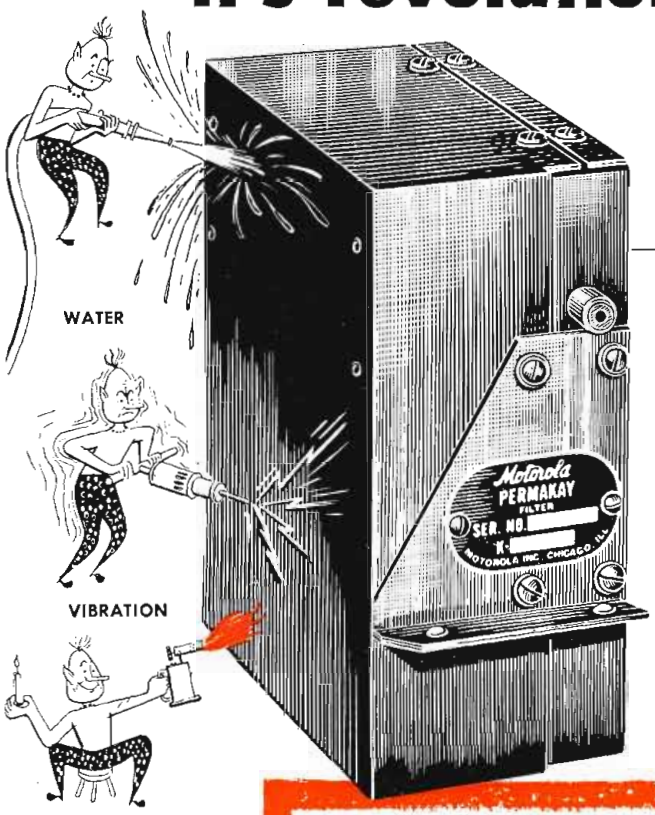
CALDWELL-CLEMENTS, INC.

it's revolutionizing 2-way radio



it's permanent!

Motorola's amazing invention . . . THE SENSICON PERMAKAY FILTER FOR GUARANTEED PERMANENT SELECTIVITY! *Thousands in the field, operating year in and year out, without failure.*

Permakay is here to stay as the keystone of the Sensicon Circuit

The Permakay I.F. Wave Filter for PERMANENT SELECTIVITY—*guaranteed for the life of the set!* This coil and capacitor filter network is noise-balanced for optimum signal-to-noise ratio, achieved by counterphasing. These super-precision elements are cast in solid waterproof plastic which will not melt, crack, loosen, or deteriorate. PERMAKAY thus assures *permanent* precision selectivity, reduces maintenance, and increases all-around serviceability of your Motorola equipment.

. . . AND HERE AGAIN THE *MOTOROLA GUARANTEE* provides perfect radio service today and protects against obsolescence tomorrow. When radio channels are split you need not buy a new receiver — simply exchange the standard-channel Permakay filter for a new split-channel filter and your receiver is up to date and ready for years of service.

this

but

we can show you how to use it less and less and less

For more information on how Centralab Printed Electronic Circuits can offer you big savings . . . See Next Two Pages.

Here's Proof: Printed Electronic

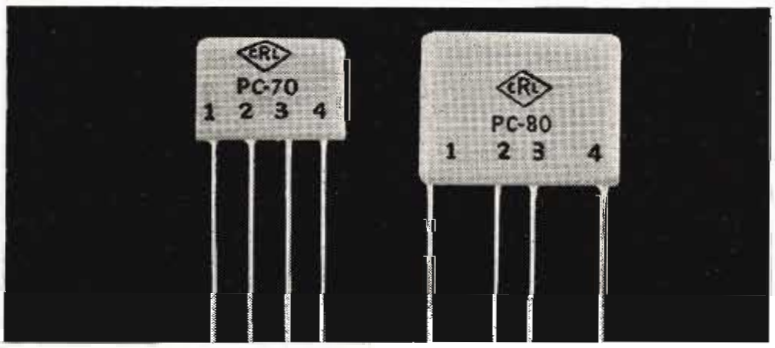
What are Printed Electronic Circuits?

Printed Electronic Circuits are complete or partial circuits (including all integral circuit connections) consisting of pure metallic silver and resistance materials fired to CRL's famous Steatite or Ceramic-X and brought out to convenient, permanently anchored external leads. They provide compact miniature units of widely diversified circuits — from single resistor plates to complete speech amplifiers. No other modern electronic development offers such tremendous time and cost saving advantages in low-power applications. ***Important to note:*** All PEC's illustrated are developed for standard applications. Numerous other circuit complements can be furnished for volume requirements.

How Do They Save Time and Money — Space and Weight?

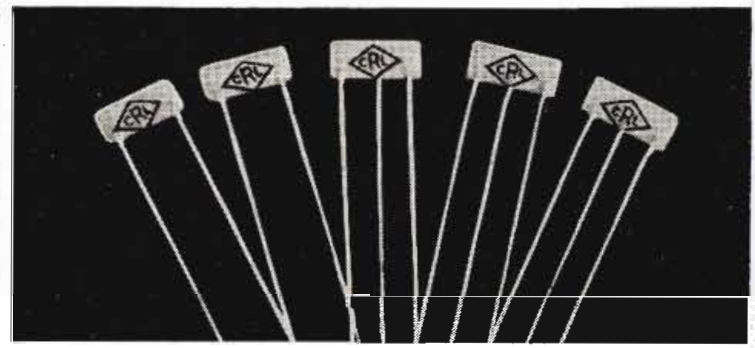
Because Printed Electronic Circuits combine several components on a single plate unit, they eliminate approximately 25% to 80% of formerly required soldered connections within the circuits they replace. This means simplified assembly — savings in material. What's more, because they replace several individual components, they cut down your purchases and inventory. Because they are complete assembled circuits, they do much to eliminate wiring errors. Their small size (note illustrations) means less space needed as well as less weight . . . important factors in today's crowded chasses.

60% Less Soldered Connections with Centralab Triode Couplates



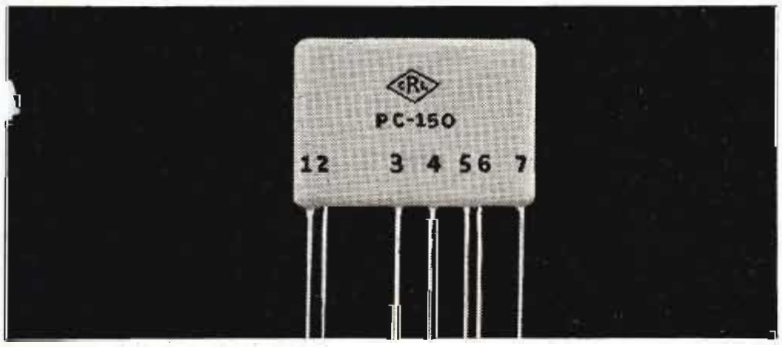
Centralab Triode Couplates replace 5 components normally used in audio circuits. Triode Couplates are complete assemblies of 3 capacitors and 2 resistors bonded to a dielectric ceramic plate. Available in a variety of resistor and capacitor values. Technical Bulletin 42-127.

Plate Capacitor and Resistor-Capacitors Excellent for Miniature Use



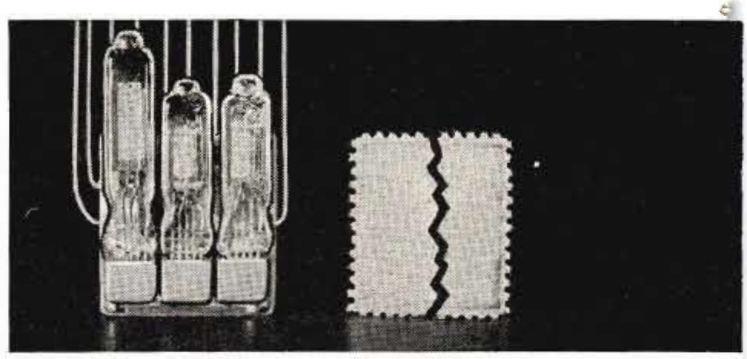
Actual size photograph of plate capacitor, resistor, and resistor-capacitor units. Because of size, they readily fit all types of miniature and portable electronic equipment... overcome crowded conditions in TV, AM, FM and record-player chassis. Technical Bulletin 42-24.

50% Less Soldered Connections with Centralab's AUDET



Audet Printed Electronic Circuits furnish all values of all components generally found in the output stage of AC-DC radio receivers. They provide 4 capacitors and 3 resistors on a small plate with only 7 leads. Technical Bulletin 42-129.

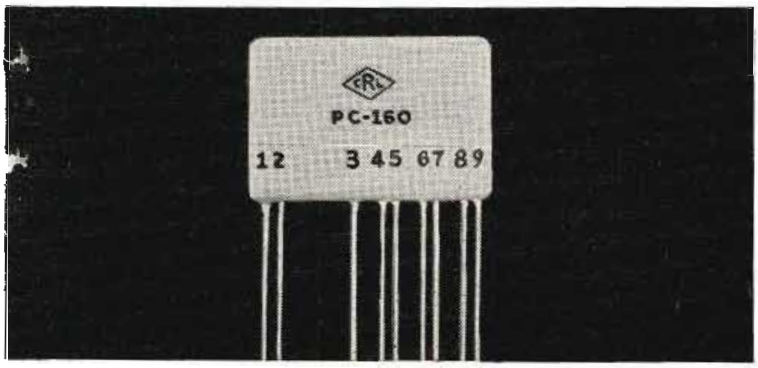
NEW Model 3 AMPEC — A Sub Miniature 3 Stage Speech Amplifier



Here's the latest outgrowth of Centralab's constant research in Printed Electronic Circuit development. The remarkably small dimensions of this new amplifier unit are approximately $1\frac{1}{32}$" x $\frac{15}{16}$" x $\frac{1}{32}$". Check coupon for Technical Bulletin 42-130.

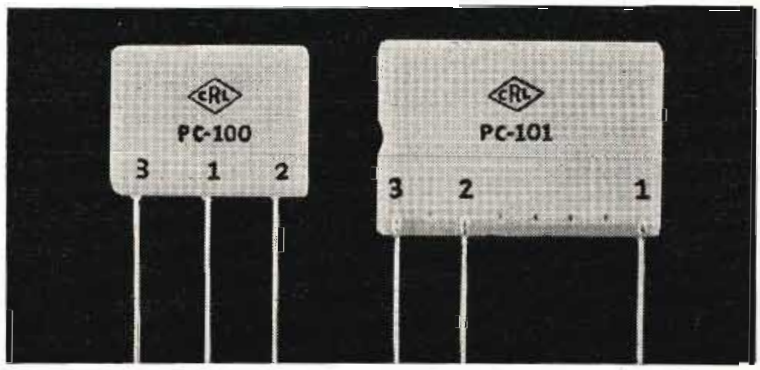
Circuits = BIG SAVINGS

50% Less Soldered Connections With Centralab's NEW PENDET



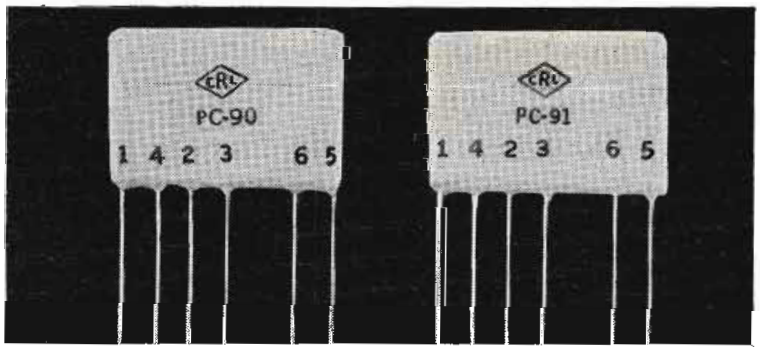
PENDET consists of 5 capacitors and 4 resistors in a single plate with only 9 leads. Similar to the popular AUDET, it is designed to couple the diodetriode and pentode tubes in the output stage of AC-DC sets. Check coupon for Technical Bulletin 42-149.

82% Less Soldered Connections With P.E.C. VERTICAL INTEGRATOR



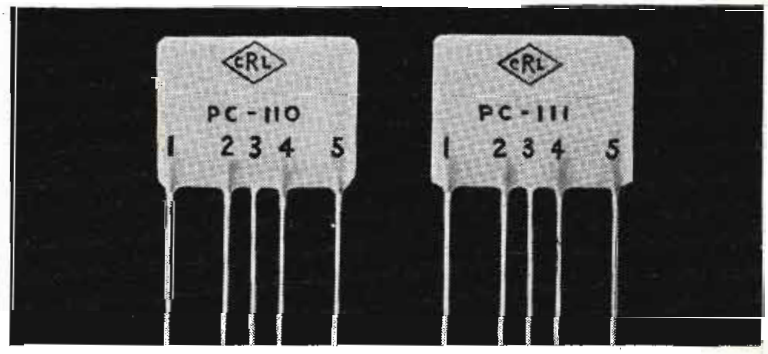
Centralab Vertical Integrators give you big savings in assembly of TV vertical integrator networks. One type consists of 4 resistors and 4 capacitors brought out to 3 leads . . . reduces former 16 soldered connections to 3! Check coupon for Technical Bulletin 42-126.

50% Less Soldered Connections With Centralab's PENTODE COUPLATE



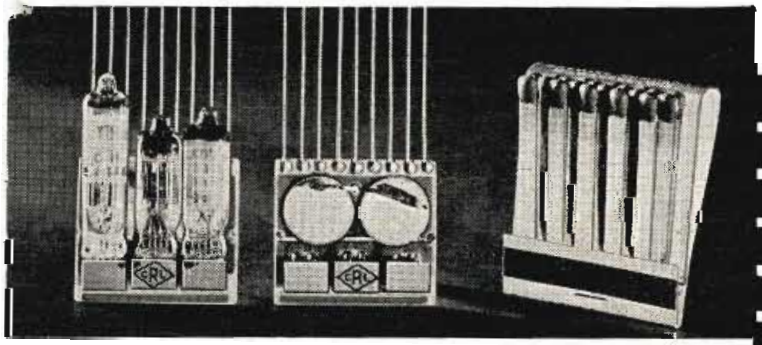
Pentode couplates are complete interstage coupling circuits consisting of 3 capacitors and 3 resistors on a small 6 lead ceramic plate. Compared with old-style audio circuits, they actually reduce soldered connections 50%—wiring errors accordingly. Technical Bulletin 42-128.

28% Less Soldered Connections With NEW FILPLATE



FILPLATES (2 resistors and 2 capacitors) for bypass and filter application in TV, FM and AM, where filter networks of comparable component values and layout are needed. Smaller than special delivery stamp. Save vital low wattage resistor stocks. Technical Bulletin 42-131.

Standard Model 2 AMPEC Miniature 3 Stage Speech Amplifier



AMPEC — A full 3-stage speech amplifier. Provides highly efficient performance. Size 1¼" x 1⅛" x .340" over tube sockets! Used in hearing aids, mike preamps and other applications where small size and outstanding performance counts. Technical Bulletin 42-117.

TELE-TIPS

ANTENNA TUNING SYSTEM designed by the Naval Research Laboratory, automatically matches input impedance of a 35-foot whip-antenna to a 50-ohm coaxial transmission line over "frequency range of 2 to 18 MC. Although designed specifically to operate with standard Navy transmitter of 400 watts output, the design is applicable to a wide variety of automatic impedance-matching problems with only minor variations.

CAPACITOR units in some of the Signal Corps equipments show practically no change in capacitance over a very wide temperature range. The requirements of one of their specifications for small fixed capacitors with ceramic dielectric are such that the measurement calls for the assured observation of a capacitance smaller than 0.03 mmf. Approximately this is the capacitance of a metallic hair, 0.005-inch in diameter, and less than ¼-inch long.

PROJECTION COLOR-TV by the revolving-disk method, is now being developed by one important laboratory near New York. This home receiver is expected to be publicly demonstrated in the near future, showing that, despite light losses in the color-disk, adequate screen illumination can be obtained.

TV AT 20,000 FT.—The first attempt to receive television aboard a transpacific Hawaii-bound airliner recently succeeded on United Air Lines' Flight 49, outbound from San Francisco. The joint experiment was conducted by technicians of United and KRON-TV of San Francisco, using a three-year-old RCA table model with a 10-inch screen. Richard Grace, United radio engineer who monitored reception of a KRON-TV newscast, reported that the program came in clear while the Stratocruiser prepared for take-off. The image grew fuzzy during take-off but as the plane gained altitude it sharpened. Reception at 20,000 feet was perfect for 250 miles west of San Francisco, Grace said. Beyond that mark the signal grew weak and finally faded out, 306 miles from the Coast.

(*Continued on page* 14)

UNITED SPECIALTIES'

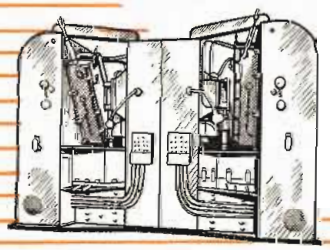
latest in television shells

21-INCH RECTANGULAR

Within the past year United Specialties Company has kept its shell designs right in step with the latest in picture tube requirements. Early in 1950 United produced deep-drawn, 16-inch round shells in quantity. This was followed by shallow 16-inch round shells and 17-inch rectangular shells. Now United is producing 21-inch rectangular shells and stands ready to answer new demands as developments unfold.

Equipped with the very latest in spinning machines, United's television shells meet the most rigid specifications of the industry.

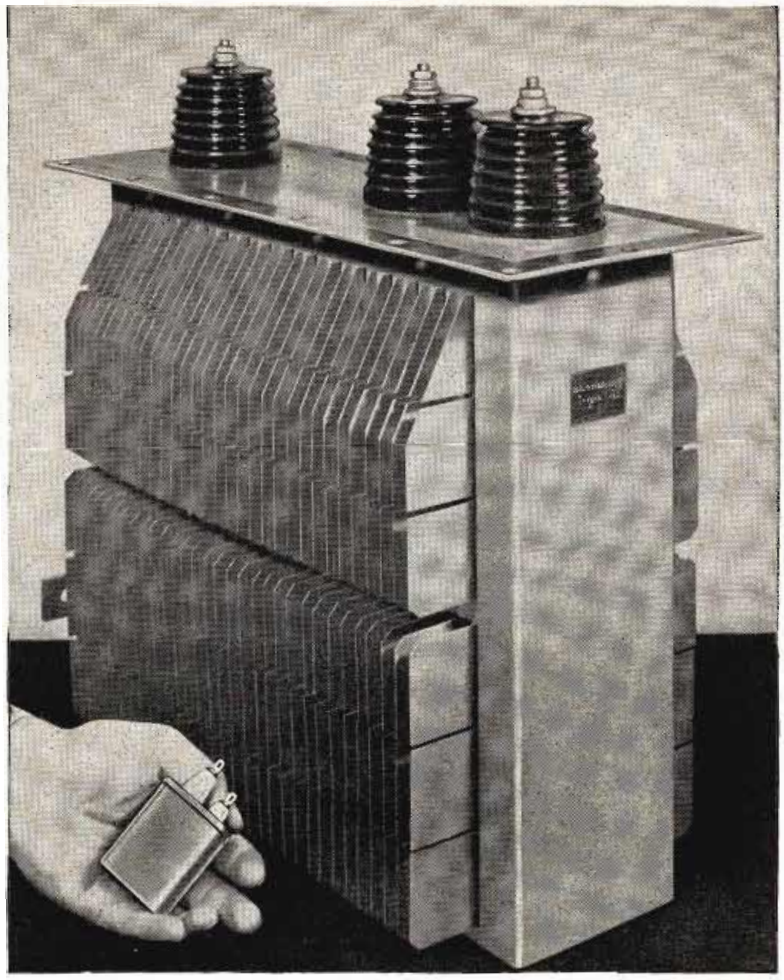
UNITED SPECIALTIES COMPANY
Chicago 28, Illinois



NEW SPINNING MACHINES EXPAND PLANT FACILITIES

With the installation of the most advanced spinning machines available, United has facilities for manufacturing heavy gauge spun products for defense needs. Utilized for television shell production now, these machines can be allocated for military needs whenever necessary.

pulse-forming Network Capacitors are dependable



for guided missiles—aircraft—land and sea radar equipments

The keystone to good service on network capacitors is complete information. Your G-E representative has a check-list of twenty-three questions that must be answered to assure you of dependable capacitor performance. And on important propositions, to simplify your design problems, it is highly desirable that o design engineer be called into the discussions as early as possible. Arrangements for such consultations can be made through any Apparatus Sales Office of the General Electric Company.

Whether you expect a service life of 10,000 hours or just 60 seconds, G.E. networks, designed to meet exacting specifications, will give you the reliable performance you require.

Pulse networks are a highly specialized field of capacitor engineering and experience is an important part of proper design work. G.E. has built networks for every type of pulse radar equipment since the inception of radar.

Since 1944, G.E. has been running continuous life tests on many types of networks to obtain more complete research data. These tests are being used to establish life limitations under various conditions of highly critical temperatures and voltages on all types of dielectrics, bushings, materials for coil forms and treating processes. Take advantage of this wealth of information and experience. Your inquiry addressed to Capacitor Sales Division, 42-304, General Electric Company, Pittsfield, Mass. or your nearest Apparatus Sales Office, will receive prompt attention.

General Electric Company, Schenectady 5, N. Y.

You can put your confidence in—

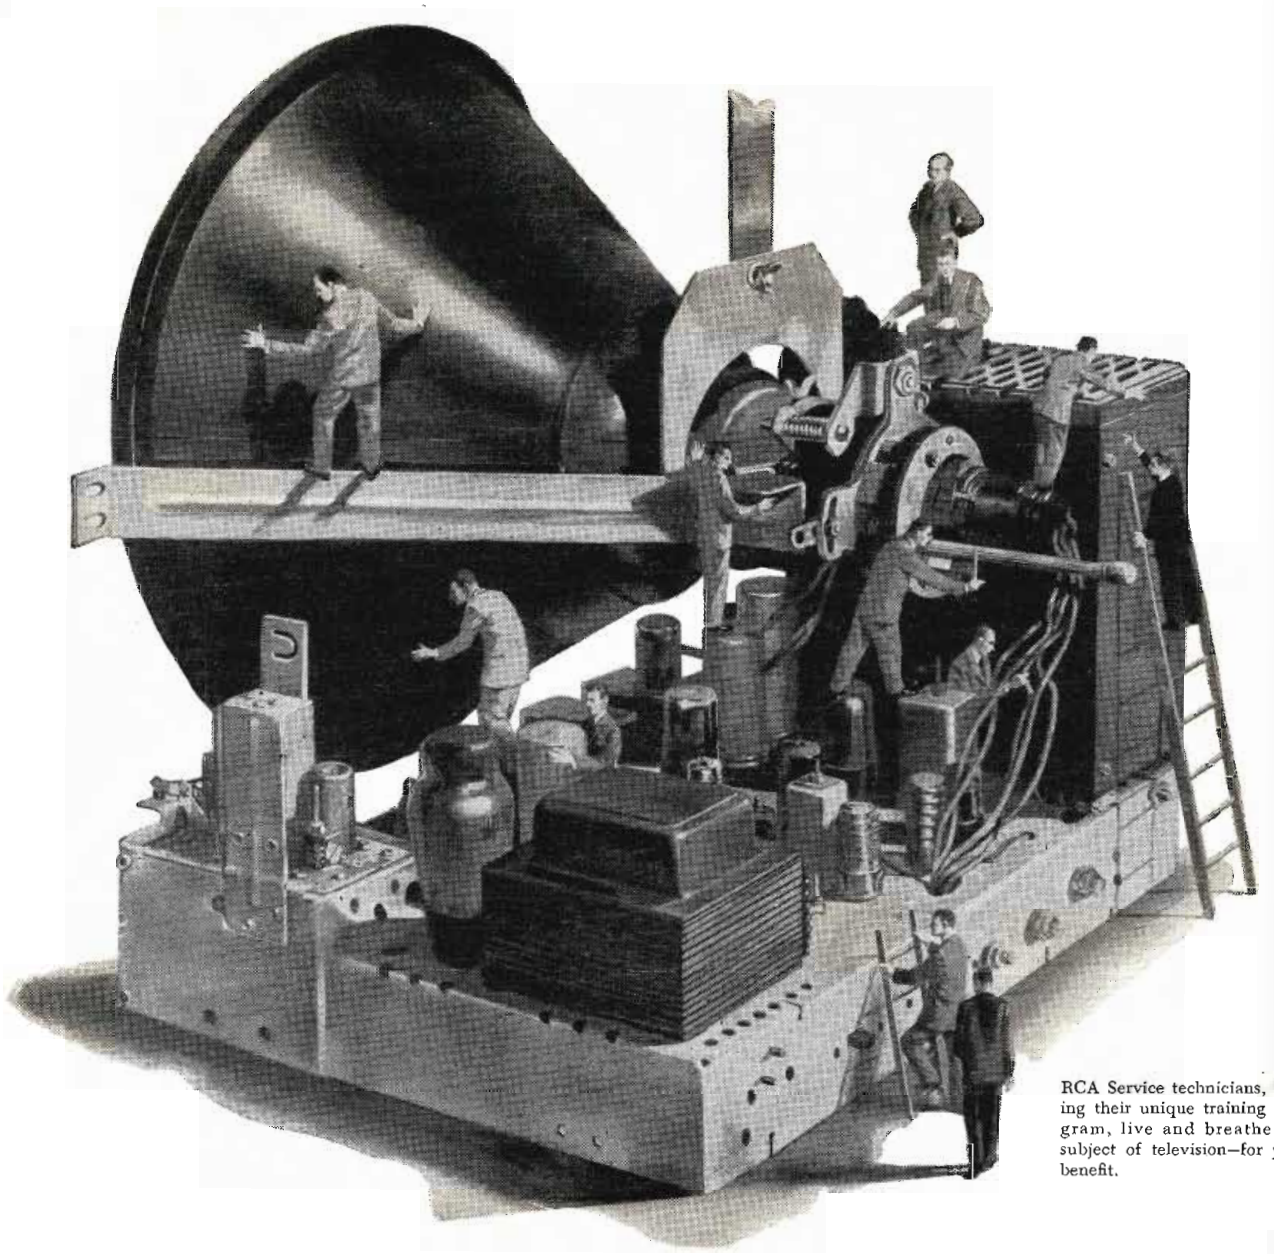
407-304



RCA Service technicians, during their unique training program, live and breathe the subject of television—for your benefit.

These men get TV's Inside Story

When you buy a fine television receiver, correct installation and maintenance are as important as the set. For service technicians, RCA has developed the only training program of its kind—a *factory* program.

During their studies, these men learn the basic facts of modern, all-electronic TV... how it reached its present perfection by research at RCA Laboratories... how to build a television receiver... how to select and install the right antenna for your *home* ...all the complexities of kinescopes, electron guns, tubes, television cameras and transmitters.

When their studies are complete, they have a grasp of television's *inside story* that assures you the most perfect installation and maintenance possible—under your RCA Victor Factory-Service Contract.

* * *

See the latest wonders of radio, television, and electronics at RCA Exhibition Hall, 36 West 49th Street, N.Y. Admission is free. Radio Corporation of America, RCA Building, Radio City, N.Y. 20, N.Y.

Get all the performance that's built into your new RCA Victor home television receiver through an RCA Victor Factory-Service Contract.

Compactness

for resistors

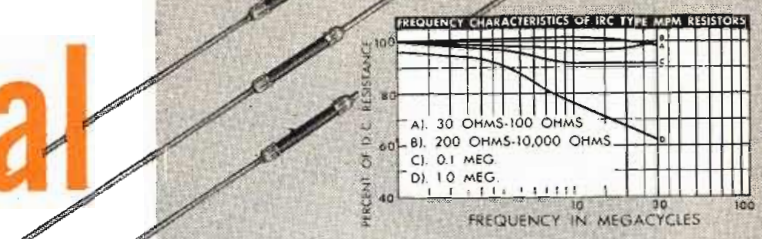
More and more components in less and less space! That's the manufacturer's dilemma as necessity shrinks the size of electrical and electronic instruments and equipment.

But compactness need not create bottlenecks —if you specify IRC *miniature resistors*. Years ago, we foresaw the trend to compactness and got ready for it. Now, with the widest line of resistor types in the industry, IRC can supply miniature components for almost any application.

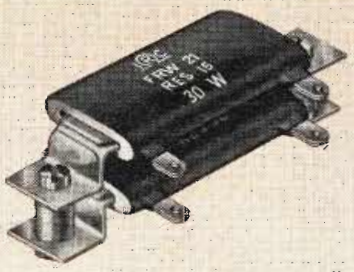
Only 15/16" in diameter, compact new IRC Type Q Controls adapt to a wide variety of small-space applications. Rugged construction features one-piece dual contactor of thin, high-stress alloy—simplified single-unit collector ring—molded voltage baffles—special brass element terminals that will not loosen or become noisy when bent or soldered. Salt-spray materials, when specified, protect against humidity; change in resistance is negligible even after long exposure. Noise level is low and Type Q Controls have unusual durability and efficiency. Coupon brings you full details in Catalog A-4.

is essential

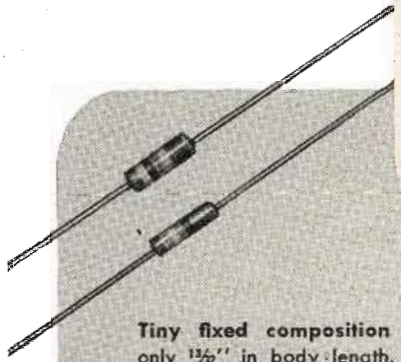
too!



Miniature MPM Resistors are ideally suited to high frequency receiver and similar applications. Frequency characteristics are outstanding, but absolute balance has been maintained with all other significant electrical characteristics. These are the same as in larger IRC Type MP Resistors. MPM's are constructed of solid steatite ceramic rods, to which a thin resistance film is permanently bonded. Changes due to humidity and aging are held to a minimum. Resistor body is 9/16" long, and active resistance section only 3/8" long. Send for complete information in Catalog F-1.



Higher space-power ratio than tubular wire wounds suits small, flat Type FRW fixed and adjustable wire wounds to voltage dropping applications in limited space. FRW's may be mounted vertically or horizontally, singly or in stacks. Non-magnetic mounting brackets extend through resistors—allow easy and economical mounting—aid in heat distribution along entire length—and transfer internal heat to chassis. Light-weight construction combines with exceptional mechanical strength and ability to withstand severe vibration. Bulletin C-1 gives full performance data.



Tiny fixed composition resistors—Types BTR and BTS—are only 13/32" in body length. At 1/3 and 1/2 watts, respectively, these miniature units set new performance standards for fixed composition resistors. Advanced BT's *easily meet the rigorous requirements of* television—actually exceed JAN-R-11 Specifications! Balanced in every characteristic, BT's are especially well suited to high ambient temperatures. Power dissipation is excellent. Other Advanced Type BT's meet and surpass JAN-R-11 Specifications at 1 and 2 watts. Write for full particulars in Catalog B-1.

When you're squeezed for "small-orders" of standard resistors in a hurry, simply call your IRC Distributor. IRC's Industrial Service Plan enables him to give you fast, 'round-the-corner delivery of standard resistors for experimental work, pilot runs, maintenance. We'll be glad to send you his name and address.

KESTER SOLDER

hp OFFERS COMPLETE COVERAGE

1. ..in electronic test instrumentation..

Today, *-hp-* offers complete insttumentation for virtually every type of electronic measuring. Fot audio work, *-hp-* oscillatots and generators, ½ to 10,000,000 cps. For voltage measurements, vacuum tube voltmeters (ac and battery) 2 to 700,000,000 cps. For VHF, UHF and SHF, signal generators 10 to 7,600 mc. For microwave, a broad-band line covering all coaxial and 6 most-used waveguide frequencies. For microwave impedance and power measurements, complete new instrumentation, 10 to 12,400 mc. For frequency measurement, standards, monitors and cycle counters, .01 to 200 mc. These and more — over 200 fast, accurate, easy-to-use instruments — the world's most complete coverage of electronic measuring needs.

2. ..in convenient, "next-door" service..

-hp- has selected the best independent organizations in America to give you person-to-person help with your measuring problems. You are served by electronic specialists—men trained by Hewlett-Packard, fully informed about all *-hp-* instruments. These men save your time by helping select exact instrumentation you require. They can offer expert counsel on your measuring problems. They are located in major business centers, as near to you as your telephone. Call them whenever, *wherever* you need personal help, in your plant, *today!*

The *-hp-* field service program saves time!

The *-hp-* direct-to-you sales policy saves money!

There is a trained *-hp-* representative near you!

(*Continued from page* 6)

PRINTING COLOR-TV—By the grapevine, we learn that in a New York print shop in the spring of 1950, experiments were conducted for RCA, looking to mass production of color-tube plates. Patterns of small dots were printed on glass sheets, using rubber plates, employing three types of phosphor pigments, similar to printing three-color pictures. Each set of dots was not to coincide with any of the other sets of dots. These experiments were successful, from the printing standpoint, and a number of such printed-phosphor glass plates were made. Other experiments were then carried on to do similar printing via the silk-screen process. The phosphor pigments used in printing were supplied by RCA. In daylight, all the material was white to the naked eye, but was said to glow blue, red and green, according to its type.

RADIO CHAOS IN EUROPE?—Last year, the nations of Europe agreed on a radio allocation for the Continent known as the Copenhagen Plan, charted on page 35 of August TELE-TECH. But now (it is claimed by the Iron Curtain countries) U. S. stations in the Occupation zones are disregarding the Copenhagen allocation and are operating powerful broadcast stations on any channel at will, making the night air of Europe an intolerable chaos, reminiscent of the U. S. radio chaos of 1926, and spoiling radio listening for France, Belgium, and Holland, as well as the Communist countries. Frantic complaints are printed in the last issue of Organisation Internationale de Radiodiffusion's "Documentation and Information Bulletin," from Prague, Czechoslovakia.

MARCONI'S "WHY?"—Hitherto unpublished correspondence of Guglielmo Marconi has been incorporated in a new booklet written by Orrin E. Dunlap, Jr., vice president of RCA. Unfolded here is story of Marconi's yearning to learn the mysterious cause of the great invention he fathered. "Indeed, the 'why' of radio continually challenged Marconi," Mr. Dunlap writes. "After a night of vigil in long-distance test of wireless between the English Channel and Australia, he turned to his friend David Sarnoff on board the Elettra (Marconi's yacht) and with a perplexed expression remarked: 'There is one thing I would like to know before I die—why this thing works!'"

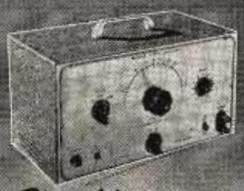
New 1952 HEATHKITS

Heathkit TELEVISION GEN. KIT $39.50

Heathkit ELECTRONIC SWITCH KIT $19.50



Heathkit AUDIO GEN. KIT $34.50

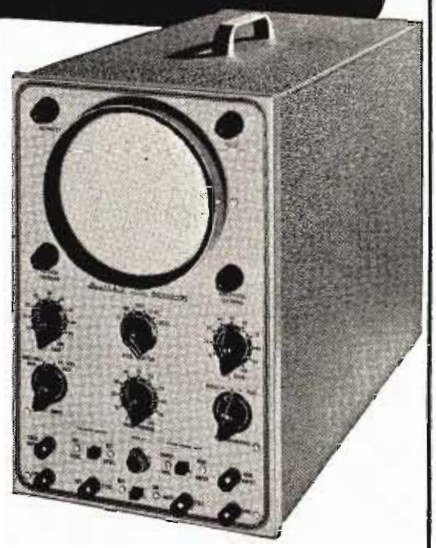
Heathkit CONDENSER CHECKER KIT $19.50

Heathkit R. F. SIGNAL GEN. KIT $19.50

Heathkit A.C. VOLTMETER KIT $29.50

Heathkit SQUARE WAVE GEN. KIT $29.50

Heathkit 5" OSCILLOSCOPE KIT



- New "spot shape" control for spot adjustment — to give really sharp focusing.
- A total of ten tubes including CR tube and five miniatures.
- Cascoded vertical amplifiers followed by phase splitter and balanced push-pull deflection amplifiers.
- Greatly reduced retrace time.
- Step attenuated — frequency compensated — cathode follower vertical input.
- Low impedance vertical gain control for minimum distortion.
- New mounting of phase splitter and deflection amplifier tubes near CR tube base.
- Greatly simplified wiring layout.
- Increased frequency response — useful to 5 MC.
- Tremendous sensitivity .03 RMS per inch Vertical .6V RMS per inch Hor.
- Dual control in vernier sweep frequency circuit — smoother acting.
- Positive or negative peak internal synchronization.
- Multivibrator type Wide Range Sweep Generator.

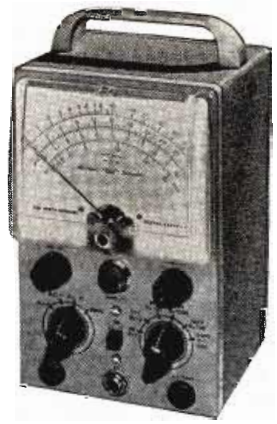
A brand new 1952 Heathkit Oscilloscope Kit with a multitude of outstanding features and really excellent performance. A scope you'll truly like and certainly want to own.

The kit is complete with all parts including all tubes, power transformer, punched and formed chassis, etc. Detailed instruction manual makes assembly simple and clear — contains step-by-step instructions, pictorials, diagrams, schematic, circuit description and uses of scope. A truly outstanding value.

MODEL O-7
SHIPPING WT. 24 LBS.

$43.50

Heathkit VACUUM TUBE VOLTMETER KIT



- New styling — formd case for beauty.
- New truly compact size — Cobinet 4⅛" deep x 4-1/16" wide x 7⅜" high.
- Quality Simpson 200 microamp meter.
- New ohms battery holding clamp and spring clip — assurance of good electrical contact.
- Highest quality precision resistors in multiplier circuit.
- Calibrates on both AC and DC for maximum accuracy.
- Terrific coverage — Reads from ½V to 1000V AC, ½V to 1000V DC, and .1 to over 1 billion ohms resistance.
- Large, clearly marked meter scales indicate ohms, AC Volts, DC Volts, and DB — has zero set mark for FM alignment.
- New styling presents attractive and professional appearance.

The 1952 Model Heathkit Vacuum Tube Voltmeter! Newly designed cabinet combines style and beauty with compactness. Greatly reduced size to occupy a minimum of space on your work-bench. Covers a tremendous range of measurements and is easy to use. Uses only quality components including 1% precision resistors in multiplier circuit for greatest accuracy. Simpson 200 microamp meter with easy to read scales for fast and sure readings.

All parts come right with kit, and complete instruction manual makes assembly a cinch.

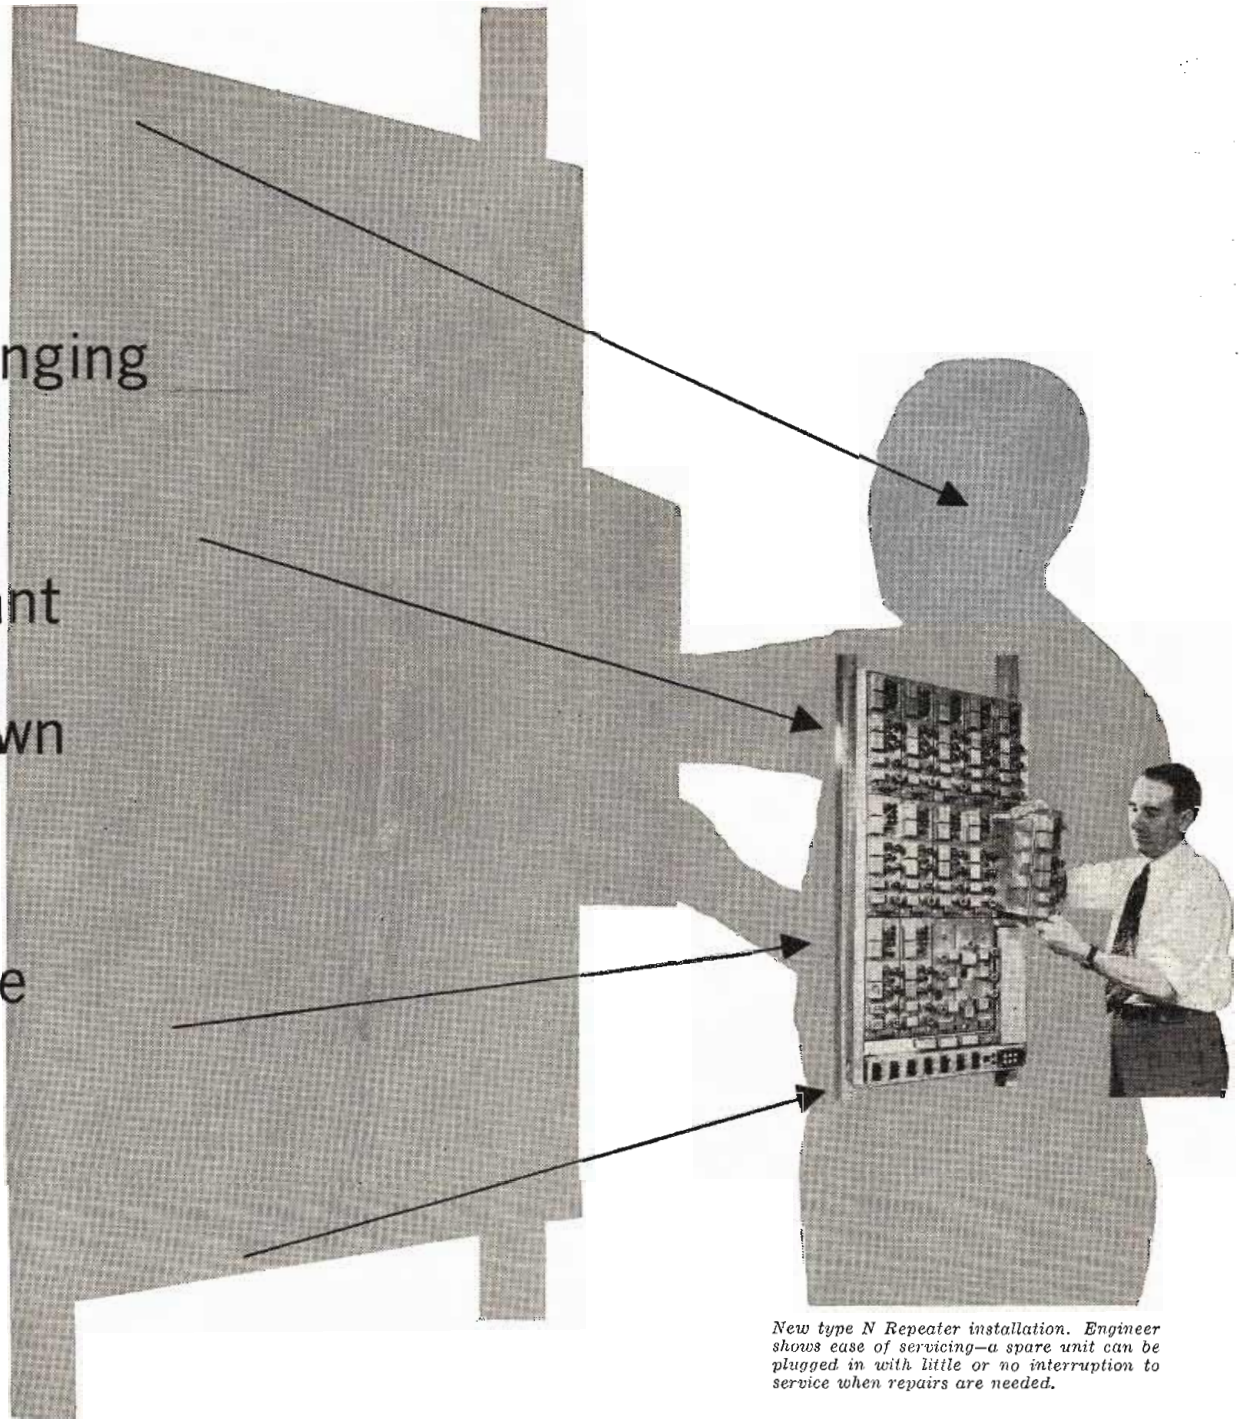
bringing a giant down to size



New type N Repeater installation. Engineer shows ease of servicing—a spare unit can be plugged in with little or no interruption to service when repairs are needed.

"CARRIER SYSTEM" telephony is economical, because many voices use the same pair of wires. But the extra equipment needed formerly limited it to the longer distances.

Now Bell Laboratories have developed new short-haul carrier, economical down to 25 miles, sending 12 conversations on two pairs of wires in a cable.

Keys to the new system are new circuits, miniature tubes, pocket-size wave filters and Permalloy "wedding ring" transformer cores that will barely slip over a man's finger. New manufacturing processes were developed in co-operation with the Western Electric Company. Components are pressed into a plastic mounting strip with heat, a score at a time, instead of being mounted separately.

With this new carrier system more service can be provided without laying more cables. Tons of copper and lead can be conserved for other uses. It's another example of how science takes a practical turn at Bell Telephone Laboratories, to improve service and to keep its cost down.

BELL TELEPHONE LABORATORIES

WORKING CONTINUALLY TO KEEP YOUR TELEPHONE SERVICE ONE OF TODAY'S GREATEST VALUES

Special Purpose TUBES AND DEVICES

Only a few companies in the country have facilities equal to ours for handling development and mass-production of special-purpose infra-red, photo-electric and advanced thermionic devices.

Our research and production specialists have done outstanding development work on such specialized equipment as thyratrons, tri-color display tubes, projection type P.P.I. presentation tubes, etc.

We have facilities for large-volume metal-to-glass sealing, high-vacuum pumping and sealing, annealing, automatic washing, handling of gases, etc.

Our 125,000 square feet of sprinklered floor space has more than a mile of flexible conveyors, large air conditioned areas and pipe line distribution of hydrogen, oxygen, purified water, city water and fuel gas. Quality control facilities and standards equal those of pharmaceutical or jeweled-movement manufacturers.

An ample supply of labor of better than average quality is accustomed to working to tenths-of-thousandths tolerances. We invite inquiries on projects requiring far more than ordinary ability.

TELE-TIPS

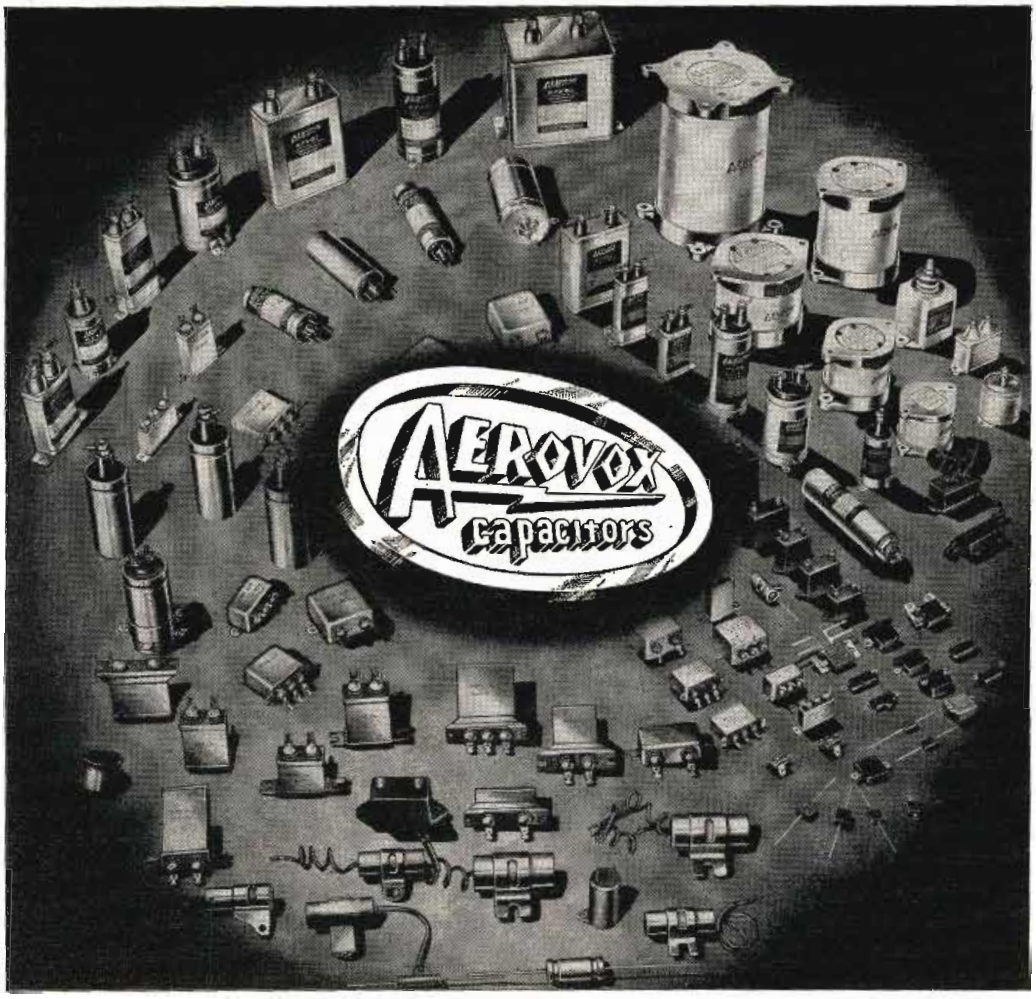
(*Continued from page* 14)

COLOR FILMS are still under 20% of the total feature pictures produced by the movie industry, according to the Motion Picture Production Encyclopedia. In 1943, the color percentage was 4.3%; '44, 5.8%; '45, 7.8%; '46, 8.1%; '47 11.2 %; '48, 16.4%; '49, 14.5%; '50, 19.6%. The first color picture was produced in this country in 1917.

MUSIC "FOR FREE" from the air is available for many residents of large apartment houses. Although usually unknown to many such residents in numerous cities, local and national background music services use carrier-current equipment for supplying music to large blocks of apartments. Hence it is often possible for the non-paying outsider to tune in to those programs at the high or low end of the band, and avail himself of free music!

PORTABLE TV-SET called "Tele-Scope" and contained in a suitcase, is being developed by Thompson L. Guernsey, R4A, 349 E. 49th st., New York 17, well-known radio figure of Dover-Foxcroft, Maine. The small picture tube, viewed through lenses, gives impression of a huge 8 x 12 ft. screen, 30 ft. distant. Set operates from 110-volt AC circuit. Provided with earphones it permits one-person viewing without disturbance to others. Also proposed for hospital and disabled-veteran viewing, police cars, beauty shops, airplanes, etc. Estimated retail price, about $150.

SUMMER is the TIME when people often come to hate radio. Hot weather means open windows, open windows mean radio "noise" percolating into adjoining apartments. Now that television programs continue as late at night as radio programs—and even later in some cases —a very real problem is sometimes posed by thoughtless neighbors. We wonder whether the FCC would sanction the manufacture and sale of miniature transmitters covering the TV channels, and with a built-in microphone by means of which sufferers could "sit on" the station of the offenders' choice and tell him more or less politely to "turn it down". We feel somehow, that the days of connecting the spark side of a *Ford* coil to a piece of wire as means of shutting up the offenders, are over!



SAFE Capacitor Specifications

● From tiniest metallized-paper capacitor symbolizing *miniaturization,* to giant oil capacitor for atom-smashing Betatron, you are SAFE in *specifying Aerovox.* For Aerovox makes *all* categories, types, sizes and ratings. More than that: with a background experience second to none, Aerovox engineers are always ready to study your circuitry, components, operating conditions and anticipated life. Thus capacitor selection is custom-fitted to your exact requirements. And that is why Aerovox capacitors have such outstanding service records.

• Literature on request. Submit that capacitance problem for engineering aid and quotations.

INTERFERENCE FILTERS

For military and civilian needs, particularly aircraft and radio-equipped vehicles.

MICA CAPACITORS

Dozens of different types, including low-loss molded casings and the silver micas.

MOLDED PAPER TUBULARS

For extra-severe service. Aerolene impregnant eliminates necessity of stocking both oil and wax tubulars. No deterioration in stock.

OIL CAPACITORS

From tiniest tubulars to giant steel-case units in ratings up to 50,000 volts.

HIGH-TEMPERATURE MINIATURES

Hermetically-sealed with vitrified ceramic seal, in tubular metal case.

METALLIZED-PAPER

Full utilization of space-saving factor, together with self-healing feature.

MICRO-MINIATURES

Molded thermo-plastic tubulars. Two sizes: 3/16" d. x 7/16" l.; ¼" d. x 9/16" l.

ELECTROLYTICS

Widest choice of containers, terminals, mountings, combinations. In 85° C. and higher temperature ratings.

THESE LIFE LINES OF AMERICA...

use long life dependable Sylvania Tubes

Progressive railroads everywhere are now using Sylvania radio tubes for multiple communications systems.

In engine-caboose-signal-tower networks, where clear tone and unfailing dependability are of utmost importance, Sylvania tubes are winning increased acceptance. These tubes are designed, built and tested to take more than their share of vibration and rough treatment.

Also, their clarity and freedom from internal noises make them ideal for critical transportation applications . . . in trains, buses, police cars, taxi cabs.

The Sylvania quality tube line is a complete line. Made in miniature and standard sizes. Also low-drain battery tubes for efficient, compact portable sets.

Get new listings

Call your distributor for new listings and full information. If he cannot serve all your needs immediately, please be patient. Remember, the tube situation is still tight and your distributor is doing his best to deal fairly with all his customers. For further information address: Sylvania Electric Products Inc., Dept. R-1409, Emporium, Pa. *Sylvania representatives are located in all foreign countries. Names on request.*

TINNERMAN

Speed Nut®

SAVINGS STORIES

Designed in Metal... to give you samples before blueprints

Every new SPEED NUT design is worked out on manual presses to provide samples for testing and approval BEFORE blueprints of the part are drafted

SPEED NUT time-savings begin early. Experimental samples are created faster because Tinnerman engineers streamline the design process.

A design-in-metal is created with only a rough draft as a guide. Dies that pierce, bend, trim are selected from thousands like those illustrated below. These are set up in a series of manually operated presses to shape bits of metal into fasteners engineered for specific fastening functions. The samples produced are accurate prototypes of the finished fasteners, and can be used for mock-up assemblies.

These parts are then tested and approved by the customer before blueprints are drafted and the part is put into production.

In times like these, high-geared fastener engineering saves valuable production hours and profit dollars. Proof of Tinnerman's ability to serve you is outlined in a new 20-page booklet, "A Story of Quality". Write for your copy. TINNERMAN PRODUCTS, INC., Dept. 12, Box 6688, Cleveland 1, O.

In Canada: Dominion Fasteners Ltd., Hamilton. In Great Britain: Simmonds Aerocessories, Ltd., Treforest, Wales.

Radio-TV's Outlook Abroad

Opportunities for AM, FM, UHF and Microwave in the World At Large

Most American radio men are so busily occupied in radio-equipping our own communities and our own continent that they give little thought to the big job that remains to be done to fit out the rest of the world with AM, FM, TV, UHF, microwaves, and all the rest of our diversified radio facilities.

The figures on the front cover of this issue will come as a surprise to many readers. Repeating them here, for your convenience:

The Western Hemisphere, with only 14% of the world's population, has 75% of the world's transmitter power; 75% of the world's tube sockets, and 97% of the world's television sets.

★ ★ ★

Let's take a similar comparison of present *world* radio statistics measured against our own USA. This affords an even more striking contrast of the tremendous and intensive radio development of our own continental area, as compared with the rest of the world:

The United States, with only 7% of the world's population, has 65% of the world's transmitter power; 70% of the world's tube sockets, and 98% of the world's television sets.

★ ★ ★

For many years your present publishers have compiled U.S. and world statistics on radio sets in use. These figures in their latest form, show that all the rest of the world has not yet caught up in radio receivers (92,000,000) to our own total (95,000,000).

And a world census of television sets shows how far, in this newest application, we have outstripped all other nations: U.S. 13,000,000; Great Britain 700,000; Canada 60,000; France 30,000; Russia 25,000; Mexico 20,000; Germany 20,000.

We need to remember that the radio spectrum, as we know it, is not limited merely to our own continental borders, but extends, with equal effectiveness all over this old globe. And soon even American TV programs may be short-waved to Europe by a series of "Stratovision" jumps between U. S. flat-tops!

American Radiomen must get to thinking hemispherically and world wide.

The rest of the world needs and wants what we have to offer.

The RADARSCOPE

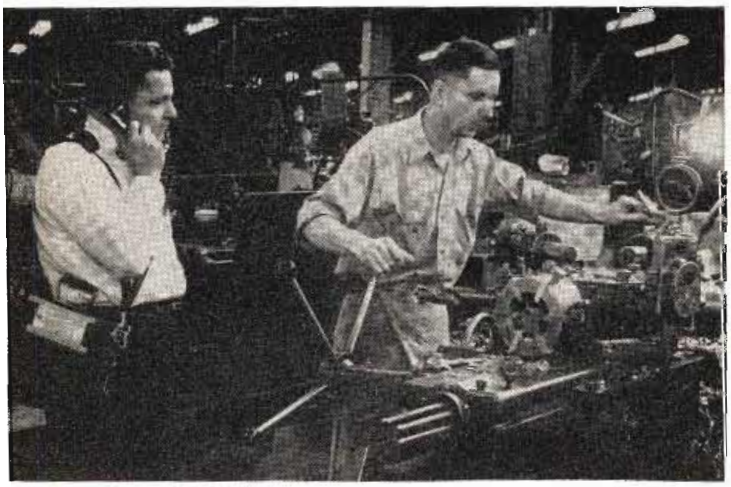
Revealing at a Glance

PENTAGON

AIR FORCE PROGRAM FOR 1951—The electronics-radio-radar manufacturing industry will have a most substantial increase in assignments from the air Force and from the Naval Aeronautics Bureau in the current program of the Joint Chiefs of Staff for a 75-per-cent expansion of military aircraft during the next fiscal year—July 1, 1952, to June 30, 1953. The boost will be from the currently projected 95-group strength of the Air Force to 138 or even 150 groups, and this would mean another 60-billion-dollar military budget. Although the program is not yet firmed—and might even be reduced by 15 billion dollars if the international situation calms—such a budget would mean the expenditure of probably more than $3 billion for electronic equipment for the military aircraft.

FCC

TV "FREEZE" THAW—With the FCC decision to commence immediately the cracking of its three-year-old "freeze" on the construction of new television stations through the consideration of applications for "temporary" power increases on a case-by-case basis, the outlook is for a full lifting of the "freeze" by early next year. With that road-block pushed aside, construction will be commenced or will be completed before the end of 1952 on at least fifty new TV stations (or about half as many as the existing 107 stations now on the air). FCC and television-industry authoritative sources estimate the expenditure for the new television-station equipment and construction will aggregate next year up to $17.5 million.



The Weatherhead plant in Cleveland has adopted "Handie-Talkie" portable radiophones in a production-control system that results in complete minute-to-minute data on all projects being handled. Men with Motorola portables move along the production floor and continuously report into the control center on the activities at each production point. By the combination of these reports, the company knows immediately the status of any contract in the building.

EXPORT

LATIN-AMERICA—It is not often realized just what a large market is offered to North American radio manufacturers by the Central and South American countries. At the present time there are over 1700 radio broadcasting stations in the lower part of the American continent. Many of these are of much higher power than corresponding stations in the US. These stations offer a valuable replacement market for radios as well as transmitting and studio equipment, and in most cases currency restrictions can be overcome. Many of these stations are high-frequency operations due to the nature of the terrain to be covered and the large areas. But most listeners are in range of one or two broadcast-band stations. Here would seem to be a market for the now-out-of-date all-wave receivers of a decade ago. Here too, is a heaven-sent opportunity for frequency modulation to find its own niche in the world. The static encountered in many parts of the southern continent makes AM useless for more than a few miles.

COMPONENTS

RECTIFIERS—While most parts and components for TV sets are now in ample supply as a result of the receiver-makers' currently reduced output, there seems to be one component shortage which may yet further restrict the manufacture of finished TV sets. This is the shortage of selenium for rectifiers, now in increasing demand for radio-TV as well as heavy-current electrical uses. Selenium is recovered from the slimes of copper-refinery wastes, and its fixed output is already far behind American industry's needs, particularly for defense applications. New sources are being opened up, as new refiners get into operation. But rectifier engineers predict that with their product preempted for heavy-industry applications from now on, selenium rectifiers will prove to be a bottle neck, holding down radio-TV manufacturers' civilian production during the balance of '51 and '52.

AVIATION

AGAIN RADIO comes to the rescue of the aviation industry. Since the very beginning of commercial air operations radio has been its guide and mentor. Now, today, radio aids are being used to bring down safely huge airliners—and small private craft—which ten years ago would have turned to an alternate base without a second thought. The latest development in radio safety equipment for airlines came with the installation of 40 new electronic auto-pilots manufactured by the Sperry Company, in Convairs of United Air Lines. These new auto-pilots actually take over and fly the aircraft into the traffic pattern of an airfield and put it on the instrument approach. This reduces the strain on the pilot who is able to concentrate

on other cockpit duties incidental in making a blind approach and who is then "handed" a perfectly trimmed aircraft flying on the proper heading just before touch-down. It will be only by the introduction and satisfactory development of such equipment that commercial aviation can offer reliable service.

COLOR-TV

NAME, PLEASE! Already a number of different titles have been proposed for the united-industry compatible color-TV system on which NTSC is working. These proposals include: sub-carrier multiplex color-TV; shunted monochrome TV; compatible monochrome TV, to which color is added by subcarrier multiplex; chromatized monochrome; compatible color-TV; color monochrome parallel system; and N.T.S.C. compatible color-TV system.

Above all, it appears necessary to find a simple natural term which will correctly interpret the NTSC system to the FCC and the public. Even the word "compatible" has been questioned, as meaning little to the layman. A simple self-explanatory label will help mightly when it comes time to sell the new color-TV system to the American public.

ALLOCATION

TROPOSPHERIC INTERFERENCE coming in from stations 1000 to 1500 miles distant, has been very pronounced this past summer and well illustrates the DX performance of which the VHF TV channels are capable when conditions, such as temperature-inversions, etc., are just right. But this annoyance of the past two months also demonstrates that merely increasing co-channel station separation, from 200 miles to even 250 miles or 300 miles, is not going to solve the problem of tropospheric interference when Old Mother Nature decides to turn it on. For complete protection we would need 1500 to 2000 miles separation, and obviously that is too high a price to pay. Tropo TVI which can't be cured, will simply have to be endured!

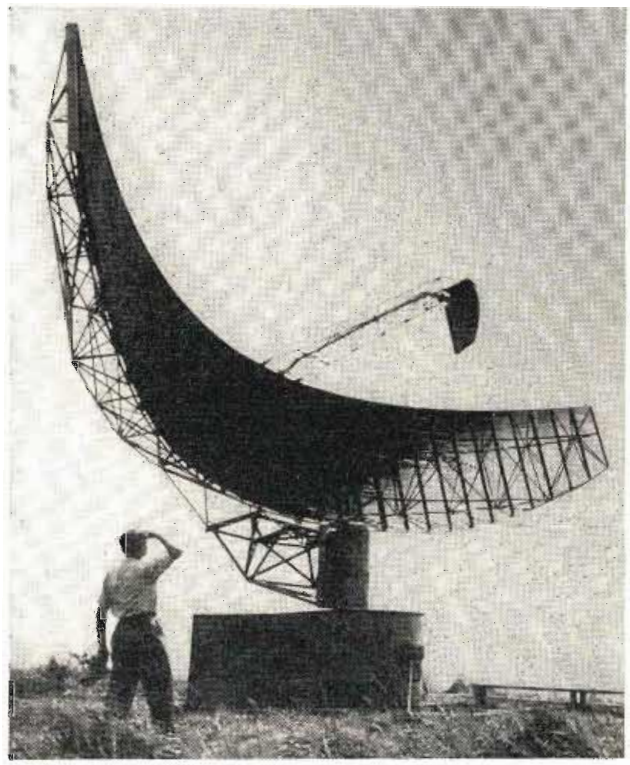
INTERNATIONAL

TELEPHONY will be the future voice of the airlines if the long range plans of the International Civil Aviation Organization mature, and radio telephony is used to replace radio telegraphy on international air routes. This will be the culmination of three years of planning for radio telephony; use in long-range aviation. It has already been used considerably by Pacific flights and now extensions of the service to Australia are planned. The problem of language difficulties has not yet been solved, but interpreters at regional stations may be the answer. In any case it is probable that the increased efficiency of radio telephony will more than outweigh the minor inconvenience of interpretation.

UHF-TV

TOP-FLOOR HOTEL-ROOM demonstrations do not properly show the expected performance of UHF-television reception in the average home living room, —it is frankly admitted by many of the engineers who took part in the recent Bridgeport FCC tests. With sets in upper-floor direct-view of the UHF transmitter only 4 miles distant, reception conditions were at their best, and the FCC Commissioners (and others) probably got an exaggerated idea of UHF's merits from comparing such reception with VHF from 56 miles distant. The real demonstration of UHF performance will be to test out UHF-adapted receivers on the ground floors of homes in average residential communities, at 10 to 20 miles from the UHF transmitter. We will then know better what to expect, in the face of down-lead difficulties, building obstructions, hills and valleys, and the steel barriers of downtown and industrial areas.

A valuable report on such everyday UHF-TV reception in New Haven, 18 miles from Bridgeport, is contained in the communication from Rudy Frank, of Station WELI, on a following page. Mr. Frank's testimony on UHF-TV results in remote ground-floor locations, both business and residential, is timely and important.



Harbor radar, constructed for the port of Le Havre, France, by Raytheon, being tested out in Boston Harbor. Radarscopes show every ship and shore feature, through thickest fogs, so that harbor-master can instruct ships' captains how to move safely to their docks, by a process of "talking the ship in" as used for airplane landings.

DEFENSE CONTRACTS— Who Gets the

Defense Budget for two fiscal years 1951 and 1952 totals $72 billion for hard goods only (military equipment).

Deliveries in fiscal year 1951 total $11 billion; may total $38 billion for two fiscal years 1951 and 1952.

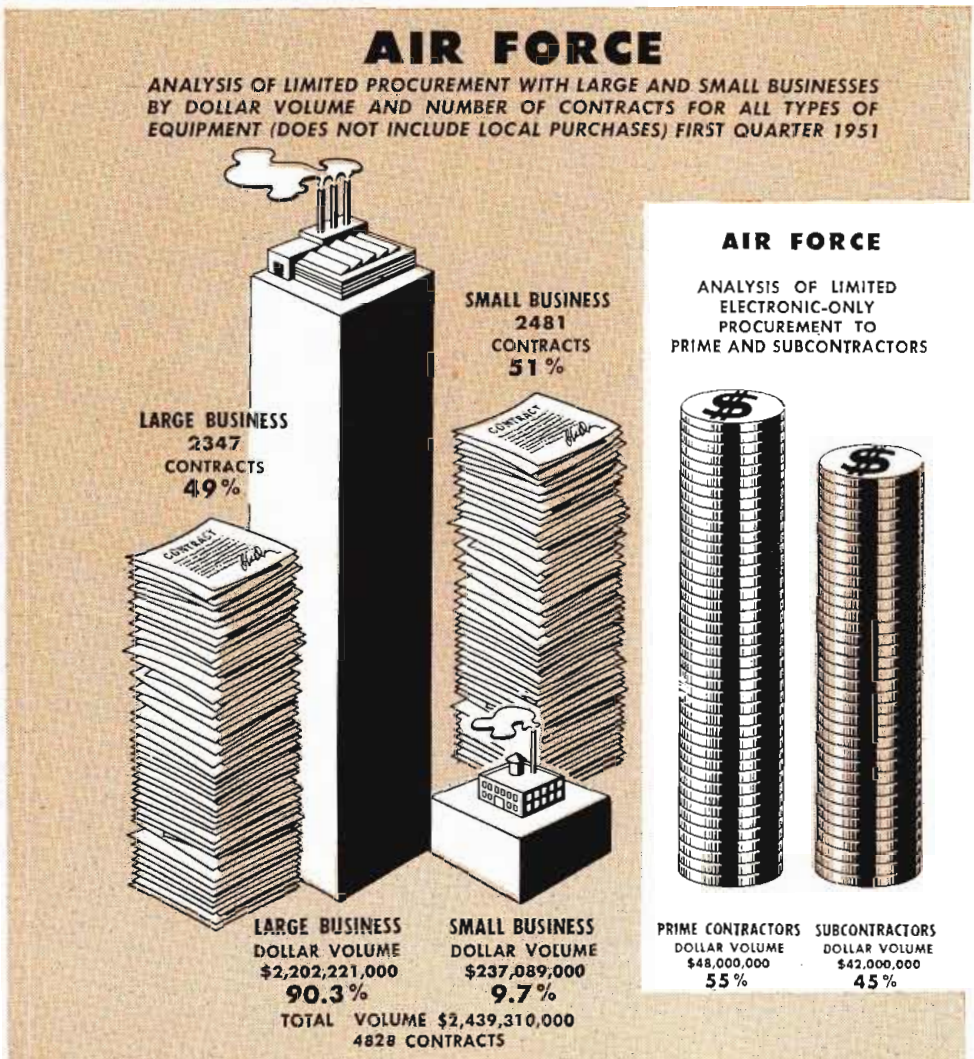
Full impact of defense requirements may reach its peak in the spring of 1952; may carry over for several years, depending on the world military situation.

Department of Defense spot-checks reveal nature of procurement actions by Army, Navy and Air Force.

TELE-TECH analysis shows small firms receiving 39.4 percent of Army and Navy's defense dollar.

Some electronic contracts are analyzed—figures speak out.

By Lt.-Col. STANLEY GERSTIN
Manager, Government Manuals Division
Caldwell-Clements, Inc., New York City



$72 BILLION IS A LOT OF money to distribute among American business for military equipment. Yet, this is the estimated amount which will be spent by the Department of Defense for hard goods (military equipment) during the two fiscal years, 1951 and 1952.

This does not mean that American industry will produce $72 billion worth of military goods by the end of 1952. Actually, deliveries of military equipment in the fiscal year 1951 have been estimated to total $11 billion. Deliveries of military equipment in the fiscal year 1952 may total $27 billion—making a total of $38 billions for the two-year fiscal period.

This does mean that the full impact on American industry for defense production is yet to come—and may reach its peak in the spring of 1952; it also means that the effect of military contractual commitments to be made during 1952 will carry-over for several years thereafter, depending upon the world military situation.

Reflecting the radio-electronic equipment industry's interests, TELE-TECH has undertaken to analyze statistical data from the Air Force, Navy and Army in an effort to reveal where military business is going, how much dollar volume is going to large and small business firms, how well the Department of Defense is succeeding in spreading business throughout the industry, and, particularly, how successful is the program for distribution of defense business among radio-electronic manufacturers.

The charts on these pages are exclusively prepared and published by TELE-TECH from data furnished by the military services and reveal the results of analysis of limited pro-

Business?

curement studies for the periods shown.

It is of interest to note that while the Air Force has achieved an equitable division of contracts among large and small businesses, as may be seen in the Air Force chart, this information tends to cloud the fact that the dollar value of the contracts awarded to small business is considerably less than that awarded to large business.

In a special analysis of $90 million in electronic procurement, made by the Air Force over a limited period, the dollar value of contracts to large and small business was almost equally divided. While this presents a favorable picture, it is prudent to observe that this particular limited study of electronic procurement is not sufficiently large to project an estimate of all electronic procurement.

The Army procurement chart reflects a better picture of procurement since the study covers more than $7.6 billion in contractual obligations. A special study of Signal Corps procurement, which is more applicable to the radio-electronic industry, reveals the distribution of contracts and dollars to large and small radio-electronic manufacturers. This limited procurement study is consistent with the present trend in military procurement throughout these services.

The Navy chart discloses that the distribution of defense contracts among small business represents nearly two-fifths of all Navy procurement.

Of special interest is the fact that a considerable portion of the defense equipment dollar could have been given wider distribution throughout all industry, as well as throughout the radio-electronic industry, since much of the business awarded to large firms could have been handled by small firms. In this respect, the Army chart reveals that nearly $4 billion of the total amount analyzed could have been awarded to small business. Of the $3.5 billion in procurement actions analyzed in the Navy chart, small business received $649 million, whereas an additional billion dollars worth of equipment actually lent itself to production by small manufacturers.

The procurement studies on these pages are limited in the number of contracts involved and dollars spent. They do represent a total of $13,685,000,000 in defense contracting. This is 1/3 of the dollar value of expected delivery of finished military equipment for the two fiscal years of 1951 and 1952. Consequently, it is reasonable to consider these pro-

Measuring Television

New unit, used in conjunction with general

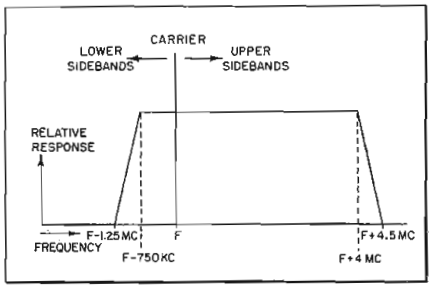

Fig. 1: Ideal television channel transmission amplitude characteristic

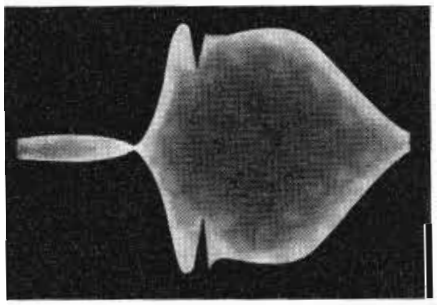

Fig. 3: Photo of the pattern obtained on the screen of the oscillograph

By JOHN RUSTON
Television Transmitter Division
Allen B. Du Mont Laboratories, Inc.
1000 Main Ave., Clifton, N. J.

THE transmission amplitude characteristic of a television picture transmitter has usually been measured by a point by point method in which the transmitter is modulated with a sinusoidal voltage of constant amplitude. The relative amplitudes of the lower and upper sideband voltages appearing at the transmitter output are then measured with a field intensity meter which has suitable selectivity. Measurements are generally made for a range of modulation frequencies extending up to about 5 MC so that the sidebands cover a range from 5 MC below to 5 MC above the carrier frequency. These measurements show how closely the transmitter response corresponds to the "ideal" shown in Fig. 1.

The main requirements are: (1) The response at frequencies lower than F — 1.25 MC shall be less than — 20 db in order to avoid interference with the lower adjacent channel, (2) The response from F — 750 KC to F + 4 MC shall be substantially uniform in order to obtain a uniform overall video frequency response when the transmission is picked up by a normal receiver. Owing to these two important requirements, it is necessary to measure the transmission amplitude characteristic quite frequently during the design and testing of a transmitter, and it is also desirable that a transmitter in service should have this characteristic checked periodically.

Transmitter Response

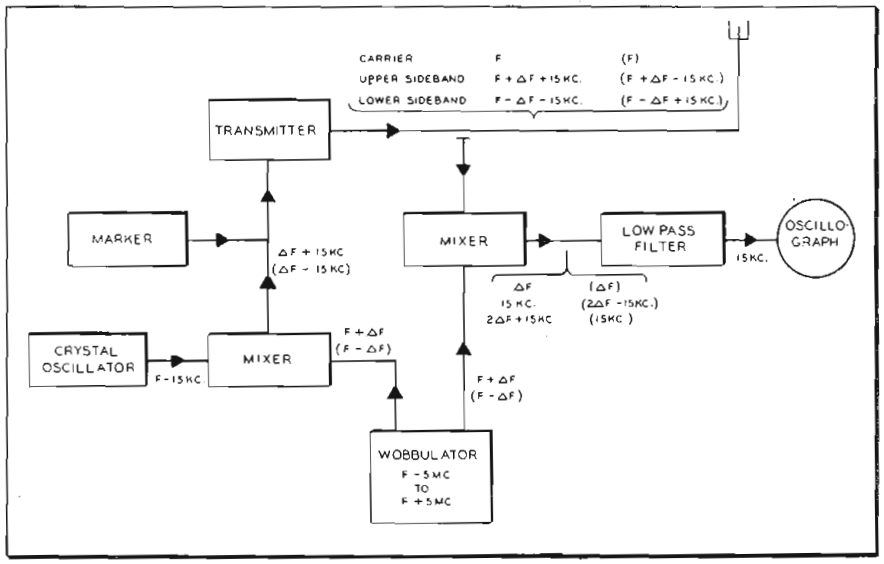
Since the transmitter response is determined largely by the adjustment of the broadband r-f circuits in the final amplifier and preceding linear amplifier stages, it is desirable that an operator shall have some means of observing the response when tuning these circuits. This is particularly so in the case of transmitters employing more than one broadband r-f stage; consequently, transmitters of this type frequently have a built-in r-f wobbulator which enables the response of each broadband stage to be observed by means of a cathode ray oscillograph.

The wobbulators presently in use for this purpose feed a swept r-f signal to the appropriate amplifier input and the circuits are then tuned by observing an oscillograph pattern representing the amplitude of the signal appearing at the amplifier output. This wobbulation serves as a useful guide when tuning the transmitter, but it does not give a true picture of the transmission amplitude characteristic since the transmitter is not operating under normal conditions of modulation and r-f drive. It is thus necessary to use some method of sideband measurement for checking the characteristic of a transmitter during design and testing or for the periodic checking of a transmitter in service.

The point by point method described previously is laborious and requires rather costly equipment, and so there seems to be a need for a simple sweep method which can be used in conjunction with a general purpose cathode ray oscillograph. Such a sweep method will be described in this paper, and it will be seen that a unit employing this method of measurement can also be used to replace the r-f wobbulators.

Referring to the block diagram in Fig. 2, the wobbulator is a radio frequency oscillator whose frequency is swept from F — 5 to F + 5 MC,

Fig. 2: Block diagram showing the principle of the system's operation



Transmitter Amplitude Characteristics

purpose oscillograph, provides relatively simple method for determining responses

where F is the carrier frequency of the transmitter to be tested. A signal from the wobbulator is mixed with the output of a crystal oscillator whose frequency is slightly lower than the transmitter carrier frequency, i.e., F — 15 KC. The difference frequency output from the mixer is in the video frequency range and sweeps from approximately 5 MC to zero to 5 MC for each sweep of the wobbulator. This difference frequency is fed to the video input terminal of the transmitter. Another signal from the wobbulator is fed to the second mixer which is coupled to the output transmission line of the transmitter. The difference frequency output from this mixer is passed through a low pass filter and fed to the vertical deflection terminal of the general purpose cathode ray oscillograph.

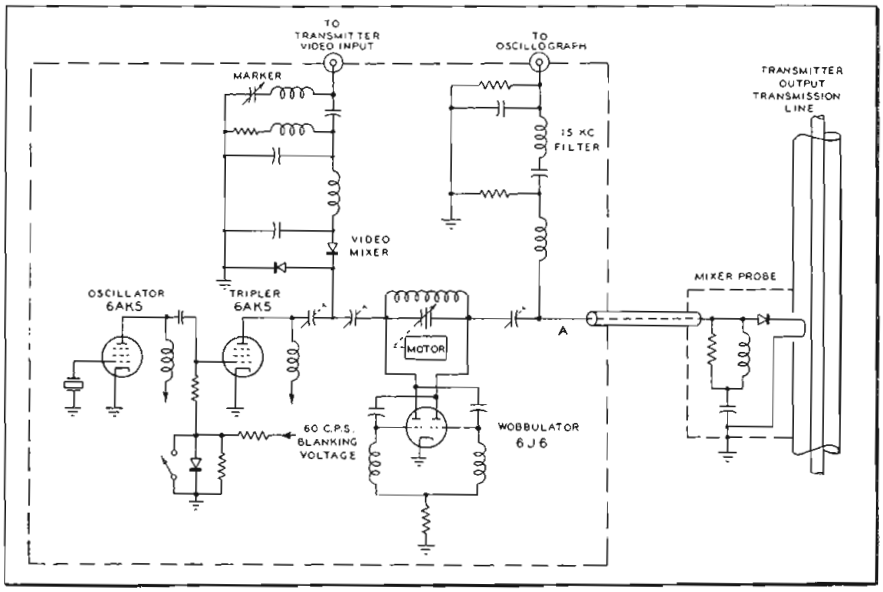


Fig. 4: Simplified schematic diagram of the system

Frequency Formulas

At any instant when the wobbulator frequency is $F + \triangle F$, the frequencies present in the various parts of the circuit are given by the first set of symbols. The transmitter input frequency is $\triangle F + 15$ KC and the transmitter output consists of the carrier frequency F, an upper sideband frequency $F + \triangle F + 15$ KC and a lower sideband frequency $F - \triangle F - 15$ KC. The difference frequency output from the second mixer has three components: F, 15 KC and $2 \triangle F + 15$ KC due to beats between the wobbulator frequency and the carrier, upper sideband and lower sideband respectively.

When $\triangle F$ is substantially greater than 15 KC, the first and third frequencies are removed by the low pass filter and only the 15 KC signal is passed on to the oscillograph. It can easily be arranged that the amplitude of this 15 KC signal shall be proportional to the amplitude of the upper sideband at the transmitter output.

When the wobbulator frequency is lower than the carrier frequency, i.e., $F - \triangle F$, then the frequencies present in the circuit are given by the second set of symbols (in brackets). In this case, the 15 KC output from the second mixer is proportional in amplitude of the lower sideband output from the transmitter.

It is thus seen that the wobbulator frequency tracks the upper and lower sidebands in turn at a frequency separation of 15 KC. The horizontal sweep of the oscillograph is synchronized with the wobbulator sweep and then the pattern obtained on the oscillograph screen is a 15 KC waveform, the envelope of which shows the transmission amplitude characteristic of the transmitter. A photograph of such a pattern is shown in Fig. 3. The individual cy-

Glide Path Cavity Antenna

Horizontally-polarized, zero-drag, 329-335 MC unit Receives signals from any forward direction and

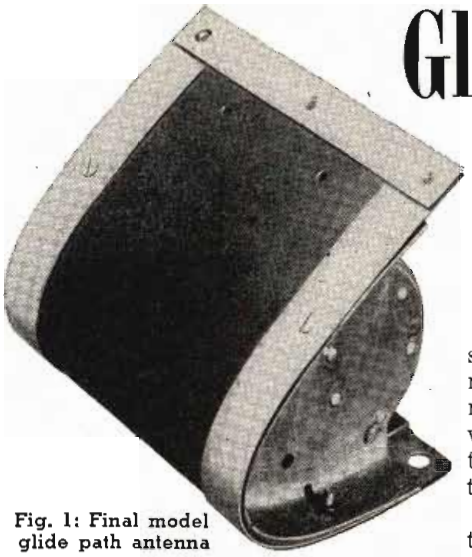

Fig. 1: Final model glide path antenna

By LOUIS E. RABURN
Senior Antenna Engineer
Electronics Research, Inc.
Evansville, Ind.

THE cavity-type antennas have been employed during the past few years as marker beacon antennas when mounted on the belly of the aircraft[1] and as a glide path antenna when mounted in the nose of a transport type aircraft. In general the cavity antenna has a rather narrow comparative bandwidth but in these two applications it was found possible to obtain sufficient bandwidth for reliable performance with careful attention to design parameters.

When it was required to develop a zero-drag glide path antenna for installation on a Jet fighter made by North American Aviation, Inc., it was decided to investigate the radiation characteristics of a cavity antenna located in the leading edge of the air intake lower lip. The specific electrical requirements for this antenna are as follows:

1. The antenna shall receive horizontally polarized and horizontally propagated radio signals with minimum practicable reception of vertical polarized radio signals.

2. The input shall match a 52 ohm coaxial line with a vswr of less than 5 to 1 over the frequency range 329 to 335 MC.

3. Electrical performance of the antenna shall be such that it will provide an r-f signal of 70 microvolts to the glide path receiver when the aircraft is on a standard USAF instrument approach path 10 or more miles from the glide path transmitter and flying at any heading within 60° of the direction of the transmitter and at any altitude less than 10° from normal flight.

4. The pattern of the antenna in the forward half of the horizontal plane for any aircraft altitude between horizontal and 20° bank, glide, or climb shall be free from nulls and sharp variations in gain.

The structural design requirements for the antenna are that it be light in weight and the method of fabrication and assembly adaptable to aircraft production techniques. In addition, it was considered very desirable if the antenna could be constructed and assembled on a production line basis without any need of post-assembly tuning adjustments.

Radiation Pattern Study

The first step in the development of this antenna was to make a radiation pattern study using scale-model techniques to determine whether or not a cavity type of antenna at this location would meet the pattern requirements previously specified. This radiation pattern study was made using the 1/10th-scale precision model of the aircraft shown in Fig. 3. This scale model is made of wood and was metal sprayed with a prime coat of zinc and a finish coat of copper to provide a highly conducting metal surface. A 1/10th-scale model of the glide path cavity antenna was mounted in center of the lower lip of the air intake and soldered to the copper surface of the model. This model antenna was matched to a vswr of 5 to 1 or better throughout the simulated frequency range as an aid in making accurate pattern measurements. The patterns were measured using a linear superhetrodyne system, and were plotted on a voltage basis using a polar recorder.

The coordinate system used for the aircraft model pattern measurements of both the horizontal, (Eϕ), and vertical, (Eθ), polarizations is shown in Fig. 2. The equatorial belt for the region of greatest operational interest is shown in Fig. 2A. In order to present the pattern data most clearly, the final sets of relative patterns were integrated and converted into patterns of equi-signal contours in the equatorial belt of the aircraft.

A preliminary set of spherical radiation patterns was measured for both horizontal and vertical polarization at the band-extreme frequencies of 329 and 335 MC. The sets of patterns at both frequencies are practically the same, and they both show that the radiation pattern characteristics of the cavity antenna in the air-intake lip location are very favorable. After it was determined that the radiation patterns did not vary appreciably between the two ends of frequency band, a complete set of spherical radiation patterns was measured for both horizontal and vertical polarization at 332 MC. The patterns at this frequency are practically the same as the patterns at 329 and 335 MC, and the principal-plane patterns for 332 MC are shown in Fig. 4.

Fig. 4 shows that the pattern for

for Jet Fighter Aircraft

PART ONE OF TWO PARTS

fits into lower lip of air intake

has a VSWR of better than 5 to 1

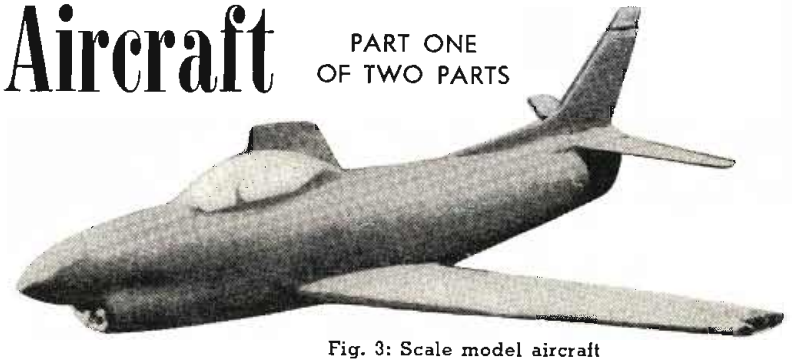

Fig. 3: Scale model aircraft

horizontal polarization consists primarily of a single lobe that is broad in the horizontal plane and directed forward in the line of flight. The patterns for vertical polarization show that for any given direction in the forward hemisphere of the aircraft, the component of vertical polarization is never more than one-fourth as much as the component of horizontal polarization. The shape of the pattern in the horizontal plane for vertical polarization suggests that most of the vertically polarized radiation is caused by the flow of currents on the vertical front-surfaces of the air inlet.

Operational Performance

In order to determine the operational performance of the antenna system at the required maximum distance of the glide path transmitter, the complete set of relative patterns for both horizontal and vertical polarizations at 332 MC was integrated by means of a polar planimeter and computations were made to obtain the average value of the relative patterns.[2] This average value gives the scale factor for converting the relative measured patterns into absolute directivity patterns. The conventional way to present the absolute directivity patterns of both transmitting and receiving antennas is to assume that the antenna is used to radiate the power of a one watt transmitter, assuming also that there is no mismatch loss or ohmic loss in the antenna system.

For this transmitting case, the equi-signal contour diagram at 332 MC for cone angles (from +30° to −30°) vs azimuth of the aircraft is shown in Fig. 5. The equi-signal contours are formed on the diagram by connecting points of equal field strength for the azimuth and cone angles shown by the appropriate cone angle patterns.

This equi-signal contour diagram can be employed, together with propagation data for the specified frequencies, performance of the transmitter, performance of the receiver, etc., to compute the receiver input signal at any specified range and altitude of the aircraft.

The computations to determine the received signal when the aircraft is 10 miles away from the AN/CRN-2 transmitter are shown in the appendix. These computations are based on the propagation data given in the book "Propagation Curves", NDRC Report No. 966-6C by Bell Telephone Laboratories. The appropriate as-

TODAY'S trend in TV broadcast equipment design is toward operational simplification, reduction of the number of equipment units, and the development of remote control devices which put a greater degree of picture quality control in the hands of the camera control unit operator while still providing for all normal control at the camera. In GPL's latest basic image orthicon chain the number of units required for station operation is three—camera, camera control unit, and camera power unit — where synchronizing generator is already available. In addition, GPL has designed an extremely compact sync generator with built-in power supply, for studio and field use.

Compactness has been stressed in the design, with the result that the chain is portable and may be set up in a few minutes in the field. With the addition of a GPL Video Switcher and a Master Monitor, the system accommodates as many as five chains and two remotes, furnishing RMA standard video outputs. The Switcher Unit provides the complete studio range of effects, in a small portable package, making it particularly adaptable to the new station where maximum field to studio interchangeability is required. Since the GPL chain can be integrated into existing installations and operated from presently installed sync generators, it meets the expansion requirements of existing studios.

I. O. Camera

The camera, compact, portable, ruggedly built, weatherproof—has been engineered with an eye to field operation. It uses an image orthicon tube, and will work without modification on either of two systems: 1) 525 lines interlaced, 60 fields and 30 frames per second; 2) 625 lines interlaced, 50 fields and 25 frames per second. 5820 pickup tube and a 5FP4A Kinescope viewfinder tube are used. Video output is 0.5 volts peak to peak.

The camera (Fig. 3) is made up of a main frame and the following major units: image orthicon assembly and preamplifier; image orthicon supply and distribution unit; electronic viewfinder; focusing servo amplifier chassis. Mounted on the main frame are the lens turret, turret drive motor and gear box, focus servo drive motor and gear box, and iris drive motor.

The lens turret accommodates 4 lenses on an 8 in. diameter lens mounting circle. Lenses of a maximum ratio of 10:1 may be accommodated without interference. Selection of desired lens is made by means of push buttons at the rear of the camera. Focusing is controlled by rotating either of two large knobs on the sides of the viewfinder, or remotely from the remote control unit (Fig. 4). The image orthicon carriage is moved by the focus servo drive motor which is controlled by the focus servo system. Regardless of lens focal length, 310° of control knob rotation shifts focus from close-up (9 in. diagonal) to infinity. Calibrated resistors in each lens mount set the "electrical gear ratio" of the focus servo system to effect this result. A switch inside the camera, mounted over the focus drive motor allows the cameraman to use the full range of each lens by switching to "extended" range. In this position, image orthicon travel is the full 2¼ in. for all lenses. Thus the camera may be focused on a 2 in. diagonal with a 2½ in. lens, a particularly advantageous feature when small commercial products are being televised.

Behind the lens turret is a filter wheel which can accommodate four filter discs. Three filters are provided for use with the camera—one minus blue and two of neutral density. Filters may be replaced by special masks for split view shots

Fig. 1: Equipment units required in the control of two image orthicon chains. Compactness, stressed in design, makes each chain portable and enables quick field setups

focus, extended remote control facilities, includ-
outstanding features of GPL's latest camera chain.

and other effects with short focal length lenses.

The iris aperture on each lens is controlled by two buttons just above the focusing knobs, on either side of the viewfinder. One button opens, the other closes the iris. The button is released on reaching the desired setting. Similar control is provided at the camera control unit. Iris setting is indicated directly in *f* numbers on meters at camera rear and on the CCU (Camera Control Unit) panel. Indications on the meter are controlled by a potentiometer, actuated by an accurately cut cam on each individual lens assembly. The cam obviates the necessity for specially designed lenses with identical angular iris ring rotation. Any lens, when returned to viewing position will have the same iris setting as when last used, irrespective of the setting for previous lenses.

The remote control unit fits under the CCU and is used in conjunction with it. Remote control is provided for lens selection, focus, iris, and camera pan and tilt.

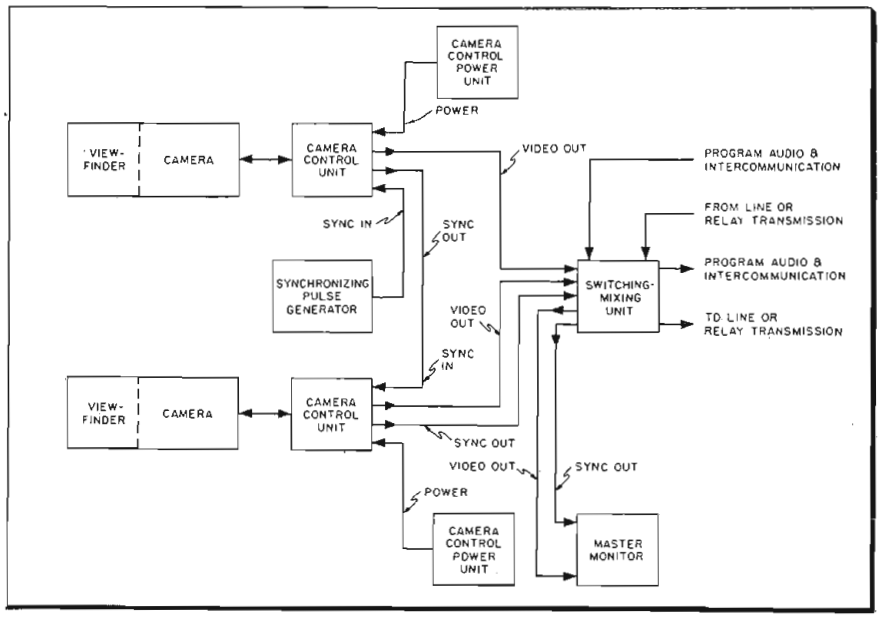

Fig. 2: Block diagram showing interconnection of the equipment elements in Fig. 1

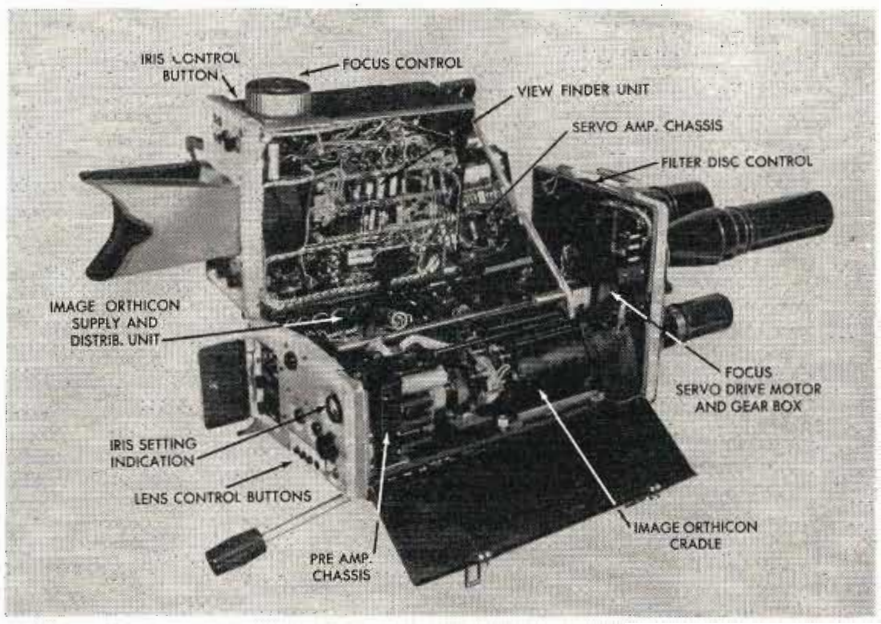
Major Camera Elements

Image Orthicon Assembly and Preamplifier: This unit consists of two distinct parts. One is the image orthicon cradle containing the tube and magnetic assembly made up of focus and alignment coil and target heater; the other is the preamplifier. The preamplifier is a four-stage video amplifier with cathode follower output.

Image Orthicon Supply and Distribution Unit: This unit generates the horizontal scan for the image orthicon, provides complete horizontal and vertical blanking, distributes vertical and horizontal driving pulses for the viewfinder, stabilizes the orthicon focus current supply, generates 1500 volts for the multiplier section and 500 volts negative for the image section of the orthicon, generates horizontal shading wave-forms, and furnishes bias protection for the image orthicon in the event of vertical or horizontal sweep failure.

Focus Current Stabilization (Fig. 5): A regulator circuit is provided to hold focus current constant within 0.1% of the desired value. Current through the orthicon focus coil is supplied via the series tube V-1 and the control resistor R-1. The voltage across R-1 is applied to V-2 and compared with the stabilized voltage across the neon regulator V-3 and thus used to control the tube V-1. The anode of V-1 is connected through the focus coil in the picture tube monitor and the viewfinder, then to plus 380 volt supply, thus stabilizing

Fig. 3: Interior view of camera showing major circuit and control elements



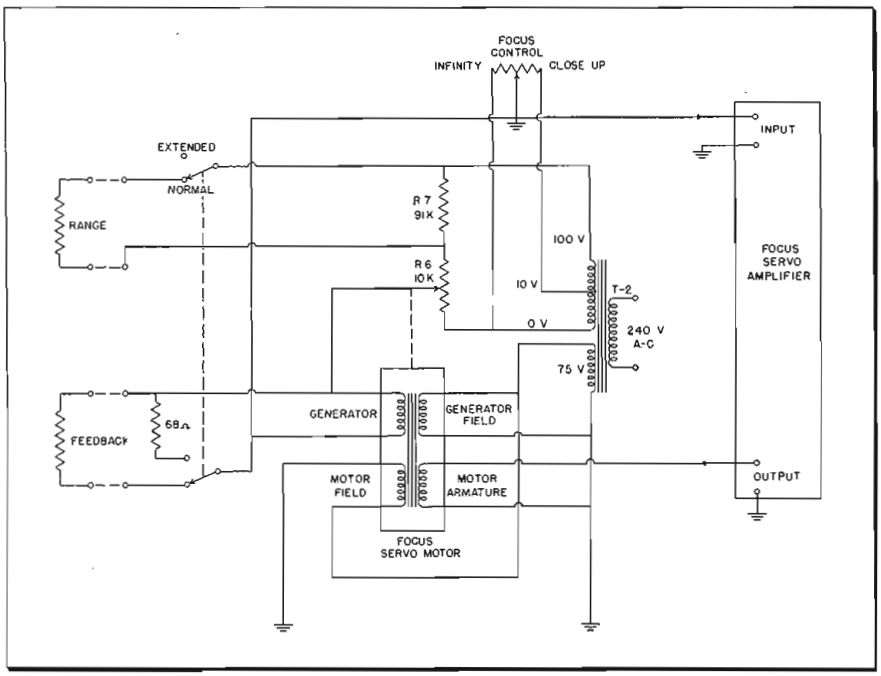


Fig. 4: Simplified diagram of focus servo circuit employing a two stage amplifier

the focus current in the viewfinder picture tube as well as the image orthicon tube. The focus current is adjustable by means of the pre-set control R-2 over a range of 60 to 90 ma.

Horizontal Scan (Fig. 6): Horizontal drive pulses from the CCU are used in the image orthicon supply and distribution unit to generate a horizontal sawtooth, which is used to drive the horizontal deflection yoke of the image orthicon through transformer T-1 (Fig. 6).

The output windings of T-1 are balanced and do not carry d-c centering current. Loading down of the high impedance deflection circuit is avoided by the use of isolating choke L-1. The stabilized focus current passes through the center tapped control R-3, which allows variable and reversible centering current to be injected into the horizontal scan coils surrounding the image orthicon tube. The two integrating networks, consisting of R-4 and R-5 in conjection with C-3 and C-4, generate opposite polarity sawtooth voltages which are applied at opposite ends of the horizontal shading potentiometer R-5 which injects horizontal shading signals into the video preamplifier. Negative pulses of T1 also combine with the sharp rise time of a signal derived from the horizontal driving pulses forming 6 to 7 microsecond target blanking pulses for the image orthicon. These pulses and similarly formed vertical blanking pulses are amplified in a twin-triode and used in a relay circuit which protects the image orthicon in case of either horizontal or vertical sweep failure. This protection is also provided in case the plug connection between the two units is faulty.

Integral Electronic Viewfinder: The flat-ended 5 in. kinescope operating at 7 kilovolts employed in the viewfinder enables the operator to see a very high resolution picture equivalent to that which is being transmitted. The use of an electronic viewfinder eliminates the possibility of incorrect focusing or aiming due to misalignment of camera and viewfinder and also provides the operator with a clear picture when working at low light levels.

The tube produces a black and white picture, magnified by a plastic lens. A tinted filter improves picture contrast for viewing under high ambient light conditions.

Cue lights are fitted at the front and rear of the camera and also inside the viewfinder hood, informing the operator when his camera is on or off the air, even though he may be looking into the hood continuously. The front cue lights can be switched off from the rear of the camera should it be desirable for performers to be unaware which camera is on the outgoing line.

Intercom: A flexible intercom system provides for split headphones, enabling the cameraman to hear pro-

UHF-Converter Design Features

More recent manufacturer's data provides additional details on technical characteristics of TV tuners.

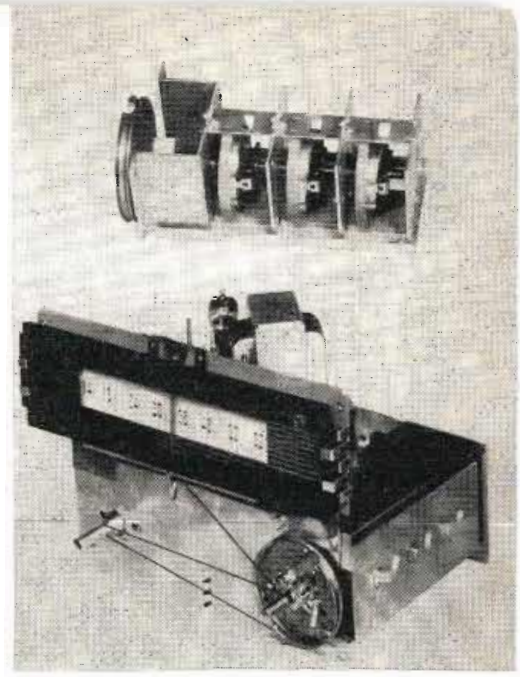

Fig. 1: (Above) Three section tuner used in P.R. Mallory's UHF-Converter (Below)

LAST month's article, entitled "TV Receiver Manufacturers Ready with UHF Conversion Devices," (p. 30) described the salient features of the new UHF tuners and converters that twelve of the nation's leading Radio-TV manufacturers are now preparing for production. Part II of the August issue also showed the UHF-TV coverage that could be expected under the presently proposed FCC frequency allocations plan. This month we are providing additional technical data on two of the units shown previously, and in subsequent issues we shall publish information on the units of other manufacturers who at this time are clearing the technical details from legal and patent standpoints.

Mallory Converter

Utilizing a recently developed type tuner, this converter, designed by P. R. Mallory & Co. Inc., Indianapolis 6, Ind., covers the r-f range of 470 to 890 MC. The tuner used in this converter is of the three section type. It consists basically of two r-f circuits overcoupled to provide a relatively constant band width, and the third section being used for the local oscillator which tunes 82 MC below the r-f band. The output of the oscillator is connected to a crystal diode as well as the incoming r-f signal. The output of the crystal goes to a low noise triode r-f amplifier which has a single broad tuned circuit in the input and a double tuned circuit in the output. The band width of the output circuit is approximately 12 MC wide so that it will cover the adjacent channels of 5 and 6. The choice of channels 5 and 6 was made because it was felt that a better noise figure could be obtained on the low TV bands, and also that the switch problem would be slightly easier. The output of the converter being at an r-f frequency of 5 and 6 enables it to be connected to any present day TV receiver.

The power supply is of the transformer type using a tube rectifier and is strictly conventional. The on-off switch serves a dual function in that it switches the VHF antenna straight through the converter to the receiver antenna terminals when in the off position. When the converter is turned on the output of the converter is connected to the VHF receiver. The UHF antenna is not switched, but is connected to the first tuned circuit at all times. A 110 volt receptacle is provided on the back of the converter so that the television receiver may be plugged in and thus turned on and off with the converter. Installation of this converter is comparable to that of installing a booster on a present day TV receiver.

Stromberg-Carlson Converter

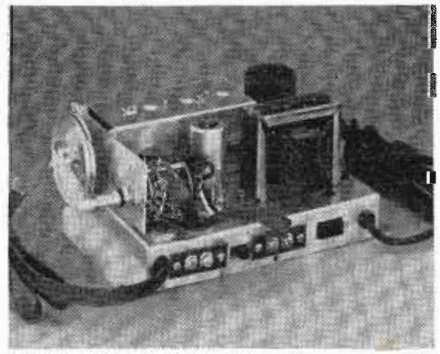
The new UHF television converter developed by Stromberg-Carlson is designed to operate on all Stromberg-Carlson receivers as well as those of other manufacturers and to tune all of the 70 channels in the UHF band. It can be installed on existing television receivers without modification in a few minutes.

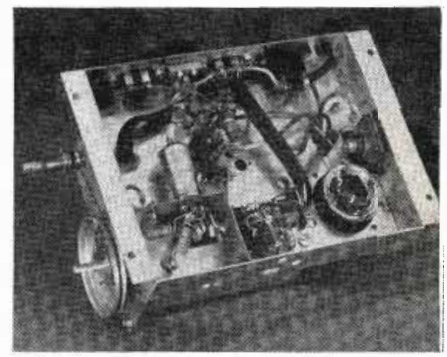
The cabinet, shown in Fig. 2, is styled in green leatherette and proportioned to harmonize with the television receiver. The outside dimensions are approximately 8 in. wide, 4 in. high and 6 in. deep. The unit weighs 5½ pounds and has a power consumption of about 10 watts. Channel indicator, vernier tuning knob and function switch are all located on the right side of the unit.

Top and bottom views of the chassis are shown in Fig. 3 and Fig. 4. The converter is designed for connection between the antenna lead-in and the television receiver. Receiver power is obtained from a socket in the rear of the converter chassis which in turn is plugged directly into the ac line. A single three-position function switch provides the following combinations: 1. Off—Both converter and television receiver; 2. VHF—a-c power to television receiver on, VHF antenna directly connected to television input. Converter heaters on. 3. UHF—a-c power to both units and choice of separate UHF antenna, VHF antenna or built-in cabinet antenna depending upon signal conditions.

The converter can be operated by

Figs. 2-4: (Left) Overall view of the Stromberg-Carlson UHF converter. (Center) Top and (Right) bottom view of chassis





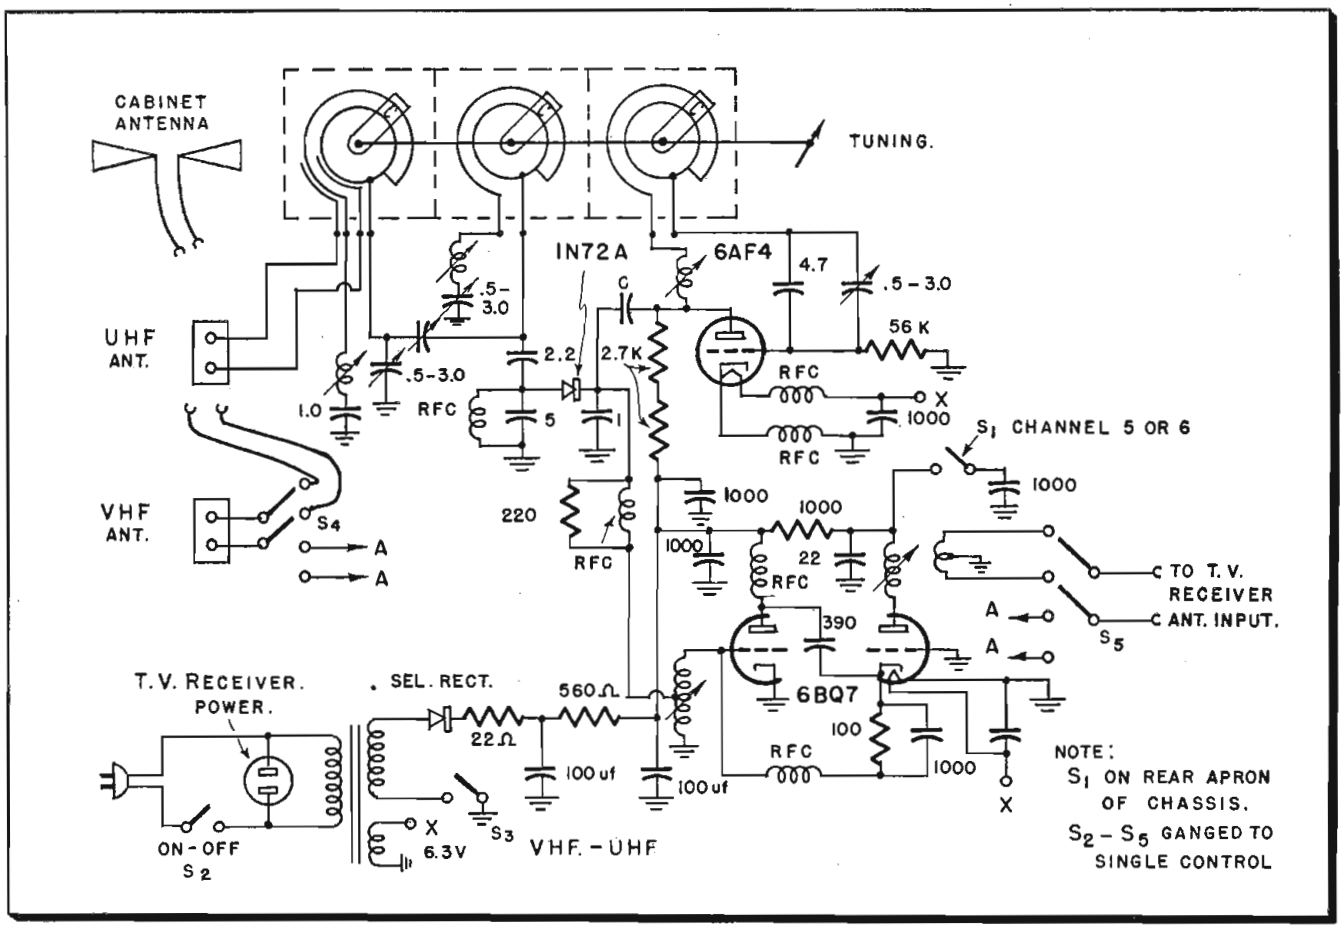


Fig. 5: Schematic diagram of the Stromberg-Carlson UHF-Converter

tuning the receiver to either of two channels (#5 or 6) which is not occupied by a local station. This choice is made during installation by a switch in the rear of the converter chassis, which shifts the first IF tuning 6 MC. The bandswitch of the UHF pre-selector circuits is 12 MC., allowing this shift without loss of tracking. Selection of this IF is a compromise providing a mean between the extremes of the high noise factor in the high channels and the undesirable spurious responses of the very low frequency channels. The rapid attenuation with increasing distance of UHF signals which might cause spurious interference appears to make it practical to use a lower IF than would otherwise be possible.

Mixer Circuits

In both the antenna and mixer circuits, the tuning elements are inductively padded in order to secure the proper tuning range. This is accomplished by extending both conductors of the antenna section and one of the conductors of the mixer section about ⅞ in. external to the tuning unit. The balanced 300-ohm antenna is coupled into the extended section of the tuning unit with the aid of an ungrounded loop.

A combination of high-side capacitive and inductive coupling is used between the antenna and mixer tuned circuits in order to provide a bandwidth of 12 MC. throughout the UHF band. The 1N72 crystal mixer is coupled capacitively to the mixer tuned circuit, and an RF choke provides a d-c return path for this circuit. (See Fig. 5)

Grounding of the low frequency ends of the antenna and mixer lines and the grounding of the rotor of the antenna section eliminate spurious suck-outs within the band.

The oscillator design utilizes a miniaturized version of the 6F4. A series trimmer condenser effectively sets the low frequency end of the tuning range, and a series trimmer inductance consisting of the grid and plate leads control the total range and the high frequency limit. This adjustment consists of varying the separation between these leads. "Holes" in the frequency range are avoided by using resistors rather than chokes in the plate and grid return circuits and by using dissimilar chokes in the cathode and ungrounded heater leads. A special UHF low-capacity tube socket is used to prevent bypassing the tuned circuit by the grid-plate socket capacity.

Tube "warm-up" drift, although somewhat a function of individual tubes, is nearly complete within one minute after application of plate voltage, with heaters previously warmed up. This initial drift is minimized by using the lowest plate power which will give reliable performance.

Complete shielding of the oscillator tube, circuit, and tuner section together with low oscillator plate voltage reduces oscillator radiation.

The conversion loss of the crystal mixer is overcome by the addition of a low noise amplifier. A "cascode" circuit using a 6BQ7 tube was selected because of its inher-

Tentative Color-TV Specifications

"Color Video Standards" Panel of NTSC Visits Demonstrations; Offers Recommendations to Guide Field Tests

THE standards for sequential color television were adopted by FCC when the commercial broadcasting of this predominantly mechanical system began some months ago. However, the majority of the television industry felt that future American audiences deserved and later would demand the superior performance offered by a compatible electronic color-TV system. All parties interested in such a system were invited to join the National Television Systems Committee under Dr. W. R. G. Baker (GE), Chairman, for the purpose of working out color standards to be submitted to FCC for adoption. This work, subdivided among nine panels, has been progressing rapidly.

Panel 13, A. V. Loughren (Hazeltine), chairman, has the responsibility for drawing standards of the complete video signal, including colormetric and electronic specifications. This group, composed of engineers from more than 20 companies active in television, had a few meetings, then embarked on a series of one-day visits to the laboratories of those who had progressed far enough in electronic color to show pictures and demonstrate the effects of changing various system constants. These visits were attended by 30 or more engineers representing 20 companies. Thus the performance resulting from various standards could be judged.

Proposed Color Test Specifications

Visits were made to: GE in Syracuse; Hazeltine in Little Neck; RCA Labs. in Princeton, and Philco in Philadelphia during the week Aug. 5-11.

At the conclusion of the round of visits Panel 13 met in New York City to discuss and record its recommendations as to standards. Formulating standards can be a dull, acrimonious long-drawn-out proceeding. But in this case, even with the natural differences of opinion between the engineering groups present, it appeared quite the opposite! Credit is due Chairman Loughren who tactfully kept the work moving and to the cooperation and willingness to compromise evidenced by those who had different ideas and methods to propose. By the end of the day all but a few of the recommendations had been reported approved. As we go to press these were next to be presented to NTSC itself. If approved, they will later be transmitted to the FCC. In the meantime, with tentative recommendations available, equipment can be built for NTSC field tests which will start as soon as possible.

These recommendations, not in their final, "polished" form, but in essence, are:

(1) The main video signal shall contain all of the luminance information for the light coming from the received picture.

2. The color sub-carrier shall be 3.89+ MC from the picture carrier. The factors are $15{,}750/2 \times 3^2 \times 5 \times 11$.

3. Oscillating Color Sequence (OSC) will be used and it will occur at field frequency. (This means that the red and blue channels will be interchanged by color phase alternating units at the field rate. This is also known as Color Phase Alternation and as "flip-flop".)

4. The color sync signal shall be in phase with the "burst" of reference carrier superimposed on the "back porch" following each horizontal sync pulse.

5. The stationary OCS axis shall be in quadrature with the phase of the color sync signal.

6. The relative amplitude and phase of the components of the color sub-carrier shall be as in the equation below:

$$E_M = E'_Y + K\left\{(E'_X - E'_Y)\cos(\omega t \pm p) + 0.5(E'_Z - E'_Y)\cos\left[\omega t \pm (p + 108°)\right]\right\}$$

Where

K is equivalent to sub-carrier amplitude, standardized at 0.75 to 1.5

p is the phase angle in degrees between OCS axis and $K(E'_X - E'_Y)$. (To be standardized later)

$\omega = 2\pi f_{sc}$

$f_{sc} = 3.89$ MC.

Gamma correction for the system is to be standardized later. For other constants see the accompanying diagram. This is used for explanatory, not equipment, purposes.

Outline of Visits

General Electric Co. showed, using a flying-spot scanner and dichroic-mirror receivers, their system set up in the laboratory. This system, in common with the others demonstrated later, consisted of a main picture carrier, modulated with the brightness information and a sub-carrier, modulated with the chromatic information. The spacing between these carriers could be varied for test purposes.

At Hazeltine, in addition to dichroic-mirror receivers, two tri-color picture tubes were shown in operation. Compatibility checks were made on three commercial monochrome receivers of well-known makes. The engineering audience commented on

A High Quality Direct-

Developed originally for military applications, this response 20-20,000 cps ± 0.5 db, harmonic distortion

By CARLTON E. BESSEY,
Signal Corps Engineering Labs., Fort Monmouth, N. J.

THE design and construction of high quality audio frequency amplifiers have focused special attention on direct-coupled circuits. The basic reasons for employing properly designed direct-coupled circuits for this application are as follows:

1. Uniformly flat response throughout the audio frequency range.
2. Constant phase shift versus frequency characteristic.
3. Low harmonic and intermodulation distortion characteristic.
4. Simplicity of layout and low cost of construction.

Many of the direct coupled circuits which are familiar to most experimenters, were found to be unsatisfactory for the following reasons:

1. Instability with respect to variation in line voltage and operational time.
2. The requirement of critical values for components which are usually non-standard sizes.
3. The difficulty in adjusting the circuit constants for optimum static and dynamic balance.
4. The requirement of expensive high voltage, high current power supplies.
5. The need for voltage regulation to provide a usable degree of operational stability.
6. Relatively high cost of construction and the requirement of a critical layout.

These disadvantages have resulted in unfavorable comments on direct coupled circuits by the majority of experimenters. Strangely enough, very little has been done to eliminate these difficulties in the basic design of the complete, direct coupled circuit.

The circuit illustrated in Fig. 1 incorporates means for eliminating or minimizing the undesirable characteristics of some of the older direct-coupled circuits.

Special attention is invited to the manner in which tube V-1 is connected to tube V-2. It is apparent that the total output of the double triode V-1 (plate to plate) drives each grid of the double triode V-2, also a phase shift of 180° for each of the input voltages for V-2 is made firm by means of the physical connections employed. This feature performs two desirable functions: The magnitude of the grid drive for each section of V-2 is twice that obtained from conventional circuits; the grid drive voltages for each half of V-2 are exactly equal and opposite in phase throughout the audio frequency spectrum.

Grid Bias

Grid bias for each section of V-2 is obtained by resistors R_4, R_5, R_6 and R_7 which divide the plate potentials of V-1 in the right ratio for optimum operation of V-2. It is to be noted that the ratio of R_4 to R_5 must be approximately 1:100 and $R_4 + R_5$ must be at least ten times the plate impedance of V-1 in order to cause negligible degradation of the signal voltage emerging from V-1. The two cathode resistors R_1 and R_3 together with potentiometer R_2 provide means for setting proper grid bias voltage for optimum perform-

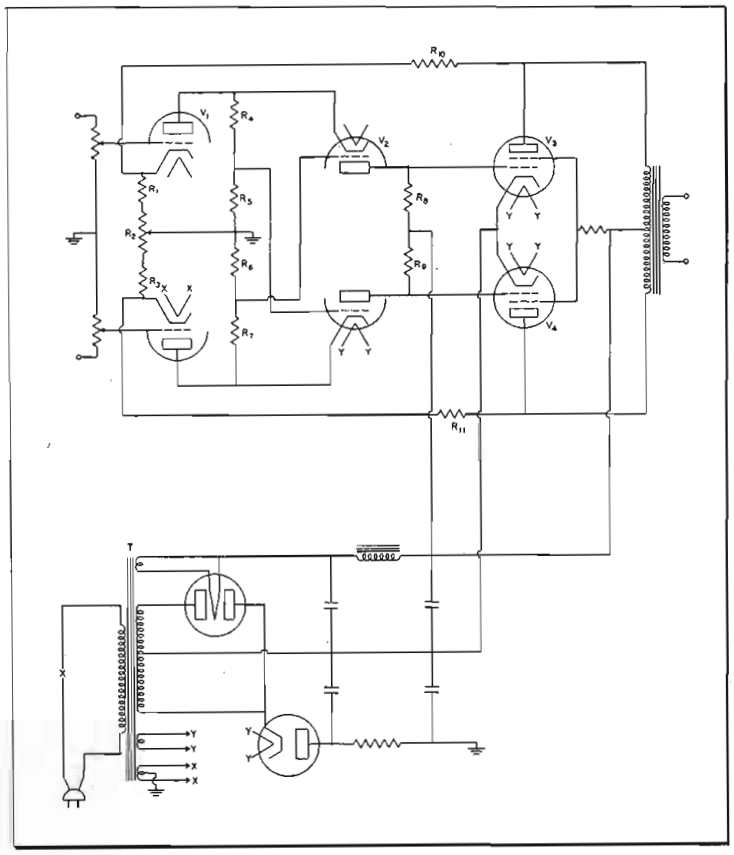

Fig. 1: (left) Basic direct-coupled circuit employed in this equipment incorporates means for eliminating or minimizing undesirable characteristics of earlier designs

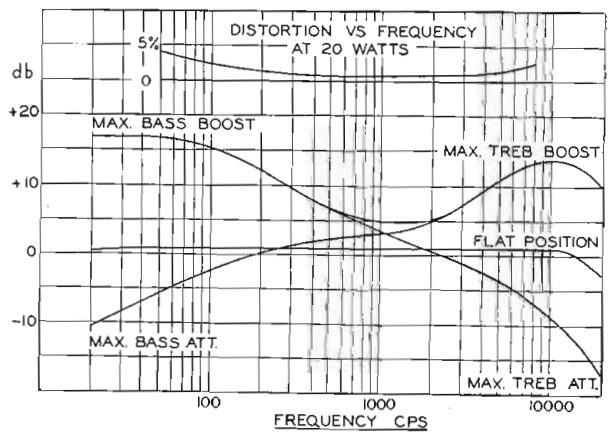
Fig. 2: (below) Amplifier frequency response with tone control circuit. Distortion vs. frequency at 20 watts output



Coupled Audio Amplifier

design features an overall 72 db gain with frequency less than 2% and intermodulation distortion less than 6%

ance of both sections of V-1. When potentiometer R_2 is properly adjusted, plate currents for both sections of V-1 will be equal and the plate voltages will then be equal, or will differ by a negligible amount.

It is evident that the bias voltages for V-2, supplied by the voltage dividing network composed of R_4, R_5, R_6, and R_7, will also be equal, which in turn results in equal plate currents for each half of V-2. The plate load resistors for V-2, which are R_8 and R_9, will then have equal IR drops and, therefore, set the d-c voltages for the grids of the push-pull power stage at equal values. The value of R_8 and R_9 can be calculated to provide the proper dc grid voltage for optimum performance of any of the popular types of power tubes. If it is found that reasonably balanced double triodes cannot be obtained for positions V-2 and V-3, a potentiometer may be inserted between R_8 and R_9. The resistance value of R_8 and R_9 should be reduced by 25% and the resistance value of the potentiometer should be approximately 50% of the original value. The potentiometer then provides means for individually adjusting the bias voltage for each of the power stage tubes V-3 and V-4.

Generally, this corrective step is not required; however, it provides means for obtaining the ultimate in performance of the system with respect to minimum internal noise and minimum distortion at full power output level.

Negative Feed-Back Loops

The negative feed-back loops are connected between the plates of the power stage and the cathodes of the input stage. These loops are purely resistive (R_{10} and R_{11}) and, therefore, contribute no phase shift versus frequency difficulties. They also contribute to the stability of operation of the over-all system since dc feed-back is also achieved. The use of a high quality output transformer is mandatory.

The power supply is designed to provide adequate power for the final amplifier stage and double voltage at reduced current drain for the

proper operation of the series connected tubes V-1 and V-2. The power transformer T has two electrically independent 6.3 volt filament windings, one of which is connected to V-1, whose cathode is operating at approximately 1.25 volts above ground, and the other supplies heater current for V-2, V-3 and V-4 whose cathodes are operating at relatively high voltages above ground. The use of a single filament winding to supply all of the heater requirements would eventually result in a cathode to filament break-down in V-1.

The system described was presented to the Signal Corps Engineering Laboratories by the author for

UHF-TV Reception in Office and Residential Locations, 18 Miles from Transmitter

Editors TELE TECH:

I read with a great deal of interest your report (August issue, p. 30) concerning the UHF conversion devices demonstrated for the FCC in Bridgeport recently. I agree with you that the line-of-sight demonstration as put on in lofty hotel rooms could be compared to a controlled experiment in some respects.

But later Commissioners Hyde, Sterling, Walker and Webster and Commission technical men Cyril Braum and William Boese were driven to New Haven to see UHF transmission at distances up to 20 miles and in anything but ideal reception locations. What these gentlemen saw, I believe, reaffirmed their faith in the upper frequencies. I should like to take the opportunity of telling you about some of these receiver-converter locations. For the purposes of comparison, I should like to evaluate the transmitter monitor picture at 100% and rate pictures in the following locations on a percentage of that evaluation.

The first location is in my office in a two-story building in downtown New Haven, approximately 18 air miles from the UHF transmitter at Bridge-

(*Continued on page 77*)

New Microwave Attenuator

Developed for use in coaxial transmission lines, this inexpensive unit utilizes magnetic fields to obtain instantaneous attenuation changes

AS an outgrowth of research in power measuring techniques, Frank Reggia of the National Bureau of Standards has recently developed a new device known as a magnetic attenuator for coaxial transmission lines. The new unit is inexpensive and utilizes a magnetic field to obtain instantaneous changes in attenuation. Its operation depends on the interaction between the electromagnetic field within a transmission line, which contains microwave energy-dissipating material, and an external magnetic field applied perpendicularly to the axis of the line. As a result of this interaction, the loss characteristics of the dissipative material are substantially altered. The NBS Magnetic Attenuator requires no movable components, mechanical controls, or slotted sections in coaxial transmission line and may be operated either manually or automatically from a proximate or remote position.

Attenuators used at microwave frequencies have multiple purposes such as adjusting power levels, isolating monitoring equipment, or padding an oscillator from variations in the load. However, their use has generally been complicated by control inaccuracies and mechanical inflexibility.

In conventional microwave attenuators, the energy is usually dissipated in an element made of resistive film on glass or bakelite, powdered carbon, or polyiron materials having characteristics that vary with length, composition, and the operating frequency. The dissipative element must often be carefully machined to close tolerances and is usually very fragile. Additional difficulties arise when variable attenuation is required in a transmission line circuit. Complex mechanisms which are necessary to insure a high degree of precision and fineness of control, usually result in bulky, hard-to-handle controls at substantial increased costs.

Attenuator Design

In designing the NBS Magnetic Attenuator, efforts were made to avoid many of the disadvantages encountered in conventional attenuators. The unit is simple in construction: it is composed only of a slug of some highly permeable and resistive ferromagnetic material placed within the field of an electromagnet. The significant feature of the device is the change in the loss properties of the dissipative material when it is subjected to a magnetic field. Because the magnetic field is produced by an electromagnet, its magnitude can be changed simply and precisely by varying the current in the field coils. Consequently, the permeability and loss characteristics of the dissi-

By PHILIP WHITNEY,
Chief Engineer, WINC, WRFL
Winchester, Va.

BECAUSE of the intensity of the power line surges*, the main fuses would frequently open in addition to the overload relays and circuit breaker opening. All fuses have now been removed as well as the manually-operated breaker in the Federal transmitter.

For protection, a Westinghouse DB15 electrically-operated circuit breaker is employed. This breaker protects against high transients such as are caused by lightning with an instantaneous break. It also protects against permanent overloads with a delay action. The instantaneous trip occurs with a 1000% transient overload current. The slow trip can be set for any current in the range of 70 to 125 amperes. The breaker is reset electrically by a recycling device that works automatically. This recycler also resets the various plate overload relays automatically. The recycler operates three to five times within a period of a few seconds, then if the trouble persists beyond this time, the recycler automatically ceases to reset either the circuit breaker or the overload relays.

When the transmitter power is disconnected by the circuit breaker, a relay across this voltage drops out. A back contact of the relay applies 110 volts from the hot side of the breaker to the recycler. The same operation occurs when any of the several plate overload relays kick open. This 110 volts feeds filament transformers which apply filament current to a type 26 tube and a type 6J5. This voltage is also applied to the plates of these tubes through 8000 ohm plate relays. These are shunted by 8 mf filter condensers.

The heater of the 26 tube is the filament type, and heats in about three seconds with a higher than normal voltage applied to it. This tube then conducts, pulling in the plate relay, which in turn disconnects the heater supply. This allows the filament to cool. When cool, the plate relay opens, applying filament current again. This oscillation continues until the heater of the slower heating cathode type tube becomes hot enough for the tube to conduct. The self rectifying action applies current to the plate relay, operating a latch type relay, which disconnects the recycler. Thus in the event of trouble other than that caused by transient high voltage, the transmitter is de-energized, and to restore operation, the latch relay must be manually reset. About 99% of all interruptions are caused by electrical storms, and service is thus restored automatically, since these pulses are of a transient nature. To date, it has never been necessary to reset the latching relay, except while testing the equipment. A thorough weekly maintenance program is scheduled. The meter readings at the transmitter are compared with the readings at the studios in Win-

* Part one (TELE-TECH, August, 1951, pages 32-35) presented a general description of the WRFL remote system as well as a discussion of the control oscillators, band pass amplifier, and the power supply. This part continues a discussion of automatic protective circuits.

Control System for FM Stations

OF TWO PARTS

chester. The readings have always compared exactly.

In the event of failure of either the STL receiver or transmitter, the operator would lose control of the broadcast transmitter. To prevent this loss of control, a relay is placed in the link receiver which automatically removes the high voltage from the FM transmitter should either the STL transmitter or receiver fail. The receiver AVC is used to bias the control tube to cutoff, so that when the AVC drops or is lost, the FM carrier leaves the air. Since link failure also means no program on the FM transmitter, it also keeps link receiver noise off the air in case of failure. The Raytheon link used at WRFL has proven itself to be trouble free with the exception of normal tube burnouts.

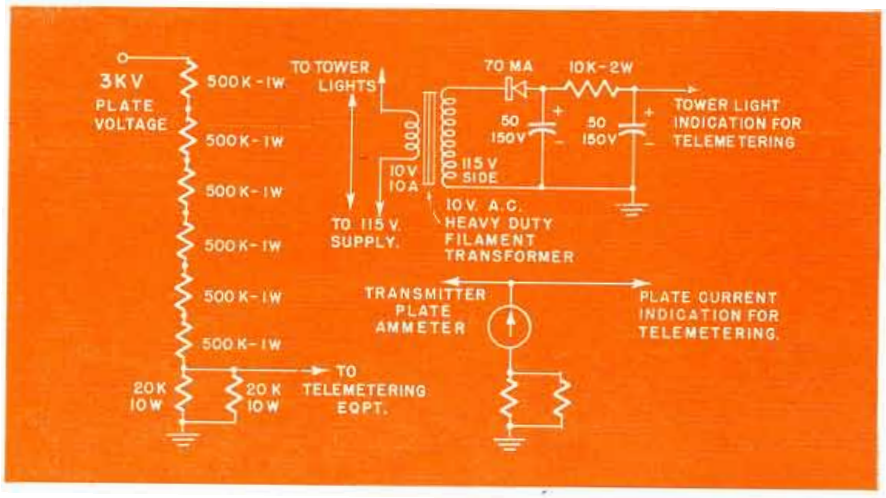

Fig. 9: Method of deriving sampling voltages for telemetering transmission remote control point. Adequate insulation is essential for high voltages points.

The Telemetering Equipment

Rather than complicate the system with a complex frequency comparison circuit, a very simple method of reading meters remotely was adopted. Fundamentally, it is merely a subcarrier modulation of the FM transmitter, the percentage of which is governed by the sampled voltage applied to it.

The meter reading subcarrier frequency is approximately 30 KC. This is generated by an oscillator similar to the ones used at the studio for control purposes. The output of this oscillator is fed to the grid of a hi-mu triode, the amplification of which is dependent upon the dc grid bias applied to it. The sample voltages taken from the various meters are applied to the bottom of the grid network, in effect cancelling the negative bias on the grid. This means that the value of the meter voltages (always directly related to the current, voltage, number of tower lights, etc., to be read), adjusts the percent that the subcarrier modulates the FM transmitter. The sampling voltages are selected by the rotary stepswitch. The subcarrier modulation of the FM transmitter does not exceed 5%.

It is necessary to calibrate the telemetering system every time meter readings are taken. The first stepswitch position applies the voltage from the standard, which in this case is a twelve volt battery. The gain control of the selective meter amplifier at the studios is then adjusted so that the meter hand is on the "calibrate" position. The metering pushbutton is then pressed successively until all voltages have been sampled, and read from the face of the 4 in. 500 microampere meter, which has been calibrated to show four scales, each indicating in the desired units the readings taken from the transmitter. This meter is operated by a 1N34 crystal which rectifies the subcarrier amplified by the meter amplifier.

An RC filter is used to damp the meter. Successive pressures on the "meters" button at the studios step the relay around a total of six times. First, the calibrating voltage is selected as explained, then "plate voltage", "plate current" (of the final amplifier of the FM transmitter), r-f line current, and "tower lights burning." The last position of the stepswitch is left vacant so that the subcarrier is taken off the air when the readings are finished. A stepswitch with more positions could be used if more

CUES for BROADCASTERS

Practical ways of improving station operation and efficiency

Edited by John H. Battison

Tape Recorder Echo Chamber

ROY L. GALLAGHER, WMCK, McKeesport, Pa.

THE public preference, as expressed in record sales, seems to learn toward recordings which are more "live"; an effect achieved by the use of controlled reverberation in "echo chambers", or other ways. Echo chambers, to be really effective, must be rather large, and the average small radio station does not ordinarily have space available for the construction of such a device. There are times when the busy engineer is called upon to produce a novelty effect for the programming department, or an "attention-getter" to help the sales department clinch a point. At WMCK, the organist, who uses a Hammond electric organ, was not satisfied with the sound produced by the reverberation devices built into the instrument.

A procedure was evolved which uses a tape recorder with three heads, allowing recording and subsequent pickup off the tape as completely separate operations. The method of producing this echo effect is simple. A bridging coil across the line to the transmitter feeds the input of the tape recorder. The output from the playback head is then fed back into the console through one of the remote positions. This gives positive control of feedback through the remote key and its associated mixer. If too much signal is fed back into the console from the tape, the system will oscillate. Experimentation will determine the critical point. The sound being fed back into the console from the tape lags the original sound by about two inches. This produces a time delay of about one-seventh of a second. The original sound recorded on the tape is added to the signal from the source, slightly delayed, and the combination then re-recorded and again fed back into the console. The number of cycles and the rate of decay is dependent on the amount of feedback introduced, and the resistance losses of the loop the signal has to travel. Examination of pulses on the scope seems to confirm the impression that the most useful effect is obtained when feedback is held to the point where four "echoes" of diminishing amplitude are heard.

$$$ FOR YOUR IDEAS

Readers are invited to contribute their own suggestions which should be short and include photographs or rough sketches. Typewritten, double-spaced text is preferred. Our usual rates will be paid for material used.

Tower Program Monitor

R. S. HOUSTON, 18 Oak Lane, Haverstown, Pa.

ON numerous occasions, there has been need to work at the tuning house, and the surrounding area, and there was no convenient way of monitoring the outgoing signal. A variation of remote antenna metering was instituted which took a small portion of the r-f signal at the coupling house to drive a speaker.

A two turn pick-up loop was loosely coupled to part of the resonant antenna tank circuit. In the case of pi couplers where there is no part which can be tapped without upsetting impedances, two turns can be made in the feed line and the link coupled to that. A 6H6 is used as an ordinary diode rectifier, and a fairly low impedance speaker output transformer is used to couple the speaker to the diode. An .001 mfd capacitor bypasses r-f. A small, six-inch projector unit was mounted on the top of the tuning house. In this way it is possible to range around the yard without being out of earshot of the speaker. Very little power is taken from the r-f source.

Duplex Operation with Presto Tape Machines

WILLIAM H. MEINERS, Chief Engineer, KRIO, McAllen, Texas

WHERE economy is a factor, broadcasting stations are purchasing one Presto PT900 tape amplifier and two mechanical units with a changeover switch box so that one can switch from #1 to #2 mechanical unit with the flip of a switch and record a full hour without a break.

However, the need arises on many occasions to record while playing back another program at the same time. In order to do this, and to make use of the high quality Presto playback amplifier, one must be able to switch the playback heads so that when recording with the changeover switch in position #1 (mechanical unit #2 playback head will be connected to the playback amplifier instead of the #1 head. Also, when the changeover switch is in position #2, the #1 playback will be connected to the playback amplifier instead of the #2 head. Another switch and amplifier can be added for monitoring the head which is carrying the program being recorded.

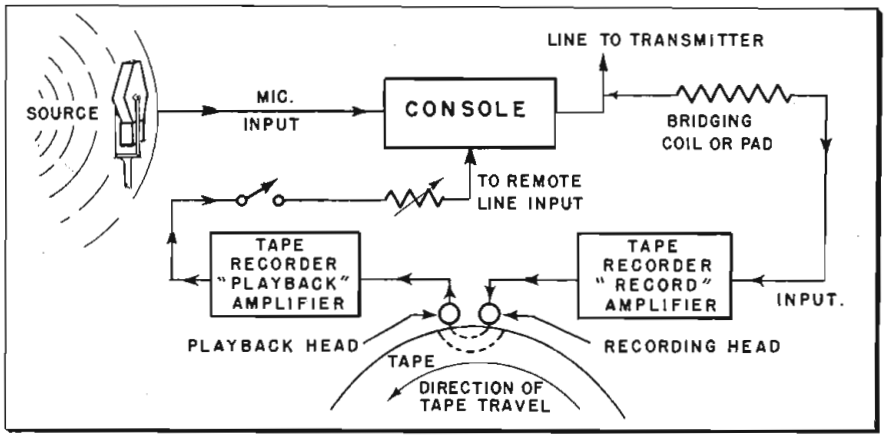
The monitor amplifier can also be used as a playback amplifier if the regular playback amplifier fails.

Automatic Arc-Over Control

G. J. CASSENS, Chief Engineer, WLDS, Jacksonville, Ill.

THE problem of providing protection against carrier failure is particularly important during the

Obtaining controlled reverberation in "a tape recorder echo chamber"



Cinch SUB-MINIATURE SOCKETS

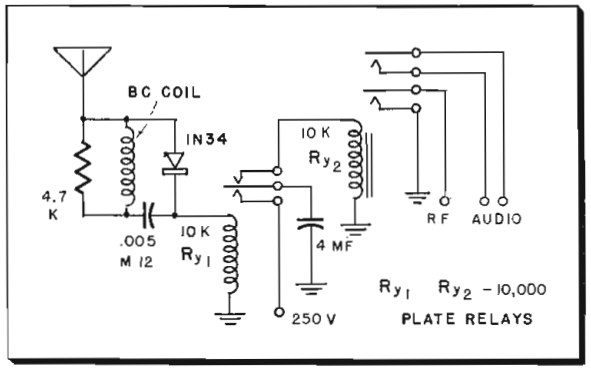
DUPLEX OPERATION WITH DUPLEX TAPE MACHINES—(left) Changeover switch box facilitates switching from one mechanical unit to the other

AUTOMATIC ARC-OVER CONTROL—(below) Carrier drop method for carrier failure control in storms



summer months when arcs from lightning or static discharge occur frequently. A satisfactory method of carrier failure control should operate automatically and quickly so as not to be discernible on the air. When an arc occurs anywhere in the transmitter, r-f feed lines or antenna tuner, the carrier and program should be interrupted for a fraction of a second to break the arc.

Carrier Drop Method

The diagram illustrates the carrier drop method used to accomplish this at WLDS. The carrier drop circuit is composed of the BC coil, diode rectifier and relay Ry_1. The antenna required to obtain sufficient current through the relay will depend upon the power of the station. Current can be regulated by changing the length, or location, of the pickup antenna and the resistance across the coil, and should be the minimum necessary to hold the relay when the station is in operation.

Relay Ry_1 is SPDT, and when actuated by the r-f picked up by the antenna, capacitor C_2 is charged from a source of dc voltage. A monitor amplifier is used in the same rack for this purpose. Any source of voltage is satisfactory as the current is small and momentary.

In the case of carrier failure due to an arc, relay Ry_1 releases, allowing the charge from capacitor C_2 to flow through the coil of relay Ry_2 and momentarily actuating this relay. Relay Ry_2 is a DPST relay mounted in the transmitter with two contacts shorting the excitation from a low power buffer stage and the other two contacts shorting the audio input to the transmitter. The stages following the buffer stage must be biased sufficiently so as not to be damaged. Shorting the audio input prevents damage to the modulation transformer if high level modulation is used.

Control of Time Constant

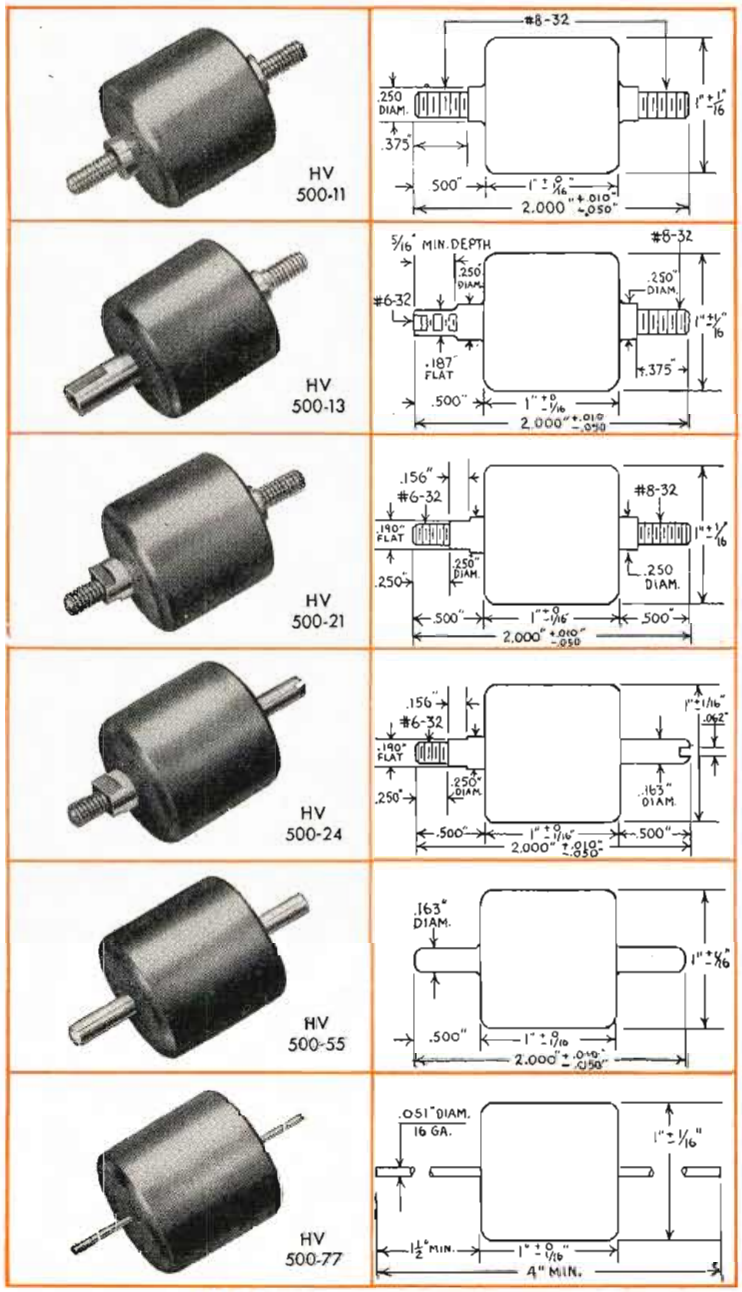
As soon as capacitor C_2 discharges through the relay coil, relay Ry_2 will release, returning the transmitter to normal operation. This will cause relay Ry_1 to actuate, again charging C_2 in readiness for another arc. The entire operation of arc-over, breaking the arc, and returning to normal operation takes only a fraction of a second and is hardly noticeable on the air. The time constant can be controlled by the size of C_2.

"Off the Air" Audio Monitor

CHARLES J. HINKLE, Chief Engineer, WFVA, Fredericksburg, Va.

A simple "off the air" audio monitor was described in the February, 1951 issue (page 40) of TELE-TECH. This is a further simplification of that idea, and shows its ease of installation in RCA-type consoles (76 series). These consoles have a number of push-buttons on the input of the monitor amplifier, for the purpose of monitoring various externally produced programs. In most installations, these inputs are either unused, or not used fully. Where such an input is available, "off the air" monitoring is easily accomplished. The circuit introduces no installation problems and a minimum of parts; the whole assembly being mounted on a small terminal strip placed where convenient near the audio block on the console base. The only external lead is the r-f pickup of very small wire, stapled under the console table. This lead is made long enough to cause approximately the same audio output from the monitor amplifier whether monitoring "off the air," or off the console output, without change of the monitor volume control.

HI-Q* HIGH VOLTAGE CAPACITORS WITH CHOICE OF TERMINALS



HI-Q High Voltage Capacitors are sturdy, thoroughly tested units capable of withstanding high voltages and operating at extreme humidity and raised temperatures.

The piercing pressure of the dielectric material is greatly increased by a meticulously exacting jacketing procedure in conjunction with a newly developed plastic with excellent arc resistant properties. Terminals are silvered brass and integrally soldered to the silver electrodes which are fired directly to the ceramic dielectric.

These HV 500 Capacitors provide an excellent working parameter when used in conjunction with high voltage horizontal output transformers.

SPECIFICATIONS

Capacity	500 mmf ± 20%
Power Factor	2% Max
Insulation Resistance	50,000 megohms
Working Voltage	20,000 V. D. C.
Flash Test	27,000 V. D. C.

NOTE: Dash numbers after HV 500 designate types of terminal. For example, HV 500-11 indicates type 1 terminal both ends; HV 500-24 indicates a type 2 and a type 4 terminal. HV 500-66 is not shown, since it is similar to HV 500-11, except that length of thread is only .250", while protrusion is lengthened to .250".

WASHINGTON
News Letter

Latest Radio and Communications News Developments Summarized by TELE-TECH's Washington Bureau

DEFENSE NEEDS PROVE HURDLE—With FCC's announced early lifting of the television-station "freeze," the national defense mobilization needs are at present a hurdle in the course of the full development of a television "boom" to spread the coverage of the entire nation with the advantages of the video art. But outside of the retarding of the installation of new television stations after the "freeze" is lifted by the FCC, it is anticipated the "boom" will get under way steadily and satisfactorily due to the avid desires of the American public for television in the half of the nation which is not served at present.

POTENTIAL OF 2000 NEW STATIONS—Barring worsening of the war threats and resultant tightening of the restrictions on critical materials and metals, the industry visualizes that after the initial 50 new stations, the establishment of new television stations will continue at an accelerated rate after 1952 to a total of 1500 new stations in the next five or ten years. Eventually, as is well known and has been forecast by FCC Chairman Wayne Coy, the VHF and UHF channels will provide spectrum space for a potential of 2000 new TV stations throughout the United States.

TV STATIONS ON AIR WITH HIGHER POWER—During late August and early this month, between 40 and 50 of the present television stations increased the power of their present transmitters, under special temporary authorizations by the FCC to permit expanded coverage of their video service areas. In many cases the stations only had to readjust their transmitters; in other instances stations moved their antennas to new higher sites, and several stations obtained new transmitters with higher power which they had previously ordered in anticipation of the FCC action. RCA in a timely announcement after the Commission decision to grant higher power, made available to television broadcasters its 10-kilowatt VHF television transmitters which are more than twice the power of TV transmitters now in use.

TELEVISION WINS OVER MOBILE—So as to provide a full sweep of space in the ultra-high frequency range, the FCC rejected the proposal of the Bell Telephone Laboratories to establish a 30-megacycle broad band service for mobile radiotelephony in the 470-500 MC area and specifically allocated the spectrum space to five UHF television channels. The vote on the Commission's majority opinion was five to one.

NATIONWIDE TV SYSTEM—Although the FCC agreed that the Bell Laboratories' presentation of the necessity for 100 mobile radiotelephone channels in congested cities through the broad band system was meritorious, its majority opinion emphatically stated the "loss of any of this (UHF) space to other services would severely handicap the attainment of an adequate nationwide and competitive television system." The FCC majority also pointed out that the 470-500 MC space can be most valuable for stratovision and polycasting in television operations.

TECHNICAL EXPERTS TO AID—In order to assist it in seeking a solution to the contested mobile radiotelephone operations, the FCC has properly called upon the Joint Technical Advisory Committee of the Institute of Radio Engineers and the Radio-Television Manufacturers Association, headed by John V. L. Hogan, to formulate the best means of saving frequency space for the mobile services. FCC Chairman Coy asked the JTAC to survey the narrowing of the separations between frequencies in the 152-162 and 450-460 MC bands; the feasibility of different methods of modulation, including single side-band; and the consideration of single channel and multi-channel and broad band types of operation.

MUNITIONS BOARD EXPERT—Marvin Hobbs, who has headed the Munitions Board's Office of Electronic Programs since last August and prior to that had been its acting chief from May to August, has been designated expert advisor to board chairman John D. Small and Production-Requirements vice chairman C. W. Middleton on all phases of the Department of Defense's planning and requirements for electronics-radar-radio equipment.

ELECTRONIC PROGRAMS OFFICE—Succeeding Mr. Hobb as chief of the electronic programs office is a well-qualified Army Signal Corps officer, Col. Clifford A. Poutrie, who has first-hand knowledge of combat requirements from his command of the Yokohama Signal Depot of the Eighth Army which has carried the brunt of the fighting in Korea. The above appointments are expected to make the functioning of the Munitions Board in the planning of production schedules and of requirements for controlled materials more efficacious.

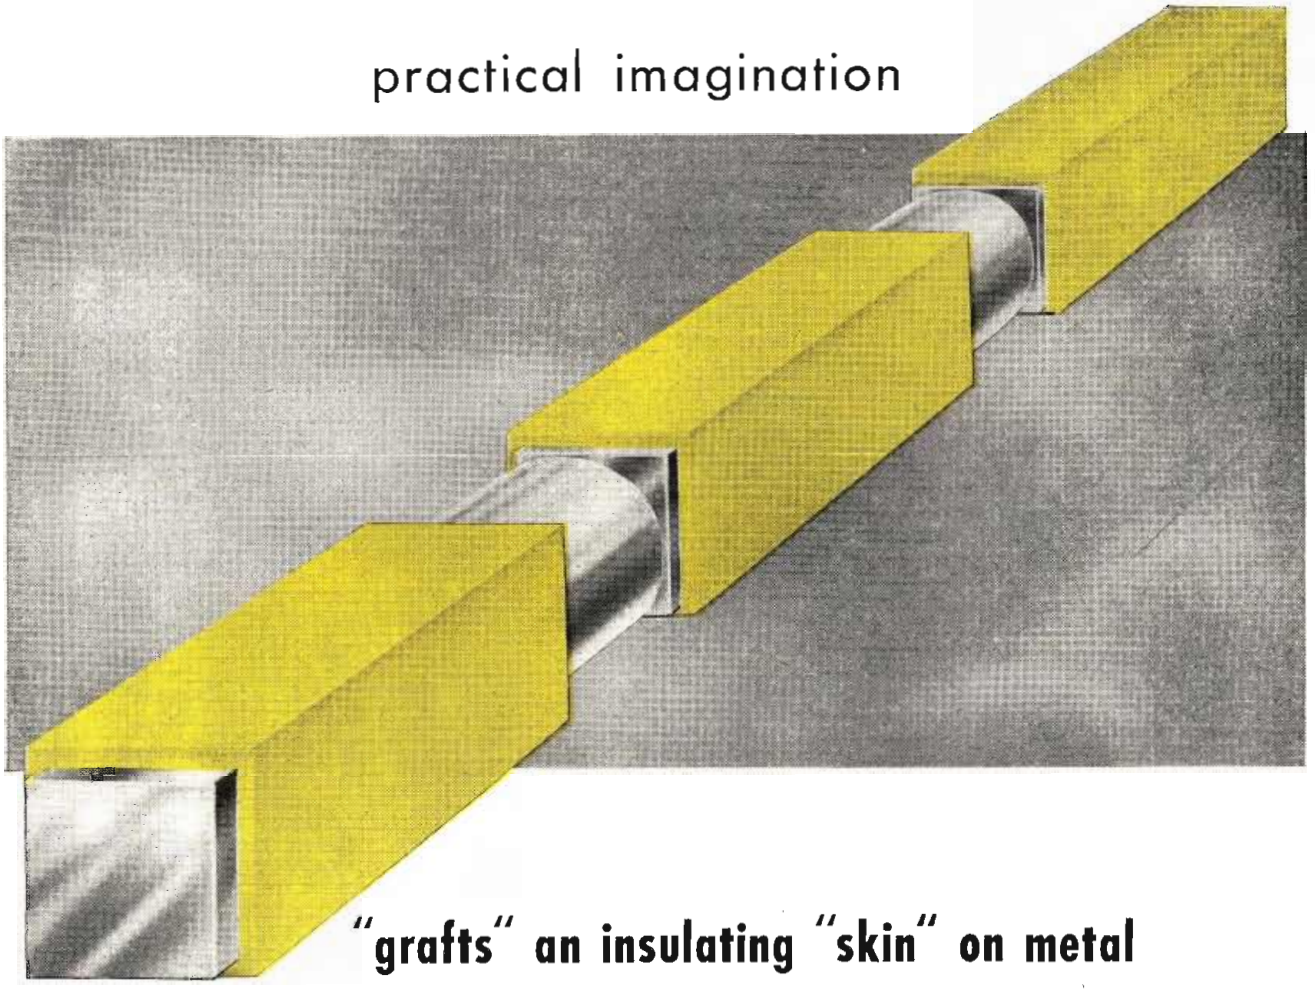
practical imagination



"grafts" an insulating "skin" on metal

Here is another example of the practical imagination C-D engineers can put to work to solve your problems. In this case a heavy electrical connector had to be covered with a safe, efficient insulation. The material best suited to do the job was C-D Dilecto.

The next requirement was to make this insulation an integral part of the whole piece. Here is where practical imagination went to work. The solution was to laminate and mold the Dilecto directly on the metal bar.

When you have a problem involving plastics—whether it is simple or complex—be sure to check with C-D engineers for a practical, unbiased recommendation. They can choose the material best suited to your needs from a wide range of grades of five basic plastics to give you any combination of mechanical, electrical or chemical characteristics. A call to your nearest C-D office will bring you this kind of help any time—all the time.

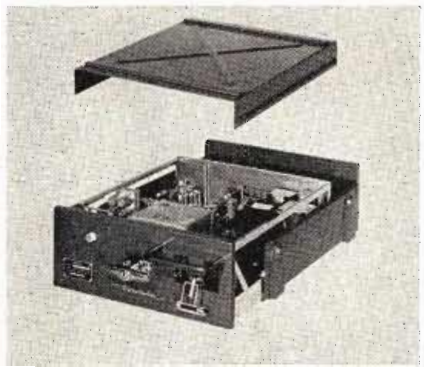
2-Way Radio with Split-Housing Design

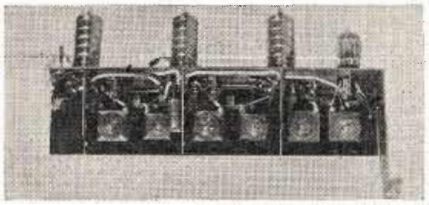
Accessibility of a 15-in. Motorola FM 2-way mobile radio housings has been increased greatly by the addition of a new "split-housing" feature. New 30



and 60-watt mobile sets are now being shipped with the new design that makes mounting possible in positions where the drawer-type housing could not be installed because chassis withdrawal would have been impossible. Because of the split-housing feature the chassis can be lifted out of the lower section of the housing.—**Motorola, Inc., 4545 West Augusta Blvd., Chicago 1, Ill.**—TELE-TECH

TV—I-F Amplifier

A high quality TV i-f amplifier has been designed to operate in the range of 41.25 to 45.75 Mc. The die stamping



method is employed to produce coils of absolute uniformity. The manufacturer can provide coil strips with or without coupling capacitors to customer's specifications. Any number of single or double-tuned coils in either circular or rectangular spiral configurations can be provided at specific values of inductance. Specifications and quotations are available upon request. Samples are available to responsible manufacturers.—**Franklin Airloop Corp., 43-20 34th St., Long Island City 1, N. Y.**—TELE-TECH

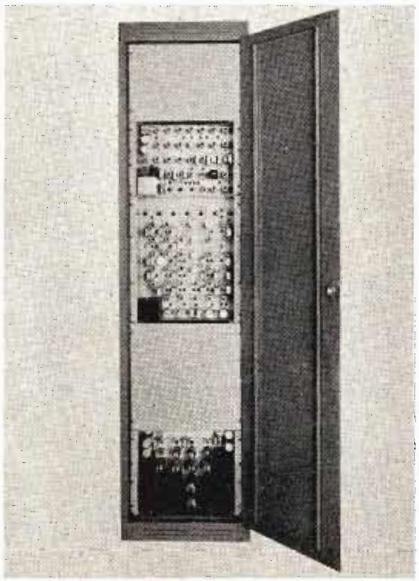
Sealed Selenium Cartridges

A new line of hermetically sealed selenium cartridges are assembled in half wave cartridges with current rat-

ings from 300 μamps up to 60 ma. The individual cartridges accommodate up to 400 cell elements with voltage ratings up to 8,000 v. per cartridge. By connecting a number of cartridges in series, voltages up to 250,000 v. have been obtained. The assembly is rugged and impervious to the effects of outside atmosphere. The units are capable of withstanding 100 G's of acceleration, and are ideally suited for airborne applications. They can be operated in ambient temperatures up to 100° C. The outside diameters vary from 3/16 in. up to 1¼ in., depending upon current rating.—**International Rectifier Corp., 6809 S. Victoria Ave., Los Angeles 43, Calif.**—TELE-TECH.

TV Synchronizing Generator

A new television synchronizing generator (FTL-63A) which meets all RMA and FCC specifications and recommendations for the synchronizing generator output signals has been developed. Dot-pattern signal is provided for the linearity testing of monitors and receivers. An exceedingly stable, high-speed binary frequency divider eliminates the need for expensive cathode-ray-tube monitoring. There are no operating controls or adjustments other than the master oscillator frequency. There is a choice of five lock-in sources: crystal, power-line, free, external, and interlace. Provision is also made for the addition of a



high-frequency interlace generator. Linearity dot pattern, mixed with blanking, is available on a separate jack.—**Federal Telecommunications Labs., Inc., Nutley, N. J.**—TELE-TECH

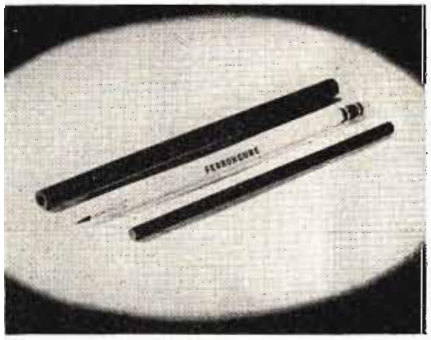
Klystron Power Supply

The 715A klystron power supply has been designed for test-bench operation of all types of low-power klystron oscil-

lators. The instrument provided a beam voltage continuously variable from 250 to 400 v. at 50 ma maximum. Reflector voltage is variable fro 10 to 900 v. at 5 μ amps. It also has provision for square wave modulation at 1 KC or may be modulated from an external source.—**Hewlett-Packard Co., 39 Page Mill Road, Palo Alto, Calif.**—TELE-TECH

Ferrite Antenna Rods

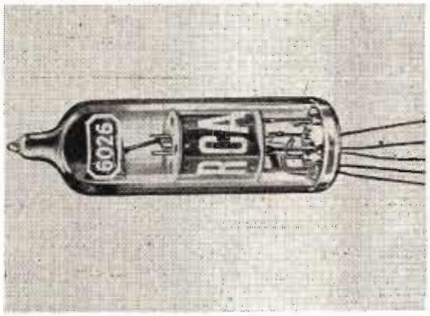
Rods of various ferroxcube materials are now being furnished to radio manufacturers and coil winding companies in



diameters from ¼ in. to 1 in. and in lengths up to 8 in. With single layer windings of insulated wire, Ferroxcube rod assemblies are used on portable radios in place of collapsible rod antennas or built-in loops. Because of the unusually high Q of these rod antennas, set sensitivity is considerably increased over the usual air loop. Because of the compactness of ferrite core antennas, they may be mounted almost anywhere in set cabinets using a minimum of space. — **Ferroxcube Corporation of America, 50 E. 41 Street, New York, N. Y.**—TELE-TECH

Oscillator Triode

The new, flexible-lead, subminiature tube type 6026 is a high-efficiency oscillator triode designed especially for



transmitting service at 400 MC in radiosonde and similar applications. In such service, it can deliver a useful power output of 1¼ watts. The subminiature structure features very short transit time and low interelectrode capacitances. Furthermore, it is small and light weight, design features which make the 6026 particularly useful in equipment requiring compactness. — **Tube Department, Radio Corporation of America, Harrison, N. J.**—TELE-TECH

Grid Dip Meter

Useful for locating parasitic circuits and spurious frequencies in transmitter and receivers, the GDO-1 grid dip meter

has a frequency range from 1.5 to 300 MC with 7 coil ranges. There is a built-in storage drawer and a large, easily-read meter with 0 —200 μamp movement. The unit is internally modulated and there are provisions for external modulation.—**Sylvan Electronic Laboratories, Broadalbin, N. Y.**—TELE-TECH

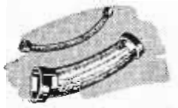
Connector Problem?

...We'll take it from HERE

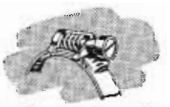
Good ideas for electronic circuitry sometimes run afoul of connector problems. Maybe existing connector units won't hold air pressure gradients, won't stand the heat, aren't rugged enough for the job. Or maybe it's a question of altitude, or under-water application. But if you can sketch the circuit, we'll take it from there. We've engineered so many special connectors, solved so many "impossible" problems, that whatever the requirements are, we can usually provide the answer.

Lightweight actuators for any requirement.

Job engineered, welded-diaphragm bellows.



Flexible conduit and ignition assemblies.



Aero-Seal vibration-proof hose clamps.

WRITE TODAY for specific information, or send us your sketches. We'll forward recommendations promptly.

BREEZE
Special CONNECTORS

BREEZE CORPORATIONS, INC.

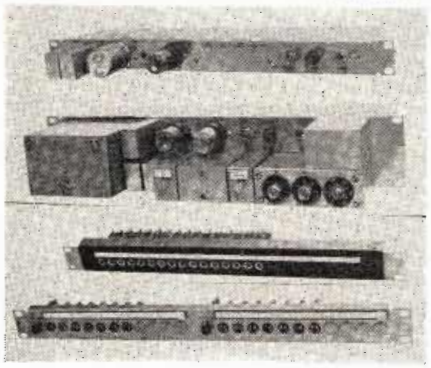
Removable pins in Breeze connectors speed soldering, save time, trouble. Pins snap back into block.

Microwave Components

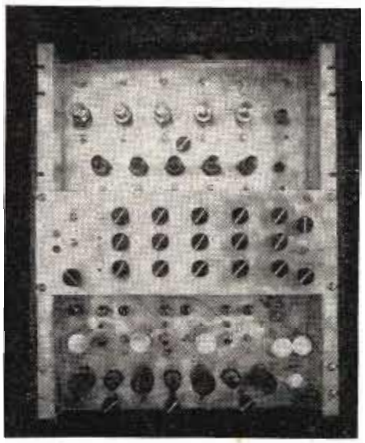
To meet the needs of microwave equipment manufacturers, apparatus for connecting microwave channel to telephone



equipment has been developed. Among these new devices are: ringdown terminating units; audio signaling oscillators; strap type attenuators; jack and lamp strips; and 4 wire to 2 wire terminating units with adjustable but not illustrated-dial terminating units, dial selective signaling and calling equipment, fault and alarm indicating and checking units. All units are designed for mounting on standard 19 in. equipment racks and feature extreme stability, long life, trouble free electronic circuit design.—**Kellogg Switchboard & Supply, Co., 6650 S. Cicero Ave., Chicago 38, Ill.**—TELE-TECH

Universal Color Bar Pattern Generator

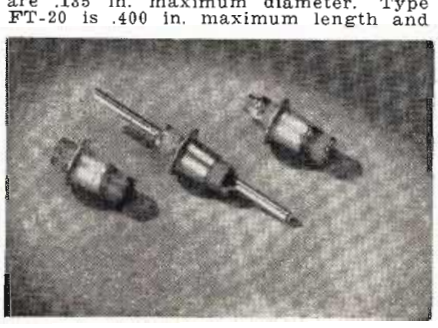
Because it generates three simultaneous color signals without noise, this new universal color bar generator can



be used for any past, present or future TV color system. Hue, brightness and saturation of the colors may be varied over a wider range than any present printing process known. Any color signal may be fed into this unit and color will be mixed with it. Levels are independently adjustable for color or monochrome. —**Telechrome, Inc., 84 Merrick Rd., Amityville, N. Y.**—TELE-TECH

Ceramic Capacitors

Two new miniature feed-through ceramic capacitors, types FT-20 and FT-25, are .135 in. maximum diameter. Type FT-20 is .400 in. maximum length and



type FT-25., .690 in. maximum length. They are intended primarily for smaller, lighter weight, commercial or government equipment. Each is equipped with a ¼ in. diameter eyelet which can be soldered to the chassis. These tiny capacitors are rated at 500 volts, dc working, 1,000 volts, dc flash test. Type FT-20 is available in any standard capacitance tolerance from 25 to 250μμf.; up to 650 μμf with 20% tolerance and up to 1,000 μμf with a GMV tolerance. Type FT-25 ranges from 50 to 700 μμf. in standard capacitance tolerances; up to 1500 μμf. in 20% tolerance; GMV tolerances apply to values up to 3,000 μμf.—**Centralab Div. Globe-Union, Inc., 900 E. Keefe Avenue, Milwaukee 1, Wisc.**—TELE-TECH

Receiver

A 9-tube receiver with power output of 3 watts and an output impedance of 4 to 8 ohms has been developed and is now available in a steel, copper coated cabinet. Known as model SR-9, it has over-all sensitivity of better than .5 μv. There is a precision slide rule type dial. The entire unit weighs 3 lbs.—**Sonar Radio Corp., Brooklyn 1, N. Y.**—TELE-TECH

Explosion-Proof Driver Units

Model XP-1 and XP-2 explosion-proof driver units are used in paging, announcing, and "talk-back" systems in

locations where flammable liquids, gases and dust present an explosion hazard. Both models are blastproof and withstand 30 rounds of blast at a peak pressure of 9.5 P.S.I. Access to the driver unit is by means of a removable back cover plate. Drilled and tapped holes internally provide for the inclusion of line matching transformers up to 30 watts capacity where required. A rugged 2-piece cast serrated mounting bracket permits easy installation on walls and bulkheads and allows wide variation in angular coverage. Voice coils are wound with aluminum wire for greatest efficiency.—**Racon Electric Co., Inc., 52 E. 19th St., New York 3, N. Y.**—TELE-TECH

Scalers

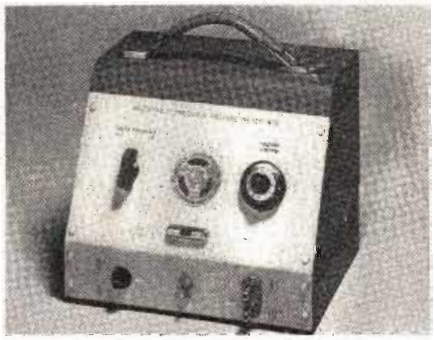
Availability of a new line of counters (scalers) featuring low cost, low current drain and dependability has been announced. The scalers are constructed on small unit chasses and are equipped with phone tip jacks to facilitate rearrangement of interconnections. They are useful for counting pulses or events, programming a series of operations, or generating time markers.—**Condor Radio, 6501 W. 83rd St., Los Angeles 45, Calif.**—TELE-TECH

Plug-In Chassis

The 8862 series plug-in chassis employs ten-element connectors of a brand new design. These are the open leaf spring type which allow full accessibility. Contact springs and stationary blades are 18% nickel silver. The chassis frame assembly and base plate assembly are furnished in a knocked-down kit. Made from heavy gauged steel, the frame and base are protectively plated. The chassis plate is of heavy gauged steel with angle edge for extra rigidity. This plate is shock mounted against microphonics with four shock mounts. Complete hardware is furnished with all kits. — **Cinera Engineering Co., 1510 West Verdugo Ave., Burbank, Calif.**—TELE-TECH

Secondary Standard Cell

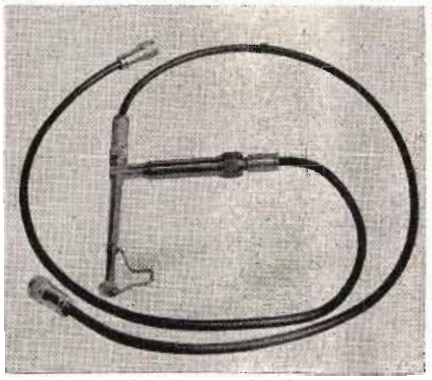
A new, adjustable, all-electronic "secondary cell," operating from ac mains to provide a continuously variable dc sup-



ply over the wide range of 0.0001 v. has been developed. It is a precision unit designed primarily to work with high impedance devices; for dc amplifier testing, calibration of dc oscilloscopes and vacuum tube voltmeters, and determination of vacuum tube characteristics. Maximum output impedance of the unit is 1,000 ohms, with accuracy maintained at 0.1% of full scale. A multiple-turn potentiometer is provided having divisions of .001 of full scale. The circuit is operable with input voltages of 105-130 v., 50-60 cycles, with full accuracy.—**General Precision Laboratory, Inc., 63 Bedford Road, Pleasantville, N. Y.**—TELE-TECH

Microwave Attenuator

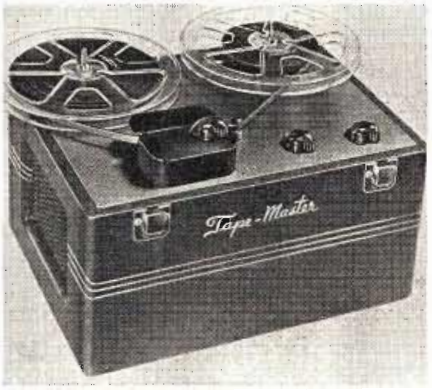
Model ST-J microwave attenuator operates on the principle of a wave-guide beyond cut-off and provides a range of



attenuation in excess of 140 db. The attenuator is designed to cover the frequency range from 4 to 12 KMC; it has a 50 ohm impedance.—**Polarad Electronic Corp., 100 Metropolitan Ave., Brooklyn, N. Y.**—TELE-TECH

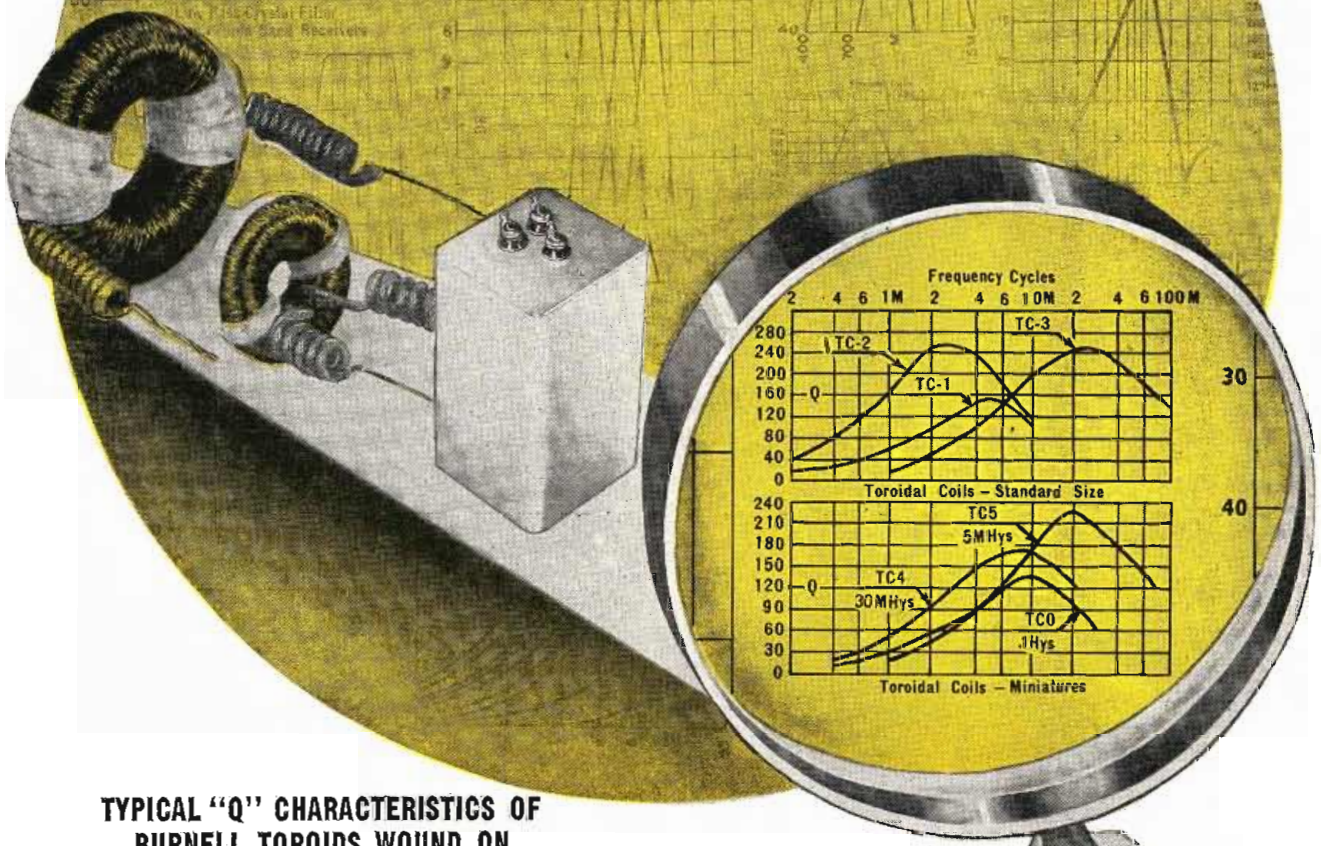
Playback Machine

A low-cost, portable tape playback machine, which is known as the "Tapemaster", is available either as a self-



contained unit with its own 5¼ in. loudspeaker and 4 tube amplifier or with pre-amp only. Both units operate at 3¾ in. or 7½ in. per sec. to 8000 cps. with 1 and 2 hours recording time respectively, depending on speed. — **Audio Master Corp., 341 Madison Ave., New York, New York.**—TELE-TECH

Burnell NOW BIGGER THAN EVER IN THE PRODUCTION OF TOROIDS AND FILTERS



TYPICAL "Q" CHARACTERISTICS OF BURNELL TOROIDS WOUND ON MOLYBDENUM PERMALLOY CORES

Several years ago we began to specialize in the design and manufacture of toroidal coils and audio filter networks. At that time too few electronic engineers were aware of the full value of toroids (particularly those wound on molybdenum permalloy dust cores) as very little publicity had ever been devoted to a product that was fast becoming one of the most vital in the development of modern communications and control equipment.

We believe that since then through our technical service and advertising methods we have helped thousands of engineers to understand and appreciate the toroid as an essential in network applications.

The resulting popularity and industry acceptance of our toroidal coils and filters have necessitated an expansion of our production facilities to ten times what they were five years ago and we are proud to point to this growth as an expression from our customers of their satisfaction in the quality of our product and our service.

STANDARD SIZES
TC-1 = 1 5/8" O.D. x 5/8"
TC-2 = 2 1/4" O.D. x 7/8"
TC-3 = 1 1/2" O.D. x 9/16"

MINIATURE SIZES
TC-0 = 7/8" O.D. x 3/8"
TC-4 = 1-3/16" O.D. x 9/16"
TC-5 = 1-3/16" O.D. x 9/16"

CABLE ADDRESS "BURNELL"

TV Picture Monitor

A new high-quality TV picture monitor, which will permit a television station to monitor video signals with full

assurance that the monitor is not "cutting into" the picture signal resolution, has been developed. Designated the FTL-84A, the new monitor is especially useful in the laboratory and production testing of television video amplifiers. Resolving power has been designed for operation well beyond the specified 600 horizontal lines minimum. The picture size is 14 in. Deflection circuits have been designed for stable operation and are independent of the separately-driven pulse high-voltage supply. This permits the adjustment of horizontal linearity and size without concern for the effect on high voltage. The high-voltage supply provides 16 KV for a bright, crisp picture. **— Federal Telecommunication Laboratories, Inc., Nutley, N. J.**—TELE-TECH

High-Temperature Rectifier

Selenium rectifiers are now available, which are capable of operating without derating in ambient temperatures of 90° C. These new rectifiers are guaranteed for a minimum of 1000 hours of continuous operation. — **Sarkes Tarzian, Inc., Rectifier Division of 415 North College Avenue, Bloomington, Ind.**—TELE-TECH

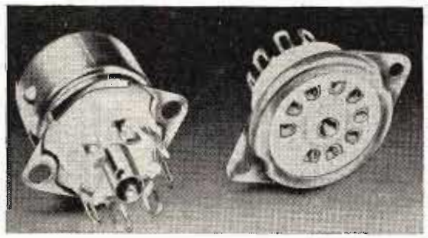
Phono Pickup

The "Fluid Sound" phono pickup consists, essentially, of an actuating arm to which the sapphire-pointed stylus is affixed; a plastic body containing three cells filled with an electrolytic, nontoxic, conducting fluid, and a rubber diaphragm. In operation, direct current flowing through the three cells in series is modulated by the motion of the stylus. The current modulations thus produced cause an output voltage to appear on the center cell electrode. This voltage is then fed in the usual manner to any audio amplifier. Needle-record contact is used only to modulate the externally supplied dc voltage as it flows through the fluid. The same basic cartridge is used for all disc-recorded sound reproduction, but three different points, universal, 1 mil. and 3 mil, are available to accommodate variations in groove-

width. Each point-size is mounted in a cartridge of distinctive color to insure quick and positive identification. Because the output voltage is derived from direct current supplied to the pickup, required tracking pressure is low and resultant stylus and record wear is minimized. "Fluid Sound" is not affected by extreme temperatures or excessive moisture or humidity; the cartridge is ruggedly constructed and will withstand more than the usual amount of rough handling, frequency response 20-10,000 cps.—**Lindberg Instrument Co., 830 Folger Avenue, Berkeley 10, California.**—TELE-TECH

Miniature Tube Sockets

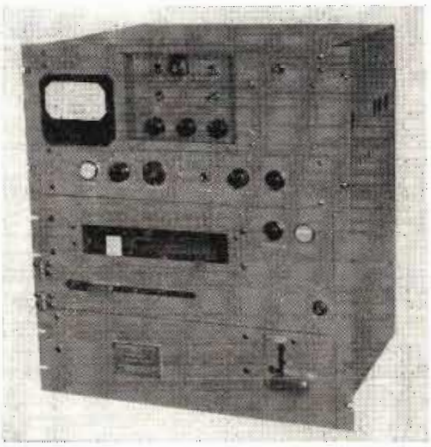
Said to be ideal wherever high or low ambient temperatures of frequency stability are problems, Chemelec miniature tube sockets are being moulded in Teflon, a tough, resilient, plastic which withstands mechanical shock and vibration and thermal shock. Teflon's loss factor is less than 0.0005 and dielectric constant only 2.0 from 60 cps to 30,000 MC and is serviceable at any temperature from 150°F. to 550°F, for long periods, with negligible change in dielectric strength, power factor and other critical electrical characteristics. Unlike other plastics. Teflon will not carbonize



in case of arcing. Also, Teflon, has a water absorption rating of 0.0% by ASTM Test; its physical and electrical properties cannot be affected by extreme humidities, corrosive atmospheres or fungus. It is nonflammable, chemically inert.—**Teflon Products Division, United States Gasket Company, P. O. Box 93, Camden, N. J.**—TELE-TECH

Recorder-Reproducer

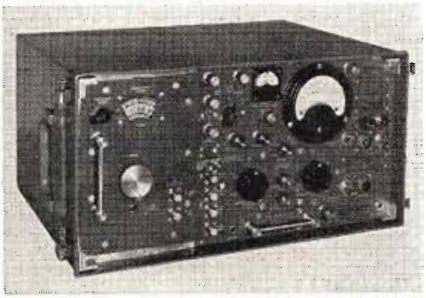
The RRP-24 is a single-channel magnetic recorder-reproducer which will continuously record or transcribe voice



frequency intelligence for an entire 24-hour day, or by utilization of its voice actuated relay control will record intermittent operations for a number of days. Separate recording and playback amplifiers permit simultaneous reproduction, or playback of earlier intelligence while the machine is operating in its recording condition. A simple, yet accurate timing arrangement indexes the entire recording. An ordinary tape recorder drives its magnetic ribbon past a recording head and stores the medium in hundreds upon hundreds of feet of tightly wound tape. The RRP-24 uses the same type of magnetic medium except that it is 8½ in. wide and 200 ft. long.—**Press Wireless Mfg. Co. Inc., Cantiague Road, Hicksville, New York.**—TELE-TECH

Noise and Field Intensity Meter

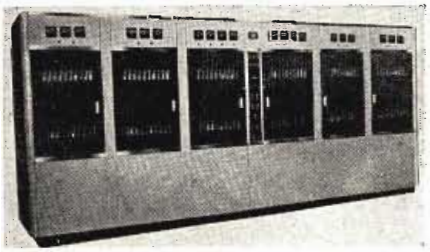
Model NF-105 is a sturdily-built noise and field intensity meter covering the 20 to 400 MC frequency range. In the de-



sign of the instrument, particular attention was paid to high accuracy and reliability of measurements, as well as to ease of operation. The frequency range is covered by means of two readily replaceable plug-in heads housing the r-f and i-f circuits. Tuning is accomplished by a single control. The unit operates on 115 v., 50 to 400 cps, or, by using an inverter, on 12 or 24 v. batteries. It is fully "A" and "B" voltage regulated for operation from 100 to 130 v. and a correspondingly wide range on battery operation. Bandwidth is 70 KC from 20 to 200 MC and 200 KC from 200 to 400 MC. The voltage range as a two-terminal r-f voltmeter is 1 to 100,000. All input circuits, termination and attenuators are so designed that the voltage standing wave ratio (VSWR) is below 1.2 to 1. The calibrating voltage is injected, by means of an injection block, at the antenna or a pick-up device used. Two calibrating standards are used: a spot frequency sinewave generator and a broadband impulse generator. The impulse generator, whose output can be made available externally, produces pulses 5 x 10^{-10} seconds wide (0.0005 microsec.). The pulse spectrum is flat to 1000 MC within ±½ db. Pulse amplitude and repetition rate are variable over a wide range.—**Empire Devices, Inc. 38-25 Bell blvd., Bayside, N. Y.**—TELE-TECH

Transmitters

Making available facilities for wider coverage and stronger fringe-area signals, new 10 KW VHF TV transmitters



are high-level modulated, air-cooled equipments. They provide a nominal peak visual power output of 10 KW, measured at the output of the sideband filter, and a nominal peak aural power output of 5 KW, in conformance with FCC and RTMA standards. Model TT-10AL is designed to operate in any channel from 2 to 6, inclusive; model TT-10AH, in any channel from 7 to 13, inclusive. Used with appropriate RCA super-turnstile-type antennas, these models are capable of providing the maximum effective radiated power proposed by the FCC. Operating costs are substantially lower per radiated kilowatt than those of commercial transmitters now in operation.

Only high-gain, air-cooled tetrodes are used in the final amplifiers of both aural and visual units. Grid modulation of these stages permits individual, non-critical meter tuning of all r-f circuits. Other design features include single-ended r- circuits which reduce the number of tubes and components required, fewer r-f stages, elimination of the need for linear amplifiers in these stages, built-in control of white saturation, high-speed ac and dc overload protection, and high-level modulation which requires only one broadband r-f circuit for tuning.—**RCA Victor Div., Radio Corporation of America, Camden, N. J.**—TELE-TECH

TV-DESIGNER'S NOISE PROBLEM

"Snow in fringe-area reception: how can I reduce it . . . economically?"

Here's a brand-new, up-to-the-minute way to cut noise nuisance at a budget figure. It's G. E.'s great new 6BK7—a miniature designed by General Electric to solve the very problem *you* face, Mr. Designer!

This new tuner tube is low in two important ways—noise level and cost. At a real bargain price the 6BK7 improves picture quality in marginal TV areas, making friends for your set right where sales are growing fastest.

Intended primarily for cascode service in v-h-f, the 6BK7 also may be used as a low-noise first-intermediate-frequency amplifier in u-h-f. Design features include: (1) a special shield between the triode sections, (2) high transconductance to improve gain and reduce noise level.

You'll take pride in the more widely usable TV set you can design around this pace-setting G-E tube. Telegraph or write for Engineering Bulletin ET-B32, just off the press! Or, if you wish, a G-E tube engineer will be glad to call on you. *Electronics Department, Section 6, General Electric Company, Schenectady 5, New York.*

TELE-TECH's NEWSCAST

IRE-RTMA Radio Fall Meeting

This year the annual IRE-RTMA radio fall meeting will be held at the King Edward Hotel in Toronto, Canada, October 29-31. Tentative program, list of technical papers, and their authors is as follows:

"Noise in Television Receivers"—S. J. H. Carew, Stromberg Carlson Co. Ltd.
"Suppression of Local Oscillator Radiation in Television Receivers"—John Van Duyne, Allen B. DuMont Laboratories, Inc.
"Report of the RTMA Material Bureau"—L. M. Clement, Crosley Division, Avco Mfg. Corp.
"A New Miniature Triode for UHF TV Tuners"—K. E. Loofbourrow and C. M. Morris, Radio Corporation of America.
"Measurement of Television Gamma or Amplitude Linearity"—W. K. Squires, Sylvania Electric Products Inc.
"A UHF Television Converter"—H. R. Hesse, Allen B. DuMont Laboratories, Inc.
"Phase Linearity in TV Receivers"—Herbert Kiehne and Stanley Mazur, Emerson Radio and Phonograph Corp.
"The Chromatron—An Electronically Registered Tri-Color Cathode Ray Tube"—Robert Dressler. Chromatic Television Laboratories Inc.
"Pencil Triode for Pulsed—Oscillator and Power — Amplifier Service — John W. Busby, Radio Corporation of America.

4th Quarter CMP Allotments

Copper, steel and aluminum allotments for the 4th quarter of 1951 to communications and electronic equipment manufacturers have been announced as follows: For communications equipment—39,453 tons of steel, 53,090 pounds of copper and copper alloys, 2,900 pounds of aluminum. For electronic equipment—72,550 tons of steel, 33,385 pounds of copper and copper alloys, 15,750 pounds of aluminum.

UHF Symposium in Philadelphia

The IRE professional group on broadcast transmission systems has announced that it is sponsoring a one-day symposium on the subject of UHF to be held at the Franklin Institute in Philadelphia, Monday, Sept. 17. This session starts at 10:00 A.M. and lasts until 6:00 P.M. Admission is two dollars. Among the technical papers to be presented are:

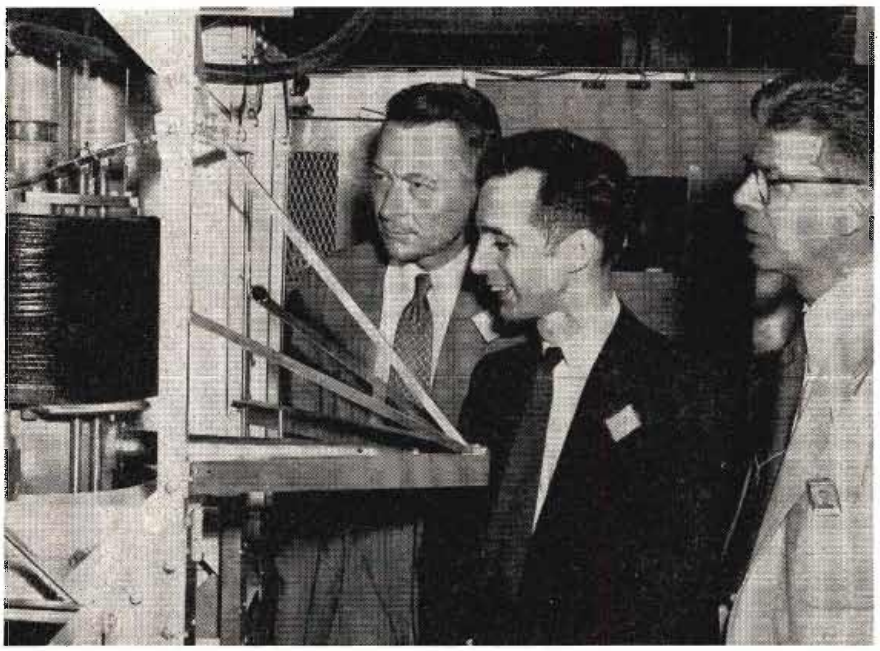
"Impedance Frequency Measurements at UHF," R. A. Soderman and F. D. Lewis, General Radio Company, 275 Massachusetts Avenue, Cambridge, Mass.
"Progress Report on RCA-NBC UHF Project at Bridgeport, Conn.," R. F. Guy, National Broadcasting Company, New York City.
"Electronic Field Strength Analyzer for Use in TV Station Field Surveys," F. W. Smith, National Broadcasting Company, New York City.
"GE's UHF Helical Antenna," L. O. Krause, General Electric Company, Syracuse, New York.
"DuMont's 700 MC UHF Installation," W. Sayre, Jr., and E. Mehrback, Allen B. Du Mont Labs., Inc., Clifton, New Jersey.
"Fundamentals of Receiver Design," W. B. Whalley, Sylvania Physics Lab., Bayside, L. I., N. Y.
"UHF Field Intensity Meter," Boonton Radio Corporation, Boonton, N. J.
"Transmission Line Problems in Ultra-Highs," J. M. De Bell, Jr., Allen B. Du Mont Labs., Inc., Passaic, N. J.
"Some Experiments with 850 MC TV," Dr. George H. Brown, RCA Labs., Inc., Princeton, N. J.

New Microwave Links for Florida Telephone System

Peninsular Telephone Co. of Tampa, Fla., has become the first independent telephone company in the United States to adopt microwave transmission. Equipment for the new system will be manufactured and installed by Federal Telecommunication Laboratories, Inc., of Nutley, N. J. Federal has produced microwave links which are now operating on more than 12,000 channel miles of non-common carrier fixed circuits in the United States and common carrier and non-common carrier circuits abroad.

The Peninsular Telephone Co., which operates approximately 160,000 telephones in the west-central part of Florida, has ordered the building of a microwave radio relay link between its central offices in Tampa and Bartow, a distance of 40 miles.

FCC ENGINEERS ON NTSC INSPECTION TRIP



FCC Chief Engineer E. W. Allen and Broadcast Chief C. B. Plummer, together with Lab Chief E. W. Chapin and Field Research Chief W. C. Boese, were guests of NTSC and travelled the rounds of the August 6-10 color-TV demonstrations. In photo, Engineers Allen and Plummer at Syracuse, N. Y., are inspecting GE's high-power UHF-TV transmitter, guided by Manager George F. Metcalf (right). (See page 39)

Coming Events

September 10-14—Sixth National Instrument Conference and Exhibit, Sponsored by Instrument Society of America, Sam Houston Coliseum, Houston, Texas.
September 11-13—National Electronic Distributors Association, 1951 Convention and Show, Cleveland, Ohio.
October 2-4—Association of American Railroads, Communications Section, Annual Convention, Chateau Frontenac Hotel, Quebec, Canada.
October 22-24—Seventh National Electronics Conference, Edgewater Beach Hotel, Chicago, Ill.
October 29-31—1951 Radio Fall Meeting, RMA of Canada, RTMA Engineering Dept., and the IRE, King Edward Hotel, Toronto, Canada.
November 1-3—The Audio Fair, Sponsored by the Audio Engineering Society, Hotel New Yorker, New York City.
November 29-December 1—Joint Engineering Tube Equipment Council, First General Conference, Seaview Country Club, Absecon, N. J.

Microwave Attenuator

(*Continued from page* 43)

pative material are controlled, and a variable attenutor results. In addition, the control characteristics are linear over a substantial range. An NBS investigation of materials such as polyiron and ferrites (with electrical resistivities from 10^2 to 10^7 ohms/cm) indicated that the loss characteristics not only depend upon the composition and length of the material but increase with increasing frequency.

The size of an NBS Magnetic Attenuator for ⅜-in. coaxial transmission lines is only 4 x 4 x 2 inches. The dissipative material, a cylinder of polyiron, is about ½ inch long and ⅜ inch in diameter. A recessed conductor hole for the center conductor is drilled into the cylinder, ceramic insulators are placed at the extremities, the whole assembly is encased in a metal sheath, and connector pins are fastened to the ends of the center conductor. Standard male and female type N coaxial connectors complete the assembly.

The electromagnet requires a d-c power source of 0 to 250 volts with a maximum of 30 milliamperes current to produce a magnetic field of 1500 gauss in the air gap. Small changes in the magnetic field are obtained by controlling the field current with a multi-turn Helipot potentiometer.

An experimental model of the NBS Magnetic Attenuator which uses polyiron as the dissipative element was operated at frequencies from 1000 to 3000 Mc. Variations in the losses of the polyiron were produced which were large enough to reduce the attenuation 60 percent, change the power by a ratio greater than 60:1, with voltage standing wave ratio always less than 1.5.

More recently, a study was made at NBS of an attenuator that employs a slug of Ferramic B ½ inch long and ⅜ inch in diameter as the dissipative medium. The dependence of the losses in the material on frequency was remarkably demonstrated by this experiment. At 2200 Mc the attenuation was reduced from 17 db to less than ½ db, and less than 45 milliamperes of current was required to maintain the magnetic field. At a frequency of 2600 Mc, changes in attenuation greater than 20 db were obtained with the same electromagnet currents. To avoid saturation in the iron core of the small, low current electromagnet, a larger unit was used to obtain greater changes in attenuation. At several frequencies, attenuation changes in

SYLVANIA PLUGS THE 16,000 MC GAP

with the new 1N78 Silicon Crystal Mixer

Sylvania adds another to the world's widest Silicon Crystal Mixer line – the 1N78 for 16,000 mc, one of the newest SHF bands. This new diode is the latest product of Sylvania's continuing exploration into frequency conversion in microwave regions.

Better and better performance at existing frequency bands and new designs for tomorrow's frequencies are both to be expected of Sylvania's advanced research and long experience in Silicon Diode technology.

Sylvania also makes Silicon Crystal Video Detectors for use as microwave detectors in receivers of non-heterodyne type. Other Sylvania products engineered for radar and SHF receivers include magnetrons, TR tubes, ATR tubes and hydrogen thyratrons.

Sylvania Silicon Mixer Diodes

Type	Construction	Design Frequency (Approx.)
1N25	Cartridge	1000 mc.
1N21B	Cartridge	3000 mc.
1N23B	Cartridge	10,000 mc.
1N78	Coaxial	16,000 mc.
1N26	Coaxial	24,000 mc.
1N53	Coaxial Miniature	Above 30,000 mc.

Write for this 16-page book, "Microwave Crystal Rectifiers," including the new 1N78 characteristics and ratings.

ELECTRONIC DEVICES; RADIO TUBES; TELEVISION PICTURE TUBES; ELECTRONIC TEST EQUIPMENT; FLUORESCENT TUBES, FIXTURES, SIGN TUBING, WIRING DEVICES; LIGHT BULBS; PHOTOLAMPS; TELEVISION SETS

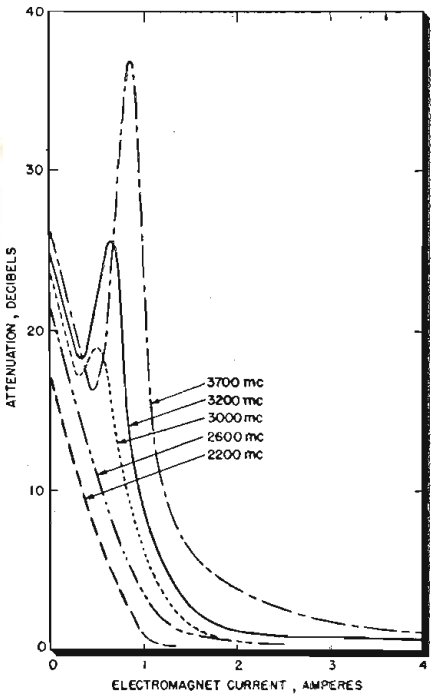

Fig. 4: Curves showing effect of ferromagnetic resonance as operating frequency is increased, 2200 to 3700 MC

excess of 95% have been obtained without difficulty.

While operating at a frequency of 3200 Mc, a striking example of ferromagnetic resonance was exhibited. As the electromagnet current was increased, the attenuation decreased from its initial value of 24 db to about 18 db, then peaked to about 25 db, and finally decreased to approximately 1 db. The peak occurred at a current of approximately 0.6 amperes. When operating at 3700 Mc, a similar phenomenon occured. The initial attenuation of 26 db was reduced to about 16 db before peaking to 37 db; finally it dropped to about 1 db as the current continued to increase. The resonance effect appeared when the electromagnet current was approximately 0.8 ampere.

When the magnetic field is rotated 360° about the axis of some of these coaxial attenuators, a position may exist where the field has its maximum effect. For instance, when a magnetic field of constant intensity was rotated about the axis of the above coaxial attenuator operated at 3700 Mc, changes in attenuation of 17 db were obtained. However, this rotational phenomena does not exist for all materials used in these attenuators.

Many applications of this magnetic phenomenon are immediately evident. An audio source can be used to vary the electromagnet current which produces a changing field in

the attenuator and consequently amplitude-modulates the r-f signal. The resultant modulation envelope includes the predominant second and higher harmonic frequencies of the audio frequency field. However, these harmonies can be readily eliminated by employing a d-c bias about which the a-c field oscillates. The use of the NBS Magnetic Attenuator in this fashion permits amplitude modulation of UHF and microwave oscillator outputs without the frequency modulation effects which occur when the oscillator is modulated directly.

The NBS Magnetic Attenuator is equally adaptable as an output stabilizer for microwave oscillators. The unit can be part of a degenerative feedback circuit in which the magnitude of the field produced by the electromagnet is controlled by a small amount of r-f power taken from the coaxial transmission line. Another magnetic unit may also be utilized in such a feedback network. The rectified control voltage coupled from the transmission line may be applied to a magnetic amplifier which controls the electromagnet field directly.

Current NBS investigations are being directed toward finding better and more efficient dissipative materials. Among the latest group of materials under study are magnetic ferrites, which yield greater attenuation changes for a given electromagnet current than does polyiron. These ferrites should thus make possible the use of smaller currents to produce the same changes of attenuation.

A waveguide attenuator using similar principles is described in "Magnetically Controlled Waveguide Attenuator" by Theodore Miller, Journal of Applied Physics, **20**, 878, (September 1949).

UHF Converter

(*Continued from page* 38)

ently good noise factor. This circuit consists of a neutralized grounded cathode input section followed by a grounded grid stage.

Both the input grid and the interstage circuit of the cascode are adjusted to have bandwidths of about 12 MC., i.e., to include both Channels #5 and 6. The plate of the output triode, however, is adjusted for a 6 MC. bandwidth and a switch is provided on the rear of the chassis to select the desired channel. Economy is achieved by the use of a simple slide switch as a channel selector which varies the value of capacity in series with the plus B end of the plate tuning coil. Balanced output is used in order to eliminate interference pickup on the

lead coupling the converter to the VHF receiver.

Since most television receivers have no provision for supplying power to an external converter, this converter is self-powered. Both chassis height limitations and power economy dictated the use of a selenium rectifier in preference to a vacuum tube, but a power transformer is used to eliminate hum interference between converter and television receiver.

AC power for the television receiver can be secured from the rear of the chassis, and a switch on the converter energizes both units and selects either VHF or UHF reception.

The heaters of the converter tubes remain on for both types of reception with a plus B switch being provided in the ground return of the power transformer secondary. Switching in this manner allows instantaneous change from VHF to UHF and also removes the voltage from the converter filter condensers during VHF operation.

Input terminals for both VHF and UHF antennas are provided on the rear of the chassis. When receiving signals on Channels #2 to 13, the VHF antenna is directly connected to the television receiver input. For reception on Channels #14 to 84, a separate UHF antenna may be used, or if signal conditions allow, either the VHF antenna or a built-in cabinet antenna may be selected.

Pioneer Awarded Contracts

The Army Signal Corps has awarded contracts totaling a quarter of a million dollars to the Pioneer Electronics Co. of Santa Monica, California, for the manufacture of radar tubes.

General Radio Expands Plant

The General Radio Co. is starting construction of a new plant in Concord, Mass. For the past thirty-six years, the executive offices and manufacturing facilities of the company have been located entirely at Cambridge, Mass. Although a substantial tract of land zoned for industrial use has been acquired in West Concord, all of the Cambridge facilities will be maintained, at lest for the near future. The new plant will be a modern three-story brick-faced building of 72,000 sq. ft. and will provide facilities for about two hundred employees. Construction is expected to start immediately.

Color-TV

(*Continued from page* 39)

the excellent color quality of the laboratory-produced pictures. The generating equipment was very flexible and many combinations were readily demonstrated. Space is not available to describe these.

The RCA equipment consisted of a large-screen projection receiver, a tri-color tube receiver, a flying-spot slide scanner plus studio pickup of "live" subjects. The number of system variations available was large and their effects on the picture were clearly shown. Some of these were: (a) the conspicuousness of dot structure in monochrome receivers (compatibility); (b) color stability; (c) spurious colors due to cross-talk and (d) color resolution.

The fidelity of the reproduced picture on the tri-color tube can be judged by the fact that in a side-by-side comparison with an optically projected image of the same scene, some of the engineers could not tell which was which!

Actually neither entertainment value nor artistic reproduction was the aim of any of the tests. In fact, Philco purposely chose to demonstrate at its Field Laboratory, a location where reception is difficult due to weak signals and strong interference from nearby automotive traffic, so that the effect of a radio link could be observed. The slide scanner was at WPTZ in Philadelphia, about 21 miles from the tri-color tube receiver at Morrisville, Pa. System variables were changed while results were noted on a color picture, sometimes nearly submerged in ignition interference. Under these practical conditions it appeared that picture quality improved with increasing sub-carrier amplitude, contrary to earlier laboratory observations.

It is not possible to mention the dozens of test combinations observed during these four days of tests. NTSC was pleased that the FCC detailed their engineers—the four who have been most concerned with color television—to witness all of these tests.

RCA Converts Camden Unit for Defense Production

An additional manufacturing unit to be devoted solely to the production of electronic equipment for the national defense effort will be established in the Camden works of the RCA Victor Division, Radio Corporation of America. Various types of radar equipment will be produced.

MILITARY CONTRACT AWARDS

Manufacturers who have received contract awards for producing of radio-radar-electronic equipment for the Armed Services are listed below by name, city and equipment. Subcontractors interested in hidding on performance of any part of each contract should sell their services to these prime contractors. This list, which is current up to our press time, covers the period from July 5 to August 1.

Antennas

Allied Aircraft Co., N. Hollywood, Calif.; American Phenolic Corp., Chicago, Ill.; Camfield Mfg. Corp., Grand Haven, Mich.; General Electric Co., Syracuse, N. Y.; Engineering & Research Corp., Hyattsville, Md.; Heyer Products Co., Belleville, N. J.; E. J. Johnson Co., Waseca, Minn.; RCA Victor Div., Radio Corp. of America, Camden, N. J.; Sylvania Electric Products, New York, N. Y.; Tung-Sol Lamp Works, Newark, N. J.; Radio Corporation of America, RCA Victor Div., Harrison, N. J.; Western Electric Co., N. Y. City; Westinghouse Electric Corp., Bloomfield, N. J.

Cable Assemblies

American Phenolic Corp., Dayton, Ohio; Colortone Television Co., N. Y. City; Crescent Insulated Wire & Cable Co., Trenton, N. J.; Lowell Insulated Wire Div., Overlakes Corp., Lowell, Mass.; The Okonite Co., Passaic, N. J.; Phoenix Cords, Inc., and Elmco Co., Hillside, N. J.; U. S. Rubber Co., N. Y. City.

Capacitors

Corning Glass Works, Corning, N. Y.; Allen D. Cardwell Mfg. Corp., Plainville, Conn.; E. F. Johnson Co., Waseca, Minn.; Electro Motive Mfg. Co., Willimantic, Conn.; Radio Wire Television, Inc., N. Y. City; Sprague Electric Co., North Adams, Mass.; Wilcox Electric Co., Kansas City, Mo.

Connectors

American Phenolic Corp., Chicago, Ill.; Cannon Electric Co., Los Angeles, Calif.; Kings Electronics Co., Tuckahoe, N. Y.; Magnavox Co., Fort Wayne, Ind.; The Pyle National Co., Chicago, Ill.; RCA Victor Div., Radio Corp. of America, Camden, N. J.; Siltronic Co., Pittsburgh, Pa.; United Transformer Corp., N. Y. City; Utility Electronics Corp., Newark, N. J.; Western Electric Co., N. Y. City.

Crystal Units

General Electric Co., Syracuse, N. Y.; Keystone Electronics Co., Stamford, Conn.; Pacific Electronics, Los Gatos, Calif.; Polytech Devices, Elizabeth, N. J.; Sherold Crystal Corp. and Espey Mfg. Co., Kansas City.

Generator Sets

Beech Aircraft Corp., Wichita, Kansas; Buda Co., Harvey, Ill.; Continental Electric Co., Newark, N. J.; Westinghouse Electric Corp., Dayton, Ohio.

Electron Tubes

Amperex Electronic Corp., Brooklyn, N. Y.; Bomac Laboratories, Beverly, Mass.; E. Thomas Casellini, Kemptron Electron Prods. Co., Salem, Mass.; Chatham Electronics Corp., Newark, N. J.; Allen B. DuMont Labs., East Paterson, N. J.; Eitel-McCullough, San Bruno, Calif.; Federal Engineering Co., New York City; General Electric Co., Schenectady, N. Y.; Haydu Brothers, Plainfield, N. J.; Hytron Radio & Electronic Corp., Salem, Mass.; Kuthe Labs., Newark, N. J.; Machlett Laboratories, Springdale, Conn.; National Union Radio Corp., Orange, N. J.; Raytheon Mfg. Co., Power Tube Div., Waltham, Mass.; Sonotone Corp., Elmsford, N. Y.

Headsets

Connecticut Telephone & Elec. Corp., Meriden, Conn.; Consolidated Radio Products Co., Chicago, Ill.

Indicators

Bendix Radio Div., Bendix Aviation Corp., Baltimore, Md.; Blackstone Mfg. Co., Chicago, Ill.; Keystone Watch Case Div., Riverside Metal Co., Riverside, N. J.; Kollsman Instrument Corp., Elmhurst, N. Y.; Magnavox Co., Ft. Wayne, Ind.; Ryan Industries, Detroit, Mich.; Schwien Engineering Co., Los Angeles, Calif.; Sperry Gyroscope Co., Great Neck, L. I.; Weston Electrical Instrument Corp., Newark, N. J.

Inverters

Magnecord Service Depot Serves Western States

Manufacturers Electronic Service, Santa Monica, California has been approved by Magnecord Inc., manufacturers of high fidelity tape recorders, as its West Coast service station.

Measuring TV Amplitude

(*Contined from page 31*)

cies of the 15 KC waveform are close together and not readily distinguishable but the envelope is clearly defined.

From left to right the pattern covers a frequency range from F—5 MC to F+5 MC. The relative response of the transmitter at any frequency is given by the distance between the top and bottom of the envelope at the position corresponding to that frequency. The distance can be measured by means of a transparent scale in front of the oscillograph screen.

For a short time during each sweep, the wobbulator frequency is within 15 KC of the carrier frequency and during this time all three difference frequency outputs from the second mixer are passed by the filter. This produces a large vertical "birdie" and conveniently serves to indicate the position of the carrier on the pattern. The positions of other frequencies on the pattern can be indicated by means of a video frequency marker coupled to the video input of the transmitter as shown in the block diagram.

The photograph in Fig. 3 was obtained with a 500 watt transmitter which employs a notching filter to assist in obtaining the required lower sideband attenuation. The position of the carrier is indicated by the large "birdie" in the center of the pattern. The response of the lower sidebands to the left of the carrier is maintained to about 500 KC below the carrier and then decreases rapidly to almost zero at 1.5 MC which corresponds to the resonant frequency of the notching filter. The response rises again below this frequency, but does not exceed 10% of the amplitude of the sidebands close to the carrier. The relative amplitudes of the upper sidebands are shown to the right of the carrier. The response decreases slightly up to 1.5 MC, rises again up to 3 MC and then falls off so that it is about 3 db down at 4 MC. The position corresponding to these frequencies is shown by means of the marker which puts small notches in the pattern at equal distances above and below the carrier. These notches are not shown in the photograph.

This shape of pattern is characteristic of the type of circuit used in this transmitter, i.e., a pair of coupled tuned circuits with a notching filter coupled to the secondary circuit. By using this sweep method for indicating the response, the effects produced by varying the

transmitter adjustments can be readily observed and the transmitter circuits can be rapidly adjusted to produce the desired response in the pass band and the desired lower sideband attenuation.

Description of Circuit

The equipment required for this sweep method of measurement can be quite simple as indicated by the schematic in Fig. 4.

The circuit shown has been simplified mainly by the omission of power supply components. The wobbulator is a conventional push-pull oscillator with its tuning capacitor driven by a synchronous motor. The signal of frequency F-15 KC is generated by the crystal oscillator and tripler and is mixed with a signal from the wobbulator in the two-crystal video mixer. The output from the mixer passes through an r-f filter and a dividing network, and is fed to the transmitter video input terminal.

The dividing network, consisting of the shunt inductor and resistor and the series capacitor, serves to remove the very low frequencies from the signal fed to the transmitter, and at the same time maintains a constant resistive load on the mixer. The removal of the very low frequencies eliminates the generation of sidebands close to the carrier. This limits the amplitude and spread of the carrier "birdie". An absorption marker is applied to the transmitter input signal with the simple series resonant circuit, the variable capacitor being calibrated for frequencies between approximately 500 KC and 5 MC.

Another signal from the wobbulator is coupled through a small adjustable capacitor to the coaxial cable feeding the mixer probe which is screwed into the output transmission line of the transmitter. The crystal diode in the probe mixes the wobbulator signal with a signal picked up from the transmission line by an inductive loop.

The simple circuit in the probe performs a number of functions. The resistor terminates the cable from the wobbulator and thus enables any length of cable to be used without introducing excessive reflections of the wobbulator signal. The inductor has little shunting effect on the resistor at the wobbulator frequencies, but effectively by-passes it at video frequencies. The capacitor by-passes frequencies above about 100 KC. Hence, all of the difference frequency signals produced by the crystal mixer

are by-passed to ground except the lower video frequency signals and the 15 KC signal. These signals appear across the capacitor and are fed back down the cable. Since they are of relatively low frequency, no objectionable reflections are produced with any reasonable length of cable. The signals are tapped off through an r-f choke and fed to the 15 KC filter which selects the 15 KC signal and feeds it to the oscillograph.

In order to obtain accurate measurements with this circuit, it is necessary that the swept video frequency input to the transmitter shall be of constant amplitude and that the amplitude of the 15 KC output from the probe shall be linearly proportional to the desired sideband amplitude. This is assured without any critical adjustments by simply making the signals fed to the two mixers from the wobbulator large compared with the signals from the tripler and pick-up loop respectively. It is not then necessary that the output from the wobbulator remain constant throughout the sweep.

Physical Layout

It is seen from Fig. 4 that the complete circuit, with the exception of the small mixer probe, can be conveniently assembled in a single unit shown enclosed by the broken lines. Photographs of a unit using this circuit are shown in Fig. 5. It is complete with its power supply and measures approximately 9" x 7" x 7". The underneath view shows the shield down the center which divides the wobbulator on the right from the crystal oscillator and tripler on the left. Signals are fed through from the wobbulator and tripler to the video mixer on the other side of the chassis. On the extreme left are the power supply transformer, rectifier tube, etc, and on the extreme right are the components for the 15 KC filter. The top view shows the video mixer crystals in the center with the r-f filter and marker circuit extending to the front panel. The calibrated scale for the marker can be seen at the top center of the front panel.

The unit shown in the photographs is suitable for making measurements on any television transmitter by simply coupling the mixer probe to its output transmission line and connecting a cable to its video input terminal. The accuracy of the measurements is, in general, limited only by the linearity and resolution of the oscillograph. With most commercially available oscillographs, the accuracy is more than adequate to determine whether or not the trans-

mitter is operating according to requirements, i.e., with regard to lower sideband attenuation and uniformity of response in the pass band.

A number of other measurements can be made on the transmitter by means of this unit. For instance, the amplitude frequency response can be measured by disconnecting the probe from the unit and connecting the probe directly to the oscillograph. The probe then rectifies a sample of the transmitter output and feeds the oscillograph a signal proportional to the peak r-f output voltage. This is determined by the percentage modulation at any instant, providing the d-c restorer or clamp circuit in the transmitter is disabled. The oscillograph pattern thus shows the variation of the depth of modulation as the modulating frequency is swept from zero to 5 MC. A zero reference line can be obtained by blanking the transmitter input voltage during half of the sweep. This can be achieved by biasing the tripler beyond cutoff as shown in Fig. 4.

It was indicated previously that a unit employing the circuit of Fig. 4 can be used to replace the r-f wobbulators presently built into many television transmitters. It is only necessary to couple a mixer probe to the output circuit of each broadband linear amplifier stage, and to include a switch at point A (Fig. 4). The unit can then be switched to each probe in turn as the appropriate stages are being tuned. The unit then enables each stage to be tuned more accurately than with the r-f wobbulator and it also enables a rapid check to be made of the overall transmission amplitude characteristic under normal conditions of modulation.

Electro-Seal Expands

Electro-Seal Corp., Des Plaines, Ill., specialists in the hermetic sealing of electrical and mechanical devices has moved to an enlarged plant at 946 North Ave., in the Chicago suburb.

Electro-Seal Corporation early applied induction heating to secure an effective hermetic seal of an enclosure without harm to the contained device. Another Electro-Seal development was a method of crimping the cover over the edge of the base of the enclosure, so that solder merely insured a good hermetic seal but was not depended on for mechanical strength. Electro-Seal products are evacuated of all traces of moisture and 99.999% of the air. They are then tested for leaks with a mass spectrometer.

Audio Amplifier

(*Continued from page 42*)

evaluation and possible military application. A mathematical analysis of the circuit operation was made[1] and the derivation of the gain formula was found to be as follows:

where e_1 = input voltage at grid of first tube
e_2 = driving voltage at grid of second tube
R_1 = plate impedance of first tube
R_2 = plate impedance of second tube
μ_1 = amplification factor of first tube
μ_2 = amplification factor of second tube
R_L = load resistor of second stage
$Z = R_1 — R_2 — R_L$
I = AC current in the system
g = voltage gain of the system

With reference to Fig. 1 one half of the push pull system consists of two triodes and resistor R_L connected in series. The tubes may be considered as ac generators having open circuit voltages u, e, and u_2e_2. The ac current is therefore:

$$I = \frac{\mu_1 e_1 + \mu_2 e_2}{Z}$$

The driving voltage for the second stage is twice the open circuit voltage of the first stage minus the voltage drop through each section of the first tube:

$$e_2 = 2\,(\mu_1 e_1 - I_1 R_1)$$

$$IZ = \mu_1 e_1 + 2\mu_2\,(\mu_1 e_1 - I R_1)$$

$$I\,(Z + 2\mu_2 R_1) = \mu_1 e_1 + 2\mu_1\mu_2 e_1$$

$$I = \frac{e_1\,(\mu_1 + 2\mu_1\mu_2)}{Z + 2\mu_2 R_1}$$

$$= \frac{e_1\,(\mu_1 + 2\mu_1\mu_2)}{R_1 + R_2 + R_L + 2\mu_2 R_1}$$

$$= \frac{e_1\,(\mu_1 + 2\mu_1\mu_2)}{R_2 + R_L + R_1\,(2\mu_2 + 1)}$$

The output voltage is equal to IR_L, and the voltage gain is:

$$G = \frac{IR_L}{e_1} = \frac{(\mu_1 + 2\mu_1\mu_2)\,R_L}{R_2 + R_L + R_1\,(2\mu_2 + 1)}$$

$$G = \frac{\mu_1\,(1 + 2\mu_2)\,R_L}{R_2 + R_L + R_1\,(2\mu_2 + 1)}$$

When the amplification factor of the second tube is large when compared to 1, which is usually the case, the formula may be simplified as follows:

$$G = \frac{2\mu_1\mu_2 R_L}{R_2 + R_L + 2\mu_2 R_1}$$

This formula does not include the loss introduced by the second stage

biasing network. The reduction in gain is caused by the effect of the network in lowering the output voltage from the first stage and in decreasing the plate impedance of the first stage. To correct gain farmula for this effect, with respect to the first stage, V-1 can be considered as an a-c generator producing the open circuit voltage e_1 with an internal impedance R_1 and a load resistance R_s across which the output voltage e out appears. This voltage is equal to the open circuit generator voltage.

$$e = 1 \frac{R_s}{R_1 + R_s}$$

feeding R_1 and R_s in parallel. The gain is, therefore, modified as follows:—

$$\mu_1' = \mu_1 \frac{R_s}{R_1 + R_s}$$

$$R_1' = \frac{R_1 R_s}{R_1 + R_s}$$

Applying the uncorrected formula to a working model, the voltage gain was calculated to be 308. Incorporating the corrections the voltage gain was calculated to be 304. This calculated gain figure was found to be very close to the actual value obtained from tests on various models of the amplifier.

Laboratory constructed models of this system were tested and the following features were apparent:—

Frequency response 20 cps to 20,000 cps ± .5 db
Distortion (harmonic) less than 2%
Distortion (intermodulation) less than 6%
Internal noise (including hum) minus 65 db
Overall gain 72 db (including an input transformer)
Good operational stability

Several of the engineers at the Signal corps Engineering Laboratories, who were either connected with the testing of this amplifier, or who heard its operation, constructed amplifiers of this type for home use. These amplifiers have been in constant use during the past two years and have been found to be satisfactory in every respect. It has been determined that the operational stability of the amplifier required that adjustment of the centering control was only necessary when worn out or defective tubes were replaced.

Fig. 3 illustrates a commercially fabricated military version of the amplifier. Fig. 4 shows a homemade model of the system constructed by F. J. Petschauer of PA Systems Unit CSL. The performance characteristics for this amplifier are shown in Fig. 12. Fig. 5 shows the schematic wiring diagram and component parts.

Acknowledgment is made for the assistance received from I. G. Pacent of the Pacent Engineering Corp., 79 Madison Avenue, New York City, at the time of construction of the preliminary experimental models.

[1] Investigation of the system made by Dr. G. Guttwein, Squier Signal Laboratory, Fort Monmouth, N. J.

Congress Acts on '52 Funds for Military

At press time the editors of TELE-TECH were advised of House of Representative's action on new military appropriations for the fiscal year 1952.

The new bill itemizes electronic-communication requirements valued at $3.2 billion. The breakdown is as follows:

Signal Corps	$ 642,200,000
Navy	1,447,000,000
Air Force	1,188,321,000

Actual obligational authority for fiscal 1952 procurement has been estimated to be:

Signal Corps	$ 782,914,000
Navy	570,357,000
Air Force	387,369,000

TELEVISION CHAIN

(*Continued from page* 36)

gram audio in one phone and directions in the other or both in one phone if desired. Cameraman may also "call" the camera control unit, and talk on a private circuit when the CCU operator depresses his intercom switch.

Focus Servo Amplifier Chassis: This unit contains the servo amplifier and the blower used to draw cooling air over the face of the image orthicon tube.

Focus Servo Circuit: The Focus Servo Circuit (Fig. 4) consists of a two-stage servo amplifier using a twin triode as an amplifier and a phase splitter and two push-pull tetrodes whose unbalanced output is fed through a single ended transformer into the motor section of the focus drive motor. The focus drive motor also contains a generator portion, and both the generator and motor fields are supplied from a 75 volt tap of the transformer T-2.

The generator output is in series with the controlling voltage and acts as a damping or feedback voltage. The amplitude of feedback is changed in accordance with the magnitude of the feedback resistors in the lens

Fig. 7: Front view of remote control unit

mounts. On extended range a diminishing amount of damping is required, therefore this winding is shunted by a 68 ohm resistor mounted on the focal range switch.

The focus controls on the sides of the camera and at the remote control box are wire wound potentiometers of 1000 ohm value. They are shunted across the 10 volt tap of the 100 volt winding on the transformer T-2. The sliding arm of the potentiometer is grounded. The 100 volt winding returns through the range resistor in the lens mount, thence through the 10,000 ohm focus range potentiometer R-6. Thus the voltage across R-6 may vary from a maximum of 100 volts if the range resistor contacts are shorted, to 10 volts where the range switch has been switched to extended or open contact.

There is an 91,000 ohm limiting resistor to assure that the voltage developed across the resistor will be 10 volts. This resistor is R-7, thus it is shown that resistor R-6 will have across it, in the case of the longest focal length lens, a voltage difference of 10 volts; and in the case of the shortest lens, a voltage difference of 100 volts. The input to the servo amplifier is an unbalanced input and it is connected to one side of the generator windings of the servo generator unit. The other side of the windings is connected to the moving arm of the potentiometer which is mechanically driven from the gear box.

Operation of Circuit

The operation of the circuit is as follows: When the focus control potentiometer is moved from its initial position, a voltage difference is developed between this control and the motor-driven potentiometer R-6. This

error voltage is sent through the amplifier into the motor armature whose phase is such as to cause the motor to turn in the direction which will try to diminish the voltage difference. As the motor turns, the generator voltage is injected in series opposition so as to prevent the system from over-shooting and hunting.

In extended range, the shunting resistor across the generator winding is 68 ohms so as to diminish the amount of feedback due to the longer and faster motion of the portion of the sliding arm of the motor-driven potentiometer R-6.

In the normal range, the voltage across R-6 is determined by the size of the resistor in each lens mount so that the ratio of voltage across the motor-driven potentiometer to the focus control potentiometer equals the gear ratio. In the extended range, the voltage across R-6 is approximately 10 volts; therefore, the gear ratio in the servo system is 1:1.

Part Two of this paper will appear in the October issue.

CAVITY ANTENNA FOR JET AIRCRAFT

(*Continued from page* 33)

sumptions regarding transmitter power, transmitting antenna directivity, mismatch loss, cable loss, and antenna effective height are also given in the appendix. The calculations are made for conditions over good soil. They also apply for conditions over poor soil since the propagation factor given for this set of conditions is approximately the same for both poor and good soil.

These calculations show that the glide path antenna will give a signal of greater than the required minimum strength of 70 micro-volts for all angles where the equi-signal diagram of Fig. 5 indicates a field strength greater than 1.26 millivolts per meter. Fig. 5 shows that the antenna signal for the important cone angles between +20° and —20° is greater than the required minimum at all azimuth angles within 90° of the aircraft line of flight.

Part Two of this paper will appear in the October issue.

Defense Contracts

(*Continued from page* 29)

curement analyses as being fairly representative. They do not appear to be isolated actions, designed to favor the picture one way or the other. The figures speak for themselves. The conclusions are as you draw them.

It is only fair to state that all inquiries and discussions which TELE-TECH editors have had with Department of Defense officials, have given evidence that a determined effort is being made to achieve equitable distribution of defense contracts throughout industry.

TELE-TECH is presently conducting a thorough survey of radio-electronic manufacturers to determine the extent of prime and subcontracting in our particular field. Manufacturers' response is highly encouraging and we hope to present exclusive and dramatic results, when the survey is completed, reflecting the extent of defense contracting and dollar value among radio-electronic manufacturers.

It is anticipated that this information will be available in time for publication in TELE-TECH's October issue.

UHF TV RECEPTION

(*Continued from page 42*)

port. There is no line-of-sight and the building is surrounded by tall office buildings on all sides. If a comparison were to be made, I would judge this point to be as inferior a location as you could select. We installed a parabola antenna approximately 30 feet high on the roof, oriented it approximately 20 degrees off actual direction and receive pictures in quality about 70% of those in Bridgeport. Here we used a General Electric 17C-103 receiver and G. E. Translator. Lead-in is 300-ohm tubular.

Another location is at the Union League Club, also in downtown New Haven. This installation is on the third floor and also has the problem of tall buildings on all sides. Similar antenna installation to that of WELI was made and the quality of the picture again is about 70%. Here the tests are conducted with a Zenith H2052R receiver provided with the Zenith UHF strip. The distance again is approximately 18 air miles from Bridgeport. The antenna is pointed directly to the station.

To give you some idea of residential installations, we have had installed UHF receivers or converters in some ten locations of WELI personnel in the New Haven area. A typical installation is in the home of Charles Wright, WELI program director, in West Haven approximately 15 air miles from Bridgeport. This location is in extremely hilly country with a rise blocking line of sight directly in the path of true direction to Bridgeport. Here we've installed a ten foot mast on top of his two story building. The antenna used is a stacked-Vee using 300 ohm tubular lead-in fed into an RCA converter having an in-put of 72 ohms. To achieve a matching impedance we utilize a balance at the converter which gives us some loss. The pictures received are about 85%. The antenna is approximately 40 degrees from true orientation.

Fred King, WELI's chief engineer, lives almost directly in the shadow of West Rock, a rise of some 700 feet in Hamden, about 20 miles from Bridgeport. Here too we have used a stacked-Vee type of antenna with 300-ohm tubular lead-in. His receiver is a Regal using the Standard Coil Products front end with UHF tuning strips added. By orienting almost 90 degrees away from true line we get pictures about 65% perfect quality.

There are many other illustrations I might make. In my own home in Bridgeport, which is as you may know, a sort of proving grounds for all manufacturer's UHF equipment, we are about 5 air miles from the transmitter with a hugh gas storage tank in direct line of sight. By careful orientation of a corner reflector type antenna we get 100% pictures at all times. Through my own personal observation I have not noticed any marked deterioration of picture quality because of foliage, rain, snow or any of the other theories advanced. This of course is not based on measurements, but on observation in an average home over a period of a year and a half.

In closing, I think a word of praise should be given to all receiver manufacturers for the remarkable progress they have achieved in so limited a time in their development of UHF converters and receivers. When UHF finally does go on the air commercially, the public will be able to receive these new stations with their present receivers by adding any of the simple devices which are now ready. And I wonder if anyone has voiced a tribute to RCA-NBC and their far-sighted people for putting the experimental UHF transmitter on the air in Bridgeport. Their's has really been the outstanding contribution to bring about a really competitive nationwide system of television to everyone.

Opportunities for Engineers

ANNOUNCING

Unusual opportunities in SOUTHERN CALIFORNIA

Senior men with degrees and several years of proven accomplishment may achieve further personal growth by working with some of the nation's outstanding scientists in the West's largest laboratories.

CHALLENGE AND OPPORTUNITY

for physicists and engineers in the fields of electron tubes, computers, precision electronics, solid state, system analysis, servo-mechanisms, intricate mechanisms, radar, guided missiles, microwaves.

HUGHES LABORATORIES OFFER

NEW AIR-CONDITIONED BUILDINGS WITH THE FINEST MODERN LABORATORY FACILITIES AND EQUIPMENT.

SOLID LONG RANGE PLANS FOR A CONTINUING FUTURE.

INTRIGUING — VITAL DEFENSE PROJECTS PLUS A STRONG PROGRAM FOR ADVANCED DEVELOPMENT OF NEW PEACETIME PRODUCTS.

EXCELLENT EMPLOYEE BENEFITS.

FREQUENT SALARY REVIEWS.

COMPANY SPONSORED PROGRAM FOR ADVANCED EDUCATION.

AMPLE GOOD HOUSING AVAILABLE

Send resumé to:

HUGHES

RESEARCH AND DEVELOPMENT LABORATORIES

CULVER CITY, CALIF.

ENGINEERS

BETTER YOURSELF WITH A BETTER POSITION AT

SPERRY

GRADUATE ENGINEERS

FOR PROJECT & PRODUCT ENGINEERING WORK

Opportunities & Salaries Commensurate with Ability

Opportunities exist for Graduate Engineers with Design, Development and Product experience in any of the following:

ANALOGUE COMPUTERS	SERVO MECHANISMS
RADAR	ELECTRONIC CIRCUITS
COMMUNICATION EQUIPMENT	AIRCRAFT CONTROLS
HYDRAULICS	INSTRUMENTATION
ELECTRONIC PACKAGING	PRINTED CIRCUITS
PULSE TRANSFORMERS	FRACTIONAL H P MOTORS

VACUUM TUBE TECHNIQUES

also FIELD SERVICE ENGINEERS

To install and flight test electronic equipment. Engineering degree and service technical experience preferred. Assignment in U. S. and abroad.

SUBMIT RESUME TO EMPLOYMENT OFFICE

SPERRY GYROSCOPE CO.
DIVISION OF THE SPERRY CORP.
GREAT NECK, L. I., NEW YORK

Admiral

Electronic Engineers

Needed Immediately for Long Range Research Program

Admiral Corporation, one of America's largest electronic and appliance manufacturers, needs electronic engineers for long range research program covering both consumer as well as governmental projects. Project and senior project engineers with minimum of two to five years' experience needed immediately. Top pay with excellent opportunities for advancement. Send resume of experience and education to Engineering Personnel Manager . . .

Admiral Corporation
Dept. T, Chicago 47

Engineering Opportunities in Westinghouse

Wanted:

DESIGN ENGINEERS.
TECHNICAL WRITERS.

Must have at least one year's experience. For work on airborne radar, shipborne radar, radio communications equipment: micro-wave relay or micro-wave communications.

Good pay, excellent working conditions; advancement on individual merit; locarion Baltimore.

Send resume of experience and education to: Manager of Industrial Relations.

WESTINGHOUSE ELECTRIC CORP.
2519 WILKENS AVE., BALTIMORE 3, MD.

Opportunities for Engineers

Wanted:
ELECTRICAL ENGINEERS

Our modern, progressive organization has a number of desirable openings for qualified graduate engineers with specialized experience in the Communication and Aerial Navigation Fields. Program includes development of FM, AM, TV and Micro-Wave Transmitters and Receivers, Pulse Code Modulation Systems, Radar, Vacuum Tubes and Direction Finders. Also openings for MS and PhD Communication majors without experience.

Technical writers with at least one year's experience in preparation of electronic equipment manuals and instruction books are invited to submit resumes.

Address inquiries to Personnel Manager:

Federal Telecommunication Laboratories, Inc.

500 Washington Ave., Nutley 10, N. J.

AN IT&T ASSOCIATE

BENDIX RADIO DIVISION

Bendix AVIATION CORPORATION

TV RECEIVER DESIGN ENGINEERS —Progressive TV Design Section has excellent opportunity for highly experienced men with proven ability. Desirable openings also available for promising young engineers. We will be pleased to discuss salaries at all levels.

ELECTRONICS ENGINEERS — At all salary and experience levels.

RESEARCH ON: Antennae, Servomechanisms, Microwave ccts. and other phases of communications and navigation equipment.

PRODUCTION DESIGN OF: Military and commercial communications and navigation equipment.

FIELD ENGINEERS — Supervise installation and maintenance of radio and rador equipment. Factory training will be given. Base solaries from $4200 to $6900 per year. 25% bonus for time spent overseas. Traveling and living expenses paid by Bendix. Insurance plan.

TEST AND INSPECTION ENGINEERS — Practical knowledge of radio, radar, or TV manufacturing processes. Good knowledge of radio fundamentals essential. Base salaries from $3900 to $5880.

TECHNICAL WRITERS — Knowledge of radar fundamentals or rodio required. Work closely with engineers to gather material for instruction and maintenance manuals. Base salaries from $3400 to $4300.

LABORATORY TECHNICIANS — Require knowledge of radio fundamentals and skill in use of measuring instruments and laboratory equipment. Previous industrial experience essential. Salaries from $262 to $321 per month.

BASE SALARIES FOR ALL POSITIONS LISTED ABOVE ARE SUPPLEMENTED BY UP TO 30% FOR REGULARLY SCHEDULED 48-HOUR WEEK.

Housing is no problem in Baltimore.

Excellent group insurance and family hospitalization plan.

Attractive retirement plan for professional personnel.

Write for application:

MELPAR ELECTRONICS INC.

ELECTRONIC ENGINEERS

for

DEVELOPMENT AND DESIGN

Unusual opportunity to become associated with outstanding research and development organization offering engineers with design and development experience a chance to work with top staff of scientists on long-range projects.

Excellent salary, extra compensation for extended work week now in effect.

Good suburban living facilities available 15 minutes from center of Washington.

Experience in one or more of the following fields required:

- **Microwave Receivers**
- **Pulse Circuits**
- **Missile Guidance**
- **Sonar Equipment**
- **Radar**
- **Electronic Sub-miniaturization**
- **Laboratory Testing**
- **Quality Control**

These are permanent positions with real opportunities for advancement in position and pay.

All replies will be held confidential.

Send inquiries to:

W. A. Busch, *Personnel Director*

MELPAR, INC.

452 Swann Ave., Alexandria, Va.

ENGINEERS WANTED

Excellent opportunities with eastern manufacturer for permanent positions with good pay, advancement, work with highly professional staff. Our work does not depend on defense alone. We need the following skills: (Write in complete confidence)

Remote FM

(*Continued from page 45*)

readings need be taken.

The plate voltage sampling is taken from a voltage divider across the plate supply. The plate current sampling voltage is taken across the meter. The line current indication is rectified voltage from a pickup loop inside the "bazooka" antenna coupling device in the transmitter. The "tower lights" indicating voltage is the rectified and well filtered voltage derived from a current transformer in the tower light circuit. A voltage from this circuit is always proportional to the current passing through the portion of the transformer in the light circuit and thus the number of lights drawing current in the whole circuit. This was calibrated by disconnecting one light at a time and marking the number left burning, on the face of the meter.

At the studio, a Magnavox FM tuner, with the de-emphasis circuit removed, feeds the selective amplifier. This is tuned to amplify the telemetering subcarrier only, rejecting all audio components of the detected FM carrier. The rectified current from this drives the meter. Even though the telemetering subcarrier modulates the FM transmitter only 5%, while programs are modulating it 100%, little, if any, fluctuation of the meter needle occurs. The FM frequency and modulation monitor is also installed at the studios. The r-f power needed to operate this monitor is derived from a stacked Yagi type antenna cut for 92.5 MC, a commercial two stage booster adjusted for FM, and a three stage r-f amplifier illustrated. Extreme care must be exercised in assembling to prevent the possibility of regeneration.

A second FM tuner is provided at the studios to furnish a positive and a negative voltage from its discriminator circuit. The positive voltage is used to operate a signal strength meter to show relative signal strength, and the negative voltage to bias a triode, so that when the carrier fails, and the negative discriminator voltage ceases, the tube conducts, pulling in a sensitive plate relay, which in turn sounds a warning buzzer and lights a brilliant light. A Meissner 8C tuner is used for this unit. A good FM receiver supplies the aural monitor needed. This is provided with a muting relay, which silences it when the microphone is opened. The FM audio level is continuously adjusted according to the monitors at the studio.

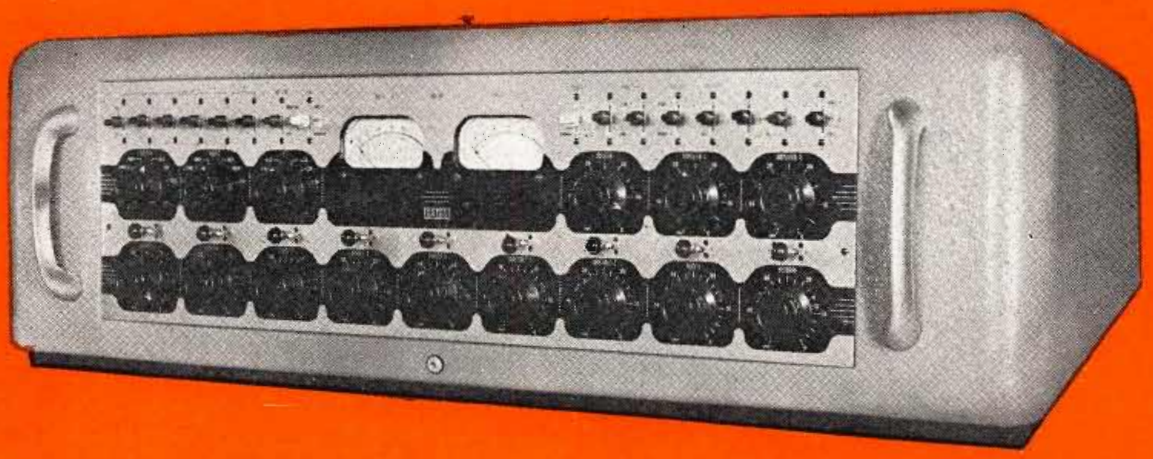
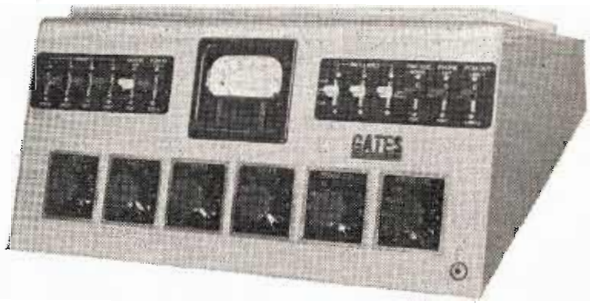
DEPENDABLE GATES SPEECH INPUT EQUIPMENT

Meets Your Requirements Today - and Tomorrow!



Whether for video or standard broadcasting, Engineers, with an eye to the future, will appreciate the exceptional versatility of GATES Speech Input Equipment. Here is equipment with unusual adaptability to the ever-changing demands of programming techniques. If you are planning a studio installation today — think of tomorrow, and consider the flexibility, the **expandability** of GATES Speech Input Equipment.

Space prevents fully describing the circuit handling capabilities of the three consoles shown. You are invited to write for the GATES SPEECH INPUT CATALOG where functional block diagrams and additional data will better acquaint you with these versatile GATES Consoles — truly, Speech Input Equipment With A Future.



52-CS STUDIOETTE

Ideally suited for small station studio applications or as part of larger master control type installation, the GATES 52-CS Studioette has all of the necessary facilities for complete studio operation and will fulfill the most rigid requirements of fidelity, low noise and distortion. Facilities include four mixing channels. Two preamplifiers, one program amplifier and one monitoring amplifier plus complete power supply are self-contained.

Send for GATES SPEECH INPUT CATALOG Today.

GATES SA-50 DUAL SPEECH CONSOLE

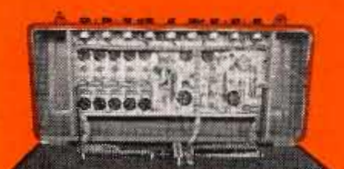
Typical of a comprehensive GATES Speech Input system is the SA-50 Dual Speech Console illustrated above.

Consisting of the main console and power supply unit, the SA-50 provides almost unlimited facilities for smooth uninterrupted studio operation of the most complex nature. Nine mixing channels: five for microphones, two for turntables and one each for remote and network service. Separate PBX type keys allow selection of any mixing channel into one of two program amplifiers.

NINE AMPLIFIERS

Five 2-stage preamplifiers and two 4-stage high gain program amplifiers are contained within the console. A ten watt low distortion monitoring amplifier and a two watt cueing amplifier are part of the separate power supply unit. Space is provided in console for two additional preamplifiers if needed. Sub-chassis units are individually removable for servicing without disrupting operation of balance of console.

SA-40 SPEECH INPUT CONSOLE



Similar in size and symmetry to the SA-50, the SA-40 Console is characterized by its extreme flexibility of operation. Of modern design, it is generously equipped for a most comprehensive installation.

Nine channels are provided; five for preamplifiers, three for turntables and one for net-remote. Seven amplifiers include five 2-stage preamplifiers, one 4-stage program amplifier and one 3-stage monitoring amplifier. Provision is made for connecting external cueing amplifier. Cabinet construction follows that of the SA-50 and features easy accessibility of all components.

STATION & STUDIO EQUIPMENT

1952 DIRECTORY 1952

TV—FM—AM—MICROWAVE—CIVILIAN—MILITARY

Making available to all users and potential users of station and broadcast equipment, a complete listing of every manufacturer of communications equipment in whose products they are likely to be interested.

Designed also as a compilation of "end products", this Equipment Directory includes listings of all major replacement parts for communication equipment. Manufacturers who build and design government and military equipment are also presented.

FOR ALPHABETICAL LIST OF MANUFACTURERS SEE NEXT RIGHTHAND PAGE

PRODUCT INDEX OF MANUFACTURERS

PRODUCT INDEX (Continued)

Alphabetical INDEX of MANUFACTURERS

(Numbers indicate sections of Directory where products are listed)

Because of lack of space, it has been found impossible to show below *all* the products of some of the manufacturers listed, beyond four or five representative product classifications. These representative products, by numbers, are given to enable readers to locate manufacturers' addresses. The main Directory, however, under all its various product classifications taken together, does present the complete lines of each manufacturer as reported by him to the publishers.

MANUFACTURERS INDEX (Continued)

(Continued on page 156)

Do You Need a Directory of Distributors?

Buyers of equipment who look to local parts jobbers or catalog houses for some of their replacements and who need a Directory of Distributors, are reminded that such a directory was published by Caldwell-Clements, Inc., in the January 1951 issue of *RADIO & TELEVISION RETAILING.*

The distributor directory is widely used in all branches of the industry and is tentatively scheduled for reissue in January 1952.

A limited supply of the last edition, in the form of reprints, has been reserved for engineers and others using the STATION & STUDIO EQUIPMENT DIRECTORY.• While they last, copies will be mailed on request without charge. Address Caldwell-Clements, Inc., 480 Lexington Avenue, New York 17, N. Y.

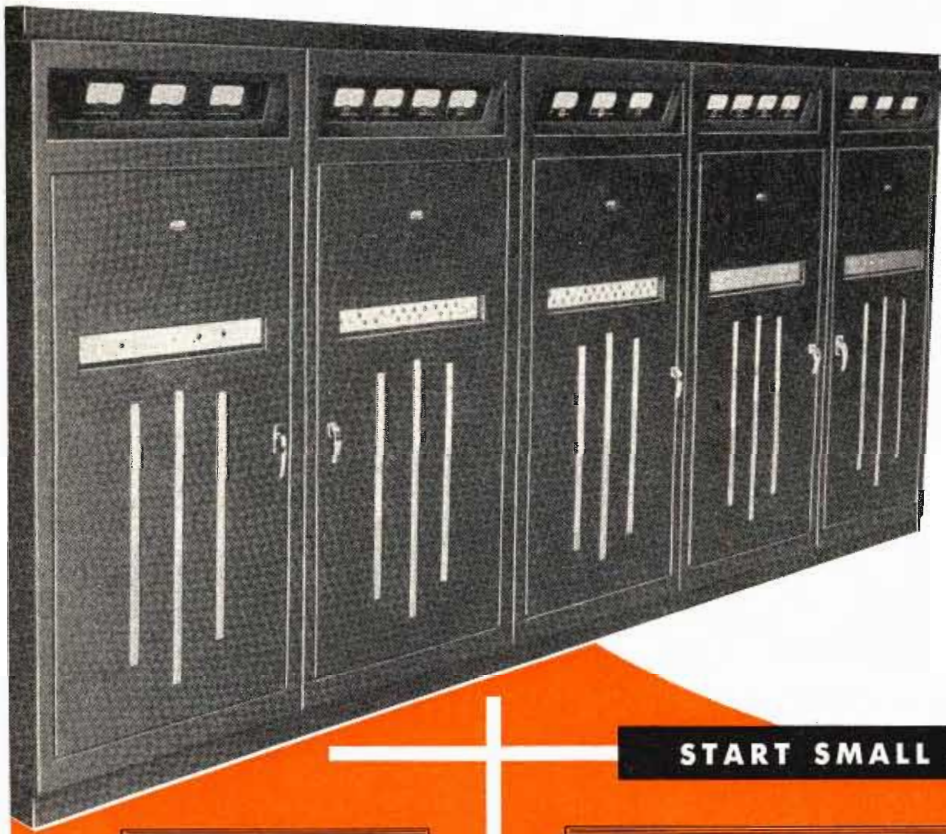
DUMONT

First with the Finest in Television

the leader . . .

NOW AVAILABLE...

5 KW OAK TRANSMITTER



Backed by five years of thorough field experience in air-cooled transmitters, serving both high or low band broadcast operation at maximum operating efficiency.

Illustrated is a model of the 5 KW Oak Transmitter for high band operation in commercial use over eighteen months.

THERE HAS BEEN NO FINAL AMPLIFIER TUBE REPLACEMENT EXPENSE DURING THIS PERIOD.

START SMALL . . . GROW BIGGER

ACORN

5 KW OAK TRANSMITTER

100/200 KW ERP

in low-cost television broadcast operation:

LOW INITIAL COST
LOW INSTALLATION COST
LOW COST TUBE COMPLEMENTS
LOW OPERATING COSTS

- **Built-in Band-Pass Indicator.**
- **Built-in Wobbulator.**
- **Air-Cooled throughout.**
- **No external side-band systems required.**

For efficiency as well as economy, and backed by five years of proven field use, DU MONT has available the 5 KW Oak Transmitter. Representing an achievement in the field of transmitter design and quality manufacturing, the Oak Series has been engineered to produce the finest transmitting operation at the lowest overall cost. It is completely air-cooled and designed for high or low band operation. The units comprising the series have been especially packaged to adequately equip the majority of television stations across the nation.

With a limited investment you can get your start on the air NOW! You will have full assurance of being able to increase your power in the future, as desired, by the addition of power amplifiers. 5 KW amplifiers are presently available. High power amplifiers to be made available upon the adoption of FCC rules allowing for their use.

Many new stations are currently investing in the DU MONT ACORN TRANSMITTER. Containing the most advanced thinking in television transmitters, the ACORN is geared to equip you at the very start of your television career. It is designed to grow with you! It can readily be expanded to 5 kilowatts comprising the OAK SERIES, or to maximum power required at a later date.

For further information on the 5 KW OAK TRANSMITTER contact your DU MONT representative or write to:

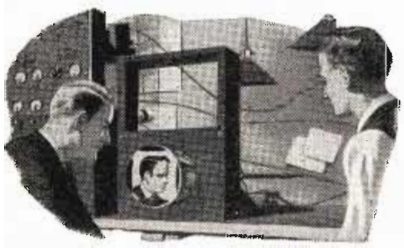
A wise buyer knows when to act . . . the informed buyer knows where to buy

20th year as pioneer

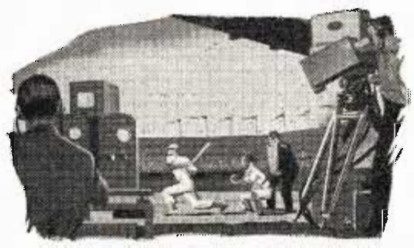
DU MONT

First with the finest in Electronics



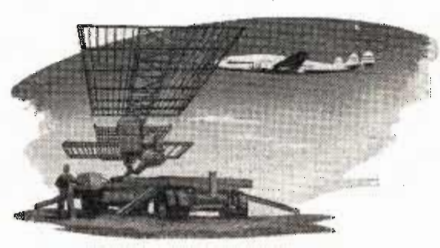
FIRST IN DEVELOPMENT

In 1931 the Cathode Ray Tube was a very expensive laboratory curiosity. Dr. Du Mont developed this tube and made electronic television practical. Today . . . Du Mont is the foremost maker of precision electronic equipment utilizing the Cathode Ray Tube.



FIRST IN TELECASTING

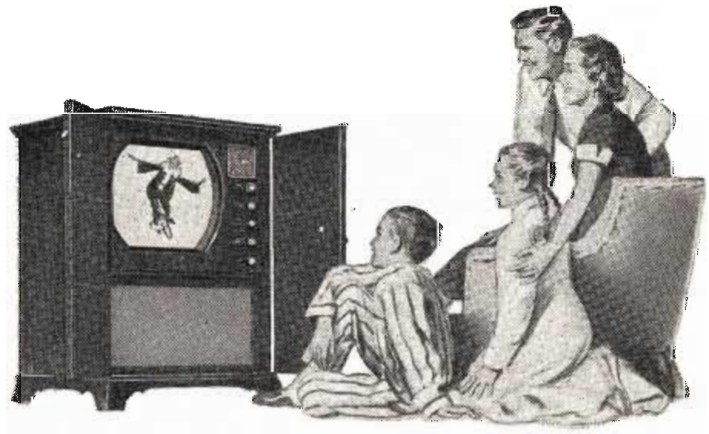
Du Mont operates the *first* television network, whose key station, WABD New York, was the *first* fully equipped station on the air. As foremost maker of high-fidelity, ptecision telecasting equipment, Du Mont has planned and built many leading television stations.



FIRST IN RADAR

In 1933 Dr. Du Mont filed a patent which the Army asked him to withdraw for security reasons. The idea, developed in secrecy, became *radar*. Du Mont also contributed ideas for *loran* . . . and other electronic devices for national defense.

Twenty years ago Dr. Allen B. Du Mont started his sensational development of the Cathode Ray Tube. From a laboratory curiosity he made this tube the picture screen of TV, the seeing eye of Radar and of countless electronic devices for industry, medical research and national security. The next twenty years will bring still greater developments to help make America brighter, happier, more secure. Many of them will again come from the Du Mont laboratories and factories...for in electronics, Du Mont has the habit of being first with the finest.



FIRST IN HOME RECEIVERS

Du Mont built the first commercial home receivers in 1939. Since then the name *Du Mont* has come to mean "firsr with the finest in television." An example of Du Mont craftsmanship is seen in the MOUNT VERNON, with giant 19-inch tube, direct-view Lifetone* picture, built-in FM radio, and plug-in for record player.

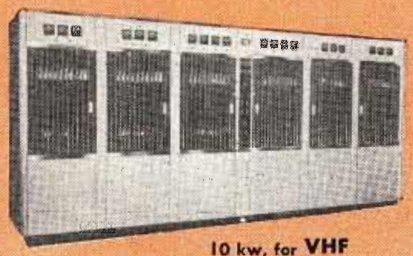
How to get any TV

TAKE ONE OF THESE TV TRANSMITTERS...

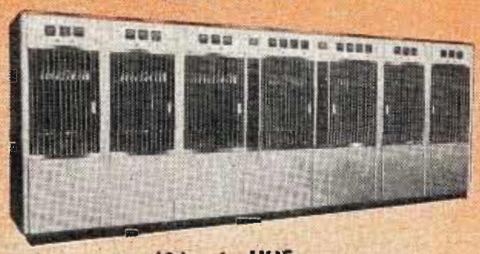
500 watts, for **VHF**
Type TT-500 A/B
(All Air-Cooled)

1 kw, for **UHF**
Type TTU-1B
(All Air-Cooled)

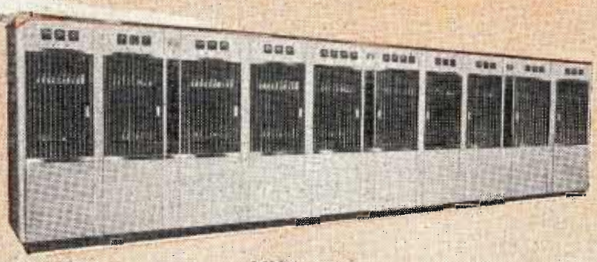
2 kw, for **VHF**
Type TT-2AL/H
(All Air-Cooled)



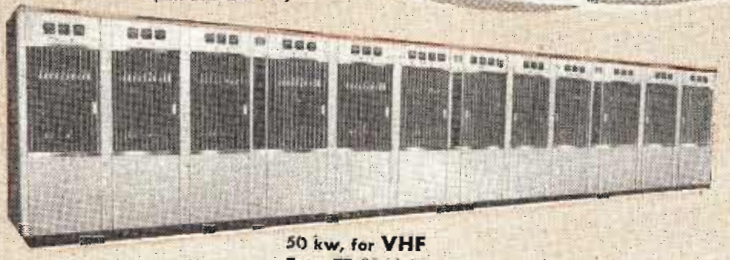
10 kw, for **VHF**
Type TT-10AL/H
(All Air-Cooled)



10 kw, for **UHF**
Type TTU-10A



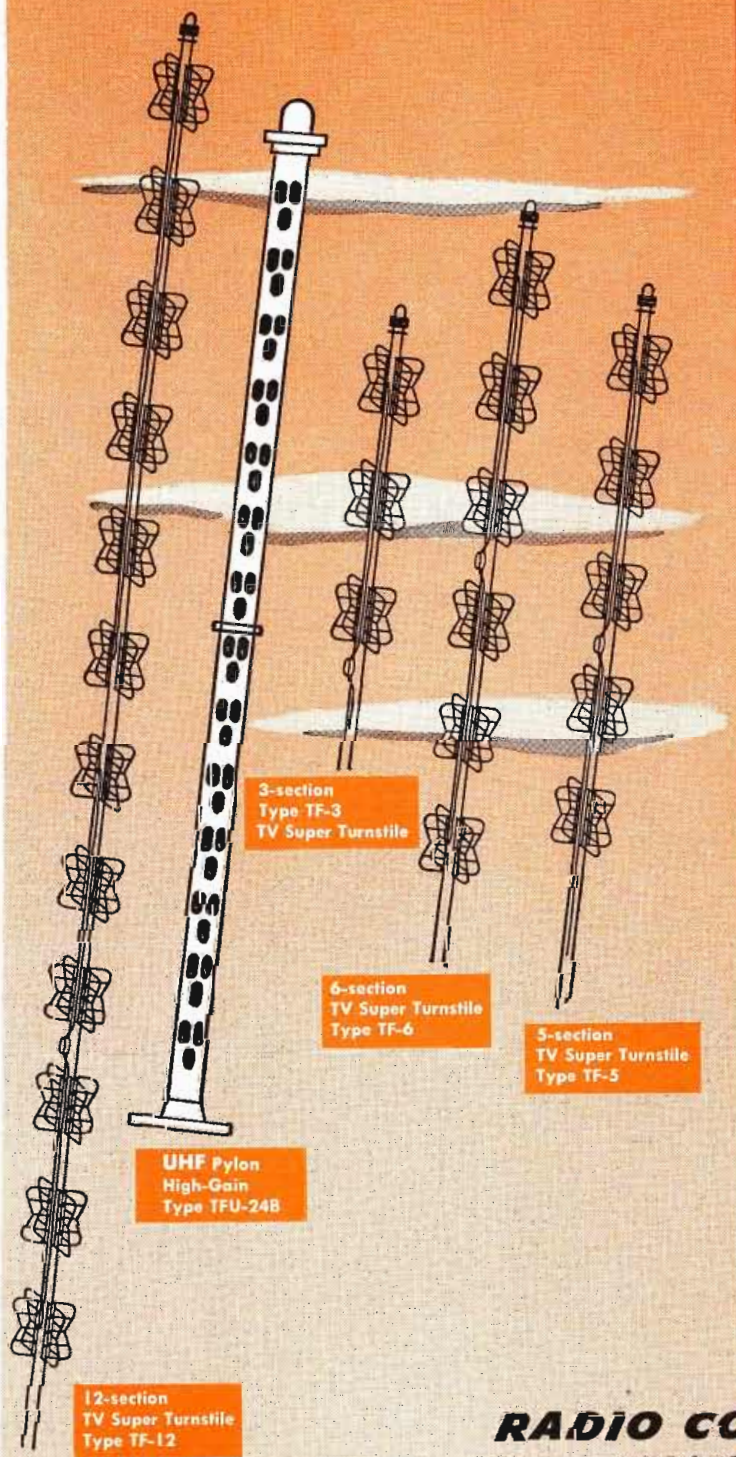
20 kw, for **VHF**
Type TT-20BL/H
(All Air-Cooled)



50 kw, for **VHF**
Type TT-50AL/H

power up to 200 KW!*

...ADD ONE OF THESE TV ANTENNAS... = YOUR POWER



With RCA's complete line of transmitters (seven different models), you can get any ERP* up to 200 kw—on any channel from 2 to 83. And in most cases, *you can get the power you want in several different ways!*

If your requirements are best met with a low-power transmitter and a high-gain antenna, *RCA has the combination!* However, if your needs are better met with a higher-power transmitter and a lower-gain antenna, *RCA has that combination too!*

Ask your RCA Sales Representative to sit down and help you plan the most practical and economical equipment setup for your station. He has an intimate knowledge of station planning—knows TV equipment from A to Z. He can tell you exactly what you'll need to get "on the air" . . . with the power you want . . . at the lowest cost.

Call him today. Or write RCA Engineering Products Department, Camden, N. J.

*Effective radiated power

FM Production Jan-June, '51

The half-year radio total included 4,212,222 home sets, 845,309 portables and 2,969,632 automobile radios.

Radios with FM reception facilities were estimated at 693,038, or approximately 17 percent of the home radios produced in the six-month period.

In addition, 240,552 TV receivers with FM audio circuits were manufactured.

Rectangular TV Tubes Now 96%

Ninety-six percent of all television picture tubes sold to receiver manufacturers in recent months have been rectangular in form.

Receiver manufacturers' picture-tube purchases during the first half of this year totaled 2,800,000 tubes at $75,000,000.

Management Queries

The Purdue University Research Foundation has copyrighted a test to facilitate choosing supervisors for promotion. It is a carefully devised and scored examination of human-relations attitudes, which many large companies are using in filling managerial jobs. Here are, some examples of the questions asked:

Which of the following practices and statements do you think are right, which are wrong:

(1) Admitting it to your workers when you make a wrong decision.

(2) Explaining the company's policies concerning hiring, firing, and promoting men.

(3) Using production records alone to determine which worker to recommend for promotion.

(4) Posting the names of the workers with the worst production records during each previous week.

(5) Most employees do better work if they get a good bawling out every so often.

(6) The best way to handle tough workers is to be tougher than they are.

(7) Most employees will do better work when constantly watched by their supervisors.

216 Million Tubes Sold First Half of 1951

Sales of receiving tubes in the first half of 1951 totalled 215,902,-325 units compared with 170,375,-921 tubes sold in the corresponding period of 1950, according to the Radio-Television Manufacturers Association.

The RTMA report showed 153,-957,766 tubes sold for new equipment, 50,105,634 for replacements, 10,358,858 for export and 1,480,067 tubes sold to Government agencies during the six-month period. Sales during the month of June amounted to 27,667,099 tubes compared with 32,480,668 in the corresponding month of 1950.

Eight ML-5682's mounted in a Doherty high efficiency linear amplifier designed for 500 kW output.

The ML-5682

A High-Power Coaxial Triode for Full-Power Operation to 88 mc/sec.

The development and commercial production of the ML-5682, a new water- and air-cooled coaxial triode for very high power operation, is an important contribution to all phases of modern electronic development. It is of particular significance in the present effort to provide the highest possible power in international broadcast applications. It finds wide application in high power AM, FM and TV broadcasting, in particle accelerators and in electronic heating. It is the key tube type in the highest power AM transmitters being built today.*

The ML-5682 is an unusually compact, rugged, high-power electron tube ideal for all high-frequency applications. It is an all-ring-seal triode capable of long-life operation at 9kVdc plate voltage and 170 kW plate input at a frequency of 88 mc/s. Operation at 16 kVdc plate voltage and 300 kW plate input is permissible up to 30 mc/s. This tube is ideal for cavity operation and its low impedance makes it advantageous for broad-band service.

*Includes State Department's Voice of America Transmitters.

Outstanding design features include:

High-conductivity, gold plated kovar glass-to-metal seals.

Sturdy electrodes.

Integral anode water jacket.

Quick-change water coupling.

High-conductivity, heavy-wall copper anode designed to dissipate in excess of 100 kw.

Muplti-strand thoriated-tungsten filament cathode completely balanced and stress free throughout tube life.

Grid capable of unusually high heat dissipation contributing to maximum stability of tube performance and circuit operation.

For full technical information on the ML-5682 or other Machlett tube types write to Machlett Laboratories, Inc., Springdale, Connecticut, or contact your nearest Graybar or Westrex office.

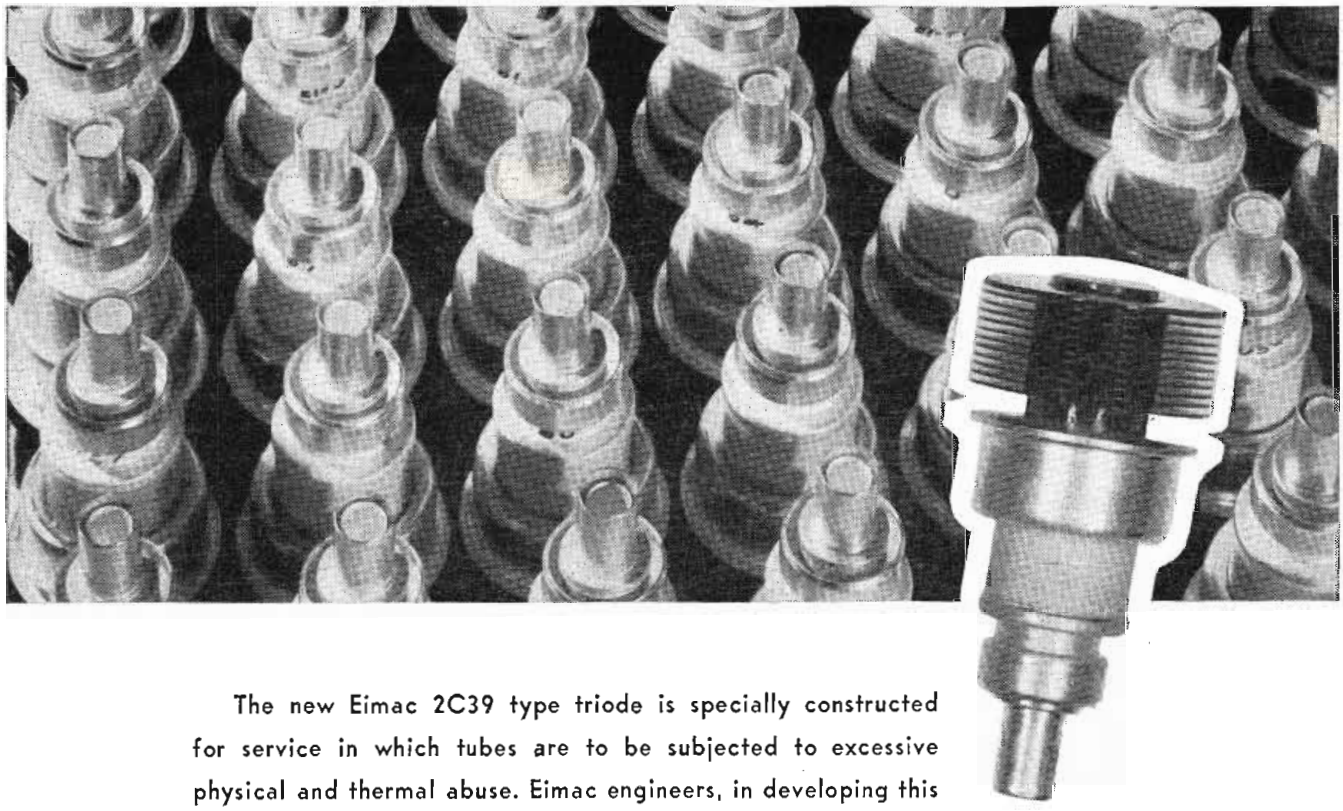
FOR RUGGED SERVICE

the new Eimac ceramic 2C39 type triode



The new Eimac 2C39 type triode is specially constructed for service in which tubes are to be subjected to excessive physical and thermal abuse. Eimac engineers, in developing this improved version of the 2C39, have replaced glass with rugged ceramics. Through the use of new manufacturing techniques and ceramic materials, this new tube will operate at appreciably higher ambient operating temperatures than the glass-envelope type tube. Resistance to physical shock is also increased to a degree beyond that which is customarily associated with vacuum tube structures.

If you anticipate requirements for a tube of this type, we suggest you contact our application engineering department immediately.

NEXT BEST THING TO A

"SKY-HOOK!"

"Sky-hooks" being expensive and somewhat impractical, why not start from the ground up with a Blaw-Knox tower to obtain support for your high-riding TV antennas?

Blaw-Knox, having built towers since spark-gap days, makes available to electronic engineers a degree of practical experience unequalled in this field. So, when you want the next best thing to a sky-hook, call Blaw-Knox.

BLAW-KNOX ANTENNA TOWERS

WORKSHOP antennas

A Complete Line for all High-Frequency Bands

COMMERCIAL		GOVERNMENT
AMATEUR	RADIO RELAY	RADAR
TELEVISION	MICROWAVE RELAY	GUIDED MISSILE OR ROCKET-BORNE
FM	STL RELAY	COMMUNICATION AND NAVIGATION
EMERGENCY SERVICES	TV RELAY	

The WORKSHOP line covers all bands from 28 mc. up. Our standard antennas fit the majority of applications, but where special situations must be met, slight modifications in design usually accomplish the desired result.

Engineering and Contract Service. The WORKSHOP handles scores of special government and commercial antenna problems every year from design through production. With our new plant and greatly expanded facilities, we are able to handle a larger proportion of this type of contract work than ever before.

TYPE and USE	MODEL NO.	FREQUENCY (MCS.)	GAIN* (DB.)	HALF POWER ANGLE E Plane*	H Plane*
PARABOLIC	940	920– 960	19.0–28.0	19.75–7.8	17.75–6.9
For radio, microwave,	2000	1990–2110	27.0–34.5	10.28–3.65	9.2 –3.25
STL and TV relay, radar, and communications.	6075	5925–6225	36.0–42.0	3.24–1.47	2.86–1.32
	6725	6575–6875	36.8–42.8	2.79–1.47	2.50–1.32
	7275	7125–7425	37.0–43.0	2.70–1.36	2.42–1.21

*Gain and Half Power Angles are dependent on size of parabolas, — 4, 6, 8 or 10 foot diameter.

				Horizontal	Vertical
DIRECTIONAL and BI-DIRECTIONAL	33C	29.5–36.5	7.8	64°	68°
For police, highway patrol, railway, forestry, utilities, oil fields.	40C	36.5–43.5	7.8	64°	68°
	47C	43.5–50.5	7.8	64°	68°

	165C	162–168	7.8	64°	68°
	171C	168–174	7.8	64°	68°
BEACON	2HW	108–144	2.7	31°	
For fire, police, taxicab, aeronautical, and private fleet communications.	3HW-B	144–152	4.2	24°	
	3HW-A	152–162	4.2	24°	
	3HW-2	162–174	4.2	24°	
	6HW-A	450–460	8		
	6HW-B	460–470	8		

TELEVISION	A	3-element, high gain (5 db.), directional; a model for each TV channel.
	2A	Two series A's spaced ½ wave apart, connected by cable harness.
	VV	All-channel, high gain, sharp directivity, patented.
	2VV	Double-stacked VV for higher gain, distant reception.
AMATEUR		A complete line for 2, 6, 10 meters and UHF.

CABLE FITTINGS AND ACCESSORIES

Model T-72 Matching Transformer. Matches 72 ohm coaxial cable such as RG-59/U to 300 ohm receivers. Voltage step up of 2 : 1, with a flat response over the TV channels from 52-216 mcs. A W-50 solderless cable connector is furnished. Size 2 inches long, 1-inch diameter.

Model T-300 Exterior Matching Transformer. Completely weatherproof device for converting 72 ohm antennas for use with inexpensive 300 ohm Twin Lead transmission line at reasonable efficiency. Can also be used with 300 ohm antennas to realize benefits of 72 ohm coaxial cable.

Model W-50 Silver Plated Solderless Cable Connector (Male). Used with RG-59/U coaxial cable. Specially slotted to withstand considerable strain. Mates with W-60 receptacle (on R-4A switch) and W-80 junction listed below.

Model W-60 Silver Plated Chassis Receptacle (Female). Mates with W-50 cable connector. For chassis or panel mounting. Threaded stem ⅝ inch long. Soldering terminal protrudes from rear.

Model W-80 Silver Plated Cable or Panel Junction (Female). Mates at either end with W-50 male connector. A complete splice requires one W-80 junction and two W-50 connectors which must be ordered separately.

Model W-100 Cable Adaptor. Required when changing from larger size RG-11/U or RG-8/U to smaller RG-59/U coaxial cables. No soldering necessary. W-50 cable connector furnished.

Model R-4A New Coaxial Switch (SP4T). This virtually lossless, constant impedance switch will connect any one of four single-channel TV antennas to a receiver. By simply using additional switches it can also be used for demonstrating any number of TV receivers in a display room, or for low-level audio applications. Size — 2⅜ inches front to back; 2-inch diameter.

If your product or service requires high-frequency antennas—research, design, test, or production—get in touch with the WORKSHOP. Write, or phone Needham 3-0005. No obligation.

Radio-TV Output Up

Despite shortages of critical materials and increased Government regulations, production of radio and television receivers in the first half of 1951 exceeded the industry's output in the corresponding period of last year, the Radio-Television Manufacturers Association reported. RTMA pointed out, however, that production in the second quarter was considerably below the output in the first three months of last year.

COMPLETE COMMUNICATIONS by *Federal*

PTM MICROWAVE

For Every Circuit Application

PIPE LINES • TELEPHONE COMPANIES • POWER UTILITIES
RAILROADS • RADIO-TV BROADCAST • AVIATION AND OTHERS

- **Instantaneous,** continuous, dependable service—without costly line construction or maintenance.
- **Most** positive basic channels for all requirements: telephone, telegraph, teleprinter, facsimile, telemetering, supervisory control, speech-plus-duplex, signaling and dialing, dispatcher circuits—with tie-in of all mobile radio units.
- **Equipment** of highest power and simplest design assures superb performance . . . outstanding for long-distance operation.
- **PTM** is the proved-in-service system—backed by the world-wide research, manufacturing and operating experience of International Telephone and Telegraph Corporation.

Thousands of Channel-miles Now Operating in 15 Countries

Federal ELECTRONIC VACUUM TUBES

Meet All Power Requirements

TRANSMITTING • RECTIFYING
INDUSTRIAL • SPECIAL PURPOSE

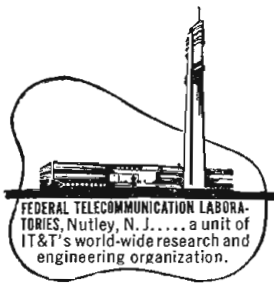
F-134
Used in high-power broadcasting and industrial service up to 22 Mc.

F-5680
Used in broadcasting and industrial applications up to 50 Mc.

F-5512
Used in FM broadcasting, industrial and research applications up to 110 Mc.

F-892-R
Used in 5 and 10 KW AM transmitters.

2J36
Magnetrons for all requirements.



FEDERAL TELECOMMUNICATION LABORATORIES, Nutley, N. J. . . . . a unit of IT&T's world-wide research and engineering organization.

GPL
Television Equipment

the Industry's Leading Line in Quality... in Design

Proved... by Industry Acceptance

GPL TELEVISION EQUIPMENT FALLS INTO THREE GROUPS:

- **Camera Chains** – Dual use, for studio and field. Complemented by the advance design **Sync Generator** and **Video Switcher.**
- **Video Recorder** – Widely accepted in the television industry.
- **Specialized TV Projectors** – For use with either iconoscope or image orthicon chains.

Since its introduction approximately a year ago, this GPL Television Equipment has been carefully scrutinized by engineers of leading networks and stations. The result is that GPL numbers among its customers American Broadcasting Company, Columbia Broadcasting System, National Broadcasting Company, and Canadian Broadcasting Corporation, as well as progressive independent stations in the United States, Mexico and Cuba.

This acceptance, acquired in one short year, is proof that GPL's *precision-line* television equipment is a leader in quality, in design—commanding the attention of industry executives who are looking ahead.

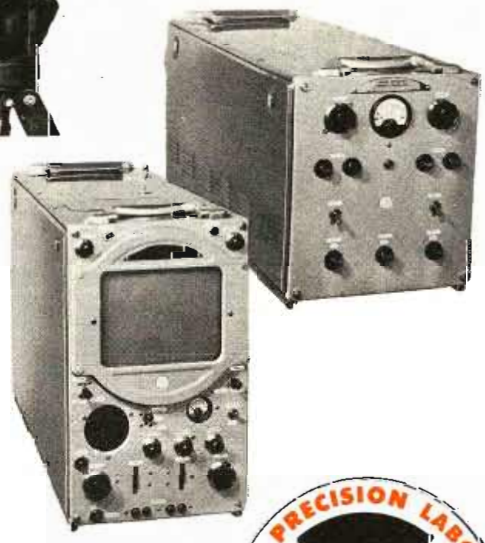
Look Ahead

YOU CAN DO *More*— DO IT *Better* WITH GPL TELEVISION EQUIPMENT

Introduced only last year, this GPL equipment has already received wide industry acceptance for its flexibility, convenience and advanced design features. Developed for easy, attention-free operation, built with watchmaker's precision, the GPL line will do more, do it better, for years of dependable service. Write now for full details . . . act now for early deliveries.

GPL

the Complete NEW LINE for Studio and Field that Increases TV Efficiency



Compact Camera Chain Simplifies Operation, Control

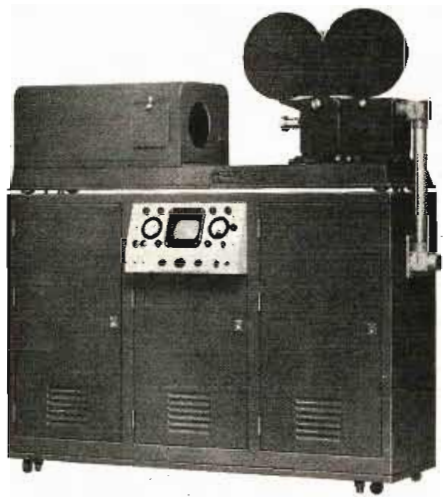
Basic 3-unit image orthicon chain features servomechanisms permitting control of lens change, focus and iris at camera, camera control unit, or remote location. World's smallest, most compact broadcast chain, engineered for unequalled flexibility in studio or field, and for maximum maintenance accessibility.

TV CAMERA CHAINS—TV FILM CHAINS
TV FIELD AND STUDIO EQUIPMENT
THEATRE TV EQUIPMENT

GENERAL PRECISION LABORATORY INCORPORATED

Single-Unit Sync Generator Requires No Adjustment

This unit, complete with power supply, is packaged for field use, may be removed from case for rack mounting. With binary counting circuits and pulse width controlled by delay lines, it provides circuit reliability better than present studio equipment and eliminates operator adjustments.



Video Recordings of Live-Program Quality

Precision electronic shutter provides steady interlace and eliminates shutter bar. High-fidelity sound recorded on the film simultaneously. New vacuum gate camera runs continuously without emulsion pile-up. Telecast recording looks and sounds like a live show.

Film Permanently Processed in 40 Seconds

The GPL Rapid Processor develops, rinses, fixes, washes, dries and waxes 16-mm film synchronously as it comes from the Recorder, or its own feed magazine. This facilitates rebroadcasts to other time zones. Operation is fully automatic, gives uniform, highest quality results.

First Professional Sync Projector for 16-mm Film

Designed for TV studio use. Has the reliability of professional 35-mm equipment. Sharper, steadier pictures, finer sound. Uniform illumination, ample light, with 100 foot-candles delivered to camera tube. May be used with any full-storage type film pick-up. Fully enclosed, 4,000 foot film magazine provides for 110 minutes of continuous operation — an entire feature.

New "3-2" Projector Works with Any Image Orthicon Camera

A portable unit of tremendous utility. Used with standard studio or field cameras without special phasing, it makes transmission of motion pictures as simple as stills. Handles film features with results comparable to specialized iconoscope chains. Projects rear-screen effects. Projects commercials to cameras in the field, eliminating expensive studio stand-by facilities. For preview work, its synchronous motor simplifies sound scoring.

WRITE, WIRE OR PHONE FOR DETAILS

Now Studio Flexibility Anywhere

with GPL's NEW PACKAGED, PORTABLE VIDEO SWITCHER

New GPL Video Switcher set up with two camera control units, a film chain control unit, and master monitor. This studio quality, field size switcher accommodates 5 cameras, 2 incoming lines.

NOW you can view, preview, switch, fade and dissolve with studio flexibility in the field. The new GPL Video Switcher simplifies field operations, reduces setup and operating time and trouble, and matches the full resources of the studio for programming variety.

Portable, and entirely self-contained, the GPL Switcher sets up in seconds and may be used with your present studio or field equipment. The monitor can view any of 5 camera inputs, plus 2 remotes, and an additional "Transmission" button switches the master monitor to view the outgoing line. Lucite self-illuminating buttons light up when depressed. Twin fading levers afford complete flexibility in fades and dissolves. An "effects" bus permits effects to be previewed on the master monitor before switching to the air.

This newest GPL development matches the other compact elements of the GPL Image Orthicon Chain, bringing to a full complement the industry's leading line in quality and design. Investigate its advantages for your operation at the earliest opportunity.

GPL Video Switcher closed for transportation.

PRECISION LABORATORY INSTRUMENTS

Model LSA

the instrument consists of the following units:

Model LTU-1 R.F. Tuning Unit—10 to 1000 MC.
Model LTU-2 R.F. Tuning Unit—940 to 4500 MC.
Model LTU-3 R.F. Tuning Unit—4460 to 16,520 MC.
Model LDU-1 Spectrum Display Unit.
Model LPU-1 Power Unit.
Model LKU-1 Klystron Power Unit.

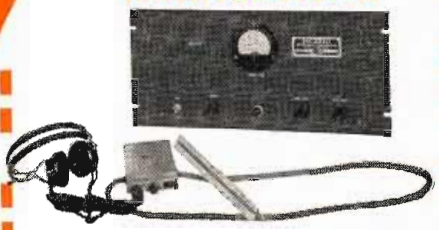
MICROWAVE SIGNAL SOURCES

Models SSR, SSL, SSS, SSM, SSX
634 MC to 11,000 MC

For use as a reliable source of microwave energy in transmission loss measurements, standing wave determination, etc. Unidial Control for accuracy and ease of operation. Direct reading (no made charts to consult). Frequency determination accurate to 1% through use of present calibration and temperature compensated klystrons.

Five Microwave Signal Sources are available to cover the frequency range from 634 MC to 11,000 MC. Units ruggedly constructed, mounted on aluminum castings to insure mechanical stability. Klystron reflector voltage automatically tracked with tuning of the klystron cavity to provide unidial control. Signal sources supplied complete with klystron.

RADIO CUE SYSTEM



Model AB

Used to direct the activities of persons within a limited area from a central control point. Widely used in broadcast and motion picture studios (sound and television). Ideal for factories, yards, hangars, airports, auditoriums, and places where the noise level is high. The Radio Cue System permits efficient operation under difficult conditions.

Pocket size receivers worn by radio directed personnel are small and light in weight assuring complete freedom of movement. Simultaneous transmission on two or more communication channels. System is portable and may be installed rapidly because of its unusual simplicity.

REGULATED POWER UNITS

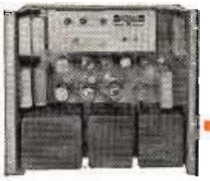
Electronically regulated power supplies designed to meet the needs of television equipment and other apparatus which require extremely fine regulation, low ripple content and appreciable quantities of D.C. power.

Output impedance less than 1.5 ohms.
Regulation better than 0.2%.

The power supplies are built on a dishpan type chassis with transformers, tubes and control panel at the front. All wiring is on the rear of the chassis which is of standard rack width. To insure long life, no electrolytic condensers are used.

A portable carrying case, Model C111, is available.

Model PT111



Consists of a positive and a negative voltage supply independently regulated.

Output Voltage: 250-300 volts D.C.
Output Current: 100-400 ma.

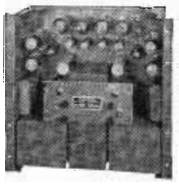
Model PT112

Heavy duty electronically regulated D.C. power source.

Output Voltage: 250-300 volts. D.C.
Output Current: 150-800 ma.

Model PT111D

(Dual Regulated)



Consists of two independently regulated D.C. power sources, (isolated from ground), mounted on one chassis. Each power source has its own power switch, fuse, pilot light and voltage control. Each power supply can be operated with negative or positive ground.

(Each power source, two such sources available)
Output Voltage: 250-300 volts, D.C.
Output Current: 100-400 ma.

all band, direct reading

SPECTRUM ANALYZER

10 MC to 16,520 MC

The Model LSA is the result of years of research and development. It provides a simple and direct means of rapid and accurate measurement and spectral display of an rf signal.

Outstanding Features:

- Continuous tuning.
- One tuning control.
- 5 KC resolution at all frequencies.
- 250 KC to 25 MC display at all frequencies.
- Tuning dial trequency accuracy 1 percent.
- No Klystron modes to set.
- Broadband attenuators supplied with equipment above 1000 MC.
- Frequency marker for measuring frequency differences 0-25 MC.
- Only three tuning units required to cover entire range.
- Microwave components use latest design non-contacting shorts for long mechanical life.
- Maximum frequency coverage per dollar invested. 5 inch CRT display.

Where Used:

Polarad's Model LSA Spectrum Analyzer is a laboratory instrument used to provide a visual indication of the frequency of distribution of energy in an rf. signal in the range 10 to 16,520 MC.

Other uses are:

1. Observe and measure sidebands associated with amplitude and frequency modulated signals.
2. Determine the presence and accurately measure the frequency of radio and/or radar signals.
3. Check the spectrum of magnetron oscillators.
4. Measures noise spectra.
5. Check and observe tracking of rf. components of a radar system.
6. Check two rf. signals differing by a small frequency separation.

WIDE BAND VIDEO AMPLIFIER

Model V 100 CPS to 20 MC

Designed for use as an oscilloscope deflection amplifier for the measurement and viewing of pulses of extremely short duration and rise time. Supplied complete with Video Amplifier Unit, Power Unit and Low Capacity Probe.

Features:

- Flat frequency response from 100 cps to 20 mc ± 1.5 db.
- Uniform time delay of .02 microseconds.
- Pulse rise of 0.02 μs with minimum overshoot.
- Gain of 50 db.
- Frequency compensated high impedance attenuator calibrated in 10 db steps from 0-50.
- Fine attenuator covers a 10 db range.
- Phase Linear with frequency over entire band.

Model V

TELEVISION EQUIPMENT

Polarad Electronics Corporation

for

- **STUDIO**
- **LABORATORY**
- **MANUFACTURER**

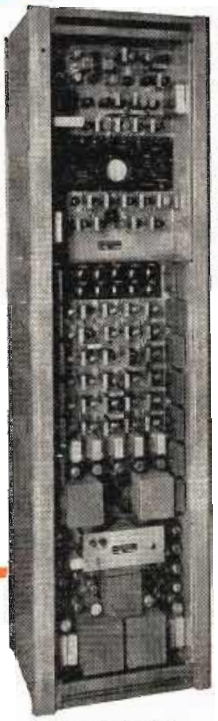
PORTABLE TELEVISION WAVE FORM MONITOR

Model TO-1

Designed for precise waveform analysis and amplitude measurement of video signals in television circuits. Also ideal as a general purpose instrument in many applications, because of its wide frequency response, high sensitivity, excellent synchronizing capability, precision calibrating circuits and unusually large symmetrical horizontal expansion. Means are provided for calibrating or comparing signals observed.

Specifications:

- Maximum Vertical Deflection Sensitivity: 0.1 volts per inch.
- Input Signal Level: 0.25 to 2 volts peak to peak.
- Input Impedance: (V. Amp.) 1 megohm, 50 mmf; (H. Amp.) 1 megohm, 27 mmf.
- Frequency Response: (V. Amp.) flat to —3db at 4 mcs; (H. Amp.) flat to —3db at 35 kc.



Model PT-101

TELEVISION MONOSCOPE SIGNAL SOURCE

Model PT-102

Used in transmitting stations, laboratories and in receiver factories where a reliable standard video signal in the form of a test pattern is a prime requisite for testing overall video performance.

Specifications:

- Composite Video Signal.
- Wide Band Video Amplifier, 3db down at 7 mc.
- Dual outputs for feeding two 75 or 100 ohm lines.
- Black positive or Black negative output.
- Resolution greater than 500 lines.

INPUT: Vertical and Horizontal Driving Pulses, Camera and Kinescope Blanking Pulses.

OUTPUT: Composite Video Signal, 2 Volts peak to peak. Complete with tubes, high and low voltage power units, cabinet rack.

Model TDA-1

TELEVISION DISTRIBUTION AMPLIFIER

Isolates and distributes television signals over transmission lines for station and production use.

Specifications:

- 5 individual wide band linear video amplifiers.
- High input impedance permits bridging of 5 amplifiers across same source.
- Positive and Negative signals available at the output.
- Undistorted output of 5.5 volts peak to peak across 100 ohms at either positive or negative polarity.
- Frequency Response: flat to 10 megacycles —.5 db.
- Power Input: 250 volts D.C., 350 ma., 150 volts D.C., 15 ma., 6.3 volts A.C., 6 amps.

TELEVISION SYNCHRONIZING GENERATOR

For use in television broadcasting studios, laboratories and receiver manufacturing where precise and stable synchronizing signals are an essential requirement.

Specifications:

- Fast lock-in action of AC line synchronizing circuits.
- Interlaced Fields: 525 lines, 60 fields, 30 frames.
- Output Signals: Synchronizing (Neg.); Video Blanking (Pos.); Camera Blanking (Pos.); Camera Horizontal Driving (Neg.); Camera Vertical Driving (Neg.)
- Output Signal Level: 5 volts peak to peak.
- Output Termination: 100 ohms.
- Power: 115 volts, 60 cps, 750 watts.

FIELD CAMERA CHAIN

Model CV-2

Used both indoors and outdoors for picking up programs. Excellent picture quality and resolution (over 500 lines) are obtained even under difficult and unpredictable lighting conditions. Camera unit supported on a special scanning mount and tripod provides excellent maneuverability in covering scenes over a wide angle. Electronic view finder plugs into the camera and is readily detachable. Removable four lens turret with interlocking switches for changing scenes rapidly without circuit transients.

Television Camera Chain consists of:

Field Camera Unit	Camera Cable
Camera Control Unit	Lens Component
Power Unit	50 mm, f 1.9
Electronic View Finder	90 mm, f 3.5
Camera Tripod	135 mm, f 3.8

The Power Unit is adjustable for varying AC line conditions and provides metering for the system. All power requirements for the Camera Chain are provided by this unit. The Camera Chain is adaptable to and can operate with existing equipment.

PICTURE and WAVE FORM MONITOR

Model M-102

High fidelity monitoring of picture signals and general supervision and investigation of composite video signals at the studio or remote point.

Specifications:

- Resolution greater than 500 lines.
- Picture Amplifier: flat ± 1 lb to 6 mc.
- Wave Form Oscilloscope: flat ± db to 3 mc.
- Input Impedance: 470,000 ohms.
- Input Signals: Video (black neg.) 0.25-2 volts peak to peak; Video Drive (Neg.) 4 volts; Kin. Blank (Pos.) 4 volts; Synchronizing Pulse (Neg.) 4 volts.
- Power Input: 115-125 volts, 50/60 cps, 6 amps.

America's Leading T. V. Stations

..... DEPEND ON HOUSTON-FEARLESS EQUIPMENT

For complete camera mobility, smooth pan effects, angle shots, running shots, tilts, dolly shots...most television stations rely on Houston-Fearless equipment . . . standard of the motion picture industry for 20 years. Houston-Fearless dollies, cranes, camera pedestals, tripods and heads combine brilliant engineering, superb quality, precision craftsmanship and proved dependability that assure perfect, reliable performance at all times.

More and more television stations and film producers are discovering the many advantages and economies in operating their own film processing labs. Whatever your needs, Houston-Fearless film processing equipment will do the job faster, better, automatically and with complete dependability.

Write for information on specially-built equipment for your specific needs.

Today's news tonight!

KTTV Staff Uses B&H Equipment To Make Deadlines

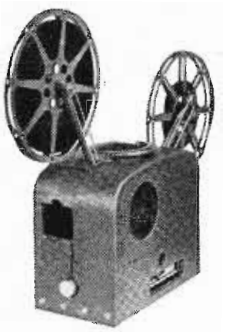
Station KTTV is attracting Los Angeles viewers with a daily "live" news reel. The popularity of this feature depends on getting on-the-spot movies of local events . . . editing and preparing them for showing the same evening . . . and making that showing a *finished* production.

To do this successfully, day in and day out, requires highly competent staff teamwork, plus the finest equipment. The staff at KTTV who work with Bell & Howell camera, projector and editing equipment have found it perfect for the job!

Shooting a street scene with a Bell & Howell 16mm "70" Camera

KTTV News Unit at work in the Film Editing Room. Man in center splices film at B&H Film Editor

Single-Case Filmosound Projector. First choice of TV experts for previewing film before broadcasting . . . and for showing film to clients. Projects 16mm film—sound or silent. Complete film protection permits running originals or work prints without fear of damage. Change from forward to reverse or vice versa at flick of a switch—no rethreading necessary. Light, compact, easy to operate.



← Matched For Your TV Needs →

16mm 70-DL Camera. This newest member of the famous B&H 70 series is built with precision . . . versatile enough for most any TV job. The 70-DL operates at 7 precise, governor-controlled film speeds—the 204° open segment shutter giving 1/40 of a second exposure at exact sound speed (24 frames). Can be adapted to take film to which sound is to be added. Three-lens turret assures you of the right lens for any shot . . . instantly. Also has positive viewfinder with matching objectives and parallax correction, critical focuser, and hand crank.

Guaranteed for life. During life of the product, any defects in workmanship or materials will be remedied free (except transportation).

You buy for life when you buy . . .

Bell & Howell

BELL & HOWELL COMPANY
7197 McCormick Rd., Chicago 45, Illinois

Please send me your booklet on TV equipment and how to use it to improve my TV services.

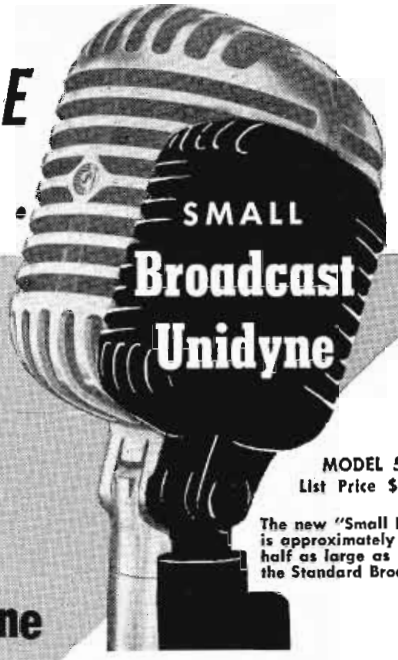
There's a NEW SILHOUETTE on the Broadcast Horizon...



MODEL 556s
List Price $100.00

The new "Small Broadcast" is approximately only half as large as the Standard Broadcast

The NEW ULTRA-CARDIOID DYNAMIC SMALL Broadcast Microphone

- Reduces pickup of random sound energy by 67%
- Solves problems of background noise, reverberation, and room reflection

Model 556s "Small Broadcast"

Cannon Electric-type Connector XL-3-11

Big improvements have been made on this *all new* Microphone. It is new on the inside as well as outside. This mighty, though little, Microphone is the *only* small-sized uni-directional moving-coil Broadcast-type Dynamic Microphone. The 556s "Broadcast" achieves new, extended high-fidelity response with an ultra-cardioid directional pattern. It is specially constructed to meet the requirements of radio and television broadcast studios, with close tolerances in frequency response and directivity.

The internal unit is based on the Shure-patented "Uniphase" principle. The moving-coil system has a high over-all efficiency and smooth extended frequency response. Large air-gap clearances and a rugged coil construction provide immunity of the moving coil system to abnormal atmospheric conditions and severe mechanical shocks. The 556s is provided with an additional isolation unit of live rubber construction and a built-in Cannon Connector.

The true uni-directional characteristics of the Model 556s provide an easy solution to the background noise and feedback problem in reverberant locations, facilitate orchestral placement, permit best utilization of space in small broadcast studios, and provide practically complete exclusion of unwanted noises.

Model 556s "Small Broadcast" Code: RUDOV List Price $100.00

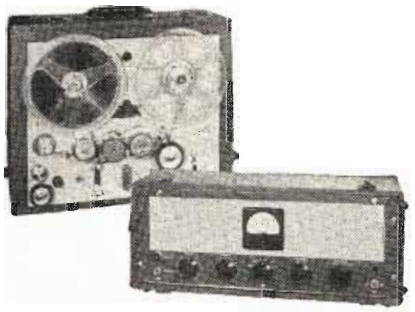
which of these famous PRESTO instruments meets your precision recording needs?



Portable Tape Recorder PT-920

New and improved successor to the famous PT-900. Compact unit with three motors. No friction clutch or tension adjustments. High fidelity, constant speed at 7½"/sec. aud 15"/sec. Instantaneous monitoring.

Turntable Tape Reproducer TL-10

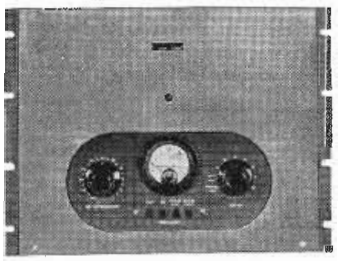
Completely new idea in tape reproduction! Operates on any standard 16" turntable, is instantly removable. Turntable acts as motor. Speeds 7½"/sec. and 15"/sec. Plugs into speech input equipment. Professional performance, low cost.

Communications Tape Assembly

Complete monitoring unit for air traffic control, police radio and other systems. Speed: 1" per second. Can record continuously up to 8 hours.

Precision Disc Recorder 8 D-G

Dual motor; direct gear drive; 78 and 33⅓ rpm without deviation; 1-D cutting head (response to 10,000 cps). Seven feed pitches inside out and ontside in.

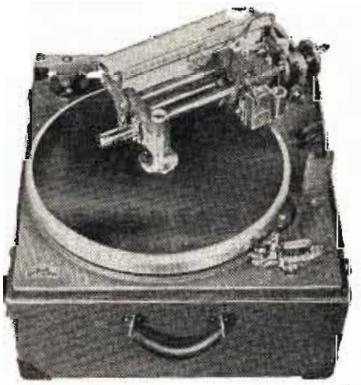


Recording Amplifier 92-B

Power: 60 watts. Frequency response: 20 to 17,000 cps within 1 db. Push-button selection of recording characteristics. Mounts vertically in standard rack, front panel easily removable.

Portable Disc Recorder 6-N

World-favorite . . . also available in cabinet for economical studio use. 1-D cutting head; speeds: 78 and 33⅓ rpm. Microgroove available at additional cost.



Here are six of the most popular most-wanted units in PRESTO'S *complete* line of professional recording equipment. Each is precision designed and constructed to combine faithful sound reproduction with long, dependable service and simple maintenance. Write direct or contact the PRESTO distributor in your area for additional data, or for assistance in meeting your specialized requirements.

For Truly Fine Recording and Reproduction

audiodiscs®

For more than a decade, Audiodiscs have consistently set the standards for quality and uniformity in every field of instantaneous disc recording. A superior lacquer, applied by a patented, precision-machine coating process, gives a mirror-smooth cutting surface with positive thread throw, brilliant h-f response, and freedom from background noise. An important improvement, perfected in 1948, makes all Audiodiscs permanently resistant to humidity.

There's an Audiodisc for every recording need — conventional or microgroove.

RED LABEL AUDIODISCS — exceed the most exacting demands for highest quality professional recordings. Aluminum base. *Double sided* — Sizes: 8", 10", 12" and 16". *Single face* — Sizes: 12" and 16".

YELLOW LABEL AUDIODISCS — the popular choice for all general-purpose recording. Aluminum base. Double sided. Sizes: 8", 10", 12" and 16".

BLUE LABEL AUDIODISCS — ideal for schools, homes, and general amateur use. Same lacquer as professional discs, but thinner aluminum base. Double sided. Sizes: 6½", 8" and 10".

MASTER AUDIODISCS — the choice of professional recordists for use where pressings are to be made. Give fine results with either silvering or gold sputtering. Aluminum base. Double sided or single face. Sizes: 12", 13¼" and 17¼".

REFERENCE LABEL AUDIODISCS — provide maximum economy for test cuts, reference recordings, auditions, etc. Aluminum base. Double sided. Sizes: 10", 12" and 16".

audiotape®

Audio Devices now offers a *complete line* of highest quality magnetic recording tape — on plastic or paper base, and with red or black oxide coating, for matched performance in any tape recorder.

Audiotape is precision made to the same exacting standards of quality and uniformity that have characterized Audiodiscs for the past decade — your assurance of maximum fidelity, uniformity, frequency response, and freedom from background noise and distortion.

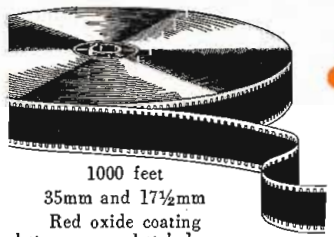
The following types of Audiotape are now available:

Length	Reel	Oxide	TYPE NO. Oxide Out	TYPE NO. Oxide In
PLASTIC BASE				
600 Ft.	5" Plastic	Black	640	641
		Red	650	651
1250 Ft.	7" Aluminum (or Plastic)	Black	1240	1241
		Red	1250	1251
2500 Ft.	Std. NAB Aluminum Hub Complete 10½" Alum. Reel	Red	2550H	2551H
		Red	2550R	2551R
5000 Ft.	Std. NAB Aluminum Hub Complete 14" Alum. Reel	Red	5050H	5051H
		Red	5050R	5051R
PAPER BASE				
600 Ft.	5" Plastic	Black	600	601
		Red	620	621
1250 Ft.	7" Aluminum (or Plastic)	Black	1200	1201
		Red	1220	1221
2500 Ft.	Std. NAB Aluminum Hub Complete 10½" Alum. Reel	Red	2520H	2521H
		Red	2520R	2521R
5000 Ft.	Std. NAB Aluminum Hub Complete 14" Alum. Reel	Red	5020H	5021H
		Red	5020R	5021R

For special recording applications, Audiotape can be supplied in any desired width.

audiopoints®

The newly expanded line of Audiopoints covers the full range of recording and playback needs—for the most exacting professional recordists as well as the non-professional and the general public. Audiopoints are available in Sapphire, Stellite and Steel — precision made by skilled craftsmen, for matchless recordings and reproduction of either conventional or microgroove recordings. Send for folder



1000 feet
35mm and 17½mm
Red oxide coating between sprocket holes on cellulose acetate base
Other sizes on request

audiofilm*

Audiofilm is a professional-quality magnetic recording medium for the motion picture and television industries — offering all the advantages of high-fidelity, uniformity and easy editing which are inherent in Audiotape.

The above Audio Devices products are available through more than 300 authorized distributors, located in principal cities from coast to coast.

Audiodiscs are manufactured in the U. S. A. under exclusive license from PYRAL, S.A.R.L., Paris

Performance of Germanium Diodes

United States production of germanium diodes for radio and electronic applications has expanded to something like 4 million a year. Yet because they are relatively new, germanium diodes have not received extensive service study, and few significant data on their characteristics in extended use have become available. Because it uses some 16,000 germanium diodes for computing and switching functions, with the requirement of very high reliability, the National Bureau of Standards Eastern Automatic Computer (SEAC) is a natural proving ground for the diodes. Of interest, therefore, are results from a recent preliminary study of experience with germanium diodes in the SEAC program, as shown in the following table.

Diode Failures in SEAC Service

June 1, to Nov. 1, 1950 (Approximately 2500 hours under voltage)

1. Failures detected during computer breakdown:		
50 out of 12,000 or		0.4%
2. Replacements made after routine checks:		
596 out of 12,000 or		5%
Excessive ib	64	⅔%
Excessive er	23	⅕%
Drift	154	1¼%
Open	2	1/60%
Unspecified	353	3.0%

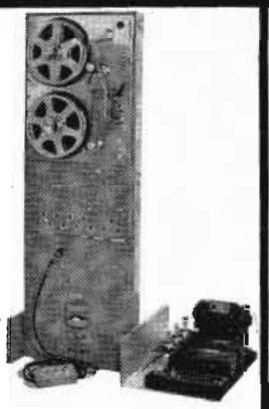
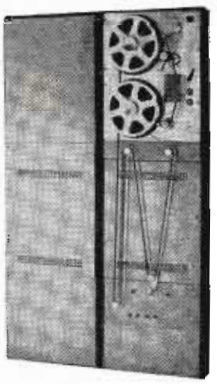
Telemetering • Data Recording with AMPEX and Magnetic Tape!

- Telemetering
- Data Recording
- Shock Analysis
- Vibration Study

There's an AMPEX for the project.



Multi-channel recorder for seismograph data recording in the field with remote control. Custom construction by AMPEX.



Multi-channel continuous loop reproducer. Custom construction by AMPEX.

MODEL 302 is designed specially to record all telemetering channels on the FM/FM system up to and including the 40 kc channel.

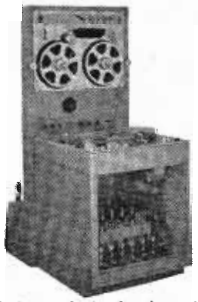
MODEL 303 is a pulse recorder designed to record and accurately reproduce pulse width modulated telemetering data. The input signal is converted to sharp pulses defining the leading and trailing edges of the square waves, which are recorded on the tape. The sharp pulses are reproduced and reconverted to square waves restoring the original pulse width modulation.

MODEL 307 is specially designed to record all telemetering channels including 70 kc channels.

MODEL 375 Precision Capstan Motor Amplifier provides an accurate source of 60-cycle power to drive the capstan motor of Model 300 series recorders, thereby providing constant tape speed independent of power line frequency variations. This unit consists of a precision, temperature-compensated tuning fork which drives a power amplifier with ample capacity to run the drive motor.

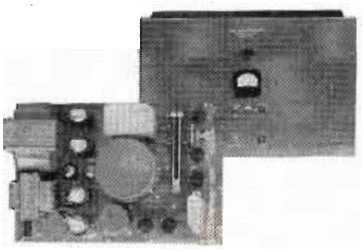
MODEL 381 Speed-Lock automatically adjusts the playback speed to insure that any recorded frequency is played back the same as it was recorded, regardless of tape dimensional changes, power line frequency changes, or slippage.

MODEL 500 Low Flutter and Wow of less than .1% peak to peak over the spectrum of 0 to 10,000 cycles is achieved by an exclusive-with-Ampex drive system. Complete specs and data describing this and all other special AMPEX equipment are available on request.

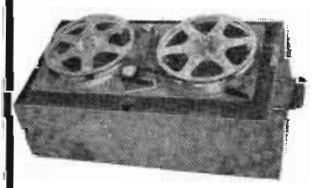


Multi-channel playback and auxiliary recorder for shock and vibration study. Custom construction by AMPEX.

Low frequency data recorder. Custom construction by AMPEX.



Madel 375 Capstan Mator Power Amplifier; front and rear views.



Mobile multi-channel shock and vibration data recorder. Custom construction by AMPEX.

AUDIO & VIDEO PRODUCTS CORPORATION represents AMPEX ELECTRIC CORPORATION in the sale of Magnetic Tape Recording Equipment. We also maintain an engineering consultation service in the fields of telemetering and data recording. Please do not hesitate to make use of this service. There is no obligation or fee.

Specifications and Data Are Available On Request

Another Tribute to TELEQUIP

Telequip units provide TV transmission and distribution for Armed Forces training.

PHILCO CORPORATION

PHILADELPHIA 34
PENNSYLVANIA

June 5, 1951

Mr. E. E. Arkin
Telequip Radio Company
2559 West 21st Street
Chicago 8, Illinois

Dear Mr. Arkin:

I have been notified that the Navy has placed an order with you for one TSG-100A Television Synchronizing Generator and Monitoring Oscilloscope on work order #800-199-79 for delivery to us.

Since this equipment will be used in conjunction with other television units for training Naval personnel, it is necessary that we have various technical data so that proper planning of equipment utilization can be carried out.

I would sincerely appreciate your sending us a copy of the instruction book and schematic diagrams on this equipment as soon as possible. Also, please advise us of the expected delivery date of this equipment.

Very truly yours,

John L. Marsey

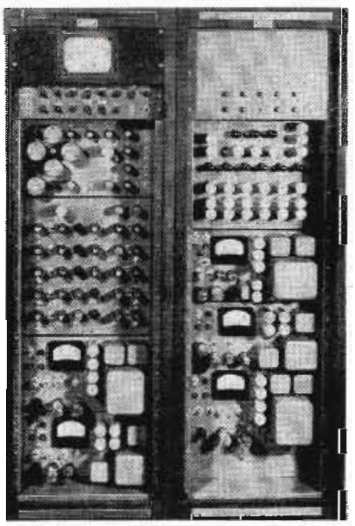
Send for the illustrated monograph completely describing the new Telequip Sync Generator and Monoscope.

TELEQUIP

SYNC GENERATOR AND MONOSCOPE MONOSCOPE PICTURE GENERATORS and DISTRIBUTION PANEL



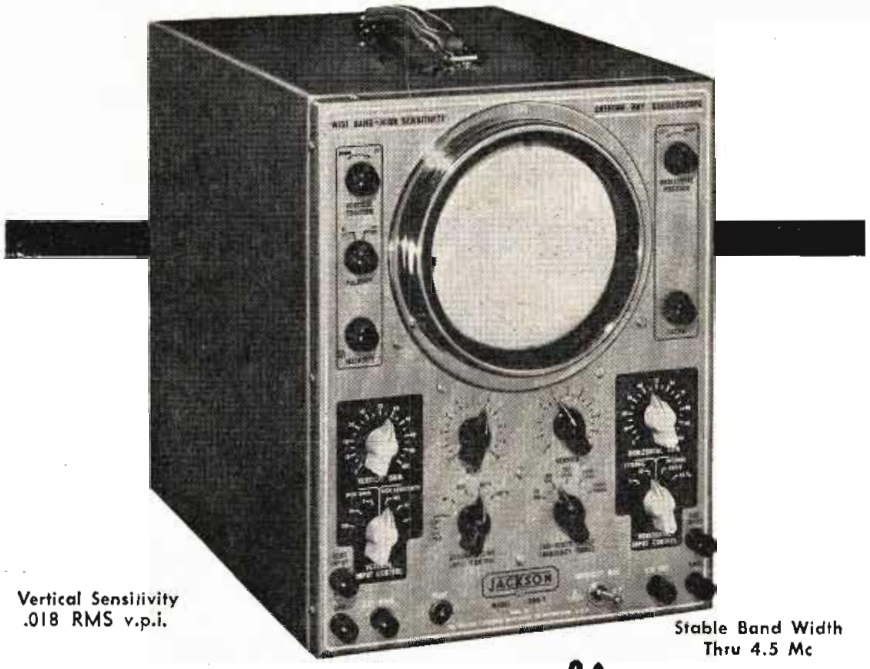
Inquiries from foreign countries will receive our prompt attention. Special packing arrangements for export.

Telequip units produce regular pictures for TV test transmission and reception. Telequip gives synchronizing, driving and blanking signals for testing, research and development work, with monoscope controls and distribution signals for use at various points of testing.

Invaluable to manufacturers of TV receivers and broadcasting units for checking faults not likely to be observed by other methods. Can be used at transmitting stations as auxiliary unit. Available either in combination or as separate units.

Picture tube and component manufacturers are finding this unit a valuable aid in speeding up production testing.

TELEQUIP RADIO COMPANY 2559 W. 21st Street Chicago 8, Illinois



Vertical Sensitivity .018 RMS v.p.i.

Stable Band Width Thru 4.5 Mc

JACKSON Oscilloscope gives you "dual service"

This is a high-quality, laboratory-grade 5" Oscilloscope that provides the "dual service" of both high sensitivity and wide band width.

specifications

Vertical Amplifier—Video-type frequency compensation provides flat response within 1.5 db from 20 cycles thru 4.5 Mc, dropping smoothly to a still useful value at 6 Mc.

Sensitivity Ranges—With a band width of 20 cycles thru 100 Kc, the sensitivity ranges are .018, .18, 1.8 RMS volts-per-inch. The wide band position 20 cycles thru 4.5 Mc has sensitivity ranges of .25, 2.5, 25 RMS volts-per-inch.

Horizontal Amplifier—Push-pull with sensitivity of .55 RMS volts-per-inch.

Input Impedances—Vertical: 1.5 megohms shunted by 20 mmfd. Direct to plates, balanced 6 megohms shunted by 11 mmfd. Horizontal: 1.1 megohms.

Linear Sweep Oscillator—Saw tooth wave, 20 cycles to 50 Kc in 5 steps. 60 cycle sine wave also available, as well as provision for using external sweep.

Input Voltage Calibration—Provides a standard voltage against which to measure voltages of signal applied to vertical input.

Vertical Polarity Reversal—For reversing polarity of voltage being checked or for choosing either positive or negative sync. voltages.

Return Trace Blanking—Electronic blanking provides clear, sharp trace to prevent confusion in waveform analysis.

Synchronizing Input Control—To choose among INTERNAL, EXTERNAL, 60 CYCLE, or 120 CYCLE positions.

Intensity Modulation—60 cycle internal or provision for external voltage for intensity modulation uses.

Additional Features—Removable calibration screen—Accessory Model CR-P Demodulation Probe for Signal Tracing—All-steel, gray Ham-R-Tex cabinet. Total net weight only 26 pounds. Same height as other Jackson TV instruments: 13" H x 10¼" W x 15⅛" D.

Prices: Model CRO-2, Users' Net $197.50. Model CR-P Probe, Users' Net $9.95.

TWO OTHER FINE JACKSON INSTRUMENTS

Model 655 Audio Oscillator

Sine-wave 20 cycles to 200,000 cycles. Less than 5% harmonic distortion between 30 cycles and 15,000 cycles. Frequency calibration accurate within 3% or 1 cycle. Hum level down more than 60 db of maximum power output. Output impedances of 10, 250, 500, 5000 ohms or Hi Z resistive output.

Model TVG-2 TV Generator

Sweep Oscillator in three ranges from 2 Mc thru 216 Mc, all on fundamentals. Reversible sweep direction. Sweep width variable .1 Mc thru 18 Mc. Marker covers 4 Mc thru 216 Mc. Crystal Oscillator to use as Marker or Calibrator. Video Modulation, from external source for using actual video signal for check, or for use with Audio Oscillator to produce bars for linearity checks.

See your electronics distributor for more information, or write

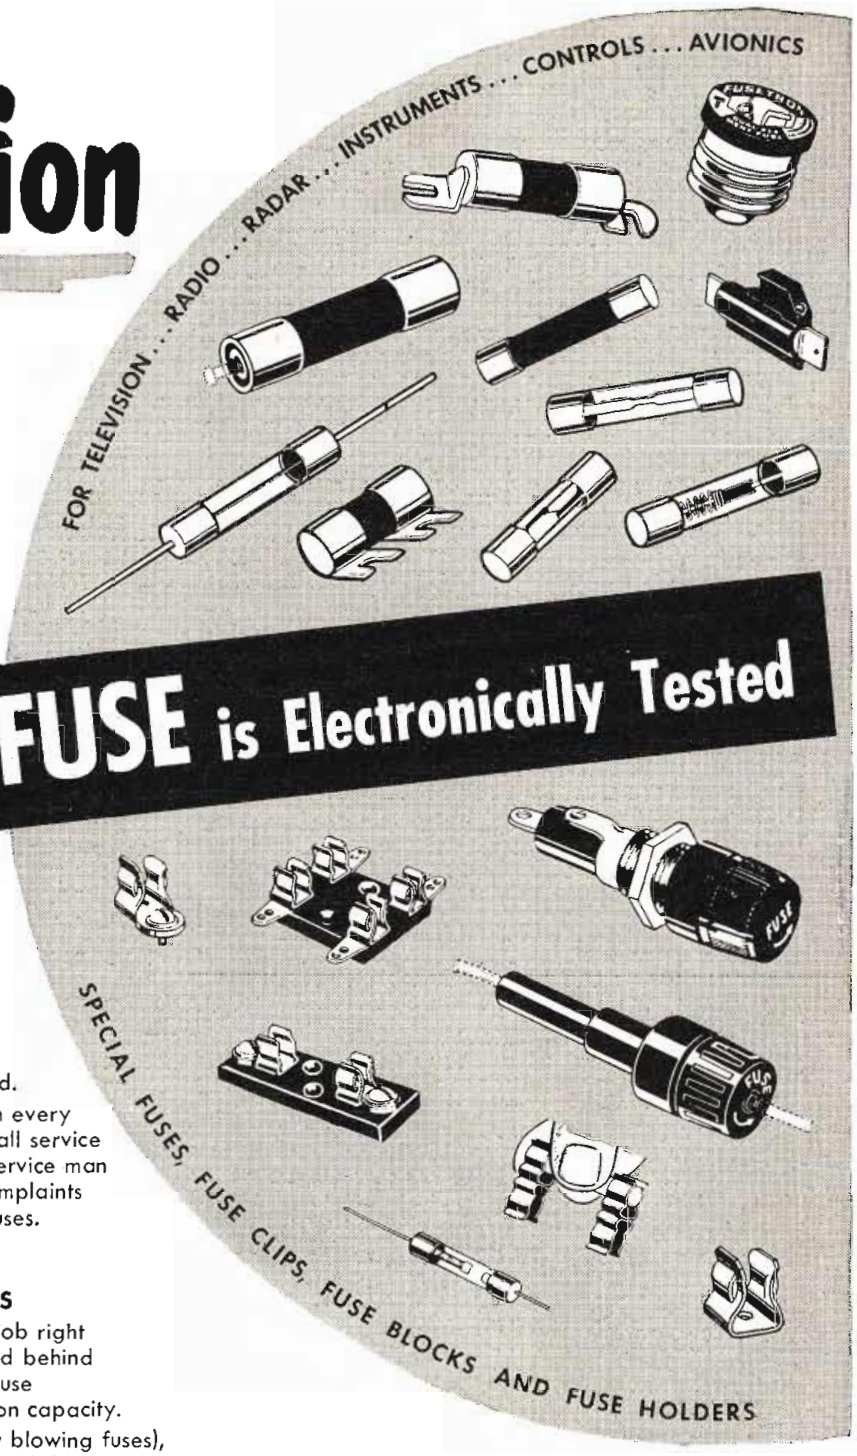
For Protection

of

Electrical Circuits

and

Your Reputation



Every BUSS FUSE is Electronically Tested

To assure and maintain top quality and performance each individual BUSS fuse is tested in a highly sensitive electronic device. Fuses that are not correctly calibrated or not properly soldered or whose dimensions are not right are automatically rejected.

That is why a user can depend upon every BUSS fuse to operate properly under all service conditions—and the manufacturer or service man can rely on them to protect against complaints often caused by use of poor quality fuses.

When electrical protection is your problem turn first to BUSS

It is easy to select a fuse to do the job right for BUSS makes a complete line — and behind each BUSS fuse is the world's largest fuse research laboratory and fuse production capacity.

Fuses of Dual-Element (Fusetron slow blowing fuses), Renewable and One-Time types are available in many standard sizes — and many special designs are also obtainable to fit unusual protection needs.

If your problem is "New and Different" turn first to BUSS

In such cases we welcome your requests either to quote — or to help in selecting or designing the special type of fuse or fuse mounting best suited to your conditions.

Submit sketch or description, showing type of fuse contemplated, number of circuits, type terminals, etc. If your problem is still in the engineering state, give current, voltage, load characteristics, etc.

Our staff of fuse engineers is at your service.

Haraden Pratt Becomes Top Radio Figure in Federal Government

President Truman has appointed Haraden Pratt, vice president of the American Cable & Radio Corp., to the newly-created White House post of Telecommunications Advisor. Pratt, long identified with the radio industry, will advise the President on the rapidly-growing communications field, as indicated on the chart on page 27 of August TELE-TECH.

Haraden Pratt, Telecommunications Adviser to President Truman.

Appointment of such an Advisor was recommended last February in a report by the President's Communications Policy Board, suggesting staff assistants for the President in carrying out his responsibilities in the radio field.

Pratt will work out of the office of the National Security Resources Board which will furnish his office and staff assistants. He will draw a salary from funds available by the White House. His appointment does not require Senate confirmation.

President Truman's responsibilities include the assignment of frequencies of Government agencies (which precede FCC allotments) and control over all communications in the event of war or emergency. Advisor Pratt thus becomes top radio man in the Federal Government, with responsibilities superior to both FCC and IRAC.

Pratt's job will be a full-time one and he will leave his private connection to take over the assignment. He was born in San Francisco in 1891, and has been active in radio since 1906, holding many important corporation and industry committee appointments. In 1938 he was president of the IRE, and since 1943 has been its Secretary.

MANUFACTURERS INDEX (Continued)

This alphabetical index begins on page 87. See page 85 for Product Index

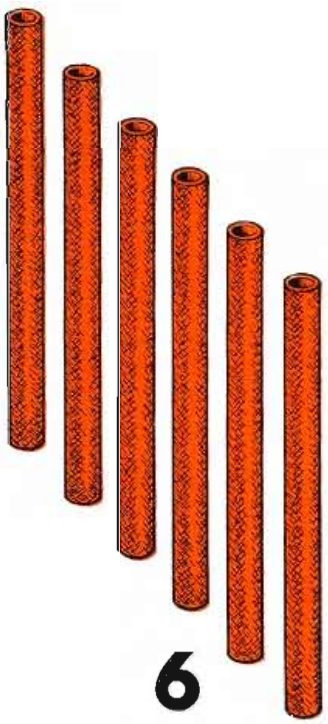
TRUMBULL ELECTRIC

"R. B. A."
HEAVY DUTY SWITCH BODY

COSMALITE

Phenolic Tubing is used in heavy duty switches.



6

COSMALITE TUBES INSULATE BODY BOLTS

In their popular "R.B.A." Heavy Duty Industrial Switch
The Trumbull Electrical Manufacturing Co.
uses Cosmalite Tubing to insulate its body bolts.

The combined electrical and physical properties of CLEVELITE* and COSMALITE* are essential wherever strength, low moisture absorption, high dielectric strength, low loss and good machineability are of prime importance!

DEPENDABLE — ECONOMICAL — LONG LASTING
. . . Why Pay More?

Made in diameters, wall thicknesses and lengths to meet special or new adaptations . . . in various grades to meet the most exacting needs. Your inquiry will receive immediate attention.

An improved miniature complement for TV tuners...

RCA-6X8 Triode-Pentode Converter

	Triode Unit	Pentode Unit
Heater Voltage (AC or DC)	6.3 volts	
Heater Current	0.45 ampere	
Plate Voltage	100	250 volts
Grid—No. 3 voltage	—	0 volts
Grid—No. 2 voltage	100	150 volts
Cathode-Bias Resistor	40	200 ohms
Amplification Factor	6900	—
Plate Resistance (Approx.)	5800	750000 ohms
Transconductance		4600 μmhos
Grid—No. 1 Bias (Approx.) for Plate Current of 10 μamp		-10 volts
Plate Current	10	7.7 ma
Grid—No. 2 Current	8.5	1.6 ma

RCA-6BQ7 Medium-Mu Twin Triode

Heater Voltage (AC or DC)	6.3 volts
Heater Current	0.4 amp
Plate Voltage	150 volts
Cathode-Bias Resistor	220 ohms
Amplification Factor	35
Plate Resistance	5800 ohms
Transconductance	6000 μmhos
Plate Current	9 ma
Grid Volts (Approx.) for plate current of 10 μamp	-10 volts

THE FOUNTAINHEAD OF MODERN TUBE DEVELOPMENT IS RCA

New RCA 6BQ7 and 6X8 provide higher gain, reduced noise factor, and simplified tuner design

Two important new miniature tubes . . . specifically designed to improve the performance of VHF television tuners . . . have been developed by RCA in its continuing program of television research.

The RCA-6BQ7 medium-mu twin triode is intended primarily for use as the first RF amplifier in VHF tuners, or as a low-noise IF pre-amplifier in UHF television receivers employing a crystal mixer. Because of its high transconductance, low input capacitance, low input loading, and low plate-to-cathode capacitance, the RCA-6BQ7 gives especial advantages in driven grounded-grid or cascode-type circuits. In such circuits, this new tube provides a reduction in noise with resultant improved receiver sensitivity. It also reduces oscillator radiation.

The RCA-6X8 triode-pentode converter is approximately equivalent to a 6J6 triode unit and a 6AG5 pentode in one envelope, and therefore contributes to the simplification of front-end designs. It is designed primarily for use as the oscillator-mixer in VHF tuners having 40 Mc IF systems. Its low value of output capacitance enables the pentode section to work into a high-impedance plate circuit with resultant increase in mixer gain. The RCA-6X8 is also especially suitable as an oscillator-mixer in AM/FM receivers.

RCA Application Engineers are at your call in adapting the RCA 6BQ7 and 6X8 to your specific designs. For prompt service, phone the nearest RCA office*. . . or write RCA, Commercial Engineering, Section 57IR, Harrison, N. J.
