INDEX

INTRODUCTION

IN this seventh edition of **Hi-Fi Year Book** we make two major changes. First, we accept the prodding of our many regular readers, and retrace our steps (more or less) to the point at which we first came in—to 1956, Edition No. 1. In that year book we published a series of very informative articles on almost all the subjects which the book covered in directory form; and we have been asked, annually, ever since, to revert to that original line for future editions.

In point of fact we have often tried to do so, but many things have stood between us and our intentions. For instance, in our second edition (1957) we were caught up in the complications which seemed to envelop the whole business of "hi-Fi"; and reference to our first and second editions will bear this out. 1956 saw the awakening of the general public as a whole to a hobby which had previously been the very personal affair of a limited few. A dozen manufacturers suddenly appeared on the horizon to join company with every one who had, previously, laboured enthusiastically to fill the demand. Scores of items of new equipment demanded attention and recognition.

★

Then came stereo. Then tape. Then home construction. And so on. And what we had originally planned to be a fairly "leisurely" type of production got out of hand and pulled us along with it. And also, in fairness to our own specialist contributors (who by then were working overtime in order to cope with our demands for a newly established "*Hi-Fi News*") we were forced to agree with them when they argued with us that they were saying monthly, and in full, what we were urging them to say again annually. And so it was that the **"Year Book"** developed more and more into a catalogue of the available products, with the addition of occasional informative articles to cover the various sections, as and when the genuine demand made them applicable. Then, two years ago, with the increasing overlap of the interests of audio and cine enthusiasts, we introduced a Cine Section. And that, finally, brought about a drastic change of policy—for cine sound also began to expand to a size and importance that demanded that we must either drop it entirely or do considerably more justice to it.

★

This year, therefore, we have dropped all cine subjects from the **"Hi-Fi Year Book"**, and have published a completely separate **"Cine Year Book"** in its first edition. And to make full use of the space thus vacated we have endeavoured to cover the present-day scene of Audio and Hi-Fi subjects with full-length articles by experts. Some of the writers are comparatively new to our regular readers: others have been followed for several years in this and our monthly publications. Stanley Kelly has found time to produce two welcome contributions for this edition—on pickups and on microphones; and his knowledge and practical working experience with both need no bouquets from us. George Tillett again contributes a most informative article on amplifiers. Arthur Wayne provides a much needed clarification of the "tuner" position. Ralph West writes once more on speakers. Graham Balmain brings Decibels under control and also strikes a new and unusual line of approach to tape recorders.

Each of these contributions is, in its own way, a unique and valuable essay. There is a gap of some six years between these writings and those which surveyed the Hi-Fi scene as it was when we first published this Year Book. In the intervening period much has happened—not only in the laboratories and the manufacturers' production departments, but also in the art of sound recording and reproduction as a whole. Though the production side of things may truly be said to have "settled down", enormous strides have been made, in terms of thinking and of practical development. **"Hi-Fi Year Book"** (1962 Edition) summarises all this in its customary Directory Sections, and it also brings its readers the very readable views, discussions and thoughts which link up the unspoken questions of the enthusiast with the practical achievements of the industry.

★

It is universally accepted that "Hi-Fi" equipment, as made in the factories of England, is the best obtainable. It has been our privilege to list and to present the details of this equipment to the world for several years in this annual. We hope that this seventh edition will be as useful to its readers as its previous editions have proved to be, and that its revised editorial policy will provide its regular followers with even greater pleasure and valuable reading material. To those readers who have found the "Cine Section" in our 1960 and 1961 editions a useful guide, we apologise for its 1962 omission—but we sincerely recommend to them the newly created **"Cine Year Book"** which now deals with the whole subject of Cine, in all its sub-sections, far more comprehensively than was ever possible in its previously condensed form in the parent **"Hi-Fi Year Book".**

★

In conclusion may we say that, to the best of our ability, this edition carries as complete and as accurate a summary of the available products that a continuous and co-operative association with the many manufacturers has made possible. Also, so far as it has been possible to do so, all details of equipment have been listed and illustrated under their appropriate headings. We do, however, recommend that our readers study the "post script" pages which we have included as an additional service for manufacturers who were unable to provide us with data by the press dates laid down.

Whilst every effort has been made to check all details and prices for accuracy, and to include all items of equipment currently available on the market, no responsibility can be accepted for omissions or inaccuracies.

THE DYNAMIC DECIBEL

By Graham Balmain

"THE **DeciBel** is a unit representing electrical power ratio. One-tenth of a Bel, q.v.".

"The **Bel** is a dimensionless logarithmic unit representing (originally) the ratio of two electrical powers, and defined by the expression:

$$N = \text{Log}_{10} \frac{P_2}{P_1} \text{ Bels.}$$

It is now used widely of ratios between other electrical quantities and is also applied to analogous relationships in magnetism, acoustics, etc. The unit is named after Alexander Graham Bell, inventor of the telephone, in which industry it was first used (under the name of 'Transmission Unit') to replace the 'standard mile' as a measure of loss in cables".

And that, some would say, is all there is to it. Yet it would be wrong and sometimes misleading to consider Bels and deciBels only in terms of the prosaic formula above. Although there is little hint in these imaginary glossary entries of their being anything more than an engineering convenience based on a mathematical device, the logarithm, the more romantic idea that they are an explicit acknowledgement of a natural law does clothe the bare sticks a little by giving some logical background to their use. One can't always, so to speak, see the wood for the logs. However, let us start at the beginning.

x 10,000,000

By setting up suitable microphones, amplifiers, voltmeters and other acoustical engineering paraphernalia, we can measure the intensity of sounds ranging from the just-audible level at the "threshold of hearing" to an uncomfortable volume at the "threshold of pain". On the average, the intensity of the latter would be about 10,000,000,000,000 (ten million million) times that from the former, and this evidently represents the possible variation of useful sound level at our ears.

Yet who can say that the loudest bearable noises actually *sound* that much louder than the quietest audible? Or that an orchestral tutti, fortissimo, *sounds* twenty million times louder than the softest violin solo, or normal speech one hundred times as loud as a whisper?

"threshold of pain".

It is in fact very difficult to judge loudnesses in terms of ratios at all. One finds it much easier to think of *differences*; thus one can fairly readily say that the *difference* in loudness between sound A and sound B is about the same as that between B and C, and so on. Various investigators have in this way built up scales of loudness differences covering the whole useful range, a typical example of which is reproduced in the table:

The typical sounds, though interesting and perhaps wryly amusing, are not really very helpful to us. What *is* useful is the arrangement of the two left-hand columns of the table, where the horizontal lines are spaced to represent equal differences in loudness, as detected by the ear. The figures they indicate in the 'Intensity' column represent the corresponding measured intensity ratios, expressed as 'powers of 10' as well as in clear.

Add to Multiply

First, you will notice that wherever the intensity is *multiplied* or *divided* by ten, a corresponding constant amount is *added* to or *subtracted* from the loudness. This holds also for other factors, of course;

Intensity	Loudness Scale	Typical Sounds
10,000,000,000,000 = 10^{13}	13 Bels = 130dB	Threshold of pain.
1,000,000,000,000 = 10^{12}	12 Bels = 120dB	Jet Aircraft at 100 ft.
100,000,000,000 = 10^{11}	11 Bels = 110dB	Hammering on steel at 20 ft.
10,000,000,000 = 10^{10}	10 Bels = 100dB	Pneumatic drill at 20 ft.
1,000,000,000 = 10^{9}	9 Bels = 90dB	Diesel truck at 15 ft.
100,000,000 = 10^{8}	8 Bels = 80dB	Very loud radio.
10,000,000 = 10^{7}	7 Bels = 70dB	Busy city street.
1,000,000 = 10^{6}	6 Bels = 60dB	Noisy office.
100,000 = 10^{5}	5 Bels = 50dB	Normal speech.
10,000 = 10^{4}	4 Bels = 40dB	Average house.
1,000 = 10^{3}	3 Bels = 30dB	Whispered speech.
100 = 10^{2}	2 Bels = 20dB	Quiet country garden.
10 = 10^{1}	1 Bel = 10dB	Minimum outdoor noise.
1 = 10^{0}	0 Bels = 0dB	Threshold of hearing.

in general, equal intensity ratios result in equal loudness differences.

Second, you will see that the powers of 10 for each ratio also change by equal amounts for equal differences in loudness, and they would therefore serve well as units in a loudness-difference scale. In fact they are already used as such; the intervals between them are each one *Bel*, corresponding to an intensity ratio of 10. Thus for instance 2 Bels means a ratio of 100, 4 Bels means a ratio of 10,000, and 13 Bels covers the whole useful intensity range of 10^{13}:1. However, these units are inconveniently large for practical work, so they have been divided each into ten deci-Bels (dB), which have become the familiar working units. This gives us the loudness scale in the middle column of the table.

Eleven minus one plus

Readers whose school mathematics has not escaped them entirely will probably remember that the power to which 10 is raised to produce a given number is called the *logarithm* of that number. The loudness scale is therefore a logarithmic one, and since it was constructed from listening tests, it follows that the hearing sense itself must have a logarithmic response to changes in sound intensity.

At first sight this may seem a rather odd state of affairs. That the ear, potentially so sensitive to distortion of sound, should itself be a non-linear device is perhaps hard to imagine. Nevertheless, there are sound physiological reasons for its being so, and it is in good company; all the other bodily senses—touch, taste, smell and vision—have logarithmic responses to external stimuli. If they had not, we should either lead most uncomfortable lives or have a much more massive nervous system. As things are, you will see that it is quite natural to judge the intensity of stimuli such as sound in terms of our logarithmic reactions to them, and to express them in logarithmic units.

Once this idea is accepted, it seems convenient to use the same kind of scale when dealing with physical quantities which are related directly or indirectly to such stimuli, or are analogous to them. The logarithmic sensitivity rating of photographic film is one example, the expression in dB of differences in the electrical output of audio amplifiers another.

The use of the Db

Thus we refer to the frequency response of a piece of audio gear as being flat within a dB or two over a certain range as a measure of how well the tonal balance of the input is preserved in the output, or as so many dB up or down at some point when it differs. We speak of the gain of an amplifier being so many dB when the output is that much higher than the input which produces it. We say that a pickup is × dB more or less sensitive than another in terms of output voltage, a recording head y dB more or less sensitive than another in terms of input current requirements. We can even use deciBels to describe variations in the mechanical modulation velocity of a disc groove or the magnetic flux in a tape track.

All this can become rather confusing, and no less so because the deciBel seems such an elusive quantity. A volt is a volt, but deciBels are jacks-of-all-trades, rootless, shifting and entirely dependent on

circumstances. You cannot reasonably ask "where is a deciBel" any more than "where is an inch"; it all depends on where its ends happen to be, and this in turn depends on what you are measuring. The only constant in either case is the distance between the ends, the difference in position or level between two points.

So every time we use deciBels we must have some point of reference. The phrase "a loudness of 100dB" is meaningless (however much that pneumatic drill annoys you!) unless we add "above the threshold of hearing".*

We normally avoid the clumsiness of that expression by calling them "*phons*" instead of dB, which immediately refers the measurement to this particular loudness scale. Electrical engineers have similar ways of tying down their reference points; for example, the symbol "dBm" implies a level in dB relative to a power of one milliwatt developed in a 600 ohm resistor. But there is neither the need nor much opportunity for any such device in hi-fi practice; we must see that every deciBel has two ends. Beware of the specification which says: "Noise-60dB". It *should* mean 60dB below maximum useful output—which should in turn also be defined—but it *could* mean almost anything, and, expressed in this way, probably does.

For power ratios only?

To return for a moment to the rather severe definition of the unit at the beginning, we have, I think, accounted reasonably well for 'dimensionless' and 'logarithmic', which leaves: '. . . . representing (originally) the ratio of two electrical powers. . . .'. It is better not to dig too deeply here, lest one falls into one's own pit.

The purists would say that deciBels should only be used of power ratios, and even then only when the impedances in which the powers are developed are equal. This idea may have been influenced by practice in the telephone industry, where transmission levels in lines are perforce measured always across a standardised line impedance of 600 ohms or 75 ohms or whatever, but it certainly has little relevance to general audio work. For one thing, the impedances encountered in a recording or reproducing chain may range from ohms to megohms; for another, the only point at which the actual power developed is of any interest at all is the output of a power amplifier.

Average house.

We are usually much more interested in voltages (or sometimes currents) because, as well as being proportional at any point in the chain to the sound input, they are directly and usefully comparable from point to point. The latter is not true of power levels; it is quite possible, for instance, to have a pre-amplifier with a power gain of unity (0dB) in which the signal voltage is nevertheless raised by a very useful factor of 100 (40dB) or more, solely because the output load impedance differs from the input impedance.

At this point you are probably complaining loudly that according to the table a factor of 100 converts to 20dB, not 40.

* Normally assumed to correspond to sound pressure of 0.0002 dynes/cm².

Ratio	0·2	0·25	0·3	0·4	0·5	0·6	0·7	0·8	0·9	1·0
dB	−14	−12	−10	−8	−6	−4½	−3	−2	−1	0
Ratio	1·0	1·1	1·25	1·4	1·7	2·0	2·5	3·0	4·0	5·0
dB	0	+1	+2	+3	+4½	+6	+8	+10	+12	+14

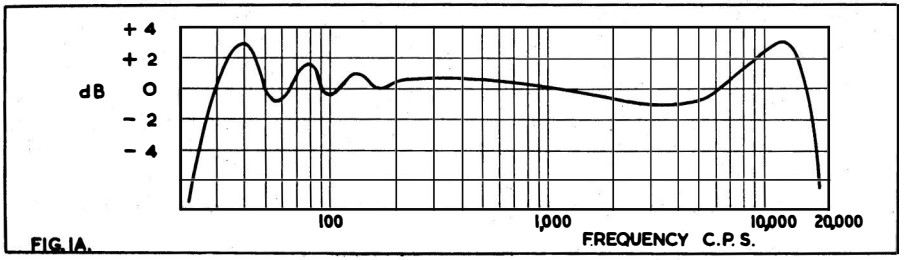

Fig. 1a. *Recorder frequency response plotted on log frequency scale and in log output units on linear vertical scale.*

So it does, for power ratios. But however much we apply deciBels to voltage or current ratios, they remain basically a measure of power ratio. Since power is proportional to the square of the voltage or the current involved, a voltage gain of 100 times implies a power gain of 10,000 times, which gives us our 40dB.

A point for purists

Here the purists will—quite justifiably—join you in complaining. An amplifier with a power gain of both 0dB and 40dB? It is impossible, of course, and again the differences in impedance are responsible for the anomaly. What we are in fact doing is adopting, quite openly, a convention that voltage ratios are expressed in dB without accounting for impedance differences. It is frankly an expedient for getting the benefits of a logarithmic scale without having to conform to all the rules, but one which has already been made respectable by usage.

Under this convention, then, a voltage or current ratio is represented by twice as many dB as an equal power ratio. Thus a power ratio of two corresponds to 3dB, a voltage ratio of two to 6dB (approximately). Note, however, that there is no basis for the popular misconception of 'power dB' and 'voltage dB' as separate units. If the signal level into a power amplifier increases by 6 dB, the voltage and power fed to the loudspeaker both increase by 6 dB also; the difference is that the voltage is doubled while the power is quadrupled.

Conversion tables

The table gives a useful range of approximate ratio/deciBel conversions for voltages and currents, and analogous quantities such as disc modulation velocity or tape modulation flux.

More accurate and detailed tables are published in various radio and electrical diaries, most electronic and audio textbooks, and in pamphlet form by the British Sound Recording Association.

There are several incidental advantages in using logarithmic scales, quite apart from their natural relationship to our hearing. The most obvious is that of using logarithms at all, that one can get away with merely adding or subtracting where one would normally have to multiply or divide. Perhaps more familiar to readers of this journal is that it saves paper by compressing unwieldly ratio scales in graphs, frequency-response curves and so on.

Compressed curves

More than this it saves paper *economically*. If that sounds redundant, or just plain silly, bear with me a moment and look at the curves in Fig. 1. The first shows the frequency response of a medium-priced tape recorder in the usual, familiar form, with a logarithmically proportioned frequency scale on the horizontal axis and a linear dB scale vertically. This recorder is typical of its kind with a slightly uneasy bass quality and a noticeable treble peak: appreciable variations to the critical listener, but by no means intolerable.

Curve (b) shows parts of the same thing plotted on linear frequency and voltage output scales—to draw the whole curve to the approximate scale of the bass end would need about 14 feet horizontally. Finding suitable paper would obviously present problems, and inspecting the curve even more; apart from the length overall, the treble scale is quite ridiculously expanded. And we can certainly do without the exaggerated corrugations in the bass. The recorder just doesn't sound *that* bad. Compress the whole horizontal scale? The treble peak would look reasonable, to be sure, but one couldn't really learn

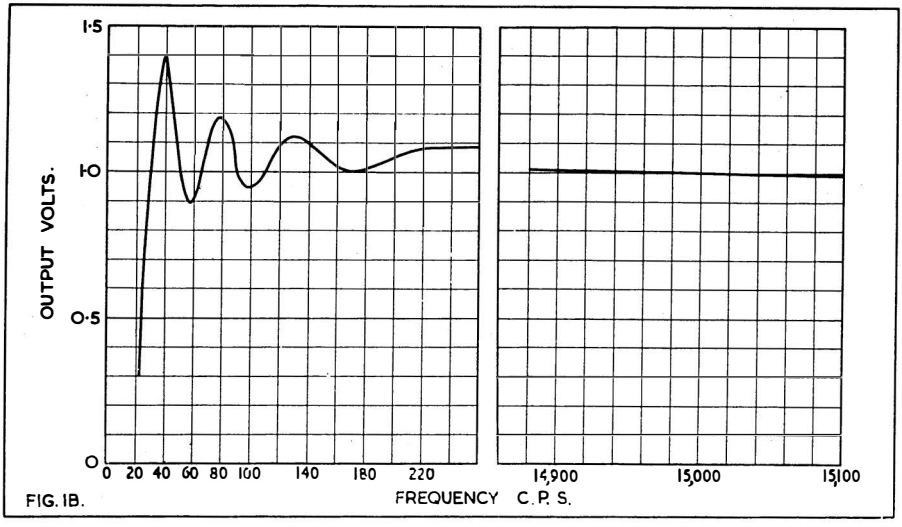

Fig. 1b. *Parts of Fig. 1a. plotted in linear units on linear scales.*

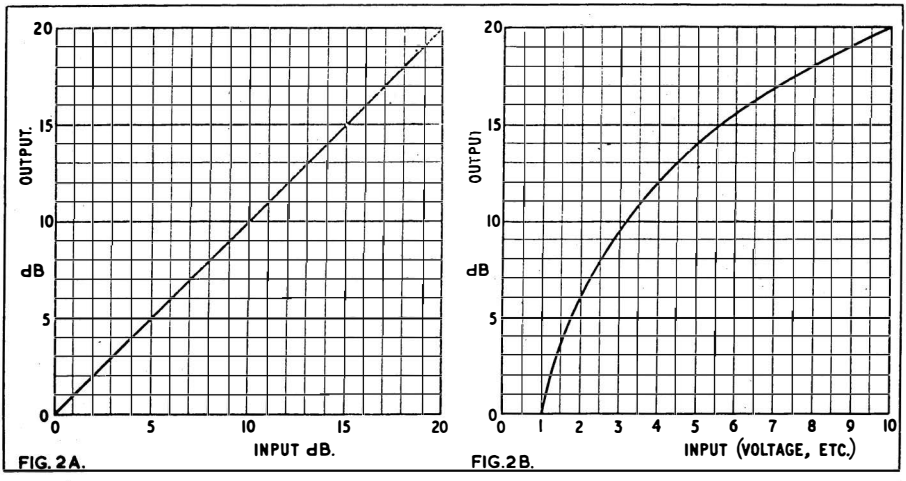
much from the whiskers at the left-hand end. One wastes paper either way.

On the other hand, the curve based on logarithmic scales shows significant information clearly wherever it occurs (which is often true, incidentally, of other kinds of relationship where large ratios are encompassed). They are equally helpful when one merely tabulates a series of suitably spaced readings, or simply watches a dB meter.

This little exercise in absurdity brings out another point: our sense of pitch is also logarithmic. The curves do not prove it, of course, but they do serve to remind us that for example, the musical octaves we appreciate as equal intervals of pitch represent 2:1 frequency ratios. Again, as you can see from curve (a), equal ratios correspond to equal differences (of pitch as represented by length, in this case).

However, one must always be careful to see that the scales one uses are compatible if graphs are not to be misleading. **Fig. 2** gives an illustration of the danger of not doing so.

Much the same kind of awkwardness can result in a more practical way from so apparently trivial a matter as the wrong



How to make a linear relationship (a) appear non-linear by using incompatible scales (b).

choice of a volume control for an amplifier. Use a linear potentiometer (in which the resistance and voltage tapped-off by the slider is directly proportional to its rotation angle), and the sound leaps out at you suddenly as soon as you begin to turn the knob clockwise from zero, increasing only slightly thereafter.

What is needed is a control whose resistance/rotation characteristic offsets the logarithmic loudness response of the ear by making the voltage rise more slowly at first and then progressively faster and faster as the knob is turned, so that the *loudness* of the output is proportional to rotation; in short, a reversed logarithmic (or 'exponential') law. This kind of control is called 'logarithmic' for reasons which I have yet to discover. Perhaps the man who named it had been reading "Alice Through the Looking-Glass" . . .

Returning to those busy city streets, full of pneumatic drills and diesel trucks, surrounded by noisy offices with jet aircraft at 100 ft. overhead, I find there is one rather obvious loose end to tidy up. Loudnesses have been treated here as though they were always steady values, as from a siren sounding "all clear" or the B.B.C.'s tuning signal, and changes in loudness as though they were clear-cut and discrete; whereas we know from experience that the sounds mentioned above, and most others, vary considerably in loudness from moment to moment and between examples. Change is the essence of informative or entertaining sounds: change of pitch and rhythm as well as of loudness.

The way in which the loudness of everyday sounds changes is usually pretty complicated, but is fairly easy to imagine in terms of fluctuations about an average value. Consider first a steady sound which suddenly changes in loudness to a new steady value. The minimum such change which the average ear can detect in everyday sounds is about 1dB at medium values of pitch, so any change greater than this will be detected almost however quickly it occurs. There is a lower limit, of course; a drift of 1dB in ten seconds or even 6dB in a minute might easily be overlooked, but in general one can readily detect a step in loudness as opposed to a drift.

Now consider the same sound starting at loudness A, stepping to loudness B and returning after a moment to A. In general, this also will be readily detected if A-B is greater than 1dB, provided that the whole process does not occur too rapidly. However, we find that such a change becomes less and less impressive as its period decreases below about 50 milliseconds, so that a loudness pulse shorter than this, measured at so many dB on fast-acting instruments, might *sound* much less than the measured value.

Changes of Loudness

Our hard-won loudness scale is obviously in danger of breaking down here, unless we have an instrument for measuring everyday sounds which reacts to their loudness fluctuations in the same way as our ears do. Such an instrument is the 'Volume Unit' (or VU) meter, which is used widely by professional engineers as a modulation indicator in sound systems. The Volume Unit might well be called a 'dynamic deciBel', for the meter has a speed of response approximating to that of the ear; while it will register the true values of loudness steps or slow variations, its response to rapid fluctuations represents their aural effect.

The VU meter

The VU meter is not, in my view, a good modulation indicator, precisely because it cannot respond fast enough to register even the average value of the rapid transient loudness peaks which so easily overload a sound system. It is perhaps a pity that the application has been emphasised to the exclusion of any acknowledgement of this limitation, because the meter really is very useful when that limitation is recognised as an intentional design feature.

We have wandered far from the 'dimensionless logarithmic unit' which started us off, but I hope some of the implications of the title will have become clearer along the way. Although the deciBel is indeed a useful practical unit for the engineer, the hi-fi enthusiast and the writer of euphemistic advertising copy, it is far from being the lifeless number which this might suggest. It is a symptom of a natural law, and a fairly precise expression of our personal reactions to one element of sound. It represents change in quantities whose essential interest is in change, in circumstances where Nature works to resist change by compressing its effect. In the widest sense, the deciBel is truly a dynamic unit.

THE DISC STEREO PICTURE 1962

by Stanley Kelly

THE year 1961 saw no startling innovations but rather a steady consolidation of development and techniques in the art of disc record reproduction. The record companies are now consistently producing magnificent stereo discs which aesthetically and technically are pretty nigh perfect. At the same time the pickup manufacturers have now thoroughly assimilated the radically new techniques of stereo hill and dale reproduction, as opposed to the lateral "push/pull" reproduction which has existed since Berliner invented the lateral type recording on disc some 70 years ago.

It should be remembered that at the advent of stereo the first pickups available were crystal, and of necessity the techniques were immature and the results crude (by comparison with 1962) in the extreme. The active element of the pickups was Rochelle Salt with concommittent variability with temperature and humidity. With monaural reproduction this not very serious but with stereo reproduction, where there may be a difference in the temperature gradient of the two crystals, variation in sensitivity of each channel and crosstalk would be the inevitable result.

★

The first serious attempt at producing stable magnetic design was of Continental origin and for a short time it held the field. Some years previously the *Decca* engineers had been working on the problem of reproducing stereo, parallel to their development of the *Teldec* recording system. This is logical because it is foolish to put something on a disc unless you have at the same time the means of getting it off again.

The result of from 7 to 10 years of research was the *Decca ffss* pickup, which at the time was years ahead of anything produced anywhere in the world. Its frequency response was remarkably extended and smooth, crosstalk was more than adequate and the needle tip impedance remarkably low, and even today it is still in the top three or four pickups available irrespective of price.

In the meantime the *Brush Clevite Corporation* of America have developed an entirely new crystaline material under the pseudonym of PZT: these letters stand for lead zirconate titanate. This crystal, which is a ceramic material, has a sensitivity several times greater than the original barium titanate elements and due to the novel form of construction known as Multimorph, the mechanical parameters were such as to render the crystal ideally suitable for transducers in stereo pickups. The crystals operate in flexure and by means of suitably proportioning the drive members between the stylus and the crystals it is possible to obtain crosstalk factors in excess of 26 dB over the middle range of the spectrum.

★

The magnetic pickups have in the meantime developed into two classes, (1) the lateral hill and dale summation system outlined in Blumlein's Master Patent of 1951 and exemplified in the *Decca ffss* and (2) the moving magnet transducers used almost exclusively in America. There is no doubt that the hill-and-dale lateral summation system is capable of giving superior results to any other form of transducer, but it is a difficult and costly pickup to manufacture, requiring precise limits which would normally be outside the capabilities of the average pickup manufacturer. With the moving magnet system considerably wider production tolerances

can be used but with a small reduction in performance, and it is to the credit of the American manufacturers concerned that they have now produced some very fine transducers using the moving magnet system, but there is no difficulty in proving mathematically and demonstrating with suitable test equipment that the English system is capable of lower tip mass and greater consistency of performance both with temperature and other conditions on an individual pickup and from pickup to pickup, under conditions of quantity production. All of which brings us to the measurement of the various parameters.

The starting point of any pickup is record and stylus wear and it is important that these be reduced to an absolute minimum. It can be shown that in order to render the life of a record practially indefinite the playing weight of the pickup should not exceed half a gramme. This at present is an impossibility, but at playing weights of 2 to 3 grammes the life of the stylus is in excess of 2,000 hours and the life of the record (especially when kept clean and static free by means of *Dustbug* or similar device) is certainly many hundreds of playings. Be it noted in parenthesis that the writer has one of the first *ffss* pickups using $\frac{1}{2}$ thou point and adjusted for $3\frac{1}{2}$ grammes playing and the flats did not exceed 0.00035 in. diameter until 1,600 playing hours.

It is normally accepted that a flat of the above dimensions is about the maximum that can be expected for high fidelity wide range reproduction. With less stringent requirements the flat could be increased to possibly 0.0005 in. and this would have increased the life of the stylus by several hundred hours.

★

Intimately associated with the playing weight is the restoring force—or as it is usually termed, the compliance of the pickup—and the stylus tip mass; although fundamentally these are static units it is usual to treat them as dynamic values, the compliance being measured at some low frequency usually 30 c/s, and the tip mass at a high frequency generally about 10 k/sc. With modern crystal pickups, where there is a considerable amount of mechanical resistance associated with the systems, in order to render the response substantially flat it is tacitly assumed that the mechanical impedance so measured is purely reactive,

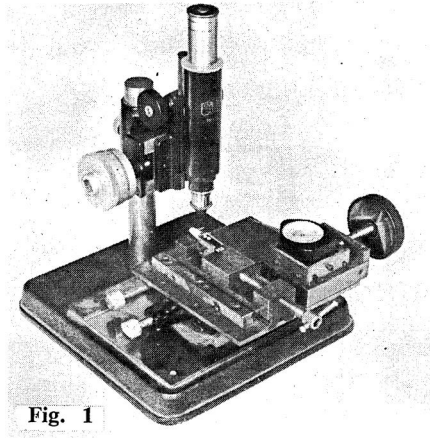


Fig. 1

and it is then equated in terms of compliance or mass. To the purist this is wrong but in practical politics it is not very important because it does relate to the ability of the pickup to satisfactorily trace record, and also it relates these values in terms which are commonly appreciated by the enthusiast.

Generally there are several methods of measuring compliance and mass, and photograph **Fig. 1** shows a basic static method of measurement. This consists of a calibrated microscope and a method of playing a known force (actually a spring balance). The balance arm is connected to the stylus by a stiff member and the displacement of the stylus for known forces is measured by the travelling microscope. The micrometer is calibrated in microns (one millionth of a meter) and taking a gramme approximately being equal to 1,000 dynes each micron in displacement of the stylus per gramme of applied force is equal to 10^{-7} cm/dyne, and with average pickups it is possible to measure the compliance of the pickup to two significant decimal places. This method, as stated above, is a static measurement and does not take into account any frictional or other forms of loss resistance associated with the dynamic system of the pickup.

★

Fig. 2 shows a dynamic compliance and mass measuring system by the resonance method. It consists of an electro magnetic drive on to a free armature of known mass (actually 10 grammes). The pickup under test is clamped on to the massive arm which to all intents and purposes is infinitely stiff and cannot move in a lateral direction

because it is supported on knife edges. The coil is driven from a beat oscillator and the velocity of the armature is measured by a capacitative probe. The resonance of the pickup compliance and the free armature is indicated by maximum output from the millivoltmeter connected to the capacitative probe, and the compliance is then calculated from the known driving mass of the armature and the resonant frequency of the system. This gives the true dynamic compliance which is not effected by the resistance associated with the restoring force of the pickup.

This latter value is determined by measuring the frequencies at the −3 dB points relative to the peak frequency from which the mechanical losses are then computed. At the same time the pickup is then driven in the high frequency spectrum (10 to 25 kc/s) and the resonances due to the mass of the stylus tip and the stylus recording compliance is shown by the usual rise in output from the pickup associated with this form of resonance. Knowing the record compliance, the mass is easily computed. Unfortunately with extremely highly damped pickups of current crystal variety the resonance is so effectively damped that it cannot be easily detected and recourse to the "non-tracking" method is used. This method consists of playing the pickup at a known frequency and velocity (from standard test records) and then reducing the playing weight until the pickup just does not track as shown by the discontinuities in the sine wave trace on the oscilloscope; from the playing weight and velocity the needle tip impedance can be computed and from that the equivalent compliance and/or mass.

★

The use of these techniques in development during the past two years have enabled designers to produce the very superb pickups which are now available. The *Decca ffss* has now been joined by the *E.M.I. EPU.100* pickup which is of the same general type, namely hill-and-dale lateral summation. A photograph of the assembly is shown in **Fig. 3** and the diagrammatic representation in **Fig. 4,** and the schematic of the connections in **Fig. 5.** It will be seen that the lateral sensing coils are connected in series and are actually on the two outer poles of the magnet system, and being a balanced system these coils will only respond to impulses in a lateral

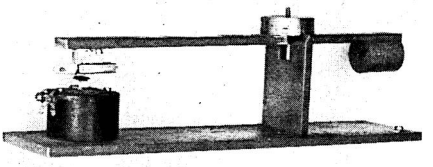

Fig. 2

direction, whilst the vertical system coils is actually one coil centre tapped, the centre tap being connected to the upper end of the lateral sensing coil and the two outers being the respective left and right hand channels. This is assembled on the centre limb magnet system which is terminated underneath the armature. Provision is made to adjust the spacing between the armature and the vertical sensing pole in order to obtain absolute equality of output between the two channels and reduce crosstalk to a minimum. The response curve of this excellent pickup is shown in **Fig. 6.**

★

Crystal type of pickups are exemplified by the *Decca Deram*, which is a high fidelity, medium priced, cartridge using the PZT cereamic material. It has a remarkably low effective mass of approximately 1½ milligrams and a very high compliance and, when used with a suitable arm, will satisfactorily reproduce any stereo record at playing weights below two grammes. The output is equalised to give a flat response without correction in the pre-amplifier, and this type of cartridge will probably be seen on the majority of medium priced, high fidelity reproducers in the future. Because of the versatility of the PZT transducers it is possible to produce a dual purpose cartridge for playing both monaural and stereo records from two separate styli. Photograph **Fig. 7** shows the "works" of one such cartridge produced by the *Goldring* Manufacturing Company. This is a relatively high output cartridge rendering the use of expensive pre-amplifiers unnecessary. The compliance and dynamic mass are such that it will satisfactorily play the majority of *lp* records at 2½ grammes and all that have been produced at present, at 3 to 3½ grammes when used with the G.60 tone arm. The response is not as smooth as the *Deram* or magnetic type

but this is to some extent compensated for by the very high output and the excellent crosstalk figures obtained, and we can expect to see many more examples of this type of cartridge on general purpose equipment of superior grade to the average run-of-the-mill radiogramophones.

Tone arms are now beginning to get the attention they deserve and the tone arm associated with the EPU 100 pickup is a case in point. *E.M.I.* state this this is an integrated stereo pickup and that in their opinion (with which the writer fully concurs) it is not possible to design a high fidelity cartridge to the precise limits required without at the same time designing a tone arm as part of the general system.

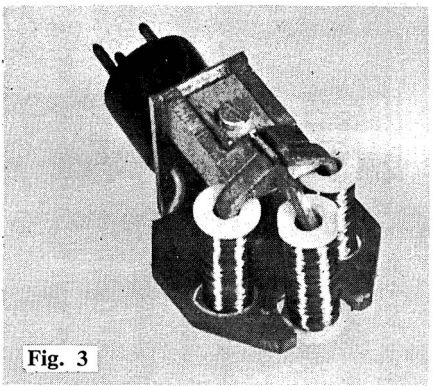

Fig. 3

The EPU.100 Integrated Arm

During experimental work on this pickup, it became apparent that conventional arms had several disadvantages when used with a high compliance pickup. Extremely careful adjustment was needed to eliminate rattle at the pivots without introducing excessive friction, and the low frequency resonance of the head and arm were excited by the slightest external disturbance. These resonances, due to the necessary compliances of the pickup and the effective mass of the head and arm, are at 8 to 10 c/s in the lateral direction, and 14 to 16 c/s in the vertical direction. The lateral resonance was particularly easily excited and this caused the pickup head to oscillate violently, often jumping several grooves of the record, while the vertical resonance produced an undesirable increase in sensitivity to motor rumble.

Although the application of a viscous compound to the pivots of the arm had the desired effect of damping the low frequency resonances, considerable difficulty was experienced in preventing the compound flowing from its correct position. A solution to these difficulties was found with a novel design of unipivot arm with built-in damping. This arm has the damping compound, now a viscous silicone fluid, situated away from the pivot, which allows closer control of the damping characteristics and suppression of the undesirable effects due to the low frequency resonances. The offset angle of the head is set to the minimum distortion value, which produces a larger than normal tracking error at the beginning of a record but allows only a small error to occur in the region of the inner grooves. This feature has enabled the production of a compact arm with a pivot to stylus distance of 9 inches.

The arm is largely constructed of aluminium alloy protected by a satin anodized finish. A cylindrical hub contains the unipivot and damping mechanism and from this projects the cranked arm with the pickup socket at its front end. Lateral balance of the arm is ensured by an offset counterweight carried on a spigot projecting from the rear of the hub. At the top of the

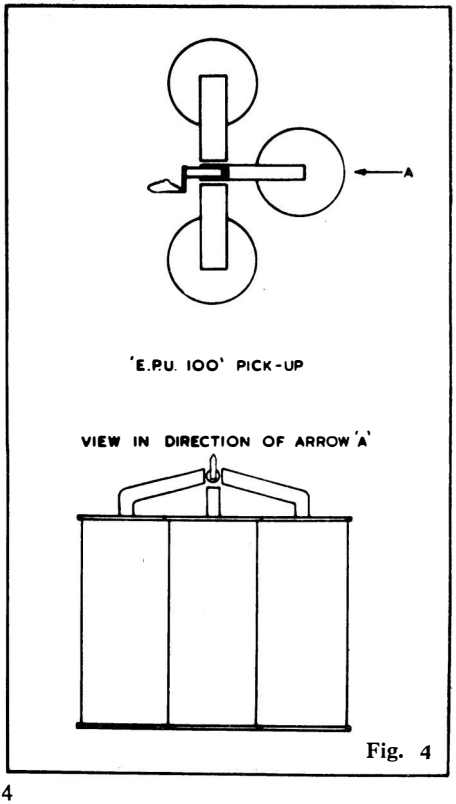

Fig. 4

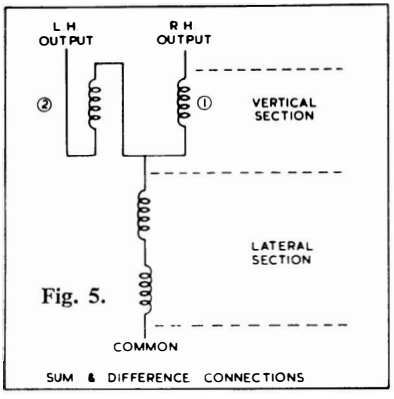

Fig. 5.

hub are the precision-finished cone and unipovot; the lower edge of the hub is re-entrant, forming an annular gallery which contains the damping fluid. The stationary part of the damping system is provided by an inverted cup attached to the pivot support. The lip of this cup is immersed in the damping fluid. Vertical movements of the arm cause the hub to rock about the unipivot, thereby displacing the fluid; lateral movements of the arm cause the hub to rotate with respect to the cup, producing a drag. The viscosity of the damping fluid has been carefully selected so that the effects of the low frequency resonances are considerably reduced. To prevent fluid leaking during transport, a plastic washer is inserted between the hub and the pillar, thus raising the hub and pressing the upper edge of the annular gallery against a rubber sealing washer in the inverted cup.

Incorporated in the supporting pillar is a lever-operated lifting and lowering mechanism which allows a controlled descent of the pickup on to the record. Although the height of the pickup above the base board has been made adjustable over a wide range, the lifting mechanism, being an integral part of the arm, does not need separate adjustment.

★

Finally, although development is never stationary, and it is extremely difficult to gaze into the crystal ball with any degree of certainty, it would appear that present day high fidelity cartridges and associated equipment are approaching the ultimate in reproduction from disc as we now know it, and without radical rethinking on recording techniques we may well see a static period in innovation for the next few years.

Goldring Manufacturing Co. (Great Britain) Ltd., 486/488 High Road, Leytonstone, London, E.11. Tel.: Leytonstone 8343.

Lenco Transcription Unit GL58. Infinitely variable speed adjustment with pre-selected stops for 16, 33⅓, 45, and 78 r.p.m. Groove location arm lowers pickup on to record as on/off is operated. Fitted with G.60 arm. Price £13 15s. (U.K. purchase tax £4 9s. 5d.)

GL70 Transcription Unit. Non-ferrous turntable, weight 8 lb. Speed may be continuously adjusted from above 80 r.p.m. to below 30 r.p.m. and from 15 to 18 r.p.m. Pre-set standard speeds. 4-pole constant velocity motor. (15 watts). W & F max. 0.2%. Incorporates L.70 pickup arm. Pickup lowering device. Price £22 10s. (U.K. purchase tax £7 6s. 3d.)

A. R. Sugden & Co. (Engineers) Ltd., Market Street, Brighouse, Yorkshire. Tel.: Brighouse 2142. Cables: Connoisseur, Brighouse.

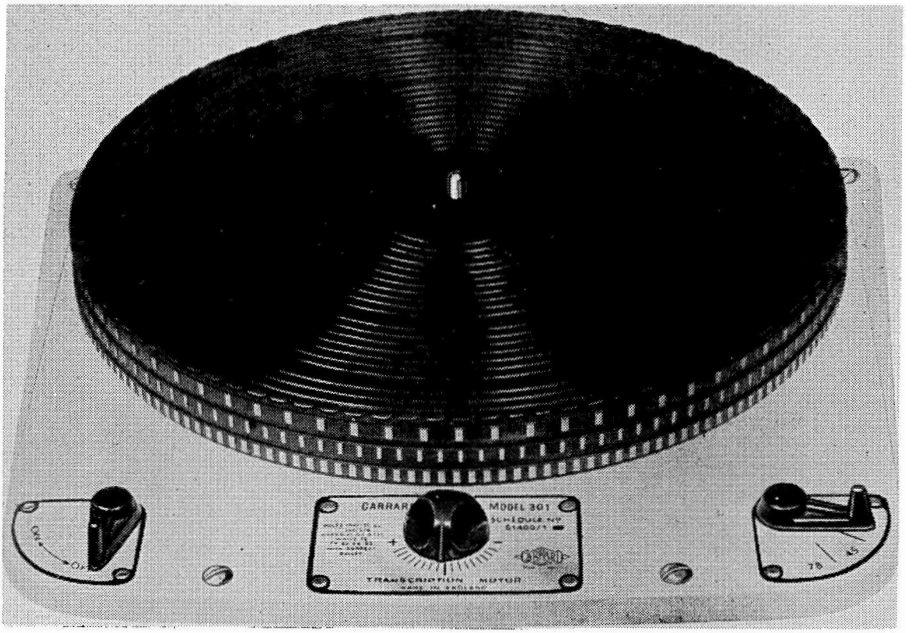
Connoisseur Transcription Motor Type B. Three speeds 33⅓, 45 and 78 r.p.m. with a 4% variation on all speeds. Precision ground and lapped revolving shafts. All bearings adjustable. Large stroboscopic disc beneath the turntable viewed though mirror with its own internal light source. Price £20 10s. (U.K. purchase tax £7 6s. 1d.)

Connoisseur "Craftsman" two speed transcription motor. Operates at 33⅓ and 45 r.p.m. fixed speeds. Full 12-in. turntable of non-ferrous material. All bearings are adjustable throughout the life of the unit. Synchronous motor. Price £14 (U.K. purchase tax £4 13s. 1d.)

Connoisseur "Craftsman" three speed transcription turntable. Requires minimum mounting space. Heavy non-ferrous 12-in. turntable. 33, 45 and 78 r.p.m. 4% variation on all speeds. Neon lit stroboscope fitted. Dynamically and electrically balanced synchronous motor. All bearings are adjustable. Provisional price £18 10s. (U.K. purchase tax £6 11s. 10d.).

Thorens. Distributed in the U.K. by Technical Suppliers Ltd., Hudson House, 63 Goldhawk Road, London, W.12. Tel.: Shepherds Bush 2581, 4794. Cables: Teknika, London, W.12.

Thorens TD124 Transcription Turntable. Four speeds with "OFF" position of selector switch between each speed. Eddy current speed control ± 3 %. Built-in stroboscope for four speeds at 50 and 60 c/s. Price £39 5s. 6d. (tax £11 11s.)



GARRARD 3-SPEED MOTOR WITH STROBO' TURNTABLE

RADIO TUNERS

by Arthur W. Wayne

THE intending purchaser of a specialized radio tuner as a satisfactory adjunct to a high fidelity system must be sure, before buying, what he really demands, and how much this is worth to him in terms of cash. Firstly, and this is absolutely fundamental to the economics of the whole matter, he must accept that he will get what he pays for, and nothing more; and that all other things being equal, the more expensive specimens in a group are usually better value in terms of lasting satisfaction.

What programmes?

The second problem is also a personal but, in addition, a technical one. What sort of programmes are wanted? If the requirement is for a limited range of material of the highest possible quality, then, for reasons to be explained, the choice must be VHF/FM; but if a wide choice of programmes is needed, including T.V. sound and the foreign stations, then there is no alternative to AM. Alternatively, both may be wanted, and many kindly manufacturers provide apparatus just for that, with FM as well as the AM bands available at the turn of a switch. But don't be carried away by advertisers' copy-writers! We are now considering *Hi-fi*—by which we understand the best possible sound and performance in our homes; and it is my experience that, in general, combined tuners, well designed as most of them are, offer but a compromise when viewed from the standpoint of the nearest approach to perfection. No doubt there will be many dissenters from this opinion, although it appears to be confirmed by one of the most (justly) respected manufacturers in the Trade, for *Quad* make sure of the best by offering for sale *either* FM or AM tuners, but not both together in one unit. *Quad*, as we all know, don't compromise.

So here is the point of decision. How much can be afforded? Then, for programmes, is it the best, is it the most, or is it a fair bit of both? (Incidentally, for the benefit of those insomniac persons who spend the small hours listening to Gluk in Upernavich discussing aerial rigs with Wun Lung Tu in Peking, even this depraved taste is catered for.)

For the uncompromising hi-fi listener, there are many makes of purely FM tuners on the market. Some of these take their power supplies from the amplifiers with which they are used, while others, enjoying the appellation "self-powered", come with these facilities built-in. While the advantage of this second sort of unit with its independance of external apparatus is not to be gainsaid, it must not be overlooked that the inbuilt extra has to be paid for, so if tuner "A" complete with integral power-supplies costs the same as tuner "B" without them, it may be assumed with some confidence that "B" is the better job from the point of view of its basic function, i.e. to be a tuner. Small power-packs are available for use in conjunction with non-powered gear at quite reasonable prices, while they are also very simple to construct. A suitable circuit is shown in **Fig. 1.**

Local Stations

FM tuners are, in effect, local station receivers, as the range of an FM transmitter is comparatively limited; but, provided adequate coverage is provided by a multiplicity of transmitters sited so as to effectively serve the areas in which they are located, this curtailment of range constitutes one of the most valuable features of FM

broadcasting—there is little or no interference from more distant stations, of the kind so distressingly apparent in AM reception. These local station characteristics operate, to the great satisfaction of the discerning listener, in another way, too, as the modulation bandwidth can be considerably extended without encroaching on the preserves of other transmitters.

It is well known that, owing to the large number of powerful AM transmitters of considerable range in Gt. Britain and in Europe, very severe limitations in respect of bandwidth are, by international agreement, imposed, in order to permit some sort of modus vivendi among the competing stations. On the medium and long wave-bands, the maximum permissible deviation around the carrier frequencies is 9 Kc/s, i.e. $\pm$ 4.5 Kc/s, a figure far below that demanded for acceptable listening; so it can be seen that AM can hardly achieve high-fidelity standards. But there are other even more serious disadvantages.

After Dark

After dark, when most listening is done, the effective range of the transmitters increases, and whistles, squeals and monkey-chatter add random distractions to detract from an already inherently unsatisfactory situation. Add the circumstance that most impulse interference, such as is caused by sparking at switch-contacts on refrigerators etc., commutators on vacuum-cleaners and electric shavers, trolley-bus pick-ups and the like is AM in character, and that the demodulation sections of AM tuners are so designed as not to discriminate against AM signals, it will be clearly seen that confusion can become worse confounded at the turn of a knob. (It does too—don't we know!)

Now, an FM demodulator—"demodulator" including the limiter in appropriate circuits—if well-designed, is insensitive to AM signals, so that random interference, which, as we have seen, is largely AM, is rejected at this stage of the tuner circuits, and unwanted background noise due to external causes is virtually eliminated. (The one most serious possible cause of proximal station interference, "capture effect", whereby closely adjacent transmissions with signal strengths above a certain critical ratio to the desired signal will compete to the entire degradation of reception, is rarely troublesome where we are concerned, owing to the comparative sparseness and wide physical separation of the transmitters. Intelligent design helps, too. In America, however, capture effect sometimes presents quite a problem, as there, many hundreds of broadcasting stations serve small local areas, some of which operate in closely adjacent territories.)

FM offers many advantages additional to those outlined above. Because of the requirements in the way of bandwidth of FM transmissions, these must be located in VHF, Band 2 being allocated for the purpose. (This is the reason for the local-station characteristic of FM broadcast transmitters.) It is thus permissible to allow the greatest possible bandwidth per transmitter—in fact, it is so generous that quality of signal is determined more by economics and engineering limitations than by proximities. That this is so is clear when the medium and VHF (metre) bands are compared.

The medium wave-band extends, in round figures, from 500 Kc/s to 1500 Kc/s, and into this 1 Mc/s are compressed x transmitters, x being a fairly large number, so that

$$\text{available bandwidth} = \frac{1{,}000{,}000}{x \text{ (a large number)}}.$$

Now consider Band 2, which extends for well over 10 Mc/s. The equation is:

$$\text{bandwidth} = \frac{10{,}000{,}000 +}{3},$$

x being the 3 transmitters per district, and the 200 Kc/s bandwidth allowed per station is obviously not going to rub elbows with its neighbours. As a matter of fact, the stations are separated by about 2 Mc/s.

Pre- and De-emphasis

Another useful feature of FM broadcasting is "pre-emphasis and de-emphasis", which helps very considerably to reduce background noise in the tuner. It must be explained at the outset that much of the noise in any tuner is self-generated, and at VHF can present a quite difficult problem. It is caused to a great extent by the emission and thermal agitation of electrons in conductors, chiefly in the valves themselves, and is generally quoted in the form "equivalent noise resistance" or R_{eq}.

(R_{eq} is greater in pentodes and other multi-grid valves than in triodes, the relevant equations being:

$$\text{Triode } R_{eq} = \frac{2.5}{gm}\ \Omega,$$

$$\text{Pentode } R_{eq} = \frac{Ia}{Ia + Ig^2}\left(\frac{2.5}{gm} + \frac{20Ig_2}{gm^2}\right)\Omega,$$

which is why VHF tuners use triodes in

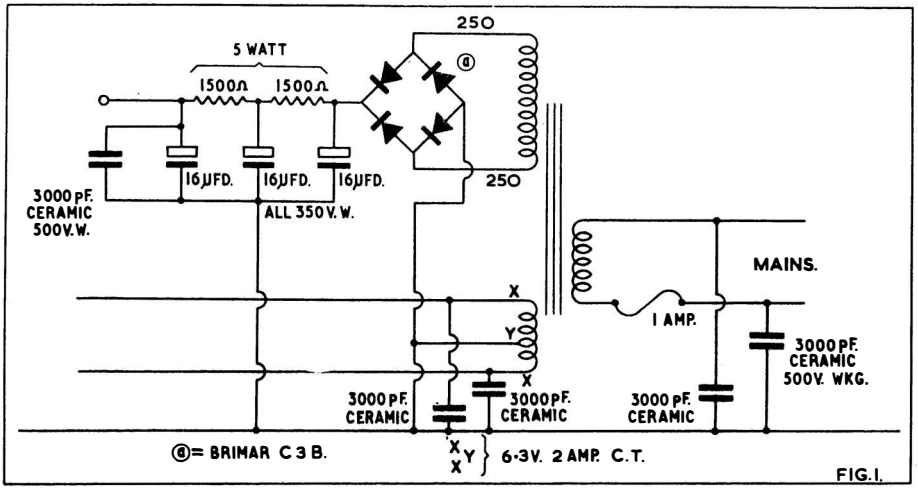


FIG. I.

R.F. and mixer stages, often to the bewilderment of newcomers to VHF.)

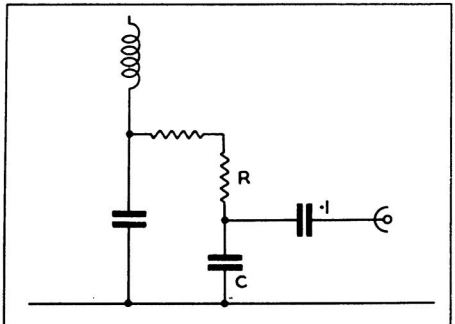
De-emphasis is nothing more than what is done when scratch becomes intolerable on worn records. We turn down the treble control. It is simply a top-cut. Now, ancients like myself may remember, in those far-off 78 days, certain American manufacturers emphasized the upper frequencies on their records, the idea being that, when the tone-control was used to minimize scratch during replay, just about enough top-cut would be brought into effect to reduce the previously recorded emphasized higher frequencies back to normal. In other words, the top was *pre*-emphasized on record, and *de*-emphasized on replay.

The device then wasn't particularly successful, as those who bought pre-war "Orthacoustic" records learned to their sorrow, although it is of course standard practice under the more sophisticated conditions of today; but it works very well in FM radio transmission and reception. All FM transmitters are so designed as to pre-emphasize the upper modulation frequencies by a certain fixed figure, — 50μs in Gt. Britain—and the tuners are arranged to de-emphasize by precisely the same amount, so that hiss and similar noises are dealt with along with the transmitter pre-emphasis (**Fig. 2**).

As we have already seen, "x" = only 3, i.e. Home, Third and Light, and some means of selecting *only* these programmes without having to chase a pointer over the dial is bound to appeal to lazy folks. Such indolents will gravitate, naturally, to the switched variety of tuner, wherein the required station is selected at the turn of a knob. It will be appreciated that such tuners must be absolutely stable so that, once correctly adjusted, they will not drift; and stability, at VHF, is no easy matter to achieve. The capacitances and inductances that comprise the tuning circuits of any VHF apparatus are very small indeed, as the following simplified formula demonstrates:

$$f = \frac{159200 \text{ Kc/s}}{LC} \qquad \begin{matrix} L = \text{henrys} \\ C = \text{pf} \end{matrix}$$

and slight variations in L and C resulting from, say, temperature changes, can cause considerable changes in the *proportions* of these constants; and cyclic and/or permanent mis-tuning can and does result in all but the most carefully designed gear. Various techniques are in common use to counter these possibilities, from most careful disposition and use of temperature com-



TYPICAL DE-EMPHASIS CIRCUIT.

FIG. 2.

pensating components to automatic means of controlling frequency—A.F.C.—whereby ± capacitance is added to the drift-prone circuits.

While it is possible to construct circuits that are virtually drift-free without A.F.C.—for example, my own firm uses this method—it is certainly easier and, on a commercial scale, probably cheaper to include it, and switched tuners (and many continuous tuned units) incorporate this type of frequency control. Unless sensibly designed, A.F.C. *can*, under certain conditions, introduce distortion, and it is possibly significant that it is becoming less popular in U.S.A., where formerly no tuner of any standing would have been without it.

With continuous tuned units, the user is compelled to perform the quite skilled operation of tuning to the centre of a wide pass-band, so some form of tuning indicator is absolutely necessary, and one is almost always incorporated. This may range from the familiar "magic eye" to an elaborate arrangement of two valve-voltmeters, the best in my opinion being the two-neon circuit fitted by *Quad*. The magic eye does well enough, but is not always to be trusted, the phenomenon of maximum signal elsewhere than in the position indicated by the eye being not entirely unknown. The cause is too involved to be discussed in this short essay, but has its roots mainly in misalignment, particularly towards the demodulator sections; and, indeed, with some types of demodulator, the ordinary magic eye is virtually useless.

Demodulators

The demodulator's—detector's in O.E.—job is, basically, to convert the amplified FM signal to AM, and two types are in general use, the Foster-Seeley discriminator and the Ratio detector (**Fig. 3**). There are others, but these cover nearly all FM tuners ordinarily available. It is generally held that the Foster-Seeley is less liable to distortion than the ratio detector, but this is not always true, at least in commercial apparatus. It is certainly easier to set up, but experience proves that, by very careful and painstaking adjustment, the ratio detector can be at least the equal of the other in the way of quality, while it has the indubitable advantage of requiring one previous stage less for efficient working. Both types can be equally effective in rejecting AM interference, but as the Foster-Seeley does not inherently discriminate against AM signals, provision has to be made in the shape of an extra limiter valve to do the job for it, whereas the ratio detector, when accurately balanced, is a very efficient AM rejector of itself.

A much quoted term in FM tuner specifications is "quieting", which, from the user's point of view, may roughly be described as signal against background noise. This is not quite the whole truth, but does convey what it usually means from the subjective angle. It is given in the form "xdb quieting for y microvolts input", y being the signal strength at the aerial input, and obviously the greater the ratio $\frac{x}{y}$ the better; but it is as well to take catalogue figures with a little discretion, as it may be reasonably assumed that quoted figures refer often to what can be done rather than what is done, although of course this is not always true. Caveat Emptor!

Good Aerials Help

Should the preceding paragraphs arouse in the reader's breast the feeling that FM provides all the earnest listener desires, it should be pointed out that there *are* some disadvantages too. Some of these are (1) a proper aerial is essential. Here, any old piece of wet string won't do at all. It must be constructed to suit the situation, and, as with all V.H.F., unless the location is close to transmitter, an aerial dimensioned so as to tune to the correct frequency is necessary. On Band 2, the length is just under 5 ft., taking into consideration the effect of adjacent structures on its performance, and it is split to form a dipole. While in good reception areas a piece of lighting flex unravelled to length and tacked round the picture-rail will suffice, in less fortunate homes the dipole must be substantially constructed and mounted as high above its own and neighbours' roofs as possible. Also, in areas towards the limits of transmission, reflectors and directors may be needed as well; but it must be appreciated that a good aerial can quite easily be the equivalent of adding a noise-free valve to the tuner, so the extra cost and trouble involved will be well repaid. Perhaps a short description of "why" may not be out of place.

A straight conductor is, in effect, a resonator similar to a closed pipe—it resonates at a wave-length of twice its own length. Broadly speaking, its self-inductance and summed self-capacitance form a parallel-tuned circuit, with maximum current appearing at a point equi-distant from the

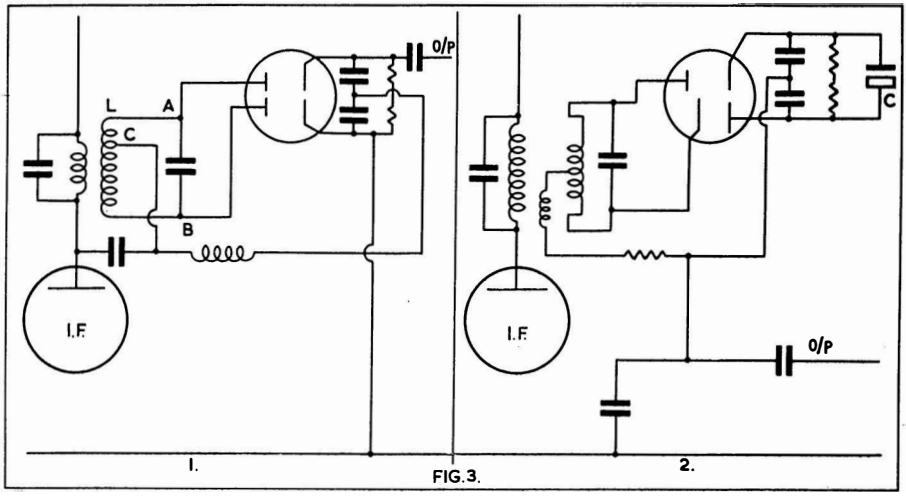

FIG.3.

Two types of demodulator— (1) *Foster Seeley*—(2) *Ratio Detector*

terminations. This centre-point is clearly the place whence to take the signal, so it is cut to form a dipole—with a characteristic z of about 70Ω—and a matching twin feeder of this impedance connects it to the input of the tuner. (Mis-matching to 300Ω inputs does not, as a rule, seriously affect performance.)

A dipole is directive, and is turned towards the local transmitter, so eliminating interference from programmes emanating from most other directions. However, the response is the same at the back as at the front, but if another conductor, the reflector, be mounted behind it, the response in the forward direction will increase; and for most locations this is a satisfactory arrangement. In poor reception areas a further improvement in gain can be achieved by the addition of yet another element, this time in a forward direction. It is known as the director, and the whole comprises the familiar three-element array.

Fig. 4 shows a plan view of the array, together with dimensions which, although not strictly theoretically precise, do not show any marked inefficiency in practice. There are many other configurations of aerial, most of which are in use in fringe reception areas. It should be noted that, with the most effective of these, gains of up to 5 or 6 dB are possible.

(2) Bound up with (1) is the matter of signal. If this falls below a certain level, background noise—$\frac{1}{\text{quieting}}$—and distortion increase out of all proportion, whereas with AM this phenomenon rarely presents serious problems.

(3) The tuned circuits. These *must* be very accurately aligned, with the "ears" of the pass-band unpronounced and absolutely symmetrical about the reference frequency. Admittedly this should also be the case with AM broadcast tuners, but misalignment in this type is not so distressingly obvious, nor is it likely to develop in the same way at the lower frequencies employed. It is always difficult to precisely align and *keep* aligned VHF circuits, and while A.F.C. can and does often help, it can also do the opposite in the way of quality.

(4) Re-radiation from the local (tuner) oscillator. In most commercial tuners intended for the hi-fi market, this particular spectre can be considered as laid; but there was—and possibly still is—one popular make of receiver that was notorious in the

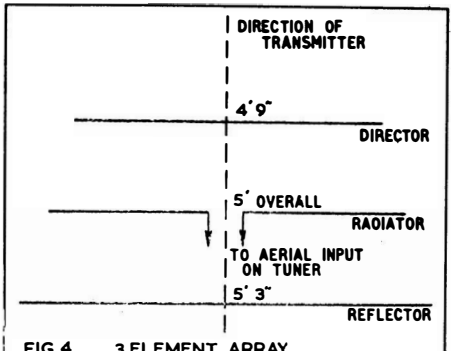

FIG.4. 3 ELEMENT ARRAY.

Trade for its transmitting capabilities. The importance of the matter will be apparent when it is realized that second harmonic radiation would fall within Band 3.

Combined AM-FM tuners

With most of these, an excellent AM performance comparable with that of a purely AM receiver is normal, so that, dependent on the number of wave-bands on the dial, most of the continentals in addition to the usual British broadcasts can be picked up with a reasonably clean background during daylight hours, and with the usual accompaniment of whistles, clicks, bangs, crashes and monkey-chatter at night. FM will usually be average to fairly good, although there are one or two manufacturers who manage to make a little more than the best of both worlds in this direction. Normally VHF/FM together with the long and/or medium bands are offered, but on some makes short-wave bands are available as alternatives or in addition. Outstanding among these latter is the Chapman type S6BS/FM with a truly striking performance on its AM bands—it has nearly the lot—and quite good reception on FM.

One or two tuners include the T.V. Sound programme, which is often considered to be the best quality transmission of all, although here the eye—or ear—of faith is sometimes discernible.

Purely AM tuners

The *Hi-fi Year Book* for 1961 lists only two, one of these being a 3 wave-band hi-fidelity unit, while the other is of communications type, with 9 wave-bands including the band-spreads. Both are outstanding in their own fields, and are, of course, the Quad AM2 and the Chapman S6BS.

Things to Come

Obviously there will be considerable developments in FM tuners in the future, as transistors alone are stimulating much thought in all electronic fields. The use of these devices demands much more than simple adaptations of circuits, and their possibilities in the way of stability are obvious, if only for the elimination of the "warming-up period". The probable increasing incorporation of the pulse-counter type of demodulator has its natural counterpart in the substitution of semiconductors in the earlier sections of the receivers, particularly in view of the lower I.F. frequencies involved. (Incidentally, it is an interesting fact that a pulse-counter demodulator was described as long ago as 1942, while Scroggie's article describing its adaptation to broadcast receivers was published in 1956.)

Do-it-yourself tuner kits

There were and probably still are a number of such kits on the market, but the most advanced appears to be the *Heathkit* FMT series, which, as is usual with *Heathkit*, enables the amateur, with an uncanny certainty of success, to produce professional results.

Advice on Choice

There is such a bewildering variety of excellent commercial tuners on the market that selection, for the newcomer or the man contemplating a change, can cause considerable heart-searching and sleeplessness. It may be stated, at the outset, that all of the tuners described in the Directory section will do their jobs efficiently and well, and any advice that will be given in this invidious situation can be only on the basis that personal prejudice is likely to be a deciding factor.

It is clear that I cannot discuss my own firm's products, but of the few other makes that have passed through my hands, the two *Quad* tuners and the *Lowther* Mark V impressed me most. I liked the *Armstrong* AM/FM and the *HMV* 558/AM/FM also, although the *Armstrong* appeared to suffer some slight curtailment of the upper audio frequencies; but this, I understand, has now been corrected. The *Chapman* S6BS/FM on its AM short-wave bands was a delight to handle, even at 3 a.m.! and although the specimen I tested had had much use over quite a long period without any service attention whatsoever, it might have come direct from the factory, so excellent was its performance. Its FM reception I found average.

The *Goodsell* tuners are very good value, and, as I know from experience extending over some years, most reliable. The *Dulci* FMT/2 and H4T/2 do their work excellently, although the FM performance of the H4T/2 is not quite equal to that of the FMT/2, which has the excellent feature of switchable A.F.C.

It would seem that progress in this field has been steady but unspectacular, with the old favourites proving how well they were designed in the first instance.

DIRECTORY OF RADIO TUNERS

★ In the abridged specifications of these directory entries the following abbreviations have been used: **P.s.n.**—Power supply needed; **A.F.C.**—Automatic frequency control.

Acoustical Manufacturing Co. Ltd., St. Peter's Road, Huntingdon, Hunts. Tel.: Huntingdon 361 and 574. Cables: Acoustical.

F.M. Tuner. Variable tuning. Range 87.5-108 Mc/s. Special double neon display ind. P.s.n. 330v at 27 mA; 6.3v at 1.85 amps. Size 10½ × 3½ × 6 ins. Price £21 (U.K. purchase tax £7 17s. 6d.)

A.M. II Tuner. Variable tuning. Range 5.8-18.5. Mc/s, 185-588 and 800-2070 metres. Magic Eye ind. P.s.n. 330v at 35mA; 6.3v at 1.2A. Size 10½ × 3½ × 6 ins. Price £24. (U.K. purchase tax £9.)

★

Armstrong Wireless & Television Co., Warlters Road, Holloway, London, N.7. Tel.: North 3213/4.

F.M. Tuner T4B. Variable tuning. Range 87-108 M/cs. A.F.C. Ratio disc. Self-powered A.C. 200-250v. Size 10½ × 4½ × 7½ ins. Price £17 (U.K. purchase tax £5 9s. 1d.)

A.M./F.M. Tuner. ST3 Mk. 2. Variable tuning. Range F.M.: 87-108 Mc/s; A.M.: M.W. 187-570 metres, L.W. 1053-2,000 metres. A.F.C. Ratio disc. Miniature bright line ind. Self-powered A.C. 200-250v. Size 12⅜ × 5½ × 7½ ins. Price £21 1s. 3d. (U.K. purchase tax £6 15s. 3d.)

A.M./F.M. Jubilee Mk. 2. Tuner amplifier chassis. Variable tuning. Range F.M.: 87-108 Mc/s; A.M.: M.W. 187-570 metres, L.W. 1053-2,000 metres. A.F.C. Ratio disc. EM. 81 ind. Self-powered A.C. 200-250v. Size 12 × 7 × 8 ins. Price £23 9s. 3d. (U.K. purchase tax £7 10s. 8d.) Also see Amplifier Section.

Stereo 12 Mk. 2 A.M./F.M. Tuner amplifier chassis. Variable tuning. Range 87-108 Mc/s, 187-570, 1053-2,000 metres. A.F.C. Ratio disc. Magic Eye ind. Self-powered. Size 14¼ × 9 × 5½ ins. Price £33 1s. 6d. (U.K. purchase tax £10 12s. 3d.)

NEW DEVELOPMENTS IN TRANSISTOR AMPLIFIERS

by George S. Tillett

THIS last year has seen very few noteworthy developments in the amplifier field although there is no doubt that much work is going on behind the scenes—especially with transistors. Before discussing transistor applications, let us take a look at the valve amplifiers. One of the new models released quite recently is the *Armstrong* PCU-25 and A20 combination which was reviewed in the *Hi-Fi News* for April 1962. The most interesting feature of the control unit is the ingenious method of using the treble control in conjunction with the low-pass filter in order to obtain a variation of "cut-off" frequency and attenuation; in other words, as a type of "slope control". **Fig. 1** shows the circuit in which VR2 is a conventional passive type treble control with a "hinge" around 1,000 c/s. Operation of the switch SI (which short circuits R15) changes its characteristics to those shown in the diagram (**Fig. 2**). Note that the filter itself is basically a bridged "*T*" type (R10, II, C7, 8 and 9). The negative feedback loop necessary to make the response asymetrical is formed by R13 which is connected around V2. A second feedback loop is taken at point X to the output of the 3rd valve.

Obviously this arrangement is not so versatile as a system having both treble and slope controls, but it is a very good com-

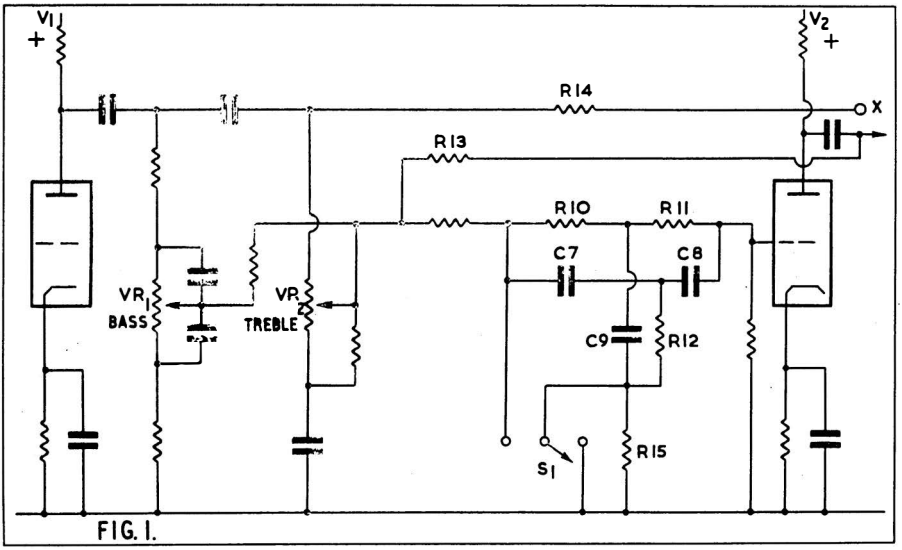

FIG. 1.

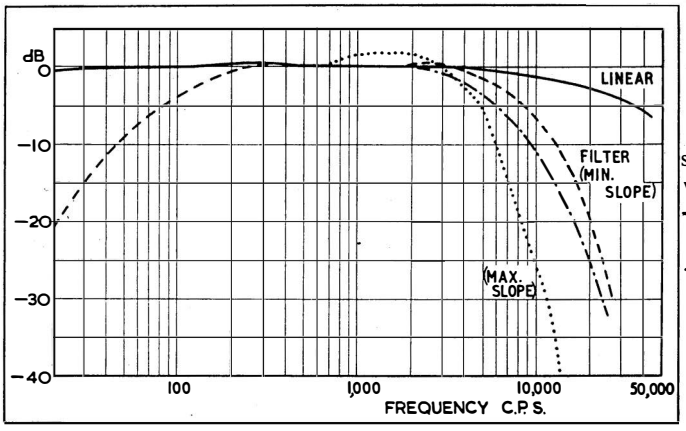
promise. As far as many people in this country are concerned—the fewer the knobs to fiddle with the better! I said as far as *this* country is concerned, because the situation is rather different in America where the designers feel that the more knobs they can cram on the better—and it is not uncommon for an amplifier to have as many as 15 controls, including volume, loudness, centre channel, blend plus tone controls for each channel. Whether this trend is due to the "audiophile's" pre-occupation with the "mechanics" of the thing, rather than with the end product, is a moot point. In the fullness of time doubtless the reaction will set in, and already it is worthy of note that the new American *Heathkit* amplifier has a hinged cover to hide the non-essential knobs!

Rogers redesigned

The *Rogers* HG88 has been redesigned and now has an increased power rating of 12 plus 12 watts. The output valves are ECL86's and the switched step-style volume control has given way to the more conventional close matched variable composition type. Other new models from *Rogers* include the "Cadet" stereo amplifier and control unit. This model has an output of 6 plus 6 watts at a distortion of 0.25% and the input sensitivity of 75mV makes this an ideal combination to use with the *Decca* "Deram" ceramic pickup. Although this is a relatively inexpensive amplifier costing but £27 10s., it is noted that a filter switch is fitted. From *Radford* comes news of further developments in amplifier design technique. **Fig. 3** shows the circuit of the latest MA15 amplifier which is claimed to have a phase margin of just under 90 degrees up to 3 Mc/s, with an amplitude margin of 25 dB. The HF step network (R1, C1) does not attenuate appreciably below 15 Kc/s, thus nearly full feedback is applied up to that frequency and the distortion at 15 watts is only 0.6% at 20 Kc/s. Note that a triode-pentode is used as a phase-splitter instead of a double-triode. R2 and C2 form the low frequency step network to maintain stability at the low end of the scale. Note also that the feedback loop is switched with the change in load impedance. Also to be released is a doubled up version of this power amplifier known as type STA15. Improvements have also been made to the DSM control unit now re-named the SC2. Triodes are used in place of the pentodes with an increase in signal to noise ratio of from 3 to 6 dB. Other features of the DSM, such as the rumble filter cutting at 35 c/s and the cathode follower output stage, have been retained.

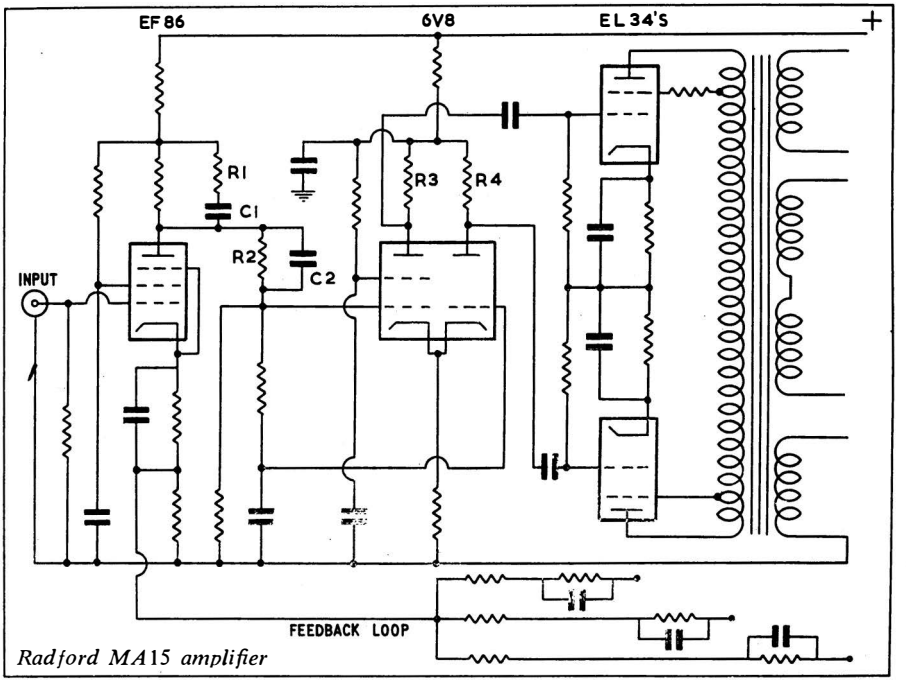
Transistors for Hi-Fi

The advantages of transistors for portable radio receivers are well known, but what is less certain is their suitability for Hi-Fi amplifiers—in other words, just what can we expect to gain? After all, it can be argued that valve amplifiers with their low distortion, wide frequency range etc., can hardly be improved on—or can they? Let us take a look at the transistor claims. (1) Greater efficiency (lower power consumption). (2) Lower heat dissipation. (3) Higher damping factors possible for the output stage. (4) Lower hum level. (5) Lower voltages mean a saving in components. (6) No output transformers needed. (7) Greater compactness. (8) Transistors have a longer life. A formidable list, to which must be added the possible advantage of no warm-



The filter characteristics of the *Armstrong* are shown in the diagram which shows minim--um and maximum slopes, plus an inter--mediate position.

★



Radford MA15 amplifier

up time (I cannot see that this is important but it *is* quoted by the American adverts!).

The modern valve amplifier is still relatively inefficient and the average 10 plus 10 watt unit would consume some 150 to 200 watts from the mains, thus most of the power is dissipated in the form of heat. In contrast, a transistor amplifier of similar rating would use between 50 and 70 watts. This is partly due to the inherent efficiency of transistors, the absence of heater current and also to the fact that high power transistor output stages are of the "class B" type or similar. The lower heat dissipation is of course a function of the higher efficiency. Higher damping factors are explained by the large amounts of negative feedback necessary to extend the bandwidth and reduce the inherent distortion, as well as for stabilising the operating parameters. Feedback loops of 40 to 60 dB are quite common with resulting damping factors of 100 and over. The lower hum level is mainly due to the absence of a heater supply for the first stages, but the smaller mains transformer means a worthwhile reduction in hum fields which are always a problem with small integrated amplifiers. So what do these claims add up to in practice?

First, the lower power consumption is obviously not too important as it means but a saving of a few pence per week at the most. (No doubt I will be contradicted by Mr. MacTavish of Aberdeen!) The lower heat dissipation scores a point, for it does enable an amplifier to be mounted quite near to (even underneath) an FM tuner without causing any dire effects. It could also mean that an amplifier could be enclosed in a small wooden free-standing cabinet if so desired. The higher damping factor as such is of no great importance, as any increase over 20 (which equals an output impedance of $\frac{1}{2}$ ohm) is quite negligible compared with the 15 ohms of the speaker itself.

Lower Hum Level

Lower hum level is undoubtedly a factor to consider—especially with amplifiers working at inputs of 2 or 3 millivolts. The saving likely to result from the lower voltages used would not be very much, and the reduced cost of the mains transformer may well be offset by the higher costs elsewhere. The inherent low impedance of transistors *does* mean that output-transformerless stages are a practical possibility, and in theory at any rate the scrapping of the output transformers offers better stability, better frequency response and superior transient reproduction. In any

case, transistor output transformers are far less elaborate and costly than valve types; in some circuits simple centre-tapped chokes can be used instead. There is no doubt that smaller, more compact amplifiers will give greater scope for styling and presentation whilst being somewhat easier to install. How about longer life? At present this is certainly true of the ordinary small types of transistor but it is rather less certain of the higher power devices. For Hi-Fi applications a power of 10 plus 10 watts is usually considered necessary, and most valve amplifiers are in this class. If a lower output is acceptable, a transistor amplifier could be operated from batteries and even a 20 watt amplifier could be powered by a car battery. (I should say two car batteries, as most high power transistor amplifiers will use a 24-volt or higher supply.) This may well have applications for those living in remote parts of the world without an electric power supply so I must include battery operation in the possible list of advantages.

Some disadvantages

Now let us take a look at the other side of the picture; are there in fact any snags? Yes, here are some of them:

(1) Transistors are "heat-conscious". (2) The spreads in characteristics are much larger than we have become accustomed to with valves. (3) The frequency response is restricted at the H.F. end. (4) The noise level is higher.

The operating condition of transistors, especially high power types, is related to the working temperature. Furthermore, if the collector current can increase without control, a condition known as "thermal runaway" is reached, when the transistor will destroy itself. These problems can be overcome by the provision of heat sinks and reasonable ventilation plus the proper stabilising precautions, which take the form of DC feedback loops, potentiometer bias supply, thermistors etc. Variations in gain and other parameters can be dealt with by using large amounts of negative feedback, which will also increase the amplifier bandwidth—provided the right types of transistor are used. As for noise level, again provided that the right types of transistor are used, this is no longer a serious problem. The real difficulty—at the time of writing—centres on the production of suitable types of transistor (low-noise and output types) at a reasonable price. It is now possible to produce a 20-watt transistor amplifier in the laboratory—an all-transistor amplifier which is quite comparable with a valve type but the cost is prohibitive. This situation will of course change, and probably sooner than many people anticipate.

Transistors versus Valves

Before considering some design features of transistor amplifiers it will be as well to compare the operation of transistors with valves. The theory of transistors was very ably dealt with by Stanley Kelly in the 1957 Hi-Fi Year Book, and more detailed information is available from a number of publications[1], so it is not proposed to go very deeply into the mathematical analysis of semi-conductors. However, for those not conversant with transistors the following simple facts must be borne in mind; transistors are low-impedance devices and are *current* operated—unlike valves, which are basically high impedance and nearly always *voltage* amplifiers.

The material used in the making of a

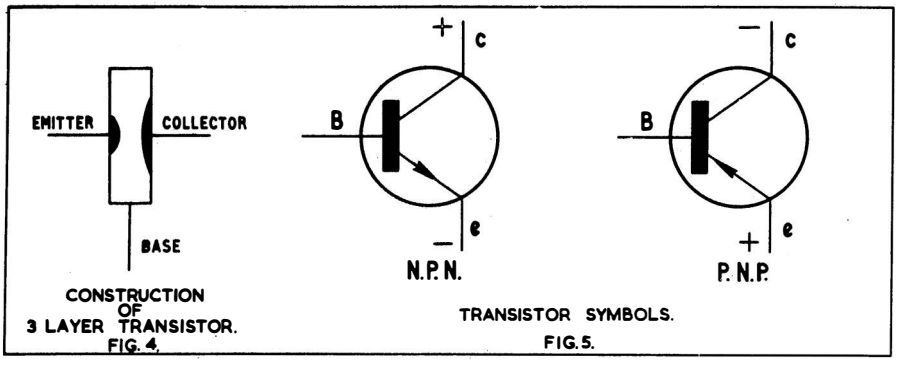


Fig. 4. *Construction of 3 layer transistor.* **Fig. 5.** *Transistor symbols (NPN and PNP).*

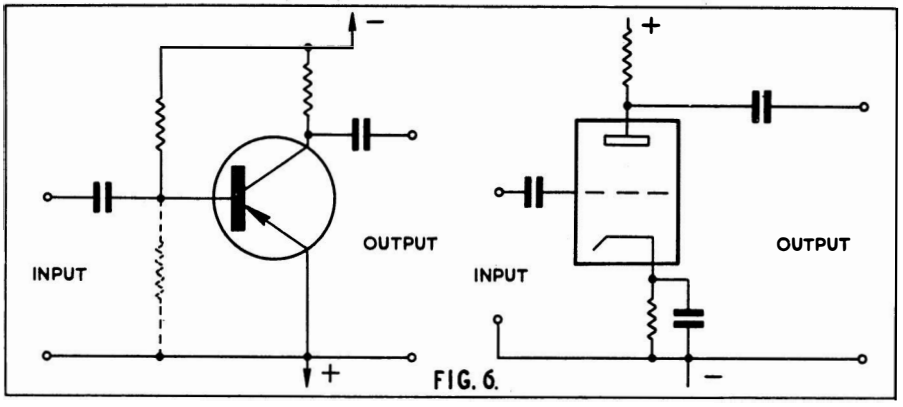

Fig. 6. *Transistor, emitter grounded, and valve equivalent.*

transistor is known as a "semi-conductor" and is usually of germanium or silicon. **Fig. 4** shows the arrangement of a junction type, the middle layer of the "sandwich" is called the *base* and one outside layer is called the *emitter* and the other the collector. Two basic types are made, one PNP and the more common NPN—the letters indicating the kind of germanium used. "*P*" means that there is an electron *deficiency*, or "hole", in the structure and "*N*" implying an *excess* of electrons. **Fig. 5** shows the symbols for both types, in the *NPN* kind the collector roughly corresponds to the anode of a valve, and provided it is biased positively, with respect to the base, it will absorb electrons therefrom. Varying the base current changes the voltage across the emitter junction, and thus controls the emitter-collector current. PNP types function in reverse, with the collector connected to the negative supply and the emitter to the positive. As mentioned before, most of the transistors used at present are of this kind. Now for some comparisons, **Fig. 6** shows a valve amplifier and a transistor equivalent.

The input is applied to the base (grid), and the output is taken from the collector (anode), with the emitter (cathode) common to both input and output. A typical input impedance would be about 1,000 ohms with an output impedance of some 30 K. The phase relationship would be 180 degrees. **Fig. 7** shows a valve cathode-follower stage with its transistor equivalent. Here the collector is grounded and the output is taken from across the load in the emitter circuit. Like the valve cathode-follower, the gain must always be less than unity and the output impedance low. Typical figures are: input impedance 1 megohm (varies with frequency) and output 100 ohms or less.

Practical Circuitry

Now let us turn to some practical circuits: **Fig. 8** shows a low-level pickup input

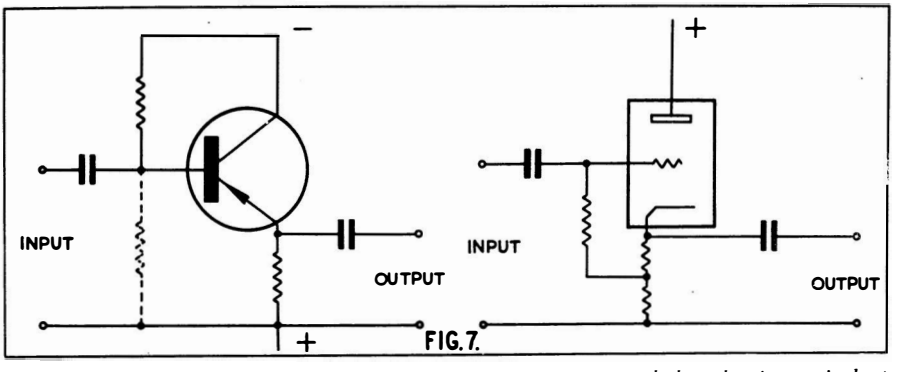

Fig. 7. *Transistor collector grounded and valve equivalent.*

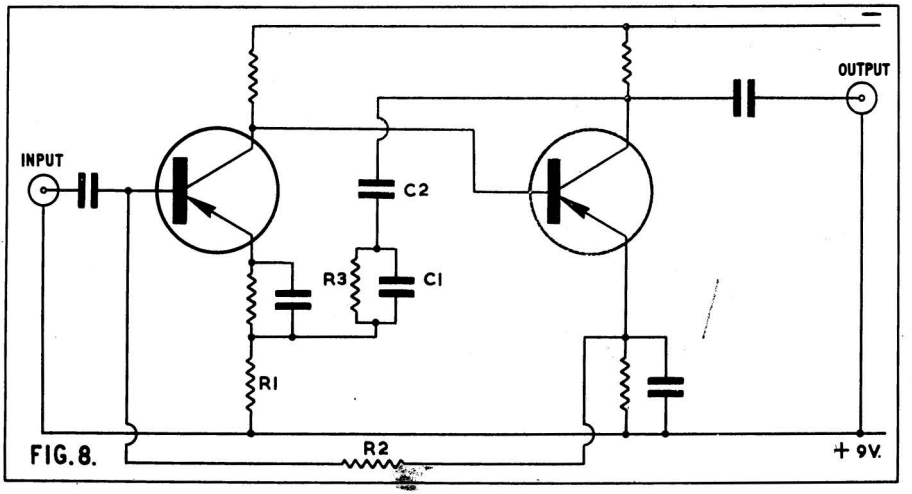

Fig. 8. *Input stage using two low-noise transistors.*

stage using the new *Mullard* low-noise AC107 transistors (or equivalent). The two are directly coupled, and equalisation is effected by the selective loop R3, C1 and C2. The omission of the by-pass capacitor across R1 gives a degree of negative feedback for stabilising purposes and increases the input impedance. Further stabilising is provided by the connection of R2 from the emitter of the second transistor to the base of the first, thus forming a DC loop. With an input of 3 millivolts this "front end' will give an output of about 0.5 volts at 1,000 c/s.

Fig. 9 shows another input circuit using two transistors. Here the equalising is effected by a loop in the second stage (R2, C1). Note that feedback is introduced into both stages by the un-bypassed resistors in the emitter circuits (R3 and R5). With both these circuits the correct equalisation depends to a certain extent on the inductance of the pickup used, and thus the values of the emitter resistors and feedback constants will only suit one particular pickup. A circuit which is effected less by the input characteristics is given in **Fig. 10**. This is a more elaborate arrangement using 3 transistors.

Note that the second transistor is of the NPN type and that both positive and negative voltage supplies are necessary. Equalisation is obtained by a feedback loop connected between the emitter of the first transistor and the collector of the second (R4, C2 and C3)—rather like the first

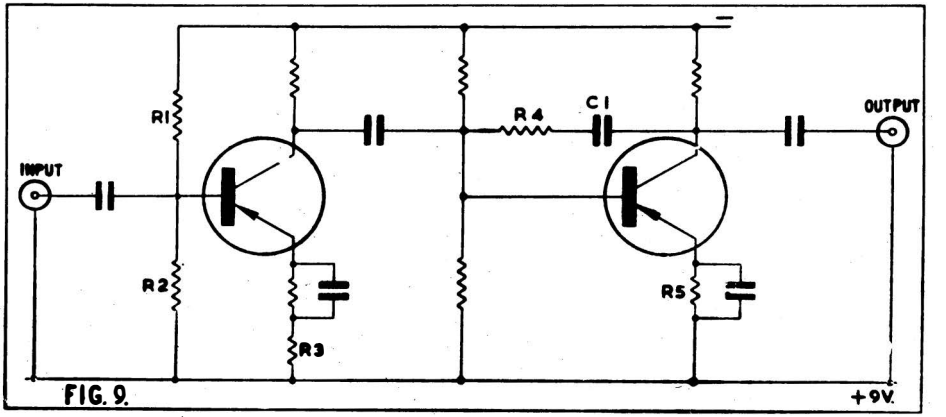

Fig. 9. 2 *transistor input circuit with equalising in the second stage (Texas instruments).*

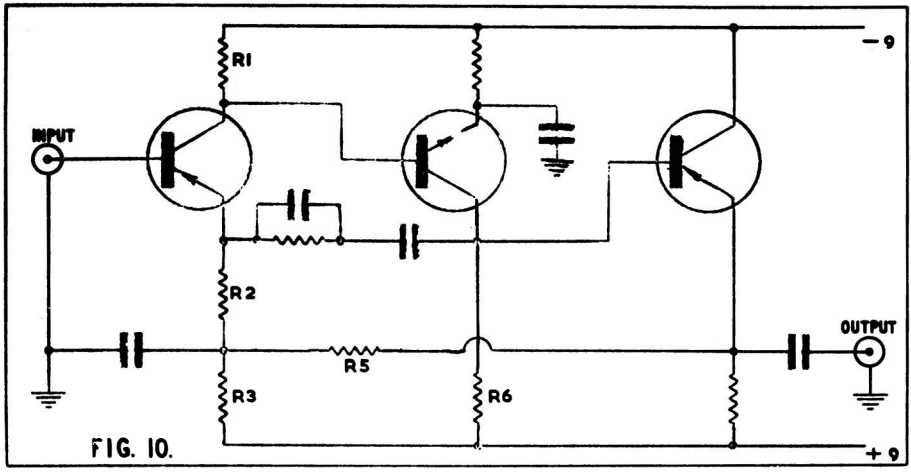

Fig. 10. 3 *transistor circuit with high input impedance.*

circuit, but in this case a larger portion of the emitter resistor of the first stage is left unbypassed. This helps to increase the input impedance to something like IOOK. The output transistor is connected as an emitter follower as shown earlier in **Fig. 7** and the output impedance is of the order of 100 ohms. C1 and R5 form a DC loop necessary for stabilising purposes.

Tone Control Systems

After the input stages come the tone control systems. **Fig. 11** shows a typical passive network for both bass and treble controls. At first sight this circuit appears to be identical with those used by valve amplifiers, but here they must be considered as current transfer networks rather than voltage networks. V1 is the volume control and V2 is the bass control and V3 the treble. All these controls would be about 50,000 ohms and C1 would be 0.25 mfd and C2 0.25 mfd. Typical values for C3 and C4 would be 0.1 mfd and 0.01 mfd respectively. These values are considerably larger than those used by the equivalent circuit in valve amplifiers. Several American amplifiers including TEC and KNIGHT use a modified Baxandall tone control circuit and P. J. Baxandall himself has given details of a tone control circuit in an article on transistor amplifiers published recently.[2]

Output Stages

A straightforward amplifying stage (or stages) which may incorporate a filter brings us to the output section which is associated with the driver stages and phase-splitter. **Fig. 12** shows a typical class

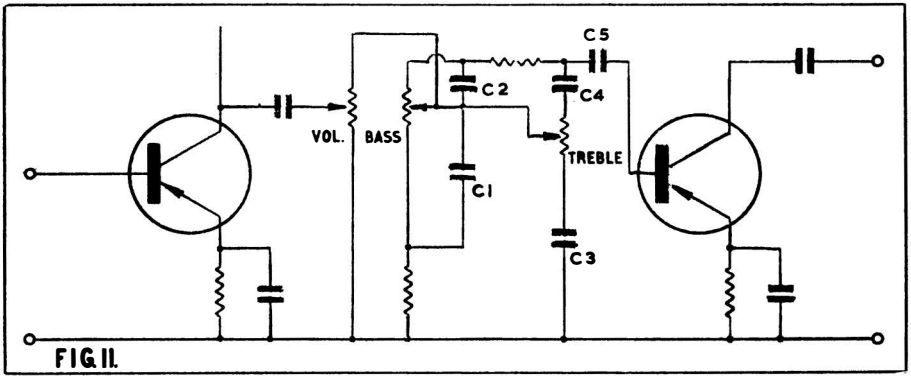

Fig. 11. *Tone control system using passive network.*

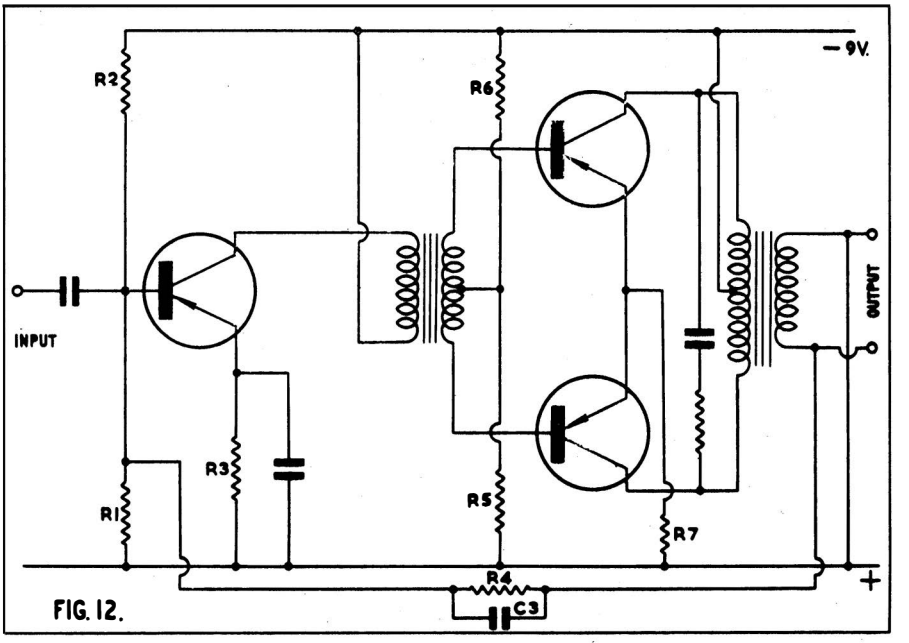

Fig. 12. *Class "B" output stage.*

B driver and output stage, as used in many portable record players and radio receivers, giving an output up to 1 watt with transistors of the OC81 class. This basic circuit is also used with larger transistors for transmitter modulators and public address amplifiers but is not satisfactory for High-Fidelity applications. In class B push-pull operation one transistor conducts while the other is "cut off", thus the two transistors amplify alternate halves of the waveform.

The three main advantages are (**1**) greater efficiency—a theoretical 78.5% against 50% for class A; (**2**) the power handling capacity related to the maximum collector dissipation is much higher, and (**3**) the amount of current taken from the power supply is related to the signal being amplified and under "no signal" conditions the power taken—the "quiescent current"—is very small.

Distortion Risks

How about the disadvantages? The answer is that unless immense care is taken with the design a class B stage will have a far greater distortion than a Class A system. The main causes are as follows: (**1**) "Ringing" can occur when the signal polarity changes at the "cross-over" point. This is most serious in the driver transformer (T1 in the diagram) and it can be reduced considerably by using a transformer with bifilar windings. (**2**) As the input swing approaches the point where one transistor takes over from the other, the input resistance of the working transistor increases to

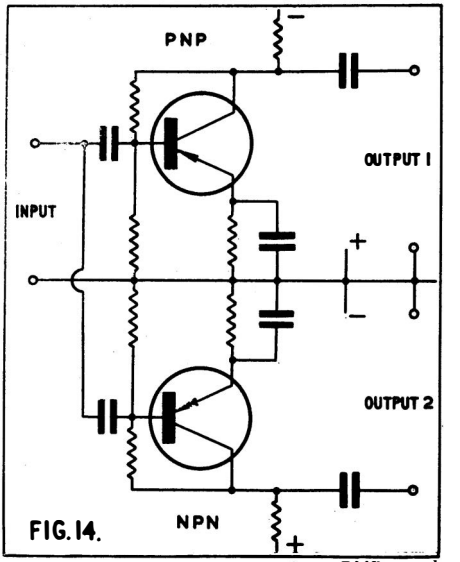

Fig. 14. *Phase-splitter using PNP and NPN transistors.*

a very high value causing a similar type of distortion to (1). This non-linearity is known as " cross-over " distortion and is very objectionable even when present in quite small percentages. The effect is not unlike that given by a faulty loudspeaker and is particularly noticeable with the reproduction of a piano. It can be reduced by applying a small forward bias so that under quiescent conditions a small amount of emitter current flows. In the diagram this potential is provided by the divider R5 and R6. (3) The current gain factor may vary over the range of applied signal swing. This type of distortion can be reduced by the application of negative feedback. (4) Mismatching the output transistors can cause considerable distortion.

Single-ended Push-pull

Apart from the obvious solution, the use of negative feedback will reduce the distortion but the maximum output will be restricted if one transistor overloads before the other. **Fig. 13** shows another class "B" output stage, this is known as the single-end push-pull arrangement and offers one or two advantages over the previous circuit. As far as small portable receivers are concerned, naturally the cheaper cost and possible reduction in size are important considerations but the absence of an output transformer is the great attraction to Hi-Fi designers. The majority of the American transistor amplifiers use this basic type of circuit known to audiophiles as the OTL (Output Transformerless) amplifier. Looking at the diagram it will be seen that the two transistors are in series across the power supply and in parallel across the load. The load impedance needed to match the transistors is one quarter of that required by the conventional type of circuit shown in the previous diagram. This drastic reduction in load impedance means that direct matching can be made with low impedance speakers. For instance using transistors of the OC81 class the load would be around 25 to 30 ohms falling to 15 ohms or less for high power transistors in the OC23 series. The resistors R8 and R9 set the D.C. stabilisation and help to keep the operating points at levels which are independent of temperature and varying transistor characteristics. The other resistors in the chain (R4, 5, 6 and 7) provide the slight forward bias needed to reduce cross-over distortion.

Crossover Distortion

When a signal is fed to T1, equal out-of-phase voltages are applied by the transformer to the bases of the output transistors. These are driven to conduction on alter-

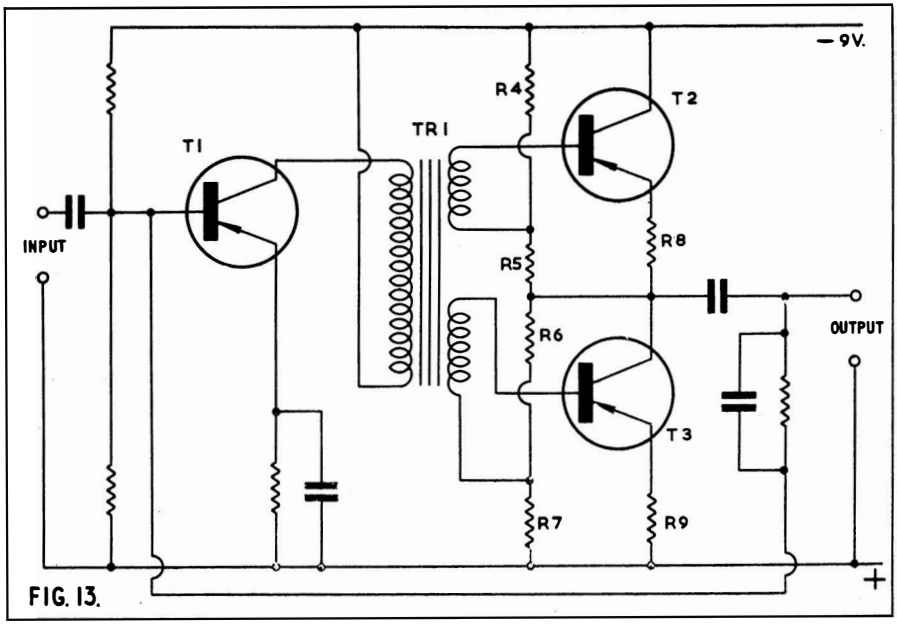

Fig. 13. *Class "B" stage with single end output.*

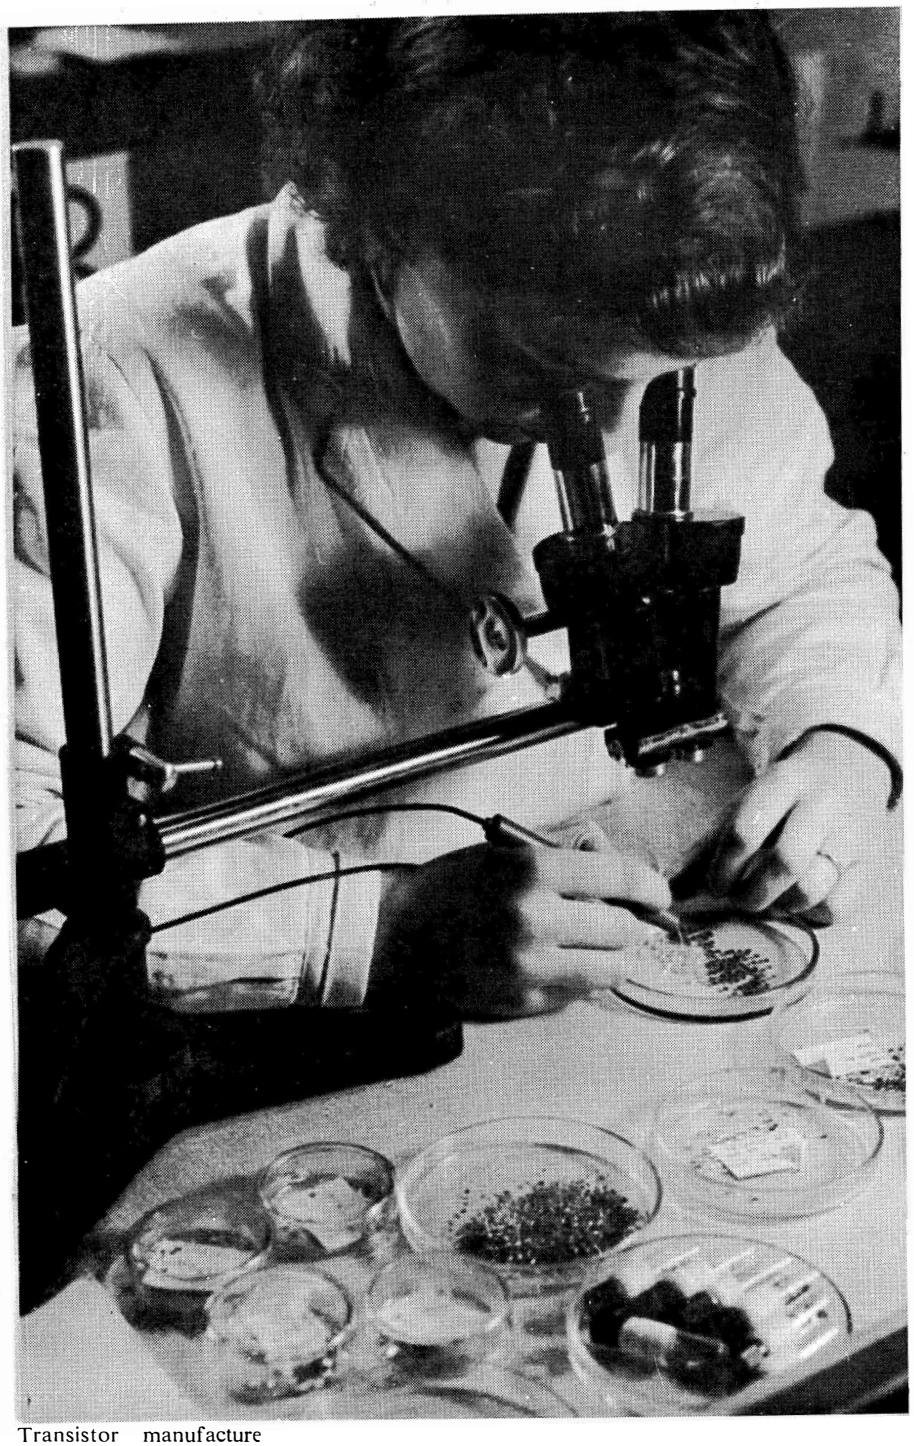

Transistor manufacture

nate half-cycles and the collector to emitter currents thus flow alternately through the capacitor C1 and the speaker. We have already noted that one source of the unpleasant cross-over distortion is the driver transformer and these components are very rarely used in amplifiers having any pretensions to Hi-Fi. **Fig. 14** shows a phase-splitting arrangement using the complementary characteristics of a *NPN* and *PNP* transistor. Apart from polarity these have to have very similar parameters and the values in the circuit shown are applicable to the *Sylvania PNP* type 2N34 and the NPN 2N35.

★

The same type of complementary circuit is used in the 10 watt amplifier shown in **Fig. 15.** This is a prototype unit developed by *Texas Instruments* and it must be emphasised that some of the transistors are not available at present. The input transistor VT1 is direct coupled to VT2, the load for this stage being R5 with C2 defining the upper limit of the overall frequency response. The rectifiers MR1 and MR2 are continuously forward-biased and provide temperature compensation for the quiescent current in the driver stage VT3 and VT4. These form the complementary circuit, VT3 being the PNP device and VT4 the NPN. They are directly coupled to the output transistors VT5 and VT6 which function as a class AB2 stage. Negative feedback is applied from the collectors to the emitter of the input transistor. This loop is no less than 57 dB and together with R12 and C4 helps to define the overall gain and bandwidth of the amplifier. The quiescent current of the output stage is determined by the zener diodes MZ1, MZ2 and the rectifiers MR1 and MR2 which also control the driver stage. Now for some performance figures:

Performance Table

Output:	10 watts
Output Load:	15 ohms
Output Impedance:	0.01 ohm in series with 500 mFd
Distortion:	0.02% total harmonic
Bandwidth:	20 cycles to 50,000
Noise:	— 88 dB ref. 10 watts
Power supply:	45 volts at 1.5 A max.

The power output is maintained to 50,000 cycles where the distortion is still less than 0.5%. Truly an amazing specification which is more than comparable with the best valve amplifiers.

A similar amplifier was described recently

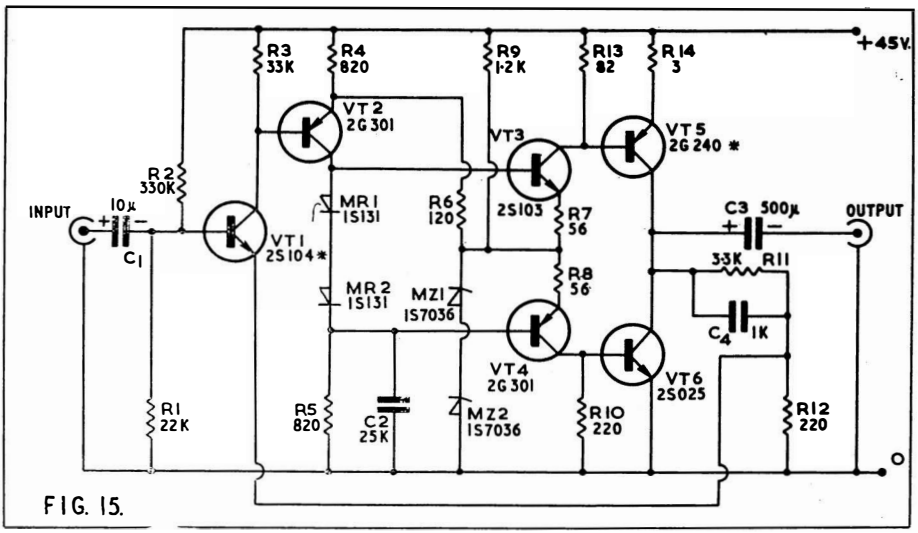

Fig. 15. *Complete low distortion 10 watt output stage (Texas Instruments).*

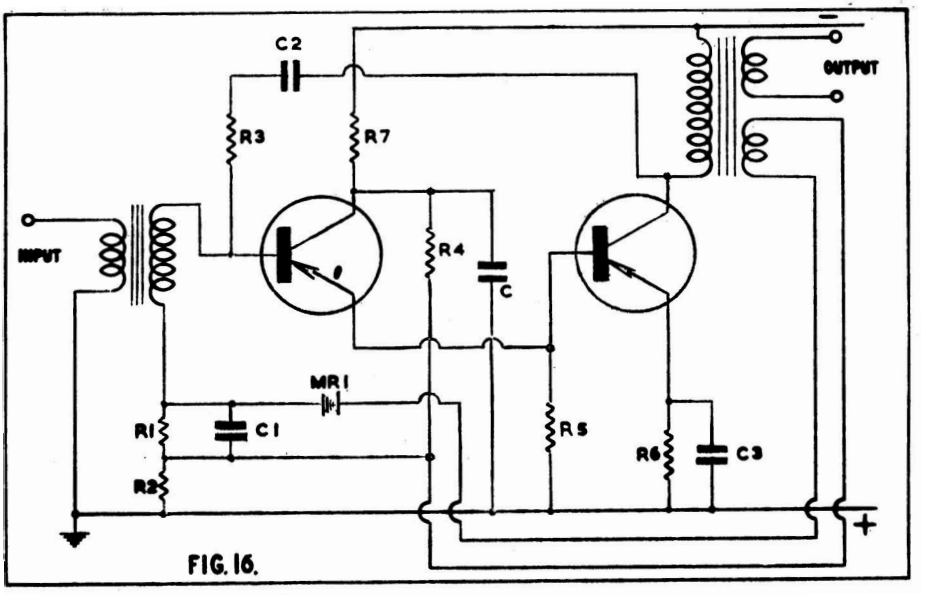

in the *Wireless World*[3]. Coming back to a less complicated arrangement, **Fig. 16** gives a circuit developed some time ago by *Mullard* and used by *EKCO* in a car radio. It is a very simple circuit which may well have possibilities for low power Hi-Fi amplifiers. The driver transistor is a OC72 and the output is a OC16 giving a power of some 4 to 5 watts. Part of the output signal is passed back and rectified by MR1 and applied to the base of the OC72. This potential is passed back to the output transistor since the first emitter and the base of the second are coupled together; thus the bias of the transistor is automatically adjusted according to the amplitude of the signal resulting in a gain in efficiency. Negative feedback is applied by C2 and R3 and the direct coupling between the transistors provides excellent D.C. stabilisation.

DIRECTORY OF AMPLIFIERS & CONTROL UNITS

★The following abbreviations are used in this directory section: **H.D.**—Harmonic Distortion; <—less than; **H** and **N**—Hum and Noise; **P.a.t.**—Power supplies available for tuner; **R.M.S.**—root mean square; **N.L.**—Noise level; **Sel.**—Selector switch; ■—Stereo equipment.

Acoustical Manufacturing Co. Ltd., St. Peter's Road, Huntingdon, Hunts. Tel.: H'don 361 and 574. Cables: Acoustical.

Quad II Q.C. II Control Unit. Inputs: radio/tape 100 mV; mic. 1.5 mV; gram. to suit pickup. Treble, bass, vol. and on/off, filter slope. Switch filter 5, 7, 10 Kc/s and "out". Tape record socket, switched playback socket. H.D. <0.1%. H and N — 70 dB. Size 10½ × 3½ × 6½ ins. To operate with Quad II power amp or similar. Price £19 10s.

■**Quad 22 Control unit.** Inputs: Radio/tape 70 mV at 100 K; mic. 1.5 mV at 100 K; pickup dependent on adaptor unit used, Vol. and on/off bass, treble, filter slope, filter switch 5, 7, and 10 Kc/s. Push-button selection of channels, mono-stereo, and record equalisation. H.D. <0.02%. H and N — 70 dB total, P.a.t. 330v 35mA each tuner, 6.3v 3 amps. Size 10½ × 3½ × 6 ins. Price £25. To operate with QUAD II amplifiers.

Quad II Amplifier. 15 watts. Dist. total 3rd harmonic and higher. <0.1% at 12 watts. Input for spec. output 1.4v. R.M.S. for 15 watts. Response 20-20,000 c/s. ± 0.2 dB; 10-50,000 ±0.5 dB. Feedback incorporated in original ultra-linear arrangement. N.L.—80 dB at 15 watts. Out. imp. 7 and 15 ohms. Output KT66's. Original combined anode/screen current circuit. Size 12½ × 4¾ × 6½ ins. To operate with QCII or Q22 control units. Price £22 10s.

★

Allegro Sound Equipment Ltd., 91a Heath Street, Hampstead, N.W.3.

■**Allegro 66 Integrated Stereo Amplifier.** Inputs mic. 30 mV, tape 30 mV. 7 watts per channel. Dist. 0.5% at 4.3 watts. Response 25-20,000 c/s ±3 dB. N.L.—60 dB. Out. imp. 15 ohms. Output ECL82's. Size 13¼ × 9½ × 5¼ ins. Price £29 8s.

★

Altobass Ltd., Percy Road, Aylestone Park, Leicester. Tel.: Leicester 31616. Cables: Altobass, Leicester.

"High Fidelity 510" Control Unit. Inputs: tape/radio 100 mV; P/U (1.p.) 50 mV; P/U (78) 60 mV; mic. 10 mV 5-pos. sel., treble, bass vol. and on/off. Tape replay socket. H.D. 0.15%. H and N—64 dB mic.; — 71 dB on other inputs. Size 10 × 3½ × 4¼ ins. Price £8 8s. Sold only with 510 power amp.

"High Fidelity 510" Amplifier. 10 watts nom., 11 watts max. Dist. 0.1% (10 watts

ACOUSTICAL QUAD 11 STEREO CONTROL UNIT

at 400 c/s). Input for spec. output 40 mV. Response 15-20,000 c/s ±0.6 dB. Feedback −20.5 dB. N.L. −78 dB relative to 10 watts. Out. imp. 3.75 or 15 ohms output EL84's. Ultra-linear. Size 13¼ × 5½ × 5¾ ins. Price £15 15s.

Altobass Seventy Control Unit. Inputs: Pickup 4 and 50 mV; Radio 250 mV; Tape 5 and 250 mV; Aux. 50 mV. 6-position sel., bass, treble, volume and on/off, switched high pass filter 100 c/s, switched low pass filter 5.5 Kc/s. H.D. 0.015%. H and N Tape − 52 dB, others − 56 dB. Size 10⅜ × 4 × 4¼ ins. Price £16 16s. To operate with Altobass 510.

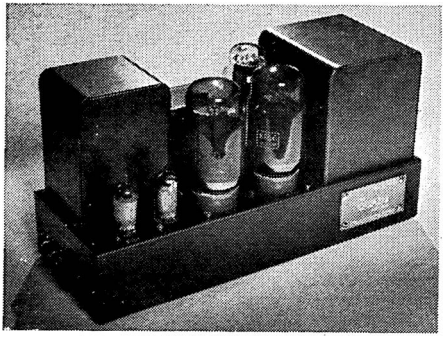
■**Altobass Stereo 70 Control Unit.** Inputs: pickup 4 mV; radio 220 mV; tape 3 mV; mic. 5 mV; aux. 100 mV. 5-position sel., bass, treble, volume, function switch and on/off. H.D. 0.015%. H and N −54 dB. Rumble filter. Size 13½ × 7 × 3¼ ins. Price £24 3s. To operate with Altobass Twin Twelve.

■**Altobass Twin-Twelve Stereo Amplifier.** 10 watts each channel, 12 watts max. Dist. 0.1% at 10 watts. Input for spec. output 150 mV. Response 20-20,000 c/s ±0.5 dB. 20 dB feedback. N.L. −78 dB relative to 10 watts. Out. imp. 4, 8 and 16 ohms. Output EL84's. Ultra-linear. Size 14¼ × 7 × 6¾ ins. Price £30 9s. To operate with Altobass Stereo 70 Control Unit.

■**Altobass Twin II Amplifier and Control Unit.** Inputs: 200 mV for 2 watts per channel. 3-position sel., dual-concentric volume and frequency controls with on/off switch. H and N −56 dB referred to 2 watts. Size: Main amp. 9 × 6 × 5½ ins., Control Unit 5 × 3 × 4½ ins. Price £16 16s. complete.

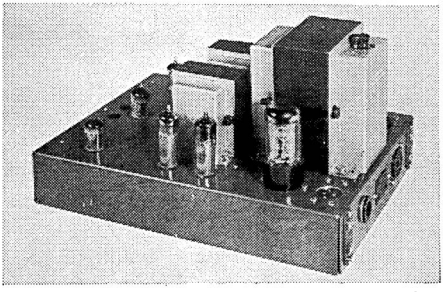
■**Stereo 44 Amplifier Kit**—See Kits Section.

Armstrong Wireless & Television Co., Warlters Road, Holloway, N.7. Tel.: North 3213/4.



Quad 11 *amplifier*

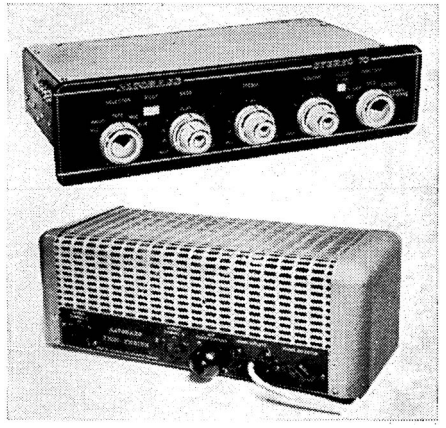
■PCU25 Stereo Control Unit. Inputs: Tape 1.100 mV, Tape 2.3 mV. Aux. 100 mV, Radio 100 mV; gram. 3.5 mV, mic. 1.8 mV. Switched rumble filter, variable treble filter. Push buttons. Output 410 mV. 6 position sel., volume, bass, treble, balance, rumble filter, treble filter. H.D. $<0.1\%$ H and N 61 dB (pickup input of 3.5 mV sensitivity). Power supplied by A20 amplifier. Response 15-22,000 c/s within 1 dB. Treble control operates as variable filter when filter switched in. To operate with A20 power amplifier. Size $10\frac{1}{2} \times 4\frac{1}{2} \times 7\frac{1}{2}$ ins. Weight 4 lbs. Price £22 10s.



A.E.I. stereo power amplifier

Jubilee Mk. 2 Tuner Amplifier Chassis. 8 watts. H.D. 0.5%. Input: pickup 180 mV. Response 20-30,000 c/s $\pm$ 2 dB. Feedback 15 dB N.L. 68 dB. Out. imp. 3, $7\frac{1}{2}$, 15 ohms. Output two ECL82's. Self-powered A.C. 200-250v. Size 12 × 7 × 8 ins. Price £23 9s. 3d. (U.K. purchase tax £7 10s. 8d.). (Also see Tuners Section.)

■A20 Stereo Power Amplifier. 12 watts nom. 25 watts max. per channel. H.D. $< 0.1\%$. Input for spec. output 410 mV. Response 15-22,000 c/s within 1 dB. Feedback 29 dB. N.L. 85 dB. Out. imp. 4, 8 and 16 ohms. Output two EL84's. Ultra-linear. Power supplies required A.C. 100-125v and 200-250v. To operate with PCU25 stereo control unit. Size 14 × 7 × 7 ins. Price £30.



Altobass stereo 70 *C/U and Twin* 12 *amp.*

■PCU27 Stereo Control Unit. Inputs: Auxiliary 2 mV. Microphone 2 mV. Radio 80 mV; Gram 1.80 mV, Gram 2.7 mV; Gram 3 3.5 mV; Tape 1 130 mV; Tape 2 2 mV. 8-position sel., bass, treble, balance controls, filter switch, slope switch, rumble filter, vol. phase, function. Tape outputs,

stereo and mono. H.D. less than 0.1%. H and N — 62 dB. Power supplies required H.T. 300 volts at 8 mA. L.T. 6.3 volts at 2 amps. Size of front panel $14\frac{1}{2} \times 4\frac{1}{2}$ ins. To operate with A20 amplifier. Price £28 10s.

★

Associated Electrical Industries Ltd., Sound Equipment Group, Crown House, Aldwych, London, W.C.2. Tel.: Temple Bar 8040. Cables: Soundequi, Estrand, London.

Hi-Fi Control Unit Mk. 1. Inputs: Mic. 5 mV; tape head 5 mV; pickup 6 and 250 mV; Equalised tape 180 mV; radio 180 mV. 8-position sel., filter, bass, treble, volume and on/off. H.D. <0.05%. H and N — 86 dB. P.a.t. 320v 30 mA, 6.3v 3 amps. Size $10\frac{1}{4} \times 3\frac{5}{16} \times 5\frac{1}{2}$ ins. Price £17 10s. To operate with BTH Hi-Fi Amplifier, or similar.

Hi-Fi Power Amplifier Mk. 1. 20 watts nominal, 30 watts peak. Dist. <0.05%. Input for 20 watts 100 mV. Response 20-20,000 c/s ± 1 dB. Feedback 24 dB. N.L. — 80 dB. Out. imp. 4, 8 and 15 ohms. Output EL34's. Ultra-linear. Size $10\frac{3}{4} \times 5\frac{1}{2} \times 6\frac{3}{4}$ ins. Price £24 10s. To operate with BTH Hi-Fi Pre-amp. or as a pair with BTH Stereo Control Unit.

■**Stereo Hi-Fi control unit.** Inputs: stereo and mono pickup, stereo tape, radio, mic. spare. 6-position sel. bass, treble, balance, vol., on/off. Rumble filter. H.D. less than 0.05% at 10 watts. H and N — 85 dB. P.a.t. 200v 30 mA, 6.3v 3 amps. Size $10\frac{1}{4} \times 5\frac{1}{2} \times 3\frac{5}{16}$ ins. To operate with BTH stereo amplifier or two mono amplifiers. Price £24 9s.

■**Stereo Power Amplifier.** 10 watts each channel, 15 watts max. Dist. less than 0.05% at 10 watts. Input for spec. output 100 mV. Response 20-20,000 c/s ± 1 dB. 24 dB feedback. N.L. — dB relative to 10 watts. Out. imp. 4, 8 and 61 ohms. Out-

put EL84's ultra-linear. Size $12\frac{3}{4} \times 10 \times 7\frac{3}{4}$ ins. To operate with BTH stereo control or similar. Price £27.

★

Associated Electronic Engineers Ltd., 10 Dalston Gardens, Stanmore, Middx. Tel.: Wordsworth 4474/5/6. Cables: Astronic, Stanmore.

Astronic A1332 Control Unit. Inputs; mic. 20 mV; gram. A.E.S., FFRR, NARTB 10-20 mV; radio/tape 220 mV. 6-pos. sel., treble, bass, vol. and on/off, gram. input attenuator. Tape record and playback socket. H and N — 70 dB. Size $12 \times 3\frac{3}{8} \times 1\frac{7}{8}$ ins. To operate with A1333 power amp. Price £9 10s. 6d.

Astronic A1432 Control Unit. Inputs: mic. 20 mV; radio 120 mV; P/U 4 mV or 20 mV; tape (C.C.I.R.) 1-2 mV. 6-pos. sel (3 record equal.), treble, bass, vol. on/off. Filter 5, 7, 10 Kc/s. Slope 6-30 dB/octave. Loudness — 18 dB max. Presence + 6 dB, 2-3 K/cs. Rumble filter. Variable P/U attenuator. Socket for direct replay from tape head. H.D. not measurable. H and N — 65 dB. Size $11\frac{1}{2} \times 3\frac{1}{2} \times 5\frac{1}{4}$ ins. To operate with A1333 or A1440 amplifiers. Price £21 19s.

Astronic A1333 Amplifier. 10 watts nom., 13 watts max. Dist. 0.1 % at 10 watts. Input for spec. output 0.33v R.M.S. Response 20-20,000 c/s ± 0.5 dB. Feedback 18 dB N.L. — 72 dB. Out. imp. $3\frac{3}{4}$, $7\frac{1}{2}$ and 15 ohms. Output N709's or EL84's. Ultra-linear. Size $11\frac{1}{2} \times 6\frac{1}{4} \times 6$ ins. To operate with A1332 control unit. Price £18 19s. 6d.

■**Astronic A1434 Stereo Control Unit.** Inputs, single channel: tape 1-2 mV; l.p. (Int.) 4 mV; radio 120 mV; mic. 20 mV; aux. 120 mV. Stereo inputs for tape, P/U and radio same sensitivities. 8-pos. sel., bass, treble, vol., on/off, rumble filter, presence switch, channel balance (pre-set). Dist. negligible. H and N — 65 dB. Size $11\frac{1}{2} \times 3\frac{1}{2} \times 6$ ins. To operate with amplifiers A1333 Mk. I and Mk. II or A1440. Price £22 5s.

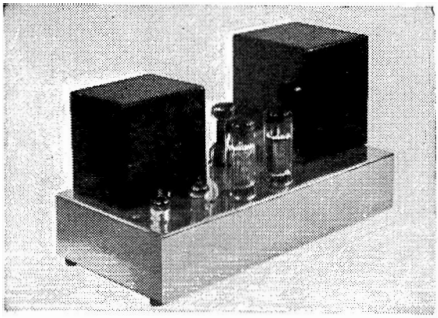
■**Astronic A1444. Combined Stereo Unit.** 4 watts. Dist. 2%. Inputs: radio, tape and l.p. discs. 150 mV; 78 discs. 350 mV. 4-position sel., bass, treble, volume and on/off. Out. imp. 3 and 15 ohms. Size $11\frac{1}{2} \times 8\frac{3}{4} \times 3\frac{1}{4}$ ins. Price £24 3s.

Atlas A1440. 20 watts nominal, 35 watts max. Dist. 0.1%. Input for spec. output 0.25 volts. Response 20-20,000 c/s ± 5 dB. Feedback 30 dB. N.L. — 85 dB. Out. imp. $3\frac{3}{4}$, $7\frac{1}{2}$ and 15 ohms. Output EL34's. Ultra-linear. Size 13 × $7\frac{1}{4}$ × $8\frac{1}{2}$ ins. Price £37 16s. To operate with amplifiers A1332, A1432, and A1434.

★

Aveley Electric Ltd., Ayron Road, Aveley Industrial Estate, South Ockendon, Essex. Tel.: South Ockendon 3444. Cables: Avel, Ockendon.

Dynakit PAM-1 Mono. Free-standing Control Unit. Inputs: pickup, radio, tape. Output 2v max. 6 pos. sel., bass, treble, volume, tape monitor switch, loudness switch, hum balance. H and N. 70 dB down on 10 mV cartridge. Power supplies required D.C. 200 to 400v at 4 mA, A.C. 6v at 0.75 amp. A.C. Response ± 0.5 dB 10-40,000 c/s. D.C. heater supply. To operate with Avel-Dynaco Mk. IV power amplifier. Size 12 × $2\frac{5}{8}$ × $6\frac{1}{8}$ ins. Weight $4\frac{1}{2}$ lbs. Price £22 19s. 11d. Available in kit form £16 19s. 11d.

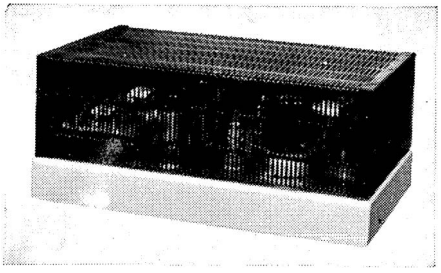


Chapman 205 amplifier

Dynakit PAS-2 Stereo Control Unit. Free-standing. Inputs: mic., tape, radio. Scratch filter. Output 2v max. 6 pos. sel., volume, balance, blend, ind. tone controls for each channel, tape monitor switch, loudness switch. H.D. unmeasurable. I.M. dist. < 0.05% at full output. H and D — 70 dB down. Self-powered. Response ± 0.5 dB 10-40,000 c/s. D.C. heater supply. To operate with two Mk. IV power amplifiers or Avel-Dynaco stereo 70. Size 13 × $3\frac{3}{4}$ × $7\frac{3}{4}$ ins. Weight 8 lbs. Price £34 19s. 9d. (Also available in kit form £28 19s. 10d.)

Avel-Dynaco Mk. IV Amplifier. 30 watts nom., 50 watts max. H.D. L.F. range <0.25%, High range 15,000 c/s <1%, mid range <0.1%. Input for spec. output 1.4v. Response ± 0.5 dB from 20-60,000 c/s. Feedback 20 dB overall. N.L. 90 dB down on 30 watts. Out. imp. 4, 8, 16 ohms. Output matched EL34's. Ultra-linear. Power supplies required A.C. 0-200/240v. To operate with PAM-1 or PAS-2 Control units. Size 5 × 14 × $6\frac{1}{2}$ ins. Price £35. (Also available in kit form £29 10s.)

■**Avel-Dynaco "Stereo 70" Amplifier.** 35 watts per channel, 40 watts max. H.D. as for Mk. IV. Input for spec. output 1.4v each channel. Response ± 0.5 dB 20-60,000 c/s. Feedback 20 dB both channels. N.L. 90 dB below 30 watts out. Out. imp. 4, 8 or 16 ohms. Output EL34's. Ultra-linear. Power supplies required 200-240v A.C. Size 10 × 13 × $6\frac{1}{2}$ ins. Price £49. (Also available in kit form £42.)



Chapman 305 *stereo amplifier*

H.M.V. 599 *stereo control unit*

Cape Electrophonics Ltd., 43-45 Shirley High Street, Southampton. Tel.: Southampton 74251.

Cape VL 50. 50 watts nom. Dist. at 1000 c/s. 0.1%. Input adjustable, from 1 mV. Response 10-50,000 c/s ± 1 dB. Feedback two loops 20 dB. N.L. — 85 dB. Out. Imp. 3, 7½ and 15 ohms. Output. K.T. 88's Ultra Linear. Size 18 × 9½ × 9½ ins. Weight 55 lbs. Price £75.

Cape VL 100. 100 watts. Nom. (Spec. as VL 50). Price £85 (Provisional).

Cape VL 20. 20 watts nom. (As VL 50) but with low distortion and noise.

★

Chapman Ultrasonics Ltd., Sales Division, 24 Upper Brook Street, London, W.1. Tel.: Hyde Park 2291.

Chapman 205 Amplifier. 20 watts from 30-20,000 c/s. Dist. <0.05% at 20 watts. Response 2-100,000 c/s ± 1 dB. Feedback 30 dB. N.L. — 89 dB at 20 watts. Out. imp. 15 ohms. Output EL34's. Ultra-linear. To operate with 205CU. Price £34.

■**Chapman 305 Stereo Control Unit.** Inputs: Pickup and tape 4.5 mV; radio 100 mV; Aux. 100 mV. 4-position sel., bass, treble, volume, balance, filter. H.D. <0.1%. H and N — 50 dB. Rumble filter. Size 12 × 4⅛ × 6¼ ins. Price £18 18s. To operate with 305 amplifier or 2 × 205 amplifiers.

■**Chapman 305 Stereo Amplifier.** 8 watts per channel, 15 watts peak. Dist. <0.1%. Input for spec. output 350 mV. Response 30-20,000 c/s ± 0.2 dB. Feedback 10 dB. N.L. — 80 dB. Out. imp. 3 and 15 ohms. Output EL84's. Ultra-linear. Size 12 × 7 × 5 ins. Price £21. To operate with 305 pre-amplifier.

Chapman 105 Combined Control Unit and Amplifier. 10 watts nominal, 20 watts peak. Inputs: pickup 10 and 50 mV; radio and tape 100 mV. Selector, bass, treble, filter, loudness control, volume and on/off. Rumble filter. Dist. <0.1%. Response 30-20,000 c/s ± 0.2 dB. N.L. — 80 dB. Out. imp. 3 and 15 ohms. Output EL84's. Ultra-linear. Size 12 × 4⅛ × 8½ ins. Price £29 18s.

★

Clarke & Smith Manufacturing Co. Ltd., H.M.V. High Fidelity Components Division, Melbourne Road, Wallington, Surrey. Tel.: Wallington 9252. Cables: Electronic, Wallington.

■**H.M.V. 555 Stereoscope. Integrated Stereo Amplifier.** 10 watts per channel. Inputs: pickup 2 mV magnetic; 60 mV crystal; tape 3 and 150 mV; microphone 2 and 20 mV; tuner 150 mV. H.D. 0.1%, 10 watts at 1,000 c/s. Response 20-20,000 c/s ± 1 dB. Power amp. 40-5,000 c/s at full output. Feedback 34 dB. N.L. main amp. 80 dB below full output, radio inputs 60 dB below full output. Out. imp. 4 and 16 ohms. Output EL84's. Ultra-linear. Self-powered. Size 4 × 14 × 13¾ ins. Price £66 3s.

■ **H.M.V. 556 Stereoscope.** Stereo Control Unit. Inputs: as for 555. Scratch and

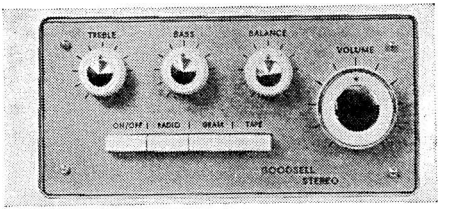
Expert stereo control unit



Goodsell stereo 111 control unit

rumble filters. Output cont. variable from 100 mV to 3v for specified input sensitivities. Input selectors: two bass, two treble, two volume, two master loudness, output monitor, junction switch, scratch filters, filter slope, rumble filter, tape monitor, pickup selector. H.D. <0.1% for 6v output. H and N. Low sens. inputs better than 66 dB down. Power supply required 110/250v at 50 or 60 c/s. Response ± 1 dB 20-20,000 c/s. Size 4 × 4 × 10½ ins. Weight 14 lbs. To operate with H.M.V. 557 amplifier. Price £40 19s.

■H.M.V. 557. Stereo Amplifier. 10 + 10 watts stereo. H.D. 0.1% for 10 watts at 1 Kc/s. Power take off 300v unsmoothed through 100 ohms at 8 mA max. and 6.3v heaters, 2 amps. max. Response 20-20,000 c/s ± 1 dB. Feedback 22 dB. N.L. 80 dB below full output. Out. imp. 4 or 16 ohms. Output EL84's. Ultra-linear. Self-powered. Size 4 × 14 × 8¾ ins. To operate with H.M.V. 556 or 599 Control Units. Price £31 10s.

■H.M.V. 599. Stereo Control Unit. Inputs: pickup, radio, tape. Output 200 mV. 5 pos. sel., bass, treble, balance, function, volume. H and N = 3 microvolts on gram. R.I.A.A. input. Power supply required 5 mA at 300v and 1.2 amps at 6.3v. Response 20-20,000 c/s ± 1 dB. Size 11¾ × 4 × 5½ ins. Weight 6 lbs. To operate with H.M.V. 557 amplifier. Price £12 12s.

Expert Standard stereo amplifier

★

Expert Gramophones Ltd., 235a Bensham Lane, Thornton Heath, Surrey. Tel.: Thornton Heath 4139. (Showroom: 82 Kensington High Street, London, W.8. Tel.: Western 0037.)

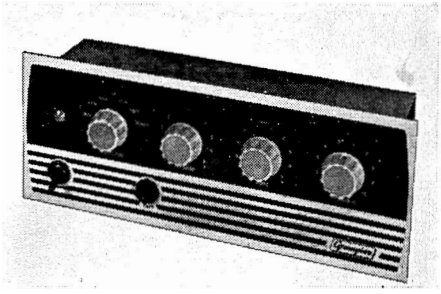
Expert "Standard" Amplifier. 12 watts nom., 14 watts max. Dist. 0.1%. Input for spec. output 200 mV. Response 20-25,000 c/s ± 0.5 dB. Feedback 30 dB. N.L. — 80 dB at 8 watts. Out. imp. 15 ohms. Output EL84's. Ultra-linear. Size 12 × 9 × 6½ ins. To operate with Expert control unit or similar. Price £23.

Expert "Master" Amplifier. 20 watts nom., 26 watts max. Dist. 0.07%. Input for spec. output 200 mV. Response 20-30,000 c/s ± 0.5 dB. Feedback 30 dB. N.L. — 85 dB at 20 watts. Out. imp. 15 ohms. Output EL34's. Ultra-linear. Size 12 × 9 × 7½ ins. To operate with Expert control unit or any similar. Price £35.

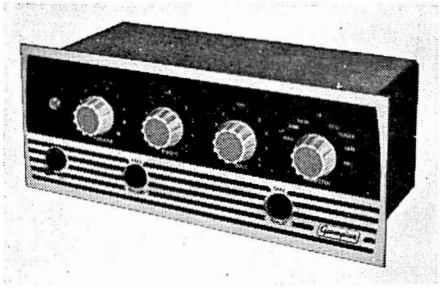
■Expert "Standard" Stereo Amplifier. 10 watts per channel. Dist. 0.1% at 10 watts. Input for spec. output 200 mV. Response 30-20,000 c/s ± 1 dB. 28 dB feedback. N.L. — 80 dB ref. 8 watts. Out. imp. 15 ohms. Output ECL82's. Size 12 × 9 × 6½ ins. To operate with stereo Mk. I control unit. Price £23.

■Expert Stereo Control Unit 62. Inputs and outputs for pickup, tape and radio. Tape, in and out, front and rear. Inputs: aux. 0.5 — 200 mV. Imp. 100 K ohms — 2 M ohms. Cha. flat, C.C.I.R. & R.I.A.A. Radio 220 mV, tape 4 mV. Pickup 1 variable, pickup 2 3 mV. Treble, bass, filter, balance and focus control. Record. outputs 200mV not affected by vol. Size 12¼ × 5½ × 4½ ins. To operate with any 200 mV amplifier sensitivity. Price £36 15s.

■Expert Stereo Mk. I Control Unit. Inputs (6) 250 mV sensitivity. Switched bass,



Grampian 580 control unit



Grampian 582 control unit

treble, function controls. H.D. less than 0.1%. P.a.t. Size 12 × 3½ × 3 ins. To operate with "Standard" stereo amplifier. Price £18.

★

Goodsell Ltd., 40 Gardner Street, Brighton. Tel.: Brighton 26735.

■**Stereo II Control Unit.** Inputs: pickup 7 mV stereo; radio 150 mV; tape 3 mV. Selector switch, vol., bass, treble, on/off. H.D. 0.1%. Size 13 × 7½ × 3¾ ins. Price £27 15s.

■**Stereo III Control Unit.** Inputs: pickup 60 mV, radio and tape 100 mV. Push-button selector, ganged bass, treble, volume controls. H and N — 65 dB. To operate with Goodsell "Mullard" stereo amplifier. Price £9 15s.

GW25 Amplifier. 20 watts. Dist. 0.1%. Input for spec. output 1.5v. Response 20-100,000 c/s. Feedback 20 dB. N.L. better than — 75 dB. Out. imp. 3, 8 and 15 ohms. Output KT66's. Ultra-linear. Size 14 × 10 × 7 ins. Weight 35 lb. To operate with PFA control unit. Price £33 10s.

■**"Mullard" Stereo Control Unit.** Details as per Mullard 2-valve design. To operate with Goodsell "Mullard" amplifier. Price £16 15s.

★

Grampian Reproducers Ltd., Hanworth Trading Estate, Feltham, Middx. Tel.: Feltham 2657/8/9. Cables: Reamp, Feltham.

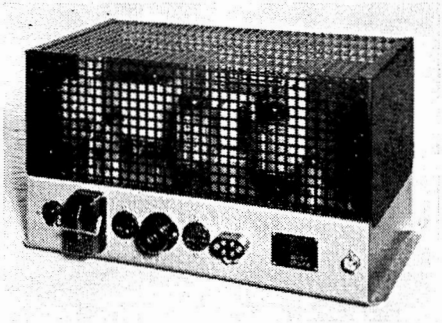
Details of New Products are given in a special supplement at the end of the book.

Grampian 582 Control Unit. Inputs: pickup 15 mV; radio 200 mV; tape 500 mV. Selector switch, bass, treble, vol. Size 10¼ × 4 × 5½ ins. Price £14. To operate with "Ten Fifteen" Amplifier.

Grampian 580 Control Unit. Similar to 582, but for crystal pickups. Sensitivity 600 mV, radio 500 mV. Price £8 5s.

Grampian 10-15 Amplifier. 10 watts nom., 15 watts peak. Dist. 0.1% at 10 watts. Input for spec. output 50 mV. Response 30-20,000 c/s ± 1 dB. Feedback 20 dB. N.L. — 65 dB below full ouptut. Out. imp. 4, 8, 15 ohms. Output EL84's. Ultra-linear. Size 11 × 7½ × 6½ ins. To operate with "580" and/or "582" control unit. Price £18.

■**Grampian 590/2 series.** Stereo Unit. 7 watts per channel, 10 watts peak. Dist. 1%. H and N — 60 dB. Inputs: pickup 0.5v at 1 Megohm, tuner and tape 1v at 0.5 Megohm. Sel., switch, balance, bass, treble. Out. imp. 4 and 15 ohms. Size: chassis 10⅞ × 3⅞ × 13 ins., wood surround 12¼ × 5¾ × 13 ins. Price 590/2 (control unit and two 584 amplifiers), £32, wood surround £2.

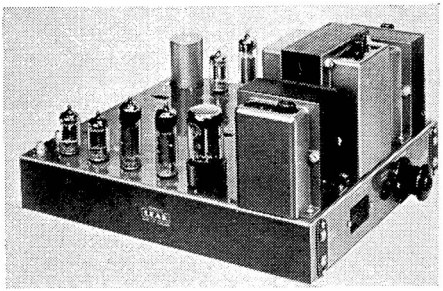


Goodsell GW 25 amplifier

Jason J2-10 Mk. 111 integrated stereo amp.

Leak Varislope 111 control unit

Leak "Point One Stereo" control unit



Leak "Point One" Stereo 20 amplifier

Jason Electronic Designs Ltd., Kimberley Gardens, Harringay, London, N.4. Tel.: Stamford Hill 5477.

J10 Combined Control Unit and Power Amplifier. Inputs: mic. 1 mV; tape 0.5V; radio 0.4V; P/U 1.0v and crystal P/U. 6-pos. sel., treble, bass, vol. P.a.t. 270v at 10 mA, 6.3v at 0.3 A. Output 10 watts nom., 15 watts max. Dist. 0.1%. Response 30-30,000 c/s ± 2 dB. N.L. better than 55 dB (mic. input). Out. imp. 15 ohms (other imps. to order). Output EL84's. Ultra-linear. Size 15 × $8\frac{1}{4}$ × $4\frac{3}{8}$ ins. Price £24.

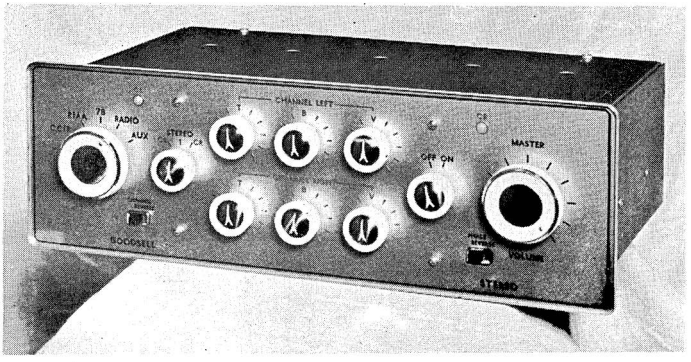
■**J2-10. Integrated Stereo Amplifier, Mk. III.** Inputs: pickup 3 mV and 60 mV; tape 1.5 mV; radio 60 mV; mic. 5 mV. 5-position sel. switch; bass, treble, vol., balance, function, 9 Kc/s and 6 Kc/s filter. H.D. less than 0.1%. H and N — 55 dB Rumble filter. 10 watts per channel, 15 watts max. 18 dB feedback. Out. imp. 4, 8, 15 ohms. Output EL84's. Size 15 × $4\frac{3}{8}$ × 12 ins. Price £40 19s.

★

H. J. Leak & Co. Ltd., 57-59 Brunel Road, East Acton, London, W.3. Tel.: Shepherds Bush 1173. Cables: Sinusoidal, Ealux, London.

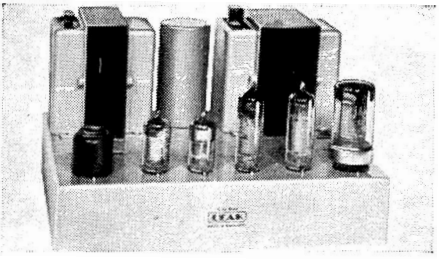
"Point One Plus" Control Unit. Inputs: tape 50 mV or mic. 4 mV; tuner 50 mV; P/U 9.5 mV. 6-pos. sel., 4 record equal, treble, bass, vol., mains on/off. Switch filter 4, 6 and 9 Kc/s. Input level control for P/U, tuner. Tape record and replay sockets on front and rear. H.D. <0.01%. H and N — 66 dB. Size $11\frac{1}{2}$ × $4\frac{7}{16}$ × 5 ins. To operate with TL/12 Plus, TL/25 Plus or TL/50 Plus amplifier. Price £12 12s.

"Varislope III" Control Unit. Inputs: tape 50 mV or mic. 4 mV; tuner 50 mV;



GOODSELL STEREO 11 CONTROL UNIT

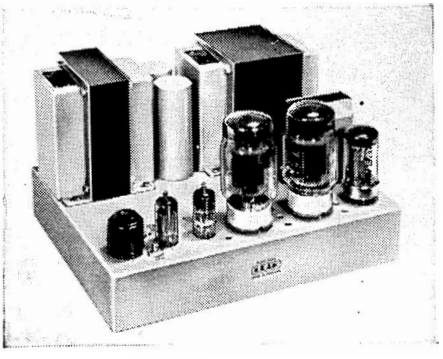
pickup I 9 mV; pickup II 9 mV. 6-pos. sel., 4 record equal and change-over switch for pickup I/pickup II. Treble, bass, vol., mains on/off. Switched low pass filter 4, 6 and 9 Kc/s plus Vari-slope control. Rumble filter cut/in. Input level controls for tuner, pick-up I, pickup II. Tape input sockets on front and back panels. H.D. <0.01%. H and N — 66 dB. Size $11\frac{1}{2} \times 4\frac{7}{16} \times 5$ ins. To operate with TL/12 Plus, TL/25 Plus, and TL/50 Plus amp. Price £15 15s.



Leak TL/12 plus amplifier

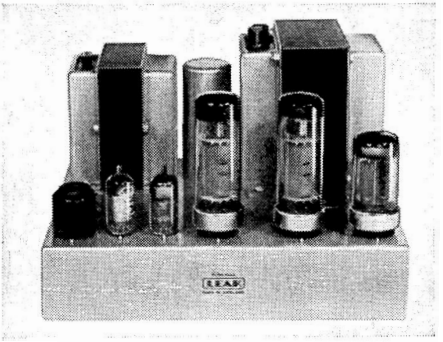
"Point One" TL/12 Plus Amplifier. 12 watts. Dist. 0.1%. Input for spec. output 125 mV. Response 20-20,000 c/s ± 0.25 dB. Feedback 26 dB. N.L. — 84 dB. Out. imp. 4, 8 and 16 ohms. Output EL84's. Ultra-linear. Size 10 × 8 × 6 ins. To operate with Varislope III or Point One Plus control units. Price £18 18s.

"Point One" TL/25 Plus Amplifier. 25 watts. Dist. 0.1%. Input for spec. output 125 mV. Response 20-20,000 c/s ± 0.25 dB. Feedback 26 dB. N.L. — 83 dB. Out. imp. 4, 8 and 16 ohms (other imps. to order). Output EL34's. Ultra-linear. Size 10 × 8 × $6\frac{3}{4}$ ins. To operate with Varislope III or Point One Plus control units. Price £25 4s.



Leak TL/25 Plus amplifier

"Point One" TL/50 Plus Amplifier. 50 watts. Dist. 0.1%. Input for spec. output 125 mV. Response 20-20,000 c/s ± 0.25 dB. Feedback 26 dB. N.L. — 84 dB. Out. imp. 4, 8 and 16 ohms (other imps. to order). Output KT88's. Ultra-linear. Size $11\frac{1}{2} \times 9 \times 6\frac{3}{4}$ ins. To operate with Varislope III or Point One Plus control units. Price £33 12s.

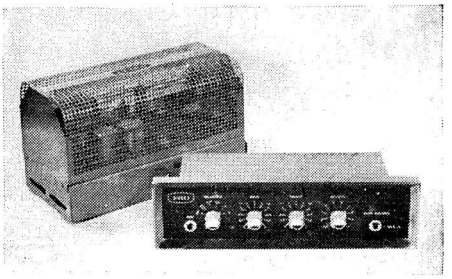


Leak TL/50 Plus amplifier

■**Varislope Stereo Control Unit.** Twin channel inputs: Pickup I 3.5 mV or 35 mV; pickup II 3.5 mV or 350 mV; tape 3 mV; tuner 50 mV or 250 mV; mic. 2 mV; extra 50 mV or 1V (all mono and stereo), sel.

LEAK VARISLOPE STEREO CONTROL UNIT

Dulci Stereo 5 control unit



Dulci DPA 15 control unit and amp.

switch. Function switch. Bass, treble, vol., on/off. Switched low pass filter 4, 6, 9 Kc/s plus Varislope control. Rumble filter cut/in. Balance control. Tape sockets for recording H.D. 0.01%. H and N — 60 dB. Size $11\frac{1}{2} \times 4\frac{1}{2} \times 6\frac{1}{2}$ ins. To operate with any Leak amplifiers. Price £25.

■**"Point One Stereo" Control Unit.** Twin channel inputs for P/U, 3.5 mV; tuner 50 mV, auxiliary 50 mV; tape head 3 mV; mic. 2 mV. Function and rumble switches, balance, treble, bass, vol., mains on/off. Input level controls. Tape sockets for recording. H.D. 0.01% on each channel. H and N — 60 dB. Size $11\frac{1}{2} \times 4\frac{7}{16} \times 5$ ins. To operate with any Leak amplifiers. Price £21.

■**"Point One" Stereo 20 Amplifier.** 11 watts each channel. Dist. 0.1% on each channel. Input for spec. output 125 mV. Response 20-20,000 c/s. Feedback 24 dB. N.L. — 80 dB. Out. imp. 4, 8 and 16 ohms. Output EL84's. Ultra-linear. To operate with "Point One Stereo" or "Varislope Stereo" control units. Price £30 9s.

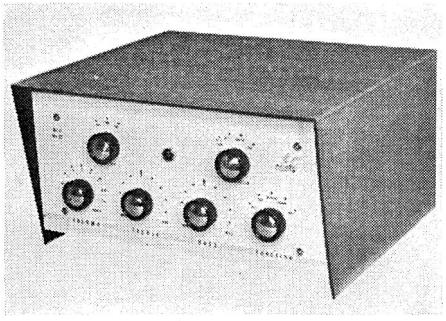
■**"Point One" Stereo 50 Amplifier.** Details as for Stereo 20 but 25 watts each channel. Price £42.

Lee Products (G.B.) Ltd., 10-18 Clifton Street, London, E.C.2. Tel.: Bishopsgate 6711. Cables: Leprod, London.

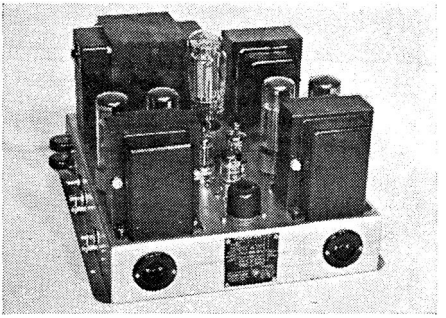
Elpico AC88. Inputs: mic. 4 mV; radio, pickup and tape 100 mV. 10 watts nom., 16 watts max. Dist. 0.5% at 10 watts. Response 50-20,000 c/s ± 3 dB. N.L. — 55 dB. Out. imp. 3-15 ohms. Out. EL84's. Ultra-linear. Size $14 \times 7\frac{1}{2} \times 8$ ins. Price £25 4s.

■**"Stereo Eight" Control Units.** Inputs: mic. and tape 3 mV; radio 100 mV; pickup 4 to 100 mV; tape 100 mV; aux. 50 mV to 2 volts. 6-position sel., bass, treble, filter, balance, function. H.D. <0.1%. H and N — 50 dB. Rumble filter. Size $14\frac{1}{2} \times 4 \times 9\frac{3}{8}$ ins. Price £23 2s. To operate with two DPA10, or SP44 amplifiers.

■**Dulci SP-55 Amplifier.** Input sensitivity: 200 mV for 3 watt output per channel. Output 8 watt peak (4 watts per channel). H.D. better than 0.5% total harmonic content. H and N — 70 dB. Response ± 1 dB from 40-25,000 c/s. Size $11\frac{1}{2} \times 6 \times 7\frac{1}{2}$ ins. Weight 13 lbs. 12 oz. To operate with Stereo-Five preamplifier control unit. Price £15 15s.

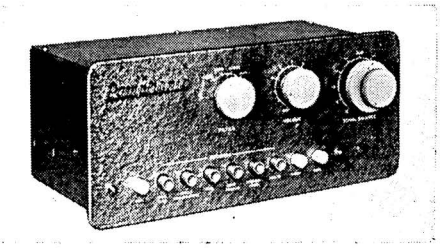


Lowther MCU MK 1V control unit



Lowther LL15S stereo amplifier

Dulci GA-505 integrated stereo amp.



Pamphonic 1002B control unit

Dulci DPA-15 Amplifier. 12 watts nom. 15 watts max. H.D. total harmonic below 0.3% at 10 watts. Response at 1 watt within 1 dB 5-20,000 c/s, at 1 watt within 5 dB 3-50,000 c/s, at 10 watts within 1 dB 30-15,000 c/s. H and N. 75 dB below 10 watts. Out. imp. switchable 3-5, 6-8, 12-16 ohms. Output EL84's. Ultra-linear. Size $11\frac{1}{8} \times 6 \times 7\frac{1}{2}$ ins. To operate with DPA-15 control unit. Price £15 15s.

■**Dulci GA-505. Integrated Stereo Amplifier.** 4 watts nom., 5 watts max. H.D. better than 1% at 4 watts per channel. N.L. — 55 dB. Out. imp. 3 or 15 ohms. Output two ECL86's. Power supply required A.C. 230v, 40-60 cycles. Size $12\frac{3}{4} \times 3\frac{3}{4} \times 6\frac{1}{2}$ ins. Price £18 18s.

Details of DPA 15 control unit and Stereo 5 see New Products supplement.

★

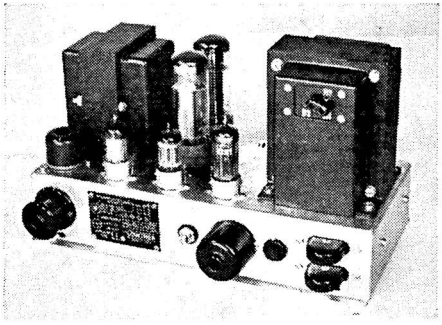
Lowther Manufacturing Co., Lowther House, St. Mark's Road, Bromley, Kent. Tel.: Ravensbourne 5225. Cables: Lowther, Bromley.

Lowther No. 2 Control Unit. Inputs: mic. 15 mV; P/U 15 mV; radio 250 mV. 4-pos. sel., treble, bass, vol., on/off. Mic./tape input socket. H.D. 0.1% on 1v R.M.S. H and N — 60 dB. Size $10\frac{1}{4} \times 2\frac{1}{2} \times 3\frac{1}{2}$ ins. To operate with LL15. Price £10 10s.

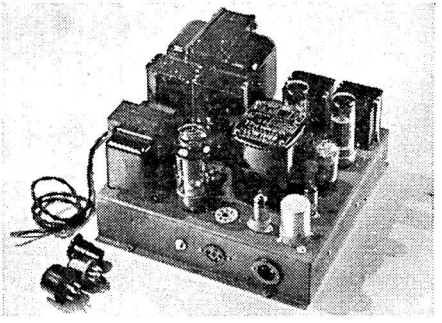
Master Control Unit Mk. II. Inputs: mic., P/U and tape head 3 mV; radio, tape and aux. 100 mV. 6-pos. sel., 5-pos. record equal, treble, bass, vol., on/off. Low pass filter. 18 dB per octave. 35 down to 4 Kc/s. Socket for direct connection to tape playback had. H.D. $<0.1\%$. H and N — 90 dB. Size $10\frac{1}{2} \times 5\frac{1}{2} \times 7\frac{1}{2}$ ins. To operate with LL15, LL26 and similar power amp. Price £24.

Lowther LL15 Amplifier. 16 watts. Dist. $<0.1\%$. Input for spec. output 0.75v. Response 20-40,000 c/s $\pm$ 1 dB. Feedback 20 dB. N.L. — 85 dB. Out. imp. 16 ohms with adjustment. Output EL34's. "Lowther Linear" (screen and anode feedback). P.a.t. Size 12 × 6 × 6 ins. To operate with MCU Mk. IV or control unit No. 2. Price £27 10s.

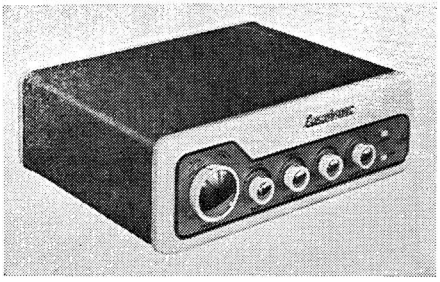
Lowther LL26 Amplifier. 26 watts. Dist. $<0.1\%$. Input for spec. output 0.75v. Response 20-70,000 c/s $\pm$ 1 dB. Feedback 22 dB. N.L. — 85 dB. Out. imp. 16 ohms with adjustment. Output EL34's. "Lowther Linear". Size 11 × 12 × $7\frac{1}{2}$ ins. Weight 33 lbs. To operate with MCU Mk. IV. Price £47.



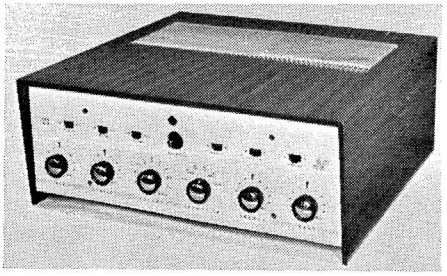
Lowther LL16 amplifier



Lowther LL26 amplifier



Pamphonic 3001 *integrated stereo amp.*



Lowther integrated stereo amplifier

Lowther Mk. IV Control Unit. Inputs: mic. 3 mV; pickup 3 mV — 300 mV; Radio and aux. 100 mV. 5 pos. sel. vol., bass, treble, filter, equalisation. Filters: 9, 7 and 4.5 Kc/s. H.D. > 0.5% H and N — 65 dB. Output cathode follower 1v r.m.s. To operate with Lowther LL 15 Mk. 1. Size $10\frac{1}{4} \times 4\frac{5}{8} \times 7$ ins. Price £20.

Lowther Mk. I Stereo Control Unit. Input as for Master Control Unit Mk. IV. Tape input sockets. H.D. 0.1%. Dual low pass filters. Dual output balanced and balance controls between channels. Size as M.C.U. Mk. IV. To operate with LL15S power amp. Price £40.

Lowther LL15S Stereo Amplifier. 15 watts output on each channel. Dist. 1%. Input for spec. output 0.75v. Response 20-40,000 c/s ± 1 dB. N.L. — 85 dB. Out. imp. 8.4 or 16 ohms. Output EL34. "Lowther Linear". Size 11 × 12 × $7\frac{1}{2}$ ins. To operate with S.C.U. Mk. I control unit. Price £47.

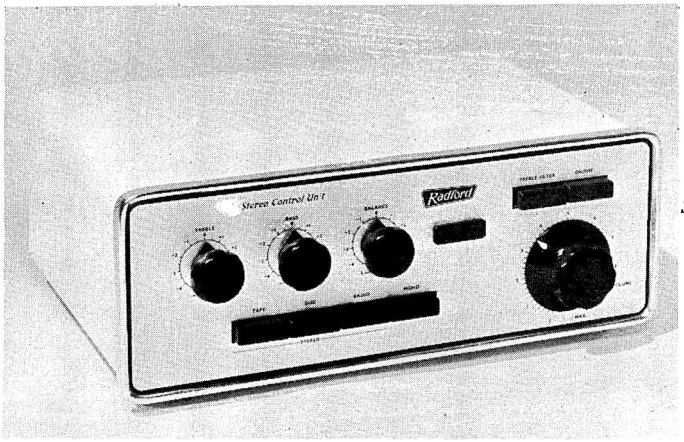
Lowther Integrated Stereo Amplifier. 12 watts per channel, Inputs: mic. 2 mV, Pickup 2 mV Tape 100 mV, radio 100 mV, Aux. 100 mV H.D. 0.2% at 10 watts. Response 30-30,000 c/s ± 1 dB. N.L. — 45 dB. Output Imp. 16 ohms. Price £70.

★

Pamphonic Reproducers Ltd., Westmoreland Road, London, N.W.9. Tel.: Colindale 7131.

1002B Control Unit. Inputs: mic. 2-3 mV; radio/tape 60 mV; P/U 6-8 mV. Push-button sel. 9 pos. (6 gram.). Cut off filter 4, 7, 12 Kc/s and "out". Terminals for tape input. H and N 60 dB below 0.5v. P.a.t. Size $10\frac{1}{4} \times 4\frac{1}{4} \times 7\frac{1}{4}$ ins. To operate with 2001 power amp. Price £25 4s.

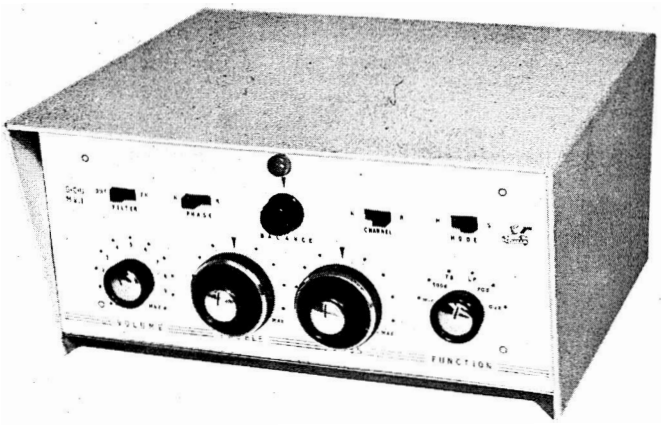
2001A Control Unit. Inputs: 3-120 mV depending on input. 6-pos. sel. Pre-set level control for tape/radio. Cut-off filter at 4, 7, 12 Kc/s and "out". Loudness control. Tape input sockets. H and N 60 dB below 0.5v. P.a.t. To operate with 2001 power amp. Price £12 12s.



RADFORD **SC2.**

STEREO CONTROL UNIT

LOWTHER SC U MK. 1 STEREO CONTROL UNIT



2001 Amplifier. 25 watts. Dist. at 1,000 c/s, 0.05% at 15 watts. Input for spec. output 0.5v. Response substantially flat 2-100,000 c/s. Feedback 28 dB. N.L. 90 dB below full output. Out. imp. 3.75, 6.6, 10 and 15 ohms. Output KT66's. Ultra-linear. To operate with 2001A or 1002B control units. Price £29 8s.

■3000 Stereo Amplifier. 7.5 watts per channel. Dist. 0.5%. Inputs: radio 1 volt; tape 0.5 volts; pickup crystal stereo. Response. 50-15,000 c/s. Feedback 20 dB. N.L. — 57 dB. Out. imp. 15 ohms each channel. Ultra-linear. Size 14 × 9¾ × 4½ ins. Price £31 10s.

■3001 Integrated Stereo Amplifier. Inputs: pickup 4-6 mV and 150 mV; tape or radio 400 mV and 1 volt. Bass, treble, balance controls. Dist. 0.5% at 6 watts. H and N — 60 dB. 7.5 watts per channel. Out. imp. 15 ohms. Response 40-20,000 c/s ± 1 dB. Crosstalk better than 60 dB. Output ECL82's. Size 13 × 10¼ × 4¼ ins. Price £38 10s.

★

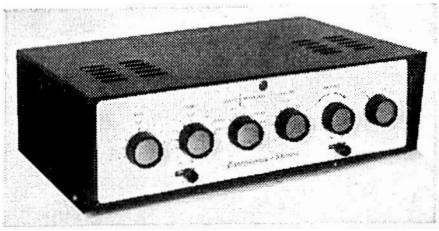
Period High Fidelity Ltd., 14 Mount Street, London, W.1. Tel.: Grosvenor 4686.

■Saville Double Six. Integrated Stereo amplifier. Inputs: pickup 5 and 100 mV; tape 100 mV, tuner 100 mV, mic. 4 mV. 6-pos. sel., bass, treble, balance, vol. controls. H.D. < 0.25% at 1 Kc/s 4 watts. H and N better than — 55 dB (main amp. better than — 70 dB relative to nominal output. 6 watts per channel. Response 25-25,000 c/s ± 1 dB, ref. 1 Kc/s. Low pass filter 5, 7 and 10 Kc/s. Filter slope control. 12 dB feedback. Out. imp. 15 ohms or to order. Output ECL83's. Ultra-linear. Size 13 × 8 × 3¾ ins. Price £38 17s.

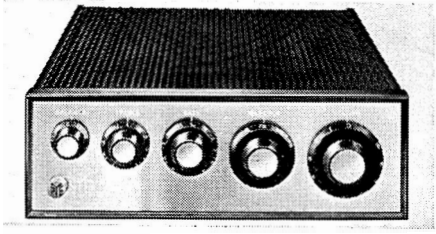
★

Pye Limited, High Fidelity Division. P.O. Box 49, Cambridge. Tel.: Cambridge 58985. Cables: Pyrad, Cambridge.

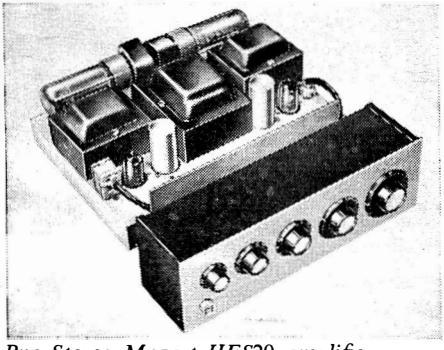
HF10 Mozart Self-contained Control Unit and Power Amplifier. Inputs: tape 100 mV; radio 100 mV; P/U 15, 8 and 8 mV on each of the 3 curves at 1,000 c/s., special compensation for all makes of P/U. 5-pos. sel., treble, bass, vol., mains on/off, filter at 4, 7, 12 Kc/s and out. Tape replay socket. H.D. 0.3% at 1,000 c/s and 9 watts. H and N main amp. — 70 dB; tape, radio — 60 dB; P/U — 55 dB. Output 10 watts nom. Response 3-70,000 c/s ± 3 dB.



Pamphonic 3000 *stereo amplifier*



Pye Mozart integrated stereo HFS20M



Pye Stereo Mozart HFS20 amplifier

Feedback 3 main loops over output stage — 5, 8 and 14 dB. Out. imp. 4, 8 and 15 ohms. Output 1 EL34. Integrated single-ended ultra-linear. Size $10\frac{1}{2} \times 3\frac{1}{2} \times 5\frac{1}{2}$ ins. Price £23 2s. Also available in metal case for shelf mounting. HF10M £24 13s. 6d. mounted in cabinet with provision for motor. 117v model available.

■**Mozart Stereo Amplifier and Control Unit. HFS20.** Inputs: Pickup 7 mV; radio and tape 100 mV. Col., bass, treble, balance, on/off, selector switch. H and N — 58 dB. 8 watts per channel nominal, 9 watts max. Dist. 0.2%. Response 5-50,000 c/s ± 2 dB. Feedback 34 dB. Out. imp. 4, 8 and 15 ohms. Output EL34. Size 4 × $10\frac{1}{2}$ × 11 ins. Price Chassis £35, in metal case £36 15s. Mounted in cabinet with provision for motor HFP3, £47 5s.

★

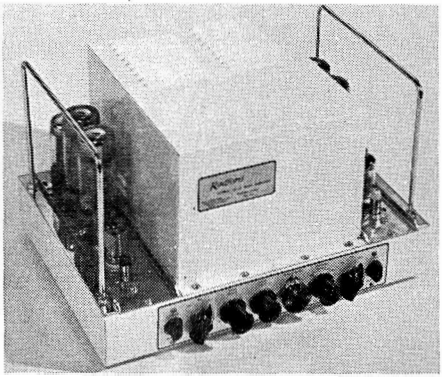
Radford Electronics Ltd., Ashton Vale Estate, Bristol 3. Tel.: Bristol 662301.

■**SC3 Stereo Control Unit.** Inputs: pick-up 4 mV RIAA; aux. 1, — 100 mV; aux. 2, — 500 mV. Rumble and treble filters. Push button sel. Treble, bass, volume controls. Additional independently controlled composite channel for wide angle stereo. Cathode follower outputs on all 3 channels. Requires 3 power amplifiers but also operates on normal pre-amp with 2 channel power amplifiers. Output 0.5 V. H and N better than 70 dB below 5 mV input. P.s.n. 6.3 V 2A, 15-20 mA at 250-350 V.

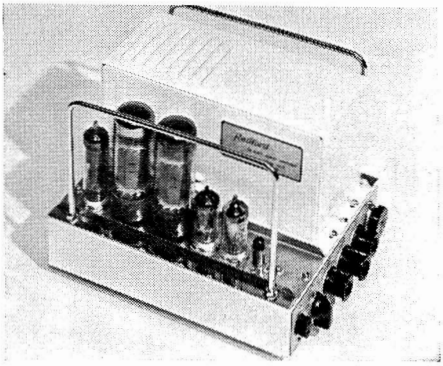
■**SC2. Stereo Control Unit.** Inputs: pickup 4 MV RIAA; aux. 1 100 mV; aux. 2 500 mV. Rumble and treble filters. Output 0.5v. Push button sel. treble, bass, vol. and balance controls. H and N better than — 65 dB below 5 mV input, better than — 75 dB on aux. P.s.n. 7-8 mA at 250-350v, 6.3v 1.2A. Response 40-20,000 c/s ± 1 dB. Complete channel to channel fade on balance control. To operate with STA 12, 2 × MA 15, 2 × MA 25. Price on application.

MA 15 Mk. 2. Amplifier. 15 watts nom. H.D. 0.05% at 15 watts. Input for spec. output 500 mV. Response 20-20,000 c/s ± 1 dB. Feedback 25 dB. N.L. better than 90 dB down on nominal output. Out. imp. 4, 8 and 16 ohms. Output EL34. Ultra-linear. Self-powered. Size $9\frac{1}{2}$ × $7\frac{1}{2}$ × $6\frac{1}{2}$ ins. To operate with SC2 and SC3 control units. Price on application.

MA 25 Mk. 2 Amplifier. Output 25 watts nom. 35 watts max. H.D. 0.5% at 25 watts. Input for spec. output 500 mV. Response 20-20,000 c/s ± 1 dB. Feedback 26 dB. N.L. — 90 dB in rated output. Out. imp. 4, 8 and 16 ohms. Output KT88. Ultra-linear. Self-powered. To operate with SC2 and SC3 control units. Price on application.



Radford STA 12 Stereo amplifier



Radford MA15 amplifier

■**STA 12 Mk. 2. Stereo Amplifier.** 12 watts nom. 15 watts max. H.D. <0.05% at 12 watts. Input for spec. output 500 mV. Response 20-20,000 c/s ± 1 dB. Feedback 26 dB. N.L. better than − 80 dB on 12 watts. Out. imp. 4, 8 and 16 ohms. Output EL34. Ultra-linear. Self-powered. Size 12 × 9 × 6½ ins. To operate with SC2 and SC3 control units. Price on application.

■**STA15 Stereo Amplifier.** Identical spec. per channel as MA15 Mk. 2.

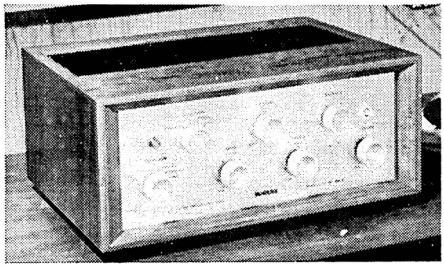
★

Rogers Development (Electronics) Ltd., 4-14 Barmeston Road, Catford, S.E.6. Tel.: Hither Green 7424 and 4340. Cables: Rodevco, London, S.E.6.

RD Cadet Mk. II Mono Control Unit. Inputs: disc. flat 10 & 200 mV, disc. comp. 8 and 160 mV; radio 40 and 200 mV; tape 100 mV; aux. 5 and 20 mV; Push-button selector, bass, treble, filter, volume—On/Off. Tape panel socket. Size: 8½ × 5¼ × 5 ins. To operate with RD Cadet Mk. II mono amplifier. Price £11.

RD Cadet Mk. II Mono Amplifier. 7 watts. Harmonic distortion 0.25%. Input sensitivity for 7 watts 600 mV. Feedback, 20 dB. Hum and noise 0.75 dB below 7 watts. P.a.t. 250 V at 40 mA, 6.3 V at 2.2 A. Out.imp.4, 8 and 16 ohms. Output ECL86's. Size 12¾ × 4¼ × 4½ ins. To operate with RD Cadet Mk. II mono control unit. Price £12.

■ **RD Cadet Mk. II Stereo Control Unit.** Inputs: disc. 75 mV; radio 75 mV; tape 75 mV. Push-button selector, bass, treble, function and balance. Volume and separate On/Off switch. Size 8½ × 5¼ × 5 ins. To operate with RD Cadet Mk. II Stereo amplifier. Price (including amplifier) £27 10s. 0d.

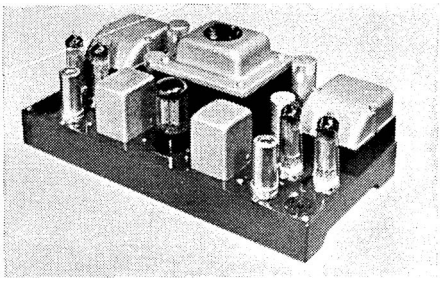


Rogers HG88 integrated stereo amplifier

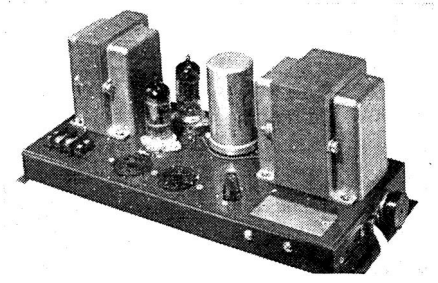
■**RD Cadet Mk. II Stereo Amplifier.** 6 + 6 watts. Harmonic distortion 0.25%. Peak output 7 + 7 watts. Response 20-20,000 c/s ± 1 dB. Out. imp. 4 or 16 ohms. Feedback: 18 dB. Hum and noise 75 dB below 6 watts. Output: ECL86's. Size 12 × 6 × 4¼ ins. to operate with RD Cadet Mk. II Stereo control unit. Price (including control unit) £27 10s. 0d.

■**RD Junior Mk. III Stereo Control Unit.** Inputs: Disc. 4 or 80 mV. RIAA or flat. Provision second mono pickup. Tape: 4 mV (CCIR) 25 mV (flat) radio: 100 mV, aux. 2.5 or 30 mV. Panel socket for tape record and replay, mic. Push-button selector, bass, treble, filter, function, balance, volume and On/Off. Hi-pass filter. Mono/stereo disc switch. Output: ECC83's. Size 11¾ × 7¼ × 5½ ins. To operate with RD Junior stereo amplifier. Price £27 10s. 0d.

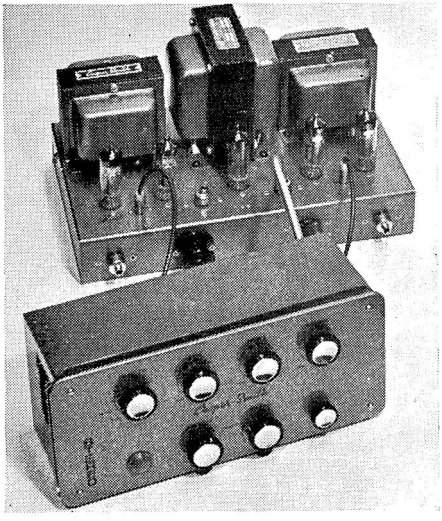
■**RD Junior stereo amplifier.** 12 + 12 watts nominal 15 + 15 watts peak. Harmonic distortion 0.2% at 12 watts. Input sensitivity 750 mV for 12 watts. Response, 20-20,000 c/s ± 0.25 dB. Feedback 20 dB. Hum and noise: 0.85 dB below 12 watts. Out. imp. 4, 8 or 16 ohms. Output: ECC83's. Size 14 × 8 × 5⅜ ins. To operate with RD Junior Mk. III stereo control unit. Price £27 5s. 0d.



Rogers RD Junior stereo amplifier



Rogers RD Cadet amplifier



Cooper-Smith stereo control unit and amp.

■**Master Stereo Control Unit.** Inputs: pickup 3-30 mV and 4-40 mV; Tape 1.5-30 mV; radio 30-250 mV. Push-button selector, bass, treble, balance, equalisation. Response, 20-20,000 c/s. ± 1 dB. Cross-talk — 40 dB. Size 14 × 6½ × 5⅛ ins. To operate with RD Junior stereo amplifier. Price £35.

■**HG88 Mk. II Combined stereo amplifier** and control unit. 12 + 12 watts. 14 + 14 watts peak output. Harmonic distortion 0.25% for 12 watts. Hum and noise: 80 dB below 12 watts. Response, 30-20,000 c/s ± 1 dB. Feed-back: 16 dB. Out. imp. 4, 8 or 16 ohms. Inputs: disc. 4 or 80 mV (RIAA) 6 or 120 mV (flat) radio 120 mV tape 4 or 20 mV (CCIR) 20 or 120 mV (flat). 5-position selector. Function, bass, treble, filter, volume, On/Off, balance. Size: 15⅝ × 10¾ × 7 ins. Price: Chassis £38 10s. 0d. Teak case model £42 0s. 0d.

Shirley Laboratories Ltd., 3 Prospect Place, Worthing, Sussex. Tel.: Worthing 30536.

Jupiter 3B/1-15E Self-contained Control Unit and Power Amplifier. Inputs: radio, tape, P/U 78 and L.P. Output 15 watts nom. 25 watts max. Input approx. 10 mV for 15 watts. Treble, bass, vol. Response 45-35,000 c/s ± 1 dB. N.L. — 80 dB. Dist. 0.2% at 10 watts and 1,000 c/s. Out. imp. 15 ohms or as requested. Output EL84. P.a.t. 250v at 35 mA, 6.3v at 2 A. Size 10 × 7 × 6½ ins. Price £23 2s.

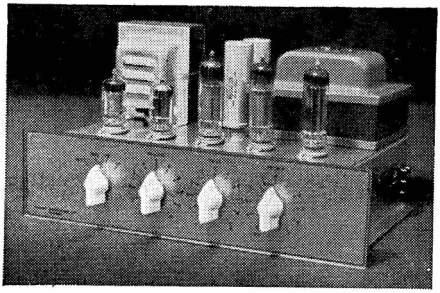
Jupiter 3B/1-30E Self-contained Control Unit and Power Amplifier. Spec. as for 3B/1-15E except output 30 watts nom., 45 watts max. Response 28-35,000 c/s ± 1 dB. Output EL34's. Price £33 12s.

■**PA 4/86 Stereo Control Unit.** Inputs: pickup 3 and 50 mV; radio 100 mV; tape 3 mV and 0.5 volts, selector switch, bass, treble, volume, balance. H.D. 0.1%. H and N — 58 dB. Price £21 1s. To operate with SF/10 amplifier, or two SB/7-30.

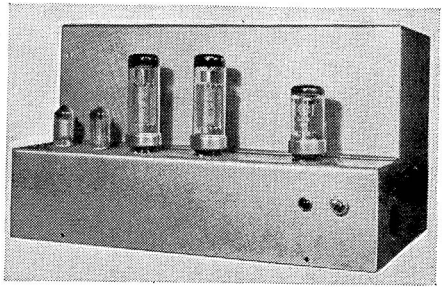
SB/7-30s Amplifier. 20 watts nominal, 35 watts max. Dist. 0.1%. Input for spec. output 2.5 volts. Response 34-40,000 c/s ± 0.3 dB. N.L. — 80 dB. Out. imp. 15 ohms. Output EL34. Ultra-linear. Size 11 × 7½ × 8 ins. Price £29 8s. 28 watt version £32 11s. To operate with PA 4/86 Control Unit.

Jupiter SB1-15F Combined Amplifier and Control Unit. Input 2 mV minimum. Dist. 0.2%. 14 watts nominal, 23 watts max. Response 45-35,000 c/s ± 1 dB N.L. — 80 dB. Out. imp. 100 ohms line or to order. Size 10 × 7 × 6½ ins. Price £23 2s.

■**SF/10 Combined Stereo Amplifier and Control Unit.** 12 watts per channel, 18 watts peak. Dist. 0.1%. Control Unit similar details to PA 4/86 above. Price complete £45 3s.



Shirley Jupiter ampli...



Shirley Mullard 20-watt amplifier

ROGERS MASTER STEREO CONTROL UNIT

■**2SB/10. Integrated Stereo Amplifier.** Inputs: magnetic and crystal pickup; tape direct from high impedance head and from tape recorder; radio. Sel. switch, bass, treble, volume, balance controls. 7 watts per channel. Output ECL86's. Price £45 3s.

■**2SB/12. Integrated Stereo Amplifier.** 12 watts per channel, 20 watts peak. Output EL84's. Other details as 2SB/10. Price £48 6s.

■**2SB/50. Integrated Stereo Amplifier.** 25 watts per channel, 40 watts peak. Output KT88's. Response 35-35,000 c/s ± 1 dB at 25 watts. Dist. 0.05% at 25 watts. Other details as 2SB/10. Price £84.

★

H. L. Smith & Co. Ltd., 287/289 Edgware Road, London, W.2. Tel.: Paddington 5891/7595.

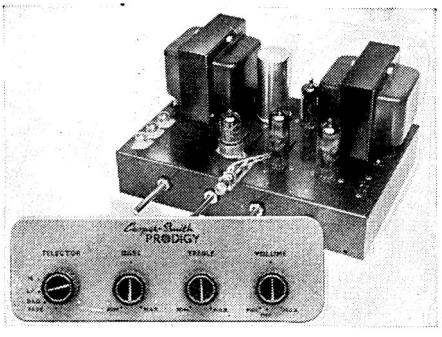
Cooper-Smith Mk. II Control Unit. Inputs: radio 100 mV; P/U 3 mV; mic. 1.5 mV; tape 100 mV. 6 pos. sel. (3 record equal.), treble, bass, vol. on/off. Switch filter 6, 8 and 10 Kc/s. Co-axial tape replay switch. H.D. 0.1% or less at 1,000 c/s. H and N — 80 dB. Rumble filter 12 dB cut at 30 c/s. Size 10 × 3½ × 6½ ins. To operate with B.P.I. power amp. Price kit £7 17s. 6d. Assembled and tested £10 17s. 6d.

Cooper-Smith B.P.I. 10 watts nom., 12 watts max. Dist. 0.15% or better at 10 watts. Input for spec. output approx. 1.9 V. Response 20-30,000 c/s ± 1 dB. Feedback 18 dB. N.L. 90 dB below max. output. Out. imp. 3.75 and 15 ohms. Output 6BQ5's or EL84's. Ultra-linear. Size 12 × 7 × 7½ ins. To operate with Cooper-Smith Mk. II control unit. Price kit £12 5s. Assembled and tested £14 5s.

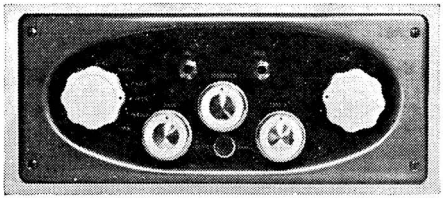
Cooper-Smith "Prodigy" Combined Amplifier and Control Unit. Inputs: pickup 8 mV; radio and tape 10 mV, 6 watts, 9 watts max. Dist. 0.2%. Response 30-25,000 c/s ± 1 dB. Feedback 15 dB. N.L. — 70 dB. Out. imp. 3¾, 7½ and 15 ohms. Output ECL82's. Ultra-linear. Size 10½ × 7 × 5½ ins. Price kit £12 10s. Assembled and tested £15 15s.

■**Cooper-Smith Stereo Control Unit.** Inputs: pickup 3 mV; tape 100 mV; radio 100 mV. 4 position sel., bass, treble, vol., balance. H.D. 0.15%. H and N — 60 dB. Size 10½ × 4½ × 3½ ins. To operate with Cooper-Smith stereo amplifier. Price kit £12 12s. Assembled and tested £15.

■**Cooper-Smith Stereo Amplifier.** 6 watts per channel, 9 watts peak. Dist. 0.2% at 6 watts. Input for spec. output 800 mV. Response 40-25,000 c/s at 6 watts. 15 dB feedback. N.L. — 80 dB. Out. imp. 3.75, 7.5, 15 ohms. Output ECL82's. Size 12 × 7 × 6¾ ins. To operate with Cooper-Smith stereo control unit. Price kit £13 13s. Assembled and tested £16.



Cooper-Smith Prodigy control unit and amp.



Sound Sales Mk. 111 control unit

Cooper-Smith Magnum. 20 watts nom., 30 watts max. Dist. 0.1% at 30 watts. Response 30-30,000 c/s ± 0.5 dB. Feedback 26 dB. N.L. — 80 dB. Output imp. 3.75, 7.5 and 15 ohms. Output EL34's. Ultra-linear. Size 14 × 8¼ × 7¾ ins. To operate with Cooper-Smith Mk. II control unit. Price kit £21 2s. 6d. Assembled and tested £23 12s. 6d.

■**Smith "Threesome" 3W. Integrated Stereo Amplifier.** Inputs: 300 mV per channel. 3 watts rated, 4 watts max. H.D. < 3% at 3 watts. Response 60-20,000 c/s ± 3 dB. Feedback 12 dB. N.L. 65 dB down at 3 watts. Out. imp. 3.75 and 15 ohms. On/off and treble cut and volume controls. Sel. switch. Output ECL 82's. Self-powered. Size 8½ × 7¼ × 3½ ins. Price £12 12s. (Kit price on application).

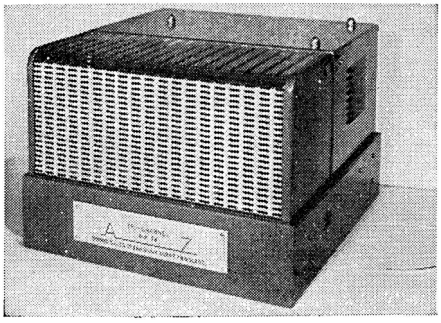
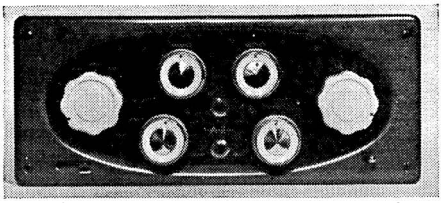
Sound Sales Ltd., Works and Acoustic Laboratories, Farnham, Surrey. Tel.: Farnham 6461/2/3. Cables: Sounsense.

A-Z Wide Range Control Unit Mk. III. Inputs: pickups 5 and 50 mV; radio 50 mV; mic. 1 mV. 8-position sel., bass, treble. presence. H.D. 0.06%. H and N — 80 dB. Rumble filter. P.a.t. 250v at 40 mA. Size 11¼ × 4⅝ × 5½ ins. To operate with Mk. III Amplifier, and not sold separately.

A-Z Mk. III Amplifier. 10 watts nominal, 13.5 watts max. Dist. 0.06%. Input for



Sound Sales Tri-Channel amplifier



Sound Sales A-Z Twin Twenty control unit

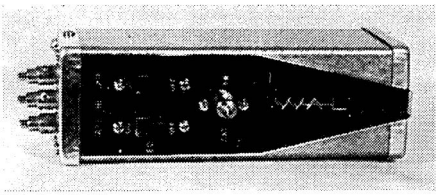
10 watts — 18 dB ref. 1 volt. Response 12-27,000 c/s ± 1 dB. Feedback 22 dB. N.L. — 80 dB. Out. imp. 3, 6, 15, and 30 ohms. Output EL84's. Ultra-linear. Size 10¼ × 7⅛ × 6 ins. To operate with Mk. III Control Unit. Price complete £25. Amplifier only £17.

■**A-Z Twin Twenty Stereo Control Unit.** Inputs: pickup 2-5 mV and 50 mV; radio 3 at 30 mV; tape 14 and 125 mV; mic. 1.4 mV. 11-position sel., balance, bass, treble, filter. Size 11¼ × 4⅝ × 9½ ins. Price £20.

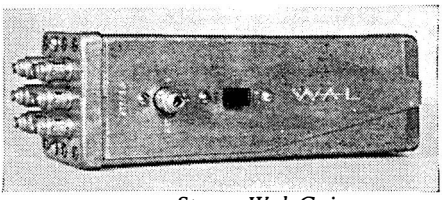
■**A-Z Twin Twenty Stereo Amplifier.** 10 watts per channel, 13.5 watts peak. Dist. 0.08%. Input for spec. output 0.1 volts per channel. Response 20-20,000 c/s flat. N.L. — 80 dB. Out. imp. 3, 8, and 15 ohms. Output EL84's. Ultra-linear. Size 12½ × 10 × 6½ ins. Price £30. To operate with Twin Twenty Control Unit, or A-Z Wide Range Control Unit.

A-Z Senior Control Unit with transistor input. Inputs: mic. 1 mV; radio 100 mV; tape 250 mV; tape 1 mV (from head) C.C.I.R. and N.A.R.T.B.; P/U variable 1-100 mV. 11 pos. sel. (5 record equal.), treble, bass, vol., presence control, switched filter, 2 pos. and out combined with variable slope. Tape recording in all positions, also jacks for portable recorders. Specially designed for use with M.C. pickups or tape-head without necessity of transformers. Size 11 × 4½ × 6 ins. Sold only with A-Z Senior power amp.

Tri-Channel Control Unit with transistor input. Inputs: mic. 1 mV; radio 100 mV; tape (from recorder) 250 mV; tape (from head, C.C.I.R. and N.A.R.T.B.) 1 mV; P/U variable 1-100 mV. 11 pos. sel. (5 record equal.). Presence, middle channel response; treble, top channel response; bass, bass channel response. Infinitely variable electronic crossover system, controlling 3 separate amplifying channels to appropriate speakers via master vol. control. Switched filter. Tape recording in all positions also



Wal Hi-Gain pre-amp.



Stereo Wal Gain pre-amp.

jacks for portable recorders. H and N better than — 80 dB. Dist. not measurable at normal output. Size $11\frac{1}{4} \times 4\frac{3}{8} \times 6$ ins. Sold only with Tri-channel amp. and speaker enclosure.

Tri-Channel Amplifier Mk. V. Bass 20-30 watts, mid channel 8-12 watts, treble channel 4 watts. Total undistorted output approx. 45 watts. Dist. 0.05%. Response infinitely variable on 3 channels. N.L. better than — 80 dB. Output LN309, EL84, EL34. Ultra-linear. Size $18 \times 10 \times 8\frac{3}{4}$ ins. Price complete with control unit and tri-channel speaker enclosure £125.

■Tri-Channel Stereo Control Unit and Tri-Channel Stereo Amplifier. Designed for stereophonic or monaural reproduction using 2 Tri-channel main amps. and 2 labyrinth speakers. Stereo to monaural changeover switch, giving parallel or stereo connection. Price complete with control unit, 2 amps and 2 speaker systems £300.

A-Z Senior Mk. II Amplifier. 20 watts nom. 30 watts max. Dist. 0.05% at 20 watts. Response flat 10-30,000 c/s. Feedback 25 dB. N.L. — 80 dB at 20 watts. Out. imp. 3, 6, 15 or 30 ohms. Output EL34's. Ultra-linear. Size $14\frac{1}{2} \times 8\frac{1}{2} \times 8\frac{1}{2}$ ins. Price complete with A-Z Senior control unit £42.

Connoisseur HQ20 control unit and amp.

LOUDSPEAKERS FOR 1962-3

—by R. L. West

AGAIN a twelve-month period has passed without any spectacular developments to report in this country; but there have been several enterprising designs and quite a few newcomers seem to be ready to "have a go". This is all very encouraging, for though the laws of nature cannot be broken, or even bent, we certainly do not yet know all the ways round them!

The foam sandwich cone—a true girder construction—has been in production for a year and it seems to be fulfilling its early promise. There are now two naked foam cones; the more recent one has a really revolutionary shape and it appears to make very pleasant noises. This material is not quite so stiff as the sandwich, but it is much stiffer than paper cones of the same mass. Only time will show whether these will oust the long established paper cone. A second electrostatic tweeter has appeared, but there is still only one full-range electrostatic speaker in the world, as far as is known.

★

The *Ionophone* and kindred speakers still remain a tantalizing possibility as far as this country is concerned, and it is doubtful whether there are now any of the originals still functioning. One day their problems may be solved.

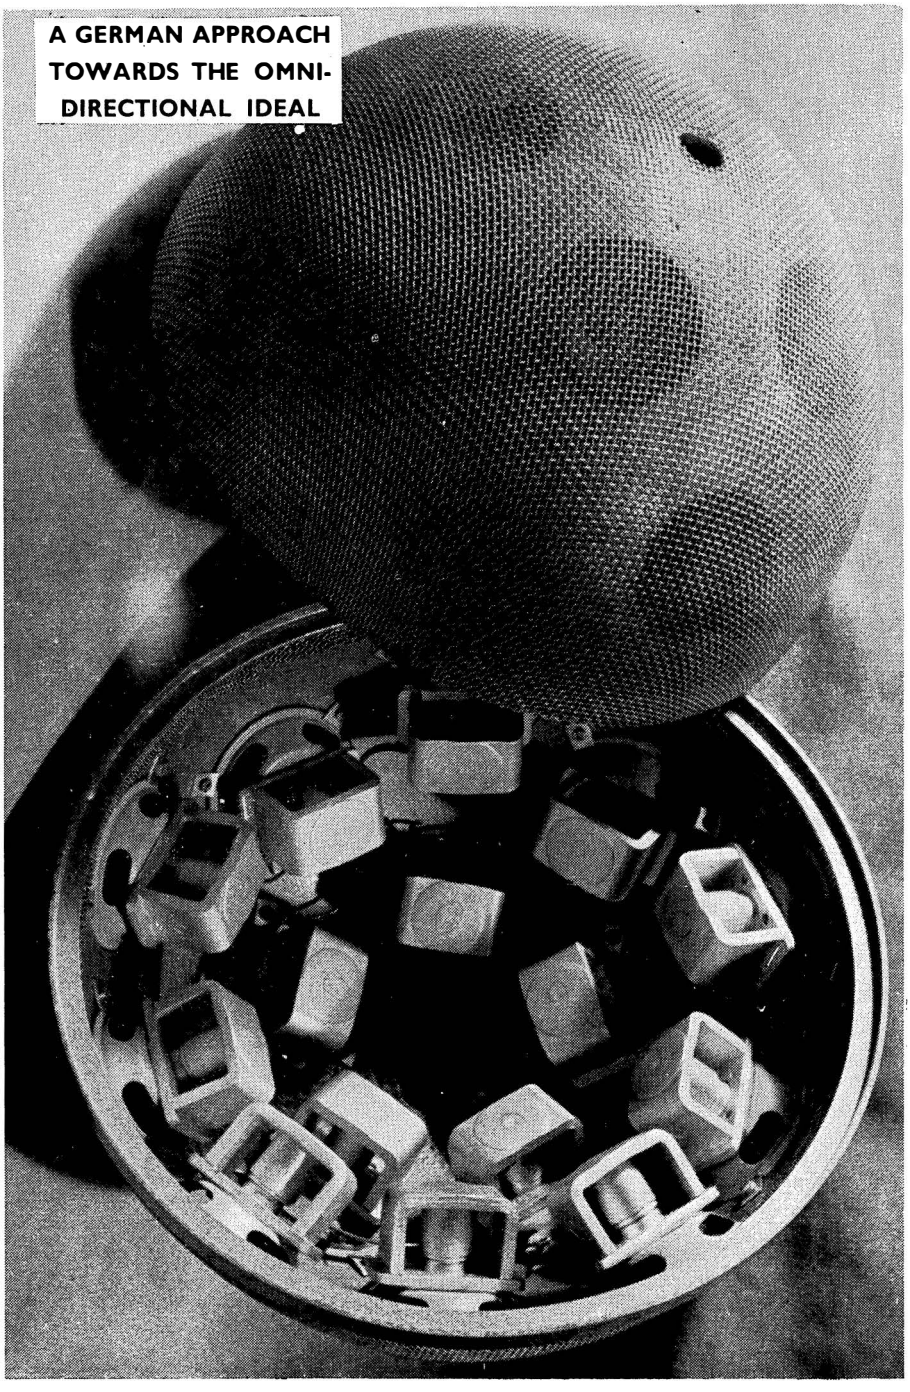
A really revolutionary design—the *Orthophase*—was demonstrated very successfully in France. It is a modern development of the old *Blatthaller* design of the nineteen-thirties and uses ceramic magnets, lots of them. Like the ESL, the whole area of the diaphragm is driven and, size for size, it can handle far more power than the ESL. The whole assemblage—made of a large number of 5 × 4 in. units—was very costly. The individual units, however, are a commercial proposition and there are other ways of using them. We will no doubt hear more of it.

The one and only ribbon tweeter continues in its seventh year, proving it to be a thoroughly sound design and is now joined by a bass unit from the same stable. There have, of course, been rumours of speakers to end all speakers, but we get used to that and enjoy the fun.

★

We have talked of compromise before—in the sense that all loudspeakers are a compromise between many conflicting requirements, and an important one of these is cost. We must be careful here and realise that cheap things are seldom a good investment. They are more likely to cause disappointment than more expensive ones. First, they may wear out or become shabby in a very short time; secondly, with increasing experience we may well become dissatisfied with them. This last point is continuously cropping up in high fidelity goods, and while it does provide a steady supply of secondhand equipment for sale, it can become a rather expensive way of gaining experience. In general, if a reasonable price is paid for a loudspeaker from a reputable firm, while it may not be the best in existence, it is not likely ever to be considered a poor buy.

Besides cost, the size and the looks and the performance have also to be considered. Theoretically, performance should come first, but many enthusiasts have to compromise with other members of the family



A GERMAN APPROACH
TOWARDS THE OMNI-
DIRECTIONAL IDEAL

on size and looks. There is no need for a specially good performer to look crude or ungainly. In the past this was sometimes so, but we have largely grown out of that. We do still seem to stick to the very conventional rectangular box with all its openings on one fabric covered side, facing into the room. Maybe this is the cost factor coming in again—it is the cheapest shape to construct. I think we could be more daring if we tried.

★

Size is a perennial controversy, in the home and in the laboratory. The modern tendency to spend our money on car, fridge, T.V., household gadgets and expensive holidays instead of decent sized living accommodation, naturally leaves us a bit short of room for a pair of loudspeakers. It is amazing what wonders the laboratories have done with overall cabinet dimensions of well under two cubic feet.

While it is quite true to say that really good fidelity can be had with the better versions of such compact loudspeakers—and very reassuring to those who perforce must use them—the writer is still unconvinced of the wisdom of this trend. When the best orchestras start using miniature double basses and tympani, and the best organ-builders stop using big pedal pipes, we shall know it is all right. However, to be fair to the modern compacts, they do produce a smoother response with less distortion and colouration than many larger and expensive loudspeakers of a few years ago. Now that a much clearer understanding exists of the physical principles involved in the production of sound, this miniaturisation has become possible. The main price to be paid is a reduction in efficiency; *i.e.* we need a few more watts to produce the same amount of sound, but this presents no problem.

★

Rather more subtle, not yet understood, and certainly as yet unmeasurable, such small speakers in most surroundings tend to sound as though they are small—as though one is listening via a small hole in a large solid wall. A larger, more generously designed speaker system, though measurement may even reveal a less flat response and more bass distortion, etc., may sound better and be preferred to the compact.

So here we are again back to compromise—and we have to choose our own compromise, often with a little help from someone more experienced.

Ideally a purchaser should live with his prospective loudspeaker for a week or so, but such a happy arrangement is not available from many dealers. The difficulties are obvious, and yet acceptance tests for larger engineering installations are the normal thing. Failing that, we must get around and hear them demonstrated, preferably several times in *different* places. When a short list has been decided, then we should make sure we hear a selection of material—serious and pop, organ, orchestral and choral, solo instrument and solo voice. If it pleases with *all* of these (musical taste apart!), then it should please for a long time. However, one should insist on hearing it played also at a low level—most demonstrations attempt to impress rather than delight—and one cannot judge properly when standing up—and when three feet away from it!

★

Strictly speaking, one should alternate listening to a loudspeaker with going to a live concert, as one can so easily develop a perverted taste. This is not being ultra fussy; it is sound advice. Musical performances, as we know them today, have evolved gradually over some 400 years or so and have proved acceptable to our human senses. It is very doubtful whether any other noises will ever give such lasting satisfaction, so our search for something as near the original as possible is nearer the mark than some would have us believe. They will say "it doesn't matter what the noise is if you like it". Maybe we have not yet found all the noises and combinations that delight our senses, but we must at least avoid being anti-social!

The loudspeaker's style of sound distribution continues to cause argument. Most designs stick to the conventional forward-facing pattern. Depending on the room, its size and furnishings, and seating distance, this traditional arrangement can be very satisfactory. It is certainly the most satisfactory arrangement for a public demonstration in a large hall.

At home, the "stereo seat" will give the most striking results if the head is kept still, but the results tend to alter with quite small changes in position—a mere head movement is enough. This is a disconcerting effect, and one that does not occur when listening to a live performance. It is minimised by *not* sitting on the axis of either

loudspeaker and the effect more or less disappears with the type of speaker that radiates in all directions and thus reflects off the wall surfaces behind it. Stereo pinpointing is not so accurate with this type, but it may be found less tiring to listen to. After all, hardly any musical instruments actually point at us when we hear them played, and the few that might, are on the move all the time, so we only get a small share. Stereo undoubtedly helps, for, at worst, it is better for the sound to come out of two small holes than one. At best, it gives a fair illusion of the real thing and exercises a few more circuits in the ear-combination than mono can!

★

Two identical speakers are best, even though the room rarely has the symmetry to treat them alike. Dissimilar speakers can work and this has often been demonstrated. It is safe to say that stereo with dissimilar speakers, provided neither is really bad, will be a worthwhile improvement on mono for most people. The same could be said of the "economy systems" which use one bass speaker and two out-rigger tweeters, or a full-range and one tweeter on the other side. Anyway, they are good stepping stones to the ultimate pair.

Building up a high fidelity system, and starting from a domestic FM receiver, the purchase of a good speaker may well be a good start, since the signal from many FM receivers is quite good, *i.e.* if they have low distortion and negligible hum.

Starting with disc playing equipment, however, first must come a good pickup or the discs will be permanently spoiled for better reproduction later on. They should not be unplayable, but with later and better equipment even slight signs of wear will easily be heard.

★

Lastly, one does not need a loudspeaker with a response that is flat from zero to infinity—not even from 30 c/s to 18,000 c/s. Thirty cycles per second, yes indeed. We all can hear this and enjoy it; but eighteen thousand?—well, it is nice to know (or think) it is there, but it will not often be used—from the BBC, never; from tape at $7\frac{1}{2}$-in. per second, very doubtful—some distortion and tape hiss most probably; from modern LP discs with a good pickup, yes; but how many of us will hear it?

The really important part is all below about 10 Kc/s, and *that* must be smooth and free from vices. Make no mistake, this is not a question of pouring ridicule on all efforts to operate with frequencies above 10 or 12 Kc/s, but rather a warning that the really important part is much lower down, and a smooth response free from distortion and all the other ills that can beset the design (be it loudspeaker, pickup, disc, or tape or tape machine), is far more important than mere bandwidth. It should be remembered that the ear is most sensitive in the range from 500 c/s to about 3,000 c/s, and that it can suffer considerable distress from things we cannot even measure in the laboratory. Nevertheless, our loudspeaker designers do try hard and they produce some very creditable results. May they ever be thus enthusiastic!

DIRECTORY OF SPEAKERS AND ENCLOSURES

●This directory is divided into two parts. **Part 1** deals with the range of drive units which, by makers' specifications, are within the Hi-Fi classification. **Part 2** deals with complete enclosures. These, as a general rule, embody the drive units of Part 1. For economy of space the following abbreviations are used: **v.c.i.**—voice coil impedance; **r.c.f.**—recommended crossover frequency (and in Part 2) **Rec.**—recommended units; Height by Width by Depth are the order of printed dimensions.

PART I—DRIVE UNITS

Richard Allan Radio Ltd., Bafflette House, Taylor Street, Batley. Tel.: Batley 1123/1308/4033. Cables: Acoustics, Batley.

Golden Eight. 8 in. Paper cone. Paper or foam surround. Voice coil 1 in. Gap flux 14,000 gauss. Total flux 56,000 maxwells. H.C. 6 watts. v.c.i. 15 ohms. F.R. foam surround 45-10,000 c/s, paper surround 60-10,000 c/s. r.c.f. Full range unit. With tweeter inner cone and aluminium voice coil, range extends to 17,000 c/s. Price, paper surround £3 7s. 6d. (U.K. purchase tax £1 3s. 10d.); foam surround £3 12s. 6d. (U.K. purchase tax £1 5s. 7d.). Aluminium or copper voice coil available.

Bronze Eight. 8 in. Paper cone. Paper or foam surround. Voice coil 1 in. Gap flux 12,500 gauss. Total flux 50,000 maxwells. H.C. 5 watts, v.c.i. 15 ohms. F.R. foam surround 45-10,000 c/s, paper surround 60-10,000 c/s. r.c.f. Full range unit. With tweeter inner cone. Aluminium voice coil. Range extends to 17,000 c/s. Price, paper surround £2 15s. (U.K. purchase tax 19s. 5d.); foam surround £3 (U.K. purchase tax £1 1s. 2d.)

Bronze Ten. 10 in. Paper cone. Voice coil 1½ in. Gap flux 12,500 gauss. Total flux 73,000 maxwells. H.C. 8 watts. v.c.i. 15 ohms. F.R. 40-5,000 c/s (bass cone) or 40-9,000 c/s (wide range cone). Price, standard surround, £4 10s. (U.K. purchase tax £1 11s. 8d.); foam surround £4 17s. (U.K. purchase tax £1 14s. 3d.)

Golden Ten. 10 in. Paper cone. Voice coil 1½ in. Gap flux 14,000 gauss. Total flux 82,000 maxwells. H.C. 8 watts. v.c.i. 15 ohms. F.R. 40-5,000 c/s (bass cone) or 40-9,000 c/s (wide range) cone. Price, standard surround, £5 5s. (U.K. purchase tax £1 17s.); foam surround £5 12s. (U.K. purchase tax £1 19s. 6d.)

ACOUSTIC RESISTANCE UNITS

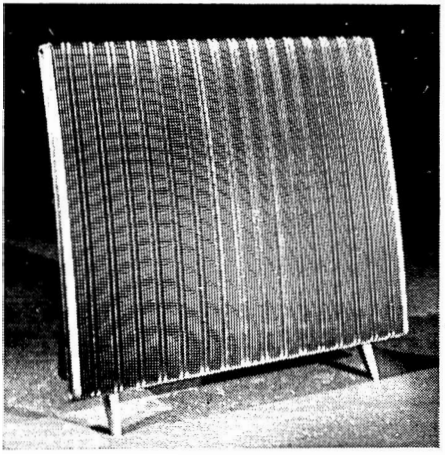
Goodmans Industries Ltd., Axiom Works, Wembley, Middx. Tel.: Wembley 1200. Cables: Goodaxiom, Wembley.

ARU Units. These units combine both reflex port and acoustic resistance in one complete unit. The port area and resistance are calculated to suit a particular cabinet volume and speaker cone resonance, thus being usable with a variety of cabinet designs and driving units. Price £2 19s. 6d. to £4 4s.

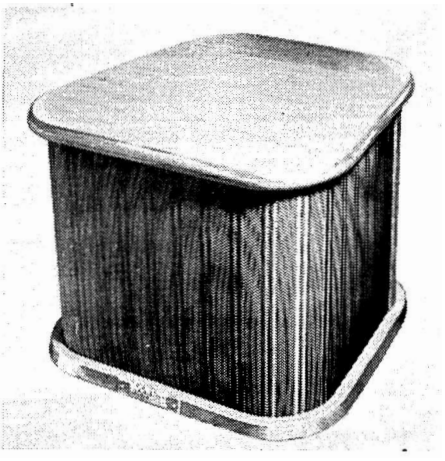
Details of New Products are given in a special supplement at the end of the book.

ELECTROSTATIC SPEAKERS

FULL RANGE, MID AND UPPER RANGE ELECTROSTATIC LOUDSPEAKER UNITS.



Quad Electrostatic full range Loudspeaker



Woollett Upper Register

Acoustical Manufacturing Co. Ltd., St. Peter's Road, Huntingdon, Hunts. Tel.: Huntingdon 361 and 574. Cables: Acoustical.

Quad Electrostatic Loudspeaker. Full range doublet covering 45 c/s to 18 Kc/s. Attenuation outside band asymptotic to 18 dB/8ve. Total integrated radiation at max. output equivalent to 95 phons in rooms of up to 5,000 cu. ft. with average reverberation. Dispersion approx. 70 deg. horizontal; 15 deg. vertical. Impedance 30-15 ohms, 40 c/s to 8 Kc/s falling above 8 Kc/s. Designed for use with standard Quad II Amplifier or equivalent. Suitable for AC supplies 100-120 or 200-250v. 50-60 c/s. Free standing unit requires no enclosure or cabinet. Weight 35 lb. Price £52 complete.

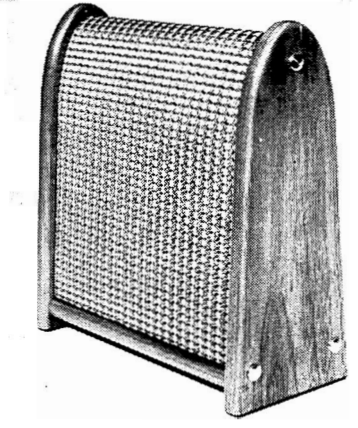
Execaphon Ltd., 77 Sydenham Park Road, London, S.E.26. Tel.: Forest Hill 9595.

Audistatic. Electrostatic, mid and upper frequencies, plastic, curved diaphragm, H.C. maximum 15 watts peak music. v.c.i. 15 ohm. F.R. 100 c/s to limit of hearing. Built-in crossover integrated 1,500 c/s. Price £15 15s. 0d.

L. G. Woollett & Co. Ltd., 21 Anerley Road, Station Road, London, S.E.20. Tel.: Sydenham 9003.

Electrostatic Upper Register Speaker. Filter mains polarising and matching. H.C. 15 watts. F.R. from 1,500 c/s upwards. Built-in crossover integrated. Price £15 15s.



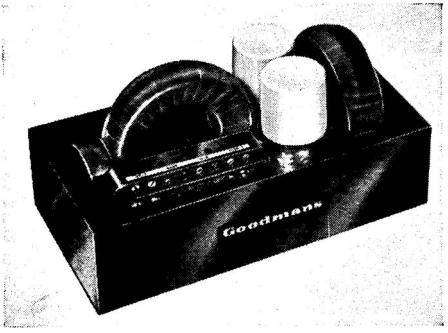
Audistatic mid & upper frequency unit

DIRECTORY OF CROSSOVER UNITS

Richard Allan Radio Ltd., "Bafflette House", Taylor Street, Batley. Tel.: Batley 1123/1308/4033. Cables: Acoustics, Batley.

CN.104 Crossover Unit. A two-way half-section parallel network. Crossover frequency 5,000 c/s. All terminations 15 ohms. Price £2 2s.

CN.1284. Crossover Unit. A three-way crossover with main crossover operating from half wave parallel network and subsidiary crossover capacity fed. Crossover frequencies 1,100 and 5,000 c/s. All terminations 15 ohms. Price £6 5s.



Goodmans XO/950 crossover unit

Goodmans Industries Ltd., Axiom Works, Wembley, Middx. Tel.: Wembley 1200. Cables: Goodaxion, Wembley.

X0/5000-Crossover Unit. A two-way half-section crossover network, operating at 5,000 c/s. All terminations 15 ohms. Price £1 19s.

X0/950-Crossover Unit. A two-way half-section, crossover network, operating at 950 c/s. All terminations 15 ohms. Price £5 5s. 8d.

X0/950/5000. Crossover Network. A multiple crossover network comprising four half-section L.C. filters. Crossover frequencies are 950 c/s and 5,000 c/s. All attenuation rates are 12 dB/octave. All terminations 15 ohms. Price £7 0s. 6d.

★

Romagna Reproducers, Factory Distributors, K. H. Williman & Co. Ltd., Blackford House, Sutton, Surrey. Tel.: Melville 1491.

CO/1/15. Crossover Network. 3 Kc crossover frequency for 15 ohm loudspeakers and amplifiers. Balance control fitted, $\frac{1}{2}$ section networks giving 12 dB/octave cut-off. Maximum insertion loss 1 dB in pass band. Potted in cast aluminium case. Price £3 3s.

★

Westrex Co. Ltd., Coles Green Road, London, N.W.2. Tel.: Gladstone 5401/8. Cables: Westelcol, Norphone, London.

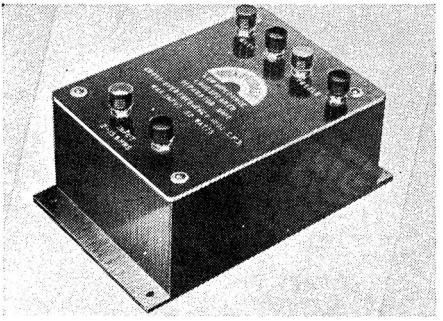
Dividing Network. Constant impedance parallel network, using two L-type filter sections, low and high pass, crossover at 675 c/s. For any impedance 16-24 ohms. Price £13 10s.

★

Wharfedale Wireless Works Ltd., Idle, Bradford, Yorks. Tel.: Idle 1235-6. Cables: Wharfdel, Idle, Bradford.

Loudspeaker Separators. $\frac{1}{4}$-section type. Operating at 1,000 or 3,000 c/s. 8 units available to cover from 2-16 ohms impedance. Slope 6 dB/octave. Size 7 × 4 × $3\frac{3}{4}$ ins. Weight 2-$2\frac{1}{2}$ lbs. Max. input 30 watts. Price from £2 11s. to £4 17s. 6d. depending on type.

HS/CR3/2. $\frac{1}{2}$-section 3-way separator unit with crossover at 800 and 5,000 c/s. Max. input 30 watts. Slope 12 dB/octave. Size 9 × 6 × 5 ins. Weight $6\frac{1}{2}$ lbs. 2 models. 2-6 ohms, Price £11; 7-16 ohms,



Wharfedale $\frac{1}{4}$ section crossover

Price £8 10s. Also available with crossover at 400 and 5,000 c/s. 7-16 ohms only, Price £10.

WMT1 Matching Transformer. Auto transformer for matching 10-16 ohms or 7-9 ohms speakers to sets with 2-5 ohms output or vice versa. Response 20-15,000 c/s ± 1 dB. Handling capacity 15 watts. Can also match speakers of different imps. to crossover unit in 2 or 3 speaker systems. Size $2\frac{7}{8} \times 2\frac{3}{4} \times 2\frac{3}{4}$ ins. Weight $12\frac{1}{2}$ ozs. Price 13s. 6d.

Stereo Truqual. Ganged twin vol. control. L-pad type attenuators for stereo speakers. 6 positions. Price £1 10s.

MICROPHONES

by Stanley Kelly

MICROPHONES, in common with other transducers, convert one form of energy into another. It is unfortunate that some energy is lost in the process, but in terms of electro-acoustic efficiency they are comparable with loudspeakers and considerably more efficient than most gramophone pickups. In some of the latest magnetic types developed for use in hearing aids, conversion efficiencies of the order of 30 per cent over more than one decade of frequency response are obtained. This is quite astounding when one realises that two forms of conversion take place: the first from acoustic to mechanical energy, and the second from mechanical to electrical energy.

The diversification of microphones is considerably greater than other forms of transducers in the reproduction field. With pickups, only two basic forms of unit are used, that is to convert either a lateral modulation or a vertical modulation of the record groove into a corresponding electrical signal; whilst with loudspeakers, with the exception of the electrostatic unit, a mass controlled moving system is used in which the piston either acts as a direct radiator or is connected through some suitable impedance transforming device to the air load. In the case of microphones, although there are two main categories, (a) those in which the polar pattern is spherical, and (b) those in which the polar pattern is either bi-directional or uni-directional, they can be divided into a number of sub classes, dependent on the modus operandi of the acoustic-mechanical-electric system.

★

The basic transducer can either be **(1)** variable resistance (this is the standard form of unit in the majority of the line telephone systems in use throughout the world, but will not be discussed at present); **(2)** capacitative, in which the instantaneous capacity of the condenser is varied in sympathy with the oncoming sound wave; **(3)** piezo-electric, in which a force which is a function of the incident sound wave is applied to a piezo-electric crystal, thereby generating an e.m.f.; **(4)** varying magnetic field, i.e., balanced armature, in which the magnetic field varies directly with the sound pressure; thus inducing a voltage in the associated coil, and **(5)** moving conductor or dynamic types of microphone, in which a conductor moves in a linear magnetic field and generates a voltage proportional to its velocity, which in turn is a function of either the incident sound pressure or the particle velocity of the sound wave, according to the acoustic structure associated with the diaphragm. It should be noted that in types **(1) (2)** and **(3)** their output is a function of the displacement amplitude of the moving element, whilst in types **(4)** and **(5)** the output is proportional to the velocity of the moving element.

★

Let us consider the condenser or capacitative type of microphone. This unit has found widespread use because of its "flat" frequency response. As shown in **Fig. 1**, the diaphragm of the microphone is a thin membrane. In some structures it is tightly stretched metal, either stainless steel or aluminium between 0·5 and 1·5 thou thick and depending on the upper frequency response, the diameter may be from approximately 1·25 inches (upper limit 10 Kc/s) to 0·4 inch (upper limit 40 Kc/s).

In another form widely used for measurement microphones, the diaphragm consists of a thin quartz or glass membrane approximately one thou thick, half-inch diameter with gold splutter on the outside. In almost all cases the diaphragm is the earthy side of the condenser. Behind the diaphragm and separated about one thou is the fixed plate. Because of the very small spacing between the diaphragm and the back plate, considerable stiffness is applied and this increases the overall resonant frequency of the mechanical structure. At the same time it reduces the sensitivity except at

resonance, where a peak of 20 bB can easily be obtained. In order to reduce the effect of the stiffness narrow grooves or fine holes are bored into the back plate. These add resistance and mass into the circuit and reduce considerably the height of the peak. By correct proportioning the system can be made aperiodic at the high frequency resonance. Where the holes are bored right through the back plate they also form a low frequency resonant circuit below which the response of the microphone will fall at 12 dB per octave, but by suitably proportioning the dimensions of these slots or holes, there is no difficulty in producing a microphone which is flat from 20 c.p.s. to 40 Kc/s.

★

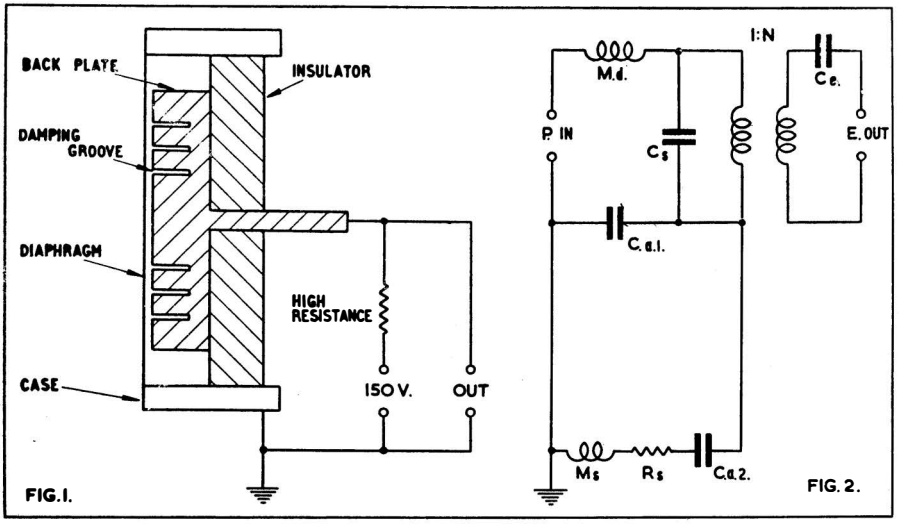
Fig. 2 shows the analogue; in which Md = mass of the diaphragm; Cs = compliance (reciprocal of restoring force of the diaphragm); Ca_1 = stiffness of the air cavity between the backing plate and the diaphragm. Ms and Rs = mass and resistance of the slots or holes in the backing plate; Ca_2 = compliance of these slots, but is short-circuited in the case of tubes going right through the backing plate. *Transformer* = transducing element; Ce = electrical capacitance of the condenser.

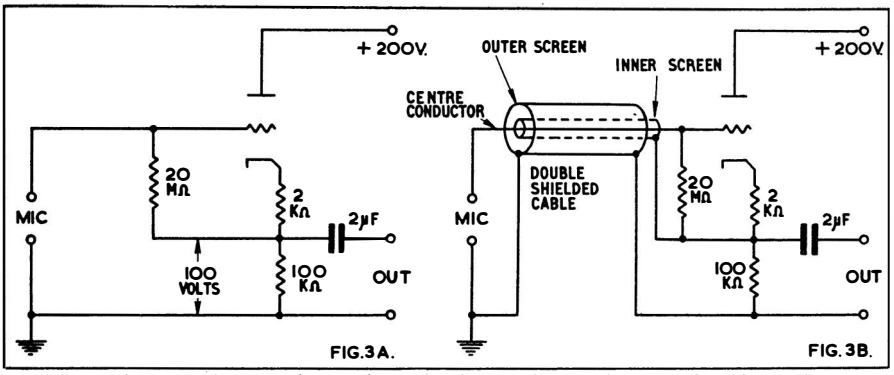
The microphone is polarized, usually with a voltage of between 100 and 200 volts and because the capacitance is usually of the order of 50 pf, the feed resistance must be of extremely high value. It is now common practice to feed the microphone directly into a cathode follower, and if the polarizing resistance is also made the grid resistance it is possible to have input impedances of the order of 300 megohms for a grid resistance of only 20 megohms.

★

Fig. 3(a) shows a standard head amplifier, and **Fig. 3(b)** shows a further application where it is necessary to have the microphone at some distance from the head amplifier. Using a double shielded cable, 0·2 inches O.D. with interscreen capacitances of the order of 1000 *pfds* will reduce the overall sensitivity by only 6 dB over medium and high frequencies in this circuit. It is possible to use the microphone as the variable tuning capacitor in a frequency modulated transmitter and commercial units are produced by both *R.C.A.* and *Philips*. If the back plate is made reasonably thin and perforated, so that both sides of the diaphragm are effectively in contact with the acoustic wave, a pressure gradient microphone will be produced and the unit will exhibit bi-directional characteristics. Likewise, if a network in the form of an acoustic resistance be applied to the back plate it is possible to produce a microphone having uni-directional (cardiod) characteristics.

A combined non-directional, "figure 8" and cardioid microphone employing a condenser unit as the transducer is shown



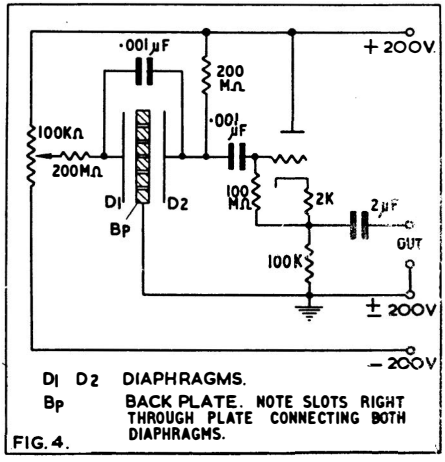


in **Fig. 4.** The transducer unit consists of two damped diaphragms. The vibrating system consists of the two separate and spaced diaphragms, each diaphragm is spaced at a small distance from the back plate; this damped space provides an acoustical capacitance and acoustical resistance for the diaphragms which are placed back to back. The cavities behind the diaphragm are interconnected by small holes, and the phase shift in the acoustical/mechanical system combined with the electrical polarizing system makes it possible to obtain a variety of directional characteristics as well as a non-directional characteristic. With the potentiometer at the full negative position a bi-directional pattern is obtained; at the zero voltage a cardioid type of directional pattern is obtained. With the potentiometer set at the full positive position a non-directional pattern is obtained.

Messrs *Neumann A.K.G.* and others have produced stereo condenser microphones consisting of two condenser cardioid elements, and by varying the differential polarizing on the two units it is possible to get almost any polar field pattern from completely spherical to bi-directional and middle/side stereophony. The frequency response is flat ± 3 dB from 40 to 15,000 c/s; sensitivity is approximately one millivolt/dyne/cm^2; and the residual noise level of the microphone and pre amplifier is 20 phons, that is approximately 53 dB below a dyne/cm^2 and approximately 90 dB below the final crescendo in large symphonic works. It is, of course, this " deafness" or threshold level of noise in a microphone system which ultimately determines the dynamic range of any reproducing equipment.

Condenser microphones used to be temperamental animals, but due to modern techniques they are as reliable as any other form of transducer. They have, however, to be manufactured to extremely close tolerances and in terms of £ s. d. cannot be considered as cheap items of equipment.

Crystal microphones, on the other hand, are among the cheapest of microphones offered today. They require no polarizing voltage, are comparatively simple to construct, and once the bimorph elements have been produced they do not require close manufacturing tolerances. The majority of crystal microphones use Rochelle Salt made in the form of a bimorph as the activating element, although in the tropics, Titanates, principally lead zirconate (PZT), is being more widely used. It is indeed fortunate that all the close tolerances required for crystal microphones or indeed any form of crystal transducer are built into the crystal element itself, because these units are produced in England alone at a rate in excess of 5,000,000 per year, and the requisite quality control and precision equipment can therefore be applied to the manufacture of crystal elements without



materially increasing the cost of the unit microphone, pickup, etc.

★

Fig. 5 shows in diagrammatic form the normal type of crystal microphone with the analogue beneath it. It behaves purely and simply as a pressure microphone in which the sound pressure vibrates the diaphragm, and the force thus generated is applied to the crystal in series with the stiffness of the cavity and the restoring force (reciprocal of compliance) of the diaphragm. Examining the analogue it will be seen that for wide frequency response *Md* and *Mx* (that is the mass of the diaphragm and the mass of the crystal) should be as small as possible, whilst the compliance of the cavity, *Cc*, and the diaphragm, *Cd*, should be large, and the crystal compliance *Cx* as small as possible. This will enable the maximum force to be developed across *Cx*, which is in series with the other impedance. Unfortunately, this requirement means a very small crystal with resultant small electrical capacitance, a large thin diaphragm, and a large can. These two latter will limit the upper frequencies that the microphone will respond to and the diaphragm will probably show resonant modes due to break-up of its structure in the mid-upper frequencies.

Because the majority of crystal microphones are today used for domestic tape recorders (which despite the claims of their manufacturers do not have an extended frequency response; and are still further restricted by the small speaker and inadequate loading of same) a frequency response for the microphone of 80 c/s to 6000 or 7000 c/s is considered adequate. Using these parameters, and assuming an electrical load resistance of one megohm gives optimum values of a crystal approximately $\frac{5}{8}$ inch square and electrical capacitance of 1500 pfds. With a can $1\frac{1}{2}$ inches in diameter by $\frac{5}{16}$ inch deep, the diaphragm cone is approximately 1·25 inches in diameter, giving a surround of about $\frac{1}{8}$ inch. The diaphragm and crystal masses will be approximately equal, the cavity compliance and crystal compliance will likewise be equal, but the surround compliance will be one order of magnitude less, and this surround compliance is used principally to control the high frequency response.

With the values just stated, the resonant frequency will be of the order of 5 Kc/s, and the sensitivity about −50 dB referred to one volt/dyne/cm². If the surround compliance is made infinite, another 10 dB of sensitivity will be obtained, but the resonant frequency will now be about 1800 c/s dropping at 12 dB per octave above this frequency. In order to reduce the height of the peak (which in the undamped condition is about 20 dB) a rigid perforated grill is fitted in front of the microphone with silk of the proper mesh firmly cemented or clamped to it. The peak can then be controlled to between 4 or 6 dB for a reduction in overall sensitivity of only 2 dB, and in this form the microphone is produced in many thousands each week.

★

The dynamic or moving coil microphone has the same construction as a moving coil loudspeaker in miniature form. The voice coil is usually connected directly to the diaphragm and is located in a strong magnetic field. The e.f.m. generated by the coil is proportional to the velocity of the coil and is given by the well known equation:

$$E = Blv \times 10^{-8}$$

where E = volts; B = flux density in gauss; l = length of the wire of the voice coil in cm; v = velocity of the coil in cm/sec.

The difficulty is in controlling the last parameter. The absolute value of the velocity will be a function of the acoustic

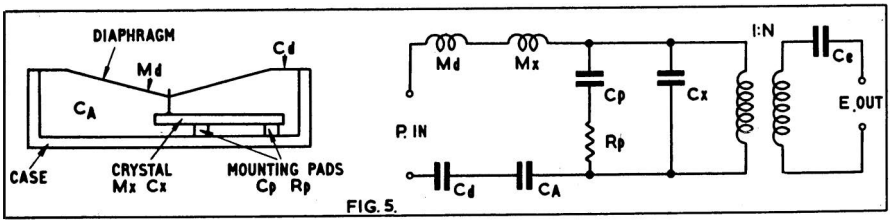


FIG. 5.

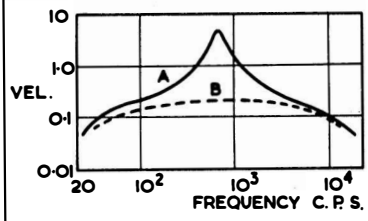

FIG 6. A-UNDAMPED RESONANCE OF 6C.
B-DAMPED RESONANCE OF 6C.
(OBTAINED BY INCREASING R_1)

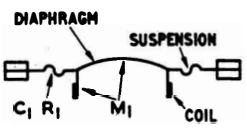

FIG. 6C.

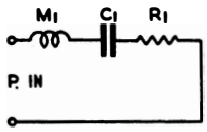

FIG. 6D.

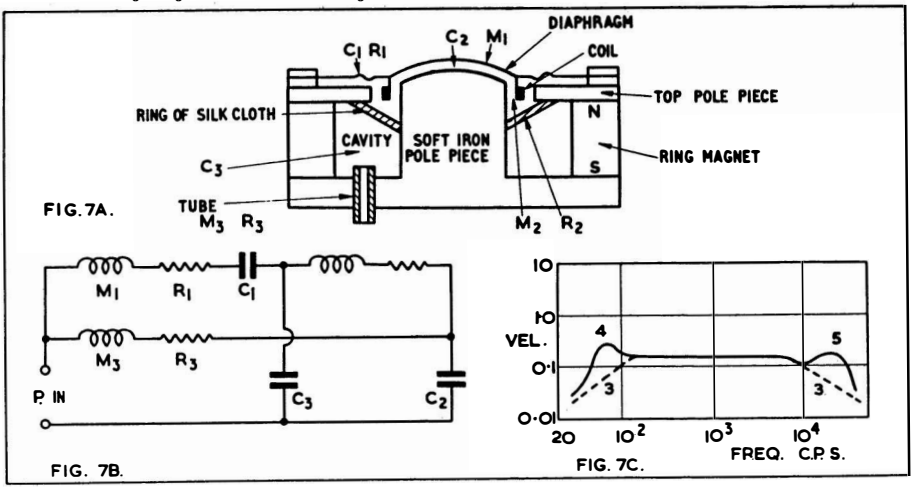
field strength, the area of the diaphragm and the mechanical impedance associated with it. In a simple mechanical circuit consisting of the diaphragm, the voice coil and the restoring force, a series resonant circuit will result giving a response of the form shown in **Fig. 6(a)**. As the value of resistance is increased, the height of the peak will be reduced and it is possible to obtain a response as shown in **Fig. 6(b)**. Unfortunately, the sensitivity is reduced rapidly as the frequency response is increased. By applying acoustic resonance to the system approximately an octave can be obtained for only slight discontinuities in the smooth response curve.

Fig. 7 shows one of the simpler methods of obtaining this. In the mechanical network M_1, Rm_1, and Cm are the mass, mechanical resistance and compliance of the diaphragm and suspension. Cm_2 is the compliance of the air chamber behind the diaphragm whilst M_2 is the effective mass and mechanical resistance of the silk cloth damping the chamber connecting the cavity Cm_3 to the back of the diaphragm. The tube M_3Rm_3 connects to Cm_3 to the incident wave. It will be seen from the diagram that the extra low frequency response (4, in the curve) is due to the addition of the tube $M3Rm_3$, whilst the upper resonance (5) is due to the compliance Cm_2 resonating with the mass M_2Rm_2 in series with Cm_3.

More sophisticated microphones are produced with an additional resonance at each end of the frequency band, the microphones are currently produced with a response from 30 to 15,000 c/s ± 3 dB. The coils are usually wound to an impedance of 25 to 50 ohms and must therefore be used with a matching transformer when fed into high impedance circuits or even normal line impedances of 200 to 600 ohms. An average microphone with a diaphragm diameter of approximately $\frac{3}{4}$ inch with a voice coil of like dimensions, and a surround of approximately $\frac{1}{8}$ inch wide, the coil working in a field of approximately 7000 gauss, will produce an open circuit voltage of approximately -80 dB reference 1 volt/dyne/cm²; and working with a transformer into a 50,000 ohm load sensitivity of approximately -55 dB per



volt/dyne/cm² is easily obtained.

The ribbon microphone, in common with the moving coil, is a velocity operated device in so far as the generating system is concerned. Unlike the moving coil unit, however, which has its main resonance in the centre of the audio frequency range, the ribbon unit when used as a pressure gradient microphone is mass controlled, the resonance usually being located below about 50 c/s. At this low frequency, due to the viscous damping of the air, the height of the resonance is not very great, although in high quality microphones extra baffles adding acoustic resistance to the ribbon are employed. The average mass of the ribbon is of the order of 1½ milligrammes and its length varies between 1 and 2 inches and width between 0·1 and 0·2 inch according to the designer's preference. The difficulty with the ribbon microphone is getting sufficient flux density in the very wide gap. In the old B.B.C. ribbon microphone the flux density was 3200 gauss, whilst in the latest unit the flux density averages 5000 gauss. Commercial ribbon microphones vary between these two figures.

The ribbon is usually constructed of aluminium or aluminium alloy foil between 0·6 and 2 microns thick. The upper limit to the length of the ribbon is determined by the required vertical polar field response. A long ribbon will reduce the response at high frequencies at angles other than perpendicular to the ribbon plane, and for a 3 dB loss at 60° to the horizontal at 10 Kc/s the maximum length of ribbon is of the order of 1¼ inches. The width of the ribbon is determined by a number of contradictory requirements: the wider the ribbon the greater the area and hence sensitivity, also the lower the ribbon impedance, but the gap field strength reduces quite rapidly; a wide ribbon can also result in torsional and cross vibrational nodes at high frequencies, resulting in discontinuities in response, and it must be made wide compared to the gap between the ribbon and the pole pieces; this latter requirement more than anything determines the ultimate ribbon width. Whilst it is possible to make laboratory microphones with a spacing of only 2 or 3 thou between the ribbon and the pole piece, in commercial practice it is usual to have a minimum of 7 to 10 thou and preferably 15 thou of clearance. This gives a minimum width of 1/10th inch for the 7 thou clearance and approximately 0·2 inch for the 15 thou clearance.

In order to obtain a low resonant frequency the ribbon must be corrugated to reduce the stiffness to a minimum. These corrugations, however, introduce transverse resonance modes at high frequencies, and whilst increasing the depth and number of corrugations will reduce the lower resonant frequency they also cause more discontinuities in the 8 to 10 Kc/s region. The optimum seems to be approximately 30 corrugations per inch with a peak to peak value of about 5 thou. The basic peak to peak value is determined empirically and in production is adjusted until the diaphragm resonates at the required low frequency value.

The open circuit sensitivity of the average ribbon unit is between 20 and 30 microvolts from a source impedance of about half an ohm, and sensitivities of the order of 2 millivolts/dyne/cm² can be obtained in load impedances of 50 to 100,000 ohms (−54 dB reference 1 volt per dyne/cm²).

It is often asked why microphones do not have the same output voltage as gramophone pickups. This disparity will be appreciated when it is realised that a minimum of 2,000 dynes operating force is available on a pickup playing at 3 grammes, whilst the maximum force obtained from acoustic sound wave is very rarely in excess of 20 dynes. Be that as it may, microphones as produced today are precision engineered devices with an overall conversion efficiency at least as high as any other form of generator, and whilst the innovations have not been as startling as in, say, stereo gramophone pickups, the engineering thought applied to modern microphones is at least of the same order. Whilst they are robust they should be treated with the same care as used with a fine watch.

★

We can expect to see more medium priced dynamic and magnetic microphones in the near future because of the increased use of transistors in tape recorders. The price of transistors has now been reduced to such values as to render them economic in all except the very cheapest instruments and the advantages, freedom from hum, long term stability, and indefinite life, make them a very attractive proposition to the designer. This in turn is putting pressure on the development laboratories of the microphone manufacturers to produce economically priced low impedance devices to match them.

DIRECTORY OF MICROPHONES

★ In these abridged specifications, the following abbreviations are used: **Source imp.**—microphone source impedance. **Rec. load imp.**—recommended load impedance, and Sensitivity is given in dB with reference to 1 volt/dyne/cm², unless otherwise stated.

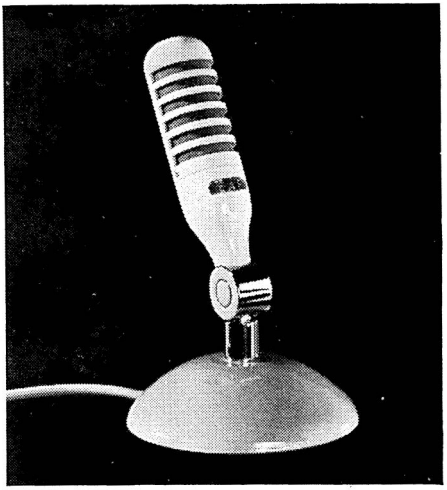
STC 4105 Moving Coil

Reslosound Ltd., 24 Upper Brook Street, London, W.1. Tel.: Hyde Park 2291. Cables: Derritron, London.

A range of semi-professional and domestic microphones, including moving coil and ribbon types. The latter are available in

bi-directional or cardioid models, and a range of matching impedances is included. The base fitting incorporates the matching transformer and muting switches may be fitted if required. Details on application.

Reslo Type PR. Pencil ribbon. Response (nominal) ± 3 dB, 70-12,000 c/s. Sensitivity 60 dB below at 40 K ohms. Source



Elizabethan Ribbon

imp. PRL 30-50 ohms; PRM 250 and 600 ohms; PRH 30-50 and 35 K ohms. Built-in transformer. (M and H tapped dual impedance.) Price PRL £8; PRM and PRH, £8 10s.

Accessories: Type **GE1.** Transistor coupling unit, for use between medium or low impedance microphone (15 to 1,000 ohms) and the high impedance (nominal 100,000 ohms) microphone input of tape recorder or power amplifier. Response within 1 dB 50-15,000 c/s. Price £6.

Type **LTU1.** Line coupling transformer unit, for use between a low impedance microphone (15 to 50 ohms) and the high impedance (nominal 100,000 ohms) microphone input of tape recorder or power amplifier. Response ± 1 dB, 50-15,000 c/s. Price £3 15s.

Types **MT101** and **MT102.** Line coupling transformer for chassis or unit mounting, for use between a low impedance microphone (MT101 for 15-50 ohms, MT102 for 250-600 ohms) and the high impedance (nominal 100,000 ohms) microphone input of tape recorder or power amplifier. Response ± 2 dB, 50-15,000 c/s. Price, MT101 £2 10s.; MT102 £2 15s.

Microphone stands: **Floor model.** Fixing to base by collar and nut. Min. height 38 ins.; max. height 60 ins. Weight 12 lbs. Price £5 10s. **Table model.** Min. height 16 ins.; max. height 26 ins. Weight 2¼ lbs. Price £3 5s. **Desk model** (round). Height 5½ ins. Base dia. 6¾ ins. Weight 22 ozs. Price £1 15s. Desk base model (optional switch). **Type SR.** Pressure Mazak diecasting arranged with cable slot and recessed to accept Reslo standard 3-pin external run plug. Size 4½ × 3¼ in. Price £1 7s. 6d. Type **SF** supplied with alternative silent cushioning in place of rubber feet fitted to SR model. Price £1 12s. 6d. Slide switch for muting when microphone is permanently fitted to desk base, price 12s. 6d.

Other accessories available include mounting units, cables, reducers, adaptors etc.

Type A. Moving coil. Response 60-8,000 c/s. Sensitivity — 68 dB. Source imp. 25 ohms. Rec. load imp. 25 ohms. Price £9 9s.

TIME ON TAPE

By Graham Balmain

INSTEAD of the far-ranging but necessarily superficial survey of the tape recording field which normally appears here, the writer proposes to take a single theme and to improvise on it in a somewhat more discursive and detailed manner than is otherwise possible. The theme happens to underline most of the necessary peculiarities of tape machines, and this you may perhaps find useful; but the main aim, rather than presuming to instruct, is to present a few ideas which interest the writer and which may possibly also arouse the reader's interest in the subject. So we shall be concerned here with reasons rather than results, with methods more than measurements. Techniques and technicalities are anyway much better learned from the many excellent specialised textbooks and magazine articles on the subject, and above all from the experience of owning and using a tape recorder.

Why is a magnetic recorder—indeed *any* kind of sound recorder—constructed as it is? What (since our theme is Time) makes a tape machine tick?

Time-Machines

Given the kind of advanced technology imagined by H. G. Wells* and his successors, we could build ourselves a time-machine which would eliminate the need for separate recorders of the sound variety as any other; a universal four-dimensional reproducer enabling us to return to the actual points in time at which interesting events occurred and re-experience them in sequence. (The reader who thinks that he has trouble now, "getting the kids away from the telly", should try to imagine life with *that* standing in the corner. At least we now know where they are!)

One might imagine that no home would be complete without its 4-D Hi-Fi; certainly it would become an essential for, say, students of history and some of the sciences. And yet it is possible that the mere 4-D enthusiast—whose main use for the thing would be entertainment, after all—would be happier with something less fundamental but more sophisticated. However strange truth may be, its impact is transient, and a little rehearsal and polish makes better entertainment. Besides, most real life is too uncomfortable to be relaxing. Who now would prefer medieval squalor to costume romances, or slipshod routine musical performances to the near-perfect ones available on record? Once, perhaps, but not more. Despite our enthusiasm for larger-than-life entertainment, we still prefer it only half as natural and will probably go on doing so.

A few more frills

If our 4-D reproducer need not actually recall time, it still has much work to do re-creating three-dimensional images in sound and vision, with perhaps smell and a few other tactile sensations thrown in, and it must still reproduce time-sequences, for these are the most important of the dimensions of experience. What form will such a device take? One can hardly guess, but some form of physical movement must be involved in the recording and playback processes (even if only that of electrons in conductors) unless by then we have found some other way of simulating the passage of time. There is also a fair chance that someone will try C. E. Maine's idea for an output stage†: electrodes placed at suitable points on the head to feed the recorded impressions directly to the brain. The storage arrangements in Maine's "*Feelies*"

† Charles Eric Maine, "Escapement", published by Hodder & Stoughton.

* H. G. Wells, "The Time Machine", published by Heinemann.

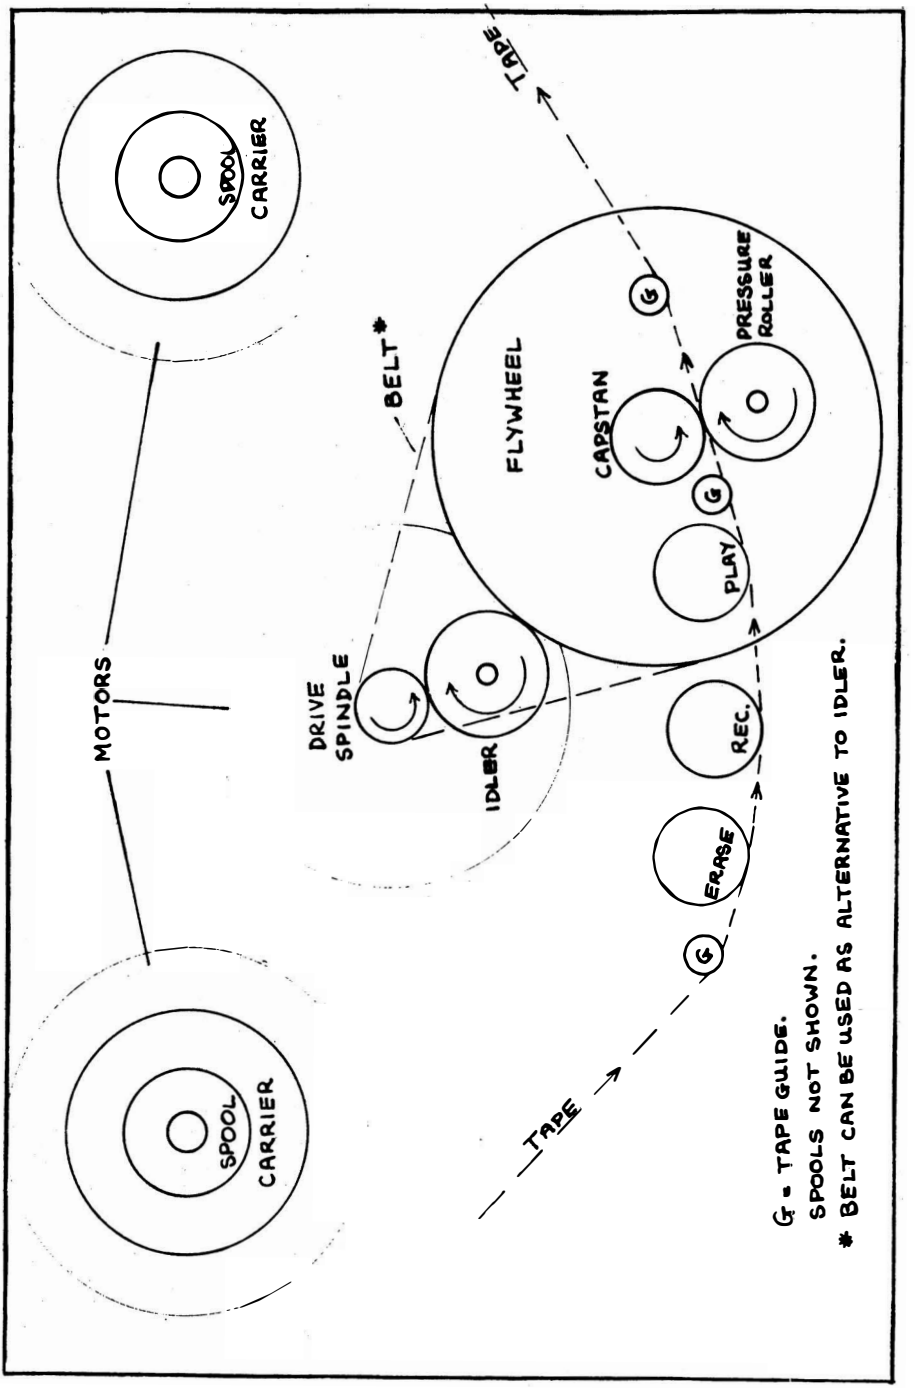

Fig. 1. *The basic layout of a typical tape deck. Alternative spool and capstan drives are possible, and many decks have single combination record/playback heads.*

were otherwise surprisingly primitive, by the way; tape recorders much as we know them.

And why not? Tape recorders are as near to time-machines as we are likely to get nowadays or at any time until we achieve the real thing; we get no nearer by adding extra dimensions or by combining with film or other effects, but merely increase the range of sensation and the overall satisfaction of the reproduction. Nor is there any strong reason against regarding them as limited kinds of time-machine, for they do all the time-simulating needed for entertainment purposes.

The basic requirement of a recording and reproducing system is clear, then: during recording the signal must either be set in motion in a stationary storage medium (and kept in motion until it is needed again), or transformed into a dimensional pattern of some kind on a moving medium; during playback the signal must move, either of itself or with the medium, relative to the reproducer. The moving signal method is quite feasible in principle, but quite impracticable for sound recording because the capacity of a reasonably small device is no more than a few milliseconds. It is sometimes used for short-term data storage in computers, however. All the familiar sound-recording systems use a moving medium, of course; and the principle is just the same whatever the actual storage method; distances along the medium (or rotation angles for discs) represent time intervals, and its speed (or angular velocity) represents what Wells called the movement of consciousness along the time dimension.

Recorders as Clocks

Now all this is rather elementary, but it is nevertheless the basis for the logic behind many of the modern applications of tape recording in both the entertainment and industrial fields. It is also a potential source of trouble to the designers of tape machines, who have to make their mechanisms run almost like clockwork (electric clockwork, usually) in order to preserve the original time-relationships on both the long-term and short-term scales. Admittedly, the long term time-keeping required of a tape recorder is pretty sloppy by clock standards. One can reasonably expect even a cheap clockwork movement to be accurate to a minute or so a day (say, $\pm$ 0.05%) and any electric one to be as accurate as the mains supply frequency; but a tape recorder is considered good enough for broadcasting use if it can keep time within 20 seconds in half-hour ($\pm$ 0.5%), and for domestic use it is given four times this latitude. Which means that the reproducing speed may differ from the recording speed by those percentages, if different machines are used for the one and the other process.

One's ears are tolerant enough on the long-term scale to accommodate such speed differences and (apart from those blessed—or cursed?—with the gift of absolute pitch) also the consequent shifts of pitch. In fact, most people would not be unduly worried by a difference of 5% provided they had not recently heard the original.

A speed accuracy of $\pm$ 0.5% is easy enough to achieve in the more expensive machines, because the designer can specify "synchronous" motors whose speed—like that of electric clock motors—depends only on the mains supply frequency under all reasonable mechanical load conditions. Provided the tape drive itself is firm enough, the tape speed should also remain fairly constant throughout the length of a reel. But cheaper machines must perforce have cheaper motors: "induction" or "shaded-pole" types whose speed depends on the mechanical load as well as on the mains frequency. Different examples of such machines, even of the same type, may show differences in average speed because of variations of bearing friction in the motor and tape drive and so on, and all will suffer some speed change from end to end of the tape because of the changing mechanical load. These variations are carefully controlled in well-designed recorders, and their effects should be unobtrusive.

Wow and Flutter

A greater problem by far is short-term speed accuracy, both because our ears are more sensitive to rapid speed changes ("*wow*" and "*flutter*") and because they are more difficult to reduce mechanically than long-term variations. (The terms *wow* and *flutter* mean just what their effects sound like.) Here we generally have to aim at something less than 1% peak to peak fluctuation about the local mean speed (say less than 0.3% *rms*) for general purpose recorders. But one's reactions to wow and flutter are extremely complex, depending on the repetition rate and waveform of the fluctuations, whether they are periodic or irregular, the nature of the programme and the predominant pitches present—even on one's sex, according to a report which claimed female ears to be more critical of their effects. It is thus possible to give

only one rule: "*the less the better*". The best professional machines achieve consistent wow and flutter figures of 0.05% *rms* or less, but in this more than anything else the ear is the best judge.

The *evenness* of the drive must therefore compare well with that of an electric clock (and be much better than that of a clockwork escapement movement which progresses in jerks of anything from one-tenth of a second to a second) even though the mechanical load conditions are much less favourable.

Tape Drive

To achieve performance of this order, mechanisms such as that sketched in **fig. 1** have been developed. The drive techniques are very similar to those used in disc recorders and players and show the same sort of variations. The one basic feature is the integral flywheel and capstan—equivalent to the turntable and its spindle—which may be driven either directly as an extension of the motor spindle or indirectly through an idler wheel or a belt as shown. The former method has long been favoured in Germany, where the first examples of modern tape recorders were found, although there are now leanings there towards the latter method which is almost always used by British designers. The idler wheel (or "puk") drive seems, incidentally, to have been first used in an early lawn-mower.

Taking up the slack

Spool-drives, whose purpose is to take up slack in the tape and to wind and unwind it neatly, also vary considerably. At one extreme we have the spool-carriers powered from a single main drive motor, through belts, or idlers, and slipping-clutches under the carriers; at the other we find separate motors for each—apart from the tape drive, as shown. The former is mechanically complex—especially in the latest versions—but makes the machine cheaper; the latter is simpler and more flexible in use but can be expensive. Given good design and manufacture in each case, there is little to choose between them for domestic applications. Apart from treating the tape kindly in a mechanical sense, spool drives must be designed to interfere as little as possible with the tape drive itself and most certainly impose no short term load fluctuations on it.

It will be evident from **fig. 1** that the tape drive must be very carefully arranged to avoid wow and flutter. The possible causes are obvious enough. For a start, any eccentricities or irregularities in the drive elements will cause speed fluctuations, as will bent spindles, sticky bearings or variations in the elasticity or hardness of rubber wheels or belts. Then the motor itself will contribute periodic fluctuations because of its energising arrangements, although the effects of this and most other drive irregularities should be attenuated considerably by the use of a massive flywheel coupled closely to the capstan.

The tape itself may also add flutter by vibrating in various ways against the heads and guides, but this can also be damped by careful design of the tape path and the judicious use of pressure pads. Nevertheless, reducing all these effects to an acceptably low level requires much thought at the design and development stage and considerable precision in the manufacture of the critical parts of the mechanism.

Turning now to the electrical side of recorders, we find we are not yet finished with the time-factor in tape recording, for there are two more ways in which it influences design. One is in setting the basic frequency response of the system, the other in curtailing it at the high-frequency and low-frequency ends.

The first arises from the fundamental law of electro-magnetic induction; the *emf* induced into a coil is directly proportional to the time-rate-of-change of the flux linking it (as well as to the number of turns on the coil and the magnitude of the flux). In tape recording we have the situation shown in **fig. 2,** where our recorded tape passes the playback head at a speed which is sensibly constant and equal to that during recording, and where the flux in that head consequently changes in a way similar to the field which originally produced the recording. The rate-of-change of flux will increase with signal amplitude (larger flux-swings in each given time-period) and with signal frequency (faster flux-swings of given amplitude).

Assuming a constant amplitude or constant flux recording, the output voltage from the playback head should therefore be proportional to frequency, resulting in the familiar 6dB/octave or 20 dB/decade relationship shown in **fig. 3.** Further, the actual output voltage from a particular head at a given signal frequency and amplitude should be independent of tape speed.

However, these basic response conditions hold only over a limited range in practical

systems. The bass response is restricted by the nature of the basic output characteristic itself which, falling at 6dB/octave, will ensure that signals below a certain frequency are simply too small to be useful. The limit frequency is fairly constant for all kinds of recorder (say somewhere between 30 and 60 c/s on average) and is more a function of the general design quality of the recorder than of any particular feature such as the type of head used or the tape speed, though these may have an indirect relationship with it.

The treble response, on the other hand, depends directly on both. This is where the other time-influence is felt, because the dimensional scale of the recording (i.e. how much tape represents so much time) actually modifies the overall output/frequency relationship. As the tape speed, and thus the scale, is reduced, the recorded signal wavelengths become proportionally shorter and those representing high signal frequencies approach the length of the playback head gap. This causes an increasing loss of signal output which becomes total when the wavelength is equal to the gap length. The situation can obviously be improved when necessary either by increasing the tape speed (and thus the wavelengths at all frequencies) or by decreasing the gap length, subject to technical limitations on the latter and cost restrictions on both.

The recording process also is subject to various wavelength—dependent losses. The two most important are: a virtual parterasure of the shorter wavelengths by the high-frequency bias field; and a partial self-demagnetisation of recorded signal elements whose wavelengths are comparable to their thickness—their effective depth of penetration into the tape coating, that is. Other losses exist, but they are either avoidable by proper adjustment or have little influence on the general design of a tape recorder.

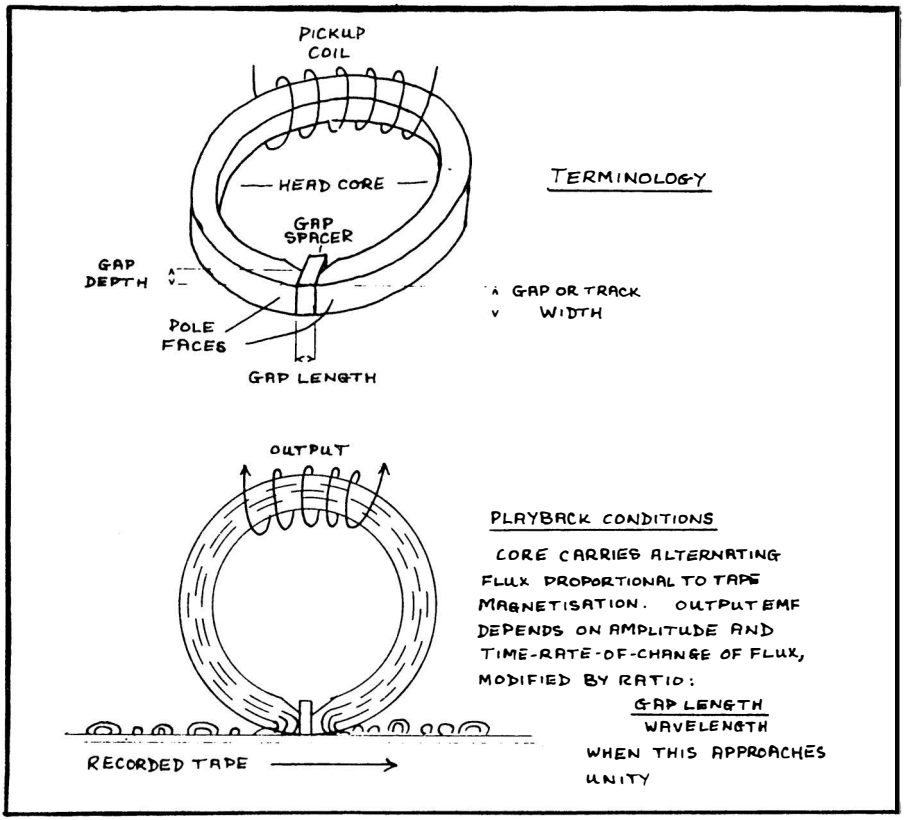

Fig. 2. *Magnetic Heads—terminology and conditions on playback.*

Adding all these various losses together, we finally obtain a family of curves such as those in **fig. 3,** from which you can see how the available overall frequency response of a tape system depends on the tape speed. Since all these curves depart grossly from the straight horizontal line which we like to think represents the ideal frequency response of a hi-fi unit, we must obviously apply some correction somewhere to restore the tonal balance of the input. The normal practice during the last few years has been to compensate for the known bass fall-off at any given speed by inserting in the playback amplifier a basic equalising network having the kind of frequency response shown in **fig. 4.** This still leaves the h.f. losses, which must be catered for individually at each tape speed according to the type of head and tape used and whether they occur in the recording or the playback process.

Playback losses are equalised by a subsidiary network in the playback amplifier, giving a frequency response such as that shown dashed in **fig. 4,** and recording losses are offset by a similar pre-emphasis network in the recording amplifier. It is pointless to consider the precise shapes of the basic curves in detail at the moment because they are currently under discussion, and although their general shapes are unlikely to be radically changed as a result, any details given now may be out of date by the time this is in print.

Nevertheless, the fact that they *are* being discussed serves to emphasise their influence on the final results obtainable from a tape recorder. The main troubles to be overcome are in the tape itself; on the one hand it generates a background noise which becomes obtrusive if the recording level is too low or if much playback equalisation is used; on the other hand it overloads and causes harmonic distortion of the signal and other unpleasant effects if the recording level is too high or if there is much recording pre-emphasis in the treble. Both troubles are thus aggravated as the tape speed is reduced, and the noise factor is also increased if the width of the track scanned on the tape (see **fig. 2**) is decreased.

As if this were not enough, hum and noise in the playback amplifier may also make a nuisance of themselves in low speed, narrow-track working. Designers are evidently trapped firmly between several devils and a deep blue ocean as far as the "economy class" recorder is concerned, although they are not too badly off at the higher speeds where little treble boost is needed within the audio range.

At any given speed, one generally reckons the absolute upper limit frequency to be about half that at which a total signal loss occurs (see **fig. 3**). We do not use the

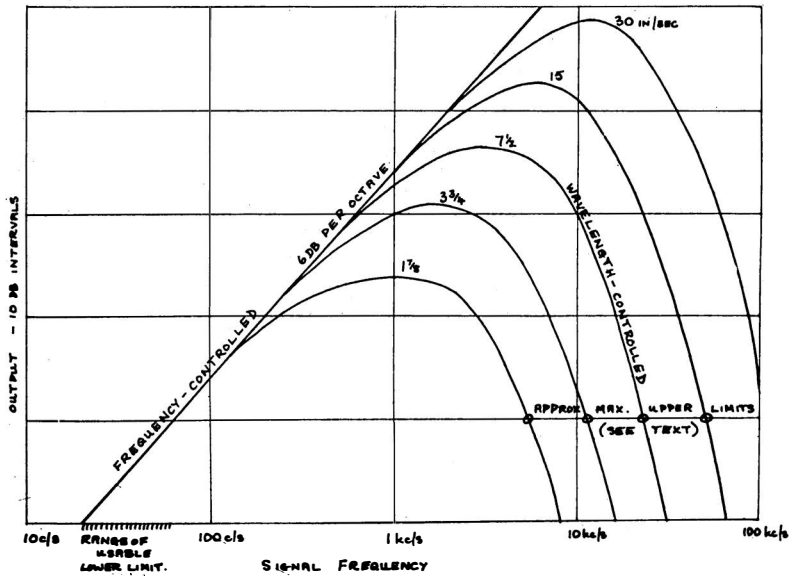

Fig. 3. *Overall Record/Playback response of typical domestic head at various tape speeds, showing available working limits.*

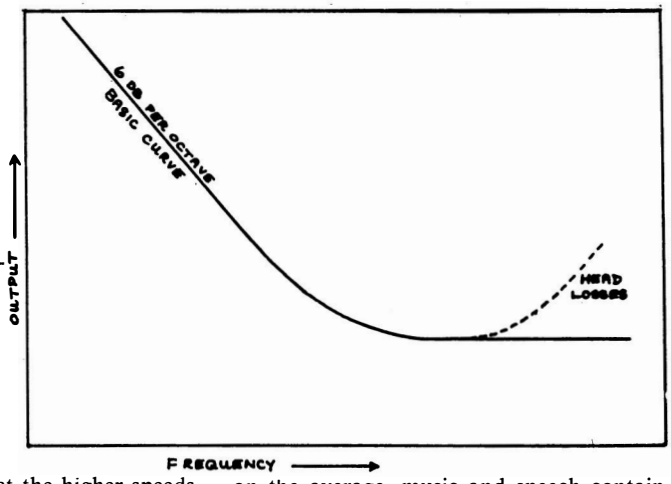

Fig. 4.

General form of present standard playback equaliser response. Typical loss-compensation shown dashed.

whole range available at the higher speeds, of course, because we do not need it, and it is not always wise (for various reasons connected with distortions) to use all we *think* we need. However, designers are virtually forced to use most or all of the available range at lower speeds, with the inevitable consequences already described above.

Of the various ways of making the best of the situation, using less h.f. bias will improve short wavelength registration, for instance, and shortening the playback gap will improve the output at short wavelengths. But less bias means also more noise and a lower tape overloading point, and a shorter gap results in *less* playback output at middle and low frequencies, so for one step forward there we take half a step backwards somewhere else. The net result of such measures is usually an appreciable (but not large) increase in *either* the high-frequency range *or* the noise factor, but rarely in both together. In short, in reducing tape speeds and track widths as far as we have up to now, we have been able to avoid some of the loss of quality which might have been expected, but not all.

Pre-emphasis and Noise

Much more useful improvements could result from the re-shaping of the pre-emphasis and equalisation curves now being discussed. The argument is this; that if more signal can be got on to the tape there will be more output from it, and noise from the tape and playback amplifier will be less obtrusive. We cannot just raise the general recording level, of course, because we should merely overload the tape, but we could take advantage of the fact that, on the average, music and speech contain less sound power in the treble and the bass than in the middle (see **fig. 5**). It would therefore seem possible to boost the low and high frequencies relative to the middle during recording, and thus to put more signal on the tape without overloading it. The complementary cut necessary on the playback side to restore the tonal balance would also reduce tape noise at high frequencies and both this and amplifier noise at low frequencies. The extra dynamic range thus gained can either be accepted gratefully or traded, wholly or partly, for an extension of the high-frequency range. A practical pre-emphasis curve might differ somewhat from that shown to give a good compromise for all kinds of programme material.

Building-in pre-emphasis

This is by no means a new idea; it was used to advantage in some of the earliest British recorders but was largely dropped later for the sake of standardisation. (It has also been widely used in disc recording for many years, of course.) However, it never really died in America and the development there of narrow-track, low-speed systems made its general revival highly desirable. Standards or not, several British and Continental recorder manufacturers have been building some recording pre-emphasis into their machines for a year or two now.

We have now covered all the features peculiar to tape recorders which arise from the time-factor in the recording process; the method of storage; the general form and some of the requirements of the mechanism; the basic response of the

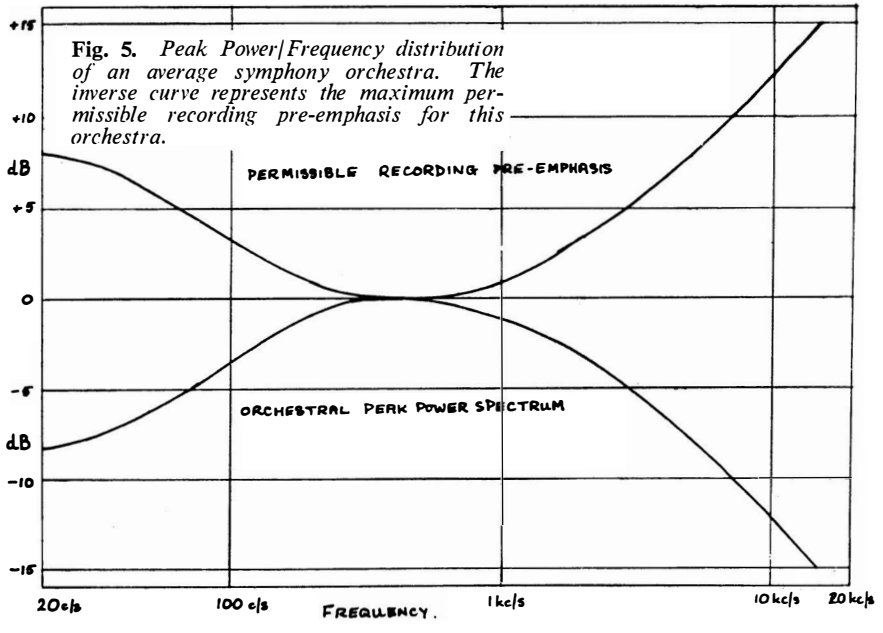

Fig. 5. *Peak Power/Frequency distribution of an average symphony orchestra. The inverse curve represents the maximum permissible recording pre-emphasis for this orchestra.*

system and its losses; the necessity for equalisation and the desirability of some recording pre-emphasis. One feature remains which has nothing at all to do with time, the use of a high-frequency bias field to obtain optimum sensitivity and distortion conditions on the tape.

High-Frequency Bias

Fig. 6 shows a sketch of the amplitude response of the tape itself to the magnetic field applied by the recording head. As may be seen, the curve is quite sharply kinked in the middle, and if we try to record with this characteristic as it stands we shall obviously have to put in a fair amount of signal before any impression at all is left on the tape. Even if the general level of the signal is increased until its peaks approach the outer curved parts—the overloading regions—it will still suffer much distortion because the central parts of its waveform are missing, and the lower level signals (the soft passages) will still not register at all.

This is avoided by "bridging the gap", so to speak; by mixing with the signal field a high-frequency field whose peak amplitude, much as shown in **fig. 6,** is such as to bring the tape to the threshold of doing something useful without actually doing it. The additional signal field must then register, however small it is, since the total field swing must overstep the threshold. The effect of the bias is thus to "short-circuit" the central kink and make the central regions of the characteristic approximately a straight line. In practice there is no sharp division between non-registration and registration, because the central kink is curved, not angular, but this merely means that the bias field can be chosen from within a small range to give optimum results according to the particular recording conditions. It does *not* mean that a substantially linear effective characteristic cannot be achieved, as we know from experience.

Applications and Possibilities

Let us now return for a moment after all this earthy detail to one or two of the rather unearthly ideas put forward earlier, which may turn out to be not so irrelevant as they probably seemed at first. For entertainment, it was said, we want something less fundamental than a real time-machine, but more sophisticated; we want reproduction larger than life, but only half as natural. Otherwise it does not *seem* natural as entertainment, for usually the whole unadulterated truth is so flat and so cluttered with detail and irrelevancies that there is too little for one's imagination to work on and too much to distract it.

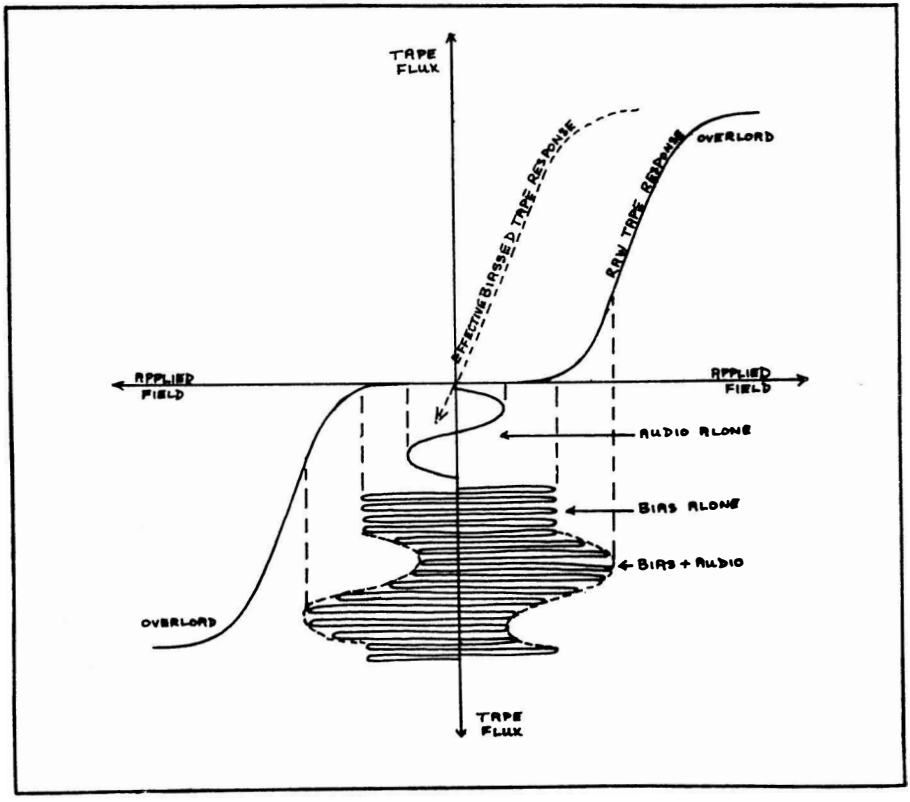

Fig. 6. *The effect of high-frequency bias on the raw amplitude response characteristic of magnetic tape.*

Every dramatist knows the value of the climax which is seldom so sharply defined in real life; every writer and poet knows the value of the effective phrasing which few of us can achieve in letters, let alone in conversation; every artist exaggerates in some way or other, and all consciously-composed music is in a sense unnatural. A small technical defect in presentation or a slight external distraction can make momentary nonsense of almost any entertainment, but heard once at a live performance, it is forgivable. Transferred permanently to a record it rapidly becomes infuriating.

So our reproduction must necessarily be artificial in presentation as well as in content. No mistakes, no mediocrity, no extraneous matter. Often the lily must even be painted up a bit; artificial reverberation, mixing, weird noises and exaggerations of all kinds are now commonplace and accepted as natural in the context. On no medium is all this so easy to achieve as on tape, and it is probably true to say that no commercial record company has put anything directly on to a disc for ten years or more.

Tapes can be cut and spliced and doctored so convincingly that it is much cheaper to build a long piece from many short passages, each rehearsed, played and recorded individually, than to have to repeat the whole thing several times to get it right. This is time-simulation indeed! (but in a form already practised by film companies for very much longer, of course). *And* the result is considered just as artistically satisfying as before (when artistic criteria are relevant) if not more so.

Not only this, but tape has made possible new musical forms—musical, that is, if one's tastes lie that way. *Musique Concrète* would have been technically quite impracticable without the facilities for editing, superimposing, reversing, echoing, speed-changing and all the other various distortions of common sounds practised during its composition, which are easily available

on tape recorders. The newer purely electronic music would have been equally difficult to manage without tape, probably. Here one grows doubtful; time-*dis*simulation, perhaps? This new music certainly has a hypnotic, timeless quality about it, and anyway one can hardly talk of simulating something which is so newly created and has so little basis in common experience. This kind of abstract composition must surely be reckoned the first creative application of tape recording—but again one long anticipated in spirit by the cinema (parts of "Fantasia" for instance) and by the various essays in blending pure colour composition with music. Even speech seems to be amenable to treatment in a way analogous to musical harmony and counterpoint.* Such trends as these are already firmly established and will undoubtedly expand.

Tape for Amateurs

One does not have to do all this to enjoy tape recording, of course, but having persuaded oneself to buy a time-machine—sorry, tape recorder—how can one make it justify its existence? A silly question, to which the obvious silly answer is: make it live up to its name; make it *record*. And yet it is surprising how many people buy quite good and expensive tape recorders and then largely use them as gramophones, to play tape records. There is a definite need for tape *players*, to be sure, which manufacturers are now beginning to realise, but it still seems a pity to miss half of the fun. Apart from the more sophisticated applications, and outside the usual baby—party — wedding — Auntie — Mabel-singing sphere, there is a great deal of enjoyment and solid satisfaction to be had from taking straight recording really seriously. Not merely taping off the BBC, either; this is mostly good, competent, often brilliant stuff of a high technical standard, but nothing like as interesting as trying to make silk purses out of sows' ears at local concerts, for instance, or making up film tracks or programmes for the local hospital or a hundred other really live possibilities.

Faithful reproduction

Here one learns the real meaning of "faithful" reproduction and how often it is necessary to avoid it in order to make the result convincing, acceptable and even artistic; one finds that high-fidelity is not quite as high-minded as one would have it. But why worry, when one can set one's own standards and make the results still sound consistent with supposed remembrances of the original? To the recordist, tape recording is still an art with all the scope that the word implies. For the engineer and designer it is fast approaching an exact science, to the recordists' benefit. The amateur recording enthusiast, in fact, has never had it so good.

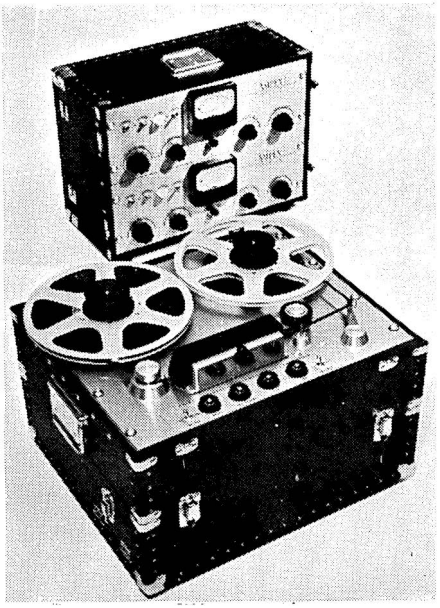
DIRECTORY OF TAPE RECORDERS

★ The abbreviations used for the specifications in this directory are as follows: **F.R.**—frequency response; **i/s**—inches per second; **P.s.n.**—Power supply needed; <, better than; **M.E.**—Magic eye; **W. & F.**—Wow and flutter; **S-N**—signal to noise ratio; ■—Stereo equipment.

PROFESSIONAL and SEMI-PROFESSIONAL



Ampex 351-2 *portable stereo*

Ampex (Great Britain) Ltd., 72 Berkeley Avenue, Reading, Berkshire. Tel.: Reading 55341. Cables: Videotape, Reading.

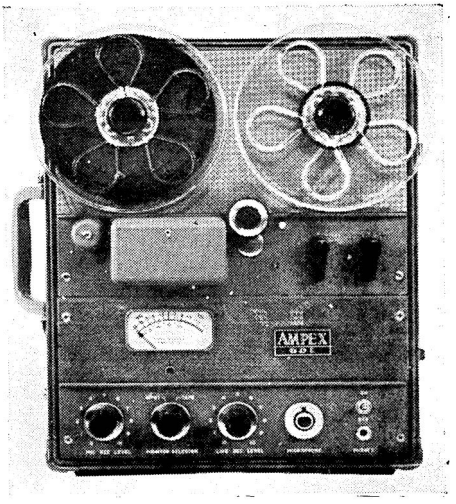
Ampex 300 Series. Prof. recorders. One to eight tracks. Speeds 15 and 7½ i/s. 3 motors. 14-in. spools up to 1-in. wide. F.R. 15 i/s, 30-18,000 c/s; 7½ i/s, 40-12,000 c/s, both ± 2 dB. Large scale V.U. meter. H and N — 60 dB full track, — 55 dB multi-track. W. & F. less than 0.1% at 15 i/s. Prices on application.

Ampex 351. Prof. recorder in console, portable or rack-mounted form. Full or half track. Speeds 15 and 7½ i/s, or 7½ and 3¾ i/s. 3 motors. 10½-in. N.A.B. spools. F.R.: 15 o/s, 30-18,000 c/s; 7½ i/s, 40-12,000 c/s; 3¾ i/s, 50-8,000 c/s, all ± 2 dB. Large scale V.U. meter. H and N — 70 dB full track, — 65 dB half track at 15 i/s. W. & F. less than 0.15% at 15 i/s. Size (console) 48 × 24 × 28 ins. Weight 168 lbs. Price (15 and 7½ i/s), £662 portable, £682 console.

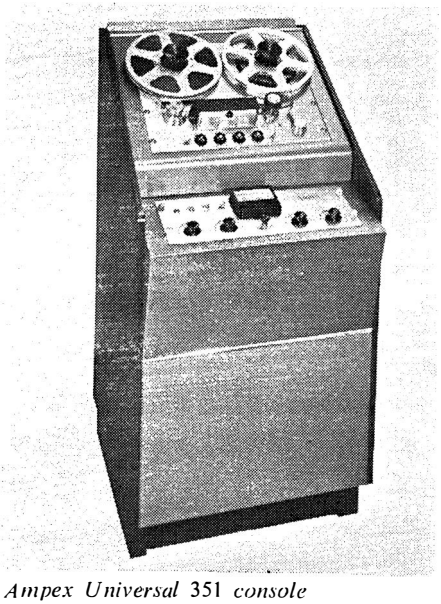
Ampex 352. Prof. reproducer only in console or rack-mounted form. Full or half track, or stereo. Speeds 15 and 7½ i/s. 3 motors. 10½-in. N.A.B. spools. F.R.: 15 i/s, 30-18,000 c/s; 7½ i/s, 40-12,000 c/s, both ± 2 dB. H and N — 70 dB full track, — 65 dB half track. W. & F. less than 0.15% at 15 i/s. Size (console) 35 × 24 × 24 ins. Weight 109 lbs. Price £503 mono, £635 stereo. Console cabinet extra.

■**Ampex 354.** Professional console recorder. Speed 15 and 7½ i/s or 7½ and 3¾ i/s. 3 motors. 10½ in. N.A.B. spools. F.R. 15 i/s 30-18,000 c/s; 7½ 40-12,000 c/s. ± 2 dB 2 V.U. meters H and N — 65 dB, W. & F. 0.15% at 15 i/s. Price on application.

Ampex 601. Prof. portable recorder. Speed 7½ i/s. One motor. 7-in spools. F.R.: 40-10,000 c/s ± 2 dB. Large scale



Ampex 601 *portable recorder*

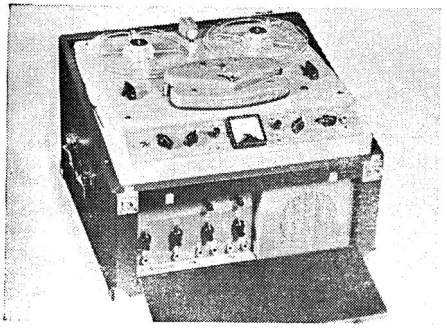


Ampex Universal 351 console

V.U. meter. H and N — 55 dB full track, — 50 dB half track. W. & F. less than 0.17%. Size 16½ × 13¾ × 8 ins. Weight 28 lbs. Price £295.

■**Ampex 601-2.** Stereo version of Ampex 601. Size 24½ × 13 × 8 ins. Weight 42 lbs. Price £486.

■**Fine Line Ampex 1200.** Four-track stereo. Speeds 7½ i/s and 3¾ i/s. One motor. 7-in. spools. F.R. ± 2 dB. 7½ i/s 50-15,000 c/s; 3¾ i/s 50-7,500 c/s. Level meter. S-N < — 55 dB at 7½ i/s, < — 50 dB at 3¾ i/s. W. & F. < 0.2% r.m.s. at 7½ i/s. Built-in mixing facilities. Built-in pair of amplifier speakers available. Mono or stereo ¼-track record and replay. Size 9 × 15 × 17½ ins. Weight 36 lbs. Price to be announced.



E.M.I. TR52 stereo portable

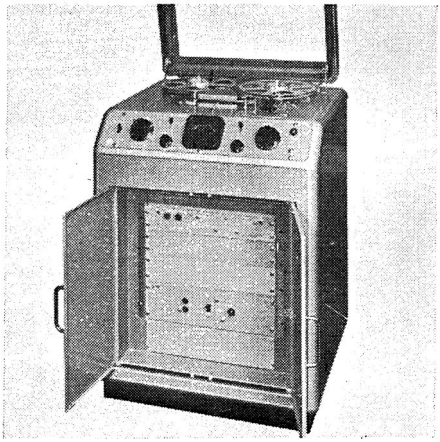
Elstone Electronics Ltd. Edward Street, Templar Street, Leeds, 2. Tel.: Leeds 3-5111.

■**Tandberg Series 6.** Speeds 7½, 3¾ and 1⅞ i/s. F.R. 30-20,000 c/s. ¼ track. 7-in. spools. H and N — 55 dB. W. & F. 0.1% M.E. level ind. Outlet from pre-amp. Superimposing. Size 15¼ × 11⅞ × 6 ins. Weight 25 lbs. Price £115 10s. Alternative half-track model also available £115 10s.

★

EMI Electronics Ltd., Hayes, Middx. Tel.: Hayes 3888. Cables: Emidata, London.

■**TR52/D.** Prof. portable stereo/mono recorder. Speeds 7½ and 3¾ i/s. One motor 7-in. spools. F.R. 7½ i/s, 50-10,000 c/s; 3¾ i/s, 50-6,000 c/s, both ± 2 dB. W. & F. less than 0.25% at 7½ i/s. Crosstalk — 45 dB. V.U. meter. Size 20 × 17½ × 13½ ins. Weight 80 lbs. Price £245.



E.M.I. TR90 in console form

EMI Model TR90. Prof. recorder for rack mounting or as a console on transportable trolley, 30 and 15 i/s or 15 and 7½ or 7½ and 3¾ i/s. 4 motors. 10½-in. spools. F.r.: 15 i/s, 50-15,000 c/s; 7½ i/s, 50-10,000 c/s; 3¾ i/s, 50-6,000 c/s. All ± 2 dB. Level meter. Size (transportable version) 2 cases 14½ × 20 × 16½ ins. Weight 80 and 58 lbs. Price from £625.

★

Leevers-Rich Equipment Ltd., 319b Trinity Road, Wandsworth, London, S.W.18. Tel.: Vandyke 9054. Cables: Leemag, London, S.W.18.

Model E. No. ER141M. Prof. reproducer console. 15 and 7½ i/s. 3 motors. 11½-in. spools. F.R.: 15 i/s, 50-15,000 c/s; 7½ i/s, 50-10,000 c/s, both ± 2 dB on C.C.I.R. test tape. Size 24 × 24 × 36 ins. Weight 200 lbs. Price £500.

Model E. 141M. Prof. recorder console. Speeds 15 and 7½ i/s. Three motors. 11½-in. spools. F.R. 15 i/s 50-15,000 c/s; 7½ i/s 50-10,000 c/s, both ± 2 dB. V.U. level meter. H and N < − 55 dB unweighted. W. & F. < 0.15% at 15 i/s. Outlet from pre-amp. Size 24⅛ × 23¼ × 37 ins. Weight 205 lbs. Price £640.

Model E. 141P. Prof. transportable recorder. Details and specifications as for E. 141M. Size, recorder 21 × 17 × 11½ ins.; amplifier 18¾ × 14½ × 10¾ ins. Weight, recorder 71 lbs.; amplifier 25 lbs. Price £615.

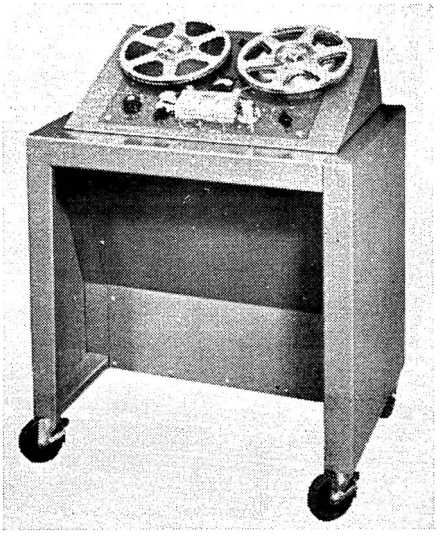
Model E. No. E141R. Complete rack mounting prof. recorder. 15 and 7½ i/s. 3 motors. 11½-in. spools. F.R.: 15 i/s

Leevers-Rich ED142K stereo

50-15,000 c/s; 7½ i/s, 50-10,000 c/s, both ± 2 dB. V.U. level meter. Other details as for E. 141M. Size 19 × 17½ × 10 ins. Weight 50 lbs. Price £545.

Model E. No. E121P. Prof. portable recorder. Spec. as for E141R. In two cases, 20 × 17 × 11½ ins. and 15 × 18 × 10 ins. Weight 79 lbs. Price £660.

Model C. Model C621P. Prof. portable recorder. 15 i/s. 3 motors. 9½-in. spools. F.R.: 50-15,000 c/s ± 2 dB. V.U. level meter. Size 13 × 18 × 10 ins. Weight 73 lbs. P.s.n. 12v battery or auxiliary mains unit. Price £450.

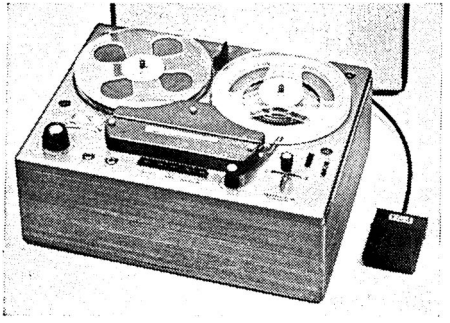


Leevers-Rich Model No. E141K

Model DB. No. DB221P. Prof. portable recorder. Spec. as for C621P but in two cases, 13 × 18 × 10 ins. and 16 × 20 × 11¼ ins. Total weight 74 lbs. P.s.n. as C621P. Price £500.

Model CS. No. CS621P. Syncropulse recorder, for magnetic recording in sync. with cameras, etc. Spec. as for C621P. In two cases both 13 × 18 × 10 ins. Total weight 73 lbs. P.s.n. as C621P. Price £550.

■**Model E. No. ED142P.** Complete portable dual channel recorder. 3 motors. 15 and 7½ i/s. Monitoring off tape, separate V.U. Meter, unit amp. L.R. and H.R. Mic. or line inputs. 11½-in. spools. Response at 15 i/s, 50-15,000 c/s ± 2 dB. Size 2 cases 16 × 20 × 11 ins. Total weight 80 lbs. Price £696. M console version, £790. All "E" Tape mechanisms are now press button operated.

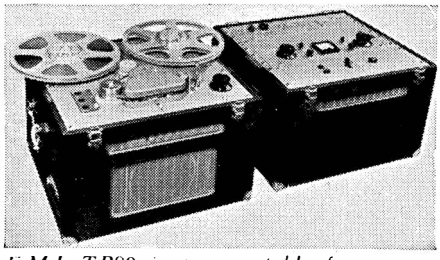


Tandberg Series 6

Pamphonic Reproducers Ltd., Westmoreland Road, London, N.W.9. Tel.: Colindale 7131.

Reflectograph Model A. Semi-prof. recorder. Speeds $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s. Three motors. $8\frac{1}{4}$-in spools. F.R. $7\frac{1}{2}$ i/s 35-15,000 c/s; $3\frac{3}{4}$ i/s 35-9,000 c/s, both $\pm$ 2 dB. Level meter. H and N — 50 dB. W. & F. $< 0.15\%$. Outlet from pre-amp. Size 20 × 16 × 10 ins. Weight approx. 50 lbs. Price £110 5s.

■**Model B.** Similar specification to Model A but fitted with $\frac{1}{4}$ track heads and facility

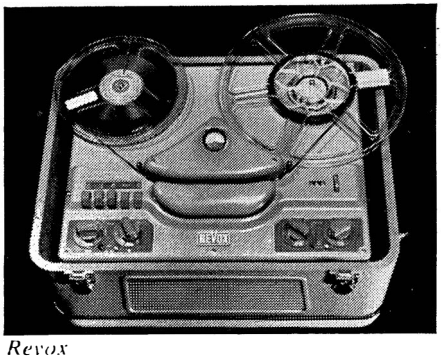


E.M.I. TR90 in transportable form

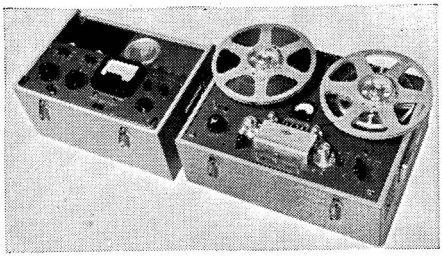
for playing back $\frac{1}{4}$ track or $\frac{1}{2}$ track pre-recorded stereo tapes with additional amplifier. Price £120 15s.

■**Model C.** Half-track semi-prof. recorder. Speeds $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s. Three motors. $8\frac{1}{4}$ in. spools. F.R. $7\frac{1}{2}$ i/s 35-15,000 c/s; $3\frac{3}{4}$ i/s 35-9,000 c/s, both $\pm$ 3 dB. H and N — 50 dB. W. & F. 0.15%. Outlet from pre-amp. Level meter. Size 20 × 16 × 10 ins. Weight approx. 50 lbs. Price £152 5s.

Model D Reflectograph. Half-track tape player. Speeds $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s. Three motors. $8\frac{1}{4}$-in. spools. F.R. $7\frac{1}{2}$ i/s 35-15,000 c/s; $3\frac{3}{4}$ i/s 35-9,000 c/s, both $\pm$ 3 dB. H and N —50 dB. W and F 0.15%. Outlet from pre-amp. 250 mV. Size 20 × 16 × 10 ins. Weight approx. 50 lbs. Price £78 15s.



Revox



Leevers-Rich Series E No. E121P

Model E Reflectograph. Half-track tape player. Speeds $7\frac{1}{2}$ or $3\frac{3}{4}$ i/s to order. Three motors. $8\frac{1}{4}$-in. spools. F.R. to N.A.B. standard. H and N —50 dB. W and F 0.2% total. Output from pre-amp 250 mV. Automatic track reversal. Size 20 × 16 × 10 ins. Weight approx. 50 lbs. Price £99 15s.

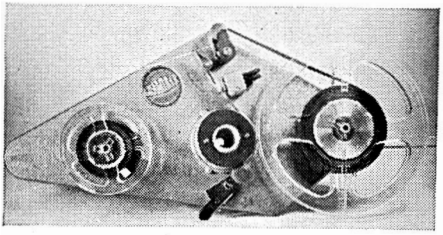
Motek K10

DECKS AND PRE AMPLIFIERS

Gramdeck. U.K. distributors, Andrew Merryfield Ltd., 29/31 Wright's Lane, Kensington, London, W.8. Tel.: Western 3603. Cables: Technology, Kens, London.

Gramdeck. Head and drive mechanism for attachment to gramophone turntable. Speeds 7½, 4.3, 3.2 and 1.6 i/s for the standard disc speeds. 5¾-in. spools. F.R. 60-10,000 c/s ± 3 dB at 7½ i/s. W and F 0.15%. Size 13½ × 6 ins. Weight approx. 2 lbs. Price including transistor pre-amplifier £11 11s.

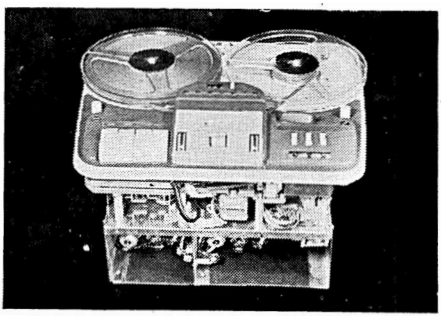


Gramdeck

★

Grundig (Great Britain) Ltd., 39/41 New Oxford Street, London, W.C.1. Tel.: Covent Garden 2995.

■**TM60.** G.P. tape deck for monaural and stereo use. Includes all pre-amplifier circuitry. 7½ and 3¾ i/s. One motor. 7-in. spools. F.R. 7½ i/s, 50-15,000 c/s; 3¾ i/s, 50-10,000 c/s, both ± 3 dB. M.E. level ind. H and N — 40 dB. W and F less than 0.2% at 7½ i/s. Size 14 × 11¾ × 8⅝ ins. Weight 24 lb. Stereo/mono recording and playback through suitable output stages and loudspeakers. Price, with tape, £94 19s.

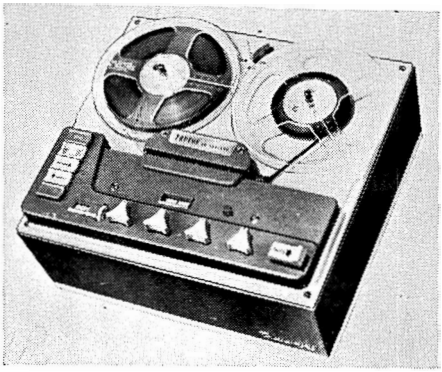


Grundig TM60

★

Truvox Ltd., Neasden Lane, London, N.W.10. Tel.: Dollis Hill 8011. Cables: Truvoxeng, London, N.W.10.

PD82. Deck mechanism with pre-amplifier. Self-powered. Specifications as for D82 but with mixing and superimpose facilities. Outlet from pre-amp. M.E. level ind. Size 14½ × 13¼ × 8 ins. Weight 29 lbs. Price £42.



Truvox PD 84

Truvox D82

PD83. Deck mechanism with pre-amplifier. Self-powered. Speeds $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s. Three motors. 7-in. spools. F.R. $7\frac{1}{2}$ i/s 30-20,000 c/s; $3\frac{3}{4}$ i/s 30-12,000 c/s, both $\pm$ 3 dB. Level meter. H and N $-$ 45 dB. W and F $<$ 0.15% at $7\frac{1}{2}$ i/s. Outlet from pre-amp. Size $14\frac{1}{2} \times 15\frac{1}{2} \times 8$ ins. Weight 31 lbs. Price £48 10s.

PD84. Deck mechanism with pre-amplifier. Self-powered. Speeds $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s. Three motors. 7-in. spools. F.R. $7\frac{1}{2}$ i/s 40-20,000 c/s; $3\frac{3}{4}$ i/s 40-12,000 c/s, both $\pm$ 3 dB. M.E. level ind. H and N $-$ 45 dB. W and F $<$ 0.15% at $7\frac{1}{2}$ i/s. Outlet from replay head. Outlet from pre-amp. Mixing. Superimposing. Quarter-track outlet from head for stereo replay. Pause control. Size $14\frac{1}{2} \times 13\frac{1}{4} \times 8$ ins. Weight 20 lbs. Price £46.

PD85. Quarter-track version of PD83.

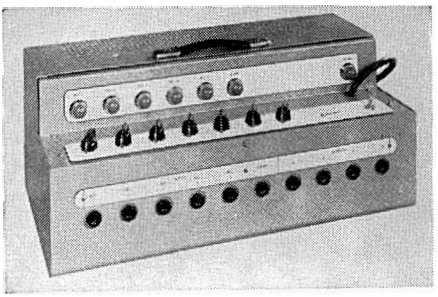
■ **PD86.** Deck mechanism with three $\frac{1}{4}$-track stereo heads and dual (stereo) pre-amplifier, self-powered. Speeds $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s. 3 motors. 7-in. spools. F.R.: $7\frac{1}{2}$ 30-20,000 c/s, $3\frac{3}{4}$ i/s 40-12,000 c/s, both $\pm$ 3 dB. Level meter. H and N$-$45 dB. W and F $<$ 0.15% at $7\frac{1}{2}$ i/s. Stereo recording, track-to-track recording, input mixing on both channels. Pause control. Size $14\frac{1}{2} \times 16\frac{1}{2} \times 8$ ins. Weight 33 lbs. Price £63.

■ **PD87.** Half-track version of PD86.

TAPE AMPLIFIERS AND MIXER UNITS

Ampex Great Britain Ltd., 72 Berkeley Avenue, Reading, Berkshire. Tel.: Reading 55341. Cables: Videotape, Reading. Telex: 84146.

Ampex 620 Speaker/amplifier. Comprises 8-in. drive unit in special enclosure. Acoustically flat from 60 to 10,000 c/s. The built-in amplifier has 10 watts output. F.R. 20-20,000 c/s $\pm$ 0.5 dB. Price £88.



Astronic A.1446

Associated Electrical Industries Ltd., Crown House, Aldwych, London, W.C.2. Tel.: Temple Bar 8040. Cables: Soundequi, Lesquare, London.

A.E.I. Four Channel Electronic Mixer. Four inputs, one output with master control 20 or 100K ohm and 20 ohm. Preset bass and top cut. Output imp. 500 ohms. sensitivity 75 μv. Powered from A.E.I. 30 watt amplifier or from separate power supply. Price £55.

★

Associated Electronic Engineers Ltd., 10 Dalston Gardens, Stanmore, Middx. Tel.: Wordsworth 4474/5/6. Cables: Astronic, Stanmore.

Astronic A.1446. 6 channel electronic mixer unit. Designed for 5 low impedance sources each 10/30 ohms, 0.5 mV; 1 high impedance source 250K ohms, 0.2 volts. There are four output sockets

supplying 0.7 volts into 600 ohms. A master gain fader is incorporated, and each channel has an indicator lamp to show which sources have been faded up. A.C. mains required. Size 9 × 11 × 8½ ins. Price £58 10s.

★

Brenell Engineering Co. Ltd., 1a Doughty Street, London, W.C.1. Tel.: Chancery 5809 and Holborn 7356.

Mk.5 Record/playback amplifier. Inputs: mic. 2.5 mV, radio/gram 100 mV, both high impedance. Outputs: 200 mV

Jason Tape Pre-Amplifier

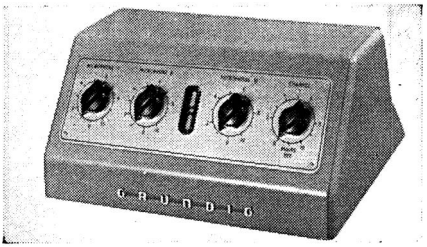
at 50,000 ohms, and 4 watts into 15 ohms for direct connection to loudspeaker. Headphone monitoring M.E. level ind. or meter if required. Price £24. Meter, £5 5s. extra.

Brenell Mixer Unit. 3 channel unit. For best results high impedance sources such as crystal microphones and pickups are recommended. There are 4 sockets for jack plugs for the three inputs and the output lead, each input having a volume control. Price £2 18s.

★

Cape Electrophonics Ltd., 43-45 Shirley High Street, Southampton. Tel.: Southampton 74251.

Binson Baby Echorec



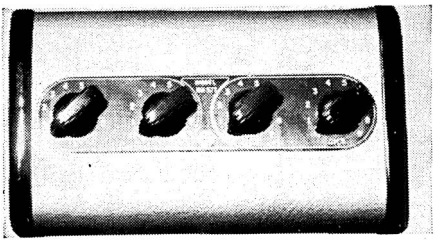
Grundig G.M.U.3

Cape VLT/2. Tape recording/replay amplifier suitable for operation with a variety of tape decks. Self-powered. Price £75.

★

Grundig (Gt. Britain) Ltd., Newlands Park, Sydenham, S.E.26. Tel.: Sydenham 2211. Showroom: 39-41 New Oxford Street, London, W.C.1. Tel.: Covent Garden 2995. Cables: Grundig, London. Telex 22054.

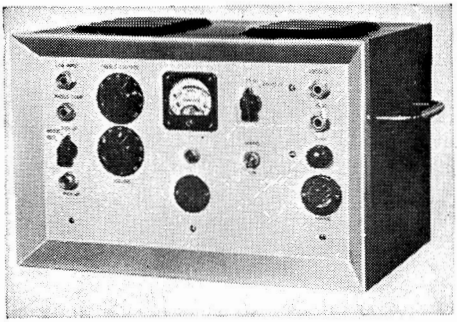
G.M.U.3. Four channel mixer and pre-amp. Inputs: Mic 1, 1.2 mV, 100 K ohms; Mic. 2, 4 mV, 100 K ohms. Polarised 100v. D.C. Mic. 3 as Mic. 2. Channel (radio/P.U.). 300 mV, 500 K ohms. Out. imp. approx, 1,000 ohms. Magic eye level ind. Output level 65 mV. Mains-powered. Price £16 16s.



Lustraphone MU 577

Jason Electronic Designs Ltd., Kimberley Gardens, Harringay, London, N.4. Tel.: Stamford Hill 5477.

■JTL. Stereo tape pre-amplifier. One input, 100 mV sensitivity. Output 0.5 volt. Equalisation for 7½ and 3¾ i/s. M.E. level ind. Controls: function, record amplifier, playback amplifier, monitor, playback/record volume, signal/bias. Simultaneous record/replay. Self-powered. Push/pull oscillator. H and N 55 dB down on 2% distortion. Suitable for any deck. To operate with Jason J2-10 amplifier. Size 15 × 9¼ × 4⅜ ins. Price assembled, £30 9s. Kit £21.



MSS RA 50 recording amplifier

The Lowther Manufacturing Co., St. Mark's Road, Bromley, Kent. Tel.: Ravensbourne 5225. Cables: Lowther, Bromley.

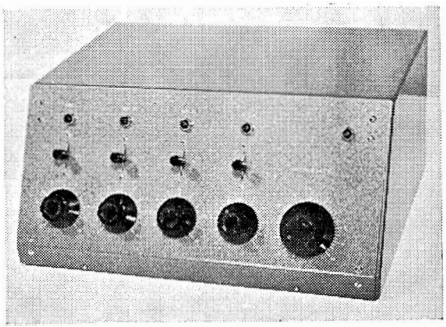
Companion Supply Unit No. 2. H.T. and L.T. power supply suitable to power radio tuners. Pre-amp and tape bias amplifier. Output 250v at 40 mA, 6.3v at 3 A. Price £5 5s.

★

Lustraphone Ltd., St. George's Works, Regent's Park Road, London, N.W.1. Tel.: Primrose 8844. Cables: Lustraphon, London.

M.U.577. Transistor mixer unit. Inputs: 1 and 2 are unbalanced and are suitable for low imp. mics. (line or high imps. to order). 2 and 3 are high imp. and suitable for radio or P/U. Output is balanced to match that from 1 and 2. F.R. substantially flat 50-14,000 c/s. Power by mercury cell with 1,000 hours life. Alternative input and output impedances to specification. Price, standard model, £19 19s.

A range of transistorised power amplifiers, up to 50 watts, and complete public address systems. Details on application.



MSS 4M2 4-Channel Mixer

Modern Electrics (Retail) Ltd., 120 Shaftesbury Avenue, London, W.C.2. Tel.: Covent Garden 1703. Temple Bar 7587. Cables: Modcharex, London.

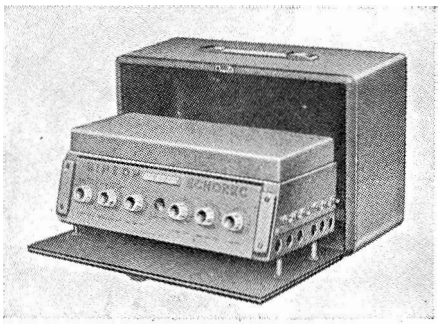
Binson Echorec Mk.1. Pre-amplifier and magnetic recording unit enabling echoes and other effects to be achieved. Three channels are included and the timing of echoes is variable. Operation from AC mains. Price £147 complete.

Binson Baby. Single channel version of above. Price £105.

★

M.S.S. Recording Co., Ltd., Colnbrook, Bucks. Tel.: Colnbrook 2431. Cables: Emessco.

4 M 2 or 2 ML. Microphone mixing and control unit. Up to 4 mics. or line, P/U



Binson Echorec

and 2 mics. Microphone switching and level control. Output sockets for 600 ohm line and headphone monitor. 4 input sockets. H.D. at 1 mW 1,000 c/s. tone, is 0.25%. H and N at normal output level on 1 mV signal to noise ratio 60 dB. Size 14½ × 12 × 7 ins. Price £50.

RA/50. Amplifier for recording and playback. 50 watts. Dist. 2.5% at 50 watts. Input for spec. output 1v. Response 30-15,000 c/s. ±2 dB. Feedback 12 dB. N.L. −80 dB at full output. Out. imp. RA50/1 1,800 ohms; RA50/2 200 ohms; RA50/3 15 ohms. Output EL37's. Size 19 × 14 × 8 ins. Power available for pre-amp. Price £70.

★

Penco Products, 36 Coniston Road, Kings Langley, Herts. Tel.: Kings Langley 3134. Cables: Penco, Kings Langley.

Epigram Mix/3. 3 channel unit. Incorporates 3 transistors and is designed for 2 low impedance 15/30 ohms and one high impedance input. Power derived from 4 volt Mercury Cell. Output is high impedance. Price £15 15s.

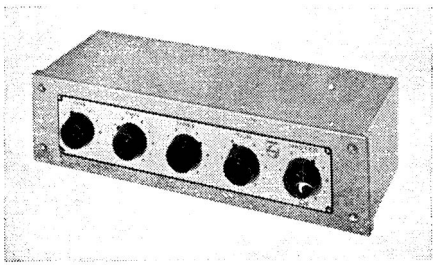
Epigram Mix/35. Details as above except that 5 transistors are included, giving extra gain, e.g. to by-pass input stage of recorder. Price £26 5s. Specials to order.

Epigram Mix/35L. As Mix 35 but fitted with low noise transistors. Price £29 8s.

★

Philips Electrical Ltd., Century House, Shaftesbury Avenue, London, W.C.2. Tel.: Gerrard 7777. Cables: Phillamps, London.

ET 1042/10. 4-channel mixer unit. Input impedance 50 ohms, 0.2 mV.

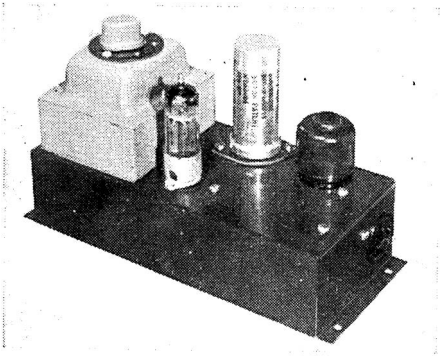


Philips ET 1042 *Mixer*

Outputs: 50,000 ohms at 200 mV or 6,500 ohms at 10 mV. Four individual mic. input controls and master. F.R. 50-12,000 c/s with speech filter giving 6 dB cut at 60 c/s. S-N −70 dB. Self-powered, 200-250v 50 c/s A.C. Suitable for all Philips amplifiers. Size $13\frac{1}{2} \times 7 \times 3\frac{1}{16}$ ins. Price £35.

EL 3374. Tape pre-amplifier. Outputs 5-pin DIN socket, 1 volt across 150 K ohms; 2 pole socket, 200 mV across 1 K ohm. Response 5-pin DIN socket, 60-10,000 c/s; 2 pole socket, 60-4,500 c/s. Powered from tape recorder. Synchronised record/playback. Suitable for use with current models of Philips EL 3541, EL 3542; Stella ST 454, ST 455; Cossor CR 1601, CR 1602. Size $6\frac{3}{8} \times 3\frac{1}{2} \times 1\frac{5}{8}$ ins. Price £6 10s.

Philips EL.3989. 4-channel mixer unit. Incorporating 4 separate potentiometers. Price £4 4s.



Rogers Power Pack

Rogers Developments (Electronics) Ltd., "Rodevco Works", 4-14 Barmeston Road, Catford, S.E.6. Tel.: Hither Green 7424. Cables: Rodevco, London.

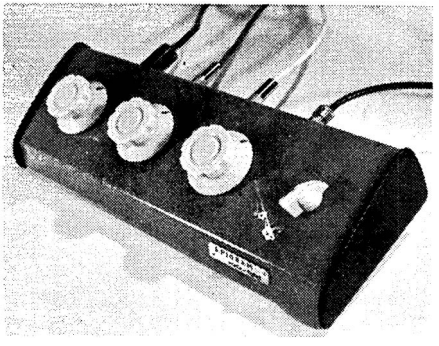
General Purpose Power Pack, Model A. Suitable for tape units and radio tuners. Output 250v at 45 mA, 6.3v at 2.5A. Size $7\frac{1}{2} \times 3 \times 5$ ins. Price £4 5s.

Model C for switched FM unit. Price £4.

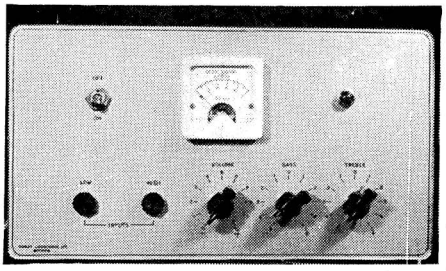
★

Shirley Laboratories Ltd., 3 Prospect Place, Worthing, Sussex. Tel.: Worthing 30536.

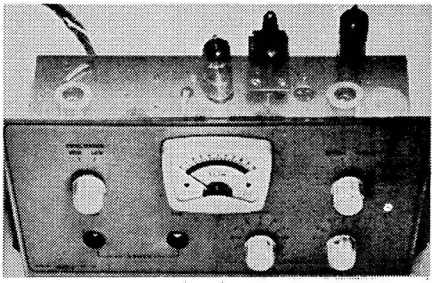
TW/PA2. Recording amplifier for use with high quality power amplifier. Inputs: 1.5 mV and 60 mV. Bias and erase oscillator. Full corrections. Valve voltmeter modulations level ind. For use with Wearite tape deck, can be supplied to order for any deck. Size $10 \times 5\frac{1}{2} \times 5\frac{1}{4}$ ins. P.s.n. from main amp. or power pack can be supplied at £6 16s. 6d. Price £31 10s.



Penco Epigram Mix/3



Shirley TWA/15



Shirley TW/PA2

TWA/15. Tape amplifier for use with most tape decks, also for use with pickup or radio. Inputs: 1-1.5 mV and 40 mV. Output. 15 watts, 20 watts peak. F.R.: as recorder 50-14,000 c/s; as reproducing and gram amp. 20-30,000 c/s. Bass and treble boost and cut. H and N 85 dB down. Valve-Voltmeter level ind. power supply on separate chassis. Price £47 5s.

TWA/1515. Complete stereo record and replay amplifier. Output 15 watts continuous, 25 watts peak on each channel. Inputs: 1.5 mV and 50 mV. Bass and treble boost and cut. Level indicated by separate sustained peak-reading valve voltmeters. Power supply and oscillator on separate chassis. F.R.: 40-30,000 as ordinary amp.; 40-15,000 as recording amp. Size: control unit 23 × 7½ × 7 ins. Power unit 10 × 8 × 7½ ins. Price £100 16s.

Mixer Units supplied to order. Up to 36 inputs. Prices on application.

★

Sound News Productions, 10 Clifford Street, New Bond Street, London, W.1.

Unimixer 1. 3-channel unit. Channels 1 and 2 have duplicate sockets for low or high impedance microphones—30 ohms or 400 K ohms. Recommended load impedance not less than 500 K ohms. F.R. from 30 ohm input 56-10,000 c/s ± 3 dB. Price £9 9s.

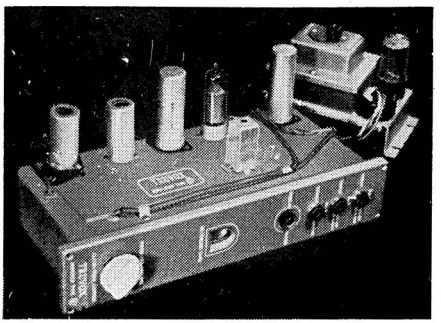
Unimixer 2. 3-channel unit. Inputs as above but high impedance is 5 M ohms in channels 1 and 2. Power supply needed 200/300 volts D.C. at 5 mA, 6.3v at 0.3 amps. Special connectors available to obtain power supplies direct from Ferrograph or Vortexion recorders without any alteration. Price £15 15s.

★

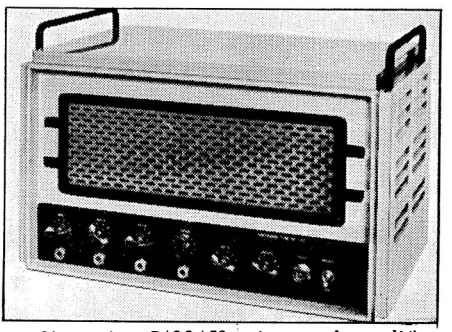
Sound Sales Ltd., Works and Acoustic Laboratories, West Street, Farnham, Surrey. Tel.: Farnham 6461-2-3. Cables: Sounsense.

A-Z General Purpose Power Pack for supplying additional units beyond the scope of the main amplifier. Output 250v at 50 mA, 6.3v at 2A. Price £5 10s.

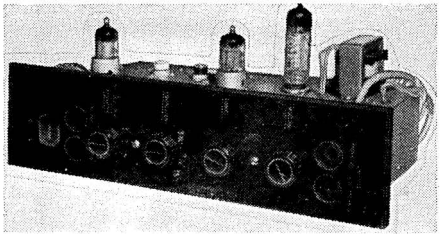
A-Z Precord Unit. Designed for use with Wearite or Truvox tape deck. Self-powered. Inputs: mic. or radio/pickup. Sel. switch for record and replay. Green and red ind. lights give add. visual check.



Truvox Type K recording amplifier



Vortexion S/30/50 mixer and amplifier



Stern HF/TR3

Calibrated recording level indicator. Equalisation for $3\frac{3}{4}$, $7\frac{1}{2}$ and 15 i.p.s. C.C.I.R. and N.A.R.T.B. characteristics. Variable bias control. Record level and replay gain control. Size $11\frac{1}{4} \times 9\frac{1}{2} \times 4\frac{3}{4}$ ins. Price £30.

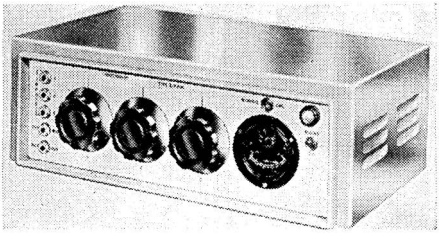
★

Stern Radio Ltd., 109 and 111 Fleet Street, London, E.C.4. Tel.: Fleet Street 5812-14.

HF/TR3. Tape amplifier. Inputs: mic. 2.5 mV, radio/pickup 300 mV. F.R. 35-17,000 c/s ±3 dB at 15 i/s. Equalisation available for 15, $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s or $7\frac{1}{2}$, $3\frac{3}{4}$ and $1\frac{7}{8}$ i/s. 3 watts output into 3, $7\frac{1}{2}$ or 15 ohms. To Mullard design, suitable for Brenell, Collaro, Motek, Truvox and Wearite decks. Price, with separate power unit, £17. Plus £3 3s. for special matching to Wearite 4A decks. Also available in kit form.

Type C Tape Pre-amplifier. Inputs: mic. 0.5 mV, radio/pickup 250 mV. F.R. 30-17,000 c/s ±3 dB at 15 i/s. Equalisation available for 15, $7\frac{1}{2}$ and $3\frac{3}{4}$ i/s or $7\frac{1}{2}$, $3\frac{3}{4}$ and $1\frac{7}{8}$ i/s. 250 mV audio output. To Mullard design, suitable for Brenell, Collaro, Motek, Truvox and Wearite decks. Price, with separate power unit, £17. Plus £3 3s. for special matching to Wearite 4A decks. Also available in kit form.

Mullard 4-channel Electronic Mixer. Model 2H. Inputs: 2 × microphone. High "Z" 3 mV; radio/tape 250 mV; pickup 250 mV. Outputs: A: 40 mV; B: 100 mV; C: 250 mV; D: 500 mV. Impedance 600 ohms. Cathode follower. Individual channel controls. Response 15-20,000 c/s ±2 dB. S-N −50 dB. Self-powered. Suitable for most machines. Size 11 × 4 × 4 ins. Price, assembled, £10. Kit £8 8s.



Vortexion 3-channel Mixer

Model 1L. Alternative to Model 2H. Incorporates matching transformer in one microphone channel. Suitable for ribbon mics., etc. Price, assembled, £11 17s. Kit £10 5s.

■STP-1. Stereo tape pre-amplifier. Inputs (each channel): radio 250 mV, impedance 500 K ohms; microphone 2 mV, impedance 2 megohms. Outputs: standard 250 mV (alternatives up to 2 volts). Response at $7\frac{1}{2}$ i/s 40-16,000 ±3 dB. Equalisation for 15, $7\frac{1}{2}$, $3\frac{3}{4}$ and $1\frac{7}{8}$ i/s. 2 in. moving coil meter. Controls: function, equaliser, record level (2), meter, meter set zero. Separate track switch. H and N −55 dB. P.s.n. 290v at 30 milli-amp; 6.3v at 2 amps. Suitable for Brenell and Truvox (quarter-track Miniflux head) and Collaro (quarter-track Reuter head). Size 14 × 6 × $3\frac{3}{8}$ ins. Price £28. Available in kit form, price to be announced.

Shirley TWA/1515

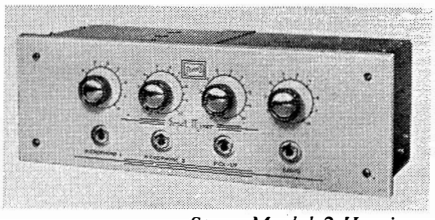
3-channel Prof. Mixer. Built-in mu-metal shielded input transformer, hermetically sealed controls, screened mains transformer. Output 1 m/W, 600 ohm balanced or unbalanced, or float. Peak programme meter calibrated zero level + 10 to ± 26 dB. Size $18\frac{1}{4} \times 11\frac{1}{4} \times 6\frac{1}{4}$ ins. Price on request.

4-channel Prof. Mixer. For 30-50 ohm mic. balanced line or other imps. to order, heavy mu-metal shielded transformers, hermetically sealed controls. Outputs $\frac{1}{2}$v on more than 20,000 ohms or 600 ohms, 1 mW. Has own screened power pack for AC mains. Size $18\frac{1}{4} \times 11\frac{1}{4} \times 6\frac{1}{4}$ ins. Price £40 8s. 6d. 600 ohms output extra. Similar 12 way is also available.

2MGT.10/15W. Combined 4-channel mixer and 10/15 watts power amplifier. Distortion 0.1%. F.R. 20-20,000 c/s ± 1 dB. 24 dB feedback. H and N −80 dB. Out. imp. 4, 8, and 15 ohms. Size $18\frac{1}{4} \times 11\frac{1}{4} \times 6\frac{3}{4}$ ins. Price £49.

S/30/50. Combined 4-channel mixer and 30/50 watts power amplifier. Distortion 0.2%. F.R. 30-20,000 c/s ± 1 dB. 22 dB feedback. H and N −85 dB. Out. imp. 4, 8, and 15 ohms and 100 volt line. Size $18 \times 10\frac{3}{4} \times 12\frac{1}{4}$ ins. Price £59.

120/200 watts power amplifier. Distortion 0.2%. Input for spec. output 0.775v into 600 ohms. F.R. 30-20,000 c/s ± 1 dB. 24 dB feedback. H and N − 95 dB. Output 110 or 220 volt. Size $19 \times 12\frac{1}{4} \times 12$ ins. To operate with Vortexion 4-channel mixer or 3-channel plus P.P.M., etc. Price £112.

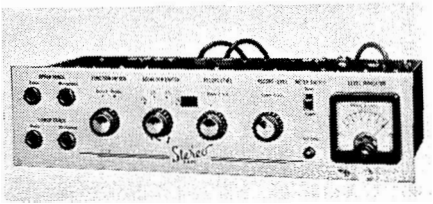


Stern Model 2H mixer

Waverley Electronics Ltd., Waverley Road, Weymouth, Dorset. Tel.: Weymouth 1987.

Waverley Mixer/fader. Pocket 3-channel mixer. Jack sockets as standard. Input and output. Price £2 5s.

Waverley Monitor. Transistorised unit to provide monitoring or act as pre-amplifier. Powered by 2 torch cells. Price £5 5s.



Stern STP-1 Stereo

TAPE ACCESSORIES and COMPONENTS

Agfa Ltd., 27 Regent Street, London, S.W.1. Tel.: Regent 8581. Cables: Telex 23705.

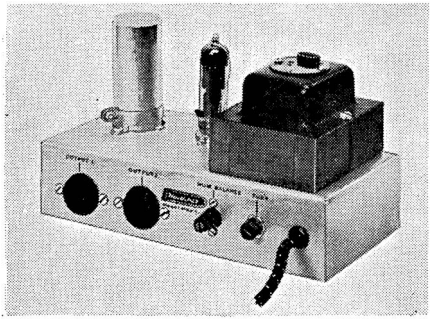
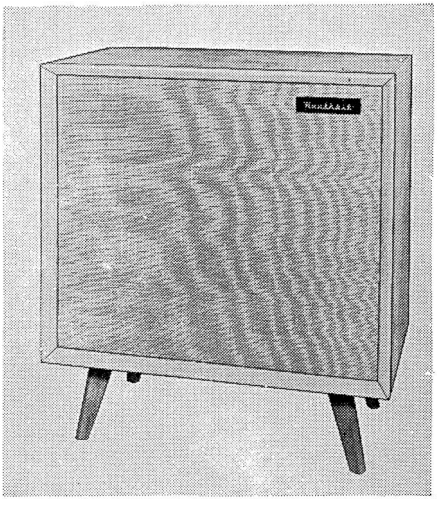
Heathkit TA-1S Stereo tape amplifier

Heathkit S-88 integrated stereo amp



Heathkit MGP-1 power pack



Heathkit Cotswold speaker system

Inputs: pickup 20 mV, radio 200 mV, tape 400 mV. Push-button sel., bass, treble, filter, balance and reversing switch. Size 13½ × 5½ × 9½ ins. Price £26 12s. 6d. High sensitivity (4 mV) model S-88B £27.

S-33. Stereo amplifier kit. 3 watts per channel. Distortion 0.3%. Input 100 mV at 1 megohm. Bass, treble, balance, volume. Price £12 8s. 6d.

USC-1. Stereo pre-amplifier. Inputs: pickup 1, 3-4 mV 50 K; pickup 2, 150 mV 1 megohm; tape 1, 2.5 mV 80K CCIR, tape 2, 150 mV 100K; radio 150 mV; mic. 3 mV 1 megohm; aux., 4-150 mV 1 megohm. Controls: bass, treble, rumble filter, variable low pass filter, balance, volume, function, channel reverse. Power required, 250v 10 mA, 6.3v 1.5 amps. Output voltage 1.3 volts RMS. Price £18 18s. 6d.

USP-1. Booster amplifier. Suitable for stereo and monaural sources of low sensitivity, e.g. pickups, tape heads or microphones. Input sensitivity 2-20 mV. Output adjustable from 20 mV to 2 volts. Maximum gain 100. Power requirements 180-250 volts, 3-5 mA; 6.3 volts 0.5 amps. Price £6 17s. 6d.

SSU-1. Speaker system kit. Comprises 8-in. and 4-in. matched drive units, and ducted-port bass reflex cabinet. Response 40-16,000 c/s ± 5 dB, crossover frequency 3,000 c/s. Imp. 15 ohms. Size 23 × 11½ × 11¾ ins. Price complete £11 18s. 6d., without legs, £10 17s. 6d.

TA-1M. Pre-amplifier. Inputs. Mic. 0.5mV. Radio 250mV. Switched controls, record/replay, bias, level, mic., radio. H.D. <0.1% for 500mV H and N − 60 dB for 500mV. Power supply required 290V 20 mA D.C. 6.3V. 1A per channel. Size 4½ × 13½ × 12 ins. Price £18 2s. 6d.

■ **TA-1S.** Stereo version of TA-1M. Price £23 6s.

TA-IC. Conversion Unit for TA-IM to convert to TA-1S. Price £6 10s.

V-7A. Valve voltmeter kit. Printed circuit. Measures A.C. volts (0-1.5, 5, 15, 50, 150, 500, 1,500) R.M.S., A.C. volts (0-4, 14, 40, 140, 400, 1,400, 4,000). Peak-to-peak, D.C. volts (0-1.5, 5, 15, 50, 150, 500, 1,500). Ohms (with 10 ohms centre) × 1, 10, 100, 1,000, 10K, 100K, 1 Meg. 0.1

ohms to 1,000 Megohms with internal battery. Input resistance 11 Megohms. Meter 200 micro-amps. Full scale deflection. Accuracy ± 3% full scale. Price £13.

MGP-1. Power supply unit. 200, 250, 270V 120mA; 6.3V, 2.5A. Price £4 16s. 6d.

OS-1. Service oscilloscope kit. 2¾-in. C.R. tube. Printed circuit. Vertical bandwidth 10 c/s to 2.5 Mc/s. Built-in calibrator. "Y" sensitivity 10 mV R.M.S. per cm. "X" sensitivity 1v R.M.S. per cm. Price £19 10s.

O-12U. General purpose oscilloscope kit. 5-in. flat face C.R. tube. Printed circuits. Vertical bandwidth 3 c/s to 5 Mc/s. Built-in 1 volt calibrator. "Y" sensitivity 10 mV R.M.S. per cm. "X" sensitivity 0.12v R.M.S. per cm. Phasing control. Z-axis modulation. Price £36 10s.

S-3U. Electronic Switch (oscilloscope trace doubler). Converts a single beam oscilloscope to double beam. Switching rates 150, 500, 1,500, 5,000 and 15,000 c/s. Signal frequency response 0-100 Kc/s ± 1 dB. Signal input range 0.1 to 1.8 volts R.M.S. Price £10 15s. 6d.

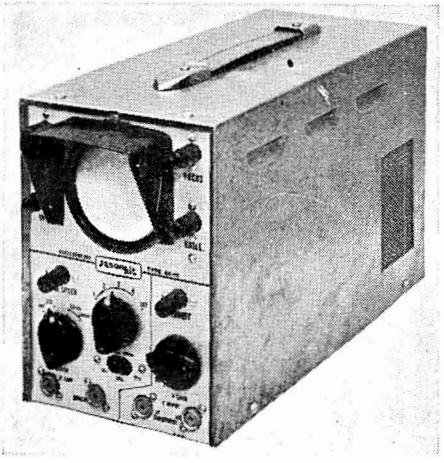
CM-1U. Direct-reading capacitance meter. Uses a 4½-in. meter with four ranges as follows: 100 picofarads, 1,000 picofarads, 0.01 microfarads and 0.1 microfarads. Price £14 15s.

C-3U. Resistance/capacitance bridge. Self-contained and powered. Capacitance range 0.00001 to 1,000 microfarads. Resistance range 100 ohms to 5 megohms. Power factor and leakage also indicated. Polarising voltages available from 5 to 450 volts. Price £8 6s. 6d.

AV-3U. Audio valve millivoltmeter. Measures voltages as low as 1 mV to a maximum of 300 volts at high impedance in 10 ranges. Frequency range 10-400,000 c/s. Uses a 4½-in. meter. Cathode follower output. Price £13 18s. 6d.

309-CU. RF probe. Extends the range of a valve voltmeter to 100 Mc/s. Uses a printed circuit board. Price £1 9s. 6d.

AW-1U. Audio wattmeter. Uses external loads or the following internal loads: 3, 8, 15 and 600 ohms. 5 power



Jason OG1O oscilloscope

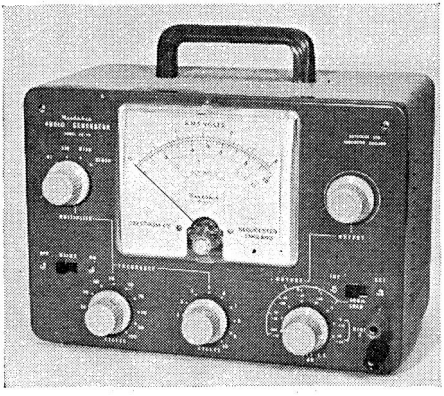
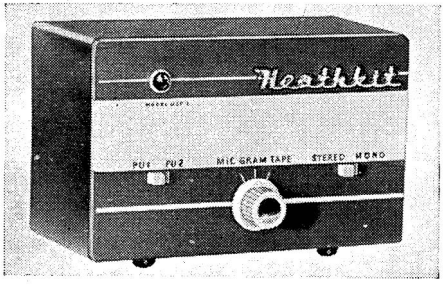
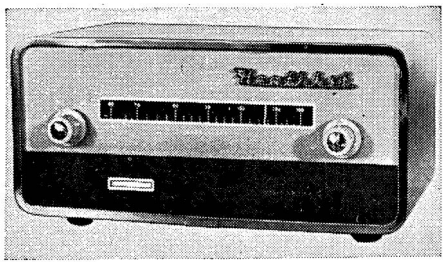
Cossor 1045K Single-beam oscilloscope



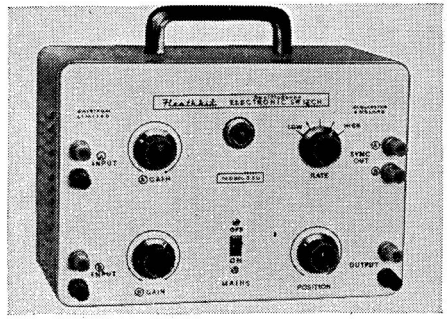
Heathkit AG-9U Audio generator



Heathkit USP-1 booster amplifier



Heathkit FM Tuner



Heathkit S-3U Electronic Switch

ranges from 0-5 mW to 50 watts. 4½-in. meter calibrated in watts and dB. Price £14 14s.

AG-9U. Audio signal generator. Range 10 c/s to 100 Kc/s. Distortion less than 0.1% form 20 c/s to 20 Kc/s. Decade switching over 8 voltage ranges from 3 mV to 10 volts monitored. Uses 4½-in. meter. Price £19 19s. 6d.

AFM/1. AM/FM tuner. Variable tuning. FM frequency range 88-108 Mc/s. AM frequency range 16-50, 200-550, 900-2,000 metres. Wide band ratio discriminator plus two limiters. Magic eye tuning indicator. Self-powered. Size 10¾ × 11⅛ × 4½ ins. Price £24 19s. 6d.

FM tuner. Comprises model FMT-4U tuner unit and FMA-4U IF strip and power supply. Flywheel tuning, thermometer tuning indicator, three IF stages with two limiters, printed circuit board and pre-aligned coils. Tuning range 88-108 Mc/s. Sensitivity 2.5 microvolts for 20 dB quieting. Price £14 16s. (for both units).

Cotswold. High fidelity three-way loudspeaker. Drive units are 12-in. bass, 8 × 5 ins. elliptical, and pressure tweeter. Range 30-20,000 c/s. Two volume controls. Celotex lined enclosure. In white wood ready cut and drilled. Dimensions 26 × 23 × 14½ ins. Price complete with cross-over unit, etc. £21 19s.

Chepstow. Cabinet for hi-fi equipment. Space available for FM tuner, amplifier and record player. Dimensions 34 × 32¾ × 18 ins. Price £11 5s. 6d.

Gloucester. Cabinet for hi-fi equipment. Space available to house records, tapes, etc. Mk. 1 accommodates tape deck or record player, FM tuner, and stereo amplifier. Mk. II accommodates both tape deck and record player, FM tuner and stereo amplifier. Dimensions: length 46⅛, height 30, depth 21 ins. Price Mk. I £16 13s. 6d., Mk. II £17 18s. 6d.

Malvern. Cabinet for hi-fi equipment. Space available for transcription record player, tape deck, radio tuner, audio amplifier (or control unit and separate power amplifiers) and tape record/replay amplifier. Price £17 10s.

Full details of test gear not included in this section can be obtained on application.

'Jason Electronic Designs Ltd., Kimberley Gardens, Harringay, London, N.4. Tel.: Stamford Hill 5477.

F.M.T.I. Standard FM tuner kit. 4 valves only are used, giving an aerial sensitivity of better than 100 microvolts. A ratio detector is combined with a limiter for low distortion and good noise rejection. Price without valves and power supply £5 19s. Power Pack kit £2 14s.

F.M.T.2. This is the same unit as the F.M.T.1, but built into a shelf mounting case. Price, less valves, but with power supply £8 15s.

F.M.T.3. A fringe FM tuner with automatic frequency control. Two limiters combat the effects of aeroplane flutter and car interference. Price with case but less seven valves required, £9 19s.

Argus AM tuner. Manual tuning. Frequency range 186-530, 1,200-1,800 metres. P.s.n. one 9v battery. Size 9 × 2½ ins. Price £7 10s.

EM10. Valve voltmeter. A four valve bridge circuit, gives good stability. May be used as a general purpose meter. 23 ranges including D.C. current range. Price £23.

AG10. Audio Generator. A capacity tuned Wien bridge covers from 10 c/s to 100 Kc/s with excellent stability and low distortion while the output is held constant within 1 dB. Output impedance is 600 ohm from a cathode follower and the Attenuator uses resistors of 1% accuracy. The rise time on square waves is better than 2 microseconds. Price kit £15 19s.

AA10 Audio Attenuator. Nine slide switches give the following attenuation. 40 dB, 20 dB, 20 dB, 10 dB, 10 dB, 5 dB, 2 dB, 2 dB, 1 dB, while the tenth switch allows the addition of a 600 ohm termination resistor. Resistors of 1% accuracy are used. The case measures 13 in. long × 2¼ in. wide × 1 in. high. Price kit £7 15s.

CC10 Crystal Controlled Calibrator. The exact frequency of a generator may be found by connecting the output to this crystal calibrator when the self-contained audio section and loudspeaker allow marker pips to be heard directly. These marker pips are generated at 10 Mc/s, 1 Mc/s, 100 Kc/s and 10 Kc/s so that

Sonadyne II Model 540S. Moving coil microphone. Response 60-10,000 c/s variable. High output. Price £16 13s. 4d.

stereo decola separates

turntable unit

Garrard 301 motor unit
Decca ffss pick-up with Mark I head
Decca microlift
Motor and board resiliently mounted
Housed in walnut Price £55.

amplifier unit

A twin AF amplifier and power unit
Power output: 12 W per channel
Frequency response: flat from 30-25.000 cycles
Distortion: measured at 10 W
less than ·1% at 1.000 cycles
less than 1·0% at all other frequencies
Input: sensitivity 90 mV for full output
Background: —75 dB referred to 12W
Output impedance: 15 ohms
Power supply: input AC 100—110—200—250 in 10 V steps
40-60 cycles 200 W consumption Price £45.

radio unit

Magic eye tuning unit
Fine tuner unit 86-108 megacycles
Housed in walnut Price £25.

control unit

Frequency response: 40-25.000 cycles (built-in negative feedback rumble-filter)
Input sensitivity: for 90 mV output
Gramophone: 14 mV
Radio: 60 mV
Auxiliary: 30 mV
Base and treble controls
Base: +15 dBs and —9 dBs relative to 50 cycles
Treble: +12 dBs and —10 dBs relative to 10.000 cycles Housed in walnut Price £26.

speakers:

1 base unit
6 HF loudspeakers specially mounted at various angles
Crossover frequency 400 cycles complete with built-in crossover units
Impedance 15 ohms capable of handling 15 W
Housed in walnut cabinets with hand-made brass grilles Price £53.0.0 each

★

professional stereo pickup

Output 1·2 mV/cm/sec per channel. Suitable for an amplifier system with sensitivity of 5 mVs.

Impedance 3.000 ohms at 400 c/s

Recommended termination 50.000 ohms

Diamond stylus radius 0·0005″ to 0·0006″

Tip mass Less than 1 milligram

Compliance Lateral: 10 x 10^{-6}cm/dyne Vertical: 2 x 10^{-6}cm/dyne

Frequency response Proportional to recorded velocity. ±1db from 40 to 16.000 c/s

Cross talk figures Better than — 20 db at 1.000 c/s and — 15 db at 50 c/s and 12.000 c/s

Recommended playing weight 3·5 grammes

Dimensions The overall length of the arm is 12″. From the diamond point to the centre axis of rotation of pick-up base 9″. From the centre of the turn table pin to the centre axis of rotation of pick-up base 8·375″.

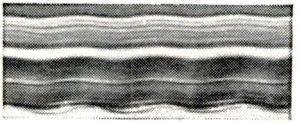
DECCA Deram

MICROGROOVE 'CERAMIC' CARTRIDGE
WITH DIAMOND STYLUS FOR
STEREO OR MONO RECORDS

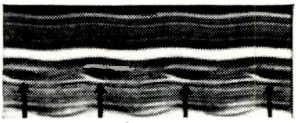
This is a new 'ceramic' pick-up head resulting from fresh consideration of the problems of record wear in relation to medium-priced equipment. Research has shown that tracking weight and stylus compliance are not the most important factors affecting record wear. To minimise wear—and the resultant deterioration of the superb quality obtainable from the modern LP—*the first essential is a low tip-mass.* No medium-priced pick-up has so far succeeded sufficiently in achieving this necessity. The micrographs show how well the Decca 'Deram' does so. It should be noted that the 'conventional medium-priced pick-up' referred to in the caption of micrograph (**c**) is in fact markedly superior to the pick-ups fitted to the current medium-priced stereogram.

Micrographs of the groove of the Decca stereo frequency test record, recorded on one channel with a 10 Kc/s signal



UNPLAYED

PLAYED 250 TIMES
with the Decca Deram—
note the absence of damage



played ONCE ONLY with a
conventional medium-priced pick-up
tracking at 3 grammes
The arrows point out the damage

Specification—changer model
Tip mass—1 milligramme at 45°; compliance—6 x 10^{-6} cms/dyne (lateral), 3.5 x 10^{-6} cms/dyne (vertical); tracking weight—3-5 grammes; frequency response—±3 dB 40 c/s to 12 Kc/s; output—50 mV/cm/sec (per channel); crosstalk—−20 dB at 1 Kc; stylus—diamond, of tip radius 0.0005/0.0006 in.
Price **4 GNS.** tax paid

Specification—transcription model
As changer model, except for: compliance—10 x 10^{-6} cms/dyne (lateral), 6 x 10^{-6} cms/dyne (vertical); tracking weight—2-4 grammes
Price **5 GNS.** tax paid

A 78 rpm cartridge with sapphire stylus is also available at 3 gns. tax paid

Decca Radio and Television Ingate Place Queenstown Road London SW8

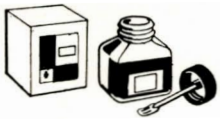
Special Emitape Features

* Anti-static
* High sensitivity
* Low 'print-through' factor
* P.V.C. Leader and Trailer strip fitted to all but 'Message' spools
* In spool sizes for all tape recorders
* Metallic 'Auto Stop' foil fitted to all 44, 88 and 99 spools except 'Message'

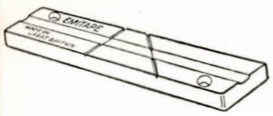
Joint and edit your tape the professional way with **EMITAPE** accessories

JOINTING COMPOUNDS
AP 35 for C.A.-base Tape and AP 77 for P.V.C.-base Tape



Special jointing fluid to make a permanent welded joint when splicing either P.V.C. or cellulose acetate base magnetic recording tape. **7/6**

EMITAPE JOINTING BLOCK AP 123



The exclusive undercut channel holds the tape fast, enabling you to cut it cleanly at an angle of 45° or 90°. **10/6**

NON-MAGNETIC SCISSORS AP 39

These scissors, made from non-ferrous metal, enable recorded tape to be cut for splicing or editing purposes without magnetising the tape. This ensures a silent joint. **16/-**

P.V.C. LEADER TAPES AP 38/1 to 38/6

With this range of coloured tapes you can insert colour code references for quick identification and indexing purposes in a reel of recorded tape. Colours: White, Red, Yellow, Blue, Orange, Green. **4/6** a reel.

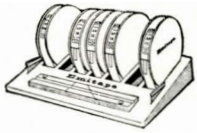
JOINTING TAPE AP 103

Specially prepared adhesive jointing tape for simple and quick splicing and editing of magnetic recording tape. In handy plastic containers. **7/6**

Metallic Stop Foil AP 125

Sufficient for 50 tapes. In handy plastic container. **6/6**

ACCESSORY KIT AP 124



Holds 3 spools of leader, 1 spool of jointing tape, 1 spool of stop-foil, Emitape jointing block, two cutters and full instructions. Packed in a plastic rack (room for 7 spools). Specially designed for the workbench. **37/6**

EMICASE

Polystyrene container. Solves storage problems, protects spools from dust and allows easy identification of leader tapes. 7"—**4/-**, 5¾"—**3/6**, 5"—**3/6**

EMPTY PLASTIC SPOOLS IN CARTONS

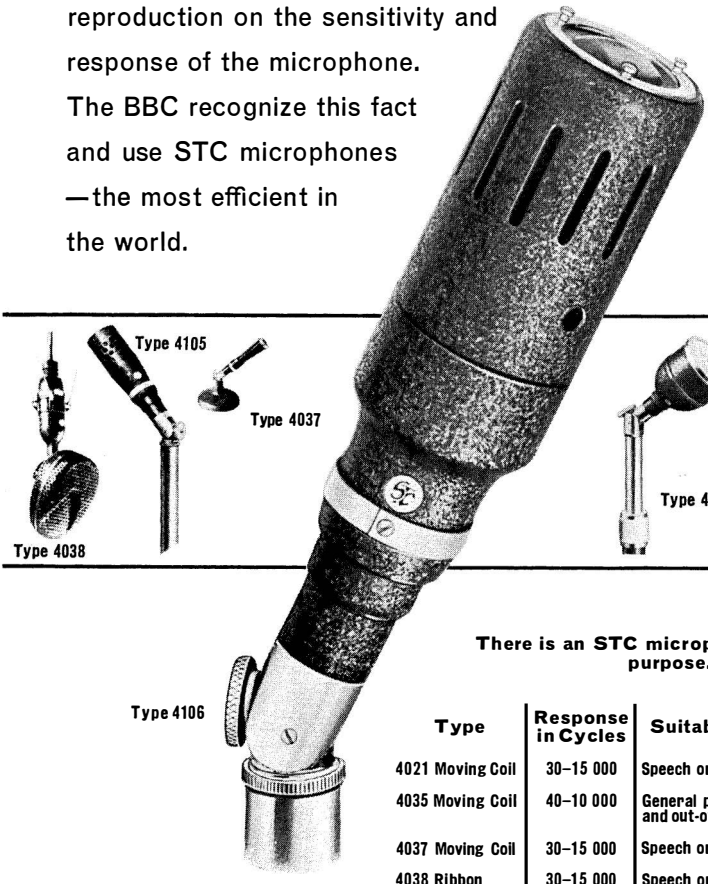
SENSITIVITY & RESPONSE

The best circuit must depend for faithful reproduction on the sensitivity and response of the microphone. The BBC recognize this fact and use STC microphones —the most efficient in the world.



There is an STC microphone for every purpose.

Type	Response in Cycles	Suitability	Price
4021 Moving Coil	30–15 000	Speech or music	£24. 0.0
4035 Moving Coil	40–10 000	General purpose and out-of-doors	£23. 0.0
4037 Moving Coil	30–15 000	Speech or music	£24. 0.0
4038 Ribbon	30–15 000	Speech or music	£43.10.0
4105 Cardioid (moving coil)	60–10 000	General purpose	£22.10.0
4106 Cardioid (moving coil)	30–15 000	Speech or music	£49.10.0

Generally microphones have an impedance of 30 ohms.

A full range of stands, accessories and cables is also available.

STC MICROPHONES—the first step to high quality reproduction.

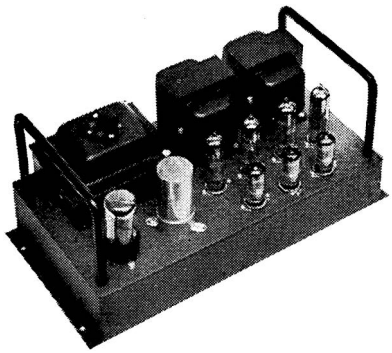
PCU25 STEREO PRE-AMPLIFIER
£21 . 0 . 0

Six inputs providing for all possible signal sources including the lowest output pick-ups and tape heads. Push button function switching. Bass and treble tone controls. Balance control. Treble filter. Rumble filter. Tape recording outputs. Distortion 0.1%. Hum and noise (high sensitivity pick-up input) 60db below full output. Valves, 2 × EF86, 3 × ECC83. Dimensions 10½″ × 4½″ × 7½″.



A20 STEREO POWER AMPLIFIER
£23 . 12 . 6

12 Watts push-pull ultra-linear output from each channel. Distortion 0.1%. Hum and noise 80db below full output. Frequency response 15-22,000 c.p.s. within 1db. Power response 20-18,000 c.p.s. within 1db. Negative feedback 29db. Stability factor 18db. Valves, GZ34, 3 × ECC83, 4 × EL84. High Specification output transformers with grain-orientated laminations and multi-sectional winding. Dimensions 14″ × 7″ × 7″.

More Compact, More Sensitive, More Facilities and a Lower hum and noise level than any Amplifier in its price range

Choose from the Armstrong T4B FM Tuner (£23. 0. 0d.) and the ST3 Mk. 2 AM/FM Tuner (£28. 10. 0d.) both of which match the new amplifier in styling and performance.

SKETCH BY FELIKS TOPOLSKI

At LARGS we delight in the "fussy" customer, although we don't call him anything so misleading. We appreciate his love of the superlative, and know that he will take full advantage of our knowledge and practical skill. After all, what is the use of our having a staff of very competent Technicians, French Polishers, Cabinet Makers and Fitters, ready to make Radio-Gramophones for the discerning music lover, if their work is not appreciated.

The typical LARGS' customer appreciates how music should sound, and how a well-built cabinet should look. He wants it to give pleasure in every way to himself, his family and his friends. Why does he come to LARGS? Just visit our Showrooms and satisfy your curiosity (and incidentally all your Hi-Fi requirements for some years to come).

Our cabinet showrooms

We pride ourselves that the range of cabinets displayed in our showrooms is the finest in the country. Featured below are just two fine examples.

ACOS

MIC 44 STEREO AND MONO MICROPHONE

The Acos MIC 44 stereo/mono microphone, incorporating two separate figure-8 response microphones, makes possible true, life-like stereophonic recording, at the same time eliminating completely the 'hole in the middle' effect sometimes produced by spaced microphones. In addition, the MIC 44 may be used as a high performance mono microphone.

Specification

Sensitivity at 1 Kc/s	−68 dB ref. 1 V/dyne/cm² (approx. ½ mV.).
Frequency response	30-12,000 c/s.
Directional characteristic	There are two pairs of inserts combined to give a pressure-differential (figure-8) response. On-axis to 90° off-axis ratio: better than 12 dB at 1 Kc/s. Directional characteristic maintained over the range 50-8,000 c/s.
Capacity of each insert	1,600 pF.
Recommended input impedance	Not less than 1 MΩ.
Lead	2 × 8 feet.

The Acos range also includes:

Microphones. MIC 28-2 lapel microphone; MIC 39-1 crystal stick microphone; MIC 40 fold-away microphone; MIC 45 crystal hand microphone.

Cartridges. Acostereo 71-5 stereo/mono single-sided cartridge; Acostereo 73-2 universal turnover cartridge for stereo, mono and 78 rpm records.

Pick-ups. The Acos range includes the astonishing Hi-Light stereophonic pick-up.

Styli. Over 150 types of Acos × 500 replacement styli, individually tested at times - 500 magnification, to fit all makes and models of pick-ups and cartridges in current use.

Changer Dust Bug. Clears record surfaces of dust and all harmful particles.

Stylus Pressure Gauge. Measures downward pressure to within ½ gramme.

PRESENTING THE

SONY 521

Stereophonic Recorder

The SONY 521 has introduced a new achievement in sparkling, stereophonic sound reproduction. Designed for the connoisseur and for professional use, this remarkable instrument is the culmination of years of research and development by the internationally renowned SONY CORPORATION.

The SONY 521 incorporates such notable features as :

- ★ 2 and 4 track monaural stereo recording and playback.
- ★ Built-in stereo pre-amplifiers, stereo recording amplifiers and stereo playback monitor amplifiers.
- ★ Separate level controls for microphone and auxiliary inputs provide professional mixing facilities for recording sound over sound.
- ★ Special tape tension guide automatically shuts off recorder at end of playing time.
- ★ Dynamically balanced flywheel . . . used in advanced "rimdrive" principle . . no pulleys or belts to wear out.
- ★ Instantaneous stop lever ensures precise editing and cueing.
- ★ Safety lock recording button prevents accidental erasure of pre-recorded tapes.
- ★ Separate channel recording indicator lights.

A full specification has been prepared and is available from the distributors for the United Kingdom — **TELLUX LTD.**

SONY TAPECORDERS

RESEARCH MAKES THE DIFFERENCE

The SONY Corporation have produced a range of recording instruments, catering for the professional and industrial user, for the serious Hi-Fi enthusiast and for the modern family. Illustrated are a few of the more popular SONY TAPECORDERS, engineered to the highest standards but very economically priced.

SONY 111 — A portable tapecorder with outstanding performance. Beautiful 2-tone styling, 2 speeds, simple to operate, complete with smart case. **29½ gns.**

SONY 101 — An "easy to use" family tapecorder; light, compact, handsome and sturdy, this recorder will delight users with its high fidelity performance. Incorporating transistorised printed circuits and dual speeds. **47 gns.**

SONY 262 — A compact, high quality instrument designed for serious recording. High performance, dual speed record-playback head assures wide frequency response (70-10,000 c.p.s. at 7.5 ips) and a tape timer will give spot-on relocation. **57 gns.**

SONY 464 — A high fidelity recorder for the connoisseur with dual speed 4-track stereo/mono recording, sound on sound facilities, instant stop and 8 mm. sync. A beautifully engineered instrument. **72 gns.**

SONY 362B — A full fidelity deluxe tape recorder with 3-speed, dual track facilities and push button mixing. Precision built, with transistorised printed circuits **79 gns.**

Illustrated literature with full specifications on these tapecorders are available from leading recorder dealers or from the SONY CORPORATION'S sole U.K. Distributors

MAGNETIC RECORDING TAPES *NEW* EXTENDED RANGE OF AUDIO TAPES

STANDARD 1½ MIL	Type	Length	Size	Retail Price
Recommended for most applications where dependable, stable, economical tape is required. Chosen by thousands of users in government and business, and by amateur enthusiasts and professional sound-recording engineers alike. An unusual value in long-wearing, extended frequency range tape.	CIP-1	150ft.	3in.	7/6
	CIP-3	300ft.	4in.	9/6
	CIP-6	600ft.	5in.	17/6
	CIP-9	900ft.	5¾in.	23/–
PROFESSIONAL	CIP-12PR	1200ft.	7in.	27/6
A premium tape each reel of which is specially preselected for uniformity. Will more than satisfy the demands of professional sound-recording specialists and discerning audiophiles.				
LONG PLAY 1 MIL	LP-9	900ft.	5in.	21/–
Exceptional tape economy! Provides 50% more footage on same size reel than "Standard" and "Professional" types. Allows 50% more playing time.	LP-12	1200ft.	5¾in.	25/–
	LP-18	1800ft.	7in.	35/–
EXTRA LONG PLAY	½ MIL (Double Play)			
Twice the playing time of "Standard"-type tapes. A break-free, long-wearing tape with all the desirable properties of Du Pont's polyester MYLAR film. Incomparable frequency response throughout the entire audio spectrum.	CMXP-3	300ft.	3in.	10/–
	CMXP-12	1200ft.	5in.	34/–
	CMXP-18	1800ft.	5¾in.	45/–
	CMXP-24	2400ft.	7in.	56/–

CBS MAGNETIC RECORDING TAPES are specially designed for use in modern tape recording equipment to satisfy the high-fidelity requirements of 4-track stereo and other advanced professional sound recording techniques. Superior high- and low-frequency characteristics are achieved by precision application of a specially prepared fine magnetic iron oxide dispersion—the result of intensive research and testing. Quality-controlled finishing processes further enhance these characteristics and assure uniform surface properties from tape to tape.

Here's the NEW range of

TELEFUNKEN

tape recorders

NEW

TELEFUNKEN MAGNETOPHON 95

Entirely new design in the Telefunken range with attractively styled case. Twin Track. Fully Portable. Three speeds : 7½", 3¾" and 1⅞". Maximum Spool Size 7". Frequency response : 30-18,000 cps at 7½ ips; 30-16,000 cps at 3¾ ips; 30-9,000 cps at 1⅞ ips. Special trick and "straight through" amplifier facilities.
59 gns (excluding microphone)

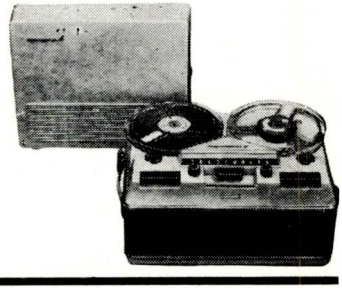
NEW

TELEFUNKEN MAGNETOPHON 96

This new FOUR-TRACK recorder has the same basic style and technical specifications as the Magnetophon 95, but offers all the advantages of the desirable four-track technique.
Playing time over 16 hours on 7" DP tape. Multiple transcription from one track to another. Facilities for playback of prerecorded stereo tape through additional amplifier or radio.
69 gns (excluding microphone)

NEW

TELEFUNKEN MAGNETOPHON 97



The stereo tape recorder which provides not only the outstanding facilities of the four-track system with its manifold possibilities for transcribing and trick effects, but also the twin-channel stereo, four-track technique for recording and playback.
Speeds, frequency response and spool size same as Magnetophon 95. Extra speaker in the lid for stereo playback.

95 gns (excluding microphone)

and of course

75K-15

75K-15—Tape speeds 3¾ ips and 1⅞ ips; frequency response of 60-16,000 cps and 60-9,000 cps. Playing time of 6 hours on 5¾" DP tape. 47 Gns (excl. microphone).

85-KL—Tape speeds 7½ ips and 3¾ ips; frequency response 30-20,000 cps ± 3dB and 30-15,000 cps. 79 Gns (excl. microphone)

DESIGN

LEAK SANDWICH

. . . an astonishingly improved loudspeaker system

LEAK set a new standard when, in 1945, they marketed amplifiers having a total distortion content as low as 0.1%. This was fifty times better than the then accepted standard for distortion content.

Now LEAK have set a new standard in Loudspeakers with their Sandwich System.

The group unequivocally voted for the LEAK "SANDWICH"

"An extended series of direct comparison tests with three current designs of commercial loudspeakers, was undertaken with a listening panel of mixed sex and age. Two of the speakers cost approximately the same as the Leak, and the third model was much more expensive. After all tests on speech and music, from records and radio, the group unequivocally voted for the Leak 'Sandwich'. The superiority on speech tests was particularly marked . . . SUMMARY: We gave the Leak 'Sandwich' loudspeaker the full treatment. It is difficult to fault it. This design must be regarded as a break-through of fundamental and far-reaching importance."

Quoted from the Test Report by Donald Aldous and David Phillips. "Audio and Record Review."

"LEAK Speakers won the day"

"This occasion proved a most stringent test as we were listening to a stereo recording of a very recent orchestral and operatic performance we had enjoyed either as audience or performer. By way of experiment other pairs of speakers were switched in, but the very smooth response of the Leak speakers won the day."

Quoted from the Test Report by Ralph West, B.Sc., M.Brit.I.R.E. in "Hi-Fi News."

"Selecting the Equipment"

"Suggestions? The Leak line comes highly recommended on two continents, the pre-amp isn't cursed with superfluous knobs, and it looks good. The mono amp would thus be the TL/12 Plus and the stereo version would be the Point One Stereo 20 Amplifier. Both run about 10-12 watts per speaker, and frankly I think this is plenty. Even with that you can rattle the windows, and the reason is that this 10W is at minimum distortion, 10W sinewave power (which means that it'll put out a lot more on peaks). The price of the Leak is also quite reasonable for uncompromised sound quality."

Quoted from the article "Frankly Speaking" by John Berridge. "Hi-Fi News."

Southdown Cabinet £21

Point One Stereo pre-amp. £21

Stereo 20 power amplifier £30 · 9s.

The revolutionary LEAK "Sandwich" cone diaphragm weighs the same as conventional cones, but is hundreds of times stiffer, and will support the weight of a man. We have thus overcome the major weakness of the moving-coil system—lack of diaphragm rigidity—for there has been no improvement of practical significance in rigidity during the 36 years since Rice and Kellogg introduced the original "R-K" design in 1925.

A loudspeaker diaphragm or cone, in order to follow accurately the signal applied to the speech coil, needs to be light *and* stiff but hitherto materials which of necessity have had to be used for their low mass have suffered from a low stiffness factor, resulting in significantly large areas of the cone vibrating in modes uncontrolled by the speech-coil. When reproducing speech and music these uncontrolled vibrations, or break-up motions, are translated to the listener as a complex mixture of ever-present and unpredictably ever-changing audible distortions—transient distortion or "hang-over", intermodulation distortion and amplitude distortion. The immense stiffness of the new LEAK "Sandwich" cone gives, for the first time in history, a direct-radiator loudspeaker diaphragm which behaves in the theoretically ideal manner of a rigid piston and reproduces the signal applied to the speech coil without flexing and free of break-up distortions.

LEAK "SANDWICH" LOUDSPEAKER . . . Price **£39·18·0d**

Tape never had it so good!

With its unique versatility the UHER UNIVERSAL "S" covers the whole range of audible sound. The simpler needs of the business man dictating a memo —the more particular demands of a discriminating recordist—all can be satisfied by this one brilliant machine with exceptional efficiency and reliability.

At $1\frac{7}{8}$ i.p.s. the UNIVERSAL "S" will give you a frequency response well above average; at $3\frac{3}{4}$ i.p.s. musical quality is superb whilst at the low speed of 15/16 i.p.s. the special features of the UHER make it ideal for speech recording.

Additional UHER accessories available include hand or foot operated remote control units and the Syncro-Akustomat—an acoustic switch which gives you sound operated control and will enable you to start and stop the machine simply by speaking.

Find out more about this exceptional machine —make a point of seeing it and hearing it for yourself.

PRICE 83 gns.

(including remote control microphone and tape)

The famous WAL GAIN PRE-AMPLIFIERS . . .

Transistorised, battery operated, the **WAL GAIN** gives you the EXTRA GAIN you need, without hum or distortion. Can be connected directly to low impedance microphones, tape heads, or P-U's, and the output taken directly to the input of the main amplifier.

MONO WAL GAIN, £5. 0. 0. Size only 3¾″ × 2″ × 2⅛″. Ideal for Reslo ribbon, STC 4021 "ball and biscuit," Lustraphone LD/61, and many others.

STEREO WAL GAIN, £7. 10. 0. Many applications for Mics, Tape heads, and also Decca ffss, SPU/G Ortofon, Shure, Grado, etc. High and Low Impedance inputs. Size 7″ × 2″ × 2½″.

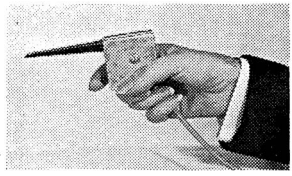
WAL HI-GAIN, size 7″ × 2″ × 2½″

WAL HI-GAIN, £7. 16. 0. Invaluable accessory for the second deck, for re-play, dubbing, monitoring or headphones. Also the second channel for stereo on mono tape equipment. CCIR equalisation, High and Low Impedanee inputs. Pair for Stereo re-play, special price, **£15.**

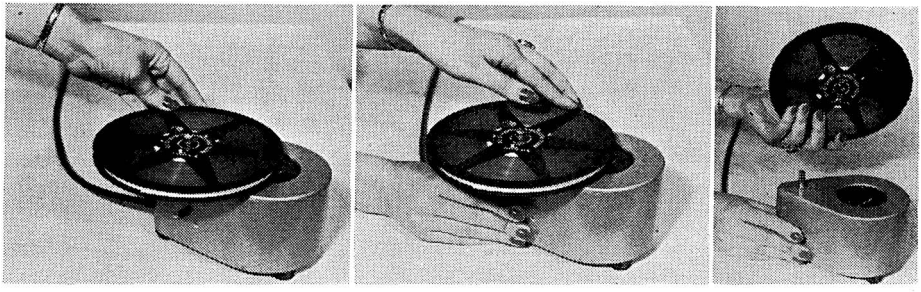
All WAL GAINS are supplied complete with phono plugs. battery, screened lead and full connection instructions.

There are many applications in the Industrial, Medical, Scientific, Cine and Audio fields where one of the WAL GAINS will solve the problem.

WAL D-MAG. Mains operated, head demagnetiser, that provides a complete degaussing circuit. NYLON COVERED PROBES, designed to reach the heads on most decks. Also "spot" erasers for unwanted sounds on tape or film. **£2. 10. 0.**



WAL D-MAG head demagnetiser



Put a reel of tape on the WAL Eraser, switch on, turn the reel several times, remove the reel, switch off.

WAL BULK ERASER, £7. 18. 6. It takes 30 seconds to "clean" both tracks from 8½″ reel of tape. The ideal accessory for professional enthusiasts.

The WAL Eraser is used in Laboratories, Colleges, Schools, Dealers' demo rooms, Studios, Offices, Tape Clubs—in fact, by anyone who does tape recording.

WALTRAK, £6. 10. 0. Output 1000 cps sine wave. Transistorised, battery operated pocket oscillator. Hundreds of applications.

AUTOMATIC GRAMOPHONE RECORD CLEANER

PATENT No. 817598

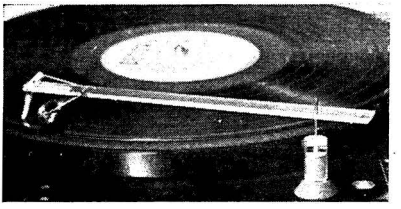
Instantly Fitted. Suitable for all Types of Record. Quality Improved. Surface Noise and Wear Reduced.

STANDARD MODEL FOR TRANSCRIPTION AND SINGLE RECORD PLAYERS.

PRICES REDUCED **17/6** (plus 5/10 purchase tax)

From Your Dealer, or

CECIL E. WATTS LTD.
(Sound Recording and Reproduction)
Darby House, Sunbury-on-Thames, Middx.



The Dust Bug may be placed in any convenient position around the turntable and the adjustable pin of the pillar raised if necessary so that the arm is approximately parallel to the surface of the record.

The use of the fluid dispenser should only provide a trace of dampness to the plush pad. It is not intended that any fluid should be transferred to the record. The slightly damp pad provides a leakage path for the discharge of any static in the record and assists in the collection of dust, etc.

The Dust Bug is the only record cleaner capable of thoroughly cleaning the groove without affecting the record surface in any way.

The # PARASTAT (Regd.)

TREATMENT FOR L.P. RECORDS *(PATENTS APPLIED FOR)*

Buy where there is a "Parastat" service — Used by dealers who have the customer's interests at heart

This Machine serves three main purposes in the handling of all types of Gramophone Records.

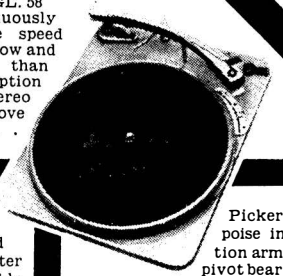
1. It cleans simultaneously both sides of the entire surface of the record (including the label), and removes every particle of dust or foreign matter from the grooves in less than ten seconds.
2. Renders the record permanently inert to all Static charges induced by any means, leaving no trace on either groove or record surface.
3. Reduces the coefficient of friction between stylus and groove wall at all points of violent acceleration reducing tracing distortion wear and surface noise.

CECIL E. WATTS LTD. - DARBY HOUSE - SUNBURY-ON-THAMES - MIDDLESEX

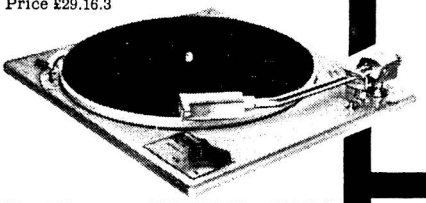
Goldring

NOW... an even wider range of transcription equipment from GOLDRING

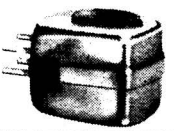
GL. 58 Continuously variable speed control. Wow and flutter less than 0.5%. Transcription arm wired for stereo or mono. Unique groove selection device . . . Price £18.4.5.



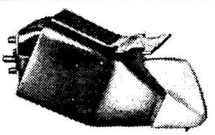
GL. 70. 8lb. die cast turntable, accurately machine finished and dynamically balanced. Wow and flutter less than 0.2%. Continuously variable speed adjustment. L.70 transcription arm, in light alloy with nylon bearings. Extremely low tracking error. . . . Price £29.16.3



Pickering Model 198 Unipoise integrated transcription arm and cartridge. Single pivot bearing. The variable reluctance stereo/mono cartridge has simple slide-in stylus changing facilities. Tracking weight 2 gms. . . . Price £58.8.8.



700 Mk 11 stereo cartridge with standard fixing centres. Normal tracking weight 3-4 gms. Frequency response 40 c/s-12,000 c/s. Channel separation—20dB at 1 Kc. . . . Price £9.14.9.



Pickering variable reluctance stereo/mono cartridges '380', '380A' and '381'. Sealed mu-metal capsule. Simple slide-in stylus assembly. '380' tracking 4 gms. . . . Price £16.13.11; '380A' tracking pressure 2 gms. . . . £37.11.3. '381' (Calibration standard) for professional use. . . . Price £50.1.8.

(All prices quoted are subject to 10% P.T. increase)

Goldring 600 mono cartridge. Wide, level, frequency · response. Higher compliance. Minimum effective mass at stylus tip. Tracking pressure 4-5 gms. . . . Price £11.2.7.

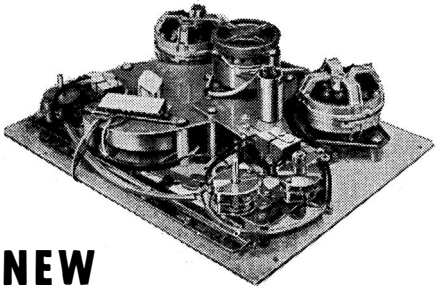
THE BEST OF BOTH WORLDS

That is what you can expect when you buy a Brenell tape deck or recorder—top quality performance and versatility at a reasonable price. The Mark 5 deck at 28 gns., the Mark 5 recorder at 64 gns. or the 3 Star Stereo at 89 gns. are all unbeatable in their class. Mere illustrations can only show the functional appearance of these machines but a practical demonstration will reveal the realism and beauty of recorded sound obtainable from a Brenell recorder. Ask your specialist dealer for a demonstration and you will hear what we mean.

All Brenell tape decks and recorders are fitted with an hysteresis synchronous capstan motor with an outer rotor and a large statically and dynamically balanced flywheel. This drive system is widely regarded as the most efficient for use in tape recorders and 'Wow and Flutter' are reduced to below ·1% at $7\frac{1}{2}$ ips.

Brenell Mk. 5 Deck
4 recording speeds $1\frac{7}{8}$, $3\frac{3}{4}$, $7\frac{1}{2}$ and 15 ips. Permits use of $8\frac{1}{4}$ in. reels (3,600 ft. of D.P. tape at $1\frac{7}{8}$ ips., plays for over 12 hours): 3 independent motors. Interlocked controls. Pause control. Digital rev. counter. Fast rewind (1,200 ft. in 45 secs.). Provision for extra heads. 28 gns.



NEW
Brenell Mk. 510 Deck
A recent introduction is the modified Mk. 5 Deck which will accommodate $10\frac{1}{2}$ in. N.A.B. and standard spools. All other features remain as before. It is available in either Hammered Gold or Hammered Grey finish for use on 200/250V 50c/s mains supplies only. The additional cost is 7 gns.

Sole manufacturers:

Brenell

Brenell Mk. 5 Recorder
The professional choice. Has all the remarkable performance features of the Mk. 5 Deck, plus monitoring facilities, complete record/play-back amplifier with power unit, coloured signal lights, selective frequency correction at $3\frac{3}{4}$, $7\frac{1}{2}$ and 15 ips. 64 gns.

Brenell Mk. 5 Type "M"
A development of the Mk. 5 giving facilities for mixing, superimposing and tape monitoring. Two separate amplifiers are provided for recording and replay and an accurate Recording Level meter ensures recordings of unvarying quality.
88 gns.

Brenell 3 Star Stereo
3 speeds. Stacked heads. Records and replays stereo. Extended frequency range. For monaural work, half track erasure is used. Exceedingly low cross talk of −60 db. Plays directly from pick-up—Stereo or Monaural. Two recording level indicators. Two internal speakers. 89 gns. With two microphones 95 gns.

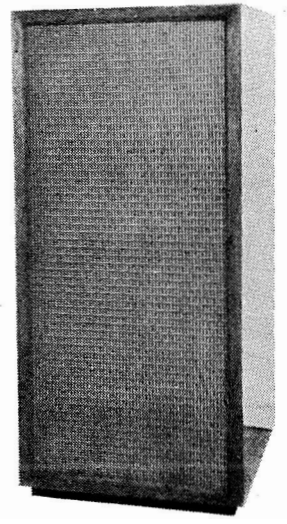
QUALITY AMPLIFICATION 1931 — 1962

Since 1931 we have enthusiastically designed and produced equipment built to Laboratory standards, that would create the closest approach to realism under domestic conditions, hence the introduction of the Tone Control, as far back as 1937 when the famous Tri-Channel was first introduced.

Our products include the Twin Twenty Stereo Amplifier, the Mk. III Mono, Professional Recording Amplifiers, F.M. Units, and the well-known Phase Inverter Speaker which incorporates a Laboratory built unit of unique design, with a cast aluminium chassis, plus a very efficient Alcomax magnet giving very low resonance, and consequently smooth reproduction from 30 to 13,500 cps. The Phase Inverter Speaker does not employ a collection of individually inferior units with crossover net works to cunningly dodge their resonant peaks. Thousands of Phase Inverter Speakers are in use at Home and Abroad — they have stood the test of time — and since everything except the attractive Cabinet is produced in our Works, they are reasonably priced; therefore particularly attractive to the Audio enthusiast, and of course our Overseas Department can ship to any part of the World.



THE PHASE INVERTER SPEAKER

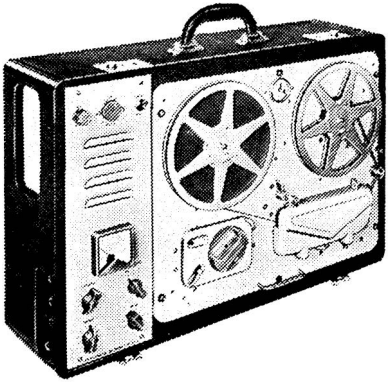
Vortexion



The W.V.B. recorder has an additional amplifier and head with provision for "before" and "after" record monitoring while the recording is in progress, and this also has echo facilities.

The W.V.A recorder has provision for a plug in stereo head and can be supplied with this and stereo playback pre-amplifiers with equalisation each having an output of 1 volt from a cathode follower. This is type W.V.A/S.

TWELVE-CHANNEL ELECTRONIC MIXER

This is similar to the 4-channel, but is fitted with 12 hermetically sealed controls, 12 balanced line microphone transformers potted in mu-metal boxes, and a mains transformer also potted in mu-metal. All components which can affect noise are tested and selected before insertion. It is supplied in standard steel case or 7 inch rack panel.

30/50 WATT AMPLIFIER

Gives 30 watts continuous signal and 50 watts peak Audio. With voice coil feedback distortion is under 0.1%, and when arranged for tertiary feedback and 100 volt line it is under 0.15%. The hum and noise is better than —85 dB referred to 30 watt.

It is available in our standard steel case with Baxandall tone controls and up to 4 mixed inputs, which may be balanced line 30 ohm microphones or equalised P.U.s to choice.

120/200 WATT AMPLIFIER

Will deliver 120 watts continuous signal and over 200 watts peak Audio. It is completely stable with any type of load and may be used to drive motors or other devices to over 120 watts at frequencies from 20,000 down to 30 cps in standard form or other frequencies to order. The distortion is less than 0.2% and the noise level —95 dB. A floating series parallel output is provided for 100—120 v. or 200—240 v. and this cool running amplifier occupies $12\frac{1}{4}$ inches of standard rack space by 11 inches deep. Weight 60 lb.

TECHNICAL EXPERTS REGARD ***ORTOFON*** AS THE FINEST PICK-UP IN THE WORLD

MODEL SPU-G/T (STEREO) CARTRIDGE

Ortofon

- *"To say I was impressed is to put it mildly . . . have never found such a remarkable range before." Percy Wilson, M.A., The Gramophone.*
- *"Must be placed without reservation among the select few designs at the top, if not right on the pinnacle." D. W. Aldous, M.Inst.E., MBKS, Audio & Record Review.*
- *"Must take its place among the few outstanding stereo heads available." B. J. Webb, Hi-Fi News.*

MODEL SPU-G/T (STEREO) CARTRIDGE

A hi-fi stereo cartridge with built-in transformers, will match into virtually all equipment without pre-amplifier, or other stages.

Channel Separation	***20-25 dB***
Frequency Response	***20-20,000 cycles***
Stylus pressure	***Below 2 gms.***
Compliance	***10^5 cm/dyne***

Fitted low Mass (1 mg) Diamond Stylus.

Model SPU-G without built-in transformers available.

MODEL C.G. (MONO) CARTRIDGE

This World-Famous Cartridge is now available in the type "G" shell for use with ORTOFON Pick-Up Arm SMG 212. All ORTOFON Cartridges in type "G" shell are suitable for use with S.M.E. arm.

PICK-UP ARM SMG-212

For exchangeable heads. Due to the special shape of the Pick-up Arm, turntable levelling is unnecessary. The turntable may be up to 30° out of level. Ball bearings are applied for both horizontal and vertical action, assuring trouble-free performance, even at the lowest possible stylus force. Height over mounting plate is adjustable.

SME SERIES 11

These new series 11 precision pick-up arms embody all the best features of the earlier models to which have been added improvements for still greater ease and flexibility of use. Decreased mass and extended range of balance anticipate lighter, higher compliance cartridges in addition to those of the present day. Reduced height simplifies use with low turntables.

The bias adjuster formerly an accessory is now standard equipment.

Illustrated brochure will be sent on request.

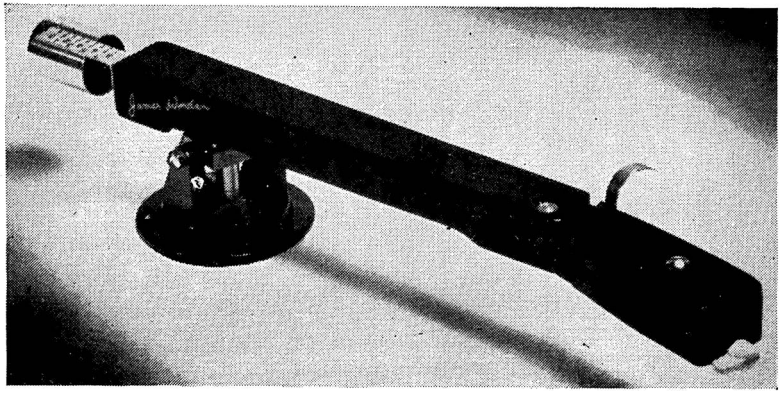
THE WORDEN ★ ARTICULATED ★ PICK-UP ARM

PAT. No. 741639

WORLD PATS. PENDING



★ A REVOLUTIONARY ADVANCE ★

CORRECT TRACKING —

Plus:— ● Very Low Friction.

● Negligible Side-thrust.

● Arm Dynamically Balanced.

A *single arm* of conventional appearance, but with *articulated head-piece*. Movement of pickup head controlled to exceptionally fine limits by means of light linking system passing within the arm, so that the stylus is maintained in correct alignment with the groove ($\pm\frac{1}{4}°$) over whole of playing area.

★ "End of side distortion" virtually eliminated; overall sound quality greatly enhanced.

★ Inward lateral thrust largely obviated, resulting in more evenly divided weight on groove walls with drastic reduction of record/stylus wear.

★ *Two main vertical pivots only* for torsional and lateral stability incorporating miniature Swiss precision bearings.

★ Quieter surfaces. ★ No groove jumping. ★ No stylus flutter.

ALLOWS THE CARTRIDGE FULL FREEDOM OF EXPRESSION

Wired for Stereo and Mono, supplied complete with one self-locking slide-on shell (spring-loaded contacts) to accommodate all popular cartridges. Adaptors for integrated pickup heads (e.g. Decca, Expert, etc.). Extra shells available. Polished black finish.

SIMON EQUIPMENT LIMITED

48 George Street London W 1

AURIOL

GRAMOPHONE PICKUP CONTROLS

No matter what combination of equipment is selected for the playing of gramophone records it will not be complete without an AURIOL pick-up control. This piece of precision equipment is designed for use with every model of pick up arm and provides the complete answer to the problem of handling the pick-up without risk of damaging the playing surface of the record, or the pick-up.
The stylus can be instantly positioned within an accuracy of 1-2 micro-grooves anywhere across the record including the first groove and the pick-up may then be automatically lowered under pneumatic control at an adjustable preset speed which provides positive, cushioned contact. At any position across the record the pick-up can be raised with the stylus being lifted vertically and cleanly out of the groove. At no time is it possible to drop the pick-up on to the record!
The control is exhibited by the Council of Industrial Design at the Design Centre, London, and has been acclaimed by many leading critics including:—

Burnett James—Gramophone Record Review
" . . . *This is quite obviously the only sane method yet devised of dealing with the problem of the ubiquitous recital record. I use one with a BJ 'Super 90' arm and I have come to regard it as an essential piece of equipment.*"

R. L. West—Hi-Fi News Test Report
" . . . *Although the Connoisseur pick-up is a very easy one to handle, used with an AURIOL it was even easier and it was impossible to damage either pick-up or record.*"

P. Wilson, M.A.—The Gramophone
" . . . *For a long time we have all been aware that one of the disadvantages of LP records is the difficulty of picking out any particular passage, and placing the pick-up there positively and gently, or vice versa, of lifting the pick-up from the middle of the record. The AURIOL solves that problem. Is its price such as one can afford? You can answer that yourself bearing in mind that an expensive record can be ruined by a single mishap in placing a pick-up.*"

Patented and proved in use throughout the world, these controls are guaranteed to give long, trouble-free service

Standard model for single record players only	**£3.9.9**	Inc. Tax
Mk. II model with swivel arm for auto-changer/manual players	**£4.4.0**	Inc. Tax

A standard indexing clip is supplied to suit $\frac{3}{8}$" (9.6 mm.) round arms. Clips are available to suit all other arms. Please specify when ordering.
