World Radio at your Fingertips!

LARGEST AND BEST SHORT-WAVE STATION LIST IN PRINT • PHOTOS OF S-W ARTISTS
WHERE TO FIND S-W STATIONS ON YOUR DIAL • WORLD SHORT-WAVE STATION MAP

NEW WORLD GLOBES
for Short Wave Enthusiasts—
at New Low Prices - - -

THESE remarkable, new globes printed in a variety of popular colors are indispensable to short-wave fans. Notable among the many features of these world globes, is that they give life-time service.

Short-wave fans are enabled to determine correct time in various centers of the world with the aid of these globes; distances from city to city can be accurately established.

There is a graduated "Meridian" scale on each globe. Another feature is the movable hour scale found at the north pole—this facilitates determining the hour in any part of the world.

You will be thrilled when you put the globe to actual use—measuring distances from New York to Moscow; from Cape Town to Tokio; from Los Angeles to Rio de Janeiro; etc. A flat map is deceptive for measuring, but take a small string and stretch it across the globe, from city to city, and you have the correct distances.

Each globe contains a listing of several thousand cities in nations all over the world—spellings conform to international geographic standards—all globes are of 1935 production. They contain such important features as—traces of Admiral Byrd's recent voyage to Little America; Lindbergh's Paris flight; the new Japanese Empire; principal railroads; **principal international short-wave radio stations** and call letters; steamship routes; and other equally important data.

The colors on our fine handmade or Library globe maps are refined and delicate. Nevertheless, the two types have an essential characteristic in common—their rich color harmony. In which each color of equal strength blends into a harmonious color unit.

The map surface of all models is protected by a high, glazed, water and scratch proof finish which can easily be kept fresh and new with a damp cloth. This finish will not fade, crack or become yellow with age. The colors are sun proof.

These globes add dignity to home, office, studio or laboratory—they are globes that everyone will be proud to own.

World Globe
No. R-16

De Luxe World Globe No. R-16

This large, de luxe, 16" library globe is designed for those who prefer a globe of real distinction. It is the most comprehensive globe map published. It contains over 9,000 place names, new countries, geographic information, and other useful data. It is extremely easy to read—and can be used for accurate reference. Its distinctive mounting and beautiful coloring harmonize well.

POLITICAL INFORMATION

9,000 name places—Latest political changes (Saar, Manchukuo)—Railroads—Steamship routes with distances—Caravan routes—Ancient ruins (Maya Persepolis)—Important sites (Boulder Dam, National Parks, Little America)—82 Shortwave radio stations and call letters listed—Submarine cable lines—Canals (Suez, Kiel)—Country and state capitals.

PHYSICAL INFORMATION

Mountain ranges—Mountain peaks, volcanos—Plateaus, steppes—Glaciers, shelf ice—Swamps—Deserts, oases—Ocean currents in white—Rivers and river systems—Important lakes—Cataracts (Nile)—Depressions (Death Valley)—Unexplored areas in white.

CONSTRUCTION

The ball is strongly made of three plies of composition board, reinforced within. The map is hand-mounted on a special prepared plaster surface which gives added strength and permits a glass-smooth finish. Water proof and scratch proof lacquer seals the map and preserves its fine colors.

MOUNTING

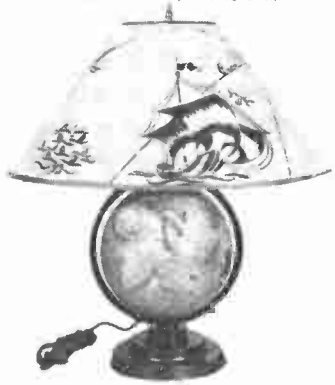
Substantial, completely reversible meridian, antique brass plated with rim, numbers and degree marks brightly burnished. Revolves at a touch on ball bearings in a beautiful, solid walnut floor cradle stand of authentic Duncan Phyfe design. Heavy brass claw feet.

SCALE OF MILES

An inch on this globe's surface is equivalent to 500 miles on the earth's surface. Because of this convenient scale, the 16" globe is specified equipment in the schools of many states.

With this beautiful globe is included the 32-page illustrated booklet entitled, "The Story of the Globe."

The World Globe No. R-16 is moderately priced. Height—39¼". Shipping weight (ball and globe) 30 lbs. PRICE **$31.75**



World Globe No. L-7

This combination globe-lamp, in addition to its decorative value can be used as a reading lamp. The 7" ball, featuring 55 short-wave stations, has a full meridian, and rotates. The 16" diameter shade is parchment, handsomely wrapped in cellophane for protection. Nautical designs in harmonizing colors add to the attractiveness of the lamp shade. The metal parts are antique bronze striped with gold. Complete with plug and cord. Height—19". Shipping weight—5½ lbs. PRICE **$2.60**

World Globe-Atlas No. P-8

This combination world globe and atlas holder adds appearance and dignity to any room—it is very attractive. The globe measures 8" in diameter. It has a full, graduated, movable meridian, finished in statuary bronze and gold. Its stand is richly decorated in a walnut finish. With this world globe is included at no additional cost, a new 221-page world atlas. Height—13¾". Shipping weight—5 lbs. PRICE **$4.25**

Gentlemen:

I received the World Globe and am well pleased with its completeness, appearance and usefulness.

Short-wave listening has become a hobby with me, and this World Globe is a necessary accuracy to any short wave listener or, for that matter, to any home.

P. C. ELLIS, Supt.
Laboratory, 19th and Campbell Sts.
Kansas City, Missouri

World Globe-Atlas No. R-12

This globe-atlas combination is one of the finest pieces that could be placed in any home or office. The 12" library ball, with its brass-plated meridian, fits snugly into the finely constructed solid walnut stand. Provision is made below for the 1935 383-page atlas which accompanies each globe, at no extra charge. 67 Shortwave stations listed. Height—16½". Shipping weight—12 lbs. PRICE **$6.85**

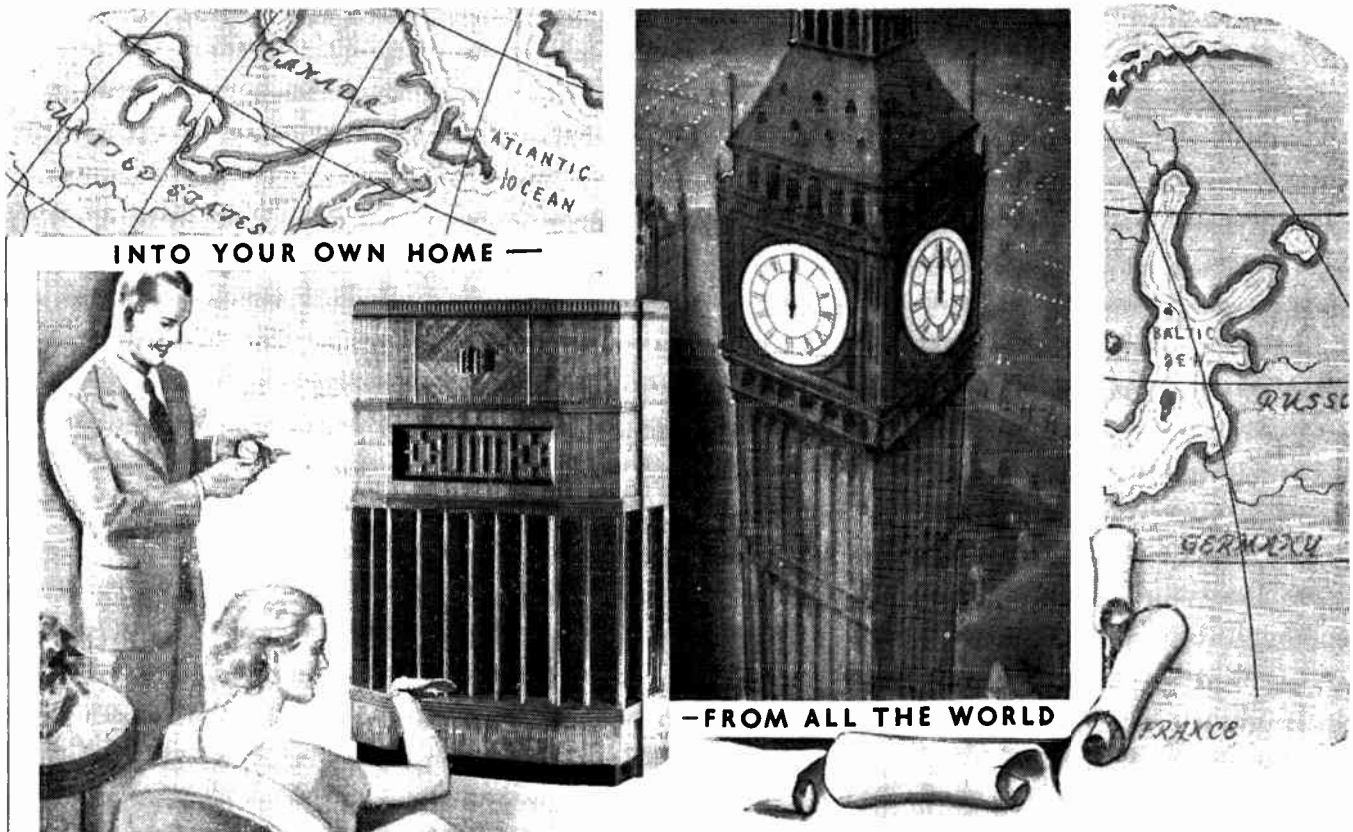
Send remittance in check or money order—register letter if it contains cash, stamps or currency. GLOBES ARE SHIPPED FROM OUR WAREHOUSE IN CHICAGO—F. O. B. FROM THAT CITY.

All globes are carefully packed in original, corrugated protected, cartons, assuring safe delivery. ORDER BY NUMBER. Send check or money order, plus sufficient postage for delivery by parcel post. Globes are shipped from our Chicago warehouse. Register letter if it contains cash, currency or stamps. Specify if shipment is to be sent express collect. ALL ORDERS ARE FILLED PROMPTLY.

SHORT WAVE CRAFT 99 HUDSON STREET, NEW YORK, N. Y.



Only the SCOTT *Full Range Hi-Fidelity* ALL-WAVE *Brings* YOU PARLIAMENT'S MIDNIGHT CHIMES WITH SUCH THRILLING TRUE TONE

London midnight — full of stars and historic towers! And the great chimes of Big Ben booming the hour across the darkness!

And in another quarter of the world: at the same instant—at a touch of the dial of your new SCOTT — you set your own watch to the same thundering measure of these great chimes ringing out over the British Parliament!

THE YARDSTICK FOR ALL DX RECEPTION

A nightly modern miracle — yours with the magnificent new SCOTT! World events—world views—inspiring music from foreign stations you have never heard before, brought in with a power and tonal splendor that stop your breath, so thrilling is the realism of SCOTT *re-creation.*

SCOTT distance records are unchallenged throughout the radio world. London — Paris — Madrid — Geneva — Brussels — Berlin — Rome — all with the clear, enjoyable sparkle possible only with the SCOTT Higher Useable Sensitivity.

Reserve power not even claimed for any other receiver. "Peak" fortissimos of a Beethoven symphony or popular dance arrangement with a brilliance and freedom from distortion that elevates the SCOTT to a class by itself.

DOUBLE THE TONAL RANGE OF ANY RECEIVER

The SCOTT Full Range Hi-Fidelity AllWave is the only receiver today which captures all the dazzling overtones of voice, violin, oboe, and trombone, from the 16,000 cycle high fidelity stations. Regular high fidelity radios with 7,500 cycle limit miss more than half the overtone range.

BULLET DIRECT SELECTIVITY—Piercing the most powerful adjacent wave length stations to bring you more foreign stations than you have ever heard before. 2 to 16 K. C.

HIGHEST USEABLE SENSITIVITY—guaranteeing less noise on distance reception than any receiver today.

PERFECTED AUTOMATIC VOLUME CONTROL—keeps distant world programs at even level.

DISTORTIONLESS PEAK RECEPTION — 35 Watts pure Class "A" output. Six times average power for unwarped tone.

SHORT WAVE STATION LOCATOR—gives clear momentary whistle when you tune in distant stations.

SOUND DIFFUSION—the only radio today with scientifically designed sound diffusers for perfect distribution of all tones.

FULL RANGE HI-FIDELITY — twice the tonal range of any other high fidelity receiver. 25 to 16,000 cycles.

THE RECEIVER THE CELEBRITIES OWN

The unparalleled performance of the SCOTT is backed by a five year guarantee of perfect service on all parts except tubes. Custom-built and sold direct from the laboratories on a thirty day home trial (U. S. A. only). Send TODAY for complete information on the new SCOTT Full Range Hi-Fidelity AllWave — the receiver owned by Toscanini, Jeritza, Rudy Vallee, Guy Lombardo, Walter Winchell, and many other celebrities.

THE OFFICIAL

DOERLE BANDSPREAD

NATION-WIDE *TESTIMONIALS* PRAISE THIS SET

Dear Sir:
I want to tell you that the radio which I bought from you recently is working fine. I have received California on long-waves, and on short-waves have logged about 93 stations. Three from the greatest distance are VK3LR, VK2ME and VK3ML, all located in Australia. And I get them consistently, not just once in a great while, at great volume, on a small window-sill aerial.
The set certainly has some "kick" to it.
Ernest J. Orishek, 118 White St., Westfield, Mass.

Dear Sirs:
Just a line or so to give you an idea of what my Doerle A. C. 5 hauled in during a 2 weeks listening test. All the G and D stations were received also TIEP, W9XF, PRADO, HJ4ABE, W8XAL, W2XE, W8XK, CJRO, YU2RC, CJRX, COC, HJ4ABB, HJ1ABB, YU5RMO, YP3RC, WCRCT, CT1AA, W1XAL, W9XAA, W1XAZ, EAQ, WE9GW, HC2RL, HJ3ABD, KEJ, HJB, HP5B, HJ1ABD, WNB, YU1RC, HIZ, JYK, FYA, YU4RC, OA4AD, RNE, PHI, RK,1 WNC, YNA, COH, PRF5, WON, XEBT, W2XAF, LSL, I2RO, IRM, JYS, UK3LR. All stations come in with strong carriers with a QSA4-5—R9 plus. "Hams" in 48 states and foreign countries besides practically all Police Radio Stations were received.
Frances Kmetz, 213 Linden St., Allentown, Pa.

Gentlemen:
The Doerle "AC-5" arrived all O.K. Had it going in about ten minutes after unpacking. It sure seems to be fine, we enjoy it very much. I am new at short-wave tuning but the bandspread dial makes tuning a real pleasure. I only have a short wire aerial so cannot give you any long list of stations received, but have received many foreign stations. I think Rio De Janeiro about the best distance at about R8 volume.
Ralph C. Rathbun, 9 Seward Ave., Bradford, Pa.

Gentlemen:
Here is a list of Short-Wave stations I have received in a short time with my "DOERLE AC5", with a very poor aerial for short-wave work. EAQ—Madrid, Spain; WIXAZ—Springfield, Mass.; W3XAF—Schenectady, N.Y.; COH—Havana, Cuba; COC—Havana, Cuba; VE9GW—Bowmanville, Ontario, Canada; CT1AA—Lisbon, Portugal; PRF5—Rio De Janeiro, Brazil; HJ1ABE—Barranquilla, Col., S. A.; PRADO—Riobamba, Ecuador, S.A.; DJC—Berlin, Germany; XEBT—Mexico City, Mexico; YV5RMO—Maracaibo, Venezuela, S. A.; CRJO—Winnipeg, Canada; W2XE—New York, N. Y.; W2XK—Pittsburgh, Pa.; HP5B—Panama City, Panama; FYA—Paris, France; G8C & G8L—Daventry, England.
EAQ—Madrid, Spain and COD—Havana, Cuba come in every night on the loud speaker regardless of weather conditions. This is the third and best receiver I have owned in the short time I have been interested in Short Waves.
Emerald H. Oelbrugge, Rose-Mary Oahlia Gardens, Martins Ferry, Ohio.
Original letters plus others may be seen at our office.

5-TUBE DE-LUXE A. C. SHORT-WAVE RECEIVER

Complete Price
$27.57 WITH TUBES
READY TO PLUG INTO 110 VOLT 60 CYCLE A.C. OUTLET

- Doublet Antenna Input or Standard Antenna Input
- 8-Low Loss Bakelite Plug-in Coils
- 15-200 Meters
- Fully Shielded
- Bandspread Dial
- Dynamic Speaker
- Headset Jack
- Beautiful Cabinet

BEFORE you buy any other Short-Wave Receiver, be sure to take advantage of our FREE five day trial offer explained below. Satisfy yourself, in your own home and at your leisure that this IS one of the greatest values in radio, and that it DOES have features which are found in more expensive receivers.

A powerful 5-tube "rig" complete with its self-contained hum-free power pack and dynamic speaker; all mounted on a single chassis and contained in a large handsomely finished black crackle cabinet with patterned screen speaker grill.

Two tuned stages—regenerative detector, 3AF stages with powerful 41 pentode output and perfectly matched dynamic speaker; all these features contribute to the great power and fine performance of this Doerle short wave receiver.

CONTINUOUS BANDSPREAD ON ALL BANDS. A special double-pointer, double-scale, airplane dial having a tuning ratio of 125 to 1 is employed.

Many fine features that you would expect to find in more expensive receivers are incorporated in this "ACE TOPNOTCHER" of the entire Doerle line.

Either a short-wave doublet or standard antenna may be used. A new antenna-adjusting scheme permits perfect alignment of both tuned circuits without appreciably affecting the setting of the tuning dial. Provisions are made to use headphones if desired, with a switch to cut out the dynamic speaker.

LOOK AT THIS DX-QSL LIST!

During its initial test, in New York City, this receiver pulled in on its loud speaker, at good room volume, the following enviable log: W1XAL, W1AZ, Boston; W3XAL, Boundbrook, N. J.; W8XAL, Cincinnati; W9XAA and W9XF, Chicago; G8C, G8O, G8E, G8F, Daventry, England; DJA, DJB, DJC, DJD, Zeesen, Germany; HBL, HBP, Geneva; VE9GW Ontario; V9DN Quebec; GE9DR Montreal; VE9HX Halifax; XETE Mexico City; YU1BC,YV3BC Caracas; CP5 Bolivia; LSN Buenos Aires; COC Havana; EAQ Madrid; WQO and WEF, testing with the Byrd Expedition and a whole flock of amateurs in practically every radio district of the United States. After that, we could no longer keep our eyes open so we "signed off" to bed.

The testimonials printed on this page testify that, in actual use, our customers are attaining even greater success. Uses a simple regenerative circuit—so simple as to be entirely reliable. Tubes: 1—6D6, 1—6F7 (actually two tubes in one), 1—37, 1—41 power output tube and 1—80 full-wave rectifier. Two gang tuning condenser; single dial control; FULL-VISION ILLUMINATED BAND SPREAD AIRPLANE DIAL. Ship. wt., 25 lbs. No. 5000. "DOERLE AC-5" Short-Wave Receiver. Complete with Tubes, Speaker and 8 coils 15 to 200 meters. Completely wired and tested. (NOT SOLD IN KIT FORM) YOUR PRICE **$27.57**

List Price $46.75 Set of 2 Broadcast coils $1.75 additional

LOG AND CALL MAGAZINE

OCTOBER - NOVEMBER, 1935

VOLUME II, No. 2

WILL YOU COOPERATE?

● *We are pleased to report to you that the Short Wave Listener magazine seems to be increasing in popularity among listeners everywhere and that the sale of the magazine is climbing constantly. We have been urged by hundreds of letters which reach us every month to make the magazine a monthly. So far, we have not been able to accede to this request, due to the fact that the sale of the magazine has, as yet, not reached a sufficient volume to make this move feasible. If, however, you are one of those who wish to see the magazine come out monthly you can help us towards this goal by telling others about the magazine.*

If the enthusiastic letters which reach us right along are a criterion, it would seem that other listeners would be benefited as much as yourself, if they only knew about the magazine. If every reader of the Short Wave Listener would take the trouble to inform a friend who has a regulation SHORT-WAVE set or an ALL-WAVE set, that here is a magazine which he should know about, your friend no doubt would appreciate it, and it will not take long before the magazine would be issued monthly.

Won't you, therefore, cooperate with us by giving us the names of your friends who now own all wave sets, using the blank printed on page 232 of this issue. Just paste this blank on a postal card or send it by letter as you wish, and we will send your friend or friends a free sample copy of the magazine immediately.

HUGO GERNSBACK,
Editor.

Popular Book Corporation
Editorial and General Offices

Contents...

This magazine is published every other month.

The next issue will be out December 15th.

OFFICIAL SHORT WAVE LISTENER MAGAZINE published every other month by Popular Book Corp., 99-101 Hudson St., New York, N. Y. and entered as second class matter at the Post Office, New York, N. Y., under the act of March 3, 1879. Additional entry, Paterson, N. J. Trademark and copyrights by permission of H. Gernsback, 99 Hudson Street, New York City. OFFICIAL SHORT WAVE LISTENER MAGAZINE is published every other month, six numbers per year. The subscription price is $1.50 per year in the United States and possessions; Canada and foreign countries, $1.75 per year. Single copies 25c.

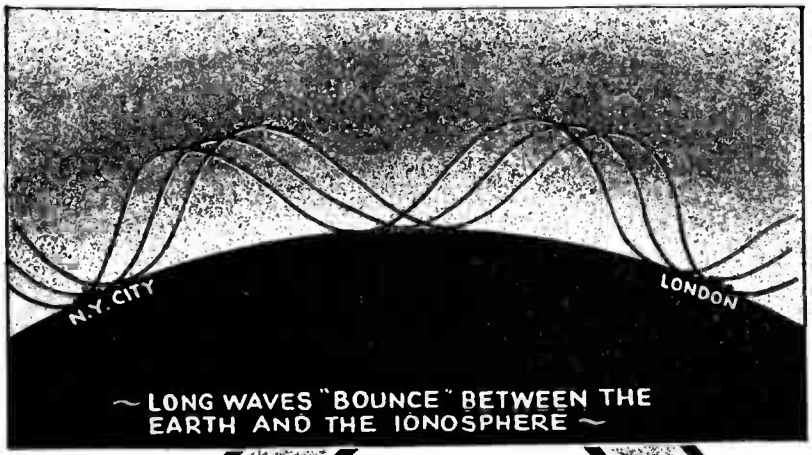
Address all contributions for publication to the Editor, OFFICIAL SHORT WAVE LISTENER MAGAZINE, 99-101 Hudson Street, New York, N. Y. Publishers are not responsible for lost manuscripts or photographs. Contributions cannot be returned unless authors remit full return postage. This magazine is for sale at all principal newsstands in the United States and Canada. European agents: Brentano's, London and Paris. Printed in U. S. A.

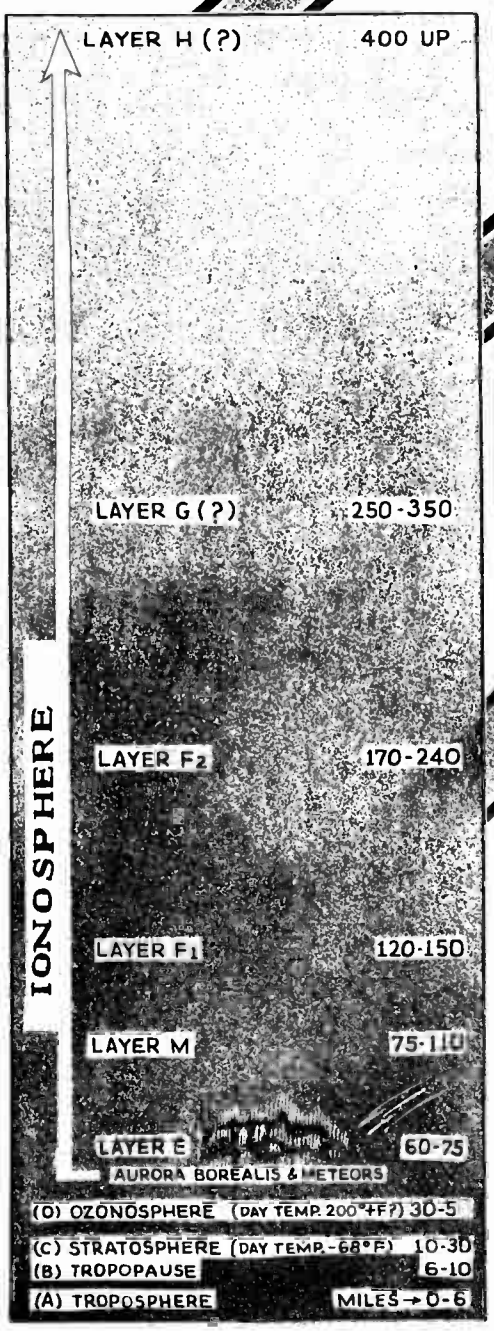
Make all subscription checks payable to Popular Book Corporation.

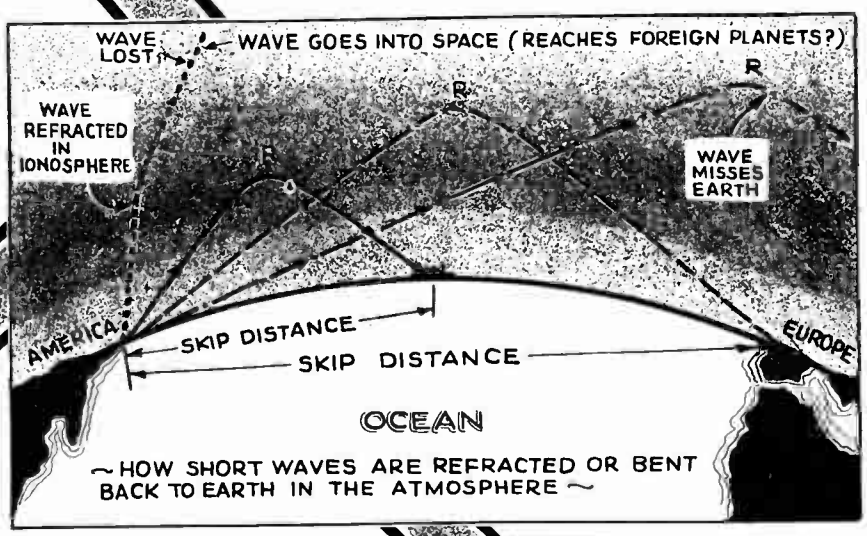
How Short Waves are Propagated and the Ranges for Different Wave Lengths

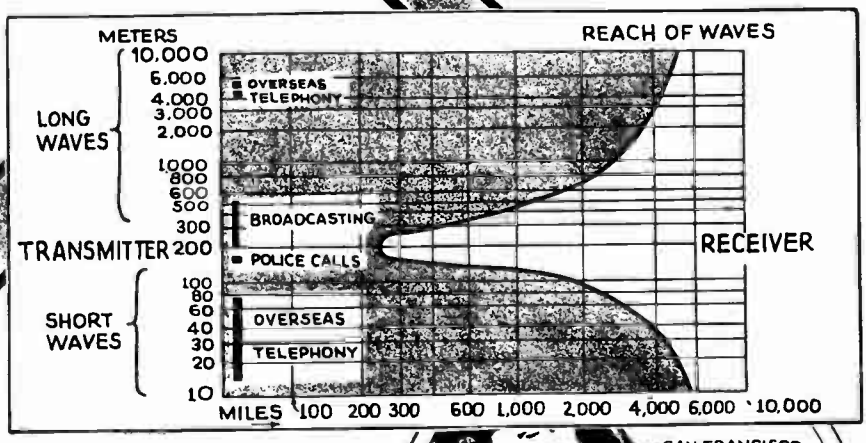
Long waves are transmitted over great distances, such as between New York City and London, by being constantly reflected back and forth between the surface of the earth and the highly ionized upper atmosphere.

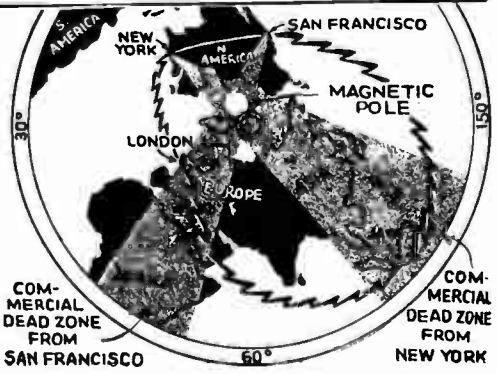
Short waves are also reflected from the highly ionized layers of the upper atmosphere as shown below, and are subject to the peculiar phenomenon known as the "skip distance." A receiving station located in this "skip distance" area will not hear the station ordinarily.











Left—A scientist's picture of the atmosphere showing the various ionized layers and the names of the various layers with their heights above the earth's surface.

Above—Chart which shows the theoretical distance covered with typical wave lengths, and with a given amount of power radiated at the transmitter. This chart is for daytime transmission; wave lengths below 10 meters are not efficient for terrestrial long distances.

Right—This chart shows a view of the earth looking down on the North Pole and, how because of the earth's magnetic effects, there is a large zone for both of the Bell System radio stations in the region of New York and San Francisco, where commercial service cannot be given directly.

How SHORT WAVES Are • PROPAGATED •

● WE are accustomed to marvel at the elaborate technical equipment used in the overseas radio telephone service. We follow its development and shake our heads in wonder over its accomplishments. Yet it would be impossible to telephone abroad were it not for a vast mechanism supplied by nature. This consists of a region of electrified particles in the upper atmosphere which scientists now call the *Ionosphere.*

Without the help of this agency, which is both a barrier and a benefactor, your voice would never get overseas. For the radio impulses carrying your words would leave the transmitter, shoot beyond the curving surface of the earth far out into space, and never arrive in the country you desired. Thanks to the Ionosphere, however, the radio waves bounce back to earth somewhat as billiard balls carom off rubber cushions and green felt. This bouncing process repeats and, by choosing radio waves of the right length, technicians are enabled to direct your conversation to its proper destination.

It was not until after the early years of this century, when Marconi first announced that he had successfully transmitted radio waves across the North Atlantic, that the effect of the Ionosphere was suspected. His report that the Atlantic had been so spanned occasioned considerable surprise, because even then it was known that radio waves were gigantically long light waves. And these waves, as was the case with light, were believed to travel in practically straight lines from their source. It was evident from Marconi's results, therefore, that some influence must be guiding these impulses back to earth, and preventing them from flying off the curved surface of our globe to be lost in outer space.

Ultimately scientists settled upon the atmosphere as this important factor and since then they have been studying it until today, like the New Deal, it is full of alphabetical designations. The envelope of gases about the earth is now neatly divided into regions as neatly labeled with letters. We live and breathe and fly our airplanes in the lower atmosphere which extends upward about six miles—the Troposphere or Layer A. Layers A to C are chiefly characterized by changes in temperature; Layer D by the presence of ozone; and, beyond that, it is a question of the density of the electrified particles floating about in the atmosphere.

As we go up, Layer A changes from warm to bitter cold; the drop in temperature is about seventeen degrees per mile. Layer B (the Tropopause, which introduces us to the upper atmosphere) is still colder, although the rate of change is not quite so rapid. Layer C (the Stratosphere—now a familiar scientific term) is just a bit colder, but as we go higher it maintains about the same temperature. Finally, because it absorbs much of the ultra violet light coming from the sun, Layer D (the Ozonosphere) becomes warmer.

Our next move upward—we are now some fifty miles above the earth—takes us into the Ionosphere which has so much to do with radio telephone service. This is divided into Layers E and F (about which a good deal of information has been gathered) and still higher regions—assumed to be Layers G and H—now being explored. (There is another region also receiving attention—an area discovered by the Bell Telephone Laboratories between Layers E and F_1 referred to as Layer M.) These divisions appear on the diagram.

What is the ionosphere? How are short waves propagated through space? How does the sun affect the transmission of short waves? What is the nature of the atmosphere so far as short waves are concerned? This clearly written article explains what happens to short waves in the atmosphere.

As the action of the Ionosphere discloses, solar influences are of predominate importance in their effect on radio transmission. The electrical particles found in the Ionosphere are produced for the most part by radiations coming from the sun. In addition, cosmic rays, ultra violet light from the stars, impacts from meteors, and thunderstorms also contribute to electrifying the upper atmosphere.

The number of electrified particles created depends chiefly on the intensity of sunlight and the density of the gases in the atmosphere. Ultra violet rays from the sun and elsewhere knock off electrons from the gaseous particles forming the atmosphere, and cause them to take on an electrical character. Since some of these particles have a positive charge and others a negative, they are constantly seeking partners of the opposite charge. Once a partner is found, the atom becomes neutralized and loses its active electrical character. Near the earth where there is more gas in the atmosphere, and thus more particles swimming about, the possibilities of making such re-combinations are greatest.

However, in Layer E and beyond, where there is less gas and consequently greater space between these particles, the possibility of finding a partner is enormously lessened. Hence, at these levels a greater number of particles remain in an electrified state. Here, then, is the Ionosphere, the dense region of electrified particles which reflects most radio waves back to the surface of the earth. Although in the form of layers, these particles are distributed somewhat irregularly; on going higher, incidentally, they usually are found to be more numerous.

Long and short waves meet a somewhat different reception when they travel upward from the transmitter and arrive in the Ionosphere. The longer the radio wave, the easier it is to bend it back on its path and reflect it down to earth. On the other hand, the shorter a radio wave, the less susceptible it is to this bending process; short waves, consequently, penetrate deeper into the upper atmosphere. Here, however, the electrified particles are more numerous and can bend the waves until they finally turn earthward. *Very short radio waves (which behave much like light waves) are so little affected by the action of the Ionosphere that they are not refracted back to earth, but penetrate this barrier and go on beyond into inter-stellar space.*

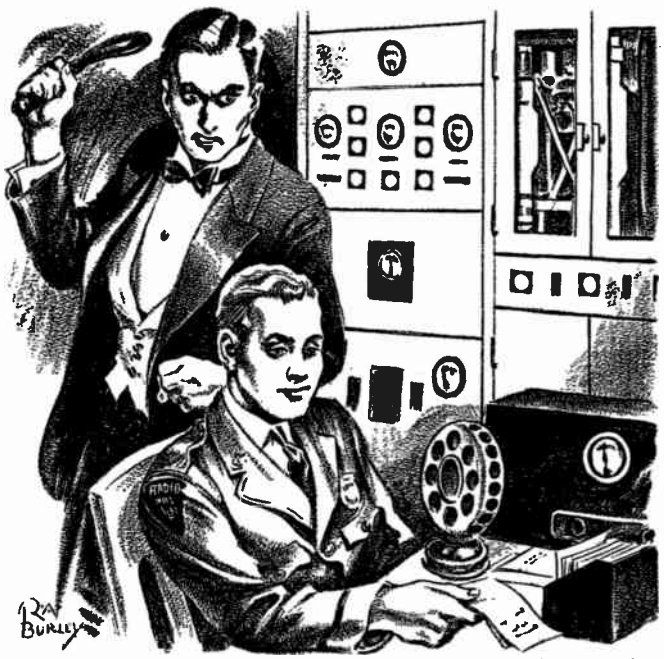
Now it happens that our atmospheric medium absorbs the energy of waves in the vicinity of 200 meters more than those of other lengths. (These waves, incidentally, are near the bands assigned to most of our broadcasting stations and this probably explains why such stations are not always heard well over long distances.) It is customary to use this region as a dividing line in talking about long and short waves—thus, those less than 200 meters in length are called *short waves* while those longer than that figure are ordinarily known as *long waves.* A diagram on the opposite page illustrates this point.

The least number of electrically active particles in the atmosphere is found just before dawn; on the arrival of sunlight with its ultra violet rays the number increases. Thus, in the daytime—especially around noon—a particularly dense region of electrified particles is created, a condition which affects the height at which long and short radio waves are reflected from the upper atmosphere. Such a change in *ceiling height,* so to speak, governs the

(*Continued on page* 232)

The Forgotten Time Signal

By FRANK CLINTON



Sandy was too occupied with his thoughts to notice any noise . . . A well-dressed man in evening clothes stealthily crept in the door . . .

● TWO A.M. on a clear starlight morning in mid September. Sandy Roberts, night relief announcer of Police Radio station WPCX, of Redwood Villa, stifeled a hearty yawn with the back of his left hand. In the early morning hours, a small mid-western town of 35,000 souls was certainly dead, at least as far as the police were concerned, he mused. It had been over two hours since the last call when he had sent one of Redwood Villa's three radio cars to investigate a noisy dog that was keeping a sleepy neighborhood awake.

He reached over and flipped a switch, turning on the 100 watt transmitter and said, "Calling All Cars—All Cars—2:15 A.M. time signal. That's all."

Certainly a nuisance this giving time signals every fifteen minutes. It was one of the old man's ideas. Supposed to let the boys in the prowler cars know if their radios were operating correctly.

Well—it was certainly much softer here in the warm confines of the Police Department's Radio Room containing the transmitter, microphone and dispatching map of the city, showing the exact location of each of the cars, than pounding some lonely beat. Sandy was elated to think that he was assured of this assignment for some time. His steel-blue eyes flashed as he remembered Chief Burke's remark that he was still looking for the man to fill the shoes to old Tim Healy, former Captain of the department who had recently resigned. Sandy secretly hoped the Chief was looking him over, preparatory to announcing the appointment of the new Captain. Of course, he wasn't any too sure of getting the appointment, for after all, he argued to himself, he was only 29 years old, and on the force five years. Lots of the fellows in the department had been there longer—but the Chief was still undecided.

Sandy was too occupied with his thoughts to notice any noise in back of him as the door slowly opened. A well dressed man in evening clothes stealthily crept in the now wide opened door. He cautiously pulled a small, but ugly blackjack out of his trouser pocket. Sandy, startled at the sound of footsteps in back of him started to rise—then there was a quick flash of pain in his head—and then utter blackness.

When he aroused himself, he was lying, securely tied and gagged, on his back. He was shocked to see the tubes of the transmitter lit up—and more shocked to hear a strangely familiar voice commanding—

"Calling Car Two—Car Two. Go to 24 East 34th Street and investigate a prowler. Watch your step boys! This man may be dangerous. Calling Car One—Car One. At 167 W. 39th Street the neighbors are complaining of a wild party. Calling Car Three—Car Number Three at" . . .

It flashed through Sandy's mind that this man's voice was almost exactly like his—the man even had that New England twang in his voice, so similar to Sandy's. He realized this debonnair fellow was sending every available car to the south side of the city. The gleam of the filaments in the transmitter died down. The well groomed intruder had finished his announcements.

Being gagged, there was little Sandy could do except to glare at the man.

"What's the matter, copper? Don't you like being gagged and tied not being able to use your radio station? I suppose you're wondering what this is all about."

He paused for a moment to light a cigarette, and then continued.

"Well, since you are going to be trussed up here for the next three and one half hours, until your relief man comes on at 6, I'll let you in on the secret. You'll no doubt recall the First National Bank has just taken in $100,000 for the payrolls at the factories in Badenville. My playmates and myself have burrowed under the vaults of the bank and have been awaiting our chance to break into the vaults. Just in case anything goes wrong and the burglar alarms go off, we don't want any snooping radio patrol cars around."

The crook seemed to sense the amazement that had entered into Sandy's eyes. He inhaled deeply on the cigarette, and let the smoke drift luxuriously out of his mouth. He smiled at his captive and continued his narrative.

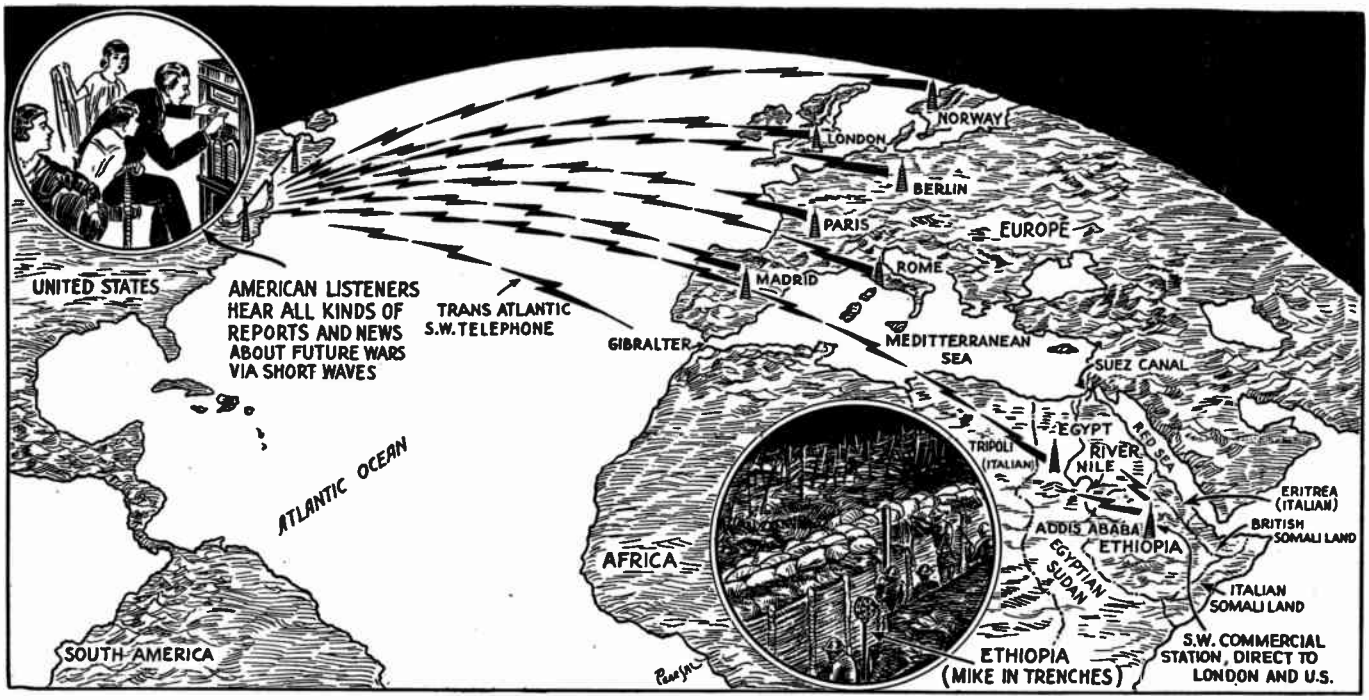
"For many weeks now, I have listened to your voice on my short wave set at home. I have practised during that time, so that I could perfectly imitate your announcing voice. In that way, I could be sure none of the listening cops would get suspicious."

The cleverest crooks always leave some stone unturned, the old saw has it, and the bank robbers in the present tale slipped a cog too!

He paused a few minutes, looking at the ceiling, dreaming of the $100,000 that he soon would share with his two accomplices.

Desperately, Sandy realized what the crook had related was true. The $100,000 payroll for the big industrial plants in Badenville, four miles east of Redwood Villa, had arrived that night from the Chicago banks. From his awkward position on the floor, it was difficult to see the large electric clock on the desk, but by straining his neck, he could see the big black hands had crawled slowly around to 2:29 A.M. If this man would only continue talking for a few minutes longer!

(*Continued on page* 238)



Thanks to short waves, those equipped with a short or dual wave receiver will hear many thrilling as well as interesting reports on the next war, direct from experts in close touch with the seat of war. For example, the Italo-Ethiopian situation will be covered by short-wave reports emanating from the principal short-wave transmitters of Europe and, unlike the World War, "hot" news will be dished up to the short-wave listening public everyday.

Short Waves in the Next War

● THE next war, whether it be in Ethiopia or elsewhere, will surely be covered in a brand new fashion by *short waves*.

Those of us who have listened in daily to the reports from foreign short-wave stations, such as those located in England, Germany, and other countries have had a sample of this already, and the opinions given by some of the leading European experts have been much "snappier" than anything published in the newspapers. We can well imagine that if Italy and Ethiopia, for example, should be engaged in a war, that we would hear some very interesting and unusual reports and opinions from the other national S-W stations, such as those located in London, Berlin, etc.

Not only will this next war be covered as never before, thanks to *short waves*, but it will be entirely unlike the conditions during the World War, in that no *radio broadcasting* whatsoever was available and we could only read the "censored" reports in the public press.

Furthermore, it is quite likely that the Italian short-wave stations will be used to broadcast daily bulletins and opinions of Italian experts in the form of propaganda, in an endeavor to influence listeners in other countries and present their side of the conflict. It is also quite probable that Ethiopia might erect a short-wave broadcasting station to "tell the world" *their side of the story!*

Another radically new angle created by short-wave broadcasting across the ocean will quite possibly be broadcasts of the sounds of actual battle, direct from the trenches or from the decks of warships. This is not an idle dream, the idea having been mentioned seriously in recent reports from abroad. The trans-oceanic commercial telephone services such as that operated by the A. T. & T. Co., by *short waves* will also bring a brand new service of vast importance to diplomats and others engaged officially or otherwise in any future wars.

Not only will short waves bring to the American public the very latest news bulletins, as well as opinions of diplomats and military experts, on any future wars, but they will also serve an important role in transmitting official messages across the oceans between diplomats and others vitally interested in the affairs of the nations concerned.

Entertainment is still another new slant that was missed in the World War and unless the commanding officers absolutely prohibit the reception of music by radio for entertaining the soldiers and sailors at war, it is quite conceivable that the short waves may supply entertaining music and song for the men under arms. It might be that an official order would prohibit the use of loudspeakers, as music or talk coming from them might give away the location of some of the front line troops, but in this case by demanding the use of *headphones* only, it would seem that the men could be royally entertained.

Short waves will find dozens of new uses in the war of tomorrow, and for one thing, the facsimile transmission and reception of maps, photos, etc. will undoubtedly be extensively employed.

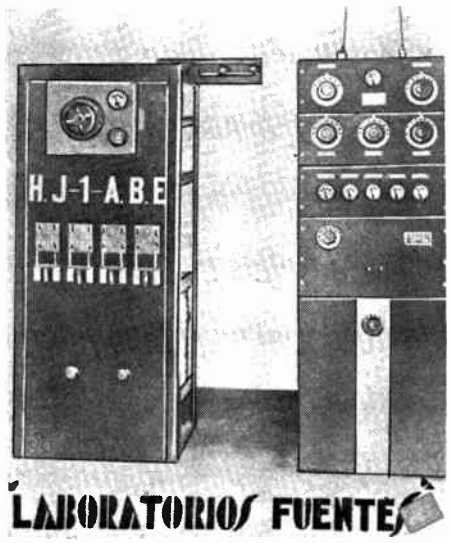
It is quite probable also that *television* may enter into the picture of tomorrow's war and either of these systems of transmitting an image or depicting a scene will be used between an airplane or Zeppelin and the earth, or from a ship to shore, and so forth. Directed beam transmission will undoubtedly be used extensively for military work, and for ranges of a mile or so transmitters operating on waves at 1/10th of a meter or less will quite likely be employed.

One advantage of micro-wave communication is that the beams can be directed quite sharply and the chances of the enemy radio listening devices picking up such waves is rendered very remote.

Short waves are already carrying many brilliant news reports from across the ocean to thousands of American short-wave listeners, which would seem to point to the fact that our reporters in the "Theatre of War" tomorrow will undoubtedly be giving us very elaborate "word pictures" of a battle scene the same day it is reported. It does not seem too great a stretch of the imag-

(*Continued on page* 239)

New Stations In LATIN AMERICA



HJ1ABE "Laboratorios Fuentes", Cartagena: Above—the new transmitter recently installed in Cartagena and now working on 6115 kc. or 49.05 meters, under the title "The Voice of the Fuentes Laboratories." The station is rated at 160-180 watts power, and provides reception throughout the world. The special "DX" tests, transmitted each Monday, from 10:30-11:30 p.m., E.S.T., are most familiar to American short wave "fans."

By H. S. BRADLEY

The South American as well as the Central American stations are now coming in strong. Here's the latest data on these popular stations to aid the Listener in finding them: wavelength, frequencies, and time on the air.

● DESPITE the presence of heavy summer static, new stations from Latin America are constantly presenting themselves to those North American listeners who take the trouble to cover the 40-50 metre wave-range with a bit of care, in the evenings. The results of an increase in power, and an improvement in quality of the average Latin American station are reflected in the daily, year-around reception which these stations provide; in past years, the reception of such unstable and poorly-modulated signals as were placed on the air in various Latin American nations, was limited almost entirely to the static-free winter seasons. No longer is such the case!

Among the best of the newcomers is station COCD, "La Voz del Aire, S.A." of Havana, which operates daily on 6130 kc., relaying the programs of long-wave station CMCD (960 kc.) from about 8-11 p.m. The station is situated at 25 y G, Vedado, Habana, but reports may be addressed to the station director, Sr. J. Benitez, at Box 2.294 in that city.

Haiti has at length taken to the air on short-waves, and the new station, situated in Port au Prince is at present operating on an irregular schedule, on varying wavelengths. A letter from Armand Mallebranche of the Societe Haitienne d'Automobiles, the firm which owns the station, lists for us the following call-letters and wavelengths now in use:

HH2R	31.44m	9545 kc.
HH2S	49.41m	6070 kc.
HH2T	25.93m	11570 kc.

Reception has been effected on the first two waves, generally late in the evenings, from 10-11 p.m., but at irregular intervals.

A brief mention of a special program from station HIH of San Pedro de Macoris, Dominican Republic seems to be in order, as it may enable fans who are otherwise unable to do so, on account of telegraph interference in the evenings, to make this low-powered catch. A special test is conducted each Sunday morning, from approximately 3-4.15 a.m., EST, on an announced wavelength of "exactly 44 metres."

Shifting the scene of our observations to Central America, we record excellent reception from two new Costa Ricans. The first, TIRCC, is owned by the Catholic church in San Jose, and is operated by Sr. Amando Cespedes M., the former operator of the world-famous TI4NRH of Heredia. Sr. Cespedes is at present announcing at TIRCC, and devoting other efforts to the construction of a new station to be operated on long-waves by the same organization. TIRCC works on a frequency of 6550 kc., or 45.8 metres, generally from 8-10 p.m. Reports addressed to the station at Apartado 1064, San Jose, bring a novel verification card in return.

The second new San Jose station, namely TI2PG, "La Voz de la Victor," has a power of 1000 watts, and works on an irregular schedule, although it may be heard most any evening, around 10 p.m., testing with near-by stations. TI2PG first used the same frequency as that used by TIRCC, but changed to 6380 kc. in order to avoid interference. Sr. Perry Girton, the owner, states that as soon as a new crystal on 6410 kc. arrives, regular programs will be transmitted, and the station will remain permanently on this latter frequency.

A verification card received from "La Voz de Sincelejo," the new station in Sincelejo, Bolivar (a bit to the south of Cartagena) confirms the writer's observation that two Colombians are using the same call-letters, HJ1ABE. When the more famous Fuentes station in Cartagena purchased their new transmitter, the old rig was transferred to Sincelejo. Although it hardly seems likely that the call assignment went with the transmitter, it is believed that the Colombian government has neglected to assign a definite call to the Sincelejo station. At any rate, Sincelejo is on the air with regular broadcasts daily, from 6.30-8 p.m., EST. on 7100 kc., or 42.24 metres, according to Sr.

HJ1ABH—"La Voz de Cienaga." From Sergio Aparicio Jr., the owner of station HJ1ABH of Cienaga, Magdalena, Colombia, comes this view of his station, together with the warning that we should not be too greatly impressed by the panels, for, as he says, "there is not much behind them." The station's power is only 50 watts, and it works on approximately 48 meters, transmitting scheduled broadcasts on Tuesday and Thursday, from 7:50-10 p.m., E.S.T.

Eugenio Quintero A., the station manager.

The anticipated power-increase has been effected at "La Voz de la Victor," HJ3ABH in Bogota, and this station is now operating with a power of 1200 watts in the aerial on alternate frequencies of 5970 and 6012 kc. A recent verification lists the following schedule: Daily except Sunday, 11.30 a.m.-2 p.m. and 6-11 p.m. E.S.T. On Sunday, operation is scheduled from 12-2 and 4-9 p.m.

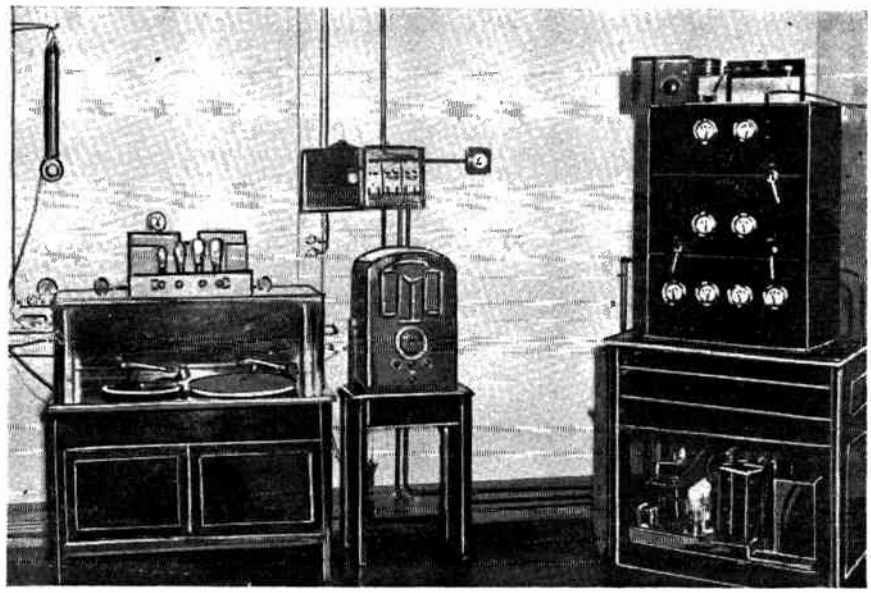
For those fans who do not yet have a QSL-card from HJ4ABA, "Ecos de la Montana" of Medellin, we list the following data which will aid them to hear, and obtain verification from this station. The schedule is from 11.30 a.m.-1 p.m., and 6.30-10.30 p.m., on 11710 kc., or 25.6 metres. Reports should be directed to Sr. F. Cuartas the station manager.

During the past year, station HJ4ABC, "La Voz de Pereira", located in the city of Pereira, Caldas (near Manizales) has provided American listeners with a "catch" difficult of reception. However, a new crytsal-controlled transmitter shown in the accompanying view, has recently replaced the former 50-watt rig, and a new frequency of 6135 kc. is used; reception from this station should prove much better than in previous months, barring interference from other signals. Cesar and Mario Arango M., the station owners, appreciate reports, and answer with an attractive QSL card.

The fifth Colombian district offers a new station, HJ5ABE, "Radiodifusora Colombiana" which operates daily from about 4.30-11 p.m., on a frequency of 14110 kc. Protests made by amateur operators are expected to cause the removal of this commercial broadcaster from within the limits of the 20 metre amateur band, and we may look for HJ5ABE on a new wavelength in the near future. Meanwhile, reports are to be sent to Sr. J. T. Calderon N., at Box 50, in Cali.

A new Venezuelan, YV8RV of Barquisemeto has recently been heard testing on about 51 metres, preparatory to starting regular broadcasts. Best reception has been noted after 11 p.m., but, as no cerification has yet arrived from this station, no official data can be offered at the moment.

We conclude our review of Latin American news with mention of the new broadcaster, VP3MR, "The Voice of Guiana" of Georgetown, British Guiana. Altho this is not truly "Latin American," it is at least South American and will therefore be of interest to U.S.A. fans, particularly so, in as much as it will offer many a chance to log a new country on phone! A recent veri-card lists the station frequency as 7080 kc., and the schedule as follows: Monday, 3.45-4.45 and 6.45-7.45 p.m.; Wednesday, 6.45-7.45 p.m.; Thursday, 5-6.45 p.m.; Sat., 6.45-7.45 p.m., and Sun., 7.45-10.15 a.m., EST.



STATION TIEP—"LA VOZ DEL TROPICO"

Above—the transmitting equipment of station TIEP "The Voice of the Tropics", San Jose, Costa Rica. This station works daily on about 6700 kc, (although listed as "6710") relaying the programs carried by the "long-wave" station on 850 kc. TIEP is a member-station of the Cadena Indo Latina de Estaciones Radiodifusoras, an association of Latin-American broadcasting stations. Eduardo Pinto H., the station owner, often changes the frequency of the transmitter into the 40 meter "amateur band", after the scheduled broadcasts are concluded. The call used on this wavelength (7238 kc.) is TI2EP.

Another interesting Latin-American s-w broadcasting station, with view of the studio.

ENGINEER USES RADIO TO CALL DAUGHTER FROM PLAYGROUNDS

● JEAN DARLINGTON, five-year old daughter of a General Electric engineer, who has been identified with acoustical equipment since her earliest days when her daddy built in her bedroom a system which automatically turned on a phonograph to quiet her on waking moment, now uses a small portable *short-wave* radio to keep in touch with her father when she is away from home.

Like Mary with her lamb, no matter where little Jean wanders the radio is sure to go. She trails it behind her in a small cart. When the engineer desires to call her from play in the neighborhood of Scotia, N. Y., he puts through a call with his amateur transmitter. The receiver is permanently tuned to his station and is in constant operation so that his daughter hears him as soon as he begins talking. Being an obedient little girl, she returns home.

"Policemen in Scotia never worry about Jean getting lost when she has her radio receiver with her," Mr. Darlington says. "This radio system might prove helpful to worried mothers in sending out a general call for their tardy children to hasten home." Soon he expects his radio to send Jean on errands without first calling her home.

This receiving station owned and operated by Mr. A. J. Webb of England, consists of a 6-tube Pilot super-het and an English HMV 5-tube super-het. By careful tuning a total of 32 "DX" stations were received by Mr. Webb.

TUNING IN THOSE "DX" STATIONS

By G. W. SHUART, W2AMN

The proper operation of a short-wave receiver is the determining factor in pulling in weak and distant stations. Read this article carefully and improve your DX'-ing.

● EVERY day our mail reveals a number of letters from readers asking the same question, *"Why can I not receive the distant stations that other fellows are receiving?"* In other words, a good many readers find it impossible to pull in those weak "hard-to-get" DX stations, while others are just blessed with stations from Japan, China, Africa, and other far distant countries.

In the past the first answer has always been—"Your location is not as good as their's." However, experience has proven that there are very few really *poor* locations, that is, locations where it is impossible to pull in very many short-wave stations. Of course, the location can be either a noisy or a quiet one. If you are bothered with a tremendous amount of man-made interference, such as that coming from electric devices, power lines, and what not, you are really in a tough spot so to speak.

True, modern engineering has devised antenna systems which go a long way toward reducing man-made interference, but it cannot be entirely eliminated if the source of the noise originates at some point quite remote from your set. Probably the most truthful answer to the question in the opening paragraph is—*"You are not carefully tuning your receiver"*—considering, of course, that the receiver is one of efficient and modern design.

The writer recently spent several hours tuning across the various short-wave broadcast bands and, after listening for about fifteen minutes, was just about ready to give up and call the band "dead" for the evening. However upon turning up the volume control and tuning *carefully* across the band, several weak carriers were heard.

Spending about one minute with each station, it was possible to bring them in with full speaker volume and really an enjoyable program could be heard, and the above experience is what prompted us to write this story.

If you own a modern super-heterodyne receiver, you are probably more apt to pass over more stations than with the simpler regenerative receivers. The superheterodyne tunes *extremely sharp* and as the dial is rotated rather swiftly, a station will bring forth nothing more than a mere click from the speaker when you pass over it. With the regenerative receiver, however, usually the set is oscillating and a squealing sound will be heard as each station is passed. A good many of the new superheterodyne receivers are equipped with what is known as *beat oscillators*, which also produces a whistling sound as the stations are tuned in, much the same as that heard on the regenerative receiver. This, needless to say, is a tremendous aid in tuning in the weak stations.

There are commercially available at the present time, *beat oscillator* units which can be attached to super-hets which are not already equipped with one, designed especially to aid the short-wave "Fan" in his etheral journeys.

Commercially available beat oscillator which can be used in conjunction with any super-het as explained in this article.

If you are operating a regenerative receiver, adjust the generation control until a squealing sound is heard on each short-wave station; then tune across the dial and if a station appears on the dial, the regeneration control should be *backed off* or retarded slightly until the whistling or squealing sound disappears. The main tuning dial should then be readjusted slightly in order to clear up the speech or music, whichever the case may be.

There is really no more in the tuning of the regenerative receiver. Some of them have what is termed an *antenna trimming* condenser. In this case, of course, an adjustment can be made to increase the antenna coupling and consequently increase the signal strength. This also requires a readjustment of the main tuning dial, however, the antenna condenser should not be adjusted to the point where the receiver becomes very *broad*, because considerable interference from stations operating in an adjacent channel will be experienced.

The superheterodyne provides "real comfort" one might say in short-wave reception, because on it we may have gain controls, that is, sensitivity controls manually operated or automatically operated. Tuning controls and, as previously mentioned, a *beat-oscillator* to provide an audible sound when tuning in a station with no modulation. In adjusting the "super-het" the volume control should be turned on just enough to allow a general rushing sound caused by atmospheric disturbances or other electrical discharges and tube noises in the set to come through. If these noises are too harsh to allow sufficient pick-up, the *tune control* may be adjusted to attenuate or decrease the high-pitched noises and in most cases will cut down the back-ground hissing and crackling noises at least 50%. The main dial should be rotated *very, very slowly* because of the very selective qualities of the "super-het."

A station *may easily be passed* and

(*Continued on page* 239)

UNUSUAL Short-Wave Experiences

By PAUL B. SILVER

● ONE night when the German Leviathan of the seas, the steamship *Bremen*, was making one of her trans-Atlantic crossings, a radio call came for help from an English freighter in distress. It was this S.O.S. which the *Bremen's* master answered. I heard the giant *Bremen* answer and subsequently obtained a verification from her, and have it framed among the other verifications I have received. It is one of my most prized verifications. The powerful radio-telephone transmitter of the *Bremen* enables it to work with Ocean Gate-WOO, Rugby, England-GBC, and Norddeich, Germany-DAF, during the entire trip. Her call is DOAH.

The Pan-American Clipper: On April 16th, at 6:50 P.M., E.S.T., the Pan-American Clipper roared over the Golden Gate, San Francisco, on the first flight to Hawaii. It was a long

Here's Paul Silver's Short-Wave Listening Station, located in a New Jersey town not far from New York City. Several short-wave receivers are used at this station, and Mr. Silver has verifications galore from practically every country on the globe.

flight, with 2,301 miles of weary flying ahead for the six officers. They were Edwin C. Musick, Captain of the Pan-American Clipper; R. O. D. Sullivan, First Officer; Fred J. Noonan, Navigation Officer; V. A. Wright, Engineering Officer; Harry R. Canaday, Junior Flight Officer, and W. T. Jarboe, Jr., Radio Officer. The Clipper was flying along at 126 miles per hour. A thrill ran up my spine you can bet as someone said—"This is the Pan-American Clipper"! After 17:54 hours the Clipper came to rest in Hawaii. A record for flying and I believe a record for short-wave reception. I received a letter of verification and also a picture of the ship and each one of her officers.

The Nairobi, Kenya Colony Station: The right name of the station is Cable and Wireless, Limited, Nairobi, Kenya, Colony, Africa. The call is VQ7LO. I have heard this station several times and here are the transmission times, expressed in E.S.T.

Monday 5:45 A.M.-6:15 A.M.; 11:30 A.M.-2:30 P.M.

Tuesday 5:45 A.M.-6:15 A.M.; 8:30 to 9:30 A.M.; 11:30 A.M.-2:30 P.M.

Wednesday 5:45 A.M.-6:15 A.M.; 11:30 A.M.-2:30 P.M.

Thursday 5:45 A.M.-6:15 A.M.; 8:30 to 9:30 A.M.; 11:30 A.M.-2:30 P.M.

Friday 5:45 A.M.-6:15 A.M.; 11:30 A.M.-2:30 P.M.

Saturday 11:30 A.M.-3:30 P.M.

Sunday 11:00 A.M.-2:00 P.M.

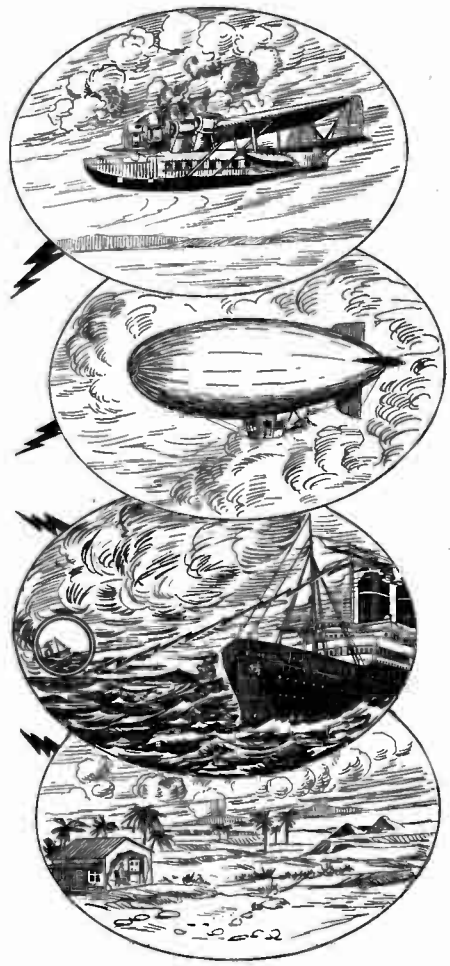
It is on 49.5 meters or 6060 kc. As it is situated only a few degrees from the Equator, that is really an unusual short-wave verification for summer-time transmission.

Another thrill via Short Waves was the reception from a Goodyear airship flying over Washington, D. C. The airship was the "*Enterprise*," a non-rigid blimp. Power for the transmitters on the airship is furnished by two dynamotors, battery driven from a 12 volt battery.

A quite unusual short-wave listening experience occurred a few weeks ago when the Empress Menen of Ethiopia, broadcast a speech on peace to American listeners by short wave. The speech of the Empress was translated into English by her daughter. A recent talk enjoyed on short waves came from Geneva and a short-wave talk heard by many and ante dating the Empress's talk emanated in Ethiopia. Also on Sept. 13 two short wave transmissions from Ethiopia took place, one of them from the King.

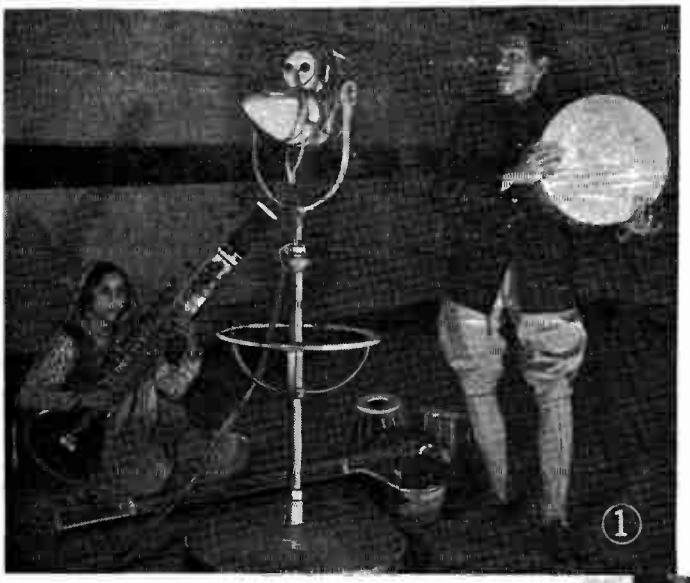
What is the greatest thrill you ever experienced on short waves? If we receive a sufficient number of exciting "short-wave thrills" in time for the next number, we shall be very glad to start a new department just for these "thrills" alone. All articles accepted and published will be paid for at regular space rates. Undoubtedly, you have had at least one good thrill while listening to short-wave stations, so sit down and write the Editor, and tell him about it. If your letter contains an unusual thrill, and it need not require a lengthy description, send it to the Editor—"Short Wave Thrills," in care of this publication.

Hints on Efficient Reception: I have tried to give you some of the unusual happenings that one receives on short-waves. The short-wave receiver is a queer instrument. First of all remember you can't pull in short-wave stations reliably on "any old aerial"! The



thing to do is get the aerial that "matches your set." If you use an RCA set, use the RCA aerial; or if it is a Philco set, use a Philco aerial. The average "DX'er" does not know more about his set than the manufacturer of the set, so why not use that which research has proved to be the best that is, a set and aerial that "exactly match."?

The FOREIGN SHORT-WAVE STATIONS PRESENT



Surya Sena and Nelun Devi, his wife, famous Singalese artists, broadcast recently from the B. B. C. short-wave stations. Note the unusual instruments these artists use, which resemble "over-grown" guitars.

Below—U. S. S. R. short-wave artists of the State Theatre at the microphone. Drama and comedy are thoroughly enjoyed in the land of the Soviet, as well as the many musical programs which are broadcast.

Radio dramatics seem to be on the increase in the U. S. S. R. and reports from listeners indicate that more people are daily picking up the short-wave stations operated by the Soviet Government. The photo below shows members of the Dramatic Theatre named after Vakhtangov, and the artists before the microphone are Derjavin, Schuken, Manssurova.

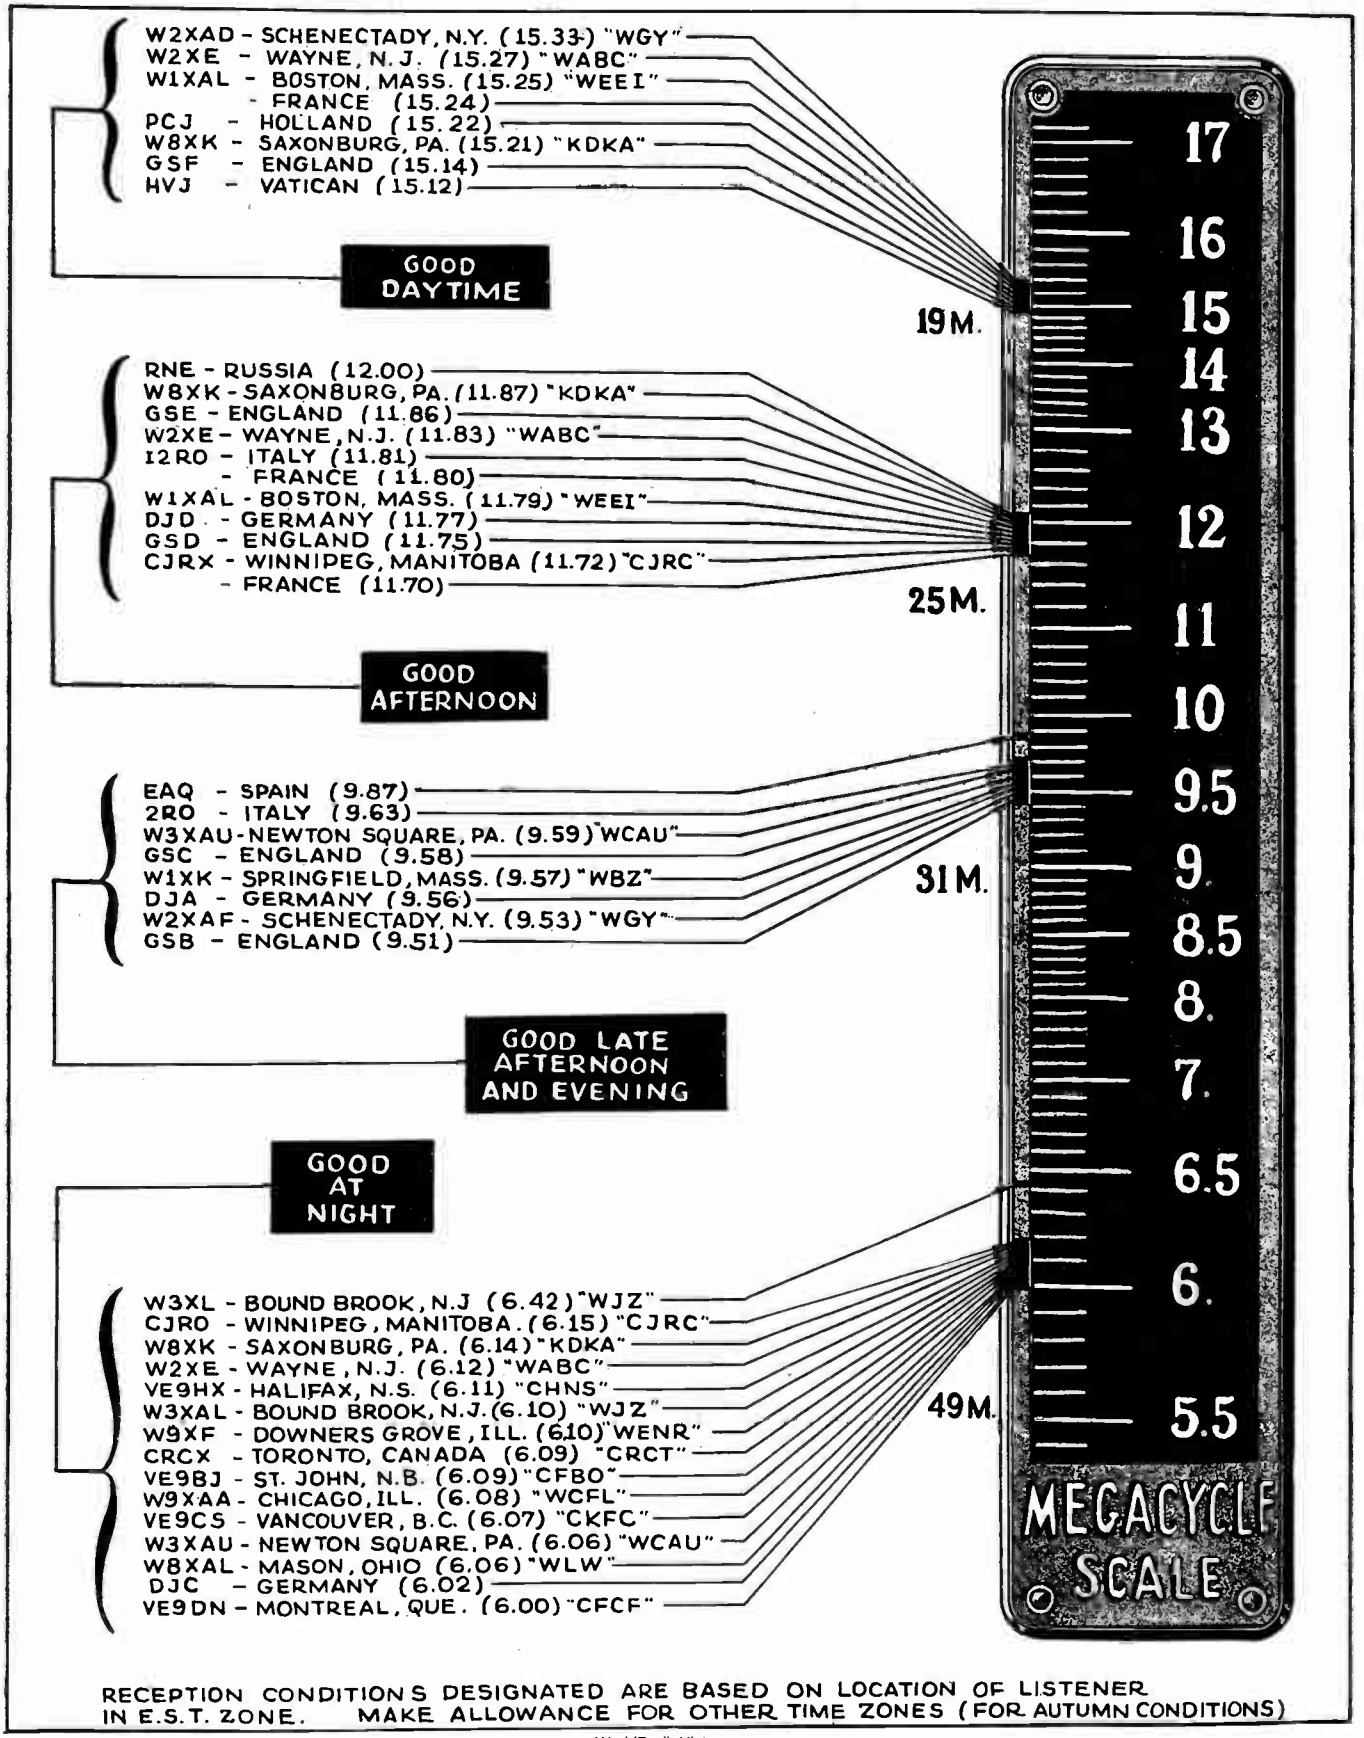
Right—Miss Lily Filotas, one of the charming lady announcers heard by American listeners who tune into the Hungarian short-wave stations. It seems that in Hungary lady announcers are very popular.

Below—Ben Williams, the Welsh operatic tenor, whose recitals are heard over the station 3LR, located at Lyndhurst, Victoria, Australia. As reported in the last issue of this magazine, quite elaborate musical programs have been arranged by the Australian short-wave stations.

Fig. 3 above — Jim Davidson, conductor of the Australian Broadcast Commission's dance band, which broadcast frequently over station 3LR.

Fig. 5 above — Ella Némethy, popular opera singer, who broadcasts over short-wave Hungarian stations.

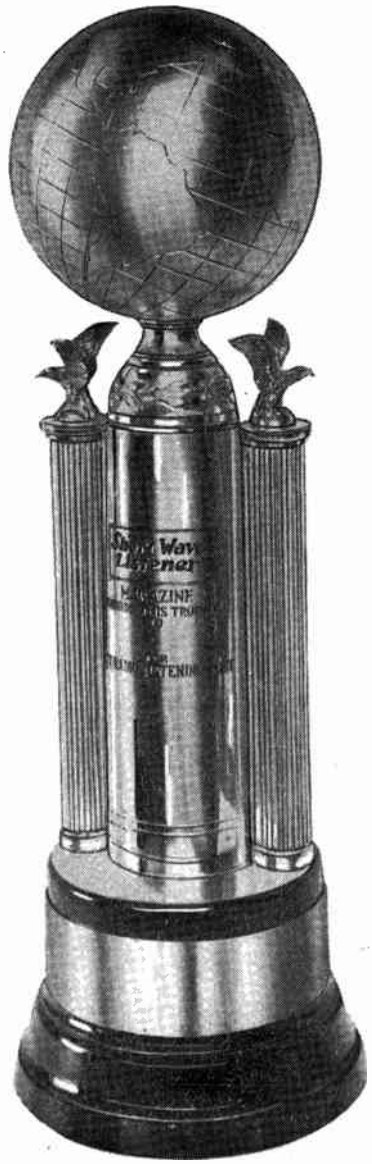
Where S-W Stations Appear on Your Dial



Win This Silver Trophy

Fourth Trophy Award to Joe Ficere, Long Beach, Calif.

The handsome Silver Trophy, illustrated here, will be awarded to the person sending in what appears to be to the judges the most interesting photograph of their short-wave listening post. The rules for this contest provide that the Trophy shall be awarded only for the BEST photo of listening post apparatus or set-up, and is not concerned with amateur TRANSMITTING stations. Those owning transmitting stations may enter such photos in the monthly contest sponsored by SHORT WAVE CRAFT magazine. This Trophy is a handsome specimen of the silversmith's art and was designed by a leading New York Trophy Manufacturer. This beautiful silver trophy stands 19½ inches high and is symbolic of the art of short-wave listening.



Here is the new design of Silver Trophy which the Editors will award for the best "Listening Post" photo. Isn't it a beauty! This new contest will cost you practically nothing to enter and you have a very fine chance of winning this handsome Silver Trophy. The editors will award one of these Silver Trophies for the best "Listening Post" photo submitted by the readers of the OFFICIAL SHORT WAVE LISTENER magazine.

For the Best "Listening Post Photo"

Rules For Short Wave "Listening Post" Trophy Contest

● THE editors of the OFFICIAL SHORT WAVE LISTENER magazine feel sure that our readers will be greatly pleased with this announcement of a brand new "Trophy Cup" Contest, in which the handsome silver trophy here illustrated, will be awarded to that Short Wave Listener who submits the best "Listening Post" photo.

Here are some of the points on which the "Listening Post" photos will be judged by the editorial staff: The photo must be clear and preferably not smaller than 5 x 7 inches, although 4 x 5 inches will do if the photo is particularly clear.

If possible try to have the photo show the owner or operator of the "Listening Post" appear in the same picture with the receiving apparatus, although a separate photo of yourself will do, of course.

Not only will the photo be judged for the quality of the photograph itself, but also for the ingenuity shown by the owner of the station in a neat and orderly arrangement of the receiving apparatus.

Do not write descriptions on the back of the photo, but simply place your name and address on the back of it or on the photo mounting.

All descriptions of Short-Wave "Listening Posts" should be typewritten or else writtin in ink, well spaced so that the editors can read them quickly. Do not send "pencil-written" descriptions and moreover keep the description of the station and the results you have obtained as brief as possible; usually 300 words is plenty.

Describe your aerial briefly with its dimensions, and particularly tell in what geographic direction it points, north, south, etc. Also mention where it is located such as above any roofs, trees, or other objects, and what form of lead-in you employ.

The announcement of the fourth Trophy Award for the best Short-Wave "Listening Post" photo appears on the opposite page. Entries for the next contest will be accepted up until November 15th, 1935.

The editors will not be responsible for any photographs or descriptions of "Listening Posts" which may be lost in the mail or otherwise, and return postage should be included with the photos if they are to be returned.

All members of the OFFICIAL SHORT WAVE LISTENER MAGAZINE'S editorial and business staff are excluded from this contest, as well as any members of their families.

In the event of a "tie" between two or more contestants, the judges will award a similar trophy to each contestant so tying. Please remember that this contest for the best Short-Wave "Listening Post" photo is purely an amateur or experimenter's proposition, and all commercial short-wave receiving stations are excluded.

The best "Listening Post" photo will also be judged not because of the fact that a handsome array of expensive short-wave receiving apparatus has been assembled for the picture, but the "pedigree" or "DX" reception results will also be carefully scrutinized by the judges. The board of judges for this contest will be the Editors of the Official SHORT WAVE LISTENER magazine.

Address all entries to this contest to: LISTENING POST CONTEST, care of OFFICIAL SHORT WAVE LISTENER MAGAZINE, 99-101 Hudson Street, New York.

Fourth Trophy Award to Joe Ficere

Editor, SHORT WAVE CRAFT:

● I am enclosing a picture of my S.W. Listening Post. The set in the picture is a Breting 12, which has a frequency range of 32,000 kc. to 550 kc. in five bands. It has a beat oscillator, crystal filter, "R" meter, Voltmeter, and band-spread. There is also a communication switch, which disconnects the audio amplifier from the set, and connects it to tip-jacks in the rear and can be used for transmitting. The speaker is a 12" one, mounted on a 2 x 2 ft. celotex board. Phones, when used, cut out the speaker.

As you can see by the photo, I constructed the antenna tuner described by George Shuart in the April issue of *Short Wave Craft*. I am using the 76 ft. doublet with 50 ft. transposed feeders, antenna running N. and S. I want to say here and now, that anyone who thinks this "rig" doesn't work F.B. (Fine Business) is very, very wrong. I have done wonders with it, and the switches on the board below it, allow me to by-pass it at will, and when I do, I get static and the station comes in very badly.

But, when I cut the tuner back in—Oh, boy! I also have another antenna, an R.C.A. running E. and W., and I find that when I figure out a station's direction I can get fine results from either. But the *tuned antenna* gets them from anywhere!

I have only had this set ten weeks, and it sure is fine for DX (Distance) in conjunction with the Shuart tuned antenna circuit. The cards and letters of veris I have now were obtained with an eight tube set last year, but in two weeks, I have received, JVM, N-H-JYS, French, Englisn, and German stations, Java, Australia, Fiji Islands, Siberia, Cuba, and practically every country in South America. I also had ZHJ, Penang, Malaya. FZR also comes in here, Phoenix, Ariz., and Paris, France, in the early morning.

The veris I have now include Japan, England, France, Spain, Cuba, all Australians, Canada, Panama, Costa Rica, Peru, Ecuador, Brazil, Venezuela, some Colombia, and United States.

I have been reading *Short Wave Craft* since last September, and won't be without one. I get tired of waiting for the newsstands to get them, so I subscribed. It is the best short-wave magazine on the market, and more than once have I found valuable information in it, that helped me out of a fix. More power to *Short-Wave Craft!*

The short-wave Listening Post of Joe Ficere, Long Beach, Calif.

I am studying for a "Ham" (transmitting amateur license) ticket and am looking over your Xmitter hook-ups,

From "The Valley of Wild Ducks"

● HERE is the photo of my "Listening Post." I have read *Short Wave Craft* for the past 1½ years and enjoy reading it very much. Sure can get lots of good information out of it. I never missed a single copy of it.

I use a Sargeant 8-34 Super-het (all-wave) which works very well on the 20 meter phones—Hi, Hi. I have listed about 1178 amateurs and DX stations. I am a member of the *Short Wave League, International Broadcasting Club* (London) and R9LL. I'm also acting as an Official Short Wave Observer for California (for *Short Wave Craft* and *Radio News* magazines.)

I have about 51 pen pals in U. S. A. and 10 abroad. I have exchanged cards with many foreign SWL's and "Hams." My famous "Duck" card is just above the alarm clock.

'California Duck" (that's me) is 24 years old, 5 feet 7½ inches tall and weighs 140 pounds, have black hair, American born Japanese, graduate of

SG'T. DENT, INDIA, A "REAL" LISTENER

Editor, SHORT WAVE LISTENER:

I am sending a photograph for your "Listener's Shack" Competition, and hope it will be O.K. Here are a few details of the shack:—It is situated on the rear verandah of the Police Quarters, and the set used is a Philco 16B, in a cabinet designed by myself to stand the moving about that it has to be subjected to, due to my transfers to other stations. I have made the whole affair, with a space at the bottom for records, etc., but being so interested in Radio, I rarely use the built-in phonograph.

All reception is on a loud-speaker, and the set is now 18 months old. I am sit-

All the Way from India

From far-away India—Sergeant H. J. Dent and his short-wave listening post. He has heard 40 countries!

Two New Aerials

To Help Catch Those "DX" Signals

Two of the newer short-wave receiving aerials which are of particular interest to short-wave "Fans" intent upon hearing the foreign stations are those described and illustrated here. A considerable gain in signal strength is obtainable with either of these aerials and the choice will depend a great deal upon the location.

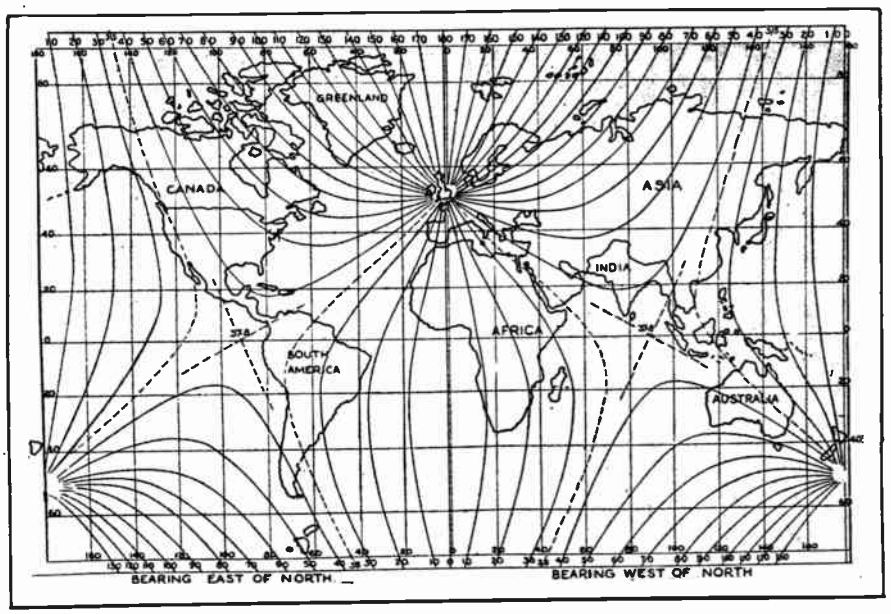
● ONE of the newest type receiving aerials is known as the Rhombic or horizontal diamond and it is shown in one of the accompanying illustrations. With this type of aerial the most important factors are: its height above the ground "H", the angle "A" between the two legs composing each side, and the length of each of the four legs of the antenna and designated by the letter "L".

The direction of maximum reception with this type aerial is indicated by the arrow on the diagram and it is opposite to the end from which the twisted pair lead-in is taken. As pointed out in a recent article by James S. Carver in the New York SUN, (see also original article on the Rhombic and Bruce antennas in the October 1932 issue of *Short Wave Craft*). The table of dimensions given for the Rhombic antenna will enable the reader to judge which size of antenna he can erect in his particular location. It will be noted from the table of dimensions that when the length of the one of the four sides, "L", is made small, the height above the ground "H" also becomes smaller, for a given wavelength.

The dimension "H" is the average height of the horizontal wire above the effective ground. What is known as the *tilt* angle "A" is shown in the diagram, and this factor determines the vertical directivity of the aerial. The front end of the Rhombic antenna ends in a non-inductive resistance as shown in the detail drawing.

The directivity of the aerial must be arranged so that its front end is pointed geographically toward the station which one desires to receive. London lies north 50 degrees and 10 minutes east from New York and the axis of the antenna (X-XI) should lie in that direction, facing London. The accompanying map will also aid in properly locating and pointing the antenna toward the Daventry station. The direction for other stations can be determined by use of a large globe.

The larger and higher the antenna the more effective the results, but an aerial selected for reception on the 25.5 meter wavelength would also prove very favorable for other wavelengths, such as the 19.6 or the 16.7 meters. For the Rhombic antenna the tilt angle "A" should be 72 degrees and the lead-in to the short-wave receiver from one end of the Rhombic or horizontal diamond antenna may be a twisted pair of insulated wires or Lynch *giant killer* cable.



A map of the world, the curved lines on which show the bearing or the direction of the Daventry (England) short-wave broadcasting station from any point.

A transposed lead-in line is best employed for the vertical diamond (inverted "V") antenna shown in the second illustration. A table of figures or dimensions is also given in connection with the vertical antenna for different wavelengths.

The measured performance of the inverted V antenna, when designed for 17 meters and using a mast 42 feet high, was determined to be approximately five times that obtained with an ordinary antenna on 17 meters! A gain in signal strength of about three times was obtained on 20 meters, and on 25 and 30 meters a gain of from 2 to 1½ times in favor of the inverted V aerial was found. Note that when using the inverted V antenna that the end most remote from the receiver is terminated through non-inductive resistance of about 400 ohms, which is connected to ground (a pipe driven in the ground, for example).

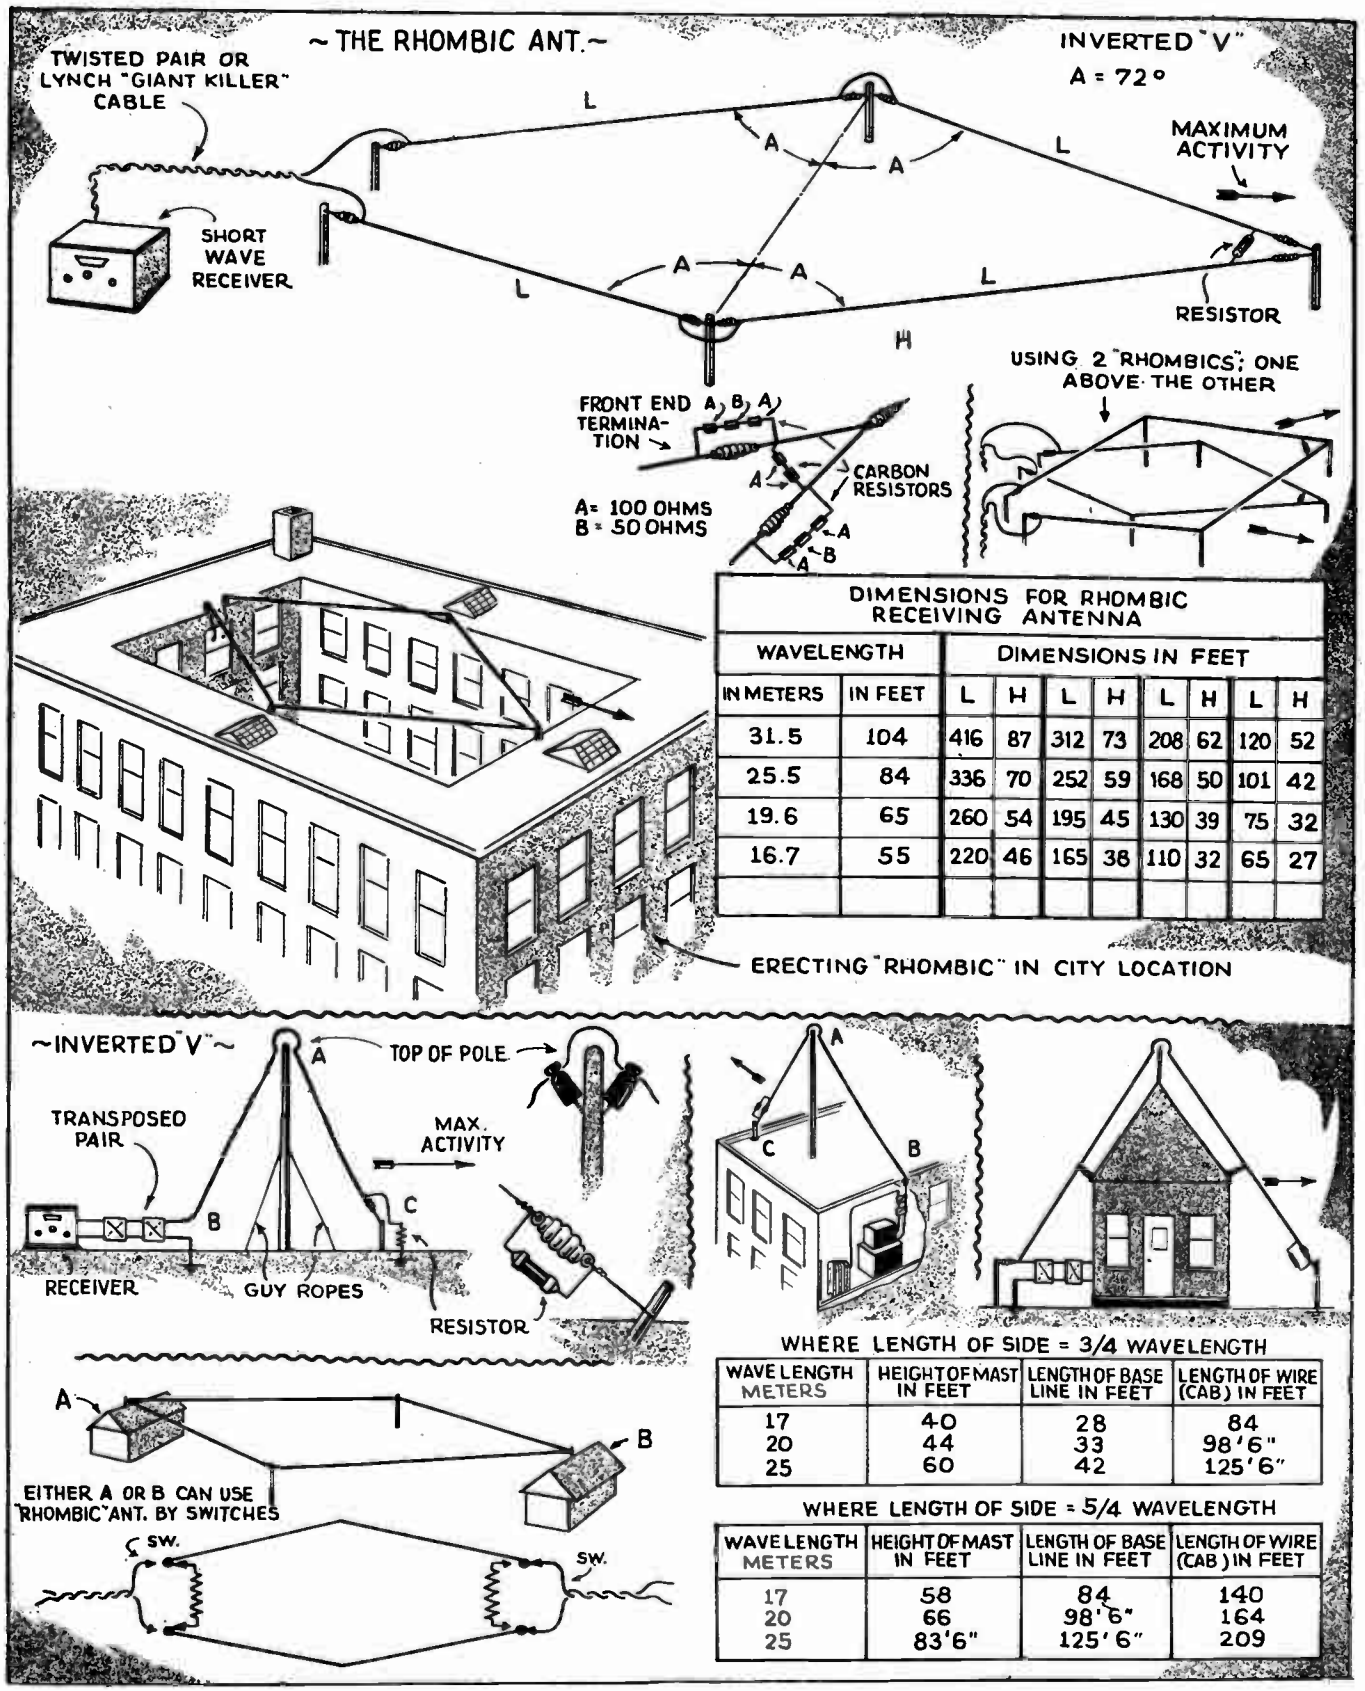
At the end of the transposed feeder line a suitable coupling transformer may be employed or else the two connections may be made to the aerial and ground post on the receiver, where the set is designed for use with a *doublet* antenna. When the inverted V aerial is properly arranged, it is *directional* and stations are received best which lie in a line with the plane of the aerial and the signals from which first strike that end of the aerial where the 400 ohm resistor is located.

Referring to the special chart showing the direction in which an inverted V aerial, for example, should be pointed in order to be most receptive for the British Broadcasting station in Daventry, or stations in that general vicinity, (including Berlin) this chart has been especially drawn by engineers of the B. B. C. to show the lines bearing on Daventry.

Lines have been drawn for every 10 degrees of bearing. Additional lines for a bearing of 35 degrees are shown to fill in a region in which the lines are otherwise somewhat wide apart, and the 37.8 degree bearing line is also drawn, as this line follows a peculiar path.

While the above lead-ins and those shown in the drawings are undoubtedly the most simple to construct, a better match between the lead-ins and antenna will be obtained by using a pair of No. 14 wires with a spacing of about 1¼" between them, (wooden or isolantite spreaders may be used). The wood ones should be boiled and paraffined to make them weather-proof.

Have You Tried the Rhombic or Inverted "V" ?



DIMENSIONS FOR RHOMBIC RECEIVING ANTENNA

WAVELENGTH		DIMENSIONS IN FEET							
IN METERS	IN FEET	L	H	L	H	L	H	L	H
31.5	104	416	87	312	73	208	62	120	52
25.5	84	336	70	252	59	168	50	101	42
19.6	65	260	54	195	45	130	39	75	32

S. W. Station Time Graph

(1) Each square under the hours represents one hour. For example: A line drawn through all the squares from 7 A.M. to 5 P.M. means that the station broadcasts from 7 A.M. to 5 P.M. Note the indication of time on the air opposite Station OCJ, 15.62 megacycles, Lima, Peru, S. A. Under the days of the week at the right of the graph, there appears the word "Irregular"; in some cases a line indicates what days of the week the station is on the air.

(2) If a station broadcast on different hours of the day on the same day, note how this is indicated for Station CEC, 19.69 MC, San Diego, Chile, S. A., this station being on the air for one hour between 11 A.M. to 12 noon, and from 4 to 5 P.M.; and the station broadcasts every day in the week.

(3) This chart is based on Eastern Standard Time; Central, Mountain and Pacific Time is given below the Eastern Standard Time. By blocking out all of the time lines except the one for your location, the chart will then be correct for your station.

The Listener Speaks

● In this department we will print in each issue letters from short-wave listeners of value to all readers. We are particularly interested in those that have constructive criticisms and information that may be of value and help to other short-wave listeners. Only those letters which are deemed of sufficient importance will be printed here. It makes no difference whether your letter is laudatory or whether it contains a "brickbat," it will be published just the same, as long as the information is deemed worthy.

Address all communications to THE LISTENER SPEAKS, care of THE SHORT-WAVE LISTENER, 99-101 Hudson Street, New York City.

Who Said "Code Hogs"!

Editor, SHORT WAVE LISTENER:

In your department, *Our Readers Ideas*, I have just read a letter in which the writer voices his thorough disgust of short waves; due to what he calls "Code Hogs", the code stations that he claims blanket the broadcasting stations. I was pleased to see that you came to the fore and defended short-wave broadcasting from such a silly condemnation. By tuning in numerous "foreign" broadcasting stations on a simple two-tube short-wave receiver, *I have proved to my own satisfaction that his accusations are wholly false!* Furthermore, he is wrong in stating that there is no international authority controlling the frequency assignments of stations. There is such an authority which assigns various portions of the short wave spectrum to various services, such as: broadcasting, amateur, mobile, and radiotelephone. When one considers the vast services performed by the code stations, he would not begrudge them the occasional interference that they might cause. The condition that the aforementioned writer claims exists on the short waves is an extremely exaggerated one, and so misleading to the novice, *that it should never have been written!*

ROBERT CURTIS,
181 Washinton Street,
Barre, Vermont.

(*Experience seems to prove that you are correct.—Editor*).

Capt. Jernigan Speaks His Mind!

Editor, SHORT WAVE LISTENER:

As I understand the Listener is OUR paper and in addition I am a subscriber to the *Short Wave Craft*. I crave your indulgence long enough to concur in the "Constructive criticism" by Jack Wasley Polick in the June-July issue where he recommends a "Ham" exchange classified page at reasonable rates and the changes from meters to megs., my amendment being that *both* meters and megs be quoted as many of us are not apt mathematicians and our short-wave or all-wave radios are not marked for anything excepts megs and kilocycles.

Now just a few words about aerials or antennas. I live on U. S. route 23 where from one to a dozen cars and trucks pass every 30 seconds by the watch. My radios and residence location is about 75 feet west of this thorofare and as I am quite a S.W. fan I am bothered often to a point of desperation and for the past two years have spent a "fortune" on the many kinds of popular makes of radios and noise-killing antennas and have about come to the conclusion that it is all "Hooey" and that one is about as good as the other as far as man made static is concerned. If your machine is properly aligned, balanced, tubes good and tone control properly adjusted you'll get just as good reception from one, with the exception of possibly a directional difference, as with the other and I have tried conventionals of all lengths, heights and direction, doublets, double-doublets, Tees, Ells, V's, cages of all lengths, verticals and diagonals, together with static filters and everything I have been able to get my hands on, to try to stop this nerve-racking auto noise, in which I have graduated to such a point that I can tell you just what kind of a car is coming, whether it is a four, six or eight cylinder or a truck. At times the radio just has to be shut off and to say the least I have found nothing that will stop or filter this noise satisfactorily; what little relief I do get costs so much more "volume" that the game is hardly worth the candle.

For the sake of others that may be in a like position, I will state what I have worked out and which is giving me better reception than I have ever had before. First I set my line on the back of my orchard nearly 200 feet from the road, with masts on the hillside that will level 55 feet high at my residence. From the top of the north pole, I ran a heavy insulated wire broken up by glass insulators every 8 feet, on which I attached a conventional antenna, running it through an insulated ring on top a 55 foot mast and direct to a lightning arrester, then through the wall to a double-throw knife switch. I then extended the heavy wire and insulators 20 feet and attached a double-doublet with 19 foot short-wave end and 46 foot broadcast end fastened to an insulator and coming down in a V through a condenser coupler with twisted pair (one red and the other black wire) both conventional and doublet antennas running 125 feet to the radio the conventional going east and west direct. The doublet runs north and south with 125 feet twisted pair and connects through a regular S.W. lightning arrester to the condenser coupler that has a short-wave and B.C. switch to which the radio is connected and is in turn connected to the double-throw knife-switch, by which means either wire may be used independently, or both of them together.

A test showed some of this noise was coming in on the power line or lighting system on which a grounded filter was attached, along with a voltage control. I forgot to state that the 125 foot lead-in runs 25 feet lower than the conventional wire does.

The advantage of this layout of antenna is that the directional feature is overcome when both wires are used, and in acting singly one can at times get better reception in this manner, but my tests show that one wire is just as good as the other, when used singly as may be shown by the throw of the knife switch. However there is often an improvement when both are used simultaneously, but at times one of them gives just as good reception as both, but one is no better than the other, so again I say I have about come to the conclusion that this killing of man-made static is all "Hooey".

The best thing of all is a good ground. If I had to take my choice between a good antenna and a poor ground, or a good ground and a poor antenna, I'd choose the latter.

In the June-July *Listener* there is an article on OXY in Denmark, which station I have never been able to get in my life on any radio, and in all the reports of the listening posts, I have never seen any record of their having received it.

What's wrong with London (Daventry) and Germany in the forenoons? For the past 30 days I have not been able to get them before 2.00 P.M. and that was Germany on special broadcast. I haven't heard "Big Ben" in the morning in so long that I have about decided he is dead.

By the way, that is rather a nifty dial on the European all-wave receiver. Why can't we have something like it?

That "Locating stations in a jiffy" is one of the best things that has ever been printed in either the *Listener* or the *Craft* and by the way, to those making reports from listening posts, let me suggest that when you report stations, why not state the *time* you received them? Gracias Senores. Adios Amigos.

CAPT. F. A. X. JERNIGAN,
Commander, U. S. W. V. No. 22,

(*Thanks for your ideas, Captain, and we intend to discuss the "ham" exchange classified "ad" idea with our Advertising Department.—Editor.*)

OUR

A "Bouquet" and a "Brickbat"

Editor, SHORT WAVE LISTENER:

"In response to your request for helpful criticism, as voiced in the June "*Short Wave Listener*", I am pleased to forward to you through this letter my impressions upon and criticisms of the "*Short Wave Listener*".

I was unusually impressed upon the neatness and clear-cut appearance of the magazine. The illustrations are numerous and attractive, and they are well balanced to assure the pleasing touch to the reader's eye.

The grand list of short wave stations was helpful, especially the list of stations alphabetically arranged. I believe that this is the first time I have ever seen short wave stations arranged in this manner, and it is very helpful to the average short wave listener.

The photographs of "BBC" artists and descriptions of various foreign short-wave stations were interesting, and provided reading that is not available in other magazines of this type.

I do think you should be more careful in editing stories submitted to you. For instance in the June number, page 95, in "Why I Couldn't Do Without Short Waves", the writer says, "When the Australian stations open . . . with a few bars of "God Save The King," I am always reminded of the nearness of our relationship, realizing that the refrain is the same as our National Anthem." Any school boy can tell you that "The Star Spangled Banner" is our National Anthem, and not "America", the Americanized version of "God Save the King." This may seem a small point to the Editor, but little slips like this loom large in the reader's mind. (*Thanks—Editor.*)

Call letters and locations of radio police stations also should be included in the lists. I spend much time listening to these thrilling stations, and I feel that most any short-wave "fan," like myself, would appreciate seeing an accurate and up-to-date list of these stations included in the next issue of "*Short Wave Listener.*"

I hope that my few suggestions and comments have been of help to you in improving upon your magazine, although, other than the few points I have outlined, there is little room for improvement in a magazine such as yours, which has gained such an enviable reputation in radio circles.

JACK WATROUS,
(Member of the Short Wave League)
La Cavoda Road,
San Mateo, Calif.

(*Thanks a million, Jack, for the orchids, and we also appreciate your criticism. As there are about* 50,000 *words in an average issue of the magazine, much of which is proof-read under pressure, errors will creep in. Thanks again for your interest.—Editor.*)

He Wants Swappers! Do You?

Editor, SHORT WAVE LISTENER:

I have just made the Doerle A.C. receiver using a 57 and a 56 and I have received GSV in Daventry, England; GSG, Daventry, England; PHI, Huizen, Holland; HAS3, Budapest, Hungary; FYA, Paris, France; RNE, Moscow, Russia; 2RO, Rome, Italy; CT1AA, Lisbon, Portugal; VK3ME, Melbourne, Australia; and VK2ME, Sydney, Australia. I also have the Globe Trotter, DXer, and a "five meter" set.

I wish you would print more articles on "Fitting up a Short-Wave Listening Den" such as the one on page 60 in the April-May issue and also I would like to see a "swapper list" in this magazine, as well as in the *Short Wave Craft*. But, if you do, please keep it up and not have any person there who doesn't want to write.

I enjoy your magazine very much, and more power to you and *Short Wave Listener*.

I would be pleased to correspond with any *Short Wave Craft* reader or what have you.

EDDIE FAWSETT,
1275 Singletary Ave.,
San Jose, Calif.

READERS

(*We like your idea suggesting a "Swapper List" in this magazine, and we are taking this opportunity to ask that every reader interested in exchanging cards with another short-wave listener, send in his or her name to us on a postcard, marked "Swapper Editor", c/o this magazine. Let's go! —Editor*).

Who Threw That Wrench?

Editor, SHORT WAVE LISTENER:

I noticed in your last issue of O. S. W. L. Magazine that you wanted constructive criticism. Well here it is.

First of all your magazine is not published often enough to be able to bring the up-to-the-minute news to the reader.

I would suggest that you put out a new issue twice a month or at least every month. Also the news printed in one issue should not be older than the date of type setting of the preceding issue. That is to say that if type were set on the first and the fifteenth of the month, the news contained in the copy put out after the fifteenth should not date back further than the first of the month. This is being done now on a monthly basis by a great many magazines, so why can't we go a step further and make a bi-monthly of O.S.W.L. and get ahead of the rest of the magazines. If need be, reduce the magazine to about ¼ the size and devote most of it to S.W. station lists and reports from readers.

There are altogether too many articles describing S.W. stations in one issue. One should be sufficient each month. Or better in one issue describe a S.W. station and in the following issue give us a "fiction" story. When we continue to read the same rot all the time we loose interest. "Variety is the spice of life," you know. I think most of the readers will agree with me on this point.

Secondly your station list should be entirely revised. Organize a chain of S.W. listening posts all over the world. Condense the information supplied to you by these and readers.

The harder "catches" that are not reported, may be put on a separate page along with the schedule obtained from the station.

In your present station list I have noticed many stations that do not exist, have changed frequency and the like but I can not find any information about some stations that I hear most every night; showing how inaccurate your list is.

The "Listening Post Photo" department is the best part of the magazine at present in my opinion.

Someone should be hired to write some articles on how to obtain verifications, give the address of the short wave stations, their identification signals and their relative signal strength.

There also should be more said about the "foreign amateurs" that may be heard on 20 and 40 meter fone.

I would be very glad to help you in any way I am able along these lines.

PIERRE A. PORTMANN,
47-20 48th Street,
Woodside, N. Y.

(*Well, Pierre, we would like to do all of the things that you suggest but at present, as it seems impossible to bring out this magazine monthly, we will have to do the best we can as far as the short-wave station lists are concerned. True, there are many stations appearing on this list that may not be in operation just at the moment, but some of these have a habit of coming back on the air at the most unexpected time, as we have learned in many instances. And then—on our S. W. L. list, you find it!—Editor*).

He Suggest Two Trophies!

Editor, SHORT WAVE LISTENER:

I have read the last two copies of the *Short Wave Listener*," and think it is a fine constructive issue. It has some very valuable, and interesting information.

The "Listening Post Trophy" section is also very interesting, but feel that the listeners on "West Coast" do not have a fair chance at it. It is true

IDEAS

we have the "Orientals" and "Mexicans," but what are their number compared to England, France, Germany, Italy, etc. Usually only the most powerful of these can be heard out West. So why not have an "East Coast" and a "West Coast" Trophy?

JAMES E. MOORE, JR.,
1504 McAllister St.,
San Francisco, Cal.

(*Two trophies! Not a bad idea.*)

A Word from Trophy Winner, Juan Storer

Editor, SHORT WAVE LISTENER:

I feel very glad sending you my photo with the trophy recently won in your "contest" for the *Best Station Photo*, so please find it enclosed with my most sincere wishes for success to this very good magazine, which I shall buy for all the time it will be published, as I read all and every page of its information.

I have received with great pleasure some letters and S.W.L. cards, which I appreciate very much from radio "fans" congratulating me on winning the trophy. Please mention in your magazine that I will be very pleased to receive and answer all letters written to me, and besides that I will accompany my letters with views of Puerto Rico and photos of my Listening Post.

JUAN C. STORER,
Jose de Diego St. No. 1,
P. O. Box 194,
Arechibo, Porto Rico.

JUAN CLOQUELL STORER
Winner of the handsome Silver Trophy for the best S-W Listening Post—See photo of his station in the June-July issue, page 117.

Tried Our "Aerial Hint" Successfully!

Editor,
SHORT WAVE LISTENER:

Since I am a short wave listener and have been looking for new ideas to improve my reception, I have been trying some of the hints that have been published in *Short Wave Listener*. One of these that I tried was the *bed spring aerial* as described in April-May issue. This aerial compared favorably with my "outside" wire aerial. The "bed spring" aerial "brought in" Daventry with a rating of R9 plus, *on a loud-speaker*.

My set consists of a 2-tube Stewart-Warner short wave converter, attached to a 5-tube Crosley broadcast receiver. A loud-speaker is always used!

The size of the bed spring is about 5½ feet by 2 feet (the "day bed" variety), and its direction is East-West.

Why don't short-wave experimental stations give their call letters after they have sent or relayed a feature program? Twice I have heard special features from other countries being sent over short waves, and then picked up by the broadcast stations, and when the program was finished, the short-wave stations would go off the air without signing off, or they would go to the "chopped up' (scrambled) variety of phone conversation. Both times that this happened to me, they were NBC presentations. One of these was from Hawaii, and the other "feature" was from France.

Y. OSCAR JOHNSON,
638 Edel Avenue,
Maywood, New Jersey.

Wants "Ham" Data Published in S.W.L.

Editor, SHORT WAVE LISTENER:

Having just finished my second issue of the best magazine ever published, the *Short Wave Listener*, I would like to have a few pros and cons with you.

In your "How to Get Best Results' department, you spoke about cutting loose the aerial to find the noise. Well, it doesn't work on my set (it is a 6-tube super-het colonial model made by the Graybar Electric Co.). I get more noise than ever.

How about putting a department in the *Listener* for some dope for the beginner who would like to become a "Ham"? Can you publish the requirements to become a licensed "Ham"? Better still, how about making it "The Ham Beginners"—giving all the dope tbe readers write in?

What is the best aerial for an apartment, where you can't use a doublet, etc.?

Why not publish the *Listener* every month. I have run the newsstands "ragged" for the "S.W.L."! Now every time I go near the stands, all I hear is "not yet".

I think your *Grand Short Wave Station List* is just the berries! For a beginner, I sure can find the short wave stations easily. I don't have any aerial, but I get England, Spain and Germany, mostly every night when I come home from work.

Hope to see the *Listener every month.*

A Would-Be "Ham",
WILBUR BLAIR,
1232 Penn St.,
Kansas City, Mo.

(In nearly every case in our experience we have found that when an antenna was disconnected from the receiver, the noise would diminish almost to zero; that is, if the noise was coming from a source outside of the receiver, and not through the power line. If the noise still persisted it could usually be found originating directly in the radio set tself.

For any information regarding amateur or "Ham" apparatus, we refer you to "Short Wave Craft" magazine. You will undoubtedly be interested in knowing that "Short Wave Craft" is now running a series of lessons for the amateur ("Ham"). This will be found under the heading of "Radio Amateur Course"; also some very valuable antenna data is appearing in the current and next few issues.—Editor.)

Free Diagrams!

Editor,
SHORT WAVE LISTENER:

I have just receievd my first copy of *Official Short Wave Listener.*

And enjoy it very much.

It's the magazine we listeners need! It is a great help to us. I have been reading another magazine for the past two years, but it cannot compare with this one.

What we need is a club among the listeners to exchange thoughts, blue-prints, etc. I would like to hear from any listener who has any trouble with his set, and would be glad to give him any information he needs. I will send any one the blueprint of a two tube short wave set, good for two thousand miles, which gives good results

DEAN SHANOFELT,
Box 104, Corsica, Pa.

International Call Letters

Editor, SHORT WAVE LISTENER:

I have just started in short waves, but your "mag." favors both the beginner and the dyed-in-the-wool short wave "fan".

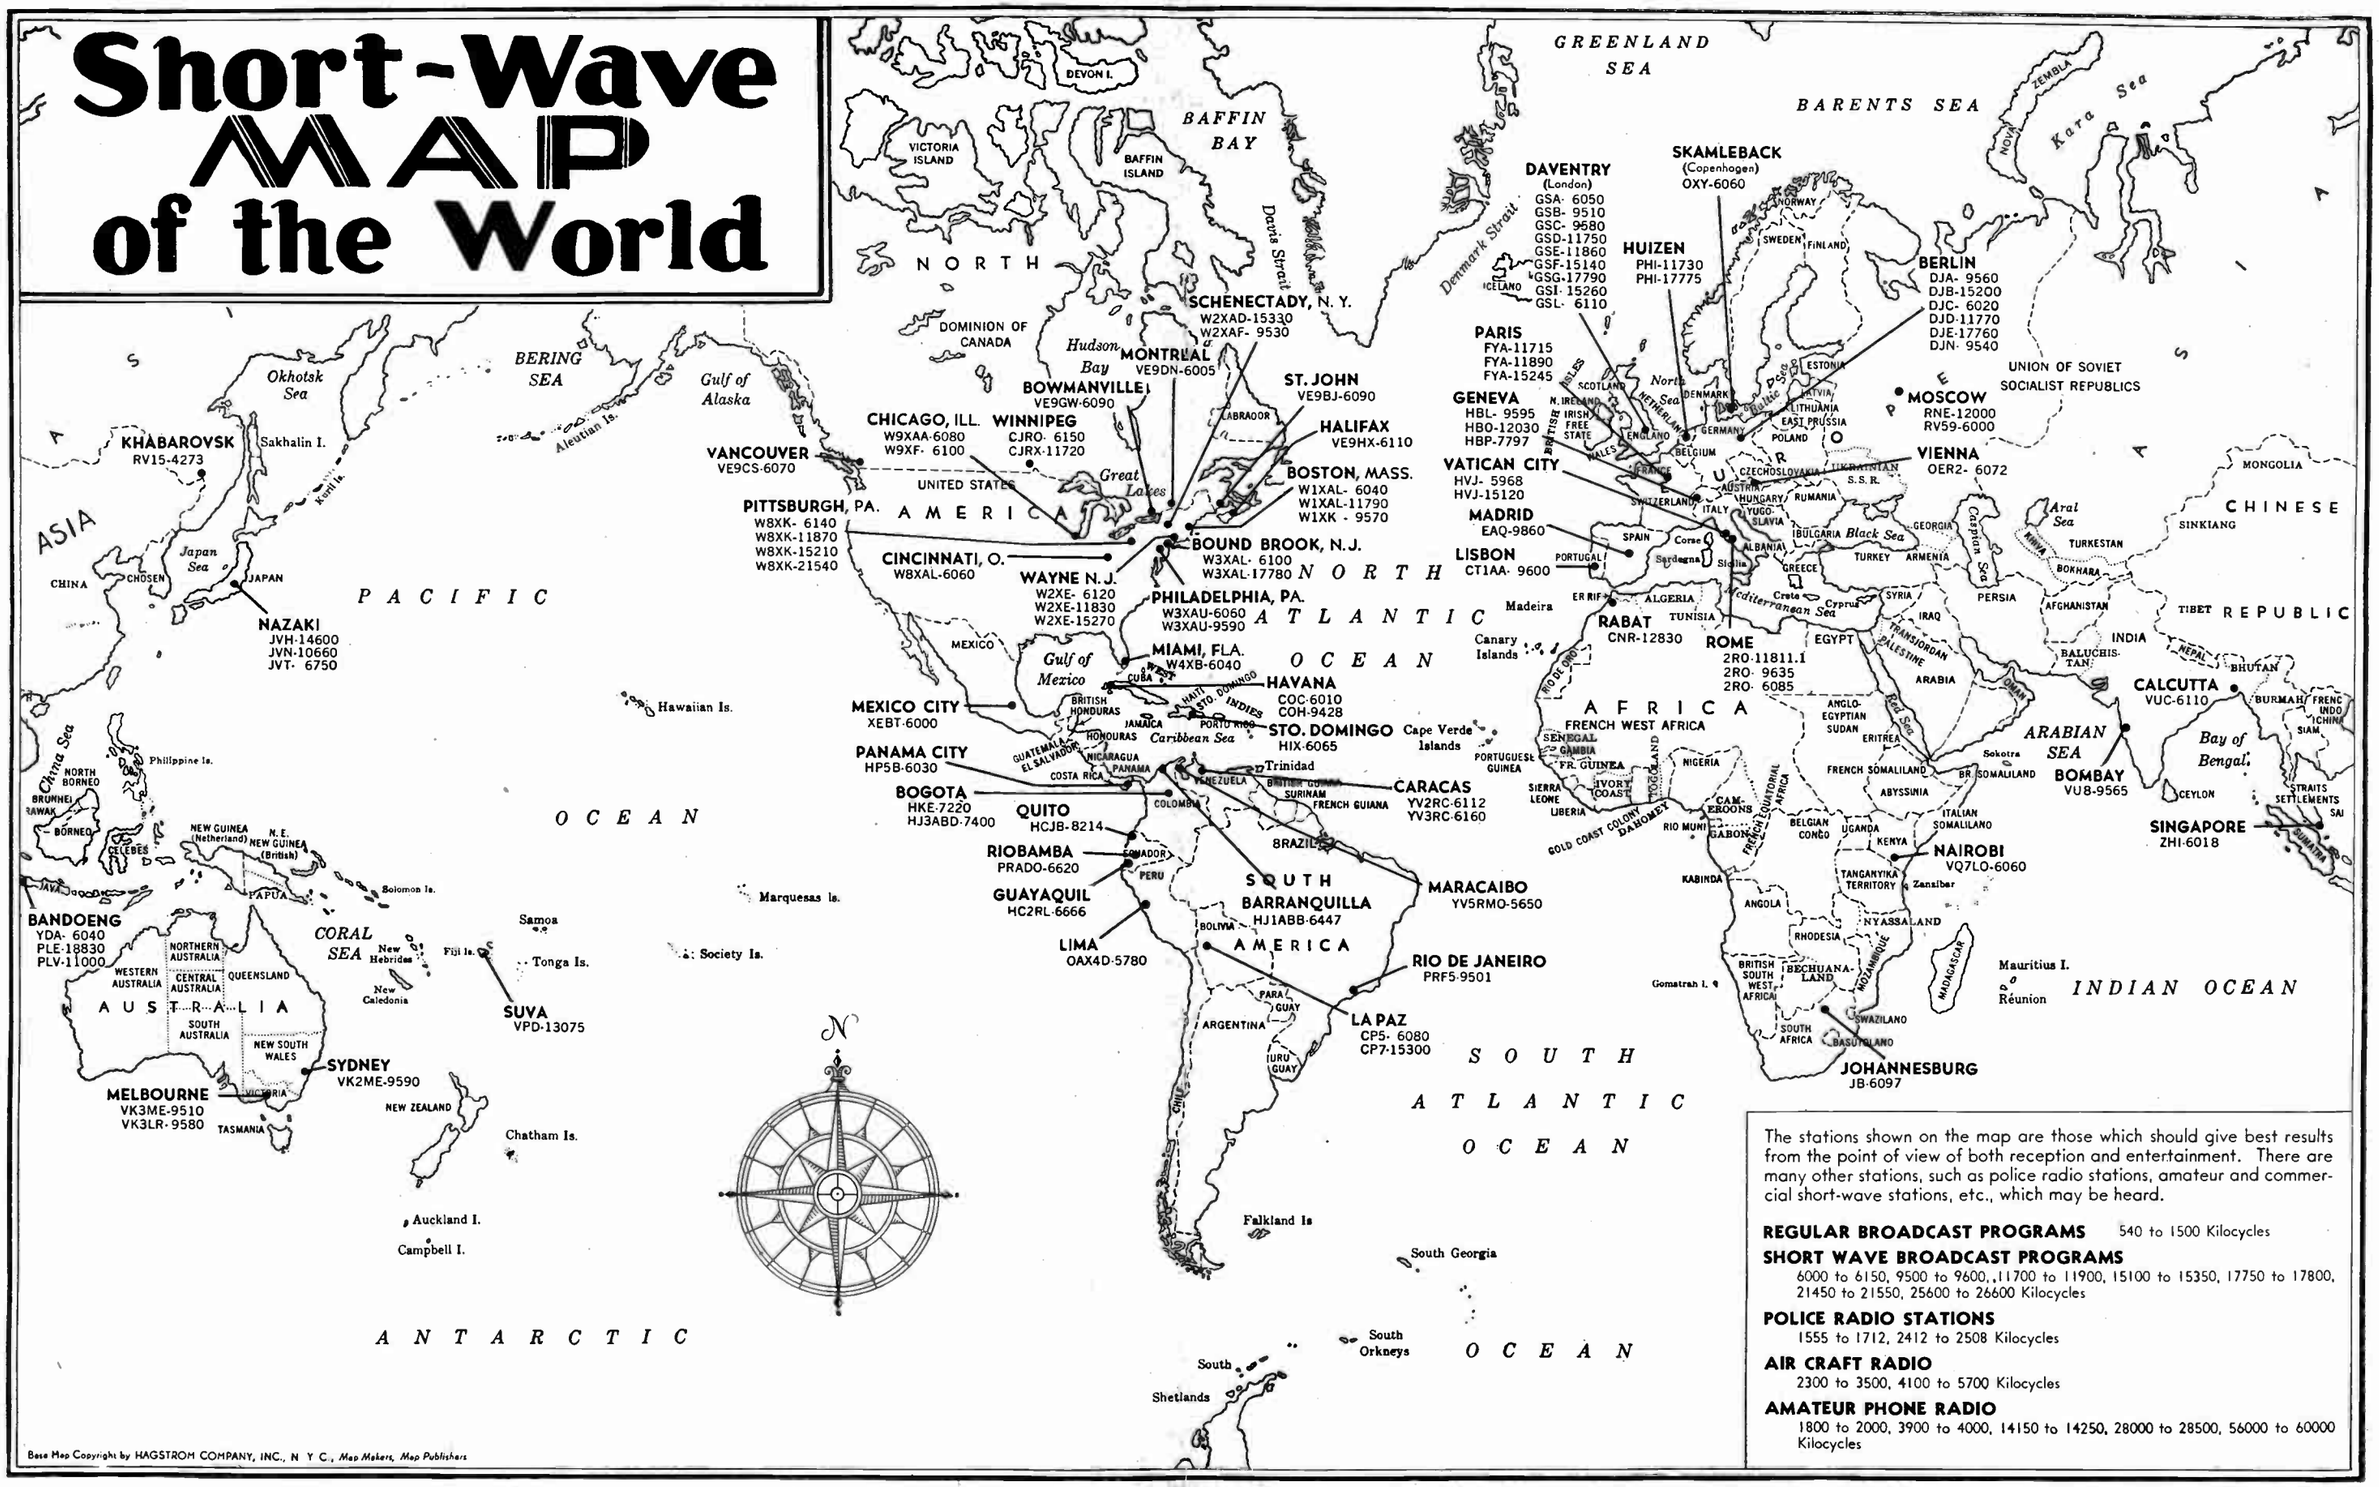
The whole "mag" between the two covers is packed full of interesting data valuable to any short-wave "fan".

There is one thing the "mag" lacks, that would bring great favor to the average short wave listener. This is *International Call Letter Assignments.*

I am wishing you such great success that this "mag" will even surpass the high qualities of its sister—*Short Wave Craft.*

JOSEPH QUICKEL,
740 Prospect Street,
York, Penna.

Short-Wave MAP of the World



The stations shown on the map are those which should give best results from the point of view of both reception and entertainment. There are many other stations, such as police radio stations, amateur and commercial short-wave stations, etc., which may be heard.

REGULAR BROADCAST PROGRAMS 540 to 1500 Kilocycles

SHORT WAVE BROADCAST PROGRAMS
6000 to 6150, 9500 to 9600, 11700 to 11900, 15100 to 15350, 17750 to 17800, 21450 to 21550, 25600 to 26600 Kilocycles

POLICE RADIO STATIONS
1555 to 1712, 2412 to 2508 Kilocycles

AIR CRAFT RADIO
2300 to 3500, 4100 to 5700 Kilocycles

AMATEUR PHONE RADIO
1800 to 2000, 3900 to 4000, 14150 to 14250, 28000 to 28500, 56000 to 60000 Kilocycles

Best Short Wave Stations

This list of short-wave relay broadcasting, commercial and experimental stations is the result of several years of work. Names and addresses included wherever possible so that you may know where to write. The blank spaces are for the dial settings of your own set.

★ Stars designate the most active and best heard stations. Times are Eastern Standard
C—Commercial phone. B—Broadcast service. X—Experimental service.

Identifying Short-Wave Stations *By Their* MUSICAL SIGNATURES

AUSTRALIA

A great many of the foreign as well as the domestic short-wave broadcast stations can be identified by their musical or other signatures which they use in opening and closing the programs, and also use them at frequent intervals while they are on the air. For instance, practically every real short-wave "fan" has either heard or knows about the

Notes of old German folk song, identifying signature of "DJ" stations. Translation—"Practice Faithfulness and Honesty." Also two National anthems are played—one, the Nazi Hymn, the other the German National Anthem.

famous Kookaburra bird or "laughing jackass," the sound of which is heard over the Sydney, Australia, Station VK2ME. This Australian station is heard best in the eastern part of the United States by short wave listeners in the early morning hours usually, or up to about 9:00 o'clock in the morning. VK3ME, at Melbourne, open their program with clock chimes.

GERMANY

Another famous musical signature well known to short-wave fans is the German folk song played on a chime over the German short wave broadcast stations. The German announcers make a very clear statement over the air in both German and English, and you will have no difficulty in recognizing the powerful "DJ" Stations. Before the station goes on the air, they play an old German folk song of nine notes, which is played over and over again, and the writer has often heard it being played as long as twenty minutes before the station came on the air. The notes corresponding to this German folk song are here reproduced, and it gives one a very fine opportunity to tune in the station and be all set for the first spoken announcement which runs like this — "Here is Deutschlandsender, DJA, Hallo Nord America. The Reichs—Rundfunk—Gesellschaft, Berlin, presents to you today" . . . . The announcement is then repeated in German—"Die Reichs — Rundfunk—Gesellschaft Berlin sendet ihnen heute.'

ENGLAND

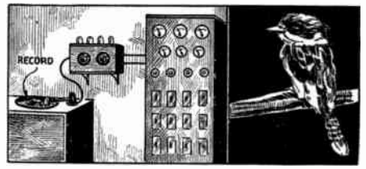
The next popular identifying signature is probably that of the chimes of "Big Ben", which are heard on the English short-wave stations. These stations are scheduled to sound the chimes of "Big Ben" on the quarter hours, and the announcer follows this with—"London calling on—(stations and wavelengths)." The English stations begin and end transmissions by playing "God save The King." This song has the same tune as our "America." London also uses the "Bow bells" for interval signals—the sound of the bells being reproduced from a record previously made.

HOLLAND

Station PHI, Huizen, Holland, may be identified by the announcement — "This is Huizen." The sound of the metronome is used.

FRANCE

The French station at Pontoise, opens and closes its transmissions by playing the "Marseillaise."



VK2ME is famous for its unique signature—the voice of the Kookaburra bird (laughing jackass). It is a large bird, growing to a size of 9 inches frequently. Its voice is usually broadcast from a record.

BELGIUM

Station ORK at Brussels, Belgium, plays the Belgium national hymn at the close of their programs.

SPAIN

EAQ, the well known station, located at Madrid, Spain, and which comes in loud and clear on American short wave receivers, announces the call of their station first in Spanish—"Ay-ah-coo, transradio Madrid." As a matter of fact, this station announces its call in Spanish as just mentioned, but our experience has been that the operator usually says—"Radio Madrid." and in some cases "Radio Espanol". Also, it is interesting to note that an English announcer makes announcements following those in Spanish, and numerous programs given in English have been heard over this excellent station.

PORTUGAL

Station CT1AA at Lisbon, uses the sound of the cookoo call between selections.

U. S. S. R.

RV59, the well known Soviet station of Moscow, which has been heard by thousands of American short-wave fans, plays the "Internationale" at the beginning and end of their programs, and announcements are made in English as well as in Russian. The U. S. S. R. stations broadcast quite a few features in English, and also features especially intended for America.

ITALY

The famous station, I2RO at Rome,

Notes of musical signature identifying the short-wave station at Copenhagen.

familiar to all American short-wave listeners, features a woman announcer in the daytime, and one of the usual salutations heard from this station is —"Radio Roma Napoli." Announcements in English are interspersed with those in Italian, and this station can easily be identified, therefore. Station IAC at Piza, Italy, calls "Pronto, pronto—(name of ship)."

HVJ, Vatican City—Hear a constant tick of the studio clock as a background to the speech. Also broadcasts the bells of Saint Peter's starting each broadcast.

MOROCCO

The short wave broadcast station, CNR at Rabat, makes this announcement usually—"Radio Rabat dans Maroc." They also use broadcast sound of a metronome between selections.

ETHIOPIA

The new short-wave transmitting station, ETA in Ethiopia, located at Adis Ababa, has been transmitting special talks in French and also in English, on a wavelength of approximately 17.3 meters or 17.33 megacycles. (Another report has it 7.5 mc.) No identifying signature has been adopted as far as we know as yet nor is it classified as a "Broadcasting" station. ETA has been in operation for quite a long time, and is classified as a *point-to-point* radio telegraph station. The programs which have been broadcast during September from this station have been picked up by the RCA short-wave receiving stations in this country and re-broadcast over the NBC network, the New York "key" station being WEAF or WJZ. It is reliably reported that in the event of hostility between Ethiopia and Italy that short-wave announcements, including "broadcasts from the trenches and

Grand Short-Wave Station List

● ***This Grand List of Short-Wave Stations of the World is a carefully edited one, and especially compiled by the editors. Only those short-wave stations which the average listener is likely to hear have been included in this list. A special "Quick Reference" list appears elsewhere in the magazine, giving the "Star" short-wave broadcasting stations, while another specially edited list contains the "Television" and "Police" station call letters.***

The editors will be glad at all times to receive corrections from our readers, and particularly any additional information on new stations not found in this list. In giving this information, please write such data on a separate sheet if the letter contains references to any other subject, so that these corrections can be handed directly to the editor of this department. A postcard will frequently serve the purpose for sending us such information.

Short Wave Phone Stations By Order of Frequency in Megacycles

Freq. Mc.	CALL	LOCATION
		199 TO 180 METERS
1.510	VAF	Alert Bay, Can.
1.510	CJD	Campbell River, B.C., Can.

How To "Log" S-W Stations and Calibrate Receivers

This article explains just how to "log" stations and also how to approximate just where they can be heard on your dial. Extreme care is really the secret of successful short-wave reception. An "accurate log" is, of course, essential.

● THE secret of successful short-wave DXing undoubtedly lies in accurate *logging* on the part of the operator and the accuracy of the receiver calibration. Tuning across the short-wave bands we have come upon several weak stations and have listened to some of them for hours at a time without hearing a single announcement as to the call letters and location. This means that if one wishes to gather enough information to obtain a verification card from the station, he would have to spend four or five hours of constant listening to that particular one.

But, if the station is *logged* by dial number and the receiver accurately calibrated, you can tune to other stations and return to the unknown station from time to time in hopes that you will strike an announcement of call letters.

Many types of log books and log sheets have been prepared and sold by different companies, and we do not intend to specify any particular type, however, a good "log" has columns for each of the following:

Call letters of the station, frequency of the station, dial setting, the date, time of day, and any other remarks which the listener may wish to note.

For instance, coming upon one of these stations that you cannot identify, mark down the approximate frequency, the exact dial setting, and the type of program heard, and possibly the language spoken, if any is heard, and also the exact time and date. At some later moment you may return to this station, obtain its call letters, and fill in the blank columns. Most of the present day up-to-date receivers are fairly accurately calibrated, that is, the dials are marked off in wavelength, kilocycles, or megacycles, and a good many times when complete instructions are not furnished with the receiver, the dial readings present as great a problem as operation.

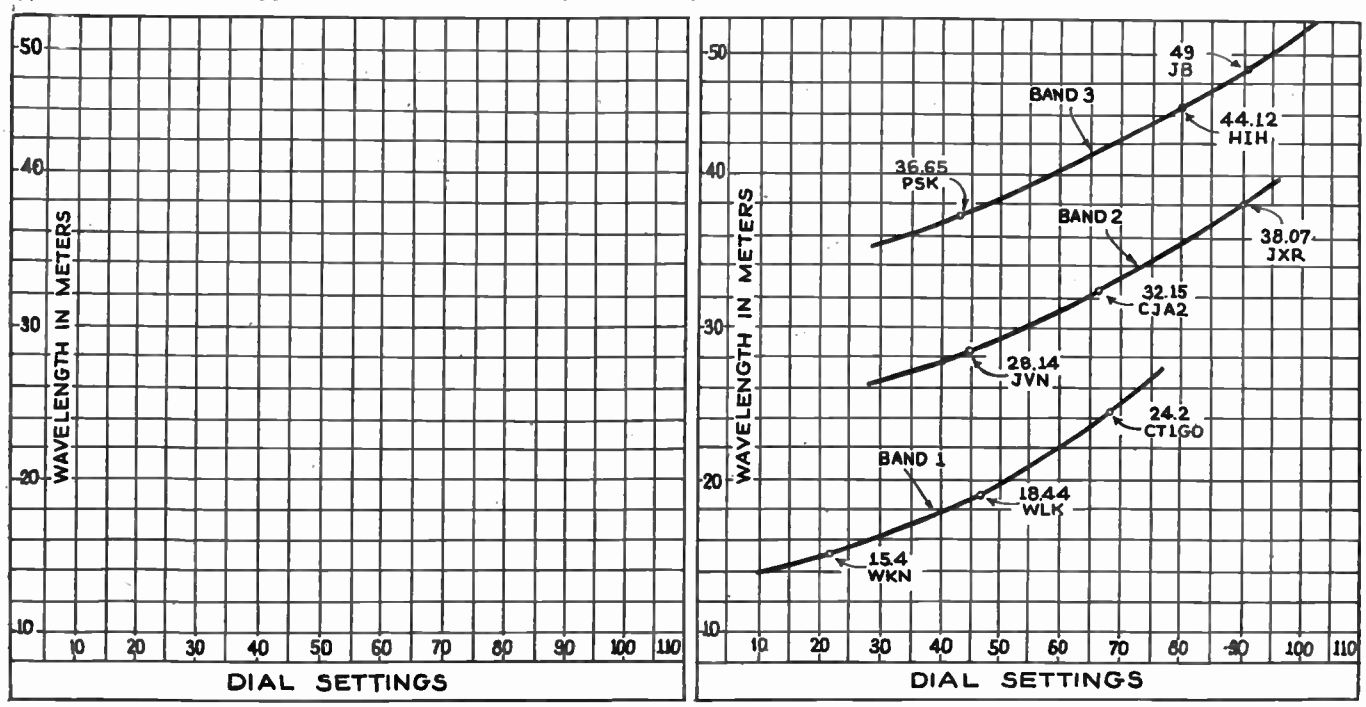
STATION	COUNTRY	FREQ.	TIME	DATE	DIAL	REMARKS
VK2ME	AUSTRALIA	9590	12.30AM	1/3/35	48	VERY STEADY

Sample "Log" showing how a station should be entered on the record.

For instance, in the station lists provided in this magazine, the wavelength and frequency are given, if your dial is marked in megacycles such as from 1.5 to say 15, it is a simple matter to follow the kilocycle designations given in our list; 9.5 megacycles is 9500 kilocycles; 1.5 megacycles is 1500 kilocycles.

At the bottom of this page you will find a graph which will aid you in calibrating your receiver if it is not marked off in megacycles. The various dial settings are plotted against the known frequencies of the stations received and later a smooth curved line is drawn between all of these marks, and the result is that you will be able to find the approximate dial setting or frequencies not indicated by the connecting line, by following the line through to the proper kilocycle column.

As shown in this graph, a separate line or curve which is really the tuning curve of your receiver, is used for each wave band. While three are shown you should incorporate as many curves as you have wave bands on your receiver. If your receiver has 4 or 5 short-wave bands then plot a corresponding number of tuning curves.



Calibration curves plotted on a cross-section paper enable you to quickly find stations when only their frequency is known.

selection of the length of radio waves used for service at various hours.

For distances over a thousand miles the shorter of the commercially useful short waves (14 to 35 meters) are generally relied on during the day, because at that time the density of the Ionosphere is greatest and the electrified particles are present in sufficient numbers to turn these waves back to earth. On the other hand, radio waves longer than 30 meter (roughtly, 100 feet) are received stronger at night than they are in the daytime.

For consistent long distance work, short waves from about 15 to 80 meters in length and waves longer than 1,000 meters are found to be more economical. This last point—economy—has an important bearing on the selection of wave lengths. Because their antenna systems are easier to construct and they do not have to cover so great a space, and because they also are easier to radiate, short waves are more economical than long waves for transmission. Where nearly 550 kilowatts of power is used to send long waves on our New York-London channel, virtually the same thing is accomplished under normal conditions by short waves and their more directive antenna systems with about 105 kilowatts.

Since they are reflected from higher regions in the Ionosphere, short waves make a longer hop than long waves in going from the earth to the upper atmosphere and back again to earth. On two of the diagrams are indicated the paths of a number of typical radio waves. As can be seen, the progress of long waves around the globe takes the form of a series of bounces. The routes of several short waves are also illustrated.

Again, with this chart in view, the phenomenon spoken of as "skip distance" is easily comprehended. As they skim along the ground, short waves diminish in strength much faster than long waves. In the case of the shorter of the commercially useful short waves, little or no signal strength is received from the point where the radio waves die out on the ground and the point where the waves return to the earth from the sky. Obviously, the receiver at the other end of the circuit must not be allowed to be in one of these dead areas. Radio engineers therefore choose short wave lengths which will bounce the conversation down into the region desired by the telephone user.

Take the New York-London circuits and those on the ship-to-shore service, for example. During the day, short waves from 16 to 24 meters in length are ordinarily used between the two cities. At this time, short waves around 18 and 25 meters in length are employed when a ship is more than a quarter of the way across the Atlantic; about 35 meters long when it is between one-quarter and one-tenth the way over; and about 72 meters when it is less than one-tenth the way out. At night, 24 meter waves and longer are generally used on the New York-London service and the range of the 35 and 72 meter waves is considerably extended for the ship to-shore service.

How Short Waves Are Propagated

(*Continued from page* 197)

Of course, there are *seasonal changes* which also affect the choice of wave length for commercial operations. The most pronounced are caused by the shifting intensity of sunlight, the changing length of day and night, or the extent to which the upper atmosphere is exposed to the rays of the sun. The shorter of the available short waves are used more in summer than in winter while the longer of these short waves are relied on during winter nights.

So much for the length of radio waves. What of changes in their strength? Here we come upon two factors: *dispersion* and *absorption*. The first is comparatively simple—as the radio waves go toward their destination, some of their energy is spent by merely being spread out into a larger and larger area. Absorption, however, is a more difficult matter. Its causes are highly technical and it indirectly involves the activity of the sun as well. Briefly, the phenomenon can be summarized as follows:

As they journey into space, radio waves transfer a good portion of their energy into another form by setting up motions of the electrified particles in the Ionosphere. In turn, these particles set up radio waves of the same pattern as those which put them into motion. In the course of such movement the electrified particles may collide with neutral particles, such as those of oxygen and nitrogen, and deflect or arrest this motion. As a result, radio energy is either scattered or lost; absorbed, in other words.

Further, there are more neutral or atmospheric particles at low levels. During the day, as we have learned, there are also more electrified particles at such low levels of the atmosphere. Hence, more collisions take place at this time and more radio energy is lost. At night, however, radio waves climb to loftier heights before meeting sufficient electrified particles to bend them back to earth. And at this level there are fewer neutral or atmospheric particles. Consequently, fewer collisions take place then, a condition which results in less absorption.

Variations in the amount of absorption are responsible for a familiar difficulty in radio reception—fading, described as "a kind of nervousness" in which the signal strength fluctuates and affects the intelligibility of speech. Wave interference is still another reason. On their journey into the Ionosphere, radio waves follow more than one path before being directed back to the earth's surface. These paths are constantly changing in length because of variations in the creation of electrified particles. Thus, as they arrive at the receiver, the waves following these various paths fall in and out of phase with each other in a random sort of way, causing the intensity of the signal to be weakened and strengthened in an equally unpredictable manner.

Since something like 1,800 *electrical storms* (thunder-storms) are going on every moment all round the world, it is not hard to label noise or static as another enemy of clear radio reception. These disturbances produce about 100 lightning flashes every second. While most discharges are between clouds, about one out of every ten is between a cloud and the earth. It is these last discharges which are most disturbing to radio reception.

Curiously enough, this ultra modern scientific observation has an ancient parallel. Long ago it was a tenet of religion—as it is now of superstition—that the action of heavenly bodies affected affairs on earth. — *Courtesy Long Lines."—A. T. & T. Co.*

$3.00 for Best S-W Hint

Each month we are awarding $3.00 for the best short-wave hint. Those presented on this page will give the reader an idea of the type of material that we are looking for. All hints printed other than the prize winner will be awarded a six months' subscription to this magazine.

PRIZE HINT

Two Dials Aid in Tuning

Here is a hint which I believe is valuable. Very often it is most difficult to write down the exact setting of a station on the dial.

Most airplane-type dials are not calibrated to such a fine degree as one would like them to be. The illustrated hint helps a great deal in logging stations. When the station is tuned in at the exact point of resonance, the readings of both dials are taken down.

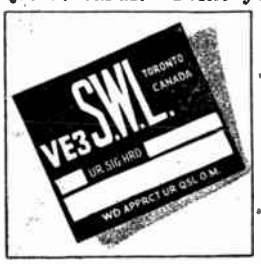
Two dials mounted in this fashion aid in tuning.

For example, thus: 7-2; 53; which means the airplane dial points on 7200 kc. set first, and then the small dial turned to exactly 53. This gives the effect of band-spread tuning on receivers that are not so equipped. The 3-inch dial allows for a much firmer grasp to be had than with a small knob, and thereby permits slow tuning.—Ernest J. Orishek.

SWL Cards

I submit a kink for consideration in your column—print your own S. W.L.'s and Q.S.L.'s.

Here is a novel and inexpensive way to print your own S.W.L. and Q.S.L. cards. Print your call letters, etc., in India Ink on a sheet of white writing paper about 3¼" x 4¼". Place this sheet (printed side down) in a small printing frame. On this place a sheet of sensitized photograph printing paper, preferably that of the post card type. Then expose to white light, remove the sensitized paper placing it in developer, then fixer, following the procedure of printing from a negative. The printing will come out in white against a black background.—A. McCall.

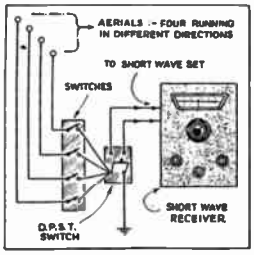


S. W. L. cards may be printed by the short wave "fan" himself.

Diversity Antenna for the "Fan"

I have just recently started reading your *Short Wave Listener* magazine and I want to take this opportunity to tell you that it is one of the best, if not the best short-wave magazine on the market. It sure has helped me with several of my problems in radio.

I am enclosing a diagram which I would like to enter in your magazine, "$3.00 for the Best S-W Hint." I have installed this about three years ago and have used it with great success. I have four different aerials running in different directions and each lead-in is connected to a switch. When I listen in on my short-wave set, I try out each of the four aerials for the best results. I can use one, two, three, or four aerials, just by throwing the switches. In this way you can receive stations that you never dreamed of hearing.

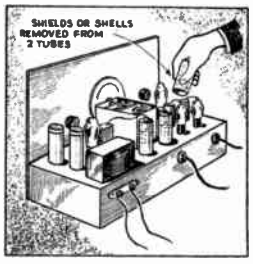


Several antennas aid in bringing in those "weak" stations.

I have "logged" stations all over the world, including amateurs on phone from the Hawaiian Islands and the Philippine Islands, also Cuba, Denmark, England, Germany, Mexico, India, Panama, Switzerland, Spain, France, South America, Australia, and many other countries. — Frank J. Schrameyer.

Increasing Sensitivity

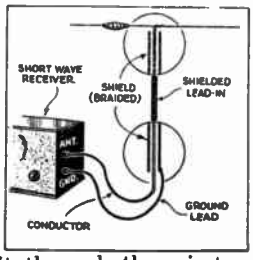
I have a S-W hint that I think might be of benefit to other fans. Removing the shields from screen grid tubes will give your set more qualities of a regenerative set and make tuning sharper and the set more sensitive. This will enable you to bring in greater DX, (distance).—Bud Toohey.



Removing one or two tube shields makes set more sensitive.

Shielded Lead-Ins

I live in the down-town part of the city in a flat and have had lots of trouble trying to eliminate interference. I now use shielded lead-in wire from the aerial down to the receiver. It is stranded copper wire, with rubber insulation and a flexible metal braid on the outside. I soldered the connection at the aerial on the roof and used stand-off insulators down the side of the building and then brought it through the window by installing a porcelain tube, and then connecting the copper core to the aerial post of the set and stripping enough of the flexible braid to reach the ground post of the set.



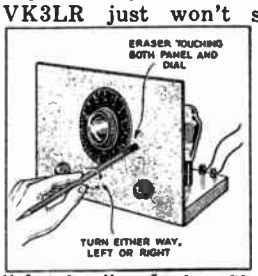
Shielded lead-in in many cases reduces man-made interference.

I was very much surprised at the results because before I could hear vacuum sweepers and automobiles, and now it works very well on both broadcast and short waves. I have an Airline 7-tube All-Wave radio and have got nine South American, three Cuban, two German, three English, one Spain, one Hawaiian, three Canadina, besides most of the United States stations.

I hope that this may be useful to others that have trouble with their lead-in picking up noise.—Kenneth McGovern.

Novel Vernier

At some time or other when VK3LR just won't slide into the "clutches" of the Short Wave Listener, as it has been for myself many and many a time, by acquiring a pencil with a good eraser on the end one can (as I have) overcome this hair-graying obstacle.



The pencil eraser may be employed as a vernier adjuster.

Simply place the pencil (eraser foremost) to the panel up against the dial so that the eraser touches the dial and panel simultaneously. Then slowly turn the pencil between your fingers always keeping the pencil firmly against the panel and dial. The result—the dial slowly moves and in slides the VK3LR (or what have you). It's just another simple method of band-spreading ,but it always is the simple idea that usually works for the average listener—and not the complicated.—Stephen Scibal.

THE LISTENER

Too many stations operating in the 49 meter band cause a great amount of interference.

TOO MANY STATIONS IN ONE BAND

John Underhill, St. Paul, Minn.

(Q) I have just purchased my first short-wave receiver, and I am very much disappointed in the results I am obtaining. It seems that this receiver does not tune sharply enough or it tunes improperly in some manner because I notice that within 5 or 10 divisions on the dial I can hear 10 or 15 stations, while I can go over the entire remainder of the dial and hear but two or three stations. It would seem to me that there is something wrong with the tuning of this receiver, that the stations should be bunched together in a few divisions.

(A) We are inclined to think that your receiver is working properly. You will find that the short-wave stations are grouped together on all receivers just the same as you are finding them on your dial. For instance, you will find 25 or 30 short-wave broadcast stations right in the vicinity of 49 meters, while you will only find two or three stations between 49 and 31 meters. This is because the stations are grouped in that manner by international regulations and there is nothing that you can do to remedy the situation.

OPERATE TRANSCEIVER WITHOUT LICENSE?

Joe Greene, Houston, Tex.

(Q) I have been informed that it is lawful to operate a transceiver without a license providing it does not transmit signals outside of the state. Is this correct?

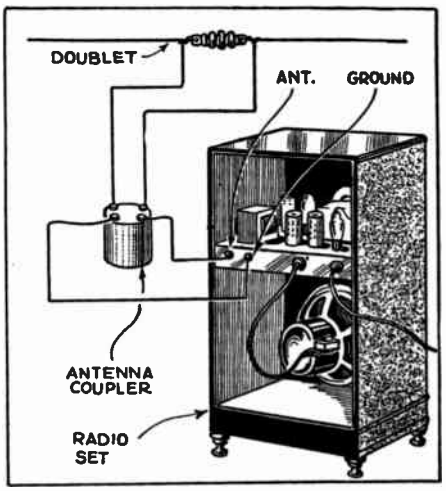
(A) Section 301 of the Communications Act of 1934 requires that a station must be licensed where the signals of that station may transcend state lines or where the signals of that station may interfere with interstate messages. Now this would seem to allow transmission without a license under the above conditions, however, our courts in all cases have held that regardless of how small the power of a transmitter, it radiates signals across the state border. In other words, all transmitters, regardless of their size are theoretically capable of transmitting signals across the state border and, for this reason, it is absolutely necessary to have a license when operating a transceiver.

USES GROUND AS AERIAL

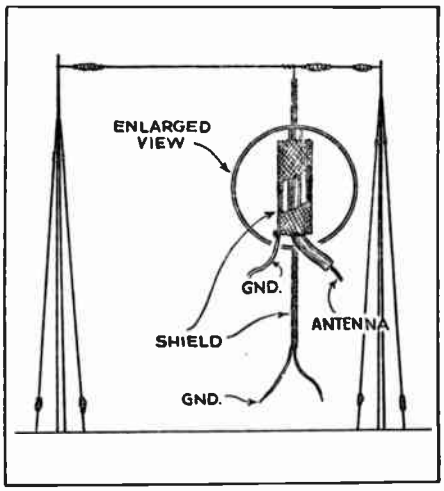
Oscar Ahrens, Tampa, Fla.

(Q) Recently my antenna became disconnected from the receiver, and a member of the family trying to right the condition, connected the ground wire on the antenna post and the antenna on the ground post. From that time on, I was able to pull in stations on my short-wave receiver that I had never before heard. I would like to know if it is due to the peculiar antenna and ground connections and just why this has not been done before as it works out so well.

(A) We hesitate to say that the improved results that you experienced are entirely due to the fact that the ground is connected on the antenna post. If they are, then we can only say that you must have a very very poor antenna system. We suggest you try turning the connections around sometime, especially when you are listening to a very weak station. This will prove whether or not the increase in sensitivity was due to the change in the antenna connection. It is quite possible that conditions have become quite a bit improved since the change was made and that you are blaming it on the change rather than general improved receiving conditions.



The doublet antenna can be connected to any set, providing the proper transformer or coupler is used.



In many cases a shielded lead-in has successfully reduced "man-made static" interference.

SHIELDED LEAD-IN

Adolph Hanson, Springfield, Mass.

(Q) I have read in numerous radio publications and catalogs that man-made static interference can be eliminated through the use of a shielded lead-in. I would like to know if this is true or not because I am contemplating putting up a new antenna and do not want to waste any time nor money in antennas which will not give proper results. A good many of my friends have told me that these antennas reduce signal strength considerably. Is this true?

(A) We have had considerable experience with shielded lead-ins of the ordinary type where a copper braid has been used on the outside of rubber covering stranded wire. While the noise has been known to decrease, some 30 or 40 per cent, with a lead in of this type, the signal usually decreases nearly as much; probably with a really sensitive receiver the lower signal level could be tolerated, in view of the reduction of back-ground noises. We have known of some cases where the signal strength has not been decreased any appreciable amount and the background noise entirely eliminated, although this cannot be guaranteed to hold true in any particular case. The type of noise you are experiencing and the sensitivity of your receiver will play a very important part in the use of shielded lead-ins.

CONNECTING DOUBLET

Henry Stages, Paterson, N. J.

(Q) My short-wave receiver is not of the newer type and I only have the standard antenna and ground binding posts. I would like to know if it is possible to connect a doublet to my receiver and still maintain the noise

ASKS

Only questions of general "Listener" interest will be answered here. No queries can be answered by mail. No diagrams of a technical or involved nature will be given here—only those which the Editors feel will be of value to the average nontechnical "Short-Wave Listener."

reducing qualities of the antenna and its lead-in. Would a special transformer be necessary or can the doublet wires be connected directly to the two posts of my receiver?

(A) The two lead-in wires from the doublet antenna can be connected to the two posts of your receiver, however, best results would be obtained with the use of a regular doublet coupling transformer sometimes called impedance matching transformer. These are available in any radio store, however, when purchasing one, provide the dealer with information as to the type of lead-in used, whether twisted or spaced pair, and also the type of receiver. Different types of lead-ins and receivers require different couplers.

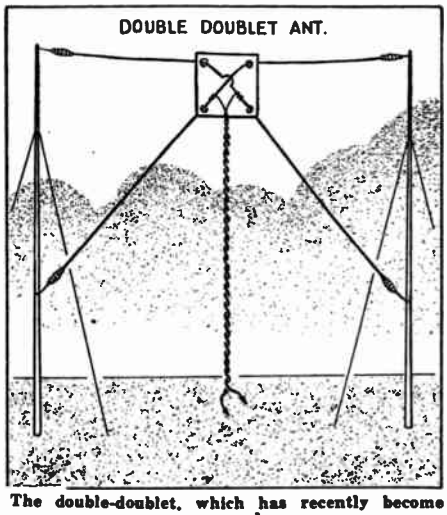
SHORT WAVES MORE NOISY THAN B.C. BAND

Robert Muller, Los Angeles, Calif.

(Q) I have a new all-wave receiver which is reputed to be one of the best on the market. It shows signs of being extremely sensitive and very selective and the tone quality is fine and I have received many foreign stations. My complaint though is that on the short wave bands I experience considerable noise which interferes with the weaker stations. I do not encounter any noise whatsoever on the broadcast band, that is above 200 meters and I am wondering if there isn't something wrong with my receiver, that might cause the short-wave bands to be noisy. Your answer in the LISTENER magazine would be appreciated.

(A) Undoubtedly if you were to turn the volume of your receiver all the way up and set the dial on the point on your receiver where no stations are received, you would find that the noise would be as great as on the short-wave band. On modern receivers having automatic volume control, the tremendous strength of the stations on the regular broadcast band is able to overcome and override the back-ground noise, but on the short-wave bands the amount of signal reaching the receiver is considerably less and, therefore, cannot compete with the general back-ground noise. If you take particular notice, you will find that on the strong short-wave stations the noise is somewhat less bothersome.

Keeping an accurate "log" enables you to return to a station at any time.



The double-doublet, which has recently become very popular.

CALIBRATING RECEIVER

Everett Gray, Hewlett, L. I.

(Q) The dial on my radio receiver is marked in figures from zero to 100. I understand the newer models are equipped with dials marked off in either kilocycles or wavelength and sometimes megacycles. Kindly let me know if it is possible to calibrate my dial in this fashion. I have considerable difficulty in locating some of the stations because, as you know, most call lists give the wavelength or frequency of the station and I have no reference marks to go by.

(A) Calibrating a short-wave receiver is quite a simple matter, however, by calibrating it we do not mean that the calibration is to be accurate within a half kilocycle or so, although it should be accurate enough to provide a convenient guide in searching for a station whose frequency is known.

First, of course, it is necessary that you keep an accurate list of the dial settings for stations that you have already received, and also the exact frequency either in kilocycles or megacycles. Then, by employing a piece of cross section paper and plotting the dial settings against the frequency of the stations, you will get a curve known as the tuning curve of your receiver. Then, anywhere along this curve the various stations can be located. In another section of this magazine, we have complete details showing just how to calibrate the receiver.

DOUBLET VERSUS DOUBLE DOUBLET

Arthur Hemerson, Detroit, Mich.

(Q) I would like to know whether or not a double doublet will improve reception and just how much better results I can expect.

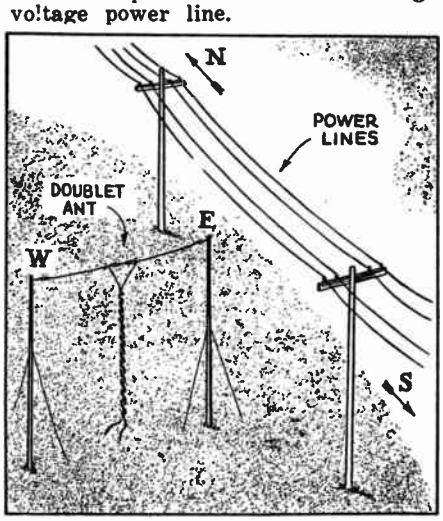
(A) Theoretically the double doublet is the more effective over a wide range of frequencies than a single doublet antenna, however, a direct comparison cannot be made on any particular frequency because the single doublet can be designed to work very efficiently on one wave band and will give very poor results on another band. So, unless we knew just what type of doublet you are using now, that is the length of it, its height above ground, etc., it is impossible to say whether or not you would obtain better results with the double doublet.

BEST POSITION OF DOUBLET

Fred Ickes, Philadelphia, Pa.

(Q) I live right near a high-voltage transmission line and would like to know just how I should use the doublet antenna in order to reduce the noise from the power line as much as possible. Some of my friends say that it should be at right angles with the power line and others say it should be parallel. Please advise through your LISTENER Question Box.

(A) The drawing below clearly shows just how the doublet antenna should be placed relative to the high voltage power line.

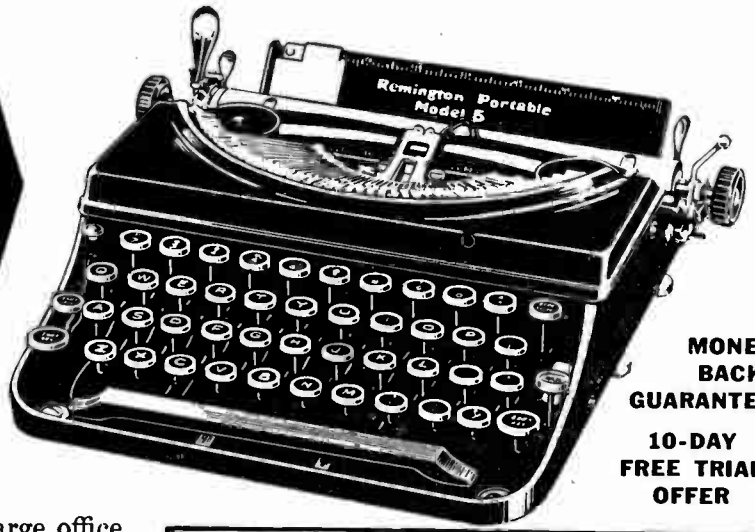


The doublet should be at right angles with power lines.

FACTORY TO YOU

LATEST MODEL REMINGTON TYPEWRITERS

10¢ A DAY



MONEY BACK GUARANTEE

10-DAY FREE TRIAL OFFER

● Brand new, latest model Remington for only 10¢ a day! Here is your opportunity to get a perfect writing machine at an amazingly low price direct from the factory. Every essential feature of large office typewriters—standard 4-row keyboard, standard width carriage, margin release, back spacer, automatic ribbon reverse. Act now, while this special opportunity holds good. Send coupon TODAY for details.

YOU DON'T RISK A PENNY

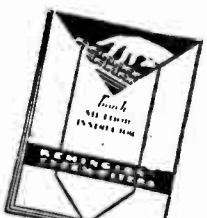
We send you the Remington Portable, Model 5, direct from the factory with 10 days' free trial. If you are not satisfied, send it back. We pay shipping charges both ways.

EVERY ESSENTIAL FEATURE found in standard machines

When you buy a typewriter, be sure you get one of the new, latest models, not a used or rebuilt machine. For you want a machine that has only the latest conveniences and devices. The Remington Model 5 you can get for 10c a day has every essential feature of big office machines. It is a complete writing machine—the most compact and durable portable ever built, one that will give you years and years of hard service. This beautiful machine offers unequalled economy in first cost, unequalled economy in service. Buy now. It is a real bargain.

SPECIFICATIONS. Standard 4-row keyboard. Complete visibility. Standard width carriage for long envelopes. Carriage return lever designed for easy and rapid operation. Margin release on keyboard. Automatic ribbon reverse. Back spacer. Two-color ribbon shift. Variable line spacer. Adjustable margin stops. Autoset paragraph key (one of the most useful features found on any typewriter.) Weight, 11 lbs. 13 oz. Furnished with Pica or Elite type.

FREE → TYPING COURSE



With your new Remington we will send you — absolutely FREE — a 19-page course in typing. It teaches the Touch System, used by all expert typists. It is simply written and completely illustrated. Instructions are as simple as A, B, C. Even a child can easily understand this method. A little study and the average person, child or adult, becomes fascinated Follow this course during the 10-Day Trial Period we give you with your typewriter and you will wonder why you ever took the trouble to write letters by hand.

MONEY-MAKING OPPORTUNITIES OPEN. Hundreds of jobs are waiting for people who can type. A typewriter helps you put your ideas on paper in logical, impressive form...helps you write clear, understandable sales reports, letters, articles, stories A Remington Portable has started many a young man and woman on the road to success.

FREE → CARRYING CASE

Also under this new Purchase Plan we will send you FREE with every Remington Model 5 a special carrying case sturdily built of 3-ply wood This handsome case is covered with heavy du Pont fabric The top is removed by one motion, leaving the machine firmly attached to the base. This makes it easy to use your Remington anywhere—on knees, in chairs, on trains. Don't delay . . send in the coupon for complete details!

A GIFT FOR ALL THE FAMILY. If you want a gift for birthday, Christmas or Graduation . . . one Father, Mother, Sister or Brother will use and appreciate for years to come . . . give a Remington Portable. We will send a Remington Model 5 to anyone you name, and you can still pay for it at only 10c a day Few gifts are so universally pleasing as a new Remington Portable. Write today.

SEND COUPON WHILE LOW PRICES HOLD

CLIP COUPON NOW . . .

Remington Rand, Inc., Dept 305-11
205 E 42nd Street, New York, N. Y

Please tell me how I can get a new Remington Portable typewriter, plus FREE Typing Course and carrying case, for only 10c a day. Also send me new illustrated catalogue.

battlefields" will be sent out from the station at Addis Ababa. Many readers have no doubt heard this station direct .

SWITZERLAND

The station HBP at Geneva makes its announcement in several languages, including English. One of their schedule announcements is—"Hillo, hillo, Radio Nations."

DENMARK

OXY located at Skamleback sounds the midnight chimes at 6:00 P.M. Eastern Standard Time.

SOUTH AMERICA

Station HJ1ABB, Barranquilla, Columbia, announces "Achay-hota-uno-ah-bay-bay."

Station HJ5ABD, Cali, Colombia, announces — "Achay-hota-thinko-ah-bay-bay."

Station HCJB, Quito, Ecuador, sounds a two-tone chime for announcements.

Station YV5RMO, Maracaibo, Venezuela, strikes a gong before announcing.

Station YV2RC, Caracas, Venezuela, announces "Ee-vay-dos-erray-say", and sounds four strokes on chimes every fifteen minutes.

Station YV3RC, Caracas, announces "Ee-vay-trays-erray-say", and plays bells on the hour.

PRADO, Riobomba, Ecuador, announces "Estacion el Prado, Riobomba, Ecuador."

Station HC2RL, Guayaquil, Ecuador, plays the Ecuadorian National Anthem at beginning and end of transmissions.

Station PSK (PRA3) at Rio de Janeiro, Brazil, plays chimes similar to the NBC chimes when signing off.

CENTRAL AMERICA

Station TGX at Guatemala City, uses a two-tone high frequency sound as their identification signal.

Station HI1A, Santo Domingo, plays "Anchors Aweigh" at the opening and closing of programs.

JAVA

Bandoeng, PMC or PLF; previous to speech you hear the sound of notes similar to a motor horn (F-D-C-).

The Forgotten Time Signal

(*Continued from page* 198)

"Perhaps," continued the man, who by this time Sandy had recognized as being Charley Graham, wanted in several states on robbery charges, "you are wondering why I'm dressed in these evening clothes. We figured your cops wouldn't see anything wrong with three gentlemen dressed in evening clothes, on the streets at 2 A.M. The boys should be finished with the job soon—and then for parts unknown with $100,000 as the booty!"

Slowly but relentlessly the clock reached the hour of 2:34.

Graham suddenly felt the cold steel of a Police Special prodded into his back, and heard the command:

"All right, fellow; Stick 'em up!"

Amazed, Graham slowly turned and as he did so he slowly raised his hands skyward. The cold blue eyes of Radio Patrolman Ralphs, of Car number Two bored into his, and lowering his gaze he found himself looking into the steel barrel of a .38 police special.

Almost every citizen in the city of Redwood Villa read in the newspaper extras that morning of the red handed capture, by Officers Roberts and Ralphs, of two bandits engaged in taking $100,000 in crisp, new bills from the vaults of the First National Bank.

But Graham had neglected to give a time signal at 2:30 A.M. thus automatically recalling all the cars to the police station.

Very few readers of this first page thriller noticed this small item in the Redwood Villa "Courier", which read,

REDWOOD VILLA, Sept. 16—Police Chief R. S. Burke announced early this morning the appointment of Sanford Roberts to the position of Captain of Police, succeeding the resigned former Captain, Timothy Healy. Chief Burke also announced the appointment of Patrolman James S. Ralphs to the position of Chief Radio Announcer, the position left vacant as the result of Captain Robert's appointment.

Tuning In Those "DX" Stations

(*Continued from page* 202)

in most cases, it may be just that station which you are looking for! If you are using a beat oscillator, this of course should be turned on when in search of the station, but after one has been located and tuned in, the beat oscillator should be turned off, because it is liable to interfere with the quality of reproduction.

Short Waves in the Next War

(*Continued from page* 199)

ination to think for a moment that we may even have television pictures of a battle projected on the screens of our theatres. One way in which this could be done would be for the official news photographers on the battle line to take a picture of the action, in the same way that pictures were taken during the last war for government records. Afterward the "movie film" would be rushed back to the nearest short wave transmitting station, and by scanning each picture on the film with a television scanner the impulses corresponding to the various points of light and shadow in the picture would be transmitted and picked up at a distant short wave receiving station, (relaying the signals through several stations if necessary) until it finally arrived at its destination, possibly several thousand miles from the scene of battle.

Fourth Trophy Award

(*Continued from page* 207)

some very good ones too. I like the Rack and Panel transmitter of George Shuart very much, and may use it for a "starter."

ALL THE WAY FROM INDIA

uated at present in a very bad locality, having 37 mills working near me (Day and night) and also being on a main road, but in spite of this, I have managed to verify all continents (less Australia) eleven times or more each, and have a total of 130 verifications.

Cordially yours,
SERGEANT H. J. DENT,
De Lisle Rd. Police station,
Jacob Crcle, Bombay, India.

Here are the Six BEST SHORT-WAVE RADIO BOOKS!

Without doubt you will have to go along way to buy better books on short waves than you find on this page. Each book is written by a well-known authority on short waves . . . each book has been carefully illustrated with photographs and diagrams to make the study of this field of radio much simpler. The volumes on this page are the finest books on short-waves which are published anywhere today. Order one or two copies today . . . find out for yourself if they are not educational. Prices are postpaid.

How to Get Best Short-Wave Reception

By M. HARVEY GERNSBACK

This book tells you everything you ever wanted to know about short-wave reception.

The author, a professional radio listener and radio fan for many years, gives you his long experience in radio reception and all that goes with it.

Why is one radio listener enabled to pull in stations from all over the globe, even small 100 watters, 10,000 miles away, and why is it that the next fellow, with a much better and more expensive equipment, can only pull in the powerful stations that any child can get without much ado?

The reason is intimate knowledge of short waves and how they behave. Here are the chapters of this new book:

1. What are Short Waves and what can the listener hear on a short-wave receiver or converter?
2. How to tune and when to listen in on the short waves.
3. How to identify short-wave stations.
4. Seasonal changes in short-wave reception.
5. Types of receivers for short-wave reception.
6. Aerial systems for short-wave receivers.
7. Verifications from short-wave stations.

The book makes excellent reading matter. There are many tricks in short-wave reception that even some of the "old-timers" do not know. Be sure to get it.

40 Illustrations, 72 Pages. Stiff, flexible covers **50c**

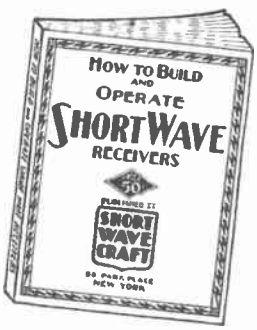
HOW TO BUILD AND OPERATE SHORT-WAVE RECEIVERS

THIS is the best and most up-to-date book on the subject. It is edited and prepared by the editors of SHORT WAVE CRAFT, and contains a wealth of material on the building and operation, not only of typical short-wave receivers, but short-wave converters as well. Dozens of short-waves sets are found in this book, which contains hundreds of illustrations; actual photographs of sets built, hookups and diagrams galore.

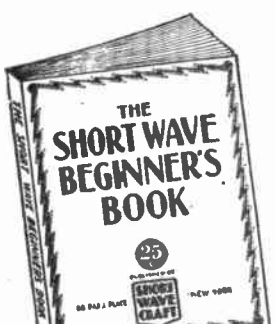
This book is sold only at a ridiculously low price because it is our aim to put this valuable work into the hands of every short-wave enthusiast.

We know that if you are at all interested in short waves you will not wish to do without this book. It is a most important and timely radio publication.

150 Illustrations, 72 Pages. Stiff, flexible covers **50c**



THE SHORT-WAVE BEGINNER'S BOOK



HERE is a book that solves your short wave problems—leading you in easy stages from the simplest fundamentals to the present stage of the art as it is known today. It is the only low-priced reference book on short waves for the beginner.

The book is profusely illustrated—it is not "technical." It has no mathematics and no technical jargon.

It also gives you a tremendous amount of important information, such as time converted to tables, all about aerials, noise elimination, all about radio tubes, data on coil winding and other subjects.

Partial List of Contents

Getting Started in Short Waves—the fundamentals of electricity. Symbols, the Short Hand of Radio—how to read schematic diagrams. Short Wave Coils—various types and kinds in making them.

Short Wave Aerials—the points that determine a good aerial from an inefficient one.

The Transposed Lead-in for reducing Static.

The Beginner's Short-Wave Receiver—a simple one tube set that anyone can build.

How to Tune the Short-Wave Set—telling the important points to get good results.

Audio Amplifiers for S-W Receivers.

Learning the Code—for greater enjoyment with the S-W set.

Wave length to Kilocycle Chart.

Wire Chart—to assist in the construction of coils.

25c **75 Illustrations, 40 Pages. Stiff, flexible covers**

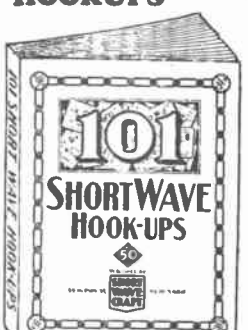
101 SHORT-WAVE HOOKUPS

Compiled by the Editors of SHORT WAVE CRAFT

EACH and every hook up and diagram illustrated is also accompanied by a thorough explanation of what that particular hook-up accomplishes, what parts are required, coil-winding information, values of resistors, etc., in fact, everything you want to know in order to build the set or to look up the data required.

To be sure, all of the important sets which have appeared in print during the past five years are in this valuable book. Sets such as the Doerle, Dimmore, the "Sky Buddy," Duplex, Oscillodyne, Denton "Stand-by," Mega-dyne Triple 2, "Globe Trotter," 2-Tube Superhet, Multidyne, "Loop" Receiver, "Doerle" 2-tube Battery, "Doerle" 3-tube Battery, "Doerle" 4-tube A.C., "Doerle" 3-tube A.C., Doerle "Signal Gripper," Duo R.F. 4-tube Receiver, The Sargent 9-33 Tapped Coil Receiver, Globe-Girdler 7, The 2-Tube "Champ"—2 Tubes Equal 3, Band-Band "2-Tube Pee-Wee" Wash All-Wave 6, Denton Economy 3, 2-Tube "Regenerative-Oscillodyne" will be found here, with full descriptions. In many cases, we have also included a picture hook-up for those who do not wish to follow the regular symbolic hook-up, but wish to have a regular wiring diagram.

This is a very handy volume, especially for those "fans" who wish to study the best sets in the short-wave art, from one tube up to ten tubes.



100 Illustrations, 72 Pages, Stiff, flexible covers **50c**

HOW TO BECOME AN AMATEUR RADIO OPERATOR

WE choose Lieut. Myron F. Eddy to write this book because his experience in the amateur field has made him prominent in this line. For many years Lieut. Eddy was instructor of radio telegraphy at the R.C.A. Institute. He is a member of the I.R.E. Institute of Radio Engineers, also the Veteran Wireless Operators' Association.

If you intend to become a licensed code operator, if you wish to take up phone work eventually—this is the book you must get.

Partial List of Contents

Ways of learning the code. A system of sending and receiving with necessary drill words is supplied so that you may work with approved methods. Concise, authoritative definitions of radio terms, units and laws, brief descriptions of commonly used pieces of radio equipment. This chatter gives the working terminology of the radio operator. Graphic symbols are used to indicate the various parts of radio circuits. General radio theory particularly as it applies to the beginner. The electron theory is briefly given, then waves—their creation, propagation and reception. Fundamental laws of electric circuits, particularly those used in radio are explained next and typical basic circuits are analyzed. Descriptions of modern receivers that are being used with success by amateurs. You are told how to build and operate these sets. Amateur transmitters. Diagrams of simplest sets are furnished so construction is made easy. Power equipment that may be used with transmitters and receivers, rectifiers, filters, batteries, etc. Regulations that apply to amateur operators. Appendix which contains the International "Q" signals, conversion tables for reference purposes, etc.

TEN MOST POPULAR SHORT-WAVE RECEIVERS

—HOW TO MAKE AND WORK THEM

THE editors of SHORT WAVE CRAFT have selected ten outstanding short-wave receivers and these are described in the new volume. Each receiver is fully illustrated with a complete layout, pictorial representation, photographs of the set complete, hookup and all worth-while specifications. Everything from the simplest one-tube set to a 5-tube T. R. F. receiver is presented. A complete list of parts are given to make each set complete. You are shown how to operate the receiver to its maximum efficiency.

CONTENTS

The Doerle 2-Tube Receiver That Reaches the 12,500 Mile Mark, by Walter C. Doerle.

2-R.F. Pentode S-W Receiver, having two stages of Tuned Radio Frequency, by Clifford E. Denton and H. W. Sevor.

My de Luxe S-W Receiver, by Edward G. Ingram.

The Binneweg 2-Tube 12,000 Mile DX Receiver, by A. Binneweg, Jr.

Build a Short-Wave Receiver in your "Brief-Case," by Hugo Gernsback and Clifford E. Denton.

The Denton 2-Tube All-Wave Receiver, by Clifford E. Denton.

The Denton "Stand-By," by Clifford E. Denton.

The "Stand-By" Electrified.

A COAT-POCKET Short-Wave Receiver, by Hugo Gernsback and Clifford E. Denton.

The S-W TENTODE-4, by R. G. Cisin, M. E.

Louis Martin's Idea of A GOOD S-W RECEIVER, by Louis Martin.
