

Radio '88 Hosts AM Rally

Alan Carter

Washington DC ... Radio broadcasters kicked off Radio '88 with a rally for AM and by honoring excellence in local achievement with the Crystal Radio Awards.

The annual fall radio convention held here in the nation's capital 14-17 September also included exhibits by more than 180 companies—40 of them technical equipment exhibitors—on 37,000 square feet, with a noticeable emphasis on new digital technology.

FCC Commissioner Patricia Dennis and Mass Media Bureau Chief Alex Felker led broadcasters in a rather calm "AM Rally"—minus cheerleaders but with plenty of balloons—extolling the future of the band in spite of its current bleak period.

Broadcasters including Ron Frizzell of WLAM/WKZS, Portland, ME; Al Martine, Martine Broadcasting, Beckley, WV;

and Gary Bruce of WHAS, Louisville, KY, also gave the insiders' view with personal stories of success in the business.

Part of the blame for the decline in AM lies on the shoulders of the FCC, Dennis said. In particular, she pointed to the past allocation policies that created interference problems, especially at night.

Programming, technical standards and allocation policies are three areas on which Dennis said she believes broadcasters must concentrate to improve the band.

Some AMs have remained dominant and carved out a programming niche, Dennis said. She questioned the benefits of simulcasting with FM because she said such a policy implied that AM has nothing unique to offer.

Dennis also expressed her support for the NRSC audio and emission standard and her assessment of the new AM band from 1605-1705 kHz as a "rare opportunity" to work with unused spectrum.

She noted her hesitation to authorize low-power in the new band, placing her support toward 5 and 10 kW stations that provide full-market service.

On overall policy, Dennis maintained her support for continued authorization of new stations because she said such action serves the public interest.

Which standard?

Felker also praised the NRSC standard. The Commission has issued a rule

A giant boom box greeted attendees of the NAB's Radio '88 convention in Washington, D.C.

New NAB Radio Unveiled

by Judith Gross

Washington DC ... Amid the ultimate in fanfare, the NAB unveiled—literally—its "ultimate receiver," designed by Richard Sequerra to incorporate the latest in high-tech radio advancements.

A large press conference was held with members of the NAB board and staff and Sequerra himself present to explain how the receiver would help AM and enhance FM.

Radio Board President L. Lowry Mays uncovered the receiver, which was to incorporate the NRSC standard, FMX, continuous tuning from AM to FM, AM stereo (in three separate models) and AM noise-blanking.

In addition, the prototype model had a specially designed shielded loop antenna tuned by a rotating dial on top. An "intensity modulated" tuning indicator was designed to show the optimum setting for an AM station.

But from the start, the Sequerra receiver faced a series of problems which dampened enthusiasm for it at the show and which may hamper its acceptance among consumers and receiver manufacturers.

Delays and glitches

The introduction was delayed by a day while Sequerra continued to work on it. At its unveiling, the AM portion was not

After the Allied Sale

by Charles Taylor

Quincy IL ... While the logistical ramifications of the late August buyout of Allied Broadcast Equipment Corp. by Harris Corp. have been spelled out by the companies, what remains to be seen is how the partnership might affect other

broadcast manufacturers and distributors.

The purchase of Allied, the largest US full-line distributor to the international broadcast industry, by Harris on 31 August undoubtedly will influence other manufacturers, many in the industry say, though it will take time to determine how.

Some claim the currently potent Allied will weaken under the wings of Harris, a well-known supplier of broadcast equipment, opening up competition more evenly among smaller companies.

"The sentiment of a lot of manufacturers is that Allied was getting much too strong," said one industry official who did not want to be identified. "If, in fact, Harris is going to botch it all up in a matter of a year or two, and therefore diversify the marketplace again, I'll be delighted."

Others say the buyout of the Allied operations will give Harris products an unfair advantage in the marketplace, leaving companies hesitant to use Allied as a distributor. One manufacturer even questioned the legality of the acquisition.

A number of observers have said that Harris' main interest in the company is to strengthen its own marketing arm.

The power of the force

In any case, many company officials are hesitant to place their names beside their opinions, recognizing the influence that the combined forces possess in the industry. Harris is valued at \$2.1 billion, according to the company. Allied's total sales figures exceed \$30 million.

AM National Licensing Panned

by Charles Taylor

Washington DC ... A handful of reply comments filed in late August lent additional support and criticism to previously stated opinions regarding the FCC's Fourth Notice of Inquiry to expand the AM band.

The issue, contained in Gen. Docket 84-467, concerns the FCC's rule making to establish 10 new commercial AM channels, from 1605 to 1705 in July 1990.

In June, the Commission presented a full discussion of the ramifications of the expansion and ideas for specific uses.

Comments following in August primarily took jabs at the FCC's concept of allowing single licensees to control portions of the band nationwide.

The idea of giving preference to current daytime stations in the expanded band also was a key issue, garnering a

majority of support.

In reply comments due 26 August, four groups responded. The filings mainly added emphasis to views on the national licensing and daytimer preference issues.

The Washington-based National Black Media Coalition argued that the expanded band should be reserved for minority and noncommercial interests and not for national licensing or daytimers.

"The daytimer giveaway sought by the NAB and other commenters would further exacerbate the Commission's eight-year tilt toward incumbent daytimers and away from more meritorious claims of minorities and public broadcasters," the coalition said.

"Daytimers voluntarily chose to operate on their frequencies. Nobody forced them onto the air. At least they have fre-

quencies on which to operate," the group continued.

The NBMC pointed out that while "daytimers may be second-class broadcasters; minorities and noncommercial interests have been third-class in the eyes of the Commission."

Noncommercial preference

WNET, a noncommercial educational station in Newark, NJ, pushed for noncommercial preference in frequency allocation, and suggested that the Commission adopt an allocations scheme that allows several of the 10 available frequencies to be assigned on a reserved basis to the largest markets underserved by high-power educational stations.

The station supported the FCC's proposal to relocate daytimers on the expanded band and opposed the national licensing scheme, primarily because

"few public broadcasters can afford to construct and operate a national network of broadcast stations, and many would lack legal authority to do so."

Also, national licensing does not address the problems of an overcrowded educational FM spectrum, which are best rectified by local AM assignments made on an as-needed basis, WNET said.

The National Telecommunications and Information Administration (NTIA) in Washington, encouraged the FCC to utilize AM band expansion to improve the quality of existing AM radio service, not just to add new stations.

This can be accomplished, the organization said, by following proposals to move existing daytimers into the expanded band, allowing them to provide more extensive service to their communities and relieving congestion in the lower band; and by moving second-adjacent stations and translators into the expanded band.

"It is important that the Commission coordinate its efforts to improve AM radio, including the implementation of the expansion band, to achieve expeditiously the revitalization of this service," NTIA said.

Yes to national licensing

Finally, EZ Communications, based in Fairfax, VA, and owner of 10 AM and FM stations nationwide, countered majority opinion in its filing by becoming the first to support the concept of national licensing.

EZ said that national licensing not only is lawful, but is in the public interest. "For the first time, many residents in rural areas could enjoy new and innovative broadcast services on the same basis as urban residents," the group said.

The company went on to observe that national licensing also would serve as incentive to the development of new receivers and to consumers to buy them, more than if stations were licensed piecemeal one at a time with programming that is indistinguishable or identical to other market station formats.

For more information on Docket 84-467, see 1 September RW, page 12, or contact Wilson LaFollette at the FCC, 202-632-5414.

NEWS BRIEFS

NRSC and Class A

Washington DC ... The FCC has set the comment and reply comment deadlines for proposed rule makings on the NRSC standard (Docket MM 88-376) and the Class A power hike (Docket 88-375).

Comments are due 22 November and reply comments 22 December on both.

Training Minorities

Washington DC ... Three broadcast associations will launch a program to encourage minority employment at radio and television stations.

Trainees will be screened by an advisory board and placed on an assignment for one year during which they will be paid at an entry-level scale. At the end of the year, the station will have the first option for hiring the trainee, but that person would be under no obligation to accept the offer.

The program, to begin in the summer of 1989, was proposed by the Radio and

Television News Directors Association (RTNDA) and received the support of NAB and the Broadcast Education Association (BEA).

Station Totals

Washington DC ... The most recent figures from the FCC showed there were 10,348 AM and FM stations broadcasting as of 31 July, compared to 10,337 as of 30 June.

The July breakdown included 4914 AMs; 4089 commercial FMs and 1345 educational FMs.

The report also noted there were 1594 FM translators in operation.

NPR Moves on Satellite

Washington DC ... National Public Radio has issued a request for proposals for the space segment of public radio's second generation satellite interconnection system. Proposals are due 1 November.

The current system, inaugurated in 1979, uses a transponder on the Westar

IV satellite that is expected to go dark in 1991.

The RFP asked for service and price quotations for both a single C band transponder and two C band transponders to be put into service no later than 1 May 1991 and last a minimum of 10 years.

Money Radio Uplinks

Los Angeles CA ... Money Radio has uplinked to the Satcom I-R satellite to implement a nationwide syndication network, according to Executive VP Vera Gold.

Stations throughout North America, including Alaska and Hawaii, can downlink Money Radio's signal on Satcom I-R's dual polarized transponder 21, to frequency 74.4.

Broadcasting live from the Pacific Stock Exchange building in L.A., Money Radio is a 24-hour, all news/talk broadcasting medium specializing in business, finance and investments.

making including both the audio and RF emission portions of the standard.

Felker said, however, that while the emission standard may be "more effective" in addressing second adjacent channel interference, the audio portion "does a real good job." He also noted a greater cost in implementing just the emission standard because of the uncertainty of measurement techniques.

Some broadcasters are concerned that the FCC will act on the emission standard and not the audio portion.

Felker also said there is an opportunity for broadcasters to improve skywave and groundwave propagation with new measuring techniques not available 40 and 50 years ago when some FCC rules were written.

Frizzell also questioned the use of simulcasting AM stations on FM, because it encourages broadcasters to neglect the AM.

WHAS's Bruce encouraged AMers to "go above and beyond" what FMs are doing in their market. With the negative perception that AM is no good, AM broadcasters are in the tough position of having to be twice as good as AM if they are going to succeed, he said.

Martine told how he took his station in Beckley, WV,

The winners were: KTNN, Window Rock, AZ; WAGE, Leesburg, VA; WBAL, Baltimore; WBEL, Beloit, WI; WKKR/WZMG, Auburn, AL; WMT, Cedar Rapids, IA; WTMJ, Milwaukee, WI;

the upcoming year.

Among the topics NAB Joint Board Chairman Wally Jorgenson stressed were interference reduction, comparative renewal and FM translators.

Radio Board Chairman L. Lowry Mays focused on the radio industry's need to lobby in Congress for radio-only legislation, a proposition where radio and TV would be separated on legislative regulations.

NAB President and CEO Eddie Fritts called radio an enduring force that is facing immense competition. He said survival in the 1990s will depend on radio broadcasters examining

(From left) Patricia Diaz Dennis, Alex Feker, Al Martine and Gary Bruce listen as Ron Frizzell speaks during the NAB's AM rally.

... Dennis maintained her support for continued authorization of new (AM) stations because she said such action serves the public interest.

At the radio insider level, WLAM/WKZS's Frizzell called the NRSC a very important tool for AM. "It needs to happen fast," Frizzell said, and he suggested the FCC institute strong penalties for stations not complying. He pointed to a survey that found 80 percent of listeners questioned could not tell the difference between an FM signal and an NRSC AM signal.

from a losing situation by switching to an oldies format. "We programmed to the community," he said.

Crystal awards

Also at the opening of the convention, NAB named the 10 winners of the second annual Crystal Radio Awards to recognize community service and involvement.

WTRE, Greensburg, IN; WWVA, Wheeling, WV, and KVON, Napa Valley, CA.

With a theme of "Radio Is the Future," the NAB introduced the Crystal Awards presentation with a skit featuring Gandar the Wizard and two young companions, looking into the future and discovering radio.

Key NAB officials also used the program to stress important radio issues for

ing new trends and "targeting the future."

Among the areas Fritts said broadcasters should be concerned about are new taxes that could come from the federal government, including spectrum fees and taxes on advertising and transfer applications.

(Complete Radio '88 coverage will be in the 15 October RW.)

15 Console Models Mono or Stereo

Add true on air reliability with these solid, dependable studio favorites. Every mixer preamp in the 150A, 250A, and 350A series consoles is selectable for a high or low (microphone) level input. Line, monitor, cue, and headphone amplifiers are all on plug-in boards. Audio quality is excellent! The Series 250A consoles feature ladder-type, step attenuators with cue detent and telephone-type roller cam key switches for silent, reliable channel selection.

Cheers, Jeers and Radio Wizards

by Judith Gross

Falls Church VA ... Hate to keep harping back to the Land of Oz analogy ... but there we were, in the nation's capital for Radio '88, and from a distance, DC does sort of resemble the Emerald City.

There's that feel of un-reality, for starters. Why else would trade and lobbying organizations spend millions to tell Congress how real people out there really think and feel?

This time the Wizard was Gandar, a spirit conjured up by the NAB to tell us all that "radio is the future." Thank you, but I thought that's why we were all there to begin with. Talk about preaching to the converted.

Anyway the giant boom boxes once again led the way, and the festivities kicked off with what was supposed to be a rally for AM.

Things stayed pretty tame, with a lot of the same technical review of AM's problems we've heard in the past.

There was no rah-rah cheering, there weren't even hot dogs, pom poms or

Abracadabra: the "ultimate" revealed.

cheerleaders. At least there were balloons. Cheerful red and blue ones proclaiming "AM Alive."

Unfortunately, by all accounts, the rest of the convention and related events were not happy ones for AM radio.

There was the NAB's invite to 180 receiver manufacturers to come and talk about better quality radios for AM. Only seven showed up.

One of those who did attend said his company had no interest in making AM radios, period.

The receiver manufacturers, along with the rest of us, did get to hear audio cuts from the B. Angell study which asked listeners how much adjacent and co-channel interference was acceptable (26 dB music, 40 dB talk, for adjacent) and the clarity of interference was at times, amazing.

But since the cuts were done with the NRSC standard in the audio, one manufacturer pointed out that the B. Angell study also shows that NRSC

alone won't clean up AM enough to get the better radios on the market. Bitter irony for the NAB, which commissioned the study, if the results also ultimately undermine the attempt to promote NRSC.

☆☆☆

And speaking of "ultimate" ... there was the unveiling of the "ultimate" radio receiver designed and built by

Richard Sequerra of (yet another old stomping ground of mine) Bayside, NY.

No sooner had NAB execs whisked off the gold lame cover before a packed hallway of reporters (we had to move the event into the hallway because the NAB

couldn't get a good signal in the convention center meeting rooms) than it became obvious the receiver was, well, underwhelming, to be kind.

First off, it's a tabletop model, with separate speakers. Gee, don't most AM

Big wheels rolling Texar to Gentner.

listeners listen in cars these days?

Then, there was only one prototype, not the three (each with a different way of decoding the stereo) that had been promised.

Couldn't tell if the Sequerra receiver will be the salvation of AM, because the AM portion wasn't working. Neither was what is probably the single most important innovation on the entire receiver, namely the continuous tuning feature. Seems a faulty chip was to blame for that.

But then, as one of my colleagues pointed out to me, the clock on the radio was 21 minutes slow as well.

The whole fiasco had consumer reporters, most of whom were unfamiliar with the industry issues involved and most of whom had been dragged down to the press conference (a day late) on the promise of a radio designed to save AM, puzzled, skeptical or worse.

The NAB still owes Sequerra \$12,500 on the \$25,000 contract for the prototypes, and still wants to get three working models.

But how are they going to get receiver manufacturers interested if they can't set

the public on fire over the idea? (Heck, even the reporters were yawning!)

This whole thing about talking to the receiver guys needs to be rethought ... you know, get everybody talking the same language, for one.

Why doesn't the NAB hire a promoter-type who has ties to the consumer industry, like the FMX people recently did? No wonder the Car Audio Specialists Association upped and endorsed FMX.

☆☆☆

AM's bad news didn't end there, either. There was the

presentation by Bill Moyes of the Research Group as to why folks don't tune in AM anymore. It's the perception of poor quality, and the words "AM stereo" which only confuses the issue (say "1230 stereo" or "WXYZ stereo" instead).

But it didn't help that those presenting the bad news aren't aiming for AM's shining success themselves. They told attendees basically not to spend money on AM unless they have an FM firmly in their pockets.

In other words, they only use the AM as a sort of "loss leader", that extra half point on the ratings to rake in a few more bucks from the advertiser.

Maybe it's one case where the messenger of the bad news should have been "killed."

If the sad AM story has you down, don't feel helpless. Ron Frizzell of WLAM up in Maine has written an incisive little article comparing AMers to passengers aboard the Titanic after the iceberg hit.

It's in this issue. Read it, then show it to your GM, or if you are a GM, show it to the FCC, Congress, the NAB and anybody else who you think it's time got up and did something decisive for AM. Then act.

A few quick tidbits from around the show: Texar's products arrived in Salt Lake City in time to appear in the Gentner booth.

Three big vans moved the entire Monroeville, PA operation out in Utah in September.

CRL's Bill Ammons said "why wait" for a better quality AM receiver. He built his own, taking a receiver and widening the IF bandwidth, adding NRSC and C-QUAM stereo. Sounded great.

Some new products were at the show, including a stereo noise generator and preemphasis monitor for the NRSC standard from Delta's; some FM and AM gear from Harris, including a module from the very first DX-50 digital transmitter.

That first unit, by the way, has already been sold to KFBK, the Group W station in Sacramento. And there were many other interesting products at Radio '88. You can read all about it next issue. Heading off to Denver next ... it's one show after another.

Heard something interesting? Spill your guts to Earwaves. Write PO Box 1214, Falls Church VA 22041, or call me at 703-998-7600. Best tidbit of the month wins a coveted Radio World mug.

This new QuantAural™ QA-100 Audio Program Analyzer gives you the advantage in competitive broadcasting

Simply put, the QA-100 quantifies what you hear. Your station sound can now be electronically monitored the way you hear it. Exactly. And, you can monitor the competition too!

Real time analysis of any audio signal. From a receiver, tape recorder, or processing equipment. You see the measurements as you hear the sound. Changes in processing or variations in system performance are immediately shown on the QA-100 panel meter or bargraph display—using program material as the signal source.

The QA-100 hears like a program director and talks like an engineer. With it you can monitor maximum peak level (relative peak modulation), overall

processing effectiveness (average level), tightness of sound and processing control (peak density), tonal balance, consistency and preemphasis (four band real time analyzer), stereo image width (L + R to L - R ratio) and "punch" (special "aural intensity" measurement).

Interested? To learn more about how the QA-100 will help your station compete, call Potomac Instruments today.

QuantAural is a registered trademark.

NAB on FM2

Dear RW:

I wish to respond to Larry Tighe's guest editorial printed in the 1 August edition of *Radio World*.

First, when several NAB staff members met with Mr. Tighe in April of this year we extended him an invitation to work within NAB committees and try to establish some kind of NAB policy on the FM2 issue. He never responded.

Based on the flow of communications to NAB over the last year, the fact is that FM2 has not had a great deal of industry support. If it did, perhaps NAB could be more responsive to Mr. Tighe's concerns.

Second, as of today NAB has spent more out-of-pocket money on AM improvement than any other NAB initiative, including HDTV.

While \$700,000 has been budgeted to fund an industry Advanced Television Test Center (ATTC), at least that much—and perhaps more—has or will be spent on AM improvement and NAB's share of the NAB/RAB Radio Futures Committee project.

Mr. Tighe is mistaken when he suggests that NAB's priorities (at least to the extent they can be measured by dollars) lie more with the future of television than with the future of radio.

Finally, Mr. Tighe's various statements that NAB is dominated by "big dues

payers" are simply not true. One NAB constituency does not have any more "domination" capability than any other NAB constituency.

Every "dues payer"—daytimers, clear channel operators, Class A FM stations, large markets, medium markets, small markets, associate members, convention attendees and exhibitors—has an important role in NAB affairs.

It should also be noted that, if anything, NAB provides more service to smaller stations than larger stations.

For example, most of the phone calls to, and member service activities of the NAB Science & Technology Department are on behalf of smaller stations. Radio membership has grown steadily and is near record high levels; we must be doing something right.

I repeat my invitation to Mr. Tighe: Come present FM2 to our committees. If FM2 is such a terrific solution for AM broadcasters Mr. Tighe should have no problem selling his proposal among his peers.

But something more than rhetoric is needed to invoke what Mr. Tighe calls NAB "muscle": facts and a plan of action. Developing policy on behalf of an entire industry deserves no less.

Michael C. Rau
VP Science & Technology, NAB
Washington DC

Class A coverage

Dear RW:

Thank you very much for the coverage you have given the Class A broadcasters in the New Jersey effort to achieve a power hike to 6000 watts.

I have been involved in this effort from the first days when the issue was raised by John Furr and John Barger of Clear Channel Communications, back in the fall of 1986.

Your publication was the first, long before *Broadcasting* and the others, to recognize our movement with an article 1 June, 1987. You have covered us all the way through our days of reversals and slow going.

Now we are a growing cause. Finally Class A broadcasters are beginning to realize we really have a chance to win a unilateral power increase. Our engineering is sound, our opposition emotional and weakly documented, and we really feel we can succeed without NAB.

The so-called NAB "compromise" position is no such thing. It is a position which discriminates against over 800

ERRATA

In the story *Transducer Operating Specs: The Basics of Mic Application* (September 1, 1988 RW), the captions for Figures 2 and 3 were reversed.

Also the author was misidentified as Bill, rather than Bruce Bartlett. We regret these errors.

A warning bell was sounded during Radio '88 for AMers—and anyone else concerned about AM's future.

Underneath the pro-radio messages of the convention program were a series of unrelated—and unintentional—reminders that AM is in trouble and the time has come for decisive action.

The bell was heard in the sparse showing of receiver manufacturers who attended an NAB meeting designed to spark interest in better quality AM radios. It was heard during an AM rally that rehashed the technical problems plaguing the band without providing leadership or concrete plans to undo the damage already done.

It was sounded again with the trouble-plagued unveiling of the "ultimate" radio which failed to work properly, failed to excite the enthusiasm hoped for, and lacked the necessary follow-up to promote its technical advances to receiver manufacturers and listeners.

Bell Tolls For AMs

And the warning bell was heard twice in a report on the public's attitudes towards AM. First came further evidence of declining listenership because the band is perceived as a low-fidelity service.

And second, there was the attitude of those presenting the findings—namely, that it's acceptable to consider an AM station a second-class property as long as you own an FM.

No one person or set of circumstances is to blame for the constant reminders of AM's troubles which plagued the show. And fault-finding is not going to help save AM.

The months of fact-finding, technical review comments and task forces are past; the data is in. Now it's time for the leading AM stations to call an emergency meeting and take action.

While technical relief needs to be mandated by the FCC, it's clear that the Commission will only act when it is sent a message stating precisely what is needed to help. But AM's problems can no longer be solved by technical means alone. It's time for owners, managers and programmers to act in unison and to get the public in on the process too.

AMers should either select whatever organization is most responsive and can do them the most good (the FCC's RAC, NAB, RAB, etc.), or decide to start their own AM-only group to get the job done.

The mis-steps and missed cues at Radio '88 show that the best efforts being put forth currently are just not enough.

For anyone who still cares about AM's future, time is running out.

—RW

Class A stations. Most of these stations are located in the populated areas of the country where the Class A power increase is needed the most.

And even for the stations that could be helped by the NAB proposal, a layer of expensive and troublesome case-by-case FCC paper work is added to the process, precluding many of the small stations from taking advantage of the proposal.

This fall the Class A broadcasters will mount the most vigorous comment campaign the Commission has seen in a long time. Organizational meetings are being held now, legislators are getting involved, the hat is being passed.

True we are the "little guys." We don't have the money or the clout of the Bs and Cs or the NAB, but we are building a very strong belief in the urgency of our causes. Most of all, we know we can win!

Michael C. Rice, President
Nutmeg Broadcasting Company
Willimantic CT

Friday "massacres" more common

Dear RW

In response to your mention in 1 September's *Earwaves* concerning former KVLTV CE Troy Langham's "Black Friday," let me fill you in on some background information about the "volatile" Tulsa market.

"Black Fridays" are nothing new here, as I personally have seen the same thing happen to other staffs at other stations during the last five years.

I have even personally experienced the humiliation of a "clean sweep" within the last 18 months. A "clean sweep" Mr. Langham was aware was coming and conveniently "forgot" to tell those of us involved, even though he was assisting the new manager in looking for a replacement engineering staff.

I was fortunate and able to come out on my feet, eventually owning two successful radio properties in Oklahoma and landing here as a partner and as the General Manager/CE of KBIX-AM and soon to be built KBIX-FM.

Mr. Langham has been successful in his quest for gainful employment. I understand he is now the CE of KQMJ Henryetta, OK. I hope he is breathing easier now.

So, as you can see, sad stories and Black Fridays are nothing new to broadcasting in Tulsa and we have all learned to take one day at a time.

Fatal Air Crash Totals FM Tower

by Charles Taylor

Valdosta GA ... A single-engine airplane crashed into a radio and TV tower here in mid-August, killing the pilot, demolishing the tower and leaving WJYF-FM off the air and without revenue for nearly three weeks.

The TV station broadcasting from the tower, WVGA, was expected to begin broadcasting at the beginning of this month after being down since the crash.

The accident occurred when Frank Blaydes, a Cairo, GA physician, was attempting to land a rented Cessna 172 at the Adel, GA airport between 2:45 and 3 AM 17 August.

Dense fog prevented him from landing at Valdosta Regional airport about 25 miles away. A sheriff's report said he may have thought the lights on the radio antenna were airport runway lights at Adel.

Visibility was estimated at less than 700'. The broadcast tower stood 950'.

"The plane ran into one of the guy wires evidently and when it snapped the wire, it set up some kind of vibrations and the tower just fell over," said WVGA-TV Station Manager Marvin Keene. "It was completely demolished, from ground level up. It was taken right off at the base and then fell onto the transmitter building."

Damage to WJYF-FM was estimated at \$15,000, according to Clyde Scott, the station's contract engineer. Destroyed were a single bay Jampro antenna and feed line, microwave dish feed line, directional coupler inside the transmitter building, the auto power board in the transmitter and other "nickel and dime" components, Scott said.

Insurance will cover those items, though station officials were negotiating about costs incurred to modify equipment for alternative transmission.

Cause discovered hours later

The 24-hour FM was thrown off the air at the time of the accident but station officials didn't discover why until several hours later, said David Handy, president and owner of Tift Area Radio Inc., which operates WJYF-FM and WTIF-AM.

The overnight operator tried to bring the station back up after it was knocked off, then called Scott when his efforts failed.

"But (Scott) was at work (at another station) and we had to wait until he got off," Handy said. "Meanwhile, the folks (at WVGA-TV) were coming in to sign on at 6 AM and nothing happened. They called their engineer and both he and (Scott) arrived from different directions at the tower site about the same time just as daybreak was coming."

By then, police had roped off the site and the cause of the power outage was more than obvious.

WJYF at first intended to broadcast the FM's signal from the nearby tower of its sister WTIF-AM. The FCC nixed that idea.

Then officials at stations WDDQ-FM and WBIT-AM agreed to share their antenna for transmission of WJYF. The station's studios and antenna are located in Adel about four miles from the crash site.

Scott modified the power to the WDDQ antenna by adding plate voltage to the station's CCA-5000 transmitter, producing a three-phase, 5 kW signal instead of the single-phase, 2 kW transmission signal that was broadcast from the previous site. Also, instead of broadcasting from 800', the stand-by antenna was perched at 220'.

Plan runs astray

But the plan went astray when Scott found that WJYF's microwave hook-up could not be attached to the antenna, leaving no way to transmit the station's signal from the studio to the tower. Undaunted, WDDQ/WBIT offered WJYF studio space to air its easy-listening programming.

"They had an FM control room that was being used for one newscast a day," Scott said, "with a four-channel stereo board sitting there and a couple of cart machines. I pulled two of the ITC-750s out of (WJYF's) automation rack, ran them down there and put in another rack, wired them in through this console, into audio processing gear, pressed the button and we were on."

The station returned to the air at 1:30 PM 3 September, 18 days after losing power. Scott estimated that it is operating at about 2/3 its normal power.

Once the new tower is built by WVGA, which is estimated for completion at the end of October, WJYF will utilize the opportunity to alter its transmission pattern to improve signal quality, according to Scott.

"We had tremendous coverage for a Class A, but it had a lot of holes in it,"

he said. "Plus we were right up against a 5' phase on the tower so it was extremely distorted signal pattern-wise."

Scott hopes to extend the tower phase by installing the station's microwave feed about 10' or 15' away from the sides of the tower. Also, he is planning to broadcast from a lower altitude— 500' to 600' instead of the former 800'—at a higher power.

In the meantime, Handy is crossing fingers that being off the air for such a period of time won't permanently harm listenership.

"This FM was at a tall point (in the county) when it went on the air in November 1986. The easy-listening for-

mat is one-of-a-kind in the market area," serving three counties, he said.

"That's what made it so appealing to me to purchase the station, which I finally did July 1st."

Fortunately, he said, the easy-listening audience is loyal to the format, so he anticipates little trouble in getting listeners back as the station endures its transition before returning to full power.

Said Handy, "One lady told me that she just left her dial set and she hasn't listened to anything since."

For more information about the accident, contact David Handy at WJYF, 912-382-1346; or Marvin Keene at WVGA-TV, 912-242-4444.

Gentner Buys Texar

Salt Lake City UT ... The latest player in the whirlwind of acquisitions hitting the broadcast equipment industry is Gentner Electronics Corp. which has entered the audio processing market with the purchase of Texar, Inc.

Gentner President Russell Gentner said the deal was an asset purchase and that Texar was acquired in a cash transaction.

The entire Monroeville, PA Texar operation was moved on 3 September to the new, larger facility recently occupied by Gentner in Salt Lake City.

Several parts of the manufacturing facility were shipped to the Gentner plant by overnight express, according to Gentner "to permit uninterrupted delivery of Texar products and service."

As of 1 September all Gentner dealers were authorized to sell Texar products and the standard Gentner warranty applies to those products retroactive from 1 September, 1987, Gentner said.

Gentner will continue to manufacture and market Texar's products, such as the

successful Audio Prism processing unit, Gentner said. The company will retain Texar founder and President Glen Clark as a consultant to the firm.

"Basically it's going to be business as usual for Texar; it will just be located in

Gentner's new expanded facility in Salt Lake City

Salt Lake City," noted Gentner, who added "all prices will stay the same."

Gentner also said the company would hire a specific manager to handle the Texar product line, noting that Gentner recently beefed up its R&D staff by filling three positions.

Yet to be revealed by Gentner is the status of Texar's latest product, Lazer. A primitive prototype of the new processor appeared at this year's NAB show, but has yet to be completed as a product. Gentner said an announcement on Lazer's status would be forthcoming.

Take Me Out To The Ball Game

Or just take me out. The STLX extender/console puts you on the air when you're on the road.

With the STLX, when you leave the studio you don't leave studio quality behind. The built-in **Comrex Dual-Line** frequency extender with multiband noise reduction will deliver full program audio on two dial telephone lines—anywhere in the world.

And everything you need is all together in one professional package. This is a studio-quality console that's rugged enough for the road, with a four-input mixer (Penny & Giles® faders are standard), complete telephone interface, full monitor system with talkback, AGC, PA feed and more. An optional battery pack is available as well as a custom shipping case that will stand up to the airlines.

For more information on how Comrex can help your road games, call or write Comrex Corporation, 65 Nonset Path, Acton, MA 01720 (508) 263-1800. TWX 710-347-1049. FAX (508) 635-0401. 1-800-237-1776.

C-QUAM[®] AM Stereo . . . setting the whole standard and nothing but the standard.

You be the judge. Here's proof that C-QUAM AM Stereo is "Setting the Industry Standard" with more.

■ **MORE STATIONS.** . . Almost 700 C-QUAM stations worldwide! Nearly 10 times more than any other AM Stereo system -- and growing!

■ **MORE RECEIVERS.** . . Over 15 Million C-QUAM IC's shipped to date! And C-QUAM is already in more than 65 models marketed by over 30 manufacturers.

■ **MORE IC's and NEW FEATURES.** . . Automatic band width control, notch filtering, low or medium voltage operation. Plus, a whole C-QUAM family of IC's to offer enhanced AM Stereo performance!

■ **MORE COUNTRIES.** . . 4 Nations already have named C-QUAM their official AM Stereo standard; many more are currently testing.

■ **MOTOROLA COMMITMENT.** . . From studio to listener, we're totally committed to AM Stereo -- IC technology, broadcast equipment, receiver design, international seminars, technical/marketing support.

Your verdict? Right. . . even blindfolded. C-QUAM is Setting the AM Stereo Standard. So put the Standard to work at your station. Call Steve Kravitz (collect) on the Motorola C-QUAM Hotline 312/576-0554.

Radio No-Shows Mar Meeting

by Judith Gross

Washington DC . . . An open invitation from the NAB to learn about AM technical improvements and discuss the possibilities for better AM radios was largely ignored by receiver manufacturers.

A meeting scheduled just prior to the Radio '88 convention here drew only a handful of receiver manufacturers of the 180 invited and the reactions of those who did attend were not as enthusiastic as the NAB had hoped.

NAB Science and Technology VP Michael Rau explained that the meeting was scheduled to expose the manufacturers to efforts on behalf of AM improvement and spark interest in the new Sequerra receiver and in a certification

mark for improved AM radios incorporating the NRSC standard.

Rau said that representatives of those companies who did attend were mainly engineers, not marketing managers, and that decisions about new radio designs are often, these days, made in Japan where the firms are headquartered.

One other obstacle, he said, seems to be the lack of interest in resurrecting an older technology such as AM radio, instead of supporting newer technologies such as CD and DAT.

One manufacturer's representative told the group his company would not design NRSC receivers "just to sell more radios." He added that "AM is just a thorn in our side; it's a market-

driven thing."

Those who attended heard some cuts from the recently conducted B. Angell listening tests which showed that listeners demand better protection ratios—especially from adjacent channel interference—than those which have been used by the FCC all along.

They also heard the latest reports on coverage figures for station complying with the NRSC standard. Recent surveys done show that the 190 top Arbitron markets have at least one NRSC station including all top 50 markets, and that NRSC signals are available to more than 196,386,000 radio listeners in the US.

Charles Morgan, of Susquehanna broadcasting told the same representatives at the NRSC meeting held just prior to the receiver manufacturers' meeting that the standard had clearly reached the point where "it's time to go to your drawing boards"—to design new radios.

But Carl Pittman from Arvin, a company that manufactures radios on contract for other companies, said "we don't have any plans to make AM radios."

David Meyer, from Thomson Electronics pointed out that decisions about new radios "go beyond the technical into the area of marketing." He added that a certification mark to help market better AM receivers may not in itself be effective, without an accompanying improvement in AM quality.

NAB's Stan Salek (left) and Michael Rau address radio manufacturers.

Bart Locanthi, representing several receiver companies at the meeting added that consumer awareness of AM is low, "around 2-3%."

Rau expressed strong disappointment in the turnout of receiver manufacturers and said after the meeting that "because of the failure of the meeting NAB will have to look at other avenues to reach the decision-makers."

One possibility, according to Rau, is to hire a person familiar with the consumer electronics industry to lobby support for better AM radios.

He said the choosing of a certification mark for improved AM receivers was "the single most important thing" to work toward, and that if the receiver manufacturers don't support the concept there's "no hope for one."

Rau predicted that over time, NRSC radios will be manufactured and marketed, but that broadcasters probably would not be informed when those decisions are made.

"It would be nice to have receiver manufacturers promoting it enthusiastically," Rau said, "but with many standards, this is the best you can hope for."

NAB Test CD in Works

by Charles Taylor

Washington DC . . . The NAB is in the final stages of mastering a compact disc containing test signals for radio station equipment, previously difficult to obtain all in one place and without a variety of signal generating equipment.

The 99-track CD, which should be available by late fall, will include NRSC noise and reference signals, as well as many of the more common test signals for frequency response measurement, harmonic and IM distortion measurement and some specialized broadcast test signals.

It will cost about \$40, according to Stan Salek, an NAB staff engineer, and will require only an above-average quality CD player to conduct the tests.

The disc originally was planned as an easily obtainable way to provide signals for NRSC compliance testing, but "we did all those and still had 60 minutes left on the CD, so we came up with a lot of test signals that would be really hard to

generate otherwise," Salek said.

Specific test signals include precise pilot frequencies; EBS/DTMF tones; and VU/PPM meter calibration signals for the new Institute of Electrical and Electronics Engineers (IEEE) impending standard.

Also included are Bessel calibration tones for FM deviation calibration, which Salek said must be measured within a 10th of a MHz in order to work properly, "so a CD with crystal reference definitely assures you of getting the right frequency"; and pre/deemphasis curve sweeps to check NRSC or 50 and 75 μ sec pre- and deemphasis networks.

NAB plans initially to press 1000 copies.

"We think it's going to be a useful product and therefore should sell well," Salek said. "Everyone who has seen the track list has been impressed."

For ordering information, contact the NAB Station Services department at 800-368-5644. For more information on the product, contact Stan Salek at 202-429-5391.

PRECIOUS METAL Has a whole new ring!

RAC to Evaluate AM Tech Filings

by Alan Carter

Washington DC ... The thoughts of a group of engineers and communication attorneys expressed one September afternoon around a conference table—on the exhaustive review of AM technical requirements by the FCC—may be reflective of the industry.

A tremendous amount of useful information has been compiled, but it has yet to be carefully synthesized, according to the FCC's Radio Advisory Committee.

In addition, those present observed that there were few firm suggestions on technical changes needed to help AM.

The group, at a joint meeting of the RAC technical and allocation subgroups, decided to undertake what could be a painstaking task.

Several volunteered to compile a report for the FCC evaluating the comments made by broadcasters and engineering consultants on a number of technical criteria for allocations on the AM band.

The FCC initiated the review in a Notice of Inquiry in July 1987 seeking comments on assignment criteria, emission limits and the National Radio Systems Committee (NRSC) pre/deemphasis curve. Other areas examined were antenna issues and subjective audio listening studies.

Action already

So far, the Commission has taken one step as a result of the review. It issued a Notice of Proposed Rule Making in June that would make the voluntary NRSC audio standard mandatory and institute a complementary RF emission standard.

The FCC wants to move quickly on the technical review, according to Wilson LaFollette, an assistant chief in the FCC Policy and Rules Division.

But he told the subgroup meeting that although there is a "wealth of data" in the filings, "I don't find a lot of recommendations." He suggested the Commission was at the point it would have to draw its own conclusions. In writing a rule making, LaFollette noted tradeoffs will have to be made, and the FCC needs to know what broadcasters would like.

Wally Johnson, a consulting engineer who is chairman of the technical subgroup and president of the Association for Broadcast Engineering Standards (ABES), questioned if the RAC could "focus in" on some main points for the Commission. There are "common threads" that may need to be drawn together.

Points to note

A sampling of interviews with broadcasters industrywide who participated in the comment period gives some idea of

what engineers think about issues addressed in the technical review.

"I think the big mystery is what the Commission will do with it," said Crawford Engineering Director Chris Alexander. "I think the Commissioners are between a rock and a hard place."

"They needed 'birth control' (for AM allocations) way back when. Now, it's impossible to clean the band up without hurting people."

Crawford supported making the NRSC audio standard mandatory, and Alexander said statistics in the filings showed the industry will have to reduce noise—which he called "impossible"—or increase the signal.

Atmospheric noise

Atmospheric noise is "getting worse," Alexander noted. "The whole noise issue was brought to light." He questioned whether the FCC realizes the importance of the situation.

Capital Cities/ABC Radio Engineering VP Al Resnick drew attention to the

NAB's radio listener study conducted by B. Angell & Associates of Chicago that found current FCC interference protection contours sufficient for co-channel AM stations but inadequate for adjacent channels.

"It gives us a chance to see what listeners expect," Resnick said. But he added, "I didn't find any of it out of the ordinary. I didn't find any surprises."

Ken Brown, manager of allocations and licenses for Capital Cities/ABC, was more wary over the findings.

"We have had no idea of how bad off we have been," Brown said. "There's more to come. It's not over yet."

Interference woes

Brown said he believes interference is the problem with the AM band. "That's what I went looking to find out, and that's what I see."

Glynn Walden, AM stations engineer manager for Group W, also pointed to **(continued on page 17)**

Car Audio Group Endorses FMX

Greenwich CT ... An association of aftermarket car audio equipment manufacturers, distributors, retailers, installers and sales reps has endorsed the FMX stereo extension system for FM radio.

Car Audio Specialists Association (CASA), based in Washington, DC, will work with Broadcast Technology Partners (BTP), the Greenwich-based organization that holds the license to the sys-

tem, to increase awareness of FMX stereo to CASA's 300 members.

CASA President Hugh Whiteman of Quality Auto Sound, a car audio specialty chain headquartered in Lakewood, CA, called FMX "the new standard for quality in FM broadcasting."

FMX is designed to allow listeners in the fringes of an FM station's coverage area to receive a clean FM stereo signal without the hiss that normally accompanies distant stereo signals.

"We support advancements in technology that enhance the performance of autosound equipment and benefit the listening public," Whiteman said.

CASA, founded in 1978, was started to serve as a clearinghouse of information about trends and developments in car audio technology and automobile engineering that impact on the manufacture, sale and installation of aftermarket car audio equipment.

The cooperative venture between CASA and BTP will include developing and coordinating promotional events that will be presented through the association's 9000 storefront affiliated retail membership. The campaign will use retail point-of-purchase displays and promotional efforts among CASA retailers and FMX stereo stations.

CASA Executive Director Cheryl Hollins said the association also will "facilitate the flow of information" concerning

FMX to its 25 manufacturer members. The information will focus on the decoder chips, the number of stations broadcasting with FMX and "what the technology does from A to Z," she said.

Approximately 50 stations nationwide are on-air with FMX or planning to implement the system.

BTP President and FMX co-developer Emil Torick said the CASA endorsement was significant in that a little more than half of FM receivers made are for automobiles, and FMX is very effective in car radios to improve signals in nulls and areas of multipath.

FMX will provide "full stereo separation at greater distances," Torick explained, as opposed to conventional receivers that are "fully blended to monophonic reproduction."

Torick said FMX creates new business opportunities for CASA members in replacement sales and would provide a boost to the radio aftermarket.

On chip development, Torick said that two chip manufacturers are proceeding with plans to market FMX decoder chips. Sanyo is distributing engineering samples and will be in production later this year. Sprague is about three to four months behind, with production expected in 1989.

For information from CASA, contact the association at 202-828-2270. Contact BTP at 203-622-2804.

Let Us Give You A Quote On Our Audio Switcher.

“When we designed our new 23,000 square-foot facility at KLBJ radio, a primary goal was to maximize operational flexibility. So, we looked at the alternate ways to route audio signals. We compared features and specs, as well as costs.

“ITC’s AUDIO SWITCHER turned out to be an easy choice. One reason is it’s designed specifically for audio applications.

“With the AUDIO SWITCHER, we’re wired to and from every satellite, network, studio, and workstation. We’re even wired to the Program Director’s office. And installation was easy.

“That was September ’87. Since then? The AUDIO SWITCHER has worked out wonderfully, and staff reaction has been very, very positive. Changes are easy, and when we reconfigure something, we save both time and money. As far as our return on investment goes, it’s been excellent.”

—Bryan King,
Chief Engineer, KLBJ AM-FM

What more can we say?
If you’d like detailed information on how you, too, can easily and effectively route audio signals, call International Tapetronics, 3M Broadcasting and Related Products Department toll-free at 1-800-447-0414. In Alaska and Illinois, call collect, 309-828-1381.

MORE radio studio, FASTER delivery, LOWER cost... That's the MAGIC of MODULINK.™

Don't let our MODULINK studio's classic good looks fool you. On the inside, MODULINK is really different. It's the first basic improvement in studio design in thirty years.

Designed and built by Arrakis Systems exclusively for Allied, MODULINK is a manufactured, modular radio studio system that can be custom-tailored to meet your exact specifications, yet its unique design allows your new facilities to be operational in days, not weeks or months.

Ideal for both new installations and renovations, MODULINK studio units come fully pre-wired with multi-pin connector "docking modules" which link all units and interconnect all equipment. We preassemble the furniture modules, install the electronics and test the entire package at our own facility. The units are then shipped to you by van. At your station, the fully-systemized MODULINK units are linked together, either by Allied installation crews, or by your own local people. Either way, the studio installation usually takes as little as a single day.

But MODULINK isn't just faster. It's better. The pre-wired, plug-in MODULINK modules offer greater electrical reliability than conventional point-to-point studio wiring methods. What's more, adding new equipment later on or troubleshooting an audio problem are so much easier with MODULINK.

Best of all, MODULINK's advanced design lets Allied give you more radio studio for lots less money. And that could be the difference between getting exactly the studio package you want, or settling for something less.

Before you start your next studio project, call the experts at Allied and let us show you how MODULINK can do it better, faster, for less.

NRSC Debates FCC Plan

by Judith Gross

Washington DC . . . With about 16% of all AM stations converted to the NRSC audio standard, the talk at the committee's recent meeting turned to the FCC's proposal to make the standard mandatory.

The full NRSC met here just prior to the Radio '88 convention, and many members expressed concern that the wording of the Commission's proposed rule making places too much emphasis on the "RF mask" or transmission portion and not enough on the 75 μ sec. and 10 kHz stopband audio portion of the standard.

Some members felt strongly that the FCC's rule making was not in keeping with the original goals set by the committee, namely to help obtain better AM receivers by "cleaning up" interference, especially second adjacent problems.

"The way it's written is not AM improvement, it's AM destruction," said Ken Brown of Capital Cities/ABC. Brown and others voiced concerns that the FCC will use the 10 kHz cutoff the standard mandates to allocate more stations in between those that already exist.

Charles Morgan, of Susquehanna Broadcasting noted that "the FCC is on a fast track with NRSC" and he pointed to the short comment period set on the rule making. Deadline for comments on the NRSC is 22 November, with reply comments due 22 December.

John Marino, of NewCity Communications asked John Reiser, an engineer with the FCC's Mass Media Bureau who attended the meeting, if the FCC might exercise any flexibility with respect to the RF mask portion of the standard.

In particular, Morgan and others voiced support for a two-tiered implementation of the NRSC, with the audio portion taking effect on the proposed date of 1 January, 1990 and the transmission portion perhaps taking effect in 1994.

While Reiser could not comment directly on the rule making, he pointed out that the normal FCC comment procedure provides for modifications of the proposal.

After lengthy discussion on the NRSC rule making, the group decided to ask the NAB and EIA to move forward to convince the FCC that "we had the right idea in the first place."

They also decided to have the technical subgroup meet once before the comment deadline to provide technical data about the effectiveness of the audio standard and the RF mask in a "real-world" situation and perhaps supply data in support of implementing the standard in a two-tiered fashion.

More NRSC monitoring

Also at the NRSC meeting, Delta Electronics, which has developed a splatter monitor to help implement the RF mask portion of the standard, introduced two other test devices to help stations comply with the standard.

Since the NRSC standard includes a definition for a test signal using pulsed USASI noise to duplicate typical program material, Delta has developed a stereo noise generator.

Delta's stereo noise generator is designed with outputs conforming to the NRSC specs which call for two sep-

arate USASI noise sources, cross coupled for a correlation of 1.4:1 (L-R 3 dB lower than L+R).

Delta has also developed a preemphasis monitor to measure the level of preemphasis used by AM radio stations.

Delta Broadcast Sales Manager John Bisset explained that the monitor is designed to help stations become more consistent in their use of preemphasis from 5-10 kHz.

FM issues next

A final subject put before the NRSC was the possibility of instituting an FM

technical subgroup to work on FM issues.

A questionnaire circulated by the NAB and the EIA received 20 positive responses from those willing to participate in such a group.

Some of the FM technical issues raised by those answering the questionnaire were multipath; receiver performance including second and third order IM, adjacent channel rejection and standardizing stereo "blending" and high frequency rolloff; subcarrier protection processing; noise reduction and radio

data systems.

The first meeting of the FM technical subgroup was tentatively set for 15 November, here, with a second tentative meeting at the winter Consumer Electronics Show in Las Vegas in January.

For more NRSC information contact Eb Tingley at the EIA, 202-457-4975 or Stan Salek at the NAB 202-429-5346.

Charles Morgan (left), Stan Salek, and Eb Tingley speak before the NRSC.

First Class Sound. Affordable Price.

Orban's popular XT2 Six-Band Limiter Accessory for OPTIMOD-FM® 8100A has been chosen by many major-market stations seeking a "highly processed" sound that's also clean, natural, and easy to listen to. What's particularly significant is how many have chosen the XT2 after comparing it to "another unit" — which costs twice as much! (The XT2 costs only US\$2,075!)*

How does Orban provide superior performance at a modest price? Simple — the XT2 uses your host OPTIMOD-FM's power supply and much of its circuitry to achieve efficiency, economy, and performance so high that the XT2 would be the processor of choice even if cost were no object.

The XT2 provides bass, presence, and brilliance equalization, plus density and clipping controls, to let you precisely tailor the sound to your station's format and target audience.

Ask your Orban Dealer for information about Orban's powerful First Class winner — the XT2. Or write, call, or FAX us directly.

FCC Group Tackles Radio Issues

by Alan Carter

Washington DC ... FCC officials gave radio broadcasters at a pre Radio '88 Radio Advisory Committee meeting some insight to Commission thinking on several major issues the industry is tackling.

The NRSC rule making is only the first of what may be several proposals to result from the AM technical review, according to Audio Services Division Chief Larry Eads. He did

not elaborate on what may be forthcoming.

On the issue of the NRSC, the Commission is considering a 1 January 1990 implementation date as suggested by the NAB in its proposal for the NRSC, said Wilson LaFollette, an assistant chief for international affairs in Policy and Rules.

Broadcasters questioned the Commission staff as to how they can stress broadcasters' concern that the audio portion

Eads assured broadcasters that the current Commission isn't interested in instituting shortspacing as part of the allocation process.

of the NRSC not get lost in what appears to be an effort at the agency to implement an RF emission standard. There was no response. The RAC, however, is preparing a report for

the FCC on the technical review.

A second issue the Commission staff addressed is the expanded AM band.

LaFollette said a rule making on the expanded band would

include technical standards and he indicated the document would be out relatively soon. The Commission wants to coordinate its introduction with the NRSC standard so receiver manufacturers can "kill two birds with one stone" in producing new radios, LaFollette said.

The Commission doesn't appear to be interested in moving very rapidly on another proposal to allow broadcasters to use FM directional antennas in short-spaced situations, Eads said.

He said there has been an increase in the number of broadcasters seeking short spacing waivers.

Eads assured broadcasters that the current Commission isn't interested in instituting shortspacing as part of the allocation process. However, he said there are no safeguards in the proposal to prevent a future Commission from taking such a step.

Action on a rule making to allow Class A FMs to increase their power from 3000 to 6000 W may be coming next summer, according to Jay Jackson of Mass Media. Comments are due 22 November and reply comment 22 December on the proposal.

On another issue, Eads said the FCC has not received "enough feedback and real world information" to make a move on allowing AM synchronous transmitters.

Of nine experimental authorizations, he said only two are on the air.

For information on the Radio Advisory Committee, contact FCC coordinator Larry Eads at 202-632-6485.

The complete FM stereo performance kit.

When you're looking for a high quality, fully-synthesized, comprehensive instrument to maintain desired modulation levels and quality standards, the TFT Model 844A is all you need. It's a 2-channel RF preselector, FM monitor, and stereo monitor in one economical, compact package!

FEATURES

- Over 20 vital test functions available
- Measure off-air signal, transmitter, stereo generator, or STL performance.

Keep a sharp eye on the competition with the 844A's exclusive, 2-channel RF preselector.

- Peak flashers and peaks-per-minute counter distinguish true modulation peaks from overshoots
- Get a handle on your true modulation ... or theirs
- Three meters with quasi-peak ballistics
- Front-panel waveform monitor outputs
- Built-in absence of modulation/carrier alarm

The suggested list price of the Model 844A is \$4,425. The companion 3-channel SCA Monitor, Model 845 is \$2,325. Delivery is normally one month or better.

Contact a TFT Radio Products Dealer today and arrange to get your complete FM/Stereo Monitor.

Texar Sold

(continued from page 7)

The purchase of Texar is the latest in a round of acquisitions for Gentner. The company first bought Advanced Design Technology, then entered the world of digital audio by acquiring MEI, which marketed the Digi-Sound digital audio storage and playback unit.

Gentner displayed Texar products at the Radio '88 and the SBE conventions. Gentner says the Texar name will remain on the products as the company becomes a "product division."

Clark called the Texar-Gentner arrangement "a good match." He said that Gentner is "one of the few companies that has the technical expertise to be able to continue the production and advancement" of such a high-tech product line.

Clark said he decided to sell the company because of "other things I wanted to do," mentioning specifically consulting on RF design and FCC matters.

Ultimate Radio Falls Short

(continued from page 1)

working, neither was the continuous tuning feature. And instead of three models—one with C-QUAM stereo, one with Kahn ISB stereo only and one multisystem stereo—only one was completed in time for the show.

In addition, the prototype model was a tabletop design with separate speakers. Reporters questioned why the NAB had commissioned a radio designed for in-home listening when most AM listening is done in cars.

The cost of the receiver has yet to be determined and the NAB was not able to explain how it planned to get receiver manufacturers interested in making similar receivers.

In addition, the NAB announced at the unveiling that the AM portion was "9-10 hours away from being completed," yet more than a day later, at the convention's close, the AM portion was not working.

Completion uncertain

NAB executive VP John Abel, Science and Technology VP Michael Rau and Sequerra himself all stressed that the model receiver was "not a production prototype."

Later Rau said that the NAB had done its part to show that a receiver with all the latest technology was possible, but that Sequerra had not completed his part of the agreement.

The NAB initially paid \$25,000 for the

design of the radio, which was completed on time. An additional \$25,000 was to have been paid for three, working prototype receivers. The NAB has paid Sequerra half that amount and has not decided about the rest of the amount owed, Rau said.

Sequerra said that in order to get consumer acceptance of new designs incorporating advances in technology "it will take strong leadership."

He added that he has faith in the receiver's ability to help AM. "I don't

Richard Sequerra fields questions as NAB's Michael Rau (l) and John Abel look on.

think I would have undertaken it if I did not believe AM to be as good as FM."

But reaction from general consumer reporters after the news conference ranged from puzzled to skeptical. One reporter questioned if the radio was "just a promotional gimmick," while others maintained that a tabletop model was not the right step to help AM.

FM DAs Opposed

by Alan Carter

Washington DC . . . Greater Media took one last opportunity to reiterate its opposition to an FCC proposal that would allow increased use of FM directional antennas in short-spaced situations.

Warning the Commission to move cautiously in approving widespread use of FM directional antennas, Greater Media said in reply comments filed for a 5 September deadline that their use is "inherently susceptible" to external factors associated with the physical environment in which they are located.

The Notice of Proposed Rule Making, Docket MM 87-121, resulted from an inquiry under which any short-spaced facility would be required to provide a signal of 3.16 mV/m over the community of license.

Existing stations and allotments would be protected from interference to the theoretical limit of maximum permitted facilities, while short-spaced facilities would be protected to actual service area contours only. A uniform 1 mV/v contour protection is proposed for all stations, including Class Bs.

Under current rules, existing commercial FM stations must comply with minimum distance separations, except for stations that existed prior to the adoption of the current table of assignments and for stations using designated antenna farms.

In other points that Greater Media made, the group owner said the Commission should institute appropriate safeguards to assure adequate monitoring of directional operations.

The licensee of WEZY-FM, Lakeland, FL, Chapman S. Root Revocable Trust, also filed a reply comment opposing the position of Edens Broadcasting, licensee of WRBQ-FM, Tampa, FL.

Edens has asked for flexibility to short-space its station toward WEZY, according to Root. Such a move should not come at the expense of interference to all stations in the affected area, Root argued.

Edens has an application pending in a non-comparative hearing over whether the company has justified a proposed short-spacing of 3.74 miles out of a required 30 toward WEZY. The stations are separated by 10.6 MHz.

For information on Docket 87-121, contact Bernard Gordon at the FCC, 202-632-9660.

RADIO

Classics

What makes a *Radio Classic*? Timeless design, flawless performance, outstanding value, and above all — bullet-proof reliability. Because, in radio, we don't coddle our classics.

The RCA 77DX is one such product. It set new standards in microphone performance. Even now, decades later, its quality still endures. Arrakis Systems' SC audio consoles are *Radio Classics* too. Introduced in 1980, the SC series set new standards in design, performance and value. Today, Arrakis SC consoles are the choice of more radio stations worldwide than any competitive unit in their class. Shown below is the 2000SC, an outstanding value at \$4695. Like all Arrakis audio consoles, the 2000SC is ultra-reliable. And it will continue to deliver outstanding performance as the years go by. After all, that's what it takes to be a *Radio Classic*.

Reaction Varied on Allied Acquisition

(continued from page 1)

Harris Senior VP and sector executive Guy Numann said in an interview with *RW* shortly after the buyout that the deal would allow the company to "further demonstrate our commitment to the industry."

Allied founder and CEO Roy Ridge, who will remain leader of what will now become a Harris subsidiary, in the same interview with Numann, echoed that the change in status should have little effect on Allied's relationship with manufacturers.

"There will be a few suppliers, of course, who have some questions but I think we can deal with those," Ridge said. "We will probably renegotiate with some of the suppliers, but I think by and large 90% of them will be very happy with the arrangement here."

"We are still going to be the department store of the broadcast industry," he said.

Numann added that Harris will not restrict the sale of other companies' products through Allied even if they are in competition with Harris products.

Competition wary

But Broadcast Electronics Inc. (BE), a broadcast equipment manufacturer, and one of Harris' primary competitors, isn't convinced there won't be problems.

Allied handles the company's FM exciters, but Harris markets an FM exciter of its own. However, the question that is most pressing, according to BE president Larry Cervon, is one of fair trade.

"We're consulting our attorneys to see if there are any anti-competitive characteristics (in the buyout). There could be some legal questions to it," said Cervon.

AM Review

(continued from page 10)

interference findings.

"AM isn't noise-limited as much as interference-limited," he said.

The comments should encourage the FCC to move toward greater protection of signal from co-channel and adjacent channel interference, Walden said, and abandon the "more is better" policy when granting new station licenses.

NAB Science and Technology VP Michael Rau said comments support the premise that more stations would be detrimental to AM. The NAB has called for a freeze on granting new AM stations and major change applications while technical changes are under consideration.

"If it's possible for them to do so, the Commissioners will add more stations," Rau said. "The jar of water is filled, and they've got to realize that. The spectrum can hold only so much. The point was made over and over, not just by NAB."

For information on Docket 87-267, contact Wilson LaFollette at 202-632-5414.

"It's a very unusual situation for a company to try to dominate the business so overtly. The end result might not be healthy for the consumer or for the manufacturing industry."

Cervon called the acquisition a "premeditated attempt to dominate radio broadcasting."

The company's attorneys have not identified specific anti-competitive elements in the Harris/Allied transaction, according to Cervon. "It came as kind of a surprise. We're studying the matter."

Neither has the company given thought yet to renegotiating a current contract with Allied.

Other companies did not openly appear as concerned about the purchase.

Mike Palmer, president of Arrakis, a broadcast manufacturer, said that the buyout presented a positive message to the international broadcast economy, despite potential conflicts surrounding the marriage of a manufacturer and distributor.

Improves international perspective

"The big players in this industry have been withdrawing: RCA sold, GE more or less got out," Palmer said.

"There's been a lot of speculation in the last three or four years that because sales at Harris have been dropping, they were either going to get out or lose international and domestic position and all in all, the industry and the country would lose."

"By Harris Corp. (investing money in the purchase of Allied), obviously the company has made a decision to reinvest in the radio industry and that's a very positive thing out of this," he said.

Arrakis markets consoles, another piece of equipment that is competitive with Harris products. But Palmer believes the initial uproar over the agreement will give way to calmer feelings.

"For individual managers over the next five years, there's going to be some good and bad, but Harris has always had the ability to produce a product that could destroy many small companies. It's just that someone plunked a stone in the middle of the pond and we've got waves and ripples everywhere for a while."

Welton Jetton, president of Auditronics, another console manufacturer whose product is distributed by Allied, said he felt comfortable with the buyout, despite the fact that Harris and Auditronics build competing products.

"That's business," Jetton said. "Each of them has a right to do what they want to do. We don't really see any problem with it. We've had a good re-

lationship with Harris through the years as well as Allied, so I don't see anything negative."

A blissful marriage

Bill Hoelzel, senior VP at QEI Corp., another transmitter manufacturer, also saw no potential conflicts for the industry as a result of the marriage of

crease its own promotions muscle.

"From what I understand, the biggest problem Harris had, with regard to vendor products, was how the paperwork was done and what the costs were as far as stocking and that type of situation," said Hoelzel at QEI.

"It seemed to me that the reason Harris went with Allied (in April 1987) was the fact that Allied (could effectively handle) the items that were not cost effective for Harris' paperwork system," he said. "From the standpoint of Allied, ob-

"Allied is a good company and we're not going to damage its effectiveness. We're not going to change any of the good things or the basic way in which (Allied) operates."

manufacturer and distributor.

The company occasionally sells products through Allied, particularly its Model 691 FM modulation monitor/test set, but maintains no official agreement.

On the distributor side, most interviewed said that it is too early to speculate on the impact this will have in the broadcast industry.

"We're all going to have to take a deep breath and step back," said Tim Schwiegger, VP of marketing for Broadcast Supply West.

Neil Glassman, sales manager of Bradley Broadcast Sales, said a Harris-Allied joint sales agreement in effect since April 1987 didn't cause a market shakeout because the two operations continued to operate fairly independently.

But, he continued, "It's probably premature to guess what the now-combined companies are going to be doing that's different."

Stories behind buyout

Various theories regarding the buyout are winding through the industry, but sources admit that more theorizing than analyzing is fueling the discussion.

One theory of prominence is that Harris was interested in the company for its strength in marketing, hoping to in-

crease its cost effective for them to do that type of business. They certainly are a force in the industry.

"I think the interesting point to follow will be whose overhead schedule and pricing format ends up being the format for the whole operation."

Plans no restructuring

Harris' Numann said he is not planning to restructure pricing as a result of the arrangement.

"Harris tends to let its units be pretty autonomous," he said. "This is a particular situation where we want to retain the autonomous strengths of these operations... My view is that Allied is a good company and we're not going to damage its effectiveness. We're not going to change any of the good things or the basic way in which (Allied) operates."

Still, the effects of the buyout on the two entities and on industry counterparts will best be determined by time.

Said Bradley's Glassman: "Both Harris and Allied have well-deserved reputations in the business. To speculate on what their position in the industry is going to be, until we see the buyout affecting the way they do business day to day, is just a bit premature."

Ridding a Board of Demon Noise

by John "Q" Shepler

Rockford IL ... Marti Armstrong balanced the telephone precariously between her cheek and shoulder so she could still use both hands to solder. "So, what's the problem again, Susan?"

"I'm not sure. It's just that I've got a ... well, a lot of noise in this board."

Susan bit her lip and hoped Marti might have some insight that she didn't. She could see the news director peering through the window of the studio door about every 30 seconds. His production studio had been down all day and he was starting to get nervous about tonight's interview schedule.

Q-Tips

"I sure wish he'd take a walk around the tower," she said, half under her breath.

Marti was struggling with a flaky cue amp and didn't really need the interruption. Still, a friend in need ...

"Is it on all the channels?"

"No, just the mics and one tape channel. It seems to buzz a lot and the noise level varies as I tinker with it."

"Sounds like RF. See if you can disconnect anything to isolate it further. I'll be over when I get this amp back in the board."

Susan breathed a sigh of relief. The studio was still down, but at least some help was on the way. Marti was one of the best engineers in town, as well as a personal friend.

She could have called one of the guys at the other stations, but they wouldn't help without a lot of snide remarks. It was tough getting started in the business.

Strange encounter

Marti tilted back the control panel of the board and plugged the cue amp board into its socket. She pushed on the circuit card a couple of times to make sure it was seated.

"OK Tom, give it a try."

The production engineer clicked a cart machine pot into cue and pushed the start button. The audio was perfectly clean: no hum, no hiss and no crackles.

"What did you do to it?"

"Replaced an op-amp and a couple of capacitors. I put in higher rated parts but I'm concerned that this board is having too many problems. I'll come in Sunday night when you guys don't need it and check the power supply and the heat build-up, OK?"

"Thanks Marti. You're the best engineer we've ever had."

Marti flashed a quick smile and then headed back to the shop. Hurrying through the transmitter room door, she nearly knocked a six foot lion into the AM transmitter.

"Excuse me ... oh. Are you alright there, uh ... Mr. Lion, is it?"

"Stop snickering and get off my tail, Marti. If this costume gets ripped I'll have to pay for it."

"Sorry, Steve. Is that for the Halloween Party at the hospital?"

"Yeah, you coming?"

"Maybe later. I have go exorcise some evil spirits out of a control board right

now."

"Well it's the right night for it, I guess. Good luck!"

Marti and Steve, the production director, took off in opposite directions. Marti quickly rounded up the attache tool kit that she kept for emergency consulting trips, grabbed her jacket, and headed out the back door.

Getting the demons out

The trip to Susan's station took longer than expected because of many costumed creatures darting across the road. Marti usually tried to avoid being out on Halloween night, but Susan's problems sounded like they needed immediate attention.

It was nearly dark when she pulled into the other station's parking lot. There were only three cars left. Marti could see

The broken mic shield would have made the mic cable act like an antenna ...

Susan coming to the front door before she even rang the doorbell.

"Oh Marti, am I glad you're here." She almost dragged her friend back to the news studio.

"Well let's hear those gremlins sing, Susan."

"Hey, you'll be proud of me. I already found part of the problem. The shield to one of the mics was broken in the connector. This tape machine also had a loose amp. Hit the front of it and the noise goes away."

That made sense. The broken mic shield would have made the mic cable act like an antenna which would overload the mic preamp with RF. The loose tape amp would have made the tape channel noisy.

"So, what's left?"

Susan put the main mic into program and handed Marti a set of headphones. The AM was still bleeding in, even with the mic cord unplugged.

"It wasn't like this yesterday."

Marti opened the board and swapped mic preamp cards. No difference. She turned off the mic and the board became quiet.

The auxiliary mic channel didn't behave like that and none of the cart channels were picking up RF.

Marti was as stumped as Susan. This could take a while. "Got a schematic?"

Sneaky culprit

While Susan rounded up board manuals and a scope, Marti opened the top of the control board again and peeked around inside. The board was clean, no hack jobs on the wiring or extra holes drilled in the panels. Susan had done a good job keeping the equipment in order.

Marti was about to close the lid of the console when she noticed something in the wiring bundle that was unfamiliar.

There was a transformer and a couple of resistors neatly fastened with plastic ties among the shielded cables. She traced the wiring to a lever switch labeled "Talkback" on the front panel.

"What's this, Susan?"

Susan set down the scope and books she was carrying and came over to the console.

"Oh, that's the transmit switch for our two-way. You can talk to the remote truck through the studio mic by pushing that switch down. It doesn't work right now because I had to take the base unit in for repairs this morning."

Marti went back to the transmitter room and sure enough, there were the audio and control wires for the two-way laying on the floor of the rack. Marti found the shield for the PTT audio and fastened it to a ground screw on another piece of equipment.

Back in the studio, Susan put the mic into program and listened in the headphones. The RF noise was gone. She turned and looked at Marti in disbelief.

"Another missing shield, Susan. The two-way audio was grounded by the two-way transmitter. When you removed the transmitter, it left a 50-foot antenna running into your mic channel. Might be a better idea to ground that cable at the console."

"You're a genius, Marti. Now figure out one more and we're done."

Phantom stations

With that, she turned up the cue volume with none of the channels in the cue position. Nevertheless, the AM audio came through clearly.

The station was signing off. When the transmitter plates clicked off, the station's air signal disappeared from the cue

(continued on page 22)

CD-1 INTERFACE AMPLIFIER

On everyone's list of the ten worst nuisances is interfacing semi-pro, IHF (-10dBV) to your professional (+4dBm) equipment. Now Bradley and Excalibur ease the pain with the CD-1. Input is via phono jack and the barrier strip output may be adjusted to levels up to +22dBm. Audio performance matches your best digital sources. Frequency response is 10Hz to 25kHz ± 0.25 dB; THD is 0.006% and noise is 90dB below +4dBm. Guaranteed to work in the strongest RF fields or your money back.

When you only need to go "one-way," there really is only one choice ... the Excalibur CD-1.

Debugging the MCI JH-110 Deck

by Jim Somich

Part I of II

New York NY ... This month and next, we'll tackle the well-known MCI (Sony) JH-110 tape machine. Most maintenance types who are responsible for the 110 seem to develop a schizoid love-hate relationship with the beast.

When the 110 is in working order, it is one of the finest decks going. But when it is acting up sometimes no amount of troubleshooting logic seems to help.

The MCI JH-110 is a first generation machine of considerable complexity and sophistication. As is the case with many trail-blazers, the JH-110 is plagued with design shortcomings.

Machines I have worked on over the years seem troubled primarily by intermittents and chip failures. Some of the circuitry has been updated to improve performance and reliability.

Maintenance Notebook

Considering the age of its technology and its design sophistication and complexity, the JH-110 is a decent performer despite being a maintenance hog.

Early history

When the MCI was introduced, it was ahead of its time and marketed by a relatively small and unknown company, Jeep Harned's Music City Inc. (MCI).

It quickly became the deck of choice for broadcasters who could afford its rather steep (at the time) price.

For many broadcast maintenance engineers, the 110 was their first contact with servo-controlled mechanics and microprocessor-based controllers.

The 110 may seem a bit "Rube Goldberg" by today's standards, but a thorough understanding of its design will help you keep 'em running and performing right along with today's state-of-the-art machines.

Several years ago Sony bought out MCI and relegated the JH-110 to the back-burner (it's available now only in 4- and 8-tracks).

Sony has been quite good in maintaining a stock of spare parts and boards for the 110 as well as providing good telephone tech help.

The new Sony APR-5000 series is the logical successor to the JH-110, but only time will tell if it will do better in the reliability department. On the surface, the 5000 seems to have solved many of its predecessor's problems.

Helpful insight

If you have been blessed with a fleet of JH-110s, you have probably developed your own list of weaknesses and symptoms. What I plan to share with you is part of my list.

I cannot take credit for all of these tips since they have come from many forgotten sources and this short column is not meant to be an in-depth discussion of the theory behind the 110 (the manual is an excellent source of this information).

My purpose here is to outline some of the more glaring deficiencies in the machine's design for those of you who

are new to the MCI.

Hopefully, it might also add a few new tricks to the bags of those now maintaining JH-110's.

While the JH-110 appears to be a real bear to service, most of its problems are common to the breed. The design has major weak points, and they keep showing up time and again in New York or Podunk.

So, if you can't afford to scrap your 110's and replace them with 1988 models, read on.

Contact problems

Any discussion of the 110's weak points has to start off with the contact

problems caused by the Molex connectors that hold this machine together. The Molexes are unquestionably the weakest link in the whole machine.

It seems that the simple Molex just cannot handle the microvolt and millivolt signals necessary for an advanced deck like the 110 to operate flawlessly.

A lot of microsecond-microvolt pulses just seem to get lost in the machine's innards somewhere!

Because of the nature of the signals being handled by the tape deck versus the electronics, there are fewer contact problems with the latter.

But everyone who has used a 110 for any length of time knows that even the

electronics are not immune to contact-induced intermittents.

Two headaches

Contact problems with the JH-110 can be broken down into two distinct categories ... electrical contact discontinuities and actual circuit breaks due to the constant flexing of the circuit boards during installation and removal.

In most cases there is simply no elegant way to extract a circuit board from the mother without excessive flexing of both.

This can result in broken solder connections where the Molex pins are soldered. **(continued on page 28)**

Performance Proofs Still Needed

by Harold Hallikainen

San Luis Obispo CA ... Last month, we reviewed the station operator requirements, including the Chief Operator requirements of 73.1870. This time, we'll review the equipment performance measurement requirements of 73.1870(c)(2) and 73.1590.

We used to call this the annual "proof" although the Commission used the term "proof of performance" with respect to measurements on a directional antenna system.

Insight on Rules

The annual audio and spurious radiation measurements were "equipment performance measurements."

Several years ago, the Commission removed the audio measurement portion of the equipment performance measurements requirement along with the required audio performance.

The requirement was moved to demonstrate compliance with audio specifications along with removal of the audio specifications altogether.

FCC or marketplace standards

With the removal of audio performance requirements, audio performance was to be determined by "market pressure"—listeners would evaluate audio quality along with programming in making their listening decisions.

Unfortunately, the removal of the audio frequency response requirements also removed a standard aimed at insuring "interoperability" between transmitters and receivers.

It appears, however, that many stations had already abandoned the interoperability frequency response standard specified in the old 73.40 (for AM stations), by operating with various degrees of preemphasis to compensate for the high frequency rolloff of receivers.

This resulted in stations adjusting their audio response in response to variations in receivers, while receiver manufacturers adjusted the receivers trying to follow the stations.

What appears to have happened is that receiver manufacturers mostly kept tightening up the IF in an effort to get rid of adjacent channel interference.

The tighter IF made the receivers roll

off the audio highs more, so the stations boosted the highs, causing more adjacent channel interference, causing the receiver manufacturers to cut back further.

This interoperability problem is now being dealt with by the NRSC standards, which the FCC is considering for adoption.

The Commission appears to be most interested in the bandwidth limitation portions of the NRSC standard (the 10 kHz audio brick wall and the RF mask) and less interested in the standard preemphasis.

This gets back to the question of what the Commission's job is. Is it merely interference protection, or is it also to establish standards that require all trans-

mitters to meet the same standards, so there is a possibility the receivers will work reasonably well?

We still have some interoperability standards in the rules. For example, 73.128 requires AM stereo compatibility with receivers using envelope detectors, although the specified tests only demonstrate interference protection (occupied bandwidth).

For FM stations, 73.317(e) specified a maximum audio preemphasis. This section used to include definite audio response limits, insuring interoperability.

Finally, 73.322 specifies the FM stereo standards, which appear to be entirely to insure system interoperability instead. **(continued on page 35)**

Radio's Early Days on the West Coast

by George Riggins

Long Beach CA ... Several months ago a friend was sent a copy of the April 10-16, 1927 *Radio Doings*, *The Monthly Authority of the Pacific Coast*. The cost was ten cents, the same as *Liberty* magazine or the *Saturday Evening Post*.

The front page featured a picture of William Wrigley Jr., and Major Lawrence Mott. The back page was a full page ad for the "Federal Ortho-Sonic" receiver, priced from \$100 to \$1000.

The ad was placed by Yale Radio Electric Co. Yale is still in business, having long since moved

from an area now occupied by the floral industry in Los Angeles to Hollywood.

Among the products mentioned besides the receiver were Elkorn, Modern, Sterling and Balkite Eliminators and Speakers by Amplion, Enchanter, Herald and Fine Arts. Also Cunningham Radio Tubes, standard for all sets since 1915. Wonder where those old timers have gone?

Kolster Radios, distributed by H. Earle Wright Inc., took a two page spread, purchasing pages two and three.

In addition to other products featured by the distributor, there was a listing of all the places in the southern third of California where the receiver could be seen and purchased.

What a far cry from the way we see receivers sold and demonstrated today.

Hardly portable

One of the more interesting ads was for Walbert's Isofarad receiver which was advertised to "operate direct from light socket."

Nowadays if we can't take our boom

box with us, why bother? The price? Electric models, \$350 to \$400, battery models, \$75 to \$270.

Ray-O-Vac, a well recognized trade name of today was being manufactured by French Battery Company of Madison, Wisconsin.

Cabinet makers were advertising console cabinets made from two-toned walnut or mahogany.

The cabinet was a piece of furniture for the lady of the house so the man could

have his contraption and not clutter the living room with all of the paraphernalia.

Look at the assembled "entertain-

ment centers" that are being sold today, and it appears as though marketing has come full circle.

Quiz the station

Does anyone remember the "Voice of Catalina?" KWFO transmitted on a frequency of 211.1 meters, 250 W of power, and was listed as being on the air from 5 PM 'til 10 PM, and possibly for a couple of hours in the morning. Silent on Mondays.

Major Lawrence Mott was the owner-operator and it was non-commercial. The person who represented the station (probably Major Mott) published a 36-item questionnaire suggesting what to ask when writing to a radio station.

Some of the questions are still germane. Others, however, were purely non-sensical for even the 1927 time period.

The last question read, "Is your station operated to please its owner or to please the public? Does it do either? When? For what specific reasons? (Two single-spaced, typed pages will be allowed for this reply)."

**Old
Timer**

57 Years Ago in RW

Editor's note: The RW of today and the RW of old fortuitously share the same name. The RW of old was printed for a period of time in the 1920s and 1930's, when radio was first becoming popular. The current version of RW that you hold in your hands has been around (in various forms and names) for over ten years.

Reprinted from Radio World, September 30, 1930

Velvetone Power Amplifier

\$56.52

Perhaps many people would ask the same question today.

Risque calls?

There were 22 stations listed for southern California and nine for the northern part of the state. Another ten stations were listed for northern and western states.

Interesting to note the number of stations still on the air with the original call letters. One of the engineers from the Portland area is still living and is still active in radio as an owner and engineer.

Will try to get a couple of comments from David Rees regarding his first remote and how his chief went about getting a program line from one building to another in Portland without using the telco facilities. Better in David's own words than in mine.

One call sign that has passed into oblivion is KFVD. I was privileged to know two engineers who worked for the station in the early years.

The only mnemonic that either man ever used was "King Ferdinand's Venereal Disease."

When a long-time resident of the southern California area was asked if he remembered the station, he said yes, and explained that the call sign was used by the owners of the Venice Dance Hall, hence the call sign with the proverbial K for being west of the Mississippi River.

KFVD had power of 500 W and a frequency of 208 m. Even in 1927, Earle C. Anthony had the most power with 4000 W for KFI (now 50 K clear channel).

DX-ing

A full page of DX stations was printed, as reported by listeners on the West Coast. Of note is the only 50 K station listed: WJZ, New York, NY, with 454 meters.

The station seemed to be on the air most of the time, at least in the evening hours in the west. PWX Havana, Cuba; CYL and CYJ Mexico City and KGU Honolulu, with only 500 watts are just a few of the stations mentioned.

NEW AND IMPROVED MCKINLEY JUNIOR "B" ELIMINATOR. No tubes to Blow Out, No Harmful Acids, Uses Non-Acid Electrolyte. Variable Voltage. Will Operate Any Radio Up to 6 Tubes, Including Power Tube.

(An environmentalists dream! No PCB's.)

Doing nothing more than taking each page of *Radio Doings* and discussing the data would provide enough fodder for several more articles.

Next time a more complete listing of the call signs, especially those that are still in use. Wonder what some of those old time engineers are saying in that great DX land about what is happening today as pertains to technical standards?

George Riggins has experience in radio and electronics dating back to the 1930s. He is also a licensed ham operator and has had his own broadcast sales and service company, Riggins Electronic Sales, for over 20 years. He can be reached at 213-598-7007.

TWO WEEKS.

The "Express" in Express Group means just that. Express service. Express delivery, with some of our systems deliverable in as little as two weeks.

The choice of Modular Studio Furniture over built-in kitchen grade cabinets is a wise decision. With built-in cabinets you are stuck with one configuration or faced with total replacement should you move or update your

equipment. Our four complete lines of Fine Studio Furniture will meet your present needs while giving you the future flexibility a modern broadcast facility demands.

Each of our four lines are made of the finest materials. All designs feature numerous access panels, hand rubbed hardwood trim, and built-in wire passes.

Don't settle for second best!

Please call or write today for our free color brochure.

Picking the Best Mic for the Job

by Bruce Bartlett

Elkhardt IN . . . Last issue, we sorted out the basic microphone types and suggested where each could best be used.

The transducer types are condenser, moving coil and ribbon; the polar patterns are omnidirectional, unidirectional and bidirectional.

In this issue we'll continue our coverage of microphone specifications to help you choose the best microphone for the job.

One of the most important specs is *frequency response*: the range of frequencies that a microphone will reproduce at an equal level (within a tolerance, such as ± 3 dB).

A frequency response from 50 to 15,000 Hz is good; 40 to 18,000 Hz is very good and 20 to 20,000 Hz is excellent.

But if the sound source produces frequencies from, say, 100 Hz to 12 kHz, then a response covering that range is adequate. A frequency response that is beyond the spectral range of the source won't offer any increase in fidelity.

For example, a trombone radiates frequencies from about 80 Hz to 8000 Hz, so a microphone with a frequency response covering at least this range will pick up all the sounds a trombone can make.

Similarly, an orchestra produces a very wide frequency span from about 40 Hz (bass drum and bass viol) to 15 kHz or higher (cymbals and other percussion).

So, microphones used to record an orchestra (or other large ensemble) should have a wide, flat frequency response covering most of the audible spectrum.

A frequency response that is beyond the spectral range of the source won't offer any increase in fidelity.

A frequency response from 80 Hz to 15 kHz is adequate for most instruments. A response from 40 Hz to 9 kHz covers the range of bass instruments; a high-end response up to 12 kHz is sufficient for brass, voice and piano; and a response out to 15 or 20 kHz is necessary for cymbals, violin and some percussion instruments.

The low end

The low-frequency response of the mic should be limited to the lowest fundamental frequency of the instrument to be recorded, if possible.

For example, the frequency of the low-E string on an acoustic guitar is 82.41 Hz. A mic used on the acoustic guitar should roll off below that frequency to avoid picking up low-frequency noise and room rumble.

Some microphones provide a low-frequency cutoff switch for this purpose. Or you can filter out the unneeded lows at the mixer.

A frequency-response curve (such as shown in Figure 1) is a graph of output level in dB at various frequencies.

For a mic the output level at 1 kHz is placed at the 0 dB line on the graph and the levels produced at other frequencies are so many dB above or below that reference level.

The shape of the response curve usually indicates how the microphone sounds at about two to three feet.

For example, a mic with a flat, extended response reproduces the fundamental frequencies and harmonics in the same proportion as the sound source.

Thus, a flat-response mic tends to provide accurate, natural reproduction at that distance.

A microphone with a rising high end or a "presence peak" around 5 to 10 kHz emphasizes the higher harmonics. The subjective effect is a crisp, articulate sound.

This type of response is sometimes

called a "tailored" or "contoured" response. It's popular for guitar amps and drums because it adds punch and emphasizes attack.

Note that microphone placement can greatly affect the recorded tone quality. A flat-response microphone does not always guarantee high-fidelity sound because mic placement has such a strong influence. That's a subject for another article.

Sensitivity

Sensitivity is a measure of the efficiency of a microphone. A very sensitive microphone produces a relatively high output voltage for a sound source of a

given loudness.

The sensitivity of a mic doesn't affect its sound quality. Rather, sensitivity affects the audibility of mixing-console noise (hiss).

To achieve the same VU meter reading a low-sensitivity mic requires more mixer gain than a high-sensitivity mic. More gain usually results in more noise.

If you record quiet, distant instruments such as a classical guitar or chamber music you'll hear more mixer noise with a low-sensitivity mic than with a high sensitivity mic, all else being equal.

With close-miked pop music, sensitivity matters little because the microphone

How to Select the Proper Mic

(continued from page 21)

signal level is well above the mixer noise floor. That is, the SNR is high.

Microphone sensitivity is often stated in "dB re 1 volt per microbar." The figure tells what voltage the microphone produces (in dB relative to 1 volt) when picking up a 1000 Hz tone at 74 dB sound pressure level.

Listed below are typical sensitivity specs for the three transducer types: condenser: -65 dB (high sensitivity); moving coil: -75 dB (medium sensitivity) ribbon or small moving coil: -85 dB (low sensitivity)

Differences of a few dB among microphones are not critical. Nearly all microphones have adequate sensitivity for broadcast applications.

The louder the sound source, the higher the signal voltage the microphone produces. Very loud sources, such as kick drums or guitar amps, can cause a microphone to generate a signal strong enough to overload the mic preamp in your mixer—say, up to 1 V!

That's why input attenuators or pads are often included in mixers to reduce the mic signal level from a loud source.

Impedance and SPL

A microphone's impedance is its effective output resistance at 1 kHz. A microphone impedance between 150 and 600

ohms is considered low, 1000 to 4000 ohms is medium and above 25 kilohms is high.

Low-impedance microphones are used exclusively in broadcasting and recording because they allow long cable runs without hum pickup or high-frequency loss. Nearly all solid-state mixers are designed to accept low-impedance mics.

Another microphone specification is maximum sound pressure level or SPL. To clarify this specification, first we need to review the term "SPL."

SPL is a measure of the intensity of a sound. The quietest sound we can hear, the threshold of hearing, measures 0 dB SPL. Normal conversation at 1 foot measures about 70 dB SPL; painfully loud sound is above 120 dB SPL.

Maximum SPL is the point at which a microphone's output signal starts to distort; usually the SPL at which the microphone produces 3% total harmonic distortion.

In the case of a microphone with a maximum SPL spec of 125 dB SPL, that means the microphone starts to distort audibly when the sound pressure level produced by the source reaches 125 dB SPL.

A maximum SPL spec of 120 dB is good, 135 dB is very good and 150 dB is excellent. Any well-designed dynamic

microphone can handle SPLs in excess of 150 dB SPL and many condenser mics can work well up to 150 dB SPL.

Self-noise and polarity

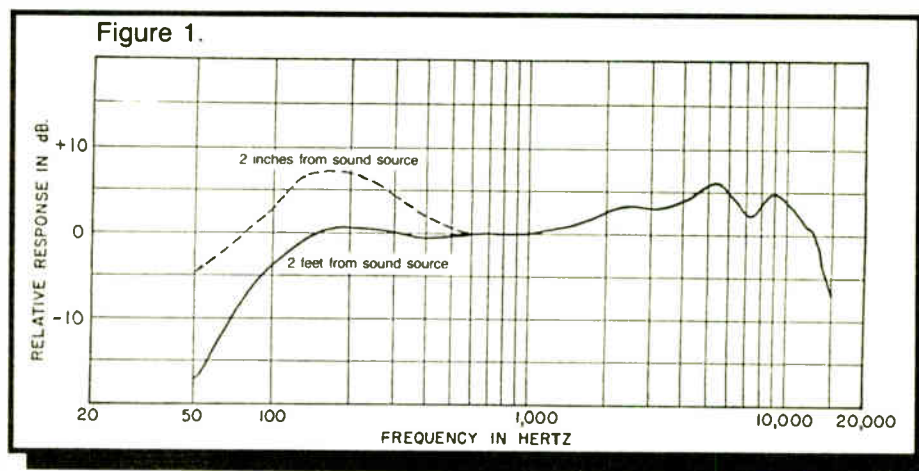

Self-noise or equivalent noise level is the electrical noise a microphone produces, equivalent to what a sound source would produce in dB SPL.

aphragm in (positive pressure).

If a microphone is wired in the opposite polarity and combined in the same channel, low frequencies in the sound pickup are attenuated or completely cancelled out.

You can prevent this from happening by checking that all your microphones are wired identically (check the microphone data sheets under the heading "polarity").

For mics that don't follow the standard, reverse the connections to pins 2

This figure is usually A-weighted, meaning that the noise was measured through a filter that rolls off low and high frequencies to simulate the frequency response of the ear.

A self-noise spec of 20 dB SPL or less is excellent (quiet); a spec around 30 dB SPL is good and a spec around 40 dB SPL is fair.

Most microphones produce a positive voltage at pin 2 with respect to pin 3 when the sound pressure pushes the di-

aphragm in (positive pressure).

Next time in the conclusion of this series, we'll feature special-purpose microphones, accessories, and a microphone applications chart.

Bruce Bartlett is a microphone project engineer and technical writer with Crown International. He can be reached at 219-294-8000.

Marti Armstrong Clears a Board of Phantom Noise

(continued from page 18)

audio, only to be replaced by a fainter signal. It sounded like all of the stations on the band, with one AM station about a hundred miles away prevalent.

Marti shook her head and laughed. "OK, that's a strange one."

They tried replacing cue amp cards to no avail. Marti grabbed a soldering iron and lifted the input coupling capacitor on the circuit board. The console was still acting like an untuned AM receiver.

Next, she restored the input coupling cap. It was easier to disconnect the output leads at the amp socket than try to lift the output cap. The cue speaker was dead as expected and Hi-Z headphones clipped to the socket of the amp sounded quiet.

Marti clicked a cart machine into cue and started one of the news carts. It was completely clean. No RF noise. No mystery stations.

The schematic showed only the cue speaker hooked to the output of the cue amp. Marti traced the wires to a three-inch speaker mounted in a rack with the reel recorders. She soldered the board leads back to the cue amp but clipped in a small substitute speaker. It sounded clean as could be.

Ghosts from the past

How could just a speaker cause this problem? Marti pulled the rack panel with the cue speaker from the rack and noticed that one of the speaker leads was connected to the frame of the speaker instead of to an insulated terminal.

This speaker must have come out of

an old radio. Carefully, she clipped the grounded lead and soldered it to the amp lead so that no wires were touching the rack panel. With the cue speaker reconnected, the cue audio sounded great with no background sounds.

"All right Marti, I give up. What was that all about?"

Marti looked over at Susan's wide eyes.

"In this case, you had too many grounds instead of not enough. The cue amp has an unbalanced output. One side of the amp is common with the console ground and the other is the signal. Both leads go to the speaker.

"The low side of the audio was grounded both at the console and the speaker via the rack. The ground loop was acting like an antenna and the cue amp was detecting the signals. How could this ever have worked before?"

Susan looked at her sheepishly. "It hasn't worked since I got here. I hoped that if we could get all the problems out of this board, the news director might cool off. I guess I should have told you that was an old problem."

"Well, since you're my protege of sorts, I won't get too mad. But next time . . ."

"Thanks Marti. Hey, its still Halloween and for all the tricks you've pulled from your cap tonight, my treat is to buy you dinner. OK?"

"It's a deal!"

THE-1

A continuation of Harris' solid-state FM exciter tradition.

THE-1, Harris' fifth generation solid-state FM exciter, is built on long experience and designed to provide top performance in any FM transmitter. Rated at 55 watts RF output for today's applications, THE-1 also offers flexibility for easy retrofit in older FM transmitters.

THE-1 provides the features you want for top FM performance, including:

- Two RF power ranges: 15 to 55 watts or 3 to 15 watts output.
- Low profile, slide-out drawer construction (seven inches of rack space).
- Two wideband (composite), two SCA, one monaural and one test input.

- Ultra-linear, low noise direct carrier modulated oscillator for cleanest stereo and multiple SCA sources.

- Broadband modular output amplifier. No tuning required!

- Comprehensive metering, status and control functions. Remotable.

- Full capability for stand-alone operation.

To learn more about THE-1, phone us today: TOLL FREE 1-800-4-HARRIS, Extension 3013. Or write: Harris Broadcast Division, P.O. Box 4290, Quincy, IL 62305-4290.

HARRIS

AM Radio: SOS From the Titanic

by Ron Frizzell

Auburn ME . . . In case no one has noticed, at the current rate of decline, sometime during the 2000 AD fall Arbitron, no one will be listening to AM radio. That's just 12½ years away, when 70% of the new cars sold this year will still be on the road.

AM radio, now, is like the RMS Titanic in 1912, 45 minutes after it struck the iceberg. At that time lifeboats were leaving this huge, safe, warm, 13-story structure.

After the mighty ship sank 1500 people drowned while 600 empty seats on the lifeboats were being rowed away. People stayed on board because they couldn't believe the mighty ship would sink.

We, like the people on the Titanic, statistically know it is going down but are finding it too hard to believe.

Even when the ship was down and awash at the bow it still seemed safe at the warm secure stern towering 100 feet above the water; people believed the ship was just too warm, too big and secure to sink—"something" would surely save it.

If AM flickers out the FCC will most likely be ordered by Congress to find out what went wrong. The spectrum will be cut in half.

Congress and the FCC, broadcasters and radio makers, who are fighting individually to keep the spectrum afloat, together are acting with a lack of intelligence, just as foolishly as the people who stayed on board the Titanic.

Weighted down by restrictions

A majority of AM broadcasters have stopped trying. The government is rigid with nearly inflexible rules.

A station in the midwest with an arbitrary FCC limit of 5000 W might cover a 20 mile radius with a competitive signal. That's sufficient to survive.

In New England, due to ground conductivity, it will cover about six miles. That's insufficient.

It has never mattered that 80% of the realistic population was missed as long as the sacred "city of license" was served. Power has always been more important than coverage.

The government has never taken into account that financially weak stations never really serve the public even though they may comply with license requirements.

The post mortem Congress orders will most likely look like this: In 1957, AM radios, especially in cars, sounded great. The cymbals, bells and whistles could all be heard. There was no apparent distortion.

Long way down

As more and more stations went on the air, receiver manufacturers cut down the frequency response of the radios to prevent interference from adjacent stations.

AM stations which had always had a technical deficiency now had a giant deficiency as the higher, more pleasant frequency responses began to vanish and distortion, created by those terrible ceramic filters, came in to take their place.

All this was occurring when the public was demanding better and better quality.

This was the beginning of the poten-

tial end. It was all in motion by 1968. AM radios began to sound worse and worse; FM better and better.

By 1978 General Motors and some foreign radio makers had perfected an AM radio that sounded as if the entire station had been shoved through a telephone before it got to the transmitter.

Indeed, the frequency and distortion rate of those car radios is about the same as a telephone line. Tragically, GM was the biggest producer of car radios. The first error of the broadcasting industry was letting radio makers do this to us.

(continued on page 38)

"Voted 1987 NAB Pick Hit for outstanding new radio products."

Finally, a great-sounding cartridge that holds up under broadcast use. The Shure Broadcast Cartridge.

Every component in Shure's three new phonograph cartridges is designed to resist strains that ordinary broadcast cartridges can't take...without sacrificing great sound.

Our revolutionary Cue Guard™ design helps prevent the stylus from bending backward or breaking during backcuing. Our heavy-duty shank resists snapping or bending, without sacrificing high frequency response.

And even if you inadvertently slide the cartridge across a record, our exclusive wrap-around stylus

grip limits lateral stylus movement, protecting the stylus.

Plus the superb sound you expect from Shure.

The precisely engineered stylus assembly, bearing and cartridge body of Shure's new broadcast cartridges give you the exceptional high performance characteristics you expect from the maker of the legendary Shure V15V-MR. And

our exclusive MASAR™ polished tip reduces surface noise and stylus and record wear from the first play.

Shure's new broadcast cartridge line consists of the BC70 spherical tip, ½" mount; BC80 elliptical tip, P-mount; and BC90 elliptical tip, ½" mount. Each delivers the ruggedness, reliability and sound performance you've come to expect from Shure.

A Guide to Running FM Stations

Starting and Operating Your Own FM Radio Station—From License Application to Program Management

Peter Hunn

Tab Books, Inc., Blue Ridge Summit PA, 1988

Reviewed by Bruce Elving

Adolph MN . . . More than a "how to" guide, this book is a history of one of America's fascinating little radio stations, WHRC 92.1, Port Henry, NY. The story about how Port Henry was picked out, how the frequency 92.1 was chosen, and the unique philosophy of this small town radio station comes through very well.

It truly is a book that covers everything mentioned in the volume's subtitle, and more, including stereo, subcarriers, translators, heights above average terrain—none of those qualities possessed by WHRC!

How then does WHRC serve as a model for other would-be broadcasters? Well, read on and learn, as I did.

You'll find out how the dream of radio station ownership could happen to almost anyone of low to moderate means and how a commercial radio station operated with no paid staff from a metal building the size of a one-car garage, which also served as apartment for the owner and his wife.

It's shades of Simon Geller of WVCA,

. . . Hunn's book (is) an interesting, recent and relevant station history.

Gloucester, MA mixed in with a bit of Roy Torian (former one-man owner-operator of KNOB 97.9, Long Beach, CA) and the Brownyard family of WHYP-AM-FM, North East, PA.

It even alludes to some very contemporary issues—the proliferation of FM translators and the threat they may have to small-town radio. The book mentions WELY-AM, which went off the air for a while, partly in response to translator inundation of the small city of Ely, MN. Liberalization of FM boosters is mentioned at the end of the book along with how an on-channel booster of a Class A station could beam out 600 W to better serve the station's primary area.

The book is not alone in the field of broadcast management. There is the outdated, business oriented *Broadcast Station Management* by Quaal and Martin. Just reprinted is Lorenzo Milam's *Sex and Broadcasting, A Handbook on Starting A Radio Station for the Community*, a disrespectful book that helped launch the NFCB and alternative FM stations like KRAB, 107.7 Seattle (the 1988 edition not at all rewritten from ten years ago).

And I can think of Ernie Wilson's *Radio Station Development*, which covers such things as pirate radio to 50,000 W AM, but leans toward low-power FM school stations and cable FM.

Too often books like these cite pet local projects almost to the exclusion of the rest of the country or the rest of the in-

dustry.

While that may be true to some extent with Hunn's book, it's an interesting, recent and relevant station history. With virtually every example drawn from his own experience, he also quotes from some other authorities, ranging from Sydney Head and Christopher Sterling, textbook writers, to Bob Doll, publisher of the *Small Market Radio Newsletter*.

Included are the basics like how a station gets call letters and how to interpret coverage maps. And there's more broadcast history than you would expect in such a management and engineering

guide. For example, Hunn points out how in 1949 Todd Storz took KOWH-FM, Omaha off the air.

"The voluntary 1949 silencing of the

Book Review

Omaha FM outlet was not an isolated incident. That year, another 211 permittees and operators of ailing FM stations did the same thing."

Well illustrated, the book even has a picture of Armstrong and cronies

demonstrating FM in a store in Bridgeport, CT in 1939 and another showing C.B. Persons at the controls of W9XYH Superior, WI, along with WEBC (AM) in 1940.

I do question the book's taking up many pages to reproduce FCC forms that can be ordered directly and seen more clearly. The pages of forms are all reduced in size and hard to read. You will find 19 pages devoted to Form 301, "Applications for Construction Permit for Commercial Broadcast Station." It is a blank form. It would have been more in-

(continued on page 32)

years ago—more technology to help you do your job better and faster.

Agile and Easy to Use

The Studer A807 is a fast, full-featured machine for making quick work of your production tasks.

Features include: • tape shuttle wheel • reverse play • right hand edit • tape dump • varispeed • multifunction tape timer and autolocator with programmable "soft keys" • digital setting of audio alignment parameters for 3 tape speeds and 2 tape types • phantom powered mic inputs on portable version • RS 232 port • optional 1/4 track playback head • a variety of portable and console configurations, including a 4 channel 1/2" version.

Studer Audio Performance and Reliability

Advanced phase compensated audio-electronics and Dolby HX Pro™ ensure that this compact Studer delivers full-sized Studer sonics.

A massive, die-cast chassis and headblock, rugged AC spooling motors and new brushless DC capstan motor, remind you that the A807 is built with the same quality and precision that have been synonymous with the Studer name for four decades.

So—if "affordable" is not the first word that comes to mind when you think of Studer—think again.

Ask us about the A807. The most affordable fully professional recorder on the market.

Portable version of the A807 with wood side panels

Timer-autolocator-control panel

Available from Studer Revox Full-Line Dealers. Or contact us directly: Los Angeles (818) 780-4234 / New York (212) 255-4462 / Chicago (312) 526-1660 / San Francisco (415) 930-9866 / Nashville (615) 254-5651

WHEN YOU'RE READY FOR REAL . . .
TEST US FOR THE BEST

DYNAMAX[®]

Cobalt Tape Cartridges by Fidelipac[®]

Recommended Test Procedures

1. Carefully clean & degauss cartridge machine heads & drive surfaces.
2. Set recorder head azimuth, bias & equalization to optimize the performance of the cartridge under test.
3. Compare various lengths of the same cartridge type for stereo phase, level uniformity, noise & distortion performance.
4. Starting with Step No. 1 above, test other brands of cartridges.
5. Compare results.

FREE OFFER

A sample kit of Dynamax Cobalt Cartridges consisting of 1 each of 70 seconds, 1 each of 3.5 minutes, 1 each of 5.5 minutes is available for the asking.

Your request should be submitted on your station letterhead, signed by the Chief Engineer, the General Manager, or Program/Production Director.

Send request to:

Denver Co . . . Classic station architecture—the systems approach that most all of us deal with—takes sources and distributes them to each studio as needed using distribution amps or bridging audio.

Conversely most TV stations use a routing switcher architecture. Every input enters a central routing switcher and each load addresses a port of the switcher to obtain any of the inputs. This allows any source to feed any load.

Historically, the difference between radio and TV has been one of economics. Routing switchers represent a smaller portion of the overall expense to a TV station.

TV stations tend to have a larger number of outside sources, need to "time" equipment to a central point and often need to use expensive playback or recording gear to service more than one studio or edit suite.

But several recent trends have made the routing switcher architecture more suited to radio station use.

Cost and flexibility

Routers, specifically stereo routers, are becoming less expensive as a result of the TV stereo market. The number of station inputs is also increasing in some formats.

Routers offer a good alternative when rebuilding stations and reduce engineering time when making changes or maintaining old wiring.

In many radio facilities, engineering cutbacks or changes, multiple ownership changes, new needs or just a history of sloppy engineering has resulted in the stations' basic structure existing in a state

Routing Switchers in Today's Radio Studio

by Fred Baumgartner

of disrepair.

Grounding plans have been violated, levels and phases are out of balance and often there is no reasonable or current documentation. In other stations equipment is at the end of its maintenance-free lifetime.

In some stations format changes require increases in plant ability.

In any case, it's time to consider what a routing switcher can do for your station. Let's look at some of the advantages of this architecture.

Many benefits

First and foremost is versatility. Because any output port can connect to any input it is impossible to have a "you can't get that in this studio" situation.

This is important from a programming point of view and may be critical on those days when something out of the ordinary (big news events, etc.) are being carried.

For engineering, being able to put another studio on line, routing around a dead pot or tape machine makes a lot of equipment emergencies less disastrous and urgent.

Then there's ease of use. Most stations have push buttons, patch bays, rotary switchers and more to get a signal to where you need it. Since each port of a

router is identical, once an operator understands any one port controller, they understand them all.

Because each port is all-powerful the operator can now do everything everywhere. And since the switcher can take care of stereo-mono compatibility, levels and the like, the operator can't goof up.

A router also has the ability to simplify paths. Work that once needed to be done in a studio—setting levels, checking it through, phase—all done under talent's elbow in audition can now be done in the shop.

And with sufficient output ports in a studio, recording a network feed need not tie up the board. A net feed can be routed directly to the machine without accidental noise from open pots and the board remains available for other use, on-air or production.

Anyone that runs any amount of continuous satellite programming can route the bird directly to the transmitter to buy an hour of studio maintenance time here and there.

Audio switcher installation costs are lower than the DA architecture. There are no DAs or combs, the quantity of wire is much lower, the install time is greatly reduced and the number of inputs on a board are reduced.

Since a given studio needs only two

to four ports for the entire outside world, the cost of a studio is dramatically reduced.

Some optional advantages

In TV stations where equipment is shared, the concept of delegation makes sense. Here the control of a machine being used by a studio or edit suite or to dub is "delegated" to the user and others are barred from starting, stopping, recording, etc. A machine's output and its controls are routed to the load.

Machine control seems to make less sense to the radio station as machines tend to be permanently assigned to one function. In reality it is a nice option.

In many cases stations record for delay. A router with machine control can take a newsroom machine, tape the hourly network news, a news service feed, the air check, the weather bureau, futures and stock market quotations.

It routes the correct audio, starting and stopping machines at the right time, resetting timers and source selections. This is done without human intervention.

In many cases substantial programming is delayed hour to hour. A machine control can allow machines to tape, recue and playback the programs to a given studio at the right time.

Allowing the machine control to talk to transmitters, telephones and other equipment really expands the potential.

Additions to routers can include distributing master clock via control cable as well as some status indications (annunciator). Some can carry intercom and internal communications.

(continued on page 32)

Splatter matters.

Splatter is a form of radio interference that can drive listeners away from AM radio. It creates distortion in your signal, wastes transmitter power on undesired sidebands and interferes with other stations. Even with an NRSC audio filter, misadjustment of the transmitter or audio processing equipment can still produce an RF spectrum that can exceed NRSC or FCC limitations.

That's why routine monitoring of your station's RF spectrum is a must. But it doesn't mean you'll have to bust your budget on a spectrum analyzer. It just means you need the rugged SM-1 AM Splatter Monitor from Delta Electronics.

For just \$2,150 you can now accurately measure your transmitter's spectral output, monitor transmitter IPM levels and make adjustments to improve clarity. An external audio input helps identify splatter sources.

The Splatter Monitor's unique offset feature tunes spectral segments for closer examination 10 kHz to

100 kHz away from the carrier. Unlike a spectrum analyzer, you can listen to the front panel speaker or your own headphones as you measure splatter levels on the front panel meter. The Splatter Monitor also has an alarm output to drive your remote control.

In this day and age where splatter matters, monitoring it doesn't have to cost you a fortune.

To find out more about the new Delta Splatter Monitor, call (703) 354-3350, or write Delta Electronics, Inc., 5730 General Washington Drive, P.O. Box 11268, Alexandria, VA 22312.

Weatherproofing Mountain Sites

by Tim McCartney

Boise ID ... Mile-high transmission plants must be designed with their mountain top environments in mind. Extreme power surges, wind gusts, ice, lightning and soil with poor conductivity are a few of the areas which deserve special attention.

While each of these considerations is part of any well-planned installation, the stakes increase at 7000 feet when site access cannot be guaranteed. Thus a proper design is key to power maintenance costs and less down time.

Engineers from the US ice belt have unsuccessfully tried to dominate discussion about ice-related problems at transmission sites. Add to the "ice-impacted" list the mountain regions, and even Florida when the orange crop falls to untypical snowfall. Actually ice plagues most stations.

Perhaps the most important design consideration in response to ice concerns is the use of *radomes*. These fiberglass covers, effective in protecting antenna bays, are mandatory on mountains whenever feasible.

The exceptions

However, on Deer Point Mountain near Boise the five VHF TV batwing antennas must rely solely on de-icers. The result is heating systems which are inadequate much of the time.

TV stations must too often live with reduced forward power and excessive VSWR. And the electrical costs of heating up to 12 batwings on an antenna system are both steep and reoccurring.

All of the FMs, however, use fiberglass protectors. Their total physical and RF protection is demonstrated under conditions in which up to two feet of hard snow tops the radomes—and no VSWR! But, the tower must have sufficient wind-load capacity to tolerate the extra stress introduced by radomes.

On the aesthetic side, radomes offer an eerie, space-age ambience to the mountaintop tower with a variety of

Many stations on the mountain have a spare bay or two installed on a tower, ready for use in the event of damage to their main system.

designer shapes and colors.

KBSU's is particularly attractive, featuring the latest in trendy radome design: red pin stripes over snowy-white fiberglass highlighting an avant-garde pretzel-shaped configuration. The chic style is supplied from ERI via three American distributors.

So, when asked by the FCC or the US Forest Service about environmental impact, one can boast of site beautification. Exhibit #75 should be a color glossy 8" x 10" of one radome balanced on the ground with a curious mule deer exploring its design. See, a properly fashioned radome blends in and adds to the en-

vironment!

The primary threat, of course, is heavy ice falling from the tower onto a radome-protected antenna system, demolishing the fiberglass and leaving copper radiators exposed for further direct damage.

Backup systems

Since tower crews are hesitant, for good reasons, to climb ice-covered structures, design considerations require consideration of some kind of backup system.

Many stations on the mountain have a spare bay or two installed on a tower, ready for use in the event of damage to

their main system.

Another approach to ice protection is the use of *ice guards* over vulnerable sections of the transmission line run, usually the area from the tower to the transmitter building.

Horizontal metal railings are mounted about six feet above the ground, with vertical ground posts anchored in the mountain. The three-inch heliax is protected from falling ice by the horizontal members of the ice guard.

True, they are yet another expensive item at installation time, but ice guards will be added after the first in-line repairs are made. So it makes sense to avoid that unnecessary expense up front.

Also on the topic of falling ice, a football helmet would be an appropriate addition to the mountain engineering maintenance equipment, right next to the snowshoes.

I remember carrying an aluminum trash can lid over my head on a number of occasions while ice plummeted off the tower.

Since craters in the ground are rou-
(continued on page 36)

Keeping the MCI JH-110 Operational

(continued from page 19)

dered to the motherboard, or even the actual breakage of small traces.

Only a bright light and magnifier will help you track down these little breaks.

Also, you have to be very careful when reinstalling a board to be sure that all pins are mating with the motherboard. On some of the boards, it is easy to miss a row of pins on installation.

Most of the time, intermittents can be traced to the connector itself. Corrosion builds up on the pins and the mating sockets and causes intermittent operation or a total failure.

Spray solution

The classic cure for corrosion has been a liberal application of Cramolin spray R-5. This superconductive cleaner is your best shot at cleaning up an intermittent contact.

In the most difficult cases, you might

have to use an abrasive like steel wool to remove corrosion.

A coating of Cramolin should retard future corrosion. The R-5 5% solution seems to work better on the MCI than the weaker 2% solution.

If all of this fails to restore a board to proper operation, you can replace the entire connector. They are inexpensive and readily available. And don't overlook the fact that you might have a component failure on the board and need one quickly.

The best indication of a contact-induced failure is when you can restore the machine to normal, or near-normal operation by pushing down on various sections of the board when it is mounted on the mother.

Very often this flexing will restore an intermittent connection, but usually only for a day or two.

The MCI JH-110 audio electronics are

well designed and relatively trouble-free.

Each module is connected to a motherboard using the Molex, however, and they are often the cause of intermittent audio problems.

The second greatest source of trouble in the electronics is the multitude of small electrolytic caps that are used extensively for coupling, bypassing and filtering.

They dry out and cause low-frequency problems or total circuit failures. Otherwise, the machines have reasonably great electronics. Something less can be said of the deck itself.

The tape transport

I seem to remember from solid-state theory somewhere that chips should last indefinitely. This is a myth when it comes to the MCI tape transport.

There are more spikes, overloads and narrow design tolerances in this deck than in any other piece of solid-state equipment you will ever be required to work on.

Perhaps it is because the 110 was a first generation machine or maybe because it was spawned from a small company. Whatever the reasons, the deck electronics will constantly challenge you with device failures!

As if this were not enough, the multitude of photocells (in the tape shutoff, motor tachs and counter circuits) seem to have a very finite life.

Also, the reel servomotors are prone to developing an AC component on their DC output which causes the tension arm to bounce wildly from one stop to the other, increasing wow and flutter tremendously.

Despite this wealth of problems that can occur with the JH-110, you will love it when it is operating properly.

When this machine hums it is unbeatable!

Next time, we'll take a look at some specific problems and their cures.

Jim Somich has been in broadcasting for over 20 years and has served as CE for a number of stations. Currently he is CE at New York's Z-100 (WHTZ-FM) and president of Major Market Engineering. He can be reached at 201-867-5000.

CONTRACT ENGINEERING

When Inspection Time Comes

Preparing for a Visit from the FCC's Field Operations Bureau

by Lee Freshwater

Part I of II

Flat Rock NC . . . The only sentence in the English language worse than "We're off the air" may very well be, "There's a gentleman from the FCC here to see you."

Immediately you panic and wonder if he will notice the many things the boss hasn't had repaired yet. Or you may say to yourself, "No, it's a joke. The FCC doesn't come around anymore."

FCC inspections are alive and well, although not as prolific as they once were. One engineer we know is about to retire and has never seen an inspector, while in the last ten years I've been through seven inspections and know of at least five more in one market.

With deregulation, the Commission is not digging nearly as deep into station operations as it used to. This makes it easier to prepare for the inevitable visit. But more importantly, it means the FCC has placed more responsibility on the licensee to maintain proper technical operations.

There are three primary reasons for a visit from the FCC: complaints, EBS or FAA requests and random inspections.

Not all severe

Complaint inspections are usually of a more serious nature than a letter from a disgruntled listener. The Commission looks into interference complaints from other services, contest rigging, double or fraudulent billing, etc.

The last inspection I was involved with was precipitated by a request from the FAA for a tower survey and to check on old EBS equipment that was given to stations back in the 1950s.

Random inspections occur primarily during renewal time. Stations are chosen at random by call signs and area. If you are operating a combo AM/FM it's highly possible that only one of your stations will be inspected.

When investigating complaints the inspector will make a "swing" through an area, and may at his discretion inspect any station. So a complaint about one station may cause the inspection of others in the area.

In addition, the inspector may "check" on other stations' modulation, frequency tolerance, etc. If he sees something wrong he may either inspect the station or send it a violation notice.

One inspector gave us the grand tour of the "field truck." It contained about \$250,000 worth of monitoring gear for AM/FM/TV and other services. Our first thought was of George Orwell, as Big Brother could watch us at any time.

Preparing for the inevitable

There are several things you can do to prepare yourself for the inevitable visit. The best is to "inspect" yourself.

As a contract engineer, the first thing you should do is fully inspect each station.

Using a "check-list" we look at the entire operation. A report is then prepared for the licensee with each item listed and what should be done. We then file a copy in our files.

After you have pre-inspected, sit down with your manager and outline what should be done and what it should cost. If you do your research properly, you can also give the manager an idea of what the fine would be if these items are not taken care of.

Another thing that has worked well for us is to "know your fellow engineer." Get to know the engineers at other stations in your area. You can do this through the local SBE Chapter.

Perhaps one of your operators knows someone at the other stations who could introduce you. Offer your assistance with parts, ideas, time, etc. It could pay back a thousand fold.

The last inspection we had, another engineer gave us a two-day warning—plenty of time to make sure the "i's" are dotted and the "t's" are crossed.

This can also help you out at 3 AM when you need a part. In one market, if the engineers took back all the parts they had "loaned" or borrowed, every station in town would be off the air.

Train your operators

To further prepare your station, have a meeting with all the operators. Make sure they fully understand that the FCC is still inspecting stations. Explain to them that operators have an obligation to fully understand the technical operation of the station.

If you have a directional array and change patterns or have different power levels, operators must know how these things are done and must do them on time.

The FCC does have the authority to levy a fine against the operator and/or the station for flagrant operating viola-

tions.

I do not know of the Commission actually fining operators, but we did have an inspector suggest to me that they could.

The operator on duty at the time of the inspection will be asked to explain and demonstrate to the inspector how to raise/lower power on the transmitter.

Make sure the operators know to be completely honest with the inspector. If the operator changed patterns or power level late, he or she should be honest about it if asked. Chances are the inspector has already monitored the station, and knows exactly when things were done.

Also talk to the receptionist. An in-

pector will first ask to see the engineer and/or the manager. It doesn't look too good for the receptionist to say, "I wonder who our engineer is." Remember, first impressions are very important.

know how to turn the transmitter on or off and in some remote situations have never even seen the transmitter. We advise stations to implement a strong program of operator training in the area of engineering. The operator need not know how to repair the transmitter, but has to be able to recognize problems and know what to do about them. This can't be done with no training.

Use the old Third Class Exam, as many of the old study guides are still available. Hold training sessions in all areas of the technical aspect and reward those who do well. It does pay off when the inspector walks in the door.

Judgement day

The dreaded day has arrived. The secretary buzzes you and announces that a man from the FCC is out front. First of all, *don't panic*.

You've pre-inspected yourself and properly trained the operators; all is in order. The inspector is there to do a job just as you are. An inspector is a member of your society, an engineer, someone who understands your language.

With that in mind say your silent prayer, put a smile on your face and go introduce yourself.

The inspector will usually tell you why your station is being inspected. If it's a routine inspection, relax, remember that you've done your homework and everything is in order.

The first thing the inspector will want to see is your licenses and control room. The second necessity is a place to work, preferably as quiet as possible.

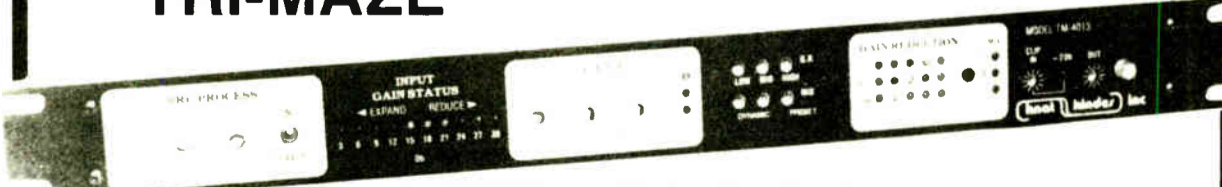

Make sure you have a notepad with you and ask the inspector if you could take notes as the inspection progresses. (This probably won't be a problem.) Also ask for a review of everything when the inspection is finished.

(continued on page 31)

FCC inspections are alive and well, although not as prolific as they once were.

When it comes to Telephone Talk Show Technology . . . the choice is simple.

GENTNER'S DIGITAL HYBRID™ & TELEMIX X™ are...

...what you need to make your on-air talk shows sound their best and run their smoothest. Yes, there is competition out there. However, there are over 300 Digital Hybrid/Telemix systems proven out in the market. Major network to individual station talk shows are using this system.

- What makes the Digital Hybrid/Telemix X system so popular?
1. Interfaces with almost anything
 2. Fully remotable
 3. Latest true digital signal processing technology
 4. Instant Auto Null & Re-null
 5. Built, sold, and serviced by a major broadcast equipment manufacturer & radio's largest distributor

The choice is simple. You can go with the most features, longest track record and unbeatable performance OR something less. But why settle for less?

People and Maintenance Parallel

by Miriam Bandfield

Marion IA . . . Truthfully now, have you ever wondered whether you are weird? I mean weird in the sense of socially awkward and out of step.

Perhaps my parents thought that of me. They were always too polite to ever say such a thing out loud but I remember one time when they might have suspected it.

I was a 17-year old girl just finishing high school. In fact it was graduation night and I had been invited to the senior class party. I didn't have a date but I knew some of my friends would be there.

Nevertheless, I did not want to go. I had something else I wanted to do, something more exciting, but my parents forbade me to do it. "Either stay home or go to the party. Tonight those are your only two choices."

I was angry but I went to the party. Oh, it was OK, but it did not compare with what had been my Plan A—to go over to the church all alone and practice on the sanctuary organ. I loved music.

I also loved learning the way in which that electro-mechanical thing worked and then developing the skill needed to play it to its full potential.

At the party with all my most-likely-to-succeed classmates I felt awkward, self-conscious. But when it was just myself and a "machine" I felt challenged yet confident.

Me and the control board

It wasn't until college that I was introduced to radio broadcasting in general and, later, electronics specifically.

Again, I found that same satisfaction in pitting myself against a "machine," first as a DJ playing the control board like some space-age instrument and later as a chief engineer tuning an entire FM station, persuing harmony.

Hours working alone with inanimate objects, however, means a correspond-

ing number of hours lost interacting with people. In one area of life my confidence grew but in another it was stunted. Now we are back to weird!

In the past three years my life has changed quite a bit. I am now a wife, homemaker and mom. My life is centered upon people now.

What a relief to discover that things I learned as an engineer, in fact some of the character traits essential to good en-

. . . some of the character traits essential to good engineers are the same as those needed to be a good friend, mate, and parent.

gineers, are the same as those needed to be a good friend, mate, and parent.

I am not going so far as to say that people are like transmitters, but I will say that good relationships with people can be developed using the concept of maintenance.

Time and patience

It seems to me that good maintenance involves understanding (or knowledge), patience and commitment.

To keep a piece of equipment running smoothly you need to know how it works *plus* you need the patience or stick-to-it-iveness to do what needs to be done until the task is accomplished. It is, for the moment, focusing more on the piece of equipment than on yourself.

If a cart machine acts up you could get angry and put your fist through the wall. That might make you feel better for a couple minutes. (At least it could divert your attention from the problem at hand to the hand itself!)

But ultimately you are going to have to settle down, focus on the cart ma-

chine, call up the necessary knowledge and apply it patiently until the problem is solved. (Some things take time.) The same approach works with people.

Maintaining the social machine

Say you are a single guy but you know that you could change that if you could only get a date. So you plan your strategy in advance when you see that new, pretty salesperson.

You decide to stop her in the hallway, do all the talking so there won't be a lull in the conversation and talk about yourself the whole time so she hears all about your good points (and not about your weaknesses).

Then you plan to ask her out in front of other people so she will be too embarrassed to turn you down.

But when you follow through with this plan it falls flat. She just keeps glancing at her watch. Finally she says she is sorry but she doesn't think she is free. Then she walks out.

What if you tried it again with some understanding and patience? Forget about yourself for the moment, both your strong points and your fears. Show an interest in her, an honest desire to get acquainted. And remember, some things take time.

The "C" word

One of the most important aspects of maintenance is commitment. If that is too frightening a word for you, call it having an eye towards long range goals. Although commitment sounds lofty it always comes down to some very nitty-gritty choices.

Let's say it's time for you to roll off the

sofa and go out to the transmitter. The station is scheduled to be off the air only a couple hours per week so the cleaning and dusting can be done and that time is *now*.

That weekly argument bubbles in your mind: "I am going to skip cleaning this week. No one will know whether I do it or not. It isn't like we'll sound any better tomorrow because I cleaned tonight. Anyway, it's too cold out there . . . or too hot, or too far up the mountain or too overrun with scorpions."

But then you think of what you want in the long run: an efficient operation and the reputation as a competent and respected chief. So, you dress for the weather (or scorpions) and go.

People-maintenance

So many people today are crying out for this same kind of commitment as you relate to them. Of course the arguments will bubble in your brain when it comes to these choices too.

"I don't want to help my friend move to a new apartment. There are other people who will do it."

"Why should I try to comfort my wife? She is always crying over some silly thing."

"Go to the kids' concert? No. I hate classical music."

As you can imagine, some of the alternatives you will be faced with are not thrilling. In fact they may be rather tedious at the moment, just like cleaning that transmitter. It may often seem that this one little thing is not going to make much difference.

But as with that transmitter, it is the accumulation of all those "little things," either done or not done, that moves you closer to your goal of firm friend, caring parent, supportive spouse.

So, weird people, relax. You *do* have what it takes . . . good maintenance capability.

Miriam Bandfield is a former radio CE living in Iowa currently at home raising her baby daughter.

Preparing for an FCC Visit

(continued from page 29)

The inspector will want to write down all the permit names, etc. Remember, all operators **must** have the FCC permit. There should also be a letter designating the chief operator.

Worst offenses

According to the FCC Field Operation Bureau, the ten most violated rules are:

1. Failure to maintain or have a complete public inspection file.
2. Failure to have a licensed operator on duty.
3. Failure to conduct EBS tests.
4. EBS monitor-receiver and/or tone generator not operational or installed.
5. Failure to operate station within the limits of frequency tolerance, modulation limits, spurious and harmonic emissions.
6. Equipment performance measurements not maintained.
7. Failure to designate a person holding a commercial radio operator permit to serve as the station chief engineer.
8. Failure to post station and/or operator licenses or permits.
9. Failure to post EBS check list at normal duty station.
10. Failure to meet specified transmis-

sion emission limitations.

Although these are perhaps the most violated rules, the FCC Mass Media Bureau has an enforcement program of their own. Among other things it enforces lottery laws, main studio rules and political broadcasting rules.

Now that the inspector is here and the ordeal has begun, there are specific areas that will come under scrutiny. We'll take a look at these areas and how they can be brought into compliance next time around.

Resonating a Load in Impedance Matching

by Tom Osenkowsky

Brookfield CT ... In some cases impedance matching may be simplified by the addition of a single component in order to achieve resonance. Resonance occurs when a conjugate load impedance is transformed into a pure resistance.

We can resonate a load by the addition of a series or parallel component. In series resonance a component having equal reactance but opposite sign is placed in series with the load, thus leaving a pure resistive value.

In parallel resonance a component is placed in shunt with the load and a value of pure resistance, always greater in value than the original, is produced.

Figure 1 shows a QuickBasic code for a computer program which will automatically determine both series and parallel resonant values.

In some instances one can take advantage of this practice in order to reduce component count thus saving money and increasing reliability.

Another approach to simplicity can be the connection of a tower base directly to a transmission line.

Since the line will act as a transformation network (and can be modelled as such) it is indeed possible to eliminate the ATU entirely or locate the ATU in a more accessible location.

A working example of the latter can be found at station WLAD in Danbury, CT.

In order to get to the tower base, a long series of stairs must be climbed up the side of a mountain. During winter months access is not always safe. Routine base ammeter readings were not always possible.

After careful study I solved the problem by using a Delta remote ammeter which now places the actual base am-

meter inside the transmitter house some 600 feet away.

Additionally, the tower base is connected directly to the transmission line where it feeds a tuning unit inside the house.

In this case, readings can be taken at will since the DC sample is fed directly to the base ammeter as well as a second DC sample for the R/C and the tuning unit can be serviced indoors.

In this particular case, the transmitters would end up seeing 59 +j7 ohms without a tuning unit. Not bad, but a -72 degree Tee network provides optimum rotation, thus excellent bandwidth at the Harris SX-1 combining point.

In some cases networks can be simplified, but as always, be careful to observe component and transmission line ratings.

Tom Osenkowsky is a radio engineering consultant and president of MASTER Software, and a regular RW columnist. He can be reached at 203-775-3060.

Launching Your Own FM Radio Station

(continued from page 25)

structive if the author had taken us step by step through the process of filling it out.

The book is good, however, in showing the mechanics of "Petition for Rulemaking," including a sample one that worked. That is usually the first step in getting an FM channel in a town, after which an application is filed, with comparative hearings often the result when more than one party wants the same FM channel.

I would like to have seen more sales helps or rules of thumb to apply as to

Figure 1.

sizes of communities where successful FM stations could be expected.

Hunn shows cognizance of competition, and explains the format and station operating hours and his news philosophy. WHRC apparently proves you can run a commercial FM station with no news wire, no network, no satellite dish, no computers and not employ hard sell in soliciting advertising—especially if you run the business with a little humor. Even the *New York Times* saw fit to run a story on WHRC.

Also interesting was the decision to sell WHRC to a Vermont company, enabling Hunn to take \$200,000 and run to a daytime AM station in Oswego, NY, hoping to turn around its fortunes. The Port Henry station is now WHWB-FM, and has embraced stereo.

Rich in historical anecdotes, the book includes a mention of the \$7,500 paid to WMCA by WHOM for 92.3 in New York City back in 1949.

It says "whether a station is profitable or not, it is often difficult for a broadcaster with radio in his blood to come to terms with selling his radio

outlet. When the station owner was the one who actually built the facility, the thought of selling can seem unthinkable."

Hunn seems to be the ideal broadcaster. Interested in radio and in serving the community, he takes the opposite approach of so many in the industry, such as Jerrel Shepherd of KWIX, Moberly, MO, which billed over \$325,000 way back in 1968, who was quoted in the book, "We are more a sales organization than we are a programming operation. It could be said the KWIX is a sales organization with the programming to support it."

Finally, the Hunn book has some caveats for would-be station owners. Does he recommend that others run radio stations from their homes as he did? Read the book and find out. I'm sure you'll find it fascinating.

Bruce F. Elving has a Ph.D. in communications from Syracuse University and publishes the FM Atlas and Station Directory and FMedial newsletter. He is an occasional writer for Radio World.

Radio Routing Switchers

(continued from page 27)

Most manufacturers can give you a router with good SNR and low crosstalk. But there are key questions which need to be answered.

Practical router considerations

First of all, what happens if I overdrive an input? Do I lose all those nice cross talk figures?

Also, do the ports' remote controls make sense? Can a DJ use them? Will it handle a range of input levels or do I need homebrew pads or amps on each input?

How does it grow, in large or small chunks, expensive or cheap chunks and how much will its power supplies and controls handle?

Most importantly, will it work forever

with no maintenance and what happens if it doesn't? Are there dual power supplies? Is the software backed up?

Can this switcher help me do more than just route signals? How are the controls connected, a common coax or twisted bus, RS232 or individual multiple conductor line?

Once your questions have been answered, it's time to look at design and a few other considerations before making a choice. We'll look at some of those next time.

Problem Areas in Programming

Breathing New Life into Small Station Formats

by Peter Hunn

Westport NY . . . Last year an engineer friend of mine decided to enter the ranks of broadcast ownership and he acquired a small, southern daytimer.

"For only 250 watts, it's got a pretty good signal," said the new station owner. "There is one thing," my compatriot continued, "I could really use your help with the program format. It just doesn't sound right."

Heading down south to investigate, I recalled that this fellow was a stickler for perfection, and that as a result, he was probably underestimating the positive points of his station's air product.

I wondered if the format would be off-key enough to warrant even a few suggestions. When I got within the little station's signal range, however, it became clear to me that my friend's concerns were not unfounded.

In fact, while taking copious notes I practically lost control of my car and headed into a guardrail!

After going over those notes, I discovered that the shortcomings of my associate's radio programming fall into a few problem areas that tend to water-down the format at many a small broadcast station.

The following paragraphs seek to identify some of these sensitive program areas, and offer guidelines for their correction.

Without a call sign (or some dial posi-

tion identification), audience members may not know what they are listening to. Unfortunately, it is not uncommon to listen to some small market stations for 20 to 30 minutes without hearing a single set of call letters, or generic ID.

For years even folks who really wanted a Pepsi would ask for a Coke simply because the name Coke was so often promoted. The same may be true of radio stations.

Obviously, when listeners in your marketing area are surveyed (whether formally or informally) you want them to come up with your station's call sign.

A station should mention the station's call letters directly after each record. For example, "WZZZ with James Taylor's latest song . . ." or "WZZZ and a tune for you by James Taylor . . ." Noting the call letters twice in each break will not hurt either.

Time checks

There are lots of people who turn on a radio for the sole purpose of getting the correct time. Again, it is all too possible to listen to a station for upwards of half an hour without hearing mention of this important element.

Give a time check after each record (and/or long spot break). I've never heard a single listener complain about stations that give too much time information.

It is also important to say the time in a natural way. If someone were to stop a person on the street in order to ask for the correct time few individuals would respond by saying, "It's 20 minutes, now,

after the hour of 2 o'clock."

And yet, many announcers needlessly draw out a time check in such a fashion. Just say, "It's 20 after 2."

Station policy needs to dictate whether digital or analog time checks should be rendered during the second half of an hour.

There are those who, arguably, feel that the recent digital watch proliferation makes it difficult for the younger crowd to relate to, "It's 18 before 3;" as opposed to, "It's 2:42," etc.

Then there's the "I can't wait to get out of here" syndrome.

Although one might not get a station ID, or a time check, he'll probably be sure to hear the radio announcer say, "I'm Joe Bloe, and I'll be with you until 7, and then John Smith will be in."

If someone kept telling you when he was going to leave, and exactly when his replacement was expected, wouldn't you get the impression that he was rather anxious to do something a bit more enjoyable?

Air talent should de-emphasize direct mention of when the next DJ is taking over the controls.

Record rotation/placement

No station owner would suggest that his DJs speak in a monotonous voice. Similarly, broadcast management should seek an interesting variety with regard to its format and related record rotation.

Ideally, the records played (within a station's format) should vary from each other just enough to make the programming interesting, while not shifting dramatically enough to make the listener wonder what type of music format the

station typically offers.

A good record rotation within a radio format might be compared to a good menu plan. Many foods are used to make an interesting meal.

The foods must, however, be presented in acceptable or familiar combinations.

A radio outlet that features a poor record rotation could be likened to a hostess who serves her Thanksgiving dinner guests a small slice of turkey and a plateful of cranberry sauce.

Commercial spot breaks

Have you ever noticed that, like records on the Top-40, commercials vary in tempo and intensity?

A polished radio format should include commercial spots that are aired in an order which is related to their energy levels. Extreme up-down-up-down segues should be avoided in commercial spot rotation.

Live spots are generally the most sedate and should have the first position in a spot break. These announcements might be followed by more up-tempo spots containing a music bed or jingle.

Without creating an over cluttered sound, all spot breaks should end with some mention of the station's call sign/ID slogan. Frequently this is contained in a station promo (to be run last in a spot break) or jingle.

In lieu of such material, it is acceptable to briefly mention the call sign over the introduction of the first song played after the spot break.

All commercials that contain music beds should have the music out by the final syllable of the commercial's last word so that no music trail interfered with (or serve to protract) a subsequent

Are Hams in Danger of Cancer from RF?

by Neil Lewbel

Stratford CT . . . Since the beginning of this year a number of newspaper articles have appeared around the country describing links between amateur radio and RF exposure with deaths due to cancer.

The cause of these recent newspaper stories is an article which appeared in the January 1988 issue of the *American Journal of Epidemiology*, a medical journal.

The article was titled "Increased Mortality in Amateur Radio Operators due to Lymphatic and Hematopoietic Malignancies." It was written by Dr. Samuel Milham, Jr., who works in the Epidemiology Section of the Washington State Department of Social and Health Services, Olympia, WA.

This article describes an extensive study of the cause of death of licensed radio amateurs in the states of Washington and California. The study covered the period from 1 January 1979 to 31 December 1984 and was the latest of several in which Milham compares death rates and causes with exposure to electrical fields.

Milham's first study appeared in the *New England Journal of Medicine* in 1982. This study was based on a comparison of the cause of death for men in Washington State with their listed occupation.

The statistics were determined for eleven occupations which involve exposure to electrical and magnetic fields. Occupations such as electronic technician, radio and telegraph operators, power station operators and television and radio repairmen were included.

In 10 of these 11 groups there were more deaths due to leukemia than would normally be expected. Milham's conclusion was that electrical and magnetic fields may cause leukemia.

Following this first study an amateur radio operator contacted Milham and suggested that he study mortality in hams, who are exposed to electrical and magnetic fields.

This resulted in Milham's second study, which appeared as a letter in the 1985 Volume 1 issue of *Lancet*, a British medical journal. The basis for this second study was the "Silent Keys" column in QST which lists some of the members of the ARRL who have died.

The study took the names of male hams in Washington and California listed in "Silent Keys" from 1971 to 1983. The cause of death or death certificates were checked for most of these amateurs. The results showed a higher than expected mortality rate due to certain types of leukemia.

The latest study which triggered the recent newspaper articles is a more ex-
(continued on page 37)

Performance Proof Guidelines

(continued from page 19)

of interference protection. Of course, this section was written before the Commission got out of the standards business.

Note, however, that this section does not require that FM stereo systems use this standard, but merely that any station that uses 19 kHz shall use it to transmit stereo meeting this standard.

Note also that 73.322(a)(3) does not preclude the use of other stereo subcarriers, hence the design of the FMX system, which uses another AMDSBSC subcarrier at 38 kHz (in quadrature with the subcarrier required by this section).

This "protection" of the 19 kHz subcarrier is similar to the protection offered the television BTSC subcarrier by 73.682(c).

When the FCC dropped the audio measurement requirements, much of the trade press wrote that the FCC had dropped the annual "proof" requirement.

As mentioned above, only the audio portion of the equipment performance measurement requirement was dropped. We'll look at 73.1590 to see what is still required for radio stations.

When to do it

All AM, FM and TV stations (except class D NCE FMs operating with 10 watts or less TPO) must make equipment performance measurements of each main (not auxiliary) transmitter when one of the following occurs.

- Installation of a new or replacement main transmitter.
- Modification of a transmitter as permitted under 73.1690(e).
- Installation of AM stereo transmission equipment under 73.128.
- Installation of FM subcarrier or stereo equipment under 73.295, 73.287, 73.583 or 73.597. Note that these measurements must be made even if you're just changing a remote control that uses a subcarrier to return metering.
- Annually for AM stations with not more than 14 months between measurements!

- When required by other provisions of the rules or the station license.

Note that annual requirement for AM stations. Note also the requirement that measurements be made when changing subcarrier equipment.

What to measure

Rule 73.1590(b) requires the measurements to demonstrate compliance with the transmission system requirements appropriate for the station (73.44 for AM, 73.317 for FM).

These are all RF bandwidth requirements, except that 73.317(e) requires that the audio preemphasis in an FM station may not exceed a 75 μ second network.

The measurements for an operating

AM station are to be made at ground level about 1 km from the antenna center, with the station operating into the antenna [73.44(d)].

Further, if the station is directional, the carrier frequency reference field strength is to be based on a non-directional antenna (as determined by one of three methods).

Assuming the measurement is made in the major lobe of the array, where the actual carrier field strength is higher than that of a non-directional antenna, the sideband and spurious radiation must be attenuated the specified amount below the ND field, which puts a more strict requirement on DAs than NDs.

Since the measurements are to be

made with modulation [73.1590(b)], and the measurement area begins at 15 kHz from carrier [73.44(a)(1)], it appears that the measurements would have to be made with a spectrum analyzer.

This contrasts with the previous requirements where "evidence" that spurious radiation was not causing objectionable interference could be provided with a communications receiver.

The required measurement data along with a description of the equipment and procedures used to generate the data must be signed and dated and kept on file at the transmitter or remote control point for two years, and be made available to the FCC on request.

Harold Hallikainen is president of Hallikainen & Friends, a broadcast equipment design, manufacture, sales and installation firm. He can be reached at 805-541-0200.

Guarding Against the Elements

(continued from page 28)

tinely formed around towers by these falling meteorites, caution is the word.

Lightning

When it comes to lightning "the tall one takes the fall" most of the time. On the mountain, the station with the highest antenna location absorbs the brunt of lightning storms. As a result, it is forced to regularly stock a spare plate transformer.

So ironically this station serves as insurance for the rest of us from the worst

of Mother Nature's electrical discharges. We should all contribute to its maintenance budget for such services rendered. But, in the end, nearly all of the stations get a piece of the action.

Some of the techniques for dealing with erratic power surges after an outage also help with lightning protection: surge protectors, uninterruptible power supplies, etc.

Ultimately, however, it comes down to straightforward bottom-line reckoning. Higher maintenance costs are required on a mountaintop at 7000' than at 2000'

on a tower.

That means you need a certain number of spare parts such as a full set of high voltage diode stacks for the transmitter power supply. It also means storing heavy items at the site rather than expecting to transport them there.

Poor ground conductivity

All of your nightmarish experiences with poor grounding exist at mountaintops. The "soil" (a loose definition at best) is made up of rock and clay, which partially explains why no

trees grow at the site.

Add in the low moisture content during most of the lightning season, and the earth fails to meet lightning protection expectations.

A central ground system ties together many sites on the mountain. But it's not adequate for the environment. The stations with the least trouble have pursued elaborate grounding strategies, which have paid off in the long run.

One station invested \$45,000 in copper about 12 years ago. It bonded copper to the tower, buried it under extensive sections of ground, used eight-inch wide copper ground strap and shielded the building inside for RF screening.

You might imagine the suggestions which have been discussed for years about a community ground system for all stations on the mountain. But, there's the matter of cost to consider.

And the stations which are now surviving lightning storms with no damage clearly have no room for improvement. Besides, they are the stations which invested heavily in elaborate ground systems.

As another strategy for such locations we've looked into chemical ground rods, which improve grounding as they produce their own moisture on a daily basis. While such a theory seems ideal for mountain sites, we have yet to actually try them.

At Deer Point

Back to how it's handled at Deer Point, each station does its best to tie into what-

Higher maintenance costs are required on a mountaintop at 7000' than at 2000' on a tower.

ever ground is available. That means a minimum of four-inch copper strap—the thick stuff and silver soldering.

Before soldering KBSU installed several brass nuts and bolts to provide additional physical support and some electrical connection in the event that a lightning strike were to melt the silver solder. This has actually occurred on the mountain.

It's not possible to get underneath one's transmitter in the trough to check the condition of the bonding. So, the best possible connection of grounds straps prior to the transmitter installation is logical.

If these suggestions strike you as being no different than design considerations for any transmission site, you're right.

While such techniques are frequently used, the difference at a mile high is that all of these approaches become mandatory, not optional. And even then, it's best to maintain a backup transmitter and an RF switcher hooked onto the transmission line input.

Thus the terrific gains in elevation are traded off by additional design expenses. On the other hand, tower construction expenses are lower. The tallest structure on our mountain is just 220', a far cry from the 1000' structures on flatter lands.

Tim McCartney is director of engineering and operations at KBSU, Boise State University. He is an SBE broadcast engineer, a former GM and has a masters degree in human resources development. He can be reached at 208-385-3760.

Orban's new 222A Stereo Spatial Enhancer augments your station's spatial image the way our OPTIMOD™ maximizes your loudness and impact on the dial: Your stereo image will seem magnified, and your listeners will hear more loudness, brightness, dynamics, and depth.

The 222A uses a new proprietary, patent-pending technique that detects and enhances the psychoacoustic directional cues present in all stereo program material. The effect is vivid and compelling—and survives even in San Francisco's brutal multipath environment. On-air tests have also confirmed complete mono compatibility and an audible increase in brightness, punch, and stereo spatial definition that complements your present audio processing.

Creating broadcast-compatible stereo image enhancement is very difficult. Do it wrong, and you can get increased multipath distortion, mono incompatibility, unnatural exaggeration of reverberation, increased sensitivity to vertical tracing distortion in disc playback, and otherwise disappointing results. If an image enhancer uses delay lines, it can drive headphone-wearing DJ's nuts, homogenize the stereo image, and comb-filter the left and right channels.

Orban's new 222A does it right. It avoids the almost endless list of traps and pitfalls, while delivering a sound that stays crisp, dynamic, and well-defined.

Most importantly, this competitive edge is remarkably affordable. At \$995.* , it is within reach of any station—FM or AM—looking to polish its image by enhancing its stereo.

Call or write today for complete information on our powerful new on-air processing tool—the Orban 222A Stereo Spatial Enhancer.

Orban Associates Inc.

Can RF Cause Cancer in Hams?

(continued from page 34)

tensive study of mortality in hams. This study was based on a list of all licensed amateur radio operators, purchased from the National Technical Information Service.

The list showed those who were licensed between 1 January 1979 and 16 June 1984. Hams with Washington or California state addresses were taken from the file.

A search for deaths was then done by name. Because there are much fewer female hams, records showing female names were removed from the study.

More than 67,000 names were compared with death records in the two states. In this group there were 2,485 deaths during the study period.

Analysis of the data obtained from this study indicates that there were more deaths due to two specific types of leukemia than would have been expected.

Acute myeloid and acute unspecified cell were the two types of leukemia mentioned. It was this point which has been emphasized in the newspapers. There are, however, several other points which

Milham made in his article describing the study which are more encouraging.

One important point was that "the overall mortality of amateur radio operators is quite favorable when compared to that of all US males."

Milham's article also indicates that in addition to electric and magnetic fields amateurs are exposed to electric shocks, soldering fumes and degreasing agents in pursuing their hobby. He also mentions that about "one third of the group also works in jobs with electric and magnetic field exposure."

However, the article also states, "The low standardized mortality ratios for malignant and non-malignant respiratory diseases suggests that members of

the ARRL have a lower ratio of cigarette smoking than does the general population."

The ARRL responded to the newspaper articles and Milham's study in the March 1988 issue of QST. The ARRL mentioned that the study also showed that amateurs had fewer deaths from certain kinds of leukemia than the general population.

The QST article also raised questions about the methodology used in Milham's earlier study of hams. But the ARRL Committee on Biological Effects of RF Energy is still studying Milham's most recent article.

Milham had several comments which put the issues in proper perspective. He

said in a phone interview that "all we know about it is FCC registrants have increased mortality in some areas and decreased (mortality) in others."

He also pointed out the fact that only some types of leukemia are elevated indicates that there is something real which requires more study.

When asked if he felt there were any special implications for broadcast engineers, Milham suggested that he would not jump ship and change jobs at this point.

He does however, believe there is sufficient justification to do more studies on the effects of electrical and magnetic fields.

Neil Lewbel, in addition to writing about radio and electronics, is licensed as amateur station KA1PJQ. He can be reached at 203-377-8517.

(continued from page 34)

event.

Back in the early 1970s when KCBQ-AM was a high energy, San Diego rocker, it featured a terrific promotion called *The Last Contest*.

During this promotion, KCBQ offered prizes like: dinner for you—and 1,000 of your closest friends—as well as yacht cruises to exotic locales. And after your happy return, you could keep the boat!

Today large stations continue the KCBQ tradition and give away big prizes such as cars, homes, \$50,000, etc. Is it possible for a small station, with few available promotional dollars to come up with a worthwhile contest? Fortunately, if you responded "yes," you win.

People seem to enjoy simple contests (like trivia questions) where they are able to play along even if they are not able (or likely) to call in for a prize.

One tried and true promotion is: "Guess the first date, this winter, on which it will snow an inch or more (as measured outside our studios)." An appropriate prize would be a gallon of antifreeze, a snow shovel, ice scraper, etc.

In any event, if your station can afford a music or general trivia book, and is able to get the local fast food restaurant to give you a couple of hamburger gift certificates your broadcast facility is well on its way to getting into the contest business.

Finally, it is true that, in addition to the areas covered in this article, there are other radio format guidelines that might require consideration.

However, when the basics mentioned here begin to get straightened out, a consistently listenable radio format is well within reach.

Peter Hunn is a former station owner, Billboard magazine air personality of the year, and holds a Masters degree in Mass Communication from Central Missouri State University. His book "Starting and Operating Your Own FM Radio Station" was just published by TAB Books, Inc.

When-and-if you're ready to UP your transmitting power, will your FM transmitter be ready too? If it's one of the QEI "New Reliables" FMQ series, the answer is YES!

Our new 3.5KW, 5KW and 10KW transmitters were designed to give you a clear upgrade path to higher power. In just a few hours, your 3.5KW or 5KW QEI FM transmitter can be upgraded to a factory-equivalent 5KW or 10KW unit, right in the field. QEI's unique modular solid state drivers and interchangeable P.A. assembly make these power upgrades easy...and very economical.

If you're shopping for a 10KW unit in the first place, the QEI FMQ-10000 has lots to recommend it. No other FM transmitter packs this much power, reliability and performance into a single 24" wide rack cabinet. And the FMQ-10000 is designed to operate on single-phase power, so there's no need to pay for installing new three-phase electric service.

What's more, for upgrades to power levels beyond 10KW, each of these FMQ series

transmitters can serve as the driver section for QEI's 20, 30 or 60KW transmitters, again resulting in major cost savings.

Every QEI "New Reliables" FM transmitter is built to deliver ultra-dependability and performance. So—whether your station is thinking of upping its power down the road, or if the power you start with is the power you stay with—you'll be glad you chose QEI. Call us toll-free at (800) 334-9154 for the full story.

The Wreck of the Good Ship AM

(continued from page 23)

We are averaging a loss of two shares a year. We lost four shares in 1987, one share in the spring of 1988. We have twenty-five shares to go; there are only 12½ years left.

Nero in Congress?

Ed Markey, the chairman of the House Telecommunications Subcommittee, the FCC's boss, may go down in history as the man who fought for the Fairness Doctrine but he will also go down as the politician who fiddled while Rome burned.

He is a champion of tight controls on radio and TV and is a champion of "more is better" in the "public interest."

Ironically, he is fiddling with those broader issues while 50% of the spectrum he was entrusted with goes dark. More bureaucracy and this slow-moving process will kill the band before he ever leaves office.

If I could do a cartoon, I'd make a Mr. Magoo-type character standing on the deck of the ship. Near him would be a life preserver and an anchor. He would represent the government and Congress.

In the water would be tired swimmers representing AM radio stations. Magoo would be saying, "Here's help, grab this, hold on tight." Then, as only Magoo can do, he would accidentally throw the anchor.

Sadly, Magoo would never know the error until it was too late. That's where we all are right now. The anchor is in the air—we're beginning to reach for it in desperation. Unless momentum ceases we're all going down, believe it or not.

Costly errors

The next error was not getting receiver makers, the FCC and broadcasters together long ago. AM is going down because people can't hear technical quality.

AM stereo presented some hope. There's no magic in stereo, but with stereo came AM radios with much higher technical quality. This error goes to the FCC for not choosing a single system of

broadcasting AM stereo.

We've lost 12 shares while the "marketplace decision" took place. Here some receiver makers, including GM, came to the rescue.

There are now millions of those great sounding radios out there. But many AM radio station owners are standing on their Titanic decks and saying "I'll wait and see."

The marketplace decision has been clearly made in favor of Motorola and thousands of AM station owners haven't even noticed—or don't care.

They have the very power to turn the band around, but they don't try. They have inadvertently shut off the emergency pumps.

We are sinking faster. The next error was allowing simulcasting. That anchor cost us four shares the first year it went into effect. In 1960, the FCC ordered us to stop simulcasting so as to make more people listen to the FM band—what logic reversal!

Based on that experience the return of simulcasting was only going to weaken AM. It solved the financial problems of many FM stations who didn't care about their AM but it has driven AM listening down more.

AM radio, now, has hundreds of radio stations whose name is "FM103." Some markets have no AM radio stations at all, just big regional FM stations broadcasting on local AM stations.

Public interest pitfalls

The FCC offered some help—the breakup of the clear channel stations. Now poor signal stations might be allowed to move down to less crowded frequencies. The biggest problem is the "public interest standard."

If I want to move my weak signal station, I go on "public notice." Because I'm already a broadcaster, I'd be the last to be chosen for the new frequency. And so present, poor signal broadcasters don't apply for their only hope.

The very public interest standard that should foster radio's development is

causing it to sink faster.

The government that could help it is caught up in a huge web of bureaucracy. A giant battle between the FCC and Congress assures any help this year will have to wait. Many AM stations are going off the air forever while the two sides bicker.

Often, their transmitter site is worth more than the declining value of the station. The public interest ultimately is served when the station goes dark and the shopping center is built.

... (By 1968) AM radios began to sound worse and worse; FM better and better.

The bureaucracy isn't moving fast enough. In a few years it will be too late. The most common question by younger people when buying a radio is, "Can I get it without AM?" FM-only radios are now in production.

Lifeboats await

The first thing that is needed is an immediate adoption of the NRSC standard—the standard that stops AM radio stations from transmitting frequencies over 10 kHz; no radio can hear them anyway.

When this happens, radio manufacturers have already agreed to produce compatible radios that contain a sound that approaches that of FM.

Yet with this immediate hope, 70% of all AM broadcasters have ignored the conversion. Their ship is sinking. They deserve it.

Next some very immediate attention is needed by the FCC and Congress. Unfortunately, bureaucracy moves slowly. If it moves slowly this time, it will eliminate the AM spectrum.

AM radio, at least temporarily, needs the latitude to upgrade, increase power where applicable and change frequencies without potential harassment applications.

Hundreds of construction permits

have been issued to non-broadcasters for AM facilities. A vast majority have not been built. The public interest standard favors non-broadcasters.

What AM doesn't need right now is a bunch of first-time broadcasters without the vast financial resources and skill that it takes to get people to listen to AM.

Fighting for AM

Many AMs need more power. In the eastern part of the country, a 3000 W FM puts out a far better signal than a 10 kW AM above 1200 on the dial.

A city with a noisy AM band from this kind of upgrading, but with 10 AM signals cutting cleanly through the noise, is better than no band at all.

Simulcasting should be stopped. If an AM/FM combo doesn't want to fight for AM, it should sell it or give it up. Simulcasting has hurt AM badly.

Some brokers will not even list an AM-only radio station because the market is too weak. FM stations are now the biggest buyers of AM radio stations, and it's just for the purpose of adding a fraction of a share point to increase an FM rate at the negotiating table.

Without simulcasting, AM owners will be forced to fight—just like FM owners did in the late sixties.

If half the AM band does go dark—and at least that much may happen—the FCC should consider spacing the remaining stations 20 kHz apart. Then AM, with increased power, would produce better quality than FM.

AM could come out fighting with technical dominance. Help is needed immediately by everyone. Anything less will eliminate 50% of the broadcast spectrum by the year 2000.

Finally, there needs to be a Congressionally mandated continuous tune dial. It worked for UHF years ago. AM now needs this help until the crunch is over.

It is imperative that these radios are high quality 9 kHz radios, so the AM will sound similar to the FM portion when they automatically change from one band to the other.

All this need to happen at the speed of light. The old demographics of AM listeners could make the downward spiral in listening irreversible in a few years.

Ron Frizzell is president of WLAM-WKZS-WJBQ in Auburn-Portland. He can be reached at 207-784-5401.

Sound thinking!

Encore Series
P100 PHONO PREAMPS

Everything you really need for superb sound.

\$269 Stereo

- +18 dBm Balanced outputs

Any of these problems sound familiar? Get to know Modulation Sciences' composite baseband solutions.

Solutions

Problems

- Transmitter noise, heat, RF field interference and physical location make the transmitter room a poor place to locate the stereo generator and audio processing. Necessary and critical adjustments are inconvenient at best; nearly impossible at worst!
- Lossy, expensive, hard-to-install 950 MHz semi-rigid coax is often impractical to run from the studio to the STL antenna on the roof.
- Fire codes won't let you run PVC jacketed coax through the ceiling, except in very expensive metal conduits.
- Long composite runs at the transmitter or studio pick up ground loop hum.
- You need to drive multiple exciters without composite level changes and switching or relay hassles.
- The station has two stereo generators and two transmitters. You want a simple way to matrix-switch them without requiring complex backloading.
- It's a pain to use your spectrum analyzer and other test gear to make composite measurements because of the hassles of interrupting the air feed to connect them.
- The PD, the CE and the GM all want to monitor and measure the station's quality. But buying three modulation monitors is out of the question.
- Keeping tabs on the competition's signal quality is important, but it's inconvenient and expensive to do.
- Lots of boxes use composite baseband—the STL, stereo and SCA generators and more. You need an easy, economical way to test their performance, and directly measure composite baseband signals.
- The station has an old modulation monitor gathering dust. You don't trust the readings, but can't it still be useful?

Modulation Sciences' CLD-2501/2 Composite Driver/Receiver

- ✓ Lets you put your stereo generators and audio processing where they belong—at the studio.
- ✓ Supports up to 3000 ft. (or two milese, on special order) of flexible, inexpensive, twinax cable – standard or PTFE-jacketed for plenum runs.
- ✓ Fully balanced against hum and noise pickup.
- ✓ 100 dB of immunity to ground-loop related noise and hum.
- ✓ Exceptional stereo separation and SNR performance.
- ✓ One driver can supply two independent receivers (each up to 3000 feet away in different directions) with composite stereo baseband audio and all SCA's.
- ✓ Works with 78 ohm twinax (Belden 9463) twinax for indoor service and 150 ohm twinax (Belden 9182) for outside or direct burial.

Modulation Sciences' CLD-2504 Composite Distribution Amplifier

- ✓ Makes distribution of composite baseband signals as easy as distributing audio.
- ✓ 1 composite input, 4 composite outputs.
- ✓ Unity gain with > 50 dB isolation between outputs.
- ✓ High impedance 50Ω input, low impedance outputs.
- ✓ BNC connectors on input and all outputs.
- ✓ Basic performance specs similar to Composite Line Driver.

Modulation Sciences' FM ModMinder™

- ✓ Provides all essential measurement functions of a high-quality modulation monitor when fed by any composite baseband audio source.
- ✓ Works with any wideband source of demodulated FM—even consumer tuners or stereo receivers.
- ✓ Displays total modulation percentage, overmodulation peaks, stereo & SCA subcarrier status, subcarrier injection level, allowable increase in modulation—all for about half the cost of a modulation monitor.
- ✓ If you have an old modulation monitor—even one that reads unreliably—that oldie's demodulator section can drive ModMinder. You get unbeatable accuracy at a \$3000 savings over the cost of a new modulation monitor.
- ✓ Plug-in cards adapt ModMinder to measure SCA sub-carriers on non-standard frequencies.

Whether you have these audio distribution or measurement problems, or some unique puzzles of your own, Modulation Sciences has the convenient, cost-effective composite tools to help you solve them. Any further questions? Of course—so call 800-826-2603 Toll-Free for complete information and specifications on Modulation Sciences' Composite Problem Solvers.

A SUCCESS STORY

THE OBJECTIVE was no small task: design a radio console that would become the new standard.

THE METHOD involved listening to veteran broadcast engineers and installers. After all, they're the people who have seen and experienced all the ideas that came before. From this research we learned of the problems that had to be solved and the features that broadcasters required. We then added ten years of console building experience and innovation, and created the A-500a console.

THE RESULT: An unsurpassed console that exceeds prior broadcast standards. Its module mainframe interface borrows from the computer industry, utilizing all-gold contact insulation displacement technology. The logic system is based on programming the module slot, allowing full module interchangeability. It also provides for separate programming of the module's "B" input selection, thus avoiding embarrassing false starts and mutes. Full console-to-machine control is supported without extensive use of interface boxes and cables. Three audio busses are provided to enhance talkshows and remote functions. There are separate processing loops for the speech and music paths, as well as individual channel insert points. A complete line of microphone and line inputs, remote selectors, and machine control modules is offered in virtually any combination, configuration or mainframe size you desire. The A-500a also features a full family of studio turret and turret components to ease facility design.

THE PERFORMANCE: Needless to say, it's a new age for audio, and the A-500a is a step ahead. While specifications don't say it all, ruler flat frequency response, .003% distortion, crisp square wave response and a noise spec that's unheard of deserve merit. Couple such performance, reliability and innovation together, and a new broadcast standard is set.

THE SUCCESS: WHEATSTONE broadcast consoles are installed in major markets all over the country, from frontline independents to national networks. They are in use right now at some of the world's largest institutions.

THE POSSIBILITIES: The possibilities are up to you.
