FOREWORD

This Seventh edition **FM Atlas and Station Directory** is published in the tenth anniversary of our original reference, called in 1971 the **FM Station Atlas**. During those years many changes have taken place in FM radio—especially the growth in the number of stations, both commercial and noncommercial. New rules are forcing the 10-watt educational stations to either increase power to a minimum of 100 watts or change frequencies. This book has faithfully tried to chronicle all of the individual station changes.

A special feature in this book is the discussion of FM translators—low-powered stations rebroadcasting an originating station as a result of broadcaster or community needs. FM translators were first legalized in the United States in 1971, although such stations existed long before in such mountainous countries as Italy and Norway.

Entirely new maps have been drawn to improve the appearance of various states, or in response to the growth in stations. Thus, New Jersey is consolidated onto one map, along with New York city and Long Island. An unique feature is "New York City's FM Dial," carrying out the "folio dial" theme of the old **FM Guide**. I just don't want people in Washington DC, San Francisco, or Chicago complaining that their cities did not get similar treatment!

California, like Texas, is now spread out over four map pages; Oregon and Washington have expanded inserts; while many of the central states maps have been expanded. Maps of Canada, Mexico, Alaska, Hawaii, Puerto Rico and the Virgin Islands continue to indicate only cities having FM stations, with the heaviest type style to show cities having three or more stations of 500 or more watts each. Other large, medium and small type faces call attention to cities having, respectively, one or two stations of 500 watts or more; cities having stations between 50 and 499 watts; and cities having stations of 49 watts or less.

One reader complained about the Canada maps, saying they are no better than a road atlas. But another Canadian said the material is in the book somewhere, even if it means more flipping of pages. Until Canada settles down and the dramatic growth in the number of Canadian Broadcasting Corporation stations and repeaters slows, those maps will probably not be much changed. With this edition, there's a return of the Southern Ontario and Southern Quebec maps, with more specific station information than any of the United States maps have. I hope all of this hasn't made these maps too cluttered!

This book is expanded because of more pages of maps and more stations and translators. Whatever your interest in FM, you are sure to find its pages full of useful information. Read the introductory material, study the key to symbols, and learn how to pick out the facts and figures about the more than 5,000 stations and 500 translators listed here.

To close this Foreword, here are excerpts from a gratifying letter that recently came from Joseph W. Dornbrock, WCUC (FM) Clarion PA: "Our collective hat is off to your comprehensive FM radio guide. It packs a lot of information in a convenient booklet."

FM's Perfect Sound Transmission Compared to AM Radio's Technical Bankruptcy

Within the broadcasting industry there is a tendency to stop thinking of the differences between AM and FM, and to lump them together into "radio." This publication opposes that trend. FM, or frequency modulation, is different from AM, or amplitude modulation. The differences are sharp and significant, and should not be lost sight of by anybody—broadcaster, advertiser or listener.

FM is the superior of the two media. Even without stereo, FM is capable of broadcasting the full audio bandwidth of 50 to 15,000 Hz, whereas AM, except in unusual cases, does not carry over 5,000 Hz. These differences have been long known by radio engineers, starting with Edwin H. Armstrong's invention of FM in the 1930s. Other advantages of FM over the older system of AM include better static- and interference-rejecting qualities, an improved dynamic range (although some FM stations purposely restrict this in an effort to sound louder than their competition), and FM radio's wider bandwidth permitting stereo and subsidiary communications activities.

One of our correspondents speaks of the AM system as "antique modulation," and I have likened the difference between FM and AM as being that of the long-playing record versus the 78-rpm record. It is one of the tragedies of electronics that any AM-only radios have been marketed on this continent since 1948, when the knowledge of making FM radios came into its own. Only some 30 years later has FM shown leadership in audience over AM, begun to achieve parity in attracting commercial advertising sales and overcome the handicap of cruel history by not having full receiver circulation. According to Federal Communications Commission data for 1979, the last full year for which information is available, 52 percent of the independent FM stations earned a profit, which was down from 57 percent in 1978. Of the FM stations associated with AMs, 64 percent earned a profit in 1979, compared to 67 percent in 1978.

It was on Harry Maynard's program *Men of Hi Fi* on WNYC-FM 93.9 New York in 1978 that I had a chance to expound on the superior sound medium, pointing out that FM has completely replaced AM in police and public service communications—and those forms of communications were just for voice. The day seems long since past when AM should be performing a broadcasting function at all in this country, much less broadcasting music. I am sure that in the lives of most of the readers of this publication AM radio is irrelevant—something perhaps to look at when in an attic or a museum. But if what has been written here strikes you as discordant, with AM still important to you, write. Excerpts from the better letters will be published in the next edition! Just the day I am writing this, in fact, a letter came from well-known radio columnist Glenn Hauser in Tennessee who said: "Wouldn't expanding to include an AM atlas and directory be a logical step sometime in the future? Blasphemy?"

The Canadian Broadcasting Corporation is planning to phase out all AM broadcasting by the year 2000, turning exclusively to FM. If it is true that in a country as vast as Canada, with several 50,000 watt stations in use, that FM can do a superior job to AM, then it should be true anywhere. The Canadian plan calls for

expansion of the basic [monaural] English and/or French-language services to all communities of 500 or larger, with FM stereo to be introduced to larger communities. The CBC networks consist of the basic English (monaural) service, the basic French (monaural) service, the CBC stereo service in English and the CBC stereo service in French (Radio Canada). Canada, too, has its private (commercial)

Canadian Radio-television and Telecommunications Commission

broadcasters, who are under considerable restriction by the Canadian

Radio-television and Telecommunications Commission. A Canadian station must get CRTC approval when it wants to change its music format. As this is written, CIGM 92.7 Sudbury is applying for approval to change from "contemporary MOR" to country. In the United States, by contrast, the FCC and the Supreme Court have told citizens groups and others that the music format of a station is its own decision to make.

FM Growth Inexorable

For the first time in history the total numbers of AM and FM stations in the United States is just about equal, with AM having 4750 authorized stations and FM 3515 commercial and 1175 educational stations for an FM authorized total of 4690, as of Aug. 31, 1981. (This total includes a flock of construction permits—stations not yet on the air). Pressures for more FM channels will undoubtedly come from stand-alone AM stations who feel they need an FM channel to compete, or even to exist. This growth is ultimately because of FM's better sound quality.

Several solutions to the channel spacing problem have been advanced. Charles E. Koontz, E-S-H Systems, Fairfield IL, has proposed spacing FM channels at 143.25 kHz, rather than at the present 200 kHz. "This would permit FM radio to grow with protection for the consumer, and at no expense to the taxpayer." Arthur Thompson, Westfield NJ, wants dual-channel broadcasting on a station's main carrier and a stereo subcarrier with separate programming that he calls "Alternate Broadcast Service."

A most interesting proposal came from the Federal Communications Commission to create two new classes of stations and to allow the intermixing of Class A, B and C stations on the same channels. As you can tell by looking at the by-frequency part of the Station Directory, certain channels are designated Class A or Class B/C within the 92-108 MHz part of the FM band, where commercial stations are found. The FCC points out that many of the Class C stations with 100,000 watts are not operating at the maximum antenna height of 600 meters, and it proposes reclassifying those stations if they do not increase height within a six-year period of time. This would mean stations could spring up at closer distances to each other, with some attendant increase in interference to travelers and DX (distance) listeners; however, the proposal would result in more stations serving the public. It's really quite a conservative proposal, and does not go as far as one by the National Telecommunications and Information Administration, which asks for the use of directional antennas by the stations and terrain shielding to reduce even further how much space there has to be between stations on the same channel or up to four channels away on the dial.

The two new classes of station the FCC would create are B1 with a maximum effective radiated power of 20,000 watts (compared to the present Class B with 50,000 watts maximum), and Class C1 with 100,000 watts at 305 meters above average terrain. Under present rules Class B stations are only found in Zone 1 and 1A (mainly the northeastern part of the United States and Southern California), but the proposal would allow Class B stations with their closer-together spacings anywhere in the country. Class C and C1 stations, however, would be excluded from Zones 1 and 1A as at present. Zones are now shown on the maps.

An FCC study of three cities shows how the new rules would help create more stations. In none of the cities would additional FM stations be possible under present spacings. Rock Hill SC (population 33,846, 1970 census) would get a Class B1 station on 92.9 and a Class B station on 106.1. Delaware OH (population 15,008) would get at least one station, as would Rock Falls IL (population 10,287). Our own analysis showed that Duluth MN could get eight new stations. In terms of area, the FCC points out its plan would open up 97 percent of the land area of central Michigan to new FM, an increase from the present 50 percent, while in parts of Ohio and Illinois the percentage increases from 5 to 81.

Former FCC Chairman Charles D. Ferris said the proposal would:

. . . Increase significantly the number of potential FM radio stations, by providing greater flexibility to our FM table. Many FM stations do not radiate their signal over their entire protected area, nor do they plan to. This results in a fully utilized FM spectrum on paper, but less than full utilization in reality. The Notice proposes to make the areas of protection more precise, opening spaces for new FM allotments. The new rules would also allow radio broadcasters who are unable to serve a large area to concentrate their service on a smaller one. Actions like the one the FCC proposes. . . are among the most effective structural tools we have for encouraging program diversity and minority expression, enabling us to reduce governmental intrusion in radio programming areas.

Public FM Threatens Channel 6 TV

Interference from some educational FM stations to reception of television channel 6 is a concern to the FCC. Accordingly, a temporary freeze was called on new FM stations or power increases on frequencies 87.9 through 89.3 MHz within the Grade B contours of channel 6 TV stations. The National Association of Broadcasters pointed out a major allocation error going back to the early days of both TV and FM when no guard band was provided between the two services. Indeed, the FCC added 87.9 (in the channel 6 TV audio sidebands) for 10-watt FM stations. As predicted in the last edition, I said 87.9, channel 200, would be an allocations failure, and so far those words appear to be correct, with the FCC making no grants to the channel, and only one application filed for it within a two-year period.

The FCC correctly points out that the problem with channel 6 interference is basically in the television receiver, since TV sets have been designed in such a way that often they can't reject nearby strong FM signals. With several educational FM stations ready to come on the air or drastically increase their power the FCC decided to act. This edition reflects the improved status of hundreds of former 10-watt educational FM stations, which have either increased their powers to 100 watts or more, or are in the process of doing so. A comparison of the map pages of this edition with the last edition in just about every state will show educational

stations (identified with *) that were formerly set in small type now in larger type. A few of those have elected to remain as 10-watt operations, and have found nesting places among the 3,000 to 100,000 watt commercial stations on 92-108 MHz portion of the dial.

Other 10-watt stations that have not yet applied for a power increase have been given an extended grace period to apply by the Commission, so you can expect scores of future power increases among these lowest-powered of America's radio stations.

Public FMs Fight Each Other in Cleveland

An unusual public radio hearing will be going on in Cleveland to decide the fate of WBOE *90.5, now reduced to a mere carrier with an on-the-hour station identification and carrying a brief subcarrier (SCA) schedule of readings to the blind. The Cleveland Board of Education tried to sell the station to the Cleveland Public Library, but another group, Cleveland Public Radio, has applied for the facilities. The applications have been designated for hearing to determine such things as which group would better serve the community, the extent to which the applicants' proposed operations would be integrated into their cultural and educational objectives, and if a share-time arrangement would be in the public interest.

FM Expands in Hawaii and the Territories

The frequencies 98 to 108 MHz are not available for broadcasting in Hawaii, but recently the FCC announced they are considering allowing FM stations in those channels (as well as TV channels 5 and 6). Formerly, the frequencies were reserved for inter-island telephone communications, but are no longer used for that purpose. Possibly the FCC will allow FM expansion in Alaska to include the frequencies 88 to 100 MHz. All FM stations in Alaska (except for Alaskan forces stations in Fort Greeley and Shemya) are between 100 and 108 MHz.

Delivering more of a wallop will be Class A stations in Puerto Rico and the Virgin Islands, if an FCC proposal becomes reality. Class A stations would be allowed 3,000 watts at 1100 feet, rather than at only 300 feet, as in the rest of the United States. In 1964 the FCC recognized the terrain problems of those islands and allowed Class B stations to increase to a maximum of 2000 feet above average terrain with 25,000 watts. Class B stations elsewhere operate with maximum 50,000 watts at only 500 feet. The Commission said by allowing increased heights for Class A stations in those territories, their coverages would be comparable to their counterparts on the mainland.

FM Programming Yields to Syndicators and Satellites

FM programming is becoming more homogeneous, dominated by syndicators who are beginning to turn to satellites as a means of delivery. This book avoids industry definitions of programming, such as "adult contemporary" (usually given a "rock" or "r" designation, or "rm," meaning rock and middle of the road), and "album-oriented rock" (usually listed as "r," or "rp," meaning a combination of "rock and progressive rock").

Pure forms of progressive rock or disco are hard to find, especially on commercial FM. Many college stations purposely try for an alternative image, and

specialize in either or both. In the larger markets stations are increasingly turning to automation and/or syndication services for their sources of music. The Satellite Music Network and a couple of other services are springing up, which will provide all the qualities of a network and a radio station via satellite. All the local broadcaster has to do is buy the satellite receive antenna, have some cartridge machines for playing local commercials, and a microphone for giving time and weather checks. Even the time and weather can be automated, along with station IDs. Services announced by Satellite Music Network at the outset are country and adult contemporary. **FM Atlas** reader and broadcaster John White plans to subscribe to SMN for his new station in Spring Grove MN, KQYB 98.3. KQYB, he says, is monaural because of the irregular terrain in southeastern Minnesota.

Translators—FM's Greatest Growth Opportunity

Helping to spread FM's sound to areas where distance or terrain make reception difficult is the FM translator. Translators have widely been used in television to improve reception in towns too far from stations for the average home receiver to get a good picture. They have also been used in mountainous areas to improve reception in valleys. Even with the proliferation of cable systems, translators are more than holding their own, with 4726 authorized to operate in the United States, compared to only 1171 television stations.

In FM, translators have only been around as long as this publishing enterprise, with the first authorized in Utah and Wisconsin in 1971. The **FM Atlas** has chronicled the growth of audio translators since then, with 87 in 1975, 205 in 1978, and 533 shown in this edition. California has the most translators—85, while Utah is closely behind at 80. Oregon has 39; Wyoming and Washington 33 each. Minnesota has 20 and South Dakota and Wisconsin each have 19. At the other extreme, vast Texas has only 4 and populous New York has 1. KSFI 100.3 Salt Lake City has the greatest number of translators broadcasting any one station with 39, followed by another Salt Lake City station, KALL-FM 94.1, with 20. KREX-FM 92.3 Grand Junction CO has 16 and KQIX 93.1 Grand Junction has 10 translators. Religious stations are widely represented among FM translators, with several in Wisconsin, California and Tennessee having five or more each.

Translators have the same characteristics as the original station—programming, stereo, hi-fi sound, SCA—but are on different frequencies. Quite similar to the translator is the FM booster, which rebroadcasts on the same frequency as the original station. Boosters are only practicable in places where there are sharp terrain differences, permitting a shielding of the signal coming in from that sprayed out to the valley below. Boosters have the advantage to the listener of not having to retune when driving from one area to another, but cannot work in most locations. If you want to hear plenty of FM boosters go to Walnut Creek, California, where four are in operation. FM boosters are identified on the maps and in the directories, as are FM translators. The city having the most FM translators, incidentally, is China Lake CA, with nine. And when you add the translator in nearby Inyokern, you will have 10 FM translators to enjoy when in China Lake.

FM translators west of the Mississippi River can have 10 watts, but those east of that river are limited to 1 watt. Many translators employ directional antennas, situated on ridges high above towns they intend to serve. By using a directional

beam, a gain of up to 10 times the input power is achieved, making a 10-watt translator 100 watts of effective radiated power, and a 1-watt effectively 10 watts in the favored lobe. Not all translators west of the Mississippi are 10-watters; many are only 1 watt there, as in the east. FCC rules require that 10-watt translators identify, either through the main station, or separately by Morse Code 3 times a day, giving their call number and city of license. A good time to tune in translator "IDs" is between 12:55 p. m. and 1:05 p. m. local time; they are also required to identify between 7 and 9 a. m. and 4 to 6 p. m. A call, such as K221-AA, refers to the FM channel 221, or 92.1. Translators are numbered in order, starting with "AA," continuing to "AB," and so on through the alphabets for "K" and "W" stations. The channel having the most FM translators is 105.5, 288A. There the "AA's" are used up west of the Mississippi River, with the latest translator K288BT.

Broadcasters can operate translators themselves if located within the 1.0 millivolt per meter primary contour of their station. Usually this is an area that gets a strong signal (and is identified in the first part of the Station Directory for each station), but sometimes because of hills that station's signal may be shadowed to a certain community. Broadcasters can also set up translators in remote communities outside the primary area of an FM station in another city. Thus, the far-flung network of translators in Utah. Third parties, such as FM Atlas readers, can set up translators in areas where broadcasters are precluded from doing so. Translators can pick up signals only from a regular FM station or another translator, but not from a satellite or microwave. Enterprising groups are trying to persuade the FCC to allow translator pick up of satellite signals, with applications on file, for example, in Iowa for translators of KEAR 106.9 San Francisco. A translator can originate 30 seconds of commercials per hour to defray expenses, and once established can go to the originating station for financial help. A fully-equipped FM translator costs between \$2,000 and \$5,000. Petitions have been filed with the FCC for 10-watt translators east of the Mississippi. But the FCC turned down a bid by a group of Rocky Mountain broadcasters to allow FM translators to carry AM signals. The FCC, quite rightly, reasoned if a signal were available to rebroadcast on a translator, it would be available anyway on people's radios without the need for a translator.

The current FCC regime is committed to "less government." I would expect that, in this spirit, it would allow 10-watt translators anywhere in this country, permit locally-originated programming, and allow satellite reception. This would be in keeping with its allowing television translators to grow into mini-stations with studios and to pick up satellite signals.

As FM radio itself is increasing in popularity, the growth in FM translators should continue. As the opportunities for creating new stations are reduced because of the spectrum filling up, broadcasters and others will increasingly turn to translators. If translators catch on in FM as they have with TV, we can expect there will be at least four FM translators for every FM station, or over 19,000. And the reason for having FM translators is even more acute than for having TV translators, considering few people bother to install FM antennas on their homes, and cable is less likely to include all of an area's FM stations. Thus, any broadcaster not having at least four FM translators on the air or in the planning stage should consider the opportunities for increased service and profits that translators represent.

FM Coverage Explained

FM station coverages are given in the geographical part of the Station Directory. The FCC requires FM stations to calculate their coverages according to antenna height above average terrain and effective radiated power data. All coverages reported in this book have been calculated according to FCC charts to help take the guesswork out of FM reception. By computing all coverages the same way, different stations in the same market can be objectively compared. Some stations, however, employ directional antennas, limiting their coverage in certain directions to avoid interference with other stations with which they may be short-spaced. Other stations may be next to mountain ranges, with coverages varying considerably according to direction. The coverage of KLIR 100.3 Denver CO is indicated on the accompanying map. Here you can see the influence of the Rocky Mountains on this station's coverage to the west.

CCVERAGE CONTOUR MAP

KLIR Stereo

SITUATED AT THE FOOT OF THE SNOW-CAPPED
ROCKY MOUNTAINS, IN MILE-HIGH
DENVER, COLORADO

EASY LISTENING AT 100.3 CIRCULAR-POLARIZED

The FCC requires FM stations to take note of their 3.16 millivolt per meter "principal city" contour, as well as the 1 millivolt "primary." This book lists the 1 millivolt primary only, and not the 50 microvolt secondary as shown in earlier editions. By showing only one mileage figure for each station some of the clutter in the station directory is eliminated. The 50 microvolt contour can only be claimed for coverage purposes if it is interference-free. With the development of more and more stations, many do not enjoy interference-free secondaries. A way of estimating secondary coverages is to multiply the primary coverage radius for a 3,000 watt station by three; and a 100,000 watt station primary radius by two. A directional home antenna can also help people enjoy FM up to and beyond the secondary coverage limit.

The best car reception will be with a vertical antenna mounted on the front fender, and extended to about 31 inches. Windshield antennas are best used in areas where vandalism is a problem. Normally, your FM radio will give you the sharpest possible reception of nearby stations. The advantage of FM over AM shows up more clearly after dark, when many AM stations leave the air, go directional, or reduce power. Interference increases on the AM band, and the traveler interested in nearby weather or travel information finds FM offers clear and distinct station separation. Stations with vertical or circular polarization (marked with a "v" in the Station Directory) offer the best mobile reception, as opposed to stations that transmit only horizontally.

Improving FM Reception

To get better home reception, the most important thing you can do is work on improving the antenna. Even radios with built-in antennas or portables with "whip" antennas can perform better simply by better placement within the room. Residents of high-rise buildings often report very good reception when such a radio is placed in front of a window facing the direction of desired stations. A connection of your radio to a building master antenna can be tried, but since most such antennas are engineered for TV, your radio might work better without it. In metropolitan areas the use of outside antennas should be avoided unless you have a set with good overload rejecting features (such as field-effect transistors in a well-designed receiver), and if the antenna can be rotated to null interference. Otherwise, the antenna could bring so much interference that the effort and expense in connecting your radio to it would not be worthwhile.

Often a rabbit ears antenna is a good choice for people who own small radios or FM tuners that include two small screws or terminals on the back of the radio for attaching of an outdoor antenna. This antenna can be mounted some distance from the radio (such as on top of a bookcase), rotated and adjusted for best reception of a number of signals.

Clearly, the best choice, when your receiver, your landlord, and your geographic area permits is the outdoor FM antenna. With your own outdoor antenna you will almost certainly pick up more FM stations than your local cable company may bring you (although perhaps not all as clearly or as fade-free). The best FM antenna is a yagi type, such as shown here. This antenna is directional, and it is best to have a rotational device, either an electronic rotator or the "armstrong" method, to turn it to favor various stations. You can also turn the antenna away from your local broadcasters and see what stations from more distant towns will come in. Even the best FM receivers will overload when you aim the antenna directly at your local stations and you live in a metropolitan area. If interference from strong nearby stations is still a problem, traps are available that can help you tune out the offending signals.

FM DX Listening

If you have an outside antenna and a good FM tuner or receiver, you might enjoy the hobby of long distance (DX) listening on FM. Anybody with the willingness to check parts of the dial without local stations will, over a period of time, be able to enjoy this unique pastime. FM DX is possible by means of **sporadic E-skip**, mainly in the summer during daylight, and bringing in stations at 1,000 or more miles; **tropospheric enhancement**, mainly in the spring along the Gulf Coast and in the fall around the Great Lakes, the Midwest and eastern United States; plus **auroral** and **meteor scatter** reception. Write the nonprofit Worldwide TV-FM DX Association, PO Box 97, Calumet City IL 60409, for more information. Annual dues are \$15; sample copies of the club's monthly bulletin are \$1.25.

Key to Symbols

- \$ A station broadcasting all or part of its daily schedule in multiplex stereo.
- v A station transmitting with a vertically (or circularly) polarized signal, in addition to the usual horizontal signal, for better reception on auto radios and portables. "d" is for a station with a directional antenna, listed after height.
- * A noncommercial radio station, usually educational, "public" or religious.
- t An FM translator.
- † A station with a Subsidiary Communications Authorization (SCA), 67 kHz.
- = Dolby-equipped station. This symbol appears after the mileage figure in Part I of the Station Directory.
- § A station sharing time with a nearby station on the same frequency.
- A station with its antenna below the average surrounding terrain.
- 15 Primary coverage radius in miles. Secondary coverages may be estimated as from about three times the primary distance for 3,000 watt stations to about twice the primary distance for 100,000 watt stations.

Program [music] codes (given in Part I of the Station Directory in small letters after city): c classical, d disco, e ethnic, g gospel, j jazz, k country, L is Latin/Spanish, m middle of the road or easy-listening, n all news, p progressive rock, r rock including easy rock, s soul, t all talk.

Language codes (given just to the left of the program codes in Part I of the Station Directory): E English (stations so listed are located in Quebec or in Latin America), F French, P Portuguese (see New Bedford MA), S Spanish.

Network codes (given in both parts of the Station Directories): A ABC-FM, with ABC standing for American Broadcasting Company, B National Black Network, C Columbia Broadcasting System, E ABC Entertainment, I ABC Information, M Mutual Broadcasting System, N National Broadcasting Company, P National Public Radio, R RKO, S Associated Press Audio, T NBC's The Source, U United Press Audio, Y ABC Contemporary, Z Sheridan Broadcasting Network.

SCA symbols (all following † in the first part of the Station Directory): A ABC network, E ethnic and foreign language, F farm news, G gospel, L Mutual network, M music, N NBC network, Q physicians news, S sports or special events, T talk including instructional programs and talking book for the blind, W weather, X is audible teletype, teleprinter or telemetry chirps.

Part I, Geographical Directory examples:

City	music	Call	Stereo	Primary coverage radius in miles	Network
Joplin	g	*90.7 KOBC	\$	221	*
	r	92.5 KSYN	\$	34	A

The state maps of the United States are arranged in a geographical order from east to west. It is the density of FM cities which generally determines the scale used for each state, and whether or not that state is to be grouped with its neighboring states. Selected FM cities in bordering states are noted on the individual state maps. For information concerning station call letters, programming, stereo capability, vertical polarization, power and heights, refer to the Station Directories immediately following the FM Atlas maps. **Key to Symbols** for the maps and Station Directories is on page 12.

Stations scheduled to change to a different frequency are shown on the maps, with both the new and old frequencies given. Minor, ten-watt educational FM stations and one- and ten-watt FM translators are shown in reduced size.

**CONNECTICUT
 MASSACHUSETTS
 RHODE ISLAND**

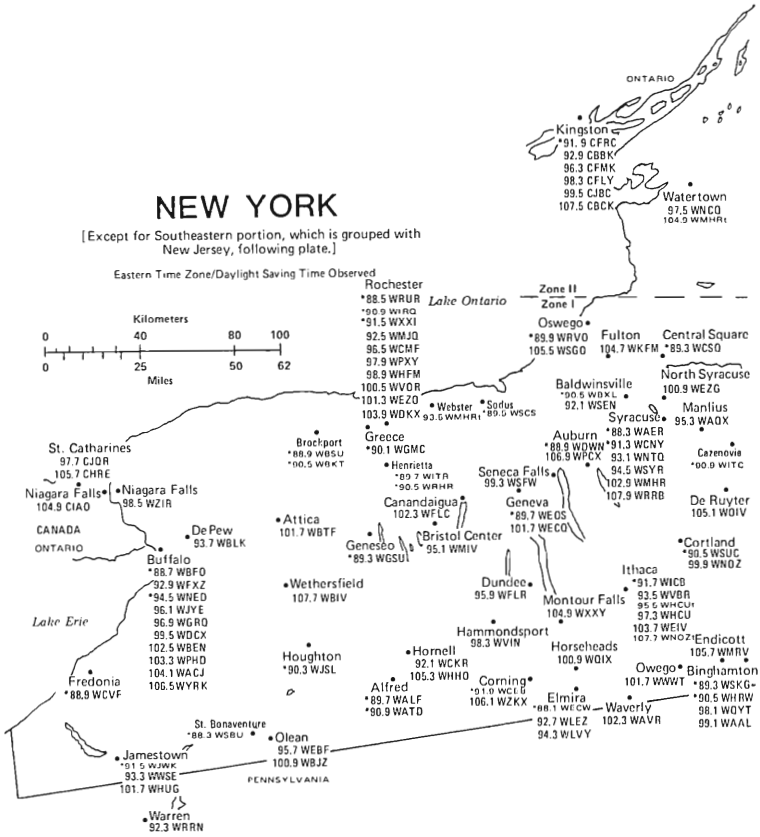

Zone 1
 Commercial Class B stations
 allowed with up to 50,000
 watts at 500 feet

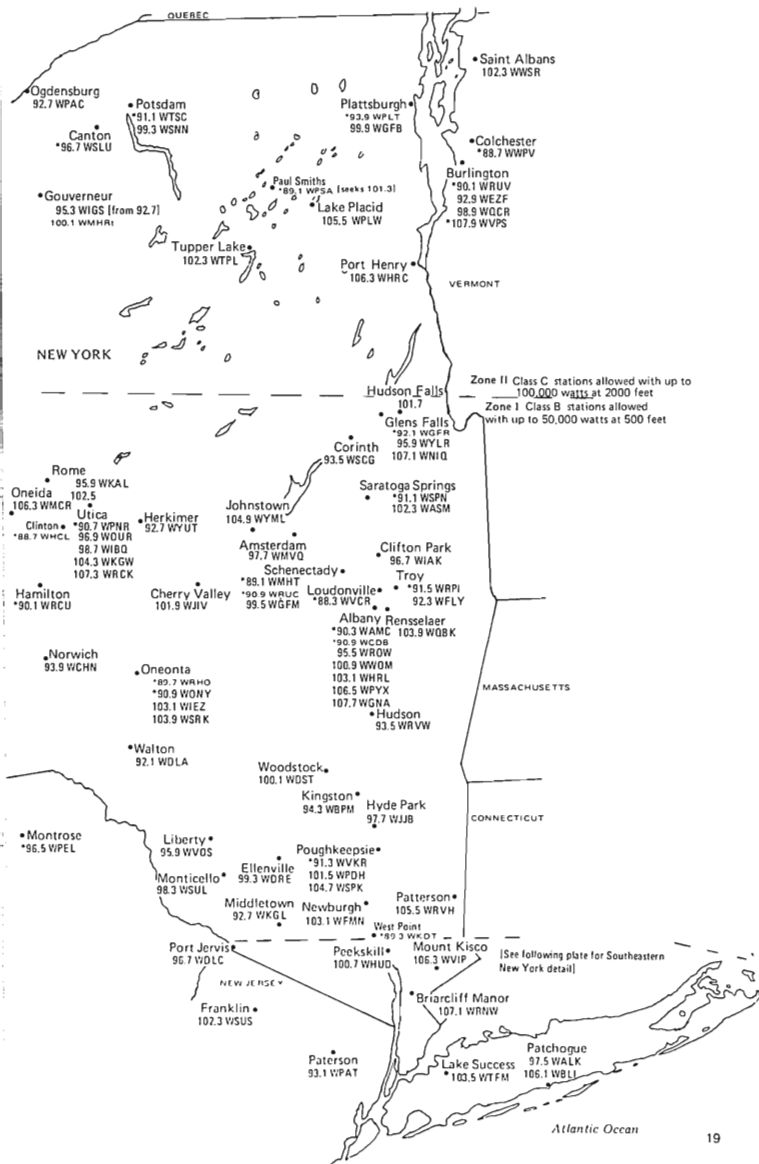

Eastern Time Zone
 Daylight Saving Time Observed

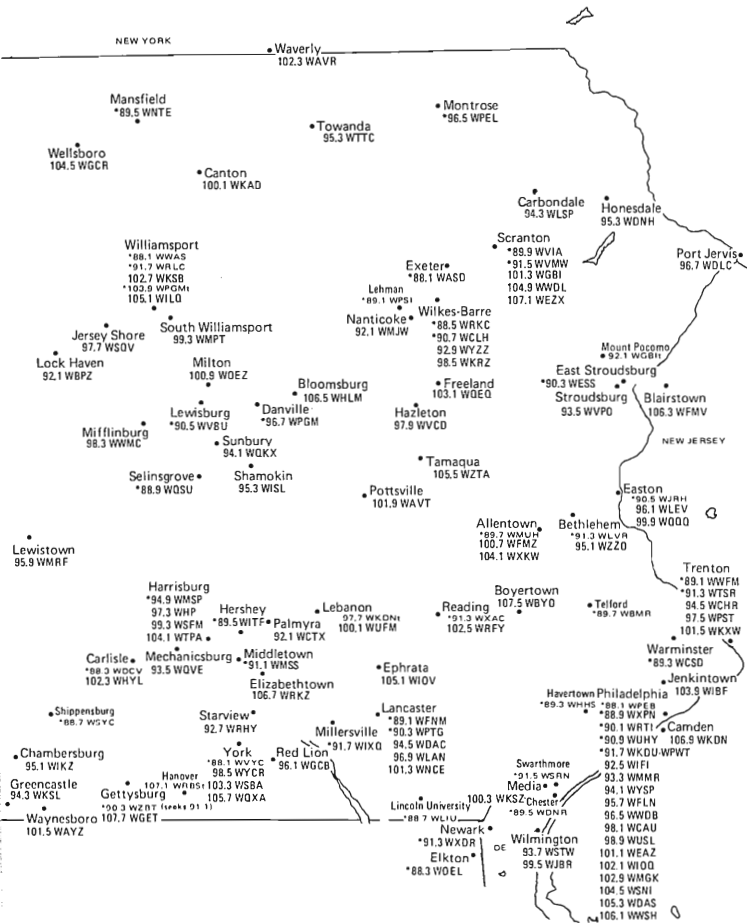

NEW YORK

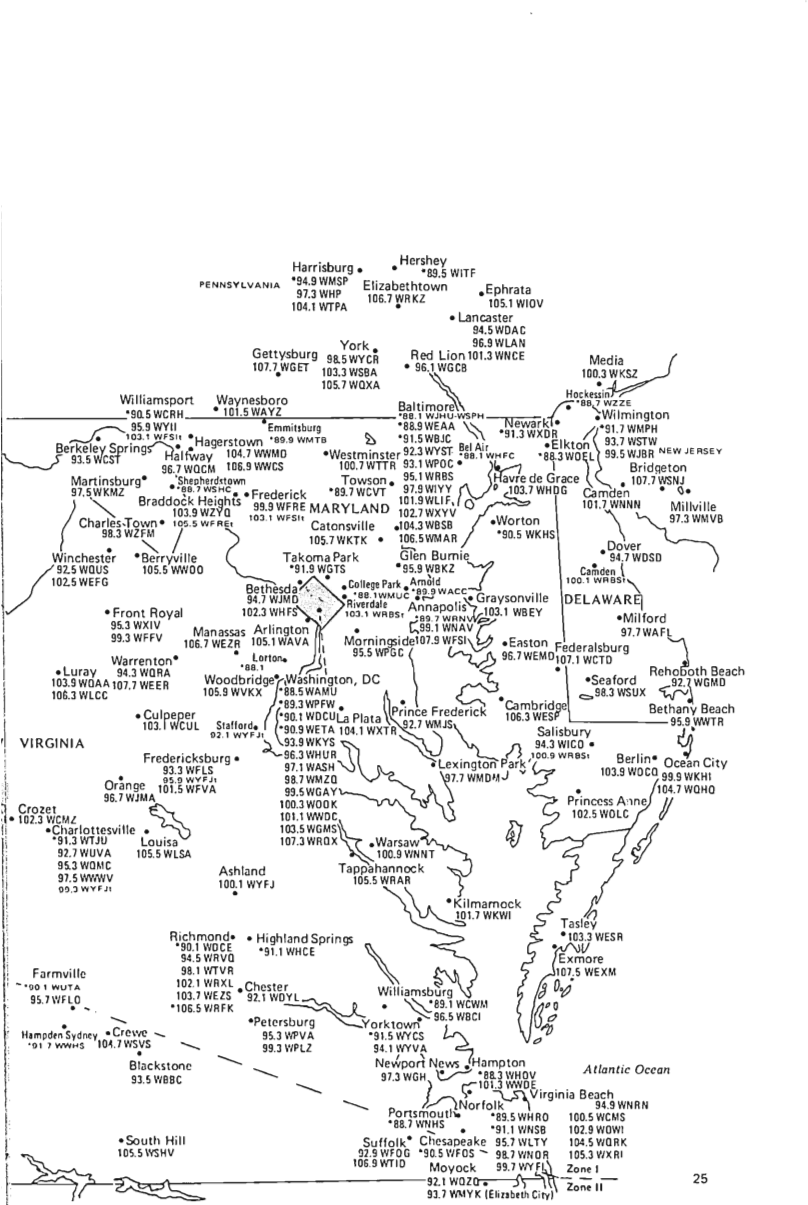

[Except for Southeastern portion, which is grouped with New Jersey, following plate.]

Eastern Time Zone/Daylight Saving Time Observed

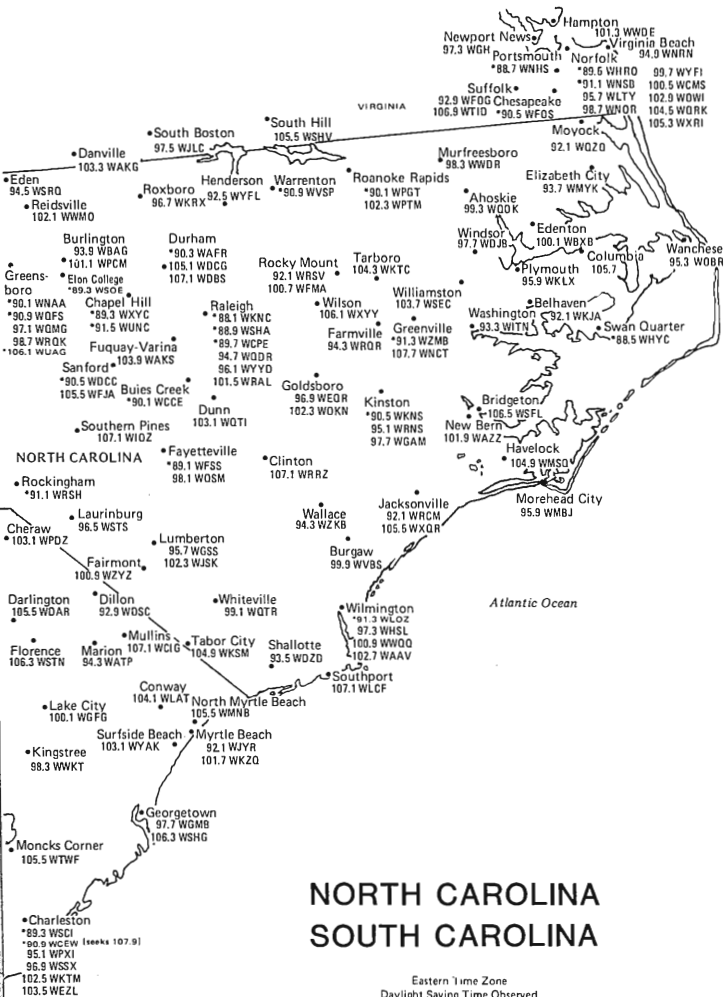

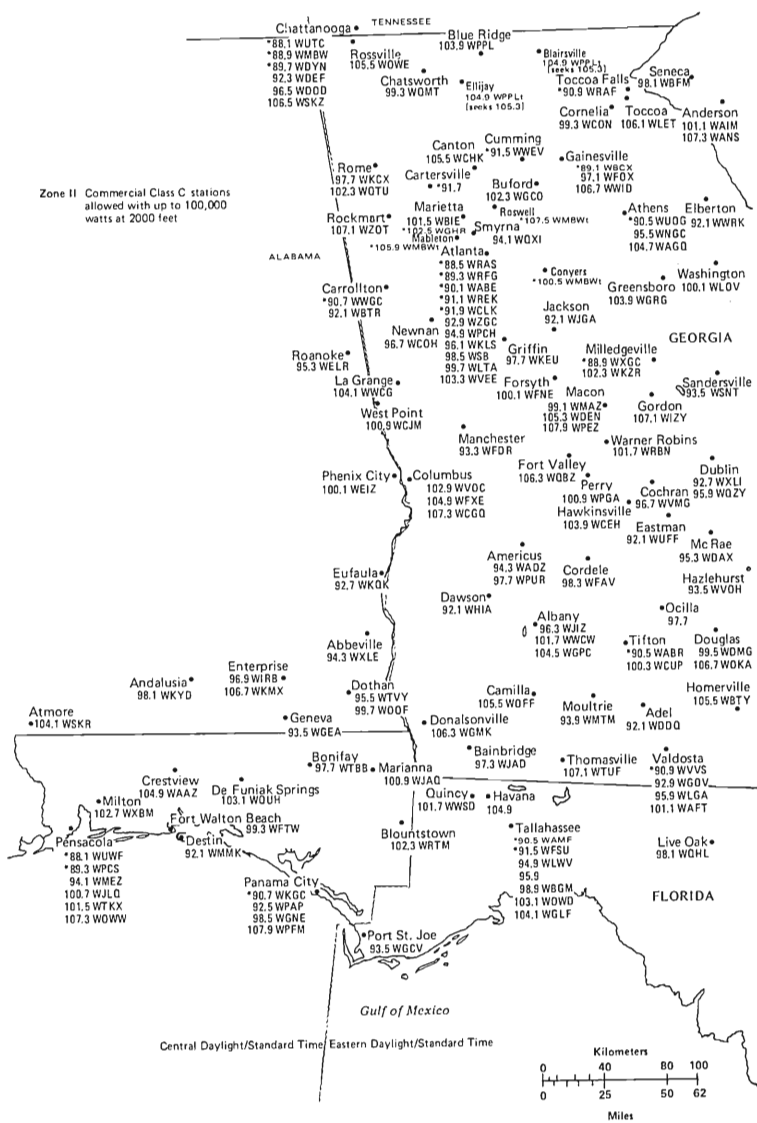

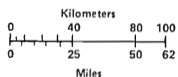

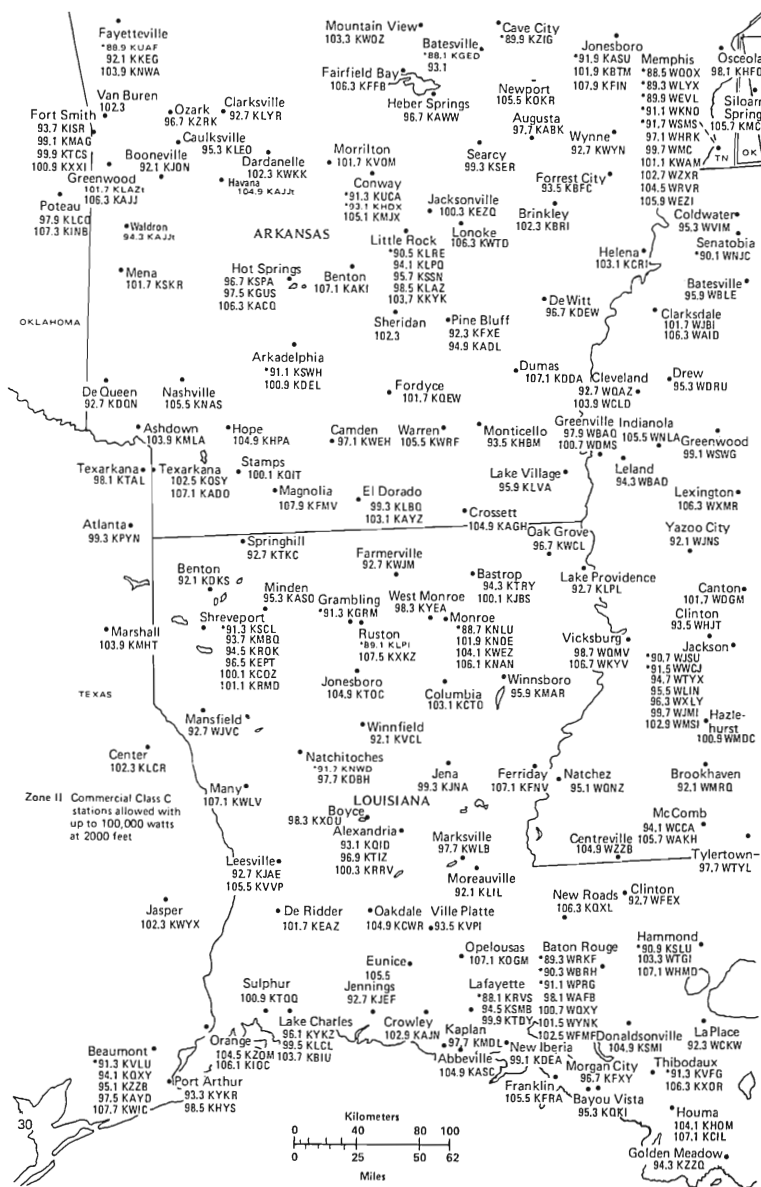

Zone II Class C stations allowed with up to 100,000 watts at 2000 feet

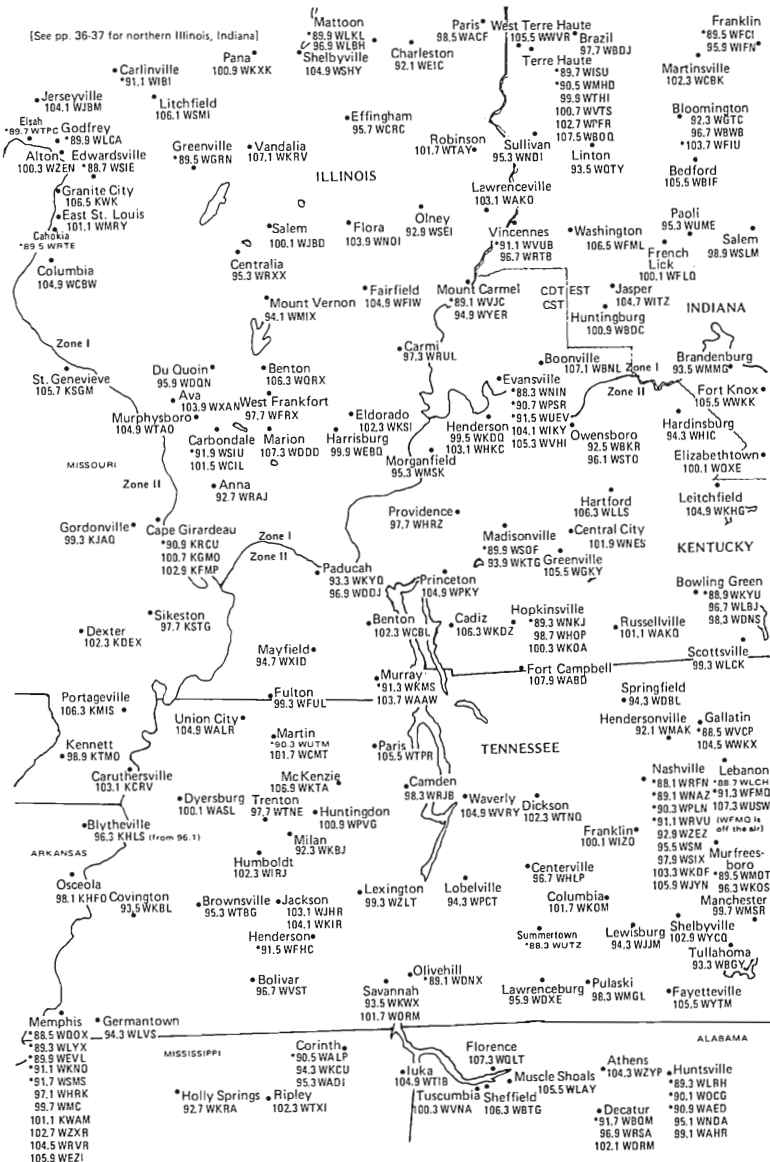

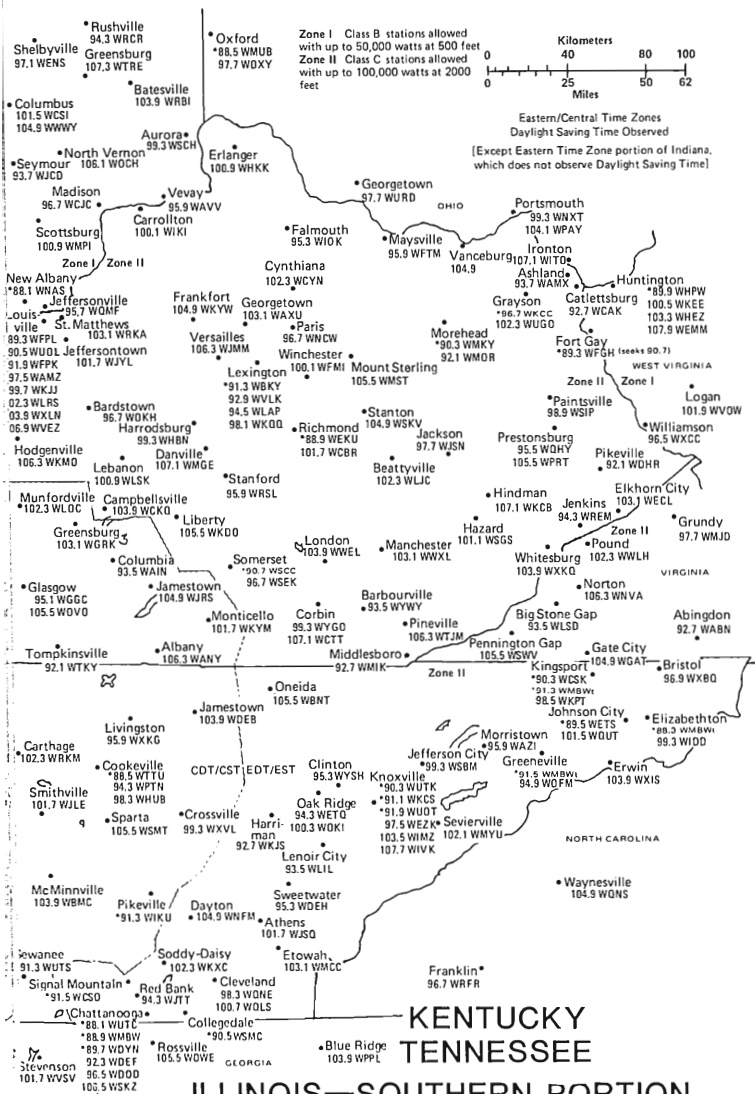

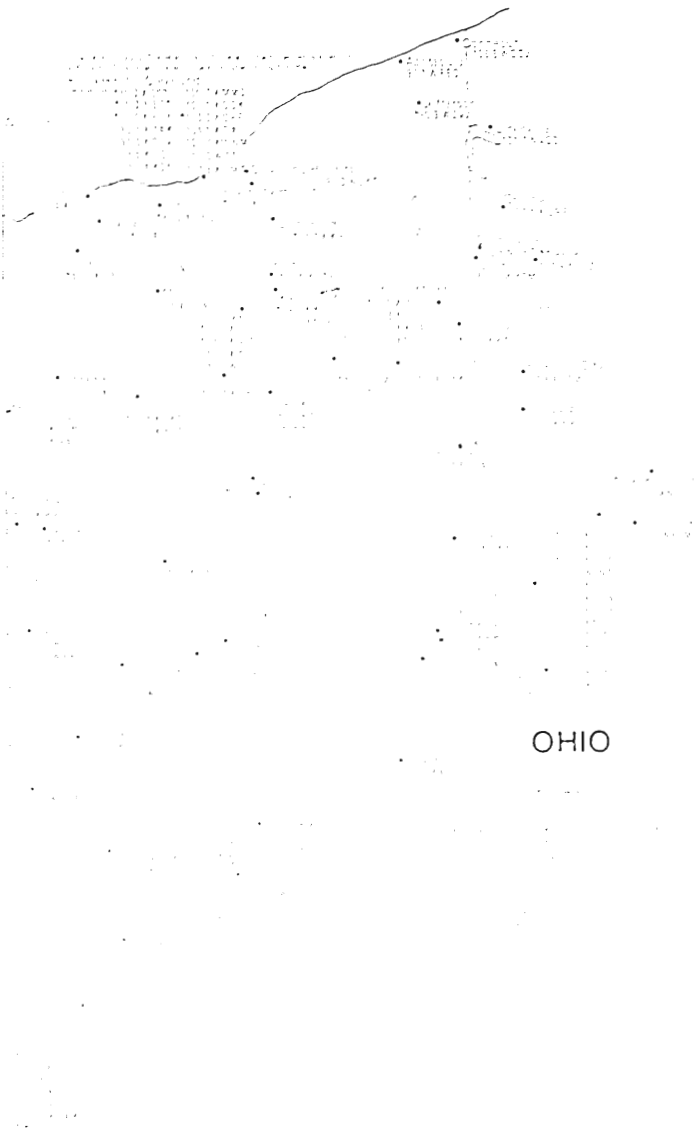

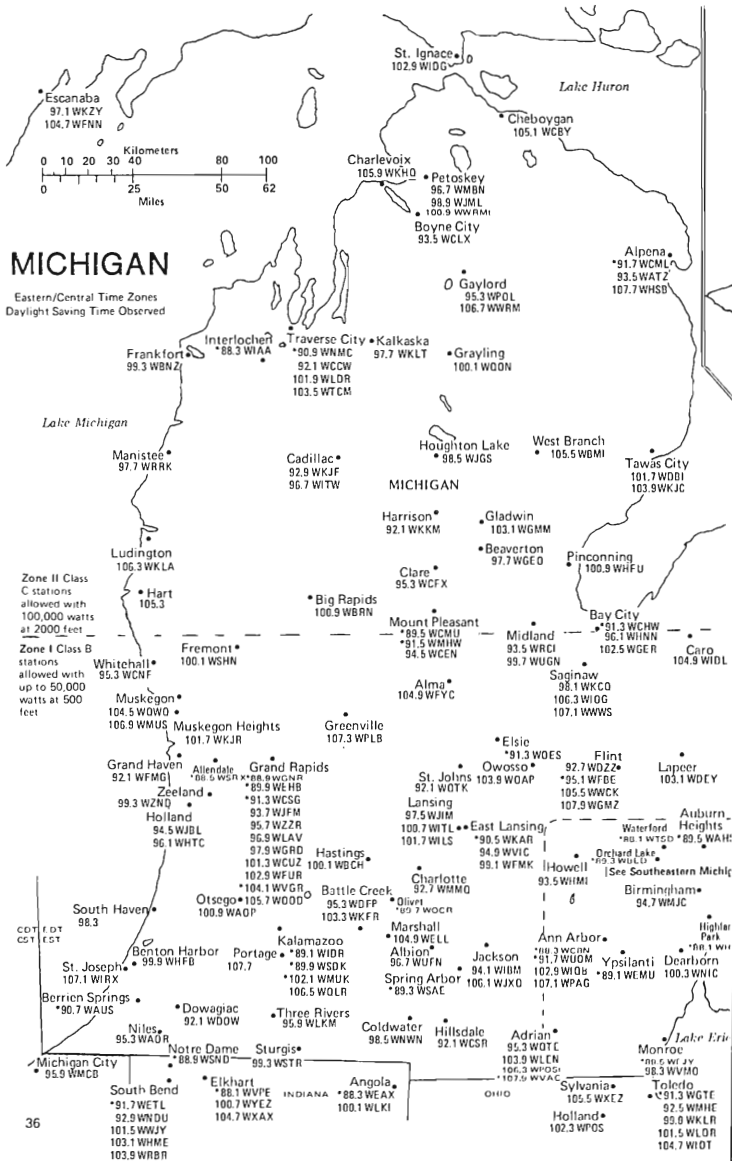

[See pp. 36-37 for northern Illinois, Indiana]

OHIO

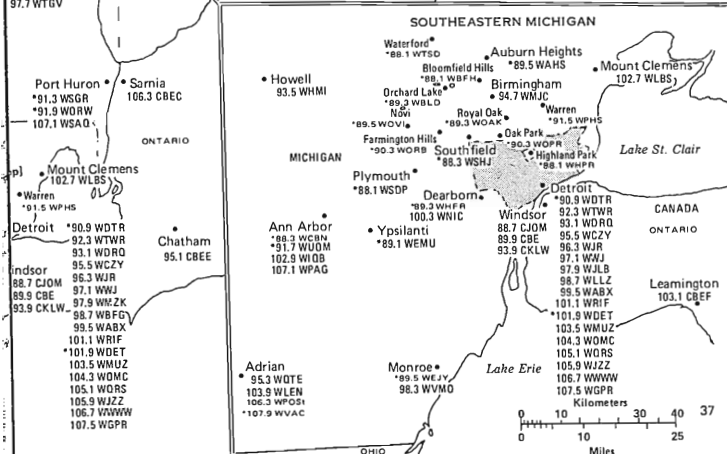

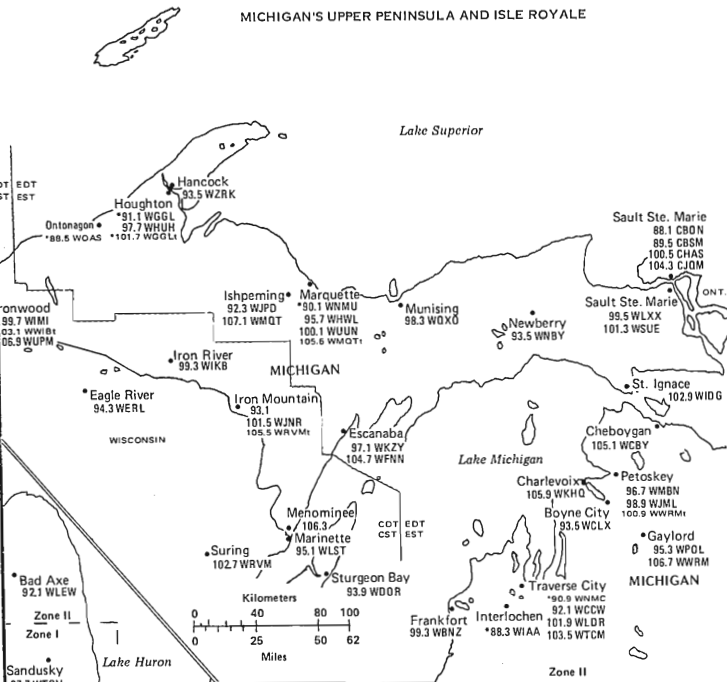

MICHIGAN

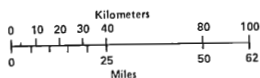

Eastern/Central Time Zones
Daylight Saving Time Observed

Zone II Class C stations allowed with 100,000 watts at 2000 feet

Zone I Class B stations allowed with up to 50,000 watts at 500 feet

MICHIGAN'S UPPER PENINSULA AND ISLE ROYALE

5 Stations that share time on the same frequency.

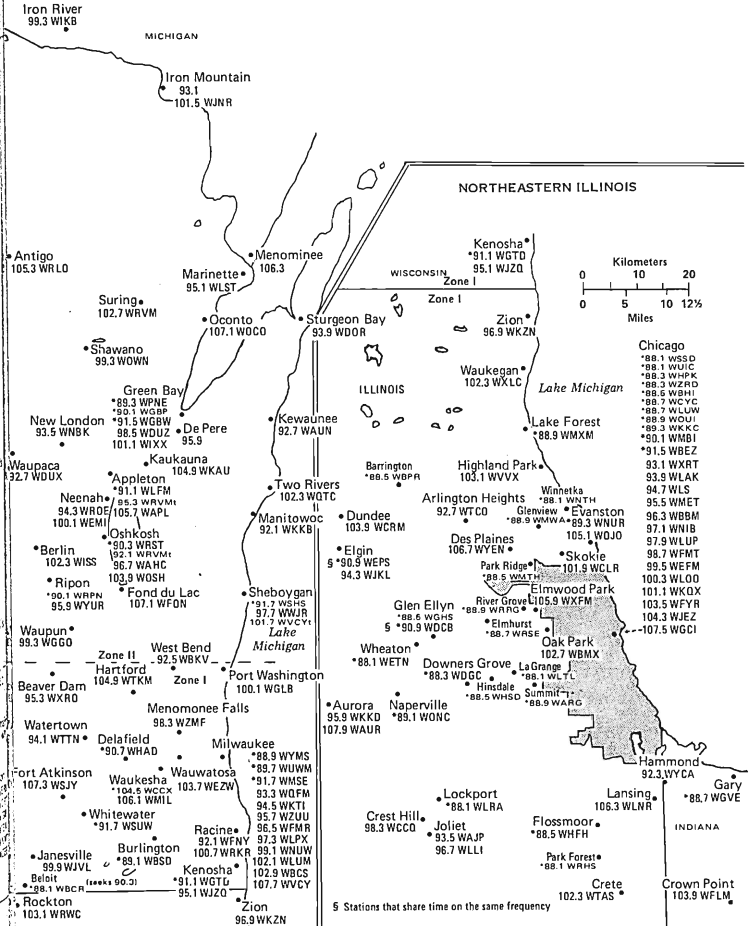

WISCONSIN ILLINOIS—NORTHEAST PORTION

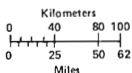

Central Time Zone/Daylight Saving Time Observed

Zone I Class B stations allowed with 50,000 watts at 500 feet

Zone II Class C stations allowed with 100,000 watts at 2000 feet

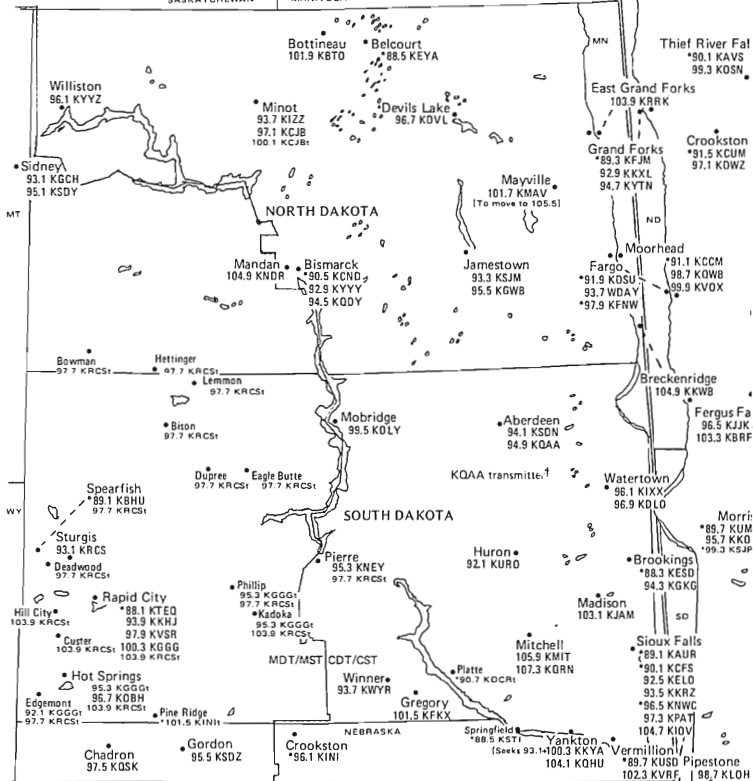

NORTH DAKOTA • SOUTH DAKOTA

CANADA

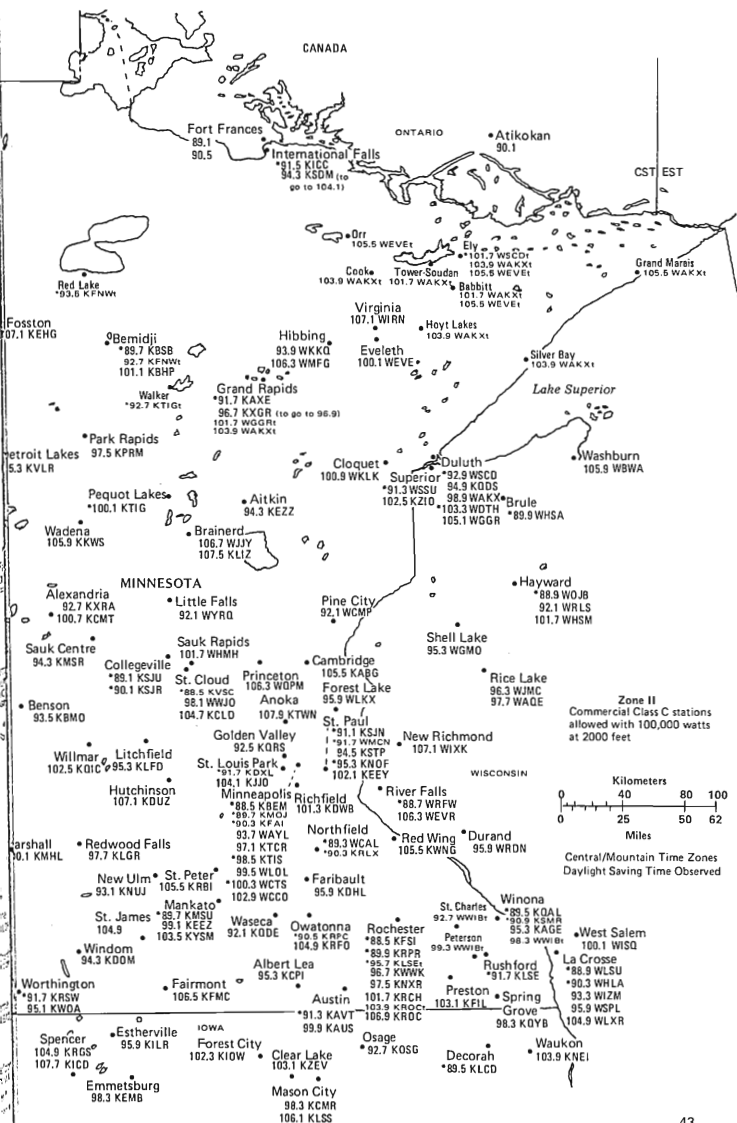

SASKATCHEWAN

CANADA

Canada Coverage Note:

Many new Canadian FM stations come on the air or change facilities without an announcement of their effective height above average terrain (EHAAT). We try to get the correct information, but because of the postal strike and publishing deadlines not all the information was available. Such stations are listed here without estimated coverages, but you can find out their effective radiated powers in Part II of the Station Directory.

MEXICO

[Map p. 68]
Mexico Coverage Note:

Mexican stations within 200 miles of the United States border report their antenna height above average terrain and other data to the F. C. C. Thus, our knowledge of those stations' facilities is more complete than it is for stations farther south in Mexico. Coverages are calculated for the stations where antenna heights are known; otherwise, effective radiated powers are given in watts for the various stations.

STATION DIRECTORY

Part II: FM Stations Listed by Frequency. Canada and the United States only (and excluding United States territories). Powers given are the horizontal effective radiated, expressed in watts. Antenna heights are above average terrain, and expressed in feet. Stations with permission to identify with more than one city are indicated, as are stations using a slogan or short phrase in lieu of call letters. See Key to Symbols, page 12.

FMeditations

This page is done, some five months after the introductory pages were prepared, reflecting the time it takes to produce an issue of the **FM Atlas**. I wish to thank the many contributors, too numerous to mention, who have taken the time to notify of changes in the FM broadcast picture in their areas. But special thanks for supplying Canadian data go to Walter Patton, Montreal PQ. Walter has kept me apprised of Canadian developments in a quicker fashion than what could be obtained from official sources. During the long process of getting the **FM Atlas** ready for publication, every station change, addition or deletion has been made, so that the data you receive will be correct as of the final publication deadline. The problem was that, after doing the Station Directories, came Walter's letter with news of some 35 new Canadian FM stations! So, squeeze I did, and it is all in there, helping to assure that information for Canada, as well as the United States, is as timely and complete as possible.

Computer Updatings Available

With stations adopting new call letters, music formats and networks, and always more and more stations coming on the air, the **FM Atlas** cannot be accurate over a period of time. For those who require updated information between editions of this book, computer updatings for the entire United States and Canada, or by individual states, are available. A new program permits the printing of data geographically or by frequency. Also available from the publisher is a listing of applications for FM stations and FM translators, priced at just six dollars.

Electronics Catalog Available in Print and Cassette Versions

Interested in FM-SCA, or other aspects of radio? A catalog detailing electronics supplies and radios, publications and audio tapes, is free for the asking from "FM Atlas," 4515 Avenue "E," Kearney NE 68847, U. S. A. For the visually handicapped the catalog is available on cassette tape, for which we ask a one dollar donation to partly cover expenses of duplication and mailing. And when you write tell about your area FM stations—changes in music formats, stations now in stereo, etc. Be sure to fill in the form below to be notified of our next edition.

Notify me when the Eighth Edition of the **FM Atlas** is available:
