
Useful screen dimensions	⩾ 60 mm x 36 mm
Useful scan	
horizontal	⩾ 60 mm
vertical	⩾ 36 mm
Spot eccentricity in horizontal and vertical directions	< 5 mm

HEATING

Indirect by a.c. or d.c. *

Heater voltage	V_f	6,3 V
Heater current	I_f	0,24 A

MECHANICAL DATA

Mounting position: any

The tube should not be supported by the base alone and under no circumstances should the socket be allowed to support the tube.

Net mass	approx. 350 g
Base	12-pin all glass; JEDEC B12–246

* Not to be connected in series with other tubes.

Dimensions and connections

See also outline drawing

Overall length	⩽	225 mm
Faceplate dimensions	⩽	72,5 x 49 mm

Accessories

Socket, supplied with tube	type 55589/55594
Mu-metal shield	type 55535

FOCUSING	electrostatic

DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical
Angle between x and y-traces	$90 \pm 1^{\circ}$
Angle between x-trace and horizontal axis of the face	$\leqslant 3^{\circ}$ *

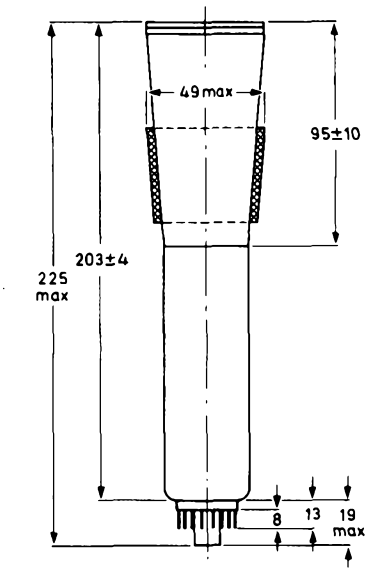
If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

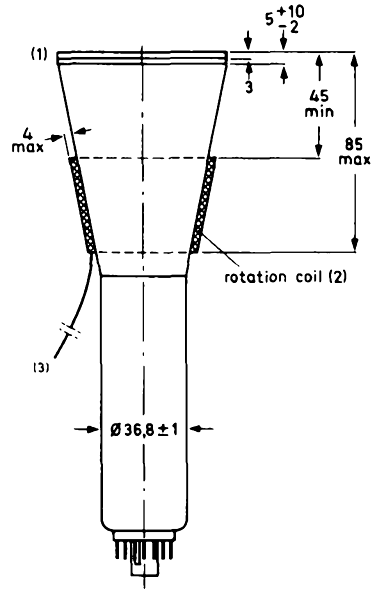
CAPACITANCES

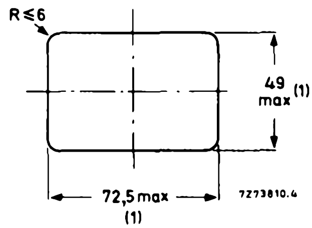
x_1 to all other elements except x_2	$C_{x1(x2)}$	3 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	3 pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	4 pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	4 pF
x_1 to x_2	C_{x1x2}	1,5 pF
y_1 to y_2	C_{y1y2}	1,8 pF
Control grid to all other elements	C_{g1}	5,5 pF
Cathode to all other elements	C_k	3 pF

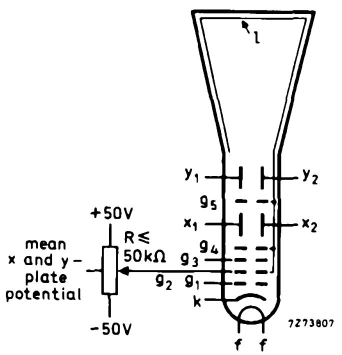
* The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the x-trace with the mechanical x-axis of the screen. The coil has 1000 turns and a maximum resistance of 250 Ω. Under typical operating conditions, a maximum of 10 ampere-turns are required for the maximum rotation of 3°. This means the required current is 10 mA maximum at a required voltage of 2,5 V maximum.

DIMENSIONS AND CONNECTIONS









(1) The bulge at the frit seal does not exceed the maximum dimensions.

(2) The coil is fixed to the envelope by means of adhesive tape.

(3) The length of the connecting leads of the rotation coil is min. 350 mm.

Astigmatism control voltage	$\Delta V_{g2, g4, g5(\ell)}$		±50 V	(note 2)
Focusing electrode voltage	V_{g3}		100 to 180 V	
Cut-off voltage for visual extinction of focused spot	$-V_{g1}$		11 to 35 V	

Performance

Useful scan				
horizontal		>	60 mm	
vertical		>	36 mm	
Deflection coefficient				
horizontal	M_x		12,5 V/cm	
		<	13,8 V/cm	
vertical	M_y		20 V/cm	
		<	22 V/cm	
Line width	l.w.		0,28 mm	(note 3)
Deviation of linearity of deflection		<	2 %	(note 4)
Grid drive for 10 μA screen current	V_d	≈	10 V	
Geometry distortion	see note 5			

NOTES

1. The mean x-plate potential and the mean y-plate potential should be equal to $V_{g2, g4, g5(\ell)}$ (with astigmatism control voltage set to zero).
2. When putting the tube into operation the astigmatism control voltage should be adjusted only once for optimum spot size in the centre of the screen. The control voltage will be within the stated range, provided the conditions of note 1 are adhered to.
3. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_\ell = 10\ \mu A$.

   As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows.
   a) Under typical operating conditions, apply a small raster display (no overscan), adjust V_{g1} for a beam current of approx. 10 μA and adjust V_{g3} and $V_{g2, g4, g5(\ell)}$ for optimum spot quality at the centre of the screen.
   b) Under these conditions, but without raster, the deflection plate voltages should be changed to: $V_{x1} = V_{x2} = 1000$ V; $V_{y1} = 300$ V; $V_{y2} = 700$ V, thus directing the total beam current to y_2. Measure the current on y_2 and adjust V_{g1} for $I_{y2} = 10\ \mu A$.
   c) Set again for the conditions under a), without touching the V_{g1} control. The screen current of the resulting raster display is now 10 μA.
   d) Focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule, consisting of concentric rectangles of 57,0 mm x 33,0 mm and 56 mm x 31,6 mm is aligned with the electrical x-axis of the tube. The edges of a raster will fall between these rectangles.

LIMITING VALUES (Absolute maximum rating system)

Accelerator voltage	$V_{g2, g4, g5(\ell)}$	max.	2200	V

FOCUSING electrostatic

DEFLECTION double electrostatic see note 3

x plates symmetrical

y plates symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam, hence a low impedance deflection plate drive is desirable.

Angle between x and y traces 90 ± 1^o

LINE WIDTH

Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_\ell = 10\ \mu A$.

Line width l.w. 0,27 mm

As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:

a) under typical operating conditions, apply a small raster display (no overscan), adjust V_{g1} for a beam current of approx. 10 μA and adjust V_{g3} and $V_{g2,\ g4,\ g5,\ \ell}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but no raster, the deflection plate voltages should be changed to: $V_{y1} = V_{y2} = 1500$ V; $V_{x1} = 800$ V; $V_{x2} = 1200$ V, thus directing the total beam current to x_2. Measure the current on x_2 and adjust V_{g1} for $I_{x2} = 10\ \mu A$ (being the beam current I_ℓ).
c) set again for the conditions under a), without touching the V_{g1} control. Now a raster display with a true 10 μA screen current is achieved.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.

TYPICAL OPERATING CONDITIONS see note 3

Accelerator voltage	$V_{g2,g4,g5,\ell}$		1500	V	
Astigmatism control voltage	$\Delta V_{g2,g4,g5,\ell}$		± 30	V	see note 1
Focusing electrode voltage	V_{g3}		140 to 275	V	
Control grid voltage for visual extinction of focused spot	V_{g1}	max.	−50	V	
Grid drive for 10 μA screen current		approx.	10	V	
Deflection coefficient, horizontal	M_x		32	V/cm	
		max.	34	V/cm	
vertical	M_y		13.7	V/cm	
		max.	14.5	V/cm	
Deviation of linearity of deflection		max.	1	%	see note 2
Geometry distortion		see note 4			
Useful scan, horizontal		min.	80	mm	
vertical		min.	60	mm	

LIMITING VALUES (Absolute max. rating system)

Accelerator voltage	$V_{g2,g4,g5,\ell}$	max.	2200	V
		min.	1350	V
Focusing electrode voltage	V_{g3}	max.	2200	V
Control grid voltage, negative	$-V_{g1}$	max.	200	V
		min.	0	V
Cathode to heater voltage	V_{kf}	max.	125	V
	$-V_{kf}$	max.	125	V
Grid drive, average		max.	20	V
Screen dissipation	W_ℓ	max.	3	mW/cm^2
Control grid circuit resistance	R_{g1}	max.	1	MΩ

Notes

1. All that will be necessary when putting the tube into operation is to adjust the astigmatismcontrol voltage once for optimum spot shape in the screen centre. The control voltage will always be in the range stated, provided the mean x plate and centainly the mean y plate potential was made equal to $V_{g2,g4,g5,\ell}$ with zero astigmatism correction.
2. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
3. The mean x and certainly the mean y plate potentials should be equal to $V_{g2,g4,g5,\ell}$ with astigmatism adjustment set to zero.
4. A graticule, consisting of concentric rectangles of 50 mm x 60 mm and 49 mm x 58.6 mm is aligned with the electrical x-axis of the tube. The edges of a raster will fall between these rectangles.

INSTRUMENT CATHODE-RAY TUBE

10 cm diameter flat-faced monoaccelerator oscilloscope tube with low heater consumption.

* Not to be connected in series with other tubes.

MECHANICAL DATA

Dimensions and connections (see also outline drawing)

Overall length (socket included)	$\leqslant$ 240 mm
Faceplate dimensions	82 ± 1 mm x 69 ± 1 mm
Net mass	approx. 450 g
Base	12 pin, all glass, JEDEC B12-246

Mounting

The tube can be mounted in any position. It must not be supported by the base alone or near the base region and under no circumstances should the socket be allowed to support the tube.

Accessories

Socket with solder tags	type 55589/55594
Socket with printed-wiring pins	type 55595

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

DYNAMIC DEFLECTION DEFOCUSING CORRECTION

The tube has a special electrode, positioned between the x and y-plates, for dynamic correction of deflection defocusing, to improve the uniformity of the extremely good line width up to the screen edges. If use is made of this dynamic correction, a negative voltage proportional to, and approx. 50% of, the negative horizontal deflection plate voltage should be applied to this electrode (grid 6).
The correction-circuit impedance must be $\leqslant$ 100 kΩ. To prevent distortion, the output impedances of the x-amplifiers should be $\leqslant$ 10 kΩ.
If no correction is required, grid 6 should be connected to mean x-plate potential ($V_{g2(\ell)}$).

Angle between x and y-traces	90 ± 1^o
Angle between x-trace and x-axis of the face plate	$\leqslant 5^o$*

CAPACITANCES (approx. values)

x_1 to all other elements except x_2	$C_{x1(x2)}$	4,5 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	4,5 pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	3,5 pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	3,5 pF
x_1 to x_2	C_{x1x2}	2 pF
y_1 to y_2	C_{y1y2}	1 pF
Control grid to all other elements	C_{g1}	6 pF
Cathode to all other elements	C_k	2,7 pF

* The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of 165 Ω at 20 °C (max. 250 Ω at 80 °C). Approx. 5 mA causes 1° trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).

DIMENSIONS AND CONNECTIONS

Dimensions in mm

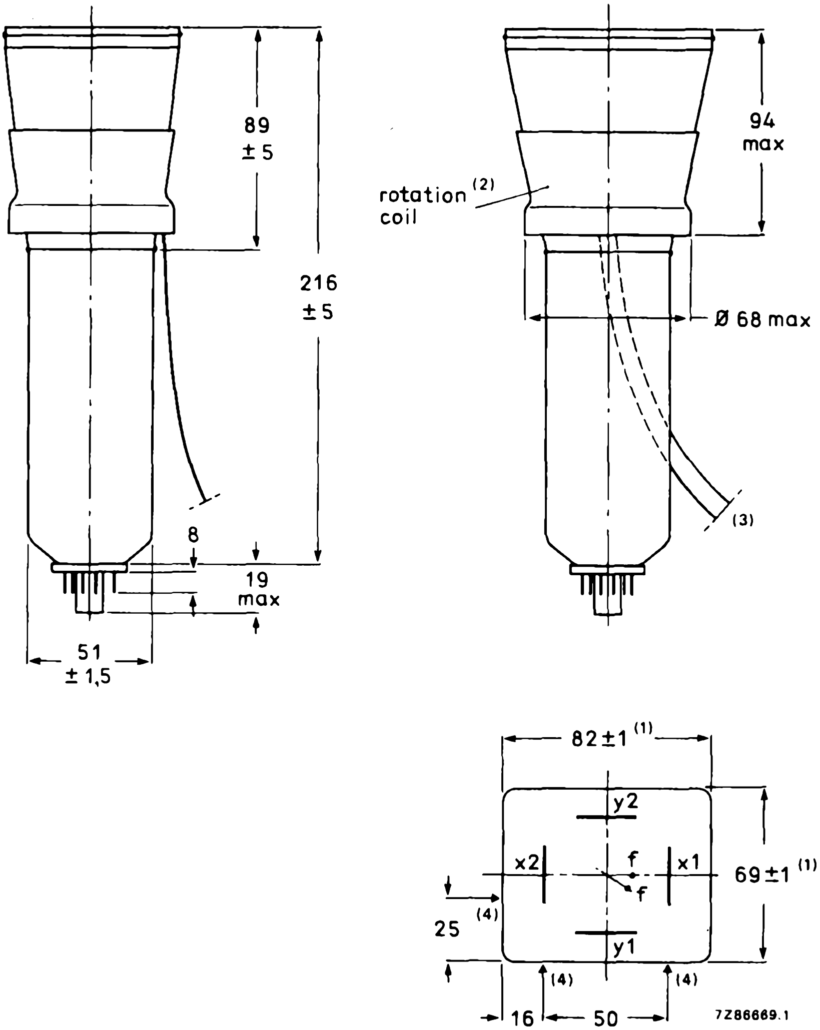

Fig. 1 Outlines; for notes see bottom of opposite page.

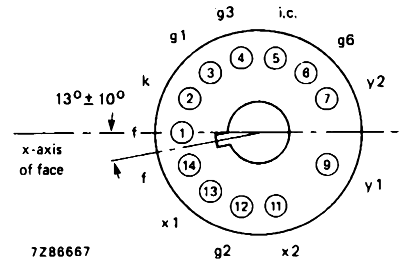

Fig. 2 Pin arrangement; bottom view.

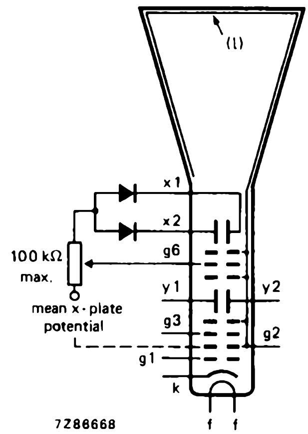

Fig. 3 Electrode configuration.

Notes to the drawing on opposite page.

1. Dimensions of face plate only. The complete assembly of face plate and cone (frit seal included) will pass through an opening of 85 mm x 72 mm (diagonal 107 mm).
2. The coil is fixed to the envelope with resin and adhesive tape.
3. The length of the connecting leads of the rotation coil is min. 350 mm.
4. Reference points on face plate for screen alignment.

TYPICAL OPERATION*

Control grid circuit resistance	R_{g1}	max.	1 MΩ

* Notes are on the next page.

NOTES

1. The mean x-plate potential and the mean y-plate potential should be equal to $V_{g2(\ell)}$.
2. The tube features internal magnetic correction for spot shaping (astigmatism) and vertical eccentricity calibration. Correction is obtained at V_{g2} = 1800 to 2200 V; optimum at V_{g2} = 2000 V.
3. Measured with the shrinking raster method within the useful scan under typical operating conditions, adjusted for optimum focus and dynamic correction applied.

   As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:
   a) Under typical operating conditions, apply a small raster display (no overscan), adjust V_{g1} for a beam current of approx. 10 μA and adjust V_{g3} for smallest spot size at the centre of the screen. When measuring the beam current, grid 6 should be connected to g2-potential and the diodes should be disconnected from the x-plates.
   b) Under these conditions, but without raster, the deflection plate voltages should be changed to: V_{y1} = V_{y2} = 2000 V; V_{x1} = 1300 V; V_{x2} = 1700 V, thus directing the total beam current to x_2. Measure the current on x_2 and adjust V_{g1} for I_{x2} = 10 μA.
   c) Set again for the conditions under a), without touching the V_{g1} control. The screen current of the resulting raster display is now 10 μA.
   Adjust V_{g3} for optimum focus in the centre of the screen and apply dynamic correction to grid 6 for optimum vertical line width.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of 70 mm x 56 mm and 68,4 mm x 54,4 mm is aligned with the face plate (using the reference points). With optimum trace rotation correction, horizontal and vertical lines will fall between these rectangles.

Control grid circuit resistance	R_{g1}	max.	1	MΩ

Notes

1. The tube is designed for optimum performance when operating at a ratio $V_{g8(\ell)}/V_{g2,g4} = 6{,}7$.
   The geometry control electrode voltage V_{g7} should be adjusted within the indicated range (values with respect to the mean x-plate potential).
   A negative control voltage V_{g6} (with respect to the mean x-plate potential) will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion, and a slight increase of background light. By the use of the two voltages V_{g6} and V_{g7}, the best compromise between background light and raster distortion can be found.
2. The deflection plate shield voltage should be equal to the mean y-plate potential. The mean x-plate and y-plate potentials should be equal for optimum spot quality.
3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4. Measured with the shrinking raster method in the centre of the screen, under typical operating conditions, adjusted for optimum spot size, at a beam current of 10 μA.
5. A graticule consisting of concentric rectangles of 80 mm x 64 mm and 78,2 mm x 62,6 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.
6. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.

INSTRUMENT CATHODE-RAY TUBE

Base	12-pin, all glass, JEDEC B12-246

Mounting

The tube can be mounted in any position. It must not be supported by the socket and not by the base region alone. The reference points on adjoining edges of the faceplate (see Fig. 4) enable the tube to be mounted accurately in the front panel, thus providing optimum alignment of the internal graticule.

Accessories

Socket with solder tags	type 55594
Socket with printed-wiring pins	type 55595

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

DYNAMIC DEFLECTION DEFOCUSING CORRECTION

The tube has a special electrode, positioned between the x and y-plates, for dynamic correction of deflection defocusing, to improve the uniformity of the extremely good line width up to the screen edges. If use is made of this dynamic correction, a negative voltage proportional to, and approx. 50% of, the negative horizontal deflection plate voltage should be applied to this electrode (grid 6).
The correction-circuit impedance must be $\leqslant$ 100 kΩ. To prevent distortion, the output impedances of the x-amplifiers should be $\leqslant$ 10 kΩ.
If no correction is required, grid 6 should be connected to mean x-plate potential ($V_{g2(\ell)}$).

CAPACITANCES (approx. values)

x_1 to all other elements except x_2	$C_{x1(x2)}$	4,5 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	4,5 pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	3,5 pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	3,5 pF
x_1 to x_2	C_{x1x2}	2 pF
y_1 to y_2	C_{y1y2}	1 pF
Control grid to all other elements	C_{g1}	6 pF
Cathode to all other elements	C_k	2,7 pF
Grid 6 to all other elements	C_{g6}	11 pF

DIMENSIONS AND CONNECTIONS

Dimensions in mm

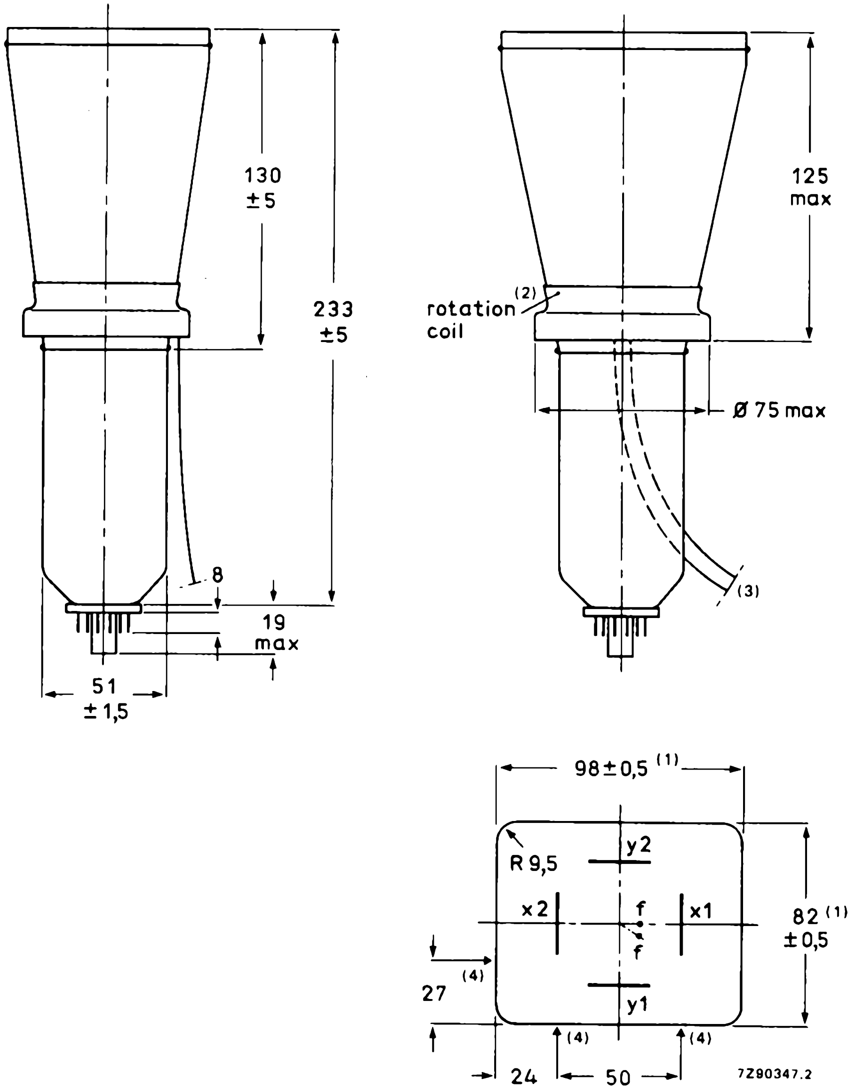

Fig. 1 Outlines.

(1) Dimensions of faceplate only. The complete assembly of faceplate and cone (frit seal included) will pass through an opening of 101 mm x 85 mm.
(2) The coil is fixed to the envelope with resin and adhesive tape.
(3) The length of the connecting leads of the rotation coil is min. 350 mm.
(4) Reference points on faceplate for graticule alignment (see Fig. 4).

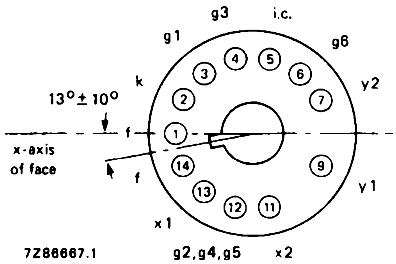

Fig. 2 Pin arrangement; bottom view.

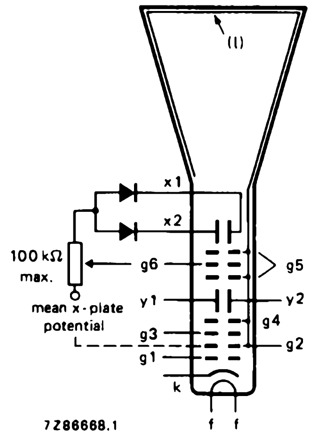

Fig. 3 Electrode configuration.

Internal graticule

The internal graticule is aligned with the faceplate by using the faceplate reference points, see Fig. 4. See also note 1.

Screen dissipation	W_ℓ	max.	3	mW/cm²
Control grid circuit resistance	R_{g1}	max.	1	MΩ

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 82 mm x 66 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The mean x-plate potential and the mean y-plate potential should be equal to $V_{g2,g4,g5(\ell)}$.
3. The tube features internal magnetic correction for astigmatism, orthogonality and eccentricity calibration. Optimum spot is obtained if $V_{g2,g4,g5(\ell)}$ is equal to mean y-potential.
4. An actual focus range of approx. 50 V should be provided on the front panel. V_{g3} decreases with increasing grid drive (see also Fig. 5).
5. Intensity control on the front panel should be limited to the maximum useful screen current (approx. 80 μA; see also Fig. 5). It is to be adjusted either by the grid drive (up to 30 V) or for maximum acceptable line width. The corresponding cathode current or $I_{g2,g4,g5}$ (up to 500 μA) depend on the cut-off voltage and cannot be used for control settings.
6. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
7. A graticule consisting of concentric rectangles of 80 mm x 64 mm and 78,3 mm x 62,3 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
8. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of 180 ± 25 Ω at 20 $^{\circ}$C, which increases by 0,4%/K for rising temperature. Approx. 6 mA causes 1° trace rotation. Thus maximum required voltage is approx. 12 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
9. Measured with the shrinking raster method within the useful scan under typical operating conditions, adjusted for optimum focus and dynamic correction applied.

   As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:

   a) Under typical operating conditions, apply a small raster display (no overscan), adjust V_{g1} for a beam current of approx. 10 μA and adjust V_{g3} for smallest spot size at the centre of the screen. When measuring the beam current, grid 6 should be connected to g2-potential and the diodes should be disconnected from the x-plates.

   b) Under these conditions, but without raster, the deflection plate voltages should be changed to: $V_{y1} = V_{y2} = 2000$ V; $V_{x1} = 1300$ V; $V_{x2} = 1700$ V, thus directing the total beam current to x_2. Measure the current on x_2 and adjust V_{g1} for $I_{x2} = 10$ μA.

   c) Set again for the conditions under a), without touching the V_{g1} control. The screen current of the resulting raster display is now 10 μA.
   Adjust V_{g3} for optimum focus in the centre of the screen and apply dynamic correction to grid 6 for optimum vertical line width.

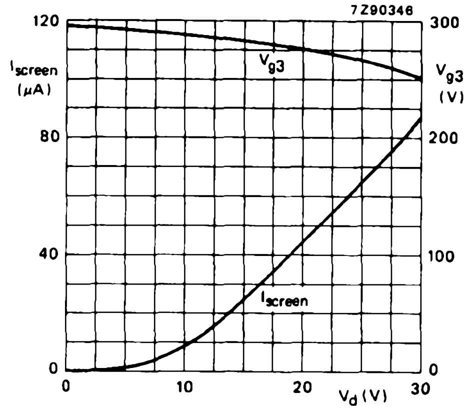

Fig. 5 Screen current (I_{screen}) and focusing voltage (V_{g3}) as a function of grid drive voltage (V_d); typical curves.

INSTRUMENT CATHODE-RAY TUBE

- 12 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- low heater power consumption
- internal graticule
- high sensitivity and high brightness
- short overall length
- for compact oscilloscopes with up to 100 MHz bandwidth

QUICK REFERENCE DATA

Control grid circuit resistance	R_{g1}	max.	1 MΩ	

Note see next page.

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 82 mm x 66 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; floating mean x- or y-potentials will result into non-uniform line width and geometry distortion. The mean x- and y-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry. A range of ΔV_{g5} = −50 to + 50 V may be applied for pincushion/barrel correction.

   The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case V_{g5} must be made equal to mean x-potential, and a range of 0 to −25 V with respect to mean y-potential will be required on g4 for astigmatism correction. The circuit resistance for V_{g4} should be $\leqslant$ 10 kΩ.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of 80 mm x 64 mm and 78,4 mm x 62,4 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of 185 ± 25 Ω at 20 °C, which increases by approx. 0,4%/K for rising temperature. At typical operation (V_{g5} = 2200 V, V_{g7} = 16,5 kV) approx. 6,5 mA causes 1° trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
   The required current for 1° trace rotation is related to approx. $\sqrt{V_{g5}}$.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_{ℓ} = 10 μA.
8. The X-ray dose rate remains below the acceptable value of 36 pA/kg (0,5 mR/h), when the tube is used within its limiting values (beam current $I_{\ell} \leqslant$ 100 μA).

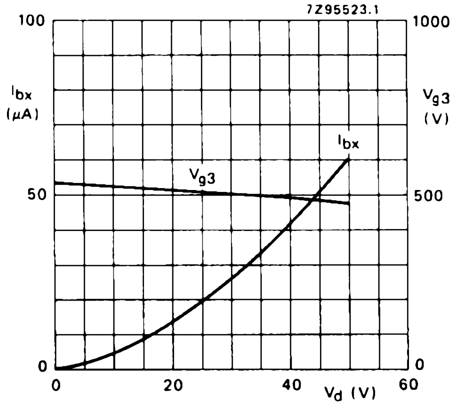

Fig. 5 Beam current (I_{bx}) and focusing voltage (V_{g3}) as a function of grid drive voltage (V_d) at V_{g7} = 16,5 kV, V_{g5} = 2,2 kV; typical curves.

I_{bx} is the beam current, without scan, measured on x2, when the deflection plate potentials have been adjusted to $V_{y1} = V_{y2}$ = 2200 V, V_{x1} = 1500 V, V_{x2} = 1900 V, thus directing the total beam current to x2.

INSTRUMENT CATHODE-RAY TUBE

- mono accelerator
- 12 cm diagonal rectangular flat face
- internal magnetic correction for astigmatism, vertical eccentricity and orthogonality
- low heater power consumption
- for portable oscilloscopes with up to 25 MHz bandwidth, and read-out devices

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 82 mm x 66 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; asymmetric drive introduces trace distortion. It is recommended that the tube be operated with equal mean x- and y-potentials, in order to minimize tube adjustments. Under this condition g_5 can be connected to g_2, g_4, and made equal to mean y-potential for optimum spot (see also notes 3 and 4).
   A difference between mean x- and y-potentials up to 75 V is permissible, however this may influence the specified deflection coefficients, and a separate voltage on g_5 (equal to mean x-potential) may be required.
3. The tube meets the geometry specification (see note 8) if V_{g5} is equal to mean x-potential. A range of ± 50 V around mean x-potential may be applied for further correction.
4. Optimum spot is obtained with $V_{g2,\,g4}$ equal to mean y-potential (see note 2). In general a tolerance of ± 4 V has no visible effect; $V_{g2,\,g4}$ tends to be lower with V_{g5} more positive. The circuit impedance $R_{g2,\,g4}$ should be less than 10 kΩ.
5. An actual focus range of 30 V should be provided on the front panel. V_{g3} decreases with increasing grid drive (see also Fig. 5).
6. Intensity control on the front panel should be limited to the maximum useful screen current (approx. 50 μA; see also Fig. 5). It is to be adjusted either by the grid drive (up to 22 V) or for maximum acceptable line width. The corresponding cathode current or $I_{g2,\,g4}$ (up to 500 μA) depend on the cut-off voltage and cannot be used for control settings.
7. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
8. A graticule consisting of concentric rectangles of 80 mm x 64 mm and 78,3 mm x 62,3 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
9. The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
10. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of 185 ± 25 Ω at 20 °C, which increases by approx. 0,4%/K for rising temperature. Approx. 5 mA causes 1° trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
11. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_ℓ = 10 μA.

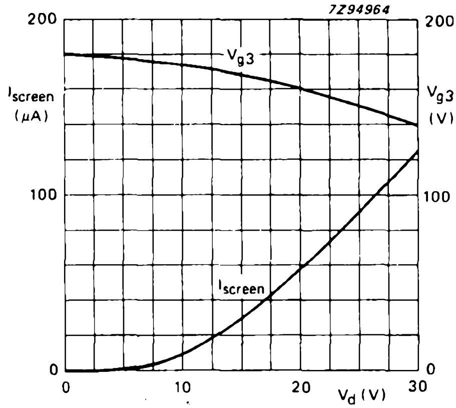

Fig. 5 Screen current (I_{screen}) and focusing voltage (V_{g3}) as a function of grid drive voltage (V_d); typical curves.

Face diameter	max.	135	mm

Base 14 pin all glass

Net weight	approx.	650	g

Accessories

Socket (supplied with tube)	type	55566
Mu-metal shield	type	55580

CAPACITANCES

x_1 to all other elements except x_2	$C_{x1(x2)}$	4	pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	4	pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	3.5	pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	3	pF
x_1 to x_2	C_{x1x2}	1.6	pF
y_1 to y_2	C_{y1y2}	1.1	pF
Control grid to all other elements	C_{g1}	5.5	pF
Cathode to all other elements	C_k	4	pF

FOCUSING electrostatic

DEFLECTION double electrostatic

x plates symmetrical

y plates symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam, hence a low impedance deflection plate drive is desirable.

Angle between x and y traces $90 \pm 1\,^{o}$

LINE WIDTH

Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_ℓ = 10 μA.1)

Line width	l.w.	0.30	mm

As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust V_{g1} for a beam current of approx. 10 μA and adjust V_{g3} and $V_{g2,g4,g5,\ell}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but no raster, the deflection plate voltages should be changed to
$V_{y1} = V_{y2}$ = 2000 V; V_{x1} = 1300 V; V_{x2} = 1700 V, thus directing the total beam current to x2.
Measure the current on x_2 and adjust V_{g1} for I_{x2} = 10 μA (being the beam current I_ℓ)
c) set again for the conditions under a), without touching the V_{g1} control. Now a raster display with a true 10 μA screen current is achieved.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.

TYPICAL OPERATING CONDITIONS *see note 3*

Accelerator voltage	$V_{g_2,g_4,g_5,\ell}$	2000	V	
Astigmatism control voltage	$\Delta V_{g_2,g_4,g_5,\ell}$	± 50	V	see note 1
Focusing electrode voltage	V_{g_3}	220 to 370	V	
Control grid voltage for visual extinction of focused spot	V_{g_1}	max. −65	V	
Grid drive for 10 μA screen current		approx. 10	V	
Deflection coefficient, horizontal	M_x	31.3	V/cm	
		max. 33	V/cm	
vertical	M_y	14.4	V/cm	
		max. 15.5	V/cm	
Deviation of linearity of deflection		max. 1	%	see note 2
Geometry distortion		see note 4		
Useful scan, horizontal		min. 100	mm	
vertical		min. 80	mm	

LIMITING VALUES (Absolute max. rating system)

Accelerator voltage	$V_{g_2,g_4,g_5,\ell}$	max. 2200	V
		min. 1500	V
Focusing electrode voltage	V_{g_3}	max. 2200	V
Control grid voltage, negative	$-V_{g_1}$	max. 200	V
		min. 0	V
Cathode to heater voltage	V_{kf}	max. 125	V
	$-V_{kf}$	max. 125	V
Grid drive, average		max. 20	V
Screen dissipation	W_ℓ	max. 3	mW/cm^2
Control grid circuit resistance	$\mathbf{R_{g1}}$	**max. 1**	**MΩ**

Notes

1. All that will be necessary when putting the tube into operation is to adjust the astigmatism control voltage once for optimum spot shape in the screen centre. The control voltage will always be in the range stated, provided the mean x and certainly the mean y plate potential was made equal to $V_{g_2,g_4,g_5,\ell}$ with zero astigmatism correction.
2. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
3. The mean x and certainly the mean y plate potential should be equal to $V_{g_2,g_4,g_5,\ell}$ with astigmatism adjustment set to zero.
4. A graticule, consisting of concentric rectangles of 70 mm x 85 mm and 68.8 mm x 83 mm as aligned with the electrical x-axis of the tube. The edges of a raster will fall between these ractangles.

INSTRUMENT CATHODE-RAY TUBE

13 cm diameter flat-faced monoaccelerator oscilloscope tube with low heater consumption.

QUICK REFERENCE DATA

Accelerator voltage	$V_{g2, g4, g5 (\ell)}$	2000 V
Display area		100 x 80 mm²
Deflection coefficient		
horizontal	M_x	31,3 V/cm
vertical	M_y	14,4 V/cm

The D13–481.. is equivalent to the type D13–480.. except for the following.

HEATING

Indirect by AC or DC; parallel

Heater voltage	V_f	6,3 V
Heater current	I_f	95 mA

LIMITING VALUES (Absolute maximum rating system)

Cathode to heater voltage			
positive	$V_{+k/f-}$	max.	100 V
negative	$V_{-k/f+}$	max.	15 V

CAPACITANCES

Cathode to all other elements	C_k	2,3 pF

INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat faced oscilloscope tube with mesh and metal backed screen.

QUICK REFERENCE DATA			
Final accelerator voltage	$V_{g7(\ell)}$	10	kV
Display area		100 x 80	mm^2

	$V_{g4/y}$	max.	500	V
Grid drive, average		max.	20	V
Screen dissipation	W_{ℓ}	max.	8	mW/cm^2
Ratio $V_{g7(\ell)}/V_{g2,g4}$	$V_{g7(\ell)}/V_{g4}$	max.	6,7	
Control grid circuit resistance	R_{g1}	max.	1	MΩ

Notes

1. This tube is designed for optimum performance when operating at a ratio $V_{g7(\ell)}/V_{g2,\,g4} = 6{,}7$. The geometry electrode voltage should be adjusted within the indicated range (values with respect to the mean x-plate potential). A negative control voltage will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion and a slight increase of background light.
2. The deflection plate shield voltage should be equal to the mean y-plate potential. The mean x-plate and y-plate potentials should be equal for optimum spot quality.
3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule, consisting of concentric rectangles of 95 mm x 75 mm and 93 mm x 73,6 mm is aligned with the electrical x-axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.
6. To align the x trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 ampere turns for the indicated maximum rotation of 5^{o} and should be positioned as indicated in the drawing.

INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat-faced oscilloscope tube with mesh and metal backed screen. The tube has side connections to the x- and y-plates, and is intended for use in transistorized oscilloscopes up to a frequency of 50 MHz.

QUICK REFERENCE DATA

NOTES

1. In order to align the x-trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 amp. turns for the indicated max. rotation of 5° and should be positioned as indicated on the drawing.

2. This tube is designed for optimum performance when operating at a ratio $V_{g_8(\ell)}/V_{g_2,g_4} = 6,7$
The geometry control voltage V_{g_7} should be adjusted within the indicated range (values with respect to the mean x-plate potential).
A negative control voltage on g_6 (with respect to the mean x-plate potential) will cause some pincushion distortion and less background light.
By the use of the two voltages, V_{g_6} and V_{g_7}, it is possible to find the best compromise between background light and raster distortion.

3. The deflection plate shield voltage should be equal to the mean y-plate potential. The mean x- and y-plate potentials should be equal for optimum spot quality.

4. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.

5. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.

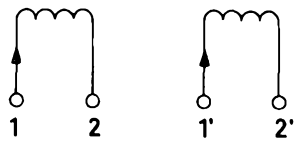
6. A graticule, consisting of concentric rectangles of 95 mm x 75 mm and 93 mm x 73,6 mm is aligned with the electrical x axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.

7. To avoid damage to the side contacts the narrower end of the Mu-metal shield should have an internal diameter of not less than 64 mm.

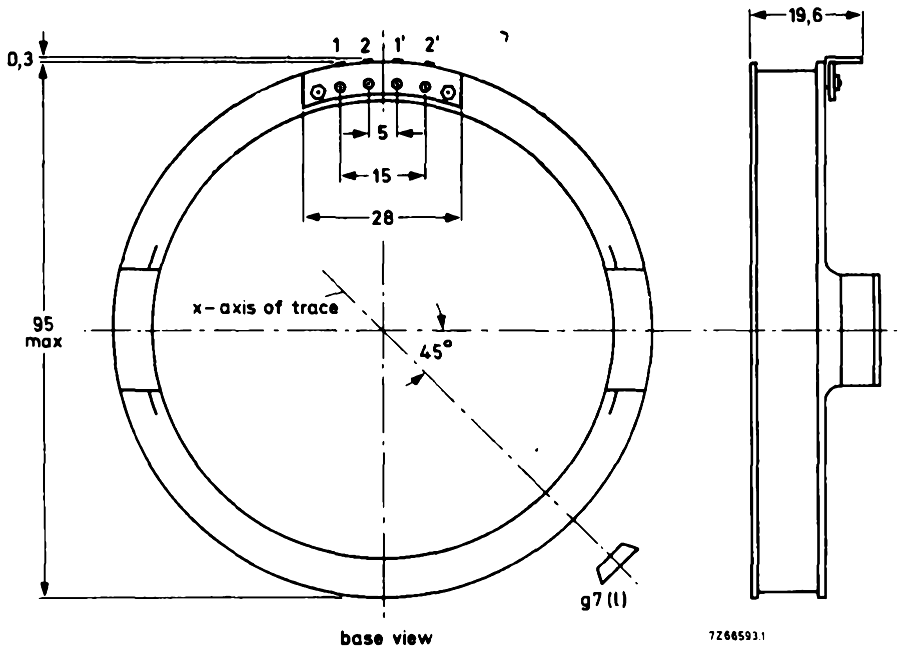
INSTRUMENT CATHODE-RAY TUBE

This type is equivalent with type D14-120GH but provided with a rotation coil as indicated in note 1 of D14-120GH.

COIL



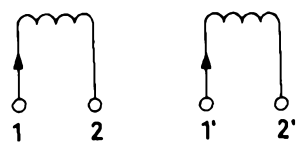
Number of turns	1 – 2	850 turns
	1′ – 2′	850 turns
Resistance of coils	1 – 2	360 Ω + 10%
	1′ – 2′	375 Ω 10%



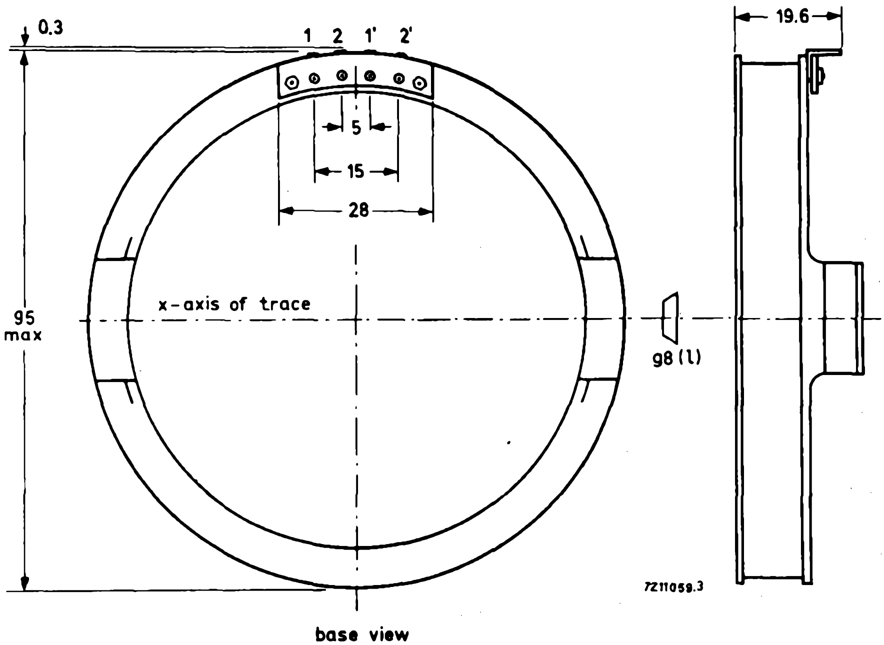
INSTRUMENT CATHODE-RAY TUBE

This type is equivalent with type D14-121GH but provided with a rotation coil as indicated in note 1 of D14-121GH.

COIL



Number of turns	1 – 2	850 turns
	1' – 2'	850 turns
Resistance of coils	1 – 2	360 Ω (± 10%)
	1' – 2'	375 Ω (± 10%)



INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat faced oscilloscope tube with mesh and metal-backed screen. The tube has side connections to the x and y-plates and an internal graticule.

Notes see next page.

NOTES

1) To avoid damage to the side contacts the narrower end of the mu-metal shield should have an internal diameter of not less than 64 mm.

2) This tube is designed for optimum performance when operating at a ratio $V_{g8(\ell)}/V_{g2g4}$
$V_{g8(\ell)}/V_{g2,g4} = 6,7$.
The geometry control voltage V_{g7} should be adjusted within the indicated range (values with respect to the mean x-plate potential).
A negative control voltage on g_6 (with respect to the mean x-plate potential) will cause some pincushion distortion and less background light.
By the use of two voltages, V_{g6} and V_{g7}, it is possible to find the best compromise between background light and raster distortion.
If a fixed voltage on V_{g6} is required this voltage should be 10 V lower than the mean x-plate potential.

3) The deflection plate shield voltage should be equal to the mean y-plate potential. The mean x and y-plate potentials should be equal for optimum spot quality.

4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.

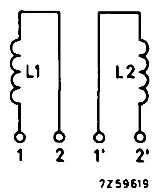
5) The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.

6) A graticule, consisting of concentric rectangles of 95 mm x 75 mm and 93 mm x 73,6 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied a a raster will fall between these rectangles.

CORRECTION COILS

General

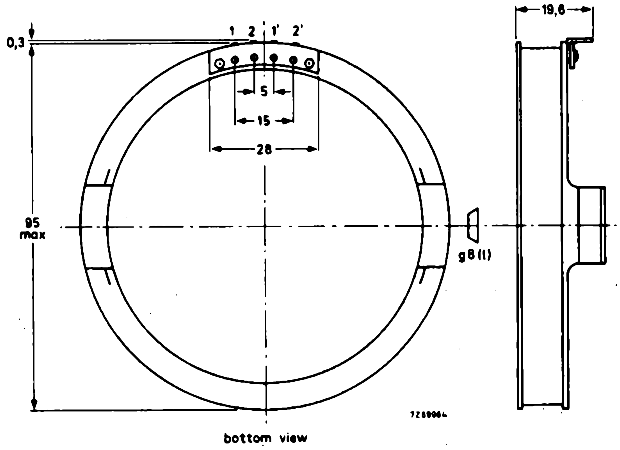
The D14-1626H/09 is provided with a pair of coils L1 and L2 for image rotation which enable the alignment of the x-trace with the x-lines of the graticule.



The image rotation coils are wound concentrically around the tube neck.
Under typical operating conditions 50 ampere-turns are required for the maximum rotation of 5°. Both coils have 850 turns. This means that a current of < 30 mA per coil is required which can be obtained by using a 24 V supply when the coils are connected in series, or a 12 V supply when they are in parallel.

Connecting the coils

The coils have been connected to the 4 soldering tags as follows:



INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal rectangular flat-faced oscilloscope tube with domed post-deflection acceleration mesh, sectioned y-plates, and metal-backed screen with internal graticule.

QUICK REFERENCE DATA					
Final accelerator voltage	$V_{g9(\ell)}$			20	kV
Display area		100	x	80	mm^2
Deflection coefficient, horizontal	M_x			9	V/cm
vertical	M_y			3	V/cm

SCREEN

Metal-backed phosphor

	colour	persistence
D14-240GH/37	green	medium short

Useful screen dimensions	>	100	x	80	mm
Spot eccentricity in horizontal and vertical directions	<			6	mm

HEATING

Indirect by a.c. or d.c.; parallel supply

Heater voltage	V_f	6,3	V
Heater current	I_f	300	mA

MECHANICAL DATA

Mounting position: any

The tube should not be supported by the base alone and under no circumstances should the socket be allowed to support the tube.

Dimensions and connections

See also outline drawing

Overall length (socket included)	<	385	mm
Face dimensions	<	120 x 100	mm

MECHANICAL DATA (continued)

Net mass	≈ 900	g
Base	14 pin, all glass	
Accessories		
Socket (supplied with tube)	type 55566	
Side contact connector (12 required)	type 55561	
Final accelerator contact connector	note [1]	
Mu-metal shield	note [2]	

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical
Angle between x and y traces	90°
Angle between x-trace and x-axis of the internal graticule	0°

See also "Correction coils"

If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam; hence a low impedance deflection plate drive is desirable.

CAPACITANCES

x_1 to all other elements except x_2	$C_{x_1(x_2)}$	4,5	pF
x_2 to all other elements except x_1	$C_{x_2(x_1)}$	4,5	pF
$y_{1.1}$ to all other elements except $y_{2.1}$	$C_{y_{1.1}(y_{2.1})}$	1,3	pF
$y_{2.1}$ to all other elements except $y_{1.1}$	$C_{y_{2.1}(y_{1.1})}$	1,3	pF
x_1 to x_2	$C_{x_1x_2}$	3	pF
$y_{1.1}$ to $y_{2.1}$	$C_{y_{1.1}y_{2.1}}$	0,7	pF
Control grid to all other elements	C_{g_1}	5,5	pF
Cathode to all other elements	C_k	4,5	pF

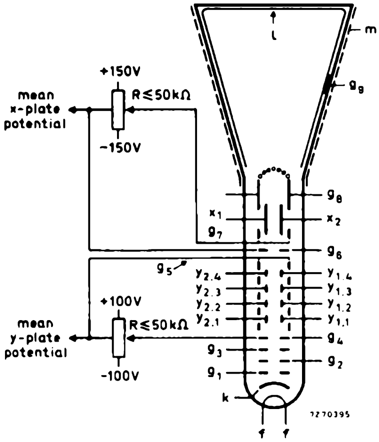
---

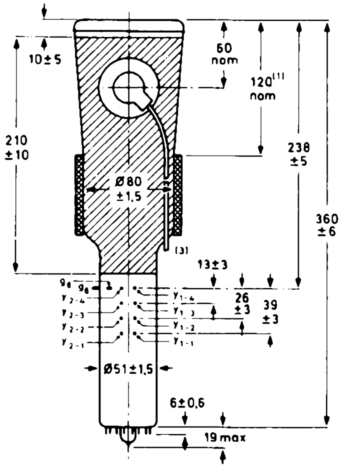
1) The connection to the final accelerator electrode is made by means of an EHT cable attached to the tube.

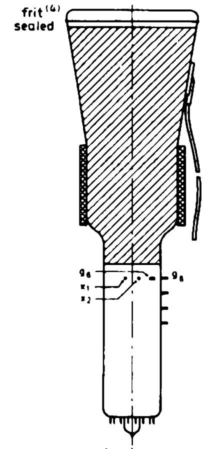
2) The diameter of the mu-metal shield should be large enough to avoid damage to the side contacts.

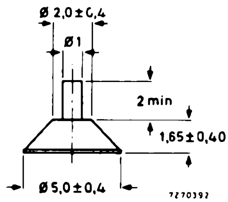
DIMENSIONS AND CONNECTIONS

Dimensions in mm

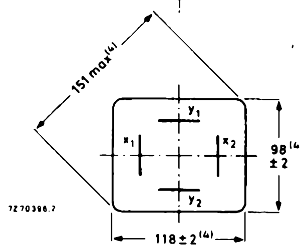


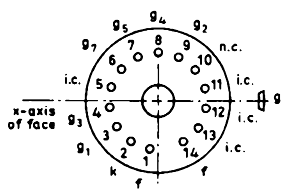




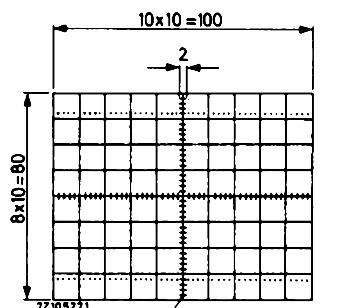


detail of side contact

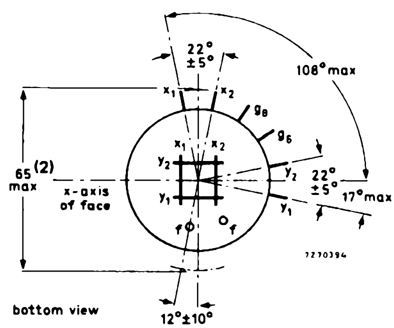




bottom view



line width 0,15 mm
dot diameter 0,3 mm



bottom view

(1) Recommended position of correction coils.
(2) See page 2.
(3) Length of cable approx. 460 mm.
(4) The bulge at the frit seal may increase the indicated maximum dimensions by not more than 2 mm.

TYPICAL OPERATION

Conditions

Final accelerator voltage	$V_{g9(\ell)}$	20	kV	
Post deflection accelerator mesh electrode voltage	V_{g8}	2000	V	
Geometry control electrode voltage	V_{g7}	2000 ± 150	V	1)
Interplate shield voltage	V_{g6}	2000	V	2)
Deflection plate shield voltage	V_{g5}	2000	V	3)
Astigmatism control electrode voltage	V_{g4}	2000 ± 100	V	4)
Focusing electrode voltage	V_{g3}	500 to 800	V	
First accelerator voltage	V_{g2}	2000	V	
Control grid voltage for visual extinction of focused spot	V_{g1}	-55 to -110	V	
Voltage on outer conductive coating	V_m	2000	V	

Performance

Useful scan, horizontal		> 100	mm	5)
vertical		> 80	mm	
Deflection coefficient, horizontal	M_x	9	V/cm	
		< 9,9	V/cm	
vertical	M_y	3	V/cm	
		< 3,3	V/cm	
Line width		≈ 0,45	mm	6)
Writing speed		> 1,5	cm/ns	7)
Deviation of linearity of deflection		see note 8	%	
Geometry distortion		see note 9		
Grid drive for 10 μA screen current		≈ 20	V	

---

1) The geometry control electrode voltage V_{g7} should be adjusted within the indicated range (values with respect to the mean x-plate potential).

2) The interplate shield voltage should be equal to the mean x-plate potential.

3) The deflection plate shield voltage should be equal to the mean y-plate potential. The mean x-plate and y-plate potentials should be equal for optimum performance.

4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.

5) If the tube is operated at a ratio $V_{g9(\ell)}/V_{g5} < 10$, the useful scan may be smaller than 100 mm x 80 mm.
The scanned raster can be shifted and aligned with the internal graticule by means of correction coils fitted around the tube.

LIMITING VALUES (Absolute maximum rating system)

Final accelerator voltage	$V_{g9(\ell)}$	max.	21	kV
		min.	15	kV
Post deflection acceleration mesh electrode voltage	V_{g8}	max.	2200	V
Geometry control electrode voltage	V_{g7}	max.	2400	V
Interplate shield voltage	V_{g6}	max.	2200	V
Deflection plate shield voltage	V_{g5}	max.	2200	V
Astigmatism control electrode voltage	V_{g4}	max.	2300	V
		min.	1800	V
Focusing electrode voltage	V_{g3}	max.	2200	V
First accelerator voltage	V_{g2}	max.	2200	V
		min.	1900	V
Control grid voltage	$-V_{g1}$	max.	200	V
		min.	0	V
Cathode to heater voltage				
positive	V_{kf}	max.	125	V
negative	$-V_{kf}$	max.	125	V
Voltage between astigmatism control electrode and any deflection plate	$V_{g4/x}$	max.	500	V
	$V_{g4/y}$	max.	500	V
Grid drive, average		max.	30	V
Screen dissipation	W_{ℓ}	max.	8	mW/cm^2
Ratio V_{g9}/V_{g5}	V_{g9}/V_{g5}	max.	10	
		min.	8	
Control grid circuit resistance	R_{g1}	max.	1	MΩ

6. Measured with the shrinking raster method in the centre of the screen, with corrections adjusted for optimum spot size, at a beam current of 10 μA.
7. Writing speed measuring conditions:

Film	Polaroid 410 (10 000 ASA)
Lens	F 1/1,2
Object to image ratio	1/0,5
Modulation	ΔV_{g1} = 55 V

8. The deflection coefficient over each division will not differ more than 5% from that over any other division; all these deflection coefficients being measured per division along the axes.
9. A graticule consisting of concentric rectangles of 95 mm x 75 mm and 93 mm x 73,6 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.

CORRECTION COILS

On request a correction coil unit can be made available consisting of:

1. a pair of coils L1 and L2 which enable the angle between the x and y traces at the centre of the sceen to be made exactly 90^{o} (orthogonality correction).
2. a pair of coils L3 and L4 which enable the scanned area to be shifted up and down (vertical shift).
3. a coil L5 for image rotation which enables the alignment of the x trace with the x lines of the graticule.

Orthogonality (coils L1 and L2)

The current required under typical operating conditions with mu-metal shield being used is < 8 mA for complete correction of orthogonality.
The resistance of each coil is $\approx 160\ \Omega$.

Shift (coils L3 and L4)

The current required under typical operating conditions with mu-metal shield being used is < 12 mA for a maximum shift of 5 mm.
The resistance of each coil is $\approx 160\ \Omega$.

Image rotation (coil L5)

The image rotation coil is wound concentrically around the tube neck. Under typical operating conditions 27 ampere-turns are required for the maximum rotation of 5^{o}.
The coil has 1560 turns. This means that a current of < 18 mA is required.
The resistance of the coil is $\approx 185\ \Omega$.

INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat faced oscilloscope tube with post-deflection acceleration mesh, primarily for use in compact oscilloscopes with 15 to 20 MHz bandwidth. This tube features a low heater consumption.

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g7(\ell)}$	4	kV
Display area		100 mm x 80	mm
Deflection coefficient			
horizontal	M_x	19,5	V/cm
vertical	M_y	10,5	V/cm

The D14-261GH is equivalent to the type D14-262GH except for the following.

HEATING

Indirect by AC or DC*

Heater voltage	V_f	6,3	V
Heater current	I_f	0,1	A

LIMITING VALUES (Absolute maximum rating system)

Cathode to heater voltage				
positive	V_{kf}	max.	100	V
negative	$-V_{kf}$	max.	15	V

* Not to be connected in series with other tubes.

INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat-faced oscilloscope tube with post-deflection acceleration mesh, primarily for use in compact oscilloscopes with 15 to 20 MHz bandwidth. This tube features a 1,5 W cathode with short warm-up time (quick-heating cathode).

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g7(\ell)}$	4	kV
Display area		100 mm x 80	mm
Deflection coefficient			
horizontal	M_x	19,5	V/cm
vertical	M_y	10,5	V/cm

OPTICAL DATA

Screen			
phosphor type	GH, colour green		
persistence	medium short		
Useful screen dimensions	⩾	100 mm x 80	mm
Useful scan			
horizontal	⩾	100	mm
vertical	⩾	80	mm
Spot eccentricity in horizontal and vertical directions	⩽	6,5	mm

HEATING

Indirect by AC or DC*

Heater voltage	V_f	6,3	V
Heater current	I_f	0,24	A

MECHANICAL DATA

Mounting position: any

The tube should not be supported by the base alone and under no circumstances should the socket be allowed to support the tube.

Net mass	approx. 1 kg
Base	14-pin, all glass
Final accelerator contact	small ball

* Not to be connected in series with other tubes.

Dimensions and connections

See also outline drawing

Overall length	⩽	333 mm
Face dimensions	⩽	100 x 120 mm^2

Accessories

Socket, supplied with tube	type 55566
Mu-metal shield	type 55591
Final accelerator contact connector	type 55569

FOCUSING	electrostatic	
DEFLECTION	double electrostatic	
x-plates	symmetrical	
y-plates	symmetrical	
Angle between x and y-traces		90 ± 1^o
Angle between x-trace and horizontal axis of the face	⩽	5^o *

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

CAPACITANCES

x_1 to all other elements except x_2	$C_{x1(x2)}$	7 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	6,5 pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	4 pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	3,5 pF
x_1 to x_2	C_{x1x2}	2,2 pF
y_1 to y_2	C_{y1y2}	1,1 pF
Control grid to all other elements	C_{g1}	6,1 pF
Cathode to all other elements	C_k	2,7 pF

* The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the x-trace with the mechanical x-axis of the screen. The coil has 1000 turns and a resistance of max. 400 Ω. Under typical operating conditions, max. 30 ampere-turns are required for the max. rotation of 5^o. This means the required current is max. 30 mA at a required voltage of max. 12 V.

DIMENSIONS AND CONNECTIONS

Dimensions in mm

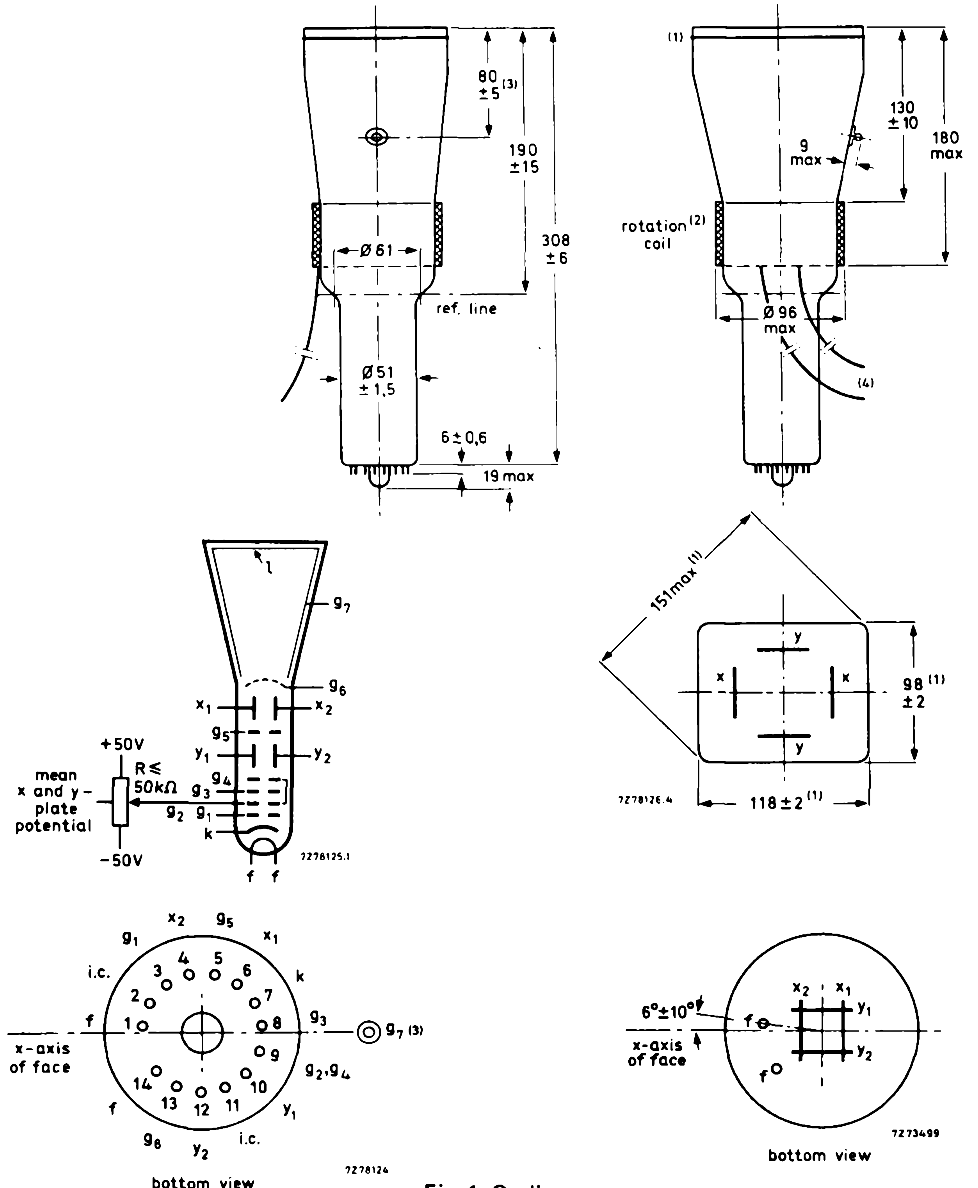


Fig. 1 Outlines.

Notes to Fig. 1

(1) The bulge at the frit seal may increase the indicated maximum dimensions by not more than 2 mm.
(2) The coil is fixed to the envelope by means of adhesive tape.
(3) The centre of the contact is situated within a square of 10 mm x 10 mm around the true geometrical position.
(4) The length of the connecting leads of the rotation coil is min. 350 mm.

TYPICAL OPERATION

Conditions

Final accelerator voltage	$V_{g7(\ell)}$	4 kV	
Post deflection accelerator mesh electrode voltage	V_{g6}	2000 V	
Interplate shield voltage	V_{g5}	2000 V	see note 1
First accelerator voltage	$V_{g2, g4}$	2000 V	
Astigmatism control electrode voltage	$\Delta V_{g2, g4}$	± 50 V	see note 2
Focusing electrode voltage	V_{g3}	300 to 480 V	
Cut-off voltage for visual extinction of focused spot	$-V_{g1}$	30 to 70 V	

Performance

Useful scan				
horizontal		≥	100 mm	see note 3
vertical		≥	80 mm	see note 3
Deflection coefficient				
horizontal	M_x		19,5 V/cm	
		≤	21,5 V/cm	
vertical	M_y		10,5 V/cm	
		≤	11,6 V/cm	
Line width	l.w.	≈	0,35 mm	see note 4
Deviation of deflection linearity		≤	2 %	see note 5
Grid drive for 10 μA screen current	V_d	≈	20 V	
Geometry distortion	see note 6			

NOTES

1. The interplate shield voltage should be equal to the mean x-plate potential. The mean x-plate and y-plate potentials should be equal for optimum spot quality.
2. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
3. The tube is designed for optimum performance when operating at a ratio $V_{g7(\ell)}/V_{g2, g4} = 2$. If this ratio is smaller than 2, the useful scan may be smaller than 100 mm x 80 mm.
4. Measured with the shrinking raster method in the centre of the screen with corrections adjusted for optimum spot size, at a beam current of 10 μA.
5. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
6. A graticule consisting of concentric rectangles of 95 mm x 75 mm and 93 mm x 73 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.

LIMITING VALUES (Absolute maximum rating system)

Final accelerator voltage	$V_{g7(\ell)}$	max.	4,4	kV
Post deflection accelerator mesh electrode voltage	V_{g6}	max.	2200	V

Voltage between astigmatism control electrode and any deflection plate	$V_{g4/x}$	max.	500	V
	$V_{g4/y}$	max.	500	V
Control grid circuit resistance	R_{g1}	max.	1	MΩ

NOTES

1. The geometry control electrode voltage V_{g6} should be adjusted within the indicated range (values with respect to the mean x-plate potential).
2. The interplate shield voltage should be equal to the mean x-plate potential. The mean x-plate and y-plate potentials should be equal for optimum spot quality.
3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4. The tube is designed for optimum performance when operating at a ratio $V_{g8(\ell)}/V_{g2,\,g4} = 5$. If this ratio is smaller than 5, the useful scan may be smaller than 100 mm x 80 mm.
5. Measured with the shrinking raster method in the centre of the screen with corrections adjusted for optimum spot size, at a beam current of 10 μA.
6. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
7. A graticule consisting of concentric rectangles of 95 mm x 75 mm and 93 mm x 73 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.

INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal rectangular flat-faced oscilloscope tube with domed mesh and metal-backed screen with internal graticule. The tube has side connections to the x and y-plates, and is intended for use in compact oscilloscopes with up to 150 MHz bandwidth. This tube features a 1,5 W cathode with short warm-up time (quick-heating cathode).

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g8(\ell)}$	16,5 kV
Display area		100 x 80 mm^2
Deflection coefficient		
horizontal	M_x	8,7 V/cm
vertical	M_y	4,7 V/cm

OPTICAL DATA

Screen	metal-backed phosphor	
type	GH, colour green	
persistence	medium short	
Useful screen dimensions	$\geqslant$	100 x 80 mm^2
Useful scan		
horizontal	$\geqslant$	100 mm
vertical	$\geqslant$	80 mm
Spot eccentricity in horizontal and vertical directions	$\leqslant$	6,5 mm

HEATING

Indirect by a.c. or d.c.; parallel supply

Heater voltage	V_f	6,3 V
Heater current	I_f	0,24 A

MECHANICAL DATA

Dimensions and connections

See outline drawings

Overall length (socket included)	$\leqslant$ 397 mm
Face dimensions	$\leqslant$ 100 x 120 mm^2
Net mass	approx. 1 kg
Base	14 pin, all glass

Mounting position: any

The tube should not be supported by the base alone and under no circumstances should the socket be allowed to support the tube.

Accessories

Socket, supplied with tube	type 55572
Side contact connector (7 required)	type 55561
Final accelerator contact connector	connection to final accelerator electrode is made via an EHT cable attached to the tube

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical
Angle between x and y-traces	$90 \pm 1^{\circ}$
Angle between y-trace and y-axis of the internal graticule	$\leqslant 5^{\circ}$ *

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

* The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the y-trace with the mechanical y-axis of the screen. The coil has 2000 turns and a maximum resistance of 650 Ω. Under typical operating conditions, a maximum of 40 ampere-turns are required for the maximum rotation of 5°. This means the required current is 20 mA maximum at a required voltage of 13 V.

CAPACITANCES

x_1 to all other elements except x_2	$C_{x1(x2)}$	5 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	5 pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	1,7 pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	2 pF
x_1 to x_2	C_{x1x2}	3 pF
y_1 to y_2	C_{y1y2}	1,6 pF
Control grid to all other elements	C_{g1}	6 pF
Cathode to all other elements	C_k	2,7 pF
Focusing electrode to all other electrodes	C_{g3}	5 pF

Cut-off voltage for visual extinction of focused spot	$-V_{g1}$	60 to 110	V	

Performance

Useful scan					
horizontal		⩾	100	mm	(note 4)
vertical		⩾	80	mm	(note 4)
Deflection coefficient					
horizontal	M_x		8,7	V/cm	
		<	9,8	V/cm	
vertical	M_y		4,7	V/cm	
		<	5,3	V/cm	
Line width	l.w.	typ.	0,37	mm	(note 5)
Grid drive for 10 μA screen current	V_d	approx.	30	V	
Geometry distortion		see note 6			
Deviation of deflection linearity		3%; see note 7			

NOTES

1. The geometry control electrode voltage V_{g6} should be adjusted within the indicated range (values with respect to the mean x-plate potential).
2. The interplate shield voltage should be equal to the mean x-plate and y-plate potentials for optimum spot quality.
3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4. The tube is designed for optimum performance when operating at a ratio $V_{g8(\ell)}/V_{g2} = 7,5$. If this ratio is smaller, the useful scan may be smaller than 100 mm x 80 mm.
5. Measured with the shrinking raster method in the centre of the screen with corrections adjusted for optimum spot size, at a beam current of 10 μA.
6. A graticule consisting of horizontal and vertical line pairs according to Fig. 6, is aligned with the electrical x-axis of the tube. With optimum corrections applied (including orthogonality correction), any horizontal or vertical trace will fall between these line pairs.
7. Deviation of linearity is defined as the proportional deviation of the deflection coefficient over any division on the x-axis and y-axis from the average values over the central eight (horizontal) and central six (vertical) divisions respectively.

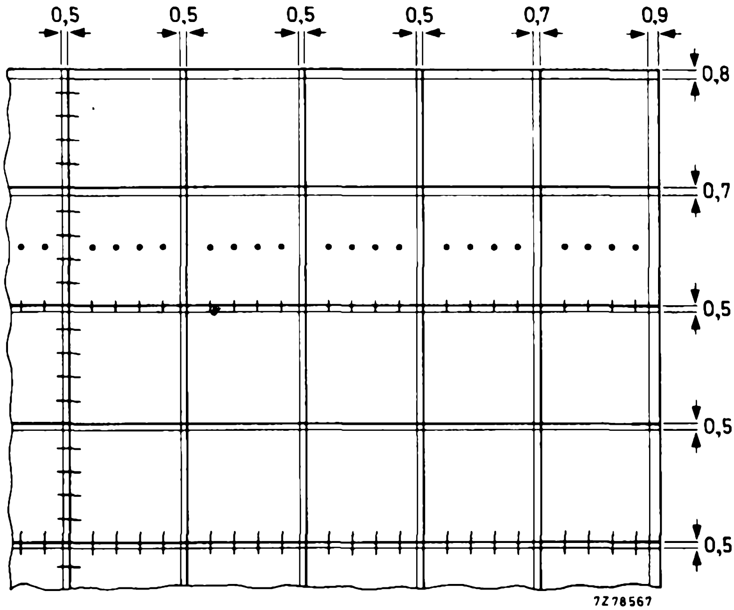

Fig. 6 Quarter of graticule with horizontal and vertical line pairs, see note 6.

LIMITING VALUES (Absolute maximum rating system)

Final accelerator voltage	$V_{g8(\ell)}$	max.	18	kV
Post deflection accelerator mesh electrode voltage	V_{g7}	max.	2500	V
Geometry control electrode voltage	V_{g6}	max.	2500	V
Interplate shield voltage	V_{g5}	max.	2500	V
Astigmatism control electrode voltage	V_{g4}	max.	2500	V
Focusing electrode voltage	V_{g3}	max.	2500	V
First accelerator voltage	V_{g2}	max.	2500	V
Control grid voltage	$-V_{g1}$	max.	200	V
		min.	0	V
Cathode to heater voltage				
positive	V_{kf}	max.	125	V
negative	$-V_{kf}$	max.	125	V
Voltage between astigmatism control electrode and any deflection plate	$V_{g4/x}$	max.	500	V
	$V_{g4/y}$	max.	500	V
Grid drive, averaged over 1 ms	V_d	max.	20	V
Screen dissipation	W_ℓ	max.	8	mW/cm^2
Control grid circuit resistance	R_{g1}	max.	1	MΩ

INSTRUMENT CATHODE-RAY TUBES

- mono accelerator
- 14 cm diagonal rectangular flat face
- internal magnetic lens system for vertical scan magnification, orthogonality, astigmatism and eccentricity correction
- low heater consumption
- with or without internal graticule
- flat screen edges facilitate graticule illumination
- reference points on faceplate for graticule alignment
- for inexpensive oscilloscopes and read-out devices

QUICK REFERENCE DATA

Accelerator voltage	$V_{g2,g4}$	2000 V
Minimum useful scan area		100 mm x 80 mm
Deflection coefficient		
horizontal	M_x	19 V/cm
vertical	M_y	11,5 V/cm

The D14-361. . is equivalent to the type D14-362. . except for the following.

HEATING

Indirect by AC or DC*

Heater voltage	V_f		6,3 V
Heater current	I_f		0,1 A
Heating time to attain 10% of the cathode current at equilibrium conditions		approx.	7 s

* Not to be connected in series with other tubes.

INSTRUMENT CATHODE-RAY TUBES

- mono accelerator
- 14 cm diagonal rectangular flat face
- internal magnetic lens system for vertical scan magnification, orthogonality, astigmatism and eccentricity correction
- quick-heating cathode
- with or without internal graticule
- flat screen edges facilitate graticule illumination
- reference points on faceplate for graticule alignment
- for inexpensive oscilloscopes and read-out devices

QUICK REFERENCE DATA

Accelerator voltage	$V_{g2,g4}$	2000	V
Minimum useful scan area		100 mm x 80	mm
Deflection coefficient			
horizontal	M_x	19	V/cm
vertical	M_y	11,5	V/cm

OPTICAL DATA

Screen	type	colour	persistence
	GH	green	medium short
	GY	yellowish-green	medium
	GM	yellowish-green	long

Useful screen area	⩾ 102 mm x 82 mm; note 1
Useful scan area	⩾ 100 mm x 80 mm
Internal graticule	type 93; see Fig. 4

HEATING

Indirect by AC or DC*

Heater voltage	V_f	6,3	V
Heater current	I_f	0,24	A
Heating time to attain 10% of the cathode current at equilibrium conditions		approx. 5	s

* Not to be connected in series with other tubes.

MECHANICAL DATA

Dimensions and connections (see also outline drawing)

Overall length (socket included)	⩽ 333 mm
Faceplate dimensions	118 ± 0,5 mm x 98 ± 0,5 mm
Net mass	approx. 1 kg
Base	12 pin, all glass, JEDEC B12-246

Mounting

The tube can be mounted in any position. It must not be supported by the socket and not by the base region alone. The reference points on adjoining edges of the faceplate (see Fig. 4) enable the tube to be mounted accurately in the front panel, thus providing optimum alignment of the internal graticule.

Accessories

Pin protector (required for shipping)	supplied with tube
Socket with solder tags	type 55594
Socket with printed-wiring pins	type 55595
Mu-metal shield	55598

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance delfection plate drive is desirable.

CAPACITANCES

x_1 to all other elements except x_2	$C_{x1(x2)}$	5,7 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	5 pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	4 pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	4 pF
x_1 to x_2	C_{x1x2}	2,3 pF
y_1 to y_2	C_{y1y2}	1 pF
Control grid to all other elements	C_{g1}	6 pF
Cathode to all other elements	C_k	3 pF

DIMENSIONS AND CONNECTIONS

Dimensions in mm

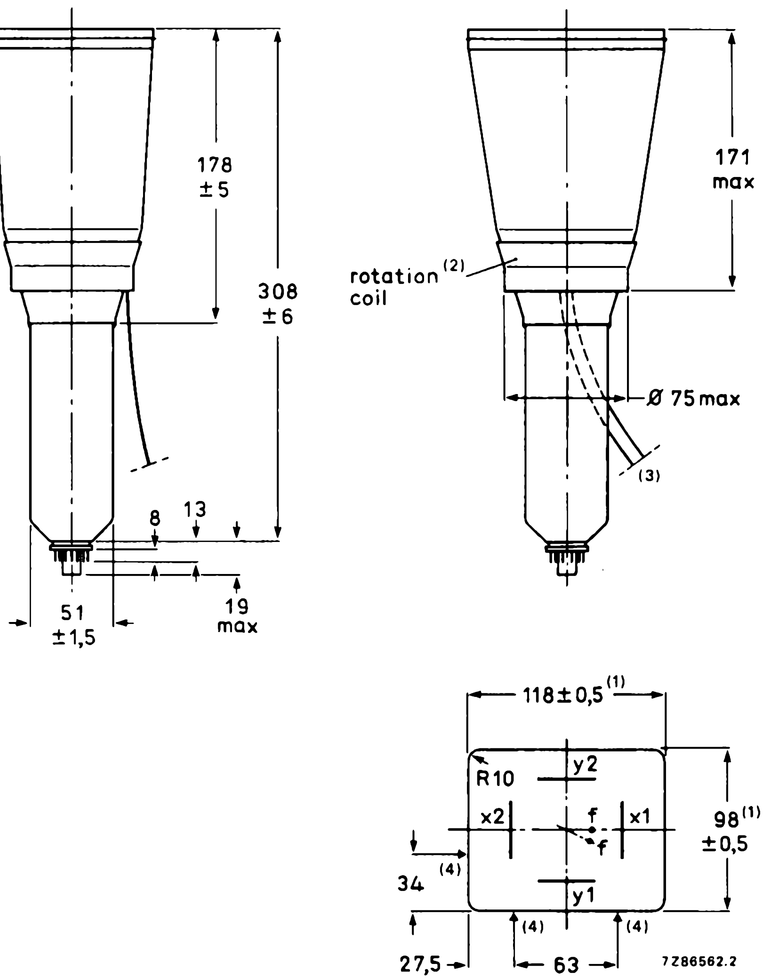

Fig. 1 Outlines.

(1) Dimensions of faceplate only. The complete assembly of faceplate and cone (frit seal included) will pass through an opening of 122 mm x 102 mm.
(2) The coil is fixed to the envelope with resin and adhesive tape.
(3) The length of the connecting leads of the rotation coil is min. 350 mm.
(4) Reference points on faceplate for graticule alignment (see Fig. 4).

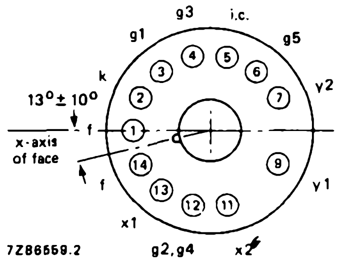

Fig. 2 Pin arrangement; bottom view.

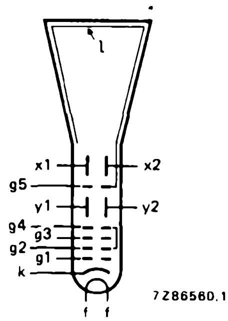

Fig. 3 Electrode configuration.

Internal graticule

The internal graticule is aligned with the faceplate by using the faceplate reference points, see Fig. 4. See also note 1.

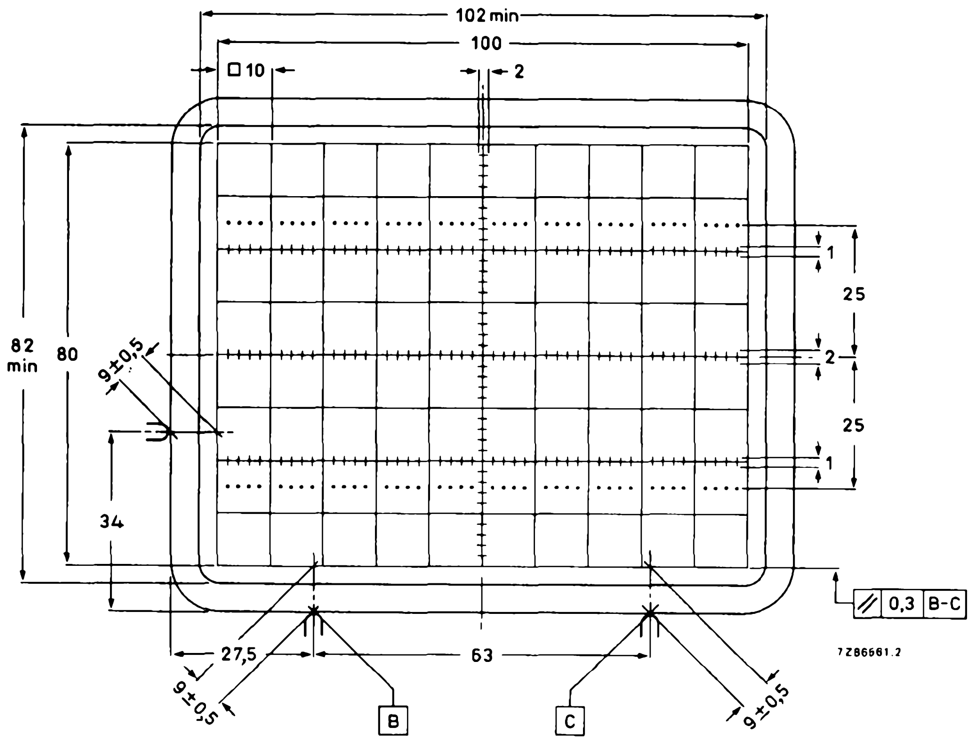

Fig. 4 Front view of tube with internal graticule, type 93.
Line thickness = 0,2 mm; dot diameter = 0,4 mm; colour: red.

TYPICAL OPERATION (voltages with respect to cathode)*

Conditions

Mean deflection plate potential			2000 V	see note 2
Shield voltage for optimum geometry	$V_{g5,(\ell)}$		2000 V	see note 3
Accelerator and astigmatism control voltage	$V_{g2,g4}$		2000 V	see note 4
Focusing voltage	V_{g3}		220 to 370 V	see note 5
Cut-off voltage for visual extinction of focused spot	$-V_{g1}$		22 to 65 V	see note 6

Performance

Deflection coefficient				
horizontal	M_x		19 V/cm	
		<	21 V/cm	
vertical	M_y		11,5 V/cm	
		<	12 V/cm	
Deviation of deflection linearity		⩽	2 %	see note 7
Geometry distortion		see note 8		
Luminance reduction at the edges of the useful scan (100 mm x 80 mm), with respect to screen centre		⩽	30 %	
Eccentricity of undeflected spot with respect to internal graticule				
horizontal		⩽	4 mm	see note 9
vertical		⩽	2 mm	see note 9
Angle between x and y-traces			90°	see note 9
Angle between x-trace and x-axis of the internal graticule		⩽	5°	see note 10
Grid drive voltage for 10 μA screen current	V_d	≈	10 V	see note 6
Line width	l.w.	≈	0,3 mm	see note 11

LIMITING VALUES (Absolute maximum rating system)

Accelerator voltage	$V_{g2,g4}$	max.	2200 V
Shield voltage	$V_{g5(\ell)}$	max.	2200 V
Focusing electrode voltage	V_{g3}	max.	2200 V
Control grid voltage	$-V_{g1}$	max.	200 V
		min.	0 V
Cathode to heater voltage			
positive	V_{kf}	max.	125 V
negative	$-V_{kf}$	max.	125 V
Heater voltage	V_f	max.	6,6 V
		min.	6,0 V
Grid drive voltage, averaged over 1 ms	V_d	max.	20 V
Screen dissipation	W_ℓ	max.	3 mW/cm²
Control grid circuit resistance	R_{g1}	max.	1 MΩ

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 102 mm x 82 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; asymmetric drive introduces trace distortion. It is recommended that the tube be operated with equal mean x- and y-potentials, in order to minimize tube adjustments. Under this condition g_5 can be connected to g_2, g_4, and made equal to mean y-potential for optimum spot (see also notes 3 and 4).
   A difference between mean x- and y-potentials up to 75 V is permissible, however this may influence the specified deflection coefficients, and a separate voltage on g_5 (equal to mean x-potential) may be required.
3. The tube meets the geometry specification (see note 8) if V_{g5} is equal to mean x-potential. A range of ± 50 V around mean x-potential may be applied for further correction.
4. Optimum spot is obtained with $V_{g2,\ g4}$ equal to mean y-potential (see note 2). In general a tolerance of ± 4 V has no visible effect; $V_{g2,\ g4}$ tends to be lower with V_{g5} more positive. The circuit impedance $R_{g2,\ g4}$ should be less than 10 kΩ.
5. An actual focus range of 30 V should be provided on the front panel. V_{g3} decreases with increasing grid drive (see also Fig. 5).
6. Intensity control on the front panel should be limited to the maximum useful screen current (approx. 50 μA; see also Fig. 5). It is to be adjusted either by the grid drive (up to 22 V) or for maximum acceptable line width. The corresponding cathode current or $I_{g2,\ g4}$ (up to 500 μA) depend on the cut-off voltage and cannot be used for control settings.
7. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
8. A graticule consisting of concentric rectangles of 100 mm x 80 mm and 98 mm x 78 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
9. The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
10. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of 185 ± 25 Ω at 20 °C, which increases by approx. 0,4%/K for rising temperature. Approx. 5 mA causes 1° trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
11. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_ℓ = 10 μA.

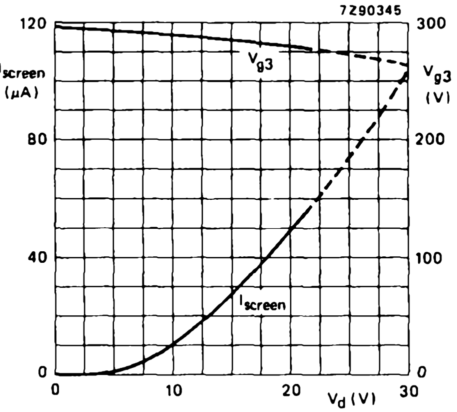

Fig. 5 Screen current (I_{screen}) and focusing voltage (V_{g3}) as a function of grid drive voltage (V_d); typical curves.

Screen dissipation	W_{ℓ}	max.	8 mW/cm^2
Control grid circuit resistance	R_{g1}	max.	1 MΩ

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 102 mm x 82 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; floating mean x- or y-potentials will result into non-uniform line width and geometry distortion. The mean x- and y-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry.

   The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case V_{g5} must be made equal to mean x-potential, and a range of 0 to −25 V with respect to mean y-potential will be required on g4 for astigmatism correction. The circuit resistance for V_{g4} should be $\leq$ 10 kΩ.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of 100 mm x 80 mm and 98 mm x 78 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of 185 ± 25 Ω at 0 °C, which increases by approx. 0,4%/K for rising temperature. Approx. 6,5 mA causes 1° trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_ℓ = 10 μA.
8. The X-ray dose rate remains below the acceptable value of 36 pA/kg (0,5 mR/h), when the tube is used within its limiting values (beam current $I_\ell \leq$ 100 μA).

INSTRUMENT CATHODE-RAY TUBE

- 14 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- low heater consumption
- internal graticule
- high sensitivity and high brightness
- short overall length
- for compact oscilloscopes with up to 100 MHz bandwidth

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g7(\ell)}$	10	16,5	kV
First accelerator voltage	V_{g4}	2	2,2	kV
Minimum useful scan area		100 mm x 80		mm
Deflection coefficient				
horizontal	M_x	8	8,3	V/cm
vertical	M_y	4	4	V/cm

The D14-371GH/123 is equivalent to the type D14-372GH/123 except for the following.

HEATING

Indirect by AC or DC *

Heater voltage	V_f		6,3	V
Heater current	I_f		0,1	A
Heating time to attain 10% of the cathode current at equilibrium conditions		approx.	7	s

* Not to be connected in series with other tubes.

INSTRUMENT CATHODE-RAY TUBE

- 14 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- quick-heating cathode
- internal graticule
- high sensitivity and high brightness
- short overall length
- for compact oscilloscopes with up to 100 MHz bandwidth

DEVELOPMENT DATA

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 102 mm x 82 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; floating mean x- or y-potentials will result into non-uniform line width and geometry distortion. The mean x- and y-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry. A range of $\Delta V_{g5} = -50$ to $+50$ V may be applied for pincushion/barrel correction.

   The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case V_{g5} must be made equal to mean x-potential, and a range of 0 to -25 V with respect to mean y-potential will be required on g4 for astigmatism correction. The circuit resistance for V_{g4} should be $\leqslant 10\ k\Omega$.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of 100 mm x 80 mm and 98 mm x 78 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $185 \pm 25\ \Omega$ at $20\ ^{o}C$, which increases by approx. 0,4%/K for rising temperature. At typical operation (V_{g5} = 2200 V, V_{g7} = 16,5 kV) approx. 6,5 mA causes 1^{o} trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances ($\pm 5^{o}$) and earth magnetic field with reasonable shielding ($\pm 2^{o}$).
   The required current for 1^{o} trace rotation is related to approx. $\sqrt{V_{g5}}$.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell} = 10\ \mu A$.

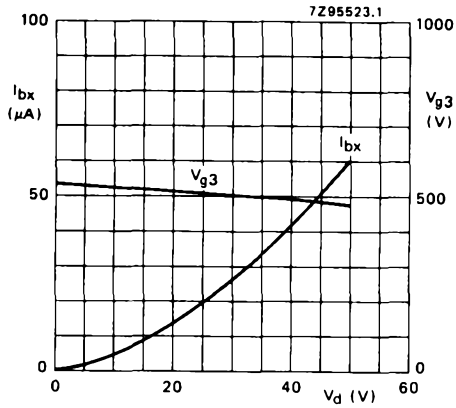

Fig. 5 Beam current (I_{bx}) and focusing voltage (V_{g3}) as a function of grid drive voltage (V_d) at V_{g7} = 16,5 kV, V_{g5} = 2,2 kV; typical curves.

I_{bx} is the beam current, without scan, measured on x2, when the deflection plate potentials have been adjusted to $V_{y1} = V_{y2}$ = 2200 V, V_{x1} = 1500 V, V_{x2} = 1900 V, thus directing the total beam current to x2.

Grid drive, averaged over 1 ms	V_d	max.	25	V	
Screen dissipation	W_ℓ	max.	8	mW/cm^2	
Control grid circuit resistance	R_{g1}	max.	1	MΩ	

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 102 mm x 82 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 5).
2. The deflection plates must be operated symmetrically; floating mean x- or y-potentials will result into non-uniform line width and geometry distortion. The mean x- and y-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry. A range of ΔV_{g5} = −50 to + 50 V may be applied for pincushion/barrel correction.

   The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case V_{g5} must be made equal to mean x-potential, and a range of 0 to −25 V with respect to mean y-potential will be required on g4 for astigmatism correction. The circuit resistance for V_{g4} should be $\leqslant$ 10 kΩ.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of 100 mm x 80 mm and 98 mm x 78 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of 185 ± 25 Ω at 20 °C, which increases by approx. 0,4%/K for rising temperature. At typical operation (V_{g5} = 2200 V, V_{g7} = 16,5 kV) approx. 6,5 mA causes 1° trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
   The required current for 1° trace rotation is related to approx. $\sqrt{V_{g5}}$.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_{ℓ} = 10 μA.

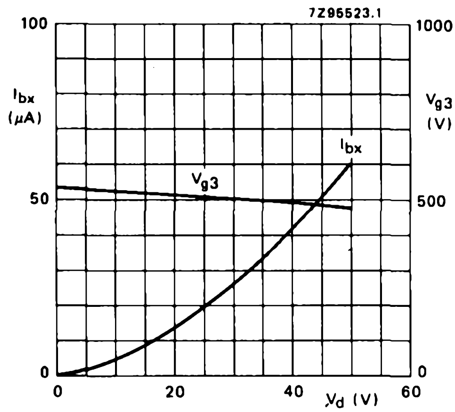

Fig. 6 Beam current (I_{bx}) and focusing voltage (V_{g3}) as a function of grid drive voltage (V_d); typical curves.

I_{bx} is the beam current, without scan, measured on x2, when the deflection plate potentials have been adjusted to $V_{y1} = V_{y2} = 2200$ V, $V_{x1} = 1500$ V, $V_{x2} = 1900$ V, thus directing the total beam current to x2.

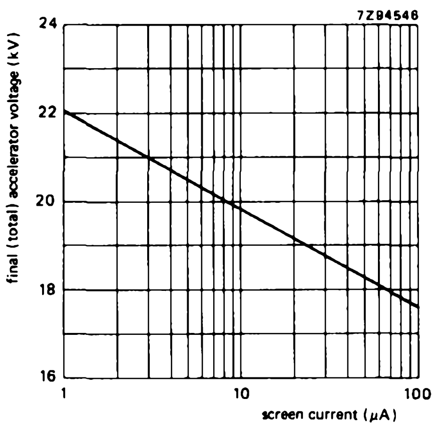

Fig. 7 0,5 mR/h isoexposure-rate limit curve, measured according to TEPAC104.

INSTRUMENT CATHODE-RAY TUBE

- 14 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- symmetrical helix system for vertical deflection
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- quick-heating cathode
- side contacts to deflection plates
- internal graticule
- high sensitivity and high brightness
- for oscilloscopes with up to 500 MHz bandwidth

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g7(\ell)}$	24	kV
First accelerator voltage	V_{g2}	3	kV
Minimum useful scan area		100	mm x 80 mm
Deflection coefficient			
horizontal	M_x	7,3	V/cm (max. 8,0 V/cm)
vertical	M_y	2,9	V/cm (max. 3,0 V/cm)
Photographic writing speed	p.w.s. min.	3	cm/ns

OPTICAL DATA

Screen	metal-backed phosphor
type	GH
colour	green
persistence	medium short
Useful screen area	≥ 102 mm x 82 mm; note 1 (last page)
Useful scan area	≥ 100 mm x 80 mm
Internal graticule	type 123; see Fig. 5

HEATING

Indirect by a.c. or d.c.*

Heater voltage	V_f	6,3	V
Heater current	I_f	0,24	A
Heating time to attain 10% of the cathode current at equilibrium conditions	approx.	5	s

* Not to be connected in series with other tubes.

MECHANICAL DATA

Dimensions and connections (see also outline drawings)

Overall length (socket included)	≤ 419 mm
Faceplate dimensions	118 ± 1,0 mm x 98 ± 1,0 mm
Net mass	approx. 1,2 kg
Base	12 pin, all glass, JEDEC B12-246

Mounting

The tube can be mounted in any position. It must not be supported by the socket and not by the base region alone. The reference points on adjoining edges of the faceplate (see Fig. 5) enable the tube to be mounted accurately in the front panel, thus providing optimum alignment of the internal graticule.

Accessories

Pin protector (required for shipping)	supplied with tube
Side pin protection band	3322 027 10200
Socket with solder tags	type 55594
Socket with printed-wiring pins	type 55595
Side contact connector for ϕ 0,65 mm pin (2 required)	type 55596 (cat. no. 9390 299 90002)
Side contact connector for ϕ 0,45 mm pin (4 required)	to be established
Final accelerator contact connector	connection to final accelerator electrode is made via an EHT cable attached to the tube
Mu-metal shield	to be established

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical (helix system)
Characteristic impedance of helix system	(2 x 165 Ω) ± 3%
Bandwidth of helix system (−3 dB)	approx. 1000 MHz

CAPACITANCES

x_1 to all other elements except x_2	$C_{x1(x2)}$		3,2 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$		3,2 pF
x_1 to x_2	C_{x1x2}		3,0 pF
x_1 to y_1	C_{x1y1}	<	0,2 pF
x_2 to y_1	C_{x2y1}	<	0,2 pF
x_1 to y_2	C_{x1y2}	<	0,2 pF
x_2 to y_2	C_{x2y2}	<	0,2 pF
Control grid to all other elements	C_{g1}		6,2 pF
Cathode to all other elements	C_k		3,8 pF
Focusing electrode to all other elements	C_{g3}		7,6 pF

DIMENSIONS AND CONNECTIONS

Dimensions in mm

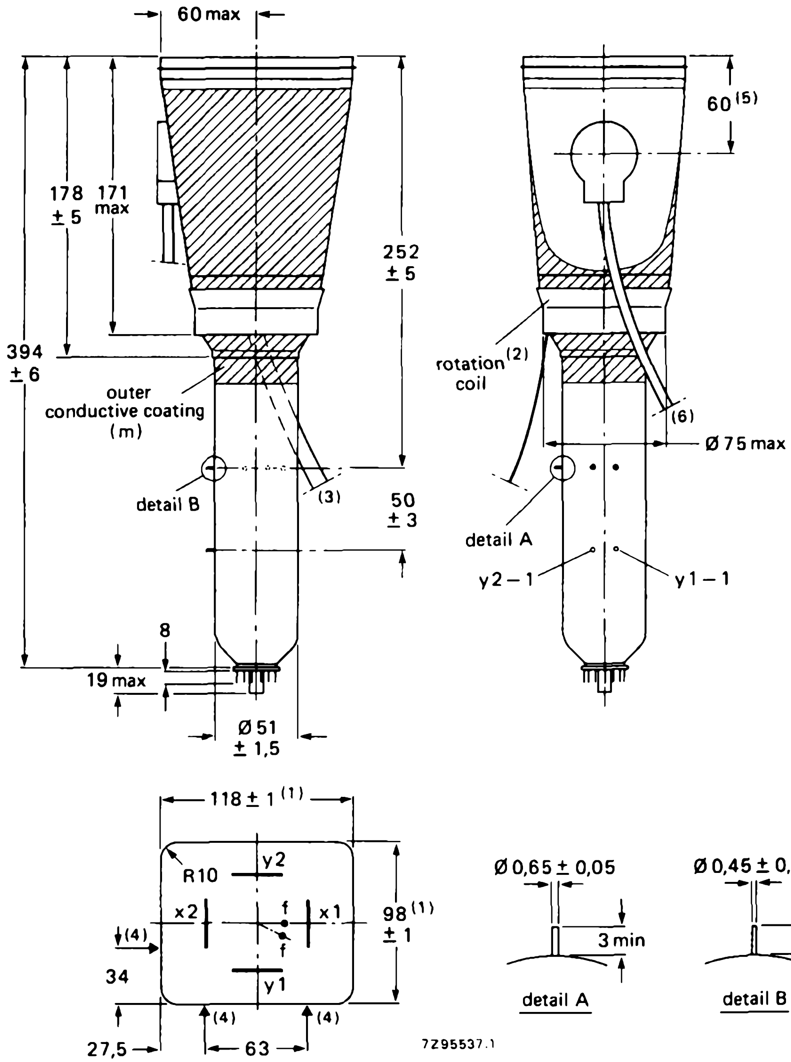

Fig. 1 Outlines.

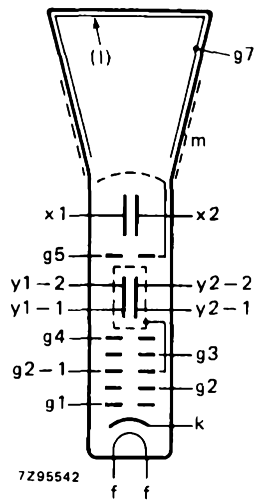

Fig. 2 Electrode configuration.

(1) Dimensions of faceplate only. The complete assembly of faceplate and cone (frit seal included) will pass through an opening of 122 x 102 mm (diagonal 153 mm).

(2) The coil is fixed to the envelope with resin and adhesive tape.

(3) The length of the connecting leads of the rotation coil is min. 350 mm.

(4) Reference points on faceplate for graticule alignment (see Fig. 5).

(5) The centre of the final accelerator contact is situated within a square of 10 mm x 10 mm around the indicated position.

(6) The length of the E.H.T. cable is min. 900 mm.

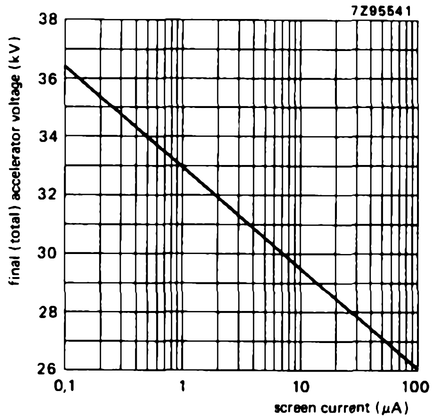

Fig. 7 0,5 mR/h isoexposure-rate limit curve, measured according to EIA standard RS-502 (formerly TEPAC104).

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 102 mm x 82 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 5).
2. The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration. Correction is obtained at $V_{g2\text{-}1,g4}$ = 2500 to 3300 V; optimum at $V_{g2\text{-}1,g4}$ = 3000 V.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case V_{g5} must be made equal to mean x-potential, and a range of 0 to −50 V with respect to mean y-potential will be required on g4 for astigmatism correction. The circuit resistance for V_{g4} should be $\leqslant$ 10 kΩ.
4. Deviation of mean y-plate potential with respect to $V_{g2\text{-}1}$ will introduce spot distortion.
5. Deviation of linearity is defined as the proportional deviation of the deflection coefficient over any division on the x-axis and y-axis from the average values over the central eight (horizontal) and central six (vertical) divisions respectively.
6. A graticule consisting of concentric rectangles of 100 mm x 80 mm and 98 mm x 78 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
7. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of 185 ± 20 Ω at 20 °C, which increases by approx. 0,4%/K for rising temperature. Approx. 6,7 mA causes 1° trace rotation.
8. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_ℓ = 10 μA.

INSTRUMENT CATHODE-RAY TUBE

18 cm diagonal, rectangular flat faced oscilloscope tube with mesh and metal backed screen.

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g7(\ell)}$	10 kV
Display area		120 x 100 mm^2

Control grid circuit resistance	R_{g1}	max.	1 MΩ

NOTES

1. In order to align the x-trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 amp. turns for the indicated maximum rotation of 5° and should be positioned as indicated in the drawing.
2. This tube is designed for optimum performance when operating at a ratio $V_{g7}/V_{g2,g4} = 5$.
   The geometry electrode voltage should be adjusted within the indicated range (values with respect to the mean x-plate potential).
   A negative control voltage will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion and a slight increase of background light.
3. The deflection plate shield voltage should be equal to the mean y-plate potential. The mean x- and y-plate potentials should be equal for optimum spot quality.
4. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
5. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
6. A graticule, consisting of concentric rectangles of 115 mm x 95 mm and 112,2 mm x 93,0 mm is aligned with the electrical x-axis of the tube, with optimum correction potentials applied, a raster will fall between these rectangles.

INSTRUMENT CATHODE-RAY TUBE

- mono accelerator
- 18 cm diagonal rectangular flat face
- dynamic deflection defocusing correction
- internal magnetic correction for astigmatism, vertical eccentricity and orthogonality
- low heater power consumption
- for oscilloscopes and general display up to 25 MHz bandwidth

QUICK REFERENCE DATA

Accelerator voltage	$V_{g2,g4,g5(\ell)}$	2000	2500	V
Minimum useful scan area		120 mm x 96 mm		
Deflection coefficient				
horizontal	M_x	21	26	V/cm
vertical	M_y	15	19	V/cm

OPTICAL DATA

Screen	
type	GY, colour green
persistence	medium
Useful screen area	⩾ 124 mm x 100 mm; note 1
Useful scan area	⩾ 120 mm x 96 mm
Internal graticule	type 127; see Fig. 4

HEATING

Indirect by a.c. or d.c.*		
Heater voltage	V_f	6,3 V
Heater current	I_f	0,1 A
Heating time to attain 10% of the cathode current at equilibrium conditions		approx. 7 s

* Not to be connected in series with other tubes.

MECHANICAL DATA

Dimensions and connections (see also outline drawing)

Overall length (socket included)	≤ 324 mm
Faceplate dimensions	142 ± 0,5 mm x 118 ± 0,5 mm
Net mass	approx. 1,3 kg
Base	12-pin, all glass, JEDEC B12-246

Mounting

The tube can be mounted in any position. It must not be supported by the socket and not by the base region alone. The reference points on adjoining edges of the faceplate (see Fig. 4) enable the tube to be mounted accurately in the front panel, thus providing optimum alignment of the internal graticule.

Accessories

Socket with solder tags	type 55594
Socket with printed-wiring pins	type 55595
Mu-metal shield	to be established
Pin protector (required for shipping)	supplied with tube

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

DYNAMIC DEFLECTION DEFOCUSING CORRECTION

The tube has a special electrode, positioned between the x and y-plates, for dynamic correction of deflection defocusing, to improve the uniformity of the width of a vertical line up to the screen edges. If use is made of this dynamic correction, a negative voltage proportional to, and approx. 50% of, the negative horizontal deflection plate voltage should be applied to this electrode (grid 6).
The correction-circuit impedance must be $\leqslant 100\ k\Omega$. To prevent distortion, the output impedances of the x-amplifiers should be $\leqslant 10\ k\Omega$.
If no correction is required, grid 6 should be connected to mean x-plate potential ($V_{g2(\ell)}$).

CAPACITANCES (approx. values)

x_1 to all other elements except x_2	$C_{x1(x2)}$	4,5 pF
x_2 to all other elements except x_1	$C_{x2(x1)}$	4,5 pF

Line width	l.w.	≈	0,3 mm		note 9

LIMITING VALUES (Absolute maximum rating system)

Accelerator voltage	$V_{g2,g4,g5,(\ell)}$	max.	3000 V
Focusing voltage	V_{g3}	max.	3000 V
Voltage between accelerator electrode and grid 6	$V_{g2/g6}$	max.	± 500 V
Voltage between accelerator electrode and any deflection plate	$V_{g2/x/y}$	max.	± 500 V
Control grid voltage	$-V_{g1}$	max.	200 V
		min.	0 V
Cathode to heater voltage positive	V_{kf}	max.	125 V
negative	$-V_{kf}$	max.	125 V
Heater voltage	V_f	max.	6,6 V
		min.	6,0 V
Grid drive voltage, averaged over 1 ms	V_d	max.	20 V
Screen dissipation	W_ℓ	max.	3 mW/cm²
Control grid circuit resistance	R_{g1}	max.	1 MΩ

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 124 mm x 100 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The mean x-plate potential and the mean y-plate potential should be equal to $V_{g2,g4,g5(\ell)}$.
3. The tube features internal magnetic correction for astigmatism, orthogonality and eccentricity calibration. Optimum spot is obtained if $V_{g2,g4,g5(\ell)}$ is equal to mean y-potential.
4. An actual focus range of approx. 50 V should be provided on the front panel. V_{g3} decreases with increasing grid drive.
5. Intensity control on the front panel should be limited to the maximum useful screen current dependent on $V_{g2,g4,g5(\ell)}$. It is to be adjusted either by the grid drive (up to 30 V) or for maximum acceptable line width. The corresponding cathode current or $I_{g2,g4,g5}$ (up to 500 μA) depends on the cut-off voltage and cannot be used for control settings.
6. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
7. A graticule consisting of concentric rectangles of 120 mm x 96 mm and 117 mm x 93 mm is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
8. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has a maximum resistance of 240 Ω at 80 °C. The maximum required voltage is approx. 12 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
9. Measured with the shrinking raster method within the useful scan under typical operating conditions, adjusted for optimum focus and dynamic correction applied.

   As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:

   a) Under typical operating conditions, apply a small raster display (no overscan), adjust V_{g1} for a beam current of approx. 10 μA and adjust V_{g3} for smallest spot size at the centre of the screen. When measuring the beam current, grid 6 should be connected to g2-potential and the diodes should be disconnected from the x-plates.

   b) Under these conditions, but without raster, the deflection plate voltages should be changed to: $V_{y1} = V_{y2} = 2000$ V; $V_{x1} = 1300$ V; $V_{x2} = 1700$ V, thus directing the total beam current to x_2. Measure the current on x_2 and adjust V_{g1} for $I_{x2} = 10$ μA.

   c) Set again for the conditions under a), without touching the V_{g1} control. The screen current of the resulting raster display is now 10 μA.
   Adjust V_{g3} for optimum focus in the centre of the screen and apply dynamic correction to grid 6 for optimum width of a vertical line.

INSTRUMENT CATHODE-RAY TUBE

- 18 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- quick-heating cathode
- internal graticule
- high sensitivity and high brightness
- short overall length
- for oscilloscopes and general display up to 100 MHz bandwidth

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g7(\ell)}$	16 kV
First accelerator voltage	V_{g4}	2 kV
Minimum useful scan area		120 mm x 96 mm
Deflection coefficient		
horizontal	M_x	6,4 V/cm
vertical	M_y	3,4 V/cm

OPTICAL DATA

Screen	metal-backed phosphor
type	GH
colour	green
persistence	medium short
Useful screen area	⩾ 124 mm x 100 mm; note 1
Useful scan area	⩾ 120 mm x 96 mm
Internal graticule	type 127; see Fig. 4

HEATING

Indirect by AC or DC*

Heater voltage	V_f	6,3 V
Heater current	I_f	240 mA
Heating time to attain 10% of the cathode current at equilibrium conditions	approx.	5 s

* Not to be connected in series with other tubes.

MECHANICAL DATA

Dimensions and connections (see also outline drawings)

Overall length (socket included)	≤ 348 mm
Faceplate dimensions	142 ± 0,5 mm x 118 ± 0,5 mm
Net mass	approx. 1,3 kg
Base	12 pin, all glass, JEDEC B12-246

Mounting

The tube can be mounted in any position. It must not be supported by the socket and not by the base region alone. The reference points on adjoining edges of the faceplate (see Fig. 4) enable the tube to be mounted accurately in the front panel, thus providing optimum alignment of the internal graticule.

Accessories

Pin protector (required for shipping)	supplied with tube
Socket with solder tags	type 55594
Socket with printed-wiring pins	type 55595
Final accelerator contact connector	type 55569/55597
Mu-metal shield	to be established

FOCUSING	electrostatic
DEFLECTION	double electrostatic
x-plates	symmetrical
y-plates	symmetrical

Screen dissipation	W_ℓ	max.	8	mW/cm²
Control grid circuit resistance	R_{g1}	max.	1	MΩ

NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. 124 mm x 100 mm is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; floating mean x- or y-potentials will result into non-uniform line width and geometry distortion. The mean x- and y-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry.

   The tube features internal magnetic correction for orthogonality between x- and y-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case V_{g5} must be made equal to mean x-potential, and a range of 0 to −25 V with respect to mean y-potential will be required on g4 for astigmatism correction. The circuit resistance for V_{g4} should be $\leqslant$ 10 kΩ.
4. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of 120 mm x 96 mm and 117,4 mm x 93,4 mm is aligned. with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has a maximum resistance of 240 Ω at 80 °C. The maximum required voltage is approx. 13 V for tube tolerances (± 5°) and earth magnetic field with reasonable shielding (± 2°).
7. *Measured with the shrinking raster method in the centre of the screen under typical operating* conditions, adjusted for optimum spot size at a beam current I_ℓ = 10 μA.
8. The X-ray dose rate remains below the acceptable value of 36 pA/kg (0,5 mR/h), when the tube is used within its limiting values (beam current $I_\ell \leqslant$ 100 μA).

DEVELOPMENT DATA

INSTUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat faced, split-beam oscilloscope tube with mesh and metal-backed screen.

QUICK REFERENCE DATA

y_1' to y_2'	$C_{y_1'y_2'}$	1 pF
y_1'' to y_2''	$C_{y_1''y_2''}$	1 pF
Control grid to all other elements	C_{g_1}	6 pF
Cathode and heater to all other elements	$C_{kf/R}$	3 pF

NOTES

1. This tube is designed for optimum performance when operating at a ratio $V_{g7(\ell)}/V_{g2,g4} = 6,7$.

   The geometry control voltage V_{g6} should be adjusted within the indicated range (values with respect to the mean x-plate potential).

2. A negative control voltage on g_5 (with respect to the mean x-plate potential) will cause some pincushion distortion and less background light. By varying the two voltages V_{g5} and V_{g6} it is possible to find the best compromise between background light and raster distortion.

3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.

4. The sensitivity at a deflection less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.

5. A graticule, consisting of concentric rectangles of 100 mm x 80 mm and 96 mm x 77 mm is aligned with the electrical x-axis of the tube. With optimum correction potentials applied a raster of each system will fall between these rectangles.

TYPICAL OPERATING CONDITIONS

Final accelerator voltage	$V_{g7}(\ell)$	10	kV	
Geometry control electrode voltage	V_{g6}	1500 ± 100	V	see note 1

CORRECTION COILS

General

The E14-100GH is provided with a pair of coils for image rotation which enable the alignment of the x-trace with the x-lines of the graticule.

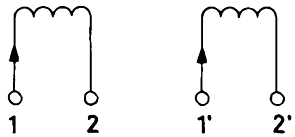

Fig. 2 Diagram of coil unit.

The image rotating coils are wound concentrically around the tube neck. Under typical operating conditions 50 A turns are required for the maximum rotation of 5°. Both coils have 850 turns. This means that a current of max. 30 mA per coil is required which can be obtained by using a 24 V supply when the coils are connected in series, or a 12 V supply when they are in parallel.

Connecting the coils

The coils have been connected to the 4 soldering tags as follows:

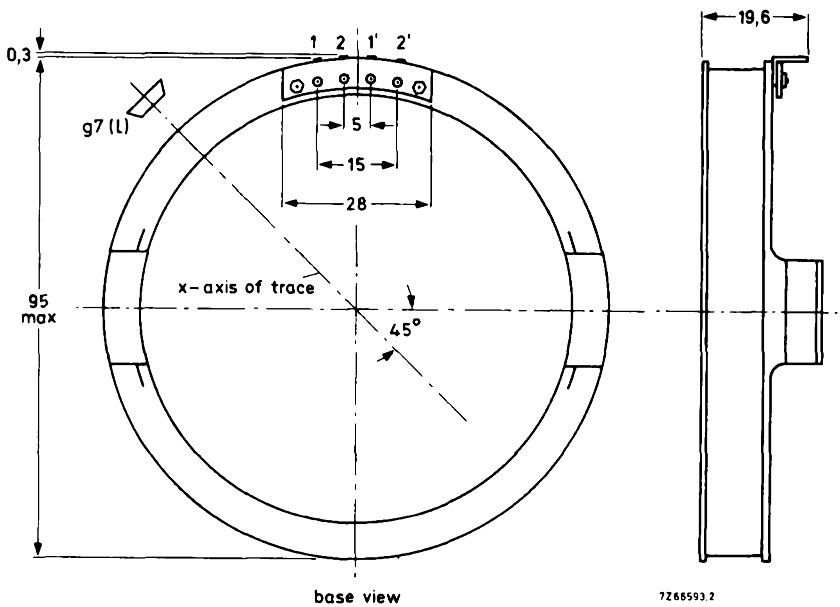

Fig. 3 Dimensions and connections.

BEAM CENTRING MAGNET

Inherent to the split-beam system a slight difference between the two beam currents can occur after splitting, resulting in different intensities of the two traces. In order to equalize the beam currents, a beam centring magnet should be mounted near the base of the gun and adjusted for the required field direction and field strength.

INSTRUMENT CATHODE-RAY TUBE

The E14-101GH is equivalent to the E14-100GH but has no rotating coil.

INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat-faced direct-view storage tube with variable persistence and internal graticule, intended for oscilloscope applications.

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g10(\ell)}$	8,5	kV
Display area (10 x 8 divisions of 9 mm)		90 x 72	mm^2

NOTES

1. These values are valid at cut-off of both flood guns and the writing gun. The H.T. unit must be capable of supplying 0,5 mA. To protect the tube against excessive surge current during erasure, an adequately dimensioned RC-network must be connected in series with the screen terminal lead (Fig. 8).

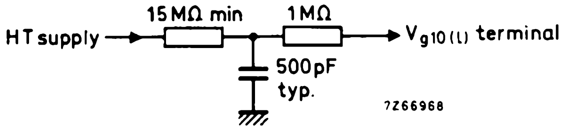

Fig. 8.

2. This voltage should be equal to the mean y-plate potential. The mean x and y-plate potentials should be equal for optimum spot quality.
3. The collimator electrode voltage should be adjusted for optimum uniformity of background illumination.
4. The voltage V_{g2}', V_{g2}'' should be equal to the mean x-plate potential.
5. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_b = 10 μA (measured against x-plates).
6. The writing speed is defined as the maximum speed at which a written trace is just visible, starting from a background which is just black. The indicated value is guaranteed for the total graticule area, with the exception of maximum 5% in each corner. The writing speed can be increased to approx. 2,5 div/μs if some background is tolerated.
7. The storage time is defined as the time required for the brightness of the unwritten background to rise from just zero brightness (viewing-beam cut-off) to 10% of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased.
8. The sensitivity at a deflection less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
9. A graticule, consisting of concentric rectangles of 88 mm x 70 mm and 86 mm x 68,5 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.

CORRECTION COILS

General

The L14-111GH/55 is provided with a coil unit (see Fig. 9) consisting of:

- a pair of coils L3 and L4 which enable the angle between the x and y-traces at the centre of the screen to the made exactly 90° (orthogonality correction);
- a pair of coils L1 and L2 for image rotation which enable the alignment of the x-trace with the x-lines of the graticule.

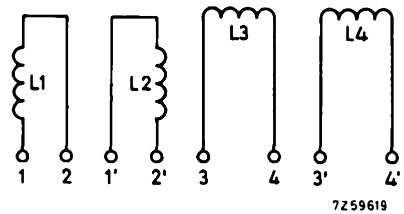

Fig. 9 Diagram of coil unit.

Orthogonality (coils L3 and L4)

The current required under typical operating conditions without a mu-metal shield being used is max. 20 mA for complete correction of orthogonality. It will be 30% to 50% lower with shield, depending on the shield diameter. The resistance of the coil is approx. 225 Ω.

Image rotation (coils L1 and L2)

The image rotation coils are wound concentrically around the tube neck. Under typical operating conditions 22 ampere-turns are required for maximum rotation of 5°. Both coils have 850 turns. This means that a current of max. 12,5 mA per coil is required which can be obtained by using a 12 V supply when the coils are connected in series or a 6 V supply when they are in parallel.

Connecting the coils

The coils have been connected to 8 solder tags according to Fig. 10.

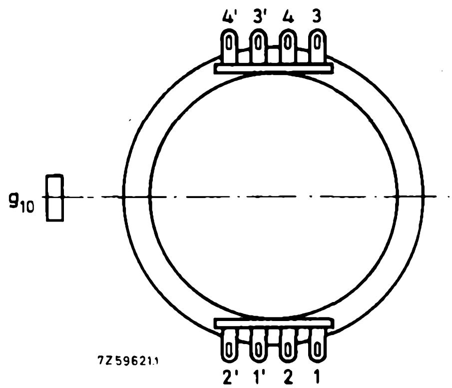

Fig. 10 Bottom view.

With L3 and L4 connected in series according to Fig. 11 a current in the direction indicated will produce a clockwise rotation of the vertical trace and an anti-clockwise rotation of the horizontal trace.

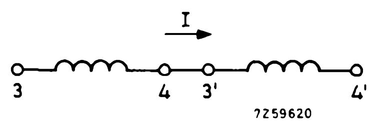

Fig. 11.

OPERATING NOTES

Modes of operation

Store mode

a. Dynamic erasure (variable persistence)

Dynamic erasure can be achieved by applying erasing pulses of positive polarity to the backing electrode. The pulse amplitude required is approximately 9V (< 15 V) and the persistence of a stored display can be controlled by varying the duty factor of these pulses.

b. Static erasure.

If no dynamic erasing pulses are applied, the storage time is limited by the potential shift of the storage layer due to landing of positive ions. In order to erase a stored display, the backing electrode should first be connected to the collector electrode voltage and then returned to its original potential for about 100 ms; after that, an erasing pulse of positive polarity and a duration of not less than 300 ms should be applied. For the adjustment of the amplitude of this pulse see Procedure of adjustment.

Non-store mode

For non-store operation, it is sufficient to make the backing electrode about 35 V negative with respect to the viewing gun cathodes. The viewing guns should not be switched off in this mode of operation since slight variations in raster geometry and deflection sensitivity might otherwise be caused. Care should be taken, especially when switching from store mode to non-store mode, that excessive writing beam current is avoided, as otherwise the storage layer may be damaged.

Procedure of adjustment

a. Adjust the cathode current of each viewing gun to 0,4 mA by means of its control grid voltage.

b. Adjustment of the erasing pulse amplitude (static erasure)

The pulse amplitude should be just sufficient to suppress any background illumination at the centre of the display area (this adjustment should be done under low ambient light conditions). Data on storage time and maximum writing speed are based on erasure to "just black". A larger pulse amplitude (erasure to "blacker than black") yields a longer storage time at the expense of maximum writing speed. On the other hand, writing speed can be increased if some background illumination is tolerated. To erase to "just black" the amplitude of this pulse is approximately 9 V.

c. Adjustment of the collimator voltage

With dynamic erasing pulses applied and a persistence control setting that yields a convenient background illumination intensity, the collimator voltage is adjusted for optimum background uniformity. This voltage will be approximately 80 V with respect to the viewing gun cathode potential. If this voltage is too high or too low, there is a decrease of intensity at the four corners or at the centres of the vertical edges of the display area respectively. For a good erasure of the display, the collimator voltage should be as low as possible.

INSTRUMENT CATHODE-RAY TUBE

14 cm-diagonal rectangular flat-faced direct-view storage tube with split-beam writing gun, variable persistence and internal graticule, intended for oscilloscope applications.

QUICK REFERENCE DATA

Final accelerator voltage	V_{g10} (ℓ)	8,5	kV
Useful scan (10 x 8 divisions of 9 mm)		90 x 72	mm
Deflection coefficient			
horizontal	M_x	9,5	V/div
vertical, system 1	M_y'	8,5	V/div
vertical, system 2	M_y''	8,5	V/div
Overlap of the systems		100	%
Writing speed		1,25	div/µs

OPTICAL DATA

NOTES

1. These values are valid at cut-off of both viewing (flood) guns and the writing gun. The H.T. unit must be capable of supplying 0,5 mA. To protect the tube against excessive surge current during erasure, an adequately dimensioned RC-network must be connected in series with the screen terminal lead (Fig. 8).

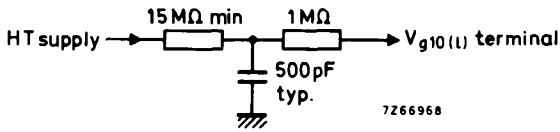

Fig. 8.

2. This voltage should be equal to the mean y-plate potential. The mean x and y-plate potentials should be equal for optimum spot quality.
3. The collimator electrode voltage should be adjusted for optimum uniformity of background illumination.
4. The voltage $V_{g2'}$, $V_{g2''}$ should be equal to the mean x-plate potential.
5. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_b = 5 μA per system (measured against x-plates).
6. The writing speed is defined as the maximum speed at which a written trace is just visible, starting from a background which is just black. The indicated value is guaranteed for the total graticule area, with the exception of maximum 5% in each corner. The writing speed can be increased to approx. 1,25 div/μs if some background is tolerated.
7. The storage time is defined as the time required for the brightness of the unwritten background to rise from just zero brightness (viewing-beam cut-off) to 10% of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased.
8. The sensitivity at a deflection less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
9. A graticule, consisting of concentric rectangles of 88 mm x 70 mm and 84,8 mm x 67,6 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.

CORRECTION COILS

General

The L14-131GH/55 is provided with a coil unit (see Fig. 9) consisting of:

1. A pair of coils L3 and L4 which enable the angle between the x and y-traces at the centre of the screen to be made exactly 90° (orthogonality correction).
2. A pair of coils L1 and L2 for image rotation which enable the alignment of the x-trace with the x-lines of the graticule.

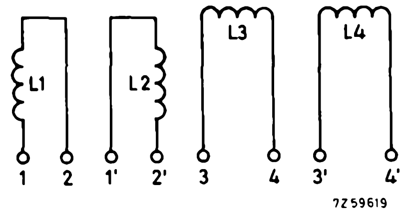

Fig. 9 Diagram of coil unit.

Orthogonality (coils L3 and L4)

The current required under typical operating conditions without a mu-metal shield being used is max. 20 mA for complete correction of orthogonality. It will be 30% to 50% lower with shield, depending on the shield diameter. The resistance of the coil is approx. 225 Ω.

Image rotation (coils L1 and L2)

The image rotation coils are wound concentrically around to the tube neck. Under typical operating conditions 22 ampere-turns are required for maximum rotation of 5°. Both coils have 850 turns. This means that a current of max. 12,5 mA per coil is required which can be obtained by using a 12 V supply when the coils are connected in series or a 6 V supply when they are in parallel.

Connecting the coils

The coils have been connected to 8 solder tags according to Fig. 10.

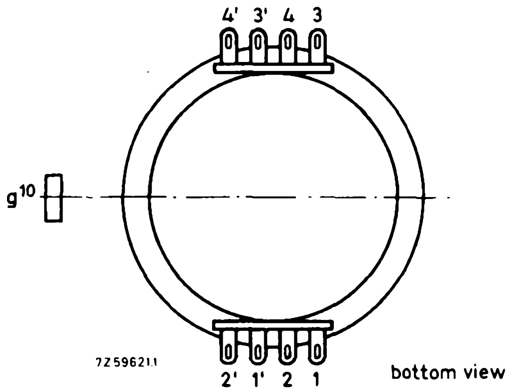

Fig. 10 Bottom view.

With L3 and L4 connected in series according to Fig. 11 a current in the direction indicated will produce a clockwise rotation of the vertical trace and an anti-clockwise rotation of the horizontal trace.

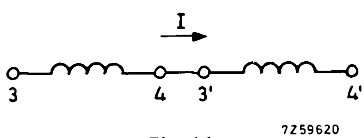

Fig. 11.

BEAM CENTRING MAGNET

Inherent to the split-beam system a slight difference between the two beam currents can occur after splitting, resulting in different intensities of the two traces. In order to equalize the beam currents, a beam centring magnet should be mounted near the base of the gun and adjusted for the required field direction and field strength.

OPERATING NOTES

Modes of operation

Store mode

a. Dynamic erasure (variable persistence).

Dynamic erasure can be achieved by applying erasing pulses of positive polarity to the backing electrode. The pulse amplitude required is approximately 9 V ($<$ 15 V) and the persistence of a stored display can be controlled by varying the duty factor of these pulses.

b. Static erasure.

If no dynamic erasing pulses are applied, the storage time is limited by the potential shift of the storage layer due to landing of positive ions. In order to erase a stored display, the backing electrode should first be connected to the collector electrode voltage and then returned to its original potential for about 100 ms; after that, an erasing pulse of positive polarity and a duration of not less than 300 ms should be applied. For the adjustment of the amplitude of this pulse see Procedure of adjustment.

Non-store mode

For non-store operation, it is sufficient to make the backing electrode about 35 V negative with respect to the viewing gun cathodes. The viewing guns should not be switched off in this mode of operation since slight variations in raster geometry and deflection sensitivity might otherwise be caused. Care should be taken, especially when switching from store mode to non-store mode, that excessive writing beam current is avoided, as otherwise the storage layer may be damaged.

Procedure of adjustment

a. Adjust the cathode current of each viewing gun to 0,4 mA by means of its control grid voltage.

b. Adjustment of the erasing pulse amplitude (static erasure)

The pulse amplitude should be just sufficient to suppress any background illumination at the centre of the display area (this adjustment should be done under low ambient light conditions). Data on storage time and maximum writing speed are based on erasure to "just black". A larger pulse amplitude (erasure to "blacker than black") yields a longer storage time at the expense of maximum writing speed. On the other hand, writing speed can be increased if some background illumination is tolerated. To erase to "just black" the amplitude of this pulse is approximately 9 V.

c. Adjustment of the collimator voltage.

With dynamic erasing pulses applied and a persistence control setting that yields a convenient background illumination intensity, the collimator voltage is adjusted for optimum background uniformity. This voltage will be approximately 80 V with respect to the viewing gun cathode potential. If this voltage will be approximately 80 V with respect to the viewing gun cathode potential. If this voltage is too high or too low, there is a decrease of intensity at the four corners or at the centres of the vertical edges of the display area respectively.

INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat-faced direct-view charge transfer storage tube with internal graticule. The tube has vertical scan-magnification with 3 quadrupole lenses and is for wide-band (100 MHz) oscilloscopy with fast store mode and variable persistence.

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g13(\ell)}$	10 kV
Minimum useful scan area		90 mm x 72 mm
Deflection coefficient

HEATING

Writing section

Indirect by a.c. or d.c.*

Heater voltage	V_f	6,3 V
Heater current	I_f	240 mA
Heating time to attain 10% of the cathode current at equilibrium conditions		approx. 5 s

Viewing section

Indirect by d.c.*

Heater voltage	V_{FGf}	12,6 V
Heater current	I_{FGf}	240 mA
Heating time to attain 10% of the cathode current at equilibrium conditions		approx. 5 s

* Not to be connected in series with other tubes.

MECHANICAL DATA

Mounting position

The tube can be mounted in any position. It should not be supported by the base alone or near the base region, and under no circumstances should the socket be allowed to support the tube. The tags near the screen should not be subjected to mechanical stress. Avoid any force on the side contacts.

Net mass	approx.	1,3	kg
Base	14 pin, all glass		
Dimensions and connections (see also outline drawing)			
Overall length (socket included)	max.	454	mm
Faceplate dimensions	118 ± 0,5 mm x 98 ± 0,5		mm
Accessories			
Socket (supplied with tube)	type	55572	
Side contact connector (8 required)	type	55561	
Small ball contact connected (6 required)	type	4022 102 21590	

FOCUSING	electrostatic		note 1
DEFLECTION	double electrostatic		
x-plates	symmetrical		
y-plates	symmetrical		
Angle between x and y-traces		90 ± 1°	
Angle between y-trace and y-axis of the internal graticule		≤ 5°	note 2

NOTES

1. Because of the use of a quadrupole lens for the magnification of the vertical deflection, two more quadrupole lenses are used for focusing. Therefore, controls for two voltages have to be provided.
2. The tube has a rotation coil, concentrically wound around the tube neck, to allow alignment of the y-trace with the mechanical y-axis of the screen. The coil has 2000 turns and a maximum resistance of 650 Ω. Under typical operating conditions, a maximum of 30 ampere-turns is required for the maximum rotation of 5°. This means the required supply is 15 mA maximum at 12 V maximum.

Writing speed (note 8)

Variable persistence mode
just black: ⩾ 250 div/ms
max. write: ⩾ 2,5 div/μs

Fast-store mode
max. write: ⩾ 1 div/ns

Storage viewing time (note 9)

Variable persistence mode
just black: ⩾ 60 s
max. write: ⩾ 15 s

Fast-store mode
max. write: ⩾ 15 s

NOTES

1. These values are valid at cut-off of both flood guns and the writing gun. The H.T. unit must be capable of supplying 0,5 mA. To protect the tube against excessive surge current during erasure, an RC-network as shown in Fig. 7 must be connected in series with the screen terminal lead; the resistance of 15 to 20 MΩ includes the internal resistance of the H.T. supply.

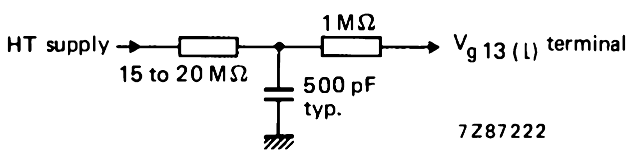

Fig. 7.

2. This voltage should be adjusted for equal brightness in the x-direction with respect to the electrical centre of the tube.
3. For minimum defocusing of vertical lines near the upper and lower edges of the scanned area this voltage should be the value indicated.
4. The indicated values concern the d.c. levels; during the erasing, preparing and transfering operation these electrodes are pulsed.
5. The sensitivity at a deflection less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
6. A graticule, consisting of concentric rectangles of 90 mm x 72 mm and 87,8 mm x 70,5 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_b = 10 μA (measured against x-plates).

NOTES (continued)

8. The writing speed is defined as the maximum speed at which a written trace is just visible starting from a background which is just black. The indicated value is guaranteed for the central 80% of the minimum screen area, except the outmost 3 mm of the screen. However, in any corner not more than 4 square divisions fall outside the guaranteed area. The writing speed can be increased, if some background is tolerated. Within the same area, a trace, written with the indicated value of max. write, remains just visible within the indicated storage time of max. write.

   The writing speed in max. write, with background, is defined as the maximum speed at which the written trace remains just visible within the indicated storage time.

9. The storage time in just black mode is defined as the time required for the brightness of the unwritten background to rise from zero brightness (viewing beam cut-off) to 10% of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased.

   The storage time in max. write and fast is related to the writing speed.

OPERATING NOTES

Scan magnifier

A scan magnification $M_{sc} \approx 1{,}8$ is the best compromise between line width and sensitivity. This is obtained with $V_{g7} = -600$ V and $V_{g4} = 200$ V. Performance is tested and specified under this condition and no adjustment will be necessary for individual tubes.

Focusing is separate for horizontal and vertical directions with V_{g3} and V_{g5} respectively. Both focus settings may depend on beam current with different steepness. Although both electrodes are positive with respect to cathode, reverse current may result from secondary electrons leaving grid 3 (max. 5 μA) and grid 5 (max. 50 μA).

Normal current direction from beam interception is to be expected on the horizontal correction electrode g_6 (up to 500 μA) and, as usual, on g_2 and deflection plates.

Modes of operations

Non-store mode

For non-store operation the front mesh V_{g12} is set to -50 V with respect to FGK.

The viewing guns should not be switched off in this mode of operation since slight variations in raster geometry and deflection sensitivity might otherwise be caused. Care should be taken, especially when switching from store mode to non-store mode, that excessive writing beam current is avoided, as otherwise the storage layer may be damaged.

Variable persistence mode

The fast mesh is switched off for this operation and used as collector by setting $V_{g11} = 140$ V.

a. Static erasure

If no dynamic erasing pulses are applied the storage time is limited by the potential shift of the storage layer due to landing of positive ions.

In order to erase a stored display, V_{g12} is increased to 500 V for 100 ms and than returned to its original potential for about 500 ms; after that, an erasing pulse of positive polarity (max. 20 V) and a duration of 600 ms should be applied.

While the erasing pulse amplitude is to be adjusted with zero d.c. level for "just black", the background illumination can be changed — even with a stored signal — by varying the d.c. level for optimum contrast or maximum writing speed.

Background egality can be optimized by balancing the viewing gun cathodes by means of a potentiometer of 2,2 kΩ, proper collimator adjustment, and by increasing V_{FGA}. $V_{g9\text{-}1}$ and $V_{g9\text{-}3}$ in positive direction during erasure.

Before first installation, depending on transport conditions, demagnetization of the tube face region may be necessary.

b. Dynamic erasure

Dynamic erasure can be achieved by applying extra erasing pulses of positive polarity to the backing electrode of the front mesh (g_{12}). The amplitude of these extra pulses is equal to that of the original erasing pulse, the frequency is 120 Hz and the persistence of the display can be controlled by varying the duty factor.

Fast-store mode

For erasure in the fast mode the front mesh has to be erased first in the same way as in the variable persistence mode but separate adjustments should be foreseen.

The fast mesh is to be prepared by reducing V_{g11} from 140 V to the stabilizing level (0 to max. 20 V) during the erasing pulse on the front mesh.

After writing, at the end of the unblanking pulse, a transfer pulse (500 V, 100 ms) is to be applied on the front mesh.

During the transfer pulse, V_{g11} is further reduced about 1 V for enhanced transmission during transfer. This reduction has to be carefully adjusted for optimum contrast and writing speed.

During the whole cycle, FGA, $V_{g9\text{-}1}$ and $V_{g9\text{-}3}$ may be increased for more viewing gun current. Details on the adjustment procedure and the voltage range to be provided for can be made available.

INSTRUMENT CATHODE-RAY TUBE

- 14 cm diagonal rectangular flat face
- direct - view storage tube
- internal graticule
- for oscilloscope applications

QUICK REFERENCE DATA

Final accelerator voltage	$V_{g10(\ell)}$	8,5 kV
Minimum useful scan area		90 mm x 72 mm

OPERATING NOTES

Modes of operations

Non-storage mode

For non-storage operation the front mesh V_{g9} is set to −50 V with respect to FGK.

The viewing guns should not be switched off in this mode of operation since slight variations in raster geometry and deflection sensitivity might otherwise be caused.

Variable persistence mode

a. Dynamic erasure

Dynamic erasure can be achieved by applying extra erasing pulses of positive polarity to the backing electrode V_{g9}. The amplitude of these extra pulses is equal to that of the original erasing pulse, the frequency is 120 Hz and the persistence of the display can be controlled by varying the duty factor.

b. Static erasure (Fig. 8)

If no dynamic erasing pulses are applied the storage time is limited by the potential shift of the storage layer due to landing of positive ions.

In order to erase a stored display, V_{g9} is increased to 150 V for 100 ms and than returned to its original potential for about 500 ms; after that, an erasing pulse of positive polarity (max. 15 V) and a duration of 600 ms should be applied.

While the erasing pulse amplitude is to be adjusted with zero d.c. level for "just black", the background illumination can be changed – even with a stored signal – by varying the d.c. level for optimum contrast or maximum writing speed.

Back ground egality can be optimized by balancing the viewing gun cathodes by means of a potentiometer of 2,2 kΩ, proper collimator adjustment, and by increasing V_{FGA}, $V_{g7\text{-}1}$, $V_{g7\text{-}2}$ and $V_{g7\text{-}3}$ in positive direction during erasure.

Before first installation, depending on transport conditions, demagnetization of the tube face region may be necessary.

NOTES

1. These values are valid at cut-off of both flood guns and the writing gun. The HT unit must be capable of supplying 0,5 mA. To protect the tube against excessive surge current during erasure, an RC network as shown in Fig. 9 must be connected in series with the screen terminal lead; the resistance of 15 to 20 MΩ includes the internal resistance of the HT supply.

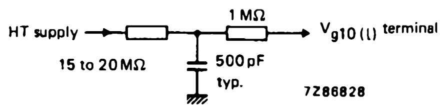

Fig. 9 RC network.

2. This voltage should be equal to the mean y-plate potential. The mean x and y-plate potentials should be equal for optimum spot quality.
3. When putting the tube into operation, the astigmatism control voltage should be adjusted only once for optimum spot size in the screen centre. The control voltage will be within the stated range, provided the conditions of note 2 are adhered to.
4. The collimator electrode voltage $V_{g7\text{-}2}$ and $V_{g7\text{-}3}$ should be adjusted for optimum uniformity of background illumination.
5. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current I_b = 10 μA (measured on x-plates).
6. The writing speed is defined as the maximum speed at which a written trace is just visible starting from a background which is just black. The indicated value is guaranteed for the central 75% of the minimum screen area, except the outmost 4 mm of the screen. However, in any corner not more than 4 square divisions fall outside the guaranteed area. The writing speed can be increased, if some background is tolerated. Within the same area, a trace, written with the indicated value of max. write, remains just visible within the indicated storage time of max. write.

   The writing speed in max. write, with background, is defined as the maximum speed at which the written trace remains just visible within the indicated storage time.
7. The storage time in just black mode is defined as the time required for the brightness of the unwritten background to rise from zero brightness to 10% of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased.

   The storage time in max. write is related to the writing speed.
8. The sensitivity at a deflection less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
9. A graticule, consisting of concentric rectangles of 72 mm x 54 mm and 69,8 mm x 52,5 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.
10. The tube has a rotation coil, concentrically wound around the tube neck, to allow alignment of the x-trace with the mechanical x-axis of the screen. The coil has 2000 turns and a maximum resistance of 650 Ω. Under typical operating conditions, a maximum of 20 ampere-turns is required for the maximum rotation of 5°. This means the required supply is 10 mA maximum at 8 V maximum.
11. The d.c. voltage on the first accelerator of the flood guns (FGA) should be equal to the mean x-plate potential.

MONITOR AND DISPLAY TUBES

SURVEY OF MONITOR AND DISPLAY TUBES

M38-120W
M38-121W

SCREENS

Although WA and WE are the standard screens certain applications require screens of a different persistence and/or colour (e.g. GH, GR, GM). Tubes with such screens are supplied to special order.

BONDED FACEPLATES

Tubes with bonded faceplates are supplied to special order.

SPECIAL OPTIONS FOR MONITOR AND DISPLAY TUBES

MONITOR TUBE M31-340 and M38-328

HIGH RESOLUTION MONOCHROME DISPLAY TUBES

In addition to the types of phosphor available on the display tubes type M31-340 and M38-328 (see Handbook T16), the following phosphor options are also available:

new system	old system	fluorescent colour	phosphorescent colour	persistence	equivalent JEDEC designation
BE	B	blue	blue	medium short	P11
BF	U	purplish-blue	–	medium short	–
GK	G	yellowish-green	yellowish-green	medium	–
GM	P	purplish-blue	yellowish-green	long	P7
GU	–	white	white	very short	–
GY	–	green	green	medium	P43
LB	P26	orange	orange	very long	–
LC	P12	orange	orange	long	–
SB*	–	yellow-white	yellow-white	medium short	–
WA	–	white	–	–	–
WE	–	white	white	medium short	P45

* Note: for use with LCD colour shutter.

The phosphor information given in this section is based in general upon the original phosphor registration (TEPAC and/or ELECTRON) and can be used as a selection guide. Slight differences may occur between the actual phosphor properties and the registered data.

Other options, such as special lugs etc., available on request.

MONITOR TUBE

17 cm diagonal rectangular flat face monitor tube primarily for use as a viewfinder in television cameras. This tube has been replaced by type M17-142WE, which features a 1,5 W cathode (6,3 V/240 mA) with short warm-up time (quick-heating cathode), and an improved phosphor, type WE.

The data of M17-140W are equivalent to those of type M17-142WE, except for the following.

HEATING

Indirect by a.c. or d.c.*

Heater voltage	V_f	6,3 V
Heater current	I_f	300 mA

SCREEN

Phosphor type	W
fluorescent colour	white

* Not to be connected in series with other tubes.

MONITOR TUBE

17 cm diagonal rectangular flat face monitor tube primarily for use as a viewfinder in television cameras. It has a bonded face plate and a metal mounting band. This tube has been replaced by type M17-143WE, which features a 1,5 W cathode (6,3 V/240 mA) with short warm-up time (quick-heating cathode), and an improved phosphor, type WE.

The data of M17-141W are equivalent to those of type M17-143WE, except for the following.

HEATING

Indirect by a.c. or d.c.*

Heater voltage	V_f	6,3 V
Heater current	I_f	300 mA

SCREEN

Phosphor type	W
fluorescent colour	white

* Not to be connected in series with other tubes.

MONITOR TUBES

- 17 cm diagonal rectangular flat face
- 70° deflection angle
- high resolution
- quick heating cathode
- M17-142WE: for use in precision monitors and as a viewfinder in television cameras
  M17-144WE: for use in photographic equipment (see Optical Data)

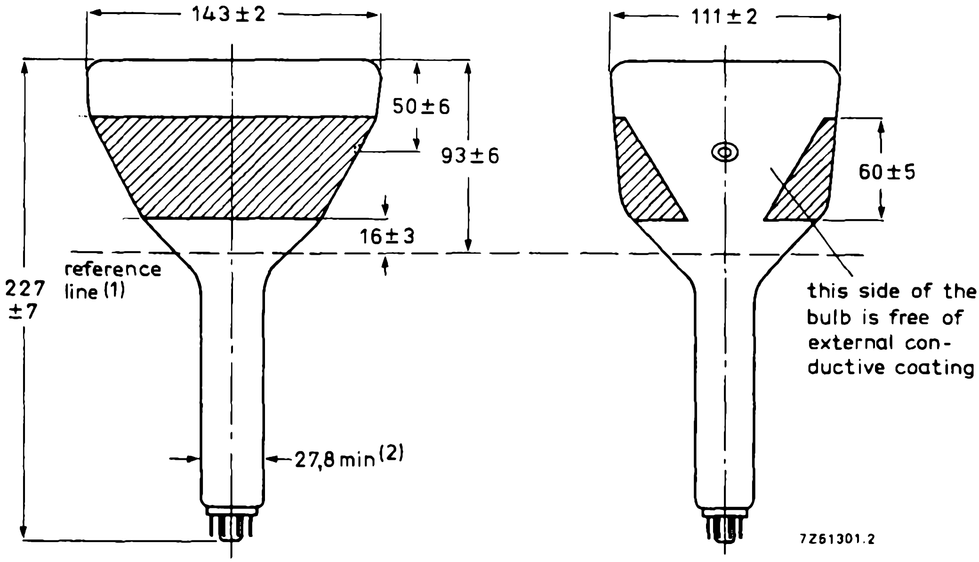
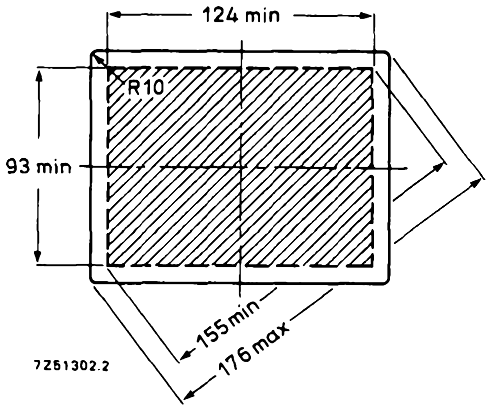
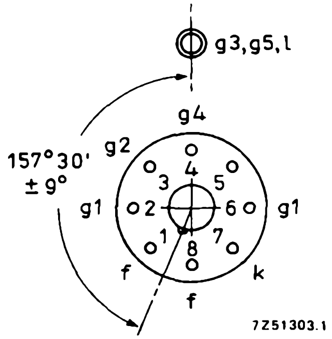
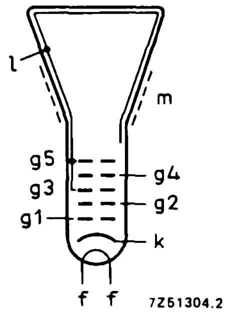
Dimensions in mm



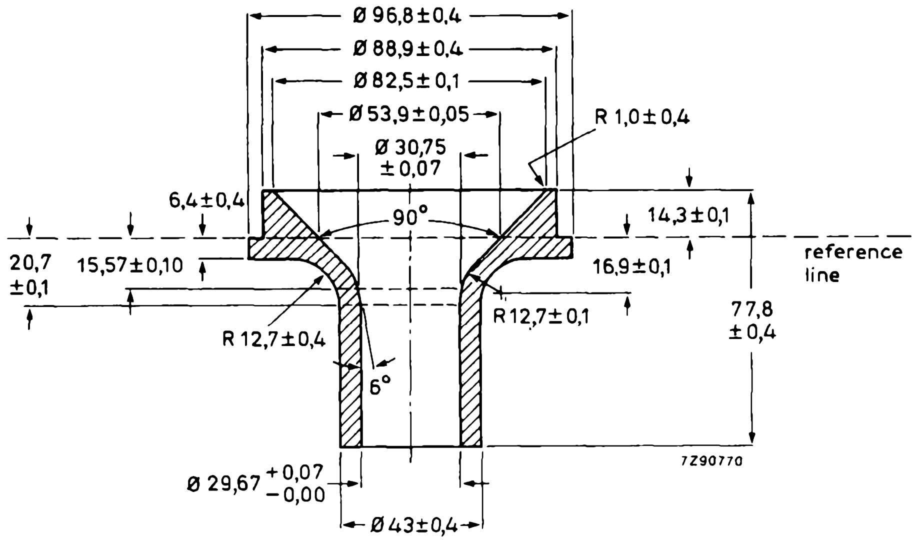


(1) Reference line, determined by the plane of the upper edge of the flange of the reference line gauge when the gauge is resting on the cone.
(2) The maximum dimension is determined by the reference line gauge.





Reference line gauge



RECOMMENDED OPERATING CONDITIONS

Final accelerator voltage	$V_{g3,g5(\ell)}$	14	kV
Focusing electrode voltage	V_{g4}	0 to 400	V*
First accelerator voltage	V_{g2}	400	V
Cut-off voltage for visual extinction of focused spot	$-V_{g1}$	30 to 62	V

RESOLUTION

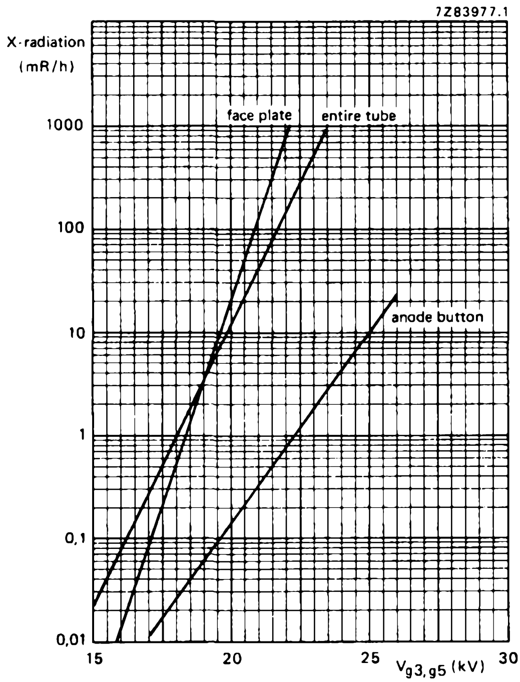
Resolution at screen centre, measured with beam centring magnet** at $V_{g3,g5(\ell)}$ = 14 kV, V_{g2} = 400 V, I_ℓ = 20 μA, luminance = 400 cd/m² ▲	min.	1050	TV lines

LIMITING VALUES

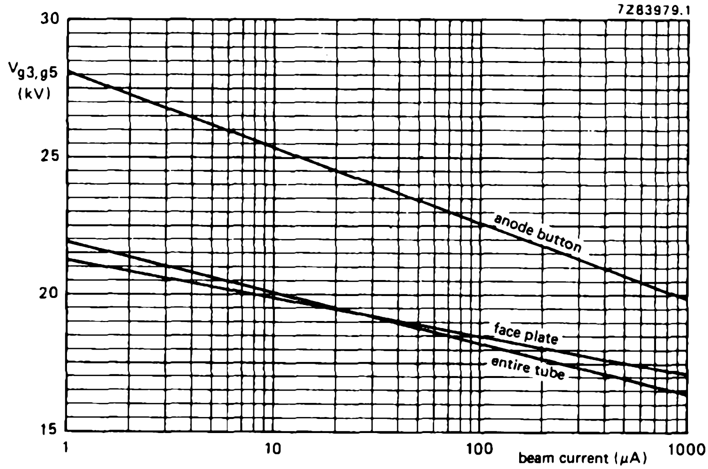
Final accelerator voltage	$V_{g3,g5(\ell)}$	max.	16	kV
		min.	12	kV
Focusing electrode voltage	V_{g4}	max.	1	kV
	$-V_{g4}$	max.	0,5	kV
First accelerator voltage	V_{g2}	max.	800	V
		min.	300	V
Control grid voltage				
negative	$-V_{g1}$	max.	150	V
positive	V_{g1}	max.	0	V
positive peak	V_{g1p}	max.	2	V
Cathode to heater voltage				
positive	V_{kf}	max.	125	V
negative	$-V_{kf}$	max.	125	V

* For optimum focus at a beam-current of 50 μA.
** Catalogue number 3322 142 11401; supplied with directions for use with each tube.
▲ Luminance is measured with a photocell, of which the spectral response curve is identical to that of the human eye, on a 312-lines raster with dimensions 70 mm x 70 mm.

X-RADIATION LIMIT



X-radiation limit curves, at a constant anode current of 250 μA, measured according to TEPAC103A.



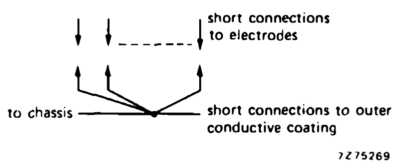
0,5 mR/h isoexposure-rate limit curves, measured according to TEPAC103A.

Product safety

X-ray shielding of the cone is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 14 kV.

FLASHOVER PROTECTION

With the high voltage used with this tube internal flashovers may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.
The spark gaps must be connected as follows:



No other connections between the outer conductive coating and the chassis are permissible.

MONITOR TUBES

- 17 cm diagonal rectangular flat face
- 70° deflection angle
- high resolution
- quick heating cathode
- bonded face plate
- metal band for mounting
- M17-143WE: for use in precision monitors and as a viewfinder in television cameras
  M17-145WE: for use in photographic equipment (see Optical Data)

QUICK REFERENCE DATA

Deflection angle, diagonal	70°
Face diagonal	17 cm
Neck diameter	28 mm
Overall length	max. 240 mm
Screen dimensions	min. 124 mm x 93 mm
Resolution at V_a = 16 kV	min. 1250 TV lines

ELECTRICAL DATA

Capacitances			
final accelerator to metal band	$C_{g3,g5(\ell)/m'}$	135	pF
final accelerator to external conductive coating	$C_{g3,g5(\ell)/m}$	240	pF

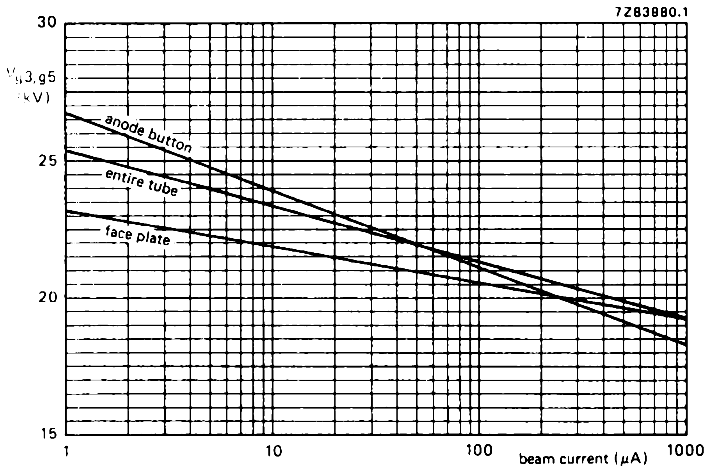
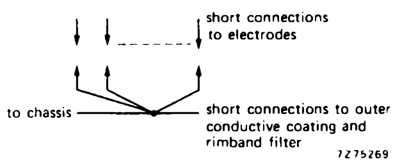
X-radiation limit curves, at a constant anode current of 250 μA, measured according to TEPAC103A.



0,5 mR/h isoexposure-rate limit curves, measured according to TEPAC103A.

FLASHOVER PROTECTION

With the high voltage used with this tube internal flashovers may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.
The spark gaps must be connected as follows:



No other connections between the outer conductive coating and the chassis are permissible.

VERY HIGH RESOLUTION FLAT CATHODE-RAY TUBE

- 17 cm diagonal rectangular flat face
- 70° deflection angle
- very high resolution
- quick heating cathode

QUICK REFERENCE DATA

Deflection angle, diagonal	70 °
Face diagonal	17 cm
Neck diameter	28 mm
Overall length	max. 269 mm
Screen dimensions	min. 124 mm x 93 mm
Resolution	approx 2500 TV lines 1800 lines (shrinking raster)

APPLICATION *

This tube has been designed for use in photographic applications where screen current is generally limited to a maximum of 20 μA. At these relatively low screen currents, the extremely good resolution together with the excellent screen quality, makes this tube ideal for use in photographic equipment.

* Application support is available on request.

ELECTRICAL DATA

Capacitances			
final accelerator to external conductive coating	$C_{g4(\ell)/m}$	310	pF
cathode to all other elements	C_k	2,8	pF
grid 1 to all other elements	C_{g1}	6	pF
Focusing method	electrostatic		
Deflection method	magnetic		
Deflection angle, diagonal	70^o		
Heating	indirect by AC or DC		
heater voltage	V_f	6,3	V
heater current	I_f	240	mA
Heating time to attain 10% of the cathode current at equilibrium conditions	approx.	5	s

OPTICAL DATA

Screen	metal-backed phosphor
Phosphor type	WE *
fluorescent colour	white
persistence	medium short
Useful screen dimensions	
diagonal	min. 155 mm
horizontal axis	min. 124 mm
vertical axis	min. 93 mm
Light transmission of screen glass	approx. 92%

The M17-220WE has an improved screen blemish and uniformity specification, to meet the extreme requirements of photographic recording equipment.

* Other phosphors available to special order.

MECHANICAL DATA

Overall length	262 ± 7 mm
Neck diameter	min. 27,8 mm
Base	JEDEC B10-277
Final accelerator contact	cavity contact, CT8; IEC67-III-2
Net mass	approx. 0,8 kg

Mounting

The tube should not be mounted in a vertical position, screen downwards, such that its longitudinal axis makes an angle of less that 20° with the vertical. This is the only restriction on mounting.

Accessories

Final accelerator contact connector	55563A
Deflection coils*	Syntronic type deflection coils are highly recommended. e.g. 15330/1

Options

- customer designed suspension system
- implosion protection
- other phosphors

* The tube has internal magnetic correction for astigmatism. To avoid changing this correction, the coil must be at zero potential, before being moved on the tube neck.

X-RADIATION LIMIT

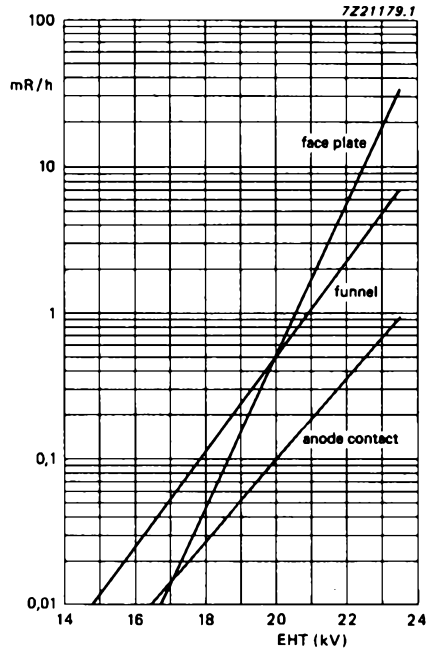

Fig. 7 X-radiation limit curves, at a constant anode current of 50 μA, measured in accordance with TEPAC164.

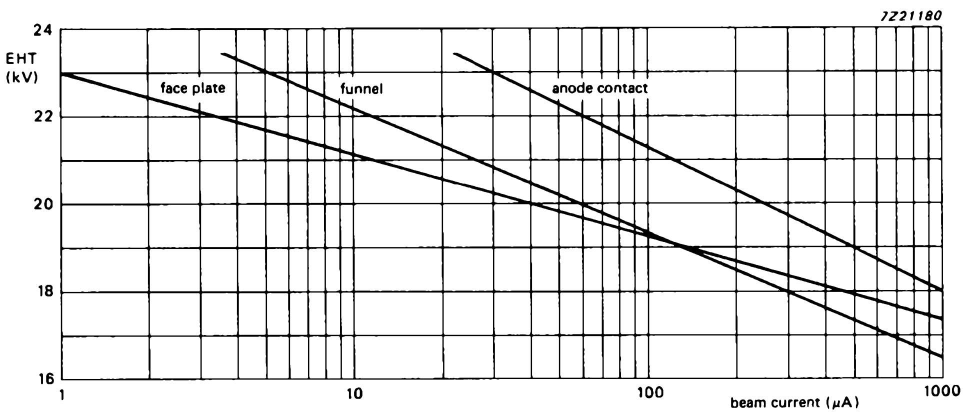

Fig. 8 0,5 mR/h isoexposure-rate limit curves, measured in accordance with TEPAC164.

MONITOR TUBE

The M24-100W is a 24 cm-diagonal rectangular television tube with metal-backed screen primarily intended for use as a monitor or display tube.

QUICK REFERENCE DATA			
Deflection angle		90	°
Focusing		electrostatic	
Resolution		900	lines
Overall length	max.	260	mm

SCREEN

Metal-backed phosphor				
Luminescence			white	
Light transmission of face glass			52	%
Useful diagonal		min.	225	mm
Useful width		min.	190	mm
Useful height		min.	140	mm

HEATING

Indirect by a.c. or d.c.; parallel supply

Heater voltage	V_f	6,3	V
Heater current	I_f	300	mA

CAPACITANCES

Final accelerator to external conductive coating	$C_{g3,g5(\ell)/m}$	420	pF
Cathode to all other elements	C_k	5	pF
Control grid to all other elements	C_{g1}	7	pF

FOCUSING

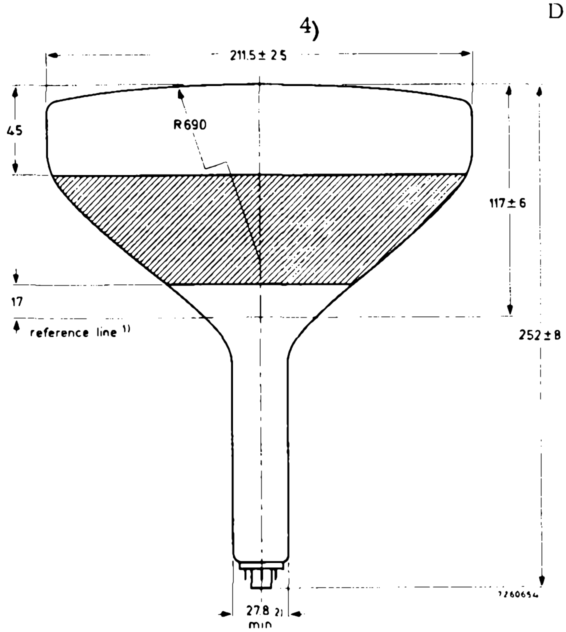
electrostatic

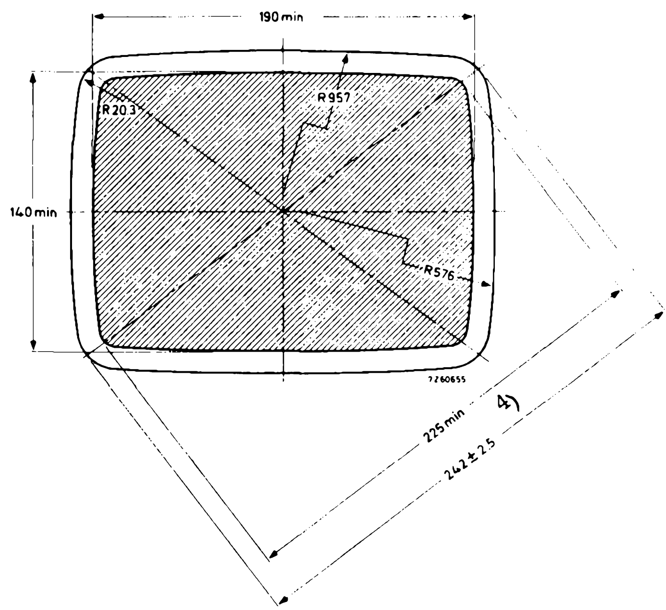
For focusing voltage providing optimum focus at a beam current of 100 μA see under "Typical operating conditions".

DEFLECTION 3) magnetic

Diagonal deflection angle 90°

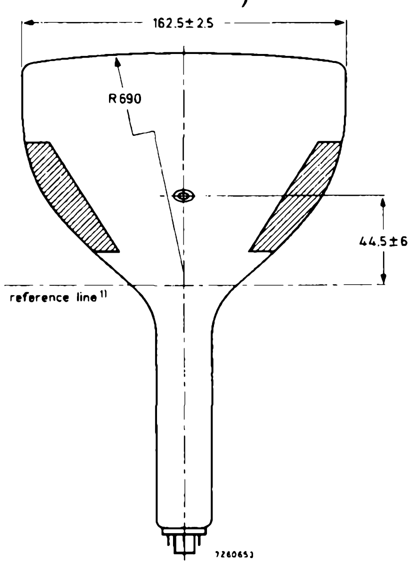
MECHANICAL DATA Dimensions in mm

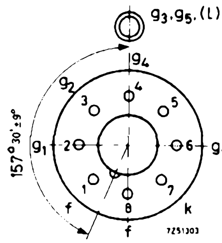


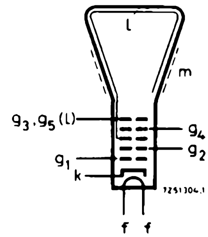


Notes see **next page.**

MECHANICAL DATA (continued)







Mounting position : any, except vertical with the screen downward and the axis of the tube making an angle of less than 20° with the vertical.

Base	Neo eightar (B8H)
Cavity contact	CT8
Accessories	
Socket	2422 501 06001
Final accelerator contact connector	type 55563A

PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to 800 A/m (0 to 10 Oe). Adjustment of the centring magnet should not be such that a general reduction in brightness or shading of the raster occurs.

NOTES

1) The reference line is determined by the plane of the upper edge of the of the flange of reference line gauge when the gauge is resting on the cone.

2) The maximum dimension is determined by the reference line gauge.

3) Deflection coil AT1071/03 is recommended. If another coil is considered, it is advisable to contact the local tube supplier.

4) The bulge at the spliceline seal may increase the indicated maximum values for envelope width, diagonal and height by not more than 6,4 mm, but at any point around the seal the bulge will not protrude more than 3,2 mm beyond the envelope surface.

TYPICAL OPERATING CONDITIONS

Final accelerator voltage	$V_{g_3,g_5(\ell)}$			16	kV
Focusing electrode voltage	V_{g_4}	0	to	400	V
First accelerator voltage	V_{g_2}			600	V
Grid no. 1 voltage for extinction of focused raster	V_{g_1}	-32	to	-85	V

RESOLUTION

Resolution at screen centre measured with the shrinking raster method (non-interlaced raster), under typical operating conditions, at a beam current of 50 μA ($200 cd/m^2$ = 200 nit) The resolution can be improved by the use of beam centring magnet catalogue number 3322 142 11401, supplied on request. 900 lines

LIMITING VALUES (Absolute max. rating system)

Final accelerator voltage	$V_{g_3,g_5(\ell)}$	max.	18	kV	
		min.	10	kV

Final accelerator contact connector	

PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to 800 A/m (0 to 10 Oe). Adjustment of the centring magnet should not cause a general reduction in brightness or shading of the raster.

NOTES TO OUTLINE DRAWINGS

1) The reference line is determined by the plane of the upper edge of the flange of the reference line gauge with the gauge resting on the cone.

2) The maximum dimension is determined by the reference line gauge.

3) This tube has an external conductive coating (m), which must be earthed.
The capacitance of this coating to the final accelerator is used for smoothing the EHT. The tube marking and warning labels are on the side of the cone opposite the final accelerator contact, and this side should not be used for making contact to the conductive coating.

4) This area must be kept clean.

5) Minimum space to be reserved for mounting lugs.

6) The mounting screws in the cabinet must be situated within a circle with a diameter of 4 mm drawn around the true geometrical position (corners of a rectangle of 207,4 mm x 158,5 mm).

7) The maximum displacement of any lug with respect to the plane through the other three lugs is 2 mm.

8) The metal rim-band must be earthed. The hole of 2,5 mm diameter in each lug is provided for this purpose.

9) The bulge at the spliceline seal may increase the indicated maximum values for envelope width, diagonal and height by not more than 6,4 mm, but at any point around the seal the bulge will not protrude more than 3,2 mm beyond the envelope surface.

CAPACITANCES

Final accelerator to external conductive coating	$C_{g3,\ g5(\ell)/m}$		420	pF
Final accelerator to metal band	$C_{g3,\ g5(\ell)/m'}$		200	pF
Cathode to all other elements	C_k		5	pF
Control grid to all other elements	C_{g1}		7	pF

TYPICAL OPERATING CONDITIONS

Final accelerator voltage	$V_{g3,\ g5(\ell)}$			16	kV
Focusing electrode voltage	V_{g4}	0	to	400	V
First accelerator voltage	V_{g2}			600	V
Grid 1 voltage for extinction of focused raster	V_{g1}	-32	to	-85	V

RESOLUTION

Resolution at screen centre measured with the shrinking raster method (non-interlaced raster), under typical operating conditions, and at a beam current of 50 μA: 900 lines (luminance ≈200 cd/m^2).

If necessary, the picture quality can be improved by using a beam centring magnet. This magnet, catalogue number 3322 142 11401, can be supplied on request.

LIMITING VALUES (Absolute max. rating system)

Final accelerator voltage	$V_{g3,\ g5(\ell)}$	max.	18	kV	
		min.	10	kV	
Focusing electrode voltage, positive	V_{g4}	max.	1000	V	
negative	$-V_{g4}$	max.	500	V

Focusing electrode voltage	V_{g4}	0 to 400	V
First accelerator voltage	V_{g2}	600	V
Grid 1 voltage for extinction of focused raster	V_{g1}	-32 to -85	V

RESOLUTION

Resolution at screen centre measured with the shrinking raster method (non-interlaced raster), under typical operating conditions, and at a beam current of 50 μA: 900 lines

If necessary, the picture quality can be improved by using a beam centring magnet. This magnet, catalogue number 3322 142 11401, can be supplied on request.

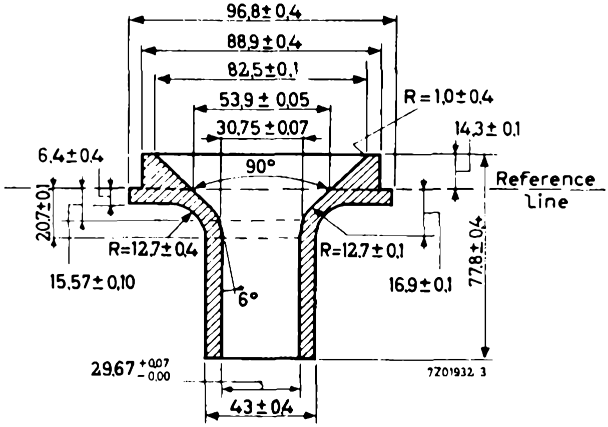
LIMITING VALUES (Absolute max. rating system)

Final accelerator voltage	$V_{g3,\ g5(\ell)}$	max.	18	kV
		min.	10	kV
Focusing electrode voltage, positive	V_{g4}	max.	1000	V
negative	$-V_{g4}$	max.	500	V
First accelerator voltage	V_{g2}	max.	800	V
		min.	300	V
Grid voltage, negative	$-V_{g1}$	max.	150	V
positive	V_{g1}	max.	0	V
positive peak	V_{g1p}	max.	2	V
Cathode to heater voltage, positive	V_{kf}	max.	250	V
positive peak	V_{kf_p}	max.	300	V
negative	$-V_{kf}$	max.	135	V [1])
negative peak	$-V_{kf_p}$	max.	180	V

1) During a warm-up period not exceeding 15 s the heater may be 410 V negative with respect to the cathode.

REFERENCE LINE GAUGE

Dimensions in mm



MONITOR TUBE

The M38-120W is a 38 cm-diagonal rectangular television tube with metal backed screen and integral protection primarily intended for use as a monitor tube.
On request this tube can also be supplied with a WA screen phosphor.

QUICK REFERENCE DATA		
Deflection angle	110 $^{\circ}$	
Focusing	electrostatic	
Resolution	min. 650	lines
Overall length	max. 279,5	mm

SCREEN

Metal backed phosphor

Luminescence	white	
Light transmission of face glass	50	%

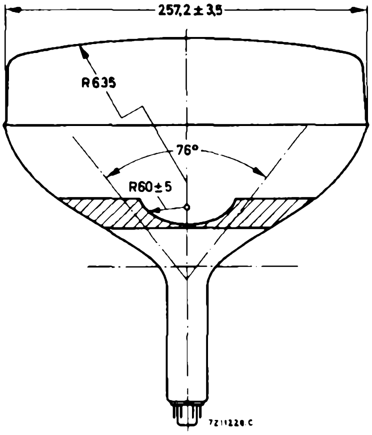
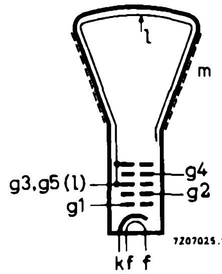
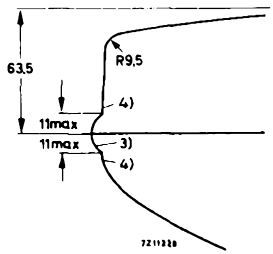
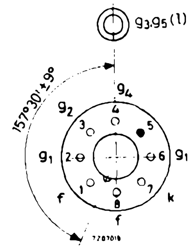
MECHANICAL DATA (continued)









Mounting position: any

Base	Neo eightar (B8H), IEC67-I-31a
Cavity contact	CT8, IEC67-III-2
Accessories	
Final accelerator contact connector	type 55563A
Socket	2422 501 06001

NOTES TO OUTLINE DRAWING

1) The reference line is determined by the plane of the upper edge of the flange of reference line gauge, (JEDEC126) when the gauge is resting on the cone.

2) End of guaranteed contour. The maximum neck and cone contour is given by the Reference line gauge.

3) Bulge at splice-line seal may increase the indicated maximum value for envelope width, diagonal and height by not more than 6,4 mm, but at any point around the seal, the bulge will not protrude more than 3,2 mm beyond the envelope surface at the location specified for dimensioning the envelope width, diagonal and height.

4) The tube should be supported on both sides of the bulge. The mechanism used should provide clearance for the maximum dimensions of the bulge.

5) The maximum dimension is determined by the reference line gauge

PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to 800 A/m (0 to 10 oersted). Adjustment of the centring magnet should not be such that a general reduction in brightness or shading of the raster occurs.

CAPACITANCE

Control grid to all other elements	C_{g1}	6,0	pF
Cathode to all other elements	C_k	5,0	pF
Final accelerator to external conductive coating	$C_{g3,g5(\ell)/m}$	600	pF

TYPICAL OPERATING CONDITIONS

Final accelerator voltage	$V_{g3,g5(\ell)}$	16	kV
Focusing electrode voltage	V_{g4}	0 to 400	V [1]
First accelerator voltage	V_{g2}	400	V
Grid No. 1 voltage for visual extinction of a focused raster	$-V_{g1}$	40 to 85	V

RESOLUTION

Resolution at screen centre, measured with the shrinking raster method (non-interlaced raster), under typical operating conditions, a beam current of 100 µA, and focusing voltage adjusted for optimum spot size min. 650 lines

LIMITING VALUES (Absolute max. rating system)

Voltages are specified with respect to cathode unless otherwise stated.

Final accelerator voltage	$V_{g3,g5(\ell)}$	max.	18	kV
		min.	13	kV
Focusing electrode voltage	V_{g4}	max.	1	kV
	$-V_{g4}$	max.	0,5	kV
First accelerator voltage	V_{g2}	max.	550	V
		min.	350	V
Control grid voltage, negative	$-V_{g1}$	max.	150	V
positive	V_{g1}	max.	0	V
positive peak	V_{g1_p}	max.	2	V
Cathode to heater voltage, positive	V_{kf}	max.	250	V
positive peak	V_{kf_p}	max.	300	V
negative	$-V_{kf}$	max.	135	V
negative peak	$-V_{kf_p}$	max.	180	V

[1]) With the small change in focus spot size with variation of focus voltage the limit of 0 to 400 V is such that an acceptable focus quality is obtained within this range. If it is required to pass through the point of focus, a voltage of at least −100 V to +500 V will be required.

CIRCUIT DESIGN VALUES

Focusing electrode current, positive	I_{g_4}	max.	25	µA
negative	$-I_{g_4}$	max.	25	µA
Grid no. 2 current, positive	I_{g_2}	max.	5	µA
negative	$-I_{g_2}$	max.	5	µA

MAXIMUM CIRCUIT VALUES

Resistance between cathode and heater	R_{kf}	max.	1	MΩ
Impedance between cathode and heater (f = 50 Hz)	Z_{kf}	max.	500	kΩ
Resistance between grid no. 1 and earth	R_{g_1}	max.	1,5	MΩ
Impedance between cathode and earth (f = 50 Hz)	Z_k	max.	100	kΩ

WARNING

X-ray shielding is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 16 kV.

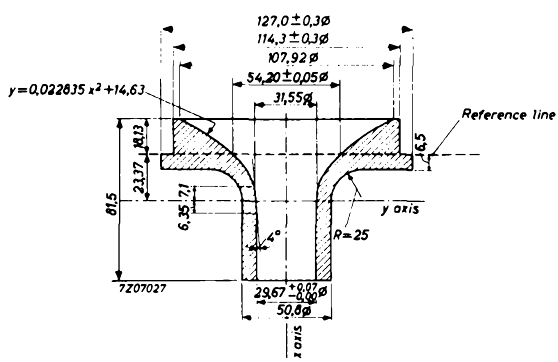
EXTERNAL CONDUCTIVE COATING

This tube has an external conductive coating (m), which must be earthed and capacitance of this to the final electrode is used to provide smoothing for the EHT supply. The tube marking and warning labels are on the side of the cone opposite the final electrode connector and this side should not be used for making contact to the external conductive coating.

REFERENCE LINE GAUGE

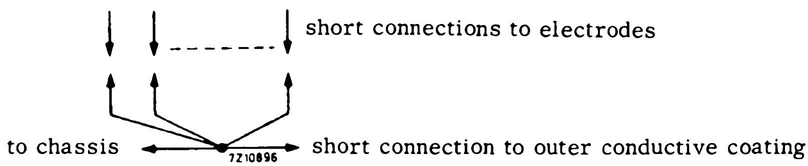
Dimensions in mm

JEDEC126



REMARK

With the high voltage used with this tube internal flash-overs may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.
The spark gaps must be connected as follows:



No other connections between the outer conductive coating and the chassis are permissible.

On request the tube can be supplied with spark traps mounted in the base (ring trap base).

MONITOR TUBE

The M38-121 is a 38 cm-diagonal rectangular television tube with metal backed screen and integral protection primarily intended for use as a monitor or display tube.

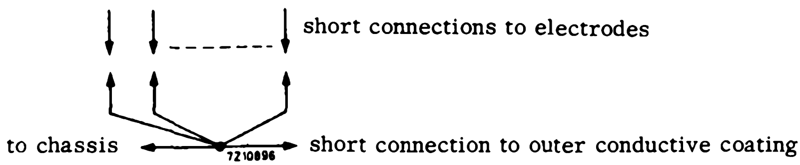
REMARK

With the high voltage used with this tube internal flash -overs may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.
The spark gaps must be connected as follows:



No other connections between the outer conductive coating and the chassis are permissible.

On request the tube can be supplied with spark traps mounted in the base (ring trap base).

VERY HIGH RESOLUTION CATHODE-RAY TUBE

The M38-200 is a 38 cm, 70° data graphic display tube with a resolution of more than 6,6 line pairs per mm (corresponding to 3000 TV lines). Used in conjunction with deflection unit AT1991 it is eminently suitable for full page document display.
The resolution easily meets the stringent requirements of the CCITT recommendations for digital group III, high resolution facsimile transmission, and those of graphic displays for computer-aided design.

Tubes with white (WA and WE) or green (GH) screen phosphors are standard; the WE phosphor is recommended for photographic applications. Other phosphors are available to special order. The tubes have a metal-backed screen and rim band for implosion protection.

QUICK REFERENCE DATA

Deflection angle	70°
Face diagonal	38 cm
Overall length	478 mm
Neck diameter	36,8 mm
Screen dimensions	226 mm x 291 mm
Resolution	3000 TV lines* ← 1800 lines* ← (shrinking raster)

* Landscape format.

Hy: $-1,0^{+1,0}_{-1,5}$	Hx: $-1,0^{+1,0}_{-1,5}$

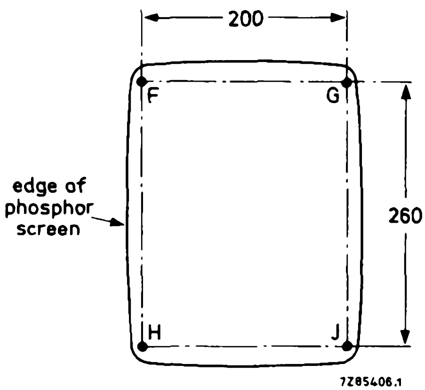

Fig. 4.

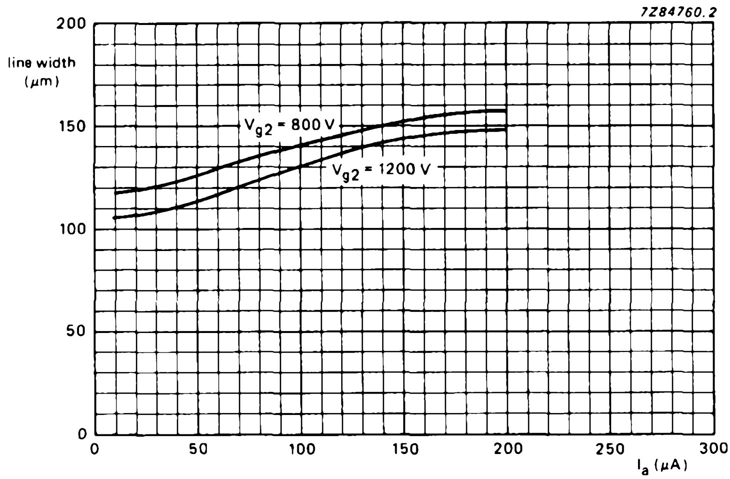

Fig. 5 Resolution.

CENTRING CORRECTION *

The eccentricity of the CRT and the deflection unit can be corrected by two independently movable centring magnets, which are magnetized diametrically (see Fig. 2). By turning the magnets with respect to each other the resulting field strength is varied. The direction of the resulting magnetic field is adjusted by turning the magnets simultaneously. The magnets must be adjusted so that the curvature of the horizontal and vertical axes disappears; in general the picture will be centred at the same time, otherwise this should be corrected electronically.

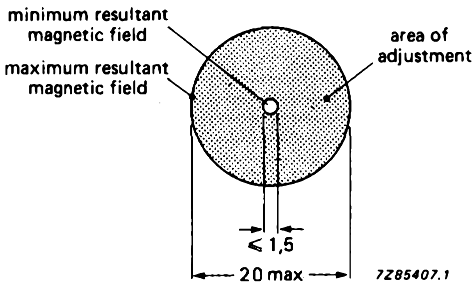

Fig. 6.

ASTIGMATISM CORRECTION *

The astigmatism of the undeflected beam can be corrected by two independently movable quadripole magnets, which are placed next to the centring magnets (see Fig. 2). By turning the quadripole magnets with respect to each other the resulting four-pole field strength varies. The direction of the resulting four-pole field is adjusted by turning the quadripole magnets simultaneously. The astigmatism of the undeflected beam is examined during a slow variation of the focusing voltage; the beam is free of astigmatism when the size, and not the shape, of the beam changes when the focusing voltage is varied around its optimum (Figs 7 and 8).

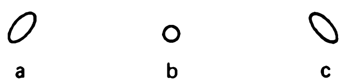

Fig. 7 Beam with astigmatism.

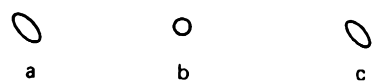

Fig. 8 Beam free of astigmatism.

a. Focusing voltage < optimum value.
b. Focusing voltage at optimum value.
c. Focusing voltage > optimum value.

* See "Precautions for use" overleaf.

PRECAUTIONS FOR USE

To avoid possible deterioration of the astigmatism correction quality of the assembly, the recommendations listed below should be adhered to:*

- To avoid changing the tube's internal magnetic correction, the coil must be at zero potential before being moved on the tube neck.
- If centring correction is necessary, adjust the coil dipole magnets so that the spot shift at the screen centre does not exceed 1 cm from its original position.
- For picture geometric distortion correction, an electrical correction is preferable to magnetic adjustment.
- When used in portrait format it may be necessary to adjust the position of the coil quadripole magnets, in order to achieve optimum astigmatism correction.
- When used in landscape format no adjustment for astigmatism correction is necessary as optimum astigmatism correction is set in the factory.

* The spot astigmatism correction quality is guaranteed for beam currents up to 250 μA, provided these recommendations are followed.

FLYING SPOT SCANNER TUBE

FLYING SPOT SCANNER TUBE

The Q13-110GU is a 13 cm diameter cathode-ray tube intended for flying spot applications.

REMARKS

Measures should be taken for the beam current to be switched off immediately when one of the time-base circuits becomes defective.

An X-ray radiation shielding with an equivalent lead thickness of 0.5 mm is required to protect the observer.

[1]) In order to avoid excessive hum, the A.C. component of the heater to cathode voltage should be as low as possible and should not exceed 20 V_{RMS}.

[2]) During a heating-up period not exceeding 45 sec.

Inductance of line coils (parallel connected)	84,5 μH
Field deflection current, edge to edge at 15 kV	0,35 A (p-p)
Resistance of field coils (series connected)	16,8 Ω

APPLICATION

This deflection unit is for use with 17 cm (7 in) 70° monitor tube M17-142 in conjunction with:
line output transformer AT2102/02;
linearity control unit AT4036/00A;
line driver transformer AT4043/56.

DESCRIPTION

The saddle-shaped line deflection coils are moulded so that the deflection centre is well within the conical part of the monitor tube. The field deflection coils are wound on a Ferroxcube yoke ring which is flared so that the frame and line deflection centres coincide. Provisions are made for centring, and correction of pin-cushion distortion. The unit meets the self-extinguishing and non-dripping requirements of IEC 65.

MOUNTING

The unit should be mounted as far forward as possible on the neck of the monitor tube, so that it touches the cone.

To orient the raster correctly, the unit may be rotated by hand on the neck of the monitor tube, with which it makes a slip fit. A screw-tightened clamping ring permits it to be locked, both axially and radially, in the desired position.

MECHANICAL DATA

Dimensions in mm

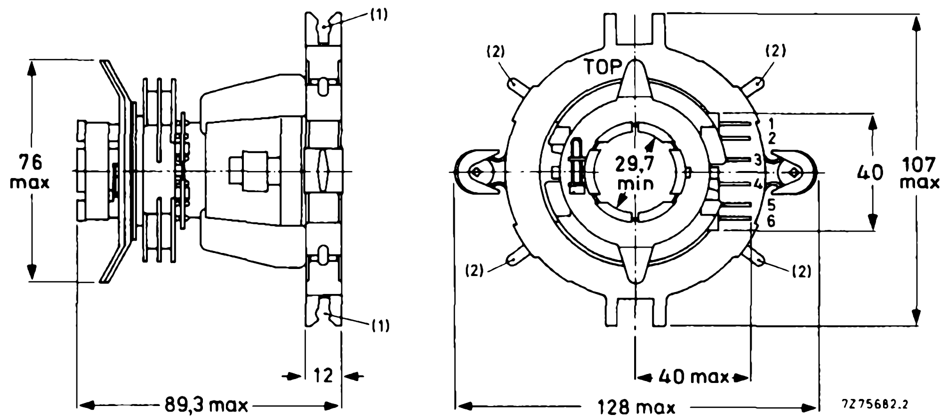

Fig. 1 Deflection unitAT1071/07; Facilities for fitting correction magnets:
(1) for plastic-bonded FXD magnet rods catalogue number 3122 104 90360;
(2) for plastic-bonded FXD magnets, catalogue number 3122 104 94120.

The unit is provided with solder pins for connection. The pin numbering in Fig. 1 corresponds to that in the connection diagram (Figs 2a and 2b).

ELECTRICAL DATA

Line deflection coils (Fig. 2a);	
Inductance (parallel connected coils)	84,5 μH ± 3,5%
Resistance (parallel connected coils)	0,14 Ω ± 8%
Line deflection current, edge to edge (116 mm) at 15 kV	6,85 A (p-p)
Field deflection coils, series connected (Fig. 2b);	
Inductance	41,6 mH ± 8%
Resistance	16,8 Ω ± 8%
Field deflection current, edge to edge (87 mm) at 15 kV	0,35 A (p-p)
Maximum d.c. voltage between terminals of line and field coils	2000 V
Maximum operating temperature	95 °C

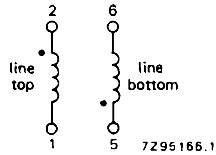

Fig. 2a Line coils.

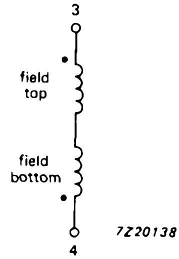

Fig. 2b Field coils.

The beginning of the windings is indicated with ●.

Sensitivity measured at an e.h.t. of 15 kV on a 17 cm (7 in) 70° reference tube.

Deflection current edge to edge	
in line direction	6,85 A (p-p)
in field direction (parallel connected coils)	0,35 A (p-p)

Geometric distortion measured without correction and centring magnets on a 17 cm (7 in) 70° reference tube (dimensions in mm)

The spreads in raster geometry are tabulated below as deviations from the ideal rectangle at the points indicated. Cartesian coordinates are used to show the extent of deviation resolved along x and y areas. Points A, B, C, D, E are fixed and hence zero spreads.

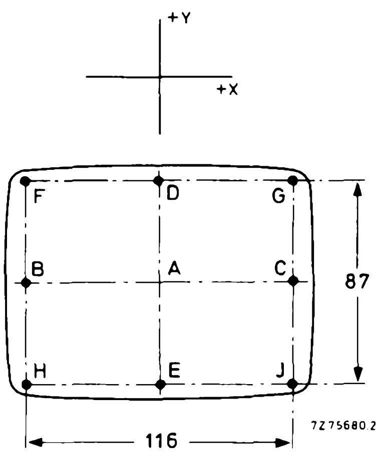

Fig. 3.

Spreads (x,y) per point

F (−0,5 ± 2,0 , +1,0 ± 1,5)
G (+0,5 ± 2,0 , +1,0 ± 1,5)
H (−0,5 ± 2,0 , −1,0 ± 1,5)
J (+0,5 ± 2,0 , −1,0 ± 1,5)

CORRECTION FACILITIES

For centring

After adjustment of the linearity of the deflection current, the eccentricity of the monitor tube and the deflection unit can be corrected by means of two independently movable centring magnets of plastic-bonded Ferroxdure. These magnets are magnetized diametrically. By turning the magnets with respect to each other the resulting field strength is varied. The direction of the resulting magnetic field is adjusted by turning the magnets simultaneously.

These centring magnets cannot be used for compensating the effects of non-linearity or of phase differences between the synchronization and time base, as otherwise the correction needed becomes excessive. Even if the correction is within the range of the magnets, curved lines may appear in the centre of the raster.

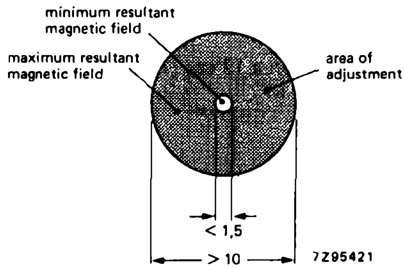

Fig. 4.

For pin-cushion distortion

Pin-cushion distortion can be corrected by two Ferroxdure magnets with pole-shoe brackets, which have been mounted on the deflection unit. Limited correction of asymmetrical pin-cushion distortion can be achieved by unequal movement of these magnets. The field strength can be adjusted by rotation of these magnets. To correct the top and bottom of the raster, two plastic-bonded Ferroxdure magnet rods* can be fitted (Fig. 1). To correct the corners of the raster, four plastic-bonded Ferroxdure magnets** (Fig. 1) can be fitted.

* Available under catalogue number 3122 104 90360.
** Available under catalogue number 3122 104 94120.

DEFLECTION UNIT

- For use with very high resolution CRTs (15 to 20 inch)

QUICK REFERENCE DATA

Inductance of line deflection coils, parallel connected, at 1 kHz		140	μH
Resistance of line deflection coils (DC), parallel connected		0,23	Ω
Inductance of field deflection coils, parallel connected, at 1 kHz		5	mH
Resistance of field deflection coils (DC)		5,6	Ω
Maximum voltage between line and field coils (DC)		2500	V
Line scan frequency	max.	125	kHz

DESCRIPTION

The saddle-shaped line and field deflection coils are surrounded by a Ferroxcube yoke ring in such a way that the line and field deflection centres coincide. Provisions are made for centring correction, and astigmatism correction of the spot at the screen centre. The field coils have internal damping resistors. The unit has a non-magnetic metal clamping ring for fixing to the tube neck.

The deflection unit meets the self-extinguishing requirements of UL.

MECHANICAL DATA

Dimensions in mm

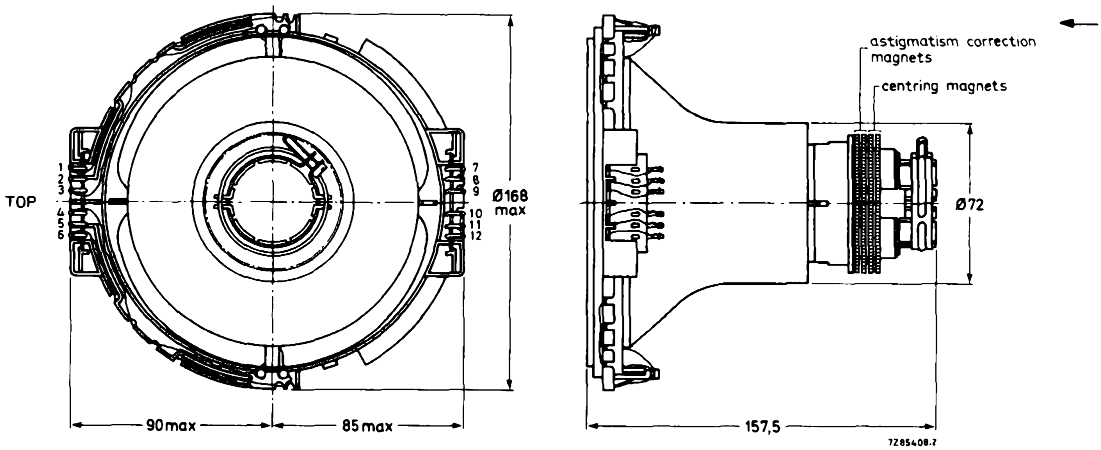

Fig. 1.

Tightening torque on clamping ring	1,3 to 1,5 Nm
Torque on centring magnets	35 to 250 mNm

Mounting

The unit should be mounted as far forward as possible on the neck of the tube, so that it touches the cone.

To orient the raster correctly, the unit may be manually rotated around the neck. The screw-tightened clamping ring permits it to be locked, both axially and radially, in the desired position.

ENVIRONMENTAL DATA

Maximum operating temperature (average copper temperature)	95 °C
Storage temperature range	−25 to + 90 °C
Flame retardant	according to UL94, category V - 1
Flammability	according to UL94, category V - 1

ELECTRICAL DATA

Line deflection coils, parallel connected; (see Fig. 2)	
inductance (at 1 kHz)	140 μH
resistance (DC)	0,23 Ω
Line deflection current, for 290 mm scan, at 18 kV*	7,6 A
Field deflection coils, parallel connected; (see Fig. 2)	
inductance (at 1 kHz)	5 mH
resistance (DC)	5,6 Ω
Field deflection current, for 225 mm scan, at 18 kV*	940 mA
Maximum voltage between line and field coils	2500 V (DC)

Note: The field deflection coils may be connected in series. (terminals 1 and 5 linked)

Field deflection coils, series connected	
inductance at 1 kHz	17 mH
resistance (DC)	20,1 Ω
resistances connected in parallel	150 Ω
Field deflection current, for 303 mm scan, at 18 kV	650 mA

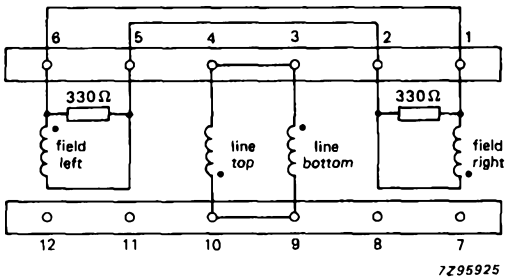

Fig. 2 Diagram of the coils. The beginning of the windings are indicated with ●.

* Values obtained using the M38-201 assembly.

CENTRING CORRECTION

The eccentricity of the CRT and the deflection unit can be corrected by two independently movable centring magnets, which are magnetized diametrically (see Fig. 1). By turning the magnets with respect to each other the resulting field strength is varied. The direction of the resulting magnetic field is adjusted by turning the magnets simultaneously. The magnets must be adjusted so that the curvature of the horizontal and vertical axes disappears; in general the picture will be centred at the same time, otherwise this should be corrected electronically.

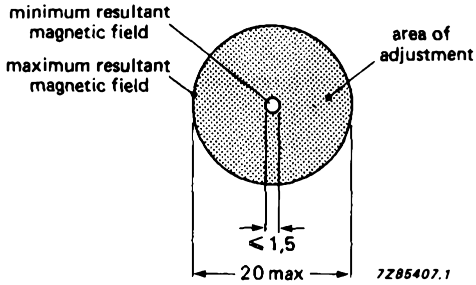

Fig. 3.

ASTIGMATISM CORRECTION

The astigmatism of the undeflected beam can be corrected by two independently movable quadripole magnets, which are placed next to the centring magnets (see Fig. 1). By turning the quadripole magnets with respect to each other the resulting four-pole field strength varies. The direction of the resulting four-pole field is adjusted by turning the quadripole magnets simultaneously. The astigmatism of the undeflected beam is examined during a slow variation of the focusing voltage; the beam is free of astigmatism when the size, and not the shape, of the beam changes when the focusing voltage is varied around its optimum (Figs 4 and 5).

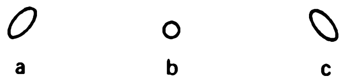

Fig. 4 Beam with astigmatism.

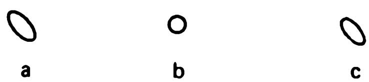

Fig. 5 Beam free of astigmatism.

BEAM CENTRING MAGNET

INSTRUCTIONS FOR USE

To obtain the best performance from an electrostatically focussed tube, it is important that the axis of the beam should coincide with that of the lens. In practice this is not always so because of small errors in geometry. By means of this magnet it is possible to adjust, if necessary, the position of the beam and so produce a true alignment in every case. The effect is illustrated in Figs 1a and 1b which show enlarged views of a single element in a spot raster under the special operating conditions given in the directions for setting. With a well aligned beam, an image such as that in Fig. 1a can be seen. Very small errors will produce a spot as shown in Fig. 1b where the brightest part of the image does not appear in the centre of the diffused area or haze. In such a case, the picture quality would be good but with only a small adjustment of the beam, so that the brightest part becomes central, a noticeable improvement can be made.

The unit has a non-magnetic ring containing a diametrically magnetized Ferroxdure core and two soft-iron pole pieces covered with plastic material to protect the glass surface.

730723-23-02

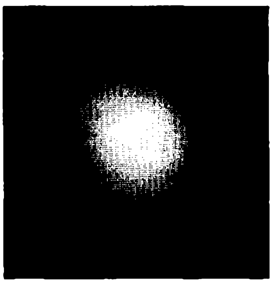

Fig. 1a

730723-23-01

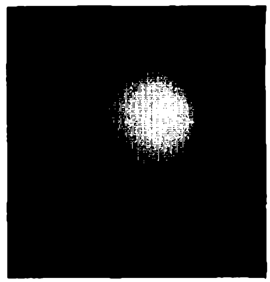

Fig. 1b

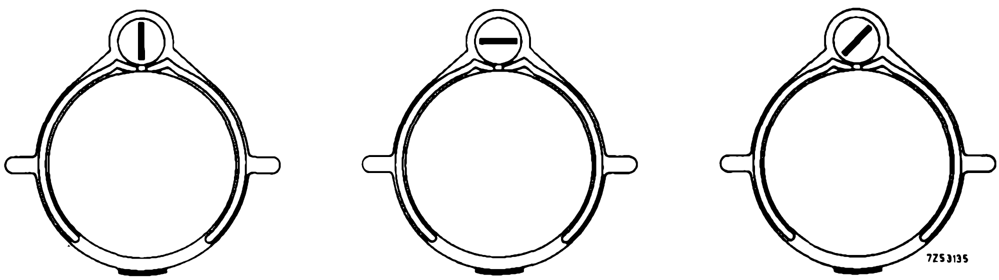
The field strength can be altered by turning the core as indicated in Fig. 2, and the direction by turning the whole unit. Moving the unit along the neck of the tube will cause a small change in the position of the beam but it is most effective at about 20 mm from the cap (Fig. 3).



a) minimum

b) maximum

c) intermediate

Fig. 2

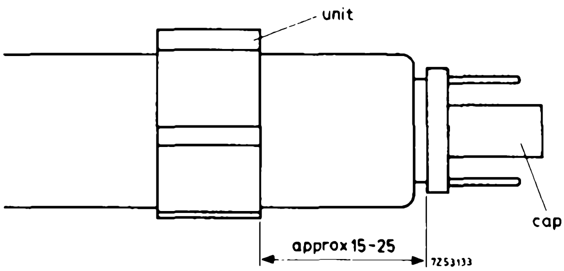


Fig.3

SETTING

This can best be done with a spot raster on the screen, and by observing one of the elements near the centre. A suitable raster would have, for instance, a spot duration of 1/6 µs with a repetition time of 6 µs and an image as in Fig. 1 can then be produced with the following conditions.

V_f	=	6.3 V	or other conditions if required
*) V_{g1}	=	0	
V_{g2}	=	600 V	
$V_{g3,\,g5(1)}$	=	16 kV	
V_{g4}	=	−300 to −500 V	

*) To avoid burning the screen, adjust slowly from -50 V to zero

Set the unit on the neck at about 20 mm from the cap and turn it until the brightest part of the image appears central in the haze.

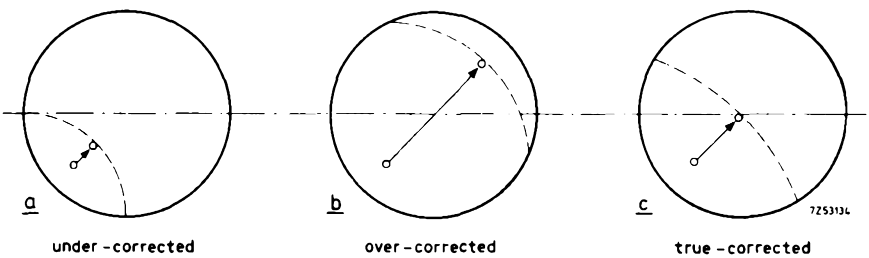

Fig.4

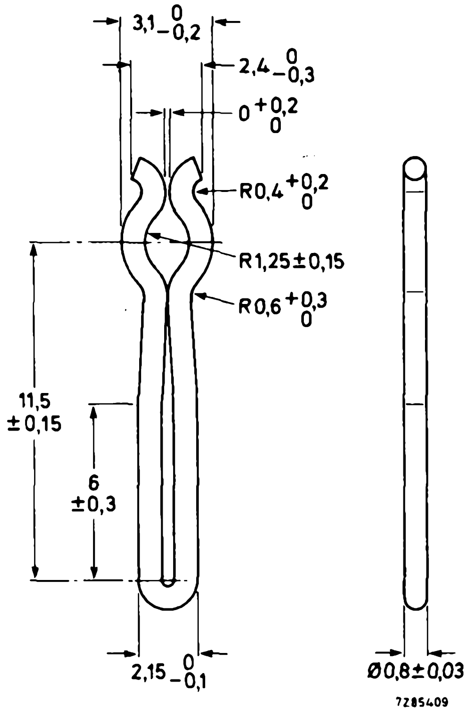
The diagrams in Fig. 4 show the process of adjusting the brightest part from its original position to the centre. The distance between the two points will be determined by the field strength, and the position of the new point along the dotted line will depend on the direction of the field.
If the magnet is under or over-correcting as in (Figs 4a and 4b), the field strength must be changed. To do this, remove the unit from the neck, push the core out sufficiently to get a finger grip and turn it towards maximum or minimum Figs 2a and 2b as required. Return it to the stop in the clamp and set the unit once again on the neck.

If the means of producing a spot raster are not available, a test pattern or suitable picture can be used when setting. It is not easy with this method, however, to assess the degree of change needed in field strength or direction but if a start is made with the line on the core set at about 20° from the minimum position in Fig. 2, an improvement can be made in most cases where it is required. In others, it may be necessary to try one or two further core settings, but with a little experience it is not difficult to find an arrangement which gives the best vertical and horizontal resolution.

The unit should be sufficiently tight on the neck to prevent movement during transit but if, for some reason, this does not appear to be so, the bends on the ring should be compressed slightly.

SMALL BALL CONTACT CONNECTOR



NOTES

NOTES

DATA HANDBOOK SYSTEM

DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of four series of handbooks:

ELECTRON TUBES	BLUE
SEMICONDUCTORS	RED
INTEGRATED CIRCUITS	PURPLE
COMPONENTS AND MATERIALS	GREEN

The contents of each series are listed on pages iv to vii.

The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Electronic Components and Materials Division is given in our Preferred Type Range catalogue (issued annually).

Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.
Product specialists are at your service and enquiries will be answered promptly.

ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks comprises:

T1	**Tubes for r.f. heating**
T2a	**Transmitting tubes for communications, glass types**
T2b	**Transmitting tubes for communications, ceramic types**
T3	**Klystrons**
T4	**Magnetrons for microwave heating**
T5	**Cathode-ray tubes** Instrument tubes, monitor and display tubes, C.R. tubes for special applications
T6	**Geiger-Müller tubes**
T8	**Colour display systems** Colour TV picture tubes, colour data graphic display tube assemblies, deflection units
T9	**Photo and electron multipliers**
T10	**Plumbicon camera tubes and accessories**
T11	**Microwave semiconductors and components**
T12	**Vidicon and Newvicon camera tubes**
T13	**Image intensifiers and infrared detectors**
T15	**Dry reed switches**
T16	**Monochrome tubes and deflection units** Black and white TV picture tubes, monochrome data graphic display tubes, deflection units

SEMICONDUCTORS (RED SERIES)

The red series of data handbooks comprises:

INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of handbooks comprises:

IC01	**Radio, audio and associated systems** Bipolar, MOS	
IC02a/b	**Video and associated systems** Bipolar, MOS	
IC03	**Integrated circuits for telephony** Bipolar, MOS	
IC04	**HE4000B logic family** CMOS	
IC05N	**HE4000B logic family — uncased ICs** CMOS	
IC06N	**High-speed CMOS; PC74HC/HCT/HCU** Logic family	
IC08	**ECL 10K and 100K logic families**	
IC09N	**TTL logic series**	
IC10	**Memories** MOS, TTL, ECL	
IC11	**Linear Products**	
IC12	**I^2C-bus compatible ICs**	
IC13	**Semi-custom** Programmable Logic Devices (PLD)	
IC14	**Microcontrollers and peripherals** Bipolar, MOS	
IC15	**FAST TTL logic series**	
IC16	**CMOS integrated circuits for clocks and watches**	
IC17	**Integrated Services Digital Networks (ISDN)**	not yet issued
IC18	**Microprocessors and peripherals**	

COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks comprises:

C2	Television tuners, coaxial aerial input assemblies
C3	Loudspeakers
C4	Ferroxcube potcores, square cores and cross cores
C5	Ferroxcube for power, audio/video and accelerators
C6	Synchronous motors and gearboxes
C7	Variable capacitors
C8	Variable mains transformers
C9	Piezoelectric quartz devices
C11	Varistors, thermistors and sensors
C12	Potentiometers, encoders and switches
C13	Fixed resistors
C14	Electrolytic and solid capacitors
C15	Ceramic capacitors
C16	Permanent magnet materials
C17	Stepping motors and associated electronics
C18	Direct current motors
C19	Piezoelectric ceramics
C20	Wire-wound components for TVs and monitors
C22	Film capacitors
