Receiving tubes

DATA HANDBOOK SYSTEM

To provide you with a comprehensive source of information on electronic components, subassemblies and materials, our Data Handbook System is made up of three series of handbooks, each comprising several parts.
The three series, identified by the colours noted, are:

ELECTRON TUBES	(9 parts)	BLUE
SEMICONDUCTORS AND INTEGRATED CIRCUITS	(6 parts)	RED
COMPONENTS AND MATERIALS	(7 parts)	GREEN

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued annually; the contents of each series are summarized on the following pages.
We have made every effort to ensure that each series is as accurate, comprehensive and up-to-date as possible, and we hope you will find it to be a valuable source of reference. Where ratings or specifications quoted differ from those published in the preceding edition they will be pointed out by arrows. You will understand that we can not guarantee that all products listed in any one edition of the handbook will remain available, or that their specifications will not be changed, before the next edition is published. If you need confirmation that the published data about any of our products are the latest available, may we ask that you contact our representative. He is at your service and will be glad to answer your inquiries.

December 1971

ELECTRON TUBES (BLUE SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1	**Transmitting tubes (Tetrodes, Pentodes); Amplifier circuit assemblies**	**January 1972**
Part 2	**Tubes for microwave equipment**	**February 1972**
art 3	**Special Quality tubes; Miscellaneous devices**	**March 1972**
Part 4	**Receiving tubes**	**June 1972**
Part 5	**Cathode-ray tubes; Photo tubes; Camera tubes**	**May 1971**
Part 6	**Devices for nuclear equipment**	**June 1971**

Photomultiplier tubes
Channel electron multipliers
Scintillators
Photoscintillators
Radiation counter tubes
Semicinductor radiation detectors
Neutron generator tubes
Photo diodes

Part 7	**Gas-filled tubes**	**July 1971**

Voltage stabilizing and reference tubes
Counter, selector, and indicator tubes
Trigger tubes
Switching diodes
Thyratrons
Ignitrons
Industrial rectifying tubes
High-voltage rectifying tubes

Part 8	**T.V.Picture tubes**	**August 1971**
Part 9	**Transmitting tubes (Triodes); Tubes for r.f. heating (Triodes)**	**December 1971**

SEMICONDUCTORS AND INTEGRATED CIRCUITS (RED SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1 Diodes and Thyristors **September 1971**

General
Signal diodes
Variable capacitance diodes
Voltage regulator diodes
Rectifier diodes
Thyristors, diacs, triacs
Rectifier stacks
Accessories
Heatsinks

Part 2 Low frequency; Deflection **October 1971**

General
Low frequency transistors (low power)
Low frequency power transistors
Deflection transistors
Accessories

Part 3 High frequency; Switching **November 1971**

General
High frequency transistors
Switching transistors
Accessories

Part 4 Special types **December 1971**

General
Transmitting transistors
Microwave devices
Field effect transistors
Dual transistors
Microminiature devices for thick- and thin-film circuits
Photoconductive devices
Photodiodes
Phototransistors
Light emitting diodes
Infra-red sensitive devices
Accessories

Part 5 Linear Integrated Circuits **February 1972**

General
Linear integrated circuits

Part 6 Digital integrated circuits **March 1972**

General
DTL (FC family)
DTL/HNIL (FZ family)
TTL (FJ family)
TTL (GJ family)
CML (GH family)
MOS (FD family)

COMPONENTS AND MATERIALS (GREEN SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1 Circuit Blocks, Input/Output Devices, Electro-mechanical Components *), Peripheral Devices — **October 1971**

Circuit blocks 40-Series
Counter modules 50-Series
Norbits 60-Series, 61-Series
Circuit blocks 90-Series
Input/output devices
Electro-mechanical components *)
Peripheral devices

Part 2 Resistors, Capacitors — **December 1971**

Fixed resistors
Variable resistors
Non-linear resistors
Ceramic capacitors
Paper capacitors and film capacitors
Electrolytic capacitors
Variable capacitors

Part 3 Radio, Audio, Television — **February 1972**

FM tuners
Coil assemblies
Piezoelectric ceramic resonators and filters
Loudspeakers
Audio and mains transformers
Television tuners, aerial input assemblies
Components for black and white television
Components for colour television
Deflection assemblies for camera tubes

Part 4 Magnetic Materials, Piezoelectric Ceramics, Ni Cd cells — **May 1972**

Ferrites for radio, audio and television
Small coils and assembling parts
Ferroxcube potcores and square cores
Ferroxcube transformer cores
Piezoelectric ceramics
Permanent magnet materials
Cylindrical nickel cadmium cells

Part 5 Memory Products, Magnetic Heads, Quartz Crystals, Microwave Devices, Variable Transformers — **June 1971**

Ferrite memory cores
Matrix planes, matrix stacks
Complete memories
Magnetic heads
Quartz crystal units, crystal filters
Isolators, circulators
Variable mains transformers

Part 6 Electric Motors and Accessories, Timing and Control Devices — **August 1971**

Stepper motors
Small synchronous motors
Asynchronous motors
Small d.c. motors
Tachogenerators and servomotors
Indicators for built-in test equipment

Part 7 Circuit Blocks — **September 1971**

Circuit blocks 100kHz Series
Circuit blocks 1-Series
Circuit blocks 10-Series
Circuit blocks for ferrite core memory drive

*) From October 1971 published in Part 1 instead of Part 5.

LIST OF SYMBOLS

Symbols denoting electrodes and electrode/element connections

Heater or filament	f
Heater or filament tap	f_c
Cathode	k
Input cathode lead	k_i
Output cathode lead	k_o
Grid	g
Electrostatic deflection plate or rod	D
Fluorescent screen	ℓ
Anode	a
Anode of a detection diode	d
Tube pin which must not be connected externally	i.c.
Tube pin which may be connected externally	n.c.
External conductive coating	m
Internal shield	s

Remarks

Equivalent electrodes of a multiple unit tube are distinguished by means of accents; e.g. the anodes of a double-anode rectifying tube are indicated by a and a'.
Similar electrodes of the same electrode system are distinguished by means of an additional numeral; the electrode nearest to the cathode has the lowest number.
The electrodes of multiple-unit tubes, in which the units are different, are distinguished by means of the following indices:

diode	D
triode	T
tetrode	Q
pentode	P
hexode or heptode	H

Symbols denoting voltages (average values unless otherwise stated)

Symbol for voltage, followed by an index denoting the relevant electrode/element	V
Heater or filament voltage	V_f
Peak value of a voltage	V_p
Peak to peak value of a voltage	V_{pp}
Supply voltage of tube electrodes	V_b
Anode voltage of a detection diode	V_d
RMS value of a voltage	V_{RMS}
Heater starting voltage	V_{fo}
Grid voltage	V_g
A.C. input voltage	V_i
Voltage between cathode and heater	V_{kf}
D.C. voltage supplied by a rectifying tube	V_o
A.C. output voltage	V_o
Voltage for gain control	V_R
Transformer voltage (secondary)	V_{tr}
Anode voltage under cold condition or cut-off condition (I_k approx.0)	V_{a_o}
Screen grid voltage under cold condition or cut-off condition (I_k approx.0)	$V_{g_{2o}}$

Remarks

In the case of indirectly heated tubes the electrode voltages are specified with respect to the cathode.
In the case of directly heated tubes the electrode voltages are specified with respect to the negative terminal of the filament, unless otherwise stated.

Symbols denoting currents

Remarks

The positive electrical current is directed opposite to the direction of the electron current.
The symbols quoted represent average values unless otherwise stated.

Symbol for current followed by an index denoting the relevant electrode	I
Heater or filament current	I_f
Anode current	I_a
Current of a detection diode	I_d
RMS value of a current	I_{RMS}
Grid current	I_g
Cathode current	I_k
Current to fluorescent screen	I_ℓ
D.C. current supplied by a rectifying tube	I_o
Peak value of a current	I_p

Symbols denoting powers

Symbol for power followed by an index denoting the relevant electrode	W
Anode dissipation	W_a
Grid dissipation	W_g
Input power	W_i
Anode supply D.C. power	W_{i_a}
Dissipation of a fluorescent screen	W_ℓ
Output power	W_o

Symbols denoting capacitances

See IEC Publication 100

Symbols denoting resistance and impedance

When for one of the following symbols Z is used instead of an R the word "resistance" should read "impedance"

External resistance in an anode lead	R_a
External A.C. resistance or load resistance in an anode lead	$R_{a\sim}$
Load resistance of a push-pull amplifier (anode to anode)	$R_{aa\sim}$
Equivalent noise resistance	R_{eq}
External resistor in a grid lead or grid circuit resistance	R_g
Input resistance	r_g
Internal resistance	R_i
Resistor in a cathode lead	R_k
External resistance between cathode and heater	R_{kf}
Protecting resistance in the anode lead of a rectifying tube	R_t

Symbols denoting various quantities

Brightness	B
Bandwidth	B
Distortion factor	d
n-th harmonic distortion	d_n
Noise factor	F
Frequency	f
Pulse repetition rate	f_{imp}
Power gain	G
Voltage gain	$V_o/V_{i,g}$
Height above sea level	h
Magnetic field strength	H
Cross modulation factor	K
Hum modulation factor	m_b
Transformer ratio	n
Transconductance	S
Conversion conductance	S_c
Effective transconductance of an oscillator	S_{eff}
Temperature	t
Ambient temperature	t_{amb}
Time	T
Averaging time of current or voltages	T_{av}
Cathode heating time	T_h
Pulse duration	T_{imp}
Shadow section on a fluorescent screen	α
Light sector on a fluorescent screen	β
Duty factor	δ
Phase angle	φ
Efficiency	η
Wavelength	λ
Amplification factor	μ
Amplification factor of grid No. 2 with respect to grid No. 1	$\mu_{g_2g_1}$

GENERAL OPERATIONAL RECOMMENDATIONS RECEIVING TUBES

CONTENTS

GENERAL OPERATIONAL RECOMMENDATIONS RECEIVING TUBES

1. GENERAL

Where deviations from these directives are permissible or necessary, statements to that effect will be made on the relevant data sheets. If applications are considered not referred to in the data sheet of the relevant tube type extra care should be taken with circuit design to avoid that the tube is overloaded due to unfavourable operating conditions.
Users are warned for applying a tube in circuits where use is made of tube characteristics not controlled by the manufacturer. When at a later date batches of tubes are delivered which show different values for these characteristics this may result in unsatisfactory performance of the equipment.

2. SPREAD IN TUBE CHARACTERISTICS

Equipment design should be based on the characteristics as stated in the data sheets.
Tube data not stated as maximum or minimum values apply to a nominal tube. When measurements are carried out on a small number of tubes, and in particular on new tube types it should be taken into account that average values and the spread figures may differ from those obtained for larger quantities.
No guarantee is given for values of characteristics in settings substantially differing from those specified in the data sheets.

3. SPREAD AND VARIATION IN OPERATING CONDITIONS

The operating conditions of the tube in the equipment are expressed as a number of parameter values each of which is subject to spread and/or variation.

3.1 Spread. Spread in a parameter value will result in individual values deviating permanently from the average value; spread is due to e.g. component value deviations. The average value is the average of such a number of individual values taken at random that an increase of the number will have a negligible influence on the average value.

3.2 Variation. Variation of a parameter value is the change of value occurring as a function of time, e.g. due to supply voltage fluctuations.
The average value is calculated over a period such that a prolongation of that period will have a negligible influence on the average value.

4. LIMITING VALUES

4.1 Limiting values are in accordance with the applicable rating system as defined by I.E.C. publication 134.
Reference may be made to one of the following 3 rating systems.

4.1.1 Absolute maximum rating system. Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment components spread and variation, equipment control adjustment, load variations, signal variation, environmental conditions, and spread or variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

4.1.2 Design-maximum rating system. Design-maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and throughout life, no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

4.1.3 Design-centre rating system. Design-centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under average conditions.

Note * A bogey tube is a tube whose characteristics have the published nominal values for the type. A bogey tube for any particular application can be obtained by considering only those characteristics which are directly related to the application.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply-voltage variation, equipment component spread and variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations or spread in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design-centre value for the intended service is exceeded with a bogey electronic device * in equipment operating at the stated normal supply-voltage.

4.2 If the tube data specify limiting values according to more than one rating system the circuit has to be designed so that none of these limiting values is exceeded under the relevant conditions.

4.3 In addition to the limiting values given in the individual data sheets the directives in the following paragraphs should be observed.

5. ELECTRODE VOLTAGES

5.1 All electrode voltages are given with respect to cathode.

5.2 Two limiting values of electrode voltage are given

a) V_{a_0}, $V_{g_{2_0}}$ etc.

These values are continuously permitted with cold cathode. They are also permitted as peak voltage during operation when a D.C. voltage in combination with a superimposed A.C. voltage is present at the electrode provided that the peak value coincides with approx. zero electrode current.

b) V_a, V_{g_2} etc.

These values are D.C. components of the electrode voltages and are continuously permitted.

In circuits with automatic gain control the D.C. component may exceed the published limiting value with 20% provided that the increase of voltage results solely from the a.g.c. action and that maximum voltage coincides with approximately zero electrode current.

Proper functioning of the tubes at supply voltages lower than 50 volts cannot be guaranteed if these values are not quoted under the operating characteristics. Unless otherwise stated all values refer to positive voltages.

Floating electrodes. All tube electrodes should have a D.C. connection to the cathode (no floating electrodes).

6. ELECTRODE CURRENT

The limiting values I_a, I_{g_2}, I_k etc. are the D.C. components of the electrode currents averaged over any 50 ms period.

If no specific pulse ratings apply, a peak value of three times I_a, I_{g_2}, I_k etc. is permitted for maximum 25 ms.

See note on previous page.

Spread and variation in electrode currents should be restricted so that with nominal tubes the specified design centre limiting values are not exceeded by more than 10% under the worst probable conditions.

7. ELECTRODE DISSIPATION

The limiting values W_a, W_{g_2} etc. are the average values, obtained by averaging over any 1 s period.

7.1 If not otherwise indicated the quoted operating conditions for audio output tubes are permitted only with speech and music signals.
When for power output tubes a limiting value $W_{g_{2p}}$ is stated this value applies only in the case of speech and music drive and it should not be exceeded when measured with a sinusoidal signal and at maximum output.
With class B operation and speech and music excitation the quoted limiting value of anode dissipation is allowed to be exceeded by max. 10% if measured with a sinusoidal signal at 2/3 of maximum drive.
When the operating conditions differ from those stated a non-decoupled series resistor of 0.5 to 1 kΩ may be required to avoid exceeding the limiting values of screen grid dissipation.
When load values vary during operation care should be taken that the limiting values of W_a or W_{g_2} are not exceeded.
Spread and variation in the electrode dissipation of audio output tubes should be restricted so that with bogey tubes the specified design centre limiting values are not exceeded by more than 20% under the worst probable conditions.

7.2 For all other types the quoted design centre limits for the electrode dissipations should not be exceeded by more than 15% with bogey tubes under the worst probable conditions unless otherwise stated in the relevant data sheets.

8. HEATER CIRCUIT

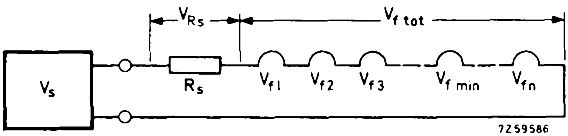
Any deviation from the nominal heater voltage (in case of parallel connection) or from the nominal heater current (in case of series connection) has a detrimental effect on tube performance and life, and should therefore be kept at a minimum.
Such deviations may be caused by:
a) Mains voltage fluctuations.
b) Spread in the characteristics of components such as transformers, resistors, capacitors etc.
Designers of heater circuits are strongly recommended to bear this in mind when dealing with equipment to be used in areas where the actual mains voltage is likely to differ from the nominal value.

8.1 Parallel connection

The maximum deviation of the heater voltage should not exceed ± 15% (design max. value).
This condition will be fulfilled when the mains voltage fluctuates by ± 10% and a ordinary transformer (see below) is used.

8.2 Series connection

The maximum deviation of the heater current should not exceed ± 8% (design max. value).
When a small number of tubes with large differences in the heater voltage is used in series connection combined with a series resistor or a series capacitor, the maximum permitted deviation of the heater current may be exceeded.
To avoid this, certain restrictions must be imposed on the composition of the heater chain; the maximum part of the supply voltage that can be eliminated, and the tolerances of the voltage dropper in series with the heaters.
A number of circuits for If = 300 mA will be described in detail below.



V_S = source voltage (mains voltage or mains voltage stepped down via a transformer)

V_{Rs} = voltage drop over series resistor

$V_{ftot.}$ = $V_{f1} + V_{f2} + V_{f3}$ .... + $V_{fmin.}$ + ... V_{fn}.

$V_{fmin.}$ = lowest individual heater voltage of all tubes in the chain

R_S = series resistor

Voltage source

The following spreads have been taken into account for the source voltage:

- Mains voltage spread ± 10% either or not combined with the voltage spread caused by a transformer with a permanent deviation from the nominal value of ± 1% and with a spread of ± 2% (ordinary, well made tranformer).

The following circuits are allowed:

8.2.1 Supply directly from a voltage source ($V_S = V_{f\,tot.}$)

- No restrictions.

8.2.2 Supply from a voltage source via a 5% series resistor ($V_S = V_{Rs} + V_{f\,tot.}$)

a. One single tube: permitted if $\frac{V_{Rs}}{V_{f\,tot.}} \leq 2$

b. Heater chain consisting of 2 or more tubes:

the maximum permitted ratio $\frac{V_{Rs}}{V_{f\,tot.}}$ can be read from diagram number 1 as follows:

Determine $\frac{V_{f\,min.}}{V_{f\,tot.}}$ of the heater chain. Draw a vertical line through the corresponding point in the diagram. Draw a horizontal line through the point of intersection of this vertical line with the line which indicates the total number of tubes in the chain. The point of intersection of this horizontal line with the vertical axis gives the maximum permitted ratio between the series resistor and the sum of the heater voltages of all tubes in the chain.

8.2.3 Supply from a voltage source via a series diode ($\frac{V_S}{\sqrt{2}} = V_{f\,tot.}$)

- No restrictions.

8.2.4 Supply from a voltage source via a series diode and a series resistor

($\frac{V_S}{\sqrt{2}} = V_{f\,tot.} + V_{Rs}$)

In the above formula $V_{f\,tot.}$ and V_{Rs} are RMS values and the maximum permitted ratio $\frac{V_{Rs}}{V_{f\,tot.}}$ can be read from diagram number 1 (see 8.2.2).

For calculation of R_S divide the required V_{RS} (RMS) by the nominal heater current: $R_S = \frac{V_{RS}}{0.3}$

Remark to 8.2.3 and 8.2.4:

When series diodes are applied, the D.C. component of the resulting heater voltage should preferably be negative with respect to the cathodes of the tubes.

8.2.5 Supply from a voltage source via a series capacitor

a. One single 300 mA tube; permitted if

$$\frac{V_{f\,tot.}}{V_s} \geq 0.50 \quad \text{when 5\% paper capacitors are applied.}$$

b. $$\frac{V_{f\,tot.}}{V_s} \geq 0.70 \quad \text{when 10\% metalized polycarbonate capacitors are applied.}$$

c. Heater chain consisting of 2 tubes or more; permitted if $\frac{V_{f\,tot.}}{V_s}$

$$\frac{V_{f\,tot.}}{V_s} \geq 0.6 \quad \text{when 5\% paper capacitors are applied.}$$

$$\frac{V_{f\,tot.}}{V_s} \geq 0.8 \quad \text{when 10\% metallized polycarbonate capacitors are applied.}$$

8.3 Stand-by (instant-on circuits)

In order to maintain reliability during life, it is recommended to reduce the heater voltage of the tubes during stand-by operation to 75% of the nominal value.

Note

If other designs for the heater supply circuit are wanted than the configurations described above it is strongly recommended to contact the tube manufacturer.

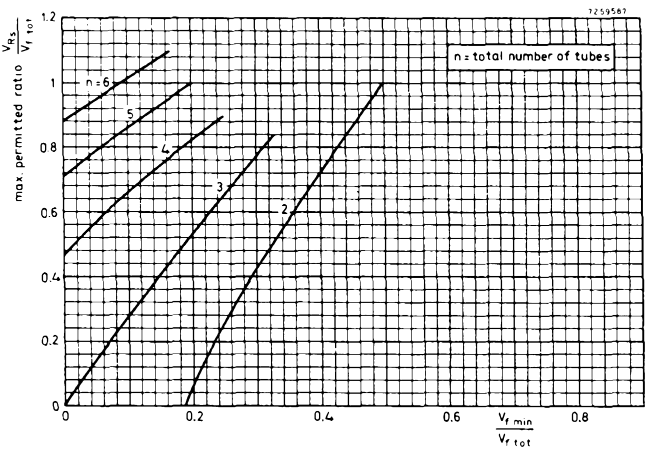


Diagram No. 1

9. HEATER-TO-CATHODE CIRCUIT

The published limiting values of V_{kf} apply to the positive and negative D.C. component of the voltage between the cathode and any of the heater terminals.
The limiting peak value is twice the rated D.C. value with a maximum of 315 V.

In stating these values figures only the risk of breakdown has been considered. No conclusions with respect to hum should be drawn from them.
To minimize the influence of variation and spread in the leakage current between heater and cathode the resistance of the external heater to cathode circuit should not exceed 20 kΩ.
However, when the D.C. value of V_{kf} never drops below three times the RMS value of the heater voltage a resistor of maximum 220 kΩ may be connected between heater and cathode provided that the hum voltage which may develop across the cathode resistor is acceptable for the application considered.
An interruption of the D.C. connection between cathode and earth or heater and earth may introduce heater-cathode breakdown and should be avoided.

10. SUPPRESSOR GRID CIRCUIT

The suppressor grid should normally be connected to the cathode; any series resistance in the suppressor grid lead should not exceed a value of 50 kΩ. The suppressor grid should not be used as a control grid unless specific recommendations are made in the data sheets. Where the suppressor grid is so used, care should be taken not to exceed the maximum screen-grid dissipation. When a tube is connected as a triode, the suppressor grid should be connected directly to the cathode, except where other recommendations are given in the data sheets. If the circuit is such that the suppressor grid is liable to be driven positive, it is recommended to consult the tube manufacturer.

11. CONTROL GRID CIRCUIT

In the interest of low hum and noise the resistance in the control grid circuit should be as low as possible.
The limiting value of the grid resistance given in the data sheets is so chosen that during the tube life the negative grid current which may occur will not result in unacceptable tube operation.
If only the limiting value of the resistance for fixed bias operation is given and stabilizing elements are used in the circuit, this limiting value may be multiplied by the D.C. feedback factor obtained by these stabilizing elements; the maximum limiting value should not exceed 20 MΩ.

12. CAPACITANCES

All data have been measured according to I.E.C. Publication 100

13. PROTECTIVE RESISTORS FOR MAINS RECTIFYING TUBES

To restrict the peak value of cathode current in a mains rectifying tube the ohmic resistance (R_t) in series with the anode should not be less than that specified in the data sheet.

When the anode supply voltage is obtained from a transformer the value of the resistance to be added in each anode lead should be calculated from the following formula:

$$R_t = R_s + n^2 R_p + R_1.$$

In case of half-wave rectification

R_t = the required protective resistance
R_s = the ohmic resistance of the secondary coil
n = the transformer ratio
R_p = the ohmic resistance of the primary coil
R_1 = resistance that must be added

In case of full-wave rectification

R_t = the required protective resistance per anode
R_s = ohmic resistance of half the secondary coil
n = transformer ratio between primary and half the secondary coil
R_p = ohmic resistance of the primary coil
R_1 = resistance to be added in each anode lead.

When an auto transformer is applied it should be taken into account that the transformer winding is partly short-circuited by the mains.

When a filter input capacitor is applied the power dissipation in R_t is supplemented by the contribution of the ripple current up to three times the value produced by the D.C. component of current.

14. LIFE

Optimum life performance is ensured if the tube is operated according to the published "Operating conditions". Spread and variation of operating conditions should be limited as much as possible.

15. HUM

15.1 When the heater supply is obtained from the mains voltage the cathode current may be modulated by the A.C. mains frequency.
This modulation, resulting in hum, may be caused by capacitive or leakage currents between the heater and the tube electrodes, by the magnetic field of the heater or by external fields.

15.2 The following measures can be taken to reduce hum.

Cathode hum

Keep the A.C. voltage between cathode and heater as small as possible; with series operation insert the most critical tube at the earthed side of the heater chain and with parallel operation connect the electrical centre of the heater to earth.

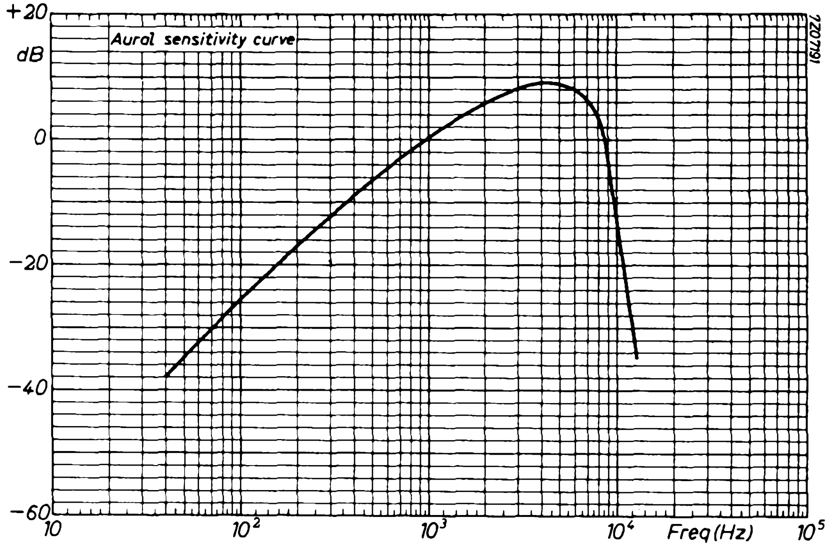
Do not include the impedance between cathode and heater in an R.F. circuit. If this cannot be avoided and the cathode must be connected to a tapping of a tuned circuit, choose the highest practicable tuning capacitance in order to reduce the influence of possible variations in circuit capacitance. This applies especially to oscillator circuits where variations in the capacitance between cathode and heater may lead to modulation hum.
Decouple the cathode resistance as far as possible.
Where negative feedback is applied, take the non-decoupled part as small as possible.

Control grid hum

Keep the A.C. voltage between cathode and heater as small as possible. Do not use idle socket contacts in the proximity of the control grid contact as anchoring points for joints connected to 50 Hz as this may cause hum due to leakage or capacitance in the tube socket.
Keep the impedance at the mains frequency in the control grid lead as small as possible.

15.3 For tubes mainly intended for use in broadcast receivers the value of Z_{g_1} at mains frequency is so chosen that the hum voltage will be -60 dB (design centre value) with respect to the input voltage for 50 mW output power.
The hum voltage in this case is measured behind a filter, the characteristic, of which agrees with the C.C.I.R. aural sensitivity curve (see graph on next page).
For tubes mainly intended for use in audio equipment the value of Z_{g_1} is so chosen that the level of hum voltage, measured with a filter linear up to 500 Hz, is - 60 dB with respect to the input voltage for maximum output power.
To obtain these values the centre of parallel-connected heaters should be earthed whereas with series-connected heaters the value of V_{kf}, permitted in connection with hum, should not be exceeded; when a cathode resistor is used, it should be decoupled by a capacitor of at least 100 μF.
It should be realized that, although the tubes may meet the requirement of a -60 dB hum level, the total hum level of the circuitry stage under consideration may be higher owing to imperfect circuitry (magnetic hum induced by transformers and smoothing chokes; unsatisfactory smoothing of the rectified voltage, etc.).
For several R.F. and I.F. types a curve has been published which shows, as a function of the transconductance, the hum voltage (V_i) on the control-grid which causes a modulation hum of 1%.

The published limiting value of V_{kf} is the maximum permissible value up to which there will be no danger of breakdown between cathode and heater, and it does not give information about the resulting hum level.



16. MICROPHONY

Whenever a tube is subjected to vibration, caused by e.g. a loudspeaker, motor, switch etc., some disturbance in the output of the tube occurs. The effect of this disturbance will depend on the individual application. The published data of various tube types make reference to the microphonic sensitivity and this should be noted when a tube is chosen for a specific application.

Where the effects of microphony are found to be objectionable, special steps may have to be taken to reduce the vibration reaching the tube. The chassis itself may show wide variations in amplitude of vibration over its area, due to resonances; therefore favourable location of the tube, or local strengthening of the chassis, may appreciably reduce microphony.

The maximum peak acceleration to which the tube may be subjected under the most unfavourable conditions is 1.5 g at frequencies < 600 Hz and 0.2 g at frequencies > 600 Hz. However, tubes should not be subjected to the maximum acceleration at a given frequency for a long period of time. In case the actual acceleration is higher than these values, difficulties with regard to microphony may be expected.

Warning: It should be noted that excessive mechanical vibration may result in the destruction of the internal tube structure.

17. ENVIRONMENTAL CONDITIONS

1. Atmospheric pressure. Ratings apply to operation at normal atmospheric pressure at altitudes below 3000 m.
   It is advised to consult the tube manufacturer if tubes have to be operated at lower pressures.

2. Thermal considerations. The bulb and the base temperature are defined as the highest temperature at any place on the bulb or the base. The base temperature should not exceed 165 °C.
   Used in practical circuits and under design centre conditions the bulb temperature of a tube should not exceed by more than 30 °C that temperature which would be attained if the tube were operated at its maximum ratings in free air at a room temperature of 20 °C.
   If, for instance, the bulb temperature of a certain type of tube operating in free air at maximum ratings is shown to be 200 °C, it is permissible to use this tube in equipment where the bulb attains a temperature of 230 °C (thus at an excess of 30 °C). In practice this means that the "ambient" temperature in the equipment may rise above room temperature by about twice 30 °C and thus may attain a value of 80 °C.
   When a tube runs particularly hot this increase of 30 °C is not permissible; the design maximum should then be 250 °C unless otherwise stated in the relevant data sheets.
   When the maximum permitted base or bulb temperature is exceeded, the tube reliability during life may deteriorate. Cooling should therefore always be adequate; it may be obtained by convection, radiation or conduction. To make it most efficient a free circulation of air should be assured around the tube and the temperature of neighbouring bodies should be low. These neighbouring bodies should preferably approach a perfect black body.
   The design of screening or retaining devices should also be such that the reflection of heat back to the bulb must be minimized. In some cases it may be necessary to reduce the electrode dissipation.
   Heat dissipating shields have the property to reduce the hot-spot temperature at the tube envelope. However, this is generally accompanied by a rise in base temperature whereas also the normal sublimation pattern inside the tube may be drastically disturbed. For this reason extreme care should be exercised when applying these devices.

3. High Voltage insulation. To avoid insulation breakdown due to ionization or tracking at high electrode voltages adequate ventilation is required.
   High voltage terminals should not have sharp or pointed edges.

18. MOUNTING AND WIRING

1. Mounting position. Unless otherwise specified, a tube may be mounted in any position.

2. Pins and sockets. Many tube types employ semi-rigid pins.

   To ensure that these pins are straight before insertion into the tube socket use may be made of a pin straightening tool. It is recommended both in wired and in printed circuits to use sockets in which the contact springs are reasonably flexible. Too stiff wiring may hold the contacts out of position in such a way that the tube base is damaged upon insertion. To avoid this the use of a wiring jig is recommended. The dimensions of the wiring jig shall b in conformity with the nominal base dimensions specified in this Handbook.

   No connections should be made to a pin marked i.c.

   The sockets used shall comply with the following:
   The insertion and withdrawal forces of sockets shall be checked before any previous gauging or sizing. The sockets shall be capable of accepting and having withdrawn from them the insertion and withdrawal force gauge* within the force limits specified below. These tests shall be made with a test jig.

   Socket compatible with small button miniature 7 pin base (IEC 67-I-10a)

max. insertion force	72 N (7.2 kgf)
min. withdrawal force	12 N (1.2 kgf)

   Socket compatible with small button noval 9 pin base (IEC 67-I-12a)

max. insertion force	91 N (9.1 kgf)
min. withdrawal force	13.5 N (1.35 kgf)

   Socket compatible with small button decal 10 pin base (IEC 67-I-41a)

max. insertion force	91 N (9.1 kgf)
min. withdrawal force	13.5 N (1.35 kgf)

   Socket compatible with magnoval base (IEC 67-I-36a)

max. insertion force	91 N (9.1 kgf)
min. withdrawal force	13.5 N (1.35 kgf)

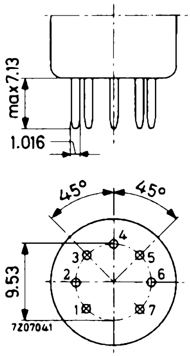
3. Retaining devices. When measures are required to prevent a tube from being shaken out of the socket a retaining device may be used.
   Care should then be taken to avoid the maximum permitted bulb temperature being exceeded.

* Described in I.E.C. Publication 149.

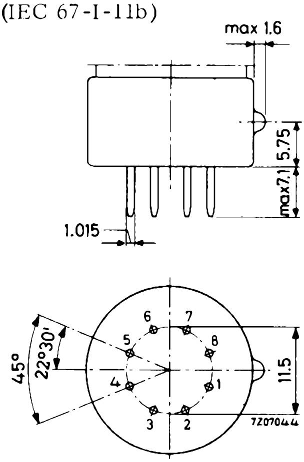
DIMENSIONS OF BASES

In the outline drawings of bases given below, some main dimensions (in mm) only have been given.
For further details is referred to IEC publication 67.
The page number on which the outline drawing can be found in this publication is therefore given for each base type.

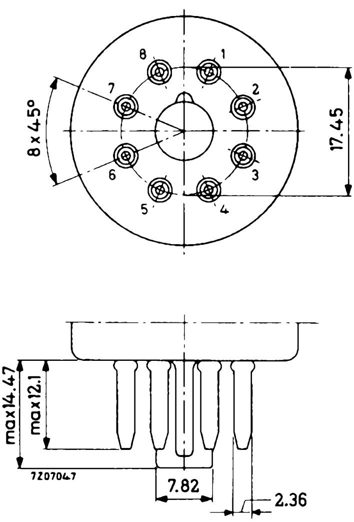
MINIATURE 7-PIN BASE
(IEC 67-I-10a)



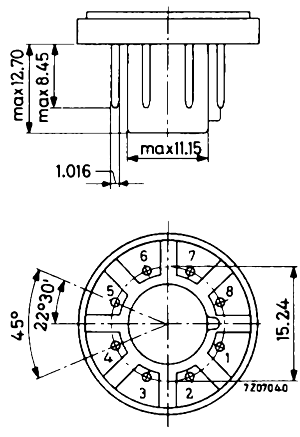
RIMLOCK BASE
(IEC 67-I-11b)



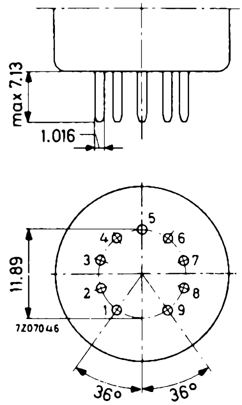
OCTAL BASE
(IEC 67-I-5a)



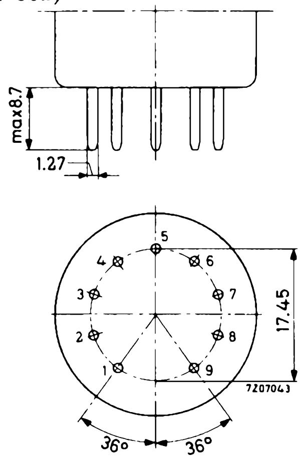
NEO EIGHTAR BASE
(IEC 67-I-31a)



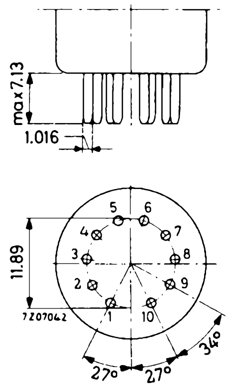
NOVAL BASE
(IEC 67-I-12a)



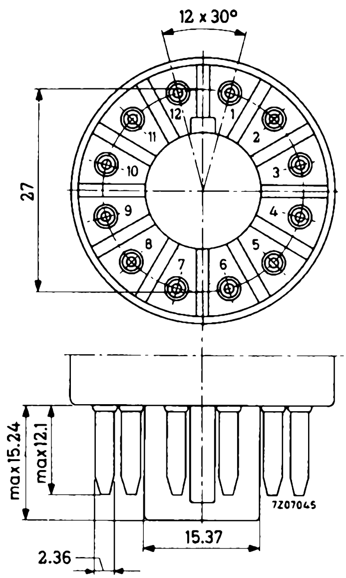
MAGNOVAL BASE
(IEC 67-I-36a)



DECAL BASE
(IEC 67-I-41a)

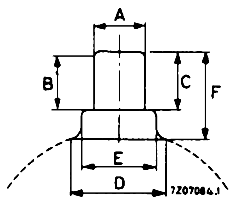


DUODECAL BASE
(IEC 67-I-17a)



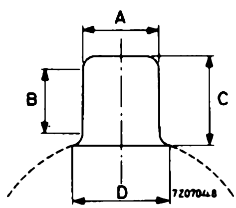
DIMENSIONS OF CAPS

The dimensions for the drawings of top caps have been given in mm. The dimensions A, B and C, which are those necessary to ensure compatibility between cap and corresponding connector are in accordance with IEC publication 67, page 67-III-1 a.



Type 1

ref.	min.	nom.	max.
A	6.23	6.35	6.47
B	5.1		
C		7.14	8.89 1)
D			11.5
E		9.15	
F		10.31	11.43 1)



Type 2

A	9.02	9.14	9.27
B	7.7		
C		10.31	11.43 1)
D			11.5

1) Without solder. On finished article an increase of 0,5 mm is allowed on this dimension for solder.

Receiving Tubes

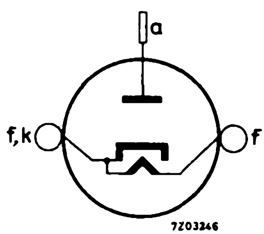
SINGLE ANODE E.H.T. RECTIFYING TUBE

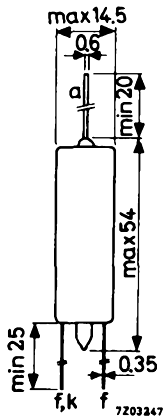
Single anode high vacuum rectifying tube intended for use in portable T.V. receivers.

HEATING: Indirect; parallel supply

Heater voltage	V_f	1.4	V
Heater current	I_f	550	mA

DIMENSIONS AND CONNECTIONS Dimensions in mm





The tube has flexible leads, which must not be bent nearer than 10 mm to the tube bottom.
The leads should not be soldered nearer than 1.5 mm to the seal.

CAPACITANCE

Anode to all	C_a	0.8	pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	100	V
Anode current	I_a	13	mA

LIMITING VALUES (Design centre rating system, unless otherwise specified)

Anode voltage, negative peak	$-V_{a_p}$	max.	15	kV
Anode voltage, negative peak (abs. max.)	$-V_{a_p}$	max.	18	kV
Anode current, average	I_a	max.	350	μA
Anode current, peak	I_{a_p}	max.	40	mA [1]
Filter input capacitance	C_{filt}	max.	2000	pF
Heater voltage ($I_a < 200$ μA) (abs. max.)	V_f	max.	1.6	V
Heater voltage ($I_a > 200$ μA) (abs. max.)	V_f	min.	1.3	V

[1]) Max. duration is 10 % of a line-scanning cycle, but max. 10 μsec.

SINGLE ANODE E.H.T. RECTIFYING TUBES

High-vacuum single-anode rectifying tubes for high tension in television receivers (E.H.T. supply from the line time base).

The DY86 and DY87 are equivalent except for the DY87 having a chemically treated envelope which avoids flash-over under conditions of high humidity and low atmospheric pressure (45 cm Hg).

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	1.4	V
Heater current	I_f	550	mA

When the heater is to be operated on R.F. or flyback pulses, the heater voltage can be adjusted to 1.4 V e.g. by measurement with a thermocouple.

Tolerances of V_f

a. As E.H.T. rectifier in television receivers

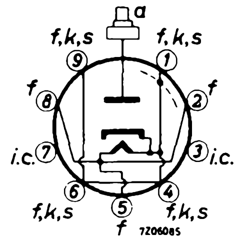
The heater voltage should be adjusted to its nominal value at a D.C. output current of 200 μA. At an increase of the D.C. output current to 400 to 600 μA which can incidentically occur during operation the decrease of the heater voltage may amount to max. 15 %. These requirements hold for nominal mains voltage and full horizontal scanning of the picture tube. If the picture width control is such that also the heater voltage of the E.H.T. diode is influenced, the influence of this control must be kept within the 15 % limit indicated above.

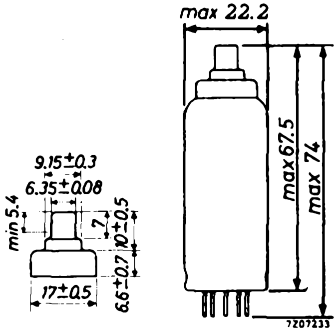
b. For all other applications the limits for the heater voltage are as given in the application directions in front of this section.

DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: NOVAL





REMARKS

a. Pins 1, 4, 6 and 9 can be used for fixing an anti-corona ring.

b. Circuit elements having the same potential as the heater (e.g. a series resistor) may be connected to pins 3 and 7. These pins must never be earthed.

c. If the tube operates at high values of $V_{a\,invp}$ and/or under conditions of high relative humidity or low pressure the metal top-cap should get an insulating cover to avoid corona phenomena.

CAPACITANCES (without external shield)

Anode to all	C_a	1.55	pF

OPERATING CHARACTERISTICS

Output current	I_o	0.15	mA
Output voltage	V_o	18	kV

LIMITING VALUES (Design centre rating system unless otherwise stated)

Output voltage	V_o	max.	18	kV	
Peak inverse voltage	$V_{a\,inv_p}$	max.	22	kV	[1]
Peak inverse voltage (Absolute max.)	$V_{a\,inv_p}$	max.	27	kV	[1]
Peak inverse voltage without current	$V_{a\,inv_p}(I_o = 0)$	max.	24	kV	[1]
Output current	I_o	max.	0.5	mA	[2]
Peak output current	I_{ap}	max.	40	mA	[3]
Filter input capacitance	C_{filt}	max.	2000	pF	

[1]) Maximum pulse duration 22 % of a line scanning cycle with a maximum of 18 μsec.

The negative peak anode voltage due to ringing in the line-output transformer must be taken into account. The ratio between this negative peak value and the positive D.C. voltage can be about 1 : 4.5.

[2]) During short periods as in television service I_o = max. 0.8 mA.

[3]) Maximum pulse duration 10 % of a line scanning cycle with a maximum of 10 μsec.

Diode No.1 to anode	C_{d_1a}	max.0.005	pF
Diode No.2 to anode	C_{d_2a}	max.0.010	pF

TYPICAL CHARACTERISTICS

Triode section

Anode voltage	V_a	250	V
Grid voltage	V_g	-3	V
Anode current	I_a	1.0	mA
Transconductance	S	1.2	mA/V
Amplification factor	μ	70	-
Internal resistance	R_i	58	kΩ
Equivalent noise resistance (A.F.)	R_{eq}	max.150	kΩ

OPERATING CHARACTERISTICS

Triode section as A.F. amplifier, circuit Fig.1

Supply voltage	V_b	250	250	250	250	V
Anode resistor	R_a	0.22	0.1	0.22	0.1	MΩ
Cathode resistor	R_k	1.8	1.2	0	0	kΩ
Grid resistor	R_g	1	1	22	22	MΩ
Grid resistor next stage	R_g'	0.68	0.33	0.68	0.33	MΩ
Anode current	I_a	0.70	1.15	0.76	1.40	mA
Voltage gain	V_o/V_i	51	43	52	44	-
Distortion:						
at output voltage V_o = 5 V_{RMS}	d_{tot}	0.55	0.6	0.5	0.7	%
at output voltage V_o = 10 V_{RMS}	d_{tot}	0.9	1.1	0.8	0.9	%

Microphony

No special precautions against microphony are required in circuits where the input voltage is min. 10 mV for 50 mW output of the output tube.

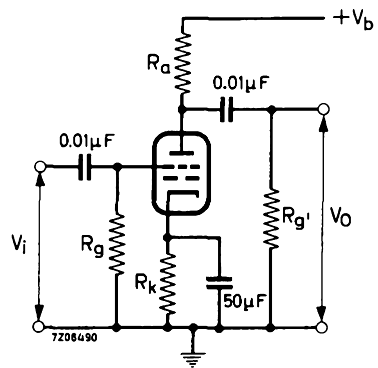

fig.1

LIMITING VALUES (Design centre rating system)

Triode section

Anode voltage	V_{a_o}	max. 550	V
	V_a	max. 300	V
Anode dissipation	W_a	max. 0.5	W
Cathode current	I_k	max. 5	mA
Grid resistor	R_g	max. 3	MΩ
Cathode to heater voltage	V_{kf}	max. 100	V

Diode sections (each diode)

Diode voltage, negative peak	$-V_{d_p}$	max. 350	V
Diode current, average	I_d	max. 0.8	mA
peak	I_{d_p}	max. 5	mA
Cathode to heater voltage	V_{kf}	max. 100	V

Note

The use of a socket with skirt is advisable to reduce the capacitances between tube elements and external conductors.

DOUBLE DIODE-PENTODE

Double diode-pentode. Pentode intended for use as R.F., I.F., or A.F. amplifier.

QUICK REFERENCE DATA			
Pentode section			
Variable transconductance			
Anode current	I_a	5	mA
Transconductance	S	2.2	mA/V
Amplification	$\mu_{g_2g_1}$	18	-

HEATING: Indirect by A.C. or D.C.; parallel or series supply.

Heater voltage	V_f	6.3	V
Heater current	I_f	300	mA

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval

Internal resistance	R_i	1.0	-	0.6	-	0.9	-	MΩ

[1]) To avoid grid No.1 current the negative grid No.1 voltage should be min. 1.5 V.

LIMITING VALUES (Design centre rating system)

Pentode section

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	300	V [1]
Anode dissipation	W_a	max.	2.25	W
Grid No. 2 voltage	$V_{g_{2o}}$	max.	550	V
Grid No. 2 voltage				
at anode current I_a max. 4 mA	V_{g_2}	max.	300	V [1]
at anode current I_a min. 8 mA	V_{g_2}	max.	125	V
Grid No. 2 dissipation	W_{g_2}	max.	0.45	W
Cathode current	I_k	max.	16.5	mA
Grid No. 1 resistor	R_{g_1}	max.	3	MΩ
Grid No. 3 resistor	R_{g_3}	max.	10	kΩ
Cathode to heater voltage	V_{kf}	max.	100	V

Diode sections (each diode)

Diode voltage, negative peak	$-V_{d_p}$	max.	200	V
Diode current, average	I_d	max.	0.8	mA
peak	I_{d_p}	max.	5	mA
Cathode to heater voltage	V_{kf}	max.	100	V

[1]) With supply from a storage battery and vibrator the max. voltage is 250 V.

U.H.F. TRIODE

Triode intended for use as grounded grid U.H.F. amplifier, oscillator or mixer for bands IV and V.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	200	mA

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage, (k pos)	$V_{kf\ (k\ pos)}$	max. 100	V
(k neg)	$V_{kf\ (k\ neg)}$	max. 50	V

For further data and curves of this type please refer to PC86

U.H.F. TRIODE

Triode intended for use as grounded grid U.H.F. amplifier for bands IV and V.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	165	mA

For further data and curves of this type
please refer to PC88

R.F. TRIODE

Triode intended for use as oscillator, mixer or amplifier in F.M.- and television receivers.

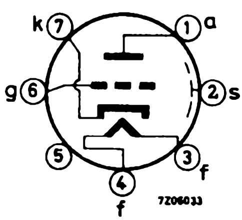
QUICK REFERENCE DATA			
Anode current	I_a	10	mA
Transconductance	S	5.5	mA/V
Amplification factor	μ	60	

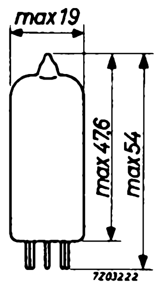
HEATING: Indirect by A.C. or D.C.; series or parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	150	mA

DIMENSIONS AND CONNECTIONS — Dimensions in mm

Base: Miniature





CAPACITANCES

Grid to all except anode	$C_{g(a)}$	2.6	pF
Anode to all except grid	$C_{a(g)}$	0.55	pF
Anode to grid	C_{ag}	1.6	pF
Anode to cathode	C_{ak}	0.24	pF
Cathode to heater	C_{kf}	2.2	pF
Grid to heater	C_{gf}	max. 0.15	pF
Anode to grid + heater	$C_{a/gf}$	1.8	pF
Cathode to grid + heater	$C_{k/gf}$	4.5	pF

TYPICAL CHARACTERISTICS AND OPERATING CONDITIONS

Anode voltage	V_a	100	170	200	250	V

Cathode to heater voltage	V_{kf}	max.	180	V
Cathode to heater circuit resistance in phase splitting circuits	R_{kf}	max.	150	kΩ

REMARK

This tube can be used without precautions against microphony in equipment in which $V_i \geqq 10$ mV for an output of 50 mW of the output tube (or $V_i \geqq 100$ mV for 5 W output) provided that the average acceleration of the tube is not greater than indicated in the section "Microphonic effect" of the "Application Directions". When the centre tap of the heater transformer has been earthed, $R_g \leqq 0.3$ MΩ and R_k is sufficiently decoupled, the disturbance level for hum and noise will then be better than 60 dB below 100 mV.

R.F. DOUBLE TRIODE

Double triode intended for use as cascode amplifier in tuners for television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	365	mA

For further data and curves please refer to PCC88

R.F. DOUBLE TRIODE

Double triode with variable transconductance intended for use as V.H.F. cascode amplifier in television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	365	mA

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage	V_{kf}	max.	50	V
	$V_{k'f}$ (k pos)	max.	150	V [1]

For further data and curves of this type please refer to type PCC189

[1] D.C. component max. 130 V.

TRIODE-PENTODE

Triode-pentode with separate cathodes intended for use as frequency changer in television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	430	mA

LIMITING VALUES (Design centre rating system)

Triode section

Cathode to heater voltage	V_{kf}	max. 100	V

Pentode section

Cathode to heater voltage	V_{kf}	max. 100	V

For further data and curves
please refer to PCF80

TRIODE-PENTODE

Triode-pentode intended for use as frequency changer in V.H.F. television tuners.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	390	mA

LIMITING VALUES (Design centre rating system)

Triode section

Cathode to heater voltage	V_{kf}	max.	100	V

Pentode section

Cathode to heater voltage	V_{kf}	max.	100	V

For further data and curves
please refer to PCF86

TRIODE-PENTODE

Triode-pentode intended for use in television receivers; triode section as limiter, noise detector, A.G.C. amplifier, sync. separator and pulse-amplifier; pentode section as sound I.F. amplifier and video I.F. amplifier.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	410	mA

For further data and curves
please refer to type PCF200

TRIODE-PENTODE

Triode-pentode intended for use in T.V. receivers; triode section as line-blocking oscillator, part of a multivibrator, sync separator, pulse amplifier or A.G.C. delay diode; pentode section with remote cut-off as video I.F. amplifier.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	410	mA

For further data and curves of this type
please refer to type PCF201

TRIODE-PENTODE

High transconductance triode and R.F. pentode intended for use as frequency changer in V.H.F. T.V. tuners.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	0.41	A

For further data and curves of this type please refer to type PCF801

TRIODE-PENTODE

Triode-pentode; triode section intended for use as reactance tube, pentode section intended for use as sine wave oscillator or pulse shaper in television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	430	mA

LIMITING VALUES

Pentode section

Cathode to heater voltage	V_{kf}	max. 100	V

Triode section

Cathode to heater voltage	V_{kf}	max. 100	V

For further data and curves
please refer to type PCF802

TRIODE-HEPTODE

Triode-heptode. Heptode section intended for use as mixer, R.F. -or I.F.amplifier. Triode section intented for use as oscillator in A.M./F.M. receivers.

QUICK REFERENCE DATA			
Triode section			
Anode current	I_a	13.5	mA

MICROPHONY AND HUM

The triode section can be used without special precautions against microphony and hum in circuits in which an input voltage of minimum 10 mV_{RMS} is required for an output of 50 mW of the output stage. Z_g(50 Hz) = 0.25 MΩ.

[1]) Measured at small input voltage.

[2]) At lower output voltages the distortion is proportionnally lower.

[3]) At lower output voltages down to 5 V_{RMS} the distortion is approximately constant. At values below 5 V_{RMS} the distortion is approximately proportional to V_o.

OPERATING CHARACTERISTICS

Distortion	d_{tot}	-	6.3	-	4.8	%

Frame output application

The circuit should operate satisfactorily with a peak anode current $I_{ap} = 85$ mA at $V_a = 50$ V, $V_{g2} = 170$ V, $V_f = 6.3$ V. The minimum available I_{ap} at end of life is;

70 mA at $V_a = 50$ V, $V_{g2} = 170$ V, $V_f = 5.5$ V
80 mA at $V_a = 50$ V, $V_{g2} = 190$ V. $V_f = 5.5$ V.

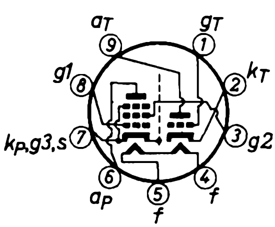
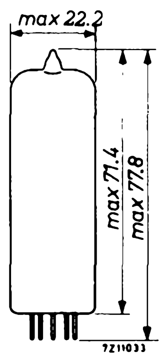
Heater current	I_f	660	mA

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





CAPACITANCES

Triode section

Anode to all except grid	$C_{a(g)}$	2.5	pF
Grid to all except anode	$C_{g(a)}$	2.3	pF
Anode to grid	C_{ag}	1.4	pF
Grid to heater	C_{gf}	max. 0.006	pF

Pentode section

Grid No.1 to all except anode	$C_{g_1(a)}$	10	pF
Anode to grid No.1	C_{ag_1}	max. 0.4	pF
Grid No.1 to heater	C_{g_1f}	max. 0.24	pF

Between triode and pentode sections

Anode triode to grid No.1 pentode	C_{aTg_1P}	max. 0.2	pF
Grid triode to grid No.1 pentode	C_{gTg_1P}	max. 0.02	pF
Anode triode to anode pentode	C_{aTaP}	max. 0.15	pF
Grid triode to anode pentode	C_{gTaP}	max. 0.006	pF [1]

TYPICAL CHARACTERISTICS

Triode section

Anode voltage	V_a	250	V
Grid voltage	V_g	-1.9	V
Anode current	I_a	1.2	mA
Transconductance	S	1.6	mA/V
Amplification factor	μ	100	-

Pentode section

Anode voltage	V_a	250	V
Grid No.2 voltage	V_{g_2}	250	V
Grid No.1 voltage	V_{g_1}	-7	V
Anode current	I_a	36	mA
Grid No.2 current	I_{g_2}	6	mA
Transconductance	S	10	mA/V
Amplification factor	$\mu_{g_2g_1}$	21	-
Internal resistance	R_i	48	kΩ

[1] The capacitance between triode grid and pentode anode (C_{gT-aP}) can be reduced to a value of less than 0.002 pF by using a shielding ring with a diameter of 22.5 mm and a height of 15 mm with respect to the tube base.

OPERATING CHARACTERISTICS

Triode section

as A.F. amplifier

Supply voltage	V_b	200	250	250	300	V
Cathode resistor	R_k	2.6	1.75	1.75	1.2	kΩ
Anode resistor	R_a	220	220	220	220	kΩ
Grid resistor of following stage	$R_{g'}$	0.68	0.68	10	10	MΩ
Anode current	I_a	0.42	0.6	0.6	0.8	mA
Output voltage	V_o	3.2	3.2	5	9	V_{RMS}
Voltage gain	V_o/V_i	66	70	75	80	-
Distortion	d_{tot}	0.6	0.4	0.4	0.4	%

A.F. amplifier with grid current biasing

Supply voltage	V_b	200	250	250	300	V
Cathode resistor	R_k	0	0	0	0	Ω
Anode resistor	R_a	220	220	220	220	kΩ
Grid resistor	R_g	10	10	10	10	MΩ
Grid resistor of following stage	$R_{g'}$	0.68	0.68	10	10	MΩ
Signal source resistance	R_s	47	47	47	47	kΩ
Anode current	I_a	0.42	0.6	0.6	0.8	mA
Output voltage	V_o	3.2	3.2	5	9	V_{RMS}
Voltage gain	V_o/V_i	66	70	75	80	-
Distortion	d_{tot}	0.6	0.4	0.4	0.4	%

MICROPHONY

The triode section can be used without special precautions against microphonic effect in circuits in which an output of 50 mW is obtained at an input voltage of not less than 4 mV_{RMS}.

HUM

The hum level will be better than 60 dB under the following conditions:
Input voltage minimum 10 mV_{RMS} for 50 mW output.
Grid circuit impedance max. 0.5 MΩ at 50 Hz.
Cathode decoupling capacitor minimum 100 μF.
Pin 4 connected to earth.

OPERATING CHARACTERISTICS (continued)

Pentode section

Class A (Measured with V_k constant)

Anode voltage	V_a		250			250		V
Grid No.2 voltage	V_{g2}		250			250		V
Cathode resistor	R_k		170			270		Ω

SHUNT STABILIZER TRIODE

Shunt stabilizer triode intended for use as in colour TV receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	350	mA

For further data and curve of this type
please refer to type PD500

R.F. PENTODE

Pentode intended for use as R.F., I.F. or video amplifying tube or as mixing tube in television receivers.

QUICK REFERENCE DATA			
Anode current	I_a	10	mA
Transconductance	S	7.4	mA/V
Amplification factor	$\mu_{g_2g_1}$	50	-
Internal resistance	R_i	500	kΩ

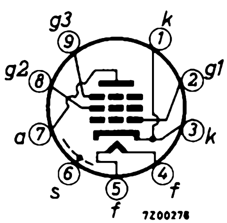
HEATING: Indirect by A.C. or D.C.; series or parallel supply

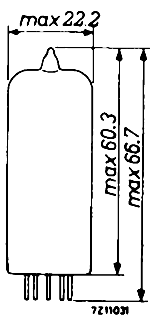
Heater voltage	V_f	6.3	V
Heater current	I_f	300	mA

DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: Noval





CAPACITANCES

Grid No.1 to all except anode	$C_{g_1(a)}$	6.9	pF
Anode to all except grid No.1	$C_{a(g_1)}$	3.1	pF
Anode to grid No.1	C_{ag_1}	max. 0.007	pF
Anode to cathode	C_{ak}	max. 0.012	pF
Grid No.2 to all	C_{g_2}	5.4	pF
Grid No.1 to grid No.2	$C_{g_1g_2}$	2.6	pF
Grid No.1 to heater	C_{g_1f}	max. 0.15	pF
Cathode to heater	C_{kf}	5.0	pF

REMARK

When using the EF80 as video amplifier the amplification between the input grid of the EF80 and the input of the cathode ray tube should not exceed a value of 25, in order to prevent microphonic effect.

OPERATING CHARACTERISTICS (continued)

Microphonic effect

A sensitivity of 0.5 mV for an output of 50 mW (or 5 mV for an output of 5 W) is permissible in those equipments where an output of 50 mW in the loudspeaker does not produce an average acceleration on the tube higher than 0.015 g at any frequency higher than 500 Hz or higher than 0.06 g at any frequency lower than 500 Hz.

Hum level

The hum disturbance level will be 3 μV (max. 5 μV) when Z_{g_1} is smaller than 0.5 MΩ at f = 50 Hz, the cathode resistor is decoupled by a capacitor of at least 100 μF and pin 4 is earthed. With the centre tap of the heater supply earthed this value will be 1 μV (max. 2 μV).

Noise voltage

The equivalent noise voltage on g_1 is approximately 2 μV for the frequency range from 25 to 10 000 Hz at V_b = 250 V and R_a = 100 kΩ.

REMARKS

1. Operation with cathode bias resistor is recommended.
2. In order to ensure a good performance with respect to cross-modulation and microphony this tube should not be used in circuits with automatic gain control. For such applications a tube with variable transconductance is recommended.

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{ao}	max.	550	V
	V_a	max.	250	V
Anode dissipation	W_a	max.	2.5	W
Grid No.2 voltage	$V_{g_{2o}}$	max.	550	V
	V_{g_2}	max.	250	V
Grid No.2 dissipation	W_{g_2}	max.	0.9	W [1]
Grid No.1 voltage, negative peak	$-V_{g_{1p}}$	max.	50	V
Cathode current	I_k	max.	25	mA
Cathode to heater voltage	V_{kf}	max.	150	V
Grid No.1 resistor	R_{g_1}	max.	1	MΩ

[1] During a heating-up period not exceeding 15 seconds this value may be max. 1.5 W. At the values of R_{g_2} specified under "Operating characteristics" there will be no risk of exceeding the maximum permissible value of W_{g_2}.

DOUBLE PENTODE

Double pentode intended for use as video output tube and as sync separator, A.G.C. amplifier or I.F. sound amplifier.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	810	mA

For further data and curves of this type please refer to type PFL200

A.F. OUTPUT PENTODE

Pentode intended for use as A.F. power amplifier.

QUICK REFERENCE DATA

LINE AND A.F. OUTPUT PENTODE

Pentode intended for use as line output tube in television receivers and as A.F. power amplifier.

HEATING: Indirectly by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	1.25	A

OPERATING CHARACTERISTICS

A.F. amplifier. Class B, two tubes in push pull

Anode voltage	V_a	300		V
Grid No.2 voltage	V_{g_2}	150		V
Grid No.1 voltage	V_{g_1}	-29		V
Load resistance	$R_{aa\sim}$	3.5		kΩ
Grid No.1 driving voltage	V_i	0	20	V_{RMS}
Anode current	I_a	2x18	2x100	mA
Grid No.2 current	I_{g_2}	2x0.5	2x19	mA
Output power	W_o	0	44.5	W
Distortion	d_{tot}	-	7.2	%

LIMITING VALUES (Design centre rating system)

Anode voltage	V_a	max.	250	V
Anode voltage for class B operation	V_a	max.	300	V
Cathode to heater voltage	V_{kf}	max.	100	V

For further data and curves of this type please refer to PL36

OUTPUT PENTODE FOR LINE DEFLECTION AND A.F. OUTPUT PENTODE

Output pentode intended for use as horizontal deflection amplifier in small screen television receivers and as A. F. power amplifier.

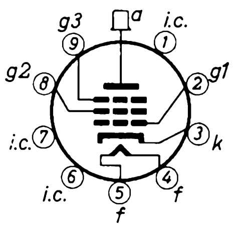
QUICK REFERENCE DATA				
Anode peak voltage	V_{ap}	max.	7	kV
Cathode current	I_k	max.	180	mA
Output power, class B two tubes	W_o		20	W

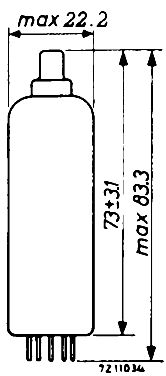
HEATING : Indirect by A.C. ot D.C. ; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	1.05	A

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





CAPACITANCES

Anode to all except grid No. 1	$C_{a(g_1)}$		6	pF
Grid No. 1 to all except anode	$C_{g_1(a)}$		14	pF
Anode to grid No. 1	C_{ag_1}	max.	0.8	pF
Anode to cathode	C_{ak}	max.	0.1	pF
Grid No. 1 to heater	C_{g_1f}	max.	0.2	pF

TYPICAL CHARACTERISTICS

A)

Anode voltage	V_a	170	V
Grid No. 3 voltage	V_{g_3}	0	V
Grid No. 2 voltage	V_{g_2}	170	V
Grid No. 1 voltage	V_{g_1}	−24	V
Anode current	I_a	45	mA
Grid No. 2 current	I_{g_2}	2.4	mA
Transconductance	S	6.3	mA/V
Internal resistance	R_i	11	kΩ
Amplification factor	$\mu_{g_2g_1}$	5.0	

B) (Measured under pulse conditions)

Anode voltage	V_a	40	V
Grid No. 3 voltage	V_{g_3}	0	V
Grid No. 2 supply voltage	V_{bg_2}	190	V
Grid No. 2 series resistor	R_{g_2}	4.7	kΩ
Grid No. 1 voltage	V_{g_1}	0	V
Anode current	I_a	180	mA
Grid No. 2 current	I_{g_2}	18	mA

OPERATING CONDITIONS

Stabilized circuits (D.C. feedback)

Cut-off voltage

The minimum required cut-off voltage ($-V_{g1}$) during flyback is 120 V at V_a = 6000 V, V_{g2} = 190 V, and Z_{g1} = 1 kΩ at line-frequency.

Supply-voltage: See page 5

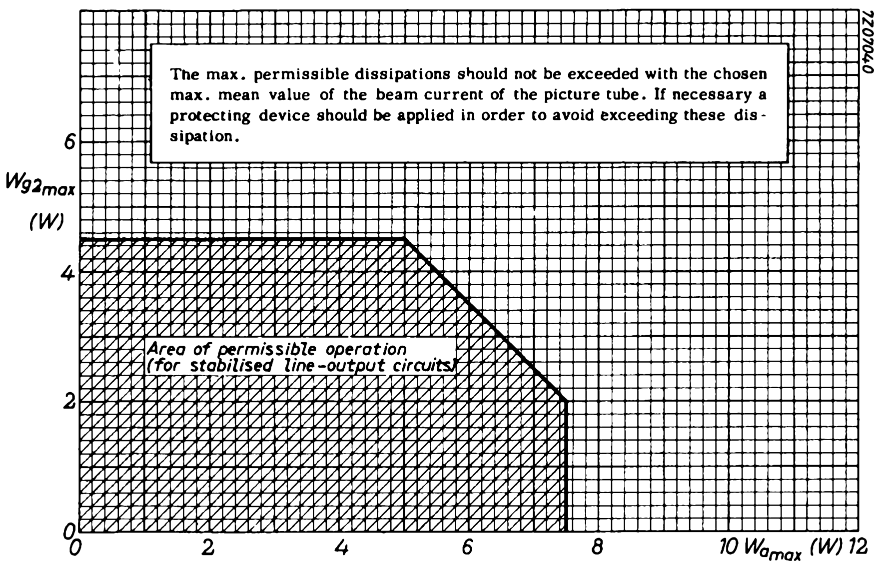
Minimum required value of the screengrid voltage and of the anode voltage, when the tube is used in a line output stage.
The graphs refer to nominal mains voltage provided the specified values of I_a at V_a min, will be available throughout life of the tube at supply voltage values 10% below nominal.
In order to prevent Barkhausen interferences and less of stabilisation, care should be taken that the anode voltage never drops below the specified V_a min. during the scanning period.

OPERATING CHARACTERISTICS as class B push-pull A.F. power amplifier, two tubes.

Anode voltage	V_a	170		200		V
Grid No. 3 voltage	V_{g3}	0		0		V
Grid No. 2 supply voltage	V_{bg2}	170		200		V
Common Grid No. 2 series resistor	R_{g2}	1		1		kΩ
Grid No. 1 voltage	V_{g1}	−27		−31.5		V
Load resistance	$R_{aa\sim}$	2.5		2.5		kΩ
Grid No. 1 driving voltage	V_i	0	16.5	0	21.5	V_{RMS}
Anode current	I_a	2x25	2x72	2x27	2x84	mA
Grid No. 2 current	I_{g2}	2x1.5	2x10	2x2.0	2x11.0	mA
Output power	W_o	0	13.0	0	20	W
Distortion	d_{tot}	-	5.2	-	6.5	%

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	250	V
Anode voltage, peak	V_{a_p}	max.	7	kV 1)
negative peak	$-V_{a_p}$	max.	7	kV 1)
Anode dissipation	W_a	See figure below		
Grid No. 2 dissipation	W_{g2} 2)	See figure below		
Anode + grid No. 2 dissipation	$W_a + W_{g2}$	See figure below		
Grid No. 2 voltage	V_{g2_o}	max.	550	V
	V_{g2}	max.	250	V
Cathode current	I_k	max.	180	mA
Cathode to heater voltage	V_{kf}	max.	100	V
Grid No. 1 resistor	R_{g_1}	max.	0.5	MΩ



1) Maximum pulse duration 22% of a cycle but maximum 18 μs.

2) During the heating-up of the cathode W_{g2} = max. 6 W.

FRAME AND A.F. OUTPUT PENTODE

Pentode intended for use as frame output tube in television receivers and as A.F. power amplifier.

QUICK REFERENCE DATA				
Anode peak voltage	V_{a_p}	max.	2	kV
Cathode current	I_k	max.	100	mA
Output power	W_o		5.3	W

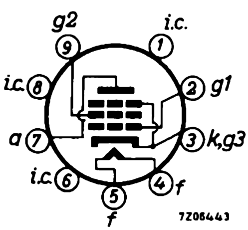
HEATING: Indirect by A.C. or D.C.; parallel supply

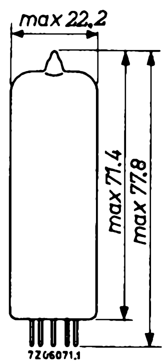
Heater voltage	V_f	6.3	V
Heater current	I_f	760	mA

DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: Noval





CAPACITANCES

Anode to all except grid No.1	$C_{a(g_1)}$		6.8	pF
Grid No.1 to all except anode	$C_{g_1(a)}$		13	pF
Anode to grid No.1	C_{ag_1}	max.	0.6	pF
Grid No.1 to heater	C_{g_1f}	max.	0.25	pF

OPTIMUM PEAK ANODE CURRENT IN FRAME OUTPUT OPERATION

The circuit should be designed so that the peak anode current does not exceed:

145 mA at V_a = 60 V, V_{g_2} = 170 V, V_f = 6.3 V
190 mA at V_a = 70 V, V_{g_2} = 200 V, V_f = 6.3 V
220 mA at V_a = 80 V, V_{g_2} = 220 V, V_f = 6.3 V

The minimum available value of the peak anode current at end of life and V_f = 5.7 V is:

125 mA at V_a = 60 V, V_{g_2} = 170 V
160 mA at V_a = 70 V, V_{g_2} = 200 V
185 mA at V_a = 80 V, V_{g_2} = 220 V

OPERATING CHARACTERISTICS

A.F. power amplifier, class A (Measured with V_k constant)

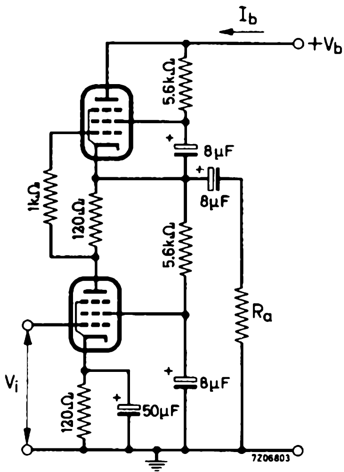
Supply voltage	V_b		200		V
Grid No.2 series resistor (non decoupled)	R_{g_2}		470		Ω
Cathode resistor	R_k		215		Ω
Load resistance	$R_{a\sim}$		2.5		kΩ
Grid No.1 driving voltage	V_i	0	0.52	7.0	V_{RMS}
Anode current	I_a	65	-	64	mA
Grid No.2 current	I_{g_2}	3.2	-	11.4	mA
Output power	W_o	0	0.05	5.3	W
Distortion	d_{tot}	-	-	10	%

A.F. power amplifier, class AB, two tubes in push-pull

Anode supply voltage	V_{ba}		250		V
Grid No.2 supply voltage	V_{bg_2}		200		V
Common cathode resistor	R_k		150		Ω
Load resistance	$R_{aa\sim}$		5.5		kΩ
Grid No.1 driving voltage	V_i	0	0.37	13.0	V_{RMS}
Anode current	I_a	2x50	-	2x55	mA
Grid No.2 current	I_{g_2}	2x2.0	-	2x13	mA
Output power	W_o	0	0.05	18.5	W
Distortion	d_{tot}	-	-	4.5	%

OPERATING CHARACTERISTICS (continued)

A.F. power amplifier, single ended push-pull



a) Single tone input signal

Supply voltage	V_b		300		V
Load resistance	$R_{a\sim}$		1		kΩ
Grid No.1 driving voltage	V_i	0	0.41	5.4	V_{RMS}
Supply current	I_b	66	–	64	mA
Output power	W_o	0	0.05	4.5	W
Distortion	d_{tot}	–	–	9.3	%

b) Double tone input signal

Supply voltage	V_b		300		V
Load resistance	$R_{a\sim}$		1		kΩ
Grid No.1 driving voltage	V_i	0		2.7	V_{RMS} [1])
Supply current	I_b	66		64	mA
Output power	W_o	0		5.5	W
Distortion	d_{tot}	–		8.5	%

[1]) Value of each tone separately.

REMARK

Single tone data are obtained with a pure sinusoidal input voltage. However such an input voltage is in general not representative for the reproduction of music and speech, since a purely sinusoidal tone seldom occurs.
The double tone data are obtained with two sinusoidal signals of different frequencies but of the same amplitude. This appears to be far better in agreement with practice. In the case of full drive with two sinusoidal signals different in frequency but having the same amplitude, the output power is half the value obtained at full drive with a single sinusoidal input voltage of twice this amplitude. To make comparison possible the obtained output power with double tone has therefore been multiplied by 2.

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	250	V
Anode peak voltage	V_{a_p}	max.	2	kV [1]
Grid No.2 voltage	$V_{g_{2o}}$	max.	550	V
	V_{g_2}	max.	250	V
Anode dissipation	W_a	max.	12	W [2]
Grid No.2 dissipation:				
average	W_{g_2}	max.	1.75	W
peak	$W_{g_{2p}}$	max.	6	W
Cathode current	I_k	max.	100	mA
Grid No.1 resistor:				
automatic bias	R_{g_1}	max.	1	MΩ
frame output application with automatic bias	R_{g_1}	max.	2	MΩ
Cathode to heater voltage	V_{kf}	max.	200	V

[1]) Valid for application in frame output circuits where the max. pulse duration is 4% of a cycle with a max. of 0.8 ms.

[2]) For frame output application W_a = max. 10 W.

A.F. OUTPUT PENTODE

Pentode intended for use as A.F. power amplifier.

HEATING : Indirect by A.C. or D.C.; parallel supply

Heater voltage		V_f	6.3 V
Heater current		I_f	200 mA

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage	V_{kf}	max.	100 V

For further data and curves of this type
please refer to type PL95

LINE OUTPUT PENTODE

Beam pentode intended for use as line output tube in television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	1.38	A

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage

DC + peak,	k positive	V_{kf}	max.	200	V
	k negative	$-V_{kf}$	max.	200	V 3)

Anode dissipation
Grid No.2 dissipation — See graph below

1) Design centre limits for W_a and W_{g_2}.
2) These limits for W_a and W_{g_2} should not be exceeded with a nominal tube operating in a normal line deflection circuit under the worst probable conditions.
3) D.C. component max. 100 V.

For further data and curves of this type
please refer to type PL 504

A.F. OUTPUT PENTODE

Beam pentode intended for use as A.F. power amplifier.

QUICK REFERENCE DATA			
Anode current	I_a	110	mA
Transconductance	S	23	mA/V
Amplification factor	$\mu_{g_2g_1}$	13	
Output power (class AB)	W_o	40	W

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	1.05	A

DIMENSIONS AND CONNECTIONS

Dimensions in mm

LINE OUTPUT PENTODE

Beam pentode intended for use as line output tube in television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	1.38	A

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage,

DC + peak, k positive	V_{kf}	max.	200	V
k negative	$-V_{kf}$		200	V [1])

For further data and curves of this type
please refer to type PL 504

[1]) DC component max. 100 V.

FRAME OUTPUT PENTODE

Pentode intended for use as frame output amplifier in colour television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	825	mA

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage	V_{kf}	max.	100	V

For further data of this type please refer to type PL508

LINE OUTPUT PENTODE

Output pentode intended for colour TV line deflection circuits.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater voltage	I_f	2	A

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage,

DC + peak, k positive	V_{kf}	max.	200	V
k negative	$-V_{kf}$	max.	200	V [1]

For further data and curves of this type please refer to type PL 509

[1]) DC component max. 100 V.

LINE OUTPUT PENTODE

Output pentode intended for colour TV line deflection circuits.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater voltage	I_f	2	A

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage,

DC + peak, k positive	V_{kf}	max.	200	V
k negative	$-V_{kf}$	max.	200	V [1]

For further data and curves of this type
please refer to type PL519

---

[1]) DC component max. 100 V.

VIDEO OUTPUT PENTODE

Luminance output tube in colour TV receivers

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	800	mA

LIMITING VALUES (Design centre rating system)

Cathode to heater voltage	Vkf	max.	100	V

For further data of this type please refer
to type PL802

TUNING INDICATOR

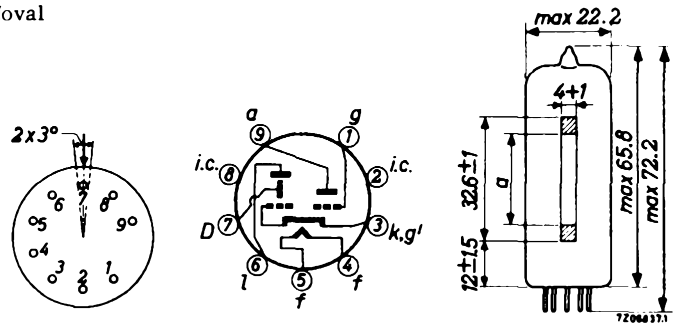
Indicator tube with triode amplifier intended for use as tuning indicator or for modulation control.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	210	mA

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval



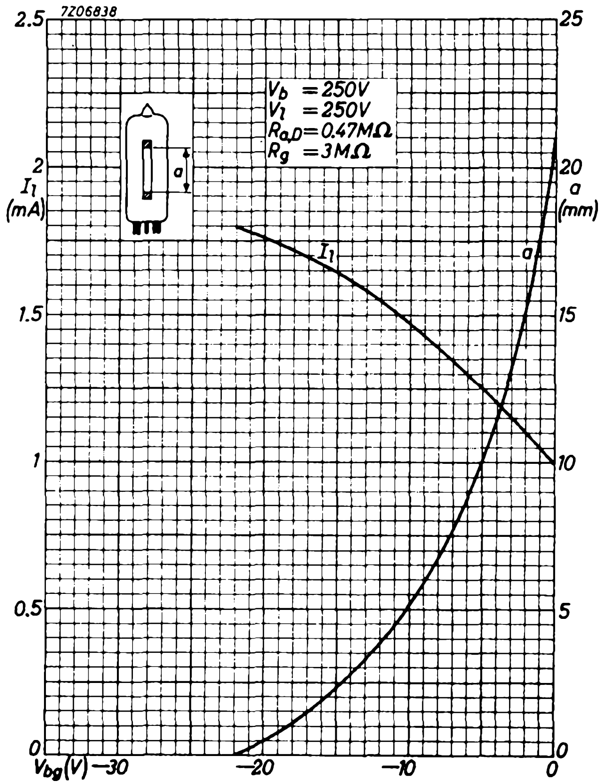
The arrow near pin 7 indicates the viewing direction.

OPERATING CHARACTERISTICS (D connected to a)

Supply voltage	V_b	250		V
Luminescent screen voltage	V_ℓ	250		V
Anode and deflection electrode resistor	$R_{a,D}$	470		kΩ
Grid resistor	R_g	3		MΩ
Grid supply voltage	V_{bg}	0	−22	V
Anode and deflection electrode current	I_{a+D}	0.45	0.06	mA
Luminescent screen current	I_ℓ	1.0	1.8	mA
Shadow length	a	21±5	0	mm

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	300	V
Anode dissipation	W_a	max.	0.5	W
Deflection electrode voltage	V_{D_o}	max.	550	V
	V_D	max.	300	V
Luminescent screen voltage	$V_{\ell o}$	max.	550	V
	V_ℓ	max.	300	V
	V_ℓ	min.	170	V
Cathode current	I_k	max.	3	mA
Grid resistor	R_g	max.	3	MΩ
Cathode to heater voltage	V_{kf}	max.	100	V
Bulb temperature	t_{bulb}	max.	120	°C



TUNING INDICATOR

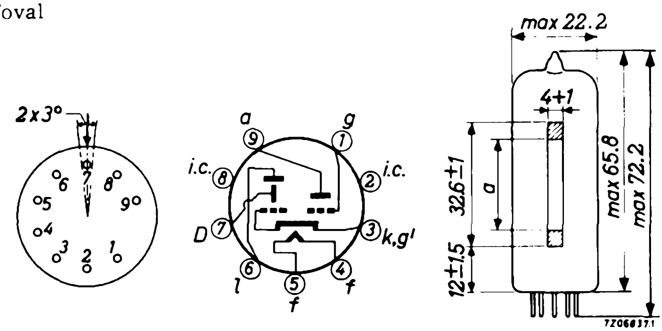
Tuning indicator tube.

HEATING: Indirect by A.C. or D.C.; series or parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	300	mA

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval



The arrow near pin 7 indicates the viewing direction.

OPERATING CHARACTERISTICS (D connected to a)

Supply voltage	V_b		250		V
Luminescent screen voltage	V_ℓ		250		V
Anode and deflection electrode resistor	$R_{a,D}$		100		kΩ
Grid resistor	R_g		3		MΩ
Grid supply voltage	V_{bg}	0	−10	−15	V
Anode and deflection electrode current	I_{a+D}	2.0	0.5	0.2	mA
Luminescent screen current	I_ℓ	1.0	1.8	2.0	mA
Shadow length	a	21	0	−1.5	mm[1])

[1]) A negative value of "a" means overlapping:
The grid bias for a = o is reduced by decreasing V_ℓ.
The measure of overlapping at V_g = −15 V will then increase (see page 4).

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	300	V
Anode dissipation	W_a	max.	0.6	W
Deflection electrode voltage	V_{D_o}	max.	550	V

BOOSTER DIODE

Booster diode intended for use in line time-base circuits of television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater current	V_f	6.3	V
Heater voltage	I_f	810	mA

For further data and curves
please refer to type PY81

BOOSTER DIODE

Booster diode intended for use in line time base circuits of television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	1.55	A

For further data and curves of this type
please refer to type PY88

BOOSTER DIODE

Booster diode intended for use in time base circuits of colour television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	2.1	A

For further data and curves of this type
please refer to type PY500

BOOSTER DIODE

Booster diode intended for use in time base circuits of colour television receivers.

HEATING: Indirect by A.C. or D.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	2.1	A

For further data and curves of this type
please refer to type PY500A

DOUBLE ANODE RECTIFYING TUBE

Double anode high vacuum rectifying tube

QUICK REFERENCE DATA			
Transformer voltage	V_{tr}	2x350	V_{RMS}
D.C. current	I_o	90	mA

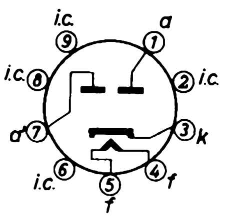
HEATING: Indirect by A.C.; parallel supply

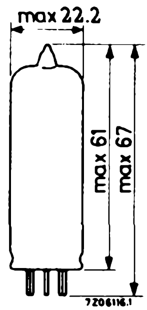
Heater voltage	V_f	6.3	V
Heater current	I_f	600	mA

DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: Noval





OPERATING CHARACTERISTICS as two-phase half-wave rectifier

Transformer voltage	V_{tr}	2x250	2x275	2x300	2x350	V_{RMS}
D.C. output voltage	V_o	260	285	310	360	V

Protecting resistance	R_t	2x125	2x175	2x215	2x300	Ω
Input capacitor of smoothing filter	C_{filt}	50	50	50	50	μF

LIMITING VALUES (Design centre rating system)

Transformer voltage	V_{tr}		max.	2x350	V_{RMS}	
D.C. current	I_o		max.	90	mA	
Cathode to heater voltage, peak, k pos	V_{kf_p}		max.	500	V	
Input capacitor of smoothing filter	C_{filt}		max.	50	μF	
Protecting resistance	R_t min.	2x125	2x175	2x215	2x300	Ω
at transformer voltage	V_{tr}	2x250	2x275	2x300	2x350	V_{RMS}

DOUBLE ANODE RECTIFYING TUBE

Double anode high vacuum rectifying tube.

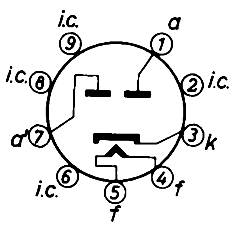
QUICK REFERENCE DATA			
Transformer voltage	V_{tr}	2x450	V_{RMS}
D.C. current	I_o	100	mA

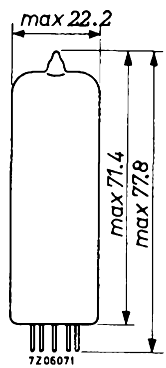
HEATING: Indirect by A.C.; parallel supply

Heater voltage	V_f	6.3	V
Heater current	I_f	1	A

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





OPERATING CHARACTERISTICS

As two-phase half-wave rectifier with capacitor input filter See page 4 upper fig.

Transformer voltage	V_{tr}	2x250	2x350	2x450	V_{RMS}
D.C. output voltage	V_o	245	352	497	V
D.C. current	I_o	160	150	100	mA
Protecting resistance	R_t	2x150	2x230	2x310	Ω
Input capacitor of smoothing filter	C_{filt}	50	50	50	μF

As two-phase half-wave rectifier with choke input filter See page 4 lower fig.

Transformer voltage	V_{tr}	2x250	2x350	2x450	V_{RMS}
D.C. output voltage	V_o	199	288	378	V
D.C. current	I_o	180	180	150	mA
Choke	L	10	10	10	H

LIMITING VALUES (Design centre rating system)

Anode voltage, peak inverse	$V_{a_{invp}}$	max.	1300	V
D.C. current	I_o	See page 3 lower figure		
Transformer voltage	V_{tr}			
Anode current, peak	I_{a_p}	max.	500	mA

SINGLE ANODE E.H.T. RECTIFYING TUBE

Single anode E.H.T. rectifying tube intended for use in colour television receivers.
The GY501 has a chemically treated envelope to avoid flash-over under conditions of high humidity and low atmospheric pressure (45 cm Hg).

QUICK REFERENCE DATA			
D.C. output voltage	V_o	25	kV
Anode current	I_a	1.5	mA

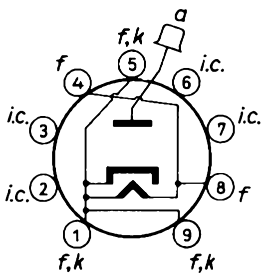
HEATING: Indirect by A.C. or D.C.; parallel supply

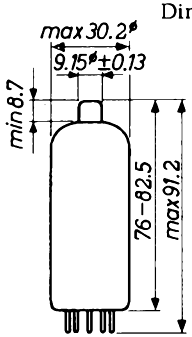
Heater voltage	V_f	3.15	V [1])
Heater current	I_f	400	mA

DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: Magnoval





Pins 1, 5 and 9 may be used to connect an anti-corona ring.

Circuit elements having the same potential as the heater (e.g. a series resistor) may be connected to pins 3 and 7. These pins must never be earthed.

Precaution: X-ray shielding may be required to give protection against excessive radiation.

[1]) Under nominal operating conditions and with the longterm average value of I_a to be expected in practice, $V_{f\,RMS}$ should be 3.15 V.
The heater voltage deviation resulting from spread or variation of operating conditions should be limited to the values indicated by the diagram in fig.A.

CAPACITANCES

Anode to cathode	C_{ak}	1.2	pF

OPERATING CHARACTERISTICS

Output voltage	V_o	25	kV
Anode current	I_a	1.5	mA

LIMITING VALUES (Design centre rating system)

Peak inverse voltage (absolute max.)	V_{ainv_p}	max.	35	kV [1])
Output voltage (absolute max.)	V_o	max.	27.5	kV
Output current, average	I_o	max.	1.7	mA
peak	I_{op}	max.	100	mA [2])

[1]) The negative peak due to ringing in the line output transformer should be taken into account.
Max. pulse duration 22% of a cycle and 18 μs.

[2]) Design max. rating system
Max. pulse duration 10% of a line scanning cycle with a max. of 10 μs.

TRIPLE DIODE-TRIODE

Triple diode-triode, intended for video and FM and AM audio signal detection and A.F. signal amplification.

HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	9.5	V

For further data and curves
please refer to UABC80

U.H.F. TRIODE

Triode intended for use as grounded grid U.H.F. amplifier, oscillator or mixer for bands IV and V.

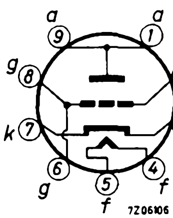
QUICK REFERENCE DATA			
Anode current	I_a	12	mA
Transconductance	S	14	mA/V
Amplification factor	μ	68	-

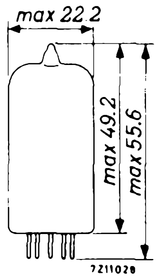
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	3.8	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





OPERATING CHARACTERISTICS

As grounded grid amplifier

Anode voltage	V_a	175	V
Cathode resistor	R_k	125	Ω
Anode current	I_a	12	mA
Transconductance	S	14	mA/V

As self-oscillating mixer

Supply voltage	V_{b_a}	220	V
Anode resistor	R_a	5.6	kΩ
Grid resistor	R_g	47	kΩ
Anode current	I_a	12	mA
Grid current	I_g	50	μA

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_0}	max. 550	V
	V_a	max. 220	V
Anode dissipation	W_a	max. 2.2	W
Cathode current	I_k	max. 20	mA
Grid voltage	$-V_g$	max. 50	V
Grid resistor	R_g	max. 1	MΩ
Cathode to heater voltage	$V_{kf(k\,pos)}$	max. 100	V [1]

[1] A.C. component max. 50 V_{RMS}.

CAPACITANCES

Without external shield

Anode to grid	C_{ag}	2.2	pF
Anode to cathode	C_{ak}	0.24	pF
Grid to cathode	C_{gk}	3.5	pF
Grid to heater	C_{gf}	0.27	pF

U.H.F. TRIODE

Triode intended for use as grounded grid U.H.F. amplifier for bands IV and V.

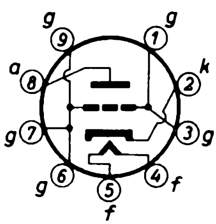
QUICK REFERENCE DATA			
Anode current	I_a	12.5	mA
Transconductance	S	13.5	mA/V
Amplification factor	μ	65	

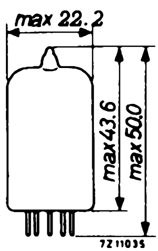
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	3.8	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





CAPACITANCES

Without external screen

Anode to grid	C_{ag}	1.2	pF

With external screen (inside diameter 22.2 mm)

Anode to grid	C_{ag}	1.7	pF
Grid to anode + cathode	$C_{g/kf}$	3.8	pF
Anode to heater + cathode	$C_{a/kf}$	0.055	pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a		160	V [1]
Cathode resistor	R_k		100	Ω [1]
Anode current	I_a		12.5	mA
Transconductance	S		13.5	mA/V
Amplification factor	μ		65	
Equivalent noise resistance	R_{eq}		240	Ω
Noise figure at f = 850 MHz	F		10	dB
Anode voltage	V_a		0	V
Grid current, positive	I_g		0.3	μA
Grid voltage	$-V_g$	max.	1.3	V

Series resonance frequencies

Measured between a point on the relevant tube pin close to the tube bottom and a point close to the relevant pin on a metal reference plane, placed against the tube bottom.
All the pins, except the relevant one, are connected to the reference plane with a negligible impedance.
The tube is screened by a metal screen with an inside diameter of 22.2 mm placed upon the metal reference plane.

Heater voltage	V_f	0	V
Anode voltage	V_a	0	V
Anode resonance frequency	f_{oa}	1700	MHz
Cathode resonance frequency	f_{ok}	1000	MHz

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	175	V
Anode dissipation	W_a	max.	2	W
Cathode current	I_k	max.	13	mA
Grid voltage	$-V_g$	max.	50	V
Grid resistor (R_k = 100 Ω)	R_g	max.	1	MΩ
Cathode to heater voltage	V_{kf}	max.	100	V [1]

[1]) To fulfil the modulation hum requirements, the A.C. component should not exceed 50 V_{RMS}.

H.F. TRIODE

Triode intended for use as H.F. amplifier, oscillator, mixer and in frame deflection circuits and line deflection circuits of TV receivers.

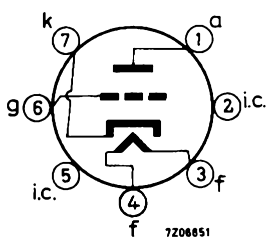
QUICK REFERENCE DATA			
Anode current	I_a	12	mA
Transconductance	S	7.2	mA/V
Amplification factor	μ	67	-

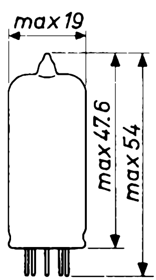
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	3.1	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: 7 pin miniature





LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	250	V
Anode dissipation	W_a	max.	2.5	W
Grid voltage	$-V_g$	max.	50	V
Cathode current, average	I_k	max.	15	mA
peak	I_{k_p}	max.	150	mA [3]
Cathode to heater voltage (k pos.)	V_{kf}	max.	250	V [1]
(k neg.)	V_{kf}	max.	250	V
	(D.C. component max. 100 V)			
Grid resistor (automatic bias)	R_g	max.	1	MΩ

OPERATING CONDITIONS AS BLOCKING OSCILLATOR

To take into account the tube tolerances, the decrease of the characteristics during life and the decrease of the emission at underheating, the circuit should be designed so that acceptable performance is obtained with a cathode peak current of 100 mA [2] (150 mA [3]). It is recommended to limit the peak current of new tubes by an automatic amplitude limiting circuit e.g. by the use of non by-passed grid and anode resistors.

[1]) During the warm-up period of the tubes V_{kf} (k pos.) (D.C. component) max. 315 V.

[2]) Pulse duration 4% of a cycle and max. 0.8 ms.

[3]) Pulse duration 1% of a cycle and max. 0.2 ms.

CAPACITANCES

Grounded cathode circuit

without external shield

Input	C_i	2.8	pF
Output	C_o	0.55	pF

Amplification factor	μ	46	48	46	

REMARK

Microphony

This tube can be used without special precautions against microphony in A.F. applications in which the input voltage $V_i \geq 5$ mV for an output of 50 mW (or 50 mV for an output 5 W) provided the peak acceleration of the tube is not greater than indicated in the section "Microphony" of the "General Operational Recommendations".

[1]) In this case grid current may occur. If this is not permissible, a condition with a bias of −1.5 V should be chosen.

OPERATING CHARACTERISTICS (each unit)

As self-oscillating additive mixer

Anode supply voltage	V_b	100	170	200	V
Anode resistor	R_a	4.7	4.7	8.2	kΩ
Grid resistor	R_g	1	1	1	MΩ
Oscillator voltage	$V_{osc.}$	1.8	2.8	2.8	V_{RMS}
Anode current	I_a	2.7	5.5	6	mA
Conversion conductance	S_c	2.2	2.8	2.9	mA/V
Internal resistance	R_i	19	15	14	kΩ
Grid input resistance (f = 100 MHz)	r_g		15		kΩ

As oscillator in television receivers

Anode supply voltage	V_b	180	V
Anode resistor	R_a	4.4	kΩ
Grid resistor	R_g	22	kΩ
Oscillator voltage	$V_{osc.}$	9	V_{RMS}
Anode current	I_a	7.4	mA
Anode dissipation	W_a	1.2	W

LIMITING VALUES (each unit) (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	250	V
Anode dissipation	W_a	max.	2.5	W

Grid to anode other unit	$C_{ga'}$	max. 0.005	max. 0.005	pF

REMARK

The unit a, g, k should be used as the grounded cathode input section and unit a', g', k' as the grounded grid output unit.

TYPICAL CHARACTERISTICS

Anode voltage	V_a	90	V
Grid voltage	V_g	-1.3	V
Anode current	I_a	15	mA
Transconductance	S	12.5	mA/V
Amplification factor	μ	33	-
Equivalent noise resistance	R_{eq}	300	Ω

LIMITING VALUES (Design centre rating system) (each unit, unless otherwise stated)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	130	V
Anode dissipation	W_a	max.	1.8	W
Cathode current	I_k	max.	25	mA
Grid voltage	$-V_g$	max.	50	V
Grid resistor	R_g	max.	1	MΩ
Cathode to heater voltage	V_{kf}	max.	50	V
	$V_{k'f(k'pos)}$	max.	150	V [1]

REMARK

In order not to exceed the maximum permissible anode voltage when the cascode amplifier is controlled, it is necessary to use a voltage divider for the grid of the grounded grid section. With grid current biasing for the grounded cathode section the anode voltage across this section should not be more than 75 V in the not controlled condition.

[1] D.C. component max. 130 V.

REMARKS

In order not to exceed the maximum permissible anode voltage when the tube is controlled, it is necessary to use a voltage divider for the grid of the grounded grid section.

The system a, g, k should be used as the grounded cathode input section and the system a', g', k' as the grounded grid output section.

[1]) D.C. component max. 130 V.

Anode to grid No.1	C_{ag_1}	max. 0.025	pF

Between triode and pentode sections

Anode triode to grid No.1 pentode	$C_{a_T g_{1P}}$	max. 0.16	pF
Grid triode to anode pentode	$C_{g_T a_P}$	max. 0.02	pF
Anode triode to anode pentode	$C_{a_T a_P}$	max. 0.07	pF

TYPICAL CHARACTERISTICS

Triode section

Anode voltage	V_a	100	V
Grid voltage	V_g	−2	V
Anode current	I_a	14	mA
Transconductance	S	5	mA/V
Amplification factor	μ	20	–

Pentode section

Anode voltage	V_a	170	V
Grid No.2 voltage	V_{g_2}	170	V
Grid No.1 voltage	V_{g_1}	−2	V
Anode current	I_a	10	mA
Grid No.2 current	I_{g_2}	2.8	mA
Transconductance	S	6.2	mA/V
Amplification factor	$\mu_{g_2 g_1}$	47	–
Internal resistance	R_i	0.4	MΩ
Grid No.1 impedance (Frequency 50 MHz)	r_{g_1}	10	kΩ
Equivalent noise resistance	R_{eq}	1.5	kΩ

OPERATING CONDITIONS

As frequency changer (It is recommended to employ the triode in a Colpitts type of circuit and not in a Hartley type)

Anode voltage	V_a	170	170	V
Grid No.2 voltage	V_{g_2}	170	170	V
Grid No.1 resistor	R_{g_1}	0.1	0.1	MΩ
Cathode resistor	R_k	330	820	Ω
Oscillator voltage	V_{osc}	3.5	3.5	V_{RMS}
Anode current	I_a	6.5	5.2	mA
Grid No.2 current	I_{g_2}	2.0	1.5	mA
Grid No.1 current	I_{g_1}	20	0	µA
Conversion conductance	S_c	2.2	2.1	mA/V
Internal resistance	R_i	800	870	kΩ

Frame output application (Optimum peak cathode current of the triode section)

To allow for tube spread, for deterioration during life and for emission drop at underheating the equipment should be so designed that it still operates satisfactorily with a peak cathode current of 100 mA (max. pulse duration 4 % of a cycle, but maximum 0.8 ms). The amplitude of the peak current occurring with new tubes should be limited automatically to this max. value of 100 mA. (E.g. by non-bypassed resistances in the grid lead.)

LIMITING VALUES (Design centre rating system)

OPERATING CHARACTERISTICS

Triode section as oscillator

Anode supply voltage	V_{ba}	190	V
Anode resistor	R_a	8.2	kΩ
Grid resistor	R_g	10	kΩ
Oscillator voltage	V_{osc}	4.5	V_{RMS}
Anode current	I_a	12	mA
Effective transconductance	S_{eff}	3.5	mA/V

Pentode section as mixer

Anode supply voltage	V_{ba}	190	V
Grid No.2 supply voltage	V_{bg_2}	190	V
Grid No.2 resistor	R_{g_2}	18	kΩ
Grid No.1 resistor	R_{g_1}	100	kΩ
Oscillator voltage	V_{osc}	2.3	V_{RMS}
Anode current	I_a	8.5	mA
Grid No.2 current	I_{g_2}	3.0	mA
Grid No.1 current	I_{g_1}	30	μA
Conversion conductance	S_c	4.5	mA/V
Internal resistance	R_i	0.6	MΩ

LIMITING VALUES

Triode section

Anode voltage	V_{a_o}	max. 550	V
	V_a	max. 250	V
Anode dissipation	W_a	max. 1.5	W
Cathode current	I_k	max. 15	mA
Grid resistor	R_g	max. 0.5	MΩ
Cathode to heater voltage	V_{kf}	max. 100	V [1])

Pentode section

Anode voltage	V_{a_o}	max. 550	V
	V_a	max. 250	V
Grid No. 2 voltage	V_{g2_o}	max. 550	V
	V_{g_2}	max. 150	V
Anode dissipation	W_a	max. 2.0	W
Grid No. 2 dissipation	W_{g_2}	max. 0.5	W
Cathode current	I_k	max. 18	mA
Grid No. 1 resistor	R_{g_1}	max. 0.5	MΩ
Cathode to heater voltage	V_{kf}	max. 100	V [1])

[1]) To fulfil the modulation hum requirements in intercarrier receivers, V_{kf} should not exceed 75 V_{RMS}.
With respect to modulation hum in A.M. sound receivers, V_{kf} should not exceed 50 V_{RMS}.

TRIODE-PENTODE

Triode pentode; triode section intended for use as reactance tube, pentode section intended for use as sine wave oscillator or pulse shaper in television receivers.

QUICK REFERENCE DATA			
Pentode section			
Anode current	I_a	6	mA
Transconductance	S	5.5	mA/V
Amplification factor	$\mu_{g_2g_1}$	47	-
Internal resistance	R_i	400	kΩ
Triode section			
Anode current	I_a	3.5	mA
Transconductance	S	3.5	mA/V
Amplification factor	μ	70	-

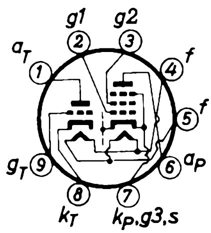
HEATING: Indirect by A.C. or D.C.; series supply

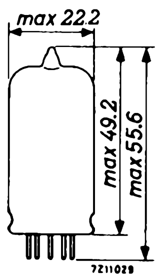
Heater current	I_f	300	mA
Heater voltage	V_f	9	V

DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: Noval





CAPACITANCES

Pentode section

Grid No.1 to all except anode	$C_{g_1(a)}$		5.4	pF
Anode to grid No.1	C_{ag_1}		0.06	pF
Grid No.1 to heater	C_{g_1f}	max.	0.1	pF

Triode section

Grid to all except anode	$C_{g(a)}$		2.4	pF
Anode to grid	C_{ag}		1.5	pF
Grid to heater	C_{gf}	max.	0.1	pF

TYPICAL CHARACTERISTICS

Pentode section

Amplification factor	μ	70	−	−	−
Grid current	I_g	−	10	0.3	μA

LIMITING VALUES (Design centre rating system)

Pentode section

Anode voltage	V_{a_0}	max.	550	V
	V_a	max.	250	V
Anode dissipation	W_a	max.	1.2	W
Grid No.2 voltage	V_{g2_0}	max.	550	V [1]
	V_{g2}	max.	250	V
Grid No.2 dissipation	W_{g2}	max.	0.8	W
Grid No.1 voltage	$-V_{g1}$	max.	220	V [1]
Grid resistor, fixed bias	R_{g1}	max.	0.56	MΩ
automatic bias	R_{g1}	max.	1	MΩ
Cathode current, average	I_k	max.	15	mA
peak T_{imp} = max. 30 μs, δ = max. 0.3	I_{kp}	max.	50	mA
Cathode to heater voltage	V_{kf}	max.	100	V [2]
Grid circuit impedance	Z_{g1} (f = 50 Hz)	max.	300	kΩ [2]

Triode section

Anode voltage	V_{a_0}	max.	550	V
	V_a	max.	250	V
Anode dissipation	W_a	max.	1.4	W
Grid resistor, fixed bias	R_g	max.	3	MΩ
Cathode current	I_k	max.	10	mA
Cathode to heater voltage	V_{kf}	max.	100	V [3]
Grid circuit impedance	Z_g (f = 50 Hz)	max.	50	kΩ [3]

[1] The instantaneous voltage between grid No.1 and grid No.2 should never exceed 550 V.

[2] To avoid hum interference the A.C. component of V_{kf} should not exceed 65 V at the specified value of Z_{g1}.

[3] To minimise hum interference decoupling of R_k is recommended. In circuits with undecoupled R_k the hum interference between grid and cathode will remain below 1000 μV when the A.C. component of V_{kf} does not exceed 25 V and the R_k is not higher than 1.2 kΩ at the specified value of Z_g.

MICROPHONY AND HUM

The triode section can be used without special precautions against microphony and hum in circuits in which an input voltage $V_i \geqq 10$ mV_{RMS} gives an output of 50 mW of the output stage. Z_g (50 Hz) = 0.25 MΩ. The A.C. voltage between pin 4 and cathode should not exceed 6.3 V. If the tube is used in television circuits where the frequency of the heater supply is not synchronized with the frame frequency, this may cause interference due to hum. At page 8 the relation is shown between the permissible value of Z_{g1} of the pentode section and the A.C. voltage between pin 4 and the cathode. This curve applies to C_{g1f} is 0.8 pF (inclusive of wiring and tube socket).

1) Measured at small input voltage

2) At lower output voltages the distortion is proportionally lower.

3) At lower output voltages down to 5 V_{RMS} the distortion remains approximately constant. At values below 5 V_{RMS} the distortion is approximately proportional to V_o.

OPERATING CHARACTERISTICS

Pentode section

A.F. power amplifier, class A (measured with V_k constant)

Supply voltage	$V_{ba}=V_{bg_2}$		170			200			230	V
Grid No.2 series resistor (non-decoupled)	R_{g_2}		0			470			1200	Ω

Anode current	I_a	2x35	2x42.5	2x30	2x34.5	mA
Grid No.2 current	I_{g_2}	2x8	2x16.5	2x6.2	2x13.5	mA
Output power	W_o	0	9.3	0	10	W
Distortion	d_{tot}	-	6.3	-	5.5	%

Frame output application

The circuit should operate satisfactorily with peak anode current I_{a_p} = 85 mA at V_a = 50 V, V_{g_2} = 170 V, I_f = 300 mA. The minimum available I_{a_p} value at end of life is

70 mA at V_a = 50 V, V_{g_2} = 170 V, I_f = 280 mA
80 mA at V_a = 50 V, V_{g_2} = 190 V, I_f = 280 mA

Internal resistance	R_i	11	9	kΩ

OPERATING CHARACTERISTICS

Pentode section

Frame output application

Anode voltage	V_a	50	65	V
Grid No.2 voltage	V_{g_2}	170	210	V
Grid No.1 voltage	V_{g_1}	-1	-1	V
Anode peak current	I_{a_p}	200	285	mA
Grid No.2 peak current	$I_{g_{2p}}$	35	45	mA

Remarks

The minimum I_{a_p} value to be expected as a result of spread of the tube characteristics, tube deterioration during life and decrease of the mains voltage to 10% below the nominal value, can be derived from the curves on page 9 by decreasing by 40% the I_a values of curve A-B at the V_{g_2} value occuring at the decreased mains voltage.

In order not to exceed the maximum permissible value of W_{g_2}, the circuit should be designed such that at a mains voltage of 10% below nominal, V_a at the end of scan will not be lower than the value determined by curve A-B at the relevant V_{g_2} value.

HUM

The equivalent pentode grid hum voltage without negative feedback is max. 10 mV when Z_{g_1} (at f = 50 Hz) $\leqq$ 0.5 MΩ, C_{g_1-f} = 0.2 pF and V_{kf} = 150 V_{RMS}.

LIMITING VALUES (Design centre rating system)

Triode section

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	300	V
Anode dissipation	W_a	max.	0.5	W
Cathode current				
average	I_k	max.	15	mA
peak	I_{k_p}	max.	150	mA [1]
peak	I_{k_p}	max.	100	mA [2]
Grid resistor				
for fixed bias	R_g	max.	1	MΩ
for automatic bias	R_g	max.	3.3	MΩ
Cathode to heater voltage	V_{kf}	max.	200	V [3]

Remark

A cathode peak current of 100 mA will be available throughout life and at under-heating.

[1]) Max. pulse duration 2% of a cycle with a maximum of 400 μsec.

[2]) Max. pulse duration 4% of a cycle with a maximum of 800 μsec.

[3]) During warming up the D.C. component of V_{kf} = max. 315 V, k pos.

LIMITING VALUES (continued)

Pentode section

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	300	V
Anode peak voltage	V_{a_p}	max.	2	kV [1]

TRIODE-OUTPUT PENTODE

Triode-pentode with separate cathodes.
The triode section is intended for use as A.F. amplifier.
The pentode section is intended for use as A.F. power amplifier.

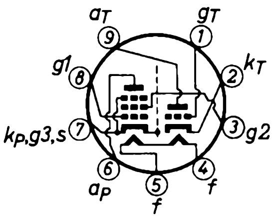
QUICK REFERENCE DATA			
Triode section			
Anode current	I_a	1.2	mA
Transconductance	S	1.6	mA/V
Amplification factor	μ	100	-
Pentode section			
Anode current	I_a	39	mA
Transconductance	S	10.5	mA/V
Amplification factor	$\mu_{g_2g_1}$	21	-
Output power	W_o	4.1	W

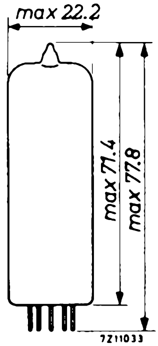
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	13.3	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





CAPACITANCES

Triode section

Anode to all except grid	$C_{a(g)}$		2.5	pF
Grid to all except anode	$C_{g(a)}$		2.3	pF
Anode to grid	C_{ag}		1.4	pF
Grid to heater	C_{gf}	max.	0.006	pF

Pentode section

Grid No.1 to all except anode	$C_{g_1(a)}$		10	pF
Anode to grid No.1	C_{ag_1}	max.	0.4	pF
Grid No.1 to heater	C_{g_1f}	max.	0.24	pF

Between triode and pentode sections

Anode triode to grid No.1 pentode	$C_{a_Tg_{1P}}$	max.	0.2	pF
Grid triode to grid No.1 pentode	$C_{g_Tg_{1P}}$	max.	0.02	pF
Anode triode to anode pentode	$C_{a_Ta_P}$	max.	0.15	pF
Grid triode to anode pentode	$C_{g_Ta_P}$	max.	0.006	pF [1]

TYPICAL CHARACTERISTICS

Triode section

Anode voltage	V_a	230	V
Grid voltage	V_g	-1.7	V
Anode current	I_a	1.2	mA
Transconductance	S	1.6	mA/V
Amplification factor	μ	100	

Pentode section

Anode voltage	V_a	230	V
Grid No.2 voltage	V_{g_2}	230	V
Grid No.1 voltage	V_{g_1}	-5.7	V
Anode current	I_a	39	mA
Grid No.2 current	I_{g_2}	6.5	nA
Transconductance	S	10.5	mA/V
Amplification factor	$\mu_{g_2g_1}$	21	
Internal resistance	R_i	45	kΩ

[1]) The capacitance between triode grid and pentode anode ($C_{g_T\text{-}a_P}$) can be reduced to a value of less than 0.002 pF by using a shielding ring with a diameter of 22.5 mm and a height of 15 mm with respect to the tube base.

OPERATING CHARACTERISTICS

Triode section

A.F. amplifier

Supply voltage	V_b	200	230	200	230	V
Cathode resistor	R_k	0	0	2.6	2.1	kΩ
Anode resistor	R_a	220	220	220	220	kΩ
Grid resistor	R_g	10	10	-	-	MΩ
Grid resistor of following stage	R_g'	680	680	680	680	kΩ
Signal source resistance	R_s	47	47	-	-	kΩ
Anode current	I_a	0.42	0.52	0.42	0.52	mA
Output voltage	V_o	3.2	3.2	3.2	3.2	V_{RMS}
Voltage gain	V_o/V_i	66	68	66	68	
Distortion	d_{tot}	0.6	0.5	0.6	0.5	%

Microphony

The triode section can be used without special precautions against microphonic effect in circuits in which an output of 50 mW is obtained at an input voltage of not less than 10 mV_{RMS}.

Hum

The hum level will be better than 60 dB under the following conditions;
Input voltage minimum 10 mV_{RMS} for 50 mW output.
Grid circuit impedance max. 0.5 MΩ at 50 Hz.
Cathode decoupling capacitor minimum 100 μF.
Pin 4 connected to earth.
A.C. voltage between pin 4 and cathode max. 30 V_{RMS}.

OPERATING CHARACTERISTICS

Pentode section

Class A (Measured with V_k constant)

Anode voltage	V_a		200			230		V
Grid No. 2 voltage	V_{g_2}		200			230		V
Cathode resistor	R_k		115			125		Ω
(Grid No. 1 voltage)	V_{g_1}		-4.7			-5.7		V)
Load resistance	$R_{a\sim}$		5.6			5.1		kΩ
Grid No. 1 driving voltage	V_i	0	0.32	3.2	0	0.34	3.6	V_{RMS}
Anode current	I_a	35	-	34	39	-	40.7	mA
Grid No. 2 current	I_{g_2}	6.0	-	9.0	6.5	-	10.5	mA
Output power	W_o	0	0.05	3.1	0	0.05	4.1	W
Distortion	d_{tot}	-	0.9	10	-	0.9	10	%

LIMITING VALUES (Design centre rating system)

Triode section

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	300	V
Anode dissipation	W_a	max.	0.5	W
Cathode current	I_k	max.	4	mA
Grid resistor	R_g	max.	1	MΩ [1])
Cathode to heater voltage	V_{kf}	max.	100	V

Pentode section

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	300	V
Grid No. 2 voltage	$V_{g_{2o}}$	max.	550	V
	V_{g_2}	max.	300	V
Anode dissipation	W_a	max.	9	W
Grid No. 2 dissipation, average	W_{g_2}	max.	1.8	W
peak	$W_{g_{2p}}$	max.	3.25	W
Cathode current	I_k	max.	55	mA
Grid No. 1 resistor, for automatic bias	R_{g_1}	max.	1	MΩ
Cathode to heater voltage	V_{kf}	max.	100	V

[1]) This value applies to operation with fixed bias. It may be multiplied by the D.C. inverse feedback factor resulting from e.g. cathode or anode resistors to a maximum of 10 MΩ.

SHUNT STABILIZER TRIODE

Shunt stabilizer triode intended for use as in colour TV receivers.

QUICK REFERENCE DATA				
Anode voltage	V_a		25	kV
Anode current	I_a	max.	1.6	mA

HEATING: Indirect by A.C. or D.C.; series supply

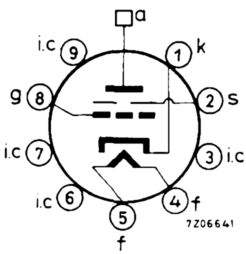
Heater current	I_f	300	mA
Heater voltage	V_f	7.3	V

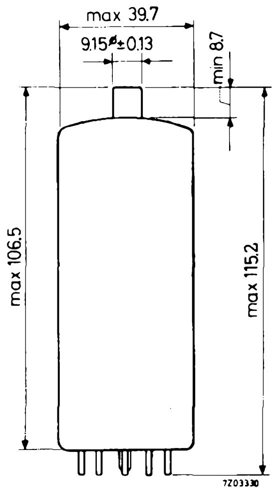
DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: Magnoval

Top cap: Type 2





Mounting: Additional supporting of the tube at the top is required.
To prevent corona-effects any metal screening applied around the tube should be at least 5 cm from the nearest point of the bulb.
Adequate ventilation should be provided for.

TYPICAL CHARACTERISTICS

Anode voltage	V_a		25	kV
Screen voltage	V_s		0	V
Grid voltage change for an anode current change from 0.1 to 1.5 mA	ΔV_g	max.	10	V
Grid voltage at I_a = 1.5 mA	V_g		-7 to -30	V
at I_a = 0.1 mA	V_g	max.	-40	V

LIMITING VALUES (Design centre rating system unless otherwise specified)

Anode voltage	V_a	max.	25	kV
Anode voltage (absolute max.)	V_a	max.	27.5	kV [1]
Anode current	I_a	max.	1.6	mA
Anode dissipation	W_a	max.	30	W
Anode dissipation (absolute max.)	W_a	max.	40	W [2]
Negative grid voltage	$-V_g$	max.	150	V [3]
Grid resistor	R_g	max.	5	MΩ
Cathode to heater voltage				
cathode positive	V_{kf}	max.	400 V_{DC} +250 V_{AC}	
cathode negative	$-V_{kf}$	max.	250	V
Screen voltage	V_s	max.	0	V
	$-V_s$	max.	400	V [4]
Anode seal temperature (absolute max.)	t_s	max.	200	°C

Precaution: x-ray shielding may be required to give protection against excessive radiation.

---

1) If due to a circuit failure the anode current becomes 0 mA the anode voltage should never exceed 45 kV (abs. max.)

2) Permissible only during short periods; in total up to a maximum of 10% of the operation time of the tube.

3) During equipment warm-up and for brief interval during receiver adjustment this voltage may rise to 440 V max.

4) The screen connected to pin 2 is provided to shield grid and cathode from the high anode voltage.
It is recommended to connect the screen directly to earth, with a minimum lead inductance.
The modulating influence of possible hum ripple of the screen to cathode voltage should be taken into account; the sensitivity for these variations in Vs/k is 2.5 μA/V max.

	$-V_s$	max.	50	V [4]
Anode seal temperature (absolute max.)	t_s	max.	200	°C

X-RAYS

When operating this tube will produce X-radiation, and a suitable screen may be required.
Because of the difference in X-ray characteristics the PD510 should never be replaced by a PD500 in equipment designed for the PD510.

---

1) If due to a circuit failure the anode current becomes 0 mA the anode voltage should never exceed 45 kV (abs. max.)

2) Permissible only during short periods; in total up to a maximum of 10% of the operation time of the tube.

3) During equipment warm-up and for brief interval during receiver adjustment this voltage may rise to 440 V max.

4) The screen connected to pin 9 is provided to shield grid and cathode from the high anode voltage.
It is recommended to connect the screen directly to earth, with a minimum lead inductance.

LINE OUTPUT PENTODE

Pentode intended for use as line output tube in television receivers.

QUICK REFERENCE DATA				
Anode peak voltage	V_{a_p}	max.	7	kV
Cathode current	I_k	max.	200	mA
Drive at V_{a_p} = 7 kV		min.	120	V

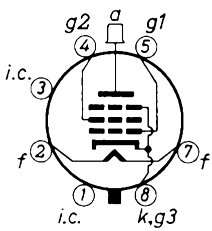
HEATING: Indirect by A.C. or D.C.; series supply

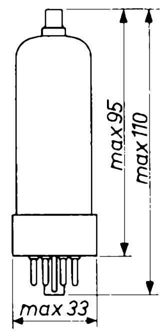
Heater current	I_f	300	mA
Heater voltage	V_f	25	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Octal

Top cap: Type 1





CAPACITANCES

Anode to all except grid No. 1	$C_{a(g_1)}$	8	pF
Grid No. 1 to all except anode	$C_{g_1(a)}$	17.5	pF
Anode to grid No. 1	C_{ag_1}	max. 1.1	pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	100	V
Grid No.2 voltage	V_{g_2}	100	V
Grid No.1 voltage	V_{g_1}	-8.2	V
Anode current	I_a	100	mA
Grid No.2 current	I_{g_2}	7	mA
Transconductance	S	14	mA/V
Amplification factor	$\mu_{g_2g_1}$	5.6	
Internal resistance	R_i	5	kΩ

REMARKS

On pages D to M curves are given for nominal new tubes. On designing a line output circuit it has to be taken into account that due to tube spread and deterioration during life the current may be reduced by 25%.

When the tube is operated below the knee of its I_a-V_a characteristic the screen grid series resistor must have a minimum value of 2.2 kΩ to avoid the occurrence of Barkhausen oscillations.

The min. drive at V_{a_p} = 5 kV is 100 V
and at V_{a_p} = 7 kV 120 V

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{ao}	max.	550	V

TYPICAL CHARACTERISTICS (continued)

B) (Measured under pulse conditions)

Anode voltage	V_a	40	V
Grid No. 3 voltage	V_{g3}	0	V
Grid No. 2 supply voltage	V_{bg2}	190	V
Grid No. 2 series resistor	R_{g2}	4.7	kΩ
Grid No. 1 voltage	V_{g1}	0	V
Anode current	I_a	180	mA
Grid No. 2 current	I_{g2}	18	mA

OPERATING CONDITIONS

Stabilized circuits (D.C. feedback)

Cut-off voltage

The minimum required cut-off voltage ($-V_{g1}$) during flyback is 120 V at V_a = 6000 V, V_{g2} = 190 V and Z_{g1} = 1 kΩ at line frequency.

Supply voltage: See page 5

Minimum required values of the screengrid voltage and of the anode voltage, when the tube is used in a line output stage.
The graphs refer to nominal mains voltage provided the specified values of I_a at $V_{a\,min}$, will be available throughout life of the tube at supply voltage values 10% below nominal.
In order to prevent Barkhausen interferences and less of stabilisation, care should be taken that the anode voltage never drops below the specified $V_{a\,min}$ during the scanning period.

LIMITING VALUES (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	250	V

FRAME AND A.F. OUTPUT PENTODE

Pentode intended for use as frame output tube in television receivers and as A.F. power amplifier.

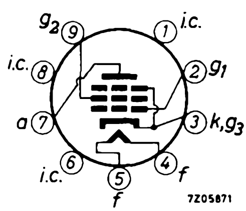
QUICK REFERENCE DATA				
Anode peak voltage	V_{a_p}	max.	2	kV
Cathode current	I_k	max.	100	mA
Output power	W_o		5.3	W

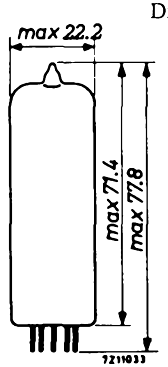
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	15	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





CAPACITANCES

Anode to all except grid No.1	$C_{a(g_1)}$		6.8	pF
Grid No.1 to all except anode	$C_{g_1(a)}$		13	pF
Anode to grid No.1	C_{ag_1}	max.	0.6	pF
Grid No.1 to heater	C_{g_1f}	max.	0.25	pF

OPTIMUM PEAK ANODE CURRENT IN FRAME OUTPUT APPLICATION

The circuit should be designed so that the peak anode current does not exceed:

145 mA at V_a = 60 V, V_{g_2} = 170 V, I_f = 300 mA
190 mA at V_a = 70 V, V_{g_2} = 200 V, I_f = 300 mA
220 mA at V_a = 80 V, V_{g_2} = 220 V, I_f = 300 mA

The minimum available value of the peak anode current at end of life and I_f = 285 mA is:

125 mA at V_a = 60 V, V_{g_2} = 170 V
160 mA at V_a = 70 V, V_{g_2} = 200 V
185 mA at V_a = 80 V, V_{g_2} = 220 V

OPERATING CHARACTERISTICS

A.F. power amplifier, class A (measured with V_k constant)

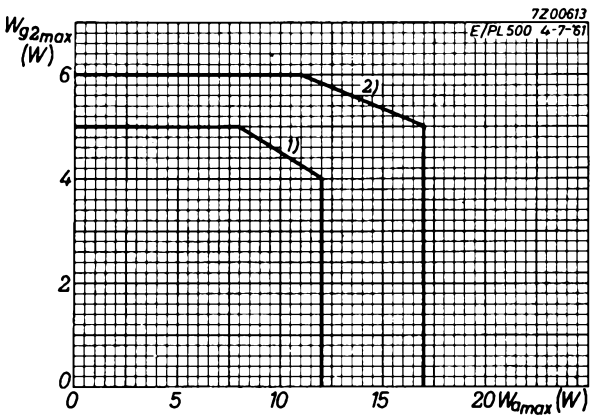
LINE OUTPUT PENTODE

Beam pentode intended for use as line output tube in television receivers.

QUICK REFERENCE DATA				
Anode peak voltage	V_{a_p}	max.	7	kV
Cathode current	I_k	max.	250	mA
Anode dissipation	W_a	max.	12	W



1) Design centre limits for W_a and W_{g2}.

2) These limits for W_a and W_{g2} should not be exceeded with a nominal tube operating in a normal line deflection circuit under the worst probable conditions.

For further data and curves of this type
please refer to PL504

LINE OUTPUT PENTODE

Beam pentode intended for use as line output tube in television receivers.

QUICK REFERENCE DATA				
Anode peak voltage	V_{ap}	max.	7	kV
Cathode current	I_k	max.	250	mA
Anode dissipation	W_a	max.	16	W

HEATING: Indirect by A.C. or D.C.; series supply

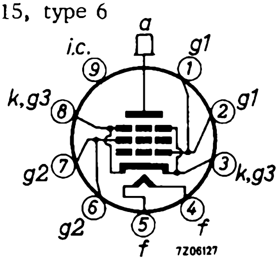
Heater current	I_f	300	mA
Heater voltage	V_f	27	V

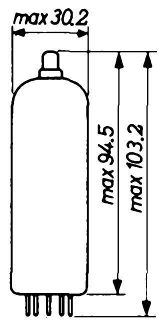
DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Magnoval; IEC 67-I-36a

Cap : Type 1

Outline: IEC67-II-15, type 6





CAPACITANCES

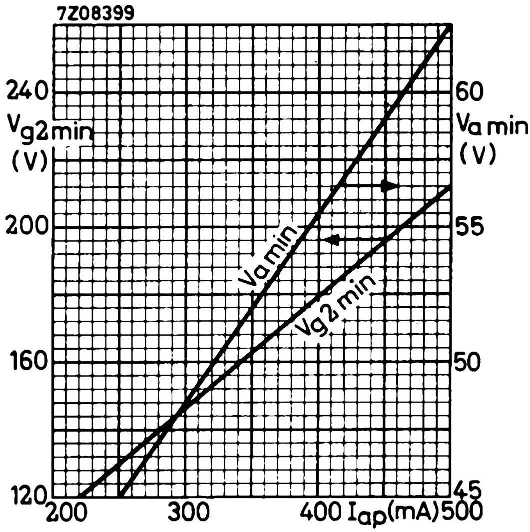
Anode to grid No. 1	C_{ag_1}		1.75	pF
Grid No. 1 to heater	C_{g_1f}	max.	0.2	pF

TYPICAL DYNAMIC CHARACTERISTICS (measured under pulse conditions)

Anode voltage	V_a	50	7000	V
Grid No.2 voltage	V_{g2}	200	200	V
Grid No.1 voltage	V_{g1}	-10	-120	V
Anode current	I_a	420	0.05	mA
Grid No.2 current	I_{g2}	37		mA

OPERATING CHARACTERISTICS

Stabilized circuits (D.C. feedback)



Minimum required values of the screen grid voltage and of the anode voltage when the tube is used in line output stages. The graphs refer to nominal mains voltage provided the specified values of V_a are increased by 10% of the anode supply voltage. The specified values of I_{ap} will be available throughout life of the tube at supply voltage values 10% below nominal.
In order to prevent Barkhausen interferences, care should be taken that the anode voltage never drops below the specified V_a min. during the scanning period.

Non stabilized circuits

Supply voltage	V_b	190	230	V
Grid No.2 series resistor	R_{g_2}	2.2	2.2	kΩ
Grid No.1 voltage	V_{g_1}	+1	+1	V
Anode peak current	I_{a_p}	230	320	mA[1])

[1]) See page 3

HUM

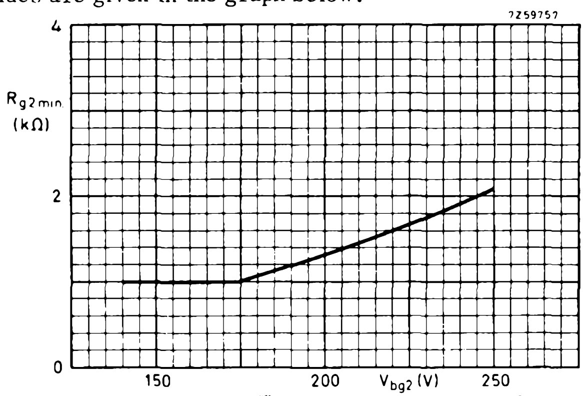
At Z_{g1} = 200 kΩ (f = 50 Hz), V_{kf} = 220 V_{RMS} and without wiring and socket capacitances, the equivalent grid hum voltage is < 5 mV.

LIMITING VALUES (Design centre rating system unless otherwise stated)

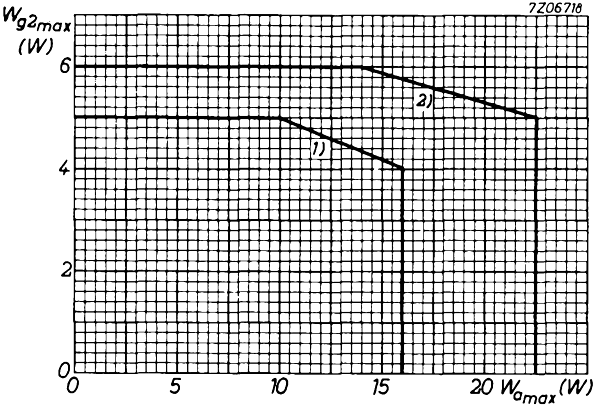
Anode voltage	V_{a_o}	max.	550	V	
Anode voltage	V_a	max.	250	V	
Anode voltage, peak	V_{a_p}	max.	7000	V	3)4)
Grid No.2 voltage	V_{g2o}	max.	550	V	
Grid No.2 voltage	V_{g2}	max.	250	V	
Anode dissipation	W_a	see page 4			
Grid No.2 dissipation	W_{g2}	see page 4			2)
Cathode current	I_k	max.	250	mA	
Grid No.1 resistor	R_{g1}	max.	0.5	MΩ	5)
Cathode to heater voltage	V_{kf}	max.	250	V	
Bulb temperature	t_{bulb}	max.	280	°C	6)

NOTES

1. To allow for tube spread, deterioration during life and a mains voltage 10 % below nominal, the specified values for I_{ap} should not be exceeded at nominal mains voltage and at the specified conditions.
2. To prevent an excessive value of W_{g2} during the heating-up period, the minimum R_{g2} values are given in the graph below.



3. Maximum pulse duration is 22 % of a cycle and max. 18 µs.
4. V_{ap} design max. 8 kV
5. R_{g1} = max. 2.2 MΩ for line output application.
6. Absolute max. value.



1) Disign centre limits for W_a and W_{g_2}.

2) These limits for W_a and W_{g2} should not be exceeded with a nominal tube operating in a normal line deflection circuit under the worst probable conditions.

LINE OUTPUT PENTODE

Output pentode intended for colour TV line deflection circuits.

QUICK REFERENCE DATA				
Anode peak voltage	V_{a_p}		7000	V
Cathode current	I_k	max.	500	mA
Anode dissipation	W_a	max.	25	W

LIMITING VALUES (Design centre rating system)

Anode dissipation	W_a	max.	25	W
Anode + grid No. 2 dissipation (triode connected)	$W_a + W_{g_2}$	max.	26	W

(Design max. rating system) [1])

Anode dissipation	W_a	max.	34	W
Anode + grid No. 2 dissipation (triode connected)	$W_a + W_{g_2}$	max.	35	W

For further data and curves of this type
please refer to type PL 509

[1]) The design maximum limits should not be exceeded with a nominal tube under the worst probable operating conditions at a normal picture width.

FRAME OUTPUT PENTODE

Pentode intended for use as frame output amplifier in colour television receivers.

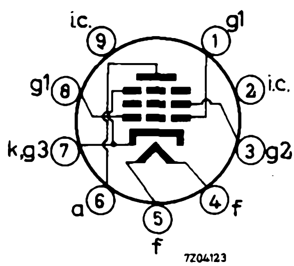
QUICK REFERENCE DATA				
Cathode current, average	I_k	max.	100	mA
Anode dissipation	W_a	max.	12	W

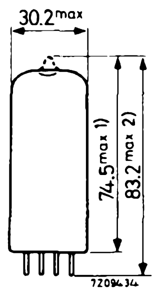
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	17	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Magnoval





CAPACITANCES

Anode to grid No. 1	C_{ag1}	max.	1.6	pF
Grid No. 1 to heater	C_{g1f}	max.	0.2	pF

1) Max. 71.4
2) Max. 80.1 } for execution with pumping stem on base side.

TYPICAL CHARACTERISTICS

(Measured under pulse conditions)

Anode voltage	V_a		50	V_a	190	V
Grid No.2 voltage	V_{g_2}		190	V_{g2}	190	V
Grid No.1 voltage	V_{g1}		-1	V_{g_1}	-17	V
Anode current	I_{a_p}		320	I_a	60	mA
Grid No.2 current	I_{g_2}	approx.	60	I_{g_2}	5	mA
Transconductance				S	9	mA/V
Amplification factor				μ_{g2g1}	8	-

Remarks.

The minimum I_a to be expected as a result of spread of the tube characteristics tube deterioration during life and decrease of the mains voltage to 10 % below the nominal value can be derived from the curves on page B by decreasing by 40 % the I_a values situated on the curve A-B at V_{g2} occuring at the decreased mains voltage.

In order not to exceed the maximum permissible value of W_{g2}, the circuit should be designed in such a way that the anode voltage should never be lower than the value determined by curve A-B at the relevant V_{g2} value.

OPERATING CHARACTERISTICS (end of scan values)

Anode voltage	V_a	70	V
Grid No.2 voltage	V_{g_2}	200	V
Grid No.1 voltage	V_{g_1}	-5	V
Anode peak current	I_{a_p}	230	mA

LIMITING VALUES (design centre rating system) unless otherwise stated

LINE OUTPUT PENTODE

Output pentode intended for colour TV line deflection circuits.

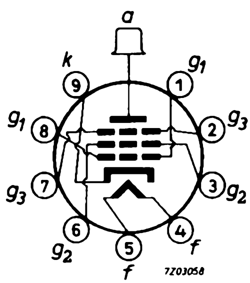
QUICK REFERENCE DATA				
Anode peak voltage	V_{a_p}		7000	V
Cathode current	I_k	max.	500	mA
Anode dissipation	W_a	max.	30	W

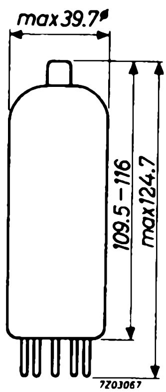
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	300	mA
Heater voltage	V_f	40	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Magnoval
Top cap: Type 1
Mounting: Additional supporting of the tube at the top is required.





CAPACITANCES

Grid No.1 to filament	C_{g_1f}	max.	0.2	pF
Anode to grid No.1	C_{ag_1}	max.	3.0	pF
	C_{ag_1}		2.5	pF

TYPICAL CHARACTERISTICS (measured under pulse conditions)

Anode voltage	V_a	160	50	V
Grid No.3 voltage	V_{g_3}	0	0	V
Grid No.2 voltage	V_{g_2}	160	175	V
Grid No.1 voltage	V_{g_1}	0	-10	V
Anode current	I_a	1400	800	mA
Grid No.2 current	I_{g_2}	45	70	mA

OPERATING CONDITIONS (D.C. feedback)

Cut-off voltage

The minimum required cut-off voltage ($-V_{g_1}$) during flyback at V_a = 7000 V and **at line frequency is at :**

$$V_{g_2} = 150 \text{ V} : V_{g_1} = -175 \text{ V}$$
$$V_{g_2} = 200 \text{ V} : V_{g_1} = -195 \text{ V}$$
$$V_{g_2} = 250 \text{ V} : V_{g_1} = -215 \text{ V}$$

Supply voltages: See pages 4-5-6

Minimum required anode voltage: $V_{a\ min}$

In order to prevent Barkhausen interference and loss of stabilization, care should be taken that the anode voltage never drops below the specified $V_{a\ min}$ during the scanning period.
If low values of $V_{a\ min}$ are required, the $V_{a\ min}$ 1-line can be shifted over 10 V to $V_{a\ min}$ 2, provided a D.C. voltage of at least +20 V is applied to the beamplate (g3).
To compensate for the influence of mains voltage variations, the specified values of $V_{a\ min}$ have to be increased with 10% of the anode supply voltage.

Minimum required values of the screen grid voltage: $V_{g2\ min}$

The graph refers to nominal mains voltage. The specified values of I_{a_p} will be available throughout life of the tube at supply voltages 10% below nominal.

Maximum permissible screen grid series resistance: R_{g2} max. See pages 4-5-6

Decoupling-capacitors in the grid no 2 and/or grid no 3 circuit

In circuits where decoupling capacitors in the grid no 2 or the grid no 3 circuits are applied, incidental flashover in the tube may give rise to excessive dischargecurrents- and component or tube failure.
Therefore it is recommended to limit the dischargecurrents to these capacitors by means of an 100 Ohm resistance between g2 and the g2-bypass capacitance.
The 1000 Ohms resistance should be protected by a spark-gap connected between g^3 **and earth.**

Hum

At Z_{g_1} = 200 k (f = 50 Hz), $V_{k/f}$ = 220 V_{RMS} and without wiring and socket capacitance, the equivalent grid hum voltage is less than 5 mV.

LIMITING VALUES

	Design centre rating system				
Anode voltage in cold condition	V_{ao}	max.	700	V	
Anode peak voltage	V_{ap}	max.	7000	V	1)

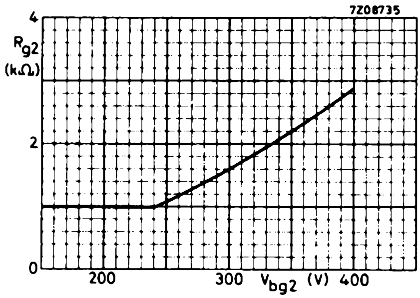
Grid No.2 voltage in cold condition	$V_{g_{2o}}$	max.	700	V	
Grid No.2 voltage	V_{g_2}	max.	275	V	
Grid No.2 dissipation	W_{g_2}	max.	7	W	2)
Cathode current	I_k	max.	500	mA	
Cathode peak current	I_{k_p}	max.	1200	mA	
Cathode-to-heater voltage	V_{kf}	max.	250	V	
Grid No.1 resistor: fixed bias	R_{g_1}	max.	0.5	MΩ	3)
stabilized circuits	R_{g_1}	max.	2.2	MΩ	3)
Grid No.3 circuit resistance	R_{g_3}	max.	10	kΩ	4)
Bulb temperature	t_{bulb}	max.	300	°C	5)

	Design max. rating system 6)				
Anode dissipation	W_a	max.	40	W	
Anode + grid No.2 dissipation (triode connected)	$W_a + W_{g_2}$	max.	42	W	
Grid No.2 dissipation	W_{g_2}	max.	9	W	
Anode peak voltage	V_{ap}	max.	8000	V	1)
Neg. grid No.1 peak voltage	$-V_{g_1p}$	max.	550	V	1)

1. Max. pulse duration is 22% of a cycle and max. 18 μs.
2. To prevent an excessive value of W_{g_2} the minimum R_{g_2} values are given in the graph below.



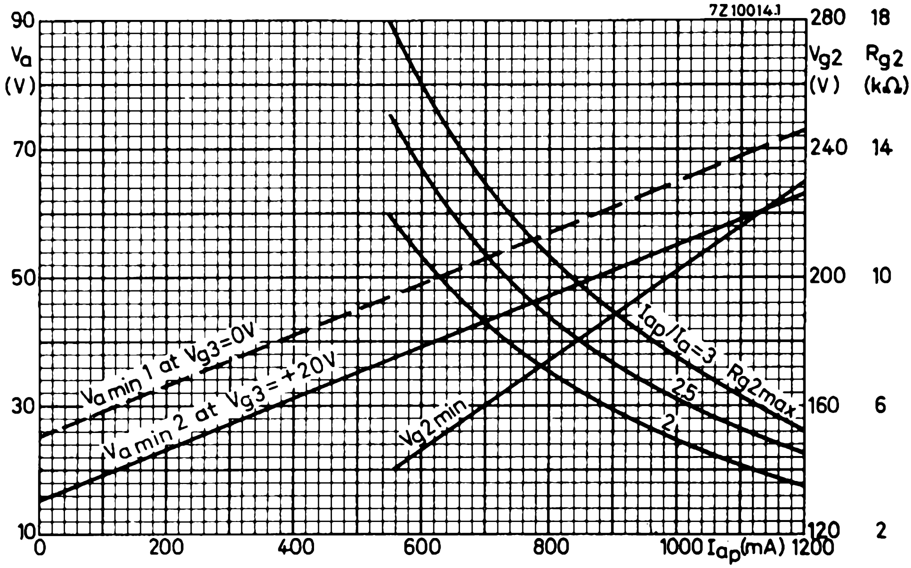
3. The circuit design has to be such that negative control grid currents up to 5 micro-amperes do not have any detrimental effect upon tube adjustment or circuit performance.
   Care should be taken that with 5 micro-amperes grid current the limiting values for I_k, W_a and W_{g_2} are not exceeded.
4. With $R_{g_3} \leq 10$ kΩ capacitive decoupling of g_3 is not required.
5. Absolute max. value.
6. The design maximum limits should not be exceeded with a nominal tube under the worst probable operating conditions at a normal picture width.

Min. required anode voltage.

$R_{g_2\,max}$: max. permissible screen grid series resistance for 400 V screen grid supply.

The specified values of I_{ap} are available at supply voltages 10% below nominal and throughout the tube life.

Remark: $R_{g_2\,min}$ for 400 V screen grid supply is 2.9 kΩ. (See page 3)

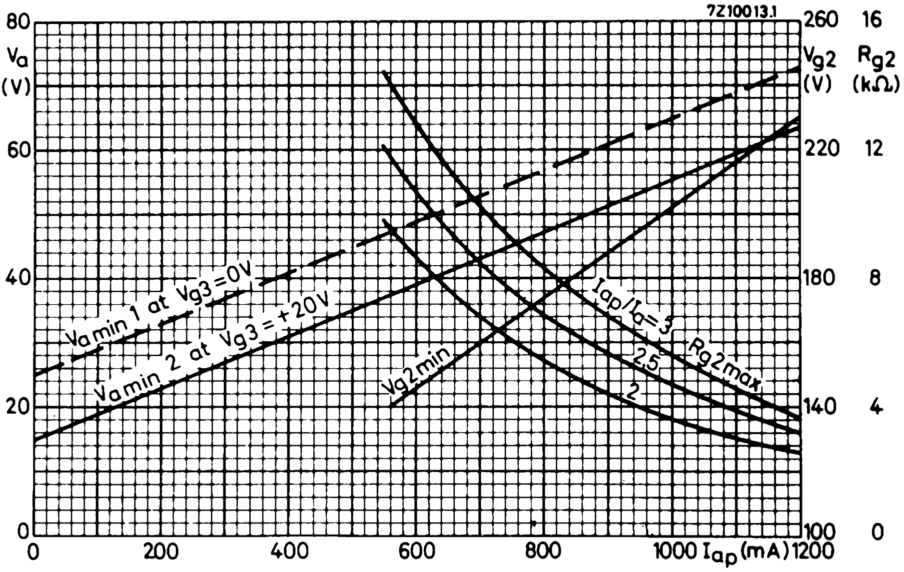


Min. required anode voltage.

R_{g2} max : max. permissible screen grid series resistance for 350 V screen grid supply.

The specified values of I_{ap} are available at supply voltages 10% below nominal and throughout the tube life.

Remark: R_{g2} min for 350 V screen grid supply is 2.2 kΩ. (See page 3)



Min. required anode voltage.

R_{g2} max.: max. permissible screen grid series resistance for 280 V screen grid supply.

The specified values of I_{ap} are available at supply voltages 10% below nominal and throughout the tube life.

Remark: R_{g_2} min for 280 V screen grid supply is 1.4 kΩ. (See page 3)

LINE OUTPUT PENTODE

Output pentode intended for colour TV line deflection circuits.

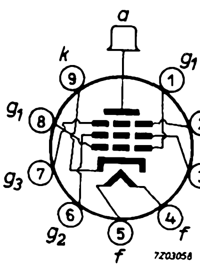
HEATING: Indirect by A.C. or D.C.; series supply

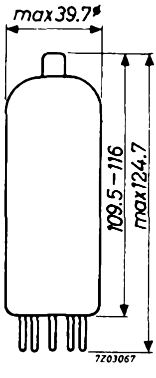
Heater current	I_f	300	mA
Heater voltage	V_f	40	V

DIMENSIONS AND CONNECTIONS

Base: Magnoval
Top cap: Type 1
Mounting: Additional supporting of the tube at the top is required.

Dimensions in mm





CAPACITANCES

Grid No. 1 to filament	C_{g_1f}	max.	0.2	pF
Anode to grid No. 1	C_{ag_1}	max.	3.0	pF
	C_{ag_1}		2.5	pF

TYPICAL CHARACTERISTICS (measured under pulse conditions)

Anode voltage	V_a	160	50	70	V
Grid No. 3 voltage	V_{g3}	0	0	0	V
Grid No. 2 voltage	V_{g2}	160	175	205	V
Grid No. 1 voltage	V_{g1}	0	-10	-11	V
Anode current	I_a	1400	800	1100	mA
Grid No. 2 current	I_{g2}	45	70	85	mA

OPERATING CONDITIONS (D.C. feedback)

Cut-off voltage

The minimum required cut-off voltage ($-V_{g1}$) during flyback at V_a = 7000 V and at line frequency is at :

$$V_{g2} = 150\ \text{V} : V_{g1} = -175\ \text{V}$$
$$V_{g2} = 200\ \text{V} : V_{g1} = -195\ \text{V}$$
$$V_{g2} = 250\ \text{V} : V_{g1} = -215\ \text{V}$$

Minimum required anode voltage during the scanning period : V_a min. See page 6

Minimum required screen grid voltage: V_{g2} min. See page 4, 5

Recommended screen grid series resistor: R_{g2} rec See page 4, 5

Decoupling capacitors in the grid no.2 and/or grid no.3 circuit

In circuits where decoupling capacitors in the grid no.2 or the grid no.3 circuits are applied, incidental flashover in the tube may give rise to excessive discharge currents and component or tube failure.
Therefore it is recommended to limit the discharge currents from these capacitors by means of a 100 Ω resistor between g_2 and the g_2-bypass capacitor and a 1000 Ω resistor between g_3 and the g_3-bypass capacitor. The 1000 Ω resistor should be protected by a spark-gap connected between g_3 and earth.

Hum

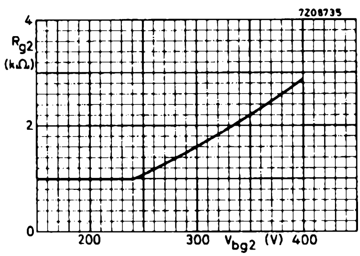
At Z_{g1} = 200 kΩ (f = 50 Hz), $V_{kf_{RMS}}$ = 220 V and without wiring and socket capacitance, the equivalent grid hum voltage is less than 5 mV.

LIMITING VALUES

		Design centre rating system			
Anode voltage in cold condition	V_{ao}	max.	700	V	
Anode peak voltage	V_{ap}	max.	7000	V	
Anode dissipation	W_a	max.	35	W	
Grid No. 3 voltage	V_{g3}	max.	30	V	
Grid No. 2 voltage in cold condition	V_{g2o}	max.	700	V	
Grid No. 2 voltage	V_{g2}	max.	275	V	
Grid No. 2 dissipation	W_{g2}	max.	7	W	2)
Cathode current	I_k	max.	500	mA	
Cathode peak current	I_{kp}	max.	1500	mA	
Cathode-to-heater voltage	V_{kf}	max.	250	V	
Grid No. 1 resistor: fixed bias	R_{g1}	max.	0.5	MΩ	3)
stabilized circuits	R_{g1}	max.	2.2	MΩ	3)
Grid No. 3 circuit resistance	R_{g3}	max.	10	kΩ	4)
Bulb temperature	t_{bulb}	max.	300	°C	5)

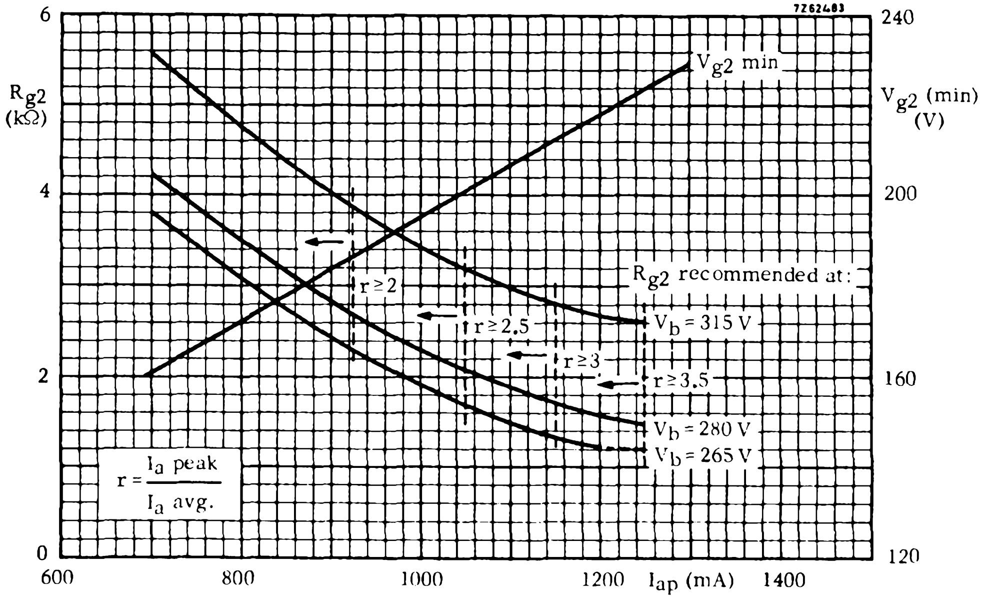
		Design max. rating system 6)			
Anode dissipation	W_a	max.	45	W	
Grid No. 2 dissipation	W_{g2}	max.	9	W	
Anode peak voltage	V_{ap}	max.	8000	V	1)
Neg. grid No. 1 peak voltage	$-V_{g1p}$	max.	550	V	1)

1. Max. pulse duration is 22% of a cycle and max. 18 μs.
2. To prevent an excessive value of W_{g2} the minimum R_{g2} values are given in the graph below.

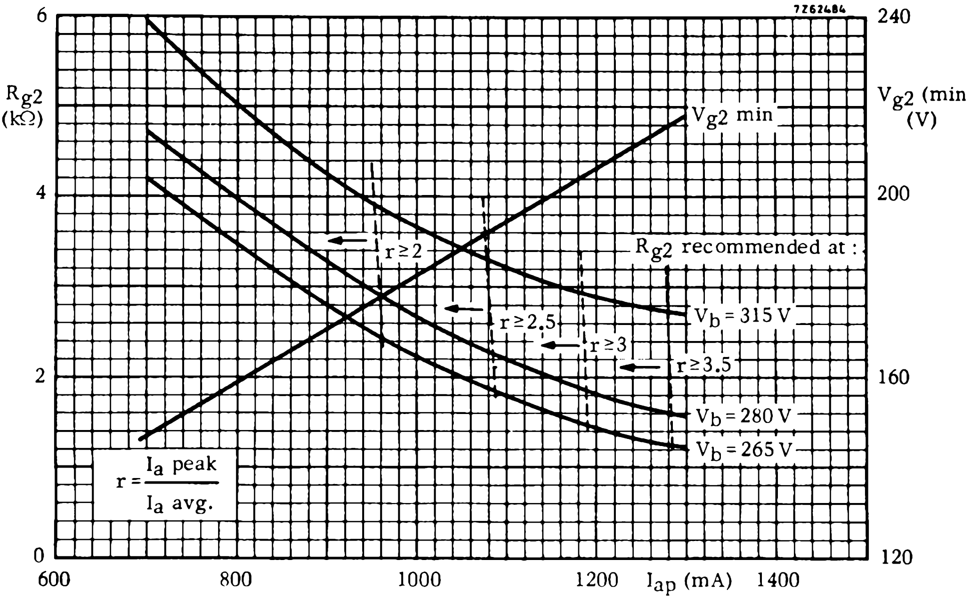


3. The circuit design has to be such that negative control grid currents up to 5 micro-amperes do not have any detrimental effect upon tube adjustment or circuit performance.
   Care should be taken that with 5 micro-amperes grid current the limiting values for I_k, W_a and W_{g2} are not exceeded.
4. With $R_{g3} \leq 10$ KΩ capacitive decoupling of g_3 is not required.
5. Absolute max. value.
6. The design maximum limits should not be exceeded with a nominal tube under the worst probable operating conditions at a normal picture width.

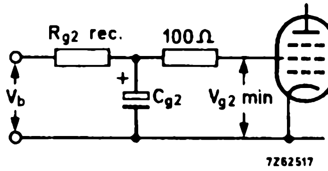
Min. required V_{g_2} and recommended R_{g_2}
Non-stabilized supply voltages.



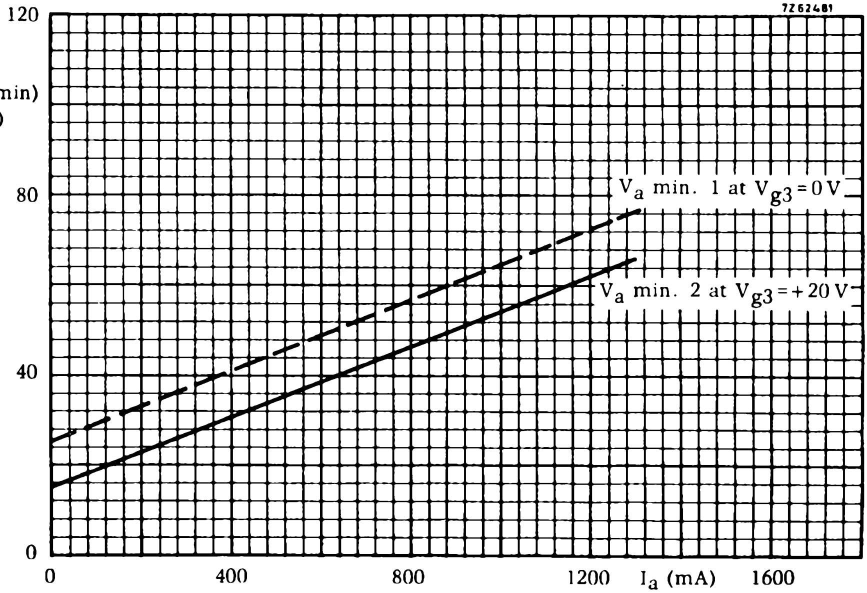
Min. required V_{g_2} and recommended R_{g_2}
Stabilized supply voltage.



The above graphs concern the design of a line-output circuit adjusted at a beam current of 1000 μA and a nominal mains voltage.
If the recommended R_{g_2} is used, V_{g_2} will be equal to higher or than the specified V_{g_2} min. and there will be adequate reserve in anode peak current throughout the life of the tube. (Tolerances of deflection-components and 10 % mains voltage fluctuations taken into account).



Min. required anode voltage, during the scanning period.



To suppress Barkhausen interference and to ensure stability, the anode load line should not be allowed to drop below the V_a line shown in the diagram. If V_a min. must be low, the V_a min. 1-line can be shifted over 10 V to $V_a$min. 2, provided a D.C. voltage of at least +20 V is applied to the beam plate (g_3). To compensate for the influence of mains voltage fluctuations, the specified values of V_a min. must be increased with 10 % of the anode supply voltage when not stabilized.

Series resistance heater chain	R_S	min.	80	Ω [3]
Heater to earth voltage	$V_{f/earth}$	max.	220	V_{RMS}

REMARK

In general it will be necessary to take measures in order to prevent the maximum permissible screen grid dissipation of the tube that derive their anode voltage from this booster diode, from being exceeded during the heating-up time of the booster diode.

[1]) Max. pulse duration 22% of a cycle with a maximum of 18 μsec.

[2]) Cathode positive with respect to the anode.

[3]) R_S = minimum resistance of the heater chain between any heater pin and any mains terminal under working conditions (the heater of another tube can be used for this resistance).

Triode section as R.C. coupled A.F. amplifier

Grid resistor R_g = 10 MΩ

Supply voltage	V_b	200	200	200	170	170	170	V
Anode resistor	R_a	220	100	47	220	100	47	kΩ
Grid resistor next stage	R_g'	0.68	0.33	0.15	0.68	0.33	0.15	MΩ
Anode current	I_a	0.56	1.00	1.60	0.46	0.82	1.25	mA
Voltage gain	V_o/V_i	53	44	34	51	42	32	-
Distortion:								
at output voltage V_o = 3 V_{RMS}	d_{tot}	0.3	0.4	0.5	0.4	0.5	0.6	%
at output voltage V_o = 5 V_{RMS}	d_{tot}	0.4	0.6	0.9	0.5	0.8	1.1	%
at output voltage V_o = 8 V_{RMS}	d_{tot}	0.9	1.0	1.5	1.1	1.3	2.0	%

Supply voltage	V_b	100	100	100	V
Anode resistor	R_a	220	100	47	kΩ
Grid resistor next stage	R_g'	0.68	0.33	0.15	MΩ
Anode current	I_a	0.21	0.35	0.52	mA
Voltage gain	V_o/V_i	44	35	26	-
Distortion:					
at output voltage V_o = 3 V_{RMS}	d_{tot}	1.0	1.3	2.0	%
at output voltage V_o = 5 V_{RMS}	d_{tot}	1.7	2.3	4.3	%

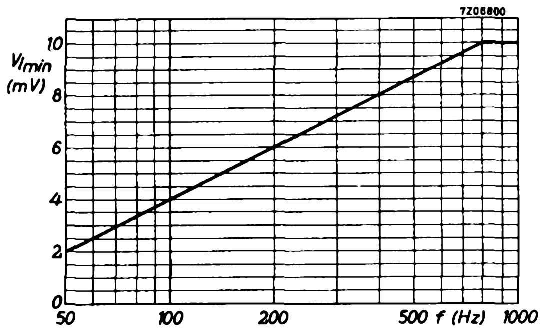
TYPICAL CHARACTERISTICS

Diode section

Internal resistance diode No. 1 at diode voltage V_{d_1} = +10 V	R_i D_1	5	kΩ
Internal resistance diode No. 2 at diode voltage V_{d_2} = +5 V	R_i D_2	200	Ω
Internal resistance diode No. 3 at diode voltage V_{d_3} = +5 V	R_i D_3	200	Ω
Ratio between R_i (D_2) and R_i (D_3)		min. 0.67 max. 1.5	

Microphony   Triode section

No special precautions against microphony are required in circuits where the input voltage is min. 10 mV for 50 mW output of the output tube at frequencies higher than 800 Hz.
At lower frequencies the sensitivity may be increased according to the figure below.



LIMITING VALUES (Design centre rating system)

Triode section

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	250	V
Anode dissipation	W_a	max.	1	W
Cathode current	I_k	max.	5	mA
Grid resistor	R_g	max.	3	MΩ
Grid resistor at grid current bias	R_g	max.	22	MΩ
Cathode to heater voltage	V_{kf}	max.	150	V [1]

Diode sections

Diode No.1 voltage, negative peak	$-V_{d_{1p}}$	max.	350	V
Diode No.2 voltage, negative peak	$-V_{d_{2p}}$	max.	350	V
Diode No.3 voltage, negative peak	$-V_{d_{3p}}$	max.	350	V
Diode No.1 current:				
D.C. component	I_{d_1}	max.	1	mA
peak	$I_{d_{1p}}$	max.	6	mA
Diode No.2 current:				
D.C. component	I_{d_2}	max.	10	mA
peak	$I_{d_{2p}}$	max.	75	mA
Diode No.3 current:				
D.C. component	I_{d_3}	max.	10	mA
peak	$I_{d_{3p}}$	max.	75	mA

[1]) With regard to hum a max. AC heater to cathode voltage of 30 V_{RMS} is recommended.

DOUBLE DIODE-TRIODE

Double diode-triode. Triode intended for use as A.F. amplifier.

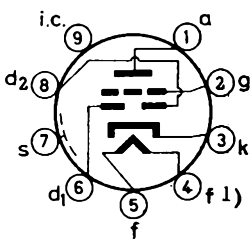
QUICK REFERENCE DATA			
Triode section			
Anode current	I_a	1.5	mA
Transconductance	S	1.65	mA/V
Amplification factor	μ	70	-

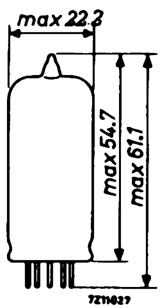
HEATING: Indirect by A.C. or D.C.; series supply

Heater current	I_f	100	mA
Heater voltage	V_f	14	V

DIMENSIONS AND CONNECTIONS Dimensions in mm

Base: Noval





1) Earthed side of the heater circuit.

CAPACITANCES

Triode section

Grid to all except anode	$C_{g(a)}$		2.3	pF

Diode sections (each diode)

Diode voltage, negative peak	$-V_{dp}$	max.	200	V
Diode current; average	I_d	max.	0.8	mA
peak	I_{dp}	max.	5	mA
Cathode to heater voltage	V_{kf}	max.	100	V

R.F. DOUBLE TRIODE

Double triode intended for use as R.F. amplifier and self oscillating mixer.

QUICK REFERENCE DATA			
Anode current	I_a	10	mA
Transconductance	S	6.7	mA/V
Amplification factor	μ	48	-

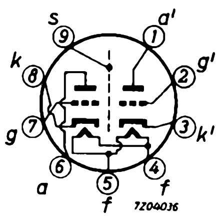
HEATING: Indirect by A.C. or D.C.; series supply

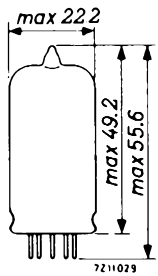
Heater current	I_f	100	mA
Heater voltage	V_f	26	V

DIMENSIONS AND CONNECTIONS

Dimensions in mm

Base: Noval





CAPACITANCES (each unit unless otherwise specified)

Anode to grid	C_{ag}		1.5	pF
Anode to cathode	C_{ak}		0.18	pF
Anode to cathode + heater + screen	$C_{a/kfs}$		1.2	pF
Grid to cathode + heater + screen	$C_{g/kfs}$		3.1	pF
Anode to cathode + heater + screen (measured with external screen of 22.5 mm diam.)	$C_{a/kfs}$		1.8	pF
Anode to anode other unit	$C_{aa'}$	max.	0.04	pF
Anode to anode other unit (measured with external screen of 22.5 mm diam.)	$C_{aa'}$	max.	0.008	pF
Grid to grid other unit	$C_{gg'}$	max.	0.003	pF
Anode to grid other unit	$C_{ag'}$	max.	0.008	pF
Anode to grid other unit	$C_{a'g}$	max.	0.008	pF
Anode to cathode other unit	$C_{ak'}$	max.	0.008	pF
Grid to cathode other unit	$C_{gk'}$	max.	0.003	pF
Anode to cathode other unit	$C_{a'k}$	max.	0.008	pF
Grid to cathode other unit	$C_{g'k}$	max.	0.003	pF

TYPICAL CHARACTERISTICS (each unit)

Anode voltage	V_a	100	170	200	V
Grid voltage	V_g	-1.2[1]	-1.75	-2.4	V
Anode current	I_a	4.5	10	10	mA
Transconductance	S	4.8	6.7	6	mA/V
Amplification factor	μ	46	48	46	-

[1]) In this case grid current may occur. If this is not permissible, a condition with a bias of −1.5 V should be chosen.

OPERATING CHARACTERISTICS

As R.F. amplifier (unit a, g, k)

Supply voltage	V_b	170	170	100	V
Anode resistor	R_a	1.3	1.5	1.5	kΩ
Anode voltage	V_a	161	155	91	V
Cathode resistor	R_k	330	150	138	Ω
Grid voltage	V_g	−2.2	−1.5	−0.8	V
Anode current	I_a	6.6	9.8	5.7	mA
Transconductance	S	5.1	6.7	5.9	mA/V
Internal resistance	R_i	8.5	7	8	kΩ
Grid input resistance (f = 100 MHz)	r_g	5.2	3.8	2.8	kΩ
Equivalent noise resistance	R_{eq}	0.82	0.55	0.61	kΩ

As self oscillating additive mixer (each unit)

Anode supply voltage	V_b	100	170	200	V
Anode resistor	R_a	4.7	4.7	8.2	kΩ
Grid resistor	R_g	1	1	1	MΩ
Oscillator voltage	$V_{osc.}$	1.8	2.8	2.8	V_{RMS}
Anode current	I_a	2.7	5.5	6	mA
Conversion conductance	S_c	2.2	2.8	2.9	mA/V
Internal resistance	R_i	19	15	14	kΩ
Grid input resistance (f = 100 MHz)	r_g		15		kΩ

LIMITING VALUES (each unit) (Design centre rating system)

Anode voltage	V_{a_o}	max.	550	V
	V_a	max.	250	V
Anode dissipation	W_a	max.	2.5	W
Anode dissipation, total	$W_a + W_a'$	max.	4.5	W
Cathode current	I_k	max.	15	mA
Cathode to heater voltage	V_{kf}	max.	90	V
Grid voltage (negative)	$-V_g$	max.	100	V
Grid resistor	R_g	max.	1	MΩ

For curves please refer to type PCC85

TRIODE-HEPTODE

Triode-heptode. Heptode section intended for use as mixer R.F.- or I.F. amplifier. Triode section intended for use as oscillator in A.M./F.M. receivers.

QUICK REFERENCE DATA

CAPACITANCES

Triode section

Anode to all except grid	$C_{a(g)}$		4.3	pF
Grid to all except anode	$C_{g(a)}$		2.7	pF
Anode to grid	C_{ag}		4.4	pF
Grid to heater	C_{gf}	max.	0.02	pF

Pentode section

Anode to all except grid No.1	$C_{a(g_1)}$		8.0	pF
Grid No.1 to all except anode	$C_{g_1(a)}$		9.3	pF
Anode to grid No.1	C_{ag_1}	max.	0.3	pF
Grid No.1 to heater	C_{g_1f}	max.	0.3	pF

Between triode and pentode sections

Anode triode to grid No.1 pentode	$C_{a_Tg_{1P}}$	max.	0.02	pF
Grid triode to anode pentode	$C_{g_Ta_P}$	max.	0.02	pF
Grid triode to grid No.1 pentode	$C_{g_Tg_{1P}}$	max.	0.025	pF
Anode triode to anode pentode	$C_{a_Ta_P}$	max.	0.25	pF

TYPICAL CHARACTERISTICS

Triode section

Anode voltage	V_a	100	V
Grid voltage	V_g	0	V
Anode current	I_a	3.5	mA
Transconductance	S	2.2	mA/V
Amplification factor	μ	70	-

Pentode section

Anode voltage	V_a	170	V
Grid No.2 voltage	V_{g_2}	170	V
Grid No.1 voltage	V_{g_1}	-11.5	V
Anode current	I_a	41	mA
Grid No.2 current	I_{g_2}	9	mA
Transconductance	S	7.5	mA/V
Amplification factor	$\mu_{g_2g_1}$	9.5	-
Internal resistance	R_i	16	kΩ

OPERATING CHARACTERISTICS

Triode section as A.F. amplifier

A)	Signal source resistance	R_S	0.22			MΩ
	Grid resistor	R_g	3			MΩ
	Grid resistor of next stage	R_g'	0.68			MΩ
	Supply voltage	V_b		170	100	V
	Cathode resistor	R_k		2.7	2.7	kΩ
	Anode resistor	R_a		220	220	kΩ
	Anode current	I_a		0.43	0.23	mA
	Voltage gain	V_o/V_i 1)		51	47	-
	Max. output voltage	$V_{o\,max}$		25	15	V_{RMS}
	Distortion	d_{tot} 2)		2.3	4.0	%

B) Signal source resistance	R_S	0.22				MΩ
Grid resistor	R_g	22				MΩ
Grid resistor of next stage	R_g	0.68				MΩ
Supply voltage	V_b	170	170	100	100	V
Cathode resistor	R_k	0	0	0	0	Ω
Anode resistor	R_a	100	220	100	220	kΩ
Anode current	I_a	0.86	0.50	0.37	0.22	mA
Voltage gain	V_o/V_i 1)	49	53	42	46	-
Max. output voltage	$V_{o\,max}$	19	20	8	9	V_{RMS}
Distortion	d_{tot}	1.4 3)	1.4 3)	1.3 2)	1.5 2)	%

Microphony and hum

The triode section can be used without special precautions against microphony and hum in circuits in which an input voltage of minimum 10 mV_{RMS} is required for an output of 50 mW of the output stage, Z_g (f = 50 Hz) = 0.25 MΩ and without A.C. voltage between pin 4 and cathode.

1) Measured at small input voltage.
2) At lower output voltages the distortion is proportionally lower.
3) At lower output voltages down to 5 V_{RMS} the distortion is approximately constant. At values below 5 V_{RMS} the distortion is approximately proportional to V_o.

OPERATING CHARACTERISTICS

Pentode section

Class A (Measured with V_k constant)

Supply voltage	$V_{ba} = V_{bg_2}$	100			170			V
Cathode resistor	R_k	170			200			Ω
Load resistance	$R_{a\sim}$	3.0			3.25			kΩ
Grid No.1 driving voltage	V_i	0	0.7	3.75	0	0.61	5.9	V_{RMS}
Anode current	I_a	26	-	27	42	-	44	mA
Grid No.2 current	I_{g_2}	5.8	-	8.6	9.2	-	15.5	mA
Output power	W_o	0	0.05	1.0	0	0.05	3.2	W
Distortion	d_{tot}	-	-	10	-	-	10	%

Supply voltage	$V_{ba} = V_{bg_2}$	200			V
Grid No.2 series resistor (non-decoupled)	R_{g_2}	470			Ω
Cathode resistor	R_k	330			Ω
Load resistance	$R_{a\sim}$	4.5			kΩ
Grid No.1 driving voltage	V_i	0	0.66	6.7	V_{RMS}
Anode current	I_a	35	-	37	mA
Grid No.2 current	I_{g_2}	7.8	-	13.3	mA
Output power	W_o	0	0.05	3.3	W
Distortion	d_{tot}	-	-	10	%

LIMITING VALUES (Design centre rating system)
