## SPECIAL RED TUBES

The present "Special Red Tubes" include a high-mu twin triode, 5691; a medium-mu twin triode, 5692; and a sharp-cutoff pentode, 5693. They are for industrial applications where 10 000-hour life, rigid construction, uniformity, and stability are paramount. The electrical characteristics, of the 5691, 5692, and 5693 are very similar to those of the 6SL7-GT, 6SN7-GT, and 6SJ7, respectively.

### • RCA - 5691 •

#### HIGH-MU TWIN TRIODE

RCA-5691 is a high-mu twin triode designed and manufactured for critical industrial applications. In such service, it is particularly useful as a voltage amplifier.

In addition to the features illustrated on page 8 this type has its heaters for the two triode units connected in series so that failure of either heater in bridge circuits makes both units inoperative.

The 5691 is similar to the 6SL7-GT except that it has twice the heater current (0.6 ampere). It is recommended as a replacement for the 6SL7-GT only where provision for the increased heater current can be made, only where the operating conditions are within the ratings of 5691, and only where long life, rigid construction, extreme uniformity, and exceptional stability are needed. If the 5691 is operated at the higher maximum ratings of the 6SL7-GT, the full advantages of the 5691 will not be obtained.

## • RCA - 5693 •

### SHARP-CUTOFF PENTODE

RCA-5693 is a sharp-cutoff pentode designed and manufactured for critical industrial applications. In such service, it is particularly useful as a high-gain resistance-coupled amplifier.

This tube can be operated with a grid-No.1 resistor having a value as high as 40 megohms depending on the operating conditions as given on page 7.

The electrical characteristics of the 5693 are similar to those of the 6SJ7. The 5693 is recommended as a replacement for the 6SJ7 only where the operating conditions are within the ratings of the 5693, and only where long life, rigid construction, extreme uniformity and exceptional stability are needed. If the 5693 is operated at the higher maximum ratings of the 6SJ7, the full advantages of the 5693 will not be obtained.

\*The cathode and grid-No.2 bypass capacitors and blocking capacitors have been chosen to give output voltages at 100 cps (f<sub>1</sub>) which are equal to 0.7 of the mid-frequency value. For any other value of (f<sub>1</sub>), multiply the values of cathode bypass, grid-No.2 bypass, and blocking capacitors by 100/f<sub>1</sub>.

†This peak output voltage is obtained across the grid resistor of the following stage at any frequency within the flat region of the output vs frequency curve, and is for the condition where the signal level is adequate to swing the grid of the resistance-coupled amplifier tube to the point where its grid starts to draw current.

5693

OPERATION CHARACTERISTICS

$E_f = 6.3$  VOLTS    PLATE VOLTS = 300    GRID-N<sup>o</sup> 3 VOLTS = 0

CURVE	GRID-N <sup>o</sup> 2 RESISTOR	GRID-N <sup>o</sup> 2 SUPPLY VOLTS
1	0 MEG.	100
2	0.25 MEG.	300
3	0.5 MEG.	300
4	0.75 MEG.	300

THESE CURVES ARE BASED ON THE FOLLOWING VALUES:  
 $\Delta I_k = 300 \mu\text{AMP}$ ,  $\Delta I_{g1} = 0.1 \mu\text{AMP}$   
 EXPRESSING THESE VALUES AS A RATIO, WE HAVE:  
 $\frac{\Delta I_k}{\Delta I_{g1}} = \frac{300}{0.1}$  OR 3000

FOR THOSE APPLICATIONS PERMITTING OTHER VALUES OF  $\Delta I_k$ , A NEW RATIO OF  $\Delta I_k / \Delta I_{g1}$  CAN BE CALCULATED. THE VALUES OF  $R_{g1}$  AS READ FROM THE CURVE MUST BE MULTIPLIED BY A FACTOR WHICH IS THE QUOTIENT OF THE NEW RATIO DIVIDED BY THE OLD RATIO. FOR EXAMPLE, IF THE NEW RATIO IS 6000 THE MULTIPLYING FACTOR IS  $6000/3000$ , OR 2, AND VALUES OF  $R_{g1}$  AS READ FROM THE CURVE ARE THEREFORE MULTIPLIED BY 2.

NOTE: TRANSCONDUCTANCE CURVES WERE OBTAINED WITH GRID-N<sup>o</sup> 2 RESISTOR AND CATHODE RESISTOR SUITABLY BYPASSED.
