## THE

## PEMBRIDGE

COLLEGE

## OF ELECTRONICS

## FULL-TIME COLLEGE COURSE

## IN RADIO AND TELEVISION

Our Course has now been extended to sixteen months ${ }^{\text { }}$ duration to include theoretical and practical instruction on transistor television receivers, U.H.F. television receivers and colour television.
Next course commences 7th Sept., 1965.
This Course is recognised by the Radio Trades Examination Board (R.T.E.B.) for the Radio and Television Servicing Certificate examinations.
Provides excellent practical experience on valve and transistor radio receivers and all well-known makes of television receivers.

## To:

The Pembridge College of Elactronics (Dept. P11)
34a Hereford Road, London, W.2.
Please send, without obligation, details of the Full-time Course in Radio and Television.

## SELF-SUFFICIENCY

RECENT letters from readers tread on the thorny subject of the competence, or otherwise, of the radio enthusiast. There are so many opinions, that it is virtually impossible to generalise. Nevertheless, we are tempted to make a few observations which may bring more tolerance-or add fuel to the flames!

Competence is a somewhat intangible element; a variable definition. What is considered to be competent by one person in a given context, may be considered highly incompetent by another. "The dictionary tells us that competence means "suitableness", "adequateness", "sufficiency".

Who can, therefore, say exactly what is competence? A piece of equipment built by A could be looked upon with awe by $B$ (who is a novice) but sneered at by $C$ (who is a professional). The horizon shifts according to ones own ability or personal criterion. If a man builds a set which works perfectly but looks untidy, is he competent? Is a highly experienced amateur considered incompetent if he cannot build a computor yet competent if he can construct a simple crystal set? Where does competence begin and end?

We have a sneaking feeling that there might be an element of inflated self-importance in those who go out of their way to make too much of a noise about how good they are and how bad others may be. There is a certain regular reader who cheerfully admits that nothing he builds ever works well, if at all, and more often than not produces bizarre results which would drive the designer grey with despair. This does not deter him; on the contrary, it seems to feed his appetite for more.

To the purist, this reader is hopelessly incompetent but, for him, his erratic constructional efforts have an "adequateness" and a "sufficiency". He may be no genius, but he probably gets more fun out of radio than many self-styled perfectionist!

## Ground Communication

I was interested in C. R. Bradley's article on ground communication (P.W. Feb.. 1965) and after reading N. W. Roberts' letter in the April issue. I had some new ideas on the subject.

A power cathode follower could be used as an output stage, being driven hard so that the output stage only conducts for a fraction of the time, as in "Class C" output stages.

A line output valve could be used to give quite a lot of power. thus greatly increasing the riange. If the carrier frequency was high enough, certain communications receivera could tune to it, thereby greatly increasing the sensitivity of the receiving end. I would suggest that a CR100 (B28) communications receiver is used. as it will tune down to just under $60 \mathrm{kc} / \mathrm{s}$
Huw Lewis.
Swansea,
Glamorgan.

## D.F. Aerial

With reference to the article "A Ferrite Rod D.F. Aerial for $1 \cdot 5-3 \mathrm{Mc} / \mathrm{s} "$ (P.W. January. 1965). The reference to "d.f. helow $3 \mathrm{Mc} / \mathrm{s}$ " should have read "d.f. above $3 \mathrm{Mc} / \mathrm{s}$ ". since we are dealing with frequency and not wavelength. Also. the reference to "adding $10^{\circ}$ to compass hearing" on paige 838. should have read "subtract $10^{\circ}$ " although the present magnetic variation is about $6.8^{\circ}$.
F. C. Judd.

South Woodford.
London, E. 18.

## Can Anyone Help?

I AM thinking of building the "Ten Five" deacribed in P.W. October, 1964, hut I am having great difficulty in obtaining some of the parts in my country. I would be extremcly grateful. therefore, to any reader who would send me the variable capacitors. coils and traneformers employed in this cireuit. In return, I will send anything of the same value from my country. Rudolph lobo.

236 Godavari Hostel. Indian Institute of Technology. Madras-36. India.

## NEWS AND

GOONHILLY PREPARED FOR "EARLY BIRD". . .

Now that the world's first commercial communications satellite 'Early Bird' is in a stationary orbit somewhere over the Atlantic and intercontinental telephone calls via satellite are destined to become everyday occurrences, the GPO's tracking station at Goonhilly has been completely modified to cope with the expected volume of traffic.

Modifications have included a new, shallower reflector surface for the aerial dish. which has brought its performance up to, if not ahead of the American and French horn type aerials. The control system too, which steers the aerial, has been modified, for although the satellite is practically stationary in relation to the Earth, there will be some movement. Weak signals received at the aerial will be amplified by travelling wave masers newly designed by Mullard Limited.

Satellite 'Early Bird' in conjunction with Goonhilly or either the French or German ground stations, will eventually provide up to 240 telephone circuits between the North American continent and a network of European countries.
...AND G6AG CONTACTS "OSCAR IH"'

Mr. C. J. McClelland (G6AG) of Chalfont St. Peter, Bucks., seen here in his shack, has the distinction of being the first amateur operator to receive reports from the U.S. of trans-AtIantic v.h.f. reception of transmissions he made via the communications satellite Oscar III. Other reception reports arrived from Czechoslovakia, France, Belgium and many English stations, while actual contacts were made with amateurs in Germany, Switzerland and Sweden.

Mr. McClelland, who is a Chief Engineer at Ultra Electronics Ltd., used a home-made transmitter operating at 1 kW on $144 \cdot 1 \mathrm{Mc} / \mathrm{s}$ for these contacts, the satellite equipment converting and re-transmitting the signals on $145.9 \mathrm{Mc} / \mathrm{s} 25 \mathrm{kc} / \mathrm{s}$.

## TRANSISTOR TESTER KIT

Just $£ 2418 \mathrm{~s}$. will buy one of Heathkit's latest test equipment kits, the IM-30U transistor tester. Available also in assembled form at $£ 3510 \mathrm{~s}$., this new instrument from Daystrom Ltd., Gloucester, will provide complete d.c. analysis of $p-n-p$ and $n-p-n$ transistors and permit direct read-off of d.c. gain (alpha, beta). Facilities for many other tests including diode or collector-to-emitter and collector-to-base leakage, collector current and voltage, etc., make the model IM-30U a really comprehensive piece of equipment.

# ..COMMENT 

SMALLER AND SMALLER

The Japanese radio manufacturers Standard have recently added three new pocket-sized recelvers to their range. The most inexpensive of the three, the G433, is also the tiniest, measuring less than $1 \frac{3}{4} \mathrm{in} . \times 2 \mathrm{in} . \times \frac{7}{6} \mathrm{in}$. Inside this minute case Standard have packed a 7 -transistor circuit, a $1 \frac{1}{2} \mathrm{in}$. speaker, a ferrite rod aerial and two mercury cells. Denham and Morley Ltd., are the UK agents for this radio which costs $6919 \mathrm{~s} .6 \mathrm{~d} .$, and all other Standard receivers.

## THE "PIRATE" DANGERTO SHIPPING

During February this year an urgent radio report from a lightship to a shore base was held up for 30 minutes because both frequencies normally available were blocked, one by a pirate broadcasting station. This was only one instance of shipping communications bands being blocked by pirate operations, but It clearly illustrates the very real danger they present.

In a written answer to a parliamentary question recently, the Postmaster-General, listed 19 specific instances when transmissions from pirate radio stations had caused interference to ship to shore communications, seven of these instances singling out 'Radio Carollne' as the offender.

## A NEW WAY TO VARY RESISTANCE

A new device which permits completely noise-free resistance control, has been introduced by Mullard. In appearance it is a plastic block measuring $17 \mathrm{~mm} \times 17.5 \mathrm{~mm} \times 22 \mathrm{~mm}$, with just four lead-out pins. Enclosed In this block are a cadmium sulphide cell and a 12 V filament lamp. Varying the brightness of the lamp causes changes in the resistance of the cell and control over at least three decades (typically 100 to 10,000 a) can be achieved with complete lack of noise.

## A JUKE-BOX FOR YOUR HOME

Now for the first time, for anyone who wents it, KB (Footscray, Kent) offer four hours of continuous 7 in . record playing (or $7 \frac{1}{2}$ hours on e.p's) with their new Discomatic portable juke-box.

The Discomatic houses forty 45 r.p.m. records and will automatically select and play any of the 80 sides in order selected by push buttons. The output from its tronsistorised amplifier is $2 \frac{1}{2} \mathrm{~W}$ and additional speakers and amplifier may be connected.

The price you pay for having a juke-box in your home is 69 guineas, but then, unlike commercial mochines, you don't have to put any money into it once you've bought it.

more News and Comment

## Dverseas Ham

I AM happy to inform you that I recently passed the R.A.E. and obtained my ticket (9M2FF).

I have just built the Beginner's 10W Transmitter (P.W. Dec. '63). which I will use as a top band and standby transmitter.

Over the years I have built many constructional projects from Practical Wireless designs, and they all work very well. Thank you for a most interesting magazine.
Mohd. Yusoff Bin Mohamed.
Mersing, Johore.
Malaya.
Considering the difficulties overseas readers often face in obtaining components, it is always gratifying to hear of the perseverance with which they pursue their hobby.-Editor.

## Botting Acid

In the May, 1965, issue you printed an article by F. L. Thurston, a continuation of "Cabinet and Chassis Techniques". Mr. Thurston describes processes involving certain chemicals and towards the end of the process advocates that "all chemicals involved should be well stoppered up in glass containers".

I would point out, however, that one of the chemicals is hydrofluoric acid, which attacks glass and should thus be kept in bottles made of wax or guttapercha.
Ian Gregory. Boreham Wood,
Herts.

## Excellent Design

My thanks to P.W. and Mr. Groome for the excellent pulse-counter f.m. tuner design in the April issuc. I made up the simpler, single limiter version and quality has proved at least equal to that from a very well known tuner selling at more than f25. By the way, I found the greater gain of an EF183 frame grid pentode, instead of the EF80 specified for the first stage, helpful in this fairly weak reception area.
H. E. Owens.

Hornsey,
London, N.8.

$\square$

THE conventional electric guitar today enjoys an immense popularity, but not so much is heard of the Hawaiian guitar, an instrument capable, in the right hands. of producing most cnjoyable music. its very constriction making the need for an electronic tremolo non-existent.

The body of the guitar is made from a solid plank of soft wood which, when completed, will be completely covered with Formica. A gloss
grained Formica is used to give the benefits in appearance of polished wood. Although a channel and a hollow pochet must be cut out of the wood, no difficult shaping is required.

The article will describe two designs for pick-up heads which may be constructed quite cheaply as compared with manufactured heads, the cheapest of which is little under $£$ ? This is where the chief pait of the metalwork comes. hence if the constructor has neither the tools. facilities nor abilities to tackle it. a head might be purchased.

The pre-amp and control circuit must be very carefally constructed. as only absolate minimum volume has been allowed for these-little over six cubic inches!

## Principle

Just as a tape-head responds to varying strength magnetic fields. as produced by the magnetic tape passing the head. so the pick-up head of the electric guitar responds to varying magnetic fields.

Fig. 10a (on the Blueprint) indicates three bar magnets placed side by side. Every magnet has two poles-which are known as north $(\mathbb{N})$ and south (S) poles. It is a well known fact that unlike poles attract and like poles repel. Hence, a $N$ and $S$ pole attract each other where a $N$ and $N$ or a $S$ and $S$ tend to repel each other. Fig. 10a indicates unlike poles placed side by side. and the dotted lines. representing the magnetic lields. indicate that they are attracted to each other where, alongside, Fig. 10b. where we have three like poles. they are seen to repel. North poles are indicated. but the effect would be exactly similar if they were south poles fas of course they are at the other end of the magnets).

Now consider Fig. 10c. This corresponds to Fig. 10a. but now we have above the first two an oscillating steel string which effects the magnetic fields. As the poles attract. the left-hand magnet's field is effected by the string directly above it, but as its field strays across towards the other magnet, not only does it affect the neighbour's magnetic field by its own changes due to the first oscillating wirc. but also it is effected by the neighbouring oscillating wire.

It will be seen in Fig. 10d. with like poles, that the influence of one pole upon its neighbour is not nearly so great and that each magnet is more free to "consider" the frequency of the oscillating wire above it.
Gain, tone and a rhythm switch are provided as well as the necessary on/off switch. It is. however, at simple matter to elininate the rhythm switch if desired. but more of this later. The output may be fed to a guitar amplifier or any high-gain amplifier.

## Construction of Guitar Body

The minimum dimensions of the piece of timber required for the body (planed), are. $3 \mathrm{ft} . .6 \mathrm{in}$. x 5 in . y $I \frac{3}{8}$ in., though 6 in . is perhaps an easier width. Firstly square one end and draw clearly a central line up the timber, taking measurements from either side of this except where stated. Mark $2 \frac{1}{2}$ in. off at cither side and then $1 \frac{5}{5}$ in. on cither side $35 \frac{1}{2} \mathrm{in}$. from the base. This gives the taper where symmetrical. Then mark the taper of, one side
(see Fig. 6) to a point $\frac{1}{2}$ in. from the central line, 6in. further along. Extend the original taper on the other side for a further $1 \frac{3}{3}$ in . before taking it to its top point $\frac{1}{2}$ in. from central line. The basic outline may then be cut.

A step is then cut out of the upper portion of the wood. leaving only $\frac{1}{2} \mathrm{in}$. width, to take the two treble key units. These should he purchased from a music shop. and the type with the winding knob set at right-ingles to the metal pin, three per plate, should be used. These must be stagezed to allow room for the two on opposite sides. Position these with care hefore drilling the holes through which pars the pins. Screws in the plate on the reverse side secture the two base plates of these keys. Ithe pins usually have a small point on their top, just enough to mark clearly central indentations if a piece of card is pressed on top of them, or more practically if they are presed on to a piece of card. Thus a template can easily be constructed. It is important that these holes are positioned accurately or the plates will not push home or may cause the pins to bend. If large. it might be necessary to cat the corner off one of the base plates to fit in the space provided. See that the pins line up with the slope of the taper.

Now we may move on to the further end of the instrument, the business end. As Fig. 6 shows. a $3 \frac{1}{2} \mathrm{in} . \times 2 \mathrm{in}$. rectangle is cut from the base to make room for the electronics, leaving two wooden sidepieces tapering from $\frac{3}{1}$ in. A number of saw cuts in the portion of wood to be removed will case the chiselling operation. When the rectangle has been removed and the edges tidied up. from the top and the bottom of the wooden sidepieces, saw or chisel enough to just allow a sheet of aluminium to sit across the sidepieces flush to the other wood.

When this has been completed a $\frac{3}{4}$ in. channel about fin. deep must be cut down the central line to the point $10 \frac{1}{3} \mathrm{in}$. along where a channel across the grain is cut to take the underside of the pickup head. Bevel the channel doun wlere it enters the end pockets.

Other than the pre-amp a battery has to be contained within the instrument to power it. The battery. honsed in a hollow near to the pre-amp. accessible from the underside. A compartment is cut out just large enough for the hattery and is covered by either a plywood lid (it will not he seen) or a block of the same wood as that of the instrument. Thin. thick. The compartment is eut in from the side of the wood as the Formica covering will hide the gaping hole thus made at right angles to the tapering side. for if it is cut in relation to the central line we have an unsuitable shape. The battery itelf. leaving room for contacts. requires a volume of 3 in . $x \quad 2 \frac{1}{\mathrm{in}}$. $x \frac{7}{6} \mathrm{in}$. helow the underside of its covering lid which screws into place with two countersunk screws. one in either side of the $\frac{1}{2}$ in. wide supporting ledge. iust deep enough to make lid flush with base of instrument. This compartment will just break through at the hack to the central channel. If you use a metal plate as a battery cover. or some very thin material. and do not break through to the channel. it will be necessary to drill a hole through to the channel, as the power supply wires run along this channel to the pre-amp.

## Construction of Preamp Chassis

Firstly a tapering plate of aluminium is cut to fit on the underside of the instrument, $2 \frac{1}{2}$ in. long, the width of the guitar (tapering from Sin). Holes are countersunk for four screws, and this may be screwed in place. Take next another piece of aluminium, scribe a line $2 \frac{1}{2}$ in. in from one side, and then cut a 5 in . width of aluminium about $4 \frac{1}{2}$ in long, tapering it from the scribe to match the taper of the base of the instrument. Before bending mark out and drill for the two switches and two potentiometers. Provided that small carbon potentioneters are used, when placed side by side with the switches, touching, there will be just enough room, but there is no room for mistakes or spacing between these components. The holes should be drilled on a central line across i.e. $1^{\frac{1}{4}} \mathrm{in}$. from base. As dimensions of different makes may difler slightly these measurements are not given. There is just, without any breathing space, enough room for two small carbon potentiometers plus two toggle switches.

When the holes for these components have been drilled. fold the aluminium at a right angle to fit round the top and end. Drill next for a chassismount type coax socket. and when this has been done fold over a small lip to just rest on the lower base plate, already affixed to the instrument. Refore folding this over, however, two further holes chould be drilled if it is wished to store the instrument on end. These are to take either kettle knobs, bolted to the inside of the chassis, or small cupboard doorknobs, passing through a hole in the aluminium to screw into the base of the wooden sidepieces. Holes are also drilled, four in number. on the topside of the metal, to take two securing screws in either sidepiece. N.B.: Doorknobs screwed into base of sidepieces will not be sufficient to hold on chassis. Chromium-plated. round-headed screws, ${ }^{\frac{3}{3} \text { in. long, say No. } 4 \text { 's should }}$ he used for the top. To give full screening to the pre-amp, the three remaining sides of the pre-amp compartment may be lined with very thin tin-plate or aluminium. making sure that all are electrically linked. hut it will be necessary of course to cuit out a cection in the one across the width to exposo the channel. See Fig. 3.

## Fitting the Formica

After checking that the sides of the instrument are square lay the shaped timber the correct way up on to the top surface of the Formica to be used. and pencil round the outline.

When the outline has been marked in pencil, and checked. enlarged by a Formica's width all the way round, scribe the line to be cut. Rememher that if grained wood. the grain should run down the instrument rather than across.

Position the holes for the pins at the top end carefully. drilling the Formica, from the top surface, holes just large enough for the pins to pass through. Always work Formica from the top surface to prevent chipping. Saw across the Formica at the bottom end slightly less than the $2!$ in. the plate covers. From the shop where the Formica is purchased may also be obtained a selection of edging, though expensive ( 4 d . per ft ) enhances the finished appearance greatly. A $\frac{1}{2} n_{n}$
width of gold strip with a centra black line was selected by the author, this edging being quite thin, flat and easily cut with scissors. This was also used to break the monotony of the sides, as well as mark the frets (see Fig. 7). If a piece of edging is fitted on the top of the Formica that is stuck to the top of the chassis, at the base and across the join, overlapping slightly, keeping the controls on the centre line between the edgings, the edging overlaps the Formica join and make it indistinguishable. The chassis section of course is held to the main body of the instrument only by the screws and is thus easily detatchable.

A rectangle $2 \frac{3}{8} \mathrm{in}$. $x=\frac{10}{8}$ in. must be cut to fit exactly over the cross-ways channel designed to take the pick-up head. This may be chiselled, but if so it is advisable not to use a good chisel. If fret-sawed the side cut will still have to be chiselled unless the blade will turn through $90^{\circ}$.
The next step is to measure 4in. towards the base of the instrument from the centre of the cross-ways channel. This is the position for the bridge. Then, using Fig. 6 and the Table, the positions for the frets may be marked. The distance from the bridge (B) to the 12 th fret should be the same distance as that from the 12 th to the top bridge (T.B.), in this case $12 \neq \mathrm{in}$. Mark this out initially, and then mark off the key frets- $3,5,9$ etc. When this has been done then drill holes along the central line where these key frets cross, and also at the two bridges, just large enough to take small $\frac{1}{4}$ in. to $\frac{3}{8}$ in. screws, countersinking them. Screw two or three in to hold the Formica in place.

Cut strips of Formica to go along the sides, ensuring that the grain runs the length of the instrument. The top Formica should overlap the side Formica, and the top Formica may be planed flush. Finally cut and shape pieces of Formica to fit the underside of the top cut out, drilling through where necessary to allow the fixing screws for the key plates to pass through, and also cut a piece for the base of the instrument, drilled as the aluminium for the coaxial socket. It is best to fold the aluminium, stick the Formica to it and to then drill all necessary holes in one operation.
A combined bridge and tailpiece may be used for the instrument if you find it possible to obtain one, but this may be difficult. If one is obtainable, however, the instrument may be made shorter. The tailpiece used in the prototype was designed to fit over the end of an instrument, being bent at a right-angle. This was straightened out to fit flat on the surface. Some length could be taken off if the furthest end of the tailpiece was cut off and new screw holes drilled. This was not done as the tailpiece shaping looked better as it was.

Position the tailpiece on the central line between the bridge position and the edging put across above the controls. Its position is not critical. Mark the positions of the screw holes and then drill them. Any central ones will unfortunately fall in the central channel and hence only a false screw through into a small block of wood may be put or a bolt if one is found to match the screws. At least two screws should go through to solid wood. To prevent this the channel could be offset. There is, however, a reason why at least one screw in the channel could be of use (explained later).

The stage has now been reached when the Formica may be stuck down. The most suitable adhesive is Evo-Stik. When the two sides have been stuck-leave after impact for ten minutesplane oft the edge of top piece of Formica if this has not already been done and unscrew. This is then stuck on before placing screws all the way down. If these screws are not put through the surface Formica there is a danger that the tension of the strings-pulling at one end on the pins, which in turn pull on the Formica, and at the other end the tailpiece, which through its screw has a similar effect-might cause the whole length to buckle upwards.
You may now mark out the additional frets, sticking edging across the marks as the final marking. Where on an ordinary guitar the frets project upwards and the fingers press the strings down on to these frets, on the Hawaiian guitar the strings never touch the frets and the fingers themselves do not play such an important role. A metal bar is used on the strings, sliding it up and down, quick oscillating movements about a point causing a tremolo effect.
The key frets, those marked initially, must be distinguishable from the other frets and this can be done in two ways. In ordinary guitars a spot is commonly placed by the fret to indicate it, for in the ordinary guitar the finger presses the wire in the spaces between frets rather than hovering above the frets as does the bar with a Hawaiian guitar. The second method, and seemingly more suitable for this type of guitar, is to make the key frets different to the other frets. The author did this with the black and gold edging, using the full width for key frets, so covering the countersunk screw heads and only the cut-out central black line of the edging for the other frets. All frets except the most important fret, the 12 th, were made the same length, the 12 th much longer as Fig. 7 indicates.

With the two plates of keys screwed in place at the top and the tailpiece near the bottom, the Formica on and edging where desired and indicating the frets, it only remains to complete the electronics and make a pick-up head.
N.B.-It would be most unwise to construct the body of the guitar as a light plywood frame as the extreme tension of the strings combined with the warping quality of plywood would make it a most unsound proposition.

## Preamplifier and Control Unit

The circuit is as indicated in Fig. 1, the pick-up head is in series with the first transistor's emitter in the grounded-base low-impedance configuration. The output is taken from Tr3 collector via a coupling capacitor. The output is coupled via VR1, the gain or volume control, and is then fed through the filter or tone control, using screened leads, and finally through the rhythm switch to the output socket.

It will be seen that when S 1 is closed R7 is shorted out and gain is determined solely by VR1. If, however, the switch is open R1 is included in the output circuitry, so reducing the volume slightly. This means that it is not necessary to adjust the gain control to drop volume briefly and
when dropped it is a simple matter to flick back to original volume. It will also be seen that with this method the reduced volume introduced by the rhythm switch being open drops the volume to a lower level, proportional to that of the original gain setting and not simply to a lower pre-selected level determined by a resistor, regardless of original setting, as many do.

If the level ohtained with this rhythm switch is not quite what is required it is varied by simply changing the value of R7. Increase this resistor to about 3.3 kgl and the rhythm level will be even lower. Obviously if the resistor is decreased, say to just above 1 ks , then the level will not drop as much.

As will be seen, the circuit incorporates a facility for shorting the output socket and hence the amplifier input when connected. This is only to be used where the instrument is plugged into a socket that has a shorting-jack, i.e. shorts out input at amplifier when no plug is inserted. This is to prevent pick-up when instrument is connected to amplifier but not switched on. Before adding this facility be sure that the input you intend to use should be shorted before doing this, and if more than one amplifier may be used do not add this facility. If in doubt leave it out.

The circuit is powered by a 4.5 V battery. This type has two brass spring clips projecting out of the top, one longer than the other. Note that the shorter one is positive. When the battery seal has been broken it is usual to then remove a thin piece of slitted cardboard to reveal the contacts completely. For this use it is best to leave this cardboard in as it prevents the longer contact shorting against the other if pressed in. There is just room at either end to make contacts and miniature bulldog or crocodile clips may be used for this purpose. Contacts may be soldered on but this. to say the least, is inconvenient. Tinned looped wires will serve if the small contact is bent and the card removed to just slide the loop over the longer clip.

Components are mounted on the paxolin side of a $2 \times 2 \mathrm{in}$. section of Veroboard.

Fig. 4 shows the copper side of the board and Fig. 5 indicates the circuit layout. The other

Components are best left flying as this means less wires to and from the circuit board. It will be seen that there are only three breaks (Fig. 4) at the reference points D1. G2 and D8.

Fit all components on to the board by bending the wires on the reverse side, then check the circuit before soldering. When soldering, heat shumt transistor leads on the upper side and remember that it is always advisable to slip sleeving over them to prevent shorting. This applies especially to Tr2 collector and $\operatorname{Tr} 3$ emitter. which pass very close to each other. not to mention all leads on Tr1. A7 to A8 is simply a wire linking tracks 7 and 8 (links only section of track 8 ). Cut off wires after the component has been soldered.

Fig. 2 indicates the wiring of pots and switches on the chassis.

The circuit board will sit most comfortably beneath the two potentiometers if these are of the miniature type.

Use microphone coax. from the pick-up head to the circuit board and also from circuit board to VR7 and all along the output line to socket. earthing all screening to chassis.

Because of the extreme compactness of the unit it will not really be necessary to anchor the Veroboard as there will be just no room for it in move! A very thin insulator-mica, card, tape. paxolin-should be placed on the baseplate and then the board laid upon this. This is to prevent the aluminium shorting to the copper tracks. When wiring see that components are pulled firmly and tightly on to the board and see that the transistors lie down flat also. It is advisable to place another flexible insulating sheet over the components then, sandwiching them, as the contacts of the controls approach very close.

## An Alternative Circuit Board

If for reasons of economy or unavailability Veroboard cannot be used, a printed circuit can be made fairly easily, using the copper-clad laminated board more commonly available. Mark out this in strips as in Fig. 4. making small holes where the holes are indicated, then etching away

The prototype instrument is finished in wood-grain Formica and gold-and-black edging material, and is seen here complete and ready for playing.
the copper not required. The square should be just under 2 in .

## Other Guitar Requirements

A metal bridge will be required and it is better to obtain this from a music shop than attempt to make one. This should be held in position by the tension of the strings alone. It is placed dircetly over the lowest exposed countersunk screw head if previous directions were followed carefully, as does the upper guide bridge, standing over the upper exposed screw head. The upper one may be pinned or glued in place. It may be found necessary to slightly raise the upper bridge if wires are not taut across it. A small wooden block or even one or more layers of Formica will do this quite easily.

You then require only the bar that is slid up and down the strings or "steel" as it is known. 5s, at a music shop and not worth the effort making (a polished surface must be offered to the stringe) and a plectrum. Three of these are used by many players of a type that pushes on to the end of the thumb or finger.

Lastly but. of course. by no means least the key part of the whole instrument, you require a pick-up bead.

## Construction of the High-quality Pick-up Head

These, except for the inferior crystal-mike type, tend to be rather expensive. However, an excellent head may be constructed for a few shillings with a little care which gives an extremely good performance. This design is shown on the front cover and on this month's free blueprint. This requires some careful drilling and the facilities to do so. If this presents no problem there should be no difficulty.
The magnets diameter is not critical but should be around $\frac{3}{16} \mathrm{in}$. diameter and length about $\frac{3}{4}$ to lin. These magnets are embedded in a brass block as this metal is non-magnetic. dimensions being $3 \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2}$ in.

Mark the centte point on one side of the brass block- $1 \frac{3}{4}$ in. from either end-and then on the central line mark 0.5 cm on either side of this central point with two more marks on either side spaced 1 cm from those marked lastly, i.e. six points 1 cm apart. These six points should be carefully centre-punched ready for drilling. Also centre-punch for a hole at either side to take securing screws for the head. The change of units -inches to centimetres-was necessary due to the fact that Icm expresses the distance better than a fraction of an inch.

Drill the holes at either end for the securing screws, countersunk on one side. Drill holes through block at the remaining six points just large enough to allow the magnets to be used to push in tightly. An experiment with an odd piece of metal would be be wise before drilling the block. When these holes have been drilled. on the opposite side of the block to that which was countersunk for securing screws, drill to a depth not exceeding $\frac{3}{5}$ in., holes to take diameter of windings on magnets, not exceeding $\frac{5}{6}$ in. See Fig. 8.

Magnets are not the easiest of items to obtain and if you have difficulty in obtaining rod magnets suitable it should be possible to order through
your local electronic spares stockist the following magnet manufactured by Mullard Lid.:
5.3 mm diameter, 20 mm long Magnadur 1 , rod magnet. No. FD196.
Six magnets will be required, of course, and the type mentioned have their north poles indicated by a white spot. If the poles of the magnets to be used are not marked it is necessary to at least determine like poles. Take any two magnets and bring them together end to end. If they attract they are unlike poles and if they repel they are like poles. It will be obvious that if they attract, turning one magnet round will cause them to repel. Mark the ends that repel. Place one magnet to one side and then compare one of the marked magne:s with an unmarked to determine which pole repels the pole marked. The one that does is like, may be marked. and hence by this method like poles determoned for all six magnets.

Take a scrap piece of wood and drill six holes about 1 cm apart just large enough for the base of the magnets to wedge in. Stand the six magnets in the holes, the marked poles in the wood (the only reason for this is that then the end of the magnets to be seen projecting through the head will not be marked).

A length of $36 s . w . g$. enamelled copper wire is then taken and wound on to the magnets in series, starting with the left-hand magnet, finishing at the right. Close-wind on the centre of each magnet, in turn, 50 turns of wire, taping or by some method securing the winds when completed. Lift the magnets out of the wood in turn to wind, replacing when secured, and go on to the next. Keep the length of wire from one magnet to the next as short as possible, taking the two final ends of wire at either end and cutting off, leaving enough length to stretch to the far end.

Fit the magnets into the brass block, ensuring that they go in the right way up, and then, if at all loose. secure by dropping a resin such as Araldite or Epophen down from the reverse side. Bostik or Durofix will serve if the above mentioned are not at hand. If necessary surround magnets on top of head but keep quantity of resin or adhesive to absolute minimum Finally take the two ends of wire to the centre and twist together to hold in place, scraping off the enamel for electrical connections. cutting short if necessary.

The magnets should be as close to the strings as possible without the danger of them actually touching: $\frac{1}{k}$ in. should be quite safe. Before completing the head it is advisable to fit one string on to the guitar and to measure the space between it and the top surface at the point where the head will go. Deducting $\frac{1}{2}$ in. for the brass bar, and a further $\frac{1}{8}$ in. for spacing, the remaining is the amount the magnets should project through the block.

Microphone-type coaxial cable should be soldered to the ends of the wires at the head and fed up the central channel back to the preamplifier compartment. When holes have been drilled in the Formica at either side of the head's recess to allow the securing screws to pass through, the head may be screwed into place with countersunk brasscoloured screws to match the head.

NEXT MONTH A SIMPLER PICKUP HEAD IS DESCRIBED

by P. Taylor

THE theoretical circuit is shown in Fig. 1. The external aerial is coupled to the receiver either via Cl or TCl , depending on the position of the wavechange switich S1. TCl has been made variable so that optimum results may be obtained on the crowded medium wave band. As will be seen from diagrams, the tuning coils have been wound on a $5 \frac{1}{2}$ in. $x \frac{1}{4}$ in. piece of ferrite rod, wound on a $5 \frac{1}{2} \mathrm{in}$. $x \frac{1}{4} \mathrm{in}$. piece of ferrite rod, the type that is commonly available from any good radio component stockist. This method results in the aerial coils having a very high ". $Q$ " which improves sensitivity and selectivity.

The r.f. signal which appears across the aerial circuit (which is tuned by VC1) is passed to the detector D1, a germanium diode.

The audio signal is then passed to the base of Trl, the first audio amplifier. Amplified signals from the collector of $\Gamma$ rl are then passed, via C2, to the base of Tr2. the audio output stage. R2/R3 are emitter biasing components and transformer T1 is the loudspeaker matching transformer. Potentiometer VR1 acts as a volume control.

## Constructional Details

The chassis was made from a $6 \mathrm{in} . \times 5 \mathrm{in} . \times \frac{1}{2} \mathrm{in}$. piece of deal with small brass carpentry nails or pins ( $\frac{1}{2}$ in. long) placed in the positions shown in Fig. 2. These are driven in to a depth of approximately $\frac{1}{4}$ in. These form the tagpoints for

Fig. 2: The wooden base-board which acts as a "chassis", components being soldered to heads of nails driven into the wood.

Fig. 3: This shows the components wired on to the board. The battery is an Ever Ready No. 8 type. VRI, VCI and 51 are mounted on a vertical panel. TCI is a 30 pF "beehive' trimmer.
components and wiring. The heads of all the pins should be tinned with solder.

The front panel was a 6 in . $\times 5 \mathrm{in}$. section of $\frac{1}{4} \mathrm{in}$. plywood. As an alternative aluminium sheet or Formica can be used.

Holes are drilled in the panel to take the four controls in the position shown in the photograph. The front panel is held in position on one edge of the chassis baseboard with small wood screws.

Mount all the large components first, using small wood screws to hold the tuning capacitor VC1 in position. Four terminals should be fitted in the position shown for the aerial. earth and loudspeaker connections. When mounting the ferrite rod aerial coil make sure that the ends of the small wire clips do not meet (see inset to Fig. 2). It is most important that these "mounting clips" do not form a "closed loop" around the rod.

## Coil Winding

L1 is the medium wave aerial coil and consists of 50 turns of $20 \mathrm{~s} . \mathrm{w} . \mathrm{g}$. enamelled wire wound in a single layer as shown in Fig. 4. L2, the long wave

Fig. 4: Winding details of the aerial. The two coils are wound on paper sleeves.
aerial coil, consists of 160 turns of $26 \mathrm{~s} . \mathrm{w} . \mathrm{g}$. enamelled wire wound in two sections. Both sections ( 80 turns each) may be pile wound. The coils should be wound on paper or thin cardboard sleves to facilitate final adjustment.

## Testing the Receiver

Connect a $3 \Omega$ loudspeaker to the receiver, plus an aerial and earth. Switch on and turn the volume control to maximum with the wavechange switch in the long wave position. Set the tuning capacitor to approximately mid-tuning position. Adjust the position on the ferrite rod of L2, the long wave aerial coil, until the BBC Light Progranme transmitter is heard at full volume. Switch to medrum wave with tuning capacitor nearly halfway open. Adjust position of Ll on the ferrite rod for BBC Home Service. Finally fix coil in position with a dab of adhesive cement or piece of Sellotape.

The total current consumption from the battery is approximately 2 mA .
The finished receiver is contained within a simple plywood cabinet with a cut-out for the loudspeaker.

## PCR MODS

IET WV. V. WणOOIDS

Improving the PCR, PCR2 and $P C R 3$ ex-government communications receivers.

LARGE numbers of the PCR communications receivers are now available on the surplus market covering the following frequencies: PCR, LW, MW, SW $15-50 \mathrm{~m}$, internal speaker. PCR2, LW, MW, SW 13-50m, external PCR3, MW, SW1 120-43M.

SW2 $43-13 \mathrm{~m}$, $\qquad$
While these receivers generally have quite agood performance it is obvious that they have a number of shortcomings which, after all, is only to be expected, since most of the PCR's are approximately 20 years old and great progress has been made in the development of radio receivers since the 1940's.

The PCR's were originally designed to work off a 12 V d.c. supply with the h.t. $(250 \mathrm{~V})$ provided by a vibrator pack. One of the first jobs therefore is to provide a mains power supply.

The valve heaters are wired in series parallel to operate from 12 V , so these must first be rewired in parallel to work off 6.3 V : a suitable power supply is shown in Fig. 1. The choke (L1) is usually already fitted to the PCR.
There is ample room for the mains transformer (T1) to be mounted on top of the chassis, but in order to leave space for any further additions it may prove necessary to move L1. On the PCR2 and 3 L 1 can be placed between the front panel and the output transformer, the mains transformer (T1) is then mounted in the space formerly occupied by L1. On the PCR the loudspeaker prevents the re-mounting of L 1 . This may be overcome by fitting a physically smaller choke in place of L1; the new choke could be mounted under the chassis. If no other additions are envisaged L. 1 may be left in its original position and T1 mounted in the remaining space between L1 and the front panel. Care should be taken to place the cores of L1 and T1 at right-angles to one another, otherwise mains hum may be induced into the h.t. line.

The valves normally fitted to the PCR's are:
$\begin{array}{lll}\text { V1 } & \text { R.F. amplifier, } & \text { EF39. } \\ \text { V2 } & \text { Frequency changer, ECH35. } \\ \text { V3 } & \text { First if. amplifier, EF39. }\end{array}$

V4 Second i.f. " EF39.
V5 First af, ave, det, EBC33.
V6 Audio output, EL32 or 6V6G.
An improvement in r.f. gain can be achieved by replacing $V_{1}$ with a 6 SG 7 or its miniature equivalent the 6BA6. The 6SG7 requires least mechanical work since it fits the same octal socket as the EF3y and only requires rewiring of the socket and the reduction of the cathode bias resistor to $68 \Omega$; the 6BA6 requires a B7G socket and mounting plate.

These two modifications considerably improve the PCR's performance and are intended for constructors who do not want to disturb the original wiring too much. However, for those who wish to make more extensive modifications and additions there are a number of other circuit changes that can be made.

Fig. 1: A simple power supply circuit designed to replace the vibrator unit fitted to the original.

## A.G.C. and Noise Limiter

IIn the PCR's original form a.g.c. was applied to the r.f. and first i.f. stages only. Since there was no manual r.f. gain control it was possible to overload the set on strong signals and to overcome this the gain of the i.f. stages (V3 and V4) was limited by using larger than normal cathode bias resistors.

By rearranging the a.g.c. line (Fig. 2) so that V1, 3 and 4 are all controlled by the a.g.c, we can increase the i.f. gain without the risk of overloading. The cathode resistors of V3 and V4 should be reduced to $330 \Omega$ and $220 \Omega$ respectively. A.G.C. is not applied to $V 2$, thus enabling it to work at maximum gain.

This alternate a.g.c. system has the advantage that we can alter the a.g.c. time constant by
switching in different valve by-pass capacitors; this can be very useful for combating various types of fading on distant short wave stations.

By substituting a 6AT6 or 6SQ7-GT for V5 we can simplify the audio and detector circuits considerably and make the circuit more suitable for the addition of a noise limiter, a most valuable addition to the receiver! The 6AT6 or 6SQ7 also increases the audio gain.

By removing the $8 \mu \mathrm{~F}$ electrolytic (next to V6) from the chassis and using wire-ended capacitors in the power supply we now have an extra hole in the chassis.

Work should commence by stripping out all wiring surrounding V5 and V6, including the tone control switch and bracket. An octal socket for V6 is now placed in the hole originally occupied

## THE THINKING MACHINE

We are told that the electronic thinking machine may very well become a reality in twenty or thirty years time... Ultimately, we will be able to leave most of the important business and government decisions to the imptartial machine!

This could result in some very interesting possibilities!
But, how about the immediate future? Are you prepared for the electronlc age that is now with us? Or more vitally still-are you
ready to face the age of automation!

Most readers of this message have already thought about this important topic and reallse that the major Impact of the electronic age is yet to be felt

As each day passes, more and more semi-skilled jobs are disappearing As each day passes, more machines are controlled electronlcally ... Yet the electronic technician and engineer are becoming more in demand.

Are you considering electronics seriously? Would you like to try a short course that will prove to you whether you should make electronics your future work? We offer a short course that will get your assurance that you should take more odvanced study with your assurance that you should take more adyanced study with ossential to start somewhore, so why not start with sim-Tech it is prove to yourself that you have what it takes to learn electrondos easily-the cost is very modest-the course excellent-the lessons crystalclear, practical, easy to master and use. Early lessons make fundamentals clear even to the beginner, while other lessons will give you the practicad knowledge of an expert!

This is a real home study course of 36 lessons that has been bound into one giant eight by eleven inch, 216 page manual. Each page is divided into two columns. A wide column features the text, while a narrow column at the side has the instructor's comments. helpful suggestions and additional plotures to simplify the more difioult parts.

Everyone can beneft from this practleal courge, including thoge whose main interest may be nothing more than a desire to have a clearer appreciation of electronics as it relateg 10 thele present work or hobby.

In eddition to the course. Sim-Tech offer the opportunity to take ni examination in radio and electronics to those who have studied the electronics course and feel they have attained a sufficiently gulnea for the examination. (Which is entirely optional.) Further details are given with eaoh course ordered.

Sounds good doesn't It, but how can you be sure that you are not wasting your money? Well, we will send you this course, on the understanding that you must be convinced this is the best value return the course (or have your money refunded if sent with order) aftar you have examined it in your own home for a full seven days.

The pricet Only 39/6d plus postage $1 / 8 \mathrm{~d}$. Terms? Why, of eourse: See coupon, Open to all permanent residents of the U.K. excluding Ireland.

by the $8 \mu \mathrm{~F}$ capacitor; V5 will now occupy V6's original position; the remaining space between i.f.t. 3 and V5 is now used for the noise limiter detector valve V7. This may be a 6AL $5 / E B 91$, 6H6-GT or EB34; alternatively two OA202 silicon diodes could be used in place of V7 or an EABC80 could be used in place of V5 and V7.

Fig. 2 also shows how a tuning indicator can be fitted if required: any type with characteristics similar to the EM81 may be used, the latter was chosen mainly for physical convenience.
The R.F. and F.C. Stages (Fig. 3)
To bring the "front end" up to modern standards substitution of an EF183 for V1 and an ECH81 for V2 is recommended.

These changes can be executed without disturbing the main coil and switch wiring. V1
and V2's sockets will have to be replaced by B9A sockets mounted on small aluminiun plates. It is advisable to have a source of stabilised h.t. for the oscillator anode and mixer screen, so the power supply of Fig. 4 is recommended.

VR2 is the r.f. gain control varying the bias on V1. A small two-lug tagstrip is mounted under the retaining bolt for the oscillator trimmer bank, thus making a junction point for R23, R25 and the 150 V stabilised h.t. line. A short piece of $80 \Omega$ coaxial cable is used between the wavechange switch and pin 2 (control grid) of V2 because this lead is rather long owing to the orientation of the valve holder to give short leads to the oscillator section.

The original V1 and V3 had a common screen supply. The new V1 now has its own separate

Fig. 3a: The modified r.f. and f.c. stages of the circuit. Sections of the circuit outside the dotted box remain unchanged

Fig. $7 a$ (top): The original layout of the chassis. The loudspeaker is only included on the PCR model.
Fig. $7 b$ (bottom): The completely remodelled chassis layout. The valveholder for VI should be orientated (by pointing its location pip-see Fig. 3b) to face the left, and V2 similarly. orientated to foce upwords.

Fig. 8a: The arrangement of the trimmers and padders which is common to the PCR and PCR2 models.

## Product Detector and B.F.O. (Fig. 6)

The addition of the product detector enables the demodulation of single sideband signals, a system of transmission favoured by many amateurs of today.

V8 (6C4) is the beat frequency oscillator which takes its h.t. supply from the stabilised 150 V line; any medium mil triode or triode connected pentode could be used for V8. V9 is the product detector, a 6BE6 or its octal equivalent the 6SA7-GT.

There is ample space for L3, V8 and V9 on the chassis between the power supply and the three-

Fig. 8b: The trimmer and padder arrangement for the model PCR3.
modulated r.f. signal generator covering the i.f. and r.f. ranges of the receiver and suitable tools to adjust the i.f.t. cores and the trimmers.

Both signal generator and receiver should be switched on for about five minutes to let them reach their correct operating temperature. The receiver should, of course, be checked to make sure that it is functioning correctly on all bands.

## I.F. Alignment (PCR, PCR2 and PCR3)

Set generator to $465 \mathrm{kc} / \mathrm{s}$.
Switch receiver to medium wave (tuning capacitor fully closed).

Fig. 9: The front panel layout of the PCR2 and PCR3 after modification.

gang tuning capacitor. New holes will have to be punched for these components.

Should all these modifications he carried out the PCR will have been transformed into an extremely useful communications receiver with the following valve line-up:

| V1 | R.F. amplifier, | EF183. |
| :--- | :--- | :--- |
| V2 | F.C., | ECH81. |
| V3 | First i.f. amplifier, | 6K7G. |
| V4 | Second i.f. amplifier, | 6K7G. |
| V5 | A.F., a.g.c., | 6AT6 or 6SQ7. |
| V6 | Output, | 6V6-GT/G. |
| V7 | Noise limiter/detector, 6AL5 or 6H6. |  |
| V8 | B.F.O., | 6C4. |
| V9 | Product detector, | 6BE6 or 6SA7. |
| V10 | Rectifier, | EZ81/6CA4. |
| V11 | V. Reg., | VR150. |
| V12 | Tuning indicator, | EM81. |

Because of the rewiring of V1 and V2 realignment will be necessary; this will require a

Inject signal into control grid (pin 2) of V2, peak i.f.t. 3,2 and 1 in that order, starting with secondary of i.f.c.3, working up to primary of i.f.t.1. The EM81, if fitted, can be used as an output indicator. The generator output should be reduced as the circuits are peaked; this prevents the a.v.c. broadening the response.

## R.F. Alignment

Positions of trimmers and padders are shown in Fig. 8. Generator signal is applied to the aerial terminal.

All trimming and padding adjustments should be repeated until one has no effect on the other.

When properly aligned the short wave performance is excellent-stations in Europe, Canada, U.S.A., Cuba, Windward Islands (using only 5kW), India, Pakistan, etc., etc., have been received and Radio Australia is heard loud and clear using only an indoor aerial 15 ft long.

# designing a MULTIMETER by K. Berry 

Theory, Design and Construction of Simple Instruments

CONTINUED FROM PAGE 32 OF THE MAY ISSUE

THE second multimeter, Design No. 2, enables measurements to be made of d.c. voltage, d.c. current and resistance. The meter employs switching but because there is no a.c. facility it is of the simplest nature and should deter no constructor. The circuit is shown in Fig. 7.

## Specification

| Voltage | D.C. only current | Resistance |
| :--- | :---: | :---: |
| $0-5$ | $0-1 \mathrm{~mA}$ | $1,500 \Omega$ mid scale |
| $0-10$ | $0-10 \mathrm{~mA}$ |  |
| $0-50$ | $0-100 \mathrm{~mA}$ |  |
| $0-100$ | $0-1 \mathrm{~A}$ |  |
| $0-500$ |  |  |
| $0-1,000$ |  |  |

Fig. 7: Design circuit No. 2. This instrument will measure d.c. volts, d.c. amps and resistance.

The basic movement is a $2 \frac{1}{2} \mathrm{in}$. round 1 mA meter scaled $0-100$. As in the case of design No. 1 the voltage ranges have been chosen so as to facilitate reading from the meter scale. The resistance of the meter used in the prototype was $100 \Omega$ and the values quoted for the shunts are based on this value. If a meter having a lower resistance than this is used a resistor can be connected in series with the meter so that the combined resistance of the meter plus series resistor is $100 \Omega$. If a meter having a resistance higher than $100 \Omega$ is used, then the resistance of the shunts required can be calculated from the expression given in the section on current measurement.

COMPONENTS LIST FOR DESIGN NO. 2

Once again high-stability $1 \%$ or $5 \%$ resistors are recommended for use as multipliers. For the shunts it is necessary for the 100 mA and 1 A ranges to make one's own. This will necessitate the acquisition of some resistance wire; unfortunately this is not usually available in very small quantities from the normal suppliers but a wire suitable for the purpose can readily be obtained from most electrical dealers. This is the wire contained in the spiral elements sold for replacements os "bowl"-type electric fires.

To determine the amount of wire required for the 100 mA shunt connect the meter (switched to its 10 mA range) in series with a 3 V battery and a 500 or $1,000 \Omega$ rheostat. Adjust the rheostat until the meter reads exactly full scale. Disconnect the battery and set the meter to its 100 mA range. Connect one end of the resistance wire to one of the meter terminals and connect a length of normal copper wire to the other meter terminal. Tap the copper wire on to the resistance wire at a point, say, 6 in . from the meter terminal and
reconnect the battery. Now slide the copper wire along the resistance wire until the meter reads $\frac{1}{10}$ full scale (i.e. 10 mA ). The length of wire required as a shunt is thus determined. This should be cut from the remainder of the wire and insulated with sleeving. It can then be wound into a coil for easy insertion into the meter circuit.

It must be pointed out that the current in the circuit must not vary whilst the shunt is being found, i.e. the battery voltage must stay constant during that time. As a check the meter should be

Fig. 81. Design No. 3-the mast comprehensive, with facilities for measuring a.c. and d.c. volts, d.e. amps and ohms.

 <br> <br> and higher rewards}

YTOUR FUTURE, if it is in electrical engineering, depends on your ability and the services you can render. The more experienced you are the better your prospects, the better your income . . . it's as simple as that! This New Edition of Newnes comprehensive and authoritative publication is invaluable to you if you mean to progress. Produced with the full technical resources of NEWNES it covers every facet of the vast field of modern electrical engineering.

## INSTALLATION WORK OF ALL KINDS

Commercial Buildings, Small Houses and Flats, Hospitals, Schools, Theatres, Cinemas, Electric Appliances, Alarm Systems.

## INSTRUMENTS, MACHINES, EQUIPMENT

Electric Motors, Control Gear, Transformerz, Rectifiers, Electronic Control in Industry, Measuring and Recording instruments and Electricity Supply Meters.

## OPERATION, MAINTENANCE, REPAIR

 Batterles.GENERATION, TRANSMISSION, DISTRIBUTION
Power Stations, Power Cables, Public Supply, Underground Distribution Systems, Town and Rural Supplies, Cable-laying and Faults.
Over 2,000 Instructive Action Photographs, Diagrams, Working Drawings, Circuits. Many Concise Data Tables,

# （3） tentorian MODEL H．F． 1016 ＇MAJOR＇ 

This unit makes use of the high flux density available in the magnet system of the previous H．F． 1016 unit．A curved diaphragm is used with a rigid centre section coupled to the voice coil．The rigid coupling and the design of the cone ter－ mination give a balanced response over the whole audio range． The unit is specially suitable for use in the smaller type of enclosure having a volume of approximately $1 \frac{1}{2}$ cubic feet． Other Stentorian speakers：

| Type | Flux Density｜ | Price | Type | ｜Flux Density | Price |

switched back to its 10 mA range, when it should read exactly full scale.
This procedure is then repeated for the 1 A range. Some difficulty may be experienced in soldering the resistance wire, since it is sometimes difficult to tin. Satisfactory results should, however. be obtained if the wire is cleaned carefully with a piece of fine emery cloth. The use of one of the proprietary non-corrosive fluxes can also be of assistance. If, however, the wire refuses to be tinned it should be wrapped round a small screw, say 6BA, sandwiched between a washer and a soldering tag. A nut is then threaded on the screw and the assembly tightened. The connection is obtained by soldering on to the solder tag.

## Design No. 3

This, the last design, is the most comprehensive of the three. Facilities are included for measuring a.c. and d.c. voltages, resistance and d.c. current. This meter should prove suitable for nearly all measurements which are likely to arise. The circuit is given in Fig. 8.

## Specification

Voltage A.C. and D.C. Resistance Cirrent D.C.

| $0-5$ | $15.000 \Omega$ |  |
| :--- | :--- | :--- |
| $0-10$ |  | $0-1 \mathrm{~mA}$ |
| $0-50$ |  | $0-10 \mathrm{~mA}$ |
| $0-100$ |  | $0-100 \mathrm{~mA}$ |
| $0-100$ |  |  |
| $0-500$ |  |  |
| $0-1,000$ |  |  |

The basic movement is a $3 \frac{1}{2}$ in. round $100 \mu \mathrm{~A}$ meter scaled 0-100. The circuit employed (Fig. 8) uses two switches. The main meter range switch SW1 is an 11-position four-bank switch, whilst the second switch SW2 selects either a.c. or d.c. volts and current. It would be possible to eliminate SW2 by increasing the number of banks on SW1 but this was thought to be undesirable on the grounds of cost and size.

A feature of this design is the use of an additional switch bank (SWID) to safeguard the meter when it is used to measure current. The use of this switch ensures that the meter reads only when it is connected across a shunt and if a switch contact connecting that shunt into circuit becomes high resistance or open circuit then no current flows in the meter. If the meter were permanently connected into circuit and the necessary shunts were switched across it then failure of the switch could result in damage to the meter.

Examination of the circuit for design No. 2 (Fig. 7) will show what is meant. If SW1B becomes defective the full load current will flow through the meter. The addition of an extra switch bank would eliminate this possibility.

The meter used in the prototype had a resistance of $1.000 \Omega$ and the values quoted for the shunts are based on this value. As in the case of design No. 2 these must be adjusted to suit the particular meter used. The values quoted for the a.c. multipliers are approximate and the precise valuc required should be found by the method given in design No. 1.

COMPONENTS LIST FOR DESIGN NO. 3

| Multipliers (all $\frac{1}{4} \mathbf{W}$ ) |  |  |
| :---: | :---: | :---: |
|  | A.C. | D.C. |
| 5 V | $38 \mathrm{k} \Omega$ | $50 \mathrm{k} \Omega$ |
| 10 V | $80 \mathrm{k} \Omega$ | $100 \mathrm{k} \Omega$ |
| 50 V | $450 \mathrm{k} \Omega$ | $500 \mathrm{k} \Omega$ |
| 100 V | $900 \mathrm{k} \Omega$ | $1 \mathrm{M} \Omega$ |
| 500 V | $4 \cdot 5 \mathrm{M} \Omega$ | $5 \mathrm{M} \Omega$ |
| $1,000 \mathrm{~V}$ | 9MS | $10 \mathrm{M} \Omega$ |
| Shunts |  |  |
| 1 mA | $111 \Omega(29 \Omega+82 \Omega)$ |  |
| 10 mA | 1082 |  |
| 100 mA | $1 \Omega$ |  |
| 1 A | $0 \cdot 1 \Omega$ |  |
| Miscellaneous |  |  |
| M moving coil meter $0-100 \mu \mathrm{~A}$ f.s.d. |  |  |
| S1, 1 pole, 11 position, 4 bank. |  |  |
| S2, 4 pole, 3 position, 1 bank. |  |  |
| 4 OA81 germanium diodes. |  |  |
| Terminals |  |  |
| Dry cell 1.5 V . |  |  |
| Potentiometer $2.5 \mathrm{k} \Omega$. |  |  |
| 2 resistors $6 \cdot 8 \mathrm{k} \Omega \ddagger \mathrm{W}$. |  |  |

The appearance of Design No. 3 when made up.
The construction of this meter should present no difficulties. As in the case of the previous designs no details of construction have been given but a suitable metal or plastic case will no doubt be easy to obtain. The version of this meter made by the author is shown in the photograph.

All times are in G.M.T.

## The Broadcast Bands-by John Guttridge

NEWS first of all this month from the Caribbean area. W. Smith (West Bromwich) reports the Windward Islands Broadcasting Service, St. George's, Grenada, and Radio Habana, (Apt Postal 7026, Habana, Cuba). W.I.B.S. has now returned to 15,085 from 11.895 for its evening transmission, whilst Radio Habana is using 11,735 for its 2010-2140 English transmission to Europe. (This is confirmed by Roy Patrick, Derby). Paul Harris, of Flgin, has heard Habana in Spanish from 1900-2000 on 9,655.
A schedule and card have been received from Trans World Radio, Bonaire, Netherlands Antilles. The card is a big disappointment, giving no QSL details and no exact frequencies. English is carried from 1030-1230 ( -1430 Sundays), and 02000430 on 800 medium wave and in the 31 m band. Other transmissions are Spanish $1000-103031 \mathrm{~m}$., 0130 ( 0100 Sunday)- 020019 m ., Dutch 2200-2215 19 m ., Portuguese $0930-1000,2300-2330,0030-$ 010019 m ., German 2300--2315 Thursday, 0000003019 m. , Russian $2330-2400$ 19m.b., French 2145-2200 19m., and Cantonese (not Sunday) 2200-2215 19m. Many of these transmissions are also carried on $800 \mathrm{kc} / \mathrm{s}$ medium wave which is still well heard during the night in the U.K. Judging from the World Radio Handbook, likely short wave frequencies are $9.675 / 9.755 / 15.265$.
Both Ian Taylor of Slough and R. Nelson of Castleton, mention La Voz de los Andes, HCJB, (Cas.691, Quito, Ecuador). The present QSL card gives no verification details. English is used from 1900-2030 on 17.890/15.115/11.755.
Moving Eastwards, Paul Harris mentions Radio South Africa (P.O. Box 8606, Johannesburg), which has full verification details on its QSL, and Radiodiffusion du Senegal (B.P. 1756. Dakar, Senegal), which be still hears on 9,675 . He has also had a report acknowledged by the outlet of Radio Nacional de Espana in the Canary Isles. The schedule is given as $1400-1600$ on 9,660 to Europe and $0000-0300$ on 11,800 to South America. All in Spanish.

One of the most popular European stations at present appears to be Radio Tirana (Rue Ismail Quemal, Tirana, Albania). Ian Taylor gives the English schedule as 2000-2030, 2130-2200 on $7,090 / 9,715$, whilst W. Smith says 1,088 medium wave is used additionally for the 2130 transmission. Both have had cards from the stationone with no date and one with no verification details. Alan Jones, of Chertsey, reports very strong signals at 0645 on 7.088 in an unidentified language.

Coming right home, devotees of the BBC should note that the General Overseas Service is to be renamed the World Servica

Items have come in about the two stations at Monaco. First Radio Monte Carlo (16 Boulevard Princesse Charlotte, Monte Carlo). W. Smith reports a QSL consisting of a piece of paper giving the date, time and metre band, and Paul Harris had a verification giving the date only. Paul also reports Trans World Radio (Rue de la Poste, P.O. Box 141, Monte Carlo) with a Norwegian broadcast from 1700-1730 on 9.630.

Full details are given on the card issued by Radio Norway. Oslo, Norway. Amongst transmissions affected by frequency changes recently are $0745-0815$ on $11,850 / 15.175 / 17.825 / 21.730 / 6.130$ and $1700-1830$ on $11.850 / 15,175 / 17,825 / 21,730 /$ 6.130 .

According to W . Smith coloured QSL's giving full details are now being issued by Vatican Radio, Vatican City, Vatican State.

New times and extensive frequency changes are fcatures of the summer schedule of the Overseas Service of Swiss Broadcasting Corporation. Berne. The new English times are: 1200-1300 on 7.110/9,665: 1845-2015 on 9,665/6.055; 01150245 on $9.655 / 9,535 / 6,120 ; 0415-0515$ on $9,655 /$ 9.535: 1315-1445 on 15.320/15.305/15,255/ 17,845; $1500 / 1630$ on $17.830 / 15,305 / 15,255 /$ 11,865: 2100-2230 on 11.865/9,545; 0830-1000 on 17,830/15,305/15,225.

An Asian station heard recently hy Paul Harris is Radio Republik Indonesia (P.O. Box 157. Djkarta). German, he says, is now aired by this station on Tuesdays and Fridays from 1700-1730 on 9.865/11,715.

Roy Patrick reports new frequencies for the transmission in English to Europe from 19452030 by Radio Pakistan ( 71 Garden Road, Karachi 3). They are $6,250 / 7.135$.

With the gradual improvement in reception conditions as solat activity increases, Radio Japan, Tokyo, Japan, has announced that it hopes to resume evening transmissions to Europe in the spring next year. Burmese is now transmitted in the South-east Asian service with the result that it has been extended by half an hour to run from $1230-$ 1600. Frequencies are $9,675 / 11,705 / 11,875$. The Hawaiian service on $15,235 / 17,725$ has moved to the new time of $0600-0700$. Other services affected by frequency changes are the African (1900-2000) on $9.670 / 11.780$ and the North and Latin American (0200-0400) on $11.780 / 15.135 / 15.235$. Three Gencral Service transmissions have been extended to a full hour. These are at 1000 and 1400 on $9.505 / 9.740 / 11.815$ and 2300 on 6.140/15.105/ 15,425 . The $1800-1830$ and 1900-1930 transmissions are now on 9,505/9,605/9,740.

## The Amateur Bands-by David Gibson G3JDG

0NCE upon a time, a scribe was foolish enough to suggest a contest for stations using as an antenna an end-fed coathanger and a pair of base-loaded cuff links. Reader H. S. Stevens of Aylesbury bravely (?) took up the challenge and here are some exiracts from his log this antennae were taken via a pi-coupler into an S 640 receiver). All on a.m. 16in. Wire Coathanger Antenna: $28 \mathrm{Mc} / \mathrm{s}-9 J 2 \mathrm{DT}, \quad \mathrm{ZC} 4 \mathrm{KW}, \quad \mathrm{ZC} 4 \mathrm{MO} . \quad 21 \mathrm{Mc} / \mathrm{s}-$ UBIBL, PY2CH, PY9WL, PY5AQM. CT3XM, CR4AJ, ZS8C, CR6CG, CR4AI. CR6DL, PY9HL, YV1PF, YVIBM, ZE7JR. UB5BH. 14Mc/sEA4, DL9,11.PAØ and SP5. 3in. Gold Plated Culf Links Antenna; $1 \frac{1}{2}$ in. lead to pi-coupler: $21 \mathrm{Mc} / \mathrm{s}-5 \mathrm{~A} 1 \mathrm{TK}, 5 \mathrm{~A} 4 \mathrm{Ti}, ~ W A 4 W V D, \quad 9 \mathrm{Q} 5 \mathrm{RB}$, PY5AQM. $14 \mathrm{Mc} / \mathrm{s}-\mathrm{UB} 2 \mathrm{KAB}, \mathrm{K} 2 \mathrm{CAK}, \mathrm{W} 4 Z Y \mathrm{~S}$, K2HLB, SM5BL, W8NGO, W1JFG, SP5AR, WB2APG.

Well done, Mr. Stevens-the outright winner (and only entrant)!

## $21 \mathrm{Mc} / \mathrm{s}$

"My favourite band." say more and more readers. This band is challenging $14 \mathrm{Mc} / \mathrm{s}$ in DX popularity.
Stephen Beal (London) collected these on his P.W. t.r.f. and 66ft. longwire: WIROU, 2ZX, 2AWD, 2 RGU, 2SJM, 3MSK, $8 \mathrm{HRV}, 8 W \mathrm{YT}$, K2HV, 3 MBF , UB5BX, EA8EA. All a.m.

Bernard Hughes (Worcester) got these between $1300-1700$ on his $840 \mathrm{C}+$ Codar preselector and dipole: CR5SP. CT3AQ. H18WSR. ITICFN, KV4CX, VE8BZ (Baffin Is.), VOIGX, WOZYM, ZS8G. ZC4MO, ZC4TJ, XE3AF, 9Q5DL, 9Q5RB.

John Fitzgerald (Gt. Missenden) says 15 m has been wide open between 1100-1900. His unusual rig is Hitachi WH837 8-transistor superhet plus a 20 m dipole-CO3CO, CR4BC, 5SP, 6DL, 7FR: CT3AM, EA8EN, ET3USA, K7JDX, 9WEZ; LU5AQ. SVOWCV. TN8BK. YV4KT, ZB1RM, $2 A K:$ ZC4HK. ZS2AR, 6ADF. 8C. 8G: 7X2MD, 9J2BK, 9L1WN, 9Q5A1. 9Q5HP. All a.m.

Martin Briscoe (Bolton) uses a VR66 and PR 30 preselector, with a folded dipole, and logged: CR7FC, ET3USA, ITICF, KZ5TD. MP4DAA, OD5CY, SV1DL, ZBIRM, ZC4MO. ZSIAB, 5AITK, 5A5TE. 9Q5RB, 9J2DT, 9X5RZ.

BRS26171 (Lowestoft) found a new ground plane was better than his 264 ft . longwire and dipole. This, with his Cr 100 and a.y.u., produced these:-CP1LN, CT3AQ, ET3USA. KP4AXC, MP4TAA (or DAA?), ODSEC. OD5DU. PY4BOP, PY6OPY, PY1AXP, ZBICE, ZB4MO (surely 1MO?), ZE7IR, 4X4AB, 9GISS. 9G5AB.
J. Cowley (Lancs) has an HA63 and a joystick on a 20 ft . pole, aided by an old 19 Set a.t.u. He found-CR6EI, HK7UL, KP4ASN, KR6MB, OA4NQ, PY1FH, PZ1CM. UL7NH, VK2EW, VR6TC (Pitcairn Is.). W7KVT, WAOHHX, ZSSKI, 9J2FB. All these were on c.w.

## $14 \mathrm{Mc} / \mathrm{s}$

Staying open later and packed with DX. A sample is the colossal log received from R. Garvey (Cheltenham) using an S640 and 90ft. longwire.

We have selected the cream, as follows-AP5HQ, CN8BU, HM5BF, JA4BJO, JA6PN, KR6MH, UL7KSB. UM8AP, XW8BA, ZL2BG, 5R8AN, WA6HLU. All on c.w.

Paul Bernard (Birmingham) sent this log: EA8EA. HA8WH. K1DHG, K2CAK. OZ7NK, SM6CKS. UAIKBE, UAIKUD, WコAXH, W2SFP, W3OJX, YO2BB, 4X4RD. The receiver was a one-valver! Aerial was 69 ft . longwire.

Alan Dailey (Leeds) uses an R107 with preselector and comments on an amazing improvement by raising his 90 ft . longwire from a height of $8-10 \mathrm{ft}$. to 20 ft . Proof of the pudding:BVIUSG, CO8MN, CX8AX, DU1AA, FK8AU, HC1MX, HC8FM (Galapagos is.), HK3AVE, HPIAA, HSIX, HVICN, HZ3TA, JAIBRD, KILMV/VE8 (Baffin ls.). KA5DG, KR6DL. KA7DB, LU5DBS, MP4MAM, PY4AS, TG9EL, VK6XX, VK9TL (Norfolk Is.), VP2LS, VP2GTA, VS9AWR, ZD3C, ZD5R, ZD8WR, (Ascension Is.), $6 \mathrm{Y} 5 \mathrm{UC}, 7 \mathrm{X} 3 \mathrm{CT}, 9 \mathrm{M} 4 \mathrm{MB}, 9 \mathrm{M} 8 \mathrm{~EB}$. Some very fine $D X$ there, Alan.
W. Clarke (Devon) has an AR88 and inverted dipole. He pulled in these on s.s.b.-AP1AD, ET3MEN, DU7GB, FM7AEL, HRISR, KC4OA, KG4AN, KP4CL, KL7DR, KX6BQ, OA1SU, VK3AM, VK4RH, VK5MS, VP2LF, VP4KD, VP9CP, XE1ME, XE1YO, YA3BMC, YV5FTS, ZL2KL, ZL2DU, ZL3FA, ZL3UY, 4X4HW, 4X4BL.

Norman Ponsford, also of Devon, uses a t.r.f. (CR45) with a 60 ft . longwire. These were heard on a.m. on one day between $1600-1730-\mathrm{F} 8 \mathrm{SC}$. HVICN, KIDIR, K1HVV, OH2T1, SP9ANH, SM4CHM, UQ $2 K F G$, UA2KAK, W2GBC, W3ZVA, W3MSK, W7ESK, W8BF, WØNVZ, 5A1TT. On a Sunday between 1725-1840 he found: EL3C. HB9DO, OE1KRB, K2UYT, SMSAWL, UB5KSP, VE2ADL, VE1AGD, W8UFG. YV5BBU, 5A4TK.
P. Whelan finds the band lively on his CR300/2 and reports CE7BV, CP5EZ, CX2CO, HK3KY, I.A4EJ/P (Jan Meyen Is.). LU4DM, LU4ACJ, OD5CY, PY2ON, VP7NY, YV5AXA. His ariel is 50 ft . of wire stretched between the lifeboats, and the log above was received "somewhere off the Kent coast." Does this make him P. Whelan/MM?

## L,F. Bands

The only report of a non-G station this month was of OKIKLX. This is surprising since DX has been about (W6, VP3, VE, etc.)-maybe it's because the DX is on c.w.

One or two have braved the $Q R M$ and $G$ sideband nets to winkle out the interesting ones. Gilles Whylie (Renfrewshire) got OHONC, TI2JIC. VE3CW, ZL2AAG. ZL4LM, all on s.s.b. Alan Dailey got HBOAFM/M, HBDAFM, PJ工AA, VE3AXU/M. D. Foster (Essex) raised VEIIE. VOIHI and W2ZTL.

One or two have taken up the challenge of DX on $7 \mathrm{Me} / \mathrm{s}$. including M. Woollin (Leeds), who found WB2GWY, K1LTZ, K2ODC, KV4CI and

# Automatic Control Systems 

A system of fully automatic change-over from send to receive and vice-versa, with only two relays.

by A. D. Taylor, G8PG/GW8PG

AUTOMATIC changeover on telegraphy or "push-to-talk" operation on telephony is a great operating convenience in the amateur station. It allows the operator to monitor the frequency during an "over", thus reducing the effects of interference, changes contacts between stations from monologues into conversations and considerably reduces fatigue during long operating sessions. The relay control system described in this article allows "listening through" between words on c.w. and also at any time on telephony by merely releasing the "press-to-talk" switch. The delay time can be adjusted, between a few milliseconds and about one second, by means of a potentiometer. As the transmitter v.f.o. is held on continuously while sending words the problem of "chirp" on c.w. is eliminated. The system has been operated on the various bands with a transmitter running at powers up to 60 W .

## Circuit Description

The circuit is shown in Fig. 1. Transformer

- T1, rectifier MR1 and capacitor C1 together provide a $24 \mathrm{~V} \quad 0.5 \mathrm{~A}$ supply for operating the
relays. This supply energises the relay coils when the morse key or "push-to-talk" switch is operated. Both relays then operate immediately, the current which operates $\mathrm{RC} / 5$ flowing through rectifier MR2. As soon as contacts RCI close, C 2 charges up from the 24 V supply and the potential across this capacitor is sufficient to hold $\mathrm{RC} / 5$ operated for a time which can be varied by altering the value of VR1. When the morse key is released for the space between symbols the keying relay, RK/1, releases immediately, but RC/5 coil is isolated owing to the removal of the forward bias on MR2; this relay therefore remains operated. When the operator presses the key for the next symbol RK/1 operates immediately and the loss of charge on C2 is made good by conduction through , MR2. If the operator makes a longer pause, such as that between words, C2 discharges sufficiently for $R C / 5$ to release and return the station to the "receive" condition. The provision of MR2 and relay contacts RC1 are key factors in the operation of the circuit. If MR2 were not fitted the charge on C2 would hold both relays operated and keying would be impossible.

Fig. 1: The transmitter control circuit. Tl should be a general-purpose low voltage transformer. MRI and MR2 should be 24 V 0.5 A components (e.g. GEC X54| B.I.P.I. or surplus (A bridge for MRI).

If C2 were connected directly across the coil of $\mathrm{RC} / 5$ instead of via RC 1 the relay would be slow-to-operate as well as slow-to-release, thus interfering with the operation of the system.

The use of the remaining contacts on $\mathrm{RC} / 5$ is self-explanatory except for the method of connecting the aerial to the receiver via contact $R C 2$, which is unconventional as will be seen from examination of Fig. 2a. On receive the receiver aerial connection is "tapped in" to the inner conductor of the coaxial cable used to connect the transmitter output to the aerial coupler. This method eliminates the need for a heavy-duty aerial changeover relay and, provided the precautions mentioned later are taken, it works very well and has no effect on the transmitter output or the s.w.r. on the cable.

Receiver muting is achieved by connecting a variable resistor in series with the earth return from the existing r.f. gain control and shorting it out on "receive" by means of contacts RC4 as

## Construction

The unit can be built on any suitable chassis or in a wooden box. The relays are fairly quiet in operation but it is suggested that they be mounted on a piece of sound-absorbent material to reduce noise to a minimum. The aerial sockets, SK1 and SK2 in Fig. 2a, should be mounted as close to each other as possible, and relay RC/5 should be placed so that the lead from contacts $R C 2$ to the sockets does not exceed 1 in . in length. The frames of the two sockets must also be bonded together carefully. The layout of the remaining components is not critical. The receiver aerial connection is made via a terminal, the key connection is via a jack and the remaining control leads are connected via an international octal plug and socket.

## Setting-up Adjustments

The first tests should be made with the international octal plug withdrawn. The mains should be connected and the 24 V output from the power

shown in Fig. 2b. This method has the advantage that it is only necessary to unsolder one wire in the receiver when installing it.

## Choice of Relays

Relay RK/1 is one of the small, ex-Government high-speed relays , often described as "Siemens high-speed relays". These are available from a number of sources and any model (there are five different types) should be suitable. Relay RC/5 can be any 24 V relay which mounts the necessary ${ }^{-}$ contact assemblies and has a coil resistance of $800 \Omega$ or more. If a very high resissance relay is used (say $10,000 \Omega$ coil) the value of RV1 should be increased to $100 \mathrm{k} \Omega$.

## Transmitter Requirements

Owing to the type of aerial connection to the receiver the p.a. should use fixed bias or a clamper valve if RK/1 is used to key an intermediate stage. Unless this provision is made there is a possibility that during reception the p.a. valve may radiate noise which will be picked up in the receiver. In the prototype installation no noise was picked up from a p.a. using a simple clamper valve, keying being in a buffer/doubler stage preceding the p.a.

Fig. $2 a$ (left): The receiver aerial connection.

Fig. $2 b$ (below): The circuit arrongement for muting the receiver.

(b)
supply checked. The key should then be connected and when it is pressed relays $\mathrm{RK} / 1$ and $\mathrm{RC} / 5$ should operate immediately. When the key is raised $\mathrm{RK} / 1$ should release immediately and RC/5 after a delay period. It should be possible to vary this delay period by adjusting VR1. The operation of contacts RK1 and RC2 to 5 should then be checked with the aid of an ohmmeter to ensure that they make and break correctly. The unit can then be connected to the transmitter and receiver, after which VR1 is adjusted to give the desired delay and VR2 (Fig. 2b) to give the desired level of sidetone from the receiver.

0WING to the great popularity of the transistor portable, it is understandable that many car owners have endeavoured to employ this possession in the car as well as in the home, office, on the bench and so forth. One advantage of the use of a portable in a car is that a separate car radio licence is not required. That is, provided the radio is not a fixture and does not run from the car battery.
It is generally possible to embrace the portable within the household licence covering the domestic radio and TV set. Note, however, that if the portable is used by a different family, even in the same house, then a licence may be required specifically for the portable. The Post Office will advise on these matters.
Unfortunately, the portable does not work very well in the car by itself. This is because it relies upon its internal ferrite rod aerial for picking up the signals, and signals do not pass very easily through the metal body of a car. There is some signal present inside the body of a car, of course,
res some is bound to get in through the windows. and a certain amount even through the metal panels. Thus, by turning the volume control pretty well full on reasonable reception may be possible provided the set is orientated so that the internal ferrite rod aerial picks up as much as possible of the little signal there is available in the car.

Under this condition the set is highly sensitive. The background noise is often fairly high. this being in the form of a "hiss" when the required station is tuned in. Provided this was the major disadvantage, the set could probably be used in 40 per cent of the cases on the local stations with reasonable entertainment value.
However, the trouble really starts when the engine is turning. Since the set is now pulling really hard to eatch on to as much signal as possible, it responds strongly to the smallest amount of interference. And inside a car with the engine running exists a high level of ignition interfcrence, even when the engine is moderatcly suppressed.

Superimposed upon the weak signal, therefore, dhetonantipuous, staccato crackle characteristic of
ignition interference. Unless the tuned station is producing a relatively high signal field in the area, the interference generally outweighs the signal inside the car and the set has to be switched off.

## POOR S:I RATIO

This arises, of course, from the poor signal/ interference ratio, as shown in Fig. 1. Here we have the strong outside signal $S_{0}$ giving rise to the weak inside signal $S_{i}$ due to the screening of the car. Also inside the car is the strong interference signal 1 . The signal/interference ratio is thus $S_{i} / \mathrm{I}$.

At $\mathrm{S} / 1$ ratios below $100-\mathrm{to}-1$ ( 40 dB ) the interference can be heard in the background. When the ratio rises above 100 -to- 1 the interference is pushed well into the background and is not heard.

Fig. 1: Poor signal, interference ratio and signal fading are factors associated with using an ordinary transistor portable inside a car. Here the signal/interference ratio is given by $S, 1$.

At ratios helow about 50 -to-I the interference can be so disturbing that the portable just cannot provide reception of entertainment value in the car.
The problem is considerably aggravated due to the directivity characteristic of the portable's ferrite rod aerial. Thus, if the set is carefully orientated in the car for the best signal/interference ratio with the car travelling in one direction, the ratio is worsened when the edr alters course.

To retain the hest signal/interference ratio while travelling in a car. therefore. it is necessary to turn the set correspondingly each time the car alters course. This is highly undesirable and not particu-

larly safe so far as the lone rider is concemed.
It is possible to improve the signal/interference ratio by placing the receiver in line with one of the windows of the car. This overcomes the screening effects of the metal car body to some extent and the signal/interference ratio may then rise to $\mathrm{S}_{0} / 1$. On fairly strong stations this may be sufficient with correct orientation of the set to produce a ratio better than 40 dB .

Unfortunately, however, the directivity problem still exists and complete fade-outs can occur when the car turns a corner. Morcover, it is not usually very convenient to have a portable perched up near one of the windows.

Transistor portable manufacturers, realising the need to do something about these problens, now almost universally fit a car aerial socket on their sets. This allows a car aerial to be employed with the set, the theory being that a signal of value. $S_{0}$ (Fig. 1) is brought into the set.

## MARGINAL IMPROVEMENT

The theory is good, but in practice the results are very marginal and sometimes there is virtually no improvement at all with the car aerial connected. There are two reasons for this.

One is that transistor portable manufacturers are in a very competitive field and so obviously they are not in a position to spend a great deal of extra money to introduce additional facilities for a minority market.

The other is that the extra signal picked up by a simple car-type derial is hardly worth bothering about if one compares the efficiency of the ferrite aerial in the set with that of the car acrial. The former is many times more efticient than the latter.

Over the past two years the author has been making a special study of the subiect and has reached the conclusion that one solution is to improve the overall efliciency of the simple cartype aerial so that it is at least as efficient as the set's ferrite rod aerial without being directional. Another solution is to "radiate" inside the car a signal field over the whole of the long and medium wave bands at least equal to that of the signal field outside the car. The resulting designs are the subject of British Patent App. No. 4097/64.

Set manufacturers have also now introduced the "hybrid" portable/car radio set. This is basically a transistor portable with facilities for swith ing out the internal ferrite rod acrial and switching in circuits for accepting the signals picked up on a

## G. J. KING

car-type aerial. This type of set has considerable advantage over the ordinary portable used in the car with an acrial plugged into the car aerial socket because the aerial circuits are designed for optimum matching to a car-type aerial.

One of the reasons why an ordinary portable fails to react so well with a car-type aterial is that the matching and coupling efliciency between the car-type aerial and the aerial socket is not generally very good. Then. of course, there is the disadvantage of the forrite rod aerial remaining in circuit as we have seen.

It is not easily possible for the owner of an ordinary portable to introduce modifications so that the ferrite rod can be switched out of circuit when the set is used in a car with a car aerial. This is because the ferrite rod aerial acts as the aerial coils as well as the "collector" of signals.

## RE-RADIATION INSIDE CAR

The author has tackled the problem from the aspect of the existing type of ordinary portable whose owner may wish to take it out in the car without introducing any modifications whatever. The "radiation" principle is of interest.

In this system a wideband amplifier feeds into a push-pull wideband power amplifier, using tran-

Fig. 2: A wideband amplifier driving a push-pull r.f. power amplifier can be employed to "radiate" strong signals, at least equal in strength to those outside the cor, inside the car.
sistors, as shown in Fig. 2. Here a wideband modium ficyuency amplitier is supplied with stghals from a car aerial and the signals at the output of this amplifier are coupled to the power amplifier by T1. The collectors of the output transistors are then loaded to a ferrite loop radiator which is located at a convenient site inside the car.

All the signals thus picked up by the car-type acrial are re-radiated inside the car at a strength at least equal to that outside the car as shown in fig. 3. The signal/interference ratio then becomes $S_{i}=S_{n} / 1$ and, provided ordinary ignition interference suppression precautions are taken, the ratio is generally better than 40 dB on all but very distant stations.

Fig. 3: The resulting improvement in the signal/interference rotio by the use of the "radiator" is shown here as $S_{i}-S_{0} /$. Directivity troubles are also eliminated.

Fig. 4: Most transistor portables feature a "car aerial" socket connected to the ferrite rod aerial by means of a small coil, as this diagram shows.

## EFFECT OF A.G.C.

The amount of interference produced by a portable operating in an interference environment is affected not only by the signal/interference ratio but also by the strength of the wanted station irrespective of that of the interference.

This is because the greater the strength of the signal picked up by the portable the greater will be the effect of the automatic gain control (a.g.c.) circuits inside the set and the less will be the sensitivity of the set to interfering signals anyway!

This means that the effect of interference resulting from a given signal/interference ratio will be less the greater the strength of the signal proper. As an illustration the signal/interference ratio is 10 to 1 with a wanted signal of $100 \mu \mathrm{~V}$ and an interference signal of $10 \mu \mathrm{~V}$. The interference

Fig. 5: By use of a wideband amplifier with goin A the signal/interference rotio is improved approximately to $S_{0}-A / I$. Thus, the ratio is improved by the numerical gain of the amplifier.
would be considerably troublesome under these conditions because $100 \mu \mathrm{~V}$ of wanted signal would be barely sufficient to push the set into a.g.c.

However, with a wanted signal of 1 mV and an interference signal of $100 \mu \mathrm{~V}$ (still 10 to 1 ratio) the interference effect would be less, since 1 mV of wanted signal would push the set well into a.g.c. action and thus diminish its sensitivity to the interference. A.G.C. action thus tends to improve the effective signal/ interference ratio.

It will be appreciated, of course, that the set-up in Fig. 3 completely destroys the directional properties of the transistor portable when it is used in the car, for the portable and/or radiator is positioned for the most convenience and the optimum signal/interference ratio. Neither the set nor the radiator moves relative to each other, so this optimum will be maintained whatever station tuned.

In practice it has been discovered that the complications and expense of re-radiation can be deleted without detracting from the overall effect by utilising the aerial coupling loop provided by the set manufacturer. This loop comprises a number of turns of wire wound round the ferrite rod and terminated across the car aerial socket as shown in Fig. 4.

## DIRECT BOOST

By using this we can do away with the push-pull output stage shown in Fig. 2 and employ only the wideband amplifier by connecting the output of the amplifier direct to the car aerial socket. This arrangement is shown in Fig. 5, from which it will be seen that the outside signal now present in proximity to the set's ferrite rod aerial is So $x A$, where A is the gain of the wideband amplifier.

If the amplifier has a gain of ten times then the signal focused around the set's ferrite rod is $10 \times S_{0}$, which could be considerable. The signal/ interference ratio now rises approximately to $S_{0} \mathrm{x} A / \mathrm{I}$. In general the signal/interference ratio is improved by at least ten times relative to the interference actually inside the car.

This can be easily demonstrated by running the portable inside the car with the engine running and the amplifier switched off, noting the background noise and interference crackles, and then switching the amplifier on. When the arrangement is correctly employed both the interference and the background noise disappear completely or very significantly.

The success of the arrangement is not only due to the boost that the amplifier provides to the signal, thereby improving the signal/interference ratio directly and also by pushing the set's a.g.c.

Fig. 6: Inside view of commercial widebond amplifier for use with transistor portables inside cars.
hard on. but by the improvement in matching that can be secured between the car-type aerial and the set's aerial socket. The amplifier can thus be designed to match at its inpiut a simple type of car radio aerial and at its output the aerial circuit of the set.

In that way optimum signal transfer results from the aerial to the set which, as has already been intimated, rarely occurs when a car-type aerial is plugged straight into the set. As with the "radiation" arrangement the direct boost also kills the directivity of the ferrite rod and, in fact, the aerial/amplifier combination easily matches the efficiency of the set's ferrite rod aerial, which was the original target of the exercise.

There are one or two points that should be remembered when these arrangements are adopted. One is that the signal/interference ratio improvement relates to the interference actually inside the car and not to interference outside the car. This means that ordinary suppression of the ignition and electrical system is required as when any radio is used in a car. Another is that if the amplifier is made with too great a gain unsuppressed passing traffic can cause trouble. Excessive gain is unnecessary since it just cannot be used on a main road. The same applies to an amplitier whose response extends beyond about $2 \mathrm{Mc} / \mathrm{s}$.

## EXTRA L.W. BOOST

Above that frequency local car interference starts showing up really badly, so it is as well to curtail the response of this type of amplifier at about $1.5 \mathrm{Mc} / \mathrm{s}$. It is generally desirable to give a lift of around 40 dB at $1,500 \mathrm{~m}$, for the Light Programme is pretty poor in some parts of the country, and this now makes a handy station for late night car travellers since the recent extension of popular music.

To determine the maximum amount of gain that can be accommodated under practical conditions

## (2) STEREO AMPLIFIER

$\mathrm{Hi} \mathrm{Fi} 10+10.25 \mathrm{c} / \mathrm{s}-40 \mathrm{kc} / \mathrm{s} \pm 2 \mathrm{~dB}$. 18 dB negative feedback. Crosstalk 26 dB down.

## Incompetence

Rarely have I seen a correspondent so completely "off the beam" as R. A. Packer (May issue). Not only is he under the impression that an 807 is an I.O. based valve fall the 807s that I have used during the past 20 years have come supplied with five-pin U.X. bases) but he is addicted to making sweeping and completely false generalisations.

He obviously never peruses the advertisement sections of P.W. because a quick glance through any recent issue would show him that many manufacturers are still making and selling a large variety of kits and completed units using the everpopular I.O. valves.

His remarks regarding "Competent Constructors" are not only illogical but show great intolerance-a "constructor" is one who constructs, a "designer" is one who designs.

Moreover, most amateurs I have met do not enjoy the obviously ample financial sources of Mr. Packer; 6K8s and 6V6s at a bob a time are a far more attractive proposition to the typically financially embarrassed amateur than ECH81s and ECL86s at several shillings each.

Finally, in case Mr. Packer thinks that I am a "Radio Square ", let me hasten to add that for years I have regularly (and quite competently) constructed equipment using everything from Jumbo valves to miniature deaf-aid components. J. D. Methven.

Crawley. Sussex.

## Correspondents

I wourd like to correspond with anyone who is interested in radio and of my own age (13). Richard Edeson.

32 Crewe Avenue,
Ferrybridge,
Knottingley,
Yorks.
I am a radio experimenter and keen reader of P.W. I would like to correspond with anyone who shares an interest in the same field. I am 26 years of age. Kenneth Smith.

## NEWS AND..

## STEREO HEADPHONES FOR DEAF CHILDREN

The little girl on the left is wearing a hi-fi stereo headset manufactured by Standard Telephones and Cables Limited and designed to rather special requirements. The microphone on the boom feeds the child's speech through a small amplifier back to the phones at increosed volume. In fact the headsets have been designed to help deaf children learn to speak by enabling them to listen to their first efforts of forming sounds and words.

These specifications required the phones to handle, without distortion, sounds exceeding the threshold of pain level for normal hearing, and for each earpiece to have individual volume control.

## RECORD DECKS AT THE FAIR

The 1965 Audio Fair was recently held in London, and naturally enough, record decks and players were well represented by a number of British and overseas manufacturers.

Garrard Engineering Ltd. (Newcastle Street, Swindon) had a wide range of decks on display, from inexpensive auto-changers to high performance transcription units and including three which had not previously been seen in the UK. One of these, type A.70, incorporates a new record-changing mechanism which, with a sloping centre spindle and a pusher platform at one corner of the deck, provides a gentler disc release than the conventional arrangement.

One of the foreign manufacturers represented at the Show by their UK agents Denham and Morley Ltd. (173 Cleveland St., London, W.I) were the Scandinavian Radio and Television Company of Denmark. Two S.R.T. transcription decks and a record player were displayed, the transcription decks both featuring belt driven turnable and variable speed control.

The German firm of Telefunken were represented by their agents Welmec Corporation Ltd. (27 Chancery Lane, London, W.C.2), who had on show two Telefunken sound systems comprising record deck, amplifier and speaker units. One of these featured a belt driven deck and a 12 -valve amplifier.

## SOME NEW MICROPHONES ON THE MARKET

Vitavox Ltd., Westmoreland Road, London, N.W. 9 have recently introduced a new dynamic microphone (Multi-Zed M100) with four alternative output impedances. Impedances of $25 \Omega, 200 \Omega, 10 \mathrm{k} \Omega$ and 'high', are available from the mic. which incorporates a tapped ratio line transformer. Frequency response is from $50 \mathrm{c} / \mathrm{s}$ to $15 \mathrm{kc} / \mathrm{s} \pm 3 \mathrm{~dB}$.

Another new microphone is the model 4126 capacitor from STC. This professional instrument measures only two inches plus, yet it incorporates the unusual feature of an integral field-effect-transistor head amplifier. Another unusual feature is the price-around $f 120$.

Another recent addition to the STC range of microphones is the!r model 4119 ribbon mic. This is a high quality tubular microphone with a narrow cardioid directional sound pick-up. Especially suitable for pop singers, the microphone costs $£ 25$.

# COMIMENT 

## PMG TO GRANT LICENCES TO VISITING AMATEURS

## Good news for overseas amateurs visiting the UK. is the recent

 announcement of the Postmaster-General that in future they can expect to be granted licences to operate transmitting equipment whilst in this country. This concession willapply to all foreign amateurs whose own country are prepared to grant similar facilities to UK licensed operators.
## NEW TRANSISTOR AMPLIFIER KIT

This is a 12 -transistor amplifier with a 20W r.m.s. music power output (40W peak) claimed by its makers. It is Sinclair Radionics' new X-20 unit which combines preamp and power amplifier on a panel measuring only $8 \frac{1}{4} \mathrm{in} . \times 3 \frac{1}{4} \mathrm{in} . \times$ lin. Tone and volume controls for mono or stereo can be added to suit praćtically any requirements, and any type of pick-up, as well as outputs from f.m. tuners and tape preamps, can be connected to it. Frequency response of the amplifier is $20 \mathrm{c} / \mathrm{s}$ to $20 \mathrm{kc} / \mathrm{s}$ $\pm 1 \mathrm{~dB}$, input sensitivity 1 mV into $5 \mathrm{k} \Omega$ and signal to noise ratio is better than 70 dB . Power requirements are 36 V d.c. at 700 mA .

In kit form the X -20 will cost you £7 19s. 6d., or built and tested the price is $£ 919 \mathrm{~s}$. 6d. from Sinclair Radionics Ltd., Comberton, Cambridge.

## POLICE TO GET POCKET TRANSCEIVERS

Police forces throughout the country will soon be using pocket-sized radio transmitter/receivers manufactured by G.E.C. (Electronics) Ltd. 400 of these sets have been ordered by the Home Office, following a period of 12 months' operational use by the Lancashire Constabulary.
G.E.C.'s transceiver is the smallest v.h.f. pocket set to be granted G.P.O. and Home Office approval and already many arrests have been attributed to its use.

## STEREO TRANSMISSIONS: NEW TIMES

The experimental pilot-tone stereophonic transmissions from Wrotham, which have until recent weeks been taking place three ofternoons a week an the Third Network Music Programme, are now forming part of the Music Programme transmissions from Wrotham on $91.3 \mathrm{Mc} / \mathrm{s}$ on Mondays from 2.30 to 3 p.m. and on Thursdays from $1 \mid$ to 11.30 a.m.

These transmissions will also be radiated by the Swingate station near Dover, on $92.4 \mathrm{Mc} / \mathrm{s}$.

# A <br> Stabilised Nine Volts 

A compact unit to power transistor receivers from the mains.

BY.P. G. THOMSON

T1 HIS power unit was originally constructed to form part of a mains-battery transistor portable radio. In the light of experience gained from building and operating similar power supplies, it was felt that a stabilised type with amp'e power rating was to be preferred, Further in designing this power unit particular attention was paid to economy, compactness and hum level.

## Circuit Design

To give an ample current rating about 350 mA is needed. The output voltage varies from $9 \cdot 3 \mathrm{~V}$ without load, to 8.7 V with a load of 350 mA (See Fig. 1.). Different output voltages may be attained for individual needs, by using a different zener diode.

The operation of the circuit is as follows. The econdary voltage from mains transformer T 1 , is
rectified by a full wave rectifier consisting of D1, D2, D3 and D4, capacitor Cl being used to smooth the output from these rectifiers. Resistor R1 allows current to flow through the zener diode D5, so setting the base reference voltage for transistor Tr 1 . The transistor de-amplifies the large voltage variations on its collector side, so that they appear as only very small variations on its emitter side. Decoupling and extra smoothing are achieved by capacitor C2. Fuses F1 and F2 are included to protect the power unit and any equipment it may be connected to.
Other output voltages and current ratings can be obtained using the same circuit, with modified component values. The main design considerations for this circuit are:-
(1) The mains transformer:-

$$
\text { Current Rating }>\left(\mathrm{I}_{\mathrm{M}}+\mathrm{I}_{\mathrm{Z}}\right)
$$

Voltage Rating $=\frac{V_{\mathrm{C}}}{\sqrt{ } 2}$
Where:-
$I_{M}=$ Maximum current taken by load.
$I_{Z}=$ Current taken by diode to establish zener voltage.
$\mathrm{V}_{\mathrm{C}}=$ Maximum voltage at collector of Tr1.
$\mathrm{V}_{\mathrm{Z}}=$ Zener voltage.
Vc is given by:-
$\mathrm{VC}=\sqrt{ } 2 \times$ Transformer secondary voltage.
The higher the secondary voltage (i.e. the greater the voltage allowed across Trl ) and current rating of the transformer, the better the regulation.
(2) The current ratings for each of the full wave rectifier diodes should be:-

$$
\frac{1}{2}\left(I_{M}+I_{Z}\right)
$$

The voltage ratings for each of the rectifier diodes will depend upon the transformer secondary voltage, which will in turn depend upon the output voltage, and the voltage it is decided to allow across the transistor. The voltage rating for each of the diodes will be:-
${ }_{\mathbf{1}}\left(\mathbf{V}_{\mathrm{C}}\right)$$?$

The demands for good Electronic Engineers is increasing almost daily throughout the world. Electronics is now the most rapidly expanding of all industries with its applications reaching into almost every sphere of human activity. If you are looking for a new career with new opportunities, then now is the time to chooseElectronics. If you are already employed in this fieldthen now is the moment to seek high qualifications to secure the top jobs which are waiting to be filled. Most of all the great potential of electronic develop. ment means unlimited scope for the future and will ensure a secure occupation for you-unlikely to be affected by possible future recessions in other industries.
The British National Radio School has had 25 years' experience of HOME STUDY coaching for students wishing to master the fascinating subjects of Elec-tronics-whether the object be career or as a hobby or new interest. The School is entirely independent and specialises ONLY in the teaching of electronic subjects. It employs only fully qualified staff to conduct and supervise each individual course taken by a student and it is this close and personal contact between Tutor and Student which we believe makes possible the successful completion of a course of study.
A special feature of our system is that all courses start right from the beginning and no previous knowledge or experience is necessary or expected. Training is carried out in easy step-by-step stages using the most modern methods of tuition. The great advantage of the home study method is that it provides a complete self-contained course giving everything needed for the subject concerned and enabling work to be done in the comfort of one's own home and over any period of time desired.

# THE LINEAR 'SUPER 30’ HIGH FIDELITY PUBLIC ADDRESS AMPLIFIER 

## TECHNICAL DETAILS

SENSITIVITY FOR 30 WATTS
Gram- -50 millivolts
Mic. $1-5$ millivolts
Mic. $2-160$ miorovolts
FREQUENCY RESPONSE
$\pm 2 \mathrm{~dB}, 30$ c.p.s. 20.000 c.p.s.
BASS CONTROL
+15 dB to -15 dB at 50 c.p.s.
TREBLE CONTROL
+12 dB to -12 dB at $10 \mathrm{Kc} / \mathrm{s}$
HUM AND NOISE
-60 dB .
H. MMONIC DISTORTION
0.5\% for 30 watte.

VALVES
Mullard ECC83. ECC83. RCC83. ELL34. ELI34, CZZ34.

WEEATIVE FEEDBACK
20 AB .
DAMPINS FACTOR
12

Send S.A.E. for leaflet.
For operation on standard $200-250 \mathrm{v}$., so c.p.s., A.C. mains. $110 / / 20 \mathrm{v}$. models available for export. Trade and export enquiries Invoted.
LINEAR PRODUCTS LTD. ELECTRON WORKS, ARMLEY, LEEDS

A Highly EFFICIENT 30 WATT GENERAL PURPOSE PUBLIC ADDRESS UNIT
With input mixing facilities and outputs for 3-7.5-15 and 330 ohms ( 100 v line)

A special feature of the 'SUPER 30' is its high degree of stability, ensuring that the longest output leads can be used without fear of the usual troubles associated with instability.

Three high mansitivity stondard Jock inputs with provisiow for high and low impedance microphones.

Fig. 2: The simple circuit of the power pack.
(3) The value of $R$ is given by:-

$$
\mathrm{R}=\frac{\mathrm{V}^{\prime} \mathrm{t}-\mathrm{V}_{2}}{\mathrm{I} /}
$$

Since the voltage at the collector will vary with the load, it is advisable to use the lowest value of collector voltage ( $V^{\prime} \mathrm{c}$ ), or else it is possible that the zener diode may operate in the wrong portion of its characteristic. It should also be ascertained that the maximum power rating of the diode is not exceeded. The power dissipated in the diode is given by the expression:-

$$
P_{\mathrm{Z}}=\frac{\mathrm{V}_{\mathrm{Z}} \times\left(\mathrm{V}_{\mathrm{C}}-\mathrm{V}_{\mathrm{Z}}\right)}{\mathrm{R}}
$$

(4) The dissipation in Trl varies with the load current, bowever it may be taken to be:-

$$
\mathrm{PTr} 1=\left(\mathrm{V}_{\mathrm{C}}-\mathrm{V}_{\mathrm{Z}}\right) \times \mathrm{I}_{\mathrm{M}}
$$

As well as not exceeding the maximum power rating of the transistor, the maximum collector emitter voltage rating should not be exceeded either. For the power unit built by the author, the maximum power dissipatéd in $\operatorname{Trl}$ was about 4 watts, as the maximum permissible dissipation was 11 watts only a small heat sink was required, which enabled the size of the unit to be reduced. Indeed it is possibly better to employ a higher rating transistor working at far less than its maximum dissipation, simply for the economy in space.

Fig. 3: An exploded view of the aluminium chassis. The right-hand panel extends above the top of the chassis to carry the mains socket, switch SI and the fusehoider for FI.

## COMPONENTS LIST

TrI OC35 or any other power transistor of 10 W or higher rating
DI, 2, 3, 4 OA202 miniature silicon rectifiers or similar
D5 VR9B 9 V 2.25 W zener diode $5 \%$, or similar 9 V zener diode
TI Small bell transformer, or similar, with 12 V IA output
RI $680 \Omega \frac{1}{2} W$ carbon
Cl $500 \mu \mathrm{~F}$ miniature electrolytic 25 V
C2 $320 \mu \mathrm{~F}$ miniature electrolytic IOV
FI $\quad 100 \mathrm{~mA}$ fuse
F2 $\quad 500 \mathrm{~mA}$ fuse
Bl Optional-see text
SI Optional-single-pole, 2-way switch
Two fuseholders. 3-pin mains input socket (T.S.L.) and plug to match. Aluminium for chassis. Piece of Veroboard for sub-chassis.

Fig. 4al A view from underneath the chassis.

## Construction

The aluminium chassis is made in three parts. The chassis dimensions and the position of the fixing holes are shown in Fig. 3. The exact dimensions and relative positions of the holes are not shown since they will depend upon the particular components used by the constructor.

The position of the larger components is shown in Fig. 4. The eest of the components are assembled together on a sub-chassis made of Veroboard (this consists of a perforated board of insulating material with strips of cupper laid across it, Fig. 5). However these components could equally well have been assembled togethe: on a piece of perspex, or similar material "and connected by means of conventional wiring.

The procedure when wiring is as follows. First mount the principal components (those shown in Fig. 4) to the chassis and connect them up. Then wire the sub-chassis and when complete, connect to the components already mounted on the main chassis. The sub-chassis is held in position by means of the wire connections made from it to the chassis.

## Operation

It will be seen from the theoretical circuit (Fig. 2), that 'switch S1 and a battery B1 have been included in the circuit. As previously mentioned the unit was designed to be incorporated in a transistor radio, B1 and S1 facilitate mains-battery operation, whether or not they are included in thesconstructor's version will depend upon the function the power supply is put to.

The hum level of this power supply is exceptionally low. The prototype was used to feed a one-watt transistor amplifier driving an $8 \times 5 \mathrm{in}$. loudspeaker, at a load of 220 mA ( 12 mA quiescent into the amplifier, the remainder into a resistive load). Hum was only discernable 6in. away from the loudspeaker, the hum level increased at 350 mA but was still barely audible. At higher loads the hum level increased appreciably.

It is important to realise that since the transistor is bolted to the aluminium chassis, the whole of the chassis is at collector potential and thus must not be earthed.

## Conclusion

The total cost to the author was about $£ 2$, which is less than other similar units, and has been achieved without sacrificing voltage regulation and smoothing.

Fig. 4b: Looking down from above the chassis, FI, SI and the input socket are shown to be fitted to the front panel.

Fig. 4c: An end-on view showing how the two vertical panels wrap round the end of the centre piece.

The would-be constructor is advised to look through radio magazines to find the most reasonably priced components.

The completed unit is capable of powering most types of transistor portable radios and record players. It will be appreciated that the output ratings and construction configuration of the unit may be easily modified to suit individual requirements.

Fig. 5: The component layout and wiring details of the Veroboard-based sub-chassis.

T1HE power pack described here is suitable for powering both audio and r.f. units of the generator. A chassis similar to that for the audio generator described last month is used. First mark the positions for the fixing holes of the transformer, capacitors, tag strip, switch, warning light and valveholder on the chassis. A suggested layout of the major components is given in Fig. 6. Securely bolt all components to the chassis, placing a slip-proof washer under each nut. The theoretical circuit is given in Fig. 5 and no difficulty should be experienced in wiring up the power supply.

When all wiring is complete it should be carefully checked for incorrect connections and shortcircuits. If all appears to be correct, the unit should be switched on and the h.t. and l.t. outputs tested with a multimeter. The open circuit h.t. voltages should be about 300 V and the l.t. should be 6.3 V . If all appears in working order the unit may be put safely to one side until the audio oscillator is ready for testing.

## The RF Oscillator Circuit

The oscillator is basically a cathode-coupled Hartley oscillator. The four switched coils are tuned by a 500 pF tuning capacitor and a range of about $175 \mathrm{kc} / \mathrm{s}-22 \mathrm{Mc} / \mathrm{s}$ is obtained. A fifth range covering the higher frequencies was tried but great difficulty was experienced in getting the valve (an ECC81) to oscillate at these frequencies.

If such a band is needed, other valves (such as ECC84 or ECC85) should be tried.

The r.f. signal may also be modulated by a fixed tone of about $440 \mathrm{c} / \mathrm{s}$ obtained from a simple transformer-coupled oscillator stage (V4a). Modulation is switched off by shorting the grid of the: modulator oscillator to chassis.

The output is taken from the anode of the r.f. oscillator V4b to a cathode-follower output stage. This is found to be quite adequate for normal use as r.f. and i.f. stages are usually of high gain and followed by the audio section. The output coupling capacitor C24 should be of $1,000 \mathrm{~V}$ working for absolute safety.

Fig. 5: This circuit will provide suitable power outputs for both the audio and r.f. oscillator units.

Fig. 61 Component layout of the power pack chassis.

6.3V indicator lamp and lampholder. One International Octal valveholder.

## Construction

This unit is built in a similar manner to the other two units. In order that better connections can be made to the chassis at high frequencies it would be better if a tinplate chassis was available as wires can then be soldered directly to the chassis.

The switch and valve holes should be cut and the transformer fixing holes and the grommet holes drilled. Holes should also be drilled to take the coil formers and tuning capacitor brackets.

The wiring should now be completed except for the coils. All wiring must be short and direct and either ceramic or mica capacitors should be used at r.f. The leads to the range switch should be wired. The coil for range 1 (L1) can now be wound.

Take the $2 \times \frac{5}{16} \mathrm{in}$. former and put a small dab of plastic cement about $\frac{3}{8}$ in. from the base. Fasten one end of the $30 \mathrm{~s} . w . g$. enamelled copper wire in the cement, leaving about 6in. free. Pile-wind 350 turns spaced to $\frac{1}{2} \mathrm{in}$. on the former, then twist a 6in. loop in the wire to form the centre tap. Wind another 350 turns in the same direction in the $\frac{1}{2} \mathrm{in}$. above the centre tap. Fasten the end temporarily with a small knot.

Connect the coil to the circuit. Test the oscillator by applying the output to a receiver tuned to the long waves via a 10 pF capacitor. The range of the coil should be adjusted by means of a ferrite slug until it covers about $600-175 \mathrm{kc} / \mathrm{s}$. In order to match up with Band II the coil should be adjusted to oscillate at $600 \mathrm{kc} / \mathrm{s}(500 \mathrm{~m})$ with the vanes of the capacitor about $5^{\circ}$ enmeshed.

The coil for range 2 (L2) is wound in a similar manner, there being two pile windings of 90 turns each over $\frac{3}{8} i n$. with a centre tap between them. This coil should be connected into circuit and the coverage adjusted by means of the ferrite slug so that it resonates at $600 \mathrm{kc} / \mathrm{s}$ with the vanes about $5^{\circ}$ from fully enmeshed. The highest frequency can be found with a s.w. receiver and will be about $2 \cdot 5 \mathrm{Mc} / \mathrm{s}(120 \mathrm{~m})$.

Range 3 coil (L3) has a total of 80 turns with a tape in the centre, but this coil is wound in a single layer. When connected its minimum frequency should be adjusted to about $2.5 \mathrm{Mc} / \mathrm{s}$ with the condenser $5^{\circ}$ from enmeshed. If the maximum frequency of range 2 is nowhere near $2.5 \mathrm{Mc} / \mathrm{s}$ then range 3 should be adjusted to overlap at a convenient frequency.

Range 4 (L4) coil has a total of 14 turns, centre tapped. In the author's prototype oscillation was not obtained over the whole band but only over the higher frequency half (the $90^{\circ}$ with. lower capacity in the tuning capacitor). The minimum oscillation frequency should be adjusted to give a suitable overlap with range 3 . As the frequency on this band is very dependent on stray capacities no two units will be alike and constructors should be prepared to experiment with this coil.

The number of turns on the coils given above is only a guide. If the correct range cannot be obtained with the slug the number of turns should be adjusted. If adjustment seems to need the ferrite slug to be driven further in increase the number of turns; if it needs to come further out decrease them. When adjusting the coils remember

to keep the centre tap exactly in the centre of the coil. When all the coils are adjusted to the constructor's satisfaction the winding should be fixed in position with polystyrene cement.

The modulating frequency is altered by changing C16. It should be about $440 \mathrm{c} / \mathrm{s}$ (a middle C on the piano) for standard work, but this is not critical.

When the unit is completed satisfactorily it may be fixed in the case and calibrated.

## Calibrating the r.f.

There are many ways of calibrating an r.f. oscillator, some more accurate and complicated than others. Such methods include the use of crystal markers or very accurate oscillators. The same restrictions were enforced in the calibration of this oscillator as with the atudio and the following method was evolved. The only equipment necessary is a reasonably accurately calibrated receiver covering the required range. The R 1155 receiver will cover up to $18 \mathrm{Mc} / \mathrm{s}$ and many "domestic" sets will cover $18-25 \mathrm{Mc} / \mathrm{s}$.

Switch the signal generator and receiver on and leave them to warm up for at least 15 minutes. Tune the receiver to $200 \mathrm{kc} / \mathrm{s}$. This is the standard for the whole calibration and must be done accurately. Turn the generator to Band I and tune
to the most powerful heterodyne. This corresponds to $200 \mathrm{kc} / \mathrm{s}$ and a note should be made of the dial reading (the dial is fitted with a temporary scale marked $0-180^{\circ}$ ). Tune the receiver to about $400 \mathrm{kc} / \mathrm{s}$ to lind the second harmonic of $200 \mathrm{kc} / \mathrm{s}$. Tune the oscillator to $400 \mathrm{kc} / \mathrm{s}$ and note this reading. Return the oscillator to $200 \mathrm{kc} / \mathrm{s}$.

Repeat this procedure over the whole of Band I and over as much of Band II as possible (until the harmonics are too weak. This will be at about $1.4 \mathrm{Mc} / \mathrm{s}$ ). You will then have a series of $200 \mathrm{kc} / \mathrm{s}$ marker points.

In order to draw an accurate graph of Band I more points are needed. Tune the receiver to $1 \mathrm{Mc} / \mathrm{s}$. When the oscillator is tuned to about midway between 400 and $600 \mathrm{kc} / \mathrm{s}$ the second harmonic of $500 \mathrm{kc} / \mathrm{s}$ will be received. Repeat this at $600 \mathrm{kc} / \mathrm{s}$ on the receiver to get the $300 \mathrm{kc} / \mathrm{s}$ mark. Fill in as many of these odd $100 \mathrm{kc} / \mathrm{s}$ marks as is possible by using the known frequencies (i.e. third harmonic of $300 \mathrm{kc} / \mathrm{s}$ gives $900 \mathrm{kc} / \mathrm{s}$ ).

The oscillator should be tuned to $500 \mathrm{kc} / \mathrm{s}$ and $500 \mathrm{kc} / \mathrm{s}$ marks made as far up the band as possible. If extra points are needed for range 2 $250 \mathrm{kc} / \mathrm{s}$ marks can be made; $1 \mathrm{Mc} / \mathrm{s}$ marks are adequate for range 4.

When sufficient checkpoints have been made four graphs can be accurately drawn showing the
relationship between dial reading and frequency for each band. A permanent dial can then be made from the graphs and firmly fixed to the knob. To check that the dial is in the correct position it is only necessary to check its position at $200 \mathrm{kc} / \mathrm{s}$.

Although this method is certainly not the most accurate it is sufficiently so for most amateur purposes and it is quite simple.

With all three chassis included the constructor now possesses a signal generator of reasonably high quality and accuracy, suitable for any purpose for which the average amateur may need it. at a price such that they cannot afford to be without it. The author built his generator from scratch for under $£ 4$ and it has served him well for some years now.

The cabinet constructed by the author was made from plywood which was lined completely with tinfoil to provide screening. Alternatively a cabinet may be constructed from 20s.w.g. aluminium sheet.

Fig. 8: An underchossis view of the r.f. unit. Dimensions for this chassis are 7in. $\times 4 i n$. with a $2 \frac{1}{2}$ in. front panel and $\frac{3}{3}$ in flanges.

## ON THE SHORT WAVES

## -continued from page |4|

6 W 8 BF on c.w., together with hordes of Europeans and U's.
S. W. L. Jolley (Staffs) uses a 66 ft . longwire and a 19 Set sans a.t.u. and preselector and found this lot between 2330-0030, all on c.w.-HA5KFR, IT1AGA, OE6MZG, SP8AQK, UA3AN, UA1KCU, VE1OU, W1HGT, WA1UKS, W2CA, WB2DU, W2CJC, W3DVO, W3FKB and 5K4ALE. If anyone knows which planet the last one comes from we would be pleased to know. Another interesting one was G3AM/TR, using only 500 mW and working ON5PA.

## $28 \mathrm{Mc} / \mathrm{s}$

Ten metres almost, but not quite, deserted. D. H. Foster (Essex) using an HRO with "very much bent' 132 ft . longwire found CR4AE on c.w. at 1830 in QSO with CO2OM. Also OD5BU and LU4DM on phone. L. Morrison (Suffolk) found ZE8IH and ZE5JS on phone around 1130. Wilfred Smith (Staffs) reports several G's active and logged ZE1JE and 9J2DT. At G3JDG a $28 \mathrm{Mc} / \mathrm{s}$ ground plane has sneaked skywards and great things are expected.

## General Snippets

P. Collins informs us that FH8CD is active on Comoros Island on 14 and $21 \mathrm{Mc} / \mathrm{s}$ s.s.b., Malta will probably be changing to 9 H 1 (at the moment it's ZB1), and PY7BAL/O is on $7012 \mathrm{kc} / \mathrm{s}$, and is situated on Fernando de Noronha.

A new one for Chatham Island is ZL3AWJ/3, and the pre-fix for Portuguese Guinea will probably now change to CR3.

ISWL/G11570 says that three W's will operate CEØXA on San Felix and San Ambrosi Islands for about one week from around April 20th. Anyone hear them? Alan Dailey says the MP4MAH operates from a caravan in Oman. ZB1JM is on Gozo Island, north-west of Malta. VS90C is on Masirah Island and is active on 20 and 40 c.w. AC5H on $14035 \mathrm{kc} / \mathrm{s}$ and XW8AX and XW8AZ are both active on 20 s.s.b.

GM3LXI left for St. Helena on the 1st April, and another call already on the island will be ZD7IP. G3JDG is active on $28 \mathrm{Mc} / \mathrm{s}$ Sunday mornings (real DX).

Contest enthusiasts have a quiet time for May. On the $3 \mathrm{rd}, 144 \mathrm{Mc} / \mathrm{s}$ portable contest; $8-9 \mathrm{th}$, USSR DX c.w.; 15-16th, Second 70Mc/s Open Contest; 29-30th, first $432 \mathrm{Mc} / \mathrm{s}$, contest. June 4-7th, CHC/FHC/HTH QSO party. Finally, June 12-13th is National Field Day.

In future please submit your logs in alphabetical order of prefix.

## CATALOGUE RECEIVED

We have recently received the latest illustrated catalogue of Messrs. Henry's Radio Ltd. (303 Edgware Road, London, W.2). This latest edition which has been completely brought up to date to include many new lines, contains 90 pages detailing hundreds of components and may be obtained from Henry's for 2 s .6 d . post paid.

## teginioni thaining in radio television and electronics

Whether you are a newcomer to radio and electronics, or are engaged in the industry and wish to prepare for a recognized examination, ICS can further your technical knowledge and provide the specialized training so essential to success. ICS have helped thousands of ambitious men to move up into higher paid jobs-they can help you too! Why not fill in the coupon below and find out how?
Many diplomo and examination courses ovailable, including expert coaching for:

## Institution of Electronics \& Radio Engineern (Brit.I.R.E.) <br> 8 C. G. Telecommunication Techns' Certs. C. \& G. Supplementary Studies <br> R.T.E.B. Radio/T.V. Servicing Certificate <br> Radio Amateurs' Examination P.M.G. Certs in Radiotelegraphy <br> General Certificate of Education, etc.

## Examination Students Coached until Successful

## NEW SELF-BUILD RADIO COUṘSES

Learn as you build. You can learn both the theory and practice of valve and transistor circuits, and servicing work while building your own 5 -valve receiver, transistor portable, signal generator and multi-test meter-all under expert tuition. Three courses to choose from

## POST THIS GOUPON TODAY

[^2]

Ideally suitable for printed wiring panels and transistorised circuits.
Incorporating a new dielectric material and of unique construction, they are of small physical size and meet the requirements of H. 5 D.E.F. 5011 Specification. The windings are virtually non-inductive and the wire terminations are soldered direct to the metal electrodes eliminating contact resistance and ensuring the minimum possible inductance.

| Cap. НF | Dimensions |  | T.C.C. Type No. |

| Q. 1 | 7010mm | \% ${ }^{\text {gr }} 7.2 \mathrm{~mm}$ | PMX4 |

Cap Tolerance $\pm 20 \%$
Voltage Rating:
Ranges available in 250 V
D.C. and 400 V D.C.

## Power Factor:

$\leqq 0.01$ at $1 \mathrm{Kc} / \mathrm{s}$ at $+20^{\circ} \mathrm{C}$.
Temperature Rating: Suitable for working at $+85^{\circ} \mathrm{C}$. without derating.
Details of the full range are given in T.C.C. Bulletin 93, available on request.

Insulation Resistance 10,000 megohms or 2,000 ohm farad whichever is less.
Terminations:
22 s.w.g. solder-coated parallel wires for vertical mounting.
Finish:
Insulated-special noncracking heat resisting thermosetting compound providing good insulation and good protection against the ingress of moisture.

## PREPARING <br>  <br> BRIAN ROBINSON.

## 8. AMPLIFIERS, FREQUENCY CHANGERS AND DETECTORS

### 8.1 The Triode as an Amplifier

I$T$ will be remembered from Article 6 that the triode valve can be used as an ampiifier and also that the amplification factor, $\mu$, was given by the ratio of the change in Va to that of $\overline{\mathrm{V}} \mathrm{g}$ when both were causing the same change in la. The three types of amplification generally met are Class A , Class $B$ and Class $C$ amplification.

Class $A$-the valve is operated on the straight line portion of the $\mathrm{Ia} / \mathrm{Vg}$ curve.
Class B-the valve is operated on the curved portion of the Ia/Vg curve.
Class $C$-the valve is biased beyond the cut-off value.

### 8.2 Class A Amplification

Assume that an alternating voltage is applied to the grid of a triode and that this voltage has a peak value of 2 V . If the negative bias applied to the grid is $-3 V$ then it can be seen that the actual negative voltage applied to the grid can vary between -5 and -1 V (i.e. $-3-2=-5 \mathrm{~V}$ and $-3+2=-1 \mathrm{~V}$ ).

Fig. 67: Typical conditions for Class A amplification.

It can be seen from Fig. 67 that the alternating voltuge applied to the grid causes an alternating current to appear in the anode circuit. The alternation of la does, of course, cause an alternating component to occur in Va , this is shown dotted in Fig. 67. The peak a.c. output voltage is 20 V as shown, and therefore the change in grid voltage of 2 V has caused a change in anode voltage of 20 V . (For the same change in la.) The amplification factor is $20 / 2$ or 10 .

For Class $A$ amplification the valve must be operated on the straight line portion of tha la/ Vg curve otherwise distortion of the signal will occur. The effect on the output caused by operating the valve used in Fig. 67 with an applied bias of -6 V is shown in Fig. 68. It can be seen that distortion of the output signal occurs. This type of distortion is called harmonic distortion and is most undesirable in a Class $\mathbf{A}$ amplifier.

Fig. 68: Class $A$ distortion due to over-biasing.

Fig. 69: Typical conditions for Class B amplification.

### 8.3 Class B Amplification

In Class $B$ amplification the valve is biased near to its cut-off value. In Fig. 69 a graph showing typical operating conditions is given. The output signal is virtually only a half cycle. This output is therefore distorted as no anode current flows on almost half a cycle. The Class $B$ amplifier is much more efficient than the Class $A$ amplifier but the distortion of the output signal is a serious problem.

If the input signal is connected to two valves connected in push-pull, as shown in Fig. 70, then the problem of distortion is overcome. The signal is applied to the valves through a centre tapped transformer and the output is also taken from a centre tapped transformer. If the valves have identical characteristics the output from the secondary of the output transformer will be a sine wave. In the circuit as drawn anode current does
not flow in either valve for the duration of the dotted part of the cycle.

### 8.4 Class C Amplification

For this type of amplification the valve is biased beyond its cut-off value. In this case then no anode current will flow for the greater part of the cycle. Class C amplifiers are generally used for radio frequencies when the tuned circuits which are used are sufficiently selective to filter out the harmonics which occur as a result of distortion. The Class C amplifier is the rost efficient of the three and is frequently used in transmitter circuits where large power outputs are required.

### 8.5 Frequency Changers

In the superheterodyne receiver (or " superhet", which will be dealt with later) the incoming signal, which could be say a broadcast station, is not amplified and then rectified (or detected) at its original frequency but is first of all converted to a lower frequency. This converting of a signal from one frequency to another is called frequency changing. The frequency to which the signal is changed is called the intermediate frequency. The advantages of lowering the frequency at which the signal is to be amplified are as follows-

1 The receiver becomes more selective, i.e. signals of stations with very close frequencies can be more easily separated.
2 Strong, signals will not "block" the receiver.
3 Amplification is more efficient at a lower frequency, i.e. the lntermediate Frequency or i.f.
The frequency changer works in the following way. Two separate valves are required (both may however be in the same envelope), one being called the mixer and the other the oscillator. As can be seen from the block diagram in Fig. 72 it is assumed that the incoming signal is at a frequency of $5 \mathrm{Mc} / \mathrm{s}$. If an oscillator generates a signal at $5.5 \mathrm{Mc} / \mathrm{s}$ then a tuned circuit at $5 \cdot 5-5=0.5 \mathrm{Mc} / \mathrm{s}$ can be placed in the anode circuit of the mixer valve. The incoming signal has therefore been converted from a frequency of $5 \mathrm{Mc} / \mathrm{s}$ to one of $0.5 \mathrm{Mc} / \mathrm{s}$ which is the Intermediate Frequency.

Fig. 72: A block diagram illustrating the principle of the mixer.

Fig. 71: Typical conditions for Class C amplificotion.

## TRANSISTOR COILS

The P50 series remain the most popular and widely used components for Medium and Long-wave Transistors Superhets:-

## VALVE RECEIVER COILS

Our individual "H" type iron-cored coils are without equal for the construction of a wide range of receivers. For the simplest T.R.F. sets covering one or more wave-bands the Aerial and H.F. Transformer coils are ideal. The standard superhet circuit using the ever-popular triode-hexode frequency change layout would employ the Aerial and Oscillator coils and the coverage can be selected from 7 different bands ranging from 12.5 to 2,000 metres. For a really high-performance receiver an R.F. stage can be added by using the Aerial, H.F. Transformer and Oscillator Coils and a circuit is provided illustrating such a layout.

H Coils 3/9 each.

# please note our change of name WEYRAD (ELECTRONICS) LIMITED recent factory, school street, WEYMOUTH, DORSET

Fig. $73 a$ (above) and $b$ (below): Two typical mixer circuits.

The i.f. would still be $0.5 \mathrm{Mc} / \mathrm{s}$ if the oncillator frequency were $4 \cdot 5 \mathrm{Mc} / \mathrm{s}$. i.e. $5-4 \cdot 5=0.5 \mathrm{Mc} / \mathrm{s}$. (In Fig. 72 it would. of course also be possible to have an i.f. of $10 \mathrm{Mc} / \mathrm{s}$. i.c. $5+5 \cdot 5=10 \mathrm{Mc} / \mathrm{s}$. hut this would destroy the object of the frequency changing!) The output from a mixer at the Intermediate Frequency is taken through an Intermediate Frequency transformer. Two mixer circuits are shown in Fig. 73a and b. The main difference between the circuits is the way in which the oscillator voltage is injected into the mixer.

### 8.6 Detectors

The simplest type of detector simply uses a diode valve. (Or a Germanium or Silicon Diode.) Generally a simple half wave defector will he wied and this is very similar to the diode rectifier dealt with in Article 5. It is assumed that the r.f. signal received by the detector is modulated. i.e. speech or some other sound is superimposed on the r.f. signal. The modulated r.f. signal is of the form shown in Fig. 74a. This is applied to the anode circuit of the detector and anode current only flows on the positive half cycle. the rectified signal is then of the form shown in Fig. 74b. The rectified signal is then passed through a capacitance and resistance connected in parallel. and

(a)

(b)

(c)

(d)
these filter out the r.f. component which remains in the rectified signal: the resulting waveform is as shown in Fig. 74c. The signal will then be passed to an audio frequenty (a.f.) amplifier through a coupling capacitor, and as the capacitor only transmits variations of voltage the voltage which reaches the a.f. amplifier will be of the form shown in Fig. 74d.

A simple diode detector is shown in Fig. 75.

Fig. 74 (left): Illustrating the action of the diade as a detector.

Fig. 75: A simple diode rectifier circurt.

The diode detector can handie large signals and its linearity is good. It does consume power from the circuit, however, and the " $Q$ " of the tuned circuit will therefore be lowered, the sensitivity of the diode is also low.

### 8.7 The Anode Detector

If a triode is biased almost to cut-off point then a change in the grid voltage will cause a corresponding change in the anode current (average). This change of anode current will follow the changes of grid voltage and the result is that rectification will take place in the anode circuit. A typical circuit for an anode detector is given in Fig. 76 (below). The anode detector takes no power from the tuned circuit and some amplification of the signal takes place. It will not handle signals as large as the diode will however, and its linearity is not quite so good.

Another popular detector using the triode is the grid leak detector and the reader is advised to look up details of this in one of the recommended text books.

## Question

In Fig. 77 (below)
a What is the applied grid bias?
$b$ What is the peak input signal voltage?
$c$ What is the peak change in anode voltage?
d What is the amplification factor?
c What type of amplifier is depicted?

## Answer to Last Month's Question

This answer is given in Fig. 78 a and $b$.

Fig. $78 a$ (above) and b (below): Graphs the same as, or similar to these should have been obtained from the dota given in last month's question.

## using a portable in the car

-continued from page 147
a prototype amplifier using an OC171 in a wideband circuit extending to about $3 \mathrm{Mc} / \mathrm{s}$ was produced. The gain was measured at about 36 dB at the top end of the m.w. band. An ordinary portable was set up at sea level on the South Devon coast and tuned round the frequency of Radio Caroline. There was no trace of the station.
The above-mentioned amplifier was then connected to the portable and to an ordinary, clip-on car radio aerial. Radio Caroline was then received loud and clear at full volume. The only trouble was that the combination picked up almost every source of interference for yards around. It seems that the most useful gain is 20 dB provided good matching is maintained at both the input and the output of the amplifier and that the response does not rise much above $2 \mathrm{Mc} / \mathrm{s}$.

Negative feedback can be adopted in the design both to equalise the response over the required spectrum and to secure the best input matching to the car-type aerial. The author has had a great deal of success with single transistor commonemitter amplifiers with a wideband ferrite transformer or choke in the collector circuit and with controlled negative feedback. Commercial representation of the author's design is shown in Fig. 6.

## NOW ADD F.M. RADIO to your MARTIN AUDIOKIT SET-UP

 with only 3 easy-to-assemble prefabricated unitsThe unique and outstandingly successiul system developed by Martin Electronics whereby prefabricated transistorised units can be assembled to make your own choice of hi-fi now brings 3 further Units, No. 15,16 and 17 to enable you to build a modern F.M. Tuner of exceptionally good design and performance. Incended primarily for those who have chosen an Audiokit hi-fi set-up, the Tuner may also be used with other good amplifiers if desired. With a few simple connections, you will have a cuner of excellent appeararice to please the most critical ear, yet is is surprisingly inexpensive.
A whole range of Audiakit Units is avallable which you can assemble to your own chorce with ease and comslete success. Ask for the Audiokit lealie

View obove shows 'Inits 15, 16 and 17 assembled. Below, the ottractive escutcheon.

UNIT IS F.M. Head \& tuning
condenser

- Sensitivity-20 micro-V for 20 dB signat nolse ratio: 5 micro-V for 40 dB
- A.F.C. - ensures easy accurate tuning.
- Tuning - 88 to $108 \mathrm{Mc} / \mathrm{s}$
- Audio Response-Flat from 30 to 15,000 c's.
(D) Controls-Tuning, and on off with switch through stage tor recording, evc.

# No. 10 Some Odd Audio 

TTHOSE of the faithful who managed a visit to the Russell Hotel for this year's International Audio Festival and Fair may well he wondering just where the search for realism is leading us.

Stop-at-homes, who rely on the reports they read in magazines such as this. are quite sure. The road to fidelity runs right off the edge of a cliff. Before it gets to the brink. it performs that curious optical confidence trick of vanishing to a perspective point. As we get nearer and nearer what we bclieve to be the ultimate, there is less and less difference between the steps we take. Improvements, to quote a reviewer, are "marginal".
last year, the gimmick was Multiplex Stereo. This year, with the radio powers-that-be still living in the age of Morse, with international committees wrangling over standards while countries go their diverse ways, even the most optimistic amplifier maker was reluctant to make Multiplex a prime selling pointdespite the Quad decoder.
There were numerous "refinements ". Anlong these, the loudspeaker with no moving parts, and the pickup with almost as

Tell a chop he is sceing double ....
inertialess a virtue. Now that Fane appear to have got rid of the ORM bug that beset Plessey in the earlier Ionophone, and Decca the transverse pick-up stresses. we must surely be a pace more along that vanishing road?
The optical illusion metaphor is apt. Tell a chap he is seeing doubic and he'll shrug it off as a bit of a joke. But tell him that the por dise that "sends" him has sounds the composer never scribbled, that the backing group did not put there, and which the vocalist could not produce. even with that twisted larynx, and he'll call you a purist. Worse, if you show him scientifically that half of what went in the microphone fails to come out of the loudspeaker, moving parts or no, he is likely to write you off as some sort of hig-headed necromancer.
The old sneer about the audiophile who listens to the decibels rather than the music is still to be heard, even in the discreetly carpeted corridors of our exhibition hotels.

Some of the charges are justifiable. After all, who wants the London Symphony Orchestra in the lounge? They would only knock over the ornaments. On the other hand, if we consider that good listening is elusive, who is to toll the hearer whether he is getting all that the composer intended?

Using this subjectivity argument we can muse on whether the composer actually intended what we hear under "normal", or even "ideal" concert conditions. Consider the latest Festival Hall assisted resonance. Helmoholtz resonators mounted above the ceiling, microphones and loudspeakers tuned to spot frequencies from 70 to $340 \mathrm{c} / \mathrm{s}$ (with the $100 \mathrm{c} / \mathrm{s}$ spot missingask Messrs Moir and Parkin why: don't complain to Henry). In all. 89 channels. with amplifiers adjusting reverberation time of each individually. All cunningly installed and adjusted

The coughs and sniffs of a Hanoverion court.
unknown to us blissful concertgners over a period of weeks.
The point is, what of the later Beethoven? Did he, hand cupped to ear, imagine his symphonies as acoustically pure as the London County Council is endeavouring to make them? More likely, he would have considered himself in a vacuum without the coughs and sniffs of the Hanoverian Court.

It does not seem to matter so much with some modern music, where even the orchestra leader is not sure if the score is upside down. It should matter even less with a beat group. Perhaps it is at this point that the two cultures meet, so let's get back to the electronics and leave the musicians to wrangle among themselves.

Electronics--that's a laugh. What about the baby grand piano at the Paris Festival du Son, which contained tape recorder, record player, amplifiers, F.M. tuner, and, crowning insult, keyboard of an electronic organ under the lid.
A parting mention, to get your audio teeth into. Patent 982,934 describes a hearing aid with the microphone coupled to a short range radio transmitter, and its receiver fitted in a hollow tooth so that the rectified signal tickle; up the exposed nerve endings.

Ouch!

# Long Wave Convertor 

This unit will very simply add I.w. Light Progromme to any medium wave-only receiver.

T1HE BBC medium wave Light Programme on $1,214 \mathrm{kc} / \mathrm{s}$ is prone to selective fading and interference from Continental stations during the evening, and this is very much worse in the south and east of England. The long wave Light Programme on $200 \mathrm{kc} / \mathrm{s}$ does not sufler these disadvantages but, however, there are a considerable number of both valve and transistor receivers which will only receive medium wave. The purpose here is to describe a self-contained simple unit not requiring any modification to the existing receiver that will convert the $200 \mathrm{kc} / \mathrm{s}$ Light Programme to a convenient point on the medium wave band.

## Description

The circuit (Fig. 1) consists of two stages, $\operatorname{Tr} 1$ being a mixer amplifier and $\operatorname{Tr} 2$ a local oscillator.

The $200 \mathrm{kc} / \mathrm{s}$ signal is received on the ferrite rod aerial and tuned by $\mathrm{TCl} / \mathrm{Cl}$. It is then amplified and converted to a medium wave frequency by Tr 1 . The output is taken direct from the collector load resistor via the blocking capacitor C4 and does not require a tuned circuit as the receiver to which it is connected will provide the necessary selectivity. No earth connection is needed provided the unit and the receiver are connected by only a short wire, the capacity between them providing the earth coupling.

The local oscillator which will determine the medium wave output frequency is tuned by TC2 and L3 and coupled by the winding L4 to the base of the mixer.

Fig. 1: The two-stage transistor circuit.

## COMPONENTS LIST

## Resistors:

Fig. 2: This component layout was found satisfactory for the plastic case used for the prototype. The methods of mounting the components is largely a matter of convenience, but thick elastic bands can be recommended for holding the ferrite rod and battery.

The bias of both transistors is conventional and the values chosen will provide suitable operation conditions for a wide range of popular r.f. transistors such as OC44, etc.

## Coils and Variable Capacitors

The tuning may be achieved by using proprietary coils or winding one's own.

If proprietary coils are chosen a suitable ferrite aerial is the Repanco FS4. This covers long wave only and has a suitable coupling winding L2. The local oscillator transformer is any medium wave coil with a coupling winding and screened, a suitable one being the Repanco XMA16.

To wind one's own coils the details are as follows L1 200 turns 36 s.w.g. pile wound. L2 20 turns 28 s.w g. close wound and adjacent to L1. Both wound near the centre of a $4 \frac{1}{2} \mathrm{in}$. piece of $\frac{1}{d} \mathrm{in}$. diameter ferrite rod. L3 80 turns 36 s.w.g. pile wound. L4 20 turns 36s.w.g. close wound. Both wound on a $\frac{5}{16} \mathrm{in}$. diameter former fitted with a

Fig. 3: Layout of components on the paxolin sub-panel.
dust slug and screening can, a suitable one being the Aladdin former and screening can.

Since the tuning of L 1 is to be fixed at $200 \mathrm{ke} / \mathrm{s}$ a Iow-value trimmer TCl may be used and the total capacity made up to approximately 300 pF by C1.

If the compression trimmer TC2 specified is not readily available a small variable capacitor with solid dielectric such as the type sold with crystal sets may be used.

## Construction

The unit is built in a box approximately $\sin . x \sin$. x $\quad \frac{1}{2}$ in., there being plenty to choose from. sold as sandwich boxes. A wooden box can also be construeted but a metal box must not be used as it would screen the aerial.

The parts may be positioned in the box as shown in Fig. 2 and fixing holes marked out. The battery is held against the box by bolting to the box a picce of broad elestic band. The ferrite rod may be held in place in the same way.
The component sub-panel (Fig. 3) is a piece of paxolin drilled with a fine drill to support the lead wircs of the components and the inter-connecting of the components done on the reverse side, using the component lead wires. Where wires cross, a piece of slecving should be slipped over.

The sub-panel is held on to the box by a small angle bracket.

## Alignment

The unit is connected to the receiver and the receiver switched on and tuned to a quiet part of the medium wave band. Note this frequency then move the receiver tuning by $200 \mathrm{kc} / \mathrm{s}$ as indicated by the receiver dial. Switch on the converter and adjust its oscillator tuning (TC2) until the receivel produces a change in background noise showing that the converter oscillator is on the frequency indicated by the receiver. Reset the receiver tuning to its original setting and the $200 \mathrm{kc} / \mathrm{s}$ Light Programme should be heard. A slight adjustment of the converter tuning TC2 may be required due to inaccuracies in the receiver dial alignment. Adjust TCl for maximum signal and the unit is aligned.

To assist in the initial alignment a long wire aerial may be attached to the base of Trl via a 220 pF capacitor, but on removal a slight adjustment of TCl will be necessary.

If it is thought that the quietest point has not been found on the medium wave band a small adjustment to the receiver tuning may be made. followed by a readjustment of TC2 to regain the Light Programme. In this way the Light Programme may be brought up almost anywhere on the medium wave band.

ACTON, BRENTFORD AND CHISWICK RADIO CLUB Hon. Sec.: W. G. Dyer, G3GEH, 188 Gunnersbury Avanue, Aston, London, W.13.
At the meeting held IBth May there was a talk and discussion on "Antennae". The Club meeting place is 66 High Road, Chiswick, and meetings start at $7.30 \mathrm{p} . \mathrm{m}$.
BRADFORD RADIO SOCIETY
Hon. Sec.: E. G. Barker, G3OTO, 63 Woodeot Road, Baildon, Nr. Shipley, Yorkthire.
On 29th April, there was a visit to the Spen Valley A.R.S., where there was a talk on Manned Space Flight. BROMSGROVE AND DISTRICT AMATEUR RADIO CLUB
Hon. Sec.: J. K. Harvey, 22 Elm Grove, Bromsgrove, Worcestershire.
G6WI will give a lecture on 14 th May, entitled "I $4 \mathrm{Mc} / \mathrm{s}$ Operation and Conditions".
Meetings are held on the second Friday each month at the Co-op. Rooms, High Street, Bromsgrove.
CHESTER AND DISTRICT AMATEUR RADIO SOCIETY Hon. Sec.: P. J. Holland, G3TZO, Field House, 19 Kingsley Road, Gt. Boughton, Chester.

There will be a surplus sale on I Ith May and G3DRB will present a film show.
Meetings are avery Tuesday except the firse in the month, at 8 p.m. in the Y.M.C.A., Chester.
DERBY AND DISTRICT AMATEUR RADIO SOCIETY Hon. Sec.: F. C. Ward, G2CVV, 5 Uplands Avenue, Litele* over, Derby.
On Ist and 2nd May, there was the $144 \mathrm{Mc} / \mathrm{s}$ Contest (portable eyent) and on 29th May there will be the first $432 \mathrm{Mc} / \mathrm{s}$ Contest. GOSPORTAND DISTRICTAMATEUR RADIO SOCIETY Hon. Sec.: J. T. Nightingale, 21 Pier Straet, Lee-on-theSolont, Hants.

Recent activities have included a talk and demonseration on Mobile 4 metre operation, and a visit to the Radio Museum of H.M.S. Collingwood.

HALIFAX AND DISTRICT AMATEUR RADIO SOCIETY Hon. Sec.: J. Ingham, G3RM@, Lambert House, Greetland, Hallifax, Yorkshire.

On 25 th May there will be a 2 Metre evening at the QTH of G3IGW, Rose Dene, Wood Lane, Hipperholme, Halifax.
HUDDERSFIELDAMATEUR RADIO SOCIETY
Hon. Sec.: R. Higton, 5 Brian Avenue, Dalton, Huddersfield, Yorkshire.

The Club recently had a visit from members of the Spen Valley Club. A favourable QTH has been taken ovar by the Club, so the Club. A avourable Qution wili be on the air under the callsign G3HOV.
ISLE OF WIGHT RADIO SOCIETY
Hon, Sec.: M. Pettit, 18 Berry Hill, Lake, Sandown, I,O.W.
The Sociaty is funntig an R.A.E. course every Monday evening. Normal meetings are held every Friday evening, and includa lectures, a construction course and film shows. All meetings are held at the Club's H.Q. at Unity Hall, Wootton Bridge, Nr. Ryde, I.O.W.

MELTON MOWBRAY AMATEUR RADIO SOCIETY
Hon. Sec.: D. W. Llley, G3FDF, 23 Melton Road, Ashfordby Hill, Melton Mowbray, Leics.

On 27th May there will be a visit to she shack of Mr. D. Fisher. All mestings are held in the St. John Ambulance Hall, Ashfordby Hill, Melton Mowbray,
MID.WARWICKSHIRE AMATEUR RADIO SOCIETY
Hon. Sec.: H. C. Loxley, 5 Guy Street, Warwick.
At the meeting on 3rd May, there was a calk on S.S.B. Reception, and on the 17 th J. Beam Aerials Led., will give a talk abour Amateur
Aerial Arrays. NORTHERN HEIGHTS AMATEUR RADIO SOCIETY, G2SU
Hon, Sec.: A. Robinson, G3MDW, Candy Cabin, Ogden, Halifax.

The Club has recently obtained a licence (callsign G2SU) which is a re-issue of one of tha founder member's callsign.

The meatings are held at the Sportsman Inn, Ogden, Nr. Halifax, at $7.30 \mathrm{p} . \mathrm{m}$.

On l2th May thare will be a visit to Manchester airport and on 26th May, there will be a recorded lecture by the late G2SU on Mieraphones.

## READING AMATEUR RADIO SOCIETY

Hon. See: N. C. Taylor, G3TOA, 83 Stoneham Close, Tilehurst. Reading, Berks.

The next meeting of the Club will be on 29th May. The meeting will take the form of a full scale rehearsal for NFD and will be held at the QTH o! G5HZ, commencins at $2.30 \mathrm{p} . \mathrm{m}$.
ROYAL NAVAL AMATEURRADIO SOCIETY, G3BZU
M. J. Matthews, H.Q., H.M.S. Mercury, Leydene, Pétersfield. Hants.

The Society is holding a Mobile Rally at H.M. Signal School, H.M.S. Mercury, to celebrate their 5th year in existence.

Mobiles equipped for amateur operation will be able to get a
"Talk-in" through GB3RN operating on $1880 \mathrm{kc} / \mathrm{s}, 70.26 \mathrm{Mc} / \mathrm{s}$ and
$144.2 \mathrm{Mc} / \mathrm{s}$. G3BZU will be operating on $3720 \mathrm{kc} / \mathrm{s}$ for mobiles equipped for S.S.B, reception on that band.
SALTASH AND DISTRICT AMATEUR RADIO SOCIETY
Hon. Sec.: D. Bowers, 95 Grenfell Avenue, Saltash, Cornwall.
On 7th May, there will be an R.S.G.B. tape lecture, "Hints on Mobile Operacion".
SLADE RADIO SOCIETY
Publicity Officer: R. L. Jenkins, 42 Warwick Road, Warlay, Birmingham 32.

On 24th May there will be a lecture by Mr. D. Collins on Logic and Digital Circuits.
SOUTH BIRMINGHAM RADIO SOCIETY
Hon. Sec.: J. Rowley, GT@O, 195 Castle Lane, Solihull.
On 20th May, there will be the half-yearly Junk and Surplus sale and on 17th June there will be a demonstration and display of Heathkit Products.
SOUTHGATE, FINCHLEY AND DISTRICT GROUP OF THE R.S.G.B.
Hon. Sec.: R. Wilkinson, G3TXA, 23 Ashridge Gardens, Palmers Green, N.I3.
On l3ch May there will be a talk by Truvox Led., poseponed from some months back.
SPEN VALLEY AMATEUR RADIO SOCIETY
SPEN SALLEY AMATEUR RA, Pride, 100 Raikes Lane, Birstall, Nr. Leeds.
There wes a talk on Manned Space Flight on 29th April, and on 13th May there will be a visit to Wharifdale Wireless Works, at Idle, Bradford.
WEST KENT AMATEUR RADIO SOCIETY
Hon. Sec.: H. F. Richards, 17 Reynolds Lane, Tunbridge Wolls, Kent.
On 23rd April there was an Exchange and Mart evening. On the i4th May final arrantements will be made for the NFD.
WIRRAL AMATEUR RADIO SOCIETY
Hon. Sec: A. Seed, G3FOO, 31 Withert Avenue, Bebington, Wlrral, Cheshire.
Orral, Cheshire. was an "expedition" covering top band 4 and 2 metres.

# Smaller than any set in the world FASCINATING to build marvellous to use <br> A.G.C. 

No set in the history of radio has ever captured the public's enthusiasm as has the world famous Sinclair Micro-6 Never was a set so smali, never so efficient and powerful. Smaller than a matchbox, the Micro-6 brings in stations from all over Europe for your pleasure and entertainment (unless you use it in the U.S.A. or Australia, for examole). It performs with fantastic efficiency in cars, buses, trains as well as steel-framed buildings, yet everything
to do with this set except the lightweight earpiece is contained in the minute white, gold and black base which is small enough to be held in a teaspoon! The many attractive features of the Micro-6 include an unusual and original 6 -stage circuit, powerful A.G.C., bandspread for easy Luxembourg reception, vernier-type tuning and three special M.A.T. Transistors. Tunes over the medium wave-band. The instructions make building easy.

MALLORY ZM. 312 MERCURY CELL (2 required) each 1/11 Pack of 6 ZM. 312 cells $10 / 6$ TRANSRISTA nylon wrist strap for wearing Micro-6 on wrist $\quad 7 / 6$

BLOCK DIAC:RAM OF MICRO-6
Three special Sinclair Micro-Alloy transistors (MAT) are used to provide two stages of R.F. amplification, followed by an efficient double diode detector which drives a high-gain 3 -stage A.F. amplifier, Powerful A.G.C. applied to the first R.F. stage ensures fade-free reception from the most distant stations tuned in and the set measures only I! $\times 13_{10} \times \frac{1}{2}$ inch.

## SINCLAIR

x-20 power unit $£ 4.19 .6$

## New design - New power!

#### Abstract

First to bring P.W.M. to constructors, Sinclair now take amplifier design even further ahead with the Sinclair $\mathbf{X - 2 0}$. This elegantly styled amplifier has all the qualities demanded of the costliest hi-fi equipment, but it costs many times less, and is far more efficient. With a maximum output of 20 watts R.M.S. (British rating) the $X$ - 20 gives you power and power to spare. It provides unsurpassed quality too, and is so designed that for very little outlay, you can add the tone and volume control system of your choice to the preamp stage included in the $X-20$. This is the ideal amplifier for stereo reproduction, and the $X-20$ manual included with this amplifier gives full depails of how to make a stereo assembly. The $\mathbf{X}-20$ measures only $81_{1}{ }^{\prime \prime} \times 31^{\prime \prime}$ $\times I^{\prime \prime}$-dimensions which will inspire constructors to build to entirely

 new concepts of design and layout.
## $=\approx=$ and the X-10 for those requiring a less powerful P.W.M amplifier

Althongh the $X \cdot 10$ has been anperseded in power by the $X-20$ this superb Sinclatr integrated P.W.M. Ampliticr and Pre-amp. gives Fon all the advantages of quality and eftciency whlch nakes thesc Ginclair designs so outstanding in every way. Many thousands of X-10's are already in use and this unit will go on giving service in listening conditions. Prices.too are parmeularly attractive. An X-10 manual is arailsble, $1 /=$
manual is available, 1/G
£5.19.6
Eeady buill $£ 6.19 .6 \quad x-10$ Pouer supply ynii $£ 2.14 .0$
For 12-15V operation. Tone control system is added to choice.

- No. of transistors- 12
- Output stage uses newest silicon epitaxial planar transistors and requires no heal sink.
- Frequency response- 20 to $20,000 \mathrm{c} / \mathrm{s}$ $\pm 1 d B$
- Total harmonic distortion- $0.1 \%$ at 10 watts R.M.S.
- Input sensitivity-ImV into 5 K ohms
- Signal to noise ratio better than 70dB

OUTPUT INTO 7.5 ohms 20 watts R.M.S. music power 15 watts R.M.S. continuous
OUTPUT INTO 15 ohms
15 watts R.M.S. music power 12 watts R.M.S. continuous

- Low pass filter in output stage

Power requirements- 36 Vde at 700 mA

- P.R.F. 65-75 ke/s
- Overall size- $-8 t^{\prime \prime} \times 3 t^{*} \times 1^{\prime \prime}$
- Total weight- $4 \frac{1}{2}$ ozs.

FULL SERVICE FACILITIES AVAILABLE TO ALL SINCLAIR CUSTOMERS

# WHAT YOU SHOLID XIOOW ABOUT  

The Sinclair $\mathbf{X - 2 0}$ integrated Pulse Width Modulated Amplifier and Pre-amp marks a further important advance by Sinclair in the development of entirely new and original amplifier designs. Many months of research and development have gone into its produc. tion and units have been subjected to impossibly severe working conditions with sensationally satisfactory results. The $\mathbf{X}-20$ has even been run flat out continuously and at the end has still shown no signs of strain or distress.

## WHY P.W.M. WAS CHOSEN

This odvanced form of Pulse Width Modulation used by Sinclair in the X - 20 offers many important advantoges over conventionally designed amplifiers. These con be summarised briefly as follows:

1. Completely faithful reproduction of the signal fed into the pre-amp. stage.
2. Brilliant transient response.
3. Absolutely flat frequency response at all power levels.
4. $95 \%$ energy conversion factor-power is not dissipated in unwanted heat.
5. Fantastically compact size in relation to power out put.
6. Prices that make it possible for everyone to enjoy hi-fi at its very best.

## PULSE REPETITION FREQUENCY

In the interests of quality the P.R.F. must be as high as possible without extending into the region of radio frequencies. In the $X-20$, the pulse repetition frequency is between 65 and $75 \mathrm{Kc} / \mathrm{s}$, a value which is found to satisfy the most stringent demands likely to be made upon it in terms of uncompromising quality. This frequency is generated within the circuitry of the $X-20$ itself and the output has rise-fall times of less than 0.2 micro-seconds, a value sufficient to ensure maximum efficiency in energy conversion to the loudspeaker with perfect reproduction of the audio signal itself.

## OUTPUT STAGE—95\% EFFICIENT

Rise and fall times of less than 0.2 micro-seconds are achieved by using silicon epitaxial planar output transistors which makes the efficiency of the output stage at least $95 \%$. Thus only I watt is dissipated in each of the output transistors when the amplifier is giving an output of 20 watts.
The complete linearity of the integrater and careful
modulator design ensure absolutely negligible distortion right up to the maximum output.

## LOW-PASS FILTER

A low-pass filter cutting off above $20 \mathrm{Kc} / \mathrm{s}$ built into the output of the $\mathrm{X}-20$ ensures that the output transistors always "see"" a high impedance at the P.R.F., making the amplifier widely tolerant of the type of load to which it is connected.

## PRE-AMPLIFIER

This consists of three transistors with two negative feed back loops which define the gain and ensure an absolutely flat frequency response. The sensitivity is sufficient for all types of pick-ups. Provision is also made for connecting high-output devices such as F.M. Tuners and Tape Pre-amps.

## TONE CONTROL SYSTEMS

The Manual included with the $X-20$ Amplifier details a variety of tone and volume control systems, any one of which may be added to the amplifier for very little outlay. Full information on stereo operation is also provided, of course.

## POWER SUPPLY -

A special A.C. Mains operated power supply unit is available for the $\times-20$, delivering 36 volts D.C. Fullwave rectification is used, and the unit is supplied ready built in a completely enclosed steel case.

Ready built and tested $£ 9.19 .6$
AC Mains Power unit for up ta two $X$-20's $£ 4.19 .6$

## PRACTICAL WIRELESS

## blueprints

MOST of these blueprints are drawn full-size and although the issues containing descriptions of these sets are now out of print, constructional details are available free with each blueprint except for those marked thus (*).
Send (preferably) a postal order to cover the cost of the Blueprint (stamps over 6d. unacceptable) to PRACTICAL WIRELESS, Blueprint Dept., George Newnes, Ltd., Tower House, Southampton Street, London W.C.2.

## DOUBLE-SIDED BLUEPRINTS

## RECEIVERS

PLEASE NOTE that we can supply no blueprints other than those shown in the above list. Nor are we able to supply service sheets for commercial radio, TV or audio equipment.

## QUERY SERVICE

The P.W. Query Service is designed primarily to answer queries on articles published in the magazine and to deal with problems which cannot easily be solved by reference to standard text books. In order to prevent unnecessary disappointment, prospective users of the service should note that:
(a) We cannot undertake to design equipment or to supply wiring diagrams or circuits, to individual requirements.
(b) We cannot supply detailed information for converting, war surplus equipment, or to supply circuitry.
(c) It is usually impossible to supply information on imported domestic equipment owing to the lack of details available.
(d) We regret we are unable to answer technical queries over the telephone.
(e) It helps us if queries are clear and concise.
(f) We cannot guarantee to answer any query not accompanied by the current query coupon and a stamped addressed envelope.

## QUERYCOUPON

This coupon is available until 3rd JUNE, 1965 and must accompany all queries in accordance with the rules of our Query Service.

VHF FM TUNER TO BUILD

TOTAL COST $£ 6.19 .6$
TO BUILD - 5-transistors, 4-diodes. $\star$ Princed circuit superhet. * Tuning range 87 to $105 \mathrm{Mc} / \mathrm{s}$ - RF stage and double tuned |FT'S-9 volt 9 mA operated.

* All parts sold separately. $\star$ Output up to 1 volt. $\star$ Size $4 \times 3 \frac{1}{2} \times 2 \frac{1}{6} \mathrm{in}$. P.P. $2^{16}$ (complete with front panel) $\star$ Cabinet Assembly 20/- extra.
MW W POCKET SUPERHET RADIO

## TO BUILD

* 6-transistor plus diode. * Push-pull speaker outpul. $\star$ Easy printed circuit. * Slow geared tuning. $\star$ Full MED and long waves. $\star$ Moulded cabinet $5 \times 3 \times 1 \frac{1}{4} \mathrm{in}$. P.P. 2/- (Battery 2/6, Phone 5/-) Amazing sensitivity and TOTALCOST 85/- , selectivity.
TWO WAVEBAND ALL TRANSISTOR CAR RADIO TO ASSEMBLE

TOTAL COST 18.19 .6 TO BUILD P.P. 316.

* Supplied as factory built assemblies-just interconnect. * 6-transistor push-pull design-double tuned IFT'S.
\& Push-button wavechange-lullatuning range.
K Size $7 \times 4 \times 2$ in.-fits any car-chromed front dial.
\& Units availabla separate!y.
太 Guits availabla separate.y.
t Guaranteed high performance and quality.
PUSH-BUTTON TRANSISTOR PORTABLE TO BUILD

* 6-transistor superhet design.
* Easy to build printed circuit.
* 8 in. ferrite aerial, and DITIFTS.
* Push-button wavechange,
* Full Med./LW geared tuning.
* Attractive sturdy cabinet. Size $10 \times 7 \times 3 \frac{1}{2} \mathrm{in}$.
- All parts sold separately. $\star$ sensitive

TOTAL COST 17.19 .6
P.P. ${ }^{3 / 6}$ (Batteries 6/-) SUPERHET TO BUILD -- VHF FM TUNER TO ASSEMBLE

* Supplied as prebuilt and aligned units plus mera! work just interconnect.
+88 to $108 \mathrm{Mc} / \mathrm{s}$. FM tuning. * 100 mV to 100 Kohm output.
* 6-transistor printed circuit. Superhet design.
* Size $9 \frac{1}{2} \times 3 \frac{1}{2} \times 4 \mathrm{in}$.

(All units available separately). P.P. 216
