# FERRANTI

## HIGH SPEED TAPE READER

...handles punched tape data  
at electronic speeds

The Ferranti High Speed Tape Reader accelerates to full speed within 5 milliseconds and stops within 3 milliseconds. It has been in use at leading computer installations for over two years and has achieved a sound reputation for simplicity and reliability in regular operation.

**FAST** (1) Mark II model reads at speeds up to 200 characters per second, and stops the tape from full speed within a character position — within .03 inch. The tape is accelerated to full speed again in 5 milliseconds and the following character is ready for reading within 6 milliseconds of rest position.

(2) Mark IIA model reads at speeds up to 400 characters per second, and stops within .1 inch.

**VERSATILE** Both models read either 5 level, 6 level or 7 level tape by simple adjustment of an external lever.

**SIMPLE** The tape is easily inserted without complicated threading. Lap or butt splices are taken without any difficulty. The same tape may be passed thousands of times without appreciable tape wear. The optical system has no lenses or mirrors to get out of alignment. Friction drive is independent of sprocket hole spacing.

**LARGE OUTPUT** Amplifiers are included for each channel, including a special squaring circuit for the sprocket hole signal. Output swing between hole and blank is greater than 20 volts.

Dimensions: 9" x 11½" x 11¼"      Weight: 37 lbs.

For use with long lengths of tape up to 1000 feet, spooling equipment operating up to 40 inches per second for take-up or supply is available separately.

# PSP SOLENOIDS COVER THE FIELD!

**What do you want in  
SOLENOID PERFORMANCE?**

#### HIGH PRESSURE TYPES?

PSP high pressure DC solenoids, engineered in accordance with aircraft solenoid specification MIL-S-4040A, will withstand internal fluid burst pressures to 7,500 psi, operate at pressures to 1,500 psi in the plunger cavity, withstand ambient temperatures to 500°F! Other features: dynamically balanced plungers, precision adjustable plunger stroke, continuous duty operation on 30 Volts DC.

#### HIGH TEMPERATURE TYPES?

PSP "hot" solenoids incorporate special wiring, special insulation and high temperature switches to operate without fail in ambient temperatures to 600°F. and beyond. Engineered to provide positive, reliable actuating force in applications where heat is a problem. Made in single and double coil and push or pull types.

#### HIGH VOLTAGE TYPES?

PSP provides DC solenoids in the 60-300 Volt range for electronic control systems on computers, missiles and aircraft. Important advantages: the same power can be obtained with less current . . . savings in weight can be realized . . . units will operate directly in electronic equipment without special circuits.

#### MINIATURES?

These little PSP solenoids can do big jobs in computers, memory units, gyros and other avionic controls! They are made in a range of types for all applications requiring short strokes.

#### CO-AXIAL VALVES?

This miniature co-axial solenoid-operated valve uses the plunger of the solenoid as a means of admitting and shutting off flow of air. Model shown has  $\frac{1}{8}$ " flow orifice, operates on continuous duty and under opening and closing pressures to 200 psi with 14-30 Volts DC applied, at ambient temperatures to 500°F.

PSP engineers will be glad to recommend one or more of 400 standard solenoids to fit your needs—or work with you toward solution of your problem.

**YEARS OF ENGINEERING KNOW-HOW, PERFORMANCE-PROVEN DEPENDABILITY AND THE HIGHEST STANDARDS OF QUALITY ARE BACK OF EVERY PSP SOLENOID MANUFACTURED.**

# New from VRL

## Missile Vibrator

### 400 cps 200-watt

- Hermetically sealed
- Temperature: 125° C plus
- Plugs into hermetically sealed miniature base
- Will stand missile shock, vibration and acceleration
- Over 90% conversion and inversion efficiency

This new VRL vibrator makes possible the design of rugged, high-efficiency power supplies occupying only 0.25 cu. in. per watt and limited in temperature only by limitations of rectifying and filtering components.

For long life applications, VRL has conversion and inversion circuitry providing substantially zero make and break energies at powers of up to one kilowatt, with vibrator life measured in thousands of hours.

## OTHER PRODUCTS

VRL also makes ruggedized 400 cps sub-miniature vibrators and supplies for powers of up to 10 watts, now in use in beacons and other small airborne devices.

Part of the VRL contribution to the field of Vibrator and Transistor Power Supplies is the miniaturization of transformers and chokes to formerly unattainable levels.

*Send us your requirements. Over 200 different Power Supply Designs are available to choose from, or we shall be glad to quote on a unit specifically designed to your needs.*

with  
**EECO  
COMPUTER-SERIES  
PLUG-INS**

Originally developed for EECO custom systems and proven in critical use, new EECO Computer-Series Plug-ins represent a refinement of the building-block concept to a degree hitherto unknown. Each of the full line of reliable, tested, and proven circuits is a complete off-the-shelf packaged function, performance-engineered for application where ultra-conservative design at the component level is essential because of system complexity.

New EECO Computer-Series Plug-ins enable you to meet your project delivery schedules by reducing systems-development time to a bare minimum and practically eliminating drafting and layout time. Your engineers can concentrate on system design instead of routine circuit detail. Your technicians can cut fabrication time and step up production by performing simple point-to-point wiring instead of wiring complex circuits. And system prototypes can generally be built directly without need for the "breadboard" stage.

Fenwal Electronics  
a dependable  
source of supply for  
**ALL TYPES OF  
THERMISTORS**

Fenwal Electronics manufactures a complete line of highly stable thermistors in the form of small beads, discs, washers and rods. Each is precision manufactured to assure you of rugged high quality construction and complete uniformity.

Fenwal precision-made Thermistors are extremely sensitive to temperature change. A minute variation produces a wide resistance change in Fenwal thermistors. Because of their high sensitivity and great stability Fenwal thermistors are ideal for such applications as voltage regulators, wire communications, temperature compensation, time delay circuits, liquid level control — and many others.

**Fenwal Electronics  
can help you**

Fenwal engineers have a vast knowledge of thermistors and their applications. This not only assures you of a uniform high quality thermistor but a problem-solving service second to none in the thermistor field.

For complete data write to Fenwal Electronics Inc., Mellen Street, Framingham, Massachusetts.

A McGraw-Hill Publication

### Electro Magnetic Pickups control, indicate, actuate and synchronize

Generate voltages from mechanical motion without contact

Pickups produce AC voltage proportional to the rate of motion of any nearby ferrous object. Voltages are generated by the motion of metallic material within the field of the pickup—such as a gear tooth, shaft keyway, screw, pin or slot. Voltage output can be made to operate electronic devices or control relays.

**New Power-Mite 3040** operates 100 milliwatt relay directly without amplification.  $\frac{3}{4}$  x  $2\frac{5}{8}$ " O.A.

**High Sensitivity, High Temperature 3030 HTAN** for temperatures up to 500° F. AN type connector,  $\frac{3}{4}$  x  $2\frac{1}{4}$ " O.A. High Sensitivity 3030 same except for temperatures up to 250° F. and different connector.

**New Miniature, High Temperature 3015 HT** for temperatures up to 500° F. Meets small space and lightweight needs in missiles, etc.  $\frac{1}{2}$  oz.  $\frac{7}{16}$  x  $1\text{-}5/16$ " O.A. Miniature 3015 same except for temperatures up to 250° F.

**Standard 3010A** for temperatures up to 250° F.  $\frac{3}{4}$  x  $2\text{-}1/16$ " O.A. 3010-AN same except that it has AN type connector.

*Air-Cooled and Sub-Miniature models also available*

### Electro Proximity Pickup Systems count, control, batch and position

Generate voltages from any moving ferrous or non-ferrous metal object—even at speeds approaching zero.

Each system consists of (a) one control unit, (b) one pickup, (c) one cable with connectors. Any combination of the following will serve your particular requirement:

#### Control units

- 4901-RAC standard relay
- 4951-RAC high speed relay
- 4901-AN DC output
- 4905-RAC standard JIC enclosure
- 4955-RAC high-speed JIC enclosure

#### Pickups

- 4910-AN threaded mount
- 4915-AN flange mount
- 4920-AN hollow coil
- 4925-AN pancake type

### Electro Power Supplies for testing, design work and servicing transistor circuits and electronic equipment

A SOLDERLESS TERMINAL  
THAT FITS ALL  
TYPES OF PRESSURE  
CRIMPING TOOLS!

## FEATURES:

- Full 1/4" working shank on all types
- Provides a vibration proof connection
- Manufactured from highest quality pure copper, electro-tinned for corrosion resistance
- Has tensile strength exceeding underwriters and government specifications
- Carries a load capacity greater than that of the wire itself
- Can be custom engineered for unusual applications
- Stock items that will meet most wiring needs
- Insulated types, color coded for ease in selection to fit various wire sizes (red, 22-16; blue, 16-14; yellow, 12-10)
- Bevel mouth for fast and easy insertion of wire
- V-type grooves in throat for firm grip on wire
- Off shelf, immediate delivery, on all types

## SIZES:

**Terminals** (Fixed Insulated Insulation Grip, Fixed Insulated Terminal, Non-Insulated) 22-16, 16-14, 12-10.

**Butt Splices** (Insulated or Non-Insulated) 22-16, 16-14, 12-10

**Pigtails** (Nylon or Vinyl Insulated) 22-14, 16-10

## pilot lights

A complete line of tamper-proof pilot lights utilizing dependable, low-power consuming long-life neon bulbs. Wide selection of lens shapes, colors and any imprints. Withstand shocks, vibration and overloads. U/L and CSA approved. Outlast associated equipment.

## safe-T-klip insulated test clips

Alligator test clips completely encased in tough, high dielectric nylon. Ideal for use with test instruments, work bench power source and 1000 other uses. Cannot short against each other, or with other components. Available in red or black for permanent lead mounting or as push-on attachment over standard phone jacks or banana plugs. A real accessory for any test equipment package. Approved for military application.

## control knobs

Nylon molded control knobs for standard size shafts and flatted shafts of Signal Corps standardized radio series. Bar knobs with set screw require no metal insert for maximum torque. Elasticity of nylon acts as lock on set screw threads. Available in colors.

and . . .

a score of other interesting, useful accessories designed to meet practical requirements. Complete engineering, tooling, and production facilities ready to serve your needs in plastic molding and electrical assembling.

# COAXIAL RELAYS & SWITCHES

ACTUAL SIZE  
CM - 26

- SMALL SIZE • LIGHT WEIGHT.
- LOW COST • EXTREME RELIABILITY.

Low VSWR not only through the UHF frequencies but in many types into the microwave range.

Excellent Crosstalk Figures—Most types ground the output(s) when not connected to the common input.

Any Connector Type with almost any orientation.

Fast Operation—15 milliseconds for CR types operated by DC.

Long Life—1,000,000 cycles minimum for CR types, 100,000 for CM types.

Low Coil Consumption—Approximately 2W for most DC operated coils, 6VA for most AC coils.

Teflon RF Insulation in all types using BNC, UHF, N, or C connectors.

Resistant to Military Environmental Conditions of temperature, shock, humidity, and salt spray.

Resistor Terminations in types intended for video switching and similar applications.

Remote Electrical or Toggle-Actuated Manual Operation available in most types.

Access to Contacts Without Disassembly provided in CR and CM types.

Twin Silver Contacts on switches rated for powers exceeding 250 watts.

Fine Silver Contacts—On special order Palladium contacts can be supplied in most types.

Complex Switching Accomplished by crossover, DPDT, and multiposition types.

Write for our catalog describing these and other types of coaxial switches and relays.

TEST SET TSG-147D

## Guided Missile Beacons

*with super reliability*

- No instance of missile malfunction because of beacon failures in hundreds of installations.
- Operates perfectly after rigorous thousand-hour testing.
- Optimum performance under adverse environmental conditions:
  - Temperature:  $-65^{\circ}\text{F}$   $+160^{\circ}\text{F}$
  - Humidity: Up to 95%
  - Altitude: 70,000 feet
  - Vibration: 500 C.P.S. at 10Gs
  - Shock: 15Gs
- Available in S-Band or L-Band models or to your specifications.

## Flexible Waveguide

*for extraordinary waveguide requirements*

- **Tele-Flex:** Standard Moulded Sections for use where vibration mounts are not practical or for breadboard applications in small quantity orders.
- **Tele-Twist:** Can be twisted for immediate field use.
- **Tele-Form:** Pre-formed where extremely tight radii must be held.

## Rigid Waveguide and Coaxial Components

**Tele-Guide:** Tailor-made to your requirements for use from magnetron through the antenna.

## ELECTRONIC ENGINEERS

## NEED MORE

## BUSINESS INFORMATION

Two BUSINESS EDITIONS of ELECTRONICS, published on the 10th and 20th of each month, are providing business-minded electronic engineers with the marketing, topical and commercial information needed to keep abreast of today's complex electronic industry. The engineer who used to be concerned chiefly with designing a circuit or product now wants to know where and how it can be sold.

ELECTRONICS TECHNICAL EDITION, published on the 1st of each month, contains the same type of business information in "Industry Report" — one of the best read sections of the magazine.

Advertisers in ELECTRONICS can reach more than 46,000 paid subscribers against a background of technical editorial matter in . . .

the TECHNICAL EDITION  
(Published the 1st of each month)

or backed up by commercial  
editorial in . . .  
the BUSINESS EDITIONS  
(Published on the  
10th and 20th of each month)

# Need precision like this?

### UNRETOUCHED PHOTO 3 TIMES ACTUAL SIZE

Talk about precision! This tiny nickel and rhodium plated board of epoxy glass for a micro timing switch is accurately etched to a minimum path width of 0.0035" with a minimum distance between paths of 0.0025". This is typical of precision production by the Bureau.

## Let the Bureau solve your etched wiring problems

Whatever your needs in boards . . . routine or extraordinary . . . custom quantities or hundreds of thousands . . . the Bureau offers you the *complete service*. Bureau engineers are fussy about specifications. You get the accuracy and quality control you need. Bureau engineers appreciate deadlines. You receive delivery as ordered.

### We offer the following services . . .

Drafting  
Photoetching  
Tool Design  
Fabrication  
Flushing

Silk Screening  
Post Forming  
Custom  
Laminating  
Through-hole  
Plating

Electroplating

# BUREAU OF ENGRAVING, INC.

FEderal 9-8721

500 SOUTH 4th STREET  
MINNEAPOLIS 15, MINN.

*precision, seamless*

# DEEP-DRAWN CASES

*at low cost*

*...even on short runs*

Zero uses a unique, super-depth drawing method which permits low cost tooling and fewer operations. These economies result in high-precision drawn cases and chassis at competitive prices.

Special precision presses hold close tolerances with sidewalls of uniform thickness and no draft. No intermediate heat treatments needed. Cases are satin-smooth, due to the use of specially compounded lubricants.

## STOCK CASES

Choose from over 1200 standard stock sizes and save tooling costs! You get seamless, high-precision deep-drawn cases on one-week delivery. All items can be modified by secondary operations... holes punched, fasteners installed, etc. Wide assortment of rectangular, round and square boxes and covers. Send for catalog.

## CUSTOM DEEP-DRAWING

Zero cuts costs on specials by exclusive technique for producing low-cost dies. The use of special presses results in extreme precision, quality and economy in custom deep-drawing. Even in relatively small quantities prices, including tooling costs, are competitive with fabricated cases.

## INSTRUMENT CASES

This handsome deep-drawn aluminum case is a stock model... one of 6 basic sizes, all available promptly in any quantity. Recessed front cover protects knobs and dials... gracefully styled. Cases and covers can be modified to your specifications and furnished complete.

## MIL-W Specification CARRYING CASES

Extra-rugged cases are deep-drawn of aluminum for high strength and precision. Special extruded gasket retainer provides positive seal. Cases are built to exceed the requirements of MIL-W specifications. Many standard sizes available eliminate draw tooling costs.

Send for complete Zero catalog, indicating your individual requirements.

- Product design
- Tool design
- Tools and dies

### COMPLETE FACILITIES:

- Sheet metal fabrication
- Spot welding (to 200KVA)
- Helium welding
- Deep drawing (to 400 tons)
- Stampings
- Assembly
- Metal finishing

Let Zero quote your Case Assembly complete...one overhead...one profit...one complete package.

# Waveguides?

The F. C. Kent Company has long been recognized as the outstanding source for formed waveguides in the country. If you have requirements for bent and formed waveguide sections — waveguides with as many as seven or eight different bends in one continuous section of tubing—in different planes and with sharp radii; if your assemblies call for waveguide tubing to be twisted, offset, tapered, expanded or call for a transition from rectangular to round; then we wish to bring to your attention our exceptional ability as specialists in bending and forming waveguide tubing in all sizes.

## everything in Fluorocarbons . . . the most complete service in parts and stock

United States Gasket, pioneers and world leaders in the fabrication of duPont TEFLON, Kellogg KEL-F and other plastics, offers you unique facilities to assist in your manufacturing program.

These facilities include cold molding and sintering, extrusion, and compression molding techniques for the production of the world's most complete stock of sheets, tape, discs, rods, tubing, electrical spaghetti, bars, cylinders, and special extruded shapes.

U.S.G. also maintains a specialized machine shop for the high-speed, low-cost custom machining of parts from Fluorocarbon stock to your specifications.

In addition, U.S.G. operates an extensive compression and injection molding plant for the large-volume part requirements of its customers.

Come to U.S.G. for all your requirements—whether for stock or parts. 30 conveniently located offices and warehouses are ready to serve you.

Use U.S.G. as an unbiased yardstick for cost measurement in deciding the most efficient means of producing your parts in the quantities in which they will be required—both at the prototype stage and in ultimate production.

OF THE GARLOCK PACKING COMPANY

**BUILD  
RELIABILITY  
INTO  
EVERY  
CIRCUIT**

**Specify Birtcher tube cooling and retention devices**

Eighty-five percent of all electronic equipment failures are caused by tube failures, and one of the main causes for tube failures is high temperatures. The Birtcher Corporation, with more than 15 years experience in the manufacture of tube retention and cooling devices, is currently solving tough reliability problems for both government and industry through the use of its Kool Klamps, JAN shield inserts, and other tube-cooling devices—specially adapted where necessary to fit customers' special needs.

**KOOL KLAMPS**

Birtcher KOOL KLAMPS perform two important functions. Being made of 99½% pure, heat-treated silver, they reduce sub-miniature and miniature tube temperatures by as much as 40°C. They also serve to hold tubes and components secure against shock and vibration. For applications where heat is not the prime problem, KOOL KLAMPS are also available in beryllium copper.

**TUBE CLAMPS**

Available in more than 6,000 modifications for your every tube and component retention need. Manufactured from type 302 stainless steel, Birtcher TUBE CLAMPS hold tubes and components securely in place, even under severe shock and vibration. The dual tension loops on the Type 22 Clamp illustrated are specially designed to compensate for the wide range allowed tube manufacturers by JAN specifications on base diameters.

**CORRUGATED JAN SHIELD INSERTS**

The Navy Electronics Research Laboratory (N.E.L.) developed these Birtcher-manufactured corrugated JAN shield inserts to combat the high rate of tube failures due to excessive heat. Made of blackened spring brass, they are designed to be inserted between tube and shield, to transmit heat from the tube to the shield. N.E.L. tests show that the use of these inserts usually brings tube temperatures well within the manufacturer recommended operating range.

*Let us help you build reliability into your circuits  
—as we've done for so many others. Write for catalogs  
or contact your local Birtcher representative.*

# SPECIFY U.S. RADIUM FOR...

## EDGE-LIGHTED DIALS AND PANELS

All USR dials and panels manufactured by the LACKON® process satisfy MIL-P-7788. Skilled personnel and advanced production techniques provide dials, panels, knobs and knob skirts with pinpoint reproduction and accuracy, as well as resistance to solvents and weathering. USR's integral edge-lighted panels represent the most significant development in the instrument and control panel field since introduction of printed circuits. These new panels simplify lighting circuit assembly and provide greater flexibility for the design engineer.

## CATHODE-RAY TUBE PHOSPHORS

Phosphors for all cathode-ray tube applications are unsurpassed in adhesion and brightness. Closely controlled through every step of processing, USR phosphors feature high batch-to-batch uniformity. Colors are prepared to customer requirements.

## DIALS AND PANELS

Metal and plastic dials and panels are available for instrument and control panel application. USR offers the widest selection of marking techniques and an extensive array of materials from which to choose.

## RADIATION AND LIGHT SOURCES

Radioisotopes and radioisotope-excited phosphors packaged in a wide variety of custom-engineered, permanently sealed containers are designed to provide optimum radiation or illumination for research, process control, data display and signalling applications.

U. S. Radium's IDEA FILE, a guide to selection of proper materials and techniques for dials, panels and nameplates, is available on request. Write for Bulletin 10.30C

# NOW...ANY MICROWAVE COMPONENT CAN BE BUILT AND ENGINEERED TO YOUR PARTICULAR APPLICATION

Regardless of complexity, design or tolerance problems—you can get UHF or microwave components that are job-engineered to your application. All units are delivered, *electrically tested and proven*, ready for immediate operation.

Components can be built from your prints or can be designed and built to integrate with the application. Close and confidential coordination is maintained from drawing board stage to installation.

Range of assemblies is practically unlimited—from dc. to over 40,000 mc., military or industrial. Typical examples are these components, delivered ready for field use:

## Telemetering . . .

Tuneable S-Band

Transmitter Cavity—re-entrant type, pulse output 150 w., operates at extreme altitudes and under extreme conditions of temperature, humidity and salt spray.

## Improving signal-to-noise ratio . . . selectivity . . .

Tuneable UHF

Pre-Selector—relatively low frequency coaxial resonator with very low insertion loss, extreme selectivity and very high signal-to-noise ratio. Especially adapted to use in aircraft or in crowded communication bands.

## Calibrating . . . designing S-Band components . . .

S-Band Signal Generator Cavity—

re-entrant type, complete with thermistor mount and calibrated variable attenuator. Frequency range 2700 to 3400 mc.

Get the facts on our complete design, engineering and mechanical fabrication facilities. Have us quote on your needs—cavities, mixers, duplexers, multipliers, rotary joints, twists, bends and other components or assemblies.

## MODEL 999 BATTERY CHARGER

Model 999 Charger is a fully automatic, constant current type unit, capable of charging three batteries independently and simultaneously. Includes a discharge circuit designed specifically for the maintenance of silver-zinc batteries.

Constant current is maintained throughout the entire charging cycle except at the initial start when battery is practically a short circuit. At this point the charger surge is limited to less than ten amperes for the short duration required to bring battery terminal voltage up.

Charger terminal voltage automatically regulates to maintain current constant from a theoretical starting voltage of zero to a critical range of 28-28.5V.

At this level the battery is considered charged and charger automatically shuts off. Charger is equipped with input line cord, three sets of charging leads with Cannon 11751 plug and one set of discharge leads.

Input: 115 volts, 1 phase, 50/60 cycles

Output: 3- independent outputs, each 5-6 A @28.5 Volts

Discharge Circuits: 1-75 Amps, 1-20 Amps

## MAGNETIC AMPLIFIER REGULATED RECTIFIER—MODEL MAR 120-10

Input: 115 volts, 1 phase, 60 cycles

Output: 10 A @ 120 volts nominal  $\pm 10\%$

Regulation: Less than 1% from zero to full load with  $\pm 10\%$  line change

Ripple: 1% RMS

Response: .2 seconds

Cooling: Convection

Meters: 3 1/2" Voltmeter and Ammeter

Cabinet Size: 28" H x 22" W x 15" D

Wall or bench mounted

Model MAR 120-10 is a ruggedly constructed magnetic amplifier regulated power supply using high efficiency silicon diodes for reference circuits and germanium or silicon for the power rectifiers.

## 4 WAYS TO END ALL CORD AND CABLE SERVICE FAILURES

*Economically*

# GRIPMASTER STRAIN RELIEFS

Interruptions due to cable and cord connection failures are eliminated because they anchor the cord to the product at the point of strain. GRIPMASTER Strain Reliefs can withstand pulls up to 100 lbs., and are acceptable to Underwriters Laboratories. All types Reg. U. S. Pat. Off.

## PROTECT YOUR PRODUCT

at point of strain  
Protect product saleability too — by insuring long life for cords, cables and conductors. Genuine "GRIPMASTER" Strain Reliefs provide these vital features—

- ★ Anchor cords to housings
- ★ Eliminate taping or threading
- ★ Prevent unraveling
- ★ Prevent cord pull damage
- ★ All sizes and styles
- ★ Easy to apply
- ★ Inexpensive

Gripmaster Strain Reliefs are "tremendous trifles" that make good products better!

Ask for samples.

WIRE BINDING SLEEVES—Preventing fraying of cord ends, these specially-treated rubber tubes are available in five sizes to fit wires to .790

### Features

Either positive or negative of any supply may be grounded.

Regulation: .01 to .001%

Line Stability: .05 to .005%

Long-term Stability: .01-.05% per hour, about 0.1% per day

Impedance: 1 to 5 Ohms

Ripple: 0.5 to 3 Mv P-P

Standard tubes used

### Constant Current Supplies

RI-222E	.01-220 Ma	0-340V
---------	------------	--------

### Millimeter Wave Generators

KSG-291	36.2-33.5 kmc	8.3-8.9 mm
KSG-290	33.5-29.7 kmc	8.9-10. mm
KSG-289	30-27.3 kmc	10.-11. mm
KSG-33	25-22 kmc	12.-13.6 mm

Any of these supplies can be modified or special designs built to meet specialized requirements.

## Northeast Scientific Corp.

617 CONCORD AVENUE  
CAMBRIDGE 38, Mass.

Ruggedized yagis in wide VHF frequency range. Available in many different types for point-to-point, rebroadcasting, etc. May be polarized vertically or horizontally.

SY-44 Screen type reflector with 4 yagi antennas. 450-470 MC range. Mounting for tower or pipe mast available. 13 db gain over half-wave dipole.

## when it comes to antennas...

AT-197  
Disc cone type.  
Frequency range  
225-400 MC.

Blade-type antennas for military and commercial communications. Wide range of models and frequencies.

16-foot telemetering parabolic reflector-antenna. Helical driver for operation in range of 215-235 MC. Other drivers available.

4-foot, one-piece parabolic reflector-antenna. Wide selection of drivers. Also, 6, 8, 10, 16, 19 and 32-foot dishes available with drivers to meet the needs of the system.

## you name it—we make it

Taco is the world's largest organization devoted solely to design, development and production of fine antenna systems for the military, commercial and home markets. A wide choice of 'stock' antenna types makes Taco the place to look for antennas to meet your needs. If we don't have what you need, we'll make it.

Send for complete technical catalog...

# TEST CHAMBERS

Model LHH-FS

## Low-High Temperature Chamber with Controlled Humidity

Supplied in sizes from 2 to 100 cu. ft. net working space, these chambers operate to  $-100^{\circ}$  F at rapid reduction rate and provide controlled humidity through a range of 35 to  $175^{\circ}$  F at 20 to 95% r.h. Full controls available.

Model L-3-TS

## Chest Type Low-Temperature Cabinet

Available in sizes from 2 to 30 cu. ft. net working space. Optional controls furnished to customer specifications. Temperature range to  $-100^{\circ}$  F. Capacity for rapid temperature reduction.

Equipment available to meet U. S. Govt. specs for environmental testing. Electronic or pneumatic recording or indicating control systems. Walk-in rooms, temperature baths and custom chambers manufactured to specifications. Optional finishes in hammertone, aluminum or stainless steel. Rounded corners standard on all equipment.

## here's another ENGINE GENERATOR SET designed and built by HOMELITE

This lightweight, gasoline-engine-driven generator is another example of how Homelite met and solved a particular power supply problem. Designed and built to the most exacting MIL specifications, this generator has a military rating of 3 KW\*, 120/208 volt, 400 cycle, single and 3 phase AC at 0.8 P.F. and has been supplied fully winterized for starting and operation at temperatures down to  $-65^{\circ}\text{F}$ .

If you have a need for light, compact, gasoline-engine or electric-motor-driven generators that must meet stringent MIL specifications, call Homelite first. With over 30 years' experience in designing and building hundreds of thousands of generator sets from .15 KW to 5 KW in a variety of voltages and frequencies, Homelite will be first with the best solution to your power supply problems.

\*This military rating must be met at 5000 ft., after 500 hours of operation, and at an ambient temperature of  $107^{\circ}\text{F}$ . Under average conditions this unit is capable of producing close to 5 KW.

For the full story, write for Homelite's new booklet, "Generators for Military Use."

# SILICONE RUBBER

and allied products

## TEMP-R-TAPE®

Pressure Sensitive  
TEFLON® TAPE

FROM STOCK Easy-to-apply *Class H* insulation or non-stick facing. -100° F to 400° F (-70° C to 200° C) temp. range, ¼" to 2" rolls. Special widths to 12", .006" and .013" thickness. 1500 vpm dielectric strength, volume resistivity 2x10<sup>14</sup>, dielectric constant 2.3 (60 cycles) 2.2 (1 meg.); power factor .0040 (60 cycles), .0033 (1 meg.) white and NEMA colors.

## SILICONE SPONGE RUBBER

FROM STOCK COHRLastic® R-10470 sheets ⅛" thru ½" thick, closed cell for soft gasketing, vibration dampening, pads or cushions. -100° F to 400° F temp. range. Meets specifications: Sperry P. .691, 746 (type HTM); Scintilla 9-3143; MCI 4546; BMS 1-23, others. Extruded rod and special shapes.

## SILICONE RUBBER SHEETS

FROM STOCK COHRLastic® 500 (AMS 3302B, MIL-R-5847A) 50 durometer ⅜" thru ½" sheets with good tensile, abrasion resistance and tear strength. -85° F to 500° F flexibility. COHRLastic® 700 (AMS 3304B) 70 durometer ⅜" thru ½" sheets for high temperature, low compression set, -70° F to 500° F flexibility. Wide range of other stocks available.

## COATED FABRICS

FROM STOCK Silicone rubber coated glass, Dacron and nylon fabrics for high temperature mechanical and electrical applications. .004" thru .042" gauge, -120° F to 500° F temp. range. By the yard or as cut gaskets and assemblies.

## CONDUCTIVE GASKETING

FROM STOCK flexible aluminum wire impregnated with neoprene rubber provides air seal, yet conducts high frequency currents. 24 and 30 mesh, .016" and .020" thick, 8" wide, length to 36 yds. or as cut gaskets.

OTHER CHR PRODUCTS include silicone rubber and sponge rubber extrusions and moldings, COHRform® (silicone foam rubber), aircraft fabric and Teflon covered seals; aircraft anti-icing, de-icing and heater assemblies; capacitor bushings, conductive silicone rubber.

**AUTOMATIC CONTROL NEWS**

by Dynamics Research Associates

**dynamag**

operational magnetic amplifiers are  
widely used for signal amplification

The highly stable **dynamag** D-C Operational Magnetic Amplifier has linear, reversible polarity output and variable gain features. It has wide application in automatic feedback control systems and D-C instrumentation where amplifying and mixing low level signals are involved.

Many important features contribute to the wide acceptance of **dynamag**. Extremely reliable, magnetic toroidal cores and silicon diodes replace vacuum tubes in the **dynamag**. It is rugged, requires no maintenance, and needs no warm-up time. Models are available to meet MIL-E-5272A and MIL-T-27A requirements. High stability is another impor-

tant **dynamag** characteristic. Zero Drift is 0.2% of full scale for a temperature range of zero to 170° F. Zero Error is 1% of full scale for a 10% variation in supply voltage or frequency.

Its linearity is 1% of reading in linear range. Highly sensitive, the **dynamag** has a small signal power drain. No D-C power supply is required. Power gains up to 300 are practical.

The versatile **dynamag** can be used as a lead-lag, summing or integrating element in servomechanisms; also as a D-C variable gain current-mixing amplifier or D-C voltage amplifier for low level, low impedance signal source.

**TYPICAL dynamag APPLICATIONS**

*Amplifier for an Electro-Hydraulic Servo-System*

Provides an output current through the torque motor coils of the electro-hydraulic valve. Mixes input and feedback signals.

*Amplification of a Low Level, Low Impedance Signal*

Voltage feedback makes input impedance of amplifier high to signal source such as a thermocouple or a low impedance bridge circuit.

WE DESIGN SPECIAL MODELS TO MEET YOUR REQUIREMENTS

**OTHER dynamag PRODUCTS**

DRA also manufactures Differential and Servo Motor Magnetic Amplifiers, as well as saturable reactors, transistorized inverters, transistorized frequency converters, D-C regulated power supplies, and line voltage regulators.

**dynateq AUTOMATIC CONTROL SYSTEMS**

DRA engineers design, develop and install **dynateq** automatic control systems to meet individual requirements in all fields of application. If you have an automatic control problem, call on DRA for its solution. No obligation for proposals.

## Printed Circuits that save you Work, Worry & Waste!

Here, in our magnificent, modern factory, we do every operation necessary for the manufacture of fine Printed Circuits. No contracting for boards here—and sub-contracting for terminals, etc., elsewhere.

**ALL ORIGINAL PARTS AND ASSEMBLY  
MADE AND PERFORMED UNDER ONE ROOF**

**Never Any  
Fractures,  
Pull Outs, Frayed  
And/Or Loose Edges,  
No Soldering  
Problems . . .**

Allied-Allegri workmanship and design set the standards for the industry—yet cost less because of high working efficiency, complete lack of waste in materials and motion—and the relief from all worry you enjoy because—this time—you know the job will be done right!

Our engineering department will help you convert your conventionally-wired product to low-cost printed circuits wherever feasible.

## ELECTRONIC COUNTING EQUIPMENT

ECONOMY, RELIABILITY, COMPACTNESS

- PRESET COUNTERS
- FREQUENCY INDICATORS
- TIME INTERVAL METERS
- COMBINATION INSTRUMENTS

Using cold cathode glow transfer tubes for counting and indication, Electro-Pulse counting and measuring equipment features the reliability inherent in simplified circuitry.

Inputs are of sufficient sensitivity for direct operation from common transducers, and provide threshold controls for discrimination against unwanted signals.

**FREQUENCY INDICATOR AND COUNTER

### STANDING WAVE AMPLIFIER

RANGE: 60 db • INPUT ATTENUATOR: 50 db. in steps of 5 or 10 db. • SENSITIVITY: 1 microvolt across 200 ohms for full scale deflection • AMPLIFIER FREQUENCIES: Wide-band, 400 cycles tunable  $\pm 5\%$ , 1000 cycles tunable  $\pm 5\%$  • AMPLIFIER: Q 25  $\pm 5$  • METER SCALES: VSWR 1-4, VSWR 3-10. DB 0-10 •

SIZE: 14 $\frac{1}{4}$ " d, 8 $\frac{1}{2}$ " w, 10 $\frac{1}{2}$ " h • PRICE: \$195.00.

### MICROWAVE POWER METER

POWER RANGES: Full scale readings of .1, .3, 1, 3, 10 Mw. Continuous readings from -20 to +10 dbm. • BOLOMETER RESISTANCE: 200 ohms • BOLOMETER

COEFFICIENT: plus or minus • BOLOMETER BIAS CURRENT: 8.6 ma. max. • ACCURACY:  $\pm 5\%$  of full scale reading • SIZE: 14 $\frac{1}{4}$ " d, 8 $\frac{1}{2}$ " w, and 10 $\frac{1}{2}$ " h • PRICE: \$195.00

### TELEMETERING TRANSMITTERS

10 KW, PULSED TRANSMITTER • Frequency 400-1200 Mc • Tuning Range 5%.

TWO CHANNEL • FREQUENCY: 215-235 Mcs. • POWER OUTPUT: 50 Watts Peak • SIZE: 5 $\frac{1}{2}$ " dia. 4 $\frac{1}{4}$ " long

MICROWAVE • FREQUENCY: 2150-2350 Mc. • POWER OUTPUT: 15 Watts CW • MODULATION: Amplitude or Frequency ( $\pm 125$  Kc. deviation) • SIZE: 2" by 4" by 7"

### SPECIAL MICROWAVE COMPONENTS

RACK & PANEL CONNECTORS: Designed to permit plug in chassis with positive mating action to connector in the rack • IMPEDANCE: 50 ohms • INSULATION: Teflon • ADAPTERS: to TNC or BNC

MAGNETRON TO WAVEGUIDE TRANSDUCERS • WAVEGUIDE SIZE: RG 69/U • FLANGE: UG 417/U • TRANSITION: Probe, stub supported.

STRIP TRANSMISSION LINES • POWER DIVISION: Equal or Tapered • IMPEDANCE: 50 ohms • FREQUENCY: Fixed.

### WWV RECEIVER

FREQUENCIES: 2.5, 5.0, 10.0, 15.0, 20.0, 25.0 Mc. • SENSITIVITY: better than 1.0 microvolt for standard output • SELECTIVITY: 10 Kc. • INPUT: dual • OUTPUT: 600 ohms and self contained speaker • TUNING EYE: zero beat indicator • SIZE: 14 $\frac{1}{4}$ " d, 8 $\frac{1}{2}$ " w, and 10 $\frac{1}{2}$ " h • PRICE: 195.00

**AIRCOM INC.**

# PRECISION SNAP-ACTING SWITCHES

FREE 24-page CATALOG gives engineering data, photographs, detail drawings, and electrical ratings for entire line of Unimax high-sensitivity, sub-miniature, general-purpose, low-cost, metal-cased, open-type, immersion-proof, and AN/JAN switches.

Write today for your FREE copy of this useful catalog.

## SEALED SWITCH Unimax 2HB56-1

Protected against splashing water, oil, dust, condensation, and corrosive gases. Silicone boot seals clearance between case and operating pin. Cover sealed to base with thermostetting adhesive. Furnished with a wide variety of actuators. Electrical rating is 20 amperes 125/250 volts a-c.

## SUB-MINIATURE SWITCH Unimax USM

Exceptionally compact, fully enclosed single-pole double-throw snap-acting switch. Furnished with a variety of actuators. Easily ganged. Sturdy, flat terminals handle up to #18 wire. Electrical rating 5 amperes 125/250 volts a-c; 4 amp. 30 volts d-c resistive, 2 1/2 amp. 30 volts d-c inductive.

## LOW-COST SWITCH Unimax WL

Engineered for low cost and high performance; widely used in mass-produced products. Handles 15 amperes 125/250 volts a-c. Quick-connect terminals for snap-on-wiring provide fast installation.

## METAL-CASE SWITCH Unimax K-Series

2HB basic switch in die-cast aluminum case, with neoprene-gasketed, interchangeable side plates; resistant to moisture, dust, and oil; various types of actuators available.

Write for FREE 24-page catalog of all Unimax switches.

AC or DC

850 Series  
Shown actual size

550 Series

650 Series

950 Series

Shown approximately half size.

- **USES**—Plate current and voltage readings; battery charging and emergency lighting; transistor testing; radio kits; voltage regulators; transmitters; receivers, etc.
- **TYPES**—Ammeters, milliammeters, voltmeters, AC and DC. Resistance meters. AC are double-vane repulsion type with jeweled bearing. DC are polarized-vane solenoid type or moving magnet construction.
- **CASES**—Newest is Series 850, clear plastic rectangular type with easy-to-read dial. Long-time favorites are three basic metal case types, all requiring 2-5/32"

panel hole. Zero adjuster available on many DC models. Also pocket meters.

- **PERFORMANCE**—Fast response and ability to duplicate readings—by far the best torque-to-weight ratio in its field. Accuracy well within the standard 5%. Each meter guaranteed for one year.
- **DIALS**—Long scale—all metal—age and moisture resistant. Special calibrations, one to five colors.
- **STOCKED**—by leading electronics parts distributors. Ask for Bulletins 63 and 75.

# An Announcement Of Importance

## TO COMMUNICATION ENGINEERS AND DESIGNERS

Scientific Radio has felt that, in order to move ahead with the design thinking and planning of the communications engineer, it was necessary to take a fresh look at our own technical and engineering staff.

As a result of this appraisal, Scientific has developed the largest and most fully qualified staff in the world in the field of frequency control and its attendant fields of application.

Besides maintaining the largest crystal research laboratory in the country—located at Estes Park, Colo.—and one of the major production units—at Omaha, Nebraska—Scientific is building a new facility for specialized production at Loveland, Colorado.

Scientific makes available for the communication industry:

- Standard military-type of crystals
- Standard civilian-type of crystals

and more important, **QUALITY PRODUCTION** in the field of:

- Extremely high precision crystals
- New designs in low frequency crystals
- Filter crystals

and

## ESPECIALLY IMPORTANT CRYSTAL FILTERS

## ELECTRONIC DESIGNERS GO FIRST TO THE "GUIDE"

Wherever designers and specifiers have immediate need for readily accessible, necessary product information at their breadboards, there, year after year, will you find the ELECTRONICS BUYERS' GUIDE. "Who makes what product or provides what service?" "Where can I buy it?" "Where can I find complete and accurate product specs?" These are questions that are asked daily by the men who design-in electronic products; these are questions that have been answered for the past seventeen years by the "Guide," the accepted reference book of the industry.

Year after year, the designers of the industry have preferred the "Guide" for its *Simplicity of Style* (as easy to use as a telephone directory), for its *Accuracy* (the industry helps the Research Staff revise its listings every year) and its *Complete Product Specs* (advertisers have told their complete product stories in the "Guide" consistently).

*The key people of the industry—the buying influences—rely on the "Guide" for the answers to their product problems.*

**For Product Data . . .**

## the electronics BUYERS' GUIDE

*Manufacturers with products to sell in the Field of Nuclear Energy find that advertising in NUCLEONICS is a sure-fire method of moving those products because they reach 16,000 potential purchasers through the advertising pages of NUCLEONICS.*

*From Absorbent Paper to Zinc Bromide... products in the Field of Nuclear Energy are SOUGHT and BOUGHT by important Physicists, Metallurgists, Geologists, Biologists, Physicians, Radiologists, Bio-Chemists, Engineers, Technicians and Management because these important buying influences go first to the sales pages of NUCLEONICS for product data in Nuclear Energy.*

100 KC to 1000 MC • 1.5 watts to 6000 watts  
50, 75, 600 ohms and other impedances

These broad band R.F. power meters are of the absorption type consisting of an oil filled, air cooled, coaxial load resistor and a voltmeter calibrated to read watts. The power meter is suitable for use as a field or laboratory test instrument, is completely shielded and non-radiating, permitting transmitter testing and adjustment without interference. The meter box is easily detached, permitting location of the load resistor at a remote point. In cases where power measurements are not required the load resistor may be used as a dummy load.

# PERFORATIONS by **MUNDT** for electronic applications

## Your electronic equipment requires THE BEST IN PERFORATION

With 85 years and over, of experience in perforating, we can manufacture the particular perforated screen or panel, in accordance with your specific requirements, in any of the following materials:—

ALUMINUM	GALV. STEEL	NICKEL	SILVER
BRASS	HARDBOARDS	NICKEL SILVER	STAINLESS
BRONZE	IRON	PAPER	STEEL
COPPER	LEAD	PLASTICS	TERNE PLATE
CUPRO NICKEL	MAGNESIUM	PLYWOOD	TIN PLATE
FIBRE	MONEL	RUBBER	ZINC

Many variations of patterns can be had with holes ranging from .018" to 2" and larger, in straight or staggered formations, of round, square, slot, or decorative designs, perforated material guaranteed to be perfectly flat, straight and parallel, and free from buckle or camber.

When considering your next perforated part in your equipment, consult our engineering department whose vast knowledge in the perforating field can assist you with the perforating applicable to the Electronic Industry which will enable you to procure the best in Quality & Workmanship.

### APPLICATION OF MUNDT PERFORATIONS

PANELS: For receivers & transmitters

HOUSINGS: For Transformers, computers, amplifiers & special instruments

GRILLES: For speakers & Microphones

BACKING SCREENS: For Radios & Television

COVERS: For shielding Hi Frequency Equipment  
and other perforated electronic parts or equipment

## TRANSISTORIZED FREQUENCY-to-VOLTAGE CONVERTERS

### MEASURE AND CONTROL:

- Flow Rate • R. P. M.
- Power Frequency
- Linear Speed

MODEL FR-302  
SUBMINIATURE  
CONVERTER

Detects AC signals down to low amplitude levels, converts to 0-5 volt DC signal proportional to frequency within .2%, gives .25% long term stability with less than .002% per degree temperature coefficient.

MODEL  
FR-303

Compares power frequency with internal tuning fork reference, gives 0-5 volts DC between 370 and 430 cps, with .05% overall accuracy under severe vibration and temperature conditions.

20 standard modifications of the FR-300 series converters are available to suit every airborne and ground requirement.

## TURBINE FLOWMETERS

... covering flow rates from .065 to 6000 GPM... are standard testing equipment in the newest missiles and aircraft, where the ultimate in reliability and accuracy are required.

## for military and Industrial Electronics

- coatings • casting, impregnating and laminating resins
- dielectrics • embedments • foams • laminates

### LOW EXOTHERM, SEMI-RIGID (-65°C to +85°C)

APPLICATIONS: Diodes, Transistors, Rectifiers, Transducers and Capacitors.

EP-FOME—Low density, foam-in-place, room temperature curing resin.

EP-330—No-shrink, flexible, room temperature curing casting resin.

EP-681—Flexible casting resins to meet MIL-16923B, Type "C".

EP-133-1—Large volume casting resin.

EP-422—Low shrink, fiber reinforced, room temperature curing resin.

### LOW EXOTHERM, RIGID (-55°C to +85°C)

APPLICATIONS: Resistors, Capacitors, Toroidal Coils, Rectifiers and Electronic Assemblies.

EP-FOME—Medium density, foam-in-place, room temperature curing resin.

EP-320—No-shrink, rapid curing, room temperature setting resin.

EP-121LOX—Rapid curing, low exotherm casting resin.

EP-495—Room temperature curing, low exotherm epoxy.

### RAPID CURING, RIGID (-55°C to +85°C and +150°C)

APPLICATIONS: Transformers, Coils, Assemblies and Packaging.

EP-110—Low viscosity, general purpose casting resin.

EP-210—Transparent casting resin.

EP-220—Fire retardant, high temperature casting resin (+150°C).

EP-1503—Two-component, resilient epoxy casting resin.

### HIGH TEMPERATURE — CASTING AND POTTING — COMPOUNDS (-65°C to +260°C)

APPLICATIONS: Components, Assemblies and Machined Parts.

EP-477—Two-component, rigid epoxy, +260°C. operating temperature.

EP-1014—Two-component, rigid, fire retardant epoxy, +200°C.

EP-819-1—Resilient, rapid curing casting resin, +200°C.

### COATINGS

APPLICATIONS: Printed Circuit Boards and Assemblies.

EP-450—Resilient, multi-epoxy, air drying, transparent coating.

EP-K-3—Air drying, resilient, cushioning coating.

EP-462—Rigid, oven curing, chemical inert coating.

EP-465—Heavy, resilient, excellent adhering qualities.

### RESEARCH AND DEVELOPMENT

Our engineering department can develop your project from the blue-print to final package. Design and building of molds, formulating the exact resin requirement and testing of the finished piece can be accomplished in our machine shop, chemical and testing laboratory.

# "Duplican"

The new Photo Contact process for dials, panels, nameplates and special markings.

"DUPLICAN" is used to mark any curved, convex, concave, irregular or flat surfaces.

"DUPLICAN" is synonymous with precision and accuracy of duplication in marking.

"DUPLICAN" can be used to mark any material—plastic, glass, metal, brass, steel or aluminum.

"DUPLICAN" can be used with any finish whether enamel, synthetic, baking or air dry, lacquers, vinyl paints, fluorescent or phosphorescent materials and in accordance with all government specifications where required.

## CRU ROLLER SCREENING

a new approach to marking of counter wheels, drums and spheres.

**ROLLER SCREENING** A product of CRU engineering development. For accurate and close tolerance marking of counter wheels, drums, spheres, dials and scales.

CRU ROLLER SCREENING brings the economy of "silk screening" to the marking of circular or spheroid shapes.

Luminous Application on Dials, Panels, Nameplates, etc. To all Government Specifications Engineering and Research Facilities Available.

0-120	0-13	2	SP 120-13	Selenium	\$710.

Powerunits furnish an adjustable source of DC from AC lines. New in appearance and functional in operation, this group of high current DC Power Supplies has been designed on the basis of our experience in supplying industry and government agencies during the past several years. Simplicity of circuit, lack of moving parts and quality of components have reduced maintenance problems to zero. A reduction in volume by as much as 50% without sacrifice of other characteristics has been achieved.

Front panel controls include a combined primary circuit breaker and on-off switch, low voltage circuit breaker, output control knob, voltmeter and ammeter, pilot light and output binding posts. Positive overload protection is assured by two circuit breakers, one in the primary circuit, and another in the output circuit. The primary circuit breaker functions if the AC current demand of the unit becomes abnormal. The secondary breaker, placed in the low voltage circuit, operates when rated DC current is exceeded. Both breakers may be reset from the front panel. Circuit breakers are chosen for their time delay characteristic. Powerunits using Germanium or Silicon rectification are generally provided with instantaneous circuit breaker protection while longer time delays are optional on units using selenium rectification.

The output control is in the form of a continuously variable autotransformer which affords almost stepless variation of output within the complete range of the instrument. A tap on this transformer may be used to secure full DC output with an AC line as low as 105 volts. Voltmeter and ammeter are 4" rectangular instruments accurate to 2%. Meters are placed adjacent to each other to facilitate simultaneous readings of voltage and current. The pilot light face is 1" in diameter and uses a standard 117 volt lamp replaceable from the front panel. Binding posts colored red and black give polarity identification for DC output. The DC output is completely isolated from AC input and, if required, either side may be grounded. Standard Powerunits are designed to operate from an AC input of 117 volts, 60 cycles, single phase. An 8 foot cord set with AC plug is supplied.

# MICROWAVE RESISTORS

Highly stable - low temperature coefficient - resistance film negligibly thin even at highest microwave frequencies - tinned electrodes solder directly into R F circuit.

**MICROWAVE RESISTORS** - Metal film fused to PYREX base, sealed with micro-thin coating of Quartz. Tinned electrodes. Bulletin M-1

**COAXIAL ATTENUATOR ELEMENTS** for 3/8 inch to the largest line size. Solder or pressure mount. Standard and Custom sizes. Bulletin L-1

**METALLIZED GLASS RECTANGULAR ATTENUATOR ELEMENTS** - Complete coverage L thru K band. Bulletin A-1

**METAL FILM PLASTIC RESISTANCE CARD** - Thin metal film deposited on fibre glass plastic sheet. Stable, simple to fabricate, uniform resistivity. Available from 25 to 750 ohms/square. Bulletin P-1

**METALLIZED MICA ATTENUATOR ELEMENTS** for use at higher frequencies. Mica sheets or cut shapes, thickness .001 to .005 inch, 25 to 400 ohms/square. Bulletin C-1

## FILMOHM CORPORATION

48 West 25th Street  
New York 10, N. Y.  
WAtkins 4-9240

FILMOHM produces many types of microwave resistors and we would be pleased to fabricate units to meet your specific requirements

A McGraw-Hill Publication

Precision sturdily built unit, pre-drilled and tapped, ready to assemble — Modular design allows great flexibility.

Highly stable regulated power supplies, constructed on modular chassis unit — Series covers all normal demands of modern circuitry.

## Vari-Flex<sup>®</sup>

### CHASSIS and POWER SUPPLIES

... Save You TIME and MONEY

- Combines ready-to-assemble chassis with high quality regulated power supplies — Saves time — Construction starts where it should with the circuits proper.
- Instantly demountable construction for circuit salvage or substitution.
- Two sizes of assembly — 9" and 13½" depth, utilizing three interchangeable chassis plates 4½", 9", and 6¾" deep.
- Standard RETMA overall size for convenient rack mounting. Panel size 8¾" x 19".
- Perforated metal shields available for top and bottom.
- Regulated Power Supplies — constructed on 4½" chassis plate — have extremely low ripple and excellent regulation and transient recovery characteristics.

**COIL FORM SERVICE**

Available...

- SQUARE TUBES
- ROUND TUBES
- RESINITE COIL FORMS
- BOBBINS
- MANDRIL SERVICE
- FABRICATING SERVICE

## SQUARE AND RECTANGULAR TUBES

Produced in any length, shape or size from  $\frac{1}{16}$ " to 8", wall thickness from .010 to .125. Fabricated from dielectric kraft, fish paper, acetate, other patented materials or combinations. Bowed side-wall or Di-Formed construction.

## ROUND TUBES

Produced in any decimal size up to 8" I. D. Fabricated from kraft, fish paper, cellulose acetate, mylar, polystyrene, quinterra, fibre glass and other dielectric materials.

## RESINITE COIL FORMS

These coil forms have the highest resistivity of any resinated product. Furnished plain, embossed, internally threaded or triangular shape... also flyback transformer forms.

## BOBBINS

Supplied round, square or rectangular. Cores fabricated from any of the above materials. Metal, asbestos, plastic or fibre flanges. Constructed to fit smaller spaces and permit multiple winding.

## MANDRIL SERVICE

Accurately ground steel and aluminum coil mandrils at cost economy comparable to commonly used undependable wood or undersized steel mandrils.

## FABRICATING SERVICE

We have modern high speed equipment to provide you with any special shape or form... rolled, spun, flared, punched or formed to your particular requirement.

Ask about Precision's complete coil form service.  
Request informative bulletin.

# TRANSISTORIZED power converters

- ▶ Four standard models provide inputs for 12 or 28 volts DC — filtered outputs of 325 volts DC at 100 or 200 ma.
- ▶ Over-designed proven circuitry, super quality components, conservatively rated for electrical and mechanical performance.
- ▶ Withstand vibration and shock loads over 100 G's during operation. No moving parts to break or malfunction.
- ▶ Life greatly exceeds all vibrator or rotary equipment. Hermetically sealed.
- ▶ Exclusive control circuit provides high conversion efficiency over widely variable loads — protects transistors under no load and the supply from shorts or severe overload output.
- ▶ Electrical efficiency up to 90% operating in ambients of -55°C. to 75°C. voltage regulation is 20% against load.
- ▶ Compact — hermetically sealed cases measure 3" x 3½" x 4".
- ▶ Light — weighs only 3 lbs. 3 ozs. for 65 watt capacity . . . a fraction of comparable rotary equipment.

These new, rugged converters are recommended where a premium is placed on exceptional reliability, light weight and small size — in severe operating conditions such as missile beacon power supplies, airborne and other mobile communications equipment.

#### CUSTOM PACKAGES

We also design and produce to your individual requirements. We can handle DC inputs from 6 to 32 volts DC, output voltages up to 1000, regulation to 0.5%, and output capacity of 500 watts. Typical of our custom designs is the power supply for the AN/DPN-19 Radio Beacon and Control Fuel Cut-Off C — 1297 (XE-1)/DPN.

## ELECTRONIC ENGINEERS NEED MORE BUSINESS INFORMATION

Two BUSINESS EDITIONS of ELECTRONICS, published on the 10th and 20th of each month, are providing business-minded electronic engineers with the marketing, topical and commercial information needed to keep abreast of today's complex electronic industry. The engineer who used to be concerned chiefly with designing a circuit or product now wants to know where and how it can be sold.

ELECTRONICS TECHNICAL EDITION, published on the 1st of each month, contains the same type of business information in "Industry Report" — one of the best read sections of the magazine.

Advertisers in ELECTRONICS can reach more than 46,000 paid subscribers against a background of technical editorial matter in . . .

the TECHNICAL EDITION  
(Published the 1st of each month)

or backed up by commercial  
editorial in . . .  
the BUSINESS EDITIONS  
(Published on the  
10th and 20th of each month)

## D-79 GAUSSMETER

Means More  
In MAGNETICS . . .

### HERE'S WHY:

- Reads 10 to 30,000 Gauss Flux Fields
- Probe is only .025" thick
- Active area .01 square inches
- Net Weight 10-1/2 lbs.
- Power Supply 105-125 Volts, 50-60 Cycle
- Overall size 13" high, 10-1/2" wide, 6-3/4" deep

Precision built to give accurate flux density measurement and determine "flow" direction. The unit also locates and measures "stray fields," plots variations in strength, and is ideal for checking production lots against a standard. Simple to operate, the D-79 gives no ballistic reading . . . doesn't jerk or pull. Comes in protective carrying case.

Write for literature—Dept. BG-57

**ADDAPLUG CONNECTING LEADS**

- (1) Self-wiping action insures contact resistance of less than 0.001 ohm
- (2) Spring-loaded pressure bar provides contact pressure without wear on spring element and compensates for wide variation in hole diameter found in commercial terminals
- (3) Instant unlimited multiple connections at any plug body
- (4) Four standard lengths—(others to specifications) in red or black

**Reduces equipment setup time**

Outlasts homemade leads 4 or 5 times and therefore costs less than homemade leads; tough polyvinyl insulation on highly flexible stranded wire; integrally molded in high voltage plastic—resists failure due to flexing at junction of wire and plug body; fits standard terminal posts, jacks, alligator clips and spade lugs. Needs no special adapters for most connections. Order Direct.

## Chassis-Trak

ROLLER BEARING

CABINET

SLIDES

ULTRA THIN

New Chassis-Trak roller bearing slides make your electronic equipment more accessible . . . faster and easier to service. Chassis Trak's ultra thin design, wider bearing rollers support up to 175 lbs. with chassis extended. Rollers assure permanent, smooth slide operation.

### PLUS:

- Ultra thin slide design (.350") for maximum use of cabinet interior
- Permanent dust-repellent, dry lubricant finish
- High corrosion resistance
- Easy installation
- 8 stock lengths, standard width
- Push button emergency chassis removal

# POUGHKEEPSIE COILS

TOROIDAL . . . Dependable - Quality Controlled - Low Cost

- POTTING
- IMPREGNATING
- ENCAPSULATION
- HERMETICALLY SEALED

Poughkeepsie Coil Co., Inc. specializes in accurately-constructed quality-controlled coils. Our coils are quality-controlled in every step . . . not only in the finished product, but with rigid inspection of materials and continuous checks in processing. They meet the most exacting military and commercial specifications. We manufacture coils for electrical, solenoid and relay applications . . . in computers, clocks, timers. Random-wound interweave, bobbin and toroid coils . . . impregnated, molded or potted . . . in any size.

### COMPARE OUR QUALITY AND PRICES . . .

Here's our offer! Send us coils you are now using. Let us duplicate them. Then try our coils. Test them. We will compete with anyone on a quality and performance per dollar value.

## FIELD REPORT

America's critical northern defense projects, the DEW line and White Alice, are reaching completion. Hughey & Phillips helped Western Electric and the Blow Knox Companies solve severe requirements by engineering and fabricating complete ready-to-install kits.

These kits include

- SLEET MELTER POWER & CONTROL CIRCUITS
- SPECIAL LIGHTING AND CONTROL CIRCUITS
- TOWER OBSTRUCTION LIGHTING
- LAMP FAILURE ALARM SYSTEMS
- EMERGENCY TELEPHONE CIRCUITS

This practical experience and knowledge is available to you in solving problems in these or similar systems employing photo-electric control units, beacon flashers, obstruction lamp failure indicator and controls. Complete systems will be engineered, fabricated and packaged in a kit for your specific job.

System being packaged for shipment

Special junction boxes with terminals and cable support, engineered specifically for your job.

Complete installation information and diagrams are included in each ready-to-install kit.

Write today for information regarding your specific problems.

TO  
THE "GUIDE"**

Wherever designers and specifiers have immediate need for readily accessible, necessary product information at their breadboards, there, year after year, will you find the **ELECTRONICS BUYERS' GUIDE**. "Who makes what product or provides what service?" "Where can I buy it?" "Where can I find complete and accurate product specs?" These are questions that are asked daily by the men who design-in electronic products; these are questions that have been answered for the past seventeen years by the "Guide," the accepted reference book of the industry.

Year after year, the designers of the industry have preferred the "Guide" for its *Simplicity of Style* (as easy to use as a telephone directory), for its *Accuracy* (the industry helps the Research Staff revise its listings every year) and its *Complete Product Specs* (advertisers have told their complete product stories in the "Guide" consistently).

*The key people of the industry—the buying influences—rely on the "Guide" for the answers to their product problems.*

# PRECISION POTENTIOMETERS

SUB-MINIATURE, MINIATURE AND STANDARD

Potentiometers of all basic types are designed for maximum reliability and broad application. Production series are just part of the story though. Special, custom designs are available to meet "unusual" specifications.

The MODEL 304-00, of the Miniature Single Turns group.

**MINIATURE SINGLE TURNS**—Only 0.375 inch body length by 0.500 inch diameter, 10 to 50K ohms, wire wound; linearity from 3 to 0.3%; 2 watts at 50°C, 0 watts at 125°C.

**TRIMMING POTENTIOMETERS**—Worm gear adjustment design produces maximum stability under extreme environmental conditions; 10 ohms to 150 K ohms, wire wound; up to 1.5 watts at 50°C, 0 watts at 150°C; as small as 0.050 cubic inch. Manufactured with leads or printed circuit terminals.

MODEL 300-00, one of the many Trimming Potentiometers

Typical Miniature Multiturn—the MODEL 341-60

**MINIATURE MULTITURNS**—The smallest precision, ballbearing, 10-turn pots offer maximum reliability with unique zero backlash construction and double wipers; 20 G's to 2000 cyc; to 250K ohms; 2.5 watts at 40°C, 0 watts at 140°C; panel or servo mount.

**GENERAL PURPOSE MULTITURNS**—To 500K ohms, wirewound, to 4 watts at 40°C, 0 at 100°C; as small as 1.0 inch diameter, sleeve or ball bearing, excellent resolution, designed to fit ALL applications.

MODEL 400, typical of the General Purpose Multiturns

Representative of the Ganged Single Turns—the MODEL 319-60

**GANGED SINGLE TURNS**—Unique screw-driver phasing, no clamp rings or movable cups; minimum depth "per cup"; from 0.875 to 3.0 inch diameter; to 500K ohms, wire wound with exceptional linearity and resolution.

**HIGH TEMPERATURE DESIGNS**—Special designs are available, offering all of the features listed for separate groups above. PLUS stability at elevated temperatures. Emphasis on 200°C to 500°C range.

Typical of High Temperature Designs—MODEL 314

Openings exist for qualified engineers.

**ANTON...  
Where PRECISION Counts**

CORONA DISCHARGE VOLTAGE REGULATOR TUBES . . . Anton's miniature and subminiature, fixed and adjustable regulators will stabilize voltages from 300v-30kv at currents below several milliamperes, with voltage tolerances within plus-minus 1%. Patented "Varijust" tubes, for precise regulation in the 650-800v range, permit variation of gas pressure in tubes resulting in smoothly adjustable regulated voltages. JAN approved types (fixed and "Varijust") available. Well-suited for use as voltage reference tubes, for stabilization of all high voltage, low current power supplies and for control of high voltage, accelerating potentials of cathode ray devices. (Request Bulletin 56V)

Special connector

CONNECTORS . . . Anton precision-built connectors are designed for use under specified conditions of altitude, temperature and pressure. Extensive research enables Anton to incorporate new techniques in hermetic sealing, high altitude operation, molding and waterproofing in its connector design and production. Anton facilities for connector design, development and production are supplemented by an experimental model shop and a complete environmental test installation. We welcome your "difficult" as well as your standard connector design and application problems. (Bulletin 56C)

MS20-34  
MP20-34

PCD22

S20P21-2  
S20S21-2

229A Ratemeter

NUCLEAR TUBES AND INSTRUMENTATION . . . Anton produces the widest selection of neutron detectors, halogen quenched counter and integrator tubes, organic quenched and other types of alpha, beta and gamma detectors, survey and monitoring instruments, ratemeters, scalars and control devices. JAN approved types available. (Bulletins 56TE, 56IE)

Other Anton custom components include precision potentiometers, meters, precisely-regulated high voltage power supplies and special vacuum and gas discharge devices. Send us your individual specifications.

# ANCHOR METAL

## SOLDER HEADQUARTERS

### Shurflo Rosin Core Solder

When heated, a special activating agent is released, which provides a more vigorous fluxing action for the rosin and makes a faster soldering job possible. Readily solders brass, zinc, nickelplate, and other metals. During the soldering the activating agent is destroyed and only pure rosin remains. Conforms to Fed. Spec. QQ571b and may be used wherever rosin core solder is required. Available in all diameters from .015 up, on spools, 1, 5 and 10 lbs.

### Rosin Fluxes

Our activated and non-activated rosin fluxes are all non-corrosive, and have individual qualities which make them particularly suitable for specific jobs in soldering electrical and electronic components, printed circuitry, dip soldering, tinning of leads, pot solder.

### Bar Solders

ANCHOR Bar Solders are made in all alloys for particular applications, dip soldering or tinning, printed circuits, in 1/4, 1/2, 1 and 5 lb. bars.

### Microforms for Semiconductors

#### HIGH PURITY ELEMENTS

Tin	Platinum
Lead	Copper
Cadmium	Nickel
Gold	Zinc
Silver	Indium
Aluminum	Antimony

#### "DOPED" ALLOYS

Our Engineering Staff will produce any "doped" alloy to your specifications in sheets, wire, also microforms of discs, washers, rings, dots, pellets, etc.

# PREFERRED

During the past 5 years, the proven performance of the EKCO Model 1079-C Vibrating Reed Electrometer has made it preferred by actual users, both here and abroad.

Low in cost, compact, rugged and easily serviced; its high, full-scale sensitivity and inherent stability makes the EKCO Model 1079-C ideal for all applications involving small current and voltage measurements.

STABILITY: .....  $\pm 1$  mv, day-to-day.  
 SENSITIVITY: .....  $0.03 \mu\mu\text{a}$  full-scale reading @ max.  
 RANGES: ..... 0-30, 0-100, 0-300, 0-1000 mv.  
 INPUT: ..... Internal, switch-controlled,  $10^8$ ,  $10^{10}$ ,  $10^{12}$  ohm resistors.  
 OUTPUT: ..... Operates with 1 ma or 100 mv recorder.  
 POWER: ..... 110/120 or 200/250 v, 40/60 cps, 40 w.  
 WEIGHT: ..... Only 29 lbs., complete with cables.

For detailed technical data on the complete line of EKCO nucleonic test equipment, including the new full-range polar rectangular single table radar antenna plotter, write TODAY to:

# Consultants in Electronics

We specialize in electronic problems of manufacturers of mechanical and electro-mechanical equipment, and in industrial process control and instrumentation for manufacturers of a wide variety of commodities and equipment. Our experience qualifies us to work with or for you on:

- Systems Analysis
- Circuit Development & Optimization
- Engineering Design & Development of:
  - Production Test Equipment
  - Industrial Process Controls
  - Custom Electronic Equipment
- Feasibility Studies
- Subminiaturization & Packaging
- Etched Circuits
- Short Production Runs
- Technical Writing

We would be pleased to discuss your electronic problems with you.

# TRANSISTOR CHARACTERISTIC PLOTTER model 331

Generates the  $r_{22}$ ,  $r_{12}$ , and  $h_{12}$  families of characteristic curves of low-power transistors and semi-conductor diodes for display on an auxiliary oscilloscope.

This Plotter combines the precision and versatility of laboratory equipment with the ease and speed of operation and the ruggedness needed for production testing and sorting of transistors and semi-conductor diodes. It has proved invaluable for transistor matching, production testing, quality control, transistor circuit design and applications, semi-conductor research and development, and educational use for laboratory work in semi-conductors.

The Model 331 Plotter has been adopted as standard by manufacturers of transistors and transistorized equipment, by semi-conductor research laboratories, research and development firms, and by university laboratories. This fully electronic instrument, featuring automatic sequential high-speed curve tracing, accommodates all types of low-power transistors and semi-conductor diodes—point contact and junction, germanium and silicon.

**NEW: Model 341 Transistor Characteristic Plotter**—a curve tracer capable of generating static curves for power transistors at collector currents to 5 amperes, collector voltages to 80 volts, and base currents to 50 milliamperes. Available August 1957.

Write for additional information on these Plotters and other DUNN transistor test equipment.

## MANSOL makes GLASS MULTIFORM PELLETS for GLASS-TO-METAL SEALS

WE CAN FULFILL ALL TYPES OF MULTIFORM REQUIREMENTS

### FORMULA 800 MULTIFORMS

Extracted from epoxy resins. "800" can be used in multiforms and for conductive or non-conductive small parts welding at 400° F. It possesses extremely high bonding strength, with no shrinkage, on metals to metals and metals to non-metals.

### MULTIFORMS OF STEATITE

We specialize in small die-pressed ceramic parts held to closest tolerances. All tools and dies are made in our shop to assure quick delivery.

**GLASS MULTIFORMS**—The ideal multiforms for Iron, Kovar, Copper, Dumet and Stainless Sealing, matching the expansion of these metals over their entire working range. They have ample mechanical strength and seal readily. Our laboratory is prepared to assist you in selecting the proper glass for any metal.

• If you are still making your own multiforms, Mansol would like to show you how to save money and eliminate rejects.

• Write to Dept. N for the complete story about multiforms. Formula 800 and our production facilities. No obligation of course.

# BURGESS

EXCLUSIVE WAFER CELL CONSTRUCTION  
GIVES GREATEST SELECTION  
IN DRY BATTERIES

Whatever You Need in...

#### CAPACITY

A correct cell size for  
any capacity.

#### VOLTAGE

Wafer Cell construction  
produces from 1½ volts  
on up.

#### SERVICE

Burgess will make bat-  
teries to fit any appli-  
cation.

## BURGESS

HAS THE WIDEST  
CHOICE OF DRY  
BATTERIES EVER  
MANUFACTURED . . .

The revolutionary Wafer Cell  
offers a 30% increase in battery  
life at *no increase in size*. This  
exclusive Burgess construction  
consists of a sandwich of man-  
ganease dioxide mix between  
two flat electrodes of zinc and  
carbon with spots of hot silver  
wax applied to each exposed  
pole of the cell, allowing perfect  
electrical contacts throughout  
and almost complete absence of  
vibration. Cells are wrapped in  
Mylar film and packed in such  
modern materials as aluminum  
for compactness, long shelf life,  
exceptional service life, out-  
standing dependability.

Burgess design specialists will  
work out the exact battery to fit  
your needs. Send your require-  
ments to Dept. E57.

**BURGESS BATTERY COMPANY**  
FREEPORT, ILLINOIS

#### SIZES AND SHAPES

Wafer Cell construction  
can meet any space, size  
and weight requirements.

#### RESERVE BATTERIES

Can be stored  
dry for years.  
Activated only  
when immersed in water.  
No handling of dangerous  
electrolyte, no spilling or  
leaking. Wider range of  
efficient operating temper-  
atures than any other type  
of battery.

# MANUFACTURERS' REPRESENTATIVES IN THE ELECTRONIC INDUSTRY

As a service to readers, **ELECTRONICS** presents the advertisements for some of the leading manufacturers' representatives in the electronic industry. These firms are qualified to help the Manufacturer with his distribution problems; the Buyer with his product needs. Representatives, listed under States served.

it's our eighth!

We are proud to further expand our facilities in the West with the opening of our eighth office in Tucson, Arizona. Neely Enterprises' growing family of offices offer the finest and most complete service to answer the increasing need for instrumentation in the electronics industry.

Each of the eight offices are strategically located and staffed by fully qualified engineers with broad electronic instrumentation background. This on-the-spot representation by a Neely engineer can save you and your organization valuable engineering time.

Call a Neely engineer from one of the *eight* offices conveniently located near you.

Output: 115 VAC, 400 cyc.; single phase, 1.53 amp.; 8000 rpm. Input: 13.5 VDC; 29 amp. **\$50.00**
- PE218 Leland  
Output: 115 VAC, single phase, pf. 90; 380/500 cycle; 1500 VA. Input: 25-28 VDC; 92 amps.; 8000 rpms.; Exc. Volts 27.5 BRAND NEW **\$30.00**
- MG149F Holtzer-Cabot  
Output: 26 VAC @ 250 VA; 115 V. @ 500 VA; single phase; 400 cycle. Input: 24 VDC @ 36 amps. **\$40.00**
- MG153 Holtzer-Cabot  
Input: 24 VDC; 52 amps. Output: 115 volts -400 cycles, 3-phase, 750 VA. Voltage and frequency regulated. **\$95.00**
- DMF2506M Continental Electric  
24-30 volts input; 5.5-45 amps.; cont. duty. Output: 115 volts; .44 amps.; 400 cyc.; 1 phase; pf. 1.0; 50 watts **\$39.50**
- AN 3499 Eicor, Class "A"  
Input: 27.5 volts at 9.2 amps. AC. Output: 115 volts 400 cycles; 3 phase 100 voltamp; continuous duty. Price **\$39.50** each
- F-16 Jack & Heintz  
Output: 115 volts, 250 voltamp, 400 cycle, single or 3 phase. Input: 27.5 VDC, 20 amp. Electronic voltage and frequency regulated. **\$99.50**
- MC-36 100 VA Eicor Class "A".  
Output: 125 volts, 100 voltamp, 400 cycle, single phase. Input: 24-30 VDC, 11 amp. Voltage and frequency regulated. Intermit-tent duty. **\$19.95**
- 1-100A115S-4 100 VA Eicor Class "A".  
Output: 125 volts, 100 voltamp, 400 cycle, single phase, 1.0 pf. Input: 24 volts, 11 amp. Continuous duty. Voltage and frequency regulated. **\$39.95**
- 1-3012/08-7 100 VA Eicor Class "A".  
Output: 125 volts, 100 voltamp, 400 cycle, single phase. Input: 24-30 VDC, 11 amp, 1.0 pf. Intermittent duty. Frequency regulated by Lea governor and has no voltage regulation or filters. **\$10.00**
- MG-58-B Eclipse-Pioneer  
Single phase; 400 cycle. Output: 115 volts AC, 450 cycle, 60-10 amps. Input: 24-30 volts DC. Continuous duty and frequency and voltage regulated. **\$24.50**
- 12144-1-A Bendix  
Single phase; 3800 cycle. Output: 115 volts AC, 3800 cycle, .95 amp (with .5 mfd series capacitor into resistive load). Input: 24-30 volts DC, 10 amp. **\$39.50**

**WX-5315 MOTOR GENERATOR SET MFGD. BY RAYTHEON**

Output: 115 volt AC, 400 cycle, single phase, 2 KVA, 90% pf. Driven by 115 volt AC, 60 cycle, single phase, 3 h.p. capacitor-start, induction-run motor. 3425 rpm. Steel dust cover encloses modulator and electronic field regulator for alternator. This equipment was used with Navy Radar S0-2. **\$250.00**

**380-1600 CYCLE VARIABLE AUTO TRANSFORMER**

Input: 115 volts, single phase. Output: 0-130 volts, at 500 volt amps. Adjusting knob for easy voltage variation. Completely housed in metal case with ventilating louvers. With four-prong amphenol connector. Dim: 4 1/2 x 5 1/2 x 2 1/4" H. **\$10.00**

## ELECTRONIC COMPONENTS and EQUIPMENT

for

LABORATORY INDUSTRIAL  
MILITARY TV & BROADCAST  
NAVAL & MARINE AIRCRAFT

The following is only a partial listing of the types of materials in our vast inventory

- TUBES  
Receiving—Transmitting—Industrial
- TEST EQUIPMENT  
General Radio, Hewlett Packard, Measurements Corp. Etc. Army-Navy Types, Microwave Spectrum.
- SYNCHROS
- CRYSTAL DIODES
- SERVO MOTORS
- COAXIAL CONNECTORS  
All JAN Types
- COAXIAL CABLE
- MICROWAVE COMPONENTS
- PULSE TRANSFORMERS
- 400 cy. ROTATING EQUIPMENT  
Inverters - Generators - Motors
- TELEMETERING EQUIPMENT
- OIL FILLED CONDENSERS
- TRANSFORMERS
- PULSE NETWORKS
- SWITCHES - RELAYS

We specialize in JAN specification components and spare parts for government types of electronic equipment.

## DUMONT HIGH VOLTAGE POWER SUPPLIES

Delivers 23 kv. fully regulated and adjustable

- RADAR SNOOPERSCOPIES
- COLOR AND PROJECTION TV
- HIGH VOLTAGE TESTING, ETC.

Made by Dumont for RA119, 30 inch TV. Pulse type H.V. generator and voltage-doubler with 3 tube voltage-regulator. Contains sweep protection circuits to disable the H.V. upon sweep failure. Low voltage also regulated by use of Sola Power Transformer with matching capacitor (cost over \$30). Contains 13 tubes and 3 relays. Input 117 V. AC 60 cycles. Schematic diagram included. Original cost over \$150.

NEW... \$49.95 ea F.O.B. BROOKLYN

### NEW

#### TS-147 X TEST SET Hard-to-get X-Band SIGNAL GENERATOR Now Available

Test Set TS 147 is a portable Microwave Signal Generator designed for testing and adjusting beacon equipment and radar systems which operate within the frequency range of 8500 MC to 9600 MC.

### NEW MICROWAVE TEST EQUIPMENT TS148/UP SPECTRUM ANALYZER

Field type X Band Spectrum Analyzer, Band 8430-9580 Megacycles.

Will Check Frequency and Operation of various X Band equipment such as Radar Magnetrans, Klystrons, TR Boxes. It will also measure pulse width, c-w spectrum width and Q or resonant cavities. Will also check frequency of signal generators in the X band. Can also be used as frequency modulated Signal Generator etc. Available new complete with all accessories, in carrying case.

### SPECIAL! 5,000 V. POWER SUPPLY

For IP25 Infrared Converter from 3 V. Battery Source. NEW, Complete with RCA 1654 Tube.

**\$990**

# COMMUNICATIONS EQUIPMENT CO.

## PULSE EQUIPMENT

**MD4/APS-2.** A new version of the MIT model 111 pulser. This unit is a lightweight, pressurized modulator designed to deliver pulses of 0.5/1 or 2 usec at a duty ratio of .001. Output is 12 KV. @ 12 Amps (Peak). Unit requires 115v at 400 cy single phase at 3.5 A. and 280v at 3 A. New, complete with all tubes and pressurized housing. With schematic. \$135  
**ASD Modulator Units.** mod. by Sperry. Hard tube pulser delivers Pk pulse of 144 kv. Similar to Mod 3 unit. Brand new, less tubes. \$95.00  
**Airborne RF head, model A1A.** delivers 50 Kw peak output at 9000 mc. at .001 duty. Complete with pulser unit and all tubes. \$185.00

## PULSE TRANSFORMERS

**352-7150.** Primary 50 ohms. Secondary 1000 ohms. 12,000 V. 12.0 Amp. Pulse: 1 or 2 usec. at .001 duty ratio. Fitted with magnetron well and bifilar winding for filament supply. \$27.50  
**MAGNETRON PULSE TRANS. #964:** Prim. imp. 30 ohms, 1600 v. pulse. Secondary imp. is 1250 ohms, 12 KV pulse. Turns ratio sec. pri. is 7.5:1. Duty ratio is 0.001 at 1.2 usec. Bifilar winding. 2A. \$8.50  
**RAYTHEON WX 4298E:** Primary 4KV, 1.0 USEC. SEC. 16K-16 AMP DUTY RATIO: 001 400 CYCLE PUL. TRANS. "BUILT-IN" \$17.50  
**GE #K-2449A** Primary: 9.33 KV, 50 ohms Imp. Secondary: 23 KV, 450 ohms. Pulse length: 1.05/5 usec. @ 635/120 PPS. Pk Power Out: 1.740 KW. Bifilar: 1.5 amps. \$62.50  
**GE #K-2748-A.** 0.5 usec @ 2000 Pps. Pk. Pwr. out is 32 KW impedance 40/100 ohm output. Pri. volts 2.3 KV Pk. Sec. volts 11.5 KV Pk. Bifilar rated at 1.3 Amp. Fitted with magnetron well. \$24.50  
**K-2745** Primary: 3 1/2. 8 KV, 50 ohms Z Secondary: 14/12.6 KV 1025 ohms Z. Pulse length: 0.25/1.0 usec @ 600/600 PPS. Pk. Power 200/150 KW. Bifilar: 1.3 Amp. Has "built-in" magnetron well. \$32.50  
**K-2461-A** Primary: 3.1/2.6 KV—50 ohms (line). Secondary 14/11.5 KV—1000 ohms Z. Pulse Length: 1 usec @ 600/600 PPS. Pk. Power 200/150 KW. Bifilar: 1.3 Amp. Fitted with magnetron well. \$29.50

## 10 CM R.F. HEAD

Complete R.F. Head and Modulator delivers 50 KW Peak R.F. at 3000 MC. Pulser delivers 12KV pulse at 12 Amp. to magnetron of .5, 1, or 2-microsec. duration at duty cycle of .001. Unit requires 115V. 400-2400 Cycles, 1 phase @ 8.5A. Also 24 28 VDC @ 2A. External sync. Pulse of 120 V Req'd. Brand new. Complete with magnetron, magnet, plumbing and all tubes. \$275

## MICROWAVE ANTENNAS

**3 CM ANTENNA ASSEMBLY:** Uses 17" paraboloid dish, operating from 24 vdc motor. Beam pattern: 5 deg. in both Azimuth and elevation. Sector Scan: over 160 deg. at 35 scans per minute. Elevation Scan: over 2 deg. Tilt. Over 24 deg. \$35.00  
**AT49/APR—Broadband Conical,** 300-3300 MC, Type N Feed \$8.95  
**Discone Antenna, AS 125 APR.** 1000-3200 mc. Stub supported with type "N" Connector. \$14.50  
**AS14A/AP,** 10 CM pick up dipole assy, complete w/ length of coax and "N" connectors. \$4.50  
**AS46A/APG-4** Yagi Antenna, 5 element array. \$22.50  
**30' Parabolic Reflector** Spun Aluminum dish 10 1/2" Focus \$4.85  
**AN/APA-12—Sector Scan adaptor for APS-2 radar—** Complete Kit \$17.50  
**LP-24** Alford loop, for use with glide-path transmitters (MRN-1), etc. 100-108 mc \$32.50  
**18" PARABOLIC DISHES,** spun aluminum. Focus approx. 8 inches \$4.95  
**10 CM. ANTENNA ASSY. (Airborne).** 30" dish with coax. dipole feed. Focal length is 10 1/2" Horiz. polarization. 350 deg. azimuth. Tilt: plus and minus 20 deg. 28 v dc drive motor, selsyn takeoff. \$65.00

## I. F. AMPLIFIER STRIPS

Model 15-30 Mc Center Frequency. Bandwidth 2.5 Mc. gain figure, 65 db. (Uses 5 stages of 6AC7's. Has D. C. Restorer and Video Detector A.F.C. Strip included. Input impedance: 50 Ohms. Less tubes (as shown) \$17.50  
**60 MC. Miniature IF strip,** using 6AK5's 6.0 Mc center Freq. Gain: 85 db at Bandwidth of 2.7 Mc. New. Complete with tubes. \$15.00

## 3000 MC WAVEMETER

Mfd. by GE for Armed Services. Calibrated directly in mes/sec. from 2200 to 4800 mc. Comes furnished with variable attenuator, coax. adaptor cord, and pickup antenna. Has output jack for external meter or other monitor device. Reasonable indicator is 3 1/2 20 microamp meter. Brand new, in portable wooden carrying case. \$75.00

## BRAND NEW T-350XM RADIOTELEPHONE - RADIOTELEGRAPH TRANSMITTERS

This transmitter is similar in characteristics to the RCA Model ET-4336. The T-350XM was manufactured by Technical Radio Corporation, San Francisco, California, for the U. S. Signal Corps. All are new, unused and export cased. Each transmitter carries our guarantee. Spare parts available. Quotations on request.

• 2,000-29,000 KCS • 350 watts—A1 Output • 250 Watts—A3 Output • Built in Master Oscillator • 5 Crystal Positions • Multi Range Impedance Antenna Tuning Network • Manual or High Speed Keying • Uses 2—813 P.A. and 2—805 Modulators Hi-Level Class B • Speech Amplifier, Remote, Mfg. by RCA • Technical Manuals (2) with Each Transmitter • Power Input: 210/250 Volts Single Phase 50/60 Cycles • Size 59" x 16" x 24" • Wt—690 Lbs. Net • Brand new—Complete—Unused

### COMPLETE STATION INSTALLATION

We can supply with the T-350XM transmitter brand new receivers and complete station operating accessories.

### GUARANTEE

—Our equipment carries with it an unqualified guarantee of satisfaction to the end user.  
—Our new laboratory is equipped with the finest testing facilities available.  
—Catalog and data sheets fully describing our offerings and hundreds of other items in our stock will be gladly mailed on request.

### COMPLETE SNOOPERSCOPIES!!!

FORMER "TOP-SECRET" INFRARED VIEWERS FOR SEEING IN TOTAL DARKNESS, ARE NOW AVAILABLE FOR CIVILIAN USES!!

Army Model M-2 Snooper scope, Made By BELL & HOWELL CO. Uses RCA Type 1P25-A Image Tube.

Priced from \$50.00 to \$125.00. Write for Descriptive Bulletins listing industrial uses and Price Information. LIMITED QUANTITIES.

### NEW INFRARED IMAGE TUBES

1P25-A ... \$19.95  
6032 ... \$29.95

### INFRARED LIGHT SOURCE

Snooper scope Part #1364A.—Input 6 volts, 5 amps. Has special 5% dia. A-1529 glass filter & goldplated reflector. Projects a powerful beam of invisible infrared radiation (free of all visible light) that illuminates objects for infrared viewing (or photography) up to a distance of 400 feet. For any Infrared system. Complete with bulb.  
STK #L-5459.—NEW, ONLY ..... \$7.95 Ppd.

### IMAGE TUBE POWER SUPPLY

Snooper scope Part #1450A.—Power-Pack for 1P25-A Tube (will also supply CV-147 Tube). Input 6 V.D.C., output 4,250 V.D.C. and additional focusing voltages. Checked-out, complete, and operating with 1654 Tube. 4 1/2 x 3 x 8". Diagram included. Gov't cost \$68.00. Used. NEW CONDITION—\$7.95 Ppd.

# BIGGEST & BEST in Surplus Communications Eqpt.!

## PRESS WIRELESS 40 KW RADIO TRANSMITTER STATION!

New, Unused, High Power complete Transmitter Station for long range, point-to-point, CW and Radioteletype. Also, Power Amplifier Section can be used as 15 KW (output) Linear Amplifier to increase power of Single Side-Band Transmitters of 2 to 2½ KW output with similar frequency range. The PW-40B covers 5.3 to 21.0 MC, is preset for one frequency in this range (MO or crystal-controlled), but crystal oscillator oven will hold up to 6 different crystals. This station consists of: RF Exciter, RF Power Amplifier, High-Voltage Rectifier (240V, 3 phase AC), and Water Cooling Unit. Complete station when set up measures approximately 18 ft. long x 7 ft. high x 5 ft. deep. Available complete with spare parts. **WRITE FOR LITERATURE AND PRICES!**

## RADIO BEACON TRANSMITTER STATIONS

Consists of 2 units; one (Model LSR 420F) for exciter-driver, frequency range 275-510 KC, 4-channels crystal-controlled oscillator and MO, output 110 watts CW or 150 watts MCW; second unit (Model LSR 520C) is a Linear Class B RF Power Amplifier to increase power output of above unit to 600 watts CW or 800 watts MCW. Both units are enclosed frame type measuring approx. 64" H. x 24" W. x 18" D. Operation is from 110 V., 1 phase, 50/60 cycles AC. Equipment is NEW-UNUSED. **WRITE FOR LITERATURE & PRICES.**

## SCR-206F RADIO INTERCEPT D.F. EQPT.

One of the finest and most versatile World War II Direction Finding and Intercept Radio Receiving Eqpts. Ideal for monitoring and locating enemy radio stations. Frequency Range 200 KC to 18.0 MC continuous in 7 bands. Designed for mobile-field use, to operate from 6 volt storage battery. Highly engineered, thoroughly shielded by heavy gauge aluminum castings which house various RF sections. Supplied complete with loop, 6 V. dynamotor, sense antenna mast sections, high-powered telescope assembly which mounts within loop (for local bearing), all installed within sturdy portable trunk for convenient carrying. UNUSED Condition. **WRITE FOR LITERATURE AND PRICES!**

## PORTABLE RADIO BROADCAST STATIONS, 50 WATT OUTPUT.

New, Unused equipment, designed for Psychological Warfare (Propaganda) and Armed Forces Radio-Troop entertainment this equipment will meet FCC specs. for carrier stability (crystal-controlled) and fidelity. Freq. Range is 1,100 to 1,500 KC, and design provides either crystal control or VFO. Modulation is 100% using a special hi-efficiency circuit. Operation is from 90 to 240 Volts, 50/50 cycles AC, and total drain at full modulation-725 watts. Audio Response is within 1 db from 100 to 5,000 cps and distortion less than 5% rms at 100% modulation. Design provides for use with quarter-wave antenna against ground, with loading coil of sufficient inductance included within transmitter to permit use of smaller antenna where conditions do not allow proper size. THE EQUIPMENT SUPPLIED FORMS A COMPLETE MOBILE OR PORTABLE BROADCAST STATION.

The following are the various units supplied: 1—Broadcast Transmitter, 1—Power Supply (operates from 110 V. 60 C. AC), 1—Pressure Cooling and Voltage Selector unit, 1—Control Console Mixer, 1—Phonograph, 2—Speed (78 & 33 ½ RPM) Turntable, 1—Dynamic Microphone, 1—Set of Operating Tubes, 9 Connecting Cables, Spare Parts Kit, Construction Manual, and 5 sturdy Trunk for housing & transporting this material. **WRITE FOR PRICES & LITERATURE.**

## RC-263 TRANSMITTING EQPT. 50/75 W. OUTPUT, 1.5-10.0 MC, 4-CHANNELS CRYSTAL OR VFO CONTROL, AUTOMATIC DIAL CONTROLS ALL OPERATIONS, FULL REMOTE CONTROL, 100-260 V., 25 to 60 C. AC OPERATION, ETC.

Radio Transmitting Equipment RC-263 consists of Radio Transmitter BC-1100-A, Remote Control Unit RM-40-A, and Microphone T-27-Q. Radio Transmitter BC-1100-A is a four-channel crystal—or master-oscillator controlled, 75-watt radio telegraph or 50-watt radio telephone transmitter (conservative ratings). It operates in the frequency range from 1,500 kc to 10,000 kc and is suitable for remote control over two pairs of telephone lines. The radiated radio telephone signals are amplitude modulated. Remote Control Unit RM-40-A consists of a microphone amplifier, line level indicating meter, microphone supply rectifier and switching circuits, and pulse dial to control relays in Radio Transmitter BC-1100-A and performs all necessary functions, such as channel selection. Power-on or off, cw or phone, etc.

The frequency range covered by each of the four individual channels is from 1,500 to 10,000 kc. Any one of the four channels can be tuned to any frequency within these limits.

Radio Transmitting Equipment RC-263 is designed to operate on 100 to 260 volts alternating current, 25 to 60 cycles, single phase. Transmitter dimensions are: 18" H. x 40½" W. x 30¼" D. The Remote Control Unit measures: 10" H. x 14" W. x 13½" D. ALL EQPT. IS NEW-UNUSED and in original export packing. Available Complete with tubes, microphone, Instruction Book, and case of full spares which includes meters, relays, tubes, resistors, capacitors, additional microphone, etc. **WRITE FOR PRICE & DESCRIPTIVE LITERATURE.**

## LARGE QUANTITIES

## NEW & RECONDITIONED:

BC-669 (SCR-543) RADIOTELEPHONES, NEW-UNUSED, 45 WATTS OUTPUT ON PHONE, 6 channels (CRYSTAL-CONTROLLED) FOR TRANSMITTER & RECEIVER.

SCR-300 (BC-1000) Walkie-Talkies; SCR-536 (BC-611) Handy-Talkies. SPARE PARTS for both eqpts.

**BIGGEST & BEST STOCK IN:** TCS Transmitters & Receivers with 12, 24, 110 DC or 110 AC Power Supplies.

Over 2,000 new-unused BC 611D chassis, less tubes, crystals, or plug-in coils, but with telescopic antenna.

200 GN-58 Hand Generators (for SCR-694 and AN/GRC-9 equipments), complete with cranks, seat pedestal, and legs. Like new condition.

Approx. 1,500 PE-104A Vibrator Power Supplies (each with spare vibrator) for receiver section of SCR-284 eqpt's. New-unused, in original export packing.

Large inventory of SCR-522 eqpt's., BC-797, SCR-610, SCR-510, SCR-508, SCR-608, SCR-511, BC-447, etc.

## BRAND NEW T-350XM RADIOTELEPHONE - RADIOTELEGRAPH TRANSMITTERS

This transmitter is similar in characteristics to the RCA Model ET-4336. The T-350XM was manufactured by Technical Radio Corporation, San Francisco, California, for the U. S. Signal Corps. All are new, unused and export casad. Each transmitter carries our guarantee. Spare parts available. Quotations on request.

- 2,000-29,000 KCS • 350 watts—A1 Output • 250 Watts—A3 Output • Built in Master Oscillator • 5 Crystal Positions • Multi Range Impedance Antenna Tuning Network • Manual or High Speed Keying • Uses 2—813 P.A. and 2—805 Modulators Hi-Level Class B • Speech Amplifier, Remote, Mfg. by RCA • Technical Manuals (2) with Each Transmitter • Power Input: 210/250 Volts Single Phase 50/60 Cycles • Size 5 1/2" x 16" x 24" • Wt—690 Lbs. Net • Brand new—Complete—Unused

**COMPLETE STATION INSTALLATION**  
We can supply with the T-350XM transmitter brand new receivers and complete station operating accessories.

## GUARANTEE

—Our equipment carries with it an unqualified guarantee of satisfaction to the end user.  
—Our new laboratory is equipped with the finest testing facilities available.  
—Catalog and data sheets fully describing our offerings and hundreds of other items in our stock will be gladly mailed on request.

# BIGGEST & BEST in Surplus Communications Eqpt.!

## PRESS WIRELESS 40 KW RADIO TRANSMITTER STATION!

New, Unused, High Power complete Transmitter Station for long range, point-to-point, CW and Radioteletype. Also, Power Amplifier Section can be used as 15 KW (output) Linear Amplifier to increase power of Single Side-Band Transmitters of 2 to 2½ KW output with similar frequency range. The PW-40B covers 5.3 to 21.0 MC, is preset for one frequency in this range (MO or crystal-controlled), but crystal oscillator oven will hold up to 6 different crystals. This station consists of: RF Exciter, RF Power Amplifier, High-Voltage Rectifier (240V, 3 phase AC), and Water Cooling Unit. Complete station when set up measures approximately 18 ft. long x 7 ft. high x 5 ft. deep. Available complete with spare parts. **WRITE FOR LITERATURE AND PRICES!**

## RADIO BEACON TRANSMITTER STATIONS

Consists of 2 units; one (Model LSR 420F) for exciter-driver, frequency range 275-510 KC, 4-channels crystal-controlled oscillator or MO, output 110 watts CW or 150 watts MCW; second unit (Model LSR 520C) is a Linear Class B RF Power Amplifier to increase power output of above unit to 600 watts CW or 800 watts MCW. Both units are enclosed frame type measuring approx. 64" H. x 24" W. x 18" D. Operation is from 110 V., 1 phase, 50/60 cycles AC. Equipment is NEW-UNUSED. **WRITE FOR LITERATURE & PRICES.**

## SCR-206F RADIO INTERCEPT D.F. EQPT.

One of the finest and most versatile World War II Direction Finding and Intercept Radio Receiving Eqpts. Ideal for monitoring and locating enemy radio stations. Frequency Range 200 KC to 18.0 MC continuous in 7 bands. Designed for mobile-field use, to operate from 6 volt storage battery. Highly engineered, thoroughly shielded by heavy gauge aluminum castings which house various RF sections. Supplied complete with loop, 6 V. dynamotor, sense antenna mast sections, high-powered telescope assembly which mounts within loop (for local bearing), all installed within sturdy portable trunk for convenient carrying. UNUSED Condition. **WRITE FOR LITERATURE AND PRICES!**

## PORTABLE RADIO BROADCAST STATIONS, 50 WATT OUTPUT.

New, Unused equipment, designed for Psychological Warfare (Propaganda) and Armed Forces Radio-Troop entertainment this equipment will meet FCC specs. for carrier stability (crystal-controlled) and fidelity. Freq. Range is 1,100 to 1,500 KC, and design provides either crystal control or VFO. Modulation is 100% using a special hi-efficiency circuit. Operation is from 90 to 240 Volts, 50/50 cycles AC, and total drain at full modulation-725 watts. Audio Response is within 1 db from 100 to 5,000 cps and distortion less than 5% rms at 100% modulation. Design provides for use with quarter-wave antenna against ground, with loading coil of sufficient inductance included within transmitter to permit use of smaller antenna where conditions do not allow proper size. **THE EQUIPMENT SUPPLIED FORMS A COMPLETE MOBILE OR PORTABLE BROADCAST STATION.**

The following are the various units supplied: 1—Broadcast Transmitter, 1—Power Supply (operates from 110 V. 60 C. AC), 1—Pressure Cooling and Voltage Selector unit, 1—Control Console Mixer, 1—Phonograph, 2—Speed (78 & 33 ½ RPM) Turntable, 1—Dynamic Microphone, 1—Set of Operating Tubes, 9 Connecting Cables, Spare Parts Kit, Construction Manual, and 5 sturdy Trunk for housing & transporting this material. **WRITE FOR PRICES & LITERATURE.**

## RC-263 TRANSMITTING EQPT. 50/75 W. OUTPUT, 1.5-10.0 MC, 4-CHANNELS CRYSTAL OR VFO CONTROL, AUTOMATIC DIAL CONTROLS ALL OPERATIONS, FULL REMOTE CONTROL, 100-260 V., 25 to 60 C. AC OPERATION, ETC.

Radio Transmitting Equipment RC-263 consists of Radio Transmitter BC-1100-A, Remote Control Unit RM-40-A, and Microphone T-27-Q. Radio Transmitter BC-1100-A is a four-channel crystal—or master-oscillator controlled, 75-watt radio telegraph or 50-watt radio telephone transmitter (conservative ratings). It operates in the frequency range from 1,500 kc to 10,000 kc and is suitable for remote control over two pairs of telephone lines. The radiated radio telephone signals are amplitude modulated. Remote Control Unit RM-40-A consists of a microphone amplifier, line level indicating meter, microphone supply rectifier and switching circuits, and pulse dial to control relays in Radio Transmitter BC-1100-A and performs all necessary functions, such as channel selection. Power-on or off, cw or phone, etc.

The frequency range covered by each of the four individual channels is from 1,500 to 10,000 kc. Any one of the four channels can be tuned to any frequency within these limits.

Radio Transmitting Equipment RC-263 is designed to operate on 100 to 260 volts alternating current, 25 to 60 cycles, single phase. Transmitter dimensions are: 18" H. x 40½" W. x 30¼" D. The Remote Control Unit measures: 10" H. x 14" W. x 13½" D. **ALL EQPT. IS NEW-UNUSED** and in original export packing. Available Complete with tubes, microphone, Instruction Book, and case of full spares which includes meters, relays, tubes, resistors, capacitors, additional microphone, etc. **WRITE FOR PRICE & DESCRIPTIVE LITERATURE.**

# — Tubes —

*Just out!*

For Domestic and Export—We offer from STOCK quantities of Receiving, Transmitting, Special Purpose, Ruggedized, and subminiature Electron Tubes, at lowest possible prices.

All Tubes are new, Jan & Commercial types.

Prices quoted immediately upon request.

### Reference and Price Guide for Industrial Tubes

The most comprehensive and complete cross reference book of old and current tube types. Contains up to the minute facts about the entire tube field. It took 18 months of painstaking research and cross checking by a competent staff with the know-how and background in the Electronics industry.

Gives approx. distributor cost. Also approximate resale price to ultimate consumer. Full list of cross reference and complete interchange of types of industrial classifications. Send \$3.00, book sent postpaid anywhere in U. S. A.

**K1097-P19 (7ACP-19) THREE BEAM CATHODE RAY TUBE**  
The Type 7ACP19 is a 6 3/4" diagonal, rectangular face, three beam, post accelerator, electrostatic deflection and focus Cathode Ray Tube. Each beam is independently controlled except for Heater, Cathode and Accelerating voltages. The Deflection Electrodes of each beam are electrostatically shielded from each other. The Gun Structures are designed so as to give no appreciable Focus Voltage Current.

Radio and Electronics  
Consulting — Research — Development  
R-F Circuits — Lines — Antennas  
Microwave Components — Test Equipment  
Harold A. Wheeler and Engineering Staff  
Great Neck, N. Y. HUNter 2-7876

# 4 Exclusive reasons why Sylvania's "Silver Screen 85" is the leading choice in Picture Tubes

**1. Super-Aluminized Reflector**—As the world's leading producer of aluminized picture tubes, Sylvania has developed exclusive processes to perfect the aluminized screen. Sylvania aluminized tubes offer up to 7 times the contrast of ordinary picture tubes.

**2. New "Preferred-White" screen color.** Sylvania's exclusive new phosphor blend produces an appealing screen color, preferred by leading television receiver manufacturers. It's a development made possible because Sylvania manufactures its own screen phosphors, and has full control of raw materials.

**3. New controlled heater**—Sylvania developments in heater coating have made possible a controlled heater warm-up time of 11 seconds. All Sylvania picture tubes now incorporate the controlled heater for use in series-string or conventional transformer circuits.

**4. New "Fast-Soldered" Pins**—Exclusive new Sylvania pin-soldering technique virtually fills the pin with solder. As a result, Sylvania picture tubes have super-bonded lead wire, offering superior electrical contact and stronger mechanical support.

SYLVANIA  
SILVER SCREEN 85

For extra dependability and fine performance, Sylvania offers a complete line of receiving tubes and special-purpose tubes. For complete information write Department F21P, SYLVANIA ELECTRIC PRODUCTS INC., 1740 Broadway, New York 19, N. Y.

In Canada: Sylvania Electric (Canada) Ltd., University Tower Building, Montreal

## MICROWAVE CRYSTAL DIODES

Sylvania manufactures microwave crystals for radar, counter-measure and test applications.  
All frequencies from 1000 to 35,000 mc are covered within the series.

TYPE	PURPOSE	FREQUENCY
1N21B	Mixer	3000 mc
1N21C	Mixer	3000 mc
1N21D	Mixer	3000 mc
1N21E	Mixer	3000 mc
1N23B	Mixer	9375 mc
1N23C	Mixer	9375 mc
1N23D	Mixer	9375 mc
1N23E	Mixer	9375 mc
1N25	Mixer	1000 mc
1N25A	Mixer	1000 mc
1N26	Mixer	24000 mc
1N53	Mixer	25000 mc
D938	Mixer	35000 mc
1N78	Mixer	16000 mc

TYPE	PURPOSE	FREQUENCY
1N78A	Mixer	16000 mc
1N79	Instrument Rectifier	3000
1N286	Mixer	10,000-23,000 mc
1N1132	Tripolar Mixer	1,000-12,000 mc
1N31	Video Detector	9375
1N32	Video Detector	3000
1N76	Video Detector	10000
1N358	Tripolar Video Det.	1000-12000
1N369	Tripolar Video Det.	3000-12000
1N369A	Tripolar Video Det.	1000-12000
1N446	Video Detector	26,500-40,000

NOTE: Reverse polarity and matched pairs are available for all mixer crystal types except 1N286 and 1N1132.

## AUDIO TRANSISTORS

Audio Types	Class	Total Dissipation P <sub>T</sub> MW	Collector Base Voltage V <sub>cb</sub> Volts	Collector Emitter Voltage V <sub>ce</sub> Volts	Typical Alpha Cut-off Frequency F <sub>α</sub>	Collector Current I <sub>c</sub> ma	Application

2142H	9375 Fixed	14 KW
6027	9375 Fixed	18 KW
6874	8800-9400 Tunable	180 KW
5789	34800 Fixed	32 KW
6799	34800 Fixed	100 KW

## COUNTER TUBES

Sylvania decade counter tubes provide visual and electrical read-out for a broad field of counting applications.

Type	Rated Speed	Outputs
6476	4 KC	10
6802	4 KC	4
6879	5 KC	3
6909	100 KC	4
6910	100 KC	10

## TRIGGER TUBES

**OA5**—Cold cathode trigger tube capable of dissipating one watt of energy. Designed in T5 1/2 bulb size.

**6403**—Cold cathode trigger tube capable of dissipating one watt of energy. Designed in T-3 bulb size.

## FERRITE ISOLATORS

Sylvania ferrite isolators are designed for use in radar microwave link or test equipment. The ferrite isolator will protect the power source from reflected energy, thereby contributing to more stable operation and longer life performance.

FD977	5300-5500	120 KW peak
FD962	7100-8000	10 watts CW
FD963	4600-5000	10 watts CW
FD1013	8500-9600	125 KW peak
FD1037	8500-9600	125 KW peak

## PIRANI TUBES

**R1111**—Pressure measuring tube.

**R1111M**—Matched pairs of Pirani tubes.

## ROCKET TUBES

Sylvania Rocket Tubes are planar-electrode disc-seal triodes for use as oscillators and amplifiers at frequencies up to 3300 mc. Design permits broadband operation. Tuning is simpler and covers a greater continuous range than that of many other types of UHF tubes.

**2C36**—is a pulse-modulated oscillator for frequencies up to 1200 mc.

**2C37**—is designed for use as a c.w. oscillator up to 3300 mc. Plate disc is flat, grid disc folded.

**5764**—is a pulse-modulated oscillator for use up to 3300 mc.

**5765**—is for use as a c.w. oscillator without external feedback in the range from 900 to 3000 mc.

**5767**—is a c.w. oscillator for use up to 3300 mc. Both discs are folded.

**5768**—is intended for use as a c.w. amplifier-multiplier up to 3000 mc.

**6018**—is intended for use as a c.w. amplifier-multiplier up to 3000 mc.

**6BA4**—High gain, low noise, UHF television amplifier.

**6481 (RT434)**—c.w. amplifier for use up to 3000 mc.

**6503**—c.w. amplifier for use up to 3000 mc.

## ELECTRONIC LITERATURE

### Germanium Diode and Transistor Applications Literature

Sylvania offers you the most complete collection of germanium diode applications ever published. "Industrial Uses for Germanium Crystals" contains 27 never-before-published circuits for industrial applications of Germanium Crystals.

"40 Uses for Germanium Diodes" covers applications in receiver, transmitter instruments and control circuits. "Electronics Short Cuts for Hobbyists" describes applications in all types of devices of interest to the home hobbyist, "screwdriver mechanic," and electrical experimenter. "28 Uses for Junction Transistors" is a new manual of practical transistorized devices developed in Sylvania laboratories. "Crystal Diode Circuit Kinks" describes many new applications of germanium diodes in crystal meters, TV receivers, and electrical experiments. Price of each book—25¢.

TWO NEW BOOKLETS... "How To Build A Transistorized Portable Radio," 25¢; "Microwave Diode Handbook," 50¢

# NEW OCTAL SOCKET

—LETS YOU STANDARDIZE PRINTED CIRCUIT TECHNIQUES

● Sylvania introduces a new octal socket designed for printed circuits. It incorporates the basic design features of the widely used 7- and 9-pin sockets, making it possible for you to develop new, more compact printed circuitry which can be standardized in production.

Current production can be speeded, too, by incorporating the new Sylvania printed-circuit octal socket wherever standard or compromise mountings are now being used.

Sylvania printed circuit sockets offer these important features

- All molded insulator
- Superior contact characteristics
- Top surface insulation
- Nesting for automatic feeding
- Positive orientation
- Cross-contact wiring

### NEW SPECIAL SOCKETS

Neo-diheptal socket assembly for color TV picture tubes. Molded in low loss phenolic or alkyd. Compact design, only 11/16" deep. Leads can be supplied taped, stripped, twisted and solder dipped.

Counter Tube Socket with "zero-adjust" feature. Provides  $\pm 10^\circ$  adjustment of socket orientation, providing for positive zero adjustment upon original installation as well as replacement.

### PARTS DIVISION

# DESIGN CHARTS FOR

**S**UMMARY — Rapid correlation of coupling-circuit performance can be achieved with parameters of a wide variety of double-tuned coupling transformers. Charts are particularly useful where power transfer is important, as in transistor i-f amplifiers. Several interesting problems are worked out to illustrate design procedure

By MELBOURNE J. HELLSTROM

FIG. 1—Typical double-tuned transformer coupling network

FIG. 2—Design curves for double-tuned transformers;  $(\Delta\omega/\omega_0)_3$  is relative bandwidth at half-power points of pass band

**I**N DESIGN of transistor video i-f amplifiers, the problem of coupling between stages may be approached from the point of view of power transfer from the output terminals of one stage to the input terminals of another. Usually this network is in the form of a single or double-tuned transformer. The design charts described in this article are applicable to a wide variety of coupling circuits.<sup>1</sup>

A typical coupling network is illustrated in Fig. 1. The transformer couples power from stage 1 to stage 2. The output impedance of stage 1 is represented by the parallel combination of  $R_1$  and  $C_1'$  and the input impedance of stage 2 by  $R_2$  and  $C_2'$ . The tuning capacitances of the primary and secondary are  $C_{T1}$  and  $C_{T2}$ . For convenience  $C_1 = C_1' + C_{T1}$ , the total primary capacitance, and  $C_2 = C_2' + C_{T2}$ , the total secondary capacitance.

The power transfer of this and many other coupling networks<sup>2</sup> is given as a function of frequency and circuit constants by:

$$\frac{P}{P_0} = \frac{(1+p)^2}{\left\{ [1+p - (\Delta\omega/\omega_0)Q_1(\Delta\omega/\omega_0)Q_2]^2 + [(\Delta\omega/\omega_0)Q_1 + (\Delta\omega/\omega_0)Q_2]^2 \right\}} \quad (1)$$

# TUNED TRANSFORMERS

where  $P/P_o$  = relative power transfer, the power transfer at frequency  $\omega$  divided by the power transfer at the center of passband  $\omega_o$ ;  $(\Delta\omega/\omega_o)$  = relative bandwidth, with  $\Delta\omega$  the difference between the upper and lower frequencies at which the relative power transfers equal  $P/P_o$ ;  $Q_1$  = primary circuit  $Q$ ;  $Q_2$  = secondary circuit  $Q$ ;  $p = K^2 Q_1 Q_2$ , the source-to-load impedance match parameter;  $K^2$  = an effective coupling coefficient.

Exact relations for primary and secondary circuit  $Q$ 's, the effective coupling coefficient and the conditions for tuning depend on the type of coupling circuit. These relations are given in a chart for four types of double-tuned transformers. It can be seen that a given transformer winding is tuned with the other short-circuited when it is parallel tuned or with the other open-circuited when it is series tuned.

To obtain a design chart from Eq. 1 relating the relative bandwidth where the power transfer is 3 db below the midband value, denoted  $(\Delta\omega/\omega_o)_3$ , let  $P/P_o = \frac{1}{2}$ . The chart is shown in Fig. 2 with curves for different values of  $p$  from 0 to 4. The trans-

former design corresponding to every pair of values of  $(\Delta\omega/\omega_o)_3$ ,  $Q_1$  and  $(\Delta\omega/\omega_o)_3 Q_2$  prescribed by a given  $p$  contour will have the same midband power transfer. The curve for  $p = 1$ , the critical coupling contour, is the same as that in the literature.<sup>3</sup>

For any given transformer, the center-frequency power transfer is related to its maximum value  $P_o$  by

$$P_o/P_{o\max} = 4p/(1+p)^2 \quad (2)$$

### Significance of $p$

The value  $p$  may be thought of as the ratio of source resistance to the load resistance reflected into the primary. When  $p = 1$ , the source and load are matched, the power transfer is at its maximum value. The power transfer for other values of  $p$  is shown by the plot of Eq. 2 in Fig. 3.

Another interpretation may be given  $p$ . Critical coupling is that coupling which affords maximum power transfer and corresponds to the matched condition  $p = 1$ . Then  $p = 1 = K^2 Q_1 Q_2$  or  $K_c^2 = 1/(Q_1 Q_2)$  where  $K_c$  = critical coupling coefficient. Hence,  $p = (K/K_c)^2$ , the square

FIG. 4—Relation between shape factors for different bandwidth ratios

FIG. 3—Power loss for matched case,  $p = 1$ , versus  $p$

of the ratio of the coupling coefficient to the critical value of this coefficient. The quantity  $n = K/K_c$  has been used in the literature<sup>4</sup> for plotting universal curves for coupling circuits. Therefore  $p = n^2$ .

### Shape Contours

In addition to the curves for different values of  $p$  in Fig. 2, there is another family of curves of constant pass band shape, which are concave outward from the origin. Every pair of values of  $(\Delta\omega/\omega_o)_3 Q_1$  and  $(\Delta\omega/\omega_o)_3 Q_2$  on a given shape contour will have the same pass band shape.

The pass band shape is described by: the skirt steepness, defined as the ratio of the relative bandwidth where the relative power transfer is -10 db to that where the relative transfer is -3 db ( $W_{10}/W_3$ ); the peak-to-valley transfer response ratio ( $P/V$ ); the relative bandwidth at the response peaks expressed in a ratio with the 3-db relative bandwidth ( $W_o/W_3$ ). The last two factors have meaning only when the response is double peaked.

The one-to-one correspondence between the factors is graphi-

# Design Charts for Tuned Transformers (Continued)

cally illustrated by the curves in Fig. 4.

For single-peaked responses, there are no real values of  $P/V$  and  $W_o/W_s$ . The shape contour for  $P/V = 1$  separates the over-coupled and undercoupled regions of the  $Q_1(\Delta\omega/\omega_o)_s - Q_2(\Delta\omega/\omega_o)_s$  plane. This curve is defined by  $p = \frac{1}{2} (Q_1/Q_2 + Q_2/Q_1)$ , which may be reduced to the definition of transitional coupling,  $K^2 = \frac{1}{2} (1/Q_1^2 + 1/Q_2^2)$ . Transitional coupling is the point at which the transfer response changes between single and doubled peaked.

Figure 2 permits the design of a transformer which will have

CIRCUIT	TUNING	$k^2$	$Q_1$	$Q_2$
	$\omega_o^2 = \frac{1}{L_1 C_1 (1-k^2)}$ $= \frac{1}{L_2 C_2 (1-k^2)}$	$k^2$	$\omega_o R_1 C_1$ $= \frac{R_1}{\omega_o L_1 (1-k^2)}$	$\omega_o R_2 C_2$ $= \frac{R_2}{\omega_o L_2 (1-k^2)}$
	$\omega_o^2 = \frac{1}{L_1 C_1}$ $= \frac{1}{L_2 C_2}$	$k^2$	$\frac{1}{\omega_o R_1 C_1}$ $= \frac{\omega_o L_1}{R_1}$	$\frac{1}{\omega_o R_2 C_2}$ $= \frac{\omega_o L_2}{R_2}$
	$\omega_o^2 = \frac{1}{L_1 C_1}$ $= \frac{1}{L_2 C_2 (1-k^2)}$	$\frac{k^2}{1-k^2}$	$\omega_o R_1 C_1$ $= \frac{R_1}{\omega_o L_1}$	$\frac{1}{\omega_o R_2 C_2}$ $= \frac{\omega_o L_2 (1-k^2)}{R_2}$
	$\omega_o^2 = \frac{1}{L_1 C_1 (1-k^2)}$ $= \frac{1}{L_2 C_2}$	$\frac{k^2}{1-k^2}$	$\frac{1}{\omega_o R_1 C_1}$ $= \frac{\omega_o L_1 (1-k^2)}{R_1}$	$\omega_o R_2 C_2$ $= \frac{R_2^2}{\omega_o L_2}$

FIG. 5—Design curves for double-tuned transformers;  $(\Delta\omega/\omega_o)_{1.5}$  is relative bandwidth where power gain is 1.5 db below center frequency value

the desired 3-db bandwidth, a known pass-band shape and percent of maximum power transfer. If a number of stages are cascaded, the transfer responses in db are additive.

To permit the design of transformers to be used in pairs or triples, design curves for a single transformer are given in Fig. 5 and 6 in terms of 3/2-db bandwidth,  $(\Delta\omega/\omega_o)_{1.5}$ , and 1-db bandwidth,  $(\Delta\omega/\omega_{1.0})$ .

When two or three, respectively, of these transformers are cascaded, these bandwidths become the overall 3-db bandwidth. The shape factors on these curves are expressed for a single transformer and they must be interpreted for cascading. For example,  $(W_5/W_{3/2})$  for one transformer is  $(W_{10}/W_s)$  for a pair;  $P/V = 1.1$  for one transformer means that for a triple  $P/V$  is  $(1.1)^3$ .

### Chart Contour Interpretation

Several properties of coupled tuned circuits are apparent from the design charts.

The transitional coupling contour ( $P/V = 1$ ) and the critical coupling curve ( $p = 1$ ) divide the  $Q_1(\Delta\omega/\omega_o) - Q_2(\Delta\omega/\omega_o)$  plane into three regions. Referring

to Fig. 2, 5 or 6: between  $p = 1$  and the axes, the circuits are undercoupled and single peaked; between  $p = 1$  and  $P/V = 1$ , they are overcoupled but single peaked; outside  $P/V = 1$ , they are overcoupled, double peaked.

Different degrees of impedance match or center frequency power transfer may be obtained with the same pass band shape. For critical or overcoupled transformers, ( $p \geq 1$ ) maximum power transfer and best impedance match for a given pass band shape occurs when the  $Q$ 's are equal. For an undercoupled ( $p < 1$ ) transformer, this occurs at two values of  $Q_1/Q_2$ .

Moving along a contour of constant power transfer (constant  $p$ ), various shape factors may be obtained with the same impedance match. It is always possible to obtain a response which is not double peaked if the  $Q$ 's are made sufficiently unequal. For  $p \geq 1$ , it is always possible to achieve transitional coupling, at equal  $Q$ 's for  $p = 1$  and at two values of  $Q_1/Q_2$  for each  $p > 1$ .

### Changing Coupling

If  $Q_1$  and  $Q_2$  are fixed and coupling coefficient  $k$  is varied, the performance of the transformer can be seen on the design curves by considering radial lines  $Q_1/Q_2$  equal to a constant as illustrated in Fig. 7.

For example, if the coupling is increased, the design point moves along the given radial line in the direction of increasing  $p$ , since  $p = K^2 Q_1 Q_2$ . As a result, the center-frequency power transfer may increase or decrease, depending on whether the original value of  $p$  was less or greater than unity. The 3, 1.5, or 1-db bandwidth will increase since  $Q_1(\Delta\omega/\omega_0)$  increases. The shape of the pass band will tend toward double peaking and steeper skirts and the spacing between the peaks, if they exist, will increase.

For any given value of  $p$  there is a maximum value of  $Q_1(\Delta\omega/\omega_0)$ . For the critical coupling

contour this value, from Fig 2, is 2.2. Thus, if an impedance match is desired ( $p = 1$ ), the maximum 3-db bandwidth which may be obtained is  $(\Delta\omega/\omega_0)_s = 2.2/Q_1$ . With  $Q_1$  too large, this bandwidth may be inadequate.

From another viewpoint, when  $(\Delta\omega/\omega_0)_s$  and  $Q_1$  are both specified,  $Q_1(\Delta\omega/\omega_0)_s$  is greater than 2.2 if  $Q_1$  is too large. It is, therefore, impossible to match this source for the required band.

It is possible to load the source with a damping resistor, but a greater power transfer can be obtained by designing for the best impedance match at the given value of source  $Q$ . In Fig. 8, point A will give the maximum power transfer if no damping resistance is added. It is the point where line  $Q_1(\Delta\omega/\omega_0)$  is tangent to the  $p$  contour which has the value of  $p$  closest to one.

If the source is dampened so the effective source  $Q_1'(\Delta\omega/\omega_0) = 2.2$  then point B will give the maximum power transfer. However, there is now a loss in damping resistance  $R_p$  which has been added across the primary.

The ratio of the maximum values of power output without and with the damping resistance is  $P_o/P_o' = 1.82Q_1(p_A + 1/p_A + 2)(\Delta\omega/\omega_0)_s$ . A plot of this expression, Fig. 9, shows the db loss resulting from changing design points from A to B, versus the source  $Q_1(\Delta\omega/\omega_0)_s$ . The positive slope of this curve shows that any partial damping will not be as efficient as point A (no damping).

### Examples

(1) The output impedance, including strays, of a common-base

FIG. 6—Design curves for double-tuned transformers;  $(\Delta\omega/\omega_0)_s$  is relative bandwidth at half-power points

# Design Charts for Tuned Transformers (Continued)

FIG. 7—Increased coupling effects

FIG. 8—Effect of addition of damping resistance

neutralized transistor amplifier stage appears as a 7,500-ohm resistance in parallel with a  $10\mu\mu\text{f}$  capacitor. The load resistance is 500 ohms. Design a parallel-series double-tuned transformer for maximum power transfer at a frequency of 21.25mc, with a relative bandwidth of 0.2.  $Q_1 = \omega_0 R_1 C_1 = (133 \times 10^3) (10^{-11}) (7,500) = 10$ .

Since  $Q_1 \times (\text{relative bandwidth}) = 10.0 \times 0.2 = 2$ , it can be seen from Fig. 2, that the matched condition,  $p = 1$ , is possible. From Fig 2,  $Q_2 = 0.8/0.2 = 4$ . The primary inductance is then  $L_1 = 1/\omega_0^2 C_1 = 1/(133 \times 10^3)^2 (10^{-11}) = 5.64 \times 10^{-9}$  hy. The coefficient of coupling is found;  $p = 1 = k^2 Q_1 Q_2 = [k^2 / (1 - k^2)] Q_1 Q_2$ ,  $k = 0.156$ . The secondary inductance is  $L_2 = Q_2 R_2 / \omega_0 (1 - k^2) = 4(500) / (133 \times 10^3) (0.9756) = 15.4 \mu\text{hy}$ . The capacitance to tune the secondary

is  $C_2 = 1/\omega_0^2 L_2 = 1/(133 \times 10^3)^2 (15.4 \times 10^{-6}) = 3.65 \mu\mu\text{f}$ .

From Fig. 2, the ratio of the 10-db to 3-db bandwidths may be interpolated as 1.86. The response is single peaked.

(2) If, in the preceding problem, the output resistance were 17,000 ohms, what would be the transformer design for maximum power transfer?

The primary Q would be increased by the factor  $17,000/7,500$ :  $Q_1 = 10 (17/7.5) = 22.7$  and  $Q_2(\Delta\omega/\omega_0)_s = 0.2 \times 22.7 = 4.54$ .

Referring to Fig. 2, it can be seen that the matched case cannot be achieved with  $Q_2(\Delta\omega/\omega_0)_s = 4.54$ . To obtain minimum mismatch loss the contour with its peak tangent to  $Q_2(\Delta\omega/\omega_0)_s = 4.54$ ,  $p = 2.68$ , will be used. From Fig. 3,  $p = 2.68$  corresponds to a loss of about 1 db with respect to the matched case. This is the minimum loss that can be achieved with a double-tuned transformer in this stage. The value of  $Q_2$  at this peak may be interpolated as 2.83.

The primary inductance is the same as in the first example. The coupling coefficient is:  $k^2 / (1 - k^2) = p / Q_1 Q_2$ ,  $k = 0.20$ . The secondary inductance is  $L_2 = Q_2 R_2 / \omega_0 (1 - k^2) = (2.83) (500) / (133 \times 10^3) (0.96) = 11.0 \mu\text{hy}$ . The capacitance to tune the secondary is  $C_2 = 1/\omega_0^2 L_2 = 5.09 \mu\mu\text{f}$ .

(3) What would be the effect in the first example of a 10-percent increase in the coefficient of coupling?

The increased coupling coefficient is  $1.1 (0.156) = 0.172$ . The primary Q is not changed and

the secondary Q is only negligibly changed by the 1/2-percent variation in  $(1 - k^2)$ .

Parameter  $p$  is  $(0.172)^2 (10) (4) [1 - (0.172)^2] = 1.22$ . From Fig. 3, the power loss with respect to the matched case is 0.04 db. Moving along a radial line  $= Q_1/Q_2 = 10/4 = 2.5$  to the interpolated  $p = 1.22$  curve on Fig. 2,  $W_{10}/W_3$  changes from 1.86 at  $p = 1$  to 1.79 at  $p = 1.22$ .

From this shift along the radial line, the value of  $Q_2(\Delta\omega/\omega_0)_s$  changes from 2 to about 2.16. Since  $Q_1$  does not change, the 3-db relative bandwidth has increased from 0.2 to  $(0.2) (2.16/2.0) = 0.216$ . Thus, the 10-percent increase in  $k$  results in a power loss of 0.04 db, an increase of 8 percent in the 3-db bandwidth and a decrease in  $W_{10}/W_3$  of nearly 4 percent.

(4) Three identical transistor amplifiers each having an output Q of 17.75 are to be cascaded using three double-tuned transformers. What is the minimum insertion loss for the three transformers, neglecting coil losses? The overall 3-db relative bandwidth is to be 0.2. What will be the shape factors of the overall pass band?

$Q_1(\Delta\omega/\omega_0) = Q_1(0.2) = 3.55$

Referring to Fig. 6 at  $Q_1(\Delta\omega/\omega_0)_1 = 3.55$ , the minimum value of  $p$  is 3. Hence, from Fig. 3, the loss is 1.25 db per stage or an overall loss due to mismatch of 3.75 db. From Fig. 6,  $P/V = 1.02$  for one stage, or  $1.02^3 = 1.06$  for three stages. Also  $W_{10/3}/W_1 = 1.37$  for one stage, hence  $W_{10}/W_3 = 1.37$  for three stages. The separation of the peaks is about  $W_0/W_1 = 0.51$  for one stage or  $W_0/W_3 = 0.51$  for three.

FIG. 9—Damping loss as a function of undamped source Q

# ECCENTRIC-LINE IMPEDANCE NOMOGRAPH

**S**UMMARY — Chart permits finding characteristic impedance of eccentric coaxial lines in terms of conductor dimensions and amount of eccentricity. Scales may be multiplied by factors of ten to increase useful range of chart

By J. A. HASSE

**D**ISPLACING the conductors of a coaxial transmission line relative to each other while keeping their axes parallel results in a configuration called an eccentric line because of its appearance in cross-section. The accompanying chart gives the characteristic impedance  $Z_c$  in terms of eccentricity.

The chart is based on the relation

$$Z_c = 60 \ln \frac{D}{d} \left[ 1 - \left( \frac{2e}{D} \right)^2 \right]$$

where  $d$  is the diameter of the inner conductor,  $D$  is the inner diameter of the outer conductor and  $e$  is the axial offset or eccentricity of the conductors. Any consistent set of dimensions may be used.

For zero eccentricity ( $e = 0$ ), the familiar impedance formula is obtained, 60 times the Napierian logarithm of the major-to-minor diameter ratio. This case also appears on the nomograph and may be used where the line is truly coaxial.

All scales except  $Z_c$  may be multiplied by the same factor to extend the usefulness of the chart. The common multiplying factor is most conveniently a power of ten so the significant figures are retained.

The chart deals only with transmission lines having air

dielectric. To determine  $Z_c$  for solid dielectric lines divide the chart value of the square root of  $\epsilon_r$ , the relative permittivity or dielectric constant.

### Example

An example will clarify use of the nomograph. Given:  $D = 1.16$ ,  $d = 0.32$  and  $e = 0.25$ ; find  $Z_c$ .

Locate  $D = 1.16$  along the calibrated line and follow this value in curvilinear fashion to intersect with the eccentricity value  $e = 0.25$ , which is plotted horizontally. From this intersection return horizontally to the line of

zero eccentricity. Now connect  $d = 0.32$  and the last point determined with a straightedge, to give  $Z_c = 65$  ohms.

If for the same example  $e$  were zero,  $Z_c$  could be read with a straightedge as 77 ohms.

To illustrate use of a scale multiplication factor, the diameters selected in the example, 1.16 and 0.32, are ten times those for RG-58/U cable expressed in inches. The cable has a dielectric constant of approximately 2.2 and  $Z_c = 77/\sqrt{2.2} = 52$  ohms. For an eccentricity of 0.025 inch, referring again to the first example,  $Z_c = 65/\sqrt{2.2} = 44$  ohms.

# MEASURING R-F PARAMETERS

**SUMMARY**— Equipment and techniques for measuring small-signal  $h$  parameters of triode and tetrode junction transistors in the range from 1 to 24 mc are described. Amount of error introduced in measurement by output terminations is considered

**B**ECAUSE OF the inherent nature of the transistor, the most readily measured network coefficients are the series-parallel or  $h$  parameters.<sup>1,2</sup> Once the four  $h$  parameters are known at a given frequency and for a given set of d-c operating conditions, such quantities as power gain, voltage gain, input impedance and output impedance of the transistor in a transmission circuit may be calculated for the same frequency and d-c operating conditions.<sup>2</sup>

This article describes methods and equipment which can be used to determine the four grounded-base  $h$  parameters of junction transistors from 1 to 24 mc.

Under small-signal conditions the electrical behavior of a transistor can be described by considering it as a linear two-terminal-pair active network, with the four differential terminal voltages and currents related to four network parameters.

## Short-Circuit Input Impedance

The electrical symbol for the transistor and the direction of instantaneous current flow and voltage rise, together with the two network equations, are shown in

FIG. 1—Two-terminal-pair representation of transistor

Rack-mounted  $h$ -parameter measuring equipment. At the right may be seen one of r-f bridges and communications receiver. Both are mounted on a conducting ground-plane

Fig. 1. For convenience, transistors are shown as  $npn$  units, triode or tetrode;  $pnp$  transistors can be measured if the polarity of the bias supplies is reversed.

At radio frequencies the four  $h$  parameters are of the form  $h_{ij} = a \pm jb = C \angle \theta$ . In Fig. 1

$$a \pm jb = h_{11} i_1 + h_{12} e_2 \quad (1)$$

$$i_2 = h_{21} i_1 + h_{22} e_2 \quad (2)$$

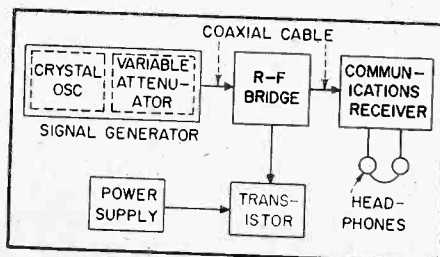

FIG. 2—Setup for measuring  $h_{11}$  parameter of transistors

where  $h_{11}$  is the short-circuit input impedance parameter and  $h_{12}$  is the open-circuit voltage-feedback parameter;  $h_{21}$  is the short-circuit current-transfer parameter and is equivalent to  $\alpha$ , except for a 180-deg phase difference. The quantity  $h_{22}$  is the open-circuit output admittance.

A fifth parameter is the short-circuit output admittance,  $y_{22}$ . This quantity may be found in terms of the  $h$  parameters by setting  $e_1 = 0$  in Eq. 1 and combining the result with Eq. 2 so

$$\frac{i_2}{e_2} = y_{22} = h_{22} - \frac{h_{12} h_{21}}{h_{11}} \quad (3)$$

As can be seen in Eq. 1, driving-point impedance  $Z_{in}$  at the input terminals will be equal to  $h_{11}$  if  $e_2$  is zero. This condition will prevail only if terminating admittance  $Y_{12}$  at the output terminals is infinite. Since this condition can be approached but never attained, it is of interest to find the error introduced in the determination of  $h_{11}$  by a finite terminating admittance  $Y_{12}$ . The following equation is therefore derived from Eq. 1 and 2. With

$$Z_{in} = h_{11} \left[ 1 - \frac{h_{12} h_{21}}{Y_{12} (1 + h_{22}/Y_{12}) h_{11}} \right] = h_{11} \left[ \frac{1 + y_{22}/Y_{12}}{1 + h_{22}/Y_{12}} \right] \quad (4)$$

Hence if  $Y_{12} \gg h_{22}$  and  $Y_{12} \gg y_{22}$ , then  $h_{11} \cong Z_{in}$ .

In the test circuit used for measuring  $h_{11}$ ,  $Y_{12}$  is the terminating admittance obtained from a bypass capacitor strapped between the collector and base connections

# F JUNCTION TRANSISTORS

By W. N. COFFEY

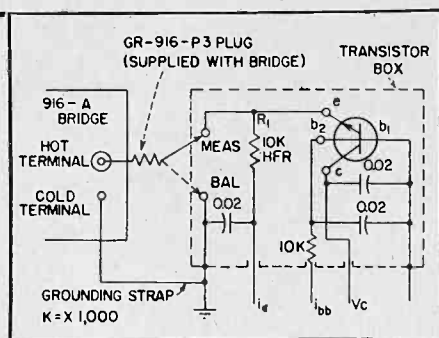

FIG. 3—Transistor-box circuit for  $h_{11}$  measurement

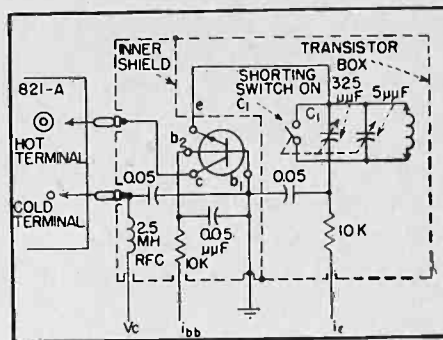

FIG. 4—Transistor-box circuit for  $h_{22}/Y_{22}$  measurement

of the transistor. The magnitude of  $Y_{12}$  is maintained  $\geq 0.1$  mho over the frequency range and thus is many times greater than either  $h_{22}$  or  $y_{22}$ .

The short-circuit input impedance is of the form  $h_{11} = r_{11} \pm jx_{11}$  in ohms and is measured with a General Radio model 916-A radio-frequency bridge as shown in Fig. 2. Additional equipment includes a crystal-controlled signal generator with 8 test frequencies from 1 to 24 mc and a communications receiver which serves as a detector. All of the equipment is placed on a sheet aluminum ground-plane. Connections to the bridge are made with double-shielded coaxial cable.

The transistor is connected to the bridge and its power supply as shown in Fig. 3. This circuit is contained in a 2 by 2 by 4 inch metal box fastened to the bridge close to the unknown terminals. Direct current for the emitter is fed in shunt with these terminals through  $R_1$ . The box is provided with a sub-miniature tube socket into which the transistor plugs.

## Correction Factors

The admittance of the parallel combination of  $R_1$ , the shunt capacitance to ground of the emitter circuit wiring in the box and the shunt capacitance to ground of the GR-916-P3 connecting lead may have to be accounted for in determining the true  $h_{11}$  parameter. This will be required generally if  $|h_{11}| > 200$  ohms and if the frequency is greater than 10 mc. Corrections for the inductance effects in the

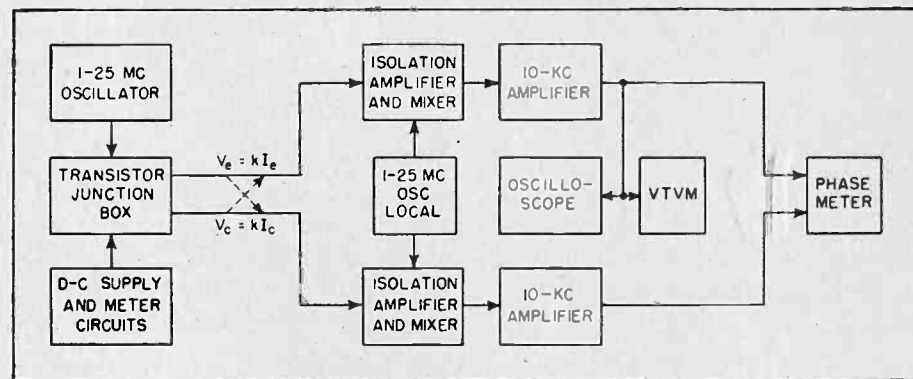

FIG. 5—Equipment necessary to measure  $\alpha$  at high frequencies

bridge may be necessary if the frequency is greater than 14 mc.

The open-circuit output admittance,  $h_{22} = g_{22} + j\omega C_{22}$  ( $\mu$ mho), can be measured as a driving-point admittance at the output terminals in Fig. 1 provided  $i_1 = 0$ , input terminals open-circuited. This parameter is measured with a GR model 821-A impedance-measuring circuit, in an arrangement similar to that shown in Fig. 2.

The transistor is connected to its d-c bias supply and to the impedance bridge by the circuit shown in Fig. 4. This circuit is contained in a small metal box and is provided with two banana jacks which plug into the bridge UNKNOWN terminals. The d-c collector current is fed through the inductance which forms part of a tuned circuit within the bridge. This inductance is connected directly across the unknown terminals.

Likewise, the d-c emitter current is fed through the inductance of a parallel-resonant circuit used to provide a high impedance in the external emitter-base circuit. The error introduced by using a finite,

but large, rather than infinite terminating impedance,  $Z_{11}$ , is given in the following equation. With  $e_1 = -i_1 Z_{11}$ , then

$$Y_{out-\infty} = h_{22} \left[ 1 - \frac{h_{12} h_{21}}{Z_{11} \left( 1 + \frac{h_{11}}{Z_{11}} \right) h_{22}} \right] = h_{22} \left[ \frac{1 + z_{11}/Z_{11}}{1 + h_{11}/Z_{11}} \right] \quad (5)$$

where  $z_{11}$  is the open-circuit input impedance,  $(h_{11} - h_{12}h_{21}/h_{22})$ .

For  $Y_{out-\infty}$  to be a measure of  $h_{22}$  with small error, it is necessary that  $Z_{11} \gg h_{11}$  and  $Z_{11} \gg z_{11}$ . In the test circuit used in this measurement, the minimum  $Z_{11}$  afforded by the parallel-resonant circuit over the frequency range is 25,000 ohms, which is adequate.

## Procedure

After the bridge is initially balanced with the junction box plugged in, the tuned circuit is adjusted to resonance by placing it across the UNKNOWN terminals of the bridge and measuring its admittance. This is easily done by strapping through the transistor connection, emitter

# Measuring R-F Parameters of Junction Transistors (Continued)

to collector. The strap is then removed and the transistor is inserted in the circuit for measurement. Correction for frequency effects within the bridge may be necessary above 14 mc.

As an alternative to measuring the  $h_{12}$  parameter directly, the short-circuit output admittance,  $y_{22} = g'_{22} + j\omega C'_{22}$ , ( $\mu\text{mho}$ ), is measured. In this case the termination required at the emitter-base terminals is a very low impedance, ideally a short-circuit.

Parameter  $y_{22}$  is measured after the  $h_{22}$  measurement, before the bridge and the terminating tuned circuit are readjusted to a different frequency. To measure  $y_{22}$  it is only necessary to turn tuning capacitor  $C_1$  in Fig. 4 to full mesh, so the bent tip of one of the rotor plates makes contact with the adjacent stator plate. This short-circuits the tuned circuit and drops the terminating impedance to a few ohms or less.

## Open-Circuit Voltage-Feedback Parameter

The open-circuit voltage-feedback parameter,  $h_{12} = |h_{12}| \angle \Psi$ , is equal to the ratio  $e_1/e_2$  if  $i_1 = 0$ , as shown in Eq. 1. To make  $i_1 = 0$ , an

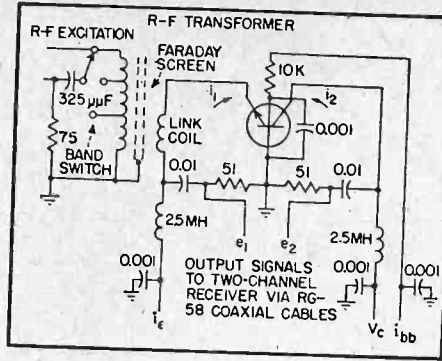

FIG. 6—Transistor junction box used for  $h_{21}$  measurement

infinite terminating impedance  $Z_{11}$  is required. A voltage generator  $e_2$  could be placed across the output terminals in Fig. 1 and the feedback voltage  $e_1$  in the microvolt range, measured with a high-impedance voltmeter across the terminals. This voltmeter impedance, plus an additional parallel impedance to allow d-c emitter current to flow would result in a finite  $Z_{11}$ . The error introduced by having a finite rather than infinite terminating impedance is determined from the relationship

$$\frac{e_1}{e_2} = \frac{h_{12}}{(1 + h_{11}/Z_{11})} \quad (6)$$

Probe-type vacuum-tube volt-

meters which can measure in the microvolt region are available, but are accurate for frequencies up to only several mc. For measuring  $h_{12}$  with such a device one could provide a parallel-resonant circuit at the emitter-base terminals and tune out the capacitive reactance of the vtvm probe and associated wiring. At the same time, d-c emitter current could flow through the inductance. Moderately high values of operating Q in this circuit will make  $Z_{11} \gg h_{11}$  so that a measure of  $e_1/e_2$  will be a good measure of  $|h_{12}|$ .

Because of the frequency limitations involved with commercially available microvoltmeters as well as the difficulty in measuring the phase angle of  $h_{12}$ , it was felt desirable to measure  $h_{12}$  indirectly using the following relationship which involves the directly measured parameters already discussed

$$\frac{h_{12}}{h_{11}} = \frac{(y_{out-oc} - y_{out-sc})}{h_{21} \left[ \frac{1}{1 + \left(\frac{Z_{11-sc}}{h_{11}}\right)} - \frac{1}{1 + \frac{Z_{11-oc}}{h_{11}}} \right]} \quad (7)$$

If  $Z_{11-sc} \ll h_{11}$  and  $Z_{11-oc} \gg h_{11}$ , then  $h_{12} \approx (h_{11}/h_{21})(y_{out-oc} - y_{out-sc})$  (8)

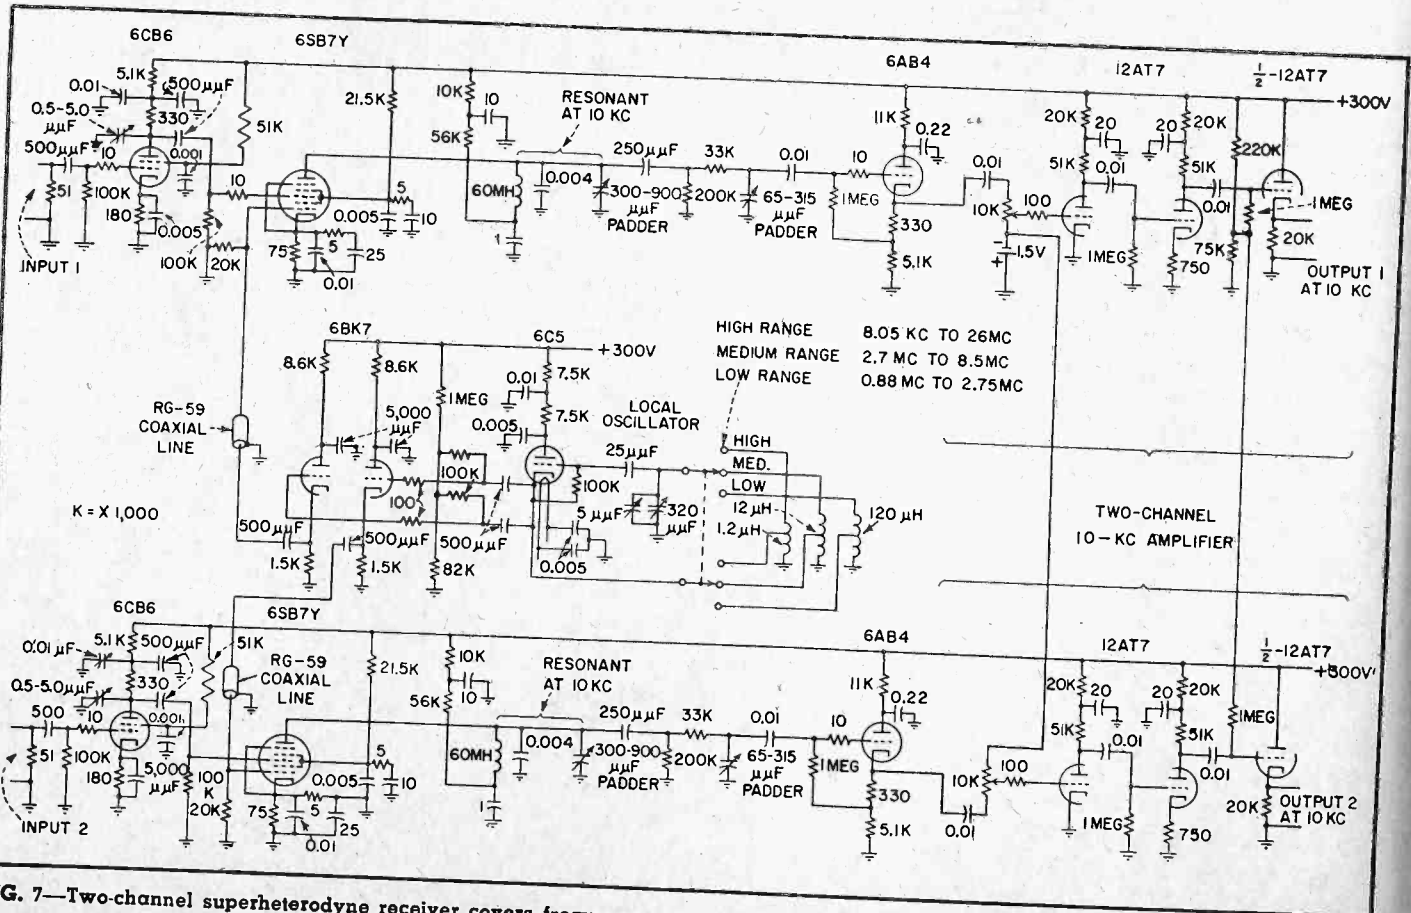

FIG. 7—Two-channel superheterodyne receiver covers frequency ranges of 8.05 to 26, 2.7 to 8.5 and 0.88 to 2.75 mc

If  $Z_{11-\infty} = 0$  and  $Z_{11-0} = \infty$ , then  
 $h_{12} = (h_{11}/h_{21})(h_{22} - y_{22})$  (9)

### Short-Circuit Transfer Parameter

The short-circuit transfer parameter is  $h_{21}$  or  $a$ , where  $-a = h_{21} = |h_{21}| \angle \theta$ .

As shown in Eq. 2,  $i_2/i_1 = h_{21}$  if  $e_2 = 0$ . This will be obtained if a short-circuit exists at the output terminals in Fig. 1. In the method of measurement to be described the two currents are measured as voltage drops across two low resistances of equal magnitude. Because each of these two voltages is developed across a low impedance, the circuit is not seriously disturbed when the reactance associated with the input capacitance of the vacuum-tube stage is connected across this impedance.

The value of  $h_{21}$  measured in this manner will have an error dependent upon the magnitude of the admittance used in the collector circuit  $Y_{12}$  according to the equation

$$\frac{i_2}{i_1} = \frac{h_{21}}{1 + h_{21}/Y_{12}} \quad (10)$$

In the circuit used to measure  $h_{21}$ ,  $Y_{12}$  is 0.04 mho, hence  $h_{21}/Y_{12} \ll 1$ .

One method of measuring the magnitude and phase difference angle of two r-f voltages in the microvolt range is to heterodyne these two voltages down to a much lower frequency, say to 10 kc.<sup>3</sup> The equipment used is shown in Fig. 5.

The r-f signal used to excite the transistor, as well as the d-c bias currents and voltages, is applied to the transistor in the circuit of Fig. 6. This circuit is contained in a brass box and includes an r-f transformer equipped with a Faraday screen. The primary is a tapped coil to cover the frequency range and is series-resonated at the operating frequency with the 325- $\mu\mu\text{f}$  capacitor. The secondary is a two-turn link winding which is in series with the transistor emitter-base circuit.

The r-f voltage induced in the link winding causes an r-f current,  $i_1$ , to flow and the transistor in turn generates current  $i_2$ . A voltage  $e_1$  proportional to  $i_1$  is fed to a pentagrid-mixer tube and voltage  $e_2$  proportional to  $i_2$  is fed to a second pentagrid-mixer tube. If both mixers are excited with a

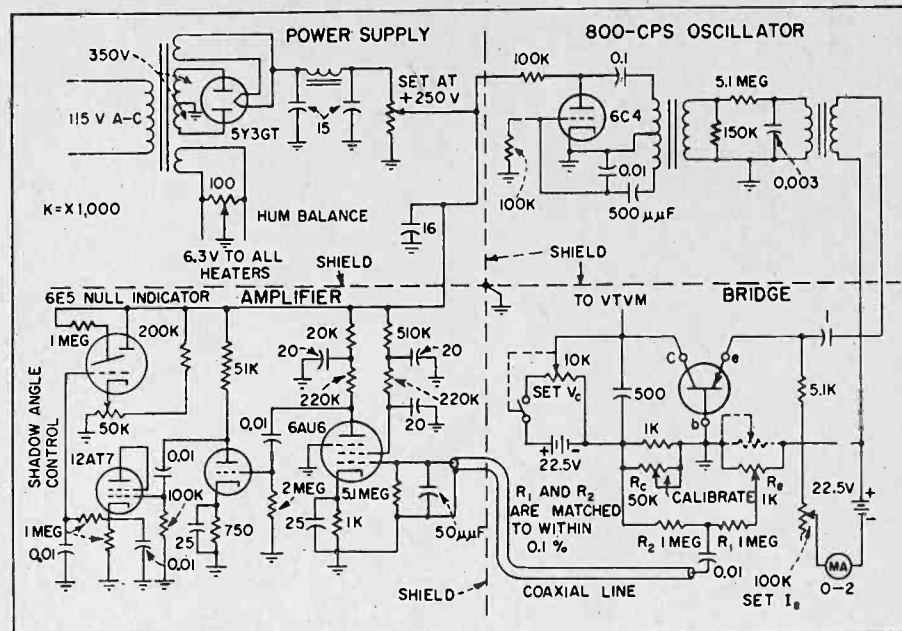

FIG. 8—Complete circuit of h-f  $\alpha$  measurement meter

common local-oscillator signal, 10 kc higher than the frequency of  $e_1$  and  $e_2$ , the two difference-frequency signals will have the same amplitude ratio and phase-angle difference as  $e_1$  and  $e_2$ , provided the amplitude and phase responses of the two channels are equal.

The bandwidth of the two 10-kc i-f channels is limited by a tuned circuit following the mixers to increase the signal-to-noise ratio of the system. An audio-frequency phasemeter indicates the angle of  $h_{21}$  directly.

To eliminate the necessity of having equal gain in both channels, voltages  $e_1$  and  $e_2$  are each switched into a common channel and the decibel ratio of  $e_2/e_1$  is read on the Ballantine model 300 vacuum-tube voltmeter.

### Two-Channel Receiver

The schematic diagram of the  $h_{21}$  two-channel receiver is shown in Fig. 7. The high-pass R-C filter shown following the tuned circuit at the output of each mixer stage attenuates the voltage induced in the inductance of this tuned circuit by stray 60-cps magnetic fields. The 65 to 315  $\mu\mu\text{f}$  variable capacitor is used to equalize the phase shift between the two 10-kc i-f amplifier channels.

To determine the grounded-base alpha-cutoff frequency, the low-frequency  $h_{21}$ , designated as  $h_{210}$ , must be known. The frequency at which  $|h_{21}|$  is 0.707 of, or 3db down from,

its low-frequency value ( $h_{210}$ ) is the alpha-cutoff frequency. The low-frequency value of  $a$  can be measured in a variety of ways.<sup>4,5</sup>

An instrument for obtaining a rapid answer is shown in Fig. 8. This is a bridge circuit, operating at about 800 cps. The bridge is balanced by adjusting multiterm-potentiometer control  $R$ , until a null is observed on the 6E5 electron-ray tube. The value of  $h_{210}$  is then read directly off the multiterm-potentiometer dial with an accuracy of  $\pm 0.2$  percent.

To insure that it is the small-signal h-parameters that are being measured, the amplitude of the r-f excitation from the generator is varied over wide limits by the attenuator. If the value of the parameter does not change with signal level, the transistor is operating as a linear or small-signal device.

The writer is grateful to R. H. Johnston for his help in the construction of the equipment and is also indebted to R. L. Pritchard for his criticism and encouragement during the writing of this report.

# DESIGNING DIELECTRIC

FIG. 2—Cross-sections of spherical lenses and ray paths. Design equations are for index of refraction  $n$  and distance from axis  $r$

**I**NDIVIDUAL LENSES, in conventional optical designs, have a constant refractive index and lens action is obtained by shaping the surfaces. In microwave optics design, the possibility of a variation in index from point to point within the lens is available, offering the designer another degree of freedom. For example, if it is desirable to minimize the thickness of a lens, focusing can be achieved partly by the lens surface and partly by a variation in the index of the material forming the lens.

### Lens Materials

Materials available for lens design in microwave optics include low-loss dielectric materials such as polystyrene and Teflon. Aluminum-flake or carbon particles in a low-density foam dielectric achieve considerable weight reduction with a slight increase in lens loss. For all of these materials, the index of refraction is the square root of the dielectric constant, so in describing lens designs either of the terms refractive index or dielectric constant can be used.

The most straightforward technique for constructing a microwave lens which possesses a variation in refractive index involves the use of many different materials, each of which has a different refractive index. For example, a spherical lens can be made up of a small spherical core, together with

spherical shells of increasing radii. The material in each shell can have a different value of dielectric constant or refractive index. By using a sufficient number of shells, the desired lens can be obtained to a reasonable approximation.

The major difficulty in this technique is obtaining the variety of dielectric materials and maintaining the desired dielectric constant from one production run of the material to the next. Most dielectric materials have a variation in dielectric constant of at least 3 percent between various samples. The finite error in dielectric constant places a practical limit on the degree of approximation to the desired refractive index.

### Artificial Dielectric

Another technique involves artificial dielectrics obtained by using the fact that microwave wavelengths are of the order of a few inches, so that obstacles can be formed which simulate the molecules of a real dielectric. As long as these obstacles have small diameters and spacing have small diameters compared to wavelength, the analysis of the artificial dielectric can be closely related to that of the real dielectric.

The most practical obstacle for general applications has been found to be of spherical shape. For such an obstacle, the refractive index is independent of the direction of the

wave passing through the lens.

It is possible to analyze the effective dielectric constant on the basis of the sphere diameter and the center-to-center spacing. These parameters can be replaced by a concept of fractional volume, that is, volume occupied by the spheres alone, compared to that occupied by the spheres and adjacent medium. The spheres considered were metallic or dielectric materials in a low-dielectric medium or voids in a base dielectric.<sup>1</sup> From the results of this study and a consideration of the mechanical problems involved in forming a lens, void-dielectric material was found best.

The dielectric constant  $K$  of an artificial medium comprised of a cubical lattice of spherical voids is<sup>1</sup>

$$K/K_1 = (1 + 2FC)/(1 - FC) \quad (1)$$

Fractional volume  $F$  is the volume of the voids in unit volume; thus,  $F$  involves the void diameter and

FIG. 3—Indication of phase-error correction through use of half-Maxwell lens

# MICROWAVE LENSES

**S**UMMARY—Data for Maxwell, Luneberg, Eaton, Kelleher and modified types of variable index-of-refraction lenses aid antenna designers. New dielectric materials provide considerable weight reduction with slight increase in lens loss. Typical design example for Luneberg lens is covered

By K. S. KELLEHER

the void density in number per unit volume. Constant  $C$  is characteristic of the base medium,

$$C = (1 - K_1)/(1 + 2K_1) \quad (2)$$

where  $K_1$  is the dielectric constant of the base medium. It has been found experimentally that Eq. 1 is valid even when the diameter and spacing of voids exceed  $\lambda/4$ .

## Cylindrical Voids

For maximum flexibility in design and ease in machining, cylindrical voids can be used to replace spherical voids.

An experimental program determined the relationship between the cylinders and spheres. Typical measured data is shown in Fig. 1. The solid curve is calculated from Eq. 1, with  $K_1 = 2.515$  (for polystyrene).

The points are experimental and apply to samples having eight cylinders per unit cube (measuring

0.936 inch on a side) and a cylinder length equal to cylinder diameter. Similar data was obtained for length-to-diameter ratios of  $2\frac{1}{2}$ . Maximum fractional volume for the two latter ratios was 16 percent. The largest cylinder diameter for which data is shown is approximately 0.172.

With the exception of a single point at large fractional volume, the maximum deviation of the measured dielectric constant from the value which would be predicted on the basis of spherical voids having the same fractional volume is one percent. This value is of the order of the experimental error. Larger cylindrical voids having a diameter of 0.344 were also tested.

A limited amount of data was taken because of the long length of sample which is required, but even with this very large element, the measured data was within 18 percent of that expected from the

spherical void theory. From these measurements, it is concluded that Eq. 1 is applicable within a few percent to all cases investigated, irrespective of the orientation of the cylinders.

## Metal-Plate Media

A third technique for obtaining a variation in refractive index uses metal-plate media. The refractive index is obtained by considering the increase in phase velocity, which occurs when a wave polarized parallel to a set of parallel plates passes through the plates. This technique has been used successfully in the design of metal-plate lenses where the refractive index is known to depend on the spacing between plates.

If two metallic surfaces are arranged so there is a variation in spacing between the surfaces and if an electric field is introduced approximately parallel to the plates, then the phase velocity, and therefore the refractive index, will vary from point to point in the region between the metallic surfaces. The index approaches one when the spacing between plates is large compared to a wavelength and zero as the spacing is reduced. This technique for obtaining a variation in refractive index is limited to a two-dimensional lens or a three-dimensional structure.

If the spacing between plates is measured, always normal to the

FIG. 4—Spherical Luneberg lens before (left) and after (right) foam binder application

# Dielectric Microwave Lens Design (Continued)

FIG. 5—Radiation patterns of Luneberg and standard parabolic lenses

particular tangent plane containing the electric-field vector, the index of refraction is related to spacing  $a$  and the signal wavelength by

$$n = \sqrt{1 - (\lambda/2a)^2}$$

If the spacing between plates is filled with a dielectric of constant  $K$ , the index is given by

$$n = \sqrt{K - (\lambda/2a)^2}$$

## Spherical Lenses

Once techniques are available for obtaining a variable index material, consideration can be given to the design of microwave lenses having properties superior to those of conventional lenses.

One of the most useful families of variable-index lenses is that in which the lens surface is a sphere with the transmitting or receiving element mounted on the spherical surface. In such an arrangement, it is possible by use of different lens designs to obtain a formation

of the transmitted spherical wave into many different wavefronts, such as spherical surfaces,<sup>2</sup> toroidal surfaces<sup>3</sup> and conical surfaces.<sup>4</sup>

Lenses which have been of most interest up to the present time are elements which yield spherical, plane and cylindrical surfaces; these are the Maxwell, Luneberg and Eaton. Cross-sections of these lenses, together with the ray paths and design equations, are given in Fig. 2.

## Maxwell Lens

The Maxwell lens has been found useful in microwave applications as a correcting element in a sharply flared feed horn. In such a horn, the phase front across the aperture has the quadratic form shown in Fig. 3. Radiation patterns from this horn have, in general, high side-lobe characteristics.

To reduce these lobes, lenses of the dielectric or metal-plate type have been successfully used; however, one-half of the Maxwell lens offers improved possibilities in side-lobe reduction. This can be understood by considering the ray paths through such a lens.

In a sphere of unit radius (Fig. 2A), the ray leaving the feed at angle  $\alpha$  intersects the aperture at a distance  $d$  from the axis given by  $\tan(\alpha/2)$ . This means that the rays, upon passing through this lens, tend to concentrate at the center of the aperture so there is a tapering in the illumination across the aperture.

Since tapered illumination produces low side lobes, it can be expected that better radiation pat-

terns can be obtained from a correcting lens of the Maxwell form than could be obtained with the conventional constant-index lenses.

## Luneberg Lens

The most important lens in terms of application is the Luneberg. This spherical lens accurately focuses an incoming plane wave into a point on its surface. Because of its spherical symmetry, it can focus plane waves arriving from any direction, a characteristic not shared by any other known optical device. Figure 4 shows a Luneberg lens constructed from a void dielectric.

It is useful to compare the Luneberg lens to a paraboloidal reflector with circular aperture. If the diameter of the paraboloidal aperture is equal to the diameter of the Luneberg sphere, then a direct comparison can be made.

Figure 5 shows a typical pattern from the paraboloid, together with a pattern from a Luneberg sphere. Neither pattern represents the best that can be obtained from either antenna. However, they do indicate that the Luneberg lens has a narrower beamwidth than the reflector, but that the reflector shows some improvement in side-lobe level. These pattern characteristics arise from the fact that the paths followed by the rays in a Luneberg lens tend to concentrate energy towards the aperture edges.

The ray making angle  $\alpha$  at the feed (Fig. 2B) intersects the aperture at a distance  $d$  from the axis of  $\sin \alpha$ . This reduction in illumination taper is known to cause an

FIG. 6—Two-dimensional Eaton lens. Feed is mounted at left

FIG. 7—Radiation pattern of Eaton lens shown in Fig. 6

FIG. 8—Cross-section of constant-thickness lens

increase in side-lobe level and decrease in beamwidth.

Consequently, the Luneberg lens cannot be used for extremely low side lobe applications. However, for applications requiring side lobes of the order of 22 db, this lens can be used and, in such an instance, its symmetrical structure gives it a wide-angle performance not attainable by the normal paraboloidal reflector.

The wide-angle performance of the Luneberg lens indicates two general applications. The first of these is for wide-angle scanning. The lens structure can be fixed and a lightweight feed horn rotated so that it always touches the surface of the lens. The beam from the horn-lens combination is swept through an angle equal to the angle of the horn rotation.

Another application utilizes a single lens with multiple feeds. Each feed has a corresponding beam in a direction given by the line joining the feed to the center of the sphere. A number of these feeds can be used to provide coverage over a wide sector of space.

### Eaton Lens

The Eaton lens produces a twin-beam radiation pattern from a single source mounted on the spherical surface as in Fig. 2C.

Consideration of the required index variation, that the refractive index be equal to the normalized radius, indicates the difficulty in constructing an Eaton lens. Since the normalized radius varies from zero to one, the refractive index must have the same variation.

Such values of refractive index cannot be achieved with normal or with artificial dielectrics. The only possibility is the use of a metal-plate medium. Such a medium has only restricted application to the Eaton lens, since it is based on the almost parallel plates previously mentioned. Use of parallel plates restricts the lens to two dimensions, so the complete sphere cannot be realized.

A two-dimensional Eaton lens has been constructed and evaluated. Fig. 6 is a photograph of the lens and Fig. 7 shows a typical radiation pattern. This lens operates over a limited frequency band.

Since the formula for index of refraction contains the operating wavelength, the index of refraction varies when this wavelength is changed.

### Disk-Shaped Lenses

Another useful lens shape is the short cylinder or disk shown in cross-section in Fig. 8. These lenses have a preferred direction or optical axis, whereas spherical lenses perform equally well for waves from all directions. The optical axis of these disk lenses coincides with the cylinder axis, causing the unusual situation of lenses with plane surfaces.

Although the disk-shaped lenses do not have the wide-angle performance typical of the spherical lenses, they have found application in the microwave-optics field. One lens has been used as a feed-correcting element with good results.<sup>6</sup> This corrector is a lens first described by Luneberg. Its index of refraction varies only with the radial coordinate, according to the expression  $n = n_0 \operatorname{sech} [\pi r / (2T)]$ , where  $n_0$  is the axial refractive index and  $T$  is the thickness. Note that the index required is a function of the disk thickness; a change in thickness would alter the lens performance.

The ray making an angle  $\alpha$  at the feed intersects the aperture at a distance  $d$  given by  $(2T/\pi) \operatorname{arc} \operatorname{sech} (\cos \alpha)$ . As indicated in the cross-section, the rays spread at the aperture edges to produce an illumination taper. This taper has been shown to be an approximation to a Gaussian distribution which produces very low side lobes.<sup>6</sup> The exact distribution depends on the lens thickness and the maximum value of  $\alpha$ .

It is of interest to compare this lens with the Maxwell lens, which can also be used as a feed corrector. The incident signal in the waveguide can be easily matched into a Maxwell lens with an index of unity at the lens surface. The constant-thickness lens, on the other hand, has an index requirement which indicates a value of the order of two along the lens axis, with decreasing index away from the axis.

The waveguide transmission line

FIG. 9—Cross-section of Kelleher lens

FIG. 10—Radiation pattern of Kelleher lens of Fig. 9

then has the problem of matching a section of air-filled line to a dielectric-filled line. Both lenses have the normal matching problem at the aperture.

The constant thickness lens permits a greater control over the illumination taper and, hence, better control over the side lobes from the corrected feed. Moreover, the depth of the corrected feed can be minimized in the constant thickness design, whereas the best ratio of feed depth to aperture is a value of  $\frac{1}{2}$  for the Maxwell lens. Both lenses are superior to the conventional correcting lenses in that such lenses always have a ratio equal to or greater than unity.

### Kelleher Lens

This lens has the same geometrical form as that of the previous

# Dielectric Microwave Lens Design (Continued)

FIG. 11—Cross-section of modified Luneberg lens

disk; the major difference is that the source is placed on the axis of the cylinder at some distance from the lens. This is the only variable-index lens designs now available, which does not have the source adjacent to the lens surface. In this respect, it is most closely allied to the conventional lenses utilizing a constant index of refraction.

The ray paths through a cross-section of this lens are given in Fig. 9. It can be seen that the source has an image at infinity. The expression for the required radial variation in refractive index is more complex than those previously given. This variation is

$$T(n^2 - 2/3 \sin^2 \theta) = (n^2 - \sin^2 \theta)^{1/2} (n_0 T - \sec \theta + 1)$$

where  $n_0$  is the index at the axis,  $T$  is lens thickness and  $\theta$  is the angle between the axis and the radius vector from the source point to a general point of the adjacent lens surface.

This lens has been compared to a constant-index lens with shaped surfaces. A typical pattern, shown in Fig. 10, indicates that the beam-width from this lens is narrower than that expected from an aperture of this size. This is probably due to the existence of a trapped field about the periphery of the disk, which tends to produce a greater effective aperture.

A comparison of the off-axis characteristics of the two lenses showed that the variable-index lens was superior. Analysis involving ray tracing has also shown that good off-axis performance can be expected.

An interesting feature of any disk lens is that it can have a periodic structure as the thickness is increased. Any lens with feed adjacent to a surface has ray paths

which are curved to focus at an image point within the thicker lens, then diverge, and again curve to form a second image point and so on until the second lens surface is reached. The radiation pattern obtained depends on the point in the cycle where the second lens surface is introduced.

In the Kelleher lens, a similar periodic structure is obtained by doubling the lens thickness so the rays are curved to form an image at a point symmetrical with the source point. Additional lenses of equal thickness can be introduced at the correct positions to continue the periodic-ray variation.

## Other Lens Shapes

Besides spherical and disk-shaped lenses, several others have been studied in the microwave-optics field. One of these is a modification of the Luneberg lens to minimize lens thickness. This modification permits a reduction in the radius of the lens in the region of the detecting system.

A cross-section through this lens, together with typical ray paths, is given in Fig. 11. A source at infinity is imaged perfectly at the corresponding point on the surface of reduced radius. Three existing expressions for the modified Luneberg lens are listed below for comparison:

$$(1) n^2 = (2a - r^2)/a^2 \text{ for } 0 \leq r \leq a \text{ and } n^2 = (2 - r)/r \text{ for } a \leq r \leq 1;$$

$$(2) 4an^2 = \frac{(1+P)[\sqrt{\delta(1+a)} + \{4P^2 + (1-a)^2\}^{1/2}]^2}{(P + \sqrt{\delta a})^2}$$

for  $0 \leq r \leq a$  and  $r^2 n^2 = 1 + \delta(1-r)(r-a)$  for  $a \leq r \leq 1$  where  $P = 1 - r^2 n^2$  and  $\delta$  is a constant;

$$(3) n^2 = (1 + a^2 - r^2)/a^2 \text{ where } a \text{ is the radius of the lens in the reduced region.}$$

## Typical Lens Design

Design of any of the lenses described is relatively simple since the index varies only with one coordinate.

A typical design involves the spherical Luneberg lens whose index varies with radius as  $n^2 = 2 - r^2$ . At this point, it should be observed that the index squared is equal to the dielectric constant, so it is possible to relate the lens-design equation directly to dielectric-constant

values. The design technique found most practical uses the void dielectric of Eq. 1 and 2. The desired sphere is formed from a collection of disks of varying radius, placed one above the other, to approximate a spherical form similar to that in Fig. 4.

There are four steps in the design.

(1) Select base material of dielectric constant  $K_1$  and obtain the coefficient  $C = (1 - K_1)/(1 + 2K_1)$ ; using polystyrene with  $K_1 = 2.52$ ,  $C = -0.252$ . (2) Write Eq. 1 using values of  $K_1$  and  $C$  to obtain a relationship between void-dielectric constant and fractional volume;  $K = 2.52(1 - 0.504F)/(1 + 0.252F)$ . (3) Combine the lens equation relating dielectric constant to coordinate value with Eq. 1 to obtain a relationship between coordinate value and fractional volume;  $2 - r^2 = 2.52(1 - 0.504F)/(1 + 0.252F)$ . (4) Compute fractional volume as a function of the position within the lens.

To use the disk assembly technique, note that  $r^2 = a^2 + d^2$  where  $d$  is the distance of the disk from the lens center and  $a$  is the radius coordinate within the disk. The fractional volume is then given by

$$F = 3.97 \left\{ \frac{0.52 + a^2 + d^2}{7.04 - a^2 - d^2} \right\}$$

For a disk at a given distance  $d$  from the lens center, the fractional volume at any disk radius is known.

In practice, each disk is divided into annular rings of width less than  $\lambda/4$  so no void will be large in terms of a wavelength. The desired fractional volume in each annular ring is determined from the above equation. This void volume is then obtained by drilling the correct size and number of holes.

# SLAB LINE NOMOGRAPH

**S**UMMARY — Design of air-dielectric slab line used as transition or matching section between coaxial and strip transmission lines. Nomograph relates characteristic line impedance, diameter of inner conductor and separation between parallel ground planes

By ELIO SION

**S**LAB LINES have numerous applications in microwave transmission circuits.

The slab line is a double-slotted coaxial line whose outer shield has been unwrapped and extended to infinity in both directions. The resulting configuration consists of a round cylindrical conductor between two parallel planes, for which exact impedance formulas have been developed.<sup>1</sup>

The simplified formula<sup>2</sup>  $Z_0 = 138 \log_{10} (4S/\pi D)$  used in the construction of the accompanying nomograph for such slab lines is accurate to within 2 percent for values of  $S/D > 1.5$ .

Suppose it is desired to design a slab line of 100 ohms impedance with an inner conductor 0.025 inch in diameter. Enter the left-hand column at  $D = 0.025$  and connect that point with a straight line to  $Z_0 = 100$  ohms on the right-hand column. The center column yields the separation between plates as 0.105 inch.

To prevent radiation the width of the ground plates should be, as a rule of thumb, at least five times the separation between plates. Here  $5 \times 0.105 = 0.525$  inch, so make the plates at least  $\frac{1}{2}$  inch wide.

# EQUIVALENT R-Z CHART

**S**UMMARY—Parallel components of resistance and reactance in a given frequency range for an unknown circuit can be obtained quickly and easily by use of Q meter and nomographs

**T**HE Q METER is useful in obtaining the parallel components of resistance and reactance of a network. When a number of readings are to be taken over a frequency range, the use of nomographs can provide a saving in time and effort. The procedure for using the nomographs is as follows:

Tune the Q meter to resonance at the measurement frequency,

By HALLAN E. GOLDSTINE

using a relatively high-Q shielded coil. Record the frequency, Q-meter capacitance reading and the Q reading. These are  $f$ ,  $C_1$  and  $Q_1$ .

Connect the unknown network

across the capacitance terminals of the Q meter. Without changing frequency, retune the capacitance of the Q meter to resonance. Only measurement values within the proper range can be used, otherwise the readings may not be obtainable on the Q meter.

Record the capacitance and Q with the network connected.

FIG. 1—Chart gives  $Q_2$  value for solution of parallel resistance equation

FIG. 2—Nomograph solves equations for both parallel resistance and reactance

The parallel resistance and reactance are

$$\frac{1}{G} = X_c Q_2 \quad Q_2 = \frac{Q_1 \times Q_T}{Q_1 - Q_T}$$

$$\frac{1}{B} = \frac{-j}{\omega(C_1 - C_T)}$$

where  $1/G$  = parallel resistance in ohms and  $1/B$  = parallel reactance in ohms.

As an example, at a frequency of 2 mc the Q meter readings were  $C_1 = 210 \mu\mu f$ ,  $Q_1 = 225$ .

After connecting the network, readings were  $C_T = 200 \mu\mu f$  and  $Q_T = 200$ .

Referring to Fig. 1 a straightedge is placed across from 225 on the  $Q_1$  column, through the value of 200 on the  $Q_T$  column, and approximately 1,800 is obtained on the  $Q_2$  column on the left side. To obtain better accuracy for high  $Q_2$  values, the right side of the chart is used. By placing the straightedge on the  $Q_1$  value of 225, through  $Q_T$  value of 200 on the right, the  $Q_2$  value of approximately 1,800 is obtained on the right-hand  $Q_2$  column.

Using Fig. 2, the straightedge is placed on the frequency of 2

mc and the capacitance  $C_1$  reading of 210. The  $X_c$  reading of 380 is read. The straightedge is then placed from 380 on the  $X_c$  column to the  $Q_2$  reading of 1,800 giving a value of 700,000 ohms.

Reactance component  $1/B$  is equal to  $-j/\omega(C_1 - C_T)$ . To obtain this value from Fig 2, set straightedge again on 2 mc, through value of  $(C_1 - C_T)$ , in this case  $210 - 200 = 10 \mu\mu f$ , and the value of 8,000 is read off the  $X_c$  scale.

The parallel components are thus  $1/G = 700,000$  ohms and  $1/B = -j 8,000$  ohms.

# UNIVERSAL RESPONSE CURVES

— By HERMAN I. LEON and HOWARD WEINBERGER —

**SUMMARY**—Graph showing spurious responses that may occur in wide-band uhf and vhf superheterodyne receivers aids in selection of intermediate frequencies and specifications for preselector selectivity

**S**ELECTIVITY of superheterodyne receivers makes possible a high degree of protection from adjacent-channel interference. Unless the receiver is properly designed, however, it is possible for a signal not in the immediate vicinity of the dial setting to produce a spurious response.

It is possible, by proper choice of the intermediate frequency, to place these spurious response frequencies far from the dial setting. In this way, the preselector selectivity required for a given spurious response attenuation is minimized.

## Equations

A spurious response is produced whenever integral multiples of the input and local oscillator frequencies differ by the intermediate frequency. The curves presented here show the strongest responses. Additional curves may be constructed for the higher-order responses from

$$\frac{F_2}{F_1} = \pm \frac{N}{M \pm 1} \frac{F_i}{F_1} - \frac{M}{M \pm 1} \quad (1)$$

where  $F_1$  = dial frequency,  $F_2$  = center of i-f passband,  $F_i$  = any input frequency,  $M$  = order of local-oscillator harmonic and  $N$  = order of signal harmonic.

This is the equation of a series of lines. For the local oscillator frequency above the dial frequency, only positive values of  $F_2/F_1$  apply. For the local oscillator frequency below the dial frequency, only negative values of  $F_2/F_1$  apply.

In the case of a receiver with a wide i-f bandwidth or one with a sweeping local oscillator, each line becomes a band whose boundaries are obtained by drawing two lines parallel to and equidistant from the original line. The displacement in the vertical direction from the original line is

$$\pm \frac{1}{2} \left[ \frac{M}{M \pm 1} \frac{B_o}{F_1} + \frac{1}{M \pm 1} \frac{B_2}{F_1} \right] \quad (2)$$

where  $B_2$  = i-f bandwidth and  $B_o$  = sweep band of local oscillator, if any.

## Example

As an example, for a vhf receiver tunable from 100 to 150 mc and having a 20-mc i-f, the ratio  $F_2/F_1$  ranges from 0.20 to 0.13 over the dial. Referring to the chart, it is seen that, for the local oscillator on the high side, the  $M = 2, N = 2$  harmonic response will appear for input frequencies 6.5 to 10 percent above the dial frequency (about 10 mc

above the dial frequency). If a 2-mc i-f bandwidth is assumed, the bandwidth term, calculated from Eq. 2 and represented by the dashed lines, reduces this margin by about 1 mc. For a crystal mixer the  $M = 2, N = 2$  response is normally attenuated about 35 db. If the dynamic range of the receiver is greater than this, r-f preselection is necessary.

Other harmonic responses at midband are  $M = 1, N = 2$  at 50 percent and at 33 percent below the dial frequency,  $M = 2, N = 2$  at 25 percent above, the image  $M = 1, N = 1$  at 35 percent above.

For the local-oscillator frequency below the dial frequency, the closer harmonic responses appear for the image  $M = 1, N = 1$  at 35 percent below the dial frequency,  $M = 2, N = 2$  at 25 percent and at 5 to 9 percent below,  $M = 2, N = 1$  at 50 percent and at 92 percent above dial frequency.

# RADAR PERFORMANCE NOMOGRAPH

**SUMMARY**—Pulsed radar performance is found in terms of percent of rated range available for a given radar target area when transmitted pulse width, average pulse power, minimum detectable signal and prf are known

**R**ADAR PERFORMANCE can generally be determined by measuring the transmitted pulse width and pulse repetition frequency (duty cycle), the averaged transmitted power and the minimum detectable signal. With these measurements, this nomograph provides a rapid method of determining the performance of a pulsed radar in terms of the percent of rated range available for a target of given radar area.

(1) Connect the pulse repetition frequency on scale 1 with the pulse width on scale 3. The intersection of this line with scale 2 will be the duty cycle.

(2) Connect the average transmitted power on scale 6 with the duty cycle on scale 2. The intersection of this line with scale 4 will be the peak transmitted power.

(3) Connect the minimum detectable signal on scale 7 with the peak transmitted power on scale 4. The intersection of this line with scale 5 will give the radar performance figure.

(4) Connect the rated performance of the radar on scale 9 with the calculated radar performance found on scale 5. The intersection of this line with scale 8 will be the percent of maximum range available for a given target. For instance, if scale 8 is intersected at the 200-percent point, a target which would normally not be detected until it was 40 miles away can be detected at 80 miles.

# DESIGN CHART FOR SELECTIVE CATHODE TRAPS

By K. HILLMAN

**SUMMARY**—Equations for determining attenuation introduced at trap frequency and at other desired frequency used with chart speed determination of values for R, L and C for cathode trap. Graph can also be used to determine bandwidth of trap

**I**N DESIGNING cathode traps of the type shown in Fig. 1, attenuation must be introduced at a trap frequency,  $f_0$ , without greatly affecting the gain at some other frequency,  $f$ .

It is useful, therefore, to consider how the gain at  $f$  relative to the gain at  $f_0$  varies with trap Q, normalized frequency spacing  $\delta$ , and the increased loss at  $f$  due to the presence of the trap. A cathode resistor  $R_k$  has been included in the circuit, but may be set to zero or bypassed, if desired.

## Chart Construction

In obtaining the expression from which the chart is plotted, the following assumptions are made: grid-cathode and cathode-ground capacitances are negligible, the tube is a constant-current generator ( $i_p = g_m e_{gk}$ ) and the trap may be represented by a parallel combination of R, L and C.

Let  $|\bar{r}_1| \equiv \frac{\text{gain reduction factor at } f \text{ with trap}}{\text{gain reduction factor at } f \text{ or } f_0 \text{ without trap}}$

$$= \left| \frac{1 + g_m \left[ R_k + \frac{R}{1 + jQ\delta \frac{(2+\delta)}{(1+\delta)}} \right]}{1 + g_m R_k} \right|$$

and  $r_2 \equiv \frac{\text{gain reduction factor at } f_0 \text{ with trap}}{\text{gain reduction factor at } f_0 \text{ or } f \text{ without trap}}$

$$= \frac{1 + g_m (R + R_k)}{1 + g_m R_k}$$

It can then be shown that

$$\frac{r_2}{|\bar{r}_1|} = \left[ \left( Q\delta \frac{(2+\delta)}{(1+\delta)} \right)^2 \left( \frac{|\bar{r}_1|^2 - 1}{|\bar{r}_1|^2} \right) + 1 \right]^{1/2}$$

The ratio

$$\frac{r_2}{|\bar{r}_1|} = \frac{\text{gain reduction factor at } f_0 \text{ with trap}}{\text{gain reduction factor at } f \text{ with trap}}$$

$$f_0 = \frac{1}{2\pi\sqrt{LC}}$$

$$Q = \frac{R}{X_{f_0}}$$

$$\delta = \frac{f - f_0}{f_0}$$

has been plotted against  $Q \left| \delta \frac{(2+\delta)}{(1+\delta)} \right|$  for various values of  $|\bar{r}_1|$ . In addition, contour lines indicating levels where the value of  $r_2$  remain constant are shown on the chart.

## Example

An example of a typical design problem will show how the chart can be used to obtain component values and aid in gaging the trap bandwidth.

It is desired to reduce the gain at 10 mc by a factor of 20 relative to the gain at 7 mc.

The gain at 7 mc is to be decreased by no more than five percent. The circuit constants are  $R_k = 0$ ,  $g_m = 5,000 \mu\text{mhos}$ . Find R, L and C.

The intersection of  $r_2/|\bar{r}_1| = 20$  and the curve corresponding to a value of  $|\bar{r}_1| = 1.05$  occurs for an abscissa corresponding to

$$Q \left| \delta \frac{(2+\delta)}{(1+\delta)} \right| = 66$$

since

$$\left| \delta \frac{(2+\delta)}{(1+\delta)} \right| = (0.3) \frac{1.7}{0.7} = 0.73,$$

$$Q = \frac{66}{0.73} \cong 90$$

FIG. 1—Basic cathode trap circuit

Also,  $r_2 = 1.05 (20) = 21 = 1 + 0.005R$  so that  $R = 4,000$  ohms

$$10 \text{ mc} = \frac{R}{Q} = \frac{4,000}{90} = 44 \text{ ohms}$$

in which  
 $L \cong 0.7 \mu\text{h}$   
 $C \cong 360 \mu\text{uf}$

Suppose a  $0.7\text{-}\mu\text{h}$  coil is now made and found to have a  $Q > 90$ . Let the measured value be  $Q = 30$ . The chart shows that the intersection of  $r_2 = 1 + 20/30/90 = 30$  and  $Q|\delta(2 + \delta)/$

$(1 + \delta)| = 94$  occurs for value of  $r_2/|\bar{r}_1| \cong 28.5$  and for  $|\bar{r}_1| = 1.05$ .

If desired, the inductance may be reduced, assuming the coil  $Q$  is held constant, so that  $r_2/|\bar{r}_1| = 20$  is again obtained but at a value of  $|\bar{r}_1| < 1.05$ .

### Trap Bandwidth

Sometimes a band of frequencies rather than a single frequency is to be attenuated. The chart may be used to gauge

the trap bandwidth. In the preceding example, the range of frequencies where the gain relative to 7 mc is decreased by a factor of ten or more can be found.

Since  $r_2 = 21$ , for  $|\bar{r}_1| \geq 10 (1.05) = 10.5$ ,  $r_2/|\bar{r}_1| \leq 2$ . The intersection of  $r_2/|\bar{r}_1| = 2$  with the curve  $|\bar{r}_1| \gg 1$  occurs at about  $Q|\delta(2 + \delta)/(1 + \delta)| \cong 2 Q|\delta| \cong 1.7$ , so that  $2|\delta| \cong 1.7/90 \cong 0.019$ . Hence the trapping bandwidth (as defined) is 0.019 (10) or 0.19 mc.

# TRANSISTOR FLIP-FLOPS

**SUMMARY**—Flip-flops for digital computers may be designed in three ways: direct coupled, emitter coupled or resistance coupled. Delay and transition times are discussed for these circuits under loaded and unloaded conditions. Non-saturating circuits and the effects of loading with zero to four transistor bases are also given

By A. K. RAPP and S. Y. WONG

**T**RANSISTORS HAVE made possible electronic computers requiring only a small fraction of the space and power required by the vacuum tube equivalent.

This article compares maximum speeds measured for changes of state for three types of circuits using surface-barrier transistors.

### Basic Pulse Amplifiers

Shown in Fig. 1, the three basic types of pulse amplifier circuits are the direct-coupled, the resistance-coupled and the emitter-follower-coupled cascades.

Figure 1A illustrates the simplest method of coupling cascaded common-emitter stages by connecting the output of one stage directly to the base of the following stage.<sup>1</sup>

The circuit modification in Fig. 1B overcomes one of the principal limitations in the switching speed of transistors, the storage of minority carriers in the base region of a saturated transistor. This storage produces a time delay at the collector on application of a cutoff signal.

One convenient means of reducing turnoff time delay is to limit

the base current by inserting resistance in the base leads. Capacitors are shunted across the base resistors to help speed up the circuit.

Figure 1C illustrates the use of an emitter follower as an active coupling network. The emitter follower does not suffer from hole storage and its low source impedance permits high charging currents to be supplied to the stray and internal capacitances, usually the limiting factors in fast pulse operation.

Figure 2 shows flip-flops using

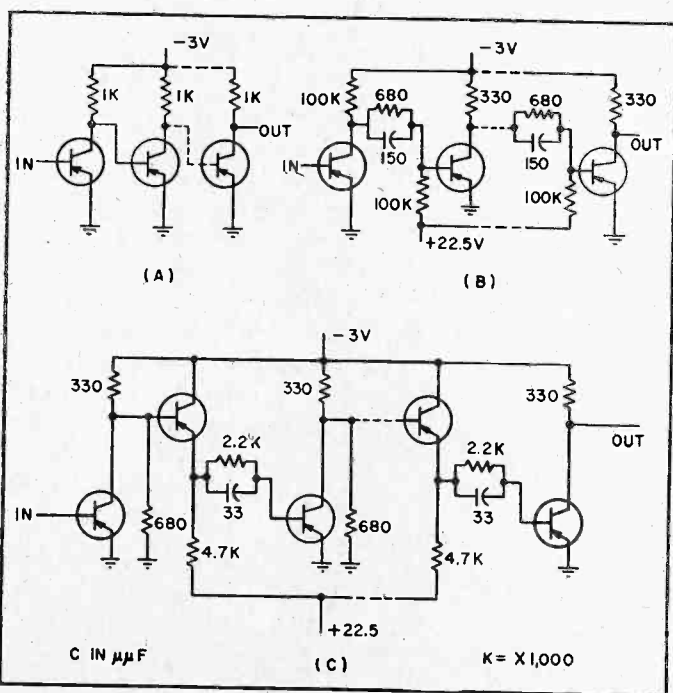

FIG. 1—Direct-coupled (A), resistance-coupled (B) and emitter-follower-coupled (C) pulse amplifiers coupled in cascade

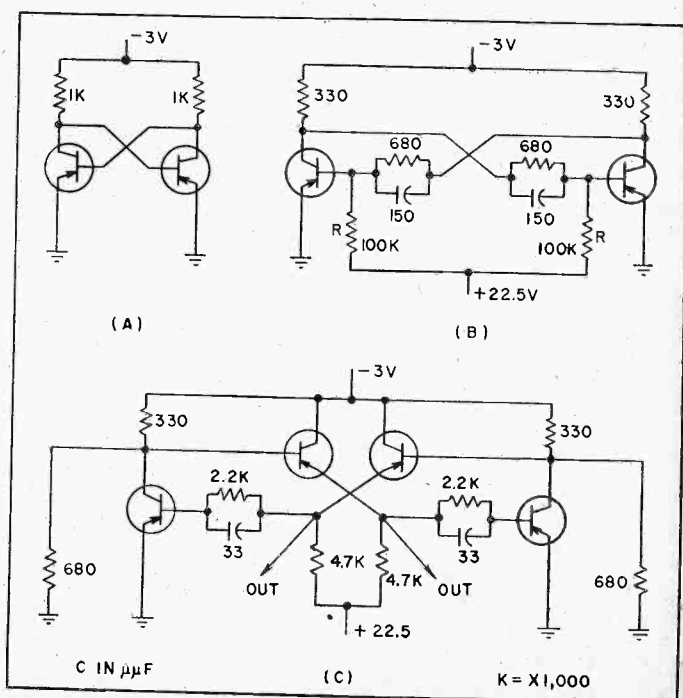

FIG. 2—Flip-flops derived from circuit configurations of Fig. 1. Circuit (A) contains a minimum number of components

the three types of coupling given in Fig. 1. The circuit of Fig. 2A is a simple flip-flop circuit containing a minimum of components.

The flip-flop of Fig. 2B is analogous to the Eccles-Jordan circuit. It may be operated without the bias network consisting of +22.5 v and resistors, R, since the network has no effect on speed but increases reliability.

The emitter-follower stages of Fig. 2C produce buffering action and consequently provide convenient output terminals.

### Switching Times

The direct-coupled flip-flop of Fig. 2A is redrawn in Fig. 3 to illustrate the switching times employed as criteria of high-speed performance. The delay time,  $\delta$  is the time interval between the point where the collector potential of the gating transistor changes by 10 percent of its total voltage excursion and the point where the collector potential of the off-going transistor falls 10 percent of its total voltage excursion.

The total transition time X is the delay plus the fall time of the collector voltage of the off-going transistor. Fall time is the time required for the collector voltage of the off-going transistor to move from 10 percent to 90 percent of its voltage excursion.

### Time Measurement

Delay and transition times were measured with the flip-flops loaded symmetrically with from zero to four pairs of transistor bases. Owing to its higher ratio of collector to base current, the resistance-coupled circuit has considerable less delay than the direct-coupled circuit. Transition time is more indicative of operational speed since it represents the total time required for the flip-flop to acquire a new state. Using transition time as the criterion, the resistance-coupled circuit requires about 18 percent less time than

the direct-coupled, while the added complexity of emitter-follower coupling results in a 70 percent reduction in transition time.

### Speed

The speed of the direct-coupled circuit increases to double its no-load value when it is loaded with four pairs of bases, while the resistance-coupled circuit is slowed down by the addition of load. The buffer action of emitter followers allows the emitter-follower-coupled flip-flop to remain relatively unaffected by load.

The nonsaturating, resistance-coupled flip-flop<sup>2</sup> shown in Fig. 4 makes use of small resistors connected from each base to ground to form a voltage divider which limits the voltage swing of the base. The insertion of resistance into the circuit common to both emitters provides d-c feedback which forces the emitter to follow about 0.3 v more positive than the base of the conducting transistor. Since this base-to-emitter potential is independent of the emitter resistance, the choice of resistance controls the emitter current. Once the base voltage and emitter current are fixed, the collector current is also determined. A small collector resistance then holds the collector voltage of the conducting transistor sufficiently negative with

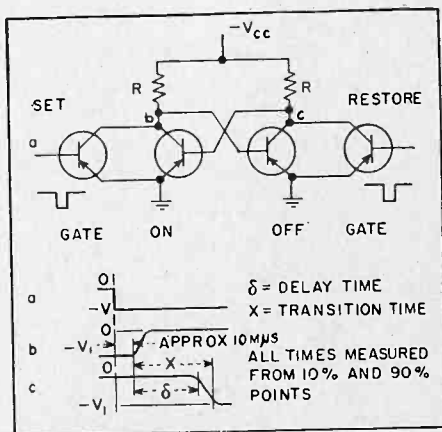

FIG. 3—Direct-coupled flip-flop illustrates switching time criteria for high-speed performance with symmetrical loads

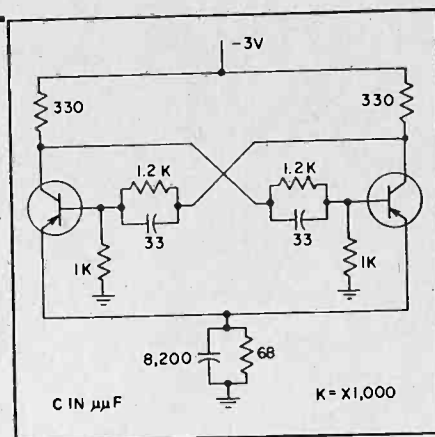

FIG. 4—Nonsaturating resistance-coupled flip-flop has d-c feedback

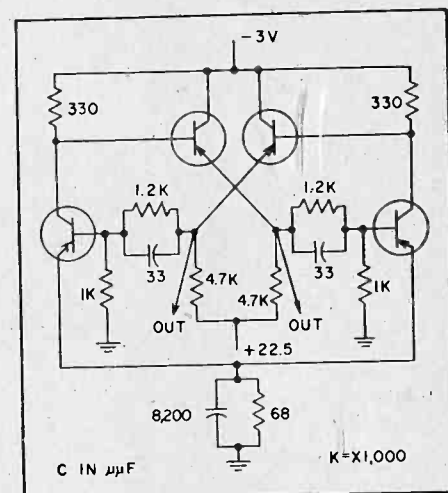

FIG. 5—Nonsaturating emitter-follower coupled flip-flop uses emitter biasing

respect to the base to prevent saturation.

The nonsaturating, emitter-follower-coupled flip-flop shown in Fig. 5 also applies the emitter-biasing method of preventing saturation to the emitter-follower-coupled flip-flop.

The avoidance of saturation produces a reduction of more than 60 percent in the transition time of the resistance-coupled circuit. Prevention of saturation in the emitter-follower circuit results in an increase in speed to the extremely fast transition time of 22 millimicroseconds.

# TOROIDAL VIDEO TRANSFORMER DESIGN

By G. W. GRAY

**SUMMARY**—Design data is given for tv video transformers with 6-mc bandwidth that drive a 50-ohm coaxial cable. In addition to line-driver applications, transformers can also be used as interstage-coupling devices in transistor video amplifiers

**W**HEN DRIVING a low impedance such as a coaxial cable from a vacuum tube or transistor, there is a loss of gain due to the poor impedance match between the load and the driving source. If the signal is narrow band, a transformer is usually used to produce a better impedance match.

This article describes the development of transformers to drive a 50-ohm coaxial cable with television video signals of 6-mc bandwidth. To ease the low-frequency requirement to passing a 15-kc square wave, the technique of using a keyed-clamp stage following the transformer has been assumed. This is the existing situation in television cameras where the video signal is amplified first in the camera and then transmitted over cable to another amplifier for additional amplification.

A gain of one-third is usually realized from the grid of the last tube in the camera to the grid of the first tube in the remote amplifier. If a transformer with a three or four-to-one turns ratios could be inserted between the line driver and the line, the gain of one-third would be increased to unity. If a second transformer could be used to step up the voltage between the cable and the grid of the first tube in the remote amplifier, the gain could be raised from unity by whatever step-up ratio could be obtained.

## Core Material

The transformers are wound on Supermalloy tape-wound toroids manufactured by the Arnold Engi-

FIG. 1—Effect of tape thickness on initial permeability of Supermalloy

neering Co. Magnetic properties of this type core are particularly suited to video transformers. The low-frequency permeability is approximately 70,000, providing the necessary inductance with relatively few turns.

The permeability is a function of frequency—high at low frequencies and low at high frequencies. This feature is of importance since the distributed capacity that tends to resonate the primary would have to be impractically low if the permeability were uniformly maintained at all frequencies. This effect allows high primary inductance at low frequencies, where it is required, and effectively decreases the inductance at high frequencies, to prevent resonance with the distributed capacity within the pass-band.

As an example, transformers with a primary inductance of the order of  $\frac{1}{2}$  henry at 1 kilocycle are needed for good low-frequency response. If such an inductance were maintained up to 6 mc, the capacity required to resonate the primary would be about 1,000  $\mu\mu\text{f}$ . Fortunately, the permeability of tape-

wound cores changes radically from low to high frequencies so the required inductance is obtained at low frequencies, but a much lower inductance is present at high frequencies. Thus resonance with the distributed capacitance is avoided at least until a much higher frequency than with a constant permeability core.

Since it is a lack of penetration of the core material by the magnetic flux that causes the decrease in permeability with increasing frequency, the core tape thickness will control the frequency at which the permeability changes. This effect is shown in Fig. 1.

## Coupling

Although loss of permeability with frequency is necessary, it is not without ill effects. With a high permeability toroidal core, the coupling between primary and secondary is good and independent of the physical configuration of primary and secondary. However, with

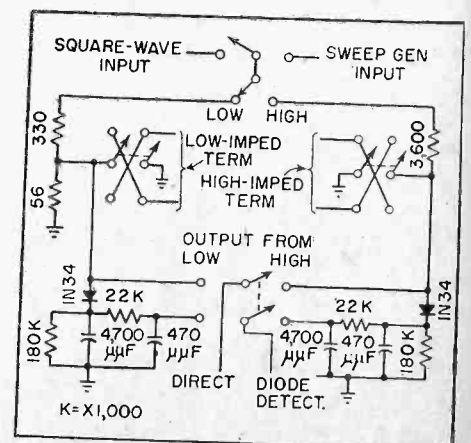

FIG. 2—Test circuit for video transformers

Steps in transformer construction, from left to right: core; core with primary; primary with rayon-tape cover; complete transformer

Completed video-transformers mounted in protective cases

a low permeability core, the coupling is almost entirely dependent upon the physical configuration of the primary and secondary. Therefore, the physical configuration of the windings must be designed for good coupling between primary and secondary without aid from the core material.

To evaluate and compare experimental transformers, the test setup of Fig. 2 was used. Either the low or high-impedance windings can be driven from a sweep or square-wave video generator, with about 3,600-ohm driving impedance for the high-impedance winding and about 50-ohm driving impedance for the low-impedance winding. Likewise, the voltage across either the high or low-impedance winding can be observed either directly for square waves or with a diode detector for sweep response. Two switches are provided to reverse the end of the winding which is grounded, for either primary or secondary.

### Windings

The primary winding used on all of the transformers is a single layer of uniformly spaced wire going around the toroid, thus producing minimum distributed capacity for the number of turns required.

The secondary winding is similar to the primary but of fewer turns, distributed uniformly over the primary and spaced a small distance away. The secondary must be distributed over the primary to maintain coupling at high frequency where the core has negligible permeability. Spacing between pri-

mary and secondary is necessary to minimize the capacity between primary and secondary, although too wide a space will decrease coupling.

To verify the frequency range over which the core contributes to the coupling, a transformer was made with the primary wound on one half of the toroid and the secondary on the other half. Response was normal at low frequencies, but fell off rapidly in the region where permeability decreased in accordance with the curves in Fig. 1.

To show that coupling is good

FIG. 3—Low-frequency response of video transformer

FIG. 4—Primary winding on 4-mil core

with the secondary wound over the primary, a transformer was wound with a lucite toroidal core the same size as the Supermalloy cores. The resulting transformer had a uniform response from 1 to 12 mc, showing that magnetic core material is not necessary above frequencies of 1 mc.

### Core Permeability

The core material has a permeability considerably greater than unity even in the megacycle region. It increases the inductance so as to cause a resonance and limit the high-frequency response. The curves in Fig. 1 indicate the use of a thicker tape would result in a permeability that starts to decrease at a lower frequency and might thereby be expected to be down to a lower percentage of its low-frequency permeability at any particular high frequency. The material which loses permeability at the lowest frequency is 4-mil tape; therefore, this material was tried. One and 2-mil tapes have also been tried, but the 4-mil tape seems to be best.

Recently two cores with 6-mil tape have been obtained. Initial work indicates a marked superiority over 4-mil tape for high-frequency response, with somewhat poorer low-frequency response. Most transformers in this article use type 5340 S-4 cores; the 5340 refers to the physical size (0.810 in./o.d., 0.440 in./i.d., 0.195 in./thick); S-4 indicates the core material (4-mil Supermalloy).

In selecting the primary inductance an advantageous compromise

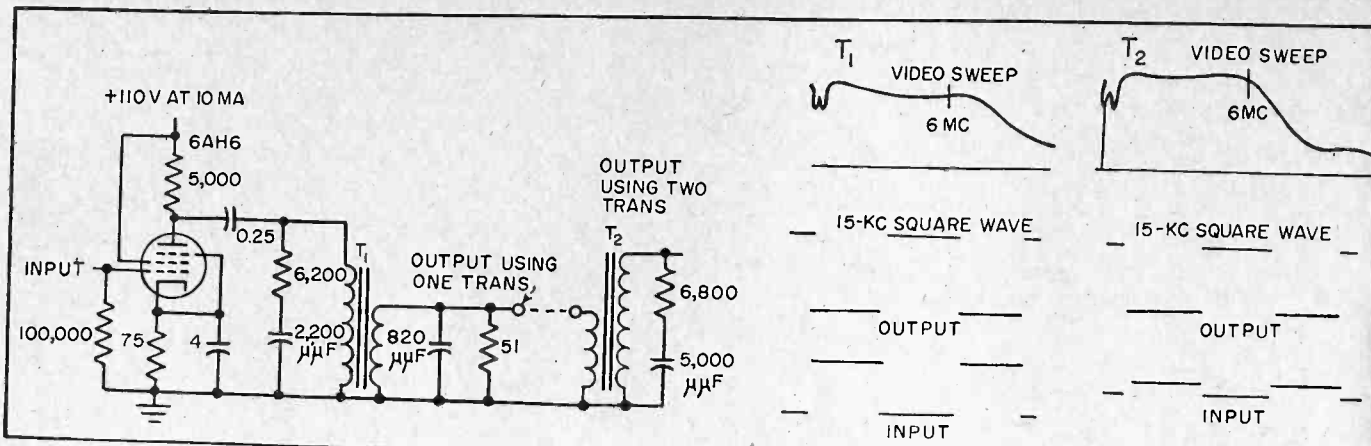

FIG. 5—Both  $T_1$  and  $T_2$  have 4-mil cores and 190-turn primaries;  $T_1$  has 190-turn primary of No. 50 Formex wire and secondary of 26 turns of 0.002 by 0.070 in. copper;  $T_2$  has 190-turn primary of No. 52 Formex and 44-turn secondary of 0.002 by 0.075 in. anodized aluminum. Video-sweep and square-wave responses are shown at right

is to allow approximately a 10-percent tilt in the response to a 15-kc square wave, thus necessitating fewer turns on the primary winding than if a more perfect low-frequency response is attempted. The fewer turns result in obtaining about a 50 percent greater turns ratio for the same high-frequency response.

The 15-kc square-wave tilt can be completely compensated at the cost of about 10-percent amplitude loss by placing a resistor in series with a capacitor across the primary; thus about 50-percent increase in gain is achieved at the expense of 10-percent loss. On this basis about 190 turns are required for the primary.

Figure 3 shows the sine-wave low-frequency response of such a transformer with a 4 to 1 turns ratio and terminated in 50 ohms. The response falls off more slowly than even a single R-C or R-L circuit would; this is caused by the peaking effect of the rising permeability as the frequency decreases. With this response, even though the amplitude does not start to fall until about 1 kc, there is enough phase shift to require compensation at 15 kc. The loss of low frequencies is due almost entirely to insufficient primary inductance. If the primary is driven from a lower impedance source, a much better low-frequency response can be obtained, confirming that the coupling in the transformer at low frequency is good.

Experimentally, it has been found advantageous to use wire at

least as small as No. 50 for the primary winding to have considerable space between adjacent turns and minimize distributed capacity. It is also important to have the uniformity of the winding virtually perfect. For example, a transformer made for a 6-mc response had one turn that crossed over the adjacent turn near the middle of the primary winding; the result was about a 5-mc response. The crossed turn was cut out and the two ends soldered together about  $\frac{1}{8}$  inch from the core; this added about  $\frac{1}{2}$  mc to the response, but did not bring the response to normal. Figure 4 shows the primary winding on a 4-mil core with 180 turns of No. 50 wire.

Experiments show that best results are obtained by winding all the way around the core. For example, a transformer that gave a 6-mc response with the winding on approximately 350 deg of the core only gave a 3.5-mc response with the same number of turns on 260 deg of the core.

### Spacing Between Windings

Having wound the primary, the next step is to decide upon the spacing between primary and secondary. Good transformers have been made with spacing from as small as possible to about 0.050 inch. A wide spacing assures ability to ground either end of the secondary to select the desired polarity of signal output. A close spacing will require the same input and output polarity, but the transformer will operate equally well as a step-up or step-down transformer.

In general good results will be obtained with a moderate spacing as is obtained by winding the primary with a ribbon of Minnesota Mining and Manufacturing No. 14 rayon tape so there is a single layer on the outside edge while the inside will be about two layers of tape. Such a spacing usually allows the secondary polarity to be reversed while still operating well as a step-up transformer.

Though the secondary may be reversed with little change in frequency response, the primary requires one particular end to be grounded. If the other end of the primary is grounded, the frequency response is nearly cut in half independent of the polarity of the secondary.

The secondary is made from wire as large as is possible to use and still maintain a single layer on the inside of the toroid with the number of turns giving the proper turns ratio, usually about 4 to 1. It is wound uniformly over the primary, starting at one end of the primary and finishing at the other end. The direction or sense of the secondary winding should be the same as the primary.

### Ribbon Wire

Instead of using round wire for the secondary, a considerable improvement in performance can be obtained by using anodized aluminum ribbon wire. This type of wire seems to produce a transformer with approximately twice the turns ratio and a bandwidth at least as wide in response as with round

wire and possibly better. Soldered connections to the aluminum are made by first copper plating the aluminum. The effect of the ribbon is to decrease leakage inductance at high frequencies by providing a continuous shield completely covering the primary.

Figure 5 shows a circuit that may be used with the transformers to drive a low-impedance line. The waveforms illustrate the gain and frequency response. Using one transformer the gain from the grid of the tube to a 51-ohm load is 1.4. The gain would be higher except for the low valued plate resistor of the 6AH6. With a higher plate supply voltage, the plate resistor could be raised to increase the gain about 10 db. The circuit provides double termination for the cable since the transformer transforms the 2,770 ohms in the plate circuit (5,000 ohms in parallel with 6,200 ohms) to 52 ohms. Thus, a cable terminated at the receiving end with a 51-ohm resistor, or gain-control po-

tentiometer, will look back into 52 ohms at the sending end. The gain can be increased about four times by using a second transformer at the receiving end.

### Frequency Compensation

High-frequency peaking, is obtained with the 820- $\mu\text{mf}$  capacitor across the 51-ohm resistor. Alternatively, an inductance can be placed in series with the 6,200-ohm resistor in the primary of  $T_1$ .

Polarity can be reversed by reversing the low impedance winding of either transformer.

In addition to increasing the gain in driving a low impedance from the tube, the transformer also multiplies the current swing obtainable. The circuit shown in Fig. 5 will produce about 2.5 volts peak to peak across the 51 ohms, which is equivalent to a current swing of 50 ma. Total d-c current is less than 15 ma.

The resistor in series with the capacitor across the high impedance winding of each transformer

compensates the low frequency response. Without compensation, each transformer introduces about 15-percent tilt on a 15-kc square wave.

Figure 6 shows the results obtained with a 6-mil core. The winding would have given only one-half the bandwidth, if a 4-mil thick tape had been used.

### Winding Machine

A device which has wound toroids with wire as small as No. 52 and maintained uniform spacing between turns is shown in a photograph. Since No. 52 wire is as small as is possible to obtain as yet, the minimum wire size the winder will handle is not known. To produce uniformity in the winding, tension is continually maintained on the wire so that the wire tends to stay where it is laid down. This is the principle feature of the winder. When the toroid with the primary winding is removed from the winding machine it is coated with a thin coating of rubber-base Bostick cement. The toroid is then wrapped with a strip of  $\frac{1}{8}$ -inch wide rayon tape, starting at the same place as the primary winding and wound in the same sense and direction all the way around. The tape should be about a single thickness on the outer rim of the toroid.

The secondary is wound to start and finish at the same place the primary starts and finishes, with the turns in the same direction as the turns of the primary. If round wire is used for the secondary, it should be large enough so a close spaced single layer winding is produced on the inner side of the toroid. If ribbon wire is used, it should lap over itself on the inner side of the toroid to produce a nearly complete covering on the outside of the toroid.

Transformers of this type have been used as interstage-coupling devices in transistor video amplifiers. They are now finding further use in industrial-television equipment, both monochrome and color, where their advantages as line drivers are being utilized.

Credit is due E. K. Kurz for the design and construction of the winding machine without which these transformers would not have been developed.

# HOW TO DESIGN COLPITT

By H. E. GRUEN

**SUMMARY**—Cut-and-try approach characteristic of crystal oscillator development can be avoided by using design method described. Oscillator output voltage can be predicted to better than 25 percent. Performance curves of output and crystal drive level allow performance prediction of circuits having a wide range of parameter values

**D**ESIGN of practical crystal oscillator circuits has always involved a considerable amount of cut and try. Although a complete mathematical analysis is possible when all circuit characteristics are known the result is so complex that its application to a useful circuit is not practical.

Often this mathematical analysis is simplified by various assumptions to the point where little, if any, quantitative information results. The method of design outlined be-

low correlates the two approaches to the problem—a simplified analysis yielding qualitative information, supplemented by circuit performance measurements to provide quantitative information.

The measurements, obtained over a wide range of operating conditions, include such factors as frequency stability, output voltage and power and crystal drive level determined as a function of circuit component values and voltages.

Design data will be developed for

the Colpitts crystal oscillator and for the adaptation of this circuit to electron coupling.

In the circuit of Fig. 1A, the crystal operates at antiresonance with the total grid-to-ground capacitance. Crystal drive level, as well as the available output voltage, is a function of crystal and tube characteristics and operating voltages as well as the capacitance ratio  $C_3/C_2$ .

For this oscillator the equivalent circuit of Fig. 1B is most con-

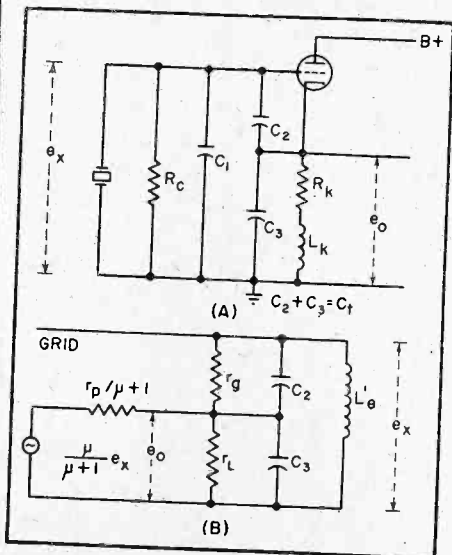

FIG. 1—Colpitts crystal oscillator circuit (A) and equivalent circuit (B) that serve as the basis of the design

FIG. 2—Circuit performance as a function of ratio of the capacitance between cathode and ground to grid and cathode

# CRYSTAL OSCILLATORS

FIG. 3—Crystal oscillator output voltage vs crystal drive as a function of grid bias resistance

FIG. 4—Output voltage vs crystal drive as a function of  $C_1$  connected between grid and ground

venient since the voltages of interest appear across the crystal and from cathode to ground. The value of  $L_k$  is chosen such that its reactance is several times that of  $C_3$ . It thus provides a d-c path from cathode to ground whose a-c impedance is sufficient to be neglected.

The grid circuit losses are represented by  $r_g$ , and the crystal loss by  $r_L$  when  $C_1$  is included as a part of the crystal network. The resistance  $r_L$  is the load on the generator when the grid loss  $r_g$  is neglected. Using this value of load impedance, the equation of conditions necessary for oscillation can be developed as follows

$$r_p = \frac{\mu PI N f(\omega r_g) f(C_1)}{(1 + N)^2}$$

where  $N = C_3/C_2$

$PI = 1/(\omega^2 C_1^2 R_c) =$  performance index of crystal

$$f(\omega r_g) = \frac{r_g \omega C_2}{[1 + (r_g \omega C_2)^2]^{1/2}} \text{ and}$$

$$f(C_1) = \left(1 + \left[\frac{(N + 1) \omega C_1 R_c}{1 - C_1/C_2}\right]^2\right)^{1/2}$$

The equation is satisfied when steady-state oscillations exist. The factors  $f(\omega r_g)$  and  $f(C_1)$  include the effects of circuit losses. The values of these expressions approach unity as the frequency increases and as  $R_c$  of the crystal decreases.

The resultant plot of the loss-free condition is shown in Fig. 2. The upper solid curve represents the amplitude of oscillation, or crystal voltage, and the lower curve the relative output voltage for this condition.

Figure 2 also shows the measured

performance of a 10-mc oscillator as compared to the loss-free condition. For the measurements shown the effective grid-to-ground capacitance of  $C_2$  and  $C_3$  was held constant while their ratio was varied. This maintains a constant crystal load capacity  $C_1$ .

### Circuit Measurements

Because of the inherently large stray capacitance included in  $C_3$ , no measurements were made at ratios less than one. The curve marked  $\Delta f/f$  shows the improvement in frequency stability as the capacitance ratio is increased. The horizontal lines A and B are used in the design examples.

The graph of Fig. 3 shows measured output voltage and crystal

drive level as a function of plate voltage for different values of grid bias resistance. This data taken at 10 mc shows increasing values of drive as the resistance increases, indicating the desirability of using small values of resistance if high output at low crystal drive is desired.

However, at lower frequencies oscillation may not start if  $R_g$  is too small. The choice of  $R_g$  is therefore dependent on the use to which the oscillator is to be put. These results were obtained at 10 mc. At lower frequencies a graph having the same scales would be obtained with larger values of  $R_g$ . For example, at 1 mc the line representing  $R_g$  equal to 100,000 ohms will be approximated by an  $R_g$  of 1 megohm.

In Fig. 4 are shown the results of varying  $C_1$ , the grid-to-ground capacitance, while maintaining a fixed ratio of  $C_2/C_1$  and a constant load capacitance. As  $C_1/C_2$  becomes larger, the output increases greatly for moderate increases in drive level. Within the limits set by stray capacitance in  $C_2$  and  $C_1$  it is advisable to make  $C_1$  as large as possible to obtain large output-to-drive ratios. However, for good stability  $C_2$  should be padded to several times the stray capacitance.

Figure 5 indicates the results obtained by use of different tube types. Both triodes and pentodes of miniature and subminiature construction are included. A type 12AT7 was selected as the reference for obtaining the general circuit performance measurements.

### Performance Curves

Circuit performance information is presented in a general form in Fig. 6. The oscillator output in volt-megacycles (rms output voltage times frequency in megacycles) and the crystal drive level are presented as a function of plate supply voltage. For a fixed supply voltage and a given frequency, a range of both output voltage and crystal drive is indicated. The exact values obtained depend on the resistance of the crystal used. The circuit and the range of resistance values used in determining the curve are shown

FIG. 5—Output voltage and crystal drive for a number of tubes used in the representative circuit (top)

on the figure.

As an example of the use of this curve, assume that an 8-mc oscillator having an output of 2 volts is required. The volt-megacycle product is 16 and from the curve the required plate voltage can be determined. In this case the required plate voltage will be in the range of 130 to 170 volts. Use of a 150-volt plate supply will yield an output of 2 volts plus or minus 15 percent. The resulting drive level will be from 1.5 to 4 milliwatts depending on crystal resistance.

At frequencies below 3 mc, higher values of grid and cathode bias resistance are required to insure proper starting and drive characteristics. Figure 7 is a generalized performance curve for the low frequency range. The applicable circuit is shown and use of the curve is the same as before.

Electron coupling is used in crystal oscillators as well as in conventional self-excited circuits. Advantages of the electron coupled arrangement include ease of fre-

quency multiplication, high output voltage to crystal drive ratio and frequency stability relatively independent of load variations. This circuit readily adapts itself to electron coupling since the plate operates at a-c ground potential.

The circuit diagram of the electron coupled oscillator appears in Fig. 8. The voltage of interest in determining circuit performance now becomes the screen voltage rather than the supply voltage. Characteristics of triode connected pentodes were determined and circuit performance data for several types are included in Fig. 5 for comparison.

The design of an electron coupled oscillator is taken from the curves just described using the pentode tube connected as a triode. When the performance of the triode circuit has been determined the plate output can be calculated as for a pentode amplifier based on effective values of transconductance and plate circuit impedance.

Excellent isolation of plate impedance variations can be accomplished by using a tube having a separate suppressor lead connected to a bypassed bias potential equal to the cathode bias. Output voltage, crystal voltage and frequency change as a function of plate load impedance for three circuit arrangements are shown in the curves of Fig. 9.

A 6AU6 tube was used, first with suppressor-to-cathode connection, then as a tetrode with suppressor connected to plate and finally with the suppressor connected to a positive bias of five volts. The solid line curves indicate the improved performance of the biased suppressor arrangement.

### Design Method

The oscillator circuit shown in Fig. 6 was designed to operate over the frequency range of 2.85 to 16 mc with large output voltage to crystal drive ratios. The corresponding circuit and performance characteristics for the 1 to 2.85 mc frequency range are shown in Fig. 7. These performance characteristics can be used directly in predicting

operation of the standard circuits and can also be used in conjunction with other figures given here to design additional circuits meeting specific performance requirements.

Use of this design method is explained in the example below. The steps necessary if the reference circuit of Fig. 6 meets the given requirements are outlined in detail as shown below.

It is required that the circuit have a frequency of 7 mc; voltage output of 2.25 v rms across a 5,000-ohm load, frequency tolerance of  $\pm 0.006$  percent and power supply voltage of 150 v.

The crystal unit to be selected should be a high-quality antiresonant unit of the desired frequency. To obtain proper operation of the crystal the circuit is designed to provide the required load capacitance, which is the total grid-to-ground capacitance of the circuit. The circuits given here are for use with military type crystal units for which a load capacitance of 32  $\mu\mu\text{f}$  is required.

Military type crystal units that can be used in these circuits include the CR-18/U, CR-27/U and CR-36/U. The CR-18/U is a non-temperature-controlled unit, while the CR-27/U and CR-36/U are designed to operate at 75 and 85 C respectively. In this case a CR-18/U crystal unit will meet the requirements provided that frequency changes produced by the oscillator are less than  $\pm 0.001$  per cent (the difference between the  $\pm 0.006$ -percent frequency tolerance requirement for the circuit and the  $\pm 0.005$ -percent tolerance of the CR-18/U over the operating temperature range).

### Reference Stability

The stability characteristics of the reference circuit are such that nominal component value changes produce frequency shifts in the order of one or two parts per million. Plate supply changes of  $\pm 10$  percent produce corresponding frequency variations of less than two

parts per million. Thus the frequency tolerance of the circuit is well within the  $\pm 0.001$ -percent (10 parts per million) requirement.

Having determined that crystal unit CR-18/U is the proper choice, other characteristics of the unit such as recommended drive level (10 milliwatts), effective resistance and other crystal characteristics should be kept in mind. Detailed information on all military type crystal units is contained in military specification MIL-C-3098B.

In this example the output requirement of 2.25 v rms at a frequency of 2 mc yields a volt-megacycle product of 15.75. Plate voltage necessary for obtaining the desired performance from the reference circuit is determined in Fig. 6. From 15.75 on the volt-megacycle scale a horizontal line is projected to intersect the center dotted curve. This is shown as line A of Fig. 6. A plate voltage of nearly 150 v is indicated. Line B projected vertically downward to the drive level scale denotes a drive

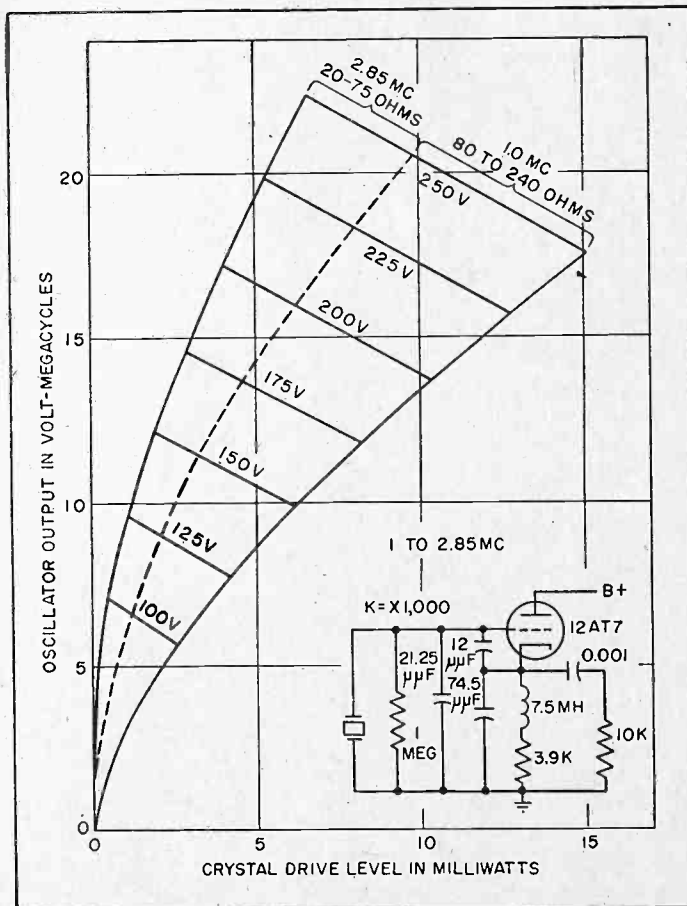

FIG. 7—Performance characteristics for low frequencies

# REFLECTION POINT AND

By Z. PRIHAR

**SUMMARY**—Determination of propagation losses over complex paths requires a knowledge of the reflection point that is seldom midway between antenna and an obstruction contributing to knife-edge diffraction. Nomograms give distance and angle with little additional computation

**A**NGLE and point of reflection of radio waves are required information when calculating propagation losses in four-path propagation, as by knife-edge diffraction.

If no logical reflection point is apparent, it is found by choosing a distance at which the angles of incidence and reflection from the tangent plane are equal. This is done by a trial and error method that is sometimes laborious and time-consuming.

A direct analytical method is suggested below. Nomograms give a direct reading of the distance and angle with little additional computation.

Referring to Fig. 1, the following particulars are usually known: antenna height  $h_1$  in feet; obstruction height  $h_2$  in feet; and distance  $d$  from  $h_1$  to  $h_2$  in miles.

From Fig. 1,

$$\begin{aligned} \text{effective height } h_1' &= h_1 - p_1 \\ \text{effective height } h_2' &= h_2 - p_2 \end{aligned}$$

If  $a$  = earth's radius (3,963 miles)

$$(a + p_1)^2 - a^2 = d_1^2$$

since

$$p_1 \ll 2a, \quad p_1 = d_1^2/2a \quad (1)$$

Denoting  $R = Ka$  = effective earth radius, for  $K = 4/3$ ,

$$\begin{aligned} p_1 = d_1^2/2R = \\ 5,280d_1^2/(2.4/3.3963) = d_1^2/2 \quad (2) \end{aligned}$$

where  $p_1$  is expressed in feet and  $d_1$  in miles.

If  $d_1$  is known, the effective height  $h_1'$  will be given by

$$h_1' = h_1 - d_1^2/2 \quad (3)$$

and

$$h_2' = h_2 - d_2^2/2 \quad (4)$$

where

$$d_2 = d - d_1$$

At the point of reflection, since angle of incidence must

FIG. 1—Geometry of path between station and obstruction

be equal to the angle of reflection,

$$h_1'/d_1 = h_2'/d_2 \quad (5)$$

Substituting Eq. 3 and 4 in Eq. 5 and rearranging results in the following implicit expression for  $d_1$  for any value of  $K$

$$\begin{aligned} d_1^3 - 3dd_1^2/2 + \\ d_1(d_1^2/2 - h_1Ka - h_2Ka) + dh_1Ka = 0 \quad (6) \end{aligned}$$

and for  $d$  and  $d_1$  in miles,  $h_1$  and  $h_2$  in feet and for any  $K$ , Eq. 6 becomes

$$\begin{aligned} d_1^3 - 3dd_1^2/2 + d_1(d_1^2/2 - \\ 3h_1K/4 - 3h_2K/4) + 3dh_1K/4 = 0 \quad (7) \end{aligned}$$

and for  $K = 4/3$

$$d_1^3 - 3dd_1^2/2 + d_1(d_1^2/2 - h_1 - h_2) + dh_1 = 0 \quad (8)$$

It will be found that Newton's approximation method will offer the simplest and quickest way of finding the value of  $d_1$ . If  $d_1$  is chosen arbitrarily for which Eq. 8 is  $f(d_1) \neq 0$ , an approximate solution will be obtained with  $d_1'$  when

$$d_1' = d_1 - f(d_1)/f'(d_1) \quad (9)$$

$d_1$  is the arbitrarily chosen value and  $f'(d_1)$  the first derivative of Eq. 8

$$f'(d_1) = 3d_1^2 - 3dd_1 + (d_1^2/2 - h_1 - h_2) \quad (10)$$

A still better approximation will be obtained by repeating the calculation of Eq. 9 with the newly found value  $d_1'$  when

$$d_1'' = d_1' - f(d_1')/f'(d_1')$$

The following example illustrates the application of the above method. Let  $h_1 = 100$  feet,  $h_2 = 2,000$  feet,  $d = 60$  miles and  $K = 4/3$ . Assuming an arbitrary value of  $d_1 = 10$  miles, Eq. 8 yields for  $d_1 = 10$  miles

$$f(d_1) = f(10) = -5,000$$

and according to Eq. 10

$$f'(d_1) = f'(10) = -1,800$$

$$f(d_1)/f'(d_1) = 5,000/1,800 = 2.783$$

hence

$$\begin{aligned} d_1' &= 10 - 2.783 \\ &= 7.217 \quad (\text{say } 7.22) \end{aligned}$$

# ANGLE NOMOGRAPHS

$$t' = (d^2/4 + h_1 + h_2) / s^2$$

$$q' = (h_2 - h_1) / ds^3/2$$

$$d_1 = w + d/2$$

$$w = sw'$$

$$s = 20 \text{ (SCALE)}$$

ALL d's IN MILES AND  
ALL h's IN FEET

### STEPS

1. DETERMINE  $t'$  AND  $q'$
2. READ OFF CORRESPONDING  $w'$  ON HORIZONTAL LINE
3. DETERMINE  $w = 20w'$  AND  $d_1$
4. DETERMINE  $d_2 = d - d_1$
5. DETERMINE
  - $h'_1 = h_1 - d_1^2/2$
  - $h'_2 = h_2 - d_2^2/2$
6. CHECK FOR
  - $h'_1/d_1 = h'_2/d_2$
7. READ OFF ANGLE OF REFLECTION FROM FIG. 3

### EXAMPLE

$d = 60$  MILES

$h_1 = 100$  FEET

$h_2 = 2,000$  FEET

$t' = 7.5$ ,  $q' = 7.12$ ,  $W = -23.2$

$d_1 = 6.8$  MILES,  $d_2 = 53.2$  MILES

$h'_1 = 76.23$  FEET,  $h'_2 = 589$  FEET

$h'_1/d_1 = h'_2/d_2 = 11.1$

Fig. 2—Intermediate nomogram gives distance data and tangent value

# Reflection Point and Angle Nomographs (Continued)

Repeating the same process for  $d_1' = 7.22$

$$f(d_1') = f(7.22) = -481.3$$

$$f'(d_1') = f'(7.22) = -1,443.2$$

$$f(d_1')/f'(d_1') = 481.3/1,443.2 = 0.334$$

$$d_1'' = 7.22 - 0.334 = 6.886 \text{ miles}$$

The actual value for  $d_1$  in the above example was 6.88 miles.

Having determined  $d_1$  all the other values can now be deduced.

$$d_2 = d - d_1 = 60 - 6.886 = 53.114 \text{ miles}$$

$$h_1' = h_1 - d_1^2/2 = 76.234 \text{ feet}$$

$$h_2' = h_2 - d_2^2/2 = 589.8 \text{ feet}$$

reflection angle = incident angle  
 $= \phi = \tan^{-1} h_1'/d_1 = \tan^{-1} h_2'/d_2$   
 From above,

$$h_1'/d_1 = 11.069; \quad h_2'/d_2 = 11.105$$

The numerical value of  $f(d_1)/f'(d_1)$  for any arbitrarily chosen value of  $d_1$  will offer some indication how far  $d_1$  is off its correct value.

for  $f(d_1)/f'(d_1) > 1$  the difference is substantial

for  $f(d_1)/f'(d_1) < 1$  the difference is small

A reasonably approximate value of  $d_1$  is given by

$$d_1 = d/2(h_2/h_1)^{1/2}$$

For instance; for the above numerical example, with  $d = 60$  miles,  $h_2 = 2,000$  feet,  $h_1 = 100$  feet

$$d_1 = 60/2 \times 4.472 = 6.75$$

The actual value, as found above, was 6.886.

$$\text{Let } d_1 = w + d/2$$

then Eq. 8 will have the form

$$-w^3 - tw - q = 0$$

where

$$t = (d^2/4 + h_1 + h_2)$$

and

$$q = (h_2 - h_1)d/2$$

where  $d$  is expressed in miles and  $h$  in feet. Figure 2 will give the value of  $w$  for any given values of  $t$  and  $q$ . To keep the values of  $q$  and  $t$  within the limits of the nomogram a reducing scale  $s = 20$  was used. With this scale, the relationships shown on Fig. 2 hold true.

FIG. 3—Chart shows tangent value for four-thirds earth and reflection angle

$$t' = (d^2/4 + h_1 + h_2)s^2$$

$$q' = (h_2 - h_1)s^2d/2$$

and

$$w' = sw$$

For the numerical example,  $d = 60$  miles,  $h_1 = 100$  feet and  $h_2 = 2,000$  feet,

$$t = 3,000, \quad t' = 7.5$$

$$q = 57,000, \quad q' = 7.12$$

$$w = -1.16, \quad w' = -23.2$$

and

$$d_1 = -23.2 + 30 = 6.8$$

For any  $K$  value, other than  $K = 4/3$ ,

$$t' = (d^2/4 + 0.75Kh_1 + 0.75Kh_2)s^2$$

and

$$q' = (h_2 - h_1)0.75Kds^2$$

where  $d$  and  $h$  are expressed in miles and feet respectively.

Having determined the value of  $d_1$  from Fig. 2, the value of  $d_2$  can then be deduced from  $d_2 = d - d_1$  and  $h_1'$  and  $h_2'$  from the relations given by Eq. 3 and 4 respectively.

Given  $d_1$  and  $h_1'$  and  $d_2$  and  $h_2'$ , the angle of reflection corresponding to

$$h_1'/d_1 = h_2'/d_2$$

can then be obtained from Fig. 3 as illustrated by the example given.

# BANDWIDTH-RISE TIME CHART

By M. DAVID PRINCE

**SUMMARY** — Straight-line chart relates bandwidth and rise time over wide frequency range for 2 to 10 pulse-amplifier stages in cascade. Overall rise time of amplifier can also be determined

**T**HE CHART presented here solves graphically two equations often used in pulse-amplifier design. The first applies to a single stage with less than 5-percent overshoot and relates the rise time to the bandwidth by the approximate empirical formula: (Rise Time)  $\times$  (Bandwidth) = 0.35.

This equation also applies to an amplifier containing more than one stage, in which case the rise time and the bandwidth both apply for the overall amplifier.

The second equation relates the rise time of an amplifier consisting of a number of identical stages in cascade with the rise time of each stage. This relation, which applies if the overshoot of each stage is less than 3 percent, is  
Overall rise time = (Rise time per stage)  $\times \sqrt{\text{Number of stages}}$ .

Care must be taken to use the A scales together or the B scales together, and to use microseconds and magacycles together or milliseconds and kilocycles together, as noted on the graph.

### Examples

Three examples illustrate several applications of the chart.

(1) The bandwidth of a single stage is 4 mc. What is the rise time of five identical stages connected in cascade?

Enter chart at 4-mc bandwidth per stage. Go up to five-stages line, then over to rise time in microseconds and read 0.2 microsecond.

(2) The rise time of one stage is 10 microseconds. What is the rise time of ten stages in cascade.

Enter chart with rise time at 0.01 milliseconds. Intersection with one-stage line gives an

equivalent bandwidth for a single stage of 35 kc. Move along 35-kc line to ten-stages line. Read on A-scale at 0.032 millisecond or 32 microseconds the rise time of ten stages in cascade.

(3) An overall effective bandwidth of 3.5 mc is required in a system. How many cascaded isolation amplifiers of 6-mc bandwidth can be used?

Enter the bandwidth scale at 3.5 mc and read up to the one-stage line. On the rise-time scale, the 3.5-mc overall bandwidth corresponds to a 0.1-microsecond overall rise time. Now, read over on the 0.1-microsecond rise-time line to the intersection with the 6-mc bandwidth line. This point of intersection indicates that three amplifiers can be connected in cascade without degrading the bandwidth beyond 3.5 mc.

# PROOF OF PERFORMANCE

**SUMMARY**—Steps required to check tv transmitters for station license or renewal under FCC proof-of-performance regulations are outlined. Frequency spectrum, field strength, visual and aural harmonics, frequency response and noise test procedures are given along with results obtained by one station. Other sources of FCC information are also given

By **JESSE R. SEXTON**

**N**EW TV STATIONS filing for a station license after Oct. 1, 1954, as well as all stations filing for renewal of license after that date, must comply with new FCC proof-of-performance regulations.

### Letter of Information

The commission's letter of information relating to these regulations contains six parts.

The first three, deal with the performance requirements for color of section 3.687.

It is assumed that the station does not transmit color programs in color, and that its transmitter has been modified to suppress the frequencies indicated in the letter,

either by the manufacturer or by installing a kit supplied by the manufacturer. All manufacturers, without exception, make this modification kit available to their customers hence complying with this portion of the requirements is relatively simple.

Part 4 of the letter deals with stations transmitting color programs in color and is not concerned with proof-of-performance tests for stations transmitting monochrome signals.

Part 5 requires data showing overall attenuation versus modulating frequency of demodulated signal for modulating frequencies from 0 to 4.75 mc.

Further information says the amplitude of the 0.2-mc sideband must be used as a reference point for comparison.

### Test Procedure

The equipment is set up as shown in Fig. 1. The test is made with the demodulator probe placed in the coaxial line to the antenna after the harmonic filter and with the transmitter operating into a dummy load. The demodulator is placed on crystal output.

To determine the various levels of the modulating frequencies the screen of a Tektronix oscilloscope must be calibrated in db. This is done by introducing a video voltage with a bandwidth of 0-5 mc from a Markasweep generator into the transmitter video input.

The transmitter is then fully modulated and the amplitude of the signal on the oscilloscope adjusted to a convenient level.

The signal generator is set at 0.2 mc and the marker pip located. The pip will be close to the carrier frequency and near the point of maximum amplitude of the oscilloscope waveform. This point is designated 0 db and a mark is placed on the screen. The sweep generator attenuators are adjusted to add 10 db to the circuit. The

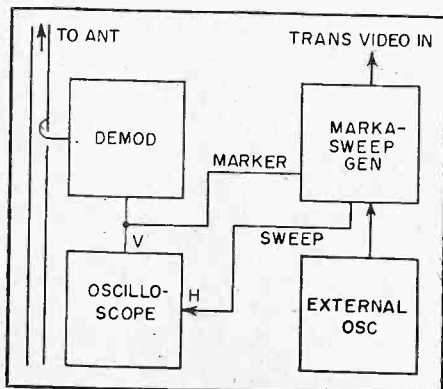

FIG. 1—Setup to obtain attenuation against frequency curves and to measure upper and lower sideband field strength

FIG. 2—Curve obtained using setup of Fig. 1 to determine attenuation against frequency for the upper sideband

# OR TV BROADCASTING

Waveform exhibit taken from face of calibration monitor

Test pattern exhibit taken from the screen

level on the scope will drop and the new level is marked—10 db. Additional steps of attenuation are introduced and each new level is marked with the appropriate db reading until the signal is completely attenuated.

The amplitude of the 0.2-mc pip is designated 0 db. Additional frequencies of 0.5, 1.25, 2.00, 3.00 and 3.5 mc are fed into the sweep generator from the signal generator.

### Curves

The db levels of the various frequencies are located along the sloping shoulder of the upper sideband and plotted on a curve as seen in Fig. 2.

None of the points should drop below the FCC limit indicated on the curve, for the rules say: "The overall attenuation characteristics of the transmitter, measured in the

antenna transmission line after the vestigial sideband filter (if used), shall not be greater than the following amounts below the ideal demodulated curve: 2 db at 0.5 mc, 2 db at 1.25 mc, 3 db at 2.0 mc, 6 db at 3.0 mc and 12 db at 3.5 mc." Should any of these values fall below the limit, it will be necessary to improve the overall linearity of the transmitter.

### Field Strength

The second paragraph of Part 5 says: "Field strength or voltage of lower sideband for modulating frequencies of 200 kc to 5 mc and of the upper sideband for modulating frequencies of 200 kc to 8 mc."

Further, information from section 3.687i not included in the above says: "All emissions removed in frequency in excess of 3 mc above or below the respective chan-

nel edge shall be attenuated no less than 60 db below the visual transmitted power (or not less than 48 db below the 0.2-mc reference point.)"

In addition, according to section 3.687 (a) (2), the respective channel edges at 1.25 mc for the lower sideband and 4.75 mc for the upper sideband must be attenuated no less than 20 db.

To measure the field strength of the upper sideband, the equipment is set up as shown in Fig. 1. Since levels must be measured 3 db above and below the respective channel edges, a video voltage 0 to 10-mc wide is used to modulate the transmitter.

### Sideband

The 0.2-mc sideband is located by introducing a 0.2-mc signal from the signal generator, and is designated 0 db. Additional frequencies from the external oscillator are then fed into the sweep generator and their levels recorded, according to the actual measurements shown in Table I.

The transmitter is swept with a 20-mc-wide video voltage to be sure there is nothing beyond the 10-mc range. In this case there was no measurable signal beyond the 9.0-mc point. The various levels are

## AND AS TO COLOR . . .

The information in this article shows how the holder of a monochrome tv broadcast station temporary authorization can obtain a full-fledged station license. Under present rules, no further proof-of-performance is required if station later decides to broadcast color.

It will be necessary, however, to adjust the transmitting equipment for color in conformance with FCC regulations. The tests to insure proper color performance have been described earlier in issues of ELECTRONICS.

FIG. 3—Curves show upper (A) and lower (B) sideband field strength

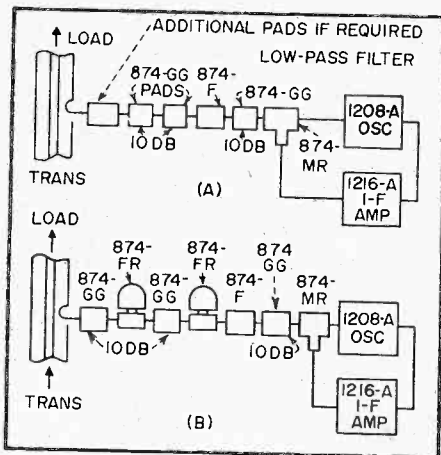

FIG. 4—Setup required to measure carrier fundamental (A) and harmonics (B)

then plotted on a curve, db levels versus frequency as shown in Fig. 3A.

The same procedure is used to measure the lower sideband. The results are shown in Fig. 3B. Since tv transmitters are single sideband, the lower sideband should fall off sharply between 0.75 and 1.25 mc.

**Harmonics**

The equipment needed to measure both visual and aural r-f harmonics includes the following General Ra-

dio types or their equivalents: oscillator 1215-B (50-250 mc), for Channels 2-6; oscillator 1209-B; 874-F low-pass filters; 874-GG loss pads; 1216-A i-f amplifier; 874-MR coaxial element; and 874-FR rejection filters.

Different model numbers of this equipment are necessary for Channels 7-13 and for the uhf channels.

The equipment is set up as shown in Fig. 4. The level of the fundamental carrier is first measured and entered in the appropriate column in the data sheet, a sample of which is shown in Table II. The levels of the various harmonics from the second through the tenth are then taken and entered. Occasionally trouble may be encountered in differentiating between the true harmonic and responses generated in the measuring equipment, especially as the higher frequencies are reached. Questions of this nature can generally be resolved by disconnecting the equipment from the transmission line and noting whether the response disappears or remains.

The actual frequencies of each

Table I—External Oscillator Frequencies

Mc	Db Level
0.2	0
0.5	-1
0.75	-2
1.0	-2.5
1.25	-8
2.0	-9
3.0	-10
3.5	-15
4.0	-16
4.5	-25
4.75	-25
5.0	-25
5.3	-26
6.0	-35
7.0	-57
8.0	-58

harmonic are given on the data sheet for each channel. The corrective factors for each harmonic, as shown on the data sheet, are used to arrive at the true db levels. The level of the fundamental carrier is then assumed to equal 0 db and is plotted along with the levels of the harmonics below the fundamental level as computed from the data sheet. Figure 5 shows plots for both aural and visual carriers.

When the measurements are taken, the transmitter should be at full power output and operating into a dummy load. Also, the measurements must be made with the probe placed in the transmission line after the harmonic filters. Each harmonic must be a minimum of 60 db below the level of the fundamental to comply with the requirements.

**Photographs**

Further requirements concerning the visual section of the transmitter include taking photographs of a waveform and test pattern. The photograph submitted as a waveform exhibit was taken from the face of the calibration monitor waveform oscilloscope being driven from the demodulator and was that of a standard test pattern. In this exhibit it is necessary that the setup interval be shown plainly to be within 2½ percent of the value of 7½ percent set by the commission.

The photograph of the test pattern was taken from the screen of the calibration monitor. It is permissible to use an ordinary home

FIG. 5—Plots show level of specific visual harmonics (A) and aural harmonics (B)

receiver if the picture shows adequate detail. Requirements are that it show at least 350 lines of resolution and 5 shades of gray.

### Aural Tests

For the frequency-response curve, the system must be measured from the studio microphone input to the transmitter output over a band of 50 to 15,000 cps, excluding any limiting amplifiers but including preemphasis. Each point must fall between the limits shown in Fig. 6 and Appendix 3, Fig. 8, Part 3 Rules and Regulations.

To make this test, the equipment is set up as shown in Fig. 7. A loss

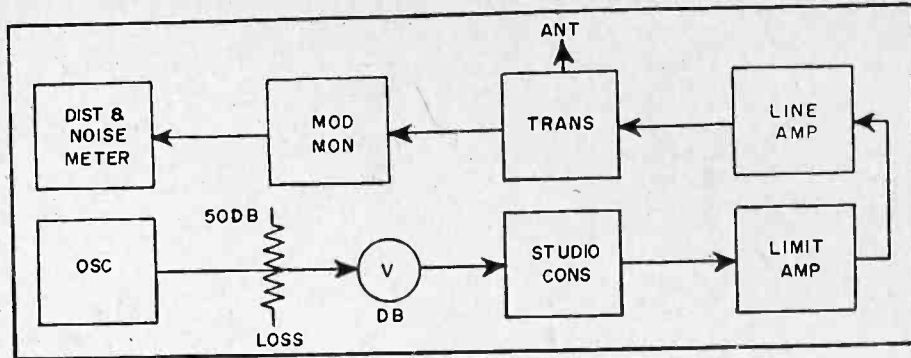

Fig. 7—Setup required to make aural measurements

FIG. 6—Limits for frequency response are shown as standard preemphasis curve at top and FCC limit at bottom with specific points obtained between

pad is introduced between the oscillator and microphone input to lower the output of the oscillator approximately 50 db, depending on the type microphone and preamplifier used. The pad should match the impedance of the microphone preamplifier input and the output of the oscillator. It should be made of noninductive resistors and the capacitance between resistors and between input and output leads should be kept as low as possible since small capacitances at higher audio frequencies can result in incorrect readings.

The db meter should be large and have a scale showing at least  $-18$  to  $+4$  db. Since preemphasis is employed and, to comply with the regulations, the transmitter must

be kept at 100 per cent modulation for each reading, it is necessary that the input values not output values be read and plotted. If the input level were maintained at a constant value for each frequency, as is generally done in making amplitude-modulation tests, the output level, instead of remaining at 100-percent modulation, would vary over a wide range owing to the preemphasis.

### Frequency Response

A signal of 50 cps is introduced into the microphone input from the oscillator. All gains are set at normal, and any program limiters or compressing devices are removed from the circuit. The oscillator level is adjusted so that the trans-

# Proof of Performance (Continued)

FIG. 8—Plots show distortion at 25 (A), 50 (B) and 100-percent modulation (C) as measured at 100-percent modulation

mitter modulation monitor reads exactly 100 percent.

The signal input meter reading will fall between 0 and +4 db. This value is carefully read and recorded. Without changing gain control settings other than oscillator level, frequencies of 100, 400, 1,000, 5,000 and 15,000 cps are fed into the system and the level read on the input meter for each frequency. At each frequency the transmitter should be returned to 100-percent modulation.

At 15,000 cps, the input level reading will have dropped off to -16 to -20 db for 100-percent modulation. Since the various input signal levels were read rather than output, the data represents an image of the output. A true curve is obtained by changing the polarity sign of each reading. The frequency response curve thus obtained and must fall between the upper and lower limits of the FCC curve.

There is nothing to prevent shifting the entire curve up or down if doing so will fit it between the limits. For example, if the 50-cps reading is +1 db and the 15,000-cps level falls outside the upper limit at +18 db, the entire curve may be moved downward 1½ db thereby bringing the 15,000-cps

reading well within the upper limit while still keeping the 50-cps reading within the lower limit. If the curve will not fit between the limits of the standard curve, then the frequency response of the system is not satisfactory and must be improved.

### Distortion

Distortion must be measured at 100-percent modulation for a frequency band of 50 to 15,000 cps and at 50-percent and 25-percent modulation for a frequency band of 50 to 5000 cps. The distortion levels must not rise above the following values: 50 to 100 cps 3.5 percent; 100 to 7,500 cps 2.5 percent and 7,500 to 15,000 cps 3.0 percent.

The test set up is shown in Fig. 7. A signal of 50 cps from the oscillator is fed into the microphone input. With all gains set at normal, the oscillator input level is adjusted for a 100-percent reading on the modulation monitor. The amount of distortion is read from the distortion and noise meter and recorded. For 100-percent modulation this is repeated for frequencies of 100, 400, 1,000, 5,000, 7,500, 10,000, and 15,000 cycles per second. For 50 percent and 25 percent modulation, frequencies of 50, 100, 400, 1000, and 5,000 cycles are used. The results are shown in Fig. 8.

### Noise

In a frequency modulated transmitter, there are two inherent types of noise—that which modulates the carrier frequency and that which modulates the carrier amplitude. Both must be measured. The f-m noise level, in the band of 50 to 15,000 cps, must be at least -55 db below 100-percent modulation. The amplitude noise level

must be down -50 db below 100 percent modulation. Measuring the f-m noise level is relatively simple. The a-m noise level presents considerably more of a problem.

To measure the f-m noise level the video transmitter is shut down, since as yet the commission has not taken into consideration noise that might be introduced into the aural section from the visual portion. The oscillator output is introduced into the microphone input through the loss pad. With all gains set at normal and no limiting nor compression used, a frequency of 400 cycles is fed into the system and the modulation brought to 100 percent by the oscillator gain control. The oscillator signal is removed and the noise level read directly from the distortion and noise meter. This is repeated for a signal of 1,000 cps.

At present there is no equipment on the market to measure the a-m noise level of an f-m transmitter. Figure 9 shows a schematic of the method recommended by RCA for their f-m transmitters. An r-f voltage from the transmitter is introduced at the circuit input.

The amplitude of the rectified r-f is adjusted by the potentiometer until a reading of approximately 4 v is obtained on the voltmeter, with the switch in the r-f position. The switch is then placed in the a-c position, and the a-c amplitude adjusted until it is exactly the same as the rectified r-f reading on the voltmeter. The noise and distortion meter is then calibrated to 0 db. The switch is then thrown back to the r-f position, and the a-m noise level read from the distortion and noise meter.

The author acknowledges the assistance of E. Miller, E. Love, and R. Richardson.

# HORSEPOWER NOMOGRAPH FOR RADAR ANTENNA ROTATORS

**SUMMARY**—Chart assists designers in making rapid preliminary calculations of the horsepower necessary to rotate shipboard radar-antenna reflectors which are not enclosed by radomes. Chart is applicable to elliptical as well as rectangular reflectors

By PAUL W. PEAY

**K**NOWING THE DIMENSIONS and desired speed of rotation of a radar antenna, this chart permits a rapid determination of the horsepower required to power the drive mechanism.

The total torque necessary to rotate the antenna was calculated from  $T = \sqrt{T_D^2 + T_U^2} + T_M$ , where  $T_D$  is torque for a balanced antenna in moving air,  $T_U$  is torque for an aerodynamically unbalanced antenna rotating in moving air and  $T_M$  is torque for a mechanically unbalanced antenna due to roll of a ship. In utilizing these torques, the following assumptions were made: wind velocity = 80 mph; aerodynamic unbalance factor = 0.25 ft; streamline or drag coefficient = 1.0; center of gravity displacement = 1 ft; antenna height above ship's roll center = 100 ft; period of ship's roll = 5 sec; ship's roll = 30 deg.

The horsepower was then found from the relationship  $hp = (\text{torque} \times \text{rotational speed}) / 5,250$ .

### Examples

(1) Find the hp per ft of antenna height to drive a 20-ft wide by 12-ft high antenna revolving at 10 rpm.

Draw a vertical line from 20

on the reflector width scale to intersect the 10-rpm curve; from this draw a horizontal line to the hp/ft scale where the answer is 1.05. Multiplying this by 12 gives 12.6 as total horsepower.

(2) Find the total horsepower to drive a 28-ft wide by 15-ft high antenna revolving at 16 rpm. From 28 on the width scale, draw a vertical line to the

16-rpm curve. From this intersection draw a horizontal line to the base line, from there to 15 ft on the height scale. Horsepower is read as 60 from the total horsepower scale.

Horsepower values shown on this chart are for rectangular antennas; for elliptical antennas, use 59 percent of the rectangular antenna horsepower.

Chart gives horsepower in terms of radar antenna size and rotational speed

# RADAR SECOND DETECTOR FILTER NOMOGRAPH

**S**UMMARY — Gives optimum circuit constants for second detector and video circuits of radar receiver when i-f value, upper video cutoff frequency, tube and socket capacitances are known

Radar receiver circuit, showing constants covered by nomograph

**O**NE DETAIL which tends to receive little emphasis in radar receiver design is optimization of the filter constants of the second detector. The recurrent problem of compromising between adequately bypassing the i-f components of the signal and retaining the high-frequency components of the video signal is solved easily by the accompanying nomograph.

## Nomograph Scales

The basic nomograph consists of the scales  $f_{i-f}$  (intermediate frequency),  $f_D$  (detector filter frequency) and  $f_V$  (upper video 3-db cutoff frequency). The equation governing the relationship,  $f_D = \sqrt{f_{i-f} f_V}$ , determines the optimum detector filter frequency to be the geometric mean of the intermediate frequency or the lower 3-db frequency of

By CHESTER W. YOUNG

the i-f pass band and the upper video cutoff frequency.

Additional scales  $C_V$  and  $R_V$  give video circuit constants. Since good detector efficiency is based upon a good  $C_D/C_{i-f}$  ratio, this scale is added to the right of the nomograph.

## Example

As an example, determine the constants of the detector and video circuits when the i-f is 50 mc, the upper cutoff  $f_V$  is 1 mc for the video, the detector diode-socket capacitance  $C_{i-f}$  is  $2 \mu\mu\text{f}$  and the video tube and socket capacitances  $C_V$  total  $30 \mu\mu\text{f}$ .

Starting at the 50-mc point on the left-hand scale ( $f_{i-f}$ ), draw a straight line to the 1-mc point on the middle scale ( $f_V$ ) and read 7 mc on the  $f_D$  scale (A).

Selecting a  $C_D/C_{i-f}$  ratio of 10 on the scale at the extreme right, connect this value with the  $2\text{-}\mu\mu\text{f}$  value on the  $C_{i-f}$  scale and read the value  $20 \mu\mu\text{f}$  on the  $C_D$  scale (B). By extending a line joining the 7-mc point on the  $f_D$  scale and the  $20\text{-}\mu\mu\text{f}$  point on the  $C_D$  scale to the right, the value 1,100 ohms is obtained for  $R_D$  (C).

If no peaking compensation is used in the video circuit, the value of  $R_V$  can be determined to be 5,300 ohms by joining the 1-mc point on the  $f_V$  scale with the  $30\text{-}\mu\mu\text{f}$  point on the  $C_V$  scale and extending it to the right to the  $R_V$  scale (D).

The rectified voltage developed at the output of a diode detector

is a function of the voltage distribution between capacitances  $C_D$  and  $C_{i-f}$ . The ratio of these two values was chosen to be 10 in the foregoing example so that most of the signal voltage (actually 10/11) is impressed across  $C_D$  for transfer to the next stage of the receiver.

From the aspect of pulse envelope rise and fall time, the diode resistance should be low compared to the diode load resistance and the impedance of the i-f stage driving the detector. Specifically, it is recommended here also that the diode anode-cathode capacitance should be

considerably lower (by a factor of 10) than the input capacitance of the following stage. This ratio of 10 is an arbitrary compromise between the driving impedance and consequent pulse envelope degradation and the amount of i-f voltage that can be utilized as a signal.

Second detector filter nomograph. Lettered lines indicate four steps of design procedure. Line A gives detector filter frequency from i-f value and upper video cutoff frequency. Line B gives detector load capacitance value from detector capacitance ratio and detector tube capacitance. Line C gives detector load resistance value from detector filter frequency and detector load capacitance value. Line D gives first video amplifier plate load resistance from upper video cutoff frequency and video tube plate-cathode capacitance

# DESIGNING TRANSISTORIZED MEACHAM-BRIDGE OSCILLATORS

Underside of amplifier chassis and top and bottom views of complete junction-transistor oscillator

By SAMUEL N. WITT, JR.

**SUMMARY**—Circuits have been designed using both point-contact and junction transistors. Operating at one megacycle, oscillators provide good long and short-time frequency stability. They are stable with respect to temperature and supply-voltage changes

**D**EVELOPED to provide exceptional stability, the transistor Meacham-bridge oscillator provides a reliable standard for measuring the performance of other transistor oscillators.

### Electron-Tube Oscillator

The Meacham oscillator<sup>1</sup> consists of a bridge circuit and an amplifier. Most analyses assume that the amplifier is characterized by relatively constant gain and phase shift, zero initial phase shift and high amplifier input impedance. Maximum amplitude and frequency stabilities are obtained when all of the arms of the bridge are equal.<sup>2</sup>

Frequency instability is given by

$$\Delta f/f_0 \approx 2 \Delta \theta / (KQ) \quad (1)$$

where  $Q$  is the quality factor of the resonant circuit,  $K$  is the magnitude of the amplifier voltage gain with

the bridge connected and  $\Delta \theta$  is the incremental phase shift of the amplifier.

The stability is directly proportional to the amplifier voltage gain and is  $K/4$  greater than would be calculated on the basis of the  $Q$  of a resonant circuit without the bridge.<sup>3</sup>

When a transistor amplifier is used, power gain becomes important since the input impedance of most transistor amplifiers is low.

For all bridge impedances approximately equal to the input and output impedances of the amplifier, frequency instability is given by<sup>1</sup>

$$\Delta f/f_0 \approx 8 \Delta \theta / [Q(|\mu| + 8)] \quad (2)$$

where  $\mu$  is the open-circuit gain of the amplifier.

In terms of amplifier voltage gain with the bridge connected, Eq. 2 becomes

$$\Delta f/f_0 \approx 4 \Delta \theta / [Q(K + 4)] \quad (3)$$

which shows that the stability is approximately one-half as great as obtained with infinite amplifier input impedance.

The frequency variation as a function of gain is

$$\Delta f/f_0|_K \approx -4 \theta \Delta K / [Q(K + 4)^2] \quad (4)$$

where  $\theta$  is the phase shift of the amplifier and  $\Delta K$  is the magnitude of the incremental change in amplifier gain.

Equation 4 shows that if the amplifier phase shift is zero, changes in gain will have no effect on frequency.

Equations 1 through 4 neglect the frequency-pulling effects of harmonic distortion. This is permissible with most electron-tube amplifiers since the amplitude is maintained relatively low. However, when transistors are used, harmonic

distortion may be of considerable importance.

### Point-Contact Transistor

It was desirable to design a transistor oscillator to have a short-time instability of less than 1 part in  $10^7$ . On the basis of Eq. 3 and 4 it was concluded that the minimum voltage gain should be 25. Frequency of operation was to be one megacycle. Available crystals had a series-resonant impedance of 100 ohms. An investigation of suitable thermistors with a resistance of 100 ohms indicated that at least 4 mw would be necessary to drive the bridge. The oscillator in Fig. 1 was designed using two Western Electric type 1729 transistors.

This amplifier was capable of supplying about 8 mw to the bridge with low distortion. The output impedance was adjusted to 100 ohms by selection of the transformer turns ratio for maximum power transfer to the bridge. The input impedance was approximately 100 ohms. With the bridge connected, the overall voltage gain of the amplifier was about 25.

Crystal  $CR_1$  is connected in series with the amplifier input to prevent uncontrolled oscillations. Crystals  $CR_1$  and  $CR_2$  must be series resonant at nearly the same frequency. The series crystal acts as a band-pass filter and has little control over the frequency of oscillation.

### Oscillator Performance

Relative band-pass characteristics for three portions of the circuit are shown in Fig. 2. The pass-

band of the amplifier was broad because of the low values of  $Q$  resulting from the circuit loading. The passband of the amplifier and crystal combination is determined primarily by the characteristics of the crystal. The effective loaded  $Q$  is approximately one-half of the measured crystal  $Q$ . Maximum voltage gain is reduced one-half by the equivalent series resistance of the crystal.

Although the two crystals have approximately the same  $Q$ , the passband of the bridge circuit is narrower than that of the amplifier because of the effective  $Q$  multiplication of the bridge.

The relative phase characteristics of the circuit are also shown in Fig. 2. The amplifier without the series crystal would oscillate uncontrollably through the negative-feedback path of the bridge while with the series crystal it will not.

The oscillator performed satisfactorily, but it was not suitable for continuous laboratory use because of the unpredictable nature of point-contact transistors and because of the circuit changes and adjustments necessary when the transistors were replaced.

To obtain maximum power gain when a transistor was replaced, it was usually necessary to change the transformer turns ratios. The effective amplifier gain with the series crystal was only 12.5, zero amplifier phase shift did not occur at the transformer tuning which produced maximum gain and an isolated output capable of supplying appreciable power was not provided. Nevertheless, the oscillator compared

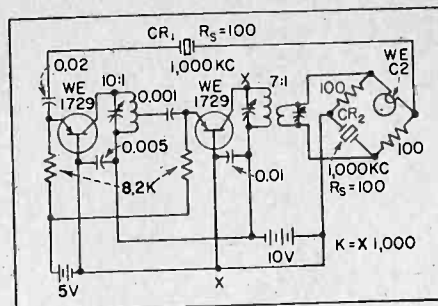

FIG. 1—Point-contact transistor oscillator using Meacham-bridge circuit

FIG. 2—Characteristics of point-contact transistor oscillator

favorably with an electron-tube oscillator' constructed for comparison. Table I shows the comparison of the two oscillators.

Short-time stability was not comparable, for either oscillator, to the voltage stability. The short-time instability was obtained as the maximum frequency change over a 4-hour period with the ambient temperature varying approximately 5 degrees centigrade. The same crystal was used for both oscillators.

### Junction-Transistor Oscillator

Of eight junction transistor types (more than 50 individual transistors), only the Germanium Products type RDX-300A was found suitable for the amplifier-output stage. The Texas Instruments type 904A silicon transistor was found suitable for the first amplifier stage.

The oscillator using junction transistors is shown in Fig. 3. The bridge amplifier is of conventional design using transformer coupling and includes a bias network to permit operation from a single power source. Measured input impedance

Table I—Comparison of Electron-Tube, Point-Contact and Junction-Transistor Oscillators

Item	Electron-Tube Osc	Point-Contact Transistor Osc	Junction Transistor Osc

# Meacham-Bridge Oscillator Design (Continued)

at 1 megacycle was greater than 100 ohms. Overall voltage gain with a 100-ohm load on the secondary of the output transformer was 50. The undistorted output to the bridge was 2 volts peak-to-peak or 5 milliwatts.

The bridge is not an equal-arm bridge. This was necessitated by the choice of the lamp thermistor. The Western Electric K1 switch-board lamp was chosen for its good nonlinear characteristics with minimum power consumption. One arm of the bridge was made variable so that crystals of different characteristics could be accommodated.

No attempt was made to compensate against temperature variations except for placing the crystal in a Lavoie type K00000005 oven. The series-resonant frequency of the CR-18 crystal was more than 100 cps below 1 megacycle. Therefore, it was necessary to raise the resonant frequency with a 30- $\mu$ f series capacitor. The capacitor was made variable from 28 to 32  $\mu$ f to permit precise adjustment.

Bypassing the RDX-300A second base had little effect on the gain or phase shift of the amplifier. When the second base was not bypassed, a signal voltage of 0.5 v peak-to-peak was observed at the second base terminal. Therefore, it was decided that this point could be used as an output since changes in loading would have little effect on the frequency of oscillation. The 904A output stage was added to provide additional isolation and greater out-

put than was available directly from the second base of the tetrode. With the transformer, the open-circuit output voltage from the power-output stage was 5 v peak-to-peak. The voltage dropped to 0.5 v with a 1,000-ohm resistive load. With 6 feet of unterminated coaxial cable, approximately 2 v was obtained.

Several decoupling capacitors, not shown in Fig. 3, were necessary to eliminate spurious oscillations.

## Construction

So-called miniature components were not used. All of the components were randomly chosen from a stock of standard tolerance components. The winding of the transformers was one of the major problems in the amplifier construction. The two transformers in the bridge amplifier were wound with tapped secondaries so the impedances could be matched to obtain maximum gain. The turns ratios shown are the ones which gave best results.

The two transformers of the bridge amplifier were placed at right angles to minimize coupling. The transformer of the power-output amplifier, at the upper left of the chassis, could not conveniently be placed at right angles to the other two transformers. As a result, some mutual coupling exists between the power-output stage and the bridge which accounts for a change in gain and phase shift of the bridge amplifier when the power-output stage is tuned. This has a slight effect on the frequency.

A regulated Transpac power supply is used with the equipment.

Table I shows that the voltage stability for this oscillator was slightly worse than that of the point-contact oscillator. The power required was less for the junction oscillator, which exclusive of the bias network and crystal oven required only 70 mw. The transistor oscillators and electron tube oscillator all operated satisfactorily over approximately the same range of voltage variations.

## Stability

Short-time stability of the junction-transistor oscillator was much better than that of either of the other two oscillators. This was in part due to the excellent temperature characteristics of the 904A silicon transistors. Use of a better crystal oven also resulted in some improvement over the other circuits. The same crystal was used with all of the oscillators.

When the junction-transistor oscillator was operated continuously for six weeks on a battery power supply, the total drift in frequency was only 1 part in  $10^7$ . This drift was caused primarily by crystal aging. The instability for periods of a few minutes was 1 part in  $10^8$ .

The transistorized Meacham bridge oscillator was developed as a part of a study by the Engineering Experiment Station of the Georgia Institute of Technology.<sup>5</sup> The program was sponsored by the Frequency Control Branch of the Signal Corps Engineering Laboratories, Fort Monmouth, New Jersey. The author expresses appreciation to B. J. Dasher and D. L. Finn of the Georgia Tech School of Electrical Engineering for their help in the preparation of this paper.

This paper was presented at the 1955 National Electronics Conference.

# DESIGNING FERRITE-ROD ANTENNAS FOR X-BAND OPERATION

FIG. 1—Basic ferrite-rod antenna system for coupling to end of standard waveguide. Tapered end in waveguide aids impedance matching

FIG. 2—Polarization and radiated power of ferrite antenna in relation to mode-switch solenoid current at 9,430 mc

By **FRANK REGGIA,**  
**E. G. SPENCER,**  
**R. D. HATCHER,**  
 and **J. E. TOMPKINS**

**SUMMARY**—Dielectric radiators use ferrite-rod elements and ferrite switching devices for mode switching, array scanning and beam lobing. Radiation patterns show optimum design configuration of rod radiators for operation in the 9,000-mc band. Gain of a single radiating element is about 20 with vswr of less than 1.2

**M**ICROWAVE antenna systems have been developed for X-band use, which employ rods of commercially available ferrites (ferrods) as dielectric radiating elements. Application of a magnetic field to a section of the ferrite radiator is used to obtain beam scanning, beam lobing, switching, modulation or rotation of the plane of polarization.

A typical X-band ferrite has a dielectric constant of 13.6 and an

initial permeability of 0.78. Its field-dependent permeability has a tensor characteristic which gives rise to the Faraday effect and the development of many useful devices.

The basic ferrite-rod antenna system is shown in Fig. 1. The radiator may be considered a dielectric-rod radiator, excited by a ferrite-filled section of cylindrical waveguide with a longitudinal applied magnetic field. The rod protrudes into the rectangular wave-

guide section and is magnetically coupled to the r-f fields. The short taper at the input end is used for impedance matching. The radiating portion of the ferrite rod is tapered to give maximum radiation along its axis and minimum radiation in the side lobes. The overall length of the system is about 5 inches. The ferrite-rod is  $\frac{1}{4}$ -in. in diameter and about  $4\frac{1}{2}$ -in. long.

The ferrite-filled waveguide section is  $\frac{3}{4}$ -in. long and is surrounded

# DESIGN OF TRIPLE-TUNED CIRCUITS

**SUMMARY**—Procedure and curves based on normalized low-pass filter enable the design of triple-tuned circuits having a maximally flat response and taking parasitic dissipation into account. Typical circuits and examples are given for interstage and band-pass filters

By PHILIP R. GEFTE

**C**ONVENTIONAL DESIGN procedures for interstage triple-tuned circuits have the disadvantages that formulas taking parasitic dissipation into account are not generally available and that conventional designs work between equal terminations. The latter causes a 6-db loss in voltage gain, in addition to the insertion loss of the filter.

### Low-Pass Prototype

The chart in Fig. 1 gives the element values of a low-pass filter normalized for a one-ohm source, open-circuit load and cutoff at one radian a second.

To design a low-pass filter to work from a source of  $R$  ohms and cutoff at  $f_c$  only impedance and frequency scaling to the normalized filter need be applied, using the following equations:

$$L' = RL/2\pi f_c \quad (1)$$

$$C_1' = C_1/2\pi f_c R \quad (2)$$

$$C_2' = C_2/2\pi f_c R \quad (3)$$

The result will be a low-pass filter having the flat-loss given in the chart and attenuation varying with frequency as follows:

FIG. 1—Curves give normalized values of  $L$ ,  $C$  and  $d$  used in design procedure

$$A = \sqrt{1 + (f/f_c)^6} \quad (4)$$

for any frequency  $f$ .

Where  $d < 0.05$  the following approximate formulas give good accuracy

$$L = \frac{4 - 12d}{3 - 12d} \quad (5)$$

$$C_1 = \frac{3 - 12d}{2 - 7d} \text{ and Loss} =$$

$$20 \log_{10} (2d^2 - 2d + 1) \text{ in db}$$

By setting  $d = 0$  in Eq. 5 the correct values for lossless inductors and capacitors are obtained, hence

$$L = 1/2, C_1 = 3/2 \text{ and Loss} = 0 \text{ db} \quad (6)$$

To choose the value of  $d$  a relationship between the band-pass filter and its low-pass prototype, must be used, thus  $d = f_0/Q_{BP} (f_2 - f_1)$  (7) where  $Q_{BP}$  is the  $Q$  that is used in each branch of the band-pass filter,  $f_2$  and  $f_1$  are the cutoff frequencies of the band-pass filter and  $f_0 = \sqrt{f_2 f_1}$ . The value of  $d$  obtained from Eq. 7 is used to obtain element values and flat-loss from the chart. This value of flat loss will apply both to the band-pass filter and to its low-pass prototype.

### Low-Pass to Band-Pass

To transform from a low-pass to a band-pass filter, scale the normalized low-pass filter to an impedance level of  $R$  ohms and cutoff  $f_c$ . The cutoff frequency is equal to the bandwidth,  $f_2 - f_1$ , of the desired band-pass filter.

Next, tune all three branches of the filter to  $f_0$  by inserting a capacitor in series with  $L'$  and inductors in parallel with  $C'_1$  and  $C'_2$ , as shown in Fig. 2. Thus  $L'$  and  $C'$  resonate at  $f_0$  as do  $L'_1$ ,  $C'_1$  and  $L'_2$ ,  $C'_2$ .

### Performance

If the flat-loss is ignored the relative attenuation is

$$A = \sqrt{1 + y^6}, \text{ where} \quad (8)$$

$$y = b(f/f_0 - f_0/f), b = f_0/f_2 - f_1 \quad (9)$$

For calculating the attenuation at frequencies remote from the pass-band the following approximation may be used

$$A \cong y^3 \text{ or } 20 \log_{10} A \cong 60 \log_{10} y \text{ in db} \quad (10)$$

FIG. 2—Transformed band-pass filter

FIG. 3—Scaled band-pass filter designed from chart

Tolerances of from 1 percent to 5 percent on element values and 15 percent on  $Q$  will usually give satisfactory results provided that each branch of the filter is adjusted to resonate accurately at  $f_0$ .

### Examples

As an example, design an interstage filter to work from a 10,000-ohm plate resistance, having 3 db points at 9 and 11 kc, coil  $Q$  of 25 and giving 50 db attenuation at 20 kc.

Here  $f_0 = \sqrt{f_1 f_2} = \sqrt{99} = 9.95$  kc,  $b = 5$ , at  $f = 20$  kc,  $y = 7.56$  hence  $20 \log_{10} A = 60 \log_{10} 7.56 = 52.7$  db.

Evidently one triple-tuned circuit will have sufficient attenuation. From Eq 7,  $d = 0.20$ . Entering the chart at  $d = 0.20$  obtain  $C_1 = 0.720$ ,  $L = 1.66$ ,  $C_2 = 1.25$ , Loss = 3.5 db.

Scaling the normalized prototype to 10,000-ohm impedance level, and cutoff at 2 kc, obtain  $C'_1 = 0.00573 \mu F$ ,  $C'_2 = 0.00995 \mu F$  and  $L' = 1.32 H$ . So the band-pass filter will have the configuration shown in Fig. 3.

Choosing  $C'$  to resonate with 1.32H at 9.95 kc gives  $C' = 194 \mu \mu F$ . Similarly,  $L'_1 = 44.6$  MH,  $L'_2 = 25.7$  MH. Since the series coil is large enough to cause difficulty with its self resonant frequency, tap  $L'_1$  and  $L'_2$  at 10 percent of their inductance. This will reduce the impedance level of the series arm by a factor of

10 to give the final design shown in Fig. 4.

As another example, a 200-cps signal varies by  $\pm 5$  per cent, and it is desired to measure the second harmonic present while attenuating the fundamental and a large third harmonic by 80 db. Design a filter which will work from a 20,000-ohm source. Inductor  $Q$ 's of 16.6 are available.

If cutoff frequencies of 370 cps and 430 cps are chosen, then  $f_0 = 399$  cps and  $f_2 - f_1 = 60$  cps. Then  $b = 6.65$ . To check the attenuation in the pass-band, write  $y = 0.682$  at  $f = 420$  which is the maximum signal frequency and  $A = 20 \log_{10} \sqrt{1 + (0.682)^6} = 0.426$  db.

At 600 cps, the third harmonic,  $y = 5.58$ ,  $A = 60 \log_{10} 5.58 = 44.8$  db.

From these calculations it is apparent that two triple-tuned circuits will be needed, and the pass-band variation is 0.85 db.

From Eq. 7,  $d = 0.4$  which gives  $C_1 = 1.25$ ,  $C_2 = 0.68$ ,  $L = 2.57$  and loss = 6.8 db.

Raising this filter to a 20,000-ohm impedance level and a 60 cps cutoff gives  $C'_1 = 0.166 \mu F$ ,  $L' = 136.3$  H and  $C'_2 = 0.0902 \mu F$ .

Finding values to resonate with  $C'_1$ ,  $L'$ ,  $C'_2$  at 399 cps gives  $L'_1 = 0.958$  H,  $C' = 0.00117 \mu F$  and  $L'_2 = 1.76$  H and the configuration shown in Fig. 5.

# REGULATED TRANSISTOR

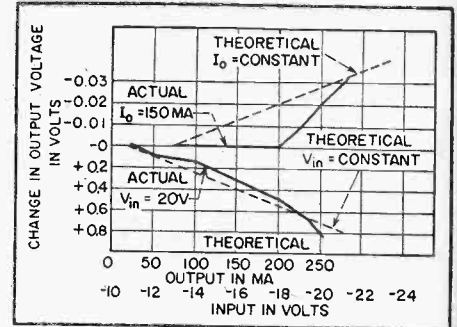

FIG. 2—Theoretical and actual characteristics of series-regulated supply

FIG. 1—Series-regulated supply and equivalent circuit (A) using transistor characteristic shown at (B)

**S**UMMARY—Series and shunt regulator design equations provide method of obtaining low voltage power supplies with any required degree of regulation. Actual circuit derived from these equations are discussed and laboratory tests show good agreement with predicted operation

Experimental supplies use terminal board construction for ease of measurement

**S**IMPLE compact low-voltage transistor power supplies are now entirely feasible using available transistors. Virtually any degree of regulation can be obtained with only a small increase in complexity of the circuit.

The output voltage of a power supply is a function of output current and input voltage

$$E_o = E_o(E_i, I_o) \quad (1)$$

$E_o$  = output voltage,  $E_i$  = input or line voltage,  $I_o$  = output or load current. Since in actual practice the load is established by the choice of load resistance, or more conveniently load conductance the output voltage can be written as  $E_o = E_o(E_i, G_L)$  where  $G_L$  is load conductance.

Then

$$\Delta E_o = \left( \frac{\Delta E_o}{\Delta E_i} \right)_{\Delta G_L=0} \Delta E_i + \left( \frac{\Delta E_o}{\Delta G_L} \right)_{\Delta E_i=0} \Delta G_L$$

Multiplying the second term numerator and denominator by  $E_o + \Delta E_o$ :

$$\Delta E_o = \left( \frac{\Delta E_o}{\Delta E_i} \right)_{\Delta G_L=0} \Delta E_i +$$

# POWER SUPPLY DESIGN

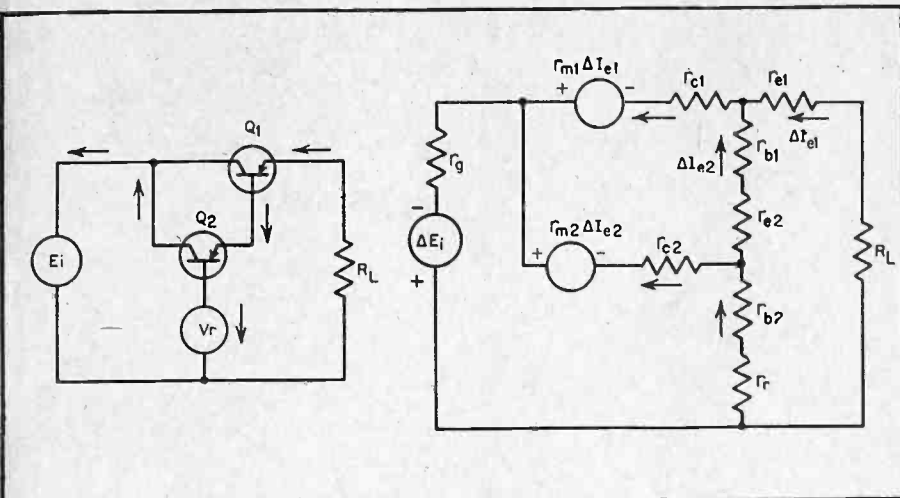

FIG. 4—Operating characteristics of two-transistor regulator circuit

FIG. 3—Two transistor regulator characteristics are determined by equivalent circuit as described in text

By J. WALTER KELLER, Jr.

$\left( \frac{\Delta E_o}{(E_o + \Delta E_o) \Delta G_L} \right)_{\Delta E_i=0} (E_o + \Delta E_o) \Delta G_L$   
 $(E_o + \Delta E_o) \Delta G_L$  differs from  $\Delta I_o$  by the term  $G_L \Delta E_o$ . This term can be neglected because, with any reasonable regulator, it is quite small compared to  $\Delta I_o$ . Thus

$$\Delta E_o = \left( \frac{\Delta E_o}{\Delta E_i} \right)_{R_L = \text{constant}} \Delta E_i + \left( \frac{\Delta E_o}{\Delta I_o} \right)_{\Delta E_i=0} \Delta I_o \quad (2)$$

This equation justifies the experimental procedure of holding  $R_L$  constant instead of  $I_o$  when obtaining the voltage regulation.

This equation is the basis for the a-c type of equivalent circuit. The output voltage variation is equal to the input voltage minus an I-R voltage drop. The two terms on the right of Eq. 2 should be as small as possible. Consequently the design of a voltage regulator should concentrate on making  $\Delta E_o / \Delta E_i$  and  $\Delta E_o / I_o$  as small as possible.

The most simple regulator design attempted is shown in Fig. 1A.

The transistor is a *pn*p power unit rated at 20 watts, with a heat sink at 25 C. The emitter of the transistor is biased in the forward direction and tends to be very close to the potential of the base which is the reference voltage. Line-voltage variations are dropped across the large dynamic collector resistance and are greatly reduced at the emitter.

To determine the coefficients of Eq. 1 assume linear operation and from small-signal equivalent circuit theory

$$\left( \frac{\Delta E_o}{\Delta I_o} \right)_{\Delta E_i=0} = -r_e - (1-\alpha)(r_b + r_r) \quad (3)$$

This is the load regulation of the circuit of Fig. 1A. The input-voltage regulation employing small-signal equivalent circuit theory is

$$\left( \frac{\Delta E_o}{\Delta E_i} \right)_{\Delta R_L=0} = \frac{r_b + r_r}{r_c \left[ 1 + \frac{(1-\alpha)(r_b + r_r)}{R_L + r_e} \right]} \times \frac{R_L}{R_L + r_e} \quad (4)$$

This assumes  $r_c \gg r_b + r_r + r_e$ , and  $R_L =$  load resistance.

The operation of input voltage

regulation can be seen by observing that the slope of the collector characteristics, shown in Fig. 1B, is approximately the series resistance to input voltage changes.

Now Eq. 2 becomes

$$\Delta E_o = \frac{r_b + r_r}{r_c \left[ 1 + \frac{(1-\alpha)(r_b + r_r)}{R_L + r_e} \right]} \times \frac{R_L}{R_L + r_e} \Delta E_i - [r_e + (1-\alpha)(r_b + r_r)] \Delta I_o \quad (5)$$

For a power transistor, substituting typical parameter values  $r_c = 10K$ ,  $r_e = 1.5$ ,  $r_b = 50$  and  $\alpha = 0.96$ ,  $R_L = 75$ ,  $r_r = 0$ , in Eq. 5 the following equation is obtained:

$$\Delta E_o = 0.004 \Delta E_i - 3.5 \Delta I_o \quad (6)$$

Using the circuit shown in Fig. 1A the curves of Fig. 2 were obtained. The nonlinearity of the experimental points and their departure from the theoretical value were expected in view of the large variation of transistor parameters with operating point. However, this does not limit the utility of the regulation equations in most practical cases because power supplies are usually employed in a narrow range making the assumption of a

Regulated power supply uses metal bracket construction as heat sink for power transistors. Rectifiers are mounted on underside of board

FIG. 5—Regulator using four transistors including a single-stage feedback amplifier (A) shows good correlation between actual and theoretical results (B)

single operating point a good approximation.

Equation 5 appears to contain sufficiently accurate relationships upon which further design considerations can be based. It can be predicted that better regulation would result from a higher alpha and  $r_e$  or lower  $r_b$ ,  $r_c$  and/or  $r_r$ .

One major drawback of the circuit of Fig. 1A is that it draws too much reference current. The circuit of Fig. 3 gives about the same regulation, but with substantially less reference current drain. Since  $I_r = (1 - a) I_o$ , the reference current assuming identical transistors is approximately  $0.002 I_o$ . This is equivalent to having a larger  $a$ .

Employing the equivalent circuit of Fig. 3 regulation will then be:

$$\frac{\Delta E_o}{\Delta I_o} = -[r_{e1} + (1 - \alpha_1)(r_{b1} + r_{e2}) + (1 - \alpha_1)(1 - \alpha_2)(r_{b2} + r_r)] \quad (7)$$

$$\frac{\Delta E_o}{\Delta E_i} = \frac{r_{b1} + r_{e2} + (1 - \alpha_2)(r_{b2} + r_r)}{1 + \frac{(1 - \alpha_1)}{R_L + r_{e1}}[r_{b1} + r_{e2} + (1 - \alpha_2)(r_{b2} + r_r)]} \times \frac{R_L}{R_L + r_{e1}} \quad (8)$$

These equations show that the reference resistance can be much larger than in the single transistor circuit before it becomes significant. Since  $Q_1$  will be carrying the full-load current and since the circuit will be required to deliver currents close to the peak ratings of  $Q_1$  the alpha and  $r_e$  of this transistor may be much smaller than for small-current bias. It would not be wise to assume equal parameters for the two transistors when using

Eq. 7 and 8. The values of the parameters used in the single-transistor regulator were large bias values. The proper values for  $Q_2$  are  $r_e = 90K$ ,  $r_b = 60$ ,  $r_c = 2.5$  and  $r_r = 50$  ohms and  $a = 0.97$ .

The equation for regulation can be shown to be

$$\Delta E_o = 0.0067 E_i - 3.7 \Delta I_o \quad (9)$$

This equation is compared with experiment in Fig. 4. The agreement is good since parameter values used in the equations were average values of a sample of ten transistors.

Both circuits discussed are basic series-type regulators employing the collector resistance for dropping line voltage to output voltage. The size of the dropping resistor is dependent upon the difference in voltage between the load and the base, or reference, less the drop in voltage caused by current in the emitter, base and reference resistances. The regulation is a function of the I-R drop in the circuit path between output voltage and reference. This drop can be made small by making the resistance of this path small or by making the change in current small in this circuit. Clearly, the size of the reference current change is dependent upon the amplification in the loop that tries to correct for output voltage changes.

When a single transistor is used to sense the difference in reference voltage and output voltage, regulation can be expressed as

$$\frac{\Delta E_o}{\Delta I_o} = \frac{\frac{r_{e1}}{1 - \alpha_1} + r_{b1} + r_r}{G_{es}} \quad (10)$$

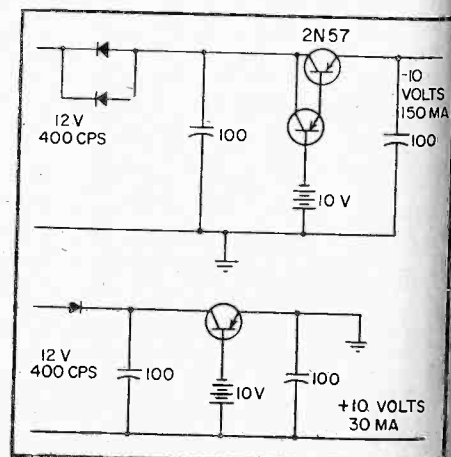

FIG. 6—Power supplies providing plus and minus 10 volts designed for use in ordnance field equipment

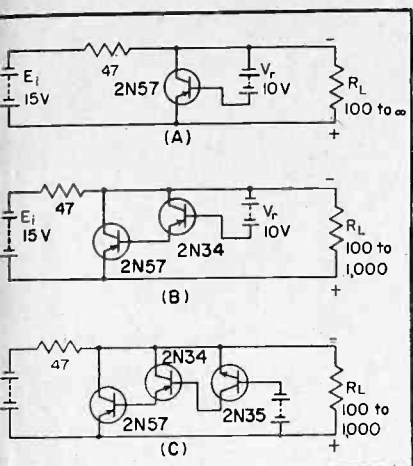

FIG. 7—Three shunt-type transistor regulators for low-voltage power supplies

$$\frac{\Delta E_o}{\Delta E_i} = \frac{\left[ \frac{r_{ef}}{1 - \alpha_f} + r_{bf} + r_r \right]}{G_c R} \quad (11)$$

where the subscript *f*, refers to the transistor parameter of the first amplifying stage, or the stage where the reference is compared with the output voltage. The  $G_c$ , is the total current gain in both the control and series resistance sections of the power supply and  $R$  is the total parallel resistance between the input voltage line and the junction of the series resistance and control sections.

Figure 5A shows an example of a voltage regulator employing a single-stage feedback amplifier. The dynamic series dropping resistor is made up of  $Q_1$  and  $Q_2$ . Transistor  $Q_1$  provides stage of gain. Transistor  $Q_2$  supplies a constant current to junction X which is shared by the base of  $Q_2$  and collector of  $Q_1$ .

If the output voltage decreases as the result of a greater load current the base voltage of  $Q_1$  will decrease toward ground causing  $Q_1$  to conduct less. The current that normally would have gone through  $Q_1$  now is diverted through  $Q_2$ . This causes both  $Q_2$  and  $Q_1$  to conduct more, which is equivalent to reducing the series-regulator resistance and results in the output voltage increasing, thus tending to compensate for the drop in voltage.

Transistor  $Q_2$  should be connected backwards, using the emitter as collector. Temperature stability of a transistor with large resistance in the base is poor unless the alpha is low. The alpha is usually quite

low in the back direction. Furthermore, the quality of this particular connection as a constant current source is independent of alpha.

Under certain conditions, better regulation could be obtained by employing transistor  $Q_3$  as an additional gain stage in the amplifier and using a resistor in the input voltage line to the base of  $Q_2$  to supply the needed current. This would depend mainly on how much larger the input voltage is as compared to the output voltage and the required regulation range.

The equation for regulation is

$$\Delta E_o = \frac{r_{e4} + (1 - \alpha_4)(r_{b4} + r_r)}{\alpha_4 R \frac{1 - \alpha_3}{\alpha_3}} \Delta E_i - \frac{(1 - \alpha_1)(1 - \alpha_3)}{\alpha_3 \alpha_4} \times [r_{e4} + (1 - \alpha_4)(r_{b4} + r_r)] \Delta I_o \quad (12)$$

A solution to Eq. 12 using typical transistor parameters gives  $\Delta E_o =$

employing high-gain servo amplifiers the major temperature problems are found in the amplifier, and principally, in the first stage where the comparison between reference and output voltage is made. Silicon components employed here may alleviate the problem but there will still be a need for compensation of the emitter to base voltage change in the first or comparison stage.

### Shunt Types

The shunt types of power supply shown in Fig. 7 are subject to the same general type of analysis as the series units. While their regulation in a limited range can be made as good as the series type, the total range over which they will regulate is in general less. Over a small range the circuit of Fig. 7C has desirable features. It is simple, its voltage reference is grounded on

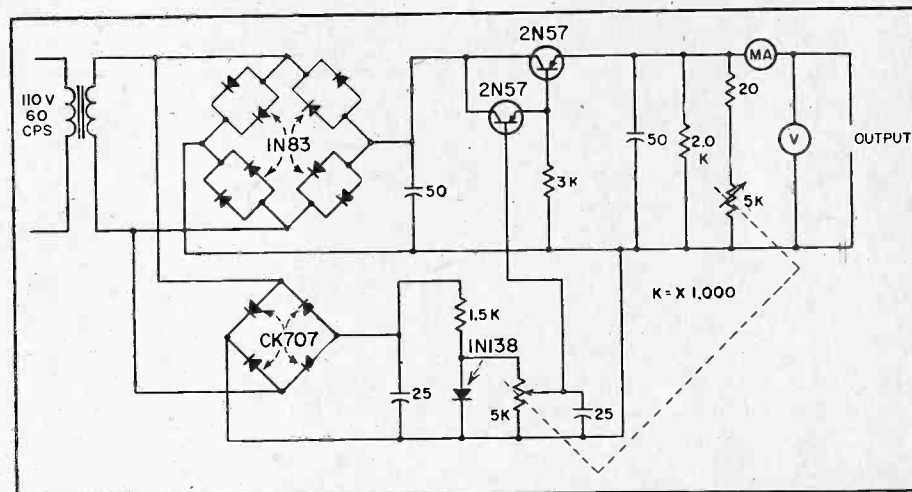

FIG. 8—Variable voltage regulated supply for laboratory use employs two transistors

$0.004 E_i - 0.13 \Delta I_o$ . The comparison of this equation with experiment is shown in Fig. 5B.

Supplies giving outputs of +10v and -10v are shown in Fig. 6.

### Temperature

The single transistor regulator of Fig. 1A has a 2.5-percent change in output voltage over the temperature range of 25 C to 80 C. The circuit of Fig. 3 has a 5-percent change in output voltage over that range. This temperature coefficient can be compensated by employing a reference with a negative temperature coefficient.

In more complicated regulators

one side which lends itself to use of Zener diodes and its regulation is comparable to the best 3-transistor series-type regulator.

A variable voltage regulated power supply for laboratory use is shown in Fig. 8. Note that there is no feedback stage. One additional transistor feeding back from the reference could improve the regulation by a factor nearly equal to the beta of the added transistor.

Thanks are extended Stanley Gordon who experimentally checked the formulas, Charles Durieu for recommendations of mathematical rigor and Morris Brenner for supplying transistor parameters.

# L NETWORK DESIGN

**SUMMARY**—Technique for using Smith chart to speed design of L matching networks for transmission lines and waveguides using lumped parameters. Shaded-area charts show at a glance impedance ranges that can be matched with each type of L network

**T**HE FAMILIAR Smith chart for transmission lines is also a useful tool for designing matching networks. As an example, consider the case where it is desired to match an impedance  $Z_L = (0.3 - j1.6)R_o$  to  $R_o$  with the L matching network shown in Fig. 1. It is assumed that the inductances are lossy so that  $R_1 = X_1 \tan \theta = 0.2X_1$ , and  $G_2 = -B_2 \tan \theta = -0.2B_2$ . All impedances and admittances are normalized with respect to  $R_o$  and  $G_o = 1/R_o$ , respectively.

Let  $Z_A = Z_L + R_1 + jX_1$ , and  $Y_A = 1/Z_A$ . Since  $Y_A + G_2 + jB_2 = 1$ ,  $Y_A$  must lie on curve  $Y = 1 - k(\tan \theta - j)$ , where  $k$  is a real variable. This curve is circle  $OA'$  with center  $C$ . To locate  $C$ , lines  $OC$  and  $OD$  are drawn as indicated in Fig. 1. Point  $D$  bisects its line. Point  $C$  is located as indicated.

Point  $C$  is inverted to obtain  $C'$  on line  $OC$  so that  $C'O = OC$ . Since  $Y_A$  must lie on circle  $OA'$ ,  $Z_A$  must lie on circle  $OH$  whose center is  $C'$ . To determine  $Z_A$ ,

By H. F. MATHIS

plot curve  $Z = Z_L + p(\tan \theta + j)$ , where  $p$  is a real variable. Point  $A$ , where this curve intersects circle  $OH$ , is the desired value of  $Z_A$ . The value of  $Y_A$  is found by inverting point  $A$  to obtain  $A'$ . Finally,  $R_1 + jX_1 = (Z_A - Z_L)R_o = (0.498 - j0.610) - (0.3 - j1.6)R_o = (0.198 + j0.990)R_o$  and  $G_2 + jB_2 = (1 - Y_A)G_o = 1 - (0.803 + j0.985)G_o = (0.197 - j0.985)G_o$ .

## General Procedure

In general, for L matching networks plot  $Z_L$  or  $Y_L$  first on the Smith chart. Next, plot the impedance or admittance into which  $Z_L$  is to be transformed, and find a suitable path connecting these points.

It is impossible to match all possible values of  $Z_L$  with a given type of L network. For example, if  $Z_L = 0.5R_o$ , the matching network shown in Fig. 1 could not be used. Impedances which may be matched with a given type of L network are shown as areas on Smith charts in Fig. 2. It is assumed that it is desired to transform  $Z_L$  into  $R_o$ , and that  $Z_L$  is normalized with respect to  $R_o$ .

# GAIN CHART FOR TRANSISTOR

**SUMMARY**—Graphical approach gives quick approximation of gain to be expected from grounded-emitter and grounded-collector amplifiers as frequency and transistor parameters are varied

By **GEORGE H. MYERS**

**D**ESIGNING transistor amplifiers involves calculating the gain as both the operating frequency and the transistor parameters vary. Use of a new

design chart that eliminates calculations in most cases is explained separately for grounded-emitter and grounded-collector amplifiers.

For a grounded-emitter amplifier, the chart shown in Fig. 1 uses the approximation that the current gain of such an amplifier

(the ratio of collector current to base current) is given by

$$G = i_c/i_b = \frac{\alpha}{1 - \alpha} \quad (1)$$

The frequency dependence of  $\alpha$  is customarily taken as

$$\alpha = \frac{\alpha_0}{1 + jf/f_0} \quad (2)$$

FIG. 1—Values of  $\alpha_0$  and alpha-cutoff frequency determine amplifier gain as a function of operating frequency

# AMPLIFIERS

The low-frequency value of  $\alpha$  is  $\alpha_0$ ;  $f_0$  is the alpha-cutoff frequency. Figure 2A shows a typical grounded-emitter amplifier with the currents indicated.

If Eq. 2 is substituted in Eq. 1, the gain becomes

$$G = \frac{\alpha_0}{(1 - \alpha_0) + jf/f_0} \quad (3)$$

For low frequencies, the gain is substantially independent of frequency and equal to  $\alpha_0/(1 - \alpha_0)$ . For frequencies greater than  $(1 - \alpha_0)f_0$ , the gain tends to fall off with frequency at the rate of 6 db per octave (or inversely proportional to frequency). This is the same frequency dependence as that of a low-pass R-C circuit followed by an amplifier, where the amplifier has a gain of  $\alpha_0/(1 - \alpha_0)$  and the R-C circuit has a cutoff frequency of  $(1 - \alpha_0)f_0$ .

## Gain-Frequency

The design chart gives the asymptotic gain-frequency curve—the gain is assumed to be constant at its low-frequency value up to a frequency of  $(1 - \alpha_0)f_0$  and to decrease at the rate of 6 db per octave of frequency for all higher frequencies. This asymptotic characteristic is the one shown on reactance charts and is usually employed in servomechanism and feedback amplifier design. A simple correction is necessary to make the asymptotic characteristic exact.

For a transistor with an  $\alpha_0$  of 0.97 and an  $f_0$  of 10 mc, a horizontal line is drawn starting at 0.97 on the  $\alpha_0$  scale until the diagonal line corresponding to an alpha-cutoff frequency of 10 megacycles is reached. The diagonal line is then followed downward. On Fig. 1 this example is indicated by the dotted line, which shows the gain-frequency curve for this transistor.

Gain is read in decibels on the scale at the right and frequency is read on the bottom scale. Thus, this transistor has a gain of 30.1 db at 10 kc but at 1 mc

the gain is down to 19.6 db; at 20 mc, the gain is only -6 db. For values of  $\alpha_0$  and  $f_0$  not on the chart, it is necessary to interpolate.

Only a slight modification of this procedure is required to make the chart work for a grounded-collector amplifier (Fig. 2B). The current gain of the grounded-collector amplifier is approximately

$$G = i_c/i_b = \frac{1}{1 - \alpha} \quad (4)$$

Using the Eq. 2 to determine how  $\alpha$  varies with frequency, the gain reduces to

$$G = \frac{1 + jf/f_0}{(1 - \alpha_0) + jf/f_0} \quad (5)$$

The grounded-collector amplifier has a low-frequency gain of  $1/(1 - \alpha_0)$ , which is nearly equal to that of the grounded-emitter amplifier. Between frequencies of  $(1 - \alpha_0)f_0$  and  $f_0$  the gain decreases at 6 db per octave, like the gain of the grounded-emitter amplifier but after the alpha-cutoff frequency is reached the gain is constant at 0 db. The zero-decibel line of the chart has been made heavy and all diagonal lines intersect this line at a frequency equal to their alpha-cutoff frequency.

The gain for the transistor with  $\alpha_0$  equal to 0.97 and an  $f_0$  of 10 mc but connected in the grounded-collector circuit follows the dotted line in Fig. 1 until the dotted line intersects the heavy line and then follows the heavy line. This transistor as a grounded-collector amplifier still has a gain of 30.1 db at 10 kc and a gain of 19.6 db at 1 megacycle but at 20 mc the gain is about 0 db.

A slight error is made in using the chart for the grounded-collector amplifier, since the low-frequency grounded-collector gain is  $1/(1 - \alpha_0)$  not  $\alpha_0/(1 - \alpha_0)$ , but this introduces an error of only 1.4 db when  $\alpha_0$  equals 0.85

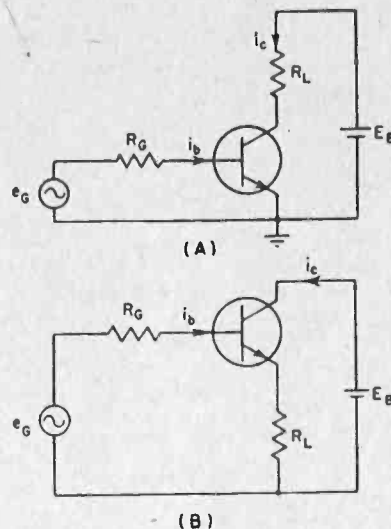

FIG. 2—Connections for transistor grounded-emitter (A) and grounded-collector (B) amplifiers

and is less for all higher values of  $\alpha_0$ .

The chart of Fig. 1 is only approximately correct, even for a grounded-emitter amplifier. A horizontal line corresponding to a value of  $\alpha_0$  should intersect a diagonal line corresponding to a particular value of  $f_0$  at a frequency equal to  $(1 - \alpha_0)f_0$ . For a constant alpha-cutoff frequency, these intersections will not lie on a straight line having a slope of 6 db per octave. If the actual curve is approximated by a straight line that has this slope, however, the error in gain is about 1 db for an  $\alpha_0$  of 0.85 and is almost negligible for transistors with  $\alpha_0$  greater than 0.90.

## Accuracy

Such accuracy is adequate for a chart of this type, since the uncertainty in the values of the transistor parameters will probably introduce more error than the chart. For transistors with values of alpha above 0.95, where alpha may be known to three significant figures, the accuracy of the chart improves. For values of  $\alpha_0$  below 0.85 the error increases so fast that the chart loses its value in this region.

Vibration testing table in vertical position with electronic gear under test mounted on top

**SUMMARY**—Techniques of chassis design, component placement and testing methods to help electronic equipment attain maximum reliability in aircraft and missile applications. Proper selection and design of components contributes to reliability under high vibration conditions

ONE most important consideration for airborne electronic equipment is the design of the mechanical chassis or supporting structure. It has to be light in weight, minimum in size, yet able to maintain good mechanical strength.

A good design should have a center of gravity as close to the mounting surface as possible to help reduce vibration amplification caused by coupling modes of vibration.

The chassis must be rigid to maintain the natural frequencies of vibration above the testing frequency range as resonant points subject the structure to high repeated loadings. Supporting members can be made rigid by increasing thickness, flanging the ends, changing the geometry of the

structure or by ribbing the surfaces as shown in one of the photographs. Use of gussets and the proper location of stiffening members also aid in reducing flexibility.

Figure 1 shows an amplification curve obtained on an existing unit. High transmissibility was experienced at the resonant point.

### Component Selection

Capacitors should be mounted to prevent relative motion between the leads and body. As an example, use of a 0.02- $\mu$ f disk type capacitor in one application resulted in broken leads during vibration. By the nature of its design, as shown in Fig. 2A, this capacitor caused a cantilever action. This action was eliminated by changing the leads so they were mounted axially

as in Fig. 2B, thus removing the cantilever effect and eliminating the large relative motion that existed during vibration.

Transformers that have mounting studs attached directly to the iron core are generally preferable. Studs mounted to a relatively weak housing can be pulled away by high vibration forces. If the mounting bolts are secured to the core, the large internal forces are removed from the housing.

Ruggedized meters are desirable to withstand vibration forces. Use of rubber grommets at the meter mounting studs will result in a low resonant frequency of the meter. Care should be taken to attach leads to the terminals with sufficient slack to avoid wire breakage.

Large resistors mounted in fer-

# EQUIPMENT FOR VIBRATION

Chassis rigidity is increased by use of dimpled surface

Tieing wires prevents build-up of vibrations in any one lead

By SALVATORE P. MERCURIO, Jr. and MICHAEL BELBY

FIG. 1—High transmission of vibration in the 31-cps region as measured on chassis under test on vibration table

rule clips should be provided with spring locks to ensure stability during vibration.

Wire breakage creates a major problem in design. When the component is mounted so motion can take place because of isolation, sufficient wire slack should be provided. One of the photographs shows use of cord to secure a group of wires to prevent build-up of vibration in any one of them. If the component is mounted solidly, so motion cannot take place, leads should not have slack.

Excessive heating of wire during

soldering should be avoided. Heat causes brittleness and produces low fatigue life.

## Crystals

Crystals have been mechanically redesigned to meet vibration requirements.

For example, crystals in the range of 244 to 428 kc were selected at random and subjected to a vibration cycle of five to 500 cps at 2 g maximum. The exterior crystal cans were removed so the internal parts could be examined under vibration with a stroboscope.

All crystals had severe resonant points. The lower rated crystals experienced mechanical failure at the joining point of the crystal quartz leads and the supporting wire mounting.

The failures were remedied by increasing the wire size, for greater support, and eliminating several sharp bends. Figure 3 illustrates the change that was incorporated. The ruggedized crystals had no resonant point within the 500-cycle range.

FIG. 2—Side-mounting of disk capacitor (A) permits high vibration. Axial mounting (B) provides more rigid support

Ruggedized tubes are being made that are capable of meeting higher vibration requirements. However, it is of little value to ruggedize a tube based on general vibration requirements if the vibration conditions are not controlled in the structure. A tube may be designed for a maximum excursion of 0.010 inch at five to 500 cps. If this tube is placed on a flexible member, the resulting excursion at resonance may be two to four times as great.

Tube failure seldom occurs be-

FIG. 3—Conventional crystal mounting (A) has lower tolerance to vibration than more rigid mount (B) designed for vibration up to 500 cps

cause the tube is inadequate. If ruggedized tubes are used with a good choice of tube location, a firm clamping system and a good chassis and supporting structure, failures can be reduced sharply.

### Fastening Devices

Components and subassemblies must be made accessible for ease in repair and maintenance and must be firmly attached to prevent imposing any great amplification of vibration forces.

Proper fasteners must be selected to obtain maximum use. Where subassemblies are attached permanently and removal is not a design requirement, rivets are useful. Rivets fastened by machine provide a more uniform tension than screws or bolts fastened by an individual assembler.

Where assemblies or components are to be mounted so they may be removed, screws are often used. Lock washers should always be used in conjunction with screws. The split ring-lock washer, in particular, was found to be satisfactory because impact loading during vibration does not cause the adjacent soft metal, such as aluminum, to deform washer.

Use of quick disconnects has the advantage that a faulty component can quickly be removed and a new one replaced. However, much care must be taken so the unit does not become overloaded by the use of improper quick-disconnect fasteners.

It is advisable to use ductile materials when possible. When design demands the use of brittle materials proper isolation should be

provided to prevent failures under impact loadings.

### Vibration Evaluation Testing

There are a number of points to be considered when conducting vibration evaluation tests on airborne equipment.

Testing facilities should be checked to determine their accuracy. This includes checking the vibration machine for levelness and resonance in the supporting table and calibrating the velocity pickups, accelerometers and other testing meters. The vibration machine shown in the photograph can be swung through 90 degrees. It has a frequency range from five to 500 cps.

Fixtures used to mount the equipment should have a center of gravity coinciding with the center line of the table. If this is not done, the equipment mounted on the fixture may be subjected to additional forces beyond the original test requirements and invalid data will result.

Weight added underneath the fixture, as in Fig. 4, brings the center of gravity of the supporting fixture and mounted unit in line with the center line of the table. Thick aluminum plates are useful in making fixtures, since aluminum has a great relative damping capacity and little elasticity.

Before making a vibration test, each unit should be inspected for electrical and mechanical accuracy and critical components tested to determine ability to withstand the vibration requirements. Wiring is then attached to the unit being tested and the vibration machine

is set up for initial vibration conditions. The vibration amplitude is checked by a vibrometer as the test proceeds.

Initial vibration of the assembly should be made at reduced amplitude to locate critical resonance points. From this test the transmissibility ratio of the equipment can be determined. In many cases, due to damping in the system, these resonance points may not be objectionable. However, if the transmissibility is excessive, corrective action must be taken. Usually supporting members are made more rigid by ribbing the surfaces, flanging the members or increasing thickness so unwanted resonance is above the testing frequency range.

FIG. 4—Adding weight under vibration test mounting will bring center of gravity in line with table center line

A monitoring device which will define the satisfactory electrical operation of the equipment is required. If at all possible, this monitoring device should encompass the complete electrical function on one indicator, such as an oscilloscope.

Recording instruments should be used if adaptable to the particular test. It is also necessary to observe the equipment being tested for any mechanical failures, which might show up in a number of ways. A slight buzzing or an abrupt change in the magnitude or quality of the vibration noise being generated by the equipment in test are common examples of failure symptoms.

# electronics

**BUYERS' GUIDE**

In the preparation of **ELECTRONICS BUYERS' GUIDE**, every effort was made to insure the completeness and accuracy of the Product Listings according to the information provided by the manufacturers.

The listings were compiled from information provided by more than 3,000 companies manufacturing electronic or allied products and include all products that will be available in the coming year, insofar as the companies themselves can determine. The completeness and accuracy of the listings are entirely due to the helpful cooperation of these manufacturers.

Products are arranged and indexed in a simple, easy-to-find, telephone-book style. Names of Manufacturers who are advertisers in the **BUYERS' GUIDE** are bold-faced in the listings and page numbers of their advertisements are shown. This makes it possible to obtain complete information on products quickly and easily by referring to the advertising pages.

Several new product headings have been added. Due to lack of sufficient information, only manufacturers who were known are included under these new headings. Listings include an index of registered trade names and an alphabetical listing of all companies engaged in the manufacture of electronic components, complete equipment or allied products.

**NOTE:** *This punch-out tab is for your convenience in locating the Product Listings in this issue. Simply push out and fold under. It will then serve as a tab mark to indicate where the listings start.*

**PUSH OUT  
AND FOLD**

# Alphabetical Listings Of All COMPONENTS—COMPLETE UNITS—ALLIED PRODUCTS Used in Electronic Equipment for All Purposes

The complete electronic and allied product lines of more than three thousand manufacturers are arranged and indexed in a simple, easy-to-use, telephone book style in the following listings.

Products are listed alphabetically by generic names followed by descriptive or type names where necessary, as ADAPTERS—Battery.

For example: To find the manufacturers of ionization tubes you would turn to the generic product heading TUBES and listed alphabetically under that you would find TUBES—Ionization.

The only exceptions are INSULATING COMPOUNDS; INSULATION MATERIALS; INSULATION PARTS; METALS; PLASTIC MATERIALS; and TUBE PARTS. Products falling in these classifications are arranged alphabetically under those six headings. A breakdown of electrical measuring

instruments is listed under the generic product heading INSTRUMENTS, ELECTRICAL MEASURING and cross-indexed. The same holds true for MICROWAVE ACCESSORIES.

Cross references are provided wherever necessary to cover names, other than the standard ones, that are sometimes used.

Manufacturers under each product heading are also arranged alphabetically. Those companies who are advertisers in this issue are bold-faced and the page numbers of their advertisements given to permit quick and easy reference for the necessary technical data.

In compiling the listings for this year's ELECTRONICS BUYERS' GUIDE extreme care has been taken to ascertain those products which are in production, or available within a reasonable time and, unrestricted for general industrial use.

Aerolite Electronics Corp., 507 26th St., Union City, N. J.  
BIRNBACH RADIO CO., INC., 145 Hudson St., New York 13, N. Y. ADV. PG. 501.  
British Electronics Sales Co., Inc., Oakland Garden Sta., Flushing 64, N. Y.  
BUSSMANN MFG. CO., St. Louis 7, Mo. ADV. PG. 60.  
CINCH MFG. CORP., 1026 S. Homan Ave., Chicago 24, Ill. ADV. PG. 131-133.  
Eby Co., Hugh H., 4701 Germantown Ave., Philadelphia 44, Pa.  
Garde Mfg. Co., 588 Eddy St., Providence 3, R. I.  
JONES DIV., HOWARD B. CINCH MFG. CORP., 1026 S. Homan Ave., Chicago 24, Ill. ADV. PG. 131-133.  
KEYSTONE ELECTRONICS CORP., 423 Broome St., New York 13, N. Y. ADV. PG. 675.  
Koltan Electric Mfg. Co., 123 New Jersey Railroad Ave., Newark 5, N. J.  
KULKA ELECTRIC MFG. CO., INC., 633 S. Fulton Ave., Mt. Vernon, N. Y. ADV. PG. 685.  
LITTELFUSE, INC., Des Plaines, Ill. ADV. PG. 459.  
Neosil Products Div. of Rubber Associates, Inc., 745 Fifth Ave., New York 22, N. Y.  
Permonite Mfg. Co., 444 N. Lake Shore Drive, Chicago 11, Ill.  
Smith, Inc., Herman H., 2326 Nostrand Ave., Brooklyn 10, N. Y.  
SYLVANIA ELECTRIC PRODUCTS INC., 1740 Broadway, New York 19, N. Y. ADV. PG. 733-739.

## BLOWERS—Small

Air Control Installation, Ltd., Ruslip, Middlesex, England.  
AIR-MARINE MOTORS, INC., 365 Bayview Ave., Amityville, N. Y. ADV. PG. 569.  
AMERICAN BLOWER DIV. of AMERICAN STANDARD, Detroit 32, Mich. ADV. PG. 352, 353.  
Ashland Electric Products, Inc., 32-02 Queens Blvd., Long Island City 1, N. Y.  
Borg-Warner Corp., PESCO Products Div., 24700 N. Miles Rd., Bedford, Ohio.  
DYNAMIC AIR ENGINEERING INC., 7412 Maie Ave., Los Angeles 1, Calif. ADV. PG. 686.  
EASTERN AIR DEVICES, INC., 385 Central Ave., Dover, N. H. ADV. PG. 312.  
Electric Trading Co., 313 Canal St., New York, N. Y.  
ELECTRO-AIRE DIV. of HYDRO AIRE, INC., 6909 Farmdale Ave., North Hollywood, Calif. ADV. PG. 510.  
El Ray Motor Co., Inc., 11747 Vose St., North Hollywood, Calif.  
Fairchild Camera & Instrument Corp., Electrical Products Div., 110 Main St., Burlington, Vt.  
Fasco Industries, Inc., Rochester 2, N. Y.  
Globe Industries, Inc., P. O. Box 101, North Dayton Station, Dayton 4, Ohio.  
HEINZE ELECTRIC CO. 685 Lawrence St., Lowell, Mass. ADV. PG. 657.  
Hertner Electric Co., 12690 Elmwood Ave., Cleveland 11, Ohio.  
Holub Industries, Inc., 414 DeKalb Ave., Sycamore, Ill.  
Hupp Electronics Co., A Div. of Hupp Corp., 743 Circle Ave., Forest Park, Ill.  
Ilg Electric Ventilating Co., 2850 N. Pulaski Rd., Chicago 41, Ill.  
JOY MFG. CO., Dept. 39, Oliver Bldg., Pittsburgh 22, Pa. ADV. PG. 362.  
KAHLE ENGINEERING CO., 1307 Seventh St., North Bergen, N. J. ADV. PG. 349.

Kelvin & Hughes Ltd., New North Rd., Barkingside, Essex, England.  
McLEAN ENGINEERING, Box 228, Princeton, N. J. ADV. PG. 414.  
Master Appliance Mfg. Co., Fourth & Ontario Sts., Ontario, Wis.  
OSTER MFG. CO., JOHN, AVIONICS DIV., 1 N Main St., Racine, Wis. ADV. PG. 130.  
Redmond Co., Inc., Owosso, Mich.  
Reynolds Electric Co., 3000 River Rd., River Grove, Ill.  
RIPLEY CO., INC., Middletown, Conn. ADV. PG. 458.  
Rotating Components, Inc., 269 Green St., Brooklyn 22, N. Y.  
ROTRON MFG. CO., INC., 7-9 Schoonmaker Lane, Woodstock, N. Y. ADV. PG. 256.  
SANDERS ASSOCIATES, INC., Nashua, N. H. ADV. PG. 534.  
Servomechanisms, Inc., 12500 Aviation Blvd., Hawthorne, Calif.  
Servo-Tek Products Co., Inc., 1086 Goffe Rd., Hawthorne, N. J.  
Small Motors, Inc., 2076 Elston Ave., Chicago 14, Ill.  
Tele Dynamics Inc., 32nd & Walnut Sts., Philadelphia.  
Torit Mfg. Co., Walnut & Exchange Sts., St. Paul 2, Minn.  
Ventrak Corp., 11 W. 42nd St., New York, N. Y.  
Western Gear Corp., Electro Products Div., 132 W. Colorado St., Pasadena 1, Calif.

## BOARDS—Capacitor or Resistor

Accurate Electronics Corp., 169 Abbe Rd., S., Elyria, Ohio.  
Aerolite Electronics Corp., 507 26th St., Union City, N. J.  
ALDEN PRODUCTS CO., 112 N. Main St., Brockton 64, Mass. ADV. PG. 567.  
Beck's, Inc., 298-300 E. Fifth St., St. Paul 1, Minn.  
CAMBRIDGE THERMIONIC CORP., 445 Concord Ave., Cambridge 38, Mass. ADV. PG. 150.  
CINCH MFG. CORP., 1026 S. Homan Ave., Chicago 24, Ill. ADV. PG. 131-133.  
DAVEN CO., Route 10, Livingston, N. J. ADV. PG. 245.  
EASTERN PRECISION RESISTOR CORP., 675 Barby St., Brooklyn, N. Y. ADV. PG. 451.  
Elm Laboratories, 18 S. Broadway, Dobbs Ferry, N. Y.  
Enflo Corp., Route 38 at Airport Circle, Pensauken, N. J.  
Eugene Engineering Co., Inc., 1217 Hyde Park Ave., Hyde Park 36, Mass.  
GENERAL COMPONENTS INC., 225-229 E. 144th St., New York 51, N. Y. ADV. PG. 696.  
Harvey-Wells Electronics, Inc., North St., Southbridge, Mass.  
INDUSTRIAL HARDWARE MFG. CO., INC., 109 Prince St., New York, N. Y. ADV. PG. 693.  
Johns-Manville, 22 E. 40th St., New York 16, N. Y.  
KEYSTONE ELECTRONICS CORP., 423 Broome St., New York 13, N. Y. ADV. PG. 675.  
LABORATORY FOR ELECTRONICS, INC., 75 Pitts St., Boston 14, Mass. ADV. PG. 358.  
Magnavox Co., The, 2131 Beuter Rd., Fort Wayne, Ind.  
Measurement Engineering, Ltd., Arnprior, Ontario, Canada.  
Molded Insulation Co., 335 E. Price St., Philadelphia 44, Pa.  
NATIONAL TEL-TRONICS CORP., 35 St. Casmirs Ave., Yonkers, N. Y. ADV. PG. 642.  
Sheffco Mfg. Corp., Grand & Ruby Aves., Palsades Park, N. J.  
Stone City Machine & Tool Co., Inc., P.O. Box 351 1206 Seventh St., Bedford, Ind.  
Strickland Engineering Co., Inc., 177 Austin St., Newtonville, Mass.  
SUFFOLK PRODUCTS CORP., Woodbine & Scudder, Northport, N. Y. ADV. PG. 598.  
Tri-Dex Co., P. O. Box 1207, Lindsay, Calif.  
Warren Plastics Corp., Warren, Pa.  
West Virginia Pulp & Paper Co., 230 Park Ave., New York 17, N. Y.

## BOARDS—Plotting

Dura Plastics of New York, Inc., 303 Fifth Ave., New York 16, N. Y.  
Elm Laboratories, 18 S. Broadway, Dobbs Ferry, N. Y.  
RS Electronics Corp., 435 Portage Ave., P.O. Box 368, Station A, Palo Alto, Calif.  
Servo Corp. of America, 20-20 Jericho Turnpike, New Hyde Park, N. Y.  
Sunshine Scientific Instrument, 1810 Grant Ave., Philadelphia 15, Pa.  
Telex, Inc., Telex Park, St. Paul 1, Minn.

## BOARDS—Plug

Accurate Electronics Corp., 169 Abbe Rd., S., Elyria, Ohio.  
Aerolite Electronics Corp., 507 26th St., Union City, N. J.  
Alcon Metal Products, Inc., 1750 N. Kimball Ave., Chicago 47, Ill.  
Enflo Corp., Route 38 at Airport Circle, Pensauken, N. J.  
General Electric Co., Technical Products Dept., Electronics Park, Syracuse, N. Y.  
Hallamore Electronics Co., 8352 Brookhurst Ave., Anaheim, Calif.  
Hoover Electronics Co., 3640 Woodland Ave., Baltimore 15, Md.  
Northern Industrial Chemical Co., 7-11 Elkins St., South Boston 27, Mass.

Pfeffer Products, 3901 W. 54th St., Los Angeles 43, Calif.

## CAPACITORS

### NOTE:

Throughout all capacitor listings

(h) indicates hermetically sealed types  
 (p) indicates pressure types  
 (v) indicates vacuum types

### Capacitors, Fixed

1. Ceramic
2. Decade
3. Electrolytic
- 3a. Electrolytic, Subminiature
4. Energy Storage
5. Feed Through
6. Fixed Composition
7. Gas Filled
8. Glass
9. High Voltage
10. Metallized
11. Mica
12. Paper
13. Plastic
14. Power Factor
15. Precision Air
16. Pulse Forming Network
17. Silvered Mica
18. Tantalum
19. Vacuum

### Capacitors, Variable

20. Trimmer-Air
21. Trimmer-Ceramic
22. Trimmer-Mica
23. Trimmer-Vacuum
24. Tuning-Receiving
25. Tuning-Transmitter
