EXPERIENCE MORE .: FREEDOM .:

Hear what you want, when you want, how you want. Audio-Technica M2 & M3 Wireless In-Ear Monitor Systems deliver the nuanced & articulate mix of your choice, for on-stage clarity & hearing conservation. Wherever your music takes you, experience more. audio-technica.com

FEATURES

- New In-ear Monitor systems offer 100 (M2) or 1321 (M3) selectable UHF channels
- Up to 10 (M2) or 16 (M3) simultaneous systems per frequency band
- Three receiver modes: Personal Mix, stereo, and mono
- Limiter helps protect hearing from sudden peaks
- Personal Mix Control allows volume & mix control of two independent signals at the receiver
- Auxiliary input connects to ambient microphone, click track & more
- XLR loop output connects to mixing console, additional IEM system or recording device

1. The branch of knowledge dealing with past events.

We've got a lot of it. With over 30+ years in the amplifier business, we've managed to gain a little experience. Throughout our lineup, each amplifier represents Yamaha's dependability and pristine sonic quality. From the installation based XM Series to the powerful touring Tn Series, the countless hours of research and development behind these amps, pulls from the past, symbolizes the present and paves the way for the future.

Tn Series

Yamaha's most powerful amplifier line intended for demanding live sound applications on the road, as well as installations

PC-1N Series

The predecessor to the Tn Series representing Yamaha's move towards larger power amplifiers for high quality installation and live sound applications

XP Series

Designed to provide excellent value with a priority on high quality sound

P-S Series

Exceptional worth and a perfect pair for Yamaha's Club Series speakers

XM Series

Four channel amplifiers designed for distribution and other commercial installation applications

When you need help, time zones shouldn't matter. Yamaha provides coast to coast 24/7 technical support. With dedicated staff and regional service centers, assistance is around the corner. If we can't fix it over the phone, we'll put a part or a person on the next plane out. It's that simple.

TWICE THE PERFORMANCE

HHB CDR-882 PROFESSIONAL DUAL DRIVE CD RECORDER

DualBurn
CDR-882 DUAL DRIVE CD RECORDER

With genuine dual drive recording, the feature-packed new HHB CDR-882 DualBurn delivers twice the performance in the most demanding live and studio CD record/replay applications. And unlike consumer-derived technology, the CDR-882 is designed from the ground up with a massive steel chassis, robust IDE CD-R drives and audiophile circuitry to ensure uncompromised sound quality and long-term dependability.

- **DiscSpan seamless recording across 2 or more discs**
 - **DualBurn simultaneous recording on 2 discs**
 - **High speed disc duplication**
 - **Industrial strength design and build quality**
- **Professional cueing and seamless track increments**

CDR-882 DualBurn: The ultimate CD recorder

Integrating Trade Shows

With the multitude of trade shows and conventions these days, it's good to see the incorporation of InfoComm and NSCA into one larger, more efficient trade show. The show gets underway June 14 in Las Vegas.

Many of the sound-only systems integrators and the AV systems professionals are interested in the same products, and this show — with a combination of great venue in Vegas and the hundreds of manufacturers showing their products — make it a much easier show to manage. From the costs of traveling to the time it takes to attend different trade shows at different times, it makes much more sense to put these two in one place.

manufacturers and amp manufacturers discussing the merits of self-powering speakers as well as using the old passive speaker/separate amp formula, the once-upon-a-time way to monitor.

There are some really good powered monitors out there these days, from high cost, big power/driver models to the utilitarian Asian-made compacts, there are models for every need. Self powering and onboard electronics' advantage is that the speakers sound can be tailored very specifically for their intended environment, and usually they can be produced at a lower price — especially with some of the newer, efficient amp technologies.

But I still like separates. I own a few pairs of self powered speakers and have tested a bunch of them over the years, but my primary system still has separates.

I know a lot of mastering engineers who swear by them. So at PAR, we still review

Although it will contain a shared expo of manufacturer booths, NSCA and InfoComm are still separate organizations and will continue to have their own education seminars, sessions and selective meetings. The organizations are different, just shared efficiency for all.

As a trade magazine covering many shows during the year, an integrated trade show makes our lives easier in covering the latest products under one roof — gotta love that! I could think of a couple more trade shows that need some integration.

If you are attending the show, stop by the NewBay Publishing booth, C2026, and say hello. We will have representatives at the show from several of our titles including PAR, Pro Sound News, Systems Contractor News, Government Video and TV Technology.

SPEAKERS AND POWER

With the domination of self-powered speakers in pro audio, Heather Johnson has compiled an interesting Q/A with speaker

both kinds speakers and an occasional set of passives (mostly from the audiophile side) and separate amps. Amplifier technology has continued to evolve — from classic Class A/AB bipolar and MOSFET output with traditional power supplies, to improved Class A output, to super efficient digital amps. Heck, I have a singled-ended stereo amp, all Class A, that has only two active devices per channel, producing only 7 watts to each channel, but amazingly transparent.

John Gatski is publisher/executive editor of PAR. His basement studio is filled with a wall of amps numbering 10 strong, including a classic Macintosh MC275.

Designed to Adapt

Nature has come up with clever ways to let some animals adapt quickly to their environments.

At Genelec our new 8200/7200 DSP Series also have the ability to adapt to their environment, by design.

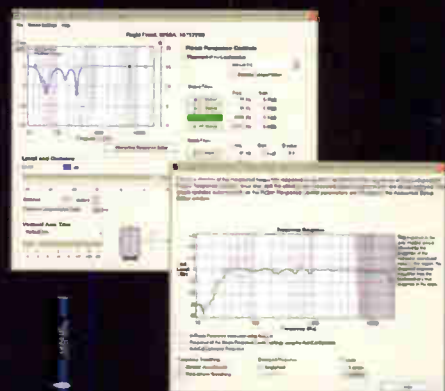

AutoCal™, Genelec's optimisation software takes into account level, distance and 8-band equalization to adapt each monitor loudspeaker to its immediate environment. What's more it does it as a system, with network control of up to 30 adaptable loudspeakers, including subwoofers.

AutoCal™

GLM

For Mac and PC

On screen, GLM software uses its *Interactive Response Editor* to give visual indication, loudspeaker-by-loudspeaker, of exactly what the response of each loudspeaker is.

In 1978 Genelec brought active monitoring to the professional audio world. An essential part of our active design is the room response controls. They are included in every Genelec analogue model to help integrate them to the listening environment. To further this, Genelec Product Specialists travel the world providing system calibration services to ensure optimum monitoring performance for our large system customers.

The Genelec DSP Series now brings this commitment, along with our acoustical knowledge and experience, directly to every customer.

AutoCal™

Cleverly designed to give you the room to adapt.

KRK Rokit G2 Powered Studio Monitor Series

The budget-priced redesigned Rokit Series offers significant improvements in imaging and accuracy.

With only a quick glance, anyone familiar with the KRK brand will immediately recognize the signature yellow cone and charcoal grey housing of its entry-level Rokit monitor line. Add power, a sleeker enclosure, extra connections and a cool glowing logo on the front and you have only a hint of what is now the Rokit Generation 2, or G2, Series.

FEATURES

The second generation of the Rokit bi-amped powered series is available as three different models. The papa bear of the line is the 20W HF/70W LF 8"-inch woofer model, which weighs 25.8 lbs/pounds. Its frequency response is 44 Hz to 20 kHz, +/- 1.5 dB, with a built-in active crossover set

at 2.4 kHz. The next in line is the 19.3 lb.pound 6-inch" woofer model with a power rating of 18W HF/50W LF. Its frequency response is 48 Hz to 20 kHz, +/- 1.5 dB; crossover point is 2.6 kHz. G2's baby bear, and what I reviewed here, is equipped with a 5"-inch LF driver, weighs a modest 13.4 pounds/lbs, and has provides a power rating of 15W HF/30W LF and with a crossover point of 2.0 kHz. The frequency range on the 5-inch" model is 52 Hz to 20 kHz +/- 2 dB. Each model of the Rokit G2 series has the same recessed one-inch soft -dome tweeter.

Most importantly, the Rokit G2 Series' upgraded design includes a redesigned cabinet. According to KRK, by curving the baffle and corners of the cabinet, the diffusion associated with boxy cornered cabinets is drastically minimized, which results in a wider sweet spot. I realized this when I found myself doing the typical 'duck neck' movement — sitting still, but moving my head all around trying to lock in on the pinpointed sweet spot. With the

volume control is included, providing input ranging from +6 to -30 dB. The notches are great, as they remove guesswork when trying to get the levels exact on both monitors. Also available is an adjustable-gain HF Level adjustment, a shelf starting at 2 kHz. This is

availableShelf gain can be adjusted in -2 dB, -1 dB 0 and +3 dB increments—helpful when making adjustments to compensate for the placement and listening environment constraints. I played with itthe shelf settings whenever I listened in an unfamiliar room, but I always ended up leaving it on 0, simply because I was still familiarizing my ears with the monitors; during the early stages, less change means less chance

FAST FACTS

APPLICATIONS

Studio, project/home studio, location/mobile recording, audio for broadcast and audio post production.

KEY FEATURES

Two-way; Rokit G2 models with glass aramid 5", 6" and 8" composite cone woofers; 1" neodymium soft dome tweeter; bi-amplified with active crossover; input gain control; radiused cabinet edges and curved front baffles; molded front-facing bass port.

PRICE

\$149, \$199, \$249 each (5", 6", 8" models, respectively)

KRK Systems | ☎ 818-534-1500
 ☞ www.krksys.com

I compared the KRKs with my current speakers of choice for smaller DAW-type work, the M-Audio Studiophile BX5a and a passive pair of KRK ST6s powered by a SAE TWO amplifier. I have an acquired taste for the ST6, but the Rokit 5 far outshined them in smoothness, imaging and accuracy across the spectrum.

speakers approximately 3' apart, the sweet spot covered a wide area and changed proportionately as I moved the speakers closer to each other.

The back of the cabinet offers three types of audio connections: XLR, TRS and even an unbalanced RCA jack. This will cover the gamut of typical setups and eliminates the need to carry around a RCA to TRS adapter/adaptor associated with many lower cost sound cards. A notched

for misinterpretation ... or so I like to think. Finally, each Rokit G2 receives power via a standard fuse -protected IEC power connector.

IN USE

I toted the Rokit G2 5-inch pair around with me to different listening environments to really get an accurate representation of what these offered. This included a very

large, acoustically correct control room (meaning it wasn't converted office space or a den) and, yes, a converted office space (where proper acoustics are on a long to-do list). In the larger facility I had the KRKs on their sides about 45 inches apart. This was a unique setup; I used the KRKs as near field monitors while the two-mix was also being fed to a set of larger monitors for an acoustic showcase in the other room. I was limited on how hard I could push the mix due to the possibility of feedback in the other room, so I quickly took a liking to the +6 dB of gain available on the KRKs. Although the power capability of the 8-inch model would have been a better fit for this large of a room, the 5-inch hung in there and, after listening back to the live mixes, had proven itself as a reliable monitoring source.

Probably the best fit in my trial run with the Rokit was in smaller rooms with the speakers located on each side of a dual monitor DAW, about 40 inches apart, sitting vertically on the 1/4 inch foam pad adhered to

the bottom of the cabinet. Video shielding is part of the G2 design, so there was never a concern of any interference from the monitors. The setup was within 4 inches of the back wall and, in one instance, within a foot of corners on both sides. Granted — this is not the ideal setup but sometimes we just have to work within the confines we are dealt.

I played these for hours on end and was not fatigued when monitoring from the KRKs.

I compared the KRKs with my current speakers of choice for smaller DAW-type work, the M-Audio Studiophile BX5a and a passive pair of KRK ST6s powered by a SAE TWO amplifier. I have an acquired taste for the ST6, but the Rokit 5 far outshined them in smoothness, imaging and accuracy across the spectrum. The BX5a is a comparable speaker to the Rokit 5, both in price and size;

the immediate noticeable difference between the two was in low end, as the BX5a are rear ported. Because of this, I have a built-in notch filter programmed somewhere in my mind to cut out the apparent low-mid build up. The KRK's front port design remedies this as all low frequency information comes right at me from a slot at the bottom of the speaker. Here, I heard what the low end was doing and was pleasantly surprised at the punchiness that came from the small package. My usual sub was disconnected during

this instance and remained off — the translation of the audio was very accurate from top to bottom. I played these for hours on end and was not fatigued when monitoring from the KRKs. When it was time to crank up the mix, the G2's sound was consistent with the sound when at lower levels.

The other difference in the BX5a and the G2 was in the sonic characteristics between the speakers. The KRK G2 was relatively flat across the spectrum and high-end hype, sometimes associated with former KRK models, was not there. The G2 was very pleasant to listen to, highlighting the shortcomings of the BX5As upper mid-range boost.

| SUMMARY

The Rokit 5 G2 would be a solid fit for an application where acoustic environment is an issue, surround mixes are taking place, or the on-the-go engineer needs a monitor able to quickly adapt to acoustic spaces and connectivity. Whether against a wall or in open space, I found these to provide a consistent and accurate reference point without wearing out their welcome on my ears. The new cabinet design adds sleekness to the look but, more importantly, lends to an accurate monitor that takes little time to adjust the ears. I can only imagine the same is true for the rest of the Rokit family. Throw in the \$300 street price for a 5" inch pair (\$400 for the 6 inch pair, and \$500 for the 8 inch pair) and the Rokit G2 Series becomes a serious player in the 'lower cost quality reference monitor' market.

UPSAMPLER

Capsule Reviews and Product Review Updates

to record and playback at 24-bit/48kHz, QuickTime recorded and played back properly. Curiously, when I recorded into Soundtrack Pro at 24/96 and exported the file, QuickTime Pro recognized the file as 24/96 and played it with no problems.

With a Sennheiser 421, I had to turn the MicroPort Pro mic gain control up all the way while I was talking at a subdued conversation level with the mic about two inches from my mouth. Even with the gain full up, there wasn't a lot of circuit noise. Using iChat and SKYPE, I talked with friends in far away places with better than

average quality. In fact, using the Sennheiser, I got comments that the audio I was sending over SKYPE was better than most cell phones.

More sensitive condenser mics required less gain and could be used at further distances. My Schoeps cmc641 sounded good,

but not as good as it sounds when recorded through my studio's pricey preamps and A/D converters.

There's a lot going on inside this little tube. Powering MicroPort Pro with USB-available voltages requires two switching power supplies: one for the circuitry and light and one for the phantom power. Being able to quickly convert any mic level source, including Phantom Powered mics, to a 24/96 digital signal with input adjustment and headphone monitoring makes MicroPort Pro a very handy tool.

— Ty Ford

CEntrance MicroPort Pro

CEntrance, Inc. | 847-581-0500 | <http://www.centrance.com>

The CEntrance MicroPort Pro (\$149) is a simple, four and a half inch long barrel with a female XLR on one end and a USB port, headphone jack and phantom power switch on the other end. The phantom supply current runs at a healthy 48V DC, 20 mA — more than enough for the hungriest condenser mic. There are also rotary mic gain and headphone gain knobs on the barrel. The headphone amp gain is very healthy. When you plug the USB cable in, a sexy, translucent white ring around the unit lights up to let you know you're connected.

You do need to know a little about the sound control panels in your computer and the preferences panels of your applications. They need to be visited to make sure MicroPort Pro is recognized. Everything worked fine with my 10.4 Macs, but I did run in to a few small problems with the newer 10.5 Macs. The audio sounded garbled when I tried to record into QuickTime Pro 7.4.5. After I changed the Mac sound control panel

"An ideal amp for those small mastering or tracking suites who want accuracy out of their passive closefields." Pro Audio Review

Avantone Active Mixcube Studio Reference Monitors

The Active Mixcube combines the ubiquitous single-driver, full-range studio reference of old with a built-in amp and a plethora of mod updates.

Now that you've installed your new subwoofer and networked 'intelligent' monitors, what else could you possibly need to add to your monitoring system? Some 5-inch, full-range mini-monitors, of course!

The standard single-driver, full-range studio monitor has always been the Auratone 5C. And today, it will be the Avantone Active Mixcube from Avant Electronics. Referencing 'real world' playback has never been this cute ... or this smart.

FAST FACTS

APPLICATIONS

Studio, project studio, audio for broadcast, audio post, location/mobile truck use.

KEY FEATURES

6.5-inches x 6.5-inches x 9.5-inches MDF cabinet with radiused edges; 5.25" New Zealand pulp and mica driver, 43 oz. magnets, die-cast aluminum frame; 35W Class A/B amp; 90 Hz – 17 kHz frequency range; 94 dB of output @ 1 watt/1 meter; Neutrik combo connector (accepting XLR, 1/4-inch TS or TRS) and RCA inputs; 7mm neoprene pad; magnetic shielding; Dacron acoustical stuffing; 5/8-inch mic stand mount.

PRICE

\$419 per pair

CONTACT

Avant Electronics | ☎ 909-931-9061
 ☞ www.avantelectronics.com

FEATURES

The popularity of the ubiquitous Auratone 5C rested in its ability to simulate playback as often heard by the

end users (listeners) of our recordings. Let's face it; even today, a lot of consumption is through devices with only a single (or pair of) full-range driver(s). Sans thumping lows and piercing highs, do your mixes translate to such bandwidth-limited playback?

Avant Electronics' original non-powered Avantone Mixcubes upped the ante on the now-unavailable Auratone via beefed up cabinetry and components. Now the \$419 (manufacturer direct per pair) Active Mixcubes take Auratone concept to its logical and thoroughly-modernized conclusion. The cabinets are solidly built and thought out with MDF construction, radiused edges, a polyurethane high-gloss "Butter-Cream" finish, a 7mm neoprene pad, magnetic shielding, Dacron acoustical stuffing and a 5/8-inch threaded insert for mic stand mounting. Input is provided on a Neutrik

combo connector (accepting XLR, 1/4 inch TS or TRS) and an RCA input.

The driver is a 5.25" paper (New Zealand pulp and mica) design with 43 oz. magnets and a die-cast aluminum frame. Power is provided by a Class A/B amp delivering 35 watts RMS. Frequency response is listed as 90 Hz – 17 kHz, with 94 dB of output @ 1 watt/ 1 meter. The Active Mixcube is slightly larger than the Auratone, but still necessarily small (only 8.8 lbs) at 6.5-inches x 6.5-inches x 9.5-inches, including its eye-catching heat sinks.

IN USE

I connected the alternate monitor outputs of my Soundcraft Ghost console to the Mixcubes with a pair of TRS cables, creating the ability to quickly A/B against my JBL LSR 4328s and their powered sub (with room mode correction). My first impression was oddly positive in that I was blown away by the external power supplies! These were large and heavy, in-line transformers (either 110 or 220 V), with a thick, shielded output cable and a threaded, metal connector on the monitor end — nice!

I cranked up the input trims with a flathead tweaker and got them

balanced with my mains. This balancing required a little work, as one must focus on the volume of only the mids, not the bottom or top end, to judge average SPL between systems.

Upon completion, I was rewarded with the focused, no-frills sound that Auratones are loved for — except the Active Mixcubes are more focused and less nasal than I remember Auratones to be. I'm really praising the qualities of the midrange here; these are far more than "no bass" boxes, like many could expect. Without the mids being split up by crossovers and multiple drivers (and all the phase inaccuracies and distortion that

result), these critical frequencies are trustworthy and honest, clearly affecting vocal and melodic instrument mix decisions.

I fiddled around with some old dialog tracks and found the Avantones immediately helpful; balancing voices was easier here than on my mains. I tried the Mixcubes on some pop mixes and found this process to be a good bit trickier, of course. I always compare my mixes on multiple monitors and headphones, but the addi-

I was rewarded with the focused, no-frills sound that Auratones are loved for — except the Active Mixcubes are more focused and less nasal than I remember Auratones to be.

tion of the Mixcubes has benefited my 'vocal to backup vocal' and 'guitar to guitar (or keys)' balances the most. I also found the Mixcubes helpful in balancing multiple tom toms, focusing on their attack and their middle, without fooling me with their boom.

Many people praise the value of using original Auratones to get 'just enough' kick and bass in their mix. This process will work on the Mixcubes as well; just dial in the kick on your mains and use the Mixcubes to check for mere audibility, not depth or fullness. Without changing the dialed-in bottom, a second EQ bump (high-

er in frequency) can be added for audibility, if needed.

Further, I carted the Mixcubes over to my local PBS affiliate (WTVI) to check them out 'in their element'; my judgements were confirmed. Perched atop WTVI's Studer D-950 digital broadcast console, the engineer there surmised they "sound like Auratones" — mission accomplished.

| SUMMARY

The bottom line is that these Mixcubes have so much usefulness in so many atypical ways that most any studio could use a pair. Combine all this utility with a reasonable price, professional construction and an impressive five-year warranty, and these little Mixcubes don't need to be so dog-gone cute to earn a spot in your nearfield. They're smart, good looking and affordable ... what a catch!

All for You Special

When the mission is flawless mix-down of live music performances, the producers of America's top rated TV shows call Paul Sandweiss and his team at Sound Design Corporation. To make sure there are no surprises when he views the shows at home, Paul relies on JBL LSR6300 Series Studio Monitors on the gig. "I work in a lot of environments and my monitoring set-up is critical. Not only do the JBL LSRs get the job done, when clients come in, they love the sound. The LSRs have great low end, warm midrange and airy sweet highs that allow me to put a little more love on my mixes. I can mix sixteen hours a day with no fatigue. The RMC™ Room Mode Correction is very helpful in situations where we have to get in quick and get going. It gets us closer faster. We just got a set of the new LSR4300 series and the automated RMC makes set up really easy. It's about knowing the mixes will translate, and the JBL LSRs work really well for us, on location and in our five control rooms at Sound Design."

Berliner U77 Multipattern Tube Microphone

The U77 is an admirable choice as your one and only truly high-end tube microphone.

Berliner Microphones — named in part after Emile Berliner, one of the first builders of microphones via a telephone transmitter in the late 1800s (which was eventually acquired by Bell Telephone) — completely skipped the cluttered budget microphone pool and jumped right into the elite world of high-end, hand-crafted, European-designed tube microphones. According to the manufacturer, the company name became a no-brainer as the capsules and transformers for its high-end offerings wound up being manufactured in Berlin — just call it nomenclatural destiny.

I spoke at length with Dana Paul, the man behind Berliner, to voice my concerns about investing the dollars to purchase a product — the U77 multipattern tube microphone — from

a startup company such as his; it was a concern that I felt was justified. Dana assured me that Berliner was created out of a passion for creating music, as he himself is a producer and has a large collection of modern and vintage microphones. He has many other successful ventures and has not put his eggs all in the Berliner basket. I say this because I have personally reviewed equipment from startups in the past to find that only a few months after print, the company's doors

are closed. For Berliner, those concerns are put to rest; should the mic ever have any trouble, it will be covered under its lifetime warranty from the Berliner US support center.

FEATURES

The U77 is just over 9 1/2-inches long, weighs 11 pounds and 5 ounces and is constructed of 'duraluminium' and stainless steel. It is right at home in its U47-style shock mount with hinged clasps to assure a good grip on the microphone.

It boasts three patterns — omni, figure 8 and cardioid — with a frequency response of 30 Hz to 20 kHz. Connectivity between mic and power supply is provided with a GAC7 10m Gotham cable using a 7-pin Tuchel connector. The brick-style power supply is encased in a thick black aluminum enclosure with the internal parts accessible via four

screws. The single PCB is roomy in layout with all components well spaced out and easy to follow traces located on the bottom of the board. The outside end of the power supply has a standard IEC power connector, selector for 115/230V A/C, power switch and indicator light. The other end consists of the 7-pin female Tuchel connector, female Neutrik XLR and pattern selector switch.

Overall, this is a very well designed and constructed mic with no low dollar Asian components. Even the transformer is hand wound in Europe and fully inspired by the original M7/49, credited in large part to its smooth and natural sound. Included with each microphone is a custom frequency response plot.

During my time at Masterfonics, there were many days where I found

myself locked down in the shop with a vintage, high dollar tube mic disassembled on the bench while I tried to track down various problems. Whether testing and replacing tubes, fixing cold solder points or testing the

components, I became quite familiar with the build and quality of vintage German microphones and even the latest high dollar microphones. Here, I decided to put that experience to work, taking apart the Berliner microphone for look under the hood.

Inside, the mic looks similar to many of the classic mics with hand-crafted point-to-point wiring accompanied by two easy to follow circuit boards. Clear Plexiglas dividers separate the diaphragm from the electronics and reinforce the construction of the microphone. The Raytheon NOS 5703 military-grade tube is hard wired due to the power requirements of the tube. This tube is known for its low noise and long life span and is similar to the original M49 tube, the AC701K. The capsule is hand-built and skinned by ex-Neumann engineer Siegfried Thiersch, one of the original builders of the M7 capsule. The U77 is built exactly the way

INTRODUCING
The Studiophile BX Deluxe Series

What happens when you surpass what people expect from a near-field reference monitor? You end up with the best selling* monitor in its category—the M-Audio Studiophile™ BX5a. Now our obsession with perfection has led us to raise the bar again. Meet the Studiophile BX5a Deluxe and the Studiophile BX8a Deluxe.

* Source: IMI SalesTrak

The BX Deluxe monitors sound balanced at a wide range of volumes, so your mixes will translate across diverse listening environments. They also provide detailed sonic imaging, seamless frequency integration and an amazingly cohesive sound. The BX Deluxe monitors are designed to deliver an exceptional monitoring experience that's true to your music. Hear for yourself at your local M-Audio dealer.

Studiophile BX8a Deluxe

- 130 watts of bi-amped power
- 8" Kevlar low-frequency drivers
- 1" natural silk high-frequency drivers
- XLR balanced and 1/4" TRS inputs
- OptImage IV wave guides

Studiophile BX5a Deluxe

- 70 watts of bi-amped power
- 5" Kevlar low-frequency drivers
- 1" natural silk high-frequency drivers
- XLR balanced and 1/4" TRS inputs

World Radio History

he built the original M7 — the Berlin double ring type — with the exception of using Mylar instead of PVC, which deteriorates over time and is subject to environmental conditions such as heat or moisture. [According to the manufacturer, PVC components are one of the reasons why the original M7 sounded slightly different from one another — Ed.]

Even the U77's case was designed with excellence in mind; it utilizes 600 and higher denier nylon, DuPont Cordura, highest quality 7/8-inch plywood, high-quality vinyl, polyester and leather with complete protection against humidity and other elements. Although I was not brave enough to try, it is claimed that the case can be fully immersed in water without the mic even getting damp.

| IN USE

My first test for the U77 was a female vocal on a song that ranged from low and raspy to high and, if not careful, ear piercing high-mids. I tried a few other low to mid-priced condenser microphones on this par-

ticular vocal and each time I was fighting to calm down the sonics. The signal chain was the U77 to a Summit 2BA-221 dialed completely into the solid state circuitry followed by a dbx 160XT compressor set to just barely grab the loudest points of the vocal.

After listening to a dry run, it was decided that no external EQ was necessary. The intimacy in the lower part was beautifully captured with the U77. Proximity really exposed the vulnerability the singer was imparting when the pop filter was 1 and 2-inches away from the microphone. The true test was when the belting started in the higher ranges. The U77's character really shone as what are usually offensive frequencies were naturally smoothed out; not dulled in any way, but more like the harshness was rounded off.

This was also the result with a male singer with more of a baritone/alto range; the mic was superb in capturing the performance while naturally rounding out what are often troubled frequencies without the assistance of equalization.

The mic was lent to another engineer to use on some overdubs consisting of banjo, acoustic guitar and violin. The basic signal path included the U77 into a combination of mic pres from API and Millennia, a dbx 160 for compression and, occasionally, the A-Designs Hammer HM2EQ tube EQ for

Berliner U77 On The Bench

added coloration to taste. Regardless of the chain, the results were excellent in each instance. So far, the U77 was really proving itself to be a great mic to have on hand for all applications. A testament to that was the violinist — a mainstay in the Nashville recording community — had such high affection for the results that he inquired about how he may acquire a U77 for his personal collection. This unsolicited endorsement spoke highly of the microphone capturing the body and fullness of the violin.

| SUMMARY

Like all microphones, the Berliner U77 has a character and color all its own. Whether or not it sounds like the M7 capsule is up for debate as I have heard M7 capsules and many other vintage mics that don't sound like each other due to age and wear. The selling fact for this microphone is I would not hesitate to line it up with its vintage and modern counterparts in a shootout to find the best microphone for the desired result. For a facility where only one high-end tube microphone is an option to have on hand, the U77 is a admirable choice that would not disappoint as the primary go-to mic. In the "put your money where your mouth" is department, that is just what we did at our studio: we made the U77 our primary microphone for spoken word, vocals and a plethora of instrumentation — and have not once regretted the decision.

Legacy Studio HD Passive Monitors

When I reviewed the first iteration of the Legacy Studio closefield monitors ten years ago, passive speakers in pro studios were still quite prevalent. Today, in a speaker world awash in powered monitors, the latest version of the non-powered Legacy Studio is a rare choice for studios.

The new Studio, priced at \$1,699 per pair, has been totally redesigned with new drivers and cabinet design. Legacy's primary market is the audiophiles, but high-end pros that choose the separate amp/speaker route have used the Studios and their larger brothers, the Classic and Focus, for the detailed, accurate monitoring.

Legacy has a few dealers nationwide but does much of its business via direct factory order with a generous return policy.

FEATURES

The Studio HD is a compact-sized, closefield monitor that sports an 8-inch woofer with a cone woven from carbon graphite and silver thread, and a custom-designed 1-inch folded ribbon tweeter with a kapton diaphragm and neodymium magnet. The ported, B4-reflex cabinet, provides bass aug-

mentation for the small 13-inches tall 10.5-inches wide and 10.8-inches deep cabinet, allowing the speakers to reach down to a claimed 42 Hz.

Overall specifications included a factory rated frequency response of 42 Hz – 22 kHz (plus, minus 2 dB). The crossover frequency is 2.8kHz. Power rating is listed at 25 watts to 300 watts continuous RMS. Impedance is rated at 4 ohms nominal.

The cabinet's internal bracing and ultra-dense hardwood housing make for an extremely inert package with no midrange or treble coloration. Finishes include walnut, cherry and black pebble. The angled edges and sloped front-to-back dimensions are said to enhance dispersion.

Cable connection is done via spade or banana plugs, and the speakers can be bi-amped or bi-wired by removing the jumpers from the four speaker posts. Two switches allow subtle reduction in the mid-bass and low treble to compensate for room and location effects on the sound — about -2 dB.

I set up the Studios in two different sys-

tems: a closefield setup with a Mac DAW and as a midfield monitoring rig in the middle of my room with a 16-channel analog console.

IN USE

In the first configuration, I sat them on Apollo stands and angled them in slightly toward the listening position. They were powered with a couple of different amps, including the reference high-power, Bryston 14B SST bipolar output amplifier, the Pass X350.5 MOSFET output amplifier and my current favorite low-powered amp, the all-Class A Pass XA30.5.

I fed reference audio from my Apple G5's Lynx L22 sound card to either a Benchmark DAC1 or Lavry DA10 converter, which fed the analog balanced outputs of my Coda monitor preamp and then the amp. Interconnects included Kimber Cable and Alpha Core solid silver, two-conductor cables. I used the Alpha Core solid silver cables to interconnect the amp to the speakers.

For reference, I also used the original Legacy Studios and the passive Lipinski L505s as well as my reference Legacy Focus 20/20s mid/farfield tower speakers.

On first listen, I could tell that the Legacy's did not need much break in. On 24-bit/96 kHz high resolution acoustic guitar recordings, the Studios sounded very natural with the accurate presence from a 1973 D35 Martin and my custom OO-28 fingerstyle guitar. Imaging was deep and wide with the complexity of the strums and plucks quite revealing without any harsh overtones. My initial listening notes contained the word "accurate" over and over.

The Studio HD is an excellent imaging speaker. I could hear a lot of treble cues spread very deep and wide in the mixes. Even compared to my Legacy Focus 20/20s towers with multiple drivers, the Studios were quite impressive in the amount of information they conveyed.

On jazz recordings, such as the DMP SACD Steve Davis "Quality of Your Silence" the ribbon tweeter had less of that seductive presence than the titanium dome of the original Studio — flatter sounding, but I believe it is more accurate.

Transient response is quite good for such a reasonably priced speaker. Drum cymbals reflect the speed and air of a well recorded setup, without a hint of harshness or over-splashiness — just like it sounds in the session.

High-resolution piano recordings also

revealed no exaggerated character or harshness in the upper register with the precise transients that quality piano mics are able to capture.

Another positive of this ribbon tweeter is its lack of extra sibilance you often hear on female vocals from some metal or soft dome drivers. This speaker shines on vocals with no exaggeration; what you hear is what you have on the recording.

The other characteristic I noticed was the good, unexaggerated bass for such small speakers. I measured test tones to 55 Hz that were just a few dB off the 1 kHz reference tone in my room. The origi-

Legacy Studio HD Rear Plate

nal Studios had good bass, but there was some mid-to-upper bass enhancement in its tuning to help out the small driver/cabinet configuration. The latest version's woofer allows a flatter bass response.

The treble and bass tilt switches offer a little bit of fine tuning for spaces that may be a bit more live or have mid-bass build up when placed close to wall. I found they sounded a bit more open in the flat position, but the effect is subtle.

For the pop music engineer, the Legacy Studio HD can be played loud without hurting your ears. Using a really good Class A or A/B amp with really good passive speakers offers clean

sound that many mass-produced powered monitor combos do not. I have heard many powered monitors that sound good at low-

to-moderate levels, but produce a bit of harsh sonic haze and edge when cranked up. You can't listen like that for very long.

I also tried the Studio HDs out in the middle of the room as a midfield monitor to see how it projected the sound from 7 to 8 feet. It was not as effective as the much bigger, Legacy Focus, but it was as effective as the standalone Lipinski L505s with more low bass. The Lipinskis need a subwoofer for any bass under 75 Hz.

As for negatives with this monitor, I had none. It sounds great, it looks good, it's easy to place and offers the flexibility of choosing your own amp. The only negative is that Legacy is an order-only company and you can't march down to your local dealer and get a quick audition. You get a 30-day audition with a money back guarantee and free pickup if you don't like them ... and I'm doubtful that you wouldn't like them.

SUMMARY

For those facilities where great closefield speaker accuracy is desired and the pocketbook does not mind plunking extra coin for a good old fashioned amplifier, the Legacy Studio HDs are hard to beat. The deal gets better if you already have a good amp sitting in the gear closet.

RECOMMENDED STUDIO AMPS

Whenever I do a passive studio speaker review, I am always asked for amplifier recommendations. With powered speakers the dominant players these days, the pros have fewer choices, but if you look into the hi-fi market, companies there are still building plenty of amps to choose from and the features really are not different from the pro amps.

•**Bryston** — Long-time Canadian amp manufacturer still makes some of the most versatile, accurate sounding amps with pro features. If you don't need gobs of power, I would try the Bryston 4B SST at 300 wpc, priced at \$3,499. The 14B SST, priced at \$5,900, will power most any speakers for big rooms — with more than 600 wpc on tap.

Contact: www.bryston.ca

•**Hot House** — Richard Rose and Co. are still making pro and hi-fi amps. The standard standby SV Stereo 400 (200 wpc) is a nice-sounding amp, priced at \$2,299.

Contact: www.hothousepro.com

•**Pass Labs** — Nelson Pass of Threshold fame has been producing his namesake line since the early 1990s. The MOSFET XA and X series are the best for the pros. They are not cheap, but I like the X350.5 (\$9,500) for medium and big speaker rooms, and the \$5,000 XA 30.5 for closefield setups.

Contact: www.passlabs.com

•**Legacy/Coda PowerBloc** — Legacy sells an OEM bipolar amplifier, produced by amp/preamp manufacturer Coda, rated at 300 wpc. I own two Coda preamps and have used the Coda amps. Transparent and analytical. \$3,800.

Contact: www.legacyaudio.com

•**Lipinski Sound** — The clever, in-stand design L-301 make Lipinski's and other speakers come alive. They feature bridged mono (600 w) stereo 300 wpc or parallel power modes and are priced at \$4,000 each.

Contact: www.lipinkisound.com

•**Parasound** — The NewClassic line of Parasound amps are still sleepers with their lower cost and good sounding Class A/B bipolar output. I like the two channel Model 2250 (250 W) as well as the five-channel Model 5125 for small 5.1 rooms.

Contact: www.parasound.com

•**Monster Cable** — That's right folks. Monster Cable's big MOSFET 250 wpc amp, Model MPA-2250, priced at \$2,499 is one pretty sounding amp that has plenty of headroom. In fact, a LA mix engineer turned me on to the amp.

Contact: www.monstercable.com

•**Behringer** — Bang for your buck is Behringer's A500 160 wpc traditional Class A/B bipolar output amp. Not in the league of the Pass or Bryston, but pretty darn good for a couple of hundred bucks. Shockingly good.

Cascade X-15 Stereo Ribbon Microphone

The X-15 stereo ribbon sounds good, has smooth character and is quite a deal at \$399.

Ribbon element microphones are all the rage these days with a range of products from companies such as Royer and AEA to the more economical models from sE Electronics and Cascade Microphones brands. Case in point is the Cascade X-15 stereo ribbon, selling for \$399!

FEATURES

The X-15 stereo ribbon microphone contains separate factory-matched 2.5 micron ribbon elements, offset at 90 degrees in a Blumlein arrangement. Typical of ribbons, its coverage comes via a Figure 8 pattern. According to Cascade, the ribbon's aluminum membranes produce a "balanced" sound from sources on either side of the ribbon.

The X-15 comes with a nice shock mount, a splitter box with two separate

FAST FACTS

APPLICATIONS

Recording, project studio

kHz, +/-3 dB with just a hint of rise from 2 kHz to about 10 kHz. (The provided measurement plot shows a roll-off after 10 kHz). The maximum SPL is rated at 165 dB maximum SPL at 1% distortion, and self-noise is said to 17 dB.

IN USE

Stereo microphones are suited for many applications including acoustic guitar, electric guitar amps, drum overheads, brass, piano. When adding ambiance, I used it on a variety of acoustic and electric guitars/amps from dark sounding dreadnoughts to small body finger pickers to Telecaster and Gibson hollow body jazz guitar.

I first mounted the X-15 on an adjustable arm stand and recorded a Guild D-55 dreadnaught. I had to play around with the positioning to find the sweet spot, finally settling on about a foot from the guitar and positioning it so the upper element paralleled the upper frets and the other paralleled the body.

With most of the stringed instruments that I used the sound was pretty consistent. With its mostly flat response to 10 kHz, the mic just does not have any hyped character.

XLR outputs, a 12 ft. connector cable and an aluminum case. The microphone is also available with Lundahl transformers that are installed in the Cascade Microphone shop in Olympia, WA for an additional \$300.

The factory specs claim a 30 Hz to 18

I recorded the audio 24-bit 96 kHz via a TASCAM HD-P2 connected to a Benchmark ADC1. The sound of the Guild is big with a lot of midrange/low treble and a tight bass for a dreadnaught.

Ribbon microphones lack the upper treble that my stereo pair high-end con-

densers produce, but I liked the sound because it was pretty smooth in the critically sensitive high-mid/low treble hearing frequencies without that hyped stridency you can get from a condenser with the broader treble rise. But sometimes you get an acoustic "sheen" from that treble tilt that many condensers impart. If you want that sheen with the Cascade, you may want to tweak the EQ — especially with a really dark instrument.

With the separate elements, proper mic placement and a good-sounding room, the stereo spread was excellent, as was the mic's ability to pick up the room sound. I tried the X-15 with my custom Martin 00-28 with silk/steel strings and it really sounded good with a tight bass and warm midrange. The resulting recording really filled out the width and depth of stereo recording.

With most of the stringed instruments that I used the sound was pretty consistent. With its mostly flat response to 10 kHz, the mic just does not have any hyped character.

The Figure 8 pattern allows you to

experiment to find the optimum position for getting the best stereo image, plus picking up a bit more of the room. Although I did not test it on drum overheads, I would expect its smooth character and two-in-to-one placement to work well in such an application.

I did not have another stereo ribbon for direct comparison, but the X-15 has the essence of a ribbon microphone with a smooth warm response. Other ribbons that I have used may have more richness in their low treble character, but there is nothing wrong with the sound of this mic. I also recorded a hard-to-record Guild and it sounded quite good as did the Gibson hollow-body and Fender Twin Reverb amp.

| SUMMARY

The Cascade X-15 stereo ribbon is a very good sounding stereo microphone with a smooth character that can work on a lot of different instruments and applications. And it is quite a deal at \$399 retail; this class of Chinese made-ribbons seems to improve with every generation. With the fit and finish, the cable, and carrying case

— it is quite a nice package. Did I mention it is under \$400?

Powering Studio Monitors

With such a wide array of excellent studio monitors on the market, it's becoming even more difficult to choose the ideal components for a particular room and budget. Both active monitors and passive designs with separate amplifiers bear strong arguments in their favor. In an attempt to weigh the pros and cons of this debate, and perhaps ease the decision-making process, we enlisted a few expert witnesses: Peter Chaikin, JBL Professional's director of recording and broadcast marketing, and Bill Bush, director of engineering for KRK, offer a wealth of insight regarding active studio monitor advances. Nelson Pass, audio designer and founder of Pass Labs, and Richard Rose, president of Hot House Professional Audio, discuss the flexibility and fidelity behind passive monitors and control room amplifiers.

PAR: *What advantages do active and/or powered monitors offer over passive monitors with separate amps?*

PETER CHAIKIN: Powered speakers offer convenience for the end-user. The system is self-contained, nothing needs to be connected externally, and the amp and the transducers work together as a matched system. That's not to say that passive speakers can't be excellent speakers. But from a design perspective, dollar-for-dollar, including amplification, we can deliver better performance from a powered studio monitor. The job of the crossover in the speaker system is to provide the right amount of power and EQ to each transducer—the woofer, tweeter,

JBL LSR 4328

and midrange transducers. A passive speaker employs a passive crossover, which sees very high power from an external power

amplifier and divides and delivers that power to each of the transducers. To handle very high level signals, the cost of the tight-tolerance components for a passive crossover can be very high. In a powered speaker, by putting the crossover in front of the amplifiers, and assigning a separate amplifier to each driver, we can optimize performance and compensate for response anomalies using equalization. Passive speakers are EQ'd as well, we just don't have the same flexibility in a passive network as we do in an active network. Using an active crossover in a powered system, we can tailor the output for each driver to optimize system performance. The end result is a much more accurate speaker dollar for dollar than can be achieved with a passive system.

BILL BUSH: Active monitors can have the drivers and the amplifiers optimized to work together as a system, making the best use of each and not having to design around possible mismatches that can be encountered with passive systems and separate external amplifiers. Active systems are bi-amped (or tri-amped for three-way systems) allowing each amplifier to be optimized (sensitivity/gain/et cetera) for the driver that it is powering. Active speakers can be tuned to provide increased low frequency extension and output without overdriving the system below resonance. This gives powered monitors more low frequency extension without overdriving them by rolling off the extreme low frequency. This also allows an active speaker to have a more linear woofer suspension because you can't have the problem of putting in too low frequency of a signal at too high a level causing either bad distortion or speaker damage. Passive systems need to have a nonlinear suspension (added distortion) to protect them from being overpowered.

Active monitors have more consistent frequency response because active crossover

frequency response is not a function of speaker driver temperature (level) or minor variations of driver manufacturing. A passive crossover changes frequency response with increased voice coil temperature and with minor primary resonance deviations in the drivers. That is to say that passive speakers sound different at different volume levels and operating temperatures where active systems have dramatically lower changes with different levels.

An active speaker can easily give frequency response adjustments with the flip of a switch, whereas it is difficult to do this with passive systems because changing the output level changes the impedance load the crossover sees, thus it changes the crossover frequency and shape.

The lower impedance fixed length of speaker wire in an active system has significantly lower power loss to the driver than does a long length of speaker wire and a passive crossover to the driver. Also, the lower fixed length of speaker wire inside the enclosure provides more consistent and increased damping of the drivers than passing the speaker level signal through a long length of speaker wire and passive crossover.

PAR: *And would this same argument apply when discussing a more "affordable" line of monitors? I understand there's a greater risk of problems at this level.*

PETER CHAIKIN: Powered speakers are pretty reliable these days. It's true that from **MONITORS** continues on page 30 ▶

HS SERIES POWERED MONITORS

The new HS Series powered monitors were designed to be true studio reference monitors in the tradition of the famous NS10MS. That means, mixes that sound good on Yamaha HS speakers will sound good on anything. In fact, that's the ultimate test of a reference monitor. Even better than that, HS series speakers not only sound good, they look great, too.

The HS10W powered subwoofer complements the HS speakers and easily handles today's bass-enhanced music or the most dramatic surround effects. The HS10W subwoofer uses a bass reflex design cabinet that maintains high efficiency and low distortion. You can combine HS50Ms or HS80Ms with the HS10W subwoofer to create different 2:1 (stereo) and 5:1 surround sound systems. So check out the new standard in near-field reference monitors at a Yamaha dealer near you.

World Radio History

time to time, a powered speaker will fail. But passive speakers also fail: they fail because an external amplifier that is too small to provide adequate power delivers distorted audio to the speaker and damages the drivers. Conversely, overpowering drivers can cause them to fail. In a powered speaker, amplification is optimized for each transducer. To ensure reliability, JBL powered speakers must survive a torturous 100 hour power test playing at full output before the design is frozen.

BILL BUSH: The benefits of an active powered monitor get even more critical as you get into the realm of more "affordable" monitors. The more the drivers, amplifiers, enclosure and crossover can be designed together as a unit, the higher the performance can be for a given budget. Active crossover cost does not rise significantly with increased complexity allowing the designer to use the crossover shape, slope, and frequency that makes the system work best, whereas passive crossovers tend to be very "limited" in an "affordable" system.

These "limited" passive crossovers tend to have looser tolerances and higher distortion with increased playback levels (in addition to the increased driver distortion that all loudspeakers have active or passive) Response shaping is very easily accomplished in an active system helping to allow design decisions to be made for lower distortion and increased linearity as opposed to flat frequency response. Thus combined with the active crossover the final system can have flat frequency response and lower distortion than could be achieved with a passive system.

PAR: *What markets do your active and passive studio monitors serve these days?*

PETER CHAIKIN : Virtually all music production studios and commercial studios use powered near-field monitors. Some high-end commercial recording facilities still use passive installed systems, although many of them now use active crossovers and bi-amp or tri-amp those speakers. JBL's passive LSR 6332 is used

in DVD mastering and sound design applications where soffit mounting, extraordinary SPL and very linear response are required. Cinema applications are still largely passive, primarily because the infrastructure is set up for passive speakers. Amps with processing and fans are installed in an outboard room, and the speakers behind the screen and the surround speakers are passive. JBL ScreenArray® Cinema systems are widely used in theaters are also used on dubbing stages to emulate what the audience is going to hear in a theater. With the increasing demand for 5.1 surround sound programming, TV and post production facilities are installing our LSR43000 Series networked powered speakers, designed for surround sound production.

BILL BUSH: We have four lines, three active and one passive. The active line starts with Rokit, which is targeted at home and project studios, but we also see them in DJ booths, front-of-house setups and smaller rooms in pro facilities. Our VXT line serves a more discerning audience in these markets, and is also gaining popularity in broadcast and post-production facilities. The Expose is

SUPERIOR SOUND NEVER LOOKED SO GOOD

aimed at pro studios and producers and engineers. Our passive Rokit6 monitor is aimed at project and broadcast applications where users want the Rokit performance and accuracy but want to use existing amplifiers.

PAR: *How has the increasing price of materials affected how you build your monitors?*

PETER CHAIKIN: We're all facing increases in petroleum costs, which means plastics have gone up, and metals, which means the cost of power transformers has increased. In the Harman Pro group we're fortunate to have the expertise to build more efficient systems and more elegant designs that reduce the costs so we can absorb these increases that are coming down.

PAR: *How has the move to an overall more digital/workstation-based recording environment affected your designs?*

PETER CHAIKIN: The advent of digital audio workstations has many implications for the entire recording system, including the

speakers. Most significantly, workstation users are likely to be working in rooms that are not application-designed and have not been properly acoustically treated. They're working in industrial parks, attics, basements, anywhere there's power. That means that the consideration for acoustics has not been given proper attention, and mixes can suffer. Low frequency anomalies—standing waves, room modes—can cause misrepresentation of low frequency content when heard in the mix position. So we JBL is developing systems, such as our LSR6300 and LSR4300 series systems that can measure the room and compensate for low frequency problems, and give greater accuracy at the mix position"

A PASSIVE APPROACH

PAR: *From a design perspective, what sort of standards do you employ to keep quality at a premium?*

NELSON PASS: Quality occurs on two levels. Our design process is fairly conservative, and we usually work by innovating existing products, giving them a life span greater than 10 years before major model changes.

Richard Rose, president of Hot House Professional Audio,

Incremental improvements have the advantage of re-using portions that already work well and allow us better focus. This conservatism extends to the reliability margins we apply to parts. Our power output devices are rated at about 150 watts, and by using between 10 and 72 of these per channel, they

don't usually have to operate much beyond 10 watts each.

In addition to technical requirements, we place a strong emphasis on listening. We have five sets of trusted ears who listen to the products critically, and we evaluate potential improvements for six months to a year before they see production. We maintain static reference systems in which things change slowly, but we try other equipment out. The speakers we use are varied—from the latest tweaked full-range drivers to classic Tannoy, Altec, and Klipsch. Most recently we worked with the new Reference 1 studio monitors from TAD.

It's very important that the product is build-able, reliable and serviceable. We build the boards and other assemblies in house, which allows us to keep a close watch on quality. We do strong QA on incoming parts, including grading and matching transistors. Subassemblies are tested before they go into product, partially assembled product is tested, fully assembled product is fully tested, then it's burned in for three days and then it's fully tested again, with minor adjustments made at each test.

RICHARD ROSE: Well-designed, durable products, built from premium components, many of which are individually tested and hand (or ear) matched, ensure the kind of performance for which we're known. But even more importantly, every piece of equipment that leaves the shop has been extensively burned in and carefully auditioned by myself or someone else with a long history of critical listening and a solid engineering background. We'll even put a pair of speakers through an extended accelerated break-in burn if we know a client is about to start an important project and can't live with a couple of weeks to loosen up his surrounds and spiders. A true testament to our level of build quality is that little did we know when we first started manufacturing electronics and introduced the industry's only dedicated control room amplifier, the original S400, over twenty years ago, that virtually all of them would still be making music today, and even more incredibly, would still be highly prized and sought after. We often get calls for the vintage amps and help by providing recycled to original spec units whenever possible. The new technology is certainly more perfect, but the old MOSFETS have a beautiful sound.

PAR: *How do you compete with today's powered studio monitors, which continue to improve in quality?*

NELSON PASS: Our market is at the top end of two-channel, where there is less competition. Being an amplifier company, we tend to look at our first loudspeaker, The Rushmore, as a loudspeaker wrapped around four amplifier channels. On the one hand, mating electronics with a specific set of drivers inside a loudspeaker offers an opportunity to optimize amplifiers to the drivers. Active crossovers easily raise the performance and efficiency of loudspeakers, and of course there is some convenience for

Nelson Pass, audio designer and founder of Pass Labs

the customer. On the other hand, most of our customers want to make independent decisions about electronics: upgrading, replacing, and repairing at will. Consequently, we see ourselves doing more in three loudspeaker categories: passive, internally active, and with external active crossovers.

RICHARD ROSE: First off, while many [powered monitors] are quite reasonable attempts for the money, the vast majority don't impress me as seriously accurate monitors, as they're built to a price point more than anything else. Many are little more than, as you refer to them, powered speakers, and are barely properly designed truly active monitors at all. While our passive PRM165 nearfield/Model One Thousand amplifier combo has gained a great following, all our models beyond that are either onboard active or supplied with a full onboard complement of amplifiers, electronic crossovers, sub controllers, cables and even isolation mounts creating an 'external' active system guaranteeing peak performance.

Since we're one of the very few companies providing audiophile quality professional amps (you can count them on one hand and still have a few fingers left over), and we manufacture high-end monitors in need of transparent power, the competition actually drives our clients 'upstream' to us, keeping us in a backorder situation as often as not.

PAR: *Does the wider array of "affordable" studio monitors on the market offer your products any sort of advantage?*

NELSON PASS: Of course. Affordable products set the stage for high-end products by raising the interest in high-quality audio. Virtually every customer who owns high-end product started with something modest and eventually experienced a desire for something better.

RICHARD ROSE: For those who want to get the most out of their "affordable" passive monitors, our Model Four Hundred frequently gets the nod. Regarding straight up amp sales, the less someone spends on "affordable" monitors, the more they have left over for a good amp. And the more they need one.

PAR: *Considering the recording business and its budgets aren't what they used to be, has your customer base shifted over the past few years?*

RICHARD ROSE: Not really. We see less activity on the mega-monitor side these days (few clients are willing to spring for a hundred thousand dollar system, or even have the space for it these days), but our nearfield and amp sales are better than ever. And surprisingly, sales to newbies and pros alike are growing thanks to [jazz recordist] Joe Ferla's enthusiasm and the buzz in the blogosphere. So we're pretty much supplying every level from the real heavy hitters to the aspirants at home who are a decade away from their first platinum.

NELSON PASS: Pass Labs is a two-channel house, committed to high-end stereo. We stayed out of the multi-channel race to home theater, and we're pleased with that decision, as we have done well by sticking to what we know best. We're a small boat, so we stay close to the shore. Over the last ten years, Pass Labs product has gradually shifted from low powered single-ended Class A amplifiers to much more powerful push-pull Class A and AB designs, broadening our appeal, and increasing the business. The domestic two-channel market has suffered a disruption in retail distribu-

tion, but customer interest is still healthy. Much of the activity has shifted to the Internet and direct sales, but as of a year ago we decided to back off this route, focusing instead on the quality “brick and mortar” guys. Over the past 20 years, the overall business has slowly moved from about 60 percent export to about 75 percent

export, with much of that growth in emerging Asian markets. These are some great customers, and we are very happy to work with them.

PAR: *The price of materials is going up, sometimes way up. Has that affected how you build your products?*

NELSON PASS: They cost more to make, and that is reflected in the price we charge. We operate on the premise that there is always a market for the best, regardless of price, and we really don't let the cost of metal influence our design decisions. At the same time, some important parts are disappearing—Low noise JFETs in particular—and stocking up on them for the future is currently taking a larger share of our attention and resources.

RICHARD ROSE: We never compromise on any parts just to cut cost. If transformers double and triple in price, we simply adjust our end-user pricing. Selling direct helps a little by saving our clients the dealer margin, but being a small “boutique” manufacturer, everything we build is done in short runs, which is proportionately more labor intensive and means we don't benefit from the economy of scale larger companies enjoy. Our products have never been inexpensive, but have always been a good value, if not quite for everybody.

PAR *Has the move to an overall more digital/workstation-based recording environment affected your designs?*

NELSON PASS: Indirectly, I think. Technology has given artists more independent control over the creative process and access to the market. Over time we expect this to help propel music and music reproduction, and “rising waters float all boats”—mine included. In the meantime, while esthetic and economic issues settle out, I'm very optimistic.

RICHARD ROSE: Not at all, since we already offer something for every type of environment. Our products have always been designed around very targeted applications, each conceived for a specific purpose, and not just the same old speaker that's bigger and louder or smaller and cheaper as you go up and down the range. You'll note there's very little “family resemblance” between our various monitors, and by design, the only thing they have in common is the presentation at the mix position ... regardless of what kind of music they're reproducing, how far away they may be, how loud they need to play, or how large a room they're in. There are reasonable technical explanations for this. But in a perfect world, large, medium or small, an amplifier should just amplify. And there should be no difference until you run out of headroom — period!

ELECTRO-VOICE RE97-2Tx Headworn Microphone

Electro-Voice has launched its RE97-2Tx headworn microphone, an ultra-low-profile, omni-directional, back-electret condenser headworn microphone targeted for applications such as houses of worship, corporate AV, theater and other venues. The RE97-2Tx is a two-ear hook design with a band behind the head for comfort and stability in any performance. The band is fully adjustable, and the hooks fold flat for storage and flips all the way over so the microphone boom can be on the left or right side of the mouth. A clothing clip to retain the cord and a removable windscreen complete the package.

PRICE: \$450

KALTMAN RF Spectrum Analyzers

Kaltman Creations has expanded its line of RF spectrum analyzers. The expansion includes the addition of a 2.4 GHz RF spectrum analyzer software package and a 2.4 GHz, 11-channel signal generator. Called the AirSleuth Pro and AirHorn (respectively), these products are designed for technicians that install, test, troubleshoot, analyze and optimize 2.4 GHz remote-control equipment and wireless networks.

The AirSleuth Pro allows the user to view 802.11 Wi-Fi channels 1 through 11 individually or simultaneously with Peak, Average and Raw trace modes. There are 10 diagnostic modes including Traces, Spectrogram, Channel Time Course, Differential Channels and Pie Charting.

Working independently or in conjunction with AirSleuth Pro is AirHorn, a 2.4 GHz ISM band signal generator that can be selectively set to generate RF signals for any number of the 11, 2.4 GHz Wi-Fi channels.

PRICE: \$395, \$135, \$499 (AirSleuth Pro, AirHorn software application, or both, respectively)

Chicago's Wise Fool's Pub owners Chris Perry and Big Bill Vance recently undertook a total upgrade on the club's audio system with local installers, Frequency Audio.

Designer Nathan Short chose premium components for Wise Fool's makeover, including the first Martin Audio Blackline F12+ speakers installed in the U.S., and Dual 18 Subs, QSC amplification and an APB-DynaSonics ProRack House console.

For the new Audio RemoteAmp Blue wireless headphone amplifier, JK audio combines Bluetooth Wireless Technology with professional audio electronics in a new belt pack design. RemoteAmp Blue allows IFB monitoring through a cell phone equipped with Bluetooth Wireless Technology. This is a listen-only connection designed for voice IFB or full bandwidth stereo music listening. I/O includes XLR line level, 3.5mm TRS line level, 3.5mm mono headphone, 1/4" stereo headphone.

Martin Audio's family of ceiling speakers has been granted a UL2043 listing. This designates that the C4.8T, C6.8T and C8.1T have been tested in accordance with the standard governing fire tests for heat and visible smoke release for discrete products and their accessories installed in air handling spaces, and fully comply.

Roland released new software for its RSS M-400 V-Mixer digital console. The Version 1.5 update contains a number of features including increased flexibility in compressor and gate assignment, addition of eight matrices, direct channel output assignment for increased flexibility when using personal mixing systems and recording splits, Tap Tempo for delay settings, addition of numerous shortcuts for faster access and rapid setup, and numerous user interface enhancements for accelerated workflow and ease of use.

IN THE CONSOLE OR IN THE RACK

by Roger Williams III

Atlas Sound PA702 Power Amplifier

The PA702 lends itself to a myriad of installed audio applications.

Atlas sound has been in the commercial audio product manufacturing business since 1934. Best known to sound reinforcement companies for their rugged microphone stands and horn speakers, they are almost a one-stop shop for just about anything needed by the installer — from volume controls to ceiling mount speakers, power distribution and rack cabinets. Every Atlas dealer is familiar with their product binder — about as thick as a phone book, testifying to the enormity of their product line.

FEATURES

I was sent their new compact power amplifier, the PA702, to evaluate. The amplifier is a two-channel unit offering 70 watts per channel at eight ohms. It has a unique design facility that allows the installer to affix the amplifier to a video projector mount pole, making it attractive as zone localized audio reinforcement for audio-follows-video applications. Another useful feature is a current sensing circuit which senses current draw from an always on AC outlet on the PA702. When a projector plugged into this outlet is powered up it automatically turns on the power amplifier, turning this into a

one-button operation. Or, by reconfiguring the rear mounted dip switches you can activate the audio signal sensor circuit, which similarly will “wake up” the amplifier from sleep mode.

When I mentioned the unit is compact, at 8.5-inch wide by 13.5-inch deep by 1.75-inch high, you can fit two side-by-side on a single (optional) rack shelf. The “BASH” amplifier design incorporates a switching

pole mount that facilitates the clamping assembly is located.

IN USE

I recently had a project that required localized distributed sound for a classroom video projector. After specifying the ceiling speakers and installing them, I endeavored to attach the PA702 to a Chief RPA-U projector mount, which would ultimately hold a Panasonic PT-L780NTU projector. The Chief mount affixes to an industry standard 1.5” O.D. pole. Unfortunately, the adapter included with the

amplifier tightens to 1.75-inches maximum, so I had to fashion a bushing that would allow me to snugly hold the PA702. I interfaced the projector to activate the audio sensing circuit, thus turning on the PA702 when the class played a DVD through the system. This gave the operator one button operation, with no need to turn on and off the amplifier. The amp’s small footprint was a natural fit between the projector and the ceiling. And the

The amp’s small footprint was a natural fit between the projector and the ceiling

power supply and class AB output stage, greatly increasing efficiency, thus enabling higher power output in a smaller package.

A look at the front panel of the PA702 reveals recessed screwdriver adjustable left and right channel gain controls, treble and bass controls, left and right channel signal indicator LEDs, limiter LED, power indicator LED and power switch. The back panel has IEC AC power line receptacle with integrated mains fuse holder, un-switched Edison style AC outlet, left and right unbalanced RCA input connectors, left and right balanced Phoenix input connector, left and right Phoenix speaker connector, dip switches for activating the above mentioned turn-on options as well as stereo-mono input selection and high pass filter, and audio/AC sensing attenuators. On the top of the unit you will see a recessed 2-inch hole, which completely passes through the unit. This is where the

recessed screwdriver adjustable volume controls kept twiddling fingers at bay.

SUMMARY

I found that the amplifier had good sonic qualities and ample headroom to drive the four 8-inch coaxials. I would like to see an adapter that would allow the PA702 to be mounted to a typical 1 and 3/8” diameter speaker tripod; it has enough power to drive a small pair of two-way box speakers, which would make it handy for rentals. It certainly is put together solidly enough to handle rental abuse. At an affordable \$332 manufacturer’s suggested retail, the PA702 is a great niche product that lends itself to a myriad of applications.

Roger Williams is a systems designer for Waveco, Inc., in the Philadelphia area and is a regular contributor to PAR.

Cover Story:

By Mel Lambert

A New Prudential Center for Newark

The Prudential Center in Newark was formally unveiled last Fall as the Tri-State's first major entertainment venue to be opened in 25 years. The new sports and multi-function entertainment venue, which cost a reported \$600 million and provides seating for more than 20,000 patrons, serves as a new home for the NHL's New Jersey Devils and the Seton Hall Pirates basketball team, as well as hosting MISL indoor soccer, concerts, family shows and other special events. The venue is managed by AEG Live and showcases 76 luxury suites, 2,200 club seats and an array of amenities. Overall design of the sound and video systems, scoreboard and acoustics treatment for the Prudential Center was the responsibility of Dallas- and San Antonio-based Wrightson, Johnson, Haddon & Williams/WJHW, Inc. under the direction of Project Consultant Kevin Day. Primary audio contactor on the project was Diversified Systems, with Andy Prager serving as Senior Project Engineer.

A GRAND OPENING

The new venue opened officially in late-October with a 10-night concert series headlined by hometown favorites Bon Jovi, plus guests My Chemical Romance, Big & Rich, Gretchen Wilson, All-American Rejects and Chris Daughtry. The opening-week concert series attracted more than 150,000 fans. "It was a double honor to be part of the opening of the Prudential Center," Chris Daughtry conceded, "and to perform with New Jersey's very own Bon Jovi." On October 27, the New Jersey Devils played their first hockey game at the arena against the Ottawa Senators.

"We worked closely from Wrightson, Johnson, Haddon & Williams' intricate

designs," Diversified Systems' Prager recalls. "WJHW routinely handles the design of large stadiums and knows this type of indoor environment very well, from both an audio and a video standpoint. The comprehensive design was predicated on WJHW's extensive experience; they can create systems that are known to work in spaces like the Prudential Center. In essence, the new sound system is primarily designed for speech: commentaries and announcements during the various hockey, basketball and soccer games played at the arena. But it is also designed to accommodate sound reinforcement systems that might be brought in by visiting musical acts."

JBL PD SERIES FOR MAIN SOUND SYSTEM

The primary sound system at the Prudential Center comprises four virtually identical clusters that are mounted just above and outside the footprint of the center-hung video/scoring display, and whose cabinets can be controlled individually via a cross point matrix/routing system and amplifier racks. The East and West clusters comprise 10 JBL Precision Directivity (PD) Series PD743 Mid/High-Frequency cabinets with a 40x30-degree dispersion pattern; four PD7164 LF Cabinets; and six ASB6128 Subwoofers mounted above. "The North and South clusters are identical to these," Prager says, "aside from [featuring] eight rather than 10 PD743 cabinets, plus an additional pair of down-firing PD764 60x-by-40 cabinets."

The PD743 Precision Directivity Mid/High Frequency Coaxial cabinet houses a pair of large-format 2430H HF drivers with IFS Interference Free Summation, dual 2250J eight-inch MF drivers; dispersion is said to be well controlled to below 400 Hz,

with a quoted 150 Hz to 16 kHz frequency range and maximum SPL capability of 139 dB continuous, 145 peak. The PD764 is physically and electronically the same as the PD743 but with a 60x40-degree coverage pattern. The PD7164 mid/low-frequency cabinet incorporate six, 14-inch drivers, while the ASB6128 Applied Engineering high-power subwoofers feature two 18-inch 2242H SVG drivers with four-inch voice coils that offer a quoted frequency range (-10 dB) of 28 Hz to 1 kHz and 35 Hz to 1 kHz, ±3 dB, plus an AES transducer power rating of 2.4 kW (9.6 kW, peak) for two hours.

To augment the main scoreboard clusters, WJHW specified a total of three discrete delay rings. "The first ring is suspended off the bottom of the catwalk," Prager offers, "and consists of a total of 24 Model PD5212/64 two-way full-range cabinets. The second ring com-

Audio Engineer Tim Wick at Yamaha M7CL48 Digital Production console.

prises 27 Community CLOUD Model 12-66 two-way, full-range coaxial loudspeakers flush-mounted in the upper-deck ceiling tiles, while the third ring comprises 36 Model 12-66T speakers for the main concession areas on a 70-volt line." The first ring is delayed between 80 and 100 mS against the main cluster, the second ring 122 mS and the third ring 84 mS. The PD5212/64 cabinet features a horn-loaded 12-inch M222-8A LF driver with a 60x40-degree coverage pattern, plus a large-format 2451H-1 Neodymium HF driver; quoted frequency range is 80 Hz to 18 kHz. The CLOUD 12-66 features a single 12-inch cast-

frame LF driver and a one-inch compression driver mounted on a coaxially-mounted 60x60 pattern control horn.

CROWN CT SERIES AND I-TECH AMPLIFIERS ON HIQNET NETWORK

"A total of 126 CT Series amplifiers equipped with PIP-Lite cards and I-Tech amplifiers are being used at Prudential Center," Prager continues. "The Crown systems sound remarkably good and have been 100 percent reliable."

"Crown products were one of two brands specified to set up a competitive-bid scenario," recalls WJHW's Project Consultant Kevin Day. "To reduce cable runs - and avoid the need for a dedicated cooling system, as would be required if the amps were in a closet - the amplifiers are located on a catwalk platform. Bradford Benn from Crown came out to set up the system and stayed for the opening events providing technical support for the installer and operator." Chris Williams served as the WJHW's Project Manager, and designed the scoring and video production systems.

"For each of the four JBL-equipped clusters," Prager explains, "we supplied a total of four I-Tech 4000s for the low-frequency and three 4000s for the subwoofer cabinets, while five CTs2000s feed the mid-range and five CTs600s the HF cabinets." A rack of seven CTs2000 amplifiers power Delay Ring #1, with seven CTs1200 amplifiers for Delay Ring #2; five CTs3000 Series amplifiers power Delay Ring #3, while CTs600, -1200 and 2000 Series power various full-range loudspeakers located within bars, lounges, meeting rooms and other locations around the arena.

YAMAHA M7CL48 AT FOH AND PEAVEY MEDIAMATRIX DSP

A 48-channel Yamaha M7CL48 Digital Production Console handles front-of-house mixing chores at the venue. Three Yamaha CobraNet cards provide direct digital out-

tion Console.

The North and South speaker clusters feature eight JBL PD743 cabinets, plus an additional pair of down-firing PD764 cabinets.

Crown International CT Series and I-Tech amplifiers on catwalk platform.

PRUDENTIAL CENTER Continued From Page 41

puts from the FOH mixer to a comprehensive Peavey MediaMatrix NION-based DSP that handles system routing and signal processing. All of the Crown amplifiers also connect to the Media Matrix system via a CobraNet 1 Gbit Ethernet network. The sound-reinforcement system is run in mono.

Crown I-Tech Series power amplifiers feature integrated DSP, peak-voltage and RMS power limiting to protect connected loudspeakers, in addition to remote monitoring and control via integral Harman HiQnet, plus a front-panel LCD readout that provides diagnostics plus preset selection for fast and easy system setup. "Remote control and monitoring of all of the amplifier channels via HiQnet is a great bonus," stresses Prager. "Using a [Crown-developed] GUI we can set input and output levels and turn groups of amplification on and off. During different events at the Prudential Center, the owners might decide to run different PA configurations, dependent upon the audience size and location within the space. With either of the two redundant control PCs – one at the sound-mixing location and the other within the equipment racks – an operator

WJHW Project Consultant Kevin Day testing the PA announcer's microphone.

can monitor and verify amplifier status for any system re-configuration within seconds." The PIP Lite add-on card provides HiQnet control/monitoring for CTs Series amplifiers via IQ Network and IQwic software.

And there is another benefit of remote monitoring, the project engineer adds. "Aside from checking input and output levels via HiQnet, the operators can monitor load and thermal

BSS Soundweb and Dolby Lake loudspeaker controllers.

conditions – and see error-reporting messages – which mean that they can be alerted when a loudspeaker is removed from the system. While loudspeaker theft isn't foreseen as a major problem, it's a very useful feature!" HiQnet is available on a number of amplifiers, signal processors, loudspeaker controllers, wireless microphones and consoles; it was developed by the Harman Pro Group System Development and Integration Group (SDIG), based in Salt Lake City, UT.

All audio-system routing, equalization, delay and metering are handled by the facility's multi-element MediaMatrix. "The MediaMatrix control system is distributed throughout the Prudential Center," Prager continues, "with chassis located close to sound-critical areas. There are six units in the catwalk adjacent to the amplifier racks; two in the Sound Control room; one in the Fiber Core main rack; and one in each of the tech-

sE
SOUND ENGINEERING

I am incredibly impressed by the seemingly contradictory combination of warmth, crispness and definition that was captured by the **sE Gemini**. It was a beautiful, natural sound - we didn't even use any eq.

Don Was
Rolling Stones, Bob Dylan, Elton John

www.sonicus.net

Emerging producers and studio legends alike are setting aside their classic tools for sE's award-winning product line. Whether it be the dual-tube Gemini or the innovative Reflexion Filter, sE delivers the results that discerning ears demand.

nical areas supplying audio to the bars, clubs and meeting rooms."

In addition, a separate Hockey Fill system comprises 10 JBL Model 2447H HF compression drivers on Model 2352 90x50-degree large-format horns and six JBL AM6212/64 60x40-degree cabinets mounted on the score board. "The arena system is designed to run in a series of operational modes controlled by the central MediaMatrix system," Prager explains. "For Hockey Mode, these additional horns and AM Series cabinets provide additional sound coverage for the outer perimeter just behind the Dasher Boards, to overcome shadowing of the main clusters. Its purpose is to enhance on-axis coverage to the second and third seating rows."

Currently, the Prudential Center is set up to provide a total of five preset modes via MediaMatrix. In addition to Hockey Mode, Basketball, Indoor Soccer, Concert and Floor Show Modes are available, with corresponding loudspeaker re-assignments and delays. "For large concert events," Prager explains, "there is provision for a dedicated south stage area and [rigging for] suspended line arrays from a

touring sound company, for example. The house system can accept a mono feed from the visiting front-of-house mixer, which is then distributed under Concert Mode to Delay Ring #1 to add presence. Of course, the delay settings are adjusted because of the different timing references to the suspended PA system."

INSTALLATION CHALLENGES

Regarding the biggest challenges faced during the commissioning of Prudential Center's Crown-powered JBL systems, Prager cites three main dimensions. "Firstly, we had a short time to complete the installation," he recalls. "We started in April 2007, and the opening concert occurred just seven short months later. Secondly, we had specified a fast 1 Gbit Ethernet fiber system between the MediaMatrix and amplifier racks that needed to be wrung out and fully functional by the first event, including four V-LAN topologies to be set up and programmed. Thirdly, we faced some logistical problems due to construction delays. We were promised a broom-clean room for the sound equipment, which [because of time pressures] was not always possible!"

MISSION ACCOMPLISHED

According to Prudential Center Audio Engineer Tom Wick, who mixes sound for a variety of sports events, "From turn on, everything sounded great! The new PA system gives a good feel to the arena; having walked the space, the overall sound is outstanding in every seat – I couldn't find a dead spot anywhere. The sound is warm with no slap back. Diversified Systems did an exceptional job during the installation. The various modes we have available from the MediaMatrix are outstanding – we can re-configure the entire system at the touch of a button. For high-end concerts the customized delay ring for the upper areas is very useful, as is coverage of the various concourse, suites and other areas around the arena. All in all, our new system is well thought out, and extremely easy to use."

Acoustics, Art, and Business At Home

It is not news that home-based studios now dominate the business of pro audio. Yet, on a regular basis, I find myself surprised and impressed by the large percentage of residential recording rigs used to record commercially successful and/or especially notable singles in this, the late 00s.

Why should I be surprised? Since I was a wee pro audio type, I was encouraged to believe that a proper recording environment (on pricey commercial property) combined with all the correct and incredibly esoteric choices in gear comprised truly great albums and singles. Yet today, late in the new millennium, such an audio production mindset is largely sentimental, progressively wrong and, at worst, stings of elitism.

Interestingly enough, the task of compiling the monthly PAR column 'Single Slice' has been my continued education in the possibilities of audio production excellence in the home, or what is primarily residential space. My 'teachers' are each and every producer, engineer, mixer, or mastering engineer that I interview regarding his or her own work.

More and more, these professionals are working in their own home facilities, if not for most of the project, for a substantial part of it. Yes, they often work in the largest and loveliest commercial studios, too — but even the biggest major label budgets can't squelch the appeal of, for instance, doing vocal ODs, or at least their subsequent edits, at home in boxer shorts. For example, could producer Howard Benson have edited Chris Daughtry's vocal tracks anywhere ['Single Slice,' PAR March 2007]? Sure. But he chose to do a great deal of that work at home. (No idea about the boxer shorts scenario — I didn't ask.)

LIFESTYLES OF THE RICH (AND NO-SO RICH) AND FAMOUS (AND NOT-SO FAMOUS)

Our industry's many tracking to mixing (and, often, mastering) businesses are generally owned by one pro who works full time as a producer of audio content. As such, their facilities do not have to be elaborate, as they exist to serve the needs of one primary user, themselves. Most of these production spaces are in residential

Appropriately, Daughtry's self-titled debut featuring the hit single 'Home' features Pro Tools editing work largely done at the home of prolific, commercially-successful producer Howard Benson.

rooms — alongside, underneath, or over typical living space where owners live, eat, sleep, and pay bills ... even raise kids and pets.

Our growing community of 'home pros' create their own creative and capitalistic synergy in their non-traditional, 'post-storefront' world. In essence, this new biz model allows the rich and the not-so rich, and the famous and the not-so famous to comfortably coexist within this dramatically broadening 'singles' audio market of ours.

IT JUST MAKES SENSE

If 2008 is good for anything so far, it is the best year ever to work as an audio pro from home. Here in America, last time I filled up my car with fuel, it cost me nearly \$4 a gallon. Conversely, high-speed Internet for a month costs the same as my full tank of gas (and I drive a small car). Further, cheap national and international phone plans abound. I can even buy new, cool audio gear for my rig without waiting for, or paying for, physical shipping (i.e. plug-in direct downloads)! Then, of course, there are the alluring tax benefits for homeowners who have a 'home office' (which is all I will say here as, personally speaking, quarterly payments to the IRS is more than plenty of involvement with this particular government agency).

So where do you really need to go to be a pro in 2008? Possibly nowhere. If my personal habitat is conducive to live instrument tracking, other artists and musicians will visit so I can record and produce them. In turn, I can reach out, too. For instance, I can roll a modest location rig to live gigs and particularly desirable acoustic environments where musicians do their thing ... and then roll back home to work on the tracks. If my home spot is conducive to mixing or mastering, and I have the skills, clients can provide their tracks via FTP; in turn, I provide complete mixes and masters to them ... all without burning a single ounce of gasoline.

BUT DON'T BE A TREE FALLING IN THE FOREST

For all the gas you can save as a home-based audio pro in 2008, getting yourself out to local gigs should be even easier. That's where you'll find your peers as well as new gigs and become more familiar with local talent while enjoying some live music.

Along with being present in the local music scene, attending pro audio conventions as well as state, city/metro, and collegiate-sponsored musical events (many of which are free to attend) are also good ways to keep up with the aural happenings (and production possibilities) around you.

Finally, don't forget to try to play in a band yourself, or at least work directly with performing musicians, as 'actually doing it' is the most direct way to encourage continued artistic production.

A IS FOR ACOUSTICS

While home spaces may be replacing the traditional studio storefront, little can replace or truthfully model the 'good sounding room.'

As this fact weighed on my mind, I

back, examined the place where I spend hours a day listening to audio, and decided that it's not a new a mic, pre-amp, console, or DAW that I need most — it's a better sounding environment.

So where do you really need to go to be a pro in 2008? Possibly nowhere. If my personal habitat is conducive to live instrument tracking, other artists and musicians will visit so I can record and produce them.

recently decided to start fresh from the beginning, continuing my investment in pro audio alphabetically ... and, in my book, 'a' stands for acoustics. For my own aural creation space, I've decided to try to make it acoustically the best it can be for what I can reasonably afford. I just stepped

As my close tree-hugging friends like to advise, 'think globally, act locally.' And nothing is more 'local' than home.

Digital Networking: Standards for Live and Installed Applications

A

analog versus digital' is a topic amongst pro audio professionals that will probably never go away. After all, audio signal must be analog in order for us to

hear it, thus most of us aren't naturally fond of ones and zeros as we are 'the real thing.' However, there's no debating that digitally networked audio within long, complicated signal chains can dramatically improve both hardware, and human, efficiency.

Digitally networked audio can very noticeably improve the overall sound quality of larger, more complicated systems, too; one simple analog-to-digital signal conversion means that a now-digital signal is suddenly impervious to change. Based on the quality of the conversion point, this audio at your FOH's main outputs, for example, is exactly what will be there at the end of the line when it ultimately hits a D/A converter before amplification and loudspeakers. This can be considered a joy of 'lossless audio.'

Finally — and what most digital network users, installers, and financiers would agree is a most important factor — a head-spinning amount of discrete signals can be delivered in comparatively miniscule bandwidth rather than through traditional (heavy, expensive, and hard-to-upsize) analog copper-based audio distribution systems.

For these and other reasons, digital audio networks have become an aspiration in nearly every corner of pro audio — and, rather quickly, a norm. For sophisticated installed and live audio networks, going digital rather

than going in and out of analog devices — requiring more conversion for necessary equalization, compression/limiting, feedback suppression, electronic crossover, etc. — makes for easy and nearly-finalized audio for any audience. Thus, sophisticated installed audio systems are now largely digital.

Manufacturers of digital audio distribution products have gone a long way to reduce headaches for pro audio types and end users; if it is configured, implemented, and explained to the user correctly, it just works (so head's up, installers). Sure, the engineer holding the aural reins still must use his ears to provide just the right mix for the gig. But in a digitally networked system, whatever's on channel 32, for example, will get there as intended: cruising on that unrestricted, well-protected virtual highway that high-resolution digital audio via Ethernet — and increasingly, fiber optics — can provide.

PROTOCOLS AND STANDARDS

Here are the most common protocols for installed and networked digital audio systems:

-AES50: Last year, Klark-Teknik purchased rights to SuperMAC and HyperMAC audio networking technology, previously owned by Sony Oxford. SuperMAC technology is the basis of AES standard "AES50-2005 for high-

res multichannel audio interconnection. SuperMAC offers up to 48 channels bi-directionally over CAT5, while HyperMAC offers up to 384 channels bi-directionally over CAT5/6, or fibre.

Currently, K-T promotes the use of AES50, SuperMAC and HyperMAC; SuperMAC and HyperMAC are used extensively within the Midas XL8 digital mixing console.

-A-Net Pro: Aviom's network audio protocol combines bidirectional audio with virtual data cables for control purposes. It is based on the physical layer of Ethernet, so it uses familiar CAT-5e cables and RJ-456 connectors. A-Net Pro comes in two Series variants: Pro 16 and Pro 64. Aviom's Pro 16 Series hardware is designed to be 'plug and play' for simplified setup and configuration; Pro 64 adds features for higher-end installs, such

as higher channel counts and sample rates, integrated control data (remote mic pre and network management), and the Aviom's Virtual Data Cables for distributing user control data. Aviom's ideas are catching on; I/O cards for Yamaha digital consoles have been enthusiastically received by the industry, and, in January of this year, the Aviom announced a partnership with Digidesign led to the ANO A-Net Output Card, an option for the VENUE Stage Rack.

-CobraNet: A longstanding protocol developed by Cirrus Logic and presently licensed nearly every pro audio manufacturer you could name — Crest Audio, Bosch companies (Dynacord, Electro-Voice, Midas, Telex, et al), Harman companies (BSS Audio, Crown, dbx Professional, JBL Professional, et al), Mackie, Peavey (for their MediaMatrix brand), QSC, Rane, Yamaha, etc., etc. — the widespread appeal of CobraNet is simple; offers Cirrus-Logic, "Regardless of the product's manufacturer, all products using CobraNet version 2.0 are compatible with one another. All products are capable of receiving software upgrades, and will therefore continue to be compatible as features are added to the CobraNet protocol."

Aphex Anaconda™

Everything a Snake Should Be

- **Open architecture**
Uses world-standard ADAT® I/O
- **Lowest latency**
42 microseconds, plus the speed of light
- **Redundancy and reliability**
Redundant fiber runs and power supplies
- **Absolute electrical isolation**
No noise, no hum, no buzz, no ground loops
- **Distance**
1.25 miles (multimode), 10 miles (single mode)
- **Complete system solution**
1788A Remote Mic Pre; 141 D/A; 142 A/D; 144 AES/ADAT
- **Splits**
Model 824 Distribution Hub adds four transmitters
- **Word Clock distribution and stability**
Eight BNC outputs, less than 1 nanosecond jitter
- **Most cost effective fiber snake**

No other snake offers the advantages of the **Aphex Model 828 Anaconda™** 64 Channel Bidirectional Digital Snake. It's the most reliable, most versatile, and easiest-to-use method of signal transport, while remaining the most affordable choice available. Find out why it was selected as the most outstanding pro product of NAMM 2008 by Live Sound International... contact your authorized Aphex dealer today!

APHEX

See us at InfoCOMM C4369

-Dante: A new digital audio networking technology by Australian firm Audinate, Dante is compatible with standard Internet Protocols — not just Ethernet — with no compromises in performance, assures Audinate.

Features include sample-accurate synchronization and low latency. Dolby/Lake and Lab Gruppen are among the licensees of this technology.

-EtherSound: The creation of French firm Digigram, EtherSound uses current 100

Base-T Ethernet hardware to provide bi-directional transmission of up to 64 channels of 24-bit digital audio at 48 kHz (or 32 channels at 96 kHz), plus bi-directional control/monitoring data. Like protocol competitor CobraNet, EtherSound

has a host of well-known licensees, such as Allen & Heath, Focusrite Audio Engineering, InnovaSON, Klein + Hummel, L-Acoustics, Martin Audio, NetCIRA by Fostex, Nexo, Peavey Electronics Corporation, Whirlwind, XTA Electronics; Yamaha, and others.

-HiQnet: Harman's own HiQnet, a plug-and-play system shares characteristics of both industry-wide, shared protocols and tightly grasped technology, as it uses CobraNet to transport audio, but the Harman Pro System Architect, a comprehensive core PC application, to control every detail component of a detailed, intelligent signal chain. It's a perfect solution to those who will have a system comprised of Harman-badged gear: AKG, BSS, Crown, dbx, JBL, Lexicon, Soundcraft, and Studer.

-REAC: Designed by and for RSS by Roland, REAC (Roland Ethernet Audio Communication) technology is designed to act as a 'plug and play' system for its associated brands. Up to 40 channels of 24-bit/96kHz audio, plus MIDI and remote control data, are part of the REAC stream.

-U-Net: Mackie's proprietary protocol was designed to transfer 32 channels at 96 kHz and control data in the midst of its own products such as the TT24 digital desk and DS3232 digital snake.

TYING IT ALL TOGETHER: THE DIGITAL SNAKE

In the midst of various protocols, standards, and processing methods, key manufacturers build the physical connections

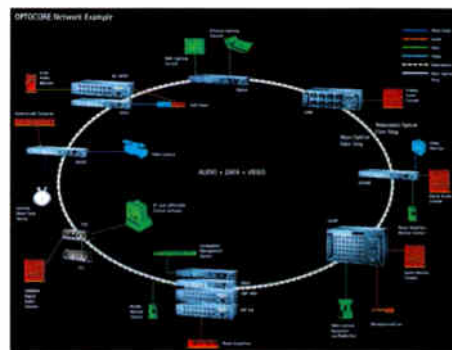

that make digital audio networks work. These system builders offer freestanding products for getting digital signal here to there in interesting ways. Relatively new manufacturers such as Media Numerics have developed their own special take on trafficking signal via CAT5 with its road-worthy RockNet system, while 'legacy' cable manufacturers such as Whirlwind have jumped into the deep end of CAT5 networking as well, offering such gear as their E-Snake.

A particularly hot subcategory in digital network products is fibre optic snakes. Companies such as Aphex, LightViper by Fiberplex, and Optocore offer products varying in features and components, yet each are based upon providing lightweight fibre optic cable runs with comprehensive, flexible I/O options.

WHAT'S RIGHT FOR YOU?

Jumping into digitally networked audio is a process chock full of key decisions and hopefully, the fundamental information provided here can be a good start for further investigation by networking newbies. Meanwhile, stay tuned to *Pro Audio Review* stream.

and sister publication *Pro Sound News* for reviews of digital network-associated gear and systems, and crucial protocol advancements, product releases, and associated announcements, respectively.

NEW PRODUCTS

APB-DYNASONICS ProDesk-4 Small Format Console

Available in 16, 24, 32, 40 and 48 mono mic/line input channels, the APB-Dynasonics ProDesk-4 includes 4 Stereo Line Only input channels, each selectable from two different input sources and controlled from 100mm faders with stereo EQ and access to all aux buses. All mono input channels also include internally illuminated Mute and PFL switches, 6 segment channel metering, 48 Volt Phantom Power switch

with LED, mic/line, Pad and Polarity Reverse switches. The ProDesk-4 input channels are similar to those used on ProRack mixers, while the cosmetics are identical to Spectra consoles.

At the heart of ProDesk-4 is APB's acclaimed wide bandwidth circuitry, most noticeable in the microphone preamps, EQ, and summing amplifier and output sonic performance. A solid mechanical structure designed to endure tough road conditions protects the electronic circuitry and provides a comfortable but solid work surface.

PRICE: \$7,400 to \$13,800 (16 to 48 mono mic/line input channels)

Yamaha Commercial Audio Systems has announced the availability of the Nexo RS15 low-profile, high-output, modular, scalable bass cabinet. The first in the RS (Ray Sub) Series, the RS15 is reportedly capable of operating in both omni-directional and cardioid modes. Comprised of a 15-inch

transducer with a frequency response of 35 Hz-200 Hz in omni or 35 Hz-150 Hz in directional mode and a sensitivity of 105 dB SPL, the RS15 is targeted for system installations and touring requirements.

Martin Audio's new W8VDQ compact, three-way system combines line array and differential dispersion technologies to provide an advanced solution for even coverage over wide angles and throw distances. The system has been designed to provide a short-throw horizontal dispersion of 120°, narrowing to 100° as the throw increases. The vertical differential directivity (VDQ) creates progressively more HF output as throw distance increases. The resulting dispersion pattern is ideally suited to covering audiences located on flat, or gradually sloping surfaces.

Danley Sound Labs is introducing the SH-46 Synergy Horn, a 40 x 60-degree dispersion pattern speaker offering very high-output capability with ultra high-fidelity. This latest addition to the company's Synergy Horn product line is designed to be operated vertically or horizontally and may be configured standalone or in an array.

The SH-46 handles 1,400 watts RMS of power and has a sensitivity of 106dB. Frequency response is 70Hz - 15kHz (+/-4dB, using two or more cabinets). The braced Baltic birch enclosure measures 29 inches high by 22.5 inches wide and 22.75 inches deep and weighs 105 pounds.

WorldWideLine

WideLine™ line array system solutions from QSC Audio offer an innovative approach to creating and programming system tunings that produce amazing accuracy when combined with our SC-28 system controller. The flexibility and rich GUI environment of networked QSCControl.net™ processors and, lest we forget, no WideLine system would be complete without QSC's PL380, the "ultimate" Class D amplifier.

Heil Sound PR-22 handheld microphone

The latest from Heil maintains the great clarity of the PR-20 with reduced handling noise.

Best known for the Peter Frampton talk box and live quadraphonic sound for The Who, Bob Heil is always coming up with innovative products for the music industry. One of Heil's most recent products is the PR-22 dynamic microphone — essentially an improvement made to his PR-20 dynamic vocal microphone.

| FEATURES

The PR-22 is very similar to the PR-20 in many ways, including the cardioid pick up pattern and precise phase plug. It has a very flat response with a slight boost in the midrange around 3.15kHz.

The flat response of the PR-22's predecessor, the PR-20, led to its Achilles heel: handling noise. Handling noise is created when putting the mic into a mic clip, rubbing the outside, tapping the mic, etc. Other manufacturers solved this problem by rolling off the frequency response around 125 Hz and disregarding the lowest octave.

According to Heil, his company decided to keep that last octave, and looked hard to

find a solution to this problem. They found it in foam used in ceiling fans called Sorbothane. This foam isolates the mic element from the body of the mic, reducing dreaded handling noise. This improvement created the PR-22.

| IN USE

I opened up the large leatherette case. I found the mic, two additional metal windcreens in gold and black, a mic clip, and a foam windscreen. I questioned, "Why the extra metal windscreens? Did they change the pickup pattern? Were they just for show?"

An e-mail to Bob Heil and a prompt phone call back from Bob determined that they were indeed for the Easter Egg colorer in all of us. I quote Bob Heil when I say, "When you're in 'Vegas, you use the gold one."

The PR-22 was initially tested through headphones, a monitor wedge, and a speaker that was set up about 30 feet away. The mic was A/B tested against many microphones in our inventory. It was also tested at a couple of corporate shows with bands.

Overall, I was impressed with the sound of the microphone. It had a smoother low end than a Shure SM-58 and a clarity that I couldn't get out of any of the mics in my shop's wardrobe,

especially in the low/mid range. The closest match in clarity came from an EV RE-20, which is much more expensive, and not very practical for live vocal use. The mighty SM-57 seemed to have a similar frequency response, except — once again — the clarity of the low/mid wasn't there.

In the live shows, I found the vocals were clean and very natural sounding. The crew on the show was impressed by its intelligibility. I did find that the PR-22 had better feedback rejection if stage monitors were placed off axis from the mic. I also discovered the PR-22 tended to feedback in the monitor before most other mics did. It took considerably more work to EQ the wedge to get the vocal to a high SPL. Because of this I wouldn't consider the mic for loud stage volumes. It would be better, in my opinion, for in-ear monitors.

I found that Heil Sound's claim of reduced proximity effect was also true in comparison to other microphones. The PR-22 lost some low end, but did not get as thin and tinny sounding as other comparable mics. Not only that, but it was discovered that this microphone would be a good choice for artists who like to "cup" the mic. I found the response of the mic didn't get

honky like other mics — unless you covered the flat top of the windscreen.

Handling noise was a big issue with the PR-20, and I wanted to know how the PR-22 compared to other mics I had on hand. When I listened to the PR-22 in headphones, I heard more handling noise than in a Shure SM-58. In speakers, however, the difference between the two was barely audible. I can't comment on the claims that PR-22 exhibited less handling noise since I did not have one in hand. But during one show, the PR-22 was passed from one person to another, and there was barely any handling noise — except when the mic was pulled from the stand.

The durability of the PR-22 was questioned because the grip of the mic seemed to slip through my hand, and the overly thick case made me question its ability to hold up to the rigors of the road. But in my own 'drop durability test,' the mic was dropped onto the cement floor several times from varying levels and positions, and the mic performed flawlessly after each drop. Seems durable to me.

| SUMMARY

Overall, I was impressed with the Heil

PRODUCTPOINTS

- Frequency response
- Exceptional clarity
- Reduced proximity effect

- Gain before feedback

SCORE

The PR-22 maintains the great clarity of the PR-20 with reduced handling noise.

PR22. Yes, this mic is a few dollars more than your industry standard live vocal mic, but for this price you get the improved performance and intelligibility of mics costing much more.

NEUTRIK ConvertiCon Unisex XLR Connector

In direct response to high professional and consumer demand, Neutrik designer and manufacturer of the XX series XLR cable connector, has officially introduced the world's first unisex 3-pin XLR connector, ConvertCon. ConvertCon (NC3FM-C) is a new 3-pin male and female cable connector in a single housing also available with black chrome housing and gold contacts (NC3FM-C-B). By simply sliding the housing back and forth, ConvertCon is transformed from a male to female connector. This new male/female cable end XLR allows for use of one connector, as it can mate with either a male or female 3-pin XLR.

ConvertCon shares some of the features and benefits of Neutrik's best-selling XLR XX series.

ConvertCon also features an improved chuck type strain relief that provides higher pull-out force and makes assembly easier and faster.

"Sure, plug-ins are okay," offers prolific music-scoring mixer Alan Meyerson, "but I need a world-class external reverb for creating realistic-sounding ambiences and reverberant spaces for my motion-picture soundtracks. As soon as I heard the new Bricasti Model 7 I knew that I had found what I was looking for. I'm so impressed with this powerful unit that I ended up purchasing a total of six Model 7 Stereo Reverb Processors. They sound amazing!"

The aforementioned Meyerson has also recently utilized Eventide's Anthology II TDM Plug-ins bundle on the soundtrack of 'Iron Man' starring Robert Downey, Jr. The largely rock soundtrack for the film was mixed at Hans Zimmer's Remote Control Studios, where Meyerson reportedly used the plug-ins to create a live feel.

Prism Sound has announced an important upgrade to its multi-channel Orpheus FireWire computer interface, a 1U, 19-inch rack-mount 192kHz-capable unit. The new upgrade enables Orpheus users to convert their audio inputs to ADAT outputs, and vice versa. This substantially improves the unit's stand-alone capabilities by allowing users to connect directly to a variety of digital audio workstations, including Pro Tools LE. Orpheus units with the new upgrade incorporate an AV/C model that behaves as ADAT Send & Return, but also works when the Firewire cable is connected. This provides users operating in DAW mode with pure audio conversion.

In other Prism Sound news, following its acquisition of the business and intellectual property rights of SADiE, the company signed a License Agreement with CEDAR Audio that enables it to restart sales of CEDAR for SADiE processes. CEDAR for SADiE is a complete suite of processes optimized for cleaning audio in areas such as multi-track re-mastering, surround, post, and film soundtrack restoration. Originally introduced in 1996, the software now incorporates five processes — Declick, Decrackle, Denoise, Dethump and Retouch V3.

Samson VR88 Active Velocity Ribbon Microphone

Old-school ribbon sound in a new-school package

It's only natural that today's largely digital production environment has welcomed, and probably intensified, the resurgence of the ribbon mic. Now, an abundance of affordable ribbon models offer various degrees of sound quality, but most all budget models are saddled with the burden of requiring a very clean, high-gain mic preamp. Samson's new VR88 attacks this problem with an active output stage and throws in a number of unexpected accessories to boot.

FEATURES

The VR88 represents a sizable investment from Samson; with five years of R&D in the making, the VR88 is handcrafted and available for only limited production. This production run is accompanied by a complete set of accessories including an aluminum carrying case, yoke mount, elastic-spider suspension mount, protective sock and a premium 90-degree right-angle XLR cable.

The VR88 is an active velocity ribbon mic, featuring a 2.5-inch long, 2-micron thick, pure aluminum ribbon suspended in a neodymium-created magnetic field. The active output stage requires 48-volt phantom power and a bit of memory (as you will probably forget to engage it at first). The bidirectional VR88 handles SPL of 135 dB, has frequency response from 30Hz - 16kHz, a self-noise level of 17dB and an impedance of 200 ohms.

The VR88 lists for \$750 with the complete mic kit, but is available for \$400 - \$500 street.

IN USE

The first thing that grabbed my attention was Samson's thorough, yet brief, owner's manual. Not only did the manual provide a number of helpful mic technique suggestions, it also included a primer of sorts on the proper care and handling of ribbon mics. Studio veterans may skip this chapter, but many a

first-time ribbon owner will be (and

should be) intrigued by how careful we engineers have to be with such sensitive equipment.

The VR88 fit nicely into its yoke mount, with the help of a threaded retainer ring that more than securely held the mic. However, this yoke has parts made of plastic, so I'm a little concerned with its long-term durability. I instead opted to use the included spider-shock mount, which also used the retainer ring to amply secure the mic to the basket, but also employed some plastic parts. The shock mount may not be stellar, but it's adequate and a welcome accessory for this low price point.

I can't live without my AEA and Beyer ribbons on drum rooms, so naturally I started there. Clearly a creature of habit, the VR88's active output made me quickly reduce my preamp gain by about 20dB. The sound was unmistakably ribbon, with a delightfully emphasized bottom, an overall (compressed) smoothness dynamically and an understated, rolled off top end. Side by side with the AEA R92 (a modern, passive ribbon mic), the VR88 was a little darker, a little slower with transients and a little less "real" sounding in its soundstage. There was a certain irregularity in the mids (I suspect a bump at 350Hz-ish and a dip around 2kHz?) that, in this case, was particularly interesting! This midrange dip made the VR88 sound a little further back, but after some EQing (I inserted a HPF and my usual corrective room EQ dip at 400Hz) and extreme limiting (about 12dB) the result-

ing sound was nicely "in my face" and attention-grabbing without nasty condenser mic transients. I ended up using both ribbon mics across the whole project, blending them to taste on each song. More room "air" means less artificial reverb required ... nice.

Rather than throw the VR88 at unusual applications, I chose to apply it where a ribbon would be a typical choice and got expected results. Tambourine found the VR88 emphasizing the "thwank" of palm hits on 2 and 4 and de-emphasizing the metallic rattle of the jingles. Even if you're looking for the opposite tambo sound (bright with rattle) the VR88 can still step up; just aggressively apply a HPF around 250Hz and push up a high-end shelf at about 8k 'til it's bright enough. It may take hefty amounts of boost, but don't worry because ribbons take EQ with grace (their cushioned transients accept such boost very pleasantly).

The manual recommended apps with jazz guitar and drop-tuned, heavy-metal guitar, so I dutifully gave them a shot. The VR88 had the right tone for jazz guitar, but it just wasn't clean enough, with distortion present unless the amp was unreasonably quiet or the mic was pushed too far back into the room. The heavy guitar actually worked much better with the VR88 about a foot back, angled in

Complete Sound System Solutions by Electro-Voice

LD Systems, Houston Livestock Show & Rodeo, Reliant Stadium

Robert Ausmus, Director of Production Services,
LD Systems

"For the last five years, LD Systems has been working very closely with Electro-Voice on the rodeo audio systems, trying to raise the bar not only in terms of our capabilities, but also with regard to developing a strategic R&D relationship that raises the bar for audio in general. This relationship has proven extremely positive: we're both committed to providing the absolute best that there can be, and as a result we can up the ante every year here at the Rodeo.

This is a very large X-Line system, with a total of 108 cabinets powered by 108 RL amplifiers distributed over a 12-array zone coverage configuration, all controlled by IRIS-Net. This year we integrated NetMax N8000 processors, which added FIR filters and reduced our cabling significantly while providing us far better speaker management and control. This was the world premiere for X-Line with FIR-drive. The system has rewarded us with the absolute best results yet in our 15 years handling sound for the Rodeo. It's mind-boggling how much more presence and performance we get out of the EV system than from our former products."

ADAM AUDIO A7 Powered Monitor

FEATURES: Two-way; 6.5" carbon fiber woofer; Accelerated Ribbon Technology tweeter; twin 50W amps; front panel detented volume control; EQ controls; tweeter control; RCA/XLR inputs; magnetic shielding. Price: \$999 per pair.

CONTACT: ADAM Audio USA at 818-991-3800, www.adam-audio.com

ALESIS M1Active 320 USB Powered Monitors

FEATURES: Two-way; USB 1.1 audio interface, TRS, RCA, 1/4" and 1/8" inputs; 3" lightweight, magnetically-shielded woofer; 1" silk dome tweeter; 80Hz to 20kHz frequency response; 10W per channel RMS; 16-bit, 44.1kHz or 48kHz sampling rate D/A conversion. Price: \$199 per pair.

CONTACT: Alesis at 401-658-5760, www.alesis.com

ALTO M4A Active Studio Monitor

FEATURES: Two-way; two 4" woofers; 1" silk dome tweeter; bi-amplified with 30W HF amp and 60W LF amp; 112dB maximum SPL; shielded magnets. Price: \$219 each.

CONTACT: Alto/ART at 716-297-2920, www.altoproaudio.com

ATC SCM 300 ASL Pro Main Reference Monitors

FEATURES: Three-way; twin 15" Super Linear woofers; 3" soft dome midrange driver; 34mm dome tweeter; four-way Class A monoblock amp delivering 275W LF, 200W midrange, and 100W HF power; 121dB continuous SPL; Grounded Source Topology; several finishes. Price: \$32,250 per pair.

CONTACT: ATC/TransAudio Group at 702-365-5155, www.transaudiogroup.com

AVANT ELECTRONICS Avantone MixCubes

FEATURES: 5.25" passive full-range 8 ohm paper cone driver; high-rigidity MDF cabi-

net/baffle for low resonance; radiused corners/edges for diffraction reduction; female mic stand mount in base; magnetically shielded; powered version available. Price: \$199 per pair.

CONTACT: Avant Electronics at 909-931-9061, www.avantelectronics.com

BAG END M-6 Time Align Loudspeaker System

FEATURES: Two-way; 6" cone woofer; 1" coaxially mounted neodymium tweeter; equalizer filter @ 3.5kHz; five-way binding posts; 3/4" MDF; black textured paint finish enclosure. Price: \$2,130.

CONTACT: Bag End at 847-382-4550, www.bagend.com

BEHRINGER Truth B2030P High-Resolution Reference Monitor

FEATURES: Two-way; 6 3/4" polypropylene diaphragm LF; ferrofluid-cooled tweeter; 75Hz to 21kHz frequency response; passive design. Price: \$189 per pair.

CONTACT: Behringer at 425-672-0816, www.behringer.com

BLUE SKY International EXO Stereo Monitoring System

FEATURES: Two two-way satellites and one subwoofer; 3" woofer; 1" soft-dome tweeter for satellite; 8" woofer for sub; 35W amp per satellite; 90W amp subwoofer; desktop remote control/connection hub (XLR/TRS, RCA and 3.5mm mini jack inputs); headphone output jack. Price: \$399.

CONTACT: Blue Sky International at 516-249-1399, www.abluesky.com

DIGIDESIGN RM1 Active Reference Monitors

FEATURES: Two-way; 5.5" doped cone with cast alloy chassis; 1" fabric soft dome with ferrofluid cooling; 3kHz crossover frequency;

50Hz to 25kHz response; XLR analog and digital (AES/EBU) inputs; 24-bit/96kHz conversion rate; 111dB peak SPL at 1m. Price: \$2,498 per pair.

CONTACT: Digidesign at 650-731-6300, www.digidesign.com

DYNAUDIO ACOUSTICS BM 6A MKII Powered Analog Monitor

FEATURES: Two-way; 6.9" woofer; 1.1" soft dome tweeter; 100W LF amp; 50W HF amp; integrated positioning filters (LF/MF/HF shelving/notch); 60/80Hz high-pass filter; clip indicator LED; slow attack optical HF protection; balanced XLR input. Price: \$1,745 per pair.

CONTACT: Dynaudio Acoustics/TC Electronic at 818-665-4900, www.dynaudioacoustics.com

EQUATOR AUDIO Research Q Series Monitor

FEATURES: Two-way, Zero-Point Reference Coaxial transducers; 8" coaxial LF; 1" coaxial dome compression driver with resin-coated constant directivity horn; 38Hz to 22kHz frequency response; bi-amplified, 400W LF peak, 400W HF peak; 2kHz crossover; XLR, TRS balanced inputs and USB in/thru; DSP with 24-bit/96kHz processing; SRC secondary reflection correction system (optional). Price: \$1,500.

CONTACT: Equator Audio Research at 888-772-0087, www.equatoraudio.com

EVENT ELECTRONICS ASP8 Studio Precision 8 Monitor

FEATURES: Two-way; 8" mineral-filled polypropylene cone with neodymium magnet; 1" ferrofluid-cooled soft dome tweeter; 35Hz to 20kHz, +/-3dB; bi-amplified with 200W LF amp, 80W HF amp; 2.6kHz crossover; balanced XLR and TRS input; continuously variable HF and LF trim; switchable 80Hz 2nd order HPF. Price: \$749 each.

STUDIO REVIEW

SAMSON Continued From Page 66

and down. Chords were all thick and chewy like wads of taffy, but the piercing high notes of solos were clearly defined and musical — no harshness here, no EQ needed.

Some acoustic guitar overdubs showed the VR88 to be picky about placement; it was just too boxy if used for miking the guitar's body behind the bridge, too woofy and windy at the soundhole, but pretty nice at the 15th fret. Good dynamics were found at lower and medium levels, but if really chunking into it, slightly audible compression and distortion edged in.

No test would be complete without an attempt at vocals, and I got some unexpected results. My first reaction was "This is going to be way too dark" as I had a male rock vocalist warming up. Fortunately, my Manley TNT preamp (the solid-state side) has selectable impedance and a 300-ohm "purist" setting that was perfect for the VR88 as the top end

opened up. Next I got aggressive with my tape monitor signal path by applying a HPF, rolling off bottom end and adding a whopping 8-9dB of top-end shelving boost. I only compressed to tape, but applied the EQ and filters in the monitor path and final mix. After a little additional limiting I got a nice, almost creamy sound (with just a touch of room air on the loud notes) for such aggressive rock vocals. The VR88 accepted the boosting without fuss, as the transients and phase response still sounded good and the noise floor did not become too apparent. Interestingly, the VR88 handled plosives really well, barely even needing a pop filter.

| SUMMARY

In a crowded field of affordable ribbon mics, it was wise for Samson to add a full complement of accessories where their competitors

sometimes include nothing more than a stand mount. For many rising engineers who desire their first ribbon transducer, the VR88 represents a great choice if only for its active electronics, which will mostly free up users from preamp related issues like headroom and impedance (although I am recommending a low-impedance preamp for best results, 600-ohm max). Flatter response would make the VR88 more flexibly useful, but even with its obvious character, the mic can be great for drum rooms or vocals where some interesting coloration can be downright desirable.

The VR88 is a great choice to begin your travels with a ribbon mic or to increase the diversity of your mic closet. Just be careful with those accessories, have your HPFs ready to go, then go get creative with that rear lobe of the figure-8 pattern (yes, it's decidedly different with a nice, low-mid scoop). After all, a little room ambience is good for you.

Single Slice

by Strother Bullins

“Pray” | King’s X

SINGLE: “Pray”

ALBUM: XV (*Inside/Out*)

DATES: Recorded and mixed January through April 2007 at Wireworld, just outside Nashville, TN.

PRODUCER: Michael Wagener

ENGINEER: Michael Wagener

MIXER: Michael Wagener

MASTERING ENGINEER: Ty Tabor at Alien Beans

OTHER PROJECTS: Wagener has worked with many successful rock bands over the past 30 years. In total, his productions have sold over 80 million albums.

STUDIO MONITORS: A.D.A.M S3A in a 5.1 configuration

STUDIO WORKSTATION/CONTROLLERS: Steinberg Nuendo 4, Euphonix MC Pro controller, Sony DMX-R100 digital consoles

SELECT PROCESSING AND CONVERSION: Creation Audio Labs MW1 Studio Tool, Seventh Circle Audio N72 mic preamp, Chandler Ltd. TG-2 mic preamp, Groove Tubes ViPre, Empirical Labs Distressor, Euphonix MADI I/O, Solid State Logic AlphaLink MADI I/O

SELECT MICROPHONES: Soundelux ELUX 251 (Pinnick vocal), Soundelux E47 (Tabor and Gaskill vocal), Royer R-121 ribbon (Tabor’s amp), Mohave Audio MA-100 condenser and Beyerdynamic M 201 (snare drum), Shure SM91 and Yamaha SKRM-100 SubKick (kick drum), Shure SM58 (toms), Mohave Audio MA-200, pair, and Royer SF-12 stereo ribbon microphone (cymbals/OH)

PRODUCER’S DIARY

Strother Bullins is a music and pro audio industry writer based in North Carolina.

Following their self-titled 1992 album, King’s X ducked from under the cape of their first producer, Sam Taylor. Yes, the band had experienced notable success with Taylor’s direction. But better things waited for the trio, as none other than producer Brendan O’Brien — Bruce Springsteen, Pearl Jam, Soundgarden, Korn, Stone Temple Pilots, the Black Crowes, Matthew Sweet, Train, Rage Against The Machine, others — de-varnished the King’s X sound of yore on their landmark, influential 1994 album *Dogman*.

Since then, the band wandered, continuing to construct a studio sound all their own. Bassist/vocalist Doug Pinnick, guitarist/vocalist (and mastering engineer!) Ty Tabor, and drummer/vocalist Jerry Gaskill each possess a style that is recognizable to many and distinctive to most listeners.

Present-day King’s X Producer Michael Wagener (Ozzy, Metallica, Motley Crue, Queen), a truly technologically astute producer, engineer, and mixer, captures the essence of what King’s X is and stays out of the way (or at least that’s what he wants you to think he does). Thus, he allows King’s X to *just play* while paving the aural road ahead of them.

On their 2nd collaboration, Wagener and King’s X create an album that feels like you’re in the room with the band, but you’re listening to them on headphones; sonically, it’s detailed and precise yet live and loose. Nowhere on the album does this approach work better than on “Pray,” the first jam in which Pinnick sings about a need for compassion over a gritty groove that would make both Hendrix and Hetfield jealous.

“The original track is done pretty much in one take, which — to me — is *the way to record*,” explains Wagener. “If I would ask Ty, ‘Could you try this?’ he comes back with what I suggested in one second — ‘Oh, you mean like that?’ For me, that’s a fantastic way of working. The better musicians are, the easier my job is ... and King’s X is just fantastic.”

Wagener called upon his most desirable, reliable sources in the studio for the recordings; for instance, on Pinnick’s vocal, a chain of the Soundelux ELUX 251 (now Bock Audio 251), Seventh Circle Audio N72 mic preamp, and Empirical Labs EL8 Distressor was employed. Wagener also employed his own hardware creation — the MW1 Studio Tool by Creation Audio Labs, a unique D.I. and re-amplification device — on every guitar and bass track on XV.

In the end, “Pray” represents a match made in heaven; here, a band’s band and an engineer’s engineer both do everything they do best.

Wagener, Tabor, and Pinnick at Wireworld.

Get Ahead Of The Curve

Whether you're just starting out in desktop recording, or you've already laid down a few thousand tracks, you've probably heard of the KRK Rokit. For years Rokit has been the popular choice for accurate monitoring in home and studios large and small. Rokit enthusiasts include guitar players, bass players, electronic musicians, re-mixers, beginning artists, and industry professionals. Now is a great time to check out the all-new, Generation 2 Rokit Powered Studio Monitors. Generation 2 Rokits set a new standard with even better performance and accuracy, raising the bar once again. So "Getting Ahead Of The Curve" means even more than ever.

Our new Generation 2 Rokits have radically curved edges which virtually eliminates diffraction and provides a wider sweet spot. Our engineers also gave the Generation 2 Rokits a more accurate response curve to match the new cabinet, custom drivers, and our true bi-amplified and active crossover systems. Designed for the studio and not just a showroom demo, Rokits allow you to hear your "Real" mix.

We have made the industry's best seller better. Give the new Rokits a listen, and become a believer too. Regardless of your budget or experience level, the new Generation 2 Rokit Series gives a whole new meaning to the phrase "Getting Ahead Of The Curve."

BRING ON THE HEAT. TUBEFIRE8

Eight Channel Tube Preamplifier with Firewire

The ART TubeFire8™ delivers the best of all worlds in one tube driven digital audio interface package. Ideal for any recording application, the TubeFire8™ adds eight incredibly warm tube driven microphone or line inputs and eight balanced outputs to any FireWire equipped computer.

Complete FireWire Based Studio Solution

Designed as a complete studio package, the TubeFire8™ is shipped with Steinberg's Cubase LE 48-track for both Mac and Windows operating systems making it a truly plug and play recording solution, although it is compatible with many popular ASIO and Core Audio based applications.

Class-A Tube Design

ART's TubeFire8™ packs eight quality second-generation discrete Class-A vacuum tube microphone preamps in a single rack space audio interface with balanced I/O and FireWire connectivity.

Versatile I/O

ART's microphone preamps provide clean quiet gain while maintaining incredible transparency through the input stage. The eight balanced outputs of the TubeFire8™ can be driven from either the analog microphone preamp inputs making the TubeFire8™ an in-line eight channel tube preamp, or from the internal high quality D/A converters making it a high quality multi-channel audio output for your PC.

Full Input Control & Low Latency Monitoring

Every input channel offers both XLR input and 1/4-inch TRS balanced input with 70dB of gain. All inputs have -10dB Pad, High Pass filter, Phase Invert clip indicators and a wide range LED meter to monitor the preamp levels. The eight balanced outputs can be summed to an integrated headphone output providing either a mono or stereo mix function for low latency input monitoring and for monitoring audio playback from the computer.

Features

- Shipped with Steinberg's Cubase LE 48-track (for both Mac and Windows operating systems)
- 8 x quality second-generation discrete Class-A vacuum tube microphone preamps
- 8 x XLR & 1/4-inch TRS Combi-jack Inputs
- 2 x 1/4-inch instrument jack Inputs (CH1 & 2)
- 8 x 1/4-inch TRS balanced Outputs
- 1 x 1/4-inch TRS headphone jack
- 8 x Input Gain / Channel Level / HPF / Phase Invert
- 8 x Channel Metering (4 bar led graph w/ clip indicator)
- 44.1KHz, 48KHz, 88.2KHz, 96KHz Sample Rates
- 24-204KHz External sample rate
- 44.1K, 48K, 88.2K, 96K, 176.4K, 192K Internal sample rates

ART
APPLIED RESEARCH AND TECHNOLOGY

We have delivered leading edge products with exceptional tone and versatility which have gained the loyalty of musicians and sound engineers worldwide - on the road, in nightclubs, arenas, recording studios, auditoriums, churches, basements, garages, bedrooms - wherever there's a need to capture your creativity or amplify it, ART is a brand you can trust.
