Commonwealth Study Conference

PETER PARKER outlines the aims of the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities within the Commonwealth and Empire at which His Royal Highness will give the opening address in the Sheldonian Theatre, Oxford, this week

G.O.S.: Monday 20.45, Tuesday 00.15 and 04.45

AT 3.30 p.m. on July 9 in Oxford a bold experiment begins, when 280 people, men and women mainly between the ages of twenty-five and forty-five, all actively engaged in industry in the Commonwealth, will meet in the Sheldonian Theatre to hear H.R.H. the Duke of Edinburgh give the opening address in his Study Conference on the Human Problems of Industrial Communities. There is no precedent for what will follow in the programme of the next three weeks of the conference. Nothing like it has been tried before. Essentially, both in the preparations which have led up to it and in the conference itself, this is an experiment in common effort in the Commonwealth.

This does not mean, of course, that the conference breaks new ground in its field of study. There has already been a great deal of work done along the lines of the purpose of this conference: to conduct a practical study of the human aspects of industrialisation, and in particular those factors which make for satisfaction, efficiency, and understanding both inside industrial organisations and in the everyday relations between industry and the community around it.

The conference will not be facing problems which are new and unfamiliar: the great hope is that the human problems arising from the growth of industry, only too familiar in many cases, might be illuminated in a new way on this occasion.

Learning from One Another

The Duke of Edinburgh had just returned from the tour of the Commonwealth with H.M. the Queen when the suggestion of the conference was being mooted. As he says in the foreword of the programme: 'Judging by what I had seen I thought the idea a good one. With the rapid progress of science and technology there is an inevitable spread of industrialisation to meet the growing needs of the world. In Britain, the home of the Industrial Revolution, and in some of the countries of the Commonwealth, we have already experienced many of the human problems that industrialisation creates in varied circumstances, problems which countries undergoing industrial development are beginning to face. We all have much to learn from one another.'

Fundamentally, perhaps, these problems arise from the challenge of change. Industrialisation is making change a condition of our lives both in countries where industry is advanced and in countries still in the early stage of industrial growth. In a very real sense the experience we share is a new bond of Commonwealth.

Of course, the membership of the conference will reflect a wide range of industrial experience—of different types of industry, educational backgrounds, races, and climates. From the total membership of 280, ninety will be from the United Kingdom, approximately 135 from the other countries of the Commonwealth, and fifty-five from the Colonial territories.

It is likely that there will be two-thirds who are managers/employers and one-third who are trade unionists/operatives. There will be no official representatives as delegates. There is no intention of having a conference of two sides: indeed, the programme excludes what normally comes within the scope of collective bargaining.

This seems to be simply a picture of contrasts. But, in fact, there is a common denominator: each individual will have some direct experience of industry. Each individual—employer or manager, trade unionist or operative—is invited to be a member of the conference as a member of industry who can contribute from practical experience.

An Encouraging Response

This is not an academic research conference, nor is it a course. It is a practical opportunity for individuals facing increasing responsibilities in industry to pool experience and opinions. And the response has been most encouraging. In Australia, for instance, in answer to a notice in the Press, 900 people applied for twenty-five places.

There is another common factor in the membership which needs emphasis. The individuals will mainly be less than forty-five years of age, and most probably the average age will be about thirty-eight. In the selection of members the conference council has sought the rising generation in industry, people with opportunities before them to put to good advantage, through their own work and in their own communities, any benefits they will gain from this conference.

There will be speeches and working papers, but the main work of the conference will be discussion groups with fourteen members in each. The discussion will begin during the first week at Oxford when members will hear talks by industrialists and trade unionists and will be preparing for their separate study tours to industrial centres in the United Kingdom.

On the tours the groups will begin to study under working conditions the themes, and will talk to people directly concerned with these problems in industry and with representatives of employer organisations, trade unions, social services, education, public utilities, distributive trades, religious organisations, and municipal authorities.

Groups will spend about half their time in factories and on industrial topics and about half on such problems as housing, education, community life, clubs, health, and travel to work.

In the last week the groups return to Oxford for further discussion among themselves, and will spend a few days preparing their final reports on their impressions.

The climax of the conference will be in the reporting back at the end of the last week, and the summing up by Sir Philip Morris, Vice-Chancellor of Bristol University, with His Royal Highness in the chair.

Commonwealth Study Conference: see page 17

Sigmund Freud and Psycho-Analysis

The centenary of the birth of Sigmund Freud has evoked a world-wide re-appraisal of his unique contribution to the study of the human mind. Here is a tribute by DR. EDWARD GLOVER, a psychologist who was a pupil of Freud. His talk is introduced by C. L. Boltz

BOLTZ: This year is the centenary of the birth of a most extraordinary man whose work has had enormous and world-wide acceptance. The centenary of his birth is being celebrated in countries as far apart as India and Great Britain. The man was Sigmund Freud, born on May 6, 1856. Freud was a Jew, and he was born in that part of Europe now called Czechoslovakia,

but at the age of four his family moved to Vienna, and there Freud lived for seventy-eight years until the coming of Hitler forced him to leave for Britain, where he died a few weeks after war broke out.

Who was Freud, and what did he do to merit such widespread centenary celebrations? If I say he was a psychologist I am right enough, but the fact hardly gets us any nearer the answer to the question. It is all much more than that. It was Freud who first developed a theory that all human motivation is unconscious. It was Freud who fired a gun at nearly everything that human beings believed about themselves. He destroyed smugness; he destroyed the old Victorian habit of explaining all human actions in terms of reason. If you forget to post a letter of congratulation to a friend and you start to work out the explanation of your forgetting and say that it is because you really are jealous of the success of your friend and do not really want to congratulate him at all, then you owe all this way of explaining it to Sigmund Freud. Before his day you would never have thought of such an explanation.

New Terms in our Common Language

The interpretation of dreams, the curing of neurotics by free association in the process called psycho-analysis, the explanation of lapses like the forgetful action I mentioned—these, and a host of other things, were originated by Sigmund Freud. He invented terms that are used even by schoolboys today and very frequently by intellectuals, and if they do not understand what they are talking about—and they often do not—it is still a sign of Freud's tremendous impact to have given so many new terms to our common language.

His impact was so tremendous that he aroused enmity—academic enmity, I hasten to add—and today there are still many who oppose Freud's theories of human character. You are either a Freudian, it seems to me, or you are anti-Freudian. A psychologist who is definitely a Freudian is Dr. Edward Glover. Dr. Glover was a pupil of Freud and at one time a director of the London Clinic of Psycho-analysis.

GLOVER: Although the name of Freud and the term psycho-analysis have become household words—indeed, Freud is considered one of the world's greatest thinkers—most people would be hard put to it to say exactly how it was that he achieved lasting fame. The most popular conception is simply that he was a Viennese doctor who invented a form of psychotherapy for mental disorders now commonly termed neuroses. This was true enough in its way: Freud was the father of modern psychiatry. There is hardly a mental hospital or out-patient centre, a child-guidance clinic or indeed any organisation that deals with the problems of individual or social adaptation, from marriage-guidance councils to prisons, the staff of which does not, wittingly or unwittingly, employ principles that were laid down by him.

A Vast but Invisible Territory

Now all this, although remarkable enough, would scarcely justify the description of Freud as one of the world's greatest thinkers. We should remember, however, that Freud was not only the discoverer of the unconscious mind and of the peculiar laws that govern this vast but invisible territory: he succeeded in building up a consistent theory of mind which revolutionised mental science. When, in 1893, he published his first contributions to psycho-analysis the science of psychology was on the whole an unfruitful pursuit, based on the most inadequate ideas of the nature of mind. Mind and consciousness, for example, were supposed to be one and the same.

Freud's discovery of the unconscious swept this misconception aside. Behind consciousness, which is largely an observation post and sampling system—a superficial organ, that is—there exists a complicated mental apparatus receiving, controlling, and discharging in the form of thought, speech, and behaviour, the excitations which arise from the instincts of love, hate, and self-preservation. This unconscious apparatus Freud was able to divide into component parts, of which one is of particular interest not only to the man in the street but to the moral philosopher and theologian. Its technical name is the 'super ego' or, as one might say, unconscious conscience, which is responsible for the sense of guilt.

Freud also laid before us the history of this mental apparatus from infancy onwards, studied the infantile forms of the instincts that set

the apparatus in motion, described the emotions and effects (such as anxiety and guilt) that can disturb its function, and the various mechanisms whereby the mind effects control, the best known of which goes by the name of repression.

He was then able to show that the disturbances that we generally describe as mental diseases are really maladaptations which arise when those unconscious laws do not run smoothly, and when in consequence the mental apparatus is incapable of dealing with stresses of instinct, in particular the stresses of love and hate.

He was able to show that all these disorders originate in infancy and early childhood, and that the main conflict that disturbs the child's development centres upon its unconscious love and hate relations to its parents. This was the origin of the famous Oedipus complex, a discovery which in its time aroused the most violent opposition in both lay and professional circles. All this, together with the fact that Freud made his discoveries in course of studying dreams and neuroses, explains why most people tend to regard psycho-analysis simply as a form of medical treatment. But it also serves to show how psycho-analysis spread in the first instance to the study of child development, child nurture, and education. For the discoveries Freud made were applicable not only to the mentally sick but to quite normal people, in fact to every man. The fate of the grown-up was seen to be determined not just by immediate circumstances, as had hitherto been thought, but by the unconscious patterns laid down in childhood.

This discovery was not only important from the point of view of child nurture, undermining as it did the rigid concepts of disciplinary paternalism that had hitherto prevailed: the whole concept of education was thrown into the melting pot. There is hardly a modern school or educational institute in English-speaking countries that has not been influenced by Freudian ideas.

But that was only a beginning. Freud later turned his attention to the factors in unconscious development that influence the formation of groups. These investigations of the structure and function of society turned psycho-analysis overnight into a new form of sociology both in its normal and its abnormal aspects. Crime in the individual and war between groups were traced mainly to disturbances arising during the formation of unconscious conscience. Even politics were not immune from inspection.

Rejected in Communist Countries

And in this connection it is interesting to note that Freud and psycho-analysis have been rejected only in Communist countries. For the Marxian does not take kindly to a system that puts the influence of unconscious love and hate before the economic interpretation of history.

The implications of his views on the development of children and the nature of society are indeed far reaching. In the first place, they suggest that if man is to succeed in controlling his primitive instincts, his emotions and superstitions, the necessary measures to effect these changes must be set in motion during the most malleable period of mental development, that is to say during infancy and childhood; and this conclusion in turn serves to put in proper perspective the unsolved social and political problem of the relation of the individual to the state, because it makes the family unit the key point in the transmission of culture.

In other directions Freud's influence was equally powerful. Early in his career he had sought for and had obtained confirmation of his views in the fields of art and literature. But he could scarcely have anticipated that within his own lifetime his views would have had such a remarkable effect on the works of writers and artists. These changes are most obvious in the case of biography and of surrealist art. In the former case the process of biography has been both widened and deepened, and in the latter artists have come to vie with each other in the pictorial representation of unconscious symbolism.

Finally, it may be asked how far Freud's cultural influences were typical of Western civilisation, and whether they accentuate the difference that is sometimes held to exist between the West and the East, namely, that the East is less material—more spiritual, if you like. This question is not easy to answer. On the one hand, Freud did not take kindly to the manufacture of a philosophy of life and limited himself strictly to a scientific *Weltanschauung* that was in keeping with man's psycho-biological nature. On the other hand he maintained that man's noblest aspirations spring from the same unconscious region of the mind that gives rise to his deepest conflicts. In one sense he regarded spirituality itself as a product of unconscious conflict, and by so doing not only set psychology above philosophy but indicated a common ground on which the East and the West can meet and compose their difference. (Broadcast in 'London Calling Asia')

A Wind-Tunnel for Exploring the Sound-Barrier

IVOR JONES, the BBC Air Correspondent, describes a wind-tunnel set up recently at Bedford by Britain's Aircraft Research Association to investigate more precisely than ever before the problems of flight through the sound-barrier—a remarkable new piece of research equipment'

RECENTLY H.R.H. the Duke of Edinburgh opened a new British wind-tunnel which is the most advanced of its kind in the world. It is specially designed to investigate more precisely than ever before the problems of flight through the sound-barrier. It will play an important part in the race to build faster aircraft of every kind—fighters, bombers, and airliners.

There is little doubt that since the end of the war British aircraft-research has been hindered by the lack of big, high-speed wind-tunnels. Substitutes have been found, such as the technique of firing rocket-propelled models of future aeroplanes and missiles in the free air and observing them from the ground with elaborate instruments. But now this phase of improvisation is almost over. This new tunnel is one of a series recently built in Britain which should meet the needs of research workers for some years to come. And in many ways it is the most important of the series.

The tunnel, which is at Bedford, is unique for two reasons. First, it is a co-operative venture by fourteen of Britain's major aircraft constructors—among the world's most determined individualists—who have jointly raised about £1,500,000 to build it. Secondly, it solves more completely than any other tunnel the special problems of research around the sound barrier. The advance it represents was explained for me in this way by Mr. Ronald Hills, the chief executive of the Aircraft Research Association, which has been set up to build and operate it.

He said: 'In previous tunnels it has been quite impossible to get any satisfactory results at speeds between about 700 and 900 miles an hour. At these speeds model aircraft in the tunnel produce shock waves. They are a little like the waves produced by the bows of a ship, and they are reflected back from the walls of the tunnel, just as a ship's waves would be from the banks of a river or lake. These waves interfere with the air flow through the tunnel, and produce a state of affairs quite unlike that of an aircraft flying through the free air. In this tunnel we are using a

Part of the tunnel can be rolled aside to allow models to be placed in the bays for testing; the movable section is then put back and made airtight

special perforated wall in the working section which should entirely eliminate these shock-wave reflections.'

This 'working section' is, of course, the part of the tunnel that matters most. It is nine feet wide and eight feet high, and specially dried air can be forced through it at up to 1,000 miles an hour. At this speed, air is moving through the working section at nearly two tons a minute, driven forward by 25,000-horse-power electric motors.

The models of aircraft and missiles used in the tunnel can be wheeled into place in the section on a device like a tramway, so that there is as little delay as possible between experiments. Research workers can observe what happens when the tunnel is running, both on large instrument-panels and by television. There are cameras mounted in the tunnel wall.

This A.R.A. establishment, as I said, promises to play a big part in British aircraft research. Another tunnel will be added to it soon—smaller, but capable of higher speeds. And the place already has its own staff of specialists. They will investigate the designs sent to them by the member firms of A.R.A., and they should in time become one of Britain's most closely knit research teams.

But this A.R.A. project fits into a large pattern: one that is making Bedford perhaps the greatest centre of aviation research in the Commonwealth. The Royal Aircraft Establishment—which in the past has done most of its work at Farnborough—has already built several wind-tunnels of its own there. One is a large supersonic tunnel.

More than this, the R.A.E. now has, also near Bedford, what is probably the biggest and longest runway in Britain. So, in the same neighbourhood, there are now facilities for testing new ideas right from the drawing-board stage until, finally, they are embodied in an aeroplane that is ready to fly. (Broadcast in the BBC's 'Radio Newsreel')

A technician checking the position of a television camera mounted in the tunnel wall and focused on a model about to be tested

Postscript to the Burma Elections

DR. HUGH TINKER, until recently Professor of History at Rangoon University, comments on the confirmation of U Nu as Premier after the second general election in Burma since independence

U Nu, the Prime Minister of Burma

THE second general election since independence has recently ended in Burma. Elections in Burma are first and foremost a holiday, a festival, and an entertainment. People wear their gayest clothes; bands blare; there is singing and dancing. Banners hang across the streets; the political parties erect bamboo pavilions, tricked out with gold and silver paper as their rallying points. All is bustle and good humour.

Yet on election day at most of the polling booths there were armed police with bayonets fixed, for the Communists had declared that they would sabotage this election as they attempted to sabotage previous elections. However, the elections have confirmed the government coalition,

the Anti-Fascist People's Freedom League, in office for another five-year term.

The League was formed out of a large number of parties in 1944 in protest against the Japanese occupation. It has now carried on the government for ten years in the face of large-scale rebellions by the Communists and other intransigents, and in the face of a dangerous invasion by Chinese Nationalist forces. Today Burma has a large degree of internal stability, and has begun to put into effect plans for a welfare state.

But this achievement has its darker side: there is still a good deal of unrest in the country; the programme of state socialism has endured serious setbacks.

During the past two years the world price of rice has been falling steadily, and as rice accounts for three-quarters of Burma's exports this has had serious effects upon the national income.

Attempts to stabilise the overseas balances by imposing rigorous import restrictions have led to spectacular rises in prices, which are now four to six times higher than a year ago. And yet the Anti-Fascist People's Freedom League has succeeded in maintaining a large majority in parliament. What are the reasons?

First, there is no opposition party that can come forward as an alternative government. The Communists have refused to take up the challenge of the Prime Minister, U Nu, to come out into the open and to accept the verdict of the polls. In their absence the largest opposition group is the Burma Workers' and Peasants' Party, which is avowedly Marxist and revolutionary. It has increased its representation in

parliament but still it offers no serious threat to the government party.

But all the opposition parties lack dynamic leadership and suffer from a complete absence of electoral organisation. Widespread dislike of the Anti-Fascist People's Freedom League, which has been accused of corruption and nepotism, has resulted in defeats for League candidates, and lower majorities. But the swing of electoral opinion has been counter-balanced by the nation-wide veneration for the Prime Minister, U Nu. Most observers have seen the 1956 election as a vote of confidence in U Nu as the leader and guardian of his country.

U Nu is something of a rarity: a practical idealist. Prime Minister of his country for nine years, he has grown in stature, in experience, and in wisdom, while remaining modest, friendly, and unassuming. This is the man who once again has received the vote of the peasant in the ricefield, the hunter from the mountain, and the coolie in the market-place.

The continuance in office of U Nu and his government ensures that Burma will remain in her chosen path towards a welfare state. In world politics U Nu will continue to stand alongside Pandit Nehru in leading the new nations of Asia in a middle way between the great power blocs. For it must be understood that U Nu's so-called 'neutralism' is not, as some foreigners assert, a policy of appeasement towards Communism: it is a genuine attempt to enter into friendship and co-operation with all nations. In so far as Burma's election is a vote of confidence in U Nu it is also a vote for peace and co-operation in Asia and the world. (Broadcast in the BBC's Overseas Service)

The Colonial Development Corporation

ALASTAIR DUNNETT comments on the encouraging report recently published by the Colonial Development Corporation on the results of its trading year of 1955

BRITAIN'S Colonial Development Corporation says in its report that it made a profit in the trading year 1955 for the first time since it was founded in 1947 to promote and encourage commercial and industrial development in backward areas of the Commonwealth. Gone, it seems, are the black, early days of the groundnut debacle in Tanganyika, and the poultry scheme in Gambia.

Lord Reith, the chairman, and his staff are near the end of the mopping-up operations on the unsound schemes, and sound schemes are beginning to pay handsome dividends. The figures for 1955 show this quite clearly. In 1954 the Corporation lost more than £500,000, but last year its consolidated profit was more than £400,000. Comparatively, then, the Corporation is about £1-million to the good.

The corporation's sixty-three projects are widely scattered throughout the world. Eighteen of them are in the Caribbean, seven in the Far East, and no fewer than thirty-seven in Africa. One of the Far East projects—the United Cocoa Development Company of Malaya—started only last year, as did nine of the operations in Africa. The Central Electricity Board in Malaya, which showed a profit of more than £250,000 in 1954, has increased its profit by £25,000, and the Federal and Colonial Building Society Limited in the same country has done equally well.

To my mind the most striking achievements are those of some of the companies, not yet

showing profits, it is true, but with their losses cut down significantly. For instance, in 1954 British Guiana Timbers Limited showed a loss of almost £115,000; this has been cut to under £38,000. Borneo Abaca Limited slashed its losses by more than £115,000, and would have done still better had not the plants from which fibre is made been attacked by disease.

Then there is the Lobatsi Abattoir in Bechuanaland. There a loss of more than £5,000 has been turned into a profit of some £98,000 during the first full year of operation.

W'ineperu; one of the Colonial Development Corporation's forest concessions in British Guiana

These are just a few of the ways in which the corporation has turned figures in its bank account from red in 1954 to black in 1955—its current account, that is to say. For the overall picture shows that the corporation is still £8-million in debt. But now the board of Management has entirely changed, and manifestly the new board has done well.

Not that it will be free from troubles in future. The Government legal advisers are not sure whether the corporation is entitled to undertake housing and roadworks—a field in which it is operating very successfully—but it seems that legislation will be passed to get over this difficulty.

Incidentally, the undeveloped nature of the areas in which the corporation is working is clearly shown by the fact that 26.3 per cent. of its capital is deployed on power schemes, and twenty per cent. on agriculture.

The corporation hopes to maintain the progress it has shown during the last year, but will only take on new projects which are likely to be financially self-supporting if not definitely profitable. It is difficult to take a decision in such matters, for the corporation must assess what will be saleable at a profit in ten to twenty years' time. It has been a struggle to get out of debt, as the report admits, and the corporation does not intend to let up until it has built up its own reserves.

But the corporation should not be judged only by financial standards: far more important is the work it is doing to raise the standard of living in overseas territories. (Broadcast in the BBC's Overseas Services)

A group of dancers from Oporto, Portugal, rehearsing against a background of Welsh hills

Young singers from Germany looking out over the river Dee below Llangollen's medieval bridge

The International Eisteddfod

J. C. GRIFFITH JONES sets the scene of the tenth annual festival of music and dancing which is being staged this week at Llangollen, in north Wales, where amateurs from twenty-two countries in Europe and America will be meeting in friendly competition

Welsh Magazine. General Overseas Service: Wednesday 21.15, Thursday 12.30

THIS midsummer the tenth successive annual International Music Eisteddfod will be held in the little town of Llangollen in north Wales. The outside village on the banks of the Welsh Dee—a river of cascading waters where the salmon leap—a place brooding wistfully for ten months in the year under the ancient spell of Welsh hills, will quicken again with exotic tumult when it is transformed for a week into a shrine for musical pilgrims from many lands.

It is a festival of the people, by the people, for the people. Unlike the Salzburg and Edinburgh festivals where the performers are matching their expert skill against other experts, the Llangollen International Eisteddfod is a magnet for amateur performers, people who earn their livelihood in other ways, but love music and practise it at every opportunity.

The prizes are token trophies, and modest lump sums in cash which divided among the members of a winning choir or dance group would scarcely enable them to do more than pay for a celebration meal and buy a few picture-postcards as a souvenir of their colourful adventure.

'Frontier-Leaping Magic of Music'

The real reward is the coming and the mixing informally and spontaneously with kindred spirits of other nationalities, the breaking down of barriers of race and language, of creed and power politics, through the frontier-leaping magic of music and common humanity.

How did it all begin? Its origin is rooted in that Welsh word *eisteddfod*, and in all that word connotes. In the palaces of the old independent Welsh princes there was patronage and honour for poets and musicians. Special tournaments were held in which the bards and minstrels of note vied with each other in performance of their arts.

This *eisteddfod*, or congress (literally, sitting) of poets and musicians evolved down the centuries, weaving itself into the texture of Welsh life and eventually expanding into the modern Eisteddfod with a capital 'E,' national cultural festival of the Welsh people, which is both a fostering ground for the arts and an annual reunion of the Welsh people from all parts of the world, met to re-strengthen their ties of kinship and human fellowship.

During the last world war the members of the governments of several European countries invaded by the Germans found sanctuary in Britain. Some of their ministers came as special guests to the National Eisteddfod of Wales, which was held, though on a lesser scale.

The foreign ministers were deeply moved by the friendliness and the inspirational quality of this festival. 'When peace comes and freedom is restored to our ravaged countries,' they said, 'we must send our own singers and musicians to Wales to strengthen the bonds of our friendship.' It was in this way that the seed of the International Music Eisteddfod was sown. A group of Welsh enthusiasts who promoted the idea of a

The nations mingle easily at the Eisteddfod: a Welsh girl poses with French friends, and (right) a Spanish dancer gives a preview of her act

festival with the widest horizons chose Llangollen as the ideal centre. It not only had spell-binding scenery to commend it but also Eisteddfod tradition and a community which had taken pride over the centuries in being hospitable.

The population of Llangollen now is little more than 2,000, but the whole community in the town and all the surrounding villages threw themselves into the venture whole-heartedly. The organising committee was fortunate in being able to call on the services of specialists, including Mr. W. S. Gwynn Williams, a musician with wide European contacts. His expert knowledge, which he has given freely as Music Director of the festival, has been an important contribution to its success.

But there is no flagging. The tenth annual festival promises to be as resounding a success as any of its predecessors, even including the high-tide event of 1953, when our young Queen Elizabeth II came to Llangollen to charm the vast concourse and to be charmed. This year there will be soloists, choirs, and dancers from some twenty-two countries.

Next week: 'Nations in Song,' a special programme reflecting events at the International Eisteddfod, will be broadcast in the General Overseas Service on Monday at 10.30 and 22.15, and on Tuesday at 06.30.

SIR HAROLD NICOLSON offers some reflections on that venerable institution, the London club. Most of the famous ones are still in existence, and, if not quite so grandiose and exclusive as they were, still as respectable, comfortable, and somnolent; but how much longer—he asks—will they be able to continue in anything like their present form?

The London Club

ONE of the institutions of Britain which has been hardest hit by inflation and the cost of the Welfare State is that venerable and, indeed, sedative institution, the London club. I was talking this week to the secretary of my own club who gave me some startling figures. In the old days before the first world war the subscriptions of members were sufficient to meet the overhead expenses and the wage-bill, and the club could thus afford to be extravagant and even lavish in its catering policy and run the dining room at a loss.

He gave me some figures for the rise in wages alone which I admit were impressive. In 1900 the total wage-bill in my own club was £2,000 a year; at the end of the first world war this figure had increased to £7,000; a year; today the annual wage-bill is as much as £19,000. You will agree that such increases, when added to the general rise in the cost of living, present the committees and secretaries of clubs with problems such as our grandfathers never foresaw.

All manner of devices have been essayed to meet the situation. The staff has been reduced, and many women waitresses have taken the place of the elderly, slow-moving but beautifully liveried footmen with whom I was familiar in my youth.

Cocktail bars have been established in even the most respectable clubs in the hope that old members and new members will thereby be encouraged to consume martinis before their luncheons and dinners. These hopes, I am glad to say, have not been disappointed. Subscriptions and entrance fees have been raised, and—most revolutionary reform of all—women have been admitted at certain hours and in certain rooms in the hope of thereby increasing the receipts of the catering branch.

Managing to Pay their Way

In spite of these changes which would have filled my grandfather, who was a most choleric man, with purple fury, most London clubs struggle on with difficulty, only just managing to pay their way. Some of them have disappeared; some of them have been wound up, and the capital distributed among the members; but most of the famous London clubs are still in existence, not quite so grandiose or exclusive as they were in the days of Colonel Pendennis but still respectable, comfortable, and somnolent. How long will they be able to continue in anything like their ancient form?

It is curious, when one reflects upon the subject, that the London club should be so specifically an English institution. When I say English, I mean English. I know that there are clubs in Edinburgh, Cardiff, and Dublin which are modelled on the London variety and which might to the superficial observer appear identical. Yet in fact they have a different atmosphere and character, if only because the members have acquired the extraordinary habit of addressing each other when they meet. The authentic London clubman will enter the great portals of Pall Mall, give a distant nod to the hall-porter, seize a newspaper from the rack, stump upstairs to the dining room, read his newspaper and consume a glass of claret and a cutlet, descend to the coffee room, curtly order a glass of port, smoke a cigar, have a little nap in an arm-chair and then return to his house at about four in the afternoon, having not addressed one single word to any other member during the whole three hours of his visit.

'A Strictly Private Place'

This practice is considered by the English to be both restful and dignified: any other behaviour would to them seem intrusive, provincial, and rather vulgar; it would appear as if they regarded their club as a public instead of a strictly private place. It would not be liked at all. But the Scots, the Irish, and, I suppose, the Welsh also, are inclined—and I assure you that I am not exaggerating—to speak to each other when they meet in their club. It is even worse abroad.

Only in the Knickerbocker Club in New York, which is resolutely modelled on the London original, do I find the peace and quiet that I find in Pall Mall. Most foreign clubs are social centres rather than resting places: one is expected to recognise one's fellow-members and address them politely. In Paris, where there exist two clubs on the British model, namely the Jockey Club and the Cercle de l'Union, it is customary for new members to be formally introduced by their supporters to the old members. Nay, the abominable practice maintains of members shaking hands with each other when they arrive or when they enter the dining room.

Moreover, the Jockey Club in Paris bears small resemblance to the bird sanctuaries which we have accumulated in St. James's Street and along Pall Mall. Its members are most exclusive, and election is a regular campaign culminating in great triumph or galling defeat.

You will remember how phenomenal it was considered that M. Swann, the hero of Proust's great novel, was elected a member of the Jockey, and with what awe he was regarded by Proust and his family for

having achieved so glittering a distinction. Nor have I noticed on my rare visits to the Jockey Club or the Cercle de l'Union that either is considered by its members to be a fit place in which to sleep quite quietly on a summer afternoon.

Now in Austria and in Germany there were also clubs which purported to be the counterparts of the Turf Club in London. There was a Jockey Club in Vienna, a Herrenclub in Berlin (which, it is true, was conservative in character rather than sporting), and even in Rome there was the Caccia, and in Madrid the Peña. Yet never did these foreign clubs manage to rid themselves of the illusion that the purpose of a club was human intercourse, or adopt our sound English view that a club is a place to which one goes in order to escape the society of one's fellows and to ruminate in quiet.

Moreover, even on their own terms, I do not think that Europeans are by nature very clubbable. They like feminine society more than we do, and when they get together they wish to talk brilliantly and very loudly to a selected audience. The silence of a London club strikes even American or Commonwealth visitors as a trifle depressing; and I have myself experienced a slight twinge of gloom when listening on a winter afternoon to the rhythmic snores of a bishop beside the fireplace. Thus the French have always preferred either restaurants to which they can take their women friends or cafés in which they can orate to their cronies or disciples.

Nearly every great French writer had his favourite café in which you would be certain to find him at a given hour. Here, at the François Premier, would Moréas orate, or Verlaine mumble his latest poem; here at the Magny would Flaubert, Sainte-Beuve, and the Goncourt brothers meet on Thursdays and discuss the faults of their rivals and contemporaries; there in the Dôme would Guillaume Apollinaire teach the prewar generation the meaning of post-impressionism; and the grander ones, the richer ones, would go to Véfour in the Palais Royal, where George Sand had sat with de Musset and Chopin, and where Jean Cocteau sits today.

In the Long Street of Pall Mall

We also, of course, in the early days had our coffee houses. There was the Mermaid in Shakespeare's day and the Triple Tunne where Ben Jonson ruled, and the taverns around Covent Garden. It was in a coffee house that the young Samuel Johnson would spend his days scribbling and his nights indulging in the most acute and forceful conversation that the walls of London have ever heard. But by the eighteenth century the coffee house or tavern became less reputable, and the owners of the West End coffee houses founded clubs that became famous and that survive today. There was the great Tory club, White's, and across the way in St. James's Street the great Whig club, Brooks's—the home of Charles James Fox.

By the nineteenth century the clubs had sprung up all over the south area of London, and the long street of Pall Mall became lined with Service Clubs, Liberal clubs, and clubs for bishops or university dons. The century between Waterloo and the first world war was the great century of the London club. Men went there to get away from their families and their lady friends. They were domes of silence, sanctuaries of peace. And great writers, such as Thackeray, found that nowhere could they rest so undisturbed or write so peacefully as at the Travellers or the Athenaeum. Today the silence of these august mausoleums is broken by the voices of débutantes chattering to their young friends on the great staircase up which Talleyrand used to limp on his way to the card room.

In my own life the London clubs have changed their membership and their ways. It was considered a social distinction to be elected to certain clubs, and the more esteemed among them possessed a long waiting list. Today the demand for members and the supply of those able to meet the increased entrance fees and subscriptions has changed in proportion. There are few London clubs today who can afford to be exclusive in the old sense of that term. At the same time the habits of members have changed. All but the very aged are too busy to slumber in the afternoon, and one can even address remarks to a fellow-member without fear of rousing a bishop in the chair beside the fireplace. Moreover, when I was a young man one was obliged, if dining at one's club, to wear a white tie, a boiled shirt, and an evening tail-coat. Today such apparel would be regarded as eccentric.

You will agree that it is a strange story. Why is it that only in London can one find the true, leathery, suet atmosphere which a club ought to possess? Why is that no foreigners have been able to produce a convincing replica? Why is it that women's clubs are so different, so restless, so disturbing? And will this unique symptom of a peculiar civilisation pass away from us, and shall we return to the coffee-house or café system and the Cheshire Cheese? (*Broadcast in the BBC's General Overseas Service*)

Away from the ear-splitting noise of the fun fair people relax by the Pleasure Garden fountains

Fun of the Fair at Battersea

JOHN STOCKBRIDGE acts as your guide to the Thames-side Pleasure Gardens at Battersea, originally planned as an integral part of the Festival of Britain and now, in response to a continuing public demand, one of London's annual summer entertainments

THERE is a tough and an easy way of reaching the Battersea Park entertainments. The tough way is to go through the Chelsea Bridge entrance and straight into the brassy glare of the fun fair—if your ears can stand the shock. The other way is by the Albert Bridge gate: a stroll along the river-side and through the more sedate Pleasure Gardens, letting the noise of the fun fair come at you more gracefully.

I always go this way, but even so when I went again the other day I had forgotten that nothing remains the same for very long. Walking along the Embankment, past the rows of coloured lanterns dipping up and down, the first sound I had come to expect was the steam-organ of the Wonder Boat; but this, remember, is the new age of the helicopter, and the Thames is now a traffic lane for these noisy machines.

The Wonder Boat has a sad look nowadays. It is the only river-side survivor of the 1951 Festival Gardens. Through the gardens, where at night the trees are floodlit in green, past the innumerable kiosks that delude the stomach into thinking it is empty, and you are in for the whirlwind of the fun fair.

Although modern fun fairs have become over elaborate in some ways, this one still maintains the essentials: the movements of up and down and round about, and the shooting galleries where men achieve a few moments of masculine superiority. But it is no longer enough to be spun round on the flying chairs. Today they are called jet cars, accompanied by noises more frightening to the spectators than the riders. And something new at the Battersea fun fair is the Water Chute, perhaps the snappiest of the vicarious thrills of lift and drop.

Like Flies on a Wall

Somewhere in the centre of the crowded stalls and pavilions is the Rotor, a huge rotating drum which pins its victims against the sides. The cautious just stay there like flies on a wall; the eager beavers of the younger set swagger round, walking parallel to the ground as though on magnetic shoes. But no one enjoys it half so much as the spectators, secure and right side up. This is the oldest and most original of the Battersea favourites. It is fun, but I would rather have the echoes of the old-style fairground, the only risk being your money, as when playing housey-housey. There seem to be miles of side-shows, midget men, fire-swallowers, haunted houses, dodgems, pin-tables, the hoop-la variety of games of chance, and always, of course, more music. For a bit of peace, a breather, you might wander over to the musical clock. Every quarter-hour this clock starts its two minutes of tinkle-bells and moving figures: fishes in ever-decreasing sizes appearing from the mouths of their predecessors; strange birds in mulberry-bush chases; little goblin-men with hammers, seen through the eyes of astonished children.

Only a short rest, and back to the highlight of any and every fair worthy of the name: the Big Dipper, the Roller Coaster, the Scenic Railway, call it what you like. But it cannot last for ever. The continuous assault on the ear-drums or on the pocket eventually sends you home, and it does so as it greets you—with music. (Broadcast in the BBC's General Overseas Service)

'There seem to be miles of side-shows, midget men, fire-swallowers, dodgems, and pin-tables'

Water Chute, Big Dipper, Octopus, Dive Bomber—all provide the essential movements of up and down and round about—agony and pleasure mixed!

The clock that helps you forget the time: every quarter of an hour the sun revolves, Harlequins swing on trapezes, and the Zoo-keeper rings his bell

TRAINING FOR TECHNOCRACY: 6

'A Living Part of Civilisation'

DR. J. BRONOWSKI brought to a conclusion in this talk the recent G.O.S. series in which speakers examined various aspects of the world-wide problem of finding and training enough scientists, technologists, and technicians to meet the ever-increasing demands of the age

THIS is a time when there is much talk about technics; about technology and the training of men for a new technocracy. There is below these phrases and these schemes a constant undertone which disquiets me. The very word technocracy suggests not a human society but a regiment of ants; and ants, of course, do not need to be educated: they need only be trained. We are in danger of picturing the future society that we want to make as a mere machine, and its men as nothing but mechanics. I do not accept this conventional picture: to accept it would be to condone the destruction of civilisation.

To me science and technology are not mere vocational skills which a man must reluctantly acquire in order to increase his output. Science and technology are part, a living part, of the structure of our civilisation. As much as art and literature they belong to our culture, and education in them is not a mere training but a part of our cultural education. This is a distinction—between vocational education and cultural education—which I ought to make in detail.

A Share in Human Society

An engineering student at night-school learns the calculus in order to become an engineer; a historian learns medieval Latin in order to read documents; I myself learnt Italian in order to read papers in mathematics. These are examples of education for a very specific purpose, and since this purpose often helps us to earn our living I think of this as vocational education. But I knew a man once (he was a schoolmaster who had just retired from teaching mathematics) who learnt Italian in order to read Dante. This was not vocational education. The learner was not fitting himself for a task, as if he had been a literary critic by profession. He was fitting himself, even at the age of sixty-five, not to make a living but to live, and to take not merely his place but his share in human society.

This is the purpose of our education in such subjects as English and arithmetic and history, without which no vocation is accessible to any one. These subjects inform and hold together the fragments of society, so that they shape—and in a sense are—its culture. And it is in this sense that I regard science as part of culture, and a scientific education as part of our cultural education. At this point the scientist is often stopped by those whose education and tastes are literary, because they find these claims puzzling. They know what culture is: it is Sophocles and Chaucer, Michelangelo and Mozart. And they know what culture is not: it is not laundry lists and the proved reserves of oil and the Statistical Digest.

In short, culture is not a body of facts: but what, they ask, is science but facts? How then, they go on to ask, can science be a part of culture, and why should one learn science to become cultured? Alas, these questions miss the very meaning of science. Because science is not itself a set of facts but is a way of giving order, and therefore of giving unity and intelligibility, to the facts. The practical scientists, the professional at his vocation, must know the facts; but science in our culture is something deeper: a framework of principles, a way of looking at all nature, an organisation of knowledge.

From Vocation to Culture

What is taught by one generation to the next is always moving from the first of the two educational modes which I have named to the second: from vocation to culture. No doubt reading was first taught as a strictly useful skill: certainly Latin and Greek were first taught in the Middle Ages so that boys might become clergymen; and in the nineteenth century arithmetic and technical drawing and debating were taught in the mechanics' institutes in order to help those who learnt them to make their way in the world.

Some subjects always remain vocational subjects. Others turn out to have a wider range of uses; and in time these broad subjects cease to be the prerogative and the burden of specialists and become general needs. Science was once the concern of specialists but now enters into the life of everyone. The switchboard and the motor-car, the treatment of flour and of cigarette paper, are our daily concerns; by these we move and act and live. We simply cannot dissociate ourselves from the hot-water system and the airmail and frozen food. A nation unskilled in these, a nation where the screwdriver and the fuse-box are still handled with suspicion, is today a backward nation.

And this goes deeper than the mechanics of earning our living. When a society is penetrated by technical skills and engines the decisions of state cannot be taken out of the context of science. Today you cannot as a voter advocate a responsible policy on inoculation against polio or on cigarette smoking unless you have a general sense both of the statistics

and of the causes of disease. You cannot ponder the decisions which we all have to make on the development of atomic energy without some understanding, among other things, of how human inheritance works; for without this the citizen does not know even the scale of the biological consequences which he is invited either to fear or to disregard.

And no Member of Parliament and no Minister can make intelligent judgments on the most profound of contemporary issues—the secrecy which surrounds fundamental atomic research—until he is at home in the tradition of science since Giordano Bruno and Galileo. Why did science wither in Italy after these pioneers were silenced? Why did it blossom in the restless England of Cromwell and the tolerant England of the Restoration? These questions have more than a historical bearing on our security programmes today.

Here we reach the hub of what we mean by a culture. Of course, we do not want Members of Parliament to be atomic physicists or experts in virus diseases. Why should they be? They are not literary critics or historians. Yet, without being specialists, they know the difference between the poetry of Milton and that of Kipling, and what sentiments each of these minds stands for. They know that Pitt and Napoleon were contemporaries, and that in the nature of things the Industrial Revolution came before and not after the American Civil War. But in the field of science the voters and those whom they elect have absorbed no such implicit knowledge. They have no framework into which to fit new information, no standards to test it by, and no vocabulary with which to handle it.

In all this I have offered only a diagnosis. I have still to propose a cure. Much of the cure, of course, lies with the next generation. But I believe that there are also things which the lively adult, hitherto unused to science, can still do. First, I want him to accustom himself to use mathematics as a practical language. At school he has been taught mathematics as a dead language—all grammar. I want him instead to practise constant translation from the everyday facts into the language of mathematics and thence back into the everyday.

Statistical Methods for All

As one corollary I believe that we now need to make statistical methods part of the education of everyone; and this for two reasons. One is that only from statistics can the non-scientist learn to use averages and approximations with confidence, and to know in his bones the difference between a million and ten. The other is that modern mathematical statistics is a new view of science, which I believe will transform it, and will replace the mechanisms of Newton by the more subtle concepts of modern physics.

My second proposal concerns physics and chemistry. Here I think that everyone should learn to make the atomic picture central to both subjects. This picture of the way atoms are assembled can be made real and exciting to the non-scientist, whose visual sense is often much stronger than his gift for handling either concepts or symbols. My third plea is that he should learn as much biology as he can.

Lastly, I think we constantly need to see science not as a collection but as an evolution of knowledge. I think this important for two reasons. Because it sees science as a historical development this view offers links with history and literature which can give help to the non-scientist.

But, more important, the evolution of science goes to the heart of the scientific method: for it shows at each step how the logical deduction from what seems to lie behind the known facts must be confronted with experience. We make an induction, we put the deductions from it to test, and on the results of the test we base a new induction.

The theme of my talk has been that science must be made part of culture, part of wisdom, a living part of our civilisation. It is certain that the educated man of the future will speak the language of science. That is not at issue: the issue is something else. Will the educated man of the future be a specialist, a scientist or technician with no other interests, who will run his fellow-men by the mean and brutal processes of efficiency of George Orwell's vision of the police state in his book, *1984*? Or will he be a statesman, an administrator, a humanist who is at home in the methods of science but who does not regard them as mere tools to efficiency? The choice between Orwell's *1984* and an earthly paradise does not depend on the scientists but on the people for whom they work. And we are all the people for whom science works. There is only one way to head off such disaster, and that is to make the educated man universal in *1984*. This is the force of my programme today: to make the language of science part of the education, the cultural education, of this and the next generation, who will have either to make or to suffer *1984*. (*Broadcast in the BBC's General Overseas Service*)

Furniture-Making at High Wycombe

SAM POLLOCK visits the charming old country town in the Home County of Buckinghamshire whose chief—but now by no means only—industrial activity of furniture-making 'grew almost literally from the soil,' or at any rate from the abundance of beech trees clothing the neighbouring Chiltern hills

The eighteenth-century Corn Market: High Wycombe lies in the midst of rolling and beautiful farming country which was the source of its prosperity

AT the moment my journeyings about Britain are taking me mostly to the Home Counties which border on the London area, and I am beginning to notice one pleasing quality which the industrial towns of the Home Counties seem to have in common. It is that so many of their leading industries could be said to have grown almost naturally from the soil, were a natural development or extension of the work of field or farm. You could not have a better example of this than the charming old town of High Wycombe, in Buckinghamshire, whose chief industry, furniture-making, for which the town is world famous, grew almost literally from the soil: the raw materials for chair-making, which was and is High Wycombe's speciality, lay to hand in abundance in the wealth of beech trees which clothed the neighbouring Chiltern hills.

Chair-making began in High Wycombe as what we might call a cottage industry—a spare-time occupation for the farm-worker and his family which kept the wolf from the door when a bad harvest or other disaster made it impossible for them to earn a living on the land. In time the cottage gave place to the factory as the seat of the industry, but in chair-making there was none of the large-scale substitution of machine-power for human skill which made the process such a painful one in the textile industry. There was mechanisation, it is true, and there were hard times. But the chair-makers of High Wycombe never quite became the rootless and single-skilled 'townies' who were the victims of the Industrial Revolution in other parts of Britain.

Household Names in 'Chairopolis'

Even today High Wycombe is still a country town: with its population of around 42,000, our town-planners would rate it as the ideal: large enough for urban amenities, but not so large that nature is banished from sight and thought and a man comes to belong to two communities—the one he works with and the one he lives with. High Wycombe is still small enough, too, for the briefest walk around it to remind the most unobservant of its title to the name Chairopolis. There seem to be timber-yards in every street, and you will not go far without passing a huge furniture-van bearing one of the town's 'household' names.

Not that chair-making—or now, even furniture-making—is High Wycombe's only industry. Every type of furniture is now produced there, and the local engineering firms include one famous name: that of Broom and Wade, who make excavating and civil-engineering plant. But a quarter of the town's workers are still in furniture, and High Wycombe, with more than a hundred firms engaged in its old trade, is still the biggest single centre of furniture manufacture in Britain outside London.

Some of the larger firms are highly mechanised—as highly as any of their kind in the world. One of them which, as we say, needs no intro-

Not all the furniture made in High Wycombe is mass-produced: some firms specialise in hand-made pieces decorated by highly skilled wood-carvers

duction is Parker-Knoll, who still concentrate mainly on the product which made High Wycombe's name and fame: chairs. The managing director, Mr. Jourdan, who showed me round, would not have it that the machine has ousted the craftsman. 'On the contrary,' he said, 'we have relieved the craftsman of a lot of unskilled and fatiguing work, and given him more time and energy to devote to his real craft.'

Certainly whatever science and mechanical power can do to take muscle-work and the rule-of-thumb out of chair-making this firm seems to have done: electric kilns for drying and seasoning the timber—controlled by dials and levers, and recorded by graphs; mechanised conveyor-belts bringing parts and equipment to the worker's elbow; infra-red drying of water-stained timber; sawing and shaping machinery of every kind—all adding up to a production of nearly 3,000 chairs a week by a force of 700 workers.

Revolutionising Furniture-Buying

Another of High Wycombe's highly modern firms where large-scale mechanised production has helped to bring within the reach of the ordinary wage-earner a quality of furniture which the old methods would have kept the privilege of the wealthy is E. Gomme, Limited. For every householder in Britain who has heard the name thousands know it better from the branded name of its products: the famous G-plan furniture.

In Gomme's the scientific and mechanical methods which are applied by Parker-Knoll to the manufacture of chairs and settees are applied to the output of practically every single article of furniture that a modern household needs. Having played their part in the revolutionising of furniture-making, it is the further aim of the G-plan people to revolutionise furniture buying. With G-plan furnishing you can start with bits and pieces, building up your home piece by piece, as you can afford it, but with the assurance that every G-plan item harmonises with another.

Then I called on a High Wycombe firm which has, so to speak, the best of both worlds: a firm which can make you a walnut bedroom-suite for £2,000 or a desk for a mere £500, but which is also adventuring with what they call knock-down furniture, whose parts are manufactured with all the High Wycombe craftsmanship, to be cheaply assembled and cheaply bought in undeveloped territories overseas where few perhaps can afford the superb hand-made items in which this firm—Nicholls and Janes—specialises.

The factory is partly located in a disused Methodist chapel, and the entrance gate to it is itself a masterpiece of the carver's art: a copy of a medieval oak-screen carved by the father of the present head of the firm. I watched one of the few remaining hand-carvers—few in Wycombe, and fewer now even in Nicholls and Janes—at work on an oak pulpit which will adorn a local church, and which will stand comparison with the loveliest masterpieces of the medieval craftsmen.

He showed me some chairs he had carved, with their riot of scrolls, floral and heraldic designs, and trumpeting cherubs. 'Twenty years from now,' he said, 'you won't be able to get a chair like that. It takes eight years to make a hand-carver, and the youngsters today want to earn big money quickly.' But I was glad to notice at the carver's bench in this works at least a couple of youngsters who had seemingly been more influenced by love of art, and of the creation of beauty, than by economics. I hope there will always be enough of them around to preserve a tradition which is High Wycombe's and Britain's heritage. (Broadcast in the BBC's General Overseas Service)

Communications

by

Standard

One of the largest telecommunication engineering organisations in the British Commonwealth Standard Telephones and Cables Limited is engaged in the research, development, manufacture and installation of all types of communication and control systems. Concerned with every aspect of telecommunications engineering, the Company is in an unrivalled position to undertake, within its own organisation, the co-ordinated systems-planning of complete communication projects involving inter-dependent systems of various types.

'Standard' products include:—

- Telecommunication Line Transmission Equipment
- Radio Broadcasting Equipment
- Radio Communication Equipment
- Air Radio Navigational Aids
- Supervisory and Remote Control Systems
- Railway Communication Apparatus
- Railway Control Equipments
- Telephone Cable
- Sound-Reinforcement Systems
- Public and Private Telephone Systems

In the field of television transmission 'Standard' portable S.H.F. links are greatly extending the range of outside television broadcasting. Illustrated is the portable S.H.F. transmitter located in London, the first of a chain of 'Standard' radio links which carried the historic Coronation television programme to the Continent of Europe

STORIES FROM 'RADIO NEWSREEL'

Here and There

GRASS AS PROTEIN

WORK has been going on at Britain's famous Rothamsted Experimental Station in Hertfordshire to extract the protein, a vital part of everyone's diet, from grass, leaves, clover, potato-tops, and so on. At the station they have designed and built a special machine which, after various processes, produces a dark-green paste. I talked to one of the men mainly responsible for designing and building it, Mr. David Fairclough, who said:

'Protein has, of course, been separated from leaf fibre in the laboratory regularly during the past 180 years. Our job here is to do it on a potentially commercial scale. Cattle do this, but they do it extravagantly, and we get back only about fifteen pounds of protein in the form of meat or milk for every hundred pounds we use to feed them. In our process there is no waste. The protein is suitable for human food. Cattle can still have the fibre that comes from the press, and the juice that runs away from the protein curd can be used for growing yeast or making antibiotics.

'There is every reason to think this is an economical way to get food, even in comparison with present costs of food in Britain. The cost of food is likely to rise, if anything, and many parts of the world need food even more than we in Britain do. This is a method of opening up a hitherto unavailable type of food for them. But, of course, the only way to find out costs is to run continually for a few months and see. Feeding trials on properly made material have yet to be carried out, but we do know that from a ton of fresh leaf it is easy to make protein equivalent to about a hundred pounds of cheese.

DOUGLAS BROWN

VACCINATING AGAINST POLIO

THE first distribution of poliomyelitis vaccine to health authorities began in Britain recently: enough to give injections to about 200,000 children aged between two and nine is being distributed to start with. The Minister of Health hopes that more than 300,000 of the children registered will have been vaccinated by the end of June. Some of the first injections took place in Oldham, in the north of England, and I was there and talked to some of the children and their fathers.

Outside the clinic was a long row of parked baby-carriages, and since nine o'clock there had been a steady flow of parents and children, with almost everybody on time. And when you remember that these first 130 children are between one and four, it was a surprisingly easy and straightforward task for the staff.

Of course, some of the very young children cried a little, not because of any physical pain but because they were not quite sure what was going on. But most children took it in their stride. One four-year-old I saw was rolling up his own sleeves with a very determined expression; another in a Davy Crockett hat was quietly singing as he sat on his mother's knee in the waiting room.

I followed some of the children through the various stages. First an attendant at the door checks that they have come at the right time; then they pass into the waiting room. Then with their parents they are called in turn into another room, and here a medical officer checks that the child is well. If it is not, the vaccination does not take place. In fact, this is the longest part of the business. And the rest—a nurse swabbing the

A scene typical of the clinics of Britain as injections of polio vaccine began—a surprisingly easy and straightforward task'

child's arm, and a doctor injecting the vaccine—is just a matter of seconds.

Finally, there is a letter to the parents reminding them to report back again in four weeks' time for the second injection; and for the children there is a sweet.

Nearly 3,000 of Oldham's 16,000 children will be vaccinated, and it was decided to start immediately on the first groups so as to finish the vaccinations before the town's summer holiday. While I was in the clinic one of the staff was checking the temperature of the room. Only limited quantities of the vaccine are taken from the refrigerator at a time, and the room temperature must not get too warm.

The first two children vaccinated at Oldham received a permanent reminder of their distinction: a silver cup each, presented by the Chairman of the Health Committee.

TOM HEENEY

MODEL CAR-RACING

A NEW kind of model car-racing has been gaining popularity recently both in Britain and in a number of countries overseas. The idea is a British one, and it sprang from the town of Boscombe, in Hampshire.

I saw a red Ferrari streaking ahead of a Maserati, and a silver Connaught dashing it out with a green BRM, just as if it were Silverstone or Goodwood: but these cars were racing round a twisting model track in a workshop just off the main street of Boscombe.

They are perfectly made racing cars in miniature—perfect in every detail, right down to the tread on their tyres, and as you watch there you get the real atmosphere of a racing track, complete with the smell of diesel-oil fumes from the exhausts. These models are not children's playthings—they zoom around this track at speeds of up to sixty miles an hour—and sixty miles an hour on a figure-of-eight circuit 150 feet long is, I can tell you, an impressive and rather frightening speed.

The man who owns this indoor racing track is Mr. Alban Adams, a builder by trade. I asked him how it all began, and he said:

'Well, first of all I built a model aircraft some six years ago which took me about three months to make. But the very first time I took it out a gust of wind came along and smashed it to the ground. From then onwards I made up my mind that I would build something which would stay on the ground, and I went in for these cars. Then I got in touch with a friend of mine who had the idea of the rail system, and he developed it to a certain extent, and we patented the idea, and from then onwards I took the whole thing over, and developed it to what it is today.'

Of course, that is the whole point of this thing—you can sit alongside the track, and watch four cars racing simultaneously because they do in fact race upon rails.

TOM SALMON

'Perfectly made racing cars in miniature zoom around at 60 miles an hour'

'Sir Laurence C
by Ruskin

The Royal Aca

BASIL TAYLOR, in these impressions of the Summer comments in particular on the work of a number of artists times called the New Realism. 'Without question,' he says

YEAR after year the opening of the Royal Academy Summer Exhibition seems to provide some incident, some work, accepted or rejected, some personal demonstration which will make a headline in the daily newspapers and stimulate public interest in a show which is in fact a good deal less interesting and significant than many others attracting a small response. This year, as on one previous occasion at least, the bait has been laid by Sir Alfred Munnings. He has stated that the Academy has been invaded by a band of 'young brutes' who have caused this to be the 'worst exhibition ever.' The ex-President has sent to the show, with his other more typical examples, a rather crude and ambiguous joke called *Does the Subject Matter?* showing a group of figures, including the Director of the Tate Gallery, examining what is apparently a piece of abstract sculpture.

Now the 'young brutes' are not abstract artists—there is not one abstract work in the show—but must be, I imagine, a number of representatives of a tendency in present British art sometimes called the New Realism. To them the subject does matter. They deal generally with objects and occasions, inhabited landscapes and townscapes taken from modern life, the unglamorous, sometimes the seamy and shabby occurrences of a mid-twentieth-century existence.

'A Vigorous, Inelegant Technique'

These subjects are treated with a vigorous, inelegant technique, sometimes on a large scale. Their masters are not to be found among the great figures of twentieth-century painting, but rather such nineteenth-century artists as Courbet and Van Gogh. Their work is certainly not shocking or difficult through being experimental or obscure, though it may trouble some susceptibilities in its assertive way.

Such painters as John Bratby and Edward Middleditch have been represented in the Academy in previous years, but the tendency they represent is present in greater force on this occasion, and it is interesting to think that in 1956 the New Realism is not only on view at the Academy but will be found in the British Pavilion at the Venice Biennale.

The question one may well ask is whether such young artists as these, who without question form the most interesting element in this year's show, are really by their work and their example going to revitalise the Academy, or whether, as some people may think, they are already Academic artists of a new kind.

Among the older painters, two—both of them members of the Academy—have a kinship with the 'young brutes'—Carel Weight and Ruskin Spear. Weight has always been a gently humorous commentator upon

as Macbeth,
Spear, R.A.

'Miss Janet Scott,' by Norman Hepple, elected A.R.A. in 1954

'William Mathieson Family and Friends,' by Henry Carr: informal group portraits seem to be becoming more frequent at the Academy

Academy Exhibition

Exhibition now on view at Burlington House, London, who represent a tendency in present-day British art some- they form the most interesting element in this year's show'

contemporary events and behaviour, particularly in the urban scene, and his pictures this year make certainly the strongest and most coherent group in the exhibition. His London has all the authenticity and detail which one finds in the painting of Hogarth, and like that master he is inclined to deal with topics having a moral-cum-social significance. Here is a gang of Teddy-boys being chased by a policeman. Here is a group of youngsters, riding their bicycles a bit too fast round a corner—*Speed Merchant*, the picture is called.

Character Portraits by Ruskin Spear

Spear, a follower of Sickert in both subject and method, has also devoted himself very often to the London scene, but this year, as last, he has sent in portraits and some satirical pictures—one an after-dinner speaker feeling a way towards his platitudes, another of a *nouveau riche* couple standing proudly beside their expensive car. His portraits are invariably character portraits, in which his sitters, in the manner of actors, seem to be playing themselves, as indeed *The Laughing Cavalier* has for centuries been putting on an excellent jovial performance.

This year he is showing a full-length, life-size painting of Sir Laurence Olivier as Macbeth, one of his roles in last year's Stratford Festival: again this is an account rather of a moment in a performance rather than a study either of Shakespeare's creation or Sir Laurence himself.

An essential and traditional element in all Academy exhibitions are the presentation portraits—public faces for public places. For once there is no portrait of the Queen, and the two pictures of the Duke of Edinburgh have no outstanding qualities or attraction to recommend them.

The present lion of society portrait-painting, the Italian Annigoni, is represented by a painting of Dame Margot Fonteyn, and this is an occasion when the artistry of the sitter far outreaches that of the painter, although the artist now commands the esteem that was enjoyed years ago by de Laszlo. He has a recipe for popular portraiture: his flattery is reserved and shrewd, which means, in fact, that his compliments are skilfully phrased, his record of appearances is detailed and painstaking. He has the glamour of a foreign name, and like the first President of the Academy, Sir Joshua Reynolds, he realises a portrait can be given a certain distinction by reference to the methods and vision of the old masters.

The sculpture is not a very distinguished collection, and Dame Margot is again the subject of the most spectacular and also the most distinguished piece—a full-length, shining bronze of the great dancer in ballet costume by Maurice Lambert. (Expanded from a broadcast in the BBC's *General Overseas Service*)

Contrasting styles in portraiture: 'Myself,' by R. O. Dunlop, R.A., and (right) 'Peter Cushing as Winston Smith in "1984,"' by Bryan Kneale

A. Daniels's 'Tea at Lyons' catches the atmosphere of a London institution. The pictures in these pages are reproduced by permission of 'The Royal Academy Illustrated'

Books to Read

Reviewed by
M. R. Ridley

IT is always a pleasure to begin with a book which one can recommend with no reservations—at all, and that is my happy position with a novel called *The Headland*, by Carol Brink. The headland of the title is a headland on the coast of France, where it happens that five children in their holidays meet and play. They are a brother and sister, half American half French, another brother and sister half French and half Spanish, and the fifth is a girl who is pure English. After an introductory chapter, the rest of the book is devoted to showing the interweaving of their destinies in later years, mainly in occupied France during the second war. The main figure is Raoul, the half-Spaniard, a most powerful and penetrating study of a nature devouringly ambitious, proud and sensitive as Lucifer, a born leader, and utterly self-centred. But the rest are just as firmly, if more quietly, drawn. Miss Brink adopts the perilous technique of letting the story be told in turn by the participants, except that, I think wisely, we see Raoul only through the eyes of the others—he never tells his own tale. Miss Brink's mastery of her method is complete and there is hardly a touch that seems contrived; each narrative is wholly in character, illuminating the other figures, and giving as much self-revelation as we have any right to expect. The insight into human nature is both kindly and keen, and the book is admirably written.

Beloved Lady is an historical novel by Barbara Jefferis. One wonders why the Paston Letters have been so little used by writers of fiction, since this series of letters of a well-to-do English county family in the period of the wars of the Roses is full of human drama. Miss Jefferis selects from her material with unerring skill and makes of her selection a moving and gripping story. One of the Paston daughters falls in love with her father's bailiff; the marriage would not be, in the ordinary sense, very seriously 'below her,' but it would be, for the family, a highly unprofitable one, in days when marriageable daughters were looked on more or less as so much merchandise, to be bartered by the head of the family for wealth or position. Every method is used to break the match. The central drama is set against a background of the turbulent and often confusing times, which is drawn not only with exemplary vividness, but also in a way which brings a large measure of clarity out of confusion. And there are a number of powerful scenes and exciting episodes, notably the two death scenes which open and close the book.

The Vows of the Peacock, by A. W. Graham, is the story of Edward II, his Queen, and his favourites, his besottedness over whom in the end drives her into the arms of Mortimer. It is a story that most of us know, if at all, from Marlowe's play. Here we have a full-length treatment of it. The story is told by Elizabeth, a daughter of the great house of Warwick, who is sent almost as a child to be lady-in-waiting to the young Princess of France, Isabel, when she comes to England as the bride of Edward. The Queen is only a year or two older than Elizabeth, and between the two girls there springs up a friendship that endures through all Isabel's vexed life. It is throughout an excellently workman-like book, but for two-thirds of its length it is a great deal more than that. I have seldom read a book which falls so decisively into two markedly unequal sections. It is as well to warn the reader that he will need patience—even though the patience will be abundantly rewarded—for the first hundred pages are just plain dull. And then, quite suddenly and without warning, with the death of Elizabeth's father, the whole thing jumps into the most vivid life, becomes exciting, and holds one in its grip, a very willing prisoner, till the end.

Now for some lighter fare, in the shape of a detective story by a new writer: *Landscape with Dead Dons*, by Robert Robinson. It is very high spirited, moves very fast, and is sometimes on the borderline, or even over it, of sheer farce. But the detective side of it is most adroitly managed, and I think completely fair, though there is this weakness, that some of the false trails are not really trails at all, but merely irrelevant dead ends. Mr. Robinson has a strong sense of humour, and this sometimes betrays him into mere vulgarity. The trouble with these lapses is not so much that they are vulgar—since it is possible to be both vulgar and funny—but that they are often completely irrelevant and so simply a distracting waste of time. Nevertheless Mr. Robinson is a new writer who is going to be worth watching.

Bach and the Heavenly Choir, by Johannes Rüber, is a quite delightful fairy tale or fantasy. It is the story of a hypothetical modern Pope, Gregory the Nineteenth, a 'holy and humble man of heart,' an accomplished musician, with a deep veneration of Bach, who has been unexpectedly translated to his high office from a quiet monastery in France. His one real ambition, to which he devotes the failing strength of his last years and his far from failing wisdom, is to secure the addition of a new saint to the calendar by the canonisation of St. Jean-Sebastien. And the story is of the methods by which he attempts to realise his ambition. The picture of him is convincingly drawn, and the book is full of kindly wisdom, which makes it much more than a mere trifle. Herr Rüber has been loyally served by his translator.

The Headland, by Carol Brink (Gollancz, 12s. 6d.)

Beloved Lady, by Barbara Jefferis (Dent, 15s.)

Bach and the Heavenly Choir, by Johannes Rüber (Hart-Davis, 12s. 6d.)

'Books to Read'—G.O.S. on Wednesday at 15.45, Thursday at 00.30 and 05.00

For the BBC cycle of Shaw plays Wendy Hiller has recorded the Eliza Doolittle that she played so memorably in the film of 'Pygmalion'

A SHAW FESTIVAL

IT is only six years since George Bernard Shaw died, yet already we have a centenary to celebrate, for he was born on July 26, 1856. Shaw had won his world status long before his death, and nobody knew it better than he. He was constantly bracketing himself with Shakespeare. When the Oxford University Press invited him to provide the 500th volume in their 'World's Classics' series he chose *Back to Methuselah*, which, he said, is 'a world classic or it is nothing.'

The centenary celebrations in Britain are modest. There is a Shaw Society, but not yet any cult or industry as there is for Shakespeare; his house at Ayot St. Lawrence failed as a place of pilgrimage and is no longer open to the public. There are a few professional and amateur productions of the plays for the centenary year and one or two commemorative meetings. However, Shaw's world status is being saluted by the BBC, and in July, August, and September the General Overseas Service and 'London Calling Asia' are combining in a Shaw Festival.

'London Calling Asia' leads off on Tuesday this week with the first of a weekly series of twelve half-hour programmes. In August, while this series is still running, the General Overseas Service will start repeating the first half-dozen.

In each play I have sought a scene which will stand on its own with the minimum of introduction or scene-setting. Sometimes this has been easy: for instance, the *Epilogue to St. Joan* and the Interlude to *The Apple Cart* are just the right length, and each is almost a one-act play on its own. In other cases two or three scenes have been linked by a narrator. Generally the work of adaptation for radio has been easy, simply because so little is needed.

Casting, too, has been enjoyable. Dame Edith Evans is to repeat for us two of the classic parts which she created under Shaw's personal supervision in the original productions—Orinithia in *The Apple Cart*, and the Serpent in the Garden of Eden scene in *Back to Methuselah*.

Wendy Hiller has recorded the Eliza Doolittle that she played so memorably in the film of *Pygmalion*. Celia Johnson, the perfect Candida, and Robert Harris, the perfect Caesar, happened to be available between theatre engagements when our productions were due. And I found that Richard Gooden, for whom the part might have been written, had never played the little Greek tailor, Androcles, though he had been in many other Shaw productions. Kenneth More will star in *The Devil's Disciple*.

Listeners will also hear fine performances from players of less starry renown. I especially recommend the St. Joan of Jill Balcon; the Dauphin and the King Magnus of John Richmond; the Cleopatra of Beth Boyd; the Charles II of veteran Wilfred Walter and the Newton of Carleton Hobbs in the same play; the Bluntschli and Raina of William Fox and Hilda Schroeder in *Arms and the Man*.

'London Calling Asia' offers a further titbit, or *hors d'oeuvre*. Shaw's prefaces are often nearly as enjoyable as the plays. So each 'L.C.A.' broadcast is being preceded by a five-minute reading from the appropriate preface. These are on Tuesdays at 13.25 GMT (the first one was given last week) with Shaw's swashbuckling justification for writing prefaces.

Arthur Russell

Dame Edith Evans is to repeat her part as Orinithia in 'The Apple Cart'

This Week's Listening

JULY 8-14

COMMONWEALTH STUDY CONFERENCE

DURING the next three weeks listeners may hear several programmes stemming from H.R.H. the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities within the Commonwealth and Empire. Much of the significance of this conference lies in its membership: men and women of many races and nations who are facing responsibilities in industry.

The G.O.S. hopes to bring some of them to the microphone during their stay in England. During the first week, in addition to the Duke of Edinburgh's opening address, a special version of the opening lecture by Sir John Maud on 'The Impact of Industrialisation' will be broadcast. Sir John is Permanent Secretary to the Ministry of Fuel and Power and has a distinguished record as a university lecturer and as a civil servant. In 'This Day and Age,' Sam Pollock will describe the early sessions.

In subsequent weeks the G.O.S. will broadcast special versions of other lectures given at the conference by distinguished speakers, and editions of 'London Forum,' 'Serious Argument,' and 'Commonwealth Club' will be devoted to its work. When the visitors attending the conference go on tour to inspect British industries Sam Pollock will accompany them and report on his journey.

Sir John Maud: Tuesday 15.45; Wednesday 00.30 and 05.00
'This Day and Age': Friday 16.45; Saturday 02.15, 09.30

THE ENGLISH-SPEAKING UNION

SPEECHES from a dinner given by the English-Speaking Union in honour of Earl Attlee will be broadcast on Friday at 01.45. Earl Attlee is the Vice-President of the Union, and the occasion will be used to pay tribute to his services to the cause of friendship between the Commonwealth countries and the United States during his twenty years as Leader of the Opposition, Deputy Prime Minister, or Prime Minister.

The toast to Earl and Countess Attlee will be proposed by the Prime Minister, Sir Anthony Eden, who will be supported by the Rt. Hon. R. G. Menzies, Prime Minister of Australia.

JOURNALIST EXTRAORDINARY

WICKHAM STEED, who was Editor of *The Times* from 1919 to 1922, and became during the crucial ten years after 1937 one of the chief commentators on world affairs in the BBC's Overseas Services, died last January at the age of eighty-four. On Thursday at 01.00 and 18.30, in 'The Extraordinary Life of Wickham Steed,' Stephen Watson will be telling the story of this most cosmopolitan of Englishmen, illustrating it with extracts from Steed's own recorded reminiscences, and with recollections of Wickham Steed by some of his friends and colleagues.

G.O.S.: Thursday 01.00 and 18.30

'SERIOUS ARGUMENT'

THIS week's edition comes from the Rotary Club of London. The 266 members of the club meet in one of the banqueting rooms of the Connaught Rooms in London, and it will be at one of these functions that 'Serious Argument' takes place. The team will consist of the Rt. Hon. Walter Elliot, M.P., and the Rt. Hon. James Griffiths, M.P., with Frank Byers in the chair.

G.O.S.: Wednesday 23.15; Thursday 06.30 and 14.45

Eddie Calvert will be joining Peter Yorke and his Silver Strings this week in 'Sweet Serenade,' the first in a series of programmes of romantic melodies

THE THIRD TEST MATCH AT HEADINGLEY, LEEDS

HEADELINGLEY, which always seems to produce exciting cricket, is England's bogey ground, where we have never beaten the Australians. It was here in 1930 that Bradman scored 309 in a day, a feat without parallel in Test cricket. The two matches since the war have produced memorable finishes.

In 1948 the Australians scored 404 for three wickets in their final innings to win the match with Morris 182, and Bradman not out 173. In 1953 the Australians were set to score 177 runs to win in just under two hours, and almost pulled it off before Hutton brought on Bailey to bowl wide of

the leg stump, so England, somewhat ingloriously, saved the day.

Commentaries on the third Test will be broadcast on Thursday and Friday at 12.00, 14.15, 16.15, and 17.15, and summaries of play by Norman Yardley at 12.30 and 17.30. On Saturday there will be commentaries at 12.00 and 17.15 and a summary by Norman Yardley at 17.30.

In addition some of the periods earmarked for 'Summer Sport' (see page 25) will be devoted to further commentaries from Headingley, and on each day's play an eye-witness report will be broadcast at 21.00.

REX ALSTON

A STRAVINSKY OPERA

IT was probably Rimsky-Korsakov with his *Golden Cockerel* who led indirectly to Stravinsky's choosing Hans Andersen's fairy tale, *The Emperor and the Nightingale*, as the subject for his first opera. Though begun in 1908 when Stravinsky was twenty-six, *The Nightingale* was not completed until 1914. In the meantime the composer had made himself known to the world through the music he wrote for a ballet by the Diaghilev company, the now famous *Firebird*.

It is said that if on returning to *The Nightingale* Stravinsky had recast it as a ballet it would be as well known today as *The Firebird*, for though its picturesque fantasy requires a stage the tale of an Emperor being saved from death by the singing of a nightingale does not provide the dramatic tension demanded by opera. The music, however, has all the colour of Stravinsky's earlier works before he went in for an ascetic and impersonal style. The title-part in the English version to be broadcast this week in the G.O.S. will be sung by Mattiwilda Dobbs.

G.O.S.: Sunday, 12.00; Monday 05.00; Tuesday 01.00

Mattiwilda Dobbs

MOTOR-RACING AND ATHLETICS

ON Saturday commentaries from the British Grand Prix at Silverstone and from the Amateur Athletic Association Championships at the White City, London, will be included in 'Summer Sport' at 13.15, 14.15, 16.15, and 17.00. Eye-witness reports on both events will go out at 21.00. The commentators will be Harold Abrahams and Rex Alston at the White City, and Raymond Baxter at Silverstone.

The A.A.A. Championships will be of even greater interest than usual this year: the team to represent Britain at the Olympic Games in November is to be chosen early in August, and the selection committee will be using to the full this opportunity of making up-to-the-minute assessments of form before their final decisions.

'THE PLAIN DEALER'

WILLIAM WYCHERLEY was a famous man in the Restoration town-houses, handsome, witty, a lover of great ladies. The chandelier shone brightly over his head; he might have climbed up to high office. But Wycherley threw opportunity away. The deceit of the drawing rooms goaded him into rage, and instead of the strategic smiles he gathered a storm of black looks under his hat.

The Plain Dealer tells the story of a sea-captain, Manly, whose conceit is his honesty: he speaks only what he believes to be the truth; he will not flatter or be agreeable to fools. The social 'game' is the pastime of the devil to him, and he always chooses to be offensive when he might be friendly. Manly is a prig, of course, but he is also the stuff from which great satire is made.

The Plain Dealer is not a play typical of its period: it is too passionate and too real. The airy wit of the usual Restoration comedy has no part of this savage, earthy satire.

H. A. L. CRAIG

G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

Radio Theatre presents

'THE YARD'

THIS is a last work by the veteran author, Horace Annesley Vachell, who died a year ago. The title refers not—as might understandably be assumed—to Scotland Yard but to the place in the country where Tom Kinsman trains horses. Tom is an independent-minded man, much respected in the neighbourhood both for his horses and on his own account. To everybody's knowledge he is a widower, and in view of his obvious fondness for Mary Chaundy, who keeps the local pub, it is surprising that he has not remarried, the more so because his daughter Missy is now grown-up.

Missy works with her father, keeping the books in the office, but Tom has had her educated to be, as he considers, above his own social station, and she mixes with the gentry. Thus she meets Commander Roddy Selwin, a former naval officer.

But the romantic set-up for all involved is upset by the arrival at Mary's pub of a brassy, middle-aged barmaid who subsequently turns out to be Tom's wife, now bent on blackmail. And when the woman is found murdered, the event threatens to deprive everybody of any hopes of happiness.

ENGLISH WRITING. Dr. Samuel Johnson, the 'Great Cham' of English literature, will be given a new assessment on Monday by S. C. Roberts, the Master of Pembroke College, Cambridge, who is one of the leading authorities on Johnson's life and works (and also on Sherlock Holmes). Nowadays Johnson is known chiefly as the subject of Boswell's masterly biography. Mr. Roberts will consider him primarily as an essayist, biographer, and critic, pointing out that Boswell himself said he was drawn to his subject by 'the amazing universality' of Johnson's genius as a writer.

THROUGH EASTERN EARS. Suvil Raj Grubb, in Tuesday's programme, will compare South Indian classical music with his favourite western composer, Mozart, and describe memories recalled by chosen pieces. Mr. Grubb was formerly a station director of All India Radio. He has now settled in England in a small town called Aylesbury to the north of London, where he is a member of the Aylesbury Choral Society.

THE WORLD OF SCIENCE. Previous speakers in this series have dealt with the fundamentals of nuclear energy, the principles of nuclear reactors, and the use of radioactive isotopes. On Saturday Sir John Cockcroft, F.R.S., will sum up and discuss the future of this important new science. Sir John is the Director of Britain's Atomic Energy Research Establishment at Harwell. In 1932 he shared with E. T. S. Walton the achievement of breaking up for the first time an atomic nucleus by artificial means.

U.S. Servicemen in Britain

GERARD MANSELL tells the story behind the documentary programme to be broadcast in the General Overseas Service this week in which Robert Reid is presenting a picture of the life of American airmen stationed in Britain today

FOR anyone living in the eastern counties of England it is not unusual nowadays to catch sight of the white vapour-trails which American jet-bombers trace, rather like chalk-marks, high up in the English sky over the fields and hedgerows of East Anglia.

But the return of the American Air Force to Britain eight years ago has also meant the arrival of thousands of American Servicemen—many of them with their families—who have settled down, thousands of miles from home, to live in the quiet, peaceful villages and small towns of eastern England, and also in some of the more heavily populated areas of Lancashire and Cheshire.

Today, living in our midst, there are something like 50,000 American Servicemen, many of whom are very young men who have left the United States—and even in some cases their own homes—for the first time in their lives.

How have these 'permanent tourists'—if they can be so described—been adapting themselves to their new environment? And how have the British people among whom they now live been taking to them? Not unnaturally, for two peoples who speak the same language, it always comes as a surprise to discover how fundamentally different each is from the other, in spite of many commonly held beliefs and ideals. And, of course, both British and Americans are inclined to the dangerous pastime of making broad generalisations from isolated cases and of mistaking appearances for realities.

Success of Co-ordinated Efforts

But minor differences and misunderstandings should not be allowed to obscure the fact that by and large the problems of co-existence are being solved daily with remarkable success, both through the co-ordinated efforts of the American authorities and of British voluntary organisations, and through the good will and common sense of individuals.

For thousands of young unmarried Americans living on isolated airfields miles from the nearest town, away from their normal background and with plenty of time on their hands, the first problem has been to get away from isolation and boredom, to adapt themselves to what must often seem to them our strange English ways, and to find friends and amusement.

The initial social contacts have not, naturally, always been easy to make. To many American Servicemen the average Englishman often seems aloof and reserved, not to say stand-offish, while many Englishmen may take American vitality, generosity, and boisterousness for brashness and lack of restraint.

But closer contact has usually dispelled these misconceptions, and in helping to foster these contacts British voluntary organisations, working closely with the American authorities, have been able to do a great deal. Wherever there are American bases, local Anglo-American relations committees have sprung up, and on many American stations today British girls—officially called Community Relations Officers—have been appointed to answer every kind of enquiry from American airmen anxious to be introduced to British life, and to facilitate contacts with the local population.

Smoothing the Initial Problems

It is not that offers of hospitality in British homes have been lacking. But American Servicemen have in the past been understandably reluctant to accept blind invitations and to have their social life organised for them; and much of the work of these Community Relations Officers now consists in getting young Americans in touch with British people with similar interests—whether farming or angling, music or amateur dramatics.

They are helping a great deal, too, in smoothing over the initial problems that present themselves to newly arrived Americans and their families—problems that range from housing, shopping, schooling, and medical attention for American wives and children, to arranging suitable partners for local dances.

The Americans themselves have done much to win the affections of the British communities in the midst of which they live, and to break down the traditional British reserve. The lavish parties given by Americans for English children have become a notable feature of country life in the neighbourhood of American bases, and the kindness and hospitality shown by American airmen in adopting local orphanages and old people's homes have contributed a great deal in getting the Americans accepted as 'regular guys' by the local people. So have the acts of gallantry performed by American airmen in helping save both animals and human beings during the great East Anglian floods three years ago.

Listeners to the General Overseas Service this week can hear a documentary programme in which Robert Reid, who was a British war correspondent with the American Forces in the second world war, presents a picture of the life of American airmen in Britain, illustrating it with interviews in which American Servicemen and British people give their views on this new experiment in Anglo-American relations.

'Eagles over Britain.' General Overseas Service: Tuesday 02.30, Wednesday 10.00 and 19.30

SIR HAROLD NICOLSON, in reflecting upon some of the mistakes which lurk at the back of perfectly sensible minds on both sides of the Atlantic and which tend to obstruct Anglo-American relations, comes to the conclusion 'it is important that the British should become less touchy and the Americans more patient'

Anglo-American Relations

THE first half of this year for us in London has been full of novelties. We had the coldest April that I can remember; not that we really suffered much from sharp frosts but that it just went on and on being as cold as January. But visitors from overseas, who are aware of our habit of contending that our ordinary climate is behaving exceptionally, will not describe that as a novelty at all. Their experience of England, as one of them remarked to me recently, is that the wind turns to the north-east in the last week of December and remains in the north-east until the second week in May.

Those of us who make gardening our hobby have little real cause for complaint: many of the more tender shrubs have been scorched by the January wind, but I feel that most of them will recover when the sun warms up. There is no need to despair. A late spring means that all the spring things come up at the same time and present us with a sudden blaze of colour. Then we have had Mr. Harold Macmillan's Budget. That certainly was a novelty since it introduced into our life the dreaded system of a lottery.

The Central Preoccupation

I am aware that the Treasury officials contend that the scheme of prizes is in no sense a lottery since the amount invested is not abolished if one fails to win. But all the same the principle of being able with Government approval to win gorgeous prizes by chance rather than by solid hard work has now been established, and I foresee that before many years have passed we shall have state lotteries even as they have them abroad. Many people will consider that a most un-English thing to do, and will regard it as a further sign that the old country is losing its ethics and trundling rapidly down hill. I hope that none of you believes anything of the sort.

Then we had the visit to Britain of Mr. Bulganin and Mr. Khrushchev. You have by now heard so much about this visit and the pain or pleasure that it has occasioned that I shall not weary you any further with it. Suffice it to say that ten years ago we should have regarded such courtesies as highly novel.

The rulers of Russia have not been here since the visit paid by the Tsar Nicolas II in August, 1909, and on that occasion the Tsar did not come to London but remained in his yacht, the *Standard*, in the gay roadstead of Cowes. So things have changed.

What I want to talk about here is something that has not changed but that remains the most central of all our many preoccupations, namely the relations between the United States and ourselves. Politically our interests are and remain identical: there is nothing that we possess which America wishes to take from us, and there is nothing that the Americans possess which we enviously covet; moreover to both peoples the aim of policy is exactly the same, namely the preservation of peace.

I suppose there are some people in the world who believe that the British Government or the American Government are in some obscure manner plotting a war. But those who believe such myths must be very few, very ignorant or very stupid. I should say that ninety per cent. of all even rudimentarily educated people are convinced that there is nothing that the average Briton or the average American dislikes and dreads more than the prospect of an atomic war. Yet although this aim of peace is the foundation of policy both in London and in Washington, although we both walk the same path, we do not always keep exactly in step and there are many whose joy it is to watch us shuffle awkwardly and to exaggerate the divergence implied.

Duet or Slanging Match?

The fact is that although at the back of our minds we desire exactly the same object, and although in many ways we think the same and feel the same, there is some obstruction in the front of our minds, or it may be some irritability of the nervous system, which, at least to foreign ears, makes what ought to be a harmonious duet all too often sound like a slanging match. I believe that this misunderstanding is largely due to the fact that on each side of the Atlantic we confuse the symptoms. By this I mean that the Americans regard as typically British attitudes of mind which never were typically British and are certainly not so today; whereas we are apt to define as typically American symptoms which are exceptional symptoms and not characteristic of the people as a whole.

I agree that it is not easy to remedy this misinterpretation. Few Englishmen today can afford to travel in the United States, and our impressions of American life and character are apt to be formed from those debased caricatures which the American film industry export in such quantity to the Old World. And many Americans base their attitude towards the English upon the prejudices and emotions which they derived when learning history at high school.

Thus many of my countrymen are inclined to dismiss everything American as what they call vulgar, meaning by that noisy, self-assertive,

and uncultured; and to many Americans we seem a curiously illogical blend between poor relations, effete aristocrats, colonial bullies and red-coats. Neither of these impressions is correct or even adult; neither would overtly be stated or confessed; but they are there as a background and they blur the unanimity of our attitude towards world affairs.

I am not, of course, referring to the lunatic fringe in each country which tends to accept as true the more fantastic legends that are conceived and propagated. I suppose that there are even today some Americans who really believe that Canada and Australia are British colonies paying tribute to the British Crown and taking their orders from Downing Street. If such people exist they must be very few and very unimportant. I suppose also that there are some Englishmen who really believe that the State Department at Washington wishes to deprive us of our Empire and to reduce us to the status of a small Power, such as Norway, or even Luxembourg.

There may even be some inhabitants of Britain who imagine that all Americans spend their days and nights lolling beside expensive swimming pools, or romping around the campus of fresh-water colleges, or attending night clubs glittering with huge balloons.

But I doubt whether those who hold these beliefs represent a large number of my fellow-subjects or whether their opinions carry much weight with their friends. In every country there exists a minority of morons who adopt these myths as deliberate forms of belief. They are not worth considering. What are worth considering are the prejudices and the mistakes which lurk at the back of perfectly sensible minds and which obstruct understanding.

I should say that on our side, on the British side, the essential fault derives from what used to be called the *superbia britannorum* or British pride. I should be the last to deprecate this quality in its noblest form, since it has proved itself the core of our courage and endurance. It was pride which kept us united and resolute after the surrender of France and the humiliation or glory of Dunkirk. But that was conscious pride: the resolve not to give way in the face of danger. It is our unconscious pride which is such a nuisance in our dealings with the United States since it is inclined to take shapes which are not those of resolute pride but those of wounded pride.

A Septic Condition

I regard the latter as a septic condition in which all manner of snakes are brought forth, such as sensitiveness, envy, jealousy, and resentment. Those who suffer from this malady tend to regard the Americans as a young and uppish people, who have no share in our long European tradition, and who in fact do not regard that tradition with the deep reverence that we expect. Men of my age can remember the time when England was unquestionably the most powerful country in the world, inviolate and invulnerable, and able to determine world policy by throwing her weight to one side or the other.

It irks us that the dollar should now be stronger than the pound, or that the Foreign Office in Downing Street has to watch its step before taking any action that may prove unpalatable to the State Department or even the Pentagon. We feel sometimes that our rights and interests are more widespread than the Americans realise, and that our experience, having been gained through centuries of trial and error, is more solid and more practical than they will admit. These resentments come from wounded pride and are often wholly unconscious. They produce an unhealthy frame of mind to which the only antidotes are modesty, generosity, imagination, and humour.

The Americans, on the other hand, suffer from an unconscious form—in a way a very noble form—of conceit which expresses itself in their missionary spirit. To them the ideals of the New World, the American Idea, is a self-evident advance upon any of the philosophies or political theories of the Old World.

It is not exactly that they adopt a 'holier than thou' attitude; it is that they really believe their special form of democracy is some magnificent revelation which, if universally applied, would bring peace, prosperity, happiness, and virtue to all mankind.

I happen to agree with this theory and hold that the world would be a happier and safer place if the American Idea was held and practised from the Arctic Circle to Ceylon and from Tokyo to Iceland. But the Americans with their missionary spirit tend to be impatient about it all and not to realise that ancient habits of thought cannot be eliminated in a generation. They feel wounded when the splendour of their generosity and the purity of their intentions are not immediately recognised and responded to by the mixed races of Europe, Africa, and Asia. But I am not pessimistic: I am convinced that in fifty years we shall be closer together and not farther apart; but in the meantime it is important that the British should become less touchy and the Americans more patient. TOMMY TRINDER

VIC OLIVER

FRANKIE HOWERD

AL READ

TED RAY

Meet the Laughter-Makers

GALE PEDRICK explains what he had in mind when he decided to make a light-hearted survey of comedy in the twentieth century. Week by week in the General Overseas Service the practitioners themselves—the 'Laughter-Makers'—will speak for those who wear the modern jester's cap and bells

IT was time (so it appeared to me) that someone should speak up for those who, metaphorically at least, wear the jester's cap and bells. A new series, called 'The Laughter-Makers,' is the result. It opens in the General Overseas Service this week.

Each week we shall meet a celebrated man of mirth and discuss, with plentiful illustration, his individual type of comedy, his approach to it, his problems, his hopes, his attitude to such important matters as the script, the fans, and the critics.

I have always wanted to know exactly what goes on in the mind of a man who has deliberately chosen to spend his working life trying to make his fellow-creatures laugh. Many others, I am sure, share my curiosity.

The most popular guests in my series 'These Radio Times' (which has flourished on the home air waves for the best part of five years) were invariably the comedians. In a single programme we would invite a famous conductor like Sargent, a busy sports commentator—say Raymond Glendenning—an actress of the calibre of Dame Edith Evans, and an expert on broadcasting to children. In addition I made a point of bringing to the studio a comedy top-liner, and tried to discover, in a very few minutes, just what really was going on in his mind.

Secret of a Master of Timing

It was obvious from the beginning that the public loved to hear these people step out of character, as it were, revealing the human being behind the motley. They were not interested so much in Ted Ray's childhood background as to know that his first lesson in timing (of which he is an acknowledged master) came not from some older and more experienced comic but from the patter of a street auctioneer.

This is the kind of thing I have in mind to coax from our subjects; and why I hope that, with luck, 'The Laughter-Makers' may develop into a light-hearted survey of comedy in the twentieth century, a survey made by the practitioners of humour themselves. In our Comedians' Gallery we may meet actors whose approach and technique differ as widely as those of Al Read and Eric Barker. But these will be discussions with a difference, inasmuch as our friends will be able to tell stories, sing, and gossip away to their hearts' content.

We may discover the answer to such questions as why the audiences of 1956 seem to have lost the knack of spontaneous, rich, rib-tickling, side-splitting laughter; and why theatre patrons think it necessary to clap their hands instead of laughing, when some funny man cracks a topical joke. There is nothing new in this. In a *Puss In Boots* pantomime of the 1890s the biggest laugh came when the Dame held out her hand in greeting to the Baron and said: 'Dr. Livingstone, I presume?'

HARRY SECOMBE

PETER USTINOV

In the past forty years the renowned British sense of humour has been called upon to withstand two world wars, to say nothing of the impact of American comedy. It would be surprising if our national outlook on what is funny and what is not had not been more than a trifle shaken.

Can we even say that all the giants of the music halls would have survived the ordeal by microphone? Wilkie Bard, Gus Elen, Marie Lloyd, Albert Chevalier—how would they have fared if in their prime radio had then been as much a part of our daily lives as the kitchen stove?

Passing of the Eccentric Comedian

If we want to know why the audiences today laugh neither so loudly nor so long, the passing of the genuinely eccentric comedian may be the answer. The modern laughter-maker of today has grown-up and gives us comedy in a lounge-suit. He has abandoned the funny hat, the carmine nose, the moustache askew. He has 'gone respectable.' It is a pity, because with the shabby, badly fitting, loud-checked outfit he has put off some of the old and infallible childish magic.

Ridiculous as they looked, they touched a chord in the onlooker, and in some outrageous way reminded him of the foibles of someone who had a part in their own lives. That absurd moustache really was a bit like Uncle Fred's; that flat-footed, pompous walk—did you ever see anything more like old Stiggins at the office? And Nellie Wallace's fruity croak—well, if you shut your eyes, you might be listening to Grandma, except that Grandma would never say such dreadful things!

But today we are all much of a muchness. There are no 'characters' abroad in the streets (apart from, say, the inimitable Beecham and Gilbert Harding).

Vic Oliver very courageously made his own position clear in a series I recently wrote for him which was based on his autobiography, *Mr. Show Business*. Vic did not mince words. He said bluntly, but with genuine good humour, 'I'm not naturally a funny man. I'm only funny when I have a really comic script written for me. I'm not like Arthur Askey or Tommy Trinder, who have only to open their mouths to be very funny.'

Mainly, the act of the modern droll is to read (or learn) a slick, smooth script, with smart gags typified by Ted Ray's answer to Kitty Bluett's 'Ted, do you love me still?' 'I don't know, darling. I've never seen you still.' Which, the way Ted says it, can sound very funny indeed.

Here is fuel for argument. These are some of the matters on to which varied representatives of 'The Laughter-Makers' will turn the spotlight week by week.

'The Laughter-Makers,' General Overseas Service, Wednesday 12.15; Thursday 20.30, Saturday 02.30

What Is this Thing Called 'Automation'?

Automation in the motor industry: in the Austin works the automatic conveyer system and mechanical handling units are monitored from this control room

THE cynic's definition of automation might well proceed as follows: 'Automation is a verbal fad referring to any technological advance which the user has in mind. Its persistent abuse for the purpose of politics, journalism, sales promotion, and self-advertisement has prevented it from acquiring any precise technical meaning.'

A less cynical definition would regard 'automation' as 'advanced mechanisation: period, mid-XXth century.' Advances, of course, are relative matters. They may involve intensified exploitation of known fields or the initial exploration of new fields or both. They may also involve a reorientation of outlook.

Four types of advance in mechanisation have matured in the post-war world. I say that they have matured, not that they have been invented; they all began at some time in the past; they are not sudden discoveries; some have their roots in the very deep past. I always advise my friends to confine the word 'automation' to these four advances; it will then cease to mean 'whatever there is a strike about,' irrespective of what the newspapers may say, and mean something definite.

Continuous Sequence of Automatic Operations

The first advance relates to coupling automatic machine tools or presses together so as to form a continuous sequence of automatic operations. In effect thirty automatic tools, say, are converted into one, and thirty manufacturing operations are performed in sequence as a result. A casting goes in at one end accordingly and the finished cylinder block of an automobile comes out at the other. This is called transfer machining, transfer pressing, or, in general, transfer processing.

The second advance is not dissimilar, and relates to the coupling of assembly operations so that a whole sequence of them is converted into one. It is known as automatic assembly. It is not new. A loom is a machine for automatically assembling a piece of cloth, and is a very old device. Electric-lamp bulbs have been assembled automatically for at least a generation. The current practice of automatically assembling a whole amplifier for a radio receiver goes a good deal further, however.

The third group of advances relates to automatic control. The thermostat on a hot-water system or cooking oven or refrigerator is an example of such control. The idea is by no means new, but advances in electronics (which has no direct connection with automation) have solved a lot of problems in this field and opened up new possibilities for running processes with the minimum of human intervention.

The fourth group of advances is concerned with what is called data-processing by means of automatic (mostly electronic) calculating machines. These are usually called digital computers. They are sometimes called electronic brains. They are likely to mechanise a great deal more of routine office-work than was possible with punched-card machines, but they still appear to be only an extension of the sort of thing that has been customary for a long time past.

There is no common factor shared among these four advances. The fact that they have matured at about the same time is somewhat of a coincidence, but it is a coincidence that has set people thinking and talking, and that is why a new word 'automation' has become popular to describe what they are thinking and talking about.

LORD HALSBURY, Managing Director of Britain's National Research Development Corporation and a leading authority on automation, defines what the term really means and discusses some of the problems presented by advancing mechanisation

People are not talking and thinking about the processes involved in automation and are not in fact much interested in them. Few people know much of any one of the four processes the word covers, and fewer still know about all of them. What they are talking and thinking about are the consequences of automation—its social and economic consequences. As a result, much nonsense tends to get talked about the processes themselves, and much of what is written about push-button or robot factories is science-fictional, like space-travel.

People confuse what they imagine is happening with what really is happening; what is done today with what may be done tomorrow; what is being done in America or Russia with what is being done in Britain; and what is really new with what is a mere extension of something old. This confusion will pass: it is transient.

What Are the Consequences Likely to Be?

What seems more likely to be permanent is a sustained and developing interest not in automation but in a more general problem. What are the consequences of advancing mechanisation, or productivity, if you prefer to call it that? Does it give more employment or less? Is it used to displace labour or to increase output? If it increases wealth, in what proportions should the increase be shared by capital and labour? Is labour's share to be increased wages or shorter hours or longer holidays or a compromise? Nothing but good can come of these discussions. The strength of a democracy is in proportion to its degree of real information on the real questions that it has to decide.

To help people understand what it is all about, individuals like myself and corporate bodies like trades unions and employers' federations have for some time been studying all that is involved, and we have been lecturing about our conclusions or publishing them as reports. The latest such report comes from the Department of Scientific and Industrial Research on behalf of the Government.

All these reports, including the Government one, agree with one another. They tend to debunk the word a little, just as I have slightly debunked it myself. They all emphasise the evolutionary rather than the revolutionary nature of automation, but point out that our danger will be going too slow for lack of the qualified personnel rather than going too fast. They all insist that its social consequences are age-old problems which solve themselves as we go along without our noticing over much. They also pinpoint issues where 'solve it as you go' is getting a bit out of date and where we need to think more clearly and take more trouble than we have always done in the past.

Have you ever read a Government report? If not, you may think it a dull sort of thing, but this one is not. Why not ask a friend to buy a copy and post it to you? *Automation*, published by the Stationery Office, price six shillings. I think you will find it fascinating reading. (Broadcast in the BBC's General Overseas Service)

PRODUCTION EXHIBITION

AUTOMATION in the motor industry is not new. In some factories it has been in operation for several years, although we are still a very long way from anything even remotely like a push-button factory. But in quite a number of car-factories the so-called transfer machine has been at work long enough to have become a routine feature of production. The term simply means joining together in a straight line all the tools required to machine a component, so that it progresses from one operation to the next automatically.

There is a very large example of this kind of automatic set-up at the Austin factory in Birmingham. This example, one of about sixty of various kinds in the works, performs something like 200 operations on the cylinder block of a car engine. It employs two men—one to load it, the other to unload it. And before long, I was told, it may be able to load and unload itself.

At a preview of the Production Exhibition in London I have been seeing this automation in model form. A group of apprentices at the factory has made an astonishing working model of the transfer line, and other models illustrating automation in car manufacture.

One of the most remarkable pieces of automation is the spray painting. Here the car body goes into a tunnel, air-conditioned to exclude dust, where spray-painting nozzles pass over the body, twisting and turning to follow its shape.

This development forecasts the end of the unpleasant business of spray-painting by men who have to be goggled and masked and dressed like space-men against the all-pervading vapour of paint. BERTRAM MYCOCK

Sir Miles Thomas studying a system for carrying passengers in cars moving on a conveyer-belt at fifteen miles an hour

The beginning of the entirely automatic factory: a conveyer which can be 'told' by punched tape to deliver components to automatic machines and then collect them again

Equipment for Mechanical Handling

HARDIMAN SCOTT visits an exhibition at Earls Court, London, to show new ways of handling things mechanically—'a step,' as he says, 'in the direction of automation'

MECHANICAL handling—ways of handling things by machine—is a step in the development of automation, that new word which really means nothing more than doing more and more things automatically by machine. I am told that if we in Britain used all the handling devices we could we should save about £500-million a year. And when you looked round this exhibition you could well believe it. There was every kind of conveyer, elevator, and fork truck, from small ones that dash about like coloured beetles to a monster that can lift eight or nine tons at a time; huge cranes—there was on view the largest overhead travelling crane in the world: it can lift a hundred tons; and another crane, electronically controlled, playing a game of chess.

But of all the wonders it seemed to me that there were two that are revolutionary. One is an electronically controlled conveyer. I know it is an awful mouthful, but this is what it means: a factory is going to produce something; it decides on its programme of production; that programme is punched on to a tape by a teleprinter; that tape is fed into a machine; and from there on the whole of the production is automatically controlled.

I watched components—they might have been parts of a motorcar—coming along on a conveyer, then automatically being delivered at certain points to automatic machines, which went to work on them, and then returned them to the conveyer system. You see what it means? It is the beginning of the entirely automatic factory.

New System of Passenger Transport

The other exhibit which struck me as revolutionary was a new system of passenger transport. It has been developed in America, but there is a firm in Yorkshire licensed to make it. When I leave work I go home by Underground. I wait on a crowded platform and then get into a crowded train. But this new system, it is claimed, will get rid of all that: we should be delivered at our destinations on a conveyer-belt.

I saw a model of it. We should go on to a platform, which is slowly moving, called a speedwalk. Alongside it, where normally there are the tracks of a train, is another conveyer-belt with passenger cars on it that is moving at the same speed. So, quite safely, we step from our moving speedwalk into the car. It speeds up to fifteen miles an hour and then drops us at our destination.

The advantages of the system are that there are no drivers or guards, and you never have to wait for a train. There is always a passenger car moving in front of you on the continuous conveyer-belt. And one of the American experts told me that this system could be introduced into London's Underground.

If you want to carry this kind of thing into your own home I found a firm in the exhibition showing a moving stair for an ordinary house: you stand or sit on the bottom and it takes you over your own staircase to the bedroom door. (Broadcast in the BBC's General Overseas Service)

A hydraulically operated, diesel-driven scoop which can also work as a one-ton crane: it is especially suitable for loading and light excavation

Useful in any house with an invalid—a lift, driven by an electric motor, which runs on rails laid over the stairs

A saloon car fits comfortably in the cargo space of this 'straddle-carrier,' which can easily handle awkward loads of up to ten tons normally shifted by overhead gantries

News of the English Theatre

PHILIP HOPE-WALLACE, the well-known dramatic critic, discusses some of the productions which have been filling the theatres in London and Stratford of late. He also interviews Enid Bagnold, author of the outstandingly successful comedy, 'The Chalk Garden'

HOPE-WALLACE: 'A dramatic critic in Britain never gets any time off: in London alone there are forty or so theatres functioning all the year round and at this time of year especially the theatre is bursting out all over—like the spring. At Stratford-on-Avon they seem to open their Shakespeare season earlier each year, though this time the opening was a good deal less spectacular than last year when Laurence Olivier and Vivien Leigh were the star attractions. This year Stratford opened with a bleak sort of Hamlet which was like the post-war Wagner operas at Bayreuth—all done by lighting on a black, stark stage. Their next production, *The Merchant of Venice*, brought out some real stars, though, and a delightfully pretty set of stage pictures wonderfully organised by Margaret Webster, a prophet hitherto not without honour save in her own country.'

'She is really English, though her reputation as a Shakespeare producer was made in America. Well, she certainly knows her stuff: it was a light-footed *Merchant of Venice* and maybe no one knows better than a dramatic critic how heavy in hand this old comedy can be. It had an enchanting Australian Portia in Margaret Johnston; and a Welsh Shylock, Emlyn Williams, who has been touring the world of late doing Dickens recitals. His was a dazzlingly clever performance, and one which, I am told, is gathering warmth every time (it was a bit cold on the first night). Maybe that was the result of thinking about it in advance, because Emlyn Williams has had his eye on this part ever since childhood. He was making us laugh about his first performance of it at school, when he spoke at the great annual Birthday Lunch given on Shakespeare's supposed birthday, April 24.'

Emlyn Williams—Then and Now

EMLYN WILLIAMS: 'We had no director for the play but the rehearsals were very plain sailing. Miss Webster will be interested to hear that I had told everybody where to stand and where I was going to stand. You must admit that I was rather a bright boy because without ever having been in the theatre I was beginning my career centre up-stage. Miss Webster moves me about rather a lot. My costume in the present production is a work of promising young Alan Tagg. In my first experience in the role I was dressed exclusively by my mother.'

HOPE-WALLACE: 'At the same luncheon Cecil Day Lewis, who is married to an actress and—perhaps just as important?—is Professor of Poetry at Oxford University, talked about the future of the theatre.'

DAY LEWIS: 'The future of the theatre seems to me to be in the hands of us, the audience. If we think of the theatre in terms of going to see a jolly show, if we think of it in terms of safe, inoffensive, unreal situations given to us in safe, inoffensive, unreal words, then we shall get the theatre we deserve, and it will be a worthless one.'

HOPE-WALLACE: 'Of course, one does feel a bit apprehensive about the fate of the theatre—with rising costs and so on. But another real danger is a social one: the people who are the readiest spenders today are those people who never seemed to care much for the living theatre: it was always the music-hall for them, and today they seem to prefer television and the cinema. Still, there is a huge audience for Shakespeare. Tyrone Guthrie's production of *Troilus and Cressida* at the Old Vic, done in 1913 costumes, is a riotous success; and it is amazing what variety of plays get put on and keep running. In the past few days I have seen such widely different things as a "musical" made out of J. M. Barrie's book *The Little Minister*, greeted as if it were another *Oklahoma*, and when I could see out of my eyes, which were full of tears from laughing too much, I saw Alec Guinness in a refurbished French farce called *Hotel Paradiso* by that master-farce-writer, Georges Feydeau.'

'A current success is the play made out of Graham Greene's book *The Power and the Glory*, in which Peter Brook produces marvellously, with Paul Scofield (who was the Hamlet we sent to Moscow) as the poor, hounded, sodden Roman Catholic priest who is on the run in an infidel state. It does not make as good a play as it did a

film; the situation is static on the stage, or only variations on the same paradox, of the cowardly priest who by reason of his divine office is precious to the faithful but who goes to his martyrdom also with squalid fear.'

'The play I have most enjoyed recently is Enid Bagnold's *The Chalk Garden*, in which merely the presence of our two leading actresses fighting for the laughs between them—Dame Edith Evans and Peggy Ashcroft—made it in itself a gorgeous theatrical occasion. But it is also a highly original comedy, with a tang and a bite in the language and something of that caustic, laconic style of language and view of life you find in Saki and in Somerset Maugham. It was a success in America first (previously it had been turned down in England). The play is about a rather vapour woman (Edith Evans) who is making a mess of bringing up a grandchild and how she hires a governess, the strange Miss Madrigal, who has those green fingers, as they are called, which can make plants (and children) grow, and who can manage this child wonderfully well—all going well until, in a wonderful scene during a lunch party, the cat is let out of the bag: Miss Madrigal is recognised as a reprieved murderess who did fifteen years in prison, and where, out of her misery, she somehow learnt wisdom such as the grandmother has never acquired.'

Catching Character in a Phrase

'Enid Bagnold is a most clear-sighted author with, obviously, a wonderful flair for catching character in a phrase—you know, the thought that goes unspoken behind the words actually uttered—and for lines-of-conduct in general. Was the origin of the play—I asked her—interest in the lines-of-conduct in the growth of the three female characters—which I thought were wonderfully done—the grandmother, the child, and the crippled, frustrated governess?'

BAGNOLD: 'No, to begin with it was due to the combination of an accident which happened to me and also the interest I have in not evading the issues of life. One's day is filled up—my days, all our days—from edge to edge, with the little things that one does: cooking, gardening, an appointment with the hairdresser, an appointment with sleep at night. And all this evades the issue of being alone. It seemed to me that if I were forced to be alone in prison, with very little to read and nothing much to do, I might get nearer to something that was real, and that is what my central character is about.'

HOPE-WALLACE: 'Tell me a little bit about the difference between the reaction of the London audience, who found these characters very original, and the New York audience, who, I suppose, thought of them possibly as typically British?'

BAGNOLD: 'I do not know that they did. The American audience laughed a great deal more, but then the American audience was such a dazzling surprise to me after the terrible time we had had in our out-of-town tour when we seemed to be getting nearer and nearer the grave.'

HOPE-WALLACE: 'There is one character that never appears at all, the only character I could not quite take: the butler who is dying off-stage upstairs. Has he some sort of allegorical role to play?'

BAGNOLD: 'I am told that he has, and perhaps rightly so. A great many things one does—in a curious sub-conscious way—have, let us hope, more meaning than we had intended; but when they do one must be thankful for it. The butler really slid down my left sleeve under the paper in a very rash and frivolous manner, and he has remained on the paper, and remained on the stage.'

HOPE-WALLACE: 'I confess I was tempted to see a little bit of an allegory in the chalk garden itself. This question of soil—I do not think you can quite wriggle out of that one. I think there is an allegorical meaning somewhere, and it is that which gives the play a kind of double edge which is extremely satisfying.'

BAGNOLD: 'But, there again, I must make a little riddle, and that is that I was always gardening on my own chalk garden while I was writing the play, and I think the chalk rose up and did something, but it was not conscious, and I used to get terribly cross. In fact one of the reasons why the play was refused in England was that it was really such "tiresome allegorical stuff." When I got a letter saying that, I was furious because I had not meant it to be allegorical, but now I have to sit down under it.' (*Broadcast in the BBC's General Overseas Service*)

Peggy Ashcroft, George Rose, and Edith Evans in a scene from John Gielgud's production of 'The Chalk Garden'

'The Feminine Touch,' with Belinda Lee and George Baker, tells the story of nurses in training

Max Bygraves makes the most of a starring role in 'Charley Moon'

A British answer to Hollywood's westerns—'Safari,' filmed with plenty of action against colourful African backgrounds

Some British 'Films To See'

DILYS POWELL, in this contribution to the G.O.S. review of the latest British film releases, discusses films that range from broad comedy to extravagant adventure, from documentary record to drama

LET me begin with the broad comedy: with Max Bygraves in *Charley Moon*. For a long time the British cinema has been wrestling with the problem of the musical. America produces brilliant musicals: witty, spectacular, with first-rate dancing and music. The Hollywood musical carries America with it wherever it goes.

Now there seems no reason in the world why Britain should not turn out good musicals in its own style; not, perhaps, the large-scale, handsome style of America but something intimate, perhaps, something with individuality and a national flavour.

Britain has the talent and the performers; but somehow we have not got the musical. *Charley Moon* is the most recent attempt. I cannot pretend it is exactly a success, but it has certain assets. I should say, before I go any further, that it is the story of a country boy with a talent for the stage who gets to the top of the tree and then suddenly realises that he prefers the simple, quiet country life to which he was born.

It is a story which gives opportunities for song and dance—it has at any rate one good song; and it gives opportunities for incidents on- and off-stage in provincial music-halls and London theatres. It is in colour, and it has some good playing. Dennis Price, for instance, gives a satirical performance as the actor who is always talking about Ibsen and the grand style when he is really quite without talent. But, of course, the greatest asset of *Charley Moon* is Max Bygraves. Mr. Bygraves is a comedian from the music-hall stage with great charm and great gifts. The trouble is that *Charley Moon* does not give him a chance to use them: the material is thin and old-fashioned, and the direction by Guy Anderson lacks the drive and the speed necessary for a successful musical.

Brave Hunter and Beautiful Blonde

Africa in the past few years has become one of the most popular settings for stories of adventure. It is the British answer to America's Wild West. Now along comes *Safari*, another story about the brave white hunter and the beautiful blonde among the crocodiles. *Safari* was produced for an American company, but its director, Terence Young, is British, and most of the players are British, though two of the stars, Victor Mature and Janet Leigh, were imported from Hollywood. The film is in CinemaScope, which, of course, allows plenty of room for the elephants, the lions, and the snakes as well as the crocodiles.

It is the story of a rich man who is possessed by the desire to shoot a famous lion; and as audience he brings along the girl he is going to marry. I need hardly say she does not really love him, but she fills the gap in her life with frequent swigs of whisky. However, she has a heart of gold, and the brave white hunter who has been hired to lead the safari gradually recognises her virtues as well as her beauty.

One must not take the plot too seriously in films of this kind. The point is to keep things moving, and that I think the film does succeed in doing. Plenty of animals, adventures with Mau Mau as well as with lions, hair's breadth escapes. The heroine, like all heroines in the jungle, is superbly silly, always wandering about outside her tent or drifting down the river towards the rapids in a dinghy—no, you could not say the film was dull. The acting does all that is asked of it. The excitement is sustained, and it is certainly worth looking at the African scenery.

A much more serious film is *The Feminine Touch*, a film in colour about life in a hospital, directed by Pat Jackson. Some years ago Mr. Jackson made another film about hospital life, *White Corridors*: it was a good film, and I think *The Feminine Touch* is good too. You might say that its theme is not particularly original: there have been many films about the hardships and rewards of medicine, and in particular of nursing. But the fact that the theme is not new does not invalidate this episodic piece about a group of girls beginning their training as nurses; discovering the difficulties of the profession they have chosen; but coming at last to understand that the rewards make it worth while.

A Background of Authenticity

The Feminine Touch has its moments of comedy, but basically it is serious: a story about hard work and self-sacrifice; and the background has the feeling of authenticity, largely, no doubt, because one of the great London hospitals, Guy's Hospital, was ready to co-operate and give technical help. The acting is good all through, and Pat Jackson is a sympathetic director.

I am glad to see Belinda Lee getting a chance as the heroine, Susan, the most idealistic of all the young nurses. Miss Lee has dash as well as good looks; and here, as a girl struggling with frustrations and disappointments, she seems to me to give a very creditable performance.

There certainly are frustrations. The nurses are disheartened by being treated not simply as nurses but as menials: the paid domestic servants have their hours but not the nurses; the nurses have to finish what has been left undone. Finally their exhaustion and their disappointment explode. Susan voices the feelings of the entire group when the matron comes to the nurses' common-room to hear their complaints.

The matron is played by Diana Wynyard—I think beautifully played. Miss Wynyard brings her authority and the composure learned in a successful stage career to the delivery of the speech in which she answers the complaints and points to the rewards which some day will come.

I must not give you the impression that *The Feminine Touch* is all serious. One of the nurses has taken up the work without any idea of self-sacrifice at all: she simply wants a well-to-do husband. The ironic thing is that though she finds the husband he is not the rich man she had imagined: she falls in love with a poor man who has a passion for research.

I wonder if you remember a film about a deaf-and-dumb child called *Mandy*? The child in that film was played by Mandy Miller; since then she has appeared in several films, and in *The Feminine Touch* she gives a moving performance as a child who knows her illness is incurable.

The Feminine Touch is the kind of film which the British make well: quiet, unemphatic, sincere. There is another film this month of a kind which the British do well: the documentary record of the Queen's visit to Nigeria. It is in Eastmancolour, and its title is *Nigeria Greets the Queen*. It cannot be easy in a record of a visit which by its very nature must have been repetitive to give an impression of variety, to keep up the enthusiasm without losing the spontaneity. But *Nigeria Greets the Queen* does just that. The scenes of welcome do repeat one another, and yet they have great individuality: the splendid parade with the emirs riding past with their retinues; the thousands of delighted schoolchildren; the crowds at garden parties; the dignitaries at investitures; the visit to the leper colony; the regatta of the war-canoes—the whole story has a wonderful air of gaiety. It made me want to visit Nigeria myself. (Broadcast in the BBC's General Overseas Service)

PHILIP MASON, Director of Studies in Race Relations at Chatham House, London, discusses various systems which have been proposed for giving Africans an increasing share in the running of those countries such as Kenya and the Rhodesias where at present government is largely in the hands of European and Asian settlers

The Vote in Africa

I WANT to start this talk about the vote in Africa on very broad general lines, considering what seem to me the basic factors which have to be taken into account, setting the detail in its place against the background. And in the broadest sense a first—I would go further and say *the* first—factor in the situation is the surging uprush of desire on the part of every African with a smattering of education that his people shall no longer be backward and despised, but shall be a people with a place in the world.

For the African it is running the country his own way that will outweigh everything else; if in one territory or in one tribe this is not true today, it will be tomorrow. Tell him that if he runs the country the standard of living will not rise and may even fall, tell him there will be no foreign investment, tell him there will be shocking corruption, and he will shrug his shoulders; he will put up with that; he would still rather run the country his own way.

It is not only political overlordship that arouses frustration and hostility; Abadan has proved that. And fifty years ago shareholders in a developed country might think it worth while to invest money that promised no immediate return, because it might be expected to produce good will which in the end would pay a dividend; today they hesitate to put money even into a proposal which holds out rich immediate prospects, because there is good reason to fear that development by foreigners will arouse resentment at foreign ways.

Help without Hostility?

Can we say, then, that the problem is to devise some means by which the West can provide skill and capital without creating hostility? Yes, provided there is at once a qualification. National interests are not merely greed; the ability of the investing country to help depends to some extent on the country helped. If Belgium was severed from the Congo both would suffer.

These considerations seem to me to apply to all under-developed territories. But they take on an extra pungency in those African territories which are British and in which there are European settlers. Of these the most important are the two Rhodesias and Kenya, and here some extra factors come into play. England learnt in the woods of Virginia in the eighteenth century that if English colonists overseas are not given their heads there will be trouble. We applied that lesson in Canada, went on applying it, and have already, though in widely varying degrees, transferred power—or, in Kenya's case, influence—to the European settlers in these territories.

That is a factor that has to be taken into account. It is difficult to imagine any circumstances in which Her Majesty's Government would try to impose their will on the electors of Southern Rhodesia, and although in Kenya there would be no constitutional difficulty—and in fact the Lyttelton Scheme was imposed—you are up against the fact that the economic power of the country is in the hands of the white electors. It is hard to see how a change wholly unacceptable to all sections of European opinion could be imposed even on Kenya without disrupting the country's economy.

In the Settler Countries

Here, then, in the settler countries, it seems to me that the problem is different. It is not how to provide skill and capital without compromising independence. Here there are—or ought to be—two objects neither of which in the long run has much hope of success without the other. One is to develop the country, to raise the general standard of living, reduce the economic gap between rich and poor, and, to these ends, to retain and increase the skill, capital, and initiative already there.

The other is to provide a bridge which will lead from an oligarchic society in which power and influence are concentrated in the hands of a small minority to a democratic society in which power is more evenly distributed. Personally, I would bar any solution which involves the exile or death of the oligarchs.

It is against this general background that I would consider the proposals which Mr. Coutts has made in Kenya for giving a vote to Africans. For historical reasons Kenya has separate electoral rolls for Europeans, who vote for Europeans, and for Asians, who vote for Asians. The African members of the Legislative Council have until now been chosen by a mixture of indirect election and nomination. Mr. Coutts has spent ten months on his enquiry in the course of which he has heard evidence of opinion from many Africans, and in some ways the evidence he summarises is as interesting as his conclusions.

He found the great majority opposed to any form of indirect election, which they felt would open the way to gerrymandering and corruption; he agrees that this is possible, and recommends direct election by secret ballot. Two other points emerge from the evidence: there is a widespread

fear that an unrestricted popular vote may lead to the election of irresponsible members; an almost universal conviction that Africans do not want some second-best device that is not good enough for Europeans and Asians.

Mr. Coutts has recommended as a transitional stage a form of plural voting by which an elector may score extra votes for experience, education, and service to the community. The Government of Kenya have accepted his proposals with some amendments which limit to three the number of votes one man may exercise. The minimum which would qualify for a vote is the threshold of secondary education or an income of £120 a year, which means a job at £10 a month held continuously for a year. That is a wage that would keep out a messenger or domestic servant but let in a man with higher skill or a business of his own.

Among some of its advantages this system opens the vote to a few African women without offending the general view that not many in Kenya are yet fit for it. The scheme meets one of the fears expressed to Mr. Coutts and should prevent the election of irresponsible people, but it does not meet the other—and could not under the terms of reference on which Mr. Coutts was working. Since Europeans and Asians vote on the one-man, one-vote system of most Western countries, it is difficult to see how Africans can help looking on the plural vote as something second-best. As things are, then, these proposals can only be a very temporary expedient.

Would it be different if some form of plural vote was available for everyone, whatever the colour of his skin, on a common electoral roll? There is a common roll in Southern Rhodesia, but then the property qualification is too high for most Africans. And a common electoral roll, probably with some form of multiple vote, is part of the programme of the Capricorn Africa Society, to whose views Mr. Coutts refers in paragraph thirty-six of his report.

A Positive African Patriotism

This is a society not afraid of stating its philosophy, of which the opening dogma is that all men are born equal in dignity before God despite their different attainments. It therefore condemns unhesitatingly and without reservation any discrimination between people on grounds of race. Its members undertake to repudiate any form of exclusive racialism, white or black. Any form of colour bar is rejected, whether it means a present rejection by white of black or some dream of a future in which black would reject white.

All such ideas, the society says, are to disappear in a new positive African patriotism which will override sectional interests. I need not spend long on these principles, which have been published in the *Capricorn Handbook* and in Dr. Oldham's book, *New Hope in Africa*, and which so far will meet with approval in Britain. I pass on at once to the most controversial aspect of the creed. Voting is to be regarded not as a right but as a privilege.

All citizens of the ideal Capricorn state will enjoy the basic freedoms such as equality before the law, equal rights to fair trial, equal rights of access to all public services and institutions, but only those who have earned it will enjoy the right to vote. And I am told—though at present the details are being worked out by inter-racial committees in Africa—that they are inclining to something like the Coutts proposals: a minimum qualification based on age, together with either some property or some degree of education, and additional votes for higher education, a responsible job, service to the state or the community.

Now this is not the one-man, one-vote system which we in Britain enjoy—if that is the right word. It was possible in the nineteenth century to think of the one-man, one-vote system with romantic optimism; today most of us would probably agree with Sir Winston Churchill that it is obviously the worst possible system of government except all the others that have ever been tried. And if I were asked today to suggest a political system for some new colony shortly to be started in the moon, where there are no existing institutions, I would certainly recommend the one-man, one-vote system.

First, because if you say that no one with less than £250 a year is to have a vote the street lighting is apt to stop short of areas where people with less than that income live. Next, because I think it is in the public interest that candidates should bribe a large electorate by putting lights in their streets rather than a small electorate by putting money in their palms. And small electorates did mean money in the palm in England before 1832 and in India before 1947. Again it may be true that many people are not fit to vote, but who is to have the say? We do not want committees of citizenship any more than committees of public safety.

But we are not talking about some state in the moon but about political realities in territories where there are existing institutions. What

Two chairs which belonged to the French royal family

Exhibits in the Red Drawing Room, which was one of the late Queen Mary's favourite rooms

Needlecraft on Show at Marlborough House

BARBARA HOOPER describes an exhibition of furniture, tapestry, and embroidery arranged by the Royal School of Needlework for public viewing at the London home of the late Queen Mary: no fewer than seven members of the Royal Family had work on show

AN exhibition of furniture, tapestry, and embroidery was held recently at Marlborough House, the home of the late Queen Mary. The exhibits, many of them centuries old, were collected together from all parts of England by the Royal School of Needlework, which has the Queen Mother for its patron. This was the first time that Marlborough House had been used for any kind of public display, but it was an appropriate setting because Queen Mary was such a keen needlewoman and she had a particular interest in the Royal School.

In many ways it was a royal exhibition: no fewer than seven members of the present Royal Family had work on show, and innumerable pieces of fine needlecraft had had royal owners in the past or at least had some royal connection, French or English. It was right that Queen Mary herself should be best represented, with a floral rug, a carpet, a stool, and a tapestry cushion bearing an unusual design of a mandolin and music.

Then there was a baby's embroidered white frock worked by the Duchess of Gloucester for her son Prince William, and a stool with a striking modern design which the Duke of Gloucester made. There were footstools, too, by the Princess Royal and Princess Marie Louise: these and a host of royal possessions seemed somehow not to have been placed on exhibition, but rather as if they had always belonged in the stately rooms of Marlborough House.

A Great Mass of Deep Colour

It would be hard to imagine a more dignified setting: tapestries lined the walls; chairs and screens were backed by splendid ecclesiastical robes, banners bright with heraldic coats of arms, fragile lace christening gowns, patchwork coverlets worked by highly skilled Women's Institute members, gold-cruised altar fronts, and needlework pictures commemorating historic events. Here and there were showcases filled with quaint embroidered knick-knacks as rare as they are artistic.

The whole formed a great mass of deep colour under the massive chandeliers of cut-glass, right through the saloon, with its high gallery and painted murals; through the state dining room, cream and gilt, with royal portraits gazing out on the smooth lawns that run beside the busy avenue of the Mall; through the pink-brocaded Red Drawing Room and the olive-brocaded Green Drawing Room.

It is hard to single out exhibits from the past, for so many of them had a notable history: there was an eighteenth-century French cope, patterned all over with flowers, that was probably ordered by Louis XV for one of his daughters who had become a Carmelite nun; and a cope and chasuble, heavy with gold stitching, made in Florence in the fifteenth century for Henry VII. The latter may have been taken by Henry VIII to the Field of the Cloth of Gold. (Broadcast in the BBC's *General Overseas Service*)

An eighteenth-century Brussels lace fan with pearl and gold sticks which belonged to the late Queen Mary, who had a collection of fans

The tapestry representing Queen Elizabeth the Queen Mother's arms was woven by the Edinburgh Tapestry Company; the armchair is an eighteenth-century love-seat; the other chairs were made by François Heere in 1790

ANDREW SHONFIELD, Foreign Editor of the London 'Financial Times,' thinks that it would be over-optimistic to expect very big increases in trade between Britain and Russia as a result of the recent negotiations, because—he says—fundamental economic changes have altered this commercial relationship once and for all

Trade with the U.S.S.R.

EVER since its early days the Soviet Union has treated trade quite frankly as an instrument of political policy. As early as 1921 Krassin, the Russian big-business man who joined the Bolsheviks after the Revolution, was in London offering some tempting orders to British firms in the hope that this would help to put the British Government in the right frame of mind to recognise the Soviet regime. In the event he was not disappointed: the trade agreement signed between Britain and Russia in that year constituted *de facto* recognition of the Communist Government—the first recognition, incidentally, accorded to the Bolsheviks by any of the great Powers.

The question that we are now asking ourselves is whether the latest Soviet trade offer to Britain falls into the usual political category. The Prime Minister, Sir Anthony Eden, has said that he regards the Russian trade offer as a big commercial opportunity for Britain. And he has appealed to business management and workers in industry to make a special effort to deliver the goods that the Russians now say they want from us. However, it may be that on this occasion the British Government has for once taken a leaf out of the Russians' book and is anxious for the trade agreement to be a success partly for political reasons.

Useful Market for British Goods

Certainly, there is every reason to expect that British exports to Russia will continue to expand in the future, as they have been doing steadily over the past two years. It is really since the death of Stalin that this, like most of the other good things in Soviet policy, has come. Three years ago Anglo-Soviet trade had fallen to a record low level. The rapid recovery since then has turned Russia into a useful market for British goods: but still, it is worth noting, comparatively a rather small market.

It is much less important as an outlet for British manufactures than the rich little countries like Holland and Denmark on the northern fringe of the European continent. Last year Russia took just about as much as Switzerland, which is one of the lesser markets for British goods in western Europe. There is no reason, of course, why the Russian market should stay quite as small as this. There is obviously scope for selling more of the kind of goods which Britain manufactures, so long as the Russian Government is prepared to let these goods in.

But what I find slightly worrying about the trade negotiations which went on in London during the visit of Bulganin and Khrushchev is that neither side appears to have taken into account the fundamental economic changes of the past few years, which, in my view, have altered the commercial relationship between East and West once and for all. I do not see in this trade offer any recognition on the Russian side of the fact that the Soviet Union and the whole Soviet bloc no longer has an exportable surplus of food to sell to the rest of the world.

It is rather odd to find the Russians promising increased exports of grain to pay for the huge mass of manufactured British products that they propose to buy here at a time when they are now importing hundreds of thousands of tons of grain from Canada. They have also been importing butter and meat from Australia. No doubt Mr. Khrushchev hopes that his great ploughing up campaign in the virgin lands beyond the Ural mountains will produce once again a surplus of grain.

Lots of Countries with a Grain Surplus

But it is worth remembering that the first purpose of these extra supplies is supposed to be to feed a lot more livestock inside Russia, and so raise the average Russian's intake of protein foods from its present low level. That is going to take many, many millions of tons of animal feeding stuffs.

But even supposing that at the end of it the Russians are left with a considerable amount of grain available for export, this is probably going to do them rather less good than they think at the moment. For there are lots of other countries with surpluses of grain who would be glad of a market. And there is no reason to think that Britain, whose custom is much sought after by all grain-exporting countries, would give preference to Russia over Australia, for instance.

It seems to me that it is going to be difficult to achieve a large-scale exchange of goods on the basis of the old pattern: that is, manufactures coming from Britain against primary produce coming from the Soviet side. This is partly because the Soviet countries today manufacture so much themselves. It is not only Russia but Poland as well which is exporting considerable quantities of steel to India. The Czechs are selling aeroplanes to Egypt, and engineering equipment all over the Middle East. And even the Russian exports westwards include a considerable quantity of pig-iron from Soviet blast-furnaces. The typical Soviet export today seems increasingly to be an industrial product.

This industrialisation of the Soviet economy also affects the kind of goods that the Russians want to import from us. Looking down the list of items that was presented to the British Board of Trade during the visit of Mr. Bulganin and Mr. Khrushchev one is struck by the high proportion of very advanced machinery that seems to be required. About one-third of the goods named are out anyway because of the embargo on certain items which are regarded as having a military potential.

But among the remainder there are a large number of things, for instance, in the field of advanced chemical machinery and automation equipment, which are in short supply in Britain. And even where the goods can be produced much of what the Russians want is already in heavy demand, so that delivery periods are extremely long. For instance, they have asked for some large cargo-ships; but the average order-book for British shipyards at the moment is about four years.

In other words, the things that the Soviet bloc wishes to buy today are in general the typical requirements of an advanced industrial country. That no doubt still leaves plenty of room for increased trade. But my point is that it is not likely to be trade on the old pattern. I do not think that the strategic embargo on certain products fundamentally alters this picture, although it would help trade if there were no embargo.

It may be that China, which is at present subject to strategic-export controls of a more rigid type than the rest, would offer much greater opportunities to British exporters, if trade were free. There perhaps the old pattern of trade would still apply; and British firms would be able to sell comparatively simple industrial products—like tractors—which the Chinese now want to buy in very large quantities.

There is some reason to believe that China would prove to be a better market in this respect, and the British Government has made no secret of its determination to get the strategic embargo on exports to China relaxed. It is arguing about this with the Americans at the moment: Britain is just as interested in opening the way for Malayan rubber exports to China, which are banned at the moment—although they may be sent freely to Russia.

But even here there are narrow limits to what the Chinese will be able to pay for in the long run by selling us their traditional products. My feeling, therefore, is that although there is undoubtedly scope for some expansion of trade with the whole Soviet bloc, it would be over-optimistic, even if the present strategic embargoes were removed altogether, to expect a very big increase. (*Broadcast in the BBC's General Overseas Service*)

The Vote in Africa

Continued from page 10

is needed is a bridge from the reality of the present that will lead in the direction of the ideal. Here let me pause to condemn separate electorates for different communities. I will admit prejudice. I lived twenty years in India where there were separate electorates for two great communities, Hindu and Muslim; I saw feeling harden and grow bitter until it ended in wholesale slaughter.

Let me also dispose of what seem to me varying forms of unrealism, all arising from the mistake of following too closely the analogy of what has happened in the United Kingdom. It has taken us a long time to develop parliamentary institutions, but that does not mean that other people cannot move much more quickly. In the industrial sphere Russia has just packed into twenty-five years what took Britain 200. Again, it is surely just as unrealistic to suppose that what has been built slowly here should be transported to Africa and dumped down, pre-fabricated, in an unsuitable climate.

And has it relevance to the immediate problem to argue, as a contemporary does, that plural votes were acceptable in a Parliament thought of as representing sectional interests, as ours was before the Reform Bill, but are out of place in a world where voting is thought of as an individual human right? Ideally and ultimately, I agree, but we need a bridge to the ideal, and it is no use following the analogy of the United Kingdom Parliament too closely.

The reality is that in Rhodesia a system has to be found which the present voters will accept. The point cannot be put so definitely in regard to Kenya; but what for Rhodesia is a necessity in Kenya is at least desirable. Considered in the light of this reality a plural vote is to be preferred to a high franchise; if education, experience, and service to the community are weighted the present voters might agree to putting the franchise lower. And in that case more people are likely to get street lighting and all that stands for. (*Broadcast in the BBC's General Overseas Service*)

On board H.M.S. 'Jewel,' an ocean minesweeper, and the training squadron's other four ships, cadets are taught all the duties of a seaman: (right) piping the captain aboard H.M.S. 'Vigilant'

The Royal Naval College Gets its Own 'Fleet'

TOM SALMON explains how under the Admiralty's revised plans young naval officers will do all their sea-training as cadets and midshipmen with a new squadron established at Dartmouth

THE young cadet in the crumpled blue jersey and faded drill trousers gently coaxed the noisy motor-boat against the frigate *Vigilant*, and I clambered aboard—aboard the senior ship of the Royal Navy's newest formation. The *Vigilant* lay in the river Dart, at anchor between the same steep Devonshire hills that have sheltered fleets of war from the days of the wooden ships of the second Crusade to the invasion barges and destroyers of the past war. The Dart has been called 'the cradle of the Navy' and, cliché though it may be, it is as good a description as any. For here, on this quiet Devon river, generations of officers-to-be of the Royal Navy have been given their first sea-training. And the *Vigilant* and the other ships of her squadron are ready to carry on the tradition—but to carry it on with a difference.

I had come aboard the *Vigilant* to find the answer to a simple question: what is the job of the new Dartmouth Squadron? And that question was answered for me in five minutes without anyone having spoken a word. For in those five minutes I saw cadets hauling on cables, cleaning guns, chipping paintwork, carrying their own food to their own mess-deck,

and even doing their own washing up. I had seen them, in fact, learning to become seamen—and that is precisely the lesson that the *Vigilant* seeks to teach.

As Captain J. E. Scotland, the Squadron Commander, told me: 'These cadets in a very short time will be commanding seamen; and we firmly believe that they won't be able to do it properly unless they learn how seamen think, work, and behave; unless they know, in fact, what seamen are like. And the best way to learn that is to be a seaman yourself.' So the cadets aboard the *Vigilant* eat in the seamen's mess-decks, sling their own hammocks, and learn to look after themselves.

It is all part of the new scheme of training at Dartmouth. Under this new scheme cadet-entrants will complete a seven-term course divided into three parts. The first part will consist of two terms on shore, during which all cadets will undergo a common training, primarily of an academic nature. The second part will take them to the new Dartmouth Squadron, where for a whole term they will receive practical sea-training in the frigates *Vigilant* and *Venus*, the destroyer *Carron*, and the minesweepers *Jewel* and *Acute*, together with experience at a naval air station.

The final phase will consist of four terms—with the cadets now midshipmen—mainly spent on shore in the Britannia Royal Naval College, studying specialist courses in gunnery, navigation, signals, and so on, but interspersed with cruises to sea in the Dartmouth Squadron.

Before this new scheme was introduced, cadets did their sea-training on a training cruiser or on a training aircraft-carrier. They left the college at Dartmouth, were promoted midshipmen after eight months in their training ship, and eventually joined the Fleet in the same rank. In future all of a young officer's sea-training as a cadet and midshipman will be done with the squadron at Dartmouth, and he will join his first operational ship as a sub-lieutenant.

One result will be that midshipmen of the Royal Navy (distinguished by the white tabs on their monkey jackets) will disappear from ships of the Fleet; so, too, will the gunrooms in which they messed. While the primary job of the squadron will be to give cadets and midshipmen a thorough sea-training, that training will place emphasis on the development of the qualities of leadership. And aboard the ships of the squadron, cadets, as well as learning to do the jobs that seamen normally do, also learn to be officers.

They plot the course of the ship in their own chart-room, which is equipped with the latest types of radar navigational aids; they stand on the bridge with the captain; they work alongside the engineering officer; they even inspect liberty men—who are, of course, their fellow cadets.

I asked Captain Scotland what advantages he thought the new type of training would have over the old. 'If you want to learn about sailing,' he replied, 'you don't go on a sixty-foot yacht: you go on a sailing dinghy. It's the same with this new training scheme. Aboard the relatively small ships of the squadron the cadets will be able to see and take part in every job that's done at sea. And that is exactly what we want them to do.' (Broadcast in the BBC's General Overseas Service)

But, as the illustrations on these pages show,

AN EXILE'S RETURN

SOME of you have probably been away from England for a long time. You think of it affectionately, but you have got used to a different life elsewhere; and sometimes you wonder whether if you tried to settle in England again for good it would really work. Certainly that is how I often felt during my twenty-one years in India. Back in England occasionally on a few weeks leave I was surprised how foreign I had somehow got. I just could not reconnect.

Cambridgeshire was the county that did the reconnecting for me when eventually I did leave India. And there is no other part of England, I see now, that could have done it nearly so well. An ordinary county—dull, some people say. And yet . . . not a bit.

It was a July evening three years ago while I was settling in: my old college had offered me a job, and I was strolling round the courts; a clear evening, rather warm. There were lime trees in blossom down the back avenue; further on, flowering privet in the hedges; a whiff of new-cut hay from the fields out Madingley way; and on the still air the sound of Great St. Mary's bells. And suddenly, suddenly I was an undergraduate again. Time had shut up like a telescope. For a moment at least I had got altogether English once more: much younger too; and those intervening years that I had spent abroad dropped away like a dream. I think that sort of thing is very important if, like me, you have not got a home in England to come back to: that you should at any rate return to some place where there happens to be vivid, happy memories for you.

It is all nonsense, of course, to suggest that any part of England of county size can be dull. There is, in fact, believe me, more full-fledged monotony in the Himalayan foothills, the whole 1,500 miles of them, endlessly repeating the same conifer-clad, steep-sided theme, than in an English shire. For geologically England is so varied.

Plenty of Difference When You Look for It

Cambridgeshire you might describe as a feat of characteristic understatement, as English conversation often is: there is plenty of difference in it, of subtlety even, when you look for it. The Cambridgeshire landscape may seem rather flat, but the low hills down south, by Royston, are of chalk like the tall cliffs of Dover or the Wiltshire Downs; not at all the same as the gently undulating country out west, towards Huntingdon and Bedford, which belongs to the Midlands.

And, up north, there is something different again: the real flatness of the Fens, from near Cambridge itself for thirty miles or more to beyond Wisbech; and very mysterious country that can be in autumn mists. I once did an undergraduate bike-ride by moonlight through those mists. In places they lay only up to my waist; all but the trunks of the trees stood out clear; and then ahead, where they were thicker and higher, a great silvery grey mass unexpectedly loomed up—Ely Cathedral.

And then Cambridge city: what a lovely capital for any county to have! It is full of young people and young enthusiasms, set in ancient, gracious buildings. There is a lot to be said for Cambridgeshire, and for its wide open skies, with the fat white clouds that roll through it after rainy days.

IAN STEPHENS

ca. 7,000 undergraduates distributed in more than twenty colleges and halls

its Capital City

Perhaps because—as one of the two speakers whose G.O.S. is a county that would amply repay a visit

NEW HALL VISITED

I WENT down to Cambridge recently to visit the new women's college there—New Hall, it is called—which has now completed its first year alongside Girton and Newnham as Cambridge's third foundation for women. Cambridge has never been as go-ahead as Oxford in providing for the higher education of women: there are five women's colleges at Oxford to Cambridge's three, of which the third, the one I am talking about, is very new and very small; and the proportion of women undergraduates to men at Cambridge is one in eleven, compared with one in six at Oxford, and one in four in Britain as a whole.

All the same, the old Victorian days of masculine prejudice against women being in the university at all are gone, as you can see when one of the oldest of all the colleges in the university, King's, makes a gift of no less than £10,000 towards the £500,000 that New Hall is appealing for. It wants the money to provide accommodation for the 100 undergraduates and the university authorities have allowed as a maximum to begin with, and for fellowships and scholarships, a hall and a library, and all the things that go to make a college fully grown up.

'A Recognised Institution for Women'

Meanwhile, any visitor can see how exciting it must be to be a member of a college right at the beginning of its history. I call it a college, by the way, for simplicity's sake: strictly speaking, New Hall is not a full college of the University of Cambridge but is called 'a recognised institution for women'—which is not really quite as grim as it sounds—and its students are members of the university, just like the women at Newnham and Girton. This term there are thirty-four undergraduates, sixteen of them just beginning their second year, and they are living and working in an early Victorian—or perhaps it is just a Regency—house that used to be a private hotel.

It began on private contributions and it is self-supporting, so New Hall cannot afford either a principal or a porter yet—the two figures that people at most other colleges would tell you are the two most dignified personages in the place. A maid had to show me into the house round the back way, through the kitchen quarters, though that was only because there was some decoration going on; and it was the senior of the college's two tutors—she is called the tutor-in-charge—who told me what the college had done in its first year, and what it hoped to do.

I talked as well to some of the sixteen girls who started the college, so to speak, a year ago, and found out that between them they had provided members of no fewer than five of the university's women's teams at various sports; two secretaries of the new women's union; and lots of other officers of university clubs and societies. They all felt that one of the things about being at a small college was that each of them was somebody straight away, and they all felt, too, that New Hall is different already from Girton and Newnham: not better necessarily; certainly not inferior—just different. And they were very proud of the difference.

Girls' schools, and the girls going up to the universities, are already aware of that special character, and for the fifteen places vacant at the college for 1956 there were 400 applicants.

A CAT'S LIFE

KATHLEEN HALE tells how the real-life Orlando—hero of her delightful cat-books—manoeuvred her by the power of his mesmeric green eyes and plaintive mew into a state of complete subjection

MAY I warn you, if you ever allow a cat to gain ascendancy over you for one minute, you are lost. My friend scooped a tiny ginger kitten from under her bed and put him into my basket. 'He's quite a character,' she purred. I called him Orlando, and took him home to my small sons. He spent most of his kittenhood in the play-pen, weaving himself in and out of the bars and into the very warp and woof of nursery life. By winning the little boys' devotion, Orlando got me just where he wanted.

'Orlando must have *this*,' they said, and 'Orlando *must* have that.' Never must Orlando be corrected or chastised, for Orlando could do no wrong. It was not surprising that he took advantage of me, and I spent my time humbly opening and shutting doors for His Lordship to stroll smugly to and fro at will. He manoeuvred me by the power of his mesmeric green eyes and plaintive mew, as a guided missile is propelled by radar; from being his 'owner' I became merely his 'employee.'

Of course, as Orlando grew older and less mischievous he made fewer demands on me, but when he became the father of a family my responsibilities were trebled by the alarms and excursions of his three kittens. And once I had been foolhardy enough to actually write a book about these cats my employment was reduced to slavery; they gave me no peace until I had written the next. Whether in a bus or a train, alone or in company, my captive brain would be obediently spinning the Orlando saga.

It was not for the likes of me to raise my eyes above cat-level, and I saw the world as through a cat—darkly. This was no case of anthropomorphic cats but of a human being changing into cat. An unreasoning dislike of dogs gradually possessed me, while I developed an active delight in beetles and mice; I also learnt to lick my fingers after meals, instead of washing them beforehand. My friends faded out of my life, for they found conversation with me quite pointless; and I relapsed into a dreamy stupidity that I hoped would pass for the meditations of a visionary. Newspapers no longer interested me, though they gained in value when Orlando showed me how warm they were to sleep on.

One Life in Pursuit of Nine

Never at my best on all fours, and quite incapable of learning how to fall on my feet, I nevertheless followed those cats on all their escapades to chronicle their adventures. I risked my one precious life in pursuit of Orlando's nine. Up trees and down ditches we went; on midnight rattling expeditions, in stables beneath horses' hooves. We serenaded cats of outlying districts by the light of the moon, only to be doused with water for our pains. Long, cramped vigils were spent lying on garden walls in burning sunshine—just waiting for 'something' to happen, my flesh positively quilted by the pattern of bricks and mortar.

It is far from my intention to give the impression that Orlando was a hard taskmaster or that his charming family were any more exigent than other cats; it was only my misfortune to be so ripe a subject for hypnotism. Truly, I do not know what I should have done all these years without his wise and kindly example, or the refining influence of his dear wife Grace, while the kittens are guaranteed to keep any artery supple.

However, I was never wholly hypnotised, for there were times when I was conscious of being neither fish, flesh, fowl, nor good red herring: sub-human I certainly was, but not entirely cat. A fraction of my almost atrophied ego resented this feline domination and suddenly seized an opportunity to cast off the marmalade yoke. One morning when Grace was out shopping I tried to draw a picture of her for one of the Orlando books, but for some reason it would not come right. I needed her to sit for me; but time went on without Grace returning. I was exasperated with myself. Then I wondered if I could possibly visualise her, in my imagination, clearly enough to draw from. Concentrating upon the rug at my feet, I tried hard to conjure up a vision of the little cat, sitting there in the pose I wanted. But nothing happened, and I lost hope that anything ever would happen.

Suddenly, there was Grace herself in her frilly apron and fur coat, gazing lustroly up at me from under her picture hat. 'Oh, you've come home at last!' I cried. 'I've needed you so badly. Please stay just as you are while I make a quick drawing of you.'

She neither blinked an eye nor twitched a whisker, and I was able to complete a satisfactory portrait. As I was about to thank her and show her the drawing for her approval, she imperceptibly melted away into the pattern of the rug. She had gone! She had never been there at all!

'There he would crouch, with his corners tucked in, like a neat parcel . . .'

Kathleen Hale with His Lordship: 'Whether in a bus or a train, alone or in company, my captive brain would be obediently spinning the Orlando saga'

An hour later the real Grace came home. 'Have you seen a ghost?' she asked me with concern. 'You're cod-white in the face, in spite of that pink shrimp-paste stuff you rub on your cheeks.' Though I assured her I was in perfect health I had in fact received a shock that left me in pretty poor shape for some time to come. I lost my appetite, and nothing interested me any more, not even mice. The pretty antics of the kittens as they manicured their nails on my furniture failed to amuse me, nor could I enter into their fun as they played Hunt the Kipper with the smoked salmon.

Miraculously, an invitation arrived one day from some 'Toms' and 'Queens' of my acquaintance, to join them in a motor-tour from Tottenham Court Road to Venice and back. The cats were delighted. 'But I haven't anything to wear!' I wailed. 'Why wear anything?' asked Orlando. 'We don't.' But dear sympathetic Grace thought I ought at least to have a picture hat like hers, and Pansy and Blanche wanted me to buy a gym tunic, while Tinkle generously offered to lend me his little yellow blazer.

Much as I appreciated their kind suggestions, I went shopping on my own—fortunately the cats approved of my purchases. Grace adored the pretty, quilted skirt that I bought to wear while motoring through the Alps; it was so cosy and warm for her to sleep on.

The day of my departure arrived, and the cats insisted on helping me to the bus with my luggage. They clung round my neck and filled my pockets while I staggered along the country lane. It was lucky that I had had to leave many of my new belongings behind for them, or that mile would have been the death of me. Our fond farewells were interminable, since cats cannot come straight to the point, and I missed the first bus. Eventually they let me go and I caught a glimpse of them from the upper windows of the double-decker, zig-zagging gaily homewards—too gaily, I thought, for this sad occasion of parting.

My holiday was only too short. It went at the rate of over 200 miles a day, and it seemed as though we returned to our starting point before the dust of our departure had time to settle. However, I was nearly human once more. Instead of the chaos and disasters that I had expected to find on reaching home, all was in order and the cats cradled in slumber.

Though I have always been interested in anything that concerned them, seldom have they considered my affairs worth a thought. I met with

polite preoccupation if I so much as mentioned the wonderful countries I had seen, and a distant look veiled Orlando's gooseberry-green eyes; his gaze ranged far beyond the Great Wall of China, explored the inscrutable Sphinx of Egypt, then veered, searchlight-wise, across the Arctic wastes, finally coming to rest just above my head. My words withered upon my tongue, and my trip abroad dwindled to the mere hop of a flea before the spectacle of Orlando travelling the girth of the earth without stirring from the spot. There he would crouch, with his corners tucked in, like a neat parcel, and the pupils of his eyes narrowed to the width of a hair—indicating that 'we are not amused.' Catalepsy once more began to steal through my veins. (*Broadcast in the BBC's General Overseas Service*)

The Orlando books are published by Messrs. John Murray, London, W.1.

This Week's Listening

JULY 15-21

Children of United States airmen stationed at an English base: 'Eagles over Britain,' a documentary on the life of these men, can be heard this week

THE THIRD TEST

ENGLAND are due to end their third Test match against Australia at Headingley, Leeds, on Monday and Tuesday. On both days commentaries by Rex Alston, John Arlott, and Michael Charlton will be broadcast at 12.00, 14.15, 16.15, and 17.15. Norman Yardley will again sum up the morning's and afternoon's play respectively at 12.30 and 17.30, and an eye-witness report will go out at 21.00.

On Saturday the Australians return to Lord's to begin a match against Middlesex. There will be commentaries at 12.00, during the afternoon, and at 17.15, and an eye-witness report at 21.00.

THE INTERNATIONAL EISTEDDFOD

THE programme 'Nations in Song' will try to convey to listeners something of the atmosphere of gaiety and colour at the tenth International Eisteddfod which was held last week at Llangollen in north Wales. Interviews with competitors and visitors will be broadcast, and also recordings made on the stage during the actual competitions.

It is worth remembering that the eisteddfod is a folk-festival—one of the largest of its kind anywhere—and that all the choirs and dancers, soloists and instrumentalists are amateurs, for there is no doubt that the standards are very high. For instance, the winners of the competition for male choirs in 1955, who came from Modena, in Italy, had won top-class awards before venturing to Llangollen; and Alfred Higson's choir from Sale, which has also appeared, is a household name at festivals in the north of England.

The reputation of the eisteddfod is so great that in recent years groups have come from Canada, the United States, and even from South America. G.O.S.: Monday 11.30 and 22.15; Tuesday 06.30

'LOVE FOR LOVE'

CONGREVE'S *Love for Love* and Congreve's *Way of the World* (heard in the G.O.S. on June 5) are the sky of English comedy; the beautiful, remote blue. Everything else in comedy is lower than Congreve's two plays; only he escaped the earth—the mirth of angels. Yet neither the plots nor the characters of his plays are memorable.

His art was the abstraction of one quality only, intelligence; and it sometimes seemed that he gave his characters minds and nothing else, no faces, no breath, no bodies, no circulation of the blood. We remember what they said, not what they were. And this was indeed the unique triumph of Congreve's art; to get more from the flutter of a lady's fan than from her face. He was concerned with character only as a crude material from which certain essences were extracted—wit, intelligence.

Nor did the heart mean much to Congreve: he kept it back or showed it only as though painted upon a playing card to be shuffled, dealt, swapped. And the heart was not even the highest card in Congreve's pack, for wit might always trump it.

G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

SOUTH PACIFIC CONFERENCE

IN April more than seventy delegates from eighteen island territories in the South Pacific met at Nasinu, Fiji, for their third conference. The South Pacific Conference is held under the aegis of the South Pacific Commission, the advisory body set up in 1948 by the six governments responsible for the administration of the islands in the area. The delegates, representing about 3-million people, discussed common problems such as the development of industry, trade, agriculture, and fisheries, and infant and maternal welfare.

This week a programme on the island territories of the Pacific and on the work of the South Pacific Commission will be introduced by Sir Brian Freestone, a former Governor of Fiji.

G.O.S.: Monday 18.30; Tuesday 10.30; Thursday 23.45

'KING SOLOMON'S MINES'

THIS year marks the centenary of the birth of Sir Henry Rider Haggard, who was not only a prolific writer of novels but also an authority on problems of Colonial agriculture and migration. His best-known book, *King Solomon's Mines*, has an African setting, and it must rank as one of the most gripping adventure stories ever published. It has now enthralled succeeding generations of readers; it has been filmed twice; and it was the subject of a skilful radio-adaptation by Alec Macdonald.

A new production of this radio-adaptation is to be broadcast in the G.O.S.: the first of eight episodes goes out this week. Once again those stout-hearted adventurers will set out across the desert and the mountains to find the fabulous source of King Solomon's wealth: Sir Henry Curtis, the flaxen-bearded giant; Captain Good, the dapper and resourceful naval officer; Umbopa, the mysterious chieftain; and, of course, Allan Quatermain, the narrator. Once again they will play their part in the turbulent affairs of the land of the Kukuanas, where Twala the usurper reigns with the aid of the evil witch, Gagool.

G.O.S.: Tuesday 13.15 and 23.45; Friday 20.15

THE LONDON BUS

THE story of the London bus is one of progress touched by romance. Shillibeer introduced the first bus in 1829: it ran from Paddington to the Bank, and the fare was one shilling—a lot of money in those days. Intense competition soon flourished among bus owners. Anybody with the money could buy a carriage and team of horses; licences were easy to get, and there was no restriction on fares. Bus touts employed every kind of method to get passengers, and their rivalry became the object of a public outcry.

Organisation was badly needed, and the challenge was met by the creation in 1856 of the London General Omnibus Company to assume control of London's transport system with a fleet of 600 buses. A programme to celebrate the centenary of the company—which has since been absorbed in the London Transport Executive—will be broadcast this week.

G.O.S.: Friday 15.45; Saturday 00.30 and 05.00

Cy Grant and Tollefsen are featured in 'Keys and Strings' on Sunday at 07.15 and Monday at 02.45

On Saturday at 18.30 Sir Malcolm Sargent can be heard conducting the BBC Symphony Orchestra on the opening night of the Proms

SIXTY-SECOND SEASON OF THE PROMS

THE sixty-second season of Henry Wood Promenade Concerts opens at the Royal Albert Hall, London, on Saturday, July 21, and continues for eight weeks until Saturday, September 15. The orchestras taking part in the two months' season are the BBC Symphony, London Symphony, London Philharmonic, Hallé, and the Liverpool Philharmonic, which is making its Prom début. The conductors will be Sir Malcolm Sargent, Basil Cameron, Sir John Barbirolli, Sir Adrian Boult, and John Hollingsworth as assistant conductor.

Listeners to the opening concert on Saturday at 18.30 will hear the BBC Symphony Orchestra under its conductor, Sir Malcolm Sargent, in Elgar's overture, *Cockaigne*; Franck's *Symphony in D minor*, and in Mozart's *Piano Concerto No. 23 in A* (K.488), with Denis Matthews as soloist.

Radio Theatre presents

'THE LAST OF THE WINE'

THE key to the title of R. O. Bolt's unusual and striking play is a speech in which Violet, the old lady who has returned from her home in Florence to visit her family in England, says of her own generation: 'We were just in time to drink the last of the wine. The men who built that chapel (in the square near the family's house) made the vintage. It took many centuries to mature it. It was broached at the Renaissance, and we Edwardians had the last of it. The 'twenties drank the dregs, poor things... Now there's none left, not a drop.'

The relatives addressed thus are her grandsons, Rupert and Percy—the former a dissatisfied and self-tormented artist who designs ceramics, the latter a priggish and self-satisfied civil servant who administers an establishment concerned with atomic energy. Also involved are Percy's fiancée, Lucy, who, it appears, was formerly in love with Rupert; and Sebastian, a former Army officer who belongs to the generation between Rupert and Violet. From their talk, from their attitudinising, the author offers us a sardonic cross-section of recent social and moral change.

But this realism is overlaid with another more macabre and symbolic consideration. If, as Violet thinks, this span of civilisation is finished, then clearly 'the Bomb' is the obvious terminating agent, and now we learn that pamphlets are being distributed throughout Britain warning of an imminent atom-bomb raid, the harbinger of universal destruction. So how will the people who have drunk the last of the wine react to, as it were, the breaking of the bottle? PETER FORSTER

G.O.S.: Sunday 00.30 and 18.30; Friday 14.15

of the latest developments

WHAT I BELIEVE. Francesca French is a missionary whose life-work took her to Northern China and Mongolia and through the Gobi Desert. For thirty years she was a member of the Inland Mission to China, and on her return wrote with Mildred Cable, her life-long friend and fellow-worker, some remarkable books telling of her travels. Her talk on Sunday will show her to be a person with a wide approach to the idea of faith and belief, with the conviction that God's gift to mankind is the idea of eternity which He has put into man's mind.

ASIAN CLUB. Canon Raven has recently returned from a visit to India and Ceylon where he was invited to talk on a subject near to his heart: that of comparative religions. Canon Raven describes himself as a liberal Christian with a firm belief that much in the main religions of the world is of a universal nature and basically similar. Questions will be invited from the audience at Sunday's meeting of the Club on these aspects of religion.

SHAW FESTIVAL. The last act of Bernard Shaw's *Androcles and the Lion* will be presented on Tuesday. This hilarious comedy is based on an old fable about the Roman persecution of the early Christians. Bernard Shaw explains that in the Roman era 'a Christian martyr was thrown to the lions not because he was a Christian but because he was a crank; that is, an unusual sort of person; and multitudes crowded to see the lions eat him simply because they wanted to see a curious and exciting spectacle.'

**CLIMATIC
CONDITIONS...**

Prospecting in Antarctic or Equatorial territories has done nothing to impair the efficient working of standard AvoMeters. They have rendered distinguished service under arduous conditions with most of the important post-war expeditions. They have, in fact, proved their unfailing dependability in every kind of climate for more than thirty years.

However, in pursuance of our policy of continually striving for something better than our previous best, we are now producing AvoMeters with special panclimatic protection against extremely difficult conditions of temperature and humidity and resistant to fungus growth. The "potting" of components and the use of recently developed special mouldings admittedly cost a little extra, but this special protection is invaluable in conditions of high relative humidity or tropical cycling of temperature.

Radio Show, 1956

Two popular broadcasters familiar to all G.O.S. listeners have combined to offer this 'pre-preview' of the British Radio and Television Show to be staged at Earls Court, London, from August 21 to September 1

THE EXPORT STORY

BRITAIN was the world pioneer in making radio equipment, and she now has an output valued at well over £200-million a year. The share of this that goes abroad in exports has trebled in the past eight years, so that now more than £36-million a year is spent by countries overseas on radio, television, and electronic equipment made in Britain. Behind this export story in a highly competitive industry is a consistent quality of output, constantly improved by costly research.

Let us look at some aspects of the story. Take television: last year, when the introduction of commercial programmes alongside the twenty-year-old service of the BBC made great demands on the industry at home, Britain was still able to take important orders from abroad. The first four television stations in Australia will be British-equipped. Switzerland and Italy bought eleven microwave radio-links for the television networks which now cover Western Europe.

Most industrial nations make or at least assemble their own domestic radio receivers. But a good many of them are made up with British components, and nearly one-third of Britain's radio exports are of this kind. In the field of sound reproduction, too, Britain has a big share of the export trade. She sells loud-speakers and record-changers, for instance, for many top-quality American instruments.

On the threshold of the automatic age British electronic gear is being bought by more and more countries. An industry which is helping so many others along the road towards automation is naturally aware of the possibilities for its own factories, and the automatic assembly of radio sets is being confidently forecast.

Making for the World

It is in communications that Britain does her best radio export trade: she makes for the world. Cities in Egypt are now being linked by twenty-four radio transmitters ordered last year in Britain. Where telephone lines cannot go, messages will soon be flashed over the swamps and jungles of Borneo by British gear. The police of many countries are fighting crime with British radio equipment.

In radar, Britain was the pioneer. Last year a single company booked orders from forty-three countries to equip more than 1,200 ships. And airports all over the world bring the airliners in with British radar control. So for travellers by sea and air the industry which will be on show at Earls Court, London, is performing a vital service. BERTRAM MYCOCK

A FAMILY AFFAIR

THE radio and television industry has one magnificent advantage over all other industries when it comes to staging its annual show. It is that its 'end product' is, strictly speaking, people—the famous people whose voices and mannerisms and appearances are as familiar to millions of listeners and viewers as those of the members of their own families.

Indeed the Old Familiars of the loud-speaker or screen are practically honorary members of every British family—with the added outstanding charm that they never call until they are asked—I should say until they are switched on—and can be got rid of without offence or embarrassment as soon as, if ever, their company does begin to pall.

'Gorgeous Reunion'

Which means that the annual Radio Show is for those millions of Britons nothing less than a gorgeous family reunion, when the familiar but famous uncles and aunts and cousins can be met in the flesh, and we are all granted a fascinating peep behind the scenes to see how radio's wheels go round—to see what goes on in studio and control room to make possible the regular visit of our radio relatives.

At too many family gatherings, let us admit, the spectre at the feast—the damper on our enjoyment—is the knowledge that any minute now Uncle Ethelbert is going to weigh in with *The Green Eye of the Little Yellow God*, and Aunt Philomena with *The Rosary*—in fact, that we are going to have to run the gamut of the 'party pieces.'

In strong contrast to this sort of thing, at the Radio Show the party pieces are the high-spots of the family reunion.

Special editions of most of our favourite variety programmes, both in sound and television, will be staged for broadcasting before audiences in the studios at Earls Court, with a daily feast of 'extras' from the arena—the latter including, I am told, a five-a-side soccer tournament specially organised by the BBC for the occasion.

In fact this is the occasion when the BBC really takes its hair down, and 'tells us all'—omitting, as Sherlock Holmes would say, 'no detail, however seemingly unimportant.' All the secrets are laid bare. The family really get to know each other—and in so doing they find time to get to know something of the achievements of the British radio and television industry, without which this happy family would have been impossible. SAM POLLOCK

GORDON WATERFIELD, in this G.O.S. broadcast, offered some reflections on present-day trends in the Middle East after reporting the Teheran meeting of the Baghdad Pact Council

Britain and the Middle East

I WANT to talk about three things which particularly interest me: first, the Baghdad Pact—how secure is it?; secondly, why did the proposal that Jordan should join the pact cause riots?; thirdly, what part did the Arabic broadcasts from Egypt play in causing or fomenting these riots, and in the dismissal of Glubb Pasha? The Egyptian Government has objected to the Baghdad Pact ever since the beginning and carried on propaganda against it for a number of reasons. The main one is that Israel is regarded by the Arab world as the enemy; Russia is regarded as a friend.

Egypt considered that in its plans for defence against Russia the Baghdad Pact turned attention away from Israel. Nuri es-Said, the Prime Minister of Iraq, does not agree with the Egyptian arguments. He considers that the pact, which was his idea, strengthens Iraq both with regard to Russia and to Israel; in his view any strengthening of the Iraqi army and economy is useful, whoever the enemy of the future may be, and is of value to the Arab world as a whole.

I came away from the Teheran meeting of the Baghdad Pact Council convinced that the Baghdad Pact is secure, for it fills a need in the fields of defence and of economics. My visit to Baghdad convinced me that even if

there were new elections in Iraq and Nuri es-Said were to go the succeeding Prime Minister (unless there were some sort of Communist revolution—which is unlikely) would support the Baghdad Pact. Nuri es-Said was wise enough before launching the pact to obtain agreement to it from all the leading politicians and prominent Iraqis.

My short stay in Jordan made me realise that it would be a great mistake to return to the suggestion that Jordan should join the pact, nor is there any question of such a move being made. That brings us to the second point: why did the proposal that Jordan should join the pact at the end of last year cause serious riots? Speaking in rough terms, a third of the population are refugees, living mostly in camps, hating Israel, and hating Britain and the United States for putting Israel into what they consider their country. Another third of the population are former Palestinians and live on the west bank of the river Jordan in the area that was taken over by the late King Abdulla in 1950. They are also filled with rancour and dream of the day when Palestine will be one country again. The remaining third of the population are the original inhabitants of the Kingdom of Jordan and live on the east bank of the river.

Therefore two-thirds of the population are

looking east to Israel; they regard Russia as their friend because she has allowed arms to go to Egypt, and they bitterly resent any attempt to deflect their attention away from Israel. That is what they considered the sponsors of the Baghdad Pact were trying to do. It could have been explained, as Nuri es-Said did in Iraq, that to have a stronger Jordan army was a good thing from any point of view, but this was not done, and the people feared that they were being betrayed.

Broadcasts from Cairo

This brings me to the third point: what part did the Egyptian radio play in all this? I think it played an important part, but not as big a part as was thought at the time in London. It did not create the riots but it fanned the flame of emotion. The Egyptian radio told the masses in Jordan what they already knew or suspected. Saudi-Arabian money was also regarded by some as the reason for the troubles but it is doubtful whether Saudi-Arabian money changed anyone's opinions; it just encouraged people to shout louder. But I do not want to underestimate the influence of Cairo Radio; it is always dangerous and irresponsible for the radio of one country to appeal to the emotions of the masses in another country over the heads of the government, so that important decisions are taken in the market-place rather than by the government. These broadcasts from Cairo were especially effective because Colonel Nasser had recently obtained arms from Czechoslovakia and had become a hero to all those in Jordan who wanted to see Israel defeated. Nasser is to many of them the new Saladin who will, they think, expel these twentieth-century crusaders from across the sea. All are weighed in the balance as to whether they are for or against Israel, and the British are found wanting.

Glubb Pasha was also under some suspicion because it was felt that he was a restraining influence on the Arab Legion. The atmosphere is such that politics overrides strategy, however sound it may be. Again, the Egyptian radio was attacking Glubb, but they did not cause his dismissal.

Glubb's Remarkable Character

There were many reasons for it in Jordan itself. Glubb Pasha had been in the country for twenty years and he was regarded as the dictator of Jordan, in control of the army, the police, and security. If anything went wrong Glubb Pasha was blamed—people in that position are seldom praised for what goes right. The British Government pay more than £9,000,000 to the upkeep of the Arab Legion; this is more than half of the Jordan budget, and it was paid by the British not to the Jordan Government but to Glubb Pasha.

It is not easy for officials in that position to last for twenty years in these days of emotional nationalism and anti-Western rancour. Indeed, I would say that it was only due to Glubb's remarkable character that he lasted as long as he did. He has great modesty and charm; it was known that he was devoted to Jordan, and his sympathies and his life were bound up with Jordan and the people of Jordan.

In those countries where British influence is predominant and obvious the British will be unpopular, and sooner or later there will be an outburst of popular feeling. This is especially so in areas where the Israeli question heightens emotion, but it can also be true further afield. (Broadcast in the BBC's General Overseas Service)

The Oversea Civil Service

SIR HILARY BLOOD comments on a White Paper setting out the policy of Her Majesty's Government regarding the recruitment and terms of service of civil servants overseas

A WHITE Paper was published by Her Majesty's Government on May 17 which is of considerable interest not only to members of the Oversea Civil Service whom it immediately affects but also to a number of people who have been very genuinely and very reasonably concerned for some time past over the staffing of those Colonies which are moving towards some measure of self-government. The object of the White Paper is to set out the policy of Her Majesty's Government as regards the Oversea Civil Service.

It deals primarily with two matters: the creation of a pool of officers with highly specialised knowledge either in administration or in one of the technical services. This pool is to be used as a reservoir from which from time to time highly qualified officers can be made available to fill posts anywhere in the Empire or Commonwealth where the knowledge of a particular kind which they possess is essential. The White Paper also deals with a special problem which has been brought to a head in Nigeria. This is one of the countries in which political and constitutional developments have made staffing problems particularly acute.

Transfer to Special List

Her Majesty's Government believes that the problem in Nigeria and elsewhere can be solved by introducing a scheme by which pensionable overseas civil servants serving in a territory where self-government is attained may transfer on certain conditions to a Special List. They would henceforth be in the service of the United Kingdom Government and seconded to local governments. The White Paper is an indication of the greatly altered conditions which now exist in the government services of various Colonies.

Over the past few years both the circumstances and the work have changed rapidly, in some places even more rapidly than was anticipated. In the result civil servants in overseas territories have felt uncertain about their future, and potential candidates for the Oversea Civil Service have been discouraged.

All this has happened just at the time when we need officers of perhaps even higher standards than in the past. They now have to deal with politically adult races: their role is to advise and to persuade rather than to direct and to give instructions.

The first indication that a new outlook on the subject is required was the creation of the Oversea Civil Service in June, 1954, by the then Colonial Secretary, Mr. Oliver Lyttelton. I remember very well hearing Lord Chandos, as he now is, make the announcement: it formed part of an important speech which the Secretary of State makes annually at the Corona Club dinner. We felt at the time that perhaps the new proposals involved more a change of name than of substance; but it was a step in the right direction.

The White Paper marks the second step, and is an earnest of Her Majesty's Government's intention in this matter. It will relieve the minds of many serving officers. That we need an efficient and contented Oversea Civil Service is plain, and we need to keep it up to strength by recruiting men and women of the right calibre. I see some of this from the recruiting angle when I sit on the Oversea Civil Service Appointments Board. A great number of good candidates comes forward but there must also be many which we miss.

The whole point of this White Paper is to see that many do come forward, and that once they have passed into the Oversea Civil Service they can enjoy that confidence which will enable them to give their whole attention to their increasingly important and difficult task. (Broadcast in the BBC's Overseas Services)

An Interview with the New Archbishop of York

ROBERT REID put some leading questions to Dr. Michael Ramsey the day before the latter's enthronement as Archbishop of York, and concludes: 'He already has the shape of a great leader'

THE enthronement of an Archbishop is always one of the great occasions in the history of the Church of England because so much depends upon the holder of the office—whether it be an Archbishop of Canterbury or an Archbishop of York. These are the two princes of the Church, and they can, and sometimes do, wield an enormous influence, not only in purely religious matters but in much wider spheres of activity.

But the Church itself does not issue edicts on such matters. In the main its views are very much a question for individual interpretation by members of the clergy and the laity. Not unnaturally the greatest weight of all is attached to views or expressions of opinion made by the two Archbishops. And, incidentally, in this matter of influence the Archbishops of York have never taken second place to the Archbishops of Canterbury. Although Canterbury takes precedence over York in the hierarchy of the Church the Archbishops of York are Primates of England and have supreme authority in the northern province of the Church.

Well, this is part of the background to the impressive ceremony which took place in York Minster when Dr. Michael Ramsey was enthroned as Primate of England, the ninety-second Archbishop of York, following a line of princes of the Church reaching back to the twelfth century.

A Distinguished Professor of Divinity

The real point of interest about Dr. Ramsey's appointment to this very great and responsible office is the fact that he is a comparative newcomer to the higher ranks of the Church. He is only fifty-one. For many years he has been a distinguished Professor of Divinity at Durham and Cambridge, but he only became a bishop—the Bishop of Durham—four years ago. Now he holds one of the two highest offices in the Church.

Because of this sudden translation from the academic world and this rapid promotion many churchmen are wondering how Dr. Ramsey will make out, what sort of viewpoints he will bring with him. I had the privilege of spending two or three hours with the new Archbishop the night before his enthronement. I went out to his palace at Bishopthorpe. It is a lovely old Tudor mansion which stands on the banks of the river Ouse a few miles south of York. When I arrived Dr. Ramsey was in the garden where the daffodils spatter the lawns with gold.

Now, he is a most engaging personality—essentially human. He is a huge fellow: he looks as though he has been a useful footballer in his time. He has got a keen sense of humour, and there is a perpetual twinkle in his eyes. But there was also a piercing shrewdness in those eyes when later on we settled down in a couple of easy chairs in his study.

* * *

REID: And now, Your Grace, one highly topical question to begin with. I understand that you are going to lead a party of Churchmen to Moscow. Do you think the Churches can bridge the gulf between the East and the West?

RAMSEY: Well, of course, we have to remember to start with that the Church in Soviet Russia and in the Soviet-controlled countries is extraordinarily limited and hemmed in in what it is allowed to do, and that

Dr. Ramsey photographed with his wife in the gardens of his palace of Bishopthorpe on the evening before his enthronement

Dr. Ramsey is led from the high altar in York Minster to be installed on the throne as Archbishop of York; the Dean of York is leading him

limitation is a very big one when it comes to making the best of contact with it. The particular conference that I am going to in Moscow in July has not on our side any special political motive: it is one of a number of conferences between the Church of England and churches in a good many parts of the world dealing with doctrinal questions. But it seems to me very important that when we think about Russia we should bear in mind that Russia is not just a political system and a set of leaders: Russia is a people and a nation with a soul and a history, and that has got something to do with religion.

REID: Yes, and this sort of mission seems to me to emphasise the responsibility of the Church towards the community. Now what do you consider to be the proper relationship of the Church to the community?

RAMSEY: In Britain we think on the one hand of the Church as a distinctive society with a distinctive calling and a distinctive set of beliefs and claims upon its members and a discipline of its own, and all that in a way makes the Church somewhat apart from the community for the community's own sake. But we also think of what I would call the diffused general Christian tradition in this country, with Christian sentiments, Christian virtues, and the like come down from the past, and it is the role of the Church and its leaders to represent the Church as a distinctive body with its own creed and also all the time to be eliciting and representing that latent Christian consciousness that is in the community in general. The two roles must go together.

Connection between Church and State

REID: Do you feel that the official connection between the state and the Church of England could be an embarrassment to either?

RAMSEY: It could be an embarrassment; I think it has once or twice been worse than an embarrassment, but I should be sorry to see the Church of England shed the state connection. The state connection has a lot of inconveniences but it is good for the Church to be 'mucking in' with the general life of the community, and I fear that if the Church were severed from the state it might be a rather introverted Church, missing both the burden and the opportunity which that entanglement with the state and the community for all its inconvenience gives it.

REID: Well, now, how far do you think the Church is entitled either logically or morally to express its views on real political matters?

RAMSEY: I am glad the Church in this country does not run a Christian political party as has been known elsewhere in history. The members of the Church inevitably belong to various political parties, and through them can exert a Christian influence in politics, but there are sometimes—and there are always likely to be—political and social questions on which the Church is in conscience bound to speak boldly and risk getting across one or perhaps all of the political parties.

* * *

I came away from Bishopthorpe very greatly impressed with this man who now shoulders responsibility for the Anglican Church in the north. To begin with, there is his wealth of scholarship, which is a sure foundation on which to build up the reputation of any Archbishop. But, more than that, I had the feeling that this is not a scholar just emerging into the world. He is already in it—and, what is more, fully aware of all the great issues with which the world is confronted at the moment.

But there is also another striking quality about Dr. Ramsey—a gentleness and humility which is bound to strike a responsible chord with everybody with whom he comes into contact. This ninety-second Archbishop of York will be no rubber-stamp. He already has the shape of a great leader. (Broadcast in the BBC's General Overseas Service)

'It is vital that Singapore should remain stable, and that it should continue to prosper as one of the world's most important centres of trade'

Singapore and Malaya

SIR PATRICK McKERRON discusses some of the historical and political factors affecting the future of Singapore—where he at one time held the post of Colonial Secretary—against the background of the recent London talks

WHY did the Singapore talks break down? The answer is not a simple one because so many factors, historical, political, and personal, are involved. When Malaya was liberated from the Japanese in 1945 Singapore, which before the war had been part of the Colony of the Straits Settlements, was constituted as a separate Colony, while the Malay States with the former Settlements of Penang and Malacca were eventually formed into the Federation of Malaya with a separate government of its own.

I have not time to go into the reasons for this separation, and would only wish to emphasise that the peoples of Malaya were not consulted. Before the war the Malayan peoples had had very little interest in politics, but their experience under the Japanese had awakened a spirit of nationalism, as it had fanned that spirit in Indonesia, Burma, and Indo-China. In Malaya the new spirit was strongest in Singapore, which was to be expected, as Singapore is a highly developed and concentrated urban area with a population of more than a million.

Beginnings of Democratic Government

The Federation of Malaya, on the other hand, was a predominantly rural and agricultural territory where politics and political thought were still in their infancy. This meant that Singapore was able to go ahead almost at once with the beginning of democratic government. The first elections were held in 1948. The majority of the new elected members of the Legislative Council belonged to the Progressive Party. A few years later the number of elected members was increased, and at the ensuing general election the Progressives again captured the majority of the seats.

I have already indicated why constitutional development was likely to be slower in the federation than in Singapore, but the pace of development there was slowed down still further by the Communist terrorist insurrection which broke out in 1948. This insurrection was in no sense a nationalist movement: it was inspired by the Malayan Communist Party, and led by alien Chinese. After some initial success caused by surprise it was contained and held, but the mere fact of its existence, and the necessity for fighting it, delayed the development of genuine national self-government. This, briefly, was the situation in the two territories in 1953.

Things have moved fast since then: some people think that they have perhaps moved too fast. In the federation by the middle of 1953, thanks mainly to the efforts and drive of General Templer, the emergency situation had improved so much that it was possible to consider the holding of elections. In 1954 these elections were duly held and resulted in a sweeping victory for an alliance of the principal Malay and Chinese parties led by Tengku Abdul Rahman, a brother of the Sultan of Kedah. The result was a complete landslide for the alliance. The possession of this overwhelming majority put Tengku Abdul Rahman in a very strong position and enabled him to head a united delegation to London in February of this year to discuss further constitutional advances with Her Majesty's Government.

It is an important point, this, that his delegation was a united one: when Mr. Marshall brought his delegation to London in April this year for a similar purpose events showed that it was a very disunited one. Tengku Abdul Rahman's talks were amicable and successful: so much so that if things go well—and there is no reason to think that they will not

—by August next year the federation will have attained a considerable measure of self-government, or *merdeka*, that Malay or rather Indonesian word meaning independence.

But what, you will ask, has been happening in Singapore while Tengku Abdul Rahman has been advancing toward his *merdeka*? In 1954 a Constitutional Commission sitting in Singapore recommended that there should be a new constitution, with a Legislative Assembly consisting of thirty-two members, twenty-five of whom were to be elected. The first elections under the new constitution were held early last year.

To the surprise of everybody, and to its own consternation, the former principal political party, the Progressives, not only failed to win a majority of the seats but saw its leader defeated by Mr. David Marshall, a complete newcomer on the political scene, who had recently been chosen to be leader of the Labour Front Party. Looking back on it, this may well have been a tragedy for Singapore, because the defeated Progressives were the only politicians with any experience of government: they had in fact been the governing party in Singapore for the past six years. Their defeat resulted in their political eclipse as a party, but they have since joined with other moderates to form the Liberal Socialist Party.

But—to return to the 1955 election results—as things turned out no party had an absolute majority. The Labour Front Party, which had emerged with the largest number of seats, was able, by combining with the Singapore equivalent of the Alliance Party in the federation, to form a government with Mr. Marshall as its Chief Minister. The new government ran into stormy weather straight away. Only a few days after it assumed office it found itself faced with serious strikes, mob violence, and trouble amongst the Chinese students. After a short period of vacillation caused largely by the extreme nature of some of its own election pledges the Marshall government showed commendable firmness and succeeded in re-establishing law and order.

Communist-Inspired Disorders

There is no doubt that the disorders had been Communist-inspired. There is also no doubt that these events opened the eyes of the Marshall government to the internal security dangers in Singapore where the majority of the population is under twenty-five. At the same time Mr. Marshall, who did not need these events to make him a fervent anti-Communist—he had always been that—became convinced that the only way to fight the Communist danger in Singapore was for complete self-government to be granted to the people, so that it could be shown that they and not a colonial government were fighting it.

There is a very great deal to be said for this proposition, but Mr. Marshall seems to have become obsessed by it to the exclusion of all else. He does not seem to have visualised sufficiently clearly the possibility of the Communist forces in Singapore making democratic government impossible. However, before he left for London he announced that in addition to allowing the British Government to control Singapore's external affairs and defence he would be willing to see provision retained in the new constitution to permit of its suspension by the British Government if internal security were to break down.

What I think he failed to realise sufficiently clearly was that external

(Continued on page 10)

SIR PHILIP HENDY, Director of the National Gallery in London, offers an expert's view of the significance of the work of the famous sculptor who—he suggests—'is a very strange phenomenon for England to have produced'

Henry Moore and his Sculpture

IF you were to ask me to say what the particular quality was in Henry Moore's work which made me admire it so much I should not find it very difficult to answer: it is his sense of form. This may seem a very obvious thing to say, for one cannot be a great sculptor without having a great sense of form. But then in England we are not yet really used to the idea of having a great sculptor in our midst. Looking at English art through recent centuries, it has to be admitted that as a whole it has not been distinguished for its form.

England has produced several great painters. The landscapes of Turner and Constable, in particular, stand up well—in spite of their Englishness—when you see them in an American museum, for instance, along with great pictures of the European continental tradition. But such artists—Hogarth was another—have made only sporadic appearances; each of them has failed to create a school, a solid tradition, because there just was not enough solid form there as a basis of their art for others to go to work on and produce something in the same tradition but new.

And as to sculptors, I cannot think of a single English-born sculptor before Henry Moore who can be called even good by international standards. Henry Moore is a very strange phenomenon for England to have produced. He is the son of a Yorkshire miner, a breed well known for its toughness and independence. As a boy he loved the medieval carvings in the parish church, and wanted to be a sculptor. As an art student, when he came to London, he began to haunt the British Museum for the sake of the sculpture of several traditions that there is to see there. Which goes to prove what I, as a museum director, like to believe—that art may always spring up anywhere, given two things: the will to make it and some works of art belonging to a great tradition.

'Form'—in Terms of Art

But to go back to this phrase I have used: a sense of form. I said the answer was easy; but it is not so easy to explain what I mean by it. Form, speaking in terms of art, is not just another word. For the physical third dimension. This belongs to any dummy in a shop window, or a lead soldier, or a white marble angel in a cemetery.

This means that you cannot create artistic form just by copying nature. Indeed, form could almost be said to come into a work of art at just that point where it ceases to be a copy of nature. The mere copyist of nature is studying and copying the outside shell so busily that he is not able to think all round it at once, and grasp it as a whole. He is not making any creative effort with his mind, and so does not give any new life to his form. The real artist, however closely he may look at nature, has to grasp her forms completely in his mind as a whole. He simply cannot do this without re-creating her forms in his head before he puts them out again in the shape of his work of art.

So much for the broad idea of form; now about the material in which the form is produced. Henry Moore has experimented in every kind of material, in a great variety of stones and of woods and of metals. In his earlier days, particularly, he sometimes almost let the material guide him. Certainly he never forgot what he was working in, or tried to make it look like something else. If he was carving in stone, he wanted the thing to look stony, to have the full weight and density of stone. If it was wood, he probably turned it into a shape which looked lighter and warmer to the touch, and let the grain of the wood play its natural part in the design.

Now that he has more commissions than he can execute he works a great deal in clay or plaster, to be cast in bronze; for results come quicker that way. But even with bronze he is working to achieve new kinds of surface textures; and he always likes to vary his work in bronze by carving now and again directly in the stone, as is witnessed by the *Family Group* unveiled at Harlow, in Essex. For this he had a young assistant for a time who began the cutting under his direction, until the thing began to take a

'Family Group' was recently unveiled at the New Town of Harlow, in Essex: Henry Moore carved it from one block of stone in four months

vague shape. But it was still very vague indeed when the assistant stopped work, and every inch of surface that you see in the finished sculpture has been made by Moore's own hand: he himself was carving for three or four months.

This new sculpture at Harlow is in light-coloured stone, and represents a man and a woman sitting down, side by side, with their child between them. The woman's arm is round the child, and the man's arm is over the woman's shoulder. It represents the idea of the family. It is a very compact group; for it goes without saying when Moore is the sculptor that it is all carved out of a single block of stone. The family is something eternal, and stone lasts longer at least than many generations of families. This is a story group, depending for part of its effect upon the weight and compactness of stone. The family sits on a hillside, with the medieval parish church not far behind it, and gazes out across the countryside without looking at each other. But it is perhaps the most human piece of sculpture that Moore has yet produced, the most Greek, with its classical calm and a kind of remote benevolence in its expression.

I think this Greekness is probably a sign of maturity on the part of Henry Moore. He has always loved Greek sculpture, and has spent hundreds of hours in front of it in the British Museum. But the traditions to which he fixed himself at first were those of more primitive races, who had lived close to the soil and had left a wildness of spirit which he could look at freshly, not through the tired eyes of culture. His earlier things often had a quite savage expression, and remind one of the carvings of Africans, or Sumerians, or above all of the South Americans of the days before Columbus.

Belonging to his generation, it was inevitable that Moore should experiment in wholly 'abstract' shapes, but there have not been very many entirely of this kind. He is very English, and the English love nature; and English art has reached its best in modern times in landscape painting. So though Moore is a sculptor there is often in his forms a great deal not only of nature but even of landscape.

If you ever come across one of his *Reclining Women* in an exhibition or in England you may well think at first that his is a very strange kind of woman, curiously distorted, chopped about at will. But if you think also of nature, of the shapes of great tree-trunks; or of caves in the rocks by the seashore, of hills and of valleys, and then look back again to Moore's *Reclining Woman*, you may well come to see in her not just a woman but a woman in a landscape. He has somehow managed to put into a single form the idea of all these things at once. Moore would always like his things to be seen out of doors, and that is where they always look best. You can have, incidentally, no better test than that: they are all big enough to stand it. (Broadcast in the BBC's General Overseas Service)

Henry Moore at work on his 'Giants' for the Time-Life building in London

Lt.-Gen. Sir John Glubb Pasha

Desert is land without water, and it may be flat or very mountainous

Where there is water there is life

The Lure of the Desert

In this round-the-table discussion Brigadier Fergusson questions three speakers who have had wide experience of living in the desert and of living with desert people—Lt.-Gen. Sir John Glubb, Col. David Stirling, and Col. Laurens van der Post—and elicits some striking sidelights on an environment that is often mysterious and always fascinating

WE are going to talk about the lure of the desert, and round the table we have Laurens van der Post, who served during the war in Abyssinia and the Middle East and Trans-Jordan and Syria, and who has lately come back from a trip to the Kalahari desert; Colonel David Stirling, who was associated with the Long-Range Desert Group early in the war and then founded and commanded the Special Air Service and who had a lot of experience in the Western Desert; and Lt.-General Sir John Glubb Pasha, whose name we all know and who has been so long associated with the Arab Legion, which he lately commanded, and who has a great experience of the deserts at the eastern end of the Mediterranean.

The point I am going to put to them first is: why is it that the island race from which three of us spring—and the European stock from which Colonel van der Post springs—why is it that we take to the desert in such a way when you would think from all logic that it was a totally alien environment for us?

GLUBB: Don't you think it has something to do with the likeness between the desert and the sea—a vast expanse without roads or tracks which people want to get across and see what there is the other side. I think it is very reasonable that an island race should be fond of desert.

VAN DER POST: Glubb Pasha has put his finger on something which has occupied my imagination for quite a long time. I have always marvelled at this faculty which the people of these islands have had—and shown in their history—for going to something so unlike their own country as the desert: for going there, loving it, living there, and being so good in the desert and with the people who live in the desert, having this extraordinary feeling of kinship. I think this sea analogy has got something enormously to be said for it. Even in my Kalahari desert, which is less like the others, you have got this unending thing that the sea gives you, and I have often thought it looks as if this thing has once been at the bottom of the sea; and if you look at the sky it looks as if there is a

blue Atlantic rolling away over it. And then, you behave so much as you do at sea. It is brought back to my mind, for instance, that on one of the big expeditions I did in the Kalahari not long ago, where we had to go through 800 miles of it, zig-zagging, we had to use one of our members as a master-mariner. We steered by the stars and we worked out bearings with a sextant and a compass to get through it.

STIRLING: We, too, were entirely dependent on instruments. In fact, very often parts of the map would have nothing on it whatsoever, and we would plot where we were by the sextant. I shall never forget on that very first trip, when we were picked up by the Long-Range Desert Group, one of the maps was almost entirely without a line on it: there was no feature, no hill—it was a blank piece of paper except over in one corner where Lady Rosita Forbes had once crossed the desert in 1936.

As Varied as Any Other Kind of Country

FERGUSSON: People who don't know much about deserts are apt to think of them as one long, featureless stretch of country with an occasional shade—nothing much more to it. Glubb Pasha, would you like to tell us, in the deserts you know, to what extent they vary?

GLUBB: They vary just as much as any other kind of country. The reason why it is desert is that it does not rain enough, but it may be flat or it may be extremely mountainous, or it may have any other conformation. The particular desert between Jordan and the Euphrates could be divided really into two halves—the northern part of limestone, which consists mostly of slightly rolling country, either strewn with gravel or flints, and an east-and-west line which runs approximately from Akaba to Basra at the head of the Persian Gulf; south of that it is all sandstone, with most fantastic mountains and eroded formations—sort of table mountains and mushrooms and umbrellas. But I think my favourite part of desert is in the south-eastern corner of Jordan, a range of sandstone mountains that have an enormous line of cliffs, 1,000 feet high and 100 miles long, facing south into Arabia—tremendously impressive; and up into the range there are these deep canyons cut in the sandstone, the beds of which are full of dunes and bushes; and then vertical cliffs on each side—a marvellous piece of country.

VAN DER POST: But if I may add to what you were saying, Glubb Pasha, I think myself there are, as it were, two phases in one's attraction: the first phase is the feeling of emptiness, that nobody has been there before, and I think that feeling lasts a very long time; but I find more and more that another phase—certainly as far as I am concerned—takes its place, and that is the feeling in this modern life that one is never left entirely alone by the outside world—there is always a foreign noise trying to catch your ear; there is always the foreign sight. Even in the Tubes there are advertisements you have nothing to do with which invade you; you are invaded perpetually by things that really have nothing to do with you. And I find that I sometimes get into such a maze that when I wake up I do not know who I am or what has happened to me. And then I get a tremendous longing to go back to a place where there is nothing but a vast, unchanging, natural scene, where one feels one can shake oneself by the hand again.

Col. David Stirling, and (left) Col. Laurens van der Post with a youthful Bushman

Bedouin tribes still lead a wandering life with their camels, but the motor-buses which cross the desert routes are a sign of a changing way of life

Photos: Shell Petroleum Company

FERGUSON: There is one other thing, though. I do not think people are aware of the ebb and flow of the seasons in the desert. Glubb Pasha, would you like to talk about that?

GLUBB: Well, of course, the contrasts in the desert are most extraordinary: for example, between the blazing heat which dazzles you so that you cannot open your eyes in summer, and valleys in the desert in winter where there is grass and flowers, much more than there are wild flowers in England. That is a most extraordinary contrast.

VAN DER POST: I do not know anything more exciting than seeing the desert immediately after the rain. It is as if an immense kind of dynamo has suddenly started up—you can hear it—and then these incredible desert flowers; and some of them are very classical flowers—the amaryllis in the desert, for instance, is quite astounding. And when you are in the desert in the spring you really get a feeling of immense contrast; a contrast not only of the seasons—I think of those peculiarly intimate contrasts you get in the desert, contrasts even in the sands. I know a place where the Kalahari desert meets another desert called the Grossup desert, and there the Kalahari sand, which is a peculiarly deep honey-coloured sand, suddenly meets another sand which is almost blood red, and the two sands never mingle, and you see this division line running over one blue horizon after the other. And even the sounds you hear on one side of the dunes are quite different from the sounds on the other side: a peculiar kind of singing, moaning noise goes on, which is quite fantastic to hear.

Shifting Sands of the Desert

FERGUSON: One thing I have often wondered about is how much sands shift—I mean, you find dunes in the same place. Why don't they shift twenty miles to the westward, according to the wind, or something?

STIRLING: They do.

FERGUSON: Well, what is the range of shifting sands—I mean, do they shift out from one district to another?

STIRLING: We have found, often going back to the same place a year later, that there would be quite a considerable difference where the bottom of the dune had advanced up to perhaps ten or fifteen yards. The effect of the wind on the sand is remarkable.

FERGUSON: Do you have that sort of thing in your Syrian or Jordan deserts, Glubb Pasha?

GLUBB: I don't know that there are much in the way of sand-dunes in Syria. In the south of Jordan there are. I think the sloping side is the direction of the prevalent wind.

VAN DER POST: But I think that is one of the things I love about your desert up north. You said there are not many dunes. But they have hills and mountains in them.

FERGUSON: David Stirling, if you were given the chance of wafting us to a favourite desert spot, what would your choice be?

STIRLING: I think it would probably be bathing in the Boadicea Pool at Siwa: not strictly desert, but like the desert, characteristic in its almost grotesque contrast with the day one probably spent getting to it. All the way through the desert it is the sense of contrast which is so fantastic.

GLUBB: Yes, the extreme cold when you get going in the morning, knowing that within an hour the extreme heat is going to hit you—the fantastic scale of change from the extreme of one sort to another.

FERGUSON: Would you subscribe to that, van der Post?

VAN DER POST: Yes, very much so. Unfortunately, in my Kalahari, there isn't water on that scale—you cannot get the sort of oasis effect you get

in the northern deserts which can be so lovely. None the less, I would go straight back to a place which I have recently come from in the Kalahari and which is, I should think, a good 300 miles from the nearest permanent water, and absolutely isolated. I do not think many people have been there before, except Bushmen—a few live in the Kalahari—and it has the attraction that it sustains the most miraculous sort of animal life: there are animals round about, you hear nothing but natural sounds, and the air is so clear. But what I had never experienced before and did experience there was star-rise; you could lie at night on your back and between your toes see one star after another coming up.

GLUBB: Well, of course, the most famous oasis in the Syrian desert is Palmyra, I suppose, and that certainly is most impressive. It is the absolute picture of what an oasis ought to be, with a spring and palm trees leaning over it. Further south you get the Wadi Sahran, which is a big depression, and that has water the whole way down—it is a whole chain of oases.

But I was going to offer an alternative suggestion of contrast: in the old days, when one rode a camel across the desert—which nobody does now—how very dreary and tired and lonely you would feel towards the evening when no one was in sight; and there, all of a sudden, just before sunset, you would see a tent, perhaps ten miles away, and a flock of sheep, and suddenly realise you were going to have somebody to stay the night with. That was a tremendous moment.

STIRLING: It is the end of the day in the desert which is perhaps its most agreeable phrase, partly because you are going to relax after being in a hurry. One thing that always struck me about the desert was the fact that it was not self-cleansing—that if a track had been made fifty years ago, or shall we say at the time of the Duke of Westminster's campaign,

The oil companies, with their pipelines and wells, are the greatest factor in changing the face of the desert in Arabia and Mesopotamia

'Perhaps George Orwell Was Right'

FRANCESCA M. WILSON, in this introductory talk in the current series in the General Overseas Service, thinks perhaps the author of '1984' was right when he said 'the British have power to change out of all recognition and yet remain the same'

THE people are bold, courageous, ardent and cruel in war, fiery in attack and having little fear of death; they are not vindictive, but very inconstant, rash, vainglorious, light . . . They are full of courtly and affected manners and words . . . eloquent and very hospitable; they feed well and delicately.' Who are these swashbucklers? The French, perhaps, or the Renaissance Italians? 'Cruel in war, fiery'—possibly Spaniards. No, they are the Tudor English, described by a Dutch historian of the time, van Meteren. He is seeing the passionate Romeos, rash Hotspurs, and witty Benedicks who were once typical Englishmen.

Where are they now, these gesticulating, excitable, boastful young men? Why and when did we change? Some would put it all down to the Puritan Revolution and say that we changed in 1642. But that seems rather too simple, because many an eighteenth-century Briton was a pleasure-loving extrovert, 'extremely sensual and intelligent,' as a French art-critic said of him. Think of what the diaries have recently revealed about Boswell, the Scot, or of the characters in *The School for Scandal* and *The Rivals*.

It is more than likely that the public schools, as developed in the Victorian age, had quite as much influence in the metamorphosis of the Englishman as Puritanism, that Dr. Arnold of Rugby is as responsible as Cromwell and Bunyan. Indeed, another Dutchman, Renier, calls him the moulder-in-chief of the modern Englishman. Renier in the 1930s wrote a best-seller entitled *The English—Are They Human?* He was thinking of the public schoolboys with their poker-faces, their understatements, their Oxford accents, their rejection of emotion. And indeed nothing could be more unlike their Tudor ancestors.

But what Englishman are these foreigners talking about? Remember Disraeli's 'two nations.' Certainly these ardent, courtly, eloquent men that van Meteren speaks of are the small nation on top. The sturdy base of the nation—the ploughman, labourer, sailor, miner—has changed much less. It is true he has become gentler, kinder, more orderly. Just 250 years ago a Swiss visitor, Muralt, was amazed at our love of cruel sports: cock-fights, gladiatorial shows, and, above all, Tyburn—for hangings were the most glorious show of all. Trying to excuse us, for he admired us for loving liberty more than other people did, he said: 'Do not be surprised by the remnant of ferocity in this nation. It is perhaps a necessary safeguard against slavery.'

A Frenchman in Victorian London

All through the eighteenth and nineteenth centuries it seemed to foreigners that we had the most ferocious slum-dwellers in the world. See how the Frenchman, Taine, in his *Notes on England* describes London's East End in 1862, less than a 100 years ago. 'Thrice in ten minutes I saw crowds collected at the doors; fights were going on, chiefly fights between women. . . The bystanders laughed; the noise caused the adjacent lanes to be emptied of their occupants: poor ragged children, harlots—it was like a human sewer suddenly discharging its contents . . . From the time of leaving the Tunnel street-boys abound—barefooted, dirty, turning somersaults for ha'pence. On the steps leading to the Thames they swarm, paler, more deformed, more repulsive than the scum in Paris, for the climate here is worse and the gin more deadly. Near them, leaning against the filthy walls, are men in astounding rags.'

The British loved their liberty too much to queue as they did in France—so foreigners were told. If you go to Hampstead Heath on August Bank Holiday nowadays and look at the well-dressed orderly people and at the patient queuing you will say that both of Disraeli's 'two nations' have changed, not only the top layer. John Bull has become a tame and gentle creature in the welfare state. But we may wonder if the change is as fundamental as it seems. Take the dislike of being regimented, the scorn of military glory. Would you ever find youth rallies, coloured shirts, goose-stepping popular among the commoners in Britain as they have been on the Continent? In 1695 the Swiss, Muralt, wrote: 'The courage of the English is everywhere well known . . . yet few of them run off to wars in foreign countries. The title of Captain is an inferior one with them.' George Orwell noted that our defeats are better remembered by the people than our victories: the Charge of the Light Brigade, Gallipoli, and Dunkirk are more familiar than Waterloo or even than El Alamein.

Then there is the privateness of English life. The German, Archenholz, in 1784 writes: 'The poorer people, provided they are not absolute beggars, do their utmost to obtain a house for themselves. The English proverb, "My house is my castle," is not an unmeaning one.' Foreigners always notice the high hedges or walls between the gardens of small houses, the 'I like to keep myself to myself' attitude. A Russian visitor

in the eighteenth century sighed that it was like looking for flowers in the desert to hope for a community life in Britain. This is changing now, no doubt, but changing with difficulty.

Then there is the feeling about foreigners. For a long time few foreigners could step on our shores without being shouted after as French dogs, whatever their nationality, and there were often riots against foreign workers. Now no one minds the foreigner in the street as they once mobbed Voltaire. Now the policeman shows the stranger the way; we are kind and polite—but the Italian miners had to go home.

The point I am trying to make is that the commoner in Britain has become gentler, quieter, more law-abiding, but basically he is very much the same as his ancestors.

As for his work: in the nineteenth century we were called a 'nation of bees,' but otherwise we have always struck foreigners as lazy. Listen to Sorbière, a Frenchman who came here in 1663: 'There is scarce a day passes but a tradesman goes to the alehouse or tavern to smoke with some of his friends, and therefore public houses are numerous here, and business goes on but slowly in the shops, for a tailor and a shoemaker, let his business be never so urgent, will leave his work and go to drink . . . This makes manufacture dear and renders the natives angry with the French people, for our tradesmen are more industrious as a rule.' Foreigners more industrious, yes, but it was always admitted that our mechanics had a high measure of skill: many of our visitors mentioned 'the perfection of English handicrafts.'

What does it all add up to? That the thin layer on top has changed, yes. As for the rest—the sturdy base of the nation—perhaps George Orwell was right when he said that the British have power to change out of all recognition and yet remain the same.

Singapore and Malaya

Continued from page 6

defence and internal security are so closely interlocked—particularly in the case of Singapore—that if the British Government are to control the external defence effectively they must have a say in the control of internal security. It was on this issue that the talks finally broke down, in spite of the patience of Mr. Lennox-Boyd and, I think, a badly advised last-minute effort by Mr. Marshall to save the situation.

Where have things gone wrong? If I may hazard a personal opinion based on my own experience of pre-war and post-war Malaya it is primarily because the federation and Singapore have been allowed, or have allowed themselves, to develop constitutionally on different sets of rails when they ought both to have been on the same track. What ought to have happened was that Tengku Abdul Rahman and Mr. David Marshall should have come to London together for discussions about a self-governing Malaya. The two territories are one entity: Singapore is to the rest of Malaya what London is to the rest of Britain.

Mr. Lee Kuan Yew, the leader of the Peoples Action Party and a member of the Singapore delegation to London, sees this clearly. At a Press conference which he gave before leaving London he emphasised that he regarded Singapore's integration with the federation as vital. I happen to know that before he left Singapore he personally strove his hardest to come to some working arrangement with Tengku Abdul Rahman. He failed, probably because the Tengku felt that he had enough on his hands working out his own recently won constitutional advances.

When I was in Singapore last August on a short visit many of my old friends there of all communities and walks of life made no attempt to conceal from me their anxiety about what would happen if Singapore were to continue to persist in attempting 'to go it alone.' Singapore lives by trade and has a delicately balanced economy, very easy to upset: there must be confidence both inside and outside the island if it is to continue to prosper—and it must prosper or die. It produces virtually no food; it has no mineral resources; its only natural resource lies in its geographical situation and in the fact that it is, and has always been, a free port. If its trade were to recede there would be mass unemployment.

Finally, Singapore is a base and bastion of the free world in South-East Asia. It is vital that conditions there remain stable, and that it should continue to develop and prosper as one of the world's most important centres of trade. (*Broadcast in the BBC's General Overseas Service*)

DR. W. E. HOARE, Assistant Director of Britain's Tin Research Institute, tells how a London laboratory has set itself the task of finding new uses for tin, and of improving existing tin products and the processes by which they are made. C. L. Boltz is the interviewer

'A Reasonably Bright Future for Tin'

Some of the many components which can now be made of bronze—an alloy of tin and copper—thanks to the discovery of new methods of casting

Keeping pace with the world's demand for tin-cans: modern plants can produce tin-plate out of sheet-metal by electrolysis at 1,000 feet a minute

At our laboratories in London there are about sixty of us who spend our time studying and working with tin in one form or another. This concentration of attention on one metal may perhaps seem to you to be a little confused: it is quite the reverse simply because the uses of tin are so widespread. In all its important outlets tin is used not by itself but in association with other metals. For example, its biggest use by far is as a coating to protect other metals, like steel, from corrosion. Tin-plate, the material from which the familiar tin-can is made, is really steel coated with about one ten-thousandth of an inch of tin. Last year the world produced about 50,000-million tin-cans, and used just about 60,000 tons of tin in doing so.

Our researches at the institute are aimed at three principal targets: first, at discovering new uses for tin; secondly, at improving existing tin products; and, thirdly, at improving the processes by which tin-containing products are made. Thus you can see that we are after new products, better products, and less expensive products. We must, of course, continue to study the classical uses of tin such as solder and bronze, because these are still vastly important, and because every day modern technology is making new demands on these older materials and older techniques.

As good an example as any is the linkage which enables you to hear broadcasts. The chain of electrical devices contains literally thousands of soldered joints. Underneath the chassis of your radio there is a complication of wiring that appears to be impossible to construct except by painstaking hand-assembly. But in the new technique of the printed circuit electronic circuits are literally printed in metal, the numerous joints made automatically, and—this is most important—made sure by dipping the whole circuit into molten tin-lead alloy.

But let me just mention to you one or two really new uses for tin. First, in the field of coatings. Generally it is not too difficult to electro-deposit single metals: you are all familiar with gold-plating, silver-plating, and nickel-plating, to name a few. But what about electro-depositing alloys? A few of us at the Tin Research Institute have been studying the basic principles of alloy-plating for quite a while now, and we have learnt something of how to persuade two different metals to deposit together, more or less in the proportions we want them to.

Useful Alloy of Tin and Zinc

One rather productive result of this work—and I mean productive in the sense that the discovery is already leading to increased tin consumption—is the invention of a procedure for electro-depositing a useful alloy of tin and zinc. We went after this one with our eyes open. We were fairly sure that a coating which combined in itself some of the useful characteristics of both tin and zinc could be astonishingly valuable. This tin-zinc alloy deposit is white in colour; you can solder it; it provides excellent protection to steel; and you can lacquer or paint it if you wish. With such properties it is not difficult to see how useful it is in the electrical, radio, and the light-engineering fields.

Another outcome of our researches on the plating of alloys is the invention of the tin-nickel-plating process. This alloy contains two parts of tin and one of nickel. It looks rather like highly polished stainless-steel, and it is absolutely tarnish-resistant. When I tell you that one of its uses is for the protection of the delicate weights used in assaying you will realise just how stable and how corrosion-resistant this tin-nickel alloy is. This process of ours is quite new, and in due course you may expect to see it used on all the multitude of everyday fittings.

Just to round off the picture let me mention a very fascinating field of our work quite distinct from metallurgical research: our study of substances called organotin compounds. These are compounds in which a

tin atom is chemically linked to a carbon atom. Ordinarily their structures are complicated and their names somewhat exotic. Dibutyltin dilaurate, for example, is a compound wherein one atom of tin is embedded in a molecule containing thirty-two carbon atoms, sixty-four hydrogens, and four oxygens—one tin atom among exactly a hundred strangers. This compound, for reasons as yet obscure, has some rather special properties. It is used for stabilising high-quality plastics, to preserve their colour and clarity. The compound is also used to combat worm-infestation in poultry.

An interesting point about these organotin compounds is their almost infinite possibilities of calculated modification. A competent organic chemist—and we have one or two—uses his radicals—his recognisable and characteristic groups of atoms—as building bricks with which he constructs molecules and materials with the properties he desires. This procedure, called organic synthesis, has yielded to us compounds having interesting possibilities as fungicides, veterinary chemicals, and wood preservatives. In this last respect the tin-producing industry may indeed be helping itself: we are now trying out organotin compounds for preserving pit-props in a Cornish tin-mine.

Improved Quality of Bronze

BOLTZ: Thank you very much, Dr. Hoare. Now if I may go right back to the very beginning. You said that one of the aims of your work at the Tin Research Institute was to improve the existing tin products. Could you give us some idea of what is being done at your place?

HOARE: I can give you an example: our work on bronze. Bronze is the oldest use of tin: as you know, it gave its name to one of the ages of man. A few years ago, however, we could see that the available methods of casting were rather limiting its use. Now, research by us, and indeed by others, showed how control of the melting and casting processes could yield better metals, and of more consistent quality. We have a rather novel casting machine at the institute which people have come from all over the world to see.

BOLTZ: You mentioned electrolytic tin-plating without giving any details about it. Could you tell us about it?

HOARE: Electrolytic really refers to the methods used for applying the tin to the steel. You see, you can do this either by dipping the steel sheets into molten tin or by electro-deposition. These modern electrolytic tin-plate plants are almost miracles of engineering and electrical ingenuity. A single plant may produce well over 100,000 tons of tin-plate in a year, and they work at speeds of more than 1,000 feet a minute.

BOLTZ: You mentioned organic chemists: what other specialists have you got?

HOARE: We have got quite a few metallurgists naturally; we have electro-chemists and engineers. But I think it is perhaps as important that we have on our staff men who are experts in the various fields of tin usage: one of my colleagues, for example, is an expert on solders and soldering; another one knows pretty well all there is to know about bronze, and so on.

BOLTZ: Your business is to increase the consumption of tin by means of your research at the institute. Now what would you say, finally, is the outlook for the consumption of tin in the future?

HOARE: I myself am optimistic. I have tried to tell you something about the new uses and, of course, people everywhere are getting a higher standard of living, so there must be more production of devices, containers, and so on, all of which can use more tin. These things seem to me to add up to a reasonably bright picture for tin in the future. (Broadcast in 'London Calling Asia')

MODEL A182 11-valve superhet with 6 band-spread short-wave ranges as well as short-wave broadcast and medium-wave broadcast ranges. Specially designed rotating vertical scale giving one of the largest scale areas of any receiver. Two matched 10" speakers. Operates on A.C. mains of 100/150 volts or 200/250 volts, 40/100 cycles. Piano finish walnut-veneer cabinet, gold colour speaker grille, scale surround and control knob inserts.

THIS NEW RECEIVER, Model A182 has been developed by Britain's foremost radio engineers. With its advanced design and comprehensive specification it is outstanding in any company. For family use, all the controls except tuning and volume can be pre-set, while when the occasion demands, all the facilities that add to the pleasure of radio reception, or reproduction from a gramophone pick-up, are at your command. A separate tuning scale automatically appears for each wave range, giving an effective scale area of over 100 sq. ins. Whether you seek perfection in home entertainment or, as an experienced enthusiast, you seek communications from the furthest part of the world, EKCO Model A182 will respond to your requirements in an unusually impressive manner.

1956 RADIO SHOW—EARLS COURT

We invite you to visit the special EKCO Export Showroom at the Radio Show. The exceptionally large range on display will include table and console television receivers, the famous Ekco TV Portable, auto-radiograms, both console and table, and radio receivers for indoors and out... for mains or battery operation. We look forward to seeing you!

Bruce Miller

WHILE one might think that the effect of a war would be to make everyone wish to forget it, in fact the study and discussion of war, once it is over, have proved irresistible to men who fought or planned the fighting. For the second world war this has meant a spate of books from spectacular escape stories to the more restrained and circumstantial official histories. My first book is one of the latter—Volume II of what will eventually be six volumes in the official British war history, on *The Mediterranean and the Middle East*. This volume is called *The Germans Come to the Help of Their Ally*. It deals with the campaigns of 1941 in North Africa, Greece, and Crete, and the Middle East and East Africa. It is written by Major-General I. S. O. Playfair with the help of other officers from the other Services. I found it an absorbing account of an exciting year's events. I was rather disappointed to find the fighting in Cyrenaica, Greece, Crete, Iraq, and Syria disposed of in 325 pages, plus appendices. Greece and Crete, in particular, were amongst the most tragic and moving campaigns of the war, and they were very much British Commonwealth affairs.

There has been a new impression of Glubb Pasha's *Story of the Arab Legion*, which first appeared in 1948. It does not deal with recent events, but ends just after the war: in it you will find some interesting sidelights on the period covered by the official history, especially the Syrian and Iraq campaigns.

Maurice Collis, who is already known for many charming and thoughtful books on Burma, has written an account of the Japanese invasion, the reconquest, and the establishment of an independent Burmese state, under the title *Last and First in Burma*. The thing which emerges from the many first-hand accounts which Mr. Collis has collected is the universal confidence which the silent, somewhat aloof figure of Wavell aroused in those around him; but no general can win with confidence on his side unless he has weapons and men, too, and these Wavell did not have. He passes out of the story with dignity and a complete absence of recrimination. The central figure in Mr. Collis's story is the Governor of Burma, Sir Reginald Dorman-Smith; but along with him go a great many others, Burmese, British, American, to make a remarkable book which is lucid, persuasive, in places even lyrical, and which displays an unsuspected talent in Mr. Collis for description of military engagements.

Field-Marshal Slim's book, *Defeat into Victory*, has already been hailed throughout the British Press as a classic and I am not going to dispute the verdict. I found it the most absorbing book by a serving soldier that I have read. It is extremely long and detailed, but every page has a personal flavour to it. He describes how his force was driven out of Burma in 1942, and how, in 1944 and 1945, reinforced and remoulded, it went back again and had the Japanese thoroughly beaten, well before the atomic bombs were dropped on Japan. The most impressive part to me was where he described the methods he used to revive his beaten soldiers and instil in them a better morale. I should think that more nonsense has been spoken and written about 'morale' than about most other ideas; but I felt that what Slim wrote about it, and about the methods he used to make it a reality to his men, ought to be read not only by every military leader but by everyone who has to make men believe in a cause and nerve themselves to a great effort.

MacArthur, 1941-1951: Victory in the Pacific, by Major-General Charles A. Willoughby and John Chamberlain, is a work of idolatry by one of MacArthur's aides, assisted by a prominent publicist of the right wing in American politics and literature. It is a highly competent book: the military descriptions are clear, the narrative picks up well from point to point, and there is a great deal of inside detail which could have come only from someone in General MacArthur's confidence. But it is written in grandiose terms by men who will never admit a mistake by the man they are writing about, and it identifies all those who opposed MacArthur or did not do what he wanted as either fools or knaves.

China Under Communism, by Professor Richard L. Walker of Yale University, is a description and analysis of the system set up by the Chinese Communists in their first five years of power: of the way China is ruled; the structure and organisation, recruitment and training of the Communist Party; the methods of economic control, especially as they apply to workers and peasants; the methods of intellectual control and propaganda; and the conduct of external relations. The facts are marshalled and disciplined: together they form a convincing outline of a Communist system of living which is very little understood in Europe and Asia. I am sure it gives a truthful picture, and one we ought to know more about.

The Germans Come to the Help of Their Ally, Volume II of *The Mediterranean and Middle East* (Her Majesty's Stationery Office, 35s.).
The Story of the Arab Legion, by John Bagot Glubb (Hodder and Stoughton, 30s.).
Last and First in Burma, by Maurice Collis (Faber and Faber, 30s.).
Defeat into Victory, by Field-Marshal Sir William Slim (Cassell, 25s.).
MacArthur, 1941-1951: Victory in the Pacific, by Major-General Charles A. Willoughby and John Chamberlain (Heinemann, 42s.).
China Under Communism, by Richard L. Walker (Allen and Unwin, 30s.).

The castle was originally built by the Normans to cover the one side of the town where the river provided no defence

The eighteenth-century English bridge across the Severn: the river formed the main defence when the town got involved in the Welsh wars, the wars of the Roses, and the Civil War

The Shropshire Town of Shrewsbury

ARTHUR BUSH, in this brief guide to the charming old town lying in a loop of the river Severn, says it provides 'almost everything to satisfy the seeker after tangible evidence of English history and tradition'

THE fact that Shrewsbury lies in a loop of the river Severn—almost making an island of it—is probably one of the main reasons for the town's survival. In the old days during the Welsh wars, the wars of the Roses, and the Civil War—in all of which Shrewsbury was deeply concerned—the natural moat provided by the river was the town's main defence. The one part where the water did not provide a natural fortification was guarded by the castle built by Roger de Montgomery. He had been given the town and a large part of the surrounding countryside as a reward for supplying most of the fleet which brought William the Conqueror's troops across from France.

There is only the Norman gateway left now of the original building to remind one of its military purpose; almost all of the town's encircling wall—a second line of defence behind the river—has disappeared, too; but if you want to be reminded of the town's violent past there are still bullets from the seventeenth-century Civil War embedded in the gateway.

Memories of a More Tranquil Past

But there are memories of a more tranquil past in the vineyard on the slopes leading down to the river which belonged to the monks of the abbey—also, by the way, founded by the warlike Roger de Montgomery. And the old town pastures are still there, although they are now a part of the grounds of Shrewsbury School. On these pastures the cattle belonging to the citizens used to graze, and here, also, the pageants of the ancient trade-guilds were held.

On these occasions each of the guilds used to set up quaint arbours or grottos which in time became semi-permanent buildings. Outside these bonfires were lighted and maypoles put up for the annual feasting and jollification. One of these arbours—that of the Shoemakers' Company—has survived and has been set up in the public park across the river. It is guarded by two figures of stone representing St. Crispin and St. Crispian, the patron saints of the guild, with these words underneath them: 'We are but images of stone. Do us no harm; we can do none.' But in spite of that rather pathetic appeal, I am sorry to say they have suffered quite a lot of damage through the centuries.

The park in which this arbour and its statues stand is in itself quite remarkable. It is called the Quarry, which, indeed, it was; for it was from here that a great deal of the red sandstone was dug out and used to build much of the town. But if you think a quarry is an ugly place you have only got to see Shrewsbury's Quarry to realise that even the ugliest thing can be transmuted into something pleasant and beautiful.

And to add to the beauty of the Quarry Park there are lovely avenues of lime trees, with swans gliding gracefully along the loop of the river at the bottom of the sloping flower-gardens. Once every year the Quarry is the scene of that gorgeous display of blooms provided by the Shrewsbury Flower Show—one of the best known in Britain—which look even more magical after dark as they are lit up by the erratic flashes of coloured light from the firework display.

One thing that has always surprised me about Shrewsbury is the scarcity of the words 'street' or 'road' there. The majority of the thoroughfares are simply called by a proper name—and delightful names most of them are: Pride Hill, Wyle Cop, Dogpole, Shoplatch, Mardol, and many others. Another unusual local naming habit concerns the many

narrow passageways and little lanes: nothing so ordinary as 'alley' will do for Shrewsbury: they are all referred to as a 'shut' or a 'gullet.'

It is in these streets and shuts of pleasant name that you come across some wonderful gabled and half-timbered old houses—although, I must admit, a few of them have been rather too obviously restored for my taste; but I suppose that is better than seeing some monstrosity of modern architecture in their place. Two or three of the old churches have also been restored, in one case from dire necessity. In 1788 the ancient church of St. Chad's suddenly collapsed because its Norman builder had left one of the main pillars hollow instead of filling it with lime-bound rubble as was the custom in Norman days. Please do not ask me to explain why that pillar took nearly 700 years to collapse.

Towards the end of the last century the renowned Shrewsbury School moved into the former Foundling Hospital, which since then has been greatly enlarged. But when it was in its original building—now a library and museum—and since its removal the school has had a long and proud record of achievement. Perhaps its most famous scholar was Sir Philip Sidney, the courtier-hero of the first Elizabethan Age; later Charles Darwin was educated there, and in more recent times Andrew Irvine, who, with Mallory, disappeared so tragically when they had almost conquered Everest.

There is almost everything in Shrewsbury to satisfy the seeker after tangible evidence of English history and tradition, and of the ways of life through which the vanished centuries have passed. But—and I apologise in advance for being so matter of fact—the most unusual thing that impressed itself on my memory is Shrewsbury's railway station, most of which is built on a bridge with the river Severn flowing placidly beneath. I do not know of another railway station in the kingdom like it. (*Broadcast in the BBC's General Overseas Service*)

King Charles I (1600-1649), after a painting by Sir Anthony Van Dyck

THE NATIONAL P

BASIL TAYLOR gave this talk to mark the centenary behind the National Gallery in London—that portraits of British men and women who have in one way

THE National Portrait Gallery, as one of its former directors said, is not primarily an art collection but a museum of history, a record in painting and sculpture of notable men and women. And so it is not surprising that it should be a nineteenth-century foundation. The Victorian age saw the establishment of historical enquiry and research as we understand it today. The impulse to record the features of distinguished men, to put their faces into albums or even galleries, is centuries old, but the desire to make such a collection official and public and scholarly, that is a typically Victorian gesture.

The year of the gallery's foundation was 1856; twelve months before Macaulay had published the fourth and fifth volumes of his *History of England*, a milestone in the progress of English historical studies. And it was a close friend of Macaulay's, the fifth Earl of Stanhope, who first proposed the idea. Stanhope himself was a historian though by no means a man of genius. The year 1853 had seen the publication of his last volume of his *History of England from 1713 to 1783*. He was also interested in the arts, was a trustee of the British Museum, and President of the Royal Society of Antiquaries.

On March 4, 1856, Stanhope put down a motion in the House of Lords 'That an Humble Address be presented to her Majesty, praying that her Majesty will be graciously pleased to take into her Royal Consideration the expediency of forming a gallery of the portraits of the most eminent persons in British history.'

This proposal had the support of the Prince Consort, and was readily accepted by the Lords and Commons. The main debate was whether the collection should only celebrate the most remarkable figures in any walk of life or whether it should provide a more comprehensive portrait of the English people. The latter view has in fact prevailed.

Catalogue of 3,800 Entries

If you turn the pages of the catalogue—and there are now more than 3,800 entries—you will find next to Queen Victoria the actress, Madame Ventris; not only Sir Isaac Newton but a little-known eighteenth-century painter, Francis Newton; not only the great statesman, William Pitt, but also Sir Isaac Pitman, known for his system of shorthand.

I have said this is a museum of history, and the first of the five rules which guide the trustees in the acquisition of works requires them to look to 'the celebrity of the person represented rather than to the merit of the artist.' But, of course, in a country where portraiture has played such an important part in the development of painting, where so many of the most distinguished artists have painted portraits, there are numerous works of aesthetic value. There are pictures here by Van Dyck and his English follower, William Dobson; by Peter Lely and Godfrey Kneller, including his famous series of portraits of members of the Kit-Kat Club, among them Addison, Steele, Congreve, Vanbrugh. There are three pictures by Hogarth, including his view of himself at his easel, a dozen paintings by Reynolds, nine by Gainsborough, and twenty-nine by Sir Thomas Lawrence. This year we are celebrating the

Ellen Terry (1848-1928), the great actress, by G. F. Watts

William Congreve (1669-1729), the dramatist, one of Godfrey Kneller's Kit-Kat Club portraits dated 1709

Dr. Samuel Johnson (1709-1784), after a painting by Joshua Reynolds

William Butler Yeats (1865-1939), the Irish poet, by Augustus John

Self-portrait of famous for h

Countess of Shrewsbury (d. 1702), a famous beauty, by Lely

PORTRAIT GALLERY

of the founding of the museum—now on a site
a record in painting and sculpture of notable
other contributed to the pages of British history

200th anniversary of the birth of the Scottish portraitist, Henry Raeburn, and although he is better represented in the Scottish Portrait Gallery in Edinburgh there are four pictures by him here. Kneller, in fact, has the largest tally of pictures, but Watts runs him close.

Just as Kneller in the Kit-Kat portraits recorded some of the notable figures of the early eighteenth century, so Watts brings us many of the great Victorians: Browning, Tennyson, Carlyle, William Morris, Cecil Rhodes, Rossetti, John Stuart Mill, Gladstone. But in a gallery where an aesthetic passport is not required for admission I find some of the most affecting works among those by less gifted people. There is, for example, the battered and clumsy portrait of the three Brontë sisters by their unsatisfactory brother, Branwell. I doubt if any of the professional painters of their time could so touchingly have discovered their loneliness and genius. This is a wonderful document, if not a great painting.

Most Satisfying Associations

And that recalls another of the precepts laid down for the trustees, that 'they should not consider great faults and errors as any sufficient ground for excluding any portrait which may be valuable as illustrating the history of the country.' There are portraits, too, with the most satisfying associations.

I think first not of the most obvious ones, Reynolds's portrait of his friend Johnson, say, or Sickert's fine picture of his fellow-artist and friend, Wilson Steer, but above all of a painting of the essayist, Charles Lamb, by Hazlitt: yes, William Hazlitt, the great critic who at one stage hoped to be a painter.

You will not find any portraits of living persons in the gallery: you have to be ten years dead to qualify for admission. The only exception is made in the case of the Royal Family, and, of course, an important element in the collection is the long series of royal portraits. Richard II is the first king to be shown in a contemporary painting.

I suppose we must all form our private image of persons from portraits, and if you visit the gallery you find there many of the ones you have known from childhood. There is Lemuel Abbott's gentle, sympathetic picture of Lord Nelson, and Nathaniel Hone's portrait of John Wesley preaching. We can also see records of famous occasions: the House of Commons, for example, on the occasion of the first Reform Bill; and there are several portrait-groups of soldiers, explorers, and artists.

Anyone with an interest in history or, more importantly, in human nature must return and return again to this gallery. Its spirit and fascination is admirably summed up in the words which Carlyle wrote to a friend two years before its foundation, words which are quoted in the Gallery's catalogue.

Carlyle wrote: 'Often I have found a portrait superior in real instruction to half a dozen written biographies, as biographies are written; or rather let me say I have found that the portrait was a small lighted candle by which the biographies could for the first time be read, and some human interpretation be made of them.' (Broadcast in the BBC's General Overseas Service)

Emma, Lady Hamilton (1761-1815), Nelson's mistress, by Romney

Horatio Nelson (1758-1805), the victor of Trafalgar, by Lemuel Abbott

William Makepeace Thackeray (1811-1863), the famous novelist, a painting by S. Laurence

G. K. Chesterton, Maurice Baring, and Hilaire Belloc, a painting by James Gunn dated 1932

(1864-1907), fine drawings

EMITAPE

The WORLD'S FINEST MAGNETIC RECORDING TAPE

Used by the leading broadcasting organisations and for recording the world's greatest artists by "His Master's Voice", Columbia and Parlophone.

EMITAPE '77' for Professional applications—'88' for General Purpose and '99' Long Play.

EMITAPE is obtainable on a range of spool sizes suitable for all standard, professional and domestic tape recorders.

EMITAPE is manufactured in the largest tape factory in Europe by a company with over 50 years experience in the science of sound recording and reproduction.

EMITAPE is the Magnetic Recording Tape with the world-wide reputation.

The Lure of the Desert

Continued from page 9

you could see the marks to this very day; you could see where they had had picnic lunches on the way. The desert is, in fact, very easily desecrated, so to speak.

FERGUSON: A lot of people think the desert is dead. But tell us about your animals, van der Post.

VAN DER POST: I could tell you masses of stories about these animals. For instance, you have lion, which to my amazement gets habituated or acclimatised to desert conditions very quickly; you have a varied species of antelope—enormous antelope—and then you have all kinds of amazing birds and lesser animal life. You have quantities of leopards, you have a lot of jackal, hyena, and wild dog, and these animals learn, just like human beings, how to dig out the tubers and to feed on these, and to grow very fat and very sleek on it. And they provide entirely the sustenance for the few Bushmen who live there.

Changing Life of the Bedouin

FERGUSON: Glubb Pasha, let us go back to something you mentioned earlier on. You painted a picture of arriving and seeing tents ahead of you and knowing you were going to have company for the night. Tell us something about the people of the desert—a broad question, I know.

GLUBB: In our part of the desert the tribes that move about are all people who are grazing flocks. In the winter, whenever it rains, the grass grows very quickly. The best way to keep large numbers of animals is to take them out into the desert. Of course, after they had got there in former days the tribes used to fight each other, and that started tremendous traditions of tribal warfare and raiding; but the economic basis of the thing is that it actually is the best place to graze animals during the winter. Bedouin tribes, of course, are too romantic for words in theory. The sad thing is that the way of life of Bedouin tribes is becoming entirely changed. The whole place is now under control. There are motor-cars and also planes and oil pipelines, and all the old traditions of raiding and fighting are dying out.

FERGUSON: Van der Post, what about the people of your desert?

VAN DER POST: Well, essentially they are Bushmen. There are other types who have muscled-in on the desert racket, as it were, who have pinched the best water from the Bushmen; but these little Bushmen are pre-eminently the people of the Kalahari desert. They have been there I don't know how long and they have been there because it is very largely a part of the world which nobody else wanted and where they have been most secure. And they are living there now as they lived thousands and thousands of years ago.

Sip-Wells of the Bushmen

FERGUSON: What do they do about water?

VAN DER POST: Well, it is quite fantastic. They have discovered that certain sands, for some odd reason, hide water in the desert, and they have evolved a technique of sucking the sand out of the water in those particular places which only they know and which they guard the secret of very jealously. I have seen them do it. A Bushman goes about with either a reed or a kind of stick which he hollows out, and he takes it to this place of the secret sands—these sip-wells, as the Bushmen call them—and there he will pick some grass and tie the grass round the end of this hollow tube to protect the sand from getting into the opening; he will then dig down with a grubbing stick or with his spear three or four feet into the sand, put the stick in and pack it very tightly, and then he will take an empty ostrich eggshell, which has a tiny opening at the top, and he will put that down next to the tube; he will then put his mouth to the tube, kneel down, and start sucking very hard, and within a minute—and it is a most miraculous thing to see—the water suddenly comes out, and as he sucks in at one corner he squirts it out at the other corner into this hole in the egg. That is how he gets his water.

FERGUSON: Do your chaps, Glubb Pasha, have any aptitude for finding water where it has been stored in a dry wadi-bed and that sort of thing?

GLUBB: They all have the most encyclopaedic knowledge of every possible place where there can be water. I think one of the most extraordinary things about water in our desert is to find wells sometimes 300 feet deep or more all cut through rock, and nobody knows who did it—they must have been there for thousands of years. And if you look you can see the marks of a sharp instrument, like a chisel or an axe; and the thing is only four to five feet in diameter and 300 feet deep. How anybody was ever lowered down that with an axe, cutting it, I don't know: it must have taken them a long time. And how a primitive person knew that 300 feet underground there was going to be water is something our modern engineers cannot tell you.

FERGUSON: I feel we have only been paddling in a very big pool. I am not sure we have decided what the lure of the desert is, but at least I have learnt a lot. (From a broadcast in the BBC's General Overseas Service)

This Week's Listening

JULY 22-28

The first performance of the Harvard Glee Club in a Prom can be heard on Saturday at 21.45

INTERNATIONAL HORSE SHOW

DURING the past five years the International Horse Show at the White City has become one of the most important sporting events of the summer in London. Each night for a week 15,000 to 20,000 spectators pour into the stadium to watch the exciting and varied programme taking place under the great floodlights. There are classes for show horses, ponies, harness horses, and a coaching marathon, but it is the jumping that is perhaps the most spectacular of all the events.

Brilliantly coloured fences of every shape and size set up on the green arena are jumped by the best riders from seven or eight different nations.

Each of the most important events—the King George V Cup, the Queen Elizabeth Cup for ladies, and the Prix des Nations—are heralded by magnificent pageantry: the mounted band of the Household Cavalry in full dress precede the competitors of each nation, who have at their head a trooper of the King's Troop, Royal Horse Artillery, bearing that nation's flag—an unforgettable sight in an unforgettable week.

On Saturday at 15.30 and 21.15 Lionel Marson and Henry Riddell will be giving a report on the three main events.

DORIAN WILLIAMS

OXFORD STUDY CONFERENCE

AT Oxford H.R.H. the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities within the Commonwealth and Empire is in its final week. The 300 people—managers, employers, trade-union leaders, and workers—who have come from twenty-nine countries and territories to attend this conference spent last week on a tour of Britain's industrial centres. Sam Pollock accompanied one of the twenty groups into which participants were divided for the tour, and will give a report on what he saw and heard on Wednesday in 'This Day and Age.'

The central theme of the study conference—the human problems of industry—provides the subject for 'Lendon Forum' on Sunday.

On Tuesday, in 'This Day and Age,' Sir Harold Hartley will broadcast a special version of the address he delivered to the conference at Oxford on 'The Two Partnerships—Man with Man and Man with Nature.' Sir Harold is the Chairman of the Conference Council.

FOR CHILDREN

SINCE history began attempts to go under the water and live there have been recorded. It is said that Alexander the Great was lowered in a great glass barrel and that he watched fantastic deep-sea monsters: one was so big that it took three days to pass by the glass diving bell! Leonardo da Vinci claimed to have solved the problem of living under water but he said he would not give away the secret because it would lead to attacks on ships and the drowning of thousands of sailors.

So it was left to the twentieth century, with its submarines and its frogmen, to make itself really at home under the sea. This week children can hear the first part of 'Conquest of the Depths,' the story (in three parts) of man's attempts to explore the underwater continents and of some of the strange things he found when he got there.

G.O.S.: Sunday 13.15; Saturday 09.45

THE PROMENADE CONCERTS

FIVE broadcasts from the sixty-second season of Henry Wood Promenade Concerts at the Royal Albert Hall, London, can be heard this week. On Tuesday at 14.45 (repeated Friday 01.00) Sir Malcolm Sargent will conduct the BBC Symphony Orchestra in a programme which includes César Franck's *Symphony in D minor*. On Wednesday at 18.30 the BBC Symphony Orchestra under Sir Malcolm give a Sibelius programme. The chief works will be the *Symphonic Poem, En Saga*; *Symphony No. 3 in C*; and the *Violin Concerto in D minor*, in which the soloist will be Ida Haendel.

Ida Haendel

The first public performance in London of Kodaly's *Variations on a Hungarian Folk-Song (The Peacock)* will be given in the concert on Thursday at 13.15 by the BBC Symphony Orchestra conducted by Sir Malcolm Sargent. Basil Cameron will conduct the London Symphony Orchestra on Friday at 18.30, when in accordance with tradition the programme will be entirely devoted to works by Beethoven.

The same conductor and orchestra perform on Saturday at 21.45. The programme will be an American one, with Samuel Barber's overture *The School for Scandal*, and the Harvard Glee Club singing madrigals and part-songs.

THE FOURTH TEST

THE fourth Test match between England and Australia begins at Old Trafford, Manchester, on Thursday, and commentaries will be broadcast at 12.00, 14.15, 16.15, and 17.15 on Thursday, Friday, and Saturday. There will be an additional period of commentary on Saturday at 15.10. Summaries of play by E. W. Swanton will go out on each day at 12.30 and 17.30, and an eyewitness report at 21.00.

Old Trafford has been the scene of many hard battles and exciting events in the past. In 1948 England came nearest to victory over Brad-

man's team when they led by 142 runs in the first innings, thanks largely to Denis Compton who made 145 not out—one of his greatest innings—but rain ruined any chance of a finish.

Old Trafford's bugbear also spoilt the 1953 game, but in the last hour, with only a draw possible, the Australians in their second innings lost 8 wickets for 35, to the bowling of Bedser, Wardle and Laker.

Though only two or three miles from the centre of industrial Manchester, Old Trafford with its modern stands and terraces always looks fresh and clean. The light is as good as on any first-class ground in England.

REX ALSTON

'CONQUEST OF GRANADA'

THE rhymed heroic tragedy of the Restoration tried to capture the imagination by first stunning the sense. The scene-painter and the scene-shifter were as important as the poet: castle walls were raised up and thrown down in a night; horses neighed in the wings; rivers of paint, the blood of heroes, flowed past the jaded, gaping audience.

Straddling this chaos, huge in their fury, monstrous in their revenge, stood the heroes, speaking in booming voices as though through megaphones. They have no part in us or we in them: they are not of human species. But a great poet, even when writing in the air, may yet earth it down to life. This Dryden did in *The Conquest of Granada*: he alone was great enough to put a heart into the nonsense of heroic tragedy.

Almanzor and Almahide, the star-crossed lovers, have survived their three centuries of bombast and foolery because like swimmers swimming the crawl they can suddenly take a gulp of real air before they kick on again.

H. A. L. CRAIG

G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

Radio Theatre presents

'LANDFALL'

NEVIL SHUTE has long since established himself as a novelist who is no less competent and convincing in dealing with technical details—of machinery, and the like—than with people.

Landfall, Stephen Grenfell's radio play from the book Shute published in 1940, thus characteristically exploits both technicalities and personalities. The time is early in the second world war when both sides were building up to the real conflict, warily watching each other.

At the beginning Flight-Lieutenant Roderick Chambers—called Jerry by all—is one of those who watch: he is on duty with the R.A.F.'s Coastal Command patrolling Channel waters to report any sight of trouble, and it is on such an occasion that Jerry sinks a submarine, thinking it to be German, only to be told that it was British.

Inevitably, after the adverse findings of a Court of Inquiry, he is transferred, and later he volunteers for duty on the research side of operations, testing a new bombing aid under conditions of great danger. But by chance he is sent to complete these tests at the same place, among the same officers, that he had known during the previous events and had hoped never to see again.

PETER FORSTER

G.O.S.: Sunday 00.30 and 18.30; Friday 14.15

Old Trafford, Manchester, from where commentaries on the fourth Test will be broadcast this week

01.00 HE LIES

IN ARMAGH JAIL

A reconstruction of a famous murder case
 Compiled from the records of the three trials
 by P. S. Laughlin
 Produced by Sam Hanna Bell
 'But suspicion rests upon a man who in Armagh Jail does lie,
 But God will do what's just and true,
 He rules the earth and sky.
 The secrets of the sinner's heart to Him are known each day,
 And he who killed John Flanagan with vengeance He'll repay'

 with recorded extracts
 13.45-14.00 The World of Science
 A weekly survey
 of the latest developments

ENGLISH WRITING. Shelley is the standard author due for re-assessment on Monday. The speaker is Stephen Spender, poet and editor of the literary periodical *Encounter*. Mr. Spender has written: 'The man in whom his countrymen least recognise their own image may nevertheless have many qualities which are characteristic of them. Thus the boy who was known to his Eton contemporaries as "Mad Shelley" was typical in many ways of a certain type of poetical English aristocrat. His youthful desire to identify himself with a revolutionary cause; his fads and eccentricities are recurrent qualities among the English upper classes.'

* * *

SHAW FESTIVAL. The Garden of Eden scene which opens part one of Bernard Shaw's marathon play *Back to Methuselah* will be presented on Tuesday. When Bernard Shaw was asked to choose one of his works as the 500th volume in the famous 'World Classics' series he nominated this play and wrote: '*Back to Methuselah* is a world classic or it is nothing.' Dame Edith Evans will re-create the part of the Serpent which she played in the original production.

* * *

BRIEF EXCURSION. Brief Excursion on Saturday will be to the Hammett Hospital and Postgraduate Medical School. This hospital is unique in Britain in that it is the only general hospital devoted entirely to postgraduate teaching. It is recognised throughout the world as a great centre of British medical science, and draws students and teachers from all parts of the Commonwealth.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

LONDON CALLING

THE OVERSEAS JOURNAL OF THE BRITISH BROADCASTING CORPORATION

No. 873. PUBLISHED WEEKLY

PRICE SIXPENCE

SUBSCRIPTION 25s. A YEAR

'BLACKPOOL NIGHT'

In a new weekly series beginning on Tuesday the General Overseas Service will bring to the microphone the leading variety stars who are entertaining visitors at the ten theatres of Britain's famous holiday resort. Our photograph shows Blackpool's well-known Tower illuminated and mirrored in the sea

'THE STORY OF COLONISATION'

Bertrand Russell will introduce an important new series of weekly talks in which a number of distinguished speakers will discuss historical and other aspects of this complex subject. Professor C. H. Philips, who is himself giving two of the talks, contributes a preface to the series on page 3

SCHUMANN CENTENARY

Special musical programmes will be broadcast to commemorate the centenary of the death of the great composer

'FORTY FATHOMS DEAD'

A feature programme recalling the amazing story of Stoker Chief Petty Officer William Brown

ATHLETICS

Reports and commentaries on Great Britain v. Czechoslovakia at the White City

CRICKET

The last two days of the fourth Test Match at Old Trafford. Surrey v. the Australians at the Oval

Notes on 'This Week's Listening'
are on page 17

Built for Heavy Duty

Substantially constructed for heavy duty, Harvey Steel Filing Cabinets have an inner framework of vertical steel channels welded together to give maximum strength and durability. This framework also ensures efficient support for the drawers, which glide smoothly and quietly to their fullest extent, despite heavy loading.

Stove enamelled Olive Green or Scarborough Grey (alternative colours to order), with chromium-plated card holders and handles.

Available, with
SUSPENDED FILING CHASSIS
if desired

UNITS OF 1 TO 5 DRAWERS
QUARTO & FOOLSCAP SIZES

NEXT TIME YOU'RE IN LONDON

you must drop in for a

WHITBREAD

at

The Printer's Devil

It's a special sort of pub just opened in Fetter Lane, Fleet Street, where you can always be sure of a first class lunch or dinner. The "Devil" lies at the heart of the newspaper world and you'll find there a fascinating collection of prints, photographs, and souvenirs which trace the history of printing. Ask any newspaperman where's the most comfortable restaurant and the best food in the City, and he'll recommend The Printer's Devil. Need we add, it's a Whitbread House.

Other Whitbread Houses, like *The Printer's Devil*, that you must visit are *The Nag's Head*, Covent Garden, for the theatre lover, *The Coach and Eight*, Upper Richmond Road, Putney, for the oarsman, and of course for the cricket lover, *The Yorker* at 189 Piccadilly, W.1.

The Story of Colonisation

C. H. PHILIPS, Professor of Oriental History at the School of Oriental and African Studies, London, has contributed the following preface to the series of talks which opens this week in the General Overseas Service on Monday at 15.45 and Tuesday at 00.30 and 05.00

NOWADAYS the term 'colonialism' is used more often than not as a term of abuse, especially by those Asians, Africans, and Latin Americans who have recently emerged from a period of European rule. Yet we all know that the ancestors of these peoples have themselves been active colonisers, not only in the remote past but also in the past two centuries, as their successful penetration of the East African coast and of the islands of the West Indies and Pacific has shown. Man is essentially a colonising creature. From the earliest change-over from a hunting to an agrarian way of life the history of mankind is in large part the story of colonisation, and we cannot isolate from this the growth of colonialism itself.

It is this story that a number of speakers, highly qualified by their historical studies and experience, will tell and seek to set in proper perspective in the series of weekly talks starting in the General Overseas Service this week. They will examine colonisation and colonialism, not as a purely modern phenomenon related only to the expansion of Europe but as an expression of the growth of human civilisations, which occurs whenever and wherever mankind is on the move.

The story of colonisation in its historical and world setting divides into four main phases: the first growth of civilisations; the subsequent rise of the early great empires around the Mediterranean and eastern seas; the irruption into them of the semi-civilised and colonised peoples of the fringe; and, lastly, the era of European dominance from which we are now beginning to move.

In the River-Valleys

This week Bertrand Russell, the great philosopher, is introducing the whole story from the time when, in the third millennium B.C., colonisation took place in the river-valleys of Mesopotamia, Egypt, India and China; and when, for instance, in China 'the men of Han' cultivated the Yellow River valley and passed from a static primitive state to an actively growing civilisation which colonised the neighbouring valleys and surrounding areas and created the basis of the Chinese empire.

From the valleys and inland seas the early empires thrust outwards. Sir Harold Nicolson, classical scholar and man of letters, will discuss the overseas expansion and the colonies of the Greeks and Phoenicians. Rome took up where they left off, spreading around the Mediterranean and across the European mainland into Britain. The Romans colonised England. From their word for cultivation they gave us the

term colony, and with it the principle that no Roman colony could be started without the sanction and direction of the metropolitan authority.

Much of the evidence for the story of Roman colonisation is archaeological in character and this aspect therefore will be treated by the distinguished archaeologist, Sir Mortimer Wheeler.

In Europe and Asia colonisation proceeded at different levels and by diverse methods. Rome put an emphasis on conquest and citizenship, the Arabs on conquest and the Islamic faith, India on the spread of culture. The very different aims and methods of Islam in the Middle East and of India in South and South-East Asia will be analysed by Bernard Lewis and myself, both of us specialists in Asian history.

Infiltration

The early empires, lacking quick and certain communications, tended to overreach themselves, to strain beyond breaking point their systems of government and administration. In these circumstances it was relatively easy for the semi-civilised peoples of the fringe and the raiding nomads to infiltrate and then break in.

Sirdar Panikkar, the well-known Asian historian, and Professor Reginald Betts, the European historian, will speak about the successive waves of so-called barbarians, describing for example how the Turks from Central Asia planted urban colonies in India, how the Angles, Jutes, Danes, and Normans conquered and colonised England, how the Turks, Tartars, Moors and others made inroads into medieval Europe.

Out of this phase emerged the nations of Europe. Professor Barraclough, successor to Arnold Toynbee in the London chair of International History, will examine their dynamic rise to world power, how they made ready through their maritime enterprise to occupy new and relatively empty lands across the oceans—North America, South Africa, and Australia; and how at the same time they conquered the maritime areas of Asia and of tropical Africa.

The European nations, especially Britain, moved their frontiers overseas; other powers like the United States in the Middle West and Russia in Central Asia and Siberia colonised by moving their frontiers across the great land masses; but, as Philip Mason and Professor Carrington of Chatham House, and Geoffrey Wheeler of the Central Asian Institute, will show, their colonising processes, whether conducted overland or overseas, had much in common.

In the contemporary period, while European

In the insectary at the London School of Tropical Medicine mosquitoes are bred for research on malaria and yellow fever

Dr. W. H. H. Andrews, of the Liverpool School of Tropical Medicine, using an apparatus he designed for experiments on the effects of anaemia caused by malaria in the liver

Britain's Schools of Tropical Medicine

DR. CHARLES WILCOCKS, Director of the Bureau of Hygiene and Tropical Diseases, tells something of the story of the two schools—one in London and the other in Liverpool—which specialise in the study of tropical diseases and their prevention, treatment, and cure

IT seems odd that two of the greatest schools of tropical medicine in the world should be in England, where tropical diseases do not naturally occur. Yet when their history is followed the reason why these two schools have been instituted—at Liverpool and London—is easily understood. For many centuries Britain has been connected by sea trade with tropical countries in every part of the world, and British sailors, soldiers, administrators, merchants, and missionaries have returned from service abroad infected by such diseases as malaria, dysentery, sleeping sickness, and leprosy, and have sought treatment at home. Still more have been affected by the more acute diseases while still abroad, and have needed immediate treatment on the spot—cholera, plague, typhus, typhoid, yellow fever, and other dangerous fevers.

It has been necessary, therefore, to pay special attention to the medical education of the doctors called upon to treat these patients, both at home and abroad, by instituting special courses of instruction in these tropical diseases so foreign to Britain, and it has for obvious reasons been found appropriate to start these schools of tropical medicine in large seaports with extensive tropical connections. Here the patients arriving by sea can be studied and treated in conditions where all the most modern facilities are at hand, in centres of intense medical activity and research. And because the teachers have been men whose experience of tropical medicine has been acquired in Africa, Asia, Australasia, and the Americas the training given to students has possessed the great virtue of universality.

But the schools are of comparatively recent date. The Liverpool school was opened in April, 1899, and the London school some six months later. Before then, although certain hospitals in Britain had for long been treating these tropical diseases, there had been no systematic courses of special post-graduate training for doctors, and only very slight instruction for undergraduates.

The Inspiration of Dr. Patrick Manson

The creation of the School of Tropical Medicine in London takes its origin from the work and inspiration of Patrick Manson, a Scottish doctor who spent many years from 1866 onwards in Formosa, southern China, and Hong Kong, and who made revolutionary discoveries which have altered our whole conceptions of certain diseases. Manson was the first man to prove that the agents of certain diseases are taken up from the blood of man by blood-sucking insects, and that in these insects they undergo a definite cycle of development taking several days to complete; and he therefore deduced what we now know to be true—that for these diseases this cycle of development is essential before they can be transmitted to a new person when the insect bites again.

Manson proved the case by his observations on mosquitoes which had bitten men in whom the tiny embryos of a filarial worm were present in the blood, and he described the developmental forms of these embryos in the tissues of the mosquito. From this pioneer discovery there have flowed the proofs of the transmission of malaria, dengue, yellow fever, and other diseases by mosquitoes, and of many other diseases by other biting insects.

When Manson returned to London after his long experience in the East he was filled with the conviction that special instruction in all these

important and imperfectly understood diseases was essential, and that the centre for such instruction should be in London. He found support in Government quarters, but only after a long period of persuasion, and with the help of the Seamen's Hospital Society the London School of Tropical Medicine was created at the Albert Dock Hospital in 1899.

Manson was a pioneer, an original thinker of strong personality and enquiring mind, and he attracted to his school a band of brilliant young workers who themselves made very notable contributions to medical research, and whose names are now known throughout the world. Students who took the courses at Manson's school have, indeed, themselves founded or taught in similar schools in India, China, Australia, Africa, and America, and it is not too much to say that the British schools of tropical medicine have set the pattern for much of the rest of the world.

Transmission of Minute Living Organisms

The study of tropical medicine is complicated. As I have said, some of the most important and widespread diseases are caused by minute living organisms which are transmitted from man to man, or from animal to man, by biting insects. The cure of these diseases has depended largely on the use of drugs, many of which must be given by injection; and the even more important prevention of these diseases entails knowledge of the minute organisms themselves, and of the nature and habits of the biting insects which convey them.

Other diseases are due to bacteria or worms, some of which are spread by insects, but others of which are spread through food or water, or by contact between patients and healthy persons.

Let me illustrate what I mean. Malaria is due to a parasite present in the blood of man, and is transmitted from man to man by *Anopheles* mosquitoes. It is therefore necessary to study the various kinds of malaria parasites—of benign tertian, malignant tertian, and quartan fevers—and the breeding and biting habits of the mosquitoes; for one of the main lines of attack on malaria lies in the destruction of these mosquitoes.

Filariasis, and its disabling sequel elephantiasis, is due to a hair-like worm whose embryos are present in the blood and are spread by mosquitoes—largely by mosquitoes of different kinds from those which carry malaria. Plague is chiefly a disease of rats and other rodents, and is due to bacteria which are carried from rat to rat, or from rat to man, by rat fleas. It is necessary to study these bacteria and these fleas and rats.

African sleeping sickness is due to a minute parasite present in the blood of man (and sometimes of certain animals) and is spread by tsetse flies of several kinds, and the incidence and distribution of the disease depend on the habits of these flies, some of which live in the sparse African bush and others in the thicker vegetation along rivers and lake shores. Prevention has been achieved largely by intense study of these flies and their elimination from human communities.

Hookworm disease is spread by indiscriminate fouling of the soil by human excrement; cholera and typhoid fever by similar fouling of water and foodstuffs. Schistosomiasis (sometimes known as bilharzia) is due to a worm which lives in the veins of the bladder or intestine of man, and whose embryos are derived from eggs passed out in human excreta, and undergo a cycle of development in fresh-water snails and from there penetrate the skin of man. The attack on this disease is partly by treatment and partly by snail control, and by improved sanitation.

I have quoted these examples to illustrate what I meant when I said

(Continued on page 8)

Belinda Lee and Bernard Brown star in 'As You Like It,' one of this summer's productions which can be watched in an enchanting corner of Regent's Park

Shakespeare in London and Stratford

ALAN DENT, Dramatic Critic of the London 'News Chronicle,' explains why the productions now in full swing at both the ultra-modern theatre at Stratford-on-Avon and the more rustic Open Air Theatre in London's Regent's Park can be relied upon to attract 'anyone out for anything resembling refreshment of the mind'

THE Stratford-on-Avon season and the Regent's Park theatricals in London have become part of Britain's summertime ritual. Sir Max Beerbohm, whose death the world of letters is now mourning, once wrote a delightful notice of a performance in Regent's Park of John Fletcher's pastoral play, *The Faithful Shepherdess*. It was really a dissertation on the caprices of the English weather. In the first act Max confesses he was shivering slightly, and in the second he sneezed once, then twice, then three times in succession. But he confessed at the end that he enjoyed it all immensely—or perhaps, he added, he should have spelled that word 'ibbedsley.' Max was, in short, as a dramatic critic, daunted by the English weather. But Mr. Robert Atkins, now celebrating his fiftieth year on the stage, is not so easily daunted. He began his annual season at Regent's Park with a production of *As You Like It*, and with only a few breaks caused by the war and by one quite hopelessly wet and disobliging summer he has been giving us Shakespeare in Regent's Park for something like twenty-three years.

Mr. Atkins is not content with doing Shakespeare. He has in the past promised us and hopes one day to give us Shelley's *Prometheus Unbound* and other mighty plays which could conceivably be done only in the open

Diana Churchill and Harry Andrews in a scene from the Stratford 'Hamlet'

air. And in the present season he promises us a revival of Thomas Dekker's jolly Elizabethan play of London low life, *The Shoemaker's Holiday*, and also a revival of last year's marked success, Edmond Rostand's *The Romanticks*, a graceful French play.

Even when we are done joking about the weather there is something exceptionally pleasant about making our way out of the din of London into Regent's Park, crossing the bridge over the tranquil lake, noting the perfume of the serried roses in Queen Mary's garden, and then going into that spacious and nowadays quite comfortable open-air theatre to sit confronting something which is more an arbour than a stage and presently to see the well-loved characters of Shakespeare emerging from bushes and briars and beginning their poetical adorations while the sun is setting behind the great elms and the copper beeches.

Stratford-on-Avon, of course, is different, for there we have an ultra-modern closed-in theatre with every improvement in lighting and scenic device. The plays this year are *Hamlet* and *The Merchant of Venice*, *Othello*, *Love's Labours Lost*, and *Measure for Measure*. And the best of the actors are Emlyn Williams as Shylock and Iago, and Harry Andrews as Othello and the King in *Hamlet*.

But even for the Stratford playgoers nature plays its part. The theatre is almost literally in the middle of a garden or at least of a riverside park. And nothing could be pleasanter on a fine summer evening than to come out at both intervals and take in the beauty of the scene, to note the ripple of the water and of the swans on the river Avon, and to savour the general and pervading beauty of the atmosphere.

Both Stratford and Regent's Park attract more than the ordinary theatre-goer or Shakespeare-lover. They attract the holiday-maker, the schoolchildren, and anyone out for anything resembling refreshment of the mind. (Broadcast in the BBC's General Overseas Service)

During intervals the playgoers at Stratford can stroll beside the calm Avon

The light of the evening sun reveals the age of the Parthenon but takes away none of its beauty

Much of the unique atmosphere of Athens is due to the Acropolis—a 'blinding vision' of marble

JOHN BECKWITH tells of some of the places he saw and of the friendly people he met during a tour of Byzantine monuments on the Greek mainland and on the island of Chios

IT may be some consolation to those who take their travelling seriously to hear that when you go to Greece for the first time it is easier to know where to begin than, say, in Italy or in Spain. For one thing, if like me you are interested in works of art there is much less to see. The works of art are not spread so thickly on the ground as in Italy; there are not considerable distances to cover between places of interest as in Spain. When you go to Greece it seems fairly obvious to make straight for Athens and to use that city as a base for expeditions inland or to the islands.

Athens itself, in spite of a rather brash modernity, is an engaging city. It is made so by a combination of atmosphere, the blinding vision of the Acropolis, which is rarely hidden, and the mercurial charm of the Greek character. The air has a clarity which seems peculiar to Greece; the sun puts the best complexion on the indifferent modern architecture, and stresses the animation of the streets.

It is an animation quite different from that of Italy or Spain. In Spain the animation is there, but always somehow shut off from the outside. Reserve meets reserve. In Burgos or Avila, in Granada or Madrid you become aware of peoples in provinces, provinces walled in by the glass of their own pride. And they are looking out of their glass, slightly catching their own reflection in the process, and you are looking in slightly catching yours.

In Italy you are conscious more of towns than provinces, and in these towns there is all the peacock self-appraisal to watch, as the girls stroll with an assumed air of indifference across the squares, and the young men practise *haute école* on their Vespas. In Greece it is all less artificial, less self-regarding either corporately or individually.

Open-Handed, Eye-Catching Vivacity

I do not want to suggest that sophistication, of a sort, is not there. You have only to walk in the Syntagma, one of the main squares of Athens, in the evening to sense the flavour of international Mediterranean life. But here, too, is concentrated the peculiar, open-handed, eye-catching vivacity of the Greeks, flushed off, as it were, by the neon signs above them.

And the neon signs are given more allure than most by the beauty of the Greek alphabet. By nine o'clock the square is both stage and audience for town life. Here the Athenians sit either voluble, alert, missing nothing, or slumped down exhausted after the siesta.

An Italian said to me: 'They think even quicker than we do.' We, of course, meant the Italians. And one can begin to understand how this quicksilver agility of mind helped in Byzantine times to feed the suspicions of Franks and Germans going to the Holy Land that the Greeks were treacherous and double-dealing. And from medieval times they have had the reputation of being a little too sharp in business. Whatever the truth of this reputation, the people have not been spoilt by the tourist trade.

A JOURNEY INTO GREECE

I went to the island of Chios to see the mosaics in the Byzantine monastery known as the Nea Moni. The monastery is believed to have been founded by the Emperor Constantine Monomachos in the middle of the eleventh century. It seems probable that workers in mosaic were sent from Constantinople to decorate the imperial foundation, and because so little that is Byzantine has survived in Constantinople—mosaics or anything else—the Nea Moni is all the more important. Yet few people have been to see it.

To go to Chios, the most convenient method is to take the night boat from the Piraeus, which with luck lands you at the port of Chios about noon the next day. You then catch a bus from the port to the little village of Karye in the hills. From there to the Nea Moni it takes about an hour's ride on a mule. I had toyed with the idea of dispensing with the mule, but later I was glad that I did nothing of the kind, since the track to the monastery is none too clearly marked. I am quite certain that without the guidance of the young muleteer I should never have reached the Nea Moni.

The journey, in spite of its roughness, is well worth making, even if you are not particularly interested in Byzantine mosaics. As we made our way through the mountains, climbing slowly, a small church would appear suddenly on a spur, or a farmstead, apricot and tan against the dark green of the olive trees and the lighter green of the sage and scrub.

Savage, Edgy Quality of Country

But for the most part the country seems uninhabited, deserted even by animals. The country has that savage, edgy quality which one becomes accustomed to but never tired of when travelling in Greece. The ground is rarely on one level for long, and if you are not used to riding a mule the abrupt unevenness of the ground tends to occupy most of your attention: you gaze with almost hypnotic concentration on the patch of ground just in front of the mule's nose. There are serene moments, however, when the distant view of the Turkish coast, or the sudden eruption of a headland close to, or the fall of a valley drags the eye away with delight, breaking the hypnotic spell.

A cluster of cypresses and white walls gives warning of the Nea Moni. As you zig-zag up the valley the church is seen to stand on a natural platform surrounded by monastic buildings, and with a tower standing separately. A few nuns and an old priest live here. The old man came forward to meet me. His long grey hair was tied in a little knot jutting out from under the back of his cap; his habit was stained with earth and sweat. The peasants working with him were a foil to the aura of dignity which came out to meet me as he bowed and shook hands. He spoke English, but his words were set in a sort of timeless, country-less ritual: the ritual of the monastic orders offering hospitality to a stranger.

The effect of the mosaics after such a journey is all the more impressive. But even if they had been set in a church in the centre of Athens their effect would be overwhelming. The designs are by a great master. The heavy, lowering features, the unusual juxtaposition of colour, the abrupt contrasts between highlights and shadows set them apart from any mosaic sequence I know, and make one more than ever deplore the almost

Olympia, in southern Greece, looks less like a surgical table than most archaeological sites: the ancient shrine gave its name to the Olympic Games

Greece is an important repository for monuments of Byzantine art, few of which have survived in their original centre of Constantinople: Mistra, near Sparta, a typical fourteenth-century church

total destruction of mosaics in Constantinople. The austerity of form, which is nonetheless vigorous and modelled, combines with an oppressiveness of atmosphere to make a singular and strange experience.

Afterwards, when the light became too poor, I was taken out on to a terrace where a chair and a table had been set with water and a large bowl of grapes. And I was left to enjoy the peace of the evening and to watch the long, deep, luminous shadows reach over the valley. Little acts of grace, like the offering of grapes, were to be repeated on the return journey. For the young muleteer, as we rode down the valley, presented me with a branch of sage. And later, at the end of the ride, as I was sitting with the mule-owner drinking coffee and waiting for the bus to take me back to the port of Chios, the boy came up again, this time with a spoonful of jam, offered with a grave little gesture.

Offerings—and a Searching Curiosity

These small acts of generosity seem to be peculiar to Mediterranean peoples. The country folk of Sicily and Spain will favour their guests in similar ways. And I noticed as I was waiting for the boat to leave the port of Chios that people brought parting gifts of branches of myrtle to their friends and relatives.

These little offerings, if made to a stranger, go hand in hand with a searching curiosity. In the village of Dhistomon on the mainland, while I was waiting for a lorry to help me towards the monastery of Osios Loukas, the villagers were insistent that I should take coffee with them. A chair was produced, and I was then submitted to a kindly examination: 'Why are you travelling alone?' The solitary traveller is always something of a puzzle to southern peoples. When I explained, perhaps rather griggishly, that a companion tends to get in the way when studying works of art—everyone nodded with understanding and congratulated me on my firmness of purpose.

'How old are you?' 'Thirty-five.' There were gratifying sounds of disbelief. Then I remembered that I had already said that I was a student. But no, it was not that. 'Why do you pretend to be so old when it is obvious that you are not?' I assured them that I was making no pretence, but I think it would have been better if I had lied. We then went on to examine my private life in some detail: family, salary, work; the entire tissue of my life was gradually unpicked.

For example, having said 'no' to the question 'Are you married?' the villagers then went into committee on whether it was better to marry early rather than late in life. What did I think?

I replied that in England, inclination and opportunity apart, the cost of living was so high that prudence demanded either celibacy or polygamy. You stayed single and regretted

the law forbade you to have four wives, who might be sent out to work while the husband stayed at home and concentrated on the higher things—as they appeared to be doing, I added. All my examiners were men: the women were working in kitchens or fields.

There was general agreement that I was thinking on the right lines, and I was pressed to postpone my journey to the monastery and spend the day in further conversation. 'What does the difference of a day make?' they said. 'The monastery will still be there tomorrow.' But the arrival of the lorry put an end to the argument, and after embraces and handshakes all round I set off in a cloud of dust and hand-waving.

The lorry took me only as far as Stiri. From there it is a matter of walking through country as wild and deserted as the approach to the Nea Moni on Chios. And it is a considerable climb to the monastery of Osios Loukas. A few monks still live here, all lay brothers and advanced in years, except for one priest. Religious vocations, they told me, were very few these days. None of them seemed to have much hope that the life of the community would last longer than the span of their own years.

They received me with the same gentleness that I had met at the Nea Moni. As each brother came in from his work on the terraces below the church I was presented with some formality. Hearing that I had come up the track from Stiri, they were concerned that no one had thought to point out a short-cut across the mountains. One of the villagers had, in fact, waved to what seemed a wildly improbable approach to the monastery, and I had ignored it.

The monks promised to show me the path when I left the next day. And, indeed, when I set out at six in the morning I found the monks were up before me and already working on the mountain-side. They had placed themselves at different stages along the path, which was the short-cut to Stiri. At each stage the monk who was acting as picket addressed me with wishes for happiness and an easy journey and the hope that I should return before too long. At the last stage the priest was waiting for me. And under his blessing, and accompanied only by the rising sun, I made across the mountain range for Stiri and the road to Delphi. (Broadcast in the BBC's General Overseas Service)

The eleventh-century church of Nea Moni on the island of Chios contains beautiful Byzantine mosaics

LORD JUSTICE BIRKETT

OUR WAY OF LIFE: 2

The Influence of the Sea

LORD JUSTICE BIRKETT, in this contribution to the current G.O.S. series about the British character and way of life, suggests that perhaps the most formative element in fashioning them has been Britain's position as an island dependent on the sea for a livelihood and for defence

I EXPECT we have all got a pretty shrewd idea of what we mean when we talk of British life and character; but if we were asked to name the chief influences in the shaping of that life and character I suspect we should not all say the same thing. We have got so used to talking about 'our way of life' that we scarcely ever stop to think about it. If we did I think we should all agree on this: that perhaps the most formative element in fashioning our way of life has been the mere accident of our geographical position.

In truth we are what we are because we are an island people living where we do. You could almost say that our marvellous history is summed up in that sentence; and although, as a people, we are supposed to dislike high falutin' language, nevertheless we do take pride in the fact that we have been described as 'a precious stone set in the silver sea,' and we sometimes add to the words of Shakespeare the words of the first Marquis of Halifax: 'There is a smell in our native air better than all the perfumes of the East.'

For our geographical position has turned out to be a most singularly favoured and fortunate one, and the influence of the sea upon our fortunes has been immensely powerful at every stage in our growth. In Robert Louis Stevenson's famous words, 'the sea has been our approach and bulwark,' the scene of some of our greatest triumphs and some of our most grievous dangers.

No Country So Rich in Natural Beauty

Others will no doubt develop this theme in subsequent talks—the effect of the successive invasions with the consequent mixing of races, and the building up of the most flexible and expressive language in the world—but I will content myself with an introductory word or two about the effect on the shaping of British life and character of the natural beauty of Britain, and the circumstance that the sea encircles all our coasts.

For do not let anybody suppose that the natural beauty of Britain has been without effect on our way of life. No country in the world of anything like the same size is so rich as Britain in natural beauty linked with historical interest, and no countryside in the world has ever been more passionately and expressively loved. The literature of the countryside through six centuries has become as noble a heritage as the countryside itself.

Listen to old Camden, who published his *Britannia* in 1586: 'Britain . . . which is well known to be the most flourishing and excellent most renowned and famous isle in the whole world; so rich in commodities, so beautiful in situation, so resplendent in all glory that if the most Omnipotent had fashioned the world round like a ring, as he did like a globe, it might worthily have been the only gem therein.'

Heroes Produced in Every Generation

Deeply embedded, therefore, in British life and character is this deep love of country, this pride in the greatness of our history, and although it is a British characteristic to say little about it in ordinary life it is equally characteristic to act nobly in its defence when occasion arises. The quality which we call patriotism has the strongest roots in our life and character and has produced heroes in every generation. Yet this love of country, which with us is one of the deepest roots of patriotism, was a comparatively late development, because much of the natural beauty of Britain was man-made; but from the very dawn of history the influence of the sea was all-powerful.

Both before and after the Christian era the invaders came to Britain by way of the sea. For many centuries the British thought of the sea as the road by which the invaders had come, and the road by which they themselves had come, and as the road by which others would come if not prevented. The times called for courage, for resolution, for resource, and for the quality of dogged resistance, and these things were forthcoming then, as they have been forthcoming ever since, and never more notably than in our own day and generation. But in course of time a newer and wider conception came into the mind of Britain. It was realised that the road by which the invaders came could be made the very means of sure defence, and could also contribute to the life and character of Britain as nothing else could.

Here is the Marquis of Halifax, writing in the middle of the seventeenth century: 'To the question, what must we do to be saved in this world? there is no other answer but this: Look to your moat . . . we are in an island, confined to it by God Almighty, not as a penalty but as a grace, and one of the greatest that can be given to mankind.

Happy confinement that has made us free, rich and quiet; a fair portion in this world, and very well worth the preserving; a figure that hath ever been envied, and could never be imitated by our neighbours.'

Happily, this conception of the sea as a defence took a most practical form, and was not confined to ships of war, properly so called. The true defence was to establish complete control of the sea by controlling the trade on the seas, and to have a vast superiority of British ships manned by British seamen. The growth of sea power brought with it, as a consequence, a great enlargement of political liberty, for great armies were not thought to be needed, and thus the dangers to liberty from a military state were avoided.

Rule, Britannia! became part of the common speech, and the idea that Britons never shall be slaves was universally approved. It is interesting to reflect that the oldest words in the language of Britain are words relating to the sea, including the very word 'sea' itself. Words like 'ship' and 'sail' and 'cliff' and 'storm,' and the points of the compass—'north,' 'south,' 'east,' and 'west'—are among the words we owe to the Angles and the Saxons who came to Britain by way of the sea in the remote past. It was by the sea that the merchant adventurers went forth to the four corners of the earth, and their voyages and exploits are part of the history of the British people.

And in the British way of life there is always the consciousness of the debt owed to the great Elizabethans for their deeds and their example. Sea power may have fallen from its high estate, and no doubt the power of Britain has suffered from the advance of other great nations with immense populations and material resources. But the moral influence of Britain in the world was never stronger than it is today; and British life and character has still a very great and perhaps decisive part to play in the politics of the world on which the destinies of men depend. (*Broadcast in the BBC's General Overseas Service*)

Britain's Schools of Tropical Medicine

Continued from page 4

just now that the study of tropical medicine is complicated. You can see that the study involves not only the diagnosis and treatment of the disease in individual patients but also the wider comprehension of such subjects as entomology, the science of insects; helminthology, the science of worms; protozoology, the science of minute parasitic animals like the malaria parasite; and bacteriology, the science of minute parasitic organisms like the plague and leprosy bacilli, the cholera vibrio, and the viruses of yellow fever, dengue, and encephalitis.

All these subjects are studied and taught at all schools of tropical medicine, including the London school. But our knowledge of these diseases, although it has advanced at an astonishing pace in the past sixty years, is still very incomplete, and research must go on. One of the main functions of a school like the London school is to conduct, or stimulate others to conduct, fundamental research into the outstanding problems.

In the past few years, since the war, the existence of a stage in the development of malaria parasites in the human body, long suspected, has been clarified. Originally it was not known what happened to the parasites after they had been injected by the biting mosquito until they appeared in the blood a week or so later. Now, thanks to careful research work on volunteers at the London school, we know that the parasites undergo development in the liver. This discovery will, we hope, help in the development of better drugs to act on that stage, and it will advance our understanding of malaria and possibly other diseases.

Other researches are related to the fundamental processes involved in the development, by insects, of resistance to DDT, to the fundamental processes by which trypanosomes live at the expense of their hosts, to the fundamental processes involved in human protein absorptions, and to a wide range of other subjects both at home and in Africa and the Far East. It is appropriate that a school of London University should conduct these enquiries into fundamental problems which so often form the basis of fruitful developments in treatment and prevention.

I hope I leave you, then, with a picture of a school of many departments—though I have not mentioned the teaching of general public health which is a main part of its function. The departments are active and enquiring, not satisfied with present knowledge but constantly seeking new understanding, and interested as much in prevention as in treatment. The students—several hundreds each year—pass through a strenuous and exacting course, and incidentally more than half of them are from overseas. (*Broadcast in 'London Calling Asia'*)

In search of inspiration: gardeners of all ages and of every social class crowd the avenues of the four-acre marquee which houses the main exhibits

The Largest Flower Show in the World

FRED STREETER, who is head gardener at Petworth House in Sussex, gives his impressions of this year's Show by the Royal Horticultural Society in the grounds of the Royal Chelsea Hospital

THE Chelsea Flower Show is not only the largest of its kind in the world but the most comprehensive: there is everything connected with horticulture. One of the marquees covers more than three acres: this is filled to the utmost with some of the finest flowers, orchids, fruits, and vegetables in the horticultural world. The arrangement of the exhibits creates a floral display of supreme magnificence, broken up by wide grass avenues. Walking along these avenues you get a clear view of the expanse and wealth of the beauty created.

Just imagine groups of annuals brought along in pots—perhaps 3,000 or 4,000—arranged in circular mounds. Delphiniums up to ten feet high; begonias as large as dinner plates; lilies, with all their fragrance, rising through masses of azaleas; sweet peas—magnificent spikes arranged in bowls with 200 to 300 in each bowl; and tropical plants in contrast to the tiny alpine tables. Then there are roses and carnations by the thousand. Other tents contain information bureaux, and experts are present to give advice and answer any questions.

Spectacular Exhibits in the Open

Out in the open there are the really spectacular exhibits: beautifully constructed rock and water gardens. A team of gardeners will have been working on them for three months. There they show you lay-outs suitable for different types of houses and positions: everything from the new suburb to the City man's weekend retreat with a sweeping drive and rhododendrons.

One walk is devoted to the more fantastic decorations—ladies are principally responsible for these creations—using anything from orchids and anthuriums to the simplest flowers. A thing I noticed especially was the number of ladies who are professional gardeners today. And to help them, as well as the weekend amateur, Chelsea has everything to make gardening easy—all kinds of tools, implements, machines, fertilisers. Then you get greenhouses, frames, and cloches in every shape and form; heating apparatus and ventilating gear with all the latest ideas in construction.

This is more than a flower show: it is a meeting place for hundreds of visitors from overseas; a magnet for gardeners, attended by Her Majesty the Queen and many royal visitors on the Tuesday. It is open to the public all day Wednesday and Thursday, and on Friday morning. Judging is carried out on the Tuesday by panels of experts in their own particular section, and this is all finished before the royal arrival.

The organisation is as near perfection as it is possible to get: military bands, refreshments, post and telephone facilities, cloakrooms, information offices—all are included. To the gardener a trip to Chelsea is the day of the year. It is an important function for a complete cross-section of society, because practically everybody in Britain is a gardener at heart. If you ever get the chance, do see it. I am sure you will love every minute. There is as great a variety of people on show as of flowers, trees, and shrubs. (Broadcast in the BBC's General Overseas Service)

Three months before the show opens a team of gardeners goes to work laying out a series of beautifully planned rock gardens and water-gardens

Breath-taking effects are obtained in the main marquee by massing flowers in their hundreds: an array of Bishop delphiniums and Russell lupins

THE REV. DR. JOHN MUNRO, Religious Broadcasting Officer with the Australian Broadcasting Commission, reflects on the significance of an historic occasion he witnessed last year in the Chapter House of St. Andrew's Cathedral, Sydney, when the final touches were put to an important document

The Church of England in Australia

LAST year I think I witnessed an historic occasion. I attended the closing hours of a lengthy debate in the Chapter House of St. Andrew's Cathedral, Sydney. While the cinema crowds were hurrying past the town hall and the cathedral which stand side by side, and dense traffic was converging towards the great bridge that dominates the harbour, the final touches were being put to an important document, a proposed constitution for the Church of England in Australia.

Although all the churches of the Anglican Communion share a certain distrust of over-centralisation, this has not prevented those of Canada, South Africa, the Episcopal Church of the United States of America, and the Church of West Africa—for example—from adopting forms of self-government which unite their several dioceses into national churches. These Anglican churches have separated themselves from the mother province of Canterbury but, of course, remain in full communion with Canterbury and one another. But, so far, the Church of England in Australia has been the notable exception in this process of 'coming of age' in the Anglican family of churches. Through the 150 years or so since its first planting in that vast continent, hopes for a constitution uniting the (by now) twenty-six dioceses have remained unfulfilled.

A Groundless—but Real—Fear

A constitution of its own might have given greater impetus to the growth of a more thoroughly Australian atmosphere in the Church. And few Australian Anglicans would hold that their respect for the Church of England as such should in any way inhibit the development of an Australian slant to the expression of their spiritual heritage. But different theological emphases from diocese to diocese have been sufficient to keep alive the fear that constitutional changes might lead to the overwhelming of strongly held minority convictions with consequent loss to all. The legislative independence of each diocese has been regarded as a bulwark against the evils of a centralised authority which might try to over-ride genuine theological differences without respect towards tender consciences. The fear may have been groundless, but it has been real.

Consequently the Church of England in Australia, having at least the nominal allegiance of between thirty and forty per cent. of the population, has never quite discovered that unity which quite clearly, as an important nation-wide church, it should possess. In practice, of course, the diocesan bishops consult regularly. The relationships between the diocesans and their metropolitan archbishops, of whom there are four—Sydney, Melbourne, Perth, and Brisbane—are all that might be expected of Christian men. Even so it is interesting to note that the bishops of Tasmania, Adelaide, and Willochra are outside the jurisdiction of a metropolitan. Their dioceses do not belong to provinces.

But the essential weakness of Anglican church government in Australia lies in the extraordinary fact that a hierarchy of synods—representative assemblies of clergy and laity—are not quite what they seem. They give the semblance of governing the affairs of the church from local diocesan levels through provincial groupings roughly corresponding to the areas of the Australian states right up to the General Synod which meets on a Commonwealth-wide basis. But this is only a semblance of ascending orders of representative government.

Authority Rests with Diocesan Synods

Real authority rests with each diocesan synod and is made possible by state Acts of Parliament recognising the rights of dioceses to govern themselves in matters ecclesiastical. Provincial synods and General Synod have no real legislative power. They can and do wield moral influence both in the church and the community as a whole, but in the last resort authority is in the hands of each diocesan assembly linked through its bishop in historic loyalty to Canterbury.

However, General Synod has now agreed on a document which each diocesan synod will consider. Whether each can agree to surrender a measure of its autonomy for the good of the whole remains to be seen. It is unlikely that sweeping changes would be the outcome of the constitution's adoption, but there are at least two fields in which the authoritative voice of the church as a whole might well be heard with increasing effectiveness.

Before I suggest what I believe these to be, let me hasten to assure you that Australian Anglicans are not blind to the existence or influence of other Christian communions. There has been a quickening of interest in the ecumenical outlook. Indeed, the visit to Australia early this year of the Executive of the World Council of Churches brought home to every Christian communion there the need to take the fact of ecumenical co-operation more seriously than has been done. And the efforts of both the Roman Catholic Church and the Methodist Church—the latter in its recent 'Mission to the Nation'—to make some mark upon national life have not gone unnoticed by members of the Church of England.

But to return to the two fields in which I believe the adoption of a

constitution by the Anglican Church in Australia may have some important repercussions: the first is an obvious one—South-East Asia. For many years Australian men and women have served as missionaries through the Australian Board of Missions and the Church Missionary Society. But no groups within the Australian Church are more conscious than those who support these spearheads of missionary work of the inadequacy of their resources in manpower and money. To meet the situation which confronts the Australian Church in Christian concern for the millions of peoples to its near north will require a unity of purpose and devotion from every devoted church-member in the Commonwealth. It may be that when the Australian Church as a whole can speak with one voice and pledge itself with one mind it will be able to act with greater effectiveness in South-East Asia.

The other field in which one church rather than a church geared to the necessarily slow working of twenty-six legislative bodies may play an increasingly effective part covers the complex of factors which make up the modern technical society. For there is no dodging the issue. Australia shares with the rest of the world a rapidly changing pattern of life made possible by tremendous technical advances. Its churches must keep pace with the influences which these changes are having upon the lives of almost everyone in the community. Lack of constitutional centralised legislative power did not matter very much in the days of the stage-coach, but there is no excuse for it when airliners have brought Perth and Brisbane within a few hours of one another.

The Church of England in Australia has always tended to look back to the Church from which it came for inspiration and models upon which it might base its life. It has not been alone in this. Succeeding generations of Scots and Irish settlers in Australia have also clung to the memories of churches which were dear because they brought sweetness and light, and gave some sense of belonging, to people who were struggling in a new and often difficult environment. Quite understandably nostalgia has been high on the list of sentiments finding their rightful recognition in all the Australian churches. But rapidly developing new needs have long been outrunning the relevance of the Anglican Church. For the character and techniques of the Church have been more suited to people engaged in pastoral and agricultural pursuits, to people to whom the pattern of parochial church life can still make sense.

Problem of Communicating the Gospel

In all this, of course, the Church in Melbourne and Sydney is not greatly different from the Church in Bristol or Belfast or Toronto or anywhere else where the Anglican Church is to be found. The problem is much the same. How is the Church to overcome the barriers to its basic Gospel proclamation, barriers created by the changing thought-forms and mental images of people working with 'things,' increasingly familiar with automation but more and more removed from other people and animals and earth and salt water which provided the Biblical pictures former generations knew so well?

Further, the Australian Church has always concentrated on the personal and domestic sides of men's lives rather than upon the industrial and political or workaday sides. Overcoming the physical problems of embodying faith in the sheer bricks and mortar of buildings for worship, instruction, and recreation has been a tremendous achievement but it has not always made for far-seeing vision. There has been much geographical pioneering, and the challenge of parishes bigger than the average English diocese is still being met by bush brotherhoods and many a gallant outback priest. But the future lies with those who can bring the Australian Church to pioneer for the Gospel's sake in ways which are still new to the Church even in England. The way forward is to tackle the problem of communicating the Gospel in intelligible terms to vast numbers of people the pattern of whose lives is largely shaped by the requirements of rapidly developing industrial techniques to which the Church has given far from sufficient thought. Anyway, whatever the answers to the problems of evangelisation or pre-evangelisation may be, the Church of England in Australia will need to think out and embody its faith in relation to a more complex society than that of former days. This is the second great field in which a more unified church may the better make itself felt.

For, after all, constitutions are only bits of paper. No matter how much care and experience are put into them they are not of much importance unless they are put to positive use in great causes. If the proposed constitution for the Church of England in Australia is accepted, and if it lends power to the Church's work in South-East Asia, and if it brings the Church to face with more unified and authoritative counsel the task of getting its message through to the Australian population as it is today, not as it was yesterday—then I was present at an historic occasion last year when the document was finally drawn up. At least this is certain. I shall know before many years are out, and so will the whole Church. (*Broadcast in the BBC's General Overseas Service*)

St. Margaret's is next to Westminster Abbey, across the road from the Houses of Parliament

The eighteenth-century tower of St. Margaret's on which repair work costing £10,000 has begun

ST. MARGARET'S, WESTMINSTER

CANON CHARLES SMYTH, Rector of St. Margaret's, Westminster, tells something of the story of his church, which is well known to visitors from overseas as one of the most historic and beautiful of London's parish churches. An appeal has recently been launched for the restoration of the bell tower

WHEN they hear the words 'St. Margaret's, Westminster' most people immediately think of what are called 'society weddings,' but this is only a small part of our work. Our marriage registers, indeed, contain some well-known names: Samuel Pepys (1655), John Milton (1656), and Sir Winston Churchill (1908). But St. Margaret's should be more famous as the parish church of the House of Commons, and the mother church of the whole City of Westminster; as a church of exceptional historic interest and architectural beauty; and as a church noted for its music.

Moreover, every year the Empire Field of Remembrance brings thousands to our churchyard to pay their tribute to those who gave their lives in two world wars. You may have seen in the newsreels at your local cinema the Queen and the Duke of Edinburgh, or Queen Elizabeth the Queen Mother, planting Crosses in this Field of Remembrance in memory of the immortal dead.

The monument to Byron's cousin, Sir Peter Parker, killed in 1814

Moreover, every year the Empire Field of Remembrance brings thousands to our churchyard to pay their tribute to those who gave their lives in two world wars. You may have seen in the newsreels at your local cinema the Queen and the Duke of Edinburgh, or Queen Elizabeth the Queen Mother, planting Crosses in this Field of Remembrance in memory of the immortal dead.

St. Margaret's also has close associations with America. Sir Walter Raleigh, the founder of Virginia, lies buried in the chancel. In 1733 the parish raised a sum of money for the development of the Colony of Georgia. A mural tablet commemorates James Rumsey, honoured by the State of West Virginia as the inventor of the steamboat, who died in London in 1792 and was buried in our churchyard.

Of exceptional interest is a finely sculptured monument to a cousin of Lord Byron, Sir Peter Parker, Bart., R.N., Captain of the frigate, *Menelaus*, who was killed fighting the Americans in a skirmish on the Chesapeake river in 1814.

Appearances are deceptive. The parish church of St. Margaret is so dwarfed by Westminster Abbey alongside that until you have entered it you

do not realise what a large church it is. In fact, we can seat 1,000; whereas the normal seating capacity of the Abbey is only 2,000.

Again, St. Margaret's, though it looks so 'modern,' is really a very ancient church, founded by King Edward the Confessor two years before the Norman Conquest. The present building, the third to stand upon the site, dates from the eve of the Reformation, being consecrated in 1523. It was repeatedly damaged by bombing in the second world war, and the traces of an oil bomb which fell on the north aisle in September, 1940, are still painfully obvious.

Yet the interior of the church remains incredibly beautiful, with its arcade of slender Perpendicular columns leading up to the glorious east window, a representation of the Crucifixion in sixteenth-century Flemish

stained glass, which was part of the dowry of Catherine of Aragon, Henry VIII's first wife. You would never expect this from the exterior; and the explanation is that 220 years ago, when Sir Robert Walpole was Prime Minister, the church, including the tower—which is a fascinating example of eighteenth-century Gothic decoration—was completely refaced with Portland stone, the House of Commons voting a grant of £3,500 towards the cost. In the eighteenth century Parliament could still vote money for such a purpose; but this unhappily is no longer possible.

It is most unfortunate that the eighteenth-century stonemasons used iron cramps to hold the stones in place, for these have since corroded and are splitting the stones apart; you can see the cracks on the outside of the tower quite plainly if you look for them. So we have now got to take off the stones again, one by one, and remove those rusted iron cramps, replacing them with other metal which does not rust. This is going to be a long and expensive job, calculated to cost at least £10,000, and we feel justly proud that Sir Winston Churchill was the first to contribute to the Restoration Fund.

Meanwhile, the bells of St. Margaret's are perforce silent while the work on the tower is proceeding: those bells which rang the Queen to Westminster Abbey for her Coronation, and whose peal is so familiar to listeners all over the world. We all look forward to hearing them ring out again when the work of restoration is completed. And I know that you will wish us well. (*Broadcast in the BBC's General Overseas Service*)

Books to Read

Reviewed by
John Connell

THE second volume of Mr. Harry S. Truman's memoirs, called *Years of Trial and Hope*, thoroughly sustains the standard set by its remarkable predecessor which, as you may remember, was a full and fascinating account of Mr. Truman's accession to the Presidency of the United States in April, 1945, and of his momentous first months in office. The second volume takes the story up to his departure from that exalted office which he had discharged with so much courage and distinction. The story of his years in office is packed with critical events from Potsdam to the Korean truce negotiations at Pammunjon. He tells it with lucidity and great narrative skill; he is brisk, modest, yet self-confident, trim but never perky. This clear-headedness is equalled by his capacity to take decisions. His memoirs were bound to be valuable and authoritative; what to a non-American reader is both surprising and refreshing is the personal charm with which every page is invested. One is not called upon to agree with every statement that he makes—on two major issues, for example, any British reader is bound to have different views: on Palestine and on the curtailment of the sharing of knowledge about atomic energy. But if any man can make American policy on these two matters comprehensible it is Mr. Truman; and of his integrity and fearlessness there can be no question. A great man has written a great book.

From the original, extremely voluminous records, personal and public, from careful study on the spot, and from a wide, deep understanding of war in all its aspects, Mr. Alan Moorehead has reconstructed in his book, *Gallipoli*, a brilliant, detailed, glowing picture which comes as near being a masterpiece as makes no matter. He tells the complete story, as seen from both sides of the hill—the hill being that barren little strip of land at the gates of the sea of Marmora which commanded the way to Constantinople, in dispute of whose possession from the spring to the autumn of 1915 so much blood, valour, and political and strategic ineptitude was outpoured. Mr. Moorehead's style is simple, straightforward, and elegant. He has a swiftness in narration and a sharp economy in comment which are both entirely admirable. The clarity and the precision of his narrative are all the more notable since he was a small child when the event occurred which he describes. It is a magnificent story which loses none of its splendour or its pathos in the retelling.

Roger Casement, who was executed for treason in 1916, and who to the Irish for whose cause he came to so terrible an end is a hero and a martyr, is to someone like myself, loyalist and unionist in every fibre of my being, a figure at once tragic and sordid, fascinating and repellent. Mr. Rene MacColl is a good deal more detached than I could possibly bring myself to be: in many ways this detachment is an obvious virtue, but it is accompanied by—and in my view not a little marred by—a remarkable ignorance of the real issues in Anglo-Irish relations. Although I like the brisk jauntiness of Mr. MacColl's narration and I respect his skilful character-drawing, I am not convinced that he makes a firm enough moral judgment on a matter of treason which, in our epoch especially, is of supreme importance. That criticism made, I hasten to add that I found Mr. MacColl's book, *Roger Casement*, extremely absorbing, and I hope that it will be widely and carefully read.

Mr. H. Maclear Bate is a British journalist with an inherited South African background and a good deal of contemporary knowledge of the country. In a book called *South Africa Without Prejudice* he gives a vigorous and concise statement of the South African Nationalists' case, in all those matters over which they are subjected to what they think to be unjustified and unmerited criticism. But I doubt whether his arguments will convince not just the uninformed and misinformed critics who so infuriate South Africans but people who—like myself—have some knowledge of the country and deep affection and admiration for its people, but do not share Mr. Maclear Bate's whole-hearted approval of *apartheid* and of the Union's attitude to the Commonwealth. I foresee tragedy ahead for South Africa, and I deplore it; and, plausible as Mr. Maclear Bate is, he has not persuaded me.

Father Trevor Huddleston's *Naught for your Comfort* is also about South Africa, and it has aroused the fiercest resentment in the Union. Father Huddleston is an Anglican priest who worked for many years in Sophiatown, the shanty-and-shack suburb of Johannesburg which, under the policy of racial segregation, has been razed to the ground and its inhabitants removed elsewhere. Father Huddleston is a strong and passionate saint; and saints are not easy to fob off with the abstractions of 'problems' of race relations when they themselves are aware of the direct relationships of man to man and man to God. Father Huddleston's book is an unsparing, utterly subjective, totally one-sided account of his years of endeavour in Sophiatown, of his clashes with authority on behalf of his parishioners, and of authority's attitude towards him. His book has the defects of its virtues; it topples over every now and again into superficiality and sentimentality; it is hasty as well as gallant.

Years of Trial and Hope, by Harry S. Truman (Hodder and Stoughton, 30s.)

Gallipoli, by Alan Moorehead (Hamish Hamilton, 21s.)

Roger Casement: A New Judgment, by Rene MacColl (Hamish Hamilton, 21s.)

South Africa Without Prejudice, by H. Maclear Bate (Werner Laurie, 18s.)

Naught for your Comfort, by Trevor Huddleston (Collins, 12s. 6d.)

STORIES FROM 'RADIO NEWSREEL'

Here and There

THE COLLEGE OF ARMS

AT a ceremony in the City of London the United States Ambassador, Mr. Winthrop Aldrich, unlocked a pair of eighteenth-century wrought-iron gates in front of the College of Arms, the home of the English heralds, now celebrating its 400th anniversary. The gates were presented to the college by an American benefactor to replace the gates that were melted down for scrap during the last war. Here is part of what the Ambassador said:

"Today I should like to give you one example which seems to me to be particularly appropriate. It is a testament to the fact that physically as well as spiritually there is in American soil a part that is forever England. At East Twenty-Fifth Street in New York City a tablet was unveiled at the opening of the East River Drive a few years ago. The inscription was written by Stephen Vincent, the Mayor, and this is what it says: "Beneath this East River Drive of the City of New York lie stones, grit, and rubble from the bombed city of Bristol. These fragments that once were homes shall testify while men love freedom to the resolution and fortitude of the people of Britain."

"It was this sense of kinship between us and of admiration for the qualities of our British allies in war and in peace which I feel sure led Mr. Blevins Davis, my fellow-American, to donate these beautiful gates to the College of Arms to replace those which were sacrificed in our common defence. I hope that these gates will henceforth remind all who see them of the friendship and allegiance between our two countries; of the fact that here in the historic College of Arms the family records of so many of our two peoples are gathered together and become one."

"Thanks for the American gift were expressed by the Duke of Norfolk who, as Earl Marshal, is head of the English heralds. He also spoke of other gifts which had made the post-war restoration of the college possible. 'Your Excellency,' he said, 'the work that goes on within these old walls extends to your country and the English-speaking peoples throughout the world. And it is a very great moment after many years of anxiety that I can assure you that on this the 400th anniversary the generosity of your country as well as the people of mine has made it possible for this ancient college to live on.'

NEW SCIENTIFIC INSTRUMENTS

AN exhibition that showed the ever-increasing part science is playing in every aspect of our lives opened in London recently. It was the fortieth exhibition of the Physical Society, and on display at the old and new halls of the Royal Horticultural Society in Westminster were the latest wonders in scientific instruments.

The exhibition was opened by Sir John Cockcroft, the atomic physicist, and he cast his mind back to the days when he and his colleagues were working in the Cavendish Laboratory: he compared that day with this, and gave an idea of how far things have come since then: 'In our time we used to count atomic particles with a microscope and a zinc scintillation screen in a dark room, and we got confused if we had more than one a second. Today the instruments which we see around here will count at a rate of about a million a second, using marvellous new scintillators. And the data comes along with such speed that we are now having to have data-analysers and digital-computers and all that, in order to decide what the data means when we have got it.'

One of the sounds that struck me when I first went into the hall, as I found out later, was the sound of a system of radar measuring the velocity of droplets of water falling about ten feet from a tube. The sound of a radio-wave meeting the drop of water at a certain frequency and being reflected back at a different frequency can be measured, and it is by measuring the difference that the operator can find the speed or velocity of the target. In this case the water was going at ten miles an hour, and I was told the police are experimenting with the system for checking the speed of cars.

Obviously, inventions are coming along all the time. I was talking to Mr. Ronald Gould, of the Atomic Weapons Research Establishment at Aldermaston, and he showed me a tiny radiation-detector he had made in an old razor-case. He also showed me another small detector—a geiger counter in miniature, really—so simple, in fact, that at Aldermaston they call it the Girl Guide's geiger counter. He said that at a time when

The new railings and gates in front of the College of Arms, the home of the English heralds and a great storehouse of family records

atomic energy is being used more and more a cheap geiger counter is really necessary, and this one, which you can plug into the light socket at home, can be made for about fifteen shillings. He was enthusiastic about people getting used to the idea of living with radio-activity: it is in many things around us—the luminous dials of our wrist-watches, even the walls of our homes.

Electronics are finding their way everywhere—even in bee-keeping. I saw an instrument which by analysing the significant sounds made by bees in the hive can assess the health of the queen bee and the bee colony generally. There was an experimental electronic telephone-exchange in the exhibition and it had no moving parts at all. LEONARD PARKIN

A PLAGUE OF MICE

THERE is a small town called Tottenham in New South Wales, Australia, and the thousand or so people who live there are crying out for the services of a Pied Piper whose speciality is mice rather than rats, for as Robert Stead of the Australian Broadcasting Commission reports, Tottenham has been overrun with mice—thousands of them—during the past few weeks.

'If you're like the women-folk in my family, and you hate mice, you won't like this story, unless for the joy of knowing that you don't live in Tottenham. It all started from flooding in areas around a group of central New South Wales towns. As the floods overran their food, swarms of mice from the wheat country retreated towards more hilly areas, and finally have concentrated in and around the town of Tottenham. There aren't, of course, enough mousetraps to go round; poison baits are being used, and people are even attacking swarms with sticks and stones. In the early days the mice got everywhere and ate everything.

They were even found inside a refrigerator at the local hotel, and by then the cupboard was eaten bare. Householders have been pestered by mice which have got into beds and even into children's cots; and now that everyone is tightly shutting away every scrap of food, straw-mattresses have become a prime attraction for hungry mice. They have done damage amounting to many hundreds of pounds.

'The town's storekeeper, Malcolm Gander, told me the mice had done damage worth £400 in his shop alone; but even for Mr. Gander it is not all loss: the townspeople have nearly cleared his shelves of tinned foods—the only safe foods to have about the house. Tottenham's one police constable, Kevin Crossingham, says he has never seen anything like it; but he believes that now the mice have turned cannibal the numbers are noticeably decreasing.

'Out of a thoroughly nasty situation have come one or two amusing stories: of the housewife who brought the fairy tale to life by lashing out with a carving knife at mice scurrying along her mantel-shelf and merely lopped off their tails; of the mice which flushed themselves off a bar shelf by eating the corks out of the bottles; and of a man who had four teeth loosened from his dental plate when the mice got at the fixative overnight. One man in the town is temporarily out of business: the cat's meat man. No cats were ever better fed than the toms of Tottenham.'

Pocket-size geiger counter for use in workshops where radio-activity is likely

Not a man from Mars but a Harwell technician wearing a protective 'frog-suit' while he works in a highly radio-active area; the picture below shows how a glass-walled glove-box enables a lathe and a micrometer to be used on radio-active material

Model showing how uranium fuel-rods are dissolved in acid to remove plutonium

A handy monitor used in testing for areas of suspected radiation

Men wearing protective clothing moving a container of irradiated fuel to a laboratory for examination: a knowledge of how such fuels behave is essential for successful reactor operation

TEN YEARS

'In the course of a few days recently some 2,500 people visited Britain's Atomic Energy Research Establishment at Harwell. They were not there on business; in fact many of them were not scientists or connected with science. They were members of the House of Commons and the House of Lords, journalists and local dignitaries, and more than a thousand of them were from the universities. For nearly all of them it was their very first visit to an atomic-energy establishment of any sort whatever. This was the first time,' said C. L. Boltz, 'that Harwell had been open to such a wide range of visitors. Part of the reason, undoubtedly, is the relaxing of security begun last August at Geneva, but the chief reason is that 1956 is, for Britain's first Atomic Energy

WHEN I first went to Harwell the thing that most impressed me was a hangar that had once housed aircraft filled from end to end with lathes and machinery. I remember standing in the gallery and trying to imagine how much equipment all those lathes could turn out. That was in 1950, when already a great deal had been done. But they had still to make, and make do, in much of their work on atomic energy. And there were many improvised laboratories, and buildings in progress round them. Now there are grass and flowers where once there was dust, and the look, almost, of a finished research station: almost—because no laboratory that is worth the name is ever finished. And you have only to go round Harwell and talk to discover that they are thinking of the next type of reactor, or the next but one, or maybe the one after that. They know what they are doing and why. And they have got the tools to work with.

We hear a lot these days about things like remote control, robot brains and calculating machines, and automatic operation. At Harwell these things are neither a luxury nor a problem for the future but part of the pattern of research. For example, you can see on a television screen an enlarged picture which shows the surface structure of a metal. You may ask: why not an ordinary microscope picture—why not use a photographic plate? And then you realise that the metal you are looking at is part of a fuel-rod that has been in a nuclear reactor, and that it is full of highly radioactive fission products. A photographic plate would be fogged at once by the radiation. As it is, the glass lenses of the microscope are turned green by it, and they transmit less light than when new. As for the specimen, it has been ground and polished, and its structure shown up by etching with acid, all without handling.

That is their own work coming back on them. It is like designing a car, and then having a look at the cylinder walls after, say, 100,000 miles: the equivalent of mileage in a reactor is the proportion of the fuel-elements that can be 'burnt up' before they are taken out to be processed and are replaced with new ones. 'Burning up' means the fission of uranium atoms, and the formation from them of those highly radioactive fission products. You might think, therefore, that it would be necessary to do some rather nasty and difficult chemistry to tell how much of the uranium had been consumed. But there is a machine that does it for you, and traces the answer on a bit of paper as easily as if a barometer reading was being recorded.

Then, as another impression, I want to take you to a long room full of large boxes, each a miniature laboratory, and each with a number of pipes that come down to it from the ceiling. Inside the boxes is

A research worker using remote-control instruments to examine irradiated fuel—made from uranium or plutonium—inside a lead-walled box

A scientist looking at the tops of fuel elements in the fast reactor 'Zeus,' on which he is standing; (below) the control desk of 'Zeus,' a low-energy version of a reactor with an enriched uranium core which is being constructed at Douvreay in Scotland

F HARWELL

Establishment, an anniversary year. It was in 1946 that Sir John Cockcroft and two others first looked at a deserted aerodrome near the village of Harwell, about fifty miles from London, the aerodrome that was to be the first atomic-energy establishment in Britain. Today there are nine research or production establishments in various parts of Britain, as well as the most ambitious programme in the world for the production of electrical power from the atom. Britain is one of the three great atomic powers, and it has all been built in ten years. The development of steam as a prime mover took over a century. Nuclear energy as a prime mover has been established in ten.' (From a talk broadcast in London Calling Asia.) The talk below is by ARTHUR HASLETT

Work at Harwell is closely planned in conjunction with industry: in the chemical-engineering laboratory processes to be used in industry are tested on a pilot-plant scale

plutonium in various forms—the material of atom bombs, an extremely dangerous substance to breathe, but also useful.

The point of it all is this. To get the fullest use from atomic energy it will be necessary sooner or later to have reactors in which the fuel-elements are plutonium, which is made in present types of reactor. Plutonium by itself would be an awkward material to work with, because it changes repeatedly from one form into another when the temperature changes. So in the safety of these boxes they are making new alloys of plutonium—they can work it, melt it, compress it in powder form with other metals, and study the behaviour of the alloys when made.

Finally, it may be useful to a designer to know how one of his reactors will behave when the conditions of operation are suddenly altered—for example, if more or less electricity were taken from the turbines that it drove. Again, there is a machine that gives the answer. To look at, it is merely three large panels, with the usual collection of lights and dials. It can take account of anything up to twenty factors in the operation of the reactor, and works out for itself what will be the effect of any short-term change in conditions.

The Next Stage of Planning

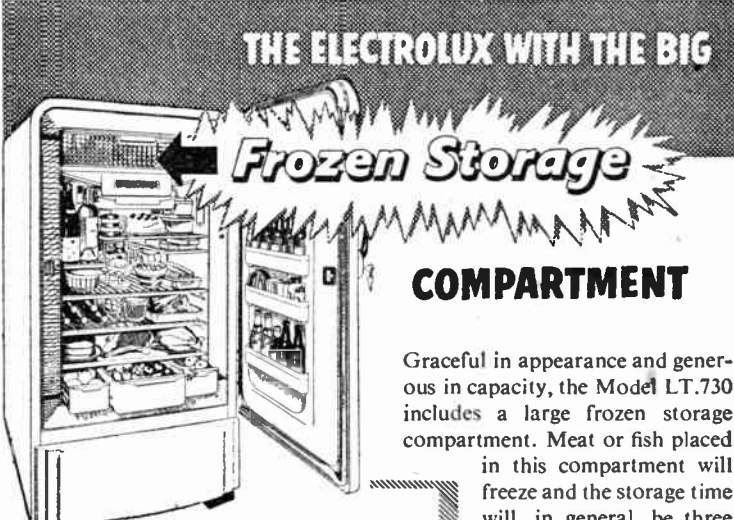

Those, then, were some of the things that we saw—that were to do with the main work of the station. From Sir John Cockcroft, the director, we heard about the next stage of planning, about the type of reactor that will be built next in the British programme after the Calder Hall type of power station which is to be opened by the Queen in October. In the Calder Hall type the fuel elements, as some of you may remember, are cooled by a gas, carbon-dioxide. Cooling in the next stage will be by a liquid, and there have been quite a number of types that have seemed possible. Harwell has taken a look at each of them, in conjunction with industry. And the choice, Sir John told us, has been reduced now to two.

In one of them the fuel-rods would be surrounded by water, and the water used both to slow up the neutrons that are released in fission—and keep the reactor working—and also to take the heat from the fuel-rods and transfer it to boiler tubes placed outside the reactor. In the second type, graphite blocks would be used, as at Calder Hall, to slow up the neutrons, but liquid sodium to extract heat from the reactor.

That, then, is the choice. They expect to have made it and built a prototype by 1960. Which means that they must be getting close now to a decision. And by the late 1960s there should be a number of this

THE ELECTROLUX WITH THE BIG

Frozen Storage

COMPARTMENT

Graceful in appearance and generous in capacity, the Model LT.730 includes a large frozen storage compartment. Meat or fish placed in this compartment will freeze and the storage time will, in general, be three times as long as in the main compartment. Five ice trays provide a plentiful supply of ice (80 big cubes) for cold drinks.

- Handy door shelves
- Interior light
- Vitaliser and Utility drawers for salad, vegetables, eggs and fruit
- Interior volume 7 1/2 cu. ft. approx.
- Operation by Kerosene, Electricity or Gas. Dual Control models, adaptable to either Kerosene or Electricity, also available
- Cooling unit guaranteed 5 years

The Story of Colonisation

Continued from page 3

colonisation has been receding, a new form of Communist colonialism on the part of Russia in East Europe and China in South-East Asia has been growing. It is ironic that this should take place because Marxist theory in the late nineteenth century had identified imperialism and colonialism with capitalism, and the Marxist socialist had made colonialism a principal target in the attack upon the capitalist system.

This had two important results: on the one hand empires became self-conscious, and the self-consciousness extended both to the dominant and to the subject peoples. On the other hand, because it was assumed that modern capitalism was a new feature in human history, producing a new form of society, it was also taken for granted that imperialism was entirely new.

This series should serve to show that this view is historically incorrect, and that, for example, in the ancient classical empires there existed, at least in embryo, all the characteristics of imperialism.

Historically it is difficult to distinguish between colonisation and colonialism, or to dissociate them from imperialism. In our own day we have tended to assume that they constitute a modern, mainly European, phenomenon. We are apt to associate colonisation with overseas emigration from the mother country and colonialism with the political and economic domination of one people by another. This series will explain that none of these assumptions is historically valid.

'THE STORY OF COLONISATION'

An Introduction
by **Bertrand Russell**

Early 'Imperialists' by Harold Nicolson	The Reaction of Europe by Geoffrey Barraclough
The Roman Empire by Sir Mortimer Wheeler	The American Adventure by Salvador de Madariaga
The Indian Drive East by C. H. Philips	Empty Spaces by C. E. Carrington
The Expansion of Islam by Bernard Lewis	Asia Today by C. H. Philips
The Hammering Hordes by R. R. Betts	Africa Tomorrow by Philip Mason
Crucibles of Civilisation by K. M. Panikkar	A New 'Colonialism'? by Geoffrey Wheeler

Ten Years of Harwell

Continued from page 15

new kind of power station: the successor of the Calder Hall type. Harwell has an interest in the health side, as you may imagine, including the results of the hydrogen-bomb type of explosion. For more than five years now they have been making systematic measurements of the amount of radioactive fall-out, as it is called. As well as systematic measurements in Britain there have been others in New Zealand, Aden, and Gibraltar. And from 1954 onwards they have watched especially the effects of hydrogen-bomb tests.

Most of the activity from a hydrogen-bomb explosion is carried round the earth suspended high up in the atmosphere. It comes down to earth—in rain—only at the rate of ten to twenty per cent. in a year. There has been a clearly marked increase as a result of hydrogen-bomb explosions, and this is continuing. And—most important—the amount of extra radiation to which we are now exposed for this reason is only a very small fraction of what comes to us anyway. So at the present rate of explosions there should be no serious cause for worry.

Harwell has gone a long way in ten years. That machine-shop hangar I mentioned is still in use. But instead of Harwell on its own it is now Harwell working and planning with industry. Harwell with its ideas, serving the industrial division of the authority, deciding the future pattern of power stations. (*Broadcast in the BBC's Overseas Services*)

This Week's Listening

July 29—August 4

THE STORY OF COLONISATION

TALK about colonisation is heard more and more frequently these days as the remaining dependent peoples press forward on the road to full independence. This complex subject is usually seen merely in its modern or local context. The derogatory terms 'Colonialism' and 'Imperialism,' so often used today, are themselves indications of this. But the story of colonisation goes back to the earliest civilisations of the world; and it is this story that a number of speakers, highly qualified by their historical studies, will tell and seek to set in proper perspective in the new G.O.S. series.

This week Bertrand Russell, who combines pre-eminence as a philosopher with a firm grasp of history, introduces the series by defining the terms of the study and setting the theme of colonisation in its historical context. Next week Sir Harold Nicolson (a former President of the Classical Association) will survey the early 'Imperialists,' contrasting such aggressive powers as Persia and Macedon with the Greek colonists proper and the trading settlements of the Phoenicians. Then Sir Mortimer Wheeler, the distinguished archaeologist who chaired the programmes on 'Roman Britain,' the last of which is broadcast in the G.O.S. this week, will speak on the Roman Empire.

C. H. Philips, who has acted as consultant for the series, will give two talks: the first on Indian penetration of the East by trading, and the question of Buddhist influence; and a talk later in the series on Asia today, dealing with the receding tide of Western dominance. Bernard Lewis, Professor of History of the Near and Middle East at London University, will speak on the historical expansion of Islam. R. R. Betts, Masaryk Professor of Central European History, will deal with the repeated incursions of barbaric hordes into Europe and assess their influence on the development of European civilisation. Sirdar K. M. Panikkar, the well-known Indian historian and a former ambassador to China, will take up Asian parallels to this and deal with Moghul civilisation and the Manchu dynasty.

Geoffrey Barraclough, a former Professor of Mediaeval History, will set in perspective the various waves of European exploration and conquest. Don Salvador de Madariaga, the famous writer on the discoverers of America, will deal with colonisation on the American continent. C. E. Carrington, author of *The British Overseas*, will tell about the filling of largely empty spaces by colonisers in Australasia and also South Africa when European and Bantu first met there. Philip Mason, Director of Studies on Race Relations at the Royal Institute of International Affairs, will speak about the dawn of independence in Africa. Geoffrey Wheeler, Director of the Central Asian Research Centre, will conclude the series by discussing whether new forms of 'colonialism' are now being developed.

'The Story of Colonisation': Monday 15.45; Tuesday 00.30 and 05.00

'Roman Britain': Monday 14.45; Friday 23.15

THE FOURTH TEST

THE fourth Test match between England and Australia is due to end at Old Trafford, Manchester, on Monday and Tuesday. Commentaries by

Raymond Glendenning's commentary on the Goodwood Cup can be heard on Thursday at 14.15

Rex Alston, John Arlott, and Michael Charlton will be broadcast on both days at 12.00, 14.15, 16.15, and 17.15, and E. W. Swanton will sum up the morning's and afternoon's play respectively at 12.30 and 17.30. An eye-witness report will be broadcast at 21.00. On Wednesday, Thursday, and Friday the Australians play Surrey at the Oval, and on Saturday they go to Swansea to begin a match against Glamorgan. Commentaries and reports will go out on all four days.

'BLACKPOOL NIGHT'

BLACKPOOL enjoys a unique reputation in Britain as a holiday resort, and this is due in no small part to its policy of supplying its visitors not only with the normal seaside pastimes but by assembling in its ten live theatres more stars of entertainment than can be found anywhere in the country outside London.

The G.O.S. will be bringing these stars to the microphones each week in 'Blackpool Night'—stars like Vic Oliver, the Beverley Sisters, Eve Boswell, Jimmy James, Frankie Vaughan, Albert and Les Ward have already been booked, and all the others will follow in turn. Each week the show will be built round Jack Watson, the compère, Reginald Dixon at the Tower organ, the George Mitchell Singers, and the augmented Northern Variety Orchestra.

G.O.S.: Tuesday 21.30; Wednesday 10.30

SCHUMANN CENTENARY MUSIC

THE centenary of the death of Schumann—he died on July 29, 1856, at the age of forty-six—is being commemorated in a series of special programmes. The Purcell Singers, under Imogen Holst, with John Thompson (tenor), will contribute a programme of some of his songs and part-songs. His *Fantasy in C for violin and orchestra* will be played by Peter Mountain and the BBC Northern Orchestra in 'Concerto.' Three piano works can be heard in a recital by Celia Arieli. They are:

Kinderscenen, opus 15; Romance in F sharp major, opus 28, No. 2; and Novelette, opus 21, No. 2. Schumann is also 'The Composer of the Week.'

Schumann's music is a fine reflection of the romantic feeling of the German literature of the period, and also of that of English literature, especially Scott and Byron. He wrote much piano music, often with fanciful titles, in addition to four symphonies, chamber and choral music, and many songs. His musical writing also helped to bring to notice the works of Chopin and other younger composers.

Purcell Singers: Sunday 05.00; Monday 23.15; Thursday 17.15

Piano Recital: Thursday 02.30; Friday 16.15; Saturday 06.30
'Concerto': Sunday 14.15; Saturday 01.00

'THE TRAGEDY OF TRAGEDIES'

HENRY FIELDING'S play, *The Tragedy of Tragedies* or *The Life and Death of Tom Thumb the Great*, has a unique claim to distinction: it made Dean Swift laugh 'for the second time in his life.' It is one of the funniest plays ever written, this burlesque story of a mighty and miniature general, Tom Thumb the Great, who defeats hordes of giants, subdues rebellions, slays champions, and who, in the end, in the day of his greatest victory is swallowed down by a cow.

Fielding wrote this 'tragedy' as a parody on the excessive, bombastic, heroic dramas of his time. He had, as he worked, copies of forty plays on the floor at his feet, kicking them open and shut, making their choicest lines ridiculous in Tom's mouth.

Fielding's burlesque, comedy, or farce (however you describe it) has long since survived the impossible plays it parodied: indeed, they are only remembered now because Fielding stood them in the stocks of his racy, absurd, fantastic wit and pelted them with Tom.

G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

Radio Theatre presents

'THE SIEGE OF MOCKING HILL'

THE Bonds have lived at Mocking Hill for more than 300 years. Lady Bond has not been there herself for the whole of that time: none the less she is the very personification of tradition, the stately owner of a stately home. Alas, the family's fortunes have declined since the days of Charles I, so much so that nowadays the old place is sadly in need of repairs.

So Mockingham Council proposes to take over Mocking Hill on its own account, and when her Ladyship shows an implacable opposition to their scheme they send along their Mr. Trimble to serve her with a compulsory purchase order.

But current legal rights mean nothing to the Bond family tradition, and Lady Bond resolves to make Trimble tremble for his temerity. Other Bonds are called into action, Bonds not met or mentioned these many years, but who can be relied upon to help in time of crisis. The trouble is that the Bonds soon discover that even if they outwit the council, victory may carry with it disadvantages almost as striking as defeat.

PETER FORSTER

G.O.S.: Sunday 00.30 and 18.30; Friday 14.15

Celia Arieli plays in a recital of piano music by Robert Schumann (right) to mark the centenary of his death this week

Nina Milkina is the soloist in the 'Prom' on Friday at 18.30

 'Listen and Speak'
 Lesson 94
 15.15-15.30 **NEWS and News Talk**

THROUGH EASTERN EARS. Sharmini Tirulchalvam, the speaker on Wednesday, was educated in Ceylon, Malaya, and England. For three years she studied medicine, but has now abandoned it to pursue a career as a writer. She has chosen two folk songs for her programme, one Sinhalese and the other French.

ASIA AND THE WEST. In the discussion on Wednesday the speakers will be Bruce Miller, an Australian, and Head of the Department of Government of the University College of Leicester; W. J. Beasley, Professor of Far Eastern History at London University; and W. A. Lewis, Professor of Economics at Manchester University. Professor Beasley will shortly visit Japan for a year to conduct research at Todai University. Dr. Lewis is a leading authority on the economic development of countries not yet industrialised.

BRIEF EXCURSION. On Saturday the BBC mobile recording unit will go to Scotland Yard—the central office for the general administration and control of the London Metropolitan Police: it is not the headquarters of a national police force, although it does perform some national services such as the maintenance of a criminal record office, a fingerprint branch, and the protection of royalty. Visits will be made to the information room where calls on the '999' telephone system are received at the rate of one every forty seconds, and to the fingerprint department where the 1,350,000 fingerprint forms of convicted persons are filed.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

SOURCES OF POWER

Natural fuels

When first a steam engine was coupled to a dynamo, the world's natural stores of coal and oil became a treasure house. Awed, as he is apt to be, by sudden realisations of Nature's wonders, Man summoned the aid of poetry. Coal became black diamonds: oil became black gold.

Not vast exaggerations, after all; because in countries where water power was restricted these were — and still are — the only fuels available for generating electricity.

It is over three-quarters of a century since Colonel Crompton first used a steam-driven generator to produce electric light; and since that time the firm of Crompton Parkinson Ltd. has been well to the fore in the development of electrical equipment and plant. Whatever the future of electricity may hold in store, rely upon it, Crompton Parkinson — always pioneers — will be in step.

LONDON CALLING

THE OVERSEAS JOURNAL OF THE BRITISH BROADCASTING CORPORATION

No. 874. PUBLISHED WEEKLY

PRICE SIXPENCE

SUBSCRIPTION 25s. A YEAR

BUDDHIST PILGRIMAGE

In the first of a series of five broadcasts the distinguished scholar John Blofeld will describe his journey to northern India to visit the scenes of the Buddha's birth, enlightenment, teaching, and death. His earlier talk on the meeting at Rangoon of the Sixth Great Buddhist Council is published on page 6

SIR ARTHUR BLISS

The Master of the Queen's Music will conduct his 'Meditations on a Theme by John Blow' at the Proms on Tuesday

EARLY 'IMPERIALISTS'

Sir Harold Nicolson is giving the second talk in the G.O.S. series, 'The Story of Colonisation'

ARTHUR BALFOUR

The recorded voices of Lord Bruce of Melbourne, Winston Churchill, and of the famous statesman himself will be heard in this week's 'Portrait of a Prime Minister'

THE WEEK'S SPORT

Rex Alston and Raymond Baxter write on page 3 on athletics, cricket, and motor-cycle racing

'A SORT OF TRAITORS'

'Radio Theatre' presents Nigel Balchin's novel dramatised for broadcasting

St. Paul's Cathedral

The Sunday Service this week is to be broadcast from St. Paul's Cathedral, London. In an interview on page 7 Sir William Holford outlines his imaginative scheme for the replanning of the bomb-devastated precincts so that Wren's masterpiece can be seen to its full advantage

The Week's Sport

REX ALSTON talks about sporting events which will be reflected in G.O.S. broadcasts: in particular he comments on the Athletics meeting between England and Czechoslovakia on Monday, and on the Australian Test team's fixtures

THE August Bank Holiday weekend always provides thrilling athletics matches between Great Britain and Continental countries: this year our visitors are Czechoslovakia, whom Britain defeated last September by 117 to 95 in the men's match, and by 58 to 48 in the women's. I was in Prague with the team, and saw some splendid performances, the most exciting being the 5,000 metres in which Pirie and Norris ran a breathless last lap against Zatopek and only one-fifth of a second separated the three of them at the tape. Pirie was the winner, with Zatopek second, and Norris third. Hewson also excelled himself by getting the better of the formidable Jungwirth both in the 1,500 metres and in the 800 metres.

Disley and Brasher came first and second against the Czech steeplechase champion Brlica, whilst Ruddy, though beaten by Janacek, who is one of the best sprinters in Europe, ran an excellent race in both the sprints, and chased the great man home.

Great Britain also did well in the field events at which the Continentals almost invariably beat us. Wilmshurst, the British captain, won the long jump, and Palmer and Savidge were first and second in the weight-put.

The best performance amongst the ladies was by Diane Leather, who though out on her own put up fastest-ever time in the 800 metres, and in the field events Thelma Hopkins won both the high jump and the long jump. As the 800 metres is not an Olympic event Diane Leather will not be competing in Melbourne, but Thelma Hopkins is one of our brightest hopes in the high jump.

Our girls last season proved themselves second only to the Russians, and the more competitive experience they have the better they will perform in the Olympic Games.

Most of these competitors are likely to be performing again, and the return contests could easily provide as many thrills as in Prague.

While these exciting events are taking place at the White City the Australians will be engaged with Glamorgan at the St. Helen's ground at Swansea. Glamorgan usually do well against touring sides, and in 1953 they made an honourable draw after the Australians had made 386, of which Harvey made 180. Those who saw it declared that this innings was the most glorious display of stroke-making seen throughout the summer. So if Harvey plays at Swansea listen for fireworks.

The Australians then have an awkward cross-country journey to Birmingham for their three-day match against Warwickshire. They will find the Edgbaston ground transformed since their last visit because Warwickshire, for the first

time for nearly thirty years, will be staging a Test Match there in 1957.

I watched the 1953 match, and recollect how the Australians were 90 behind on the first innings, how Warwickshire declared twice, and how during the last hour, when Hassett was playing a superb defensive innings on a crumbling wicket against Hollies, the crowd took exception to his tactics and booed and jeered.

The Australian week ends at Derby against one of the best seam bowling attacks in the country, as purveyed by Messrs. Jackson, Gladwin, and Morgan. The equivalent match in 1953 was played at Chesterfield and drawn after much time had been lost owing to rain.

THE ULSTER T.T.

THE Ulster Tourist Trophy enjoys a history of classic racing which is rivalled only by the traditions of the Isle of Man. Indeed it would be fair to say that Dundrod is the nearest thing available on British territory to the mountain circuit in the island. The rivalry between Ulster and the Isle of Man as home of the great classic races is in fact as old as motor racing.

This year, however, a new and additional interest focuses our attention on the Ulster Tourist Trophy to be held on Thursday and Saturday. The affair of Geoffrey Duke and his competition licence resolves itself at the end of this month, and Geoffrey Duke will be in the saddle for the Belgian motor-cycle Grand Prix.

But already the young Londoner John Surtees has made a superb start in the world-championship stakes by winning the Senior Tourist Trophy in the Isle of Man with the M.V. Augusta. At the time of writing it is highly probable that he will win the Dutch T.T. Consequently Duke will enter the lists two victories down on his greatest rival.

The Senior (500) race will probably be, as last year, over twenty-five laps, 185 miles, as against the 350 race of twenty laps, 150 miles. But in either case the tortuous 7½-mile lap, with its constantly changing gradients and assorted curves will provide an extremely severe test for both driver and machine.

However, the element of chance in races such as these is a very considerable one. Enthusiasts will recall the cruel misfortunes which have robbed many leading riders from an apparently certain victory at Dundrod, but this of course is the essence of the sport. There is no such thing as foregone conclusion in motor or motor-cycle racing, and in surroundings such as those provided by the Dundrod circuit a good entry makes first-class racing the only known certainty (see page 25). RAYMOND BAXTER

ANDREW SHONFIELD

ANDREW SHONFIELD, Foreign Editor of the London 'Financial Times,' outlines the reasons why—in terms of trade with Britain—the Australians feel rather aggrieved at the moment, and he goes on to explain why he believes a matter that looks simple and straightforward will turn out to be extremely complex and possibly explosive

Anglo-Australian Trade

THERE is little doubt that on balance Britain gets more than it gives in trade advantages under the system of Imperial Preference. That was not always so. In the 1930s, during the period immediately following the Ottawa Agreement which established the system of Imperial Preference in 1932, the producers of food and raw materials in the Com-

monwealth, who were then engaged in a desperate struggle for markets, probably benefited at least as much as Britain.

Even today, there are particular groups of Commonwealth producers, some of them important—like the sugar-growers in the West Indies or the wine-producers of Australia and South Africa—who benefit very greatly from the privileged position which they have been granted in the British market. But it remains true that in the aggregate Britain obtains more preferences on a larger volume of goods from the Commonwealth than she gives in return. And this situation is very largely dependent on the high level of preferences established in Australia and New Zealand.

Advantages for British Goods

For the rest, the tariff advantage given to British manufactured goods in other Commonwealth markets is in general of no very great practical significance. That still, however, leaves a number of individual British manufacturers with valuable protected positions in particular Commonwealth markets. No doubt this helps to explain the feeling among those concerned with this matter in Britain that there will certainly be no desire on this side to push the matter forward for general discussion at the Commonwealth Prime Ministers' Conference. More likely it will be reserved as a special issue for separate Anglo-Australian negotiation.

The Australians, in fact, want to talk with Britain about other trade matters as well as Imperial Preference. They are particularly concerned about the effect of agricultural protection upon their exports. It is a fact that western Europe as a whole has become much more nearly self-sufficient in things like grain than before the war. This is partly the result of deliberate protectionist policies and subsidies granted to the farmers, and partly the effect of much more efficient farming methods developed in recent years. Britain has led the way in both respects. British farming is much more highly protected than before the war and also more efficient. Its production of grain, in which Australia is, of course, particularly interested, has risen far above the pre-war level.

It is no wonder, really, that the Australians feel rather aggrieved at the moment. On top of these difficulties in overseas markets for agricultural produce there has come a drop in the prices of Australia's stable export lines. As a result of this Australia's wool, which accounts for about half of her total exports, will bring in many millions of pounds less this year than it did last year. And there seems to be no chance of making up for the lower price by selling increased quantities. The world market for wool just will not absorb that much more.

The Prospect before Australia

The same applies to Australia's other big agricultural export, wheat. It must be extraordinarily frustrating for a new country developing its own resources extremely fast to find that its growth is now threatened because the rest of the world will not buy two of the necessities of life which it is trying to sell. This is the prospect which the Australians now face. The recent government White Paper analysing the state of the economy reached the conclusion that there was little likelihood of any significant increase in Australia's export income in the near future. And it finally posed the question whether Australians would have to accept from now on a slower rate of growth, commensurate with the country's earning power abroad.

So it is not surprising that the first reaction is to turn on Britain, whose goods get preferential treatment when they are sold in the Australian market, and to ask why it is not prepared to buy more Australian produce. But although the matter looks simple and straightforward I believe that it will turn out to be extremely complex and possibly explosive. You see, the Australian demands really touch upon two most sensitive points. The first point is the system of protection for British agriculture which has been built up, and the other is Imperial Preference.

Agricultural protection is one thing on which both of the political parties in Britain are united. The only question which is worth discussing is how much further any government may go in subsidising sections of British agriculture which cannot stand up to world competition in a free market. After all, it has to be remembered that the prospect for Britain, as for Australia, is that the balance-of-payments problem is going to be with us for a long time yet.

But it would seem reasonable that Australia should be able to claim the right to be consulted on any proposal for British agricultural protection which affects her interests. The Australians point out that they, for their part, have given Britain this right when considering any changes in their tariff on manufactured goods. Well, no doubt an improved system of consultation will help. But it seems unlikely to make a decisive difference to the essential Australian problem. For the truth is that the Australians, in common with other primary-producing countries, are battling against a world-wide trend.

Britain's case is only one example of a tendency that is apparent in most of the industrial countries of the West. They have nearly all been growing less dependent on foreign supplies of food and many industrial raw materials. They have, it is true, meanwhile become more dependent on imports for their primary source of industrial energy—oil instead of coal. But in most other commodities the advance of technology, the greatly increased use of synthetic products, and the general improvement in productive efficiency, have all tended to make these countries more self-sufficient both in industry and in agriculture.

That still leaves many of them importing a larger absolute quantity of raw materials than in the past. But my point is that each additional unit of industrial output requires a smaller proportion of imported raw materials. The consequence is that world industrial production grows much faster than the rate of growth of demand for primary commodities.

Now that is a general truth covering very wide variations between individual commodities. But it so happens that the two items in which Australia is particularly interested—wool and wheat—are especially vulnerable to the new trend in the industrial countries. Wool is increasingly meeting the competition of nylon and other synthetic fibres; and wheat is usually the first thing that a country goes for when it decides to extend its agricultural output.

Europe's Second Agricultural Revolution

It is also true that wheat and cereal production in general has been greatly assisted through the advance of mechanisation in agriculture in Britain and in the rest of Europe since the war. This is in fact something like a second agricultural revolution; and countries like Australia find it hard to adapt themselves to it. The markets for food nowadays are to be found to a much lesser extent than in the past in the traditional rich countries, and much more in the poor countries of the East. Here the Americans with their subsidised exports of agricultural produce, forming part of their foreign-aid programme, have a decisive advantage.

Turning now to Imperial Preference, this was never intended to, nor could it ever, deal with a problem of the present dimensions. But the Australians undoubtedly feel that it ought to provide some relief against the pressure. Specifically they claim that Britain buys Argentine or French wheat when it is only fractionally cheaper than Australian, whereas the British do not suffer when things are the other way about because there is a generous Australian tariff-preference to cover any such discrepancy between the price of British manufactured goods and those of their foreign competitors.

The trouble is that to give the Australians a similar preference on wheat you would have to impose a duty on supplies coming from outside the Commonwealth; and at the moment all wheat enters Britain duty-free. The same applies to wool. In fact, the Australians have not asked for any preferential tariffs on these staple exports, which they are successfully selling in a wide range of markets at the world-market price.

What they would like to have is some kind of a guaranteed outlet for a certain quantity of their produce, such as they had through the bulk-purchase agreements under the British Labour Government. Similar agreements still exist for Commonwealth sugar. But it is my impression that there would be very strong resistance in Britain to any plan to extend such arrangements to other commodities like wheat.

I do not want to be gloomy about this, but it seems to me that these issues contain the seeds of trouble which are liable to sprout rather quickly. Britain cannot in fact increase her preferences on Australian goods because she is bound by an international agreement—the General Agreement on Tariffs and Trade—not to do so. But there is nothing to stop the Australians or anyone else from reducing Imperial Preferences, if they feel that they must balance out this present unequal distribution of advantages at all cost.

And once this process of downward adjustment begins on one side, the other side will almost certainly find some point where the balance of advantage is the other way and retaliate there. One danger is that a new round of bargaining involving many other Commonwealth countries besides Australia would bring the main structure of Imperial Preference toppling to the ground. (*Broadcast in the BBC's General Overseas Service*)

The first Western fashion show in Moscow for forty years proved to be hard work for the six models, but they all counted themselves lucky to have been chosen

British Model Girls in Moscow

BARBARA HOOPER tells how London girls spent three highly successful weeks in Moscow displaying at the Gorki Park of Rest and Culture a hundred of the latest British winter fashions to thousands of enthusiastic Russian Women

IT all began when a delegation of Russian fashion-buyers visited Britain last year. They liked what they saw, and ordered some outfits from one of the members of the London Model House Group. So the idea grew: why should not all eleven designers in the group pool their resources and send to Moscow a representative autumn collection—with the model girls to display it?

Cherry Marshall, a dynamic and attractive fashion agent who also runs a training school for mannequins, flew over to Moscow with her friend Betty Millan to make preliminary arrangements, and they came back with plans that exceeded everyone's expectations.

The shows were held twice a day for three

weeks in the Hall of the Gorki Park of Rest and Culture, Moscow's post-war equivalent of London's Royal Festival Hall. The hall was elaborately decorated; strip-light had been installed; recorded British light music was played in the background; and Cherry Marshall gave the commentaries, translated by a Russian girl interpreter. To give you some idea of the scale of these shows, nearly 30,000 people bought advance tickets (at ten roubles or nearly £1 a time); 3,000 posters were produced and 17,000 catalogues printed.

And that was not all. In alcoves round the main hall they arranged a changing exhibition—or dummies—of the outfits not modelled in the parades. There were special showings for the trade, and one at the British Embassy for diplomats' wives and VIP's.

The six model girls found little time for shopping, sight-seeing, or visits to the Bolshoi Theatre ballet, but they fitted them in somehow. In spite of the hard work (and for each of them it meant thirty miles of walking and over 300 changes of dress) they all told me they counted themselves lucky to have been chosen.

The hand-picked six were Ann South, Nola Rose (an Australian), Joy Weston, Joy Slape, Molly Frith, and Pagan Grigg, all in their twenties, and they were chosen for looks, figure, and personality, as typical British-type girls. All of them are blondes except Joy Slape.

It is true that with their hand-span waists and slender hips they were scarcely modelling for the average Russian figure, but the designers felt they wanted to send an absolutely representative cross-section of their autumn collections, not clothes modified to suit the Moscow waistlines, purses, or climate (though they all can be adapted). Above all, Russia had asked for some really glamorous clothes, as well as heavy coats and cold-resisting suits.

But warm materials had their place: tweeds, nubby or smooth and close-woven; thick camel-hair; large capes and cowl-collars; and plenty of the fur trimmings that (I am told) are dear to every Russian woman.

Dresses were in jewel colours, brilliant peacock blues and jade greens, with every shade of red and pink from salmon through to pillar-

Cherry Marshall, the London fashion agent, who flew to Moscow to arrange the show

Three of the fashions displayed: a Koupi coat with fur hood, a Luton flower-pot hat in scarlet, and a Matita tweed dress and cape

box, to strike a cheerful note in the harsh Moscow winter. And they were in corduroy, jersey, and soft wools, bell skirted, princess line, or strictly tailored.

But, in contrast, bouffant ball-gowns and shorter evening dresses (for cocktail parties, for dining out or theatre-going) tended to be fragile and diaphanous, often shot with gold or silver thread. Glittering crystal organza was a favourite, and the colours suggested fondant sweets: lime, lemon, apricot, pink, white. Black velvet and black lace were much used, too, sometimes high-lighted with touches of white.

Even slacks, sportswear, and flimsy lingerie and night-wear were not left out, and the all-British accessories were carefully chosen, from hats right down to umbrellas and beauty-boxes.

Prices ranged from a few pounds to thirty or so, but mostly came between twelve and twenty. At current rates of exchange the outfits should be very favourably marked in the Moscow shops. Certainly all the parades had an overwhelmingly enthusiastic reception. And Mr. Leslie Carr-Jones, chairman of the London Model House Group, told me confidently he expects orders worth at least £1,000,000. (Expanded from a broadcast in the BBC's General Overseas Service)

The great man-made summit of rock on a Rangoon hill in Burma containing the cave-like chamber where the sixth Great Buddhist Council has been meeting

'THE DAY OF NIRVANA'

JOHN BLOFELD gave this talk to explain some of the complexities of Buddhist doctrine before setting out on a scholar's pilgrimage of Buddhist centres in India. This pilgrimage is the subject of a series of talks under the title of 'In the Path of Lord Buddha' opening in the General Overseas Service this week (see note on page 17)

ON the night of the full moon in May this year, millions of men and women pondered with renewed respect the teaching of the Lord Buddha, a teaching which has persisted for 2,500 years and for many centuries influenced at least a third of the world's population. The pages recording it are countless, and it is not easily explained in a few words, but the basic doctrine is this: life as we know it and suffering are indivisible, for who can escape the pains of birth, sickness, old age, and death? Yet much suffering can be avoided by cultivating the utmost selflessness. If we show compassion to all beings and avoid strong attachments and strong aversions we can gradually attain an inner peace surpassing all the pleasures of the senses and leading us through numerous re-births to the state where greed, hatred, and illusion no longer blind us to that universal reality which is called Nirvana.

To gain this blissful state we must dedicate ourselves to purity of mind and practice the virtues of tolerance, compassion, harmlessness, and non-attachment to self. For a man can gradually break down the accretions of selfhood caused by attachments, aversions, and prejudices based on a knowledge of the exterior world he has gained from his wholly unreliable senses, and only then will he be free from greed, hatred, and illusion. It follows from this that a man who strives after enlightenment and seeks to apprehend universal reality or Nirvana must live a very calm and unselfish life, holding cruelty and harmfulness to others as the greatest of all evils. All Buddhists accept this doctrine as the basis of their faith. Nevertheless, divisions into schools and sects have arisen with the passing of the centuries. Today there are two great schools: the Mahayana of China, Japan, Korea, Vietnam, and Tibet; and the Theravada, sometimes called Hinayana, of the southern countries—Ceylon, Burma, Thailand, Laos, and Cambodia.

The schools are principally divided by largely external considerations, but there are some more fundamental differences. One of these is that the Mahayanists accept the doctrine of *bhodisattva*, beings who reach the Nirvana's brink and then renounce it, preferring to remain in the universe as spiritual forces available to faithful men and women who lack the strength to reach Nirvana by their own unaided efforts. This doctrine is denied by the Theravadins, who teach that a man's salvation depends entirely upon himself, yet both schools are united in the cultiva-

tion of selflessness, and it may be that both roads will lead them to their goal.

The sixth Great Buddhist Council held in Rangoon this year was organised almost entirely by the five Theravadin countries—Ceylon, Burma, Thailand, Laos, and Cambodia. For its purpose was to revise and perpetuate the texts of the Theravadin version of the canon. Yet when I visited the hostels for monks and guests from abroad I found Mahayanist Japanese, Chinese, and Vietnamese monks all enthusiastically taking part in the council's work.

The sixth Great Buddhist Council came into being in the following manner. Five years ago the Burmese parliament recorded its firm belief that side by side with material progress the nation must cultivate its own and the world's spiritual and moral well-being, for the Lord Buddha had taught that greed, hatred, and illusion are the three great fires which consume the hearts of men in the world itself. Burma, shockingly disfigured by the second world war, had had enough of violence and conflagration. The first result of this resolution was the convening in Rangoon of the sixth Buddhist Council.

A Truly August Lineage

This council possesses a truly august lineage, for the first council was held almost 2,500 years ago soon after the passing away of the Lord Buddha, who left his disciples a legacy of teachings based on profound wisdom and boundless compassion. For fear that his precious word should one day be forgotten or distorted groups of monks were entrusted each with a certain portion to be learnt by heart and lovingly passed on to future generations. During the centuries which followed two further councils were convened in India, one of them under King Asoka, the great patron chiefly responsible for the peaceful spread of Buddhism in India; but it was not until almost the beginning of the Christian era that the teachings were committed to writing.

This occurred at the fourth council held in Ceylon, and nearly 1,900 years later King Mindon of Burma convened the fifth council at Mandalay and had the whole of the teaching recorded on 729 marble slabs, lest it should perish and men be deprived of its light. And this year once more Burma convened a Great Council, for there is an ancient prophecy that 2,500 years after the passing of the Lord Buddha the people of the world, many of them groaning under fearful burdens, will turn with longing to the Buddha's message of hope and peace.

So upon the crest of a Rangoon hill has been erected a white pagoda with a gold-encrusted spire that its shimmering brilliance may remind men of those noble words: 'Never in this world does hatred cease by hatred; hatred ceases only by love.' And next to this is a great man-made summit of rock containing the cave-like chamber where the council holds its sessions. This was constructed in imitation of the scene of the first great council, held in the caves of Rajagraha in northern India.

When it was known that a cave was required men, women, and children flocked in from all over Burma to build it with their own hands. They came in tens of thousands not to labour beneath the lash of some taskmaster as did the builders of the pyramids of Egypt but to raise block upon block of stone in loving tribute to the Teacher of Gods and Men.

Surrounding the rocks which shelter the blue-and-gold chamber from the heat of the sun hostels were built sufficient to accommodate and feed thousands of monks and laymen.

The principal work of the council has been the formal recitation of the entire Buddhist canon as it exists today in the Pali tongue—eleven times longer than the Old and New Testaments together. The exact wording of each text was first approved by sub-councils convened in each of the five countries belonging to the Theravadin or southern school

Rebuilding Plans in the City of London

With the approval of the Court of Common Council the first step has been taken towards the fulfilment of Sir William Holford's plan for the creation of a worthy setting for St. Paul's in the cathedral's bombed precincts

SOMETIMES good indirectly flows from evil, though no one who saw the City of London burn during the wartime blitz could have felt at the time that the planners of the future would have ever anything to thank the Germans for. However, one effect of the destruction from the air, especially around St. Paul's, was to enable even the man in the street to see the great cathedral in something like the perspective its designer, Sir Christopher Wren, originally meant it to be seen.

When the replanning began, it was the subject of some controversy; the net result has been that, with official approval, a thirty-acre site surrounding St. Paul's has been set aside for careful rebuilding so that Wren's fine monument may continue to stand out in all its grandeur. The proposals for rebuilding in the precincts have been drawn up by Professor Sir William Holford, who explained them to BBC reporter Donald Milner.

MILNER: Well, now, what amount of demolition is involved in this plan?

HOLFORD: In the first place, absolutely none; the rebuilding is all on bombed sites, really sites that have been cleared by bombs, and we can

Sir William Holford with the model of his plan for the rebuilding of the precincts of St. Paul's

build straight away. In the second stage there are one or two buildings that will have to be taken down: they are old ones, and by that time the firms who work in them will be replaced in new buildings. The third and last stage is going

to be much longer because it is a question of economics. We can't, in fact, tear down large occupied buildings until we can afford to write them off.

MILNER: So substantial blocks—like Faraday House, for example—are there for a long time?

HOLFORD: That is really rather another category of building; the Faraday block is the Central Telephone Exchange, the International Telephone Exchange, and those buildings are the most permanent of the lot, because they are so full of equipment. They are the whole sinews and working apparatus of the City, and those will have to remain.

MILNER: Then, of course, you are also leaving us, as far as I can see from the model, most of the Wren churches in the neighbourhood?

HOLFORD: Yes, we have, of course, a great number of fine ones left, though not as many as there were a hundred years ago.

MILNER: But the main object is to provide a central, satisfying sort of environment for the cathedral itself: how far are you preserving the familiar vistas?

HOLFORD: We are preserving all the sort of traditional vistas and opening up a few new ones. We are really designing the spaces between the buildings rather than the buildings themselves.

MILNER: One of the things in connection with the setting of St. Paul's which has caused a lot of controversy in late years is the question of the height of the surrounding buildings, and from what I can see from this high building on the plan it looks to me as though it is about 200 feet.

HOLFORD: Yes, it is just about 200 feet from the terrace on which it is set, and, of course, we can't help it. Wren built for three-floored houses round about, and then it became five floors, and then under the London Building Act we were allowed to build up to a hundred feet. Now, of course, we are going higher than that.

In spite of all that I believe that the south side of the cathedral has got to be regulated; you can't build high buildings there because they get in the way of your views from the Bank side of the bridges and so on. But on the north side I have suggested a typical tall economic office building. (Broadcast in the BBC's Overseas Services)

Design for Living in the City

THE City of London authorities have announced details of a plan for a proposed scheme of flats, schools, and gardens within the devastated Barbican area, which lies about half a mile north of St. Paul's Cathedral. The plan is under consideration by the City Fathers, the Court of Common Council.

The present scheme joins up with an alternative plan for these forty acres of wartime ruins: a plan prepared jointly by the City Planning Officer and the London County Council's Chief Architect. It is an attempt to show how a residential area can be fitted into the predominantly commercial city. The thirty acres or so concerned in this scheme correspond roughly with the parish of St. Giles's Church, Cripplegate.

A hundred years ago about 14,000 people

lived in this parish; five years ago there were only twenty-eight. If this scheme is approved there will be flats in the same areas for nearly 7,000 people. But this is not simply a plan to crowd as many people as possible into a small area. The architect who designed it intends to make a garden out of the present desert that is there, and round this garden build his flats, most of them in compact, terraced blocks, eight storeys high.

The rest of them he has put into three thirty-storey towers which rise excitingly on the north-west side of the site. Each of them is 300 feet high, and I expect the proposal will be attacked as strongly as every other attempt to raise skyscrapers within sight of St. Paul's.

In the precincts of the flats would be the lawns and trees that you might expect but also an imaginative use of water, running in a canal past some of the blocks and down a cascade towards the glass conservatory shaped like a pyramid. Also in these gardens the architect has put several schools which belong to the City of London. It is the Guildhall School of Music and Drama which gets most of his attention, with not only a theatre and concert hall in one building but also a magnificent amphitheatre topped at its brink by a semi-circular block of flats. Their residents would get a wonderful view of whatever drama was being played down on the stage. DAVID HOLMES in the BBC's 'Radio Newsreel'

A model of the proposed Barbican residential scheme north of St. Paul's

18th-Century European Art at the 'V and A'

This room—probably of north-Italian workmanship—has walnut panelling with the carvings in gold on a white ground: the silk-draped bed is French

IF you visit the permanent exhibition of eighteenth-century European art which was lately opened at the Victoria and Albert Museum the first thing that is likely to catch your eye is a group of portrait busts placed by themselves in the middle of the room. This is as it should be, because it is natural that people should attract our attention before the works of their hands and their belongings, and these portraits in marble and terracotta are very alive.

The most life-like is a bust of Voltaire by Houdon, one of the greatest writers and certainly the greatest wit of the century portrayed by one of its greatest sculptors. It is a vivid and forcible piece of characterisation. 'His eyes, bent slightly to one side, seem to search out an adversary. His pointed nose is like a fox's muzzle. His mouth, framed between two sardonic furrows, looks as though it were chewing sarcasms.' So Rodin, a century later, described his impression of this remarkable portrait.

Voltaire's Last Few Days

It was nearly never made. Voltaire was over eighty at the time, and, complaining that his teeth had gone and his sight was going, he declared himself 'point du tout sculptable,' and evaded all attempts to make him sit. But in 1778, on his last visit to Paris from his home in Switzerland, where he lived in voluntary exile, he relented, and the portrait was taken—only just in time, for a few days later Voltaire was dead.

Houdon made several busts from his original model and on this one, dated 1781, he inscribed a dedication to the Marquis de Villette, who had been Voltaire's host during his last days in Paris.

Confronting the cynical octogenarian and forming a poignant contrast is a charming bust by Jacques Saly, another French sculptor, representing a young girl on the threshold of life—which, there is reason to believe, she had hardly crossed before she died; for the sitter is thought to be Alexandrine d'Étiolles, the daughter of Madame de Pompadour, who died in 1754, aged eleven.

Not far away a bust of Louis XV by Lambert Sigisbert Adam provides a different sort of contrast. In place of Houdon's searching observation of character this portrait offers us an idealised vision of a magnificent young king in the semblance of Apollo, executed with a vigour and a sense of theatrical effect learnt from Bernini. Modelled in 1745, it represents the king in the prime of life and at the zenith of his reign, handsome, confident, and full of promise, so popular among his subjects that he was

PETER WARD-JACKSON, of the Victoria and Albert Museum in London, describes a permanent exhibition of everyday things—from salt-cellar to whole rooms—giving a vivid impression of life in a wealthy eighteenth-century household

called 'Louis le bienaimé,' a nickname which he afterwards forfeited through the scandals and the inertia of his riper years.

But portraits are not the only way of learning about people. Much can be gathered about the character of a man by wandering round his house and observing his belongings, and though it is hardly possible in a museum to preserve an entire house this gallery contains so many things that were once in daily use—glass, china, pottery, silver, and furniture—that it is as though we had the run of an old house, the home of a generation which passed away a century and a half ago.

Here, for example, is a dinner service of Dresden china fit for a palace, the salt-cellar and other receptacles being supported by fauns and nymphs modelled by Kaendler, a gifted sculptor who spent many years in the service of the Dresden factory, and had the happy gift of imparting to such miniature figures a singular vivacity and sense of movement.

Not far from Adam's bust of Louis XV is a pair of pistols made for the king, their walnut stocks inlaid with silver and their barrels damascened with gold, exquisite examples on a small scale of the so-called Louis XV style. Another delightful weapon is a German hunting sword, of the same date, complete with scabbard, frog, and belt, which are overlaid with enamel plaques painted with scenes of the chase.

My Lady's Boudoir

Here also, to give us some idea of the houses in which people lived, is the boudoir of Madame de Sérilly, bought by the museum in 1869 when it was already nearly 100 years old. It became very dirty in the London air, but the gold and glowing paintwork were still intact beneath the grime, and now that it has been cleaned it can be seen again in all its pristine brilliance, as it was when Madame de Sérilly received her friends there, among them Houdon the sculptor, who made a portrait of her in marble, now in the Wallace Collection in London, and André Chénier, the poet, who during the Revolution died under the guillotine.

Madame de Sérilly and her husband, who was treasurer of the armed forces under Louis XVI, were also sentenced to death on a trumped-up charge; but though she could not save her husband she herself escaped death by feigning pregnancy. In their happier days before the catastrophe she had persuaded her husband to gratify a desire which perhaps few people have not experienced: of doing up one small room in their old-fashioned Paris house in the latest taste, regardless of expense.

The artist they engaged was a carver and painter named Jean-Simon de la Rottière, who with his father and brother was much employed by the French royal family on work of this kind, notably on Marie-Antoinette's *salon doré* at Versailles and on her boudoir in the Château of Fontainebleau. He was an exponent of the new classical style which came into favour in the 1770s after a long period of revolt against classical discipline. We call the style new because it seemed new at the time, but in reality it was to a great extent a revival of a type of ornament first employed by the great Raphael in the decoration of a loggia in the Vatican early in the sixteenth century. Raphael, in his turn, had borrowed the idea from the examples of ancient Roman stucco work which were then being unearthed in the half-buried ruins of Rome.

The models which inspired him can still be seen in the subterranean

Three portrait busts that catch the eye: (left) Voltaire, modelled by Jean-Baptiste Houdon in 1781; (centre) a girl, believed to be Madame Pompadour's daughter, by Jacques Saly; and (right) Louis XV by Lambert Sigisbert Adam

A chest of drawers in marble, gilt brass, and inlaid wood, attributed to David Roentgen (1780): it is decorated with scenes from the Italian comedy of the time

galleries of Nero's Golden House and in Hadrian's villa, and anyone who has seen them can scarcely fail to admire the skill with which he has reconstructed an ancient style from a few fragmentary remains and the spark of genius which enabled him to breathe fresh life into something long dead.

So completely, indeed, did Raphael achieve his aim that the scholars and architects who initiated the classical revival during the second half of the eighteenth century copied him as much as the true antique—a tendency strikingly illustrated in our boudoir, for the decoration of the walls is closely modelled on Raphael's work in the Vatican. In both cases the walls are divided into narrow strips, which are filled with vertical designs made up of ornamental tablets and medallions, suspended one above the other on a light and airy framework composed of various fantastic devices—baskets of flowers supported on the heads of human figures, candelabra, spiral tendrils, and wreaths of foliage.

In Raphael's loggia the work is carried out in low relief in painted stucco, as in Roman times, but in this French boudoir the ornament is carved in the oak panelling of the walls. It is of surprising minuteness and delicacy, considering the hardness of the wood, and the raised parts are picked out in bright colours and various shades of gold and bronze on an ivory-tinted ground.

The rest of the room, including the architrave and ceiling, is embellished with appropriate classical ornament. In fact there is hardly a vacant space, and the effect might be thought excessively rich in so small a room were it not tempered by a grace and lightness of touch perfectly adapted to the small scale of the architecture.

Next to the boudoir, and hardly less attractive, though not so accomplished in design or workmanship, is another room of about the same date which was lately presented to the museum and is now exhibited for the first time. Unfortunately nothing is known of its history. Not even its nationality is certain, though the walnut wood used in the panelling indicates that it was made somewhere in southern Europe, probably in north Italy, where walnut is a common material. It is oval in plan with a domed ceiling. The panelling is carved with scrolls of foliage interspersed with medallions and vases, as in classical pilaster fillings, the ornament being picked out in gold on a white ground.

The exhibition also includes a selection of eighteenth-century furniture which helps to fill in the architectural background. Madame de Sérilly's boudoir is furnished with a table and two comfortable tapestry chairs which, though they do not belong to the room, reflect the same refined

Wall-panel for a Vatican loggia decorated by Raphael early in the sixteenth century

Madame de Sérilly's boudoir in the style of the 1770s: it was the work of Jean-Simon de la Rottière, who closely followed models by the great Raphael

Part of a Dresden dinner-service by Kaendler which Frederick the Great of Prussia gave as a present to one of his generals during the Seven Years' War

classical taste. More the room will not comfortably hold, being clearly intended for quiet conversation with a friend over a cup of tea or chocolate rather than for large gatherings. The other room contains a splendid French bed of the period, with a domed canopy.

But perhaps the most attractive piece of furniture in the gallery is a low chest of drawers—or commode, as it was called—made in about 1780 by David Roentgen, a well-known German cabinet-maker who worked for a number of years in Paris. He excelled in marquetry, or inlaying, and this commode is a fine example of his art. The front is divided into three panels, showing in the centre a scene from the Italian comedy, so dear to eighteenth-century audiences and the ancestor of our Punch and Judy shows; while on each side we see members of the audience looking on from their boxes. Two more pictures decorate the ends of the commode, and in these we see some musicians from the orchestra rehearsing while a couple of flautists relax over a bottle of wine. These charming pictures in wood are executed with a virtuosity and a truth to nature which make them into works of art in themselves. (Expanded from a 'Radio Newsreel' interview)

DR. A. L. ROWSE

OUR WAY OF LIFE: 3

Four Nationalities in One

DR. A. L. ROWSE, in this contribution to the current series in the General Overseas Service, discusses the various stocks that have gone into the making of the present inhabitants of the British Isles: 'altogether it is a very remarkable mix-up . . . much more varied and mixed than people realise'

ENGLISH historians have been apt to think too much in terms of the dominant stock in these islands—the Anglo-Saxon; and perhaps that is not surprising when we consider that they bore such Anglo-Saxon names as Green and Froude, Kingsley and Freeman and Stubbs. But in our generation, when the head

of our profession bears the obviously Celtic name of Trevelyan—though a Northumbrian, he comes of old Cornish stock—we are much more aware of the different strains that have gone into the making of the English, or perhaps I should say British, people.

Abroad people are apt to overlook the fact that the islands are occupied by some four nationalities—English, Scots, Welsh, Irish—or at least to under-estimate its importance, for it has been very important in our history. Even today no Scot likes to be taken for an Englishman; no Welshman likes to have his difference ignored, while Welsh and Irish, Irish and Scots have not liked each other much: they seem to prefer even the English. These differences are obvious and on the surface for all to see; they provide the stock-in-trade for many jokes about national characteristics, many laughs at each other's expense.

These nationalities, as we may legitimately call them, have come about partly as the result of history: the pressures and pulls, the conflicts between peoples organising themselves into states within the islands. For most of our history Scotland was a separate state, a kingdom on its own with a capital at Edinburgh. Ireland was a congeries of four or more tribal kingdoms with a titular High King. But it is the situation inside England that is much more subtle and interesting—and much less realised.

For underneath these historic divisions there are the less clear but none the less influential differences of racial stocks. We may conveniently divide these into two main elements: the dark folk who are dominant down the western side of the islands, and the fair-haired, blue-eyed folk who predominate in the eastern half. This is a very rough and ready way of putting it, for there are exceptions and people have become much mixed up together—to use Sir Winston Churchill's phrase of English and Americans. In this region it is hard to be exact; on the other hand, it is hard not to notice the salient facts.

The dark population of the islands came into them up the Atlantic coast from the Mediterranean (I belong to that type myself). The fair stocks entered Britain from across the North Sea or the Straits of Dover. It is again convenient and usual to refer to the first as Celts, though that name really applies to linguistic not racial divisions; and we may refer to the fairer elements as the Teutonic stocks.

Both these elements have important sub-divisions. The Celts, for example, are divided into two main groups. The northern group contains Highland Scots and Irish, with the population of the Isle of Man as a

stepping-stone; the southern Celts consist of Welsh and Cornish, with their cousins, the Bretons, across the Channel in France. Of the Teutonic stocks the Angles and Saxons were the most important: the Angles, who occupied a great part of the eastern half of the island from Edinburgh to the Thames, gave their name to England. The Saxons settled much of Essex, Sussex, Wessex—east, south and west.

But hardly less important were the Danish and Norse elements that came across the North Sea in the time of the Viking invasions: the Danes settled fairly thickly in Anglian territory, in Yorkshire, Lincolnshire, Nottingham, Derby, Leicester, and in East Anglia. You can easily spot their settlements by the place-names ending in 'by' or 'wick'—on the coast as at Whitby, or as far inland as Hardwick. Then the Norse from Norway settled thickly down the Western Isles of Scotland, around the Irish coasts, where they founded the towns, and in the English Lake District, Cumberland and Westmorland.

Altogether, it is a very remarkable mix-up: the British stocks are much more varied and mixed than people realise, and this has been a far more important factor in our history than people are aware of. I have suggested in my little book, *The Spirit of English History*, that the English owe something of their creativeness to the subtle fusion, the process of internal colonisation, of different peoples learning to bed down together over the centuries of their common experience. It is a never-ending process. It may be that the English owe to it, too, their reliance upon intuition, feeling out their way, as against the precise compartments, the rigid logic, the strong external plastic sense of the Latin peoples.

These things are hard to define. They exist none the less, and often people fail to see what is right under their nose. How can one avoid noticing how much of Lloyd George's personality was due to the fact that he was a pure Welshman? Or of Ramsay MacDonald, that he was a Highlander? Of Lord Baldwin, that he was only half English: on his mother's side he was a Highland MacDonald? We all recognise the importance of the strains in Sir Winston Churchill's make-up: English aristocrat on his father's side, on his mother's, youthful, zestful American. He has, very notably, characteristics from both sides of his inheritance.

These things have their importance; yet it is difficult to be precise about them, for we must not incur the crude errors of a vulgar racialism. Yet just as we can all recognise their presence in leading representatives of our people—in William the Conqueror and Queen Elizabeth I no less than in Lloyd George or Winston Churchill—so I am sure they are not without their significance in the make-up of other representatives thrown up by our people—a Carlyle or Kipling, a Montgomery or Aneurin Bevan, a T. S. Eliot or Dylan Thomas—as they are present in that behaviour of the people themselves which is history. (*Broadcast in the BBC's General Overseas Service*)

'The Day of Nirvana' (Continued from page 6)

of Buddhism, and the whole canon has now been prepared for translation into numerous languages and scripts, including English.

On April 23 I had the good fortune to attend the magnificent ceremonial opening of the final session of this council. Entering the great cave-hall I seated myself among a brilliant throng of Burmese men and women. Their gay silken garments dimmed the sheen of the fine matting upon which they were grouped in graceful attitudes of respect facing the far end of the hall. On either side rose many-tiered balconies occupied by rows of cross-legged, shaven-headed monks, their yellow robes melting into the pale yellow, gold, and blue of the walls and gigantic roof pillars.

As this was to be the Ceylon session, named in honour of a fellow-Buddhist country, the principal gallery at the end was thronged mainly by Sinhalese ecclesiastical dignitaries clad in various shades of yellow cloth, ranging from reddish ochre to pale gold. Below them sat a group of eminent laymen, the Burmans in bright silks and the Sinhalese in pure white. The ceremony opened with the beating of great drums and gongs accompanied by the soul-stirring wail of giant conch-shells. Then came the solemn chanting of sacred verses intoned in the ancient Pali tongue.

Upon an altar placed in front of the chief laymen was a large ebony elephant with a magnificent silver howdah supporting a glass and silver reliquary. This proved to be the chief gift brought to Burma by the Sinhalese visitors.

Later that day a further ceremony was held during which the final session of the sixth Buddhist Council was solemnly inaugurated with numerous addresses delivered in the languages of the many Buddhist countries there represented. Much of the ceremonial which followed

was of profoundly antique origin. Probably some part of it was identical with that used at the first Buddhist Council almost 2,500 years ago.

To non-Buddhists who may perhaps think that this work does not necessarily make any immediate contribution to world peace a Burman would reply: 'Look at our country. We are still a young nation, independent as yet for only eight years and ravaged by many years of war. Yet we have spent millions and incalculable efforts on this splendid moral gesture: to building armies, we have preferred to build a pagoda of peace.'

The doctrine of the Lord Buddha is indeed a message of peace, for it teaches that one who harms the smallest creature by intention harms himself most of all. So this night of the full moon in Burma was an occasion for unprecedented rejoicing: prisoners were being freed, and no less than 2,500 novices were taking the yellow robe. The youths were arrayed in silver and white like young princes and placed upon silken cushions beneath ceremonial umbrellas encrusted with silver and gold. This was to symbolise the life of princely luxury led by the Buddha to be in the days before he sought enlightenment in the deep jungles of northern India. Then, after elaborate ceremonies performed in the presence of their delighted families and friends, the boys made their renunciation of the world, their heads were shaved, and their silken robes exchanged for garments of coarse, yellow cloth. Though they would not remain in the order for more than a few months it was held that the experience would be of lasting benefit to all of them.

Buddhists hope that the site of the council will become a lasting spiritual centre, a great international Buddhist university which will radiate wisdom, truth, and righteousness. (*Broadcast in the BBC's General Overseas Service*)

The yellow of massed daffodils starts off the gardening season at this cottage in Oxfordshire, and soon the beds will fill with an abundance of later flowers

The gardens are as variable in their size and lay-out as the cottages themselves

English Cottage Gardens

FRED STREETER, who last week was telling our readers about the largest flower show in the world—at Chelsea—turns now by way of contrast to the little cottage gardens that are such a characteristic delight of the English countryside

ONE of the most delightful things in the English countryside are the cottage gardens; there are hardly ever two alike. Many of them have some flower or other in bloom all the year round. It is generally the lady of the house who looks after the front garden full of flowers while the man is in charge of the fruit and vegetables. And what pleasure they get out of their gardens—plenty of hard work, but they just love that. There is no doubt in my mind that this love of flowers is born and bred in Englishmen through these cottage gardens. Just picture the roses and clematis entwined over the front porch of the cottage—one glorious mass of colour in the summer months. Often the path leading to the front door from the road is flanked by mixed borders with perhaps a local stone edging, maybe flints, covered with pinks or aubrietia and arabis for spring flowering.

While the cottager's wife looks after the front garden he tends the vegetables and the fruit trees at the back

How the cottager loves a mass of display! You can often tell what the man does for a living by looking at his garden: a carpenter, for instance, is bound to introduce a trellis; the mason will have a stone seat, perhaps, or a brick or stone shelter, while the blacksmith will have a few arches of climbers. How they love their groups of mixed sweet peas; dahlias have come right back into the picture these days; old-fashioned hollyhocks flowering eight or nine feet high break up the lines, and it is nothing to see a nine-foot hollyhock springing out of the flint edging practically on the path.

Brompton stocks are a great favourite—real sturdy old specimens which have weathered many a gale. Every cottage has a few sweet williams and pansies and a group or two of gardener's garter; spreading a little too far, perhaps, but very attractive. The ground is absolutely choked with bulbs of every description from snowdrops to May-flowering tulips; they have been there for years and are still making a show.

The back garden, as it is called, is filled with the most useful crops, potatoes taking three-quarters of the space. The cottager is very particular about his potatoes: a few rows of a 'first early' variety like Sharpes Express, followed by Majestic these days. He can generally give the professional gardener a few tips on growing and caring for potatoes. Spring cabbage comes next to his mind; he must have a good spring-cabbage bed to follow the winter greens. The cottager always has his eye on a good hot dinner on Sunday—maybe it is the only day he can get home.

Every foot of space crowded with blooms and shrubs: a typical Surrey garden

Then the onion bed—this is one of his real joys: a few Tripolis or autumn-sown varieties followed by Bedfordshire Champion or James long-keeping. He has to grow sufficient to last twelve months: his wife would never dream of buying onions. You should hear her remarks if she happens to see one of the onion-sellers coming round her district with the ropes of onions on his bicycle! Of carrots and turnips he has just a few rows, and always an early row or two of broad beans, and some three or four rows of peas. In little groups near the path there is often a root or two of mint for his new potatoes, and sage if he is fond of sausages.

He will only grow the things he likes no matter how much the wife wants them. She is told: 'You look after the front, my dear; I'll attend to this part.' Of course, if he is fond of fruit you will find an old blackcurrant bush or two, perhaps a few redcurrants, and several old gooseberry bushes. Too short a season for me—except if he happens to like blackcurrant jam for the winter's cold. Then the trees will be attended to: one or two apple-trees, a Victoria plum, and his garden is full. But the pleasure he gets from this garden—why, it is the salt of the earth. (Broadcast in the BBC's General Overseas Service)

Key man, key industry

HERE IS JAMES WOOLLEY, first hand melter in a steelworks in Lincolnshire. His job needs strength, and skill as well. James Woolley has both. He's been making steel for twenty-six years.

Steel from his company goes to all parts of the world. It may leave Britain in any one of a hundred forms: as railway equipment, as ships, as massive structures for engineering purposes.

As the world's demand grows, British steelmakers increase their efforts to turn out steel of the quality and quantity needed. Behind these increased efforts are men of the calibre of James Woolley.

Daniel George

THERE are moments when one feels just a little impatient with Mr. J. B. Priestley. His voice seems so often raised in complaint or reproach about something or other, and we cannot help murmuring 'You've got nothing to complain about: you've got everything to be satisfied with.' But most of the time, of course, we are very pleased with him, and we tell ourselves we must not grumble when he grumbles, especially when he confesses that he is a born grumbler and apologises for the fact while grumbling that he has been misunderstood. The essay in which he makes this apology, defence, and complaint is contained in a book called *All about Ourselves and other Essays*—a selection of Priestley's essays made by Eric Gillett, whose own introductory essay on the essay as a literary form and on Priestley as a most distinguished practitioner of it is a very useful and interesting performance. Here are seventy-odd essays judiciously chosen from his books over a period of twenty-seven years: judiciously chosen, because they exhibit Priestley's development as a writer and represent him in a variety of moods. In fact, I do not mind admitting that I have not enjoyed a book so much for years. If you want Priestley in a more pontifical, less endearing manner there is a little book called *The Writer in a Changing Society*. This prints a lecture given by him to the English Centre of P.E.N. early this year.

Some problems for authors are considered in a book by Norman St. John-Stevass: *Obscenity and the Law*. It has an introduction by Sir Alan Herbert, who explains that the book arises more or less out of a committee appointed by the Society of Authors to consider what changes should be made in the law under which several authors and publishers had recently been prosecuted. Mr. St. John-Stevass, a barrister, who helped to draft a Bill which had a first reading in the House of Commons, has now written the history of obscenity, so to speak, or rather of the attitude of the law towards it. Although our confidence in our own judgment is shaken when we read of the righteous horror provoked in the past by books in which now, with the worst will in the world, we should find it difficult to discover anything to object to. Think of Keats being condemned as prurient and immoral, or Thomas Hardy described as an author with a 'curious mania for exploring sewers.' Although the books I have in mind and many others were abused and in some cases banned by libraries, few were the subject of legal action. In this book you will find every aspect discussed in an authoritative manner.

Dylan Thomas, it is generally agreed, had a streak of genius, and he had the waywardness, the unpredictability, of genius; he did not conform to conventions in life any more than he did to conventions in literature. John Malcolm Brinnin, an American poet and author of *Dylan Thomas in America*, arranged for Dylan to make a series of poetry-reading tours in America. The last was in 1953. It ended with Dylan's death from alcoholic gastritis in New York. In the course of the tour he had several bad lapses; he often broke engagements and affronted his hosts. It was all very distressing for his manager. The book makes painful reading—painful but fascinating. I must not give the impression that his book is one long complaint against Dylan: on the contrary it is a testimony of his affection and admiration.

Elizabeth Barrett to Mr. Boyd is a collection of letters written, before her marriage, by Mrs. Browning to a scholarly old gentleman who was teaching her, or at any rate trying to improve her, Greek. The letters began when Elizabeth was only twenty-one, in the year 1827, and they cover a period of nearly twenty years. They are interesting in revealing the development of her mind, and they give some glimpses of her relations with her father and other members of the family.

Sebastiano Locatelli could hardly have foreseen that his journal of his travels 300 years ago would be printed this year for our amusement and delight. Under the title simply of *Sebastiano* Mr. Wilfred Blunt has edited this Italian priest's too diffuse original. He was a rather simple fellow, credulous but courageous, and not always as strict in his ideas of morality as a priest should be. He made the journey from Bologna to Paris and back again between 1664 and 1665, and, in a way rather like Boswell, leaves little out of his account. Altogether this is an entertaining, friendly kind of historical travel book which makes easy reading and is not without value for its detail.

Another book of essays, *Literary Essays*, is by David Daiches, a critic known to critics on both sides of the Atlantic. In this book he is making a broader appeal: he is writing for readers rather than critics or would-be critics and writing about what the writers wrote rather than about what has been written about them. An excellent essay here is on the poetry of Dylan Thomas—a very nice piece of appreciative criticism.

Here and There

GROESBECK MEMORIAL

AT five o'clock in the morning on February 8, 1945, British and Canadian divisions, backed by a barrage of 1,000 guns, began their final assault to clear the south bank of the Rhine. This was the peak of a campaign that had begun in the autumn of the previous year with the airborne assault on Arnhem. The Groesbeck Canadian War Cemetery now stands at the taking-off point of that final assault, and there a memorial has been unveiled to the men who died in the campaign and have no known graves. I was there to see the unveiling by the Duke of Gloucester.

The great thing about the ceremony was what it meant to the relatives. More than 400 of them managed to make the journey, and among them were five widows with children now aged eleven, children who were born the year their fathers were killed. About fifty of the relatives came all the way from Canada at their own expense, but the largest proportion—nearly 400—were British pilgrims. The British Legion had laid on a special trip for them, and they were spending four days in Holland. For their stay they were guests of kindly Dutch people, the people of nearby Nijmegen, who well remember that day in September when parachutes filled the sky and the airborne battle began.

The Duke of Gloucester and Prince Bernhard of the Netherlands were escorted to the ceremony by a detachment of white-helmeted Dutch military police, and in the forecourt between the cloisters royal guards of honour were mounted.

After inspecting the guards the Duke went to a dais, and at the end of a short speech he referred to the gratitude and admiration of the people of the Commonwealth for the people of Holland: 'We recall, too, the undaunted spirit of their resistance movement in those dark days before their freedom was regained; and today we owe a debt of gratitude to the Dutch people who come periodically in great numbers to our war cemeteries to honour the memory of those who died fighting for their country's liberation.'

Then the Duke pulled a lanyard and the Union Jack fell away from the Stone of Remembrance, and on it we saw the words: 'Their name liveth for evermore.' At the same time flags fell away from the arches of the cloisters—the Union Jack, the flags of the Commonwealth countries, the flags of the Netherlands—and as they fell away drums rolled and buglers of the Royal Welch Fusiliers sounded *The Last Post*. DOUGLAS BROWN

U.S. EMBASSY IN LONDON

DRAWINGS and a sketch model of the new chancery of the United States Embassy in London were brought to Britain recently by the architect, Mr. Eero Saarinen. The building will occupy the entire west side of Grosvenor Square, Mayfair, and Mr. Saarinen spoke about it in an interview:

'Let me try to explain the way I saw the architectural problem of it. We have Grosvenor Square with neo-Georgian buildings on all three sides. Our problem was to put a building on the west side which has a different function from the other three sides. The other three sides are mostly apartment buildings of six to eight floors in height. Now for our building we had to judge fairly carefully the height so that it carries the general line of the square.

'Another thing was to have the scale of the windows in the surrounding buildings continue in this, so that it was a harmonious part of the square. But it could not just be harmonious: it had to be something else also: it had to be an official building—really the most important building that the United States has in London.

'We're building it of Portland stone because Portland stone is a very good material. It weathers in a very nice way: it gets dark and then cleans itself off. One of the reasons why the facade of this building has quite a bit of relief in it—between the windows, and so on—is because Portland stone really weathers better when there is a texture on a facade.

H.R.H. the Duke of Gloucester and H.R.H. Prince Bernhard of the Netherlands leaving Groesbeck Cemetery after the unveiling of the war memorial

'I would not say there's anything revolutionary inside. We've tried to make a straightforward, really efficient, modern office building particularly on the four upper floors. The two first floors are really the main floors. On what might be called the upper ground floor, about ten feet above the pavement level, are the important rooms—the entrance to the embassy, the consulate, the library, and so on. One of the reasons for placing these rooms up above the ground level was to gain for these rooms a good view over the park.'

SYNTHETIC DYES

JUST 100 years ago a young student at the Royal College of Chemistry, in London, during the professorship of a noted German chemist, Hoffmann, carried out some experiments at home, and from those experiments has sprung up one of the world's great industries: the manufacture of synthetic dyes. From it, too, came the greater part of the organic chemical industry—textile and rubber chemicals, plastics, and synthetic fibres. The young man was William Henry Perkin. His discovery and its consequences were described by the distinguished chemist, Sir Robert Robinson, former President of the British Association:

'William Henry Perkin went to the Royal College of Chemistry when he was fifteen and within two years had become a skilled original investigator. A remark of Hoffmann that it would be desirable to synthesise quinine led him to try an experiment with this object: it gave no quinine but instead a dark precipitate.

'Perkin was interested. He had been working with a modified aniline, rather hard to come by, and so he tried the same process with aniline itself: again he got a dark precipitate from which he was able to extract a deep-mauve colouring matter. All this was done in his home laboratory in 1856, and this youth of eighteen had the nerve to send his specimens to Messrs. Poole, of Perth, who soon told him that a colour like this was very much wanted.

'Against the advice of Hoffmann, Perkin then decided to undertake the manufacture of mauve. His generous and courageous father risked most of his capital in supporting the venture, which eventually proved successful, but the difficulties that had to be overcome were indeed formidable. Discovery then followed discovery, and in a few years mauve was superseded by improved dyes.

'Perkin's great merit was not that he was fortunate enough to discover a brilliant dye but that he had the vision to perceive his opportunity and the power to grasp it. Alas, there was nothing in Britain to correspond with the chemical schools of Germany, and the major developments in this field for the next fifty years were in Germany.'

A model of Mr. Eero Saarinen's design for the new United States Embassy building in Grosvenor Square, London: work will begin in the spring of 1957.

Canada's Transcon

COLIN WYATT describes the strategic development of the vast project of the Distant Early Warning line every fifty miles over the whole top of the

THREE years ago the Canadian Arctic was just what you would imagine—2,500,000 square miles of tundra, swamps, lakes, and ice fields, inhabited by a mere 10,000 Eskimos, Stone Age natives living by the hunt as did our ancestors thousands of years ago. Among them lived also a total of perhaps 300 white men: fur traders, missionaries, and Mounted Policemen. Nobody really took any interest in the area, not even the Canadians themselves.

But suddenly all that changed—it was the Cold War that did it. With the new supersonic aircraft of enormous range America and Canada realised that these almost uninhabited spaces to the north were a wide-open back door—that the distance from Russia to the industrial centres of North America across the North Pole was little farther than from Europe across the Atlantic, and there were no other countries in between to give warning should an attack come. The industrial heart of North America lay wide open. So something had to be done about it, quickly. The Arctic wastes of Canada suddenly became strategic defence area number one.

Giving Ample Time for Interception

The result was the D.E.W.-line project—D.E.W. standing for Distant Early Warning—which is as much talked of in Canada today as was the Maginot line in Europe in 1939, only Canadians hope the D.E.W. line will be more efficient: it is certainly more costly. It is not yet fully operational, but when finished it will consist of a super-efficient radar listening post every fifty miles over the whole top of the North American continent from Alaska across the Canadian Arctic to Greenland. Any enemy aircraft approaching from beyond the Pole will be picked up while still near 2,000 miles from its targets, allowing ample time for a warning to be radioed south so that interceptors can take off and fly north to battle. Any fighting will then take place over uninhabited country where no harm can be done. To be on the safe side there is another radar defence chain, the Pine Tree line, right across Canada at about the sixtieth parallel, or some 800 miles south of the D.E.W. line, but this is too close to the densely populated areas to allow sufficient time for warning.

Work on the vast project of the D.E.W. line was begun only in December, 1954, when a few light ski-aircraft flew up 1,200 miles from the northernmost Canadian cities and landed small crews with tents on the frozen pack-ice of the polar seas, among the Arctic islands. These men then levelled and cleared landing strips on the wind-driven snow-waves of the polar wastes on which heavy cargo planes could land. By April 1955, a lot of the initial equipment and prefab huts had been landed and strips now cleared on the solid land of the islands. Now the really heavy constructional equipment could be flown in, and when I arrived there work was well advanced.

Scattered across the north, some fifty or more little townships have sprung up, huge construction camps where armies of men were busy at work, civilian labour from Canada and units of the United States and Canadian armed forces. Enormous dumps of aviation fuel-drums had been flown in, and trucks, jeeps, bulldozers, and mechanical shovels roared everywhere. From the stony runways levelled along the tundra ridges great four-engined transport planes came and went every hour on the round flights of 2,400 miles from the nearest city to the south. The D.E.W. line was under way.

Then, at the end of July last year, an Armada of fifty ships came up from the Pacific coast of America through the Bering Straits between Siberia and Alaska, and sailed along the Arctic Ocean to Canada. They were Liberty ships, tank-landing ships, everything you could think of. They brought in the really heavy equipment. It was a rush job, for the

mental Radar Screen

of Canada's Far North and the work in progress on e, comprising a super-efficient radar listening post American continent from Alaska to Greenland

Arctic Ocean is open only for six weeks during the late summer; after that the pack-ice drifts in and seals off the top of the continent.

Of course, the poor Eskimos were completely flabbergasted by all this sudden rush and noise—they had never seen so many white men before, let alone all the aeroplanes and big ships. Except for the few ships of the early explorers a hundred years or so ago and for the two little supply ships of the Hudson's Bay Company, which bring in supplies to their trading posts in July and August and take out the furs, the only boats in these parts had been the sealskin kayaks and uniaks of the Eskimos.

They were not happy about it. Nor would you be if your ancestral hunting grounds upon which you depend for your life were suddenly invaded by thousands of people; where, for all the vast area of space, there is enough livelihood only for your own immediate family and tribal friends. Until then their life, even if very hard during the long winter, had been quiet and peaceful, and the only things which disturbed the peace were the wings of the swans and the geese, the plovers and the ducks, come from far to the south to nest in the Arctic solitudes.

Of course, there were compensations. Strange things to stare at, men who gave you things you had never seen or tasted before, soft drinks, chewing gum, cakes, and candies. But these things were not very good for their health, and also we unknowingly brought up the germs of colds and flu with us, and the natives fell sick and died. So the Government had to do something about that quickly, and it did.

Luckily most of the D.E.W.-line sites are at least thirty miles or so away from the nearest Eskimo hunting camps, but to a people who think nothing of travelling 300 miles each way in winter by dog-team merely to visit friends or another camp, or to try to intercept a herd of migrating caribou, distance means nothing.

The Atomic Age—and the Stone Age

So a strict rule was made that Eskimo camps were out-of-bounds, and no fraternising was permitted. Also, no native labour was to be employed, except under special circumstances, so that the natives should not be lured away from their normal way of life. It would not have been fair to let them become dependent upon Western food and clothes and then just leave them in the lurch when the construction period was over and only a small military detachment left on the site. So for the past year the nearest Mounted Police post in each area has been told to make periodical visits to ensure that this rule is being kept.

As a result of all this the Atomic Age has really had very little impact on the Stone Age, and even a camp of a thousand men is such a drop in the ocean in these vast open spaces that the Eskimos can carry on their old traditional life practically undisturbed. The missionaries, the police, and the traders have, of course, benefited hugely, for aircraft now bring them mail and supplies every month or so, or, in the most isolated outposts, make them a parachute drop, whenever they fly over, which is a great improvement on waiting for the annual supply ship.

The D.E.W. line should be fully operational this summer; then the civilian work crews will pull out, and only United States and Canadian Servicemen will be left in charge. The Canadian Arctic will no longer be a remote area thousands of miles from anywhere but one of our most strategic frontiers and very much an integral part of the every-day life of the Dominion of Canada. There must now be few Canadian families who do not have friends or relations who have actually lived and worked there, or whose Servicemen sons may not soon be posted there. In two short years the Canadian North has suddenly become of world importance to the West. (Broadcast in the BBC's Overseas Services)

Only the use of aircraft of all sizes has made possible the rapid construction of the line: a helicopter helping to ferry oil-drums from a supply ship to the shore

Operating the fleet of planes to supply the scattered camps and sites has been a tremendous achievement in itself: a snow-blower clearing a runway at an R.C.A.F. base

An Eskimo camp near a D.E.W. post: the Government forbade the employment of Eskimos on the line so that they should not be lured away from their traditional life

Armchair Cricket

A BBC GUIDE TO CRICKET COMMENTARIES

'Armchair Cricket' is a new BBC publication specially compiled for all listeners to BBC cricket commentaries and broadcasts. During the present season listeners will be able to follow the Australian team's tour and many other cricket events through the eyes of BBC commentators. The illustrated contents include a full-length review by Brian Johnston of the cricket commentator's work and problems. Antony Craxton describes the BBC Television producer's task, and Roy Webber writes on 'Scoring for the BBC.' There are drawn plans of England's major cricket grounds and a full glossary of cricket terms.

PRICE 3/- sterling

You can obtain 'Armchair Cricket' by sending a remittance of three shillings sterling to BBC Publications, London, W.1, England, or it can be ordered through your newsagent.

A COPY FOR YOUR FRIEND

We shall be pleased to send a free specimen copy of LONDON CALLING to a friend or relative on receipt of their address. Please write to BBC Publications (II), London, W.1, England.

LONDON CALLING surface mail edition is posted weekly to any address for 25s. a year sterling or pro rata. Remittances should be sent to BBC Publications or any of the following addresses:

AUSTRALIA:	Gordon and Gotch, Ltd., 111-115 Little Collins Street Melbourne, and branches: BBC, National Building, 250 Pitt Street, Sydney
CANADA:	Messrs. Wm. Dawson Ltd., 587 Mount Pleasant Road, Toronto; W. H. Smith & Son (Canada) Ltd., 224 Yonge Street, Toronto; Gordon and Gotch, 43 Victoria Street, Toronto
INDIA:	Central Newsagency, 12-90 Connaught Circus, New Delhi; Higginbotham's Ltd., Mount Road, Madras; Oxford Book and Stationery Co., 17 Park Street, Calcutta, 16

LONDON CALLING World Air Mail Edition is available by subscription for £1 sterling a year plus newspaper air mail rates. Specimen rates including cost of copies: India, Hong Kong, £3-12-0, Australia and New Zealand £1-5-0 sterling. Special rate to H.M. Forces (outside Europe) £2-6-0 post free. Full details and specimen copy from BBC Publications, London, W.1, England.

The Rector of Droxford blessing the tablet: the ceremony helped publicise a fund-raising campaign to save the village's Domesday church which is infested by death-watch beetles and is now threatened with collapse

IZAAK WALTON MEMORIAL

IN the Hampshire village of Droxford a memorial has been unveiled to Izaak Walton, the 'compleat angler.' It is a board made of local oak which stands in the churchyard to commemorate Walton's association with Droxford and its church. This church, by the way, is mentioned in the Domesday Book; it was valued at twenty shillings. Later in the history of the village a train drawn up in the siding there was the meeting place of Sir Winston Churchill, General Eisenhower, Field-Marshal Smuts, and General de Gaulle during the four days before D-Day.

The short and simple unveiling ceremony took place on the newly mown turf of the churchyard beneath elm and sycamore trees which were just coming into early leaf. Beyond the flinted wall was the garden of the old rectory where Izaak Walton stayed for a great proportion of his time during the last seven years of his life. The garden leads down to the Glebe, a flat water-meadow, deep in lush grass and clumps of kingcups.

Separating the old village from the higher wooded slopes on the eastern side of the valley flows the Meon which Walton, who knew all the chalk streams in this part of the country, called 'this swift, shallow, clear and pleasant brook.' Above the stream Droxford church has stood for eight centuries, a church faced with local flints and roofed with dull red tiles, and with a corner of its low square tower just showing above the traditional churchyard yew-tree.

The churchyard of Droxford church, where Izaak Walton worshipped, standing beside the Meon on which he spent many happy hours, is an appropriate place, I think, to mark a great man's connection with a lovely county and a jewel of English villages. PETER MAGGS in the BBC's General Overseas Service.

Before the ceremony Commander E. H. G. Stokes, chairman of Droxford's fund-raising committee, went fly-fishing in the river Meon for trout to present to Mrs. D. Dagleish, who is a descendant of Izaak Walton

This Week's Listening

ARTHUR BALFOUR

HALF a century has passed since Arthur Balfour was Prime Minister, and a quarter of a century since he died. He was Prime Minister of Britain for only three years, and he was not really very successful. Yet there are many alive today who remember Arthur James, first Earl of Balfour, with personal if not political affection. And there are many more, living in far corners of the earth, whose lives have been affected by the consequence of some part of Balfour's statesmanship.

As a statesman Balfour had a long life. He first entered the House of Commons as a Conservative supporter of Disraeli's last administration in 1874. He left the Cabinet room for the last time in 1929 after four years as Mr. Baldwin's Lord President of the Council. He was then eighty-one years of age, and had to his credit not only his Premiership but such famous achievements as the Balfour Education Act, the Balfour Declaration in favour of a Jewish national home in Palestine, and the Balfour

A. J. Balfour

Definition of 1926 giving expression to those Commonwealth ideals which led later to the status of countries like Australia and Canada being made equal with the mother-country in the Statute of Westminster.

With all this great work, Arthur Balfour never appears to have been particularly interested in politics: he was interested in conversation, in society, and above all in philosophy. As a young M.P. and friend of Lord Randolph Churchill, Balfour had published *A Defence of Philosophic Doubt*. The only surviving record of Balfour's voice is a philosophical talk broadcast in 1927.

In 'Portrait of a Prime Minister,' narrated this week by A. P. Ryan, can be heard not only the voices of friends like Lady Violet Bonham Carter and Lord Bruce of Melbourne, former Prime Minister of Australia, but also Balfour's own voice, and part of a recording made in 1909 by the Rt. Hon. Winston Churchill, M.P., then President of the Board of Trade.

G.O.S.: Monday 17.30; Tuesday 02.30; Wednesday, 10.00

'IN THE PATH OF LORD BUDDHA'

EARLIER this year the BBC invited John Blofeld to undertake a scholar's pilgrimage. Starting from Bangkok, where he teaches at Chulalongkorn University, he was to travel first to Rangoon to attend a meeting of the Sixth Great Buddhist Council, and then, in the weeks of May leading up to the Buddhist Full Moon celebrations, to journey on to northern India to visit the scenes of the Buddha's birth, enlightenment, teaching, and death.

John Blofeld will be relating in a series of five talks his experiences as he followed 'In the Path of Lord Buddha.' In the first of these he tells how he found his way—finally on the back of a tiny Nepalese pony—to the scene of the Buddha's birth in the Garden at Lumbini. His story is that of a scholarly pilgrim, journeying in the scorching heat of the Indian summer yet forgetting personal discomfort in the recollection of events of 2,500 years ago. His talks reflect, too, his study of those pilgrimages made to India in the fifth, sixth, and seventh centuries by Chinese mendicant priests who adopted the title of Sons or disciples of Sakya (the Buddha's people), for John Blofeld is also a Chinese scholar of distinction, and spent much time in earlier years in Chinese Buddhist monasteries.

G.O.S.: Friday 15.45; Saturday 00.30 and 05.00

EARLY 'IMPERIALISTS'

IN the history of western civilisations the first real colonies were the trading posts set up by the Phoenicians in the eastern Mediterranean and along the shores of the North African coast—many of which later became flourishing communities on their own. The Phoenicians were followed by the Greek city-states, whose inhabitants colonised for a great variety of motives—some for trade, some for adventure or political reasons, and some purely to ease the pressure of population. The striking character-

August 5—11

istic of all ancient Greek colonies, with the exception of those of Athens, was their independence. They were generally autonomous and bound to the mother-city only by ties of sentiment or of economic and military necessity. The armed invasions of Persia and Macedon contrast with that relatively peaceful development.

This is the subject of the second talk in the G.O.S. series, 'The Story of Colonisation.' It is given by Sir Harold Nicolson, who, as a former President of the Classical Association, has always maintained his interest in the ancient world, although he is perhaps more generally known as a biographer of modern times, and also of course as an essayist. Besides his talk on 'Early "Imperialists,"' later in the week he will, as usual, be broadcasting his fortnightly radio essay on some topic of current interest.

Early 'Imperialists': Monday 15.45; Tuesday 00.30, 05.00
This Day and Age: Thursday 15.45; Friday 00.30 and 05.00

PROMENADE CONCERTS

OUTSTANDING in the Promenade Concerts this week is the programme on Tuesday when Sir Arthur Bliss, Master of the Queen's Music, conducts the London Symphony Orchestra in his *Meditations on a Theme by John Blow*. Before this work Sir Arthur will give a short talk.

The *Meditations* was one of three works commissioned from British composers last year by the John Feeney Charitable Trust. The Bliss work was well received by the critics, and is a series of meditations on the Twenty-third Psalm. The theme, from one of Blow's verse anthems, is not announced until the end when its full statement provides a powerful summary of what has gone before. Both the novelty and the orchestral virtuosity of the composition were warmly praised. It was first performed in

Heather Harper

Birmingham in December last year, and in London in February this year.

Other programmes from the Proms include a Mozart-Haydn concert with Sir Malcolm Sargent and the BBC Symphony Orchestra, on Wednesday, when the soloists will be Heather Harper (soprano) and Kathleen Long (piano); a performance on Thursday of Phyllis Tate's *Concerto for Saxophone and Strings*, with Michael Krein (making his Prom debut) as soloist, and the London Symphony Orchestra, under Basil Cameron; and the Liverpool Philharmonic Orchestra, making its debut at the Proms this season, in a Beethoven concert (also conducted by Cameron) on Friday. Campoli is soloist in the *Violin Concerto*.

SIGMUND FREUD

THE centenary of the birth of Sigmund Freud is being celebrated this year. He was born at Freiberg, Moravia, of Jewish parentage. In 1873 he became a medical student in the University of Vienna, although he did not qualify until many years later. When he did eventually qualify as a doctor he specialised in nervous diseases.

He was awarded a Travelling Fellowship in 1885 and chose to visit Paris to study with Charcot. And it was there that he became intensely interested in neuroses. When he returned to Vienna he joined forces with Breuer, and between them they evolved the clinical method which Freud later called psychoanalysis, and to which Freud devoted the remainder of his life.

Ernest Jones, an intimate friend of Freud's who is now writing the official biography, will talk of his life and work from personal knowledge. The earlier years of Freud's life will be portrayed in a programme called 'The Man who Looked Within.'

'The Man who Looked Within': Thursday 01.00 and 18.30
'Sigmund Freud': Friday 14.15 and 23.15

The scene at the start of the Ulster Grand Prix at Dundrod on which G.O.S. listeners will hear commentaries on Saturday (see page 25)

Radio Theatre presents

'A SORT OF TRAITORS'

THIS play, taken from Nigel Balchin's novel of a few years ago, might almost have been called *A New Sort of Traitors*. For while treachery is at the heart of the matter the form it takes and the issue it poses are intensely contemporary in detail and application, so much so that these circumstances can hardly have arisen before.

Indeed, the scientist's dilemma at the present time is uniquely pressing and painful in the conflict between moral duty to mankind in general and patriotic duty to one's country in particular.

Should scientists—like Professor Sewell here—acquiesce in the restriction and even suppression of his discoveries because they be helpful to a hostile foreign power?

But the problem must be taken a stage further. Perhaps Sewell would agree that national security comes first; but who is to determine what constitutes national security?

And who is to decide what must be kept secret? The collision between the dogged, rather visionary old scientist and determined, wholly practical power makes an exciting play.

PETER FORSTER
G.O.S.: Sunday 00.30 and 18.30; Friday 14.15

'THE LONDON MERCHANT'

A ONE-EYED jeweller, George Lillo, wrote *The London Merchant* as a warning to youth, a bloody and terrible instruction of what would happen to the apprentice who so much as lifted his eyes from his master's ledger to view the milky hills, Temptation.

The play was performed on holidays before a compulsory audience of apprentices and servant boys, who must have returned home shaking from the 'moral beating' they had suffered. Yet underneath the propaganda a simple story is told that is true tragedy. No moralising can diminish it. It purges with pity and terror.

The London Merchant is taken—locks, stocks, and gallows—from an old grisly ballad handed down from the Elizabethans recounting a murder for profit. George Barnwell, apprentice, falls into the snares of a woman of the streets, Sarah Millwood. This toxic lady, the deadly nightshade of Shore-ditch, persuades Barnwell first to rob his master, and then to rob and murder his uncle and bring the spoils to her.

When that money is spent she betrays him and tries to get rid of him to the gallows. Her plan works, and recoils, she goes with him to the hangman, her dangerous beauty to be destroyed.

Lillo wrote this tragedy with such originality that when it was produced it caused a revolution in the art of the playwright. It was the first English tragedy to be written in prose. At a stroke he released the theatre from what, in the poor state of poetry, had become its gag and stammer, rhyme and verse. *The London Merchant* provided, indeed, one of the greatest first nights in the history of the English theatre.

 A preview of the week's programmes
 with recorded extracts
 13.45-14.00 **The World of Science**
 A weekly survey
 of the latest developments

ASIAN CLUB. By inviting both John and Roy Boulting on Sunday, Asian Club is not breaking its unalterable rule that there should be only one speaker at each meeting since these identical twins consider themselves as one, so far as film production, direction, and writing are concerned. They have been making films for nearly twenty years. The war interfered with their career, but they were granted special leave in 1942 to make the highly successful 'Thunder Rock.'

* * *

ENGLISH WRITING. The nineteenth century's reverence for the romantic writers led to a slump in the reputation of poets such as Pope and Dryden, the masters of the precise rhymed couplet. With the modern swing away from romanticism, there is a new respect for the Augustan poets. Ruth Pitter gives a re-assessment of Pope on Monday. She herself writes comic as well as solemn verse, and has a particular affection for the rapier-work of Pope's satires.

* * *

SHAW FESTIVAL. Celia Johnson, star of many stage and film successes, plays the part of Candida on Tuesday. Candida is the lovely wife of a popular and successful parson. She befriends a young poet, allows him to fall in love with her, and neatly punctures her husband's self-esteem by deciding that he needs more feminine protection than the poet. The scenes chosen involve these three characters only. Godfrey Kenton plays the Reverend James Morell, and Oliver Neville the poet Marchbanks.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

Caribbean Farm Journey

HILARY PHILLIPS introduces a programme of recordings to be heard in the General Overseas Service this week which he collected during a recent tour of the West Indies to study agricultural problems
Monday 17.30, Tuesday 02.30, Wednesday 10.00

ON Easter Sunday I left London Airport bound for New York, on my way to the West Indies. I had just a month in which to cover the ground—Jamaica, British Guiana, Trinidad, Barbados, and St. Vincent. Here was as diverse an agriculture as could be imagined, spread over an enormous area and bottled up in little islands, each a world of its own.

Some outstanding impressions remain: the green orderliness of the sugar-cane estates, especially beautiful from the air, the attractive red pod of the cocoa tree, the citrus groves and coconut plantations, the rice-fields and the ubiquitous banana, but it is almost impossible to tell a coherent story about the agriculture of this part of the world.

The land is tilled by big estate-owners and by small farmers. For the most part estate agriculture, organised on big-business lines, is efficient and productive; while the small man, often illiterate and always conservative, is backward and sometimes downright destructive as far as the soil is concerned.

Yet it is essential that the small farmer, who is producing the food crops, should increase his output if the ever-growing population of the West Indies is to survive. In most parts of the Caribbean the birth rate is three or four times the death rate. In Barbados, island of sugar, the population density is 1,382 to the square mile; in England, island of factories, it is 753.

Most of these peasant farmers have only a few acres, often only two or three; as like as not their land is on steep slopes, and often severe erosion has resulted through lack of soil-conservation practices. Many farmers do not earn enough from their land for it to be more than a part contributor to their existence. Yet it could often be made to grow more than enough to give them a living.

Depression v. Prosperity

Within the limits of the money available from governments and from Colonial Development and Welfare funds everything possible is being done to improve the small man's output. In Jamaica the Department of Agriculture, the Jamaican Agricultural Society, and the Jamaica Social Welfare Commission are all concentrating their energies on the small farmer.

'Rehabilitation' is a much-used word in this part of the world, where hurricanes and economic depressions vie for supremacy over prosperity. Just now, in most parts of the Caribbean, the farmer has every opportunity to help himself: he can get improved plants, free of charge, or at a much reduced price, which will raise both the quality and the quantity of his crop.

In Trinidad, for example, the La Pastora

cocoa-propagating station, where rooted cuttings from selected clones are produced, is giving away free about 420,000 young plants a year, costing about 3s. 6d. each to produce. The farmer also gets a subsidy towards the cost of planting.

In Jamaica I learned about the farm-development scheme which is helping the farmer with credit, farm planning, and technical assistance. It often proves difficult, though, to get farmers to take advantage of these schemes. Some of them seem to think that borrowing money, for instance, does something to their respectability.

Young Farmers' Movement

Tremendous strides have been made in Jamaica in the development of the 4-H (young farmer) movement; and this, as much as any other single thing, can be expected to show results. In British Guiana a beginning has been made in the establishment of young farmers' clubs, and there is a well-organised agricultural information service. A survey has shown that quite a large number of farmers have radios, and already a weekly radio programme for farmers has been started.

In Trinidad the Eastern Caribbean Farm Institute opened for its first batch of students in 1954. Its job is to teach junior staff of the Departments of Agriculture in Trinidad, British Guiana, and most parts of the Caribbean except Jamaica (which has a school of its own): much can be expected of this development.

So far, throughout the West Indies, as elsewhere in the tropical world, livestock research has lagged behind research on crops; but now outstanding progress has been made in Jamaica with the development of the Jamaica Hope, a dairy breed especially designed to fit the small man's level of farming, yet with great production capacity. This breed, now reported to be a fixed breed, is basically Jersey, but with some zebu blood, giving it added heat tolerance under tropical conditions. For beef the Jamaica Red and the Jamaica Black promise as much.

In British Guiana, in the savannahs in the interior, the Santa Gertrudis breed from Texas may provide one solution to the beef shortage; and an enterprising beef-by-air scheme there is solving the difficulties created by the arduous month's trek through forest and swamp to the market on the coast.

Earlier I referred to soil erosion. Nowhere in the Caribbean has this been tackled to better effect than in St. Vincent, where arrowroot is the principal crop and contouring of the steep slopes is vital. St. Vincent, although it is smaller than Britain's Isle of Wight, and thickly populated, is one of the chief food-crop exporters in the whole Caribbean area.

Field-Marshal Lord Alexander of Tunis in procession as Chancellor of the Order. He is followed by the Prelate, the Bishop of Gloucester

THE MOST DISTINGUISHED ORDER OF St. Michael and St. George

SIR HILARY BLOOD, who is a Knight Commander of St. Michael and St. George, tells the story behind the creation of the order of chivalry whose annual service combines 'exquisite music, decorative and orderly ceremonial, and appropriate and illuminating symbolism'

THE annual service of the Most Distinguished Order of St. Michael and St. George is held each year at St. Paul's Cathedral, in the City of London. And what a wonderful service it is! Exquisite music, decorative and orderly ceremonial, appropriate and illuminating symbolism. The band of the Scots Guards and the St. Paul's Choir; the processions of members of the order along the main aisle of the cathedral to and from the Michael and George Chapel; the banners and the robes of the Knights Grand Cross; the stars and the badges of the Knights and the Companions—all these see to it that ear and eye are deeply satisfied: and then the form of the service, the emphasis on the duties and privileges of service overseas or connected with foreign affairs; this profoundly moves the hearts and imaginations of the congregation of some two thousand people.

But first let me say something about the order itself—the Most Distinguished Order of St. Michael and St. George. It cannot lay claim to any great antiquity. Not only the fourteenth-century Order of the Garter but also the Bath and the Thistle were long since established when in 1818 the Michael and George Order was created.

In 1815 the seven Ionian Islands were placed under the protection of Great Britain as an independent Mediterranean state. Next year the then Governor of Malta, Sir Thomas Maitland, was appointed Lord High Commissioner of the Islands. Maitland was a soldier. He served in the Seaforth Highlanders and in the West India Regiment; and he had been Commander-in-Chief in Ceylon.

A contemporary writer described him as a 'rough old despot.' He was eccentric and arbitrary; but he was also an able administrator. Later generations were to acknowledge his sagacity and the beneficial results of his work. To Maitland there fell the duty of organising the new government to be set up in the Ionian Islands. Like all governors he was concerned not only with 'the punishment of evil-doers' but also with 'the praise of them that do well.'

It was this second aim which led to the creation of the order. There was no way in which the merits of the people of the islands could be rewarded or their loyalty encouraged other than by conferring on them the honour of Knight Bachelor. This honour has no insignia, and the Ionian Islanders were by custom and tradition attracted by personal decorations. They had at one time been part of the Venetian Republic; at another, a part of the French Empire; at another time they had been under Russian-Turkish rule, and for a few years an independent Sept-insular Republic. The deserving Ionian Islander at the beginning of the nineteenth century must have sparkled like a Christmas tree and shone like a rainbow. And now what was England going to do about decorations?

The answer was the Order of St. Michael and St. George, established by the Prince Regent on the advice of Sir Thomas Maitland. The name? St. George, of course, for England; but as this saint is also the patron saint of the Order of the Garter the name of St. Michael was prefixed, a militant saint held in honour by all Christians—Pro-

testant, Roman Catholic, or Greek alike. And the insignia? The Ionian Islanders could not, I think, deny that England had done them proud.

The first statutes of the order provided that the Knights Grand Cross should wear a mantle of blue satin lined with scarlet silk, on the mantle an embroidered star in silver and gold, over the star the cross of St. George, in the centre of the star the archangel St. Michael, sword in hand, trampling upon Satan. And for good measure they had also a badge of silver and gold enamel, on one side similar in design to the star, and on the other St. George with a spear encountering a dragon. Knights Commanders wore a star and a badge, and Knights a badge.

Such was the order of which Sir Thomas Maitland was the instigator, and the only commoner to hold the office of Grand Master. Such were the trappings which, in Maitland's words, the members 'could pin on their coats.' The exquisite gold collar composed of Lions of England, Maltese crosses, and the cyphers 'S.M.' and 'S.G.' which Knights Grand Cross now also wear, is a later addition to the insignia.

A Number of Appointments for Gallantry

In 1864 the Ionian Islands were ceded to Greece. Four years later membership of the order, hitherto confined to the Ionian Islands, Malta, and the Mediterranean, was extended to the Colonies generally; and later also to persons rendering important services in relation to foreign affairs.

During the first world war a number of appointments were made to the order in recognition of distinguished or gallant service by members of the Armed Forces of the Crown. The practice was not continued after the creation of the British Empire Order, which makes special provision for this purpose. Nowadays the order consists, in addition to its officers, of the Sovereign, the Grand Master, who is the Earl of Athlone, 100 Knights Grand Cross, 335 Knights Commanders; and 1,330 Companions.

In 1906 the south-west chapel of St. Paul's Cathedral was inaugurated as the chapel of the order. Since that year a service has been held annually, save in war years or for other over-riding reason.

And so I come back to the service. It falls into three parts; the first part is held in the chapel where this year the new Chancellor, Field-Marshal Earl Alexander of Tunis, was installed; the second and third parts are held in the cathedral itself.

The service begins with a procession of members of the order headed by the Choir of St. Paul's and by the Dean and Chapter. It assembles in the choir aisles and passes under the dome down the main aisle to the chapel. I watched it go past me—a bright, scintillating ribbon of colour. The plain black and white of the choir—the boys wearing their goffered ruffs—and the crimson and gold of the Dean and clergy gave place to the dark formal dress of the Companions wearing their badges, then to the Knights of the order with their badges and their stars. Then came the banners of the Knights Grand Cross carried by squires. Then the Knights Grand Cross themselves in their gorgeous blue and scarlet robes and their golden collars. Then the officers of the order in scarlet robes—the King of Arms and the Gentleman Usher of the Blue Rod side by side, followed by the Secretary and by the Registrar. Then the Chancellor-elect. And, last of all, the tall, incredibly dignified figure of the Prelate. Our Grand Master could not be present this year owing to ill-health.

The Ceremony of Affixing the Banners

On arrival at the chapel there takes place the ceremony of affixing the banners of Knights Grand Cross. This year the ceremony was preceded by the formal installation of the new Chancellor. He was conducted to his stall by the Prelate saying these words: 'Sir, by command of Her Majesty our Sovereign Queen we do hereby install you as Chancellor of the Most Distinguished Order of St. Michael and St. George. God be with you in your coming in, and in your going out, from this day forth for evermore.' This year only one banner was affixed—very appropriately that of the new Chancellor. And what more suitable comment on this ceremony can there be than the singing of Psalm XV—the 'Gentleman's' psalm—*Lord who shall dwell in thy tabernacle or who shall rest upon thy holy hill?*

After this the procession re-forms and passes up the aisle again into the choir for the remainder of the service. To the Knights Grand Cross banners already carried in the procession are now added those of the late Chancellor, the Earl of Clarendon, and of two late Knights Grand Cross, Colonel Sir Leslie Wilson, and Captain the Earl of Bessborough. These banners are handed to the Prelate, who lays them on the altar while the banners of the living Knights Grand Cross are dipped in salute. Then comes the final act of the commemoration ceremony—the names of members of the order who have died since the last service are read out, and the Chopin *Funeral March* is played on the cathedral organ while the whole congregation stands.

Finally comes the ceremony when the Prelate bids members of the order make an act of re-dedication. He says 'Having now commended the souls of our departed Brothers, let us who yet remain here on earth re-dedicate ourselves to Almighty God, and in service to our Queen, our Country, and our fellow men, according to the high ideals of Chivalry, Justice, Mercy, Truth and Freedom, which our Knightly Order upholds. To that end, let silence be kept for a space.' (*Broadcast in the BBC's General Overseas Service*)

Past and present Prime Ministers, Sir Winston Churchill and Sir Anthony Eden, chat after the latter's installation

Against the dramatic backcloth of Windsor Castle the Knights of the Garter wend their way slowly in procession to take part in the installation service

The Garter Ceremony at Windsor

LEONARD PARKIN describes the colourful and ancient ceremony which attended the installation of three new Knights of the Garter in St. George's Chapel, Windsor, in the presence of Her Majesty the Queen

IN St. George's Chapel, Windsor, Her Majesty the Queen attended the colourful and ancient ceremony of the installation of three new Knights of the Garter. They are the Prime Minister, Sir Anthony Eden, the former leader of the Opposition, Earl Attlee, and the Earl of Iveagh. As the organ of the Chapel of St. George played quietly, a procession crystallising the 600-year history of the Order of the Garter was making its way slowly from St. George's Hall in Windsor Castle to the chapel. They came robed in colours as vivid as the titles of the heralds who led them: titles like Fitzalan Herald, Rouge Dragon Pursuivant, Arundel Herald Extraordinary, and Rouge Croix Pursuivant.

Following the heralds came the members of the order, among them the three who were about to be installed. Sir Winston Churchill was there, and so were Viscount Montgomery, Earl Mountbatten, and Earl Alexander, to mention only four more of the Knights Companions who preceded the Queen Mother and the Duke of Gloucester, the officials of the order, and then the Queen, accompanied by the Duke of Edinburgh, and followed by the Deputy Constable and Lieutenant-Governor of Windsor Castle, Lord Freyberg, and the Military Knights of Windsor, and a detachment of the Queen's Bodyguard of Yeomen of the Guard. It was a procession as colourful as the banners of the Knights themselves which hang in a blaze of red, black, and gold above the stalls of the chapel. Banners which have had their predecessors on the battlefields of British history.

In, then, to the chapel of the Order of the Garter: in came the Queen, her knights, and her heralds, and as she entered the west door the State Trumpeters sounded a fanfare from their position on top of the choir-screen of dark carved oak. As the procession passed through the screen the royal children, the Duke of Cornwall and Princess Anne, looked down from an ante-chamber above the choir. They were standing on blue velvet-covered stools. They watched as the richness of colour spilt through the narrow door into the choir.

The Queen stood during the singing of the National Anthem on the deep-blue carpet which ran the length of the choir over the chessboard floor of black and white marble squares. Like her Knights, the Queen was wearing the Garter robe, the mantle of dark-blue velvet lined with white taffeta, and she wore the hat of black velvet, with its three white ostrich feathers and the dark tuft of heron's feathers.

The three new Knights (from left to right), the Earl of Iveagh, Earl Attlee, and Sir Anthony Eden, were followed in the procession by Sir Winston Churchill

As the congregation stood the Queen gave her assent to the installation of the new Knights: 'It is our pleasure that the Knights Companion be installed.' After Sir Anthony Eden had been conducted to his stall by Garter King of Arms the names of Earl Iveagh and Earl Attlee were called, and they too were taken to their stalls from where they were standing facing inwards. Garter conducted the Queen to the Sovereign's stall, and the service of installation began. The service ended, the scarlet-coated Military Knights of Windsor left their stalls to head the outgoing procession, and as the Queen left her stall the fanfare sounded again. The installation was over, and the procession moved off through the nave and the still figures of Her Majesty's Corps of Gentlemen-at-Arms and men of the Yeomen of the Guard. (Broadcast in the BBC's *General Overseas Service*)

PROFESSOR R. J. C. ATKINSON, of the Department of Prehistoric Archaeology at the University of Edinburgh, outlines the various ways in which archaeologists try to answer the question that most often confronts them: 'How old is it?'

Dating the Prehistoric Past

THE most usual question that people put to archaeologists is 'How old is it?' Indeed, this is the question that archaeologists most often ask themselves, so much so that to the outsider, and particularly to historians, it must often seem that archaeologists are entirely obsessed with questions of date. This is quite understandable. The historian's task is to interpret events whose dates are known with greater or less precision from documentary sources. He is dealing, as it were, with a file of letters from the past which can easily be arranged in their proper order because each has its date written at the top. And once they are arranged in order the dates themselves are no longer of much importance.

For the archaeologist, on the other hand, and particularly for the prehistorian, there are no documents, so that he cannot even begin to interpret the events he is dealing with until he has established the order in which they occurred. For him the letters from the past have no dates and no postmarks, so that he can only arrange them in order by studying the internal evidence of their subject-matter, and until he has done this he will not make much sense of the correspondence. Fortunately, even where there is no direct written evidence there are some kinds of archaeological find, such as coins and inscriptions, which we can date fairly accurately because they refer to persons or events known to us historically, and the dates of these things can be transferred to other objects found with them.

Reading the Evidence Backwards

This method of dating by association, useful though it is, can obviously be applied only where there is a starting point of known date. As soon as the archaeologist has to deal with the strictly prehistoric past—for which by definition there are no documents—he has to abandon all hope of arriving at absolute dates in years B.C., and must make do simply with relative dates. He can no longer ask 'When was this made?' but only 'Was this made earlier than that or later?'

In such cases there are two principal methods of approach. First of all there is the evidence for changes in the plan and style of buildings, and in the objects of everyday use found in them, to be derived from the excavation of settlements and fortifications that have been occupied over long periods of time. Here, obviously, the ruins and rubbish of the earliest inhabitants will be at the bottom and those of later generations will have accumulated successively in layers above them. These stratified layers can be likened to a book lying title-page downwards so that the last pages are on top. The pages can be read by excavation but they have to be read backwards, beginning at the end, since the excavator has to work downwards from the top.

The second approach to relative dates is through the study of the gradual changes that take place in time in the form of everyday things like tools and pottery, and in styles of ornament. Archaeologists usually call this the typological method, but this is no more than an academic name for the process many of us use almost unconsciously to date a car by the shape of its body and radiator. By studying improvements in design or developments in ornament the archaeologist can establish sequences of types, just as one could arrange a series of cars of a single make in pretty well the right order without knowing their actual dates of manufacture.

The Limitations of Traditional Methods

We can then use these sequences as rough, relative time-scales, though their reliability will often be open to question, if only because technological improvements and changes in fashion notoriously do not proceed at uniform rates: things may still persist in widespread use long after they have become inefficient or unfashionable. There is no question of abandoning these purely archaeological methods of dating by association, stratification, and typology, which I have been discussing, but because of their limitations archaeologists are beginning to rely more and more on methods of dating borrowed from the natural or physical sciences in order to confirm and supplement their own necessarily uncertain conclusions.

Most of these scientific methods of obtaining dates are based either on irreversible chemical or physical changes which take place in bone and other organic substances, or on changes in man's natural environment during his long prehistoric past. Chemical methods of dating have been used chiefly for the time of the great Ice Age, which lasted from about 500,000 to about 15,000 years ago in the Pleistocene period. Our time-scale for this immense period is based on changes in climate and has been built up mainly from the observations of geologists upon such things as moraines, boulder clays, and the gravels laid down in the valleys of rivers.

During most of this time the only evidence we have for human settlement and activity is in the form of flint tools which have been swept away by rivers in spate, and have been incorporated in beds of sand or gravel along with the bones of contemporary wild animals. The types of

animal represented often give a clue to the climate prevailing at the time, and so to the possible position of the humanly made tools in the climatic sequence. But unfortunately it often happens that tools and bones from an earlier gravel may be washed out and re-deposited in a later one, so that we get a mixture of human and animal remains of different periods.

It is now possible to determine the relative age of bones from any one locality by chemical analysis of the amount of fluorine they contain. In most places there are minute amounts of fluorine in the soil, and this combines with the bone to form an insoluble compound which accumulates in the bone. The older bones in a gravel deposit will contain more fluorine than those deposited later, and can thus be distinguished from them. Moreover, the results of fluorine analysis can often be checked by a similar analysis for the element uranium, which is absorbed progressively by bone in the same way.

Both these methods are likely to be used more and more in the future. But owing to the variation in the natural fluorine and uranium from place to place neither method can be used to give absolute dates but only relative ones.

For the period of about 15,000 years that separates us from the end of the Pleistocene Ice Age the time-scale is again based on changes in climate. But the evidence for these changes, at any rate, in Britain, comes chiefly from botanical studies rather than from geology. As the ice-sheets gradually melted and retreated to the mountains of central and northern Europe numerous lakes were formed in which deposits of vegetable mud and peat have gradually been built up. These deposits include the pollen grains of trees and other plants. These pollen grains are extremely resistant to decay and can be extracted from a sample and identified under the microscope. By taking samples at close intervals through the whole depth of a thick deposit of peat, and identifying and counting the pollen grains in them, it is possible to reconstruct the variations that have taken place in the local vegetation, and so in the climate, over a period of many thousands of years.

In this way the peat deposits of various regions have been divided into as many as ten zones, and this sequence of zones provides a relative time-scale. To this the archaeologist can relate the remains of human settlement and activity which are discovered at various levels in the peat.

A Promising and Exciting New Method

Fortunately, there is one very promising and exciting method of dating, developed only during the last ten years. It is already making it possible to assign absolute dates not merely to samples of peat but also to a wider range of organic material found on archaeological sites. This method is known as the radio-carbon or C-14 technique because it involves the detection of the radio-active isotope of carbon of atomic mass 14. Roughly, this is how it works.

All living matter whether animal or vegetable contains carbon, almost all of it the ordinary stable isotope of atomic mass 12. But a very small proportion is the radio-active isotope which is formed in the upper atmosphere through the action of cosmic radiation. As living matter is constantly exchanging carbon with its surroundings through breathing, feeding, and excretion, the ratio of the two kinds of carbon in its tissues is the same as the ratio in the atmosphere and remains constant so long as it is alive. But as soon as a plant or an animal dies the exchange of carbon ceases, and the radio-active component begins to decay as do all radio-active substances. In this way the radio-activity of the substance gradually diminishes in time, and diminishes, moreover, at a known rate, so that it is reduced by half roughly every fifty-seven centuries.

What happens in practice is this: a sample of carbonaceous matter such as wood is taken from an archaeological site, converted into a gas such as methane or carbon dioxide, and pumped into a special form of geiger counter which measures its specific radio-activity. The degree of radio-activity can then be referred to the known scale of radio-active decay, and so we can find the period which must have elapsed since the death of the sample in order to reduce the radio-activity to its present level. In this way it is now becoming possible to date suitable samples far more accurately than by any other means, and in some cases to within a hundred years.

This radio-carbon method is certainly the most promising of all the present scientific approaches to the problem of dating the past, even though its use is limited to the past 30,000 years, beyond which the radio-activity drops below a measurable level. When the method has been refined further it will take a lot of the guesswork out of archaeology—or so we hope. But even so it would be rash to assume that archaeology will ever become a precise science, or that this or any other scientific technique will ever entirely supersede the traditional approaches that have been worked out by archaeologists themselves. (*Broadcast in the BBC's General Overseas Service*)

Producing a television play: 'I watch the practical men and women, all using their specialised knowledge with great skill, and that gives me much pleasure'

'I WORK IN TELEVISION'

MARY ADAMS, who has worked in BBC Television since 1936—and still does, helping to 'plan ahead'—reflects upon some of the many satisfactions she derives from her challenging medium

ALTHOUGH I work in television now, and have done since 1936, I was trained as a biologist, and I look back on those ten years in Cambridge with great thankfulness. They were years spent in laboratories and libraries, talking with friends and going for walks in that lovely flat Cambridge countryside—years of useful pleasure.

Then I got married; we had a little motor-car and very little money; I became interested in adult education. Just about that time came radio—the wireless, as we called it in those days. I was immediately attracted by this new medium which would enable facts and ideas to get to so many people so quickly, and in the 'twenties I began to give broadcast talks on my own subject of heredity. After making, I suppose, something of a success in broadcasting, someone suddenly wrote me and said: 'Would you like to come and join the staff of the BBC?' I did, and I have remained with the BBC ever since.

Being in broadcasting was satisfying, but I could never forget that in science one saw things and did things. In teaching science, using a blackboard and practical apparatus was necessary. So as soon as television became talked about I became interested in it as a visual medium. Then my baby daughter was born, and at the same time came an invitation to go and work in television. I need not tell you which was more important: my baby daughter. Nevertheless, I went to television in 1936, and a period of three very hard, exciting years followed until the war came in 1939. Then, of course, television closed down, and I did other things.

Number One Topic of Conversation

In 1946 television in Britain started again. We started again where we left off. There were then about 20,000 receiving sets in the country: now there are more than 5,000,000. That is a big difference, and looking back now, in 1956, over these past ten years, the thing that stands out is the growth of the audience.

Television is number one topic of conversation today. You hear people on buses and trains beginning a conversation by saying: 'Did you see so and so on the "tele" last night?' One cannot help feeling what a tremendous responsibility it is to work in a medium which has such extraordinary popularity.

Nowadays, I no longer produce programmes—such a pleasure and a delight in the old days. Instead I help to plan ahead. I have been asked to say what I find most satisfying in my job. There is one thing which is unsatisfying: I am too busy. And that means that I cannot see as much of my friends as I would wish. If you are too busy you cannot see as much of your home and family as you would wish. But, bearing that in mind, let me say what I find most satisfying.

First is the sense of responsibility which television gives one. Television

The outside-broadcast cameras at the Oval: 'Television does give people a chance to see things that they might not otherwise be able to see'

is a challenge—a challenge to see that the best in life and art should find its way on to the screen, and that vulgarities and inaccuracies should not find a place there. Second is the opportunity television gives of opening doors: television does give people a chance to see things that they might not otherwise be able to see.

Television opens closed doors and throws up windows shut before. How many people, for example, have seen down a mine? Down a microscope? Seen life on a North Sea trawler when blizzards abound? How many people have seen inside a star's dressing room? And another satisfying thing is working with so many good colleagues: people who go about their work not only with their hands and minds but with their hearts. I watch the practical men and women, the engineers and cameramen, the lighting experts, the make-up girls, the carpenters, dressmakers, all using their specialised knowledge with great skill, and that gives me much pleasure. And then the artists: actors, musicians, painters, designers, all working because they want art to find a place on the screen, and viewers to be able to enjoy its pleasures.

And then, perhaps the most important satisfaction, the responsibility of working in an international medium—a medium which has viewers not only in Britain but in many parts of the world, a medium which will grow, and make, perhaps, one world for our children. (Broadcast in 'London Calling Asia')

'In the Path of Lord Buddha'

Lumbini, the birthplace of the Buddha, 'is destined to become a lovely park once more, with fresh green lawns and groves of sal trees'

THE chief shrines of Buddhism in north India have long been strangely remote and silent places, very different from the Holy Sepulchre at Jerusalem where incense and chanting rise night and day, or from the Holy Ka'aba of the Moslems daily ringed about by processions of the faithful. For the Buddhist shrines are only now being fully reclaimed from centuries of oblivion, during which they were enveloped in the clutch of ever-thickening jungles or lost amid the millions of ruined Indian monuments.

But, in this year of the 2,500th anniversary, it is natural that there should be a new stimulus towards undertaking pilgrimages, and that pilgrims, in far greater numbers than ever before, should be planning to visit the places hallowed by their ancient scriptures and traditions.

My own pilgrimage took place in May, the month during which the full moon marks the Birth, the Enlightenment, and Final Passing of the Buddha. Religiously this is the ideal month, but it confronts the traveller with many hardships inseparable from the burning, blistering heat of high summer. At times I found the heat almost beyond endurance, but everywhere I encountered compensations in the form of astonishing kindness and hospitality. And if, now and then, my determination faltered I was quickly shamed by recollections of the awe-inspiring steadfastness of the ancient pilgrims from China, of whom I had often read.

These devout men, some 1,300 to 1,500 years ago, endured incredible hardships to seek what I was seeking at the small price of a few weeks' relative discomfort. Fa Hsien, Hsuan Chuang, I Ching, and others spent years upon the terrible overland journey from China to India. Across the burning deserts of Central Asia they followed paths marked solely by the bones of men and beasts who had preceded them. As they went their skin and flesh were withered by the sun, their tongues swollen and black with thirst. Later, in the mountains of Tibet, they faced a hell of cold-blue ice, treacherous snow-drifts, cruel rocks, and bone-piercing winds shrieking like demons amid the Himalayan crags.

The Seven Holy Places

In spite of all this they remained masters of themselves sufficiently to set down the most detailed descriptions of all they heard, saw, and endured with such good result that the whole world is indebted to them for the light they throw upon the history of Asia in that early period. My journey, made by train, bus, various species of horse-cart, and on horse-back or foot was a miracle of comfort compared with theirs.

It is difficult to visit the seven holy places in proper sequence, for the Lord Buddha spent much of his life wandering to and fro on foot, the better to spread his teaching of wisdom and compassion. But any description of such a pilgrimage ought clearly to begin with a recollection of the strange events surrounding the Lord Buddha's birth and to end with the mystery of his final absorption into Parinirvana. And so I shall begin my story with some account of the Garden of Lumbini.

2,580 years ago, in the small kingdom of Kapilavastu which bestraddled what is now the India-Nepal frontier, the Queen, Maya Devi, had an unusually vivid dream. So her husband, King Suddhodana, a great believer in omens, at once consulted his wise men as to its meaning; for the

JOHN BLOFELD, in this first talk in the series of five he is currently giving in the General Overseas Service, starts out on his scholar's pilgrimage in Northern India to visit the scenes of the Buddha's birth, enlightenment, teaching, and death. (The second talk, which is being broadcast this week, is introduced in a note on page 17)

Queen had beheld a lordly white elephant, who presently changed into a vapour and entered into her body. The opinion of the wise men was that a royal prince would be born, a lord of men, a conqueror of the world. But whether he would be as the kings of earth, magnificent in riches, glory, and armed might, or whether he would conquer the world in some unimaginable way by the power of the spirit was not manifest. The King was not pleased by the latter alternative, but the Queen just smiled and said little. From that day forth she became strangely tranquil and filled with a mysterious loveliness.

And when her time was nearly come she left the court to journey to her parents' home, as was the custom. On the way the royal procession came to the Garden of Lumbini, where gaily flowering trees and woodland sounds beckoned her to rest awhile. She alighted from the royal litter and walked about breathing deeply the fragrance of the blossom until suddenly her attention was caught by a magnificent sal tree, laden with scarlet flowers. Raising her right hand, she clasped one of the branches, and at that very moment knew that her child's birth would follow immediately. And it is said that in some mysterious way, while she was still standing supported by the sal tree, the prince was painlessly born: this prince, named Siddhartha, was he who later became the Buddha, the Enlightened One, and who is acknowledged by Buddhists as the greatest man ever born on this earth.

Asoka—Apostle of Buddhism

From the accounts in the ancient books Lumbini must once have been among the loveliest of pleasure gardens, but, alas, the little kingdom of Kapilavastu all too soon became a vivid illustration of the Buddhist teaching that all things are transitory. Less than a century after the birth the clan of Sakyas who ruled there were utterly destroyed and their city laid waste. Lumbini, sharing this fate, fell back into the ever-eager clutch of the surrounding jungle. So the Chinese pilgrim, Fa Hsien, arriving in the vicinity early in the fifth century A.D., says: 'The Kingdom of Kapilavastu is a great solitude; the people are scattered; wild elephants and lions are apprehended on the roads.'

The very whereabouts of the birthplace would now be unknown, were it not for the great Emperor Asoka. This splendid monarch, who lived in the third century B.C., was transformed by hearing Buddhist teaching from a bloodthirsty tyrant and conqueror into a humane ruler and ardent apostle of Buddhism. In the twentieth year of his reign he performed a great pilgrimage and set up immense stone pillars at the holy places with detailed inscriptions. The Buddha, even in his lifetime, had attained prodigious fame, and it is scarcely to be doubted that after the passage of much less than three centuries King Asoka had ample means to identify each spot correctly.

Lumbini, as I saw it, was still a lonely spot. One evening I arrived at Nautanwa, the terminus of a small railway pointing like a finger at

MARIE WORSLEY tells something of the history that is being embroidered into the hassocks or kneelers for Chelsea Old Church, London. An exhibition of the kneelers was recently organised at the Royal Hospital, Chelsea, to help raise funds for the church, now in reconstruction after being largely destroyed by bombs during the war

History in Embroidery at Chelsea Old Church

An eighty-year-old Chelsea Pensioner stitching on a frame at the exhibition

IT seems that a manor house existed in Chelsea as early as the reign of Edward III. In 1368, we are told, one Richard de Heyle leased the manor house to the Abbot of Westminster for £20, and while continuing to live nearby he also demanded two white loaves of bread each day, and two flagons of wine plus a robe of silk annually, all of which we have embroidered in petit point around his name.

The sixteenth century was for Chelsea an epoch of tragedy and glory, for a new manor house became the home of three of Henry VIII's Queens—Anne Boleyn, Katherine Parr, and Jane Seymour lived there—it was also the nursery of the young Princess Elizabeth, later the Tudor Queen. In 1529 Sir Thomas More, the Lord High Chancellor of England, settled in Chelsea with his large and clever family and walked with his royal master in his riverside garden. The events of 400 years ago still seem close to us today, and with twenty-five individual embroideries made for the More household this famous story will be passed on visibly to future generations.

In the seventeenth century the Lawrence chapel was built in the church, and here several generations of Lawrences were buried. This has an interesting link with the New World, for one of the family, Thomas Lawrence, emigrated to Maryland and was commissioned by the Crown as Secretary of the Colony at that time. At home in England he had been a social success: he had moved in court circles; he dressed lavishly, and he had a gay and flamboyant manner. In Maryland, however, he found himself embroiled in a series of tedious disputes concerning the fees of his appointment, and his own aggressiveness finally caused him to be thrown into prison, although Queen Anne, hearing of this, quickly ordered his release and reinstatement.

Towards the end of the eighteenth century fashionable life in Chelsea was coloured by the arrival from New England of William Penn's granddaughter, Philadelphia Hannah Freame, who married Viscount Cremorne and who, in her lovely riverside home, entertained Queen Charlotte, the consort of King George III. During their friendship the Queen and her daughters embroidered a flag bearing the Royal Arms which they later presented to Chelsea Old Church as a thanks offering for deliverance from a threat of invasion during the Napoleonic wars, and which hung there until the bombing.

A name which brings us nearer to our own time is that of Henry James, the great American-Englishman, who interpreted our two continents with such skill and

The Thames-side church is rapidly taking shape again, and this midsummer picture of the rebuilt east end gives little hint of wartime havoc

sympathy. His monument stands in Chelsea Old Church, and the embroidery to him, which was executed in Boston, shows that outstanding honour—the Order of Merit—held also by another great American-Englishman of today, T. S. Eliot, who lives amongst us now.

The personal effort that has gone into this whole scheme has been made in warm spirit of co-operation not only by parishioners but by many people who through some past association with Chelsea felt sympathetic towards the needs of the church and wanted to help in its reconstruction. The embroidery on the kneelers has been done mainly by amateurs, and because it has not been limited to those skilled in the art of design and embroidery young and old have found joy in its creation, and pride in its accomplishment. Sick people have found its effect soothing, lonely people have made friends over a common interest, and all have been glad to add their share of beauty to this ancient church.

The project has meant delving into countless records in order that we might give to each person or family a significant symbol or an accurate heraldic device, and in so doing to visualise the people themselves.

In pre-Reformation times it was Pope Nicholas IV who gave the name of 'All Saints' to Chelsea Old Church. He was a patron of the arts, and so for this pious prelate who valued fine embroidery we have designed his arms and those of his royal contemporary King Edward I.

Those are only a few of the 200 people of Chelsea whose names, tumbling out of the pages of the past, have been embroidered with pride. To us in 1956 they are united in a fellowship of centuries which time can only strengthen. It is significant that in this age of unrest and realism peace and solace can still be found in the creation and application of beauty, proving that it is still possible to 'salvage something from the deluge of time,' and so leave a legacy for those who come after us. (Broadcast in the BBC's North American Service)

Another kneeler perpetuating an Anglo-American link: it is for Thomas Lawrence of Chelsea, who emigrated to Baltimore

OUR WAY OF LIFE: 4

W. G. HOSKINS

The Changing English Countryside

W. G. HOSKINS, in this contribution to the current G.O.S. series, points out that the vast majority of people in England have centuries of countrymen behind them who made the familiar landscape of today: and today, he says, the countryside is going through its biggest change for 400 years

I SUPPOSE England is the most highly urbanised country in the world: four people out of every five live in towns big or small, and mostly big and ugly. And I suppose it is safe to say also that among the multitudinous hobbies of Englishmen and women gardening is easily the most widespread and deep-rooted.

City men in the lunch-hour stand and stare in seed-shop windows, and at the weekends hurry home to get in a long spell in the garden. We are at heart a nation of frustrated countrymen.

Five generations ago—not long in terms of English history—four people out of every five lived in the country, and of those who lived in the towns most lived in small places in sight and easy walking distance of green fields and woods and heaths. This enormous migration from country to town has taken place since about 1800, and it is a fundamental break not only in English social history but also in the private history of nearly every family in England. If you ask a random gathering of English men and women, as I have done, how many of them know where their great-grandfathers were born, very few can tell you for certain.

This extreme shortness of family memory would have struck an Elizabethan or Georgian farmer as most remarkable. They could probably have told you about their ancestors for many generations back, and most of them would have lived in the same parish or within three or four miles of it. But the great trek from the ancestral countryside to the early nineteenth-century towns uprooted millions of English families, obliterated the past after a generation or two, and established new roots in city streets and pavements.

The vast majority of us, then, have centuries of countrymen behind us. If you trace the pedigree of an ordinary family you get back to Stuart and Tudor farmers; and behind them, if you are lucky in your enquiries, you will discern the shadowy figures of medieval peasants; and behind them, again, there are the yet more distant generations of Saxon peasantry, back to the pioneers who entered into what was almost a complete wilderness and proceeded to make it—yard by yard and year after year—into the landscape of fields, hedges, lanes and paths, farmsteads, villages, mills, churches, cottages, and all the things that shine in the afternoon sun when we stand upon a hill and look over a wide and cultivated countryside.

They made almost every yard of this landscape: made it almost literally by hand, with only the most primitive tools—axe and mattock, spade, and saw—with no power but the power of human muscles until comparatively recent times, and the power of draught animals. We come from these villages, from hamlets, and from solitary farmsteads in the western and northern hills—the three fundamental modes of human settlement upon the land. Every English village has its distinctive history. It is such nonsense to say 'This place has no history,' when you think that thousands of ordinary people have lived here, got their living off the soil here, governed themselves and amused themselves, for some ten to fifteen centuries. And they have their own history, which we are only just learning to write.

The Very Beginning of Things

Why is the village there at all? Sometimes one can see the answer on the spot, for close to the parish church—too close to the churchyard for modern taste perhaps—one sees the ancient well, now covered by a pump, which was the very beginning of things, older even than the church, older than the oldest house in the place. Here was the natural source of water that was first seen by Saxon pioneers as they trudged into the silent countryside—silent so far as the human voice was concerned, at any rate.

The water they found has flowed unfailingly ever since, and continued to flow when the larger reservoirs of modern man have run dry at times. Then we understand precisely why the village is here, why it was planted at this spot. The prosaic village pump becomes an object of veneration, an historical monument from which the living waters still flow, to all who have an imaginative sense of the past.

We think, especially in exile perhaps, of the English village as something permanent and universal in our countryside. But it is neither. We have discovered in quite recent years that more than 1,000—perhaps as many as 1,500—villages and hamlets that once existed have disappeared from the face of the landscape. Usually we can rediscover their sites by following certain clues, but in some cases they have vanished without a trace. A whole book has been written about these lost villages. But in some parts of Britain, more especially on the western side—the Celtic West as it is sometimes called—the village has always been a rare thing. Here

men live in hamlets, that is little clusters of three or four farmsteads, or in completely isolated farmsteads.

Some of these solitary farmsteads were first created in the woods and on the moorland edges by Anglo-Saxon pioneers, and many more go back to the generations between the Norman Conquest and the Black Death. England had to be colonised just like any of the countries we used to speak of as 'the colonies' until recent years. We can regard the Romano-British, or the Celts as they are more commonly known, as the inhabitants of an under-developed country with millions of acres of land for the taking all around them, and waves of foreign settlers—Angles, Saxons, Jutes, Danes, Norwegians, and still other peoples from the European mainland—coming in to occupy and clear the virgin lands. England between the fifth century and the twelfth was a sort of Africa or Australia. Thousands of villages were created in this way, and the great majority of them have survived to the present day.

Downfall of the Country Houses

The countryside looks permanent and unchanging, but it is changing all the time beneath its superficial immobility, and we in England are now living through the biggest changes for more than 400 years. It is sad to see the downfall of the great country houses: it makes me think of the downfall of monastic civilisation in the sixteenth century.

But there is another side to this sad picture. Speaking as an historian, I believe that the ownership of land in England is now more widely spread than it has ever been in our history, certainly since the Norman Conquest, and I believe this to be a thoroughly good thing. And in general English farms are cleaner, better looked after, and more efficient than they have been for centuries.

For all the changes—many of them for the worse, as I think—England is still a good place to live in, and much of it is still unspoilt and beautiful, beautiful not in a grand way but with the associations and detailed lineaments of 1,500 years or more of this uninterrupted human use. (Broadcast in the BBC's General Overseas Service)

'In the Path of Lord Buddha'

Continued from page 8

Nepal. Beyond the cloud-capped hills to the north lay mountainous wastes without rail or roadway. The little townlet boasted no hotel, but I was comfortably lodged in a Buddhist rest-house.

The next morning I set out on the back of a Nepal pony, my feet almost touching the ground, and the Hindu guide easily able to keep up with me at a steady walk. Soon we crossed the first of three shallow rivers flowing at right-angles to the misty line of mountains to the north. The water was dotted with Hindu villagers taking their morning bath, some laving their heads from copper vessels, others standing throat-deep and intoning prayers to the rising sun. All around was an immense rice-plain.

Nowhere was there any sign of jungle: only rice-fields, low mud-brick villages, and a few orchards. Presently, I caught sight of rather Chinese-looking people among the darker Indian villagers, and guessed we had crossed into Nepal. It took three hours to reach Lumbini.

Here, too, the jungle had been cleared. Indeed, it looked desolate and cheerless. Even virgin jungle would have seemed more park-like than these ugly scars of uncompleted archaeological work. The stump of the Asokan pillar, hewed to the ground by the invaders 800 years ago, was protected by an ugly iron railing and fronted by an insignificant Hindu temple. To either side were mounds of bricks raised years before by the Nepal Government in *stupa* form, but devoid of beauty. For a while my heart ached; but then my mood changed, for I began to see signs that Lumbini is again coming into its own. A fine domed temple with beautifully carved teak doors is arising, together with several rest-houses; an all-weather pilgrim's way is under construction, and the ruins of ancient monasteries are being patiently uncovered. Lumbini is destined to become a lovely park once more, with fresh green lawns and groves of sal trees.

Feeling much happier, I stood beside the stump of the Asokan pillar and shut my eyes. Suddenly it seemed that all about me was the fragrance of flowering trees and the songs of birds. In front of me stood a huge sal tree, weighed down with blossom, and upon the lowest bough lay the jewelled hand of the lady Maya Devi, Queen of Kapilavastu and mother of the Lord Buddha. I dared not let my thoughts roam further, but opened my eyes quickly, and turned to face the hot ride back with a sense of deep satisfaction and peace in my heart. (Broadcast in the BBC's General Overseas Service)

The castle was built a hundred years after William the Conqueror came to Britain. Among its noble owners in the Middle Ages was the Black Prince

On a steep-sided rock sticking out into the sea are the ruins of the castle of which some of the walls still stand with their windows and arches

Tintagel—Fact or Fiction?

RICHARD LONGLAND takes you to the north Cornish coast half-way between Bude and Padstow to consider the facts—or the fiction—associated with King Arthur and the Knights of the Round Table

IT is easy enough to find the facts about Tintagel, because you can go and see them. On the north Cornish coast, half-way between Bude and Padstow, a steep-sided rock sticks out into the sea, and for miles on either side the massive cliffs rise sheer and dark, a line of white foam at their base: a savage coast where for hundreds of years ships, vainly seeking a harbour from the gales, have smashed their timbers to driftwood, for there are few friendly havens from any gales that blow from the west, the north-west, and the north.

On the rock itself, a rough square little more than 200 yards each way, are ruins. There is a castle of which some of the walls still stand with their windows and arches, and a few scattered groups of stone and turf huts, hardly more than bare foundations. Those are the remains of a monastery of about the year 500. As for the castle, it was built about a hundred years after William the Conqueror came to Britain. It did not have a very exciting history, as far as we know: no stirring sieges, no gallant rescues of imprisoned maidens, no enchanters, nor even an ogre. It seems to have been just a plain, workaday, useful castle, acting as guardhouse to the landing place, an important one, on the beach in the sheltered little cove down beside the rock. It was owned by various nobles, including the Black Prince, and when it fell into disuse in the fifteenth century it just quietly slid into a ruin, and Tintagel was once again empty and peaceful, with nothing but the mutter of the sea and the cries of the gulls and the whistle of the wind through the empty windows.

The Cavalryman Called King Arthur

And now for the fiction, or shall we say legend, because it is very difficult to separate the two. Tintagel is one of those places which form the background to the romantic and highly coloured story of King Arthur and the Knights of the Round Table, a story which began to be written down in the twelfth century and which poets and story-tellers have been re-shaping ever since.

We know something about Arthur. He seems to have been a sort of cavalry general or brigadier, who may have become a king, and who had his own brigade or division of professional warriors and held back for a few years the invading Saxons somewhere at the end of the fifth century. Arthur's deeds and fights and victories, of course, were enshrined in tribal songs and ballads, and when the Celts were finally defeated and pushed into the west and over to Brittany they took these songs and stories of Arthur with them.

Round about the year 1100, with the birth of some kind of civilised life in Europe, Arthur and his Round Table suddenly became what you might call a best-seller. Every poet and writer took up this stirring story and re-shaped it for the particular noble he served, and this almost forgotten cavalryman—half Roman, half British—took on the guise of a medieval knight. In these stories Tintagel is the place where Uther Pendragon, the King of Britain, took possession of the widowed Countess of Cornwall who became the mother of Arthur. And if you let yourself

Penhallick Point, Tintagel, recently given to the National Trust: it lies to the south of the cliff property which the Trust has owned for many years

be influenced by the names of the teashops and curio-shops at Tintagel you are apt to think that the Round Table met there every Monday, just like any Rotary Club.

So in the end that is all there is of the legend of Tintagel as a part of the story of King Arthur and the Round Table. Yet I do not know that we can really laugh at it. So many legends these days are turning out to be authentic history after all. At Glastonbury there is the reputed burial-place of King Arthur and his queen. For years archaeologists and historians have laughed at the story, and said it was entirely false, and now only the other day a very famous archaeologist indeed said in a broadcast that it was very likely Arthur and his queen had been buried in that very spot after all. So maybe somebody in Arthur's band of knights did go to Tintagel and maybe pitched his tent there.

Meanwhile, let us enjoy that superb story that Sir Thomas Malory wrote and not worry too much if it was truth or legend or just plain fiction that Tintagel formed part of the tapestry against which moved Arthur and all that high-coloured chivalry of the last of old Britain. (Broadcast in the BBC's General Overseas Service)

In 1955 lifeboats of the Royal National Lifeboat Institution were launched nearly 600 times to go to the aid of seafarers off the coasts of Britain

500 RESCUES A YEAR

ROUND the shores of the British Isles there are 151 lifeboat stations. Each is equipped with a modern motor-lifeboat of special design, capable of sailing in the worst of storms, and saving lives from the cruel sea. British coastal waters are often dangerous, beset by rocks, shallows, and tricky currents. Without these lifeboats—many seafarers would never have been rescued from wrecked or sinking ships. Last year, for instance, there were nearly 600 lifeboat launchings, and 500 people were saved. And that is an average figure for most years. Altogether, since a national lifeboat institution was founded in 1824 its lifeboats have rescued more than 80,000 men, women and children.

Very few countries have such an elaborate system for saving life at sea, and the most remarkable thing about this system is that it is supported by a voluntary organisation. On the door of the headquarters of the Royal National Lifeboat Institution you can read the words: 'Supported solely by voluntary contributions.' And it is true: every penny that is spent on building new lifeboats, on lifeboat stations, on running costs, comes from donations and legacies.

A lot of money is needed: in 1955 alone the cost of the lifeboat service was £776,000. Yet it is even more remarkable that the institution managed to raise that amount, plus another £61,000 for its reserves. This figure shows that the British public has a strong feeling of respect—almost of affection—for the lifeboat crews, who without hesitation will launch their small boats into the teeth of a gale for the sole purpose of saving precious human lives.

When one reads of the fantastic experiences of some of these lifeboats one cannot help admiring the crews who risk their own lives on such humanitarian missions. For they too are volunteers. Most of them are fishermen familiar with the hazardous coastal waters through which they sail. The institution makes *ex gratia* payments to crews for each mission, and if they should lose their own lives the institution will look after the bereaved families they leave behind.

Groups of Voluntary Helpers

All over Britain you will find groups of voluntary helpers—my own mother is one of them—who have no connection with the sea yet spend a good deal of time raising money for lifeboat work. They organise bazaars, sales of work, flag days, and other fund-raising activities. There are collections in cinemas, donations from groups of workers in factories and the public services, and from other voluntary organisations; and, of course, there are occasional gifts from shipping firms who realise what sterling service is given by the lifeboats.

It is not merely a question of saving sailors from sinking ships. The list of emergency launchings last year shows that about a quarter were to save people from largish vessels that had run into trouble; another quarter were to help small craft—mostly motor-boats, small yachts, and fishing boats. But other lifeboats went out to help swimmers in difficulties, people cut off by rising tides, and to fetch sick people off remote islands, or take doctors to an isolated place. An increasing number of launchings these days are to pick up pilots and crews of aircraft that have come down in the sea.

In this work, as in other emergencies at sea, the lifeboats are getting more and more co-operation from helicopters, operated by the Services, which can pick people straight out of the sea, or lift them off wrecks which a lifeboat cannot reach. There were fifty-eight cases of such co-operation last year, and I am sure that the number will get larger as more and more helicopters are available.

There has always been something especially dramatic about shipwrecks and storms at sea, and among those who have proved themselves real heroes the men of Britain's lifeboat service have a place of honour. (NORMAN MACKENZIE in 'London Calling Asia')

Books to Read

Reviewed by
Geoffrey Bournemouth

IF you are fond of detective stories I can put you on to an absolutely first-rate travel book (travel and escape). It is *The Long Walk* by Slavomir Rawicz. The author was a young Polish cavalry officer at the beginning of the war. He survived the German invasion, only to be arrested by the Russians for no better reason than that his home was near the frontier and therefore he must be a spy. He was tried and sentenced to twenty-five years forced labour. Then came a nightmare train-journey which lasted a month and took him 3,000 miles into Siberia. This was followed by a forced march of forty days shackled to a long chain towed by a lorry. And so to the prison camp almost on the Arctic Circle. His mind was bent on escape, and escape he did, with six others. This takes up almost half of the book, and is good but hardly remarkable reading. But from the moment of the break-out, there comes a change in mood and style. A heroic simplicity is achieved for which the only word is Homeric. For the prisoners set out on a long walk indeed—4,000 miles through Siberia, Mongolia, across the terrible Gobi Desert, into Tibet, across the Himalayas, and so to India. They fell in with a seventeen-year-old Polish girl and felt it necessary to take her with them. Their delicacy with her, and her eventual death of exhaustion in the Gobi Desert are among the most moving parts of the book. Two of the men die before India is reached. An epic journey indeed, and wonderfully told. And now, the problem of detection: is it true? The author says 'Yes'; the publisher says 'Yes.' But the fact is that no proof in substantiation has yet been forthcoming. For myself, I believe it is true. But it does not really matter, because either way it is a most remarkable book.

And now for a very different sort of travel book, *The Lycian Shore*, by Freya Stark—different because it takes us as deeply into times long past as into foreign lands. It is the second instalment of her exploration of the Aegean coast of Turkey, seen as nearly as may be through the eyes of ancient Greece and to my mind it is even more perfect than the first book, *Ionia*, which I recommended strongly to you a year or two ago. Perhaps this even greater success has come because, like the old Greeks and Persians whose ghosts fill her mind, this time she travelled by sea—in a five-ton motor ketch owned by a consular friend of hers. Miss Stark was then reading the history of Alexander the Great, and she became anxious to learn something of the climate of that age—to discover what Alexander found in men's minds when he marched down from the Granicus in 334 B.C.

It must be good to have the Himalayas at your door, so that you can go and spend your holidays among them. This is the happy lot of G. D. Khosla, and in *Himalayan Circuit* he tells us of one such tour he made with a party of Indian officials and the wife of one of them. He himself is an Indian High Court Judge. The party was a large one, and the seven principal members with their necessary subordinates moved off from Kulu, north of Simla. Their objectives were the two wild valleys, lying beyond the main Himalayan range; their official purpose to see what the Government could do to improve the lot of their Mongolian inhabitants. Anthropologists will find much of interest in the description of the lives of these isolated people.

For the general reader, the descriptions of Himalayan scenery, of people, and of the daily incidents of travel are well done, often with quiet humour. The photographs are more than usually excellent, and there is an introduction by Pandit Nehru.

Anyone thinking of coming to Britain and wanting to visit places of real beauty and interest which are yet not on the usual tourist track might do worse than take as their guide *A Prospect of Britain* by Andrew Young. The author's interest in wild flowers has taken him all over Britain, from the Orkneys to the Isles of Scilly, and given him an unusually wide knowledge of the country. This he has clearly supplemented by equally wide reading. Altogether a highly suggestive and stimulating guide-book. But it should have had an index of place-names.

The Fremantle Diary, reprinted for the first time since 1863, is very easy and entertaining reading. It tells of the American Civil War as seen through the eyes of a young officer of the Coldstream Guards, Lieutenant James Lyon Fremantle. This young man, whose later career was quite undistinguished, had the happy idea of spending his leave as an observer of the Civil War from behind the Confederate lines. Of the battle of Gettysburg he has left the best eye-witness account, and the best portrait of General Lee. For the rest, the book is well worth reading for its lively picture of the old Deep South.

Pan Books put us further in their debt with cheap editions of Fitzroy Maclean's *Eastern Approaches* and Eric Shipton's *Upon that Mountain*, both grand books to get if you have not already read them.

The Long Walk, by Slavomir Rawicz (Constable, 15s.)
The Lycian Shore, by Freya Stark (John Murray, 25s.)
Himalayan Circuit, by G. D. Khosla (Macmillan, 18s.)
A Prospect of Britain, by Andrew Young (Hutchinson, 16s.)
The Fremantle Diary, by J. L. Fremantle (Andre Deutsch, 21s.)
Eastern Approaches, by Fitzroy Maclean (Pan Books, 3s. 6d.)
Upon that Mountain, by Eric Shipton (Pan Books, 2s. 6d.)

STORIES FROM 'RADIO NEWSREEL'

Here and There

BRITAIN'S ROCKET TESTS

FOR the first time in ten years correspondents were recently able to visit Britain's main centre of research into rocket motors which are now being developed for guided weapons and the highest speed aircraft. It is the centre of the Rocket Propulsion Branch of the Royal Aircraft Establishment at Westcott, near Aylesbury. Among other things it is developing a motor for Britain's high-altitude research rockets intended to reach a height of 100 miles or so. The BBC air correspondent, Ivor Jones, visited the centre, and in his broadcast report he said:

'It is clear at Westcott that Britain is already getting ready to build a very long-range guided weapon capable of travelling perhaps many hundreds of miles at very high speeds. The evidence for this is that a test-house is being built there for the kind of rocket motors such a weapon would need. It looks like some-sort of Inca pyramid, with heavy concrete foundations and a steel superstructure about fifty feet high. It will be able to test new rocket motors—many times more powerful than anything now used in aeroplanes—in what would be their operational firing position. They will be anchored in it upright, with their exhaust pouring into a deep pit in the foundations. This is for the future; but even today we have some formidable motors.'

'We saw a Mayfly rocket, a slim cylinder only about ten feet long, but as powerful as the world's biggest jet engines. I saw it send out a brilliant stream of flame—pink, gold, and white—that spattered on a steel wall fifteen yards away. The Mayfly—used for boosting guided missiles—is driven by the explosive cordite.'

'We also saw the motor for Britain's high-altitude research rocket, due to reach up 100 miles in Australia later this year. The motor is called the Raven, and is eighteen feet long, and it looks a larger version of the Mayfly. It will be ready for test running in a month or so.'

'There were different types of rocket motor, too. One of them, the Gamma One, is a neat motor designed for fighter aircraft. It could fit under the bonnet of most motor-cars. It burns crude petrol, with hydrogen-peroxide, at an incredible rate.'

'As well as these rockets that burn at incredible heats, Westcott also has what it claims is probably the coldest room in the world. It is a test chamber that develops 120 degrees of frost and more. A few of us spent a minute there. Our breath filled the place with ice particles. After ten seconds I felt as if I were frozen inside a block of ice. The cold crept like some icy liquid through my light clothes and up my coat sleeves and trouser legs. And the oddest thing was that—even in that minute—my shoes got so frozen that my feet felt cold for half an hour afterwards.'

LONDON-YORKSHIRE MOTORWAY

WHAT the new motorway from London to Yorkshire will look like was displayed in London in the form of a number of models which have been built of some of the kinds of road layout and bridges that will be used. The first section of the Great North Road—as you might call it—will run from the north end of the new St. Albans by-pass—when it is built—at a point south of Luton, northwards to near Ashby St. Ledgers in Northamptonshire. There will be an extra leg to the road to link up Birmingham traffic with it at Dunchurch in Warwickshire.

The models which were shown to correspondents at the Ministry of Transport in London have been approved, with some minor amendments, by the Royal Fine Arts Commission. At the showing the Minister, Mr. Harold Watkinson, interviewed by BBC reporter Ronald Robson, said:

'The London - to - Birmingham section will be in use as soon as ever we can get it done. The actual laying of the concrete and building of the bridges ought to be done, I think, in two to three years. The unknown factor is how long it will take me to clear the 136 objections to the actual buying of the land and line of the route. And, of course, everybody has got to be treated fairly. If we can get that through quickly I think it is possible that motorists might be able to use this first piece of motor-road in not much longer than five years from now.'

Mr. Harold Watkinson (left), with Sir Owen Williams, the architect, examining the model of an over-bridge for the London-Yorkshire motorway

Tests at the Rocket Propulsion Branch of the Royal Aircraft Establishment: a solid-propellant rocket motor, and (right) a liquid-propellant missile engine

'You are not only building the models—I take it that the actual planning is going on now?'

'Parallel with getting on with land acquisition we are doing all the working drawings; we are doing the soil surveys, the bills of quantities—everything—so that once we have got the land we shall be ready to build the bridges and lay the concrete.'

'What kind of objections are being raised?'

'Well, it's quite natural that when a road cuts off a piece of a man's farm or a bit of his garden he is going to want to look at it all carefully, and we try where we can to alter the line a little bit to meet objections, or give special access, but unfortunately—and it is quite right that it should be so—all these things take time. But I do hope that with co-operation we shall be able to buy the land in a reasonable period so that we can get on and build the road.'

GOODBYE TO KNOCKERS-UP

A SERVICE that has roused generations of workers in the Lancashire town of Oldham is going out of business, and one more link with a famous north-country tradition broken. The members of the Ratcliffe Street Watch have been paying sevenpence a week, collected every Friday night at their front door, and for that they get an urgent tattoo on the bedroom window anytime they like between five o'clock and six-thirty to herald the dawn of a new working day. Some of them had been roused in this way for forty years, and they still find it hard to believe that such a trusted old friend is disappearing, a victim of changing conditions. It is officially admitted the reason is the alarm clock!

Now the question arises: who knocks up the knockers-up? At Ratcliffe Street it is simple: the full-time men stay up all night, because for your sevenpence a week you also get a patrol in the early hours of the morning to make sure you have not forgotten to lock the front door. But at half-past four the full-time knockers-up go round and knock up the part-time knockers-up, and from then on it is a case of moving smartly through the streets.

There was a time not so long ago when 900 people relied on the long pole of the knockers-up to get them to mill and workshop on time, but now the membership is down to 400 and the watch is paying out more than it is drawing in. A colourful chapter of north-country working life is finally closing. It is planned to share out the cash reserves of £370. The knocking-up sticks will be sold and, in the words of Mr. Miller, 'A lot of owd folks will be grieved.'

THE STATE VISIT

I AM sure one of the things the Queen will remember most vividly about her State Visit to Stockholm—and will go on remembering even after the recollections of the ensuing pageantry on land have grown dim—is the way she came to the Swedish capital. For she and the Duke, in the Royal Yacht *Britannia*, had a first greeting from an unscheduled and phenomenally persistent fog which settled down on that arrival morning and just about obliterated the Swedish capital and the mid-western Baltic for hour after hour.

It was only when we were but an hour and a few miles from Stockholm itself that the weather changed, but then it changed dramatically. The sun blazed out, hot and dazzling, hundreds of yachts and launches raced alongside the now speeding *Britannia* in unofficial escort; watersides were crammed with cheering people; guns fired salutes; and hundreds of jet fighters of the Royal Swedish Air Force came screaming and wheeling over with a breath-taking welcome all of their own.

Then, in one of the waterways that penetrate the very heart of Stockholm, the ship came to rest; and the Queen and the Duke were rowed ashore in state—and eighteenth-century style—aboard Sweden's richly adorned royal barge that looks like a grand gondola with a miniature Louis Quinze drawing room for a cabin.

The King and Queen of Sweden were at the landing steps to greet the visitors; and there followed a State Drive through the crowded city which matched London's great processions in splendour of cavalry. The Queen and the Duke were received with full ceremony when they arrived at the massive royal palace, where every step of every staircase was lined by men of the State body-guards in dress of 300 years ago: Life Guards in breastplates, top-boots, and tunics and trousers made of great sheets of old chamois leather that was wonderful to behold.

A rare sight, too, was the State Banquet in the palace that night. Two hundred guests at one glittering table—fifty yards long!—I have never seen anywhere such magnificence of full-dress uniform and evening gown; such observance of Court graces preserved through the centuries.

Brilliant and Huge Social Gatherings

There were informal occasions during this visit, but it was remarkable for its brilliant and huge social gatherings: the gala opera; the Amaranth Ball in that wonderful Town Hall, where 1,800 people sat down to supper together in one room, and where there was a rare gathering of European royalties; and the supper and theatre party which King Gustav gave at his summer palace, Drottningholm—from which the Queen returned by water on a perfect Scandinavian summer's night, with the sun beginning to light the sky at one o'clock in the morning.

The formal State Visit lasted only three days; but the Queen and the Duke, joined now by Princess Margaret and the Duke and Duchess of Gloucester, stayed on in Stockholm for a week longer, living aboard the royal yacht instead of in the royal palace, and attending the equestrian events of the Olympic Games.

And wherever they went the Swedish people—who, I had been told, were 'undemonstrative'—waited at roadsides to get a glimpse of their visitors and to give them affectionate greeting.

and Sporting Occasion

to the BBC have written these postscripts recording the Queen and His Royal Highness the Duke of Edinburgh provided a beautiful and hospitable setting

EQUESTRIAN OLYMPICS

WHAT a setting Stockholm provided for the Equestrian Games of the XVIth Olympiad! Dressage and jumping took place in the stadium which was built for the Vth Olympiad in 1912. It is not large by some standards, but with its medieval-style Marathon Gate and its towering walled walls of mellow brick it must rank as one of the most beautiful riding arenas in the world.

The Endurance Phase of the Three-Day Event was held in rolling, wooded countryside some fifteen miles outside the city, but here, in spite of a drizzling rain for part of the time, the beauty of the surroundings was perhaps the last thing in our minds as we watched the drama which unfolded on the cross-country course. Many experienced horsemen felt that the endurance test was the most severe they had seen anywhere.

Riders of Twenty-Nine Nations

After the pageantry of the opening of the Games, with the lighting of the Olympic Flame and the great parade of the horses and riders of twenty-nine nations, the first part of the competitions was the Dressage phase of the Three-Day Event. From this Britain emerged with a clear lead. Britain came near to winning the individual gold medal for the event, too, and the tension could be felt in the Stadium when Lt.-Col. Frank Weldon took Kilbarry over the fences in the final phase. If he had done a clear round the gold medal was his.

But the Three-Day is essentially an event where the team and the individual come before the individual. The British riders had operated superbly as a team.

The Grand Prix de Dressage brought a Swedish double gold, for Henri St. Cyr on Juli was placed first individual, and the Swedes also fielded the winning team. Britain did not figure as a team in the event, having only two riders—Mrs. H. L. Johnstone on Rosie Dream and Mrs. D. S. Williams riding Pilgrim. The second and third team-placings went to Germany and Switzerland.

The Grand Prix dressage is a field in which Britain has still a long way to go, but in the Grand Prix Jumping competition the British team was first in the front. In fact there was perhaps some disappointment that Britain did not collect at least the individual gold medal in the last event of the games. As it was, the team gained the bronze medal, Germany taking the gold, and Italy the silver. And much though every British rider there longed to see Miss Pat Smythe ride to victory, as the first British woman to compete in such an event in the Olympics, nobody was satisfied with the result in the individual placings. Hans-Gunther Winkler, of Germany, who won the gold medal riding Halla, was eliminated on his first round but insisted on riding his second round to help his team in the event. After receiving injections to deaden the pain he not only went over the course the second time but jumped a clear round, a feat equalled only by a member of the silver medal winning Italian team. This was Raimondo d'Inzeo on Merano, who came second in the individual placings.

And so we came to the strangely moving closing ceremony and the relighting of the Olympic Flame. It will burn again next for Equestrian Olympic Games in Rome in 1960.

THE STORY OF COLONISATION

AT its greatest extent the Roman Empire stretched right across Europe from the river Clyde in Scotland to the river Euphrates in Mesopotamia, a distance of nearly 3,000 miles. The heart of this Empire came into being during the 150 years before the birth of Christ, although some of its largest territorial gains were not made until the beginning of the second century A.D. It was an Empire which crumbled and perished between the fourth century and the sixth.

The Roman Empire will be the subject of the third talk in the G.O.S. series on 'The Story of Colonisation.' It will be given by Sir Mortimer Wheeler, the distinguished archaeologist. 'If I were asked,' Sir Mortimer says, 'to name the outstanding qualities of mature Roman colonisation, I would say that they were law, peace, and tolerance.' He will be speaking about these qualities in his talk.

G.O.S.: Monday 15.45; Tuesday 00.30 and 05.00

'THE PLACE OF ENLIGHTENMENT'

IN his second talk in the series 'In the Path of Lord Buddha,' John Blofeld tells of his visit to the holiest of all Buddhist shrines in northern India: at Bodhgaya, some sixty miles to the south of Patna. There, behind a great tower of carved and polished stone, a simple slab marks the place where the young Prince Siddhartha attained Enlightenment—or Buddhahood—as he sat beneath the tree of which Sir Edwin Arnold wrote in *The Light of Asia*:

The Bodhi-tree (thenceforward in all years
Never to fade, and ever to be kept.

In homage of the world, beneath whose leaves
It was ordained that Truth should come to
Buddh.

It could be said that the tree has never faded, since John Blofeld found its descendant still shading the Place of Enlightenment. He also found in Bodhgaya many fellow-pilgrims and a certain lonely Chinese monk to whom his visit gave pleasure.

KEIR HARDIE CENTENARY

THE first man to enter the British Parliament under the banner of Labour was Keir Hardie. Other working men and trade unionists had got into Parliament before him—men like John Burns, for example—but they remained members of the orthodox Liberal Party. Keir Hardie played a great part in the development of British trade unions and in associating them with politics and the independent Labour Party, which he set on its feet.

Hardie was born in Lanarkshire on August 16, 1856, and soon went to live in a poor district of Glasgow. With his father unemployed the family knew very hard times. He had no schooling, but he taught himself to read. While he worked as a miner he contributed articles to local newspapers: soon he was a journalist and a miners' leader.

In 'The Man They Remember,' a programme compiled entirely from the words of people who knew him well, listeners can hear an account of Hardie's private and public life and an evaluation of his achievements.

Geraldo leads his orchestra in the first of a new series of 'Tip Top Tunes' on Monday, Thursday, and Friday

LONDON FORUM

WHEN Bertrand Russell, the eminent philosopher, and Lord Hailsham were considering what they should choose as their topic in 'London Forum' this week the literary periodicals were full of reviews of Sir Winston Churchill's *History of the English-Speaking Peoples*, the first volume of which had just appeared. A passage from Sir Winston's book seemed to offer a very suitable theme for the discussion.

It dealt with the Dark Ages of England when King Alfred faced, almost alone, the Danish invasion: 'The Saxons . . . very nearly succumbed completely to the Danish inroads. That they did not was due—as almost every critical turn of historic fortune has been due—to the sudden apparition in an era of confusion and decay of one of the great figures of history.'

As their guest in a discussion on the extent to which great men can turn back the tide of events, Lord Hailsham and Bertrand Russell have Isaiah Berlin. To his distinction as a philosopher and Fellow of All Souls College, Oxford, he adds the reputation he gained in the second world war in the British Embassy in Washington and Moscow.

G.O.S.: Sunday 16.15; Monday 02.15

'THE BEGGAR'S OPERA'

NO criticism can be made of *The Beggar's Opera*. It exists by itself, like a lonely moon, without rivals, without companions. You may, of course, say it is not as bright as the sun, but that will not bring it down. The story of the bold amours and sad misfortunes of the highwayman, Captain Macheath, cannot be told better because it cannot be told differently.

Gay wrote it, it seems, almost blindly, by luck. On the surface, *The Beggar's Opera* is an easy, playful affair—written, Walpole said, by a 'fat clown'—but underneath it is a shark. Almost every song had a row of teeth; and well might Walpole sneer, for the teeth were buried in him. It was an almost necessary sport of the Georgian wits to

attack and ridicule the corrupt, bribing administration of Robert Walpole.

It is hard for us now to comprehend the nuance of eighteenth-century satire, but we might remember as we watch the gay Captain Macheath that he was once thought 'dangerous' by a king and a 'devil' by an archbishop.

H. A. L. CRAIG
G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

'COMMONWEALTH OF SONG'

ONCE again the popular series of music and song provided by artists from different parts of the Commonwealth returns to the General Overseas Service. The BBC Revue Orchestra, under its South African conductor, Harry Rabinowitz, will provide the firm musical foundation for eight of the thirteen shows, while the BBC Variety Orchestra, under its conductor, Paul Fenculhet, will play in the remaining five shows.

The Bob Brown Singers will be in permanent residence, and the Kenny Powell Trio and the Frank Baren Trio will play in alternate weeks.

G.O.S.: Sunday 09.45 and 23.45; Wednesday 20.15

'THE CONVERSION OF MR. GROWSER'

THE characters in Toytown never vary in their truth to type, so it is quite impossible for Mr. Growser to be 'converted' in the usual sense of the word. To be converted implies a change of heart, an experience as impossible to Mr. Growser as a change of spots to a leopard.

Mr. Growser does not change his mind with a view to goodness: he changes his policy with a view to gain. In no other of the classic Toytown cycle of plays is his character so ruthlessly exposed.

G.O.S.: Sunday 13.15; Saturday 09.45

Radio Theatre presents

'THE CREEDY CASE'

IN *Macbeth* Shakespeare gives a couplet to one of the witches (appropriately or not, according to taste) stating that 'you all know security is mortals' chiefest enemy,' but security is a word which has acquired a special connotation in recent years. It is on its moral aspects that Edward Crankshaw's *The Creedy Case* really turns.

The time is the summer of 1943. George Scoresby, a distinguished young Army officer now relegated through wounds to a desk job at the War Office, is required to post to Delhi, without explanation or warning, a brilliant subordinate engaged on secret research work named Captain Creedy. When Scoresby jibs at the order, he finally gleans the information that Creedy is suspected of Communist affiliation and of passing over confidential information to the Russians.

At that Scoresby jibs with double vigour. For if Creedy is guilty of treason, surely he should be tried and punished, not sneaked away to the other side of the world? And, in any case, this is a time when the Russians are still supposedly our allies.

Mr. Crankshaw argues out the dilemma in dialogue of exceptional cogency, conveying the atmosphere of high-level intrigues and the nature of the Communist mind with skill.

A preview of the week's programmes with recorded extracts
13.45-14.00 **The World of Science**
A weekly survey of the latest developments

ASIAN CLUB. Sir Cyril Burt, Emeritus Professor of Psychology at London University, will answer questions on Sunday on 'How the Mind Works.' Sir Cyril was a pioneer in England in using the now-common techniques and tests in measuring intelligence in children. He has conducted many studies in adult and social psychology and in statistical analyses to discover whether there was any relationship between the intelligence and the size of the family or social class. He says that a good mind is like a good library: a large room is needed to start but it needs to be filled with books.

SHAW FESTIVAL. Bernard Shaw wrote *The Devil's Disciple* while he was still seeking fame as a dramatist. It is therefore one of his most straightforward, easily-assimilated plays. He himself insisted that it was a popular melodrama, without any novelty. Whatever the formula, it is infallibly effective in the theatre. On Tuesday, Kenneth More plays the part of Dick Dudgeon.

ASIA AND THE WEST. In Japan in 1867 a new set of leaders started a deliberate and systematic modernisation of Japan which made her a world political power in less than forty years. To economists and historians recent Japanese history makes a fascinating study of the intense application of western experience to an Asian background. Whether this Japanese experience is relevant to the other countries of Asia is the subject to be discussed on Wednesday by Bruce Miller, W. Arthur Lewis, and Professor W. J. Beasley.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

THE EDINBURGH FESTIVAL

The opening ceremony of the tenth Edinburgh International Festival, attended by Her Majesty the Queen and H.R.H. the Duke of Edinburgh, will be the subject of a G.O.S. report with recordings on Monday. During the week there will also be broadcasts of Sir Thomas Beecham conducting the Royal Philharmonic Orchestra at the Usher Hall and of Rosalyn Tureck in a pianoforte recital at Freemasons' Hall. An introduction to the festival is on page 3. Our cover picture is of Edinburgh Castle floodlit for the festival's Military Tattoo

EMITAPE

The WORLD'S FINEST MAGNETIC RECORDING TAPE

Used by the leading broadcasting organisations and for recording the world's greatest artists by "His Master's Voice", Columbia and Parlophone.

EMITAPE '77' for Professional applications—'88' for General Purpose and '99' Long Play.

EMITAPE is obtainable on a range of spool sizes suitable for all standard, professional and domestic tape recorders.

EMITAPE is manufactured in the largest tape factory in Europe by a company with over 50 years experience in the science of sound recording and reproduction.

EMITAPE is the Magnetic Recording Tape with the world-wide reputation.

Emitape provides a sound basis for your recording.

Pye Hi-Fi — the new sound in home entertainment

All the atmosphere of a live musical performance reproduced in your own home, with the sound exactly adjusted to your needs—that is the magic that a Pye High Fidelity system can bring to your enjoyment of recorded or broadcast music. And the heart of the system is the amplifier. The Pye HF25 (above) has an undistorted output of 25 watts and facilities for radio tuner, microphone, record and tape players. The Pre-Amplifier with copper control panel is alternatively available housed in a luxury walnut veneered cabinet. Full details from any Pye Dealer—or from the address below.

Take it home with you!

The Edinburgh Festival

DAVID GRIFFITHS, in this introduction to the tenth International Festival at Edinburgh, looks back on some of the artistic triumphs of the past decade and mentions some of the highlights promised during the present season (see footnote for G.O.S. broadcast times)

ON Sunday, August 19, the tenth International Festival will be opened at Edinburgh with a service of praise and thanksgiving in St. Giles's Cathedral.

The history of the Edinburgh Festival over the past ten years is a tribute to the foresight, imagination, and courage of a band of pioneers led by Lady Rosebery, Rudolph Bing of Glyndebourne, and Sir John Falconer, who was the Lord Provost of that time.

These were the people who believed that there was a place for art, music, and drama even in a materialistic age, and looking for halls and theatres, for accommodation for visitors, and, above all, for a background of dignity and beauty, they found these things in Edinburgh.

Such a setting alone would be worth visiting, even if the initial standard of artistic excellence had not been maintained. Fortunately there has been no falling away. Rudolph Bing, the first artistic director, has passed on to New York, but his work has been ably carried on by Ian Hunter and now by Robert Ponsonby.

A catalogue of the names of the famous writers and performers whose work has gone to the making of these ten festivals would be voluminous. Many of them come again and again and are now old friends, for none have outstayed their welcome. Glyndebourne has borne the burden of opera, and with the names of John Christie and Carl Ebert we recall vivid productions of Mozart and Verdi, Rossini and Strauss. The Hamburg State Opera on their previous visit brought no less than six operas. This year we welcome their return with works representative of four composers: Mozart, Cornelius, Strauss, and Stravinsky.

Ballet for all Tastes

Ballet has ranged far afield to Yugoslavia, Denmark, America, and Japan, and is now bringing us the Ram Gopal Indian Ballet in the world première of *The Legend of the Taj Mahal*. From nearer home comes Ninette de Valois' Sadler's Wells Ballet, with Margot Fonteyn and Michael Soames. New works in the programme include Searle's *Noctambules* and a production of *The Miraculous Mandarin* with music by Bartok. For those whose tastes are more conservative there is *Coppélia*, *Les Sylphides*, and *Swan Lake*.

Art exhibitions this year are devoted to Braque and to 'The Dance in Indian Art,' worthy successors to those of earlier years in which we have studied Raeburn and Ramsay, and the art of France, the Netherlands, and Spain. Along with these one must not forget the unofficial attractions of what has come to be called 'the

Fringe.' Many of these collections of art and craftsmanship are of absorbing interest, and one remembers amongst other things silver in rich profusion and Paisley shawls.

In the festival proper they have, of course, produced Shakespeare and Shaw, T. S. Eliot's *Cocktail Party* and *The Confidential Clerk*, Eric Linklater's *The Atom Doctor*, and last year the incomparable Edwige Feuillère in *La Dame aux Camélias*. Shakespeare comes again in 1956 but this time from Canada, with the Stratford Ontario Festival Company's production of *Henry V*. Henry Sherek brings back Bernard Shaw in *Fanny's First Play* and introduces Dylan Thomas's *Under Milk Wood*.

A Bridie Play

Another new feature is the Piccolo Teatro of Milan, with new productions of plays by Goldoni and Pirandello. It is good to see the Edinburgh Gateway Company's presentation of James Bridie's *The Anatomist* in the official programme, for Edinburgh owes much to the Gateway, as does Scotland to James Bridie.

At the Assembly Hall in the first week of the festival George Scott-Moncrieff's *Pleasure of Scotland*, an entertainment of dancing, singing, and piping, will be part of Scotland's own contribution to her international festival, and as we look back over the past ten years we must not forget Tyrone Guthrie's triumphant reincarnation of Sir David Lindsay's *Ane Satyre of the Thrie Estaites*.

In the field of music the past ten years have brought to Edinburgh the orchestras and the conductors of Vienna and Berlin, of America, Denmark, and Holland, of France, Switzerland, and Italy; the cream of our own British orchestras; the choirs of Rome, Milan, and Huddersfield; the singers and the soloists and the instrumental ensembles which filled the mornings with delight at the Freemasons' Hall.

Kathleen Ferrier and Bruno Walter are no longer with us, but we welcome the return this year of Sir Thomas Beecham, Irmgard Seefried, Rosalyn Tureck, and Isaac Stern. We look forward especially to the visit of Sir Arthur Bliss, the Master of the Queen's Music, whose overture *Edinburgh* will be presented for this occasion, and above all we are graciously honoured at this the tenth festival by the patronage of Her Majesty the Queen.

Edinburgh International Festival
Opening Ceremony in St. Giles's Cathedral. G.O.S.:
Monday 00.30, 04.45, 12.00.

Thomas Beecham. G.O.S.: Monday 20.15.
Bach Recital. G.O.S.: Wednesday 10.00

British Electronics Are Still Booming

The control room of the British-built television station which was recently opened in Baghdad, Iraq: part of the studio can be seen through the glass panels

WHEN I think of the Radio Show I am always reminded of an iceberg. Glittering cheerfully above the surface in the exhibition halls is a wonderful array of radio and television equipment winking under the arc-lights: electronics, they seem to say, were invented for your enjoyment; here are the latest results—and very impressive they are, too. But take a look below the surface, and you come upon a vast industry which supports not only electronics for entertainment—electronics in its party clothes, as it were—but also electronics in a thousand industrial and scientific applications, with a place in almost every factory and laboratory, ship, and aircraft, electronics with its overalls on.

Before the war the British radio industry was almost wholly devoted to producing radio transmitting and receiving equipment. Exports of electronic equipment in 1938 were worth about £2-million. During the war the demands of the Services trebled the industry's productive capacity. Every aircraft, tank, and ship, every military unit needed some form of radio equipment. When radar appeared on the scene elaborate installations were developed for detecting approaching aircraft and ships, and for guiding attacking air forces onto the target and home again.

In 1946, one year after the war ended, the radio industry's exports were worth more than £7-million—three times the 1939 figure. Today they are worth much more than £30-million. It has been an impressive expansion. Scientific discovery and development have played a vital part in this growth. The radio industry is certainly one of the most research-minded in Britain, and spends hundreds of thousands of pounds in its laboratories every year. What are these new developments?

First, techniques of radio-communication have developed almost beyond recognition. Pre-war transmitters were cumbersome, valves had to be water-cooled, and engineers had to be constantly in attendance. Modern transmitters, like those being installed in the British Post Office's new station at Rugby, have air-cooled valves—which need much less space—and are largely remote-controlled.

Exploitation of Very High Frequencies

Another important trend has been the exploitation of higher and higher frequencies, and the introduction of frequency modulation. The BBC's frequency-modulated sound broadcasts can now be received by forty per cent. of the British population, and anyone who has heard them will vouch for the beautiful clarity of reception. Very high frequency—or V.H.F.—radio links are revolutionising communications, especially in sparsely populated areas of the world. One such link was recently completed between Nakuru in Kenya and Jinja in Uganda, 230 miles apart. It provides thirty-six simultaneous speech-channels and can be easily extended. Its capital cost works out at about £450 a mile. In comparison, a standard twelve-channel cable laid across the same mountainous country would have cost £900 a mile.

Short-range two-way radio such as is used by taxi firms, fire brigades, the police, tug-boats, and large industrial firms, has developed astonishingly since the war. Firms operating vast factory areas are finding that they can make quite surprising savings by keeping in touch with lorries, trucks, cars, and even individuals with the help of mobile radio.

A different though related field of development is radar. All major airports and the majority of civil aircraft are now equipped with one or more types of radar. With some of the latest devices navigation has become child's play even over long distances, and blind landings can be made at airports in conditions which would have kept aircraft grounded before the war. The equipping of ships and ports with marine radar is proceeding fast.

JOHN DAVY, Scientific Correspondent of the London 'Observer,' discusses some of the developments which have contributed to the post-war expansion of Britain's electronics industry, whose achievements will once again be highlighted at the Radio Show opening at Earls Court, London, this week

Much of the recent research in radar is, of course, secret, because of its military applications. The specifications which radar engineers are now having to meet for modern jet aircraft, and especially for guided missiles, read like pure science-fiction. A modern anti-aircraft missile fired from the ground accelerates to well over 1,000 miles an hour in a second or two. The vibration is unbelievable—like the inside of a colossal pneumatic drill—and would shatter any normal electronic equipment in a fraction of a second. But high-performance radar sets which fit into a tiny space, perhaps not much bigger than a bowler hat, have been developed to stand up to these frightful conditions.

The problem of packing complex equipment into tiny spaces has given a great boost to research on 'miniaturisation.' Two inventions which are making a vital contribution to this, and to which the radio industry is devoting a great deal of attention at the moment, are transistors and printed circuits. Transistors are tiny substitutes for radio valves: the most familiar form consists essentially of a wafer of extremely pure germanium. They are robust, long lasting, compact, and produce next to no heat. They are ideal for things like guided weapons and hearing aids, but they are gradually appearing in all kinds of other equipment. A 'transistorised' wireless-set is on the market in America.

Printed circuits were invented during the war by a German refugee in Britain, Dr. Paul Eisler. They consist basically of a pattern of thin copper-foil 'wires' printed on to a sheet of insulating material. They have two advantages: they are ideal for mass-production, as they can be made by an application of conventional printing techniques; and quite complex circuits can be fitted into a very small space.

Increasing Demand for Computers

Both transistors and printed circuits have found immediate application in another and exceedingly important sphere of electronics, namely, electronic computers. The uses of these machines are only just beginning to be explored. They are already used for making scientific calculations which would require days or years of laborious work by any other method; for keeping accounts, and other office work; for weather forecasting; for the automatic control of machine tools; and for a host of other purposes. Several kinds of computer are being commercially produced, and though they are still fairly expensive they are going to be increasingly in demand.

This survey would not be complete without mentioning the vital role of electronics in atomic energy. Only electronic equipment is fast enough and sensitive enough to detect and count the rays and atomic particles emitted by radio-active substances. Special electronic instruments are essential for controlling every atomic reactor; for detecting radio-active isotopes being used in laboratories and in industry for hundreds of different purposes; for prospecting for uranium; and so on. In fact, where there is radio-activity you can be pretty sure you will find a piece of electronic equipment nearby. The demand for such instruments is clearly going to increase rapidly, and there are signs that British firms are going to be able to build up a substantial export trade in this field.

Perhaps I have said enough to indicate something of the scope and scale of the electronics industry today. Most of the developments I have mentioned have occurred within the past ten years or so. There is no doubt that the next ten years will bring many more. (*Broadcast in the BBC's General Overseas Service*)

V.H.F. receiver: the use of very high frequencies ensures very clear reception, and has opened the way to cheaper and faster communications in many areas

The Oval—the traditional setting for the last Test in each rubber—from a painting by Charles Cundall at this year's Royal Academy Summer Exhibition

The Oval—Scene of the Fifth Test

JOHN ARLOTT, one of the BBC's team of Test commentators, recalls some of the traditions and glories of the south-London cricket ground where England and Australia meet on Thursday for their final match in the season's series. (Details of G.O.S. commentaries can be found in a note on page 19)

SO we come to yet another Oval Test match. The Oval, if you wish, or, more sympathetically and more accurately, Kennington Oval. Lord's is Lord's, somehow isolated behind its wall from the rest of London, the capital village of cricket—international, not local. The Oval, however, is part of south London: the red buses running round it; the tall blocks of flats, the gasholders, and the distant spires looking down on it; the great chimneys sending their soot gently over it to settle on that rather grimy, essentially Cockney turf.

Not a comfortable ground, you might say, although the recent improvements mean that of the 30,000 people the ground can contain 18,000 to 20,000—including members—can watch from the relative comfort of wooden seats. Just as its walls do not seem to shut out the world outside, so within the ground the pavilion is not the distant sanctum that it is at Lord's but somehow very near the spectators.

The Oval Test match nowadays is synonymous with 'the last Test,' but it was also the scene of the first Test match ever played in England.

That England v. Australia match took place at the Oval after many shifts and failures to arrange an international match on September 6, 7, and 8, 1880. To read that score sheet now is to conjure up a procession of almost mythical figures of great players.

Lord Harris was captain; W. G. Grace went in first—and incidentally scored 152—with his brother E. M. Grace, 'the coroner'; the third Grace brother—G. F.—went in at number nine, the only occasion on which three brothers have ever played in a Test. G. F.—Fred—caught the Australian hitter, Bonner, off so towering a skyer that the batsmen completed their second run before it came into his hands. Alas, it was G.F.'s last first-class match: he made a pair of spectacles; and only a month later, at the age of thirty, he was dead.

The First Test Australia Won

It was at the Oval, too, in 1882, that Australia first won a Test in England: that memorable game which has been rehearsed almost ball by ball by some of the greatest of cricket writers. It was, as in 1880, the only Test match of the season; that Australian team has been described as their country's greatest XI. Still from that first home Test of two years earlier England had 'W.G.'—top scorer with 32 in England's unsuccessful attempt to score 85 to win in the second innings. There, too, were the legendary Yorkshireman, Ulyett—'Happy Jack'—the Hon. Alfred Lyttleton, the wicket-keeper who once took off his pads to take four Test wickets as an under-arm bowler; A. G. Steel, of the prodigious leg-breaks; Barlow, the great stone-waller.

The Australians with Blackham—'the prince of wicket keepers'—and Massie, who hit 55, won through the great bowling of Spofforth—7 for 46 in the first innings, 7 for 44 in the second: the 'Demon Bowler' indeed! At the end of the match there appeared that historic obituary notice in the *Sporting Times*: 'In Affectionate Remembrance of English cricket, which died at the Oval on 29th August, 1882, deeply lamented by a large circle of Sorrowing Friends and Acquaintances. The body will be cremated and the Ashes taken to Australia.' This notice coined the term 'the Ashes.'

My own first great cricket memory is of that August day in 1926 when England won the Ashes from Australia after fourteen years. Of recent years rubbers against Australia, West Indies, South Africa, and Pakistan have gone to the Oval for final decision. There again, in 1953, the Ashes came back to England after almost twenty years; the West Indies won

their first rubber in England; and Pakistan made history by drawing the rubber with England.

It has become the ground of farewells. In 1930 Jack Hobbs played his last Test match against Australia on the turf which had been the scene of so much of his great cricket. On the Australian side in that match, Sir Donald Bradman made 232: so as one giant stepped off the stage his successor stepped on to it. Bradman in his turn was to say farewell to the Oval. In 1948 the crowd stood all the way round the ground and cheered him to the wicket in his only innings of Australia's win.

It was a most moving moment. Sir Donald was a sternly realistic cricketer, but I have often wondered if even his shrewd eyes were a little misted by the warmth of that reception. Surely he had never before in his career failed to spot a googly such as that with which—second ball—Hollies bowled him for one of the few ducks he ever made in Tests.

For seventy-six years now the Oval Test has been played on a strip never varying more than six feet either way, directly ahead from the players' gate at the bottom of the pavilion steps. As the players walk out the grimy little Oval sparrows and the flock of pigeons move to let them through. In through the Hobbs Gates to the game, and there is little Bert Strudwick on his way to keep score—a link in the long chain of Test-match history at the Oval. This week sees that saga continued.

In 1880 W. G. Grace batted at the Oval in the first Test ever played

In 1948 Sir Donald Bradman bade farewell to Test cricket at the Oval

Preparing to drive a drill-pipe deeper at a Trinidad Oil Company well: one advantage of the take-over will be to provide capital for new explorations

THE TRINIDAD OIL DEAL

WILLY RICHARDSON, who is himself a Trinidadian by birth, discusses in this 'Commentary' the possible effects on the economic and social life of the island of the offer by an American firm to buy out the Trinidad Oil Company

THE offer of the American Texas Oil Company to buy out Trinidad Oil was the signal for an orgy of speculation and doubt. Why should an apparently successful company choose to sell out at that precise moment? I say 'apparently' because only recently when I visited the company's refinery in Trinidad it seemed in full swing and very impressive to look at: the storage-tanks, the giant cat-cracker, the large pipelines to the pier, all painted in silver and gleaming in the sunlight. And we know that in 1955 it provided the Trinidad Government with almost twenty per cent. of its revenue. But according to Mr. Vos, the chairman of Trinidad Oil, the company does not have adequate resources to expand its activities—for example, the recent explorations for new sources of oil both on land and sea.

This offer may silence for a while the Jeremiahs who have been claiming for years that the oil-wells of Trinidad would soon run dry. But it is true that the industry is now going through a stage of secondary recovery, which costs considerably more than the primary drilling operations when the oil is flowing freely. So that when the Texas Oil Company made its very handsome offer it found Mr. Vos willing to negotiate.

The concern which has been caused in Britain is not difficult to understand. But what do the people of Trinidad feel about a deal which affects them more directly than anyone else? Before the deal goes through the company will be asked to accept certain undertakings with regard to continuity of production and the maintenance of industrial relations as established, and so on. But, given even these undertakings, how is it going to benefit the people of Trinidad?

A Greater Supply of Money, but . . .

It will mean, for one thing, a greater supply of money in Trinidad itself, and other material benefits in an island which already has the highest standard of living of any British West Indian territory. There is the additional factor that since the war every attempt has been made to woo American capital into the Caribbean by tax concessions and other facilities, and already there is a considerable amount of investment in the area—in bauxite, in textiles, and in the tourist industry. The size of this transaction does, however, provoke anxieties that were never felt when the smaller enterprises were being launched.

The first of these relates to the fact that most of the people of Trinidad are coloured. Will the presence of the Texas Oil Company mean an increase of racial discrimination, which has been dying out gradually during the years? Since the war the United States has made a great attempt to put its own house in order, but anyone who has spent any time in a southern town, as I did quite recently, knows that many southern states still have legalised discrimination. Both the United Kingdom and the Trinidad Governments have stated that they will insist on a no-discrimination clause, and one hopes that there will be no difficulties in this respect.

With regard to proposed safeguards, one wonders how they will be imposed. One can only hope that oil-men in Trinidad will have no desire to isolate themselves from the rest of the community. More subtle and difficult to combat will be the pressure caused by the supply of easy

dollars within the territory. During the last war Trinidad was a United States base, and no one will dispute the social upheaval that this occasioned. In the long run only Trinidadians can decide at which point they will interrupt any drift towards Americanisation, which some deplore. At the same time it is only fair to note the advantages which American capital has brought to Puerto Rico, an island which many West Indians regard both as an example and a goal.

Naturally the presence of a large American concern in any West Indian island becomes a matter of importance to a much wider area than hitherto, for with the federal arrangements which are now going forward whatever happens in one territory is bound to affect the others. Will it mean the possibility of jobs for workers from the other islands? Will it affect the decision as to where the federal capital should be? This deal can have far-reaching consequences for the people of the West Indies. (*Broadcast in the BBC's General Overseas Services*)

THE COMMONS DEBATE

JUST over three and a half hours were devoted to the Trinidad oil debate in the House of Commons—and several speakers deplored the fact that more time had not been allowed. I felt, however, when it was all over, that the four Front Bench spokesmen and the nine back-benchers who took part in the discussion had said all that there was to be said on this vital issue—for the moment, anyway.

The Chancellor of the Exchequer, Mr. Macmillan, had little to add to his statement when he first announced the proposed sale of the Trinidad Oil Company to a Texas firm, and Mr. Harold Wilson, who was the Opposition's first speaker in the debate, resorted to a recent and effective trick he has developed of diverting attention from the main issue by a series of entertaining wisecracks and witticisms.

He did not approve of the Trinidad deal at all: he called it 'a regrettable transaction,' and said that the Chancellor had not told the House what possible advantage the deal would be to Britain. On the other hand Mr. Wilson had no reply to the sniping of Conservative back-benchers who maintained that Britain should not be a 'dog in the manger.' Since she could not provide the capital investment herself, why should she deny the Trinidad Oil Company this chance of expansion? It was a 'galling decision to Britain's national pride,' but it was the right idea.

The Main Issue at Stake

When Mr. Wilson sat down those nine back-benchers, Conservative and Labour in turn, held the floor between them for a good hour and a half. And several times the debate degenerated into a good old Parliamentary rough and tumble with personal accusations hurled back and forth across the floor of the House. Points of order were constantly raised, and the Deputy Speaker had to use a firm hand more than once. The serious issues seemed to be forgotten as party capital was made, first by one side, then by the other. And I felt it was a case of a good time being had by all, until the closing speeches brought the House back to the main issue.

First came Mr. James Griffiths for the Opposition, and then the Colonial Secretary, Mr. Lennox-Boyd, who wound up for the Government. Until these last two speeches the attendance in the chamber had been only fair, but towards the end of the debate members began filing in, and for the last twenty minutes or so the House was packed. Mr. Griffiths' main point was that the Government should not go forward with the deal until the autumn elections in Trinidad. But Mr. Lennox-Boyd said that the consent of the Governor of Trinidad and his Council had been obtained and that was enough. He saw no point in postponing the deal until the autumn.

Mr. Lennox-Boyd was clearly in a hurry to get on with his speech in order to finish at seven o'clock, when the division which the Opposition had insisted upon was due to take place. But Labour members interrupted him constantly and called upon him repeatedly to expand upon and develop the safeguards which the Chancellor of the Exchequer had mentioned earlier in his statement.

These undertakings which the Government of the United Kingdom and the Government of Trinidad are asking the Texas Oil Company are, first, that the Trinidad refinery is operated at full economic capacity, and if possible, expanded; second, that exploration in Trinidad is intensified; third, that existing oil resources in Trinidad are exploited on the basis of sound operating practice at the maximum economic rate; fourth, that industrial relations are maintained on the basis of existing and established practice; fifth, that there is fair treatment of existing personnel and training of as many local men as possible to take high positions in the company; and, finally, that there is no racial discrimination in any of the company's plant and the rights of local persons are respected.

The precise form of these safeguards, said the Minister, was a matter for discussion between the governments of the United Kingdom and Trinidad, and the Texas Company. These discussions would be held as soon as possible. At the end of the debate the House divided, and the Opposition's no-confidence motion was defeated by sixty-eight votes. The new biology building, and (right) the main block: many old students of the college look back upon their time there as the best in their lives

An Imperial College of Tropical Agriculture

HILARY PHILLIPS, who has recently returned from a tour of the West Indies, describes some of the activities of the institution just outside Port of Spain, Trinidad, which has become a centre of research and education for agricultural students from all over the world. A G.O.S. programme on the college can be heard on Monday at 17.30 and 23.15, and on Tuesday at 10.00

RECENTLY at one of our agricultural shows I met a young Nigerian. When I told him that I had just returned from a visit to the Imperial College of Tropical Agriculture in Trinidad he became very excited. 'My time there was the best in my life,' he said. I found much the same reaction when I talked to present students at the college.

ICTA is the world centre for research and education in tropical agriculture. It is at St. Augustine, about half an hour's drive in the heavy traffic out of Port of Spain. Academic standards are high. For example, a Colonial Officer probationer, studying for the Diploma in Tropical Agriculture, must already hold a degree in agriculture, or an honours degree in science before he begins, and in addition he must have completed a year's post-graduate course at Cambridge (or, more recently, Reading or Wye). There are also undergraduates at ICTA. They come mostly from all over the Caribbean, but many other parts of the world are represented. The ninety-two students at the college come from nineteen different countries and all around the world today there are Directors of Agriculture and eminent agriculturists who are past students of the college. Friendships made at ICTA are put to practical use in later years by these people, many of whom maintain their links with one another and with the college.

Students do project work on the farm, and this is not always closely related to the job which they expect to have after their course is ended. They are encouraged to broaden the base of their training, and this has its advantages, as in the case of the ex-student bound for Tanganyika who found himself on arrival unexpectedly in charge of a newly opened citrus-propagation station.

An immense amount of research is going on at ICTA. In four days of intensive interviewing at the college I found it quite impossible to cover

A class watching a practical demonstration in preparing land for rice growing

all the ground. Of special interest, I thought, was a long-term practical experiment organised by Dr. A. L. Jolly which takes the form of a series of trial peasant-farms. The experiment has shown that a three-acre farm can earn for the farmer and his wife a net income of more than £350—just five or six times the normal Trinidad income for such a place.

Work on bananas, cocoa, and soils has been going on for many years. Now the research into these three important subjects is co-ordinated by the newly formed Regional Research Centre at ICTA which is studying common problems in various parts of the Caribbean. For instance, Mr. N. W. Simmonds is trying to breed new disease-resistant strains of banana, an arduous business demanding great perseverance. Last year he brought back almost 100 collections of wild banana from south-east Asia and the Pacific. Now, after trying a good many thousand varieties, he thinks they have three or four which look 'quite promising.'

Mr. T. A. Jones told me how in British Guiana two men have been able to survey the soils over an area of 1,200 square miles. An expert, it seems, can look at an aerial photograph, and put it, in Mr. Jones's words, into 'a meaningful picture, as far as the soil is concerned.'

In the West Indies cocoa is commonly grown under a shade crop—usually bananas—to begin with, until the cocoa gets too big. But I learned from Mr. D. B. Murray that on very fertile soils good crops of cocoa can be grown with very little shade—even with none at all.

At the weekend Dr. Herklots, the principal, casts the cares of the college aside for a few hours and disappears into the country with Mrs. Herklots, to return triumphant with a bird, a picture of which is duly sketched and painted with skill for a book on the birds of the island.

Running ICTA is a complex job. Dr. Herklots told me that a sense of humour was essential. Judging by his annual reports he has one. For instance, in the 1954-55 report there is a note about the inadequate addressing of mail. A postcard arrived, postmarked Devon, and addressed to nobody in particular inscribed: 'Lots of love from Auntie.' The report continues: 'Eventually the right nephew was discovered without consulting the principal, who has an aunt, in the nineties, in Devon.'

On one of Trinidad's cocoa estates students watch a demonstration of the variation in cocoa-pods: measuring the weight of fresh beans

Bodhgaya—the Place of Enlightenment

The tower which marks Buddha's Place of Enlightenment at Bodhgaya

THE holiest of all Buddhist shrines is Bodhgaya, a village in the province of Bihar, not far from Patna. For Buddhists no place in the world is so evocative of feelings of profound reverence and delight, for there the Prince Siddhartha attained to that Enlightenment which is called Buddhahood—a direct, intuitive understanding of the formless Reality underlying the universe of form. Buddhists regard this Enlightenment as the greatest event in the history of the world: from it stems the whole of the Lord Buddha's teaching, which has convinced at least a third of the human race that every individual may ultimately gain the power and knowledge which will enable him to transcend the world of form and to achieve direct experience of Reality. So my thoughts as I approached this holy place were charged with deep emotion.

Surroundings of a Dream-Like Quality

On the day of my arrival I reached the Gaya railway station soon after sunrise, and during the seven miles' journey to Bodhgaya itself the soft light and fragrance of the Indian dawn lent a dream-like quality to my surroundings.

Villagers fresh from their morning bathe were setting out for their fields, the women clothed in brightly coloured saris clanked heavy jewellery and anklets of wrought silver. Rumbling ox-carts blocked the road, the white, humped oxen wearing such expressions of gentleness in their great, liquid eyes that it was easy to understand why Hindus regard them as manifestations of the divine. Once I came upon an enormous elephant being respectfully groomed by its human servitors. The huge, docile beast seemed to be actually smiling.

I found Bodhgaya to be a dusty one-street village fronting the group of Buddhist and Hindu temples clustered near the splendid tower which marks the Place of Enlightenment. First I went to one of the rest-houses for breakfast, and here I met a Buddhist monk who looked unmistakably European.

He explained that he was a German who had walked or hitch-hiked overland all the way from Sweden to India, braving extreme cold to which his thin, yellow robes were not at all well adapted, and sometimes the scorn of people who found his appearance odd. Though entirely dependent on charity for his food he even talked calmly of continuing his walk to Japan *via* Burma and Thailand.

Next to the rest-house was a Tibetan *gompa* or monastery, where lamas in blood-red cassocks welcomed me and invited me to the main shrine-room. This was gay with gilded statues and a profusion of richly coloured silken carpets and hangings. As we stood there talking I was surprised

JOHN BLOFELD, in the second talk in the series he is currently giving in the General Overseas Service, records his impressions of the holiest of all Buddhist shrines at Bodhgaya, in northern India, where Buddha achieved the state of Enlightenment. (The third talk, which is being broadcast this week, is introduced in a note on page 19)

by the entrance of a group of Hindu pilgrims—country folk likely to know almost nothing of Buddhism—who began prostrating themselves to the ground before the Buddha statues. Such is Asia! Muslims apart, Asians find nothing astonishing in offering their respects at the shrines of several faiths.

From the Tibetan *gompa* I walked out into the burning sunshine to seek the Place of Enlightenment and enter upon the supreme experience of my pilgrimage. But first I studied the great *vihara* which fronts the actual Place of Enlightenment. I saw a magnificent tower of carved and polished stone, tapering from a wide square base to a slim cylindrical neck and pointed top 170 feet above the ground. It reminded me of an immensely elongated pyramid, and I recognised it as substantially the very building I had read about in the account written by the Chinese pilgrim Hsuan Chuang some 1,300 years ago. In those days Buddhism was still flourishing in India. So he found the tower decorated with golden figures and splendid silver and gold ornaments.

The Wonderful Scene of Long Ago

But in the twelfth century invading central Asian hordes reduced it to a heap of bricks, along with the thousands of other monuments of India's greatness. Then it was lost to history until the nineteenth-century Burmese kings interested themselves in the holy place. After that fate added a curious twist to the tower's destiny; for when the Burmese King Thibaw lost his throne to the British it fell to Christians—the then British Government of India—to restore this holiest of Buddhist shrines. The work was completed under the supervision of Sir Alexander Cunningham, an archaeologist to whose ability and zeal the Buddhist world owes many debts.

The tower, despite its magnificence, is but a prelude to a simple monument lying just behind. This is a horizontal slab of carved stone which covers the actual spot where the Lord Buddha did final battle with ignorance and won supreme enlightenment. It is shaded by a Bodhi tree which is the descendant at one remove of the world-famed Bodhi tree which offered shade to the Lord Buddha during the culmination of the mystery of Enlightenment. As Buddhist pilgrims reverently lay their foreheads upon the stone memorial the sacred associations of the place enable them to visualise the wonderful scene of long ago.

With what Wordsworth calls the 'inward eye' they behold the gentle Prince Siddhartha renouncing the promise of great empire, the love of wife and child, and the sensuous luxuries of his court for the austere life of a forest-dwelling hermit.

They see him wandering in the jungles for seven years, ever seeking the secret of life and death, until at last he seats himself cross-legged beneath the Bodhi tree and declares his unshakable determination to succeed, using the words: 'Indeed, let only skin and bones remain; let the flesh and blood of this body dry up; never will I abandon this seat without attaining the state of supreme enlightenment.'

One of the ancient Chinese pilgrims records with apparent faith a legend that when the world was formed a now-invisible diamond-hard and indestructible throne, the Vajrasana, arose from the ground in this place; without which earth could not remain, for it would be unable to support the spiritual weight of a supremely enlightened being, a Buddha. True, I myself did become sensible of a spiritually charged atmosphere of holiness and peace—an experience commonly encountered by pilgrims at the moment of paying reverence at that sacred spot.

After a while I reluctantly turned away to explore some of the other monuments, including a lovely sandstone railing charmingly engraved with figures, medallions, and flowers, somewhat in the style of the Asokan period. Many of the Buddha statues round about have been sadly mutilated by invading armies, and others are now worshipped by the local people who suppose them to represent gods.

Later I was bidden to dinner by a Chinese monk, who was so delighted to find a single human being able to talk his language that he prepared enough food for at least twelve people, though only three guests were bidden. Before lunch I happened to mention that I was leaving that evening; and this made him so melancholy that he did not eat a single mouthful of the feast he had cooked with his own hands. Before I left he offered me the priceless gift of some ochre-tinted leaves from the Bodhi tree, which Buddhists naturally treasure.

That night I felt tired out and went early to bed. Before I slept my thoughts travelled back to the holy seat beneath the Bodhi tree, and I recalled some of the first words spoken by the Lord Buddha after his Enlightenment. They express his certainty that the delusion of self has at last been revealed and conquered, thus eliminating all danger of rebirth into this unreal and sorrow-fraught world, and thus ensuring final peace in Nirvana. (Broadcast in the BBC's General Overseas Service)

New vehicles and new services on British Railways: a diesel train on the Bradford-Leeds run, and (right) the South Wales Pullman train on its daily run

FAREWELL TO THE THIRD-CLASS CARRIAGE

PETER ROOS, commenting on the decision of British Railways to do away with third-class carriages in their trains as part of a general plan to increase travel efficiency in Western Europe, recalls some earlier and more revolutionary episodes in railway history

THIRD-CLASS travel on British Railways has disappeared. It sounds as though a social revolution of the first magnitude has occurred: actually it is nothing of the kind; all that has really happened is that third class has been redesignated second class. Travel in Britain will not cost any more on this account, for fares in the new second class are those now charged for third-class travel.

The change is part of a general plan by the railways of Western Europe—except those of Spain, Portugal, and Greece—to reduce the number of classes to two: first and second. This will simplify through bookings, by land and sea, between the various countries. Even so, behind the announcement there is a fascinating story of social change, a change which began more than a hundred years ago and has not been publicly acknowledged until now.

Why, it may be asked, did we have only a first and third class? What happened to the second class which, by inference, must have existed at some time or other? In the really early days of railways there were, on some lines, as many as four different classes. Often whole trains were restricted to the use of passengers with first-class tickets. In one of my early Bradshaw timetables, beneath the London and Southampton service of 1841 there appears this footnote: 'The first-class trains take first-class passengers only, except a limited number of servants in livery.' On another page there is a very ambiguous note. It reads: 'The Sunday trains are all mixed.' And elsewhere the would-be traveller is warned: 'The Manchester 7 a.m. train is the only one by which passengers can go to London in wagons.' I expect they were duly thankful for that.

In the mid-1840s, forty-one out of every hundred passengers travelled first class, forty-two went second class, and the remaining seventeen used the much-to-be-avoided third class. At that date third-class passengers usually travelled in open wagons in slow trains which also conveyed merchandise. These were carefully timed to make sure they failed to connect with other trains. If possible travellers were left stranded for the night at whatever outlandish spot the company could find. The object was, of course, to dissuade people from travelling third class.

Second-class carriages were provided with seats upholstered in stiff leather, but these were a distinct improvement on open trucks. The first-class vehicles were very much like the coaches to which the gentry had long been accustomed.

The consequence of all this was that the railways failed to attract the vast middle-class public. In 1884, therefore, by an Act of Parliament now known as Gladstone's Act, after the famous statesman, the railways were compelled to give third-class passengers carriages with seats, protection from the weather, and an average speed of twelve miles an hour—for a fare not exceeding a penny a mile.

This had the immediate effect of increasing the number of third-class passengers. But the Act was not a popular measure with the companies, who continued to provide only the bare necessities. Things drifted on until, in 1872, the Midland Railway Company exploded a bombshell: they announced that henceforth they would admit third-class passengers to all their trains. And in 1875 they not only abolished the second class altogether—they also reduced first-class fares to second-class level.

This was revolution indeed! Other companies were forced to follow. More than three in every four passengers now travelled third class. By the turn of the century the figure had risen to nine out of ten. And the latest report of the British Transport Commission shows that nowadays all but about two in every hundred passengers travel third class, or, as it now becomes, second class.

Tremendous Improvement in Rolling Stock

Personally I think the most revolutionary aspect of the whole business has been the tremendous improvement in the rolling stock. Today the new second class of British Railways compares more than favourably with its counterpart anywhere. Of course, I know the question of decoration is largely a matter of opinion. We often argue among ourselves as to whether the brass luggage-racks and teak exteriors of the old Great Northern coaches were to be preferred to the more graceful curves and chocolate-and-cream colouring of those on the Great Western. But despite this partisan loyalty to the past we are pretty well agreed that the modern all-steel carriage takes some beating. It has no doors that open directly to the chilly outside air; its deep windows give a good, clear view of the passing scene; and the hardly perceptible glide with which British trains start and stop, due to the universal adoption of continuous brakes and screw couplings, is something we are always ready to boast about.

One feature at least persists from the past into the present, and that is the railway compartment. Apart from carriages built for dense suburban traffic most British rolling stock is still of the compartment type. This, too, is a survival from the early days. Originally, passengers were permitted to take their own coaches by train, and flat wagons were provided by the companies for the purpose. The railway carriage derives

from this practice and the early examples were little more than several coach bodies placed side by side on a common chassis.

We seem now to have reached a significant stage in the development of inland transport. In the past year or so British Railways have been turning over more and more of their lines to diesel and in a few cases to electric traction. This process will continue until, in due course, steam locomotives become things of the past. Those of us who regard them with affection will regret the passing of old friends. We in Britain were the first country in the world to employ steam locomotives, and we have already made sure we shall not be the last to enjoy the economy and comfort that newer sources of power make possible. (*Broadcast in the BBC's Overseas Services*)

OUR WAY OF LIFE: 5

DUDLEY STAMP

The Truth about the British Climate

DUDLEY STAMP, Professor of Social Geography in the University of London, in another contribution to the current G.O.S. series clears up some misunderstandings among strangers about the British weather: 'We can,' he says, 'claim in Britain that we have almost the ideal climate of the world'

IT is a curious thing that our British weather and our British climate are very much misunderstood by strangers. American visitors, for example, who come to Britain seem to expect to find thick fogs—or pea-soupers, as they used to be called—at almost any time of the year, and if they come around Christmas they are quite disappointed if the ground is not white with snow. Our Victorian fiction is probably to blame for this, because it is almost impossible to imagine Sherlock Holmes in his Baker Street flat without a thick fog outside; and, of course, we think from novels by Dickens of people enjoying a white Christmas.

As a matter of fact fogs are really much rarer in Britain than in many countries of the world; even the foggiest localities do not have fog more than two per cent. of the total time in a year; and as for Christmas, well, a white Christmas is really quite rare. With regard to fogs we have got this new trouble which we call 'smog.' That is particularly associated with towns, and we believe it to be due to the exhaust gases from the new motor-vehicles. That is not really, then, climate.

We can, I think, claim in Britain that we have almost the ideal climate of the world. Now why is that? It is first of all never too cold for outdoor work and exercise. The Englishman loves living in his own home—the Englishman's castle—and on a fine frosty morning in winter it is very delightful to go out for a brisk walk to get warm. Again, in the winter sport and work normally continue, only occasionally interrupted by hard frosts. And then in summer it is never too hot: sun-bathing is sought rather than shelter in the shade.

What do these things mean in figures? We can say this: the thermometer practically never drops to nought degrees Fahrenheit—one or two possible records excepted. So that if the thermometer drops below twenty degrees Fahrenheit—that is, twelve degrees of frost—there will be headlines in the newspapers about it. Similarly, in summer it is doubtful whether the thermometer has ever risen above 100 degrees Fahrenheit in the shade; and, again, if it rises to over ninety there will be headlines in the newspapers.

Then, of course, another thing: we get rain throughout the year—some people say too much. But the point is that if there is no rain for as long as fifteen days that is officially called a drought. When one remembers that in many countries of the world there is no rain for six months or more you will see that drought is really non-existent. As the result of this amount of rainfall no irrigation is really needed for any of our crops; a few special vegetable crops may be watered, but by and large irrigation is not necessary.

How is our weather caused? I think we should say first that in Britain we lie in the westerly wind-belt, so that most of our weather originates over the Atlantic to the south-west, and that is one of the difficulties in forecasting weather. We have a passage of depressions

over our islands, but the forecasters are never quite sure whether they are going to swing to the north, swing to the south, or whether they will pass right over the heart of the British Isles. When a depression is coming we know we see light feathery clouds in the sky, then the heavy rain clouds come, and then, perhaps, strong but warm south-westerly winds and a downpour of rain. The rain passes into drizzle and, perhaps, fine weather again, and then as the front, as we call it, has passed we get the down-draught of much colder air with clearing up showers from the north, and then fine weather again.

You can see that that sequence does give us great variety, but it goes on and on and on often throughout the year. Of course, we can turn that, if you like, into modern ideas when we think in terms of air masses, and we can say that for much of the year we are under the influence in Britain of warm moist air from the south-west: M.T.—maritime tropical—air we call it. At other times we are under the influence of C.A.—continental Arctic—or even C.P.—continental Polar—that is cold air from the north. Occasionally in the winter we get really cold air from the poles, and occasionally in summer a mass of C.T.—that is continental tropical—air coming right the way from north Africa.

What does this give us? In the winter we find that the eastern half of Britain is comparatively cold; the western half, facing the Atlantic, relatively warm. In summer it is different: it is the south which is warm and the north which is cold, and so in the extreme south-west of the British Isles we have the greatest equability of climate, where it is mild in the winter and warm in the summer. In that part of the country, with an average temperature which never drops below forty-three or forty-four degrees, the grass grows throughout the year; the cattle will feed out in the open right in the middle of the winter.

It also means that as far as rainfall is concerned in the hilly regions of the west one gets more than sixty inches rainfall, and that is really too much. Over much of the Midlands and the lower ground in the west the rainfall is between thirty and sixty inches. That is a little too much for the ripening of crops but it is ideal for the growth of grass, and that is why so much of Britain is occupied by either temporary or permanent grass, and why the country seems so green to strangers throughout the year. Only in the east of England, where the rainfall is less than thirty inches, we find the conditions that are really right for the ripening of wheat and of other grain.

I suppose there is one thing which I ought to say against our climate: we do not really have quite enough sun. Along the south coast of England there is an average of about five hours of sunshine per day throughout the year, but I am afraid in some of the northern areas around Manchester and the Highlands of Scotland it is less than three hours per day. That, perhaps, is our one main disadvantage. (*Broadcast in the BBC's General Overseas Service*)

THERE has just been published a plump and immensely expensive book which gives the result of a recent census of the population of London. It has taken five years to collate the census findings and print them, but I must say the result seems well worth the time, expense, and trouble. The book exposes London as neatly as if the city had been X-rayed.

It tells you that there were nearly 11,000 wives in London aged from fifteen to nineteen—very young for English wives—and that two-thirds of male Londoners between twenty-five and twenty-nine are married. It tells you that only half the population of 8,348,023 was actually born in London; that half a million come from overseas; that only two cities in Ireland contain more Irishmen than London; that 50,000 Poles, 35,000 Germans, and 24,500 Russians are domiciled in London. It tells you that there are 625 Londoners who were born at sea.

Besides this agreeably useless information, the book also contains some astonishing statistics about the quantities of people who live outside the city and come into London to work every day of the week.

No less than 950,000 people make long journeys every day of their working lives into central London. Every year more people come in from farther away. The aggregate number of hours and money consumed by this daily flood in and out of the city is fantastic: five years ago—and things have certainly got worse since then—the time spent in travel by all the workers of central London was the equivalent of the time spent at work by something like a fifth of them. The cost is correspondingly vast.

A Million Commuters

It must be admitted that sometimes this daily journey is a misery. This is especially so in winter when the million commuters get up in total darkness, perhaps go to the nearest railway station in pouring rain, crowd into steaming carriages for an hour, and then jostle and shove their way to their offices *via* the underground railway system.

Bad weather and crowded trains apart, commuting becomes a way of life. I used to travel regularly to London from a small town fifty miles out. Each carriage was like a small club: the same men sat there every morning in the same places; they all knew one another; they relaxed, smoked, read the papers, chatted. For an hour they were free of trouble and entirely their own masters, out of the range of their wives, their bosses, and the telephone.

Most people travel in complete silence, a national characteristic I am often grateful for when I recall a train trip I made once in Portugal when one man talked solidly for five hours when I was trying to sleep. The silence of English travellers leaves the way clear for reading, which is how most commuters occupy themselves, and to judge by the number of newspapers consumed daily by travellers in and out of London it would seem likely that they are the best informed group of people in the world.

What is most striking about London commuters is the way in which each man keeps himself to himself. One scarcely ever even hears an argument on a commuters' train. Windows are opened and shut by mutual consent, after a general poll of opinion in the carriage has been taken. (MICHAEL DAVIE *in the BBC's Far Eastern Service*)

'Taya,' an oil painting by Miguel Villa, a Catalan who was born in Barcelona in 1905

'The Washerwomen,' by José Gutiérrez Solana (1885-1945)

20th-Century Spanish Painters

HARDIMAN SCOTT tells of an exhibition at the Arts Council Gallery, in London, at which some eighty works by thirty-one artists gave the British public a first overall impression of painting in Spain: 'strongly Spanish, yet strongly individual'

DURING the past few years in Britain we have been lucky enough to see a great many exhibitions of paintings—classical and modern—from famous collections all over the world. As far as modern painting is concerned one country had been almost unrepresented: Spain. Apart from the paintings of Picasso, we had seen almost nothing of the work of twentieth-century Spanish painters. Now eighty pictures, the work of thirty-one contemporary Spanish artists, have been on show to the public at the Arts Council Gallery in London, and the exhibition is going on to Glasgow and Sheffield.

From what I could tell, at any rate from these paintings, Spain must be among the few countries which has not got caught up in what you might call international ideas in art—the kind of fashions you can find everywhere. It is true there were paintings of the kind you could find in any capital in the world, but most of them seemed as though they could only have come from Spain: they were strongly Spanish, and yet the interesting thing is they were strongly individual. The fierce light of Spain, the atmosphere, and especially the burnt-earth colours, they were to be found in nearly all the paintings, even in some of the abstract paintings.

'Gypsy in Blue,' by Isidro Nonell (1873-1911), a friend of the young Picasso

For the most part the Spaniard paints what he can see, but he gives it his own individual twist. Among the older generation there was Nonell (he died in 1911), who devoted a lot of his time to painting gypsies. He was a friend of the young Picasso, and there was a fine sombre painting, *Gypsy in Blue*, which might almost have been a very early Picasso.

Then there was Solana, right in the tradition of Velasquez and Goya, a realist and a dramatic painter. His *The Washerwomen*—its patterning of white and black and the intricate balancing of the folds in the clothing—was one of the finest paintings in the exhibition. Quite different but just as exciting is the work

'Nocturne,' an oil painting in lively colours by Rafael Zabaleta (born 1907)

of Gutiérrez Cossio, who is still alive—indeed I saw him at the exhibition. He is almost wholly concerned with the play of light.

Then, among the middle generation, I think perhaps the most outstanding painter is Zabaleta. In his paintings, *Peasant* and *Nocturne*, his figures are not natural or real: they are rather primitive. It is as though a very sophisticated peasant had been painting. *Nocturne*, for instance, shows some reclining figures in the moonlight: beautifully moulded forms, carefully balanced shapes, and all painted exactly in the most brilliant blues and greens and pinks.

Then there is Brotat Vilanova, who is just thirty-three. His *Paradise* is charming and naive: it is a kind of decorative Garden of Eden which looks almost like a tapestry. Among the youngest painters the abstract works left me a little cold and they were not very Spanish, but it was worth looking at a painting by the youngest in the exhibition: Vaquero Turcios, who is only twenty-three. His *Doric Landscape*—rocks, pillars, and a white bull—seems a return to more realistic painting without losing any individuality. Altogether, it was an exciting exhibition, quite fierce with the spirit of Spain. (Broadcast in the BBC's 'Radio Newsreel')

LORD HEMINGFORD

A Morning with 'Secondary V'

LORD HEMINGFORD, a former Principal of Achimota College, Gold Coast, in this talk contributed to 'I Remember Africa,' a current series broadcast in 'Calling West Africa,' delves into his memories of twenty years ago to recall the most delightful surprise he ever had during his long teaching career

I REMEMBER a morning at Achimota twenty years ago when the Vice-Principal called me to his office and said that as Sandy Fraser was unwell he wanted me to take Secondary V's Scripture period. He added that they were studying the book of *Amos*, but that I might teach what I liked. So I scratched my head, quickly made a plan, and twenty minutes later entered one of those upper classrooms near

the clock-tower from which you look over the Accra plains, on the one side to the sea and on the other to the Akuapem hills.

I can see the class now: some twenty boys in cream-coloured, open-necked shirts and chocolate-coloured shorts, and about six girls in green uniform dresses. Their average age was perhaps eighteen or nineteen—anyway, much higher than you would find in Secondary V today. They came from every part of the Gold Coast Colony and Ashanti, but none from the Northern Territories.

To me they were an unfamiliar class, for all my regular teaching was in the teacher-training department; but I knew a few of the boys who belonged to Livingstone House, of which I was housemaster, and some old friends—girls as well as boys—to whom in the Lower Primary School ten years earlier I had taught reading and writing and numbers, clay-modelling and knitting. In little more than a year's time they would all be taking the Cambridge School Certificate Examination.

The Music—and Meaning—of a Poem

They were surprised to see me, and after we had exchanged greetings I explained my presence. I then said that I was going to recite to them an English poem called *The Scribe* by a living poet, Walter de la Mare; and I asked how that might be linked with religious knowledge. As most of them were studying Latin, someone soon pointed out the connection between 'scribe' and 'scripture.' I then recited the poem twice:

What lovely things
Thy hand hath made,
The smooth-plumed bird
In its emerald shade,
The seed of the grass,
The speck of stone
Which the wayfaring ant
Stirs, and hastes on.
Though I should sit
By some tarn in Thy hills,
Using its ink as the spirit wills
To write of Earth's wonders,
Its live willed things,
Flit would the ages
On soundless wings
Ere unto Z
My pen drew nigh,
Leviathan told,
And the honey-fly;
And still would remain
My wit to try—
My worn reeds broken,
The dark tarn dry,
All words forgotten—
Thou, Lord, and I

Secondary V instantly appreciated the music of the poem but not its meaning, which indeed would present difficulty to most English pupils; so we spent the greater part of the forty minutes' period discussing it. They saw to whom the poem was addressed—'What lovely things *Thy* hand hath made.' They found little difficulty in 'the smooth-plumed bird in its emerald shade,' and none in 'the seed of the grass.' More easily than an English class they could picture 'the wayfaring ant' stirring 'the speck of stone.' I had to tell them that 'tarn' means a lake and is often used of lakes in the north of England that are cupped by hills.

It was probably an Ashanti, with memories of Lake Bosomtisi, who explained why the poet spoke of 'the *dark* tarn' and likened its waters to ink. He found a religious meaning in the word 'willed' in 'Its live willed things'; and when we came to 'flit' in 'Flit would the ages on soundless wings' a girl helped us by a homely question about the anti-mosquito mixture with which we sprayed the walls of rooms.

'Leviathan' took us to Psalm 104, and I suppose it was a Fante from Cape Coast or Sekondi, a Ga from Accra, or perhaps a Ewe from Keta who knew what the great sea-monster was. 'The honey-fly' reminded us of the tiny flies that attacked the mangoes at the back of Livingstone House and elsewhere.

And finally we came to the last lines about the even greater wonders, God and Man:

And still would remain
My wit to try—
My worn reeds broken,
The dark tarn dry,
All words forgotten—
Thou, Lord, and I.

The class insisted that I should write the poem on the board so that they might copy it. I did so, and as the bell rang for the end of the period I remarked that anyone who wanted to keep a poem for ever committed it not only to paper but to memory. Then I said good-bye and went away, happily reflecting that it had been a good lesson. In teaching it I had done nothing more than any sensible teacher of English would have; but it *had* been a bright idea to choose that lovely poem of de la Mare's. And what an intelligent, responsive class Secondary V were! I was sorry to think that I should not meet them again.

Some days later, however, Sandy was still off duty; I happened again to be free; and once more Mr. Blumer requested me to take Secondary V's Scripture. This time I went with notes for a lesson on *Amos*, but before beginning it asked with a challenging smile if anyone could say *The Scribe*, for I thought there might perhaps be a few literary enthusiasts who would deserve a pat on the back. To my amazement the whole class rose to their feet and with beaming faces repeated the poem.

That was the most delightful surprise I have ever had in a classroom, and I still marvel at it. The poem had nothing to do with Secondary V's course: it would not help them to pass the School Certificate. I had not set it for prep: I had only hinted at the general value of learning by heart. They certainly had not learnt it to please or impress me, for we never expected that I would enter their classroom again. And fancy *all* of them had learnt it! It was not that time hung heavy on their hands. Not only were they working for the certificate—to be taken in a language not their own—their leisure time was crammed.

They had to clean their dormitories and do physical training before breakfast, tend their house gardens, take their turn as waiters in the dining halls, and play games, usually football or cricket for the boys, netball or rounders for the girls. Some had responsibilities as house-monitors. Some belonged to the orchestra; some would be learning parts for house plays, some preparing speeches for the debating society, others practising their tribal drumming and dancing. Most gave one afternoon a week to social service, treating sores or weighing babies at the village dispensary, teaching games to village children who had not the chance of going to school, visiting the patients in the Labadi leper settlement, the Accra lunatic asylum, or Korle Bu Hospital.

Three Qualities of the West Africans

But I am telling you of this incident not only because it was exceptional but also because it was typical. I do not mean that all pupils in every class were always equally pleasing—of course they were not. But I do mean that this incident might have occurred at any secondary school in the Gold Coast, and, I fancy, any in West Africa. And it illustrates three qualities that I think the West Africans have. The first is enthusiasm. I remember how the students' eagerness for learning would suddenly fuse with their gay vitality and produce a flame of enthusiasm that brought warmth and energy to their work.

The second is their sense of community. They, perhaps more than most people, love the heightened pleasure that an emotion or an activity gains when shared with a whole group. They have, I believe, an inward craving for unity. The third quality of which I am thinking is love of beauty. I remember some of them finding beauty in drawing or carving, some on the potter's wheel or the weaver's loom, and nearly all of them in music and in words, for they have the good fortune to be rhythmical to their fingertips, rhythmical to the tips of their dancing toes. Much of their attention today is given to politics, naturally and rightly. But since a nation's life does not consist in politics alone they are wise to go on cultivating beauty.

In 1948 I returned to the Gold Coast after an absence of eight years at a time of tension and rioting when anti-British feeling was in the air, and some of the large shops in Accra were looted and burnt. One day I entered a small store to buy a tin of cigarettes. The other customers when they saw me stopped talking and looked away glumly, except for a tall well-built man who repeatedly glanced at me. As I turned to him his eyes twinkled, a smile spread over his face, and he said: 'Sir, I know you.' Then he fascinated everyone in the store and made us all at ease with one another by sweeping off his hat, drawing himself up, and saying: 'What lovely things Thy hand hath made, the smooth-plumed bird in its emerald shade . . .' (Broadcast in 'Calling West Africa')

The seventeenth-century bridge across the Tweed at Berwick: behind it can be seen the new road-bridge

Men of the King's Own Scottish Borderers at the gateway to the barracks—the oldest in England

'Our Town of Berwick-upon-Tweed'

CYRIL RAY visits the town on the Border and explains how it came about that for 400 years in Acts of Parliament and in treaties the British Government always spoke in the name of 'England, Scotland, Ireland and Wales, and our town of Berwick-upon-Tweed'

I HAD to drive up to Scotland, and as I came to the Tweed at Berwick I had to remind myself all over again that this was not the Border: not quite and not yet. I was still in England, and I would still be in England for nearly four miles the other side of Berwick. I had to remind myself of all this because you come to the river, with its three fine bridges, and there is the grey old town with its fortifications standing high on the northern bank, and it really does look as though you are leaving one country for another, England for Scotland.

But Berwick-upon-Tweed changed hands thirteen times in the Middle Ages—they say up there that it has stood more sieges than any city in the world except Jerusalem—and the last time it changed hands left it with the English on the battlements and the Scots retreating northwards, and Berwick-upon-Tweed is in England still. But only in a rather special sense: the city had been shuttlecocked backwards and forwards so many times that lots of people at home and abroad were never quite sure whether it was in England or in Scotland, and so for 400 years in Acts of Parliament, and declarations of war, and treaties of peace, just to make quite sure, the British Government always spoke in the name of 'England, Scotland, Ireland and Wales, and our town of Berwick-upon-Tweed.'

And that is how the story got about that Berwick is at war with Russia. What happened, the story goes, is that when Britain went to war in 1854—the Crimean War—the declaration was in the name of Great Britain and Ireland and Berwick-upon-Tweed, but that when peace was made the custom had been abandoned. Only Great Britain and Ireland made peace. And so it has become a sort of local legend and local joke. When Marshal Bulganin came on his state visit to Britain people said: 'Well, it is a great pity, but, of course, he cannot come to Berwick.' I am sorry to be the one to demolish an ancient legend, but it is not really true, you know. Yes, it could have happened, but it did not.

'A Very Understandable Pride'

But it is true that the city was mentioned all by itself in royal proclamations, and there is a song they are very proud of in Berwick that goes like this:

Which of all other spots in the country can say,
Alone, independent, she stands here today—
She's a nation herself for, pray you, take heed,
It's Great Britain, and Ireland, and Berwick-on-Tweed.

It is a very understandable pride, in a city as ancient as this, and I must say the city lives up to its long tradition, with its ruined castle and its ancient walls. In fact there is every kind of history in every kind of building. Just look at the three bridges: one built in the seventeenth century for horsemen and lumbering coaches; one built by Robert Stephenson himself, more than 100 years ago, for the tall-chimneyed railway trains of the 1840s; and one built between the wars, the longest road-bridge in the country, for men like me in motorcars.

The barracks are the oldest in Britain still in use, built at a time when the kings of England quartered the French lilies on their coats of arms—you can see it over the barracks gate. Look at the sentry on duty: a Scots bonnet and tartan trews, because this is the depot, four miles inside England, of the King's Own Scottish Borderers. How is that for burying the hatchet? (Broadcast in the BBC's General Overseas Service)

Today the castle looks out over the peaceful valley of the Tweed, but in the medieval wars between English and Scots it changed hands thirteen times

The Royal Border Bridge at Berwick was built by Robert Stephenson more than 100 years ago to carry the railway across the Tweed into Scotland

A GOOD way to soothe itchy feet is to go and see a film that whis you away to a remote landscape and a new atmosphere. Of cour the chances are that if the film is sufficiently well made you w come away with your feet itching more than ever. But what I mean that of all the substitutes for travel the film is best: far better, I thin than a book or a snapshot. It is the nearest you can come to feeling rig there on the spot without being right there on the spot. The countries the Commonwealth keep up a steady supply of films like this: films th give people in Britain and other parts of the world a lively impressio places that are unfamiliar but should not be.

In *The Snows of Aorangi*, from New Zealand, we can watch t red and blue jackets of skiers moving in vivid pin-points of rhyth against the white slopes of Mount Cook. *Hot Earth*, from the sar country, takes us inside the crater of a volcano. In this film we are al to study at close quarters the thermal activity of the earth that has be harnessed to perform a useful purpose, like supplying a hospital Rotorua with steam, or providing the necessary heat to cultivate an orch

Corral, from Canada, is a film without speech. It uses visual poet accompanied by the music of a guitar, in its brief study of a cowb roping and riding a half-wild horse in the foothills of Alberta. Ne Zealand and Canada make short documentaries like this particularly we They are financed, as a rule, by the government or by some commerc firm, but it is surprising how often the film-maker is given elastic terr of reference and allowed to exercise his imagination.

Documentary with an Epic Quality

The art of making a government-financed film without obvious pr paganda is demonstrated in *Pumiceland*, a New Zealand documentary th was showing in London recently. The purpose is to explain, and perha to justify, government expenditure on a huge scheme for bringing life a vitality to the Central Plateau in the North Island, which was ove whelmed by a volcano eruption 2,000 years ago. The task of converti a desolate waste covered with pumice into rich farmland assumes dramatic quality through a treatment that breaks away from the stodg formal style of a routine documentary.

There are beautifully composed shots of ploughs turning the earth, 1 leasing fertile soil to the air and the sunlight. The sound-track backs 1 the dramatic camerawork rather too earnestly: 'The land was surveye says the commentator, and immediately there is a flourish of trumpets th would probably cause a surveyor to blush with embarrassment. B visually *Pumiceland* gives an epic quality to the laborious work of 1 generating the barren earth.

 or film-making in Commonwealth countries

advertising is the Australian documentary, *The Back of Beyond*, an informative and artistic representation of life in the vast northern areas of the continent, where people have learned to accept an isolated existence. Some of them are as far as ninety miles away from their nearest neighbours. The sharp photography sees a strange beauty in the deserted landscape traversed by a postman on his extensive round. Vignettes of the characters he meets are etched in crisply and naturally, and one is not reminded that the bill for *The Back of Beyond* was footed by a petrol company. Presumably we are intended to assume that the postman's ramshackle van is fueled by the sponsor's product.

An Australian documentary with a very topical note that has not arrived in English cinemas yet but that we are looking forward to is *Melbourne—Olympic City*, a Cinemascope film made by the Department of the Interior to give the world a glimpse of the Victorian capital where the Olympic Games are to be held this year.

Experimental Specimens of the Cartoon

The majority of Commonwealth films are documentaries, but Canada also has some interesting and highly experimental specimens of the cartoon film. *The Romance of Transportation* is one that uses witty animated figures and a droll commentary to put across some hard facts about the development of transport in Canada from the days of the canoe and the ox-cart up to the most futuristic kind of aircraft. *The Romance of Transportation* is an educational pill coated with well-refined sugar. It has a laugh-while-you-learn technique that could be studied to advantage by film-makers anywhere in the world.

More experimental still are the cartoons of the Canadian artist, Norman McLaren, who has made a number of little films without using a camera. He draws his animated figures right on to the film itself, and sometimes he even draws or scratches the soundtrack of the film to build up an accompaniment of artificial percussion-music. His films have titles like *Blinkity Blank*, *Boogie-Doodle*, and *Hoppity Pop*. Of course, I can only mention a few individual films. The supply is considerable. Inevitably it includes a good deal that is commonplace, but the quantity of really imaginative short films from the Commonwealth is sufficient to earn a heartening number of awards at the film festivals in Cannes and Venice and Edinburgh.

On the other hand the feature film is almost non-existent in most Commonwealth countries, with the exception of India, which has a prodigious supply for the home market, and just this year an Indian film, *Pathar Panchali* ('The Ballad of the Path'), has received one of the awards at the Cannes Festival. It is the story of a peasant family in

Armchair Cricket

A BBC GUIDE TO CRICKET COMMENTARIES

'Armchair Cricket' is a new BBC publication specially compiled for all listeners to BBC cricket commentaries and broadcasts. The illustrated contents include a full-length review by Brian Johnston of the cricket commentator's work and problems. Antony Craxton describes the BBC Television producer's task, and Roy Webber writes on 'Scoring for the BBC.' There are drawn plans of England's major cricket grounds and a full glossary of cricket terms.

PRICE 3/- sterling

You can obtain 'Armchair Cricket' by sending a remittance of three shillings sterling to BBC Publications, London, W.1, England, or it can be ordered through your newsagent.

A COPY FOR YOUR FRIEND

We shall be pleased to send a free specimen copy of LONDON CALLING to a friend or relative on receipt of their address. Please write to BBC Publications (II), London, W.1, England.

LONDON CALLING surface mail edition is posted weekly to any address for 25s. a year sterling or pro rata. Remittances should be sent to BBC Publications or any of the following addresses:

AUSTRALIA:	Gordon and Gotch, Ltd., 111-115 Little Collins Street, Melbourne, and branches; BBC, National Building, 250 Pitt Street, Sydney

Commonwealth 'Films to See'

Continued from page 15

Bengal, with no professional actors in the cast (in this sense it has something in common with the Italian neo-realist school), and international critics at Cannes were loud in their praise of it.

Some feature films have been made in South Africa and Australia from time to time; but financial considerations, and perhaps a diffidence about competing with Hollywood imports, have made Commonwealth countries reluctant to broach the feature film on anything like the level acceptable to a world audience. However, a number of English films have been made, wholly or in part, on location overseas. South Africa has been a popular location spot.

Just lately there is a new spate of English film-making in Australia, too, which interests me especially because I am an Australian myself. *Smiley*, from the novel by Moore Raymond, was filmed entirely in Australia by the English director, Anthony Kimmins. *Smiley* is a nine-year-old boy, and the story is about the pranks he gets up to in order to earn himself enough money to buy a bicycle. Mostly it is comedy, but there is a touch of mystery when the youngster gets involved unwittingly in a plan to smuggle opium to the aborigines.

Familiar Names in the Cast

The local police-sergeant who unravels this part of the plot is played by 'Chips' Rafferty, who became well known internationally when he appeared in *The Overlanders* some years ago. Other familiar names in the cast are Ralph Richardson and John McCallum: they both happened to be in Australia for theatre seasons at the time *Smiley* was being made. Anthony Kimmins had the film ready for a London premiere in July.

Meantime another English company—Ealing—is starting work in Australia on *The Shiralee*, from the novel by D'Arcy Niland. Peter Finch, an actor who spent most of his life in Australia and who has been doing some extremely good work in British films lately, is going out to play the lead. It is the part of a swagman travelling in the outback with his small daughter, who is the *shiralee* of the title. The word is an aboriginal one meaning a burden, and the small daughter is the swagman's burden. The story concerns his estrangement from her mother and his changing attitude towards the child. At first he finds her a nuisance, but circumstances alter this point of view. *The Shiralee* is being directed by Leslie Norman, and the associate producer is Jack Rix.

* * * * *

Just before he left for Australia recently Jack Rix was invited along to the studio, and was asked if this were just going to be a brief location trip, as is sometimes the case, or if they would be making the bulk of the film in Australia.

Rix: Oh yes, we certainly will; we shall do all the exteriors in Australia. After all you can't find Australian-looking countryside in England, and we want to get the wild expanses of Australia. I should say two-thirds of it will be made out there. Then we shall come back to the studios to do the interiors afterwards.

Gow: I think Australia as represented in films is invariably all outback. Will you have any shots of the cities in this one?

Rix: I'm very glad to say we shall, because so many Australians have said to me in the past: 'I don't know why you can't make films about Sydney and Melbourne and Brisbane—why it always has to be the wilds.' So this time I'm glad to say that, although not many, there are some scenes which will be played in Sydney.

Gow: Good; I think it's a splendid idea to let people know if you can that we are thoroughly civilised in our metropolitan life out there, and that Australian cities are compared very frequently with American cities.

Rix: Personally, I'm very fond of Sydney: I think it's a wonderful place, a great flourishing city; in fact, I think Australia is a great flourishing country with a tremendous future ahead of it.

Gow: Will the Ealing policy in future continue to incorporate a number of films made in Commonwealth countries? Is it going to be part of the policy to make films when you can in Commonwealth countries?

Rix: Undoubtedly it will be. Of course, we can't say we're going to make a series of films in Africa or Canada or anywhere else, because you've got to find the subject first. But as far as we are concerned we think that stories with a Commonwealth setting are good box-office, and I would say that whenever a chance presents itself we shall be only too happy to go out to any part of the Commonwealth to make a film.

Gow: This is an encouraging sign. There is every reason why films should be made in Commonwealth countries: the interest of the unfamiliar scene, the advantage of good clear light for outdoor photography. Many parts of the Commonwealth have that advantage. Perhaps in time writers might be commissioned to develop stories with Commonwealth locations specifically in mind. Perhaps eventually the Commonwealth countries themselves will develop permanent schools of indigenous feature film-makers. In the meantime there is a great deal to admire in the way of indigenous documentaries, and these alone are a strong indication of the possibilities ahead. (*Broadcast in the BBC's General Overseas Service*)

Marble Arch, London, where the standard of oratory—and of heckling—is very high Tower Hill came: the prophet of a lost cause or of a future triumph?

Free Speech in the Open Air

SAM POLLOCK gives some examples of London's popular forums—at Marble Arch and Tower Hill—'where the city workers eat their sandwiches with a sauce of rhetoric poured forth by advocates of every idea under the sun'

EVERY visitor to London knows the Marble Arch, the familiar London landmark which stands near the Oxford Street end of Park Lane. But not everyone, I imagine, knows that the popularity of this area as a parade ground of the capital's idlers and sightseers is many centuries older than the institution of 'Speakers' Corner,' the open space in Hyde Park which lies beneath the shadow of the Marble Arch, and which resounds nightly, and on Saturday and Sunday afternoons, with the eloquence of the propagators of a thousand and one religious, political, and cultural nostrums.

The Marble Arch almost exactly marks the site of Tyburn Tree, where many a gallant highwayman or other enemy of society as then constituted paid, as we say, the last penalty. And since our ancestors, according to a foreign observer, loved a hanging above all things, and since our ancient laws ensured a long and continuous run of that form of entertainment, one can imagine a trip to Tyburn in those days had all the attractions of a trip to Brighton or Southend for their descendants.

It was also noted by a foreign observer that the English 'dearly loved a lord,' and if they wanted to gratify both passions at once they only had to resort to Tower Hill, a couple of miles away, where the central figure of the entertainment—especially in the gory days of Henry VIII—was likely to be a noble politician who had backed the wrong horse—or backed it before it was due to win.

Oddly enough Tower Hill, like the Speakers' Corner which was once Tyburn Tree, is also today one of our popular forums, where the city workers eat their sandwiches with a sauce of rhetoric poured forth by advocates of every idea under the sun. But perhaps not so oddly. For though Speakers' Corner and Tower Hill have their quota of apostles of faiths that are more or less established they are in the main the forums of causes that are lost or whose triumph lies in the future—which was the case with many of the political offenders who addressed their last words to the audiences at both centres in the days when unsuccessful politicians had more to lose than their deposits.

Wandering from platform to platform one Sunday afternoon, I could not help thinking how lucky several of the speakers were to have been born in this day and age. Listening, for example, to a Scottish Nationalist speaker—and please, Scottish readers, this was not one of the lost causes I had in mind—but listening to this speaker's examination of the claims of Her Majesty to govern the Northern Kingdom I could not help reflecting on the rough treatment which would have been his certain fate at the hands of Her Majesty's undoubted Scottish ancestor, King James VI and I. The Stuart equivalents of the two policemen who stood smiling benevolently on the edge of the crowd would have had him in the Tower before he could have said 'Scots wha hae.'

Next to the Scottish Nationalist an earnest young man

was going to the opposite extreme in advocacy of world government, much hampered by an Irish heckler who wanted to discuss the Irish record of Oliver Cromwell, and (unwittingly, no doubt) by the hymn-singing of a Salvation Army meeting on his other side. Further along still a supporter of Government by the People contended with a speaker who wanted Poetry—lots of it—for the People. And dotted all over the place were spokesmen, not only of the hundred religions known in Britain (which a French wit has contrasted with the one sauce we know) but of every religion known on earth, and of every race anywhere which is alleged to be suffering from tyranny or injustice.

The standard of oratory at Speakers' Corner is, I think, remarkably high. After all, it was here and at like spots all over London when he was spouting for Socialism that Bernard Shaw acquired some of his command of language—and of an audience—and I can believe some of his knowledge of common speech and phrases which he used so well in his plays. For the orators at Speakers' Corner have to be listeners, too—not only to the hecklers but to those who button-hole them after they have descended from their platforms, to engage in a verbal fencing-match, on the level ground and on level terms. It must have been something like this, I have thought, when the crowd gathered around Socrates in the market-place of Athens, or around St. Paul in the same place when he spoke of 'the Unknown God.'

A Regular Cross-Talk Act

The heckling (apart from an occasional monomaniac like my Irish friend) is of as high a standard as the speaking. For the hecklers are, so to speak, professionals, too, and as regular in their attendance as the speakers. Some of them attach themselves to a particular platform, and with the speaker offer the audience a sort of Massa Bones and Massa Janson cross-talk act which is one of the regular attractions for those who know and frequent their Speakers' Corner.

It is impossible to imagine a harder or a more efficient school for the beginner in the world of oratory, and listening to some of the young men of the just-down-from-the-university type battling for their chosen causes I could imagine that still in this 'deep end' of public speaking there is many a hitherto mute inglorious Shaw learning his job.

There are, of course, comic turns as well, but these, I think, are the mere jam which covers—if I may put it that way—the very health-giving pill which institutions like Speakers' Corner administer to our body politic. The change from the scaffold on which holders of minority views died by the law for their faith to the platform on which, under the protection of the law, they can now propagate their views, however unpopular or near treasonable, is a parable of something pretty big that has happened to Britain in what is, historically speaking, a short span of years.

'Jaw-jaw,' said Sir Winston Churchill once, speaking of international conferences, 'is better than war-war.' That is true nationally, of course, as well as internationally. (Broadcast in the BBC's General Overseas Service)

A non-stop oratory, but 'jaw-jaw is better than war-war'

Your Wavelengths

London Calling is published several weeks in advance and we regret that, for reasons beyond our control, it is sometimes necessary to alter wavelengths after we have gone to press. The latest information is always given in Programme Parade.

This Week's Listening

'PALACE AND DEER PARK'

THE most imposing and most often visited of all the Buddhist shrines in Northern India is that at Sarnath, near Benares. Here, in the King of Benares' deer park, the Buddha preached his first sermon—'setting in motion,' as Buddhists call it, 'the Wheel of the Law.'

When John Blofeld visited Sarnath in the course of his scholar's pilgrimage he was delighted to discover that the park had again been stocked with deer. He found, in fact, that much of Sarnath's ancient glory had been restored, and in his third talk in the series 'In the Path of Lord Buddha' he makes particular reference to a fine example there of Indian sculpture.

This part of John Blofeld's journey also took him to what is now the village of Sahet-Mahet but was once Sravasti, the capital of a powerful kingdom, and one of the principal centres in which the Buddha taught his followers. In reflecting on his visit to the ruins of Sravasti he recalls the story of a wealthy disciple who bought a prince's palace to provide fitting accommodation for his beloved Teacher.

G.O.S.: Friday 15.45; Saturday 00.30 and 05.00

BUDDHIST SCULPTURE IN INDIA

THE Buddhist scriptures were mostly the work of learned and devout men. But the extraordinarily vital Buddhist sculptures of India were carved by illiterate guild-craftsmen, living in close contact with the superstitions and folklore of ordinary people. In 'From the Third Programme' John Irwin, who is Assistant Keeper of the Indian Section at the Victoria and Albert Museum in London, analyses the significance of the specifically Buddhist contribution to Indian sculpture.

He believes that Buddhism, with its spirit of tolerance, was a social rather than a philosophic influence in India. Early Buddhism, in his opinion, 'prepared the way for a tremendous release of popular forces which were soon to transform its original character as a monastic order to that of a popular religion with a cult, incorporating the beliefs, practices, and modes of worship characteristic of the traditional cults of the soil.' Mr. Irwin illustrates his analysis of this development with descriptions of Indian Buddhist sculpture.

G.O.S.: Monday 14.45; Friday 23.15

'TWELFTH NIGHT'

WRITTEN about 1600 and printed in the First Folio in 1623, *Twelfth Night* is said to have been Shakespeare's farewell to comedy: the last carefree play he wrote before entering the tragic darkness in which lurked *Hamlet*, *Othello*, *King Lear*, and *Macbeth*.

Marius Goring

The romantic story of the four lovers and of Viola impersonating her brother was not new: it may be found in the *Historie of Apollonius and Silla*, which Barnabe Riche took from Banello's Italian tales or from Belleforest's French translation. But the comic characters (if Malvolio is accepted as comic) are wholly original creations.

And how Shakespeare must have loved them, sharing, as they did, in his last fling in the sunshine!

In the G.O.S. production this week Marius Goring will play the part of Malvolio, Peter Coke will play Orsino, and Gwen Cherrell will be heard as Olivia.

G.O.S.: Wednesday 14.15; Thursday 01.00 and 18.30

THE INDIANS AS COLONISERS

THE Indian peoples throughout history have been great colonisers. The whole story of the penetration of the Indian sub-continent in the first millennium B.C. by the Aryan-speaking peoples from the north is one of colonisation in its broadest political and cultural senses.

Indian adaptability to new countries and conditions has been demonstrated again and again in the past 200 years. Tamil labourers have made possible the plantation development of Ceylon, and Indian communities are flourishing in areas as far

apart as Trinidad and Fiji, British Guiana and Tanganyika.

It is no wonder, therefore, that the existence of the massive remains of Hindu culture in South-East Asia had given rise to the view that in the early centuries of the Christian era armies from India conquered large parts of South-East Asia and established Hindu empires.

But scholars now reject this hypothesis in favour of the view that Indian colonisation of this great area took a cultural and commercial rather than political form. C. H. Phillips, Director of the School of African and Oriental Studies in the University of London, will discuss the Indian drive East in his contribution to the G.O.S. series 'The Story of Colonisation.'

G.O.S.: Monday 15.45; Tuesday 00.30 and 05.00

SHAW'S 'PYGMALION'

THE famous tea-party scene from Bernard Shaw's *Pygmalion* will be the first of a series of programmes in the G.O.S. celebrating the centenary of Shaw's birth. Wendy Hiller, now leading lady at the Old Vic, will play Liza Doolittle, the part she took with brilliant success in the film made under Shaw's personal supervision.

Wendy Hiller

Liza, a Cockney flower-girl, is taken up by a professor of phonetics who bets that within six months he can pass her off as a duchess at an ambassador's party. He wins his bet, but not without some comic moments. One of them is at the earlier tea party, which happens to be Liza's first appearance in society.

With artificially perfect elocution she keeps up a flow of appalling small talk. The climax comes when she sweeps out with the devastating line saying she is going home by taxi.

G.O.S.: Sunday 07.30; Tuesday 20.15; Friday 10.00

Radio Theatre presents

'HEAVEN IS MY DESTINATION'

GEORGE Brush is a young travelling salesman from Kansas, an eccentric whose peculiarities (for so they must seem in the American Middle West in the mid-1930s) include an unwillingness to accept interest from a bank, a doctrine of voluntary poverty, and a highly personal interpretation of Gandhi's teachings about non-violence.

To some George is a credulous crank, even a menace: to others he is the stuff of which saints are made. Not that he worries about being different; as he says himself: 'I didn't put myself through college for four years and go through a difficult religious conversion in order to have the same ideas as other people have.'

The trouble arises when George starts to put his theories into practice under existing conditions: when, for example, he actually helps a shopbreaker in the hope of shaming him into reform, or when he conscientiously forces a girl he once wronged into renewing an unhappy relationship because he thinks it is morally right. In fact, one way and another, George Brush is a lineal descendant of Voltaire's *Candide*, who also went on a voyage through the world and learned of the difference between what ought to be and what is.

Thornton Wilder wrote this cautionary story as a novel in 1934. There is obvious serious comment on human behaviour here, but Wilder's approach is distinguished by his genial good humour.

The wit is not cruel wit, as witness the delightful scene after the shop-lifting episode between George, trying to explain his attitude, and a kindly but very, very puzzled judge.

PETER FORSTER

G.O.S.: Sunday 00.30 and 18.30

Sir Thomas Beecham conducts the Royal Philharmonic Orchestra at the Edinburgh Festival on Monday in a performance of Brahms's Second Symphony

WELSH FOLK SONGS

THE well-known harpist, Osian Ellis, will introduce and sing a programme of folk-songs from Wales to his own harp accompaniment this week. The traditional music of Wales includes harp music, folk-songs and dances, ballads, and that characteristic Welsh style known as penillion singing. Collections of Welsh folk-music appeared in the eighteenth century, and there is manuscript material in existence from earlier periods. In 1908 the Welsh Folk Song Society was founded to collect and publish folk-songs, carols, and ballads.

The harp music is best known inside Wales and includes such well-known airs as *David of the White Rock* and *March of the Men of Harlech*. These and others have become folk-music by adoption, though they originated among professional bards and harp players.

The 'songs of the people' had not the formality of bardic productions: they were based on common experiences and paid much homage to the beauties of nature. Many of the songs had a love theme; others were full of plaintive longing, others again rhythmically accompanied the work of ploughing, or labour at the smithy, or the gallop of the horse. Nursery songs and lullabies were sung to the children and survive in the ancient. *Suo-gan* (Hush Song) and *Sleep, my pretty child*.

G.O.S.: Tuesday 13.45; Wednesday 00.15; Friday 20.45

FOR THE CHILDREN

A NEW serial by 'Sea Lion' involving 'Tiger' and 'Snort' begins on Sunday. H.M.S. *Magician*, a brand-new atomic submarine, ran into a gale while being towed from the Clyde to Devonport. The hawser parted, and she disappeared. Shortly afterwards the Admiralty learned that she had been stolen.

And that is where the two 'snotties' come into the story: Midshipman 'Snort' Kenton and Midshipman 'Tiger' Ransome have a lot to do with getting her back.

G.O.S.: Sunday 13.15; Saturday 09.45

THE FIFTH TEST

THE fifth Test match between England and Australia begins at the Oval ground in London on Thursday. Commentaries by Rex Alston, John Arlott, and Michael Charlton will be broadcast at 12.00, 14.15, 16.15, and 17.15 on Thursday, Friday, and Saturday. Summaries of play by Alf Gover will go out at 12.30 and 17.30 on each day, and an eye-witness report at 21.00.

On Monday and Tuesday this week the Australians will be ending their match against Essex at Southend. Eye-witness reports on the day's play will be broadcast at 21.10 on Monday and at 21.00 on Tuesday.

Sam Pollock writes: 'In my contribution to the LONDON CALLING Cricket Number under the title of 'At the Court of King Willow' I made reference to a new design of cricket ball produced by Messrs. Thomas Twort and Sons, of Tunbridge Wells, Kent. The improved balance of the new ball, I now learn, is obtained not by altering the seams—as I suggested—but by the introduction of two sets of specially designed linings which compensate for the irregularity normally caused by the seams.'

 A preview of the week's programmes with recorded extracts
 13.45-14.00 The World of Science
 A weekly survey of the latest developments

SHAW FESTIVAL. Part of the immensely long scene in hell from Bernard Shaw's *Man and Superman* will be presented on Tuesday. It is Shaw at his most Shavian. Don Juan, the libertine, eloquently harangues Dona Ana (one of the girls who were once his victims), her father (whom he killed in a duel), and the Devil, on the subject of the 'Life Force' with some lively interruptions.

THROUGH EASTERN EARS. Wednesday's speaker will be Raden Soedeoro from Indonesia. Mr. Soedeoro is now at Cambridge University but before resuming his academic studies he was a broadcaster in the BBC's Indonesian Service. Although his specialist subject in economics is public finance, his interests and hobbies range from sports to Javanese dancing.

BRIEF EXCURSION. When the BBC started to make its own recordings in 1935 it began to build up for broadcasting purposes, a library of historical recordings. It has preserved ancient phonograph cylinders, rescued from junk-shops or dusty attics, of the voices of such famous people as Gladstone, Tennyson, and Florence Nightingale. The recorded voices of Gandhi and of all the great literary figures have been added to the collection, which also includes recordings of historic occasions. Stephen Black will introduce Saturday's programme, and will interview the people who work in the library and who are responsible for deciding which recordings shall be kept permanently for future broadcasts.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

OVERSEAS JOURNAL OF THE BBC

Meeting of the British Association

ROSEMARY JELLIS outlines the origin and aims of the British Association for the Advancement of Science whose meeting at Sheffield this week—attended by some 1,500 scientifically minded visitors—will be reflected in broadcasts to overseas listeners (details at foot of page)

THIS week the city of Sheffield will open its doors to some 1,500 scientifically minded visitors. Among them will be well-known scientists, teachers, students, school-children, and self-chosen representatives of the many thousands of people who are not practising scientists but who want to know more about the findings of science.

These 1,500 visiting members, many of them regular followers of the British Association as it moves each year to set up its seven-day 'camp' in a different city, will probably be joined by at least as many more from Sheffield itself. British Association meetings, particularly in the north of England, and in Scotland, can always be relied upon to draw a large attendance.

When the British Association was founded in 1831, a time of great expansion of scientific knowledge, it had two main aims, both of them well expressed by one of its founders, the Rev. Vernon Harcourt, a canon of York and a devoted student of chemistry. The first of these aims was to bring together scientists working in different fields.

As Mr. Harcourt put it: 'As the facts and speculations in any department of knowledge are multiplied, the study of it has a tendency to engross and confine the views of those by whom it is cultivated. . . .

'The chief interpreters of nature have always been those who grasped the widest field of inquiry, who have listened with the most universal curiosity to all information, and felt an interest in every question which the one great system of nature presents.'

Keeping Scientists in Touch

His warning is even more urgent 125 years later. Specialisation is increasingly necessary within the frontier-posts of knowledge as they are moved farther on and more widely apart. But somehow they must be kept in touch with one another, and the British Association is still helping to do it.

At last year's meeting one speaker expressed the same thought in the idiom of the twentieth century: 'If we're too deep down to see what the other chap's doing we'd better put up a periscope and find out.'

The second aim of the British Association was to spread an understanding of philosophy (we would say 'science') among laymen. On this point, too, Mr. Harcourt is still topical, perhaps because the development which he foresaw is not yet complete:

'Scientific knowledge has of late years been more largely infused into the education of every class of society, and the time seems to be arrived

for taking advantage of the intellectual improvement of the nation. Let philosophy at length come forth and show herself in public; let her hold court in different parts of her dominions; and you will see her surrounded by loyal retainers, who will derive new light and zeal from her presence and contribute to extend her power on every side.'

Nowadays, through the Press and radio, the British Association has an audience outnumbering by millions the little group of 200 'friends of science' which first assembled in York in 1831. We hope that, for the benefit of scientists

and laymen alike, more and more of this great audience will become friends of science.

Not all of the interest of a British Association meeting can be shared with the distant audience, though, within Britain, television helps to extend the range.

There is always much to be seen, particularly in a great industrial centre like Sheffield, where the university, the city, and industry combine to show the visitors their contributions to scientific and technical progress and to take them out to explore the beautiful hills and valleys of the Peak District.

There is much, however, that can be shared. The Presidential Address is always the occasion for a survey of an important subject by a distinguished scientist, and this year's President, Sir Raymond Priestley, formerly Principal and Vice-Chancellor of the University of Birmingham, has chosen a theme of great interest to many people: 'Twentieth-Century Man against Antarctica.' A special version of his address will be broadcast this week.

Discussion on Polar Physiology

Sir Raymond, who as a young man went with both Scott and Shackleton to the Antarctic, is now directing the research work of the Falkland Islands Dependencies Survey while Dr. Fuchs is away leading the British Commonwealth Trans-Antarctic Expedition.

This theme will be followed up by a discussion on the new science of polar physiology—the reaction of man to life at extremely low temperatures.

There will also be a review of plans and preparations for the International Geophysical Year, a survey of the growth of the science of biochemistry, and—appropriately in Sheffield—an account of steel-making since Bessemer, who first developed the process on which so much of Sheffield's industry is built.

Another major subject will be the problem of education in under-developed countries. It is hoped that one of the speakers will be Mr. Philip Sherlock, Vice-Principal of the University of the West Indies.

These and other themes will find their place in 'Science Review' and in 'This Day and Age' in the next few weeks, and in this way it is hoped to keep overseas listeners among the friends of science who derive pleasure from the British Association's meetings.

SIR HAROLD NICOLSON looks back without regret on the disappearance of certain English social habits of sixty years ago. 'I am grateful to destiny,' he says, 'that being born in an age of transition I was not afflicted by a preference for nineteenth-century modes'

Reflections on the London 'Season'

THE other afternoon, returning from luncheon, I decided to cut across Hyde Park. I entered by the gate in Park Lane and walked slowly to Hyde Park Corner and out through the great stone screen designed by Decimus Burton. It was a lovely afternoon, and the rhododendrons were pink and scarlet. My mind was filled with memories of things past. It was, I reflected, the month of June, and as such what used when I was a boy to be called the height of the season. Today there is no longer any season and no longer any height.

At least not for me. From time to time I observe in the newspapers a paragraph headed 'The Season's Dances' which contains a list of the balls to be given in the next few weeks. I observe that these balls do not take place in the houses of those who give them but in some public place of entertainment. Moreover, it is seldom that a single hostess gives a dance on her own, since she generally combines with some other person to give a joint dance for their débutante daughters. I suppose that if I were still a person who went to dances I might be invited to one of these entertainments. But I am not invited. Thus what remains of the season leaves me aside.

Strawberries and Champagne on the Stairs

I suppose that even today young women who have had their coming-out parties, even been presented at Court, sit on the steps of the staircases in between the dances and are brought strawberries and cream by their partners, and glasses of champagne. I suppose that happens. But for me the houses where I used to dance in the good days of King Edward are all museums or turned into flats or motor show-rooms, and the grandeur of that world has departed for ever.

On the very path that I was at that moment traversing, on the section between Stanhope Gate and the garden of Apsley House, as well as on the path on the opposite side of the road, there used when I was very young to occur a strange social ceremony. It was called 'Church Parade' and occurred every Sunday between twelve-fifteen and one. The great family landaus would drive round the park in the interval between morning church and Sunday luncheon.

The father and mother would sit there straight and stiff, greeting their friends as they passed; the children would huddle in the seat opposite, feeling bored. Occasionally some very smart little victoria would pass in and out of these great family battleships, with a pair of smart cobs in glistening harness, and beside the coachman a little boy in tight, white breeches and a top hat who was called a 'tiger.' Some of the church-goers preferred to walk during that half-hour, and up and down the parade they would saunter in top hats and bonnets, gazing at the flow of carriages up and down. Then we would all return to our respective houses and have a large Sunday meal.

A Purple Bonnet with Mauve Feathers

Now did this really happen or am I just imagining? When I think back upon it I realise that I am dating the ceremony too late. It did not occur so much in the days of King Edward: it occurred in the last decade of Queen Victoria's reign. I am sure of this when I think back, since I see myself dressed in a little Eton jacket, with a top hat and a wide, stiff collar—a uniform which I discarded when I reached the age of fifteen. It must therefore have been in 1896 or 1898. Purple my mother's bonnet was, with feathers of light mauve: very ugly I thought it at the time and very ugly I think it now; I prayed ardently that we should not encounter one of my own school-fellows on that parade.

It seemed strange to me as I passed the statue of Byron sulking behind its railings that I should have witnessed this remote and vanished world: that I who was still alive and walking quite quickly, with the same feet and hands, should have strolled along that very path sixty years ago, regretting that my dear mother had an ugly bonnet, and wondering, I suppose, what we should have for luncheon.

You see, in those days the royal parks were closed to public vehicles and open only to the glistening equipages of the rich and great. The old eighteenth-century tradition had persisted, and although the clothes of British women were uglier than the clothes of French women, and although in most British—no: here I shall say 'English,' since in Scotland the food was good—in most English homes the cooking was almost as bad as it is today, the carriages and horses were the finest in the world. Everything shone and glistened; the panels of the huge landaus shone as brightly as the flanks of the horses or the hats of the coachmen and the footmen; the harness shone with wax and metal-polish; the whole world sparkled.

But it was a heavy world. I am glad that I grew out of it when I reached the age of eighteen. People of my own age will agree that we have been granted a unique experience. We have witnessed the passing of a civilisation in the space of our own life-time. Generally such changes

occur gradually. There survive, for instance, letters written at the time of the collapse of the Roman Empire—the letters, for instance, of Sidonius Apollinaris who lived in Gaul in the time of the last of the Roman emperors—from which it is clear that in spite of the onrush of the barbarians most of the old customs and habits lingered on for generations.

Rich landowners still lived in luxurious villas and were served by slaves; they still were carried through the streets of the town in litters, and they still scribbled down their engagements on a roll of papyrus which they held in their hands. People like Sidonius were aware that the old order was passing; they were shocked when they visited the court of Theodoric at Bordeaux to observe that the Visigoth princes wore togas as if they were authentic Roman citizens; but they did not realise that the Empire had completely collapsed and that the world henceforward would belong to barbarians who put rancid butter on their hair.

We western Europeans of my generation have in the space of fifty years seen the world change over: power has shifted from Berlin and London to Moscow and Washington; the landaus, the victorias, and the broughams have been relegated to museums or farm stables; the fumes of petrol destroy the scent of the azaleas in the parks; and few people remain in London on Sundays, and none of them between twelve-fifteen and one walk slowly up and down the pathway outside Apsley House. When I recall those days I can still feel the tightness of my Eton collar around my neck, I can still feel the tightness of a top hat across my forehead: I rejoice that my collar is soft today and that no longer is it necessary to wear any hat at all.

As I said before, there is one thing which has today almost vanished, and which before the first war was a delightful institution, the passing of which I much regret. I refer to week-end parties. How beautiful and exciting it was to leave the office on Saturday afternoon, to drive in a hansom cab to the railway station, and to arrive on some June evening at some great country house, not knowing who was to be there. The week-end party provided time to get to know one's fellow-guests. There was dinner on Saturday, and a lovely, easy Sunday, sitting in the rose garden or playing golf.

By Dinner Time on Sunday . . .

By the time dinner had arrived on Sunday a sense of intimacy had been established: one knew that one had made friends for life; one made engagements to meet again in London during the coming week. But now when week-ends are rare and restricted how is it that young people ever get to know each other? Obviously they must devise some sort of means, since I observe that they are all on Christian-name terms, which in my day was considered improper and even vulgar. But how they achieve this intimacy, and where and when, passes my understanding.

Now you younger people who may be reading may feel that I am an old man regretting the past. Certainly I am an old man, but I do not regret the past. I was not made for the past. I did not like dressing up in tight clothes or going to dances or paying calls. What I liked was wearing slack clothes and going off alone, or with only one companion, hiking down the Rhine or motoring in a precarious little two-seater down to Italy. Comfort I have always cared for, but what sensible man could possibly desire grandeur? A cottage path is for me a more satisfying object than the vast herbaceous borders and the mighty cedars of the Victorian and Edwardian epochs. I was always bored by Society, I always detested the Season; but I much enjoyed the company of my friends, and I am still enabled to enjoy that.

Yet it may be that I am like Sidonius and blind to the fact that the whole world has altered, that nobody except a Basuto chieftain today wears a top hat, and that, with the distribution of incomes, private comfort will become for my grandchildren a rare opportunity. Yet they, unlike the grandchildren of Sidonius, will be accorded at least a minimum welfare. And those who depend upon privacy will always be able to create it for themselves, if not perhaps in a boudoir of silk and satin, then at least in some hollow in the wood.

Thinking of these things, I passed under the archway of Hyde Park Corner and was faced by the roar and rattle of Piccadilly traffic. The landaus and barouches of fifty years ago did not perhaps make quite as much noise or emit that oily smell; but when they did move onwards they moved slowly. There was none of that delighted spring with which a taxi of today hails the coming of the green light. Clop, clop, clop, the older horses made on the pavements; the hansom cabs made a brisker, quicker sound; but it was a slow business—believe me, it was as a business very slow indeed. And being an impatient person I hate slowness. So I am grateful to destiny that being born in an age of transition I was not afflicted by a preference for nineteenth-century modes. I have no wish at all to stroll slowly in the Park between church time and time for luncheon. (Broadcast in the BBC's General Overseas Service)

The harbour at Belize, the capital: more than 20,000 of the colony's 80,000 people live there

British Honduras Today

WILLY RICHARDSON introduces a programme to be broadcast in the General Overseas Service this week on 'the only British territory in Central America.' The British Colonial Development and Welfare Organisation, as he explains, is giving aid and advice for a programme of economic expansion

'The Empty Land'—Monday 23.15 and Wednesday 10.00 and 18.30

ONE of the most interesting aspects of the discovery of the Americas was the creation of a frontier civilisation. In the richer areas the frontier was pushed further and further west to the shores of the Pacific. But today there are still marginal territories where opportunities abound for anyone who is willing to work hard or take risks.

British Honduras is one of these. It lies on the western edge of the Caribbean, a lean slice of land bordered by Guatemala and Mexico, the only British territory in Central America. Many kinds of people live in this country. Some of them are recent arrivals, pioneers who have come within the past two centuries to settle in the villages and towns along the coast—Europeans, Caribs, Asians, Creoles, and Mestizos. Fortunately these comparative newcomers have not ousted the indigenous people, the Mayas, and they manage to live side by side in apparent harmony. They all seem to share a natural reserve, but nevertheless strangers soon feel that beneath the shyness there is genuine friendliness.

The British influence is not obvious at first sight, but as one learns more of the country one begins to see occasional signs of it. Among the most recent buildings in Belize, the capital, is the Baron Bliss Institute. It is a modern concrete structure with a flat circular roof, and stands out among the brown roofs of Belize. The institute owes its origin to a wealthy invalid who spent the last years of his life fishing around the Cayes which lie outside British Honduras. Baron Bliss never went ashore,

Archaeological work in progress on ancient Mayan dwellings: Mayan Indians, the original inhabitants of Honduras, once had a flourishing civilisation

Agricultural development depends largely on the building of roads: a stretch of new road near Orange Walk

but he was so taken by the friendliness of the Hondurans who came out to his boat that he bequeathed his money to help develop their country.

Unfortunately one man's generosity is not sufficient to solve the many problems that the country faces today. What are these problems? Last May I spent the best part of a week in British Honduras, and was able to see some of its difficulties. For years an appreciable portion of the country's revenue was derived from the timber trade, particularly mahogany. But until quite recently no efforts were made at conserving the forests, and the stocks became sadly depleted. There was, too, always the possibility of a sudden fire sweeping through the pine forests.

It is always an expensive business repairing the damage caused by a natural disaster, as was seen when hurricane 'Janet' hit the northern part of British Honduras last year. The British Government immediately put through a special grant of £800,000 for rebuilding the town of Corozal and its environs, and this will be a tremendous boost over the next three years. But a journey across the country reveals tremendous deficiencies.

Partly responsible for the country's poverty have been the traditional methods of farming. The Indians have a simple system of burning the bush before planting, moving constantly from one patch of land to the next. Attempts are now being made to educate these farmers and to demonstrate to them ways in which they can produce more to their own and the country's benefit.

There are many parts of British Honduras which are inaccessible because of the lack of roads. Markets are rudimentary, and not until there is an adequate network of roads across the land will the fullest agricultural development be possible. The Humming Bird Highway, which cost more than 2,000,000 dollars, has already proved its value every mile of the way, especially to the citrus industry in this area.

Perhaps the most limiting factor of all is the size of the population. There are about 80,000 people in all in a country the size of Wales. The obvious answer is not one completely accepted by the people of British Honduras. They feel that to encourage immigration would not of itself solve any of their problems. Until there are jobs available no artificial increase of the population will be considered. The Government's view is that if present attempts to attract more capital are successful it will be time enough to think of opening their doors to immigrants.

Where would these immigrants come from? One does not have to look far. The islands of the Caribbean are only too anxious to find any avenues for their surplus populations.

Another hope is that British Honduras will join the British Caribbean Federation. Recent constitutional advances have brought British Honduras within easier reach of other Caribbean territories, and federation could confer mutual benefits on all.

For the present, British Honduras is about to embark on a development programme with financial assistance and advice from the British Colonial Development and Welfare Organisation in the hope that the economic and political development of the country will run on parallel lines. It would be very exciting if the next fifty years saw the blossoming of a modern civilisation in a land where once the Mayan Indians came to an early flowering.

KENNETH BRADLEY

My Faith in the Gold Coast

KENNETH BRADLEY, Director of the Imperial Institute, in his contribution to the 'I Remember Africa' series speaks of the two years he spent in the Gold Coast, and in this personal message addressed directly to the people of that country he says: 'The challenges which you have to face will not end with self-government: they are only just beginning. I am sure you will meet them and win as you always have'

IT is nearly eight years since I left the Gold Coast, and I only lived there for just over two, so you will understand that I had some hesitation in accepting the invitation of the BBC to contribute to this series. I could not help wondering whether anybody in the Gold Coast would remember me at all, out of that long stream of British officials which has flowed through the Gold Coast for nearly a hundred years. One or two friends, of course, will remember me, and some of the older generation of chiefs and other public men with whom I used to work, and with whom, I hope, some memory of me will linger.

In the history of any country except the Gold Coast eight years is a very short time, but with you so much has happened. You have crammed into this little space of time enough to fill fifty years in the peace-time history of any older country. You are, if I may say so, a very exciting people. And to me, when I met you ten years ago, you were particularly exciting. I came among you from the other side of Africa, where I had been working for fifteen years or more with the people of Northern Rhodesia—or rather, with the remnants of the people, for more than half of them had been wiped out by the Arab slave-traders from Zanzibar during the nineteenth century.

'A New Africa of the Future'

Most of those who were left were still very much at the beginning of things. They had very little education and very little money, and in politics, when I left, they were still learning the rudiments of democracy in their Native Authorities and had not got as far as the Legislative Council. You, I found, were a hundred years ahead of those central Africans. I felt as though I had somehow fallen asleep and woken up in a new Africa of the future where many of the dreams and hopes which I had had for my African friends in Rhodesia had suddenly come true.

I found, for example, Achimota. There was no Achimota in Northern Rhodesia. There the idea of a great secondary school like that was still a dream, but in the Gold Coast I found it, built more than twenty years before and long since grown into the finest African school in the whole continent: a school in which the best of Africa and the best of Britain had been very happily blended. Everything was exciting like that: the schools, the hospitals, the first-class roads, the wealth of the country—with its cocoa, gold, timber, and all its other resources—and the prosperity which all these things had brought to the people.

In 1941 I only knew two chiefs in Northern Rhodesia who owned motor-cars, and neither of them could afford to buy the petrol on which to make them go. One harnessed oxen to his and used it as a kind of cart; the other used his for sleeping in when he got tired of sleeping in his hut. In the Gold Coast, so many of the people seemed to have bigger and more expensive cars than I could possibly afford myself.

Wonderful Opportunity to Work Together

And how exciting it was to meet and work with African colleagues in the Executive and Legislative Councils. That was the period when for the first time your people had an unofficial majority in the Legislative Council. The Gold Coast was the first country in Africa south of the Sahara to achieve that, and very proud of it you all were. It was the first great step towards the fully democratic government which you have today. I remember telling you in a broadcast from Accra what a wonderful opportunity it gave to us all to work together for the Gold Coast; and judging by the headlines in the newspapers next day most of you agreed with me.

Since then our peoples have continued to work together, and the achievement has been great. Some of us, and some of you, too, are a little worried now lest the fulfilment of your dreams for the Gold Coast may be spoilt or delayed by the political troubles which you are having just at present. I hope you can solve them, and I believe you can. I was never one of those who doubted the ability of the Gold Coast to make its new democracy work, or who thought that democracy came to the Gold Coast too soon or too fast. I had worked with you and knew what you could do.

I remember one of your most distinguished judges telling me that the Gold Coast people would always rise to a challenge, just as they had risen to the challenge of Achimota when Guggisberg had prophesied so great a future for it. I remembered that particularly when I was chairman of the committee which told the Secretary of State in 1947 that the Gold Coast wanted to have its own university college on Legon Hill, for Guggisberg had foretold it, and it is there now; and one day before I die

I want to go out and see it, for that is yet another dream of mine come true. I remember standing with that committee on the top of Legon Hill and saying what a glorious site it would be and how lovely and cool the breeze was off the sea. One of the members of the committee gathered his cloth about him and said he thought it would be too cold and that the students would get pneumonia. But they do not, do they?

Yet not all my happiest memories of the Gold Coast are those of work and official occasions. I remember the very early days of the Gold Coast Club, which some of our African friends founded with us because we thought there ought to be a club where we could meet. We had no money and no building, and we used to meet sometimes at the British Council, and sometimes, I remember, under the trees by the racecourse. I wonder if the club still exists and whether it now has a club-house of its own? I hope so. I remember, too, bathing in the moonlight and riding in on a great wave that sparkled across the sea like a many-stranded chain of diamonds; and dancing all one long, very hot afternoon with the people of a village who had invited me to their harvest festival. What fun it all was!

And, talking of harvest festivals, what a splendid festival they make of it at Krobo! Chief Matekole once invited me to that. I often think of it because the ceremonies there seemed to me so typical of all that is most fascinating in the life of the country. I suppose all the most important people in the Gold Coast today are trying to achieve the same thing: a marriage between their traditional culture and the principles and techniques of Western civilisation. Your statesmen, your artists, your teachers, your chiefs are all in their different spheres faced with this very difficult problem.

What has this to do with a harvest festival at Krobo? Well, there were all the chiefs of the neighbourhood gathered together, sitting in a great circle under their state umbrellas, dressed in their most gorgeous robes, with all their gold regalia, and surrounded by their linguists and most distinguished followers. And there was Chief Matekole himself, in silver and purple, and before the local priests came out in their simple, white cloths to pour the libation and scatter handfuls of the harvest grain upon us, Matekole made a speech to us.

He spoke first in his own language and then repeated his words to us in his faultless English, and he used a microphone and loudspeakers so that not only all of us could hear him but the thousands of his people who were listening in the background. There you had the marriage of African tradition with western techniques.

A Sign of Gratitude

Yet there was more to it than that, because when he spoke to his people and to us the Chief explained that the purpose of this African religious festival was exactly the same as that of the harvest festivals held in the Christian Church. The people had come together to thank God for all the good things of the earth which He had given them. He also explained to us why the priests were showering us with grain. It was, he said, the custom of his people always to return a small part of any gift to him who gave it, as a sign of gratitude.

This is what the priests were doing as they scattered the grain upon us and upon the ground. They were returning a little of the harvest to the gods. It seemed to me, an Englishman, to be a very valuable custom, and one that should be preserved for ever in the Gold Coast. As the Chief left his chromium-plated microphone and sat down again on his ceremonial stool under his umbrella I thought how admirably the whole festival had brought together one or two of the good and useful things in the African and the Western ways of life.

And that, I think, is really what I wanted to say to you. On three occasions recently in London African friends from the Gold Coast have spoken to me of this same problem of how to weld together the cultures of Europe and West Africa. One was a professor at your university, the second a politician, and the third was a young and brilliant sculptor. All of them said to me: 'You cannot help us to find the answer to this problem, and we ourselves have yet to find it.'

I think that is true, and I think that if you do find the answer it will help you to solve all your political and other problems too, because if a people have good principles to guide their lives by, and good ideals to work for, they can usually get their politics right, but if their values are wrong their politics go wrong too, and nobody can be happy.

Your people and mine have both contributed to the achievements of the Gold Coast. We have faith in you, and I hope that you have faith in us. The challenges which you have to face will not end with self-government: they are only just beginning. I am sure you will meet them and win as you always have, and we shall still be glad to help you if you will allow us to. (Broadcast in 'Calling West Africa')

The cinema's prophets: (left to right) Lucretius and Ptolemy noticed the persistence of vision; Ibn el Haitham and Leonardo described the 'camera obscura,' and Kircher the magic lantern; Plateau produced the first moving image

SIXTY YEARS OF THE CINEMA

A. M. ABRAHAM gives his impressions of a London exhibition organised under the auspices of 'The Observer' newspaper which reviewed the progress and achievements of the art of film-making from the beginnings of the 'moving picture' to the present day—a fascinating story of human invention, talent, and industry'

SIXTY years of the cinema—but is the cinema only sixty years old? What about the shadow plays of China and India and Indonesia, which were such a highly developed art in the East so many centuries ago? I am serious when I say this: and film historians will agree with me, I am sure, that the history of the cinema goes much farther back than the day the Lumière brothers first demonstrated the 'cinematograph' in London.

One room in this exhibition is in fact devoted to this ancient art of the moving picture, the moving shadow. Here in this room are shown a number of interesting pictures from the shadow plays of the East. The exhibition thus, in fact, goes much beyond the past sixty years. Of course, it is correct technically to say that the cinema is sixty years old, because photography is the basis of the cinema, and photographic moving pictures were invented only sixty years ago.

The growth and development of films in these sixty years is a fascinating story of human invention, talent, and industry. In this exhibition one can see the different phases of this development. An enormous collection of stills, historical documents, and models have been assembled in the different rooms, and it is all arranged chronologically. In the modern section a very interesting thing to see is a miniature studio built by the British company, J. Arthur Rank Productions, showing the whole process of how a film is made today.

When moving pictures were first shown even their inventor, Lumière, did not think they had much of a future. He thought that people would soon tire of the novelty of moving pictures: 'the craze might last six years, perhaps less. But it did not happen that way. There was always something new that was happening in the cinema to keep it going. The films that Lumière made were a sort of early newsreel: the arrival of a train at a platform, a fire in a building, and so on.

Then came the American director, D. W. Griffith. He is the famous

The Lumière brothers in France were the first people to give public showings of films on a commercial basis: an early poster advertising their business

Kenneth More looking at posters for the film 'Reach for the Sky' in which he stars—a display illustrating the role of posters in film publicity

Four rooms were entirely given over to the American cinema in its various stages: in the 'America since 1927' room 'Westerns' were given their due place

creator of *The Birth of a Nation*, a film classic made in 1915. This film is one of the main attractions in a long selection of films of historical importance that will be shown at the exhibition. Griffith was the first master of the cinema technique, and it was he who started many of the accepted practices in acting and in photography. For instance, he was the man who introduced the close-up. After Griffith came the other great names of early Hollywood days—directors and actors like Chaplin, Valentino, Eric von Stroheim, Mary Pickford, Gloria Swanson—and soon after we were in the modern age of sound films or talkies.

The interesting thing about the history of the cinema is that with every new development there were sceptics who gloomily prophesied the end of films. When sound was introduced many people thought it would finish cinema as a visual art. Of course, nothing of the sort happened: the film has withstood all crises. Indeed, every crisis rather than affecting the film adversely gave new life to it.

Today the cinema is again at a critical stage. There is the competition offered by television, there is competition within the industry itself, there is the mounting cost of production. But it is this very crisis that is causing progress in the cinema today: new artistic values are forming, new experiments are being tried. We are seeing a renaissance of the film in many countries: after the war there was the revival of the Italian cinema; more recently there has been the exciting entry of Japan into the international field. A new phase has just begun in Russia and in India. All this is having a tremendous influence on the art of the film.

One thing is certain: the cinema of the future will be less and less dominated by any particular country or studio: it will be a world cinema. (Broadcast in 'London Calling Asia')

The ruins of the temple at Sarnath, one of several buildings devastated seven or eight centuries ago

The stump of the pillar erected at Sarnath in the third century B.C. by the Emperor Asoka on the site of Buddha's first sermon

Sravasti and Sarnath—'Palace and Deer Park'

JOHN BLOFELD, continuing his scholar's pilgrimage to the Buddhist shrines in northern India, visits two centres which were the scene of some of Buddha's most important teaching. The fourth talk in 'In the Path of Lord Buddha' is introduced in a note on page 17

OF all the Buddhist shrines the most frequently visited is Sarnath, chiefly because it is so easily reached from the world-renowned city and tourist centre of Benares. The road from the city is highly picturesque; it is bordered here and there by walled gardens in which some of the buildings are ornamented with stucco peacocks. You can imagine my astonishment when a life-like peacock I particularly admired suddenly emitted a raucous scream and flapped its way to the ground. I had not realised that flesh-and-blood birds nested among their stucco counterparts. Along the road, too, there were trains of camels laden with farm-produce, who superciliously ignored the modern traffic. The Buddhist scriptures abound in stories of birds and beasts, and their presence all around me in India helped me to bridge the gap of 2,500 years.

I saw at once that modern Sarnath is by far the most imposing of the Buddhist shrines. Though I find simplicity and relative solitude more conducive to the Buddhist contemplative spirit, I reflected that a great world religion does require a few large centres with facilities for the study and propagation of the doctrine. I first made my way to the focal point of the whole sacred park: the stump of the Asokan pillar, set up in the third century B.C. to mark the spot where the Lord Buddha preached his first sermon or, as Buddhists say, where he set in motion the Wheel of the Law.

The first sermon contains the fundamentals of the whole of the Buddhist doctrine; it teaches the Middle Way between the extremes of sensual pleasure and self-mortification; and it includes the Four Noble Truths: namely, that life is inseparable from suffering; that craving and its attendant lusts are suffering's cause; that extinction of craving leads to the end of suffering; and that this can be achieved by the Noble Eightfold Path—a method of controlling thoughts, words, and actions so as to cultivate compassion, to destroy craving, to attain inner serenity, and to enter into that direct experience of Reality called Nirvana.

'Piercing the Veil of Dreamlike Forms'

The Buddha regarded the world of the senses as a barrier between ourselves and Reality, and he sadly recognised that birth, sickness, old age, death, pain, unsatisfied desire and its counterpart, aversion, are the common lot of human beings. Yet he was no pessimist, for he taught that our pleasures and pains are an ever-shifting mirage, an ever-changing dream, behind which lies Reality, unchanging, serene, utterly satisfying. And he taught the methods of piercing the veil of dreamlike forms, revealing the face of Reality.

Nor was the Lord Buddha a puritan teaching us to shun happiness as though it were a crime: he was an advocate of serenity and non-attachment. Thus, there is no harm in my enjoying the foaming splash of some mountain waterfall unless the enjoyment is allowed to give birth to an unquenchable longing for it when I am forced to live, say, in one of London's noisier suburbs. Buddhism is not a running away from life but a means of rising above the circumstances of life so as to become impervious to the sorrow and disappointment inherent in the transitoriness of life.

To commemorate the first sermon, delivered in what was then the King of Benares' deer park, part of Sarnath has again been stocked

with deer: this seems to me quite the most delightful result of the vast programme for Sarnath's improvement. The sacred park is so well cared for that I could hardly visualise the appearance of Sarnath as it was near the turn of the present century, when the whole area was described as being divided between thick jungle and a breeding ground for pigs, full of filth. Presumably, the jungle had been allowed unimpeded growth since the destruction of the Asokan pillar and neighbouring monasteries by fanatic Central Asian hordes seven or eight centuries before.

Prior to that Sarnath had been a great religious centre. The ancient Chinese pilgrims speak of flourishing monasteries there, and Hsuan Chuang of the seventh century describes the Asokan pillar as 'bright and shining as a mirror, its surface glistening and smooth as ice.'

Example of Indian Classical Art

Fortunately, not only the stump of the Asokan pillar remains but also its magnificent capital, housed in the Sarnath museum. This is one of the finest examples of Indian classical art I have ever seen. I was delighted with this seven-foot-high block of polished sandstone, sculptured into the form of vigorous, life-imbued lions sitting back upon a plinth, and below them an inverted lotus and life-like animals—elephant, bull, horse, and lion. I tried to imagine its splendour when viewed from the foot of its supporting pillar, seventy feet high and of the same highly polished stone.

Today much of Sarnath's ancient glory has been revived, largely owing to the work of private Buddhist organisations and to the help provided by the Government of India. Besides the ancient *stupas*, the deer park, and the museum I especially admired the many beautiful Asokan-style railings of austere simple grey-brown sandstone, polished till it glitters in the brilliant sunshine. The most lavishly decorated building is a temple which reminded me of one of those oblong Christian churches with the steeple rising over the high altar at the further end; but there is no close resemblance, for the cool stone architecture is purely Indian, and the soaring tower looks more like a thin, elongated pyramid than a church steeple.

Inside I found many treasures, including colourful frescoes of scenes from the Lord Buddha's life, and a great gilded bell from Japan, whose deep-toned, long-drawn note is followed by a melodious humming which evokes a feeling of deep solemnity. The peoples of India and further Asia take prayer to mean an attunement of the mind to the all-pervading Infinite. They find this easier to achieve with the help of deep-toned bells or gongs, or the melody of gigantic drums.

Relics play their part in Buddhism. Many of these, considering their age, are surprisingly well authenticated. For the Buddha at the time of his death was already so widely esteemed throughout the kingdoms of north India that after his cremation the rulers competed for the honour of housing his relics. These were placed in caskets of crystal or other precious materials beneath splendid monuments with inscriptions on stone. Within the past century or so archaeologists, many of them Englishmen devoted to India, have with the help of these inscriptions discovered undoubtedly authentic relics of the Buddha and his disciples. The relics at Sarnath are exhibited each year on full-moon night in November. They are placed in a lovely silver casket and carried in procession by representatives of many nations, colourfully dressed in their national costumes.

From Sarnath the Buddha story takes us to Sravasti, where the

The Fishing Industry in South-East Asia

D. W. LE MARE, Director of Fisheries of the Federation of Malaya, describes some of the work which his department has been doing to help fishermen improve their methods of catching, preserving, and distributing fish, which forms a main source of protein food for the peoples of South-East Asia

OVER a considerable part of the fishing industries of the British territories in South-East Asia, that is to say in the Federation of Malaya, in Singapore, Sarawak, Brunei, and North Borneo, it is no longer correct to say that the people are very backward. In the past ten years many considerable developments have taken place. How has this come about?

First of all it is necessary to have trained and skilled staff. Many members of the staff have had additional training under the auspices of the Food and Agriculture Organisation and the Colombo Plan. This staff has been equipped with a variety of seaworthy craft and fishing gear, with laboratories and workshops ashore.

The work which has been accomplished has always been with the help and co-operation of the fishermen themselves, for one of the fundamental factors in all development work is that it shall be realistic and directly related to the economic needs and human aspirations of the fisherfolk. In all this work, too, we must acknowledge the willing help of many commercial concerns in pioneering new equipment for the tropics.

Intensive Programme of Mechanisation

First, let us turn to fishing boats. It has been necessary to carry out an intensive programme of mechanisation, and many experimental craft of varying sizes have been constructed which combine the practical needs of the fisherman with the advantages both in economy of operation and in ease of running and maintenance of the modern diesel-engine. Without going into the details of lines and the making of models, let me give but one example of a fleet of about thirty fishing boats, all with modern diesel-engines and with new and modified nets, which caught more than 10,000 tons of migratory shad, known as the *hilsa* in India and Burma, or the *ikan terubok* in the countries which speak Malay.

This occurred in the six months from September, 1954, to February, 1955, and all this fish was packed in ice and distributed all over the country by fast road-transport, and was available to the public anywhere at the equivalent of sixpence a pound in first-class condition. All fresh fish must be in first-class condition in Malaya, for the Malayan housewife is exceptionally particular as to the quality of the fish which she purchases for her family. While fish is a staple food in Malaya there are many villages in remote areas or on secondary roads, so that the problems associated with fulfilling the wishes of the housewife are many.

To get small quantities of fish in first-class condition to remote villages cheaply enough for the agricultural people to be able to afford it, has led to a number of simple but effective insulated containers being made. These are of corrugated iron, or of an aluminium alloy, and are insulated with glass fibre or with blown and vulcanised rubber or granulated cork. They must be large, strong, and effective enough to make them economically profitable. Finally, they must be able to keep iced fish at a temperature within a few degrees of freezing for twenty-four hours, even though

The Fisheries Department has designed a number of types of cheap and simple diesel-engined boats: fishermen sorting out their nets on one of the new craft

Breeding fish in ponds is an ancient practice in Malaya, but the Government helps by importing specially suitable stock—like this Chinese grass-eating carp

it may be put out into the tropical sun at midday, either on the carrier of a bicycle or, for instance, on the middle seat of an up-river canoe.

Let us turn to nets. The traditional method of preserving nets is by steeping them in an infusion made from the bark of mangrove trees. This is good, cheap, and easy. But for certain types of twine it has been found in temperate seas that an oily solution of organic copper salts or copper soaps are a better preservative. By experiment and demonstration we have been able to show the fishermen where these methods will apply, so that they will get a better life from their nets.

Not only are we concerned with fresh fish but with marine by-products. In South-East Asia we are making a paste from the plankton—from a species of small crustacean which occurs in enormous quantities in certain places and at certain seasons. This is caught with straining nets made of China-grass, and then fermented with salt and put into an electrically or diesel driven mincing machine two or three times: the result is something like a dark purple cheese. It is packed in plastic wrappers with the maker's trademark and sold as a nutritious and tasty condiment known as *belachan*.

Of course, *belachan* is not new, but the improved manufacture and processing, with packing in hygienic polythene wrappers which keeps it fresh and moist, are. We have perfected methods of quick freezing tropical fish, so that after appropriate storage they cannot be distinguished from sea-fresh specimens, and can satisfy the discerning eye and palate of the Malayan housewife even after six months. Malayan fish are now being canned, and the delicious curries so much relished by many Asians will soon be finding their way on to world markets, but the problems associated with the chemical erosion of tinsplate by the spices call for the combined skill of chemists and engineers.

Turning an Art into a Science

In many parts of the world fish-oil is made from fish waste. But in Malaya we are now experimenting with the catching of fish for the specific purpose of turning it into fish meal. And the purposes for which we are intending the meal are as chicken food, pig food, vegetable fertiliser, fertiliser for choice flowers such as orchids, and, finally, as a basis for human food, either mixed with seasoning and spices to make condiments or as a flour to be incorporated in biscuits or stews. But in doing all this we must keep an eye on costs and the relative availability of fresh fish: while it is acknowledged that we must set protein to the people, it must be cheap.

Now something about the actual fish farming, the breeding and rearing of fish in special ponds. Of course, the rearing and breeding of fish in ponds is as old in Asia as Asia itself. It is a fascinating procedure by means of which food can be made available in inland areas. It has been going on for many centuries, and in the last few years we have been making a study of what is virtually an art in order to try and make it a science. And all this in order to increase the supply of food which the world needs so much in many heavily populated areas. (Broadcast in 'London Calling Asia')

OUR WAY OF LIFE: 6

WALTER ELLIOT

Britain's Unity in Difference

THE RT. HON. WALTER ELLIOT, M.P., in another contribution to the current series in the General Overseas Service, points out that the differences in the origins of the English, Irish, and Scots, are reflected in the political, social, and religious institutions which these peoples have framed

THE United Kingdom is made up not only of Englishmen, Welshmen, Irishmen, and the Scots—about whose various origins and make-up there may be some argument. The United Kingdom is made up of the national, political, and social organisations which these people have framed, and there is no doubt whatever about the separate identities of these. The United Kingdom consists, therefore, of a mosaic of separate, sharply angled parts fitting together. It is not an amalgam, and does not desire to be one. The proudest boast of the United States is to call itself a melting pot. Such a description would lead to an uproar of protest from any audience within our four seas. It would, by the way, be equally unpopular in Canada.

This unity in difference is an idea which has spread widely over the Commonwealth. The idea was rather charmingly put by André Maurois. He said: 'England is not one person. It is a man and his wife. It is always the wife who answers the telephone. But she never does anything without consulting her husband.' The same idea appears less charmingly in Europe's description, 'perfidious Albion.' Europe is never quite sure who has finally got hold of the telephone.

These differences are not only political: they run deep down into the fibre of our constituent units. They are reflected in sport, in culture, in education, in religion. In sport, for example, the English public is as passionately interested in cricket as is the American public in baseball or the Spanish public in bull-fighting. But cricket plays no part in the sporting life of Scotland at all. Very few parts of Scotland have ever seen a game of cricket played; any interest in the game is purely academic or dilettante; the metaphors drawn from cricket are, to a Scotsman, quite meaningless. Scotland's national game—apart from football, which is now international—is golf, a game played by the working classes in Scotland and by the upper classes everywhere else.

As for culture, the Welsh, for example, sing naturally. They sing when waiting at a station for a train. They sing at the opening or closing of a political meeting, at a lunch, at a football match, anywhere, without the least difficulty, without the least self-consciousness. Whereas an Englishman bracing himself up to sing in public is like a dog attempting to walk on its hind legs: one watches the performance with a mixture of apprehension and of pity. The Irish and the Scots regard singing as a professional matter. They admire, but they do not participate, except in church where they sing the psalms.

The differences in education, in religion, go deeper. The English are by nature a hierarchical people: they enjoy rank and order; in schools they like to segregate themselves, one class from another. In religion they crystallise out in an infinite series of well-understood orders, from churchwardens to archbishops. The Scots, on the other hand, are egalitarian

in each of these aspects of life, in religion especially. There they refuse passionately any idea of gradation. Their form of church government is essentially the General Assembly, a great gathering of clergy and lay elders, held each year, and each year with a differing chairman, to whom no form of precedence other than that of a chairman is allotted. It would take too long to describe the religion of the Irish or of the Welsh.

On all these subjects Wales and Ireland have a furious approach of their own. Wales has a certain ambivalence of envy and admiration towards England. She has in some respects a tenacity of national institutions, such as language, which surpasses even that of the Scots: Welsh is a living language for a great part of the nation, while Gaelic in Scotland is not. Northern Ireland is preoccupied with the remainder of Ireland to the south in a fashion familiar abroad but almost incredible to the tolerant and easy-going English: the Northern Ireland Government, for example, has remained continuously with one party for some thirty years on this one issue of maintaining their separate existence.

All these differences produce a power of comprehension on a variety of levels, a flexibility of understanding, which is from time to time of great service in enabling Britain to get into touch with other countries and groups across the world.

The feverishly cherished border, the boundary of the national soil, of the fatherland, one step across which is a mortal insult, a mortal peril—that is certainly unknown in England, because their land frontiers have not been subject to a serious retreat in war for 1,000 years. But it is realised along the Welsh border, along the Scots border, along the Irish border, as a man knows the threshold between his door and the street. And so Europe, and the East, can find in Britain men who appreciate as they do the irrational but magnetic pull of frontier issues.

There is not time to do more than mention the differences which the different legal systems embody. The Scots system derives from the Roman-Dutch law; the divergences between that and English law are so great that not merely such things as inheritance and marriage but the crucial issues of life and death are treated differently on either side of a line running along a totally unguarded, totally un sentinelled demarcation.

These differences are not trivial. They have their importance for the rest of the world in the existence of the vast English tolerance in the midst of the intolerance, the passions, of Ireland, of Scotland, and of Wales. The balance between the two, the interplay of the forces concerned, has had much to do with the place which the United Kingdom has come to occupy in recent history. The Commonwealth is, after all, rather a remarkable political phenomenon. It cannot rest on tolerance alone: understanding is also necessary. The different attitudes towards life which I have touched upon so briefly give at the centre a hearth upon which both of these fires can burn. (*Broadcast in the BBC's General Overseas Service*)

'Palace and Deer Park' (Continued from page 8)

teachings laid down in the first sermon were more fully elaborated during the years that followed. For the Lord Buddha's habit was to interrupt his endless travels during the rainy season and to spend the time carefully instructing his disciples.

At Sravasti he passed no less than twenty-four of the forty-five rainy seasons between his Enlightenment and death. This once famous capital of the mighty Kosala kingdom is now a mere village called Set-Mahet, situated in the Gonda district of the former United Provinces. I found the remains of the ancient city lost in thick jungle, but its once massive walls and towers are still indicated by certain undulations and hillocks.

I arrived there from Balrampur in an *cku*, a light, single-horse vehicle in which the passenger, if alone, sits cross-legged beneath a canopy and may fancy himself a minor Hindu deity ensconced in a flimsy shrine. With the sweet-faced, elderly Burmese monk who met me I had no language in common, but he hobbled around with me, smilingly identifying the ruined monuments by name. Both of us happened to be carrying red Burmese sunshades, which the local Hindu peasants apparently took for symbols of sanctity, for many who darted forward to touch the venerable monk's knee, and thereby take to themselves a little of his merit, also touched my knee, from which I fear but little virtue flowed.

Sravasti has many delightful associations, of which the following story is a good illustration. Anathapindika, a rich merchant, at his first

meeting with the Lord Buddha became an ardent disciple. So he invited his Teacher to reside sometimes at Sravasti with his followers, but could find no place worthy of such guests except the Jetavana Garden belonging to Prince Jeta. This prince, unwilling to part with his lovely place, tried to silence Anathapindika's importunities by saying jokingly: 'All right, you can have the place, but the price must consist of enough gold coins to cover every inch of the ground.' To his astonishment this offer was promptly accepted. This shamed the prince into reducing the price by half, for he was awed by the usually canny merchant's measureless love for the Lord Buddha. A fine monastery was then built to accommodate the large retinue of monks; and the Lord Buddha showed his appreciation by returning again and again.

Stories of this kind illustrate the tremendous impact made by the Lord Buddha's personality on his contemporaries. He had to decline an offer of half King Bimbisara's kingdom at their very first meeting. And the number of wealthy people—princes, merchants, great ladies, and courtesans—who were willing to sacrifice everything for their Teacher, or to embrace a life of poverty and renunciation in emulation of his own example, is the greatest testimony to his noble qualities.

A character so well compounded of wisdom, tolerance, manly strength, compassion, measureless resolve, and untroubled serenity can seldom have had its counterpart in this world. (*Broadcast in the BBC's General Overseas Service*)

The castle was built by Robert Fitzhardinge of Bristol, ancestor of the Berkeley family, who had received the grant of the manor from King Henry II

Berkeley Castle—Eight Hundred Years of History

CHARLES BREWER tells of a visit to a castle overlooking the River Severn between Bristol and Gloucester which enjoys the unique distinction of being the only one in England to have been occupied in unbroken succession for eight centuries by the descendants of the man who built it

IT was a grey, misty, winter's afternoon as I walked up to the gatehouse of Berkeley Castle—grey weather which perhaps matched one's somewhat grey thoughts, for here in a room built into the castle's keep the unhappy King Edward II was fiendishly put to death in 1327. That thoroughly bad Queen, Isabella, and her paramour, Mortimer, ordered the kind-hearted and compassionate Lord Berkeley away on some pretext, and installed their paid assassins to do this dreadful deed with red-hot irons.

The medieval castles of England, among their many purposes, usually served that of a prison, and Berkeley was no exception. But in a number of respects it is undoubtedly unique among British fortresses. In the first place, it is the only castle in the land which has been held and occupied unbrokenly for 800 years by descendants of the man who built it. In 1153 Henry II handed the Manor of Berkeley over to Robert Fitzhardinge of Bristol, and he became the ancestor of the Berkeley family. It was he who raised these massive walls.

And that brings me to the second unusual characteristic of Berkeley Castle. Normally the stone-walled keep was erected on top of the mound strong-point. Only at Berkeley and Farnham was the keep constructed so that the mound was entirely enclosed within it, resulting in a truly impregnable fortress of unusual size. Again, Berkeley was the scene of the last battle in England between individual land-owners and their private armies when 500 years ago William Berkeley safeguarded his right of occupation of the castle in conflict with a rival claimant.

A Fourteenth-Century Kitchen

In the long drawing room the gilt furniture is upholstered in tapestry worked by the wife of the fourth Earl of Berkeley. An old painting shows the Berkeley coat-of-arms flying from the mast-head of one of the wooden ships of England. The glorious coloured ceiling of St. Mary's Chapel in the castle carries quotations from the *Book of Revelations*, translated from Latin into English in 1380 by Lord Berkeley's chaplain, a Cornishman named Trevisa—nearly 200 years before William Tyndale translated the Bible. And, to speak of more material things, the fourteenth-century kitchen at Berkeley is a rare example of its kind.

The castle stands on a rocky hillock close to the River Severn. The castle keep faces the only high ground near at hand—the churchyard of Berkeley town. Just now I called the keep an impregnable fortress. But it was in the churchyard that during the Civil War Cromwell set up his guns and in three days blew a breach in those same walls. But he restored the castle to the Berkeley family, subject to an enlargement of the breach as a safeguard against further resistance. And there, to this day, that safeguard remains.

I was shown over the castle by young Mr. John Berkeley, who resides there. I could not help wondering, as he and I walked round that keep and through that gatehouse, whether his thoughts ever cast back over those 800 years, whether he ever pictured his ancestors as young men of his own age—maybe in medieval chain-mail or in colourful Tudor doublet and hose; in Royalist plumed hat, lace, and high boots, or in Georgian full-skirted coat with flowered lappets—and all stepping through that same gatehouse from their ancestral home on their lawful occasions. It struck me as something of which he must be very proud—of which, indirectly, we as a nation should be very proud. (*Broadcast in the BBC's General Overseas Service*)

The keep entirely encloses the mound of the original Norman fortress on the site: Edward II is said to have been murdered in a room over its entrance

In the long drawing room are embroideries by the wife of the fourth Earl

'Delicious—remarkably tender' was the verdict on the first cargo of beef treated with aureomycin: the sampling took place at Butchers' Hall, Smithfield

Preserving Perishable Foods with Antibiotics

THE other evening in London (said C. L. Boltz) I went to eat at a Burmese restaurant. My wife and I ate several Burmese dishes, and then we came to the sweets. What could we have? I asked the proprietor, and he told me that we could have mango slices. Mango slices in London, nearly 7,000 miles from where the mangoes grow: how could it happen? You know the answer as well as I do. The mangoes had been preserved by putting them in an airtight tin after they had been cooked and were still hot. This canning is but one modern way of preserving food. Because of several preserving techniques people in London can eat food from all over the world, from Antarctic whale to Chinese liches and Australian lamb.

Preservation like this is a modern development, and one particular sort of preservation enabled me to eat beef in London that had been killed nearly two months earlier in New Zealand. You yourself know what a problem this preservation is, especially in hot climates. To very many people ways of preserving perishable foods, especially meat and fish, are very important indeed. There are many thousands of people who never taste meat because they cannot get it fresh. In fact, one of every two people in the world live where there is really not enough food, and part of this is due to the difficulty of transporting perishable food because it soon goes 'off' and becomes uneatable.

Keeping Spoilage Bacteria at Bay

This is not the only aspect of it. There is the great financial loss in countries like the United States because of the amount of food that spoils in transit. Many ways have been tried to preserve food, especially meat and fish. The oldest is probably salting: salt-fish is known the world over. Other food preservatives are used, such as benzoic acid and sorbic acid. In addition, scientists have recently tried radiating food with electronics; refrigeration is now widespread; and today there is still another.

But I will let a scientist tell you more about this: Dr. J. H. Taylor is a microbiologist who advises the Lederle Laboratories on many of their activities. These laboratories have recently started to use yet another method of food preservation, the one used on the New Zealand beef I ate. Dr. Taylor will tell you about ways of preserving food, and especially the new process he is now concerned with.

DR. TAYLOR: The new process that I am concerned with extends the freshness of foods by treating them with very small quantities of an antibiotic. The evidence already available suggests that this process will considerably facilitate the handling and distribution of a variety of perishable foods. To appreciate the significance of this development let us consider briefly the changes which lead to the spoilage of meat and fish products. As soon as an animal is killed a very wide variety of bacterial species contaminate the meat. While the animal is alive these spoilage bacteria cannot enter the living cell, but as soon as the animal is killed chemical changes take place to allow the bacteria to feed on the cells.

The spoilage bacteria get into the meat mainly during the stages of handling and processing. It is for this reason that most meat handled under clean, hygienic conditions will keep longer than that which is grossly contaminated. If one could imagine meat being protected from all microbial contamination it would remain fresh for a very considerable

period of time. The rate of bacterial spoilage increases with the degree of contamination and also with the storage temperature. It is, therefore, not surprising that most methods of food preservation depend either upon reducing storage temperature, as with refrigeration, or applying some agent which will directly delay bacterial growth.

In recent years antibiotics such as penicillin, streptomycin, and so on have become widely used in the treatment of human and animal bacterial diseases, and as such they have interested the food technologist as perhaps being able to prevent the growth of food-spoilage organisms. Very briefly, an antibiotic is the product of growth of a micro-organism, and when in very great dilution it has the property of inhibiting the growth of other micro-organisms. An outstanding feature of most antibiotics is that although they are very effective in inhibiting the growth of certain types of bacteria they are relatively non-toxic to the consumer, and do not impair the quality of foods so treated.

At last, then, it appears as though we have available a group of substances, some of which will be ideal for the preservation of perishable foods. Recently a new group of antibiotics has been developed with the ability to inhibit the growth of a wide range of micro-organisms. These so-called 'broad spectrum' antibiotics are known chemically as the tetracyclines. They are both highly effective and relatively non-toxic, and they thus open up interesting new possibilities. One of this group of compounds, chlortetracycline, known also as aureomycin, has been shown to inhibit the growth of up to ninety-nine per cent. of poultry spoilage organisms, while other members of the group are less effective but still inhibit the majority of spoilage organisms.

Already they have been used to extend the freshness of red meat, poultry, and fish, while their possible use in milk, eggs, and other animal products is being investigated. As the rate of spoilage increases with temperature, so antibiotic treatment may add an extra one to two days to the storage life of meat at tropical temperatures, or an extra one to two weeks at refrigeration temperature. The precise method of application varies with each type of food product, and the benefits obtained vary with the product treated and also the temperature at which it is stored.

Doubling the Storage Life of Poultry

In the normal processing of poultry in America, for example, it is a common practice to dip the birds in iced water immediately after killing in order to reduce the body temperature. Subsequent storage life has been shown to be extended by incorporating as little as ten parts per million of chlortetracycline in this cooling water. The antibiotic is absorbed into the superficial tissues of the bird and subsequently delays the development of surface contamination. Such birds will then stay fresh for up to three weeks at chilled temperatures. This is at least twice as long as they would last without the antibiotic treatment.

The preservation of beef carcasses has been achieved in tropical countries by post-mortem infusion with an antibiotic solution, or by injection of the live animal immediately before slaughter. In certain of the South American countries, where meat must normally be consumed within about twenty-four hours of slaughter, meat treated with chlortetracycline has been shown to be fresh after seventy-two hours' storage at atmospheric temperature. An interesting result of this treatment is that by allowing meat to hang for a few days at this temperature the normal process of tenderisation is able to take place, whereas usually this is not possible.

In the more temperate climates it may be sufficient simply to spray the surface of the carcasses with an antibiotic solution to delay surface spoilage. This procedure may be of use as an adjunct to chilling in the long-distance transport of meat.

Perhaps one of the most interesting applications of antibiotics is in preserving the freshness of fish. In Great Britain work carried out by the Department of Scientific and Industrial Research has already demonstrated that ice containing four to seven parts per 1,000,000 of chlortetracycline will extend the freshness of fish by an extra seven to ten days. We are about to undertake further work to evaluate this treatment under large-scale experimental and commercial trawling conditions. Not only will this procedure ensure a fresher product for the consumer and less wastage due to bacterial spoilage but it could also permit fishing vessels to stay at sea for longer periods and fish in distant waters which have so far been out of reach.

Very briefly, then, these are the benefits to be expected from antibiotics in the preservation of perishable foods. Much more experimental work remains to be done, but already it can be stated with confidence that this new development represents a very important advance in the science of food technology.

Now, of course, antibiotics are well known in a number of places, and I am sure it must come to everybody's mind that antibiotics do sometimes have side effects, and they will ask whether this treatment of the meat with the antibiotics holds any danger at all for the people who eat the meat. That is something which has been investigated very intensively over the past five years, and we have found in almost every case that as soon as antibiotic-treated meat or fish is cooked the antibiotic is completely destroyed. In view of that, there appears to be no harm, although this requires a good deal of investigation. At the present time we are making a very careful examination of the long-term feeding of antibiotics to human beings. (Broadcast in 'London Calling Asia')

STORIES FROM 'RADIO NEWSREEL'

Here and There

JOAN OF ARC PAGEANT

OVER 500 years ago, in 1431, Joan of Arc was burnt at the stake in Rouen, and it was not until twenty-five years after her death, after another formal trial, that her innocence was declared. People of Rouen have been celebrating the fifth centenary of that declaration, and thousands of country people from the villages of Normandy crowded into the city to see the processions, the pageantry, and the religious ceremonies. With these celebrations was combined the official reopening of the cathedral of Rouen, which has now been restored after the damage done by Allied bombers during the war.

I was in the stand in the old market place itself, very close to the actual spot where the poor nineteen-year-old child paid the unjust penalty of a sublime faith in her own country. The statue marking the actual spot was surrounded by a mass of white and light-blue flowers, the colours of Joan's battle standard. Looking at the ancient buildings around Rouen one has an almost bodily sense of history, a feeling which grew from the beginning of the procession to its tragic end. For each phase there was, of course, a different Joan, from the peasant girl sitting under a tree to the resigned martyr awaiting her fate. But somehow the physical differences between the successive Joans did not seem to matter.

The sinister approach of Joan's English guards, armed archers followed by others bearing faggots for the burning, was cleverly accentuated by the dull thud, thud, thud from the drums marching at their head.

I must say that I felt almost relieved when French friends spoke kindly to me afterwards. And it was certainly a pleasure to see at the following day's ceremony in the same place a smart guard of honour from the two British naval minesweepers who had specially come to Rouen for the occasion. I saw, too, the Union Jack alongside a banner with the words in English: 'Homage to Joan of Arc.' These had been brought over by a deputation of British men and women as a private gesture of their own. I, for one, was glad of it, and even more so to learn that the same groups and their supporters had paid £1,000 for a window to Joan's memory in the cathedral.

It was a happy coincidence that enabled the cathedral to be thrown at long last entirely open for public worship on this occasion, but it was a coincidence due only to the inspired devotion and skill of the chief architect, M. Chauvel, the contractor, M. Landry, and all the engineers and masons who had thrown their whole hearts into the job during the past ten years: a job that included the repair or restoration of more than half of the entire inner structure. A lot still remains to be done, by the way, to the outside.

THOMAS CADETT

PUBLIC RECORD OFFICE

AFTER being closed for reasons of economy for four years the museum of the Public Record Office in London has been reopened, and many famous documents, including the Domesday Book, are on view once more. Most important of the new exhibits is a replica of Magna Charta, signed by Henry III on February 11, 1225. This is the final and definitive form of the charter signed by King John and the barons in the meadow between Staines and Runnymede on June 15, 1215.

A visitor looking at the Domesday Book, one of the priceless exhibits on show at the recently reopened Public Record Office Museum in London

Joan of Arc depicted on horseback in a pageant staged at Rouen to mark the 500th anniversary of her rehabilitation: 200 people took part in the pageant

A household account book checked and signed by Elizabeth of York, Henry VII's queen, shows an entry which starts: 'Item—for six yards of black velvet for a gown for the Queen.' It goes on to give the price as 9s. 8d. a yard, and the total as 62s. 10d., which is 4s. 10d. too much. The Queen passed this error, but then Roman numerals are not the easiest things to multiply, and multiplication itself was a comparatively unfamiliar art in those days.

The indictment on which John Palmer, better known as Dick Turpin, was hanged, is also exhibited for the first time. Described as a labourer, he is accused of stealing a black mare—the famous Black Bess. She was worth £3, and was stolen with a filly foal worth 20s. from Thomas Creasey at Weldon in Yorkshire. The document is dated March 1, 1739, and shows that although Dick said he was innocent he was found guilty and hanged at York.

RAY COLLEY

PLANT PROTECTION

SCIENTISTS from forty countries came to England for the second International Conference on Plant Protection at the Fernhurst research station in Sussex. There were altogether more than 200 delegates, and the subjects discussed included means of combating weeds, insect pests, and plant diseases which together account for the loss of something like half the world's crops every year. For the first time at a conference of this kind closed-circuit television was used to enable the speakers to illustrate their talks. I went along to the research station to talk to Doctor Holmes, the Plant Protection Technical Director.

'Now farming is becoming more and more a scientific business,' I asked him, 'do you think the increasing use of weed-killers and insecticides and so on is having a bad effect on the standards of farming?'

'Generally speaking, I do not think so. At one session of the conference it was stressed that good husbandry must go with the use of chemicals in this particular field. Now good farmers are the people proud of good husbandry, are the people who are mostly using the chemicals. It is the poorer farmers who do not take much notice of good husbandry anyway who are not using the chemicals. I think the object in the future is to educate the poorer farmers not only to use chemicals but to use good husbandry first.'

'A question now from the consumer's point of view: is there any danger at all that this increasing use of chemicals will affect the quality of the crops?'

'The risk that the produce itself may be harmed has been recognised for some time by the manufacturers of the chemicals, and certainly the responsible companies do carry out long-term experiments to make quite certain that there are no long-term ill effects on the crop. Similarly, since the working parties under the chairmanship of Sir Solly Zuckerman, there has been official recognition of the hazards and official action to minimise any danger from that point of view.'

I then went out into the market garden to see some of the machines in operation, and spoke to Doctor F. W. Lane, who looks after the mechanical side of the research station. He said:

'I should explain that quite apart from being in charge of the machinery and looking after the equipment we have on the estate we are also responsible for and do a considerable amount of development work. For example, this machine here is, if you like, the last in line of several machines that have all been developed with a view to reducing the volume of spray liquid that is used for spraying an acre of fruit trees.'

HUGH DRIVER

The entrance to the Marlborough House exhibition, where more than 1,000 relics of V.C.s, including many portraits and pictures, were arranged in chronological order

Bugle captured in Korea in the action in which Colonel Carne won his V.C.

Souvenirs of Wing-Cdr. Guy Gibson who led the raid on the Moehne Dam

An early tank in which a lieutenant won a posthumous V.C. in France in 1918

A water colour of Queen Victoria presenting one of the first V.C.s on June 26, 1856

The Centenary of

Three hundred V.C.s from all over the Commonwealth are on display in Hyde Park and an inspection by the Queen to mark the centenary of the award of the first V.C.s 100 years ago. And at Marlborough House an exhibition of relics connected with the wearer of a V.C. Both events

MARLBOROUGH HOUSE

WEARING a tight-waisted, scarlet jacket with something of a military cut, and a skirt of blue serge, Queen Victoria stood in Hyde Park almost exactly a hundred years ago and pinned on to the tunics of sixty-two sailors and soldiers the first Victoria Crosses ever to be awarded. You could see that very tunic and skirt in an exhibition which was opened by the Prime Minister, Sir Anthony Eden, in London.

The V.C. Centenary Exhibition had been set up in Marlborough House, where Queen Mary used to live. I cannot imagine that there has ever been an exhibition before that has brought together so many front-page stories to be told so modestly by their relics, because every single thing in this exhibition had a story behind it of some 'significant act of valour'—to quote Queen Victoria's original warrant.

The relics covered every sort of thing connected with a winner of the Victoria Cross: portraits, paintings depicting the scene when he won his Cross, articles of uniform or the personal weapons he used—everything, in fact, from a tie-pin to a tank.

Altogether, 1,347 V.C.s have been won, three of them double V.C.s, and two of these were won by doctors. They are made with the metal from guns captured from the Russians during the Crimean war. Two of these guns, their huge barrels all ridges and knobles, flank the entrance to Marlborough House. The first V.C.—it was made retrospective—was won on June 21, 1854, by Lieutenant C. D. Lucas of the Royal Navy. There are pictures illustrating the occasion: he picked up a live shell which had been thrown on to his vessel and tossed it overboard.

Most Remarkable Actions of War

At the other end of the time-scale were the scarlet tunic, pipe banner, and claymore of Major K. Muir of the Argyll and Sutherland Highlanders, who won the V.C. in 1950 in Korea, and a stone carving done by Colonel Carne of the Gloucesters while he was a prisoner-of-war in Korea. Between the two is the history of most remarkable actions of war. You can see the tunic, breeches, battered cigarette case, and bits of the aircraft of Capt. Albert Ball, the air ace of the first world war. He destroyed forty-three German aeroplanes.

In an adjoining room was the actual model of the Moehne Dam on which Wing-Commander Guy Gibson and his comrades were briefed before their furious attack that earned them the name of Dam Busters. More than two years afterwards Leading Seaman Magennis, a diver in a midget submarine, attacked a Japanese cruiser, his own craft being jammed beneath the enemy vessel. So there was little room for him to work to fix his limpets on to the bottom of the cruiser. Then later, when one of the limpet carriers would not release itself from his craft, although he was exhausted he dived again and freed it. There was his rubber diving suit—just one of many relics commemorating bravery.

Then, again, there was the story of the first V.C. awarded to a civilian: that was at Lucknow during the Indian Mutiny, when Mr. T. H. Cavanagh put on native clothing—now looking rather tattered—and passed through the rebel lines to get relief.

HARDIMAN SCOTT

M. the Queen, accompanied by Lord Freyberg, inspecting the Hyde Park parade

At the end of the parade the 300 V.C.s marched smartly past the royal dais in order of countries: Lord Freyberg, the commander, was at their head, and a score of V.C.s in wheel-chairs at the rear

The Victoria Cross

gathered in London this summer for a parade in the centenary of the first award of its kind 100 was set up of relics covering every sort of thing described in the 'Radio Newsreel' reports below

HYDE PARK PARADE

IT was the best summer day of the year so far: people were even grateful for the shade of the splendid trees which framed that level grass parade-ground of Hyde Park. When the V.C.s marched on in the blazing sun the thousands of spectators stood and applauded, and those thousands included not only relatives and friends of the heroes, Londoners and holiday visitors to London, but also, at and near the royal dais, members of the Royal Family, the Prime Minister, Commonwealth Prime Ministers, members of the Cabinet, members of the Lords and the Commons, Lord Mayors and Mayors, and Service chiefs.

On they marched to the music of the band with Lord Freyberg, commander of the parade, at their head: men in dark civilian suits and bowler hats and trilbies, rows of medals glinting on their chests; here and there a V.C. still in uniform—tall Lance-Corporal Speakman, for instance, who won his V.C. in Korea.

A Tremendous Spectacle

The parade formed up by countries, and behind the ranks of the V.C.s were guards of honour from all the Services and massed bands. The arrival of the Queen was heralded by a fanfare, and the orders for a Royal Salute rang out. The arrival of Her Majesty, accompanied by the Duke of Edinburgh, was a tremendous spectacle.

Presently, from the royal dais, the Queen walked out to inspect the parade. And a thorough inspection it was, too, lasting twenty-two minutes, Her Majesty stopping to talk with many of the men, including those heroes in the wheel-chairs, for they, too, were lined up with military precision on the grass. Then the Queen went over and walked along the line of relatives of posthumous V.C.s—women and children proudly wearing the medals of brave men now dead. Then, before the V.C.s marched past at the end of the ceremony, the Queen addressed the parade, and here are some of Her Majesty's words:

'We are not a warlike nation. But whenever war has come our fighting men have shown a standard of courage which has inspired the respect of all nations and the dread of the aggressor. In all the changes of these 100 years that courage has not changed. No one in 1856 foresaw how in our time the citizen will take his equal place in war beside the professional fighting man. The tradition of courage has in this century become the common inheritance of all citizens of the Commonwealth.

'In the past century 1,344 men have won the Victoria Cross, three of them more than once. They were men of all ranks, and they came from all walks of life. They were of different colours and creeds; they fought in many lands and with many different weapons; but their stories are linked by a golden thread of extraordinary courage. Each man of them all gave the best that a man can give, and all too many gave their lives.

'But on this proud occasion let us not forget that courage in battle is only one side of war's account. Do not let us think that it cancels out the suffering and misery which man, whether willingly or unwillingly, has inflicted on man. We must all pray and strive to secure that the account may now be closed.'

GODFREY TALBOT

Books to Read

Reviewed by
Bruce Miller

THE books I am going to talk about are all published in Britain, but are all concerned with countries in Europe. Together they seem to me to illustrate some of the problems of the British approach to Europe. The first is *Germany's Eastern Neighbours*, by Elizabeth Wiskemann. Miss Wiskemann is one of the most accomplished British writers about Central and Eastern Europe: her book on the Rome-Berlin Axis, for instance, is the standard work in any language. She knows the confused pattern of European inter-relationships as few others do. In this book she throws light on the problems raised by the post-war frontier between Eastern Germany and Poland, and the new frontier between Germans and Czechs. Miss Wiskemann has to take her story back to the beginning of this century and beyond to explain the complications set up by the frontiers of 1945. Today in Britain, I think, we regard these frontiers as unimportant compared with the line drawn down Europe between the Communist countries and the West. But the lesson of Miss Wiskemann's book is that the long-standing antipathies, enthusiasms, and latent patriotism of the various people involved have not been conjured out of existence by the division between Communist and non-Communist Europe: they remain, and still constitute a threat to peace.

Empire of Fear, by Vladimir and Evdokia Petrov, is a very different book. This is an account of life in the Soviet Union, and particularly in its secret police, by the two former Soviet citizens, the Petrovs, who defected from Russian service in Australia two years ago. It is, I think, a good book as such books go. The personalities of the two Petrovs come out clearly and give an impression of truth. At times there is a tendency to over-dramatise things, but that is probably inseparable from defectors' stories. The Petrovs do not disguise the fact that it was fear that made them give up the Soviet service, and that it is only since their defection that they have acquired any particular affection for Western ways. Two things stand out from their story. The first is the impression they give of the MVD, or NKVD, or OGPU—the secret police—as a career which people in the Soviet Union aspire to enter as someone in the Western world might think of going into a bank. It is a special portion of the civil service, no more; the fact that it carries out killings,

and spies continually on people with a view to exposing their lack of enthusiasm for the Soviet state, is an incidental matter. The other thing that stands out is the universal quality of fear in the Soviet Union—fear of work-mates, fear of one's family, fear of the police, fear of the government, fear of foreign aggression, fear of capitalist revenge.

Now two books about France—*Modern France*, by F. C. Roe, and *France 1940-1955*, by Alexander Werth. The first of these is sub-titled 'An Introduction to French Civilisation,' and is concerned more with the unpolitical aspects of life in France; the second, on the other hand, is exclusively political. Professor Roe's book I enjoyed because it gave me my first clear picture of the French legal system, the French education system, and some of the attitudes towards life that Frenchmen share and foreigners find hard to penetrate.

Mr. Werth's book is much longer and more ambitious, and has excited much comment in Britain, favourable and unfavourable. It is a political history of France between the establishment of the Vichy regime in 1940 and the fall of M. Mendès-France's cabinet in 1955. Mr. Werth was not in France for all this period, but he was for most of it. Before the war he was known as a penetrating commentator on French affairs; and this book is clearly an attempt to re-establish himself in that position. I do not think it succeeds, but it is a notable attempt. Its main defect is that although it is extremely long and detailed it is history written by a gossipy journalist; not by someone who is trying to see events against their full background. Yet I do not want you to think that this is a bad book. It has gusto and vitality, and it reveals a complex personality more interesting than that of any other writer in my list of books.

My final book is *Cyprus Challenge*, by Percy Arnold, an account of Cyprus ten or twelve years ago by an English journalist who ran a newspaper in the island then. It is well written, amusing, astringent, and illuminating about Cyprus now, although the events it deals with are over. For it shows how long-standing are the grievances which Greek Cypriots are now voicing, and shows how difficult it has been for the British administrators of Cyprus to recognise that they were dealing with a European people with a Western cultural tradition older than their own, and how galling this has been to Cypriots of Right and Left alike.

Germany's Eastern Neighbours, by Elizabeth Wiskemann (Oxford University Press for the Royal Institute of International Affairs, 30s.)

Empire of Fear, by Vladimir and Evdokia Petrov (André Deutsch, 18s.)

Modern France, by F. C. Roe (Longmans, 21s.)

France 1940-1955, by Alexander Werth (Robert Hale, 35s.)

Cyprus Challenge, by Percy Arnold (Hogarth Press, 21s.)

This Week's Listening

'CLOISTER AND CAVE'

ASK anyone to name some of the world's famous universities and the answer will almost invariably include Oxford, Cambridge, the Sorbonne, Heidelberg, Harvard, Yale. . . . Yet not one of these could claim to house and teach, entirely free of charge, 10,000 students at a time. This was once the record of Nalanda in northern India.

The university of Nalanda derived from a Buddhist monastery founded in the third century B.C., and one of its illustrious students (in the seventh century A.D.) was the Chinese pilgrim, Hsuan Chuang. The site of this ancient university was, therefore, a natural point for John Blofeld to gravitate towards in the course of his scholar's pilgrimage in northern India. At this stage of his journey he also took the opportunity of seeing what remains of the cave near Rajagriha in which the first Great Buddhist Council was held.

John Blofeld's talk, 'Cloister and Cave,' will be the fourth in the G.O.S. series, 'In the Path of Lord Buddha.'

G.O.S.: Friday 15.45; Saturday 00.30 and 05.00

THE EXPANSION OF ISLAM

A HUNDRED years after the death of the Prophet Muhammad in 632 the frontiers of the Islamic Empire stretched from the Atlantic Ocean across Spain, North Africa, the Middle East, and Central Asia to the borders of India.

These vast territories were ruled by Muslim Arabs who had overwhelmed the ancient kingdom of Iran and had wrested many provinces from the Christian Byzantine Empire. Today that empire has ceased to exist, although Islam remains as a religion and a culture throughout the territories over which the Arab Caliphate originally held sway.

Bernard Lewis will be speaking in the G.O.S. series 'The Story of Colonisation' about the historical expansion of Islam during the early Middle Ages. Mr. Lewis is Professor of History of the Near and Middle East at London University, and he has written many articles and books on both Islamic and Turkish history. His talk this week was specially recorded at the University of California, where Mr. Lewis has recently been teaching and completing some research on the Crusades.

G.O.S.: Monday 15.45; Tuesday 00.30 and 05.00

'ANDROCLES AND THE LION'

SHAW'S hilarious comedy is based on an old fable about the Roman persecution of the early Christians. Androcles is one of them: he is a little Greek tailor who meets a lion and extracts a thorn from its foot.

Later he is taken to Rome with a batch of other Christians. They are given the choice of making a nominal sacrifice to the goddess Diana or else being torn to pieces by lions in the gladiatorial arena. Androcles refuses to make the sacrifice; but the lion turns out to be his old friend, and they leave the arena together.

Bernard Shaw explains that in the Roman era 'a Christian martyr was thrown to the lions not because he was a Christian, but because he was a crank: that is, an unusual sort of person; and multitudes crowded to see the lions eat him, simply because they wanted to see a curious and exciting spectacle.'

In the last act of *Androcles and the Lion*, which forms this week's contribution to the G.O.S. Shaw Festival, Androcles is played by Richard Goolden, famous for his 'little man' parts. Leonard Trolley is the lion.

G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

EIGHTEENTH-CENTURY CONTROVERSY

IN 1715 a correspondence started between Leibnitz, the great German writer and philosopher, and Dr. Samuel Clarke, a Cambridge mathematician who had at one time been domestic chaplain to Queen Anne. In the correspondence, Clarke was acting as spokesman for Sir Isaac Newton, for it was Leibnitz's attack on the 'experimental philosophy' of Newton that started this exchange.

This 'literary discussion' will be the subject of a talk by Stephen Toulmin, Professor of Philosophy at the University of Leeds, in the series 'From the Third Programme.'

G.O.S.: Monday 14.45; Friday 23.15

Aug. 26—Sept. 1

THE FIFTH TEST

THE fifth Test match between England and Australia is due to end at the Oval ground, London, on Monday and Tuesday. It will be the last Test of this season's series. On both days Rex Alston, John Arlott, and Michael Charlton will be giving commentaries at 12.00, 14.15, 16.15, and 17.15, and Aif Gover will sum up play at 12.30 and 17.30. Eye-witness reports will be broadcast daily at 21.00.

The Australian tourists have two further fixtures this week. On Wednesday they begin a three-day match against the Gentlemen of England at Lord's, and an eye-witness report will go out daily at 21.00. On Saturday they are meeting an England eleven at Hastings in a match which will be the subject of commentaries at 12.15 and in the course of the afternoon, and a report at 21.00.

'MISTRESS OF THE HOUSE'

THE setting for *Mistress of the House* has been described as 'the most wonderful of all Elizabethan houses,' and no one who has seen Hardwick Hall can fail to ponder on the character of its builder—that 'E.S.' who set her initials on the very roof-top as a triumphant challenge to all the world. The spirit of Elizabeth, Countess of Shrewsbury—the fabulous Bess of Hardwick—still broods over the great house in Derbyshire.

The author of the play, Elizabeth Dawson, says: 'The first time I went there, one rainy Sunday in 1954, I could not help wanting to know more about this extraordinary woman who had impressed her personality so firmly on bricks and mortar that 300 years seemed just a moment between us.'

'Elizabeth was born the red-headed, strong-willed, and beautiful daughter of John Hardwick, humble country squire, and died the founder of a great family and builder of four magnificent houses.'

'The tale of her four marriages, each more ambitious than the last, her passion for building, and her overwhelming desire for power and possessions would provide enough material for half a dozen plays. I chose to write about the last and most ambitious of all her "works"—the attempt to secure the crown of England for her tragic granddaughter, Lady Arabella Stuart.'

G.O.S.: Thursday 01.00 and 18.30

'SISTER ANGELICA'

ON purely musical grounds *Sister Angelica* does not deserve its neglect, a neglect not shared by its two companions of the triptych of one-act operas completed by Puccini in 1918, the grimly dramatic *The Cloak*, and the refreshingly humorous *Gianni Schicchi*. Nor can its story be accused of lacking strong drama: a nun commits suicide after hearing of the death of her illegitimate child.

Nevertheless, the convent setting (the opera is for women only) and, still more, the last-minute escape from bitter reality into a slightly sentimental, consolatory cloudland, i.e., a vision of the Virgin holding out a little child, have stood in the way of the opera's general acceptance.

Victoria Sladen takes the title-role, and Nora Swinburne (right) is the narrator, in this week's production of Puccini's opera 'Sister Angelica'

Flashback to the 1954 London-Moscow meeting: A. Anufryev leading K. L. Norris during a lap in the 10,000 metres; Norris went on to win for London

Visions of this kind—and indeed several incidents that precede it—are better imagined and 'felt' by the listener than seen, so that this week's broadcast in the G.O.S. should win the opera more converts than a stage production.

G.O.S.: Sunday 12.00; Monday 05.00; Tuesday 01.00

INTERNATIONAL ATHLETICS

TWO years ago a Russian team labelled Moscow, but in reality representing all Russia, beat London in a floodlit match, the highlight of which was the wonderful 5,000 metres race between Chataway and Kuts which the Englishman won by a foot or two.

Last September the first full International between the two countries took place in Moscow, where at the Dynamo Stadium the field events gave the Russians a comfortable victory. This year's match, which will be Great Britain's last home International before the Olympic Games, will be described by Rex Alston and Harold Abrahams, who will be the BBC's representatives in Melbourne.

They will be giving an eye-witness account on Friday and Saturday at 21.05, and commentaries in the course of Saturday afternoon.

NATIONAL YOUTH ORCHESTRA

THE National Youth Orchestra of Great Britain will be heard from the Edinburgh International Festival, conducted by Walter Susskind, on Friday at 19.00. Their programme opens with Berlioz's overture, *Le Corsair*.

The National Youth Orchestra of Great Britain is now in the ninth year of its existence, and its achievements are acknowledged to be of a remarkable and sustained quality. It was founded by Ruth Railton: she selected 120 young musicians from auditions for 2,000 boys and girls, and formed them into an orchestral team. In 1953 the Queen Mother became patron of the orchestra.

The members of the orchestra meet during every school holiday, three times a year, for study, instruction, and practice, and well-known instrumental musicians act as professors for the various sections.

THE STORY OF THE PROMS

The Story of the Proms is the title of an illustrated BBC publication which traces the history of the Promenade Concerts from their inception in 1895 at the Queen's Hall in London. It tells how Robert Newman's ideal of educating the British musical public achieved realisation through the unflagging energies of Sir Henry Wood and of the sponsorship, from 1927 onwards, of the BBC. Today the Promenade Concerts have become a national institution, unrivalled anywhere else in the world. In *The Story of the Proms* also there is information about all the orchestras and conductors who have appeared at the Proms, and the new works that have been played. Among the contributors, Basil Cameron writes on Sir Henry Wood and W. W. Thompson on Robert Newman. *The Story of the Proms* can be obtained through your local agent or, in case of difficulty, directly from BBC Publications, 35 Marylebone High Street, London, W.1, price 2s. 6d. sterling, post free.

Your Wavelengths

London Calling is published several weeks in advance and we regret that, for reasons beyond our control, it is sometimes necessary to alter wavelengths after we have gone to press. The latest information is always given in Programme Parade

15.00 Radio Se Angrezi
(English by Radio)
'Listen and Speak'
Lesson 98
15.15-15.30 NEWS and News Talk

WHAT I BELIEVE. The speaker in Sunday's programme will be Mr. Sidney Silverman, who has been Labour Member for Nelson and Colne since 1935. He was formerly University Lecturer at the National University of Finland. An ardent campaigner for the abolition of capital punishment, he is the co-author of the book, *Hanged—and Innocent?*, and was responsible for introducing the recent abolition bill in Parliament.

SHAW FESTIVAL. Dame Edith Evans, one of the dominating figures of the English stage, who created the part of Orinithia in Bernard Shaw's *The Apple Cart* in 1929, will repeat it in the scene to be broadcast on Tuesday. She has told how, during the original rehearsals, she started by playing the King's mistress in a rather 'larky' manner. Shaw himself corrected her with the explanation: 'Remember, Orinithia is a goddess.' John Richmond will take the part of Magnus.

BRIEF EXCURSION. Last year an international group of students met in Britain for the first time under the auspices of the English Quakers to take part in a residential seminar. They discussed problems which were urgent in their separate countries as well as the more general international ones. The seminar was so successful that it is being repeated this year at Worcestershire. The chairman will be Otto Van der Sprengel, the Oriental historian. Recorded extracts from the discussions will be broadcast on Saturday.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

DIESEL POWER AT WORK

On the farm Perkins Diesel engines offer greater power, easier starting, greatly reduced fuel and maintenance cost. This is a Massey-Harris 780 Combine Harvester fitted with a Perkins L4 TA type diesel engine.

Municipalities find Perkins Diesel engines save up to 5-11d. per mile compared with petrol engines. Here is a Dennis Gully and cess-pool emptier, fitted with a Perkins P6(v) engine.

This Royal Naval Midget Submarine, for which engine reliability is absolutely vital, is powered by a Perkins P6 Diesel engine. Perkins Marine Diesel engines range from 25 b.h.p. to 100 b.h.p.

POWER, SPEED AND ENDURANCE are three of the outstanding characteristics you'll find in every Perkins Diesel engine, at work on land or at sea. But that's only part of the story. Diesel engines start easily, and their thermal efficiency means fuel costs about half that of petrol driven engines. Fire risk, particularly important in marine application, is eliminated. Diesel reliability is a by-word. Statistics prove that they outlast any other type of engine. Whether you need power for vehicles or boats, for farm equipment or industrial applications there is a Perkins engine to suit your particular requirements.

THE FARNBOROUGH AIR SHOW

The Society of British Aircraft Constructors Flying Display and Exhibition at Farnborough—one of the world's greatest displays of aircraft—will be described by Charles Gardner and Raymond Baxter in a G.O.S. programme this week. A preview of the show by Ivor Jones is on page 5. One of the exhibits will be the new Bristol Britannia turbo-prop airliner (shown above) which is due to enter BOAC service on the Springbok route this summer and will later be introduced on services to Australia

CHRISTMAS GIFTS

For Friends and Relations
IN GREAT BRITAIN

Wherever you live in the world why not let us do your Christmas Shopping for you? The JOHN LYLE GIFT SERVICE specialises in packing and posting a complete range of Gifts carefully selected from Britain's foremost manufacturers. No worry about your parcel reaching England in time—it's posted in England. All gifts are stored in our own warehouse and delivery is guaranteed before Christmas and the recipient does not have to pay any Duty. It's all so simple. All you have to do is to send us your order, remittance and greetings card, we do the rest.

Write NOW for our magnificent fully
★ illustrated FREE Christmas catalogue ★
showing over 150 different presents to suit all
ages at all prices.

OVERSEAS JOURNAL OF THE BBC

This Day and Age in the Soviet Union

DR. GEORGE H. BOLSOVER, Director of the School of Slavonic and East European Studies in the University of London, introduces a new series of talks by various experts which opens in the G.O.S. this week on Tuesday at 15.45 and Wednesday at 00.30 and 05.30

ALL foreign countries and peoples are hard to understand. But Russia and the Russians under both Tsars and Soviets have usually been called an 'enigma.' This is hardly due to lack of information about them: on the contrary, in a book called *Accounts of the Muscovite State by Foreigners*, Klyuchevsky pointed out that Western travellers described even Muscovite Russia more often and fully than any country in Europe. It has been due rather to the striking and surprising contrasts and contradictions which Russia has always presented and which foreigners has found it easier to record than make comprehensible: 'Meekness and brutality, Communism and the most advanced individualism, the strongest state and the weakest political consciousness, absence of race hatred and the most cruel pogroms, the deepest religious nature and the most abject superstition, an all-pervading democracy and the most absolute monarchy'—as a distinguished American Slavist wrote in 1915.

Not unnaturally the Bolshevik Revolution reinforced the idea that Russia was 'enigmatic.' In particular, it injected such intense political passion and prejudice into much that was written about Soviet and even Tsarist Russia that the same thing often seemed heavenly or hellish according to the politics of the observer. This helped to pile contradiction on to contradiction and appeared to leave the 'enigma' more inexplicable than ever.

But in spite of appearances it is questionable whether Russia is really more 'enigmatic' than other countries. Every country usually has its contrasts and contradictions, and, even though Russia's may seem particularly striking, the persevering and patient student can usually discover and explain why and how they arose, provided he approaches her like any other country and ceases to regard her as an 'enigma' having a solution.

It is true that the study of Soviet Russia presents its own special difficulties even for those who try to leave both enigmas and politics on one side. They arise mainly from the quantity and quality of the information available about her, which for long periods has been very incomplete and tendentious. But a careful, systematic, and intelligent combing of the Soviet daily and periodical Press and of other Soviet publications, including literature, particularly when supplemented by reports of travellers and others who have lived or worked in Soviet Russia, can provide sufficient material from which to piece together a general and fairly reliable picture of Soviet development in most major fields of activity.

It has been said with much truth that there are no experts on Soviet affairs, only varying degrees of ignorance. But the extent of the ignorance is often exaggerated, and it mostly concerns matters of detail which cannot invalidate the picture as a whole.

For example, Western students of Soviet affairs were well aware of the shortcomings in post-war Soviet agriculture even before the Soviet leaders disclosed their nature and extent after Stalin's death. Nor did they need Khrushchev's recent revelations at the Twentieth Party Congress to know that Stalin had been a totalitarian dictator who over-rode the law and the

constitution and used the secret police as one of his main instruments of government. In any case, the Soviet authorities have recently been readier to release information and to admit foreign visitors than for many years past, and if this continues and develops it should now become possible to make even the general picture more detailed and reliable.

The importance of studying Soviet affairs as fully and soberly as possible scarcely needs to be argued. The Soviet Union claims to have built a new type of society which promises mankind the certainty of salvation and fulfilment here on earth; and China and the countries of eastern Europe are already following her towards it under Communist direction. In less than forty years and in spite of two world wars and a civil war she has been ruthlessly transformed from an economically backward and primarily agricultural country into the strongest industrial power in Europe. Now she aims to surpass the industrial output of even the U.S.A.

Though her leaders say they no longer regard an eventual armed clash between the capitalist and Communist systems as necessarily inevitable, and are stressing peaceful co-existence instead, they still see the relationship between the two systems as essentially one of rivalry and struggle and look on co-existence as anything but a permanency. On the contrary, they are certain that our grandchildren if not our children will see the whole world become Communist.

This means that whether we like it or not Western civilisation and the civilisations of Asia and elsewhere face a challenge which is sure to grow if the power and attraction of the Soviet Union and the rest of the Communist bloc increase. For this reason, above all, a knowledge of Soviet affairs is essential.

Beginning this week the General Overseas Service is broadcasting a series of weekly talks on the Soviet Union in 'This Day and Age.' All the speakers have made a special study of the topics on which they have been invited to speak, most of them having lived in the U.S.S.R. for longer or shorter periods.

The first talk is given by Lord Strang, who describes the land and peoples of the Soviet Union. In his talk Lord Strang also examines the question of how far the Soviet Union embodies the traditions and policies of the old Russian national state, and how much the country has been fashioned in the image of a Communist society. Lord Strang, who spent some years in the British Embassy in Moscow before the war, was Permanent Under-Secretary of State at the Foreign Office until his retirement three years ago.

SIR JOHN SLESSOR

SIR JOHN SLESSOR, a former Chief of the Air Staff, re-examines some of the traditional principles of 'Imperial Defence' against the background of a rapidly developing Commonwealth in an age of air-power, nuclear weapons, and guided missiles

Commonwealth Defence

I HAVE obviously not been let into the secret of what the Commonwealth Prime Ministers talked about at their meeting. But I should think it is a pretty safe bet that the subject of defence was not entirely ignored. So I am going to think aloud for a bit about some of the problems of defence in this rapidly developing Commonwealth in the nuclear age. First, let us remind ourselves of the general concept of what we used to call in the old days Imperial Defence, and see how it has changed in recent years; for it has changed, at first sight almost out of all recognition, but on a second, more careful look, perhaps not as much as all that. Do not misunderstand me: I do not mean for a moment that the whole problem of war and peace has not fundamentally changed with the coming of age of air-power and the advent of nuclear weapons, guided missiles, and so on. I am not talking about that now but about the relationship of the different nations of the Commonwealth and their interdependence in matters of defence.

'Britannia Ruled the Waves'

In the old days, not so long ago, the security of that great world-wide agglomeration of nations and territories in varying stages of political development under the Crown which we knew as the British Empire rested in the main on the Royal Navy. The Army, and more recently the R.A.F., was available, though not committed, to join our Continental neighbours in preserving the balance of power in Europe; to defend the British Isles against air attack and invasion; to act as goal-keeper for the Fleet, defending its bases; and—for years its greatest responsibility—to help the Indian Army defend the frontiers and preserve the internal security of India. Not only that—and here is one of the most significant changes today—that magnificent Indian Army was then available, and was constantly used, to defend our imperial interests in the Middle and Far East. More, in the Kaiser's war it joined the British Army in the cold mud of Flanders, fighting the Germans.

The Dominions, as we then used to call them, maintained in peacetime small forces of their own, mainly on a non-regular basis; but we were a maritime empire: Britannia ruled the waves, and as long as she did so their defence was sure. There was, however, an unwritten understanding that if the Mother Country was in peril Canada, Australia, New Zealand, and even South Africa would be there. There was no commitment: Mr. McKenzie King, for instance, declined to consider establishing R.A.F. training schools in Canada before the outbreak of war in 1939. But everyone really took it for granted that if the United Kingdom were involved in a great war the Dominions would automatically be in it too.

One other point about the old days which is of particular significance to Commonwealth defence when we consider these new days: somewhere, thousands of miles away across the grey ocean, was the United States, busy extending her frontier westwards, building up a colossal prosperity, unconcerned with these Europeans with their incorrigible habit of fighting each other, and sternly disapproving of imperialism—particularly of British imperialism, which their school-books told them was an evil thing from which their founding fathers had freed them not so many years ago.

The Defence Situation Today

Hardly one in a million of their people had the faintest idea that they had been able to indulge in these agreeable pursuits thanks largely to the protection of the British Fleet, which for a century or more had been their shield and the sanction behind the Monroe Doctrine. And after their belated intervention in the 1914-18 war they buried their heads more firmly than ever in the sand of isolationism. The main reality about America in 1939, as far as Europe was concerned, was the Neutrality Act—cash and carry and all that sort of thing—almost unbelievable when one looks at it nowadays.

Now against that rather over simplified background, let us have a look at the Commonwealth defence situation today. How has it changed? I should obviously have to talk for a couple of hours if I had to cover all the differences, but I will try to touch on what I think are the really basic changes in the past half-century.

Underlying everything, of course, is the technological revolution. The world has shrunk in terms of time to a fraction of its former size, and we now see air-power armed with the ultimate weapon—the hydrogen bomb—as the dominant military factor. That may or may not have put paid to total war as we have known it, though I personally think it has. What it has certainly done is to have the effect that Britain is no longer an island, and sea-power is no longer the Empire's sure shield.

Then, while it is still important to the Commonwealth that western Europe should not be dominated by a hostile power, the old idea of a balance of power in Europe is out-dated. It is now a question of preserving

the balance of power in the world as a whole. Great Britain, after bearing the brunt of the two most terrible and destructive wars in history, is no longer the richest and most powerful nation on earth. And we have seen the astonishing rise of the two colossi—the United States and Russia—with another, potentially perhaps even more powerful in the future, in the shape of China.

Now it is not easy for British people to get accustomed to this changed situation. But when we are tempted to criticise the brashness and crudity of some manifestations of American policy do not let us forget how enlightened was the self interest which led to things like Lend-Lease, the Marshall Plan, and NATO, and let us be thankful that the United States have risen on the whole so nobly to their new responsibility of world leadership. In Europe there is still a potential enemy—a successor to Napoleon and the Kaiser and Hitler. And while Japan will surely never again be a first-class military power the new China may grow into a desperately dangerous enemy in Asia, not necessarily by any means, but probably inevitably unless there is a change in the United States and Commonwealth policy *vis-à-vis* Peking.

And that brings me to the other basic change in recent years: the emancipation of Asia, the end of Western domination, and the rise of nationalism in the new nations of the East. In particular, we see the two great powers of Asia—India and China—both pursuing the same end in different ways: both striving to modernise and industrialise their social and economic systems, China by the method of totalitarian dictatorship, and India by an adaptation of the liberal, democratic system inherited from British rule.

Of course, the relations of Asia with the West are bedevilled by all sorts of catch-words, particularly, as we saw at Bandung, the slogan of anti-colonialism: I have recently heard a great European statesman describe that as being in fact 'a trauma of wounded Asian pride, a pathological reaction after years of foreign rule, and really just a convenient new label for a dislike of foreigners.' It does tend, however, to blind Asians to the fact that the Kremlin is the most imperialist power in history, and that no shadow of independence is permitted to the peoples it has subjugated, in Central Asia, perhaps, less than anywhere.

That Word 'Independence'

The emergent nations, by the way, do not always think very clearly about the word 'independence.' No nation can be truly independent unless it is capable of conducting its own defence policy. In that sense, of course, no nation in the Commonwealth is really independent. They are all dependent on each other and on our allies. And Britain sometimes seems to be one of the few nations in the world who does not consider it beneath her dignity to have allied bases on her soil.

Now, what does all this add up to? Does it mean that if Britain is ever involved in another great war we shall not find our Commonwealth partners rallying round as they have always done in the past? Of course, it does not mean any such thing. One unfortunate and very important change is the position of India, which I shall touch on in a minute. As far as what it is convenient to call the old Dominions are concerned, I think it is worth reminding you that there never has been anything in the nature of an imperial combined staff or Commonwealth defence plan; but their loyal co-operation in war is as certain as ever it was: as a matter of fact it is, if anything, more so, because now they are most of them committed by treaty, which they never were before. They will rally round all right, but in a different way. They are committed not just to the support of the Mother Country but also as partners with the United States in the far more powerful Western coalition of which Britain is a leading member.

We have Canada, for instance, as a member of NATO. Who would ever have dreamt only a few years ago that we should see Canadian battalions and squadrons stationed in Europe in peacetime? We have Australia and New Zealand linked in South-East Asia not only with Britain in a Commonwealth defence arrangement known as ANZAM but with Pakistan and with the United States, France, Siam, and the Philippines in the Manila treaty. In the Middle East, where the decline of British power is one of the most disquieting changes in recent years, we have, nevertheless, Pakistan also linked with us in the Baghdad Pact.

South Africa has undertaken to send a division and an air contingent to the Middle East in the event of a general conflict. Actually, I am least happy about South Africa: it seems to me that if she persists in her present racial policy it may be only a matter of time before she ceases to be a dependable member of any alliance beyond her borders—she may be too busy at home.

In other words, Commonwealth defence arrangements are no less valid because, as Mr. Menzies of Australia has recently written in *The Times*,

(Continued on page 16)

Vickers will be showing the latest type of Viscount, which can carry 65 or more passengers, and (right) the Vickers Valiant—one of Britain's latest big bombers

The Farnborough Air Show

IVOR JONES, BBC Air Correspondent, offers you a preview of what he calls 'the world's noisiest and most exciting shop window,' where members of the Society of British Aircraft Constructors display their products to visitors from more than a hundred overseas countries

THE Farnborough air show is the world's noisiest and most exciting shop window, and the more aircraft and engines Britain sells abroad the more important this window becomes. This year aviation exports have been breaking every record—during most months they have been about seventy-five per cent. above the corresponding figures for 1955. Whether or not these sales are improved still further will depend in no small measure on the impressions that visitors from probably more than 200 countries carry away from this Farnborough display.

Most of the aircraft they will see are not strangers to this annual show. They are aeroplanes, such as the Vickers Viscount and Bristol Britannia airliners, the Hawker Hunter and Gloster Javelin fighters, and the English Electric Canberra and Vickers Valiant bombers, all of which have considerable flying experience behind them. This will not be one of those spectacular years when every other aircraft on the programme seems to be a new type.

Not that there will be no new aeroplanes. For instance, the Vickers-Supermarine N113 is expected to make its first appearance. This is the fastest, heaviest, and most advanced day fighter ever built for the Royal Navy, capable of going through the sound barrier in a shallow dive and of carrying an atomic bomb.

There will be other novelties, too. The Fairey Fireflash will be shown—Britain's first air-to-air guided missile to destroy a target aircraft in flight. It is a sharply pointed and sinister-looking dart, set between powerful booster rockets that carry it to supersonic speeds in a matter of seconds. The Fireflash will be seen fitted to a Hunter fighter, a combination in which it is thought some Commonwealth and NATO countries may be interested. Fairey's, incidentally, will also be showing their elegant F.D.2 research aircraft for the first time since, last March, it set up a world speed record of 1,132 miles an hour.

Britain's efforts to meet the future needs of aviation will perhaps be reflected more at this Farnborough in engines rather than airframes. There will be the Rolls-Royce Conway and the Bristol Olympus, two of the most powerful jets in the world. They have become more important than ever since last year, because they both have a chance of at least part of the huge market for aero-engines that will be created by the big American jet airliners, the Boeing 707 and Douglas DC8. Indeed, Trans-Canada Airlines have already ordered Conways for their DC8s.

But, besides the jets, there will be rocket

motors as well—fierce, violently noisy machines of the kind that, some time in the future, may be driving space-ships. It is expected that at least two aircraft will be flying with rockets fitted to them: a Valiant bomber, equipped with de Havilland Super-Sprites to help it during take-off, and a Canberra with the Napier Scorpion.

To jump from these to what is probably the quietest type of engine, as well as the most economical: two new, big turbo-props should be airborne at Farnborough. One is the Bristol Orion, and the other the Rolls-Royce Tyne. If, as many experts believe, there is a lasting place for turbo-prop airliners in the world's air fleets, there should be a considerable future for both these engines.

Most Successful Medium-Range Airliner

Certainly Britain's two present airliners of this type should have a special place in the show. Vickers propose entering the latest type of Viscount—one of the 800 series, able to carry sixty-five or more passengers at up to 360 miles an hour. This is a great improvement on even the Viscounts now in service, already the world's most successful medium-range airliner.

Bristol's intend putting in their extended version of the Britannia—the 300 type—which will have a speed of nearly 400 miles an hour and can carry up to 100 passengers. It will be the first time a '300' has been seen at Farnborough.

Farnborough is always something of a progress report on the British aircraft industry. It seems now that it will show this past year as one of consolidation. The Javelin fighter and the Avro Vulcan bomber, for instance, have appeared there before. But this time there will be a difference. Since the last display both of these have gone into service with the Royal Air Force. It has been proved, in fact, that they are ready for the work for which they were built.

I said earlier that Farnborough is a shop window. Like a shop, it has its offices where business can be discussed. These are the lines of caravans, set up at the side of the airfield, and fronted by striped awnings, which are in fact the aircraft firms' headquarters.

There, over lunch or a cocktail, very confidential matters can be talked over with foreign airline executives, air attachés, and manufacturers from abroad. These caravans add much to the gaiety of the Farnborough scene. But it is in them that the most serious assessment of the show will be made, and of where it places Britain in world aviation.

The acrobatic team of Hawker Hunter fighters from the R.A.F.'s 54 Squadron is again expected at the show

SIR JOHN MAUD

SIR JOHN MAUD, Permanent Secretary to the Ministry of Fuel and Power, addressed representatives from all over the Commonwealth gathered at Oxford for the Duke of Edinburgh's Study Conference on the Human Problems of Industrial Communities. Here is a broadcast version of his address

The Impact of Industrialisation

I DO not want to waste time trying to define my terms, so let me give you some illustrations of what I have in mind when I think about 'the impact of industrialisation.' I spent most of my life between the first and second world wars at Oxford, and during that time there was a small-scale industrial revolution there. This was due to the spectacular growth of the Morris motorcar industry at Cowley on

the outskirts of Oxford, and it wrought such changes that some of our friends in Cambridge began describing Oxford as a suburb of Cowley.

Another place where I had the chance of observing the impact of industrialisation was Johannesburg. By 1936 Johannesburg had become a great metropolitan centre with a million or so inhabitants—some black, some white (of English and Dutch extraction), some Asiatic. Fifty years earlier it had been bare Transvaal veld, and the root cause of the change had been one thing: gold mining. Kuwait, on the Persian Gulf, is another example, only there it is the discovery of oil that has turned the penniless sheikhdom of ten years ago into a state with a revenue of £100-million a year. Lastly, and nearer home, a virgin patch of the Berkshire downs, at Harwell, has become a place of world importance during the past few years, the centre of our research into nuclear power.

It Is Happening All the Time

There you have four rather dramatic examples of the way in which we find our lives can be upset, and a new kind of society created, by industrialisation. The motor industry comes to Oxford; nuclear research comes to Harwell; gold is discovered in the Transvaal, oil in Kuwait; and in each case men, women, and children find themselves caught up into a new, dynamic, rapidly changing way of life. That is what results from what I call the impact of industrialisation; and, of course, something of the kind is happening all the time in almost every part of the world.

Now let us quickly clear out of the way two bits of nonsense, two myths that we sometimes, perhaps unconsciously, tend to accept as having something to be said for them. There is the myth of the Golden Age, and what I will call the myth of the Pre-Golden Age. According to the myth of the Golden Age, the discovery of gold or oil or nuclear power or any other new application of science to meet our material needs (industrialisation, in other words) is bound to prove a blessing; from that time onwards things are bound to be better than they were before; there will be more to eat and drink, less need to work, more time to enjoy one's family and one's friends; more chance for the fine arts to flourish and man to rise to his full height and exploit his God-given capacities—all this being the inevitable consequence of industrialisation.

'The Good Old Days'

According to the other myth, the myth of the Pre-Golden Age, everything was wonderful in the good old days and the trouble only starts when gold is discovered or some other form of industrialisation begins. The consequence of industrialisation is outrage on the countryside, dreary towns, boring work, ugly gadgets, endless rows between employers and employed, the progressive enslavement of the human spirit to materialism—all these in contrast to the happy carefree life of our pre-industrial ancestors, living their own simple lives in unspoiled country, at peace with God and man.

Both these theories, I suggest, are dangerous nonsense. Let us reject them and have a look at the facts—which are far more exciting and complicated. The first fact about industrialisation is that it enormously increases our power, and therefore enormously increases our responsibility for what happens in the world. It enables us to do all sorts of things we could not do before: to make things and move them about from one end of the world to the other, to keep a far larger number of people alive, to talk to each other across long distances and arrange our affairs through quite new kinds of government. And all this means that we have much more responsibility than before—for how much food there is, and how many people there are to eat it, and how much each person can get, and so on.

The second fact is a shift, or rather constant shifting, in the pattern of power. 'The powers that be' are not the powers that were. New men, new organisations run the show: large employers, trade unions, and the boards that run nationalised industries, in the industrial field; in the field of government, new political parties seeking to represent the new interests within society, and new types of political leader. These are the people that wield the new powers. These are the people who have to carry the new responsibilities.

And the third fact is a negative one: there is no inevitability about the results of industrialisation. Whether the consequences are for better

or for worse, for richer or for poorer, for sickness or for health, entirely depends on the success or failure with which the new powers are used, and in particular on the success or failure of the men and women who are chiefly responsible for using them. This last conclusion certainly seems borne out by the extraordinarily mixed bag of good and evil that we find around us in the actual experience of industrial societies.

Industrialisation has brought us new dangers of slavery and new chances of freedom. Dangers of slavery to the machine and to the tediousness of repetitive work; to the factory, shop, office, firm that employs one; to the trade union; if one is a small employer, to a trade association; dangers of slavery to the state or even to the local authority if it is a big inhuman one. But at the same time new chances of freedom: to choose one's wife or husband from outside the narrow circle in which one grew up; to find one's form and develop one's talents through education; to choose one's job, and change it; freedom to become a leader instead of having to accept as final the limitations imposed by birth.

Then I think industrialisation has also brought us more loneliness and more fellowship. 'I a stranger and afraid, in a world I never made'—I am afraid that is a description that a lot of people would often apply to themselves in our industrial towns when their work makes them feel like cogs in a huge machine and when the hostel or suburb where they live makes them feel neighbourless and without roots.

On the other hand, there is the fellowship on the floor of the shop or in the mine; the chance of finding people with the same interests as yourself—in games, music, theatricals, and so on; the trade union and all the clubs and societies that flourish in a town; opportunities of travel, at home and abroad, and all the contacts which are made through reading newspapers or listening to the wireless—contacts which tend to enlarge one's world.

Both Menace and Opportunity

The plain fact is that industrialisation is at the same time a fearful menace and a tremendous opportunity. It threatens to destroy us, to standardise us, barbarise our life by dividing it into compartments of work and leisure, destroy our personal relationship to each other and substitute the impersonal one of cogs in a machine. But at the same time it offers us fullness of life in a sense never within our grasp before.

What does this challenge demand of us? Chiefly, I suggest, imagination and character. To match the new powers over physical nature given us by pure and applied science we have to find in ourselves new vision to show us how to use those powers, and a new integrity to resist the corruption that always becomes more threatening as power increases. 'The factory was made for man, not man for the factory': it is easy enough to say that, but infernally difficult to make sure that it is true in practice.

My own conviction is that we retain our mastery and avoid becoming the servant of the machine only by serving something else. That is why what we need most to meet the impact of industrialisation is vision and strength of character—continuous, determined striving to live by our answer to the question: 'What is the purpose of our life on earth? What are the things we are really prepared to live and die for?'

So what I believe we have to do, if we are seriously going in for this adventure of industrialisation, is to keep firm hold of what we believe—of what we believe, for instance, about the fundamental difference between good and bad, truth and falsity, beauty and ugliness—and try to build our new industrial society on the rock of those beliefs. For the first nuclear power-stations that we are now building in Britain we need sites with even firmer foundations than we need for conventional stations because the nuclear reactors are not only more powerful but heavier. For much the same sort of reason our new industrial society needs even stronger foundations than the old.

What those foundations should be in each of our countries we have to decide for ourselves. For my part I believe the two most important are these: faith in the supreme value of each individual man and woman and child, and faith in men's capacity to work together. If we have the patience, imagination, and courage to go on building on these foundations I believe there is a chance that the scales of the balance in industrial society will be gradually tilted against slavery and loneliness in favour of freedom and fellowship.

There is a chance that more and more industrial workers will take the sort of delight in what they do that creative artists have always taken; that we shall discover the twin secrets of leadership and discipline in our industrial life; that out of a rich diversity of groups and individuals the community will progressively become more of a community. But it will take time and deeper spiritual resources than any human society has so far shown. (*Broadcast in the BBC's General Overseas Service*)

Dounreay, Scotland: what the atomic power-station of the future will look like. The spheres are of steel, 135 feet high, and will house the reactors

Britain's Fast Breeder Reactor

ABOUT as far north as you can go on the mainland of Britain one of the strangest engineering jobs of the century is now under way: it is at Dounreay, a few miles from John O'Groats. There the Atomic Energy Authority is building an experimental fast breeder reactor, an atomic pile that may set the pattern for the way that nuclear power will be generated in the future.

Dounreay is going to be a world centre of research into nuclear power generation. Other atomic nations are following various lines of approach on how to convert the intense heat of nuclear fission into usable electric power. Britain at present leads the world in this. Calder Hall, which the Queen will open in October, is the first atomic power-station of a commercial size in the world. But the Atomic Energy Authority, looking far ahead for better methods, is building a reactor, an atomic pile, that will have the magic property of creating as it goes along more atomic fuel than it burns. This is the so-called fast breeder reactor. The difference between Dounreay and Calder Hall is this: one ton of uranium at Calder Hall will do the work of 10,000 tons of coal; in the breeder reactor at Dounreay it will do the work of a million tons or more.

Dounreay is already half-way in the building of its miraculous furnace. It will be a great steel ball 135 feet high—it would fill Trafalgar Square. I have been climbing about on the massive steel shell which is now half built: it stands like a giant cup on the edge of the wild coast of Caithness. The reactor will be inside the steel ball, simply as a safety device against the unlikely event of an atomic mishap. From the lip of this cup I looked outwards to the Orkney Islands on the near horizon, below the wild coastline thrashed by the breakers, and near at hand the ruins of Dounreay castle, built in the fourteenth century to command the bay where, centuries earlier, the Vikings used to storm ashore on the raiding missions.

Looking inwards from the lip of the cup, and turning from centuries past to the things of centuries to come, I saw the structure that will house the real heart of the atomic furnace. It is a tremendous vault of concrete, everywhere five feet thick. It weighs 50,000 tons—more than

The first of the reactor buildings taking shape: the steel shell will act as a shield in the unlikely event of a mishap; inside this shell, buried in five feet of concrete, will be the atomic furnace itself—just about the size of a dustbin

most ocean-going liners. In the flat circular top is a round hole, and down inside it will be the core of the reactor itself, the glowing heart of the furnace. It will be tiny compared with the giant sphere that will hold it: in fact a small dustbin would be no larger.

The concrete vault will shield the outside world from the deadly radiation of the fission process. It will also hold the exchangers which will draw off the heat from the fission process and take it the first stage along the chain of events which will make it into steam and so into electricity.

The engineers talk of cooling the pile with liquid metal, because the pile will be so intensely hot that molten metal will be cool by comparison and will absorb that sun-like heat. The power-station to make electricity from this tiny but intense furnace has yet to be started: it will be one of the few conventional things in the strange atomic set-up at Dounreay. (BERTRAM MYCOCK in the BBC's *General Overseas Service*)

Laying pipes to carry the dangerous radio-active waste well out into the sea

The main 'stupa' at Nalanda, and (left) one of the Asokan pillars marking Buddhist holy places

'Cloister and Cave'

JOHN BLOFELD, in the fourth talk in the series he is currently giving in the G.O.S., records his impressions of the Buddhist college at Nalanda and the ancient place of pilgrimage at Rajagriha. The final talk, which is being broadcast this week, is introduced on page 17

ONE of the Buddhist shrines most evocative of spiritual atmosphere is a hill called the Vulture's Peak. It is near the modern townlet in Bihar Province which marks the site of Rajagriha, once the magnificent capital of a proud empire. The town is set around by five hills, their slopes crowned with the shrines of no less than four religions: Buddhism, Hinduism, Jainism, and Islam. And we are even assured by certain Russian mystics that Jesus Christ himself paid a visit to this place some time before his thirtieth year; so it is not inconceivable that one day the shrine of a fifth faith will be added.

I was naturally very anxious to visit a place hallowed by thousands of years of pilgrimage, more especially as the Lord Buddha himself had frequently resided there; but first my route led me to stop off at another place of great interest some six miles short of Rajagriha. This was the site of the once great university centre of Nalanda, where I planned to pass several days. A bus set me down amid ruin-dotted rice-fields, where used to stand a university capable of accommodating 10,000 students at a time. Nearby was its very modest successor, a handsomely designed little institute recently erected for the use of students doing research on the ancient sacred tongues, Pali and Sanskrit.

I passed into some cloisters surrounding a wide courtyard where a group of yellow-robed monks sat listening to a lecture on the philosophical background of Buddhist doctrine. Suddenly I was astonished to hear myself greeted by name, for I had supposed myself among strangers, but some Thai monks present had at once recognised me as coming from Bangkok, where my home is. They set about making me feel more than welcome, for though on taking the yellow robe a man severs his ties with his family and the world, years must elapse before he enters so deeply into the meditative life that he is no longer moved by reminders of home.

I was next introduced to the philosophy professor, a former Hindu *swami* turned Buddhist monk. Such conversions are rare in India, which for all that it was once the native country of the Lord Buddha, and once predominantly a Buddhist country, is now the only non-Islamic part of Asia where Buddhists form but a tiny minority. Yet in ancient times it was Indian Buddhist missionaries who lit a flame in further Asia which burns to this day in all the vast territories stretching from Tibet to Japan and from Mongolia in the north to Ceylon, Thailand, and Vietnam in the south.

The library of Nalanda Pali College impressed me by its stock of rare works in seven or eight languages, and I found that the professors and students include people from nearly every part of Asia. Curiously enough, in this most Asian of Asian colleges English has to be the medium of instruction, as it is the only living language common to a group composed of so many nationalities. At first I was saddened to find less than fifty students where once there were 10,000; but my new friends told me that plans are afoot to revive Nalanda's ancient glories. Towards evening, when the great heat became more bearable, the Thai monks accompanied

me to visit the principal ruins. But I found that a few mounds of rubble and some recently unearthed remains of brick walls are all now left of what was once the greatest university in the world.

The university stemmed from a monastery founded by the Emperor Asoka in the third century B.C. Within a few hundred years it developed into a full-scale university, which later achieved gigantic proportions. The princely generosity of the culture-loving Indian rulers of those days made it possible to board and educate 10,000 students at a time, and this without any sort of charge. Hsuan Chuang, the seventh-century Chinese pilgrim, spent seven years at Nalanda, where he studied more than eighteen systems of Buddhist philosophy, also the Hindu Vedas, and logic, grammar, medicine, and mathematics as well. A paraphrase of his description of the place runs as follows:

'The students are largely composed of men of the highest ability and talent, of pure and blameless conduct, who follow severe monastic rules and are respected throughout the countries of India. Learned men come in multitudes to take part in discussions, and the stream of wisdom spreads far and wide. Those who desire to take part in the discussions cannot enter until they have answered some hard questions posed by the gatekeepers. Many are unable to answer and must retire. For only a man deeply learned in ancient and modern studies can hope to enter.'

Hsuan Chuang adds that the cosmopolitan body of students was supplied with servants, rations, transport by elephant and litter, and with all things required to leave them entirely free to concentrate on their studies and upon the development of inner serenity by the practice of deep meditation. All this was made possible by heavy endowments and daily offerings in kind made by hundreds of villages.

'All Things Are Transient'

But as Buddhism so rightly teaches all things are transient. The Chinese pilgrim, while still at Nalanda, had a disturbing dream. He beheld the buildings of the university desecrated by buffaloes and by filth, the surrounding villages in ruins, and a golden figure of the Bodhisattva Manjusiri, divine patron of learning, prophesying utter desolation to come. By the eighth century A.D. the university was already declining on account of the resurgence of Hinduism, but still the fulfilment of that dire prophecy was delayed. Then in the fateful twelfth century came invading hordes from Central Asia who upon reaching any place dedicated to Buddhism or Hinduism put monks and priests to the sword, burned libraries, and hewed to the ground buildings or monuments of brick and stone.

Thus Nalanda perished in a hideous wave of desolation; wind-blown soil veiled its remains, and slow-stepping oxen dragged wooden ploughs over the buried seats of learning.

From Nalanda to Rajagriha I had expected to travel alone by narrow-gauge railway; but three Thai monks, who had come to the station to bid me farewell, hospitably decided to accompany me and leapt into the rickety carriage just as the train moved off. Arriving in the late afternoon, we paused at the Burmese rest-house to arrange for our stay, and then began our explorations. Rajagriha, already ancient when the Lord Buddha

(Continued on page 10)

The town centre—just far enough from Manchester to have escaped absorption. Kay Gardens—one of several parks and open spaces within the town boundary

Bury—a Typical Lancashire Town

ALAN DIXON takes you to one of those typical Lancashire towns on the fringe of the great industrial area around Manchester: the citizens are especially proud of their town hall which is one of the most modern in the kingdom

BURY is one of those typical Lancashire towns standing on the fringe of the great industrial area that surrounds the city of Manchester. In this way Bury must count itself lucky, for even though it is placed between the manufacturing and cotton centres of Bolton and Rochdale it has escaped being surrounded by a mass of mortar and bricks. The green foothills of the Pennines separate it from the staunch group of Lancashire cotton towns like Colne, Nelson, Accrington, and Burnley that lies to the north; the Pennines themselves rear up to cut it off from the Yorkshire centres of industry.

Market day in Bury is one of the big days of the week. I went to market, and not for the first time, for this busy centre attracts visitors from many parts of Lancashire and the not-too-distant regions of Yorkshire, too. I walked round the crowded roadways between the stalls with Mr. Birch, the Market Superintendent, who told me that the market had been established for more than 200 years and was at one time attached to the manor of the earls of Derby. The corporation purchased the site in the 1870s, and it has been moved three times. The present open space in the middle of the town has plenty of room to house the 300 stallholders, who sell everything from buttons and beads to lino, meat, fish, fruit, and vegetables.

Famous Makers of Black Puddings

But most of all I wanted to meet the famous makers of the Bury black puddings. The black pudding is a typical local dish of distinctive flavour. Mr. Harry Reddish and his wife, descendants of the Thompsons who first started making the black puddings more than 150 years ago, were busy serving at the stall. Today you can buy your black puddings hot, and munch them as you walk round the market place.

To me these puddings look like a small haggis, black, and about the size of a snooker ball. Harry Reddish told me that they still get orders from all parts of the world. There was the customer from Texas who had them sent out by air; others from the Argentine; and even Bury Corporation had dispatched a consignment of black puddings in bulk to the men of the Lancashire Fusiliers while they were serving in the Far East. Harry told me that the recipe—still secret—had not changed over one and a half centuries, but he did confess that basic ingredients of the Bury black pudding were groats, blood straight from the beast, and spices. 'Another thing,' says Harry, 'you can't make a black pudding with a machine: you've got to mix it by hand.'

I walked over to the town hall to meet the Bury Town Clerk, Mr. Edward Smith. Bury's town hall is going to be the most modern in Britain; and to me this seems to be a justifiable claim.

The town hall is a place of large windows, pastel colourings, and modern furniture. The woodwork and the furniture are made from timber grown within the Commonwealth. Mr. Smith pointed out fine carving in Indian laurel, African bubinga, Tasmanian blackwood, Lagos mahogany, and Australian black bean, and these are only a few of the beautiful woods which are being used for interior decoration. Altogether it is estimated that the building will have cost about £500,000 when it is completed in about a year's time. It seems pretty obvious to me that Bury people will feel that the expenditure was worthwhile in even 100 years from now. (Broadcast in the BBC's General Overseas Service)

Work on Bury's town hall was interrupted by the war but resumed in 1947: the building is now largely in use and will be completed in a year's time

The council chamber: all of the woodwork is in Commonwealth timber

OUR WAY OF LIFE: 7

'A People of Paradoxes'

GRAHAM HUTTON

GRAHAM HUTTON, in this contribution to the current G.O.S. series, offers his estimate of the English character, with its genius for 'muddling through,' and discusses its chances of survival in this new era when—as he sees it—the advantage seems to lie with the nations who plan and organise and train

ONE of the earliest documents about the English or Anglo-Saxon people was written by a scribe in the eighth century, setting out what lands each tribe or folk of the English possessed in England. At the bottom of one page the scribe has amused himself by writing down the characteristics of all the

peoples of Europe known to him at that early date—such phrases as the wisdom of the Greeks, the fortitude of the Romans, the cruelty of the Franks, and so on. But when he came to write about his own people, the English, he wrote 'the stupidity of the English or Anglo-Saxons.' And that is the reputation we have had—I may say, I think we have earned it—for the intervening twelve centuries.

Why stupid? Why have we always been known throughout Europe as a lazy, unthinking, unimaginative, fond of sport, fond of animals, fond of drink, and rather dirty, untidy people? Now I am talking of us as a nation, not of the small minority of about two and a half per cent. of us who always formed a European *élite*, made the Grand Tour, and were rich, whether in the seventeenth, eighteenth, or nineteenth centuries.

If you take the whole nation you have to admit—today as centuries ago—that the great mass of the English folk—not, of course, the Celtic Scots, Irish, or Welsh—are rather lazy, physically and mentally; they are conservative and traditional: they do not like change—change of homes, or work, or radio programmes, or in their sports teams, or diet, or newspapers; they are great lookers on, or watchers, of sport, but do not play it much; there are 9,000,000 of them enrolled in trade unions, yet less than six per cent. of them ever attend their union meetings. We English actively distrust and evade all organisation, planning, tidiness, and blueprints, especially do we mistrust them if they are drawn up for something in the future.

We, the English (and not the Scots or Irish or Welsh), excel, and enjoy ourselves thoroughly, in breaking all the rules, going against all accepted plans or regulations, and in the end succeeding where everybody else—the Germans, Americans, and so on, with their better and tidier and infinitely more detailed plans—has failed. For proof of that you have only to look at our military and naval and air history, with its heavy reliance on the unexpected, the ways of Providence, the unforeseen accident, and the need for much individual initiative.

We proved it on the high seas and in Norwegian fjords; in the air over Britain and the Channel; in African deserts and Burmese jungles; in Arabia in the first world war, and in many a tight spot from Malta to Malaya in the second. Scarcely anything ever went 'according to plan' for us English; and I suspect that for most of the time there was no hard and fast plan at all. But this heavy reliance on local initiative paid off handsomely in our favour.

We English are not an obedient folk; but we are perhaps more patient than Germans or Americans, who would certainly never put up with the inconveniences and bad services which we English seem to like.

We are an odd mixture. We are politically shrewd, decent, and canny. The mass of us are perhaps the least and worst formally educated nation of the Western world. We hate formality, yet adore the trappings of an antique monarchy which we have deprived of all power. We are a lazy, unquarrelsome, easy-to-live-among, uninquisitive, uninquiring people; yet we are the terror of the earth—at any rate of Europe—when roused; and like the old bulldog we never let go too soon.

We lose all the first games, or battles, because we never believe in plans or preparations or training; yet we catch on quicker than others, and generally manage to 'muddle through' to somewhere very near first place after incredibly painful and unnecessary last-minute organisation and convulsions which a little forethought would have spared us. We are, as the American, Emerson, called us exactly a century ago, a people of extremes, yet we hate extremes; a people chockfull of paradoxes.

Now under all such extremes and paradoxes there must be an English philosophy of life. I think it consists mainly of a deep sense of tragedy, of uncertainty, of doubt about everything, of the imponderables of life thrown in by Providence; a sense of the littleness of mankind, of humility about making plans for the future, and of scepticism, even stoicism, about the outcome of anything in the future. This vein of stoic scepticism runs through our so rich poetry, drama, and literature, and in our folk-music.

We live in a cold island, in unpredictable weather. From the security of that island, for centuries until within our own memories, we could look on at other people's wars and misfortunes, or join in, whichever we wanted. But we could not plan; we did not dare to set out to organise Europe as the Romans did, and as the French tried to do, and the Spaniards and the Germans later on. Indeed, when we got an empire, mainly by commercial venturing overseas, we never organised it from the English centre, as Rome and the others tried to do. It never had a plan or blueprint or organisation.

The plain truth is that in all past centuries we distrusted planning and organisation, training and preparations; we trusted in luck, God, Providence, the English character—by the way, training for that is still our chief ideal today in every kind of school—and, last but not least, in the stoic duty of Englishmen to do their damndest and their best in any situation, even if, generally, it was a nasty one which they themselves had allowed, lazily, to occur.

I wonder if we shall still be able to 'muddle through' on character alone (of which we have, I admit, tons more than most peoples); or whether in this new complex, technical era the nations who plan and organise and train will not steal a long, long march on us. But I would desperately mind it if we abandoned reliance on what in the past composed that remarkably tough, stoic, yet altruistic instrument: the English character. And it may be that to get it you have to pay the price of some laziness, untidiness, and—let us admit it—stupidity. (*Broadcast in the BBC's General Overseas Service*)

'Cloister and Cave' (Continued from page 8)

lived nearby, was at that time the extremely wealthy and luxurious capital of the proud Magadha empire. Today the sole traces of its former glory are a few newly excavated monastery foundations. Some remnants of the vast boundary walls with their thirty-two main gates and sixty-four lesser gates gave me an idea of the enormous size of the ancient city. But the five lovely hills—gazing at them I beheld the very same vista of beauty which had so often presented itself to the eyes of the Lord Buddha.

Towards sunset we climbed one of these hills by a steep flight of steps almost a mile long. To the left and right I saw many religious buildings: the tombs of Muslim saints, Hindu temples, and the sacred Jain dwellings. Half-way up we heard a distant drumming, and presently a Japanese monk approached, beating a wafer-thin drum and intoning the praises of the Lotus Scripture in a weird, rhythmic chant. As our paths crossed, he honoured us by a number of loud ceremonial crashes of his drum, followed by three profound bows.

Near the peak of the hill we came upon the crumbling remains of the Sattapanni cave where shortly after the Lord Buddha's death the first Great Council was held to agree upon the wording of the scriptures. As I had recently attended the sixth of these Great Councils in Rangoon this cave held an especial fascination for me. Here were the beginning and ends of a chain stretching unbroken through 2,500 years of history. When we came back to the foot of the hill we entered the bath-house of a Hindu temple; and we bathed there, squatting beneath streams of

hot mineral water splashing down from curiously shaped stone conduits, fed by a spring which has flowed since the days when the Lord Buddha bathed himself in that place.

Early the next morning we drove past the ruins of the famous Bamboo Grove Monastery to the foot of the mountain called Vulture's Peak. This was a favourite residence of the Lord Buddha, who visited it often in his wanderings and delivered many sermons there. The steps leading to the remains of the monastery near the summit were first built by that wealthy and powerful monarch, King Bimbisara of Magadha, who was one of the Lord Buddha's chief admirers and the first great patron of the Buddhist order. Near the top we came to the remains of the building where the Lord Buddha once dwelt upon the pinnacle of Vulture's Peak.

Here, after reverently paying our respects, we sat for long enjoying the view and inhaling such an atmosphere of peace as is seldom found in this world. And on the way back to the city we stopped to see the site of the jail where King Bimbisara had been imprisoned by his son for abandoning military prowess in favour of the compassion he had learnt from the Lord Buddha. From here I could clearly see the Vulture's Peak.

That evening, when the Thai monks had left for Nalanda, I visited the learned abbot of the Japanese monastery. As we sat in his garden talking of sacred things, the sun dropped behind the hills, and from the nearby shrine-room came the thunder of drums and the deep chanting of the Japanese priests. (*Broadcast in the BBC's General Overseas Service*)

'Resolution' and 'Adventure' at Tahiti—a painting by William Hodges in the Maritime Museum

Model of 'Endeavour Bark,' the ship in which Cook made his first exploration of the South Seas in 1768

A Captain Cook Exhibition

PROFESSOR MICHAEL LEWIS, the distinguished naval historian, tells of an exhibition at the National Maritime Museum, Greenwich, in honour of the great English seaman whose explorations first taught Europe the true size, shape, and possibilities of the Pacific Ocean

AT the National Maritime Museum in Greenwich a special exhibition was opened this summer by the High Commissioner for Australia, Sir Thomas White, in honour of the great seaman and explorer, Captain Cook. Among the exhibits are several treasures of Cook's famous voyages across the Pacific, as well as some relics of his lesser-known journeys across the Atlantic—journeys which had a decisive influence on the history of Canada and Newfoundland.

It was a happy inspiration that made the National Maritime Museum invite the High Commissioner for Australia to open its exhibition commemorating Captain Cook because it is largely owing to that great Englishman that Australia is today a white man's home and a member of the British Commonwealth. But Cook's three momentous voyages, undertaken between 1768 and 1779, did many other things.

They first taught Europe the true size, shape, and possibilities of the Pacific, shattering for ever the geographers' pipe dream of a vast temperate continent covering the southern half of that ocean. They were milestones, too, in the stories of navigation, charting, and surveying, and the maintenance of health at sea. In all these arts this modest, self-made Yorkshireman proved outstanding, as thorough and sensible as he was skilful and enterprising.

The exhibition is rich in original material; journals of Cook himself and his companions; the logs of his earlier surveys in Newfoundland; letters in his own hand to Lord Sandwich, then First Lord of the Admiralty; correspondence with the Navy Board concerning his ships, officers, stores, medicines, and scientific instruments; and his own chart of Quebec, which his fine navigation had helped Wolfe and Saunders to win back in 1759.

There are many contemporary books, paintings, and drawings—far too many for individual notice.

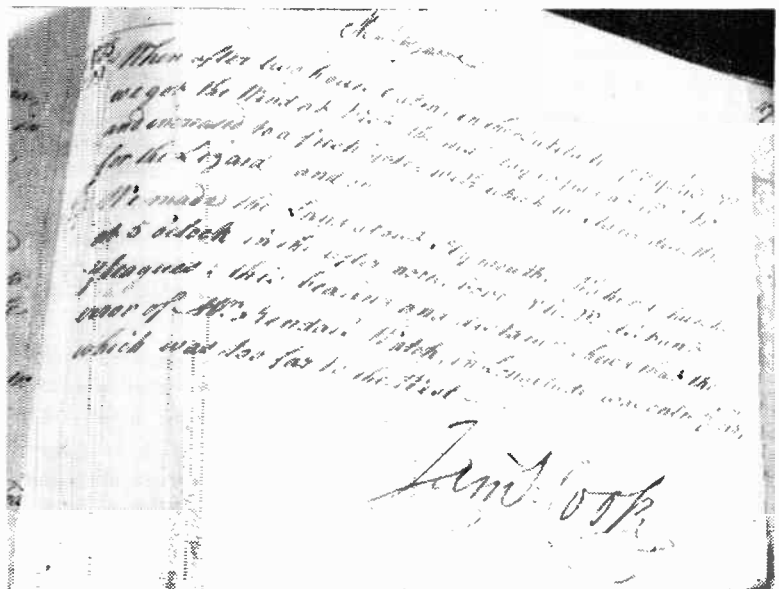

A Staffordshire pottery figurine of Captain Cook with his journal

But I would mention just one series of wash-colours made by various young officers detailed by Cook to sketch headlands and bays as they sailed along: not great works of art, perhaps, yet exceedingly interesting when we remember that these persevering young men were really making a photographic record—without a camera. There were also, of course, the official artists—William Hodges and John Webber—and their works also are well represented at the exhibition, which is open until the autumn. (Broadcast in the BBC's 'Radio Newsreel')

'The error of Mr. Kendal's Watch, in Longitude was only 7' 45", which was too far to the West'—an entry in Cook's own hand from one of his journals

A bit of sunshine—and a 'nation of ramblers' sets out to enjoy the countryside

Nostalgia for the Countryside

SAM POLLOCK talks about some of the problems that arise when the Englishman's love of natural beauty comes into conflict with his country's need to earn a living as a great industrial workshop

I HAVE an American friend—or perhaps I ought to say, with an eye on my Canadian listeners, a friend who is a citizen of the United States—who came across to Britain in the year 1913 to have a quick look around, which he did not anticipate would take him longer than a month. He is still here. When he first came to Britain he was, in the Army phrase, 'seconded' to a British engineering works which was associated with his employers in the United States. He decided, he tells me, that this was the country he was looking for when he discovered that not a single workman in the British plant seemed to be attending evening classes with a view to becoming managing director: all their ambitions, all their competitive and acquisitive instincts, seemed to be directed towards growing bigger cauliflowers and more beautiful roses than their neighbours on the work-bench.

He later found, he adds, that something of the same spirit permeated the board-room as well as the workshop: none of the directors of the firm, according to him, wanted to be bigger and better directors of a bigger and better concern: all their ambition seemed to be to accumulate enough capital to acquire 'a little place in the country' to become that almost exclusively English product, a country gentleman. My American friend is a writer, and so we must make some allowance for artistic licence in his picture of conditions in British industry. I mean, from the news that we have recaptured the world's air-speed record at the not quite rustic dawdle of 1,132 miles per hour, it looks as if we can now and again take our minds off the crops and the cauliflowers to some purpose.

But broadly speaking it is a fact that if you scratch the ordinary Briton you find a countryman: 'To be a farmer's boy' seems to be the theme song of nearly all Britons of all classes. Perhaps the most striking evidence of this widespread nostalgia for country life and country ways is the record popularity of the BBC's family serial, 'The Archers'—a chronicle recording the day-by-day doings and obsessions of a family of farmers, that is to say, of a family which is typical of about half of one per cent. of the inhabitants of this highly industrialised island.

Not many of us can indulge our nostalgia by retiring to a country bungalow, much less to a manor house, but it has made us the most enthusiastic nation of amateur gardeners and country ramblers in the world—where the first sign of a bit of sunlight provokes the remark in a thousand pubs that it will bring the roses or the beans along.

In this Britain of recurring economic crises we have all become familiar with the colloquial definition of inflation: too much money chasing too few goods. Well, there is an inflationary condition operating against us as lovers of the countryside, too: in fact, too many people—50-million of us—chasing too little countryside. Not long ago a writer in the *Architectural Review* prophesied that if things kept going as they are at present there would in fifty years' time be no distinction between town and country in Britain: there would be nothing but one long untidy sprawl of housing and industrial estates, of camps and aerodromes, of barbed wire and concrete, of Cosy Nooks and Ye Olde Tea Shoppes—nothing, in fact, but Subtopia, to use a recently coined name for it.

We are still a long way from this condition, but not so long that public anxiety about the threat to our unique heritage is not justified. For the English countryside is unique—there is nothing like it in the whole world—and this is an Irishman saying it. Even if speed and cheapness of travel and increased leisure one day make it possible for us to spend a weekend by the Grand Canyon as easily as we do now in the Cotswolds, we shall not be compensated if the High Street of every Cotswold village becomes indistinguishable from the High Street of a London suburb, with the same chain-stores and the same chain-cinemas.

Another Point of View

And yet if you talk, as I have done, to some of the keepers of those poky little shops, and to some of their regular customers, you will often find that they do not regard this gloomy prospect in quite the same light as some of us townsmen who have our eyes on the quaint little village as a nice place to retire to when we have made our pile in industry or qualified for our pension. I spent a week once in the beautiful village of Hope in the Peak District at a time when all the papers from London and Sheffield and Manchester were filled with indignant protests from townsfolk against a proposal to expand a cement works in the Hope valley—a proposal which involved the building of a great chimney.

When I got to Hope itself I found that everyone who not only lived but worked there—everyone who had a living to make, especially the local shopkeepers and innkeepers—was in favour of the expansion. 'It's all very fine,' said one of the shopkeepers to me, 'for some of these people from Sheffield to want to get away from the muck they made there while they were making their money, and then want to keep both the muck and the money away from here. If they want a pleasant place to live let them go back and do something about Sheffield, and not try to take the bread out of our mouths.' Which, anyway, is a point of view.

And it must be said that it is not the spoiling of the countryside which is new in Britain today but the conscience we have about it. In these days every project like that cement works in the Hope valley is only approved after an exhaustive public enquiry in which every objection gets a hearing and every alternative is considered. And even when the project goes through the industrialists concerned have scruples which never would have occurred to their grandfathers.

The much criticised chimney itself was built by one of our greatest functional architects, which might strike you as a matter for irony, but if it does let me repeat what was said to me by the manager of the cement works. 'I'll bet you,' he said, 'that two hundred years from now when we perhaps decide to pull this chimney down the papers will be full of letters protesting against the vandalism of destroying one of the Peak District's best-loved landmarks. After all, I expect our ancestors denounced the first windmills that were built as a blemish.'

Maybe he would lose his bet, but he was in a way reminding us of what it is that has largely given our countryside its unique quality. It is mostly a man-made countryside: not an artificially preserved National Park but the seat of one of our greatest industries—farming. We do not want our countryside to become Subtopia, but neither do we want it to become a museum piece. The task before us in Britain is to preserve the happy mean. (*Broadcast in the BBC's General Overseas Service*)

Industrial buildings of today are often the beloved landmarks of tomorrow: a factory chimney broods over a typical Peak landscape in the Hope valley

Her Excellency Mrs. V. L. Pandit, High Commissioner for India, after unveiling a plaque commemorating her opening of a new L.C.C. school

STORIES FROM 'RADIO NEWSREEL'

Here and There

COMPREHENSIVE SCHOOL

THE first London County Council comprehensive secondary school to be run on co-educational lines was opened by the High Commissioner for India, Mrs. Pandit. It is called Woodberry Down school; it is in Stoke Newington in the north-east of London, and it accommodates 1,250 boys and girls, who will first go there from primary schools at the age of eleven and can later carry on any of the courses of education which are normally found in secondary modern, technical, and grammar schools. The school has actually been running since last September.

From the outside the school is very modern and looks more like a spacious and airy hotel in a select holiday resort. Inside the modern atmosphere is maintained, and the drab colours of the schools of past years have been replaced by bright pastel shades. Everywhere there is an air of roominess. The most unusual features are the rooms in which the pupils carry out the more practical side of their education; apart from a library, a number of science laboratories, lecture rooms, a history room, and geography rooms, there are a greenhouse for students of biology, a pottery kiln, three housecraft rooms, and two flats for teaching homecraft.

Woodberry Down school has been described as a brave adventure in education: it differs from any other of the comprehensive schools in London in that it is co-educational, and it was to a mixed audience of boys and girls that Mrs. Pandit spoke. She said that most of India's leaders were produced by Britain's educational system, and continued:

'India is today modelling herself on a democratic pattern almost similar to the one you have in Great Britain. And that is an interesting thing, because it shows that even though people may be different in colour, in religion, in their way of living, in the language they speak, if they follow a common purpose they can be bound together with bonds which are much closer than those of colour or religion or race or anything else.

'And that is the bond that I hope will unite not only India and Britain but India and all the countries.'

RAY COLLEY

COVENTRY CATHEDRAL

SIX of the largest stained-glass windows ever to have been seen in London have been on view in the Victoria and Albert Museum. They are some of the ten such windows which are being made for the nave of the new cathedral at Coventry.

They are each eight feet wide and seventy feet high, and they tell symbolically the story of the life of man.

As I stood before a large-scale model of

the cathedral, with music playing softly in the background, with these six windows sweeping seventy feet upwards, one felt overawed by the splendour, the kaleidoscopic colours flowing down from them: the many-hued greens for childhood, the red for manhood, passion, and marriage, the multicoloured rainbow for the complexity of later life, purple for old age, and the bursting gold symbolising the after-life.

For these windows will go in pairs—two greens, two reds, two multi-coloured, two purple, two golden—to portray the life of man. The designs are abstract but beautifully express a whole world of Christian symbolism. As I looked at the green window I saw symbols of spring twining from the earth, of the family, and then the adolescent ascending the tree of knowledge to the spinning wheel of fortune.

And beside it in the red window the seven-branched candlestick of Jewish faith grows into the advent of the Messiah, and the great cross stands for the life and passion of Christ.

HARDIMAN SCOTT

SHARK FISHING

THE BBC correspondent in South Africa, Patrick Smith, has been visiting Durban, from where he sent this description of the holiday scene: 'The Zulu rickshaw boys—decorated with bulls horns, feathers, skins, shields, and assegais—prance along the sea-front. Everywhere the beaches are crowded with bronzed folk swimming, surf-riding, or just sunbathing. People in Durban can swim in safety in spite of the great

number of sharks of all kinds which infest the waters around, especially at this time of year when the off-shore whaling season is in full swing, for the sharks, guided by pilot fish, follow the whalers in shore. The shark, apparently, cannot see very far in front of his snub nose. More than a mile of netting reaching under water for some twenty feet protects Durban's main beaches from the sharks, and casualties are very rare indeed.

'Many visitors to Durban have been having a vicarious thrill inspecting a 1,200-pound blue pointer shark which was caught after a running battle of an hour and a half by a young fisherman. When I saw it people were sucking in their breath at the sight of the double row of murderous, ragged-edged teeth and the massive muscular bulk of this monster fish.

'Durban is the main centre for shark fishing in South Africa, and, as I have seen, it is a tough sport requiring strength and patience. Few over thirty-five are fit enough to compete. The big-game fisherman stands on the pier with his twelve-foot-long glass-fibre rod and large wooden reel, holding between 700 and 900 yards of strong flax line. He baits a large hook some seven inches long with two or three pounds of whalemeat, attaches thirty feet of wire—no more is allowed by the International Game Fish Association—then with some of his line paid out he takes the baited line and whirls it round his head like a hammer-thrower and hurls it fifty or sixty yards out to sea and waits for results.'

300 Years of the

LEONARD PARKIN describes some of the highlights of this summer to mark the 300th anniversary of the Grenadier Regiment of Foot Guards. As well as the exhibition mounted at St. James's Palace, London, tracing the

THIS is the year of the Grenadier Guards: the year of the 300th anniversary of the founding of the regiment: the year when the history and tradition of the senior regiment of the Brigade of Guards is on parade. Through all the polished precision, the pageantry, and the sparkle of the regiment on parade there runs this year a new pride in its title, the First or Grenadier Regiment of Foot Guards. London, which sees so often the scarlet jackets and white-plumed bearskins of the Grenadiers, has been asked to join in the celebrations of the regiment's 300th birthday; and now the history that makes a man proud to be a Grenadier Guardsman has been restated. It has been seen distilled in a magnificent exhibition at St. James's Palace, where the founder of the regiment, King Charles II, was born.

Charles founded the regiment in the bitterness of exile in the historic city of Bruges, in Belgium, in 1656. He formed his Royal Regiment of Guards, as he called it, while the Lord Protector, Oliver Cromwell, held power in England, from bands of loyal Englishmen, exiles like himself. The first colonel of the regiment, in those days when the regiment had only the future to wait for, was Lord Wentworth.

In a way the regiment was twice-born. At his restoration to the Throne in 1660 Charles left the men of his Royal Guard abroad, and ordered a second regiment to be formed for his protection. Two years later, however, the original band of loyalists came back to London, and in 1665 both regiments were amalgamated. They now had two colonels—John Russell in addition to Lord Wentworth—but on Wentworth's death Charles formed his regiment into twenty-four companies under Russell, and in 1666 Charles ordered that his Royal Regiment should take precedence over all other units in the Army.

Founding of the Regiment Recalled

The tercentenary exhibition, which was held at St. James's Palace by permission of the Queen, the Colonel-in-Chief of the regiment, traced the history of the regiment from 1656 to the present day through manuscripts, relics, uniforms, silver, models, and pieces of china. The founding of the regiment was recalled in the exhibition by three relics sent from Bruges, lent by the Guild Royale de Saint Sébastien, a guild of archers of Bruges. The first was the Golden Book of the guild, open at an entry of 1656 by which Charles bound himself to pay a death debt of 1,000 écus. He had become a member of the guild during his exile.

Bruges also sent a bust of Charles, and a silver arrow which was presented to the guild of archers by Charles's brother, the Duke of Gloucester, when he joined.

Throughout its history the regiment has been served by famous men, and naturally they were remembered in what was a distinctly personal exhibition. There was the commission as an ensign in the regiment in 1667 of John Churchill. There too was 'the Blenheim letter,' which

...s of the celebrations which have been taking place ...nding by the exiled King Charles II of the First or ...parades at home and abroad, an exhibition was ...y of the famous regiment from 1656 to the present day

Churchill wrote later as Duke of Marlborough to his wife reporting his 'glorious victory' of 1704 for the information of Queen Anne; and his two capacious silver wine-bottles, which tradition says were carried full of claret on a couple of mules for Marlborough's refreshment on his famous campaigns.

All the furious action of Blenheim is pictured in one of six historical dioramas, seen for the first time at the exhibition. They are three-dimensional models with figures an inch high representing six-foot men, permanent reconstructions of notable events in the regiment's history. The Blenheim diorama shows the 1st Battalion First Guards in the storming of the fortified heights of Schellenberg, leading the British army in the vital assault of July 2, 1704.

A Title Gained in Battle

The regiment claims to be the only British unit to have gained its title in battle. The name Grenadier Guards came after one of the most famous battles of all—Waterloo. On the evening of that great day, June 18, 1815, Napoleon directed the onslaught of his formidable Imperial Guard, which he had been holding in reserve, against a ridge which was sheltering Wellington's army.

The ridge was being held by two battalions of the First Guards. The men of the English regiment lay on the ground until the grenadiers of the French Imperial Guard were within twenty yards. Then, suddenly, they leaped up, opened fire, and charged. The French fled in disorder. After this action the First Guards became the First or Grenadier Regiment of Foot Guards, the name it bears today, by decree of the Prince Regent. But paradoxically it has never been a regiment of grenadiers.

The defeat of the French Guard is depicted in another diorama, which captures the surge of movement and the noise of the battle, still and silent though the model is. The other dioramas show a scene at the founding of the regiment, with Charles riding through the camp; an assault on a sandbagged battery at Inkerman in November, 1854; the winning of a Victoria Cross by a member of the regiment at La Couronne in 1918; and an armoured attack at Pont-a-Marq in 1944, during the thrust by the Guards Armoured Division to liberate Brussels.

In this exhibition nothing was too great historically, and nothing too small. Regimental history is made by men and their deeds, and the personalities of famous men long dead were highlighted not only by what they did but from the paraphernalia they took with them on their campaigns. Besides Marlborough's claret bottles there were numerous relics of the Duke of Wellington.

Wellington's campaign silver was there, and there was his elaborate dressing case, with its little compartments and bottles for his fastidious needs; there were the boots he walked in and to which he gave his name,

Books to Read

Reviewed by
M. R. Ridley

OF the five books I am going to recommend I think the most considerable is one called *Anglo-Saxon Attitudes*, by Angus Wilson. It is very long; nothing much happens in it; there is a vast deal of conversation illuminating the careful analysis of a large number of characters hardly one of whom would be in ordinary life in the least interesting. None the less I do, and most warmly, recommend the book. First as to length: a novel is not *per se* the worse for being long—indeed it would be hard to point to any acceptedly great novel that is *not* long. But the trouble with so many modern novels is that they are too long for what they have to say. That is not so with this book. Mr. Wilson needs plenty of room for the interactions of the many characters. Then as to the character analysis, the book would be well worth reading for the sheer technical accomplishment alone. Further, Mr. Wilson does not analyse to show off: he does it because he is genuinely interested in his characters, and his interest is infectious.

Charmed Circle, by Susan Ertz, is not unlike *Anglo-Saxon Attitudes* in theme in so far as it is also a study of a family and its interactions. It is not as brilliant or as distinguished a piece of work as Mr. Wilson's but it is the work of a long practised and very skilful hand, and extremely readable. The charmed circle is that of a wealthy American family: father, typically possessive mother, two sons and a daughter. They are all, emotionally, hopelessly inbred. The story is of the attempts of the children to break out of the circle. The girl gets most 'suitably' married—and flutters back to the nest in a panic on her wedding night. Later she makes a disastrous marriage which ends in a divorce and a kind of hardened and loveless independence. The younger brother drifts into half-baked Communism and is accidentally shot by his father who mistakes him for a burglar. The elder son escapes—more or less—through a wholly happy marriage. All ends placidly. It is not an exciting nor a particularly original novel. We have been here before; but seldom with so unobtrusively skilful a guide.

I have a great liking for historical novels when they are good ones, and *The Iron King*, by Maurice Druon, seems to me of the very first order. It has been highly spoken of in France, and is well translated. It is the story of the last few months of the reign of Philip IV of France, the Iron King, now on the edge of his final triumph over the great order of the Knights Templar. The court which he dominates is a seething, sweltering hotbed of lust and intrigue, and the two main threads of the story are his dealings with the Templars and with this court, especially with his unsatisfactory sons and his profligate daughters-in-law. M. Druon seems to have all the equipment needed for the outstanding historical novelist. He can, to begin with, make historical figures live.

The portrait of the king himself is a triumph, secured against odds, since he was certainly not a likeable character, perhaps not even an interesting one. But he was certainly great, and there is a kind of arid nobility in his ruthless and selfless pursuit of one end: the greatness of France. All the other characters are drawn with the same sureness of touch, from the princesses of France and Isabella of England right down to the labourer, André of the woods. Then M. Druon has a fine power over the isolated scene, like that which opens the book between Robert Artois and Isabella, or the grim little vignette of the breaking on the wheel—he does not spare us the brutalities of the time. And he has also a strong sense of dramatic contrast, as when the burning of the Templars is overlooked by, and at one point indeed watched from, the jasmine-scented adulterous luxury of the apartment in the Tour de Nesle. The comparison with Dumas is inevitable, and almost always, I think, to the more modern writer's advantage. He is every bit as exciting, but he is tauter, with a steadier tension, and more economical.

Disquiet and Peace, by William Cooper, is a most genuinely entertaining book, light but not in the least trivial. It often goes quite deep into human nature; it is rather *recherché* entertainment, and needs a sensitive palate, like a dry wine. It is a brilliant sketch of the social and political life of the Edwardian period; presented with a delicious and delicate irony. It has about it more than a little of the appeal of the problem picture. The two main characters are firmly etched, but they are never, until the very end, explained, and I am not sure that even then we are meant to accept the explanation. We are stimulated to make our own solution, with such help as the title gives us.

No Great Magic, by Lalage Pulvertaft, is a trifle, but again not trivial. It is deliberately light entertainment and wholly enjoyable. It is a first novel, and has many of the marks of inexperience. It opens clumsily, and the archaeological background, though admirably drawn, seems to be there mainly because the author knows all about it and knows that she can draw it rather than because it offers a particularly suitable background for the action and the characters. These minor defects are more than outweighed by positive excellences. The book is full of vitality and the best kind of high spirits. Miss Pulvertaft, it is clear, wholeheartedly delights in contemplating the human comedy. And she understands her characters, watching them with an abundant good humour which is at once penetrating and kindly.

Anglo-Saxon Attitudes, by Angus Wilson (Secker and Warburg, 15s.)

Charmed Circle, by Susan Ertz (Collins, 13s. 6d.)

The Iron King, by Maurice Druon (Rupert Hart-Davis, 15s.)

Disquiet and Peace, by William Cooper (Macmillan, 15s.)

No Great Magic, by Lalage Pulvertaft (Secker and Warburg, 12s. 6d.)

Commonwealth Defence

Continued from page 4

they have ceased to have an overall Commonwealth character (which actually I do not think they ever really have had) but are 'coming to be selective and regional.'

Lastly, India. Their policy is one of what they call non-alignment with either of the power blocs, and is designed to create an area of stability, to preserve peace for that ordered social and economic progress which in itself is some defence against Communism. They claim that their neutrality is not merely negative but positive and dynamic—and there is something in this. It is no good preaching to them about the so-called immorality of neutralism. It is one of the facts of life to which we must accommodate ourselves, and, incidentally, was American policy before America herself was directly threatened.

No doubt the Indians would fight if they were attacked; but we must face the fact that they would be quite incapable of defending themselves. We must not allow ourselves to be irritated by the belief that—perhaps only sub-consciously—they permit themselves the luxury of neutrality because they are aware that potential aggressors know quite well (in the words of a recent article in *The Economist*) that 'there would be the devil to pay with the Commonwealth and the United States if they got tough with India.'

Nevertheless, there is no getting away from the fact that the loss of the great Indian Army and of India as a base would be a serious setback to Commonwealth security in the East in the event of war.

Now to sum up. Mr. Menzies has pointed out that the altered position of the Crown in certain new Commonwealth countries has modified the structure of the Commonwealth. And, in his words, 'you cannot convert a structural association into a merely functional one without creating new tasks and developing a new approach.' Well that, in effect, is what we have done in the sphere of Commonwealth defence, and on the whole, I think, have done it well. (*Broadcast in the BBC's General Overseas Service*)

The Grenadier Guards

Continued from page 15

and there were even his monogrammed nightshirt and nightcap. And there in a case were a scarf and a pair of woollen mittens, knitted by Queen Victoria for Sir Charles Russell, one of the regiment's Crimean V.C.s, to keep him warm against the Crimean winter. Several of the relics had been lent by the present Queen, a new portrait of whom by Raymond Kanelba was also on show.

As the parade of history and tradition at St. James's Palace ended, the regiment mounted a parade of the present. The Queen reviewed her Grenadiers at Windsor Castle. Spectators, many of them with family connections with the regiment, formed a great square round the wide sweep of smooth, green turf below the eastern battlements of the castle. To the music of their band—and you can never mistake the music of a Guards band for any other—the 1st Battalion swung on to the green square. The battalion had special leave to come home from Germany at its own expense for the parade.

Behind the 1st Battalion came the 2nd and 3rd, resplendent in scarlet and bearskins; and then came the 1,200 men of the Comrades Association, in suits and trilbies or bowlers.

The Queen arrived on the parade lawn; behind her were the Duke of Edinburgh, Queen Elizabeth the Queen Mother, Princess Margaret, and the Royal children, the Duke of Cornwall and Princess Anne. As the Royal family sat, the Queen went forward, a slight figure in blue, and mounted the dais.

After the Royal Salute, the parade was reported ready for review. The Queen walked to the Queen's Company, accompanied by the colonel of the regiment, General Lord Jeffreys, and the lieutenant-colonel commanding the regiment, Colonel Sir Thomas Butler. She passed up and down every rank, taking twenty minutes over the whole inspection.

The inspection over, the Queen mounted the dais, and the regiment marched past in column of companies, marching, of course, to *The British Grenadiers*. The Queen's Company (the average height of its men is more than six feet, three inches) led the march-past with its colour, the Royal Standard of the regiment, on a pike topped with the large metal ornament given to the company by King William IV.

Khaki swung by, scarlet swung by, and then came the Comrades, needing no uniform to frame the pride of their bearing. Each detachment was led by an officer, who smartly lifted his bowler to the Queen while his men gave an 'eyes right.'

Then the whole regiment advanced in review order to give a Royal Salute, remove headdress, and give three cheers for the Queen, their Colonel-in-Chief. The parade was over. Three hundred years of history had been celebrated, and surely there could not have been a man who did not feel proud of belonging to a continuing tradition. (*Expanded from the BBC's 'Radio Newsreel'*)

This Week's Listening

'THE HAMMERING HORDES'

THE 'hordes' which will be the subject of this week's talk by Professor Reginald Betts in the series 'The Story of Colonisation' were the armies of nomadic tribesmen from Central Asia—mainly Tartars and Turks—which at intervals throughout the Middle Ages invaded and colonised the countries on the eastern fringe of Europe.

The first of these empires was that of the Huns in the fifth century, but one of the most lasting was that of the so-called Golden Horde which in the thirteenth century held sway over a vast dominion stretching from the borders of Poland to Astrakhan on the Caspian Sea.

At about the same time further south, in Asia Minor, the Ottoman Turks were supplanting the Arabs and the Seljuks as the spearhead of Islam, and beginning a series of conquests which gave them the mastery of the eastern Mediterranean. Their capture of Constantinople from the Byzantine Greeks in 1453 opened the way into south-eastern Europe and the Danube valley. At its height the Turkish Empire included the Balkans, Asia Minor, and parts of Arabia and north Africa, and it endured until the last sultan was deposed in 1918. PORTRAIT OF A PRIME MINISTER

THE last Prime Minister to preside over a huge Liberal majority in the House of Commons was Herbert Henry Asquith, later created Earl of Oxford and Asquith. Forty years have passed since he left

The Earl of Oxford and Asquith
National Portrait Gallery

Downing Street to be succeeded as Premier by Mr. Lloyd George at the head of a Coalition Government. Today Mr. Asquith is remembered for many things. Before becoming Prime Minister he had held with distinction the Cabinet offices of Home Secretary and Chancellor of the Exchequer.

As Premier he secured the passage of many measures of social reform which laid the foundation of the Welfare State in Britain. He overcame opposition to these measures by the Parliament Bill, which secured the supremacy of the British House of Commons over the House of Lords. Then he had the courage to go to the support of Belgium in 1914, and lead a united Britain against Germany in the first world war.

Some idea of Asquith's mind and character, and of the historical events in which he played a leading part, will be given in another 'Portrait of a Prime Minister' by A. P. Ryan. The speakers in Mr. Ryan's programme will include Asquith's daughter, Lady Violet Bonham Carter, Lord Templewood, a Conservative opponent, Lord Stansgate, and Lord Samuel, the only surviving member of Asquith's Cabinets. A recording of Asquith himself speaking in 1909, and one of his second wife, Margot, made about twenty years ago, can also be heard. G.O.S.: Monday 17.30 and 23.15; Wednesday 10.00

'DEATH AND CELEBRATION'

UNDER this title John Blofeld gives the last of five talks on his pilgrimage 'In the Path of Lord Buddha.' Having begun the series with an account of his visit to the Buddha's birthplace, he now ends it by telling of his journey to Kusinara, the scene of the Buddha's death.

In spite of a daytime visit in burning heat and a scorching wind he found it a moving experience to sit near the simple *stupa* that marks the place, and to recall the events of that night some 2,500 years ago as the Buddha lay dying.

John Blofeld then went on to Delhi, where he arrived in time for the Buddha Jayanti celebrations. It is with a recollection of the significance of the rise of the full moon of May for all Buddhist people that he closes the story of his scholar's pilgrimage—undertaken at the BBC's invitation—to the Buddhist shrines of northern India. September 2-8

THE MANX GRAND PRIX

IF racing conditions are good this week faster speeds than ever before are likely in the motor-cycle events during the Manx Grand Prix meeting on the Isle of Man. With more facilities available during the season for amateur riders, competition is keener than ever, and the enthusiasm of the clubs will be well represented at the various vantage points around the thirty-seven and a quarter miles of the famous T.T. mountain course.

On Tuesday the 350 c.c. class will be decided over six laps. The 500 c.c. riders, many of whom will have ridden in the previous race, will follow in their tracks on Thursday.

Once again BBC commentators will be there to convey all the excitement that can be expected. Commentaries on the 350 and 500 c.c. events respectively will go out on Tuesday at 12.00 (repeated 20.45) and Thursday at 12.00 (repeated 21.05).

MALTESE MUSIC

THE Band of the Royal Military School of Music will be heard in a programme 'Tribute to Malta, G.C.' Two works by Maltese composers are included: Charles Brincat's overture, *The Siege of Malta*, and Samut's *Innu Malti*. Also in the programme are Sir Arnold Bax's march, *Malta, G.C.*, Jeremiah Clarke's *Trumpet Voluntary*, and Harold Scull's march, *Trombones to the Fore*.

Charles Brincat is one of the outstanding band-master-composers in Malta, which has a great reputation for its virtuosity in band technique and performances. The late Sir Arnold Bax wrote his *Malta* overture as a tribute to Malta's heroic stand in the second world war.

G.O.S.: Monday 12.00; Tuesday 21.00; Friday 14.15; Saturday 17.30

SHAW FESTIVAL

THE Garden of Eden scene which opens Part One of Bernard Shaw's marathon play *Back to Methuselah* will be presented this week. When Bernard Shaw was asked to choose one of his works as the 500th volume in the famous 'World Classics' series he nominated this play, and wrote: '*Back to Methuselah* is a world classic or it is nothing.'

Dame Edith Evans, one of the great ladies of the English stage, re-creates the part of the Serpent which she played in the original production in 1923. G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

'BY AND LARGE'

PETER JONES, who is well known as an actor, playwright, and author, is to appear in his own sound-radio series. Called 'By and Large,' it is a revue-type show with Robin Bailey, Irlin Hall, Maria Charles, Benny Lee, John Forde, Irving Plinge, Shirley Bassey, The Hedley Ward Trio, and Malcolm Lockyer and his Octet.

The script is written by twenty-six-year-old Ted Taylor, who recently joined the BBC after leaving Cambridge University where he wrote and acted in the 'Footlights Revue.' The producer is Pat Dixon. G.O.S.: Sunday 11.30; Wednesday 16.15; Friday 23.45

David Knight plays in 'Radio Theatre' this week

Judy Grinham of Hampstead, a British record-holder and Olympic hope for the 100 metres back-stroke

SWIMMING CHAMPIONSHIPS

THE eyes of all swimming enthusiasts in Britain will be turned towards the Derby Baths, Blackpool, where the Amateur Swimming Association are holding their eleventh National Championships this week. Both senior and junior titles will be won and lost during this six-day event, but the focus will be on the senior events where all the Olympic possibilities are entered, and from whom the team of twenty-three swimmers and divers will be picked to make the trip to Melbourne in November.

Seventy-five per cent. of the participants in this year's A.S.A. Championships are under twenty, but one of the few exceptions is thirty-three-year-old Ron Roberts, national sprint champion.

Another swimmer who has hit the headlines is seventeen-year-old Judy Grinham of Hampstead, holder of the back-stroke record, who in November last year at Moscow jumped into world class by winning an international 100 metres back-stroke and recently in Paris beat the Olympic record for this distance with a time of 73.4 seconds.

The 1955 'Swimmer of the Year' Graham Symonds, a nineteen-year-old engineering draughtsman from Coventry, is hoping to improve upon his time for the butterfly stroke, which for 200 metres is 2 minutes, 30.8 seconds—3.6 seconds faster than the 1952 Olympic winner.

On Saturday afternoon the G.O.S. will carry commentaries on some of the finals, and an eye-witness account at 21.00.

Radio Theatre presents

'THE SINGING SANDS'

THE late Josephine Tey's pet, Detective-Inspector Alan Grant, is by now an old friend of listeners: one has heard him deduce his way through many mysteries, and this time it all starts when Grant attempts to get away from the Yard for a fishing holiday in Scotland.

A man is found dead in the next-door compartment of the 'sleeper' coach in which Grant is travelling. Concussion after an accidental fall due to drunkenness is diagnosed, and is accepted by the coroner. Grant is not involved; it is none of his business. But as a trained investigator certain unexplained facts catch his attention, which is applied more closely when he finds that by mistake he has taken away the dead man's newspaper, on which is scribbled a mysterious poem.

Under the circumstances, to expect Grant not to intervene is to expect a cat to ignore the chance appearance of a mouse, and he duly starts to piece together the clues and answers of the little poem like a crossword puzzle. It involves some Hebridean folk-lore, and then it takes him very much farther afield, to the Middle East.

Indeed, with Inspector Grant stories, the ingenuity of construction is all, and Miss Tey is admirably ingenious in contriving that her Scottish waters abound in red herrings. PETER FORSTER

G.O.S.: Sunday 00.30 and 18.30; Wednesday 14.15

WORLD TIME CHART

The following correction is necessary to bring up to date the LONDON CALLING World Time Chart: GOLD COAST: amend to: add $\frac{1}{2}$

Your Wavelengths

London Calling is published several weeks in advance and we regret that, for reasons beyond our control, it is sometimes necessary to alter wavelengths after we have gone to press. The latest information is always given in Programme Parade

with recorded extracts
13.45-14.00 The World of Science
A weekly survey
of the latest developments

ENGLISH WRITING. Jane Austen will be the subject of Tuesday's programme. Although in this century Jane Austen has become a household name and she is firmly established as an English classic, recognition of her genius came slowly. When she died in 1817 at the age of forty-two it is said that she was just beginning to feel confidence in her own success. Nevertheless she always had her devotees among such people as Coleridge, Tennyson, and Scott, while Macaulay's adoration of her genius amounted almost to idolatry.

* * *
SHAW FESTIVAL. *In Good King Charles's Golden Days* was written in 1939 when the author was 83. In it Shaw brings together Charles II, Newton, the scientist, George Fox, the founder of the Quakers, and three of the King's mistresses, including Nell Gwynn, the actress. (His Queen appears in a later scene.) Shaw says in his preface that Charles's vulgar reputation as a 'solomonic polygamist' has obscured both his political ability and the fact that he was an excellent husband. In the scene to be played on Tuesday Wilfred Walter will take the part of Charles, Carleton Hobbs that of Newton, and Jane Hilary of Nell.

* * *
THE WORLD OF SCIENCE. The series of four special talks on Atomic Energy which was first broadcast last June is to be repeated. The first talk will be heard again on Saturday when Professor Jack Diamond of Manchester University will deal with the fundamentals of this new science.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

SOURCES OF POWER

The Sun

Soon, we are told, the Sahara will blossom like the rose. That is as may be: what seems likelier, sooner, is that many better-loved places will bloom anew at the Sahara's expense. The natural heat-traps of the world can be used for transforming solar rays into electrical power. Already a device exists by which one square mile of desert could be made to supply 175 million horse-power-hours a year. To handle and control such amounts of electricity would vastly interest Crompton Parkinson—who, since the dawn of the electrical era, have been associated with the pioneering and production of major electrical developments. When and where the sun is *invited* to scorch up the earth, Crompton Parkinson, hot but happy, will be perfectly capable of putting the resultant power through its paces.

by

Standard

One of the largest telecommunication engineering organisations in the British Commonwealth **Standard Telephones and Cables Limited** is engaged in research and the development, manufacture and installation of all types of communication and control systems. Concerned with every aspect of telecommunications engineering, the Company is in an unrivalled position to undertake, within its own organisation, the co-ordinated planning of complete communication projects involving inter-dependent systems of various types.

'Standard' productions include :—

"Standard" telecommunication systems serve society on land, at sea, and in the air. In the realm of aviation, "Standard" radio equipment flies in many of the world's leading aircraft, including the Vickers Viscount illustrated above

- **Telecommunication Line Transmission Equipment**
- **Radio Broadcasting Equipment**
- **Radio Communication Equipment**
- **Air Radio Navigational Aids**
- **Supervisory and Remote Control Systems**
- **Railway Communication Apparatus**
- **Railway Control Equipments**
- **Telephone Cable**
- **Sound-Reinforcement Systems**
- **Public and Private Telephone Systems**

LONDON CALLING

OVERSEAS JOURNAL OF THE BBC

Mozart in London

LIONEL SALTER sets the scene of the programme he has devised on 'Mozart in London'—to be broadcast in the General Overseas Service this week on Thursday at 20.10—and gives some interesting sidelights on the musical life of the capital in the eighteenth century

ON hearing of two British victories in 1782 Mozart wrote to his father: 'You know that I am thoroughly English at heart'; and as late as 1787—four years before his death—he was thinking of settling in England. He had discussed the project very seriously with his pupil, Thomas Attwood (who later was to write anthems for the coronations of three British sovereigns), and preparations were already in hand when he was appointed chamber composer to the Emperor, though at a pitifully low salary.

Why had Mozart such an affection for England? He had friends such as the singer, Nancy Storace, to whom he was greatly attracted, and the Irish tenor, Michael Kelly; he had been closely attached to Thomas Linley the violinist; but the real reason was almost certainly because he always retained happy memories of his visit to London in 1764 as a child of eight.

He and his sister were being shown off as musical prodigies by their father, Leopold, at most of the European courts. As the children were enthusiastically received everywhere, and young Wolfgang was a singularly unspoilt child, he would probably not have attached undue importance to the extremely friendly reception given them by King George III and his queen; but in London, almost alone of the countries they visited, he found congenial musical companionship, and underwent influences later to prove of importance.

London was an extremely musical city at this time: indeed, Leopold complained of the number of concerts, 'which really weary one here.' Johann Christian Bach, who had settled in London two years previously, had just begun a series of subscription concerts in partnership with his father's former pupil, Abel, in Carlisle House, Soho Square (where now the British Board of Film Censors works); other concerts abounded in sundry rooms and at the many pleasure gardens so popular with Londoners—Vauxhall, Ranelagh, Richmond, Marylebone, Spring Gardens, and Sadler's Wells. For these a vast number of songs was written by various composers, and the chief soloists of the day were engaged.

The most fashionable theatre was the King's, in the Haymarket. Among the works presented there at this time was *Il Re Pastore*, composed by the manager, Giardini—Mozart was to set this himself ten years later; and there were various *pasticcios* to which J. C. Bach contributed, and for one of which—*Ezio*—Mozart composed his first concert aria.

Other popular musical theatres were Covent

Garden and Drury Lane, at which works by Thomas Arne were frequently to be heard. Concerted vocal music flourished, and the music of Handel, who had been the principal figure in London musical society for many years, was still much played and sung.

And we should not forget the numerous river-parties held on the Thames, many of which (as we can see from paintings of the time) had small bands to provide entertainment. When, on account of Leopold's health, the Mozart family moved out to Chelsea (then a village two miles from London), Wolfgang heard many of these river bands and as a result asked his sister to

remind him to write specially good parts for the horns in his symphonies. It was in Chelsea, unable to play an instrument for fear of disturbing his father, that he composed his first symphonies, K.16 and K.19.

Their chief musical friend in England was the Queen's music master Johann Christian Bach, to whom Wolfgang remained devoted throughout his life. Delighted with the boy's quick musical mind, he would play the harpsichord with him sitting on his lap, each of them taking a bar in turn; or he would start a fugue and leave Mozart to finish it. From him Mozart learned much about the Italian style of *opera seria*; and it was in his scores, and in those of Abel and Arne, that Mozart first came across the clarinet, which had been popular in London for well over a decade, graduating from wind bands at the pleasure-gardens to the opera.

Wolfgang made his first public appearance at the start of June in the Great Room of Spring Gardens: London was full for the king's birthday the previous day, and as a result the receipts surpassed even Leopold's highest expectations; and Wolfgang created a sensation. Three weeks later at Ranelagh there was a concert in aid of the Lying-In Hospital in Surrey, at which Wolfgang, described as 'the most extraordinary prodigy and most amazing genius that has appeared in any age,' played a concerto on the organ.

On their return to town from Chelsea the Mozart family played at Court for the third time; but the novelty of the 'prodigies of nature' was beginning to wear off, and for two more public concerts in 1765 prices of tickets had to be reduced and publicity stepped up in intensity. The children were advertised as playing every day from twelve to three in a tavern on Cornhill; and a touch of charlatanism was adding by stating that 'they would play together on one clavier with the keyboard covered'—a trick which might appear amazing to the lay public but which would present few problems to a musician.

The children's sightseeing was not neglected: they visited Greenwich and all the historic London buildings; and after visiting the British Museum Mozart wrote specially for it a short motet on English words, 'God is our refuge and strength.'

As late as 1790 an impresario was wanting Mozart to return to London to give concerts, and the manager of the Italian opera there was also interested; but alas! it was not to be. However, English Mozart-lovers will always feel gratified to know that their country's affection for him was reciprocated.

BERTRAND RUSSELL

BERTRAND RUSSELL, in this introduction to the series of twelve talks by authoritative historians currently being broadcast in the General Overseas Service, defines the terms of their study and sets the theme of colonisation in its historical perspective as a medium for spreading civilisation

The Story of Colonisation

THERE are various different aspects from which the history of mankind may be viewed. One of the most important of these concerns the spread of civilisation. In its earliest phases this is marked by the presence or absence of certain skills and techniques. The domestication of animals, agriculture, writing, and the use of metals are the most important of these. The beginnings of agriculture are prehistoric, but its gradual spread after a beginning in certain river valleys occurred in historical times and was not complete until our own day. The use of metals spread with almost equal slowness.

The art of writing, which seems to have developed slowly out of pictures and not originally as a representation of spoken language, can be traced through many early stages in Egypt, the Hittite Empire, and Phoenicia, to Greece. Writing in China, which was not alphabetic, appears to have developed independently. It would seem that in Mediterranean countries, but more especially in Egypt, writing was for a long time a mystery understood only by the priests. In the Dark Ages this had again become the case in western Europe. It was only gradually that kings decided to teach their children to read and write.

Various agencies have been favourable to the growth of civilisation. I think the most important have been military conquest, commercial intercourse, and missionary zeal. In regard to all three a very important part has been played by colonies. A colony, as the word was understood by the Greeks, consisted of a small group of seafaring men accompanied by their families, all coming from some one Greek city and settling on the sea-coast of some comparatively uncivilised country. Such cities were founded at an early period of Greek history in Asia Minor, southern Italy, and Sicily.

Wherever they went, they carried with them the institutions of the parent city, with which they retained close ties in spite of political independence. They were maritime commercial cities, and many of them achieved great wealth, which has become proverbial in the case of the epithet 'sybarite.' They did not aim at conquest of the hinterland, although many of them maintained considerable armies of mercenaries. The Phoenician colonies, especially Carthage, were essentially similar; and before the rise of Rome the Mediterranean from Sicily westward was dominated by the rivalry of Carthage and Syracuse. It was owing to the Roman victory over Carthage that Greek and not Phoenician culture became prevalent throughout the West.

A different kind of colonisation was inaugurated by Alexander the Great. The Greek colonies which he planted from Egypt to the Indus came in the wake of conquering armies and not as an incident of commerce. Where Macedonian or Roman armies preserved their supremacy these colonies remained centres for the diffusion of Hellenic culture. But where, as in Persia, Afghanistan, and northern India, the Macedonians lost their power the trickle of Greek culture became gradually less and less, like a river losing itself in the desert. Even in India, however, it left traces: its influence on early Buddhist art is acknowledged.

Northern Europe, including Germany, Scandinavia, and Poland, owed its civilisation mainly to missionaries, except for the conversion of the Saxons by Charlemagne. Buddhism, quite as much as Christianity, affords examples of the spread of culture by missionary zeal. China, at about the beginning of the Christian era, acquired Buddhism from India, and with it learnt important elements in Indian culture. But this movement, important as it was, owed its success rather to saintly pilgrims than to colonisers, and therefore hardly falls within our theme.

Military conquest has played a very great part in the spread of culture. But here there is a broad division between cases where the conquerors were more civilised than the conquered and cases where they were less civilised. And the cases in which the conquerors were less civilised, again, fall into two classes: those in which the conquerors swept away the conquered civilisation, and those in which they absorbed it and carried it on.

The barbarians who invaded the western Roman Empire in the fifth century degraded the level of Western civilisation for centuries, but the Arabs, in the East, assimilated Greek science and philosophy. Many centuries later western Europe regained from them what it had destroyed when the western Roman Empire fell.

Over and over again in history an advanced culture has been overthrown by barbaric conquerors. Sometimes, as when the Greeks overthrew the Cretans, the barbarians have quickly surpassed those whom they had overthrown. Sometimes their destructiveness has proved more permanent. The Mongols in Persia did irreparable damage, but in China in the course of two generations they learnt everything that the Chinese had to teach.

The Danes in the eighth and ninth centuries wiped out the civilisation of Ireland and gravely impaired the nascent civilisation of Yorkshire monasteries. But their kinsmen, the Normans, became—when they had finished conquering—the leaders in all that was best in the West.

Much the largest example of colonisation known to history was the settlement of the western hemisphere by white men. This proceeded on somewhat different lines in tropical and in temperate latitudes. In temperate latitudes the American Indians were gradually driven out or confined to reservations.

In tropical latitudes, on the contrary, where white men felt unable to undertake severe physical labour they remained an aristocracy. In many regions they tried to employ Indian labour, but the Indians often proved recalcitrant, and the white men fell back upon negro labour imported by the slave trade. In many parts of Latin America a large Indian population survives. Latin America, consequently, has not, except in the far south, produced a more or less pure white civilisation. Nevertheless, the language, religion, and culture of all Latin America are those which were brought by the Spaniards and Portuguese.

North American colonists were of two different sorts. There were those who went for gain, and there were those who went to escape religious persecution and to found communities on new political principles. These principles were developed in England by discussions in the army of Cromwell but were suppressed first by Cromwell himself and then by the Restoration. After a somewhat obscure persistence, however, they burst upon the western hemisphere in the American Revolution, and upon Europe in its French sequel.

The acquisition of the Western hemisphere by white men was one of the causes of the supremacy in world affairs which they enjoyed for some centuries. They can hardly recover this supremacy by new colonising efforts after the old pattern, because there are no longer large regions that are empty or nearly empty awaiting the coming of vigorous and enterprising men.

New Meaning of the Word 'Colonial'

In quite recent times the words 'colonial' and 'colonialism' have acquired new meanings. They are now habitually used to denote regions where the governing class is white but not Russian, and the bulk of the population is of some non-white race. Western ideals of freedom have been propagated throughout the world by Western instructors and have produced an unwillingness to submit to alien domination which in former times was either non-existent or very much weaker.

National independence, which has become an obstacle to colonisation, seems to modern men a natural human aspiration, but it is, in fact, very modern and largely a product of education. If the human race is to survive, nationalism will have to come to terms with a new ideal—namely, internationalism. I do not see how this new ideal, which will concede to each nation internal autonomy but not freedom for external aggression, can be reconciled with the formation of new colonies, because empty regions can no longer be found.

Perhaps internationalism as a principle may sometimes be compelled to override even what might seem to be the internal affairs of a country. This may be illustrated by the problems which have arisen in relation to the latest serious attempt to found a new colony. I mean the creation of the state of Israel. This has raised difficult and bitter controversies. I do not wish to express any view on these controversies on the present occasion, but their bitterness is likely to make statesmen wary of similar experiments in any foreseeable future.

Throughout history colonies have been among the most powerful agents for the spread of the arts and sciences and ways of life that constitute civilisation. For the future it seems that mankind will have to learn to do without this ancient and well-tried method. I think mankind will have to depend not upon force or domination but upon the inherent attractiveness of a civilised way of life. The Romans when they overcame the Greeks were at a much lower level of civilisation than those whom they defeated, but they found Greek civilisation so attractive that from a cultural standpoint it was the Greeks who were the victors.

Those among us who value culture and a humane way of life must school ourselves to learn from the Greeks rather than from the Romans. If this is to be done successfully, we shall have to eliminate those harsher features of our way of life which have repelled many alien nations with whom we have had contact. Missionary and soldier have hitherto played equal parts in the diffusion of civilisation. For the future, it must be the missionary—taking this term in a large sense—who will alone be able to carry on the work. (*Broadcast in the BBC's General Overseas Service*)

The Story of Colonisation: 7. Crucibles of Civilisation, by K. M. Panikkar (see page 19)

The Queen Mother talking to the manager of the Bapton herd of shorthorns: this breed won the beef trophy

'The Royal'

HILARY PHILLIPS, in this G.O.S. 'Five Minutes for Farmers' report, gives some impressions of the 1956 Royal Agricultural Show which was held at Newcastle-upon-Tyne

The cattle parade in the main ring: some 1,400 head, grouped in nineteen breeds, were entered

THIS was the seventh time the Royal Show had come to Newcastle; in fact it has been to Newcastle more often than to any other centre since it was first held long ago in 1839. It is a big site, covering 156 acres, about two and a quarter miles right the way round the outside, so it makes you pretty weary to take a look at everything that there is to see. And of course there is always a tremendous amount to see here at this, the biggest agricultural show of its kind in the world.

To give you an idea of what there was to see, let us take the livestock first. There were 1,400 cattle entered in nineteen breeds; 800 sheep in—surprisingly, to many overseas people—thirty-one breeds; 600 pigs; a fair entry of poultry, and, for the first time for a good many years, an entry of pigeons.

One of the things that many overseas people would take a lot of interest in is the exhibition of wool and of fleeces. And I know the men at any rate would be very happy to go and look at the mannequin parade (which incidentally made its debut at the Royal Highland Show at Inverness, where I spoke with the four mannequins who are doing a very excellent job showing that wool not only keeps you warm but makes some very attractive dresses). Among those mannequins is June Mallett, who comes from the wool-producing country of Australia. She is a citizen of Sydney.

Let us turn now to machinery, which covered about fifty acres at the show. Every year manufacturers enter new inventions in a competition for the Burke Trophy and for silver medal awards. This year, to give you an idea of the new inventions that have been accepted for judging, here are just three that I put down on a piece of paper. One is a power-operated tool for cutting silage, another is a mechanical bale-stocker, and yet a third—a very simple thing, one would think—is a metal box for putting eggs into. The trophy was awarded to a mechanical bulb-lifter.

The Farm of the Future

The electricity stand this year was more ambitious than ever, and consisted of a model 'electricity farm.' That is what they called it, and the BBC did a television programme about it called 'The Farm of the Future.' There you could see how electricity could help you to do nearly every job on the farm.

The Ministry of Agriculture always have a wonderful exhibit at this show, about half an acre or more, and this year they showed with growing crops and with real livestock how the hill-farmer (which is the type of farmer that you find mostly in this part of the country) can produce more and better beef and mutton from the hills—by better farming.

Then there were the competitions: the International Young Farmers' Clubs Dairy Cattle Judging competition had seven countries competing, among them Jamaica and the United States (which won). There was a new competition for dry-stone walling, a traditional British craft it is very good to see being encouraged by the society; and then there was an amusing competition in very tricky tractor-driving, with trailers attached to the tractors, getting them in and out of narrow gateways and all that kind of thing.

Her Majesty Queen Elizabeth the Queen Mother visited the show, and the Newcastle crowds turned out to see her. In fact by the end of the show, with a gate of 242,548, all attendance records had been broken. (Broadcast in the BBC's General Overseas Service)

A group of Russian agricultural experts were among the many visitors showing particular interest in the display of machinery, which covered about fifty acres

Four mannequins who appeared in a 'Fleece to Fashion' exhibition staged to prove that wool not only keeps you warm but makes some very attractive dresses

A tractor-drawn train of machines which mixes and lays a soil-cement road base as it goes along

Roads for the Colonies

ROBERT REID describes the work of the recently established Colonial Section of the Road Research Laboratory at Harmondsworth, Middlesex, which is helping to tackle all sorts of problems involved in the building and upkeep of roads in overseas territories

I WAS sitting in an office in a block of buildings just off the busy main highway which runs past London Airport. The roar of airliners arriving and departing kept breaking into the conversation I was having with a keen young engineer who was showing me all sorts of maps and filling me up with a lot of indigestible statistics. And the oddity of the situation suddenly struck me. Overhead there were men and women, flying in the greatest degree of comfort in planes charted on courses which would take them as straight as a die across country after country and continent after continent, while down below in that office—trying to make ourselves heard above the din—we were talking about the adventures of blazing trails through jungle and swamp, and the enormous difficulties of trying to drive a few miles of road through unmapped territories in places like North Borneo.

For the office I was sitting in was the headquarters of the Road Research Laboratory—more particularly, the recently established Colonial Section, which has come into being because of the increasing demands for highways in many parts of the Colonies. Since these laboratories were set up more than twenty years ago they have proved invaluable in helping traffic of all kinds to move safely, quickly, economically, and comfortably over a road-system which costs Britain more than £100-million a year. And now that many of the Colonies are planning their own road schemes—some of them on a fairly large scale—they are going to benefit by those twenty years of research work done in Britain.

Mind you, this is not just theoretical work. Apart from all the laboratory tests which go on continuously—tests of road-making materials, studies of road design, safety measures, and so on—a considerable proportion of this research work is carried out on the roads of Britain, where a variety of problems are studied under real working conditions with non-stop streams of heavy traffic pounding along the whole time.

So far as the colonial work is concerned this is, in its way, an unexpected dividend from the war. Allied forces were stationed for operational purposes in many colonial territories. That meant the introduction of a good deal of heavy transport and the hasty improvisation of road systems—or the extension of existing road systems—to take this new traffic. At the end of the war thousands and thousands of vehicles were left

behind to be sold off locally. As a result, many of the Colonies really became transport-minded in a big way for the first time: to such an extent, in fact, that in Sierra Leone, for example, the number of registered vehicles increases by about thirty per cent. annually.

But unfortunately the war-time roads and the earlier roads in many of these places have not stood up to the heavy demands being made upon them as traffic increases. In addition, there is a growing realisation that new roads will have to be provided to cope with the many projects—important economic projects—which will follow the opening up of hitherto undeveloped territories.

Another aspect of this dividend from the war—something which has brought the Road Research Laboratory so very much into the picture is the fact that its work was already well known in the Colonies. Many engineers from overseas, who came to Britain during the war in the Forces, got to know its work. In fact, many of them come back to take part in study courses which are arranged at the laboratories. Incidentally, forty-eight Colonies have an interest in this work.

Now, what sort of road problems are being tackled for the Colonies? In the first place, a most extensive survey is being made by members of the section. That young engineer I was telling you about spends about half his working year travelling in the Colonies. He studies every aspect of road transportation in the places he visits. He recently returned from a trip of more than 5,000 miles

—all by road—through Nigeria. He has also been in the West Indies, Malaya, Borneo, and Sarawak.

The immediate results of all these travels is the building up of a series of particularly comprehensive reports about all these areas: information about existing roads and dirt-tracks, the nature of the local terrain, the type of soil; records of local rainfall, humidity, vegetation; geological information; details about labour and engineering resources—all data which is going to be invaluable to the work of the Colonial section.

One member of the staff has been seconded to the Gold Coast as a materials engineer. Two other officers are now working in the West Indies. One of them is working on road design; the other is making a special study of local soil problems: knowledge of local soils—their moisture content and so on—is part of the basic job of building good roads anywhere in the world. Canisters of soil are being sent back from the Colonies so that they can be analysed and a complete classification made of all tropical soils for future reference and guidance.

Samples of local rock and other potential road-making materials are also being collected and put through crushing tests, because one of the main objects of this study is to show colonial engineers how they can construct roads as economically as possible with materials already available on the spot. They will also be helped by experiments and developments in already existing methods of mixing soil and cement for road crusts.

Of Special Interest to Malaya

I had a look round the laboratories where some of this work is being done. These materials are crushed and pounded in special machines which turn out short lengths of cylindrical columns which give the labs, the appearance of being archaeological museums where somebody has been stacking up the remains of Grecian and Roman temples. Another machine shoots ultrasonic pulses through these cylinders for tests of strength and so on. In one laboratory they are carrying out tests which will be of particular interest to Malaya: they are studying the use of rubber as a binder with other materials in the search for a combination of materials which will give both elasticity and strength.

There is a small enclosed compartment where tropical temperatures can be simulated. In this compartment a couple of motor wheels, controlled from a central point, tear round and round a circular road-track which has been built just to see how various types of road surface stand up to heavy punishment under a variety of temperatures. Outside in the grounds a wide range of road surfaces have been laid out and are being put through wear-and-tear and weather tests. There are machines which try to vibrate the life out of them; there are machines which test their profiles—that is, to see whether the surfaces are even and conducive to comfortable travel. (Broadcast in the BBC's General Overseas Service)

An instrument used for measuring the resistance of rubberised road-surfaces to the bumps and ruts caused by heavy traffic

The Incomparable Max

HAROLD NICOLSON pays tribute to the late Sir Max Beerbohm, who achieved a high reputation as a wit, essayist, and caricaturist in his youth, and in his maturity went on to acquire an even wider popularity as a broadcaster

MAX BEERBOHM died in Italy in the early morning of Sunday, May 20. He was eighty-three years of age. Few writers, especially few writers who have produced so little creative work, have achieved such wide popularity. Yet even as I use that word 'popularity' I am conscious that it is the wrong word. When talking or thinking of Beerbohm it is awkward not to choose the exact words one means: he was a man of precise and careful expression. No—I do not mean 'popularity,' since that is a term applied to film stars, band-leaders, or comedians: I mean affection. How came it that this mischievous but never malicious writer was so widely beloved?

After he retired from London before the first world war he was unknown to, and unmet by, the general public. He never made platform appearances, and although he was perhaps the most consummate broadcaster of his age his wireless talks were infrequent and short. He had long ago ceased to write articles for the daily or weekly newspapers, nor did he intrude his name into any contemporary controversies. His later caricatures were irrelevant to our modern problems, and he had, in fact, ceased either to criticise, or to mock at, a life which he did not pretend to like or understand.

Yet somehow his death was regretted by millions of people who had never known him, who had never even seen him, and yet who smiled with affectionate sadness when they heard the news. How can we explain this truly exceptional position that he had acquired for himself in the affections of the whole English-speaking world?

Max Beerbohm, in the first place, was one of those rare people who have been able when still in their teens to realise both the quality and the scope of their own talents and for sixty-five years to stick to the same key. I do not mean by this that he played the same tune over and over again: far from it, since his variety was infinite; I mean that he played his many tunes always in the same key—a key that was perfectly adjusted to his own range and compass.

It was a minor key and deliberately so. It was hesitant, modest, delicate, and dispassionate. Not a note was struck too loudly, not a passage was either rhetorical or forced.

It suggested a deep underlying sincerity, and it was, in fact, shams, pretensions, and affectations that he always attacked. He exposed the absurd side of life so gently, so harmlessly, that one felt obliged to laugh with him. Never, unless it was in his parodies which were all too true to life, did he cause offence. Violence, vituperation, invective were all

well outside the range of his expression: his medium was the medium of soft ridicule, even of softer hints. He never raised his voice above the tone of mild expostulation or padded irony.

He was thus an uncontroversial writer in that he only attacked by implication—and very subtle implication at that—the institutions, ideas, or feelings which were dear to his compatriots. Even those who read him most assiduously, or studied with the most acute attention his parodies and caricatures, had the impression that he was never laughing at them, always at someone else. They felt pleased and flattered, therefore, rather than incensed.

This impression was conveyed, I repeat, by Max Beerbohm's really remarkable consistency, by the fact

Beerbohm in 1942 while making a broadcast for the BBC

that the note of anger never echoed in any of his work, only the subdued note of distant laughter tinkling, or a benevolent sigh at the grotesque pretensions and conduct of his fellow-mortals. Beerbohm never felt really angry, and thus he never aroused anger. It all came from his sticking to the minor key which he had discovered for himself when he was eighteen years of age.

In the second place, there was the special note of intimacy which he managed to introduce into his work. What was so endearing about Max Beerbohm was that so many of his satires on human behaviour were illustrated by stories from his own experience. The person whom the reader was invited to laugh at was the author himself.

How often, when poking ridicule, for instance, at those who are vain of their ability to speak foreign languages, or when illustrating the special brand of social or literary snobbishness which afflicts certain esoteric

'They call me the inimitable and the incomparable . . . I wonder if I am?'—two self-portraits by Sir Max Beerbohm

types, would Beerbohm take himself as an example of absurdity.

It was this device of always laughing at himself before he even began to laugh at other people that rendered him so intimately endearing. We felt, when we recognised our own defects, that they were shared by the satirist himself, and that we were all of us in the same ship of fools. It was this that rendered his irony so companionable and his satire so intimate. That this was a device, a wholly amiable device, was apparent to those who knew him. He was not, in fact, what one would call an intimate man. Polite, yes, courteous, hospitable, and most amusing, but not intimate. I would come away from meeting him, or lunching with him, charmed by his personality, comforted by his politeness, delighted by the range of his conversation, but saying to myself: 'I wonder what Max is really like underneath that careful mask.'

Only those very close to him ever saw behind the mask. No: he was not an intimate person, but he certainly conveyed the impression of being so by the disarming ingenuousness of his mask. It was the mask of an undergraduate, a most confiding undergraduate, held before the face of a wise, disillusioned, and rather formidable old man. I am not, of course, suggesting that he deliberately set out to deceive the world: far from it, since he loathed, and was wholly incapable of, the slightest imposture. It was rather that he was so sensitive, so modest, so fundamentally shy and reserved, that he adopted an impish disguise to conceal from all but a very few the realities of his nature.

Here again we have his perfect taste in remaining loyal to his own manner: he knew that the quality of his mind was not attuned to the grandiose or the passionate, so he restricted his self-expression, his 'intimacy,' to the minor key. How right, how sincere, how utterly honest he was in so doing!

A third reason why he aroused such affection was that he was in himself slightly absurd. His small size, his enormous eye-lashes, the pleasure he derived from flippant conversation or tricks, his very careful and individual apparel gave the impression of a miniature dandy, of an exquisite dilettante without ambition and without seriousness. The circumstance that this was an incorrect impression in no sense detracted from its charm.

He was not, in fact, a trifler: he took his art very seriously. He was much preoccupied by the problems of style, and anyone who has devoted any time to the study of his prose will have realised that such excellent

(Continued overleaf)

Thermo-nuclear skyline in the Pacific: '... you can eat the products of explosions. In fact you have—and do—on a small scale, because they come down eventually as rain, which falls on grass which is eaten by cows, and so on'

Radiation Hazards

ARTHUR HASLETT offers some expert comments on the report of a committee set up by the British Medical Research Council at the request of the Prime Minister to consider the medical and genetical effects of radiation on mankind

ALMOST all of us must have been worried by these thermo-nuclear test explosions—by the H-bomb, as once we called it. There were, first, those Japanese fishermen. And reports of radioactive rain. And fears of long-term genetic damage—the weakening of human heredity by all this extra radiation. Behind the fear and the talk there were real questions. And to get the answers the Medical Research Council in Britain appointed a committee on the hazards of nuclear and allied radiations. It was a big committee, and a good one. It gives us a clean bill up to the present—barring that one accident—and probably for some time ahead, though not with a great deal in hand.

But let me go back to the beginning and ask first what are nuclear and allied radiations. One answer is: things like X-rays and the radiation from radium, which we all know to be dangerous. But to say that and leave it sounds more out of the ordinary than it should. For example, there is radio-activity in our bodies, but we do not die. And there is cosmic radiation that comes to the earth from space, and radioactivity in rocks and soil. So there are two points: that this penetrating kind of radiation is dangerous; but that its effects depend on quantity.

A second question is: how does atomic energy come in? Atomic energy and these explosions? The answer is that for every ton of uranium or plutonium that undergoes fission—and so releases energy—a ton of radio-active fission products is produced. And so long as the activity lasts, there will be more of this penetrating radiation. That is true equally of an A-bomb or an H-bomb—of an explosion or of the Calder Hall power station, except that fission products from a power station are under control: they will be stored first, and then disposed of, whereas those from an explosion are broadcast: they go up with the mushroom cloud that we know from pictures.

Now as to the damage to be expected: there are, first, the immediate effects, familiar from descriptions, that follow any very heavy exposure to radiation. They may be drastic, even fatal, but they should never again happen in a test. Second, there may be delayed effects, still on the individual. For example, many of the early workers with X-rays or radium died years later from effects not known about at the time. And, third, there is the chance of genetic effects, operating in whole populations, and coming out through many generations. It is the last two—the delayed effects on the individual, and the still more delayed effects on whole populations—that the report is mainly concerned with.

One more point by way of preliminary. When we talk of radiation, of whatever kind, we think usually of radiation coming from outside the body, and it then matters little where it comes from: there is merely so much extra radiation, and a common arithmetic: common to X-rays, or radium, or the products of thermo-nuclear explosions.

But there is also another possibility. You cannot eat X-rays, but you can radium. And you can eat the products of explosions. In fact, you have—and do—on a small scale, because they come down eventually as rain, which falls on grass, which is eaten by cows, and so on.

What happens next depends on what in particular we have eaten. If

it is calcium it goes into bone, and if it is an element that, chemically speaking, is like calcium, then it will also go into bone. That is true of radium, and for that matter of strontium.

I spoke earlier about fission products—and many different elements are produced. One of them is a radio-active form of strontium—radio-strontium for short. It is relatively a long-lived material. So it is little help—as with many others—that it comes down only slowly to earth. It is still active, and it goes to bone, as I said, and builds up. Once there, we would expect by analogy with radium that in a proportion of people it would produce bone cancers and other troubles, provided that enough of it was in the bone.

I come now to a conclusion, and one that is important. Suppose for the sake of argument that we have first of all the present rate of thermo-nuclear explosions, and then an increased rate, and then one bigger again. Sooner or later there would be trouble. But if we can pin down any one dangerous effect, and say that it will show itself with a smaller rate of explosions than any other, then we know where we are. And this, radio-strontium can tell us. We know how much already is in our bones, and that amount is increasing. We know that if it went up a hundred times, we should be in trouble. And we can say that if it went up even to ten times we would do well to look urgently at the problem. Which is what the committee have suggested, and what I meant at the beginning when I said that we were all right for the present, and probably for some time, but not with a great deal in hand.

But that will only do for explosions. And there are still questions about the total amount of extra radiation that comes to us for whatever reason. That includes the use of X-rays and radio-active materials—for example, in medicine and industry—and all those from atomic power stations. All of them are so many extra sources of radiation, and they add up.

What we shall need to know sooner or later is just how much of them we can stand. It is a difficult question, and for two reasons. One reason is scientific. It seems that even a small increase in exposure to radiation will cause a corresponding increase in inherited changes. And that what matters is the accumulated total of radiation that falls on the reproductive organs from birth to the age of breeding. But we do not know yet how big the effect is—at least in man, who most concerns us.

The second difficulty is one of morals or arithmetic, however you look at it. Most of these inherited changes are bad, and we must expect that slightly more of them will be produced. On the other hand we know that X-rays are useful, and so, too, will be an extra source of energy to drive power stations. But how is a balance to be struck? How much can be accepted as the price of progress? For that in the end it must come to, though not yet, because the extra radiation produced by atomic energy is so far too small in amount to matter. (*Broadcast in the BBC's General Overseas Service*)

The Incomparable Max

Continued from page 7

form, such perfect decoration, are not achieved by chance but only as a result of wide erudition, an exquisite ear for the balance of language, and a capacity for taking infinite trouble.

It was his subtlety controlled by his intellectual probity which rendered him so fine a broadcaster. Let me tell you a story which although most damaging to myself does illustrate how seriously he regarded any work on which he was engaged. A common friend of ours, that most gifted writer, Mr. Christopher Sykes, visited Max Beerbohm on behalf of the BBC with the view to arranging a short series of talks.

Christopher Sykes suggested to Beerbohm that I was among the original pioneers of the natural or unaffected method of speaking on the wireless. Beerbohm did not entirely approve of my method, and I shall tell you the wounding words he said to Sykes, who, of course, on his return repeated them to me with friendly glee. 'Yes,' said Max Beerbohm. 'I agree that a certain art is required if you are not to convey to the listener the impression that you are reading aloud from a script. Now we all, from time to time, pause before a word when broadcasting in order to give emphasis to that word. But Harold pauses as if he were searching for the word. And that, my dear boy, is not playing the game.'

I was so shattered by this criticism that I determined never to broadcast again, a resolution to which I adhered for only a few weeks. But his remark did prove to me not only his acuity of observation but also the utter sincerity, the complete integrity, that he demanded of the broadcaster as of every other performer in any branch of art. I was unaware that I conveyed a fraudulent impression of broadcasting spontaneously and without a written text; but thereafter I was careful, or thought I was being careful, not to convey the impression that I was searching in my head and memory for the exact word.

Now if I were asked why I shared this wide affection for Max Beerbohm I should not answer 'because of the intimacy that he conveyed,' since he was not, as I said, an intimate man. I would answer: 'Because he was a satirist who never caused undeserved pain, and an artist who never wrote or drew anything below his own standards.' (*Broadcast in the BBC's General Overseas Service*).

'Pacific Destiny.' Arthur Grimble (Denholm Elliott) and his bride Olivia (Susan Stephen) are greeted by the District Officer, McAllister (Gordon Jackson)

Arthur Grimble with the native magistrate (Inia Te Wiata) and Olivia, finds to his dismay he is expected to speak to the people in their own language

'FILMS TO SEE'

ROGER MANVELL reviews some British film releases and discusses the possibilities of a new system of film-making known as the Dynamic Frame which has been developed in England: 'The Door in the Wall,' a film using this technique, was recently shown in London

NOWADAYS, the different screen shapes that the cinema is using make the critic tend to decide the relationship of film form to subject, and this month there has been a demonstration in London of an extraordinary experimental film using a variable screen shape—a kind of film chameleon. It sets out to prove that the shape of each individual shot in a film should change to suit the nature of what is being shown: that is, that the director, like a painter, should decide the shape of an image for each separate composition he makes. This system has been developed experimentally in England by a young American called Glenn Alvey. It is known as the Dynamic Frame, and the test film Glenn Alvey has made is called *The Door in the Wall*, after the story by H. G. Wells on which it is based.

The Door in the Wall is about a very successful politician, a member of the Cabinet, who is haunted by a magical experience he had as a small boy when he discovered in a back street a wonderful garden and parkland behind a battered old wooden door. At various periods in his life he finds this door again, always in different parts of London. He never goes in: he accepts success as it comes and never fulfils his ardent desire to forget his work in the professional world and discover once more the haunting experience of beauty belonging to his childhood.

Glenn Alvey uses the principle of dynamic frame to assist the dramatic potentialities of this story. The first shot opens on the Cabinet minister and his friend in a small close-up, and the picture gradually expands to take in the street in which they are walking. When we go back to the scenes of his childhood, and the little boy enters the green door, the picture narrows like a keyhole and then gradually opens up as the splendour of the garden is revealed. Suddenly the child finds himself near a prehistoric monster; from a small picture at the foot of the screen the frame suddenly opens out to full size showing the giant creature over-topping the boy. I did not find these changes as distracting as I thought I would; in fact, I am sure the film gained from them in dramatic effect.

It's Great To Be Young is a modest, rather charming little musical about a young schoolmaster who is mad about music and teaches it on every occasion he possibly can. He does this against the wishes of his new

and rather pompous headmaster. Instruments bought too casually on hire-purchase are impounded and the school orchestra closed down. When the headmaster can stand no more the young schoolmaster is dismissed, a sad outcome to so much wild enthusiasm, including playing jazz in a public house at night to help pay off the instalments on the impounded instruments. Nevertheless the children manage to free their instruments and play us some well-rehearsed concert pieces.

No one but a fool would stop such playing by schoolchildren, in fact. But for purposes of the film the headmaster has to be a fool, and then he finds he has a strike on his hands because he has sent away the most popular master on the staff. John Mills plays this part of the music teacher with a constant bubbling excitement which gives the film its charm.

Pacific Destiny is a different matter altogether. It should, I think, have kept the title of the series of radio talks, and later the book on which it is based: Sir Arthur Grimble's *A Pattern of Islands*. Sir Arthur Grimble is an officer retired from the Colonial Service, and he made a great reputation for the stories he told on the radio as a result of his experiences as an administrator on British islands in the South Seas.

The film is a dramatisation of the story of his youth: his arrival with his young wife; his failure to please his irascible chief or, for that matter, himself; his despair that he will ever be any good; and his final emergence as a sympathetic administrator with the joint help of his wife and a friendly Polynesian magistrate, played with great dignity by Inia Te Wiata, who loves him and adopts him for a son.

Denholm Elliott, who plays this young man in the British Colonial Service of half a century ago, is not a film star: he is just a very good actor with a responsive, sensitive, intelligent face.

This episodic rather inconsequential film is, in fact, a series of incidents which collectively illustrate the experiences of the young couple who are learning, half consciously, half unconsciously, to live and work for the benefit of a colonial people without any help at all from the senior officer in their territory. These episodes are punctuated, like life on the islands, by songs sung by the people. (*Broadcast in the BBC's General Overseas Service*)

'It's Great To Be Young.' Schoolboy Nicky (Jeremy Spenser) being coaxed into a difficult passage by music-master Dingle (John Mills)

Pilgrims from many lands met for celebrations at Bodhgaya, in northern India

Mr. Nehru, India's Premier, laying the foundation stone of a monument in Delhi to mark the 2,500th anniversary of the Buddha's death

JOHN BLOFELD, in the last of five talks on the pilgrimage to Buddhist shrines in northern India which he undertook at the invitation of the BBC, tells of his visit to Kusinara, the scene of the Buddha's death, and of his subsequent arrival at Delhi in time to witness the Buddha Jayanti celebrations

The End of a Scholar's Pilgrimage

WHEN, just before his eightieth birthday, the Lord Buddha foresaw that death was fast approaching he exhorted his disciples not to give way to grief, since such partings are inevitable in a world so transient. To comfort them he promised that if they clung steadfastly to what he had taught them they would have no further need of a Teacher. But, of course, many of those who had come to take a last farewell shed bitter tears, and it is natural that an echo of that sadness should strike the modern pilgrim as he approaches Kusinara, the place of the Lord Buddha's death.

My own feelings when I reached that little village in North Bihar were like those of a Chinese pilgrim who, arriving there some 1,300 years ago, bitterly lamented having been born too late to learn wisdom and compassion from the lips of the Lord Buddha himself.

Kusinara, unlike most of the other Buddhist holy places, does not lie amid the submerged ruins of a great city, for the Lord Buddha deliberately chose to spend his last hours near a small mud-walled village, which his disciples regarded as far too poor to afford the pomp fitting to such a momentous occasion.

Memories of a Full Moon in May

Today the place where he passed away in the shade of two scarlet-blossomed sala trees is marked by a simple *stupa*, a mere mound of ancient bricks. Nearby are a reclining image, and a rest-house presided over by a solitary Burmese monk; and that is all. The image was unfortunately bricked over during some repairs to its shrine, so I saw nothing of note but the *stupa* itself.

Normally I should think it irksome to make a long journey at the height of north India's cruel summer just to gaze at a symmetrical pile of age-worn bricks; but that was not my feeling then.

The Lord Buddha's death was occasioned by his eating a dish offered at a banquet given by a lay disciple. He was perhaps aware of what would happen, for he forbade the others to touch that particular dish while he himself would eat no other. He may have felt it fitting to die on the night of the May full moon, the anniversary both of his birth and of his Enlightenment; and the reason he no longer resisted death was this: just forty-five years earlier, after spending seven years as a forest hermit dedicated to the discovery of the truth about life and death, he had triumphantly achieved his object. Sitting cross-legged beneath a Bodhi tree, he had entered into Nirvana, the state of perfect comprehension of ultimate truth.

Henceforth he felt calmly assured of freedom from rebirth into this world of ever-transient forms. He was no longer a so-called self, compounded of personal likes, dislikes, prejudices, ignorance, desires, and passions: he was already one with Eternity.

That he remained in the world for another forty-five years, sharing the inevitable disabilities inherent in a human body, was due to his compassion. Not content with his own great achievement he desired to lead others to that goal. Year after year he wandered from place to place, teaching that ultimate truth could only be reached by the practice of compassion, by diligent self-mastery, and by an unwavering determination to solve the riddle of existence.

But as his eightieth birthday drew near he felt that he had accomplished

all that could be done for his disciples. In short, the time had come to cast off the weight of a human body. Yet it was not death in the ordinary sense which he courted, not death followed by an endless cycle of rebirths, but *Mahaparinirvana*: that utter passing away which leaves no trace behind, that passing into a state of indescribable bliss which can, perhaps, be hinted at in some such terms as 'absorption into the eternal, unchanging reality lying behind the transient and essentially dreamlike world of form.'

Buddhists do not care to attempt a description of *Mahaparinirvana*, for who can describe the Infinite? Still, the words I have used may serve as an indication of what Buddhists believe to be the final goal of sentient beings. Not long before his death the Lord Buddha pronounced the famous words which throw into relief the most unique feature of Buddhism as a religion. They are: 'Be ye lamps unto yourselves, islands of refuge to yourselves. Betake yourselves to no external refuge. Hold fast to Truth as a lamp. Hold fast to Truth as an island of refuge. Look not for refuge to anyone beside yourselves.' And this teaching was echoed by the last words he spoke before his death: 'Oh brothers, I exhort you: decay is inherent in all compounded things. Work out your own salvation with diligence.'

At a little distance from Kusinara there is a covered declivity where according to tradition the Lord Buddha was cremated. Some of the earth is slightly blackened, so it is said that charred remains of the funeral pyre still linger there. I find this hard to accept after the passage of 2,500 years, but some people revere the place almost as much as Kusinara itself. Chief among them is an old Chinese monk who, to symbolise his final cutting of worldly ties, for many years inhabited a small shelter clinging to the branches of an adjacent tree. Now in his old age he has left the tree and built a little hut at its base. The local Hindus, recognising a holy man, make all sorts of offerings to him which he always refuses, except for the barest minimum of coarse food.

Legacy of Wisdom and Compassion

Most Buddhists do not approve of such extreme austerity, but how can one help admiring such devotion? Perhaps he would like to draw wider attention to the sacred character of that long-neglected spot in the hope that someone will erect a monument worthy of the place which once housed the ashes of the Buddha?

The sadness I felt while meditating near the Kusinara *stupa* gradually melted away as I reflected upon the vast legacy the Lord Buddha left behind him: his doctrine of wisdom and compassion which has brought solace to so many hearts and inspired much of the greatest art in Asia.

This thought remained with me as I journeyed on to Delhi for the great Buddha Jayanti celebrations to be held on the night of the full moon. The station bookstalls everywhere were packed with magazines in English and Hindi which had devoted the entire May issue to the Buddha and his doctrine, and to the superb sculpture, architecture, and painting inspired by his life and teaching.

In Delhi itself the newspapers generally devoted as much as a third of their space to Buddhist subjects. This was particularly significant in view of the fact that Buddhism has long ceased to be the religion of

(Continued on page 12)

THE SHROPSHIRE TOWN OF IRON BRIDGE

CUTHBERT WILKINSON takes you through some very striking country near Shrewsbury to a small town on the banks of the Severn which in the second half of the eighteenth century was the scene of far-reaching developments in the industrial applications of iron

SHROPSHIRE is a county of great and varied beauty, and Shrewsbury, its county town, possesses more perfect specimens of houses in the timbered or black-and-white style concentrated into a small place than any other town I know. Through it flows the river Severn, famous in history and romance, and within easy distance are places galore which not to know is to be uneducated.

But to how many who claim to know England 'pretty well' do the two words heading this article convey their meaning? Well, Iron Bridge is a small town, and its name was not Iron Bridge before the latter part of the eighteenth century. It is situated on the banks of the Severn, about a dozen miles east-south-east of Shrewsbury and two and a half miles from the famous Buildwas abbey.

Here the Severn flows through a deep and wide gorge with steep, wooded banks; and in the vicinity are the great iron and coal districts around Coalbrookdale. Great names in the early industrial history of iron are connected with this district, for here flourished in the second half of the eighteenth century firms founded by the Darbys, the Walkers, and the Wilkinsons, without the last of whom James Watt could not have made a success of his efforts to build an efficient steam-engine.

Launching the First Iron Boat

Moreover, across the gorge was built the first iron bridge, and into the waters of the Severn flowing through it was launched the first iron boat. And the man who was responsible for these three achievements was John Wilkinson, son of Isaac Wilkinson, who came to the neighbourhood from Lancashire. John Wilkinson is reputed to have been 'iron mad.' There was, however, plenty of method about him.

When the iron trade was thriving in the Coalbrookdale-Madeley-Broseley districts communication across the Severn gorge was an essential. The available bridge was inadequate and tottering. The iron-founders decided to build a new one. 'Wood,' said they; 'Iron,' said Wilkinson; and for a year or two they wrangled. But eventually Wilkinson had his way: the design was produced, the castings were made at the Darby works at Coalbrookdale, and the bridge was erected and opened for traffic in 1779.

And there it still stands, scheduled as an ancient monument, graceful and dominating, having disproved all melancholy prophecies of Wilkinson's opponents and having completely justified his 'madness.' Whilst the argument was proceeding he was quietly experimenting with the building of iron barges, since making them of wood was too slow and he needed more and more water transport for his raw material and finished goods.

When his first iron barge was ready for launching crowds of sceptics came to the Severn gorge to see it take water and sink to the bottom. But it did not do so: it floated as easily as John Wilkinson knew it would do.

The town took its name from the first iron bridge ever erected—forerunner of Sydney Harbour and many other bridges built since 1779

So at Iron Bridge was erected the precursor of Sydney Harbour bridge and was launched the precursor of the *Queen Elizabeth*. And to complete the trio of inventions, his legacies to civilisation, Wilkinson devised a method of boring cannon which he was able to apply to Watt's need for the accurate boring of cylinders which would prove steam-tight, and which were the precursors of subsequent stationary and mobile steam-engines.

Iron Bridge today is an interesting little place set in the midst of very fine and striking country. Six miles to the south-east is the pleasant town of Much Wenlock, which gives its name to that very remarkable ridge of hills known as Wenlock Edge, rising gradually from 350 to 900 feet above sea-level and dropping almost precipitously for 400 feet into a delightful valley separating it from the Sretton hills, including Caer Caradoc and the Long Mynd.

Ancient Road and Roman City

An excellent road traverses half a dozen miles of the ridge and gives views of extreme interest and beauty. Caradoc is a most shapely hill, 1,506 feet high, rising very steeply out of its surrounding valley. Beyond it, with Church Stretton sheltered between, the hills of the Long Mynd rise to more than 1,600 feet—a wild and rugged stretch of country traversed by an age-old track known as the Port Way.

All this is facing north-west into Wales. South-east are seen Shropshire's two highest hills: Abdon Burf, the summit of Brown Clee Hill, 1,750 feet; and Titterstone Clee Hill, 1,700 feet. Corvedale and the river Corve separate these hills from Wenlock Edge. North-west of Iron Bridge three or four miles away rises the Wrekin, which because of its compactness, its steepness, and shapeliness gives an impression of height although its summit beacon is only 1,335 feet above sea-level.

On Wenlock Edge the wood's in trouble;
His forest fleece the Wrekin heaves;
The gale it plies the saplings double,
And thick on Severn snow the leaves.

How well A. E. Housman brought to us the vision and atmosphere of all this country in his delightful and pathetic poems, *A Shropshire Lad!* And how well did Mary Webb bring us the vision and atmosphere of the hills of the Long Mynd and of the country of the meres!

Between the Wrekin and Shrewsbury is *Uriconium*, being all that remains of the Roman city of that name. It stood on the Roman road, traces of which can still be identified southwards through Church Stretton down to Hereford. But the Romans and their roads were modern compared with the Long Mynd's Port Way, which was in all probability made and in use 4,000 years ago. Its line is clear and unmistakable, and it is largely in use as a by-road today.

The original way, however, still shows clearly. It is brooded over by extremely modern gliders, passing, as it does, the operational quarters of a gliding club. Very beautiful is their flight in the sunshine, and one cannot but feel how far removed they are from Wilkinson and his iron bridge and iron barges. Certainly 175 years have brought us progress in our making of utilities. But the original iron bridge is still a thing of beauty, though we dare not think that it will therefore last for ever.

Strettondale with Ragleth Hill, Caer Caradoc, and the Lawley, seen from the Long Mynd

OUR WAY OF LIFE: 8

HENRY FAIRLIE

The Younger Generation

HENRY FAIRLIE discusses the beliefs and attitudes of Britain's younger generation—by which he means those who today are thirty-two or younger. They believe, he says 'in respectability, in the obligations of family, and in the permanence of oaths. Those are very odd things for young people to believe in'

THE people I want to talk about are the young men and women in Britain today who are thirty-two or younger—possibly just thirty-three—not those who are thirty-four or thirty-five. I hope it will become clear in a moment why I think this distinction of only a

couple of years is important. Walter Bagehot, who was one of the most acute observers of British life in the nineteenth century, once said that all the important changes in politics occur with changes of generation. Thus, the most important change in the nineteenth century came not with the passage of the Reform Bill in 1832 but some thirty years later when those who had grown to maturity since 1832 at last occupied the positions of power and influence: when, in short, Gladstone and Disraeli replaced Palmerston and Lord John Russell.

To me it seems that the outbreak of war in 1939 was just the same sort of watershed as the passing of the Reform Bill in 1832. Those who were in any way involved in the disquiets and discontents of the years before 1939 remain today men and women of the 'thirties and even the nineteen-twenties.

Even those who were only seventeen in 1939 had had a year or so in which to feel themselves involved in what was going on around them. But those who were only fifteen cannot recall anything emotionally significant about the 'thirties, and feel no involvement in them.

In fact, at this moment in Britain the generation which is just starting to make its mark is a generation which—to take the most obvious examples—has never had to meet the emotional challenge of Fascism and which has never known unemployment. Here, then, is a great barrier; and the young Socialist and the young Conservative are likely to be far closer together than the young Socialist and his Socialist elders or the young Conservative and his Conservative elders.

What, then, you are likely to ask, do these young people believe? That in itself is a question which they would repudiate, if by it is meant that they should be able to utter a creed. 'I believe in the Spanish Republic, and in writing to persuade other people to die for it'—this is the kind of creed which misled so many in the 'thirties, and the men and women under thirty-three today will have none of it. You fight a war against Fascism, call it a holy war, take as your ally the devil, and then find that you have to fight the devil afterwards: this the young men and women today regard as futility.

They have, in fact, come to regard political action itself as futile. This attitude affects different people in different ways. For example, I know one prominent young British novelist who would never vote anything but Labour; he has many of the old Labour instincts; I have driven round in a car with him distributing pamphlets urging the abolition of capital punishment; but he would never consider it worth his while to take to a Labour platform and urge the workers to unite. Politics is an abstraction and not real, so it seems to him.

A Revolt against Politics

On the other side, the 'new Conservatism' which is so prominent in Britain today among younger people is not a revolt to the Right in strictly political terms, because it is a revolt against politics itself. With some young men and women this means that they look to religion for their support, and the significance of the revival of religious belief among young men and women who try to think for themselves is something which even Cambridge rationalists do not deny any more. With those to whom religious belief presents no attraction the same attitude nevertheless persists: the agnostic young Conservative will in all probability tell you that what matters is personal relations, the way in which you behave to the few people you know and not to the millions of Chinese whom you do not know.

Here, then, is an attitude—and not a creed. I think it is worth watching, because though we have had our revolution and seem to accept it today that does not mean that there will not be new developments in the next twenty years which will precipitate this attitude, and by then the young men who are thirty-two now will be in positions where they can influence the course of events.

What is the central point in this attitude which is likely to hold during the next twenty years? It is, I think, a new reverence for, above all things, tradition. The young men and women in Britain today, looking at what liberalism did by dismembering the European empires without putting anything more stable in their place, and what it did in Britain itself by setting class against class during the nineteenth century, are convinced that it is worth buttressing all the old prejudices, all the old

customs, all the old traditional attitudes, all the old obligations which have just succeeded in keeping Western society together during more than a thousand years.

They will tell you a safer guide than reason is instinct, and although this horrifies the old men of the 'thirties when they hear it there is no doubt that this attachment to instinct is the predominant influence on the attitude of the young men and women who will be influencing thought and action in Britain in the next twenty or thirty years. If I were asked to put it in a nutshell, I would say that the attitude of men and women over thirty-five to divorce is that divorce should be made easier; the attitude of those younger than thirty-three is that it should be made more difficult. The younger generation in Britain today believes, in so far as it has beliefs at all, in respectability, in the obligations of family, and in the permanence of oaths. Those are very odd things for young people to believe in.

That is why I think they are important. I should perhaps utter one warning against my own case. There is, mainly in the provincial universities, among the characters who people the novels of Mr. Kingsley Amis, a strong and persistent undercurrent of rationalism. It is possible that these people will assert themselves—already Swansea is becoming an intellectual centre of its own—in which case a battle of ideas will develop amongst the young which will be enthralling to watch. But whichever side wins it will speak a language which is intelligible to its opponents but not intelligible to its elderly supporters. A generation has revolted; and it has revolted as a generation. Even the new Left will carry the banners of Authority and Obligation. (*Broadcast in the BBC's General Overseas Service*)

The End of a Pilgrimage

Continued from page 10

more than a tiny handful of Indians. This was non-Buddhist, predominantly Hindu India paying tribute to one who is freely regarded as India's greatest son.

The night before the full moon a celebration was held upon the ridge above Delhi, followed by the laying of the foundation stone in the plinth of a great statue of the Lord Buddha, for which architects all over the world have been invited to submit their designs. The Vice-President of India, Dr. Radhakrishnan, and the Prime Minister, Mr. Nehru, both made moving speeches calling upon India and the world to practice Buddhist tolerance and purity instead of indulging in hatred, dissension, and strife. The Lord Buddha's plea for universal tolerance and compassion had too long remained unheeded, and all too little time was left in which to oppose true selflessness to death-dealing weapons.

The following night, amid the deep-blue dusk of a Delhi summer evening, the main celebration began. Upon a rostrum, backed by the ambassadors of every Buddhist nation, sat the President of India, Dr. Rajendra Prasad, with Dr. Radhakrishnan and Mr. Nehru. One after another they spoke in honour of the Buddha to hushed crowds numbering thousands upon thousands. Now it was even more difficult to remember that India is not a Buddhist country.

Soon after moonrise an almost total eclipse occurred, and Mr. Nehru, pointing to its darkened orb, compared it to our present world lost in the darkness of violence and fear. This, he cried, was because we had too long neglected the Lord Buddha's teaching of compassion and selfless love for one another. Yet, should we heed it now, the world might emerge from the surrounding darkness, as would the moon this night. Mr. Nehru added that though Buddhism had long left the land of its birth to shed its light upon more distant lands of Asia the people of India were beginning once more to heed his words.

I found this vast assembly wonderfully inspiring, especially when I recalled that such meetings were being held throughout India at the self-same hour. And all over the Buddhist countries of Asia the rising moon was being hailed as the symbol of a new personal and national dedication to more selfless living and to worthier efforts in the cause of world peace.

In the stillness of the night millions and millions of people would gaze at the moon, so recently emerged from the shadow of eclipse, and whisper the age-old Buddhist formula: 'May all beings be peaceful, may all beings be happy.' It was upon this note of shared resolve and still cautious optimism that my pilgrimage ended. (*Broadcast in the BBC's General Overseas Service*).

BBC commentator Raymond Baxter interviewing the Captain of the 'Queen Mary'

Television Goes To Sea

JOHN HITCH gives some examples of the way BBC Television is bringing pictures of life at sea into the homes of people all over Britain

IN 1910 Dr. Crippen was identified sailing in an Atlantic liner by means of radio using the morse code. He was arrested on board, and later hanged for wife-murder. Recently a passenger on the boat deck of the *Queen Elizabeth* at sea was recognised by friends in Dublin from television pictures transmitted by the BBC from the great liner. No criminal charge is expected to follow this identification. Once more the BBC has pioneered a development in television which makes the world seem smaller. In 1950 it introduced international television by carrying pictures from Calais across the Channel, and now, so rapid has the development been, the passenger aboard the *Queen Elizabeth* could have been seen as clearly in Rome, Paris, Brussels, Amsterdam, and other European cities, had the television authorities chosen to take the BBC's ship-to-shore programme by means of the international system which now links eight European countries.

This is not the place to discuss the possible role of Atlantic liners in inter-continental television when it comes, but it is interesting to find aboard the *Queen Elizabeth* two television sets side by side, one for use in American territorial waters, and the other for use in British. Technically, British and American television systems have different characteristics, and for any exchange in the future a convertor would be needed to change the characteristics of the one to those of the other, just as in European exchange the programmes pass through a convertor in the disused casino at Cassel, near Lille, in northern France.

High winds and heavy seas have dogged the ship-to-shore experiments which started in September, 1954, with pictures from the British Railways 3,330-ton steamer, *Lord Warden*, ferrying cars from Boulogne to Dover. For this first television transmission from a moving ship at sea it was necessary to get a mobile transmitter on board. The first hitch occurred when the port authorities at Dover would not allow the vehicle to be crane-loaded because of a high wind. Very hurriedly an international carnet had to be got for the vehicle so that it might be driven on to the Dover-Dunkirk night-ferry boat.

In France the next morning the mobile transmitter was driven under its own power from Dunkirk to Boulogne, and there driven down the ramp on to the car deck of the *Lord Warden* just in time for the advertised programme. Two television cameras were set up on the wings of the bridge, while a third was slung from a quayside crane. Good pictures were seen in Britain from the ship in port, and we felt confident of success at sea. But as the boat passed the harbour bar into the English Channel she encountered an enormous wave which drenched us all on the bridge and knocked a television camera to the deck.

BBC engineers sorted things out, and by the time the white cliffs of Dover came in sight the *Lord Warden* was again transmitting excellent pictures which were fed into the BBC television network by means of the chain of relay-transmitters between Dover and London used for European programmes.

On another morning recently we were waiting on the quay at Cherbourg with BBC equipment for turning the 83,673-ton *Queen Elizabeth* into a floating BBC television station for the day. Once more the weather was unkind, and the captain, Commodore Sir Ivan Thomson, decided

(Left) A BBC cameraman aboard the frigate H.M.S. 'Grenville' getting pictures of the submarine H.M.S. 'Tapir,' from which pictures (right) were successfully transmitted when the submarine was submerged

not to come alongside. So the gear was loaded by tender, and we embarked to cross the Channel at a leisurely pace and then to spend three hours off the Isle of Wight where the great liner was waiting for the tide.

Soon after leaving Cherbourg pictures could be seen on the ship's receivers from the BBC station at Rowridge in the Isle of Wight. A BBC transmitter of a new type was installed in the starboard garden-lounge, where Alan Chivers sat to produce the programme with a choice of five pictures screened in front of him. Three were from camera positions on the ship, and two from camera points ashore at Southampton.

From tests made at sea the transmitter proved to have a range of forty miles or more. Its broadcasts on fifty centimetres were less subject to interference than wavelengths normally used for outside television broadcasting. Thus there was no clashing with the ship's radar. As for the programme, we had some delightful pictures of the delicate manoeuvring of the ship's vast bulk as she came alongside at Southampton right on time; interviews with the captain, Sir Ivan Thomson, and with Sir George Nelson and several other passengers; and shots of Shackleton aircraft of Coastal Command which flew out to welcome the liner home.

Earlier, cameras had been taken to the engine-room and to the bridge in the *Queen Mary*—points which passengers do not normally see. In this way viewers at home saw more of the intricate workings of the great liners than any of the passengers actually on board.

Under the protection of the men who fly this flag, ships and sailors from all over the world come on their lawful occasions to London—one of the safest of ports

Bridges attract suicides, and sometimes bodies have to be recovered by patient dragging

The sun sets over the Pool of London, and twilight descends on the barges and

Policing London

TOM FALLON, formerly Chief Superintendent of Police, introduces a series of three programs a week on the work of a patrol whose 'parish' extends from Teddington to Dartford Creek. The first

Monday 11.30, Wednesday 11.30, Friday 11.30

THE annals of crime and detection offer few more fascinating stories of 'Cops and Robbers' than were provided by the fantastic happenings which gave rise to the sailor-policemen of London's River at the turn of the eighteenth century. Beginning with a bloody and protracted encounter with a gang of cut-throats and freebooters who were preying on the shipping of the Thames, the history of the river police over the ensuing 150 years has developed against a background of crime, shipwreck, violent death, heroic rescue, and unselfish service.

It will doubtless come as a surprise to many unfamiliar with the Thames tideway to learn that the river, from the Pool to the creeks in the lower reaches, is a veritable Aladdin's Cave of treasure. Ali Baba and the Forty Thieves could hardly have beheld a more lush accumulation of potential loot than is to be found on and about the river. There, in the big ships lying moored or at anchor, in the dowdy barges that ride unattended on the ebb and flood, and in the wharves and warehouses of the riverside, lies a collection of merchandise, almost within grasping distance of prowling thieves, for which the 'fence' ashore would bid high.

Yet in our time this Aladdin's Cave is in safe custody, and all who would journey over the tideway on their lawful occasions may do so without hindrance from the waterborne hijacker. The Port of London today is known the world over as a 'safe' port, a place where mariners of all nations fetch up without fear of molestation. It was not always so.

For the boon of a secure port in our capital we have to thank the men whose day-and-night patrol ensures the preservation of the Queen's Peace on London's longest street—the river Thames. The citizens they serve know little of the trials and hazards of the men who spend their working lives in the thirty-foot patrol boats on a treacherous tideway, where fog and foul weather more often than not make the river policeman's job an extremely arduous occupation.

It is a little-known fact that the craft of the British policeman had its beginnings on the Thames—in that first encounter with the river pirates in 1798. In that year a Government official, using the sober phraseology of his profession, described the prevailing situation in these terms: 'Smuggling is carried on by armed gangs who overawe the Excise Officers by superior force of arms and numbers.'

The Port of London had become a pirates' pool, and an elaborately organized black market negotiated the disposal of the continuous flow of loot from the river. Prices for an inward-bound cargo were sometimes quoted before the ship concerned had dropped anchor in the port. Receivers of stolen property were located at strategic points, and their henchmen were ready at hand to do their bidding. From these strongholds the gangsters sallied forth on their missions.

1.30, Friday 02.30

The great fleets from the Indies beat their way up the twisting river reaches, loaded to the waterline with the wealth of the Orient, to squat like fat ducks on the tideway until the thieves were ready for the plucking. Out on the oceans they could spread their canvas and show their heels to a threatening buccaneer. Here in the 'safety' of the tightly packed port they were helpless.

Cupidity and disagreement among the merchants and City Fathers frustrated concerted action among those most affected until the trickle of loot had become a torrent. Then Parliament, prodded into action by the merchant adventurers of the East and West Indies, was forced to tackle the menace. Out of this decision to fight the pirates emerged two of the outstanding characters in British national biography. John Harriott, master mariner, soldier, surveyor, inventor, and born leader of men, was the man of action. Supporting him and providing the back-room organization and drive was Patrick Colquhoun, a purposeful Scot, at that time residing as a magistrate at Westminster.

Humanity and Courtesy

The river pirates were routed, and the rule of the gangster afloat was broken. Out of this victory came something even more important: the proof that a small band of firm and courageous citizens, well disciplined and led, can always outmatch the guiles and villainies of a gang of criminals. That, and one thing more—the formulation of the British policeman's code of behaviour. Confronted with a spate of violence and crime without parallel in these islands, these two enlightened men insisted that their subordinates should make no unnecessary resort to force, and that every citizen, law-abiding and wrongdoer alike, should be treated with humanity and courtesy.

It is impossible in a series of three half-hour programmes to do more than give a brief impression of conditions then and now. John Snagge, afloat in the BBC launch, assisted by the technicians of the BBC Outside Broadcasts, will transmit something of the atmosphere of the London tideway the river policemen patrol. On-the-spot interviews with the men of the force will bring some of these officers to the microphone.

PACKIE COLQUHOUN

Tom Waldron, the producer of the programmes, was for some years a mariner, so between us we shall hope to bring you an authentic sound-picture of the 'Sailor Cops' of London Town, past and present.

It was my privilege to serve with them in peace and war for many years, and I have the greatest possible regard and admiration for these former colleagues. I believe you will feel that way, too, when you have heard their story.

Powerful launches equipped with radio-telephony enable the police to reach any 'incident' within ten or fifteen minutes; a patrol leaving to answer an urgent call

The Thames policeman's duties take him from the peaceful upper reaches where the pleasure craft ply to the teeming docks where ocean-going ships and tankers tie up

SAM POLLOCK discusses the reasons for the falling off in custom at that essentially English institution, the fish-and-chip shop, and suggests there may be some social danger in abandoning this tried old favourite form of sustenance in favour of—shall we say—scampi

Fish And Chips

TELEVISION has been blamed for killing or injuring many of the old traditions and habits in Britain, but now I see it is feared that it is striking at an institution which was at one time as stout a pillar of 'our way of life' as afternoon tea or the roast beef of Old England: I mean the fried-fish-and-chip shop, where the delicacy known to others as seafood and French-fried is sold over the counter, mostly for consumption off the premises, and wrapped in the product of that other great British institution—our Free Press—with generous lashings of vinegar.

It is reported that the proprietor of a fish-and-chip shop in Bradford, Yorkshire, has been granted a music-and-singing licence by the local magistrates to enable him to install a television set on his counter. Apparently, such is the siren lure of 'the tely'—even in hardheaded Yorkshire—that the customers will not even leave it for the time that it takes to collect what used to be the family's routine supper. Instead they take a cold snack which has been prepared in advance. The proprietor of the shop is now trying to beat the threat to his living by arranging for the customers to be able to keep contact with the screen while their order for cod or haddock simmers in its native batter.

Competition of School Dinners

I hope the proprietor's enterprise pays off, but the (for him) sad fact is that television is only one of several influences which have been undermining the fish-and-chip habit. When I was in Lancashire some time ago—and Lancashire used to be the very heart of the fish-and-chip zone—I was talking to a man whose firm specialises in the manufacture of fish-and-chip-making equipment. He told me that if it were not for their export trade they would be in the bankruptcy court. 'It's these cheap school dinners,' he said. 'Children are losing the fish-and-chip habit.'

In the old days, when every grown-up in a Lancashire wage-earning family went to work in the local cotton-mill, mother would neither have the time nor the energy to prepare a meal at home in her lunch break for either the workers of the family or the children at school. So the fish-and-chip shop filled a much-felt want: a couple of bobs' worth—in

those days—collected piping hot in several thicknesses of newspaper made a meal for the lot. Today it is not only the cheap and plentiful dinners which our children can have at school: there is also the fact that every mill now has a canteen where normally the worker can buy himself a cooked meal of two or even three courses rather more cheaply than it could be bought and prepared at home.

In fact, like almost everything else in Britain today, it all comes back to full employment, which has both made it necessary for employers competing for labour to offer competitive canteen conditions, and made it possible for fully employed workers to take their holidays further afield, where they know not fish and chips or sausage and mash.

Decline of the High Tea

The process started during the war, when rationing and shift-work made the provision of home meals or even sandwiches for war-workers more difficult than ever, and we all got the eating out habit. Not that the factory-workers in the old canteenless days ever ate very well at midday—it was mostly an affair of sandwiches—but, again, our standards were getting higher. Office-workers also got the eating out habit during the war, and today the London business offices which cannot compete for workers with canteens are offering 'luncheon vouchers'—tax free—which enable the office-worker too to become rather more 'choosy.'

All this has reacted on the meals at home, not only in encouraging more variety and adventure there but in making less important what were really at one time during the week for ordinary people the two British main meals—breakfast and high tea.

The high tea—which might be egg and bacon or kippers or—yes!—fish and chips with loads of bread and butter and scones and cakes and oceans of tea—still holds its own to some extent in Scotland and the provinces—apart from anything else they can mostly get home earlier after work than London suburbanites—but even there other ideas are creeping in. Blackpool boarding houses, for example, which before the war made high tea the last meal of the day, except for tea and sandwiches at maybe ten o'clock, today serve a varied dinner at 7.30.

So, all in all, I do not think even television sets in fish-and-chip shops are going to lure the customers back in anything like pre-war numbers. But there are not lacking signs that what these establishments are losing in numbers they may one day regain in 'tone.' The dish will, I think, in the current jargon, become terribly 'U': terribly upper class, and pretty silly we non-U types are going to look when we find we have stamped ourselves as irrecoverably vulgar by abandoning the old favourite for scampi. On one summer's day of the year, in aid of charity, visitors are allowed into the grounds of Chartwell Manor (above), Sir Winston Churchill's home at Westerham in Kent. (Right) a picnic party by Sir Winston's swimming pool

STORIES FROM 'RADIO NEWSREEL'

Here and There

CHARTWELL MANOR

OF all the many country-house gardens which are thrown open to the public on certain days of the summer, one of the most famous and historic of all is just on the edge of the Weald of Kent, but its fame and its history do not go very far back in years. In fact the man who made it famous is still alive: he is Sir Winston Churchill—statesman, author, soldier, lover of gardens, and on certain occasions amateur brick-layer. There are people who set so much store on seeing the gardens at Chartwell Manor near Westerham that they come long distances and even from overseas in order to strike the one day each summer when the grounds are open in aid of charity.

Sitting looking out over the Weald of Kent you could guess what made Sir Winston buy Chartwell thirty-four years ago. The grounds fall away steeply in terraces, right away towards the plain, and through a break in the belt of woodlands that rings round the park you can look clear across a wide sweep, maybe thirty miles of some of the greenest and pleasantest miles in England's green and pleasant landscape. There were people there on the open day this year from all parts of England; they had come by coach, car, bicycle, every kind of transport, and there were overseas visitors too. Everywhere you could hear Commonwealth and American accents, and quite a few foreign languages too.

It was a fairly typical June day, patches of sun and patches of cloud, but just warm enough to eat your sandwiches on the grass. On the terrace round the house the people were thickest, among the great banks of purple rhododendrons, and they were peering in at the windows of Chartwell Manor itself, a square, sturdy, red-brick building, with Sir Winston's standard as Lord Warden of the Cinque Ports flying from the roof.

People were photographing the swans, the baby calves, the horses, the miniature swimming pool, and the garden pavilion with its paintings of the Battle of Blenheim, where Sir Winston's ancestor, Marlborough, was victor. Above all they were photographing and filming themselves, so that one day they will be able to show the snaps to their grandchildren, perhaps, and say proudly: 'I went to Chartwell while it was Sir Winston Churchill's home.'

BARBARA HOOPER

MAN-MADE FIBRES

THERE are plenty of people in Leeds, Bradford, and other parts of the West Riding of Yorkshire who are said to be able to take one look at you and tell you to the nearest penny or so how much the cloth for your suit cost, for the economy of the West Riding for many a year has been based largely on wool; but nowadays the sheep have a rival in man-made fibres, which came originally from a test tube.

Some people, though not all, think of these synthetic fibres as a serious rival to wool, and that is why Leeds University, which for many years has had an important textile industry department, has now added a new division to it devoted entirely to these man-made fibres. It was opened by the Duke of Edinburgh, who said:

'This new building can only be justified if the man-made-fibres department has constantly in mind that its work can be of direct service to the country. It does not matter in the least how you set about doing the work or what methods are employed so long as you never lose sight of the ultimate object. I would also like to say this: that I understand

that the industry has supported this venture most generously. But that is only the beginning, because the department can't possibly flourish without the active and continuous interest and encouragement of the industry. In fact I would go further and I would say that the department will only be kept up to the mark if the industry makes constant and quite impossible demands on it. And I have a suspicion, anyway, that professors only become really productive when they start tearing their hair—if they've got any. I know that some people would like universities to be quiet pools of leisurely learning, but any student going in for a technological subject in these days has got to do more than just to master his subject: he has got to feel a very real urgency about it, otherwise he would be too late and too slow for an industry which is changing very rapidly. You can do great things here for yourselves, for the university, for industry, and for the country.'

SOMEWHERE IN RUSSIA

WHAT are things like in Russia today, right off the beaten track? Suppose, for instance, you were driving along the highway, somewhere in Russia, and decided to find a place for lunch, just as you might do in most countries? This is what happened in Russia to the BBC's air correspondent, Ivor Jones, when he found himself at a little village called Galitzino.

'We—that is, two other British journalists, a Russian broadcaster, and myself—went there simply in search of lunch. We had driven out of Moscow down the broad, straight highway that runs west-south-west towards Minsk—mostly, it seemed, through dense forests—to an airfield at a place called Kubinko. There, Western air staffs were being shown some of Russia's newest aeroplanes. We saw them only from the edge of the field. An officer at the gate told us: "No correspondents are admitted, by personal order of Marshal of Aviation, Pavel Zhigatev."

'So there we were, cut off from the lavish refreshments laid out in a marquee on the aerodrome. The man from Moscow Radio—he could not get in, either—set out to make this good. He decided we had better take to the by-roads that run not through forests but past the scattered huts and small allotments of the peasants, backed by the broader lands of the collective farms on which they have to do most of their work.

'Now and then we stopped to make enquiries about food, and eventually learned that we might get some at a village called Galitzino, which boasted a railway station. It was of the sort, I should imagine, that Chekov's characters would have looked on as the gateway to the delights of Moscow. Its main building was such as you might find in the remotest parts of British Railways, except that it was painted blue and white, and had curious eastern flourishes in the stone-work over its windows. It faced a dusty square, on the other sides of which were roughly built wooden shops. In one corner was an ice-cream tricycle. We went into the buffet and had smoked ham, black bread, and beer. There was no vodka, though. Around us, at the other tables, were the local people: men in the roughest of shirts and trousers, women in the usual shapeless Russian frocks, and an occasional old man with white hair and a moustache and a battered peak cap with a slightly military air. The waitress seemed to be trying to keep the room tidy, but it was a losing battle.'

This Week's Listening

THE SOVIET CONSTITUTION

IN the second talk in the G.O.S. series 'This Day and Age—The Soviet Union,' Leonard Schapiro will speak of the development of the Russian constitutional system since the 1917 revolution, and of the part played by such bodies as the Supreme Soviet and the Council of Ministers in the running of the country.

At the same time he will examine the claim of the Soviet Union to be a federal state, and draw attention to the close relationship between the governmental system and the Communist Party. The party will itself be the subject of next week's talk by Dr. George Bolsover.

Mr. Schapiro is a Lecturer in Soviet Government at the London School of Economics, and the author of a standard work on *The Origin of the Communist Autocracy*.

G.O.S.: Tuesday 15.45; Wednesday 00.30 and 05.00

CRUCIBLES OF CIVILISATION

IN history the aftermath of nearly every conquest has been a struggle between the culture of the people conquered and that of the conqueror. The result has often been assimilation of the conquerors by the original inhabitants and a mingling of national characteristics.

In the past two millennia Asia has witnessed similar cultural struggles on an even larger scale. Civilised communities have been subject to recurrent pressure from nomadic peoples. In time these peoples have been 'tamed' and absorbed by civilisations which they had overrun. Leaders with nomadic ancestry like Akbar the Mogul, in India, or Ch'ien Lung the Manchu, in China, settled down and became the strongest representatives of community and city life.

Sirdar K. M. Panikkar, the well-known Indian historian and a former Ambassador to China, will be speaking about the taming of nomadic peoples in 'Crucibles of Civilisation,' a talk in the 'Story of Colonisation' series.

G.O.S.: Monday 15.45; Tuesday 00.30 and 05.00

THE HAUNTED RECTORY

THE story of the haunting of Borley rectory was made famous by the late Harry Price chiefly in two books: *The Most Haunted House in England* and *The End of Borley Rectory*. From his own experiences and those of other witnesses he made one of the best ghost stories of all time, presenting his findings as 'a scientific enquiry.'

After Price's death in 1948 his Borley files were made available to the Society for Psychical Research, three of whose members conducted a lengthy investigation. They showed that a rather different construction could be put on events at the rectory. Price's own conduct in the matter, it was suggested, was frequently not above suspicion.

Some people are now convinced that Borley never was haunted; others still believe in both Price and the haunting; and some while admitting that he

September 9-15

was unreliable claim that much happened at Borley which cannot be explained away.

The programme 'The Haunted Rectory' briefly reviews the tangled history of the Borley 'haunt' from its inception as a local legend to its present somewhat dubious celebrity.

G.O.S.: Monday 17.30 and 23.15; Wednesday 10.00

CHRISTIANS ACROSS FRONTIERS

THE World Council of Churches recently held its Central Committee Meeting in Hungary, the first time an international Christian meeting of this kind had been held in an iron-curtain country. In his talk, 'Christians Across Frontiers,' Cecil Northcott, who was present at the meeting will speak of its significance.

He will also describe other events of the summer in Europe which show that Christians still have fellowship across the frontiers which geographically and ideologically divide them

G.O.S.: Monday 19.00; Tuesday 23.15

Beth Boyd

Robert Harris

'CAESAR AND CLEOPATRA'

A SUB-TITLE of Bernard Shaw's preface to this play poses the question 'Better than Shakespeare?' He claims that the character of Julius Caesar as portrayed here is an improvement on Shakespeare's, and few would disagree. But he does not claim the power of writing better plays than Shakespeare.

In the scenes from Shaw's *Caesar and Cleopatra* to be presented in the General Overseas Service, Robert Harris plays the ageing Caesar, and Beth Boyd is the sixteen-year-old Cleopatra.

G.O.S.: Sunday 07.30; Monday 20.15; Friday 10.00

Servicemen in Cyprus will exchange greetings with their families in 'Link with Home' on Tuesday at 11.30

Mozart's visit to London in 1764 as an infant prodigy will be the subject of a musical programme devised by Lionel Salter on Thursday at 20.10

LAST NIGHT OF THE PROMS

ANOTHER successful eight weeks' season of music-making at the Royal Albert Hall, London, ends on Saturday. The orchestra will be the BBC Symphony Orchestra, conducted by Sir Malcolm Sargent and Basil Cameron, the joint conductors who have again borne the brunt of the arduous season.

The concert opens with Wagner's *Tannhäuser Overture*, conducted by Sir Malcolm, after which the rest of the first part of the programme is conducted by Basil Cameron. It consists of Saint-Saëns *Symphonic Poem: Le Rouet d'Omphale*; Franck's *Symphonic Variations for piano and orchestra* (in which the soloist is Eileen Joyce); and Sibelius's *Symphony No. 7 in C*.

The seventh symphony is regarded as the apex of Sibelius's profound symphonic thinking. Taut, spacious, and richly beautiful, it has a compelling power. It is in one movement.

G.O.S.: Saturday 18.30

Radio Theatre presents

'NO BAIL FOR THE JUDGE'

IT is an open secret—which is the most tantalising sort—that the pseudonym 'Henry Cecil' hides the identity of no less a personage than one of Her Majesty's judges.

Here Cecil has had the beguiling idea—which perhaps started as a nightmare—of a judge being himself arraigned before the bar of justice. Not that the idea is original: thrillers abound in which a respectable person finds himself confronted with seemingly irrefutable evidence of some dreadful crime supposedly committed during a fit of amnesia. Cecil's inspiration has been to turn it into a comedy-thriller.

Thus when Sir Edwin Prout is discovered under circumstances which strongly suggest that he killed Flossie French while suffering from loss of memory he is more worried about the legal precedent than his own future.

In fact, it is only the chance encounter of his daughter, Elizabeth, with an unusual young man named Ambrose Low that starts off a line of investigation offering a hope of fresh proof pointing to innocence. Naturally and properly it all culminates in a full-size court scene. PETER FORSTER

G.O.S.: Sunday 00.30 and 18.30

'I FLEW WITH BISMARCK'

HISTORIANS have long been puzzled over the mysterious connection between Bismarck and Dick Bentley. Bismarck, when closely questioned about Bentley, is reputed to have said, 'I think I fancy a little boiled fish about now.' What, it may be wondered, lay behind this enigmatic statement? Listeners may learn the answer—or they may not—by tuning in to the first of a series of Bentley reminiscences.

17.00 RADIO NEWSREEL

17.15 THE CHAMELEONS
 Directed by Ron Peters

17.30 THE HAUNTED RECTORY
 The late Harry Price after many years of investigation claimed that Borley Rectory was the best documented case of a haunted house on record. Since his death his presentation of the evidence has been strongly criticised. Whether or not the Rectory was haunted is still a matter of dispute. This programme reviews the evidence for and against and includes the voices of people who have first-hand experience of the story.
 Narrator, John Snagge
 Production by Joe Burroughs

Round and about Britain
with the BBC's mobile recording unit
To Hampton Court
- 13.40 Programme Parade
A preview of the week's programmes
with recorded extracts
- 13.45-14.00 The World of Science
A weekly survey
of the latest developments

ASIAN CLUB. Sir Geoffrey Vickers, v.c., the speaker at Sunday's meeting, worked in India for some time in his legal capacity, and found a great deal to interest him there. He admired particularly the Indian attitude to life and material possessions. He resigned from the National Coal Board in 1954, and now devotes his leisure time to the study of mental health and of cross-cultural problems.

BRIEF EXCURSION. Last year BBC microphones paid a successful visit to Hampton Court; the programme will be repeated on Saturday. The Palace was built by Cardinal Wolsey in the sixteenth century. It was given by him to Henry VIII, and was used as a royal residence until the time of George II. The State rooms are now open to the public and house valuable furniture and works of art.

THE WORLD OF SCIENCE. H. J. Grout, Deputy Head of the Reactor Division at Harwell, will give the second talk in this series on Saturday, and will speak about nuclear reactors. The first large atomic power station in the world to produce electricity on a commercial scale will be formally opened next October by Her Majesty the Queen at Calder Hall in the north of England. The talk will also include a description of the fast breeder reactor which is now under construction in the north of Scotland, and from which in theory it should be possible to extract energy equivalent to about 1,000,000 tons of coal per ton of uranium and thorium.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

LONDON CALLING

THE OVERSEAS JOURNAL OF THE BRITISH BROADCASTING CORPORATION

No. 880. PUBLISHED WEEKLY

PRICE SIXPENCE

SUBSCRIPTION 25s. A YEAR

BBC commentators will be at London Airport on Friday when Princess Margaret leaves for her second Commonwealth tour. Ian McCulloch is reporting the Princess's arrival at Mombasa where she is joining the Royal Yacht 'Britannia' for her journey by sea to the Colony of Mauritius. The General Overseas Service will broadcast reports by Patrick Smith covering the progress of the royal tour

EMITAPE

FOR RECORDING AT HOME ... OR IN THE STUDIO

WHEREVER it is, with EMITAPE you can be sure of obtaining the finest possible results...

for the professional... for the amateur... at home and abroad—in fact the world over

EMITAPE is the finest magnetic recording tape.

THE EMITAPE RANGE—

There are three types of EMITAPE—Emitape '77' is a special "Pen Tested" tape for professional application—'88' is a General Purpose tape and '99' is a special thin base tape for Long Play purposes. Emitape is wound on a variety of spool sizes which fit all standard, professional and

domestic tape recorders and provide for all possible magnetic recording requirements.

A RECOMMENDATION—

Emitape is used by people who know the recording business—“His Master’s Voice”, Columbia and Parlophone for recording world-famous artists and by broadcasting organisations throughout the world.

use **EMITAPE** for YOUR recordings

Lands rich in opportunity

Many generations of peaceful development have shaped in the British Caribbean an ideal area for business opportunities.

INDUSTRY has the advantages of abundant raw materials, ample labour resources and no language problem.

TRADE is bound to flourish in this domestic market of 3½ million people, which is on the doorsteps of North and South America, and well served by the world's air routes.

AGRICULTURE has a tremendous and assured potential backed throughout the Caribbean by the research of the Imperial College of Tropical Agriculture.

TOURISM, of course, is unrivalled.

Glenfield Control

IN HYDRO-ELECTRIC POWER PLANTS

After the dam is built there remains the need to control the impounded waters at the points where scour and compensation water are required to be discharged.

“Glenfield” Needle Valves combined with Jet Dispersers are performing this function on dams throughout the world.

Caribbean Horizon

WILLY RICHARDSON, after a 3,000-mile tour of the area, describes the background to a special series of programmes which he has written for the General Overseas Service about the British Caribbean on the eve of federation (see note on page 19)

IT took Christopher Columbus six years and four voyages to discover the islands of the West Indies. Today, thanks to the aeroplane, the islands are only hours apart. They are superb in appearance, and a traveller can take his pick of sights—the Blue Mountains in Jamaica, the twin-peaked Pitons in St. Lucia, Grand Etang, a lake in Grenada, the numberless rivers of Dominica, or a choice of beaches at Worthing in Barbados, Store Bay in Tobago, L'Anse La Roche in Carriacou, and Ocho Rios on the north coast of Jamaica.

An historian might be haunted by many ghosts as he stands behind the cannon of Brimstone Hill in St. Kitts or looks at Regency houses surrounding a square in Basse Terre where slaves were once bought and sold, or strolls through the house at English Harbour in Antigua where Lord Nelson lived. Or he might be touched to meet the last survivors of the Carib race, living in the fastnesses of St. Vincent and Dominica.

The different races who live in the West Indies have managed to evolve an admirable tolerance of each other, and intermarriage is gradually showing a solution to the problems of a plural society. At all levels, efforts are being made to break down those barriers which prevent the various sections of a society from associating in creative effort to their mutual benefit.

There are many difficulties with which the area has to contend. Some of them are caused by the nature of the islands themselves. Most of them are small, with limited resources and comparatively large populations. All of them share a history of monoculture, and today sugar still plays a dominant part in their economy. The presence of minerals in the larger islands has tended somewhat to redress the balance, but it will take a great deal of effort before the islands get within a measurable distance of self-sufficiency.

At present, each island is carrying out a programme designed to raise the productive level, to provide jobs for the people and maintain decent standards of living. One method being used is the establishment of industries in the large islands and the encouragement of alternative crops in the smaller ones. For instance, in Antigua progress is being made in cotton-growing, and bananas are making up for the serious decline of the lime industry in Dominica.

Everywhere hopes are expressed that more tourists will visit the islands. So far, however, tourists have shown an inclination to visit only those islands which have first-class hotels and which make a determined effort to attract them

and cater for their needs. One drawback is that tourism, like sugar, is a seasonal industry, as well as being subject to sudden variations in taste. So there is no easy, ready-made solution to the problems of the West Indies.

Since the war many West Indians, aware of higher standards of living in metropolitan areas, have been taking every available opportunity to migrate. Many of those who are leaving are unemployed but there are others whose departure leaves a gap that cannot be easily bridged. In the recent exodus there have been teachers, policemen, and skilled workers who cannot be immediately replaced.

Strangely enough this mass migration coincides with an increase of national sentiment. The currency of the word 'West Indian' has an enhanced value throughout the islands. This, no doubt, is due in some degree to the amount of recognition which West Indians have been winning for themselves in such places of entertainment as Lord's and the Palladium. But it is due in even greater measure to the efforts that are being made in the West Indies to accept the challenge of their daily lives seriously and soberly. A visit to the Legislative Assembly in Barbados will convince anyone that West Indians can conduct their public affairs with as much efficiency and decorum as can be found anywhere.

Even more stimulating is the University College of the West Indies, situated among the Mona Hills in Jamaica. It is the biggest attempt so far to bring West Indians together for a period of years, to share their problems, to see them in relation to the vaster problems of mankind, and to work out a solution which may not be immediately accepted but which will certainly influence the future of the region.

In all this the West Indies has been helped by the Government of the United Kingdom. For sixteen years the Development and Welfare Organisation in Barbados has been handing out grants to the various islands and providing advice in the undertaking of several projects. More recently a Regional Economic Committee has been formed in the hope that the potential of the islands will be fully exploited and that opportunities for investment will be provided for overseas capital.

The most difficult job in the near future may be avoiding duplication of industries in each island which might lead to a self-destructive internal competition for markets, and in this respect a great deal of restraint will have to be shown by the unit governments of the Federation. Care will have to be taken, too, to avoid those social ills which unplanned industrialism can so easily breed.

As far as federation is concerned, it is easy to assess current interest by comparing West Indian newspapers with what they were, say, twenty years ago. More space is being devoted to each other's affairs—even the most insular are becoming aware that they have signed on as crew in the same ship of state.

Each man who journeys through the West Indies embarks on a search. A geographer, like Columbus, searches for a new world. A poet, like Raleigh, searches for a golden image. Today three million West Indians are searching—trying to discover themselves.

SIR HILARY BLOOD

One of the decisions of the London conference on British Caribbean federation was that federal elections should be held in the first quarter of 1958. The interim federal machinery that has to be put into operation is here outlined by a former Governor of Barbados, SIR HILARY BLOOD

The Wheels Begin To Turn

THE delegates to the British Caribbean Federation Conference which met last in February summed up the results of their work in this way. They expressed unanimous agreement that the countries concerned—that is, Jamaica, the Leeward Islands, the Windward Islands, Barbados, and Trinidad—should be bound together in federation; and the delegates went on to declare an earnest wish that the Secretary of State for the Colonies should introduce a Bill accordingly. On this happy and practical note the conference closed. Now what has, in fact, happened up to date as regards West Indian federation, and what has still to happen before federation is an accomplished fact? In the first place, the delegates have now settled all the major issues relating to the constitution; they have agreed on the form of the federation and on the powers of the Federal Government. Let us look at these constitutional proposals. The preamble to the constitution is to contain three 'recitals,' that is three statements of fundamental aims which the federation is to pursue.

Freedom of Movement, Worship, and Trade

These recitals relate to freedom of movement for persons and goods within the federation; to the continued enjoyment by all persons in the federation of the free exercise of their respective modes of religious worship; and, thirdly, as essential to the economic strength of the area, that there should be an integrated trade policy and a customs union including internal free trade.

The federal legislature is to consist of a Governor-General, a Senate, and a House of Representatives. The Governor-General represents H.M. the Queen and exercises the executive power of the federation on her behalf. The Senate—the upper house of the legislature—is to consist of nineteen members appointed for five years by the Governor-General after consultation with unit governors, one member in respect of Montserrat and two in respect of each of the other units.

The House of Representatives is to consist of forty-five members allocated among the units on a population basis and elected in accordance with an electoral law to be passed by the Federal Government. As an interim measure the first general election will be held on the basis of existing electoral law in force in the units. The Senate will elect its own President and the House of Representatives its own Speaker. Relationships between the two Houses are regulated on lines similar to those in Britain.

Now let us look at a very important part of the constitutional arrangements: the division of powers between the unit governments and the Federal Government. This is perhaps the crux of the whole concept of West Indian federation. It is, or was, a highly contentious matter, and the agreed division of power has been reached only as a result of compromise and patient negotiation. It represents the highest common factor of agreement. But, as the Secretary of State observed, the result is that the powers of the Federal Government will not at the outset be very strong nor its field of activity large.

Exclusive Legislative List

In effect the Federal Government takes exclusive power to deal only with matters which affect the very existence of the federation: defence, exchange control, immigration and emigration, federal law, federal public services, federal elections, federal revenues and so on, and the provision of federal agencies for advisory and similar services. Matters such as these on which the Federal Government alone can legislate are contained in what is called an Exclusive Legislative List. There is also a much longer list of subjects—the Concurrent Legislative List—on which either the Federal Government or the units may legislate, but if there is federal legislation it automatically prevails.

Now consider the federal executive. As I have said, the Governor-General is to exercise on behalf of Her Majesty the executive power of the federation, either directly or through his subordinate officers. In the exercise of this power he is to be advised by a Council of State, and he is to act in accordance with the advice of this council save in certain strictly defined circumstances. The Council of State is to consist of the Prime Minister—a person elected from among its own members by the House of Representatives; seven persons from one or other chamber of the legislature, nominated for appointment by the Prime Minister; and three members of the Federal Senate appointed by the Governor-General in council. In addition, as an initial arrangement only, the Governor-General will nominate three officials who have the right to attend Council meetings and to take part in the discussions.

As regards judicial arrangements, there is to be a Federal Supreme Court, and such other federal courts, or courts invested with federal

jurisdiction, as the legislature may decide. The Federal Supreme Court will have original and appellate jurisdiction. Finally, as regards finance, federal revenues will during the first five years be derived from the profits on the currency issue and from a mandatory levy on unit governments, calculated in accordance with precise instructions, less any sum raised from customs and excise duties which the Federal Government will be given power to levy.

This, then, is the nature of the federation into which British Caribbean territories—with the exception, at present, of British Honduras and British Guiana—have unanimously agreed to be bound: this, very briefly, is the federal constitution which they wish Her Majesty's Government in the United Kingdom to create. But though this is the heart of the matter it is by no means the end of the affair. The whole panoply of federation will not fall complete from heaven like a ripe nutmeg off a tree in Grenada—if, indeed, last year's hurricane has left any trees. Indeed, if the federal nutmeg did so fall it could not land because the site for the federal capital has not yet been selected. No, there is much work to be done during this interim period leading up to the federal elections which are to be held early in 1958.

Although major issues relating to the federal constitution have been settled there are still minor constitutional points on which decisions have to be taken. For example, the Commissioner who last summer reported on the work and staffing of the Federal Supreme Court has raised various matters.

The Civil Service and the Fiscal Commissioners also raised points which have to be dealt with. And, no doubt, as he works on the final draft of the constitution, which it is hoped will be ready towards the end of this year, the legal draftsman in London will throw up a number of points of detail requiring decisions. Then there is also much administrative work to be done, both before the appointment of the Governor-General and between his appointment and the first federal elections, to ensure that when the elections have been held there will be in existence an administrative machine to carry out the business of the Federal Government.

Aspects of Pre-Federal Planning

As Civil Service Commissioner last year I was largely concerned with this aspect of pre-federal planning, and a job already interesting was made quite fascinating by the need to try to probe into the minds of the yet unknown federal ministers and to imagine how they would envisage their tasks. There were naturally certain fundamental matters in connection with the future federal civil service obvious from the start. For example, the need to offer conditions of service in the administrative grades which would attract the best West Indian brains from all over the Caribbean; arrangements whereby the smaller islands could have their share in staffing the federal headquarters, either immediately or after suitable training.

But it was not so easy when we began to consider the strength of the staff required, the number of permanent secretaries and assistant secretaries, and so on. You see, before you can work out details of that nature you must have some clear idea of the size of the administrative machine: its size depends on the amount of work it is given to do, and that in turn depends on what the Federal Government is going to take on and deal with in its offices and departments. And here we ran into difficulties.

We knew that the Federal Government would be concerned with matters arising from the constitution and federal set-up, and we knew that it would be concerned with subjects in the Exclusive Legislative List; but how many of the subjects in the Concurrent List it might wish to deal with was a matter of surmise. Also we could only guess at the extent to which the Federal Government might wish to take on development and welfare advisory work, or be interested in other such matters without actually engaging in legislation. So on a very hypothetical basis we had to devise a possible framework for the federal offices and departments.

Then there was the problem, or rather a whole set of problems, set for the Fiscal Commissioner and myself by the lack of decision on the location of the federal headquarters. This question of the capital is so thorny and contentious that even the London conference fought shy of it in the end and decided that the matter should be enquired into by a fact-finding commission.

For all this work—constitutional and administrative—post-conference machinery has been devised: cumbersome machinery, I fear, made necessary again by the requirements of compromise. The delegations to the recent London conference are to continue as a standing body to be known as the Standing Federation Committee. It will have as its chairman the Comptroller for Development and Welfare in Barbados—that is, until the Governor-General is appointed. After that it is thought that the committee will continue as an advisory body to the Governor-General until the elections take place and the Federal Government comes into being. King Feisal at Buckingham Palace with H.M. the Queen, H.R.H. the Duke of Edinburgh, and (on the left) King Feisal's uncle, Crown Prince Abdul Illah. (Right) The procession to the palace after passing through Admiralty Arch

King Feisal of Iraq

STEWART PEROWNE, former Oriental Counsellor at the British Embassy in Baghdad, talks of the character and career of the young King whose recent State Visit reaffirmed the bonds of alliance and friendship which unite his country with Great Britain

KING FEISAL is only twenty-one, but he is an old friend of Britain and of our Queen, and he represents one of the world's oldest dynasties. Britain's relations with what is now Iraq, both political and commercial, go back to the eighteenth century. After the first war Iraq, formerly part of the Ottoman Empire, became a kingdom. For a few brief years it was under a British Mandate but in 1930 it became an independent sovereign state. Its ruler was King Feisal I, the brilliant son of King Hussein of the Hejaz, who had sponsored the Arab revolt against the Turks.

King Feisal II is a grandson of King Feisal I; he is an only child. When he was not quite four his father King Ghazi was killed in a motor accident. His mother Queen Aliya—now, alas, also dead—was a wonderful woman. With her brother Prince Abdul Illah, who became regent for the infant king, she saw to it that her son should be trained for his great position. Never had a king a better mother and uncle, nor a kingdom a more single-minded regent.

After the war King Feisal, who already spoke fluent English, came to Britain and like his father before him went to Harrow, where he proudly sported his father's straw hat. At the age of eighteen, in May, 1953, he came of age, constitutionally speaking, and his assumption of power was celebrated by magnificent ceremonies in Baghdad. Among the guests, who included princes and ambassadors from many lands, were five Harrovians, school-friends of the King: it was a happy thought, typical of their host.

At twenty-one King Feisal is exceptionally able and cultivated: he takes an interest in everything from politics to painting, and is a painter himself. Despite a congenital shyness, which he has largely overcome, he is affable and has a bubbling sense of humour.

Cadets formed a guard of honour when the King visited his old school, Harrow

King Feisal replying to the toast of his health at a luncheon given in his honour at Guildhall by the Lord Mayor and Corporation of London

Iraq is now very rich, and is becoming richer. It is using its oil revenues—already about £80-million a year and still rising—on great schemes for the benefit of the whole country. But Iraq is vulnerable: it has an area three times that of the United Kingdom, with only a tenth of our population; of all Arab lands it is nearest to Russia. It was Iraqis who led the original Arab revolt; it was Iraq which sponsored the Arab League: Iraq has always taken, and will always take, a leading part in any truly Arab movement.

But just because Iraq is so Arab, Iraq is independent. Its policy must spring from within, not be dictated from without. Hence the Baghdad Pact, which was designed primarily by Iraq for Iraq. Others might join, and Iraq is glad that Britain has done so, because Iraq looks to the West and desires the support of the West.

The Iraqis are good friends of Britain: we have common interests; we like each other. So this State Visit not only renewed a personal association between two royal houses which goes back three generations, but was the symbol of a deep and growing friendship between the ordinary folk of Iraq and Britain. (Broadcast in the BBC's Overseas Services)

Iraq: 'Model Oil State of the Middle East'

Iraq's oil revenues already add up to £80-million a year, and seventy per cent. of the money is handed over to an independent board for capital development

IRAQ is rapidly acquiring a reputation of being the model oil-state of the Middle East: it is certainly using its oil revenues in an entirely different way from its neighbours. In Iraq most of the money paid over in royalties by the oil company is moved straight into a development fund, and from there it is supposed to flow out into a great variety of projects that will greatly increase the productive power of the country over the next few years. But having the money available is only the beginning of the answer to the problem of development, as the experience of half a dozen under-developed countries has shown in the past few years: it is a much more difficult problem than is generally imagined to deploy these resources most effectively so as to raise the production of things that you really want.

In fact, one of the main lessons which Asia has learnt in these past few years is that economic planning is an exceedingly difficult art. Now it was with this realisation in mind, no doubt, that the Iraqi Government invited Lord Salter, formerly Minister of State for Economic Affairs in the British Government, to prepare a new five-year plan of development for it. 'First of all, Lord Salter, what is it that allows Iraq to succeed where the other Middle Eastern states seem to be failing?'

Fortunate in Comparison with its Neighbours

'There are, of course, certain natural factors and certain human factors, both of which have to be taken into account in answering your question. In some respects Iraq has been particularly fortunate in comparison, for example, with its neighbours.

'If you take countries like the Lebanon or Syria or Jordan you find that they would have substantial opportunities for economic development, but they have not got the capital resources required to secure that development. On the other hand, if you take countries like Saudi Arabia or Kuwait, which have immense oil revenues, they have not opportunities for economic development at all like those of Iraq. In addition, of course, Iraq is not troubled, as a country like Egypt is, with an enormous surplus, or potentially surplus, population. That is a very rare combination, and when you take in conjunction with that the fact that you have a great mass of alluvial soil between the two great rivers—the Tigris and Euphrates—you have very considerable natural advantages.'

LORD SALTER, a former Minister of State for Economic Affairs in the British Government, is the author of Iraq's new five-year development plan, and in this interview with Andrew Shonfield he discusses the unusual advantages which enable the country to use its oil wealth to raise the standard of living of its people

Rashid Street is the principal thoroughfare in Baghdad, the thriving capital city where more than a sixth of the country's five million people live

'What are these special opportunities that you mentioned that Iraq had and the others didn't have for development?'

'Above all the agricultural development. You have this great mass of potentially fertile alluvial soil, subject only to proper irrigation and drainage, and then you have, with the water supplied by these two great rivers, also the opportunities for irrigation. But having emphasised the natural advantages by comparison with those of her neighbours it would be unfair not to recognise the human wisdom and skill which has made use of those natural advantages.

'For example, the rulers of Iraq have had the wisdom to set up an independent development agency—the Development Board—members of which have a tenure independent of changing governments, and to provide by law that no less than seventy per cent. of the oil revenues—which themselves amount to a great deal more than the total ordinary taxation receipts of the state—should be handed over to this board for capital development purposes. Now I am not going to suggest that all is perfect in Iraq—there are many administrative deficiencies which it is very important to cure—but by comparison with their neighbours it is well to recognise the wisdom and prudence of a good deal of her policy.'

'So far they are going ahead well, but this is, after all, only the elementary stage in development: what is to prevent them from coming up against another obstacle, which is excessive rises in costs?'

'Undoubtedly there is great danger of inflation and rises in costs, but a good deal can be done, if not to prevent that altogether, to mitigate the trouble. Let us just look at how it arises. You have a large amount of money becoming available, let us say, for building dams, for making irrigation canals, and so on. You let out contracts to people to do that work. Directly they begin to get on to the work they have to employ labour on the spot. Several of them come in, they compete for the labour, and, of course, they're drawing upon the same labour that has previously been employed by other people elsewhere.'

Emir Feisal, who became the first King of Iraq in 1921

Two barrages, one over the Euphrates and one over the Tigris (right), were recently opened by King Feisal in schemes to irrigate potentially fertile areas

'At once, naturally, labour costs go up a good deal—labour wages. But what do they want their wages for? They want to buy things, food and clothing and all the rest of it. The supply of those is not immediately increased, consequently the cost goes up; as people have more to spend and no more to buy, the costs go up. They don't get any particular advantage, therefore, out of their higher wages, and the people who are not having higher wages are, of course, very greatly hurt.

'On the other hand, you can do a good deal to stop that.' First of all, you can take care so to space and to place your contracts, and therefore your demands for labour, that you don't put too much upon one particular region. Secondly, anticipating that there will be a demand for more goods to buy, you can take care to see that more goods are imported from abroad. Fortunately Iraq has this advantage: she has what economists call a positive balance of payments; that is to say, she's selling more abroad than she's buying from abroad, and therefore she could afford to import more clothes and all the things that people are likely to buy when they get their extra wages. And those two measures, carefully planned and carefully executed, could do a good deal to prevent anything like a run-away inflation.'

A Margin of Exports over Imports

'What you're suggesting is a little unusual. Lord Salter: usually people go for capital goods to the exclusion of the other.'

'I know; but people think of inflation, for example, in a country like Britain. Now the trouble here is that we're always on the edge of buying more from abroad than we're selling abroad, and therefore we have to be very careful about importing more. But our basic fuel is coal, which we used to export, and now have to import. It is quite different with Iraq, Iraq's basic fuel is oil; she consumes comparatively little at home; she exports it; she has therefore got a margin of what she is selling abroad to use to pay for what she is importing, and can import in greater quantities.'

'Lord Salter, in your report you postulate a rate of growth of the Iraq economy, a doubling of the standard of living in a generation. In a way that looks as if it might be altogether too modest: can't they speed the process up a bit more than that?'

'Nobody can tell just how quickly it will go, because while the extent of an increase in a standard of living depends upon your opportunities of development and the capital available, the pace at which you do it depends really upon human factors. What human skill have you available? How rapidly can you increase it? How far can you move people from one job to another, from one place to another? How can you provide all the complicated administrative machinery that is required to get your best results out of the new opportunities that are developing? Now it's anybody's hunch how quickly that will go.'

'It is a problem, is it, of administrative talent, in the widest sense?'

'It is administrative efficiency and talent. It is an extraordinarily difficult thing to have a system of government machinery, in a country in which administration has naturally been on a rather moderate and limited scale for a long time past, to take advantage of these great new opportunities. For example, it's quite easy to spend, say, forty million pounds or so on building a dam, but when you come to using the water that dam provides to irrigate, to drain, to increase the fertility of new land, then you have to select your settlers for the new land; you have to see that they're properly trained, that they're provided with finance, with equipment, that the public services are available: that means skilled, competent, persistent administration on a very big scale and of a very difficult kind, and that is the kind of thing that limits the real growth of the standard of living.'

Bringing water through irrigation ditches is only a first step in creating new farmlands: settlers must be found, and housed, trained, and equipped

'And what about the suggestion that one of the difficulties of Iraq is that it is under-populated?'

'Undoubtedly you want more men to secure the full increase in economic strength of which the country is capable. It isn't just men at this stage: it is skilled men, available where they're wanted and able to do the work that is wanted. There is a good deal of available labour though not from a pool of unemployed; you don't have large pools of unemployed, but you have a very considerable number of people who are under-employed. You have people, for example, who work on the land for perhaps half their time. You can use them to do work, let us say, on making irrigation canals in the neighbourhood of the land which they're tilling. For a long time you can draw some labour in that way. On the other hand, it would be a good thing, too, if as shortages of labour develop there was easy and free opportunity for people from neighbouring lands to come in and supplement the local labour to meet this demand.'

'That brings one straight on to the central problem of the Arab world at the moment—the Arab refugees. This presumably offers a big opportunity in the long run for absorbing such people?'

'I would rather like to think of that in terms not of a big plan of large-scale immigration but of opportunities for permitted infiltration; not as a question of principle but as a matter of practical convenience as demand actually occurs.' (Broadcast in the BBC's General Overseas Service)

SIR HAROLD NICOLSON, in his contribution to the current G.O.S. series, 'The Story of Colonisation,' draws the contrast between military imperialism under which the conquerors took more than they gave, and colonial settlement under which the settlers gave more than they took

SIR HAROLD NICOLSON

Early 'Imperialists'

WHEN I was a boy such words as 'empire' or 'colonies' aroused feelings of pleasure and pride: today they have been distorted into 'imperialism' and 'colonialism' and are intended to provoke displeasure and shame. This change of meanings furnishes an interesting example of the effect of propaganda on untrained minds. A moment's reflection should convince us that there are as many differing types of colonialism as there are of government, and that some can reasonably be defined as good and others as bad.

Colonisation has always been a natural process. Human beings in the same way as ants or bees are, as Professor Cyril Philips has pointed out, 'essentially colonising animals.' Even in prehistoric times colonies tended to fall into two main categories, each containing several variants and sub-divisions. The first category could come under the general heading of predatory conquests. The second category could be defined as the spread of civilisation.

Empires of the First and Second Millennia

If the conquering race possessed standards of civilisation higher than those of the conquered race, and if the conquest lasted long enough for these standards to be inculcated and absorbed, then much benefit resulted. But if, as Bertrand Russell has pointed out, the conquerors were less civilised than the conquered, or were only aiming at seizing loot and capturing slaves, then the event proved unfortunate for mankind. Thus the Roman conquest of western Europe was an excellent development of the benefits of which we, the conquered, are still conscious today: whereas the capture of Rome by the barbarians was a long misfortune which disturbed the order and dimmed the intelligence of western man for close on a thousand years.

In this survey of early 'imperialists' I shall draw attention to the contrast between military imperialism under which the conquerors took more than they gave, and colonial settlement under which the settlers gave more than they took. The former were grandiose, predatory raids, differing in extent and duration only from the cattle-stealing of our tribal ancestors. The latter were essentially pacific and pacifying settlements, furthering the spread of civilisation.

The vast if transitory empires created during the second and first millennia before Christ by the Egyptians, the Chaldeans, the Assyrians, and the Persians were essentially the results of the struggle for power between rival dynasties. Peoples were subjugated and provinces annexed for the main purpose of securing strategic frontiers and increased wealth and manpower. There was no idea of colonisation in the later meaning of that term. The Assyrians went so far as to adopt the ruthless method of transferring whole populations from one conquered province to another; as we know, Tiglath-Pileser III transported the Israelites as well as many other conquered tribes from their homeland to Mesopotamia. This system did not prove remunerative, and it was not on any similar scale repeated until the twentieth century A.D.

How the Ancient Empires Disintegrated

These ancient empires eventually disintegrated owing mainly to internal disruption. The lack of any means of rapid communication rendered impossible the establishment of centralised authority. Thus when the great Cyrus in 550 B.C. subjugated the Medes and founded the Persian empire he and his successors found it impossible to administer the provinces from Ecbatana or Persepolis. They were obliged to rule their dominions as satrapies under viceroys: centrifugal tendencies developed increasingly until the empire fell an easy prey to Alexander.

The Persians, moreover, never managed to create in their empire any sense of community of interest. They regarded trade (that great lubricant of intercourse) as a degrading occupation and went so far as to forbid the presence of shops in their cities, with the result that trade was carried on in suburban markets and never entered closely into the life of the population as a whole.

They ruled wholly by the sword, and thus when once their military power ceased to be irresistible and inevitable the whole edifice collapsed without leaving behind it much more than huge mud walls.

The glamour of Alexander the Great's tremendous adventure has obscured the fact that it also was a war of conquest and not a system of colonisation. The more remote provinces which he subjugated did not, under the rule of his successors, long survive. Yet so potent was the Greek influence which in the wake of his army he spread from the Bosphorus to the Indus, that traces of it lingered for centuries in northern India, and a lasting type of civilisation (half Asian, half Greek)

was created in the delta of the Nile. As an example of military imperialism the imperialism of Alexander has been surpassed only by the immense civilising mission of Rome.

I now pass to the second category, from imperialism by conquest to colonialism proper, and I must begin by that amazing Semitic people, the Phoenicians of Tyre and Carthage. On the collapse of Minoan dominance in the twelfth century B.C. the Phoenicians of Sidon and Tyre became the masters of the Aegean sea and eventually of the Mediterranean. They established trade depots or settlements in Cyprus, in the Greek islands, and even on the isthmus of Corinth.

From there they spread to Heraclea in Sicily, along the whole northern coast of Africa, to Malta, to Sardinia, and eventually to Cadiz and Tartessus in south-western Spain. They became the middlemen for the whole caravan trade from the East; they traded in amber from the Baltic and in tin from the Scilly Isles; they exported their own dyes, their wool, their glass, their textiles, and their metal ware. They became immensely rich.

When Tyre after a protracted siege was captured by Alexander the Great, the Phoenician colony of Carthage, which had been founded some 450 years previously by Queen Dido, assumed and extended the Phoenician leadership. Carthage occupied Sicily, Sardinia, and the Balearic Islands. She established trading posts in west Africa, and planted settlements in Madeira and the Canaries. She exploited the Spanish silver mines at Huelva, Osea, and Cartagena. She sought to establish a monopoly of trade in the Mediterranean basin, kept her geographical discoveries wholly secret, and would capture and sink any foreign vessel found between Sardinia and the straits of Gibraltar.

This policy provoked the three wars with Rome, and led to her final destruction in the third Punic war in 146 B.C. The Phoenician colonies were self-governing and united to their mother cities of Sidon, Tyre, or Carthage by sentimental and religious ties alone. Unlike the great military empires which I first considered they were peacefully acquired and exercised a pacifying influence in the territories where they happened to be situated.

Colonies of the Greek City States

The colonies sent out by the Greek city-states were of immense antiquity. Cumae in southern Italy claimed to have been founded 1,100 years before Christ, and it was from Cumae that the area of Naples was settled. The prosperous colonies of Tarentum, Sybaris, Locri, and Rhegium date from the eighth century B.C. In 734 the Dorians of Corinth founded the mighty city of Syracuse, in 630 colonists from Thera crossed to north Africa and built Cyrene; and in 600 the Phocceans established themselves at Marseilles. Meanwhile colonists from Miletus had entered the Black Sea where they established as many as nine overseas settlements, and in 685 and 658 the Megarans created across the entry to the Bosphorus the two great cities of Chalcedon and Byzantium.

The main reason for the despatch of these colonies from the parent hive was pressure of population: a prosperous Greek city-state doubled its native population every few years, and their own fields and olive groves proved insufficient. A further cause was party strife: when the aristocrats gained the upper hand they would often dispose of the labour opposition by shipping them overseas. These displaced persons would land in some distant uninhabited harbour and immediately start trading with, and therefore civilising, the neighbouring barbarian tribes. The profits were quick and large. When in 600 B.C. Kolaos of Samos was blown by the east gale through the straits of Gibraltar and sold his Samian pottery at Cadiz in return for Iberian silver he made a profit by this single voyage of £150,000.

The Greek colonies, like the Phoenicians, were self-governing. They brought with them the Greek language, Greek culture, a sentimental affection for their parent city, and a common reverence for the religious and athletic rites of the Hellenic world. The systems of government which they established varied according to local conditions from tyranny to democracy. They directed their own foreign policy and contracted alliances among each other for purposes of defence. Athens alone among the Greek cities established garrisons, or cleruchies, which were maintained by armed forces. The other Greek colonies were founded and maintained with the consent of the local barbarians and their prosperity became a mutual advantage. The existence of these outposts of civilisation was of incalculable value to human progress. In them, as in the British Commonwealth system, we see colonialism at its most humane and reasonable, and therefore at its best. (*Broadcast in the BBC's General Overseas Service*)

The Antique Dealers' Fair

CYRIL RAY goes to Grosvenor House, London, where each year at the height of the season ninety of the leading antique dealers in Britain exhibit some of the treasures they have for sale. 'It is like a great museum of the fine arts and the domestic arts,' he says, 'and everything in it is carefully hand-picked for authenticity'

EVERY year in summer—somewhere between the Chelsea Flower Show and the Eton-Harrow cricket match at Lord's, so that it is one of the events of the London season—about ninety of Britain's leading dealers get together in the great ballroom of a hotel in Park Lane for the Antique Dealers' Fair. If there is anybody who still thinks of an antique shop as a sort of dusty cave of delightful muddle I would like to take him to the balcony overlooking the fair to see the ordered array of gleaming elegance: cut glass of the eighteenth century throwing off a thousand twinkling little stars of light; the rich colours of Dutch paintings and the gay colours of German porcelain; the gloss and the gleam on walnut and mahogany and satinwood furniture.

It is like a great museum of the fine arts and the domestic arts, and everything in it is at least as carefully hand-picked for authenticity as if it were in fact in a museum. Because these are the leading dealers in Britain, and it is more than their reputation and their livelihood—it is their whole attitude to life—that depends on Britain's reputation as the world centre of the trade in antiques and works of art, a reputation that dates back to the time when eighteenth-century English noblemen making the Grand Tour brought back works of art from Italy and France, and nourished since then by the scholarship and the integrity of the great London auction-rooms—Christie's and Sotheby's—and of the dealers.

So the fair is almost like a club, a self-governing organisation to which a dealer only belongs by invitation—and by the invitation of his business colleagues and rivals, who will not ask him to come in unless they are confident that he will not let the trade down. Once he is accepted, the dealer has to agree that everything he exhibits is for sale, that it was made before 1830—that is the date that has been decided on as the dividing line between the age of hand crafts and the age of the machine—and he has to submit every single item, down to the last tiny silver teaspoon, to the critical examination of those same sharp-eyed business rivals; you can imagine that they do not let each other down lightly.

The Examining Committees at Work

The dealers elect from among themselves sixteen examining committees—one for paintings, one for glass, one for silver, and so on—and for a whole day before the fair opens, and every morning after that, as new pieces are put on show to replace those that have been sold, these committees are going round—each dealer dropping out in turn as the examination reaches his own stand—vetting every piece on show. I was there the day before this year's fair opened, and I saw the committee on European porcelain, some of them with magnifying glasses, critically examining glazes and texture and factory marks, and stroking their chins and looking wise; and I saw the furniture committee turning a table upside down and peering into the corners with electric torches to make quite sure that it was the Chippendale piece that it claimed to be.

I have known this happen at the fair: a table was rejected, and the dealer asked to remove it from his stand, because it was what is called a married piece. The top was all right, a fine piece of Georgian mahogany; and the legs were all right, beautifully carved Chippendale legs; but the top and the legs had not always belonged to each other: it

was the top of one table and the legs of another joined together at a later date than the whole table purported to be, and the join was spotted as being perhaps a Victorian piece of work.

As usual, and very naturally and properly, the great wealth of the fair was in the eighteenth-century English craftsmanship on view. Hepplewhite furniture, for instance, and Georgian silver, Waterford glass and Chelsea porcelain, all the product of that golden age of English design and workmanship that stretches from Queen Anne almost to the accession of Queen Victoria—the whole of the eighteenth century and a bit over. But there was French furniture, too, and porcelain from Meissen and Nymphenburg, and Italian bronzes and maiolica, and Russian silver, and Chinese jades and Austrian enamels, to say nothing of pieces that were not so much antiques as antiquities: an Egyptian bronze bowl, for instance, that was more than 5,000 years old, and one from the China of more than 3,000 years ago.

Rare Pieces and High Prices

When pieces are as rare as that the prices are correspondingly high. I did not ask what you would have to pay, for instance, for the gold communion cup given by Catherine the Great to a convent in St. Petersburg—the gold studded with 1,350 big diamonds and with so many small ones that nobody has bothered to count them.

When you see piece after piece as splendid and as rare as these you understand how some people have come to estimate the value of what is shown at the fair as getting into the matter not of hundreds of thousands but of millions of pounds. There was one piece alone—a Spanish diamond and emerald ornament—so rare and with such magnificent jewels, that it is valued at £12,000.

On the other hand, though, I have handled Georgian silver caddy-spoons, beautifully made, in perfect condition, and just as carefully authenticated as anything else at the fair, that cost as little as fifty shillings; Georgian silver wine-labels—those pretty trinkets that say 'Port' or 'Sherry,' hanging from the neck of a decanter—for thirty shillings; and tiny ivory boxes mounted with gold, each with a little mirror in the lid—boxes that eighteenth-century ladies kept their beauty patches in—marked at as little as two and three guineas.

So there is something at the fair for almost everybody to buy. But during the couple of weeks that it is on, thousands of people go just to look, and well they might, because although it is like a museum it is the only museum where you can pick things up, and handle them, and get the man in charge to tell you their story.

For curiosity, there was the gold tie-pin that has as its ornamental top a miniature of one eye of the beautiful Princess Amelia, the daughter of the Duke of York—very beautiful, they say, but somehow I do not fancy it; and for combined pathos and craftsmanship, the smallest known example of the models that the French prisoners-of-war used to make—the prisoners the British took in the Napoleonic wars: a seventy-four-gun ship of the line carved from wood—rigging, masts, guns, and hull—less than two inches long, less than two inches high, and a quarter of an inch wide. (Broadcast in the BBC's General Overseas Service)

OUR WAY OF LIFE: 9

Bringing Up the Children

MARGHANITA LASKI, author and journalist, considers some of the special difficulties faced by English parents—in particular those that belong to the professional middle classes—in this age of transition

TO be a good parent has never been easy, and every period in history has its own peculiar difficulties. What I want to talk about are the special difficulties that confront English parents in the time we are living in now, and especially those parents who like myself belong to the professional middle classes. For people of my age, with children in their early teens, the present period seems very much a time of transition, and though we hope that what we are moving into may be as good as, if not better than, what we have had before, to know how to prepare our children for it often seems very very difficult.

To start right in with one of the most important problems we face, there is the problem of our children's futures, of what they are going to be when they grow up. I belong, as I have said, to the professional middle class, and that means that most of the people I know best are in the kind of work where the service you give is counted as more important than the money you get: we are writers and artists and teachers, doctors and lawyers and civil servants. When we—the people of my generation—took up these careers, we knew that the money we would get would have no particular relation to the work we put in; but we did have reason to suppose that the money we would get would be sufficient to lead a decent, modestly civilised life.

This is hardly true any more. Compared with the rest of the community, the standard of living of professional people is steadily going down. If the rewards at the top are adequate, for the professional rank and file, the moral and cultural backbone of the community, they are not. The rewards are not sufficient to support even that most modestly civilised life we must lead if the new generation is to be trained to carry on with a way of living and working that we believe to be truly valuable.

So here is our major problem. Are we to encourage our children to choose professional careers, or ought we to turn them to other ways of life which are more profitable financially if spiritually less valuable? 'But', you may say, 'surely the rewards people expect from their work depend on the way they're brought up? Surely a home with the right values can teach children that spiritual rewards are more important than financial ones?' But, you see, another of the problems of parents in our time is that no matter what the values of the home outside influences are becoming increasingly more potent. We have to face the fact that we are steadily becoming a mass-production, mass-communication society: its values are not those of the professional middle classes.

For mass-production has to be matched by mass-consumption, and the organs of mass-communication play their part in ensuring that this is so—indeed, sometimes I think this is their main function. Directly or indirectly pressure is constantly put on all of us, adults and children alike, to believe that happiness is attained by buying goods and services. We few who do not believe that this is the way to happiness cannot cut ourselves off from the rest of the community. We cannot reasonably expect our children to grow up to be the only group in the community that lives without television and motor cars and holidays abroad, without new clothes and new furniture, constantly renewed. We may be able to train our children not to expect to be rich but we can hardly train them to be eccentric.

Social Equality and Outward Conformity

In the past, of course, it would not have been eccentric for any group to have its own separate standards and forms of behaviour. But today we are pledged to social equality, and the particular way that social equality manifests itself in this transition stage is by outward conformity, by an outward ironing out of differences, good as well as bad. So to ask our children to stick to our particular ways would be to ask them to be eccentric. Yet somehow we must find an answer to the dilemma that professional life at the present time simply does not bring in enough money to lead what is now accepted as a normal life—and to professional people no other life brings sufficient rewards of a non-financial kind.

You will realise, of course, that the point of view I am putting before you is a minority one: if it were not, there would be no dilemma. But a community, like an individual, gets what it seeks in life, and we, having achieved a startling social revolution in the last few years, are at the moment determined to enjoy its tangible rewards in the shape of all that mass-communication and mass-production can bring. But if the services that professional people can give are for the moment under-valued, we may believe that this will not continue for long.

In the meantime we, as parents of the professional classes, must resolve our dilemma by clinging to what we value and to what we believe other people will come to value too. When our values are wanted they must be available. (*Broadcast in the BBC's General Overseas Service*)

BERTRAM MYCOCK, the BBC Industrial Correspondent, sketches the background to the 1956 Commercial Motor Show which will be opened at Earls Court, London, this week by the President of the Board of Trade. This year's show will be the largest ever staged

Commercial Motor Show

WHILE the makers of private cars in Britain have been undergoing some difficulties in the past few months, with home demand contracting and overseas competition becoming ever more intense, the commercial end of the motor industry goes from strength to strength. The output figures for goods vehicles of all kinds and for public-service vehicles have been rising steadily month after month, and with the great economic developments in many parts of the world the industry seems to be riding the crest of the wave.

It is against this background that the 1956 show will display the products of forty manufacturers of commercial vehicles. Most of them will be British, but the doors are open also to Sweden, the United States, Holland, Czechoslovakia and West Germany. There will be on view every kind of commercial motor-vehicle, from the very largest lorries to the smallest delivery vans; there will be buses and a multitude of vehicles specially designed to do difficult jobs in arduous conditions.

Four out of every ten commercial vehicles built in Britain are sold abroad. In the first half of this year nearly 84,000 of them were exported, and nearly 2,000 of these were buses which will carry the names of British firms into the streets and highways of many foreign countries. The British motor industry has for a long time seen the great trading possibilities which come in the train of all the schemes of industrialisation and development that are going ahead all over the world.

New Trends in Design

Partly because of its established success in markets in a highly competitive world, and partly because it feels the need to be in a state of constant readiness to jump into new markets when these various trade barriers go down, the British commercial-vehicle industry is paying the closest attention to good design and to adaptability for different conditions in countries overseas.

Let us look for a moment at some of the trends in design. Perhaps the most remarkable single feature is the switch from petrol to oil, and, in particular, the popularity of the smaller diesel-engines of two and a half litres which will power the one-ton vehicle. One famous maker of diesel-engines is, in fact, producing a type of power unit which can run an ambulance or a truck or a road-making roller, and it claims that this is money-saving, because the engine is made in such large quantities that its first cost is low and service after sales is quick and easy.

This easy maintenance is, in fact, a big point with engine-designers and chassis-designers today. Increasingly the engine of the commercial vehicle is being switched from under the bonnet to under the floor. It not only provides for a larger pay-load but makes maintenance a great deal easier, since these under-floor engines can easily be slid out on rails to become completely accessible for the mechanic. The cylinder liner is another short-cut to cheap maintenance: the cylinder carries a detachable lining which can simply be withdrawn and replaced, thus saving the costly business of machining the cylinder block.

The designers are paying the closest attention these days to the comfort of the driver, realising that comfort means safety, and it means, too, that profitable high speeds can be maintained on long runs. In the past designers seem to have proceeded on the assumption that every driver of a commercial vehicle stood about five feet, ten inches, and was fairly long in the leg. The adjustable seat is every bit as important to the man who drives a truck as it is to the one who drives a car. It is this demand for comfort which has brought power-operated steering out of the super-car field and into the commercial-vehicle field. Not only are many British makers building their trucks and buses with steering powered from the engine: several firms are making auxiliary units which can be bought and fitted to existing vehicles.

Designers are turning their attention more and more to the weight of vehicles, and indirectly the aircraft industry has led the way with its own preoccupation with this problem. Many of the light alloys which were perfected because of the demands of the aircraft designer have now found their way into commercial vehicles. Indeed one British maker is selling alloy bodies for a considerable range of standard vehicles in a form so designed that any competent garageman anywhere in the world can build the body on to the chassis in a couple of hours. Some of the commercial vehicle builders are looking to plastics.

The British industry has one of the best-equipped proving grounds in the world, and the commercial end of the industry has made great use of it. The designer of a truck, for instance, can take his prototype to the proving ground—a converted airfield in the English Midlands—and can test it under exact scientific controls in conditions which reproduce those that are likely to be found in any part of the world—from desert to jungle, and from tropical mountains to arctic snows.

Next week there will be a G.O.S. report on the Commercial Motor Show on Monday at 21.00 and Tuesday at 04.45 and 12.00

The ruined keep of the Norman castle

Abbot's Hospital, a home for the aged

The High Street: on Saturdays it is as crowded with shoppers as many a street in London's West End

The Old Town of Guildford

SAM POLLOCK visits a famous Surrey town on the Portsmouth road which is not only a dormitory for London's workers and a market for the prosperous farming area which surrounds it but also the centre for a wide variety of industrial concerns

THE old town of Guildford in Surrey is one of the best examples I know of a peculiar glory that surrounds the majority of our old towns. With all their architectural beauties and historic interest and old traditions they are no mere tourist centres, no mere museum pieces artificially preserved for the delight of the visitor. Most of them are still important and flourishing centres of trade or industry, with a lively present and a hopeful future to make their past a matter of pride, not of nostalgic regret for vanished glories. It is not Ichabod—'The glory has departed'—which is inscribed on the two best examples of Georgian architecture in Guildford's High Street but 'Fifty Shilling Tailors' and 'F. & W. Woolworth Ltd.' respectively.

And why not? Our ancestors, who built their handsome market places and graceful market crosses for strictly utilitarian purposes—to shelter the 'barrow boys' of medieval times—would have seen nothing incongruous in this, any more than in the fact that the High Street's best example of Jacobean domestic architecture is to be found in a tea-room, or that you can still order your wine in the Angel Hotel from vaulted cellars built in the Middle Ages. The old Guildhall, with its projecting clock dated 1683, is still the centre of Guildford's local government; the grey, cloistered, and leaden-windowed grammar school founded by Edward VI still resounds with schoolboy clamour; and Abbot's Hospital, founded by a Stuart archbishop, is still what many hospitals were in Stuart days: a quiet retreat for the aged.

These three all overlook Guildford's steep, cobbled High Street, a thoroughfare which has not many equals in all Britain for historic interest and architecture. They also overlook a stream of traffic on wheel and foot which proclaims Guildford's present-day importance and prosperity as a shopping and trade centre for south-west Surrey.

Some of the 50,000 electrically driven toy cars turned out each year by a Guildford firm: they are all scale models of well-known British makes

It is as a centre of trade for the prosperous agricultural area which surrounds it, and as a residential centre—not so much as an industrial centre—that Guildford scores. Thirty miles from London, and protected by a 'green belt' against the threat of absorption by London, it is favoured as a residential area by business executives who work in the capital and who can have the best of both worlds by living in the gracious and pleasant surroundings offered by Guildford while making the forty-minute train journey daily to the City.

As would be expected from this set-up, the majority—well over half—of Guildford's wage-earners are employed in what we call service industries: distribution, transport, administration, and so forth. But there are a wide variety of small and medium industrial concerns, and one large manufacturer—Dennis Brothers—whose fire-engines and commercial and municipal vehicles are in service all over Britain and the world.

Municipal Vehicles Made to Order

In a brief tour of their huge works, which cover twenty-six acres, I noticed fire-engines and other vehicles destined for Dar-es-Salaam, Beirut, New South Wales, and Trincomalee. In the vast workshops in which they build their vehicles their 2,000 workers are almost lost. The kind of job they do at Dennis's needs space: turning out giant fire-engines with three-hundred-foot ladders on revolving platforms; municipal vehicles which are in effect mobile plants for the treatment, packing, and disposal of rubbish; industrial vehicles which are in effect mobile chemical plants.

And the need for space is enhanced by the fact that every job is, as the engineers say, 'one off': every vehicle is built to a special design and to meet the special requirements of the customer; there is nothing that could be called mass assembly. As my guide told me: 'Here the vehicle is the customer's from the start; it's ear-marked at the beginning not at the end of an assembly line.' It is, in fact, built like a ship—some of them are as big as ships. Which also means that a high proportion of the workers—mainly men—are skilled craftsmen who may be called upon to do something new and strange every day.

A Guildford firm which contrasts with Dennis's in size and product but which resembles it in the almost exclusive employment of craftsmen is the printing firm of Billings. Billings are mainly noted for their Bibles: they print Bibles in almost 400 languages for the British and Foreign Bible Society. I saw them being printed in African dialects which before they were set in type by Billings had no written literature: they had only the spoken word.

One of industrial Guildford's very recent success stories is that of Victory Industries, a firm which employs about seventy workers—mostly girls—in the manufacture of model cars. This may not sound anything very new, but there is something very new and very special about these model cars. A word which you must never use in connection with the model vehicles made by this firm is 'toy'—not in the hearing of any of the staff. They are scale models officially approved by Britain's car manufacturers, and they are turned out with all the scrupulousness as to efficiency and design of their big brothers. (Broadcast in the BBC's General Overseas Service)

JACK DIAMOND

C. L. Boltz introduces a series of four talks in which different experts in the field of atomic energy explain its principles and describe some of its more immediate applications. The fundamental physics of atomic energy are here explained by the Professor of Mechanical Engineering at Manchester University, JACK DIAMOND

What Is this Atomic Energy?

NO other subject has been in the news as much as atomic energy in the past few years. Ever since the first atom bomb exploded over Japan in 1945, starting a shock wave of fear that went round the world—and, I believe, is still doing so—people have been fascinated by atomic energy. Unfortunately most people still seem to think of it rather morbidly in terms of bombs. Yet in Britain we have concentrated millions of pounds and thousands of men on the business of making atomic energy serve peaceful purposes. Here is a new and hitherto unused source of energy and power for mankind, energy that in due course can bring benefits to all people. Even now the great benefit to medicine of the new and remarkable sort of chemical called the radioactive isotope has been felt everywhere, and day after day aircraft fitted with special wing-tip carriers fly these British-made isotopes all over the world.

In Britain itself we have an atomic power station ready to pour its electricity into the national grid when the Queen has opened it next October. Our Central Electricity Authority has also the most ambitious scheme in the world for atomic power stations—a dozen new ones in the next nine years. As far as Britain is concerned the atomic age is here.

The Present—and the Future

But let us turn to the present, and the future. What is this atomic energy? How can we use it? What are the future prospects?

Professor Jack Diamond, who was one of the original British atomic team in Canada and who has been in nuclear engineering ever since, is going to explain the fundamental physics of nuclear or atomic energy.

'Your dictionary will probably define an atom as a body too small to be divided, but scientists have known for half a century that this is not true. The generally accepted picture of the atom shows a nucleus surrounded by electrons moving in orbits; that is to say, it is a system rather like the planets moving around the sun; and each of these electrons—the planets—has one unit of negative electricity.

'According to this picture, not only is the atom divisible but its centre or nucleus can also be split up into parts. It is composed of protons, each having a positive electrical charge, and neutrons, which have no charge at all. Neutrons and protons are comparatively heavy particles, very much heavier than an electron, and practically all the weight of an atom is in the protons and neutrons which make up the nucleus.

'The number of protons in a nucleus determines a chemical element, but in any given element the number of nuclear neutrons may vary slightly. For instance, the nucleus of every atom of iron has twenty-six protons, but some iron nuclei have twenty-eight neutrons, others thirty neutrons, and there are even two other variations. Atoms of an element having different numbers of nuclear neutrons are called isotopes. Isotopes of an element are identical chemically, but because of the different number of neutrons in their nuclei they behave rather differently in some respects. This leads us to one most important element—uranium.

The Neutron as a Projectile

'All uranium atoms have ninety-two nuclear protons—that is what makes them all uranium—but there are several uranium isotopes with different numbers of neutrons. The three isotopes of most interest to us are called Uranium 233, Uranium 235, and Uranium 238; the numbers indicate their atomic weights. Only the isotopes U235 and U238 occur to any extent in nature. Natural uranium consists almost entirely of U238 and only a small part of it is U235.

'Let us examine the nucleus of the isotope U235. The forces which bind the ninety-two protons of similar charge closely together represent a large store of latent energy. If the nucleus can be split up, some of this binding energy will be released. This is what we mean by "atomic" or "nuclear energy"—and the key to the splitting, or fission, is the neutron; which, as a projectile, is likely to split the atom it hits.

'If a neutron moves in from outside and enters the nucleus of a U235 atom, there is a very good chance that it will split the nucleus into two parts. Some of the binding energy of the nucleus is thereby released, and the two smaller nuclei, called fission fragments, fly apart at high speed, carrying most of the released energy as kinetic energy. They are then slowed down by hitting nearby uranium atoms and heat is generated in the uranium. This result of fission is extremely important because it is this heat which may be turned into power by removing it from the uranium and driving an engine with it.

'This leads me to an important fact in nuclear fission. Almost immediately after an atom is split by one neutron two or three other neutrons are emitted at high speed. If there are more uranium atoms

nearby these new neutrons can cause further fissions, and so on. Thus a continuous chain reaction is possible. Now a nuclear reactor is designed to work by controlling this chain reaction.

'The fission fragments, which were created in rather a hurry, are unstable and eventually radiate energy to achieve stability. After nuclear fission there is a lot of radioactivity and most of it is due to the fission fragments.

'I said just now that the neutrons emitted after fission have very high speeds. They are called fast neutrons. Although there is a chance of a fast neutron causing fission in one of the nuclear fuels I have mentioned, it has a much greater chance if its speed is reduced and the greatest chance of all when its speed is what we call thermal: that is, when it has a speed appropriate to room temperature—2,200 metres per second.

'Reactors which make use of thermal neutrons to cause fission are called thermal reactors. There are many more thermal reactors in the world today than fast reactors. This is because the very much greater probability of fission by thermal neutrons in U235 makes it possible to use very dilute fuels such as natural uranium in which only one part in 140 is U235. From the point of view of a thermal reactor we must regard the more plentiful U238 isotope largely as a dilution, although it must be remembered that U238 absorbs some of the available neutrons to form plutonium, and this is a valuable nuclear fuel.

'But to get back to the thermal reactors themselves. Something must be done to slow down the fast fission neutrons, and the best way so far found is to put near the uranium a material called a moderator which slows the fast neutrons down by making them collide with the nuclei of light atoms. The lighter the nuclei the more energy is lost per collision, and hydrogen, deuterium, beryllium, and carbon may be used.

'Nuclei other than nuclear fuel may absorb neutrons without a fission. Materials vary enormously in this respect and great care must be taken in the design and erection of nuclear reactors to maintain freedom from impurities which would absorb neutrons wastefully. The moderators I have just mentioned—hydrogen, deuterium, beryllium, and carbon—have low neutron-absorbing power and are chosen partly for that reason. The carbon is in a very pure form called graphite.

A Typical Thermal Reactor

'We can now begin to visualise the form which a thermal reactor must take. In a typical example, with natural uranium fuel and graphite moderator, rods of fuel in metal cans are laid in long holes formed in the graphite structure. They are placed in metal cans to prevent corrosion and escape of fission products. The distance between the holes in the graphite structure is governed by the amount of moderator necessary to slow down to thermal speed the fast neutrons born in the rods.

'Although more neutrons are emitted from each atom that is split, unfortunately some of them are lost to the surroundings, so the mass of fuel and moderator must be big enough to maintain a continuous chain reaction despite this loss. The amount which will just do this is called the minimum critical size.

'As I said, the chain reaction must be controlled. It must be possible to maintain a steady power level. This may be achieved by inserting into the core rods of neutron absorbing material such as a boron carbide. These control rods absorb some of the neutrons and so allow the reactor to be kept working at any power required.

'The neutrons and other radiation created in the reactor are dangerous to human beings, and some of these harmful particles and rays can escape from the reactor and so a thick absorbing shield must be placed round the reactor to protect the operators. This is commonly made of steel and several feet of concrete.

All the time the reactor is working the heat generated in the uranium fuel rods must be removed by passing a cooling fluid over them. This fluid in turn gets hot and must be cooled outside the reactor. Obviously the fluid must be chosen carefully as it must not be one which absorbs neutrons heavily or the reactor will not work.

'In a typical thermal power reactor the cooling fluid is circulated first past the rods in the reactor, where it is heated, and then to a heat-exchanger. Here the heat is used to generate steam which drives turbines. The circulating fluid, now cooled, is returned to the reactor where it is reheated and the cycle is repeated.

'The temperature of the cooling fluid has an important effect on the efficiency of a power plant, and many of the problems of the designer arise from his desire to achieve as high a temperature as possible. Thus the materials of construction of power reactors must not only have good nuclear properties—they must be strong and resist corrosion at a sufficiently high temperature as well. Such materials are few and very many difficulties have to be overcome.' (Broadcast in 'London Calling Asia')

Somewhere along the mail train's route postmen arrive at a railside standard with bags

The mail is put into pouches fixed to the standard to be hooked up by the passing train

Besides collecting pouches on its way past, the train drops others into a net

The G.P.O. Mails Go Through

JOHN CAMPBELL went to Euston Station in London to meet the General Post Office's special mail train at the end of one of its nightly runs from Scotland. Our pictures show something of the work which goes on while the train is travelling, and of the way in which more mail is collected from stations along its route

AT four o'clock in the morning in London the mail train from the north of Scotland arrives at Euston station. It is a regular procedure, but, one morning recently when it pulled in, the Assistant Postmaster-General, Mr. Cuthbert Alport, was at the station to meet it, and to travel with the mail to a sorting office in central London to watch the final stages of its sorting and its delivery by nine o'clock in the morning. I also saw the night's mail arrive, and interviewed Mr. Alport.

It was still dark when I got to Euston at four o'clock, dark except for lights on the station and on the trains, and the noise and bustle was typical of any big railway station at rush hour, although on this occasion it was not only railway staff who were rushing about but Post Office staff as well. All had but one aim: to get the mail out of the railway vans, drop the bags on to trolleys, and hurry them along the platform.

Everyone was moving fast to shouted orders. There was the roar of the engines from the scarlet Royal Mail vans, the deep humming and bustle of tractors, and the clank and rattle of trolleys. With military precision the Royal Mail vans swung into line, their doors standing open ready to receive the mail; and dozens of blue-uniformed Post Office men stood by to handle it. Then a train swung into sight, a special train bringing letters from all over Britain. It slowed to a halt with a hiss of steam and a clank of pistons, and at once its doors were thrown wide.

Slowly the grey, angular piles of mail bags began to grow. Most of them were already sorted into districts: all that remained was for the van crews to load them up and speed them away to every part of London for sorting and final distribution when daylight came.

The only man not in uniform was the Assistant Postmaster-General, Mr. Cuthbert Alport, who was standing watching the unloading of mail from this long train, and I asked him about it: 'This train,' he said, 'this great special train, which consists entirely of mail coaches, came throughout yesterday afternoon and through the night from the north of Scotland right through the country down to London. It carries something like 1,200 bags of mail, and by nine o'clock or thereabouts this morning every letter here should, if it is physically possible, be delivered to its destination. It's not always so easy, because after all there are difficulties sometimes in timing, but that is our aim and that is what we try to do.'

While we were talking the mail was already on its way to sorting offices where it was distributed throughout the metropolitan area; and by about nine o'clock it had been delivered. (Broadcast in 'Radio Newsreel')

On board the train incoming mail-bags are opened, the letters sorted, and once more bagged according to their destination: this saves precious time

On arrival at Euston station the bags are loaded into waiting vans or trolleys

Police control the crowd as the champion spaghetti-eaters get down to it in a Frith Street restaurant: the contest was won by a slim young woman from the East End

'The grand carnival procession played, danced, and sang its way along the narrow streets. Beautiful women, jazz bands . . . and more beautiful women trundled along'

Soho's Queen, Andria Loran, greets Montmartre's Mayor, and police and fire chiefs

A busker, one of Theatreland's professional street entertainers, goes into a lively number

During the fair even busier Godiva-like belles

Soho's Week

'ALUN WILLIAMS, a BBC producer of *Our Year's Soho Fair in London's West End*—'something new and fascinating happened' the streets of polyglot restaurants and cafés

IT is a pity that the word 'Soho,' because of recent events and the resultant publicity accorded them, conjures up for many people the picture of razor attacks, pavement 'affrays,' and all the accompanying unpleasantness of gang warfare. The members of the Soho Association do not deny the existence of a seamy side of life in their parish but they do emphasise that the volume of publicity accorded these incidents is in itself a proof of their rarity. Last year's fair celebrated the formation of the Soho Association, and in arranging this week of festivity its members were reviving an old custom: the first fair was held in 1883, and there are still venerable folk in Soho who remember the stir it caused in fashionable society. Today's fair is, of course, less 'fashionable,' because Soho has opened wide its door to welcome the world.

This Gathering of the Nations

On Sunday, July 8, I returned to London after a hectic week on the Continent, and felt, as I strolled in the sunshine down Frith Street and Dean Street, Old Compton Street, and Wardour Street, that I might just as well have saved myself a lot of time, trouble, and petrol by staying in Soho and letting the Continent come to me. There were sixty-five starters for the Waiters Race at midday, and their names provided a clear enough indication of this gathering of the nations that is Soho. There were Fannino and Hajiloizou, Rigotti and Grattarola, Vargas and Gan Ghi, König and Chung Yu.

Each starter was armed with a tray, bearing a bottle of champagne, a glass, and an ash-tray, all of which were required to be up-standing and unbroken at the end of the 550-yard course round Soho Square and down Greek Street to the junction of Greek Street and Old Compton Street. The competitors were allowed to walk, trot, or run, and this year's race provided a sensation: an objection to the first man home—Vittorio Bertoletti of the Versailles Restaurant—on the grounds that he held the bottle with his left hand for a moment, was sustained, and the £25 prize went to Nicolai Toufexis of the Belle Etoile, with Caluori of the Trocadero a bottle-neck behind, and Pressi of the Hungaria third.

Earlier that morning an inaugural mass had been sung in the Tower Chapel of St. Anne's in Shaftesbury Avenue, and at the Church of Our Lady of the Assumption and of St. Gregory in Warwick Street. In the afternoon a large congregation gathered again in St. Anne's to sit in the sun-drenched square—all that remains of the church after bombing with the exception of the tower itself—and hear the lesson read in English, Dutch, Spanish, French, Welsh, and Italian and a stirring address by Father Reid, followed by the saying of the Lord's Prayer by the congregation—each member in his own particular language.

At half past three Soho was in truth *en fête*. The grand carnival pro-

...ried on Soho-style: these

reets. Beautiful women, jazz bands, Chinese dragons, Morris dancers,
nd more beautiful women trundled along in a shower of streamers and
nfetti. The judges awarded the first prize to the Hong Kong restaurant,
ut very few saw on their magnificent tableau a little *Li See*: this was a
osy of green ferns containing 'good luck' money presented to them in
ie true Oriental tradition by *Ley On's*, a rival Chinese restaurant—an
idication, surely, of the true spirit of Soho.

But the spirit of carnival was not confined to the organised procession.
rom early morning throughout the week small groups of musicians in
ie colourful costumes of their own countries wandered around the streets.
hose old friends of ours, the buskers, had a wonderful time with an
udience of hundreds at every corner. One of the busking teams proved
o popular that they held up the traffic. The irate owner of a shining car
interrupted the performance with his horn, but the spirit of carnival
reailed, and he finished up by joining in the act. In the evenings those
ho could not get into the pubs drank on the pavements, and the
ecordionists and guitarists kept them happy from the upstairs windows.

Something new and fascinating happened every day: a spaghetti-eating
mpetition was won by a slim young woman from Stepney who left
ardened gourmets gasping; but there was champagne all round for the
ers. A 'beautiful-legs' competition attracted an audience of—at a
ugh estimate—fifty to every leg. There were singing and beauty
mpetitions and a contest to find the owner of the finest beard.

The shops and business houses gathered together their talents to provide
ie best-dressed window, and in the evenings there were roof-garden
arties, bacon barbecues, and art exhibitions by some of the residents of
ie community. Nor were the children forgotten, for roundabouts and
vings, coconut shies and candy floss, games and Punch and Judy shows
eant that no excuses could be made by Mum and Dad for leaving the
ungsters at home.

At one time—light-hearted speculation has it—the huntsmen in these
arts shouted 'So Ho!' to the hounds as they pursued the hare across
iburban fields. Recorded history tells us more seriously that the perse-
nted Huguenots made their homes here in the late seventeenth century
nd established a reputation as a settlement of skilled craftsmen. Since
en other venturers—not all political exiles—Italians, Greeks, Swiss,
aniards, Hungarians, Chinese, Turks, and other nationalities have added
e best of their particular crafts and swelled the population of this world
miniature. So conviviality and business thrive side by side, and here
eir claim is—and who will deny it?—that they can offer the best of
ood, wine, and entertainment. And once a year there is all this and the
oho Fair too.

The prize-winning float in the carnival procession represented a Chinese restaurant:
it was heralded by strains of oriental music, romping clowns, and a dragon (below)

HIGH TEMPERATURE LIGHTWEIGHT RECTIFIERS

- For operation in ambients of up to 85°C
- Elimination of cooling fins for compactness
- Light alloy construction for light weight
- High stability

These are some of the salient features of this new range of rectifiers, primarily developed for Service requirements, but now available in production quantities for all applications. Units can be supplied with various finishes to comply with RCS.1000 categories H.1 and H.2.

Details of this new range of

can be obtained from

Dept. LC7, WESTINGHOUSE BRAKE & SIGNAL CO. LTD.,
82, York Way, King's Cross, London, N.1. TERminus 6432

Books to Read

Reviewed by
Daniel George

WE tend, most of us, when we do not stop to inquire about it, to think of the Victorian age as one of piety and earnestness, narrowly religious, and rather prudish. Muriel Jaeger in her book called *Before Victoria* shows that at least fifty years before Queen Victoria came to the throne the intense moral and religious regeneration of society had begun. There were, of course, some who were unsympathetic. But on the whole the evangelical movement, helped possibly by the French Revolution, the Industrial Revolution, and the Napoleonic wars, soon gathered momentum. The subtitle—on the jacket though not on the title-page—*Changing Standards and Behaviour 1787-1837* does sum up the theme of the book.

Walter Lord, in his book *A Night to Remember*, gives his account of the sinking of the *Titanic*, the behaviour of the crew and passengers, and the treatment the Press gave to the disaster. Mr. Lord is American, so his book inevitably has an American slant, and his style is affected by current slang. But so far as it is humanly possible at this date to get at what actually happened he has been outstandingly successful. It was the *Titanic's* maiden voyage from Southampton to New York. Altogether she carried a total of 2,207 men, women, and children; of these only 750 survived. One reason was that there were not enough life-boats. There are some discrepancies in the estimates of the number of lives lost: Mr. Lord thinks the Board of Trade's estimate of 1,503 most convincing.

The behaviour of passengers and crew was not irreproachable. There were, of course, heroes and heroines, setting examples of the greatest courage, enterprise, and endurance; but there was no getting away from the fact that an avoidable disaster had occurred, at any rate a disaster of some magnitude. Naturally, accounts were conflicting and legends survive. But here, as near as the truth can be got to, is the story in as exciting a book as any to be met in the bookshops at the moment.

Frank Swinnerton describes his book *Background with Chorus* as 'A Footnote to Changes in English Literary Fashion between 1901 and 1917.' Actually, it peers a little into the future beyond the last date—to the war novels and films and the school of T. S. Eliot—but in the main it sticks to its chronological limits and its theme. In effect, it is a discursive and highly personal account of publishing and authorship and literature before the first world war. I found the book quite extraordinarily interesting. From the literary critic's point of view it is valuable in showing the books and authors in the context of their time, and it certainly, as its subtitle promises, demonstrates very clearly the changes in literary fashion and, incidentally, the futility of literary prophecy.

Almost a companion volume, though it begins later in the century, is Percy Muir's autobiography, *Minding My Own Business*. It opens with a history of the firm of Elkin Mathews with which Mr. Muir has been associated since 1930. In its earlier years the firm had published most of the famous or notorious authors connected with the Yellow Book and the eighteen-nineties. After the death of Elkin Mathews the business was acquired by A. W. Evans and traded as antiquarian booksellers, and it is with the ups and downs of that trade and his own adventures in it that Percy Muir is concerned. He tells us, since that is his purpose, more about the people he met than the books he bought or sold. It is a strange, little-written-about world that we are introduced to by Mr. Muir—not so specialised that his book will not be of interest to everybody interested in books.

The International P.E.N.—a world association of writers—recently held its twenty-eighth annual congress in London, and associated with that occasion is a book edited by John Lehmann, *The Craft of Letters in England*, a symposium to which various authors have contributed, among them J. R. Stewart on modern biography, C. V. Wedgwood on living historians and their methods, Alan Pryce-Jones on personal books (autobiographies, individual travel books, etc.), Francis Wyndham on novelists. It provides a kind of survey of the activities of English authors in various branches of literature at the present time.

Also timed for the congress was *New Poems 1956*, the fifth of the P.E.N. annual anthologies, this one edited by Stephen Spender, Elizabeth Jennings, and Dannie Absie. It is a very representative collection of modern poetry and includes, it is sad to say, because the publication of this book almost coincided with his death, three poems by that charmingly great poet, Walter de la Mare.

Before Victoria, by Muriel Jaeger (Chatto and Windus, 18s.)

A Night to Remember, by Walter Lord (Longmans, 16s.)

Background with Chorus, by Frank Swinnerton (Hutchinson, 18s.)

Minding My Own Business, by Percy Muir (Chatto and Windus, 21s.)

The Craft of Letters in England, edited by John Lehmann (Cresset Press, 21s.)

New Poems 1956, a P.E.N. Anthology (Michael Joseph, 12s 6d.)

Her Majesty the Queen looking at one of the regimental books of remembrance for Guardsmen killed in action in the second world war, and (right) the interior of the Household Brigade memorial cloister at Wellington Barracks

STORIES FROM 'RADIO NEWSREEL'

Here and There

GUARDS MEMORIAL

NOT far from Buckingham Palace the Queen unveiled a memorial to the officers and men of the Household Brigade who died in the last war. It takes the form of a cloister leading to what will eventually be the new chapel of Wellington Barracks. The old chapel was badly damaged by a flying bomb in 1944, and it is now being restored. The Queen was received by the colonels of the regiments, one of whom is the Duke of Edinburgh, Colonel of the Welsh Guards. The State Trumpeters sounded, and the Queen, in a pale-cream coat and navy-blue hat, walked to the dais with Major-General Sir Alan Adair, who is Chairman of the Memorial Cloister Fund Committee, and Major-General Johnson, commanding the Household Brigade.

The cloister is part of the design for the restoration of the Wellington Barracks Chapel. In recesses on either side of the cloister are the regimental books, which contain in lettering of red and black the names of those who fell. On the wall above each book is the carved badge of the regiment. At the far end of the cloister stands the general monument to the Household Troops, the gift of the Royal Family. Behind it rise the colours of the brigade and the cavalry standards. In the middle of the step lies a wreath of gilded bronze. LEONARD PARKIN

RIVERS OF DESTINY

THIS report is about a river—in fact, the jigsaw of innumerable rivers that link, divide, fertilise, and sometimes bring destruction to parts of East Bengal. Here, between the flat expanses of rice and jute fields, rivers are the natural form of transport and the least reliable: they flood, they dry up, they get clogged with silt. The greatest of these waterway

Shops and offices are going up fast in Dacca, which 'is not really a city, although this is the third time it has been a capital'

networks—the Brahmaputra/Ganges system—cuts East Bengal in half and is quite unbridgeable; but there is something endlessly fascinating about life on these waterways.

Bengal has evolved its own breed of boats, ranging from little sampans with the stern-timbers rising into a horseshoe form to seventy-year-old paddle-steamers like floating grandstands; and there are steam launches called *Cecilia* and *Primrose* that look as if they have been built for English comedy films. Piles of raw jute are ceaselessly on the move.

It is on the rivers that the new industries are growing up. For example, just above Dacca there are the biggest and most up-to-date jute-mills in the world, using mostly Scottish equipment. Upstream from Chittagong I saw a new paper-mill using bamboo as its raw material.

Upstream again, the Karnaphuli river is being harnessed for hydro-electric power. Because of the difficulty of getting and maintaining heavy equipment lots of the work is being done by hand, thousands of coolies hacking out the cliffs by the basketful.

All of these things are part of the battle to correct the economic lopsidedness of East Bengal, for it is an agricultural, raw-materials-growing economy from which the industrial prop of Calcutta has been pulled away. This would not have been so serious if the population had been smaller, but on every square mile of land nearly 800 people are trying—and all too often failing—to make a living.

Dacca, although this is the third time it has been a capital, is still not really a city. The shops and offices are going up as fast as the concrete-mixers can pour them. Enchanting little bay ponies loiter about the racecourse, in the middle of which is a golf-course, in the middle of which are two flourishing Hindu temples. But the finance, experience, employment, and trade which Calcutta meant have as yet no real substitute. Bengal hopes to find them on the banks of her rivers of destiny.

GERALD PRIESTLAND

WILD GOOSE CHASE

A PARTY of six people—two of them schoolboys—have left Britain on what is literally, you might almost say, a wild goose chase. They are going to north-east Greenland to try to round up and net large stocks of the geese which breed there. These will then be ringed and released again so that their migratory movement can be studied. The party is being led by Doctor Thomas Wright, of Marlborough College, and with him are going two senior boys from there, two undergraduates from Cambridge, and a Danish student.

Doctor Wright himself says: 'The difficulties in an expedition to Greenland and Spitzbergen are complicated by the fact that the breeding grounds of the geese are separated by large ice-fields, mountain ranges, and fiords. One of our difficulties in Greenland is the question of transport. We are very fortunate in going on a Norwegian expedition ship which is going to the region to relieve a meteorological station the Norwegian Government maintain there. The method that we shall be using for catching the geese is the standard method using nylon netting pens, and we shall chase the geese, when they are unable to fly, into the pens. One of the snags is that the geese take to the water if they possibly can, and we are taking rubber dinghies so that we can get them off the water if possible. We shall be living under canvas, and our feeding will be of the most primitive.'

This Week's Listening

September 16-22

A ROYAL TOUR

ON Friday this week Her Royal Highness the Princess Margaret leaves for her second Commonwealth tour. It will be remembered that early last year the Princess made a very successful tour of the British Caribbean.

BBC commentators will be at London Airport to describe the scene as Princess Margaret leaves for Mombasa in Kenya. There she will join the Royal Yacht *Britannia* for her journey by sea to the Colony of Mauritius, where she will arrive on September 29. After spending three days on the island she will sail on October 1 for Zanzibar for a three-day stay. Then on October 7 the Princess goes to Dar-es-Salaam, arriving on October 8 for the beginning of her ten-day tour of Tanganyika. From Tanganyika Her Royal Highness goes to Kenya, where she will spend a week, and she leaves for home on October 25.

Reports will be broadcast in the General Overseas Service on the Princess's progress: Ian McCulloch will be at Mombasa for the arrival, and the remainder of the tour will be covered by Patrick Smith, the BBC's correspondent normally based in South Africa.

WEST INDIAN IN EAST AFRICA

A G.O.S. producer, Willy Richardson, who recently returned from a visit to his homeland in the West Indies, has since been to East Africa. This trip took him first to Zanzibar and then to Tanganyika, giving him the opportunity of comparing these places with the Gold Coast and Nigeria, in West Africa, which he visited last year. The African visit took Richardson to many of the places H.R.H. Princess Margaret will be visiting; and programmes which he has recorded will be broadcast in the General Overseas Service during the royal tour.

'CARIBBEAN HORIZON'

IN April and May, Willy Richardson made a tour of the West Indies to have a look at the steps being taken to implement the British Caribbean Federation, which was agreed upon earlier this year at the Lancaster House Conference in London.

He spent five weeks visiting Jamaica, the Leeward and Windward Islands, Barbados, Trinidad, and Tobago, flying a distance of 3,000 miles through the Caribbean. He took with him a midget tape-recorder, and interviewed the leading politicians, administrators, and industrialists of the region, who told him about the attempts that are being made to diversify the economy of the area and to raise the people's standard of living.

'THE REACTION OF EUROPE'

ON November 26, 1095, at the town of Clermont in France, Pope Urban II delivered a great speech: he urged that an armed pilgrimage should set out to free the Christian churches in Syria from

The work of the University College of the West Indies will be discussed in the 'Caribbean Horizon' series

In the first programme, 'Our Place in the Sun,' in the series 'Caribbean Horizon,' he tells of the progress that has been made in the various islands. He has not minimised the difficulties of the task, and touches on the recent increase of emigration to the United Kingdom. The chief speakers in this first programme will be V. C. Bird of Antigua, Robert Bradshaw of St. Kitts, Ronald Mapp of Barbados, and Albert Gomes of Trinidad, who are all Ministers in their respective governments.

Robert Lightbourne, the first manager of the Industrial Development Corporation in Jamaica, and Sir Stephen Luke, the Comptroller for Development and Welfare in the West Indies (who is also the Commissioner for the Preparation of the Federal Organisation), also contribute their views on the future of the British Caribbean.

G.O.S.: Monday 17.30 and 23.15; Wednesday 10.00

'THE COMMUNIST PARTY'

IN the G.O.S. series of talks on the Soviet Union in 'This Day and Age' Dr. George Bolsover will speak about the Communist Party. He will describe the development of the party under the leadership of Lenin and Stalin, and examine the control exercised by the party's Central Committee and its Presidium—formerly known as the Politburo.

The party held the twentieth congress of its history earlier this year, and the dramatic denunciation of Stalin by Mr. Khrushchev at that congress will provide ample material for Dr. Bolsover to discuss the problems of leadership with which the party is now faced.

G.O.S.: Tuesday 15.45; Wednesday 00.30 and 05.00

MUSIC BY THOMAS TOMKINS

TO commemorate the tercentenary of the death of Thomas Tomkins (1572-1656) the Choir of Salisbury Cathedral, the In Nomine Players, and Thurston Dart (harpichord) will give a concert of his music, including two five-part pavanes for strings, and the anthems *When David heard* and *O pray for the peace of Jerusalem*. The programme has been devised by Denis Stevens.

The Tomkins were an English family of six musicians, including several Thomases. The Thomas whose tercentenary is being marked was born at St. David's and died near Worcester. He was a pupil of Byrd, and was appointed organist of Worcester Cathedral in about 1596.

In 1607 he took his Bachelor of Music degree at Oxford. Although he stayed at Worcester until the second siege of 1646 he became one of the organists in the Chapel Royal in 1621.

G.O.S.: Tuesday 14.45; Wednesday 19.00

LONDON FORUM

WITH them in another edition of 'London Forum' Bertrand Russell and Lord Hailsham have Kingsley Martin to discuss whether the political Left has been right or wrong in its analysis of social issues and in its aims. Mr. Martin, who has recently celebrated twenty-five years as editor of the Left-wing weekly periodical *The New Statesman and Nation*, joins with the other speakers in first defining the term 'Left.' After this the team considers what is meant by progress and seeks to determine if there has been an inevitable movement towards the Left in a democratic society. In addition, they examine the interplay of both Right and Left in the shaping of society.

G.O.S.: Sunday 16.15; Monday 02.15

Radio Theatre presents

'A SLEEPING CLERGYMAN'

CHARACTERISTICALLY, the title of the late James Bridie's play has nothing whatsoever to do with its theme. For this is 'a story told before dinner, in a Glasgow club, by one physician to another. The story is concerned with three generations, and it spans the seventy years before the time of its telling. There is a third person present while the story is told—a clergyman—but he is asleep.' Whether or not Dr. Cooper is able to get through his tale in peace depends upon the reverend gentleman's continued torpor; naturally Bridie saw to it that he did not awake too soon.

The play's setting is significant, for Bridie was himself a Glasgow physician, his real name being Dr. O. H. Mavor, and in his life he combined medicine with play-writing. Thus when he came to combine them in a play the conjunction resulted in one of his most popular and successful works.

Here he was concerned with heredity. There is an old north-country saying, expressing belief in reversion to type, which runs: 'Clogs to clogs in three generations.' But Bridie knew that the wind of heredity blows less predictably, and so he shows us how a disgruntled, consumptive medical student, dying in a small Scottish seaside resort, may through his illegitimate son transmit qualities which in the next generation produce a good-for-nothing, and, in the generation after that, a great doctor.

PETER FORSTER

G.O.S.: Sunday 00.30 and 18.30; Wednesday 14.15

'THE STORY OF COLONISATION'

Introduced by Bertrand Russell (whose talk was printed on page 4 of our preceding issue)

PART I

★ Early 'Imperialists' by Harold Nicolson

The Roman Empire by Sir Mortimer Wheeler

The Indian Drive East by C. H. Philips

The Expansion of Islam by Bernard Lewis

The Hammering Hordes by R. R. Betts

Crucibles of Civilisation by K. M. Panikkar

★ Printed on page 8

PART II

† The Reaction of Europe by Geoffrey Barraclough

The American Adventure by Salvador de Madariaga

Empty Spaces by C. E. Carrington

Asia Today by C. H. Philips

Africa Tomorrow by Philip Mason

A New 'Colonialism'? by Geoffrey Wheeler

† See note above

Turkish oppression. The result was the launching in the following year of the first Crusade, which was followed by a series of European thrusts eastward during the next three centuries: In 1071 the Seljuk Turks had captured Jerusalem, the climax to a long series of blows struck by different forces at various points along Europe's eastern frontier and that of the Byzantine Empire.

Now Europe began to hit back. For some time the Germans had been colonising Prussia and the fringes of the southern Baltic coast. A period of European expansion through trading, exploration, and conquest was beginning and was to continue right down to the eighteenth century.

'The Reaction of Europe' is the subject of this week's talk in the G.O.S. series 'The Story of Colonisation.' The speaker will be Geoffrey Barraclough, Professor of Medieval History in the University of Liverpool, who on October 1 takes up his appointment to the Stevenson Research Chair of International History in the University of London.

Professor Barraclough has become well known in recent years for his challenging approach to the writing of history.

LONDON CALLING ASIA

Broadcast in the Eastern, Far Eastern, and British Far Eastern Services

Sunday

13.15 **'What I Believe'**
Speaker:
Sir Miles Thomas
13.30-14.00 **Asian Club**
Speaker:
Sir Ian Fraser, C.H., C.B.E., M.P.

Monday

13.15 **Ideas and Events**
13.25 **Children in Verse**
13.30-14.00 **English Writing**

Tuesday

13.15 **Ideas and Events**
13.25 **'Shaw Festival'**
Scenes and prefaces to mark
the centenary of the birth of
George Bernard Shaw
Author's Preface
13.30-14.00 **Scenes from**
'Captain Brassbound's Conversion'

Wednesday

13.15 **Ideas and Events**
13.25 **Through Eastern Ears**
13.30-14.00 **Question Time**
Speakers:
Mrs. Barbara Wootton, Sir John
Wolfenden, Dr. W. I. Jones

Thursday

13.15 **Ideas and Events**
13.25 **Rhythm Patterns**
13.30-14.00 **International**
Press Conference
A person in the news is cross-
questioned by journalists

Friday

13.15 **Ideas and Events**
13.25 **Editorial Opinion**
Taken from British and other papers
13.30-14.00 **Week-end Review**
A radio magazine

Saturday

13.15 **Brief Excursion**
Round and about Britain
with the BBC's mobile recording unit
13.40 **Programme Parade**
A preview of the week's programmes
with recorded extracts
13.45-14.00 **The World of Science**
A weekly survey
of the latest developments

WHAT I BELIEVE. Sir Miles Thomas until recently was Chairman of the British Overseas Airways Corporation and was largely responsible for the Corporation's post-war development and expansion. From 1948 to 1951 he was Chairman of the Colonial Development Corporation. In his talk on Sunday Sir Miles will speak of the basic beliefs of a businessman in relation to early training within the Church of England.

QUESTION TIME. The team of speakers on Wednesday will comprise Mrs. Barbara Wootton, Sir John Wolfenden, and Dr. W. I. Jones. Mrs. Wootton is a well-known economist and a Nuffield Research Fellow at Bedford College, University of London. She has just completed her term of office as one of the Governors of the B.B.C. Sir John Wolfenden has been Vice-Chancellor of Reading University since 1950; he received a Knighthood in this year's Birthday Honours List for his services to education. Dr. W. I. Jones has been Director-General of Research, the National Coal Board since 1946.

THE WORLD OF SCIENCE. The use of radio isotopes in medicine, agriculture, and industry is increasing rapidly. Britain is the world's largest exporter of isotopes, and last year shipped over 20,000. In his talk on Saturday Mr. J. L. Putman, who is Head of the Industrial Research Group, Isotopes Division, will describe some of the uses for isotopes, and with the aid of a portable geiger counter will illustrate how they are used.

BBC Far Eastern Station

The output of this station, which broadcasts from transmitters in Malaya to South-East Asia, the Far East, India, Pakistan, and Ceylon, consists largely of relays of BBC programmes, and provides a valuable supplement to the BBC's direct transmissions from London

THE OVERSEAS JOURNAL OF THE BRITISH BROADCASTING CORPORATION

No. 881. PUBLISHED WEEKLY

PRICE SIXPENCE

SUBSCRIPTION 25s. A YEAR

NEW ZEALAND DAY

Songs of the Maori, introduced by Lindsay Macdonald, will be broadcast this week by the General Overseas Service in celebration of New Zealand Day. The occasion will also be marked by a concert of choral music by Schola Cantorum of Wellington under the conductorship of Stanley Oliver

'THE AMERICAN ADVENTURE'

This week's talk in the G.O.S. series 'The Story of Colonisation' will be given by Don Salvador de Madariaga

INTERNATIONAL SPEEDWAY

An eye-witness account by Cliff Michelmore of the world championships can be heard on Sunday

'WHAT'S BECOME OF WARING?'

The entertaining play about publishing adapted by Peter Fraser from the novel by Anthony Powell is being presented by 'Radio Theatre' on Sunday and Wednesday

This Is Mauritius: Illustrated Feature by Sir Hilary Blood on pages 14 and 15

Built for Heavy Duty

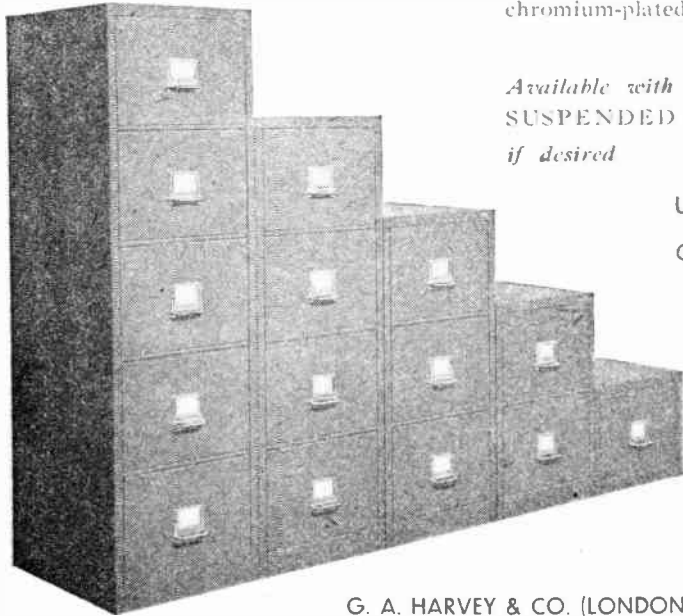

Substantially constructed for heavy duty, Harvey Steel Filing Cabinets have an inner framework of vertical steel channels welded together to give maximum strength and durability. This framework also ensures efficient support for the drawers, which glide smoothly and quietly to their fullest extent, despite heavy loading.

Stove enamelled Olive Green or Scarborough Grey, (alternative colours to order), with chromium-plated card holders and handles.

Available with SUSPENDED FILING CHASSIS if desired

UNITS OF 1 TO 5 DRAWERS
QUARTO & FOOLSCAP SIZES

Please ask for Catalogue No. LC800

The Two Partnerships

SIR HAROLD HARTLEY, F.R.S., in addressing the Duke of Edinburgh's Study Conference at Oxford, took as his theme two partnerships: man with man, and man with nature. Here is the text of a specially recorded shortened version of the address

THE survival of primitive man depended on his success in combating nature, and then slowly he learnt to tame her to his purpose in domesticated animals and plants. The successive ages of civilisation were marked by man's progress in the use of metals. And then he learnt to question nature by experiment and read her answers—the birth of modern science.

Then at the turn of the past century came that spate of new discoveries—the electron, radioactivity, the quantum theory, relativity, and the nuclear atom—which were to give man not only a much deeper insight into nature's secrets but also to provide him with more powerful new techniques like X-rays and the electron-microscope for his researches. These have made possible an unprecedentedly rapid advance in man's understanding of nature, the basis of their closer partnership

It is a paradox of human destiny that the rapidity of that advance has been quickened so much by the catastrophe of war and by the threat of war that human nature has brought upon itself. But the advance has come. It has placed in the hands of mankind a new source of power, it has made possible new levels of productivity, higher standards of living, greater comfort, better health, and more leisure.

And it was, too, largely under the stress of war that scientific research was harnessed effectively to industry and has done so much to change its pattern.

There have been three major changes in industry in this century due mainly to the impact of research. Mechanisation was at the root of the Industrial Revolution, and now a new factor is coming in—automatic control. It accelerates production and produces goods of higher quality, as electronic devices are much quicker and more accurate than the human brain. The second major change has been the scientific processing of materials to meet the diversified needs of modern life, the demands for higher quality, and the need for economy. The third major change is the production of synthetic materials, some because they are cheaper, others with new properties like thermo-setting plastics, and some that are complementary to natural products like synthetic fibres and rubber.

Of all the world's material needs today food is by far the greatest. What are science and development doing to increase the productivity of the soil? The broad answer is fairly simple: mechanisation, improved methods of cultivation, irrigation, better strains of animals and plants, fertilisers, and weed-killers and insecticides, all dependent on a closer partnership with nature. But the partnership is not easy. Nature does

not yield her secrets easily, and there must be no arrogant assumption that man can control nature: she will always have her way.

What are the possible limiting factors which may influence the present phase of rapid economic expansion? There are at least seven—water, soil, energy, raw materials, manpower and human skill, diseases and pests, and capital investment. Water I put first as it is essential to all life and industry. But it is not only the vital factor in life and fertility: it is also their destroyer by floods, soil erosion, and as a potent carrier of disease. So the water problem merges into the wider problems of water control.

Only a fraction of the land area of the world is suitable for agriculture, and much of it is already cultivated. Here great progress is being made in our knowledge of the delicate balance of factors in the top few inches of soil on which fertility depends, and in the deficiency diseases of plants and animals which can be cured by adding missing elements like copper and cobalt to the soil. Irrigation, too, is adding to the cultivated area, but brings with it the danger of salinity unless it is accompanied by drainage.

It is not surprising that industrial production is increasing much more rapidly than food production. The factory works with a regular intake of raw materials and energy while the farm is at the mercy of the weather, and has a much smaller output per acre than the factory—fifty tons per acre per day for a steelworks compared with twenty-one cwt. of cereal crops per acre per year in Britain.

What is the prospect of synthetic food from the factory? We can manufacture simple molecules like indigo or dyes, we can string them together to make synthetic fibres or plastics, but we cannot hope to make economically the complex proteins and carbohydrates we need for food without the aid of living organisms which make them so accurately and cleanly. For food, man's most pressing need, he must remain dependent on the living process, on his partnership with nature.

Today, with the expanding economy of the world, the drive for greater production and productivity, and the increasingly keen atmosphere of competition which this breeds, there is a growing awareness that the resources of the world are not unlimited, that with the erratic distribution of nature's gifts among the nations there is an inevitable community of interest between them. The material problems we are facing can be solved only by co-operation between nations and on the individual level by the closer partnership of man with man, and the recognition of the human ties, the human understandings which that implies.

The path will not be easy. In this complex civilisation man has created for himself he must for ever be on his guard that he is not taken unawares; he must be for ever watchful of nature's reactions. He must realise that the very complexity of our social system places a new responsibility on us all, in recognition of our common interest, not to throw it out of gear.

Those are the material aspects of this problem that confronts us. But is there not another side to this partnership with nature which can help satisfy man's craving for deeper insight into the mysteries of human destiny? I believe there is.

SIR MORTIMER WHEELER, in another talk in the current G.O.S. series 'The Story of Colonisation,' tells how Rome came to rule 'almost accidentally' over most of Europe and part of Africa and Asia

Sir Mortimer Wheeler

The Roman Empire

BESIDE the Roman fort of South Shields, in County Durham, set on its hill above the bustling estuary of the Tyne, an enlightened modern borough has built a charming little museum. I stood within it the other day in front of two Roman tombstones which may serve as my text. One was that of a Moor who had been freed from serfdom in the service of a trooper of a Spanish cavalry regiment long stationed in Roman Britain. The stone shows the freedman or his master banqueting in paradise. The other memorial is that of a woman of the Catuvellauni, a tribe that at one time occupied Hertfordshire, with its capital at St. Albans. She had married a man from Palmyra, in the deserts of Syria, and here at South Shields her gravestone depicts her sitting happily for evermore with her sewing basket and her jewel-box.

Parallel with the British Empire

When I was a boy, and the British Empire was still intact in its Victorian shape, the resemblances between ancient and modern colonisation were superficially more exact than they are today. It was not difficult for a British officer coming back from his Afridi levies in the Khyber pass to understand a Roman or Romanised officer commanding a battalion of Asian archers on the Scottish frontier. Our Governor-General at Calcutta stood easily in the shoes of the Roman Agricola at *Londinium* or *Eboracum*. The British Empire might appear in its main outline to be the Roman Empire writ large. I propose to pursue this thought.

First, let us see how Roman colonisation came into being. I should, of course, begin with the Romans themselves, but that is too difficult. Historians can define the needs and opportunities which opened the way to empire and can describe the manner in which those opportunities were grasped; but whether Romans or Britons be in question the things that really matter escape definition. They are things of the mind and the character, things which we may call imagination, intelligence, vision, without getting much nearer to an understanding of them. They are qualities which are sometimes uncomfortably close to stupidity and opportunism. Both sets of qualities have won empires, just as both sets have won Victoria Crosses. It is easier to turn aside from them to consider Rome itself.

A Londoner can readily understand Rome because the two cities have a comparable geography. Rome like London was originally built on two hills above the lowest convenient crossing of an arterial river. Granted the will to live and expand, Rome and London alike under ancient conditions had to look seaward. Indeed, London began as a seaport, with a supplementary harbour at Richborough on the Kentish coast, just as Rome had its coastal counterpart at Ostia. And looking seaward Rome found the ships of African Carthage in jealous possession of the Mediterranean markets. The next step—human (and in particular Roman) nature being what it was—was inevitable: Rome conquered Carthage and became automatically embarrassed by the possession of the Carthaginian harbours of Sicily, Africa, and Spain.

Growing Burdens of the City by the Tiber

But that was not all. A more modern imperialism has affirmed that the Mediterranean is indivisible. Mussolini's *mare nostrum*, 'our sea,' was in fact merely the repetition of an ancient slogan. Having won the western Mediterranean, Rome turned by force of circumstance, though with a genuine and almost lovable reluctance, to the domination of the eastern Mediterranean. Indeed, through the history of Roman expansion there is a recurrent hesitation, sometimes amounting to refusal, to add new colonial responsibility to the growing burdens of the little city by the Tiber. The long-retarded conquest of Britain is a later case in point.

And so when confronted with a Macedonian kingdom that had combined with Carthage against her, and was striving officiously for leadership in Greece and Asia Minor, Rome reluctantly took the field, beat the Macedonian king, liberated Greece—and then withdrew from the scene. A few years later the operation had to be repeated; this time the war was carried across the Hellespont into Asia; Rome again defeated the Macedonians, exacted a large indemnity—and once more withdrew. Only years later were Macedonia and Greece made Roman provinces.

Republican Rome thus almost accidentally became a great colonial power. Certainly at the outset she was the veriest amateur at the business, and made a pretty fair mess of it. At first she governed through politicians generally ignorant of all the particularities of their task.

The provincial governor held office only for a short term, and during that term was expected to make three fortunes: one to pay the debts incurred in the achievement of his office, one to bribe the judges who might be expected subsequently to try him for his misdemeanours (true or

trumped up) whilst in office, and a third for himself. All this, and much besides, had to be extorted from the unhappy provincials.

But on the other side of the balance-sheet were four palliatives. First, extortion carried to the length of diminishing returns defeated its own ends, either by excessive impoverishment, or by excessive unrest, or both. Roman law, partial and often enough corrupt though it was, stood on sound basic principles of equity rarely found outside the Roman world. Peace was ensured or, if broken, re-imposed with sternness. In local matters the traditional pre-Roman usage of the provinces was retained, save insofar as it conflicted with these ruling conditions. For instance, in northern Gaul and Britain the framework of the old Celtic tribal system was retained as the basis of the Roman administration.

Indeed, were one asked to name the outstanding qualities of mature Roman colonialism, the three last qualities that I have named could claim precedence over all others: namely, Roman law, Roman peace, and Roman tolerance. Under the empire established by Augustus at the end of the first century B.C. many of the cruder abuses of the free-for-all republican administration were curbed.

In particular, the financial exactions from the provincials were more closely regulated. From time to time irregularities still led to disturbances such as that which in Britain stirred Boadicea to her famous rebellion; and her monument, on Westminster Bridge opposite St. Stephen's, may serve as a perpetual reminder that there is a degree of taxation beyond which it is the treasured tradition of the British people to rebel. But, as against that revolt of Boadicea's, we possess in the British Museum the majestic memorial to the financial officer who was sent out to put things right after the rebellion was over. There was a hard justice in the Roman character that ever and anon looked in upon itself.

From the Clyde to the Euphrates

In the second century of our era the Roman Empire extended from the Clyde to the Euphrates, a distance of nearly 3,000 miles. Throughout that vast range two languages (Latin and Greek) would carry you through all the towns. There were good, direct roads with inns or caravanserais at suitable distances, and there were no passports. Save in times of local stress, travel was reasonably safe. Why, with the world's talent at their command, the Romans never invented printing or other simple technical devices it is difficult to say.

The truth is, of course, that the timeless labours of countless slaves were the easy substitute for an evolving technology and any approach to automation. The Moor and the Hertfordshire lady with whom I began this talk had both at one time been slaves. The Roman Empire was based upon a vast slave-machine, and by the fallibility or neglect of that machine it ultimately collapsed. For even slaves were in the long run susceptible to new and subversive ideas; perhaps I should have said especially slaves.

The Roman Empire had no long-term policy of evolution. Quite early it ceased to march forward, and its legs atrophied. It relied more and more upon other people's legs, and it was carried at the will of its bearers not at its own. In its prime it was the kindest and most successful attempt at an international polity that had ever been essayed. Its physical and intellectual concrete has endured and is integrated in the fabric of our life today. But it could never have carried India or Pakistan into the future as its great successor-empire has done in recent times.

Instead of looking forward Rome was for ever looking over her shoulder. Years after Britain had in fact drifted from the Roman Empire it remained on the official books at Rome. The empire passed from a reality to a fairy-tale. To tell the truth, it was never adequately comprehended as something more than a back-garden beside the Tiber: Rome never quite realised that there were other categories of mankind besides Romans and slaves, and that turning slaves and subjects into Romans was no ultimate answer to the human problem. But for a time this short-cut to world civilisation worked with a surprising and convincing effect. You and I owe more to it than can easily be told.

And finally, let me say this: Professor Toynbee, who is one of our most accomplished and widely read historians, has written off the Roman Empire as the 'far advanced disintegration' of the old Hellenic civilisation. I cannot agree with that view. I mention it here because it misunderstands at some length that empire of which I have been speaking. In so doing it fails to emphasise the prime values of straight roads and straight laws. It subordinates to the fossilised woodwork of the Parthenon the aspiring dome of Hadrian's Pantheon, the sky-flung vaults of the Baths of Caracalla or Diocletian. In short, it obscures the Roman Empire as the vital intellectual—and physical—bridge between the ancient and the modern world. For that high and original function the Roman Empire was well built. (Broadcast in the BBC's *General Overseas Service*)

'The Story of Colonisation.' *The American Adventure*, by Don Salvador del Madariaga: see note on page 10

Mr. Wilfrid Cripps oiling Great Tom's 'works' as he has done for the past twenty years, and (right) the clock-tower of St. Paul's which houses the bells

Great Tom Takes Over

HARDIMAN SCOTT tells the story of the famous bell in the south-west clock-tower of St. Paul's Cathedral which is 'understudying' on the air for Big Ben while 'the Great Clock of the Palace of Westminster' is being overhauled

THE husky voice of Big Ben, known so affectionately throughout the world, has recently given way to a different, less solemn, less familiar note—the voice of Great Tom, the clock at St. Paul's Cathedral. For many months now the huge face of Big Ben has been fretted with scaffolding while workmen have been doing repairs. Now the clock itself and its thirteen-and-a-half-ton bell are silent, so that the mechanism and the bell hammers can be overhauled. Meanwhile, the BBC is broadcasting, as its understudy, the voice of Great Tom.

Although the clock at St. Paul's is not so well known this is by no means its radio debut: that took place in 1934. Great Tom was standing in for Big Ben on that occasion, too, and indeed he has every right to: he has a much longer history. One might almost call him the father of the lusty son that is Big Ben. Ben spoke with his throaty voice for the first time in 1859, but there was a Great Tom at Westminster nearly 600 years before that, when Edward I built a clock-tower there.

And when Wren built St. Paul's, Great Tom was sold to the Commissioners of London for the new cathedral, and a founder called Wightman was paid for casting 'ye olde broken great bell,' but he did not do his job very well, because Wren had to defend him against critics by pointing out that the bell had been on view to the public, and for a small fee they had been allowed to give it a good whack. It had to be cast again, and the bell now bears the inscription: 'Richard Phelps made me, 1716.'

It is about six feet high, nearly seven feet across, and weighs just over five tons. Tom hangs in the south-west clock-tower of St. Paul's above an even vaster bell, Great Paul, a seventeen-tonner, used on special occasions. Two quarter-bells produce the ding-dong-like chimes, but it is Great Tom that strikes the hours. He also has a more solemn duty: to toll upon the death of the Sovereign, or the Archbishop of Canterbury, the Bishop of London, the Dean of St. Paul's, or the Lord Mayor of London.

The clock itself is one of the largest hand-wound clocks in the world. It is still wound by hand every day. It has three black faces—or dials, to use the correct term—each just over seventeen feet across; that is nearly seven feet less than the face of Big Ben. They look out upon what is now the smokeless zone of the City of London. The dials have gilt figures which are, in fact, carved out of the stone. This present clock was made in 1893.

Several experimental recordings were made with microphones in different positions in the bell-tower to find out the best way of broadcasting Great Tom to the world, but of course it is not a recording that listeners hear. A plug pushed into a socket in the Control Room in Broadcasting House puts Great Tom on the air 'live.' He speaks in the key of A flat, although I am told that over a great distance it sounds like E flat.

When Big Ben was stopped for his overhaul it was done almost literally by putting a spanner in the works. That is to say, someone slipped a rod between the legs of the escapement wheel. This held it up, and the pendulum slowed down to stop. Then to signify the silence of the Great Clock of the Palace of Westminster, as it is properly known, the hands were set at twelve o'clock.

Overhauling the biggest and, incidentally, the most accurate striking clock in the world is not surprisingly a big job. The mechanism weighs about five tons, and the clockmakers have ten men working on it continuously. The whole movement is being taken to pieces and the parts

laid out on the floor of the clock room. They are being thoroughly cleaned, the bearings polished, and then the whole lot will be put together again. At the same time the bells are being dismantled and lowered on to special stagings which have been put up to support them. A good deal of work is being done on the hammer bearings. In addition, the three weights, weighing about two and a half tons, have also to be lowered.

The clock faces—they are nearly twenty-four feet across with figures two feet high—are being reglazed. When this has been done the hands will be taken off, cleaned, and put back again. And the minute hand alone is fourteen feet long and weighs a couple of hundredweight. Meanwhile the Ministry of Works has been experimenting on the best way of lighting the dials. Fluorescent tubing has been tried, but no decision about the lighting has yet been made.

Big Ben's first little bit of trouble came very soon after his career began—in 1859—and he has never got over it, because that was when the hour bell developed a crack, and his familiar voice has been cracked ever since. But this has never prejudiced the affection and esteem felt for the King of Clocks ever since his first broadcast, when he announced the new year of 1924. (Based on broadcasts in 'Radio Newsreel')

Great Tom, bearing the inscription 'Richard Phelps made me, 1716,' is six feet high, nearly seven feet across, and weighs more than five tons

H. J. GROUT

H. J. GROUT, Deputy Head of the Reactor Division at Britain's Atomic Research Establishment at Harwell, contributes the second talk in a special series of four, and he deals with the problems of designing nuclear reactors to produce power, as at Calder Hall. His talk is introduced by C. L. Boltz

Nuclear Reactors

LAST week Professor Diamond told you about the fundamental physics of nuclear engineering, especially in relation to nuclear reactors. Let me run through in bald outline what he had to say. He said first that our picture of the invisible atom, of which all matter is made, is that of a sort of miniature solar system with tiny negative electrons, the smallest things on earth, moving round and round a positive nucleus. It is this nucleus that is of importance in all our discussion of atomic energy. The nucleus consists of two sorts of heavy particle—protons and neutrons. The protons are positively charged; the neutrons have no charge at all. The number of protons determines the element itself. For instance, an atom with twenty-six protons in the nucleus is an atom of iron, and nothing else. But you can have an atom of iron, each with its twenty-six protons, that has a different number of neutrons from another atom of iron. In this case both atoms are said to be isotopes of iron. Uranium, the commonest atomic fuel, itself has several isotopes. What we call natural uranium is mostly Uranium 238, but has a tiny amount of Uranium 235 in it.

A Very Important Fact Indeed

This Uranium 235 is important because if an atom of it is hit fair and square by a neutron it splits into two nearly equal parts—it undergoes fission, as we say, and at the same time several neutrons are released. This is a very important fact indeed, because it means that in the right circumstances each of these neutrons can cause another fission, each releasing still more neutrons, and so on. This rapid build-up of fission is called a chain reaction. In an atom bomb this chain reaction goes mad, so to speak. But in a nuclear reactor we control the chain reaction.

As a result we get a piece of apparatus in which heat is generated in great quantities, in which spare neutrons are available both to bombard other chemicals, and so make isotopes, and to be used for experimental work. So a nuclear reactor is a very valuable piece of apparatus, and is, in fact, the heart of any atomic-energy project.

But Professor Diamond said the actual practical realisation of a nuclear reactor is not at all a simple matter. To tell you about the difficulties and how they are being overcome here is Mr. H. J. GROUT, who is deputy head of the Reactor Division at Britain's Atomic Energy Research Establishment at Harwell. Mr. GROUT knows pretty well everything that is going on to do with nuclear reactors.

Professor Diamond described to you the basic principles of nuclear fission and how, by building an assembly of uranium rods surrounded by a moderator such as graphite, a continuous chain or nuclear reaction could be obtained. He also explained how the heat produced by this nuclear reaction is used by means of a circulating gas or liquid coolant and how it is converted into useful power or electricity by means of steam generators and turbines.

Calder Hall Type of Reactor

'You will realise that since the nuclear reactor produces heat only by burning uranium as the fuel it is essential to burn this fuel economically. We must therefore design the reactor in such a way that the circulating fluid is heated to a sufficiently high temperature for what we call an efficient thermodynamic power cycle. These two requirements, the economical consumption of the uranium fuel and the high temperature of operation, are the main technical problems to be overcome.

'The first large nuclear power station in the world designed to produce electricity economically is the sixty megawatt thermal reactor station which has been built at Calder Hall in the north of England and which will shortly be brought into operation. I will first talk about some of the problems we encountered in developing this type of gas-cooled reactor before going on to tell you of other possible types.

'To use the uranium fuel economically we had to design the reactor so that it has a high neutron efficiency: this can best be explained by reminding you of the neutron cycle in a typical natural uranium thermal reactor. The fission of a Uranium 235 atom produces on average 2.4 neutrons. These are all accounted for as follows: 1.0 is needed to maintain the chain reaction; 0.4 are absorbed to produce Uranium 236; 0.2 are lost by leakage and absorption in structural materials; and the remaining 0.8 are absorbed to produce a new fissile material—plutonium.

'So you see if we lose too many neutrons, by absorption in the graphite moderator or structural materials in the core, or by non-fission capture in the uranium, or through leakage, then the critical quantity of uranium needed to make the chain reaction possible becomes very large, with the result that the investment in the uranium fuel would be uneconomical.

So the graphite used in the moderator must be very pure, with low neutron-absorbing power.

'Professor Diamond also pointed out that the uranium rods have to be placed in a protecting can to prevent the release of highly active fission products, and to separate the chemically reactive metal uranium from the coolant fluid. Now if we use too much canning material, or choose the wrong sort, this will absorb neutrons wastefully. Suitable metals for canning are very limited—in fact only aluminium, magnesium, zirconium, and beryllium have sufficiently low absorbing powers to be acceptable.

'By using these special materials, and with careful physics and engineering design, it is possible to reduce the uranium investment of a large nuclear reactor of this type to less than 100 tons. This 100 tons of uranium, remember, is the fuel, and obviously we must extract from it as many megawatt-days of power as possible before it has to be discharged and replaced with fresh supplies, otherwise our fuel costs will be too high. Two factors limit this energy extraction—or burn-up, as we call it. First, the Uranium 235 is used up, leaving behind waste nuclear ash. This in time would stop the chain reaction, and a fresh charge of uranium would then have to be provided.

'The second factor which could limit the life of the uranium is damage to the fuel-rods as the result of fission in the uranium. This would cause the rods to distort or break up, and possibly lead to failures in the protective canning, so that the rods would have to be removed and replaced at an uneconomical rate. The development of satisfactory fuel-elements has been a most difficult problem, but by precise metallurgical processes, heat treatment, and so on, it is possible to minimise these radiation and fission effects, and achieve the burn-up we need.

'It is now certain that thermal reactors, based on a graphite moderator, with natural uranium as fuel, and heat removal *via* a pressurised-gas system, can be designed and built as an effective means of producing power economically. We also feel sure that this type of reactor is capable of considerable improvement, leading to significant reductions in the cost of generating electricity.

Other Types of Nuclear Reactors

'So much for thermal reactors. There are, of course, other types of nuclear reactors which may be developed for the production of power, and which may be more suitable for the smaller power outputs or for marine propulsion, and there are others again which in the future may lead to a more efficient use of the uranium fuel, and so result in lower generating costs.

'I cannot possibly deal with all the alternatives, but I will mention three or four that are particularly interesting. It is possible to construct a reactor using ordinary water both as the moderator and the coolant fluid, but because of the relatively high neutron-absorbing power of water it is necessary to use uranium which has been enriched in Uranium 235, and this is a costly process involving the construction of large gaseous diffusion plants. Much research and development work has been carried out on this system but serious problems have to be overcome, the most important of which are the development of suitable fuel-elements and canning materials to resist corrosion. By replacing the water with a hydro-carbon or oil it may be possible to avoid these problems.

'As I mentioned earlier, the development of satisfactory fuel elements capable of high burn-up—that is, a high utilisation of the available energy in the fuel—is one of the central problems facing the nuclear engineer, but by carrying the fuel either in solution or as a slurry it might be possible to avoid this particular difficulty. Two such systems are being investigated—the homogeneous reactor, where uranium sulphate is dissolved in heavy water, and the liquid-metal fuelled reactor, where uranium is dissolved in a liquid metal such as bismuth.

'Finally, I would like to mention a very important project now in the development stage in Britain. It is known as the fast power breeder. This system operates on the fast fission cycle, that is with neutrons travelling at speeds ten thousand times faster than those in a thermal reactor. For a variety of reasons this system should have such a high neutron efficiency that the conversion factor—that is, the number of atoms of new fissile-material produced per atom destroyed—is greater than one, and thus in theory it should be possible to extract energy equivalent to about a million tons of coal per ton of uranium or thorium.

'The United Kingdom Atomic Energy Authority is building a large prototype of this fast breeder at its reactor testing station in the north of Scotland, and scientists and engineers engaged on this project firmly believe that it will ultimately enable us to supply the entire power requirements of the United Kingdom from a mere few thousand tons of uranium or thorium per year.' (*Broadcast in 'London Calling Asia'*)

'Market Scene,' by Kenneth Long

'East Sussex Engineering Company, Ground Floor Shop,' by F. J. Yates, was awarded the first prize of £150

Painting the Industrial Scene

DAVID HOLMES discusses an unusual exhibition held in Chelsea to show the results of a competition organised by a large steel firm. The 220 works on show were selected as the best out of more than 1,200 submitted by 600 artists on the theme of 'Industrial Britain'

YOU might not expect steel companies to be interested in art, and as a whole I do not expect they are. But here is a steel company—one of the biggest in Britain—doing more than being merely interested in art. This company—Richard Thomas and Baldwins—has become an art patron: not in the usual way of commissioning this well-known painter or that to execute an impressive portrait of the chairman but in what, to my mind, is the far more imaginative and useful way of inviting a host of lesser painters (week-end painters, art teachers, students, and others) to submit two pictures each on the subject of 'Industrial Britain.'

The word 'industrial' was to be interpreted in the broadest sense, not meaning simply factories and machinery but also streets and landscapes which bear the mark of industry; work of any kind, and any workman at his job or at his leisure. The company was not, of course, offering to buy these paintings, although in the end they did buy several of them: the affair was organised as a competition, with a first prize of £150 and many lesser ones.

Some 600 painters responded, with only a sprinkling of well-known names among them. Their 1,200 pictures went before a formidable panel of judges—established artists and critics most of them—who for reasons of space had to reject four out of every five. The selection was not an easy task. 'Inevitably, there were at least fifty paintings about whose

'Tyneside Shipyards,' by John Ellison, won a £50 prize: one of the works which showed how stimulating industrial landscapes can be for the painter

excellence there could be no doubt whatever,' says one of the judges: 'Equally inevitably, there was a good deal that fell below the reasonable standard that every jury has a right to demand. But between these two extremes the level of good paintings was surprisingly high.'

These 220 pictures that came to be hung at this exhibition in Chelsea made an exciting show. As I went round I saw hardly any of that air of dull professional competence without imagination which disfigures many art shows today. Some of the work was plainly untutored: perspectives here and there had gone askew, for instance, or tonal relationships did not come off. But these are failings which one occasionally finds even in some of what we think of as the best painters. There was a certain amount of 'primitive' work to be seen, but since it came from people who had clearly lived all their lives in the places they painted, or worked for long years there, sincerity and a true uncluttered vision of what they were painting carried them through.

A lot of the inspiration for these pictures came out of the steel industry, but not all, by any means. There were mines and miners, docks and dockers, fishermen and railways, and town landscapes in which all these different occupations are joined. Then there were the men and women who live in the houses and stand on the streets of such towns.

What does this steel company hope to gain from its enlightened idea? In terms of profit probably nothing at all; but there are two good things they have in mind. One is that other wealthy industrial concerns may be encouraged to make similar expeditions into art patronage and so help painters who are much in need of help. The second is that other painters who come to see this exhibition should discover what a stimulating place to the painter's eye the industrial scene can be. (Expanded from a broadcast in 'Radio Newsreel')

A 100-guinea prize went to Alfred Daniels for 'General Ironworks, Earls Court'

OUR WAY OF LIFE: 10

RONALD HAMBLETON, a Canadian playwright and poet who has had many opportunities to study the English at close quarters, offers some reflections on two prominent facets of character which he regards as anything but superficial: politeness of manner and fluency of speech

English as She is Spoke

IT has always impressed me, as it has impressed many others, that the two prominent facets of the English character are politeness and fluency: politeness of manner, and fluency of speech. But is it quite suitable to elevate these possibly superficial characteristics into such dignity as to make them part of a way of life? I think so, but I admit that the matter takes some looking into, perhaps even some getting used to.
