STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

WEDNESDAY, MAY 19, 1954

UNITED STATES SENATE,
SUBCOMMITTEE NO. 2 ON COMMUNICATIONS
OF THE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The subcommittee met at 9:32 a. m., pursuant to call, in room G-16 of the Capitol, Senator Charles E. Potter (chairman of the subcommittee) presiding.

Present: Senators Potter, Schoeppel, Bowring, Hunt, and Pastore. Also present: Senator Edwin C. Johnson; Bertram O. Wissman, chief clerk; and Nick Zapple, counsel for Subcommittee on Communications.

Senator Potter. The committee will come to order.

I wish to apologize for being late. I had a breakfast at the White House and I am still naive enough in politics to be readily impressed by having a breakfast at the White House. We just concluded.

You have been very kind to wait until I returned. I am sorry that our accommodations here are such that some people have to stand. I had not realized that we would draw such a crowd.

I might add that it will be a relief for me to have a hearing about television rather than a hearing that is on television.

We have many witnesses whom we plan on hearing. I would like to caution at this time that we have quite a full schedule. I ask you to keep your statements as short as possible and give us all the pertinent information that you care to give. It would be greatly appreciated by the committee.

Senator Johnson. Don't you want to add, Mr. Chairman, that if they have other testimony it can be placed in the record?

Senator Potter. That is right. If you have prepared statements, you can submit your statements for the record and if you care to possibly brief it in your oral testimony, you may do so.

This hearing is being conducted by the Subcommittee on Communications of the Senate Interstate and Foreign Commerce Committee on the problems concerning the status and development of ultra high frequency television channels, and Senate bill 3095, a bill relating to the multiple ownership of television stations. A copy of S. 3095, which was introduced by Senator Johnson, of Colorado, will be inserted in the record at this point.
Each such license which transfers, has been or is of, necessity, the broadcasting to any applicant (including all corporations of any of the following)—

(1) such applicant directly or indirectly owns, operates, or controls another television broadcast station which serves substantially the same area; or

(2) such applicant, or any stockholder, officer, or director of such applicant, directly or indirectly owns, operates, controls, or has any interest in, or is an officer or director of, any other television broadcast station, if the granting of such license would result in a concentration of control of television broadcasting in a manner inconsistent with the public interest, convenience, or necessity.

(b) In determining, for the purpose of subsection (a) (2), whether the granting of a license would result in a concentration of control of television broadcasting in a manner inconsistent with the public interest, convenience, or necessity, the Commission shall consider the facts of each case, with particular reference to the size, extent, and location of areas served, the number of people served, and the extent of other competitive service to the areas in question.

(c) In no event shall the Commission grant any license (including the renewal of any license) for a television broadcast station which would result in any applicant (including all corporations under common control), or any stockholder, officer, or director of such applicant, directly or indirectly owning, operating, or controlling, or having any interest in, or being an officer or director of, any television broadcast station in excess of the following:

(1) five television broadcast stations operating in the very high frequency channels and no television broadcast stations operating in the ultra high frequency channels;

(2) four television broadcast stations operating in the very high frequency channels and two television broadcast stations operating in the ultra high frequency channels;

(3) three television broadcast stations operating in the very high frequency channels and four television broadcast stations operating in the ultra high frequency channels;

(4) two television broadcast stations operating in the very high frequency channels and six television broadcast stations operating in the ultra high frequency channels;

(5) one television broadcast station operating in the very high frequency channels and eight television broadcast stations operating in the ultra high frequency channels; or

(6) no television broadcast stations operating in the very high frequency channels and ten television broadcast stations operating in the ultra high frequency channels.

(d) Any person who, prior to the date of enactment of this section, has been granted a license for a television broadcast station operating in the very high frequency channels which, within five years after such date, he relinquishes, transfers, or fails to renew shall, upon notice to the Commission and application filed therefor within such five year period, be entitled to be granted, for each such license which he so relinquishes, transfers, or fails to renew, two licenses for television broadcast stations operating in the ultra high frequency channels, one of which shall serve substantially the same area as the station the license of which he so relinquishes, transfers, or fails to renew.

(e) In applying the provisions of this section—

(1) 'control' means actual working control in whatever manner exercised and is not limited to majority stock ownership; and

(2) in the case of a corporation which has more than fifty voting stockholders, only those stockholders shall be considered who are officers or directors or who directly or indirectly own 1 per centum or more of the outstanding voting stock.

STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

WEDNESDAY, MAY 19, 1954

UNITED STATES SENATE,
SUBCOMMITTEE NO. 2 ON COMMUNICATIONS
OF THE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The subcommittee met at 9:32 a.m., pursuant to call, in room G-16 of the Capitol, Senator Charles E. Potter (chairman of the subcommittee) presiding.

Present: Senators Potter, Schoeppel, Bowring, Hunt, and Pastore.
Also present: Senator Edwin C. Johnson; Bertram O. Wissman, chief clerk; and Nick Zapple, counsel for Subcommittee on Communications.

Senator Potter. The committee will come to order.
I wish to apologize for being late. I had a breakfast at the White House and I am still naive enough in politics to be readily impressed by having a breakfast at the White House. We just concluded.
You have been very kind to wait until I returned. I am sorry that our accommodations here are such that some people have to stand. I had not realized that we would draw such a crowd.
I might add that it will be a relief for me to have a hearing about television rather than a hearing that is on television.
We have many witnesses whom we plan on hearing. I would like to caution at this time that we have quite a full schedule. I ask you to keep your statements as short as possible and give us all the pertinent information that you care to give. It would be greatly appreciated by the committee.

Senator Johnson. Don't you want to add, Mr. Chairman, that if they have other testimony it can be placed in the record?
Senator Potter. That is right. If you have prepared statements, you can submit your statements for the record and if you care to possibly brief it in your oral testimony, you may do so.

This hearing is being conducted by the Subcommittee on Communications of the Senate Interstate and Foreign Commerce Committee on the problems concerning the status and development of ultra high frequency television channels, and Senate bill 3095, a bill relating to the multiple ownership of television stations. A copy of S. 3095, which was introduced by Senator Johnson, of Colorado, will be inserted in the record at this point.
A BILL To regulate multiple ownership of television broadcast stations

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Communications Act of 1934 is amended by inserting after section 309 a new section as follows:

"SEC. 309A. (a) No license for a television broadcast station shall be granted to any applicant (including all corporations under common control) if—

"(1) such applicant directly or indirectly owns, operates, or controls another television broadcast station which serves substantially the same area;

"(2) such applicant, or any stockholder, officer, or director of such applicant, directly or indirectly owns, operates, controls, or has any interest in, or is an officer or director of, any other television broadcast station, if the granting of such license would result in a concentration of control of television broadcasting in a manner inconsistent with the public interest, convenience, or necessity;

"(b) In determining, for the purpose of subsection (a)(2), whether the granting of a license would result in a concentration of control of television broadcasting in a manner inconsistent with the public interest, convenience, or necessity, the Commission shall consider the facts of each case, with particular reference to the size, extent, and location of areas served, the number of people served, and the extent of other competitive service to the areas in question.

"(c) In no event shall the Commission grant any license (including the renewal of any license) for a television broadcast station which would result in any applicant (including all corporations under common control), or any stockholder, officer, or director of such applicant, directly or indirectly owning, operating, controlling, or having any interest in, or being an officer or director of, any television broadcast station in excess of any of the following:

"(1) five television broadcast stations operating in the very high frequency channels and no television broadcast stations operating in the ultra high frequency channels;

"(2) four television broadcast stations operating in the very high frequency channels and two television broadcast stations operating in the ultra high frequency channels;

"(3) three television broadcast stations operating in the very high frequency channels and four television broadcast stations operating in the ultra high frequency channels;

"(4) two television broadcast stations operating in the very high frequency channels and six television broadcast stations operating in the ultra high frequency channels:

"(5) one television broadcast station operating in the very high frequency channels and eight television broadcast stations operating in the ultra high frequency channels;

"(6) no television broadcast stations operating in the very high frequency channels and ten television broadcast stations operating in the ultra high frequency channels.

"(d) Any person who, prior to the date of enactment of this section, has been granted a license for a television broadcast station operating in the very high frequency channels which, within five years after such date, he relinquishes, transfers, or fails to renew shall, upon notice to the Commission and application filed therefor within such five year period, be entitled to be granted, for each such license which he so relinquishes, transfers, or fails to renew, two licenses for television broadcast stations operating in the ultra high frequency channels, one of which shall serve substantially the same area as the station the license of which he so relinquishes, transfers, or fails to renew.

"(e) In applying the provisions of this section—

"(1) 'control' means actual working control in whatever manner exercised and is not limited to majority stock ownership; and

"(2) in the case of a corporation which has more than fifty voting stockholders, only those stockholders shall be considered who are officers or directors or who directly or indirectly own 1 per centum or more of the outstanding voting stock.
“(f) This section shall not apply to the granting of licenses for noncommercial education television broadcast stations.”

Senator Potter. When the Congress enacted the Communications Act of 1934, it placed on the shoulders of the Federal Communications Commission the full responsibility of making available, so far as possible, to all of the people of the United States, a nationwide, efficient radio and television service.

The Commission, in adopting the sixth report and order, with its assignment of channels to the various communities in the United States, stated:

The Commission has always recognized that even with an extensive scattering of VHF assignments, the 12 channels available are not sufficient to meet the objective of providing TV service to all of the people. With the additional UHF channels, however, the Commission was able to formulate an assignment plan that has the potentiality of fulfilling the objective of section 1 of the Communications Act. If all the VHF and UHF channels are utilized, there should be few, if any, people of the United States residing beyond the areas of television service. (See priorities 1 and 3.) Moreover, the table has gone far in fulfilling the needs of individual communities to obtain local TV outlets. It has provided at least one assignment to over 1,250 communities. (See priority 2.) And it has attempted where possible to provide each community with at least two assignments. (See priority 4.)

During the past months, the committee has received many complaints and numerous requests to do something with regard to the development of UHF television channels. I need not emphasize the various problems that have been confronting the development of UHF channels since the lifting of the TV freeze in April 1952. The statistics from the Federal Communications Commission show that 72 grants have been dropped or surrendered since the lifting of the freeze and of this number, 60 of them have been UHF grants. Is this trend going to continue? What effect, if any, will this have on the objective of providing a nationwide television service to all the people?

In order to obtain a complete picture and develop all the facts as they relate to the development of UHF, the committee originally announced that open hearings would be held on this subject on April 6. Since that time, more than 40 persons have requested an opportunity to appear and testify.

The committee has set aside 3 days, May 19, 20, and 21 for the hearings and will be able to accommodate only a majority of the witnesses. At the conclusion of the testimony on Friday, May 21, the committee will recess the hearings until June 3 and 4 because the National Association of Radio and Television Broadcasters Convention is scheduled for next week, and most of the broadcasters and other interested parties will be there. All witnesses who are not heard during the first 3 days will be given an opportunity to be heard when the hearings reconvene June 3 and 4.

When the subcommittee on communications decided to schedule the hearings on the problems concerning the status and development of UHF television channels, the Federal Communications Commission was requested to furnish the committee with a list indicating the persons who had surrendered their construction permits since the lifting of the television freeze.

Such a list was prepared as of March 31, 1954. In order to obtain a complete picture, I endeavored to contact each of these persons
to obtain all the information possible as to the reasons for the surrender of the permit. In my letter to each of these grantees, I asked them to furnish me information which would give a clue as to the reason or reasons why they surrendered their permit. I asked was it a lack of finance, availability of appropriate transmitter equipment, programming, circulation, set conversions, too many stations serving the area, economics, or competition? A substantial number of these persons have submitted replies which I now incorporate in the record at this point.

(Correspondence referred to is as follows:)

**Davenport, Iowa, May 20, 1954.**

**Mr. Charles E. Potter,**

*Chairman, Subcommittee on Communications,*

*Senate Office Building, Washington, D. C.*

**Dear Mr. Potter:** I am very sorry that your letter of April the 6th addressed to Harold Hoersch and Mel Foster did not reach us. I thank you for enclosing a copy of it with your letter of May the 13th, and I will endeavor to answer as nearly as possible the questions raised in your letter.

Before filing our application for a permit with the FCC, we acquired a piece of property well located in the central west part of Davenport, which we were advised by our engineers would serve the whole quad-city area because of its central location. After the permit was granted, we made application to the city for a change in zoning on this 20-acre tract and ran into a great deal of opposition with some of the householders in the area, even though there were no homes within the immediate area, the closest one being a little over 800 feet. At the time this happened, we were most disappointed, but as we see it now, it was probably a very fortunate circumstance.

During the ensuing delays in trying to find another site and our efforts in pursuance of our case for the change of zoning in the previous site, we had a chance to examine 2 or 3 other UHF stations that had gone on the air, and frankly we were discouraged in our efforts to take advantage of the permit because of what appeared to be a pretty competitive proposition with the UHF station competing with VHF, and, of course, we have two in this quad-city area. We then had a study made as to the situation in the area that could receive UHF programs without the cost of installing converters, and this study was a most discouraging factor. As a result of these complications and the problem that we would have in converting a sufficient number of the 40,000 sets that were supposed to be in existence in our immediate viewing area, we decided that at least for the time being, that we should give up our permit and observe the industrial operation as it relates to UHF for awhile. Mr. Hoersch, who participated in this application with me, is a lawyer here in Davenport, and he endeavored in the release when the permit was given up to do it in a proper way in the hopes that if we would have a change of mind that we would be in the good graces of the Commission and could reapply if conditions indicated that we wanted to make the investment at some future time.

I believe this answers the questions in your letter of April 6th, and if there is any further information that I could supply you with, feel free to call upon me.

Sincerely,

**Mel Foster.**

**Salem, Oreg., May 22, 1954.**

**Hon. Charles E. Potter,**

*Committee on Interstate and Foreign Commerce,*

*United States Senate, Washington 25, D. C.*

**Dear Sir:** I regret that absence from my office prevented my replying to your letter of May 6th in time for the hearings on the status and development of UHF-TV channels.

Regarding the return of construction permit, the principal reasons are: (a) Too many channels in a small marketing area; (b) tax depreciation rules are such that one with an outside income (as one must have to have sufficient capital for a station) will find station operation unprofitable, even though the station makes a profit because the net after taxes is too small a percentage. Call money
would gain a better return; (c) there is no "freedom of the press" on TV (or radio) for editorial comment the same as a newspaper.

I trust this is the information you desire.

Yours very truly,

LAWRENCE A. HARVEY,

CONNECTICUT AVENUE AND DE SALES STREET,
Washington 6, D. C., May 18, 1954.

Senator CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington 25, D. C.

DEAR SEnATOR POTTER: I have been authorized, as counsel for Oshkosh Broadcasting Co. and William F. Johns, Jr., to make this reply to your letter of April 7 and May 6 addressed to the Oshkosh Broadcasting Co., with regard to the reasons why its construction permit for a television broadcast station, WOSH-TV, was returned to the Commission.

Oshkosh Broadcasting Co. was granted a construction permit on November 26, 1952, to operate on UHF channel 48 with an effective radiated power of 1.31 kilowatts visual. The station began operation on June 27, 1953. An application for modification of the construction permit, increasing the effective radiated power to 13.8 kilowatts, was filed on October 19, 1953, and granted on November 4. The station began operating with the increased power on or about November 24, 1953. The station ceased operation on March 22, 1954, and the construction permit was subsequently canceled by the Commission.

Oshkosh Broadcasting Co., its management and staff had had ample experience in the operation of radio broadcast stations, both standard broadcasting and FM broadcasting, but had no actual experience in television broadcasting. They have operated standard broadcast station WOSH in Oshkosh successfully and profitably over a period of years and have owned interests, some of which were the controlling interests, in other stations in Wisconsin, Minnesota, and Illinois.

As experienced businessmen, Oshkosh Broadcasting Co. investigated fully construction and operating costs and revenue possibilities. The company's national advertising representative estimated that WOSH-TV would receive revenue of from $5,000 to $6,000 from national advertising and the management estimated that 1 to 2 thousand dollars a month could be obtained from regional advertising. It was not anticipated that local advertising would be sufficient to carry the station, inasmuch as the population of Oshkosh is only 41,084 (1950 census). It was estimated that the operating expenses would be about $15,000 a month. The station went on the air with $18,000 a month in television contracts. It was only a matter of days, however, before it became apparent that broadcasting on the UHF channels posed problems that VHF operating transmission did not. Although the station transmitter was located no more than 3 miles from the farthest residential area, a great majority of the UHF receivers were unable to receive a picture comparable to that received from VHF station WBAY-TV, located in Green Bay, which is 40 miles from Oshkosh, and WTMJ-TV, Milwaukee, which is 75 miles from Oshkosh.

It was found that the installation of UHF receivers is much more critical than installation of VHF receivers. The same picture quality cannot be obtained unless the UHF receiver is 100 percent efficient. Unfortunately, a majority of the local television dealers did not have technicians sufficiently trained in UHF installations to install the receivers with the degree of perfection necessary, and the dealers became discouraged, some of them recommending against the purchase of UHF converters or tuners.

Inevitably, the television advertisers also became aware of the problems and, by the end of the first full month of operation, business on the station diminished to approximately $15,000 a month and the sales volume decreased every month the station remained on the air, while operating expenses remained approximately the same. During the last full month of operation the station revenue was $8,500 and the expenses were $15,000.

The Oshkosh Broadcasting Co. would have attempted to refinance the television operation and continue operating if the management could have foreseen any possibility of obtaining the national and regional business necessary to support the station. It was found, however, that the New York, Chicago, and Milwaukee advertising agencies had little or no confidence in UHF, and that they offered substantially no prospect of national or regional business. This fact,
together with the local merchants' lack of confidence in UHF, forced the management to terminate the station's operation.

When WOSH-TV began operating, there were relatively few television receivers in Oshkosh, as the only stations that could be received were WTMJ-TV, operating from Milwaukee on a VHF channel, and WBAY-TV, operating at Green Bay on VHF channel 2. Both of those stations increased their power to the maximum after WOSH-TV began operating, so that in many instances it was easier to receive them with CBS and NBC programs than to receive WOSH-TV.

While the coverage of WOSH-TV could have been extended by installing a 12-kilowatt amplifier, the lack of any prospect of additional national or regional business made the expenditure of $100,000 for such an increase in coverage appear to be unjustified. An adequate return on such an investment could not be envisioned. The management of Oshkosh Broadcasting Co. is satisfied, however, that if the station had been operating on a VHF channel, with the same coverage and programs, the operation would have been a financial success.

Very truly yours,

OSH KOSH BROADCASTING CO.,
By E. D. JOHNSTON,
Its Attorney.

WCOW-TV CO., 208 THIRD AVENUE, NORTH
South St. Paul, Minn., May 18, 1954.

HON. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Committee on Interstate and Foreign Commerce,
Senate Office Building, Washington, D. C.

DEAR SIR: Your letter of April 6, 1954, to the WCOW Telecasting Co. has been referred to me for reply.

There were many reasons which contributed to the decision to return the construction permit for UHF channel 17 to the Federal Communications Commission, and each of them can probably be given the same amount of emphasis. Some of them are as follows:

1. Any UHF station coming into an established VHF market (in the Minneapolis-St. Paul area there were two established VHF stations) would have to expect an uphill fight to acquire an audience. My clients were willing to take this risk, as long as the additional VHF channels allocated to this area were being contested. They felt they could establish themselves on a firm footing and acquire an audience while these other contests were being resolved. The practice of the Commission in granting quickie mergers enabled a third VHF station to come into this area approximately 1½ years before it was expected.

2. It is debatable as to how many television stations a given area can support. This can only be proved by experience, but it is our opinion that more than three ordinary commercial stations in the Twin Cities area would be economically unsound. It is also our opinion that only three stations in this area would not give the public the most adequate choice of programming to which they are entitled. It is our opinion that some form of subscription television is the answer to the problem of the UHF station in a multiple-station area. There are presently in operation 3 major networks (NBC, CBS, and ABC) and 1 other (Dumont). It has been estimated that 80 to 90 percent of the homes in this area have television sets, all receiving only VHF. It is reasonable to expect that no network, even the minor one which receives the least desirable time, would want to switch over to a station on the UHF band, where the audience must once more be sought from the very beginning. The UHF station must therefore depend solely on its own resources and in an area such as this cannot expect any assistance from network programming to gain an audience. As I have stated above, it is our opinion that some form of subscription telecasting is the answer to this problem.

3. It is also true that the high cost of set conversion also served as a deterrent. This problem, however, existed at the time of the original application, and the permittees felt that, if an adequate programming arrangement could be achieved, conversion would follow as a matter of course, even though it might be a slow process. In addition, once the actual construction of the station would have begun, purchasers of new sets would probably have demanded sets equipped to
receive UHF signals. While this was a problem, it was not an insurmountable one.

I hope that this resume of our situation will assist your committee in its investigation. Should you desire any further information concerning our particular situation, please do not hesitate to call upon me.

Sincerely yours,

(Signed) S. J. Gray, 
FREDERICK EPSTEIN, 
Attorney at Law.

PROVIDENCE, R. I., May 12, 1954.

Hon. Senator Charles E. Potter, 
Chairman, Subcommittee on Communications, 
Committee on Interstate and Foreign Commerce, 
Senate Office Building, Washington, D. C.

Dear Senator: I have just recently been given your letters addressed to the New England Television Co. concerning your scheduled hearings on UHF. I am glad to give the subcommittee any information that will assist in its understanding of the problem.

In the first instance, I believe that the creation of the UHF channels by the Commission should have been handled in such a way as to insure the equal development of the U station with already existing and to-be-created V allocations. I believe the Federal Communications Commission very seriously wished to see that U stations be placed in an equally competitive position with any other type of television station, both from the viewpoint of audience, programing, network affiliation, or general economics. Unfortunately this was never done, nor were the proper steps taken, in my opinion, to implement the Commission's decision and its desire to place UHF in a competitive position with V stations.

1. I sincerely question the advisability of mixing U and V stations in the same area, and I suggest that any grants of any future V stations in a present U area be held up pending the creation of an audience for the U station.

2. Assuming the present continuance of mixture of V and U stations in the same market, I suggest that your committee take every step possible to insist that network programs be made available to the U station on an equal basis with the V station. While I am aware of the fact that such is the present Commission policy, investigation will easily demonstrate that all networks are extremely cautious (to say the least) about U affiliations, especially where a V station or stations exist in the same area. This reluctance by the networks is not necessarily prejudice but is based upon the fact that the U audience does not substantially exist where a V is already established unless you have special circumstances concerning a particular market that changes the general picture. Of course, the proper network affiliations, especially with the three leading networks, will assist in the creation of an audience. Thus the network policy in substance, based upon the lack of a U audience, helps continue the very reasons which created the policy. If the law could be amended to insist that the networks implement FCC policy of equalization, but stating specifically that no television station shall be entitled or allowed more than a certain number of commercial network hours before any other television station in the same area received an equal amount of commercial network hours and that no affiliation shall be withheld because the potential affiliate is a U station, I think some help would be given, although I realize that other factors may still give all the substantial benefits to the V station in a given market.

3. Questions with respect to programing are really merged in the question of network affiliation because a local station, in the ordinary market, at least, can never hope to compete in general program attractiveness to the public. The network, by reaching so many areas and so great an audience, must always be able to produce programs at a much lesser cost per unit of audience than any one station in a given area. The local individual station can never secure the stars and production services that go into the creation of the general network program. For better or worse, the ordinary audience will watch in general the name shows and stars produced by a network.

4. Nor have the manufacturers of receivers been pushing all-channel tuners or a set that (to the viewer) is equally capable of receiving a U station as a V channel. (I mean by that no discernible differences between the ability to receive either frequency.) I do not think that the blame can be put on the
manufacturers for realizing the economic situation of the U station. If the public has no great desire to receive a U channel, the manufacturer will not necessarily create such a desire. However, the Commission should insist that the public be able to receive both U and V channels. Any other approach is in substance specifically contrary to the reason for creation of the U channels; i.e., the desire of the Commission to provide a nationwide television service. The public is entitled to receive all the service that the Commission has seen fit to allocate in any given area, and any approach which does not secure to the public this ability is in defeat of the public's rights. On this ground I believe the Committee and the Commission can and should insist that said manufacturers be required to deliver to their distributors receivers that can secure all the stations that the Commission has seen fit to grant in any area.

With respect to the New England Television Co. and return of its construction permit for channel 46 in Fall River, this station was not permitted because of the nonavailability of appropriate transmitting equipment at the proper time. The board of this station realized that this station must be operated substantially before the institution of programing from other potential stations in nearby areas. Unfortunately, the proper equipment was not available until after permits were granted to nearby areas, particularly in Providence, R. I., and the board felt that this increased competition would make the chances for financial success of their U station so hazardous as to not warrant construction, especially in view of the experience of other U stations throughout the country. The main problem of the U station is audience and while the U station in a V area can induce to some extent set conversions, it is difficult without the existence of networks and manufacturers to equalize the U station with the V. The U station is entitled to no less and no more than an equal opportunity to compete. This, it has not received. The millions of dollars invested in U stations throughout the country, the millions of dollars invested in receivers throughout the country, require that specific steps be taken to equalize the U station. If economic interests are hurt by one method or another in this equalization process, your committee should view this as necessary in the equalization process. It is no answer for the V station to recite its investment and its desire to receive the revenues it now enjoys, since they should not enjoy any revenues derived because of an enjoyment of an unequal competitive situation.

Your committee could possibly consider in good faith a possible elimination of the V band and thus for all stations to be completely equal. From a long overall basis, this may be less costly to station operators and to the public than any continuation of the present mixture. Representations implied or specifically made by Government authorities that the U operator would have every opportunity to compete on an equal basis must be met if the Commission and your committee wish to insure a nationwide television coverage on a fair basis.

I'll be glad to answer any further specific questions you might have or submit any more detailed information concerning Channel 46 in Fall River.

Very truly yours,

NEW ENGLAND TELEVISION Co.,
ABRAHAM BELLOVE, Treasurer.

WBES-TV, INC.,
BUFFALO, N. Y., MAY 18, 1954.

HON. CHARLES E. POTTER,
CHAIRMAN, SUBCOMMITTEE ON COMMUNICATIONS,
UNITED STATES SENATE, WASHINGTON, D. C.

DEAR SENATOR POTTER: In reply to your letter of May 6, 1954, we enclose a copy of a letter previously submitted to the Secretary of the Federal Communications Commission which we feel sets forth our position regarding UHF.

Yours very truly,

CHARLES R. DIEBOLD, PRESIDENT.

DECEMBER 16, 1953.

Re WBES-TV, Inc.; Buffalo, N. Y. (Buffalo-Niagara Television Corp.) BFCT-1413; BMFCT-972; BMFCT-1268.

SECRETARY,
FEDERAL COMMUNICATIONS COMMISSION,
WASHINGTON, D. C.

GENTLEMEN: We are enclosing herewith authorization from you which was given by you to this corporation to broadcast on channel 59 in the city of Buffalo. Please be advised that we are discontinuing our broadcasting operations as of the close of business at 11:30 p.m., Friday, December 18, 1953.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

This action is a result of a unanimous resolution of the stockholders of this corporation at a meeting held on Wednesday, December 16, 1953:

Resolved, "That appropriate officers of the corporation return to the Federal Communications Commission the license heretofore granted by them to WBES-TV to operate on channel 50 in the city of Buffalo, N.Y. ; that the secretary of the corporation advise the Federal Communications Commission of this action; that in view of the apparent lack of interest on the part of the large networks and national and local advertisers in ultra high frequency as a medium of communication, despite the aggressive and purposeful attempts made by the officers of the corporation to interest such major networks and advertisers so as to make the project commercially feasible, all of which have resulted to no avail;

"That in view of the fact that the stockholders of WBES-TV were interested solely in performing a community service and that this is not possible unless commercial support is given to this medium; that in view of the difficulties experienced by the corporation since its inception and the complete lack of promise for the future; that despite attempts made by this corporation to obtain through direct application or by consolidation with other applicants one of the is available very high frequency channels allocated by the FCC to the city of Buffalo, either in whole or in part, which apparently would have resulted in protracted litigation and particularly in view of the fact that in order to do so it would have been necessary for the corporation to discontinue broadcasting under present FCC regulations: Be it

"Resolved, That WBES-TV discontinue its operations as of the close of business, on 11:30 p.m., Friday, December 18, 1953."

The directors and stockholders of this corporation have reluctantly come to the conclusion that it is not going to be possible to continue the operation of this UHF channel in the city of Buffalo. Your honorable Commission has herebefore allocated three UHF channels and three VHF channels to the city of Buffalo. At the time this corporation became interested in providing television service to this area, there was only television station operating. We were advised that the entire industry, as well as the advertisers, were interested in getting into this market, and we knew that the citizens of Buffalo wanted additional television outlets. In addition, we were led to believe that UHF was going to get the complete support of everyone concerned with the communications industry. Indeed, we were greatly encouraged by representations made to us before we got on the air with our test pattern on September 3, 1953, and with commercial broadcasts on September 27, 1953.

We attempted to obtain a basic major network affiliation before and after our project was launched. We recently concluded that this is not possible, and two things became more and more apparent to us. Firstly, that this operation could not succeed without a basic major network; and secondly, that the major networks were awaiting the outcome of the contests for VHF channels here in Buffalo, so as to make an arrangement with the successful applicant.

In this posture, we then decided that if we were to survive, it could only be with a VHF channel. Negotiations were had with a group of local people who had applied for a channel, since it was our belief that these channels should be allocated to residents of this community. This did not result in an agreement. It then became known that we could not operate on channel 50 and apply for a VHF channel at one and the same time as the result of a decision by the FCC. To discontinue operations at that point would have resulted, we felt, in a breach of faith with the citizens of this area who had spent millions of dollars converting their sets so that they could receive our programs. However, subsequent events disclosed the fact that we were getting cancellations on programs and buyer resistance at all levels because we were a UHF unit.

At this point, we decided that since we could not render a community television service, and had done everything in our power to do so with UHF with no success, that it would be necessary to apply for a VHF channel and we engaged Washington counsel and prepared an application for presentation to the FCC. In this circumstance, we intended to return our permit on channel 50 simultaneously with our application for a VHF channel with an offer to continue our operation even at a loss, if the Commission desired us to do so pending a determination of the VHF issue.

At this point, we had discussions with a merged group applying for a VHF channel and it became clear to us that the controlling faction consisted of local people, all of whom were well known to us, and that once our application was submitted, it would have entailed protracted contests and litigation. Since we were prepared to discontinue our operation, we concluded that we would not
wish to be a party to the contest and decided to withdraw from the television field in this city in a way that would provide the people of this community with a continuous service. It was our expectation that if your Commission had granted a construction permit to the merged group for channel 2, that they could have gone on the air at the time that we went off the air, so that there would have been no interruption in the television service to this community. The disclosure of this possibility to the press and in trade journals has made further operations impossible.

We genuinely regret having to make this decision. We have 25 stockholders representing a true cross section of this community. We have provided many notable programs that were in the category of community service; plans had been formulated to incorporate other programs of a community character into our schedule, since it was our honest desire to provide not only entertainment, but instruction, education, and a forum for local institutions. Obviously, this type of service cannot be rendered unless the enterprise is able to secure sufficient income from advertising sources to make it a reality.

If you should wish any further information or require any administrative procedures, we will be glad to cooperate in every way possible. If you desire any statistical information for historical purposes, we will be glad to furnish this as well. The people in this community have a tremendous investment in television as a medium. They have been very patient, helpful, and cooperative throughout this period.

Yours very truly,

WBES-TV, Inc.

BELOIT BROADCASTING CO.,
Beloit, Wis., May 17, 1954.

HON. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: Pardon delay in acknowledging your letters of April 7 and May 6. I have been out of the city and as a consequence absent from my desk.

I am enclosing a copy of my petition to the FCC requesting cancellation of my construction permit for a UHF television station in Beloit, Wis. This gives you the reasoning behind my petition.

What my chief engineer and I found in our investigation of UHF problems last year, holds true today to a far greater extent. It is my opinion that the damage has already been done and that UHF is headed for the same grave as FM radio.

The first mistake was made when VHF franchises were granted along with UHF franchises in medium-sized markets. VHF-TV is definitely regional. UHF is strictly local.

I don’t think it will ever be feasible for UHF operators in the smaller markets to go into the high power, now being discussed, nor to attempt to compete with powerful VHF-TV stations by means of UHF satellites and boosters. The cost would be prohibitive, and the mass audience will be no more interested in UHF receivers than it is now where VHF signals are satisfactory.

The public has already shown that it is not interested in spending more money for UHF circuits in TV receivers or for UHF converters than it was interested in FM circuits in radio or FM converters.

The fact that manufacturers were not required to put UHF circuits in all TV receivers when the freeze was lifted in July 1952 automatically lessened the value of UHF to the networks and to the sponsors.

Rapid obsolescence of UHF broadcast equipment makes this type of television operation prohibitive in the smaller markets.

From personal experience I know that neither the networks nor the larger advertisers are interested in UHF where they can get coverage via VHF.

I will be glad to elaborate on this if you wish some time in the future. In the meantime I hope this information is what you want.

Sincerely,

SIDNEY H. BLISS, President.
The petition of Sidney H. Bliss sole trader doing business at Beloit Broadcast-
ing Co. to present the Federal Communications Commission, Washington, D. C., File No. BF-1523

Re: Application of Sidney H. Bliss, trader, doing business as Beloit Broadcasting Co., for television construction permit, Beloit, Wis.

PETITION

The petition of Sidney H. Bliss sole trader doing business at Beloit Broadcasting Co. alleges as follows:

1. On the 11th day of February 1953, the Commission issued to Sidney H. Bliss a construction permit BPCT-1523, for the construction of a television broadcasting station at Beloit, Wis. Originally the call letters assigned to such station were WGFZ-TV but by subsequent change, these call letters were designated as WRIJ. This proposed station would serve Rockford, Ill., Beloit and Janesville, Wis., with class A and B service. These cities were in the fringe area of existing service at that time.

2. Upon the issuance of said construction permit, applicant went to New York in an effort to obtain network affiliation. Two of the networks expressed definite interest in the proposed station. One network went so far as to request that applicant return later bringing with him positive indication from major distributors serving his market that they desired to have proposed station added to the television advertising schedule of their supplying manufacturers.

Applicant made contacts with the major distributors in Rockford, Chicago, Milwaukee, and Madison, serving this area. On May 19, applicant returned to this network with the requested information but was not given the opportunity to present it. The network on this occasion showing no interest whatsoever in the proposed station.

The applicant then contacted the second available network and was advised that, no decision could be made at that time because the successful Rockford applicant for Channel 13, which had been granted a construction permit only the week previous, was coming to see said network the following week. This precluded any interest in applicant’s UHF station.

Apparently the grant of Channel 13 the previous week was also the reason for the first network’s lack of interest in applicant’s proposed station.

The other two networks already had affiliation contracts with the Rockford station operating on Channel 39.

The situation remained indefinite until August 11, when the grantee for Channel 13 in Rockford publicly announced he had signed affiliation contracts with both of the networks contacted by applicant.

In the meantime, following the issuance by the Federal Communications Commission of applicant’s construction permit, applicant and several members of his staff visited VHF and UHF stations on the air and others under construction in the following cities: Youngstown, Ohio; Peoria, Rock Island, and Rockford, Ill.; Davenport, Iowa; South Bend, Ind.; Green Bay, Milwaukee, and Oshkosh, Wis.; Jacksonville, Fort Lauderdale, and Miami, Fla. Construction, technical operation, programming, production, personnel, selling, and operating costs were studied in each of these plants.

These visits and a continuing study, made in the light of the changing television situation in this area, have resulted in the following conclusions:

1. The Rockford, Beloit, Janesville market is no longer fringe area and is now served with excellent VHF signals from Milwaukee, channel 4, with its increased power, 100 kilowatts, and antenna of over 1,000 ft. and carrying NBC, ABC, and Dumont.

2. Rockford, channel 13, is providing this entire area with a class A signal and will feed CBS and ABC.

3. Channels 2 and 5, Chicago, will unquestionably put class B signals into this area when they go on the air with their increased power.

4. When the Madison, channel 3, controversy is settled and a CP granted there is now no question but that this station will furnish class A network service throughout this area.

5. From these studies applicant concludes that a network affiliation for a television station in a market as competitive as the Beloit, Rockford, Janesville area is a prerequisite to economic survival.
6. Because of the increasingly competitive VHF service in the Beloit area now and because of the inability of the applicant to obtain network service, applicant is convinced that a UHF venture at this time would be economically unsound. Applicant therefore requests permission of the Commission to return his construction permit for cancellation without prejudice and for cancellation of the call letters assigned to such station. Applicant further states that he has not been promised, nor has he received directly or indirectly, in connection with filing of such petition for cancellation of his license, any consideration of any nature whatsoever.

SINDNEY H. BLISS.

STATE OF WISCONSIN,
County of Dane, ss:

Sidney H. Bliss, being first duly sworn, deposes and says that he is a sole trader, doing business as Beloit Broadcasting Co., permitee of WRBJ, Beloit, Wis., and that the facts stated in the foregoing petition are true of his own knowledge except as to such statements as are therein stated on information and belief and as to such statements, he believes them to be true.

SINDNEY H. BLISS.

Subscribed and sworn to before me this 6th day of October, 1953.

EDWIN CONRAD,
Notary Public.

My commission expires April 7, 1957.

Hon. Charles E. Potter,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

Dear Senator Potter: This will acknowledge receipt of your letters April 6 and May 6, 1954.

We are distressed to advise you that the president of our organization is seriously ill in Florida and, having been ill for some time, is unable to comply with your request.

As he was the only individual in our organization who handled all television matters and made the final decision to turn in our construction permit, he therefore is the only person who could answer the questions you outline. We do not feel that there is any other person in our group who is able to give you the information you request.

We are extremely sorry not to be able to contribute to your most valuable hearings.

Sincerely,

Alan W. Long,
General Manager.

WMEV,
Marion, Va., May 14, 1954.

Senator Charles E. Potter,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

Dear Senator Potter: Please pardon my delay in answering your letter of April 7 and I hope the following information will be helpful to you during the investigation on the status and development of UHF TV channels.

We of the Mountain Empire Broadcasting Corp. returned our UHF construction permit for a station to operate on channel 50 after a rather thorough and exhaustive investigation. Our problem was not one of financing the original construction since we are fortunate in having several stockholders who were financially able to build the proposed WMEV TV.

Programming did not concern us too much, as the American Broadcasting Co. indicated that they would be willing to make our proposed TV station an affiliate.
Equipment was no bottleneck, as several manufacturers were most willing to sign contracts with promised delivery dates. I visited one of the equipment plants and saw every indication that equipment could be delivered to us.

Economics of operation was the deciding factor. I made four trips to New York City and talked with advertising agencies regarding the potentiality of sales on our proposed UHF channel 30 TV station. I was told by almost every one I talked to that national advertisers were not at present buying spots and programs on UHF stations where there existed any VHF reception. The reason being a very practical one—lack of circulation. As we all know every TV set made so far will receive VHF signals. Conversion to UHF has been too costly. All channel sets have necessarily cost more money than a straight VHF set.

We knew that to operate a TV station at the present time in Marion, Va., a town of 7,000 people, that about 90 percent of our sales would have to be national business (network and spot business). After our visits to New York we became convinced that at the present time our proposed TV station was not economically feasible.

I believe that at a later time if all channel sets become the rule rather than the set with an extra price and when the price of transmitting equipment and accessories, such as tubes, come down to a reasonable price that TV stations can and will be operated on a comparable basis to our present-day local AM stations, for I feel that with a reasonable cost of construction and a moderate cost of operation television advertising can be placed within the reach of our Main Street merchants just as today they are happily and successfully using local radio advertising.

If I can be of any further assistance during your hearing please let me know.

Sincerely yours,

ROBERT C. WOLFENDEN,
Vice President.

KCNA,

HON. CHARLES E. POTTER, Chairman,
Subcommittee on Communications,
United States Senate, Washington, D. C.

DEAR CHAIRMAN POTTER: As I have been out of town, your letter reaching me just today, it was necessary to dig deep in the pile to get you the information you desire.

1. We did not have a UHF grant—it was VHF, channel 9.
2. The information you received from the Commission that we turned our permit in was correct, and they also should have informed you that the reason was one of economics as outlined on our request for deletion.

There is nothing that we can add at this time as our position is clearly stated. We did not choose to commit financial suicide after looking over the market and its potential in the face of TV grants, incidentally all of them are VHF for Tucson.

However, there are some dillies allocated for UHF in Arizona in towns such as Ajo, Eloy, etc., which unless oil is found in Arizona, will always be a comfort stop on the road.

Personally, I don’t think the country will ever need UHF. Where is the money coming from to support all the proposed VHF stations?

Sincerely,

WAYNE SANDERS,
Manager, Radio KCNA.

WACE, REGIONAL BROADCASTING CO.,

HON. CHARLES E. POTTER,
United States Senate,
Washington, D. C.

DEAR SIR: In response to your letter of May 6, please be advised that the following statement is in response to your questions regarding the channel 36 grant which Regional TV Corp. has issued to Northampton, Mass., which was returned prior to actual construction.
After a careful study of the market, taking in consideration three factors, namely, VHF service to the area both current and projected, number of UHF stations already in the market, and the progress of said UHF stations, it was decided that there was not sufficient potential audiencewise or businesswise to support the grant.

A New Haven VHF station 60 miles to the south had serviced the market for 4 or 5 years with excellent success signalwise. Two UHF stations had been on the air 6 months at the time our grant was turned back, giving us the opportunity to observe UHF acceptance. We, therefore, felt that since the VHF station had the primary audience and, as a matter of fact, continues in that position; and since there were two UHF stations in the market having considerable trouble businesswise and audiencewise as a result of the VHF station, plus the fact that there is in hearing at this time and projected at that time a possible grant of a channel 3 VHF station in Hartford (25 miles south of Springfield), there was, therefore, little chance of a network being available and slim chance of sufficient revenue to exist as the third UHF in a 300,000 market with two powerful coverage-wise stations on the edge, both able to serve the market with fine signals.

These are the facts on Regional TV's decision to give back the grant for channel 36 for Northampton, Mass. Northampton is 5 miles north of the metropolitan district of Springfield-Holyoke, Mass.

We shall be happy to supply any further facts you require.

Cordially,

RALPH J. ROBINSON,
General Manager.

WKMI, STEERE BROADCASTING CORPORATION,

Hon. Charles E. Potter,
United States Senate, Washington, D. C.

Dear Sir: I recall receiving a what I thought was a form letter from you regarding the hearings coming up on the status of existing UHF-TV channels. Since WKMI voluntarily surrendered its construction permit for UHF channel 36 last fall, I felt we could add very little to the full picture you are trying to build concerning UHF. I still feel that the UHF stations currently in operation are the only ones which can help the committee to any extent.

As president of Steere Broadcasting Corp., I surrendered our UHF grant because I felt that a UHF station getting started in a market already being served by an established VHF-TV station would have a hard time. I am sorry that events which have transpired during the last 6 months in the UHF field have lent support to my opinion.

You, as chairman, and the subcommittee have my best wishes in the work you are undertaking.

Sincerely yours,

HOWARD D. STEERE,
President.

CHRONICLE PUBLISHING CO., INC.,
Marion, Ind., April 15, 1594.

Hon. Charles E. Potter,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

Dear Senator: Your letter of the 6th reached me at a very busy time which accounts for the delay. There are several reasons why we finally concluded to return the construction permit for a UHF television channel.

1. When we first made application, we were lead to believe that our signal would cover a 40-mile radius but we discovered according to the Commission formula that our coverage would be confined to a 20-mile radius. This coverage would not reach enough people to justify the venture.

2. Our investigation disclosed that the large networks were not interested in UHF. The consensus of opinion seemed to be that if they could reach 85 percent of the United States buying segments with VHF, there is little reason for them to attempt to cultivate the other 15 percent through UHF.

3. We have been operating an FM broadcasting station for the past several years, giving the people of this community within a 60-mile radius interesting
provide themselves with the facts regarding killing to the conclusion that UHF is another FM deal. We are convinced that FM was killed by premeditated treatment on the part of the large stations.

4. When we found ourselves in such a predicament with our FM station, we attempted to secure a 1400 kilocycle channel which became available to us as a result of financial failure of its owner in Kokomo 30 miles west of us. An existing station here, day time, also filed for that frequency. Despite all the facts regarding financial irresponsibility of the other station, the commission refused to give us the AM frequency so that we might be able to put our venture in the black. The predictions made before the Commission have come true. The antinewspaper complex which exists with the communications department also has a bearing on our decision.

From the above you will notice that this company attempted to be a part of the new communications facilities in order to serve our people. There has not been a lack of finances nor availabilities of transmitting equipment nor too many stations serving this area. It looks to us that the urban territory on fringe VHF signals can only be served when the individuals in those communities provide themselves with high-powered receiving antennas. UHF like FM produces better reception. People tell us they listen to FM because it sounds better, and UHF will have a hard time, too.

It occurs to me that the Commission should have recognized the value of FM in radio and to have gradually transferred the small AM stations to FM providing clear AM channels for long-distance coverages.

I trust that this letter will help to correct some of the mistakes of the past. Yours very truly,

GARDNER J. THOMAS,
President.

Sen. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Senate Office Building, Washington, D. C.

Dear Senator Potter: Your letter of April 7 directed to the Telepolitan Broadcasting Co., Star Route, Clovis, N. Mex., has just been turned to me for attention, and while I note that the hearings were scheduled for May 4, 5 and 6, I thought it might be of some value for the record to forward this on anyway.

Under date of October 20, 1953, we wrote to the Secretary of the Federal Communications Commission, an airmail letter setting out the reasons why the permit was being returned. For your convenience, I am enclosing a copy of that letter, and I believe it fully explains our position. If there is any other information you might require, it will be forthcoming upon your request.

Respectfully yours,

WESLEY QUINN.

Clovis, N. Mex., October 26, 1953.

In re Application of Telepolitan Broadcasting Co., Clovis, N. Mex.;
File No. BPCT—1293

SECRETARY, FEDERAL COMMUNICATIONS COMMISSION,
Washington 25, D. C.

Dear Sir: In view of the fact that in the not too distant future the construction permit for the construction of Telepolitan station KNEH in Clovis, N. Mex. will run out, and the holders of that permit, Mr. Sam and Sid Pipkin, being in a quandary, as to what course to pursue, they have directed me as their attorney to write this letter asking the indulgence and consideration of the Commission to the problems with which they are faced due to the economic conditions in the Clovis area.

We have for the past several years been in the middle of a drought condition, which has affected this whole trade territory. In the past our periods of time in which we have had a shortage of rainfall have been relatively short, and we could always anticipate that conditions would brighten after a year or two of such conditions, but this drought has held on so long and has affected so many phases of our economic life that at the present moment the investment of a sizable
amount of capital in television here does not appear to be feasible. At the time this application was filed a drought condition existed, but based on past experience we had every reason to believe that the cycle was complete and the following year would put us back on a more normal basis. Such has not been the case.

To locations in the industrial East or Midwest, or on the coast, the weather is not such an important factor as it is to us in the Southwest. Here, it is the all-important basic factor with which we must constantly be concerned. The applicants did not go into this matter with the idea that large returns on their investment would be immediately forthcoming, and were prepared to have a reasonable period of loss until the matter could be developed. Now, however, with conditions as they are, the applicants cannot foresee any sort of a return any time in the reasonable future, or at least for possibly 2 or 3, or even possibly 4 years. Ours is an economy based on cattle and crops and railroad employment. We know the Commission is well aware of what has happened to the price of cattle. When there are no crops to be shipped, it of course affects railroad employment and thus all three of our basic elements have suffered.

If this was a permanent situation the applicants would at this time withdraw their application and not burden the Commission further with their problems. It is, however, far from a permanent condition, and in every sense of the word "temporary." Your applicants are people who have helped pioneer this country and have great faith in it, and just as quickly as economic conditions adjust themselves and the matter is at all feasible they still want to proceed. Several conferences have been held with every medium of the dissemination of information and advertising, including the radio stations and newspapers in this area, and individuals and the applicants are convinced that if more time were allowed to them it would in no sense of the word be blocking the efforts of other possible applicants. As the Commission knows, there have been no other applicants for the other channel allotted to Clovis, and we feel certain that for the next year at least there will be no other application filed.

We would be glad to have the opportunity to furnish the Commission with any forms of evidence that might be requested which would substantiate our position in this matter. We have approached this problem from every conceivable angle that we can think of and if the matter is pursued further there is a possibility that we would want to change the location from the one designated to the Hotel Clovis, which is a structure approximately ten stories high, which would enable us to use the hotel itself as a tower with all of the transmitting equipment on the top of the hotel and with offices in the hotel itself in the center of town. We might add that the Hotel Clovis has been most receptive to our overtures in this connection.

If the Commission could see fit to allow us to extend the time for the construction work for a year from this time, we feel sure that we will have a better grasp of the economic condition for the foreseeable future, and we feel that it would be in keeping with the policies and purposes of the Commission itself, inasmuch as we know that the Commission does not like to have a failure on the part of any applicant due to conditions over which the applicants have no control. After very much considered discussion we have decided that the submission of this letter setting out as fully as we felt the Commission would be interested was the only right and fair thing to do, and then if the Commission decided to cancel the application we would request that it be done without any prejudice toward the filing of a new application by the same parties at some future date.

To repeat, the indulgence and consideration of the Commission to this letter is respectfully requested, and any additional information desired by the Commission will be forthcoming immediately upon request.

Respectfully yours,

LEWISTOWN BROADCASTING CO.,
Lewistown, Pa., May 13, 1954.

Mr. Charles E. Potter,
Chairman, Subcommittee on Communications.
United States Senate, Committee on Interstate and Foreign Commerce, Washington, D. C.

Dear Sir: In reply to your letter of May 6 we beg to advise that our company surrendered its construction permit to build a UHF television station on channel 38 for the Lewistown, Pa., area for the following reasons:
1. Analysis shows that the available market is not sufficient to support a television station under the present economics of the art.

2. Because of the direct line of site coverage characteristics of UHF, no suitable transmitter location could be found in this extremely mountainous section of the country from which an adequate signal could be delivered to the existing population.

3. It is noted that there is a definite lack of acceptance of UHF on the part of the general public.

If changed conditions in the future would indicate to us that operation of a television station for the Lewistown, Pa., area would be economically and technically feasible, it will be our intent to install and operate such a station.

Yours very truly,

J. S. Woods, President.

---

ENGLISH, GILSON, BAKER & BOWLER,

Hon. Charles E. Potter,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

Dear Senator Potter: This is in reply to your letter of April 6 and your further letter of May 6 directed to Mr. James B. Donovan, of Capital Television & Broadcasting Co.

The Capital Television & Broadcasting Co. was a partnership composed of Mr. Donovan, Mr. McBrier, and myself, and I have, in effect, the managing partner. Please accept this letter, therefore, as a reply on behalf of the whole partnership.

The partnership received this construction permit shortly after the same individuals, plus others, received a permit for channel 28 in Raleigh, N. C. We ordered equipment from Federal Telecommunications Laboratories for both permits, but we put first priority upon the Raleigh grant because no other CP had been granted in the Raleigh-Durham market. Due to equipment delays, we did not get on the air in Raleigh until the 12th of July 1953.

In the meantime, in Baton Rouge, another permit holder got on the air and began a successful operation, and it became clear that still another permit would be granted to the newspaper interests in that city. We were, therefore, in Baton Rouge, in the position of being the third ranking station in the market, with CBS probably remaining with the present station and NBC going with the station affiliated with WJBO in Baton Rouge. We felt that Baton Rouge would be an excellent two-station market but would be a poor three-station market for the third station. The development of the situation made it clear to us that it would not be wise at this time to go forward with the permit, and we surrendered it to the commission.

This surrender was not dictated by the fact that it was for a UHF channel, because the present channel 28 in Baton Rouge is, we understand, operating well and successfully, and the all channel sets established by that station would be equally useful to a new UHF station. Our surrender of the CP would have taken place regardless of the channel, and was dictated by the economic size of the market, and the fact that we would inevitably have been the third station in that market.

We feel, as evidenced by the fact that we are happy with channel 28 in Raleigh and some of us are interested in channel 35 in Erie, that there is no reason to believe that the higher channels cannot be just as economically sound as the lower channels in the proper market and with proper promotion. We believe, however, that manufacturers should certainly see that all sets can receive all channels so that there should be no disadvantage in operation between the higher channels and the lower channels.

I hope this will be of some assistance to you.

Respectfully yours,

John W. English.

---

Dear Friend: At this time, it appears that ultra-high-frequency television station WFPG-TV cannot render a program and transmission service of pride to the viewers of southern New Jersey. Accordingly Neptune Broadcasting Corp. intends to apply to the Federal Communication Commission to authorize
temporary suspension of the operation of channel 46 in Atlantic City, N. J., effective May 17, 1954.

Radio station WFPG operation on 1450 kilocycles is unaffected. It will continue without interruption and will present its full schedule of CBS, baseball and local programs.

Temporary discontinuance at this time of WFPG-TV operations only will permit study of the results of technical and economic surveys of UHF being conducted throughout the Nation as to whether UHF provides a truly nationwide competitive system to the original VHF television. This study will include the forthcoming hearings by the United States Senate Committee on Interstate Commerce. Sixty companies have surrendered UHF licenses. WFPG-TV will appear before the Senate Committee to report experiences as a member of the UHF industry coordinating committee.

New Jersey received no allocation for educational or commercial television other than in the newer ultra-high-frequency band. WFPG-TV was a first UHF station in the country in 1952 when in 51 days after FCC authorization, it began telecasting on channel 46. The loss of 33 half hours weekly of network and other peak programs has made it increasingly impossible for WFPG-TV to present a schedule of audience-preference programs. WFPG-TV received these program cancellations because superpower metropolitan market VHF stations 60 miles from Atlantic City established a concept of coverage generally satisfying television viewers. Therefore, extreme audience and economic loss compels suspension at this time because WFPG-TV cannot now render a service of pride to the south Jersey area for which it was planned, built, and dedicated.

Most sincerely,

NEPTUNE BROADCASTING CORP.

Salinas-Monterey Television Co.,
Monterey, Calif., April 15, 1954.

Senator Charles E. Potter,
Senate Office Building,
Washington, D. C.

Dear Senator: It is a pleasure to respond to your letter of April 6 in which you inquire on behalf of your Subcommittee on Communications into the circumstances leading up to the turning in of the construction permit for UHF channel 28 held by this partnership in 1953.

My partner, Mr. Grant Wrathall, is writing you his own views on TV allocations, UHF, and possible reliefs.

The main reason our permit was turned back was the considered belief that we would be committing economic suicide to try to start or operate a UHF station in present conditions dictated by FCC policies, attitude of networks and agencies, and technical problems.

The main problem, and the one which determined our action, was the demonstrated unwillingness of the networks to affiliate with any UHF station in an area where they had access to a VHF channel. Since programs are the lifeblood of any communications service, radio or TV, the denial of network service could only force an abnormal high program costs via film or local resources, and in a market which could not sustain such charges as are presently made for films, union talent, staff, etc.

In our case we had made a legal appeal by our partnership direct to the FCC to take cognizance of our plight, but they declined to act, stating they had no power granted to control network affiliation practices.

I would like to review the details of our case, since some of the background facts may give you an idea of how these forces come into play, and what results are created.

My partner and I are experienced radio owners, operators, and engineers. We applied for UHF in the Salinas-Monterey area with a full knowledge of the costs and technical problems involved. I have spent over 27 years in radio operating business and the management of stations, including network outlets. Mr. Wrathall has been a consulting engineer and station owner for many years. Both of us are intimately acquainted with the present limitations of power on FCC by Federal law.

At the time of the application for KICU there were pending 2 applications for the only VHF channel (8) assigned to this area, which is about 100 miles south of San Francisco, on the coast, and separated from any other potential TV station east or south by 100 or more miles.
The 2 applicants for channel 8 were KSBW-Salinas and KMBY-Monterey. KSBW had a contract under which the San Francisco Chronicle, operating KRON (TV), channel 4, San Francisco, an NBC outlet, could buy 25 percent interest in any channel 8 grant. KMBY was owned by Bing Crosby, radio star with contractual commitments with CBS, and by Kenyon Brown of KWFT-Wichita Falls, Tex., a leading member of the CBS network affiliates advisory committee. Thus, it is obvious that we were opposed for any network affiliation by interests closely allied through other connections with the two leading TV networks, NBC and CBS.

These 2 applicants conceived and executed the idea of each applying for half time on channel 8, and thus eliminating the conflict which the FCC would have had to decide. The FCC promptly granted their request, the first in the country, although it had been regarded that television stations had to use facilities full time. KICU promptly appealed on this point to the FCC and was denied any relief, or reopening of a more complete hearing to develop our contention such a grant was in effect furthering a control of both radio and TV in this area between two standard stations.

We pointed out to the FCC that the effect would be to monopolize the networks by virtue of the applicants’ connections, and the public and KICU would be deprived of any regular program service from the networks blocked out. The channel 8 proposal called for operating roughly 2 hours on CBS, then 2 hours on NBC, and so forth.

Nevertheless, we went ahead to plan our station while the FCC considered our application. Contacts at networks were fruitless. It ranged from complete ignoring of our requests for discussion on the part of CBS, to evasion and delay and stalling on NBC, to a statement by Dumont that they would consider us later if the VHF affiliation did not work out.

The channel 8 applicants made statements in the area they would have all 4 networks, and the damage to our prospects with advertisers was considerable.

After considerable expense in litigation, trips to New York and Washington, and so forth, we felt the refusal of networks to tie in with this market on UHF was a killing blow, and we turned back our CP to the FCC.

Today, channel 8 has a monopoly on all 4 networks. No network is being provided with full-time service on that area.

The solution, as I personally view it, lies in these points:

1. The FCC should be given authority to regulate network affiliations in any area. Networks should not be allowed to crowd in one major facility in an area, ignoring the inferior ones. This is no different than regulation of air routes by the CAA or railways by the ICC, or even the FCC disposition of technical facilities in any given area.

In a market with more than 1 station, say 2, like Salinas, no station should be allowed to affiliate with more than 2 networks so long as another station is available.

This is the only way you will force networks to use the available stations.

The FCC should also be empowered to force the networks to service stations in areas which may not be as commercially profitable as the big cities. This is the same principle applying to telephone and power facilities into rural areas at the expense of city profits.

2. The ultimate conversion of all TV into the UHF channels, giving all VHF operators about 5 years to amortize their investments. This would equalize operating conditions, and eliminate the present “TV aristocracy” of VHF or big city television.

The same pattern is repeating itself in TV as happened in FM. FM was killed by the refusal of networks to program the new and technically superior means of transmission on new outlets, or even on some of their own stations. The FCC’s advent NBC had the majority of the 50,000-watt AM stations in the country. They were top dog in facilities, with widest coverage, much superior to either CBS-ABC-MBS.

The FCC-FM plan contemplated equal coverage of all FM stations in major markets, plus smaller areas. This would have removed the superiority of NBC, and competition thereafter on an FM system would have been fought out on program quality alone among all networks. Thanks to the machinations of NBC and RCA which extended, in my belief, down to the deliberate reluctance to provide efficient FM receivers in quantity, FM slowly died on the vine. RCA extracted millions of dollars in the sale of FM transmitting equipment, while NBC did its hatchet work in the programing and sales end against FM. I
think there is ample evidence and many witnesses who can bear out and prove these points should the committee ever wish to explore them.

(3) UHF has many technical problems, but in my opinion these can be overcome in time. The lack of program supply will effectively kill present UHF outlets and stop future ones. People will buy UHF conversions only for more or better programs. UHF can only provide these programs with more circulation of receivers. That is why the need for network service is so acute. People will not be satisfied with 30-year old movies on UHF, or 4 hours of westerns every night!

What is behind the networks attitude? In my opinion, it is traceable to several desires and motivating influences.

(a) The easiest way out is to sell VHF against UHF.

(b) The networks would prefer a national system of few major market stations in lieu of hundreds of smaller markets. A few are easier to control than many.

(c) The attempt to preserve the huge areas of service now claimed by big city VHF stations, and thus justify the high charges for time being made on those few stations. By blocking out any network service in the fringe area listeners are obliged to tune in the distant big city VHF station, even with an inferior signal.

What are the dangers ahead?

(a) The TV empires now building of networks, stations, set-manufacturing, program production are going to get bigger unless the Government separates the monopoly elements.

(b) Extreme high power on UHF, to equalize with VHF, is both impractical from cost or operating factors today and for the foreseeable future.

(c) A tradition has been built up which is going to be harmful to UHF for years to come by the network attitude on UHF affiliation. No one knows what rumors and innuendoes have been given out by network salesmen to the advertising trade. The networks have been conspicuous by their lack of support of UHF.

I sincerely hope your subcommittee can implement some suggested changes. I feel the FCC can wisely administer these new powers. If strong, positive action is not taken I predict that UHF will soon perish, and we will be in the grips of a VHF monopoly of few stations and few owners with the apparent evils of such concentrations of power.

I regret I cannot be in Washington to appear in person, but you may use any of this information as you wish, and I will be glad to supplement or document additional requests. A copy of this letter is going to Senators Knowland and Kuchel and to Congressman Younger of my home district, San Mateo.

Very truly,

STEPHEN A. CISLER, Partner.

THE TRUTH ABOUT THE SALINAS-MONTEREY TELEVISION SITUATION

Here is a plain language statement from KICU owners on WHY, and also some Challenging Questions

The action of the FCC in suspending the grant to channel 8 on a share-time basis was a surprise to everyone. In the interests of fair play, we think the true situation should be explained to the public and dealers.

(1) The first grant for television in the Salinas-Monterey area was for KICU, channel 28, owned by the Salinas-Monterey Television Co., a partnership of Grant R. Wrathall and Stephen A. Cisler. KICU is to be located on Frement Peak. Construction plans have begun. Some equipment is on hand. Some major items are not available until early fall. KICU hopes to be on the air in September 1953. It is not held up in any way by the FCC action.

(2) The channel 8 grant was made on a share-time basis. One-half of the time was to be operated by a Salinas station, KSBW. The other half by a Monterey station, KMBY.

Now KICU is not opposed to having competition. We think the people of this area are entitled to two TV stations. We are able and willing to meet competition on a fair and square basis.

The share-time grant was made by the FCC very suddenly. No notice was given that such action was contemplated, nor was a full disclosure made of the actual operating methods of the two former opponents on channel 8 who now merged their cases. The grant was the first one of this type in the country. It
took advantage of an obscure legal technical loophole in the wording of the FCC rules.

KICU filed a protest with the FCC on these grounds:
(1) To grant one channel to two stations is to create a monopoly fraught with dangerous possibilities.
(2) The stations proposed to maintain separate studios in Salinas and Monterey. This gives channel S an unfair advantage over KICU in that all operating and equipment expenses are cut in half for each station. It would enable them to undersell KICU rates at will.
(3) The stations proposed to take NBC and CBS TV network service, although neither one could handle the full-time service of either one network. The practical effect would be to deprive this area of many of the fine programs of both networks, which lie outside of the time-sharing schedule of each station. For instance, when KMBY was carrying CBS what would happen to the NBC programs at the same time?

KICU charges that this arrangement bottles up the two dominant networks on one station, and does not represent the best type of program service.

(4) KSBW-TV will be owned in part by the San Francisco Chronicle who operate the NBC-TV outlet, KRON. The Chronicle is furnishing most of the funds for the construction of KSBW-TV. It is obvious that control of operating practices and programs will rest with the source of the money, especially since KSBW people have no actual experience in TV operating, while KRON does. Further, KRON will be in position to stop NBC-TV programs from being put on KICU if that station offers its facilities during the time KSBW-TV is not able to carry NBC. Isn't it common sense that KRON would protect its child?

(5) KMBY-TV is being built with funds to be supplied by Bing Crosby and George Coleman. Both are esteemed citizens. Mr. Crosby has business contracts with the CBS network. These contracts enabled him to get CBS network on KMBY some time ago. The CBS network is under obligation to Mr. Crosby, and this influence would very likely preclude any CBS-TV programs being aired over KICU when KMBY-TV was unable to carry CBS. Why should the people of this area be forced to look only at the programs of one network at the same time, while the other major network program is bottled up? KICU charges this "dog in the manger" operation is not in the public interest.

(6) What is to prevent the two stations KMBY-TV and KSBW-TV from agreeing to maintain the same rates, possibly low enough to kill any competition? Suppose they said to local advertisers, after competition was suppressed, now "you must buy BOTH TV stations or not get either one." Or suppose they said, "you must buy my KMBY radio station to get on KMBY-TV station." This is called forced combination. It is an evil in the newspaper business in many cities, although the Federal Government now is stepping in to stop it by court action. Fortunately, this newspaper combination does not exist in this area, and it should not be allowed to exist in television.

(7) The combination of the two stations on one channel means that they have twice the resources of a single station. It is in the judgment of KICU unfair competition, and our protest simply asked the FCC to review these practical operating problems, to investigate the restrictive covenants possible, and to insure that competition in TV in the Salinas-Monterey area was fair and square.

KICU will be happy to expedite any hearing the FCC holds on this matter. In fact, we suggest to the channel S people that they clarify the way they intend to operate, whether they propose to keep networks off rival television stations, and why they did not have the courtesy to even answer the KICU proposal that all stations serve the area from the same antenna on Mt. Baldy?

Inquiry should also be made as to the origin of the local rumor started in Salinas recently following the channel S grant, that the station would not be built. This damaging and false allegation was answered by TV distributors in letters to their dealers, and in a series of newspaper advertisements by distributors who were selling UHF receivers very well until this incident.

We suggest that to expedite TV service to this area on channel S, a separate corporation be formed with a trustee group of reputable citizens of both Salinas and Monterey, none of whom have any business or legal connection with the KMBY or KSBW owners, new stockholders, or employees. Let this trustee group take title to the equipment already on hand, finish the construction, and operate the station until the FCC determines the facts in this matter. After such adjudication the continued commercial operation would be passed over to the approved FCC applicant.
It is significant that the FCC has recalled several other share time permits of the same type. These permits are for other sections of the country, equally deserving of TV service as Salinas-Monterey. There must be a question in the mind of the FCC that this topic deserves a full exploration before allowing these strange creatures to go into operation.

KICU places its faith in the FCC ability to search out the inherent evils of a share time operation, and to insist on certain needed safeguards for protection of public interest.

We charge that John Cohan knew that channel 8 could not get on the air by the promised May 1 date. When was the equipment shipped from New Jersey? Has KSBW and KMBY settled the trouble with the IBEW union which could stop installation? See what has happened in Fresno where the equipment is on hand, yet the starting date had to be moved back from April to June! There is more to putting in a TV transmitter than installing a TV receiver.

We deny the loose allegations of Cohan that the delay on channel 8 will cost dealers much money. Sets will continue to be sold now and later. No set will be useless or obsolete because of this delay on channel 8. Thousands of sets in Monterey County receive San Francisco channels 4, 5, and 7 every day now. This fall service will be coming from channels 28 and 8.

KICU owners believe in Monterey County. We are investing thousands of dollars in television service. Is it not right that we ask fair play for the public and ourselves? KICU wants to be sure the public interest, necessity and convenience will be served for a long, long time and not be the instrument of a self-styled "Mr. Television."

This may irritate some people for the moment, but the long range benefits of insuring equal competition between two TV stations in the area, will be with us all for a long, long time.

The owners of KICU will be happy to answer any questions, or appear in any public or private meeting place to discuss this situation openly and without bias.

Meanwhile, KICU hopes to give you channel 28 service this fall.

Grant R. Wrathall,
Partner, Salinas, P. O. Box 237.
S. A. Cisler,
Partner, Monterey, P. O. Box 1070.

Here is the exact copy of the protest filed by KICU with the FCC.

Mr. T. J. Slowie, Secretary,
Federal Communications Commission,
Washington, D. C.

Dear Sir: On behalf of S. A. Cisler, Jr., and Grant R. Wrathall, d/b as Salinas-Monterey Television Co., permittee of UHF television station KICU, Salinas, Calif., (BPCT-1466), by S. A. Cisler, Jr., partner, protest is made in accordance with the provisions of section 309 (c) of the Communications Act of 1934, as amended, to the action of the Commission of February 18, 1953, in granting without hearing the applications of Salinas Broadcasting Corp., Salinas, Calif., (BPCT-1222), and the Monterey Radio-Television Co., Monterey, Calif., (BPCT-1225), for share-time operation on VHF channel 8 to serve the Salinas-Monterey area. (See Public Notice 87046, Report No. 2182, dated February 19, 1953.)

In support of this protest the Commission is advised that my partner and I, identified above, received a grant for a construction permit to erect a new UHF television station in Salinas, Calif., by virtue of Commission action January 14, 1953. The station is in the process of construction.

The records of the Commission will show that prior to February 18, 1953, there were two VHF applications, identified above, for one VHF channel to serve both cities, Monterey and Salinas. However, on the 11th of February an amendment was filed to both applications to share time of operation on VHF channel 8. Without giving members of the undersigned partnership an opportunity to study this matter, the Commission just 7 days later, on February 18, 1953, granted said applications without hearing. My partner and I are parties in interest as contemplated by Congress in section 309 (c) inasmuch as the proposed combination as granted by the Commission will result in unfair competition and an impossible situation as shown below in sales rates and availability of network programs.
The undersigned partners also protest on behalf of the public in the Salinas-Monterey area that the combination as authorized by the Commission will result in two strong connections with the networks tying up network programs making it impossible for station KICU to obtain a source of programs to broadcast to these communities.

The principles involved in the AM stations KSBW, Salinas, and KMBY Monterey, are the same individuals involved in the two corporations which received the sharing-time grants mentioned above on February 18, 1953. KSBW of Salinas, is obtaining its funds through advances from the San Francisco Chronicle, owners of KRON-TV, San Francisco, affiliate in that city with the NBC Television Network. Although the Chronicle is to hold a minority share in the KSBW company, the mere fact that it is a dominant source of finances can lead it to exert a controlling influence on that station's policies and availability of NBC-TV programs in that area.

KMBY of Monterey is obtaining its funds by advances from Bing Crosby and George Coleman. Mr. Crosby is very closely connected through entertainment contracts with CBS, and in addition, Mr. Kenyon Brown, president of the KMBY company, is a member of the CBS Affiliates Committee.

The two companies have already announced through the press in the Salinas-Monterey area, and in meetings with the dealers, that it expects to have not only NBC and CBS programs, but also programs of the other two networks—Dumont and ABC. Station KICU is faced with financing one complete station, whereas the two competing VHF companies, each with their own AM stations and each with their own studios and individual sales staff, are only required to build one transmitter and antenna plant. The undersigned partnership charges that this "share-time creature" is unfair and inequitable competition, the public itself will suffer through a jumble of network programs, Station KICU will have to be satisfied with whatever crumbs are left over, making it extremely difficult to serve the public as contemplated by Congress and it is strongly protested that the undersigned partners had no knowledge or information that a sharing-time arrangement for channel 8 would even be considered by the Commission. An examination of section 3.551 of the Commission's rules pertaining to time of operation discloses that "all television broadcast stations will be licensed for unlimited time operation." The undersigned partners had a right to rely on the Commission's rules and it is charged that the Commission has not been fair with the industry nor with the protesters herein.

In view of the foregoing, we respectfully request the Commission to reconsider its action of February 18, 1953, in granting the above mentioned applications without hearing, and to designate the same for hearing and to name the undersigned partners as parties respondent to such hearing to present not only the grievances of the partnership which are economic in nature, supported by the Sanders case, but also to prevent the grievous injustice to the public as the result of the action of the Commission of February 18, 1953, referred to above.

In the event our wishes are granted we will be very happy to present our evidence at the hearing.

The Commission in its releases has professed to have an interest in establishing UHF television, and the Commission is well aware of the economic handicaps that all UHF permittees must overcome, and yet in this instance the Commission, without previous notice to the industry, has permitted the creation of a creature, the combination of two powerful companies with only one transmitting plant to effectively monopolize the economic support for television in the Salinas-Monterey area and also to monopolize the available network programs. The Commission is reminded that the undersigned partnership is not a "mere applicant" as referred to in its memorandum opinion and order released December 30, 1952, in the case of the Music Broadcasting Co. The undersigned is the permittee for a UHF television station that is expending every effort to bring television to the Salinas-Monterey area, and to make network programs available on a fairly competitive basis to this area. The action of the Commission places a serious obstacle in the path of the permittee to carry out its mandate set out by Congress that it must serve public interest, convenience or necessity.

48550-54-3
I have this day mailed a copy of this letter to the Monterey Radio-Television Co., Monterey, Calif., and Salinas Broadcasting Corp., Salinas, Calif.
Respectfully submitted.

S. A. CISLER, JR., and
GRANT R. WRATHALL
D. B. A. SALINAS-MONTEREY TELEVISION Co.
By S. A. CISLER, JR., Partner.

Subscribed and sworn to before me, a notary public, this 19th day of March, 1953.

MAYA CLARE JAMES,
Notary Public.

WGCN BROADCASTING Co.
Gulfport, Miss., April 20, 1954.

HON. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: Thanks very much for your letter of April 6, in regard to our reason for giving up our UHF grant.

Our only reason for not building the station was because we felt that the UHF station would not survive in this market. We watched the situation very carefully, saw what was happening in other parts of the country, and we finally determined that it would not be good business to undertake the project. We went through the FM hysteria a few years back and did not wish to make the same mistake.

It was most unfortunate that we did not have a VHF grant, and I believe it is unfortunate that the VHF channels could not have been spread over the country, with low powered, medium powered, and high powered stations. However, the Commission labored many hours over this and I'm sure they handled the matter in the only practical way.

I still believe UHF will go in some markets, but I believe a majority of them will find it almost impossible to compete against the VHF stations, all of which are high powered stations equal to clear channel AM stations.

With best wishes, I am,
Sincerely yours,

HUGH O. JONES, General Manager.

WASHINGTON 6, D. C., April 21, 1954.

HON. CHARLES E. POTTER,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: This is in response to your letter of April 6, 1954, to WIBM, Inc., requesting information concerning the reasons for the cancellation of its construction permit for a UHF television station to operate on channel 48 in Jackson, Mich.

WIBM, Inc., requested that its channel 48 construction permit be canceled because of economic difficulties attending a UHF operation in a community such as Jackson under existing circumstances. Between the time the application was filed and its cancellation, the tremendous economic difficulties which UHF operators would and were facing all over the country became apparent. Moreover, it appeared likely that the Commission would allocate a new VHF channel to Jackson or a community near Jackson. Such a channel would present a Jackson UHF operator with impossible competition. Preferring to apply for this VHF channel rather than to operate a UHF station—the Commission's rules do not permit both—WIBM, Inc., relinquished its construction permit.

Respectfully yours,

WIBM, Inc.,
By HARRY M. PLOTKIN,
Arnold, Portas & Porter (its attorneys).
DEAR SIR: Please excuse this delay in answering your letter of April 6, 1954, but it has just come to my attention.

Your letter requested information about WCTV-TV, Flint, Mich., for the scheduled hearings for UHF-TV. While we did have an initial delay because of unavailability of transmitter equipment, we decided not to complete construction of WCTV because of an anticipated lack of advertising revenue. Neither of the two largest networks would give use basic affiliation, and national advertisers had an increasing reluctance to use a UHF station. To give any community a balanced program schedule the revenue would have to be larger than that which could be received from the local Flint advertisers.

Only because of the benefit of "hindsight" it is felt that perhaps UHF could have been a success if the FCC had imposed an artificial freeze for a period of 5 years on all VHF construction or power increases; at this time no solution seems ready to correct this problem. If you require any further details please let us know.

Sincerely,

JAMES L. RUBENSTONE, President.

M. B. RUDMAN, OIL PRODUCER,
Dallas, Tex., April 20, 1954.

Dear Senator: In answer to your inquiry of April 7, 1954, this is to advise that our UHF-TV construction permits were returned because of the vast increase in our business of exploring for and producing oil and gas. The increase necessitated the expenditure of extra large sums, as well as requiring that more time be devoted to our business.

We certainly regret the surrender of the permits; but, under the circumstances, we feel we had no other alternative in the matter. May we take this opportunity to express our appreciation to you, as chairman, and to the entire Subcommittee on Communications of the Senate Interstate and Foreign Commerce Committee for the excellent cooperation and understanding which we received.

Yours very truly,

RAYMOND A. WILLIAMS, Jr., General Manager.

KEPO,

MILLER C. ROBERTSON.
KUTA,
Utah Broadcasting and Television Co.,
Salt Lake City 1, Utah, April 23, 1954.

Mr. Charles E. Potter,
Chairman, Subcommittee on Communications, United States Senate,
Committee on Interstate and Foreign Commerce,
Washington, D. C.

Dear Mr. Potter: This is an answer to yours of April 6 directed to the Idaho Broadcasting and Television Co., Boise, Idaho, of which I am president.

We exchanged our Boise TV construction permit on VHF channel 9 for a VHF channel 6 construction permit. The channel 6 is assigned to Nampa, Idaho. We felt that since the city of Boise already had two television stations, that the third in this area should be more of a rural coverage Boise Valley station and thus chose Nampa, Idaho, the center of the valley and channel with a better coverage potential.

Yours very truly,

Frank C. Carman.

Hon. Charles E. Potter,
Chairman, Subcommittee on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

Honorable Sir: Your letter of April 6, 1954, about KAGR-TV construction permit release received.

We wrote the Federal Communications Commission in our three-page letter of January 28, 1954, fully asking for extension of construction permit.

The reasons mentioned in your letter do not apply in our case.

Your interest in behalf of the public is appreciated.

Sincerely yours,

John Steventon.

The Palladium Publishing Co.

Hon. Charles E. Potter,
Senate Office Building,
Washington, D. C.

Dear Senator Potter: This will answer your recent letter touching on the survey of the Subcommittee on Communications of the Interstate and Foreign Commerce Committee of problems dealing with UHF-TV channels and development.

It is true that our company withdrew our application for a UHF license (channel 42). This action was taken after the FCC had acted favorably on our original application.

However, we did not receive the formal permission until almost 90 days after it had been granted. This of course delayed any formal start on construction. When we did get the formal approval, we found that it required construction to start within 6 months from the date of the approval.

In addition, the permit provided that no construction was to start until engineering data dealing with the height and use of the antenna, now serving our AM and FM station, had been submitted to the FCC. This of course required work by our Washington engineers and by the time this data was prepared by the engineers and ready for submission to FCC our 6 months' time limit was about up.

Just about this time, too, the local authorities were proposing a city-suburban area ordinance dealing with the height of buildings and other structures with relation to the interference of local airport operations.

We had previously run into this aeronautical problem, along in 1946-47 when we were building our WHFB radio station and tower. The local airport board twice objected to sites which we had selected and each time, at considerable expense, we had to get out Washington engineers to hunt for a new site. Obviously, this was expensive.

In the light of this experience we looked with some misgivings on what was contemplated in the proposed local ordinance, which has not yet been formulated and enacted.
Under the circumstances, after submitting our engineering data on the tower, and which was approved, we asked for a 6 months’ extension. To this the FCC replied that we had not made a suitable showing in starting construction, or contracting for it, but was willing to give us a further hearing.

Six of us, including with us Washington attorneys, Dow, Lohnes & Albertson, we were advised to return the permit without prejudice until we could later come back when these various factors were better resolved.

We are not complaining that the FCC was not according us the same consideration as it did other applicants. In fact, in our 7-year operation of station WHFB-AM and FM our relations with the FCC have been, on the whole, very pleasant. Probably the Commission thought that we were “stalling” on the job. We were not; the delays we encountered were unavoidable and not of our making.

What we think the FCC should do, with regard to the small, hometown UHF stations, is to take a more liberal attitude in allowing these applicants more time to mature their plans for construction, financing, etc.

We spent nearly 2 years before we got our original TV permit investigating the situation. Our station manager and the company’s vice-president, devoted much time collecting data, investigating costs, procuring estimates and conferring with applicants who were about to file applications or were getting ready to broadcast.

In addition to this, we contacted the big networks and found them not interested in a service hookup. Their position seemed to be that they were already covering this area, so why pay for circulation they already had.

This might be explained, in part, by the fact that Benton Harbor and its sister cities, St. Joseph, Kalamazoo, and other places miles east of Chicago. Four big network stations (VHF) boom in across the lake to us from Chicago; in addition, there’s 1 from Kalamazoo, 1 from Milwaukee, and 1 from Grand Rapids. The best reception, however, is from Chicago.

Thus, first, this area does now have TV reception—and there is no great rush to give local people TV service; then, secondly, if we cannot obtain a network contract this reduces the home operation to a purely local TV operation.

This itself can be financial murder for a purely local TV station, as any competent operator knows. Indeed, we were advised by competent counsel that we should expect to lose a minimum of $60,000 per year until the station could get a listening interest.

As you know, UHF calls for so-called converters on TV receivers and this in itself calls for costly promotion to induce listeners to invest. We found this out when we were promoting our FM service.

We think FCC should consider these facts in connection with UHF applicants; the fact that so many permits have been returned we think indicates the need for greater consideration of those who, like ourselves, are willing to get into UHF-TV on a purely local basis.

Not only from our experience in newspaper but also radio operation, we believe there is a field for purely local TV stations in towns as small as ours.

The possibilities of serving a local community with live news, pictures, and programs are potential, but it’s a 5- to 10-year task which will be terribly costly until the break-even point is reached.

It should be remembered, too, that color is coming in and here, for the little fellow, is another factor of cost that will be heavy. In fact, not only is the initial investment heavy, but constant improvements, changes, etc., in the mechanical end of essential equipment faces up to the possibility that a major part of original investment may well be obsolete in a very short time.

We are trying to point out the great difficulties for the small home-town TV operators and what we have encountered. We hope the committee may find something in this that will be helpful.

Thank you for giving us this opportunity to be heard.

Cordially yours,

S. R. BANTON.
Hon. Charles E. Potter,
United States Senate,
Washington, D. C.

Dear Senator Potter: This will acknowledge receipt of your letter of April 7, 1954.

In response to your inquiry as to the reasons for our relinquishing the construction permit for KMON-TV, this is to advise that on December 7, 1953, we requested additional time within which to complete construction of the station, and the Federal Communications Commission advised the following:

"(1) Montana Farmer, Inc., has not been able to finalize plans with networks for affiliation. This has definite bearing on type of service to be rendered and economic stability of operation.

"(2) Because the Great Falls area will already be served within the next 3 months by another TV station, it is not incumbent upon us to bring such service regardless of the efficiency of technical service, affiliation and adequacy of coverage.

"(3) Appointments have been made with two networks to discuss further engineering in an effort to bring the best type of service to this area. At this date there seems to be a disparity of opinion regarding this factor.

"(4) At a time when KFBB-TV is on the air (within the next 3 months), an adequate study of type of engineering can be made based upon their actual experience and further planning can be done with certainty and fact.

"(5) Several sites in lieu of the site specified here have been examined in an effort to bring the best type of coverage to this area. Thus far, alternate, high-level, acceptable sites have either been not available or proven too high priced to fit into a reasonable economic pattern.

"(6) For the reasons specified above, it has not been possible to make firm contracts for construction or equipment. However, Montana Farmer, Inc., stands ready to act with assurance of reasonable delivery dates when sites and engineering problems are solved."

On December 23, 1953, the Commission advised that on the basis of this showing it could not grant an extension of time to complete construction. On January 21, 1954, we submitted to the Commission the following letter.

"This answers your letter of December 23, 1953 to the Montana Farmer, Inc., advising of your unwillingness to grant our request for more time on our construction permit for a TV station on channel 3 in Great Falls, Mont.

"We feel we have been reasonably diligent. We feel, also, that to date we have been prevented from constructing by causes not under our control. We have, for us, made substantial and continuing investment of money, time and travel for consulting engineering services, site investigations, equipment studies, legal review, discussions with networks on affiliation, and studies of comparable television properties.

"The newspapers and farm publications and radio station operated by companies affiliated with us in ownership have a long record of outstanding public service in this primary Montana area. We take some pride in this record.

"Since you are unwilling to grant necessary time for completing these vital studies without which we cannot justify the major expenditures essential to a quality television operation, we respectfully request that our application be dismissed without prejudice. We request this so that we may be able at a later date to reapply."

Trusting that this answers your inquiry, I am, Cordially yours,

Robert H. Warner,
General Manager, Radio Station KMON.
STATUTED UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

WROV, ABC, MBS
Roanoke, Va., April 19, 1954.

Hon. Senator Charles E. Potter,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

My Dear Senator Potter: We certainly appreciate the opportunity to bring to your attention and to the attention of the Senate the problems encountered by the Subcommittee on Communications of the Senate Interstate and Foreign Commerce Committee the problems which were encountered by television station WROV-TV on UHF channel 27 operated by Radio Roanoke, Inc. from February 15, 1953, to July 18, 1953.

Since September of 1953 Radio Roanoke, Inc. has been engaged in a hearing before the FCC with the Times-World Corp. of Roanoke, Va., both seeking VHF channel 7 allocated to Roanoke, Va.

A portion of the information exchanged is enclosed on seven mimeographed sheets which we feel adequately covers the subject of why the construction permit for UHF channel 27 was returned to the FCC by Radio Roanoke, Inc.

I feel it appropriate to state here in answer to the last sentence in the second paragraph of your letter dated April 7 that at the time of the grant of the UHF channel 27 construction permit, the FCC found Radio Roanoke, Inc., to be legally, financially and technically qualified to construct and operate a television station and upon accepting for filing Radio Roanoke's application for VHF channel 7, the FCC has again found Radio Roanoke, Inc., to be legally, financially and technically qualified to construct and operate VHF channel 7 in Roanoke, Va., as outlined in Radio Roanoke's "McFarland letter."

For your information we are enclosing a copy of Broadcasting-Telecasting magazine's story titled, "What Happened in Roanoke?" This, too, may be helpful to you in gathering information on the subject of UHF.

If there is any other information that you feel that we may have that would be helpful to you, please permit us to assist you.

Sincerely,

Radio Roanoke, Inc.,
Frank E. Koehler,
General Manager.

Factors Which Led To Taking WROV-TV Channel 27 Off The Air

The following is a summary of factors which led to taking WROV-TV channel 27 off the air:

1. It was realized that there would be problems with UHF that would not be encountered with VHF; therefore, many precautions were taken and much effort expended to overcome the well-known difficulties in obtaining adequate distribution of UHF receiving equipment, adequately installed and properly adjusted. After the expenditure of the time, the effort and money, a TV field test was made by the Philco Corp. on April 23, 1953, using a 90 chassis Philco TV set at various locations under varying conditions in the Roanoke area. A copy of the survey is in the files of WROV-TV. A study of the results of the survey showed that with excellent equipment, properly installed and properly operated by experts in the field of television, the results were generally poor and sufficiently conclusive that channel 27 operating in Roanoke, Va., was not competitive with the VHF channel 10 station then and now operating. The survey team agreed that the same test for VHF channel 10 and/or channel 7 would have shown and will show excellent results. The Philco survey substantiated by experts in the field the findings of the station with respect to reception problems.

2. The following financial information is introduced only for the purpose of establishing an economic trend which is related to the technical noncompetitive-ness of UHF channel 27 and VHF channels 10 and 7 in Roanoke.

As above mentioned it was felt that the trend had been somewhat established in the face of channel 10, NBC-CBS-Du Mon1 competition. It was observed that the future would also bring VHF channel 7 on the air in Roanoke and it was assumed that inasmuch as the CBS network preferred VHF channel 10 when UHF channel 27 facilities were available that the CBS affiliation would go to
channel 7 resulting in a VHF channel 10 NBC affiliate and a VHF channel 7 CBS affiliate competing with a UHF channel 27, the shortcomings of UHF channel 27 in Roanoke, Va., herein mentioned notwithstanding. In consideration of the current and future competition it was impossible to perceive on what basis an increased number of UHF equipped sets could be expected. It was also impossible to perceive how after the meticulous following of manufacturers' recommendations that reception could be improved much less equal VHF reception. It was impossible to perceive how the economic loss trend could be reversed with the anticipated increase of VHF channel 7 competition. It was impossible to perceive how the better and best network programs could be attracted to WROV-TV UHF channel 27 with the admittedly preferred VHF service available or to be available on channels 10 and ultimately 7. It was impossible to perceive how the operation of WROV-TV on UHF channel 27 in Roanoke, Va., could be construed as in the public interest when after the additional expenditure of an estimated quarter of a million dollars for UHF receiving equipment on the part of the general public reception was as limited and of such poor technical quality that viewership was as low as the following American Research Bureau surveys revealed.

3. The American Research Bureau, Inc. of Washington, D. C. conducted two UHF-VHF surveys in Roanoke, Va. The results of the first sample 997 made in April 1953 is as follows:

**Television saturation:** Percent of all homes - 34.9

**UHF saturation:**
- Percent of all homes - 16.0
- Percent of television homes - 46.0

Channels being received (a total of 4 different channels were available to homes in this area):

- Channel 10: 100.0
- Channel 27: 46.0
- Channel 3: 2.3
- Channel 2: 0.6

Channel viewed most:
- Channel 10: 96.6
- Channel 27: 3.4

The second sample 1004 was made in July 1953, and is as follows:

**Television saturation:** Percent of all homes - 50.6

**UHF saturation:**
- Percent of all homes - 36.5
- Percent of TV homes - 72.0

Channels being received (a total of 4 different channels were available to more than 1 percent of the TV homes in this area):

- Channel 10, Roanoke: 100.0
- Channel 27, Roanoke: 72.0

Others (Lynchburg, Greensboro) less than 20 percent (Lynchburg now 15.2 percent).

Channel viewed most:
- Channel 10, Roanoke: 95.9
- Channel 27, Roanoke: 1.2
- Others: 0.4
- No choice: 2.5

Consideration of the above three items necessitates the admission that it is more difficult to receive a UHF picture than a VHF picture; in some instances and under certain circumstances it is impossible to receive a UHF signal where a VHF signal is available. In many instances the UHF picture is very inferior to the VHF picture. Because of these factors networks and advertisers—national, regional, and local—prefer VHF facilities to UHF facilities where available, resulting in greater viewership on VHF of higher rated programs which results in less viewership on UHF due to lower rated programs. The complication of receiving UHF pictures against the simplicity of receiving VHF pictures
also creates a preference for VHF. It can be assumed that because the public prefers VHF that the advertiser, the network, and the broadcaster prefers VHF. It is felt that in Roanoke, Va., it is more in the public interest to broadcast on VHF channel 7 than on UHF channel 27.

After thorough consideration of the above, in June 1, 1953, Radio Roanoke refiled an application for VHF channel 7 and at the same time requested the Federal Communications Commission to waive its rule prohibiting a holder of a construction permit for one channel from filing for another channel in the same area. Not having received a response from the Federal Communications Commission with regard to this action, on July 14, Radio Roanoke refiled an unqualified application for VHF channel 7 and at the same time notified the Federal Communications Commission that after the close of business on Saturday, July 18, that WROV-TV would not return on the air on channel 27 and that the channel 27 construction permit would be returned to the FCC. No response was received from the FCC with regard to this action. Consequently, WROV-TV UHF channel 27 left the air at the close of business on Saturday, July 18, 1953.

**PHILCO TV FIELD TEST**

April 23, 1953—Field test was made on 90 chassis Philco TV set for WROV, channel 27

[From Broadcasting-Telecasting, July 13, 1953]

**WHAT HAPPENED IN ROANOKE?**

A UHF station's candid announcement that it couldn't meet VHF competition has provoked widespread doubts about UHF's future. Here's the report of a B-T editor who found out that what happened in Roanoke won't necessarily happen elsewhere.

By J. Frank Beatty

The eyes of the television world are turned toward Roanoke, a thriving industrial city in the Blue Ridge Mountains of western Virginia.

This rather conservative but steadily growing market has developed into an electronic field laboratory where the merits of UHF versus VHF are on trial.

To date the competition has been one-sided—so one-sided that the results have started comment all the way from Madison Avenue to Hollywood and Vine as timebuyers wonder if UHF is going to follow the pattern of FM.

In brief, WROV-TV Roanoke has decided it simply can't compete on UHF channel 27 with WSLS-TV's VHF channel 10 service (B-T, June 29, July 6).

What WROV-TV wants to do is get FCC to make an exception to the rules so the station can continue operating on channel 27 while it competes for a third channel available to Roanoke VHF channel 7.

Contrary to a widespread impression, the Roanoke case has not demonstrated that UHF is a weak or impotent service. Nothing of the sort has been shown.

On the other hand, the Blue Ridge laboratory shows that UHF can deliver a good signal over the bottom of the Roanoke bowl.

It shows, however, that a UHF signal from a 2,000-foot point can't climb 4,000-foot mountains 10 or 12 miles away.

It shows, too, that a UHF station hemmed in by mountains faces frightening odds in trying to compete against a VHF station sitting on a favorably located peak that permits coverage of good markets out to 100 miles or more.

And it shows, finally, that people hesitate before spending extra money to tool up their homes for UHF when most of the popular network programs are on a VHF channel.

Things are rough in Roanoke for WROV-TV. Its income has been falling steadily. Expenses keep climbing. Every week the losses are getting heavier, and the stockholders are gravely concerned about their $250,000 investment.

**PROBLEM IS COMPLETE**

No single factor is responsible for WROV-TV's troubles. Rather, the station can look to a combination of events and attitudes.

In any case, the coveted channel 7 is still unassigned because there are two applicants. WROV-TV asks for the right to make it a threesome, while still operating on channel 27.

The Roanoke case gets to the fundamentals of TV engineering and economics. Its impact already has become serious as snap judgments have been made on the basis of cursory examination of the facts.
Obviously the only way to find out what's wrong in Roanoke is to make a first-hand study of the situation. Many questions are raised by WROV-TV's expressed desire to get out of UHF and into VHF scarcely five months after the first test pattern was fanned out over the city. Is there something inherently wrong with UHF—in Roanoke, that is? Has WROV-TV given UHF a fair shake? Have dealers and distributors cooperated fully? If not, what's to be done? Why can't WROV-TV get more network programs when there's only one other station in the city and connections are available? Is WROV-TV the victim of a "Madison Avenue complex"? Are TV receivers well engineered for UHF? Is the trouble due entirely to circumstances beyond WROV-TV's control or is it the fault of ownership or management? Would more power and/or a higher site do the trick? These questions, and others, can be matched against the story of Roanoke television since WROV decided back in February 1951 that it wanted to add TV to its successful local radio service.

Pleased with their monthly financial statements, the half-dozen local businessmen who had started WROV in 1946 decided they wanted to be the first to apply for a TV station in Roanoke. A channel 7 notice was filed despite the freeze. Later WSLS, regional Roanoke station operated by Shenandoah Life Insurance Co., applied for channel 10 as did Polan Industries, which had several TV projects in the works. Last summer, after the freeze, WDBJ filed on channel 7 besides WROV. WDBJ is owned by Times-World Corp. and is Roanoke's oldest radio station, a 5 kilowatt regional.

At that point there were two applicants for channel 7 and two for channel 10, but nobody had applied for UHF channel 27, the third commercial facility available to the city.

WROV's stockholders met one day in July, 1952 after they found WDBJ seeking the same channel 7 facility. They wanted to get into television as quickly as possible. After all, the FCC was encouraging use of the new TV band and the RCA Bridgeport, Conn., project was demonstrating that UHF really works.

Bridgeport-bound

The only sure way to get into television without long and costly hearings would be via channel 27, the stockholders decided. That evening Frank E. Koehler, WROV general manager, was Bridgeport-bound for a first-hand look at UHF service.

The new medium looked good, and WROV went into action. An RCA 1 kilowatt UHF transmitter was ordered, "and please hurry." Next was the question to finding a site. The choice narrowed down to Mill Mountain, a colossal 750-foot hump stuck right in the south end of the city, and 4,000-foot Fort Lewis mountain, about a dozen miles to the southwest.

Since UHF has strong line-of-sight traits and high-power transmitters were a year or more away, it was decided to use the Mill Mountain site. There the antenna could look right down into the living rooms of nearly every home in Roanoke.

With the main policy decisions out of the way, WROV continued its studio experiments with an RCA TV camera it had owned nearly a year, still its only camera. It also twiddled its corporate thumbs for weeks and more weeks while awaiting delivery of the transmitter. Eventually it had to abandon all hope of being Roanoke's first television station because WSLS had meantime been granted a channel 10 permit. Polan Industries had switched its channel 10 application to channel 7 after WROV's selection of UHF channel 27, leaving the way open for WSLS.

The delay in getting a transmitter was a cruel blow to WROV-TV. Last November 11 WSLS-TV took the air on channel 10 from Poor Mountain, a lofty peak 4,000 above sea level and 3,000 feet above Roanoke itself. This peak is 13 miles from the city.

At that time Roanoke had a thousand or more TV sets, fed from $150-$200 stacked yazis and assorted dipoles that could catch WFMY-TV Greensboro, N. C., 100 miles away and frequently WSAZ-TV Huntington, W. Va., or WTVR (TV) Richmond.
Even before WSLS-TV was transmitting, local appliance stores were conducting campaigns to sell VHF sets. Local merchants were joined by fiery promoters whose gorgeous claims and easy credit helped stimulate the demand for sets—all this during the pre-Christmas season when TV sets move at their fastest, and on into the winter.

Eventually WROV's transmitter arrived. After a fortnight of testing, the station started program service March 3.

By that time WSLS was claiming over 40,000 sets in its service area—relatively few of them able to receive a UHF signal. WROV-TV had started promoting conversion during the winter and had conducted dealer-distributor educational campaigns.

That was the situation last March. A heavy share of TV sets nearly all VHF-only, had been bought on time. To catch WROV-TV's picture meant $30 to $50 for an antenna or lead-in, plus $5 to $50 for a strip or converter ranging from one channel to the whole UHF band.

An educational campaign aimed at dealers and distributors was showing signs of results. Installation crews were learning the hard way that UHF presents special problems. Sometimes they threw up their hands and said they guessed there wasn't a UHF signal anywhere on the roof.

**ROW TIES AND YAGIS**

Even so, bow ties and yagis started sprouting from Roanoke rooftops. At the same time, dealers began meeting some sales resistance. Having sunk $200 to $400 or so in a TV set, customers raised this point—why spend all the dough tooling up for UHF when all the NBC-TV and CBS-TV programs are on WSLS-TV?

WROV-TV had ABC-TV service, picking it up from a 35-mile A. T. and T. microwave link. This added up to only a few hours a week. WSLS-TV, on the other hand, started off the day with NBC's Garrowway and was possibly 80 to 90 percent network right through to the 11 p. m. news. Nearly three-fourths of the network programs on WSLS-TV are NBC, the rest CBS.

The WROV-TV program service starts at 5:30 p. m. with a religious series, moving along with local personalities to 6:30 when it has a western film. Local news and assorted local programs and film shows are carried to signoff, usually around 11 p. m. Like WSLS-TV, it is limited to one rather small studio though WSLS-TV has two cameras plus a third in the Appalachian Power Co's auditorium.

At first the local merchants and services were buying plenty of WROV-TV time, enough to justify its backers' hopes that life with television would be quite merry after the first few months. The conversions weren't fast enough to suit them, however, and they started comparing WROV-TV's programs and coverage with those of WSLS-TV.

Then began real sponsor trouble. Local contract cancellations started to come in—polite, as a rule, but quite firm. New York timebuyers were courteously indifferent.

The networks, too, were disinterested, aside from ABC-TV. The AM part of the WSLS setup had an NBC affiliation. Since WSLS-TV carried many more NBC-TV programs than CBS-TV, why couldn't WROV-TV get the unused CBS-TV programs? "You answer it," WROV-TV officials say when the question is posed, adding, "We've tried and tried."

**NEAR 70 PERCENT SATURATION**

Since March WROV-TV has watched the number of UHF installations increase steadily if not spectacularly. By May there were signs of nearly 50 percent UHF saturation in Roanoke TV homes and the figure has been described as approaching 70 percent or even more.

But that's in Roanoke proper, with a population of 91,000 (28,000 families) in 1956. The Roanoke metropolitan area (Roanoke County) has nearly 140,000 people, or 38,000 families.

According to WROV-TV, it can slap a good signal into most of the populous parts of Roanoke County, with an estimated 19,000 homes having UHF equipment.

The station frankly says it is practically blind beyond 12 or 15 miles because Roanoke is nearly surrounded by mountain ranges that overshadow its own 1,750-foot Mill Mountain. The signal sneaks out through some valleys, but unfortunately many of the valleys have their openings turned away from Mill Mountain. Thus WROV-TV says it can't do a good job in Rocky Mount, Bedford or Troutville, for example.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

CANT GET OVER

WROV-TV plants a 2,000 microvolt signal on Catawba Mountain 12 miles away, but simply can't get over it to reach the other side. The signal averages 2,000 microvolts in an 8-mile radius, according to James W. Robertson, chief engineer. Though WROV-TV's 21-slot antenna puts out a signal of 18 kilowatts, the FCC rates it at 9.77 kilowatts because of a 1 degree electrical tilt and 0.3 degree mechanical tilt.

Now take a look at the coverage story of WSLS-TV, with a 2 kilowatt RCA transmitter driving a high-gain antenna radiating a rated 26.2 kilowatt. WSLS-TV's antenna reaches 4,007 feet above sea level compared to 2,000 for WROV-TV. The WSLS mail map shows regular response from such cities as Bristol (125 miles), Richmond (140 miles), Lynchburg (45 miles), Bluefield (70 miles), Henderson, N. C. (120 miles), Danville (60 miles), Beckley (80 miles), Winston-Salem (90 miles) and many other North Carolina cities. The WSLS-TV set count of 87,000 is said to include Bluefield, Lynchburg (which has its own WLVA-TV), Martinsville, Danville, Radford, and Bedford. Its total market adds up to 306,000 families or 1 1/2 million people, according to WSLS-TV.

WSLS-TV RATES UP

Believing it really has 100,000 sets and anticipating a total of 300,000 sets in its area in the not too distant future, WSLS-TV is in the process of revising its rate card upward. It plans a big radio-TV center.

A vicious circle is thus apparent—vicious from the WROV-TV standpoint and a matter of sincere concern to its friendly competitor, WSLS-TV, which wants to see Roanoke become a saturated, satisfied, and competitive television market.

The vicious circle starts at the perimeter mountains whose forested slopes refuse to let channel 27 impulses pass on to the other side. That limits WROV-TV's potential audience roughly to the 35,000 families in the metropolitan area of the country. The circle moves on as WROV-TV faces dealer resistance to the more severe installation problems and customer resistance to paying more for UHF receiving sets plus $30-$50 antennas. Lacking wide coverage, WROV-TV now has only 2 national accounts and 10 local accounts, at least 1 being a stockholder.

CIRCLE CONTINUES

The circle continues as advertisers sponsoring network shows fall to show interest in WROV-TV when they see the WSLS-TV market data. Since WROV-TV has only a few ABC-TV network shows in its log, it can't interest New York timebuyers in buying adjacencies because there aren't any—or at least, only a few.

Now take a look at the WROV-TV financial picture.

FINANCIAL PICTURE

In its first 3 months of operation, WROV-TV took in $15,569 (March $6,829, April $4,771, May $3,969). Its expenses totaled $27,045 (March $9,068, April $8,730, May $9,247).

Just for the sake of argument, project the three-month figures to an annual basis. WROV-TV, then, would show income of $62,276, expenses of $108,180 and loss of $45,904—assuming the last 3 months of the year were like the first 3.

That's enough to scare the financial wits out of the businessmen who have put up the funds to start this electronic operation.

And just for the sake of another argument, take those projected figures and compare them to the estimated income, expenses and construction cost in the early application.

This application carried the following item: Estimated operating cost for first year, $165,504. This is far above the $108,180 figure derived from a projection of WROV-TV's first 3 months.

Then the application carried a second figure: Estimated revenue for first year, $160,000. The 12-month projection of the first 3 months' income falls roughly $100,000 short of this figure.

Enough to pucker any stockholder's brow, especially when it is observed that the third month produced barely five-eighths the revenue taken in the first.
THE LOSS TREND

But what really alarms WROV-TV is the loss trend. March, the first month, was pretty good—$2,238 in the red. That wasn’t bad for a new electronic enterprise. April, however, brought bad news in the form of a $3,920 deficit. And then came May, with a frightening $5,277 loss. That’s red ink at the rate of $63,224 a year, if the figure is multiplied by 12.

Now, WROV-TV admits, June was worse than May and July is more of the same.

In its June 23 petition to FCC, WROV-TV, asking that FCC rules be waived so it could continue operating on channel 27 while applying for channel 7, said: “** if the Commission will not waive the provisions of its temporary processing procedure it (WROV-TV) will relinquish its permit for Channel 27 in order that this application (Channel 7) may be received and processed.”

WROV-TV’S TROUBLES

Citing WROV-TV’s troubles in an accompanying letter, Leo F. Henebry, station president, said the station believed half the sets in the immediate Roanoke area could tune channel 27. Since that time an independent survey has around seven out of every 10 sets can get the WROV-TV picture.

Taking the most recent highest TV saturation figure for Roanoke, 1 out of every 2 homes, WROV-TV would appear to be reaching at least 13,300 homes in the immediate area.

Like the other WROV-AM-TV stockholders, Mr. Henebry is a businessman full of enthusiasm for the market and eager to provide it with a profitable television service.

“My jewelry store in Roanoke has not been off radio a single day in a quarter-century,” he told B-T, recalling he put time signals on WDBJ free when it took the air in 1924. “All of us are Roanoke businessmen. We are really interested in the stations.”

“We had accumulated about $100,000 from radio though we lost heavily when we started in 1946 as the original $75,000 ran up to $130,000.

“We aren’t men who throw money away. Right now we have forgotten profits. We’re fighting for existence. We have more than $250,000 invested. The networks aren’t sympathetic and people who strained to buy TV sets are thinking twice before spending $50 more to get UHF.”

There’s the WROV-TV problem. It shows that a UHF station in the rugged Roanoke terrain can’t compete with a VHF station with better coverage and network programs. After all, when WROV-TV was picking a site it didn’t dare take a chance on putting a costly UHF installation atop a mountain 10 or more miles away when 10 kilowatts UHF amplifiers were over a year away. It feared Roanoke coverage might be inadequate, choosing the safer Mill Mountain instead.

WROV-TV showed business courage when it came out into the open with the facts of UHF service in Roanoke. It knew what Madison Avenue would say. It knew what Roanoke people would say. It knew the legend would be spread that “WROV-TV has given up the ghost” whereas it merely was asking for the right to apply for Channel 7 frequency it had originally sought.

Would high power solve the Roanoke UHF problem? Engineers aren’t giving a definite answer. Even with 100 kilowatts, the signal still would get bumped around and be blind to many areas. People would still have to buy expensive gadgets. There would still be the problem of competing with the WSLS-TV UHF signal and two-network service.

Worst of all, channel 7 will be opened one of these months.

A STEADY MARKET

Roanoke is a steady, dynamic market, third in the State, and has high buying power. The town has adopted television as a medium—not spectacularly because it leans toward the conservative side. People do a lot of viewing. The Times and World-News (WDBJ and applicant for channel 7) print complete logs of both local TV stations plus Richmond, Lynchburg, Huntington, and Greensboro TV stations.

The WSLS-TV basic rate is $300 an hour. WROV-TV has a national rate of $200 and local rate of $140.

Obviously, in Roanoke the program’s the thing. WROV-TV originally envisioned 11 or 12 daily hours of top local programing, a policy that had been
responsible for its success as a local outlet in a market that had two regionals and has recently added a radio daytimer (WRIS). Such an array would require vast sums of money. Live TV and remotes are costly.

What would you do if you were sitting on channel 27 in Roanoke, competing with channel 10 and facing additional channel 7 service?

WJON, THE GRANITE CITY BROADCASTING CO.,
St. Cloud, Minn., April 21, 1954.

Senator Charles E. Potter,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

Dear Senator Potter: In reply to your letter of April 6, 1954:
Enclosed you will find a copy of a letter that we wrote to William P. Massing, acting secretary of the Federal Communications Commission, on December 2, 1953. This letter can best explain the reasons why we gave up channel 7 at St. Cloud, Minn.

If perchance we can be of any further service, please write us.

Yours very truly,

Max H. Lavine.

December 2, 1953.

Mr. William P. Massing,
Acting Secretary, Federal Communications Commission,
Washington 25, D. C.

Dear Sir: We are in receipt of your letter of November 24, 1953, inquiring as to the steps proposed to be taken to meet the recommendation of the Washington Airspace Subcommittee that the tower to be erected at the location specified in the application not exceed 1,449 feet above mean sea level. The limitation in tower height as indicated would not be desirable from our point of view because it would tend to decrease potential coverage and service to the public to a substantially greater degree than we believe feasible for such a proposed operation.

Among other things, we had been giving consideration to the possibility of a higher tower at the present location but that would now seem to be eliminated by the action of the Washington Airspace Subcommittee.

We do not believe that present conditions warrant the substantial expenditure for a different site with additional building costs. In addition, every effort has been made to obtain a network affiliation and none of the networks will agree to an affiliation of any character, except one which would be economically impossible for a station in St. Cloud to support.

Because of the foregoing considerations, it is our present judgment that the outstanding authorization to construct a new TV station on channel 7 at St. Cloud be canceled in order to avoid any further requests for extensions of time to construct and should there be a change in the aforementioned conditions, we would expect to take steps looking to new authorization from the Commission. Therefore, we reluctantly request that the present permit be canceled.

Very truly yours,

Granite City Broadcasting Co.,
By Max H. Lavine, President.

Subscribed and sworn to before me this 2d day of December, 1953.

Violet Lalonde,
Notary Public.

Alexandria, La., April 12, 1954.

Hon. Charles E. Potter,
Washington, D. C.

Dear Sir: I recently returned my construction permit for Channel 62 for Alexandria because I was convinced I would have been unable to operate it at a profit because I would have had to compete with a VHF station which has been granted a permit for local operation. It remains to be seen whether Alexandria offers a large enough trade area for even a single station to be successful financially; and certainly with two stations competing with each other, the UHF station would have very small chance for survival.

Yours truly,

Barnet Brezner.
WCHV, CHARLOTTESVILLE, VA.,
April 12, 1954.

Senator CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

DEAR SIR: Your letter of April 7 has been turned over to me to answer, inasmuch as I was closer to the television problem confronted by radio station WCHV than anyone else concerned.

The reason WCHV returned its construction permit to the FCC for a UHF station on Channel 64 was as follows: At the time WCHV filed, only one station was readily receivable in Charlottesville, and its picture was considered poor in most areas. When our planning had progressed to a point where we were ready to order equipment and start transmission, three things happened almost simultaneously that made UHF, for this area, out of the question. They were:

1. Station WLVA-TV came on the air on Channel 13 with maximum power, broadcasting CBS, ABC, and Du Mont programs;
2. Harrisonburg came on the air on Channel 3, broadcasting programs of all 4 networks;
3. WTVR, Richmond, was granted use of maximum power, broadcasting NBC and kinescopes of the other 3 networks.

In the Charlottesville area, there are approximately 17,000 television sets. With clear reception from three VHF stations offering the best in network production, no way presented itself whereby we could encourage the conversion of those sets to UHF. No network was available to us, and a majority of the film programs available to us were being or had been shown on 1 of the 3 stations listed above.

Our engineers had advised us that coverage on Channel 64 in this mountainous section would be poor at best. This, along with the impossible situation outlined above, prompted us to turn in our construction permit on 64 and start seeking means of obtaining a VHF channel for this area. We are investigating this possibility at the present time.

In the hope that this fully answers your inquiry, and hoping that you will call on us if you require additional information or testimony, I remain

Sincerely yours,

ROBERT WALKER, Manager.

WHITE’S AUTO STORES, INC.,
Wichita Falls, Tex., April 13, 1954.

Hon. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: I have your letter of April 7, and the reason I surrendered my construction permit for a UHF broadcast station was because I was unable to obtain a network affiliation.

As you probably know, the networks will not affiliate with a UHF station if there are VHF channels assigned to that particular market.

Sincerely yours,

W. ERLE WHITE.

THE LAKE ERIE BROADCASTING CO.,
Sandusky, Ohio, April 14, 1954.

Senator CHARLES E. POTTER,
United States Senate,
Washington, D. C.

DEAR SENATOR POTTER: I hope the following information will be helpful to your subcommittee during its investigation into the development and status of UHF television.

The Lake Erie Broadcasting Co. returned its construction permit for the primary reason that thorough study led us to believe that television, especially UHF, was economically unfeasible in a city the size of Sandusky, located in a VHF saturated area as we are. Because of the coverage, the four networks were not interested in affiliation with our proposed station even though special presentations were made in New York in an effort to secure an affiliation. We were firmly convinced, after talking with various industry leaders, that TV is a losing proposition without network affiliation.
However, the basic problem in any advertising medium is circulation. In TV, this means sets capable of receiving UHF. Therefore, I believe that the entire situation could be solved if the manufacturers would produce only all-channel sets then, regardless of the engineering conditions (VHF or UHF) circulation would be assured. As it stands now, a UHF operator must not only face the same problems as a VHF operator, but must carry on a continual fight for set conversion. If every set manufactured had all-channel reception, then the TV fight for audience would be relegated to one of programming, as it should be, and not one of mechanics.

May I add that I do not believe that our situation is a fair reflection of UHF television and I sincerely think our decision would have been the same regardless—a decision reached on an economic and programming basis rather than engineering.

If there is any further information that I can supply to your committee, I will be more than happy to do so.

Cordially,

JAY WAGNER,
President and General Manager.

KRTV, LITTLE ROCK TELECASTERS, INC.,
Little Rock, Ark., April 12, 1954.

DEAR MR. POTTER: In response to your letter of April 6 to Little Rock Telecasters concerning the return of our permit to the Commission, we have forwarded your original letter to Mr. Kenyon Brown, KWPT-TV, Wichita Falls, Tex., who was president of Little Rock Telecasters at the time this action was taken.

Yours very truly,

JOHN H. FUGATE,
Little Rock Manager—KATV.

WHKP,
AMERICAN BROADCASTING CO.,
Hendersonville, N. C., April 14, 1954.

DEAR SIR: In order to give you a brief picture of our reasons for turning in our UHF TV permit, I shall list these in the order of importance in the making of our decision.

(1) Failure to receive any encouragement from any network that they would at this time or in the future be interested in any type of affiliation with the proposed station.

(2) The assignment of additional VHF channels to the area to be served and the granting of same which would make it almost impossible to obtain sufficient conversion of VHF sets to gain any reliable financial support from advertisers.

(3) The poor showing of UHF stations in VHF markets and the subsequent turning in of UHF permits in the face of VHF competition.

The writer, from a considerable study, does not feel that UHF and VHF are comparable and the situation is close akin to the situation that FM radio finds itself in.

If the writer can supply any further information to your subcommittee, he will be happy to do so.

Sincerely yours,

B. M. MIDDLETON, President.
DEAR SENATOR POTTER: This letter is in reply to your dated April 7, 1954, regarding the hearings before the Subcommittee on Communications, United States Senate, Washington, D. C.

Early in 1953 I purchased 100 percent of the stock of KGKL, Inc., a Texas corporation, licensee of Radio Station KGKL and permittee for a proposed television station on VHF channel 3 in San Angelo, Tex.

At the time of my purchase, another group had been granted a television station construction permit on VHF channel 8 in San Angelo.

KGKL, Inc., petitioned the Federal Communications Commission to cancel the channel 3 construction permit. This was necessary because, as sole owner of the company, I was not financially able to build and operate the television station. It was not my desire at the time to seek financial assistance to build and operate a second television station in the San Angelo market.

If I can furnish additional information, I shall be glad to do so.

Sincerely,

LEWIS O. SEIBERT,
Manager, Radio Station KGKL.

SANTA FE, N. MEX., April 13, 1954.

DEAR SENATOR POTTER:

This will acknowledge receipt of your letter of the 7th inst., requesting our reasons for returning to the FCC our construction permit for TV channel No. 2, call letters KTVK, Santa Fe, N. Mex. Briefly they are as follows:

The cost of construction and putting a TV station into operation seemed to us prohibitive, and the investment was too big to operate at a loss for a period of several years. Then, it seemed an impossibility to affiliate our station with either of the major networks. We did not choose to take this risk.

Then the FCC allowed KOB-TV and KGGM-TV, Albuquerque, N. Mex., to construct their transmitting tower atop the Sandia Mountain giving this area two additional stations, namely channels 4 and 7.

Our reasons can briefly be stated that economics and competition caused us to return our permit.

Very truly yours,

GREER & GREER,
By NATHAN C. GREER.

EMPIRE COIL CO., INC.,
New Rochelle, N. Y., April 15, 1954.

DEAR SENATOR POTTER: We have received your letter of April 6th inquiring about our views relative to the major problems concerning UHF.

In our opinion, the problem varies with each set of facts in the different markets, but the primary problem everywhere is the availability to a UHF station of network and other good programing. If satisfactory network programing is not available, people will not spend $50 or more to convert their sets, especially if there are 2 or 3 VHF services available, for the reception of which no conversion expenditure is necessary.

A partial alternative to good network programing would be strong film, local live, and remote pickup features. These, however, involve heavy operating expenditures, and the process of getting conversion is likely to prove much slower. As a result, large losses might be sustained by a station for an indeterminate period of time.

If networks or other strong broadcasters took over some of these UHF stations, I believe they could build them to success.

Yours very cordially,

HERBERT MAYER.
Milwaukee 3, Wis., April 12, 1954.

Senator Charles E. Potter,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

Dear Senator Potter: In response to your letter of April 7, I am attaching herein a copy of the petition for dismissal of our grant on UHF channel 31, addressed to the FCC. This outlines, in detail, our reasons for turning back the grant.

I would like to add one further observation. You cannot, by legislation, force an advertiser to pay too much for his advertising. To attempt to do so would be a repudiation of our way of life.

If an advertiser has available a VHF station covering 600,000 homes and also has available, in the same market, a UHF station covering 200,000 homes; if, as is always the case, the cost per thousand reduces as the circulation increases; that advertiser will buy the VHF station.

By the same token, a network cannot be forced (or should not be forced) to affiliate with a station that technically offers fewer potential listeners because the network, too, if it is to survive, must offer advertisers the most economical purchase available.

I have seen no evidence to indicate that super-power in UHF is economically feasible or that it would make it possible for a UHF station to cover the same number of persons as a competing VHF at the same cost to the advertiser. Nor do I find good reason for expecting consumers to pay a premium for all-channel sets and special receiving antennas.

Perhaps the fault lies in the basic FCC philosophy of mixing VHF and UHF stations in the same market. There may well be a technical reason for this but, from the basis on which your committee is investigating the matter, therein lies the harm.

Sincerely yours,

Jerome Sill, General Manager.

December 1, 1953.

Wm. P. Massing,
Acting Secretary, Federal Communications Commission,
Washington 25, D. C.

Dear Mr. Massing: Cream City Broadcasting Co., Inc., filed its application for construction permit for a commercial television station on UHF channel 31 on November 13, 1952. After considerable delay, the application was granted on August 19, 1953. At the time the application was filed there was only one television station on the air in Milwaukee: WTMJ-TV on VHF channel No. 3. In the Commission's Sixth Report and Order WTMJ-TV was ordered to move to VHF channel No. 4 and the only other commercial television channels allocated to Milwaukee were VHF channel No. 12 and UHF channels Nos. 19, 25, and 31.

Immediately after the Commission granted the application of Cream City Broadcasting Co., Inc., for construction permit on UHF channel 31, we undertook to take the necessary steps looking toward the construction and operation of the station. We paid General Electric a deposit on the UHF television equipment, including the UHF transmitter. We employed Adler Communications Laboratories of New Rochelle, N. Y., to do preliminary work in connection with our UHF installation. We undertook to find additional studio space and commercial lease negotiations for such space. We interviewed several potential key personnel for our UHF station and also negotiated with a number of program sources for film programs. We met with representatives of American Telephone & Telegraph Co., and Wisconsin Telephone Co. to discuss the availability of leased lines and microwave facilities to be used for program originations. Mr. Jerome Sill, our general manager and secretary-treasurer of the company went to New York and negotiated with ABC, CBS, and Du Mont looking toward an affiliation contract for our proposed UHF station and he also discussed with several national sales representatives their availability to represent our proposed UHF station nationally.

On October 8, 1953, the Commission released its proposal to allocate VHF channel 6 to Whitefish Bay in the Milwaukee area. We consulted with our communications attorney and our consulting engineer and were advised that from an engineering and legal point of view the proposal to allocate VHF channel 6 to Whitefish Bay appeared to be feasible. The addition of VHF chan-
channel 6 to the Milwaukee area has changed the entire situation and has caused us to reassess the television situation in Milwaukee.

It was our purpose in filing our application originally to be in a position to render service to the greatest number of persons and we believed then that UHF would be an important factor because it appeared that there would be only two commercial VHF stations. It now appears that since there will be three commercial VHF stations that it will not be possible to carry out our original plans through the medium of UHF television.

A UHF signal can be received by only a fraction of the persons who can receive a VHF signal, because of the physical limitations of UHF propagation and because of the economics involved in attempting to obtain superpower on UHF, even were superpower equipment now available from the equipment manufacturers. Moreover, only a percentage of the families among the 500,000 who now view WTMJ-TV on VHF channel No. 4 could receive a WMIL-TV signal on UHF channel No. 31.

Moreover, the addition of VHF channel No. 6 to the Milwaukee area will, in the opinion of WMIL-TV slow down considerably the conversion to UHF in Milwaukee. Conversion can be accomplished at considerable cost only through the purchase of converters or all-band receivers and special antennas.

There are in excess of 350,000 radio homes within the half-millivolt contour of WMIL. We had hoped to serve through the medium of television as many of these persons as possible with TV. It is apparent that it is not possible to do this on UHF channel No. 31 but it is feasible and possible to do so with a VHF channel. For these reasons, Cream City Broadcasting Co., Inc., has decided to file an application for VHF channel No. 6 and requests that the Commission cancel its outstanding construction permit for UHF channel No. 31.

Very truly yours,

CREAM CITY BROADCASTING CO., INC.,
JEROME SILL, General Manager.

WVJS,
April 14, 1954.

HON. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Interstate and Foreign Commerce Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR POTTER: Thank you for your letter of inquiry concerning our relinquishing of a permit on UHF channel 14.

I quote the following news story which was issued by WVJS on September 18, 1958:

"In action upon WVJS's (Owensboro On The Air, Inc.) petition, the Federal Communications Commission today entered a final order allocating VHF channel 9 to Hatfield, Ind. Immediately following this action by the Commission, WVJS filed application with the FCC for a construction permit for a television station to be operated on channel 9 at Hatfield. In a simultaneous action, WVJS returned to the Federal Communications Commission, the construction permit for UHF channel 14 which it received on August 19 of this year. If no competing application is filed on channel 9 which will throw WVJS into a hearing, it is expected that a construction permit can be granted at an early date and WVJS can begin construction of the new television station in the very near future.

"In a departure from the television field, the Owensboro Publishing Co., publishers of the Owensboro Messenger and Inquirer, the principals of which operate radio station WOMI, withdrew its application for a television station on UHF channel 14 on August 18, 1953."

"This action by the Owensboro Publishing Co. automatically caused the granting of a construction permit on UHF channel 14 to Owensboro On The Air, Inc. (WVJS). Being determined to bring TV to Owensboro, WVJS did not relinquish its application for a permit on UHF channel 14 until favorable action on channel 9 was assured. When the Federal Communications Commission today issued the final order allocating VHF channel 9 to Hatfield, WVJS then relinquished its construction permit on channel 14 in favor of obtaining channel 9 facilities, which it, WVJS was responsible for discovering, and along with the FCC, for obtaining for this locality. Of course, if another application is filed on top of the WVJS application, that will again automatically create a necessity for a hearing before the FCC. This could prolong the bringing of television to the Owensboro vicinity indefinitely."
"Today's action by the FCC on WVJS's petition was taken after many months of work by WVJS, its consulting engineers and attorneys, toward bringing television to the Owensboro area. WVJS first filed for television permit on channel 10 during February 1952, and subsequently amended to channel 14 during April 1952, immediately after the new allocation table was adopted. Two months later, on June 28, the Owensboro Publishing Co. filed for the same channel. This action by the Owensboro Publishing Co. prevented a grant to WVJS and made a comparative hearing mandatory under the Federal Communications Act. If there had been no conflict between these applications, the Commission could have made a grant nearly a year ago, during last September or October, when the city of Owensboro was reached under the Commission's processing procedure.

"Immediately after discovery by WVJS that the action of the Owensboro Publishing Co. had thrown its channel 14 application into hearing status, WVJS instructed its engineering consultants in Washington to institute a search for another possible spot on the spectrum wherein a television station could be placed locally. It was realized by the operators of WVJS that under existing conditions and because of the heavy backlog of applications and hearings facing the FCC, that it would necessarily be a great length of time before the mutually exclusive applications could be resolved in a hearing. The search by WVJS's Washington engineering staff, was rewarded by the discovery that VHF channel 9 could feasibly be placed at Hatfield, Ind., approximately 10 miles northwest of Owensboro. On October 9, 1952, the Federal Communications Commission was petitioned by WVJS to allocate channel 9 to Hatfield, Ind. At that time, the FCC stated that action could not be taken until the expiration of the 1-year allocation rule, which ended on June 3, 1953. A new petition was filed by WVJS on June 3, and in a subsequent action, the FCC initiated rule-making proceedings looking toward the allocation of channel 9 to Hatfield.

"The action taken by the FCC today brought to fruition the work of WVJS and its associates of these past many months in behalf of obtaining a VHF channel for this area. WVJS, in its application for channel 9 asks for 221,000 watts effective radiated power visual and 115,000 watts aural.

The reasons VHF service is preferred by this corporation are: Lack of available sets in this area adjusted to receive UHF television and apparent lack of acceptance of UHF television by advertising agencies and television networks.

I hope this will give you sufficient information concerning our case.

If you need further information from us, please call upon us and we'll be more than glad to supply it.

Sincerely,

MALCOLM GREEP,
Vice President and General Manager.

OLD DOMINION BROADCASTING CORP.,
Lynchburg, Va., April 20, 1954.

Mr. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

DEAR MR. POTTER: In reply to your letter of April 7 requesting information on our reasons for returning the UHF application, I will try to set forth the information you desire. The principal reason could be listed under the general classification of economies. Of course, there enters into the picture the lack of availability of equipment at the original time of the proposed building of the station. In other words, if the equipment had been available, the economic picture might have been different. Just about all of the reasons you set forth in your letter could be taken into consideration. The fact that there is a VHF station competing in the market makes the position of the UHF less tenable in view of the experiences of other UHF stations in similar markets.

I trust this information will satisfy your requirements and sincerely hope you will call on us for any further assistance we may offer.

Sincerely,

CHARLES R. MAILLET,
General Manager.
Hon. Charles E. Potter,  
United States Senate, Washington, D. C.

Dear Senator Potter: In response to your letter of April 7 with respect to the relinquishment of a UHF-TV construction permit and requesting our reasons therefor, we submit the following information.

On February 18, 1953, we were granted a construction permit to operate a TV station on UHF channel 20 at McAllen, Tex., which is one of the principal communities in the lower Rio Grande Valley. At that time a Mexican station was operating on VHF channel 7 at Matamoros, across the border from Brownsville, Tex., also in the lower Rio Grande Valley. Our investigations indicated that there were somewhere between 12,000 and 20,000 television sets in the lower Rio Grande Valley at the time we were authorized our construction permit.

We were aware of the conversion problem for UHF, however, it was our feeling that by installing a maximum operation, both as to power and programing, permitting wide area service to the valley, we would be able to meet this problem, provided we could get on the air before VHF channels 4 and 5, located in the valley, could get on the air. Before the application for reengineering of the proposed station could be granted by the Commission, the applicants on channel 4 resolved their differences and a construction permit was authorized May 21, 1953, on channel 4 in Harlingen, Tex., also in the lower Rio Grande Valley. As a result, it was decided that channel 4 would probably be on the air before we could commence operations and that the set conversion problem would be even more difficult under these circumstances. Accordingly, we decided to relinquish our construction permit and dismiss our application for modification thereof.

Respectfully yours,

Gene L. Cagle.

Senator Charles E. Potter,  
Senate Office Building, Washington, D. C.

Dear Senator Potter: In reply to your communication of April 7 relative to the KIT-TV UHF grant, I should like to submit the following information.

In the early part of December 1952, I received two TV grants at practically the same time, KIT-TV, Yakima, Wash., a UHF assignment, and KMO-TV, Tacoma, Wash., a VHF assignment.

I started construction of the Tacoma grant as quickly as possible but was unable to proceed with the Yakima grant simultaneously because of limitation of manpower, etc. The operation of KMO-TV convinced me that, without a basic or sound supplemental network affiliation whereby the station received compensation, a station will have extreme difficulty in attempting to operate economically and profitably.

A survey of the Yakima market indicated a maximum potential coverage of approximately 40,000 homes with one UHF station already on the air as of July 1953. The National Broadcasting Company submitted as their best affiliation offer a deal whereby KIT-TV must pay $2,500 per month for the microwave line costs and this payment to be credited with what commercial programs were sold on the station at a rate of $150 per hour less their usual multiple discount structure. They did not guarantee a single commercial program nor any sustaining programs. This $2,500-per-month guaranty would buy a lot of film for programing, and I could not see where it was economically feasible to proceed on this basis.

A survey of the economic structure of Yakima further convinced me that local revenue alone could not support 3 radio stations and 2 television stations, and I, therefore, reluctantly requested the cancellation of my UHF grant.

It is my firm conviction that the economic status of all television stations is controlled with a death grip by the major networks. In my opinion, there are only two types of television stations operating in the country today, namely, those which are making a great deal of profit and those which are losing money or at the best approximately breaking even. The networks do not see fit to make supplementary affiliations in secondary markets under which a station
might soundly operate. A classic example is Tacoma, a city whose metropolitan population is in excess of 300,000 according to sales management and is located approximately 30 miles from Seattle, and it does not have either a radio or television network affiliation except KTNT-TV. This latter, I understand, is on interim basis only until Seattle's channel 7 has been definitely assigned. The hilly terrain in this area precludes adequate TV service from Seattle stations, which are limited to a maximum of 1,000 feet above sea level, and yet the networks will not grant supplemental affiliation in Tacoma.

I strongly urge in this investigation that the network effect upon the economic lifeblood of TV stations be thoroughly explored. In the Tacoma case, the Seattle affiliate has a rate of $800 per hour, and the KMO-TV rate is $400 and is gasping for business because of the inability to compete programwise with network stations. This will result inevitably in communities such as Tacoma eventually not having any direct TV service.

Trusting this information may be helpful to you in your investigation, I am

Very truly yours,

K I T, INC.
CARL E. HAYMOND,
President.

WEOK—Mid-Hudson Broadcasters, Inc.,
Poughkeepsie, N. Y., April 16, 1954.

Hon. Charles E. Potter,
Chairman, Subcommittee on Communications U. S. Senate,
Washington, D. C.

DEAR SENATOR POTTER: In reply to your letter of April 7, regarding UHF-TV channel 21, the construction permit for which we finally returned to the Federal Communications Commission, wish to advise our reasons for doing so were as follows:

1. Although Poughkeepsie is approximately 75 miles north of New York City, strong VHF signals from the various New York City stations reach this area perhaps by reason of the open water up the Hudson River, plus a signal bounce from the Palisades, which puts an unusually good VHF signal in this vicinity. There is roughly a 76-percent VHF saturation of homes already in this area equipped to receive the New York City stations with antennas beamed to the top of the Empire State Building. Local residents are satisfied with the VHF reception they are now getting from New York City and judging from a general survey amongst potential UHF viewers their reaction unanimously indicated they would not consider the bother or expenditure to convert their present sets or antennas. This situation existed even before the New York City VHF stations increased their power.

2. Preliminary discussions with several of the networks also indicated a lack of interest in giving us an affiliation due undoubtedly to the fact they too realized the situation described above.

3. Since our area is located in very hilly terrain it was apparent we needed as strong a signal as possible and at the time of our interest in proceeding with our construction permit the manufacturers were not in production on sufficiently high powered transmitting equipment.

4. Due also to the terrain it became a "must" that we have as high a transmitting site as possible. We were frustrated in our several attempts to establish a suitable location by a series of rejections by the Civil Aeronautics Authorities, one of which came several months after an original approval. In summary, it seemed impractical at the time to rush into such a costly venture until the atmosphere cleared and at least some of the existing problems were straightened out.

Sincerely yours,

Arthur J. Barry,
President, Mid-Hudson Broadcasters, Inc.
HON. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: I have your letter of April 7, 1954, inquiring as to the reason why the Brockway Co. returned to the Commission its construction permit for UHF Station WWNY-TV, Watertown, N. Y.

In the television allocation proceeding our company requested the Federal Communications Commission to allocate a VHF channel to Watertown in order that we might render the widest possible coverage to the rural areas in Jefferson and surrounding counties of northern New York without other television service. However, because of insufficient mileage separations, the Commission found it impossible to allocate a VHF frequency to Watertown and instead allocated UHF channel 48, for which we then applied and received a construction permit.

Subsequently, due to a change in Canadian VHF allocations, the Commission on its own motion proposed to allocate VHF channel 7 to Carthage, N. Y., a community located approximately 15 miles from Watertown in Jefferson County. The Brockway Co. supported this proposed allocation which was made final. Thereupon we filed an application for channel 7 in Carthage and upon its grant, returned for cancellation our WWNY-TV permit in order to avoid conflict with the rules prohibiting ownership by one group of two television stations serving substantially the same area.

With the transmitter site of our channel 7 station WCNY-TV located between Watertown and Carthage, we will be able to render primary service to both of these communities, as well as render a very good service to areas of northern New York without any other service. As you may know, on VHF it is possible to render wider coverage than of UHF and at less cost.

I have enjoyed the manner in which you have conducted yourself and directed your interests on the Senate permanent committee on investigations. You have shown a commendable discernment with respect to fairness and breadth that attests to your experience and belief in the American system.

With best wishes, I am,
Sincerely yours,

JOHN B. JOHNSON,
President and Treasurer.

WFTM—STANDARD TOBACCO CO., INC.,
Maysville, Ky., April 15, 1954.

HON. CHARLES E. POTTER,
United States Senate, Senate Office Building,
Washington, D. C.

DEAR SENATOR POTTER: Our reasons for returning the construction permit granted to the Blue Grass Television Co. by the Federal Communications Commission were as follows:
1. The aversion of the general public to spend additional money to convert their sets to receive UHF.
2. The inability to get firm commitments for network service.
3. The inadequacy of the 5-kilowatt UHF transmitter.

Along with the three major points as outlined above, there were several minor facts that governed our decision to return our construction permit to the Federal Communications Commission. All things taken into consideration, it added up to be an unsound economical venture.

Due to the facts outlined above, we have also asked the Federal Communications Commission to dismiss the application of WFTM-TV without prejudice.

Sincerely yours,

BLUE GRASS TELEVISION CO.,
J. W. BETTS, General Manager.
Hon. Charles E. Potter,
Chairman, Subcommittee on Communications, United States Senate,
Capitol Building, Washington, D. C.

DEAR SENATOR POTTER: I have been away from the office for several days and this is my first opportunity to reply to your letter directed to T. E. Allen & Sons, Inc., at Durham, N. C.

I am answering this letter because our company owned 50 percent of the T. E. Allen & Sons, Inc. company and by mutual consent, we were charged with the responsibility of constructing and operating the station at Durham.

We returned the permit for channel 46 at Durham, as indicated by the records at the FCC, and I will attempt to explain to you as briefly as possible why we took this action.

As will be shown by the application we filed with the Commission and on the basis on which the grant was issued, we were certainly well financed and the permit was not returned because of lack of funds.

Insofar as availability of equipment, we were assured by RCA they could deliver equipment to us by August or September of 1953. Basically, the permit was returned because we felt we could not obtain permanent network service. We were informed we could obtain the services of the top networks but that, as soon as the VHF channels were granted, we would in all probability lose this service.

Another important factor in our decision was the experience of the operation here at Winston-Salem where our station has been on the air since September 1953.

Our experience here indicates a number of factors which make it extremely difficult for a UHF station to compete with a VHF station. Some of these are as follows:

1. The converters and strips that are used to adapt existing sets to UHF channels are grossly inferior and in a vast number of instances are so unsatisfactory as to be useless. We receive hundreds of complaints from the American public who have gone out and purchased this equipment only to find that it is not satisfactory.

2. In the sale of new receivers, the manufacturer charges a higher price which in turn is passed on to the consumer and the public becomes very reluctant to spend an additional $20 to $50 more in order to receive a single UHF station.

3. Because of the inefficient converters and also the resistance to converting to the UHF channels we, of course, do not have the circulation or potential audience that the VHF stations have. As a result, the advertisers are reluctant to buy time on the UHF station. Surprising enough, this is not true here in our home town, where the advertiser is close to the situation and knows exactly what the station is doing. Here in our own market, we outsell the VHF station by a considerable margin. However, the national advertising agencies who place advertising dollars for nationally advertised products have apparently decided they will not buy UHF stations under any conditions.

4. The RCA 1-kilowatt transmitter we are using does not supply the coverage we expected from it. As a result, the signal strength is so low both in our own city and within a few miles of our transmitter that, even with a converter that works satisfactorily, we do not have sufficient signal strength to provide a television picture. When we move out from our city for a distance of 20 to 25 miles from the transmitter, our signal strength falls off so rapidly that it is absolutely unsatisfactory. We can in no way compete with the VHF signal. This is a situation we cannot correct because RCA does not have the equipment available. When the equipment does become available it is priced so high that it costs considerably more for a UHF station to operate with less power than it does a VHF station.

In view of the factors listed above which we experienced in the Winston-Salem station, we concluded that the difficulty of undertaking a UHF station in the Durham market was overwhelming and we requested the Federal Communications Commission to cancel our construction permit.

In addition to the permit at Durham, we also hold a construction permit for channel 29 at Richmond, Va., and it probably will be necessary for us to cancel that one also for the same reason.

I hope this information will be helpful to you.

Very truly yours,

John G. Johnson,
General Manager.
Hon. Charles E. Potter
Chairman, Subcommittee on Communications,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: I have just returned to my office after an absence of several days and this is my first opportunity to thank you for the courtesies extended me on my recent visit.

I thoroughly enjoyed my meeting and talk with both you and your counsel, Mr. Zapple.

We called a meeting of more than 20 UHF stations in Washington on last Monday and over a period of some 18 hours, we thoroughly explored this UHF problem.

We retained legal and engineering counsel to work with the stations in preparing and coordinating a presentation for your committee hearing. We believe this is the sensible approach and will give your committee the full benefit of all the information and suggestions at our command.

There is one factor I think should be particularly brought out during the hearing. This is the present survey being conducted by the Federal Communications Commission into the economic status of UHF stations. As outlined to you and Mr. Zapple, the problem exists only in the mixed markets where UHF and VHF channels are in competition.

We found at our meeting, there are some UHF stations in mixed markets which are presently faring reasonably well but in each instance, the station was frank to admit that just as soon as the additional VHF channels assigned to their markets go on the air, the UHF station will automatically lose its network service, as well as most of its business. This means the Federal Communications Commission survey may be, to a certain extent, misleading because these particular stations will show a healthy situation today but will probably be in desperate financial condition in the near future. I refer here specifically to such markets as Buffalo, New York, St. Louis (Belleville, Ill.), and there are others which are in the same condition.

I merely wanted to bring this out because I think the survey is based upon conditions as they exist now, whereas, these conditions will be considerably changed as soon as all the VHF stations have been granted and begin operation. To this extent, this survey may be misleading.

Again, I wish to thank you for the courtesies extended to me on my recent visit with you.

Sincerely,

JOHN G. JOHNSON,
General Manager.

GORDON ALLEN & ASSOCIATES,
Salem, Ore., April 14, 1954.

Senator Charles E. Potter
Senate Office Building, Washington, D. C.

DEAR SENATOR: Thanks a lot for your inquiry on the FCC's handling of the UHF-TV problem. First let me say that these are the remarks of a young broadcaster of 34 who is a graduate engineer.

In Oregon, the FCC's channel assignments in the Willamette Valley were such as to preclude any UHF development in this area. There were 2 educational VHF's assigned where one would have covered the valley and then the bulk of the assignments in the populated areas down the valley from Portland were all UHF's with the exception of 1 VHF in Salem and Eugene and none in the Lebanon, Albany, Corvallis area (95,000 population).

Under these conditions and with the high cost of UHF equipment, a conversion problem, and network's hatred of UHF I see no possibility of a competitive TV situation in the Willamette Valley in Oregon.

The low-cost operation of local UHF or even VHF here in Salem is out of the question. I feel that the FCC's proposed minimum of UHF transmitter power of 5 kilowatts so as to get the same coverage that a 1/2 kilowatt VHF transmitter would give is a perfect example that to make UHF work technically one has to have 10 times the power at twice the cost or more.

If the same FCC engineer that is recommending this had had the least bit of commercial sales experience on the street he would have known how stupidly impractical this proposal is. We would have to get 95 percent of our small
market TV revenue locally and yet the lowest cost equipment and best coverage is being denied to small markets where low cost operation is a must!

I know of no small market VHF or UHF operation west of the Mississippi that compares with the same comparable investment in AM radio as far as a good business venture is concerned.

Part of the trouble is this "pie in the sky" attitude of the FCC.

Now, as far as UHF in Eugene where I dropped my CI—with a VHF grant there to a consolidated group with a logger mainly picking up the tab, I felt that a broadcaster looking to go into a business venture could not possibly compete with a conversion problem and without any type of network income.

The powerful VHF station in Eugene gets to Salem (about 75 miles). My little UHF percolator would get about half way here and the dealers can't sell all channel sets. (Because of low profit margins in TV set they cut the cost by selling the cheaper VHF sets.) Portland also has a UHF conversion problem even tho it is a pioneer UHF area because of strip tuners and then Sackett's second UHF station is still broadcasting to a primary VHF-set area. I am sure he'll tell you some of these same things.

So, as far as allocations go there is no possibility for TV competition here in the Willamette Valley.

The FCC's allocation of channels is a burden on small markets because instead of permitting a fellow to go on the air with low-cost equipment built around the kernel of a low cost 1/2 kilowatt VHF transmitter they have put the premium on costly power and necessity for conversion of sets already manufactured.

Then, a rebuttal would be "well, if you haven't the money don't go into the TV business." This doesn't hold because it isn't good business, unless one is in the field of broadcasting just to be broadcasting. Commercial broadcasting is a business and when a fair profit can't be made then the business is impractical.

I maintain that UHF-TV is impractical in Oregon for a number of reasons, one major reason being the allocation plan of the FCC allowing no chance for a low-cost competitive TV operation of let's say 500 watts VHF in the three population centers of Salem, Lebanon-Albany-Corbaullis and Eugene Springfield.

High programing costs and network's desire to reach only major markets are other factors. The advertising dollar is sliced so thin that actually most retail accounts are relieved when they don't have to consider buying TV.

Under these conditions the 5-year freeze and the theoretical allocation of nationwide TV channels was just a pipedream of a group of engineers who obviously never sold a dollar's worth of advertising time in their lives. And I speak from the standpoint of one who is an engineer himself. The freeze was a fiasco and the allocation plan in Oregon worse. These are my feelings.

Very truly yours,

W. Gordon Allen.

St. Louis, Mo., April 20, 1954.

Sen. HARRY TENENBAUM.

Chairman, Subcommittee on Communications,
Senate Office Building, Washington, D. C.

Dear Senator Potter: Thank you for your letter of the 10th advising of the change of dates for the scheduled UHF hearings. I will definitely attend these hearings on the dates scheduled.

It has only been a very short time since my recent visit with you. However, within that period 1 of the 3 UHF stations here (KACY) has gone off the air, and the examiner for the FCC has recommended approval of a VHF grant on channel 4. This further jeopardizes the position of UHF in this market. Already the expectation of channel 4 coming on the air has lead the advertisers to immediately cancel shows and time on our station.

Thank you ever so much for your kindness in writing me.

Sincerely yours,
Hon. Charles E. Potter,  
United States Senator,  
Senate Office Building, Washington, D. C.

Dear Senator Potter: In response to your letter of April 7 inquiring as to the reasons for our surrender of the construction permit for our Kansas City UHF station, we are pleased to forward the complete file of the material which we assembled in connection with the surrender. As you can see from that file, the reasons had a base in virtually all of the suggestions made in your letter. The file contains:

1. Copy of a letter to the Federal Communications Commission from Dr. Du Mont, announcing the decision to surrender.
2. Copy of a letter from Dr. Du Mont to all television broadcasters.
3. Summary of reports (from our surveyors and staff) concerning KCTY, Kansas City.
4. Copy of a letter from Mr. Bergmann, director of our broadcasting division, to advertising agencies and advertisers.
5. Copy of a letter from Mr. Bergmann to Du Mont network affiliates.
6. Copy of a memorandum of information on the subject.

I hope the information contained in this file will be of help to you and your committee.

Sincerely yours,

Keeton Arnett,  
General Assistant to the President.

Allen B. Du Mont Laboratories, Inc.,  
Clifton, N. J., April 14, 1954.

Subject: KCTY, Kansas City,  
Federal Communications Commission,  
Washington, D. C.

(Attention: Hon. Rosel H. Hyde, Chairman.)

Gentlemen: It is with reluctance that we must notify you of the intention to close our UHF Television Station KCTY in Kansas City.

When upon short notice we took over the operation of this station from Empire Coil Co. at the end of 1953, we had hoped that the additional impetus of backing by Allen B. Du Mont Laboratories, Inc., with its receiver manufacturing and distribution, its transmitter manufacturing both in VHF and UHF fields, and its extensive television broadcasting operations would provide a more favorable possibility of eventually creating a successful operation of this ultrahigh frequency station in Kansas City. We immediately set out to make a detailed survey of the entire situation in Kansas City. This survey reveals a very discouraging situation, perhaps peculiar to Kansas City, but nevertheless conclusive as to its indication that we must forego further effort toward continued operation of this station.

In brief, operation of KCTY in Kansas City is an unsound business risk under the present circumstances. Our survey reveals the following pertinent factors:

There exists very stiff competition from the three VHF channels 4, 5, and 9 (dual operation) currently operating in Kansas City and the fourth VHF channel 2 in nearby St. Joseph, Mo. For successful competition the present technical facilities of KCTY would require extensive further capital investment to permit moving of the UHF station to the center of the area served and the equipping of facilities to permit extensive local program operations.

An extended period of operation with its consequent costs would be required before there would be even a possibility of reaching a break-even point. Such interim operation would be required so as to encourage the expansion of adequate UHF receiving facilities into the majority of the homes in Kansas City. Presently only a token quantity of the homes are properly equipped with necessary outside antenna facilities to provide good quality UHF performance.
Only when extensive circulation has been achieved would there be the possibility of advertiser support of an operation to a degree which would make the station profitable. These obstacles appear so severe a financial problem that we are forced to conclude that it is impractical to continue KCTY at this time in Kansas City.

We feel, however, that UHF television operations can and probably will prove to be quite successful in certain other areas where a more favorable combination of circumstances can be anticipated.

We contemplate that the programing will be terminated on or about February 28, 1954.

Soon thereafter, we expect to relinquish the formal construction permit and special temporary authorization papers to the Federal Communications Commission, the specific form of tender to be contingent somewhat upon disposition plans for the station's equipment which are currently being determined.

Respectfully yours,

ALLEN B. DU MONT, President.

ALLEN B. DU MONT LABORATORIES, INC.,

To All Television Broadcasters:

DEAR SIR: Sound business judgment forces us to the conclusion and decision that we should terminate television broadcast service to the Kansas City area from KCTY (channel 25) on February 28.

As one associated with television broadcasting, you may be interested in the conditions surrounding our original acquisition of the station and the reasons governing our present decision to terminate operations.

In the closing hours of 1953, it became apparent that KCTY was in a precarious position and was in imminent danger of being forced to close down. In the interest of maintaining UHF service in Kansas City while a complete survey of all of the factors contributing to the economic difficulties of the station could be completed, we seized this opportunity to study its problems at first hand. By doing so, we not only acquired knowledge and experience, but were able to extend the period of service to the few in Kansas City who had equipped their sets to receive a UHF signal.

During the time we have operated the station, we have conducted extensive and intensive studies of the local problem. These studies have embraced the fields of economics, civic characteristics, programing, television trade problems, competition, and propagation. We utilized the best-trained personnel and specialists in each field which were at our command.

The reports they made and our careful analyses add up to these conclusions:

1. Nearly all viewers of the Kansas City area, with nearly 400,000 VHF receivers, are content with their choice of programs from three VHF stations which they are equipped to receive.

2. Programs from all four networks (including Du Mont) are received in the Kansas City area on VHF receivers.

3. Nearly all viewers, due to the aforementioned freedom of choice, are reluctant to spend additional sums of money for equipment necessary to receive service from channel 25.

4. Due to the transmitter location several miles outside of Kansas City, outdoor antennas are required to receive the channel 25 signal in most of the service area. Resistance to the use of outdoor antennas appears to be more pronounced than in any other area of which we have knowledge.

5. The VHF services which are available to local advertisers to reach large established audiences appear to be in excess of demand for their use.

6. The operation of UHF broadcasting service in Kansas City faces problems of a local nature not common to all other markets.

7. The opportunity for a fair return on money invested to overcome those problems is not present.

As you can see, our action at KCTY is predicated on circumstances applicable to that area.

We, at Du Mont, will continue our development, design, and production of transmitting equipment for television broadcast stations throughout the television band. We believe the ultimate goal of nationwide television service can be obtained successfully only through VHF and UHF.
We are providing you with a summary of reports our personnel made, as a means of highlighting the abnormal situation in Kansas City and to offer information and conclusions which may be helpful to you.

Sincerely yours,

ALLEN B. DU MONT, President.

SUMMARY OF REPORTS CONCERNING KCTY, KANSAS CITY

I. Technical considerations

(1) Transmitting equipment: KCTY operates with an ERP of 20 kilowatts, the three local VHF stations with ERP’s ranging from 30 kilowatts to 100 kilowatts. A fourth VHF station located at St. Joseph operates with an ERP of 52 kilowatts.

(2) Transmitter location: KCTY transmits from a location approximately 10 miles southwest of the center of Kansas City. The three local VHF stations transmit from locations very close to the center of the city.

(3) Receiving equipment: Not more than 7 percent of the Kansas City population is equipped to receive a satisfactory signal from KCTY, whereas 78 percent of the population is equipped to receive satisfactory signals from the three VHF stations.

(4) Nature of the service area: The rolling nature of the terrain in the area further discriminates against the reception of satisfactory UHF signals, compared to VHF reception.

(5) Aversion to outdoor antennas: Since the inception of television in Kansas City in 1949, a very strong local anti-outdoor-antenna campaign has been in effect. This campaign has been more detrimental to UHF than VHF because the UHF field is considerably weaker than the VHF field.

(6) UHF signal strength: The survey group found through measurements that adequate signal strength exists over substantially the entire metropolitan area of Kansas City to permit satisfactory reception of KCTY providing good UHF installation practices, including an outdoor antenna, are employed.

II. Economic considerations

(1) Competitive VHF stations: There are 3 VHF stations operating in Kansas City, plus a fourth VHF station in St. Joseph, less than 50 miles distant, all 4 providing service to Kansas City.

(2) UHF conversion problem: It has proven very difficult to convince the television viewer that he should make a conversion investment of from $50 to $100 merely to receive a fifth television channel. As noted above, after 8 months of operation, only 3 percent of the television owners have seen fit to make the conversion.

(3) Programing: The 4 VHF stations carry most principal programs of the 4 major networks. Hence, except for locally-originated programs, KCTY could only duplicate some of the programs already available.

(4) Station revenue: Due to the very limited audience, it has proven extremely difficult to persuade advertisers, either locally or nationally, to utilize the facilities of KCTY.

In evaluating the size of the investment required to make KCTY competitive in all phases of its operation, against the probable ultimate earning capacity of the station, it can only be concluded that such an investment is economically unsound.

It should be emphasized that the items listed above are peculiar to, and apply specifically to, the Kansas City market. As is well known, UHF broadcasting is operating very successfully in many parts of the country, where conditions are more favorable.

We, at DuMont, are firmly convinced of the long-term need and the ultimate success of UHF broadcasting. We are backing this conviction with the resources of all the divisions of the laboratories, including research, manufacturing, and broadcasting.
Letter to Advertising Agencies and Advertisers From Ted Bergmann

Personalized letter printed on Du Mont television network stationery

February 13, 1954.

Dear ———;

Perhaps you missed the announcement, issued back in the Christmas holidays, of Du Mont's purchase of Station KCTY in Kansas City. I certainly can't expect that you will remain long unaware of our decision to suspend that operation on February 28. It was my feeling that you as a buyer of advertising are entitled to all the facts leading to that decision.

We took over in Kansas City on the very eve of a scheduled surrender of its license, to avert, if possible, loss of service to our network clients already using the station, a lessened availability of programing to viewers in that area and the possibility of inferences being drawn—however mistakenly—of a failure chargeable to the shortcomings peculiar to the ultrahigh frequency bands.

In the 6 weeks since that time, we have invested many man-hours of study and thousands of dollars in surveys. We have analyzed advertising support at both network and local levels, listening habits in the whole Kansas City area, the competitive situation and the public attitude.

We are now convinced that neither the viewers interest nor the future of UHF would be served by perpetuating, under the spotlight of publicity, an operation which through a combination of conditions applicable only to this market and situation cannot be justified as either investment or public service.

Chief among those obstacles are a low rate of set conversion and the public's reluctance, under pressure of a civic campaign, to mount outdoor antennas capable of delivering a channel 25 signal to the great majority of homes. The availability of ample television programing from three existing VHF channels within the market and a fourth with substantial penetration from nearby St. Joseph, assures both Du Mont advertisers and the viewing public of adequate continuing service in this important area.

The Du Mont position with respect to UHF remains unchanged, and is in no way involved in our decision. It is our continuing belief that United States television cannot furnish advertisers and set owners a truly national and competitive service without the utilization of the ultrahigh frequency.

We hope by our action in Kansas City to help, rather than hinder, this vitally important development.

Sincerely,

Ted Bergmann.

Letter to Du Mont Affiliates From Ted Bergmann

Personalized letter printed on Du Mont television network stationery

February 13, 1954.

Dear ———;

You have probably read in the trade press the announcement that Du Mont is ending its operation of KCTY in Kansas City, and surrendering the CP and STA for the station, effective February 28. We believe, as a Du Mont affiliate, you are entitled to an explanation of our action in this situation.

We took over KCTY on the very eve of a scheduled surrender of its license, on literally less than 48 hours' notice. We did this to avert a precipitated loss of service to our clients using the station, to prevent a lessening of programing service to viewers in that area, and to prevent any inferences being drawn, however mistakenly, of failure chargeable to any alleged shortcomings of UHF.

In the six weeks since that time, we have invested many man-hours of study and thousands of dollars in surveys. We have analyzed advertising support at both network and local levels, listening habits in the whole Kansas City area, the competitive situation and the public attitude.

As a result of these studies, we are now convinced that neither the viewer interest nor the future of UHF will be served by perpetuating a situation which, due to a combination of conditions peculiar to this market, cannot be justified either as an investment or as a public service.

Chief among these obstacles are a low rate of set conversion and the public's reluctance, under pressure of a civic campaign, to mount outdoor antennas capable of delivering a satisfactory signal. To overcome this obstacle would entail moving the present channel 25 transmitter to a completely new location,
with greatly increased power, and with proportionately great additional investments. From a sound business viewpoint, taking into consideration the three TV services which now exist locally and the one additional service which has substantial penetration from nearby St. Joseph, such additional major expenditures to bring KCTY up into a competitive position just could not be justified.

The Du Mont position with respect to UHF remains unchanged and is in no way involved in our decision. It is our continuing belief that United States television cannot furnish advertisers and set owners a truly national and competitive service without the utilization of the ultrahigh frequencies.

We hope by our action in Kansas City to help, rather than hinder, this vitally important development.

Sincerely:

TED BERGMANN.

MEMORANDUM OF INFORMATION

TELEVISION STATION KCTY, CHANNEL 25, KANSAS CITY, MO.

On December 31, 1953, Allen B. DuMont Laboratories, Inc., purchased television station KCTY, channel 25, a UHF station, in Kansas City, Mo., from the Empire City Co.

HISTORY OF KCTY

Television station KCTY has been on the air since June of 1953. The owner was the Empire City Co., operator of the first commercial UHF station, in Portland, Oreg. When KCTY made its debut, there was but one other station operating in Kansas City, prefreeze WDAF-TV, channel 4. At the time the station began operations, it appeared there would be no other television station competition in Kansas City, for some time, as other applicants for VHF channels seemed to be headed for time-consuming hearings before the FCC. This situation changed quickly as a result of mergers and drop-outs, and KCTY soon found itself competing with three Kansas City VHF stations plus an additional VHF station in nearby St. Joseph, Mo. Despite intense promotion and the expenditure of a great deal of money, the station owners were faced with the prospect of continuing heavy losses. At the time of the transfer to Du Mont it is estimated that $750,000 had been expended on behalf of KCTY in equipment and operating losses. The station was offered for sale and termination of operations was threatened.

(For use on or after 6:30 p.m., e. s. t., February 12, 1954)

CIRCUMSTANCES OF TRANSFER TO DU MONT

In the closing hours of 1953, the suggestion of effecting a transfer to Du Mont was first made by the Empire City Co., with the intimation that the station would be closed and its assets liquidated if the transfer were not completed on December 31.

In the interest of television broadcasting, Du Mont felt that an assessment of the situation should be made to see whether this UHF service could be salvaged.

There was not sufficient time to collect comprehensive facts and data about KCTY, the Kansas City market, or the competitive situation. Nevertheless, Du Mont agreed to the transfer so that service could be continued while a thorough analysis of the problem was made. There were two alternatives: Allow the station to go out of existence immediately, or agree to take it over, hoping that a thorough analysis of the facts would show a means for its permanent operation.

COMPREHENSIVE SURVEY IS MADE

Immediately after the transfer, Du Mont dispatched to Kansas City a team of experts in station operation, propagation, service, programing, advertising, and economics. Their purpose was to collect facts and thoroughly analyze the Kansas City situation so that Du Mont could determine its future course.

An exhaustive study of all findings revealed that continuation of television broadcasting by KCTY would be economically unsound.
THE TELEVISION BROADCASTING AT KCTY TO BE DISCONTINUED

The only possible sound decision for Du Mont to make as a result of this survey was to discontinue service from KCTY and to liquidate the station's assets. The station, therefore, will cease operation on February 28, 1954. The station's employees have been notified that the station will close.

THE ECONOMICS OF UHF IN KANSAS CITY

Du Mont Laboratories is sensitive to the fact that 2 of every 3 possible allocations for television stations are in the UHF portion of the spectrum. It realizes that a competitive television system on a national basis is dependent upon financially successful UHF operations. As a network broadcaster—as the pioneer company in television—as a leading supporter of UHF broadcasting, Du Mont is aware of the need to ascertain the strength and weakness of problems confronting UHF broadcasters. Du Mont's surveys show that problems local to Kansas City render UHF operation there uneconomical at this time.

Signal reception

Station KCTY uses a 1-kilowatt transmitter with its antenna located 10 1/4 miles from the center of the city. Acceptable signals are received in most of the metropolitan area by those receivers that have correctly installed outdoor UHF antennas.

Antennas

An important factor in Kansas City which makes it a difficult area for UHF television is the aversion of the public to outdoor antennas. This is the outgrowth of an inspired program to develop civic pride, which is manifested in this way to a greater extent than is generally the case.

Signals from four VHF stations can be received in Kansas City with varying reception quality on indoor antennas. UHF signals on channel 25 are received in only one section of the city with indoor antennas. UHF, in most instances, must have correctly installed outdoor antennas.

Set conversion

Dependent upon what survey is used as the basis for figures, the number of sets with capabilities to receive UHF are 50,000 or 58,000. However, a realistic appraisal of those receivers which can actually receive the channel 25 signal in a satisfactory manner is but a few thousand. With outside antennas numbering less than 5 percent of the homes (25,200), UHF outside antennas do not number more than 1 out of each 20 outside installations or a total of 1,250.

Cost factors

There is in Kansas City a situation in which the consumer has been educated against outdoor antennas and is able to receive signals from four VHF stations without taking on the extra cost of an antenna installation. Add to this the uncertainty generated by the advent of color television, and we find that the average consumer in Kansas City is buying television without incurring the added expense necessary to receive channel 25.

Competing stations

In addition to channel 25, the Kansas City area is presently served by station WDAF-TV, channel 4, which presents local and NBC programs. It is served by station KCNO-TV, channel 5, which presents local and ABC programs. It is served by station KMBC-TV, and WHB-TV, channel 9, on a share-time basis which present local and CBS programs. The area gets further service on VHF from station KFEQ-TV, channel 2, in nearby St. Joseph, Mo., which presents Du Mont programs and CBS programs. The Kansas City area is receiving very complete service on four different VHF channels with presentation of both national and local programs. Consumers in the area, because of factors mentioned above, show little inclination to spend the necessary money or to change their thinking about antennas in order to receive a fifth service.

DU MONT AND UHF

The rate of receiver conversions to UHF in other markets appears to be ahead of the rate of conversions in Kansas City, because of the peculiar local factors mentioned. Many UHF stations are currently operating at a profit and many others are approaching the break-even point. There is a direct relationship
between the success of a UHF station and the extent of established VHF competition. In Kansas City, the competing services number four.

The company believes that the Kansas City area is not a true proving ground for development of UHF possibilities. It believes, however, that UHF television operations can and will prove to be successful in other areas where a more favorable combination of circumstances can be anticipated.

Du Mont will continue to develop, design and produce UHF broadcasting and receiving equipment for use in achievement of a national competitive television system.

---

ASSOCIATION OF TELEVISION SERVICE COMPANIES,
St. Louis, Mo., April 20, 1954.

Hon. CHARLES POTTER,
Senate Office Building, Washington, D. C.

DEAR SIR: We in St. Louis view with considerable concern the future of UHF television in St. Louis in particular, and all over the country in general.

UHF channels 14, 30, 36, 42, and 54 have been assigned to the Greater St. Louis area but as of now, 30 and 42, because of the economic aspect, have not been fit to go on the air. Channel 14 went off the air a couple of weeks ago and are perhaps insolvent. The channel 14 situation is a result of their inability to obtain and televise network programs.

It appears now that channel 4 (UHF) will be on the air very shortly. It is the consensus here that this would mean the end of UHF in this area and the resulting effect of relegating approximately $25 million in UHF equipment to the scrap heap. There are about $15 million in UHF converters, new sets and aerials in the hands of the public, about $7,500,000 in the stocks of retail dealers and wholesale distributors, and about $2,500,000 invested in the 3 UHF transmitters here.

The public did not complain too strongly when FM radio died here, but if the above mentioned UHF tragedy occurs here, it would not only make it impossible to sell the public any new radio or television ideas, but may ruin financially many places of business depending on television for their income.

Something must be done immediately by the FCC to prevent the failure of the UHF system. Keeping new VHF stations off the air in UHF areas until UHF is firmly established is one answer. Another is granting network programs to UHF stations. Although CBS has no basic TV affiliate in this area, channel 14 was unsuccessful in getting any CBS programs. Had they obtained CBS programs, we are convinced they would be successfully operating today.

Can you do something to prevent a "$25 million UHF bust" in St. Louis? Time is of the essence! May we have your thought on what can be done and when it will be done?

Very truly yours,

VINCENT J. LUTZ, President.

Senator Potter. In addition, I want to incorporate into the record at this point the letters and telegrams that have been received from various parties who are unable to testify here as witnesses.

(The material referred to is as follows:)

KXLF—PACIFIC NORTHWEST BROADCASTERS,

Senator CHARLES E. POTTER,
Senate Office Building,
Washington, D. C.

DEAR SENATOR POTTER: I wish it was possible for me to attend the hearing but I am having a problem with UHF. UHF is definitely a problem child, but so is television in small markets such as we have in Montana. VHF is not doing so well in some of these small markets. When you finish your UHF hearing you may want to find a way to assure the people in small markets of continued television and of television comparable to that supplied the people in metropolitan areas.

When program costs are several times that of what we can sell our station time for, we approach the same problem that the UHF boys have, and someone may have to look around to try to find out what the answers are going to be before too many of these small market stations pass by the board.

Sincerely yours,

ED CRANEY.
Senator Charles S. Potter,

United States Senate, Washington, D.C.:

Local situation typical plight UHF stations over nation. WCOC-TV, channel 30, on air with very latest GE equipment with 252,000 watts. WTOK-TV, channel 11, on air with second-hand equipment and 31,200 watts. Stations located side by side highest point all this area. Antennas equal height—maximum allowed by CAA. WCOC-AM on air since 1926 and Mississippi first station. Operated 5,000 watts power day and 1,000 watts night on 910 kilocycles and has long record outstanding public service. Has been CBS radio affiliate 18 years.

WTOK-AM on air 1946 and operates 250 watts on 1450 kilocycles. Despite these conditions WTOK-TV has all four networks, although we made strenuous efforts to obtain network affiliation. This precludes our selling many national and regional spot accounts, as they require network stations. Greatly appreciate your efforts in behalf UHF and urgently ask that early action be taken to bring assistance to stations facing this almost unsurmountable handicap. To have all sets all channel would also be great aid.

Best regards:

WITHERS GAVIN,  
Manager WCOC-TV.

Senator Potter,  
Senate Communications Subcommittee, Washington, D.C.:

Understand your committee considering new TV freeze. Which will further delay start of the only VHF station within 100 miles of this city. We believe further delay is unfair and unjustifiable.

GORDON DUNN,  
Mayor, City of Fresno.

Hon. Charles Potter,  
Senate Office Building, Washington, D.C.

Dear Sir: First let me thank you for your interest in the problems facing UHF stations today, I was hoping that the Federal Communications Commission would do something to remedy the defects of their sixth report, to date no changes or recommendations have been made.

Most of the UHF stations are at present, operating with large losses and cannot continue under these conditions. This comes about from the fact that the station cannot secure revenue from advertisers if there is a VHF station in the area.

A UHF station cannot compete the VHF, this is due to the difference in coverage, inefficient operation of the UHF equipment and lack of development in tubes and items operating in the UHF band. Even if the tubes were developed, they would cost more to operate and again, could not compete with VHF.

I feel that it was the duty of the Commission to allocate a television band for this service instead of three, by using one band for television, the manufacturer would have less problems in designing equipment and antennas, also, the one band would equalize the facilities and competition would then be based on a program basis which I believe is the way it should be.

In view of the above, I think that there should be no mixture of UHF and VHF in the same markets. That there should be an immediate freeze to further study the situation and that network contracts should be investigated to determine a fair arrangement with regards to programs and revenue.

I am familiar with many UHF operations and have based the above on my experience, I tried to be as brief as I could yet give you the important points. Should you be interested in a complete evaluation giving facts, experience and etc., I would be only to glad to cooperate.

Respectfully yours,

Jack Siegel,  
Radio Engineer.
Senator Charles E. Potter.

United States Senate, Washington, D. C.

Dear Senator Potter: On the basis of the sixth report on final television allocations, our company invested a large sum of money, as well as time and effort, in the construction of a UHF station in Ann Arbor. WPAG-TV was the first UHF station on the air in Michigan, beginning operation in April 1953.

We have made a sincere effort to make the station serve the needs of the community. A service that no other TV station is able to perform and a service that this community can receive only under a competitive TV system.

Our entire effort is in jeopardy at the present time by two actions of the FCC. One was allowing VHF stations to go to superpower before UHF stations were underway. With Detroit and its three VHF stations 40 miles east of us, this resulted in the refusal on the part of the three major networks to feed programs to our station, even at the request of sponsors. Even programs that our station has been willing to carry at no charge to the sponsor or network have been refused by the networks. In addition, one Detroit station has attempted to influence film distributors to refuse sale of films to us, because of the Detroit stations' coverage of this market. This, in spite of the fact that Detroit and Ann Arbor are two separate markets, 40 miles apart.

The second action of the FCC, threatening the existence of UHF, is the juggling of the VHF portion of the sixth report by the FCC. I refer specifically to Jackson, Mich., 38 miles to the west of Ann Arbor. A UHF channel was assigned to Jackson, under the sixth report, and a grant was made. Before construction of the station was started, the FCC began consideration of a change in allocation to assign VHF channel No. 10 to that area. Now it has been allocated to that area and the UHF grantee returned his grant to the FCC. There will undoubtedly be a long hearing on the channel No. 10 grant, and the Jackson area, which would have had local TV service last year, will not have it for some time. UHF is dead in Jackson, and if and when the VHF station is granted there, our UHF station in Ann Arbor will be encircled by VHF stations.

Many advertisers appear so certain that UHF is doomed that they refuse to consider the use of a UHF station, regardless of individual conditions. The door is closed on any consideration of an individual station’s merits, merely because it is UHF.

This condition is increasing and I believe it will spell the end of UHF unless drastic action is taken immediately. Any long drawn-out consideration of the problem will probably result in the closing of many UHF stations. I thereby urge that a halt be called at once to any further action by the FCC in all but those markets where there is no TV service whatsoever, and that consideration be given to reduction in power of superpowered VHF stations. The present trend in VHF power will lead to domination of television by a few.

Such an action would inspire UHF station operators to continue the battle and would result in renewal of interest in UHF on the part of advertisers, networks, and equipment manufacturers. Only by the establishment of many stations across the country can people have a worthwhile television system. Domination of television by a few stations will not serve the public interest.

Very truly yours,

Edward F. Baughn,
Vice president and General Manager.

Hon. Charles E. Potter,

United States Senator,

Washington, D. C.: 

Urge immediate freeze of all TV applications until UHF-VHF problems can be studied and reasonable solution of TV allocations can be realized.

VAN C. COOK.
Hon. Ed. C. Johnson,
Senate Office Building,
Washington, D. C.

Dear Sir: I would like to commend you upon your untiring efforts in trying to keep monopoly out of radio and television fields.

We are the permittees of a UHF station, channel 39, here in Allentown, Pa. At the present time we are not on the air, but hope to be some time this summer or early fall. The present wave of cancellations of UHF grants can certainly upset one's thinking.

We feel that the Allentown-Bethlehem-Easton area is an individual metropolitan section in itself and that in the long run its people, schools, and businessmen need the advantages of television. At present there is 1 station in Bethlehem, which is connected with NBC-TV Network, and 1 in Easton, which is connected with ABC-TV and Dumont networks. So we naturally thought that our connection would be with CBS-TV. However, when we came to talk to CBS-TV about the situation we were told that they believed that WCAU-TV in Philadelphia covered the area. This has been proven through engineering surveys not to be true.

However, they do send in a picture here. If you live by the FCC standards the picture is not a good picture, in fact it is nowhere near noise free. We even appealed to the head of the engineering department at WCAU-TV to give us the green light to get CBS-TV Network. However, we ran into the old radio claims that they were selling the coverage of Allentown and Bethlehem to their national advertisers and, therefore, they did not want to be surrounded by smaller CBS-TV stations. This was approximately the gist of the conversation.

Consequently, it looks like Allentown (a town with 160,000 population) will have UHF stations too, but on an independent basis. We would not feel too bad facing the prospect of losing money if the UHF equipment, such as transmitters, had the same penetrating qualities as the VHF, and if the cost of operation was not so rough as it is in UHF. Add to that the lack of sensitivity in receivers and you can possibly have trouble.

At the present time there is one CBS-UHF located in Reading, Pa., which does not have a good signal in the Allentown-Bethlehem-Easton area. However, the thing that we cannot understand is why Reading should get CBS-TV Network, but Allentown-Bethlehem market (which is a bigger market) is frozen out.

In other letters we are urging other Senators to cooperate with you in your investigations.

Again I want to say thank you, for a job well done.

Sincerely,

QUEEN CITY TELEVISION Co., Inc.
O. R. Davies, Manager.

GRANCO PRODUCTS, Inc.,
Long Island City, N. Y., May 5, 1954.

This is a confirmation of a telegram sent May 4, 1954.

Hon. Charles Potter,
Chairman, Communications Subcommittee of the Senate Interstate Commerce Committee,
Washington, D. C.

My dear Senator: I am taking the liberty of writing to you with regard to the pending ultrahigh frequency television hearings scheduled to be held by your subcommittee. As the head of a small company, whose entire commercial life has been devoted to the development, manufacture and sales of ultrahigh frequency equipment, I feel that immediate steps should be taken to do everything possible to strengthen and improve ultrahigh frequency television service, and dispel the atmosphere of gloom and pessimism which is growing within the industry. Because of my close association with the UHF market, I have been able to observe the rapid and steady growth of this service from its inception by the Federal Communications Commission, and have also seen a recent alarming tendency to falter and deteriorate because of both economic and technical reasons. This tendency can be halted if serious measures are taken to eliminate the many unfair competitive practices which face the ultrahigh frequency television stations throughout the country.
Specifically it is my belief that there are three primary causes for the lack of success of many of these UHF stations. First is the practice of permitting a single television station to monopolize all of the desirable network programs channeled into many reception areas serviced by-both a VHF and UHF station. In effect, this gives the established VHF station priority of choice over all desirable programs and leaves only left-overs for the weaker UHF station. By keeping these good network programs from UHF stations most of the incentive on the part of the public to receive these stations is eliminated. It appears to me that the only real solution to this problem is to eliminate this monopoly and enforce competition by a permanent equitable division of network programs among all stations both VHF and UHF, competing for the same market. Once such a division has been made the UHF stations can securely build a loyal viewing audience based upon good programming.

Another of the practices which has caused considerable trouble among UHF stations is that of allocating a new VHF channel in their primary service area. While there is no doubt that these stations are desirable and must be assigned eventually to these areas, any assignment following so soon after a UHF station has gone on the air serves only to multiply the technical and economic problems of the UHF station. In many cases these problems have resulted in the bankruptcy or near bankruptcy of these stations. If it is the intent of your committee and the Federal Communications Commission to foster the development of UHF television service, it would appear that a delay in the granting of VHF construction permits in UHF service areas should be given serious consideration. Such a delay of possibly 1 year would permit the UHF stations to solve many technical problems which face them in obtaining reliable coverage of their service areas, as well as the economic problems of building a viewing audience and obtaining advertising income. They would then be in a much better position to compete directly with any VHF competition which at present starts with all the odds in its favor.

Another serious problem which continuously faces an established UHF station is the recent trend among VHF stations toward increasing their transmitting power. In many cases this has resulted in the introduction of unforeseen competition from stations which normally have never satisfactorily penetrated into the UHF service areas. While I realize that such power increases are desirable and necessary, I feel that the timing is wrong. Again I urge that these power increases be delayed to permit the UHF service to strengthen itself before exposing it to the overwhelming competition of strong long-established VHF stations.

There are undoubtedly many other problems which your committee will uncover during this hearing; however, it is my belief that most of these are characteristic of any pioneering effort to establish a new service or industry. The industry has demonstrated its willingness to assume great risks and overcome many technical obstacles which were anticipated. However, it is unfair to expect it to cope with the problems outlined above. Your hearings coming at this time can serve as a much needed “shot in the arm” by first uncovering the facts and then demonstrating its serious intention to do everything in its power to aid the industry. This would restore the confidence of all of the many companies and individuals who are devoting their time and money toward building a strong and reliable national television service. It would be foolhardy at this time, after encouraging the industry to make such a large investment in ultra-high-frequency television, to force this service to get along on its own resources. We must recognize that it is still in its infancy and repeated aid and encouragement will be necessary before it can stand on its own feet and provide a complete nationwide television service equal to radio broadcasting.

Very truly yours,

Henry Fogel, President.

Hon. Charles A. Potter,
United States Senate, Chairman,
Subcommittee on Communications, Washington, D. C.

Dear Senator Potter: Thank you for your reply of April 30 to my letter of April 27, 1954. You asked for material or data that would be helpful to the committee.

I enclose herewith a recent Videodex Research survey taken from April 1-15 showing the comparative reception in the 9 primary counties receiving our sig-
nal. Note that WICS, channel 20, heads the list of stations in the percent of all TV homes in those counties receiving various channels. This was a considerable increase over the last Videodex report taken the 1st of January. As I told you in my last letter, we have about 95 percent conversion in our home county.

I do hope that this will give you an indication of the ability of a UHF operation to do a community job. Thank you for your consideration.

Sincerely yours,

Milton D. Friedland, General Manager

Springfield, Ill.

WICS, test pattern, September 17, 1953; began programming, September 30, 1953.

Hon. Charles A. Potter, United States Senate, Washington, D.C.

Dear Senator Potter: Station WICS, channel 20, operating out of the State capital market of Springfield, Ill., is indeed concerned with the trend of UHF television development and particularly with the pending hearings before your subcommittee of the Senate Interstate and Foreign Commerce Committee next week in Washington.

We wish to join with the numerous UHF stations in respectfully requesting favorable consideration of the UHF problem and in urging action to alleviate the mounting seriousness of the problem with positive action in the near future.

WICS is extremely interested in an equalization of facilities between UHF and VHF, particularly in markets such as ours. We would like to go on record as favoring one class of service. For your information, WICS is the only UHF station in Springfield, Ill. We have been on the air since September 30, 1953. We are not in distress but rather have enjoyed a steady increase in our business since our inception. Fortunately, we are in flat terrain and therefore have no physical barriers to the penetration of our signal and also are in an enviable position with respect to conversions to UHF. At this writing we have approximately 95 percent conversion in our home base. The potential looks good.

However, there is an application for a VHF channel 2 contested by 2 competitive radio stations, one a CBS affiliate and the other an NBC radio affiliate. We currently have a primary optional affiliation with NBC and secondary affiliations with both Du Mont and ABC. Needless to tell you, we do not have a firm contract with any of the networks, although we would very much prefer to have a firm 2-year affiliation with NBC. It is obvious that the networks are awaiting dispositions of the grant of channel 2 in our market before committing themselves to any definite firm contracts with our UHF operation, despite the fact that we are doing
a fine job of serving the diversified interests in this community composed of commerce, agriculture, industry, and government.

This is one of our problems, Senator Potter; namely, one of basic insecurity with network affiliations for the future. In addition the network picture is complicated further by the fact that VHF channel 3 operating out of Champaign, Ill., on a regional-concept basis covering a large area with its full power and close to 1,000-foot tower, definitely hurting UHF stations in Danville, Bloomington, and Decatur, as I understand it. Fortunately for us they have been unable to sell local advertisers in our market but without a doubt WCIA channel 3 in Champaign is definitely hindering us from obtaining a number of national network programs and spot business with their claims that they are covering our area. It wouldn't be too bad if they only had a CBS network affiliation, but they managed to get an NBC affiliation as well and have obtained and are continuing to obtain NBC clients to our detriment.

I wish to emphasize that where a UHF station is first in the market, such as in our case, it can develop television for that market and serve the community interests to the utmost if it is not impeded by a VHF competitor attracting strong networks and the national revenue necessary to a successful operation. As long as a feeling prevails among the large advertising agencies, and this feeling evidently does exist, that UHF generally is inferior to VHF, then the UHF station has a tremendous uphill fight on its hands against unfair odds. A UHF station can operate successfully if allowed to compete in a market with another UHF station, and particularly without the competition of a powerful VHF outlet situated in an area of relatively small population yet serving a large region.

Although the position of WICS channel 20 Springfield is now very good, we cannot point to the future with stability without a firm network affiliation with a strong network that affords top network programming. And without a doubt the public wants to see the popular network shows, of course, combined with good local programing; but a station must be able to offer strong network shows.

In conclusion, it is my opinion that immediate action must be taken to protect the UHF stations in their growth to achieve stability. Toward that end I feel that one class of service would be highly desirable. I look forward with great interest to the scheduled hearings and do hope that constructive action in favor of UHF telecasting materializes from them.

Yours very truly,

MILTON D. FRIEDELAND, General Manager.

WRITTEN STATEMENT OF ANDREW G. HALEY OF THE LAW FIRM OF HALEY, DOTT & SCHELLENBERG, WASHINGTON 6, D. C., ON BEHALF OF VARIOUS TELEVISION STATIONS AND APPLICANTS ON THE JOHNSON BILL, S. 3065

As I understand the announcement of the hearing, the only formal legislation definitely to be considered is S. 3065, a bill introduced by Senator Johnson of Colorado to regulate multiple ownership of television broadcast stations. On May 13, 1954, Senator Bricker introduced S. 3456, a bill which would empower the Federal Communications Commission to regulate radio and television networks. This bill may also be considered by the subcommittee, but because of the recent date of filing and the great importance of the measure, I am not prepared in this brief statement to submit comments thereon.

I understand that this hearing is to be vitally concerned with gathering and assimilating facts for the guidance of the subcommittee and of the Federal Communications Commission. It seems to me that the great body of facts so carefully and laboriously gathered, assembled and considered by the Commission in the hearings, which formed the basis for its sixth report and order, should not be lost sight of and, in fact, should be available in a convenient form for the members of this subcommittee. Accordingly, I submit as appendix I to this statement a compilation of the data on utilization of the VHF band for televi-
sion considered by the Federal Communications Commission in acting upon and
promulgating its sixth report and order in the matter of the amendment of
section 3.606, etc., and, as appendix II, the data on the same subject with refer-
ence to the utilization of the UHF band, similarly considered by the Federal
Communications Commission. The data submitted in these appendixes cover
the statements made by witnesses who appeared and who voiced significant
opinions—the brief condensations cover thousands of pages of record, but I most
sincerely believe that every important opinion and fact is set forth therein.

The most casual reading of appendixes I and II will reveal that practically
every problem that now exists was anticipated and considered during hearings
before the Federal Communications Commission and numerous solutions to the
problems were suggested. The value of these compilations, to my mind, repose
in the proposition that the committee will immediately have in a condensed form
the facts heretofore considered by the Commission so that the committee will
be able immediately to give its attention to new facts and new solutions, com-
bining the wisdom of the past with the thinking of the present in the most
convenient manner.

And now I will touch for a moment on the basic problem, namely, the preserva-
tion of UHF televising. This is a matter of supreme importance in the field of
mass dissemination of intelligence and entertainment, as the utilization of the
UHF spectrum is essential to a nationwide, competitive, television broadcasting
system. The subcommittee will hear facts, opinions and proposed solutions from
many competent persons, and we will limit observations to the following four
points:

We are of the view that the problems of UHF televising would be significantly
aided by the Commission relaxing its policy imposing severe limitations on
television-station operated microwave relay links, so that network or multiple
station program service could be transmitted to the users quicker and on a
much cheaper basis than is now afforded by the great common carriers.

We believe that the Commission should authorize booster or satellite stations
to penetrate blank spots in authorized UHF coverage areas.

We are of the view, without commenting on the wisdom of regulating the
number of stations that any party may own, that UHF television would be
aided by any regulation such as was proposed by the Federal Communications
Commission in its proposed rulemaking of December 23, 1953, or as is proposed
by Senator Johnson in S. 3005. In brief, any regulation that would give UHF
a premium position, is of necessity good for UHF.

Finally, we believe that Senator Johnson's proposed measure to eliminate the
10 percent excise tax on UHF receiving sets and components, is a very practical
step in aiding UHF circulation.

APPENDIX I

A COMPILATION OF DATA ON UTILIZATION OF THE VHF BAND FOR TELEVISION
CONSIDERED BY THE FEDERAL COMMUNICATIONS COMMISSION IN ACTING UPON
AND PROMULGATING ITS SIXTH REPORT AND ORDER IN THE MATTER OF THE AMEN-
DMENT OF SECTION 3.606 OF THE COMMISSION'S RULES, ETC. (FREQUENCY ALLOCA-
TIONS FOR TELEVISION BROADCAST STATIONS)

INTRODUCTION

The Commission has before it extensive testimony in dockets 8739, 8975, and
9175 on standards and allocations in the VHF band. Of particular importance
are the general comments submitted at the hearings on July 26-28, 1948, on the
proposed revised allocation plan of May 6, 1948; the testimony submitted at the
September 13-14, 1948 conference with industry; the testimony submitted at the
November 30-December 3, 1948 engineering conferences; and the report of the
Ad Hoc Committee, released by the Commission on June 8, 1948.

The testimony in the above records has been analyzed and classified into the
subjects to which it is directed, i.e., tropospheric effects, terrain effects, syn-
chronization, directional antennas, etc., and the annexes attached thereto have
been prepared on each of the subjects. In addition to the testimony of record,
an annex has also been prepared on reported experiences of record in the use
of carrier offset as a means of reducing interference between stations. Analyses
have also been made (annexes S and T) of pending applications and authorized
stations (as of June 17, 1949) in terms of height and power requested and
assigned.
Adair (consulting engineer)

"In its original allocation report the Commission proposed the assignment of four channels to an area in order to permit assignment of a reasonable number to the smaller cities and to maintain a mileage separation which provide service to adjoining rural areas. The demands of the larger cities caused the Commission to change the number to seven. This required that either the smaller cities be denied television facilities or that service of each station be severely restricted. In general both of these undesirable conditions resulted. At the time of the allocation the Commission indicated this was a temporary allocation and recognized that tropospheric propagation would at times cause interference (and service) considerably beyond that indicated by the Commission's curves. While there is considerably more quantitative data available now, in my mind it merely substantiates the order of interference which was originally expected.

"In my opinion, the present concern over tropospheric effects has arisen more because of a somewhat changed viewpoint as to the meaning of the allocation than to any startling discoveries as to tropospheric propagation" (Tr. 1705-1706).

"The original concept of the tables of the allocation of channels was a guide to facilitate the selection of channels and to provide for an orderly allocation in so far as possible. It was expected that there would be changes and that the gaps would fill in as the need developed and applications were made, each application being considered on its merits.

"If I understand the present concept the allocation is considered as fixed and changeable only by an administrative hearing which has permitted a great emphasis to be placed on tropospheric effects and which at this date if applied would be almost a reversal of policy and would deny many areas of service" (Tr. 1706-1707).

"In 1945 when we had this problem we faced the same thing. In fact, the figures we have been kicking around for the last 3 days are almost exactly the ones that were kicked around in 1945 at which time the Commission backed the proposition that more stations were more desirable than the extended service. We are now attempting to back up on that. I don't know which is the best in the long run, but there is some balance in there" (Tr. C-285-286).

Du Mont (Du Mont)

"* * * in our experience we find that the present allocations in our estimation have worked out quite satisfactorily" (Tr. 1856).

"The one thing that bothers us more than anything else is the ability of the present number of channels to really provide a nationwide service" (Tr. 1857).

"We have come to the conclusion that now is about the time to consider a different allocation scheme than we have at the present time utilizing the VHF frequencies for some of the bad spots in our present allocation picture. The VHF frequencies would be retained pretty largely as they are except in these bad areas" (Tr. 1857).

"The particular spots that we consider bad in the present allocation plan of course are the allocations of less than 150 miles" (Tr. 1857).

"To give you an example of our thinking, such cities as Bridgeport, Waterbury, Hartford, Springfield, Worcester and Providence have very few channels assigned to them. With the congestion in that particular area under our present scheme very little relief can be expected. In addition to that if these stations go ahead on the present channels you may run into some interference problems.

"There are other areas where this same thing applies. For instance, out in the area around Canton, Youngstown, and that general area" (tr. 1858).

"We have found that it is very difficult in a town with a single television station, or even two, to create real interest, and also to supply a real public service to those people. They desire to have a choice of programs and I feel that at least four channels should be available in all these cities" (tr. 1858).

"Mr. Cortone, in reference to your proposal for allocation of channels on the VHF, proposed allocation, you feel that the Commission should get back to the minimum 150-mile separation co- and 70 adjacent channel, as I understand your testimony?"
“The Witness. I would like to see the minimum of 150, and would like to see that spread as far as you can past that point where you can do it without causing conflict. The 75, I am not so worried about. I think you may be able to shade that. Seventy-five is certainly a good working distance. But that isn’t as serious as the cochannel” (tr. 1866).

Guy (TBA)

“TBA is of the opinion that when our present standards were adopted, namely, 75 miles adjacent channel separation and 150 miles cochannel separation, that a better job was done than some people now seem to think. And TBA recommends that the Communications Commission proceed to allocate or make grants on the basis of these standards without waiting. We feel that if we were to start right now from scratch without any precedent to dwarf or affect our thinking, we would probably come up with standards that were very much like that. We see no need to withhold grants in which those separations are maintained” (tr. 1785).

Jett (WMAR-TV)

“Commissioner Sterling. Mr. Jett, do you recall the considerations which led to the choice of the 5 millivolt protected contour of television stations?

“The Witness. Yes, I was on the Commission at the time and, as I said in my statement, there were only a few thousand receivers in service and a very few television stations on the air. We had just come out of a long, hard war, and there was very little experience. We called hearings, and because of the scarcity of channels—that is, the relatively few channels—it was felt that we would have to crowd stations in television more than might otherwise be desired. I do not believe, however, that anyone at that time realized that the actual standards would deprive certain metropolitan areas of coverage of the entire area” (tr. 1618).

Lodge (CBS)

“I believe, however, that the difference between the amount of interference that was anticipated when the present allocation plan was devised and that which will result when tropospheric transmission makes itself felt in actual operation will be much less than assumed by many here and that the net service will still be good for a large percentage within range of the station” (tr. 1819–1820).

Popple (TBA)

“In the discussion of modifications and additions to section 3.606, table showing allocation of television channels to metropolitan districts in the United States, proposed by the Commission on May 6, 1948, and the proposals by others, I believe it would be advantageous to review the television allocations by going back as far as 1944. On March 27, 1944, committee 4 of panel 6 of RTPB approved a subcommittee report No. 2, entitled ‘Suggested TV Allocations in the VHF Portion of the Spectrum.’ This report was subsequently approved by panel 6 and submitted to the Federal Communications Commission as an exhibit in Docket 6651. This report showed the number of stations that could be obtained if some 26 channels were made available for television broadcasting. It further showed where these stations might be assigned. The placement of cochannel stations was based upon a minimum separation of about 170 miles and of adjacent channel station separations in the order of 80 miles. At that time there was practically no measured data available on groundwave transmission nor was there any information available on tropospheric transmission. The performance of television sets, when they would again be made—the war was still in progress—was a matter of conjecture. Thus, there was no way of accurately ascertaining the service areas which these stations might have when they were limited by interference from other television stations. A study made at that time indicated that any substantial increase of these separations for cochannel and adjacent channel stations would require a considerable increase in the number of channels necessary to provide the facilities in the same cities. “The Commission, in its report of allocations from 25,000 kilocycles to 30,000,000 kilocycles, dated May 25, 1943, set up 13 television channels, below 300 megacycles. On September 22, 1945, the Commission proposed rules and regulations including a table of allocations of television channels to metropolitan districts in the United States. The cochannel separation of stations within this table was also in the order of 170 miles. Principally, since these proposed allocations provided for only four stations in the New York metropolitan area, they were objected to by TBA and others. Television Broadcasters Association showed that substantially the same number of stations could be accommodated in the bands assigned and
that New York could have seven stations if directional antennas were employed to serve some of the smaller markets. The Commission agreed that New York should have seven stations but was unwilling at that time to require directional antennas for television stations. Instead, the Commission, in a report on November 21, 1945, established an allocation table in which some of the cochannel separations were decreased and community stations were permitted on channels 2 to 13 in addition to channel 1. This table provided assignments only for cities within areas defined as metropolitan districts by the United States census.

"As I have mentioned above, the early allocation plans were formulated upon cochannel separations in the order of 170 miles. In these plans, only the large cities comprising metropolitan districts were considered. While there were considerable differences in the sizes of service areas necessary to cover these different metropolitan districts, it did not seem feasible in the early plans to differentiate between them. There should be considerable study devoted to the merit of equal treatment of many individual assignments when these assignments are the cause of substantial interference to other stations" (tr. 1420-1426).

ANNEX B. AN ALLOCATION PLAN BASED ON A PROTECTED AREA RATHER THAN A PROTECTED CONTOUR

Allen (FOC)

"That procedure would involve, as I see it, something of a departure from previous concepts of what a service area ought to be. It seems to me we have been thinking in terms of service up to the 500-microvolt or the 5,000-microvolt contour whereas the needs of the community might not agree with the 5,000-microvolt contour at all, it might be a trade area, or something of that nature, so that the Commission would say that this trade area has a community of interest with this trading center in this town, and he would have to put a certain signal over this area. Once you get 1 millivolt, say, at the edge of the trading area, immediately, and I believe the Commission has in a few cases expressed it, we want to protect the 1-millivolt contour all around here, not because it has any community of interest with this trading area, but it is a usable signal; so it would seem that some different approach to the type of service to be protected would be involved in this case" (tr. C-158-159).

Jett (WMAR-TV)

"The point marked 'X' is the southermost boundary of the Baltimore metropolitan area, and it was my thought that a metropolitan station should be protected throughout its metropolitan area. Therefore, if a contour circle were drawn from that point marked 'X,' which would include all of our metropolitan area, and some of nearby contiguous rural areas, then we would ask for protection to the 1,000 microvolts per meter (tr. 1726-1727).

"Secondly, I recommended that the Commission call an engineering conference with a view to revising the rules and standards on the basis of sound engineering principles, and I pointed out that such a conference may possibly recommend one type of standard for a particular region and a different type of standard for another region. For example, FM stations in area I are protected to their 1,000-microvolts-per-meter contour, where in others it may be protected to its 50-microvolts-per-meter contour" (tr. 1728).

Kear (ABC)

"Inasmuch as our study has disclosed means whereby the effect of tropospheric propagation may be reduced within the present framework of section 3.606, we are making recommendations of a general nature which we believe are not only valuable in the particular instances which we have used for demonstration purposes, but also will aid Commission consideration of the final form of section 3.606 as revised on the basis of this hearing (tr. 1335-1336).

"* * * the American Broadcasting Co. recommends and strongly urges that the following steps be taken prior to the approval of a revised section 3.606 of the Commission's rules:

"(1) The charts of appendix V should be prepared and released and their use should be made mandatory in computing interference. At the same time a formula should be added to the standards whereby the summation effect of two or more interfering signals can be computed.

"(2) Section 3.604 (b) should be revised so as to eliminate reference to protection to any specified contour. Likewise, section 3.606 (b) should be revised so as to eliminate all reference to definite distance separations.

"There is a very good reason for that. In the standard broadcast band we talked about contours, 5 millivolts per meter and 2 millivolts per meter contours,
with a fair degree of assurance. It was something we could tie down, measure, and determine, and if a person bought a receiver in the standard broadcast band, and put an antenna up, he could receive a certain signal and we could tell him just about what sort of signal he would receive.

"Such is not the case in the television band. ** the actual meaning of \( \text{mv/m} \) is very vague and any reference to contours, protected contours, in terms of millivolts per meter tends to become meaningless. Likewise, in connection with the distance separation table our experience in the standard band indicated, I believe, that it was far more satisfactory to protect areas on the basis of actual interference computations rather than on the basis of distance separations **.

"(3) Since in section 3.606 the FCC has undertaken to specify the cities in which television stations can be located, they should also specify in connection with each city the area which a television station located in this city is intended to serve. This can be, for example, on the basis of the trading area for rural stations, the metropolitan district for metropolitan stations, and the immediate community for community stations. Other definitions can be established but care should be taken to avoid specifying any field intensity contour as the boundary of service. The area to be served should be determined by geographical or economic features, not by the artificial means of field intensity contour.

"(4) Having decided upon the areas and populations which should receive service and having supplied the missing portions of the Standards of Good Engineering Practice, the Commission should then reanalyze the existing section 3.606 to determine to what extent the allocation outlined therein will provide the intended service to the desired areas and populations. Where it is found that on the basis of the standards, the interference-free contour of the station contemplated in 3.606 does not extend to the boundary of the area which must be served, steps should be taken to revise the allocation to afford the additional required protection. In many cases, this can be done by regulating and limiting the permissible radiated power. For example, a station required to serve the Chicago area would probably require greater radiated power than one serving the metropolitan district of Grand Rapids. It is probable that adjustment of power will not solve all of the interference problems. In such cases the FCC should notify the station or stations involved that at such time as directional antennas have been shown to be feasible and economically practical, they will be required to directionize to the extent necessary to afford the requisite protection to the other station or stations involved. In many cases the geographical distribution is such that reasonable directionization, together with proper adjustments, will be able to effect a highly satisfactory degree of mutual protection, thereby insuring interference-free service to the area set forth in section 3.606.

"(5) When this realization has been completed the Commission should next examine the presently proposed revision of section 3.606 to determine what portions of this revised section could be adopted without introducing additional interference to the stations designated in the present 3.606. Here again judicious choice of radiated power and the specification of directional antennas as needed will no doubt enable many of the proposed additional allocations to be included in a revised 3.606, such revision being based upon adequate protection to the desired service areas with the protection being computed on the basis of the revised Standards of Good Engineering Practice hereinbefore referred to.

"(6) The recommendations of paragraphs (1) to (5), inclusive, having been adopted by proper legal procedure, additional proposals from the industry may be considered. Consideration should be given to these only when such proposals meet the requirements of paragraphs (a) and (b) of section 3.606 of the rules as revised ** *(Tr. 1350-1355).

"Mr. Cottone:

"QUESTION. Dr. Kear, I take it that your basis for determining allocations would be entirely different from that which has been followed by the Commission in the past, namely, the protected service contour and specifying a specific service area that is based upon the normally protected contour. Am I correct in so interpreting your testimony?

"ANSWER. Yes, sir; if you mean in speaking of a normally protected contour assigning it any particular value, like 5 millivolts and 2 millivolts, since as I pointed out at these high frequencies the value of a contour ceases to have a great deal of meaning **.

"QUESTION. How would you deal with the situation where you have licensed a station, let's say in New York, on a particular channel, and presumably you license it to serve the metropolitan district of New York, or some other specified area, and you have a subsequent request in another community, let's say for the purpose of the Illustration Albany, where the only available channel may be
one already assigned to New York. What standard would you have the Commission follow under those conditions?

"ANSWER. * * * I would say that the applicant for a station in Albany would be required to restrict the power radiated in the direction of New York that the contour of the New York station which surrounded the metropolitan district was not interfered with. In his case it would be the region nearest him. So it would be the contour at the normal metropolitan district that would be required to be protected.

"QUESTION. Even though the use of that channel in Albany, taking Albany as an example, might not result in service to the Albany metropolitan district?

"ANSWER. Well, that again would be, then, a matter for the Commission to decide as they decided in the cases of interference in the standard band. Frequently they decided additional service warranted a grant even though some interference was created. But as far as the relative merits, it would be consideration on the basis of the degree of protection afforded this metropolitan district, which presumably would be interference free" (tr. 1369-1364).

Wilmotte (consulting engineer)

"The next question is service. Well, if an operator is asked to serve a certain town I think it would be possible to put a certain line around that town and say whatever you do you have got to give good service inside of that line, and by good service we mean good service, and you can define a very good service. The question is something up to the operator to extend as far as he can, provided in so doing he does not cause more interference than he is permitted in his license" (tr. C-157).

"Well, I agree that the remarks made just now, and the remarks I am making now, are in complete variance to the thinking that has been going on in the Commission and the engineering division since early 19—the early 1930's—but I have never been sympathetic with that type of thinking, I have great difficulty in believing that the public interest is connected with the millivolt contours. It is my very strong feeling that that concept has done serious damage to the regular broadcast band and I hope it can be dropped before these new bands are completely jammed up. I think that the economic, social and geographical problems are the dominant problems from the public service angle, and that the engineers, including the Commission engineers, of course, but basically, more basically the engineers connected with the designing of stations or a system, should be given a degree of responsibility to fit their millivolts to the economic requirements, rather than to try to make the economic requirements fit the millivolts" (tr. C-159).

ANNEX C. THE CONTOUR TO WHICH PROTECTION SHOULD BE AFFORDED

Goldsmith (DuMont)

"The methods of approach outlined in the FCC report TID 4.2.1 treat this adequately and we feel that the 500 uv/m contour of a station should be protected for a net service 90 percent of the time" (tr. C-35).

"we feel that the ground wave 2,000 uv/m contour should be considered as a primary service area and should be protected under all conditions. Wherever possible, protection should further be granted to the 500 uv/m as a secondary service boundary. The FCC has treated this adequately in its recent report" (tr. C-38).

"When one inspects the service areas in a number of cases which have been brought out in this hearing, it is quite obvious that many important centers of population will not be provided with service if a station is protected only to its 5,000 uv/m contour and encounters interference beyond this boundary. We therefore recommended that the Federal Communications Commission rules be modified so that engineering protection is provided to a station to its 2,000 uv/m contour and, where possible, on out to its 500 uv/m contour.

"It should be pointed out that the 2,000 uv/m contour is not a smooth circle as it would be deduced from smooth-earth ground-wave theory alone. The irregularity of terrain causes the signal strength to depart materially from the smooth-earth theory, in some cases being above the theoretical values and in others well below the theoretical value. The extension of protection to the 2,000 uv/m contour, as a rule of thumb, will to some degree offset the uncertainty of this terrain factor pending the time when a dependable quantitative terrain factor correction can be applied in allocation planning" (tr. 1512).

Guy (TBA)

"It seems possible and desirable that the protected contours be changed. Two millivolts seems like it might be reasonable and attainable" (Tr. 1785).
Jett (WMAR-TV)

"I believe that the 5,000 microvolts per meter contour, which is now referred to in the Commission's rules, is entirely too stringent, that something between 500 and 5,000, and, in my opinion, and I am not basing my opinion upon a detailed study, but in my off-the-cuff opinion I feel that 1,000 microvolts, similar to the standard for area 1 of FM, would be a reasonable standard. However, I realize that it would be necessary to examine any particular contour in reference to the metropolitan districts throughout the United States to insure that all metropolitan stations would at least be provided protection within their metropolitan areas" (tr. 1729).

Poppele (TBA)

"(2) Two mv/m contour and protection standards: Protection standards should be reviewed prior to the adoption of any new allocation plan. This is particularly true of the protection normally afforded different classes of stations. As a result of the study of the engineering committee, the Television Broadcasters Association recommends that protection be afforded to the 2 mv/m contour from cochannel and adjacent channel interference, in consideration of (a) the existence of tropospheric transmission, and (b) the likelihood that increased television power will be necessary to provide an improved grade of service as the television art advances" (tr. 1420).

"This determination of interference involves, in addition to propagation information, a realistic protection standard and due care that no unnecessary 'white areas' are created in television service. The present rules specify that 'The service area of a metropolitan station shall not be protected beyond the 5,000 uv/m contour.' It must be our conclusion that such protection of service will not result in preserving an adequate, and in most cases, the only service available to urban and farm areas which surround television cities. Much of this service would be destroyed by allocations such as those proposed. It would seem that a more reasonable figure for the normally protected contour would be in the order of 2 mv/m or less. If such protection is not afforded, many television stations in the East will have the interference-free service areas which would be comparable with the night service areas of many regional stations on standard broadcast bands. This would leave large areas in the populous East without television service" (tr. 1430).

Siling (RCA)

"We feel that the interest of the public in the maximum utilization of the 12 VHF channels will best be served if the Commission will promptly lift the 'freeze' and make its assignments upon the basis of protecting the 2 mv/m contour of metropolitan stations for not less than 90 percent of the time. The service areas of such stations would be extended to approximately the 500 uv/m contour for not less than 90 percent of the time by use of synchronization of carriers, where that is necessary for adequate service. When this is done the stations should be protected to the 500 uv/m contour. Such an extension of the service area would have the advantage of making television available to a larger part of the rural population of the United States" (tr. C-321).

ANNEX D. ALLOCATIONS BASED ON ERP'S OTHER THAN THE INEXHIBILE STANDARD OF 50 KILOWATTS AT 500 FEET OR ITS EQUIVALENT

Adair (consulting engineer)

"This [tropospheric interference] difficulty can be minimized by the judicious use of directional antennas and by allocating power according to the needs of the area and of the areas of other stations which would be affected thereby ** ** (tr. 1708).

"I personally did not think that 50 kilowatts 500 feet is the proper power for all areas.

"Mr. Down, in other words, there should be some variation between areas and applications rather than a uniform height and standard power that might be impractical" (tr. 1711).

Cullum (consulting engineer)

"We now have, then, the existing operating plan and we have need for additional service. Don't you think we could fill in that need for the additional service by analyzing the existing coverage, taking into account all of the best engineering factors and then breaking the country up into not one area, or two areas, but a whole bunch of areas and fitting in additional services to those areas
to provide the service where it is needed and not to provide an additional service in those overlapping areas? What I have in mind is:

"Do you feel we are on the right track so that we can set it up with a push-button allocation from here on, or should we be realistic about it and recognize that we do have allocation problems now and that there are gaps in service, and not set it up as a pushbutton allocation plan but a plan whereby we can take into account all of the engineering factors, and take it up from there?" (tr. 1721).

Dowd (attorney)

"The second point that we wish to note is the difficulty of getting something a little more than 1 kilowatt at 500 feet and something considerably less than 50 kilowatts at 500 feet. Because of the procedures that the Commission has adopted in seeking to set forth a rather ironical allocation plan we find ourselves in the position of having clients who desire to cover a certain market in a certain area and they cannot do it with a community station under the present standards. On the other hand, they do not wish to have 50 kilowatts at 500 feet. In view of the fact that they want to use 2 kilowatts they are forced to come in to a proceeding and prove that if they use 50 kilowatts at 500 feet they would not cause interference to someone else" (tr. 1842-1843).

Duttera (NBC)

"When lesser separations occur, the same protection should be afforded existing stations by reduction of the effective radiated power of the proposed stations, by adjustment of its height, by the use of a directional antenna, or a combination of these" (tr. 1755).

Guy (TBA)

"* * * TBA does not feel that the Commission should make grants which violate those separations until an attempt is made to give protection which would be equivalent, by the use of reduced power, directional antennas or both * * * (tr. 1786).

"Perhaps some of them could be helped by adjustment of powers, I can visualize the situation where a station in a small community might feel that 50 kilowatts at 500 feet is an economic burden which he did not relish and he could serve his market with substantially less power and would be glad to have it" (tr. 1702).

Jett (WMAR-TV)

"There may be other ways to take care of the situation, by either reduction of the antenna height, in case of one, or reduction of power" (tr. 1739).

Kear (ABC)

"The second point is that, as pointed out in the testimony, the 50,000 watts at 500 feet as an arbitrary level of power for all metropolitan stations is believed not to be desirable; that there should be provision somewhere to adjust the power to the needs of the community. As was pointed out in my testimony, we propose that the area to be served be decided upon and then the power adjusted to provide service to that area.

"In some cases, as previous witnesses have testified, in New York it might require higher power. Places out in the center of the country that are smaller might require a lower power. By judicious choice of power a considerable number of stations might be able to be added to the present allocation without creating additional interference even if full consideration was given to the most serious considerations of tropospheric propagation" (tr. 1885-1886).

ANNEX E. RURAL SERVICE IN A VHF ALLOCATION PLAN

Adair (consulting engineer)

"It seems to me that television right now, while it is a very desirable thing for the people in the rural areas and smaller towns, depends on the economics for development largely from the more built-up areas and to get it started on that basis would seem more proper" (tr. 1736).

"It seems to me when you are located out in a fringe area, just because you want to receive New York when you should receive Washington—when you can receive Washington and cannot receive New York—well, you have got to be more or less satisfied or take some steps to cure it. In some cases, as pointed out, you can at least improve the situation with more complex receiving antennas.
In some cases you cannot do much about it. But that is the unfortunate situation that occurs in any radio service which, under our system depends largely on large populations to support it. When a person lives out in an area distant from that, he has to take what he can get and do the best he can about it” (tr. 1718).

Jett (WMAR-TV)

“Do you think in establishing standards we should strive for ideal or practical standards, one that would provide reasonably satisfactory service in rural areas and good service in urban areas? * * * (tr. 1691).

“It was my hope that at this conference the Commission could spring on a point between the ideal on one hand and the day-to-day practice on the other. I think we have got to do that if we are going to provide facilities with 12 channels for most of the cities.

"* * * As a practical matter, we know that the people within the service area of the transmitter tune their picture signal down and they still have signal left, and when they fish for distance, then they turn their picture signal up and they get a picture. That has been my experience in going around talking to people, that they get different results * * * (tr. 1692).

“I would like to emphasize once more that I do not think it would be well, in view of the limited number of television channels, to strive for an ideal standard. I think that in actual practice you will find that people at a distance do have their receivers turned up, and do take advantage of the last microvolt per meter. But out to 15 to 25, or so, miles, I think in most cases the television receiver has some signal to waste from the local station, and that in practice he will turn his controls down, and by so doing he will automatically eliminate much of the tropospheric interference that theoretically and sometimes in practice is actually existent * * * (tr. 1733).

“Mr. Cottage. "Would you be concerned about the possible failure to protect rural areas?

“Witness. No, because as a practical matter you don’t have stations all around the periphery of your contour. There are many areas out at a distance where there will never be any interference problem. For example, down on the Eastern Shore of Maryland, in the area of Cambridge, let us say, I doubt very much if people down there will ever be bothered from interference from Philadelphia or Washington. They will look to Baltimore as the station that should serve that area. Yet Cambridge is probably 70 miles from Baltimore air line, 60 or 70” (tr. 1741).

Kear (ABC)

“I believe that with the present limit on the number of channels, and the number of people who are applying for the facilities in those channels, it is going to be exceedingly difficult to have any large number of purely rural stations, and very likely the only rural type of operation we will be able to achieve is from some city which is given an increase in power, an increase in protection from neighboring stations so they can serve rural areas. I don’t believe that is a condition we would select if we had free choice. We would rather have channels available where we have full protection. I think this is a question of limitation” (tr. 1890-1891).

ANNEX F. TROPOSPHERIC PROPAGATION IN AN ALLOCATION PLAN

Adair (consulting engineer)

“However, I did want to go on another point, with respect to the 99 percent and the 1 percent, which, to me are figures entirely out of reason. In television service particularly with the experience we have had with respect to ignition interference, diathermy interference, outside interference, flutter, and everything else, it seems to me that 10 percent is the most interference we should talk about here. As to FM service I think that is entirely a different proposition, but with television I think we are kidding ourselves even with 35 microvolts at 50 feet. There is a considerable amount of interference where the homes are located close to the streets” (tr. C-287).

Boese (FCC)

“The conclusion should be kept in mind that the data upon which this study has been made are very limited and that rather great variations may be anticipated in other parts of the country. However, it is believed that the present study represents a first approximation of the effect of tropospheric propagation
on allocations which, while far from accurate, will give a better picture than the curves in the FM and television standards at the present time” (tr. C-6-7).

**Guy (TBA)**

“Under our present standards—that is for 10 percent of the time—under our present standards that would imply that in the area of interference you had no service. That is not so. You do have service. If you go out just a bit further, you have a little less service, and if you go out to the half millivolt contour you have a little less. It is just a matter of degree. But at all times you may have a signal which is salvageable and which has entertainment value and which you can understand with once you have it. You don’t lose all that service. You only see some interference on it.* * * *

“There is this difference: Where you have interference you don’t lose service, you merely don’t get as perfect a picture. So when we say there is tropospheric interference with a separation of 150 miles, we can say on the one hand that service is lost over a large part of area or we can be a little more realistic and say that the service is still there but the service is not as perfect as it could be over a portion of the area” (tr. 1788–1789).

**Poppele (TBA)**

“(1) Standards re tropospheric transmission: On October 11, 1945, at the Federal Communications Commission’s hearing with reference to docket 6789, the Television Broadcasters Association pointed out the interference that would result from tropospheric transmission. Since that time, it is understood that additional data thereon has been collected by the Federal Communications Commission and others; but no standards have been established for tropospheric transmission. It is the recommendation of Television Broadcasters Association that such standards be immediately considered and established before additional allocations are made in which there is less than a 150-mile metropolitan, co-channel separation, or wherein the protected area of any station for any class or condition is less than the equivalent of that protection received by cochannel metropolitan stations 150 miles apart” (tr. 1419).

**RMA Committee T8-3**

“It is obvious that in setting up a practical allocation scheme compromises with quality and extent of service are involved. The committee believes that to expect service 90 percent of the time is probably unnecessarily idealistic. Certain limitation on other broadcast services do not have this equivalent approach to perfection. Perhaps 90 percent service may have to be the compromise. In this regard it should be noted that the degree of tolerance of more-than-perceptible interference is a subjective problem which has received no study at all so far as this committee is aware. Also, ameliorating local expedients may be useful, such as directional receiving antennas” (JTAC rept. vol. II, annex 7, p. 4).

**ANNEX G. TROPOSPHERIC PROPAGATION IN PARTICULAR SECTIONS OF THE COUNTRY**

**deMars (consulting engineer)**

“I feel quite certain that as far as the west coast is concerned, and when I say ‘west coast’ I understand that area to be the area between the Pacific Ocean and the first range of hills, that the duration of tropospheric signals and their intensities will differ markedly from any east coast data or any other section of the country that we know of. And it seems to me the only way that can be dealt with is by giving it special consideration. And it is quite true that special conditions exist over the Great Lakes and the gulf, and even in some part of the time along the Atlantic coast. Those conditions are pretty well understood because of the correlation, or let me say the dependence on meteorological conditions. They can be predicted reasonably well.

“I think that the only way those anomalies or departures from average conditions can be dealt with is to treat them as specific cases” (tr. C-445–446).

**Leydorf (WJR and WGAR)**

“One of the serious tropospheric transmission problems facing television is that presented by transmission across the Great Lakes” (tr. C-92).

“It appears from the data which has been analyzed that there is a pronounced seasonal effect in transmission across Lake Erie, strong signals being very frequent in the summer and quite infrequent during the winter” (tr. C-93).

**Luecke (Don Lee)**

“The characteristic variation of field intensity is one of slow variation. The yearly variation is marked and is particularly identified with a long and steady
tropospheric propagation during the summer months, from perhaps May to September, inclusive. As a matter of fact, the way that this matter first came to our attention was the reception report of a Mr. L. G. Gilbert in San Diego, who, living on the seacoast, assembled a television receiver and indicated to us that he was receiving the television images of W6XAC at an elevation of 2,000 feet in San Diego with clarity and dependability. This was in the summer of 1946 and we immediately rendered a report and two subsequent reports to the Commission on this phenomenon.

"With respect to this coastwise tropospheric propagation relatively little diurnal variations have been noted" (tr. C-44).

"The tropospheric propagation in a qualitative way appears to be independent of frequency, channel 12 being received as well and with the same general characteristics of reception with respect to time and season as channel 2" (tr. C-45).

"I would like to conclude with merely the statement that for the unusual condition of the persistent temperature inversion during the summer on the west coast, and because of the almost constant field strength, as a consequence the log normal distribution for considering the tropospheric propagation is probably not the correct one. It is almost a constant case and may be duplicated around the Great Lakes, or other places, where persistent temperature inversions are to be expected" (tr. C-49).

ANNEX H. TROPOSPHERIC INTERFERENCE PRIMARILY A FUNCTION OF POWER
deMars (consulting engineer)

"Mr. Chairman, in order to introduce an optimistic note into the meeting I would like to state that up to the point where the study of the effect of the troposphere, that is, the factors dealing with antenna heights, fading factors, and so forth, reach the point of attempting to be tied into a theory, I believe that the results represent the best that can be obtained from the available data. I think that the curves with respect to the 1 percent or 10 percent values for 500-foot antennas come as close to representing the probable tropospheric situation as can be determined from present data. But I think that it is completely unwarranted to attempt to fit this data into a theory and then extend the use of that into antennas of other heights and over other distances.

"We have heard a good deal of testimony to the effect that the signal intensity via the troposphere is related directly to the power and not to the heights of the antenna. If that is the case and it turns out that that is substantially the fact then the adoption of an earth radius 10 times to normal for predicting conditions other than for the 500-foot antenna would be in error and the error would increase in proportion to the height differences with 500 feet ** (tr. C-180-190).

"The tropospheric signal that we predict is not independent of antenna height at 100 miles. Consequently, we can't draw the sweeping conclusion that the tropospheric signal is dependent only upon one power and not upon height, unless we qualify it by the distances involved.

"I am convinced that the tropospheric signal intensity at distances in excess of 200 miles is much more dependent—in fact almost entirely dependent upon the radiated power rather than antenna heights for antenna heights under 5,000 feet" (tr. C-443).

Pink (JTAC)

"In particular, the influence of the transmitting antenna height on tropospheric propagation of the signal is a critical question, since the value of antenna height used in practice may depart widely from the value assumed in the curves cited. If such departures impair the utility of the curves, the effect of such departures must be taken into account in establishing the effective radiated powers and antenna heights permissible or desirable in the allocation plan ** (tr.C-15).

"Effect of transmitting antenna height.—It is the opinion of JTAC that the present FCC regulation concerning effective radiated power as a function of antenna height requires careful review. The present rule states that the effective radiated power must vary inversely as the square of the ratio of the actual antenna height to 500 feet. There is practical and theoretical evidence that the signal level propagated to a distance by the troposphere is nearly independent of antenna height. If this is proved generally to be the case, the ratio of the tropospheric interference area to the service area must decrease as the antenna height is increased, the power radiated remaining unchanged. It would then appear that the service to the public would be maximized by the use of the highest feasible antenna height, consistent with cost, regulations of the Civil
Aeronautics Authority, and similar factors. The use of a lower than maximum antenna height increases the interference area, when higher power is associated with the lower height, without increasing the service area.

"Based on the existing evidence, JTAC surmises that the proper exponent, relating antenna height ratio to the effective radiated power, should lie between the values 0 and 1 (class C), rather than 2 as presently stipulated in the Commission's rules. The JTAC is not in a position to recommend a definite change in this regulation, but suggests that study of the matter is in order to maximize service areas relative to interference areas" (tr. C-19-20).

Goldsmith (Du Mont)

"The difficulty lies in the apparent fact that the tropospheric interfering signals are primarily a function of power only and are relatively little affected by antenna height. On the other hand, the desired signal strength is influenced advantageously by increased height, particularly to those service areas at distances of 20 to 50 miles. Let us take for example two stations on the old height-power power allocation plan. Let them operate on co-channel assignments assuming station A to have a power of 50 kilowatts at 500 feet. Let station B have a power of 12 1/2 kilowatts at 1,000 feet. Let stations A and B be separated by, say, 150 miles. The higher power of station A will give a more serious long-distance interfering signal than will station B. The resultant service area which is free of interference for 90 percent of the time will, therefore, be considerably smaller for station B in spite of its higher antenna tower than for station A. We, therefore, recommend that it would be more equitable for allocation purposes to set a power ceiling for broadcast stations irrespective of antenna height and encourage all stations to use very nearly this full power. Then the individual applicants will automatically plan to use as great an antenna height as is practical in each case in order to increase their primary service areas" (tr. C-36-37).

Lubeke (Don Lee)

"I would like to agree with the Commission’s findings and other testimony indicated today that the height of the television transmitter has little relation to the tropospheric propagation that is to be expected" (tr. C-43).

"Our own station at a height of 200 feet above sea level for the transmitting antenna operating on Channel 2 is found to be received in the San Diego area with approximately the same efficiency, let us say, as the several other television stations now operating in the Los Angeles area, notably KTLA, on Channel 5, KFI-TV, on Channel 6, and KFAC-TV, on Channel 13. Thus our data indicates that a ceiling on power and all the height that a telecaster can achieve is the proper overall plan of allocation rather than the inverse ratio of the more height you are able to achieve the less power you should be granted" (tr. C-44).

Siling (RCA)

"We do not believe that the effect of transmitting antenna height is well established in either the standards affecting principally the ground wave coverage or in the tropospheric curves affecting principally a station’s interference capabilities. It is therefore suggested that this subject receive more intensive study involving measurements to determine specifically the height effect. The making of such a study does not, however, require that a lifting of the ‘freeze’ be postponed until the measurements are completed” (tr. C-322).

Wilmutt (Consulting Engineer)

"* * * that the interference seems to be principally dependent upon the powers used, and not very much on the height” (tr. C-157).

RMA Committee TS-3

"The above discussion would indicate a condition consistent with a physical characteristic that the tropospheric field beyond the horizon is dependent mostly upon transmitter power, and very little upon antenna height. Whether this is actually the case should, we feel, be explored through a series of measurements directed toward this point specifically.

"If such a condition is, in fact, found to exist, then the committee would recommend that the present allocation practice with respect to reducing assigned power where the antenna height exceeds 500 feet, be modified. This would remove what appears to be a serious inequity in the present allocation plan.

"The modification required would be in the direction of assigning power independent of antenna height” (JTAC Rept., vol. II, annex 7, p. 4).
Annex I. Interferences Other Than Tropospheric As Factors in an Allocation Plan

Adair (Consulting Engineer)

"From my personal standpoint I have never received any interference from another station on television. I have received quite a bit of interference due to automobiles and diathermy and noises of that nature, but not from other stations" (tr. 1709).

Chittick (RMA)

"In general, ignition interference into television receivers is not a problem if the television signal strength is 5,000 microvolts per meter or higher. There are few instances where interference is present at these high levels, but most of these cases are due to close proximity to very heavily traveled highways. Ignition interference becomes progressively worse as the television signal frequencies fall below 5,000 microvolts. At 1,000 microvolts or lower, the ignition interference is a serious problem, both from the standpoint of interference in the picture, and the possible loss of synchronization. One company has reported that 56 percent of all their television installations are affected by ignition interference to the extent that a service call is necessary" (JTAC Rept., vol. II, annex 9, pp. 1-2).

Gillett (Consulting Engineer)

"While it is true that tropospheric transmission will reduce for a small portion of the time the service of the television stations to a somewhat smaller range than was originally expected, it is also true that in the fringe service areas thus affected, other types of interference have already degraded the service there to where the tropospheric interference may not be nearly as significant as the bare curves would indicate.

"Also, this interference can be greatly minimized by synchronization, as has been shown by the RCA experiments. The rather extensive experiments which were carried out by the Bell System in the early 1930's show that the synchronization of AM broadcasting stations would reduce the effect of cochannel interference by a factor of about 20 decibels. * * *

"Also, the normal dipole and reflector that will be used with the average receiver in the outer-service area of a television station will have a directivity which will discriminate automatically against the undesired interfering signal by an amount between 6 and 12 decibels. Higher discrimination is easily available from the better receiving antennas, as has been shown by Dr. Brown's one here" (tr. C-392).

Goldsmith (Du Mont)

"A number of interferences other than from adjacent or cochannel operation are present in areas where television receivers are now operating. The severity of such interferences will be increased when full occupancy exists under the allocation plan. Examples of these further interferences are the beats between stations widely separated in frequency resulting in intermediate frequency signals, image responses, local oscillator radiation and acceptance of intense direct signals through the circuits because of lack of shielding of critically sensitive parts. Many of these conditions can be greatly alleviated by more attention being given to the radio frequency tuned circuits of the receiver. Additional RF selectivity is highly desirable for many reasons and will be essential in receivers even though it substantially increases the technical complexity of future sets" (tr. 1959).

Kaar (RMA)

"(1) Signal strength to give satisfactory receiver performance.

"(a) * * * It would thus appear that no less than the present FCC figure of 500 microvolts per meter should be provided for satisfactory pictures and that even this is only half enough in the high band of 174 megacycles to 216 megacycles.

"(b) In the presence of man-made interference, in metropolitan regions, the field strength must be increased above the 500 microvolt level. In general, it has been our experience that 5 millivolts is usually sufficient although not always. At a few locations the noise is so high that even 50 millivolts is insufficient. Based on a rough estimate of the number of such situations, however, it is believed that 90 percent of the locations will receive satisfactory service with a 5 millivolt per meter field strength." (JTAC Rept., vol. II, annex 16, pp. 1-3.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

ANNEX J. TERRAIN EFFECTS IN THE PREDICTION OF SERVICE AREA

Goldsmith (Du Mont)

"** we find that the shadows of hills and buildings materially change the measured average field intensity from that calculated from the smooth earth predictions. Field strength values for 90 percent of the measurements made lie between the values predicted by theory and values 20 decibels lower than these. Some latitude should be allowed for this practical condition when choosing "safe allocation spacings for stations" (tr. C-33).

"** we definitely feel that a terrain factor and perhaps distribution factor as defined above should be considered in the methods of predicting service areas ** (tr. C-37-38).

"I should like to list here a few of these further major factors. The condition of the terrain surrounding a television station causes the realizable field strength at the homes of the potential customers to depart widely from the smooth-earth ground-wave theoretical predictions both regarding service and interference. An appropriate quantitative means of evaluating and applying a terrain factor is desirable" (tr. 1444).

Lubeke (Don Lee)

"Now, with respect to terrain, we find that the Commission's considerations are in general supported by our data and experiences. We have in the past made measurements in which we determined that California hills are 10 times as efficient barriers to VHF waves as New York buildings. And we find that the lower the carrier frequency the less effect a hill or a building has upon the possibility of proper image reception behind such a hill or building" (tr. C-47).

Smith (Cornell)

"We have here a brief study made by us as a result of examination of the data presented in one of the technical information division reports on study of terrain factors. The paper we are here commenting on concerns the effect of systematic terrain discrimination upon opposite traveling very high frequency waves, and its influence upon permissible ratios of general levels of desired to undesired signals when potential interference areas lie in irregular terrain.

"The current development of engineering standards for television allocation appears to be coming to an acceptance by engineers of 10 decibels as a ratio of desired to undesired signals for negligible video cochannel interference and 30 decibels as a ratio for acceptable service. These ratios, when combined with attempts to protect ground wave 500 microwave contours from 10 percent tropospheric signals, lead to the necessity for reduction of the number of station assignments on the presently available channels, Nos. 2 through 12, in line with the release of the Bureau of Engineering of the Federal Communications Commission dated November 18, 1948. In many cases the need for such severe deletion as there illustrated can be removed when the potential interference areas involve irregular terrain" (tr. C-80).

Conclusion: Full consideration of the above factors will operate greatly to the advantage of the rural listeners in irregular terrain by permitting more closely spaced stations on available channels. This necessarily results in a larger percentage of receiver locations unable to overcome local conditions in securing a minimum of multiple choice television service" (tr. C-80).

ANNEX K. CARRIER SYNCHRONIZATION IN AN ALLOCATION PLAN

Fink (JTAC)

"Effects of carrier synchronization on interference. The JTAC has received information that the cochannel protection ratio of 40 decibels may be reduced by a substantial amount if the 2 television picture carriers are rigidly synchronized (tr. C-246) **.

"The carriers of stations WNBT, New York, and WNBW, Washington, have been synchronized and the results observed at Princeton. A marked improvement in signal to interference ratio, estimated at approximately 15 decibels, has been noted on the viewing screen. If such a method were applied universally to all stations on the same channel in contiguous interference areas, the permissible interfering signal at points intermediate to the stations might be increased by approximately 15 decibels. This is class C figure (tr. C-247) **.

"We come to the phase-synchronization of television carriers and our recommendation concerning it. The benefits of phase-synchronization of television station carriers appear to be so important that they should be considered as a
factor in allocations planning, despite the meager experience with the system. In particular it seems to JTAC that it would be unfortunate if an allocations plan were put into effect, in advance of reliable information on phase-synchronized carrier operation, which precluded utilizing the potential benefits of this method.

"Experiments indicate that the interfering carrier may be increased by 15 decibels relative to the desired carrier without incurring additional interference, when the phases of the 2 carriers are locked in a fixed relationship.

"This is at present a class C estimate. There is some theoretical justification, not yet fully developed, for assuming that such an improvement might be expected. If further experience shows that this 15 decibel increase in interfering signal strength may be a fact to be tolerated, the advantage gained in allocating stations is very substantial. In the illustrative examples in chapter VI, it reduces the minimum separation for 90 percent protected time from over 210 to 150 miles at 63 megacycles and to 163 miles at 195 megacycles. In fact, a separation not substantially different from that set up in the allocation prior to September 1943 (150 miles) would become feasible, provided these examples turn out to be engineer conclusions" (tr. C-261-262).

Kell (RCA)

"Using the data presented in the FCC report Summary of Tropospheric Propagation Measurements and the Development of Empirical VHF Propagation Charts it would appear that for a 40-decibel desired to undesired signal ratio 90 percent of the time at the 500 microvolt per meter contour, a separation of 250 miles is required.

"If an improvement of 10 times in voltage or 20 decibel due to synchronizing of the carriers is assumed the same interference will be obtained at 146 mile separation 90 percent of the time on the 500 microvolt per meter contour. Again, taking an improvement of 15 decibel the separation required is 164 miles to protect the 500 microvolt per meter contour to a 40 decibel desired to undesired signal ratio on the same basis.

"From a practical point of view the 146 or 164 mile separation may be considered as 150 miles. On this basis it is believed that the field strength contours can be given the same protection with 150-mile separation with synchronous operation of the television stations as can be obtained with 230-mile separation and nonsynchronous operation" (tr. C-340).

Siling (RCA)

"RCA Laboratories has developed a system of synchronizing the carrier frequency of cochannel television stations. We believe this system holds much promise of valuable results to the television industry:

"(a) In minimizing the effects of tropospheric interference.

"(b) In making possible a greater service area for individual television stations, and

"(c) In permitting a larger number of television stations in the VHF band, that we recommend it for consideration by the Commission in making its channel allocations" (tr. C-320).

"We feel that the interest of the public in the maximum utilization of the 12 VHF channels will best be served if the Commission will promptly lift the 'freeze' and make its assignments upon the basis of protecting the 2 mv/m contour of metropolitan stations for not less than 90 percent of the time. The service areas of such stations would be extended to approximately the 500 uv/m contour for not less than 90 percent of the time by the use of synchronization of carriers, where it is necessary for adequate service. When this is done the stations should be protected to the 500 uv/m contour. Such an extension of the service area would have the advantage of making television available to a larger part of the rural population of the United States" (tr. C-320-321).

"Mr. Allen. In your recommendation (3) on page 5, that television stations be protected to the 2 microvolt contour for not less than 90 percent of the time without synchronization of the carriers, or to the 500 uv/m contour for not less than 90 percent of the time with synchronization, do these figures agree with Mr. Fink's 15 decibel? It would seem to me his 15 decibel wouldn't make quite this much improvement" (tr. C-323-324).

"Mr. Siling. These are based on, first of all, not 15 decibel, but a ratio of 20 to 1, that would be 20 decibels, so there would be some difficulty, but taking the Commission's curves they are based on 20 decibels.

"Mr. Allen. Rather than 15?"
Allen (FCC)

"For synchronized operation, a 150-mile spacing is approximately equal to the 210-mile unsynchronized, if you assume that a synchronized ratio of 20 to 1 is satisfactory." Proceedings of the NAB Engineering Conference, April 7-9, 1949, page 339.

ANNEX L. USE OF CARRIER OFFSET IN AN ALLOCATION PLAN

[No testimony or exhibits were submitted at the allocations hearings or engineering conferences with respect to the use of carrier offset as a means of reducing interference. In recent weeks, however, the trade publications have carried accounts of experimentation that has been conducted on carrier offset and of the results that have been obtained. Extracts or summaries of these accounts are hereinafter set forth in chronological order.]

"In its hunt for interference-reducers, RCA is currently experimenting with separating cochannel stations by half of line frequency (about 8 kc.). It has no conclusions yet, may have some in a few weeks. If system works well, it would have some advantages over synchronization in that no intermediate station or phone line would be needed." (Television Digest and FM Reports, vol. 5, No. 16, Apr. 16, 1949.)

A system of off-frequency cochannel television assignments has been developed by RCA labs which its exponents are confident will reduce interference at least as well as synchronization, without synchronization's extra expense.

"Not yet formally announced because work is still in progress, the plan is believed capable of permitting cochannel operations at spacings of approximately 150 miles—the separation FCC aimed at in its original allocation.

"Dr. C. B. Jolliffe, executive vice president in charge of RCA labs, told Broadcasting that the heart of the plan is to stagger the carrier frequencies of cochannel stations by about one-half the line frequency. Thus, he said, the venetian-blind pattern arising from mutual interference is reduced to about the width of a scanning line, and disappears.

"Dr. Jolliffe said the new system has been in operation on RCA-NBC's WNBT (TV) New York and WNBW (TV) Washington for about 2 months. The results, he said, are fully as good as were obtained by the exact synchronization of the two stations' frequencies in earlier tests." (Broadcasting, January 3.)

"If utilized by the Commission, the system would pose no extra cost for broadcasters. FCC's assignment producers would specify the exact carrier frequency to be used—about 8,000 to 10,000 cycles apart for cochannel operations—and station operators would buy the crystals they need, just as they do now.

"Cost of producing units similar to those used in the previous synchronization tests has been estimated at about $5,000.

"If 150-mile separation for cochannel stations is shown to be feasible, FCC could salvage much of the allocation plan which many authorities regarded as doomed by tropospheric interference effects. In many instances, however, the allocation provided for spacings narrower than the goal of 150 miles for cochannels and 75 for adjacent channels. * * *" (Broadcasting, p. 31, May 23, 1949.)

"'Offset carrier' system of cochannel interference reduction (vol. 5:16-19) was due to start this weekend between Boston's WBZ-TV, Schenectady's WRGB, New York's WNBT. After watching it work between Detroit-Cleveland and New York-Washington, RCA has definitely shelved synchronization. Offset is said to give improvement of 20 decibels, compared with 15 decibels for synchronization—without the expense and complexity. CBS was sufficiently impressed with system to order new crystal, will shortly offset New York's WCBS-TV from Baltimore's WMAR-TV, on channel 2" (Television Digest and FM rep, vol. 5, No. 23, June 4, 1949).

"Closer spacing of television stations on the same channel, or at least a reduction in cochannel interference, may develop from the displaced carrier or off-frequency technique, judging from results of experiments at FCC's Laurel, Md., laboratory.
"In a demonstration of the off-frequency method, the laboratory last Monday showed how interference is reduced. * * * "The FCC's tests of offset carrier technique to reduce cochannel interference supported findings of RCA (Broadcasting, May 23), in the opinion of a number of engineers who watched the Laurel demonstration.

"Edward W. Chapin, chief of the FCC Laboratories Division, directed Monday's tests. * * * "When normal AM video and offset AM were compared, with the same ratio of desired-to-undesired signal, the offset or displaced technique revealed a vastly better signal. Most observers said the improvement was at least 5 to 1" (Broadcasting, p. 40, June 13, 1949).

"By an 'offset carrier' operation authorized by FCC, WCBS-TV New York and WNBW-TV Baltimore have extended their interference-free viewing areas by 10 miles, according to a claim by William B. Lodge, CBS vice president and general director of engineering. "The change went into effect June 16 and by the next morning viewers sent in unsolicited reports expressing gratification at the improvement, it was said. "The operation involved a slight shifting of the station frequency, so slight, however, as not to affect the tuning of receivers. Until the change, both stations, which are on channel 2, maintained their frequencies precisely in step. Now they differ approximately 6,200 cycles—only a tiny percentage of channel 2's band of 6,000,000 cycles" (Broadcasting, p. 47, June 27, 1949).

"Use of offset carrier to reduce TV interference, increase coverage (vol. 5; 16 et seq.) begins to look almost like a network operation. All reports we've received so far are extremely good. If FCC's new allocation proposed to delete many VHF channels from major cities, you can expect major argument from applicants claiming offset can save channels. On channel 4, following stations are now offset—either 10.5 kilocycles up, 10.5 kilocycles down, or on frequency: Boston's WBZ-TV, down; Schenectady's WRGB, up; New York's WNET, on; Lancaster's WGAL-TV, up; Washington's WNBW, down; Cleveland's WNBK, up; Detroit's WWJ-TV, on; Chicago's WNBQ, down. On channel 2, New York's WCBS-TV and Baltimore's WMAR-TV report 10-plus miles extension of coverage for each through offset. Both say they received unsolicited calls from enthusiastic viewers the morning after start of operation June 16" (Television band of 6,000,000 cycles" (Broadcasting, p. 47, June 27, 1949).

**ANNEX M. COCHANNEL AND ADJACENT CHANNEL INTERFERENCE PROTECTION RATIOS**

**Adair (consulting engineer)**

"* * * it is my opinion that 100 to 1 is very idealistic at the present time, particularly with respect to the ghosts that are being experienced in the very high frequency band and with respect to the channel limitations particularly caused by the coaxial cable networks, that to set 100 to 1 as the basis of allocation in this time is a little impractical. "I believe that not more than 50 to 1 would be required to provide the same order of service that we are receiving from other sources" (tr. 1709).  

**Fink (JTAC)**

"Cochannel interference protection ratios. The RMA Television Systems Subcommittee TS-3 received unanimous agreement in the replies to its questionnaire (annex 7) that the cochannel interference protection ratio would be 100-to-1 (40 decibels) in field strength, as is now established in the Commission's rules" (tr. C-244).

"Adjacent channel protection ratios. The adjacent channel protection ratio (desired to undesired signal strength ratio) specified in the Commission's rules is 2 to 1, or 6 decibels" (tr. C-247).

"The FCC rule specifying 6-decibel protection is adequate on the lower adjacent channel and more than adequate on the upper adjacent channel. These figures have class B reliability" (tr. C-248-249).

"Mr. Fink, for explanation on that point, take channels A, B, and C, if you want to put a station on channel B the interference ratio with respect to channel A being low, you would have to have 6 decibels, but with respect to channel C it would be zero decibels? "Mr. Fink. That is right.  

"Mr. Plotkin. When you look at it from C's point of view wouldn't C need 6 decibels? "Mr. Fink. Very definitely. If there is no choice in a case like that obviously the higher protection ratio must be adopted but we believe that there
are places where this tolerance of 6 decibels could make the difference of getting one more station in" (tr. C-249).

Goldsmith (DuMont)

"However, to be practical, we feel that the 100 to 1 signal strength ratio is probably adequate" (tr. C-38).

"We feel that the adjacent channel ratio at the receiver input terminals may safely be reduced to 1 to 1 for allocation purposes but we do not believe that adjacent channel operation in the same service area is practical because of the signal distribution due to the terrain factor" (tr. C-38).

Guy (TBA)

"We have 100 to 1 as the standard for desired to undesired signal intensity as our yardstick. That yardstick in the opinion of T. B. A. might be modified to advantage (tr. 1783) * * *.

"In other words, 50 to 1 may be an acceptable picture, although the interference may be visible to a slight degree. That would mean that the area subject to interference would be very substantially reduced" (tr. 1694).

Kear (ABC)

"The next item has to do with the 100-to-1 ratio on cochannel protection. I don't believe there is any intent of the Commission or industry to set up this 100-to-1 ratio as any sacred number. However, I believe it was adopted after careful consideration by a committee appointed for that purpose, and at that time it no doubt represented an adequate ratio of protection.

"It is quite possible that nowadays with more knowledge of propagation conditions and the operation of receivers and the tolerance values which viewers may have, that this ratio should be changed. However, I do not believe it should be changed until a study has been made, which could be made by the engineering department of the Federal Communications Commission, to determine whether any reason exists for amendment of that ratio" (tr. 1886).

Kaar (RMA)

"100-to-1 ratio of wanted to unwanted signal should be provided in the allocation plan against cochannel interference. This is 40 decibels previously deemed satisfactory for random noise * * * the regular pattern formed by carriers beating together is much more annoying than evenly distributed interference of the noise type. The beating carriers cause a venetian blind pattern on the picture. A 720 cycle carrier frequency difference would cause a pattern having 12 slats.

"The protection ratio against interference on adjacent channels is based on the selectivity provided by receivers of practical and economic designs.

"(a) With respect to interference in the upper adjacent channel, the ratio of fields strength may be 1 to 1.

"(b) With respect to interference in the lower adjacent channel, the ratio of field strengths should be 2 to 1 in favor of the desired channel" (JTAC rept., vol. II, annex 16, pp. 1–3).

ANNEX N. ADJACENT CHANNEL INTERFERENCE

Fine (FCC)

"If we glance at figure 1 we see that the rate of degradation is much more rapid for the adjacent channel than the cochannel station. For example, if say the 2 mil contour were specified as the protected contour, an adjacent channel would cause much more havoc to the service beyond that protected contour than a cochannel station, and for that reason it might be wise to specify the limitations to be protected. For example, we might say that the 2 mil contour must not be invaded by the 10 percent interference signal and the 1 mil contour should not be invaded by say, the 50 percent interference signal. The second basic proposal is that each interference should be treated individually. It is shown here that the interferences are practically additive. If two stations are causing interference to the desired station the total interference is practically the sum of the two" (tr. C-237–238).

Gillett (consulting engineer)

"As for adjacent channel interference, my viewpoint has always been that that is largely controllable by receiver set design, and that factor therefore is subject
to improvement as time goes on and as the requirements are imposed on the receiver manufacturers to do it.

"As pointed out yesterday, the manufacturers will get by with as poor discrimination as they can economically do, and I think adjacent channel interference is not in the same order of weight that co-channel interference is" (tr. C-395).

Goldsmith (Du Mont)

"Use of exhibit L, which is the family of loci of points at which the radius of desired signal to interfering signal is 2 to 1 for adjacent channel metropolitan stations would indicate on the map that many areas would be subject to interference of this magnitude of 2 to 1 well within the 500 uv/m contour, and in some cases, even within the 5,000 uv/m contour. We feel that this 2-to-1 factor may be pessimistic provided the best design considerations are given to television receivers. If the television receiver has good selectivity in its intermediate frequency tuned circuits, then it can reject adjacent channel signals at a ratio where the desired signal to the interfering signal is 1 to 3.

"I am not suggesting a change in that 2-to-1 factor, but I am saying that we would have some leeway for safety in that particular factor" (tr. 1502).

Kear (ABC)

"Answer. That is correct. There is another thing we should bring out. That is an adjacent channel operation in which event the tropospheric effect is far less important than it is on cochannel" (tr.1415).

Kell (RCA)

"Mr. Plotkin. How about adjacent channel problems?

"Mr. Kell. I do not believe there are any" (tr. C-366).

Siling (RCA)

"In general it has been our experience that adjacent channel interference is not anywhere near the same factor as the cochannel interference and is more probably corrected by receiver design, whereas we cannot correct cochannel interference by that method. That is, I think we are a little bit more concerned about cochannel interference for that reason" (tr. C-326).

ANNEX O. DIRECTIONAL TRANSMITTING ANTENNAS IN AN ALLOCATION PLAN

Adair (consulting engineer)

"This difficulty can be minimized by the judicious use of directional antennas and by allocating power according to the needs of the area and of the areas of other stations which would be affected thereby" (tr. 1708).

Bailey (consulting engineer)

"As far as directional antennas are concerned the standards now provide for them I believe in both FM and television. They reflect a certain amount of our AM thinking. I call attention to the fact that it is required that it be specified the relative phasing amplitudes of currents in the elements, and you may recollect that Mr. Alford was at a loss to give that type of information, the type of antenna he proposed. I think we ought to make those flexible enough so it will cover almost any type. I am recommending that we do not in the standards eliminate now the possibility of directional antennas. I think it should be kept, that enough leeway be put in to allow for any reasonable proposal which is thought of.

"Now, in the discussion of directional antennas, and this is not a new thought, I think JTAC advanced it, but I have considered it for some time, there are two ways to fit them into an allocation picture. One is to see if by the use of directional antennas going to set up your allocation ahead of time, you cannot get a few more stations in by putting directional antennas back to back, protecting each other, getting these values down to where they will not be interfered with. It is a method which might apply, it was a method which I think TBA proposed at one time on the eastern seaboard in order to make what they felt was better use of the channels. It has one fault and that is, as can be seen in the presentation last summer, the use of a directional antenna in television requires an availability of a site and proper direction, that the energy be distributed properly over the city, that there not be reflecting points which will cause a lot of radiated energy to be reflected back into the protected area, and it is quite a job to fit it in.

"The alternative is to go ahead and build your plant on a nondirectional basis, raising it, perhaps, to saturation, which will soon happen, I am sure, no matter what we decide, and then leave it to the person who desires to add a facility
to prove that he will not seriously affect the other stations planned for or existing, and the Commission can, as they have many times, then weigh, if there is a little damage, the good versus the damage. * * *

"Weighing the two I would recommend taking the latter course, that is, building up your plant on a nondirectional basis and let the directional antennas come in where they can. For instance, I would hesitate to tell a place like Scranton, or Wilkes-Barre, that they have to use a directional which radiates north, west, and southeast. It might not be the proper way. Therefore I think the latter would be more desirable” (tr. C-107-110).

Brown (RCA)

"Mr. Allen. Have you any remarks to make with regard to directional antennas?"

"Mr. Brown. For transmitting?"

"Mr. Allen. Yes."

"Mr. Brown. Well, I personally feel this way. We all know that directional antennas have been used in these frequencies, they have been used during the war for radar purposes. I don't regard directional antennas at these frequencies as anything very mysterious, they are things that can be built.

"I suppose that on the matter of directional antennas for these frequencies I would regard the problem something like this. I would have not the slightest hesitation now in feeling that I could design rather easily directional transmitting antennas with, let's say a 10-to-1 suppression. By that I mean 10 to 1 down in voltage from what we would get from an r.m.s. pattern. As we go into the things we are going to have to get engineering experience.

"I would find it difficult to say that 10 to 1 is what we can do and 20 to 1 is what we cannot do. As we begin to go down to suppression of the order of, maybe, 50 to 100 to 1, those are the things we have to learn by experience, we are going to have to learn about all these factors that have been mentioned—reflections from buildings that may get back to the service area, there may be changes in those reflections at times of the year, say a hill may give a different sort of reflection in the winter or summer—those are things we are going to have to learn about.

"As to problems of monitoring directional antennas, which has been mentioned, I think it was mentioned yesterday, I haven't any concrete thought to offer, but I would like to say that in the broadcast station directional antenna you have a ground system that you are using as part of your system, most of these high frequency antennas are built on a pole, they may be a tube, may be some sort of sheet radiator, there are those factors that might make a change, icing probably will do things—those are things that are subject to correction. But I don't feel that we have quite the change at the antenna that we may experience in the broadcast directional antennas, and I don't look at the problem of directional antennas as, should we say, at least the problem as far as the manufacturing is concerned, the installation, I don't look at it as anything but a straightforward engineering problem” (tr. C-376-377).

Duttera (NBC)

"After an examination of tropospheric propagation standards and a review of protection to be afforded the service area of individual television stations, we believe it will be found that additional allocations in some areas can only be made in the public interest by the utilization of directional antennas. Until these standards are set up, the separation of metropolitan stations should not be less than 150 miles on a cochannel basis and 75 miles on an adjacent channel basis. When lesser separations occur, the same protection should be afforded existing stations by reduction of the effective radiated power of the proposed stations, by adjustment of its height, by the use of a directional antenna, or a combination of these. We therefore believe that the Commission should adopt suitable standards for the use of directional antennas" (tr. 1755).

Fink (JTAC)

"Transmitting antennas having horizontal directivity are considered practicable and should be used in particular instances where they can be shown to afford protection to other stations without unwarranted reduction of the intended service. However, it is suggested that the use of directive antennas be confined to assignments in particular situations warranting their use, and that their use should not be taken as a basis for setting up the basic allocation to television and FM broadcasting stations. * * *

"The remarks regarding directive antennas are based on Class A information” (tr. G-54). (See also, tr. C-261.)
"Mr. Boese. Do you have any suggestions with regard to these directive antennas?

"Mr. Gillett. Why should we cut our throats and not take advantage of all the technical tools we have?

"Mr. Boese. What would you suggest as reasonable limits?

"Mr. Gillett. Well, at the present stage of the art I would think that a 10 decibel reduction between maximum and minimum would be a safe limit to consider. There are a few cases, like the Detroit-Cleveland area where perhaps greater directivity would be warranted if it can be obtained. You are there faced with the situation already existent and you have to go as full out as you can to clean it up * * * (tr. C-402). * * *

"Mr. Allen. One further question on that. Your idea on directional antennas is that they should be used in specific instances where an improvement would be made, or should an allocation plan include the required directional antennas in specific cities or areas?

"Mr. Gillett. If the gain is large, for instance, certain seacoast areas, I don't see why we shouldn't require it. That would depend essentially on the population distribution of the area in question" (tr. C-403).

Goldsmith (Du Mont)

"The use of directional antennas for the broadcast station and for receivers promises relief under some circumstances where interference would otherwise be quite extensive with regard to both cochannel and adjacent channel operation. Television receiver design improvements may contribute substantially to relief of certain interference conditions. Appropriate choice of intermediate frequency selectivity and adequate radio frequency selectivity are important factors concerning receivers which will allow for the most efficient utilization of broadcast channels" (tr. 1446).

"Directional antennas at the transmitting site may prove beneficial in serving areas of congested population where there is a scarcity of available channels. The combination of directional antennas with appropriate natural terrain distribution can readily provide some protection from interference" (tr. 1502).

Guy (TBA)

"T. B. A. takes the position that the Commission should revise their policy with respect to directional antennas to permit their use, if not to encourage it.

"I see no reason why directional antennas for television cannot be developed and manufactured just like any other piece of television equipment. We feel that when there is a demand for such antennas they will become available.

"We feel that by the use of directional antennas it will probably be possible to make grants in a number of instances where it would not be possible to otherwise make them without causing destructive interference" (tr. 1780).

Herbst (RCA)

Regarding high gain and directional antennas, RCA has completed the development work on such equipment and is in the position to supply such radiating systems on order. The realizable power gain of omnidirectional antennas is in the order of 20:1 the directional patterns available are an offset circular pattern, cardloid pattern, and bidirectional pattern. The ratio of the power radiated in the direction of the maximum and in the direction of the null is in the order of 10:1. The advantages of both the high gain provided by vertical directivity and the directional characteristics in the horizontal plane may be incorporated in one antenna structure" (JTAC Rept. vol. II, annex 11D, p. 1).

Kear (ABC)

"I think * * * we should take into account the possibility of employment of directional antennas at some time when we have found they are practicable—and we may find when Mr. Goldsmith testified; I am not passing judgment on that—use the directional to reduce the interference in the television spectrum the same as we have in the standard broadcast * * * (tr. 1405). * * *

"The American Broadcasting Co. favors the use of directional antennas for television stations where such use would provide more adequate use of the spectrum space. We feel, however, that they do need proving so far as their design is concerned, before any indiscriminate licensing of stations with directional antennas is undertaken. One or two pilot installations might well be authorized and the procedure determined from their operation which could be followed in later general procedure for use of directional antennas, should the Commission decide that such action is desirable" (tr. 1885).
Lodge (CBS)

"Consistent with our viewpoint that there should be the maximum number of signals available, we recommend that the engineering standards provide for the use of directional transmitting antennas" (tr. 1816).

Lubcke (Don Lee)

"As to horizontal directivity, it has been our experience in using a horizontally directive antenna since 1940 that a horizontal directivity of a few times, such as 2, 3, or 4 is practicable, unless it is necessary to service, we might say, important segments of the public behind hills, or, in other words, located in transverse valleys" (tr. C-48).

Poppele (TBA)

"(4) Directional antenna: The Television Broadcasters Association urgently recommends that the Commission immediately review in general the question of directional antenna for television broadcast purposes and its own policy with regard thereto (tr. 1420).

"If there were not other ways in which television stations could be allocated to additional cities and towns, there would seem to be no doubt that the proposed assignments would be in the public interest. However, the operation of these additional stations on a nondirectional basis, with many of the separations as proposed, is quite similar to the operation of standard, regional, broadcasting stations with nondirectional antennas. This does not mean that the service areas of the television stations would be reduced to the same extent as would the service areas of the standard regional stations operating nondirectionally, but, rather, that the problem of protection of video stations is not greatly unlike the same problem which regional stations have faced in standard broadcast for years. Economically, the investment of a television station in a directional antenna is in a far smaller ratio in comparison with the total cost of the television plant and in comparison with television operating expenses, than is a directional antenna for a standard broadcast station. The problem of obtaining a suitable location for a directionalized television operation should be much less complicated than is the same location problem for a regional station, principally because such a television station requires only sufficient land for the erection of a tower and a transmitted building, while the regional standard broadcast station requires acres of land in order to erect a multiplicity of towers and install an adequate ground system. In areas of irregular terrain, the regional station must also find rather extensive cleared plots of ground which have no great terrain irregularities and which are purchasable. It therefore seems reasonable that full consideration should be given to the practicability of directional antennas in television allocation matters, and that because of the possible use of these antennas it is entirely feasible to provide adequate protection in areas in which the program service of other stations would not be replaceable" (tr. 1430-1432).

Siling (RCA)

"We suggest that the Commission require the use of directional transmitting antennas where such use w'l permit the operation of new stations without impairment of the public service capabilities of existing stations. The use of such antennas would make possible the operation of television stations which would not otherwise be practicable. If directional transmitting antennas are authorized, the allocation plan itself should, of course, be based on the use of such antennas, where practical" (tr. C-321).

Kaur (RMA)

"The use of directional transmitting antennas should be permitted in order to provide more effective coverage and to minimize the nuisance field in the direction of a cochannel station" (JTAC Rept., vol. II, annex 16, pp. 1–3).

ANNEX P. DIRECTIONAL RECEIVING ANTENNAS AS A SAFETY FACTOR IN AN ALLOCATION PLAN

Brown (RCA)

"There has been some discussion during these hearings * * * on whether directional antennas for receiving should be used in allocation. As Mr. Siling indicated, we believe that synchronization, proper spacing of stations should be used in an allocation plan, and we look on the receiving antennas, directional receiving antennas, as an additional insurance, the factor that takes care somewhat of our engineering guesses on the other factors, and again I say we do
not believe it should be used in the allocation plan as a governing factor, because one can easily cite instances where directional antennas just don't do any good, because of the relations of the stations and the person at the receiver” (tr. C-306-307).

Fink (JTAC)
“Receiving antennas having horizontal directivity are likewise practicable and may be employed by the public to avoid interference in many stations, particularly in locations collinear with the desired and interfering stations. But in situations where interference may be experienced from more than one direction, and particularly where the desired and interfering stations lie in nearly the same direction, their utility is much reduced. In any event, it is the conviction of JTAC that the allocation should not rely on the possible use by the public of highly directive receiving antennas” (tr. C-54).

Goldsmith (Du Mont)
“The television receiving antenna can serve to minimize, in many cases, the interference which would be indicated by use of the cochannel and adjacent channel curves shown on the transparent charts of exhibits K, L, and M. At Cleveland, for example, parts of the interference areas would receive service in spite of signals from Detroit because, generally speaking, the dipole antennas would be directed toward Cleveland and would be end on for a minimum signal reception from Detroit” (tr. 1504).

Kear (ABC)
“So the problem of receiving antennas is one which must be preserved for elimination of ghosts and for satisfactory service in the receiver, and I think not considered in connection with protection of cochannel stations” (tr. 1412).

Lodge (CBS)
“There are two I have in mind. First * * * if the receiving antenna were directional in nature, that a closer spacing would be feasible?” (tr. 1896).
“It was only trying to bring out that if directional antennas were used at the home receiver, some of the people who where listed as not receiving service in your data might be able to improve their situation * * *” (tr. 1897).

Siling (RCA)
“High-gain directional television receiving antennas with high front-to-back ratios are now available. Since the receiving antenna is an element of television service not under the control of the Commission, it cannot, of course, be used directly as one of the bases for an allocation plan. Nevertheless, such antennas are very effective in eliminating interference and constitute an important safety factor for whatever allocation plan may be determined. It is suggested that the Commission may wish to recommend the use of such receiving antennas as one means of neutralizing interference in troublesome fringe areas” (tr. C-321).

ANNEX Q. COMPARISON OF COVERAGE ON CHANNELS 2 TO 6 AND 7 TO 13 VERSUS THE EQUAL POWER CONCEPT FOR ALL STATIONS IN THE SAME CITY

Kear (ABC)
“The following conclusions may be drawn from the results of the foregoing tests * * *
‘First, the voltage delivered across the receiver input terminals for a given installation varies considerably with frequency. * * * A given field intensity on the low channels will produce substantially greater receiver terminal voltages than the same field intensity on the high channels, when reasonable, practical, and properly insalled receiving antennas are used. * * * ‘Second, the radials made generally north of New York show a tendency for channel 5 to establish a more nearly uniform field and to be less affected by rise and fall of the terrain. * * *
‘On the basis of the foregoing observations it is believed that further consideration and study should be given to the meaning of field intensity insofar as it affects service on the television channels. On the basis of these observations, it can be concluded that provision should be made for equalizing the service on the various channels” (tr. 82-84).

Kirchner (consulting engineer)
Kirchner compared the voltage at the receiver terminals on channel 4 and channel 11 in New York to determine what power increase would be required on
channel 11 to make the coverage equivalent to that given by channel 4 (tr. C-220-221). After plotting the measurements, he found that power increases for channel 11 of up to 100 times would be required to bring the voltage at dipole terminals equal to channel 4 in the 1- to 2-mile sector (tr. C-221). In the 5- to 10-mile sector, a power increase of approximately 10 times would be required (tr. C-221). From 10 to 40 miles, power increases of perhaps 8 times would be required to obtain equal voltage at the dipole terminals (tr. C-222). For 70 percent of the median sectors to give equivalent dipole voltage, a power increase of 11 times would be required, and for 50 percent of all sectors to give equivalent dipole voltage, a power increase of 9 times would be required (tr. C-222).

Fink (JTAC)

"There is a footnote to the effect that we are using in this report the customary units for denoting service contours and field intensities, namely microvolts per meter or millivolts per meter. The IRE Wave Propagation Committee has brought to the attention of JTAC the opinion that these units are not particularly well suited to allocations problems, particularly for services covering a wide range of frequencies, and in addition to the record here the suggestion was made that a unit of power density, such as watts per square meter, or watts per square wavelength, would be a more appropriate and more suitable unit to measurement, in that it would minimize variations in reception conditions which occur with frequency if microvolts per meter is used.

"JTAC, however, does not wish to inject that change at this time, for very obvious reasons. We do feel, however, that it will be a very pertinent matter for discussion in the future, and possibly before the standards are written (tr. C-241).

"The FCC value of 500 microvolts per meter is shown to be satisfactory for the low-band channels 2 through 6, but on the low side for the high-band channels 7 through 12" (tr. C-242).

"The requirement for higher field strengths on the high band channels and in the presence of ignition interference may justify the establishment of a higher value than 500 microvolts per meter (tr. C-243).

"The signal strength for suburban-rural television service on channels 7 through 13 should be somewhat greater than that for channel 2 through 6. A value between 500 and 1,000 microvolts is recommended for channels 7 through 13" (tr. C-290).

Gillett (consulting engineer)

"The measurements introduced by Mr. Ring for WPIX, Dr. Kear for WJZ-TV and Dr. Brown's earlier measurements confirm our measurements at WATV as well as fundamental studies which show that if the basic concept incorporated in the present allocation at the television stations on the various channels in a given metropolitan area shall have an equal service range, we will have to abandon the equal power limit for these stations.

"Our studies indicate that the service areas can be approximately equalized if the stations are granted effective powers increasing with frequency so that they deliver an equal field strength per wavelength at the outer service limit at the stations. This approximation apparently fits quite well the sum of all the factors entering into the result and has the very real advantage for regulatory purposes that it is easily defined and understood (tr. C-390) ** **

"Mr. Allen. Now, your recommendation includes not setting a particular power assignment but that the power should go up with the frequency so as to include approximately the same service radius.

"Mr. Gillett. Yes. If you are going to maintain the concept on which the allocation was apparently based, that the various stations in a given area should have the same service area, then the measurements which we have made of WATV and others introduced here, shows that you must give the high frequency stations much more power relatively. That is due to the fact that the grazing influence is much larger—the effects of trees and buildings, is much larger. And measurements of WATV show many such examples of differences along a tree-lined avenue as compared with open terrain. So you can't just blast through and get anything like the same coverage as the lower frequencies.

"Mr. Hoese. That would mean that the high band stations would have something like ten times the power of low band stations?

"Mr. Gillett. That is right. You will have to do that if you are going to give them the same service area (tr. C-390-400) ** **

* * *
"Mr. Boese. In other words, you would think that before we raise the power permitted on the lower channel beyond 50 kilowatts, we should wait until we get 50 kilowatts on the higher band?

"Mr. Gillett. Yes, or whether you allow the high band to go up to antenna height under the present rules to get increased coverage by increasing their antenna height. There are other ways of getting power. Also, it is easier to get high gain on the higher frequencies. So the effective power, not the transmitting power must be increased (tr. C-401) * * *

"Mr. Heffernan. Mr. Gillett, in correcting for this apparent lesser coverage on the higher band, would it be your opinion as a matter of procedure that the Commission might abide by its present 4/3 earth curve in the standards and apply this field correction with frequency that you have, or that the Commission should try to establish a different set of curves which included the frequency effect in the propagation curve?

"Mr. Gillett. Well, actually we arrived at the approximation on the assumption that the present curves would continue to be used. And if you change your curves, then you will have to change your correction factor to correspond, if the change is large enough. We are not advocating that this is good to the second decimal point, or a significant figure. I question whether regulatory practices should be based on the second significant figure for the most part.

"Mr. Allen. As a simple procedure, then, you feel it would be equally satisfactory to maintain the present curves and then use a correction factor, in other words, as you have suggested here?

"Mr. Gillett. Use a Butcher factor to make up for it. After all, they are not very close to the facts. Whatever they do, they are computed on an average condition that doesn't fit the individual condition too closely (tr. C-410) * * *

"Mr. Heffernan. Mr. Gillett, I would like to go back to your Butcher factor for a moment. You mentioned the ignition and diathermy interference.

"Mr. Gillett. Yes.

"Mr. Heffernan. In determining what your Butcher factor should be, I take it you would agree that that kind of interference to which the lower channels are more subject than the upper channels, is one of the factors that ought to be taken into consideration; is that right?

"Mr. Gillett. Oh, sure. I don't advocate being blind to any facts" (tr. C-416).

Wilmotte (consulting engineer)

"There has been some discussion on this equality of area problem, on the principle that all the stations covering a particular town should have all the same service. Mr. Gillett pointed out that in order to do that it would be necessary for the higher frequency stations to have more power than the lower frequency stations. At the same time he said that the maximum power available should be used at all frequencies. Since the likelihood is that the equipment is likely to be more difficult to produce for high power at high frequencies than at low frequencies, there is a contradiction in the proposal. I should have asked Mr. Gillett his opinion at that time but I did not think about it until afterward. However, it leads to this:

"It seems to me that it should be pointed out to the Commission that if they retain the principle that the engineering interpretation of equal area for all the stations, means that the public will receive the minimum service that can be obtained over the frequency band and over various conditions such as the ownership of a high tower, or the ownership of a high building.

"That, I think, is the engineering presentation, and separated from the social aspect as to the relative merits to the American public of reducing the degree of competition. The point should be presented I think clearly that the principles imply a minimum service and not a maximum service" (tr. C-516-517).

ANNEX B. THE USE OF HIGHER EFFECTIVE RADIATED POWER WHERE NEEDED TO PRODUCE ADEQUATE SERVICE AND WHERE CONSISTENT WITH THE STANDARDS

Duttera (NBC)

"We feel that, under prevailing interference conditions, it is only by the use of higher power that improved reception can be provided for the public throughout the service area of a television station. This interference results from automobile ignition, diathermy, amateur stations, and other types of man-made electrical noise."
“The use of higher power may also make it possible to reduce the cost of television receivers.

“Accordingly, we recommend that the Commission authorize increases in power where such increases would be consistent with the standards which it may determine relating to tropospheric propagation and protected contours” (tr. 1755-1756).

Guy (TBA)

“I would like to point out the situation in one city with which I am particularly familiar. Now the Commission’s power lid is 50 kilowatts and 500 feet. In New York City we have a very large metropolitan district as defined by the United States Bureau of Census.

“With the present Federal Communications Commission power lid it is not possible for a New York television station to serve more than about 25 percent of the metropolitan district with the 5 millivolts, your standard of service. There are other cities where 50 kilowatts and 500 feet is adequate and there are probably now, or there may be in the future, other communities, metropolitan districts where less than 50 kilowatts at 500 feet would be adequate to serve their area and population.

“Therefore Television Broadcasters Association feels that the Commission should keep an open mind with respect to power and make grants where power is needed to adequately serve the areas” (tr. 1781-1782).

Goldsmith (Du Mont)

“We recommend that the Commission’s rules placing a limit of 50 kilowatts at 500 feet for metropolitan stations be amended upward to allow a maximum power corresponding to 500 kilowatts at 500 feet. If all television stations were to increase their power by the same percentage, the mutual interference conditions between stations would not be altered seriously. The interference boundaries would still be in about the same position. Thus, the same minimum spacing conditions would satisfy this higher power. However, television receiver owners would experience a considerable improvement in signal-to-noise ratio, the receivers being able to operate much more satisfactorily in the presence of industrial noise and other nontelevision interference” (tr. 1513).

Sitting (RCA)

“We believe that the Commission should authorize the use of higher power for television stations, and, if that is done, revise the protected contour of such stations accordingly.

“We feel that by the use of higher power improved reception can be provided for the public throughout the service area of a television station. Higher power would also make possible the simplification of receiving antennas and the installation of television receivers. Accordingly, we suggest that the Commission authorize increases in power where such increases would be consistent with the standards which it may determine relating to tropospheric propagation and protected contours” (tr. C-322).

RMA Committee T8-3

“The committee notes that, with the present allocation structure based on 50-kilowatt 500-foot stations, many stations having antennas higher than this are operating at reduced powers. In many cases, it has been necessary to reduce the transmitter power output to 50 percent of the rated transmitter output. We feel that this is unfortunate, since the service provided is degraded to a level lower than that which the transmitter could provide were it operated at full output.”

“It is felt that effective radiated powers must be increased beyond the presently contemplated 50-kilowatt ceiling. If the power increases are made in ‘horizontal’ fashion, the quality of service will be improved over a given area. This will mean that existing ideas of protected contours will have to be revised upwards, but the service areas will remain unaffected. Thus, the committee feels, is a very desirable object, and urges that its accomplishment be planned and expedited” (JTAC rept., vol. II, annex 7, pp.4-5).
### Status of UHF and Multiple Ownership of TV Stations

#### Annex S.—Analysis of pending applications in terms of height and power requested

| City and State | Channel | Power | Height | Equivalent power at 500 feet

1 Computed from appendix IV of the Standards of Good Engineering Practice. 
2 As used herein, "—", indicates that calculation of equivalent power at 500 feet has not been made either because the height specified in the application is within a few feet of 500 feet and consequently there would be no appreciable change in power, or because the height specified is less than 100 feet and there is no means afforded by appendix IV of the standards for converting such heights into 500 feet equivalents. 
3 Indicates request for change of existing station or modification of CP. Italic represents change from original authorization sought. 
4 Over 1,000 kilowatts. 
5 100 feet above ground-height above average terrain not available. 
6 700 feet above ground. Height above average terrain not available.

1 Computed from appendix IV of the Standards of Good Engineering Practice.
2 Calculation of equivalent power at 500 feet has not been made either because the height specified in the application is within a few feet of 500 feet and consequently there would be no appreciable change in power, or because the height specified is less than 100 feet and there is no means afforded by appendix IV of the standards for converting such heights into 500-foot equivalents.
3 Over 1,000 kilowatts.

**Blonder-Tongue Laboratories, Inc.,**

**Hon. Charles E. Potter,**
Senate Office Building,
Washington, D. C.

Dear Senator Potter: We most sincerely urge you and your committee to give all possible support to the continuance and growth of UHF television.

Entertainment, education, and news coverage through the magic window of television is now possible for many additional millions of people. This has only been made possible by the establishment of many new UHF stations.

Regarding the fallacious opinion that these areas might have been covered by VHF channels, we in the television business know that good reception is possible at distances over 200 miles with VHF channels, and we have received many complaints in regard to reception difficulties where several channels can be received on the same, or adjacent frequencies.

The addition of local UHF stations transmitting on widely separated frequencies is the only answer, and we have already received a great many expressions of thanks for the equipment we manufacture which adapts VHF sets to receive all of the new UHF channels. This group also includes subscribers to community and master TV systems which provide both UHF and VHF to an estimated...
1 million viewers in remotely located cities and towns, and also the tenants of hotels, apartment houses, etc., all over the country.

Thanking you, I remain,

Very truly yours,

JOSPEH H. KERNER, Sales Manager.

AERO SALES CO.,

Hon. CHARLES POTTER,
United States Senate,
Washington, D. C.

DEAR SIR: The present confused state of UHF-TV and its effect on our local station W'AG-TV (UHF), is of great concern to our association.

We feel that its operation is in jeopardy and that the loss of the station would be a great loss to this community, both culturally, as well as, a local public service. It is our feeling that the mixing of high power VHF coverage in this region, works an insurmountable handicap for the local UHF station. Needless to state, public acceptance of UHF is extremely difficult to arouse on any equitable volume basis, which we feel is the direct result of mixing as above stated.

In our opinion, the present situation tends to create a VHF monopoly, which if allowed to continue, is likely to result in the loss of local TV service to communities such as ours.

We respectfully ask that you use any influence you may feel warranted to correct the inequities in the present situation.

Yours very truly,

J. E. LITTELL,
Secretary, Ann Arbor Television Service Association.

WTAD-TV, MIDDLESEX BROADCASTING CORP.,

Hon. CHARLES E. POTTER,
United States Senate,
Washington, D. C.

DEAR SIR: As recently as February 1, 1954, in a letter to Commissioner George E. Sterling I expressed the feeling that intermixture of VHF and UHF channels in the same community was necessary to provide for a truly nationwide TV service. However, on that date I also stated that in my mind I had some doubt that UHF's problems would be of short-term duration if the current trend continued; also, that some of the economic problems arising out of intermixture might seriously hamper the healthy, competitive growth of television. On that date I requested that a hearing be set up by the FCC to consider the economic and financial problems arising out of intermixture, before any further VHF stations were given construction permits in currently intermixed areas.

In my opinion, fast-moving events of the past 3 months clearly indicate that intermixture is not working out satisfactorily; UHF economic problems are now reaching crisis proportions; the future development of the entire television industry is seriously affected; public interest, investment and faith dangle precariously in the balance.

On February 28, 1954, Du Mont terminated television broadcast service to Kansas City from UHF station KCTV (channel 25). This action began what appears to be a continuing chain-reaction of UHF shutdowns in intermixed areas. UHF stations are rapidly becoming a statistical series of disasters. The trend indicates an increasing and alarming rate of UHF failures; these shutdowns are strong evidence of UHF economic vulnerability in intermixed areas and stronger evidence that intermixture is seriously breaking down.

In my opinion, the protection of the public interest, the development of UHF, and the solution to the intermixture problem will not be found by allowing the current economic trend to continue. If the Commission wants to develop properly
a strong nationwide television service, may I request that an immediate halt be called to the further issuance of VHF permits in intermixed areas.

I am now convinced that many of the currently unassigned UHF channels will be needed in working out a solution to intermixture.

Sincerely,

FRANK LYMAN, Jr., President.

THAMES BROADCASTING CORP.,

Senator CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Interstate and Foreign Commerce Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR POTTER: This communication is in compliance with your invitation for comment from the UHF industry.

UHF—the upper high frequency band in television—has now reached the end of its second complete year. And, with it, this spectrum has reached the crossroads, in the opinion of many executives at every level of the radio-broadcasting industry. VHF's past is black, and its future is bleak, say many of the experts—people in a position to know.

Many serious questions are now being raised concerning UHF. Can it ultimately succeed, technically? Can it survive, economically? And—transcending all other questions in importance—is the public being served to the limit of America's ability? Your own special congressional subcommittee is now reviewing the whole UHF question. In an effort to aid this committee, and to help supply some of the answers to the questions asked above, this letter presents a succinct analysis of the entire UHF problem. The data contained herein represents the findings of this company, in a continuing 2-year study of ultrahigh frequency. The conclusions drawn are based upon the beliefs of numerous experts in the radio-television field—engineers, station operators, general managers, economists, advertising agency executives, and firms engaged in station representation.

Primarily, whence came UHF? UHF was designated in April 1952 as a new spectrum to fill the gaping void in television service, in this country. The VHF spectrum was—and still is—grossly inadequate and ineffective, in its service to the public of the United States. Exactly what were UHF's aims; goals; overall purpose? To better serve the public:

1. Through an adequate, more effective, TV system. As a result of the new spectrum, the American public hoped—
   (a) For a greatly expanded television reception.
   (b) For a real selectivity in stations, on their home TV set.
   (c) For a choice of networks on their home TV set.
2. By means of a highly desirable UHF service, available to every home, without forcing that home to pay a prohibitive price for such service.
3. From the station standpoint, the UHF operator was encouraged by this cheering news: the admittedly powerful sending signal of existing VHF stations would be offset by compensating power to be allotted UHF stations (up to 1 million watts, of generated power) it was pointed out.
   (a) Network service would be readily available, it was assumed, with
      (at least) a four-network system, i.e., CBS, NBC, ABC and Du Mont.
   (b) Station operating costs (it was hoped) for UHF would be no higher than operating costs for a VHF station, the income being much lower than VHF.
4. Viewed from the national-economy standpoint: The new UHF allocation promised to revitalize the important TV-set industry and many millions of additional sets would be sold, everyone thought. And so, everyone within and without the industry, in fact, the country as a whole, looked forward, hopefully, to fulfilling the promise held out in the new allocation, confident in their knowledge that America can lick any problem, even UHF. And so, what happened? Just this: After 2 long years of blood, sweat, and tears, the great majority of folks in the industry are in agreement on one point: Appraised as a whole, UHF is a fiasco, and steadily deteriorating.
   (a) From the public's viewpoint: Instead of filling the void left by VHF, UHF has proven merely a weak, supplementary service to the public, expensive, inadequate, often exposing the viewers to pitiful programs, 10th-rate
films, no network service, inconsistent signal, inadequate signal, or no signal at all.

(b) From the station operator's standpoint: Many stations have been unable to obtain network service; others have lost the network when a VHF became available; still others fear losing it, in the future, to a VHF (perhaps now in a hearing) when that VHF goes on the air.

(c) Ten stations have now either been sold to avoid business failure, or suspended operation for the same reason. More are expected. Forty-eight additional UHF licenses have been turned back to the FCC.

(d) The TV set industry failed to come up to expectation, because of UHF's failure.

But, you ask, why has UHF been a failure? Why can't American initiative, inventive genius, and manufacturing ability, lick the UHF problems? Where did it fail? Is there a better method of expanding the American television system? Over all other considerations, is the public being served by a continuance of the UHF allocation, in its present form? There are many reasons for UHF's failure. Specifically, these fall into three main headings:

(1) Set difficulties.
(2) Station difficulties.
(3) Failure of equipment manufacturers to deliver.

Let's look at the reasons from these three different vantage points.

(1) Set difficulties:
(a) All-band TV sets at one low price are not yet available, and the sensitivity is extremely inferior on the existing higher cost all-band sets.
(b) Comparable UHF sensitivity not only does not now exist but it is doubtful if it ever will, because, in the opinion of the experts, no sincere effort has been made by leading manufacturers to produce UHF receiver tubes and circuitry, capable of adequate performance.
(c) In the case of UHF converters, the sensitivity is equally, highly inadequate.
(d) Yet, despite this unsatisfactory performance, the overall cost of conversion remains prohibitively high, for the average American family.

(2) Station difficulties:
(a) Two years have elapsed since UHF came into being, yet the manufacturers have failed to produce a satisfactory, high-power UHF transmitter. Many highly regarded figures in the industry, seriously challenge the sincerity of the manufacturers' efforts in behalf of UHF, particularly when leading equipment manufacturers are inextricably involved in the VHF field, and TV network ownership.
(b) Cost of maintaining a UHF transmitter is so prohibitive as to be unsound, economically.
(c) Instead of the compensating power designed to put UHF on an equal footing with VHF, as promised by the Commission, UHF almost from its inception was working against itself, when superpower, and high antenna privileges extended to VHF stations by the FCC, proved an almost insuperable economic barrier to overcome, for new UHF stations.
(d) Because of the difficulty outlined in (c) above, station owners find it very difficult, indeed, to obtain—
   (1) Network affiliations.
   (2) National-spot business.
   (3) Regional business.
(e) The stations thus wind up with inferior programing and hence, offer little incentive for the public to convert sets to UHF.
(f) UHF stations are now boasting coverage up to, and selling advertising based upon, their 100-microvolt contour, a service apparently never envisaged by the FCC when the Commission granted so-called super power to VHF stations. This has had an added crippling effect to UHF operators.
(g) On the one hand, color has been held up as the probable all-powerful future salvation of UHF. On the other hand, the possibility of moderate-cost color in the near future has actually had a definite retarding effect on UHF conversion, with the public.
(h) Further, once again the manufacturers' sincerity is suspect, in that the first color TV sets coming off the assembly lines are geared for VHF only.
(i) Another farcical factor faced by stations struggling for conversions: Manufacturers have so reduced the cost of brand new VHF sets that, in
many cities, it is possible to buy a VHF set, for less money than it costs to convert an old set to UHF.

(1) While it is a fact that a handful of UHF stations are ostensibly flourishing, the following factors have a sobering effect on any enthusiasm raised by these few outlets:

(1) Such stations are usually enjoying a temporary, false prosperity because of contributing factors such as these: VHF service has been postponed because two or more applicants are tied up in hearing; or the VHF station servicing the area has not yet availed itself of allotted super power.

(2) Further, such stations are usually enjoying top network service temporarily pending the entrance into the field of a VHF station, delayed from the scheme first mentioned (1) above. More often than not, the existing UHF loses its network affiliation to the VHF, then.

(3) For every station that seems to be enjoying this temporary success, based upon a false foundation, there are dozens of others, either in the red, in a perilous financial condition, or, at best, in a dangerous status quo.

(3) Manufacturers' difficulties:

(a) Manufacturers have failed to produce a UHF transmitter with power anywhere near comparable to VHF.

(b) Manufacturers have failed to produce a one, low-priced, all-channel set.

(c) Life span of UHF transmitter tubes is but a fraction of VHF tubes' life span.

(d) Despite this short span of life, the UHF transmitter tubes are ridiculously costly compared with VHF tubes.

(e) Maintenance costs for UHF transmitters are fantastically high.

(f) Manufacturers have found engineering bugs in UHF equipment to be innumerable and insuperable.

Who is to blame for the UHF fiasco? There is a great unanimity of opinion throughout the entire television-broadcasting industry, holding that the FCC is entirely inculpable. In fact, when one stops to consider the gigantic workload accomplished by the Federal Communications Commission in both radio and television, since 1947, with a limited budget, one can only agree with this consensus: that it (the Commission) has done a monumental job, with a modicum of money.

In the case of UHF, the Commission certainly was well motivated. And, while great technical difficulty was foreseen for UHF, few, if any, folks in the industry expected that, after 2 years, the new spectrum would still be in a state of retrogression, instead of healthy progress.

Indeed, the Commissioners, like the rest of us, doubtless take great hope from statements like the following (every time we feel like throwing in the sponge): "Manufacturers see hope ahead for UHF." "UHF still very much alive." (The corpse moved a little, when kicked again, as rigor mortis had not as yet set in.)

"Experts see UHF as a genuine competitive system, with some technical improvements."

"UHF bugs will be straightened out in the years ahead," etc.

Yes, you've seen statements like these; we all read them, every day, in the trade press. But UHF continues on the downside, with its basic problems entirely unsolved.

Well, what is the honest, factual, future of UHF? We discussed UHF's future with scores of radio-television people, at every level. A handful were optimistic; a surprisingly small segment expressed hope; the great majority of people in a position to predict, however, foresaw nothing but disaster ahead. Here are some of the consequences still to be faced, in the opinion of the experts, should UHF be continued in its present form:

(1) There will be scores of additional failures among UHF stations. And, while it is not within the Commission's purview to fret over the financial survival of station operators, yet, all are agreed that such a shaky financial foundation angers anything but a bright future for the television industry, but, on the contrary, portends a shaky structure, indeed.

(2) The VHF system, through consistent aggrandizement will become one of the most powerful, invincible, financial monopolies ever perpetuated in this country. It already has a giant start, thanks to UHF.

(3) Over all else—just as they have not been served in the past by this system, just as they are not being served, presently, by this spectrum, the public will not
be served in the future, through a continuation of UHF in its present form, because—

(a) Millions of American homes will continue to be denied anything better than grade C television service.
(b) Millions of American homes will continue to be denied a selectivity of TV stations, for home entertainment.
(c) Millions of American homes will continue to be denied a choice of network service.

(4) Consequently, television can never be the great medium that it should be in America, despite its great popularity with the American people.

"In short," roar the experts in the UHF field, "the public is not being served, and the FCC would do well to act before it's too late.

Many radio-television people saw definite dangers ahead on "promises." "Watch out for these manufacturers' promises," they warned, "they'll generate terrific enthusiasm for a one, low-priced, all-channel, set that they have coming off the line. Later, after the Senate subcommittee, the Commission and the industry take on new hope, we'll discover that it's an 'all-channel' set, in name only. The sensitivity will still be inferior; the circuitry inadequate, and the performance, nebulous. But, the damage will be done! Next, you'll be hearing about a powerhouse. UHF transmitter, 50 kilowatt probably! The Joker, however, is that maintenance power and tube costs for such a transmitter would run into such astronomical figures, as to be fool-hardy. Watch out for such promises!" (These comments crystallize the opinions expressed around the industry, although, in almost every case, the speaker did not care to be quoted.)

Well, what about therapy? What can be done to put American television in a stable, sound position? To establish a truly competitive system? Cures, remedies, and pain-killers were a dime a dozen, from Madison Avenue to Sunset Boulevard. However, again, a great majority of the experts, particularly in the engineering field, were in agreement. The one, great, panacea, they insisted, is to break down the VHF system, in any one of many ways, such as:

1. More realistic and practical use of the present FM band.
2. The use of directional antennae in VHF.
3. Possible use of frequencies now held by the Government and other services.
4. There are several additional plans which are feasible.

Although some difficulties would have to be faced, should UHF be discarded, and a greater use of VHF be made, these difficulties do not compare, in number, nor intensity, with the problems faced by a continued ultra high frequency system. In fact, they are anything but insurmountable:

1. The present VHF stations need not be affected in any way, should UHF be entirely supplanted by a larger VHF spectrum. Their power need not be reduced; their resources need not be jeopardized; and their influence need not be curtailed. In short, the change can be made with impunity to present VHF operations, and with facility by the industry.
2. There is hardly an existing UHF operator who would not gladly swap his permit for a VHF license. The revenue realized, ultimately, would far exceed the expenditure outlay for the changeover.
3. A truly competitive TV system would then exist in America, rather than the unilateral monopoly now scaring the industry.

4. The TV set industry would realize the most wonderful impact ever experienced. Millions of additional sets could be sold; there would be a consistent, year-round, market for sets, thus eliminating the present seasonal, soft spots, perennially plaguing the TV set industry. Overall, this would have a powerful salutary effect, on the nation's economy.

5. And again, over all else, the public would be served as it never can be, with the present UHF system.

Respectfully submitted.

THE THAMES BROADCASTING CORP.,
GERALD J. MOREY, President.

Your attention is also directed to the detailed causes for the suspension of operations, given by the owners of WTAC-TV, Flint, Mich.; and WFPG-TV, Atlantic City. The reasons outlined coincide, closely, with the UHF problems and difficulties enumerated in our earlier letter to your office. Incidentally, WFPG-TV, Atlantic City, was the first UHF station on the air, and the nearest VHF station is 60 miles away.
Respectfully submitted.

Gerald J. Morey, President, The Thames Broadcasting Corp.

**Lansing Broadcasting Co.,**
**WILS-AM TV,**

**Hon. Charles E. Potter,**
**United States Senate, Washington, D. C.**

Dear Senator Potter: My company operates UHF television station WILS-TV and Radio Station WILS in Lansing. A prefrequency VHF station is also operating in Lansing on channel 6 in conjunction with another radio station. The VHF station has primary affiliations with NBC, CBS, ABC, and Du Mont television networks. In addition, they teletech exclusively all of the regional sports and special events, such as Detroit baseball, hockey, and boxing. Because of their monopolistic practices, we are unable to obtain any first class network programming and carry only what the VHF station discards from the ABC and Du Mont television networks. We are not allowed to carry any CBS or NBC programs whatsoever.

Furthermore, the VHF operation uses their superpower television station as a wedge to coerce radio advertising for their radio station in favor of our radio station.

To make matters even worse, the Federal Communication Commission recently made a new channel 10 VHF allocation to Parma-Onandaga, Mich, only a few miles from Lansing. These villages are under 1,000 population and receive television service from several stations. There are three applicants for this channel and a grant is eminent. This action will completely squeeze us out of the television business. This channel 10 allocation could be utilized equally well to serve Lansing, but my company is not in a financial position because of the large investment and losses in UHF to compete for channel 10 in a hearing. If present trends continue, the present Lansing VHF station and the new channel 10 station will share the four networks and we will be left with nothing. On the other hand, if we were allowed to change to channel 10, it would solve
the problem because we would be competitive with the Lansing channel 6 station. We would be financially able to make the switch if no hearing were involved.

The UHF station WBKZ in Battle Creek has closed, UHF station WTAC in Flint is closing and it is my understanding that UHF station WPAG in Ann Arbor is going to close unless some immediate relief is forthcoming. This leaves only two commercial UHF stations in Michigan, WKNX in Saginaw and ourselves. Unless there is some immediate action taken such as mentioned in the preceding paragraph, we will cease operations and that will leave only WKNX. Michigan television will be monopolized by a few VHF operators. This is a bad situation and I trust your committee will take appropriate immediate action.

Respectfully yours,

John C. Pomeroy,
President and General Manager.

Senator Potter,
Washington, D. C.:

Our company is one of the many who has backed UHF with millions of dollars only to find no market for our products due to poor programs by these stations. Government assistance is imperative in allocating network programs with financial assistance until a listening audience can be established and stations become self-sustaining.

Allen D. Cardwell Electronics Production Corp.,
Ralph H. Soby, President.

City Island, N.Y., May 10, 1954.

Hon. Charles E. Potter,
United States Senate, Washington, D.C.

Dear Senator Potter: I note, with great interest the various thoughts that are being developed regarding the future of UHF. As you know, in Michigan, one station at Battle Creek has discontinued operation. The other applicant at Battle Creek has delayed construction and, in the city of Flint, a large community without a local VHF signal, operation has also been discontinued. There may be individual factors that govern these decisions that I am not aware of, but it is regrettable that this is taking place; however, I surely want to wish you success in helping develop a plan that will give the public this additional service. While I realize that there are many obstacles in developing any plan, I will outline the thought that I discussed with you and briefly state the reasons:

1. I believe we all agree the only reason for adding a convertor, or purchasing an all channel receiver in a mixed VHF and UHF market, would be to get an additional choice of programs.

2. However good the quality, a new station with programs that are not known to the viewers in the area, would find it difficult to have a rapid conversion to UHF.

3. Television manufacturers should be vitally interested in the success of UHF.

4. I believe that the television manufacturers have programs on the air today that are familiar to all in television areas.

5. Should it be possible to transfer these programs to a new UHF station for 6 months or more and then revert to the station of their choice, I believe sufficient momentum would have been instigated to place this first UHF station, and the others that might open later, in a position to make it possible to continue in business.

6. The addition of 8 or 10 of these "Name" shows to a weekly schedule would do a great deal to encourage others to place programs on this station.

7. It would be essential to discontinue these programs on other stations that now place a good signal in the UHF area.

It might be advisable to also check into the following:

8. Purchasers of almost all TV sets sold in the past 3 years were told they could put tuning strips so as to add UHF stations at about $10 each.

48550-54—8
In response to your query regarding our reasons for the indefinite suspension of our construction of WLAP-TV on UHF channel 27, we are attaching hereto a

(9) Purchasers of these sets are now being told that these strips are not satisfactory.

(10) I believe your committee could determine which make of sets provide a good signal with the addition of these strips.

Respectfully,

GEORGE WEDEMEYER, President.

ANN ARBOR, MICH., May 7, 1954.

HON. CHARLES E. POTTER,
United States Senator, Ann Arbor, Mich.

Hon. Charles E. Potter, United States Senator from Michigan,
Washington, D. C.

Dear Senator Potter: I have been in the radio, electronics, and television business since their respective beginnings and am very much concerned with the present confused state of the UHF television frequency allocations.

As matters now stand, the public cannot hope to get the local television service and coverage they want and deserve unless the situation is cleared up immediately.

I urge an immediate freeze on TV applications and power until a satisfactory plan can be evolved to clear up the present bad situation.

The Senate hearings scheduled for the 19th, 20th, and 21st of this month should produce ample evidence, along with the recommendations of qualified engineers, as to what needs to be done.

Your careful consideration of all the factors involved in this important situation will be greatly appreciated.

Sincerely,

GEORGE WEDEMEYER, President.

ANN ARBOR, MICH., May 7, 1954.

HON. CHARLES E. POTTER,
United States Senator, Washington, D. C.:

Consider freeze of all TV applications imperative until just solution of television channels and power is effected.

WEDEMEYER ELECTRONIC SUPPLY CO.,
GEORGE WEDEMEYER, President.

LEXINGTON, KY., April 29, 1954.

Senator Charles E. Potter,
Chairman, Subcommittee on Communications,
Interstate and Foreign Commerce Committee,
Senate Office Building, Washington, D. C.

Dear Senator Potter: In the absence of Mr. Gilmore Nunn, president of station WLAP (American Broadcasting Corp.) your good letter of April 22 has been referred to me for reply.

First, in the interest of accuracy, may I respectfully point out that we have not returned our construction permit for a television station on UHF channel 27 to the FCC. Although we have suspended all construction work on WLAP-TV at this time, we retain our construction permit in the hope that by some unlikely miracle, the many inadequacies of UHF television, as compared to VHF, may be overcome.

In the meantime, in a continuing effort to provide this important central and eastern Kentucky area with the real television service it needs and deserves, we have petitioned the FCC to allocate VHF channel 4 to this area. This can be accomplished simply by placing this area within zone 1 where, in our opinion, it rightfully belongs, instead of in zone 2 as at present. Our petition to the FCC sets forth in detail the facts to substantiate our petition. Should the FCC act favorably assigning VHF channel 4 to this area, we will immediately file application for a construction permit for channel 4. Other applicants would, of course, be privileged to do likewise.

In response to your query regarding our reasons for the indefinite suspension of our construction of WLAP-TV on UHF channel 27, we are attaching hereto a
small pamphlet published in February 1954 and distributed by WLAP and which spells out those reasons in detail. We also enclose a tear sheet of a full-page newspaper advertisement which appeared in the Lexington newspapers on February 19 and 20 which contains identical copy.

We hope the information supplied herein will be helpful to you and your committee. If we can be of further service, please command us.

Respectfully submitted.

J. E. Willis,
Vice President and General Manager.

[From the Lexington (Ky.) Leader, February 19, 1954]

SO THE PEOPLE MAY KNOW

It is with mixed emotions, and a confidence of public understanding, that we announce an indefinite postponement of the construction of the WLAP-TV channel 27 UHF television operation.

After having spent 7 years of work and over $100,000 on our television efforts to date, it is hardly necessary to say that our decision was made with great reluctance, and in what we believe to be the best interests of the public. The necessity of such a decision was indicated some 2 weeks ago at which time we stopped construction on our new studios on the Belt Line. In the meantime, while preparing this statement, we have been conferring with the Federal Communications Commission, the television networks with which we had already become affiliated, tower and equipment manufacturers, suppliers and other facets of the industry. On the brighter side, we are renewing our efforts and hope to obtain for this area one of the standard, well-established VHF channels through which this entire area may receive the proven, acceptable type of television service it demands and deserves. We, who have served you over WLAP since the first days of radio, had confidently expected to bring to central Kentucky the best in television, and in our mutual interests feel we can accept no compromise.

In 1948 we were filing for the VHF channel (4), originally assigned to this area, when the Federal Communications Commission's "television freeze" prevented further consideration. The Commission then, in its best judgment, and in its attempt to assure nationwide television service, which the too few VHF channels could not render, created a new nationwide allocations plan making use of new channels in the ultra-high-frequency band. Under this proposal, which would permit 1455 UHF stations and 617 VHF stations, the FCC took away from this area its VHF channels and assigned to it only UHF channels. When the freeze was lifted in 1952, we filed for maximum power on UHF channel 27, having been assured that WLAP-TV, on UHF channel 27, could furnish to both the viewers and the advertisers throughout our area the best in television service. The day the WLAP-TV grant was made, nearly 2 years later, in December 1953, we started with full speed and confidence in the UHF representations which had been made to us, on behalf of the community, and planned to go on the air late this spring.

We immediately started construction of our new, ultra-modern radio and television building (which is already nearing completion on the Belt Line). The bases and anchors were installed for our 500 foot tower (already fabricated and ready for erection). We signed a contract for a primary, full service CBS television network affiliation, as well as contracts with other networks for additional service. The American Telephone & Telegraph Co. finalized its plans to install the extensive microwave facilities for the transmission of these network services. Notwithstanding the completion of these favorable arrangements and our extensive expenditures in time, effort and money, the difficulties with and general unacceptability of an areawide UHF system, both to the advertisers and the viewing public, suddenly became extravagantly apparent. Some day the UHF system may be able to serve an area and a market as large and populous as is this major market, but we don't believe it is possible on today's UHF standards, particularly as far as many receivers, new or converted, are concerned. Until consistent and acceptable reception throughout central Kentucky is assured, we are not going to encourage the investment of millions of dollars in UHF receivers and installations by either the viewing public or by the television set dealers. At the moment, television in central Kentucky today is simply one of the many victims of the rising tide of UHF tragedy which has suddenly engulfed the country.
Forty-five UHF grantees have turned back their television licenses to the FCC within the past few weeks. Others are unhappily on the air and are literally losing hundreds of thousands of dollars each year in operations. Still other UHF licensees have either suspended operations or have been sold at a fraction of their original investment costs. In Kansas City, one of the largest markets in the country, the UHF licensee which had been on the air only 6 months, after having invested $750,000 in equipment, property, and operating losses, last month sold its properties to the Du Mont television manufacturing and network people for the nominal sum of $1. This month, less than 30 days later, Du Mont announced that they felt it necessary and advisable to take their loss, suspend operations, and turn in their UHF license in Kansas City. Du Mont took this action even though they operate their own television network and are one of the country's largest manufacturers of UHF transmitters and receivers. In another major market, Roanoke, Va., the UHF licensee was forced to suspend operations after being in business less than 5 months, having sustained staggering losses during each month's telecasting. Many more will undoubtedly suffer similar fates. Truthfully, we would rather be a live casualty than a dead hero. Furthermore, pride and disappointment notwithstanding, we are not going to be a party to making central Kentucky a guinea pig.

At this time, even with the fine cooperation and wishful thinking of the many interested parties, we believe an acceptable area wide UHF television service from Lexington would be an economic imposition on everyone concerned. In addition to the tremendous investment required initially, we were prepared to sustain sizable operating losses before beginning to realize any return on the investment. We know the viewing public was prepared to collectively spend millions to convert and/or purchase sets for UHF reception. If we were convinced of the permanent, long-term value of area wide telecasting, in light of possible high-powered, high-towered VHF developments, both we and the public would be making sound investments. As it is, we prefer to take our loss and save your money. When and if, in the next few months, the UHF picture improves, or this area is granted a VHF channel, we will reactivate our plans and proceed in confidence.

The history of our efforts, to say nothing of the money we have already invested in trying to make an acceptable UHF service a reality, is ample testimony, we hope, to our sincerity of purpose and unflagging determination to someday bring you the kind of television this area deserves.

We would be remiss if we did not gratefully acknowledge and openly thank, both personally and on behalf of the viewing public, our many friends both within and without the broadcast industry who have given so freely of their time and advice in counseling with us on these matters. We are confident the facts and information they furnished will save all concerned even greater disappointment than we now suffer, and that the final result will be an adequate, acceptable television service of which we may all be proud. The cooperation and understanding of the Federal Communications Commission certainly deserve the public's appreciation.

The Management and Staff of American Broadcasting Corp.,

Gilmore N. Nunn, President.

Licensee of WLAP AM and FM, WLAP-TV.
Supplement A

Statement of Raymond M. Wilmore on Polycasting—Service for Large Rural Areas and for Large Cities

I. SUMMARY

Polycasting may be used for serving large rural areas in a manner that may make such a service economically attractive. It may also be designed to serve large cities. In the statement filed with the Federal Communications Commission on August 26, 1949, an example of estimated service with polycasting was given. In this supplementary statement four other examples are given. Two of them cover large rural areas and two highly built-up areas. For completeness the example given in the original statement for suburban type of area is also included. The engineering basis of the estimates of service is given below.

The arrangement here proposed for serving large rural areas is to locate the component stations of the polycasting system at suitable towns in the area.

Serving large rural areas in this way appears to be the only way by which the economic problem of such a service can be met. It does not appear possible to meet the costs of maintaining a television service with a station in a small town, particularly if facilities for programs of local interest are contemplated, nor does it seem likely that such a town can provide an adequate variety of interesting programs. But if it is permissible to serve a number of such towns by stations located in them, and selected so that their rural services overlap, the system can be designed so that good service can be rendered in all the several towns where the stations are located, and in all the rural areas between these towns, and for a substantial distance beyond. Two of the examples given of polycasting operation with four and twelve 2-kilowatt stations at 300 feet show grade C service to areas of 5,500 square miles and 10,000 square miles, respectively. A single station at 500 feet would require powers of 300 kilowatts and 200,000,000 kilowatts, respectively, to provide service over the same areas and would still not be able to serve the individual towns as well. The fading would be greater with a single station than with the polycasting system. The example for the smaller of the two areas is depicted in figures 1, 2, and 3, and for the larger in figure 4.

It is believed that a polycasting service as outlined here may be capable of giving a sufficiently large and good rural service to provide adequate economic incentive to the operator.

Three examples are given for city service: two applying to heavily built-up areas, and one to suburban or not so heavily built-up areas. Illustrating these examples are figures 5, 6, 7, 8, and 9. The estimates of service are of course dependent on the assumptions made on wave propagation and interference conditions, but even if it develops that these assumptions are not correct the relative powers required from a polycasting service and from a single station service given in table I, which is attached, are likely to be of the right order, although even in this, errors in the simple process of reading the curves may cause errors in estimating power of the order of as much as 1 decibel.

The great difference in the power required for polycasting compared to a single station operation indicated by table I is due in part to the fact that the signal falls off rapidly with distance so that with a single station most of the energy is spent in producing an extremely high level of energy immediately around the station. This great peak of energy is much greater than is necessary and may do more harm than good. With the several stations in polycasting the field intensity is spread out more uniformly because the radiation comes from several points and can do no harm because of the very low powers used at each station.

Another and very important reason is that since at any one location the signal comes from one of several stations, the chances are good that the signal from at least one of the stations will be strong and it is only seldom that all the signals are weak. Polycasting, therefore, produces an effective boost of signal over and above that of a single signal of the same total power. Another way of expressing this factor is to state that the shadows are filled up. Mathematically this can be expressed in the slope of the distribution curve. An example is shown in figure 10 of the effect of combining four equal signals, each having a probability distribution corresponding to that used for heavily built-up areas. Figure 11 shows the effect of combining four equal signals when each has the probability...
distribution found in rural areas. With four signals the slope of the new distribution is less steep than for a single station. It will be seen that for a good service condition such as that corresponding to 90 percent of the locations, the signal with 4 stations in a heavily built-up area is 20 decibels greater than with one, although the increase in total power is only 6 decibels, thus providing a gain of 20 decibels or 100 times the power.

These estimates make no allowance for the fact that when a polycasting system is designed special effort will be made to take advantage of terrain irregularities to reduce shadows to a minimum.

Engineering design will involve care in locating stations to insure that there will be few shadows. This result corresponds to an even greater power gain.

The gain of 20 decibels represents the largest gain for the examples given in this supplement. Gains for other conditions are given in Table II, which is attached. When four stations are used in a polycasting system at the corners of a square, the worst point within the square for service and interference is its very center. At this point the median values of all four signals are equal. The power gain at this point, compared with the signal that would exist there if the total power of all four stations were concentrated in a single station located at one of the corners of the square, is shown in Table II.

The point of greatest interference from ghosts occurs in a polycasting system at the intersection of the perpendicular bisectors of the lines between the co-channel stations assuming approximately similar conditions around each station. The amount of interference decreases rapidly away from this point so that the area of most interference is small. In designing a polycasting system, care will naturally be taken to have this area fall where there is little population or even outside of the service area. An example of the service obtained when this point falls outside the service area is shown in Figure 9 where the stations lie in a straight line.

At the higher frequencies in the UHF band the location distribution curve is likely to be steeper than at the low frequencies, particularly in built-up areas so that the power gain by polycasting should be greater than estimated above.

The estimated power gain for various percentages of locations is given in Figures 10 and 11.

II. SHAPE OF POLYCasting SERVICE AREA

By locating the component stations of a system suitably almost any shape of area may be served. An example referred to as Example V is given in Figure 9. In this example the stations are located in a straight line. The area is therefore long and narrow. No single station could effectively approximate this kind of service. In Table I the power required for a single station is the estimated power to provide service over the whole of the major axis of each grade of service contour.

The example shows grade A service rendered over an elliptical area with major axes of 46 and 30 miles and an area of 1,100 square miles. A single station capable of providing grade A service over the whole of the major axis would require a radiated power of 4,700 kilowatts at 300 feet and of 1,200 kilowatts at 500 feet.

III. SEPARATION OF POLYCasting SYSTEMS

The mileage separation between polycasting systems depends to some extent on the arrangement of the stations within each system.

Examples of the separation needed to protect cochannel operation of different services by 46 decibels and adjacent channel by 12 decibels for grade B, and by 40 decibels for cochannel and 6 decibels for adjacent channel for grade C service are given in Figure 12 for the case of grade B service, and in Figure 13 in the case of grade C service.

The minimum separations of polycasting systems were arrived at in accordance with the following specifications:

(a) Permissible cochannel and adjacent channel interference ratios as are given in the Federal Communications Commission proposed standards.

(b) There are 4 groups of 3 systems each in Figures 12 and 13, labeled A, B, C, and D. The limitation in Figures 12 A and C, and 13 A and C, is cochannel interference and in Figures 12 B and D, and 13 B and D, is adjacent channel interference. Station pairs in a polycasting system are shown either in line with a channel or adjacent channel station pair of another system with which interference is to be avoided, or else broadside to the cochannel or adjacent channel station pair of the other system. These two cases represent the extremes of the minimum possible and maximum necessary separation of systems.
(c) If polycasting systems are placed other than corner to corner, as they
are shown in figures 12 and 13, the required separation of systems is inter-
mediate between the extremes shown at the left and right of each of the four
groups of systems, A, B, C, D.

(d) In making up figure 12, showing protection of grade C service, the slope
of the terrain distribution curve was taken to be 27, and for figure 13, showing
protection of grade B service, the 2 terrain distribution slopes of 27 and 42
decibels were used in the case of urban to rural service. Propagation from
the urban stations to the limit of grade B service was assumed to require a
terrain distribution slope of 42 decibels, and for the rest of the area a slope of
27 was assumed to apply. The required separations are, however, found to be
substantially independent of the slope of the terrain distribution curve.

Examples of the minimum separations required between single stations pro-
viding the same service as the polycasting systems illustrated in figures 12 and 13
are shown in figures 21 and 22, respectively. Groups A and B show minimum
separations of a rural and a city service for cochannel and adjacent channel
stations, and groups C and D show minimum separations of two rural services
for cochannel and adjacent channel stations. This corresponds to the presenta-
tions in figures 12 and 13.

Protection of grade B service is illustrated in figure 21, and protection of
grade C service in figure 22. As in figures 12 and 13, a terrain distribution slope
of 42 decibels is assumed in establishing the service contour of the heavily built
up urban area. For estimating interference and in establishing rural service
contours a slope of 27 decibel is assumed. All single station powers are those
listed in table I of this supplement, and the permissible cochannel and adjacent
channel interference ratios are those proposed by the Federal Communications
Commission.

IV. PROPOSED OPERATION

In the proposed operation of a polycasting system the studio and principal
source of programs will be located at one of the transmitting points and will be
referred to as the master unit. From there the program is relayed to the other
slave units of the system by highly directional transmitting antennas operating
in a band in the thousands of megacycles. This would be carried out by convert-
ing the fully modulated UHF to a lower frequency by beating with a carrier of
suitable frequency, and using this completely modulated signal to modulate the
relay carrier. At the receiving end another directional antenna would be used.
The signal would then be demodulated to obtain the lower frequency and would be
brought back to UHF by beating with a carrier of suitable frequency. The
resulting UHF can be made identical with the original UHF or at a UHF corre-
sponding to another channel as required. To obtain the exact frequency it may
be convenient to transmit it as a pilot or a submultiple of it as a modulation on
the relay carrier.

The operation of all units except the master unit from which the programs
are originally transmitted should be automatic. A monitoring transmission
back to the master station to indicate that the slave units are operating properly
would be desirable.

The slave units would also be used to transmit remote programs back to the
master unit by installing suitable relay equipment.

This type of operation could be developed in the course of time to provide
continuous relay links throughout the country.

V. DATA USED FOR ESTIMATING SERVICE

(a) Terrain factor

In the statement filed by me with the Federal Communications Commission on
August 16, 1949, an estimate was given for the terrain factor at 600 megacycles
to use in making an estimate of service by polycasting. Since then additional
data has been analyzed and additional information has been published.

Figure 16 shows the log normal distribution with location for different terrain
conditions. The circles indicate measurements of the median fields as published
in the article by G. H. Brown on the UHF survey made in Washington, D. C., by
the Radio Corp. of America on a frequency of 505 megacycles. The sources of
this data are figures 8 through 15, inclusive, on pages 574 through 577 of the
December 1948 RCA Review. It will be seen that the data are in close agree-
ment with the distribution curve proposed by the Federal Communications Com-
mission. This curve is the same as r(L) of figure 2 of the Ad Hoc report.
The crosses on figure 16 are taken from the recently published data of the Philco survey of the same operation (Joseph Fisher, Field Test of UHF Television—Electronics, September 1949, p. 106) and represent the terrain distribution factor of the same operation with one exception. In the case of the Philco data the information is limited to the points lying only within a 4-mile radius of the transmitter location. These points were taken from figure 4, page 109 of the article. It will be seen that the distribution of these points does not fit the previously suggested terrain factor. It is believed, therefore, that the dash line on figure 16 represents more closely the terrain distribution factor for heavily built up areas than the factor \( r(L) \) of figure 2 of the Ad Hoc report.

In the two examples of rural service and the city example for "suburban" type of area, the \( r(L) \) curve entitled "Rural and Suburban" was used. In the example for the "heavily built up" type of city area, the dashed curve was used entitled "Heavily Built Up." Theoretically different log normal distribution should be used at different distances. To reduce the work involved, however, the same log normal distribution was used.

The slope of a log normal distribution is \( E(99) - E(50) \), as defined in the Ad Hoc Committee report.

(b) Propagation curves

In the estimate of a 600-megacycle propagation curve previously made, an estimate of the correction from the theoretical field intensity versus distance curve was assumed. The analysis of the operation on UHF in Washington indicates that this assumption was probably optimistic, and almost certainly so for heavily built-up areas. Figure 17 shows the previously estimated correction factor corresponding to the function \( M(df) \) of the Ad Hoc report.

Three other curves for obtaining the correction from the inverse distance value out to line of sight for 500 megacycles are shown and were obtained in the following manner:

Curve A, labeled N. Y. 510 megacycles.—The source of the information contained in this curve is the article in the June 1948 RCA Review, Comparative Propagation Measurements, by G. H. Brown, J. Epstein, and D. W. Peterson. The southwest radial shown on figure 16, page 188, was analyzed for distribution of signals. This radial was selected because it covered the smoothest terrain. It was found to have a slope close to the factor \( r(L) \) of figure 2 of the Ad Hoc report with a median deviation of approximately 8 decibels below inverse distance field. The signal was reduced 2 decibels at 24 miles to correct for the fact that the measurements were made from a 1,000-foot high antenna in order to bring them to the equivalent field that would be expected from a 300-foot antenna. The distance 24 miles is "do" for a 300-foot antenna on 600 megacycles, the frequency being considered in the polycasting examples. The correction factor from the inverse distance curve thus obtained corresponds to as smooth a terrain as may be found anywhere so that curve A probably represents a maximum of field intensity.

Curve B, labeled RCA 505 megacycles Washington.—The source of this curve is the RCA Review, December 1948 article entitled "Field Test of UHF TV in Washington Area," by G. H. Brown, which was also referred to above in connection with the terrain factors. The information on figures 8 through 15, inclusive, of this article, was analyzed (pp. 574 through 577). The median deviation as shown on figure 16, attached, is 21 decibels. This point was plotted at 24 miles on figure 17 and forms the basis of the curve. This point should probably have been plotted at a closer distance. (If this had been done the indicated saving of power by polycasting would have been considerably greater.) The antenna height of the Washington installation was 357 feet above ground with various elevations over the 2- to 10-mile average terrain in the 8 directions.

Curve C, labeled Philco 505 megacycles Washington.—The source of this curve is the RCA Review article Field Test of UHF TV, by Joseph Fisher, of the Philco Corp. Figure 4 on page 109 was analyzed in respect to all plotted points at less than 4 miles. The limitation was imposed in order that the result would be representative of built-up areas in heavily populated metropolitan areas. The distribution of points formed the basis of the dashed line on figure 16, attached. The points are shown as crosses. The inference was drawn that the attenuation below inverse distance for the first few miles was greater than the value shown for the Radio Corp. of America measurements. The "C" curve was extended by blending into the "B" curve at a distance of 12 miles.

The point at 37.5 miles of -8 decibels was obtained from the recordings described in the August 1948 Electronics article UHF Propagation Characteristics, by Edward W. Allen, Jr., of the Federal Communications Commission. On figure 6, page 89, a value of -8 decibels is shown for the ratio of the measured 50-per-
cent field intensity to the theoretical value at the Princeton recording site on a frequency site on a frequency of 700 megacycles. The location was approximately 45 miles from the transmitter. The Ad Hoc report indicates that the same correction would apply at a distance of 37.5 miles. This value has therefore been used.

The signal at any one point in a polycasting system is taken as the strongest signal from any of the stations of the system. The "A" curves for 300 feet and 500 feet were used in estimating the service in the two rural examples and for the city not heavily built up. That is in examples I, II, and IV. The "C" curves for 300 feet and 500 feet were used in estimating the service in examples III and V for a city heavily built up.

In estimating the power necessary to produce service areas equivalent to the polycasting examples it was necessary to estimate the field intensity at distances up to 80 miles. The curves from approximately 55 miles to 100 miles were obtained by interpolating from figures 3, 4, 5, and 6 of the Ad Hoc report. It was felt these represented the best guide since there is no published information for UHF propagation at these mileage ranges. Figure 18 shows the field at the distances of 50, 90, 100, and 200 miles plotted versus frequency. The circles are points obtained for the frequencies of 63, 82, 98, and 195 megacycles as given in the Ad Hoc report. Lines were drawn through these points to extrapolate to 600 megacycles.

(c) Fading

The estimates of fading are based on figure 19. This figure was obtained from data for 195 megacycles shown on figure 27 of reference D to the report of the Ad Hoc Committee for distances up to 60 miles. It is certain that fluctuations in the field will be as great at 600 megacycles at short distances as are experienced at 195 megacycles. At a large distance these fluctuations will be greater at 600 megacycles as indicated by the scant published information. The fading at large distances was obtained by comparing the estimated F(50,1) fields with the F(50,1) fields of the Ad Hoc report. The published information leads to the assumption that the F(50,1) values of field are substantially independent of frequency at large distances. Log normal distribution of fading was assumed and the values for F00/F00 were interpolated from the F00/F00 fading range. It will be seen that the fading is greater than that suggested in the standards proposed by the Federal Communications Commission, but at distances less than 30 miles the differences are quite small.

(d) Grades of service

The definitions of grades A, B and C service are substantially those proposed; that is:

- Grade A, 65 decibel at 90 percent locations, 90 percent time; grade B, 65 decibels at 70 percent locations, 90 percent time; grade C, 60 decibels at 50 percent locations, 90 percent time.

(e) Interference

In calculating the separation required between polycasting systems to give adequate protection to the service contours, a desired to undesired ratio of 40 decibels has been assumed between cochannel stations and of 6 decibels between adjacent channel stations. These are the standards proposed by the Federal Communications Commission.

In calculating the interference within a polycasting system by one unit on another on the same frequency it has been assumed that with a directional antenna, or other means, it is possible to separate signals 10 decibels apart. A signal has been considered to be free from interference when its value for 90 percent of the time is greater by 10 decibels than the arithmetic sum of the median values of the interfering signals.

This figure of 10 decibels is based on the concept that the directional antenna will provide 10 decibels separation between the desired and undesired signal and that the receiver alone can receive satisfactorily two signals operating with offset carrier if the ratio of their intensity is 20 decibels. With a directional antenna it should be possible, therefore, to obtain acceptable service with a signal ratio of 10 decibels at the antenna.

The question may reasonably be raised at this point as to why it has been assumed that an amplitude separation of 10 decibels is satisfactory for cochannel stations within a polycasting system and a separation of 20 or 40 decibels between polycasting systems. The figure of 10 decibels is, as explained, a guess. It is, I believe, a realistic guess, but there is no field experience to prove it. It is reasonable to expect that an owner of a polycasting system will endeavor to engineer
the location of his station with special consideration to providing the best service so that shadows will be eliminated as much as possible. No such planning can be expected from the owner of a neighboring polycasting system. For the same reason, the accuracy and maintenance of offset carrier or synchronous carrier, or of the synch pulse, may be expected to be more accurate inside a single polycasting system than between polycasting systems. Generally speaking, it is easier to correct defects in one’s own back yard than nuisances from one’s neighbors. It is inherently appropriate, therefore, to specify a greater amplitude separation between polycasting systems than between stations within a polycasting system. In addition, to provide such increased protection between Polycasting systems frees each receiver to direct his attention more exclusively to reducing ghosts whether they be due to reflections or from a polycasting station. If some figure other than 10 decibels is used as the acceptable rejection ratio within a polycasting system for cochannel interference, the size of the service areas given in figures 1 to 9 will not be materially affected for they depend principally on signal strength. What will be affected is the percentages of locations free from the ghost type of interference in the area within the polycasting stations. These percentages are marked on the figures and indicated by dashed lines. The manner in which these percentages would change can be approximately estimated from figure 14 for a polycasting system with stations at the corners of a square and from figure 15 for a system with stations in a straight line.

The separation between polycasting systems can and should be reduced to about 20 decibels by requiring synchronous operation of all cochannel stations, or by the method that I feel is preferable: namely, by operating with FM.

STATEMENT OF RAYMOND M. WILMOTTE BEFORE THE FEDERAL COMMUNICATIONS COMMISSION, NOVEMBER 10, 1949, CORRECTION TO SUPPLEMENT A

With the presentation made by me before the Federal Communications Commission on November 10, 1949, I submitted in exhibit No. 280 estimates of service for a number of examples of the application of polycasting. I also explained the assumption on the propagation of waves at UHF used in arriving at these estimates. By some mishap the explanation of the assumptions was taken from some work sheets that were not used in the calculations. The curves actually used are given below.

Attached figures 1 and 2 show the propagation curves used for 600 megacycles. The M(d,f) curve used which corresponds to figure 1 of the Ad Hoc report and figure 17A of my supplement A is shown in attached figure 3. This correction is applied to the theoretical propagation curve for a smooth sphere of \( \frac{1}{2} \) the earth's radius to obtain the curves in figures 1 and 2 up to 40 miles from the transmitter. For distances beyond 80 miles the propagation characteristics were obtained by extrapolating the Ad Hoc Committee curves to 600 megacycles as shown in figure 18A of supplement A, exhibit No. 280. The propagation curves were completed by connecting these 2 sections with a smooth curve over the distance from 40 to 50 miles. Receiving antenna heights are assumed to be 30 feet for all estimates.

The dotted curves in figures 1 and 2 represent the theoretical field intensity versus distance curve referred to as S in the Ad Hoc report. The distance \( d_s \) beyond which S is always less than the free space field is 10.5 miles for a transmitter height of 300 feet and 16.5 miles for a transmitter height of 500 feet.

For comparison, the propagation curve of the Ad Hoc Committee for 105 megacycles for a transmitter height of 500 feet and a receiver height of 50 feet is shown in figure 4. (Charts are in official files of committee.)

SUPPLEMENT B

STATEMENT OF RAYMOND M. WILMOTTE ON ALLOCATION OF POLYCASTING SYSTEMS

A polycasting system is not limited to serving a circular area, nor is the area limited in size as it is with a single station operation. A polycasting system can be designed, therefore, to fit substantially with the great variety of social, cultural, economic, and political areas that make up the country. In any allocation that takes these basic factors into account, the polycasting systems used should vary greatly from one area to the next. However, to simplify the study of an estimated allocation pattern, a simple polycasting system, consisting of 2 channels with 2 stations having 2 kilowatts of radiated power at a height of 300 feet on each channel, has been taken as the basic polycasting unit.

Two examples of possible allocations are shown in figures 1B and 2B. One is designed for a typical midwestern area and the other for a congested eastern area.

For the first example the section of the country taken includes the cities of St. Louis, Kansas City, and Wichita. Each city in the area which has a population of more than 100,000 has been assigned as many UHF polycasting services as are provided for it in the proposed allocation of the Federal Communications Commission, including those provided in both the VHF and UHF bands. After an adequate number of channels was provided for these cities, the rest of the area was studied with the view of serving the whole area with grade C service or better.
There are innumerable ways of providing this service. The arrangement shown in figure 12B is one such arrangement. It is seen that the whole of the rural area can be served with the use of only nine channels.

The purpose of providing UHF services in the large cities to the same number as is provided in the VHF band in the proposal of the Federal Communications Commission was to indicate that the UHF band was large enough to carry all the services required in a truly complete national television service in the area studied.

Table 1B shows the channels allocated to cities of more than 100,000 in the example, and indicates also the estimated possible number of services that might be provided for cities and rural areas if all channels from 14 through 55 were used. The numbers in parentheses, for instance (14-36) refer to every other channel; that is, 14, 16, 18, etc., through 36.

In making up the proposed allocation for a typical midwestern area, the required separation of polycasting systems shown in figure 12A of the preceding supplement was used.

In making this study the minimum separation of polycasting systems shown in figure 12A of supplement A was maintained with only a few minor exceptions. Also in accordance with the concept explained previously, the individual stations of a polycasting system were located as far as possible in small towns. In some of the larger towns, such as St. Joseph, Mo., and Lincoln, Nebr., it was arranged to have two stations belonging to different polycasting systems designed to serve areas lying in different directions from these towns.

The population within each polycasting system is given approximately in Table 11B. It is seen that a substantial population is served by each system.

The service area of the systems in the large cities is not shown because they can be designed with greater latitude in view of the density of population.

For the second example the congested area lying between New York City and Baltimore was selected. The allocation in this area as shown in figure 2B was designed to provide grade B service over the whole area. Here again all cities of over 100,000 population of which there are 16, were provided with as many services as was proposed by the Federal Communications Commission for the VHF and UHF bands combined. An exception was made for New York which was provided with 10 channels, 4 more than were proposed by the Federal Communications Commission. For the rest of the area, polycasting stations were located whenever possible at the more important population centers.

A deviation from the simple basic polycasting system of locating the station at approximately the corners of a square was used in one case on Long Island where the service from a number of stations in a line is shown as an ellipse. To serve the Scranton-Wilkes Barre area, a similar arrangement would probably be used.

The service area in the large cities of more than 100,000 is not shown: What is shown is their approximate metropolitan areas. In some cases it will be desirable for some of the services in these cities to include the city proper plus an area extending in one direction, while other services will include areas in another direction. Such an arrangement will make it possible to bring adjacent polycasting systems closer to the city. For instance, in the case of New York City, if a polycasting system were established in New Jersey starting at Asbury Park and going south along the coast, a New York City system could be established on adjacent channels but designed to spread its service toward Long Island or Westchester County and deliberately restrict its service in New Jersey. For similar reasons, some New York services would spread into New Jersey to allow adjacent channel systems to serve Long Island or Westchester County.

In figure 2B not all the channels between No. 14 and No. 55 have been used. Some 4 additional services could be provided to the Del Mar Peninsula, and along the coastline 1 additional service could be added.

**Supplement C**

**Statement of Raymond M. Wilmotte on Television Polycasting and Frequency Modulation at UHF**

I. Polycasting

Polycasting is a method of providing radio broadcasting service over an area by using several small stations located inside one city if the city is large, or in several small towns relatively close together, if a rural area is to be served. The operation of several stations by one operator is not monopolistic, it is simply a more efficient manner of serving an area, and permits the laying down of a stronger signal over the area than is possible with a single station of the same total power. In fact, polycasting should increase competition for it will put UHF stations on a competitive footing with VHF.

There is no opposition from engineers to this concept except from the point of view that the picture received may be deteriorated by "ghosts." I have made an estimate of the effect of ghosts and that estimate shows that if two channels are used, this ghost problem, while it exists, is not serious.

The great advantage of polycasting is that since signals at any one point come from several directions, it is unlikely that all these signals will be shadowed by obstructions, so that one may reasonably expect that at all points at least one signal will be strong, or in other words that shadows will be substantially eliminated. It is the effort to provide a good signal in these shadows that requires such tremendous powers at UHF from a single station. It is for this reason that it is generally recognized that good service cannot be rendered at UHF over large areas or in areas having large structures or hills, except with unreasonable amounts of power.

Polycasting seems to be the only alternative. Estimates that I have made show that in a heavily built up area, a polycasting system consisting of four 2-kilowatt stations at a height of 300 feet will give grade A service over the same area as a single 1,000-kilowatt station. For a small suburban type of area, a similar polycasting service will provide the same area of grade B service as a single station of 110 kilowatts. For rural service of 5,500 square miles a 4-station
polycasting system (a total power of 8 kilowatts) would provide better service than a single 1,250-kilowatt station; and over 10,000 square miles; 12 polycasting stations (a total power of 24 kilowatts would provide better service than a single station of 400,000,000 kilowatts.

As to cost, it is difficult to compare a polycasting with a single station, operation because high powered transmitters are not yet available. It is clear, however, that when dealing with radiated powers as low as 2 kilowatts which would require transmitters of only a few hundred watts, these would be made in sufficient quantities that their price would become quite low. The total equipment cost of a slave station including tower and antenna would be about $25,000. The slave stations could be automatic and would need no attendance, so that the cost of installation and operation would probably be substantially less than the corresponding cost of a high powered single station operation.

A question may be raised that polycasting has not been field tested. That, of course, should be done to obtain quantitative answers on a number of factors still unknown. But it should be borne in mind that single station high power operation has not been tested either at UHF and there are many questions still unanswered. In fact, what tests have been made indicate that such service would not be very satisfactory.

II. FREQUENCY MODULATION

In comparing AM with FM for television, early tests decided in favor of AM. It has been brought out, however, that the FM tests were carried out with AM receivers! The Federal Communications Commission laboratories have recently shown the fallacy of such tests. Indeed they have shown that without any special design techniques FM appears in many ways superior to AM. The laws of nature give FM a number of inherent advantages. For instance, FM makes much more complete use of the channel than AM; it also gives freedom to the engineer to produce a much greater variety of results. These characteristics will undoubtedly be developed to the full by engineers if they are given the opportunity to do so. These advantages will be reflected in practical operation in the reducing of the disturbing effect of ghosts, of interference and of noise. Such improvements when developed fully are of the greatest importance for without them it may be difficult for television service to reach the quality and general use that sound broadcasting has reached.

These improvements could be expected to solve almost all problems of allocation and competition. They would also improve the operation of polycasting. In fact, by combining FM with polycasting there would be good likelihood that in due course every operator could serve his whole service area with strong signals, thereby largely eliminating the need for outside directional receiving antennas and permitting stations to be located so close together that every area could be served by many operators.

The only disadvantage of FM in the UHF band is that it will require different standards than those now existing in the VHF band. Receiving set manufacturers are naturally unfavorable to using different standards for they fear damage to the immediate market, even though UHF adapters for VHF sets could readily be made to comprise means for operating with FM without changing the circuits of the VHF sets. But since the standards decided now will undoubtedly last many decades the question arises whether we should standardize on an inferior system merely to alleviate the fears that the present market might be slightly decreased.

As to time of making the UHF band available, I believe that the adoption of FM and polycasting would bring the UHF band more rapidly into general operation. There is no particular difficulty in manufacturers designing FM receivers. In fact the Federal Communications Commission engineers have already used circuits that are very satisfactory. A certain amount of study should be given to the exact standards that should be applied to FM; however if work were carried out along this line, in a matter of 6 months adequate information should be available for this purpose. The greatest delay in providing television broadcasting service at UHF on the presently proposed standards appears to be due to our present inability to build high powered AM transmitters. With FM, and more particularly with FM and polycasting, the power required would be so small that transmitters should be available in a matter of months, so that making FM the standard of operation is likely to open the UHF band more rapidly than forcing the VHF standards on the UHF band. Moreover, it will make UHF operation competitively as good as, and probably eventually better than, operation in the VHF band.
Probably more important is what we can expect of the long distant future. Technical progress in the past has been great, but we can expect even greater progress in the future. The degree of progress will depend however on the flexibility that the standards permit. FM inherently provides greater flexibility than AM. With an eye on the future, that reason alone should make FM by far the more desirable. To standardize on AM now will prevent engineers from translating the inherent potential advantages of FM into improved service to the public.

III. A DESIRABLE PROCEDURE

Ideally, the whole of television should be operated in the UHF band, leaving the VHF band for other services that are in much need of it and simplifying the design of receivers. Practically, that cannot be achieved because of the present substantial operation and investment in the VHF band and because UHF equipment is not yet ready. It would therefore be desirable to make the UHF standards as perfect as possible so that there might be expected a trend from VHF to UHF purely for performance and economic reasons. Rather than tie down UHF to the VHF standards it would be better to find the best standards for color, service and freedom from ghosts and interference; and make these the standards for the UHF band, leaving the VHF standards unchanged.

If that is done, American engineering ingenuity will find ways of handling any intermediate condition while both VHF and UHF are in demand by the public. Our American economy and technical growth is largely based on our faith that the best progress is made by freedom and evolution as against a growing thinking in some other parts of the world (which is bound to be temporary if we are right) that progress is best achieved by detailed regulations and decrees. In television today there is a unique opportunity, unusual in radio regulation, in that a frequency band is ready to be used and is still not used. There is more engineering freedom in FM than in AM, more freedom also in polycasting than in single station operation. This, I feel, is a very real and basic argument in favor of both these types of operation, for if we apply our national faith here, we should seek for the standards in this UHF frontier, which is about to open up, the maximum freedom for technical evolution.

SUPPLEMENT D

STATEMENT OF RAYMOND M. WILMOTTE BEFORE THE FEDERAL COMMUNICATIONS COMMISSION, NOVEMBER 10, 1949

Polycasting estimate of city service

In supplement A which was presented on November 10, 1949, and given in some detail in exhibit No. 280, examples of the estimated service rendered by polycasting were given. Most of the information referred to comparisons with a single station type of operation for a whole service area. In this supplement are given estimates of the signal strength that may be expected in a limited area where good service is required as in the case of a city.

The polycasting system assumed is an arrangement of four 2-kilowatt stations 300-feet high located at the corners of a square having diagonal 10 miles in length. Two examples are given: Where the slope of the distribution curve for location is 42, as appears to be the figure for heavily built up areas; and where it is 27, as in the case of suburban or rural areas. In other respects, the assumptions made in the estimate are the same as those described in supplement A, as corrected, of exhibit No. 280.

The curves in attached figures 1D and 4D refer to the estimated field intensity for grade A service (namely, for 90 percent of the locations and 90 percent of the time) along a diagonal of the square of the polycasting system.

Figures 1D and 2D refer to the example with a slope of 42 for the distribution curve for locations. In figure 1D is also shown the field intensity for a single station of the same total radiated power; namely, 8 kilowatts at the same height of 300 feet. Figure 2D is similar to figure 1D except that the single station has a power of 1100 kilowatts.

Figures 3D and 4D are similar to figures 1D and 2D except for the slope of the distribution curve for locations which is taken as 27 instead of 42. In figure 3D the single station radiates 8 kilowatts while in figure 4D it radiates 200 kilowatts.

These four figures show the great advantage of polycasting as against single station operation that appears to be possible as regards field intensity over a densely populated area. (Charts are in official files of committee.)
Re communications hearing.

Senator Charles E. Potter,
United States Senate, Senate Building, Washington, D. C.

Dear Senator Potter: The Neenah-Menasha Broadcasting Co., owners and operators of television station WNAM-TV at Neenah, Wis., desire to have this letter represent our statement to your committee on the subject of Senate bill S. 3095 hearings.

WNAM-TV at Neenah, Wis., is a UHF station operating on channel 42 since January 26, 1954. Our construction permit was granted in December of 1952. Shortly after our FCC construction permit was granted, WNAM-TV filed an application with the National Broadcasting Co. television network and the Du Mont television network. At that time, the nearest NBC-TV affiliate was Milwaukee, Wis. Channel 2 at Green Bay, Wis., was not on the air, but contracts had been announced with ABC-TV, CBS-TV, and Du Mont.

In New York, early in 1953, we were told that NBC-TV would not be able to give us an opinion on affiliation until after Milwaukee moved from channel 3 to channel 4 with 100 kilowatts. When the move was made and it was clear that Milwaukee and NBC-TV did not have primary coverage in this market, we again asked for an affiliation. On our second request we offered to carry NBC-TV programs as a bonus station, even paying the costs of network lines. As late as December 1953 we were informed that NBC-TV could not affiliate with us. We quote from a letter signed by Tom Knude of NBC-TV: "Obviously this conclusion has been reached on the basis of drawing-board information, and our final position with respect to Neenah-Menasha can't be determined until the Marinette-Green Bay facility is in operation. We feel, however, that the best interests of all parties involved will be served by not affiliating with WNAM-TV at the present time."

This then brings up the first statement we should like your committee to consider. Allocation plan of the FCC sixth report. This plan allocated 2 VHF channel to Green Bay, Wis., and 1 VHF to Marinette, Wis. The FCC has recently seen fit to grant the Marinette facility a transmitter location at Pensaukee, Wis., which is 23 miles north of Green Bay. The proposed site is closer to Green Bay than to Marinette.

It is our humble opinion that the grant of this location actually places three VHF stations in the Green Bay area; such action prohibits WNAM-TV from receiving an affiliation with NBC-TV, since the Marinette station is classified by NBC as their "Marinette-Green Bay facility," and that such action does not make the best use of the facility because an area north of Marinette, Wis., will not receive primary television service as a result.

We believe, therefore, that a 10-mile limit should be placed on VHF transmitter sites from the principal community to be served, rather than signal strength to the principal community.

Our second statement is in regard to the FCC's proposal to revise section 3.658 (b) on Chain Broadcasting Rules.

The Neenah-Menasha Broadcasting Co. favors this proposal on the basis that WNAM-TV would benefit to the extent of having some national network programs available to us where the advertiser wishes to place it. The Neenah-Menasha-Appleton, Wis., area has been classified as one market by Sales Management, Standard Rate and Data, and the Audit Bureau of Circulations. As such, this market becomes the fourth largest market in Wisconsin with a 1950 census population of over 55,000 persons, a large enough market to warrant national advertisers to place network time.

In summation, it is our opinion that UHF can best be served and it in turn provide a competitive television system if (1) VHF stations are limited to transmitter locations not more than 10 air-line miles from the principal community to be served, and (2) the FCC revises section 3.658 (b) of the Chain Broadcasting Rules to preclude network affiliates from contracting with its network to prevent stations located in another community from carrying programs of the networks.

Respectfully submitted.

Don C. Wirth,
Vice President.
Senator Porter. I want to insert in the record at this point a constructive editorial that appeared in TV Guide April 30, 1954, concerning “all channel tuners in color sets.”

The editorial states:

It is evident that color sets gradually will replace monotone receivers over the next few years. If, during the replacement period, provision can also be made for reception of UHF stations, viewers will benefit twofold.

I am hopeful that the manufacturers will do this. This editorial will be inserted at this point in the record.

(TV Guide editorial is as follows:)

[From TV Guide, week of April 30–May 6, 1954]

ALL CHANNEL TUNERS AND COLOR SETS

Now, as we enter the new era of color TV, is the time to establish ultra high frequency television as a major factor in the medium. It can be done, simply and easily, by installing at the factory a combination VHF–UHF tuner in every color set produced.

There is room in the frequency spectrum for only about 300 VHF stations, while the spectrum can accommodate about 1700 UHF stations. The public would be served best by the greatest number of stations. More outlets in each area would mean a wider choice of shows for viewers.

As things stand now, it is difficult for a UHF station to make its way in a region served by a couple of VHF stations. In order to receive new UHF stations, the viewer must install a converter in his set, and that entails expense. So far, UHF outlets have been successful chiefly in areas that have no VHF competition.

The Federal Communications Commission has done almost everything in its power to push UHF. It has yet, however, to urge that manufacturers install tuners capable of receiving both VHF and UHF telecasts in all color sets.

A check of major manufacturers shows that only one specifies VHF–UHF tuners for all its color sets. The others either have made no decision yet or are installing them only as ordered by customers.

This is a golden opportunity, perhaps the only opportunity that ever will arise, to put over UHF television. It is evident that color sets gradually will replace monotone receivers over the next few years. If, during the replacement period, provision can also be made for reception of UHF stations, viewers will benefit twofold.

Senator Potter. We have as our first witness today the Chairman of the Federal Communications Commission, Mr. Rosel Hyde. It is a pleasure to have you here. I know that there are busy times for you, but this is a problem which the Commission has given much attention, and studied too, so we will be pleased to have your testimony on this vital subject at this time, Mr. Hyde.

STATEMENT OF ROSEL H. HYDE, ACTING CHAIRMAN, FEDERAL COMMUNICATIONS COMMISSION

Mr. Hyde. Senator Potter and members of the committee, the Commission is pleased to cooperate and supply for that purpose all the information and assistance it can. The statement which I am able to present is longer than I would wish to offer. However, we thought that at the outset it would be desirable to have a full statement of the TV allocation plan and the considerations that went into it. I should like to explain that this statement has been approved by a majority of the Commission. However, it may be expected that some members will have additional views or views somewhat different in
some respects to this statement which I am presenting, and Commissioner Hennock has a statement of separate views which she wishes to present to the committee.

Senator Potter. We will hear Miss Hennock after you have completed your statement, Mr. Chairman.

Mr. Hyde. Mr. Chairman and members of the committee, my name is Rosel H. Hyde. I am Chairman of the Federal Communications Commission.

I appreciate this opportunity to join you in a discussion of the status and development of UHF channels: For the fate of the UHF channels is a matter of great import in the development of our Nation's communications system.

The problem which confronts us today stems basically from the fact that the television service began in one part of the frequency band—the VHF. Now, that service has been expanded into another and substantially higher portion of the spectrum—the UHF, or ultra high frequencies. The Commission envisages television service as one service not a scheme with classifications of UHF and VHF, but rather as a single service, all TV and all giving service with the same standards and with the same benefits to the public. We have endeavored at all times to prevent a breakdown which would divide the service or the licensees into separate groups.

The stations in operation prior to June of 1952 all operated in the VHF. And all of the television equipment—transmitting and receiving—was geared to VHF operation. The UHF stations require new types of transmitting equipment, and in order for the stations to be received, the public must either purchase new receivers, or make extensive changes in existing receivers. In short, UHF operation requires substantial changes by manufacturers and by the public, and therefore has a significant impact on advertisers, networks, and all other elements in the industry.

I think it necessary to an understanding of the problems that are presented that we review and keep before us the principal events and considerations which have brought this situation about. I shall, therefore, set forth briefly the factors which led to the utilization of the UHF band and the manner in which it was to be used. I shall indicate specifically why we could not place all television in the VHF, why we intermixed VHF and UHF channels in the same community, and why we provided for wide-coverage areas for all stations. I shall also analyze the growth of television stations since the lifting of the "freeze" and the current financial reports of new VHF and UHF stations. Finally, I shall touch on the measures the Commission has under consideration affecting UHF.

Senator Potter. Has the Commission ever considered placing all television in the UHF band?

Mr. Hyde. Yes; the Commission did consider that in connection with its allocation and I shall have a rather full discussion on that in my presentation.

Television is a newcomer in the art and industry of communications. You will recall that commercial television began in 1941 but was blocked from normal development as a result of the wartime freeze, which lasted until October of 1945. The utilization of the UHF band is an even more recent development. In the sixth report and order, adopted April 11, 1952, after 3 years of extensive hearings in which
hundreds of experts were heard and thousands of exhibits were care-
fully studied, the Commission promulgated a nationwide table of
Television assignments and rules and standards to govern the tele-
vision-broadcast service. For the first time commercial television
stations were authorized to operate in the frequency band 470–890
megacycles, commonly known as the UHF band. This table of assign-
ments provided for assignments of both VHF and UHF channels
in the same community. In addition, the rules and standards govern-
ing the television broadcast service adopted by the Commission at
that time specified the powers and antenna heights that stations
operating on VHF and PHF channels might employ.

It was apparent that the 12 VHF channels allocated for commercial
television would not be adequate for a competitive nationwide system
of television broadcasting. And it was equally apparent that realis-
tically there was little prospect for allocating to television more chan-
nels in the VHF portion of the spectrum. To do so would have
required that other highly important radio services would have to
be deprived of frequencies vital to their operations. These other
services include the use of radio frequencies for FM as well as for
Police, fire, aeronautical, petroleum, utility, railroad, and other non-
broadcast services. Accordingly, the plan adopted by the Commis-
sion in its sixth report and order provided for use of the 12 VHF
channels and, in addition, for the use of 70 UHF channels. I repeat
again there are 12 VHF channels and it is planned that there will be
70 UHF channels in that part of the spectrum.

Senator Potter. What about the area between 4 and 5? Wouldn't
the Government have a little piece of the spectrum?

Mr. Hyde. Yes; as a matter of fact, there are 2 breaks in the VHF
part of the spectrum, and I should like to tell you what the reasons
are which accounts for that break in what otherwise might be a solid
allocation to 1 service.

I have some specific notes on that if you will bear with me just a
moment.

When the television allocation was made the whole allocation was
influenced to a considerable extent by various developments of the
wartime period. That had to be taken into consideration in the gen-
eral allocation which included an extensive aeronautical radionavi-
gation system in worldwide use by the United Staes and its allies which
used the frequency 75 megacycles for aeronautical marker beacons, the
band 108–112 megacycles for aeronautical localizers and the band
328–336 megacycles for aeronautical glide path. (These were the
three essential elements of an instrument landing system for blind
landing.)

An extensive aeronautical communications system in worldwide use
in the band 112–132 megacycles.

An essential requirement for Government communications in the
band 225–400 megacycles.

A need for frequency allocation for a variety of non-Government
land mobile services in the UHF spectrum for which no communi-
cations equipment was yet available above 225 megacycles.

Senator Potter. With reference to the 112–132 megacycles, where
would that be on your dial, as we say?

Mr. Hyde. I have a chart that will indicate that, Senator. The
blue is channels 2 through 6 television.
Incidentally, I would like to introduce Mr. Curtis Plummer, the Chief of the Broadcast Bureau of the Federal Communications Commission. He might explain this chart further.

Mr. PLUMMER. The yellow is the FM band. In the band between 108 and 174 is the area that the Commissioner is talking about. It includes aeronautical services.

Senator POTTER. Is that above the 12 line?

Mr. PLUMMER. No; the other 7 television stations are here [indicating] but VHF is between 104 and 216 megacycles.

Mr. HYDE. The area in blue are the three divisions. The reasons for those separations were developments and investments in equipment and usages which had to be recognized when the Commission set up a plan. I can supply more detail on that if you wish.

Senator POTTER. Is that being used?

Mr. HYDE. Yes; it is. As a matter of fact, the suggestion has been made that the radiobeacons should be eliminated and there have been long-range plans looking toward that. But that is something that could not possibly have been effected in the time of the television application and indeed it would not be practicable to undertake it at this time.

Senator POTTER. There have been some suggestions to put in a channel 4½ or something like that.

Mr. HYDE. I believe that those suggestions had in mind the possible use of the FM part of the spectrum, that part now dedicated or allocated for FM operations.

There are in the neighborhood of 600 FM stations operating including about 100 operating in the noncommercial educational service and the Commission envisages a more effective use of these FM channels for what you might call auxiliary services related to it.

We have a rulemaking out on it. Any proposal to limit broadcast service would have a very large impact on the public. That may not be realized because of the amount of attention that television gets. But there is a continuing interest in FM. We still get applications for new stations. The interest is greater in some areas than in others, but it is real, not something that you can brush aside as an outmoded service or one in any sense abandoned.

If I may summarize my answer to your question, it is that the Federal Communications Commission had to find places for other services based largely on developments over the wartime period and it was not possible, there was not other VHF space available for television.

Senator POTTER. Do you agree with the statement made by Commissioner Sterling in the speech given in Washington, D.C., on May 10, 1954, and I wish to read a portion of his speech, a couple of paragraphs, and see if that is the Commission's position? I quote now from Commissioner Sterling's remarks:

Suggestons and petitions have been filed with the Commission from time to time suggesting that an additional VHF frequency be allocated to the TV broadcasting service by utilizing the 72-76 megacycle band which has some limited use because of the need of protecting the 75-megacycle nautical aeronautical marker beacon system. The proponents suggest that some real-locations of adjacent space would yield a 6-megacycle TV channel which might be identified as channel 4½. I can scotch any hopes of those desiring to obtain this space for TV broadcasting service by announcing that on April 5 of this year CAA, in response to an inquiry, advised the Commission that the decommissioning of L/MF four-course radiorange will not be complete until 1958 and
that the ILS program calls for continued use of the 75 megacycles beacon. They suggest that the aeronautical requirements be reviewed at some date after 1963.

I assume 1963 is when their allocation time runs out, is that correct?

Mr. HYDE. I think that there is no firm limitation on the allocation, but I think that is their amortization program and the ILS means instrument landing system. I consider that Commissioner Sterling's statement is a fair appraisal of the situation, yes, sir.

Senator Potter. Then he goes on with another paragraph which I will read:

Others have suggested utilizing the lower half or all of the FM band for TV broadcasting. Such a proposal would, of course, be vigorously opposed by the FM licensees as well as their loyal listeners as well as fixed and mobile services who are seeking additional spectrum space. A hearing of some proportions would necessarily be required if the Commission were to entertain such petitions. The situation in this regard is aggravated by the Commission's proposed rulemaking to authorize multiplexing of FM channels for storecasting and other similar services, and if finally adopted might pave the way for the survival of an excellent broadcasting service as well as the possibility of stereophonic aural broadcasting coupled with the high fidelity interference-free broadcasting service now available from stations operating in this band.

Do you concur with that?

Mr. HYDE. I agree with that. I think the Commissioner showed a proper concern about a final elimination of FM service which still holds great promise.

We have a chart dealing with that. If you wish, Mr. Curtis Plummer could give you a very brief outline of the situation with the help of the chart.

Senator Schoeppel. Will we have breakdowns in small ways for our files?

Mr. HYDE. We will supply them, Senator.

(Small size copies of charts to be supplied for official files of committee.)

Mr. Plummer. This is a section of the radio spectrum between 50 megacycles and 108 megacycles which is almost the top end of the FM band. You will notice that channels 2, 3, and 4 are in a block.

Then there is this gap between 72 and 76 megacycles that you have mentioned as a possibility for channel 4½. Then channels 5 and 6 and then the FM band. Now 72 to 76 contains these aeronautical markers at 75 megacycles on the top half of this band, as the chairman has already mentioned. They are a sort of a keystone that you have to move some way but it costs money and the problem of amortization. That was true in 1945 when we made this allocation. So the best thing to do at that time was to merely put the channels around there.

Senator Potter. Would that provide another channel, Mr. Plummer?

Mr. Plummer. Not alone because there are only 4 megacycles there and it takes 6 megacycles for a television channel.

The proposal has been made to use that plus 2 megacycles of the FM band and so move channels 5 and 6 up. Those two megacycles happen to be the noncommercial educational megacycles.

Mr. HYDE. May I ask Mr. Plummer to give a further explanation? Would it be necessary to make changes in the transmitters of all those stations operating on channel 5 and channel 6, and of course the receiver receiving programs on that?
Mr. Plummer. Yes, sir. Let us assume that there are 40 stations on each channel 5 or 6 which were operating. All those transmitters would have to be retuned. There are millions of receivers. I would guess that a considerable number of receivers would need work by servicemen to be returned to those two channels. Some of the manufacturers could give you more detail on that.

Mr. Hyde. I think there are other special problems that might come up such as assuming that we were able to salvage one more VHF channel and thus patch up the VHF situation. Wouldn't that be a worse position than we are in now?

I had stated that the Commission set up an allocation plan of using 12 VHF channels and 70 UHF channels.

In reaching this decision the Commission rejected another proposal which had been made—that all television be moved to the UHF band. For at that time there were one or more VHF stations in operation in 63 of the most populous centers of the United States. There were 108 stations authorized. At the end of 1951, close to 15 million families, located principally in and around these 63 areas, had VHF sets. In many of these cities set saturation was more than 50 percent. The assignment of all television stations in the UHF would have had staggering consequences not only to the industry but to the public as well. The investment of consumers in VHF at that time amounted to billions of dollars. Similarly, the industry—including broadcasters, manufacturers, service and repair people—had invested untold millions in the VHF. May I mention that if you take an average cost of $200 for a VHF television receiver and multiply it by 13 million you will come out with $3 billion, and that is only the cost of the consumer, the cost applicable to receiving sets.

Another thing, any time any change is made in an allocation which causes inconvenience to the public, which I am sure has come to your attention, it causes great public concern. A new station coming on the air causing even a fringe limitation on an existing operation gets communities very excited.

Senator Potter. And the communities get their Congressman very excited.

Mr. Hyde. That is right, and the Congress asks us what is the matter. In many instances the adjustments are made in connection with the advent of a new station and things work out, but it is sometimes a painful experience. You must recall a Michigan situation in that connection?

Senator Potter. I do recall it.

Mr. Hyde. To put the matter simply, if we were to provide an adequate number of television facilities, if we were to meet the need for multiple and local sources of expression, if we were to meet the need for adequate service, then we had no other choice. We were obliged to use not only the 12 channels available in the VHF portion of the spectrum but also the 70 channels in the UHF band. We must not lose sight of the fact that the assignment plan must serve not only for the present but for the future. It must serve as the basis for the long-range development of our national television service.

Senator Pastore. How do you get so many channels in some places and so few in others?

Mr. Hyde. We made an appraisal of the relative needs and tried to adjust the allocation to those needs as best we could gage them.
I should like to say that when we had made this allocation which does have the purpose of serving our long-range needs, we were aware of the fact it would be subject to adjustments as a more exact examination might be made of particular areas and our rules setting up this allocation like all other rules of the Commission are subject to change, and we have made some changes in the allocation plan but not in its basic concept.

I would like to add further to my answer. One of the considerations that we examined first was the development of AM broadcasting. It gave an indication of the public interest and the public support for broadcasting and in determining the number of channels that might be reasonably allocated to cities. We took into consideration the number of stations broadcasting in those cities.

Senator Pastore. I appreciate the explanation you have given me, but I am not satisfied with it, to be real honest about it. When you say to meet the needs, whose needs are you trying to meet, the viewing public or the people running the stations?

Mr. Hyde. The paramount need is the overall need of the viewing public, but we have to take into consideration the factors that will contribute to the service of the overall public.

Senator Pastore. What is the standard? How do you justify 7 stations in New York City and 1 in Providence? Aren’t they entitled to see the same shows? Do you get it down to persons or to area?

Mr. Hyde. We would hope in an ideal situation, that every citizen should have the same number of programs and if there were some Government rule that could bring it about—you know that we have to take into consideration the economic realities, the distribution of population, and we have to take into consideration the economic possibilities of the stations.

Senator Potter. Along that line, isn’t it the Commission’s policy to establish a nationwide competitive system?

Mr. Hyde. Yes.

Senator Potter. I know from my experience and to answer the Senator’s question of what do you mean by a nationwide competitive system, there is no competition if there is just one station; is there?

Mr. Hyde. That is right, sir. My attention is called to the fact that in Providence there is a provision for 4 stations as against the 7 authorized in New York. I think there is provision for additional UHF stations in New York, as a matter of fact. We endeavor to make the distribution as fair and realistic as possible, having in mind the size of the markets. We took into consideration the comments of all interested parties. This was done as a result of rulemaking. The allocation was announced on a tentative basis. We received the comment and assistance of the interested parties, all of which was examined in detail.

Senator Pastore. The trouble with getting the view of all interested parties is that it boils down to several potential interests in television. How do we tell the American public that you can go to 1 place and look at 7 channels and if you go to another place you can look at only 1 or 2 or 3 or 4, how do we justify that? Why do we talk so much about competition?

They are falling all over each other to get these licenses. I understand once you get a license it is worth $1 million. That may sound
funny to some people, but the way they are scrambling for them, I understand that is so.

Oh, is that figure of $1 million too low? Did somebody say $5 million?

Miss Hennock. That is right; $5 million.

Mr. Hyde. It is too high in some places, and much too low in others. It depends on the market and the economic factors involved also to a large extent.

Senator Pastore. But no one has actually answered my question of the ability of the people of New York to get 7 stations and what power have the people, say, in Providence got to get only 1?

Mr. Hyde. The difference isn’t 7 to 1. It is true that there are not four VHF assignments there.

One reason is the early development of television in New York. The other is raised when you go to remove stations that were constructed early. Another is the relative short spacing between cities in the northeast section of the United States and the large number of cities, making it still more difficult to divide the scarce number of channels.

But if you examine the allocation scheme I think you will find the Commission made an allocation of channels per city on a pretty equitable basis. It was not done to meet the interests of only certain interests; it was done to satisfy the listening pleasure and interest of the overall public. It would have been faulty if the Commission would disregard the economic picture. Cities have tried to get four channels in a place where they could not exist and we have attempted to hold out the service, at the same time denying multiple service to cities which could support them.

Senator Potter. Of the seven stations in New York, how many are making money?

Mr. Hyde. I am told the non-network stations are finding it somewhat difficult. If we could examine this thing from the beginning we think some of those persons who were very much interested in having seven stations in New York would probably have a different viewpoint about it today.

Senator Pastore. On that viewpoint, I have been told that the reason why you cannot get the proper equitable distribution of these stations is because you start out with 7 concentrated in 1 area and there is the technical aspect that is involved that makes it rather hard without interference to get into an adjoining area when you start out with 7 in New York. Am I right or wrong?

Mr. Hyde. It is true when you put 7 stations in 1 community, you limit the channels in other areas immediately around there.

Senator Pastore. Can you answer my question? Am I right or wrong?

Mr. Hyde. Haven’t I answered it, Senator? I admitted that.

Senator Pastore. I am not trying to confuse you. I am just trying to get the fact. I have been told that unless you take some of the seven stations away from New York, you will never get the proper equitable distribution within the area surrounding New York City, as an example. If these people are losing money, why can’t the Federal Government condemn some of these stations so that you can
start out and make the proper distribution? If you build an inequity upon an inequity the situation will get worse and worse.

Your starting point is that at the beginning certain large cities, because that is where television experimenting started, have come in on the ground floor and gotten themselves a lot of stations. That happened in Los Angeles and in New York.

Mr. Hyde. There are 2 cities that have 7 channels. The other cities have four, usually. I think you would find that a pretty reasonable distribution has been made, taking into consideration the situation from which we had to work.

Senator Pastore. Would you be better off in carrying out your equity if you had let them have less stations in New York City and less in Los Angeles?

Mr. Hyde. You could make a better distribution that way; yes.

Senator Pastore. If these people were losing money, wouldn't it be better for the Government to condemn some of these stations so that you might do this job right?

Mr. Hyde. That is a question that would require some study. I would not want to say "yes" to that.

Senator Pastore. Fundamentally, isn't that where your real trouble is?

Mr. Hyde. No.

Senator Pastore. All right then, you explain it to me.

Senator Potter. Providence has one, is that right?

Mr. Hyde. Yes.

Senator Potter. There is an application for how many more?

Mr. Hyde. Four more channels available.

Senator Potter. Is there another VHF channel to go in there?

Mr. Hyde. I am sorry. Two VHF assignments in Providence.

The delay in television there is incident to determinations on the case.

Senator Pastore. I am using Providence only as an example.

Mr. Hyde. And I was using it on that basis, too. The New York situation and the Los Angeles situation are the 2 instances where there were as many as 7 in 1 city.

The Commission was faced with the necessity of making a judgment as to whether it was in the public interest to undertake revocation of licenses or rule making to convert them to UHF or move them out to take into consideration the investments that had been made and the listening habits of the public, and on the basis or the representations made to the Commission, it made the judgment that it would be better to work the allocation the way it was done.

Senator Potter. Under the Commission's plan of allocation, how many were allocated four or more TV stations?

Mr. Hyde. Seven all told.

Senator Potter. How many had three or more?

Mr. Hyde. Seven communities have assigned to them four or more commercial VHF stations. A total of 37 communities have assigned to them three or more commercial VHF stations.

Senator Potter. I think one answer we will have to get along the line that Senator Pastore has been speaking of is, what does the Commission mean by a nationwide competitive market?
Mr. Hyde. We mean by a nationwide competitive service operating assignments available in every community in sufficient number to that there can be more than one choice of service, both from the listener standpoint and those interested in broadcasting service.

Senator Schoeppell. I would like to ask this; do you take into consideration geographical approach to it or an economic approach?

Mr. Hyde. Certainly we do take into consideration geographical approach.

Senator Schoeppell. You started primarily with geographical, didn't you?

Mr. Hyde. Yes, Senator, but actually you have to take into consideration both elements.

Senator Schoeppell. I would think so.

Mr. Hyde. The Commission had to take into consideration the size of the markets and the number of stations which it would be prudent to contemplate and you also had to take into consideration the geographical element in order to get some distribution of service.

As is set out in the sixth report, which I hope the Senators will give further consideration to, you will find that the Commission undertook to provide as many services as supply of channels would permit, having due regard for the market potential. Our problem was to meet the needs of the public and the operating realities in a way that would conduce to the overall pleasure and benefit of the public.

Senator Potter. How far are you from having a nationwide competitive system?

Mr. Hyde. Very far. This map I have here indicates the degree to which the television freeze has been lifted. The area in red indicated operating stations. You can see from that that the Commission has provided for the expansion of television service on a broad front to an enormous area. The yellow circles indicate stations authorized.

Senator Potter. This is on VHF?

Mr. Hyde. VHF only. The overlay indicates the UHF stations that have been authorized.

Those in blue are operating today. Those in orange are authorized, but not operating.

Senator Potter. Do you consider that as nationwide?

Mr. Hyde. That takes it in pretty much, it takes in by far the greater part of the population of the United States and it is not as complete as we hope to make it.

However, the number of stations operating now is 377 total which are operating.

The total number authorized is of the order of 570.

The total number of stations which we will have when all stations applied for have been authorized will be 673. That is the potential of the total file of applications.

Senator Potter. It is the Commission's contention to really reach the goal as far as nationwide coverage is concerned, is it?

Mr. Hyde. We have gone a long way toward that goal, but I think the picture can be improved substantially.
Senator Potter. That is my second question. What about the competitive nature of the coverage?

Mr. Hyde. On this plan here, this map, we have in red those areas which will have three or more stations operating in the VHF. In the area in yellow, we only have all the stations provided for in the plan; you will have at least 1 or 2 stations in VHF only.

Senator Potter. How can one station be competitive?

Mr. Hyde. One station can be competitive in many instances where there is service received from other communities in that sense.

We would like to have competition in every community, but we would not want or desire to have multiple stations or none prevent another community that can only support one station from having a single station.

Senator Pastore. How do you determine that? How does anybody determine when a community can support something?

Mr. Hyde. We do not determine that.

Senator Pastore. Every time you have an available channel it is like a stampede and then you say that a community cannot afford it. Why cannot it afford it?

Mr. Hyde. It is a little more complicated than the question suggests. We provided for more than 1,800 commercial station assignments. When the total of stations contemplated in the applications were authorized, they were in the order of 673. There are many assignments in the plan which simply have not been applied for.

Senator Pastore. VHF?

Mr. Hyde. Yes, sir; for the reason that they are in markets which are not attractive to applicants.

Senator Pastore. And about how many places does that happen in?

Mr. Hyde. The overall percentage figure is 25 percent have not been applied for.

Senator Pastore. Of the VHF?

Mr. Hyde. That is right. But that would be in smaller markets. The thing that makes a television assignment attractive is its location. One of the leading markets of the United States is up in the northeast, of course.

Senator Pastore. You say you have 377 operating stations?

Mr. Hyde. Yes, sir.

Senator Pastore. How many individuals or corporations own the 377?

Mr. Hyde. There are 431 separate ownership interests in TV. I can tell you this, that no more than 5 stations are under the control of 1 interest. You can see that there are no large concentrations in the area because there is a fixed limit of five.

Senator Pastore. Do many own five, or is that the exception or the rule?

Mr. Hyde. There are not many that own five. There are just a handful. Approximately 487 different companies or individuals own the 570 TV stations authorized as of May 1, 1954. A total of 51 companies or individuals had either majority or substantial minority own-
ership interests in more than 1 TV station. A breakdown of these ownership interests is as follows:

<table>
<thead>
<tr>
<th>Number of stations in which a majority or substantial minority interest is held</th>
<th>Number of companies or individuals holding such interest</th>
<th>Number of stations involved</th>
</tr>
</thead>
<tbody>

Of the 377 stations on the air as of May 1, 1954, there were approximately 304 separate companies of individuals owning such stations.

**Senator Pastore.** Is any one interest allowed to own more than one station in the same city?

**Mr. Hyde.** Not more than one television station; no, sir.

**Senator Potter.** That refers only to VHF, does it not?

**Mr. Hyde.** Yes, Senator.

**Senator Potter.** If UHF is allowed to die, what will it do to your competitive market?

**Mr. Hyde.** If UHF is allowed to die, there will be a number of communities where there will be only one service and in some instances none.

I think there are 70 communities with UHF only. The figure of 70 comes from the fact that there are 70 UHF stations in communities where there are no other television stations. That does not mean that there is no television coming into the communities from stations in other communities.

**Senator Schoeppel.** Some of it on a very unsatisfactory reception standpoint.

**Mr. Hyde.** Some at very great distances. It varies, of course.

**Senator Potter.** Has the Commission considered putting booster stations?

**Mr. Hyde.** Yes, we have.

**Senator Potter.** And the other term was, I think, satellites?

**Mr. Hyde.** Yes.

**Senator Potter.** Will you please tell me the difference between a booster and a satellite station?

**Mr. Hyde.** A booster station—and booster seems to be the preferred name—is the name for the station which simply boosts the signal of a given station at a given frequency.

A satellite would operate usually on a different frequency, but would rebroadcast the program of the originating station.

**Senator Schoeppel.** A booster would be comparable to a relay?

**Mr. Hyde.** Yes, sir, that is the best way to describe it.

**Senator Potter.** In some of remote areas, isn't that the best way to expand television coverage?

**Mr. Hyde.** It probably will be. The Commission has had a real challenge in lifting the freeze for the primary stations. It has
seemed good judgment to try to get the main allocations established before filling in the chinks which cannot receive service from an independent station. However, the Commission is currently studying these various suggestions that we use satellite or booster stations to improve the coverage over these areas, the UHF coverage to help them in their efforts to satisfy the public and meet the challenge of competitions of other stations.

Senator Potter. It would seem to me that it might be desirable where you have land masses that would interfere with the coverage, that would enhance the coverage.

Mr. Hyde. We have been liberal in the granting of channels for true research in that respect. There are areas, where, because of the nature of the terrain, it seems that such measures would be necessary to reach the public which, as I have mentioned, is our primary interest.

A reference to the pattern of development of AM emphasizes the importance of this long-range viewpoint. Twenty years after the institution of the aural broadcast service there were less than 900 stations: From time to time the view had been expressed that this country could not support more than that number of stations. The fact is, however, that since 1945, the number of operating AM stations has increased almost threefold so that today there are approximately 2,600 radio broadcast stations. An assignment plan that limited AM to 900 stations obviously would not have been in the public interest. If anyone had made a plan based on the indicated usage just a short time ago, that would have put a severe restriction on the potential.

With the increased demand for television service following the end of World War II it was perfectly clear that 12 channels were not enough to do the job needed to be done.

Senator Potter. If that is so, why didn't it meet this problem before you allocated more of these VHF channels?

Mr. Hyde. At one time the Commission did propose allocating 18 in the VHF spectrum. A television channel represents an enormous demand on a spectrum. It represents six megacycles of space, an enormous block of spectrum space, and the VHF part of the spectrum is vitally needed for other services than broadcasting and television. If I showed you a diagram giving the relative amounts of space needed for the AM broadcasting and some other services, it would illustrate this point very well.

Over to the extreme left on this chart there are very fine divisions of space which can be hardly seen without glasses, which represents the spaces dedicated to AM broadcasting, which we have 2,600 stations. AM broadcasting, as you know, operates on the frequency from 540 to 1,600. If you subtract your 540 from 1,600 you get roughly 1 megacycle of space. It takes 6 times that amount of space for 1 TV channel. That indicates the kind of demand on spectrum space represented in television.

It is because of the band width required on the one hand and the shortage of this very valuable part of the spectrum space that made it impossible for the Commission to set up a vast area for broadcasting alone.

Senator Potter. If you knew in 1945 that you needed more channels and you knew that you would have to go into the UHF band—

Mr. Hyde. Actually, the Commission—and I was not a party to that judgment, did look ahead in somewhat the way you suggest or
indicate they should have and they envisaged that TV when fully developed would probably have to be in the UHF part of the spectrum and it was only for that reason that this UHF space was available when the allocation was made in 1952.

Actually, it probably would have been squeezed down except that in 1945, the Commission thought that for color broadcasting, it would take channels of wider band width than the 6 megacycles. They were thinking in terms of 13 to 17 megacycles and the only place where space of that order could be found was in the UHF. It was this thinking that you might need channels of these great widths and it was desirable to have a competitive system which resulted in the reservation of a large block of space in the UHF for experimental television, where the Commission thought television generally would find its lodging.

There was a very rapid development of TV in the VHF with upwards of 5 million sets and representing service relied upon by the public to an amazing degree.

Senator Potter. As I understand your testimony, the Commission recognizes the fact that you needed to have, in order to have a nationwide competitive system, you had to develop the VHF band, of course, but you particularly needed to develop the UHF band; is that correct?

Mr. Hyde. That is right, sir.

Senator Potter. If you recognized that fact after the war, why didn’t you meet this problem at the time of the freeze, rather than to loosen up on the VHF channels and put them in competition?

Mr. Hyde. At the time of the freeze, it was already too late. Also, and here are some of the reasons why I say it was too late, we still did not have the equipment that would give the public the service they were demanding and for which they had a taste by reason of the operation of the limited number of stations in VHF. If the Commission at that time had undertaken to move all television into UHF, they would have had a public reaction that would have compelled us to give up the planning and all you would have accomplished would have been a tremendous disruption in the TV service. Objections to go to UHF were made, but the weight of the evidence indicated it would not be in the public interest to do it, taking into consideration the matters which I have mentioned and others which are set out in the allocation report. It was not feasible to make the big shift in 1952, in the judgment of the Commission.

Now we are looking at it with the benefit of hindsight.

Senator Potter. I realize that it is easier to be a Monday morning quarterback than a Saturday afternoon quarterback.

Mr. Hyde. Yes, sir.

It was necessary therefore to use both VHF and UHF channels. And, for reasons which I shall discuss in some detail, it was necessary also to make both VHF and UHF assignments in the same community in order to avoid serious limitation on the number of services that might be provided. Indeed, of the 100 most populous markets, the Commission felt that the assignment of UHF channels in addition to VHF was needed in 70 of these top markets. Thus UHF was needed to provide the fourth commercial local station in 24 of these communities, the third commercial station in 29 communities, and the second commercial local station in 17 communities. I will paraphrase that by saying that the UHF was needed to provide for com-
petitive service of at least a multiple service. In another 17 of these
top 100 markets only UHF assignments were made. Some examples
may help to illustrate the problem: The Boston metropolitan area is
able to support 17 radio stations. Are three commercial VHF sta-
tions adequate to meet the needs of that community? The Baltimore
metropolitan area supports 11 radio stations. Are 3 VHF stations
adequate to meet its needs? The Chicago metropolitan area supports
approximately 30 radio stations. Are 4 commercial VHF stations
adequate to meet its needs? The same question may be asked of
many, many other leading markets. To ask the question is to answer
it—for the answer is indeed obvious.

But there is a further consideration which impels the intermixture
of UHF and VHF assignments. Technically it is the most efficient
way of allocating the scarce and precious television frequency space
to maximize the number of assignments. As we have pointed out:

* * * VHF stations are capable of providing a greater coverage than UHF
stations. Hence a more extensive television service is made available where
some VHF assignments are made in as many communities as possible than
where only VHF assignments are made in some communities and only UHF
assignments are made in the other communities.

Stated otherwise, if we do not arbitrarily limit the assignment of
VHF stations, we achieve a greater flexibility in the utilization of
these assignments and as a result are enabled to use them more often
and where needed the most.

I think I can clarify that by an added sentence. If we had a rule
which said that we will not put a VHF assignment where there are
UHF assignments there will be situations where a channel would
work but would be left out simply in order to avoid having channels
in two different parts of the spectrum. It would be denying service
and cutting down the stations in order to keep them from inter-
mixture.

Senator Pastore. Would all UHF stations have the same accep-
tance to the same program as VHF?

Mr. Hyde. All UHF stations have that acceptance subject to the
economic considerations and the choices of the operators, the choices
of the advertisers. Those are matters controlled by factors out of
our jurisdiction and control, of course.

Senator Pastore. The reason I asked that is if you confine a location
solely to UHF wouldn't the people be put at a tremendous disad-
vantage?

Mr. Hyde. We thought so. We did not think we should deny
the use of a channel simply to avoid intermixture.

Senator Pastore. Isn't there some feeling on the part of the opera-
tors of UHF now that they are being denied equality of access to
the same quality of programs coming over?

Mr. Hyde. I am sure there is that. They have felt the reluctance
of sponsors and networks to buy the time of a UHF station if it was
available in the competitive area of a VHF station.

Senator Pastore. Have you any opinion as to what extent that
feeling prevails that that field is monopolized at the present time?

Mr. Hyde. We have some information on that in an annex to my
statement. Based on the Commission's study of network program-
ing during the week of March 14-20, 1954, the average UHF station in
cities of 250,000 and over population carried 19 hours of network pro-
grams during that week; the average postfreeze VHF station in
cities of the same size carried 37 hours of network programs. In cities
under 250,000 population, the average UHF station carried 14 hours
of network programs during that week while the average postfreeze
VHF in that city size carried 15 hours.
In the 34 cities where both VHF and UHF stations were in opera-
tion during that week, the average VHF station in those cities carried
44 hours of network programs and the average UHF station carried
14 hours. Of the 11 hours of network programs listed among the Top
Ten programs (by 3 different research organizations) the average
VHF station in the VHF-UHF cities carried 5 of these 11 hours while
the average UHF station carried 1 hour.
Senator Pastore. You will come to it?
Mr. Hyde. It was only completed last evening.
Senator Pastore. It will be in the record?
Mr. Hyde. It will be in the record.
Senator Hunt. Isn't that a matter entirely under the control or
networks in the last analysis?
Mr. Hyde. I would say that the control is still farther back in the
hands of advertisers who must pay for the time.
Senator Hunt. And it has to do with what programs certain net-
works make available.
Mr. Hyde. And this matter of programing that we are now dis-
cussing is emphasized by the fact that television, more than other
broadcast services, have found it necessary to depend to a very large
degree on network programing.
Senator Pastore. We start out with the philosophy that the Gov-
ernment supervises this field because of the public interest involved.
This is a predicate for the question I will ask you about who should
control the accessibility to equality of programs. If this is regulated
as a field in the public interest, and we are raising the point because
the field of VHF is already well taken up and you have got to go to
UHF, why shouldn't it be the concern of Government to see that
there is equality of opportunity between UHF and VHF? Why
should it be controlled exclusively by business?
Mr. Hyde. You have raised a question.
Senator Pastore. Isn't that the crux?
Mr. Hyde. That is a very complicated question.
Senator Pastore. Let me simplify the question.
Mr. Hyde. The question has a premise that there is a certain
amount of programing which everyone should have. I think that we
should not indulge in that limitation on sources of programing. I
think there should be opportunity for programing from many sources
and I think that it is unfortunate that as of now too many stations
are depending on a limited number of program resources.
Senator Pastore. Don't you think that unless we make it our con-
cern from the standpoint of protecting the public interest, you raise
the power of certain interests in this country to choke off the UHF
and if the rest of it is monopolized you will find yourself in a position
that no matter how much UHF you allocated no one will see it be-
cause it will not be of any importance?
Mr. Hyde. I am hopeful that there can be some provision for the
expansion of this industry without anything that even suggests super-
vision of programing or its distribution. As of now, the policy of
the act is to keep these matters of programing, and so forth, on a free-enterprise, competitive basis.

Senator Pastore. I am all for that until we get to the point of getting into monopoly.

Mr. Hyde. The Commission is vitally concerned about the development of UHF because for reasons which you pointed out, it is in the use of those channels that we have the opportunity for establishment of television on a broad basis with many stations with adequate competition which I think is more important in the field of ideas, distribution of news, development of public opinion, and any other line.

Senator Schoeppel. Along the line of Senator Pastore's question with respect to the new developments coming up, do you feel that the development of color TV would go ahead if color TV was confined to UHF?

Mr. Hyde. I doubt if it would. The development of color is not coming about automatically by any means. The Commission, as you know, approved signal specifications for broadcasting color on December 17 last year, but the amount of broadcasting in color and the distribution of such is still quite limited. That, of course, was to be expected because there was no opportunity for setting up on production lines and the laying of the plans until the standards would be established. But even now we do not have in the immediate offing volume production of color sets such as to give low retail price, and I believe that the interest of the UHF will have to have more immediate attention than the color. I believe, too, although I should think color would help and color should help in this respect, that many people will buy sets in order to get color reception as it becomes available.

Senator Potter. Don't they manufacture the sets to receive color by just VHF?

Mr. Hyde. In some instances. I am told one manufacturer has indicated its color sets will receive all channels, on all channels. The Commission, of course, would hope that all color sets would be manufactured to receive in UHF so that the public, as they find it appropriate or they wish to replace their sets, could get color and would automatically get access to the UHF channels. It would be a constructive thing for the development of the industry if set manufacturers would incorporate provisions for reception in the UHF channels in their color sets. It would make it possible for the exploitation of the UHF.

Senator Potter. What is the purpose of the Commission's exclusivity?

Mr. Hyde. You have reference, I am sure, to the network regulations. In connection with our study of the UHF situation, we have proposed in a rulemaking notice to change the network rules so that a station affiliated with a network could not limit the network or the sponsor of a program from making that program available to another station, providing that station is located in another city.

Under the present rules, a station affiliated with a network can enter into a contract which would preclude the network from supplying that program to another station serving the same area.

Senator Potter. Even though the station did not use the program themselves?
Mr. Hyde. No. If the station were using the program they could have a contract which would prevent any other station reaching that same area from having it, but under the proposal the network could affiliate with another station serving the same area or a part of it, provided the other station were located in a different city. The importance of that arises from the fact in many situations that a station in one city will have service extending into another community which will have its own television station. We have thought it might be helpful to the second station if the first station could not, by contract, limit its ability to get that program.

Senator Potter. Do you think that will help the UHF station any?

Mr. Hyde. I would not suggest that would afford any general relief to them. We hope that it will give some measure of assistance. We hoped that that will give some indication of our views that there is a need for a wider distribution of service to stations.

Senator Pastore. I am not going to ask your opinion on the legislation because I think it would be unfair at this time, but merely to ask you whether you are familiar with it. On May 13, Senator Bricker, the chairman of the full committee, introduced a bill to give to the Commission authority to establish rules and regulations and make orders with regard to networks and such other activities as affect licensed broadcast stations that operate in the public interest. Are you familiar with that?

Mr. Hyde. I am familiar with the fact that he has introduced such a bill, but I have no recommendations to make on that at the moment. It is a subject on which one would want to make a very careful examination before making any recommendation.

Senator Hunt. Mr. Hyde, why is it that television broadcasting equipment for UHF has not been available?

Mr. Hyde. This is a new part of the spectrum insofar as use for television is concerned. There had been no operation in it beyond experimental as far as television is concerned prior to 1952 and, as is always the case, it takes time to work out the problems which invariably develop when you move into a new part of the spectrum. I think very substantial progress has been made, although frankly we are disappointed in the time it has taken to achieve the amount of power for operation of the stations.

Senator Hunt. I assume that has been simply an attitude of the business situation. The great demand for the VHF equipment with so many more stations merely slowed up the production of UHF?

Mr. Hyde. There are technical considerations and it does take time to develop new equipment for distribution to the public. You can make a preliminary prototype for purposes of experimentation, but it takes time to develop a receiver or transmitter for general use under operating conditions. I believe the question you have asked me will probably set some attention from manufacturers who have had experience of developing this equipment.

Senator Potter. And they will testify?

Mr. Hyde. I am glad you mentioned that.

Senator Potter. When the Commission made their sixth report, didn't the Commission state at that time that there was evidence that it will be possible to operate stations in the UHF band with 400-kilowatt radiated power by the time the authorizations are issued.
Mr. Hyde. We did indicate that there was rapid development. You may be quoting from our report.

Senator Potter. I understand it is a quotation from the report, but I would like to know how many kilowatts are now available.

Mr. Hyde. The highest now in use is 12 kilowatts. That has a higher effective radiated power. The highest power for the transmitter is 12 kilowatts, but that has made an effective radiated power of 200 kilowatts.

Senator Potter. It is about half the power that is needed.

Mr. Hyde. Half the power that is needed to approach the service areas that we hoped would approach those of the VHF.

Senator Potter. Do you think that some people have been dragging their feet on this? Why haven't they had the high-power transmitters that are necessary?

Mr. Hyde. I have no evidence that there is any dragging of feet on it. I do believe that if the UHF stations would begin to prosper a bit and if the interest in that field could be stimulated that work on the material could be possibly expedited, but the Commission has no evidence of dragging of feet or of any refusal to go ahead.

Senator Potter. It seems to me that if you expect the UHF operators to be competitive, that there is a need for high-power transmitters that are necessary, and also adequate receivers.

Mr. Hyde. That is right.

Senator Pastore. And good programing.

Senator Potter. And competitive programing.

Mr. Hyde. It takes the programs to get the distribution of sets, and apparently it takes the distribution of sets to get the programs because the sponsor of the program wishes to buy time where he has the largest circulation. It is one of those circulation things.

Senator Potter. Probably you will discuss that in your statement, but do you have any suggestion as to how we can overcome this?

Mr. Hyde. I do have some suggestions here in my statement. Of course, we are going to be following this whole examination for all of the help and assistance that may come from an examination of the subject here. We have undertaken some measures which I will mention in my statement.

Senator Schoeppel. I would like to ask this by way of suggestion. I know nothing about the technical side of this thing, but I do know when you introduce color television the folks who have the ordinary sets will not be so happy. It has an appeal and it more clearly reflects things that we have not been able to view before, as we all know. As color television becomes popular, it makes possible the production that brings prices down, and surely the Commission of which you are a member realizes that if they can go to those higher areas that you are discussing here, don’t you think that there would be a tremendous shift then to UHF?

Mr. Hyde. If color were restricted to UHF?

Senator Schoeppel. Yes.

Mr. Hyde. There would be this difficulty about it in that some cities would not have color, and so I believe that we may need the impetus of television viewers generally to get a satisfactory development of color and mass production of sets.

Senator Schoeppel. I wouldn't want to see an order go in of a commission empowered to make that kind of an economic decision,
but I would think as a matter of development that it would encourage going to UHF as color television comes in and utilizes greater coverage.

Mr. Hyde. I am sure it is the attitude of the Commission to encourage everyone concerned to provide for reception in color. Commission Sterling, in a public speech, and others of us, whenever the opportunity has presented itself, have expressed the hope that manufacturers will improve their color sets so as to provide reception on the ultrahigh channel, that is, equip their sets manufactured to receive color to give reception in ultrahigh frequencies so that people replacing their black and white sets in the manner you have mentioned would become potential viewers of the ultrahigh frequencies.

Senator Potter. You may proceed.

Mr. Hyde. The Commission concluded, therefore, that intermixture was necessary. However, even had we been willing to limit arbitrarily the number of channels in communities—even had we been willing to utilize a less efficient method of assigning the VHF portion of the spectrum—even so, we would not have eliminated the effects of intermixture. For eliminating the intermixture of VHF and UHF assignments in the same cities would not have eliminated the overlap of VHF and UHF service areas. And there is the rub. For one of the principal difficulties facing most UHF stations is that they are within the service areas of large VHF stations.

But the difficulties in the long-run development of UHF would, in my opinion, have been greater than they are today if we had failed to intermix.

Senator Potter. Do you think an ultra-high-frequency operator can compete in a VHF market?

Mr. Hyde. I would have to answer that with some “ifs.” Based upon our experience, those that have gotten started before the VHF came along, and therefore had the advantage of getting UHF set distribution, have been able to compete.

Those who have started out with UHF in communities where they already had a VHF set saturation found it very difficult.

I would not want to conclude yet as to what the final results would be. I trust that some of the UHF stations that have been able to meet this challenge will give you the benefit of their experience. I know there are some who have had difficulty that have already been to see you, as you mentioned earlier in the hearing.

At the time of the lifting of the freeze, there were 108 television stations operating throughout the United States. These were all VHF stations, and they were located in 63 of the top markets in the United States—markets which contain over 60 percent of the Nation's population and which account for approximately 60 percent of the Nation's retail sales. If we had not assigned additional UHF stations to these very important population and economic centers, then for a certainty the UHF would have been permanently relegated to an inferior position in the television service. For if we had assigned the UHF service to the smaller communities only, then such incentive as presently exists for equipment manufacturers to produce reliable low-cost, all-channel tuners or converters, or to produce UHF high-powered transmitting equipment, would have been very substantially lessened.
If I may go back to the question as to whether or not UHF can compete with a VHF station—

Senator Potter. I have been informed—if you will allow me to break into your statement, Mr. Chairman, but I understand that there are some people in the hall who would like to hear. We have a room in here where some can stand in here at least.

We will have a 5-minute recess at this point for the purpose of moving the public around.

(Whereupon, a short recess was had.)

Senator Potter. The committee will resume its session. The people who are in the back of the room, there is still room in the side room, if you care to take it.

Proceed, Mr. Hyde.

Mr. Hyde. A further statement on your question as to whether or not a UHF station can compete with VHF might be helpful. In AM broadcasting we have local 250 watt stations, regional stations of 5-kilowatt power competing successfully with 50-kilowatt stations. We have independent, locally programed stations competing with network stations, very successfully, but there is this difference, when the AM came in all receiving sets, practically all of them, would receive on all channels from 540 to 1600, so that a newcomer starting business in this field has access to the receivers in the homes.

Now, in this field you have a situation where the newcomer must promote the distribution of UHF sets and in those instances where he comes to the market developed already by the VHF, he has the uphill task of persuading the owner to convert or buy new sets. If we could get a wider distribution of all-wave receiving sets, then you would have an opportunity to make a comparison.

Senator Potter. What has been the technical development of receivers for UHF? Are they adequate as compared with the VHF reception?

Mr. Hyde. I expect that you will get expert views on that from the designers of these sets. I have observed reception on UHF, which is very good indeed. I am sure that in that field, as in others, further improvements can be made and that is likewise true of the VHF.

Senator Pastore. Have you any knowledge of the cost of conversation from the conventional set to UHF?

Mr. Hyde. Yes, the costs range from just a few dollars to put in a strip to $20 to $75, or even $100. Sometimes it will be necessary to put in an additional antenna. Sometimes the person converting the set will want one that is converted to receive on several UHF channels, which will cost more than if the conversion is only to one. There are many variables in it, but as I have indicated, the cost can be quite substantial.

Senator Hunt. Is there any variation in the distance of good reception from UHF to VHF?

Mr. Hyde. There are substantial differences and even with UHF operating with the maximum power, they cannot reach the same distance that a VHF station does. However, they are able to reach their community very satisfactorily, which is something that many AM stations cannot do.

I think it is the effect on set distribution more than the difference in coverage that is critical here. In most instances, the UHF station can reach its logical market. He runs into difficulty if stations in other
markets invade the same area and if sponsors of programs getting access to it on other stations are reluctant to buy his.

Senator Potter. Isn't it a fact that it costs more for the UHF operator to put his signal in the air? In other words, his transmission costs as compared with VHF operator costs would then, on the receiving end, would cost more money to bring him to the home than it does for a receiver to receive VHF?

Mr. Hyde. I guess I would have to say "Yes" and "No" to that and explain, if I may.

Based on data reported by postfreeze licensees, the average construction cost of the 109 VHF stations was $376,000 compared to $300,000 for the average cost of 100 UHF stations.

It costs more for the same amount of power for UHF, but actually our figures as to the investment in UHF indicate that the cost of installing stations has been on an average less to the operator, by and large, with less power, but for anything approaching equivalent coverage, more, and as I have indicated, in order to get UHF reception it usually means conversion or when you buy a new set in the dealer's store, there is a differential right away.

Senator Potter. What is the differential for an all-purpose set?

Mr. Hyde. Thirty-five dollars, usually. We have always hoped and expected that on the basis of the manufacture of sets for all channels, with mass-production techniques, that that cost could be reduced, as I believe it could be.

In recent weeks some currency has been given to proposals for the reallocation of the spectrum assigned for television broadcast stations. Sometimes it is suggested that we reallocate the VHF portion of the spectrum so as to provide one or more additional VHF channels and then assign all stations in the VHF. On the other hand, it has also been suggested that we move all stations into the UHF. Both proposals have an obvious appeal. For, in one fell swoop, they would eliminate the disparity between stations; put all stations on an equal competitive basis; and thus remove the UHF problem.

But the very factors that made such moves impracticable 2 years ago, when the Sixth Report and Order was adopted, still exist, and perhaps in even more intensified form at this time. The needs of other services in the VHF portion of the spectrum are at least as great now as they were several years ago. You will recall that these include other broadcasting services, such as FM. They also include many other services such as police, fire, aeronautical, petroleum, utility, and railroads which are not only important to the national economy, but also to public safety. In these services many thousands of stations are operating. New lodgings in the spectrum would have to be found to house these services, with a resulting chain reaction of dislocation. And even the most drastic action would secure only a few additional VHF channels, hardly enough to supplant the 70 UHF channels. In view of the cost, the widespread disruption and confusion that would result from any effort to move these stations elsewhere in the spectrum, it must be concluded that a proposal to obtain more VHF channels for television to replace UHF channels is infeasible and impracticable.

I would like to add to that, any suggestion for reexamination of the spectrum to make a redivision would necessarily include the examination of the needs of these other services, and I can tell you that
they all feel crowded. They all feel that their needs are not adequately taken care of.

We would again come to one of those situations where we would have to balance needs and there is no one who can guarantee or promise in advance of a hearing that reexamination of the spectrum or suggested new use of some parts of it, such as FM, would automatically provide additional space for television.

Senator Potter. The fact that you have 70 channels in UHF, under the most optimistic development can you envision how many of those channels will be actually used?

Mr. Hyde. Actually, when we were working with the allocation plan, we had expected to use 54 channels at one stage in the UHF, reserving some for possible unanticipated uses, but as we got into the problem of providing an opportunity for a competitive, nationwide system, we found ourselves obliged to make use of a whole block of 70.

Why we have not worked out a nationwide allocation based on UHF alone, which would be the only way you could tell how good your coverage is, we have done enough work on it to know that limiting television to the UHF would give us some pretty tight situations, particularly in the Northeast where you have many large and important cities. You would find it very difficult to find enough assignments.

Senator Potter. It seems to me it would be difficult to sell the public to tune in to channel 54 or channel 38. When you have the small number, it means a lot more, but when you go into 70 channels, in addition to your VHF, it would be difficult to educate the public that channel 54 or channel 68 is my channel.

Senator Schoeppe. It would depend on what was on channel 54.

Mr. Hyde. And then there is this, too, the number of channels in one city would be limited to eight or less. If they would become known by their call letters rather than the No. 58, it wouldn't make much difference. Yet I recognize that you are calling attention to some psychological factors of the mass listening habits, and people do acquire listening or viewing habits and they tend to come back to the same place where they were before.

And the impact upon the public and the industry of a move of all stations to the UHF would be far greater now than it was 2 years ago, for since the lifting of the freeze, the number of VHF receivers in the hands of the public has increased from approximately 15 million to 30 million. And the number of stations operating on VHF channels has increased from 108 to 250. Similarly, the investment of the industry, including broadcasters, manufacturers, service and repair people, has increased severalfold. Here, too, the disruption and dislocation, the uncertainty and confusion, make this proposal infeasible and impracticable.

I have dealt at some length with the salient considerations involved in the assignment of channels because of the importance of these matters to the national television structure. A second and equally important problem arises from the nature and extent of the service area that should be provided for television stations authorized to operate on the assigned channels.

It was our objective to provide the whole of the American public—including people who reside in cities, farms and rural areas—in all parts of this country, with at least one television service. In addition,
it was our objective—wherever practicable—to make it possible for the American people to be provided with a choice of two or more television services. Further, it was our objective to make a nation-wide service available at the earliest practicable date. We assumed that in the immediate future, at least, television service would originate from the larger cities where there was a substantial economic base for their operation, in terms of population and purchasing power. Consequently, if persons outside these cities were to obtain television service in the near future, it would have to come from stations in the large centers.

In the light of these objectives and considerations, it was the Commission’s decision that all stations should have the potentiality of relatively wide coverage. Further, we concluded that the high power which was necessary for wide coverage was further desirable since it made possible a better grade of service to the viewer within the service area. We, therefore, authorized the use of high power.

I think you can see that in terms of the public interest there is substantial justification for providing television stations with side coverage. However, the fact is that the transmitters necessary to provide such high powers for the UHF have not yet been developed. The result is that the approximation to comparable coverage that we hoped would be possible between VHF and UHF stations has not yet been attained.

Now, I should like to review briefly the growth of television stations since the lifting of the “freeze” and the current financial status of these new stations. I do not propose to burden the committee with the detailed data, but rather I shall set out the highlights of our analysis. The summary figures are available in these tabulations which I have had prepared for this proceeding. In addition, I would like to make available copies of a previous report which the Commission released on the UHF situation.

As you know, there has been a very rapid expansion in television during the past 2 years. There are well over 3 times as many stations in operation now as compared with April 1952. Of the 377 commercial stations on the air as of May 1, 1954, 127 were UHF.

On the basis of applications already received, there could be a total of 673 commercial stations. Of these, 404 would be VHF and 269 UHF. By comparison, in our allocation plan, we provided for approximately 550 commercial VHF and 1,300 commercial UHF stations.

Now, how extensive is intermixture of VHF and UHF stations in the same community? The great majority of UHF stations on the air—68 percent—do not operate in the same community with a local VHF station. Another 26 percent of UHF stations have only 1 VHF station in their same community. Only a handful—6 percent of the UHF stations—are in communities with 2 or more VHF stations. I want to emphasize that I am now talking about intermixture in the same community. However, intermixture on an area basis—that is, VHF signals coming in from outside communities—is very general.

I said a moment ago there could be 673 commercial stations on the basis of stations authorized and applications pending. This, however, presumes two things: (1) That all stations on the air will continue in operation; and (2) that all permit holders will eventually build stations.
Let me indicate what has been our experience thus far with both of these factors. Thus far, a total of 77 permittees have canceled out their authorizations before going on the air or have ceased operation after going on the air. These 77 include 13 VHF and 64 UHF.

Senator SCHOEPPEL. I should like to ask a question at that point. Those stations that have gone off the air have done so because they could not get the program. I believe that that will probably be the answer indicated by the responses. I note that Senator Potter has asked that very question of the licensees, and I have not the time to suggest a survey on the basis of information coming directly to me.

Mr. HYDE. The usual explanation is, inability to get programs and sponsors, because of inability to get set distributions, and inability to get set distributions because they do not have the programs or the sponsor.

Senator SCHOEPPEL. Assume that they could get the set saturation, now; then, should we not give consideration, at some place down the line, to the possibility of control of programs. The control of programs is going to be the responsibility of somebody, some place down the line.

Mr. HYDE. Senator, my view is that we should try to solve this problem without anything that tends to place either the responsibility or the control of programs on a Government agency.

Senator SCHOEPPEL. I grant all of that; and that would be the last thing I would want. But if we find that, by reason of the programming, contractualwise or agreementwise, or otherwise, that we run into an impasse, I say somebody is going to have to wrestle with it, either the industry, itself, or—

Mr. HYDE. Yes. I think, Senator, that what we have here is a challenge to industry as well as to ourselves; and I would think that all elements of the industry would recognize that the thing to do, the thing to avoid regulation, is to find some way to get a better distribution of programs and sets, so that there will not be any need for further regulation.

Senator SCHOEPPEL. That is the very reason I am raising this question, because it seemingly is pointing in the direction of the type of programs that are controlled; and you cannot blame them, because they have already taken terrific losses, to start with, in developing it; and, therefore, they ought to be protected. But, at some place down the line, if we find that that is getting into a channeled area to the exclusion of other areas, all over the country, I am afraid we are going to be confronted—somebody is going to be confronted—with finding the solution to it.

Mr. HYDE. Senator, I would not want now to conclude that it is necessary for the stations to have access to certain program sources which now seem to be uppermost in the minds of many of these stations. Very often, the complaint is, "I cannot get the programs of a certain network." Up to now, network programs have seemed to be the lifeblood of television. In the aural field, as you know, there has been a high development of the independent type of operation, in one network—one whose type of operation lends itself to that.

In television, it is very difficult because, while the network shows the big variety shows, it is the public that pays their bill. They exploit—perhaps "exploit" is not a nice word, there—they present big names known to the public, names that are familiar to them, in pro-
grams which attract the public as against local producers. However, we should not give up and conclude now that a certain limited number of program sources are to provide the whole fare of program material for the American public. The film technique is still being developed.

Now, I am “reaching out in the yonder blue,” as they say—the magnetic-tape type of recorded program material, used extensively in AM for sound reproduction, is not yet available for video reproduction. But we should not assume that this is not going to be available. It is well advanced. I would not want a base allocation of principles or licensing policies, nor would I urge this committee to adopt legislation geared to a present situation which may be only temporary. Nevertheless, we are concerned about this temporary situation, for this reason, and that is, for the development of ultrahigh companies to suffer a setback at this time; and there are no sets in the hands of the public. It is going to make it still more difficult later on for any development of the additional stations which we believe are necessary for a country as big as ours, and for the type of competitive effort that we think there should be.

Senator Potter. I contacted the 60 UHF operators who turned back licenses, and received a reply, I think, from 47; and of the 47, a vast majority stated that inability to secure or to “network” an affiliation, or an acute network affiliation, was one of their reasons for turning their licenses back.

Mr. Hyde. That is what I expected you would probably get from such a questionnaire.

To continue: Thus, the number of UHF cancellations is half as large as the total number of the UHF stations in operation. However, it should be noted that few of the dropouts had actually gone on the air—2 in VHF and 10 in UHF.

Senator Hunt. May I ask, Mr. Hyde, what percentage of these permits were exchanged, bought, and sold, prior to the canceling out? Do you happen to know that?

Mr. Hyde. Two UHF stations were transferred from their original owners to new owners prior to the cancellation of the stations’ authorizations. These were KRTV, Little Rock, Ark., and KCTY, Kansas City, Mo. In addition, 1 UHF authorization and 1 VHF authorization were transferred from their original owners to new owners after the stations had gone on the air. Subsequently, the new owners of these stations shut down the stations’ operations with a request that the CP’s be retained pending future developments and reorganization.

Senator Hunt. What about VHF?

Mr. Hyde. In VHF there was one station, in Lincoln, Nebr., I recall, which canceled out under these conditions. The HF’s apparently find it difficult for both of them to live under the competition, after the stations over at Omaha have merged. As a result of that merger, one of them planned to drop out. I understand that there is some plan, now, to convert it into an educational station, but that was an instance of a transfer in the sense that they merged their interests in one licensee, and one station stopped.

There is one in Honolulu, where a station got in distress and then passed into other hands. I believe it was temporarily off the air, and is now back on. That was a VHF.
In the great majority of cases where UHF permittees have cancelled, they faced substantial VHF-only set saturation in their markets. This was true not only in communities in which a VHF station was in operation in their community, but also in communities which had no local VHF station. It is also true that in a number of these communities VHF-set saturation was relatively low in May 1952, when the Commission had just lifted the "freeze." Such VHF-set saturation developed between then and the end of 1953 as the result of two factors: new VHF stations going on the air; and increased coverage of existing VHF stations.

There are now 120 UHF permits outstanding, in addition to the 127 UHF stations on the air. Over 60 percent of the 120 UHF permits outstanding are now at least 8 months old. We do not know when these 120 UHF permitholders will go on the air. We do know that they face the task of overcoming considerable VHF-only set saturation. This is particularly true of the 49 UHF permittees scheduled to go into 33 prefreeze markets. To a somewhat lesser degree, it is also true of 40 UHF permittees authorized for operation in 40 UHF-only markets where there are no UHF stations now in operation and no UHF-set circulation, but where there is considerable VHF-set ownership under study.

On the other hand, those affecting communications can be of very, very important interest, because people have a very great interest in television. They put in these high antennas, which are sticking all over the rooftops, and, in the absence of any other standard facilities, they will accept a very low grade of signal quality. They can have a lot of "snow", but if the action is there, they are still interested; and consequently there is a widespread distribution of VHF sets in areas where one would be surprised to find television.

Previously, I have indicated that if UHF is to achieve comparable coverage with maximum-power VHF stations, it must have higher power. In fact, it would require radiated power of 1,000 kilowatts. This calls for a transmitter with rated power of 50 kilowatts or more. RCA, GE, and DuMont have advised that such transmitters are currently under development, but they are not likely to be available commercially until late 1955 or by mid-1956.

The bulk of UHF transmitters now in operation are relatively low powered. They have a rated power of 1 kilowatt and with high-gain antennas they operate at approximately 20 kilowatts. The highest rated UHF transmitter currently in operation is 12 kilowatts; with high-gain antennas these operate at approximately 200 to 240 kilowatts radiated power.

With the transmitters now available to UHF operators, they generally cover their local community, but they cannot reach out as far as VHF stations nor can they overcome poor viewing conditions as well as VHF stations.

We do not know precisely how many UHF sets are presently in the hands of the public, but the best information available indicates that the figure is somewhere between two and three million. A survey made in November 1953 by a commercial organization indicated that as of that date there were 27.5 million families with a television receiver, including 1.8 million families who were equipped for UHF reception. In this connection, it is important to note that factory
production and factory sales of combination VHF-UHF receivers have both gone down rather substantially between October or November 1953 and March 1954.

Senator Potter. That is very significant.

Mr. Hyde. It apparently reflects the demand of the buying public. Apparently the rate of manufacture was higher at the time the ultrahigh stations were opening up markets. You will note that my testimony shows a number of them located in cities where there were no other stations; and, of course, ultrahigh did get on the air before any other service in some fairly large markets—Portland, Oreg., for instance. It is this dropoff in the number of sets equipped to receive on ultrahigh that causes more concern, perhaps, than anything else, because if that is a continuing trend it will accentuate the difficulty now present, now being encountered by the ultrahigh operators.

The financial statements of the stations taken as a whole should reflect broadly the various factors operating in the industry. However, because there has been a sudden expansion of stations and because most of the postfreeze stations have had a relatively short operating experience—their average age is only 9 months—the financial pattern at this point is still somewhat confused. However, the financial reports of the industry for 1953 and the first quarter of 1954, which we have collected and analyzed, do reveal some broad trends, and are of considerable importance for the light they shed on the UHF problem.

First I should like to report on the overall 1953 financial experience of the television industry. The industry as a whole had a prosperous year. Total revenues were $450.8 million. Income before Federal income tax was $68.4 million. The average prefreeze station had revenues of $1.9 million, and income before Federal income tax of $658,000. The 4 networks and their owned and operated stations as a group had revenue of $231.7 million and income of $18 million.

With respect to the postfreeze stations, let me first give you an overall view of their investment. As of the end of 1953, the postfreeze VHF stations reported a total investment in tangible broadcast property (transmitters, studios, land and buildings, and so forth) of $41 million, or an average of $376,000 per station. The UHF stations reported an investment of $30 million, an average of $800,000 per station. That was the difference to which I had reference.

To measure the experience of postfreeze stations in terms of profit and loss, we are using as our benchmark the reports of the stations detailing their operations during the 3 months, January, February, and March, 1954. This is necessary because of the varying periods that these new stations have been in operation and their very limited experience overall. The information pertains to 175 of the 192 postfreeze stations that were in operation by November 1, 1953.

About 37 percent (33 stations) of the postfreeze VHF group reported profitable operation during the first quarter of 1954. By contrast, only 15 percent (13 stations) of the UHF group were profitable during the same period.

The average monthly profit of the profitable VHF and UHF stations was about the same—between $10,000 and $11,000. However, the monthly losses experienced by the losing UHF stations were substantially higher than for the losing VHF stations—between $10,000 and $11,000 for the UHF’s, and $7,000 for the VHF’s.
Senator Potter. Is this monthly?

Mr. Hyde. Monthly—right.

Thus far, I have discussed the economic condition of postfreeze stations in terms of profitability. I think it important that we view these data in another light, to determine the number of these stations which suffer continuing substantial monthly losses. We find that 25 percent of the postfreeze VHF stations, as contrasted with 60 percent of the UHF stations, reported substantial monthly losses.

I have described in very broad terms the growth, development, and present status of UHF television. When examined in detail, the problem is exceedingly complex: in some degree it varies from market to market, and it changes from month to month. Some of the facts are readily measurable, others are not. The applicability of some of the factors is not limited to the UHF only. Such factors as size of the market, the number of stations already in existence, the resources and experience of station operators, will influence the success of any station, VHF or UHF. Thus, any generalization which is drawn may have only limited applicability in understanding the present status of any individual UHF operation.

With these caveats and qualifications in mind, I believe we can draw at least the general outlines of the problems and difficulties that confront the UHF broadcaster. I have pointed out that 68 percent of all operating UHF stations are in markets with no competing VHF station. But intermixture of service areas is far more general, and I would say that the typical UHF broadcaster finds himself in competition for the viewing audience with one or more VHF stations.

In this competition the disadvantage of the UHF station in coverage is two-pronged: In most cases, he finds that his own service area is already effectively covered by high-powered VHF stations located in large urban markets; UHF stations frequently are in the position of providing duplicate coverage. And it is well known that national advertisers seek as far as possible to avoid duplicate coverage. The second disadvantage stemming from inequality of coverage is that where VHF and UHF stations are in the same market, the national advertiser can reach many more people by buying time on the VHF rather than the UHF station.

But most important, in my view, is the receiver difficulty with which UHF stations must contend. This difficulty arises from the fact that VHF receivers in the hands of the public cannot receive transmissions from the UHF station without conversion. This, I believe, is the most critical disability facing the UHF.

There are relatively few large-sized markets in which UHF stations can be located, which do not already have 25 percent or more VHF only set saturation. Thus, the new VHF operator will often find a ready-made substantial market in the sense that the public will receive his signal merely by a twist of the dial. The UHF operator, however, must actively sell and promote the distribution of UHF converters which may cost $50 to $75, and which may not operate altogether successfully. Or, he must persuade the public that in the purchase of new sets they ought to buy receivers which will tune all channels, including the UHF channels; and such combination receivers may cost the consumer substantially more than a VHF only receiver.
To accomplish this task of building audiences, the UHF operator must make his service sufficiently attractive so that the listener will voluntarily incur the added expense involved in the conversion of his VHF receiver, or in the purchase of a new all-channel receiver. In a community which is not reached by VHF service, the UHF station can expect gradually to build up a UHF audience. At best, the process is slow and costly to the station.

At the other end, where there are two or more local VHF stations or signals from outside stations serving the same community, and especially where these VHF stations are bringing in popular network programs, the incentive to convert or to buy UHF equipment, which is higher priced, is substantially weakened. And, where UHF set circulation is low, obviously advertisers and networks are reluctant to place their programs on the UHF station. And so, to the extent that these factors apply to individual cases, the circle is complete. The audiences of UHF stations are limited. They can be increased by obtaining network programs. The UHF stations do not get sufficient network programs because they do not have an audience. The problem is to break into that circle.

This set-conversion problem also has serious long-run implications. While UHF stations are on the air, they are in active force in persuading people in their community to buy UHF equipment. But if the UHF station become discouraged as a result of slow conversion, or if it does not have the financial resources to wait out the period necessary to achieve substantial UHF set circulation, and it goes off the air, then, what are the consequences? The chances are that progress will be halted in building up UHF set circulation, only VHF only sets will be purchased, and it will be even more difficult in the future for new UHF stations to operate in that community. In other words, so long as VHF only receivers are manufactured and retailed and purchased, time alone will not solve the UHF problem in many, many communities. In fact, time would tend to make it realize that, if the trend goes toward VHF only sets.

In brief, then, the UHF problem, generally speaking, stems from three limitations: the limitation of low UHF set ownership, of coverage, and of programing. These limitations are substantial, and I must state my own conviction that there is no one magic solution to the problem. Nevertheless, there are measures which may help overcome some of the present handicaps of UHF. Some, the Commission, itself, has proposed; others have been urged on the Commission by outside parties. I should like to review these proposals with you, although I cannot, of course, state the ultimate decision which the Commission may reach in their consideration of any one of these proposals.

First, the problem of coverage. On March 11, 1954, the Commission issued a notice of proposed rule-making looking toward the upward revision of its requirements with respect to the minimum power which UHF stations might utilize. In the Commission's notice it pointed out that requirements of power by UHF stations were made in the light of the equipment which was then available. At that time, transmitters capable of producing an effective radiated power in the order of 100 kilowatts were not available in the UHF. Since the adoption of the sixth report, it appears such power has become available and can be accomplished with a transmitter with
a rated power of 5 kilowatts. Accordingly, the Commission proposed to require all UHF stations to operate with a transmitter with a minimum rated power of 5 kilowatts. The time afforded interested parties for the submission of views expired on May 17, 1954. Any decision the Commission makes in this will, of course, take into consideration the views which have been submitted in response to the notice.

Another proposal for extending coverage was made in two petitions filed by parties requesting an amendment of the television broadcast rules so as to authorize the use of new techniques for extending the service of television stations. These techniques have been labeled as satellites and boosters. The satellite operation contemplates the operation of a subsidiary station on a different channel than is authorized for the operation of the main station. The booster technique contemplates the operation of a subsidiary station on the same channel authorized for the main station. Both petitions which have been filed and are presently pending before the Commission request the authorization of satellites and boosters on both the VHF and the UHF channels. The Commission has already authorized Sylvania Electric Co. to experiment with satellites and several parties, including RCA, WSM, Adler Communications Laboratories, and Associated Broadcasters to experiment with boosters. The results of these experimental authorizations will undoubtedly help the Commission in its final decision.

The problem of building of UHF set ownership is, as I have pointed out, of major significance in the present situation of UHF stations. This problem need not be one of indefinite duration, however. First, if the manufacturers of receivers were to manufacture only all-channel tuners, obviously this problem would disappear as new sets were purchased. The data I have furnished sets out the extent to which all-channel tuners have been manufactured. Further, the problem would be considerably lessened if set conversions were readily accomplished. The Commission's authority in this area is virtually nonexistent. But to the extent that actions in other fields within our competence and jurisdiction have a bearing on this problem, I think it appropriate to raise it at this time. The committee is aware that, on December 23, 1953, the Commission issued a notice of proposed rulemaking, looking toward a revision of its multiple-ownership rules. The rules in effect specify a five-station maximum for television stations, without distinction between UHF and VHF. The revision proposed by the Commission is to increase the maximum permissible ownership of television stations to 7, no more than 5 of which may be in the VHF band. In its notice, the majority of the Commission stated their view that this amendment would help encourage the development of the UHF band. This proposal is designed to encourage large organizations with program production, know-how and resources, to enter into the UHF field, in the ownership and operation of stations. To the extent that this is accomplished and results in the rendition of full network programs over UHF facilities on a regular basis, a direct incentive would be furnished to persons within the service range of such stations to convert to UHF. Moreover, to the extent that a number of major networks have UHF stations with popular programs, the greater the incentive to manufacturers to turn out all-channel receivers only and high-power UHF trans-
mitters. Accordingly, although no action can be taken by the Commission directly with respect to the UHF-receiver problem, it might be that the liberalization of the multiple-ownership rules would help indirectly in some measure to reach the same result.

I have been told by operators of ultrahigh stations, coming to the Commission, that when they call upon sponsors and agencies, they simply say, "Nobody is using ultrahigh, and we are not spending any money there." We think that that situation could be changed if it were made clear to them that important broadcast interests are operating in that field.

Senator Potter. Is there not a difference in the types of ownership? Under the multiple ownership, you blanket them all in one; is that not correct?

Mr. Hyde. Yes.

Senator Potter. In other words, a network with 5 stations is in the same position as an individual who has 5 stations spread throughout the country?

Mr. Hyde. No two of them may be in the same city. Sometimes stations in separate markets will present a degree of overlap in an intervening area, and we have tried to keep that to a minimum; but, as to the network stations, they are all at widely separated points—usually at points where they have program facilities, like Los Angeles, Chicago, or New York.

Senator Potter. It seems to me there would be a difference between a network that furnishes the program that affects many stations, and one where there would be an individual who has to furnish individual programs for a station with respect to having multiple stations.

Mr. Hyde. Well, there is. Of course, our rule would apply across the board. It was not an invitation to give networks any opportunity beyond that which any other citizen or interest might have. The important thing was to get users of radio to use ultrahigh, to stimulate the production of ultrahigh receivers and, generally, to stimulate the use of ultrahigh service.

On March 9, 1954, a Senate bill, S. 3095, which generally looked toward the same objectives as the Commission's proposal, was introduced in the Senate. This bill proposed to add a new section to the Communications Act, which would regulate the multiple ownership of television broadcast stations. The Commission's views on this bill were submitted to the full committee yesterday; and I believe they can be, and should be made available today.

Senator Potter. Yes. Without objection, the Commission's recommendation on S. 3095 will be made a part of the record.

FEDERAL COMMUNICATIONS COMMISSION,

HON. JOHN W. BRICKER,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

DEAR SENATOR BRICKER: I am enclosing herewith copies of the Commission's comments on S. 3095, a bill introduced by Senator Johnson to regulate the multiple ownership of television broadcast stations.

While these comments were submitted to the Bureau of the Budget for clearance quite awhile ago, we have been informed by the Bureau that they have not yet been able to secure the necessary coordination with other interested agencies. In view of the relationship of this bill to the hearings on UHF matters scheduled to commence before the Potter subcommittee on May 19, 1954, the Bureau has authorized us to submit these comments to you at this time without prior clear-
S. 3095 provides for the amendment of the Communications Act of 1934, as amended, by inserting after section 309, a new section which would regulate the multiple ownership of television broadcast stations. The new section would prohibit the granting of a license for a television broadcast station to any applicant if—

"(1) such applicant directly or indirectly runs, operates, or controls another television broadcast station which serves substantially the same area; or

"(2) ** * if the granting of such license would result in a concentration of control of television broadcasting in a manner inconsistent with the public interest, convenience, or necessity."

The proposed legislation further provides that the Commission shall in no event grant a license which would result in any person having interests in television broadcast stations in excess of—

(1) 5 VHF and no UHF
(2) 4 VHF and 2 UHF
(3) 2 VHF and 4 UHF
(4) 2 VHF and 6 UHF
(5) 1 VHF and 8 UHF
(6) 0 VHF and 10 UHF

Provision is also made that, during the 5-year period following the enactment of the section, any applicant who has been granted a VHF station license will, if he relinquishes same, be "entitled to be granted" for each such VHF station license relinquished, 2 UHF licenses, 1 of which shall serve substantially the same area as the station he relinquishes.

In considering the provisions of S. 3095 it is important to recognize that the Federal Communications Commission has adopted a series of rules dealing with the multiple ownership of broadcast facilities, and relating to radio as well as television stations. These rules, sections 3.35 (AM radio stations), 3.240 (FM radio stations) and 3.636 (television stations), contain a provision similar to that contained in the proposed bill precluding common control by any 1 party of 2 or more stations serving substantially the same area. And, like S. 3095, they also provide that no license will be granted to a party having any interest in other stations in the same service where the result of such a grant will result in an undue concentration of control inconsistent with the public interest, and that, in no event, will the Commission authorize any one person or group to have an interest in more than a specified maximum number of stations. Under the Commission's existing rules this maximum is 7 stations in both the AM and FM radio fields and 5 stations in the television field.

These rules have recently been the subject of extensive consideration by the Commission and their present form represents the culmination of rulemaking proceedings extending back as far as 1948 and concluded on November 25, 1953. In adopting these rules, however, the majority of the Commission did so without prejudice to their subsequent consideration of proposals which had been advanced during the course of the rulemaking proceedings under which, as an integral part of the development of the new UHF portion of the frequency spectrum, the maximum number of television interests any party could have would be increased, on condition interests in stations over and beyond five in number would have to be in the UHF portion of the spectrum. And on December 24, 1953, the Commission, with one Commissioner dissenting and another concurring specially, issued a notice of proposed rulemaking which looked toward the amendment of section 3.636 of the rules to provide for a 7-station maximum on the number of television interests which could be held by any 1 party, provided that at least 2 of the 7 stations are UHF.
It would appear that the provisions of paragraph (c) of the proposed new section 309 (A), which would permit persons to hold more than five interests in television stations providing a specified number thereof are on UHF channels, have, like the Commission's outstanding rulemaking proposal, the primary objective of encouraging the rapid development of UHF stations. But if this is the case, the Commission does not believe that the proposal incorporated in S. 3095 is as likely to achieve its objective as that which has been proposed by the Commission. For S. 3095 would require parties who already have interests in 5 VHF stations to relinquish 1 of such stations for each 2 UHF licenses to be acquired. The Commission has grave doubts that the present status of the broadcasting industry warrants an assumption that such persons would in fact find sufficient incentive to acquire any UHF stations if they were obligated to relinquish a VHF station to do so. Consequently, the Commission believes that the short-range consequence of the adoption of S. 3095 would be likely to be the maintenance of the status quo with respect to ownership of television stations by the networks or the other major interests in the broadcasting field, and that the objective of affording special impetus to UHF operation would be effectively frustrated.

The Commission also questions the advisability of any attempt to cope with what appears to us to be primarily a short-range problem through the enactment of permanent legislation of the type contemplated by S. 3095. While the Commission's proposed rulemaking recognizes the temporary disparity which exists between VHF and UHF television stations, the television allocation plan incorporated into the Commission's rules is based upon the necessary assumption that, after the admitted difficulties of this initial period, both VHF and UHF stations will play an integral role in providing adequate television service to the American people. We believe it might be unfortunate therefore to write into the Communications Act as permanent law any indication of fundamental inequality between VHF and UHF channels. Nor are we convinced that in any event it would be in the public interest for any person to have interests in more than seven television stations, even though a substantial percentage of such stations were operated on UHF channels. In this respect the committee's attention is called to the fact that the Commission has determined, in the AM field, that it would be contrary to the public interest for any person to have interests in more than 7 stations irrespective of whether these stations are 50-kilowatt clear-channel stations or 250-watt local stations.

The Commission therefore cannot support enactment of S. 3095. We should like to point out, however, certain additional questions which are raised by the proposed subsection (d) of the bill, in the event that Congress should feel that enactment of legislation of this type is desirable. This subsection is apparently intended to provide a special inducement for present licensees of VHF stations to go into the UHF spectrum by offering them, for a 5-year period, the absolute right to relinquish a VHF station and secure in return 2 UHF stations, 1 of which is to be in the same area as was served by the VHF station given up. But the provision, insofar as it would give an existing licensee the absolute right to two new stations of his choice, irrespective of other applications which might be on file therefor, would constitute a complete departure from the present law which requires a choice between applicants where more than one has applied for a specified assignment, and might, therefore, require the grant of an application which would less well serve the public interest than would another. And the additional requirement that 1 of the 2 UHF stations to be assigned to such person must substantially serve the same area as the VHF station relinquished might in a number of areas of the country be impossible of fulfillment without deleting existing assignments or substantially revamping the basic allocation plan.

**SEPARATE VIEWS OF COMMISSIONER HENNOCK**

I agree with the Commission's comments on S. 3095 to the extent that it questions the advisability of any attempt to cope with the UHF problem through the enactment of permanent legislation of the type contemplated by this bill.

I dissented, however, to the Commission's notice of proposed rulemaking proposing to increase the maximum permissible ownership of television stations to 7, not more than 5 of which may be in the VHF band. I do not believe that the weakening of the safeguards against the concentration of control of the media of mass communications is either an appropriate or an effective manner of stimulating the development of the UHF band. Varied factors contributed to the present plight of the UHF service. An effective solution to the UHF problem
may, therefore, be found only by directly attacking each of the causes of the existing disparity between UHF and VHF.

Mr. HYDE. In addition, on May 11, 1954, a proposed amendment of H. R. 8300 was introduced, which would exempt from the 10-percent excise tax all television sets with built-in UHF tuners. Obviously, that is designed to encourage the production of sets.

Senator POTTER. It is to stimulate the production of more sets.

Mr. HYDE. Yes.

Now, let us consider proposals designed to assure UHF stations better programing. Under the present provisions of the Commission's chain-broadcasting rules, a network affiliate which renders coverage to a substantial portion of the service area of a station located in another community may contract with a network organization to preclude the station in that other community from carrying network programs which the affiliate carries. The network affiliate may do so, even though the program's sponsors and the network itself desire that they be broadcast by the latter station also. This is the point we discussed earlier. On April 1 of this year the Commission issued a notice of proposed rulemaking looking toward a revision of this section of its chain-broadcasting rules. The change proposed by the Commission would continue to recognize the right of an affiliate to contract with the network to preclude stations located in the same community as the affiliate from taking programs of the network. The proposed rule would operate to the benefit of UHF stations, where the existing rule, because of the wide latitude afforded the VHF affiliate, has operated to preclude UHF stations from obtaining network programs where the sponsor desires to broadcast over the UHF facilities. The time for the submission of views by interested parties expired on May 10, 1954, and that proposal is presently pending before the Commission for final action.

On April 29 a further proposal seeking a revision of the Commission's network rules was filed. That proposal requests an amendment of the chain-broadcasting rules to provide—in effect—that 1 year from the effective date of the amendment at least one-third of network television affiliates, receiving revenue from the sale of network time, be UHF stations, and that 2 years from the effective date of the amendment at least one-half of network television affiliates receiving revenue from the sale of network time be UHF stations. That petition is presently pending before the Commission.

More recently, on May 13, 1954, a bill was introduced in the Senate (S. 3456) which looks toward a revision of the Communications Act to give the Commission authority to—
establish rules and regulations and make orders with respect to networks and such of the activities as affect licensed broadcast stations to operate in the public interest.

In addition to the foregoing proposals designed to assure UHF stations a high-quality program fare, a number of petitions have been filed with the Commission relating to subscription television. Subscription television takes various forms, but basically it is a technique for coding or scrambling the transmitted signal so as to produce a distorted picture and unintelligible sound at any receiver which is not equipped with appropriate decoding or unscrambling devices. The systems contemplate a regular charge by the operator of the system for the periodic purchase of the code or key to activate the decoding units.
Developmental and experimental research has been carried on for some time and there are presently several different systems in various stages of experimentation and development. From time to time, upon request of interested parties, the Commission has granted special authorizations to permit developers of subscription television systems to use broadcast facilities for such developmental work and experimental operations.

Among other things, the proponents of the system urge that the operation of subscription television by UHF stations will open the way to many new avenues of attractive programing and thus speed up set conversions, and also that it will supplement the revenues of such stations. In addition, it is alleged that subscription television will free stations of their dependency on networks. These petitions are presently pending before the Commission.

Also, there is now pending H. R. 6431, a bill to amend the Communications Act with respect to its application to subscription radio and television. Last week, in reply to a request from the chairman of the House Interstate and Foreign Commerce Committee, the Commission submitted its comments on this bill—and I should like to make a copy of the Commission's comments available.

Senator Potter. Without objection, it is so ordered.

[FC 54-601 4926]

Comments of the Federal Communications Commission on H. R. 6431, a Bill to Amend the Communications Act With Respect to Its Application in the Case of Subscription Radio and Television

H. R. 6431 is a bill concerned with the application of the Communications Act to subscription operations carried on over either radio or television stations. Specifically, it attempts to clarify the legal status of such operations by amending the definition of "broadcasting" in section 3 (o) of the Communications Act of 1934, as amended, expressly to exclude communications, intended to be received by the public, which involve "the payment of any charge, subscription fee, or other form of direct compensation." At the same time, section 3 (h) of the Communications Act would be amended to provide that persons engaged in subscription operations in interstate or foreign communication by radio shall be deemed to be common carriers.

No subscription service, in the sense that that term is usually used, is presently authorized by the Commission; broadcast-station licensees may not transmit radio or television programs for reception by the public on home receivers under circumstances where such programs can only be received by those members of the public willing to pay a specified fee. There are, however, presently pending before the Commission a number of petitions requesting the authorization of subscription radio or television services by broadcast stations and in the broadcast bands. The entire problem is now being actively studied. Pending the conclusion of its study, the Commission wishes to stress the fact that it has reached no determination relative to the merits of subscription radio and television, and that these comments are in no way based on any policy decision with respect to subscription operations.

There has never been any definitive determination, either by the Commission or the courts, as to whether the transmission of program material intended to be received by those members of the general public willing to pay a fixed charge or subscription fee can properly be classified as broadcasting within the meaning of the present definition of that term in section 3 (o) of the act. It would appear, however, that, were the Commission to decide that such subscription operations were in the public interest, such programs could be classified as broadcasting within the meaning of the present language of section 3 (o). It might be argued that such programs are not "intended to be received by the public" since their intended receipt would be limited to members of the public willing to pay the specified price. But, absence of any charge for the program is not made a prerequisite of broadcasting operations under the present language of section 3 (o). And the reliance of the broadcasting industry upon advertising revenue,
rather than upon direct charges to the public as its principal source of revenue, has not been the result of any action by either Congress or the Commission, but rather the result of the natural development of the industry. It would appear that the primary touchstone of a broadcast service is the intent of the broadcaster to provide radio or television program service without discrimination to as many members of the general public as can be interested in the particular program as distinguished from a point-to-point message service to specified individuals. If this is true, subscription services should properly be characterized as a type of broadcast service. For while particular subscription programs might have a special appeal to some segment of the potential audience, this is equally true of a substantial portion of the programing now transmitted by broadcasting stations.

The legislative history of section 3 (o), while admittedly meager, does not in any way detract from an interpretation of the language of the section under which subscription operations would be held to be broadcasting. At the time of the passage of the Radio Act of 1927, which contained no definition of broadcasting, there was some discussion of subscription radio, and H. R. 16867, a separate bill, upon which no action was ever taken, had been introduced which would have prohibited the broadcast of programs for which a fee was charged. And in the course of the debates on the bill. Senator Dill, who was the manager of the bill, stated that in his opinion nothing in the Radio Act would prohibit the institution of a subscription service and that, while he had doubts as to the extent to which the public would be willing to pay for radio programs, he did not believe Congress should preclude such a broadcast service.

(See 68 Congressional Record 2880-2881.) The present definition of broadcasting was adopted at the time of the enactment of the Communications Act of 1934, without discussion or explanation in the committee reports or in the public debates. It was apparently derived from the definition of broadcasting which had been adopted at the International Telecommunications Conference held in Madrid in December 1932 and incorporated into the Radio Regulations annexed to the convention signed there. A study of the documents surrounding these negotiations also fails to disclose any consideration of the question of whether a radio program service offered to the public upon the payment of a specified fee would, because of such charge, cease to be a broadcasting service.

The exclusion of subscription services from the classification of broadcast operations, which would be accomplished by the proposed amendment to section 3 (o), would not, in and of itself, preclude the authorization of subscription operations by licensed stations operating in the broad cast bands. The Commission may authorize other services on the broadcast bands if it determines that the public interest will be served thereby.

The proposed amendment would, however, have certain significant effects upon any subscription operations which the Commission might authorize. For there are several provisions of the Communications Act which by their terms apply only, or particularly, to broadcasting activities. These include section 303 (1), which gives the Commission authority to make special regulations applicable to stations engaged in chain broadcasting; section 307 (d), which limits the license term of broadcast stations to 3 years, but permits licenses for other classes of radio stations to be for as long as 5 years; section 315, which provides for equal opportunities for legally qualified candidates to use the facilities of broadcast stations; section 317, which provides that, in the case of broadcast stations, matters paid for or otherwise furnished to the station licensee must be properly announced as such; section 325, which provides no broadcast station may rebroadcast a program of another broadcast station without express authority of the originating station; section 506, relating to coercive labor practices affecting broadcasting; and section 603 of the act which expressly exempts "the contents of any radio communication broadcast" from its application.

The Commission believes that it would not be advisable to make these various provisions inapplicable to any stations which might be authorized to provide subscription programs to the general public for home reception. Thus, while it is not presently known to what extent networking of subscription operations would be either technically or economically feasible, there would appear to be no reason why the Commission should not have the same authority over any chain operation in the subscription field as it now does over stations engaged in conventional chain broadcasting. Similarly, to the extent candidates for public office might use subscription services, or the program material of such operations be paid for, or furnished by commercial sponsors, or other groups, it would appear that the provisions of sections 315 and 317 of the act, relating
to the handling of such programs over broadcast stations, might well be applied to the subscription operations.

Section 1 of the proposed bill would amend section 3 (h) of the Communications Act to classify the operations under consideration as common-carrier operations. Although it might be felt to be desirable to subject subscription services to regulations as a public utility, the Commission does not believe that classification of these services as common carriers would be appropriate. Stations engaged in subscription operations would appear to be selling program material to the members of the listening or viewing public, either developed by the station itself, or procured by contract with another originating source, rather than providing them with a communications service for hire. It has been a fundamental concept in the communications field that a person is not a common carrier of communications where he is providing his subscribers primarily with a news or information service, rather than with a communication service enabling subscribers to communicate among themselves. Thus, for example, while the furnishing of leased wires or radio circuits by the telephone or telegraph carriers is part of their common carrier activities, the use of such leased wires by the news services to transmit news to their subscribers, or by the stock exchange to transmit price quotations has been held not to involve common-carrier operation. Similarly, in the case of subscription radio or television program services, the subscribing members of the public would be paying for the programs rather than for the use of communications facilities. Moreover, it obviously is not contemplated that subscription stations would have the common carrier obligation of carrying, without discrimination, all programs offered for carriage. And since the Commission's jurisdiction over common carriers runs only to their interstate operations, a serious question would be raised as to whether particular subscription operations are interstate or intrastate, for purposes of the Commission's common-carrier jurisdiction. The Commission believes, therefore, that subscription program services do not lend themselves to classification as common carriers, pursuant to the provisions of title II of the Communications Act.

The Commission now has authority under title III of the Communications Act to adopt such regulations as might be required with respect to matters such as the number and type of hours during which subscription programs could be broadcast by any station, the number of stations in any community which could engage in subscription operations at any one time, or the approved transmission standards for such operations. Any subscription service which might be authorized will be likely to be faced with the natural forces of competition from other subscription operations (including closed-circuit operations by wire of the type now utilized in theater television), and from conventional broadcasts received by the public without direct charge. In the absence of experience in this field, we cannot now foretell the effect of these natural competitive forces and whether any additional regulatory authority would be required in the future.

Adopted: May 6, 1954.

Mr. HYDE. Thus far, I have described those proposals made by the Commission and by interested private parties which are related to the three principal problems that I have described, i. e., coverage, UHF set ownership, and programing. In addition, there have been filed on April 29 of this year a couple of miscellaneous proposals looking generally toward a relaxation of the Commission's rules with respect to the operation of UHF stations. One request seeks a revision of the Commission's technical standards to authorize what has been described in the request as "binaural third dimensional or stereophonic sound"—designed to provide "*** tonal perspective with movement and quality and *** a feeling of realism." A further request for the amendment of the Commission's operating requirements of UHF television stations seeks an amendment of the Commission's rules so as to authorize aural transmission by stations with varied fixed images rather than moving images as the rule presently requires.

In addition to these requests a further request presently pending before the Commission seeks a suspension of the further processing and
grant of construction permits in the television broadcast service until such time—

that the Commission may adequately study, particularly in the light of forthcoming Senate hearings, an adjustment of the inequities presently existing between UHF and VHF television stations.

In conclusion, I should like to state that this meeting between representatives of the Government and the industry can be helpful in adducing all relevant data so that we may explore fully all facets of the problem. The Commission will, of course, cooperate to the fullest extent with this committee.

STATISTICAL APPENDIX

TESTIMONY OF CHAIRMAN ROSEL H. HYDE ON THE STATUS AND DEVELOPMENT OF THE UHF CHANNELS IN THE UNITED STATES

Source: RETMA reports.
Table 25.—History of TV development

February 25, 1928: First television license issued to Jenkins Laboratories, W3XE, between Silver Spring and Wheaton, Md.
June 30, 1928: First mention of "visual" broadcasting in FRC annual report.
1929: FRC allocated four 100-kilocycle channels in 2000-3000-kilocycle band for "visual" broadcasting.
1936: April and October
March 1939: First FCC report—no standards approved. Television should remain developmental.
November 13, 1939: FCC's Television Committee issued second report.
December 22, 1939: Rules permitted sponsored programs on a limited basis.
February 29, 1940: New rules adopted providing for two classes of stations, experimental and experimental program.
March 20, 1941: Hearing to get new evidence on industry agreements on standards. Report made by NTSC.
April 30, 1941: New rules adopting NTSC standards—18 channels—minimum hours of operation.
June 17, 1941: First television licenses for regular commercial operation.
April and October 1942: Order prohibiting new construction due to war.
August 15, 1944: Order on general allocation hearing.
May 25, 1945: Report of allocation hearings (490–920 experimental TV). Docket 6551 on the matter of allocation of frequencies to the various classes of non-governmental services on the radio spectrum from 10 kilocycles to 30 million kilocycles.
October 7, 1945: Commission rescinded above orders.
First 140 metropolitan districts.
April 10, 1946: First CP granted after war “freeze” on construction.
December, 1946: January and February 1947 (Doc. 7896), hearing on CBS proposal for color.
August 14, 1947 (Doc. 8487): Proposal to delete channel 1 and sharing on remaining channels. Sharing of TV with mobile services deleted in exchange for channel 1 to be used by these services. Dockets 8975 and 8736. Table of assignments amended to reflect the deletion of channel 1.
May 6, 1948: Notice of proposed rulemaking to amend table of assignments in order to provide assignments to smaller communities. Previous separations of 150 miles cochannel and 75 miles adjacent channels continued. Approximately 655 assignments proposed in 459 communities on the 12 VHF channels. No other changes such as classes of stations, powers, etc., proposed in this docket. Dockets 8975 and 8736.
June 29, 1948: Hearings on May 8, 1948, proposals began (Docs. 8975 and 8736).
August 18, 1948: Last of CP's granted prior to official "freeze" order on new construction.
September 13-14, 1948: Commission-industry conference to discuss procedure.
September 30, 1948: "Freeze" order adopted.
November 30, 1948: Engineering conference. Ad hoc committee set up as a result of this conference.
May 27, 1949: Report of ad hoc committee sent to Commission.
July 11, 1949: Notice of further proposed rulemaking (Docs. 8975, 8736, 9175, 8976). Proposed new rules, standards, and allocation table. 12 VHF and 42 UHF channels utilized with remaining UHF for experimental uses. Plan contained 3 classes of stations. Comments were invited on 61 megacycles color systems.
September 26, 1949: Hearings began on part I (general issues).
September 1, 1950: First report of Commission (color TV issues). Second notice of further proposed rulemaking (bracket standards). This report proposed to make final, the CBS field sequential standards.
October 16, 1950: Hearing recommended on general issues.
March 21, 1951: Third notice of further proposed rulemaking. 12 VHF and 52 UHF channels; one class of station with various minimum power; height combination, 220 miles cochannel in VHF, and 200 in UHF. Educational reservations.
June 21, 1951: Third report denying partial lifting of freeze.
July 12, 1951: Fourth report and order; denied Bell Telephone petition and assigned band 470-500 kilocycles to TV B/g.
July 25, 1951: Fifth report and order.
Docket 8736 et al: Authorized temporary increases in power for existing stations. (Partial lifting of the "freeze.")
August 27-December 1951: Written hearing on third notice.
April 11, 1952: Sixth report and order lifting the freeze. All 70 UHF channels intermixed, zones system, increased heat and power. In United States 2002 assignments (509 v, 1433 U) in 1,274 cities.
June 2, 1952: Post "freeze" rules became effective.
July 1, 1952: Processing of applications commenced.

HEARING ON STATUS AND DEVELOPMENT OF UHF CHANNELS BEFORE A SUBCOMMITTEE OF THE SENATE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE

Comments of the Federal Communications Commission with respect to miscellaneous factual inquiries raised on the record in the above hearing May 19-21, 1954. Transcript reference cited in connection with each question

Question 1. How many separate ownership interests are there in television?
Answer. 431.

Question 2. How many licensees own 5 stations? 4 stations? 3 stations?
Answer. Approximately 487 different companies or individuals own the 570 TV stations authorized as of May 1, 1954. A total of 51 companies or individuals
had either majority or substantial minority ownership interests in more than one TV station. A breakdown of these ownership interests is as follows:

<table>
<thead>
<tr>

Of the 377 stations on the air as of May 1, 1954, there were approximately 304 separate companies or individuals owning such stations.

Question 3. How many communities have 4 or more commercial VHF stations? 3 or more commercial VHF stations?

Answer. Seven communities have assigned to them 4 or more commercial VHF stations. A total of 37 communities have assigned to them 3 or more commercial VHF stations.

Question 4. How many VHF and UHF canceled CP's were transferred or sold?

Answer. Two UHF stations were transferred from their original owners to new owners prior to the cancellation of the stations' authorizations. These were KRTV, Little Rock, Ark., and KCTY, Kansas City, Mo. In addition, 1 UHF authorization and 1 VHF authorization were transferred from their original owners to new owners after the stations had gone on the air. Subsequently, the new owners of these stations shut down the stations' operation with a request that the CP's be retained pending future developments and reorganization.

Question 5. To what extent are UHF stations denied access to network programs?

Answer. Based on the Commission's study of network programing during the week of March 14-20, 1954, the average UHF station in cities of 250,000 and over population carried 19 hours of network programs during that week; the average postfreeze VHF station in cities of the same size carried 37 hours of network programs. In cities under 250,000 population, the average UHF stations carried 14 hours of network programs during that week while the average postfreeze VHF in that city size carried 15 hours.

In the 34 cities where both VHF and UHF stations were in operation during that week, the average VHF station in those cities carried 44 hours of network programs and the average UHF station carried 14 hours. Of the 11 hours of network programs listed among the Top Ten programs (by 3 different research organizations) the average VHF station in the VHF-UHF cities carried 5 of these 11 hours while the average UHF station carried 1 hour.

Question 6. Were the UHF applicants radio people or were they newcomers?

Answer. Approximately 2 out of 3 UHF authorizations were issued to persons or companies operating radio broadcast stations.

Question 7. Is there any appreciable difference in the cost of UHF and VHF stations?

Answer. Based on data reported by postfreeze licensees, the average construction cost of the 109 VHF stations was $376,000 compared to $300,000 for the average cost of 100 UHF stations.

Question 8. What percentage of UHF stations are solvent at the present time?

Answer. It is not possible to state the number and percent of UHF stations which are solvent at the present time, since the Commission does not have information on the current balance sheet items of the UHF licensees. In order to answer this question it would be necessary to have current data concerning each UHF station on the amount of its available working capital and other current assets as well as the amount of its current liabilities.

In terms of profit and loss, however, the Commission's survey of 87 UHF stations during the first 3 months of 1954 revealed that 13 were operating
profitably during that period. Of the remaining 74 UHF stations which reported a loss for this period, 10 were profitable in 1 or 2 months of the period; 11 were approaching a break-even point on a month-by-month basis; and 53 were operating with continuing substantial losses in each month. Of these 53, 8 stations had ceased operating by May 1, 1954.

Similar data for 88 postfreeze VHF stations showed that 53 reported a profit during the same period. Of the 55 reporting an overall loss for the period, 20 reported a profit in 1 to 2 months of the period; 12 were approaching a break-even point on a month-by-month basis; and 23 were operating with continuing substantial losses in each month. Of these 23, 1 had ceased operating by May 1, 1954.

Question 9. How much has radio advertising dropped off in the last 5 years?
Answer. Between 1948 and 1953 total expenditures for radio advertising increased by approximately 15 percent. During this period expenditures for national radio advertising declined by about 2 percent, while expenditures for local radio advertising increased by about 48 percent.

Of the 1,813 operating AM radio stations in 1948, 581, or 32 percent, reported losses for the year. In 1952, of the 2,312 operating AM radio stations, 468, or 20 percent, reported losses for the year.

Question 10. How many radio stations own television stations?
Answer. Approximately 3 out of 4 of the 570 authorized TV stations are owned by companies or individuals operating radio stations.

Question 11. What percent of the station's total revenues comes from network, national spot, and local advertising?
Answer. The average prefreeze TV station in 1953 derived 23.4 percent of its total time sales from network advertising; 44.3 percent from national spot advertising; and 32.3 percent from local advertising.

Question 12. How long does a TV set owner keep his set before buying a new one, i.e., what is the average life of a TV set?
Answer. It is estimated that the average TV set is turned in for a new set after 6 or 7 years.

Senator Potter. Thank you, Mr. Hyde.
We will now recess until 2 o'clock. The Chair will endeavor to secure a more adequate hearing room. If you should come back at 2 o'clock and find someone at the door, he will inform you that the committee will meet in another place. However, I forewarn you that, if we can secure another hearing room which will accommodate all the people who are interested, I shall try to do so. If not, we shall meet here at 2 o'clock this afternoon.

(Whereupon, at 12:07 p.m., the subcommittee recessed until 2 p.m.)

AFTERNOON SESSION

The Subcommittee, No. 2, on Communications, reconvened at 2:03 p.m., in room 318, Senate Office Building; Senator Charles E. Potter (chairman of the subcommittee) presiding.

Senator Potter. The committee will come to order. If anyone is here, under the misapprehension that this is still the McCarthy-Army hearing, I can assure him that it is not.

I believe we concluded, this morning, with the statement by the Chairman of the Federal Communications Commission, Mr. Hyde. Miss Hennock, Commissioner of the Federal Communications Commission, is present, and will state her views on this subject.

STATEMENT OF COMMISSIONER FRIEDA B. HENNOCK, OF THE FEDERAL COMMUNICATIONS COMMISSION

Senator Potter. All right, Miss Hennock. Do you care to give your statement at this time? First, I may say we are always pleased to have you grace our committee meetings with your presence, at any time; we look forward to it.
Miss Hennock. Thank you very much, Mr. Chairman. And to you Senator Bowring, I want to pay my respects, as the first woman to serve on this committee. I am sure from the statements I have read that you are a great tribute to our sex.

Senator Bowring. I hope I shall be as great a tribute as you have been, Miss Hennock.

Miss Hennock. Thank you very much.

Mr. Chairman and members of the committee, my name is Frieda B. Hennock. I am a Commissioner of the Federal Communications Commission. I want to thank you for the opportunity to appear before you. I came here because I feel that, though I may be imposing on your limited time, the UHF problem is so critical that my views should be made known to you.

Television is at the crossroads. For the success of the nationwide competitive television system is completely and inextricably bound to the fate of UHF.

Television can be a service limited to 12 VHF channels, or it can occupy 82 channels—depending upon whether or not UHF is in existence. It can be a service with big city operators controlling the programming from two strong networks and perhaps a weak third network, with a fourth unable to survive. It can serve the large corporations; or it can get into every community and give the small-business man an opportunity to get on television at a reasonable rate. It can be in the hands of some 2,000 licensees with diversified ownership and interests, who will provide some 1,300 communities with local means of expression, and our country with an exchange of diverse ideas, political and otherwise; or it can simmer down to a few stations in each State dominated by a few large interests. In short, on the solution of the economic problems of UHF depends the future of a truly nationwide competitive television system. No consideration of public interest transcends in importance the necessity for such a system of television broadcasting. The alternative is monopoly—a condition which free enterprise abhors. The choice must be made now.

These are bold statements, but television is a bold medium. Its course during our lifetime depends on the outcome of these historic hearings. We must accept this challenge. For the mere passage of time without immediate action will make the whole problem academic. The improvements of the art itself depend on the fate of UHF. If just a handful of people control this medium, they will not compete with each other. There will be no need for it and, as in every monopoly, improvements will be slow in coming. If this is allowed to happen, the public will be the loser. For in a field with so many improvements possible, this medium can afford competitive advantages to all—the broadcaster, the consumer, and the set-holder.

With the benefit of hindsight, I am now convinced that the approval of internixture was a basic mistake. It has enabled VHF to smother UHF. I take my due share of the blame for creating this problem. But that is not enough. Something must be done now in order to enable UHF to survive. From a technical point of view, UHF can, under the present table of assignments, provide a nationwide service. I have seen the UHF signals. The quality of the UHF picture is every bit as good as VHF. The real question is what can be done about the UHF problem at this stage? I have five specific recommendations to make.
My first recommendation is to impose an immediate freeze on all grants of new construction permits for VHF stations and new allocations of VHF channels.

UHF stations should have had a head start from the beginning over VHF to enable them firmly to establish themselves in their community and to overcome the initial handicap of service in a new part of the spectrum. This was needed to allow UHF to compete with VHF licensees who, at the time the “freeze” was lifted in April 1952, enjoyed an advantage of 15 million VHF sets in the hands of the public unable to tune to UHF. Now with the number of VHF sets almost doubled, the opening of every new VHF station with its wider coverage still more retards the chances of success of the UHF station whose service area it blankets. Any map depicting the coverage of VHF and UHF stations will show that virtually every community with an existing or prospective UHF station will also receive one or more viewable VHF signals from distant stations. With the set conversion problem what it is, this represents a dire threat to these UHF stations. This threat is accelerated through mergers and “drop-outs.” These mergers and “drop-outs” can still take place in pending competitive proceedings.

The situation is further aggravated by what has descriptively become known as “drop-ins.” Since June 1953 (when the Commission commenced accepting petitions for amendments of the table of frequency allocations), new VHF channels have been “dropped-in,” in addition to those provided in the sixth report and order. Requests for more “drop-ins” of VHF’s are presently pending before the Commission. Typically these additional VHF channels have been “dropped-in” to communities which either have a UHF channel available but not applied for, or a UHF station on the air, or are in small communities adjacent to large cities which appear profitable for an additional VHF station. Each such “drop-in,” therefore, spells economic disaster for the UHF station on the air, and kills any prospect of anyone applying for a station on the available UHF channels, because of the known fact that advertisers and networks gradually whittle away the flow of programing and advertising to their UHF outlets upon the opening of a VHF station in the same area.

Unless this race of “drop-outs” and “drop-ins” is stopped immediately, the extinction of many additional UHF stations is threatened, and the entire problem of survival of UHF stations in intermixed markets and maintenance of any adequate competitive television service in these markets will have been rendered academic. An immediate suspension of all VHF grants as well as a discontinuance of new VHF allocations or “drops-ins” would give those UHF licensees on the air courage to continue, and much needed encouragement to the holders of UHF construction permits to go ahead and build stations; it would give them an opportunity to bring and continue to render a first local TV service to many communities which they do not now have if the licensing of VHF stations continues at its present rapid rate; and it would reassure the UHF operators, construction permit holders and applicants that they may rely on the table of allocations in estimating their economic prospects.

Of course, the VHF applicants affected by the freeze on VHF grants should be given an opportunity to apply for a UHF channel in place
of the VHF one. I am sure that in every case an appropriate UHF channel can be found.

That was my most important suggestion.

My second recommendation is to cut back the power and antenna height of VHF stations, to approximate the coverage which UHF stations may presently obtain.

Admittedly one of the major difficulties facing UHF is the overlapping service areas of large VHF stations, causing blanketing of UHF stations. The most obvious and forthright remedy is to cut down these service areas. The coverage of VHF stations in many cases is 3 to 4 times as large as that of today's UHF stations.

The question of power and antenna height concerns in essence the relationship between the VHF and UHF portions of the spectrum, as well as the development of television in the smaller communities of the country. Certainly a system comprising only a few hundred VHF stations, each with the greatest possible coverage, would be most profitable from the point of view of the existing VHF stations. This would, however, indeed create a monopoly for the large city VHF's and annihilate the prospects of a nationwide competitive service for 1,300 communities, depriving scores of cities of their sole opportunity for local self-expression.

By cutting back the power of these powerful VHF stations we would insure that most, if not all, UHF stations in UHF only cities would stay in business. For, as soon as this cutback in power is accomplished, the Commission should issue show-cause orders to the VHF licensees and permittees with a view to requiring them immediately to comply with the new power limitations. As to the applicants and prospective applicants in UHF only communities, they would be assured that these communities would remain that way. This, in turn, would encourage the building of more UHF stations as a means of local expression, and contribute to the achievement of a nationwide competitive television service.

My recommendation to cut the power of VHF stations finds precedent in the history of broadcasting. In 1938 when it appeared that the Commission was about to inaugurate an era of super power in the AM broadcast field, the Senate, at the instance of Senator Wheeler, the then chairman of the Senate Interstate and Foreign Commerce Committee, adopted a resolution which stated that it was the sense of the Senate that no AM station should be authorized by the FCC to operate with power in excess of 50 kilowatts. (S. Res. 294, 75th Cong., 3d sess., 1938). This resolution—and it is only a resolution—has been honored by the FCC to this very day.

My third recommendation is to require VHF transmitters to be located in close proximity to the principal community to be served and the station's service confined to the area which would not overlap the coverage of UHF stations in other communities.

This is a corollary of the power problem. Under the present rules of the Commission (sec. 3.685) there is nothing that ties the transmitter to any specific location. The transmitter of a TV station may be located at any distance from the community to be served by it on the channel assigned thereto, so long as the station will provide a signal of the minimum prescribed strength over the whole of that community. As a result, an applicant is free to select a transmitter site many miles distant from that city to which a channel is assigned in order to serve
a larger city and a more desirable market. Two consequences follow:

(1) Some of the population around city A that legitimately expects service from the channel assigned to that city is deprived of the service, and UHF operators in city B are pitted against another VHF competitor. To prevent this, applicants should be required to locate their transmitters not more than 5 miles, for example, from the community they are expected to serve under the Commission's allocations plan, except upon a very strong showing that a site more distant than 5 miles is peculiarly suited to serve the community and will not result in serving another.

I am aware that all three recommendations may be criticized on the ground that their adoption would result in a loss of VHF service to the areas involved. To this I would reply that the lost VHF service would soon be replaced by new UHF service which would not only compensate the areas concerned, but also bring closer to reality a nationwide competitive service.

As my fourth recommendation, I urge the adoption of Senator Johnson's bill to remove the excise tax from UHF-equipped receivers. This bill, if enacted into law, would give the manufacturers incentive to produce immediately all-channel receivers, UHF converters and tuners. It would offer the public an advantageous purchase. Some people may say that this is a bounty. Perhaps so; but it would not be the first time that the Congress has indulged in bounties to stimulate a pioneering industry in the public domain. And I want to commend Senator Johnson of Colorado, because this is the last year of his service in the Senate. I think it only proper and fitting that he should have introduced such a fine bill, based on his many years of experience in the protection and furtherance of the public interest; and this is certainly that kind of bill.

Senator Propper. If I may comment at that point, I think the members of the committee and, in fact, all members of Congress, as well as Senator Johnson's many friends throughout the Nation, regret that the distinguished Senator from Colorado has decided not to return to Washington. He is probably the leading authority in the Senate in this great field of communications, and the termination of his service here will be a great loss to the Nation. I, as one member of the committee, highly endorse Senator Johnson's efforts to have the excise tax removed from UHF facilities.

Miss Hennessy. As my fifth recommendation, I favor the general objectives of Senator Bricker's bill, S. 3456. For the life and death of a television station depends upon its ability to secure network affiliation; to the extent that they cannot do so, they are unable to obtain popular programs and advertising revenues, and cannot exist. This measure holds promise of breaking the vicious cycle of not enough UHF receivers because there are no popular programs on UHF—no popular programs on UHF because there are not enough UHF receivers.

I realize that there are those who have recommended that the solution for UHF is to move all television into the ultrahigh band; others urge that only UHF stations should be permitted to use subscription television and color television. These are important measures that merit full hearing and careful long-range planning. They must not be confused with what is needed now, and that is immediate emergency measures.
I want to go back to a point made earlier, that the principal problem of UHF is intermixture. I urge you to direct the Commission to make a study of the matter and report back within 6 to 9 months as to the steps that can and should be taken in order to abolish intermixture. Of course, there would be no point in such a study, unless the freeze I recommended is imposed, and imposed immediately.

There will be those who will contend that a VHF freeze is too extreme; that dire consequences will result therefrom, especially to avid VHF license seekers in large metropolitan areas. You heard some reference made this morning to the value of the freeze in that area. I think that a freeze imposed now on VHF when there are over 370 stations on the air in order to preserve 85 percent of the television spectrum, is far less extreme than the imposition of a 3½-year freeze in 1948 when there were only 108 stations authorized, and 1½ million sets in the hands of the public. As a matter of fact, I do not think there were over 60 or 70 stations on the air in 1948. They did build up to 108, because they had already been authorized. I repeat: I think that a freeze imposed now on VHF when there are over 370 stations on the air, in order to preserve 85 percent of the television spectrum, is far less extreme than the imposition of a 3½-year freeze in 1948 when there were only 108 stations authorized. This is so, especially since the proposed freeze will apply only to VHF, and anyone seeking to extend television service will be able to get a UHF grant and thus help establish a truly nationwide competitive service.

Where so much spectrum space is involved for the most important medium of mass communications, certainly the proclamation of a freeze now and an announcement of a firm intent to act and employ every measure necessary would, in and of itself, produce a salutary effect. This is inherently within the jurisdiction of this committee and the regulatory Commission whose rulings so vitally affect the broadcasting industry.

Mr. Chairman and members of the committee, I realize that this problem is not easy at this time, but I feel confident that attacking it on all fronts and immediately will produce a complete and satisfactory solution.

I thank you for your patience and courtesy.

Senator Potter, Miss Hennock, you have made five recommendations. Would you tell the committee whether any or all of the five recommendations were taken by the Commission?

Miss Hennock. Mr. Chairman, you mean recently?

Senator Potter. Yes.

Miss Hennock. Through the years, when the cease-and-desist order was first issued, in 1952, and the Commission increased the power and the height of the VHF, the matter was taken up by me, because I resented it very vigorously and opposed it. The problem was that if reception were blocked by these large VHF stations, it was impossible to get the program; therefore, it was impossible to get the people to buy the sets; there would be no incentive for them to do so. That is reflected in our rules issued in April 1952.

Senator Potter, Miss Hennock, I want to thank you for your comprehensive statement. It gives us additional views with which to attack this problem.

Are there any questions? Senator Schoeppel?
Senator Schoeppel. No, thank you. I am sorry I was late.

Senator Potter. Senator Hunt?

Senator Hunt. What percentage of UHF stations are solvent at the present time and are on the air?

Miss Hennoch. Senator Hunt, that is a very good question; I am glad you asked it. If a large percentage of them are still solvent, they will not remain so if they keep on granting VHF construction permits. I have already seen where the manufacturers are not going into the production of VHF converters, because the demand does not exist, and because they know that of the 311 plants that were given construction permits only 127 are on the air; and they also know that some of them are just holding on, breathing their last breath, you might say; and there will be more, in the next 6 months or a year. You will see a deterioration of the present situation; and, the more of the VHF's that are opened up in other areas, and if there are any more of these blackouts, I do not know how many will be left—I would say, just a handful. I hate to paint such a dark picture, in contrast to the optimistic picture to which I pointed in my own statement. I was trying to show you that there was nothing inherently wrong with UHF. Today, it is a fine service; it can serve television adequately; but, unfortunately, it has not been given a chance to flourish, and they have closed up—why? My answer to you is that I do not know. I am very, very much afraid that not very many will be found.

It is not possible to state the number and percent of UHF stations which are solvent at the present time, since the Commission does not have information on the current balance-sheet items of the UHF licensees. In order to answer this question it would be necessary to have current data concerning each UHF station on the amount of its available working capital and other current assets, as well as the amount of its current liabilities.

In terms of profit and loss, however, the Commission's survey of 87 UHF stations during the first 3 months of 1954 revealed that 13 were operating profitably during that period. Of the remaining 74 UHF stations which reported a loss for this period, 10 were profitable in 1 or 2 months of the period; 11 were approaching a break-even point on a month-by-month basis; and 53 were operating with continuing substantial losses in each month. Of these 53, 8 stations had ceased operating by May 1, 1954.

Similar data for 88 postfreeze VHF stations showed that 33 reported a profit during the same period. Of the 55 reporting an overall loss for the period, 20 reported a profit in 1 or 2 months of the period; 12 were approaching a break-even point on a month-by-month basis; and 23 were operating with continuing substantial losses in each month. Of these 23, 1 had ceased operating by May 1, 1954.

Senator Hunt. I think it is tremendously interesting that so many would apply for UHF's, with this situation later developing, of course. We are, so to speak, doing Monday morning thinking, now. It would really seem to me that the signs were pointing very clearly. I cannot understand how so many of them got into it.

Miss Hennoch. Well, they were not clear, Senator. When they got our allocations plan, they had a right to assume that a city without UHF in the plan would remain so, and that that would be an ultra-high area. But, suddenly, stations from the larger cities blew in
and covered that city. To take a specific example, Atlantic City had a right to assume that if UHF was confined to Atlantic City—and I am just taking it at random—it would be a UHF city. Immediately another station went on the air; which, as I remember, recently shut down. They immediately went on the air, serving Atlantic City with television. But in May the new Philadelphia station upped its power and blacked out Atlantic City. There were only so many converters. The public did not feel altruistic. When they could get three stations from Philadelphia, why did they want to undertake to have a local UHF?

Senator Hunt. Who were the applicants for the UHF? Were they people of the radio and television industry, or were they amateurs?

Miss Hennock. Approximately 2 out of 3 UHF authorizations were issued to persons or companies operating radio broadcast stations. A great many of them were experienced, and are very fine, reputable, practical businessmen; and they had very fine operations. As a matter of fact, I have seen some of their individual operations, and I daresay they could get a network, in terms of advertising dollars.

Senator Hunt. Is there any appreciable difference in the cost of the UHF and the VHF stations?

Miss Hennock. I should say not, Senator, on a long-range basis. Based on data reported by post-freeze licensees, the average construction cost of the 109 VHF stations was $376,000 compared to $300,000 for the average cost of 100 UHF stations. It means very little, to them, that extra bit of money for higher power, with respect to making or breaking that station. They always knew they had to have higher power. They knew that they could be dropped out. That is the thing that has forced an awful lot of the UHF's out of business. We, of the Commission, settled those rules by the announcement of the April 1952 decision.

For instance, since you have in a city like Kansas City only 1 VHF on the air, you had just that 1 with which to compete; and so it would take several years, in a hearing, to permit the next VHF on the air. But suddenly, they had dropped out, and there were 2 new VHF's. You could not compete against those, and then you were left without a network program.

Senator Hunt. You say they first had 1 VHF, and then 2?

Miss Hennock. Two of them, and one was a dropout. The other was another kind.

Senator Hunt. Would you tell the committee just what you mean by saying one of them was a dropout? I think I know what you mean by a dropin, but I do not know what you mean by a dropout.

Miss Hennock. That is right. I shall make myself a little clearer. Assume more than one applicant filed for a channel and therefore a competitive hearing must be held. They had both filed for that channel—channel 6, let us say—in Kansas City. Then—or, take any channel. Take St. Louis, or any one of the other large cities. One of the applicants got it.

There is no typical dropping out. There are different types of dropping out. Assuming that one decided to drop out, and, in consideration of the amount of money he spent for such things as engineering fees, he is induced to withdraw his application. He will have no plan to compete with the one remaining. Therefore, that remaining
applicant—there were two competitors—would apply, on a Tuesday afternoon, and get an immediate grant of a VHF construction permit on Wednesday morning. That did away with months and months of litigation and hearings between those two competitors. In other words, there was an impetus to get as many VHF's as possible on the air, in a hurry; and to the extent that they got on, in a hurry, they did so at the expense of the development of the UHF stations, because they did not give those UHF stations an opportunity to develop a following, to get the sets converted, to get a viewing audience, and to establish a position sufficient to warrant advertising on a network, for that UHF station.

Senator Hunt. I do not quite get what you have said to us, as yet. You have two plans for VHF stations. They are very valuable, provided they are supported. Now, by a dropout, do I correctly understand you to mean that they act together for one company, and only get one company?

Miss Hennock. Right. Or, one of them drops out, leaving the other. There are different types of dropouts, as I indicated. There may be a merger of the 2 applicants into 1 corporation, or it may be done by various other means. They can get together and occupy and use the 1 channel; or they may arrange it so that 1 applicant will drop out, and the other applicant remain.

Senator Hunt. But as to that channel, it is still available to anyone who wants to make an application for it?

Miss Hennock. I know.

Senator Hunt. Now, that is what I want you to explain.

Miss Hennock. In order to prevent a new applicant from coming in as the remaining applicant—now, perhaps it would be better if I illustrated it, using Chairman Hyde as an example. Let us assume that Chairman Hyde and I were competing for a channel—we are not that practical; we are just poor public servants—that Chairman Hyde and I talked it over, and I cold convince the chairman—he could probably convince me—and he would assume whatever expense it took for me to file my application, with lawyers' and engineers' fees, and so forth—and I hope there are no other considerations attached, for I would have strong objections—but, anyway, he is a remaining applicant, and he convinces me I should drop out. I would withdraw my application, and the chairman then files new papers, on a Tuesday afternoon, and he does it about 5 o'clock, so that no other applicant can get in; and by Wednesday morning he gets a break. He would get around to the Commission. It would be taken up on our agenda Wednesday morning.

Senator Hunt. What would happen to your channel if Mr. Hyde got one?

Miss Hennock. I am sure I am no longer concerned.

Senator Hunt. But the channel is still available?

Miss Hennock. What channel are you talking about? There was only one channel.

Senator Hunt. Well, was there only one? I thought there were two.

Miss Hennock. No; only competing applicants for one channel.

Senator Hunt. I thought you were each going after two.

Miss Hennock. Now, what would happen to that UHF channel—that is what I was talking about—in this city that had spent $1 million
to get started and set upon the air? It shouldn't happen to my worst enemy. He's a dead duck. [Laughter.]

Senator Potter. Do you have any questions, Senator Bowring?

Senator Bowring. No.

Miss Hennoch. It is very difficult for me to come up here and talk to you gentlemen and to Senator Bowring, because this is a very difficult problem, but I cannot conceive that 85 percent of our spectrum space is going by the board in an important medium like television.

If radio jumped by leaps and bounds in a few years to 2,600 AM stations, the possibilities of this medium on our entire Nation in a few short years is just limitless, and it is one of the most important and dynamic industries in the country. On this spectrum space depends that medium. If you limit it to this space and it is there, what you do here will determine its course for many years to come, perhaps in our lifetime.

Senator Potter. Thank you very much, Miss Hennoch.

The next group of witnesses are from the UHF Coordinating Committee, represented by Senator Scott Lucas. The various witnesses are under your control, Senator, and you may present them at will.

I would like to say, first, that we are pleased to have you here, with your great legislative record as a Member of the United States Senate; it is indeed an honor to have you present the case in behalf of the UHF Coordinating Committee.

STATEMENT OF SCOTT LUCAS, COUNSEL, UHF COORDINATING COMMITTEE

Mr. Lucas. Mr. Chairman, you are very kind in those remarks. Obviously, I am grateful. It seems to me I have seen you in this committee room before, however.

Senator Potter. This is a much more pleasant experience, however, Senator.

Mr. Lucas. Mr. Chairman and members of the subcommittee; my name is Scott W. Lucas. I am a member of the law firm of Lucas & Thomas, with law offices in the city of Washington, D. C. Benedict P. Cottone, who will testify later in these hearings, is one of our associates.

We appear before your committee on behalf of the UHF Industry Coordinating Committee, an organization composed of some 70 UHF station owners scattered throughout the Nation. The names of these stations and owners will be submitted later for the record.

Mr. Chairman, I became a Member of Congress the year following the passage of the Communications Act of 1934, and served both in the House and Senate until January 1951. I have had occasion to study this measure from time to time, with the result that I have a general working knowledge of this extremely important piece of legislation as it affects the public interest.

In addition to the foregoing, our firm has had some active experience through litigation in this field.

Mr. Chairman, the 70 station owners that we represent are men of excellent character, as has been testified to by the fact that their applications for television permits were granted by the Commission. They are leaders in the economic and social life of their respective communities. They have laid out and expended large sums of money
in good faith, thoroughly believing that they would be able to make a reasonable profit on their investments, as well as serving the public interest. Their venture into the communications field was based upon the Commission’s own principles of assignment of television channels.

But, Mr. Chairman, the principles laid down by the Commission, and upon which their investments were made, have been altered and modified. The rules have been changed in the middle of the game, and our clients are caught in the squeeze. We candidly admit that we have an ax to grind. However, we come before your committee in a cooperative spirit. We desire to be helpful, and we feel that the witnesses, including experts, as well as certain individual station owners who have suffered irreparable loss, will give great aid and comfort to this committee in helping to find a solution to a most difficult problem.

In conclusion, I say with the utmost sincerity that unless affirmative relief soon comes to this pase of the television industry, the great majority of UHF stations are doomed to die. I am confident this statement will be borne out by witnesses to follow, who will advise the committee of their financial plight and the reasons therefor. They recognize their danger. They know that survival is impossible unless relief is granted.

In conclusion, Mr. Chairman, I desire to thank you and members of the subcommittee as well as all members of the Interstate Commerce Committee who have been responsible for the calling of this hearing. It is timely. In fact, it is almost too late because of the fact that some of the stations are in peril as a result of the policy that the Federal Communications Commission has laid down, and we are grateful to you, Mr. Chairman and members of the committee.

Senator Potter. Thank you, Senator. I think we are cognizant of the fact that this committee has no pat answers. We are seeking information. It is a complex problem and we hope that the hearing will bring some light on this question so that solutions can be brought before it which will aid in saving the UHF band.

Mr. Lucas. Precisely so, and I should conclude further by saying that members of this committee are all active individuals in the UHF field and have spent a good many hours, through the experts, engineering and otherwise, in attempting to provide this committee facts upon which you can base definite and affirmative conclusions.

Senator Potter. Thank you.

Mr. Lucas. Mr. Thoms is our next witness.

STATEMENT OF HAROLD THOMS, PRESIDENT, STATION WISE AND WISE-TV, ASHEVILLE, N. C.

Mr. Thoms. Mr. Chairman, and members of the subcommittee, I am president of WISE and WISE-TV, Asheville, N. C.; secretary and supervisor of WAVS and WAVS-TV, Charlotte, N. C.; a minor stockholder of WTSK-TV, Knoxville, Tenn.; and secretary of WCOG, which holds a construction permit for a television station in Greensboro, N. C. All of my television interests are in the UHF band.

I have been asked to serve as chairman of the UHF Industry Coordinating Committee, which consists of a group of UHF stations operating in every part of the country. Our present membership is 70 stations.
The UHF Industry Coordinating Committee was organized shortly after it was announced that this subcommittee had been formed to hold hearings on the UHF problems. I wish to state that every broadcaster who has become a member of this group saw in the announcement of these hearings a bright ray of sunshine on UHF breaking through theretofore black and ominous clouds. It was an event which galvanized the UHF broadcasting industry into what I fairly believe is a solid and unified front to present their problems to this subcommittee, as well as the results of many, many weeks of hard work by these broadcasters to put together their best thinking as to the solution to those problems.

I wish to conclude now by expressing the deep sense of gratitude of UHF broadcasters throughout the country to the Congress and to the Senate committee of which this subcommittee is a part, for giving us this opportunity to lay our problems before you. We hope, and will most certainly make every effort, to give you every possible measure of assistance, which I know that a proper decision as to these problems will require.

Senator Potter. Do you have a UHF station on the air now?

Mr. Thoms. Yes, sir; both in Asheville and in Charlotte.

Senator Potter. You have two stations?

Mr. Thoms. Yes, sir.

Senator Potter. How long have they been on the air?

Mr. Thoms. Ever since 1953. Asheville has been on the air since August 2, 1953.

Senator Potter. And do you have to compete with VHF?

Mr. Thoms. Outside coverage only, no coverage from within. There is a VHF assigned and it will probably have inside coverage about September.

Senator Potter. Have you experienced any difficulty in having the sets, in the public purchasing sets that will receive the UHF signal?

Mr. Thoms. In Asheville, I was particularly fortunate in that I secured the network contracts from NBC, CBS, ABC, and Du Mont, and with the strong programing that we were able to secure, we have had a reasonable amount of success with the station and to this date it has not suffered too badly from UHF.

We did have a conversion problem. We still have it and are working with it every day. We have used all the ingenuity and experience and backlog of our 13 years of experience in AM, mine particularly, to apply to television in Asheville, and I think we can safely say that it has only been because we have not had any VHF coverage from within that we have, to this date, not lost very much money.

Senator Potter. Did I understand you to say that you are affiliated with all four networks?

Mr. Thoms. Yes, sir.

Senator Potter. So you have good programing?

Mr. Thoms. Yes, sir.

Senator Potter. Have you had any problem with your transmission power, the equipment, securing the equipment necessary to transmit your signal?

Mr. Thoms. I think I can safely say, and it will probably be checked up by other testimony, that we have had fairly successful luck with what might be termed experimental equipment.

Senator Potter. What power transmission do you have?
Mr. Thoms. One thousand watts and a 27-gain antenna with an effective radiated power of 24,000 watts.

Senator Potter. How far out can you reach?

Mr. Thoms. Well, I would hate for Madison Avenue to find this out.

Senator Potter. Is it grade A or grade B service areas?

Mr. Thoms. I can say that it has lacked considerably in reaching the projected coverage or circulation that we had anticipated.

Senator Potter. That sounds like many of the answers we got here last week.

Have you any questions, Senator Schoeppel?

Senator Schoeppel. I take it that the men who will follow you will indicate as they see it what the problems are under the present rules established by the Federal Communications Commission and which are causing you people, as you see it, this difficulty.

Mr. Thoms. That is right, sir.

Senator Schoeppel. That is all.

Senator Potter. Do you have any questions, Senator Bowring?

Senator Bowring. No questions.

Senator Potter. Thank you again, Mr. Thoms.

Will you have your next witness come up, Senator Lucas?

Mr. Lucas. The next witness is Mr. Fred Weber.

STATEMENT OF FRED WEBER, STATION WPFG, ATLANTIC CITY, N. J.

Mr. Weber. Station WPFG operates AM today. It operated station WPFG-TV for 18 months until Monday of this week. I have been in broadcasting 27 years, connected with the networks as general manager of Mutual, had the privilege and opportunity to participate in Commission and Senate and House proceedings in connection with the network rules. I was connected with a UHF and radio station in New Orleans, La., prior to residence in Atlantic City.

Senator Potter. You operated a UHF station for 18 months?

Mr. Weber. Yes, sir; reluctantly and regretfully discontinued from the air because of lack of ability to continue its operation with pride because of the economic situation that arose and we had built the station for the purpose of servicing the area.

I will present at a later date individual testimony with respect to that operation. At this time the committee has requested me to present the general picture regarding the UHF matter.

The UHF broadcasters throughout the country who have organized themselves into the UHF Industry Coordinating Committee deeply appreciate the privilege and opportunity afforded by these hearings to give to the Congress the facts about the past, present, and future of television in our country. This subcommittee has been constituted for the express purpose of considering the problems of UHF. It is our committee’s objective to present to this subcommittee all the facts and experiences of UHF television broadcasters throughout the country which may place those problems into the proper perspective for consideration by the Congress, and to present as well our studied views as to the solution to those problems.

I may say at the outset of my testimony that you will hear many times an expression which you will probably come to regard as hackneyed before these hearings are concluded. I am not going to offer
any apology for my repetitive use of that phrase. I refer, of course, to the phrase "nationwide competitive system."

I will also say at the outset that you will not be kept in suspense as to what we believe is the solution to the problems of UHF. We believe that the basic disparity and inequality now inherent in the present television system of broadcasting must be eliminated by a reassignment of television channels through administrative proceedings, having the goal of doing away with the intermixture of UHF and VHF service in the same areas. We expect to show you from the facts of bitter experience that however laudable was the intention and expectation that VHF and UHF stations could live, side by side, with the hope of healthy competition between the two, that that expectation has proved to be misguided and unrealistic at the present.

The UHF Industry Coordinating Committee fully understands the serious nature of this proposal. It will no doubt be characterized as drastic. If it is, we believe it is more than justified by the more drastic consequences and injury to public interest which are fairly to be expected by the continuation of the two-class system of television which now exists under the present television allocation plan.

The alternative to the remedy we propose is dangerous monopoly of the most potent medium of mass communications and the most powerful force for the molding of public opinion which has ever been developed up to date. We have become accustomed to hear that atomic energy, with its tremendous potentialities for evil, has greater potentialities for good. Let me paraphrase this, to suggest that television, with its tremendous and already-realized potentialities for good, also can have serious potentialities for evil. We honestly believe that the borderline between the good and evil potentialities of television is the point at which it has ceased to be a truly nationwide competitive system and begins to be a monopolistic or concentrated system. If the latter possibility is not fantasy, and we believe it will be very real unless present trends are checked, no remedy which offers reasonable promise of avoiding that result should be considered drastic.

But the remedy we propose is not seriously drastic. We have had reevaluations and changes in existing patterns of radio broadcasting before without undue injury to the public and private interests. It is fairly to be expected that the application of the best brains of Government and industry to the task of working out an allocation system which no longer perpetuates the basic disparities and inequalities now existent in the utilization of the two spectrum systems should be able to produce at an early date, a result which would avoid any serious dislocations of public and private interests.

We have carefully considered other solutions. But we have found after careful study that such solutions merely fringe the periphery of the basic problem and do not go to its core. We believe that these solutions merely attack the result of the problem, not its cause.

We do not wish to be understood as disfavoring any of the many proposals, of which you will hear a great deal, such as measures requiring greater availability to UHF stations of network and other high-quality programs, giving financial assistance possibly to UHF broadcasters, correcting current UHF receiver and transmitter problems, or of making attainment of maximum powers by UHF stations more possible in order to achieve an equality with VHF, excise-tax measures, and many other measures. You will also hear proposals for
subscription television. Also, color television will be brought in as the possible cure, with the suggestion that it is to be expected that color receivers will not perpetuate the class distinction that now exists between UHF and VHF. However, we believe that these proposals are only palliative, and may provide temporary relief. But they just do not go to the cause of the problem.

You may also hear that there is nothing wrong with the present system; that the whole problem lies in the failure of the UHF industry to attract the necessary brains, management, skills, ingenuity, and the other wherewithal that are required for successful operation of successful broadcasters. To these qualities of successful broadcasters will be added the quality of patience and a mental attitude and perseverance to sustain the necessary losses during the so-called development period of UHF. It has been suggested in certain quarters that UHF operators are guilty of faulty business judgment in going into the markets for which the allocation of UHF channel were made. We believe we can show that this kind of thinking is neither logically justified nor fair, and that the problem we have today is not to be attributed to lack of ingenuity, incentive, management skill, or willingness to bear losses, sound business judgment, or any of the like suggestions.

We wish to have it plainly understood that we are not here to throw stones, to cast blame, or to criticize. We are in complete accord with, and commend the sincere purpose and objective which the Commission has had over the years in creating a nationwide competitive television system. We are hopeful that the Commission and we believe that the Commission is still anxious to do everything possible to achieve that result. Historically, its efforts in that direction have been notable, and we believe that this history is worthy of some discussion.

The groundwork of television broadcasting service in this country was laid in the extensive allocation proceedings which the Commission conducted in the year 1935. A whole reallocation of the entire radio spectrum was then undertaken by the Commission. The demands of the many conflicting claimants to frequency space were many and most difficult to equate. Television broadcasting was given at that time a share of the spectrum which everyone recognized could not reasonably be expected to give long-range television service on a nationwide competitive basis.

In the 1945 allocation proceedings, 13 channels, each of 6-megacycle band width, were assigned to television broadcasting. These were contained in that part of the radio spectrum which is known as the very high frequency, or VHF, portion. In its report at the end of these proceedings, the Commission expressly found that the number of channels so provided for television was admittedly inadequate for a truly nationwide competitive system. Looking to the long-range requirements for television broadcasting, the Commission stated that the ultra high frequency, or UHF, portion of the radio spectrum must be relied upon to meet these other requirements. It allocated for experimentation by television broadcasters in the UHF band a block of frequencies between 480 and 920 megacycles.

Shortly thereafter, the Commission adopted rules and standards for utilization of the 13 VHF channels then allocated for commercial television. A table of assignments was adopted which made geographical
assignment of these channels to various communities throughout the United States.

Some of the 13 VHF channels so allocated by the Commission were shared by other radio services. As a result of technical problems found to have resulted through this sharing, the Commission in 1948, after conducting formal proceedings, eliminated the sharing of television channels with other services. In its report in that proceeding, the Commission adverted to the previous recognition of the insufficiency of the VHF channels assigned for nationwide competitive service and reiterated that—

there is insufficient spectrum space below 300 megacycles (namely the UHF band) to make possible a truly nationwide and competitive television system, and such a system must find its lodging higher in the spectrum where more space exists.

By the end of 1948, it became apparent that the demands for television facilities throughout the country could not be provided on the basis of the existing assignment table. In May of that year, in an effort to meet this problem, the Commission instituted the proceedings which somewhat later resulted in the so-called freeze. The freeze order was adopted in order to prevent the complication of the task of making the reassignment of channels which then appeared would become necessary. Following comprehensive engineering studies undertaken by the Commission's staff in conjunction with technical experts of other Government agencies and of the industry, the Commission, on July 11, 1949, proposed an assignment plan which included not only the utilization of the 12 VHF channels, but proposed to make available for commercial use 42 channels in the UHF band.

While the technical problems underlying the table of assignments were under study through informal procedures, the Commission began proceedings in September 1949 on the question of approval of color television standards. The color television proceedings were not concluded until October 11, 1950, at which time a report adopting a set of color television standards was approved. A formal hearing on the engineering principles and technical issues underlying the table of assignments was then conducted, and a new assignment plan was proposed. Under this plan, the number of UHF channels assigned to television broadcasting was increased to 70, and these channels were distributed to communities throughout the country, intermixed in the larger communities with VHF channels. After comments and testimony in written form had been received from hundreds of parties, the Commission's so-called sixth report and order, lifting the freeze and approving standards and a revised table of assignments, was adopted in April 1952.

The intermixure of UHF and VHF channels in the same markets was one of the most critical and difficult problems considered in these proceedings. One position expressed at that time was that in view of the current state of development of UHF, and the high rate of saturation of television sets equipped for VHF reception only, that the UHF stations in the intermixed markets and service areas would have great difficulty in competing successfully with the VHF stations. It was argued that suitable receiver equipment could not become available for some time. But the Commission concluded, upon the basis of expert engineering evidence advanced in the proceedings, that these problems were only temporary in nature since "it is reasonable
to assume that "* * * television receivers will be built to receive VHF and UHF signals". That is from paragraph 189 in the report. It was the Commission's opinion that intermixture of UHF and VHF stations in the same market was necessary in order to provide enough stations in such markets for adequate competition.

The table of assignments adopted was based upon a premise that channels were assigned to specific communities and for the purpose of serving the needs of those communities. However, it was felt that the needs of outlying areas beyond those communities should be met through providing substantially wider separations between VHF stations than formerly existed. Also, in order to achieve such wide-area coverage beyond the particular community to which the channel was assigned, heights and powers considerably in excess of those previously permitted were provided for and encouraged.

Senator Potter. I am sorry to have to interrupt you at this point, Mr. Weber, but it sounds like a vote in the Senate and the committee will have to recess. We will recess at this time for 15 or 20 minutes. (Whereupon, at 3:13 p. m., the subcommittee recessed for 13 minutes.)

Senator SCHOEFFEL. The committee will come to order, please. Senator Potter will be detained for a little while at another important committee conference and has suggested that we proceed with the hearing.

You may proceed, Mr. Weber.

Mr. Weber. Because of the technical characteristics of UHF stations, narrower separations were required to be set up for such stations. In addition, because of the technical characteristics of UHF, the Commission sought to provide equality of coverage with VHF by providing for maximum powers for UHF of 1 million watts. Only one-tenth of that amount of power was found to be necessary, and was prescribed as a maximum, for stations operating on 5 of the VHF channels, and one-third of that power was found to be necessary, and prescribed as a maximum, for the remaining 7 VHF channels. As in the case of receiver equipment, the unavailability of transmitter facilities, as yet undeveloped, which would achieve the million-watt power and the equality of coverage with VHF stations expected to be provided with such facilities, was stated to be a temporary problem. Upon the basis of the evidence it had heard, the Commission voiced confidence in the early availability of such equipment for UHF stations. It stated that the evidence showed that—

it will be possible to operate stations in the UHF band with 400 kilowatts radiated power by the time that authorizations are issued for such stations. Further, there is no reason to believe that American science will not produce the equipment necessary for the fullest development of UHF.

That is from paragraph 199.

The table of assignments constructed upon the foregoing premises was intended to provide a distribution of VHF and UHF channels to specific communities throughout the United States so as to accomplish, first, the purpose of complete coverage of all the areas of the country with television service, and, second, a sufficient number of stations for each community to provide the amount of competition among such stations believed to be necessary.

As will be noted from the foregoing recital, the 1952 allocation order of the Commission had the laudable purpose of providing addi-
tional stations throughout the United States in order to provide the public with the maximum nationwide competitive television service. However, we have now gone through 2 years of experience with the method provided to achieve this purpose and no other conclusion is now possible, in the light of this experience, than that this method cannot reasonably be expected to achieve the intended purpose. For we have now found that there is such a fundamental disparity and divergence between VHF and UHF, whenever they are subjected to practical direct comparison and when viewed in the light of the unnatural handicaps against which UHF has been forced to struggle, that equality cannot reasonably be hoped for under present and foreseeable conditions.

We do not believe that under the present allocation plan, the fundamental aim can reasonably be expected to be realized even as an ultimate goal for the future. Today's trend points forcefully to increased concentration of the most desirable and popular television programs on favored VHF facilities, and an ever-decreasing program distribution to UHF stations in all substantially intermixed areas. This we believe is a consequence of the monopoly accruing to VHF assignments possessing unnatural facility advantages.

You will hear the experiences of UHF broadcasters showing that the present allocation system has not provided, nor can it reasonably be expected to provide, to the public the hoped-for diversification of informational and entertainment service that a rounded service must provide. It does not achieve for UHF stations generally a practical capacity for equality of competitive opportunity to achieve this result. These experiences will illustrate why 13 stations have signed off; why 61 stations have returned construction permits; why few, if any, new permittees have undertaken recent construction; and why many of the 130 present operators have good reason to fear the fate of others where they are beginning to feel the pinch of increased direct comparison with VHF stations. In this atmosphere, UHF operators who have genuine pride in rendering public service on a competitive basis find their efforts along this line threatened by the situation facing them today.

All broadcasters are keenly aware of the commendable motives which fostered the commencement of early television operations. They appreciate, too, the forthright action 5 years ago which halted additional licensing in order to prevent limitation of the number and type of television services, and to prevent the concentration of programs. The FCC objective was to attain for the public the widest coverage, and the greatest amount of competitive services in a climate of free enterprise. As in any far-reaching scientific development, however, the 1952 allocations had to be based on the results of quite limited experience under the laboratory ideal conditions prevailing in the Bridgeport experimentation program which preceded these allocations. We now know that this one major experimental application of UHF did not provide the facts that practical, widespread public and commercial experience in over 100 markets during nearly 2 years can now produce and show. Today, wherever UHF is subjected to direct comparison with VHF transmission and reception performance, the public and the advertiser reaction, we have a representative demonstration of why UHF suffers competitive inequality in its ability to serve the public. And the disparity has been simul-
taneously compounded by the substantial increases of authorized power and antenna heights to VHF stations which create vastly enlarged service areas which encroach upon areas served or expected to be served by the UHF stations.

At this point, I would like to make it clear to this subcommittee that UHF broadcasters are not, for the most part, inexperienced. Many have been in the radio business for many years, as long as 25 years in some instances. They were successful in that. They, along with many others with equal incentive and willingness to venture into public service, realized the potentialities of television and wanted to get into television. While the television presented the great potential, it was also very plain that UHF was the only way many could get into television. UHF at that time was presented as a vital new force. Responsible sources presented UHF as comparable with VHF, and in many respects even superior to VHF. These persons accepted as fact the word of responsible spokesmen upon whose experience and knowledge reliance could reasonably be placed. These broadcasters may indeed be regarded as pioneers. They brought into this new field their enthusiasm, their determination, their management abilities, their venture capital and all of the other attributes, which, added to the expected capabilities of UHF, gave reasonable assurance of a fair fighting chance of success. Criticism can hardly be directed to those who were willing to take the developmental risks that were involved. Rather, criticism might more appropriately be addressed to an unwillingness to venture into this field.

The licensing and rulemaking authority properly reserved to the Commission furnishes, in our opinion, the correct approach to the consideration of the current problem. This approach alone can reasonably assure equitable and nationwide maximum competitive service to the public, and fully bring about equal opportunity to all broadcasters to serve the public. And it is only through this approach that fundamental disparities of facilities creating unnatural barriers can be removed.

If we reflect for a moment, it will readily be seen that the direct approach we suggest, by striking at the roots of the problem, not only gives the greatest promise for curing the ailment, but will avoid climate for undesirable and unsatisfactory remedies if present trends are allowed to continue. If monopoly and concentration of television facilities results in this country, the beneficiaries will certainly not be the public. Those who will privately profit may find their gains short lived. For monopoly breeds public distrust and public distrust breeds direct regulatory action. And the degree of direct regulatory controls publicly demanded will undoubtedly be commensurate with the extent of the evil. We have seen evidence of this in the demands now current for direct regulation of network operations and for similar measures of a like nature.

I think we would all agree that broadcasting should be allowed to develop under a pattern in which competitive forces are allowed full play. But because of the spectrum limitations of this great medium, Government must fix the basic outlines or ground rules of that pattern. There can be no true play of competitive forces if the ground rules impose unnatural obstacles to some who enter the field, and unnatural advantages to others obtainable through no initiative or enterprise on their own part. It was for these purposes that Congress
wisely provided for a minimum amount of regulation of the field of broadcasting. Broadcasting channels were expected to be allocated in a fair, efficient, and equitable manner, and licensed to qualified applicants who would then survive or succumb, in competition with each other, according to the attractiveness of their service to the public. It is only by making equal facilities available, that additional regulatory controls become unnecessary since under a pattern providing equal competitive opportunity, the failure of any broadcaster to survive cannot be placed at anyone's doorstep but his own.

At a later time, this subcommittee will hear testimony from many UHF broadcasters who will recite their experiences. I believe it would be helpful if I were to summarize, at this point, the general nature of the many difficulties which they have encountered.

EFFECT OF THE UHF AND VHF LABELS

One of the major handicaps under which UHF has been forced to operate is that classification of its service by a particular name setting it apart from the VHF service which has a long background of public acceptance. We live in a trade-mark-conscious America, and labels have great psychological power. The separate nature of UHF service, emphasized by its name, is exploited in trade circles by those who either seek to gain in a competitive way, by critical comment, or unwittingly by those who disparage it because they are influenced by such comment.

THE TRANSMITTER PROBLEM

The nonavailability of adequate transmitter equipment is a serious difficulty of UHF. The evidence upon which findings were made by the Commission as to the early availability of suitable UHF transmitter equipment was given by technical experts approximately 3 years ago. The plain fact is that today VHF equipment with maximum power is readily obtainable but there is yet to be manufactured a transmitter capable of an output of greater than one-fourth the maximum expected power for UHF. So far as we know, there is not even in present prospect a possibility that UHF transmitters capable of 1,000 kilowatts ERP will be available in the foreseeable future. The unavailability of adequate transmitters is a handicap additional to the greater proportionate cost which 1-million-watt transmitters would involve as compared with VHF transmitters capable of providing comparable coverage.

Further, it cannot be accepted as a certainty, even if UHF transmitters with the specified power become available, that comparable coverage would be attainable in relation to VHF transmitters of far less power. As to the low-power transmitters which have been available to UHF broadcasters, technical transmission problems of performance have been encountered which have complicated their difficulties.

THE RECEIVER PROBLEM

It is now clear the Commission's expectation that receivers for adequate reception of UHF stations would be available and in circulation within a period of time which would enable UHF stations to procure the necessary audience for effective competition with VHF
ECONOMIC CONSEQUENCES OF THE TWO-SPECTRUM ALLOCATION SYSTEM

Stations can survive or succumb in accordance with their ability to obtain the necessary revenues for operation. This, in turn, depends upon the availability of programing of a sufficiently attractive nature to stimulate public acceptance of the station. A vicious cycle is created by the unavailability of adequate receiver and transmitting equipment because the inability of UHF stations to obtain the necessary coverage blocks UHF stations from obtaining sponsored high-quality programing.

The lifeblood of any television station under today's conditions is the availability of adequate network programs. Networks are interested in the lowest cost per 1,000 sets, and consequently they invariably favor competitive VHF stations. Experience has shown that even though a UHF station with a network affiliation has been established in a community for some time, whenever a new VHF station comes into that market it is able to obtain the network affiliation. Many UHF stations which have network affiliations do not even have the first call on all the programs of their network and they find the better programs taken away from them to be broadcast over a VHF station. This frequently happens in cases where the VHF station is not even located in the same market as the UHF station, but is in a separate city.

The situation has been complicated in many instances by the fact that VHF stations have been permitted to locate their high-power transmitters at a point far removed from the community to which the channel has been allocated. Such moves have generally been prompted by the desire to obtain desirable network affiliations which would not be obtainable in the market to which the channel was assigned, and have resulted in serious detriment to UHF stations located in the different market to which the move is made. The network problem has further been complicated by the fact that in a given market, existing VHF stations are given the opportunity to carry all of the choice programs of all networks even though such programs cannot be carried at the time originally broadcast. This results in unavailability of any of such programs to any of the UHF stations in the same market which might have carried them live at the time of the broadcast if selected by the advertiser.

In addition, there are situations where VHF stations obtain exclusive long-term arrangements from suppliers of film programs, which preclude VHF stations in another community from obtaining such films. These problems, of course, stem from the basic problems which give rise to an inability to obtain circulation of UHF stations comparable to that of the VHF stations.
The inadequacy of UHF coverage, cost of conversion, and the other problems pointed out above are frequently exploited to the further detriment of UHF stations by competitive VHF operators and others who stand to gain by such tactics. Thus, the competitive efforts of those interested in VHF are frequently directed to playing up such inadequacies and the extra investments required by the public to enable them to receive the UHF stations in the area. In some instances, VHF stations entering a market in which a UHF station has been established have engaged in a heavy promotional campaign to discourage conversions.

The difficulties of UHF operators are compounded by the burdens of paying the great cost of equipment. While equipment may be purchased on a deferred credit basis from the manufacturer, the credit terms extend over a relatively short period which is not realistically geared to the period of time which UHF operators necessarily require to become established and to overcome their existing handicaps. These handicaps, of course, make more difficult the availability of adequate credit terms from normal banking sources, because of the risks involved.

It was possible for the Commission to make grants of large numbers of UHF authorizations because of the absence of conflicting demands for such channels as compared to the demands for VHF channels. In the major markets of the country, the number of applicants for the scarce VHF channels portended proceedings of extensive duration which it was assumed would give UHF operators a fair chance to become established and minimize the existing competitive handicap before additional VHF competition in those markets could be authorized.

Commission procedures which are designed to eliminate conflicts through the encouragement of merger of applications and so-called overnight grants have intensely aggravated the difficulties of UHF stations in many markets, particularly in intermixed markets. These merger efforts have been proceeding at a rapid pace in many of the cities in which competitive proceedings remain.

The high cost of telephone interconnections and the charges for expediting of network interconnection have also had a serious effect. Quite naturally, networks cannot support the connection costs except where they know commercial program traffic will yield a return for underwriting the connection cost. Thus, wherever stations are not demanded by agencies and advertisers because these people believe the market is fringe covered or because of market size or the station is “less desirable because it is UHF,” the telephone cable cost prevents station development.

In radio, stations often had to be willing to carry network programs without payment for time or charges to the advertisers to build audience and commercial acceptance. This was called a bonus network affiliation. They cannot do so generally in television because without revenue the cost of telephone connection becomes prohibitive and uncompetitive with their VHF rivals who do not have to underwrite cash payment for telephone connections. An example cost is the $3,200 monthly for television compared with $250 in radio for less than 60 miles from Philadelphia to Atlantic City. And in addition,
this prohibition to development of new stations is compounded in many instances by postfreeze telephone expediting charges for prompt interconnections varying from $7,500 to $20,000 initially and the proposed higher fees for color transmission that the established and favored VHF stations will not have to finance individually.

Preliminary inquiries made by the UHF Industry Coordinating Committee reveal the serious plight of UHF stations in many of the intermixed areas. It is not an understatement that, unless adequate measures are promptly instituted, the extinction of many UHF stations is threatened, and the entire problem of survival of UHF stations in intermixed areas and maintenance of any adequate competitive television service in these markets will have been rendered academic.

The conclusions of the UHF broadcasters who have constituted themselves as the UHF Industry Coordinating Committee may be stated as follows:

First, the paramount consideration of public interest which should be recognized by the Senate subcommittee and the Commission is that the American public has a vital stake in the preservation of existing television stations as a competitive force in the industry.

This consideration is based upon the basic governmental determination which is implicit and explicit in the nationwide television allocation report and plan that the existing VHF channels are inadequate to assure the attainment of a truly nationwide competitive television service. Pertinent to this general public interest factor are the great financial and economic stakes of UHF broadcasters, UHF station personnel, and television dealers, distributors, service men and manufacturers.

Second, bitter experience has now proved that intermixture of UHF and VHF channels in the same market was based upon a misguided, though sincere, faith in the ability of UHF stations to achieve competitive equality of opportunity with VHF stations in the same service areas.

Therefore, administrative proceedings should immediately be instituted to explore methods of reallocation or reassignment of channels in such a manner that such equality of competitive opportunity is more readily available. Such plan should, of course, seek to safeguard against serious dislocation of public and industry investments in television.

Third, so that the problem of survival of a competitive television system will not have been rendered academic by the extinction of all UHF broadcasters in intermixed areas, and in order to avoid complicating a solution to the intermixture problem, pending completion of such proceedings, there should be an immediate suspension of any further grants of applications for new television permits and for changes in existing television authorizations affecting coverage.

Senator Schoeppel. Thank you, Mr. Weber. Do you have any question, Senator Bowring?

Senator Bowring. No questions.

Senator Schoeppel. I understand the next gentleman who desires to be heard is Mr. Ben K. McKinnon, of Greenville, S. C.

You may proceed, sir.
STATEMENT OF BEN K. MCKINNON, GENERAL MANAGER, WGVL-TV, GREENVILLE, S. C.

Mr. McKINNON, My name is Ben K. McKinnon, of Greenville, S. C. I am general manager and a minority owner of television station WGVL, which operates on channel 23 at Greenville, S. C. I am a member of the board of directors of the Ultra High Frequency Television Association and a charter member of the UHF Coordinating Committee.

I consider it a distinct honor to have the opportunity of appearing before this committee for the purpose of expressing my personal views concerning one of the problems facing UHF stations. The problem I wish to discuss concerns the manner in which the Commission has carried out the principles as expressed in its Nationwide Television Allocation Plan, the Sixth Report and Order.

The Commission adopted two basic principles in the nationwide television plan which they offered:

1. There should be an intermixture of UHF and VHF with many communities having both UHF and VHF television stations.

2. Television allocations would be made to more than a thousand individual communities all over the country.

The Commission expressly rejected plans for the establishment of a few regional stations and large metropolitan area stations. Instead, they wisely decided that the opportunities of viewing television should be given to citizens in every community and that many allocations to many communities, large and small, would provide better public service, better meet local needs and enable television to serve particular needs and objectives of particular communities.

It is in my opinion that despite the worthy principles it adopted in that report, the Commission has not followed through, in actual practice, with its basic proposition that grants will be made to individual communities and that there will be no regional stations—witness the many grants of higher power and antenna height to the old established VHF stations directly in the midst of the great struggle to create pioneer UHF television—and it is further my opinion that this failure of the Commission has caused serious hardship to both UHF and VHF stations, but the serious hardship has fallen primarily to the new UHF stations; to the operators and owners trying to carry out the television plan declared to be the best to serve this great Nation by the Federal Communications Commission.

There are many examples of situations where the Commission has failed to follow through with this basic principle; since I think our situation in Greenville, S. C., is a typical one and proves a point which should be in the records of this important committee, I will confine my comments to the individual case of channel encroachment, as we see it in Greenville.

In the Sixth Report the Commission allocated 2 commercial television channels to Greenville, UHF channel 23 and VHF channel 4. The city of Spartanburg, S. C., some 30 miles away, was assigned UHF channel 17, VHF channel 7 and later UHF channel 74. As I indicated before, the basic philosophy was that these channels were assigned to these separate communities for the purpose of the Greenville channels serving the needs of the Greenville community and the
Spartanburg channels serving the needs of the Spartanburg community. Indeed channel 7 had originally been assigned to Columbia, S. C., but was reassigned to Spartanburg for various reasons—one of which voiced the opinion that Spartanburg could not expect to be served adequately from Greenville and should be granted an individual VHF channel of its own.

Relying upon the above-allocation plan and desiring to expedite television service to the Greenville community, some 14 prominent, civic-minded Greenville businessmen formed a corporation and applied for UHF channel 23 in Greenville. This application was granted and WGVL commenced operation on August 1, 1953. Since that time WGVL has rendered a great service to the Greenville community, has programmed as many as 24 hours of live, local programs weekly including many extremely popular public-service programs such as: You and the Law, the WGVL Roundtable, the Voice of Safety, the Furman University Hour, TV Chapel of the Air, the JayCee Hour, and many more.

WGVL’s programing and technical performance is on a par with the other Greenville station—VHF channel 4 and WGVL’s owners are extremely proud of the wonderful community work the station has done and of the exceedingly fine reputation that the station enjoys in Greenville. WGVL signed on the air affiliated with ABC, Du Mont, and NBC networks. When channel 4 in Greenville, WFBC-TV, signed on the air in January 1953, the NBC network affiliation was moved to this station.

I would like to say that WGVL knew at the time that we signed with NBC that the network would be moved to FBG-Greenville.

There are now about 100 owners of WGVL, most of them Greenville residents. Of course, the owners of WGVL have always recognized that there would be competition from VHF channel 4 in Greenville, which is also rendering fine public service and programing to the city. While the owners of Greenville Television Co. were not absolutely sure of the future of the new medium—UHF television—but relying on the assurances of the Commission that UHF would be nationwide, accepted, competitive television—they were willing to take the desired risk, believing that there would be only one local VHF station in competition with them.

They did not anticipate that the Spartanburg VHF allocation, designed to serve the Spartanburg community, would ever become a Greenville allocation. This is happening now.

I want to make one point clear at this time. WGVL certainly realizes that it has no right to insist that the status quo as to channel allocations be frozen forever; we knew at the time that we applied for channel 23 that there were legal and fair ways of rulemaking to change the allocation table, even to the extent perhaps of assigning additional channels to Greenville. We did think, however, that if such a proposal were ever made, the Greenville Television Co., which pioneered television for Greenville through WGVL, would at least have an opportunity of being heard in such a rulemaking proposal; of opposing it if it thought justifiable or alternatively of applying for the new allocation, if thought desirable. In other words, we thought that if a change were to come about it would be done in a lawful hearing or other rulemaking proceeding which would at least give WGVL a chance to state its stand before the Commission.
The fact of the matter is that the Commission has permitted the VHF allocation in Spartanburg to be changed in practical effect to an additional Greenville VHF allocation without giving WGVL any effective right to object.

The Spartanburg VHF allocation was granted to a local Spartanburg group. After receiving that grant which specified that transmitter would be on Hogback Mountain to serve the Spartanburg community most effectively, the Spartanburg station—WSPA-TV—asked the Commission for temporary authority to locate its transmitter on Paris Mountain, 5 miles from Greenville and over 27 miles from Spartanburg. The site chosen was the best site available for service to Greenville, though not for Spartanburg, as is supported by the fact that both Greenville stations operate on that same mountain. Indeed, WSPA-TV's location is 1 mile closer to Greenville than the location of either of the 2 Greenville stations.

Now, I think it is pertinent to look at the market rank of Greenville and Spartanburg. The July 15, 1953, edition of TV Factbook shows how the J. Walter Thompson Advertising Agency ranks the first 312 markets of the United States. This authoritative research report ranks Greenville as a B market as 105th in the United States. Spartanburg is ranked as a D market as 166th in the Nation. The manager of Time-Buying for McCann-Erickson, another well respected advertising agency, ranks the TV markets in the Television magazine, February 1954. In that report Greenville is shown as the 75th TV market in the United States but Spartanburg is not listed in the top 162 TV markets.

Greenville is an established far larger market than Spartanburg; WSPA-TV from Paris Mountain will get a better combined coverage of Greenville, Spartanburg, and Anderson—also some 30 miles from Greenville in the opposite direction from Spartanburg—WSPA-TV, by moving transmitter an additional 30 miles away from the transmitter of WBTV in Charlotte, N. C., the closest VHF station to Greenville carrying CBS programs—Charlotte is 102 miles from Greenville—apparently will also be able to obtain a CBS network affiliation and could only obtain this by operating from this central location, some 30 miles past Spartanburg. I ask you, gentlemen, if you had a construction permit for a television station in Frederick, Md.,—would you not be delighted to move your transmitter to Washington, D. C. if you could obtain a CBS television network affiliation by doing so.

The committee can appreciate, I am sure, the tremendous adverse effect this new grant had on WGVL's operation—locally and nationally. Due to the fact that UHF stations are not judged individually on performance and audience but, in many cases, just shrugged off as another UHF television, we have had some problems with national advertising—despite excellent technical performance, programming and verified set count approaching 100,000 families. Naturally, with the news that the Spartanburg VHF would be in Greenville with CBS affiliation, national advertiser resistance became even more noticeable. And local advertisers began asking us if CBS shows were coming into Greenville. We had, of course, offered to carry CBS programs but had been unsuccessful in obtaining any type of affiliation with the network.

What had originally been a two-station market—one UHF and one VHF—now, without any change in the allocation plan at all, had be-
come a three-station market—2 VHF and 1 UHF. Needless to say, WGVL, as the only OHF station, was placed in a serious competitive position which would require a fight for its very survival.

We did, and indeed are, fighting to the best of our ability. Apart from the competitive fight that we are waging, we also formally protested to the Commission under section 309(8) of the Communications Act. We argued that to permit WSPA-TV to operate from its new location completely violated the allocation plan and rendered meaningless the requirement of the Commission that stations be allocated to certain communities only. We were joined in this fight by UHF operators and Cp holders from Anderson and Spartanburg. We argued that to permit this Spartanburg VHF station to move to Greenville would be particularly damaging to our relatively new UHF station, which was trying to establish itself in the Greenville market, even though suffering substantial initial operating losses in the neighborhood of $100,000.

The Commission, however, denied our protest on the grounds that we were not a part in interest and weren't sufficiently injured by this change in transmitter location. Immediately we appealed to the United States Court of Appeals for the District of Columbia, claiming that we were entitled to a hearing on our protest. The Court of Appeals entered a stay order suspending the effectiveness of the WSPA-TV temporary grant, until we could be heard on the merits of our case.

But we had not won the fight yet, for apparently the Commission was determined that the Spartanburg VHF station was going to get its chance to operate from the Greenville location no matter what the court said. The Commission, upon a request by WSPA-TV, canceled the temporary authorization permitting WSPA-TV to operate from the new location. The Commission then moved to dismiss our appeal on the grounds that the appeal was moot. This motion has not as yet been acted on by the court. Immediately thereafter, and upon application by WSPA-TV, the Commission granted a permanent authorization to WSPA-TV to operate from the identical location near Greenville, and certainly under identical circumstances, to those about which WGVL had protested.

The startling thing about this new grant to WSPA-TV is that it was made by three members of the Commission. Three Commission members established this permanent location of the Spartanburg station on Paris Mountain, a move that could possibly have damaging results to the entire UHF industry; far-reaching and policy forming. There was no unanimous opinion—there were only five members of the Commission present. The vote was not even a clear-cut majority of 4 to 1. No, it was 3-2, with 1 of the 2 minority commissioners writing a strong dissenting opinion. One of WGVL's original assertions had been that WSPA-TV planned permanent location on Paris Mountain, despite request for special temporary authority to operate. This statement has not been proved.

Needless to say, WGVL and the many other UHF stations following this case with avid interest were greatly chagrined at the important decision rendered by so few Commissioners. Again we have protested this new grant, alleging the same grounds as before. As yet the Commission has taken no action on our protest.
I honestly believe that this sort of Commission action, operating supposedly within the framework of the present rules, has been most injurious to our pioneer UHF operation and to many other pioneer UHF operations in other parts of the country. And, as I indicated at the very beginning, our case is typical of others faced with the same sort of invasion by stations allocated to nearby communities.

The Commission has, in my opinion, shut its eyes to its own requirements that a TV station in Gastonia, N. C., be a Gastonia station and not a Charlotte station, that a Spartanburg station be a Spartanburg station and not another Greenville station, regardless of the desire for transmitter relocation to obtain network affiliation. Any station which is allocated to and located in a relatively small community is going to try to locate its transmitter and to so program as to serve and take advantage of the larger market area. Obviously, therefore, the competition to stations in the larger community is going to be increased. Unfortunately, due to a combination of other problems and their growing pains, the first station to suffer and suffer the most is the UHF station.

UHF stations and the UHF industry may or may not need some sort of special assistance during the present transition period. The Senate committee will decide the answer to this question. But certainly UHF at least needs a thorough and sincere effort by the Commission to adhere strictly to its own allocation plan, where such adherence will assist in the effective establishment of a truly competitive UHF system. When the Commission lets the bars down and permits VHF stations from nearby smaller markets to invade larger UHF markets without so much as a cursory hearing, the Commission is itself cooperating in the destruction of their own UHF industry.

And to illustrate how this Commission action appears to the general public, I would like to introduce, as a part of this statement, the report of Commission action in regard to WSPA-TV permanent permission to operate on Paris Mountain as made public in an authoritative publication of the radio and television industry, Radio and TV Daily, issue of Monday, May 3, 1954, the first paragraph only. It has a Washington dateline and it states as follows:

The allocation in FCC’s Sixth Report and Order of channel 7 to Spartanburg, S. C., was wiped out Friday when the Commission, in effect, made it a Greenville station, over the protests of stations at Greenville and Anderson, S. C., over the dissents of 2 FCC members, and without the participation of 2 Commission members.

Channel encroachment is a serious situation to the UHF industry, the individual stations, the UHF Coordinating Committee and the UHF Television Association are vitally concerned with the manner in which the Commission has carried out the principles are expressed in its Nationwide Allocation Plan, the Sixth Report and Order.

I appreciate the opportunity to have been heard.

Senator Potter. I wish to apologize for being away since the recess. I had another executive meeting of a committee meeting and it took longer than I had expected. I appreciate Senator Schoeppel’s having taken over while I was gone.

Thank you very much, Mr. McKinnon.

The next witness is Mr. Glen McDaniel, president of the Radio-Electronics-TV Manufacturers Association.
STATEMENT OF GLEN MCDANIEL, PRESIDENT, RADIO-ELECTRONICS-TELEVISION MANUFACTURERS ASSOCIATION

Mr. McDANIEL. My name is Glen McDaniel, I am president of the Radio-Electronics-Television Manufacturers Association, 777 14th Street NW., Washington, D. C. Our association, now celebrating its 30th year, consists of about 380 companies engaged in the manufacture of television sets, radios, other electronic end products, and their component parts. Its membership includes most of the manufacturers of television sets.

I am not a UHF broadcaster, but some of the UHF broadcasting witnesses are not here and I understand my appearance has been on ahead of some of them.

Senator Potter. You have a vital part to play in this, I assure you.

Mr. McDANIEL. We do appreciate the opportunity of coming here.

We appreciate the opportunity to appear before the committee and we are certain that these hearings will serve a useful purpose. The economic problems now faced by television broadcasters in the ultrahigh frequency band are serious. There is no single or simple solution to the problem. These hearings should go far toward stimulating and crystallizing the thoughts of all those in industry and Government who are sincerely interested in the healthy growth and economic soundness of television broadcasting. We hope they will produce new ideas and measures that will help solve the problems of UHF broadcasting.

The manufacturers of television sets are vitally concerned in the economic well-being and healthy growth of television broadcasting. If there is no broadcasting, we have nothing to sell. And generally speaking, the more broadcasting there is, and the wider the choice of programs available to the viewer, the greater and more promising is the market for our products.

Early in the development of television broadcasting, the set makers showed their interest in making more channels available to the public than the 12 allocated in the VHF band. Others scheduled to testify here will recount some of the efforts to develop transmitting equipment that would make the UHF band useful. This work included years of experimental work.

Examples of this work include the experimental UHF transmitting station of RCA and NBC at Bridgeport, Conn., which commenced operations on December 29, 1949. When this station went on the air, the Bridgeport area became a laboratory for the set makers to test and develop their receiving sets and converters. After some months of this process RETMA, our association, sponsored a demonstration of UHF receiving equipment to the members and the staff of the Federal Communications Commission. This demonstration, held at Bridgeport in June 1951, included receivers, converters and antennas of eight manufacturers and indicated to the members of the Commission that clear and sharp pictures could be produced commercially in the UHF band.

Later, when the first regular UHF broadcasting station—KPTV—went on the air in Portland, Oreg., in September 1952, again the set
makers were there with their crews of experts making observations and carrying on experimentation under a variety of test conditions. The set makers felt then, and still feel, that the UHF band will open a new era of broadcasting and a much wider market for the industry's products. But we must remember that the way of a pioneer is not easy. Especially in broadcasting, it has always been difficult to launch a new service because of the interrelation of programing and set circulation. In this sense the experience of other broadcast services should encourage the UHF broadcasters in their present difficulties.

My main task today is to try to give the committee the relevant information concerning receiving equipment.

The set manufacturers have made and sold as many VHF-UHF receivers as the public will buy. The statistics indicate that for a while we made substantially more VHF-UHF sets than we were able to sell, and the manufacturers were forced to reduce their optimistic UHF production schedules.

Our industry statistics for UHF began in 1953. The first station, as I noted, went on the air in the latter part of 1952 and the statistics began in 1953.

The figures on production are set out in table I, which shows that 1953 production of UHF sets was 1,459,475, or 20.2 percent of total set production, and that in the first 4 months of 1954 UHF production was 412,913 or 21.6 percent of the total.

Senator Potter. When you speak of UHF sets, are you referring to the combination set?

Mr. McDaniell. That is correct. These are all sets tuned to all channels.

Senator Schoepfell. What is the difference in the cost of these sets, VHF and UHF?

Mr. McDaniell. The difference to the consumer between a VHF only set and a VHF-UHF set ranges between $20 and $60. If you had to pick a narrower range, I would say $30 to $40 to the consumer, and most of them are in that range, I think.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS 217

Senator Schoeppel. Thank you.

Mr. McDaniel. The present situation in a nutshell is that during the first 4 months of 1954 our factory inventories were 32 percent VHF-UHF sets but only 22 percent of our sales were VHF-UHF sets. In other words, we have been making more VHF-UHF sets than we can sell.

As you will see from table II, the proportion of factory sales represented by UHF was 15 percent in the first 6 months of 1953, rose to 32.4 percent in November of 1953 and has been steadily declining since November until in April it was 17.5 percent.

From table III you will see what has happened to inventories. From practically no UHF inventory in the first part of 1953, the proportion of our inventory represented by UHF sets has risen steadily until it reached 38 percent in February of this year. It is obvious that an industry cannot carry 38 percent of its inventory in an article that is accounting for only around 22 percent of sales. Thus, the proportion of UHF inventory fell to 32 percent at the end of April. We may assume that UHF inventory will continue to seek a balance with sales.

1 At end of the month. May is 1st month for which we have data.
Senator Potter. Do you have any information as to whether the retailers have tried to sell the UHF sets? Do they advertise the UHF sets as they do the VHF sets?

Mr. McDaniel. I think they do. I think it depends a great deal on the individual area, but tremendous efforts have been made in many areas in promoting UHF sets. In others, there have been complaints that the dealers have not shown the enthusiasm they should have shown. It is varying depending upon how optimistic a particular dealer is about the chances of selling, but they have certainly had vigorous promotion efforts all over the country.

We hope that these hearings will result in some new ideas or measures which will stimulate these sales and permit the manufacturers to dispose of their excess inventory of UHF sets.

The question has been asked as to why the manufacturers are not marketing receivers which tune only to the UHF band. The answer is purely one of economics. It is my opinion that whenever a manufacturer comes to the conclusion that the market for UHF is big enough to afford an advantage to one who markets a UHF-only set, such a set will be made and sold. No one has made that decision. Presumably one reason is that the cost saving is too small in terms of the present market. Another possible reason is that past history, as in FM, indicates that when a new frequency band is authorized, the public does not readily buy a receiver that tunes only to the new band but prefers to buy either a receiver that tunes only to the old band or one that tunes to both bands.

Our board of directors at its last meeting on April 29 discussed some of the problems confronting UHF broadcasters, and one of the directors suggested a practical means of encouraging the manufacture of VHF-UHF television receivers. And I might say that it is one of many discussions that we have held over a long period of time. He pointed out that if the 10-percent Federal excise tax were removed from all VHF-UHF sets, there would be an incentive to manufacture only those sets that tune to UHF broadcasts.

Our UHF policy committee concurred in this suggestion, and I was authorized to propose it in my testimony before this committee. However, in the meantime, Senator Johnson of Colorado introduced a proposed amendment to H. R. 8800 embodying the same idea. This proposed amendment was referred to the Finance Committee on May 11. And I was most happy to hear your endorsement of it earlier this afternoon, Mr. Chairman.

I would like to endorse the legislation sponsored by Senator Johnson and explain briefly why we believe it would stimulate sales of VHF-UHF receivers.

As the committee knows, there is a price differential between VHF-only sets and VHF-UHF sets, necessitated by higher production costs. Our association does not collect any statistics relating to prices, but trade journals have estimated that the price differential to the customer ranges between $20 in the case of the least expensive sets to $40 and $50 in the case of higher priced sets, and I should add $60 as I did a moment ago in answer to a question by Senator Schoeppel.

It is said by some individual manufacturers that this price differential is decreasing as the industry gets into higher quantities of UHF production. It must be emphasized, however, that no amount of quantity production can entirely eliminate the price differential between
VHF-only sets and VHF-UHF sets. It costs more to make an instrument that tunes to 82 positions than one that tunes to 12 positions. The experts say there is no way that this increased cost can be eliminated.

There is a way, however, that this increased manufacturing cost can be offset.

As this committee is no doubt aware, the Congress, in the summer of 1950, shortly after the outbreak of the Korean war and under the stress of the revenue needs arising from that mobilization, imposed a 10-percent manufacturer's excise tax on television sets. Up to that time there had never been an excise tax on television sets.

Prior to the outbreak of the Korean war, the Treasury had made a proposal for such a tax but it had been defeated on three separate occasions in the House Ways and Means Committee and in the Senate Finance Committee.

We propose that the excise tax be removed from VHF-UHF television sets. This will offset the manufacturing cost differential entirely, I believe, in the case of medium- and high-priced sets, and in less expensive sets it will offset most of the manufacturing cost differential. The revenue loss to the Treasury at present production rates would be about $25 million annually which is a minor amount as budget figures go. Naturally, the revenue loss to the Treasury will increase as the amendment successfully encourages the manufacture of relatively more tax-exempt sets.

Lest the manufacturers be misunderstood, I should point out that we have steadfastly argued that the excise tax on television sets is unsound legislation and we have repeatedly urged its complete repeal. Television is an instrumentality of public education and enlightenment and is an important means by which citizens gain the knowledge that enables them to participate in their own self-government in these times when democracy is threatened throughout the world. The circulation and use of such an instrumentality should not be impeded by a selective and discriminatory excise tax. By proposing the removal of the tax from UHF sets we do not mean to condone its application to other television sets, or to radios.

In recent hearings on H. R. 8224, which was the excise tax bill of 1954, and 8300, the revenue revision bill, we urged that the tax be suspended on color sets in order to permit this new product to have a breathing spell and reach quantity production before the burden of the tax is imposed upon it. We have said, here is a new instrument and Congress has traditionally shown a solicitude for infant industries and new developments by not imposing excessive excise taxes on them until they have had a chance to get into production and growth.

Senator Potter. What is the excise tax?

Mr. McDaniell. Ten percent of the manufacturer's selling price.

This proposal was voted down by the Finance Committee. We also asked for a general reduction in the tax consistent with the treatment of other consumer goods. The tax was kept at the full 10 percent on all sets despite the fact that the tax on other household products was reduced from 10 percent to 5 percent, and despite the fact that it was virtually removed from admissions to movie houses which had recommended the imposition of the tax in 1950 as a means of equalizing competition between the movies and television.
The proposed amendment to H. R. 8300, introduced by Senator Johnson on May 11, offers a golden opportunity to accomplish several things at once:

1. Encourage the manufacture and sale of sets capable of receiving UHF broadcasts;
2. Encourage the incorporation of UHF equipment in all color sets so that, as we emerge into the new era of color television, UHF will be stimulated by the added attraction of color;
3. Encourage color television itself by permitting removal of the tax from all color sets that tune to the UHF band and thus help to bring the advantages of color to the American public.

All of these things can be accomplished at a small loss in Treasury revenue. We do not see how Congress can balk at this revenue loss, in view of the fact that in the recently enacted H. R. 8224 it provided substantial tax reductions at enormous revenue loss to the movies, to furs, jewelry, and perfumes, and to refrigerators, home laundry equipment and other household articles, but gave not one cent of tax reduction to the purchasers of television sets.

The time for action on Senator Johnson’s proposed amendment is very short. The Finance Committee of the Senate is in daily session on H. R. 8300.

I might say that the staff director of the committee tells me that he has heard that the Finance Committee will reach tomorrow the place in H. R. 8300 that this excise tax proposal would normally go in. I do not think it means that they will not act on it later, but the place where they reach it will occur tomorrow.

We strongly urge that this committee immediately call upon the Finance Committee to include the Johnson amendment in the Finance Committee’s version of H. R. 8300.

We wish to reserve the opportunity to present at a later time our recommendations concerning the detailed language of the amendment. I have no criticism of Senator Johnson’s draft, but we have not had time to formulate our comments on any questions of statutory language.

I wish to reserve the opportunity to present at a later time any recommendations that we might have about the detailed language of the bill. I have no criticism at all of Senator Johnson’s draft, but we have not had an opportunity to study the detailed language of it and we might have some comments at some later time on that.

Representatives of UHF broadcasters have expressed a desire for higher sensitivity in UHF sets. I do not think that has been a matter of any contention here today, but it has been discussed many times in leading up to these hearings. Our comment on this is twofold.

First, UHF sets now being made are of a quality as high as can be reasonably expected in the present state of the art. This conclusion can be drawn from a report issued by the Hazeltine Laboratories after testing 52 representative UHF sets and 3 representative UHF converters marketed during 1953.

Incidentally, they are unbiased in that they do not manufacture sets. They are research laboratories.

The Hazeltine report, No. 8018, was issued on March 24, 1954. As the committee knows, the quality of a product under a free competitive system ranges between the lowest priced article which as the minimum quality necessary for public acceptance, and the product which has
the highest quality the consumer is willing to pay for. I believe that the tests made by Hazeltine covered a representative sample throughout this range.

The Hazeltine tests, which also included 37 VHF receivers, showed these averages of sensitivity:

<table>
<thead>
<tr>
<th>Channel Range</th>
<th>Sensitivity (Decibels)</th>
</tr>
</thead>
<tbody>
<tr>
<td>VHF low band, channels 2-6</td>
<td>91.5</td>
</tr>
<tr>
<td>VHF high band, channels 7-13</td>
<td>86</td>
</tr>
<tr>
<td>UHF band, channels 14-82</td>
<td>80</td>
</tr>
</tbody>
</table>

Senator Potter. What do you mean by decibels?

Mr. McDaniel. It is simply a level of measuring the sensitivity of the set, and that is about as much as I know of it. I have a copy of the report here.

Senator Potter. It is a means of measuring it?

Mr. McDaniel. That is right. The decibel is a unit of sound, the volume or intensity of sound.

In other words, the sensitivity of these representative receivers in channels 7-13 was 5.5 decibels poorer than the sensitivity in channels 2-6, and the UHF receivers were only 6 decibels poorer in sensitivity than the VHF receivers in channels 7-13. This, incidentally, surprised me because I had known a little about the tremendous difficulty of producing equipment which would produce a good picture in the UHF band. That point was not touched on directly by Chairman Hyde this morning, but at the time the first 12 channels were released, we could not produce television pictures in the UHF. The art had not developed that far. To offset this 6-decibel loss in sensitivity, the engineers say it is necessary to double the voltage and quadruple the radiated power. Increases of this order were provided for in the FCC's plan.

Second, an increase in the sensitivity of UHF receivers would not make a significant contribution at the present time to the solution of UHF broadcasting problems. It would be equivalent, for example, to increasing the reception area from a radius of 50 miles to one of 55 miles. It would be a mistake, it seems to me, to increase the price of UHF receivers to gain this order of advantage. The engineers tell us that the sensitivity of UHF sets cannot be increased at this time without an increase in price.

Good progress is being made toward bringing greater sensitivity at the same price, but we believe that the sensitivity of present sets is not substantially impairing the growth and development of UHF and that greater sensitivity will not make the difference between success and failure.

There are other factors affecting the quality of UHF sets besides sensitivity. One is the noise level, which is an important factor. But when all these factors are taken into consideration, it may be concluded that UHF receivers being marketed today are better instruments than were the VHF receivers at the comparable stage of development. These are technical matters as to which the committee will receive very detailed information from company representatives who are scheduled to testify after me.

You may be sure that when it is possible to make more sensitive sets, with greater range and less noise, at a price the public will pay, the intense competition of the set industry will bring about the manufacture and aggressive marketing of such sets.
In making its assignment of channels in the UHF band the Federal Communications Commission assumed that the set manufacturers would use the 41.25 standard intermediate frequency which had been recommended to the Commission by RETMA. Some UHF spokesmen have indicated that the failure of some manufacturers to use this standard intermediate frequency in their television receiving sets is making the job of UHF reception more difficult.

This is a problem to which our association has been earnestly devoting its attention for a long time. It is a companion of the problem of spurious radiation from receiving sets. Much committee work and engineering investigation have been conducted under RETMA auspices on these problems. The work led to a RETMA proposal transmitted just 2 months ago today to the Federal Communications Commission involving the establishment of an independent scientific laboratory which would certify receiving sets as being free of objectionable radiation. This would be an entirely voluntary program since the association could not and would not try to bring any pressure or compulsion against any manufacturer.

Under this plan RETMA is sending out invitations to a number of scientific laboratories to bid on the job of conducting tests and making certifications. Manufacturers would voluntarily submit their television chassis for testing and if they passed the tests they would be authorized to display a label on the set certifying that it is free of objectionable interference. That chassis is a plural word, incidentally. They would have to submit 1 out of every 100 receivers, I believe the figure is. In order to earn this label, a set will have to use the 41.25 intermediate frequency. We have strong hopes that this certification laboratory plan will hasten the day of complete uniformity in the use of the 41.25 intermediate frequency.

I think I should add that there are relatively few stations that do not use the 41.25 intermediate frequency. I do not know exactly how many, but it is a small percentage.

Ten days ago the staff director of this committee asked RETMA for information concerning the plans of the set manufacturers for incorporating UHF tuners in color television sets. Our association had no such information because it is our firm policy to confine our statistical services to past and existing fact and never to deal with production plans or other matters affecting future production. The staff director, on behalf of the committee, then requested us to obtain such information for use in these hearings in view of the public interest involved and of the need of this committee for such information. In compliance with this request, we sent a questionnaire to set makers in RETMA on Friday, May 7.

 Replies to the questionnaire received by May 18 may be summarized as follows. Let me put it this way, so far as we know, there are 16 companies manufacturing color television today. We have received replies from 15 of those, one of them since we prepared our material for presentation today.

So, out of the 14 companies which we had reports from previous to coming here, this is our report:

1. Of 14 companies currently producing color sets:
   Seven reported that they include VHF-UHF tuners in some or all of their color sets.
   Two reported that they include VHF-UHF tuners in all of their color sets.
Let me interject again that I am stating that the third one can be verified by telephone. It only came in before lunch and I want to be sure that that was right, and I have not had the response from the telephone verification.

Senator Potter. What are the three companies?

Mr. McDaniel. RCA, CBS, and Bendix. Bendix is the one that came in this morning and I am checking on it by telephone.

Two reported that they include VHF-UHF tuners in color sets if ordered by the distributor.

Two reported that they make color sets with built-in provision for conversion to UHF reception in the field.

One reported that it does not offer VHF-UHF tuners in color sets. Industry production reports indicate that only two companies currently producing color sets failed to reply to the questionnaire by May 18.

Senator Potter. In other words, there are just three companies that manufacture sets, where all their sets provide for UHF tuning?

Mr. McDaniel. That is correct, at the present time. There are many, several of these companies that are not marketing the color sets on much of a scale. They are demonstrating them and making them in pilot-run quantities, so that I do not think that the results of the questionnaire at this time are a very strong indication of what they might do when they get into production.

2. Of nine companies who indicated that they are not currently producing color sets but intend to do so:

One reported that it will include a VHF-UHF tuner in some or all of its color sets.

Eight reported that they have made no decision.

3. In addition, four companies indicated that they are not producing color sets currently and may or may not do so in the future. Apparently they have done no thinking on this problem.

Presumably the committee is interested in the suggestion of TV Guide magazine and Senator Bridges that measures be taken to assure that UHF tuners will be installed in all color sets. We have three comments to make on this proposal:

1. If Congress fails to remove the excise tax from sets containing UHF tuners, there is not a great likelihood that such tuners will be installed in all color sets, in my opinion, unless it is required by law. This is because in a free competitive system, especially in an industry so intensely competitive as ours, all possibilities of cost savings that are acceptable to the public will be utilized. Based on experience so far in black and white, it seems clear that there will be some market for color sets without UHF tuners. Needless to say, our industry association would not and could not take any action or permit any discussion at its meetings looking toward an agreement by the manufacturers to install UHF tuners in all color sets. In our opinion, such an agreement might well raise questions under the antitrust laws.

2. If UHF tuners are required in color sets by law, this would probably promote the immediate financial interest of the manufacturers in that it would force the public to pay for a higher priced article and the manufacturers would benefit to the extent their normal profit rates were applied to a higher dollar volume of business.

3. Despite this immediate monetary factor, such a law would mean intervention by Government in the regulation of the manufacture of television sets. Besides being of doubtful constitutionality, it would
be unsound legislation, and our industry would be vigorously opposed to it on principle. We believe that a system of free competition is best for the public in the long run.

The objective of having UHF tuners installed in all color sets can be encouraged, in our opinion, by the removal of the manufacturer's excise tax from VHF-UHF sets, because this would provide an economic incentive to include the UHF tuner in color sets.

Now I will leave the question of receivers and speak of converters for a moment.

Unfortunately, there are no statistics to show how many sets have been converted to UHF reception in the homes of viewers. One trade press editor has estimated the figure at 2 million, but this is only a guess. This, you will notice, is a much higher one than that implicit in Chairman Hyde's statement this morning.

Senator Schoeppel. He gives 1½ million.

Mr. McDaniels. Yes, as I understood him, he estimated between 2 million and 3 million total, including the field conversions and we produced 1½ million in 1953 and several hundred thousand this year, so his estimate will have to be substantially under this 2 million.

The marketing and installation of converters is not an easy or simple job. A tuner is a delicate instrument. The manufacturers have assiduously searched, and I am sure are still searching, for ways to make them satisfactorily at less cost.

The problem of the servicemen in installing the antenna and converter is not a simple one and he complains that the customer does not realize the amount of time necessary to do a good job. Customers in turn complain that the servicemen are poorly trained and careless.

In the nature of the television service, business customers are quick to complain if a television set goes wrong or if a substantial fee has to be paid to repair it. The same is true of the installation of antennas and converters.

Our association has long worked to encourage the serviceman and to promote better training. We have developed a model television training course in New York which has been made available to schools throughout the country. Our members have supplied equipment to training schools to help in service training. We have done much and will do more in the area of consumer education and understanding of service problems.

We know of no easy shortcut to alleviate the serious problems of the UHF broadcaster in the matter of conversion of existing sets. It is indeed a difficult and serious problem.

Three manufacturers of transmitting equipment are scheduled to testify in these hearings. Our association has not gathered from the transmitter manufacturers any information about transmitting equipment for presentation at these hearings. We believe the committee's purposes can be served much better by obtaining the information direct rather than secondhand.

Many proposals have been put forward in recent months for new laws or regulations on programming and network affiliation as measures to assist the UHF broadcasters in overcoming their economic problems. RETMA is not in a position to comment on these proposals. While some RETMA members have network interests and individual broadcasting station interests, RETMA does not represent the broadcasting activities of these members and is not authorized to speak for them on broadcasting problems. We have no rec-
ommendations to make on broadcasting problems or network affiliation policies at this time.

We hope that the Federal Communications Commission will help UHF broadcasters to the fullest extent possible by shifting channels from one place to another or making other refinements in the allocation plan. We believe, however, that a reworking of the allocation plan will not solve the present problems of the UHF broadcasters.

We would object to a freeze on the processing of station license applications. It is too late to go back and re-engineer the general allocation plan. Those UHF applicants who are confident that they have prospects of healthy economic operation of UHF should be allowed to proceed.

While the manufacturers are most seriously concerned that a solution to the UHF broadcasting problem can be found, we have no specific remedies to suggest at this time other than the excise tax proposal, which will be a help but by no means a cure-all. The UHF problem is one which calls for a synthesis of expert information and experienced judgment in several fields, of which equipment research and manufacture is only one. The manufacturers are not in a position to undertake such a synthesis. This is one reason we welcome these hearings. After you have heard the contributions by experts in the various fields, you will then confront a task calling for a high order of legislative judgment.

Whatever other action you may decide to take, we strongly urge that the committee act immediately to put through an amendment to H. R. 8300 removing the excise tax from receiving sets containing UHF tuners as proposed by Senator Johnson.

We shall be happy to cooperate with the committee if we can be of assistance by gathering or submitting further information on this problem which is of such great importance to the future of the broadcasting and set manufacturing industries.

Senator Potter. Mr. McDaniel, we thank you for your comprehensive statement. Will you be back here tomorrow?

Mr. McDaniel. Yes.

Senator Potter. Will there be other representatives from the receiver manufacturers' group?

Mr. McDaniel. There will be several representatives from RCA, Du Mont and General Electric, and, after you have heard them, if there is other information you would like from us, we trust you will speak to Mr. Zapple and we will be glad to come in.

Senator Potter. Thank you for your statement.

Mr. COTTON. Mr. Chairman, unfortunately, we were not able to proceed because we were waiting for a witness and we arranged for Mr. McDaniel to move in.

We do have several additional witnesses for the UHF coordinating committee and we would appreciate it very much if we could be allowed to proceed. I am not suggesting that we proceed right now.

Senator Potter. I believe it will be best to go through the list and see how we go through that and your witnesses will follow after tomorrow's hearing.

The committee will recess until 10 o'clock tomorrow morning in this room.

(Whereupon, at 4:59 p. m., the hearings were recessed to 10 a. m., Thursday, May 20, 1954, in the caucus room of the Senate Office Building.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

THURSDAY, MAY 20, 1954

UNITED STATES SENATE,
SUBCOMMITTEE NO. 2 ON COMMUNICATIONS
OF THE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The subcommittee met at 10:05 a. m., pursuant to recess, in room G-16 of the Capitol, Senator Charles E. Potter (chairman of the subcommittee) presiding.

Present: Senators Potter (chairman of the subcommittee), Schoeppel, Bowring, Hunt, and Pastore.

Also present: Bertram O. Wissman, chief clerk, and Nick Zapple, counsel for the subcommittee.

Senator Potter. The committee will come to order.

First I would like to apologize for this moving around from the Capitol over to the Senate Office Building and back.

Yesterday, we had been assured that the caucus room would be available for our hearings today and tomorrow, and then we were notified this morning that another committee had made arrangements for the caucus room 6 weeks ago. So we were evicted.

I am sorry that it happened, but yesterday we were assured that it would be available for us.

The first witness this morning will be Dr. Du Mont.

Dr. Du Mont had a map which is over in the caucus room, but it is being brought over, and when that comes we can either take a recess or they can put it up if it doesn't distract too much from the testimony.

Dr. Du Mont tells me they are prepared to start their presentation now, and then they can use the map when the map arrives.

This room is small, and in order for all to hear I would appreciate it if you would keep your voices down as much as possible, and I would also suggest to the person who is testifying to talk as loudly as convenient, so that all can hear.

I believe we can use the room in here for any overflow that we might have.

Mr. Wissman. Yes; that's all right, Senator. It wouldn't work out too well, but if it is necessary—

Senator Potter. All right, Dr. Du Mont.

STATEMENT OF ALLEN B. DU MONT, PRESIDENT, ALLEN B. DU MONT LABORATORIES, INC., CLIFTON, N. J.

Dr. Du Mont. My name is Allen B. Du Mont, and I am president of the Allen B. Du Mont Laboratories, Inc., with its main office at 750 Bloomfield Avenue, Clifton, N. J.
Our company operates the Du Mont Television Network, and owns three television stations which are located in Washington, D. C., New York City and Pittsburgh, Pa. It also manufactures television transmitters, television receivers, cathode-ray tubes, and cathode-ray oscillographs.

It also has extensive research and engineering laboratories.

This company was the first manufacturer of cathode-ray tubes suitable for television in this country, produced the first cathode-ray commercial television receiver, and was the first to operate a network between its own television stations.

Because of our wide interest in television, we are particularly concerned with the present situation as concerns the ultra high frequency stations. Their success directly determines whether we are to have more than two television networks in this country.

Before getting into the details of the present situation, it might be well to summarize what has gone on previously as concerns this question. The subject of utilizing the ultrahigh frequencies for use in television came to the fore in the 1949 hearings of the Federal Communications Commission.

These hearings were very extensive, resulting in a freeze of the construction of new stations for a period of almost 3 years, and the final determination as to the allocation scheme was not released until April 14, 1952.

In 1949 Du Mont submitted to the Federal Communications Commission a proposed allocation of frequencies which provided for at least four VHF or UHF stations in the top 100 markets of this country. A copy of this allocation proposal is hereby submitted as Du Mont exhibit A.

It was our feeling in submitting this proposal that a number of important objectives would be accomplished by its adoption.

For one thing, it would provide equal opportunity to the four networks to compete on an equal basis provided by the allocation scheme and eliminate the necessity of equality by regulation. Second, it would provide a minimum cost to the American public as regards the purchase of television receivers.

As will be noticed in this plan, there is not intermixture of VHF and UHF stations in a single city, so that in the VHF areas the television set owner would only need a VHF receiver, antenna, and lead-in; and in the UHF areas the television listener would only need a UHF receiver, antenna, and lead-in.

We felt then, and we feel even more strongly now, that with the intermixture of VHF and UHF stations in the various cities, it is impossible to have a competitive situation as between the networks in a given area.

In 1949 we were not alone in our thinking, and the testimony of the Columbia Broadcasting System at that time clearly outlines the problem.

I would like to quote from a portion of the final television allocation report, under paragraph 256 (d) in this connection:

* * * a major objective of the Commission is the reasonable assurance of the possibility of a nationwide competitive television service—and that CBS is genuinely concerned that very real dangers of monopoly inher in the Commission's proposed allocation.

CBS stated that:
The Commission itself has recognized that for a considerable period perhaps 5 years, perhaps more, a commercial UHF station cannot compete on anything like an equal basis with a commercial VHF station in the same community **.*

CBS urged that it—

must be obvious that during the not inconsiderable growth period of UHF, network A with UHF outlets in Chicago, San Francisco, and Boston would be under a crippling competitive disadvantage vis-a-vis network B with VHF outlets in these three cities.

Thus CBS argued—

it is quite possible that the Commission's allocation plan will as a matter of practical necessity permit the development during the critical formative years of only two full nationwide competing television networks.

The point that I am trying to make in this connection is that unless there are four competitive television networks the question of ultrahigh frequency stations is academic as, if we are only going to have two networks, only a very few UHF stations are required.

For instance, in our present allocation scheme, network A can obtain 88 VHF outlets in the top 100 markets; network B can obtain 67 VHF outlets in the top 100 markets; whereas network C can only obtain 30 VHF outlets and network D only 7 VHF outlets under the same conditions.

We believed in 1949 that in order to prevent monopolistic system of broadcasting, four networks were required. We still feel that way today.

Mr. Ted Bergmann, who is the director of our network, will present facts to show that from a commercial standpoint four television networks can be amply supported by revenue from the advertisers.

Printers Ink, one of the leading advertising trade publications, recently published a preliminary estimate of total advertising expenditures for 1953. This revealed that television received $688 million in 1953, as against $663 million for all magazines.

These figures are simply given to show the status of television advertising and to indicate that vast sums are available to support it.

Having only two networks not only has the effect of monopoly in the television broadcasting business, but has the effect of extending the monopoly so that only a relatively small number of large companies can utilize television for the sales of their products. Television advertising in one respect differs greatly from advertising in magazines, newspapers, and so forth.

In a magazine or newspaper, any advertiser desiring space can obtain it as it is only necessary to print additional pages to allow any number of advertisers to appear in the publication. In television, we have only about 4 hours a day of prime advertising time and, if we assume that 8 advertisers wish to present half-hour programs on television per evening, we use up completely the facilities of one network. With a two network setup, therefore, it would be only possible for 16 advertisers to appear per evening. In some cases the advertisers desire to put on hour programs, thereby reducing the number possible to appear.

We have had numerous instances in the past where national advertisers desire to obtain time on television but cannot due to the limited facilities now available.
I would like to point out to the committee that this 1949 plan was turned down by the Federal Communications Commission because of the principles of assignment adopted by the Commission.

In order to salvage as much as possible, we submitted a revised allocation plan which we did not consider as good as our original plan. In the Commission’s report of April 14, 1952, you will notice that there are numerous references made to a Du Mont plan, and this second plan is the one referred to.

Even this plan was vastly superior to the plan of the Federal Communications Commission as it provided for a much greater opportunity for four networks to operate competitively.

The Federal Communications Commission’s priority in setting up their allocation scheme was as follows:

Priority No. 1: To provide at least one television service to all parts of the United States.
Priority No. 2: To provide each community with at least one television broadcast station.
Priority No. 3: To provide a choice of at least two television services to all parts of the United States.
Priority No. 4: To provide each community with at least two television broadcast stations.
Priority No. 5: Any channels which remain unassigned under the foregoing priorities will be assigned to the various communities depending on the size of the population of each community, the geographical location of such community, and the number of television services available to such community from television stations located in other communities.

In contrast to this, our principles of assignment were based on the following:

1. To provide television service, as far as possible, to all people of the United States; and
2. To provide the most services to the people.

We have always felt that the basis on which the FCC allocated stations is not a realistic one.

To take just one item, priority No. 2 states that they wish to provide each community with at least one television broadcast station. It is obvious that something like 75 percent of the allocations they have made will never be used.

They have provided television stations, as they stated in their principles, to almost every city in the United States. For example, in the State of Michigan they have provided 71 allocations and only 25 cities are over 10,000 population. This same holds true in many other States, and they have even provided allocations for villages having only a population of several hundred people.

We know from experience that in order to support a television station, from a financial standpoint, it is necessary to have approximately a population of 100,000 people within range of the transmitter. As there is an average of slightly over 3 people to each home, this would provide, if everybody purchased a television set, a sale of approxi-
mately 30,000 television receivers. However, only about 90 percent of the homes normally purchase television receivers, and this would mean that in an area where 100,000 people lived, there would be approximately 27,000 television receivers.

We also know from experience that the total advertising support will be about $10 per set per year, which means that under these conditions the television station would have an income of approximately $270,000 a year. With the figures we have and the experience we have, a television station can be operated under these conditions at a very slight profit.

This is being recited to show how unrealistic the Commission has been in their allocation of frequencies.

The Commission has stated at numerous times that they are not concerned with the economics of the situation. To me this seems absolutely indefensible as most other commissions of the Government regulating railroads, airlines, and so on, consider the economics of the situation of prime importance.

By not considering the economics of the situation, much more valuable frequency space has been used up than was necessary and, instead of allocating on the basis of the largest number of people that can be served, the allocation scheme primarily is based on geography.

It is interesting to note that priority No. 3 of the Commission states that the scheme should provide a choice of at least two television services to all parts of the United States, which to me clearly indicates their thinking that a two network setup in the United States is all that is necessary.

It is interesting to note that as late as several weeks ago one of the Commissions in a speech stated:

I do not believe the Commission can be blamed for those who displayed bad business judgment in trying to move in on the (UHF) channels without making a thorough assessment of the availability of equipment both for receiving and transmitting as well as the economic factors with which they might be confronted in the communities in which they proposed to establish service.

I am firm in my belief, as I was on the day I voted for the sixth report and order, that the Commission made a sound engineering allocation plan designed to meet the twofold objective set forth in the Communications Act of 1934, to provide television service, as far as possible, to all people of the United States and to provide a fair, efficient, and equitable distribution of television broadcast stations in the several States and communities.

The economic problem, as it pertains to sponsorship of programs by the time buyers and advertisers, is beyond the purview of the authority vested in the Commission by the organic act from which it derives its power. There are those who would have us move in this area, but this is a business arrangement that must be settled without interference from the Commission.

It will be noted that the present allocation scheme is justified on the basis of sound engineering judgment. To my mind, you cannot have sound engineering judgment unless you have considered economics. When a bridge is to be built, or a building is to be built, the engineer must not only consider the requirements to be justified but also the cost of accomplishing this. When I went to school there was a rough definition of an engineer, which stated that an engineer was a person
who could do for $1 what any fool could do for $2, and I think this definition still holds good today.

The reason the ultra-high-frequency stations are in trouble today, in my estimation, is because of the fact that the Commission has not taken economics into consideration in their allocation scheme, and when they intermix VHF and UHF stations, it is obvious which one is going to come out on top.

There have been numerous statements by various members of the Commission that we should allow the stations and networks to fight this thing out in the good old American philosophy of commercial competition. We certainly agree with this premise wholeheartedly, but it is a difficult situation for some stations and some networks to accomplish this with the intermixed allocation scheme we now have.

It is like putting one person on a bicycle and another person in a jet airplane and having a race between two cities. No matter how hard the person on the bicycle tries, he certainly is never going to catch up with the person in the jet plane, and I think this analogy applies directly to our present situation.

Much will undoubtedly be said about the technical differences, both as concern receivers and transmitters, between VHF and UHF. There is no question that there is considerable difference technically between VHF and UHF but, as we see it, the fundamental problem of the UHF stations is programing. We have studied a number of areas and in many of these areas UHF is providing excellent technical coverage.

Recently I had an occasion to make a study in the Albany-Troy-Schenectady area where there is 1 VHF station and 2 UHF stations. In most locations in this area the UHF stations were providing a stronger and crisper picture than the VHF station.

Yet, when you see what programs are on the different stations, we find that the VHF station is carrying practically all network programs, whereas the two UHF stations only carry occasional network programs.

Mr. Chairman, at this point I should like to offer an article which appeared in the May 6, 1950 issue of Business Week, entitled “No. 1 TV Problem: Thawing the ‘Freeze.’”

Senator Potter. Without objection, that will be made a part of the record.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS 233

(The matter referred to is as follows:)

[From Business Week, May 6, 1950]

**Television—No. 1 TV Problem: Thawing the Freeze**

</table>
Industry Wants More Channels, Less Mixing

Here's the number of stations that the Nation's top 20 markets would get under (1) the Federal Communications Commission's plan for the TV industry, and (2) Du Mont's counterproposal.

The black ink sections, show mixing of ultra high frequency and very high frequency stations in the same market. The industry argues that this is economic poison, that a UHF station would simply have no audience at all where everyone in town already has a present-day VHF television set.

The industry doesn't underwrite the Du Mont plan, but it approves in principle Du Mont's effort to keep VHF and UHF markets segregated.

The numbers on the chart represent channels allotted to each city—another deep concern of the industry. In more cases than not, Du Mont's plan would increase the allotment. By contrast, the FCC plan allows only 3 or even 2 channels in many major markets.

In a few cases, Du Mont has had to cut a channel or two. But against these backward revisions, Du Mont stacks the advantage of no intermixture. It insists that its plan, though it may hurt a handful of markets, provides a fairer distribution for the Nation as a whole.

The Federal Communications Commission is about to move in on the most vital issue facing the television industry—unfreezing the freeze.

Hearings on color television are now dragging their weary way into the final stretch. This week FCC announced that a new set of hearings will begin on June 5. The subject will be allocations—the vexatious business that brought on the freeze in the first place. (The decision on color supposedly will come sometime in the early summer.)

Overlooked—Trouble is that the furor over color has made everyone forget what the original issue was all about. Color is a very important matter (Business Week, April 1, 1950, p. 19). But it is not nearly so important or fundamental as allocations. For what FCC finally does about allocations and the freeze will decide the overall pattern of TV.

Recently, Chairman Wayne Coy of FCC said he hoped the freeze would be lifted by year's end. His hope, though, left the industry in a politely skeptical mood. The industry cocks one eye at the schedule and notes that before FCC really gets down to business, it must first take up:

Bell System's request for an ultra high frequency band for mobile communications. This would take a chunk out of the spectrum tentatively allocated to TV. Large segments of the industry—including the Television Broadcasters Association—oppose the Bell request vigorously. After that, FCC must tackle—

Technical standards.—In this phase, the experts will have to thrash out the involved problems of interference, station separation, wave propagation, and similar thorny questions. And when that is all over, FCC will finally have to get down to cases with—

Allocation of channels.—And here's where the fun begins. At this point in the hearings, two hundred-odd interested parties will start beating each other over the head to get the channels they want.

Add to this fact that it will take 2 or more years to get the new licensees on the air, and you will see why one industry expert says, "Hell, this is no freeze—it's an ice age."

Everyone wants in.—Basically, the problem facing FCC is simply that there is only so much spectrum to divide up among a list of strongly competitive services—radio, radar, mobile communications, television, ham operators, etc.

Toward the end of the war, FCC found it had a whopping job to handle. Radar, one of the two or three major technological developments of war, had turned out to work best in the higher frequencies; as a result, engineers worked their way up into the spectrum. This opened up the upper stretches of the ultra high frequencies.

At the same time, TV was getting ready to make its public debut. As far as TV was concerned, FCC had two major decisions to make: (1) What part of the spectrum should be assigned to TV? (2) Should TV be given the green light right away, or should FCC wait for further technical developments?

Thirteen less.—The resultant hearings, called by Chairman Coy the most comprehensive in the history of radio, got under way in 1944. During the sessions, FCC decided to get started on TV right away. Since TV's possibilities in UHF had still to be explored, this meant that for the time being at least TV
would be confined to VHF (very high frequency). In 1945, FCC came up with the basic groundwork for a nationwide TV system by handing the industry 13 VHF channels (it later took 1 away again). The Commission figured that would give enough room to provide 400 stations in 140 markets.

But it didn't. By 1948, when there were only about 50 stations on the air, it became obvious that FCC had crowded things much too close. Interference, particularly from tropospheric transmission, which bounced TV signals back to earth miles from where they should have been, became a real annoyance. Hence the freeze, which stopped all further allocations when the tally stood at 110 licenses.

Rainbow chasing.—FCC then went back into a huddle with the industry, mainly with the idea of exploring the UHF band. On July 11, 1949, it came up with a new plan for TV. Just as this was about to go into hearings, FCC took off to "chase colored rainbows," as one industry observer put it. It has been chasing them ever since.

FCC's allocation plan, when it finally gets an airing, will call for the addition of 42 UHF channels to the 12 VHF channels now in use. In the VHF range, station separation will be upped from 150 miles to 220 miles for stations on the same channel, and from 75 to 110 miles for stations on adjacent channels. UHF stations on the same channel will have to be 200 miles apart; on adjacent channels, 100 miles (VHF stations have a shorter broadcasting range). All told, on both VHF and UHF, there will be room for some 2,000 stations in about 1,500 markets.

Compared to the old program, this looks pretty good. But it isn't good enough to keep the industry from complaining.

Intermixture.—In the first place, to shoehorn in all these stations without changing wavelengths already assigned, FCC has resorted to intermixture. This simply means mixing VHF and UHF stations in the same area. Under FCC's proposals, only about 40 percent of the Nation's communities with a population of 500,000 and over would have 3 or more channels unmixed. When you get down to the 50,000-to-100,000 level, less than 10 percent would have 3 channels without mixing.

The industry says intermixture is economic poison. Take Philadelphia, which is earmarked to get 3 VHF channels and 1 UHF channel. It would be suicide, argues the industry, to open a station on that UHF channel. There are more than 435,000 TV sets in operation in Philadelphia today—sets that receive VHF only. Since a converter would cost somewhere in the neighborhood of $25, the UHF station would, as a result, have almost no audience at all.

Stations at whistle stops.—The second thing about FCC's program that bothers the industry is the number of channels allotted to individual markets. For 165 cities of 50,000 population and over, there would be only 1 or 2 stations. Only 75 cities would have 4 or more channels.

All this worries the industry as much as intermixture. Television people say that FCC went off the track in its proposed allocations. They charge the Commission with being more interested in giving a station to every crossroads than in giving adequate coverage to the major population centers.

The industry is afraid that FCC's failure to provide enough channels in so many cases will stifle competition.

Charge of monopoly.—Du Mont—the only organization that has filed a comprehensive program to counter the FCC's—goes even further in its criticism. It argues that the FCC plan will help create a monopoly, or at least a "demonopoly" in television. If you leave all these markets with only a handful of stations, only 1 or 2 networks will be able to get a look in. These will be the ones that line up and can deliver to advertisers the big markets that have only skimpy coverage. The other nets will slowly be frozen out.

For advertisers, says Du Mont, this could have serious repercussions. Many of them might find it difficult, if not impossible, to get into the big markets. And the public will get a smaller selection of programs.

Du Mont's plan would carve out a larger chunk of the UHF spectrum than FCC's. To begin with, it would give 48 channels to commercial users as against FCC's 42. Du Mont would then add another 12 channels to be parcelled out on a first-come-first-served basis to take care of the forgotten man. Besides this, it would set aside 9 channels for noncommercial educational use.

More for all.—On this foundation, Du Mont would rear a bigger structure. Under its plan, nearly 100 percent of the cities with a population of 500,000 and more would have 3 or more unmixed channels. So it goes down the line. FCC would provide only about 30 percent of the cities with 100,000 to 250,000 popu-
lation with 3 or more unmixed channels; Du Mont would see that 80 percent got 3 or more.

Much the same holds true for the number of channels. Du Mont's plan would give 4 or more channels to 155 cities with a population of 50,000 and more—or a little better than twice what FCC proposes.

Du Mont also claims that it has taken into account several interference factors that FCC has not. One of them is the so-called local oscillation of receivers. Du Mont spaces its channels so that this interference won't occur.

Drawback.—But—and it's a big but—Du Mont's plan has one very serious drawback. To create what it considers an optimum program, Du Mont has had to propose that about 30 present stations move from one channel to another. Rea
don for most of these moves is that the stations are too close to other stations on the same channel—a problem that the industry feels FCC has sidestepped.

In the cases where the change would involve only moving from one low-band VHF channel to another, the cost to the station would be slight. But when you have to shift from VHF to UHF—as you would have to in some cases—it would really run into money.

Even more upsetting would be the shifts where Du Mont would clear VHF out of a city and make a changeover to UHF.

Hurdle against good.—Du Mont admits this is a pretty drastic step, but argues this way: There actually will be only about a dozen hardship cases. Match this against the general good of the country as a whole. After all somebody has to get hurt, and it's better than only a few do.

To soften the blow, Du Mont would allow several years for the changeover to go through. What's more, to help station operators in distress, Du Mont for its part is willing to take back its own broadcasting equipment at the depreciated prices.

Whether this argument will sway many television or set owners—is doubtful. However, Du Mont is willing to compromise in order to save the overall plan.

Can't please all.—Trouble is, at this late stage, there is simply no perfect plan. No matter what FCC does, it is going to bring at least one-half of the industry down on its neck—and hard.

Dr. Du Mont. I would just like to state in connection with this article in Business Week that it is a concise summary of the proposition that we submitted in 1949, and you will find pretty much in this article many of the problems that were brought up yesterday that we looked ahead in 1949 to what would happen, and pretty much that has happened in the interim period.

Senator Potter. Doctor, is there any particular reason why Baltimore was to be next?

Dr. Du Mont. We tried extremely hard to take care of that situation, and it was one of the most difficult to take care of in the United States for the number of frequencies available.

The reason for it, fundamentally, is because of the close proximity to the south of Washington and Philadelphia to the north.

It is more or less the greatest concentration of population, as far as television is concerned, and there are just not enough frequencies to take care of it. It was the one exception that proved the rule, and if you study that plan you will find that we have provided at least 4 VHF or 4 UHF stations in 243 markets in the United States.

So, it is really quite an inclusive plan, and then beside that, in the small cities there were a lesser number of stations provided.

We felt then and we feel even more strongly now about that.

As to the paragraph beginning at the bottom of page 2 and continuing to the top of page 3, I might explain just briefly the basis for the figures I gave there:

The way this was worked up, and what is really means, is that there are 7 markets out of the top 100 that have 4 stations. There are 30 markets out of the top 100 that have 3 stations, and so forth. I mean, that's the way that particular basis was worked out.
Mr. Bergmann will show actually in practice how it worked out. In other words, there is some equalizing, and the low will get a few more, and the high will not get quite so many.

Senator Potter. I was interested in your quoting CBS. Was that in a report CBS submitted to the Commission?

Dr. Du Mont. That is in the official report of the Federal Communications Commission, in which they simply quoted the testimony of CBS, and along those same lines.

Senator Potter. When was this?

Dr. Goldsmith. April 14, 1952.

Dr. Du Mont. Along those same lines, if you look back over the records, you find out that pretty generally most of the people that were testifying agreed that intermixing was a bad thing. The big reason that people were opposed to this plan, where people were opposed to it, was specific cities where it would help them individually to have a different channel.

In other words, they didn't take an overall look at the entire picture for the United States, but were interested in one city to get a better channel.

For further and more ample discussion of the UHF technical problems, Mr. Chairman, I would like to introduce Dr. T. T. Goldsmith, Jr., vice president in charge of research for our company.

I don't know whether the map has arrived.

Senator Potter. Yes; Doctor, that has arrived.

Dr. Du Mont. We could just bring it in now.

Senator Potter. Before Dr. Goldsmith presents his statement, I thing it would be well if we bring in the map, and then if you gentlemen would care to move in this other room at this time, it might be a little more convenient. We will take a 5-minute recess while they bring the map in, and move into the other room.

(Recess taken.)

STATEMENT OF THOMAS T. GOLDSMITH, JR., VICE PRESIDENT, RESEARCH, ALLEN B. DU MONT LABORATORIES, INC.

Senator Potter. Dr. Goldsmith, will you please proceed with your statement at this time?

Dr. Goldsmith. Thank you, Mr. Chairman.

I am Thomas T. Goldsmith, Jr., vice president in charge of research of the Allen B. Du Mont Laboratories, Inc.

Senator Potter. Pardon me, Doctor. Because of the crowded condition in the room, in order for everyone to hear the witness, we will have to be as quiet as possible. So, if you will show as much courtesy as you possibly can, I will appreciate it.

Excuse me.

Dr. Goldsmith. I have had experience over the last 18 years or so in television, and have been present and acting very actively in a great many of the industry's coordinating plans on all occasions and the growth of television generally; have participated in many of the FCC hearings, and we have tried to work cooperatively with them as to what we can do about this television business.

This is another session in that same endeavor.

We are concerned in these Senate Committee hearings with a serious problem confronting ultra-high frequency, or UHF television throughout the United States.
These 70 new channels recently opened to broadcast television are at a very serious disadvantage with respect to the older 12 VHF channels under the present very complex competitive circumstances.

I wish to touch briefly upon the circumstances which surrounded the establishment of these UHF broadcasting channels in the hope that we can cast light upon the consideration of these current difficulties and help clarify certain possibilities for remedy.

During the past 10 years, United States television has grown from a laboratory novelty to a nationwide communication medium affecting the daily lives of more than 90 percent of the American people. During this brief decade, television manufacturing and broadcasting has attained the stature of a billion-dollar-a-year industry.

This tremendous expansion has not been accomplished without growing pains. One of these, the so-called freeze, resulted in a moratorium on station building which lasted for 3 years. Unfortunately, the subject of color television received extended attention during that freeze, and unduly delayed the lifting of the freeze, which had primarily been instituted merely to determine proper channel allocation practices.

The immediate problem of mutual interference between stations was ultimately solved, a large new group of television channels was added to the existing 12 VHF channels, a new nationwide allocation plan was adopted and television construction once more moved ahead.

Unfortunately, the decisions accompanying the lifting of the freeze contained the seeds which have since grown into an even greater problem.

The purpose of these hearings is to find a solution to this new problem, a solution which will permit further healthy growth of the United States television industry.

We will now review briefly the history of television since the lifting of the freeze, demonstrating the causes and effects of the current troubles, and finally suggesting possible remedies.

We have here, over on the side, a map of the United States containing 320 small lights. A copy of this map is inserted in the bound testimony as exhibit B. By placing a punched card in the switch, we may operate any predetermined set of lights. If no card is inserted, all of the lights light. Here we see the top 320 markets in the United States.

By placing this card 3 in the switch, we can limit the lights to the top 100 markets. Lists of cities that are shown by this card and ensuing cards are inserted in the bound testimony as exhibit C. In the ensuing discussion, these 100 markets will be of principle interest.

These markets have been chosen primarily on the basis of population. However, in certain cases, cities well served by neighboring large cities have been deleted and certain isolated cities have been added. For example, Brockton, Mass., well served by Boston stations, has been deleted, and Madison, Wis., a large market not otherwise served, has been added.

Here we see the top 320 markets in the United States. That takes us down to cities of the order of 50,000 nominal population, and is down where television must exist if you are going to serve most of the people.

By placing this card, No. 3, in the switch, we can limit the lights just to the top 100 markets.
There is a hole punched for each of those cities. That is just the top 100 markets, and we may want to use that card again and again to limit us to the big markets to see what the financial support can sponsor.

Senator Potter. That will take you down to a population of about what?

Dr. Goldsmith. Takes us down to a population of something like 300,000 people in the television-service area.

Now, there is disagreement with a city listing, because television-service area out to 50 miles or so doesn't agree with market surveys as we are currently accustomed to reading them, but it is more practical from a television-broadcast standpoint to consider the service area.

Lists of cities that are shown by this card are inserted in the bound testimony as exhibit C. In the back of the book you have detailed lists of these cities, and they go by card number. For example, exhibit C comprises about half of the back portion of the book there, and a little description at the top of each list points out what can tie with the cards, as well as describe them.

In the ensuing discussion, these 100 markets will be of principal interest.

These markets have been chosen primarily on the basis of population. However, in certain cases, cities well served by neighboring large cities have been deleted, and certain isolated cities have been added further down the line, as mentioned. So we get the top 100 important television markets from a commercial standpoint and a public-interest standpoint.

Now, what is UHF television? As is well known, all television receivers now in the hands of the public are equipped to receive 12 television channels. These are called the VHF, or very high frequency channels, and lie between the frequencies of 54 and 216 megacycles.

With the lifting of the freeze, a new portion of the spectrum was allocated to television broadcasting. The channels therein are called UHF or ultra high frequency and lie between the frequencies, for television purposes, of 470 and 890 megacycles.

The millions of receivers in the hands of the public when the freeze was lifted could not receive the UHF channels without substantial additional investment by the owners, the initial available UHF transmitter power was small relative to the available VHF transmitter power, and UHF receivers were, temporarily at least, inferior in performance to VHF receivers.

Because of these conditions, it was strongly urged by some that a national allocation plan be adopted which would minimize the intermixture of UHF and VHF in any given market.

As an example of what could be accomplished, a nonintermix plan was prepared in 1949, and submitted by Du Mont to the Federal Communications Commission. This plan utilized the 12 VHF channels plus an additional 48 UHF channels at that time on a completely nonintermix basis.

Under this plan, cards Nos. 104 and 3 show those cities in the top 100 markets which would have had 4 or more nonintermixed channels. There were 92 such cities.

The FCC, however, decided during the hearings, upon the advice of some in the industry, that UHF would have a better chance of success if UHF stations were placed in the biggest markets along with
VHF. It was further decided that no operating stations or construction-permit holders would be required to change from a VHF to a UHF channel. Thus, the current plan was adopted. Under this plan, only these cities in the top 100 markets as shown by card No. 105 have at least 4 similar service channels. There are 14 such cities.

The issuance of the FCC's sixth report and order, making possible grants for new stations after July 1, 1952, opened the floodgates. Hundreds of new applications were filed, the Commission speeded up its processing methods and within a few weeks new stations were coming on the air. By the middle of 1953, the rate had reached one a day.

In the sixth report and order the Commission had recognized certain technical inequalities between the UHF and VHF transmissions. It had sought to rectify these inequalities by permitting UHF stations an effective radiated power 10 times as great as was permitted low-band VHF stations.

Unfortunately, the transmitter industry and the construction-permit holders were unable to take advantage of that particular opportunity. No one knew how to build a 50,000-watt UHF television transmitter.

Consequently, the great majority of the UHF stations started operation with a 1000-watt transmitter, which with an antenna gain of 20 could give 1 million watts of effective radiated power. Consequently the great majority had an antenna gain of 20, giving them 20,000 watts effective radiated power. Furthermore, the sensitivity of the UHF receivers was considerably lower than that of the VHF receivers, and finally, they cost more.

We wish to make one point very clear. There is nothing fundamentally wrong with UHF television from a technical point of view. Given the proper incentive, the technical difficulties outlined above will prove transitory. UHF can and in some cases is providing a television service at least as good as that being provided on VHF.

In many areas there had been no television until after the lifting of the freeze. In a few of these, the first station on the air operated on a UHF channel. In these areas, this was television, and it was widely acclaimed. Unfortunately, in most areas, the new UHF stations did not introduce the people to television. Well-entrenched VHF stations, carrying all of the best programs, had been in operation for several years. In these areas, there was little incentive for the public to equip their television sets to receive the new UHF stations.

A vicious circle ensued. Because the UHF broadcaster had no audience, he was unable to obtain the necessary advertising support either nationally or locally to provide attractive programs. Because he lacked good programing, the public had no incentive to convert their receivers. Thus, his audience failed to grow substantially. Today many of these UHF pioneers are in serious trouble. Several UHF stations have already been forced to cease operation and as this hearing shows, many more will follow unless something can be done to eliminate the unhealthy competitive situation now existing.

VHF itself has a frequency spread of 4 to 1 in megacycles. Channel 13, for example, is four times the frequency of channel 2; 250 megacycles to 50 megacycles. Now, the lowest UHF channel is 450 megacycles, and the highest is 216, a ratio of about 2 to 1 in frequency. That means there is nothing wrong with UHF channels as such. They just got here too late.
We have 100 AM channels in the AM broadcasting for the last thirty-odd years. We certainly need 82 TV channels to give a nationwide service: 12 frequencies of VHF is not sufficient alone to do it, and the only part of this spectrum where there is room for television is this UHF. We have to make good use of it.

Unless something can be done, and done very quickly, to eliminate the unhealthy competitive situation now existing, many more UHF stations will be forced to cease their operations.

I would like to interpose a comment there:

The individual stations have a lot to tell you about their troubles, because of the Madison Avenue effect. They don't think the advertiser wants to know they may be in trouble, but perhaps I can assure you, on a collective basis for the whole United States, that there is very serious trouble, and we've got to do something about it. The pressure that has been put on you from other quarters indicates the same thing.

Senator Hunt. The point is I think the people on Madison Avenue now understand the situation.

Dr. Goldsmith. We will now illustrate on the light map exactly how serious this situation is.

As of April 15, 1954, a convenient cutoff date for currency of this map, these cities in the United States, as shown by card No. 6, had at least one operating television station. There were 197 such cities or market areas.

So, you can see it is very widespread over the population of the country.

That is only one service.

Senator Potter. But they have at least one or just one?

Dr. Goldsmith. At least one. That is one or more television services in each of these 197 cities.

Now, there are a few beyond this light map, 320, but they are still smaller cities. They perhaps have one station, but this is a significant trend of the whole country, even there.

VHF stations were operating in these cities shown by card 80—that is, VHF television stations—and they could, of course, be received by anyone with a television set—143 cities.

UHF stations were operating in these 87 cities as shown by card No. 7—that is UHF—but their audience consisted only of those people who had gone to the additional expense of converting their receivers or buying new, all-band receivers.

That is the UHF situation today.

Senator Potter. Are those stations on the air?

Dr. Goldsmith. Those are one or more UHF on the air.

Now, you can see here a geographic and probably an economic support spread on a map, which is quite different from the impact you get with a list of cities or with charts that show quantity.

This is a geographic and service area portrayal of what television has, and this is the UHF stations on the air.

Senator Potter. That is very graphic.

Dr. Goldsmith. It is of interest to consider the network alinement of these stations.

The lights and maps present a pictorial idea of geographic distribution, whereas other exhibits we will show later will present in chart form some of the quantitative and economic aspects of station operation and network affiliation.
Past and present network radio affiliations and other factors of economic self-interest have naturally brought the powerful, well-established VHF stations and the strongest television networks together. The result is that in these 62 cities, indicated by card No. 13, which is detailed in the back, in the top 100 markets, one of the large networks has primary VHF outlets—these 62 cities—whereas card 14 shows that in only these 20 cities, in the top 100 markets, does this same network have primary UHF outlets.

This is UHF outlets, on one of the large networks.

It will be noted that there is no VHF outlet now operating in most of these cities.

You can look at a great many of the cities there, and you will find Scranton, Pa., has no VHF. So, obviously it goes to U, and it is one of the top 100 markets.

Tampa, Fla., currently has no UHF on the air, though there were two VHF applicants for which there is multiple application pending.

On the one hand—let’s look at 1 of the smaller networks—1 of the 2 smaller networks has VHF primary affiliates in only these 15 cities, indicated by card 17, compared with a large network having outlets in 62 cities, all but 1 of which have at least 3 VHF stations in operation.

In other words, we have gotten into those 15 cities perhaps on a part-time basis, because there are many of these on the air, whereas this same smaller network, as shown by card 18, has primary UHF affiliates in these 24 markets.

The mutual dependence of UHF stations and the smaller networks becomes immediately apparent. Without the UHF stations, these networks would have very few affiliates and without the smaller networks the UHF stations would have no programing.

It is well known that several stations have recently ceased operations.

We will consider only those in the top 100 markets because in these markets additional television stations could be supported.

Now, we have a double-card structure. We can put 2 cards at once and get the product of the 2 cards. In other words, we can have the situation for the entire United States and then put in the 100-station limit and see just those in the top markets.

We will use that double-card technique a little from here on.

Let us first see, by inserting cards 3 and 11, where in the top 100 markets VHF construction permits have been returned.

There is one—only one light comes on. That is a VHF turned in, in the top 100 markets.

There are two stations already operating in El Paso, and this market is, of course, one of the smaller top 100, and that was actually a case where the fellow decided to go in with one of the others. So, one dropped out. There is still VHF service there.

On the other hand, by inserting cards 3 and 12, we find that UHF construction permits have been relinquished in these 16 markets.

It will be appreciated that such cities as Buffalo, Dayton, Indianapolis, St. Louis, could readily support additional television stations.

Senator Potter. We lost Buffalo.

Dr. Goldsmith. All right. There it is. It is on now.

We have a little problem with the map in making all of the pinball points work.

Commissioner Hennock. We had quite a problem with Buffalo.
Dr. Goldsmith. But you see these are big cities that can well support additional television services. They failed in UHF because of the competitive situation.

It has been noted that the VHF stations naturally become affiliated with the larger networks. But, in cities where at least two VHF stations are operating these stations are almost invariably affiliates of the two larger networks.

A UHF station coming into such a market must start out with no audience and inferior programing, from both a quality and quantity point of view. Accordingly, the public has little incentive to convert and the audience does not grow rapidly.

Now, card 81 indicates the 51 cities now—that is April 15, 1954—having at least 2 VHF stations operating—51 cities having at least 2 VHF stations operating.

Now, by removing card 81 and inserting card 7, the 87 cities having at least one UHF station are shown.

That is one UHF.

By reinserting card 81—

Senator Potter. Is that UHF alone?

Dr. Goldsmith. No. We will come to that in a moment.

The combination cards will show that story.

By inserting card 81, the V's, two V's, together with card 7, the one or more U's, we see those cities where at least 2 VHF stations and 1 UHF station are in operation. There are only 10 such cities and these are facing extremely strong competition in those 10 cities.

Apparently it is not sound economics for a UHF station to attempt to compete with two VHF stations.

There is a question on Dayton, for example, there.

Some of these stations have begged permission to hold up until maybe this Senate investigation can give them a new lease on life.

So, some of our cities are kept on the list as expecting to go back into business perhaps, but they have shown definite signs of failure by stopping temporarily servicing the public. So, there may be some disparity between the lists that you have.

Let us see what this means in the future.

Card 72 shows that under the allocation plan the Commission has allocated UHF channels to these 288 cities in the 320 markets of the country—the top 320 markets of the country.

Looking at card 69 instead, we see that at least 2 VHF channels have been allocated to these 118 cities. The lights show the cities before the stations are in operating condition. Now, this is a forecast for the future, that is, the allocated conditions if you had full occupancy.

These are the 118 cities which have been allocated to at least 2 VHF channels.

By inserting card 3 along with cards 69 and 72, we find that in the top 100 markets at least 2 VHF and 1 UHF stations have been allocated to these 64 cities.

Unless a competitive picture is radically changed, we may reasonably expect most of these UHF allocations will never be used.

Another illustration showing why we may expect this can be obtained by examining the UHF conversion situation, where people have changed over their sets to receive UHF.

Card No. 96 shows that at least 50 percent of the receivers in these 44 markets are equipped to receive UHF signals, and once again card 81
shows the 51 cities in which 2 or more VHF stations are now operating.

Inserting both cards, we see those cities having at least two VHF stations, where more than half of the receivers are equipped to view the UHF station. There are only two such cities.

Actually, these two cities—

Senator Pastore. Would you name them, please?

Dr. Goldsmith. Duluth, Minn., and Jackson, Miss.

These two cities—Duluth, Minn., and Jackson, Miss.,—are more than 75 percent converted. However, in both these cities the UHF station was on the air several months before the VHF station settled down and got their grants and got on the air. So, the priority of UHF there can pretty well account for those stations still going.

This card shows clearly in those areas where the public can receive at least two VHF stations there is essentially no incentive to convert their receivers for UHF reception.

Jackson, Miss., down there, is estimated to have 17,000 receivers. It has got 2 V's on the air and 1 U on the air, and a city that size—well, there is more in the fringe—we don't know whether the U can really hold out; but in present circumstances those are the 2 cities that fill this bill.

It has been established that relatively few UHF stations are being built where VHF competition is strong.

It has further been established that in areas where VHF reception is available receiver conversion is low.

We will now examine the current UHF stations in the light of VHF competition which they may expect under the allocation plan.

Here, once more, is card 7, which shows the 57 cities now having UHF stations, and this card, No. 9, shows the 8 cities currently having no VHF station closer than 75 miles.

They have got no VHF service from a city that is closer to the center of that station than 75 miles.

In several cases, however, additional VHF channels have been allocated and will ultimately be built.

This card 103 shows all of the currently operating UHF stations which, under the plan, will never have VHF competition closer than 75 miles.

Senator Pastore. Name that one.

Dr. Goldsmith. One light comes on. That is Fort Wayne, Ind. That has no fringe interference, let's say—one city.

Senator Potter. They have it made.

Senator Hunt. That is monopoly, isn't it?

Dr. Goldsmith. There is 1 station on the air in Fort Wayne, and there is heavy competition for the other—2 UHF allocations to that city.

That has a chance of getting going, except that manufacturers would hardly go very far to getting prices down in behalf of one city out of the whole United States.

I think it can be concluded that Fort Wayne is now and will continue to be a good UHF market.

Conclusions: In summary, perhaps some of the most important reasons for the present UHF difficulty are the following:

1. The relative distribution of VHF and UHF throughout the United States does not permit competitive opportunity for UHF operation.
2. The economic factors of television support have not received adequate emphasis in the allocation tables.

3. VHF television had a long head start over UHF television.

4. The public has less than 10 percent of its total of 30 receivers equipped for reception of UHF.

5. UHF stations require excellent programs to encourage set conversion, but advertising support of such programming requires first a high percentage of set conversion—that vicious cycle.

6. UHF apparatus, while rapidly improving, has not reached the stage of technical perfection experienced in VHF, largely due to its much more recent introduction.

I might point out, Senator Potter, we have a great many more cards that analyze other phases of this situation, and Mr. Robert Wakeman, who has very ably handled the map for us, will be here and if you have questions it may just be we have cards that will visualize and clarify for you some of the other points.

Senator Potter. I appreciate that because we can use it all through the hearing, if it can be made available.

Dr. Goldsmith. Well, it will be here for your use.

Incidentally, we used maps of this type with the Federal Communications Commission in the course of the hearings in Washington. We brought 2 16-foot maps down, 1 with the FCC plan and 1 with the Du Mont plan, the 2 side by side, with cards, which showed the whole story, and I think it does aid in assisting in planning.

The 16 maps, incidentally, have the complete status shown around each city. It is big enough to where we have pins that show the existing stations that are allocated, the ones for which applications are pending, the construction permits granted and the channel numbers, and the operating stations, and you can put a variety of cards on there. I think we probably have a thousand or so punchcards to show different analyses factors in television.

I have tried to present some of the technical and allocation factors involved in this complex problem. There are very important economic and public-service problems which face the broadcaster and the network operator which can more readily be discussed by the director of the broadcast division of Allen B. Du Mont Laboratories, Inc., and we should like to call on Mr. Theodore G. Bergmann to give you his report on these matters.

Mr. Bergmann.

Thank you, Senator Potter.

Senator Potter. Thank you.

STATEMENT OF THEODORE G. BERGMANN, DIRECTOR OF BROADCASTING, ALLEN B. DU MONT LABORATORIES

Mr. Bergmann. Mr. Chairman, I have some charts. I wonder if we can get them set up?

Senator Potter. All right.

Mr. Bergmann. We are ready, Mr. Chairman.

Senator Potter. Mr. Bergmann.

Mr. Bergmann. My name is Theodore G. Bergmann. I reside at 113 Searingtown Road, Manhasset, N. Y., and I am appearing here today in my capacity as Director of Broadcasting of Allen B. Du Mont Laboratories, Inc.
You have heard a discussion of the technical considerations relating to ultra-high-frequency television broadcasting. I would like now to turn to the commercial and public-service considerations, especially as they relate to network telecasting.

On October 20, 1950, we appeared before the Federal Communications Commission during the course of the hearings on the Du Mont allocations plan and made the following statement, and I quote:

Unless there are a sufficiency of channels in the major metropolitan areas which do and can support national advertising, the number of competitive networks will be limited.

Today we are prepared to illustrate to you how events have transpired to prove out this statement, beyond argument.

However, before we do, I think it would be well to examine the national economy in respect to advertising in general and television in particular in order to determine its ability to support 4 outlets in all of the top markets and assure 4 national television networks.

During the past 5 years, or since 1949, we have been a part of a growth of a national advertising medium which has been nothing short of phenomenal. In 1949 national advertising expenditures were approximately $2.9 billion. That same year national television, consisting of network and national spot expenditures, totaled $49.2 million or approximately 1.7 percent of the total national advertising expenditures.

Senator Schoeppel. Mr. Chairman, I would like to ask the gentleman a question.

Senator Potter. Yes, Senator Schoeppel.

Senator Schoeppel. Now, in newspaper advertising I presume they have something like a uniform rate. I am asking this question because I don't know anything about your rates—the rates that are charged for television advertising.

Now, have the television advertisers gotten together on a kind of uniform scale of charges for television advertising?

Mr. Bergmann. Not to my knowledge, Senator. The rates in television are set to be commensurate with the amount of circulation that each station delivers within its own market, and there is no uniformity.

As a matter of fact, some stations, if you examine the rates throughout the country, charge a higher rate for less circulation than do other stations which charge a lower rate for more circulation.

Senator Schoeppel. Well, that is what I wanted to get at.

Senator Pastore. May I ask a question on that point?

Mr. Bergmann. Surely, sir.

Senator Pastore. Are the rates higher where you have one channel in the city than where you have several channels?

Mr. Bergmann. Well, I haven't examined that recently, Senator, but it would be my impression that that is so; yes, sir.

Senator Pastore. In other words, where there is lack of competition, the rates are higher.

Mr. Bergmann. That's right, sir.

Senator Schoeppel. Do you know whether anybody has made an analysis of these advertising ratios?

Mr. Bergmann. From what point of view, Senator?

Senator Schoeppel. Well, in some of these cities where they have 2 competing networks, or, say, 3 competing networks, I wonder if some
place down the line, if somebody has it, so the committee would have the benefit of that information?

Mr. Bergmann. I think that is something we could work up for you Senator. I am not prepared with it today.

Senator Schoeppel. I understand that.

Senator Potter. Could you do that, and supply it to the committee?

Mr. Bergmann. Surely.

Mr. Benedict P. Cotton (counsel for UHF Industry Coordinating Committee). Mr. Chairman, this is Melvin Goldberg, who is the industries economic consultant.

I hope you will forgive the interruption, but it may save some time. Senator Potter. All right.

Mr. Melvin A. Goldberg (economic consultant, UHF Industry Coordinating Committee). At the time the original allocation plan was set up, I was working for the Du Mont network, and at that time we did submit to the FCC an analysis of station rates, breaking out those to single station markets, and multiple stations, and there tended to be a higher rate.

It is in direct proportion to the set circulation, but it tended to be a higher rate than for the multiple, and if you wish I can get that data and bring it up.

Senator Potter. Would you do that?

Mr. Goldberg. Yes, sir.

Senator Potter. Thank you.

You may continue, Mr. Bergmann.

Mr. Bergmann. In 1953 the total national advertising expenditures increased to $4.5 billion and national television represented 11.7 percent of the total, or approximately $530 million.

On the basis of a weighted and conservative projection, it is anticipated that at the end of the next 5 years national advertising expenditures will have increased to slightly more than $6 billion per year.

The national advertising expenditure projections indicate that advertisers could continue to increase their television budgets and demand for time from 11.7 percent of the national dollar in 1953 to 20.7 percent in 1958, resulting in billings of $1.25 billion in 1958, for national television.

Now this could be done only if they are to handle such a volume.

Incidentally, these figures do not include local support, which a station garners from its own community, and usually represents 20 to 25 percent of its total.

Senator Potter. This is just national advertising handled through the networks, I assume.

Mr. Bergmann. No; it is national advertising handled through the network on a national spot basis. The placement by a national advertiser of programs or station-break announcements in local areas throughout the country.

Senator Potter. How is that national advertising broken down between the four major networks, A, B and C and D.

Mr. Bergmann. We are going to come to that, if I may, Mr. Chairman.

Senator Potter. All right.

Mr. Bergmann. It might be interesting to note at this point that national radio billings at their peak were $406 million or approxi-
mately one third of our projection for television 5 years hence. Based on the ratio between advertising dollars and gross national product for the entire country, television's $530 million in 1953 represented a movement of almost $25 billion worth of gross national products and services.

In 1958 it is anticipated, if allowed to achieve its full potential, television will be responsible for the movement of almost $60 billion worth of national products and services.

Senator Hunt. Mr. Chairman, may I ask a question?

Senator Potter. Surely, Senator Hunt.

Senator Hunt. How much has the radio advertising dropped in the last 5 years? Percentagewise, how much?

Mr. Bergmann. I believe we have those figures.

Senator Hunt. If you don't have them available, I would appreciate having them later. I would just like to know the exact impact of television on radio broadcast advertising.

Mr. Bergmann. All right. Sir. We have them.

Senator Potter. Do you know whether radio advertising has increased or decreased?

Mr. Bergmann. My impression of the figures is that it has maintained somewhere between $300 million and $400 million. That is national spot and network radio. It hit its peak, I believe, in 1946, of this $406 million.

Senator Potter. That is sort of leveling off now?

Mr. Bergmann. That's right.

Senator Pastore. And while you are doing that, could you give us statistics on how many radio stations own television stations?

I mean, it interlocks pretty well; doesn't it?

Mr. Bergmann. It certainly does.

Senator Pastore. Whatever fluctuations you had on radio, they picked it up on television. It is still about the same ownership, isn't it?

Mr. Bergmann. There is still a lot of the same ownership. We had examined one network, and found out of the top 100 markets, as we will say here a little later, I believe the figure was—this network was able to clear 80, but 53 of those 80 were radio affiliates of that same network.

Senator Pastore. Over 50 percent.

Mr. Bergmann. Yes, sir.

Thus, not only do we have an economy which will be able to support national television at almost 2.5 times its present size but one which will be dependent upon it for the sale of goods representing 12 percent of its total volume.

In order to achieve this promising future and assimilate billings such as those I have described, television must be able to present circulation and availability to advertisers. Both of these are dependent upon a sufficiency of outlets in the major market areas of the country.

It is our firm conviction that one way in which this existence can be assured is through the promulgation of four healthy television networks.

Senator Potter. Why do you say 4, because there are 4 now? Could it be 5 or 6?

Mr. Bergmann. It could possibly be more, Mr. Chairman.
Senator Potter. You say——

Mr. BERGMANN. Four has been a traditional number, as carried over from radio. If these billings build sufficiently, there could even be 5, if there were enough outlets to handle 5.

In accordance with the sixth report and order adopted April 11, 1952, this sufficiency was theoretically provided for by the allocation of UHF channels operating in competition with VHF frequency channels in many of the same market areas. Any station in order to be competitive, regardless of its frequency, must have access to equally attractive program sources.

This becomes an even more acute problem in the operation of a UHF station telecasting in competition with a VHF station where that VHF station has built up an audience prior to the entrance of the UHF station due to the fact that the programing on the UHF station must create an incentive on the part of the local viewers through its attractiveness to spend additional money to convert their receivers and establish viewership.

The greatest source of top-rated, attractive programing has traditionally been the networks. However, the ability of a network to program strongly is directly related to the network's ability to achieve circulation and, consequently, advertiser support.

It stands to reason that an advertiser cannot afford to purchase a $20,000 weekly program and place it on a mere handful of stations. Program expenditures must be tailored to fit station clearances and be commensurate with the circulation achieved.

This factor holds true for both network and advertiser alike. Neither can afford to maintain programs whose costs are disproportionate to their circulation. This applies to public service program expenditures by the networks as well.

I might explain that the network's source of income results from the moneys from advertisers which it is able to retain after paying its stations, its interconnection costs, and its operating overhead.

If a network is unable to clear stations, this income must necessarily be curtailed. However, the network must still maintain its operation overhead and its interconnection costs which then become disproportionate to its income.

An example is the purchase of interconnection facilities between cities. American Telephone & Telegraph supplies these facilities under Government-approved tariffs which take no cognizance of the station scarcity along the cable routes.

One example is the purchase by the Du Mont network of cable between New York and Chicago. Along this route there are 41 cities which have television outlets. The network is required to purchase 8 hours a day, 30 days a month, in order to maintain a favorable rate from A. T. & T.

The 41 cities when multiplied by the 240 cable hours per month produce a potential usage of this facility of 9,840 hours of station time monthly. However, because of the preponderance of single- and dual-station cities within these 41 cities between New York and Chicago, the Du Mont Television Network can only clear 736 hours monthly, or between 7 and 8 percent of its potential. The cost of the cable, however, remains the same.

In the United States today, we are operating on 2 cylinders of a 4-cylinder engine—at half capacity. The result is that television is only
half able to serve the public interest and contribute to the national economy. In other words, we are living in a 2-network economy when we should be enjoying a 4-network economy.

May I illustrate:

It is axiomatic that a network in order to achieve a real state of health and to interest advertisers, thereby enhancing its ability to program attractively, must be in a position to offer clearance to national advertisers in the top 100 market places of the country.

For the purpose of these illustrations, we have taken the top 100 markets and we will examine them in the light of physical television facilities.

I direct your attention to the chart, and that is reproduced as exhibit D in your book.

Prior to the lifting of the freeze in July of 1952, all networks were operating on hope. We see here if we take the theoretical position that one network was able to achieve the maximum clearance in any single time period which you might select, we find that fortunate network only able to clear time in 58 of the top 100 markets.

In the same time period, due to the fact that 35 of the 58 were markets which contained only 1 station, a second network was able to clear 23 markets. However, 11 of those 23 contained only 2 stations; thus, network 3 could clear only 12 markets, while network 4 had to content itself with only 4 markets due to the fact that network 3's 12 markets contained 8 areas in which there are only 3 stations.

Now, this does not bear a direct relationship to the actual clearances. We are just demonstrating the physical facilities, physical outlets that were available with four networks operating simultaneously.

Senator POTTER. What you are saying there is that network No. 4 at that time could only—had a chance to market when there were 4 stations; is that correct?

Mr. BERGMANN. That is correct.

Senator POTTER. And 3 when there were 3 stations, is that right?

Mr. BERGMANN. That is correct.

At this point the freeze was lifted, and for the first time in 3½ years new stations began to come into existence and we see the picture changing in this form. It is now possible, in any given time period, for network 1 to clear 96 out of the top 100 United States markets.

However, we still have with us the single-station market problem, as you will note. Network 2 can only simultaneously clear time in 65 markets because of the continued existence of 31 single-station markets. Network 3 has a potential of only 24 markets due to the fact that we still have 41 markets in which there are only 2 stations, and, finally, network 4 can clear time in only 8 markets which contain 4 or more stations, but we have added a dimension—UHF.

The clearance of 96 markets is made possible only through the utilization of 23 UHF stations. In order to clear 65 markets our second network finds itself employing 29 UHF stations. To clear 24 markets, our third network must utilize 8 UHF stations, and, finally, our fourth network must employ 3 UHF stations to achieve its 8-market time clearance.

Now, it is interesting to note, and I might say somewhat symptomatic, that the preponderance of UHF employment is in the 1- and 2-station markets, while the 3- and 4-station markets contain a total of only 11 UHF stations. The reason for this situation is obvious.
UHF has a chance for existence only where any one of these following factors occur:

1. The station has no competition;
2. The station's competition is only UHF; or
3. The station's competition is only one other station, regardless of whether it is VHF or UHF. Under the sixth report and order, the Federal Communications Commission has provided for this total operation if all of the allocations were utilized in the top 100 markets.

We now see network 1 capable of clearing time in a total of 100 out of the 100 markets.

In the same time period, network 2 could conceivably clear 100 out of the 100 also, since we no longer have any single-station markets in the top 100.

Network 3 is capable of clearing time at the same time in 79 of 100; and network 4, 53 out of the top 100—but let's look at UHF.

Network 1 must employ only 12 UHF stations now. Network 2, 33 UHF stations, or approximately one-third. Network 3 must use 49 UHF stations out of a total of 79, and network 4, 46 stations out of a total of 53 markets reached.

However, as previously demonstrated it is extremely doubtful under present circumstances whether these UHF stations will ever come into existence to service networks 3 or 4 due to local competition.

Now, up to this time we have been talking in pure theoretical terms based on total allocation and one network gathering unto itself all of the prime clearances with the second, third, and fourth networks ranging down the scale, each one utilizing the leavings of those ranking ahead.

Let's examine the picture as it exists today in actual practice.

Based on a study conducted at our request by one of the leading broadcast research organizations, we arrived at conclusions regarding actual networks based on clearance enjoyed by each of the four operating networks. These results are embodied in this chart. Our conclusions as to whether or not an assignment of a station in the top 100 markets to an individual network was arrived at by weighing the amount of clearance that network achieved during the hours of 6 p. m. to midnight, 7 nights per week, during a typical week.

Each network's clearance was weighed in proportion to its total offerings, and nighttime was chosen because all four networks do operate simultaneously during these hours. Thus, we arrive at the following:

NBC is currently clearing 82 of these top 100, of which 20 are UHF stations. However, an examination of these 20 UHF stations reveals that 15 of them are in single or dual-station markets where we already noted UHF can compete.

CBS is clearing time regularly in 76 of the 100 markets utilizing 20 UHF stations, 14 of which are contained in single- or dual-station markets.

ABC is clearing 51 of the 100 markets but must utilize 31 UHF outlets in order to achieve this clearance.

Seventeen are in single- and dual-station markets, and 14 are in 3 or more station markets and, finally, Du Mont's regular clearance consists of 39 markets with a total of 16 VHF's and 23 UHF's, 12 of which are in single- and dual-station markets.

As a rule of thumb, we might naturally assume since the CBS and NBC program schedules outweigh in values the ABC and Du Mont
schedules, with very few exceptions, in the single- and dual-station markets, ABC and Du Mont must content themselves with delayed and fringe-time clearances, while NBC and CBS enjoy live clearance in preferred time.

Now, the point which is obvious from this illustration is that in order to exist, the two networks whose clearance is limited must be dependent upon the success of UHF in multistation markets.

The manifestation of the clearance problem is clearly illustrated in a study of the networks' billings over the past 5 years.

These network billings bear a direct relationship to the total amount of time clearance enjoyed by each network.

NBC in 1949 billed $6.5 million and, as a result of its ability to clear stations, has increased its billing to 96.6 million in 1953.

CBS started in 1949 with $3.4 million yearly and increased to $97.5 million in 1953.

ABC, with $1.4 million in 1949, with much less clearance than the previous two networks, has been able to increase its billing only to $21.1 million.

Du Mont, with $1 million in 1949, finding itself in a situation more comparative to ABC than to NBC and CBS, came up with $12.4 million in 1953.

Both ABC and Du Mont, as a result of the billings on this chart have been forced to maintain continual investments in their networks in order to stay alive. Speaking for Du Mont, this investment has been considerable and up to this point there is little chance of its recovery. However, I am certain, if these prospects are changed, both Du Mont and ABC can ultimately show a profit in their network operation.

From these charts we may then arrive at some very definite conclusions:

1. Two networks enjoy 85 percent of the total network advertising revenue. As a result of lack of clearance opportunities, the other 2 networks must be content to divide between them the remaining 15 percent.

2. The 2 networks which are on the short end of the billing are dependent upon UHF outlets for more than 50 percent of their clearance.

3. As a result of lessened advertiser support the two low networks do not have an opportunity to build programing capable of creating circulation through receiver conversion in the intermixed markets. We have seen numerous UHF stations close their doors in markets where competition from two VHF stations carrying the CBS and NBC program schedules, leaving only the ABC and Du Mont schedules to the UHF.

If the situation is allowed to continue as currently, there is no doubt in my mind that the existence of four competitive networks is not possible. If as a result of this situation, two networks are all that survive, the country is then faced with a situation which will manifest itself in the following ways:

1. The viewing public will have available to it just 2 sources of network programing rather than 4.

2. Television stations in all except the top few metropolitan areas will be limited to two in number which must result in an almost complete elimination of public-service programing and local advertising,
for stations are dependent upon the existence of networks in all but the largest population centers.

3. The existence of only two networks will create unfair competition in almost every national consumer product industry in our country. If manufacturer A can achieve time on 1 of the 2 existing networks and his competitor, manufacturer B, is frozen out, manufacturer B must attempt through the purchase of other less potent advertising media to offset the competitive advantage afforded manufacturer A as a result of television's tremendous selling impact. We have already seen manifestations of this monopoly situation at CBS and NBC as described in the advertising-trade press. If I may quote a trade-press item published Wednesday, April 28:

The situation is such at NBC-TV and CBS-TV today that major clients with shows already to go are practically begging for time that is unavailable.

The article goes on to mention four of America's largest advertisers who are unable to spend their money on network television. One of these advertisers was quoted in Advertising Age of April 19, 1954, as saying:

We were just kicked out and there is nothing we can do about it.

When asked about moving to ABC or Du Mont, this advertiser stated that they "have plenty of time and programs, but they don't have the stations."

We have many such instances, and they are becoming more frequent every day.

4. If the viewers in this country are ultimately reduced to dependency upon a two network system in as powerful a means of communication and dissemination of public information as television has proved to be, not only will they be denied their rightful opportunity to be served by this medium but a duopoly will exist which must place in the hands of a few individuals control of opinion and thought dangerous to the entire country.

A fine example of this point has been afforded us right at this moment in the Senate hearings which are being conducted by your eminent colleagues into the Army-McCarthy controversy. The two lesser networks are the only means by which millions of Americans saw their Government in action as it was transpiring in a most crucial moment in our history; and this was being afforded only to the few who live in States where station facilities exist in numbers necessary to the existence of four networks.

The public interest and the national economy can only be served by the institution of a truly competitive network system of telecasting.

Thank you for your attention. May I now turn the testimony back to Dr. Du Mont?

Senator Potter. Before you leave, Mr. Bergmann, do you have any views on the bill introduced by Senator Bricker?

Mr. BERGMANN. I have read the bill, Mr. Chairman, and it is my feeling that possibly this is one way of getting at the problem.

Dr. Du Mont, in his testimony which follows mine, indicates what those ways are, and I think you will be able to see how they fit into Senator Bricker's bill.

Senator Potter. Thank you.
Senator Pastore. Let me ask you a question, Mr. Bergmann: Does the pending bill remedy this problem that you have presented?

Mr. Bergmann. You are referring to the Bricker legislation?

Senator Pastore. No.

Mr. Bergmann. Senator Bricker——

Senator Pastore. No; I am referring to S. 3095.

Senator Potter. The Johnson bill.

Mr. Bergmann. It could possibly, but I am afraid not in its present form, Senator.

Senator Potter. Well, what would you do to it?

Mr. Bergmann. Well, as I told the chairman, Senator, we have a proposal which allows two types of systems to be instituted, one of which is an incentive system on the part of the networks to improve this situation on their own, without regulations, if this bill can be amended in such a way as to permit that type of incentive system for the networks in the acquisition of multiple, or more stations, actually.

I think that will be a little bit clearer, as you see in these plans, as they are developed, and will follow the tenets of the bill a little more closely.

Senator Potter. Dr. Du Mont will give us the recommendations that you have in this problem.

Dr. Du Mont. That is right, sir.

Senator Potter. Any other questions?

All right, Dr. Du Mont.

Mr. Bergmann. Thank you, Mr. Chairman.

Dr. Du Mont. Mr. Bergmann has given a vivid description of the network picture. UHF broadcasters, generally, are also in economic distress and their situation is getting worse. Hence, speed in finding a solution in this is imperative.

Their lack of audience is the result of the lack of programing of sufficient quantity of audience appeal to attract viewers who will spend the necessary amount of money to equip themselves to receive their signals.

Topflight competitive network programing is the key to relief of the situation. Four strong networks are essential to place VHF and UHF broadcasters on an equal, competitive footing. That is not possible under the present plan of channel allocations and conditions which stem therefrom.

Briefly, the situation is this:

1. We have two strongly entrenched national television networks and two relatively weak networks.

2. We have a group of strongly entrenched, high-power VHF television stations and a group of relatively new low-power UHF stations.

3. Economic self-interest has promoted the affiliation of the VHF stations with the two stronger networks.

4. The weak UHF stations must affiliate with the two weaker networks or forego network programing.

5. The two weaker networks are not in a position to strengthen their programing to competitive stature because of the inability to reach established audiences in the key markets of the country.

6. The present situation breeds itself so that the strong are becoming stronger, and the weak are becoming weaker.

7. Establishment of UHF broadcasting on an economically competitive basis requires strengthening of the two weaker networks.
It is apparent that television broadcasting has reached the point where, without some Government intervention, it will shortly become the property of two networks and a relatively few powerful VHF stations, and there will be, in effect, a television broadcasting monopoly. It is also apparent that under such conditions, there will be a strong trend running toward monopoly in distribution of the products of industry.

In our original allocation proposal, equal competition was provided for by a proper allocation of frequencies. We do not think it practical at this late date to go back and correct this to any great extent.

We would much prefer to see a fully competitive national television system developed without Government intervention, but at this stage that doesn't seem possible.

We do not know that we have the absolute answer to the problem, but we have three suggestions which seem to hold greater possibilities than any others we have heard about.

It can be demonstrated that under present conditions, the market which is one-hundredth in national rank can just support four television stations. A healthy network requires access to the top 100 markets. In the development of our suggested plans, it has been assumed that each of the 100 top markets will ultimately have 4 television stations. This will require no drastic changes in the existing allocation plan. In many cases where fewer than four channels have been allocated, the common practice of building a station assigned to an outlying town as close as possible to the major city will solve the problem. In a few cases, it may be desirable to move a channel for which no application has been made from a neighboring town to the major city.

It has been assumed further that the two stronger networks will have first choice of the stations, and that the VHF stations will have first choice of the networks within a given market. Both of these choices must, of course, be made within the rules of the plan under consideration.

The principal aims of the three plans to be discussed are threefold:

1. To increase the stronger networks' programing time on the UHF stations, and;
2. To increase the weaker networks' programing time on the VHF stations, and;
3. Finally, to place VHF and UHF on an equal, competitive footing.

Attainment of these aims will result in conversions and purchases of receivers which will find all viewers equipped to receive all signals.

We have called our first suggestion plan A. It requires that each of the networks make primary affiliates of certain UHF stations. For accomplishment of the results sought, a list of the top 100 markets by rank should be established, and the 4 networks would be required to take turns in affiliating UHF stations exclusively wherever less than 4 VHF stations exist in any 1 market.

The chart shown here, which is also shown in our bound testimony as Exhibit J, illustrates the result of plan A under the condition of full occupancy. Each of the vertical bars represents a network. The top section of each bar represents the top 25 markets. The central section represents the second 25 markets. The bottom section represents the remaining 50 markets. The red indicates VHF affiliations and the blue denotes UHF affiliations.
The chart shows that all 4 networks will have primary affiliates in all of the top 100 markets. It also shows that there will be many primary UHF affiliates in the top markets, of which approximately half, or 95, will be affiliated with the 2 strong networks. Thus, immediate relief will be provided for these UHF stations and, by increasing widespread conversion, will promote the welfare of all UHF stations.

The formula is simple, but may require legislation to bring about such Government regulation of networks.

Our suggested plan B provides a formula which calls for a degree of regulation as applied to stations. In essence, the formula would be in one example:

Each station must relinquish on demand of a network 25 percent of its networking class A time, 25 percent of its networking class B time, and 25 percent of its networking class C time to the network which makes the demand. No station shall make any type of rate discrimination between networks.

In practice, the formula would work out like this:

1. In a market of 3 VHF and 1 UHF stations, the 3 VHF stations automatically will be primary affiliates of 3 of the networks. On demand of the fourth network, each of the stations would be required to carry the fourth network's program for up to 25 percent of the networking time.

   Obviously, the 3 networks which have had 25 percent of their time preempted on the VHF stations will place their programs on the UHF station. The result then would be that a UHF station would have 25 percent of its networking programs from each of the 4 networks.

2. In a market having 2 UHF and 2 VHF stations, each of the 4 stations would carry network programs from the stronger networks for half of their networking time and programs from the weaker networks for the other half of their time.

3. In a market with 1 VHF and 3 UHF stations, the VHF station would be found to be devoting 25 percent of its networking time to each of the 4 networks, and each of the UHF stations would devote 75 percent of its time to 1 of the networks and 25 percent of its time to the fourth network.

4. In markets where only VHF or only UHF stations exist, each of 4 stations will automatically become primary affiliates of 1 of the networks.

The chart shown here, which is also shown in our bound testimony as exhibit K, discloses a fairly even distribution of both UHF and VHF among four networks. Two networks, A and B, have a slight VHF advantage in the first 25 markets, but in the other 75 they are just about even.

The result of the operation of this suggestion would be more and better programs to UHF stations and more and better outlets for the weaker networks. The formula is relatively simple and is believed to require only the statement of regulation and formula to be included in licenses issued by the Federal Communications Commission to every television station.

Plan C is unique in that no Government regulation is required. It is an incentive plan.

Under the present multiple-ownership rule, several interests have acquired their limit of five owned and operated stations. The four networks either have their limit or are in the process of obtaining them.
Such profits as have materialized to date in television broadcasting have stemmed from the operation of stations to a large degree rather than from network operation.

The expense involved in producing and distributing television programs makes network operation either a losing proposition, or if any profit is realized it falls far short of being commensurate with the investment necessary to the operation. Networks in general are dependent on their wholly owned stations to assure profit or to reduce their losses.

Accordingly, an owner of five stations which does not operate a network enjoys an extremely profitable operation, whereas the networks which provide the programs have extreme difficulty in making a profit. Therefore, plan C makes a differential between a network and the operator of multiple stations.

The plan provides for an amendment of the multiple-ownership rule which might be stated as follows:

A qualifying network will be permitted to have an additional wholly owned television station for each group of seven primary UHF affiliations maintained, provided that:

1. One of each group of 7 UHF affiliations thus maintained shall be in one of the top 25 markets by national rank;
2. Two additional of each group of 7 UHF affiliations thus maintained shall be in the group of the top 50 markets by national rank;
3. Four additional of each group of 7 UHF affiliations thus maintained shall be on the top 100 markets by national rank; and
4. No network shall be permitted to own more than 11 stations under the provisions of this or any other rule.

For the application of this rule, it would become necessary to define a "network" and establish the rules for qualification as well as to establish administrative procedures for regulating the maintenance of affiliations.

Under plan C, all networks would profit through the acquisition of valuable properties while UHF stations would profit through the maintenance of primary affiliations with networks. The weaker networks would profit through the availability of affiliations with stations having established audiences, and the UHF conversion of the Nation's receivers would be accelerated.

The chart on the easel, which is also shown in our bound testimony as exhibit L, illustrates the probable eventual lineup on the plan. It should be pointed out that in connection the ultimate distribution is not so universal as in plans A and B. On the other hand, it would successfully promote major network affiliations for many UHF stations and provide access to enough VHF stations to give the weaker networks exposure they must have in major markets if they are to survive.

One of the advantages of the plan appears to be in the speed with which results could be accomplished. It is believed that competition would force all of the networks to acquire their maximum number of stations as rapidly as possible. This would result in very quick establishment of primary affiliations for 168 UHF stations.

It is noteworthy that these results can be accomplished under plan C with no governmental regulation either of the networks or of the television stations.

In submitting these suggestions, we know there will be some who will object to any one or to all of them. Obviously, some will be deprived of preferred positions which they now enjoy. But in con-
clusion I would like to point out the situation must be leveled out by Government action or we shall wind up with a noncompetitive television system falling far short of the public's needs and well along the road toward monopolies in the distribution of consumer goods.

In conclusion, I want to say that we are most appreciative of this opportunity to present our views to you and of your interest in the problem. We hope your deliberations will be productive of the much-needed results.

Thank you.

Senator Potter. Doctor, is it your contention that the two smaller networks' future rests in the future of UHF?

Dr. Du Mont. Absolutely; yes, sir.

Senator Potter. If I understand your suggestion, the first suggestion was that the top 100 markets would be—the allocation would be rotated?

Dr. Du Mont. That is right. For instance, if you start with No. 1, New York City, and then you go down the line, I believe the first city that you hit that only has three VHF stations—that's Philadelphia—one network would take that. Then you would go down the line, the next station would be, say, Boston. That would be another network, and you would rotate so it would be equal to all networks.

In other words, one would take—one network would take in one market circulation.

Senator Potter. What is the normal procedure in contracting for networks? How long are you contracted for?

Dr. Du Mont. Two years only.

Senator Potter. Only two?

Dr. Du Mont. You are not allowed to make contracts for over 2 years. There may be some amendments that would have to be made in the regulations that the FCC has at the present time, because certainly you wouldn't want a network to make a deal with a UHF station for 2 years, getting his additional V station, and then drop him. You would have to put the regulations in to be fair and protect the thing.

Senator Pastore. Would you give us an example, Doctor, as to how your plans would help, let's say, ABC and Du Mont?

Dr. Du Mont. Which plan do you mean? Any one of the plans?

Senator Pastore. Any one of the three.

Dr. Du Mont. Well, if you take the first plan, which is the one we were just discussing, it would give us the necessary outlets so that we could spend the same amount for programs as the top two networks. We can't spend the money now for the programs because we can't feed it to enough stations.

You've got to figure out your cost per program and the cost per station, and any one of these plans would allow us to run on, you might say, an even track with the top two networks.

Now, we originally tried to do it, and we, incidentally, spent $100,000, believe it or not, in investigating this allocation scheme—this 1949 and the later allocation schemes—because we would have liked to have seen it done without any Government regulation.

You had 4 tracks, and 4 people could run on those tracks, but it was decided otherwise, to intermix UHF and VHF.

But any of these 3 plans insofar as the 2 networks are concerned, would even the thing up very, very much.
Dr. Goldsmith. Four networks.
Dr. Du Mont. Four networks, I mean.
Senator Potter. Isn't it true—
Dr. Du Mont. And give you a chance for these UHF stations to have some support, and be successful—
Senator Potter. It would give you the same circulation.
Dr. Du Mont. As the other people.
Senator Potter. As the other ones.
Dr. Du Mont. That is right.
Senator Potter. And thereby you could get national advertisers.
Dr. Du Mont. That's right.
Senator Pastore. It would naturally entail NBC and CBS giving up something; wouldn't it?
Dr. Du Mont. It would entail NBC and CBS together.
Senator Pastore. Would they have to give up any VHF stations?
Dr. Du Mont. They would not have to give any owned and operated stations up; no. Not in the third plan.
They would simply, as it is now, the top two networks, as you saw from those charts of most of the V's, and very few U's, the other networks have a lot of U's and very few V's. It would equalize that.
In other words, to put it very bluntly, it would mean that effectively each network would feed the same number of VHF stations and the same number of UHF stations.
In other words, you are doing by regulation what could have been done by allocation.
Senator Schoepfel. What you are saying, though, now, is: You limit the entire country to four networks.
Dr. Du Mont. It could be worked out for more than four. We have used this an as example. We don't say you can only have four networks.
Senator Schoepfel. That is the thing I am glad to have you get in the record.
Dr. Du Mont. Yes.
Senator Schoepfel. Now, next: Would that not involve some agency determining rates, where you say there should be no discrimination in rates?
Dr. Du Mont. It would, in some of the plans it would, and in some of the plans it would not.
In other words, plan C—
Senator Schoepfel. Yes; that's right.
Dr. Du Mont. Which is the incentive plan, would not necessarily require that.
Senator Schoepfel. But A would.
Dr. Du Mont. I think A would, and B might. I think there is a good chance A and B conceivably might have to have some regulation of, what do you call it? Rates and rules; whatever you call it.
Senator Schoepfel. Well, some place down the line it would seem to me that in the interest of the overall public effect that obviously this thing is going to have to come to some kind of determination of a rate structure.
Dr. Du Mont. Well—
Senator Schoepfel. If you make some of these shifts.
Dr. Du Mont. I think it may lead to that, invariably. You have other Commissions, like your ICC, and the railroads. When a rail-
road runs between two towns and gets a franchise, they have to take both passengers and freight.

Senator Schoppeppel. That's right.

Dr. Du Mont. Many of them would like to eliminate passengers. Well, this says if you run a network, you have to have UHF and VHF. Now, at the present time the 1 wouldn't like to have UHF. Once UHF is built up in a couple of years you wouldn't need that regulation, the thing would go along because you would have your UHF stations established.

Senator Potter. Is there any definition, by law, of "network"?

Dr. Du Mont. I don't believe so.

Mr. Cottone. Yes, sir.

Senator Potter. What is your definition?

Mr. Cottone. There is one.

Senator Potter. What is your definition?

Dr. Du Mont. I don't know that I can give a good one, offhand, but fundamentally it is an organization that feeds programs to a number of stations. That is the way we look at it; provides service, sustaining programs, commercial programs and public-service programs to a reasonable number of stations.

Senator Pastore. The thing that I am trying to settle in my own mind, thinking about your plans, and I don't profess to understand them too well—I am asking the question that hasn't been answered yet:

Do NBC and CBS have to give up any contracts that they now have with VHF stations in order to put your plan through?

You have been talking about advantages. Now, I want to get on the side of disadvantages. I want to see where the opposition is going to come from.

Dr. Du Mont. I think that is undoubtedly true, NBC and CBS would have to give up some of their contracts with VHF stations and place them with UHF stations.

Senator Pastore. In other words, they would have to come down in order to allow you to go up.

Dr. Du Mont. That's right.

Senator Pastore. In other words, in order to create this equalization that we are talking about.

Dr. Du Mont. Yes; I think that is true. But ultimately, as I explained, when you build U's up, then it would be just an interim situation, when the U's are built up.

Senator Potter. Then it would be enough for all networks.

Dr. Du Mont. That's right; then you would not have the problem.

Senator Schoppeppel. But, looking at it from a strictly equitable viewpoint, wouldn't we or some agency that might attempt it, either by legislation or executive direction, have to provide some safeguard for the protection of valid, arms'-length contracts?

Dr. Du Mont. Oh, I think so; yes.

Senator Schoppeppel. Yes. And there would have to be a time element in there.

Dr. Du Mont. That is right; you couldn't put it in effect immediately, as it is now you can't make a contract for longer than 2 years, so they are all automatically running out every day, you see. So they are not all set forth for a specific time. When a station goes on the air you usually make a contract, so they are all running out at various times.
Senator Pastore. Would we be abridging any contracts in the carrying out of these plans?

Dr. Du Mont. It would all depend on how the law would be set up. If you waited until the contract ran out before you provided them with the U, you wouldn't be abridging any contracts. If you make them break contracts immediately, you would, although most of the contracts—I am not too familiar with the contracts—but they do provide the cancellation of some of them at a very short period. Is that correct?

Mr. Bergmann. I wouldn't say the majority of them do, Doctor.

Dr. Du Mont. Some of them.

Mr. Bergmann. Some of them do.

Dr. Du Mont. Yes.

Senator Schoeppel. I would like to ask one other question here. I'm like Senator Pastore here. I don't know very much about this, but we are playing with some legislation in here that is going to affect a lot of folks.

Dr. Du Mont. Sure.

Senator Schoeppel. Have you in your research department given any thought to the legislative approach to this with reference to the bills now before us?

Dr. Du Mont. We have given some thought to it.

The bill of Senator Bricker, which allows the Federal Communications Commission to take into consideration a network jurisdiction, which they had not before, I think would implement these plans. It would allow the Commission to set regulations that could set these plans into effect.

Senator Potter. They would have to do that. You would have to pass a bill such as Senator Bricker's.

Dr. Du Mont. That's right.

Senator Potter. If a plan such as your plan is involved.

Dr. Du Mont. Conceivably my plan C would not require it, but I am certain that plans A and B would. The bill of Senator Johnson's, which provides, if you give up a V, you can have two U's, and so forth, like that, my feeling is it doesn't help any, because certainly a person that has a V doesn't want to give it up for two things that are maybe worth 10 cents. I mean that's simply the emphasis in the wrong direction on that.

There would be no incentive for a network to give up the V's, and go to U stations with the present situation.

Senator Pastore. May I ask you another question:

If we adopted any one of the three plans that you suggest this would be a terrific boon to the stockholders of ABC and Du Mont; wouldn't it?

Dr. Du Mont. Well, it could conceivably be; yes, sir.

Senator Pastore. Terrific; wouldn't it?

Dr. Du Mont. Well——

Senator Pastore. You could almost envision that stock going up 300 percent.

Dr. Du Mont. Well——

Senator Schoeppel. We shouldn't start that.

Dr. Du Mont. I am not an expert on that. I couldn't say.

Senator Pastore. I mean it would be envisioning a terrific profit; wouldn't it?
Dr. Du Mont. No; I would not say that it would. As I pointed out here, I think the impression is that networks are very profitable operations. They are not. We lose money on our network, and a lot of money on the network, and I believe that is true of some of the others. You can get those figures, of course, which we can't get—the other fellow's figures, from the Federal Communications Commission. So you can determine that.

Here the networks are pretty much responsible for television in this country, because they have put the programs out that have been interesting enough for people to buy service, and yet the networks make relatively a small percentage of profit as compared with what the stations make.

Senator Potter. Does IBC make money from the station, rather than the network?

Dr. Du Mont. Without seeing the figures, I would say that is true, and their profits come from the operation of the stations and not the network. And you can take some people like Westinghouse and Storer, and so forth, that have five stations, and contributing nothing to the programing, and they do very, very fine, the people that just own stations; the network business is not a paying proposition, and never has been.

So, when you say a “terrific rise,” that way I think it would have some effect, but after all, the operation of the network of any of the companies you mention is relatively a small percentage of the total operation of the company.

As far as we are concerned, we have 6 divisions; 1 is the network division, and that is not the largest division we have, and that applies to the other people, too. So it would have some effect.

Senator Pastore. Is there any plan that you can think of that would cure this problem without taking anything away from any of the stations who do not now have contracts?

I'm getting into the practical aspect of this, now. I mean you can imagine—

Dr. Du Mont. Well—

Senator Pastore. As you sit there, the resistance—

Dr. Du Mont. Let me say this:

Plan B, which provides for only taking a percentage of the time away from any station, would be the least affected, as far as taking away any contracts. In other words, as it is now, a network feeds a station its program and under that plan they would feed it only 75 percent, but it would get a feed from another network, and I would say plan B would have the least effect on stations than networks.

There would be relatively little hurting of anybody.

Senator Pastore. In other words—

Senator SchoeppeL Would it be true now, in answer to the question posed here by Senator Pastore, that there would be considerable, if not heavy, investments put in on the part of the two minor networks to accomplish this?

Dr. Du Mont. That's correct.

Senator SchoeppeL So it obviously wouldn't be construed to be anything like a windfall?

Dr. Du Mont. That's right.

Senator SchoeppeL You would have to have a responsibility at-

tendant some place—
Dr. Du Mont. Correct.
Senator Schoeppel. To be able to do this; would you not?
Dr. Du Mont. That is right.
I think plan C, as I see it, would not take anything away from anybody, to speak of. In other words, plan C provides that the networks can have an additional station if they feed so many U's, so in effect what you are doing is helping somebody and not hurting anybody particularly.

In other words, it is an addition. If a network can have a VHF station that they can make money on, they have to agree to feed seven UHF stations to order to help him. So there wouldn't be much damage to anybody there. You would simply be—if you want to call it that—subsidizing the network; it wouldn't be a Government subsidy, but you would be giving him some more money so he could afford to carry seven UHF stations.

Senator Pastore. Well, could the major networks service more UHF without giving up some VHF?
Dr. Du Mont. Probably not some in the major plants at the present time.
Senator Potter. You don't anticipate NBC or CBS will come in and support this program; do you?
Senator Pastore. Of course not.
Dr. Du Mont. I hadn't particularly thought so, but I can conceivably see where they would be much better off in the plan C than they are now.

In other words, with the additional UHF stations it may well be NBC and CBS would be making more money than they are making now.

Senator Potter. Without studying.
Dr. Du Mont. And, of course, the public would be getting the benefit of four services throughout the country.

Senator Pastore. In other words, it is your considered opinion you can't actually accomplish the public good in this case unless some sacrifices are made by the two large networks.
Dr. Du Mont. Except for plan C; I don't think there is any sacrifice for the two major networks in plan C. I really don't.

Senator Pastore. I don't want you to be redundant, but would you explain plan C to me again in simple terms?
Dr. Du Mont. In simple terms?
Senator Pastore. What does it do?
Dr. Du Mont. It is simply this: At the present time the networks can only own five stations. That's where they make their money. We can't make enough money on the stations to take care of our losses on the network, and that is true of some others, too.

If you allow a network to have 6 VHF stations instead of 5 stations, forgetting that sixth station the network has to agree to supply 7 UHF stations with primary affiliation, so it makes it possible for the UHF station to operate and be prosperous.

It makes it a chance for the network to make a little more money than they are making now.

Senator Potter. Isn't that true that program would put the networks just further into the operating business?
Dr. Du Mont. It would put the networks so that they had more stations than they have now, approximately double the number, but
if you let it go the way it is going, in effect you are going to have to have two networks that just control every station. Whether they control it directly or not, they are going to be taken over, or go out of business.

Senator Pastore. In other words, we have to create a new monopoly to break an old one.

Dr. Du Mont. Well, it is a lesser—

Senator Potter. Increase it from 2 to 4.

Dr. Du Mont. Let's say it is less of a monopoly than we have now.

Senator Potter. I was interested in your proposal No. 2. If I understood you correctly, you say if a community had, for example, 3 VHF stations and 1 U, the U would take 25 percent of the time?

Dr. Du Mont. You would get 25 percent feed from all 4 networks.

Senator Potter. In other words, say there was ABC and CBS and NBC—

Dr. Du Mont. Yes.

Senator Potter. Were affiliated with the V's.

Dr. Du Mont. Right.

Senator Potter. And Du Mont with the U's.

Dr. Du Mont. Right.

Senator Potter. I believe you would get 25 percent ABC time on your station, your U station.

Dr. Du Mont. U.

Senator Potter. You would get 25 percent CBS time and 25 percent NBC time.

Dr. Du Mont. And then we would feed 25 percent to the other 3.

Senator Potter. It would seem to me there might be a practical problem there. There is a difference in the—you have some valuable time, and you have less valuable time.

Dr. Du Mont. Well, we proposed in this to have it allocated with the three time periods. There's an A, B, and C time, that should be 25 percent of each time to make it fair to everybody.

Senator Potter. Do you have that type of breakdown now?

Dr. Du Mont. Yes; that is the way it is broken down now. This would take care of it. B is a little bit more complex to set up than A or C, but it does have some advantages. It is a very difficult situation.

Senator Potter. Yes.

Dr. Du Mont. We could say reallocate, and you would have solved the problem, but you have an investment of 12 or 13 billions of dollars in the hands of the public, any they would have to go out and spend $50 to $75 in order to get any pictures.

Senator Potter. Doctor, the basis for all of your proposals is that it would give the U's better programing, competitive programing.

Dr. Du Mont. That is correct.

Senator Potter. Do you think that is sufficient incentive to warrant the people to convert their sets, or to pay the additional cost for sets?

Dr. Du Mont. We believe so; yes. Definitely.

And we think it has been proven in—we can recite, and we could go over and submit additional information where good programs have existed, generally speaking the U's have been able to prosper.

There are just 1 or 2 instances in the United States that I know of where they have geographic—a geographic situation that makes it a little difficult, but it is sort of the exception that proves the rule.

Senator Potter. Any other questions?
Senator Hunt. Doctor, what's your conception of the duty and the function of a government in this terrifically important—in this important industry?

Dr. Du Mont. I think the function of the Government is to see that the people of the United States get the best service they can get, and if any of these plans do not improve the service to those people, I say you shouldn't even consider them, but we feel to allow the people throughout the United States to have a choice of 4 programs, rather than 2—4 different viewpoints—to a certain extent, to allow business to have access, not just a few businesses, to this medium, we think it is in the public interest, and we certainly don't recommend anything be done to help out a couple of networks or UHF stations if it is not for the benefit of the public.

Senator Hunt. Do you think the Congress has been lax or over-energetic in legislation with reference to television?

Dr. Du Mont. I don't know of much legislation to my knowledge that has been put through recently concerning television. I know very little that's gone through that has had much of a bearing on it. I think it's grown very rapidly and I don't think, generally speaking, Congress has been cognizant of the problem that is involved there.

I think this FCC decision was made, and I don't think Congress knew the effect of it, generally, and they allowed it to go along.

I think if they had been in close touch with that, they would have corrected that before it went out, and we would not have the situation we have today.

Senator Hunt. Do you think television is approaching the status of telephone, and other utilities?

Dr. Du Mont. Well, it's certainly a different class of service than telephones, and I wouldn't say it's exactly approaching the telephone business yet.

Senator Hunt. That is a part of your industry.

Dr. Du Mont. What is that?

Senator Hunt. The telephone is a part of your industry, and a very great part.

Dr. Du Mont. Well, you are talking of the electronics industry.

Senator Hunt. I am thinking about A. T. & T.

Dr. Du Mont. Well, they are sort of separate; apart from the rest of the industry. There you have decided to supply just one service to everybody, and obviously the Government has to regulate that.

Previously, in television, theoretically you have had a choice of a large number of services, but with the situation existing it's narrowing down to a few.

Senator Porter. A. T. & T. isn't operating in a competitive market.

Dr. Du Mont. No; they are not in a competitive market. We are in very much of a competitive market, and I certainly would rather see it done without Government regulation than with, if possible, and some of these plans do provide for that.

Senator Hunt. Without Government regulation, you feel there is some hope, some prospect, that the FCC will get around to doing it by regulation?

Dr. Du Mont. I would say this: I think if the Commission, if they had some guidance and general principles, might very well act and do something about it. We have had a situation in the industry where the FCC and the industry generally have not seen eye to eye.
If you go back to this mechanical color decision that the Commission put out, about 99 percent of the industry was against it. The Commission was for it. They put it out. It was a flop, and finally it was changed here recently, and the thing that changed that was a committee of Congress that investigated it, made recommendations to the FCC. In a very short time they put it out the way the industry thought it should be put out, for the benefit of the public, and now we have a chance to go ahead with television.

You had the situation in this allocation hearing. If you look back in the history of it, you will find, generally speaking, that the industry was in favor of not having the intermixture.

The other networks went along on it, and there were very few people that wanted to see it intermixed, but the Commission decided to go ahead on it.

In other words, I have been appearing before the Commission from 1927 up to date, and up until, oh, around 1948–49, they always gave a lot of consideration to industry opinion.

We had a situation with the FCC for 3 or 4 years, where they called all of us a bunch of burglars, and thieves, and wouldn't listen to us at all. Now that is the honest fact, down there. The situation has changed within the last year or two. But we had certain Commissioners in there that fortunately are not now there. We had a rough time, and they would not listen to the industry. They just felt their decisions should be arbitrarily opposite from what the industry requested. That is my personal view of it.

Senator Hunt. Does the FCC offer any hope of a solution at this time to your problems?

Dr. Du Mont. From the recommendations made yesterday, I would say no. They are all very minor. They are just pinpoints. They would not help the situation, in my estimation.

Senator Hunt. I take it from your comments you feel it is time for Congress to step in again.

Dr. Du Mont. I feel it is definitely time for Congress to step in again, to look into it, and assure itself of what the situation is, and make recommendations, and I'm certain the FCC would be very happy to take those—would act on them, and this thing would be cleaned up in a hurry.

Senator Schoeppe]. I would like to ask this question at this stage of the testimony.

There has been some reference in here to a freeze. Do you have some comment to make on that?

Dr. Du Mont. Well—personally, the freeze we had before was extremely damaging to the industry, and I don't think an awful lot would be accomplished by putting a freeze in.

I frankly don't. The idea is to put the freeze in so they can reallocate, and I think it is just out of the question for that to be considered. I can see a slight reallocation, but we talk about reallocating throughout the country—you are going to damage the public if you do that, and they are the people that really have the investment in this.

In other words, there are 30 million receivers in this country that cost the public between $10 billion and $12 billion. There are about 382 stations which, according to the figures, run less than a half a million each. So you are talking about an investment of $12 billion as
against an investment of say, $200 million, and certainly the public is to be considered.

Senator Schoeppel. That should be the first consideration.

Dr. Du Mont. Absolutely.

Senator Schoeppel. Because of the overall weighted cost.

Dr. Du Mont. That is right. It is on the public's side in this thing.

Senator Schoeppel. It is on the public's side.

Dr. Du Mont. That's right.

Senator Potter. Any further questions?

Senator Schoeppel. I have no further questions.

Senator Potter. Dr. Du Mont, I wish to thank you and your colleagues for a very graphic and excellent presentation, and the committee will stand in recess until 2:30.

(Whereupon, at 12:22 p.m., the committee recessed until 2:30 p.m., of the same day.)

AFTERNOON SESSION

(The subcommittee reconvened at 2:30 p.m., pursuant to recess, Senator Schoeppel presiding.)

Senator Schoeppel. The committee will come to order.

I understand that Mr. Paul L. Chamberlain, general manager of broadcast equipment, General Electric Co., is the next witness.

Let the record show your statement will become a matter of record before the committee and you proceed in any way you desire to deliver it, sir.

STATEMENT OF PAUL L. CHAMBERLAIN, GENERAL MANAGER OF BROADCASTING EQUIPMENT, GENERAL ELECTRIC CO.

Mr. Chamberlain. Thank you.

I would first like to mention that Dr. Baker, the general manager of our electronics division, has asked me to express to the committee his sincere regrets that long-standing prior engagements made it impossible for him to be here today, and he has asked me and two of my associates to appear on his behalf.

Senator Schoeppel. That is quite all right.

Mr. Chamberlain. I appear here today as a representative of a television equipment manufacturer. My testimony will be limited to a discussion of UHF broadcast equipment, and the technical problems which have a bearing upon UHF broadcasting. I will be followed by two of my associates who will discuss the technical aspects of UHF receivers and UHF tubes.

For the information of the committee members, the General Electric Co., one of the pioneers in the television field, manufactures television broadcast transmitting and studio equipment, television receivers, picture tubes, and receiving tubes. The company conducts an extensive research program in the entire area of communications, including television, through the facilities of the famed General Electric Research Laboratory in Schenectady, N. Y., and the Electronics Laboratory in Syracuse, N. Y.

Through the work of the scientists in these laboratories, and our extensive engineering organizations, General Electric has made many important basic contributions to the television art in a number of
areas, not the least of which is the ultra-high-frequency area. Some of these contributions will be brought out in the course of my testimony.

It is my hope that I can place before the committee today, in as brief a form as possible, an evaluation of the broadcast-equipment problems in the UHF field because these problems have a distinct bearing on the UHF situation as it now exists. I feel that only with a full understanding of these problems is it possible to draw sound conclusions for any course of action which might be taken to find a solution for the disheartening UHF dilemma and prevent not only economic catastrophe for many station owners, but also maintain for the benefit of all citizens the extremely valuable national resource that is the UHF broadcast band.

Television is a highly technical field and, in discussing equipment or the state of the art, it is sometimes necessary to speak in technical language. If, for this reason, I do not at any time make myself clear to the committee members, I would appreciate your asking me to interpret this technical language.

The problems which face the combined television and broadcast industries today in UHF are not entirely new. The same or similar problems existed in the introduction of other new communication services to the public, including AM and FM radio and VHF television. There are technological problems and economic problems. The technological problems, I can assure you, will be solved, but not without the expenditure of considerable research and engineering time and funds.

My company alone, has invested over 360,000 engineering man-hours and over $3,600,000 in engineering alone to make possible acceptable broadcast service and reception in the UHF band.

We, and other elements in the industry, have made good progress to the point where UHF broadcasting technically is almost, but not quite, competitive with VHF broadcasting. There still remain some handicaps to be overcome and developmental work to be accomplished before we can reach the maximum allowable power ratings for UHF stations as established by the FCC.

If I may draw a simple analogy, UHF broadcasting is to VHF broadcasting like endeavoring to carry on commercial farming on the slopes of Mt. Everest, up toward the timberline, as compared to farming in the valley. As we move farther up the radio spectrum, we're moving farther up the mountain where new equipment, new methods and new techniques must be developed. Equipment alone is not the answer. This must be combined with the intelligence, the aggressiveness and the ability of those using the equipment.

First, if I may, I would like to draw one general conclusion concerning television broadcasting. Since we have a financial stake in broadcast stations to the extent that we do not receive full cash payment for transmitters, studio equipment, and antennas we supply to broadcasters, we have been more than interested observers of the difficulties some stations are encountering. In our judgment there are a number of elements which control the success or failure of any broadcast station. One, of course, is the broadcast equipment itself, its ability to function properly and transmit a signal of sufficient strength over a selected area. This I will discuss in some detail.

Of equal importance are those factors which control the success or failure of any business, under our free enterprise system: financing,
product, market, and management. Lacking just one is enough to place a station in trouble.

I cite these facts and conclusions for one purpose only—to stress that broadcast stations are governed by the same factors which govern success and failure of any business, and although they have some problems unique unto themselves, there may be deeper and underlying causes for some of their difficulties.

Now in turning to the technical story of UHF broadcast equipment, I believe the committee is acquainted with the fact that there are technical factors which govern the reception of a good UHF picture in any given location.

These are:
1. The transmitted power, that is, the effective radiated power from the transmitter and antenna system of the broadcast station.
2. The general propagation characteristics at the transmitted frequency.
3. The distance from the antenna to the location of the receiver.
4. Special terrain characteristics.
5. The receiving antenna.
6. The transmission line between receiver and antenna.
7. Receiver sensitivity and noise factor.
8. General or localized interference problems.

Any one of these factors can affect the creation of a good picture in the home of the set owner and it is an oversimplification to charge the transmitter or the receiver with failures in the absence of detailed information on all these points; and, of course, it must be remembered that even if the picture is technically perfect, but doesn’t interest anyone, the whole effort is a failure.

The first basic technical problem is that UHF requires much higher effective radiated power or ERP as compared to VHF to attain the same degree of coverage of a given area. As an example, figure No. 1, attached to the copies of my statement shows a chart of the District of Columbia and surrounding areas. Assuming the same location for a VHF and a UHF station, with the same antenna height of 500 feet for each, 5 kilowatt ERP is needed for primary coverage out to 10 miles by the UHF station as compared with 1.6 kilowatt ERP for a VHF station.

To extend the primary coverage out to 32 miles would require 1,000 kilowatt ERP for the UHF stations and 200 kilowatt ERP for the VHF stations.

This need for higher power for UHF stations was of course recognized by the FCC in establishing the higher power maximums for these stations. The General Electric Co. early recognized the developmental problems involved and was the first to make available UHF broadcast equipment producing more than 200 kilowatts ERP, or UHF transmitter power of 12 kilowatts.

As an illustration of the complexity of this problem, I would refer you to figure 2 which shows three electron tubes. The first is a common receiving-type tube generally employed in your radio and television receivers at home. The second tube is a transmitting tube capable of delivering 10 kilowatts in the high channel VHF band, that is, channels 7 to 13. The third tube is the klystron used to develop 12 kilowatts of UHF power. The 10 kilowatt VHF tube is a design introduced about 2 years ago and consequently represents
the state of an art for which industry has been actively designing equipment since before World War II.

The klystron, which stems from a radar development of the late war years was not considered for television application until 1948, and a final product was not available for transmitter design until 1952 even under a highly accelerated engineering development program.

The usual time cycle for design of a new transmitter following transmitting tube development is 1 full year, and normally another full year is required for manufacture of the first unit.

We were able to compress transmitter design and manufacturing from 2 years into less than 1 year and to ship the first 12 kilowatt UHF transmitter in December of 1952.

The photograph marked “Figure 3” shows one of these transmitters. As an indication of size this equipment is 21 feet 6½ inches long, 83 inches high, 34 inches deep and weighs, with its power supply and cooling equipment which are externally located, over 6 tons.

It must be recognized that the transmitter is only one of the essential equipments of a broadcast station. Additional design and development was required for antenna, coaxial transmission line, wave-guide, and such transmitter accessories as filtrexers, demodulators, sweep generators, harmonic filters, aural station monitors, and visual station monitors. These are all specialized pieces of equipment necessary to operate a UHF transmitter in accordance with FCC requirements.

The filtrexer, for example, is a device which shapes the transmitted visual signal in accordance with FCC requirements, and, in addition, permits the mixing of the aural and visual signals so that both can be transmitted from the same antenna. A comparable device to the UHF filtrexer as transmitter accessory equipment is the VHF diplexer.

Figure 4 illustrates one type of VHF diplexer and a UHF filtrexer.

The filtrexer is the one on the left. It looks like a plumber’s nightmare.

The difference in complexity of the two designs is immediately apparent.

Another significant point of comparison between VHF and UHF is evident in the spread of frequencies for each service. In the case of VHF, the frequency spread from the lowest to the highest channel is 162 megacycles. In the case of UHF, the spread of frequency is 420 megacycles. Consequently the UHF equipment involves considerably more adaptability, or as an alternative, different designs must be offered for different ranges of frequency within the UHF band. This is particularly evident in the klystron where six different designs are necessary in order to supply a klystron transmitter for any channel the customer might be assigned.

Basically, and very briefly, this describes the technical problems faced in the development of UHF broadcast equipment. Another and separate phase of these problems was the amount of technical education necessary. When the freeze was lifted by the FCC in 1952, 2 short years ago, there were not more than 20 broadcast-transmitter engineers throughout the United States familiar with the design problems and characteristics of UHF. Presently there are not more than 400 maintenance operating and servicing personnel qualified in the UHF field, as compared with the 5,000 to 6,000 which ultimately may be required.
In the face of these problems, here essentially is what we have been able to accomplish. General Electric has developed, produced, and marketed a complete line of UHF transmission and studio equipment. We were able to deliver the first 12-kilowatt transmitter less than 6 months after the first CP was issued by the FCC. We have delivered 44 UHF transmitters in all, of which 34 are 12-kilowatt transmitters. We have equipped 100 percent of all stations operating with more than 5 kilowatts of transmitter power and more than 90 percent of all stations over 1 kilowatt. We have developed antennas capable of transmitting up to 1,000 kilowatts of ERP, the maximum authorized by the FCC.

Senator SchoeppeL If you do not mind an interruption—
Mr. Chamberlain. No, sir.
Senator SchoeppeL I take it your company has practically furnished all of the equipment in this new field; is that right?
Mr. Chamberlain. The high-power equipment, Senator?
Senator SchoeppeL Yes. That is what I have in mind—the high-power equipment.
Mr. Chamberlain. The bulk of the transmitters in the field today are operating on a transmitter of 1 kilowatt and an effective radiated power of 20 to 25 kilowatts, depending upon antenna gain and transmission-line losses.

It might be enlightening to the committee if I give an exact timetable covering the development of this UHF broadcast equipment. General Electric began development of UHF television-transmitting equipment in October 1948, following by less than 1 month indication that UHF allocations were being considered by the FCC. Initial development was centered on producing a basic 100-watt exciter unit, and on investigation of circuitry and tubes for power levels of 1 kilowatt and 5 kilowatts.

Our investigation indicated the desirability of a klystron tube approach for the higher power levels, so we approached Varian Associates in November of 1948 regarding development of such a tube.

Senator SchoeppeL What do you mean by Varian Associates?
Mr. Chamberlain. Varian Associates is an organization in California primarily headed by two brothers by the name of Varian, who hold, I believe, either directly or on assignment, most of the patents on the klystron type of tube. They are two extremely able engineers and physicists who have been the mainstay, you might say, of klystron development.

In March of 1949 we entered into a contract with them for the development of a 5-kilowatt tube. Not until April 1951, did our experience with the 5-kilowatt tube indicate that power ratings of 12 kilowatts, or even higher, were practical. We then made the decision to direct our work to the development of this 12-kilowatt klystron. This, with the four-bay antenna, would permit the maximum ERP then contemplated.

In April 1952 the FCC issued its sixth report which contains the new rules governing television-broadcast stations in which it was announced that the maximum ERP for UHF would be established at 1,000 kilowatts.

We immediately began an investigation of the possibility of reaching this maximum allowable ERP. Based on the receipt of the first development model of 75-kilowatt klystron, currently promised for January of 1955, we estimate production delivery of a 60-kilowatt
UHF transmitter could be made by spring or summer of 1956. This is based on an estimated accelerated transmitter design period of 9 months and an accelerated production cycle of 6 to 9 months. This schedule also is predicated on satisfactory commercial acceptance of transmitters of this rating and could be amended if the market outlook changes.

I recite these facts, not with any feeling of braggadocio but as a foundation for the statement that the broadcast-equipment industry in general, and General Electric in particular, has utilized every available bit of engineering and research talent to provide successful UHF broadcasting equipment to the broadcast stations. I feel it has been a significant engineering achievement without which UHF broadcasting would not have advanced to the point it has reached today.

I would be the first to admit that we did not attain the above-listed achievement without errors or without difficulties. In no accelerated program dealing with highly technical and complex equipment could a 100-percent performance record be expected. In effect, we wrapped up an engineer with each of the early transmitters shipped. But we did the same with the first VHF transmitters, back after the war.

Then we not only wrapped up the engineer, but we also had them make out their wills before they left since they might be too old or too confused to do so when they got back. I can now report that every one of the installations are providing normal or above-normal service. The shakedown cruise is over, and the equipment has been proven capable.

So there may be no misunderstanding concerning our investment in UHF, I would like to point out to the committee that we have invested far more than the 360,000 engineering man-hours or $3,600,000 in research and development covering items such as tooling and things of that sort.

Because of our background of VHF experience we recognized that few if any new stations would become howling financial successes immediately they went on the air. We knew from experience that many would lose money until they had built up—primarily by good programming—sufficient demand for their service that the public would invest in television sets capable of receiving their signals, and had established an audience that made it attractive for advertisers to purchase time. We knew that this would not be an easy nor a brief task in many areas. We have arranged comparatively long-range financing for these station operators to ease the burden of their launching a successful operation. Total value of our shipments of UHF equipment to CP holders is over $10 million. Outstanding at the present time, that is, late last month, is over $7 million. Let me point out that the financial risk is not that of the station owners alone, but that equipment manufacturers too have a sizable stake in the success or failure of UHF. But even if the station is eminently successful, the equipment manufacturer receives only the contract price with no added bonus for the risk he has taken.

If I may sum up briefly, I believe that the General Electric Co., as one of the major broadcast equipment manufacturers, has rendered an outstanding technical service to the broadcast industry in carrying out at considerable financial risk an accelerated program of development and manufacture of UHF television broadcast equipment. I believe also that, because of this contribution, the state of the art, that is, UHF technology, is well developed, and within a short time, probably by early 1956, we will be able to make available transmitters capable of
the maximum ERP presently authorized by the Federal Communications Commission.

But I want to stress that at this moment, and for some months past, UHF transmitting equipment is available to broadcasters which will enable them to transmit an adequate signal. We can make available to any of the low-power UHF stations 12-kilowatt amplifiers that will raise their effective radiated power to the limits now imposed by the state of the art—in other words, to approximately 250 kilowatts ERP. Several broadcasters have already raised transmitting power from 1 kilowatt to 12 kilowatts by adding a 12-kilowatt amplifier—and, incidentally, we can deliver within 30 days of receipt of order.

I would like to interpolate one little thing here, if I may, Mr. Chairman.

Senator Schoeppel. Yes, sir.

Mr. Chamberlain. And that is some people who are not engineers do not have a true concept of the difference in received signal with variation in transmitter power. If we can assume for a minute a UHF station using a 1-kilowatt transmitter, with a given antenna height and a given antenna gain, and consider that as 1 unit of received signal at the receiving point, then by going to 12 kilowatts of transmitter power, everything else being equal, the received signal at any given point will be 3.4 times as strong; by going to 60 kilowatts and assuming the same conditions otherwise, the received signal will be 7.7 times as strong as from a 1-kilowatt transmitter.

Senator Schoeppel. Now, will that affect the receiving sets that can be operated on both of these methods?

Mr. Chamberlain. Yes, sir.

Now, I might make 1 other comparison, for the benefit of those stations presently operating at the 12-kilowatt level: If everything else remained the same and they went to 60 kilowatts, then the received signal, if it were considered as a unit of 1 again at the 12-kilowatt level, with a 60-kilowatt amplifier, would be about 2.26 times with 60 as it would be with 12.

Senator Schoeppel. Would that then affect these sets that were advertised as or capable of receiving both of these types of broadcasts?

Mr. Chamberlain. Yes, sir.

That will be covered in more detail by the next speaker, who will give you additional information.

Senator Schoeppel. You will pardon some of these questions in a purely elementary way, and don't make the fatal mistake, as far as your acting chairman is concerned, that he knows anything about this thing. So, the more you can get it in lay language and in an understandable way, the more it will be appreciated by us when we go into this record, I assure you.

Mr. Chamberlain. Senator, we appreciate the questions and the opportunity to try to clarify anything that is in doubt.

The approximate 250 kilowatts of ERP mentioned above is based on an omnidirectional antenna pattern. For certain special market geography it is possible to directionalize the helical antenna to achieve effective radiated powers of 400 to 500 kilowatts ERP from 12-kilowatt transmitter power in certain specified directions.

Senator Schoeppel. Now, what do you mean by that?
Mr. Chamberlain. An omnidirectional antenna is one that radiates a substantially equal signal in all directions. In other words, here sits the antenna and the territory around it is the one you want to cover. With an omnidirectional antenna, the signal being sent out a given distance, terrain being discarded, will be approximately the same in all directions from the antenna.

A directional antenna is one that has been purposely distorted in such a way that more of its energy is radiated in a desired direction than in a less desirable direction. For instance, if you had an antenna here to cover Washington and the station and the antenna were located other than at the center of the population, you might want to get more of your energy into the heavily populated areas. That is practical within certain limits. In other words, you beam it a little like a searchlight, shall we say, purposely changing the construction of the antenna.

We can't make any more power. We can only direct the power that is presently there.

Incidentally, that is the only reason we use the term "effective radiated power" rather than "transmitted power." We take what power is available, direct it where it is most useful.

This is accomplished by attaching horizontal stubs to certain turns of the helices. These excited radiators desiringly distort the circular horizontal field to give the increased gain in certain directions as desired by the customer.

In conclusion, there exist some technical limitations in the higher frequencies, built-in disadvantages, they might be called, but the engineering and research talent of the industry has overcome most of these handicaps.

From a technical viewpoint UHF broadcasting equipment is a cogent example of the ability of American industry to open up new frontiers of knowledge in a brief span of time and make the benefits of our increased technology available to the public.

Senator Schoeppel. I would like to ask you something here with reference to Dr. Dumont's plan—not on whether you agree with the plan or not, but the thing I was wondering about, as I listened and forgot to ask him, was this: Assuming that some of those plans would be feasible and proper or, in the wisdom and judgment of everybody who has to deal with it, would approach some kind of solution, would it still not entail a realignment of practically the major portions of all of these sets now out to be able to fit into those programs by the enlargement of the UHF?

Mr. Chamberlain. The adjustment of the receivers?

Senator Schoeppel. Yes; the receivers.

Mr. Chamberlain. Well, again you will get more information from the next speaker.

Senator Schoeppel. All right.

Mr. Chamberlain. Certainly if you were going to have a universal television service, in which certain program services are available only through UHF or only available at UHF at certain portions of the time, then you will not bring that to full fruition until all receivers or essentially all are converted to receive the UHF signals as well as VHF signals.

That is part of the crux of the matter, I believe, as far as the economic success of the broadcaster is concerned.

I didn't intend to get into this end of it, but certainly the old story of the hen and the egg applies as far as UHF broadcasting is con-
concerned. People, we believe, will convert to UHF when there are programs on UHF that they want to see and hear badly enough.

Advertisers, I believe, will buy time on UHF when they consider that UHF is rendering a circulation service, an economical circulation service.

So, the problem is to get the hen and the egg to arrive somewhere near simultaneously.

Senator Schoeppel. I don't mean to monopolize your time here, but you are more than an ordinary expert in this field, and your company—probably other companies—have done a world of research, and you are not doing this without some idea of getting reimbursement by reason of increased sales. That is the good, old American system.

Mr. Chamberlain. We have hopes.

Senator Schoeppel. Now, is this a fair question to ask you—and if you have any enlightenment, I would really like to have it because it goes to the public side of this thing—do you feel you are making rapid strides in developing new techniques and applications or apparatus that could be utilized by a majority of the good standard sets to make this conversion?

Mr. Chamberlain. Again it is a receiver problem, and the next speaker will touch on it in more detail.

Senator Schoeppel. All right.

Mr. Chamberlain. But my honest opinion is we already have apparatus that is entirely adequate to do what you are speaking of.

Senator Schoeppel. I see.

Mr. Chamberlain. I think there are economic and programing factors that are really the important things here.

Senator Schoeppel. I am inclined to agree with you, from what little I have heard about it.

Mr. Chamberlain. My testimony is to nail down, if I can, the thought, as far as the apparatus is concerned, at either the transmitting or the receiving end, and they are both equally important—they are a part of a system—that as far as that portion of this problem is concerned it is reasonably well under control—not perfect, but reasonably well under control. I think there are some other things, and I think many in the room probably would agree with me, that are nowhere near under control.

Senator Schoeppel. Senator.

Senator Bowring. Nothing more. Thank you.

Mr. William A. Roberts (counsel for Allen B. Du Mont Laboratories and Du Mont television network). Senator, my name is William A. Roberts. I am counsel for Du Mont.

Senator Schoeppel. Yes, sir.

Mr. Roberts. In regard to your earlier question you said you would have addressed to Dr. Du Mont were he still here—

Senator Schoeppel. Yes, sir.

Mr. Roberts. Which had to do with the question of whether any one of his three plans would require any or great change to the major portion of television sets now on the market, thus making them capable of receiving UHF, it would not for these 2 reasons: The first 2 plans do not contemplate changes in any place where you already had 4 VHF stations—as, for example, New York, Chicago, Los Angeles, cities with great occupations of sets, great penetration of sets. Of course, they would not have to be changed there because you would have no compulsory effect on programing.
Now, with respect to the cities where you promote or enlarge the population of UHF receivers, obviously they would have to have UHF changes; but that would be a relatively small proportion of the entire present number of sets in the hands of the public.

Senator SCHOEPPEL. That is most helpful. I appreciate getting that into the record. I think it may have some informational value.

Let me say thank you, sir, for your presentation here, which will be most helpful, and the exhibits attached to your statement will be made a part of the record at this point.

* Maximum power allowed by FCC
** Maximum power possible at present state of the art (12 KW Transmitter with 5-bay antenna)
Senator Schoeppel. If there are no further questions now of this witness, we will proceed now with Dr. L. R. Fink, who is manager of the engineering, radio and television department of the General Electric Co.

Your statement, sir, and exhibits will become a part of the record, and you may proceed as you wish.

STATEMENT OF DR. L. R. FINK, MANAGER OF THE ENGINEERING, RADIO, AND TELEVISION DEPARTMENT, GENERAL ELECTRIC CO.

Dr. Fink. Thank you, sir.

My name is Lyman R. Fink. I am manager of engineering for the radio and television department of the General Electric Co.

Senator Schoeppel. I want to ask you—and I know you have been doing it—not to throw us into this wall with your voice, but I take it some of these interested folks back here would like to hear what you have to say; so, if you would speak up I think it would be appreciated by the folks in the back of the room.

Dr. Fink. Thank you, sir, and I will appreciate a suggestion if you find it lapsing a little bit.

Senator Schoeppel. All right.

Dr. Fink. My purpose in appearing here today is to present the story of the UHF receiver from a technical and from an economic viewpoint. I will touch upon the preparations the General Electric Co. made during the freeze for introducing UHF receivers and the progress that we have made in UHF reception since commercial broadcasting started. I believe it will be clear to you as the story develops that the acute competition existing in the receiver industry has provided assurance, and will continue to provide assurance, that the UHF customer will always get his choice of the best UHF performance and cost that the technology will allow. This same keen competition also provides assurances of maximum effort toward improving that technology.

It is appropriate in such a hearing as this that we should examine the performance of the receiver manufacturer. He was faced with a major problem of providing a new service to the American public. He faced the challenge of providing that service with the conflicting requirements of the best possible product performance at the lowest possible cost.

As I said, this is a highly competitive industry. The manufacturers in this industry are engaged in an intensive struggle to earn a profit in a buyer's market. Under these circumstances even the smallest cost factor at the manufacturer's level can assume critical importance.

The desire shared by most large corporations to be responsible industrial citizens implies an obligation to give the public the best possible products and services at the lowest possible cost, but the down-to-earth profit motives in a competitive economy positively demand that we do so.

In almost every consumer product there is available to the customer a free choice of performance level. It is entirely proper that this be so, for he should not be required to pay additional money for performance he does not need. This practice, for example, is found in almost
all consumer goods lines, from clothing to automobiles, from foodstuffs to homes. This is equally true with UHF-equipped receivers.

While our company elected to offer the maximum performance we know how to provide at any reasonable price, others offered a choice of lower performance UHF circuits at lower prices. In general, the lower-cost solutions were capable of completely satisfactory performance in the stronger signal areas. It should be recognized, too, that throughout the industry UHF performance improved rapidly with the technology. Thus, for example, an average UHF receiver built late in 1953 performed better than a neighboring receiver built early in 1953.

It is my personal conviction that an excellent job has been accomplished with an exceedingly difficult problem.

We began our work on UHF receivers in 1948. Our early work consisted almost exclusively of engineering development directed toward having continuously at hand a converter design which could be used for receiving UHF as soon as broadcasts became available. We first put in production a VHF receiver equipped for field or factory conversion as early as 1950. In 1951 we manufactured and made available to our distributors a quantity of several hundred UHF converters, model UHF 101.

I have here a sample of that early model T converter.

You will note this was before the allocation was released. We did not know how the channels would be numbered. So, the scale is graduated in megacycles, in frequency, instead of channel number.

Senator SCHOEPPEL. What would that have cost me if I had bought one?

Dr. FINK. I am coming to that here.

Senator SCHOEPPEL. All right.

Dr. FINK. It would have cost you $49.95.

This was done prior to the time that the FCC released its allocation plan and was done for the purpose of educating the factory and field representatives. This action demonstrated that our receivers then in the hands of the public were capable of receiving UHF through such means. As a point of interest, the engineering investment which we had in UHF conversions as of this point of time, prior to the release of the FCC’s allocation plan, was of the order of tens of thousands of man-hours.

As of the date of the action by the Commission in lifting the freeze and releasing its allocation plan we were in this position from the standpoint of the receivers:

1. Every GE receiver in the hands of the public was capable of receiving UHF broadcasts through the use of UHF converters.

2. All of our receiver production incorporated the 41-megacycle intermediate frequency which had been adopted by the Commission as an integral part of its UHF allocation plan.

3. Several different designs of converters had been given extensive field tests both on the experimental broadcasts made available by NBC in the Bridgeport area, and on the broadcasts of the General Electric experimental station at Syracuse.

4. Several hundred of the model UHF 101 converters which we had built were still available for sale to the public—and here I answer your question directly, Senator—at a price of $49.95, which, incidentally, represented a very substantial manufacturing loss.
An improved and simplified design was undergoing tooling and was planned to be in production in time to meet the first commercial UHF broadcasts.

A very significant portion of our total engineering effort in television-receiver design was directed toward the development of improved UHF reception means. Part and parcel of this work was the continuing coordination with and pressure on component vendors for improved components suitable for UHF purposes, including particularly oscillator tubes and converter crystals.

Before proceeding to the story of our actions subsequent to the lifting of the freeze, it may be appropriate to explain some of the problems unique to the UHF receiver, including some details on the types of conversions which could be and were, in fact, utilized.

The committee members will recognize, as Mr. Chamberlain pointed out, that the introduction of UHF as a consumer service represented a major technological stride. From the standpoint of the new components and the new disciplines required for mass production of a successful product for UHF this step forward was technically difficult. Many alternative solutions to the problem had to be explored by every major competitor in the industry and quite a large variety of solutions were brought forth to be tested in the market place. Not only were we as a company developing several alternative designs, but we also were assiduously testing the offerings of many vendors in this field, including some competitors.

The problem facing the set manufacturer at that time might be summarized thus:

1. The time at which the freeze would be lifted was completely unpredictable.
2. The time at which a significant amount of commercial UHF broadcasting would be in place was even more unpredictable.
3. The pace of technological progress was such that the manufacturer could expect that any new design on which he undertook to tool up would probably be obsolete before advisable production was realized.
4. Until a significant fraction of the manufacturer's output was to be sold in areas where the customer would need both VHF and UHF service, neither the customer nor the manufacturer could afford to pay the considerable premium required to fully equip every set for both services—and this situation, of course, applies even today.
5. The portion of the television set most influenced by the addition of UHF is the tuner or head end, as it is called. The manufacturer's problem was to modify or add to his VHF head end in such a manner as also to receive UHF.

Now, in the hope that it might contribute to an understanding of the UHF receiver story, I have brought examples along of some of the choices available for doing this:

a. Some head ends of the turret type were designed so that a VHF turret strip could be removed and a UHF turret strip substituted.

I have here such a turret-type head, with the strip ready for removal, which can be removed, and the VIIF can be removed and a UHF strip such as this substituted.

Senator Schoeppel. What would that cost?

Dr. Fink. This, sir, I am not familiar with in detail. I use this for illustrative purposes. I believe in the UHF form it costs the manu-
facturer in the neighborhood of $15 or so. The UHF strips, I believe I was told, ran around $12 or $15, something like that.

I am sorry that is not authoritative data.

Senator Schoeppel. Thank you. We understand.

Dr. Fink. (b) A separate 1 or 2 or multiple-station converter could be added to the set either internally or externally. The UHF stations could be preset on such a converter according to the channels on the air where the set was to be used.

Here is an example of this type, where you can preset the stations, and this converts the UHF to a VHF signal to go then into the conventional VHF.

Senator Schoeppel. And what would the cost be on that—some approximation of the cost?

Dr. Fink. I believe, sir, that was in the order of $20, plus the installation charge in case it was not already in the set; and again if that figure is important to you, I will be very glad to verify it accurately.

Senator Schoeppel. I just wanted something in the record indicating the probable range of cost.

(c) Alternatively, a so-called continuous tuner could be added to the set either internally or externally.

Here is an example of such a tuner, covering in this case all of the UHF channels.

Senator Schoeppel. Would that be comparable in cost as you mentioned a while ago?

Dr. Fink. Roughly comparable. These were different chronologically in time, and costs do change with time, but the same order of magnitude applies; yes.

I think I should correct that to say the cost to the consumer was quoted, I believe, yesterday, and perhaps fairly accurately.

Senator Schoeppel. Yes.

Dr. Fink. The range, as you recall, was from 20 to 60, averaging around 30 or 40.

Combinations of these various alternatives also offered certain advantages.

Now, all of these choices had to be evaluated in terms of the estimated percentage of UHF sets to be built, the cost added to every set to use them on every set, and most importantly the current and expected performance to be achieved by each scheme.

Let us review now the program which we have followed since the lifting of the freeze on July 1, 1952.

When the freeze was lifted we immediately released production on the best design of converter available in our laboratories. Production on this unit commenced about coincident with the first commercial UHF broadcasting at Portland, Oreg. The unit was made available not only as an integral, built-in part of our then current line of sets, but also as a kit which could be added internally or externally to every VHF set we had built.

As the UHF broadcasting picture unfolded and as technology in components and circuits advanced, we have continually refined and improved our UHF offerings. Normally we have introduced new VHF chassis only once each year; but in 1953 we introduced three different UHF designs, each a step ahead of its predecessor.

In our latest 1954 offering, the premium for UHF service is as low as half what it was in our early sets, while the performance in terms
of ability to receive a satisfactory picture on UHF has been improved several-fold.

We continually have offered our distributors and dealers the best UHF receiving equipment we are able to make and, except during the starting rush, in whatever volume they were willing to order.

It may be of some interest that, as Commissioner Hyde and Mr. McDaniel told you yesterday, during 1953 the industry shipped about 20 percent of their sets equipped for UHF; in our own case, approximately 22 percent of our total 1953 production was equipped for UHF as it left the factory; enough UHF kits to field change an additional 8 or 10 percent were shipped. Since early last fall, our working inventory of UHF equipped sets in the field has been proportionally very much higher than VHF only sets.

Now, where do we stand as of May 1954?

Our company still has a major engineering program in the UHF receiver field both as to sets and as to components. We are offering the UHF customer much more for his money than ever before. We are continuing in the race against competition to make our UHF performance the best that the technology will allow. Every television model we produce is available either with or without UHF and every VHF only set we ship can easily be changed in the field to add UHF. We are rapidly approaching the time when a UHF set will give as good a picture as a VHF set under equivalent signal conditions.

I would like to illustrate our progress with some photographs we have made for this purpose. These were made in our laboratories under controlled conditions simulating as nearly as possible the average TV reception obtainable with VHF and that obtainable with UHF, both when it first went on the air in late 1952 and currently.

But first, if you will pardon the distraction, I would like to digress into a somewhat technical vein.

It was mentioned earlier that the receiver noise factor is important to satisfactory reception, and I would like to clarify this, sir.

When your radio is between stations or on a distant station, you sometimes hear atmospheric static and receiver noise. This receiver noise is generated in the set and is characteristic of electric circuitry. In a television picture the noise signals, instead of being heard, appear as what is commonly called snow. The engineers still refer to it as noise.

Senator Schoeppehl. That is what is happening to my set. I can testify you are right on that.

Dr. Fink. The weaker the signal, the higher proportionately is the noise generated by the set. If the signal is strong, noise generated by the set is negligible.

Engineers have devised methods of measuring the noise-generating capacity of a receiver and speak of this as a noise factor.

One of the problems of receiver designers is to make that noise factor as low as possible while still keeping the cost of the receiver also as low as possible.

There are many important design problems in UHF receivers, but the noise factor is the only really fundamental technical limitation that we have faced.

The noise factor commonly is computed in decibels, called db's and the noise factor for UHF receivers has been and still is considerably higher than for VHF receivers. The history, however, is one of rapid
improvement. The industry average last year has been reported at 20 to 24 decibels, with General Electric UHF receivers closing the year at 16 to 20 decibels and currently running 12 to 16 decibel. Some further can be expected.

Now in the chart we have indicated the quality of picture obtainable under the conditions I mentioned earlier. We have simulated a receiver noise factor of 6 decibels for VHF, which is good current practice, and which was also available in the best VHF sets in 1952.

That, you see, is in the first column, the VHF column.

The second column shows a noise factor of 12 decibels which is rated as good to excellent performance at the present state of art of the UHF.

In the third column we have simulated a 24 decibel noise factor, which is only slightly worse than the average UHF performance through the industry in late 1952.

In the first row we represent a strong signal such that the set-generated noise or snow is masked and an excellent picture is obtained regardless of high noise factor.

You will note the picture is equivalent both in the VHF and in the early and late UHF receivers.

In the second row we have an indeterminate signal, strong enough to override noise in the VHF set, but one in which UHF at its present technology suffers slightly by comparison.

Perhaps from your distance you cannot quite see that. There is some snow in that center picture.

The earlier UHF sets were somewhat worse off—on the right—but still giving a definitely usable picture.

In the bottom row we have a weaker signal, giving a somewhat noisy VHF picture—in the lower level.

A correspondingly weak signal at UHF would give a rather poor picture even today and a scarcely usable picture in 1952—in the lower right-hand corner.

This, of course, simply means that the simulated 1952 set is beyond the useful range of transmission, or that its receiving antenna would have to be improved, or the transmitted power should be increased.

I should hasten to point out at this point that we have presented here a rather hypothetical situation which implies that all the other factors mentioned earlier by Mr. Chamberlain, factors which contribute to differences between VHF and UHF reception are made equal, and equal signal voltages are delivered to the receiver terminals.

As I mentioned earlier, the noise factor is the fundamental limitation that the set manufacturer has been fighting. No TV set manufacturer can be complacent with the present performance level, but certainly, as you can see, very gratifying progress has been made.
What I want to leave with you gentlemen is this: Building a technically good UHF receiver at a price the consumer is willing to pay has been a momentous task and is a continuing task. The result of our work has been that the customer has had continuously available a choice of UHF receivers capable of performance up to the limits of our known technology. The receiver is not a real limitation to the growth of ultra-high frequency.

Thank you, sir.

Senator Schoeppel. Thank you very much, Dr. Fink.

Senator Hunt, do you have any questions?

Dr. Fink. The sale of UHF sets compares with the VHF a little less than the ratio I mentioned earlier. Last year we built 22 percent UHF and the sales were somewhat below 22 percent. So, at the close of the year we were heavy in the field in UHF compared to VHF. Our working inventory was disproportionately high in UHF.

Senator Hunt. Then you run something like 4 to 1?

Dr. Fink. A little more than that, sir; yes.

Senator Schoeppel. Senator Bowring. I just want to compliment you and the people who have appeared before you that you make it possible for a layman to have any grasp of it at all. I am really surprised I have any feeling of knowing what you are talking about.

Dr. Fink. You are very kind. Thank you.

Senator Schoeppel. Senator Pastore.

Senator Pastore. No.

Senator Schoeppel. Thank you very much, Dr. Fink, and I might say the exhibit attached to your statement will become a part of the record.

Dr. Fink. Thank you, sir.

Senator Schoeppe1. The next gentleman testifying will be Mr. Haase, manager of development engineering, receiving tubes, also of the General Electric Co.

Now, your statement will become a part of the record and your exhibits, so far as reproduction is possible, and you may proceed in any manner that you desire, sir.

Mr. Haase. Thank you, Senator.

Senator Schoeppe1. The floor is yours. Proceed.

STATEMENT OF ALLEN P. HAASE, MANAGER OF DEVELOPMENT ENGINEERING FOR RECEIVING TUBES, GENERAL ELECTRIC CO.

Mr. Haase. My name is Allen P. Haase, and I am manager of development engineering for receiving tubes of the General Electric Co. As manager of development engineering, my responsibilities include the development of certain tubes for application in UHF-TV receivers. The General Electric Co. is one of the major manufacturers of electronic receiving tubes and is one of the primary sources of new tube developments. Last year we manufactured over 100 million receiving tubes and in the last 2 years we have introduced approximately 30 percent of all of the new tubes developed in this country.

For many years we have supplied tubes for application in radio and TV receivers, military and airborne equipment, computers, industrial-control devices, and other electronic apparatus. Our customers include nearly all commercial receiver manufacturers.

We have been engaged in the specific development of receiving tubes for UHF-TV applications for approximately 5 years.

The history of tubes designed to operate at these frequencies goes back to World War II when we engaged in the development of radar receivers. For the higher frequencies at which radar devices operated, some of them within the present UHF-TV frequency range, it was necessary to develop special tubes. This was done by the use of techniques that could best be described as brute-force methods when performance meant lives and cost considerations were secondary. The so-called lighthouse tubes were developed for these applications and were capable of operation at frequencies as high as 2,000 megacycles.

I have here a light house tube of the type that was used at that time. There was a family of these tubes developed for radar purposes.

Acorn tubes also were developed during this period and were capable of operating to frequencies of hundreds of megacycles.

Here are Acorn tubes of that type. Notice the complex construction.

As you can see from the construction these tubes were difficult to produce, were expensive and yielded performance far below our present standards.

For higher frequencies of operation the receiving type klystron was taken from the laboratory and adapted to manufacturing techniques that were in existence at the time.

The UHF detectors that were used were generally crystals of the silicon type and their performance left much to be desired. Here, again, the brute-force method was used and 2 or 3 production percent yields were common.
This early history is cited to indicate our wartime experience with receiving devices in the present UHF-TV frequency range. Right after the war, FM broadcast service was established in the 88 to 108 megacycle region. This was the first widespread public use of high frequencies and underscored the inadequacies of tubes and production methods available at that time; and it might be of interest to note that at about this time the miniature tube construction was just becoming well accepted by the industry.

Efforts were made to improve the performance of tubes for FM and with circuit improvements, performance to a frequency of 200 megacycles was attained.

By mid-1948 we had developed special tubes for airborne communications equipment for the Armed Forces that could oscillate and amplify efficiency at 500 megacycles.

At the FCC hearings in 1948, there was general agreement that the area from 470 to 890 megacycles should be used for black-and-white television on the present standards; namely, a continuance of the present standard of television carried over into these ultra high frequencies.

In the fall of 1948 our engineering organization was reorganized at its present location in Owensboro, Ky., and work was started to develop a UHF oscillator tube which could be produced efficiently in large quantities for application in UHF-TV receivers. This tube, the first of the group specifically designed for UHF-TV receivers, was designated the 6AF4 and was made available to receiver designers in October of 1949.

We have a display on the left—on your right—which shows those tubes that we will be referring to.

The oscillator tube, 6AF4, is at the left of that display, and is shown as 1949 oscillator.

Prior to the development of this tube, designers could look only to makeshift methods for obtaining the signal energy at UHF frequencies needed within the receiver in order to obtain operation. This involved using harmonics of an oscillator operating at lower frequencies and proved quite undesirable from several viewpoints. To summarize, none of the tubes in production at that time were suitable for UHF-TV applications as oscillators or amplifiers, and the special-purpose devices made during the war were prohibitively expensive or inadequate in performance to justify their use.

In order that the committee may have some understanding of the problem, it might be well to point out the reasons why vacuum-tube technology at UHF frequencies is different from that which had been known previously. In order to present the basic concepts without resorting to complex technical terminology it will be necessary to greatly simplify the explanation.

The basic problems of UHF tube design are: (1) Transit time effects; (2) circuit constants; and (3) performance/cost ratio.

The most simple high vacuum tube which will amplify received signals is the triode. This consists of a three-element tube, and I believe we have a diagram here which will illustrate this.

In the center of the tube is a black object, a cathode, which emits electrons.

Surrounding that cathode and supported by those two red electrical wires we show in the cross-sections a grid which is used to control
the flow of those electrons; and surrounding that, the blue object there, is a plate or an anode, which collects the controlled electron stream.

Now, in the space between the cathode and the grid electrons can be controlled by the grid, while in the space between the grid and anode no grid control is possible.

Electrons leaving the cathode travel at a relatively low speed toward the grid; and when the distance between the cathode and the grid is large, this journey requires a relatively long time.

At low frequencies of operation the voltage applied to the control grid changes slowly and an electron is able to complete its trip from cathode to the anode side of the grid before the control-grid voltage changes appreciably. However, as the frequency is increased, the voltage applied to the grid changes more rapidly and electrons which started away from the cathode may not be able to travel outside the influence of the control grid before its voltage changes causing them to return to the cathode.

This means that controlled electrons are not received by the anode of the tube and that no amplification is possible by that device at these high frequencies. For instance, near the low-frequency end of the present UHF television band, 500 megacycles, 1 complete cycle or oscillation of the radio-frequency signal occurs in two-billionths of a second.

It might be well to note here the statement which has been printed is in error. It reads two ten-millionths, but this happens in two one-billionths of a second.

This means that 500 million times every second, and nearly a billion times per second at the high end of the band, the electrostatic field between grid and cathode makes a complete cycle of reversals.

This description of the transit-time effect is far from complete but should serve to indicate that one of the requirements of a UHF tube is that the physical distance from the cathode to the grid must be small.

Considering the second item, circuit constants, we are all used to thinking of a piece of wire as a conductor which is used to connect different parts of a circuit together. In our vacuum tubes wires are used to connect the active electrodes, the cathode, grid and plate, again, to the external circuit elements which make proper operation possible. At low frequencies these wires within the tube are just such conductors, but at ultrahigh frequencies this is no longer the case. At UHF these wires have relatively high inductive reactance, just as do the coils which make your radio work at low frequencies. Moreover, the total inductance which can be used at UHF may be several times less than that contained in only the leads of a regular receiving tube. Thus, another requirement of UHF tube design is that this lead inductance must be kept very low by some means if any of the circuit which the designer is to use is to be located outside of the vacuum tube. Unless this circuit is available to the designer, the receiver cannot operate properly.

These two factors dictate that the size of the tube must be limited. Other factors, such as standing wave voltage distribution on the active elements, interelectrode capacitances, cathode coating uniformity, operating temperature, plate dissipation, stability, and mechanical strength must all be considered.

In terms of cost, many of these requirements impose demands which can be satisfied only by the use of expensive materials, and the tube
engineer must arrive at an economical balance of efficient materials utilization and manufacturability against electrical performance.

Since 1949, when the 6AF4 design was made available to the industry, many improvements have been made in terms of its construction and performance, and the sketch which I have here and the cross-sectioned specimens which you have before you gives you some idea of the present construction of that tube.

Notice the extremely small control grid-to-cathode spacing.

That is the dimension on the lower right which is outlined in red.

You can see the extremely small control grid-to-cathode spacing and the small diameter wire which is used for these control electrodes.

To give you an idea of the physical size of this wire, consider that an ordinary human hair is approximately three one-thousandths of an inch in diameter, whereas the wire which is wound on the grid is approximately one one-thousandth of an inch in diameter.

That is the dimension shown in the upper left and outlined in red.

Also, consider that approximately 200 of these wires are stretched across every inch of the length of the control grid.

The spacing between the control grid and the cathode is much less than the thickness of an ordinary piece of paper. We are sure that you can appreciate the production problems that are inherent in manufacturing such a device.

In the UHF TV receivers under development during 1949, this oscillator tube provided energy to a crystal mixer. No RF amplifier tubes, other than the costly and difficult to apply lighthouse and acorn tubes were available.

Development work was initiated in 1950 to produce an RF amplifier tube which would operate with significant amplification at these high frequencies and would have a suitably low noise figure to be of use in TV receivers. In addition, development was being carried on to provide an improvement in performance reliability and other operating characteristics of the 6AF4 oscillator tube.

By 1950 the miniature tube was the standard of the vacuum tube industry and so a combined theoretical and experimental study was undertaken to determine the possibility of applying this physical structure to the needs of the amplifier and improved oscillator problems.

Considerable attention was paid to the factors involved in connecting the active elements of the vacuum tube to the external circuit elements, and it might be well to point out again that at these frequencies a considerable portion of the active external circuit is normally taken up by the leads within the tube.

Under my direction circuit work and vacuum tube research and development engineering was undertaken on a task force basis. The work of our group was reported at the 1952 IRE national convention and was published in detail in the January 1953 issue of the Institute of Radio Engineers Proceedings which was devoted to UHF TV.

Reprints of those publications which indicate the scope of our investigations are attached to our statement as well as copies of the Engineering and Application data for the commercial tube types 6AJ4 and 6AM4 which resulted from our efforts.

These types were made available to receiver manufacturers in the fall of 1952 and at the time of their announcement represented a considerable performance improvement over then current systems in terms of power gain and noise factor at the UHF frequencies.
The two tubes to which I refer are located as 1951 detector and 1951 amplifier, 6AJ4 and the 6AM4, respectively.

The crystal to which I referred is shown as 1951 detector, and that is that little brown object in the middle there.

The cost of adding these tubes to a receiver was, of course, considerable and in any receiving system placed on the competitive market the cost-performance ratio must receive serious consideration.

During the time that these tubes were being developed, considerable work had been done by crystal manufacturers in an effort to improve the performance of their products.

When the circuit development work had been completed for the commercial application of these tubes, the performance of crystal mixers was such that at the high end of the UHF TV band—that is around a thousand megacycles—very little noise figure advantage was obtained.

At lower frequencies the tubes presented a real advantage, and at least one manufacturer has included a tube mixer in his UHF head end.

To date only limited use has been made of the 6AJ4 RF amplifier tube by commercial manufacturers of TV receivers. It has been our objective to improve upon the performance of this amplifier tube, and considerable progress has been made in that direction in cooperation with the designers of UHF head ends.

In 1953 still another miniature type triode amplifier tube was introduced to these designers, and a highly efficient miniaturized version of the Planar lighthouse tube, known as the GL6299, was made available for possible future application.

The Triode type to which I refer is indicated as the 1953 amplifier, and the GL6299 is shown as 1955 with a big question mark.

This latter tube, the GL6299, is not yet in large-scale production, but does represent the present standard by which all other RF amplifiers are judged. It might be interesting to consider that the price of this tube alone is $55 and, therefore, it can hardly be considered for commercial application in entertainment type devices at this time.

From our standpoint, this has been a continuous development program. Today crystal detector units provide the primary method of converting UHF signals to the intermediate frequency signals at which TV receivers operate. As to the future we can anticipate almost immediate application of a new tube type which we have developed and which is similar to the tube shown on the display as 1953 amplifier. This tube, operating with highly developed circuitry, should provide an improvement in performance over presently available head ends. In addition, we are currently developing new devices which should provide additional improvements in receiver performance and which should be available to commercial users at a reasonable price.

Performance measurements have been made on various manufacturers' tuners to establish comparative gain and noise factors as a gage of performance. It has been our experience that there has been a marked improvement in both in the past year.

A year ago average figures might show about 25 decibel noise factor, whereas this year the average would be from 18 to 20. The best commercial units are considerably better than that, perhaps an improvement of 6 decibels might be possible between the average and the best unit.
Dr. Fink has mentioned these figures previously.

We have found that if we utilize the best practices applying the best tubes and optimum circuitry, we can measure noise figures at the high end of the UHF band less than 7.5 decibels. This noise factor would be roughly comparable to that which is realized in a standard VHF receiver today. However, it should be noted that a receiver capable of tuning all UHF channels and employing these optimum practices might well be expected to cost the consumer $175 to $200 more than presently available sets. Based on my own knowledge of the situation with respect to early VHF-TV receivers, the trend in UHF performance is comparable.

I would like to emphasize that the problem of achieving comparable performance in UHF receivers has been immensely more difficult. The progress we have made was only attained by building upon the stepping stones of VHF developments and by an optimistic approach and dogged determination to conquer the tube and circuit problems I have mentioned.

I would be hopeful that the committee members may have as much faith as I do in the ability of the electronics industry to solve any specific technical problem which is placed before it. That ability has been well demonstrated in both war and peace. It is impossible, of course, to establish a timetable for research and development, but amazing strides have been made, and will continue to be made in the more effective utilization of the radio spectrum.

Senator SCHOEPPEL. Thank you very much, Mr. Haase, for your testimony, and your explanations which you have given us the benefit of.

The exhibits which you have attached to your statement will become a part of the official records of the committee.

Senator SCHOEPPEL. I notice, in just looking at the witness list, in the absence of your chairman, who has been in attendance at another executive session of another committee and who will return as quickly as that is over, we have a number of witnesses here. We would like to get as many of them heard today as possible. Those who might feel disposed to summarize and, of course, have their entire statement filed, we will, of course, be happy to have them do that.

I mention that only in the manner of expediting the hearing and hearing as many of the witnesses today as we possibly can.

As I understand, Mr. Watts is the next witness. He is executive vice president of Radio Corporation of America.

Mr. Watts.

Let me say to you gentlemen who have testified: Thank you very much for your contribution here today. You have been most helpful.

Mr. Watts, we will let the record show that your entire statement officially becomes a matter of record, and you may proceed.

**STATEMENT OF W. WALTER WATTS, EXECUTIVE VICE PRESIDENT, RADIO CORPORATION OF AMERICA**

Mr. Watts. Thank you, Senator.

My name is W. Walter Watts, and I appear in behalf of Radio Corporation of America. I am executive vice president of RCA in charge of electronic products, and my office is at 30 Rockefeller Plaza, New York City. At the outset I would like to express RCA's appre-
ciation to the committee for permitting RCA to give testimony in this investigation of the status of UHF television broadcasting. We know that substantial problems exist at this time in connection with the development of the UHF and we believe that the committee's present investigation, to ascertain the fact regarding that development, is a healthy and constructive step.

My statement will not be directed to economic matters relating to programing and network affiliation of UHF broadcasters, but will be concerned primarily with RCA's development of the UHF as a technical service, and with apparatus which RCA has engineered and made available for use at the UHF.

Mr. Joseph C. Hellerman, vice president of the National Broadcasting Co., a service of the Radio Corporation of America, is scheduled to testify later in these hearings concerning economic aspects of UHF broadcasting and I will not anticipate that testimony.

RCA already has a very substantial stake in the success of television broadcasting at the UHF. We know of no other organization which has devoted as much money, as much time and as much engineering effort to the development of the UHF band. RCA has been engaged in development work in the ultrahigh frequencies for more than 20 years. To date, RCA has spent more than $16 million in bringing UHF to its present state of technical development. This expenditure involved the utilization of more than 1,800,000 engineering man-hours by RCA scientists and engineers.

In 1948, when the Federal Communications Commission instituted hearings on opening up the UHF band to television broadcasting, RCA and NBC installed a complete UHF television system operating in a 504- to 510-megacycle channel at the Wardman Park Hotel in Washington.

In 1949 RCA and NBC built and began operation of an experimental commercial-type UHF broadcasting station at Bridgeport, Conn. This was the first UHF station ever to broadcast commercial television programs on a regular schedule.

In 1952 RCA equipped and installed the first commercial UHF television station to go into operation, station KPTV, affiliated with the National Broadcasting Co., in Portland, Oreg.

According to statistics issued by the Radio-Electronics-Television Manufacturers Association, about 8½ million television receivers were manufactured by the entire industry during 1953 and the first quarter of 1954. During this period more than 23 percent of the television receivers manufactured and sold by RCA had UHF tuners built in at the factory. The average for the rest of the industry was about 20 percent.

For the first quarter of 1954, almost 28 percent of the television receivers shipped by RCA had UHF tuners built at the factory. During the same 3-month period, the average for the rest of the industry, as reported by RETMA, was 23 percent.

In addition, every RCA television receiver which does not have a UHF tuner built in at the factory is easily adaptable to UHF in the field.

RCA sells efficient and reasonably priced UHF tuners and selectors designed for these sets and the RCA Service Co. is available to install these tuners in RCA receivers.
RCA has just completed the manufacture of its first 4,000 commercial color television receivers. Each of these receivers was equipped at the factory with a UHF tuner.

We are proud of our record of pioneering and leadership in research and in manufacture of UHF television transmitting and receiving equipment, and we believe that our record gives us more incentive to continue to work for the success of television broadcasting at the UHF than any other organization. For this reason, we are particularly gratified that this committee has indicated interest in the future of UHF broadcasting.

To obtain an adequate understanding of present technical problems at the UHF, some historical background is appropriate to place present events in proper perspective. Accordingly, I will briefly review some of the pertinent historical facts relating to the development of the UHF band.

The search for space in the radio spectrum to accommodate the constantly increasing number of radio services has been going on since shortly after the invention of the three-element electron tube in 1906. Before the appearance of that tube, radio communications were limited mainly to point-to-point contact between ship and shore stations. The need for more spectrum space for this purpose was not critical and radio traffic congestion, when it did exist, could be blamed more properly on the crude apparatus in use rather than on any real scarcity of available wavelengths; but the coming of the versatile electron tube opened up a wide variety of uses for radio signals, many of them far removed from the original marine wireless applications.

Prior to the early thirties, the UHF portion of the spectrum—that is the portion of the spectrum from 300 to 3,000 megacycles—was a no-man's land exhibiting formidable obstacles to those who attempted to examine and utilize its widespread areas.

Actually, however, these obstacles were not unexpected. For many years substantial technical problems had been anticipated whenever the theory of wave propagation at high frequencies was examined by scientists; but, because the possibilities in this portion of the spectrum were admittedly tremendous, the UHF became a challenge to scientists and engineers despite the magnitude of the problems to be faced.

Senator Schoeppel. Might I interrupt you there, sir?
Mr. Watts. Yes, sir.
Senator Schoeppel. That is the bell I was afraid of, Mr. Watts.
We will take a recess until we can get back, and we hope we will not be too long.
Mr. Watts. Thank you, sir.
(Whereupon, at 3:56 p.m., the hearing was recessed and reconvened at 4:09 p.m., Senator Potter presiding.)

Senator Potter. The committee will come to order.

I am sorry it appears we are running this in shifts but, as you probably know by now, we have a lot of duties that take us away from time to time. I wanted to be here as much as I could during the hearings but it always happens that an executive session where a vote is needed has been taking my time.

I am informed that Mr. Watts was in the middle of his statement when the vote came, and if you would care to finish your statement, Mr. Watts, it will be fine.

Mr. Watts. Thank you. I shall continue, sir.
Early technical progress was disappointingly slow. Electrons, which were easily controlled when generated for tests at the lower frequencies, were obstinate and not easily regulated at the UHF. Tubes that functioned well at lower frequencies were practically useless in the higher region. Components and circuits, which had been devised for frequencies up to 300 megacycles, could not be depended upon to function at higher frequencies.

The first receiving-type electron tube to operate successfully at the UHF was a unique acorn tube developed by RCA engineers in 1933. The production of this tube was an important factor in breaking the logjam which theretofore had held up development at the UHF.

Also, in 1933, RCA engineers working in laboratories at Rocky Point and Riverhead, Long Island, produced 2 UHF transmitters which would operate on 462 megacycles with a power of 6 watts. After preliminary local tests, communication was established between the two towns. Existing tubes were adapted to novel circuitry and special antennas were developed to radiate the signals.

Later, when a 100-watt transmitter was developed, steps were taken to study the effect of greater distances on UHF transmissions. A small portable receiver and antenna were devised and mounted in an automobile to permit signal tests at greater distances from Rocky Point.

The experience and data obtained as a result of these early tests, particularly as they related to the sending of signals over the terrain involved and the relation of output power to reliable communications, marked an important step forward.

In 1941, RCA and NBC engineers built and operated the first radio relay of a television program picked up at a remote point and relayed by use of the UHF. An NBC mobile television truck at Camp Upton, Long Island, picked up scenes of Army recruits in training, transmitting the resulting signals by microwave to a tower near Hauppauge, Long Island, a jump of 17 miles, thence to a second relay at Bellmore, Long Island, 22 miles distant, and finally direct to New York City, another hop of 28 miles.

In April 1945 an experimental two-way UHF circuit was placed in operation between Philadelphia and New York City. Two relay points for the 82-mile span were selected, one 37 miles from New York and the other 26 miles from Philadelphia. Hundred-foot towers were erected at the repeater stations with experimental equipment housed in enclosures on each tower top. The power used in tests of this circuit was approximately one-tenth of a watt.

In 1950, RCA designed and manufactured microwave equipment for the Pennsylvania Turnpike. Utilizing 960 megacycle apparatus, the system as now operated employs 13 UHF relay stations to pass the signals from one end of the 327-mile highway to the other.

Shortly after the completion of the Pennsylvania Turnpike system, RCA worked on the planning, design, and manufacturing of a UHF microwave system for the New Jersey Turnpike.

Dependable interconnections between various field headquarters of the Allied air forces in central Europe were established by an extensive UHF radio relay system also engineered and installed by RCA.

The versatility of this system was demonstrated in 1953, at a time when winds and tides caused disastrous floods in the low countries of northwest Europe. When telephone communications broke down,
some of these NATO units were rushed to Holland and functioned successfully until normal telephone lines could be rebuilt.

I have briefly outlined these various diverse facets of work by RCA engineers in the UHF preliminary to discussing our work specifically directed to television broadcasting at the UHF. I have done this because, in considering and evaluating the present status of UHF television broadcasting, it is important to remember that, only a short time ago, any radio use of the portion of the spectrum above 300 megacycles was not commercially feasible. Only within comparatively recent years has it been possible to utilize the UHF band commercially.

As a result of constant pioneering research, the commercial utilization of the UHF spectrum has continually been expanded; but it would be a mistake to assume that there is not substantial room still left for additional technical development of apparatus for use at the UHF frequencies and for improving service at those frequencies.

It is to this end that RCA has in the past made, and continues to make, substantial investments; and we believe that no other organization has made contributions remotely approaching those made by RCA engineers and scientists in this field.

Work at the ultrahigh frequencies undertaken, for example, to perfect point-to-point microwave service develops experience and skills useful in television broadcasting at the UHF. Conversely, development work in broadcasting at the UHF develops experience and skills which may be utilized in other applications employing UHF frequencies. With increasing knowledge of the performance of electrons at the UHF, it thus becomes possible to obtain more effective utilization of these frequencies.

It took television, however, and the great incentive to expand television as a postwar service to the public, to bring the higher frequencies to the forefront as a broadcasting service.

Because a television signal takes about 600 times as much space in the spectrum as a standard sound broadcast signal, the Federal Communications Commission early realized it would have to find additional spectrum space into which the rapidly growing television service could expand.

In 1945 the Commission tentatively set aside the UHF band from 480 to 920 megacycles for experimental television broadcasting.

As part of its report of May 25, 1945, providing for this allocation the Commission stated:

The Commission repeats the hope * * * that all persons interested in the future of television will undertake comprehensive and adequate experimentation in the upper portion of the spectrum. The importance of an adequate program of experimentation in this portion of the spectrum cannot be overemphasized, for it is obvious from the allocations which the Commission is making for television below 300 megacycles (VHF) that in the present state of the art the development of the upper portion of the spectrum is necessary for the establishment of a truly nationwide and competitive television system.

RCA and NBC had already been engaged for years in research and development work on problems affecting the UHF. For this reason, they were in a position promptly to respond to the Commission's challenge.

Although prior to 1946 there was comparatively little television broadcasting experience at the lower frequencies and no television
broadcasting experience at frequencies above 70 megacycles, by early 1946 RCA and NBC engineers were ready for preliminary field tests. By midsummer of that year, a 67.25 megacycle transmitter and a 288 megacycle transmitter had been developed, built and installed by RCA and NBC engineers in the Empire State Building in New York.

Both transmitters fed omnidirectional antennas above the roof of the Empire State Building. These were complete broadcasting systems insofar as the television components were concerned. A comprehensive series of tests of the signal broadcast by these transmitters was then undertaken by RCA and NBC engineers. Experimental model receivers were spotted at various points and field measurements and observations made to acquire information on the variation of propagation as a function of different terrain conditions and to show the magnitudes and differences of multipath effects at the two frequencies.

Despite severe multipath and shadowing conditions created by the tall buildings in Manhattan, it was nevertheless possible to obtain usable pictures in most locations.

Further development of directional receiving antennas specifically adapted for use at the UHF was undertaken and these antennas were found of substantial value at the higher frequencies.

Later in 1946 additional observations were made of broadcasts at a frequency of 490 megacycles and, by 1947, it became possible, with knowledge and experience obtained in the previous tests, to extend the frequencies used up to 910 megacycles.

The RCA tests showed the necessity of increasing the radiated power with any increase in frequency. Accordingly, our engineers designed and installed high-gain unidirectional antennas on the 87th floor of the Empire State Building. In addition, new and improved models of UHF transmitting equipment were designed and installed. Although not of broadcast caliber, these transmitters served to extend the propagation studies through the UHF television range before better transmitters were available.

As a result of the intensive work carried on in connection with these experimental transmitters we learned more about shadowing effects resulting from terrain obstacles and the need for increased power at the higher frequencies.

Senator Potter. What is mean by "shadowing effects"?

Mr. Watts. If there is a building in the way of the signal, immediately behind the building, you may not be able to receive it on the UHF.

Senator Potter. I see.

Mr. Watts. And with the multipath effects, on the other hand, behind the building, you may be able to see the signal reflected over another building.

That is one of the characteristics of the UHF.

Senator Potter. Do they have that problem with VHF?

Mr. Watts. To a certain extent, but not to the same magnitude.

It became apparent that it would be necessary to make appropriate changes in then existing concepts of the UHF and that direct comparison to, or equivalence with, the VHF was not appropriate.

Our tests and surveys also indicated that it was doubtful that a UHF station would serve as many viewers per dollar expended as a VHF station. Nevertheless, it was also apparent that UHF could be so
developed that, under proper conditions and with adequate apparatus, it could render service to the public as a broadcasting medium.

In 1948, we had made plans to operate a complete experimental 500 megacycle television broadcast system atop the Empire State Building in New York. Our objectives were to gather field data for a commercial broadcast system operating at the UHF and to gain experience with the installation and operation of UHF home receivers.

When, in May of 1948, the FCC announced it would hold public hearings to obtain information on possible utilization of UHF frequencies in the 475 to 890 megacycle band for television broadcasting, we decided it would be preferable to establish operations for our test in Washington. Accordingly, we installed a complete television system operating in a 504 to 510 megacycle channel at the Wardman Park Hotel. Fifty home installations of experimental-type UHF receivers were made throughout the Washington area to check the results of these transmissions. In connection with the home receiver installations, we designed and constructed home receiving antennas adapted to UHF reception and UHF converters to be attached to existing VHF receivers.

With antennas on the WNBW tower radiating the same program at both the UHF and the VHF, it was possible for us for the first time to compare results at the UHF and at the VHF under similar conditions.

At each installation, receiver terminal voltages for the UHF and for the WNBW channel 4 transmission were measured and compared. Here again, analysis of the data corroborated the conclusions reached as a result of previous tests—significantly higher radiated power would be required at the UHF to establish broadcast service comparable to the existing service at the VHF.

This led to the development by us of high-grade omnidirectional transmitting antennas. One of the natural consequences of the increase in radiated power requirements was to seek more advantageous distribution of the radiated power and this, in turn, led to further experimentation.

As a result of the information obtained from the Washington tests, we decided we were ready to go ahead with a test of a commercial-type UHF station. Accordingly, land was purchased by us at Stratford, Conn., near Bridgeport, for the first test of a commercial-type UHF television broadcasting station.

The Bridgeport area was selected because its terrain was typical of many other locations in the United States where UHF might be called upon to supply a television-program service.

On February 8, 1949, the National Broadcasting Co. applied to the Commission for a construction permit for an experimental station and, on May 4, 1949, the permit was granted. The project was rushed to completion by RCA and NBC engineers.

On December 29, 1949, the first commercial-type UHF television broadcasting station in the world, KC2XAK, went on the air using the band of ultrahigh frequencies between 520 and 535 megacycles.

Two weeks later, on January 19, 1950, this pioneer station inaugurated regular UHF television-program transmission on a 5-day-a-week schedule.

From 9 in the morning to signoff time in late evening, the Bridgeport experimental station rebroadcast programs picked up from
WNBT in New York by means of a 2,000-megacycle microwave relay direct from the Empire State Building.

Later a second transmitter, operating on 850 megacycles, was also installed by us at Bridgeport to permit a study of transmission and antenna techniques at the upper end of the UHF band.

We also built and distributed among local residents 50 receivers equipped to receive both UHF and VHF and 50 UHF converters for attachment to existing VHF receivers. These instruments were placed in homes in and around Bridgeport at locations selected by RCA and NBC engineers. Technicians of the RCA Service Co. installed and serviced these sets.

To supplement the data derived from reports of viewers in whose homes UHF sets had been placed, RCA also equipped a mobile unit to make additional tests. Our mobile unit was installed in a truck and included sensitive instruments to measure both signal strength and interference. By laying out and following radials, the mobile unit with its crew of six covered the entire area of the station's effective range.

Regular reports were made by the personnel of the experimental broadcasting station, by the persons in whose homes receivers and converters had been installed and by the technicians who comprised the crew of the mobile-unit truck.

For the first time it was possible to obtain results of a practical test of UHF broadcasting under conditions approximating those of commercial operation.

The data derived were analyzed and prepared as an exhaustive report, copies of which were filed with the Federal Communications Commission. In addition, RCA and NBC engineers published the data in technical papers so that all segments of the television industry would have access to the information.

RCA and NBC assumed the full responsibility for, and the expense of, planning, conducting, and reporting these activities.

For more than 2 years experimental UHF television broadcast station KC2XAK served as an electronic guinea pig for the entire radio and television industry.

The experiment was costly but the station's facilities and the experience our engineers obtained as a result of the experiment were offered to competing electronics manufacturers for tests of their own equipment.

Representatives of the FCC and of virtually every electronics manufacturer came to Bridgeport in order to learn the newest developments in UHF and to test UHF receivers.

The data we collected from the 2-year operation were made available to the FCC, to the industry, and to American broadcasters.

The Bridgeport experiment resulted in obtaining substantial additional important information, much of which would not otherwise have been available to the industry. For example, the experiments demonstrated that the propagation pattern permitted the use of specially shaped vertical antenna patterns and the possibility of serving a specified area with constant field strength and improved efficiency was found to be feasible.

During the period of operation of the station at Bridgeport, the signal was recorded at the David Sarnoff Research Center at Princeton, N. J., about 90 miles away. This recording and a similar re-
cording at Riverhead, Long Island, were undertaken at the request of the Federal Communications Commission. Our studies led us to the conclusion that tilting the antenna would permit the station to adapt its signal to meet the requirements of its individual locality and terrain and distribute the radiated power more efficiently throughout the desired service area. This, in turn, eventually led to further development of the RCA Pylon Antenna for UHF television. This slotted cylinder-type antenna, although remaining vertical, can readjust electrically to provide the same effect as would be obtained by mechanically tilting the antenna structure.

At the same time, and particularly in view of the higher power requirements which were now seen to be inevitable for UHF television broadcasting, work continued on improved types of power tubes. These types included tubes capable of greater power output which higher frequencies required, such as the 6181 developed in 1951. The 6181 was a forced-air cooled power tetrode for UHF television service capable of a synchronizing level power output of 1,200 watts at 900 megacycles.

Work also continued on new types of tubes for UHF receivers designed to solve the unique problems posed by reception of television broadcasts at the UHF.

One of the previous witnesses went into that in some detail. Special monitors for UHF stations, UHF coaxial transmission lines and components and UHF wave guides and components also received concentrated attention.

New types of receiving antennas appropriate for the home were devised by our engineers and installed and tested by technicians of the RCA Service Co.

Although by the end of 1951 the Commission had not yet taken final action in opening up the UHF band to commercial television broadcasting RCA, in response to the Commission’s challenge in allocating portions of the UHF band for television, already had made it possible for broadcasting to commence at the UHF whenever the Commission deemed such action appropriate.

On April 14, 1952, the Commission issued its new allocation of UHF frequencies setting aside 70 UHF television channels occupying the band between 470 and 890 megacycles.

The first commercial UHF station to go on the air following this Commission action was Station KPTV in Portland, Oreg., installed and equipped by RCA and owned by the Empire Coil Co.

Learning that our experimental Bridgeport station had completed its assignment, the owners of the Empire Coil Co. contacted RCA to obtain the Bridgeport facilities and have them shipped to Portland.

A crew of RCA engineers started dismantling the Bridgeport station on August 18, 1952. Manufacture of a new UHF antenna was expedited and delivery of accessory equipment made to Portland. A group of RCA engineers and technicians traveled with the transmitter and other equipment by train, plane, and truck and, once on the site, immediately commenced reerecting the units.

In only 30 days from the close-down in Bridgeport, the KC2XAK transmitter, now carrying the commercial call letters KPTV, went on the air at Portland, the first commercial UHF television station ever to be put in operation and the first television service to be made available in that community.
Anticipating that Portland’s residents, previously outside the range of any television station, would crowd to retail stores for receivers, RCA rushed substantial quantities of UHF receiving equipment to that city; other manufacturers did the same. The shipments included receivers with built-in UHF tuning facilities and converters to enable VHF receivers to pick up the signals from the Portland station. With the Bridgeport experience to guide them, RCA Service Co. personnel were on hand to install receivers and converters and supply the necessary service.

The day after station KPTV broadcast its first signal into Portland, RCA began a thorough field survey of the Portland area to obtain additional information on the performance of UHF receivers under operating conditions.

This information, in turn, was collated and analyzed to form the basis of a series of studies on the Portland operation which were released by RCA to the Commission, to prospective UHF station owners, and to competitive manufacturers.

The first four production model UHF television transmitters were shipped from the RCA plant in Camden, N. J., on December 19, 1952. From that time on UHF television transmitting and receiving equipment has continued to be turned out in substantial quantity by RCA.

There are now 75 RCA 1-kilowatt UHF transmitters in use. More than half of the UHF television stations in operation are equipped with RCA transmitters and they are giving good service.

In this connection we were gratified recently to read comments, filed April 13, 1954, in an FCC proceeding, by Radio Columbia, the owner of station WCOS-TV at Columbia, S. C. Station WCOS-TV is equipped with a standard RCA 1-kilowatt transmitter.

A report filed by the president of station WCOS-TV with the Commission states that the present RCA transmitter installation provides an effective radiated power of 8.32 kilowatts in a horizontal plane and the location of the transmitter is such, with respect to the city of Columbia and the size of the city, that the FCC minimum field requirements are not only met but exceeded.

These factors, according to the WCOS-TV comments, are such that the station is in a position to say that its present installation enables it:

* * * to give highly satisfactory local coverage and generally satisfactory rural coverage to 40 miles or more. That this is true is shown by the fact that the last survey in the city of Columbia indicated that in excess of 86 percent of the television receivers were equipped to receive UHF.

Comments also were filed with the Commission in the same proceeding by the Piedmont Broadcasting Corp., licensee of Station WBTM-TV, which provides UHF television broadcast service to the Danville, Va., area. Station WBTM-TV uses an RCA 1-kilowatt UHF transmitter.

Attached to the WBTM-TV comments was an affidavit by Edward C. Gardner, vice president of the corporation, stating in part that:

The public response by communications to station WBTM-TV since the commencement of operation has been most gratifying from a coverage standpoint. Within the city of Danville, the comments have been enthusiastic with respect to the quality of the signal received, and there have been no complaints of failure to receive WBTM-TV service in Danville by reason of receivers located in dead spots. In addition, there have been communications from persons living in communities as far distant from Danville as 65 miles complimenting the station on the service which has been rendered.
In many communities a transmitter with a rated power of 1 kilowatt may with present antennas give an effective radiated power of from 15 to 20 kilowatts and render good service.

The sole consideration is by no means the rated power of the transmitter. Among other factors which must be considered are terrain, antenna system characteristics and antenna location and height.

Often an adequate signal can be obtained more effectively and economically with a properly contoured high-gain antenna and a relatively low rated power transmitter than with a transmitter of higher power rating and a less effective antenna. In addition, a high-gain antenna having a properly contoured pattern not only can provide a good signal over the principal community to be served, as is the case with WCOS-TV and WBTM-TV, but also may have the effect of extending and improving coverage in other areas.

As of the middle of last month RCA had 29 firm orders on record for 1-kilowatt transmitters.

Senator Potter. Do I understand by this that it is not necessarily the power of the transmitter that makes the good signal, that your antenna has a great part to play in it?

Mr. Watts. That is correct.

Senator Potter. From your knowledge of the present UHF stations, are antennas normally put up properly and efficiently?

Mr. Watts. Yes; they are all using high-gain antennas of one kind or another, and the point we are trying to make here is the fact that UHF stations have been restricted by the development of our two relatively low powers and have not yet been able to provide powers up to the limit allowed by the Commission is not, in itself, the limiting factor in the success of the UHF.

The RCA 1-kilowatt transmitter has been so designed that it can serve to drive a 12-kilowatt amplifier. We have designed such an amplifier for those who desire higher power and we now have on hand 47 orders for 12-kilowatt amplifiers.

It is expected that the first of these amplifiers, designed to operate on any UHF channel, from channel 14 to channel 83, will soon be ready for delivery. When used in conjunction with the presently available RCA high-gain UHF pylon antenna, this transmitter and amplifier combination will be capable of providing effective radiated power of from 200 to 300 kilowatts.

We are also developing a new UHF high gain, high power antenna having a power gain ranging to values in excess of 50. This antenna, when used in combination with our 12-kilowatt transmitting apparatus, will provide effective radiated power of from 500 to 600 kilowatts, and is a long step toward the 1,000 that the Commission has allowed.

Two decades of intensive UHF tube development by RCA engineers and scientists were climaxed in March of this year with the introduction of the most powerful beam power tube ever developed, the RCA-6448.

In color and black and white television service the RCA-6448 can deliver a synchronizing level power output of 12,000 watts at 900 megacycles. Development of this tube promises increased economy, efficiency, and simplicity in UHF television broadcasting.

RCA also has been a leader in the manufacture and promotion of UHF home receivers. It is RCA policy aggressively to promote the
sale of UHF receivers. As a result, the percentage of UHF receivers leaving our factory is well above the average of the balance of the industry.

For the first quarter of 1954, the latest period for which industry-wide UHF receiver statistics are available from the Radio-Electronics-Television Manufacturers Association, 23 percent of the television receivers manufactured and shipped by others in the industry were equipped at the factory for UHF reception. During the same period almost 28 percent of the receivers manufactured and shipped by RCA were factory equipped for UHF reception. Accordingly, the proportion of UHF-equipped receivers shipped by RCA in the first quarter of 1954 was almost 22 percent higher than the proportion of UHF-equipped receivers shipped by the balance of the industry.

Our policy is to make and sell as many UHF receivers as our dealers can sell. In this we are governed by public demand.

We have made substantial efforts to promote the sale of factory-equipped UHF–VHF receivers in all areas in which UHF television broadcasting is available. On the other hand, inasmuch as there is a price differential between UHF receivers and VHF receivers, because of competitive reasons we are not in a position to require our distributors to supply UHF–VHF receivers exclusively in areas in which UHF receivers are available.

In our shipments of various types of receivers, we are and must be governed by what the public is willing to buy. Naturally, we hope that the public will continue to buy a substantial number of receivers UHF equipped at the factory. The fact that we have shipped a greater proportion of factory-equipped UHF receivers than the industry average shows that our promotion of this type of receiver has been hard hitting and successful.

Since January 1953, all models of RCA Victor television receivers have been available factory equipped for UHF. In addition, every current RCA VHF receiver is designed that, if the purchaser initially buys a VHF receiver and later desires UHF, a UHF tuner can readily be internally installed.

RCA also sells a number of types of external selectors for use in UHF conversion.

The RCA Service Co. is available in most television markets to make the necessary alterations to adapt receivers for UHF.

Recognizing the need for informative material on the theory and application of ultra-high frequencies, the RCA Service Co. in 1952 prepared a booklet entitled "Introduction to UHF Television." Material from this book was presented in the form of lectures to 117 groups of service technicians. More than 8,000 men who were interested in the new upstairs field of radio attended. Upward of 65,000 copies of the booklet have been distributed throughout the industry.

A detailed study of the applications of RCA Victor instruments to UHF reception was compiled and presented as another lecture series. Entitled "Technical Aspects of RCA Victor UHF Receiving Equipment," the talk was given at 78 meetings attended by 5,700 technicians representing various segments of the industry. Nearly 40,000 copies of this lecture in printed form have been distributed as an aid to UHF development.
From 1931 to 1945, members of RCA’s engineering and laboratory staffs were authors of 65 articles on the subject of UHF in general, and specifically on theory, circuits, components, and systems. From 1946 to the end of 1953, articles on these and allied subjects totaled about 150.

The indexes of technical papers on UHF written and contributed to periodicals by RCA engineers that are available are impressive. These technical papers embody much of the basic research and development work which have proved fundamental in the advancement of UHF.

Publications written in nontechnical language for the information of the public have been equally a part of RCA’s forward-looking plans for promoting UHF.

“UHF—What It Means to Television * * * And to You” was a 24-page pamphlet distributed gratis to schools, libraries, and to individuals. It related the history of UHF, the characteristics of UHF as they varied from VHF, and pointed out the increased television program service that UHF would provide for the Nation’s viewers.

Another pamphlet, “UHF Questions and Answers,” was prepared by RCA as an aid to television dealers in supplying information sought by the public. Phrased in simplified form, the data covered the field in question-and-answer form for fast assimilation by the reader. Three hundred and fifty thousand copies of this publication have been distributed by us.

Contributions have been made by many branches of the RCA to development of the UHF, and I do not wish to take time today to discuss each of these other than merely to refer to the general type of work which RCA has done.

In our work on the development of UHF transmitting and receiving equipment, RCA and its subsidiaries have invested more than $16 million in engineering development. This includes more than 1,800,000 engineering man-hours.

The RCA Laboratories participated in the development of high-power UHF tubes, UHF black and white and color television transmitters, tests of UHF propagation, UHF field intensity recording, and research into UHF receiver and UHF selector development.

The RCA tube division has developed 18 transmitting tube types and 23 receiving tube types specially adapted for use at the UHF.

The RCA engineering products division has utilized the transmitting tube developments by the tube division in engineering transmitters specifically designed for operation at the UHF. Likewise, our engineering products division has developed antennas specifically designed for use at the UHF, monitors, UHF coaxial transmission lines and components, and UHF wave guides and components.

The RCA Victor home instrument division has worked on the development of UHF receivers and selectors and tuners for the purpose of adapting VHF receivers for UHF reception.

The RCA Service Co. has developed UHF home receiver antennas, UHF-VHF all-weather transmission lines, and measuring techniques for UHF components. These items have helped to make it possible for VHF receivers in the field to be satisfactorily adapted for reception at the UHF.

Simplified UHF test equipment also has been developed by the RCA Service Co. and area surveys have been conducted in such places as
Bridgeport, South Bend, Portland, Wilkes-Barre, York, Trenton, Norfolk, New Castle, Reading, Augusta, and Asbury Park. The results of these surveys have been made available to the entire television service industry in order to enable it to be in a position to provide the best possible UHF reception on all makes of receivers.

The fact that there may be some limitations inherent in television at the UHF as compared with VHF obviously did not deter RCA in its pioneering. In fact, these limitations have served as an incentive to our engineers and scientists to work harder in an effort to provide the best possible service at the UHF. As a result, although there are various respects in which broadcasting at the UHF does not equal VHF, we believe that the UHF has been so developed that today, under most conditions and with proper apparatus, it can render satisfactory service.

Senator Schoeppel. I would just like to ask at that point: I notice up there at the top of page 29 the great Midwest, outside of South Bend, was neglected. Do you figure that was satisfactory?

Mr. Watts. Portland, Oreg., sir—

Senator Schoeppel. I mean in the Midwest. That is the Pacific coast.

Mr. Watts. I think that had something to do with the way the station went on the air. No slight was intended, I assure you.

We are continuing our exploration and experimentation at the ultra-high frequencies in an effort to build on and to improve the knowledge and experience which we already have and which we have made available to the industry.

On April 26 of this year the Federal Communications Commission granted an RCA application for special temporary authority to conduct experimental field tests of a new method to extend coverage of UHF stations to shadowed areas. This system utilizes a low-power auxiliary transmitter developed by RCA engineers. The newly developed equipment will be installed near Vicksburg, Miss., in cooperation with station WJTV of Jackson, Miss.

That, I believe, Senator, is somewhere in the Midwest.

An auxiliary transmitter installed some 30 miles from the WJTV main transmitter is expected to provide improved service for areas in which reception now is shadowed by geographic elevations.

Plans for a full-scale field test of the new system have been formulated, and exhaustive measurements of picture quality and other factors will be made available to the industry as these tests progress.

The Vicksburg experiment is one more example of our determination to explore every engineering avenue in an effort continually to improve service available at the UHF.

A few days ago, on May 10, Federal Communications Commissioner George E. Sterling participated in a symposium on UHF held by the Washington section of the Institute of Radio Engineers. In the course of his remarks he said:

* * * I think that you, as engineers, will agree with me that the pioneer experimental work done by RCA and NBC at Bridgeport, Conn., plus the successful operation of some UHF stations, give ample demonstration that it is possible to provide high-quality TV-broadcasting service on UHF channels.

RCA has already made what it believes to be a greater investment in time, effort, and money than any other organization in the future of UHF.
It was the history of broadcasting at the VHF that, for most television broadcasters, years passed before their investment became profitable.

It took a pioneering spirit and determination to continue to operate VHF stations in the early days of television broadcasting.

We see no reason why those who today are pioneering at the UHF should expect that their path will be easier in this comparatively new field than was the experience of VHF broadcasters.

That concludes my formal report.

I would like to enter into the record a copy of a broadcast division technical magazine that we put out every other month, which has in it UHF's success story, the development of a new UHF television wave guide, and another story on WFTL-TV rounds out a year of successful UHF-TV broadcasting.

Senator Potter. Without objection, that will be incorporated in the record at this point and will be made part of the official files of the committee.

Mr. Watts. That concludes my statement.

Senator Potter. Mr. Watts, what do you think about the possibility of tailoring the operation to meet the needs of the community rather than just setting a minimum standard?

Mr. Watts. Tailoring?

Senator Potter. Yes. Is that logical?

Mr. Watts. Well, I think that will follow as a natural result of the development of the art.

I don't think anybody is going to put the thousand kilowatts on at the UHF or 316 kilowatts at the VHF to cover a town or an area, service area, that can be covered with substantially less power. That seems not to be good economic sense, and I would think, as we have found in AM broadcasting and in existing television broadcasting, you will find——

Senator Potter. The move to take care of the needs?

Mr. Watts. That is correct.

Senator Potter. Senator Schoeppel.

Senator Schoeppel. No further questions.

Senator Potter. Thank you.

Mr. Watts. Right.

Senator Potter. Mr. Roberts.

Mr. Roberts. Yes, sir.

Senator Potter. I might announce that we will conclude after Mr. Roberts' statement and, in order to hear as many witnesses as we can tomorrow, I will announce now we will start at 9:15, in this room.

STATEMENT OF WILLIAM A. ROBERTS, GENERAL COUNSEL, ULTRA HIGH FREQUENCY TELEVISION ASSOCIATION

All right, Mr. Roberts.

Mr. Roberts. My name is William A. Roberts. I am the senior partner in the law firm of Roberts & McInnis, in the Desales Building in Washington, D. C.

My early engineering and legal professional career was primarily directed in matters affecting the regulation of utilities and transportation companies.
For the last 25 years, I have been associated with the communications industry, and since 1938 I have been counsel for Allen B. Du Mont Laboratories and later for the Du Mont television network. A very substantial part of my practice has been in representation of States and cities and consumer interests, and I served for 6 years as special assistant corporation counsel and people's counsel for the District of Columbia.

In this proceeding, I am testifying as general counsel of the Ultra High Frequency Television Association, a nonprofit corporation of the District of Columbia, formed in the fall of 1953 by a substantial number of ultra high frequency television broadcasters and licensees.

Senator Potter. How does this association differ from the UHF coordinating committee?

Mr. Roberts. The UHF coordinating committee represents a very considerably larger number of the broadcasters who have come together with the members of the Television Broadcasters Association primarily for the purposes of this hearing. That is the group Mr. Cottone is working with.

Senator Potter. In other words, you have people who belong to your association who are still members—

Mr. Roberts. Yes; who are still members of the coordinating committee, and I have, myself, worked with the coordinating committee a great deal, as they have with me. There are, however, some differences or variety in our presentation, which has a broader coverage with respect to the UHF than does the coordinating committee.

This organization was originally equipped with a technical staff for comprehensive study of the difficulties affecting the use of the ultra-high frequencies in television and for the purpose of seeking remedial action. Original founding members contributed $5,000 each toward this organization. The rate of contribution proved impossible to most of the industry—and the staff, incidentally, has disappeared.

Mr. Goldberg, who will testify, was executive secretary and was the economist for the committee up until some short time ago. He will testify for the coordinating committee.

So, you can see the sources are much the same.

I have appeared in all the major television proceedings before the Commission of an industrywide nature since 1938 and conducted the Du Mont presentation in the allocation proceeding.

In this instance, my testimony is to be taken as the official report of the Ultra High Frequency Television Association and my own personal views, although the statement has been completely coordinated with all of the operators in the industry who have evidenced interest, and particularly with the coordinating committee formed for the purpose of presentation in this proceeding before the Senate.

A list of our present members and of other operators who are associated with the association in this proceeding is appended to the copy of my testimony which I am handing to the reporter.

With certain limitations on engineering subjects, I will be available for questioning on the regulatory, economic, or legal phases of the industry's problems.

This is a very condensed version of the report, and I will be glad to depart from it at any time.

The question: Let us examine first the problem before us and define the scope of UHF's present difficulties. The basic issue before the
Senate subcommittee with respect to the regulation of television broadcasting is that it must make recommendations looking toward the creation and assurance of a truly nationwide actually competitive television system in the United States. More specifically, the subcommittee will examine into the question of whether or not the ultra-high-frequency channels of the radio-frequency spectrum have been properly and efficiently utilized.

The position of the Ultra High Frequency Television Association takes the position that immediate action is absolutely necessary for the preservation of free communication by television under the commercial system presently in use in the United States. If such immediate action is not forthcoming, the public interest, convenience, and necessity will suffer irreparably in that there cannot exist a truly nationwide competitive television system.

POINTS OF RELIANCE

(1) The television medium: Television is the most powerful medium of mass communication yet devised. However, under present Government regulation it is on the way to becoming part of a monopoly of communication.

Unquestionably democratic government cannot tolerate a private monopoly of communication. At the other end of the scale is inevitable Government ownership and the death of commercial competitive independence in the television field.

The subcommittee must assist in charting an administrative course between these extremes, a course that is at the same time healthy with free enterprise, yet not conducive to monopolistic control.

(2) VHF channels are inadequate: It is a practical impossibility to provide adequate television outlets for either sustaining service or commercial programing on the 12 available VHF channels.

At this stage of the debate the subject, I think, requires no additional proof. The Commission and everybody else in the industry agrees it is impossible to serve the country with the 12 VHF channels.

(3) Difficulty of adding V channels: While 1 or 2 more VHF channels may be added by ousting other radio services from parts of the spectrum, the total would still be far short of the minimum number required. Furthermore, the addition of 1 or 2 new VHF channels would necessitate a new type conversion of millions of existing television sets and, as in the case of UHF, would entail economic difficulty in establishing service on the new channels. In and of itself, the addition of 1 or 2 VHF channels is not a solution.

The proposed channels could be that which was designated as channel 4½ which, as explained to you by the Commission, fell in the middle of the television spectrum, or it could be the first channel of the FM, which would be 6½.

In the case of the 4½, you have to move everything up 2 megacycles, which means that all those presently assigned at channels 5 and 6 throughout the country would no longer serve the public.

The portion of the public which already has receivers adapted to those channels 5 and 6 would have to adapt their receivers and modify them.

The statement was made that possibly that could be secured by a serviceman's adjustment. We have had the statement made to us, as
a result of long canvass of the numerous manufacturers and a good deal of laboratory workers, that is not always true, that it might require more service adjustment than the slight change of 2 megacycles in the tuning.

When you get to channel 6½, which is at the bottom of the FM channel, you have difficulty getting that spectrum, which is very badly needed, anyway. The FM people want it. There are certain governmental and commercial users which find it more desirable than other places in the spectrum, and the use of that 6½ generally would mean, of course, you would have to revise all existing receivers, both all-channel receivers and VHF channel receivers, except a very few continuous tuning receivers, so as to pick up the new 6½ channel.

So, you would have a conversion problem affecting whoever got moved to that frequency.

Senator Potter. You would have to convert most of your sets?

Mr. Roberts. You would have to convert practically all the sets. Very few sets in the tens of thousands of sets were ever built so they had continuous tuning all the way through, from the lower band of the VHF channels up through to the UHF channels.

Now, in that connection, I point out this discussion of two additional channels has to do with an effort to get a complete television system by adding more VHF channels.

Another method of adding VHF channels, above the top half of the VHF band, in joint service with various governmental agencies, has been suggested, in which you could probably obtain, by duplicating Government service, some 10 or 12 additional VHF channels.

We had hearings as early as 1940 and 1941, which demonstrated that even 22 channels would not be adequate, and you have seen the statement made in this record that you can't even take care of the entire competitive needs of the country with even 70 channels.

So, let's dismiss as foolish the suggestion you can get a true competitive system of television by using all VHF.

UHF is the only universal service.

In the present compromise, the joint use of VHF and UHF channels even if allocations were ideal, is less satisfactory than an entirely UHF service for which receiving and transmitting equipment could be standardized throughout the Nation. Such an all-UHF system could result undoubtedly in a marked superiority in freedom from noise, interference, and in economy of construction.

I will say in that connection—those are very condensed words again—that we who are primarily interested in UHF are very well satisfied that UHF can have freedom from external noise—for example, natural noise like lightning—

Senator Potter. Airplane.

Mr. Roberts. Airplane, and so forth, is not as important a factor in UHF.

Senator Potter. I was interested here in your statement as to economy of construction. I had assumed it cost more.

Mr. Roberts. Well, we have, to the extent of our ability, through being in the industry before and our contact with the consulting engineers association, with which we try to work as closely as we can, and the manufacturers, knowledge in the laboratory, certain facts about UHF, which indicate that to be the case once you get past the developmental stages. For example, a UHF antenna is a very small
thing compared to a 12-bay VHF antenna, and when you are up at
the top of a thousand-foot tower that makes a lot of difference from
the standpoint of wind pressure, and other matters of that kind.

There are certain factors about UHF which could some day lead to
actual economies, although at present it may have some larger costs.

Technical development: Propagation characteristics and a time-
consuming delay in development of equipment hamper technically
UHF broadcasters in competition with VHF, but in time, these techni-
cal disadvantages can and will be overcome.

They have principally to do with questions of the power, perfection
of apparatus, and development of new designs.

In that connection, I might comment on earlier testimony in this
fashion: It has been suggested that perhaps a thousand-watt trans-
mitter was a pretty good thing for a UHF operator. Let’s not be mis-
led. The Commission put 1,000 kilowatts in there because they knew
we needed it and, while you can get by and get a good signal on a
thousand-watt transmitter, it puts you in the same category as a 250-
watt station, with kind of a second-class or secondary citizenship.

That is what we are here to fight against. We don’t want the
thousand-watt transmitter.

In its recent action, the Commission did propose the elimination of
the VHF transmitters below 5 kilowatts. That is still pending. We
oppose this action because in the small markets at the present time,
with the present UHF economy, the small UHF operator can’t afford
to keep changing the size of the transmitter every 3 months, as often
as higher power continues to develop, from 1 kilowatt to 3 kilowatts,
12 kilowatts, 25 kilowatts, and 50 kilowatts. There isn’t enough
money in the world for the UHF operator to crawl up this chain until
he gets to the maximum power.

As far as the suggestion which has been made with respect to high-
gain antennas, of course, gain which is acquired by closing the signal
down vertically so you are serving a useful part of the area where
people are, not the sky, is a very desirable thing, and it is much more
easily attained in UHF as compared to VHF operations, by the way.
Higher gains can be obtained. On the other hand, if you cut the
signal down until it is a mere disc or slice, you run into other difficulties
of UHF which might leave valleys unserved and raise other problems
that are quite serious problems.

You can’t resolve your problem entirely with gain. You have
got to have power.

So, the UHF operator wants that power and would like to spend his
money once for it, not get it by progressive steps.

I might answer a question at that point. A question was asked as
to the limitations of closing in—the closing down part—you asked it,
Mr. Chairman, reducing power in the sense of serving a smaller area
for smaller communities.

The limitations were not put on there to effectuate the minimum
limitations of service. That was a different limitation. That was
put on with respect to the signal. The power of the signal was set
at different minimums for communities of different populations.

The minimums we have described, in effective radiated power and
distance, to be covered, were maximum limitations, consistent with
the Commission’s political and geographic theory of allocation, so you
could get as many stations in the country as you could, taking into
account interference on cochannel or adjacent channel and certain other technical factors of interference in the country.

Those are maximum limitations, and can be seriously affected by the point Commissioner Hennock mentioned—the mallocation of transmitters at variable distances away from the cities they were supposed to serve.

So, maximum limitations become a farce if you can move 50 miles out with your tower, for example.

Those are the kinds of things I am talking about, discussing temporary disadvantages of UHF, and our complete conviction you can give a beautiful signal, just as good as anything VHF can give on VHF, and you can serve the public just as well when you have the other elements overcome.

I might add, in connection with the virtues of UHF small-power stations, I haven’t noticed any networks owning as their owned and operation station any UHF stations. They seem to prefer a VHF station of maximum power.

Despite discouraging results to date, any assurance of the continued and expanding use of UHF would expedite development of new and particularly higher powered transmitting equipment for use in the UHF band.

In the judgment of the association, the development of both receiving and transmitting equipment for ultra high frequencies has been seriously retarded by a lack of confidence on the part of manufacturers in the future of UHF, and its availability awaits, in a large measure, only adequate assurances of the continuation of UHF broadcasting on a national basis.

On the one hand, there has been plenty of reason for the manufacturer to be somewhat alarmed at the effect of the UHF operator in the recent period. Part of that has been brought to our attention through actual failures of people, and those who have CP’s won’t go into operation—some of my clients just won’t go into operation—they have got CP’s—because they are confronted with 1 or 2 V’s, and they know they can’t hope to put anything in it and have a hope of getting something out of it.

Now, that doesn’t mean they want to get out of television. It means they don’t want to lose a million dollars. They want to get a half break.

I might say in that connection there have been some discouraging statements about UHF made by people in high governmental authority not so long ago, statements in connection with the advisability of being UHF. There have been some very discouraging statements made by people engaged in the advertising business and people who happen to own a lot of “V” stations, and those discouraging statements have affected the advertising business, and you can discover who those advertisers are by looking at the trade press and seeing whose agents advertise, “We handle VHF only.”

That is a very encouraging thing for a man who is trying to run a “U” station, on the other side of this encouragement-of-morale fence, when you think of the operators who went into UHF.

I call your attention to the hearings of the Commission in the allocation proceeding. After that lengthy proceeding, with much difference of opinion, many, if not most, of the UHF operators who went into that service did so because they read in the Commission’s report
they could do it safely. The great Commission had said there would be plenty of power soon. The great Commission said this business of intermix will give us lots of good receivers, and individual Commissioners and individual staff members, as you will see from the testimony of others, actually were convinced or said they were convinced that the solution of the allocation question meant that UHF could go ahead. That was first because it would have time to go ahead since the VIIF controversial problems were being decided and, secondly, because they had assurance there would be no serious difficulties in the matter of equipment.

Now, they had encouragement at that time, and they have only discouragement now.

I will add one point to that—and that is the fact that once you start down on his UHF thing it is very serious to the public because you don't go down arithmetically. As soon as the manufacturer finds his warehouse is full of all-channel receivers, he stops the production line. When he stops the production line, he makes less. When he makes less, the cost goes up, and when the cost goes up people won't buy the all-channel sets. So, you are going down in a geometrical proportion.

The same thing is true with respect to engineering work on speaker transmitting facilities, and the same thing is true with respect to efforts to restore public confidence in advertising.

You can't knock UHF very far down the line without taking with you the good stations, the ones which have the market, and once they start to go you are in trouble, and they have started to go down, and we say now is the time for action.

Senator SchoeppeL As has been brought out, though, there has been a technological problem in here about furnishing expeditiously the transmitting equipment in these ranges; is that not true?

Mr. Roberts. That is true. I thought that was well explained by the GE man on tubes.

Senator SchoeppeL Yes. I had reference to that testimony.

Mr. Roberts. I don't think anybody can continue in the manufacturing business by saying, "We are laying back on UHF."

Senator SchoeppeL But that did, from a technological standpoint, require time, and that all adds, of course, to legitimate delay.

Mr. Roberts. And when you found some of the finest economists and engineers in the business advising their clients not to go into UHF at the time of the allocation report, you would have found that we would have had much more progress had the engineers and consultants had confidence in an allocation system that would work. After all, Du Mont's broadcasting engineers and the rest of us had our lives in this business and couldn't have been entirely stupid, and had there been an allocation system to start with, then the manufacturers could have gone faster because then they would have had more confidence in the ability of the operators to make money.

Senator SchoeppeL It does look to me, as one member of this committee, that practical suggestions were thrown out there and that quite a while back someone didn't have too much confidence and faith from an administrative standpoint.

Mr. Roberts. Well, somebody did. I was about as familiar with that record as anybody could be.

By the way, the record in the allocation case—there is a stack of transcript about that high, with maybe 3,000 or 4,000 exhibits, in several steel file cabinets; and as early as 1938 and 1940 we knew televi-
sion had to have sufficient spectrums, that it could not be served in the low frequencies and that you would have to go up. That has been said officially and unofficially ever since, and we are still not up there.

UHF operational difficulties: The basic difficulty in establishing UHF stations under the present intermixed allocation plan adopted by the Federal Communications Commission is attributable to:

(a) Conversion: The necessity for listeners converting their receivers and appurtenant antenna equipment in order to satisfactorily receive UHF stations.

Again interrupting, you were quoted certain figures for various types of temporarily satisfactory converters and internal conversions for receivers and for continuous types of equipment for the manufacturer of receivers and for conversion, but that isn't the full cost. Sixty dollars isn't the full cost.

Experience shows that the cost of servicemen handling the unusual equipment and the towers and the difficulty of precise location with a weak signal, which requires much more accurate location of the receiver within a house, and the difficulties you had with that type of equipment on top of apartment houses, where the owners just wouldn't let you play around quite as much, and you didn't need to for VHF, all represented a larger cost. So, instead of thinking in terms of $35 for practical conversion of a VHF to UHF receiver—and it is never as good as a proper one—you still have to add, on the average, certainly in the fringe area, with low-power 1,000 watt transmitters, towers, receiving towers, receiving antenna, and to maintain them, which is a very expensive item.

Senator Potter. I assume another problem you would be confronting, too, is the fact that many of your service men in placing your antennas wouldn't have the knowledge or the know-how as to where to place them, and they would try to operate as they did with the VHF antenna, by just putting them up and letting them go.

Mr. Roberts. Mr. Chairman, the only trouble with your statement is to use the past tense. They don't know right now. Many of them don't know right now, and many who call themselves servicemen and never had any trouble have been able to get paid for doing that work, although there has been a tremendous development in that respect.

Senator Potter. I can see your statement is going to bring on many questions.

Mr. Roberts. I can summarize it to some extent.

Senator Potter. Would you prefer to finish tonight?

Mr. Roberts. I will stick to the prepared report. I can finish the statement tonight and be available tomorrow if you want me, although I would prefer to come back tomorrow, sir.

Senator Potter. If it is all right, I would prefer to have you do that.

Mr. Roberts. I will be glad to come back tomorrow.

Mr. Schoepfell. You are here in town, anyway?

Mr. Roberts. Yes; I am here.

Senator Potter. Yes.

I think that will be better.

Mr. Roberts. All right, sir.

Senator Potter. We will recess until 9:30 tomorrow morning.

(Whereupon, at 5:15 p.m., the hearing was recessed, to reconvene at 9:30 a.m., tomorrow morning, Friday, May 21, 1954.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

FRIDAY, MAY 21, 1954

UNITED STATES SENATE,
SUBCOMMITTEE NO. 2 ON COMMUNICATIONS
OF THE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The subcommittee met at 9:15 a. m., pursuant to recess, in room G–16 of the Capitol, Senator Charles E. Potter (chairman of the subcommittee) presiding.

Present: Senators Potter (chairman of the subcommittee), Schoepfell, Bowring, Hunt, and Pastore.

Also present: Senator Edwin C. Johnson; Bertram O. Wissman, chief clerk; and Nick Zapple, counsel for the subcommittee.

Senator Potter. The committee will come to order. When we concluded last night, Mr. Roberts was in the middle of his statement. We will conclude with his statement at this time. We have many witnesses whom we would like to hear today. This will be the last day of this part of the hearing due to the convention next week.

We will meet again on June 3 and 4, and I hope that we can all conclude the testimony at that time.

We have scheduled for today 20 witnesses, so you can well appreciate that time is of the essence. We would appreciate it if you could limit your remarks to not more than 15 minutes, if it is possible. We do not want to cut off any witness. We want to get all the witnesses we can, and all the facts, but if you have any additional material to submit you may submit it as part of the record.

STATEMENT OF WILLIAM A. ROBERTS, GENERAL COUNSEL, ULTRA HIGH FREQUENCY TELEVISION ASSOCIATION—Resumed

Mr. Roberts. I would like at the beginning of my testimony this morning to make a correction in the prepared statement of testimony that was filed with the committee by striking the name of S. Bernard Berk of WAKR from the list appearing on the front page. His name was included under misapprehension.

Senator Potter. All right.

Mr. Roberts. I was discussing UHF operational difficulties.

The basic difficulty in establishing UHF stations under the present intermixed allocation plan adopted by the Federal Communications Commission is attributable to—

(a) Conversion: The necessity for listeners converting their receivers and appurtenant antenna equipment in order to satisfactorily receive UHF stations.
(b) Programing: The inability of UHF stations to obtain programing of comparable quality with competitive VHF stations in the same markets.

(c) Advertising revenue: The inability of UHF stations to obtain national and regional advertising revenue sufficient to support local productions and thus attract comparable audiences. Thus we have what UHF broadcasters recognize as the vicious circle.

One of the most important elements of UHF's present plight is programing. The Ultra High Frequency Association has devoted careful and serious study to the factors involved in television station programing and has reached several conclusions.

It is undeniable that ultra high frequency broadcasters in intermixed markets cannot obtain the competitive programing to attract audiences that must first convert VHF receivers or purchase all-channel receivers. This is fundamentally true because of the following:

(a) Dominant network: The two dominant networks, long established in radio operation, have preferred and supported their basic affiliates in television as well as in radio, and through primary affiliation or through station ownership control programing for VHF outlets in all major markets.

(b) Custom: Established contracts and customs result in, and in fact require preferential clearance of, time in favor of the major networks.

Senator Potter. What are your views on Dr. Du Mont's three proposals?

Mr. Robert. Of course, I work for the company, and in this instance I am entirely on my own. Dr. Du Mont knew when I went with the association that I was to represent my own views on the matter. With respect to the report, I think it is a most excellent view and I think it is entirely true in all respects and deserves all the consideration in the world.

With respect to the three proposals they all have some disadvantages. But the critical thing is that they contemplate that relief can be had solely by one of the three proposals, whereas I do not believe that. I do not believe that merely requiring networks to give fractions of their time to some other stations or inducing networks by allowing them to have 11 stations or any of the other programing devices will solve the basic problem which, in my opinion, is fundamental and has to do with improper intermixture, and that you must set up in all the primary markets, in my opinion, stations of common type operation at the present time and for a long time to come and in sufficient numbers to provide for and support four sources of national programing.

If you do not do that by eliminating intermixture as far as you can, then the other remedies will not be sufficient. But in like manner, I feel that mere intermixture is not sufficient. You would have to use some device similar to one of the ones that Dr. Du Mont presented.

His experience and the experience of his staff in the business and the fact that they have been on the low end of the totem pole for a long time and the theory of the programing requires that those methods be given consideration.
I fear a large number of owned and operated stations in the hands of a small group of ownership. That is my own personal expression on it.

(c) Kinescope repeat broadcasts: Even when affiliated VHF stations cannot use network programing on a live basis, they show kinescope recordings at off hours and thereby prevent use of the live program by competitive UHF stations. This practice effectively frustrates the UHF operator from any good live network programing. I add there one sentence that the same thing is applicable to the source of film, that the dominant station acquires the bulk of a series of shows on film and may put on a first-class production at 2:30 in the morning, thus holding up the market so that the market is not available to the UHF producer. If we do have commercially available the use of tape-recording video, it doesn't change it because somebody has to produce it. It is not the technical desirability but the source of the program that makes the program not available. We will not cure the deficiency whose trouble comes due to saturation of the media.

(d) Limited network clearances: Major network advertisers cannot afford to produce superior programing unless they secure "clearances" from networks in a sufficient number of top markets to justify the expenditure and network and cable charges, and under the system that now prevails, they are solely dependent upon the two largest networks for such maximum audience clearances. Needless to say, clearances, relatively speaking, are not forthcoming for UHF stations.

(e) National advertising revenue: Similarly, national spot advertisers generally place their time and announcements around feature programing and will not use UHF stations which cannot secure attractive feature programing. Even if these good local features that do not want it because they want something that is shown around the country, and you heard the estimate that between 20 and 30 percent of the revenue comes from local operations of a local operator. For instance, a local operator in St. Louis reached his quota for local advertising revenue with very fine UHF equipment, but that still left him with four-fifths of his revenue to be raised without the national spot advertising, according to the existing figures and customs he could not survive.

(f) Film: Release of desirable feature motion picture film at reasonable cost has been withheld by major motion-picture studios and by various talent and labor agreements. Control of released motion-picture film of suitable entertainment quality has often been concentrated in major networks and in a few distributors. Use of some desirable foreign films has been restrained by governmental and labor requirements.

Senator Potter. What is the policy on the use of motion-picture film? Does it have to be 7 years old?

Mr. Roberts. I have no evidence of a specific agreement among the major network producers to withhold feature films within their libraries, but the testimony before the Commission at various times has shown that factors affecting the release, even where the investment has been completely amortized, are such things as the Petrillo agreement, the expense of clearing for talent claims in the picture or the original writers of the picture, the cost of just clearing that to
be certain that there would not be some expense there and finally the reluctance of the motion-picture industry to release their motion pictures which are the most recent ones. In any event, the net result of all these things is that a great mass of a good black-and-white film is not available for local production.

Until the last 2 years the production of color film by the industry was limited so that practically all the good feature color film is, since the Petrillo agreement—and if we do have to produce color on a non-network basis, it will be difficult to secure good programing material. The foreign film is largely the production of the foreign organizations and the labor organizations in this country have taken steps to prevent the introduction and use of foreign films.

Senator Potter. Are new films being produced, any films being produced especially for television?

Mr. Roberts. Oh, yes. Many television programs are being put directly on film, timed out, many of the best programs, and with the introduction of one or two recent developments, continuous motion-picture devices are now available and are now being distributed that are enormous improvements over the quality of film showing, so that will make a great difference in local distribution of film.

That doesn't change the fact that ownership and widespread distribution is what makes it available to the operators. If you wipe out all major networks, there wouldn't be any difference in that regard.

Other factors have conspired to make the operation of a UHF television station increasingly difficult. Among these:

A. Inequitable results: Restrictive and unfair governmental regulation, e.g., the threat of expedited or “quickie” grants of competitive VHF channels, unforeseen and unforeseeable when UHF owner received his grant, and the rapid functional obsolescence of early UHF equipment have discouraged equity capital and made loan credit unobtainable by many UHF operators. That “quickie” grant has been extremely bad thing and a new thing. Just because it has been bad for a UHF operator, and that in principle, doesn't mean there is no defense for it. The operators of the VHF grants wanted them to go through quickly. There was enormous pressure to get the “quickie” grants through. One thing they are doing is foreclosing the correction of the internixture situation. If you dump in more or less overnight grants through collision or agreement by the operators involved, you make it more and more difficult to correct this situation. On the other hand, VHF competitors have been encouraged and their financing facilitated by major network programing agreements, friendly governmental regulations and established stability of equipment design and construction. Obviously, much more could be said on the topic.

B. Unrealistic taxation: Unrealistic and inequitable tax requirements, including fixed schedules for depreciation, prevent realization of early profits by the UHF operator in markets where VHF competition has been deferred or limited. That has been taken up with the Treasury Department by the association for several months and we have good reason to believe that the schedules are taking into account the rapid obsolescence of UHF equipment. The new tax bill has some relief and the further spread of early losses or profit will be taken into consideration.
(a) Hiatus: Hiatus is a freeze with a new name. A minimum 90- to 180-day hiatus, effective upon all applicants and holders of construction permits who have not yet requested authority to conduct equipment tests, thus providing the subcommittee and the Federal Communications Commission with sufficient time to study solutions to the problem and establish an integrated permanent plan that will assure the competitive national television service. Every day the hiatus is postponed further aggravates the already chaotic condition in the most important branch of the Nation’s communications industry. And I mean by every day, I mean today, action that would be taken by the Commission today to prevent further releasing of “quickies.” It doesn’t take very long and it is imperatively required.

(b) Transfer from VHF to UHF: Ultimate transfer of all television broadcasting to the universally adequate UHF band is desirable, and barring the perpetuation of present monopolistic conditions, inevitable.

Senator Potter. You contend that eventually we should have all of our television on the UHF band.

Mr. Roberts. Will you have it on an equitable basis for everybody or will you wait until UHF is available to only two networks and let them have it for the entire country?

(c) First step, eliminate intermixture: It is the considered judgment of the Ultra High Frequency Association that the above could best be accomplished by stages. The first stage to be an immediate reallocation eliminating VHF and UHF intermixture on a market-by-market basis. This is to be accomplished by a mandate permitting the substitution of channels between markets, the change of existing operating frequencies from VHF to UHF, and vice versa. This remedy may require, in some instances, the extension of the right to operate by the same station with both UHF and VHF transmitters during an interim period. There is a possibility that it may require the use of one television channel from the FM spectrum.

(d) Network programing: As to programing, no voluntary solution is in sight. There has been undoubtedly an undesirable concentration of control of television broadcasting through advertisers and television outlets. This is in the main attributable to governmental regulation and to the insufficiency of immediately available equivalent channels in major markets. Voluntary commercial subsidization of UHF broadcasting stations by advertisers or by networks has not, and will not occur. The immediate and necessary remedy lies in mandatory regulation of networks and other program sources, to enforce equitable distribution of opportunities for programing without regard to affiliation agreement or immediate audience. Networks must be compensated for this investment in the future of communications freedom, by grant of certificates of convenience and necessity which will preclude unnecessary future competition. This, in view of the fact that the committee has before it legislation intending to accomplish this purpose, if you will make the networks distribute the unbalanced programing so as to induce a field in which you can have some of the other programing, that means some of them will have to give up some of what they have got. It would be unfair to ask them to do that without defining networks as the bill proposes and without requiring the Commission to give grandfather grants to the existing
networks so when they do make this expenditure they will not be confronted by a "come lately" who wants to disrupt all the things on a national basis.

Senator Potter. It would freeze in four networks.

Mr. Roberts. Yes, sir. They are the 4 who paid the money, and the boy who sits back with 5 stations and does not offer network service should not be granted that privilege. If there is a need for a fifth, the Commission could grant the fifth.

(a) Receiver production: Production of all-channel receivers of the desired type on the part of the viewing public to convert to UHF through utilization of improved equipment can be expedited by Federal Trade Commission rulings, and we were before the Federal Trade Commission last fall to make it an unfair practice on this matter of advertising television receivers. You would have to say this is a VHF receiver, for instance. That would be very important, and even without formal action by the Federal Trade Commission many better-business bureaus picked that up, and it did a lot of good throughout the country.

It can further be expedited by Federal Communications Commission regulations, such as the restriction of spurious emission from inferior equipment; or by a preference for all-channel receivers through a reduction or elimination of excise taxes.

Senator Potter. The question that concerns me, if you start switching from VHF to a UHF market, what about the people who have invested many thousands of dollars in television receivers? What about the problem of forcing them to convert, which would mean an additional money outlay to the consumer?

Mr. Roberts. The important thing is under the step-by-step plan we have talked about. Very great numbers of them do not have to change at all. For instance, in New York and other markets where you would have the same kind of problem you would have at least four networks, and they would continue in the nonintermixed field with their surrounding areas, probably by the granting of further VHF's.

Secondly, as you have noted, the production of the manufacturers has been such that there is a natural transition by people who prefer to get fringe-area programing and want an all-channel receiver.

Thirdly, there is a change by individuals anyway. It is a well-known fact that children are requiring a receiver in the back of the house and the 12- or 15-inch receiver, black and white, is being moved back to an inferior use for a new, larger receiver which is coming into the front of the house. That transition permits, without any serious outlay, you can get a transition naturally to UHF. It isn't as great a burden as it might seem.

Senator Potter. Do you have any figures as to the average length of time that the average homeowner has a set before he trades it in?

Mr. Roberts. I have never seen any conclusive evidence. Probably you could estimate 4 years, but each technological change, for instance, to good UHF programing brings about a greater turnover than that and color will be the next opportunity for making the change without hardship. Four years might be reasonable for dealers expecting to make resales.

Senator Pastore. Mr. Roberts, you had said—

Ultimate transfer of all television broadcasting to the universally adequate band is desirable, and barring the perpetuation of present monopolistic conditions, inevitable.
Mr. Roberts. Yes.

Senator Pastore. Why do you say that?

Mr. Roberts. Because you cannot get a nationwide competitive broadcasting system giving the people the variety of programs they want throughout the country on the VHF channels. You cannot maintain as economic a service between the VHF and the UHF. The Government and other services want the channels presently used by VHF pretty badly. There is a tremendous demand for use for other purposes, more necessary purposes in some respect by the channels presently used by the local band of the VHF channel.

If you were on all UHF you would have a greater similarity of equipment throughout the country and you would eliminate the internixture problem and you would have transmitters and receivers which could be universally sold throughout the UHF band. There is every reason to go to all UHF. The only thing that stops us is the commitment to the VHF’s at the present time.

Senator Pastore. May I ask Mr. Hyde whether or not he agrees with that statement, “yes or no”?

Mr. Hyde. That it is necessary to move all television to UHF in order to have a nationwide competitive service?

Senator Pastore. Yes.

Mr. Hyde. No; I am not ready to agree to that.

Senator Pastore. Do you agree to the statement made by Mr. Roberts?

Mr. Hyde. You mean where you said: “Ultimate transfer of all television broadcasting to the universally adequate UHF band is desirable, and barring the perpetuation of present monopolistic conditions, inevitable”?

Senator Pastore. Do you agree with that statement?

Mr. Hyde. No; I do not agree with that, but, Senator, that is a type of an agreement that I would want to examine in some detail before I would give a complete answer.

Senator Pastore. It is important as to whether we end up with UHF.

Mr. Hyde. There are serious questions as to whether or not within the presently allocated UHF television channels you could work out a sufficient number of assignments to take care of certain congested parts of the country. Before you could be absolutely certain as to how complete that coverage would be, it would be necessary to engineer the plan.

I say it would be difficult because of the experience we had in trying to fill out an allocation in the northeastern part of the country with the use of both the UHF and VHF parts of the spectrum.

Senator Pastore. You say it will be desirable to make greater use of UHF, but not exclusively; is that right?

Mr. Hyde. The Commission found it necessary to use both parts of the spectrum in order to provide the coverage necessary. Mr. Roberts feels that the coverage could be worked out in the UHF, but he says with technological improvements in the offering. I don’t know what he means by that, and perhaps there are some devices that he has in mind that will give a more efficient distribution of UHF than seemed available to us.
Senator Johnson. Mr. Chairman, the Senator from Rhode Island has asked a very interesting question. There is a technical question as well as a question of policy involved.

We are fortunate this morning in having Commissioner Sterling here who is an electronics technician, and I would like to hear his reply, too.

I would like to hear Frieda Hennock’s reply. She is an expert on public relations and public service, and I would like to hear briefly a reply from each of these Commissioners to that same question.

I also have one question for Commissioner Hyde. I want to know if you could not have a better allocation with the 40 channels in UHF or the 12 channels in VHF.

Mr. Hyde. With the 70 channels in UHF?

Senator Johnson. There may be 70 but you have 40 now.

Mr. Hyde. You would have more broadcasters with stations in communities with the 70 UHF channels than you would with the 12 VHF channels.

Senator Johnson. There would be less danger of monopoly.

Mr. Hyde. You would have more opportunity for competition. I do not think that the distribution of stations on the VHF constitutes a monopoly. It does not afford the amount of competitive opportunity that we would like to have and which is the reason for going into the UHF.

Senator Johnson. It is very rapidly drifting into monopoly, Mr. Commissioner.

Mr. Hyde. I think that there would be on the order of 500 stations. That is not a monopoly, Senator.

Senator Johnson. You count the stations and say that there is not a monopoly? That doesn’t mean anything.

Mr. Hyde. And not more than five of them under common control.

Senator Johnson. That doesn’t mean there is not monopoly in VHF.

Mr. Hyde. In some communities there would be one station, and I suppose that would be a local monopoly, but you would not have a general monopoly.

Senator Johnson. There is a very serious monopoly in the VHF, and I am sure the chairman knows it, that we do not have a nationwide competitive service in this country because of the monopoly in VHF.

Mr. Hyde. I have urged in previous testimony that the Commission went into that matter in order to give an opportunity to competitive stations in as many markets as possible, of course, I agreed to that principle, but I do not believe that we have a monopolistic situation now. I think we have one that could be improved by more successful use of all the channels.

Senator Johnson. But the situation is this, if the chairman will permit me to say so, the very fact that the Commission found it necessary to go to the UHF in order to get a competitive service of television is proof enough that the Commission realized and recognized that there was monopoly.

Now, the sad situation is that UHF is being blanked out because of a lack of receivers and because of the very monopoly that caused the Commission to go into UHF and supplement VHF with UHF. UHF is about to be blanked out and completely eliminated, and that
is what this meeting is about. That is what this hearing is for. That
is what we are considering. We are trying to find out some way of
saving UHF, and the reason is so that we may have a competitive ser-
vice in the United States in accordance with the law adopted by Con-
gress on this very subject. I will not interject any more arguments
into this, Mr. Chairman, I promise you.

Mr. Hyde. In my statement which I made at the beginning of this
hearing, I indicated that it was the Commission’s purpose to have a
television service on the broad basis of not 12 or 70 channels, but 82
channels and we did not want the television service divided into
classes such as UHF and VHF.

It was the Commission’s objective, and it is still our objective to
have as many of these channels in active use as the public can make use
of in the interest as wide diversification, in the interest of having as
many choices of service as possible for all the public.

Senator Johnson. Mr. Chairman, we also have Commissioner
Webster here who is an electronics engineer and expert. He served
well and faithfully in the Federal service and I regard him as one
of the outstanding electronics engineers of these times, and I would.
like to suggest that the question which you submit to the chairman be
also submitted to him for brief comment. Now, I will subside.

Senator Pastore. On the point raised by Mr. Hyde where there
is a desire to raise the competition on the bands to 82 instead of 12
with the competition of VHF and UHF, the trouble is that the whole
thing is sewed up under the 12 channels of VHF. The good programs
are in VHF and that is exactly where the problem is.

The other people are not on a competitive level for the simple reason
that they do not get the same quality of program. It doesn’t pay for
anyone to convert unless that is the only alternative he has. If there
is only one UHF channel he would have to use his channel for that.

The point is that people are not converting because all the good
programs are coming through on the VHF channels, and they are
not going to convert as long as you have that situation.

Senator Potter. If there are other Commissioners here who want
to comment briefly on the question asked by Senator Pastore as to
whether or not they feel that eventually all television can be and
should be on the UHF band, we would like to hear them. Would you
care to comment on that, Commissioner Sterling?

Mr. Sterling. I find myself in agreement with what Chairman
Hyde has said, but I imagine what Senator Johnson had in mind was
the long-term program and not an immediate program.

The making of a television allocation plan is of some proportions.
You cannot generalize on something which is so important as that.
One would never have thought that we were going to have over 2,000
AM broadcasting stations. From a long-term standpoint, I do not
believe there would be sufficient UHF channels to provide for a nation-
wide competitive service, but I believe that as time goes on the manu-
facturers will, in response to a demand for cheaper equipment and
competitive features, will get into this, that there will be many smaller
communities that will want a small power cheap, inexpensive tele-
vision outlet, and I do not believe that from a long-term standpoint
that you could make a nationwide television competitive system by
utilizing the UHF. It is dangerous to generalize on such an impor-
tant subject.
One must take all the factors into consideration, the trends of the time and it does get into engineering.

Are we going to have the mega watt of power that we estimated to be available? We have a present limit of 2,000 feet for antennas for UHF. We do not have such antennas at this time. I will not say we may never have them. You must take into consideration all the technical aspects. I do not believe I would want to say that you could make a nationwide competitive system and guarantee service as we had hoped to guarantee service to all the people of these United States in the important media of television.

Senator Potter. Today it is a key question because eventually if all television will be in the UHF band, or should be in the UHF band, or should be in the UHF band, we had better start taking a new look at the grants for VHF. We would like to hear from you Commissioner Webster.

Mr. Webster. I have been away for about a month and have not had time to digest material brought before your committee. I have read the testimony of our chairman, and I have read some of the material that Commissioner Sterling has made, that is through one of his talks and in conversations with him, and I concur heartily with both of their statements or speeches that they have made.

During the time that we considered this whole problem in the Commission, I could see no way from an engineering point of view, that you could give a countrywide television service with just the UHF band. It is a very difficult engineering problem and I think that no one can make a general statement without going into the details from one end of the country to the other and try to allocate these frequencies.

To make a general statement that you can do it in UHF, I want somebody to come up and prove it. That was my conclusion at the time we worked on it.

There is one other point in going into all UHF, and that is to change the stations now on VHF over to UHF.

Anyone who will go into the legal problem involved will find that it is a very difficult problem. Even with the 108 stations, we were faced with at that time we made our decision that it was a grave question as to whether you could force those stations to go over to UHF.

I think the legal problem involved and the long procedures that you might have to go through in changing them over would have to be gone over.

I heartily endorse everything said so far with regard to the problem with respect to our Chairman and what I have heard from Commissioner Sterling.

Senator Potter. Commissioner Hennock, we would like to hear from you.

Miss Hennock. It is very difficult for me to state my problem. I have to take my hair down and blame the Senate as much as the Commission.

The 331 applicants which you now permit and all the other applicants have dropped by the wayside, and I think there were another 40 which gives 370 or 380 people who thought very highly of UHF.

I blame the Senate because of the senatorial pressure. I am all for these improvements that these people talk about, but if there is any
testimony that there is anything the matter with UHF, they have not told me it for 5 years.

What do we mean as a Commission by sitting here and saying to these people that this is just as good as VHF and never make a distinction between the two bands, and if you want me to tell the truth, when you Senators call up this Commission and say hurry up and give us television service to our communities and give it to us tomorrow, and give it by the most unethical manner known to man, what do you mean by allowing applicants to come in on Tuesday at 5 o'clock and file an application and not allow anybody to compete for that channel and allow the worst interests in those communities—and I do not mean disreputable necessarily, but when you allow two companies to merge and not even to let the public know what is happening to the public interest and necessity in this country and the free speech and opinion, what do you think I will say when you ask me that question?

I am ready to cry and give up and if you want to know the rest of my statement I will give it to you before I am through this hearing.

Senator Potter. We have the newest member of the Commission, Mr. Lee. Mr. Roberts, in his statement, mentioned that the future of television lies in the UHF field and that eventually all television should go into the UHF band. Do you have any views on that Commissioner Lee?

Mr. Lee. Mr. Chairman, from my standpoint, I am a strong free-enterprise man. I haven't heard anybody come to us and say that they have made too much money, why don't you take some away? I would do anything I could to help UHF on a technical basis, but as far as the allocations, I think the disruption would be awfully serious when you consider 30 million sets.

I can imagine what would happen in Congress with the uproar with all those people who would have to make some adjustment of their aerial and some adjustment of their machines. I expect there are VHF stations which are having difficulty, too. It may be that we are still breaking ground. Every week we are putting some more stations on the air. We are going through a period where maybe the stations are ahead of the market. I don't know.

I have information that UHF will be all right in the long run. I would hesitate to go so far as to impose more governmental control in order to help a problem and thereby create more problems by the very means we use to solve them.

I am in sympathy with the removing of the excise tax and I would do things like that, but anything that would not be well within the free-enterprise system, I would oppose transferring to the UHF or putting all television in the UHF band.

Senator Potter. I am a member of another committee where all the members of the committee once in a while take the witness stand, and we have the same situation with members of the Commission giving their testimonials. I think it might be desirable, in order to expedite the hearing as much as possible, that we continue with the regular scheduled witnesses and then at the conclusion of the hearing, to have the Commission come back and pick up these various points with the members of the Commission.

Mr. Hyde. If we might, I would ask that we be permitted to submit a statement which will take up points that have been made by a number of witnesses. I would like to add right now that I do not
consider that any of the Commission procedures are in any way unethical at any time.

Senator Pastore. I realize the desire of the chairman to expedite the hearing. However, I do have one question I would like to ask Mr. Hyde.

Mr. Hyde, could you inform us as to the number of operating television stations, and I think you said 376.

Mr. Hyde. 377.

Senator Pastore. How many people or individuals own the 377? I know that one cannot own more than 5, but how many of them have 5? How many owners have we?

Mr. Hyde. 300 is approximately right. I will make a careful check on that.

Senator Potter. Will you submit that for the record?

Mr. Hyde. I think his question meant by "persons" to cover individuals or corporations?

Senator Pastore. Yes; the same interests owning 5 or 3 or whatever the number is.

Mr. Hyde. Yes; we will supply that.

Approximately 487 different companies or individuals own the 570 TV stations authorized as of May 1, 1954. A total of 51 companies or individuals had either majority or substantial minority ownership interests in more than 1 TV station. A breakdown of these ownership interests is as follows:

<table>
<thead>
<tr>
<th>Number of stations in which a majority or substantial minority interest is held</th>
<th>Number of companies or individuals holding such interest</th>
<th>Number of stations involved</th>

Note.—Of the 377 stations on the air as of May 1, 1954, there were approximately 304 separate companies or individuals owning such stations.

Senator Potter. You may proceed, Mr. Roberts.

Mr. Roberts. I have been working with Chairman Hyde and Commissioner Webster and Commissioner Sterling for a great many years, and the mere fact that I have a difference of opinion doesn’t mean I would want to compare my judgment with their collective judgment, and if what we have to say cannot stand on cold logic before you I wouldn’t want it to be considered necessarily as being in opposition to what they are saying.

The question from Senator Pastore was not completely a fair one. You cannot expect the Commission to conclude that the ultimate transfer was inevitable when the Commission was committed in its Sixth Report and Order.

Senator Pastore. The four words I directed my attention to are "all television" "UHF" and "inevitable". That is a final statement. You see no matter what we do we will wind up with everything on UHF.
Mr. Roberts. I start with the following reasons, immediately before the allocation the Commission took away from the broadcast band from 470 megacycles and gave it to the telephone company. The Commission reserved 15 channels of the UHF without specific assignment. They were not necessary for their assignments going down to villages of a few thousand population. Fifteen is in my mind more than 12, so that you could get rid of all the VHF channels and still have 3.

The Commission assigned a large number of channels to educational purposes and I am saying nothing about taking them away.

In the next place, in the entire Sixth Report and Order, there is only one place where there was mention made of 82 channels and that was put in after the report was completed and it was not supported, to my knowledge, by the testimony of a single witness. There was never a witness who said we needed 82 channels. There never was an allocation plan that used up all the 82 channels.

We know, and the testimony is in on this, we know that no television system can be supported on the basis of present labor and material costs in a city with a population of less than 100,000, but I submit there is plenty of room in the 70 megacycle field.

Senator Potter. You are using 40 UHF channels?

Mr. Roberts. You have got 70 but a lot of them are assigned to education and 15 reserve channels they contemplate using and you could move above the ultra top.

Mr. Hyde. There is no channel in reserve. They have been worked into the plan.

Mr. Roberts. Those channels that are frequently assigned throughout the country and you have many that are not assigned.

There is no application for them. There are many UHF channels which could be moved around.

Miss Hennoch. May I ask one question that might clarify something? What about booster and satellites which Commissioner Sterling is in favor of. As a matter of fact, they could extend the coverage and give you nation-wide service.

Mr. Roberts. I think the term booster, which means a fill-in within the required maximum service area, obviously that can be used too. As to the satellites you can extend it into a market into which no one else is reaching.

Miss Hennoch. 85 percent of our channels are already in UHF. Couldn't we by technical improvement, both by improving the power and the tube situation and the few remaining things that have to be improved increase our 85 percent of our channels to make them equal 100 percent if we really went to town and did the job with these great experts in the field?

Mr. Roberts. One of the technical improvements would, of course, be the use of boosters and satellite stations.

Another would be attaining 1,000 kilowatt power. The third would be directional antennas, not only vertical but horizontal directional antennas which could be of tremendous value in economical distribution of channels.

Senator Potter. I think we had better continue, Mr. Roberts, or the other 19 witnesses will not be on the stand.

Mr. Roberts. They know very much more than I do, and I will be glad to get off.
(f) Income taxes: The modification of present income-tax laws and regulations to permit flexibility in depreciation and tax spread by UHF operators can constitute a valid method of assisting the UHF broadcaster.

(g) Equipment research: A Federal contract for UHF transmission and receiving tube research as is presently carried on by the Federal Government in such fields as agriculture, aviation, shipping, and others is a major step toward the development of an adequate national television service. The cost of development of a tube, either by absorption by the manufacturer or else go into the cost of the all-channel receiver—since the defense services have need for facilities of this kind, it would appear that encouragement by your committee of a small part of their research funds to permit experimental work in attaining high power in UHF and attaining better tubes for UHF receivers would be much more desirable.

(h) Financial assistance: Authority for refunding by loan of impaired capital of properly qualified existing and future UHF stations for a limited period, to offset the injury inflicted by improper and inadequate governmental regulation. I believe that this is due to a governmental mistake and a change in plans that, on a case-by-case basis I think the Small Business Administration should be ordered to provide replacement of capital by UHF operators to prevent this and reduce the loss of capital when they are driven off the market.

Senator Potter. Is it difficult for the UHF operator to secure capital?

Mr. Roberts. It is practically impossible. It is almost impossible for him to receive an extended plan payment even by a company or the companies most interested in helping him. They cannot get it from any governmental agency at all.

The association feels that any and all of these suggestions and recommendations are workable, are helpful, and are reasonable. There is no panacea for UHF broadcasting. There is a long, hard road before the UHF owner as it has ever been for any pioneer. The UHF industry does not want any handouts nor any special considerations that will get our Government to guarantee him a profit on his investment. Rather, what he wants is only a fair opportunity to compete against the already entrenched VHF competitors who presently control the market place. If this subcommittee can help the UHF broadcaster to a square deal from Government regulatory agencies, from manufacturers, and from the major network interests, it will not only have strengthened a vital arm of our communications media but will also have bolstered immeasurably the cause of free enterprise in our Nation.

Finally, with respect to the legislation, I would say that the legislation, both the Johnson and Bricker bills, are beneficial in this way.

Senator Potter. I would like to thank you for your statement. You have certainly brought into the hearing some views which I know that the committee will give considerable thought to. We are going to interrupt the scheduled witnesses at this time to hear Mr. Morris Berman from the New York Society of Engineers.
Mr. Berman. My address is 393 Central Park West, New York City. Mr. Chairman, this is the table prepared by Columbia Broadcasting System showing the heights of towers and the relative ranges of broadcast signals.

At present there appears to be a hopeless chaos in the television and FM broadcasting industry owing to weak reception or no reception at all in many areas of the Nation, as well as station interference, because of the need of limiting power used by the relatively low transmission towers, the highest of which is about 1,500 feet, with the limited coverage resulting. If transmission towers were 5,000 feet—about a mile—in height, the entire Nation could be covered by seventy-five 1-mile-high towers and an equal number of low towers between them, as shown in figure 1, where crosses indicate the mile-high towers, and dots the intermediate towers, less than 1,000 feet high.

The advantages of the system proposed would, first, be the elimination of all but 150 of the 2,053 stations predicted for the near future by the Federal Communications Commission, meaning the elimination of 1,903 aviation hazards. The proposed towers would be provided with adequate radio signals to warn fliers, and would therefore be less hazardous than the 64 mountain peaks in the United States, all over 2½ miles high. Commercial and military airways are 2 miles high and above. Total coverage of the Nation would also result in increased set sales and better programing resulting from the additional listening potential.

Senator Potter. Do you mean if you had 75 towers you would have 75 stations that would cover the Nation?

Mr. Berman. By directional transmission, it is possible to sort of focus by a spotlight system using directional broadcasting. It is possible to have any community served as a spotlight affair exactly as it is now. In other words, although you have 1 tower, you can actually have even 100 stations to service that area by means of simply broadcasting a beam to cover that area exclusively.

Senator Potter. What would be the purpose of the high tower?

Mr. Berman. As you see, Mr. Chairman, here is an experiment in the city of New York. Previously towers were very low and recently the Radio Corporation of America has sort of combined all of their broadcasting facilities in the New York area on the top of the Empire State Building. The experimental work was successful and worked exceedingly well. If this is going to be a general tendency to combine the towers into a more efficient high tower, you will find greater efficiency in operation, greater economy. You will find that you will not need superfluous coaxial cables.

Senator Potter. You mean for several stations using the same tower?

Mr. Berman. Any number of stations may use the same tower. A broadcast station would not be defined as something emanating from the same tower, but rather in the terms of the area covered. So all the existing regulations could be made to apply by merely defining the words “broadcast station.”
Senator Pastore. Have you tried to sell your invention to the industry?

Mr. Berman. Negotiations are now going on with the leaders in the field.

Senator Pastore. And your purpose is that if they do accept your idea the law would have to be amended.

Mr. Berman. Yes, sir; otherwise you would have the situation of 75 broadcasting stations in the United States.

Senator Potter. You would have to develop some pretty stable steeplejacks.

Mr. Berman. There was a time when a 1,500-foot tower would have been called fantastic. You can have it verified that there are any number of applications for towers of that height. The reason the high tower is now possible is that the suspension bridge principle is made use of, that is by a series of cables, a suspension bridge across the Golden Gate is an example of what we mean. If they used the usual bridge procedure the girders would have to be 1,500 feet high and the steel alone would cost $1 billion.

By using cables, according to this expert who had so much to do with the building of the Golden Gate Bridge, you could get the same result by using a 25-foot bridge, and the cost would be $50 billion. The economy of design where cables support vertical and horizontal members to prevent buckling, a 5,000-foot tower is feasible economically.

The writer has spent a year on calculations for very high towers, and has developed original designs for towers 1 mile in height which would be highly economical to erect, by using the cable design (fig. 3) found to be economical for suspension bridges of over 1,500 feet in span. The TV or FM range of a mile-high tower for signals of sufficient magnetic intensity for large cities is about 85 miles, and the towers would be 200 miles apart and would control an area bounded by a circle 100 miles in radius. Between the 85-mile radius circle (figure 2) and the 100-mile circle there would be a 15-mile fringe area covered by the lower intermediate towers. A hundred mile radius circle covers an area of 30,000 square miles, and 100 towers would cover an area of 3 million square miles, which is the area of the continental United States. Figure 2 illustrates the tower spacing and fringe area coverage. In all cases “directional” broadcast antennas are used, with sharp coverage boundaries at which boundaries the magnetic intensity will drop sharply rather than fade gradually as with present antennas, so as to eliminate interference. The absence of interference will obviate the need of power limitations, now set at 1,000 kilowatts as a maximum for low towers and much less for higher towers or ground elevations. I had promised to take only 10 minutes. Now I have a drawing with me which I would like to submit. Figure 1 on that drawing shows the location of a group of stations.

Senator Potter. That drawing will be made a part of the official files of the committee.

Mr. Berman. Some of the results would be that the entire United States would be covered.

The question came up, How about Indiana or how about Nebraska or Kansas?

Senator Potter. Or Michigan?
Mr. Berman, Of Michigan.

The entire United States can be covered by a series of 5,000-foot towers. Recently experiments were made with high level transmissions by the Glenn Martin Co. and the West Co.

The advantages of broadcasting from high altitudes have already been pointed out in connection with experiments in TV broadcasting from airplanes, Mechanical Engineering, April 1949. These partial advantages will here be restated:

1. A coast-to-coast network for regular TV and FM programs will be provided, including news events direct from scene.

2. Expanded TV coverage for millions of rural listeners who will be unable to receive TV programs for years, if ever, with conventional TV broadcast methods.

3. A military communications system independent of ground conditions—this cannot be as well realized by prescope.

4. A network for communications systems within the HF range.

5. A network system for transmitting TV programs simultaneously to audiences assembled in theaters and other public places.

6. A TV network to meet military reconnaissance needs.

The 75 main towers—1 mile high—would have antennas of all of the TV and FM licensees within a hundred-miles radius, somewhat as in the case of the Empire State Building multioperated TV and FM tower in New York City, except that antennas could be located at lower levels in addition to the 1-mile level, if desired. For a coast-to-coast network, the intermediate, relatively low towers would be used to relay programs to any or all of the adjoining main towers, using an UHF wave of high frequency for relaying purposes not assigned for program broadcasting. The relay distance between a main and intermediate tower would be about 115 miles—very low tower to be used for local relaying. Such relaying would be more efficient than with coaxial cable, which permits only a narrow band width to be transmitted, and is relatively costly to install and maintain. The entire Nation—city and rural areas alike—would have the advantage of magnetic intensities now required for principal cities alone—that is, 5 millivolts per meter of antenna length in the case of channels 2 to 6, 7.07 millivolts per meter for channels 7 to 13 and 10 millivolts per meter for UHF channels 14 to 83. Present power requirements, 1,000 kilowatts, will have to be increased somewhat as follows: Channels 2 to 6: Permit 1,000 kilowatts instead of the present kilowatt limitation, to attain an intensity of 5 millivolts per meter 85 miles from the transmitting tower; channels 7 to 13, now power changes; channels 14 to 83, present 1,000 kilowatts limitation to be increased to about 3,000 kilowatts—or whatever power would be required for a 10 millivolt per meter intensity 85 miles distant from a mile-high tower.

Directivity requirements: At the 85-mile distance the intensity should drop sharply, rather than fade gradually as at present, to avoid interference; marginal areas between the 85-mile radius circles are serviced by directional antennas on the intermediate towers, as noted in figure 2: again, there must be a sharp drop in intensity at the boundaries of the directional beams. It is not believed a broadcasting antenna to meet such specifications has as yet been developed, but it can probably be designed for the heights and distances indicated. Purely local broadcasting will be effected by relaying a pro-
gram to a main tower, where it would be rebroadcast to the local area—very low tower to be used for local relaying.

The suggested amendment to S. 3095 introduced by Hon. Edwin C. Johnson, entitled "Regulation of Multiple Ownership of Television Broadcast Stations," in order to permit centralized broadcasting is as follows:

309 (a) (G). The term "broadcast station" as used in this section shall include, for an existing station, transmitting means from a regional centrally located source hereafter to be erected or used, and used exclusively or in common with other licensees, from which source essentially the same area of the existing station will be served after its present transmitter is abandoned and relocated to said central transmitting source. For a new licensee to operate from a regional centrally located transmitting source the covering area assigned shall not exceed that which may at present be served from a tower 1,500 feet above the elevation at or near the area at the point where the transmitting tower could have been located under regulations heretofore in force.

It is respectfully suggested to this subcommittee that it make its own study of the possibility of centralized or regional TV and FM broadcasting, and that it ask for an appropriation therefor. Such a study would include tower locations, tower designs—structural—directional antenna design for the purpose, public reaction, including inhabitants of farm areas, relaying and related subjects. It is suggested that the immediate preliminary appropriation be set at $25,000.

Senator Potter. Thank you very much, Mr. Berman. Are there any questions?

The next witness will be Mr. Lou Poller.

STATEMENT OF LOU POLLER, PRESIDENT AND GENERAL MANAGER OF WCAN, MILWAUKEE

Mr. Poller. I am president and general manager of WCAN, Milwaukee.

An editorial in Broadcasting magazine, May 3, 1954, starts off like this:

Was the final television allocation bungled 2 years ago, and if so, what can be done about it?

I will try to reconstruct, in retrospect, the metamorphosis of a UHF television station in Milwaukee, the 13th market in the United States, and thereby show that UHF has still been accepted as good competitive TV by over 300,000 people who invested more than $30 million so that they could get UHF, in a little over 6 months.

The market was properly surveyed, the technical requirements were analyzed, planned, and well executed. Financial requirements were properly anticipated; a network affiliation with CBS helped provide good program nucleus. An experienced staff of technicians and performers assured consistently acceptable programing. The station not only operated profitably but reinvested its profits in improved facilities as soon as they become available. It is the kind of operation that any board of directors would be extremely happy with, and yet WCAN-TV is threatened with extinction exactly as if it might have been conceived or operated poorly. The climate that been established for UHF will take the good with the bad.

You, therefore, have a television station that was properly planned and executed, a station that served a definite public need and service, a station that was enthusiastically accepted by the public, and despite
all this, is doomed for extinction—so that who might gain. The public? Not possibly, since they would stand to lose their investment in UHF apparatus of over $30 million in Milwaukee alone. That portion of the public not yet converted? Hardly, since they represent less than one-third of the entire population of Milwaukee. Furthermore, when UHF was established, it was expected by those who established it that the public would be required to invest money for the added service as they are now expected to invest huge sums if they wish to enjoy color. The individual would have to submerge his personal inconvenience for the good of the Nation.

Who then becomes the benefactor and at whose expense? Some individual applicants who sat by on the sidelines, not being very much interested in whether the public was the benefactor, until the time was ripe, the risk no longer present, and, in fact, the returns look so lucrative as to make bedfellows, by means of mergers, of contestants who made the most serious charges against each other just the previous day. Some applicants were delayed by the “freeze”—that is true—others were dilatory or conservative. Perhaps they felt that there would never be the courage required to adjust the present problem and they could therefore wait for the storm to blow over.

I have spent the last 30 years of my life in most phases of the radio business. We acquired the Midwest Broadcasting Co., which owns WCAN, in June 1952. The station was then 5 years old and had shown an operating deficit amounting to over $300,000 during the 5-year period. Less than 5 months after we acquired WCAN it no longer operated at a loss, and for the first time in its history was in the black. The TV freeze had been lifted and WCAN had filed an application for channel 12, a VHF channel, for Milwaukee.

The final allocations made by the FCC for Milwaukee consisted of 3 VHF channels, 4, 10, and 12; and 3 UHF channels, 19, 25, and 31. Channel 4 had been on the air since 1947, channel 10 was designated as an educational channel, and channel 12 had other applicants on it in addition to that of WCAN.

The FCC had a processing line and a hearing procedure, and it was generally concluded in Washington that this would result in a delay of 2 to 3 years before Milwaukee could anticipate additional television service. I made the most diligent survey possible of UHF with manufacturers of equipment. I read and reread the sixth and final report of the FCC and made inquiry in Washington, concluding that UHF could bring service to Milwaukee almost at once, when it was so badly needed. We therefore amended our application for UHF. One of the largest equipment manufacturers accepted my order for a 50-kilowatt transmitter to be delivered by September 1953. I think they did it in good faith. I later had great difficulty in extracting even a 1-kilowatt transmitter by August of 1953 from the same manufacturer. We were not alone in these conclusions.

February 1953 we were granted a construction permit for channel 25 for Milwaukee. We were very happy about it. We gave a luncheon to over 700 television distributors, dealers, and servicemen within a week after our announcement of Milwaukee’s second TV service. Experts were brought in to help these people understand UHF so that they could properly represent what they sold and serviced in this new art. Over $50,000 was spent by WCAN in publicizing UHF
in Milwaukee from February through September. We had faith in UHF and we still do.

The tallest building in the center of Milwaukee, the Schroeder Hotel, a structure valued at $15 million agreed after 6 months of persuasion to permit the tower to be erected on its roof at a cost to us in excess of $100,000. The best equipment available was installed in the studios and transmitter and 3 months were spent in training a crew of technicians so that the operation would be smooth, efficient, and professional. Superhuman effort was exerted in launching the new station in the most efficient manner.

WCAN-TV went on the air September 5, 1953, and from the very first day, and ever since, has been on the air from 7 a.m. in the morning to after midnight. This is very unlike the early days of VHF when programming was restricted to 3 or 4 hours daily, and the only competition, where there was any, came from other TV stations having equal power and facilities, and many of whom were insulated from any TV competition of any kind in many markets for almost 4 years. WCAN-TV faced the competition of another UHF station at once, and from an additional source of an established VHF station, 7 years old with 3 networks from whom to choose their programs. The public is the benefactor when competition is keen.

We joined CBS as an optional affiliate, which meant that we had to sell each and every program on our merits. We now carry almost 90 percent of the network schedule. Our contract, of course, is subject to a 6-month cancellation and although, to the best of our knowledge, both the network and its clients are greatly pleased with the progress we have shown, the common question of the day is: "How long do you think CBS will stay with WCAN after a V comes to Milwaukee?"

The reasons for such comment are obvious.

Less than a month after we were on the air, an application for rule-making was filed by the Hearst Corp., who own the morning newspaper and a radio station affiliated with CBS radio in Milwaukee. Twice before such request had been made before the FCC for the assignment of channel 6 to Milwaukee and twice before it had been denied by the FCC. This time the Hearst Corp. requested that channel 6 be assigned to White Fish Bay, a residential suburb only 5 miles from the heart of Milwaukee. It is a small village having a few blocks of retail establishments that could neither support nor desired a TV station of its own. In fact, White Fish Bay actually resented being used as a pawn and enacted legislation at once prohibiting any TV tower over 20 feet high in the community. It was not expected nor is it required by regulation that the TV tower be erected in White Fish Bay. I merely state this point that White Fish Bay did not need nor want any additional TV service. Nevertheless, the rule was adopted and there are now three applicants for channel 6, White Fish Bay, Wis.

In passing, let me say that before too long, 2 of the 3 applicants left little to the imagination and filed requests to be permitted to build the White Fish Bay studios and offices right in the heart of Milwaukee, the city where the FCC had twice before denied it, but not the third time. Now Milwaukee had seven stations allocated to it.

Newspaper articles and architects' renderings of the new channel 6 station started to appear regularly early in December, with explanations that as soon as approved, Milwaukee will have its second TV
station that will not require any additional investment by the public like UHF requires. In fact, one of the staff FCC attorneys argued before the court of appeals here in Washington that it would not be fair to make over 50 percent of the public who had not yet converted to UHF in Milwaukee go to the added expense. Today there is only about 30 percent not yet converted. Hearings have been called for channel 6 and hearings have been in process since January for channel 12, both for Milwaukee. This was current as of 3 days ago.

Three days ago the applicants on channel 12 merged and they are now eligible.

The public is confused. The advertiser is confused. The stations are confused but I hope this Senate will not be confused after all the facts are in. WCAN-TV is living proof that UHF is a fine service. In less than 4 months, and in the face of all the bad publicity that UHF faces generally, on the air WCAN-TV invested an additional $150,000 for a higher power transmitter and placed an order for color equipment and a 50-kilowatt transmitter as soon as it became available. I suppose fools walk in where angels fear to tread.

The station is operating profitably under extremely adverse conditions, but its life span could be extremely short, not because of lack of planning or execution, not because of lack of know-how, not because the public is lacking service, not because of anything that could have been avoided when WCAN-TV decided to bring a much-needed service to Milwaukee, but because for the first time we find that there are first- and second-class citizenships in television in this country. Perhaps not by design, but there they are.

May I repeat that WCAN-TV has not sought economic guaranty nor protection from competition, merely the truly competitive system that had been sought, planned, expected, promised, and really needed—if the public is to be the benefactor. Yes; we went in with open eyes, an open mind, and with the same faith that we had reason to anticipate, as so many more UHF stations had done but who are hesitating in great numbers lately. Given an even chance, this country will still have a nationwide truly competitive system as a result of UHF. The record is abundant and clear that UHF and VHF have been mixed in the same markets based on certain theories that never materialized as facts. I think they were honest mistakes.

It is my opinion that if all of the television stations in Milwaukee were one class of service, with no legislated advantages for any one of the stations, that the present applicants—incidentally, there are seven such applicants—that these applicants would have little or no interest since a fourth station in a city like Milwaukee would be a risky undertaking. Obviously, this is not a contest for another television station, but rather for a network affiliation.

Senator Potter. Is it your contention that if you could retain your network affiliation that you would be in the same competitive position that you are in now?

Mr. Poller. Without doubt, Senator.

Senator Potter. Your main concern is that if another VHF is granted to Milwaukee, you will lose your network affiliation and therefore you would not have the program to be competitive?

Mr. Poller. Yes, sir. In fact, there was another UHF granted to an applicant who had long ago worked with one of the networks and the very day that we signed our application, he announced that he
had just received a grant and would like to talk about an affiliation. The call had been made from the west coast and the operator told him to deposit $3.10. When he was told that the application had been made and granted he said, "What do I do now?"

He was told to ask for his $3.10 back.

I doubt very much that the channel for which he applied in Marquette, Mich., could support his application. There are many prospectors, not only in uranium but in television.

Should this happen, how would the public gain by merely transferring the programs from channel 25 to another channel?

A story that has been repeated all over the country wherein a number of applicants tear at each other's throats one day, making strong charges against each other, but when the prize is made so lucrative, merge and become bed partners. Incompatibility is erased for a price. And I believe that the very able Senator from Rhode Island set the price as a very decent one the other day. It becomes a temporary expedient resulting in trafficking with the public's facilities at premium prices. Such "quickie" grants are for personal gain and serve no public conveniences.

I will not attempt to discuss the technical phases of UHF and VHF other than to say that the public has endorsed UHF in Milwaukee without reservation. Our coverage area at this time, utilizing only one-fourth or one-fifth of the power that will be available, is far beyond the sphere of Milwaukee influence, socially or economically. The mere duplication of programs over a wide area with little or no regard for local public service is contrary to the requirements set up by the Communications Act. This is probably the only temporary advantage that can be claimed by VHF. I think that is one of the most important ones in television today.

Senator Johnson held hearings on high-power radio and the testimony was very conclusive that a 50-watt station in a city like Philadelphia, which commercially claimed coverage in Georgia, South Carolina, and so forth, never once invited a minister or any other public servant from communities 10 and 15 miles from Philadelphia, and if the yardstick is public convenience and necessity, and not dollars and cents, they will not get it by 5,000-foot towers or 1 million watts. Each community must be represented.

We do our best in Milwaukee to give time to all views, whether we agree with them or not. They get time on the air.

Senator Potter. How far out do you go?

Mr. Poller. Our signal is well received from 50 to 60 miles. I am sure that, insofar as the economics of the situation is concerned, if we broadcast in the direction of Chicago which, after all, is only 80 miles away, we will not be drawing customers up to Milwaukee who are closer to Chicago. That is useless coverage.

In other directions we go to Madison, which has its own stations. I do not have to tell you that we do not have to duplicate their programs but the local programs are of interest to the Milwaukee market. We cannot convince Madison Avenue that we can do as well for Procter & Gamble in the hinterlands, and if we cannot we will be wiped out.

I know in Senator Hunt's area the cities are not large and it is very difficult for every small community to have a station of its own. If they can put up a tower there to cover the entire State, I think it would be wise and economical and would pay, but in the northeastern part,
that is something else. In New York and in Rhode Island—and Senator Pastore raised this question so vividly the other day—there are 3, and probably 4, stations losing money and are tenaciously holding on and I think they give the Commission more trouble in trying to find an allocation plan.

If they moved to other good communities, at some future date New York might have more than four stations that would not today have the difficulties they have and it would be profitable for them.

Senator Potter. Do you have any difficulty in the service being given to the set owners?

Mr. Poller. No. We fought awfully hard to get the servicemen to understand what good installations were.

In fact, we spent about $12,000 of our own money installing converters and we put them in the new sets in the homes of all the advertising agencies and some of the civic leaders of the community before we went on the air, because we knew that they were the bell cows of the community and we wanted to be sure that they saw us and I am sure that is what started the program.

Senator Potter. Do you think your reception is as good as VHF?

Mr. Poller. We think it is better. Some of the engineers will tell you that high power VHF has its disadvantages in the closeby areas where you pick up signals that bounce off the wall and it is just like too much liquor. It is no good for you, whereas we do not have ghosts or interference from diathermy.

I respect the VHF station in Milwaukee. I know that they were plagued when they went into high power and I wish I, too, had a newspaper in which I could be able to advertise to let the public know about it, as they did.

They spent months telling the public how they had to overcome this trouble.

I will not point a convicting finger at any individual, manufacturer, or governmental agency. I have talked to Commissioners and manufacturers and they understand that I have done the best I could under the circumstances. I would not try to do their job and I would not trade places with any Commissioner at any salary. I don't know how they stand the pressure. Next to a Senator, they are subjected to the most pressure.

As the facts unfold it is obvious that the wrong road was chosen in attempting to bring television to the entire country with the greatest expediency. Each of us traveled the same road; some of us recognized the dangers that lay ahead and protested. I think Commissioner Hennock pointed out.

We are not trying to turn back, but we are seeking a crossroad that leads to a better television system for all of the people. I think we are now at that crossroad. We may not get another chance.

A solution which will benefit all the people ultimately, which will remove the stigma of second-class citizenship from a segment of the broadcasters and which will not transfer the hardship removed from one group to that of another group is now available at this crossroad. One class of television service means that the manufacturer can concentrate his research and produce a better product. The public is no longer confused or burdened with continuous change and loss of investment. The national advertiser is in a competitive market and there is room for expression by the local advertiser. And that is so
important. The local advertiser has been priced right out of the market in television. The ingenuity of management results in better programs for the public rather than the yardstick of public service being measured by a better channel or a more powerful transmitter. This, truly, becomes free enterprise. And Commissioner Lee has expressed that view.

Such a single class of service is available only in the UHF band. The record is clear that there is not sufficient room in the VHF band for a nationwide television system. Intermixture has not worked out. Color is about to make its bid into the American home. The cross-road presents an opportunity for an orderly transition, even if accomplished by stages. There are about 25 million television sets in the country that will be retired from service, at least during the next 5 years or sooner. These sets will normally be replaced both by color sets and by modern all-channel receivers. It is during this transition period that existing television stations can continue to render the existing service while the entire industry prepares to transfer to one class of television. Critical intermixed areas can be dealt with at once.

The public therefore makes only voluntary investment in more modern equipment, the broadcaster amortizes his equipment at a normal rate, and the only possible inconvenience occurs to the applicant whose interest remains in having a technical advantage in a given market but would be reluctant to take his chances on even terms. Intermixture looms as a threat that will stop the growth of television on a national scale and create a monopoly even if not by design.

Senator Potter. How?

Mr. Poller. If they would immediately do what Colonel Roberts suggested and take some of the top seriously intermixed markets to whom the rest of the industry look for guidance and make them either all VHF or all UHF as an immediate remedy toward the ultimate step, while the public will buy the equipment, that will make the television set a complete television set, not one-sided, one-faced.

By eliminating those problems from the network which run together more accounts, that will enable them to do more programming to start a little chain going. You my displace in some markets some people temporarily. The only people who would be displaced are the ones net yet in the business who are standing by waiting for this thing to get ripe. I will give as an example Milwaukee or St. Louis or Pittsburgh, where you have one VHF station that for 5 or 6 or 7 years has been doing a good service and a good job. If you have 2 or 3 UHF stations that are also doing a good job, if they were permitted immediately to simulcast on UHF or VHF and no more VHF's would be permitted on the market, the public would go over to UHF.

Senator Potter. Would it be expensive?

Mr. Poller. For the manufacturer? I told one of the owners of five stations yesterday that in 5 years' time he would amortize a $225,000 transmitter and replace it with a new one, and I think the public reports show that that is possible, and I think his reports showed that his station earned about $1 million gross each year and that $40,000 a year out of that $1 million amortized out of the tax money would certainly not be a great expense. He was not so sure. I said I will quickly change places with you and do it tomorrow.

Senator Pastore. And what was the answer?
Mr. Poller. He said that is a socialistic thing, taking $150,000 of the public investment in UHF investment and if they lay those antennas from end to end, they would reach from coast to coast. That is not socialistic, but taking $40,000 out of the profit might be socialist. I could not interpret it that way. He did.

A Senator mentioned that inequities are piled on top of inequities.

After taking the wrong road, we all had to justify the road signs.

A very basic principle and practice during the formative years of radio, when you had a little 100-watt radio station on 1490 on the dial and your service to the community enabled you to improve the frequency power and you found you could go to 620 with 5,000 watts of power, you filed such an application, meanwhile continuing to give this service to the public on your present facility. Anyone else had the same right to oppose your application and enter into a competitive field. It might have dispossessed you, but that is the way that radio conditions improved.

A rulemaking procedure was adopted with respect to television, which prevents any station on the air from filing for what might have been considered an improved facility unless that station suspended service which it was then rendering to the public in order to be eligible as an applicant to the same community. That station had to go off the air and deprive the public of all programs in order to be an applicant on another channel.

Senator Potter. Is this a Commission regulation?

Mr. Poller. Yes, sir; and has been strongly enforced. Some stations have gone off the air. The first was Roanoke. The intent was so that applicants would not straddle channels and keep out competition. But in actual practice it did not work out. Some of the big 50,000-watt stations today started out with 100 watts. I think one of the reasons was that there were so many more channels or frequencies available in radio. The channels that seemed to be important, the VHF, are so successful that the Commission had to do this in defense of getting a quick television service going in the country and preventing people from applying on one channel and stopping it and applying on another.

If I wanted to become an applicant for one of the VHF channels, I would have to cease operating tomorrow and deny the public the service until it was ultimately decided who was the best applicant.

Senator Potter. I wish you would be prepared to discuss this, Mr. Hyde.

Mr. Hyde. I am prepared right now.

Senator Potter. I would prefer you wait until the end of the hearing. Will you mark that down as a question to discuss?

Mr. Hyde. Yes, sir.

Mr. Poller. The public therefore makes only voluntary investment in more modern equipment, the broadcaster amortizes his equipment at a normal rate, and the only possible inconvenience occurs to the applicant whose interest remains in having a technical advantage in a given market but would be reluctant to take his chances on even terms. Intermixture looms as a threat that will stop the growth of television on a national scale and create a monopoly even if not by design.

King Solomon tried to solve a serious problem and did so wisely. There were three principals involved; a mother, a child, and a claimant.
We find three principals involved in this problem; the public, UHF, and VHF. Can it be solved without threatening to divide the child and give each claimant a half? I am afraid not. It was tried with intermixture. If the infant is permitted to grow up normally, it would then have a voice in the decision; if it lives to grow up.

We have a serious time element that did not confront King Solomon. We all agree that the child, or in this case the public, has to be protected. The public invested some $45 million in good faith and we cannot let them lose their money and their faith, for if they do, there will be great public reluctance to invest in color and in any other television development. When you take one sheep to slaughter, the entire flock flees in panic.

It must and can be done in a manner whereby the public voluntarily makes the transition, as I stated before; however, we cannot continue with the present rules, the present impossible climate established for VHF and ask the public to cooperate. An orderly plan on the mechanics for this solution will be proposed to this committee, later in the day.

Thus, we have both the transparent and reflective sides of television mirror. UHF is providing a real public service not otherwise available to Milwaukee and many other cities. It can be obliterated in a few months, legislatively and not through lack of public service, convenience, and necessity. The intent of the Congress and the Federal Communications Commission was to create a nationwide truly competitive system and it can be done. We are entering a crucial period in the history of our country. Communications, unhampered and unrestricted by selfish interests, will insure strong American-type independent thinking. Controlled communications have been the parent of the dictatorships in the rest of the world. History records that we have always taken the high road and that has made America strong. I have faith that we will take the right road now.

Senator Potter. Thank you very much.

Senator Hunt. I think I have learned more from your statement with reference to this situation than I have so far in these hearings.

Mr. Poller. Thank you very much, Senator Hunt.

Senator Pastore. Are you familiar with the bill introduced by Senator Bricker?

Mr. Poller. Yes, sir; the network regulation bill?

Senator Pastore. Do you feel that would provide for the situation you talk about?

Mr. Poller. To preface my remarks with being probably one of the strongest proponents of free enterprise, I love competition and a good fight and if that would include the term to equalize the services, and if that authority were given to the Commission to use with proper discretion, I think it is important.

Senator Pastore. I feel that is in there. The Commission would have to use its power in justice and equity to all.

One of the things you complained about is the fact that if the VHF comes in in Milwaukee, you may, at the expiration of your present contract, lose your contract with CBS, is that right or wrong?

Mr. Poller. But I do not think that could be changed by legislation. I believe that the advertiser spends his dollar where he thinks it is best. If I had the choice between the four networks, I would certainly fight to get CBS or NBC, and conversely, if they have the
choice, the chain being no stronger than its weakest link, they will take the strongest affiliate, but if the affiliates are equal technically, they will buy management.

Senator Potter. What do you think about Dr. Du Mont's suggestion about dividing the programing among the stations in Milwaukee and Milwaukee would have 2 VHF's and 2 UHF's, and 2 major networks would supply half the programing on the UHF's.

Mr. Poller. Dr. Du Mont's original proposition was beautiful. I think he should be commended as an individual for putting all that work into it. I am afraid his solutions were idealistic, theoretical rather than practical. Dr. Du Mont, with the greatest respect I can give him, is very much like an architect who is in Wisconsin, Frank Lloyd Wright, who is the father of modern architecture and is referred to by other architects as a theoretical architect. In practice, I am afraid Dr. Du Mont's plan would never work out. You simply cannot legislate competition. You must give it a climate in which to operate. Then it becomes simple to operate.

Under the present plan, to give a rash example, I could take a moron or an imbecile and give him channel 2 in Chicago with 100,000 watts of power and he wouldn't know what to do with the money he could make. He could stay in Florida or Hawaii all year round.

However, if I took the most intelligent man in the business and gave him channel 25 in Chicago, the most astute operator, under those circumstances and under the present system, he will die. The public doesn't get the benefit of the human element here. It is strictly a mechanical element.

Senator Potter. I assume you advocate a freeze on the VHF grants?

Mr. Poller. I call it a hiatus or a chill, because I would personally dread the thought of another 3- or 3½-year freeze.

In the investigations we have made, I think they are back in 90 days with the kind of a solution acceptable to the people. I do not believe in isolating. As much as I love it, I think I would grow fat and lazy. That is, if I were given a monopoly to operate and I do not like it.

Senator Pastore. Is your statement to allow the VHF to broadcast in UHF and stop further licensing in VHF and ultimately they would all be on the same level of UHF?

Mr. Poller. Precisely. They will gravitate there by the normal process of free enterprise, but if you do not stop it now, you will compound the inequity upon inequity.

Senator Pastore. In order to promote this nationwide competition in UHF, you are satisfied if you do not need as tremendous power, you feel that seems to be an obstacle?

Mr. Poller. Except on a case-by-case basis, I hope, and except that as Senator Hunt mentioned and that map on the easel there clearly demonstrates where you could put your high power, it is unrealistic to expect a community of 2,000 or 3,000 to afford such a high power station.

Senator Pastore. There is no reason why the station in Boston should reach Providence.

Mr. Poller. Certainly not.
Senator Pastore. And if people in Providence want more of the outlets, they should have more of their own and not rely on a relay from Boston.

Mr. Poller. Yes, sir.

Senator Pastore. And that is the reason why Providence has only one station?

Mr. Poller. Yes, sir. They should have the ability to have their own expression.

Mr. Chairman, I have a coverage map which shows the Milwaukee station is now rendering service to the State of Michigan. If the Senator has difficulty getting time on a few of the stations in Michigan we, in Milwaukee, can span the lake.

Senator Potter. Do you have any questions, Senator Bowring?

Senator Bowring. No, except that I am very encouraged, coming from Nebraska. We have no television at the present time. It looks like there might be a field.

Mr. Poller. I certainly think that the Midwest ought to have unrestricted power if it will not interfere with somebody else's electricity.

I am an easterner and have moved to the West and in 1 year I have been accused of being a Wisconsin liberal in the year that I have been there.

I am proud of the fact that these people who are so far removed from the coast, where so much of the activity is, manage to keep their fingers on it pretty well. They have a natural ability, a farmer's ability to reason these problems out and get to the core pretty fast without the hogwash that goes with it.

I think they are entitled to the same programs that you get in a big city.

Senator Bowring. We are willing to wait a little while, but not forever.

Mr. Poller. Thank you, Senators.

Senator Potter. You made an excellent statement, Mr. Poller, and I thank you for the statement.

Senator Hunt. I would like to ask a question.

Mr. Poller. Yes, Senator.

Senator Hunt. I wish you would explain for my benefit why the need of the very high towers when we can, as we are now out in my country, every 30 miles, put up what I presume you call a booster station, which we put on top of a peak every 30 miles, some sort of electronic equipment that receives and transmits the signal, so that we are getting, as I say, at the present time, television in Casper, Wyo., although I don't know where it originates.

Mr. Poller. It is economic, Senator. Where it is cheaper to bring it by the community pipeline system, they do it that way.

We don't know enough about boosters and satellites now. They are being developed.

Where it will be more economical to do it by booster and satellites, they have indicated they will do it that way.

Commissioner Hennock was at a meeting I attended of RETMA, where they explored boosters and satellites, and I know the thinking of the Commission is to give them a free hand, as much as possible, within the limits of electrical service, to expand that service; but
where a high tower, tall tower will do it more economically, they will use that.

I don’t think we should have a definite rule for one or the other. I don’t think our rules ought to be that hard and fast.

The people come first.

I mentioned here, we spend $50,000 in trying to educate the people on UHF.

I, personally, made hundreds of talks, wherever I could get a dozen people together, at schools, fraternal organizations, and so on. I talked on UHF, and I always prefaced my remarks with this fact:

You people have been told time and again that if you don’t like your Government, it is your fault if you don’t vote. You have that right, and I am going to tell you something. I am getting the privilege now of becoming a fat cat, of living quite well, using your facilities. They belong to you. If you don’t come in and tell us what you want us to do; if you don’t make yourself heard as to what you like and what you don’t like, you deserve all of the programs that you think are bad.

I think the public ought to be given that preference, and that authority rests with the Commission, and should if they would exercise it properly, if the Congress told them what their intentions were.

If you put an overall ceiling on power in order to protect what Senator Pastore pointed out, the congested area of one area, that is not applicable in this country to another area.

Senator POTTER. In other words, it should be patterned to fit the needs of the people rather than to have a rigid pattern?

Mr. POLLER. Rigid pattern; yes.

Senator POTTER. I would assume, in certain areas—I am thinking now of northern Michigan, where we have a lot of small communities—probably the answer would be booster stations or satellite stations.

Mr. POLLER. Or directional antennas, as they are talking about now.

There is going to be a lot of progress made.

In the RETMA presentation yesterday I think the temperature chart of the patient appeared beautifully, and if the Senators will remember to look at that—around December was the high peak of the growth of UHF, and you will notice each month up to December the percentage of UHF stations in the country got greater. Then something started happening, and it starts falling down to where their inventories are great now and their sales are small.

That is something that has happened as a result of the climate which has been established in the country for UHF generally. The sheep are fleeing in panic; and if that continues—as Colonel Roberts said, it is geometrically worse, not arithmetically.

Senator HUNT. I want to ask one other question: Do you know any way we can stop this practice of two applicants being very greatly interested in one channel, and then the night before the award is to be made they make a deal?

Now, I am not saying it is a dishonest deal at all. It is just sharp business, but I don’t think it is in the public interest.

Do you know any way we can stop that?

Mr. POLLER. The chairman interrupted before to make that point very strongly, and I said it would be covered later.

Under the present rules and under the present demands of the representatives of the people to give television economically, I don’t
believe they close their eyes to it; but they do that which is most expeditious for the people. However, in retrospect, if you look today, those people who have emerged in most cases—as soon as the storm blows over, they sell out their interests and one remains.

In fact, there is another type of a drop out. I believe it is called the Shreveport doctrine, in which, say, 3 or 4 applicants decide that one will build a station and operate it immediately, while the rest of them go through the long, drawn-out maneuvers of a hearing, and then whoever ultimately is the successful applicant—he will then get the prize, the station.

When you are talking about three-, four-, five-million-dollar prizes—and they are prizes—it is strange how quickly the curve lines straighten out. What appears to be a straight line is really an improper line.

Now, I can take, without discussing the names, the applicants right now in Milwaukee. I was part of that. I was drawn in and accused of fostering one of the applicants. There were three. I was accused of fostering the fourth one. The issues that developed promised to show that one of the applicants conducted a bawdy house. Now, that applicant has been merged in with the other three. I am no longer accused of fostering them since they have merged. They have agreed. Any of the charges they had made against each other—they disappear now. Where they, individually, 3 of them, may not have been qualified—only 1 could be qualified—suddenly all 4 emerge, becoming qualified.

Senator Potter. Does this type of thing happen: You mention these grants amount to four, five million dollars in certain cases.

Mr. Poller. Oh, easily.

Senator Potter. Isn't it true a lot of people file for a grant, hoping to be bought off, hoping to get somebody—

Mr. Poller. I think the record shows in Providence, R. I., the price paid was $225,000 or $235,000.

They find new ways of doing it now.

The Commission, I am sure, does not look with favor on any of these payoffs. So, they don't make payoffs any more because they know the Commission will stop them dead in their tracks. So, they give them options to buy in. Then, at a future date, they either buy those options back or let them come in for a little while and they pay them off.

All of these inequities are brought about by the fact there is a disparity between the two services, and there is a chance here to annihilate somebody and get that bounty.

Mr. Roberts. The question was: What to do about it; what can the committee do about it?

Mr. Poller. The final answer to what Senator Hunt said is: If the Senate adopted a committee resolution, instructing the Commission as to what they think this thing ought to be, I am certain that would take a load off the Commission, to where they would know what direction you want them to go in.

One of the most important things that has not been brought out here is the fact that, with all those pretty lights on there, I doubt there is a community in the country today, of any major size, where there is no television service, so that this hiatus, this chill, does nothing to the public.
Some individuals may see a $3 million bill fly out the window they thought they had in their hand, but the public does not get hurt. They are getting service; and, if they were not, I would be the first one to say no chill should prevent the granting of service to a community that doesn't have it.

Senator Potter. That doesn't have service.

Any other questions?

Thank you for your statement.

The next witness will be Mr. Garrison, Jack Garrison, Station KACY of St. Louis.

Mr. Garrison, we are happy to have you present your statement.

STATEMENT OF JACK G. GARRISON, PRESIDENT AND GENERAL MANAGER OF THE OZARK TELEVISION CORP.

Mr. Garrison. Thank you, sir.

Mr. Chairman and members of the committee, my name is Jack Garrison. I am president and general manager of the Ozark Television Corp., holders of a construction permit for—until recently operators of—KACY-TV, channel 14, licensed for Festus, Mo. I have worked in all phases of radio and television for a period of 20 years, excepting 4 years' infantry service in World War II.

If I may, Mr. Chairman, I would like to depart just a moment from my prepared text, because I have done something rather irregular. When we found we were going to be extended the courtesy of appearing before this committee, we prepared in our hometown a statement. The statement was prepared along the issues that we were interested in as a station and was done to the best of our ability. When I got up here and began to listen to the testimony, it appeared to me we were not rendering the service with reference to information that we possibly could render for the committee. So, I stayed up all night and worked up another statement. If I may, I would like to put in evidence the feelings of the corporation in the previous statement, and I would like to differentiate between these two statements. The first one is the statement of the corporation as authorized by the board of directors. This, for reasons developed in the statement, is a personal statement.

Senator Potter. This statement here is the one that was the original statement; is that correct?

Mr. Garrison. Yes, sir.

Senator Potter. That will be made a part of the record at this point.

(The statement referred to is as follows:)

STATEMENT OF JACK G. GARRISON, PRESIDENT AND GENERAL MANAGER, OZARK TELEVISION CORP.

KACY-TV.—Ozark Television Corp. is the owner and operator of television station KACY-TV, channel 14, Festus, Mo., serving the St. Louis market. The company was granted a construction permit on December 31, 1952, commenced commercial operation on November 25, 1953, temporarily suspended operation on April 2, 1954, and is now seeking reorganization in the St. Louis United States District Court.

48650-54—23
Operative commercial stations:
- KSD-TV (channel 5), since February 1947.
- KSTM-TV (channel 36), since October 1953.
- WTVI-TV (channel 54), since August 1953.
- KACY-TV (channel 14), since November 1953.

Additional commercial stations oncoming:
- KWK-TV (channel 4), granted April 1954.
- KFUO-TV (channel 30), granted January 1953; (channel 11), in hearing.
- WIL-TV (channel 42), granted January 1953; (channel 48), not applied for.

Networks.—All four networks furnish programs in the market. KSD-TV as the only operating VHF station in the market has a primary affiliation with NBC, and a secondary affiliation with CBS. KSTM-TV has a primary affiliation with ABC, and WTVI has a primary affiliation with Du Mont and an arrangement with CBS for programs not carried by KSD-TV. KSD-TV also selects and shows certain ABC top programs. KACY-TV has never been successful in obtaining any kind of affiliation with any network, and in fact has never been able to obtain a single network show.

CBS seeks channel 11 in the market and if this grant is made it would most likely result in the following eventual affiliation line-up: CBS, channel 11; NBC, channel 5; ABC and Du Mont, channel 4.

Financial status.—KSD-TV, owned and operated by the Pulitzer Publishing Co., grossed an amount in excess of $5 million in 1953, according to the magazine Television Age, and a conservative estimate of the net income for this period for KSD-TV would be at least $3,500,000.

KACY-TV suffered an operating loss of $307,188.49 from July 1, 1953, to March 31, 1954. It is believed that KSTM-TV and WTVI-TV are still operating at a loss, and that the total operating losses of the three UHF stations in the market exceed $1 million.

St. Louis' investment in UHF.—According to figures compiled by Mr. Vincent J. Lutz, president of the Association of Television Service Cos. of Greater St. Louis, Inc., which have been furnished to Senator Potter, the people of St. Louis have the following investment in UHF in this market:

| UHF converters, new sets, etc. | $15,000,000 |
| UHF dealer stocks | 7,500,000 |
| UHF station investments | 2,500,000 |

Total St. Louis investment in UHF: $25,000,000

We believe these figures to be conservative, and we further note that even more important than this huge potential money loss to the people of St. Louis in the event that UHF fails, is the potential loss to the area of adequate local coverage and programing and selectivity of programing.

UHF potential.—Unless Congress and the Federal Communications Commission take immediate and drastic steps in recognition of the chaotic condition of UHF television, within 4 months there will be no UHF stations operating in the St. Louis market, and with no hope that UHF ever could be revived in the market.

On the other hand the UHF stations in the market have proved that UHF potentially had public acceptance as an equal to VHF, as conversions in the market were proceeding satisfactorily until KACY-TV was forced to suspend operation, and the Federal Communications Commission granted a VHF permit on channel 4 in St. Louis. If the UHF stations in St. Louis had been able to obtain network programing of the caliber enjoyed by KSD-TV, today they too could be in the financial state of grace similar to that enjoyed by KSD-TV.

The solutions to the problems of UHF are difficult and require the courage and foresight of those who would solve them, but it is not an impossible task, and once performed, will inure to the benefit of the public interest, convenience, and necessity.

THE IMMEDIATE REQUIREMENT

The complexities of the UHF problem, its effect upon television broadcasters, networks, manufacturers, advertising agents, sponsors, dealers, and most importantly the public, the considerations in arriving at an integrated and final plan, and the necessary immediacy of relief by UHF operators, permits only one conclusion. The Federal Communications Commission should immediately issue a freeze order effective upon all applicants and all holders of construction
permits who have not yet requested authority to conduct equipment tests, until such time as the Congress and the Federal Communications Commission can study the problem and resolve an integrated plan.

The proposal for freeze and study is drastic and undoubtedly will be met by the hue and cry of those, primarily VHF applicants and grantees, whose interests are selfish and in disregard of the public interest. But it is axiomatic that UHF stations now going off the air or headed in that direction can only be speeded along the road to failure by the event of additional stations coming on the air in their market until such time as UHF problems are solved, and it is fitting therefore that the UHF operators face not only the risk of their investments but their operating losses already suffered. Their financial considerations are the greater, even ignoring the necessities of the public interest.

SPECIFIC REMEDIAL PROPOSALS

Ownership rule of "Five and Two and One-half."—Ozark Television Corp., licensee of KACY-TV, has made a continual effort to elicit interest in a change in Federal Communications Commission ownership rule that would make it possible for a multiple-station owner to own 5 VHF stations and a total of 50 percent of 5 VHF stations. The plan offers many advantages.

1. Immediately revitalize UHF on a national basis and mitigate to the greatest possible extent all of the factors presently hamstringing the majority of UHF station operations.

2. Could be immediately effected by the Commission under existing powers.

3. Would cause the minimum dislocation within the industry.

The proposal as originally transmitted to the Chairman of the Commission, the Commissioners, and the Potter committee is attached hereto as exhibit A.

Regulation of networks.—The solution of many of UHF's problems are dependent upon strict regulation of networks, beginning with a clear definition of a network. Some plan must be adopted whereby no station can carry more than 1 network in a market with 4 or more stations. In markets of 3 stations, 1 station may be allowed to carry 2 networks, and in 2-station markets each station may carry 2 networks. In single-station markets the operator has no network problem.

This plan should be implemented by the prohibition of delayed broadcasts of kinescope programs unless the live broadcast has first been offered to other stations for live broadcast with advance notification of the availability of such programs required.

In order for this plan to be effective and to prevent networks from acquiring, through negotiation, an affiliation contract detrimental to the affiliated station, the Federal Communications Commission should require standardization of all affiliation contracts and all such contracts should be made a matter of public record.

There are undoubtedly many other phases to network regulation which the Federal Communications Commission should incorporate on the basis of nationwide experience.

Reserve subsidy.—A Department of Defense research grant or contract for further experimentation and development of ultrahigh frequency transmission and receiving tube should be made.

To a considerable extent, the present status of television is built on research and manufacturing procedures developed as a part of the national-defense effort during World War II.

The company is of the opinion that many of the difficulties experienced in UHF operations is due to a general slowing down of electronic research since the end of the war.

Certainly the tubes for UHF transmission and reception called for in the Federal Communications Commission's sixth report have not yet seen the light of day.

In this electronic age the frequencies presently used by television both UHF and VHF are of increasing importance and interest to all branches of the defense established with particular emphasis on the Air Force and the Navy.

Present status of guided-missile development available to public knowledge is such that there is every indication that in event of future war the utilization of some portion of the television frequency spectrum for the national defense would be mandatory.

Research that would advance the development of high power UHF transmission tubes and all channel reception tubes would be an outstanding contribution to the defense effort.
It is respectfully submitted that a coordinated effort by the Federal Communications Commission and the Department of Defense could accomplish the research objective within the framework of existing legislation. Certainly, lasting good would result for a billion dollar industry, for the national defense, and the welfare of the public.

Industry estimates as to the cost of completing the development of high power UHF transmission tubes and all-purpose receiving tubes that would utilize the UHF spectrum to its fullest extent is $3 million.

Private industry has been unwilling to dedicate the facilities, time, effort, and money to accomplish this due to the uncertainty of the attitude of the Commission, industry, advertisers, and public to UHF television.

Standardization of color receivers.—Inasmuch as color telecasts are now being made daily and color output predictions estimate 50,000 color sets this year, UHF television and the public are confronted with another grave problem, which requires a prompt solution. Therefore, the Federal Communications Commission should immediately take regulatory steps to require that all manufacturers produce only those color sets that include all channel tuners.

CONCLUSIONS

The foregoing references that have been respectfully placed before the committee for consideration are not presented with the idea of accomplishing any all-inclusive panacea that will afford a guaranty of financial return for a UHF television broadcaster. With any degree of equality of opportunity there will always be operations that are in varying degrees either financially good or bad directly predicated on the ability of the operators. However, such is not the case in television in America today. Under the present rules of the game and the manner in which they are interpreted and enforced, the UHF operator has absolutely no opportunity for survival. Operators, industry, and the public have lost approximately $500 million, and there cannot be a national television system in the United States.

In a mixed market, it costs at least as much to operate a UHF station as it does a VHF station. Unless the UHF station has a breathing spell while a consideration of the foregoing is undertaken it will be completely impossible for the overwhelming majority of UHF stations to survive.

EXHIBIT A

JANUARY 29, 1954.

Re recommendations concerning the proposed rule of “Five and Two” Docket No. 10822, amendment of section 3.636 multiple-station ownership.

Hon. Rosel Hyde, Chairman, Federal Communications Commission, Washington, D. C.

Dear Mr. Hyde: We, as the operators of UHF channel 14, Festus, Mo., serving the ninth market of St. Louis, feel that we have a vital economic interest in the Commission’s decision in the above proposal.

In relationship to the present ownership regulations, we support the rule of 5 and 2 but we offer for your serious consideration, a rule of 5 and 2½.

Our proposal of 5 and 2½ would permit ownership in a maximum number of 10 television stations; partial or total ownership in a VHF station or more than 50 percent ownership in a UHF station to count as 1 against the 5, and 50 percent or less ownership in a UHF station to count as one-half against the 2½. Thus a single owner could own 5 VHF stations and 50 percent or less in 5 UHF stations, or for further example, 3 VHF and 2 UHF stations, and 50 percent or less ownership in 5 UHF stations, etc.

It is our considered opinion based upon operating experience, that UHF television desperately needs every possible subsidy and protection that the Commission and the Congress can provide. Certainly this is support by an examination of the Commission’s survey of postfreeze television stations of December 30, 1955, wherein the economic prospects of the UHF stations considered were not bright, even though only 2 of 41 under consideration were located in mixed markets where prefreeze VHF stations were in operation.

One very palatable method of subsidizing UHF stations is to entice the newer or multiple-station operators to adopt the UHF “infant.” This can be done in the foreseeable future only on the basis of the ownership incentive, but should be done without devoting UHF stations operators who are pioneering the field. Thus, the 5 and 2 rule in practical parlance, means that each net-
work or multiple station operator may acquire 2 UHF stations in the United States and it is obvious that this will be on a full ownership basis. We propose that ownership limitations be expanded to make possible the acquisition of 50 percent or less of 5 UHF stations in the United States so that solid support behind UHF, both financial and programming, may go into 5 different markets rather than only 2, and yet permit individual (and generally local) ownership of half of the UHF stations in the market. Thus in mixed markets, all UHF stations in the market, both network and independent, will be immediately assisted by the impetus of conversion to UHF reception.

Furthermore, without detailing well-known facts, once the networks and multiple station operators acquire sufficient UHF interests, their influence over television transmitter and receiver manufacturers can only result in better UHF transmitters and better UHF receivers all in the public interest.

In regard to this, reference is made to Codel's Television Digest—pages 3, 4, and 5, issue of January 24, pertaining to the present inadequacy of receiving and transmitting equipment as originally called for in the Commission's sixth report. The million watt UHF transmitter is still a gleam in the designer's eye. A UHF tuner comparable to the perfected VHF tuner is yet to hit the market. The rumors concerning the existence of such a tuner in the laboratories of two of the major manufacturers, do not have sufficient substance to provide the operating climate for a multimillion dollar industry without immediate, extraordinary assistance.

There is another even more important consideration—the matter of national and regional advertising support. Due to the tremendous expenses involved in even the minimum television operation in the public interest, convenience and necessity, an appreciable degree of national advertising about is an absolute necessity. The majority of national television advertising is purchased through national agency offices in New York, Chicago, and Los Angeles. There is not a single UHF television station operating in the three aforementioned cities. In that agency account executives and media departments do not have personal experience in the matter of UHF, they lean on the networks for information and the networks who are without operating experience in this form of transmission, are not in a position to provide it. This is not to imply anything sinister, but rather something thoroughly human. Due to the manner in which the American system of broadcasting and telecasting has developed, the average agency buyer of national or regional telecasting time tends to lean heavily on network practices and experience as a standard of acceptance.

With reference to UHF, an agency inquiry to a network official quite often results in a comparison of misinformation, generally adding up to a complete condemnation of UHF. The undersigned actually had an experience with one major advertising agency where the New York office was using a UHF article in a 2-year-old copy of a magazine-stand science publication as a yardstick for purchasing television time on UHF stations. As they say, "the agency has no means of evaluation." Thus, it is contended that network and/or multiple operator ownership of UHF stations would immediately broaden the base of operating knowledge and increase national and regional advertising mating for all stations. This is true because adequate information about one station in a market must necessarily be accompanied by information about all stations.

The third consideration is a thoroughly practical one for all UHF station operators, and particularly those in mixed markets. Most of us believe that we entered the game under one set of rules and that after we were committed, the rules were changed. The reference is to the expedited processing procedures and policy changes that have proven conducive to accelerating the granting of VHF licenses to an extent that in many markets they are appearing on the air at least a year earlier than originally anticipated. Appreciation of the "practical" necessity of some of these processing and policy changes does not alleviate the catastrophic results they bring about. It is respectfully suggested that the "3 and 2½" rule as herein proposed would make it possible to insure a national television system through the further development of the UHF telecasting art, and at the same time satisfy other interests through expediting the granting of VHF licenses without bringing financial ruin to the former.

Without wishing to quarrel with a recent letter written by Senator Johnson opposing the "5 and 2" rule, and mindful of the fact that our proposed "3 and 2½" rule might further extend the breach between the viewpoints of the Senator and the Commission on ownership, and being further mindful of the Senator's announced support of UHF television, we believe the Senator's position on ownership does not meet the facts or answer the survival problems confronting UHF operators. First, on theoretical grounds, an increase of maximum individual
ownership from 5 stations to 7 or even 10, does not reflect a trend toward network or single entity monopoly or denial of "public rights" by virtue of additional ownership by admittedly vested television interests, because if a network was properly permitted to own 5 stations out of 400 channels on the old VHF assignment table (1.25 percent) then network ownership of 10 stations out of 2,053 channels on the new combined VHF-UHF assignment table (0.5 percent) is even more proper. Second, if UHF television is to survive in large mixed markets, it must have the support of continued network programming on one or more stations in order to get the public to convert to an extent sufficient to make UHF competitive with VHF in the market.

In that the undersigned worked for a period of 6 years to bring his station into being and organized it entirely with money from nonindustry investors, there is little room for a claim that this writing speaks for monopoly. The undersigned herewith states that he is not now negotiating nor has he in the past entered into negotiations with a network or multiple-station owner for a sale of all or part of his facility.

With reference to fear and concern of Senator Johnson and others concerning monopoly, it is respectfully suggested that it is extremely difficult to legislate against evil. May it be further said that a too stringent effort to avoid any coherent expansion of UHF telecasting because of fear of monopoly might well result in no possibility of monopoly due to the fact that no UHF stations were operating. It is suggested that a vigilant Commission such as the present one, properly financed by the Congress, will at all times be able to properly police station operation.

As a result of considered judgment, the following results would be anticipated from Commission adoption of a rule of "5 and 2 1/2":
1. Immediate acceleration of improved transmitter and receiver design, manufacturing and marketing. It would and could bridge the receiver marketing gap until color receivers are perfected and ready for general use.
2. Immediate acceleration of national and regional spot advertising for all UHF stations, both network and independent.
3. Bring into full realization the Commission's desire for a truly national television system.
4. Immediately accelerate set conversions and net set purchases in mixed markets, so that all stations, networks and independents, could do a better job.
5. Make possible continued acceleration of VHF grants without destroying those with faith, vision, and foresight who followed the FCC's provisions and attempted to operate licensed UHF stations.
6. Bring new money into 20 to 25 UHF stations at a time when it is badly needed.
7. Generally raise the standards of all UHF television stations.

The undersigned and his associates have full faith in the future of telecasting at the UHF end of the spectrum either as an independent or network station, and are convinced that under Commission guidance and encouragement there is at the very least a strong possibility that within the next decade of this electronic age all the blessings of television may come to us over what is now called UHF. But that is of the future, and the problems are immediate.

We do not speak loosely or tritely, and we speak only for ourselves and with recognition of the public interest. This week we commenced our third month of commercial operation on channel 14 in the Ninth Market of St. Louis during which 2-month period our operating loss added up to a considerable sum of money. During this period we have been the most powerful UHF station in America—operating on the most favorable UHF channel—from the highest tower in the market.

In conclusion, we support the rule of "5 and 2" over the present rule of 5, but believe that it should be extended to a rule of "5 and 2 1/2". And whatever the conclusion of your Commission may be, we ask in the interests of UHF and ourselves that it be decided rapidly and clearly.

Very truly yours,

OZARK TELEVISION CORP.,
JACK G. GARRISON, President.

Mr. Garrison. Forty-nine days ago my station suspended service to the 2 million people in the Greater St. Louis metropolitan area. It was at that time the most powerful UHF station in America, operating from the highest tower in the market, with the largest and most
complete studios in the market, staffed by a group of the most thoroughly experienced television people in the Middle West.

May I note here that I have made available to the committee as exhibit A a bound presentation of photographs of the installation and some of the local programs with which we served the market.

I have an express purpose in making this exhibit. To begin with, perhaps beyond all bounds of objectivity, I am very proud of the station it represents. Then there's something else—the plant pictured there was constructed in just 44 days, from a cow pasture to a completed operating facility, the most powerful UHF station in the Nation, in 44 days, which we think is something of a record. We were able to do it because we knew our business and because we had splendid assistance and guidance from the General Electric Co.

We then tested our facility for 30 days, during which time we caused to be electronically measured the area covered by the station's television signal. It extended well over a 50-mile radius and offered service as a potential to some 2 million people.

On November 25, 1953, we opened the station commercially. On April 2, 1954, we ceased operating the station, after an operating loss in excess of a quarter of a million dollars.

We built the station, we opened it, and we closed it.

In deference to the committee, I have tried to condense tens of thousands of man-hours of work and several hundred thousand stockholder dollars into a few hundred words.

The foregoing condensation leaves two questions: "Why," as Senator Hunt asked the other day, "if this thing is so bad, did you get into it in the first place?" and, parenthetically, "After you got into it, why did you have to suspend?"

Well, the question, How did we get into UHF?

Here is how it happened: Shortly before the end of the freeze we had discussions with two members of the Federal Communications Commission. We saw them on separate occasions. The upcoming sixth report was discussed at length. It was their opinion that UHF offered the best opportunity for an early start in television and that we would have from 2 to 3 years to establish UHF in our area before there would be additional VHF competition.

We spent additional months in surveying the market, figuring construction and operating costs, potential revenue, operational plan, and so forth. We decided to apply for a UHF license. The decision was based on the following:

1. That the St. Louis market presented an excellent UHF potential, due to the fact that there was only 1 VHF television station in operation, and that there would be 2 or more UHF operations going on the air at about the same time to provide impact.

And, if I may, sir, I would like to depart from the text there in this respect: Developments have been so fast—even working in the late hours we have not been able to keep up with them.

I might say we were proud in St. Louis that we had a laboratory that could prove the possibilities of service on UHF.

We considered that we had a laboratory objectively for this reason: Going on the air within less than 3 months of each other were 3 UHF stations, all operating with maximum power.
The terrain, topography in the St. Louis area is such that what few operational difficulties there are at present with UHF are at a minimum. The ground is relatively flat.

So, we had three different stations the people could get if they wanted to convert.

That has changed rather quickly. A grant has been made to an additional VHF station and, as I will bring out later in the testimony, we are led to believe there is an extreme possibility there will be an additional grant for a third VHF station. So, ipso facto—the potentially great UHF market that can show whether or not UHF will work becomes a VHF market.

Senator Potter. Do you have any UHF stations in operation at the present time?

Mr. Garrison. Yes, sir.

My station was the first casualty. There are at present two UHF stations operating.

I will bring out later on, unless something is done, and done immediately by this committee, in my opinion, in 150 days there will be no UHF television in St. Louis.

The second point I made before I interrupted myself was the terrain there was ideal.

These are points as to why we thought UHF would work.

I think Senator Hunt’s question was very aptly put yesterday:

If this thing is in such terrible mess, and you knew about it, why did you get into it in the first place?

I have tried to show we did give every conceivable consideration to it; that we would have network service to start with and could build set circulation—and this is a reference to my own operation—and that after we had circulation built we could get along without a network if we had to.

Senator Potter. Do you have network affiliation?

Mr. Garrison. No, sir.

But if we got the best and most powerful equipment obtainable and used it to the greatest possible advantage we would have enough coverage power to do the job.

I might say in our particular reference the equipment furnished us by the television industry was more than satisfactory. We worked very hard with them. We tried to exploit every conceivable advantage. We obtained the assistance of the Federal Communications Commission in trying a new procedure in reference to antennas, and our signal was terrific.

5. That there were so many applications for the VHF stations that we would have ample time to build our set circulation by conversion, as pointed out by the Commissioners in our initial talk with them.

6. That we had available to us a highly efficient group of willing, skilled people who through the years have been trained in their work, and that, if we worked hard enough over a period of years, we would have a good, substantial business.

Well, the next question: What happened to these assumptions?

They all become academic with my station, KACY, when we were unable to obtain a single network program. In spite of the fact that there are 4 networks and that 3 of those networks have prime affiliation contracts in the St. Louis area, we were not able to obtain a single
network program from the 1 network that did not have an affiliation in the market.

We negotiated with this particular network for a period of 8 months. In December of 1953, we made a complete presentation, and this presentation to the network has been made available to the committee marked as "Exhibit B."

My idea in putting this in as an exhibit was that actually in the limited time we had this exhibit shows more about what kind of station we had than anything else I could give you.

Senator Potter. Why was this one network that didn't have an affiliation in St. Louis reluctant to affiliate with you?

Mr. Garrison. Sir, I am on dangerous ground there, and I would like to read one more sentence, if I may.

Senator Potter. All right.

Mr. Garrison. This subject is now in the courts, the subject of a triple damage antitrust suit, and I have, humbly speaking, neither the desire, inclination or authority to try the case before the committee.

Needless to say, our inability to obtain network programing severely hampered our ability to serve the people of the St. Louis area.

In spite of the cost and time consumption of negotiations with the network, we were able to materially build our local television business revenue.

The week of April 2, when our station suspended operations, we had local business equal or superior to the other two St. Louis area UHF stations. Our billings were in excess of $6,000 a week. These billings were local.

Due to the complete absence of network programs, we operated without national sponsorship, either program or announcement.

I might explain here that it is the established practice of the major advertising agencies to buy announcements and programs on only those UHF stations that have network affiliations. We found this policy established beyond the shadow of a doubt during hundreds of calls made on advertising agencies in New York and Chicago.

I might note here that, when all costs are considered, it takes a minimum of $13,000 a week to operate a completely equipped, competitive television facility in a major market.

You may consider this figure a bare minimum when you are operating a station without a single network program.

In the time that we were on, sir, we sponsored an awful lot of time ourselves.

And, so, in summary, our station suffered from a mortal wound because it was faced with a situation of complete inability to obtain programs from a network that did not have a prime affiliate in the market. It is my belief that we could have operated at a profit if we had been able to obtain network programs, and I think our local business substantially implements that belief.

Senator Potter. Somebody testified here the other day the station normally has about 80 percent of their advertising as national advertising or through the network.

Mr. Garrison. Well, sir——

Mr. Roberts. Including national spots.

Senator Potter. Pardon.

Mr. Roberts. It was including national spots, sir, too.
Senator Potter. Yes.

Mr. Garrison. Those statistics actually, in my judgment, would have to come from VHF stations who, as one of the points that we in this segment of the industry bring up, tend to monopolize their schedule with national advertising because, one, it is easier to produce. That is something that has not been brought out in these hearings, and I don’t presume to bring up an entire point by myself, but I might say one of the basic reasons that a VHF operator, wherever he may be, has such a large amount of national advertising is because it is in the trade, what is called, clean business. He very seldom has to produce local programs in order to obtain the revenue.

Senator Potter. Is local business called dirty business?

Mr. Garrison. With reference to—not to avoid the answer to your question, sir, but with reference to—what it costs to produce as against national business, a man who is interested only in the column of figures would so think. Announcements come in a little can of film. You splice them together. You run them through a projector, and the cash register just rings like mad.

The same applies to film programs.

I might point out two of the most popular programs in the country are now filmed. I refer to I Love Lucy and Dragnet, but, nevertheless, they are network properties and they come in and you have got a guy standing there by the projector, and it is not necessarily the highly defined end of the television art to just keep that film feeding in there, but it sure helps at the end of the year.

As I pointed out earlier in my introduction, within the last month, what we consider, as far as UHF is concerned, as the black death has come to UHF television in St. Louis. Where before there was only one VHF television station, a change in the Commission’s processing structure has now brought about the license of an additional VHF station and, as I said parenthetically a moment ago, I am told that the licensing of the third VHF station is only a matter of days or hours away.

And, so, the stage is pretty well set for UHF to die completely in St. Louis.

With reference to UHF stations, first there were 3; now there are 2, and unless something is done soon there will be none.

In the event the committee and the Commission decide they want it to die, it will not be without monuments—in the St. Louis area over $25 million worth of monuments in the way of antennas on rooftops and converters and new television sets in people’s living rooms.

If I might, I would like to say with reference to television, the poor people get hurt first—and I am not referring to the operators—I am referring to the viewers.

I think it is a general observation, from people that watch the development of VHF, that oddly enough the antennas first begin to show up in the homes of the poorer people, because it meant a lot more to them. People with more means had the ability to entertain themselves, but even at almost prohibitive cost a television set for a poor family represents a tremendous segment of their recreational, educational, and entertainment life.

Senator Potter. It is a cheap form of entertainment.
Mr. Garrison. Yes, sir; and that has applied to UHF. In running
a survey on our conversions, we determined that actually the poorer
people convert first.

Senator Potter. What percentage of sets were converted in St.
Louis?

Mr. Garrison. As of today, the two national surveys that are gen-
erally accepted as McCoy on it, would figure one-third, which we
figure slightly in excess of 200,000 sets. The VHF station indicates
at present they have 600,000.

Now, with reference to conversion in St. Louis, we are fortunate
or will be fortunate later due to the arrangements made by Mr.
Zappel to have the expert in St. Louis testify on this, the gentleman
who is the president of the entire association of servicemen in the
whole metropolitan area, who have installed these converters and all-
channel sets and antennas.

Now, may I say the monuments that I referred to above have a
way of decreasing in value.

In Kansas City a leading drug chain ran an ad, and the sense of
it was: "Bring in your worthless converter. We'll give you $5
for it."

I might point out that the unused UHF tubes in Little Rock, Ark.,
would provide illumination for a ghastly Christmas tree, but it isn't
likely they will glow again for any reason at all.

Senator Potter. Why would this drug chain run an ad?

Mr. Garrison. Well, sir, I might point out if they obtain a con-
verter for $5, and if they are going to run it through a production
line and clean it up, that is, make sure all the tubes are all right
and the crystal is all right, for a cost of approximately $7 they
have got an item they can sell at retail and make a considerable
profit on, below the actual wholesale cost of the converter, if it is in
the normal channels of trade, and I am not privileged, because I am
not familiar with the actual situation there, to enter into the record
information as to what extent that worthless converter market might
be, or the number of sets in Little Rock.

Commissioner Hennock. I can tell you—70,000 sets. I was there
2 weeks ago.

Mr. Garrison. You have got 70,000 sets. I don't know what the
ratio was between all-channel and converters, but let us say, for
example, 35,000 of those were converters. The converter retails at
$29.50. The people who work this gimmick through the drug store
can retail them for 10 bucks.

In some sections in Washington UHF is referred to as a $50 million
mistake. Not because my money is in part of the possible mistake
money but actually and factually I am afraid the figure comes con-
siderably closer to $350 million.

In my judgment, it is up to the committee to decide whether the
mistake was one of origin or administration. If it be the former,
the Nation should know it now; and if it be the latter, some changes
can be made.

The following reference I make respectfully with reference to the
Federal Communications Commission: On being questioned as to
why the processing schedule had been changed, one of the Commis-
SIONERS is reliably reported as having said: "It is the democratic process."

And, oddly enough, perhaps he is right.

Certain pressures, which I think were very well brought out in my limited experience with Commissioner Hennock this morning, have resulted in the change in the processing structure, and I am of the opinion that if, in the national welfare, sufficient reason exists for the reversal of these pressures this subcommittee will recognize it.

Two other commissioners have made recent statements to the trade press to the effect that the UHF broadcasters who entered the industry and ran into trouble have only themselves to blame.

I might insert there, in some contact I have had with the very excellent staff that the Commission has, that that feeling, and only naturally would it be so, is reflected down from the commissioners to the staff, who feel, "Well, you people go in there. You went in of your own volition. Nobody up here put a gun on you. Now, you've been hurt. It's your fault."

I don't subscribe to that. I sincerely believe I have met a cross-section of the broadcasters who have attempted to operate on UHF, and in no instance have I found a single UHF operator, present or past, who was not equal or superior to a successful AM radio operator.

My point in bringing this up is we are told the provisions made by the Commission were the best that could be made and that the trouble with them was that we don't know our business, and I don't think it's right.

In my opinion, the Federal Communications Commission is powerless to act in a manner that will implement a climate in which UHF can live without definite assistance from this committee. Such assistance is either warranted by the committee or it is not.

Remedies that I suggest?

Well, many remedies have been suggested so far in these hearings, and I subscribe to most of them—some to a stronger degree than others—but I do believe that all who are genuinely interested in the future welfare of the industry at large subscribe to the recommendations of Commissioner Hennock that there be an immediate freeze or chill, or whatever you might want to call it.

I fully subscribe to the position of the Ultra High Frequency Association with reference to the elimination of intermixture.

That was explained to you by the association's general counsel, Col. William A. Roberts.

May I say, in my opinion, unless 4 equal service stations are available in the first 50 markets there cannot be 4 networks available to feed television stations; and I have no contact whatsoever with the Dumont Television Network nor any other network.

I will say this, though: In my judgment, unless a network can clear time in the first 50 markets, it can't exist; and, from my standpoint, as an operator who has gone through an experience of trying to build a market without any network programs, there has to be a minimum of four networks, whoever owns them.

There not only has to be a minimum of four networks, but there is a basic economic justification in the desires of the industry for four networks, but those networks cannot exist unless they can sell the products
of the advertiser first in the first 50 markets. Other people say a hundred. I say 50 as the bare minimum.

Senator Potter. The key to your statement here is equal service?

Mr. Garrison. Yes, sir.

In my judgment—and I think we have proved it in St. Louis—if it isn’t equal, it isn’t service, because it is on a precipice. It is doomed to failure.

The point I tried to make there is: Unless the major markets are covered by competitive networks, the small stations in the outlying hinterlands will be completely without network service, because by its very essence they can’t live unless they are in the major markets.

Senator Bricker’s bill on the regulation: The men in the white coats could perhaps come forward for me now, for what I am going to say, but I believe it. I, personally, have suffered as much as anyone due to the lack of network regulation. I spent 7 years of my life in work on a station that died because of lack of regulation, but I am opposed to it in principle by statute unless there is irrefutable evidence and experience to the effect that legislation is the only possible method of regulation.

I am convinced that the Federal Communications Act of 1934 provides more than adequate regulatory power within the FCC.

In the Commission’s basic regulation of license renewal, there is every opportunity to regulate every process desired, that is, if the Commission can know how elected officials desire it to be administered.

Senator Potter. You believe there is ample authority in the Communications Act for the Commission to regulate the networks in order to bring about equality of service?

Mr. Garrison. Yes, sir, by one or two methods.

An immediate method would be by rule-making.

I think the actual powers as set forth in the Communications Act of 1934 for rule-making are almost without limit, the exercising of them needing only a desire.

With reference to an actual change in the network regulations’ portion of the thing, I don’t seek at all to be facetious, because I’m real serious, but the thing we talked about as kids, the old rhyme, “We don’t smoke, and we don’t chew, and we don’t go with girls that do”—I mean the reference I have got is: The only thing they have to make known is under what conditions they are going to renew that license, and some people might not get real happy about it, and perhaps they have been happy in the past, but it can be done if there is a will; but these people who perhaps in the future might not think I should own even 15 percent of a filling station, these people are human. They cannot be told one day, “Here is X number of hundreds of thousands of dollars. Now, you just get back there and you exercise the thing you are supposed to do, and you just get out licenses as fast as you can, because people want them,” and then a few months later say, “You shouldn’t have gotten them out so fast.”

There was a cartoon in a national magazine a while back that showed a big boss sitting in front of a desk, and there was a chart that showed the stock was going right through the floor, loss in value, and there was a meek, little man standing in front of the boss, and the boss says, “Why didn’t you tell me to sell that stock?”

And the little man said, meekly, “Well, I did.”
And the boss said, "Why didn’t you pound the table?"

Senator Potter. In all fairness to the Commission, I think I should state I know the Commission has been under great pressure from the Congress and various areas to expedite the action on the various VHF grants and, while the Commission may have the authority, in existing law, I think it is more or less a policy decision—I think it will need leadership or expression from the Congress or this committee in order to act.

Mr. Garrison. Yes, sir.

Senator Potter. They are caught in sort of a squeeze, from pressure, on the one hand, to act on these VHF applications and, on the other, from you folks who are up against a real immediate problem.

So, I think the Commission will need action certainly by this committee in order to know what the policy should be.

Senator Hunter. Senator Potter, let me interpolate here.

I think both the Congress and possibly the Commission are to blame. Not once, to the best of my knowledge, have all of the Commission appeared before our committee, and we had lengthy discussions on this particular matter. We have been very, very negligent in our duty, not just with this Commission, but with many other commissions, in not knowing their problems.

Senator Potter. That is right.

You may continue.

Mr. Garrison. Thank you, sir.

I might say—

Commissioner Henlock. Pardon me, Mr. Garrison.

May I make a statement, Mr. Chairman?

I want you to know the reason I brought up the question of Senate pressure to get out the licenses for VHF’s was because—I am sure they have had pressures brought to them, in turn, from their home States and applicants, and I am sure they were not aware of what they were doing to the UHF.

Senator Potter. That is right.

Commissioner Henlock. But I certainly didn’t want to sit here and see the Commission take all the blame either, because then I have no business serving on a dishonest Commission, if I am an honest woman, and I didn’t want to see my colleagues to get all the blame.

Senator Potter. I thoroughly agree, and I don’t think there is any intention to cast reflection upon the Commission. I think it is a major problem that the Commission has, and we, in turn, the Congress, have helped create the problem. I think the average Member of Congress, particularly if he is not on this committee, reacts as the wind blows pretty much. If the wind is blowing for action on a certain VHF application, it is going to blow downtown; if it is blowing in the direction or from some UHF people that are in trouble, that is going to blow downtown.

Since I have been here in the Senate, I know there has been a great deal of effort on the part of many to get the Commission to act as quickly as possible on these applications.

So, the Commission, in carrying out the intent, will need additional appropriation funds so they can expedite these things much faster.

I am sure at that time the committee was not aware of the problem which the UHF people were confronted with, and that is the reason for these hearings.
We hope, as a result of these hearings, getting expressions from all segments, that some action can be taken which will save this UHF band as a medium for television operation.

Mr. Garrison. Sir, I don’t subscribe to the saving of a UHF band unless, in the considered judgment of this committee, after they hear all the testimony, it means the saving of television.

We have been considered as opportunists. We have been considered as people who took a different approach, and having taken an untried path and not clicked, we deserved it; but my reference is this: Either this is a matter now in which it is necessary to set a course that is good for the country or, for some reason, that course isn’t needed, and we, as individual operators, are in no position to pre-judge it. All we can do is give you our side of the story, which is biased, but in the overall essence of the thing either we are necessary for television or we should die and, like the flowers at the end of the summer, we are going to die very quick.

Thank you, sir.

I will continue. I don’t want to take other people’s time.

My reference here to the Johnson bill is a misnomer. Certainly we owe, as a segment of the industry, much to Senator Johnson. His multiple-ownership bill is perhaps the only possible way for us to be heard, but my actual reference in this section is to the document of the 5 and 2.

The Ozark Television Corp has taken a position for many months that in the event the Commission decides to relax its multiple-ownership rule the greatest good accrues to all of UHF by granting the right for multiple-station ownership to own 50 percent of 5 additional UHF stations rather than 100 percent of 2 stations.

This is discussed in detail in material that I have already filed with the committee in the previous exhibit that I gave before I read this one.

It stands to reason that if the Commission’s desire to assist UHF through VHF ownership is justifiable it can best be accomplished through ownership of 50 percent rather than 100 percent of the stations to be bought in.

The beneficial effects of 50 percent rather than 100 percent are, among others, the following:

No fire sales.

I might say—and again I am treading for myself on dangerous grounds—that in certain discussions I had with certain officials who worked with a network, who had examined my property, minutely, I was told, unfortunately, they couldn’t affiliate with me; they might buy me.

I had to think that over all of 30 seconds before I got real mad and worked up a proposition which, in my judgment, was equitable, whereby if they did buy me I would have the tail of it.

Now, that is the sensible thing to me. As I examine it, it makes sense to me on this basis: I am not saying the Commission should take the present rule of 5 and add to it, but I am saying if they do take the rule of 5 and add anything to it they should not take whole units, because if we do we are sitting ducks. If they do, it will not help nearly as much taking 2 stations and giving them to an individual operator as it would taking 50 percent of 5 stations.

What UHF has needed from the very beginning and has never received is national acceptance.
You go along Madison Avenue, where there are no UHF stations; you go along Chicago where there are no UHF stations—they don't know what you are talking about and they don't want any.

Certainly the Commission document of 5 and 2 brings out the thinking, either rightly or wrongly, that if large operators were able to own additional stations that they would be interested in getting in behind it.

We worked for many, many weeks in analyzing the thing, in the 5 and 2, and 5 and 2½, and it does, as I pointed out, give greater impact. It makes the possibility of greater benefit in mixed markets.

The provision, if added to the 5 and 2, or 5 and 2½, or whatever the Commission, in their own judgment, decided on—if they insist these be in present markets that are subject to intermixture, it would help. If these people are allowed to go out in the hinterlands, where there is no competition between the spectrums, it is not going to help anything except their statement at the end of the year.

Senator Johnson's bill with reference to the excise tax on ultra-high-frequency receivers: In my judgment, the passage of this bill could result in material assistance to the industry, providing an all-channel tuner is specified.

Now, if the manufacturers are allowed to get by with just putting strips in, I don't think it is worth a subsidy. The only thing—and let's face it—what we are talking about is a subsidy. The only possibility of a subsidy being of any value is if it ends in equality, and as near as we can come to equality today is an all-channel receiver. So, if that bill did so state that the relief it attempts to give was given for all-channel receivers, it would mean something. If it didn't it would mean a good advantage to some manufacturers.

In conclusion, may I say in my judgment the Federal Communications Commission has done the best that any commission could do presented with a problem of such a complex nature, but the time certainly has now come for a reassessment, an examination of what is desired and how it can be accomplished.

Today's chaotic conditions are either the ultimate that can be done because of practical limitations or else there is something better available. I think there is.

The Commission formulated a plan that, in the light of operating experience, has very little opportunity for success.

It never did have much opportunity for success.

Then, through practical necessity or democratic process, or whatever you might want to call it, the Commission has administered this plan in such a manner that it hasn't had any chance for success at all.

In my own city, St. Louis, the eighth or ninth market in the Nation, the sixth report and the manner in which it has been administered has resulted in the following:

That, barring changes recommended by this committee, within less than 150 days, there will be no UHF television in the St. Louis area, with a loss to the operators in excess of $3 million which is actually just a small part of the iceberg because the loss to the public is twofold. Financially it is in excess of $27 million, plus the far greater permanent loss of competitive television service.

I might note that I have got two figures in here as to what the conversion financial picture is in St. Louis. I have it for a very definite reason. The public is, in spite of the fact they have knowledge of
VHF coming in, quite interested in the programming schedule of two of the UHF stations. One has the ball games. So long as the ball games are on, everything is fine and they are going to continue buying sets. I have no personal knowledge of their method of operation; but unless something is done here, it is my judgment shortly after the baseball team stops playing there will be very little reason for continuing the operation of the television station.

I commend the problem to the committee: Television has been called the eye of the atomic age. The television art is potentially an insurance policy for our way of life and a method by which it may be destroyed.

The ability of our Nation to see, and to a certain extent have what it will see, is dependent on the outcome of your deliberations.

May I thank you for your courtesy in giving me a chance to be heard.

Senator Potter. Thank you for your excellent presentation, Mr. Garrison.

Do you have any questions, Senator Hunt?

Senator Hunt. No.

Senator Potter. Thank you kindly.

Mr. Garrison. Thank you, sir.

Senator Potter. Mr. Ronald Woodyard, station WIFE, Dayton, Ohio.

Mr. Woodyard, we are pleased to have you appear before the committee. We will be interested in hearing your statement.

STATEMENT OF RONALD B. WOODYARD, STATION WIFE-TV, DAYTON, OHIO

Mr. Woodyard. Mr. Chairman and the committee, first, I want to thank the committee for the opportunity of appearing before you and, secondly, speaking directly as an American taxpayer, I want to thank this committee for affording us, through the democratic process of government, the opportunity of coming down here and telling you people what we think is a serious situation concerning 160 million American people; and I speak to you here this morning before going into my statement not as a television operator because I am out of business, but I speak to you this morning, as I feel, as an individual citizen of these United States, and I hope there will be no misunderstanding regarding my testimony.

I also desire to say this:

Because some of the proposals I am making may be considered radical, may be considered sensational, I think that my past 24 years has indicated I am a very conservative man; but I am sort of getting a little bit fed up on what I have been preaching for 24 years myself, namely, this great free-enterprise system. I am beginning to wonder if we haven't learned to misinterpret free enterprise to the building of gigantic monopolies in this country to the detriment of 160 million citizens.

Therefore, I would like now to present my statement.

It is my considered opinion, after operating a UHF television station in a market which contains two established VHF stations, that
UHF has little or no chance of succeeding financially under present conditions.

Dayton and the surrounding territory comprises a metropolitan market of approximately 500,000 people. In this market we encountered difficulty in the operation of our UHF station in the following categories:

1. By allowing VHF stations to go to high power, the Federal Communications Commission enabled Cincinnati VHF stations to penetrate the Dayton territory with a signal practically as good as the local VHF stations. WHIO-TV in Dayton carries CBS, ABC, and Du Mont programs, while WLW-D in Dayton carries NBC and ABC programs. Each of these stations continued this network programming even after our UHF television station was placed in operation.

A Cincinnati station, WCPO-TV—incidentally, owned by Scripps-Howard newspapers—a basic ABC station, augmented network coverage of the two Dayton stations by carrying any ABC and Du Mont shows which were unable to clear time on the two Dayton VHF stations.

Thus, the Dayton audience was permitted choice of any and all network programs without having to go to the expense or trouble of converting to UHF. The net result was none of the established networks had any interest in ordering or selling a commercial network program on UHF station WIFE operated by us.

2. We were unable to compete with the established VHF stations in buying film, because they were able to outbid us for whatever choice film might be available for the market.

3. With little or no network programming and inferior film, we were forced to our own devices for local programs. Features such as the University of Dayton basketball games, which had intense local interest, were denied us.

Furthermore, since these two established VHF stations have for a considerable length of time been enjoying a substantial and profitable revenue, they were in a position to outbid us for programming talent, features, and manpower. Therefore, what local programming we could devise was of inferior quality and limited interest to the viewer.

4. We failed to find a satisfactory converter, although we tested several manufacturers' products. Every single converter had a tendency to drift. Furthermore, our own transmitting equipment, although it was of the finest obtainable and was carefully checked by a professional engineer, caused us continued trouble.

5. Even though were able to obtain 41,000 conversions at a needless expense—and I say a needless expense now since the station is out of business and there is no UHF station near Dayton—to Dayton citizens of about $2 million, we were unable to attract the local, regional, or national advertiser to use our facilities at one-fifth the rate of the established VHF stations, because the advertiser preferred the 100 percent potential audience at a rate 5 times higher than our station delivering a limited portion of the audience.

6. We were unable to obtain a satisfactory network contract and, moreover, were forced to pay the American Broadcasting Co. $1,000 per month for the use of their sustaining programs, which meant, in effect, gentlemen, that we bought any sustaining program in order to get something on our station, which WHIO, who had the ABC con-
tract, the basic contract, could reject or accept, and then and there, if they didn't have the time to carry sustaining programs, such as the McCarthy hearing, or anything else of public interest, we were allowed to take them, but at the same time each month we were forced to pay $1,000 for that privilege.

One network even denied us permission to carry a so-called co-op program, which was a feature that might have stimulated substantial interest in our station.

We made repeated attempts to get network advertisers to place their programs on our station at no cost to the advertiser. Solicitation was made directly to the advertiser, himself, in many cases. In the majority of these cases we found the advertisers were unwilling to accept UHF in the 42d market of the Nation, though I say our good friend, Dr. Du Mont, has now moved us up to the 41st market in yesterday's testimony, for nothing, even though they had not been able to secure clearance on a local VHF station.

However, we did secure a few network shows by virtue of the close business connections between directors of our company and the heads of nationally know corporations who sponsored network programs. Even some of these programs were placed on our television station at no cost against the advice of the advertising agencies representing the company.

7. Also, we made a determined effort to interest advertising agencies in using our UHF facilities, but nearly always we found there was not only a lack of interest, but a feeling of pity for us because we had the temerity to attempt to operate a UHF station.

8. To serve the best interests of the citizens of our primary area we engaged from the outset in a most determined and elaborate public service programing policy.

We felt this was particularly advisable, not only to satisfy our commitments to the Federal Communications Commission, but also because we saw an opportunity to serve our fellow citizens who were being virtually ignored with programing of this type by the established VHF stations.

From a selfish standpoint we also felt this was advisable, because through this means we hoped rapidly to attract attention to our station.

Again we were faced with the discouraging reaction that even free public service time had little interest either for viewers or for the beneficiaries of such programs on a UHF station.

9. Starting well in advance of the operating date of our television station we began an intensive and thorough promotion and educational effort among television service and repair men, as well as with wholesale electronic dealers and the representatives of all the national television set manufacturers. We knew it was in our best interest to be as cooperative and helpful with these people as we possibly could. Despite this, we repeatedly learned service repair men and set dealers were discouraging the public from converting the television sets they already owned or from buying new sets equipped to receive UHF.

At that point I would like to add this: I think this committee was misled a little yesterday, not intentionally, from the set manufacturers, because, as I recall, testimony was given here yesterday that it cost, on an average, 40 or 50 dollars to bring a UHF station into your home.

Now, gentlemen, they told you that was the cost of the converter,
but they did not tell you what it would cost to put up an antenna in most of the cases, nor did they tell you the cost the servicemen charged. In our area it ran all the way from $60 to $125 in order to bring our television in the homes in many cases.

Senator Potter. That is to put up the antenna?

Mr. Woodyard. That is right.

And let me explain another thing, because it may seem peculiar to you gentlemen why these servicemen were not interested in making money: Because of the problems they had in installation of UHF antennas and converters in homes, they had to make maybe 5 or 6 trips back to that home, and if they put a charge on that they had kickbacks from people they were trying to serve; and, therefore, they had no interest or little interest in UHF, in getting that money, because they did not feel they made a profit on it.

On nearly every set, manufacturers placed a markup of at least $40 additionally for equipping it to receive our UHF signal. Of course, this discouraged prospective buyers from purchasing sets equipped to receive our station.

To my best knowledge, even at this late date there is not any television set manufactured which is constructed to receive UHF alone; rather, even in the factory the set must be converted for UHF at the end of the production line.

In other words, the public has been allowed to believe that UHF equipped sets are actually extra luxuries and not the necessities they should be for complete television reception.

Facing all of these difficulties—

Senator Potter. Can you receive UHF in the metropolitan areas by the use of the so-called rabbit ears as you do VHF?

Mr. Woodyard. In some cases, Senator; in some cases, you cannot.

Senator Potter. Is it the same type of rabbit ears or is it a special type?

Mr. Woodyard. Well, a special type.

Facing all of these difficulties, with the accompanying economical ruin which seemed imminent, we were forced to suspend our UHF television station from operations—and I want the committee to get this point: Had we not done so, the excessive capital drain would have ruined our corporation and would have resulted in silencing our radio property, which I say here in the presence of the Commission this morning is a very successful one.

Lest it be said I am a broadcaster who is ineffectual and prone to meet failure, I would like to humbly state that we have been able to establish a successful radio station against severe competition, against a basic NBC station, against a basic CBS station and against an ABC station. We operate an independent station. Fortunately, however—and this is the point—we did have the opportunity for our signal to be heard from the day we began operating of our radio station, which was a privilege denied us when we attempted to operate a UHF television station.

Now, consider the problem more broadly. I am personally acquainted with every member of the Federal Communications Commission and I have the highest respect for the integrity and character of each member.

I want to call the committee's attention at this point to the fact that I say this sincerely, from the bottom of my heart. I think this Com-
mission is composed of as fine public servants as we have in the Government.

When you stop to consider that these people have it within their power to give out licenses and grants that involve millions and millions of dollars, and to the best of my knowledge—and I say this from the broadcasting end, not from the Government end—I have never once ever heard a single indication that there is anything morally or corruptly involved in this Federal Communications Commission as it is presently constituted, and I think that is certainly a high compliment to a Government bureau.

Senator Potter. It certainly is. They have huge responsibilities.

Mr. Woodyard. That is right.

Furthermore, I am fully aware of the complex problems with which they are engaged. Nevertheless, I honestly believe a terrible mistake was made by the Commission in mixing UHF and VHF channels in any market of the United States.

Perhaps—perhaps—by this time the Commission itself recognizes this mistake, but if the Commission persists in failing to rectify this condition, then the injustices already done both to the citizens of this country and the telecasting operators will be compounded.

Unless this problem with which we are faced today is promptly solved, the opportunity for UHF to serve viewers is practically impossible.

As a taxpayer and a citizen—and once again I want to call your attention to that statement—I would like to call to the attention of the committee a fact which should be given great consideration. It seems to me, as I have sat here 3 days, despite the advice of my doctors not to be here, because I have been in a serious automobile accident and only been out of the hospital about 10 days——

Senator Potter. I am sorry to hear that.

Mr. Woodyard. I want to say to you that I think the committee and each one of these broadcasters and the Commission should keep in mind a very important fact: It isn't what happens to we people in the broadcasting business particularly that is concerned in this matter, but it is what happens to 160 million people and people who have become imbued with the idea of television, fascinated with it, and which I think is an art which we probably all agree is probably the most important art ever known to mankind.

This fact is that there is no broadcaster—and I hope every member of the committee will give this next statement that I am going to make great consideration in going over this record—there is no broadcaster in these United States who owns any part of a radio or television station other than the physical plant. The air over which we transmit belongs to the people, and yet there are very few of our citizens aware of this fact, and many broadcasters operate oblivious to this fact.

It is my feeling that the job of the Federal Communications Commission, like that of any other Government bureau, is to act solely in the interest of all the people under the direction of Congress.

For this reason, it is my belief that no individual or member of his family, or a company or corporation in which he may be interested, should own an interest in more than one radio and/or television station—and I want to point out to this Commission at different times in my life I have owned an interest in several radio stations, and as
long as that policy is in effect, and I see an opportunity to make money and an opportunity to buy into a station, I shall continue to do so.

In other words, if it is fair for the other fellow, it is fair for me; but I believe the time has come to establish real competition in this country where television and radio are concerned, and I think it can be done best by this paragraph I have just read.

Further, I believe that no newspaper should be permitted to own a radio or television station.

This unfair monopolistic condition is serious enough, in my opinion, to warrant action by Congress.

In evidence of the degree to which this monopoly has grown I point to the conditions that prevail in my own market. In Dayton WHIO-TV is owned by a corporation which operates the 2 daily newspapers, as well as a radio station, with a basic CBS affiliate, and also the only 2 daily newspapers in nearby Springfield, Ohio. In addition, this corporation owns and operates all the newspapers in Atlanta, Ga., and has a television and radio property there. It is also an applicant for a television station in Miami, Fla., where is owns a daily newspaper and a radio station.

The other television station in Dayton is owned by a large manufacturing corporation which has no interest in Dayton other than the operation of this very profitable television station. It additionally owns VHF television stations in Cincinnati and Columbus, Ohio, and in Atlanta, Ga. Furthermore, it is readily apparent the television station this company operates in Dayton, Ohio, is being operated in direct violation of the duopoly rulings of the Federal Communications Commission, since its signal markedly overlaps the VHF stations it operates in Cincinnati and Columbus.

I believe the only way to secure real competition, and thus to elevate the standards of operation in the television broadcasting industry, is to limit an individual or company to the ownership of 1 radio and/or 1 television station.

I say this because it certainly is reasonable to assume that an individual who owns only one property will undoubtedly take more interest in the community in which it is located than he would if he owned property in several communities and divided his interests.

I would like to inject this thought here: I have been very interested in a situation which has recently arisen in Colorado, in Senator Johnson’s own State. There were two applicants, as I remember, for frequency out there. A very valuable application for frequency was given one applicant, and decided on the basis—I don’t know the reason, but I imagine because—that applicant showed many years of continuous operation of a very fine radio station. I assume that is the reason. I have not seen the decision. Now, less than a year later—and there was another application by people, many of them local people, applying for that VHF channel, who lived in Denver and who desired to operate that television station in Denver. Now, less than a year later we find the people who were originally given the grant selling the grant to not Denver people or not to people who have any interest in Denver. Colo., particularly, but to an organization known as Time magazine, who probably has a great deal of money that they desire to invest in a very profitable business, and they have picked out Denver, Colo., as the logical place to make a great income on the money they desire to invest.
Now, it seems to me, as a citizen, that situations like that should be set for a hearing where there is an opportunity for those people who originally filed for that grant to come back in there and ask for the privilege, since they are local people, to operate that television station in that market.

Even though my business philosophy has always been firmly founded upon the conviction that there should be a minimum of Government interference in private business, I nevertheless sincerely believe that practices which prevail today among the networks should be scrutinized by this committee. Yet, I further realize such scrutiny is not warranted without power from Congress. Thus, a congressional directive might well be in order. Surely, some of the practices which border very closely upon restraint of trade should be examined.

To return again to this matter of multiple-station ownership, let us consider the conditions now prevalent in the industry.

We are told there are an extremely limited number of VHF frequencies. Yet, a number of powerful interests in the broadcasting industry have already acquired as many as five VHF television frequencies in various large markets of the country. Furthermore, there have been a substantial number of valuable VHF stations sold.

The very fact that individuals or corporations are allowed to own more than one VHF station, up to 5 of them, in fact, is conclusive proof, in my mind, that monopoly is being fostered in the television business.

Consider the implications of this policy. With the few VHF frequencies available, by placing 5 of them in the hands of 1 individual or corporation, a powerful group of 15 or 20 gigantic interests could gain virtually complete control over the television audience of this Nation.

This is a power over people greater than has ever been known before in the history of this country.

In this way a group of 15 or 20 owners, controlling the greatest motivating force mankind has ever known, could virtually control the thoughts and emotion of 160 million people.

It is my feeling that if Congress fails to assume its responsibility in seeing that television service becomes available for all of the people of this country and that it is of a competitive nature, then at some future time the people of this country will become aware of their rights in owning the airways and insist on the Government owning and operating the broadcasting facilities of this country.

To be specific, my recommendations to this committee are as follows:

1. That a law should be enacted, ordering the Federal Communications Commission to directionalize every VHF frequency in the country immediately, which in turn would afford an opportunity for many more VHF stations. For example, it would be very easy for a directionalized facility to be provided in Dayton without interfering to any great extent with any other VHF station serving other cities.

2. This committee should recommend that the Federal Communications Commission cease allocating UHF frequencies within markets where VHF frequencies exist or are likely to be granted.

3. Some authority should be found to restrain networks from serving more than one station in a market, if there are multiple stations in that market.
Further, I would strongly urge this committee to advocate a law which would forbid ownership of radio or television stations by networks, and this law should likewise extend to any officer, director, or stockholder of a network.

And at that point, knowing the networks are going to come in here later with a far more elaborate program than we little, humble people out in the Middle West can ever present to this committee, I should like to point out the argument that has been advanced by the networks for years that they can't afford to operate a network unless they own 5 stations—I say to you, and I think I am on safe ground, that if the Columbia Broadcasting System or the National Broadcasting System were to say tomorrow that they desired to sell their network and operate M. and O. stations, I don't think they would have any trouble finding buyers.

I would also like to call your attention to the fact that I bought Columbia Broadcasting Co. stock for $27 some years ago, and I looked it up in the paper before I came up here this morning and I see it is $57 as of this morning. So, it seems to me they are doing all right.

Senator Potter. You don't think they need a subsidy?

Mr. Woodyard. I don't think so.

Senator Potter. I wish to thank you for your statement, Mr. Woodyard.

Mr. Woodyard. Pardon me just a minute.

Senator Potter. I am sorry.

Mr. Woodyard. I am not quite through. May I have a few more minutes?

Senator Potter. Yes; certainly.

Mr. Woodyard. Thank you.

Now, I would like to continue with something here—5 more recommendations:

I endorse Commissioner Hennock's first recommendation, and I respectfully—and if I am out of order, Mr. Chairman, please inform me, because, as I say, I am just a little fellow from the West and I may be presumptuous—

Senator Potter. We don't use point of order in this committee.

Mr. Woodyard. But I think you Senators have heard enough here in the past 3 days to realize that there is a very serious situation where the television business is concerned and the operation of television stations. Therefore, I recommend, in addition to the first recommendation of Miss Hennock—or, rather, I don't recommend, I respectfully request once again, as a taxpayer, and not as an operator—that this committee give consideration at some time this afternoon about going into an executive session and deciding whether it would not be to the best interests of all the people of this country to immediately issue a directive—to issue a directive to the Federal Communications Committee on Monday morning—to cease issuing any more licenses or any further station construction permits until this committee can decide whether there is any merit to what it has heard or what it has not heard; and I strongly urge consideration be given to that proposal.

No. 2: I endorse Miss. Hennock's No. 2 recommendation to this committee.

I would just like to have the record show that.
I endorse No. 3 of Miss Hennock's recommendations.

I do not endorse her No. 4 recommendation—Senator Johnson's bill to remove the excise tax—and I will tell you why: Because I, along with thousands of theater owners, signed the petition to this Congress asking you to remove the theater tax, under the assumption that the price of movies would come down. I am sorry to say in my town, since you have removed the tax, all the theaters have done is stuck that tax in their pocket, and I think the same thing would happen in this case.

Senator Potter. You don't think it would lower the cost of the set?

Mr. Woodyard. I do not.

Now, fifth, I want to take a position here—and I can take it, Senator, and I hope you will understand why. You will have to remember there are many people who desire or who want to remain in this business. As far as I am concerned, if coming here before Congress and telling this committee the truth, as I see it, means that I am through in this business, that is O. K. with me; but I want to say I am going on record in favor of the Bricker bill because I don't think anything is more badly needed for the protection of the American citizen than the enactment of the Bricker bill by this Congress.

I would also like to say this, so that the record may be complete, because this may be the last opportunity that I, as a broadcaster, will ever appear before a committee: If this committee desires to find out what happens where these VHF stations are concerned—and I know only about my own market, where I have been an operator for many, many years; I have been in this business for 20 years—then I respectfully suggest this committee request the Federal Communications Commission to have a staff member over there assemble the logs from March 13, 1952, to March 13, 1953, on WWL-D, WHIO-TV, and WIFE-TV, and let's see how much public service and what time of day it was rendered by all three of the television stations in Dayton, Ohio, because I think that would be of value to this committee in arriving at some conclusions regarding UHF and VHF from a public service standpoint.

I would also like to take this opportunity to say—and I don't mean to be emotionally inclined, but I feel this thing very deeply, Senator, because I feel what is taking place in this room is one of the most important hearings ever heard on this bill. I sat and watched another hearing in which you are taking part and, frankly, it is nothing of importance as far as the American people are concerned to this hearing.

Senator Potter. I will concur with that.

Mr. Woodyard. And I say to you—and once again I want to repeat I say this with the utmost respect to the members of the Federal Communications Commission, but I was shocked—I was shocked—to read the other day the reason I have failed—and I am putting myself in a general category—was because I was inexperienced; I didn't know how to use promotional material and, therefore, I had no business being in UHF.

Now, Senator, I don't think that is the right kind of theory for any member of that Commission to take, and especially if that gentleman has not operated a radio and television station—and I say that very candidly and in the presence of a Commissioner whom I have the highest esteem for as a Commissioner and as a person.
Now, you have heard that statement made here this morning by the gentleman from St. Louis. You have also heard me say it. So, in order to find out what happened in Dayton, Ohio, I once again suggest this Commission ask the Federal Communications Commission to present to them the operating statements of the three radio stations in Dayton, Ohio, for the years—I don't care when—for the years of 1952, 1953, or for the first 3 months of this year, and bring it to the attention of this committee and just find out what kind of an operator this fellow, Woodyard, is and whether he can operate it successfully.

We operate a station out there, Senator, which is owned by 62 or 63 citizens of that town. It certainly is a cross section of the people in that town. We have men who have been president of the chamber of commerce. We have bank directors. We have people who work on a salary. We have a secretary that owns stock in our company. I don't think there is a company that is more diversified in ownership in the United States than the Skyland Broadcasting Corp., and certainly we went there 5 years ago with the most severe competition of 2 television stations which opened in front of us, and I think the records of the Federal Communications Commission will vindicate whether or not we have any operating ability and whether we have any know-how in this business.

Our station did not fail because of no know-how. Our station failed because of our inability to attract the programs to our station that were necessary to get the people in our market to convert: and I say to you that if I had—and we are perfectly willing and the fact of the matter is, I think I should tell this committee, my corporation, despite the fact we have lost over a half million dollars in the television business—my stockholders have already instructed me and have set aside a sum of several thousands of dollars—they have instructed me to spend that money in an effort to put a VHF station in Dayton, Ohio.

So, I think—it is 62 we have now. A few of them got freighted when the station went under, but I think it is about 62 stockholders we have now. So, 62 people in that town think we know how to operate, provided we are on some kind of a basis of equality with the other fellow; but we can't do it unless we are.

Now, I once again, in conclusion, would like to urge this committee to give great and serious consideration to the issuance of this directive to the Federal Communications Commission that all of these grants be suspended temporarily, until this committee has an opportunity—maybe 30 days; maybe 60 days—I don't call it a freeze; I say let's stop things because it is quite evident—it is quite evident, Mr. Chairman—that the Commission, despite their efforts and despite their thoughts, have been unable to find a solution to this matter, and yet they must know something is terribly wrong. So, I say let's call a hiatus, or whatever you want to call it, here for a little while, and stop all of this for the sake of the country until we find out what is going on.

I thank you very much.

Senator Potter. Thank you, Mr. Woodyard.
At this point I would like to insert in the record a letter I have received from Hon. Edwin C. Johnson, United States Senator from Colorado, regarding transfer of the licensee of Aladdin Radio & Television Co., Denver, Colo.

United States Senate,
Committee on Interstate and Foreign Commerce,
June 5, 1954.

Hon. Charles E. Potter,
Chairman, Subcommittee on Communications, Interstate and Foreign Commerce Committee, United States Senate, Washington, D. C.

Dear Senator Potter: During the hearings on the status and development of UHF channels, held on May 19, 20, and 21, Mr. Ronald Woodyard, of Dayton, Ohio, referred to the Aladdin Radio & Television Co., of Denver, Colo.

Mr. Woodyard, in his testimony, made some generalized remarks which conveyed a false picture. In order to clarify the record, I am enclosing a statement that I respectfully request be incorporated in the record immediately after Mr. Woodyard's testimony so that the committee will have a full and complete picture of the entire situation involving Aladdin Radio & Television Co., Denver, Colo.

Sincerely yours,

Edwin C. Johnson.

Statement of Senator Johnson

A Mr. Ronald Woodyard, testifying before this committee on Friday, May 21, departed from his prepared text and made certain statements about a situation in which he said he was very interested and which occurred in my home State, Colorado. Generally, Mr. Woodyard is a solid thinker and precise in his statements but, in this instance, I think he went far afield. I am sure he is not familiar with all the facts.

Mr. Woodyard was referring to the pending sale of Aladdin Radio & Television Co. (KLZ, KLZ-FM, KLZ-TV), of Denver, Colo. Even though Mr. Woodyard expressed great interest in this case, he admitted he had not read the decision, which is unfortunate as the statements he made were an inaccurate generalization that could, if left uncorrected, lead to a misunderstanding of the facts.

Since I am familiar with the reasons for the proposed sale of Aladdin Radio & Television Co., I must clarify this record.

Aladdin Radio & Television Co., is a licensee of radio station KLZ, a station that has been in continuous service for more than 30 years. The company is also a licensee of frequency modulation station KLZ-FM, which has been in service for about 15 years. No radio station in the entire country has a better record or has done a more outstanding job in serving the public interest. The Aladdin Co. was one of the first to apply for a television permit in Denver, only to be caught in the freeze. As a result of the first postfreeze competitive hearing, Aladdin received a construction permit for KLZ-TV in June 1953. KLZ-TV went on the air November 1, 1953, and has been providing fine television service ever since.

Since 1940 the broadcast operations of KLZ (AM-FM) have been under the able and outstanding management of Hugh Terry. Since 1949 these stations have been controlled largely by an outstanding group of Denver civic leaders who, for the first time, provided Mr. Terry an opportunity to acquire an ownership interest in the business to which he has devoted his career. The broadcast operation under these civic leaders and Hugh Terry not only has made a tremendous contribution to Denver and Colorado but has enjoyed a reputation as one of the outstanding operations in the entire industry. The present owners originally invested over $1 million in the business, and have since plowed back profits to improve service and prepare for television. Over a period of 4 years the company spent a considerable additional sum of money in processing its television application, training employees, and getting on the air. Since 1949 the sparkplugs of this whole operation have been Hugh Terry and Harry Huffman, a long-time business executive of Denver.
In mid-January of this year, Mr. Terry, Aladdin's president and general manager, was stricken with a severe heart attack. He is slowly convalescing and as yet is able only to undertake a small portion of his former duties. Not only that but Mr. Huffman has suffered several strokes during 1953 and is unable to assume the added duties brought about by the illness of Mr. Terry. Another major stockholder, Mr. Elroy McCaw, must dispose of some of his broadcast holdings in order to comply with the FCC's multiple-ownership rules, as amended in 1953. Prior to Mr. Terry's illness, numerous efforts of other persons to buy the business were rejected. In fact, money couldn't buy this station were Mr. Terry and Mr. Huffman well. It has long been their great ambition to operate a combined radio and television station.

This combination of most unusual and unforeseeable circumstances is certainly a proper justification for the pending sale of Aladdin.

I wish to point out but 1 or 2 other inaccuracies in Mr. Woodward's statement. He refers to the other applicant as "local people" whereas they are largely non-residents of Colorado. He also indicated that the proposed purchaser of Aladdin "hasn't any interest in Denver, Colo., particularly." I must advise that Time, Inc., does now have, and for some time has maintained, a very substantial interest in Denver and Colorado. Furthermore, it is my opinion that Time, Inc., is splendidly equipped and has the capacity as it has demonstrated in its operations elsewhere, to render a fine radio and television service in the public interest. Before granting Aladdin this television license, the FCC held long and exhaustive hearings on the contested application. I want to go on record as stating without equivocation that the FCC did not make a mistake in their final decision. It was made in the public interest.

It would seem important to the health of the industry that people may devote their lifelong labors and their fortunes to it, with the knowledge that their investment will be safe and secure in the event of sickness, death, or Government edict. Were it otherwise, no prudent and intelligent person would invest in any broadcast operation.

Senator Potter. The committee will be in recess until 2 o'clock.

(Whereupon, at 12:35 p.m., the hearing was recessed, to reconvene at 2 p.m. of the same day.)

**Afternoon Session**

(The subcommittee reconvened at 2 p.m., pursuant to adjournment, in room G-16 in the Capitol, Senator Charles E. Potter, chairman of the subcommittee presiding.)

Senator Potter. The committee will come to order.

First, I would like to submit for the record a statement by Mr. Thomas E. Martin, executive vice president of the Hawley Broadcasting Co., Reading, Pa.

I have a statement from Mr. William L. Putnam from UHF television station WWLP, Springfield, Mass.

I have also been asked to submit as a part of the record an article by Earl Abrams that appeared in the May 3, 1954, issue of Broadcasting-Telecasting, entitled "Losing Money in Television Isn't New." There has been a great deal of talk about losses suffered by television stations. This article discusses the losses suffered by the various television operators during 1948, 1949, 1950 and 1951 and brings the financial picture up to date.

(Prepared statements of Thomas E. Martin, William L. Putnam, and article by Earl B. Abrams, "Losing Money in Television Isn't New" are as follows:)}
STATEMENT OF THOMAS E. MARTIN, EXECUTIVE VICE PRESIDENT, HAWLEY BROADCASTING CO., READING, PA.

My name is Thomas E. Martin and I am the executive vice president and general manager of the Hawley Broadcasting Co., of Reading, Pa., which operates stations WEEU AM and TV.

The Hawley Broadcasting Co., has had an extensive background in radio broadcasting in Reading. We acquired station WEEU in 1946 and have operated it continuously since that time. When we acquired the station it was a daytime only station. We spent approximately $100,000 in improving the facilities and obtaining permission to operate during nighttime hours.

In 1947 we applied for VHF channel 5 and presented our case before the Commission in competition with another application for the same channel. Our hearing had been concluded and the case was awaiting decision when the FCC decided to impose its much-publicized freeze on all television activity. When the freeze was finally lifted on April 14, 1952, we were greeted with the fact that VHF channel 5 was no longer available for use in Reading and that in its stead, 2 UHF frequencies were assigned, channels 33 and 61.

Some of the members of this committee may be aware of the importance of Reading as an industrial market in the East; but for those who of you are not familiar with the area I would like to point out that it is one of the principal industrial areas of the State of Pennsylvania. It has diversified industries and it is the center of a substantial trading era. The importance of this market is best illustrated by the fact that for many years the market has supported three successful radio stations in active competition.

As you can see from the prior recitations, my organization has a record of serving the public through broadcasting. Our stockholders are also the owners of the Reading Eagle and Reading Times, which publish daily newspapers for this community, and on Sunday we publish the Reading Sunday Eagle. Accordingly we decided to apply for UHF channel 33, which was subsequently assigned to us. Following the grant of this construction permit, we built a very extensive plant and modern studios that would do credit to a city many times the size of Reading.

Our investment in television at this point is in excess of $450,000.

Your committee is anxious to know the experience of stations such as ours so that it may be in a position to make recommendations which might lead to the solution of some of the ills of UHF broadcasting. I have given long and serious thought to the problem and recognize that there is no magic wand which can be waved and which will automatically wipe out all the losses and convert them into substantial profits.

I have read suggestions made by others in the broadcast business, many of which have been and will be presented to you. I do not know whether any of these suggestions will provide the answer, but I do feel qualified to tell you that in our particular case there appears to be only one way out—to assign an additional VHF channel for our use.

This may sound like a very superficial suggestion, but when you understand our problem you will realize that I am not taking the first thought that comes to mind.

When we started broadcasting in 1933, the city of Reading and our surrounding area was heavily saturated with television service. Television was not new in our market. Three strong VHF signals come in from Philadelphia, Pa., and one from Lancaster; the people of Reading and this vicinity have been receiving VHF television in their homes for several years. At the present time approximately 80 percent of the homes in the Reading market are equipped to receive VHF service.

At the time that we started our construction the Philadelphia stations were operating with a power which had previously been limited by the Commission before the UHF band was added. Since that time these three Philadelphia stations have been granted power increases and are presently operating with superpower so that their service area encompasses a great deal more than what would be regarded as the normal trading area. Incidentally, I would like to point out that, although UHF channels are available in Philadelphia, no station has been constructed as yet on these frequencies—an obvious recognition of the problems that a UHF broadcaster would have to contend with in trying to meet the competition of the powerful Philadelphia VHF stations.
When we went on the air we felt that the local service we could provide would result in a steady growth of conversion to UHF. We were, indeed, optimistic, but our experience has indicated that the steady conversion that we anticipated has not materialized.

I would like to point out to you that if a new radio station should go on the air tomorrow in Reading it would automatically be available to the same number of radio homes as the existing stations. Therefore, from a competitive standpoint, it has an equal opportunity and competition is thereby fostered. In UHF this is not the fact and we, as a UHF broadcaster, cannot reach all of the homes which are equipped for television reception from Philadelphia and other VHF markets. To receive a local UHF program the viewer must go out and buy a converted or pay an additional amount for the UHF band. We feel this is a burden upon most people and as a result it prevents them from receiving the competitive service to which they are entitled.

Some of the broadcasters who appear before you will put the fault on the networks, but that can't be true in our case because we have an affiliation with NBC and ABC. We provide topnotch network programing and excellent local programs, but apparently this combination is not enough. We have a well-rounded program formula locally that includes religion, education, entertainment, and community service. Local community leaders have lanced us, but the local advertisers are not buying enough due to pay the bills.

We have told an honest coverage story and we have gone to considerable expense to measure the noise-free area in which our signal is being received. Our research has been substantiated by outside groups such as ARBI, Hooper, and NBC research. The combined efforts indicate that we have approximately 50,000 sets equipped to receive our picture but when it comes to rating shows, the Philadelphia stations capture our audience because the public has become accustomed to receiving program service on VHF even though from a distant market.

I have said before that the answer lies in assigning us a VHF channel. Our engineering studies indicate that channel 5 which we had originally applied for before the freeze can be used in Reading by installing a semidirectional antenna. We are satisfied that we will not cause interference to any other VHF station, and that the directional antenna could be installed with the greatest simplicity.

It would require, however, a change in FCC regulations, particularly in mileage separation on cochannels and adjacent channels, to achieve this end. Directional arrays protecting stations on cochannels and adjacent channels in radio are accepted as fact today. A reexamination of the VHF-UHF channel problem in mileage separation and the use of directional antennas might well solve similar problems in many markets of the country facing situations such as ours.

Also, if the FCC permitted low power for these proposed VHF stations, it would protect all existing high-power VHF stations and assure local equally competitive service in markets such as ours and also make available local community service programs unavailable from distantly located high-powered VHF stations.

The Hawley Broadcasting Co. does not desire to interfere with any other existing television station on the VHF band nor to improve its position at the expense of any other UHF station. The proposal that I have made will not cause undue interference to existing stations on channel 5 but will permit a solution to our problems.

If the Commission will authorize us to use a directional antenna in this manner we will automatically compete on an even basis for the 80 percent market saturation that now exists in VHF receivers.

I would like to point out one other factor which we regard as very significant. UHF frequencies are comparable to line of sight, and natural barriers such as hills, mountains, and ridges seriously interfere with program reception. The people of Reading and environs live in valleys. Consequently even though we do a good coverage job for Reading and Berks County in which Reading is located, neighboring towns 30 miles distant have some trouble receiving our signal because of the intervening terrain. With a VHF signal which is not nearly as critical to line of sight we would adequately serve these communities with good local and network programs. Then if they had a choice between our station and a Philadelphia station, we know that we could prevail.

It is also important to bear in mind that from our present transmitter location we can provide a better picture in the city of Reading than any competitive station. The Philadelphia stations must overcome terrain factors
which definitely limit the type of reception that the public can receive in Reading. As a result, the Philadelphia stations have a relatively poor picture in Reading which the public endures only because there is no other VHF service available to it. If we switch to VHF from our existing location we will provide a superb picture which will give to the people of Reading for the first time proper television service from a technical standpoint and most assuredly from the standpoint of local program service.

In order that you may visualize the great benefits that would come to us if we were granted a VHF channel, I would like to submit for the record a table of coverage and market data in our area. This table will show that we have 219,020 homes within the area of which 54,206 have UHF receivers. If we switch to channel 5 as I propose, we could reach each of the 219,020 homes, thus increasing our audience potential by four times.

In conclusion, I ask that you seek independent engineering advice to confirm my testimony that the use of directional antennas on VHF frequencies will provide the answer to the ills which have beset UHF in many markets. Certainly it will do the job for us in Reading.

WEEU-TV, channel 33, Reading, Pa.—Coverage and market data (as of Apr. 20, 1954)

The following represents the views of the Springfield Television Broadcasting Corp., owner and operator of UHF television station WWLP, Springfield, Mass., concerning the television situation in general, and the thoughts we have that might be of value and interest to your committee. I am treasurer of the corporation and manager of the station. We present only our own opinions and facts we know from our own experience. We have been operating on channel 61 since March 17, 1953, using a 12-kilowatt transmitter, the highest power available.

Our situation is not vastly different from a number of people in the television business. We are a medium-sized station in the medium-sized community, owned by local people and endeavoring to provide good service to the community to which we are assigned by the FCC.

Let me say at the outset that we knew many of the limitations of UHF transmission before we went into this business. We knew as much as anyone did at that time about the characteristics, advantages of UHF broadcasting. In the last 2 years much data has been accumulated. From operating experience we have learned a great deal more. The situation looks somewhat different in the light of facts than it did when most knowledge was theoretical. However, we're still glad we did it.

We have made good progress, since going on the air, toward establishing ourselves as a part of our community. Several months ago a national survey indicated that over half of the people in Springfield have television receivers capable of receiving our UHF signal in their homes. This compares with about 80 percent of the homes in our city which can receive the VHF station in New Haven, which has been established for several years and in whose fringe area Springfield is located.

We are encouraged by the progress we have made. The networks (NBC and ABC) have been very helpful to us. National and local advertisers have seen the effectiveness of our station. We are not what might be called "blue chip," but we are doing well.
Our major question is whether the channel allocation system and power limitations now in effect are consistent with the expressed desires of the FCC to establish local television stations that will serve their local communities. This we feel is the most important matter that can be studied by your committee. The Commission decided that it wanted commercial channels assigned so that every part of the country could have its own television station in its economic community. It has even gone to the extent of assigning channels to communities with less than 10,000 population. We feel that some effort must be made to see that those stations are allowed to exist financially, in areas where it is still possible.

Since there is a vast difference between the various frequencies that are assigned for television operation and since this is the only difference between any station assigned to our community and any station that might be assigned to any other nearby community, it is our opinion that the Commission must review the channel assignments that are currently in effect.

At present, in the market we are assigned to cover, there are a number of outside television signals receivable, all of which vary in quality. The principal of these is channel 8, which is assigned to New Haven. This station has been on the air for a number of years and it has a desirable VHF frequency. We are able to compete with them because of our local shows which interest the people of this area, and because of our full network schedule, but due to the cost of UHF receiving equipment, people have a tendency to be slow about conversion. Our signal is stronger than these outside channels, but equipment is not available with which people can receive our signal as readily as they receive VHF channels. This is a problem that we expect will disappear with the passage of time, as better receiving antennas and better tuning equipment for UHF are developed.

We still have fears, however, for the ultimate outcome. We are aware that in the not too distant future the FCC will authorize a channel 3 station in Hartford, about 25 miles from Springfield. Anyone familiar with the current channel 3 proceedings will realize that this channel is being fought over intensely. The reason for this intense fight is the great value of the channel from a commercial point of view. Everyone knows that a low band VHF signal can reach a greater area, regardless of terrain or any other limitation, and hence will attract advertisers more readily. Because of the unfavorable frequency we have to use, we look with great apprehension on the construction of this channel. Our future economic health, as well as the whole idea of local television stations in the Springfield metropolitan area will be seriously affected.

The Connecticut Valley area is set up in the channel allocation system so that it will be served by UHF stations. Except for New Haven, at the extreme south, all stations on the air, or assigned, in this valley are UHF. We feel that it will be eminently unfair to the whole idea of local stations if channel 3 is allowed to go on the air in Hartford as a commercial station. We do not mean by this that VHF stations should not go on the air in other parts of the country. In many areas VHF is so well established that it is extremely unlikely that UHF stations will ever amount to a great deal without a major reorganization of the whole television picture. However, in our area there is great hope for UHF, provided it is given a chance.

Equipment is readily available so that the maximum power can be radiated on channel 3, which from Hartford will completely cover our area. Even disregarding all the other considerations I have mentioned above, this alone would be frightfully unfair competitively since we cannot possibly fight back in power output.

Any electronics engineer can give exact information on the relative value of a signal at 60 megacycles as opposed to 600 megacycles. While it is not exactly a 10-to-1 ratio it is greatly different in signal strength at a very limited distance from the point of transmission. The Commission allowed for this discrepancy in effectiveness of power output by allowing greater power to UHF stations. Of course, this whole business is theoretical since no one has yet even designed equipment to radiate the maximum permissible power in the UHF band.

We have found that with the most powerful equipment available we are radiating 146 kilowatts of visual power and this appears to be all we will be able to radiate for some time. Even if more powerful equipment were available preliminary indications are that the operating expenses would be prohibitive. Our monthly electric bill alone would increase by $2,573.77. The additional matter of amplifier tube rental is a figure I would hesitate to think of and hate to have quoted.
UHF can continue to succeed in our area if it remains a UHF area, but if a commercial VHF channel is allowed in here, then we believe it will make all the UHF stations extremely marginal, at best. We feel that your committee can recommend action to solve this problem in our area and perhaps thereby come up with a solution that will help many other areas with similar problems.

Our suggestion would be one of the following: Make channel 3 in Hartford an educational channel and at the same time release channel 24, presently set aside for education purposes, to commercial broadcasters. This plan would make all of our Connecticut Valley (north of New Haven) a UHF commercial area and would thereby enable the communities to develop their own stations in accordance with their needs. Another solution would be to reduce the maximum permissible power output on VHF stations, either in general or in certain areas. Also reduce the height above average terrain from which their center of radiation is to be. This would restrict the vast regional coverage that VHF stations enjoy. A third solution would be to move channel 3 to a predominantly VHF area.

You hear a lot of talk these days about how much money is being lost by new TV stations, particularly those in the UHF band. But the condition is not without precedent, as this summary of early television financial history shows.

**Losing Money in Television Isn't New**

*(By Earl B. Abrams)*

At the UHF hearings which the Senate Communications Subcommittee will conduct, one of the principal arguments for UHF protection will be that station operators are facing protracted periods of financial loss. However valid that argument may be, it is pertinent to recall that VHF operators faced similar prospects back in the early days of TV. Last week Broadcasting-Telecasting went to the record books to see how VHF fared when it was the pioneering service.

Losses—heavy losses—are not new in television. Certainly, for the first few years even the now vaunted VHF stations went deeply into the red. Although TV began its first commercial stirrings in 1945, following the conclusion of World War II, it was not until 1948 that it coalesced into a separate element of broadcasting. This was recognized then by the FCC which, for the first time in its annual financial reports, gave TV a separate accounting—all of one table.

In 1948, the Commission reported that the television broadcast industry—which comprised 4 networks and 50 stations—showed a loss of $15 million overall. The 40 non-network-owned stations showed a loss of $8.5 million.

Television losses mounted in 1949. According to that year's FCC financial report, networks and stations (98 altogether) went into the red to the extent of $25.3 million. *Losses* for the 85 non-network-owned stations amounted to $13.3 million.

Only 4 stations, of the 98 which operated for the full 12 months of 1949, showed a profit. One station did not have data available.

In 1950 some of the red ink had turned to black. Although the total industry loss for 14 network-owned stations and 33 independently owned stations was $9.2 million, the latter showed an aggregate profit before Federal taxes of $800,000. Fifty-three stations made a profit that year and 53 reported a loss (and failed to supply data). The median income of the 53 profitable stations was $129,000; the median loss, $85,300.

Thirty stations reported losses between $1 and $100,000; twelve $100,000 and $200,000; six, $200,000 and $400,000, and five, over $400,000.

Based on reports of losses from 47 nonnetwork-owned stations, 16 had done a gross business of up to $200,000; 16, from $200,000 to $400,000; 7 from $400,000 to $600,000; 4, from $600,000 to $800,000; 3 from $1 million to $1.5 million, and 1, over $1.5 million.

In the 1-station communities in 1950, 18 stations reported losses; in the 2-station markets, 18 reported losses; in the 3-station cities, 6 reported losses; in the 4-station markets, 2 reported losses, and in the 7-station markets, 9 reported losses.
By 1951 TV stations were by and large "in the black." Total income before Federal taxes amounted to $41.6 million for 15 network-owned and 93 independent stations. The latter made a profit of $30.6 million before taxes.

In that year, 92 stations reported a profit, and 14 reported losses (and 2 did not furnish the required data).

Median income of the 92 stations reporting a profit was $330,000; the median losses for the 14 stations reporting losses were not computed because of the small number of stations involved.

**Improvement in 1951**

Changes occurring in 96 stations which operated for the full 12 months of 1950 and 1951 were as follows: Five stations reported increased losses; 2, decreased income; 1 losses in 1951 but profits in 1950; 6, decreased losses; 33, profits in 1951 against losses in 1950, and 49, increased income.

Three stations reported losses of less than $100,000; 4, between $100,000 and $200,000; 3, between $200,000 and $400,000; 2, between $400,000 and $800,000, and 2, over $800,000.

Relationship between gross revenues and losses, indicated that 3 of the stations in the red grossed less than $250,000; 2, between $250,000 and $500,000; 1, between $500,000 and $750,000; 1, between $1 million and $1.25 million; 2, between $1.5 million and $2 million; 3, between $2 million and $2.5 million, and 2, between $2.5 million and $3 million.

Most of the 14 stations losing money in 1951 were in cities of over 2 million population. These totaled nine. Three such stations were in 500,000-1 million markets, 1 in 250,000-500,000 class and 1 in the under 250,000 category.

In the 40 one-station markets, only 1 station reported a loss; in the 11 two-station markets, 3; in the 8 three-station cities, 2, and in the 2 seven-station area, 8.

In 1952—the latest year for which official FCC data are available, the 122 stations on the air reported income before Federal taxes of $55.5 million.

Ninety-three nonnetwork-owned stations, operating for the full year, made a profit of $45.8 million and 14 other nonnetwork-owned stations, on the air for less than 6 months, reported a loss of $200,000.

The average profit before taxes for the 93 stations operating for the full year was $500,000.

Only 94 of the 108 stations which operated commercially for the full year reported a profit; 14 indicated a loss. The median profit of the 94 successful stations was $450,000. The median losses for the 14 stations which failed to make a profit were not computed due to the small number of stations involved.

Of 165 stations in operation for the full year in 1951 and 1952, three indicated an increased loss in 1952; nine indicated decreased income in 1952, four showed a loss in 1952 and income in 1951, five listed a decreased loss in 1952, five indicated income in 1952 and loss in 1951 and 79 listed increased income for 1952.

Five stations reported they lost more than $100,000; three, between $100,000 and $200,000; three, between $200,000 and $400,000 and three, over $800,000.

Relationship between gross revenues and the 14 stations which reported losses in 1952 showed that 1 took in less than $500,000; 3, between $500,000 and $750,000; 1, between $750,000 and $1 million; 1, between $1.25 million and $1.5 million; 1, between $1.5 million and $2 million; 3, between $2 million and $2.5 million; 3, between $2.5 million and $3 million, and 1, over $3 million.

Surprisingly, no station in a city with a population below 250,000 was among the 14 stations reporting a loss. One was in a city with a population between 250,000 and 500,000; 2, between 500,000 and 1 million; 2, between 1 and 2 million; and 9, over 2 million.

In the 40 one-station communities in 1952, no station reported a loss; in the 11 two-station communities, 1 station reported a loss; in the 8 three-station communities, 2; in the 2 four-station communities, 2; in the 2 seven-station communities, 9.

Senator Potter. I recognize Mr. Seymour Krieger.

Mr. KRIEGER. I am counsel of the Joint Committee on Educational Television.

In the interest of saving time, I would like permission to submit a written statement and forego the opportunity of speaking orally.

Senator Potter. I wish to thank you kindly and the committee appreciates the fact that you are saving us time on that.
Your statement will be made a part of the record.
(Prepared statement of Seymour Krieger is as follows:)

Statement on Behalf of Joint Committee on Educational Television

My name is Seymour Krieger. I am counsel of the Joint Committee on Educational Television and I am appearing here today on behalf of that organization. The Joint Committee on Educational Television would like to have this statement considered as a part of the record in this hearing by the Communications Subcommittee of the Senate Committee on Interstate and Foreign Commerce on the problems concerning the status and development of UHF television channels.

The main function of the Joint Committee on Educational Television is to make available information and technical assistance when desired to those communities over the country making plans to establish educational television stations. The constituent members of the joint committee are seven national educational organizations: the American Council of Education, Association for Education by Radio-Television, Association of Land-Grant Colleges and Universities, National Association of Educational Broadcasters, National Association of State Universities, National Council of Chief State School Officers, and National Education Association of the United States.

The tremendous public interest in the use of television for educational purposes found effective expression in the television hearings conducted by the Federal Communications Commission, beginning in September 1948 and ending in April 1952. In those hearings, 71 witnesses urged the Commission to reserve television channels for the exclusive use of educational institutions. A total of 808 colleges, universities, State boards of education, school systems, and public-service agencies submitted written statements in support of these reservations. Mayors, parent-teacher groups, chambers of commerce, libraries, art associations, newspapers, civic groups, municipal boards, clergymen, numerous Members of the United States Senate and House of Representatives, and other distinguished public officials testified or submitted written statements in support of these educational assignments.

After these extensive hearings, on April 14, 1952, the historic sixth report and order, issued by the Federal Communications Commission, lifted the freeze on television and adopted a table of assignments providing for nationwide television service: 2,653 assignments were made in 1,291 communities throughout the United States, its Territories and possessions. Of this total number of assignments 242, or about 12 percent, were reserved for education, each State receiving 1 or more assignments. Since the lifting of the freeze, 9 additional channels have been reserved for education, making a total of 251. If the opportunities offered by these reservations are fully realized, most of the people of the country will be within the listening and viewing range of at least one of these educational stations.

Of the channels now reserved for educational use, 83 are VHF and 18 are UHF. Since there are more than twice as many UHF channels reserved for education as there are VHF, the joint committee is vitally interested in the studies being made by your Communications Subcommittee. In 24 of the 168 communities where there are educational UHF reservations, the only television assignment is the educational UHF one. In other words, under the present assignment table, the only possibility for these communities to have local television stations is to activate these educational UHF channels. In 17 communities where there are educational UHF reservations, construction permits for educational stations have already been granted by the FCC and the stations are in varying stages of construction. Three of these 17 are already on the air and several others are expected to be in operation soon.

The UHF educational stations which have been on the air for some time are Station KTHE at Los Angeles, Calif., operating on UHF channel 28, and Station WMPA-TV, operating on UHF channel 60 at East Lansing, Mich.

Station KTHE has been on the air since November 29, 1953, and is operated by the University of Southern California, Allan Hancock Foundation. There are 7 commercial VHF stations operating in the Los Angeles area and 1 commercial UHF station, KHI-C-TV, on channel 22. It is estimated that there are more than 30,000 television sets in the Greater Los Angeles area capable of receiving UHF signals. In November of last year there were approximately 5,000 such sets. This represents an increase of approximately 25,000 in a period of about 6 months. It is estimated that there are in excess of 1,000,000 VHF sets in the Greater Los Angeles area.
The second UHF educational station that has been on the air for some time is Station WKAR-TV operated by Michigan State College at East Lansing, Mich. This station has been operating since January 15, 1954, and there are in operation in that area 1 VHF station, WJIM-TV on channel 6, and 1 commercial UHF station WILS-TV on channel 54. According to a survey conducted in February of this year more than 33,000 television sets were in use in Lansing and East Lansing and more than 33 percent of these sets were capable of receiving UHF signals. The A. C. Neilson Coverage Service for CBS-TV reports that in Ingham County in which WKAR-TV is located there were as of November 1, 1953, 42,200 families with television sets and that 13,800 or 25 percent of these families had sets capable of receiving UHF programs. According to this same survey, as of the same date last November, there were 1,417,930 TV families in the State of Michigan. Only 59,120, or approximately 3 percent, had sets capable of receiving UHF programs.

In addition to the above two UHF educational stations, WHA-TV officially began broadcasting about 2 weeks ago. This station is licensed to the Wisconsin State Radio Council at Madison, Wis., and operates on UHF channel 21. There are two commercial UHF stations operating in Madison, occupying channels 27 and 33. There is only one VHF channel assigned to that city and it is now involved in a competitive hearing and no station as yet has been authorized on it. Because the only stations operating at present in Madison are UHF, practically all the sets in the city and nearby area are equipped to receive UHF signals. According to recent estimates, approximately 30,000 sets are in use. It is significant to note that in Janesville, Wis., about 30 miles from Madison, a commercial company has recently installed 300 television receivers and rotomatic tuners with channel strips to receive programs from the 3 UHF stations in Madison.

The Greater Cincinnati Educational Television Foundation has almost completed the construction of its educational station WCET on UHF channel 48 at Cincinnati, Ohio. This station is expected to commence broadcasting in the very near future. Ohio State University has begun construction of its educational television station WOSU-TV to be operated on UHF channel 34 in Columbus.

Construction permits for new UHF educational stations have been granted in other communities in the United States. In addition, there are three applications for UHF educational stations pending before the FCC.

In a substantial number of the 1018 communities where there are UHF channels reserved for education, local organizations have been set up and are at work making plans to file applications for educational stations. Because of the general progress that has already been made in the development of educational UHF stations, the joint committee is vitally concerned in protecting the gains already made by the educators in these communities and in helping in every way possible to solve the problems concerning the development of UHF about which your committee is concerned.

A proposal has been made that the Federal Communications Commission impose a freeze on further grants of construction permits for television stations. This would apply to both commercial and noncommercial stations in both the VHF and UHF bands. The Joint Committee on Educational Television is opposed to this proposal because in numerous communities over the country educators have made substantial progress in their plans to establish educational stations and a freeze on new grants for an indefinite period, as has been proposed, would interfere seriously with the culmination of these plans.

While the Joint Committee on Educational Television is not at this time prepared to evaluate other proposals which have been made in this hearing, because of our great interest and concern for educational UHF we stand ready to cooperate in every way possible and to supply any information we have at hand to assist this subcommittee in its efforts to solve the problems of UHF television to the end that an efficient nationwide television service will be made possible and the educational interests of the country served.

Senator Potter. We will now hear from Mr. Robert J. Campbell, director of the Dayton Educational Foundation, Dayton, Ohio.
STATEMENT OF ROBERT J. CAMPBELL, DIRECTOR, DAYTON EDUCATIONAL TELEVISION FOUNDATION

Mr. Campbell. I represent the Dayton Educational Television Foundation and its executive director, Mr. Chairman and Senators of the committee.

First of all, may I say thanks for the invitation to appear before your committee. I wish, however, that this statement on behalf of the Joint Committee on Educational Television had been available before in enough time so that I might have seen what they have to say about educational television.

I have no prepared statement and, with your permission, I will speak from notes.

Senator Potter. It is perfectly all right.

Mr. Campbell. The Dayton Educational Television Foundation was incorporated as a nonprofit corporation under the laws of the State of Ohio and, quoting from the articles of incorporation, article 3:

Said corporation is formed for the purpose of (1) serving the educational needs of the area through radio television programming for the advancement of educational programming and in effecting nonprofit educational television broadcast service, and (2) acquiring and holding over said money, real estate, and other property to carry out said purposes and doing any and all things reasonable, proper, and necessary for said purpose.

The Dayton Educational Television Foundation was formed but not incorporated as of January 2 of this year. The incorporation was effective as of April 15, commencing official business as a corporation on April 15 of this year.

Quoting now from the first quarterly report as submitted by me to my board of trustees:

Although considerable work was done in behalf of the Dayton Educational Television Foundation prior to January 1, 1954, this report shall concern itself with the activities of the foundation during the first 3 months of 1954.

At a meeting prior to January 1, the proposed incorporators of the foundation met and appointed Robert J. Campbell as executive director of the foundation and assigned to him the duties of writing, producing, and supervising radio and television shows of an educational nature.

On January 2, 1954, offices (furnished by the University of Dayton) were occupied by the foundation and a meeting was arranged between the foundation and the program departments of television stations WWHO-TV, WIFE-TV, and WLW-D for the purpose of selecting time to be used by the foundation and to be furnished free by the stations as offered by them prior to this time.

Before the actual beginning of our operations we were in several meetings with representatives of the three stations at that time who offered us as much time as we felt we could conceivably use for the purpose of educational television programs.

Our purpose in doing this was (1) to prove to the public in Dayton that we were able to program educational television programs that would be acceptable by the public, and (2) to gain some experience in the production of television programs of an educational nature.

Senator Potter. Do you plan on having your own station eventually?
Mr. Campbell. We hope by proving to the public of Dayton, to raise money enough through public subscription, to be able at some future time to build our own educational station. The allocation from the educational commission assigned channel 16 for educational purposes.

I was offered the job as executive director by reason of my experience in television, that being now more than 8 years.

In spite of their willingness to cooperate with the foundation, stations WHIO-TV and WLW-D were not able to immediately arrange time for the production of educational programs because of their heavy commercial schedule. However, WIFE-TV, having just begun programing, and having a lighter commercial schedule, was able to offer to the foundation almost unlimited time for programing.

A list of programs either in format or script stage was submitted to all stations. These programs had been approved by the board of trustees, program director of the foundation. From this list stations were to choose those programs which were most acceptable to them from the standpoint of ease of production, compatibility to already scheduled programs, and audience appeal. A full report of those programs aired will be found on following pages.

While there has been no paid professional staff, with the exception of Dr. Campbell, the programing during the first quarter of operation has been possible because of the wholehearted cooperation of teachers, parents, school children, university students, and staff as well as various business and professional groups.

Although the foundation produced 98 radio and television shows during the first quarter of this year, that total would have been more than 155 had not station WIFE-TV suspended operations on channel 22 on March 13. Of the 98 shows produced, the placement was as follows: 69 TV shows on WIFE-TV; 19 TV shows on WHIO-TV; 1 AM show on WONE; 0 shows on WLW-D; 9 AM and TV shows (in part) on all stations for promotion of the Urban League's Vocational Opportunity Campaign Week.

In addition to the shows produced, three new series of shows (described later) were in rehearsal for airing starting the week after WIFE-TV announced their suspension of operation and six other shows are not in the process of development. While the above breakdown of programing shows no activity on the part of WLW-D, one show has been planned and prepared for that station, to be telecast from noon to 12:30 each Sunday, starting on April 18, 1954.

Other activities of the foundation during the past 3 months include 28 speeches by Dr. Campbell to service, church, and parent-teacher groups interested in educational television; more than 15 other speeches by Mr. Clarke and Mr. Harris and others of the board of trustees and a campaign of direct and newspaper publicity by Mr. Clarke and Mr. Harris in favor of the foundation. In cooperation with the Junior League, a 12-hour workshop on educational television has been planned for the month of May and other workshops of specific nature are being planned for the summer months. To give the foundation a better understanding of the needs for educational television, a survey of the viewing habits of school-age boys and girls has been started with the cooperation of the University of Dayton.

During this first quarter of 1954, the Dayton Educational Television Foundation has acted in an ex officio capacity since the actual incorporation of the organization has not yet been accomplished. Therefore, considerable time has been spent by the foundation in trying to settle the legal technicalities of incorporation.

The reason why I welcome the opportunity to speak before this committee is because I hope those whose interests, perhaps financially, are much greater than ours will not forget that educational television has been provided for by this committee through the activities of our Federal Communications Commission.

I feel very small in being here because I have no station. That has gone out of operation. I do not object much because that has not been thrown down the drain. I feel that I have a great responsibility to the great number of people particularly in our community.
numbering nearly one-half million people whose interests have been in educational television.

When station WIFE-TV went off the air we were flooded with a great number of letters and telephone calls and post cards saying that it was regretted by all these people that we had to suspend all these shows that were produced. Those letters and post cards, while I did not bring them to show you, came from representatives of such organizations as the women's clubs, the American Federation of Labor, the medical society, Community Welfare, the Red Cross, Good Will Industries, YWCA, the Dairy Council, chambers of commerce, the Dayton Bar Association, the Farm Bureau, and the list goes on and on, of civic-minded organizations and individuals who stated their regret that we had to curtail our production of educational television shows.

The other thing that has had a great deal of influence on it is the fact that we have had a UHF failure and that does not mean that we cannot continue our principles for educational television even using channel 16 in our city, but it does mean that there has been a reluctance on the part of those people who had formerly shown a great interest toward the building and support of the station to go ahead with it in the face of a commercial failure in our city. I do not mean that it is not possible to go ahead because we have in operation a plan which I think and hope will allow us to continue our operations.

I would like to say this, and speaking now as authorized by my board of trustees, we would like very much to see a third station on a commercial basis in our city as well as being able, in the future, to build our educational station, the reason being that we feel that the more stimulation there is in television, by and large, the better job we will be able to do in educational television, first of all, because it is going to be some time before we will be able to be on the air with our own educational television. The business of raising that sort of capital is a rather tedious and laborious proposition.

Senator Potter. How much capital do you think you will need?

Mr. Campbell. According to an estimated budget, we would require approximately $250,000 to put our station on the air and maintain it for 1 year. This is a very low figure, but this is based on the operation of 20 to 25 hours of educational programming per week.

Thereafter it would cost us $90,600 per year operational costs. These are estimated, and are based on existing educational type stations, actual figures, and I got figures from manufacturers and others who would have to supply us.

Senator Potter. Are there any other questions of Mr. Campbell?

Thank you very much, Mr. Campbell.

We will now hear from Mr. Benedict P. Cottone of the UHF Coordinating Committee.

STATEMENT OF BENEDICT P. COTTONE, UHF COORDINATING COMMITTEE

Mr. Cottone. I am very grateful, Mr. Chairman, for the committee's indulgence in permitting me to come in at this point. I only asked for that privilege and opportunity because of an event maybe of some importance in the consideration of the problem we have here
this afternoon, this event having occurred last night. I will get to that, if I may.

My name is Benedict P. Cottone. I am an attorney practicing law in the city of Washington, being associated with Scott Lucas in the law firm of Lucas & Thomas.

We have been engaged as counsel for the UHF Coordinating Committee and work with a group that consists of 70 UHF broadcasters in the country.

The group has grown, having initially started with a very small number of stations.

My statement is not prepared. We did have a prepared statement, but in view of a good deal of the testimony that you have heard it became unnecessary for me to say the things that I thought had to be said.

Briefly, I might tell you that the purpose of my prepared statement was to try to give this committee the benefit of the thinking as to the consequences of the monopolistic situation which we believe firmly we are headed for unless something drastic is done.

I need not repeat what Mr. Bergman said, and I think he illustrated very vividly some of the consequences.

If I may be permitted to add one further mention of the consequence that flows with respect to the right of the public to obtain the necessary information and the necessary discussion of public issues that flows out of the candidacy for public office, the committee is well aware of the provisions in section 315 of the act which intends to assure that candidates for public office have some opportunity to reach their constituents whose vote they are trying to get. With the kind of time limitation that will occur from the type of monopolistic situation that we have had and have heard so much about, we think it is a very serious danger to candidates for public office and they will have a most difficult time in obtaining at a local level the opportunity to reach their constituents and to get before them the issues of campaigns on which they are running for office.

Senator Potter. In some cases that might be considered a public service.

Mr. Cottone. I would not wish to suggest at this late date that the premise on which that was put into the act was erroneous.

Before I start with a discussion of what I was directed to say this morning, I would like to dispose of a very brief item. First, we had several witnesses whom we had expected to put on who have had prepared statements made and we are giving them to the committee and we are now offering the prepared statements of Mr. Elfred Beck, the owner of station KCEB, Tulsa, Okla.

The next is the prepared statement of Mr. Theodore B. Pitman, Jr., from television station WTAO, Cambridge, Mass.

The next is the statement of Mr. Gary Cohen, vice president of WBUF-TV, Buffalo, N.Y.

And if I may at this moment also, if it has not been already included in the record, with the committee's permission I should like to have included a column by Mr. Jack Gould of the New York Times discussing this problem and entitled "The Crisis in UHF." I would like to ask that the pencil marks on this item be disregarded.

Senator Potter. Without objection, the statements of Mr. Elfred Beck, Mr. Theodore B. Pitman, Jr., and Mr. Gary Cohen, and also
the newspaper article by Mr. Jack Gould will be made a part of the record at this point.

(Prepared statements of Elfred Beck, Theodore B. Pitman, Gary Cohen, and newspaper article by Jack Gould, are as follows:)

**Testimony of Elfred Beck, Station KCEB, Tulsa, Okla.**

My name is Elfred Beck. I own and operate UHF station KCEB in Tulsa, Okla. I have invested close to a million dollars in the construction and promotion of this station. Recently there arose in Tulsa a serious threat to the survival of my station and to the interests of other Tulsa broadcasters as a result of the FCC's grant of VHF channel 8 to Tulsa Broadcasting Co., for the alleged purpose of a station in Muskogee, Okla., only 60 miles from Tulsa.

The Tulsa Broadcasting Co. is principally owned by the Griffin family, which also owns radio station KTUL in Tulsa, radio station KFPW, Fort Smith, Ark., radio station KOMA, Oklahoma City, 50 percent of KWTV, a television station in Oklahoma City, also television station KATV, Pine Bluff, Ark.

Tulsa Broadcasting Co. received a grant on April 8, 1954, after 2 other conflicting applicants withdrew their applications after the Commission held a 20-minute hearing. The so-called Muskogee station will locate its tower and transmitter only 20 miles from Tulsa and will establish its studios in Tulsa itself with "the obvious purpose" of getting an additional television service into the Tulsa market.

Four television channels have been assigned to Tulsa for commercial service—2, 6, 17, and 23. Television station KOTV, broadcasting on channel 6, has been in operation for more than 4½ years. Television station KCEB, my own station, has been granted a license on channel 23, and we have been in program operations since March 13 of this year. A construction permit for channel 17 has been granted to Mr. Arthur R. Olson, a resident of Tulsa. Two applicants for channel 2, Central Plains Enterprises, Inc., and Oil Capitol Television Corp., have been designated for comparative hearings.

Tulsa Broadcasting Co. owner of radio station KTUL in Tulsa, did not attempt to file application on any of the channels legitimately allocated to broadcast on the Tulsa market. The express reason for their failure to apply for a proper Tulsa channel was that even after a long and expensive hearing, they could not be sure of obtaining such a grant. Further, Tulsa Broadcasting Co. felt that it would be a much simpler matter to overcome competitive applicants in Muskogee, and then to locate their transmitter for channel 8 only 20 miles from Tulsa and be able to cover the Tulsa market, instead of utilizing their Muskogee channel for the benefit and interest of the people of the area in which the channel was designated.

It should be pointed out that if the proposals of Tulsa Broadcasting Co. are approved, and its plans are put into effect, such a development will have certain results.

First, the proposal would subject the rightful and legitimate holders of television franchises to unfair, inequitable, and unwarranted competition from an organization presumably authorized to provide television service for an entirely separate and distinct community; and, second, a transmitter located in accordance with Tulsa Broadcasting Co.'s proposal, in order to encroach upon the Tulsa market, is situated in a position where service to its proper service area is diminished. It is demonstrable that, from the standpoint of most efficient coverage of the population of the Muskogee area, more desirable transmitter locations, with higher natural elevations and more strategic positions, are available to the east and northeast of the city. A transmitter in such a location would not only allow complete coverage of channel 8's proper service area, but would provide service to the people in areas of eastern Oklahoma and western Arkansas to whom the benefits of television broadcasting would not otherwise be available.

I should also like to raise a further point, that of "duopoly" television stations, which supply appreciable service to overlapping areas.

Tulsa Broadcasting Co. proposes to erect a 1,000-foot tower for the transmission of channel 8 signals at a distance of only 20 miles from Tulsa. Broadcasting with 316 kilowatts of effective radiated power from an overall elevation in excess of 1,900 feet above sea level, the management claims, and I believe with justification, that the station will be able "to blanket an area 75 to 100 miles from the transmitter." The common owners of KWTV in Oklahoma City and Tulsa Broadcasting Co. also propose to broadcast over channel 9 in
Oklahoma City with 316 kilowatts of effective radiated power from an antenna 1,575 feet in height, thus, in effect, to furnish receivable television service throughout the major portion of Oklahoma. Assuming that the effective radius of the Oklahoma City installation will be at least that of the proposed Muskogee outlet, and recognizing that the air-line distance between the 2 installations is approximately 100 airline miles, the area in which transmission services will overlap is appreciable, and the population of this overlapping area will be provided with 2 television services under common policy and operating control of a single organization.

As a further consideration, television stations, even under fair competitive conditions, must rely upon network affiliations and network programing to establish economic stability and security.

Two VHF and 2 UHF channels have been assigned to Tulsa, and franchises on all 4 of these channels will eventually be assigned and operated upon. Approval of the plan of Tulsa Broadcasting Co. to locate its station in a position deliberately selected so that channel 8 may be practically considered to be a competitive service in the Tulsa market is prejudicial to the interests of the legitimate license holders in Tulsa, who are then placed in jeopardy with respect to establishing affiliation agreements with 1 of only 4 available network program sources. The jeopardy is especially marked in the case of the two existing UHF franchise holders on channels 17 and 23, inasmuch as the operators under these grants are already saddled with serious competitive problems attendant upon the inequality between current UHF circulation and established VHF circulation in the Tulsa market. The reality of this threat has been proved in our own case, in which negotiations with American Broadcasting Co. have been broken off by the network, and they have announced intentions of waiting for the completion of the station of Tulsa Broadcasting Co.

The continuation of UHF circulation increase is vitally dependent upon the availability of network programs which will induce the potential audience of the Tulsa region to acquire receivers which will make additional network programing available. It is undeniable that the establishment of a third VHF station, deliberately and admittedly located to blanket the Tulsa market area, as proposed by Tulsa Broadcasting Co., would offer strong inducement to at least one network affiliate with this outlet with its broad VHF coverage, to the exclusion of legitimate Tulsa UHF outlets which now are, or may become, available in Tulsa and which for a time will have a less extensive audience potential.

The Federal Communications Commission has frequently expressed its deep interest in the welfare and expansion of UHF television services as the only means of providing a broad, universal television service in the interest of the greatest percentage of the population of the United States. An economic threat, such as that implicit in the plan of Tulsa Broadcasting Co., as disclosed above, is grossly inimical to that interest and, if executed, may well spell the economic death of valuable and useful UHF television service to which the people of Tulsa and the Tulsa region are entitled.

Tulsa Broadcasting Co. did not wait long after it received a grant for a Muskogee station, to move into Tulsa with a heavy promotional campaign. This campaign consisted of newspaper advertisements and announcements, billboard posters, repeated announcements on their radio station in Tulsa, and many other publicity stunts having the effect of keeping the public from converting their sets or buying sets which could receive UHF.

When two UHF stations in Oklahoma City were struggling for their economic life and attempting to stimulate the conversion of television receivers to make new program resources available, the common owners of KTV and Tulsa Broadcasting Co. began a campaign to deter and to discourage conversion in that city. As is obvious, the entire intent of widely published advertisements was to discourage and to stop the expansion of broad and diversified program service in the interest of the population of the region whose best interests they were obligated and professed to serve.

That this threat is a dangerous reality and not merely an hysterical cry of "wolf" is fully borne out by the UHF experience story in Little Rock, Ark. The circumstances are the same—the principals in interest are the same—the tactics are the same—and the results will be the same if KTUL's proposals with respect to channel 8 in Muskogee are allowed to develop. The Little Rock story is as follows:

KTV, broadcasting on channel 17, went on the air in April 1953 with a transmitter located in Little Rock best to serve the people of the area.
KRTV commenced operations under affiliation agreements with CBS, NBC, and Du Mont.

KATV under a grant on channel 7 in Pine Bluff, Ark., commenced operations under affiliation agreements with CBS, ABC, and NBC in December 1952.

The principal owners of KATV, Pine Bluff, are the same as those of KTUL, Tulsa, of KWTV, Oklahoma City, and of Tulsa Broadcasting Co., applicants for channel 8 in Muskogee.

The KATV, Pine Bluff, transmitter is equidistant from Pine Bluff and Little Rock, which are 40 miles apart—a direct parallel of the Tulsa Broadcasting Co.'s proposal for channel 8 in Muskogee.

As an outgrowth of stringent competition by the encroaching signal of KATV in the greater Little Rock area resulting from the placement of the transmitter to effect such unfair competition, KRTV has been sold out to KATV—Griffin interests. The KRTV permit on channel 17 in Little Rock was vacated and the people of the area deprived of a service to which they are entitled.

Because of the Greater Little Rock coverage, from KATV in Pine Bluff, CBS considered dropping its KRTV affiliation in Little Rock.

KATV has moved into the studios and offices of KRTV in Little Rock while maintaining ostensible main offices at the KATV plant in Pine Bluff.

I beg the serious consideration of this subcommittee of the expressed intent of the would-be stewards of a public trust for a television channel assigned to Muskogee. I request serious appraisal of the legitimacy of the Tulsa Broadcasting Co.'s clear proposal to utilize a rightful Muskogee channel allocation, primarily, to encroach upon and to compete inequitably and unjustifiably in the market properly assigned to rightful Tulsa television franchise holders and applicants.

Statement of Theodore B. Pitman, Jr., WTAO-TV

My name is Theodore B. Pitman, Jr., of Cambridge, Mass. I have been in the television and advertising business since 1948. I have been, first, a client; as assistant advertising manager of the First National Bank of Boston, I was producer of the bank's radio and television shows, and put on their first television show in June of 1948. Following that, I was sales manager for a motion-picture studio making films for television; after that, I was radio and television director for one of New England's largest advertising agencies, John C. Dowd & Co., where I produced as many as 13 live shows a week on New England television stations. In my capacity at that time I also performed the duty of buying radio and television time for the clients of the agency. Following that, I became vice president of the Julian Gross organization of Hartford, Conn., operators of WKNB-TV in New Britain and owners of the Julian Gross Advertising Agency. In the latter job, I acted as radio and television director for the agency and program director for the television station. Following that, I became program director of WTAO-TV and of late have served as station manager. In short, my experience gives me a background in the television industry as a client, time buyer, program director and station manager.

I am here today to tell you of the present television situation in Boston and some of the current problems of station WTAO-TV. WTAO-TV is a UHF station operating in an intermixed market. Two VHF stations are in operation in the Boston market and have been since 1948. Our station went on the air commercially in September 1953. By lack of network programming, WTAO-TV is currently forced to cut back to operating only 3½ hours per day, 7 days per week; out of that total number of hours we have an hour and 30 minutes of network time from the Du Mont network, and 15 minutes of network time from the ABC network. In other words, out of a total of 24.5 hours per week of operation, total network time consists of 1 hour and 45 minutes. Of the hour and 30 minutes of Du Mont time, 1 hour is a cooperative program, which means that we were allowed to sell it to a local sponsor, and one-half hour is a network-sponsored program. The 15 minutes of ABC time is network sponsored.

We have been offered more network programs by both networks in the form of unsponsored sustaining programs, provided we paid the audio line charges into Boston in the case of Du Mont, and provided we paid the audio and video line charges into Boston and the program costs in the case of ABC. However, of the total network programs coming into Boston from all 4 networks, I estimate that the 2 operating VHF stations, WBZ-TV and WNAC-TV, get 100 percent of
NBC and CBS time, 90 percent of Du Mont time, and 75 percent of ABC time. Therefore, it can be seen that even though Du Mont and ABC networks have offered WTAO-TV more program time provided that the station pay the line charges plus other costs, the programs being offered are from the "bottom of the barrel"—programs that the two VHF cannot carry, or do not choose to carry. The reason for this situation can be seen from our Du Mont affiliation contract, which I would like to introduce here as Exhibit A. I should like to quote some of the wording of that contract at this point. Paragraph 4, on page 2, is entitled "First Refusal," and reads as follows:

"The station shall have the right of first refusal, subject to the prior right of the VHF stations in the Boston area, as long as that right shall continue, good for 72 hours, as against all other television broadcast stations in the city to which the station is allocated, upon all sustaining and cooperative programs offered by the network after the effective date of this agreement for delivery to said city. If the station does not accept any such program within 72 hours, the network shall then have the right to offer such program to any other television broadcast station."

I should like to call the attention of the committee to the words, "subject to the prior right of the VHF stations in the Boston area, as long as that right shall continue." The original printed contract does not contain these words, and this qualification was typewritten into the contract at the time of its execution. Technically, this contract allows WTAO-TV to claim tertiary affiliation with the Du Mont network. With respect to ABC network, WTAO-TV does not even enjoy such a limited and qualified contract, although repeated efforts have been made to get even this much from that network.

The best we have been able to do with ABC is a letter dated October 23, 1953, signed by Ned Hullinger, ABC's regional manager, station relations. I offer a copy of this letter as exhibit B. Briefly, the letter contains the terms upon which ABC will deliver programs to WTAO-TV. In digest, the terms specify hourly rates and costs. The wording in point 2 contains the phrase, "when and if the various co-op programs are offered to you." With the passage of time, those three words, "when and if," seem to have become the most important qualification, because even after months of attempted contact, WTAO-TV still does not have if ABC will offer the station any programs, or when.

So the situation in Boston, as it concerns television, is as follows:

Four networks come into Boston, and there are three television stations. NBC and CBS have primary and basic affiliation contracts with the two existing VHF stations; WBZ-TV is the basic NBC outlet, and WNAC-TV is the basic CBS outlet. However, with ABC and Du Mont Networks have primary affiliations with these two VHF stations. Therefore, these latter two networks have to offer these VHF stations first choice on all programs for at least 72 hours. Simple arithmetic shows that these VHF stations which already enjoy a choice of all NBC and/or CBS programs dependent upon their individual basic affiliations with those networks get a total of 144 hours, or 6 full days, between them to choose from all ABC and Du Mont programs before these programs can be offered to WTAO-TV. The 144-hour rule applies to Du Mont only, of course, because of our affiliation contract. ABC is not bound by even this rule. I need not say that the pickings that remain after this process takes place add very little incentive for WTAO-TV to pay for high audio and video line charges into Boston, plus other costs, to get the programs that are left.

Please allow me to give you a few examples of what is taking place. It was repeatedly brought to my attention by one of my contacts in the industry that one of the networks was in the process of negotiating to place a network show in Boston. This process has been going on for weeks, and still the show has not been offered to the VHF stations on the 72-hour forfeiture basis. The fact that our station is available to the Boston Market does not seem to contracts, our station would at least have had a crack at that show by this time. However, I am not even allowed to find out about such available, or possibly available, shows on an above-the-board basis. I cannot even get a chance to approach the client about offering him live time on our station.

Another case example is a program that offers a news broadcast. I learned that the VHF stations could not carry this news broadcast on a live time basis, i.e., carry the program at the time it is originally telecast from its source. I approached the ABC network and offered to carry the program live. I was turned down. I asked Mr. Malcolm Lang, ABC station relations director for New England, if I might approach the client and offer live time to him. Mr. Lang
told me, and I quote, "I do not want you to go to the agency. However, I can't prevent it. But if you do, and if the client questions me, I will recommend that they stay where they are on a delayed broadcast basis." Hence, a news program that might be coming into Boston live, and up-to-date, is still being telecast 2 days later on a delayed broadcast basis. I leave it to you gentlemen to decide if delayed broadcast of news is in the public interest; in my opinion, such delayed broadcast is not in the public interest.

I tried to get the John Daly show. I was bluntly told that the advertising agency handling that show is not buying UHF stations in intermixed markets. In short, WTAO-TV is sitting with its antenna perched over more than 1 million television sets in Boston and cannot provide these set owners with additional service and program selectivity because there has not been enough program incentive to get these sets converted to receive UHF reception. The two Boston VHF stations have enjoyed special privileges for a number of years, and they still continue to enjoy these special privileges even though WTAO-TV has been operating for approximately 7½ months. In addition to special privileges for VHF in Boston, the average television viewer has been restricted from selecting program choice from a third television station. We cannot get an affiliation out of ABC. The reason for this is that ABC has a primary affiliation with the CBS basic affiliate station, WNAC-TV, in Boston. In my opinion, from my experience and from actual conversations with ABC executives, ABC wishes to keep this affiliation strong because when and if pending VHF channel 5 is granted in Boston, they feel that channel 5 will become the CBS basic station in Boston and that, therefore, they do not want to do anything to upset, or in any way jeopardize, their relationship with channel 7, WNAC-TV.

Well, what can be done about such a situation? You might ask, is more network regulation needed? I have had the feeling from the beginning that the system adopted for channel allocations was extremely faulty. After several years of observation, and actual working experience, I now believe that there is no doubt about the unworkability of the present allocations. Intermixture is seriously breaking down throughout the country. In my opinion, under the present allocation plan, more network regulation is needed to help UHF survive, particularly in intermixed markets; however, such regulation will not cure the basic and fundamental problem of equal economic natural facilities and opportunity. I believe the real cure will be a more realistic reallocation that will eliminate intermixture; such a reallocation eliminating intermixture might make the need for further network regulation unnecessary, or, in any event, hold further network regulation to a minimum.

In my opinion, an immediate suspension of grants should be instituted before any more serious and irreparable damage is done to the chance of having a truly nationwide competitive television system. I believe that the further licensing of VHF and UHF stations at this time is doing considerable harm to the possible chance of developing such a truly competitive nationwide television system. Once a suspension is called, the next step is an immediate and expedited study of reallocation of all existing VHF and UHF channels in order to eliminate intermixture. I feel that eliminating intermixture is the only correct solution to the problem facing this entire industry.

Under such a reallocation, you would then have all VHF stations competing on an equal economic basis with equal natural facilities and you would have all UHF stations also competing on a similar economic basis. Also, such a plan would give the average television viewer the greatest selectivity of programs by maximizing network affiliations, as well as promoting local programing. I further believe that by this reallocation you would stimulate the building of more UHF stations and you would immediately stop the turning in of construction permits at the rate they are now being turned in. Therefore, you would encourage new businesses in many, many communities, and, in that way, you would be helping the employment situation throughout the country, as well as establishing a truly nationwide competitive television system.

STATEMENT OF GARY COHEN, VICE PRESIDENT OF WBUF-TV

My name is Gary Cohen. I am vice president of WBUF-TV, a UHF television station in Buffalo, N. Y.

I am here to give the subcommittee the history of WBUF-TV to show the problems which its management encountered when it accepted the public trust
placed upon it as the holder of a television channel allocated to Buffalo to provide that community with the best program service possible. The organization which became WBUF-TV was first formed in June 1952. Its members were some 20 public-spirited businessmen, all from the Buffalo-Niagara Falls area. At that time we had only one television service in our area. As the Buffalo-Niagara Falls area constitutes the 14th largest retail market in the United States, and includes within its limits a population of over a million and a quarter people, the Federal Communications Commission authorized it 3 VHF channels and 2 UHF channels—for commercial purposes—and 1 UHF for educational purposes.

On August 8, 1952, the WBUF-TV group filed an application for a UHF channel, channel 17. At that time one VHF station was on the air and competing applications were on file for both the VHF channels. The other UHF channel—channel 59—was vacant but subsequently another group applied for and was granted that channel.

When WBUF made its application it had two choices before it. One, it could join the competition for one of the two VHF channels or two. It could file for a UHF channel. Under the rules governing the processing of applications that were in effect at that time, there appeared to be no likelihood that any UHF channel could be granted in less than 3 years. The prospect for immediate grant in UHF looked good. WBUF-TV realized that many economic obstacles lay in the path of successful operation of a UHF television station. However, with the objective of bringing an additional television service to Buffalo at the earliest possible date and with the hope that a 3-year headstart sufficient UHF receiver circulation could be built up to make the enterprise worthwhile.

On September 10, 1952—approximately 1 month after WBUF filed for its UHF channel—it placed an order for UHF transmitting equipment contingent only upon receipt of a construction permit. The Commission granted the application in December 1952. An immediate order for the delivery of the equipment was placed with the manufacturer. Delivery was promised in March of 1953 but it was August 15, 1953, before a transmitter was delivered. And I am sorry to say that the transmitter that was delivered was a 1 kilowatt transmitter whereas we had ordered and expected a 5 kilowatt transmitter.

It will be recalled that the Commission granted WBUF its television construction permit in December 1952. Beginning in January 1953 WBUF inaugurated a strenuous campaign to promote the conversion of existing VHF only sets and the sale of all-channel receivers. From early January 1953 to the middle of August 1953, when WBUF went on the air, numerous meetings were held with local distributors and servicemen. WBUF ran—and is running—daily ads in the local newspapers to acquaint the public with the programing of WBUF and the quality of its service. WBUF representatives constantly visited appliance dealers in order to assist them in merchandising UHF sets. No effort was spared nor is now being spared.

We did not make the mistake that is ascribed to other permittees of trying to get on the air too soon and with inadequate preparation. The day we took the air—I am proud to say—the quality of our picture was as good as that of the VHF station and the quality has remained good to this day. Moreover, the quality of our programing the day we started operation was as good as that of the VHF station and has so remained to this day.

The public responded beautifully to our efforts. From August 17, the day we started on the air, until the middle of December 1953, conversions proceeded at a most satisfactory pace. By the first of October approximately 14 percent of all sets in the Buffalo-Niagara Falls area were able to receive WBUF-TV signals. The percentage of conversion continued to increase so that by the end of December 1953 almost 27 percent of all receivers were able to receive UHF programs.

Even more encouraging than the conversion picture was the fact that from August until December it was not possible, as a practical matter, for dealers to sell new television receivers unless they were equipped with UHF. UHF-equipped receivers were more expensive than VHF receivers but the public would not buy a receiver that did not enable them to receive the quality programing that they could get only by tuning in to WBUF-TV.

The picture changed abruptly in the middle of December 1953. What happened was that on December 8, 1953, a merger was effectuated on channel 2. Although it was several months later before a final grant was made in that case the newspaper publicity beginning on December 8, made it clear to everybody in
the Buffalo-Niagara Falls area that a second VHF station was imminent. The results were immediate. The other UHF station, which had been operating in Buffalo, closed its doors. The public stopped converting their sets with the result that whereas up to December 8 conversion had been proceeding at approximately 5 percent per month, it dropped to approximately 1 percent per month. Moreover, for the first time, dealers began to sell new sets which were VHF only.

The reason for the change was obvious. So long as there was only 1 VHF in the market, WBUF-TV was able to carry the programs of at least 2 networks. However, with the advent of a second VHF station, it became clear to the public that they would henceforth be able to receive the programs of all 4 networks from the 2 VHF stations. The incentive which formerly existed for spending additional money for UHF equipment thus disappeared.

I do not want you to infer from what I have said so far that we have lost faith in UHF. We definitely have not. It is our experience that when we have good programing available to us that the public cannot receive from any VHF station, they will pay the extra money needed to buy UHF-equipped receivers and once they buy those receivers, we can take care of ourselves. A very vivid illustration of the effect of good programing is presented by the experience which we have had in the past several weeks in televising the Army-McCarthy hearings. Since we are the only station in Buffalo that televised them live in their entirety, our share of the audience has increased and an increase in conversion has again become apparent. This shows that if we are able to get good programing, we are able to take care of ourselves.

To show our faith in UHF and in the efforts of this committee to do something about UHF, and in order to keep faith with the thousands of people in the Buffalo-Niagara Falls area who have converted, are converting and will convert, WBUF-TV has made arrangements to install a new transmitter which will increase our power from something less than 20,000 watts to more than 200,000 watts. This requires a purchase of a 12-kilowatt transmitter, whose market price is more than $350,000. Final arrangements have been made for the acquisition of this transmitter and we have every confidence that it will be on the air as of June 15 of this year.

You can realize from what I have said so far that the key to success for UHF stations, or any television station as far as that is concerned, is the availability of good programing. Speaking generally, good programing is available on a consistent basis at the present time from only two networks, NBC and CBS. In my opinion the principal reason for this is that the other two networks have been unable to secure clearances on enough stations that have good circulation to be able to attract sponsors. That is why it is so important for this committee to do something about saving UHF. As the Commission has told you, there are not enough VHF outlets to assure a nationwide competitive service. UHF must be relied on for this purpose and if UHF is placed on a sound conversion basis it will be possible to have 4 strong networks rather than 2. And our experience has shown that if we are able to receive good programs, we are able to compete effectively.

The fate of WBUF-TV is important not only for commercial purposes but also for educational purposes, because upon the survival and the success of WBUF-TV rests the fate of WTVF—the educational television station in Buffalo. This is true not only in Buffalo but in many cities throughout the country where the educational stations must rely upon UHF channels. In order to encourage educational television in Buffalo, WBUF-TV is offering the use of its facilities to the board of regents in an effort to train their personnel in the technical aspects of broadcasting and to enable them to acquire experience on the programming end. Our efforts and the board of regents' efforts, however, will be in vain if commercial UHF stations are forced to go off the air and the public stops buying UHF receivers.

The solution to the problem lies in an immediate freeze of all new VHF grants. Only a freeze can buy the time necessary to work out the complicated problems reasonably and intelligently. Only a freeze can save television now. If a freeze is not imposed, any solution that is worked out is bound to be academic. The accelerated rate at which UHF stations are closing the doors shows that a remedy must be found within days, not months.
390 STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

[From the New York Times, April 18, 1954]

THE CRISIS IN UHF—DIFFICULTIES AFFECTING TV OPERATION IN NEW BAND ARE MANY AND VARIED

(By Jack Gould)

A growing crisis is affecting television across the country and it can be summed up in one phrase: Ultrahigh frequency.” In jeopardy are many of the high hopes held for the nationwide development of television, both as a commercial service bringing diversified entertainment to the homes of millions and as a new educational force.

The situation already has assumed sufficiently serious proportions that a subcommittee of the Senate Interstate Commerce Committee plans to make informal inquiry to see what can be done. That something must be done is obvious.

The UHF problem has both technical and economic aspects.

The original channels for TV—No. 2 through No. 13—fall within the very high frequency band. This is known as VHF video.

To provide space for more stations, the Federal Communications Commission opened a new band called the ultrahigh frequency band. This is known as UHF television and covers channels 14 through 83.

Virtually all of the 28 million television receivers now in use were designed to receive only the VHF channels. If those receivers are to pick up UHF channels, set owners must spend additional money. First, a UHF converter must be purchased, and this may cost anywhere from $15 to $50. Second, in most instances the set owner must install an additional antenna with a new lead-in. Such a supplementary antenna can be extremely critical in adjustment, which means the service charge can be substantial.

The necessity for the public to go to added expense and trouble to receive UHF is the heart of the crisis. It has become painfully apparent that where VHF already exists, set owners cannot be easily persuaded to show interest in buying a supplementary service.

What this has meant is that, while the expansion of America’s television is tied to the UHF channels, UHF television is in a tough fight for mere survival. A number of applicants for UHF stations have given up. Some present UHF broadcasters view the future with great apprehension.

OVERALL PICTURE

This is not to say that UHF by any means is a failure everywhere; in some few localities it is doing well. But the overall picture is grave. The UHF broadcaster is in real danger of sharing the economic and technical peril of the frequency modulation radio broadcaster. He is the orphan of TV and must have help urgently and quickly.

If he is operating in a community which already has VHF service, he must build up an audience by persuading tens of thousands of persons to install converters. Yet without an audience, or with a much smaller audience than a rival broadcaster, he finds it hard to obtain sponsorship of programs that set owners will feel warrant the investment in conversion.

But the UHF broadcaster also has a further handicap. The VHF station usually can cover well a much larger area than the UHF outlet. So, even if a UHF broadcaster has the field to himself, he still has worries. In many cities he must be prepared for later competition from either a new VHF station in his own town or from an increasingly powerful VHF station some miles away.

In this connection it is significant to see where there is provision for both VHF-UHF stations in the same community.

According to the Joint Committee on Educational Television, all 8 cities with a population in excess of 2 million persons fall into this category. So do 30 out of 35 cities with a population ranging from 450,000 to 2 million. So do 48 out of the 72 cities with a population ranging from 150,000 to 400,000. There are few areas, in short, where the UHF problem is not very real, either for the moment or for the future.

The stakes are high. Anything close to a collapse of UHF would lessen competition among networks, which need adequate outlets to attract sponsors, and could have a direct bearing on the quantity and quality of programs seen by everybody. If there is to be educational television in many areas, its future depends on UHF. Without UHF the independent local commercial station, so essential as a complement to network shows, simply would not exist in many cities.
COURSE OF ACTION

What can be done or should be done? Present speculation includes these points:

1. The set manufacturing industry must face up to the realities of the UHF emergency. Many receiver makers are including the UHF band, but others are either leaving it out or making it optional at extra cost, to gain a competitive retail edge. Even under the best of circumstances it would take years to build up a UHF audience through the sale of new receivers. The manufacturers played a major role in sponsoring programs on VHF stations to build an audience. Should they not do the same with UHF?

2. The FCC may have to reconsider its allocation tables. Did it not make a fundamental mistake in making many communities a mixture of VHF and UHF? Would not the sounder course be to make a community either one thing or the other to equalize the competitive factors?

3. A major bombshell, certain to stir up great controversy, is in the offing. This is a proposal that the frequency modulation radio band should be recaptured for television use. The FM radio stations actually fall between channels 6 and 7 on a television set and their removal would permit room for 3 more VHF video channels, which at least would ease the situation.

The argument against FM is that this radio service has not been a success and attracts at most a relatively small minority audience. The majority of FM stations, it is noted, merely duplicate standard radio programs. The articulate few who want FM's better technical quality should pay the price of conversion, it is argued, rather than the millions who want TV. The FM radio broadcasters might as well prepare for battle; the struggle seems bound to come.

4. Many UHF stations feel they should have a chance to try at least the idea of subscription video. If they could boast of showing brand new movies not otherwise available, they believe they might be able to compete realistically with VHF. If a converter and a gadget to collect or record fees for looking at a pay-as-you-go program were combined in one installation, perhaps the public would be more attracted to UHF. And might not subscription TV be one way to finance educational television?

As is readily apparent, there is no pat remedy for the UHF situation. What needs to be done now is first to recognize the situation, bring it out in the open and then see if fresh and imaginative thinking might not suggest some cures. Senator Charles E. Potter, Republican of Michigan, is scheduled to head the UHF inquiry in the Senate. He can perform a major public service by thoroughly and promptly setting forth all the facts.

Mr. Corrone. Last night, Mr. Chairman and members of the subcommittee, a group of some 40 to 50 UHF broadcasters met at the Statler Hotel in order to seek to arrive at some definite regulation that we felt should be made and pressed before this subcommittee as the immediate solution or at least the temporary immediate solution to the problem with which UHF broadcasting is confronted today.

At that time we had a meeting that consisted of the members of the UHF Television Broadcasters Association from whom you have heard, and of our own committee, the UHF Industry Coordinating Committee. It was unanimously determined that we should present respectfully to this subcommittee resolutions which I might state in general terms have not been written down in any specific form but which are as follows:

It was decided that the Commission in light of many things that have happened, particularly the desire of Members of Congress to obtain expedited service in many communities in the United States, that the Commission is now to be considered under a moral if not a legal obligation to expedite the grants of television facilities throughout the country.

It was felt that in fairness to the Commission there should be a complete understanding at this moment that a continuance of that directive might be very, very dangerous to the continued existence of a competitive television system.
Therefore, it was determined and we hope that this recommendation will not be considered presumptuous and we hope that it is considered in the light of the very strong feeling of all these people that they are in a desperate plight and that national television is in a desperate plight.

It was therefore decided unanimously that a request be made to the Federal Communications Commission that the Commission immediately, and when I say immediately—everyone meant immediately—suspend the grant of all applications for initial construction permits or for modifications of construction permits. They could do that by placing, as they have done in the past in the pending files or pending applications for such facilities, that the commission also suspend that and all grants made in the 30 days preceding the action which is here to be taken, namely of suspension of all grants.

And that the Commission suspend also all requests for so-called special temporary operation with respect to facilities that have already been authorized under construction permits. That would not preclude the last—that suggestion would not preclude anyone who has a construction permit to proceed to construction pursuant to the provisions of that construction permit, with the exception of those which have been granted within the last 30 days to proceed to construct their facilities under the permit originally granted, but would merely prevent them from obtaining an authorization which permits them to engage in an interim operation with some what lesser facilities than are normally provided in the construction permit.

The word that was used was hiatus. By any other name it is still a freeze.

We think that the period of time for which that equipment hiatus or freeze should be in effect should be the period of time that this committee may require in order to consider the evidence that it has before it and in order to complete these proceedings.

We would leave that period of time to the absolute judgment of this committee. We would be presumptuous to suggest any particular period of time.

We have said and you have heard from many witnessees that the only solution to this problem is immediate steps looking toward eliminating this competitive inequality between the UHF stations and the VHF stations, and we have said and taken the position rather firmly that the correct approach is the institution by the Commission of such necessary proceedings as might eliminate that differential.

In plain words, gentlemen, we have come to the conclusion that the goal toward which such a reallocation should look is a complete transition from VHF to UHF.

That may sound like a drastic proposal, but we would like to say that we do not believe we are suggesting anything more drastic than the suggestion upon which all television broadcasting itself was instituted in this country.

The committee heard the words from Mr. Weber who pointed out to the committee that the very first time that the Commission made a reallocation of the radio spectrum after the war, the Commission, in allocating 13 VHF channels to television, stated that it is not possible for a nationwide competitive system to be constructed upon the 13 VHF channels, which are now 12, that had been provided. The Commission specifically stated that television
must find its home eventually in the upper portion of the spectrum known as UHF. The Commission again said it when it was forced, by virtue of the pressing demands of the other services, to delete channel 1. The Commission again raised that point and repeated its prediction or expression that television broadcasting must find its lodging in the upper portions of the radio spectrum. That was in 1947, I believe, which was just before the Commission instituted the proceedings which led to what we have come to know as the freeze order.

We have heard a great deal about the drastic consequences of such a proposal in terms of the impact on the public. If we analyze this for just a moment and if we may accept as doctrine the Commission's own statements that have prefaced every important move in respect to television broadcasting over the years, we see that all we are doing is in effect carrying out the expectation of the Commission itself with respect to television broadcasting. If that expectation was that all television broadcasting and all television reception should be such that UHF can be received by the public, we are doing no more for the public than the Commission expressed initially. What is the difference? What are the crossroads?

The simple question is, have we arrived at that crossroads today? If we have not arrived at that crossroads today we will never get to the Commission's ultimate expectation of what the television situation should be in this country. We think the committee has heard enough to indicate what the crossroads is so that at least we may start on a course which looks toward the realization of this initial expectation.

Senator Potter. What do you think of the suggestion made by Mr. Poller that you conduct simulcast during the transmission period until they could finally move into the UHF?

Mr. Cottone. I was going to get to that.

We discussed last night that there is unquestionably going to be the necessity for a transition period here and, as Mr. Poller stated, it will become necessary in that period of transition to provide for simultaneous operation for some period of VHF and UHF stations. There would be this common ownership for some period of time which should be geared and related to some reasonable period of amortization of existing VHF facilities that pertain where there would be two services from a single operator. In and of itself, the provision of duplicating of programing by the same operator cannot be successful.

In FM there was the provision for duplication of programing. The Commission thought at one time it would be in the public interest to require separate programing for FM to develop as it felt it should develop. Duplication became the order of the day and we have never had any separate programing in the FM field, any of it that has been of any assistance to the development of FM. But it being plain that network broadcasting is the only means whereby there can be an inducement to the public conversion, it is our suggestion and I may say that we have appointed a committee that is a representative group of the two organizations from which you have heard testimony, to work out the outlines, the details of a plan which is designed to accomplish this transitional period by a method which provides for distribution of network programing between the commonly VHF and UHF owned stations in the same community.
Their plan contemplates a method whereby a certain number of hours of network programing will be distributed as between the VHF and the UHF station commonly owned during this transitional period, with the goal of eventually and moving gradually into the situation where that programing by the end of the period when the transitional period has been completed, all of that programing will be conducted on the UHF station. I do not wish to imply that we have worked out, in any definite form, that suggestion. We have basic outlines. We feel that it is quite important to give any plan very deliberate thought and we hope that we may be able to come back to you before these proceedings are over and if we will be given that opportunity to do it we will welcome it to come back to you with the details of that plan in a manner which may be considered feasible and in any event it would seem quite proper should be provided for the consideration of every possible feasible method of accomplishing what I believe we all agree is the ultimate goal toward which television broadcasting must go.

Senator Johnson. Mr. Chairman, may I ask a question?

Senator Potter. Yes.

Senator Johnson. Do I understand you to say that each licensee for a VHF station would be given a UHF station and he would either be permitted or compelled to broadcast on both UHF and VHF until such time as the Commission was ready to remove the VHF broadcast? Is that the way it would work?

Mr. Cottone. That is generally the plan. In other words, that period of time would be geared to two things: First, the period of normal amortization of the VHF facilities; and, second, relating that period to the normal period of replacement of the television sets, and we have had some testimony yesterday and the day before on that normal period, what it would normally be. It would be 4 years or thereabouts, I believe, and there are some statistics that can be provided on that.

Senator Johnson. Would the 4-year dual operation work quite a hardship on the station if they had to broadcast in both UHF and VHF?

Mr. Cottone. Perhaps I should have answered your question by saying that there will be no compulsion to continue to broadcast on VHF. That choice would be left to the broadcaster.

Senator Johnson. But that would be allocated?

Mr. Cottone. Yes, in other words, they would be given the opportunity to have a UHF channel which could be utilized for simultaneous broadcasts during a period of time which might be considered the transitional period.

Senator Johnson. And their use of the UHF channel would be their own choice, at their own peril.

Mr. Cottone. The UHF channel?

Senator Johnson. At the end of 4 years the VHF would have to be given up and if they haven't trained the audience to listen to the UHF, it would be their hard luck.

Mr. Cottone. You say give up the UHF?

Senator Johnson. I mean the use or the lack of the use of it.

Mr. Cottone. Yes, that is exactly right, sir.

One of the other proposals we thought we should lay before the committee is that we are now at the opening of an era of color television. If we are right in proposing eventually going to UHF, and
since we are in a period where there is going to be the commencement of substantial investment in color television, we believe and believe firmly that color television if it is started during this period of transition should be permitted only on UHF.

Senator Potter. Does that conclude your statement, Mr. Cottone?

Mr. Cottone. No, sir, I am exceeding the time but I have been addressing myself to certain points and I haven’t completed the additional proposals that this group would like to be considered as supporting, if I may.

Senator Potter. All right.

Mr. Cottone. Before I am through I am afraid I am going to get Senator Johnson mad at me. Let me take Senator Johnson’s bill first.

Senator Johnson. That bill was put in for hearing purposes and to bring the question out so that it might be discussed, and I am very grateful to Senator Potter, the chairman of this subcommittee, for holding hearings on it. I am not taking my own bill seriously.

Miss Hennock. Which Johnson bill?

Mr. Cottone. There are two bills. We support one of the bills.

Senator Johnson. The one that you do not support, I am not taking seriously.

Mr. Cottone. Let me say that the one that we do support is the one that provides for the removal of the excise tax on all-channel receivers. We believe that that might be a very strong incentive to manufacturers and distributors to get out to the public receivers that are capable of providing at least a part.

Senator Potter. That is passed on to the consumers.

Mr. Cottone. That is a problem, and frankly how that problem can be avoided or how anything can be written into law to avoid it, I have been unable to solve. It is in that area where you can hope that the good faith of the manufacturers will see to it that the savings of the excise tax will not go back in their own pockets. That also goes for the distributors.

The bill pertaining to additional ownership of stations by a process whereby depending upon the number of VHF stations owned no additional stations may be owned and help to—and I thing a maximum of 10 is the expression—we have grave misgivings about that bill. We are concerned with attempting to alleviate a situation which we are recognizing as very dangerous from the standpoint of construction and concentration of these stations in the hands of a few and monopoly. We do not believe we would be consistent to come before this committee and approve the elimination of one kind of monopoly, urge it, and have substituted for it a different kind of monopoly.

Five stations are a tremendous amount of power. Ten stations will be twice that amount of power. Five stations are a tremendous amount of concentration. Ten stations will be a far greater amount of concentration.

Secondly, we cannot understand and we have not heard any valid, factual or other kind of an argument as to how that is going to help UHF. We have had no representations—and I have looked for them—on any specific kind of plan if we say that this is to benefit the network—we have heard no statement as to what intention the network or other multiple ownership has in implementing this idea for advancing the interests of UHF.
Senator Johnson. May I suggest to Mr. Cottone that in discussing this proposal that he keep in mind the proposal before the Commission, to give the folks holding 5 VHF’s 2 extra UHF’s, which would be 7.

Mr. Cottone. That is a greater evil, I believe. I believe that a combination, if we are to assume that we will continue under the same order of things, a combination of 5 VHF’s and 2 UHF’s is less to be desired than 10 UHF’s. Assuming that we continue under the present order of things, that is. Of course, if we have all UHF’s and they are all equal and we have 1 type of television broadcasting system and they cover 5 VHF’s, multiplied by 2 under your bill, Senator Johnson—the group that met last night feels that that wouldn’t—they would like to take this proposition up with respect to the so-called Bricker bill. We have said that you can best obtain the attainment of an equal nationwide competitive system by providing the basic groundwork for equal competitive opportunity among broadcasting stations. That concept is implicit in the statutory principle of the fair, equal distribution of facilities.

Having provided that kind of pattern of ground rules, it seems to me that there is less necessity for governmental intrusion into the area of regulation.

I think that one of the things that should be considered on this score is that, if we examine the pattern of governmental regulation such as provided for in certificates of convenience and necessity, any attempt to regulate under the so-called common-carrier concept really is productive of a different kind of monopolistic situation.

In some areas that kind of monopoly may be in the public interest. One might be able to say that telephone regulation is in that area because of the waste and duplication that exists.

In the field of broadcasting we have started out with the concept that there should be opportunity to all, not only to the broadcasters, but to all who wish to get into the field of supplying programs to broadcasters.

It is a very dangerous possibility that by regulation of that nature you will limit the field of those who may provide programming to the American public to what we have today.

Senator Potter. Do you envision more than four networks?

Mr. Cottone. I do not today envision more than 4 networks, but I would not today wish to shut the door on more than 4 networks.

Senator Potter. Do you envision that, going on as we are going on now, there will be only two networks?

Mr. Cottone. Oh, as we are now, we are on the way to just two networks. But we believe that the way to cure that is to put this on the level where individual initiative, given the equal opportunity, can bring about the equalization in that field. I do not wish to be understood as saying for this group that we do not believe that there should be no attempt whatsoever at governmental regulation of this matter. I sincerely and deeply believe that the consequences of so drastic an action as that could not assist us in achieving the goal we are trying to achieve by the reallocation method and I think it becomes vitally necessary to do it by regulation. That should be considered an alternative.

Senator Schoeppel. But you are now asking for some governmental regulation to get yourself out of this mess.
Mr. COTTONE. I am only asking that the Federal Communications Commission, as a result of the authority traditionally recognized, set up the facilities in such a way that everyone has an equal competitive opportunity in the open market place.

Senator SCHOEPPEL. At one stage of the game that is what they thought they were doing.

Mr. COTTONE. That is right.

Senator SCHOEPPEL. And they did not do it.

Mr. COTTONE. Yes.

Senator SCHOEPPEL. And now when they started gobbling them up, you say somebody will have to unscramble that, and obviously we are not going to get it done by letting it up to those who have preempted some rights, so somebody should step in.

Mr. COTTONE. Yes; but I am suggesting that there is one form of stepping in that is much more to be desired than another form.

Senator SCHOEPPEL. I get your position on that, but you cannot breathe hot and cold. You will have to take some degree of regulation, but we all hope that it is going to be equitable, fair, and consistent with what is in the public interest, and the investing public has millions and millions of sets.

Mr. COTTONE. I agree with that. I was not suggesting that there should be hands off on regulation. I say if we cannot accomplish this in the way that we should try to accomplish it, by this freeze, by this effort toward reallocation, and by, in the interim period, providing that kind of regulation as to programing that assures this distribution of programing between VHF and UHF, then I say that it becomes vitally important.

Let me put it this way: I think the authority should be given to the Commission. Whether the Commission should exercise the authority and issue rules and regulations should depend very strongly on what has been accomplished by having proceeded on this other method. I do not disagree with the purpose of this bill, nor does this organization, but what the Commission does should depend upon how successful it has been in proceeding in the other direction.

Senator SCHOEPPEL. But at this stage of the game it looks as if there was either an error in judgment or not knowing what the technical advances we may have missed are.

Mr. COTTONE. Yes, sir, precisely; and I should like to say one word about this question of intermixture.

Senator SCHOEPPEL. Unfortunately, I have to leave. I would like to ask one question before I go, and I do regret that I do have to leave.

Mr. COTTONE. I do, too, sir.

Senator SCHOEPPEL. How far should the networks be regulated and by whom? Have you got a judgment factor to express on that?

Mr. COTTONE. I think the networks should be regulated to the fullest extent of the concepts under our antitrust laws that prevent any kind of restrictive practice, prevent that kind of advantageous arrangement that networks may be able to obtain by virtue of their stronger bargaining position.

I believe that to the extent that the Commission could implement the antitrust laws and keep out those restrictive practices and keep out those exclusive arrangements in a sense from creeping into the relations between networks and stations, I even say that there is no reason
why networks, for example, should have any kind of a privilege to have any particular kind of an option or exclusive right on the time of a station. That was the path along which we went in 1943.

Senator Hunt. Do you feel that the networks should offer the same programs and let everybody who wants to buy them?

Mr. Cottone. I feel that there should be at least an opportunity for competitive bidding or bargaining in the market place for everyone who would like to have this program to have an opportunity to do so to carry it on their stations.

Senator Hunt. Your answer is that those willing to pay the price should get them?

Mr. Cottone. Yes; but in a competitive market the price will adjust itself to a reasonable price, I would say.

Senator Schoeppel. I would like to ask this other face of my two-pronged question: By whom would you have the regulation of the networks?

Mr. Cottone. I would have the regulation under the Commission, present regulations and insistence upon the provisions of those regulations by the Commission, and enforcement of the provisions of those regulations and that goes beyond merely the written arrangement that might exist between networks. It requires a far greater staff than the Commission now has to investigate these practices and investigate the type of arrangements that may exist by understandings between networks and stations than the Commission now has.

Senator Potter. You say the Commission has the authority to do it now?

Mr. Cottone. I say the Commission has the authority to do many things.

Senator Johnson. I want to find out whether you think that there are sufficient standards for the Commission to act now in the regulation of networks or that Congress should lay down some specific standards?

Mr. Cottone. I would say that for the reason that if the Commission were to proceed on the basis of its present authority it would be tied up in court for years and it would be desirable for Congress to reiterate the authority of the Commission in that field so that there can be no question about it. We are going to have whatever kind of regulation is adopted by the Commission and we are going to have bitter fights about that.

Senator Johnson. If Congress passes the law placing the regulation of networks under the Commission, there will not be necessity for reiterating anything, but if Congress does place them under the jurisdiction of the Commission, should then Congress follow up with the specific standards of that regulation, or should it be left to the general law as now exists, the general congressional law?

Mr. Cottone. I would say that, if you could reasonably expect that the Commission will regard its own utterances with regard to competition with respect to the desirability of the avoiding of practices that may be restrictive and monopolistic in principle, and the Commission has said that the policies of the antitrust law are embodied into the act, if they could be reasonably expected to do that, I think it would be unnecessary to write any standards in the form of legislation.

However, I think there will be a great deal of difficulty in doing that. If Congress could prescribe the standards, it would be of great
help to the Commission to reexamine the basic authority of the Com-
mission and the standards could be written by law on the philosophy
and theory of our antitrust laws.

Senator Hunt. Is there any network that does not own broad-
casting stations?

Mr. Cottone. Dumont does not own any radio broadcasting
stations. They own television stations.

Senator Hunt. The art of programing seems to me is today under
the jurisdiction of the Commission. Now the regulating of the sta-
tion is, but it seems to me network programing is a separate and dis-
tinct part of the bill altogether. Do you feel we need additional
legislation on that?

Mr. Cottone. I think what you are thinking of is that the Com-
mision may not have any authority over the content, but the Com-
mision has the authority over the relationships that lead to arrange-
ments for the obtaining of programs. That has nothing to do with
the content of the program.

Senator Hunt. No authority over the placing of network programs.

Mr. Cottone. Except indirectly. I think that the Commission does
have authority to prescribe, and I am sticking my neck way out.

Senator Hunt. Do you know of a case where the Commission has
said such and such a station will carry such and such a network
program?

Mr. Cottone. No.

Senator Hunt. That is what I meant.

Mr. Cottone. But I see no reason why under the same token the
Commission might not regulate the networks with respect to how
many options the stations can arrange for with networks and various
other provisions that have to do with the furnishing of programs by
the networks. The Commission could not provide a standard as to
how much network programing can be obtained from any specific
network by a station.

Senator Hunt. Do you thing that up to this time the allocation of
network programing has been fair and equitable?

Mr. Cottone. I do not. I most certainly do not.

Senator Hunt. That is what I am getting at, and if it hasn’t been
and the Commission has the authority to see that they are, then
the Commission has not been diligent or they do not have the authority.

Mr. Cottone. I do not hold to the view that the Commission has
as little authority as some people claim for it. We have gone through
this question of the authority of the Commission. It came up before.
There was bitter opposition, and there were all of the legal talents
of the broadcasting industry all arrayed against the side of the Com-
mision on the question of jurisdiction under the network regulation.
You gentlemen know the history of that. The Commission adopted
the network regulation but those networks went to the Supreme
Court and the Commission’s authority was sustained.

The Commission has exercised rule-making authority in many fields.
It is true that in the network field they did mention that Congress had
certain views on the subject and had said something about authority
to write rules about network regulation, but the Commission has
exercised this rule-making authority in the general public interest.

I would like to cite the lottery case. There were two grounds upon
which the Commission’s authority was attacked, that the Commission
had no authority whatsoever to adopt rules, that the Commission was getting into the business of regulating programing and censorship and the various other arguments that had been held since way back in the days of the network rules and regulations.

The Court held that some of the Commission's lottery provisions had not properly interpreted the penal statute. The authority of the Commission to make rules in that area was sustained by the district court in New York and by the Supreme Court. So that the Commission's rule-making authority then is not as limited as some would have this committee believe.

Senator HUNT. Would you agree with me that the networks' hold over these UHF stations is that of life or death?

Mr. COTTONE. I certainly do believe that, Senator Hunt.

Senator HUNT. It is tremendously important that we look at that phase of the problem.

Mr. COTTONE. It most certainly is.

Senator POTTER. Even if the Commission has the authority to regulate the network, I assume you are aware of the problem of possible court action which could delay it for many years.

Mr. COTTONE. Precisely so.

Senator POTTER. It would seem to me, and this again would be a matter of high policy, that it would be necessary for the Congress at least to act in this field if action is needed.

Mr. COTTONE. I would most certainly think that the way to be assured of action is for the Commission to relieve——

Senator POTTER. If the Commission has authority now, I would assume that that authority relates more to the field of the antitrust laws, whether it is a restraint of trade rather than to the rules and regulations as far as the broadcasting is concerned or their affiliations, how they shall make the affiliations. I don't know.

Mr. COTTONE. I think it is a little broader than stating that they may stick to the letter of the antitrust laws.

In the Supreme Court decision in the network case the Supreme Court said that the Commission does not have to find that there is a violation of the antitrust laws, but it is enough for them to determine that it is in violation of a broad public interest policy which stems from the antitrust laws. It is much broader than a restriction to the letter of the existing laws.

I think that the Commission's authority is geared directly to the factors that Congress said must be considered in deciding where the public interest must be served.

Senator POTTER. But if you were a Member of the Congress you would want an expression from Congress.

Mr. COTTONE. I most certainly would welcome it. There are some other matters which I would like to take up. There was some discussion about the attainment of the ultimate goal which should be done by the process of attempting intermixture elimination. I think that will be a complication of the task of the ultimate goal of going to UHF. There is no way you can eliminate intermixture.

The Commission, because of the powers and height—and I say this in no critical sense—but it has become most difficult to keep the service areas of VHF entirely separate and distinct from the service area of UHF, and any consideration of any proposal, even the Du Mont proposal, will illustrate that, that it is a tremendously difficult job.
The concept that should be followed is one that looks to the single market concept. In other words, obtain a kind of television broadcasting system that looks to service to his own market or the trade area or the community of interest for which that television channel was assigned.

The present system of permitting the great spread by tremendous heights and powers of service areas makes that very difficult in areas where you have a smaller station, in a smaller community, where you have a small station, and it is very difficult for that smaller station to be outside the shadow of the larger station in the larger market which can be built to tremendous heights and powers because the market can more readily support that kind of an operation.

Let me say also on the question of the difficulty of arriving at a plan that will provide enough channels for a nationwide competitive system of UHF. One thing is overlooked, and in some of the questions that were asked this morning attention was not addressed to this problem. I think one of the reasons asserted for the inability of the UHF band stems from the 7 channels in New York and the 7 channels in Los Angeles. If because the 7 stations in New York and the 7 stations in Los Angeles it becomes impossible to get enough spread of UHF throughout the rest of the country, New York and Los Angeles are just going to have to sacrifice a little bit, and there should be methods and means of adjusting that without doing any injury or serious harm to anybody. Some of these stations in New York have not been able to operate over all these years in the period of lush profits at a profit, as Senator Pastore mentioned. There should be some way whereby that operator could set up in business somewhere else which offers more promise of success for his operation, but should not be permitted to deter at least a consideration of the possibility.

With the plans we have in this industry it cannot be accepted as dogma and I want to add that I am not a technical man, that it is impossible to attain a nationwide system on UHF. I say you cannot accept the premise necessarily of the heights and powers today which of course makes it more difficult to place these stations where they want to place them.

I would like to state also that the people who have been working on this matter and who are here before you are people who have a great deal at stake. I think, in the words of Jack Garrison, who testified this morning, there is a serious, serious danger if something isn't done very quickly that we will not have any UHF, and if you accept the premise on which this was started you will not have a nationwide television system. It is an irrefutable fact that cannot be ignored.

Thank you very much.

Senator Potter. Thank you. Are there any other questions of Mr. Cottone?

We will hear from Mr. Burton and Mr. Craig at this time.

STATEMENT OF DONALD A. BURTON, PRESIDENT AND TREASURER OF UHF STATION WLBC-TV, MUNCIE, IND.

Mr. Burton. My name is Donald A. Burton, and my residence address is 420 Alden Road, Muncie, Ind. I am president and treasurer of the permittee of UHF station WLBC-TV, Muncie, Ind., and am general manager of this station.
Early WLBC-TV history. We at WLBC-TV have affirmed our faith in UHF. We believe that a UHF station can succeed even in a VHF-dominated market. This we believed when applying for a construction permit. This we believe today, after more than a year in operating WLBC-TV on channel 49 at Muncie, Ind. When WLBC-TV began commercial telecasting on May 8, 1953, Muncie, Ind., had a television saturation of more than 67 percent of all homes, according to a national survey made in June 1953. This survey disclosed that television reception from a total of 10 different channels was available to more than 1 percent of the TV homes in Muncie, with channel 6 in Indianapolis available to about 98 percent of these television homes, and stations in Dayton, Cincinnati, and Louisville available to 5 percent to 20 percent of these TV homes. This survey made about 6 weeks, which was June 15, 1953, after WLBC-TV began telecasting also disclosed that approximately 26 percent of the television homes had converted to channel 49 at that time.

UHF conversions: The problem which we faced was that of all UHF stations starting in a market previously dominated by a VHF station. In spite of the high VHF saturation, it was obvious to anyone who knew the difference between a good and a poor picture that the VHF pictures received in Muncie were not actually of good quality, although the majority of viewers stated that they received excellent VHF pictures. Thus, our first step in facing the VHF problem was to be certain that the picture received from WLBC-TV was the best obtainable and continued to be far superior in quality to that of the VHF stations.

We believed our problem to be twofold—technical and programming. We felt that UHF conversions could be obtained if our potential audience was given the best in video fare both technically and programmatically. We believe that we solved these problems to a great extent. I shall outline for you the first step—the technical. Mr. William F. Craig, who is vice president and commercial manager of WLBC-TV, and as such has had general supervision of the station's programming, will then cover programs, sales, and the final results of our first year of operations.

WLBC-TV technical operation: The technical aspects of the operation of WLBC-TV consisted of the following:

Obtaining the best possible pictures and full power from our RCA transmitting equipment. We relied on personnel from the RCA Service Co. to make the initial adjustments to this equipment. Our chief engineer, Mr. Maury Crain, and his staff have kept the equipment in optimum operating condition since this initial adjustment with occasional assistance from the engineers from the RCA Service Co.

A second aspect of our efforts to stimulate conversion to UHF was largely educational in nature. In this effort, we stressed the better pictures that could be expected from WLBC-TV, our expected coverage, operating hours, program schedule, and types of converters and receiving antennas necessary for good reception. In this respect we believe the following items were most important in implementing this phase of our efforts:

1. Many talks by me on the foregoing items before civic clubs and TV servicemen's organizations. These talks were given in Muncie and in the towns and cities within a radius of 35 miles of Muncie.
2. Promotional and educational spots, programs, and news stories on our radio station WLBC and advertisements and news stories in many papers in the area.

3. Mr. Crain, Mr. Craig, and I made an effort to attend all of the manufacturers', dealers', and servicemen's clinics and meetings in the area.

4. After WLBC-TV started operating, we worked very closely in the field with these manufacturers, dealers, and servicemen striving to help them get perfect pictures at every location. This we considered to be important, as we learned very early that poor reception at one home in a given neighborhood was a deterrent to further UHF installations in that area. I was on more than 100 field trips with installation crews, dealers, and manufacturers' representatives, actually going to the rooftops of houses to work out these problems. From these personal inspections many things were learned about UHF reception problems.

5. As a result of this field experience I wrote a booklet titled "Best TV Reception From UHF the Easy Way." We distributed nearly 8,000 of these booklets to set owners, dealers, and servicemen in our area and I am submitting copies to be placed in the record in this proceeding.

 Senator Potter. Without objection the pamphlet will be placed in the official files of the committee.

 Mr. Burton. In addition to these efforts in engineering and education, we believe that the following promotional and technical endeavors are worthy of mention here.

 Promotional efforts: In the promotional field, I want to discuss first what we called Operation 49. This was a contest among the sales people of 10 of Muncie's most prominent TV set dealers, for cash prizes given by WLBC-TV to those individuals who sold the most UHF conversions and new sets with UHF installations as a result of door-to-door sales efforts by these sales people.

 This contest ran from August 10, 1953, to September 9, 1953. This is a period when set sales are at a low ebb and during this contest many new sets were sold and numerous conversions were made. This promotional effort also gave impetus to the fall and winter set sales.

 Another factor which speeded up conversions was the appearance on the market, in our area, in the early fall of 1953, of a good, all-channel converter which retails for $14.95. The distributors have reported to us that they sold several hundred of these items every week for many, many weeks.

 Technical efforts: In an effect to improve our signal locally, we obtained and installed in September 1953 a new type of RCA transmitting antenna. This antenna uses what engineers call offset feed and utilizes a small amount of electrical beam tilt. We made measurements using the old antenna at a number of locations in Muncie and enlisted the aid of servicemen in other surrounding towns and cities to make measurements also. These readings were compared with those taken after the new antenna was installed and operating. We were delighted to learn that most of our local dead spots were eliminated and signal strength increases ranging from a slight to a considerable amount were observed by our friends in WLBC-TV's and grade A and B contours.
Anderson, Ind., which is approximately 20 miles west of Muncie, Ind., and has a population of 46,820 according to the 1950 United States census, is a very important part of the area we expected to serve with our WLBC-TV programs. In order to help the servicemen in this area to obtain good snow-free pictures from WLBC-TV, we cooperated with one of the servicemen's engineering concerns, Howard W. Sams & Co., Inc., publishers of PF Index, in making a series of tests in late September of 1953, in Anderson, Ind. This company used, first a portable tower which could be raised and lowered to various heights from 22 to 42 feet, second, a variety of types of receiving antennas, third, signal strength meter, fourth, TV set, and fifth, a portable power supply. In cooperation with the servicemen from Anderson, Ind., this company made measurements with different types of receiving antennas in eight locations within 2 miles of the center of the city of Anderson.

A part of Anderson is very hilly, and as might be expected a weaker signal was observed at low antenna heights in the depressions or hollows in these hilly areas. However, in 7 of the 8 measured locations more than an adequate signal was received with use of proper antenna and an antenna height of 42 feet or less. In the eighth location which was in a very deep depression only about a 25 percent signal was received at an antenna height of 42 feet, but no greater height was tried at this location and only relatively simple antennas were used. Use of greater height and higher gain antennas would no doubt would give considerable improvement.

Our conclusion from these tests is that a 1-kilowatt transmitter with an antenna height of 542 feet above ground, which is the height of the WLBC-TV tower, can give satisfactory service on our channel to a considerable area.

Conclusion: In concluding this part of our testimony, I would like to stress that we believe that the personal attention on our part from the management level to the problems of obtaining perfect UHF reception was very important in obtaining and keeping the good will of our viewers and that of the dealers and servicemen of our area. We sincerely believe that because we spent long hours working for and with these people we first stimulated the servicemen and dealers to greater efforts in their attempts to obtain perfect pictures from WLBC-TV and that in turn encouraged the viewers to insist that these dealers and servicemen make good and proper installations in their homes. I appreciate the opportunity to tell you about the WLBC-TV success story from the technical standpoint, and Mr. Craig will now discuss the other aspects.

Senator Potter. Do I understand your station is making money?
Mr. Burton. Yes, sir.
Senator Potter. And you have a VHF station in Muncie, Ind.?
Mr. Burton. No, within 50 miles.
Senator Hunt. Do you have a VHF station in Muncie?
Mr. Burton. Not in Muncie. In Indianapolis, which is slightly less than 50 miles from Muncie.
Senator Hunt. What is the distance from Indianapolis?
Mr. Burton. Approximately 50 miles.
Senator Hunt. What is the distance to Dayton, Ohio?
Mr. Burton. About 67.
Senator Hunt. And the distance to Cincinnati?
Mr. Burton. About 90.
Senator Hunt. And Louisville, Ky.?
Mr. Burton. About 90 miles.
Senator Hunt. Isn't your location very, very exceptional, not having any immediate competition from VHF right in your home community and these other stations being at a big distance from you?
Mr. Burton. We had a 67 penetration of VHF receivers in our market. Sixty-seven percent of the people had sets and they thought they were getting good pictures.
Senator Hunt. It was not a hometown station.
Mr. Burton. No, sir.
Senator Hunt. And you carry all four networks?
Mr. Burton. Yes, sir.
Senator Hunt. Mr. Burton, is your company a closely held stock organization, or do you have any stock available for sale?
Mr. Burton. No stock for sale.
Senator Hunt. Thank you, Mr. Chairman.
Senator Potter. We will now hear from Mr. Craig.

TESTIMONY OF WILLIAM F. CRAIG, VICE PRESIDENT, UHF STATION WLBC-TV, MUNCIE, IND.

Mr. Craig. My name is William F. Craig, and my address is 1505 Granville Avenue, Muncie, Ind. I am the vice president of the permittee of UHF station WLBC-TV, Muncie, Ind., and the commercial manager of this station.

Mr. Donald Burton has outlined the manner in which we tackled our first problem in conversion—the technical side. I shall try to outline some of the things which we believe contributed to our obtaining a high percentage of UHF conversion and the largest share of the viewing audience in Muncie, Ind., according to a national survey.

Senator Potter. What is the percentage of conversion today?
Mr. Craig. Eighty percent today. I want to state, with your permission, that it has been put in evidence here that there are a great many UHF stations who are having difficulty because they are blanketed from the outside and simply because we do not have a competitor within our own doorstep does not mean anything as far as our audience or our problems are concerned, and it is for that reason that we do not feel that we should be included with the UHF industry as a whole, that all UHF shall be in the same category, any more than anybody who is named Bill Craig should be damned for my sins.

On this network affiliation, some of the people laughed when Mr. Burton said we had four networks. Let me tell you we did not get those very easily. We did not walk in to the networks and say we had a grant and it was 50 miles to the nearest station. We had to prepare a great deal of factual matter concerning our population and all that sort of thing. We had to be able to prove to these networks that we did have a population of sufficient size that the national advertiser might be interested in adding our facilities in Muncie. Muncie itself is just 60,000. However, the density of the population surrounding Muncie made it, in our opinion, a very good market.

Senator Hunt. Would you tell us your local market, in population?
Mr. Craig. Sixty thousand.
Senator Hunt. What is the population of Muncie?
Mr. Craig. Sixty thousand is the population of Muncie.
Senator Hunt. Do you have outlying communities, small towns nearby?
Mr. Craig. Yes, sir.
Senator Hunt. What is the total?
Mr. Craig. The total potential population would be 500,000 if they were all converted, and that would be within 35 to 40 miles.
Senator Potter. How many sets receive your station?
Mr. Craig. Seventy thousand.
WLBC-TV network affiliations. First, a word about network affiliation. We were able to obtain affiliation agreements with all four television networks. To this end, we prepared a great amount of factual data concerning population, incomes, retail sales, and so forth. It was our premise that a television market must be considered not from the size of the city from which its programs originate but upon the population, retail sales, and so forth, of its potential coverage area. We were able to show the 4 television networks that the population of Muncie itself was a little more than 60,000 and with the density of population of its surrounding area nearly a half million people lived within the potential coverage area of WLBC-TV. We compared this coverage with other Indiana markets and were able to prove that the potential coverage of WLBC-TV was greater population-wise than the potential coverage of other proposed Indiana TV stations, although Muncie itself was smaller than the home cities of these other TV stations. I make this point because I believe many of the stations that have claimed to have difficulty in obtaining a network affiliation perhaps may not have properly presented their case to the networks.

Networks programs carried by WLBC-TV: We believe that network programs were essential to our successful operation, but we realized that affiliation agreements were not enough to assure network commercial programs for WLBC-TV. I do not think that you can legislate by law today to make these networks add these stations. You may be able to do that, but I do not know of any way that you can make the advertiser add that market. You cannot propose in the same way that the advertiser spend 95 percent of his dollar in television.

We believed that it would be necessary for us to go directly to the sponsors and their agencies, and to solicit the cooperation of the distributors in order to obtain our fair share of network commercial programs.

Senator Potter. Hasn't there been a reluctance on the part of many of the advertising companies to go to UHF?
Mr. Craig. I have heard that statement made and I will cover that in just a moment.

Our efforts in this direction have paid off and WLBC-TV now enjoys a lineup of many of the top shows of all networks; for example, Milton Berle, Bob Hope, Howdy-Doody, Robert Montgomery, Hit Parade, This Is Your Life, The Goldbergs, Dollar a Second, Danny Thomas, Ray Bolger, Meet Millie, You Are There, That's My Boy, Herb Shriner, Dennis Day, Fred Allen, Joan Davis, Ford Theater, Break the Bank, the Baseball Game of the Week, Television Playhouse, the Loretta Young Show, Paul Winchell, Dave Garroway, Life of Riley, the Gillette Fights, to mention a few, are examples of programs from each of the networks carried by our television station.
WLBC-TV was not interconnected during our first 8 months of operation: we carried, however, most of these shows via kinescope. I would like to state that we found no evidence whatever that the Madison Avenue agencies or the advertisers they represent are prejudiced toward our station because it is UHF. They expect circulation, audience, and product sale at a fair cost. This we have tried to provide—this is what we have endeavored to sell, and we feel that we have succeeded. May I emphasize again, we have found no prejudice toward UHF on the part of the national advertiser or their agencies.

May I also state in reference to the fact that we have all four networks, there are some stations who have closed the doors who were so privileged too.

Syndicated programs carried by WLBC-TV: While WLBC-TV carries many of the top syndicated film programs, no single package was purchased. It was believed that a wider choice of programs could be obtained by selecting from several producers and then sell the individual film to a sponsor, who in turn signs the film contract with the producer, not the station. Examples of the syndicated films carried by the station are Badge 714, I Led Three Lives, and Liberace, which are the three top syndicated programs in the Nation according to a Videodex report appearing in the May 17, 1954, issue of Broadcasting magazine. Other illustrative top syndicated shows carried are Duffy's Tavern, Play of the Week, Cisco Kid, Boston Blackie, etc. Some of these programs are carried by the VHF stations coming in the market, and arrangements were made with each producer to carry their show before it was presented by the VHF station under the theory that WLBC-TV did not cover the home city of the VHF station while there was some viewing in Muncie of the outside VHF stations. Thus, locally WLBC-TV was considered as a station which "beat the others to the punch."

Local programs presented by WLBC-TV: It was the belief of the program department that top network and syndicated shows are not enough, and that any station must establish a local flavor by presenting local live programs. It was discovered that eastern Indiana was blessed with sufficient good talent to present such popular programs as Teen Canteen, in which the best teen-age talent is presented, and the Forty-niners, an hour long barn dance held each Saturday night complete with square dancers and varied talent. We realize the importance of the children in our viewing audience and devote the early part of our evening program schedule to them. Such programs as our Corral Club which brings eastern Indiana kiddies in front of our camera, in our opinion, has been an important factor in our obtaining conversions. Each evening during our Western Theater, we have asked the children to send us photographs of themselves which we in turn televise as a part of Western Theater. Parties held for these children at such places as Kiddie Land and the local drive-in theaters have helped create a great amount of goodwill for WLBC-TV. As one of the features of our Corral Club program, we conducted a Conversion Contest among the 6,000 members of the Corral Club. We offered such prizes as bicycles, and so forth, to the boy or girl who obtained the greatest amount of conversions to channel 49. We feel that the very fact that hundreds of boys and girls went house to house knocking on neighbors' doors and asked that they convert to
channel 49 was a wonderful publicity opportunity for WLBC-TV. WLBC-TV has demonstrated the importance of local news in TV and presented two nightly newscasts which include photos and news of national and State importance; but more important in getting and keeping a news audience—news and pictures of eastern Indiana events and people are being presented, and I know that there are some stations that do not use news on camera particularly.

Muncie is in the hotbed of all basketball enthusiasts, basketball being the most popular sporting event in Indiana. While our field-house holds 7,800 people, all season tickets were sold with thousands of local people unable to obtain seats for these games. Consequently, WLBC-TV filmed the Friday night home games of the Muncie Bearcats, condensed the games to a half hour, and played them via this film the following Wednesday night. We placed them opposite one of the most popular network programs carried by the Indianapolis VHF station and naturally, because of the extreme local interest in these games, obtained a large share of the audience.

These are only a few of the many gimmicks that we use and had to use in order to obtain conversion. Our path has not been a bed of roses in any manner of speaking.

Conversion success for WLBC-TV: How well our policies have paid off is evidenced by the fact that more than 70,000 homes had converted to channel 49 by May 1, 1954. This 70,000 figure is based on surveys by two national organizations.

1. The April 1954 survey made by one of these organizations for Delaware County, in which Muncie is located and is the county seat, discloses that more than 75 percent of all homes in that county have television and, that of these television homes, 80 percent have converted to channel 49, Muncie. In Delaware County WLBC-TV now has a 60 percent saturation of all homes—a larger saturation of all homes than many VHF stations.

2. A survey made April 1 to 15, 1954, by the other national organization disclosed that the following counties currently receive the UHF signal from Muncie. They are Delaware, Madison, Grant, Randolph, Wayne, Henry, Jay, Blackford, with partial coverage in these additional seven counties—Hancock, Wells, Rush, Tipton, Fayette, Hamilton—in Indiana and Darke County in Ohio.

Senator Potter. How far out does your signal go?

Mr. Craig. That depends a great deal on the individual location. We have a very good signal out about 28 to 30 miles. We have had reports from farther than that, but frankly I do not believe that the signal is what one would like to listen to or view.

In these 15 counties 53.7 percent of all television homes are receiving channel 49, Muncie. In other words, while the conversions in Delaware, our home county, total 80 percent, the average conversion in our full coverage territory is 53.7 percent. With more than 130,000 television homes in the counties just mentioned, and 53.7 percent of them equipped to receive channel 49, Muncie, WLBC-TV now has a set count of more than 70,000 homes, with 19,000 of these in our own county.

A survey made in March of 1954 disclosed that WLBC-TV enjoys a viewing audience of more than 65 percent of the sets in use, day and night. The Berle show, for example, had a 68.9 percent share of audience and a 33.2 rating; Howdy-Doody had a 70.2 percent share.
and a 20.7 rating. The WLBC-TV Barn Dance had a 63.2 percent share and a 21.5 rating. News and weather had a 68.2 percent share and a 21.5 rating. I should like to point out in passing that four of the VHF area stations from which a signal can be received in Muncie were operating on maximum power when these surveys were made. In no way, however, in my opinion, does their picture quality compare with that of our UHF picture. And, as stated by the editor of TV News, published in Indianapolis, Ind., which published 10 different TV station programings, in the May 7 issue concerning station WLBC-TV:

As of today—Muncie's UHF channel 49 stands as a small giant among many television giants. Within a video-wave's throw of 49 are located some of the Nation's most powerful and best channels. If this proves disturbing to channel 49, they show it only by continuous program improvement and extended hours.

Hour for hour, minute for minute, there just is no better program service offered viewers than that offered by "the little giant."

This combination of the best picture and good programs has been the reason for our high conversion and largest share of audience.

Senator Potter. Do you find any reluctance on the part of the customers to switch the dial over to 49?

Mr. Craig. Which customers do you mean?

Senator Potter. The set owners.

Mr. Craig. Oh, yes. In the early days we did. They thought they were getting good pictures from the outside. Their programs were established. We had to compete with established habits. We had to convince them first by giving them the best picture and the local interest and then gradually giving them network shows. It was a sales job to the viewer and the advertiser.

Senator Potter. I have heard it was more or less a psychological block to switch over.

Mr. Craig. At the present time networkwise we are operating from 1 in the afternoon to midnight, 7 days in the week, and of that we are only carrying approximately 23 hours of network commercial.

Senator Hunt. I am speaking of local advertising now. What is local advertising now? What is local advertising carried on the VHF stations that were getting into your community?

Mr. Craig. Not very consistently. However, we did have some local people who were spending money on the Indianapolis VHF station.

Senator Hunt. I presume you have practically all of that advertising now, no doubt. Are there still outside stations carrying any Muncie advertising?

Mr. Craig. There is little on the Indianapolis VHF station.

Operational requirements for success: Of prime importance in a successful operation is technical know-how and good programs, but these alone are not enough in our opinion to guarantee success. A new station must not be overstaffed as many have been. The reason why we are in the black is that we are operating a radio and TV station combined with approximately 35 people.

It is necessary to have a staff of well-trained, well-paid individuals, willing to work and grow with the station. It is always possible with the proper staff and good management to have the correct relation between income and expenses. Whether it be a VHF or a UHF station, unless it is properly programed, properly sold and properly
managed, a television station cannot succeed. With these essentials and given a market of sufficient size, any UHF station can become a dominant station. Final proof of the success of UHF in Muncie is the fact that station WLBC-TV is operating in the black.

On behalf of WLBC-TV we want to thank you for the opportunity to present this account of the success story of WLBC-TV, and hope that it will prove helpful to this subcommittee in its UHF considerations and also to UHF stations which have not yet found success.

We feel that there are a great many successful UHF stations in this country who have been able to get networks through sheer hard work, get network programing through their own sheer hard work and sales ability.

We believe that they are located in communities which are covered from the outside by VHF stations. We think it unfair that UHF generally be presented as it has been presented in this hearing generally.

Senator Potter. On the allocation plan is Muncie allotted a VHF station?

Mr. Craig. It is not.

Senator Potter. So your competition is from other VHF stations that may be in the area, or is that UHF?

Mr. Craig. That is right, sir. There are three VHF stations located in Indianapolis, 50 miles away. There are two coming in from Dayton.

Senator Potter. What about other UHF?

Mr. Craig. No, no other UHF. There are allocations, but no stations.

Senator Potter. There are allocations?

Mr. Craig. Yes. Anderson and Marion.

Senator Hunt. Do you feel you could operate successfully without network programs?

Mr. Craig. I believe that we could, and I will tell you the reason why. We have been in the radio business in Muncie since 1927 and during the early part until 1943. We operated as an independent station.

You talk about the difficulty of getting network affiliation agreements. We worked for 6 years before we could convince one of the major networks to add us radiowise, but through sheer determination we finally got a network, radiowise.

Senator Hunt. I am interested in that figure of the cost of a converter. You mentioned the figure of $14.95. We have had other testimony that it ranges to about $40 and installation brings is up to $75 and $80.

Mr. Craig. That is a technical question that I will try to answer. It is an all-channel converter. In addition to that it would be necessary to put up an antenna which, depending upon your location, and a lot of people have done it themselves in Muncie and have done it satisfactorily.

Senator Hunt. How do you account for the discrepancy between the price of $40 for a converter and your price there of $14.95?

Mr. Craig. I do not know, sir. I do not know what is available in other markets but I do know there is a $14.95 converter available in our market and as a matter of fact there is a new one being presented by the Tarzian outfit that retails for $8.95.
Senator Potter. Who makes the $14.95 converter?

Mr. Craig, Regency.

Senator Potter. Thank you for your statement. Are there any further questions?

Thank you very much, Mr. Craig?

We will now hear from Mr. Mortimer W. Loewi of station WITV, Fort Lauderdale, Fla.

STATEMENT OF MORTIMER W. LOEWI, PRESIDENT, STATION WITV
FORT LAUDERDALE, FLA.

Mr. Loewi. My name is Mortimer W. Loewi, and I am president of the Gerico Investment Corp., owners of Station WITV, channel 17, Fort Lauderdale, Fla.

My background in television dates back about 20 years at which time I was instrumental with Dr. Allen B. Du Mont in the organization of Allen B. Du Mont Laboratories, Inc., and for a number of years until the middle of 1951, was director of the Du Mont television network.

WITV channel UHF 17 has a pattern covering an area from Palm Beach to the Keys. There are presently authorized for this Florida area 10 television channels, of which 5 are UHF, 4 are VHF commercial and 1 educational, all of which are capable of covering the same territory from Palm Beach to the Keys, and a picture quality that I do not think is surpassed by any station in this country and I recommend that any inquiry will develop that fact.

Of these 10 stations, there are presently on the air, 1 VHF transmitter, channel 4, 2 UHF channels, 17 and 23 in Fort Lauderdale, and channel 21 in Palm Beach, and by October 1954 1 additional VHF transmitter will be on the air in Palm Beach.

WTVJ channel 4 in Miami has been on the air for approximately 4 years and was recently granted permission to move out of Dade County and is now operating in Broward County, some 15 miles from Miami, their original allocation, and are now to within 1,000 yards of our own tower. Our tower is 762 feet and their new tower is 1,000 feet. Also, their power has been increased with this move from 16 to 100 kilowatts. Their operation started about 4 days ago on their new location, and with your permission I will show you the advertisement as an exhibit in which they warn you that it costs no extra money to receive their station and that they cover the 4 networks, the choice programs from 4 networks.

Incidentally, our tower is 762 feet and their new tower to which they recently moved is 1,000 feet.

WTVJ channel 4 has primary affiliations with 4 networks, and our channel 17 WITV has secondary affiliations with 2 networks, Du Mont and ABC, but unfortunately for us, the channel 4 affiliation being a prime affiliation, gives them a prior call on any programs of the 4 networks and they have and they can take from us any programs that they desire. They are presently advertising to the public that they carry the best shows from our networks and that it is unnecessary for the public to spend any additional to get their signal. This has discouraged the public from buying converters, and because we are never certain of how long we can keep a show due to their first call on same, we find this competition unbearable, particularly if other VHF stations are sanctioned to begin operations in this same territory.
A number of witnesses before this committee have directed their attention to the disadvantages of UHF stations located in markets where they are in competition with VHF stations. I have no doubts as to the ability of UHF operators to provide equipment and facilities which will give the public at least as satisfactory a television picture as any VHF competition. We are doing it. I would not be in the business if I didn't believe that this was true.

The difficulties lie in other directions. For example, under the arrangements presently in effect with the sanction of the Federal Communications Commission, the telephone company has exclusive control of the operations of intercity network connections. Under its tariffs and in formal agreements, it will provide or release the cables or relay necessary for a television station to interconnect with the network systems only on order of the network. It follows that unless a station can get a primary affiliation agreement with an established network which has an allocation of these cables, it cannot participate in programing of national importance or in the conventional entertainment programing sponsored and supported by the national advertisers.

This can preclude a UHF station without affiliation from receiving the benefits of participation in the nationwide system of broadcasting and compel it to provide exclusively local programing with limited possibilities of securing revenue from national spot advertisers.

It has already been explained that where connections of the cable system are required the primary affiliates of the networks have such services provided by the network as a portion of its cost of operation, whereas a secondary affiliate is obliged to provide such services and at times to pay large additional sums to the telephone company for them in order to obtain occasional programing which is released by the primary affiliate; and in our case we are paying $6,000 a month for this connection.

Senator Potter. If you have a primary affiliation with a network, they pay for all the——

Mr. Loewi. They pay for the loop, but they demand normally in the network business a certain number of free hours; and it seems unfair for a network to carry a line and pay the costs of it, which is very expensive, without some guaranty that they will get some return from that. Therefore, we are placed in the position of either not having a network or paying these costs.

So, you see, there is not equal programing opportunity for all stations, although they all encounter the same competition for audience attention.

I should explain that the relationships between networks and television stations are governed by affiliation agreements under certain very general rules of the Federal Communications Commission.

These agreements are supposed to be filed with the Commission and are maintained in confidential files where they are not accessible for general public scrutiny. They may include the results of long association of the network and a broadcaster in the radio field.

The primary agreement assure the broadcaster of preference in the receipt of programing, and since VHF stations, through earlier establishment and other relationships with networks, are preferred for such agreements, they are in like manner preferred in the clearance of valuable and desirable network programing.
I might say uniquely I have been an operator of a network, of the Du Mont network, for a great number of years and find myself now in the position of an affiliate trying to get network service. So, I feel I have had a little experience on both sides, although, unfortunately, I have not been able to find such utopia as I just learned from our last witness exists in Muncie, Ind.

A secondary agreement really means nothing except a general arrangement to handle the occasional crumbs from the table in programing when the primary affiliate is so congested with programing from one or more networks that it doesn't care to handle the program.

Under such arrangements, stations like my own can negotiate for and secure excellent and popular programing through prompt action only to find the program taken away when the audience is established and given to the primary affiliate.

This action may be upon the demand of the agency handling the advertising, upon the demand of the primary affiliate, or by action of the network itself.

All of these conditions require prompt and effective remedy.

I should explain that, with the foresight that was exercised in the location and construction of our UHF station, we can compete effectively for audience, given a fair break.

My basic concern in appearing before you arises from my realization that as a UHF station I cannot be fully successful unless the entire system of UHF operations is strong and an integral part of television broadcasting throughout this country.

The failure of UHF stations elsewhere affects me in discrediting my type of service in the minds of advertisers and producers of programing, in my relationship with the networks and, in fact, with the viewing public, who, incidentally, unless I can provide the entertainment and programing that the VHF provides will not go to the expense of putting in the converter, which I can tell you in our territory runs nearer the $85 average and not the figures that have been given here today, and in many cases are not too well put in, and we have, with our engineering staffs, made corrections in many of these antennas and tuners.

The constant decline on the market for UHF receivers is alarming, as the smaller production inevitably means higher production costs and sales prices and greater difficulty in my own market to secure for my viewers reasonably priced and satisfactory equipment.

The withdrawal of UHF broadcasters elsewhere means greater delay in the perfection of UHF transmitting equipment, harsher credit terms and higher prices.

Above all this, I cannot accept the universal conclusion of all persons in the industry that ultra-high-frequency must eventually embrace all television without recognizing that something must be done now in order to preserve those who are pioneering in the development of the upper spectrum.

Now, I left a great deal of testimony out, mainly because so much of this had been covered prior to my coming on the stand, and I dealt only on the individual station.

I would be very happy to return and try to present to this committee 4 to 5 years of the networking end, but it is my honest belief that unless the networks are controlled and there is some diversions the
two networks cannot live and UHF cannot live—and that is my conclusion.

Senator Potter. Thank you, Mr. Loewi.

Have you any questions?

Senator Hunt. No.

Senator Potter. Thank you for your statement.

Mr. Loewi. Thank you, sir.

Senator Potter. Mr. Tarzian.

You may proceed with your statement.

STATEMENT OF SARKES TARZIAN, OWNER AND OPERATOR OF STATION WTTV, BLOOMINGTON, IND.

Mr. Tarzian. Thank you.

My name is Sarkes Tarzian, and I am owner and operator of Station WTTV in Bloomington, Ind.

Senator Potter. Is that far from Muncie?

Mr. Tarzian. Actually, we get into Muncie, too, even though they didn't admit it. So, they have two VHF station signals in that area.

Our company has the unique experience of being one of the largest producers of TV tuners—a pioneer in this field—as well as a TV broadcaster covering a large territory—2½ million people with one-half million sets—operating from a small community of Bloomington, Indiana.

This is our fifth year of TV broadcasting. Therefore, we have gone through all the growing pains and all our experience has been gotten by trial and error.

We believe for TV stations to be successful they must give a service that a sufficient number of people want and are now not getting. This is true whether the TV station is VHF or UHF. If this basic requirement is not met, the TV station is doomed to failure.

Whether it is VHF or UHF, if a station has a service that a large number of people want, it still takes time to acquaint people as to what is available and to sell them on the idea of buying equipment to watch their programs.

In the early days of television this period lasted from 2 to 3 years. During this time the station generally lost money. Far-sighted management would provide for this contingency.

Of the pioneer 108 TV stations, only a small number operated profitably from the day of commencement.

After the freeze, I believe that many UHF broadcasters started operations with the expectations that immediately their stations would be profitable, and it was on that basis they went into business. Since they were speculating rather than trying to operate on a long-term basis, some of them were disappointed.

Due to this haste to get on the air and reap a fast profit many started operations with low power and low tower height, with attendant poor coverage.

The broadcast equipment and TV sets manufacturers have also been at fault. They made promises on performance of equipment which they could not meet.

At FCC hearings on UHF it was implied that high-power transmitters would be available, as well as satisfactory TV receivers. Yet,
engineers knew—and I was one of them—that these were at least three
or more years off.

Unfortunately, when any one manufacturer makes an unrealistic
statement, everyone else agrees to it so as not to be at a disadvantage
competitively. They feel that if one fellow can do it, they can do
it, too. As a result——

Senator Potter. The first liar doesn’t have a chance, does he?
Mr. TARZIAN. No; they are all on the same basis.

As a result, the broadcasters and the public suffer—and that is
what is happening with UHF today.

We have 50 kilowatt VHF amplifiers commercially available to
broadcasters. However, the highest UHF amplifier is 10 to 12
kilowatts.

VHF receivers have excellent fringe-area performance. UHF
receivers, until we recently came out with our Model UV-13 tuner,
have had about one-third the fringe-area performance of VHF sets.
That is what the UHF receivers had had—one-third the perform-
ance, the ability to get weak signals—one-third.

Senator Potter. When did you come up with that?
Mr. TARZIAN. I will get into that in a moment.

With strips this figure can be as low as a fifth—not one-third, but
a fifth.

With low-power UHF transmitters and relatively poorer perform-
ing UHF receivers, UHF stations have had a very serious disadvan-
tage up to now; and, also, a reasonably good UHF receiver has cost
from $30 to $50 more than a straight VHF set.

We feel as far as future VHF and UHF sets are concerned they
are now on an equal basis.

We have here developed a UHF-VHF tuner, which is very simple,
and compact.

Now, this is what the industry has had to use in the past.

There is a VHF-UHF tuner.

See how complicated this is, with all this gear drive, reduction
ratios, and so on and so forth.

That is one type—relatively simple type.

But look at what one manufacturer, well-known manufacturer, is
now using to get VHF-UHF coverage.

Now, look at the difference in the two.

We can save the manufacturer $10 on his chassis by going to this
tuner, and this tuner now is as good as the VHF tuner, whereas the
UHF that is in this thing to the public would cost $30 to $40 more
and is only one-third as good as this one or the VHF tuner.

Senator Potter. How much will this sell for?

Mr. TARZIAN. This will sell for $17.95 to the manufacturer. The
VHF portion of it will sell for $11.70. So, for $6.25 you get full
range UHF performance, the UHF performance that is as good as
VHF, which up to now we haven’t had.

Senator Potter. If we remove the excise tax, that would——

Mr. TARZIAN. That would make UHF-VHF sets cheaper than
straight VHF sets, if you remove the excise tax.

Now, the other thing is: If the manufacturer wants to, he can send
a set out in the field with just the VHF one and all you need is a
screwdriver to put on the UHF in the field. You don’t have to be
a technician or do a lot of soldering, and so forth, to make the two
work together.

I have photographs of this, if you would like to have them.

Senator Potter. Is this on the market now?

Mr. Tarzian. Yes. Several manufacturers have started to use
them.

We now have available a UHF tuner which only costs a manu-
facturer of TV receivers $6.25 for full-range coverage. This comes
to a cost of about 9 cents per channel—for 70 channels, 9 cents per
channel—whereas VHF tuners cost 90 cents per channel for 12
channels.

This new UHF tuner has comparable fringe-area performance to
VHF.

If receiver manufacturers can be persuaded not to mark up the
$6.25 for UHF tuners to the customer, by a factor of 3 to 1, which
they ordinarily do, then there can be a mass distribution of UHF
receivers. Everyone will pay $6.25 additional for their television set
to have full UHF coverage.

We are selling these UHF tuners, for $6.25, at our cost as our
contribution to the future of the TV industry; and if receiver manu-
facturers will do likewise, I am sure that at least one big bottleneck,
higher cost of UHF receivers, as well as comparable performance,
will be solved.

Our UV-13 there covers full range, both UHF and VHF or 82
channels. In many cases it means a saving of at least $10 to manu-
facturers over UV tuners they are now making, which have poorer
performance on UHF.

Senator Potter. Is that what is normally in a set?

Mr. Tarzian. That is right. That is what has actually come out
of a current production of one of the leading manufacturers in this
country. I don't want to give their name because they may feel
ashamed of it. I don't know.

Here are two tuners that we build and sell to our customers, up
until now, until we came out with this.

So, you can see the complexity, and also the fact that the UHF
performance is only a third of the VHF performance.

Senator Potter. Who buys this from you?

Mr. Tarzian. Westinghouse is buying it from us now. Farns-
worth—Capelhart-Farnsworth—is buying it from us now.
We are dickering with a lot of other people who want to get into
it, too, after they make field tests.

Up to now all the comments of manufacturers have been very, very
favorable, and we have facilities to produce it for them.

Senator Potter. Do you think you will ever be able to get that
cost down lower than even that?

Mr. Tarzian. We are selling it for six and a quarter, which is our
cost, and, as I will point out later, if we can eliminate the excise tax
on full range, not stripped—I hope the committee recommends
full-range, real, honest-to-goodness full-range UHF-VHF receivers—
then these UV receivers will actually be lower priced than a straight
VHF set, and everybody will want full range.

I mean that is one place where I think the UHF broadcasters have
been at fault. They haven't gone out and promoted UHF nationally,
in this sense: That if you buy a straight VHF set, even though cheaper
by $20, $30, or $40, you are buying an obsolete set.
They haven't done that. So, people don't know, unless you tell them, and, as a result, people are price conscious and they are going to buy what is cheaper.

Now, if the UHF broadcasters would gang together and, instead of fighting court suits, and so on, spend that money in promoting UHF to the American public, and what it means to them, I think we would all be better off.

Senator Potter. Are there many receivers now on the market with that type of tuner in them?

Mr. Tarzian. They are just coming out, Senator.

Senator Potter. They are just coming out.

Mr. Tarzian. This is a brand-new development, and this is the first time it is being shown in the public.

We have worked with our customers in developing it and testing it, and this is the first time we are showing it.

So, we are pioneering in this thing. I know other people are going to duplicate it. They are going to copy it, and to be competitive it will carry an equivalent price tag. So, everybody will have it, I am sure.

The UV-13 tuner is designed so that the UHF tuner, if desired, can be installed in the field by anyone who can handle a screwdriver—this design.

We have also developed a single-channel and dual-channel converter which stations can buy for $8.95. These units can be installed with outdoor UHF antenna and sold to the public for $18.95—that is installed—thereby permitting owners of straight VHF receivers to watch UHF broadcasts.

The only way you can do that, Senator, is not to depend on the servicemen to do this job for you. These stations have to set up their own installations' crews, and just like a newspaper will spend money to build up its circulation—they have to do the same thing; Sell this at cost, whatever it costs them, and they can do that job and increase their circulation and build their viewing audience by making it available to the viewers at a relatively low price, so that they can afford it.

Now, just to give you an example from our own personal history: When we went to channel 4 in Bloomington, Ind., we had a reasonably good signal in Indianapolis; but to be sure that you got an excellent picture under all conditions you needed an outside antenna. If we sat in Bloomington and waited for the Indianapolis serviceman to install those antennas, it would take 3, 4, 5 years; but what we did was to get the best, low-price, all-band, all-channel antenna that we could get hold of, and we set up our own crews, and they are out today, every day during the week, installing 300 to 400 VHF all-channel antennas in Indianapolis, and we are selling it for $12.95.

Now, the servicemen in Indianapolis got up in arms about that—"You're taking the bread out of our mouths."

And we told them, "Look, if we get more people to view channel 4 and, as a result, more people will have variety of programs, instead of just having one station to watch, they are going to buy more sets; they are going to watch television more, and you are going to get more business. We are not in the service business. You can keep that."

And now they are seeing the light. Now the service people are the ones who are installing it for us at twelve ninety-five; but in the beginning there was just the revolution. They even boycotted us.
I just want to give an example of some of the things that can be done, that the UHF broadcasters have to do, if they want to increase their circulation.

However, UHF broadcasters, I think as a rule to date, have been negligent in promoting ideas of this kind to increase their audience. They have to help themselves by aggressive promotions and services of this type, just like the station in Muncie did.

The only other item remaining to put UHF technically on a sound basis is a reasonably priced hundred-kilowatt amplifier. We don't have that yet, but that will come.

UHF is not as good as its promoters painted it, nor is it as bad as some people are trying to make it today. It has its place but, like all businesses, it must give a service that people want and be well managed by people who know the facts and are willing to work to achieve success.

Constructively, Congress can help UHF by eliminating excise tax on UHF converters and full-range UHF-VHF receivers—not strips. The lowered price will help equalize cost to the consumer between straight VHF sets and full-range, 82-channel receivers. However, this reduction in excise tax should be limited to full-range sets, not makeshift strip arrangements which have been a delusion, because every time a UHF station comes on the air you have got to go through the whole rigmarole of getting the guy to buy another strip, and that is just energy wasted. It is time wasted. It should be done properly and done in the beginning.

At WTTV we will be happy to train UHF station personnel on the methods of running a low-cost, economical operation.

Our company is also developing a low-cost, complete-package UHF station for smaller communities. We hope to have such a station in experimental operation by fall of 1954 in Bloomington, Ind.

We already have our license for such an experimental station.

Now, while I have been waiting here to testify—I was supposed to testify at 9:15 this morning—I have heard a lot of comments, a lot of answers, as to how this whole problem can be solved. One of them is: Push everybody into UHF, that that will create equality—something like the Russians: make everybody poor and we'll all be better off.

Now, to me, it seems this way: That if you allow some UHF stations—and that's the standard today—to have 2,000-foot towers, to have thousand-kilowatt amplifiers—and to do all that takes a lot of money—it is going to take $2 million to do such a thing.

How many of these gentlemen who are here can put $2 million into such an installation?

Those VHF stations who now have basic affiliation with the networks can do it, and those stations that are now owned by the networks will do it.

So, where is your equality?

You are still going to have the problem of UHF stations with 2,000-foot towers, thousand-kilowatt transmitters, covering a big area, blanketing everybody else.

So, that isn't the answer.

Now, the other thing is programing. These gentlemen say, "If we could just get programing, why, we would be all right."

But let's also face the facts, gentlemen. There is only so much programing available in this country, programing that people want
to watch, and an advertiser wants to make that programing available to the public in this country at the minimum possible cost to him.

Now, whoever does that job for them at the minimum possible cost is going to get the business. If the VHF's do it, they are going to get it. If the UHF's do it, they are going to get it. If everybody is UHF and they have high power and high tower, they are going to get it because they can do it more economically.

So, we come down again basically to things I don't think any legislative body can do. It's just a case of supply and demand, and those people who were willing to take the gamble in the early days of VHF and get in on the ground floor and lose money and have a facility there: that people want—now, I don't think it is a good idea now to make these VHF broadcasters go to additional expense to go to UHF again, a second time.

Now, someone said here there are three VHF stations in New York who are marginal operations, losing money. If you go to those people and tell them, "Now, you have got to go to UHF; we're sorry; we made a mistake," do you think they are going to go to UHF when they haven't been able to make a go of VHF?

Why should they go and spend more money and go to trouble with something else when they are already having trouble operating at the present time?

So, you are going to lose people. You are going to lose broadcasters.

All I can say is all the things that have been suggested here like trying to take away something from some people who were, let's say, foresighted enough or foolhardy enough or crazy enough to go into television in the early days and set up a service; and they would like to get in it, too, but there is just so much of it available. No matter what you do, there is just so much available; and whatever the supply and demand and the amount of money that is available to spend—those are the people who are going to get it.

Now, I do not believe that it is the function of government to guarantee a profit for every broadcasting enterprise. Profit should be earned by successful service to the people. The early TV broadcasters had no guaranties.

We in Bloomington, Ind., in 1946, applied for channel 10. In a little town of 15,000 people, we applied for channel 10. At that time there wasn't a commercially available channel 10 transmitter. We had to build it to get on the air.

There were five VHF allocations to Indianapolis, Ind. Not a single radio station wanted any of these.

Maybe we were crazy fools. We went to the Commission and said, "We want channel 10. Will you give it to us?"

And the Commission did, and it took us 2 years to get the station on the air; and we lost money for 3 years, but we have gradually developed the thing.

Now, I ask all of you: Is it fair to come around to a VHF broadcaster who has pioneered, who has done a job, who is giving the service, who spent money, and say, "Well, boys, it's too bad. Now, we've got to start all over again?"

Senator Potter. When did your station go on the air?

Mr. Tarzian. We went on the air in 1949. This is our fifth year.

Senator Hunt. I didn't understand whether you are VHF or UHF.

Mr. Tarzian. VHF.
Senator Potter. You lost money for 3 years?
Mr. Tarzian. Three years.
The early TV broadcasters had no guaranties. In fact, for several years, prospects were very dark and many, without the guts and vision, handed in their construction permits, just as some are doing with UHF today.
Senator Potter. Do you have any questions?
Senator Hunt. No.
Senator Potter. Thank you for your statement.
Mr. Lutz.

STATEMENT OF VINCENT J. LUTZ, PRESIDENT, ASSOCIATION OF TELEVISION SERVICE COS. OF GREATER ST. LOUIS, INC.; VICE PRESIDENT, NATIONAL ALLIANCE OF TELEVISION & ELECTRONIC SERVICE ASSOCIATIONS

Mr. Lutz. My name is Vincent J. Lutz of St. Louis, Mo.
After listening to some of the witnesses, I would like to qualify myself a little further as a witness, other than I stated.
I might state that my radio experience goes back to 1914, prior to World War I.
Since 1923, I have made a living in the radio and electronic and television business solely.
I am the president of the Association of Television Service Cos. of Greater St. Louis and the vice president of the National Alliance of Television & Electronic Service Associations.
Some of these ideas are my own and some of them are a consensus of both our local and national organizations.
Listening to some of the men who made previous statements, I began to wonder whether we are all working for each other or entirely for ourselves.
We have to remember, somebody mentioned, this may be one of the most important hearings that was ever held here, when we take into consideration that 7 years ago television was a nonexistent industry, practically so, and today it is the third largest. In 7 years it has gone from nowhere to be only surpassed by steel and automobiles.
The men from Muncie apparently have no problems, but it would be like saying that we in St. Louis do not have trouble with Dodger fans throwing bottles at the umpire because we have no Dodger fans in St. Louis.
We have had other men say they were against monopoly, but the previous witness, not only a broadcaster—he is a manufacturer, and now he suggests that the rest of the broadcasters go into the business of selling, delivering, installing, and servicing the equipment in order to make the stations a success. I don't know how much more of a monopoly we might suggest getting into.
Some of the things I know. I know that as president of our association I needled Senator Johnson when he was the chairman of your committee in getting stations for St. Louis. I know I wasn't the only one. We also needled the FCC the same way to get us more stations.
The proper place to start, in my opinion, would be to give to the committee the number of UHF sets, converters, and aerials in metropolitan St. Louis and their value, the value of inventory of retail
dealers and wholesale distributors, and the value of the three UHF transmitters in the St. Louis area.

In 1953 RETMA reports state that their members delivered in the metropolitan St. Louis area 102,000 new TV receivers equipped to receive UHF, valued at $35,700,000. That is a retail value.

Local distributors claim 120,000 installations of UHF aerials and/or converters, valued at $12 million.

Based on accurate estimates, but conservative estimates, $8 million has been added to the above 2 items since January 1, 1954.

Manufacturers not belonging to RETMA are estimated to have put in the hands of the public another $1 1/2 million in equipment up to May 1, 1954.

Retail dealers and wholesale distributors claim another $7 1/2 million in UHF sets and equipment to be in their present inventory.

The total investment in the 3 UHF transmitters in St. Louis is $2 1/2 million.

These items come to a grand total of $66,700,000, which is a considerable increase over the figure which I gave you, Senator Potter, in my letter of April 20.

The original figure was thought to be an accurate estimate, but closer checking with more dealers and distributors caused me to revise the figure upward to $66,700,000, which in my opinion is an honest figure.

Someone previously stated that they thought the serviceman had not pushed the installation of UHF converters because they didn't make any money on them.

Well, I don't believe that fact to be wholly true because in many instances I made estimates figuring 8 man-hours to make an installation and ended up doing the job and furnishing as high as 15 to 20 man-hours for the same price in order to get the set to function properly—that is the UHF installation—because we are not in business for today. I have been in business a long time, and I intend to stay there. So, satisfied customers are necessary, and we haven't made any money, but we have made the sets perform in many instances.

Senator Potter. Does it take considerably more time to install a UHF receiver than a VHF receiver?

Mr. Lutz. Much more time. It is a much more critical installation.

It is the consensus in St. Louis that if the UHF system fails the $66,700,000 would be a total loss.

As stated in my letter of April 20, 1954, the failure of the FM radio system, while causing many, many complaints, was not too serious. This was due to the fact that there were not near as many FM radio installations as there are now UHF television installations and that the average cost of each FM installation was but a fraction of a UHF television installation.

I am talking here from the point of the little man that uses it. Try to get an overall picture of 166 million people that are trying to get television entertainment and service.

Now, if the people in the St. Louis area were to no longer be able to receive UHF programs and the $66,700,000 in UHF equipment were made useless to them through the failure of the UHF system, the hue and cry would be so loud that it could be heard here in Washington.

I am sure that our two good Senators from Missouri and our Rep-
resentatives from the St. Louis area would not want my fellow St. Louisans to suffer such loss financially.

The loss of the programs which are brought into the St. Louis area as a public service and necessity are not to be overlooked.

In creating the UHF system the Federal Communications Commission caused the people of St. Louis to spend over $66 million so as to be able to receive these programs.

The FCC apparently put their stamp of approval on the UHF system and thereby caused the public to accept the fact that their Government was backing the UHF system.

By allocating UHF channels and granting licenses to three UHF stations in St. Louis, the FCC, in my opinion, has caused the expenditure of the aforementioned $66,700,000 in St. Louis and, therefore, have an obligation to see that this investment is protected.

This protection of other UHF stations is needed in all UHF areas. I thought that, but I see now there is one that doesn't need it.

Senator Potter. As I understand, you have two UHF stations there.

Mr. Lutz. Well, we actually have three. One is not operating. I will cover that further.

The amounts of money invested in other areas are not known to me, but I believe would vary proportionately with the relative population of each individual area.

The total loss would exceed, I believe, a billion dollars should a nationwide breakdown on UHF occur.

Many retail dealers and service dealers in St. Louis and throughout the country, depending entirely on television for their income, would be financially ruined should the entire UHF system fail.

With business in general declining, the failure of UHF cannot be tolerated, especially when the public was against the idea in the beginning and all television dealers in St. Louis put themselves out on the limb with their customers, selling an idea created by the FCC.

What new ideas on electronics or home entertainment could be sold to the public by us if UHF fails?

This applies to color television, which has not even reached St. Louis, and is heralded as a new era in home entertainment.

Just how long would color television have to be in existence before the public would be convinced it would not go the way of FM and UHF?

In my opinion, it would take years, if ever.

Now, let us consider the technical aspects.

I am not talking as a broadcaster because I am not on that end, but this is from my end, on the receiving end, and from the hundreds of thousands of customers that myself and our affiliated members in the association serve.

UHF television will give a sharper, cleaner picture than VHF; a picture seeming to have more depth than VHF; a picture not affected by ignition and man-made interference like VHF is affected.

More UHF stations can be allocated in the same area without interfering with each other.

People I know living in southeast Missouri cannot receive a decent television picture because the VHF station in St. Louis interferes with the VHF station in Memphis, Tenn., even though the two stations are approximately 300 miles apart. This would not be true if the
two stations were telecasting on UHF. In fact, many stations could be spotted in between St. Louis and Memphis without causing interference.

That is true in the general area. I don't mean in a beeline.

Senator Potter. Yes.

Mr. Lutz. If and when all the UHF stations the FCC allocated go on the air, almost everyone in the United States could expect good television reception. This would have been impossible with the original VHF allocation made by the FCC.

Let me finally present the programing situation.

Channel 14 is bankrupt because they were unable to schedule a single network program with any network. Yet, many good programs are presented by the networks that are not coming into St. Louis.

Why is this?

I would like to mention another fact here that was brought up by someone stating the thinking it was not proper for a newspaper to own a television station. Channel 5 CSA-TV is owned by the St. Louis Post-Dispatch, which is a good newspaper, and channel 5 is a very good station. It has some very good public service programs, but up until recently they carried in the Post-Dispatch the three UHF station listings and their own channel 5 VHF listing. The VHF listings were carried in very bold type. They owned the paper that printed it. They owned the station. The UHF stations were carried in very small type that you had to put your glasses on to see; and only when the UHF stations finally got together, after a long time—now the programs are printed in the same size type.

I am of the opinion that in some way this action may be construed to be in restraint of trade. At least, programs of public interest are being withheld from viewers in St. Louis.

An outstanding example of this is the Dennis Day show, an NBC show, scheduled every Monday at 8 p.m. St. Louis time. KSD-TV, channel 5 VHF, in St. Louis, is reputed to be one of the better NBC basic outlets, yet they do not carry the Dennis Day show. Repeated requests have been made to NBC to put this program into St. Louis for our people, but they say that KSD-TV cannot clear time for the show.

What does KSD-TV, a basic NBC outlet, carry every Monday at 8 p.m.? A CBS show entitled "Mama," and coming as a kinescoped or film show.

The Dennis Day show is a live show, and all live shows are superior in picture quality to film shows.

Now, someone mentioned they didn't know anything about advertising agencies not recommending UHF. I saw the copy of a letter before I left St. Louis from an advertising agency to a client recommending that their show not go into St. Louis until channel 4 was on the air. They had requested to go in on a UHF channel, and they told them to hold off until channel 4 would be on the air.

I am told that efforts have been made by the sponsors of the Dennis Day show and their dealers to get "Mama" transferred to one of the UHF channels and to get KSD-TV to carry the Dennis Day show. Failing to do this, I am told KSD-TV was asked to waive on the
Dennis Day show so it could be carried on a UHF channel in St. Louis. This request, I am informed, was also refused.

KSD-TV also carries another very popular show, the Red Skelton show, at midnight every Friday, on film, a week later than the actual show. I understand UHF stations in St. Louis have unsuccessfully tried to get this show live early in the evening when many more viewers would enjoy it.

Finally, may I urgently request that the UHF stations and the existing investment be protected in some way until UHF is established and can stand alone. The time required may be as long as 2 years.

Something was mentioned about the rate television sets were being manufactured. On projected figures, manufacturers of television figure that by 1956 a general replacement market—that is, a saturation point in television will have been reached and a general replacement market, continuing on from that time of about 6 million receivers a year will be manufactured.

I bring this point out in support of requiring manufacturers to build a full television set, the full tuner, UHF-VHF, and maybe even sometime dropping the combination, so that when a user—when you ask a user, "Are you looking at UHF or VHF?"—that is a hazard today to ask him that—he will say, "I am looking at channel 5," or, "I am looking at channel 54," and erase from his mind that there is a difference, that he can get a good picture on both spectrums.

Subscription television on UHF stations only would help, and so would placing color television on UHF only, for a limited period.

Allowing networks on television stations to own and operate more than five stations, if the stations are UHF stations, would provide an incentive for pushing UHF into a self-sufficient position.

Television manufacturers installing UHF tuners in every set they build would establish public confidence in UHF and create a desire on the part of advertisers using television as an advertising medium to place advertising contracts with UHF stations, thereby insuring the station's existence and the public's investment.

Radio Station KWK has recently been granted channel 4 and will be on the air within 3 months. It is rumored that they will be a CBS basic outlet. No one objects to channel 4 coming on the air, but if they come on the air with CBS network and nothing is done concretely to protect the UHF stations, the UHF stations will be seriously hurt, maybe to the point of going off the air entirely.

Since the granting of channel 4 in St. Louis there is something that has gone on in St. Louis that I have heard no one else bring up. It may be in other cities also, but this is a rumor going on that UHF in the St. Louis area is ready to fold up entirely. We cannot pinpoint or find out who is originating this, but people are willing to bet, take bets, that there will not be a single UHF station on the air in the St. Louis area after the baseball telecasting is stopped.

These rumors and offers to take bets have only appeared since the granting of channel 4.

Senator Potter. Baseball is being televised by one of the U stations; is that right?

Mr. Lutz. Yes. One of the UHF stations has that outlet, and they also have an option—the sponsor has an option—for next season, that is, the 1955 season, also. So, evidently the sponsor is well sold on UHF, if he has an option for next year.
The decision on UHF help must come quickly to avoid UHF failure in St. Louis as in Kansas City, Mo., where UHF was ruined trying to exist with two VHF network stations.

I might say some of these figures we heard about—fourteen ninety-five converters—some of the dealers who immediately run up to Kansas City from St. Louis were able to buy converters that we were paying $32 wholesale for—they were able to buy them for $5 apiece because those fellows were ready to give up, and they were selling out for what they could get for what they had.

Senator Potter. You were here when the previous witness testified and showed his all-channel tuner?

Mr. Lutz. Yes.

Senator Potter. Do you have any of those tuners in St. Louis?

Mr. Lutz. Well, those tuners, of course, are coming, evidently, in the late 1954 or early 1955 models.

I would say, in taking a manufacturer's formula for arriving at a list price, or retail price, and using it in reverse, I would say a manufacturer should be able to, at his level, produce a set for about $2.95 more with an all-channel tuner than he is doing it today.

Now, that is based on the fact that many manufacturers are advertising a VHF only set for just $20 less than a combination, complete, not a stripped tuner but a continuous tuner, cover all channels of VHF and UHF. So, there is $20 at the retail level, and my understanding is it probably cost him about $2.95.

Senator Potter. What has the experience been in St. Louis with new sets that are being sold? What percentage of them will receive just VHF and what percentage have an all-channel tuner?

Mr. Lutz. Well, up to now the figures that I have been able to gather from the distributors—most distributors have not delivered anything but combination UHF-VHF sets for the last year.

Senator Potter. In other words, people who are buying sets now are getting the all-channel tuner?

Mr. Lutz. That is right.

Now, there is one other figure that Mr. Garrison got that I think is a little pessimistic for the UHF operators, and I got a very recent figure. The figure of 600,000 sets in the St. Louis area given out by the VHF station is gathered from the local power and light company, who get their figures from all of the distributors of television sets in the St. Louis area; but some of those distributors distribute sets in Springfield, Mo., Hannibal, Quincy, Ill., Decatur, Ill., Springfield, Ill., and that is not a primary St. Louis area. So, deleting some of those, plus the fact they do not ever take anything off for a set that is junked or traded in, I would say the fair figure for the St. Louis area would be 500,000, not 600,000; and our figure of 220,000 UHF sets would not make it a 30 percent but almost 50 percent conversion factor in St. Louis.

I think possibly in a little newspaper item I have here we might say UHF has a moral victory, but you don't pay off on moral victories. The station in Spartanburg, S. C., asked to move their tower down within 6 miles of an existing UHF area. The UHF station objected, and it was taken to the Federal Communications Commission, and the tower has been moved, and they report the signal is many times stronger now in the UHF signal than it is in the city to where the VHF channel has been assigned.
Where I get the moral victory for that is Commissioner Hennock was the only one that dissented and said it wasn't fair to the existing stations to move somebody else in on top of them when they are getting along fairly well as they are.

Another article on Senator Johnson suggesting that the manufacturers put a combination VHF-UHF unit in the color television sets—I think it would be a better idea if it went in all sets, not just in the color television sets.

But I am not attempting to blame the FCC or the Senate. It is again something that everybody pushed. Everybody pushed for more television stations. It was done in a hurry, and anything that could start from its birth and reach No. 3 position in 7 years is going to have a terrific amount of growing pains, and in order for a lot of people not to be seriously hurt it is going to probably require some aid or intervention in some way.

Senator Potter. And you don't think it has stopped growing yet either, do you?

Mr. Lutz. No; it hasn't stopped growing yet. There are many other things, such as subscription television, and we haven't even had color television, and I heard recently at a national meeting of the national people that a certain manufacturer was now ready to demonstrate his three-dimensional television set.

Senator Potter. That is all we need.

Thank you kindly.

Mr. Israel.

Mr. Israel. Yes, sir.

Senator Potter. Mr. Israel, will you identify yourself for the record?

STATEMENT OF LARRY H. ISRAEL, VICE PRESIDENT AND GENERAL MANAGER, TELECASTING, INC., PITTSBURGH, PA.

Mr. Israel. My name is Larry H. Israel. I am vice president and general manager of Telecasting, Inc., permittee of television station WENS, channel 16, Pittsburgh, Pa.

WENS began operation August 29, 1953. It uses in excess of 200,000 watts of power and an antenna height above average terrain of over 850 feet. With the exception of Saturdays and Sundays, when our hours of operation are fewer, we are now operating 16 hours each day.

Our station was built at a cost of approximately $580,000, and since August 1953 additional investments bring the total fixed assets to approximately $850,000.

Our corporation is owned by 23 individuals and 1 corporation. All the individual stockholders are residents of the Pittsburgh area or have business and civic interests in that community. The single corporate stockholder, Tyrone Corp., is a Pennsylvania corporation with offices in Pittsburgh.

Pittsburgh is the largest intermixed UHF-VHF market in the nation.

WENS is owned and operated by Pittsburgh people. Its staff has a combined VHF-TV experience of 110 years and 4 months. These people did not become any less adept in their positions when they switched to the UHF band.
I make this point because it has been implied some of the UHF broadcasters are Johnny-come-latelies to TV.

The investors in the station are all active in Pittsburgh civic and business life. Most of them are lifelong residents of the city. They have not invested on a speculative basis.

It was conceived with great care and study. Equipmentwise the station is competitive with the existing VHF station in every possible manner.

Programwise we did not depend on network service as our mainstay of programing, although we would like to point out that ABC and CBS have been helpful and cooperative with us in Pittsburgh to the limit of their ability. For example, in 6 months WENS completed more hours of remote telecasting—major sports and special events—than had been accomplished previously in the market in 5 prior years.

We telecast special sports events from New York, three or more in a series, many times providing service to a regional network, many stations of which were VHF.

We did this at great cost in equipment expenditures and rights charges.

No new station, U or V, to our knowledge, ever worked harder to promote television.

We do not seek any special dispensations for UHF, but do seek the same ability to compete rather than the unnatural handicaps placed upon the new band.

If UHF does not succeed in a major market such as Pittsburgh, it will be academic if it succeeds in the sparsely populated areas, for if a network is to be competitive it must clear time in the top markets of the country and there are not enough television channels to go around in these markets unless UHF is used.

WENS has confidence in the ultimate success of UHF. However, we feel that UHF stations should have the same chance to succeed as did VHF stations.

Now, the rules have been changed to the extent that the FCC, perhaps unwittingly, has created an additional handicap for UHF in Pittsburgh by circumventing its original allocation plan by which most applicants were guided when they ventured into the new band. In other words, the rules have been changed to hasten VHF at the expense of UHF.

After making its original allocation—by "original allocation" I refer to the sixth report—for two V's and three U's for Pittsburgh, the FCC, by what I call a special gimmick, circumvented its own allocation. This gimmick, in reality a television gerrymander, was to add a VIHF channel in the city of Irwin, Pa., on the outskirts of Pittsburgh—population 4,200. To all practical intents and purposes, this will be a Pittsburgh channel. Therefore, we are proposing that in fairness the hearings on this channel—channel 4, Irwin, Pa.—which were set for May 21, today, be delayed for 1 year pending a reexamination of UHF in intermixed markets.

We have no quarrel with the FCC's original allocation for Pittsburgh. We were aware of what the competitive picture would be. Therefore, there is no dispute by WENS as regards channel 11 now in hearing. Channel 11 is now in hearing.
The FCC indicates that it is sympathetic with some of the obstacles placed before UHF. The Commission, however, says it has no authority to help. It does seem that if it had this authority to assign new VHF channels after its original allocation was made it would seem logical that the same power and authority could be used to put UHF on the same competitive level as VHF.

If this undue handicap is placed on UHF in Pittsburgh, it could very well create considerable economic hardship from UHF itself. Thus far, based on present UHF conversion and based on a minimum of $50 per converted set by the public, it would mean a financial loss of $15 million in Pittsburgh alone. Multiplied by similar markets, the total sum would run into the hundreds of millions. This demise of UHF could, by the same token, mean the demise of the third and fourth networks.

It is generally agreed, with but two networks in this country, such telecasting monopoly could readily lead to thought control. It would end once and for all any thought of a nationwide competitive service, because a network cannot long survive without sufficient affiliates in key markets.

In order to preclude a too-little, too-late proposition, WENS proposes two series of plans:

Firstly—short-range proposals which can and should be effected immediately;

Secondly—long range, which can be made operative over a period of time and on a gradual, transitional basis, if the short-range proposals don't work.

(a) Short range:

1. That channel 4 hearing in Irwin, Pa.—and those similar additions in other intermixed markets circumventing the original allocation plan—be suspended for 1 year pending a reexamination of UHF.

2. That the FCC-proposed multiple-ownership plan—or preferably the Du Mont plan—I, personally, like plan C—be legalized immediately.

Thus far, while ABC and CBS have cooperated with us in Pittsburgh, the networks have had no financial interest at stake. The networks are equipped and geared in a promotional way to build UHF nationwide. This promotion should be spread and shared equitably by the four networks.

I would like to point this out: That, unlike VHF, the difficulty with UHF now is that it is being sold from the bottom up by the individual stations alone rather than from the top down, with all the industry working together, as they did originally in VHF.

3. That an immediate halt should be made to share-time grants and the quickie, overnight mergers.

(b) Long range—if the short-range solutions do not solve the problems, I propose—and I know others have been proposed by the coordinating committee and Du Mont, and I merely toss these in the hopper—perhaps theirs are better:

1. In order to preserve UHF as a competitive service and at the same time solving the intermixture problem in markets so affected, it is proposed that all V's in intermixed markets be transferred to U's over a period of 5 years.

This would indicate to national time buyers that UHF is permanent and would preserve the present U's as a nationwide service.
For any dislocation or replacement of gear that might be necessary for V stations in these markets, possible tax concessions could be made. In other areas where U's have been allocated but not constructed, no such problem exists.

2. As an alternate plan, the replacement of the FM band between channels 6 and 7 could be utilized in the intermixed markets, providing three additional V's, the number of which to be used in a given intermixed market to be based on the number of UHF's presently operating in that market.

I would just like to point this out: Some of the manufacturer representatives here that I have been listening to said they are doing everything possible to sell UHF. Frankly, in my experience, this is mere lip-service.

Let me show you this newspaper from Pittsburgh—and I don't want to use the manufacturer's name, Senator, but I would like to show you this. The headline is "Terrific"—blank—"TV Value, $139.95"; very small type below, "If you want UHF too, it's only"—and you see the price below.

That is one newspaper clipping. To me, if it isn't dishonest, it is almost, I think, unethical.

Commissioner Hennoch. What is the price?

Pardon me, Mr. Chairman.

Senator Potter. Thirty dollars.

Mr. Israel. An additional $30, which is modest in this case. Most of them are between 50 and 60.

I would like to make that a part of the record.

Senator Potter. That will be made a part of the official record of the committee.

Mr. Israel. Attached to that is another newspaper, and the article I have reference to is entitled "TV Topics." The headline says "Why Do They Charge Extra?"

I would like to quote very briefly from this:

If manufacturers were making an honest effort to help promote the growth of television, they would discontinue, at once, the practice of charging extra for sets that cover both the VHF and UHF bands.

Almost all the sets being sold in the district are equipped for reception on all channels, including UHF. Of course, but there is a "slight additional charge" over models designed for VHF only.

I recall being told by the president of a well-known TV manufacturing company several years ago:

"When UHF comes we will absorb the additional cost of the all-band tuner. It won't amount to much, and there's no reason why all manufacturers shouldn't be able to do the same."

I won't read the rest.

Senator Potter. That will be made a part of the official files of the committee.

Mr. Israel. All right, sir.

I would just like one final word, if I may.

Senator Potter. I have a vote waiting for me downstairs.

Mr. Israel. I will make it very brief.

Certain witnesses here have said UHF broadcasters might be faced with and should expect a long, hard road in pioneering, and we are prepared for that. We expect no profit certainly for the first year; and I have pioneered in both VHF and UHF and, believe me, this is
the fallacy: While VHF progressed daily; you could see it grow; it was only a question of time—UHF has now reached an impasse.

Thank you.

Senator Potter. Thank you for your statement.

I am sorry, but we are going to have to recess until I get back or another Senator gets back from the vote.

(Whereupon, at 4:51 p. m., the hearing was recessed until 5:03 p. m.)

Senator Potter. The committee will come to order.

We have three more witnesses, and we would like to conclude them this evening, if we can, and we will recess at the conclusion of the hearing tonight until June 3.

Mr. J. P. Beacom.

Mr. Beacom, we will be pleased to hear your statement.

STATEMENT OF JOHN PATRICK BEACOM, PRESIDENT-OWNER OF WJPB-TV, INC., FAIRMONT, W. VA., ACCOMPANIED BY ROBERT M. DRUMMOND, VICE PRESIDENT AND GENERAL MANAGER OF RADIO AND TELEVISION OPERATIONS, WJPB-TV, INC., FAIRMONT, W. VA.

Mr. Beacom. Mr. Chairman, Madam Commissioner, members of the committee; my name is John Patrick Beacom. I am president-owner of WJPB-TV, Inc., in Fairmont, W. Va.; and this is Robert M. Drummond, our vice president and general manager of our radio operations and television operations in Fairmont.

In connection with our television station, WJPB-TV, I also own and operate radio stations in Fairmont and New Martinsville, W. Va., and Butler, Pa.

I am a little reluctant at this late hour, Mr. Chairman, to take up so much of your valuable time. As a matter of fact, I had thought earlier this afternoon of presenting my statement and having it inserted in the record; but in view of some testimony that had been given here in the late hours this afternoon, I felt that it might be proper for the cause of our UHF group that I say a few words, and I shan't be too late.

Senator Potter. You can do that and you can submit your statement, if you wish, and it will be made a part of the record, and you can discuss whatever points you would like to discuss.

Mr. Beacom. Thank you very much.

As I say, I am a little reluctant to follow the gentlemen from Indiana, two of them, Muncie and Bloomington, who have told you of the wonderful record of achievement for WLBC and also the V station in Bloomington, for we in our little market, which is, of course, not in the same class as either Muncie or Bloomington, and Indianapolis, feel that we in Fairmont have—

Senator Potter. How large is Fairmont?

Mr. Beacom. Twenty-eight thousand people. That is the city.

Senator Potter. Yes.

Mr. Beacom. I am speaking of the market now—

Senator Potter. Yes.

Mr. Beacom. Which covers Muncie and Bloomington, which is larger, have a success story, nothing like Mr. Burton's or Mr. Tarz-
ian's, but, to be sure, nevertheless, one which we feel merits some consideration by this committee. 

Now, Indiana has its full share of success stories as evidenced by what Mr. Tarzian told us here a few moments ago.

I think one of the first statements he made was that no one should go into the television business without sufficient reserve to protect themselves against a long pull of losses. I think he is very wise in that statement, but I can also think of the time—and I have read his success story, I think, in one of the weekly periodicals—where he started in business not too many years ago for less than $5,000, and he has made quite a success of his business.

So, I would say in this American way of business, of free enterprise, I think it is a challenge for perhaps some of our smaller stations in our smaller communities and smaller markets to see if we can't bring television, the greatest medium of expression today, to the people of our area.

Now, I would just like to say, if I might, Fairmont, as I told you, a city of about 29,000 people, is considered America's smallest market with a camera-chain station, UHF station, for live television programs.

WJPB-TV has been cited in various industry media as the lowest-cost chain, camera chain, station on the air to date.

I think that is important for this committee and perhaps for the Commission.

Senator Potter. What do you mean by "camera chain"?

Mr. Beacom. We mean by that a station which has a live camera, a camera which takes studio pictures and transmits it over the air for transmission purposes.

Therefore, we feel that our appearance here today before this distinguished subcommittee, and the Commission, may in a measure—and we hope at least will—assist you in your study of the UHF economic problems affecting the small markets and, let's say, the grassroots areas of our country, coining a phrase from our colleagues from Nebraska and Kansas.

Any solution of these economic problems of the UHF television operators must recognize that the American public has a vital stake in any nationwide television system, based upon free enterprise.

Such a competitive television system must be based upon a sound plan for allocation of channels over the country. This was the objective of the sixth report and order of the Federal Communications Commission; yet, in considering the various problems which have beset UHF, it is becoming increasingly clear that with the present allocation system the UHF stations cannot possibly achieve an equality of competitive opportunity with the VHF stations.

UHF in its present stage of development is economically handicapped.

You have heard all about that. The problems are multitude.

A corrective must be found, lest the operation of television stations in the smaller communities, in the grassroots areas, of our country cease to exist.

I shall not attempt, as I told you, this afternoon, in this brief statement, to catalog all the problems already affecting UHF in our area, because most of those factors already have or will be brought to your attention in this hearing.
Aside from the high cost of conversion of VHF sets that we have heard about, the continued manufacture, promotion, and sale of receivers capable of VHF reception only, the very great price differential between UHF all-channel and VHF-only receivers and the failure to manufacturer RF amplifier tubes for practically home UHF reception have contributed greatly to the increasing apathy of the public to purchase such receivers and the lack of enthusiasm on the part of the dealers in these areas to sell UHF.

Now, a small local station, either television or radio, can survive only so long as it can obtain the necessary revenue for operation. This depends entirely upon the availability of programs sufficiently attractive to cause public acceptance of the station.

Today the very existence of any television station is the availability of adequate network programs. For the most part networks are interested in the lowest cost per given number of receivers and, consequently, in most cases they favor the VHF stations.

It is just a natural course of economics.

In the case of WJPB-TV in Fairmont, we are more fortunate in this respect than others. Through the generous and friendly cooperation of the Du Mont Television Network and its owned and operated Pittsburgh station, WDTV, we have been allowed—that is WJPB-TV, our station, has been allowed—to pick up off the air all Du Mont Network programs, which we could not otherwise have carried had it not been for the willingness of Harold Lund, the general manager of WDTV, and the Du Mont Television Network, through E. B. Lyford, the station relations manager, to help a little grassroots television station get started.

WJPB-TV is not interconnected by American Telephone & Telegraph Co. to network cables.

We are also affiliated with the National Broadcasting Co. and the American Broadcasting System on what is termed a nonconnected basis.

We receive little revenue from the network for the programs carried, but we do have the advantage of good programing through these networks, which, after all, means dollars and cents in other ways.

Our agreements with the American Broadcasting Co. and the National Broadcasting Co. are such that they can be canceled by the network at any time within 60 days’ notice.

Experience has shown that even though a UHF station with a network affiliation has been established in a community for some time, whenever a new VHF station comes into the market it is usually able to obtain the network affiliation.

In the case of WJPB-TV, we are wondering what effect the coming of VHF to nearby Clarksburg will have on our present network affiliations.

That is approximately 25 miles from Fairmont.

Frankly, should be lose our network affiliations, we would be inclined to discontinue the operation of our television station, unless something in the interim would develop which would prove otherwise.

All attempts by WJPB-TV to work out an agreement with the Columbia Broadcasting System to affiliate with the CBS network has met with a series of rebuffs. The attitude of that network has been anything but cooperative insofar as WJPB-TV is concerned, this despite the fact that CBS does not have an affiliation anywhere
in this area which furnishes a grade A television signal to the Fairmount, Mongantown, or Clarksburg area, and by that I say they have no affiliate in Pittsburgh, in Johnstown, or the Wheeling area that will get them into Fairmont, even a hundred miles away.

Now, we are very interested in CBS for one reason, one particular program, that is, the Westinghouse Studio One, because in Fairmont we have the largest Westinghouse plant for the manufacture of fluorescent bulbs in the United States. They employ some 5,000 people. They would like to see their program. They would like to see it on a local station. We can't bring it to them. We told them we would carry it for free; we would take it as a public service, but that had no effect upon their decision with respect to feeding WJPB-TV any CBS programs.

I point this out merely to show you we can get cooperation from some networks, but we certainly haven't had it from CBS.

The inadequacy of UHF coverage—and later in this report I shall discuss this more in detail as it concerns WJPB-TV—the high cost of conversion, interference, and other problems are frequently exploited by VHF operators to the further detriment of UHF stations, and the competitive efforts of those interested in other than UHF television are frequently directed to playing up such inadequacies and the necessary extra investments required by the public to enable them to receive the UHF stations in the area.

It is in this direction, gentlemen, that I suggest the members of your committee look, for we in Fairmont, a very small community and small market, are encountering an economic threat to the very existence of WJPB-TV through the accelerated expansion of the unregulated and uncontrolled community antenna systems.

Fairmont geographically is located some 78 miles from Wheeling, where there is 1 VHF station, 115 miles from Pittsburgh, where there is 1 VHF station and 2 UHF stations, and 125 miles from Johnstown, where there is 1 VHF station and 1 UHF station. Each of these cities operates one or more television stations.

According to the Commission's engineering studies, none of the television stations in the above-mentioned cities should provide a signal of sufficient strength to serve Fairmont. Thus, on the surface of the Commission's findings, Fairmont would not expect to have television, other than that furnished by its own VHF station, WJPB-TV, on channel 35.

Now, the situation becomes complicated because the J. H. Whitney interests of New York, through their Jerrold Electronics Corp. in Philadelphia, have come into West Virginia and, under the name of the Fairmont Television Cable Corp. in Fairmont and the Clarksburg Television Cable Corp. in Clarksburg, have built a network offering closed-circuit television service to these communities with programs from Wheeling, Pittsburgh, and Johnstown stations.

The Fairmont Television Cable Corp. picks up off the air the signals of the above-mentioned stations, with or without their consent, amplifies it and, for an installation fee of $137, plus $3.75 per month, pipes it to the homes of the subscribers. As a result, Fairmont, with only 1 television station, only 1 allocated by the Commission, channel 35, allocated to it for geographic and economic reasons, now has, for all practical purposes, 3 nonallocated TV stations competing with the local UHF hometown station.
Senator Potter. What kind of an operation did you say this was?

Mr. BeaCOM. A community antenna system.

We will get into that in just a moment with some other data here that I would like to furnish the committee.

I am bringing this out because it has not been brought to the committee's attention until now.

To further complicate our problem, WJPB-TV was added to the closed-circuit system of the Fairmont Television Cable Corp. when it went on the air in March. Two days later, without notice to its subscribers, that is, the cable subscribers, the public, or the station, WJPB-TV, their signal was removed from the closed-circuit system.

Much publicity and advertising pointing out that Fairmont's own television station, WJPB-TV, would be carried by the Fairmont Television Cable Corp., making it unnecessary for the several thousand subscribers to convert their sets to the UHF channel 35, had been given previously, adding further confusion.

In that connection, I should like to submit to the committee here this full-page advertisement out of the Fairmont paper which, as you can see, says: "Welcomes Fairmont's Own TV Station, WJPB-TV, and Will Carry WJPB-TV Programs on the TV cable."

In effect, they are saying: "You don't have to convert. Don't convert. It won't cost you anything."

There, if you will accept it, please, Mr. Chairman, is that advertisement.

Senator Potter. Yes. That will be made a part of the official records of the committee.

Mr. BeaCOM. We would like to put in the record they are unregulated and uncontrolled, and the statements they can make in the press are such that they are not borne out in their actions, and it certainly does affect the stations that have come through the regular and proper channels, designated by the Congress, in setting up the rules and regulations for the operation of the television stations.

It is important that in communities where UHF stations are operating, and perhaps some VHF stations are operating, that these unregulated community antenna systems must be brought under some sort of supervision or regulation, whether it is as a utility, so they can't raise the rates, which they can do at any time now, or whether to determine by the Commission or some regulatory body how they can operate.

I think it is extremely important that we point out that we are not in an economic depression as far as WJPB-TV is concerned. Our station, as we have said at the outset here, went on the air for the lowest cost of any operation to date in the country, a little less than a hundred and eighteen thousand dollars, with a camera chain.

Our operating costs—and I will go into those in just a moment—have been sufficiently low, I believe, as to indicate we can operate a television station and stay in business at reasonable cost; but the point we make is that television suffers where these unregulated community antennas operate, and we hope you will consider this in your deliberations on this committee.

The paramount consideration of public interest which should be recognized by the Senate subcommittee, aside from this, of course, is that the public has a vital stake in the preservation of existing television stations as a competitive force in the industry.
This consideration is based upon the basic governmental determination which is implicit and explicit in the nationwide television allocation report and plan that the existing VIIF channels are inadequate to assure the attainment of a truly nationwide competitive television service.

We have attached to the original copy of our statement copies of some newspaper advertisements covering some of the points we have discussed concerning the Fairmont Television Cable Corp., some of which I have already presented to the chairman, some of which we have here which we will also present.

I would also like to enter for the record a copy of the advertisement of the Jerrold Electronics Corp., of Philadelphia, concerning the closed-circuit community television system, from which I quote:

Serving the public in over 220 cities and towns in 34 States and Canada, subscribers by the thousands get live network programing on Jerrold community television systems from distant stations out of range of ordinary reception.

I respectfully submit this to you for your records, too.

Senator Potter. Yes. That will be made a part of the official records of the committee.

Mr. Beacon. I respectfully draw your attention to this again because it certainly affects our grassroots UHF rural stations.

The foregoing impels me to point out that only recently the FCC saw fit to authorize the construction of a special microwave relay for a community antenna system in Poplar Bluff, Mo., to feed station signals from Memphis to community systems to be built in Poplar Bluff and Kennett, Mo. Immediately the two Memphis television stations served notice they would not consent to the use of their signals by community systems.

Community operators say they aren't concerned with the station's objection and are going right ahead with plans to take the signal. If such is permitted, then the action of the FCC opens new towns and areas to community cable systems at the expense of the UHF hometown, grassroots, television stations.

Now, in fairness to the FCC, it should be pointed out to this committee that the Commission is in doubt about its authority over community antenna systems, and in connection with this and in commenting on the matter the Commission has said—and I quote from a recent decision:

The Commission is not making any express or implied decision as to the existence or extent of any jurisdiction it may have with respect to the installation and operation of any community TV systems.

In view of the already serious economic effect the community system in Fairmont-Clarksburg has had on WJPB-TV, I urge this committee's careful consideration of the matter of recommending legislation to regulate and control the community systems so that UHF stations in other sections of the country will not be subjected to the same competitive handicaps we suffer in Fairmont.

It is also important, I think, for your committee to have the information, as I have told you, concerning the building of WJPB-TV at a low cost of approximately $118,000 and the operating figures for the first 2 months of television in Fairmont.

Our operating expenses for April—and we operated approximately 8 hours a day—were just under $8,000. This figure will be increased slightly for May.
Revenue for April was less than $5,000, and will be about the same figure for May.

Our losses for the first 2 months will be cushioned somewhat by the revenue and profit from radio operations. However, we cannot hope to exist for long on the strength of radio revenue. We are hopeful of breaking even before August, because our programming is good and the network cooperation is now shaping up so that we can expect cooperation and support there.

We also feel that, despite the reluctance of the Madison Avenue group and despite what has been said by the gentleman from Indiana to the effect they have had no trouble with the Madison Avenue time buyers—I might say that Mr. Drummond here, who is not only our general manager but is one of our top sales experts, has found it pretty hard to even get in the door of some of those boys along Madison Avenue.

But we are in business in Fairmont. We are going to stay in business. We think the UHF operation we have will be a success and that success in part is due, I would say, to the wonderful cooperation that we have had from the equipment manufacturer who has furnished us with our equipment.

I am making a part of this original report a letter and data furnished by the General Precision Laboratory of Pleasantville, N. Y., who have described in detail, with pictures, the necessary equipment to furnish WJPB-TV to start television operations at the low figure I have told you.

In this connection I should like to say that the cooperation and support we have had from the General Precision people has been one of the highlights of our television experience to date. If we don't make a success of UHF in Fairmont, it won't be because our equipment isn't good or because the equipment people haven't cooperated to the fullest with us.

The difficulties of UHF operators are compounded by the burdens of paying the higher cost of UHF equipment.

Equipment may be purchased on a deferred-credit basis from the manufacturer, but the credit terms extend over a relatively short period which is not realistically geared to the period of time which UHF operators necessarily require to become established and to overcome their existing handicaps. These handicaps, of course, make more difficult the availability of adequate credit terms from normal banking sources, because of the risks involved. It becomes increasingly apparent, therefore, that the Small Business Administration must assist the good, sound UHF television operator by underwriting long-term loans if others are to go into the business or some of them that are already in the business are going to be able to exist, because they have millions of dollars worth of equipment and these investments might be wiped out by short-term credits.

I recommend to the committee that some consideration be given—not for WJPB-TV, but for some others than I know that could be helped by the Small Business Administration who, because of rules or regulations, cannot now under the present setup make loans to the television stations. They think it is too risky.

The problem of survival of a competitive television system in the Nation should not be rendered academic by the extinction of all UHF broadcasters.
That, of course, is important.

In order to avoid complicating a solution to the problem, pending completion of this committee's proceedings, there should be, I think—and we certainly endorse the recommendation of the Madam Commissioner here for the immediate suspension of further grants of applications for new television permits and for any changes in existing television authorizations affecting coverage.

I think you should also, if I might say, in this committee—I would like to point this out—call in the military to see what their needs will be in the future in the VHF spectrum. It may be the VHF channels will be needed for our military defenses, and that is important to check in the consideration of this.

One other point before I close here: I should like to say that the Commission has been most helpful to our small operation.

I believe the Commission is willing to do its full share to help the small stations exist and continue to operate, if this committee will make some recommendation to them so that they can have something to hang their hats on. Let's put it that way. I am sure they will work with you.

And I would like to make one other statement, if I might, before closing: It has been stated by our friends from Muncie, Ind.—and I can't help but get back to that—that they have the utopia for all UHF in Indiana. Well, Indiana is a great State. We like it in West Virginia, but we think we can do the same kind of a job in West Virginia.

We have 3 networks—1 a recent one—but we still have 3 of the 4—and we still aren't making money yet. We are going to. We are having our struggle, but bear this in mind: That all UHF stations are going to have their problems when the VHF signals get into their market, and today Muncie doesn't have that competition. One station in Indianapolis is getting into Muncie without any degree of competition.

They say you need good management to stay in business. Well, we like to think we have some fair management in our little stations. Our radio stations have made money. So, there is no reason why our television stations can't make money.

The Muncie group, WLBC, say they operate on 40 people. Well, we operate both radio and TV in Fairmont on 20, and we are still not making money.

So, it is a problem. It is an important problem—and I am talking today not for WJPB-TV in Fairmont, but all of the other smaller market TV stations in the United States; and I certainly hope that this committee will, in its wisdom, be able to work out something that is going to save the basic economic free-enterprise television system that we have today in the United States.

I appreciate being here, Mr. Chairman. Thank you for giving me this time.

Senator Potter. We are glad to have your statement.

Commissioner HENNOCK. Mr. Chairman, may I ask permission to ask one question?

Senator Potter. Yes.

Commissioner HENNOCK. Mr. Beacom, the president of Jerrold—I have forgotten his name now—he is an engineer—

Mr. BEACOM. Yes.
Commissioner Hennock. Was in my office. I voted for this last decision you are talking about.

Mr. Beacom. Yes.

Commissioner Hennock. I want to take my share of the blame again, and I asked him what effect these community antenna systems are having on ultra high and he said to me he was duplicating your program on the community antenna system—not only yours, but all of the UHF stations—and, therefore, enlarging your coverage.

Now, you have given me an entirely different picture, and again I am just so terribly distressed by having hurt you with my vote.

Mr. Beacom. Well, Madam Commissioner, I appreciate this: That—let us say this—whether or not we are on the cable in Fairmont, WJPB-TV is still going to exist; we would be more helped if we were on it, but I am thinking of other areas that are going to be opened up, and if they come in without some sort of regulation it is going to hurt them badly.

Commissioner Hennock. I didn't know he was advertising and saying, "Don't convert."

Mr. Beacom. Well, there is the advertisement.

Commissioner Hennock. I think that is highly unfair.

Mr. Beacom. We thank you very much.

Senator Potter. Thank you, and these advertisements and other data you have submitted will be made a part of the official records of the committee.

I wish to submit for the record at this point a telegram received from Blair Foulds, vice president of the General Precision Laboratory, Inc.

COMMUNICATIONS SUBCOMMITTEE OF THE INTERSTATE AND FOREIGN COMMERCE COMMITTEE OF THE SENATE,

Senate Office Building.

(Attention of Mr. Zapple.)

The General Precision Laboratory, Inc., respectfully withdraws its request to appear before you in the UHF proceedings since we feel that others closer to the operating problems can be more constructive on this serious UHF matter. However, we respectfully wish to bring to the committee's attention forcefully the possible effect that the uncertainty of the future of UHF can have upon technical progress with regard to high-powered transmitters for UHF.

Only the incentive provided by a healthy potential industry can justify the magnitude of the investment required of the manufacturer to rapidly develop high-power UHF-TV transmitters and further justify the large capital investment required of the UHF-TV broadcaster to acquire and place in operation such high-power transmitters.

In spite of the present unsettled climate in UHF, we are proceeding with the development of high-powered equipment. We will deliver our first GPL—continental 50-kilowatt UHF transmitter in July 1955. The actual recommendations that will assist in resolving the current UHF-TV economic difficulties must be left for those closer to the overall operational problem than ourselves. We can, however, attest and attest strongly to the need of the UHF-TV industry for positive corrective action.

BLAIR FOULDS, Vice President.

Senator Potter. Mr. Merryman.

I understand, Mr. Merryman, you agreed to just testify on your recommendations now and you will be back with us later for the balance of your statement; is that correct?

Mr. Merryman. Yes, sir; if that is acceptable to you.

Mr. Beacom. Mr. Chairman.

Senator Potter. Yes.
Mr. Beacom. There is one thing important I forgot to state, and I would like to add that I would like to endorse the principles of the Bricker bill which is pending before you.

Senator Potter. I am glad you mentioned that.

Mr. Beacom. Thank you.

Senator Potter. Thank you.

STATEMENT OF PHILIP MERRYMAN, PRESIDENT AND GENERAL MANAGER OF SOUTHERN CONNECTICUT & LONG ISLAND TELEVISION CO., INC., TELEVISION STATION WICC-TV, BRIDGEPORT, CONN.

Mr. Merryman. Senator Potter, I do have a prepared statement which I would like at this time to have accepted for the record in full.

Senator Potter. That will be made a part of the record at this time.

(The prepared statement submitted by Mr. Merryman is as follows:)

STATEMENT OF PHILIP MERRYMAN, PRESIDENT AND GENERAL MANAGER OF SOUTHERN CONNECTICUT & LONG ISLAND TELEVISION CO., INC., TELEVISION STATION WICC-TV, BRIDGEPORT, CONN.

My name is Philip Merryman. I am president and general manager of Southern Connecticut & Long Island Television Co., Inc., owner and operator of UHF television station WICC-TV, Bridgeport, Conn. My background and experience in radio and television broadcasting are summarized in appendix A hereto.

With your permission, I would like to address myself first to the general problems facing ultra-high-frequency television broadcasting as we see them after more than a year of operating a UHF television station; and then comment briefly on particular problems affecting our own operation in the highly competitive situation in which we find ourselves in Bridgeport, Conn.

We undertook the operation of a UHF television station under what have now proven to be erroneous assumptions. In the fall of 1948 the Federal Communications Commission discontinued the issuance of authorizations to construct television stations while they restudied the problem of how to provide a truly competitive nationwide television service. They rightly concluded that the conditions under which they were allocating television stations prior to 1948 would lead to a monopolistic situation. The Commission studied this problem for nearly 4 years, and in the course of their investigation took testimony from broadcasters, manufacturers, educators, and organizations primarily interested in seeing that the public was not deprived of a competitive television system.

Much testimony was introduced by the manufacturers of television receivers and television broadcasting equipment that technically, a new band of frequencies extending from 470 megacycles to 580 megacycles offered practical opportunities for television broadcasting. Consequently, the final conclusion of the Commission was that they would maintain the existing 12 VHF frequencies for television and establish 70 new frequencies in this UHF band for additional commercial and educational stations. In so doing, the Commission, relying upon testimony introduced by the manufacturers, said it was its considered opinion that there would be adequate devices manufactured at a price the public would pay for adapting existing television receivers to stations in the new band.

The Commission further stated that the manufacturers of television receivers would very quickly convert their production to receivers capable of tuning all the television channels including the 70 new channels in the UHF band. Unfortunately for us, these statements of the manufacturers in actual practice proved to be a hope rather than a fact and the result is that after 14 months of operation, we are faced with the fact that the manufacturers have yet to put on the market an all-channel converter which is technically satisfactory at a price the public is willing to pay. Of course, if the only way the consumer can get a television program or, if his existing VHF television service is limited,
either in the quantity or the technical quality of his VHF reception, he will make this additional investment. We are not only faced with this price situation but the manufacturers of television receivers never reached more than 30 percent of the total output with all-channel receivers and what is more alarming, the percentage of such receivers had declined from 1948 to 1952 to somewhere around 20 percent at the present time. To add further to our discouragement we are advised that most manufacturers of colored television receivers are not incorporating and do not plan to incorporate tuners for the UHF band in the color television receivers they will sell to the public.

All of this amounts to public rejection of UHF television whenever and wherever VHF television is available and that, of course, creates a favorable climate for increasing the monopolistic situation which exists in most areas of our country today in the television broadcasting field.

I am not certain in my own mind what this committee can do to alleviate the situation since the monopoly arises from public reaction and attitude toward the system of allocating television licenses created by the FCC. It is my feeling that this committee should investigate and determine how this monopoly came into being. I am well aware that there is nothing this committee can do to control the natural economic law of supply and demand and, indeed, I would not ask this committee to attempt to impose artificial limitations on the natural workings of our free enterprise system in our great democracy. It is for that reason that I cannot subscribe to the theory that the public interest would be served by clamping another freeze on the construction of new television stations either in the UHF or VHF band of frequencies. I do, however, think that it is this committee's business to examine the facts as to monopoly in the television broadcasting field, and to ascertain whether or not there have been artificial limitations placed on free private enterprise in the television broadcasting field by the Government itself.

It is my conviction also, that the companies now enjoying this monopoly understandably will seek out and use every device available to perpetuate this situation. This monopolistic effort extends into the field of programs so that two of the networks, NBC and CBS, would deny their network programs to individual markets such as ours on the assertion that they already serve our market with another television station located in some other city and, they would thus deny to stations such as ours the great entertainment programs to supplement the programs we present which look toward satisfying the needs of our community for its own local television programs designed to help develop a healthier and happier community.

The crux of the matter is that UHF television stations find themselves, under our great free enterprise system, attempting to compete in a highly competitive field without the opportunity to compete on an equal basis. The conditions for this unequal competition were created by the Government itself through its independent office—the Federal Communications Commission. In other words, prospective operators of television stations had only two choices when the FCC first opened its door to applications for the right to operate a television station in 1952: (1) Either to go it alone or to operate television stations in the interests of its community or, (2) to undertake such operation with handicaps not suffered by television stations prior to the freeze in 1948, or by the existing VHF stations. Most of us chose to undertake operation of television stations for the benefit of our communities with the handicaps, rather than to subscribe to the idea that our communities were to be deprived of the benefits of this great new public service medium.

I would think that it would be your desire to make some recommendations to the FCC looking toward the elimination of monopoles in the broadcasting industry. When I say monopoly, of course I mean the monopolies enjoyed by VHF television stations individually, and by CBS and NBC in the network field.

It appears to me that three courses are open: (1) That the Commission create new VHF channels in the frequency band of 88 to 174 megacycles, and particularly in the band of frequencies from 88 to 108 megacycles. It would seem to me that 3 new television channels could be encompassed in the 88- to 108-megacycle region without seriously affecting frequency modulation broadcasting. Such a solution, of course, raises the problem of the public's investment in UHF conversion devices and would present any UHF television station proposing to switch to a new VHF frequency not now incorporated in existing VHF television receivers with a public relations problem of some proportions, since those consumers who had invested in UHF converters would now be asked to invest in still another conversion device in order to continue to receive his local television station. It is for that reason that we do not feel this is the most advantageous solution to WICC-TV's problem.
(2) A second course would be to require all television stations to operate in the UHF band so that all stations would then automatically be on an equal basis. Such a course seems impractical when we consider that the public has, according to Broadcasting-Telecasting magazine, invested some $6 billion in VHF television receivers; and while their television receivers themselves would not be obsoleted, each of them would require a UHF converter.

(3) A third solution, and the most practical one that occurs to me, would be that the Commission withdraw from its position that directional antennas and/or lower powers and antenna heights than the prescribed maximums should not be used on VHF frequencies.

For practical application, I believe that VHF stations utilizing maximum power height under the Commission's allocation plan for VHF have entirely too much coverage. Some restriction of VHF station coverage of that now permitted, and which aggravates the monopolistic situation existing in television broadcasting, would permit the creation of many additional VHF stations and thus solve the problems of many UHF broadcasters.

Indeed, it would be possible to create many new VHF stations without even infringing on the monopolistic coverage of the existing VHF stations. In our own case, for example, we could operate on channel 6 without any appreciable interference to VHF stations and I submit herewith an exhibit (appendix B) to show how this could be done. Under such operation we could operate TV program service to every existing receiver in our community and thus in our own community we would have an equal opportunity to compete with the alien service arriving in our market from New York City.

That we could complete with alien services in the broadcasting field is well demonstrated by our experience in sound broadcasting where the program service we render has proven so satisfactory that even though there are some 12 stations that can be received satisfactorily in Bridgeport, our radio station WICC at times has 78 percent of all radio sets in use tuned to it. Such a good showing by a local station is, of course, important to the business community since by radio, at least, consumers in our market are not constantly exposed to the advertising of the New York market merchants who are constantly endeavoring to entice the buyer in Connecticut into their New York stores. With the ever-growing dominance of television as an advertising medium, our Bridgeport merchants face the loss of business to New York merchants unless there is local Bridgeport television through which they may advertise. I do not believe that it is true to say that unless Bridgeport has local television the community's prospects for retail business growth, even more for maintaining its present competitive position, are severely impaired.

If we could, with our television station, achieve an equally high interest in our programs (and I think we can if we are given an equal opportunity to compete with the New York stations which are now enticing Connecticut consumers away from our local stores) the business climate of our area would be greatly improved.

I understand that even though directional antennas have been designed and prove workable, the Commission feels that it should not adopt the practice of assigning stations with directional antennas because applicants would not then seek assignments in the UHF television frequencies. In other words, it appears to be a method of forcing prospective television broadcasters to use UHF even in those cases where VHF could be assigned.

Now, gentlemen, this situation has a precedent. Prior to about the year 1931, radio stations were allocated by the Commission on the same basis they now allocate television stations. That is, by the use of mileage separation tables so that there would be a separation spelled out in miles which would not be violated by any one assignment. Separations applied not only to stations using the same channel, but there were additional tables for stations on adjacent channels. That is the formula whereby television stations are allocated today. Now, such a solution to the problem of assigning television grants is a nice neat one from the bookkeepers point of view, but it does not, to my mind, meet the mandate of the Communications Act of 1934 to provide television service as far as possible to all people of the United States; and to provide a fair, efficient, and equitable distribution of broadcasting stations to the several States and communities, nor does it utilize the technical possibilities for immediately utilization of VHF television frequencies to create new television stations and furnish additional population of the United States with television service.

The assignment of desirable AM radio station grants had about reached its maximum in 1930. Under the then mileage separation table system of allocation, the total number of stations had reached 612. It was then that engineers
came forward with a plan for applying some simple principles of physics to radio broadcasting station antennas so that additional assignments could be created without encroaching upon the service of the existing stations. It was the application of this principle, for example, that permitted our radio station WICC in Bridgeport to operate on the desirable frequency of 600 kilocycles. This grant was made some 20 years ago. Since that time, the number of radio stations in the United States increased from 612 to more than 2,000, and still new assignments are coming forth from the Commission regularly. Thus, the authorization of the use of directional antennas and power and height combinations tailored to the needs of the communities to be served, I, along with a great many others, maintained stoutly that there was no parallel between frequency modulation as related to AM broadcasting and UHF television as related to VHF television broadcasting. There was no new technical system of broadcasting pictures involved. There was only a difference in frequency on which the broadcasting was done. But with each passing day, it becomes more apparent that these original conceptions were erroneous, simply because, with each passing day, the public demonstrates emphatically, except for a very small percent, that they will not invest in UHF converters if they have a reasonable choice of VHF television programs or stations to choose from. And, with each passing day, it becomes more apparent that for the foreseeable future UHF stations will be successful only in those areas where there is no satisfactory VHF television service.

The type of station that could be established by the use of directional antennas or lower powers and heights on the existing VHF frequencies obviously would not be the superpower monopolistic station we now think of as a VHF station. Its service would, necessarily, be restricted in certain directions and it would be limited in the power with which it operates and the area it serves; but, we do not need in Bridgeport a superpower monopolistic station. We are not so self-seeking that we want to get the advertisers' money not only for services to our own community, but for services to other communities whose needs are alien to the needs of our own particular community. All we want or need is a station that would enable us to help integrate and unify the forces working for the benefit of our particular community.

I have said that we will ask the Commission to make an exception to their rule so that we could operate on channel 6. It appears that it would also be possible to operate in our area on channel 10 or channel 12 so that this proposal on our part does not foreclose the establishment of a competitive television station in our own or nearby markets. I make this statement because television antennas are much more susceptible to directionaJ application than are AM radio station antennas, since the factor of skywave is not important in VHF; and, it should be possible to design accurately antennas so the service of the existing VHF stations are tailored to fit the contours of their rightful coverage area. Even though it might somewhat restrict the farflung coverage the stations have come to regard as their rightful domain.

I would, therefore, recommend to this committee that they request the Federal Communications Commission to reconsider their policy with respect to VHF allocations and make a thorough engineering study, both as to the number of stations and the total population that could be served. It is my conviction that
they must necessarily conclude that a great many cities could have adequate VHF stations and, in the final analysis, that far greater numbers of people would be served than provided for by the present plan.

In reevaluating its VHF allocation policy, the Commission may conclude that it is no longer necessary to retain an allocations table and, instead, that applications may hereafter be filed, as they are in AM, for channels in whatever areas they may be fitted. Under this plan the Commission would consider all applications on their individual merits, granting them or denying them as the public interest may require rather than, as now, refusing to accept them for filing because minimum mileage separations are not always met. The FCC no longer need be concerned that a return to the AM method of allocating stations would result in the VHF channels being concentrated in the larger markets, for the allocation table has been implemented by grants already made to the point that the reasons for its establishment have been satisfied. It is an axiom of good administration, both in government and in business, that when the reason for a rule ceases to exist, the rule itself should cease to exist.

In our own case, we are asking the FCC to make an exception to their rule which prohibits such operation (or to change the rule) because our situation seems peculiar inasmuch as 7 New York VHF stations, and 1 VHF station in New Haven, Conn., serve our area with varying degrees of success, thus creating what is probably the most highly competitive situation facing any UHF broadcaster.

After nearly 14 months of operating our station in the public interest (see appendix C) we show a substantial operating loss and a public response such that less than 10 percent of the receivers in our area are capable of receiving our channel. It seems to us that we have exhausted every approach to the problem of presenting a program service locally produced, of interest and benefit to our community, and still the public will not spend the sums ranging from $12.50 to $37.50 to equip themselves for our channel 43. Now these prices were arrived at only after intensive effort on our part to get the prices down. I do not see any prospect of this rate of conversion to channel 43 in Bridgeport substantially increasing, and thus I foresee a long period of time which could be a minimum of 3 years but which could last up to 10 years or more during which we compete unequally for the audience in our own community with the supertelevision stations assigned to other communities.

I would like now to introduce an exhibit (appendix D) prepared by our sales manager to show the extensive and extremely burdensome efforts we made to get the costs of WICC-TV conversion devices down to a reasonable amount and to get adequate supplies of them. We even went so far as to purchase converters, antennas, and transmission line directly from manufacturers and resold them at no profit to servicemen and dealers in this effort.

I would like to point out that we have found through experience in our area that persuading the television set owner to purchase the equipment for channel 43 is only the first step in the problem I mentioned earlier—that no manufacturer has yet manufactured a satisfactory conversion device at a price the public is willing to pay. The existing devices, while simple in operation to an engineering mind, present great difficulties to the nontechnically trained television viewer. In a great many cases, the devices, after they are installed soon become unworkable and require the attention of a qualified serviceman; but even when working satisfactorily it is so much more difficult to tune channel 43 than it is to tune the VHF frequencies, that most users simply will not take the trouble to tune the station in and, thus again, our opportunity to compete has been further curtailed.

I have spoken of the encroachment of the New York stations on the consumers in our own community. I would like now to present in evidence a letter I wrote to Dr. Frank Stanton, on June 9, 1953 (appendix E) and the reply of the president of the Columbia Television Network dated June 19, 1953 (appendix F). It is clear from this correspondence that the Columbia Broadcasting System, which is probably the most powerful of the network monopolies, is determined to claim Bridgeport exclusively for Columbia Broadcasting System network programs for its own New York television station, WCBS-TV, even though that television station must devote itself primarily to the service of its own community, namely, the metropolitan area of New York, and cannot possibly program so as to meet the community service needs of Bridgeport, other than through the entertainment value of its programs.

Furthermore, CBS is maintaining the right to bombard our Bridgeport community with the product advertising of New York merchants. This attitude is in sharp contrast with that of the American Broadcasting Co. and the Du Mont
Television Co., who have extended both commercial and sustaining program service to us even though their New York stations serve our area almost as well as do the New York stations of CBS and NBC, who have refused us program service. ABC has been particularly cooperative. They have extended us a primary affiliation contract and have shown every consideration to our needs that any individual television station could possibly expect from its network. I think it fair to state that this cooperation not only has made it possible for us to render a full program service to our community, but that, as of now, it is largely responsible for our continuing ability to operate a television station at all. Without the ABC programs we now carry, I doubt that our meager income from sales would permit a sufficiently extensive program service to warrant WICC-TV continuing to operate.

Another matter that I would like to bring to the committee's attention is the policy of the Small Business Administration to refuse to extend loans to UHF television stations, even though they are certainly small business and certainly in need of relief, because the SBA says it cannot be accused of attempting to influence the policies of companies engaged in public communications. On February 3, 1954, within a few days after the SBA was opened for business, I wrote the New York office of that agency (appendix G), pointing out that because our WICC-TV building was located in a rural area and was, perforce, a specialized building unsuitable for other business use, we had not been able to obtain an adequate first mortgage from any bank or insurance company or other reliable financial organization at a reasonable rate of interest. Instead, we had had to accept a much smaller mortgage at a high interest rate and had been deprived thereby of the additional working capital we so desperately need. The SBA replied on February 16 (appendix H) that we were not eligible because of their policy not to extend relief to companies engaged in public communications. I would like to suggest to this committee that they recommend to the SBA a relaxation of their rules so as to guarantee mortgages to television stations. I cannot, under any circumstances, conceive how the guarantee of a first mortgage by a Government agency could possibly influence our public service policies. Thank you very much for your attention.

APPENDIX A

PHILIP MERRYMAN, BIOGRAPHICAL DATA

1918: Licensed by Radio Division, Department of Commerce, to operate radio telegraph stations.
1922: Constructed two broadcasting stations in Astoria, Oreg.
1922-26: Attending school.
1947-49: Consultant to broadcast stations on engineering and management problems.
1950: President, general manager of Bridgeport Broadcasting Co.
1952: President, general manager of Southern Connecticut & Long Island Television Co., Inc.

APPENDIX B

USE OF CHANNEL 6 BY WICC-TV, BRIDGEPORT, CONN., UTILIZING A DIRECTIONAL ANTENNA

The attached map shows the grade B interference-free service area that would be provided by WICC-TV operating on channel 6 with 700 feet effective antenna height and a power of 2.8 kilowatts ERP employing a directional antenna with 10 decibel suppression. The transmitter site shown for WICC-TV is the site now utilized in the operation of its UHF station, which also utilizes the 700 feet effective antenna height.

The directional antenna selected for WICC-TV and represented on the attached map complies with the directional antenna requirements presently specified by the FCC. Advancements in the art permit the use of directional antennas with even FCC. Decimation compression ratios; if a more modern directional antenna were utilized more service could be provided by WICC-TV without causing inter- ference to existing stations.
In designing the directional antenna for WICC-TV represented by the enclosed map, the radiation in the directions of cochannel stations in Philadelphia and Schenectady has been maintained below that permitted for stations operating with the maximum power and height and minimum mileage separation values provided by the present FCC rules. In other words, operating as proposed on channel 6, WICC-TV would cause less interference to cochannel stations in Philadelphia and Schenectady than would be caused by maximum power and height stations allocated at the mileage separations provided for in the rules.

(Map showing grade B interference is as follows:)

**INTERFERENCE STUDY CHANNEL 6**

Map showing outlines of Bridgeport urbanized area and Grade B interference free area of WICC-TV operating on Channel 6 with 700' effective antenna height and a power of 2.8 kw ERP employing a directional antenna with 10 db suppression in the direction of WRGB. All interfering stations are assumed to operate with 100 kw ERP and 1000' effective antenna height.
The philosophy on which WICC-TV programming has been based during its first year of operation grows out of a conviction that our real reason for existing (and at the same time our best chance for success) lies in the performance of a community service not available to our potential audience on any other channel. With this in mind, WICC-TV's consciousness of the personality of its community and the needs to be served, played a large part in the very early planning stages of the company. The total audience, it was felt, could best be served through a policy of providing entertainment peculiar to the nature of the area, of disseminating news and other information of particular interest to the area and of giving strong emphasis to publicizing the local aspects of various civic and charitable ventures. This might include a block party being put on by a local church or cooperation with the local chapter of a national organization such as the American Red Cross. No bazaar, no charity picnic, no teen-age dance would be considered too unimportant for note by the community's only locally operated television station.

It was also felt that it would be necessary not only to cut across the lines of specialized community activities in the manner described above, but also to serve and appeal to those specialized groups which in the aggregate create the personality of the community. The area served is made up of people of many different national origins, religious affiliations, age groups, educational levels, occupational ties, and social interests. These are some of the highlights of the station's efforts to serve these people within the framework of their particular interest.

From the first day the station went on the air there has been a program on the schedule 5 days a week designed for the particular purpose of serving as a publicity medium for civic and charitable enterprises. A local popular personality has served as host to representatives of over a hundred different organizations which had something to say to the public at large. With words and pictures this program has been able to tell the story of such activities as the Connecticut Symphony Orchestra, the 4-H Clubs, the Girl and Boy Scouts, the YMCA, YWCA, Jewish Community Center, various CYO's and many more too numerous to mention—but all served by this open-house policy. It can truly be said that since the first day of station's operation, no organization of any kind with a need for TV coverage has failed to get it.

In the field of youth activity, WICC-TV has approached the problem from two points of view. One is information for youth; the other is participation by youth. Information for youth has been generally channeled through spot announcements or through the medium of established local personalities with a special appeal for the younger people. In the more important field of actual participation by teen-agers, we have in this first year produced a 26-week series of teen-age panel shows entitled "The Younger Generation" and are currently presenting a 1-hour weekly "Junior Journal" which is actually written, produced, and performed by representatives of all high schools within our coverage area. The younger members of the youthful set (those not yet in their teens) appear regularly as guests on any 1 of 7 different half hours per week. We estimate that to date over 2,000 children from the community have been before our cameras. In addition to these studio activities, the station has sent camera crews to do on-location coverage of such activities as our North End Girls Club, Woodfield Children's Village, and others.

Service programs for women have included a half hour daily At Home show featuring daily guests chosen from the feminine public and a half hour daily cooking program geared especially to the low-budget economics of the average housewife and the cosmopolitan tastes of this particular community. Service programs for men have included a locally produced series on fishing and hunting and a novel twist to a nightly sports program on which the guests are members of the public rather than name figures.

Service programs of general appeal include the weekly locally produced Connecticut Town Meeting dedicated to the discussion of purely local and regional topics and a nightly quarter hour news commentary on which the commentator again turns to John Q. Public for his guests—seeking out their opinions rather than the opinions of the experts.

The Hungarian-American Theater (the first Hungarian television program on the air) makes a special attempt to serve the largest national group in this area—the Hungarian-American. Plans are presently afoot for producing a similar effort.
on behalf of the large Polish population in this vicinity. The most popular Negro personality in this area produces a weekly half hour variety show.

The predominant religious group in this area is Roman Catholic. They are now served through the medium of a nightly quarter hour during which the Family Rosary is said. This series was locally produced on film by WICC-TV at the specific request of the diocese of Bridgeport. Our TV chapel is a purely non-commercial and nondenominational Protestant half hour originating in our studios each Sunday afternoon. Cooperation with members of the Jewish faith has rested largely with our response to their specific requests in cases of civic and religious activities as they arose.

Undoubtedly the greatest single effort at community service undertaken by WICC-TV in this first year of its existence has been its program of cooperative production with the University of Bridgeport. This experiment has been unusual enough in its nature to have attracted a good deal more comment in the national press than is usually afforded a local station. During each semester of the school year, the station makes available to the University of Bridgeport 8 hours a week plus all its production facilities and personnel for the televising of actual classroom courses. The instructors and their students meet in simulated classrooms and proceed exactly as though they were on the campus. There is no attempt at making a show of higher education. The cameras merely look expertly in on the classroom proceedings on behalf of the viewers at home or at such specific places where monitors have been set up. The university has arranged that home viewers may earn regular credit by participating in these televised courses and reporting for examinations at the end of each semester. In entering into this unusual agreement, the station fully realized that this type of programming offered little hope of financial reward and realistically faced the fact that such programs would probably not earn better than minimum audience. We have felt, however, that here was a true community service that could be performed only because of the existence of the local television station-operating as a service medium—not purely as an entertainment vehicle.

Before actual operations began last year, the WICC-TV program department set out to find a really attractive and at the same time worthwhile format for a children's program. A meeting was arranged with a panel of experts in the field of child study, Dr. Tug of Yale; Dr. Smolen, of the Bridgeport Family Service Society; and others met with our program department and discussed those features which would both entertain and educate the young viewers and at the same time provide them with wholesome and worthwhile influence each afternoon. A well-qualified woman was employed to produce the program which arose from these conferences, and she succeeded in presenting an extremely good show. Such people, however, command substantial pay; and when the problems of UHF placed the station in an economically unsound position, this noble experiment had to be dropped.

Such a case history has resulted in our being somewhat timorous about starting other shows which we have designed and believe could be of real community service. We have in mind shows on how-to-do-it, shows on sewing and dressmaking, on amateur photography, on PAL boxing and on Little League baseball. The implementation of such ideas, however, calls for economic support which to date has not been forthcoming.

WALLACE DUNLAP,
Director of Television Operations,
WICC-TV, Bridgeport, Conn.

APRIL 29, 1954.

APPENDIX D

UHF CONVERSION PROBLEM

After 13 months of operation, I would like to report to you some of the problems which I have been faced in the field of public relations with dealers and servicemen who in the final analysis hold the key to the success or failure of our venture in UHF. I would also like to report to you later in this memorandum on my efforts in the national sales field to secure network programs from the advertising agencies sponsoring programs on NBC-TV and CBS-TV.

My first contacts with dealers and servicemen in the field began 17 months ago on October 12, 1952. It was at this time that I began the effort to organize the dealers and servicemen in the Greater Bridgeport area into a group for purposes of establishing uniform conversion rates and for instruction in the technical phase of UHF installations. While it was almost a simple matter to organize the group for concerted action, the purposes of the organiza-
tion were never achieved. This can be attributed to several reasons, of which two primarily stand out.

One, the dealers at that time were able to purchase only high-price continuous UHF tuners and antenna systems for which there were no uniform prices. Since there was no central purchase point to supply the various dealers and servicemen with this material for UHF conversion, each member dealt with distributors and manufacturers to the best of his ability. Since the dealers and servicemen varied in size and since their business philosophies varied equally so that the profit motive was a prime factor, it was impossible to get them to agree to a standard price.

Second, the servicemen almost to a man with 1 or 2 exceptions, and here perhaps their personal egos were involved, resulted in our inability to convince them that a UHF installation was at relatively simple matter but completely different or different to a degree from a VHF installation. As a result, two things immediately happened when we first took to the air. The dealers sold UHF conversions at grossly unfair prices ranging between $65 and $110, and installations were so poor that contracts for installations were rescinded within days of the installation. Servicemen then came to the incredibly inaccurate conclusion that it was almost impossible to make a decent UHF installation without alienating their customers. In order to protect their public relations with their customers, WICC-TV became the target of their abuse since the servicemen could find no other excuse for their own inefficiency. If we were actually in operation that I learned through my contacts with them that the organization which originally had close to 50 member groups had almost completely disintegrated.

It was also at this time that I learned that dealers had almost to a man (there were 1 or 2 exceptions) decided it was too expensive and costly in terms of public relations to sell a WICC-TV conversion. As a result, when potential viewers made some effort to convert their present sets to WICC-TV, they were literally talked out of it by both the dealers and the servicemen on the grounds that it was too expensive and too critical for them to handle. Even though we are providing them with a service which was local in nature and which they could not receive from any other channel, the dealers and servicemen then set out on a campaign to establish that WICC-TV could offer nothing in the way of service that the viewers couldn't presently receive from the existing VHF signals from New York.

At this point, you will recall we decided that the only way we could solve the conversion problem was to establish on a limited basis our own distribution of UHF materials such as converters, antennas, and lead-in wire. This was achieved in July of 1953 by purchasing RCA U2 two-channel converters, DiCo bow-tie antennas, and Anaconda 270-ohm lead-in wire. You will recall further that we sold all of these materials to servicemen and dealers in the area at cost so that in effect we suffered slight losses since we absorbed the shipping charges for these materials. Although we did manage to stimulate some interest among dealers by virtue of this action, for the most part we were unsuccessful in our ultimate purposes because most of the servicemen continued to charge $45 and $50 for installations even though they were now saving considerably on parts. The futility of this operation became evident within a matter of 60 days with the result that we suspended our activity in this field. During this period we probably achieved approximately 150 conversions.

Our next step, you will recall, was to establish the WICC-TV salute at eight different locations throughout the area at our own expense. While I will admit we did receive good public relations for a short time, the overall effect was negligible.

Before offering you the conclusion of the summary, I would like to state that during the course of the past 17 months, I have been in contact personally with 117 servicemen and dealers in an area embracing Bridgeport, Stratford, Fairfield, Milford, Ansonia, Shelton, Derby, Seymour, New Haven, Danbury, and Waterbury. It is my feeling now that the time spent in this effort was to a great degree wasted since even today only about 10 percent of the receivers in the dealers' stores have continuous tuning heads on their sets or, to put it another way, somewhere between 80 and 90 percent of the sets on display are still strictly VHF models.

The past year has seen converters reduced considerably in price and to this day, I have not seen a UHF instrument whose value is comparable to its counterpart in VHF. It is this last which has made this effort so terribly frustrating.

In the national sales field, I made every effort with interested clients to use their programming on WICO-TV. While the wall of resistance was almost in-
surmountably high, I did manage at Needham, Louis, & Brorby in Chicago to get an order from the Johnson’s Wax people for the Robert Montgomery program originated by NBC-TV. However, while this order was sent to the network, it was never registered in New York because the network was unwilling to handle the program since we did not have an affiliation agreement with them. This same situation occurred at the Russell Seed Co., the agency handling the Schaeffer Pen account. In this case, it was the Jackie Gleason show on CBS-TV. Again the order was sent to New York and again also not registered because we did not have an agreement with CBS-TV to carry their programs. These are the two major cases where clients obviously were willing to place their programs in Bridgeport, but the network was not. After facing the realism of this problem and the frustration attached to it, I decided my effort in this direction could only be fruitless and, therefore, I suspended this type of sales effort in May 1953.

MANNING SLATER,  
Business Manager, WICC-TV, Bridgeport, Conn.  
April 20, 1954.

ADAM YOUNG TELEVISION CORP.  
New York 16, N. Y.

INTEROFFICE COMMUNICATION  
April 23, 1954.

From: Leonard E. Hammer.  
To: Manning Slater WICC-TV.  
Subject: WICC-TV and National Business.

DEAR MANNING: At your request I am writing this letter which confirms the views and comments I expressed to you during our meeting and discussions this past Tuesday pertaining to the potentiality of national business for WICC-TV.

To begin with, Manning, for the past 14 months I have contacted numerous accounts endeavoring to sell WICC-TV; however, I must admit that I have met with very limited success. Your station in my estimation represents one of the toughest sales that exists in television today. WICC-TV is not only confronted with the problem of being adjacent to 7 television stations in New York and 1 in New Haven, but the Bridgeport market is sandwiched between New York, the No. 1 market in the country, and New Haven, the 33d.

Having been on the air for 1 year, the UHF conversion according to your monthly reports is approximately 72,000, but that figure does not have acceptance among the advertising agencies in New York City. As I mentioned to you, Television magazine, which as far as I am concerned is considered by most agencies as being quite reliable, in the March issue credits WICC-TV with 37,050 sets. Your set count in relation to New York with 4,195,600 sets and New Haven with 634,844 sets, puts you in a very weak position from the standpoint of receiving consideration from national advertisers. In view of the fact that television service emanating from both New York and New Haven certainly does cover the greater part of your service area, the importance and individuality of the Bridgeport market is unfortunately lost.

Here again, based on my experience with advertising agencies which to date have shown little or no interest in Bridgeport television, to be basically honest with you and myself, it is absolutely impossible for me to project or estimate the amount of national business that I can place during the next 8 months. Frankly, at this writing and as I told you on Tuesday, I do not have one “hot” prospect for WICC-TV.

With your very competitive situation, the selling of WICC-TV has to be eventually predicated on a cost per thousand factor, as determined by surveys and ratings. This necessitates a tremendous increase in the number of set conversions. In terms of just television homes, WICC-TV will have to have approximately 150,000 sets before we can commence to evaluate your station on a cost per thousand basis in relation to that of WNHC-TV, New Haven. There is a strong possibility that the Brooklyn Dodgers baseball schedule might very well give great impetus to the growth of set conversions and the month of September could very well give evidence that there are 125,000 sets which can receive WICC-TV's picture. Then and only then, and assuming that your station has some well-rated periods, will we be able to approach the sale of WICC-TV on a competitive basis with New Haven.
You know the local sales story much better than I. From what you told us Tuesday, local sales hit a peak in November-December 1953, and then suffered an appreciable decline. I feel that certainly for the time being while you are going through this period of growth and expansion, the great bulk of your revenue must come from local sales, national sales representing a small percentage of the overall gross.

As far as I am concerned, Manning, the above represents the hard, salient, and realistic facts which surround the selling of WICC-TV. And yet with this situation at hand, every effort is being made to sell aggressively WICC-TV and the Bridgeport market which it is serving to national advertisers.

Best wishes.

Very sincerely,

Leonard E. Hammer.

Frank Stanton, Esq.,
President, Columbia Broadcasting System,
New York City, N. Y.

June 9, 1953.

DEAR Frank: Just for the record I thought you should know the subject matter of my conversation with Fritz Snyder on May 26, which ensued following several days of unsuccessful effort to reach your vice president in charge of station relations, Herbert Ackerman, in regard to the order by the Russell Seeds Co. for their clients for the Jackie Gleason show for 26 weeks beginning June 20 which had been placed with CBS in Chicago, referred to the New York office for approval and then rejected because WICC-TV does not have a working agreement with CBS.

I advised Fritz that this was either the third or fourth incident of this nature; that we were not asking you for an affiliation agreement, although we would be receptive to having one, but merely a working arrangement to clear these individual programs when the client requested you to add us to their station list. You could thus relieve your sales department of the embarrassment of trying to sell a UHF station to your clients or of affiliating another UHF station with the CBS network.

Fritz proceeded to tell me that you were not going to clear these programs to us and poke a big hole in the coverage of your network key station; that your picture was tops in Bridgeport and there was, therefore, no reason for adding the Bridgeport station. Whereupon I asked about New Haven and he again replied that you could argue that question until doomsday and nobody would ever find the answer and that the decision had been made not to furnish programs to WICC-TV and that was that. I found this hard to believe, Frank, but then advised Fritz that in my opinion you were making a serious mistake since WCBS-AM once dominated the Bridgeport market and it was now a poor second to WICC; that the same thing would happen with TV, and that one day you would be coming to us for time and we would not have time available. This Fritz construed as a threat whereas I meant simply that because in a matter of time we would be so in demand by advertisers there would be literally no time available.

I think the position of CBS is interesting inasmuch as it seems to me that the company’s position as the operator of a network and its position as the operator of a TV station assigned to the New York area seems to be in conflict. As a network you are engaged in the business of syndicating programs some of which are for sale in such manner as to cover simultaneously a large percentage of the total population of the United States. The success of this enterprise as a business depends on making the package attractive to advertisers, but in our case the advertisers requests were rejected on the grounds that it interferes with your other business—that is, a slight decrease in the sales attractiveness of WCBS-TV.

I wondered if you were informed of this action since all of us who operate radio stations by grants realize that we are licensed to operate a station in the public interest, convenience and necessity and nothing whatsoever is said in the license about running an advertising business. This led me to the question of what made Fritz assume that as the operator of a station licensed to the New York metropolitan area you are authorized to encroach upon the services of a station licensed to Bridgeport, Conn.? Your primary responsibility as the operator of WCBS-TV must necessarily be to serve the needs of the community.
in which you are authorized to operate. You cannot do that and at the same time so operate that station to serve the needs of the people in the State of Connecticut. WICC and WICC-TV are so operated.

As a long-established station WICC is the station the public in our area look toward for their community service. As a fledgling, WICC-TV is working toward that objective. However, the economics are burdensome. Should such unnatural factors as a decision by the management of CBS to boycott WICC-TV be thrown into the balance, the question of whether the station can survive its period of formation to later serve the interests of the people of Connecticut arises.

Also, I am enclosing a map prepared by our consulting engineers which shows by FCC standards the limits of metropolitan coverage by WCBS-TV, WICC-TV and your nearest other affiliate WKNB-TV, New Britain, Conn. As you will note, there is no duplication. On the contrary there is considerable gap between the areas.

I should appreciate an early reply to clear up the matter since we would like to fulfill our order by the Russell Seeds Co. for their clients if possible.

Very sincerely yours,

PHILIP MERRYMAN,  
President and General Manager, Southern Connecticut & Long Island Television Co., Inc.

APPENDIX F

CBS TELEVISION,  
DIVISION OF COLUMBIA BROADCASTING SYSTEM, INC.,  

Mr. PHILIP MERRYMAN,  
President, Bridgeport Broadcasting Co., Bridgeport, Conn.

Dear Mr. MERRYMAN: Dr. Stanton has asked me to reply to your letter of June 9, 1953, to him.

In our opinion, we best serve the public if the CBS Television network is constituted so as to (i) make CBS Television network programs available to the largest number of people and (ii) provide efficient, economical coverage for advertisers. Fulfillment of the second objective aids us in attaining the first.

In our opinion, the addition of WICC-TV would hinder rather than assist us in achieving these objectives, irrespective of any effect WICC-TV might have on CBS-TV. Incidentally, I don't think it would have any effect.

Finally, I would like to point out a number of inaccuracies in your letter of June 9:

1. If the WCBS-TV contour shown on the map you enclosed is intended to show the grade A contour, it is in error. A proof of performance survey by CBS-TV engineers shows the median field at the contour shown to be 4.5 mv/m.

2. Nowhere in either (a) FCC rules, or (b) trade practices generally employed in appraising the coverage of television stations, will you find support for your contention that a television station cannot serve a metropolitan area outside of the 4.5 mv/m contour (or the grade A contour, whichever your map was intended to show).

3. Field strength measurements indicate that WCBS-TV delivers a median field of approximately 60 dbu (1 mv/m) in Bridgeport. We believe this is an adequate signal.

4. Supporting the adequacy of the WCBS-TV signal in your area, the Nielsen Coverage Service shows WCBS-TV with an evening circulation of 95 percent of the television homes in Fairfield County. In fact, it shows that 82 percent of these homes watch WCBS-TV on 6 or 7 nights a week.

5. In the third paragraph of your letter, you state that WCBS (AM) is now a poor second to WICC. The latest Hooper survey fails to substantiate this claim, showing WCBS to have a 27.9 percent share of the audience for all periods rated, versus 25.3 percent for WICC.

Very truly yours,

J. VON VOLKENBURG, President.
**APPENDIX G**

**SOUTHERN CONNECTICUT AND LONG ISLAND TELEVISION CO., INC.**

*February 3, 1954.*

**SMALL BUSINESS ADMINISTRATION,**

*New York 16, N. Y.*

**GENTLEMEN:** It has been called to my attention that we might obtain relief through you for a problem which causes us some concern.

We are a new television station and have been in operation less than a year. In late 1952 and early 1953, we constructed a new building for our operations at a total cost of $163,100. Repeated efforts to obtain a first mortgage on the building through the usual channels of banks and insurance companies were not successful, largely because our building was a special purpose building located in a rural area and, we were a new company without an operating history. Finally, and in desperation, we secured a $50,000 first mortgage from the builder at an interest rate of 10 percent. We feel that a higher first mortgage was justified and that an interest rate of 5 percent should be adequate.

The purpose of my letter is to inquire whether we can seek relief through the Small Business Administration and, if we are eligible, information as to the proper procedure.

I would appreciate your advice on this matter.

Sincerely yours,

PHILIP MERRYMAN, President.

**APPENDIX H**

**SMALL BUSINESS ADMINISTRATION,**

*New York 16, N. Y., February 16, 1954.*

**Mr. Philip Merryman,**

*President, the Bridgeport Broadcasting Co., Bridgeport 3, Conn.*

**Dear Mr. Merryman:** This is in response to your inquiry of February 3, regarding the eligibility of a television and radio station for financial assistance from this Administration.

We regret to advise you that, under our policy, loans to any sources which disseminate information to the public of the type carried by newspapers, magazines, radio broadcasting or television broadcasting companies, or similar enterprises, are ineligible.

Very truly yours,

DAVID J. DUGGAN, President.

**New York Regional Office.**

---

**Mr. Merryman.** The statement was drafted before the hearings began, and I have some additional suggestions, which I feel will take a long time to develop the reasons fully for.

Senator Potter. Surely.

**Mr. Merryman.** So, I would like to submit the recommendations at this time.

Senator Potter. Surely.

**Mr. Merryman.** And be permitted to come back and develop the reasons for them.

Senator Potter. Yes.

**Mr. Merryman.** Now, I was very happy yesterday to hear the RCA witness say that RCA had proven in Bridgeport that UHF commercial television was practical. I wish they would get out a press release to the boys on Madison Avenue, advising them they have discontinued their experimental operation in Bridgeport 2 years ago, because our experience in Bridgeport leads us to believe that the boys on Madison Avenue think we are continuing the NBC experimental operation.

Mr. Chairman, I have these recommendations to make. I have divided them into two categories—those looking toward providing
immediate relief in this highly monopolistic situation and those looking toward long-term relief in the industry.

My qualifications to discuss industry problems are set out in the statement and I won’t take any time with them now.

I do believe though one thing we can all agree on, as a result of these 3 days of hearings is that there are inequalities and inequities existing in the television broadcasting field, and looking toward relief for those, I have these recommendations for immediate relief:

One: That this committee recommend to the FCC that it relax its rule against directional antennas and the use of lower power for allocation purposes in the VHF band and to permit the use of such antennas, even though they would interfere with the secondary coverage areas of existing VHF stations.

I believe that would provide immediate relief to many broadcasters, and will tend to eliminate some of the basic monopolistic conditions which exist.

For our own purpose, as it is set out in my statement, we are filing with the Commission for authority to operate on channel 6 in Bridgeport. It will provide relief in our particular case, and I think it will provide relief in a great many other cases.

It won’t be a complete success, of course.

Secondly: I would like to have this committee recommend to the Small Business Administration that they relax their rule against extending relief to companies engaged in public communications, to the extent of taking first mortgages on buildings of UHF television stations when it can be shown that reasonable margins are otherwise unobtainable.

That, I think, would go to some length in extending economic relief to UHF television stations.

The third recommendation to provide immediate relief would be to remove the excise tax from all channel television receivers.

The fourth recommendation would be that the FCC implement its proposed order against exclusive network area affiliations.

The final suggestion that I have for immediate action is that you ask the FCC— with their large engineering staff, I believe they could do it by the time you reconvene the meetings of the committee—to bring to this committee an allocation plan showing only what can be done to serve the public interests, with a truly competitive broadcasting system, using only UHF television stations.

There will be a great deal of argument about whether that can or cannot be done and I believe the Commission could make that information available to your committee to better guide you in evaluating the further recommendations I will now make for long-term relief.

For long-term relief, I suggest:

First, That the committee or Commission restrict the use of color television broadcasting to UHF television stations.

Very briefly, the reason for that recommendation is that we are at the threshold now in the development of color television.

The reason has been brought forth that UHF was impractical because of the public’s investment in VHF receivers which, according to Broadcasting magazine is approximately $6 million and does represent a considerable public-relations problem, that they not compound the error at this time by giving those stations the right to broadcast
color and persuade the public to invest in color television receivers that receive only VHF frequencies.

Now, in order to make that recommendation fair and equitable, I further recommend that the Commission allow each existing VHF broadcasting station to establish a companion UHF television broadcasting station, provided that all of the programs of the VHF station are duplicated on the UHF station.

That would mean, of course, those color programs that were put on UHF—only the black and white portion of them would be broadcast on the companion VHF station.

That, briefly, Senator, are my recommendations.

Senator Potter. I wish to thank you for submitting your recommendations, and we will be waiting for your complete statement when we meet the following week.

Mr. Merryman. Thank you very much.

Senator Potter. Mr. Patterson.

You may begin, Mr. Patterson.

STATEMENT OF S. H. PATTERSON, OWNER OF RADIO STATION KSAN AND KSAN-TV, SAN FRANCISCO, CALIF.

Mr. Patterson. Mr. Chairman and members of the committee, my name is S. H. Patterson. I am sole owner of radio station KSAN and KSAN-TV in San Francisco, Calif., and sole owner of Radio station KJAY, Topeka, Kans. I have been in radio since March 7, 1926, a little over 28 years. I have owned and operated radio stations since September 1, 1933, ranging from 100 watts to 5,000 watts. My son, Norwood J. Patterson, is a consulting engineer, practicing before the FCC for various stations. My daughter and her husband own a radio station in Portland, Oreg. I am one of the oldtimers in radio. KSAN-TV, channel 32, is my first ownership in TV.

KSAN-TV, channel 32, was granted approximately April 20, 1953, and it went on the air with a pattern on March 20, 1954, and regular programs April 6, 1954.

San Francisco Bay area has a population of 2½ million, in a radius of about 50 miles.

Our present power video, 20,000 watts; audio, 10,000 watts. It has CP for video of 87,000 watts and for audio of 46,800 watts.

The antenna is AGE helical, 16 bay, a power gain of 24, and transmitter GE 1 kilowatt.

Location on mountain in the center of San Francisco, near Twin Peak.

Antenna height above ground, 531 feet.
Antenna height above average terrain, 1,261 feet.
Antenna height above sea level is 1,326 feet.
Listened to from 40 to 50 miles away.
Total equipment cost is about $235,000.
Total VHF receivers, about 850,000.
Total UHF receivers, approximately 40,000.

To encourage set conversions, KSAN-TV obligated itself for the 1954 TV rights of San Francisco Seals and the Oakland Oaks baseball teams for the total obligation of $120,000, televising 4 games each week for the entire season.
All four daily newspapers wrote up for several days the story of Patterson's saving the Seals franchise and televising the Seals and the Oaks. TV conversions to UHF were fast and most encouraging, totaling about 30,000 conversions before regular programing started on KSAN-TV.

The difficulty of UHF converter installation caused the converter sales and installation to slow up tremendously.

KSAN-TV has been on regular programing about 7 weeks and only about 9,000 converters have been installed during those 7 weeks. There are more than 600 certified TV small and large shops and servicemen in the KSAN-TV coverage area. That means about 12 sales per man in 7 weeks.

Even the servicemen do not push converter sales now because of the time and trouble of proper installation. When an antenna and a lead-in is particularly designed to make installation simple and easy, their converters would be sold and installed speedily.

There is considerable engineering research and experimental work to be done on the performance of the transmitting antenna which is installed by KSAN-TV:

To determine the cause of certain dead spots that exist within sight of the antenna;

To determine if the claims of manufacturer are working out in the field that the antenna is so designed as to throw the TV signal down and serve the people living within a mile or two of the transmitter.

Norwood J. Patterson, the consulting engineer, is proceeding with this research. This takes time, expense, and the operation of KSAN-TV until this has been accomplished. This may take several months of research and experimentation. Once this is accomplished the findings may well be a great benefit to all UHF installations in other locations of hilly country like San Francisco.

I might divert here just a moment to explain to you our operations so that you may know we went into UHF with the full knowledge we would not get a network.

There are three VHF stations in San Francisco, and others are coming on. They monopolize all four networks, and all the networks have refused us any programs, even though they were not released by any station in San Francisco.

We went to this extent to get programing to attract the people, programing that wasn't on any radio station. If it were not for the difficulty of the installation of the equipment, our picture would have been different.

I recommend:

1. All manufacturers of TV receivers to build only all-channel receivers, with components adequate for dependable receptions, so the public moving from one locality to another can still use their TV set. Also the new sets will soon replace the old part-channel sets.

2. The speedy delivery of higher power transmitters.

3. The full consideration for financial loans from the Government, as for other businesses, perhaps of less importance to the community.

4. Networks cooperate with UHF stations in releasing network programs to UHF stations.

5. For full TV coverage of our Nation, UHF is essential, in time of peace and war, and for a competitive TV service to our Nation.
Accepting that UHF is an essential business, and should have equal consideration and cooperation in loans as the Government gives other businesses, then I recommend that the policymakers of the Small Business Administration consider including loans to TV stations on the same basis as other businesses, especially UHF stations that are faithfully striving for a place on the earth.

I wish to speak of the condition that is responsible for the plight of the UHF telecaster today. If we get to the cause, then we may find an immediate assistance.

The real cause is the receiver does not receive the UHF signal. In 1934, when the Government passed laws to control the sending of radio and TV signals, it could have passed laws to control the receiving of such signals; then the FCC would have been empowered to order on April 11, 1952, when it authorized the use of UHF bands, the manufacturer to make only sets capable of properly receiving such signals. Then UHF could have and would have lived in a fair competitive system.

If the manufacturers say they do not want Government control of manufacturing, then the manufacturer must take the full blame and responsibility for creating this terrible calamity on the public and on UHF telecasters.

Instead of the manufacturer coming to this committee and acknowledging he is wrong, as did Miss Hennock, Commissioner of the FCC, Mr. Glen McDaniel, president of Radio-Electronics-Television Manufacturers Association came before this committee on May the 19th and asked for a handout of Government aid in the form of a tax reduction, so they can make more millions. At no place in his speech did he say that the manufacturers represented by his association would make only all-channel receiving sets.

It seems to me to be a better recommendation to this committee to leave the excise tax on the TV set and take a part of the $25 million tax money and distribute it to the dying patient, the UHF telecaster, and save his life now, immediately.

I know this is somewhat a divergence, but let's consider it.

This would insure the manufacturer to make more sets. It would insure the manufacturer that UHF is here to stay and he would have confidence in the future to make a ruling that he would build only all-channel sets. We did not receive positive promise to that effect from the manufacturer that he would build only all-channel sets, even though the tax was removed.

Our honorable Chairman of the FCC, Mr. Hyde, said there were presently 127 UHF stations now on the air, and the FCC had provided for 1,300 UHF stations to be granted.

If the Government made available only half of this tax money to UHF stations, that would be almost a million dollars per station per year, or even with one-half of that amount, the UHF telecasters would show you a nationwide competitive system, with a nationwide UHF network, within 2 years that would be really competitive.

The cause of the condition that now prevails in the UHF bands can and should thus receive immediate assistance without costing the Government anything, by leaving the tax on the receiving sets as now is, and appropriating a part of the tax money to the source, the UHF telecaster.
This could be done through the Small Business Administration or some other plan. If, however, the Government does not see fit to leave the present tax on the UHF receiving set, then I recommend that arrangements be made that the present UHF telecaster, in dire need, may receive a grant or longtime loan from the Government through the Small Business Administration or some other plan immediately. He then can live while future permanent plans are worked out.

The condition the UHF telecaster is now in was brought about by unfair competition, not of his own making, and something must be done.

1. This plan of using the TV set excise tax money for the additional programs in the home is the greatest direct benefit the taxpayer has received for such taxation. It is placing the tax dollar back in the form of service to the taxpayer. It is like using gasoline tax money to improve roads. The user gets the benefit.

2. This plan would save the present licensee of UHF.

3. This plan would make it possible for present grantees to construct their UHF station.

4. This plan would encourage and make it possible for new applicants to apply for UHF stations. It would place UHF stations in the hands of many and not a few.

5. This plan would encourage manufacturers to enlarge and speed up the research of and development of better quality and higher powered UHF transmitters and auxiliary equipment.

6. This plan would encourage, if not demand, all manufacturers to build only all-channel receiving sets.

7. This plan would insure the future existence and nationwide confidence in UHF. In a very few short years it would give the citizens of the United States a truly nationwide competitive television system.

8. This plan would be made workable immediately without a long legislative battle by simply appropriating the funds that are now already levied.

Senator Potter. You have never seen them appropriate funds.

Mr. Patterson. I guess not.

9. This is the plan that could eventually, if the Government so decided, move all TV into the UHF bands and have one unified television service.

10. This plan will aid the economy of the Nation, the 70 UHF television stations payrolls; the payrolls of the manufacturer building the transmitting equipment, the receiving equipment, the distributors, salesmen, servicemen, over the entire Nation; the advertising men and the overall increased sales of products advertised.

The Senate bill 3095 tends to further monopolize the UHF band by making it possible for seven large firms to own all the TV stations in the United States. This could happen if all TV were moved to UHF.

The Senate bill 3294 pertaining to advertising of alcoholic beverages, will take another large revenue from UHF and give it to the newspapers, magazines, billboards, and direct mail. If this were not discriminating against radio and television, but including all forms of advertising, it would be more equitable.

Senator Potter. I had hoped we wouldn't bring up that subject.
Thank you kindly for your statement.

Mr. Patterson. Thank you.

Senator Potter. I think the last witness is Mr. Townsend.

Mr. Townsend, I understand you are going to ad lib your statement; is that correct?

STATEMENT OF S. W. TOWNSEND, PRESIDENT AND GENERAL MANAGER OF RADIO STATION WKST AND TELEVISION STATION WKST-TV, NEW CASTLE, PA.

Mr. Townsend. Yes, sir.

If the Senator and the committee please, I started out here with a statement and there has been so much said and so much of mine compared with it that, in the interest of timesaving, I would rather, if I may, do a little ad libbing.

Senator Potter. I will appreciate that.

Mr. Townsend. Thank you, sir.

In the first place, since the question came up——

Senator Potter. I wonder if you would identify yourself fully for the record, give your full name and who you represent.

Mr. Townsend. S. W. Townsend, New Castle, Pa. I am president and general manager of WKST radio and WKST-TV.

Since there is a question about experience, I thought maybe I should get into this a little bit.

I went in the broadcasting business in 1925, became a manager of a station in 1927, have continuously been in the broadcasting business except for 5 years active duty in the Navy, at which time I was the first Naval Reserve officer to be a district communications officer, the Fourth Naval District.

I mention that because I had a lot to do with the telephone company, as far as naval radio stations, in the administration of a lot of radio stations.

Senator Potter. You are not a novice in the field?

Mr. Townsend. Well, I hope not.

I have been in the UHF television business, on the air, since April 15, 1953.

The thing that alarmed me a little at the beginning was recriminations of whose fault this mess we are in happened to be.

Actually, I think the Federal Communications Commission and the Federal Radio Commission before it have made so few mistakes compared with what could be made that they deserve all through the years a vote of thanks and appreciation.

I think that goes, by and large, for broadcasters; I think that goes by and large for networks, and I think it even goes by and large for equipment people.

However, I think equipment has turned a lot of good ideas into difficulties. They have helped, of course.

My own feeling is, and I noticed that Chairman Hyde, in his original testimony, the first day, made mention, as well as I can recalled it, that they did consider putting all television in UHF during the freeze period, that is, they considered this during the freeze period, but since equipment was not available, either transmitting or receiv-
ing I gathered that was given very little further consideration, and I think that was entirely correct.

There was no UHF transmitting or receiving equipment then available in any sort of quantity at all, and it was absolutely impossible then to do anything about changing the band. It would have stopped television cold.

I don't think the Commission foresaw, and I don't think the industry foresaw, the impact of television originally.

I know I didn't, though I, incidentally, filed for VHF in 1948 and was caught in the first freeze.

I wonder, Senator, if it would be possible since I can't put thoughts in the Chairman of the Commission's mind—I wonder if it would be possible to ask him if, during the freeze, by reason of the unavailability of UHF equipment, they gave detailed examination and consideration to making nationwide television available in the 70 UHF channels?

Senator Potter. Do you care to answer that, Mr. Chairman?

Mr. Hyde. I would make a brief statement on that, if you please.

Senator Potter. Yes.

Mr. Hyde. During the Commission's consideration on allocation plans, the idea of shifting the entire service to the ultra-high, so that all stations would have the same type of channel, was considered to a certain extent.

At that time, the Commission was aware of quite a large number of television sets in the hands of the consumers.

By the time the report was released, the figure was about 15 million.

It was, of course, aware of the serious dislocations of service that would be involved in any general shift.

It was aware, of course, of the inconvenience that it would cause to the public.

It was, of course, aware of the impact any such move would have on a new industry just getting started.

Actually in 1952, there were still people holding the opinion that television couldn't operate in the way the broadcast services have traditionally operated in this country.

There were well-known people in the broadcasting field making public statements that television couldn't survive on advertising revenue.

The committee has heard witnesses mention that permits for VHF stations were surrendered. There were 20 such permits surrendered. There were a larger number of applications for television permits that were withdrawn, in some instances quickly, for fear the Commission might grant a permit before the application could be withdrawn.

Now, that indicates, I believe, some of the fear and some of the concern about whether television, as a service, could get started.

In that kind of a psychology, on the basis of that kind of an outlook, and with the dislocations I have mentioned, the Commission could hardly have undertaken a shift of this struggling industry into an undeveloped part of the spectrum.

You may say, "Why did we attempt to extend the industry into that field?"
Wel, we didn't do that without getting the advice and opinion of everyone that can be helpful, and it was done, as the testimony, which has been presented, shows, on the basis of assurances that equipment, as such, would be made available as the allocation was ready for implementation; and, of course, as always, the Commission had to proceed with faith and confidence in an industry which has made remarkable achievements.

The original television allocation was made on that basis. There were many skeptics who had doubts in the workability of television, not to mention its prospects as a business enterprise.

Now, I believe I mentioned that the usual experience of the first television stations to operate, the universal experience of them, was to lose money. As more and more stations got on the air and set distribution increased, the time it took for a new station to begin to make money was shorter.

That, I think, explains some of the reasons why the Commission did not make an effort to wipe the slate clean and move the whole industry up into ultra-high.

Senator Potter. Does that answer your question?

Mr. Townsend. Yes, sir; I think that does, in that I believe a complete study now that equipment is available, now that we have operating data throughout the country on UHF—I believe now that there is an excellent opportunity and chance to move all of television to UHF, as the association has recommended, not overnight—certainly not—that would be getting us into a worse mess than we are in—but it can be done, in my opinion.

I don't pretend to be an allocation engineer but I think there is another factor, beyond the fact, as I understand the Chairman's statement, the Chairman of the Commission, that there was not a concentrated effort to plan the 70 channels for use throughout the country alone, because of the consideration of keeping 12 going.

Senator Potter. I assume also they didn't know the capabilities or limitations of UHF, which they do today.

Mr. Townsend. Yes, sir; I agree with that, Senator.

Another thing—and I want to mention how long I have been in the radio business before the Federal Communications Commission came into being and you opened a station and you got an automatic grant. We had at one time, I believe it was, 32 radio stations in the city of Chicago. You enacted the Radio Act of 1927 to eliminate the chaotic condition, the interference.

Some of them couldn't get to the city limits of Chicago with all of this interference and that was the first time there was a real upheaval in regulating communications as far as the general public is concerned.

Now, at that time, 900, I believe, it was, total stations in the country was considered way too many, and we got down to, I believe, 600 after the Federal Radio Commission came in—don't hold me to the exact figure, but approximately—and now you know where we are—2,600.

I think the same thing can be done in television.

Now, to get back to the operating costs: I think there was one other thing. I was interested in that $800-a-month operating figure that someone gave you. I think that is the minimum you can operate the present TV station at the present state. If that be so, and that allowing no profit, and that with only part of the homes converted, that means that you must have a large number of homes per station in the area for
it ever to economically exist, which, in my opinion, means that most of these small city allocations now provided on the 70 channel UHF spectrum will never be built.

That would further tend to relieve the situation that we are now facing.

Another thing that I haven’t noticed mentioned directly is that the Commission, very correctly—and incidentally, their propagation figures, I think, are very accurate, relatively speaking—they plan graduated power in 3 different spectrums—2 to 6 a hundred kilowatts; 7 to 13, 316 kilowatts; 14 to 85, a thousand kilowatts.

By reason of the fact that no one has a thousand kilowatt transmitter today, here we go again to this equipment, which I think keeps being our principal difficulty.

Since none of us can go—and I assure you I wouldn’t go to a thousand kilowatts; I can’t afford a megawatt transmitter—and there is none available anyway—and since that means all stations, even those in large markets with large power equipment, can get above 200 kilowatt effective radiated power, or one-fifth of their designed power, that puts the 2 to 6 and 7 to 13 stations at a great power advantage today over any UHF station.

In other words, if their power were reduced one-fifth, as the UHF stations are by reason of lack of equipment, then you would see a lot less present inequity and much more equitable use of the facilities, which, as I recall, was in the original Radio Act and the Communications Act, equitable distribution of facilities.

I do not want to take any more of your time, and I certainly appreciate this opportunity, sir.

Senator Potter. I am sorry we had to wait so long. Someone has to be late.

Mr. Townsend. It is all right with me, if it is all right with you, sir, and I appreciate the Commission being through so many of these meetings with us.

I would like to endorse the part of the Du Mont testimony pertaining to monopoly. I think it is extremely important that we have ABC and Du Mont.

Incidentally, they are the two networks that have given me encouragement—and it is not alone that I say that; but I think we need more than two networks. We needed it in radio and I am certain we need it in television; and I think we need stations that can serve the public, which, after all, is all we are all here for, because if we don’t serve the people, we won’t do any business.

I would like to endorse, therefore, that portion of Commissioner Hennock’s recommendations in connection with what to do with VHF and how to help the UHFers—incidentally the unhappy frequencies at the expense of the very happy frequencies.

I guess you probably heard that one.

Particularly, I wish to endorse the UHF Coordinating Committee and the UHF-TV Association’s recommendations to you, sir.

I think they are in two parts, for good reason. We need immediate relief and I think you ultimately need a better, overall integrated system.

And I certainly thank you, sir.

Senator Potter. Thank you.
I want at this time to express my appreciation for the statements that have been given to the committee. You are the people who are in the field and face the problems and the only way we know about the problems are the way you present them.

I think you have done an excellent job.

We regret that we cannot continue with this next week but we cannot do so for two reasons: There is a convention, I understand, that takes place next week and the curtain goes up on a show over here at 10 o'clock Monday; but we will continue on June 3, and we hope then to move right on to a conclusion. In the meantime, I hope possibly the committee can get together, possibly in executive session, and discuss some of the proposals that have already been submitted.

I think we must appreciate the fact that in a hearing of this kind, it is unusual for the committee to take any action until all testimony has been heard.

So, I wish to again thank you for your help you have given the committee, and I want to thank the members of the Commission—Chairman Hyde, Miss Hennock and the other members—for being as attentive at the hearings as you have.

We are all interested in the same end—you people in the industry, the members of the Commission, and the members of the committee—and we are looking for that right solution.

Commissioner Hennock. Mr. Chairman, may I say something?

I just want you to know that, as I have been here these last few days, most of the broadcasters have come up and talked to me and have remarked about your complete mastery of this subject as a new chairman of this subcommittee in charge of communications. It has been very inspiring to see you learn so much in a short time. I know how long it has taken me to learn the little I know in 5½ years, and I want you to know that they all feel that they are getting a wonderful hearing; and they look to you, Mr. Chairman, for relief, and they know they will get it at your hands and at this committee's hands.

I, personally, want to thank you for your patience with me when I got a little emotional about this, but, as I say, I have taken my share of the blame, and I feel the Commission has been perfectly honest about it, and my colleagues have, from the beginning; and it is a very critical situation, and it is a very difficult one, to place at your door as a new chairman.

I just want you to know we all think you are wonderful.

Senator Potter. You are gracious.

(Whereupon, at 6:15 p.m., the hearing was recessed until Thursday, June 3, 1954.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

TUESDAY, JUNE 15, 1954

UNITED STATES SENATE,
SUrCOMMITTEE NO. 2 ON COMMUNICATIONS OF THE
Committee on Interstate and Foreign Commerce,
Washington, D. C.

The subcommittee met at 1:32 p.m., pursuant to call, in room G-16 of the Capitol, Senator Charles E. Potter (chairman of the subcommittee) presiding.

Present: Senators Potter, Schoeppel, Bowring, and Pastore.

Also present: Bertram O. Wissman, chief clerk, and Nick Zapple, counsel for the subcommittee.

Senator Potter (chairman of the subcommittee). The subcommittee will come to order.

The hearings on the status and development of UHF television channels and S. 3095, a bill relating to the multiple ownership of television stations, will now come to order.

During the first phase of the hearings, held on May 19, 20, 21, the committee heard testimony from 31 witnesses. There are 37 witnesses scheduled for this phase of the open hearings.

It is the committee's hope that all the facts concerning this most important problem will be developed so that the committee will have before it a complete and thorough picture when it considers the record.

I have emphasized time and time again, orally and in written statements, that all interested parties are invited to appear or submit statements for the record.

I might mention now that tomorrow's hearing will begin at 9:30 in the morning in this room.

I sincerely regret that we had to postpone our scheduled date for this phase of the hearing; but, as you probably know, I have been busy to a certain extent in another hearing, which, by the way, hasn't been concluded yet, but as far as I am concerned I have adjourned to take up this hearing, which I am sure is conducted in a much more refreshing atmosphere.

I would like to first submit many statements and wires, too numerous to mention, and have them made a part of the record at this point.

463
Senator Charles E. Potter,
Senate Office Building, Washington, D. C.

Dear Senator Potter: While in Washington recently, Mr. Nicholas Zapple, of the Interstate and Foreign Commerce Committee, kindly permitted me to read the testimony of Ben K. McKinnon, general manager of WGVL-TV, Greenville, S. C., before your subcommittee. In his testimony, Mr. McKinnon took exceptions to the action of the Federal Communications Commission in permitting WSPA-TV, of Spartanburg, to move its transmitter site from one mountaintop in Greenville County to another mountaintop in the same county, both sites being approximately the same distance from Spartanburg.

The Commission on June 3, 1954, passed on a protest filed by WGVL-TV against our modification of construction permit to change transmitter sites. The protest raised substantially the same arguments presented by Mr. McKinnon before your committee. The protest was rejected by a 5 to 1 vote by the Commission. The memorandum opinion and order passing on the WGVL-TV protest is such a complete answer to Mr. McKinnon's objection to our changing transmitter sites that we would appreciate your including it in the record of your hearing.

We would like for your committee to know that our company has been diligently working since 1949 to bring to Spartanburg the benefits of a VHF television service. It was a result of our efforts that channel 7 was allocated to Spartanburg instead of Columbia, as first proposed by the FCC. It was our contention that since VHF channels had been allocated to Greenville, Columbia, Charlotte, and Asheville, all of which compete with Spartanburg for trade, it was necessary to the future growth of our city that we too have the advantages of a VHF channel. We feel it is extremely unfair and contrary to public interest that those who enjoy the privilege of a television broadcasting license in Greenville, as well as Anderson, should resort to the methods they have in seeking to delay Spartanburg having its own local television service.

Our television studios, soon to be completed, are in downtown Spartanburg, and as the Commission so well points out, our entire local program structure is geared to serve Spartanburg and the surrounding area. WSPA-TV is and always will be a Spartanburg station, but we will serve Greenville and Anderson just as WFBC-TV of Greenville serves Spartanburg and Anderson. To do less would be contrary to the public interest.

Greenville and Anderson were both in our city service coverage contour from our original site on Hogback Mountain. These cities will continue to receive city service from Paris Mountain, just as they would have from Hogback. Our service contours from Paris are within those from Hogback and our new site meets all requirements of the FCC. From the very beginning, it has been our proposed intention to serve the entire lower Piedmont section of the Carolinas, of which Spartanburg is the hub, with good television. Had we been contented with UHF coverage, we would never have expended the time and money we did in presenting Spartanburg's case for a VHF channel to the FCC which resulted in channel 7 being moved to Spartanburg from Columbia.

We feel that no television station, whether VHF or UHF, should ask for Governmental action to give them artificial support at the expense of the listening and viewing public. That is exactly what the Greenville and Anderson stations have done in their activities to delay Spartanburg from enjoying its own television station. That your committee may know how Spartanburg feels about this effort to delay this city from having a television station, I am enclosing copies of resolutions and statements adopted by the Spartanburg Chamber of Commerce, the Spartanburg County legislative delegation, the City Council, and the Radio and Television Committee of the Spartanburg Ministerial Association.

When your committee has all the facts, I am sure it will not take any action which would encourage the invalidation of the congressionally approved policy of the FCC which places the public interest above private interest and which is the very life and spirit of the great American system of free and competitive radio and television broadcasting. Our company would appreciate your having this letter and enclosures printed in the record of the proceedings of your subcommittee.

Respectfully submitted,

Walter Brown
President, General Manager, WSPA-TV
The Spartan Radiocasting Co.
UHF-TV statement, from Oklahoma City.

Senator CHARLES E. POTTER,

Senate Office Building, Washington, D.C.

DEAR SENATOR POTTER: The FCC has made it clear that UHF was necessary for establishment of a "truly competitive" television system in our country. This industry now faces a dilemma through costly mistakes made in Commission actions by allowing VHF operators to deviate from the rules just enough to stay "legal" and slip in the back doors to virtually destroy the budding UHF pioneer.

I'm sure there are many UHF operators who jumped into the television business hoping for a bonanza that wasn't there in the first place. Others made costly mistakes in overbuilding with lavish layouts and still others filed for and received grants for stations in markets not able to support TV of any sort.

That is not the case with KTVQ. This operator has had 20 years' experience in radio and television. We carefully analyzed the market potential, our own financial ability and spent a minimum of money on "show" but put our money in programs and promotion.

We are proud of the service record and the ground we have gained at KTVQ. We are in business to stay. KTVQ was the first UHF station in the State of Oklahoma, going on the air November 1, 1953.

We've taken some unmerciful beatings in these 6 months but I'm more than ever convinced that UHF, if properly operated, is good television and equal to all.

Here is the television story in Oklahoma City.

In August KTVQ was given a grant and we started building immediately.

In September the applicants for VHF channel 9 merged and were given a grant for a 1,572-foot tower, maximum power, etc. They immediately started promotion with newspaper space and their AM affiliate KOMA using "Wait for Channel 9, KTVQ, no conversion necessary" as prime copy. This seemed highly unethical and on the "dirty pool" side. Backed by a combined $20 million group, 1 we at KTVQ nevertheless said "Nuts to 'em" and went on. We stuck our necks way, way out and promoted like mad.

Channel 9 went on with "interim power," but never let up for 1 minute on the "1,572-foot tower—tallest in the world—no conversion necessary" campaign. They now operate "interim" but still infer the other.

In the meantime KMPT-TV, channel 19, another Oklahoma City UHF aspirant, went on the air. Two months later theyfiled for reorganization under the bankruptcy law.

WKY-TV, powerful, newspaper owned, kept up its barrage. The day KTVQ bought a page in WKY's newspaper announcing our antenna mounting atop the First National Bank—that day—WKY-TV ran a page announcing color as here now.

Talk about a change! One VIHF for 5 years and in 2 months—November 1 to December 29—2 VHF and 2 UHF.

WKY (4) of course had all the networks at the start. As soon as KWTW (9) hit the air they (KWTW) absorbed all CBS shows. KMPT—TV (19) got Dumont one show—Bishop Sheen, and WKY kept the others. KTVQ (25) got ABC, but only as second choice to WKY. From June through October WKY cleared for as many ABC shows as they could manage to handle, playing back the weaker NBC shows at 10:30 and 11 p.m.

We made an analysis of the WKY-TV schedule the week of May 16—22, 1954:

3 ABC programs were live off the network.
11 ABC programs were delayed kines (79 percent delayed).
28 NBC programs were live off the network.
14 NBC programs were delayed kines (50 percent delayed).

Why were they delayed? To serve the public? Hardly. Some of the delayed programs ran at 10:30 and 11 p.m.

A pure case of gobbling up all network. We don't believe a station can properly serve the public by simply throwing the network switch 80 percent to 90 percent of the time.

For that reason we endorse, in principle, a network regulation along the Senator John Bricker line or as placed before your committee on May 20 by Mr. Allen B. Dumont.

1 KTVQ.

2 KWTW.
Right here though let me say I find no great beef with ABC. They have been cooperative, but I personally feel they lack courage. ABC tells a story that through lack of clearance by stations they missed over $8 million in revenue last year. My argument to them is to build their own network instead of playing third violin to the WKY's of the country. They frankly admit they lack the courage to take a stand. However, it goes further—they are willing to sacrifice the new stations for temporary high V income, figuring that someone else will replace those that fall by the way. This requires action now—not 6, no, not even in months, but now.

It is NBC that, as far as KTVQ is concerned, has been malicious, monopolistic, and deliberately working toward reducing the number of competitors in Oklahoma City. A report on this is attached hereto. I believe in free competition without Government interference. However, monopoly, collusion, and unfair practice is beyond my ability to break.

With all the aforesaid problems we nevertheless succeeded in making important inroads.

ARB says we had 81,000 UHF homes on January 10. Hooper says we had 35 percent UHF saturation January 10. Pulse, Inc., gives us approximately 45 percent UHF saturation the latter part of January. We now claim 110,000 UHF potential viewers.

KTVQ is telecasting the Oklahoma City baseball games. We present good, top-drawer, live programs, good film programs, and each day looks some brighter.

There is a definite need for us. We are the only station taking a true interest in community welfare.

I love a good fight. I don’t believe in governmental control, but I believe in trustbusting or monopoly smashing by the Government before an entire industry is permanently unbalanced.

Attached is material on how some stations promote, the same basic copy ran for weeks on KOMA the KWTW radio arm.

Earlier in this letter I referred to V’s sneaking in the back door, remaining “legal” but only because the FCC has not set rules for certain situations. Here is an example.

For 20 years I was associated with what I term the Griffin Organization. They operate radio stations KTUL, Tulsa; KOMA, Oklahoma City; and KFPW, Fort Smith, Ark., and TV stations KWTW, Oklahoma City; KATV, Pine Bluff, Ark., and have a grant for channel 8 in Muskogee, Okla., granted to KTUL, Tulsa.

Because of my years of association with the Griffin Organization, and because a friendly relationship still exists, it is hard for me to point out some glaring actions that are being taken. However, these actions have a deteriorating effect on UHF and what hurts UHF anywhere in some degree hurts KTVQ.

The Griffins co-own my direct competition in Oklahoma City, channel 9 KWTV, which has participated in the foregoing has indulged in some “dirty pool” promotion in using their KOMA facilities to promote channel 9 on the basis of “no conversion necessary” and boasting of complete State coverage upon completion of their 1,572-foot tower, although actually operating on the smallest tower and lowest power in Oklahoma City.

Considerable speed and advance agreement was necessary between the Griffins and CBS to assure a CBS affiliation for KWTW. Inferring one thing and doing something else.

However, the complete Griffin story is told quite thoroughly in a petition filed by KCEH-TV, KSPG-TV and KOTV all of Tulsa against the channel 8 grant at Muskogee to KTUL of Tulsa. I refer you to those petitions for the full story.

These things are common knowledge in the field. Most UHF operators do not have the financial ability to hold out against well heeled V’s who are sneaking in the back door through present FCC legal loopholes.

Tulsa-Muskogee and Little Rock-Pine Bluff are super perfect examples of well financed V operators who haven’t the courage to go into UHF but are sneaking in through the loopholes and forcing UHF off the air.

The loopholes should be drawn together.

I do not claim to have all the answers, but I am confident that positive action will serve notice that UHF will not be abandoned and will give truth to the statements that UHF is needed.

It will offset in some part the bad press UHF is getting. It is very strange (and yet not so strange) how every UHF demise or problem receives widespread circulation in both general and trade press.
Please forgive the length of the letter but these are critical times and I state my case for your information.

Respectfully yours,

JOHN ESAU, President.

STATEMENT in re KTVQ—NBC by JOHN ESAU

November 1953: I discovered WKY was not carrying the Gillette Friday night fights due to ABC program commitments.

December 1, 1953: I was in New York and secured from Ray Stone at Maxon, Inc., the NBC Gillette fights order. Harry Bannister of NBC immediately told Ray Stone that NBC would not feed KTVQ even though lines were available. Ray Stone got "damn mad" and insisted, NBC kept refusing.

December 17, 1953: I wired General Sarnoff and Pat Weaver at NBC that inasmuch as Gillette and Maxon had ordered the fights, that KTVQ had cleared and thus Oklahoma City was deprived of this service. I told them this was rank discrimination and unless WKY did clear we would expect the order or I would file a complaint with the FCC under rule 3.658.

December 23, 1953: Harry Bannister, NBC, wired me that WKY would clear "in the future."

December 28, 1953: I wrote Mr. Bannister "in the future" wasn't good enough. I received no answer but WKY shuffled their schedule and started carrying the Gillette fights Friday, January 15.

(Simultaneously.)

December 10, 1953: I secured from Tucker Scott and Frank Silvernail at B. B. D. and O, an order for the Tuesday night NBC Armstrong Cork Co. Circle Theater. I was advised next day, by these men, that Mr. Bannister at NBC said they had no agreement with KTVQ and would not feed this to us. Mr. Scott and Mr. Silvernail kept the order in but to no avail.

December 20, 1953: I was again in New York and tried to reach Mr. Bannister but could not do so.

December 22, 1953: I wired Mr. Bannister from my New York hotel that if I did not hear from NBC by the following Monday I would apply rule 3.658 at the FCC. On Monday Mr. Tom Knode of NBC called me to tell me that they would feed KTVQ the Circle Theater.

(Simultaneously.)

December 19-22, 1953: While in New York I decided to sell and secure from agencies other NBC shows not cleared by WKY.

January-February, 1954: We got the local Chevrolet dealers and the zone manager to request of their home office the Chevrolet NBC Dinah Shore show Tuesdays and Thursdays at 6:30 p.m. Subsequently, these dealers were advised that Campbell-Ewald had ordered Dinah Shore for KTVQ.

February 22, 1954: Raymond Ruff, KTVQ sales manager, was in New York and confirmed this order.

February 25, 1954: I received a wire from the agency that they could not order KTVQ without NBC approval.

February 26, 1954: Raymond Ruff advised me by phone that he had just come from a meeting with Spike Knapp, NBC station relations, concerning the Dinah Shore show.

Mr. Knapp told Mr. Ruff that wherever and whenever NBC had anything to say they would not approve and feed KTVQ.

Mr. Knapp stated that John Esau had been "too damned unreasonable" and they (NBC) would do everything possible to kill or cancel any agency order for KTVQ service.

Mr. Ruff attempted to show Mr. Knapp that actually we had helped NBC by forcing WKY to clear for the Gillette fights. Mr. Knapp disagreed but admitted they'd have to feed KTVQ when ordered and reiterated that NBC would, whenever possible, kill any agency order for KTVQ.

March 16, 1954: NBC reluctantly gave KTVQ the order for the Dinah Shore show after agency and client insistence, however, we do not have the NBC Friday night Garroway show, and some others even though we are sure orders for KTVQ service have been placed with NBC.

April 20, 1954: NBC wired KTVQ giving us 2 days' cancellation notice of the Dinah Shore show inasmuch as WKY-TV had suddenly decided to take the show the following Monday.

May 18, 1954: No further word has been heard on the Garroway or other NBC shows.

All in all a severe case of deliberate harassment and collusion.
In order to resolve the UHF problem we should first determine what is basically wrong with our UHF television system. We should then decide whether there is reasonable possibility that these faults can be sufficiently reduced or eliminated.

The first important difficulty with the present status is this: It is now clear that in the foreseeable future of television there cannot be nearly so large a number of commercial stations as originally provided for in the allocations table. This means, since VHF channels are more desired, that the large majority of stations will be VHF and a minority will be UHF. Additionally, the VHF stations will generally be larger and the more influential. This leaves UHF stations in a relatively secondary or supplementary position, and further compounds their difficulties. Since there is no rapid cure for this trouble the only course remaining is to in some way equalize VHF and UHF. Since VHF is dominant, long established, and satisfactory, it is logical to not disturb it but rather to alter UHF so that it is made more nearly equal to VHF.

This brings us to the basic reason why UHF is less desirable than VHF. This simple reason is that the frequency is too high, particularly in relation to VHF. If we sufficiently lower the frequency of the UHF stations they would no longer be UHF but would also be VHF stations. This is the most desirable solution if it can be arrived at.

The next thing to consider is whether it would be possible to make this change, how to make it, and the effect of making it.

It may be possible, with the help of Congress, to acquire some spectrum space between present channels 6 and 7, and above channel 13. A study should be conducted to find what would be a realistic number of channels and to determine just what frequency bands should be sought from the standpoint of availability and usefulness.

It is urgently desirable, however, that the space decided upon should specifically include 3 particular 6 megacycle channels, namely: just below present channel 7, just above channel 13, and just above channel 6 (FM band). These three additional channels would be allocated wherever possible and be made first available to present UHF stations. It is presumed that an extremely large percentage of present receivers would be capable of receiving these channels, where assigned, when tuned to the adjacent channel and with only a "screwdriver" adjustment. Assignments would need to be made on the basis of somewhat greater adjacent channel mileage separation than is used at present at least for a limited time.

I would also suggest that in the case of the proposed channel just above present channel 6 that it not be assigned in any area where there would not be enough remaining FM channels to at least accommodate the present number of FM stations in that area. New York City might be an example of where it could not be assigned. It should also be required of any TV station given a permit for this channel to bear the cost of any shifting of FM stations that would be caused thereby. With a view toward not disturbing the FM situation the operation of TV in this band should be considered as temporary or transitional. At a later date, perhaps 5 years, when a large portion of receivers would tune the entire of whatever new bands are selected these stations might be required to move and this should be a condition of the grant. This would then amount to borrowing from the FM band in areas where it is not completely used and would not be a threat to FM which needs encouragement.

There would be only a very small number of presently operating UHF stations not absorbed by these three additional channels. For the minority still not accommodated there might have to be some transitional period of dual channel operation. The type of receiver conversion here required might well be in such a low-cost category that it could be handled directly by the broadcasters on a mass-production basis.

I further suggest the following possible procedure:

1. Freeze the issuance of all UHF construction permits and suggest that all presently authorized construction be at a minimum.

2. As soon as the spectrum additions are finalized action should be instituted so that all manufacturers would be required to include the additional ranges in all future receivers.

3. VHF procedure to continue with extra emphasis on slight adjustments to permit squeezing in of some additional stations where possible but substantially
adhering to present standards. Allow present UHF stations or permittees to compete with some favor for these channels.

4. Some consideration might be given to establishing one or more of the added channels (not including the specific three) as local channels with lesser spacing and lower maximum signal.

Some plan such as outlined above is the only course that could eventually equalize UHF with VHF. If however, it is decided not to attempt to equalize UHF but rather to continue it as a supplementary service there are various areas where effort should be bent to assure that UHF will survive. These would include such items as: Bettering the network situation, and improving the receiver situation.

West Caldwell, N. J., June 8, 1954.

Senator Charles E. Potter,
Washington, D. C.

Urge subcommittee on communications to provide equal competition for four networks to get top quality programing on UHF.

Wm. Carlin.

New York, N. Y., June 8, 1954.

Senator Potter,
Chairman, Subcommittee on Communications.
Senate Office Building, Washington, D. C.

Free enterprise can be well served by four competitive television networks. The United States economy can support four networks and a minimum of four TV outlets in all major markets. The key to the situation is strong programing now resting in the hands of NBC and CBS. Unless the UHF stations receive aid from the United States Senate a monopolistic situation will continue and UHF stations will die. It is essential that the Senate act to insure a fair opportunity for UHF stations. Please give this matter your earnest consideration.

Thanks.

Norman Knight, Weston, Conn.

Davenport, Iowa, June 4, 1954.

Senator Charles E. Potter,
United States Capitol, Washington, D. C.

Consider it absolutely necessary to do something to make it possible for UHF stations to exist. Two broadcasting companies now have it in their power to make or break stations and serious thought should be given Mr. DuMont's suggestion regarding dividing time among VHF and UHF stations; also extra cost of UHF sets imposes a tremendous burden on purchaser of sets so possibilities of obtaining listeners for UHF is handicapped. Elimination of excise tax on UHF sets would materially help. Have discussed this with over 200 of our dealers. Practically all agree with above. Appreciate your attention.

G. J. Timmermann.

Senator Charles E. Potter,
Washington, D. C.

I urge you and the subcommittee on communication to support equal opportunity for both UHF and VHF television. A strong four network system producing quality programing is necessary to support this important medium of communications. Competition serves the interest of a free society. Help four network TV and UHF.

William L. Hyde.

Senator Charles E. Potter,
Senate Office Building, Washington, D. C.: I urgently request that your Subcommittee on Communications provide equal competitive opportunities between the VHF and UHF in a manner that will allow four networks to compete on a basis of equality. Top quality network programing is vital for the survival of UHF stations now in serious financial difficulties.

W. I. McGinnity,
Allen B. Du Mont Laboratories, Inc.
470 STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

Senator CHARLES E. POTTER,

Senate Office Building, Washington, D. C.:  

May I request your Subcommittee on Communications to provide equal competitive conditions to make it possible for four television networks to compete on an equal basis.

WALTER E. HUSSELRATH.

EAST PATerson, N. J., June 4, 1954.

Senator CHARLES E. POTTER,

Senate Office Building:

I urgently request your assistance in seeing that the Congress provides equal competition situations as between ultra-high frequency and very-high frequency television channel in such a manner as to make it possible for the four networks to compete on the basis of equality and not on the basis of statutory or administrative disadvantage as you know top quality network programming is essential to survival of ultra-high frequency.

HARRY HOUSTEN.

Booth Radio & Television Stations, Inc.,

Senator CHARLES E. POTTER,

F-80 Capitol Building, Washington, D. C.

Dear Senator Potter: Having been a UHF television broadcaster for 1 year, I feel that my experiences should be voiced for the benefit of those interested in the trend of events which have led to the present situation.

On May 22, 1953, I began UHF television service with WBKZ-TV, channel 64, in the cities of Battle Creek-Kalamazoo, Mich., area, with a basic TV network contract wherein the network undertook to provide video service when facilities were completed—first estimated as June 1953; then December 1953; and finally scheduled for January 1954. In August 1953 this network decided set conversion was not to their liking and effectively tore up the contract and substituted a bonus kinescope contract at a material cost to WBKZ-TV for the privilege of carrying commercial network shows without compensation to WBKZ-TV. Good local, live, television shows were added so that WBKZ-TV carried attractive entertainment.

I have found that television station operation requires substantial amounts of national and regional advertisement to meet costs. This national and regional advertising is virtually nonexistent for UHF stations when distant VHF stations claim coverage of the area. These same VHF stations have on occasions prevented national and regional advertisers from purchasing time for programs on WBKZ-TV, although WBKZ-TV was ordered. This action was accomplished by refusal to permit off-air pickup of such programs and claims of complete coverage of the area. For example: March 28—Rodgers and Hammerstein show, General Foods, and the 1953-54 Stroh hockey games.

The influx of VHF television from Grand Rapids and Lansing, added to the VHF station at Kalamazoo, became progressively worse with the increase of tower heights and power. The recent “drop-in” of VHF, channel 10, at Parma has rendered this situation untenable and will remove all hopes for future economic progress by eliminating the present television network affiliations.

The situation in the Battle Creek-Kalamazoo market demonstrates the effect of multiple-city coverage in that UHF set conversion is severely restricted by high-power and high-tower VHF television stations located within a 60-mile radius. What originally appeared as a 1-VHF market has developed into a 3-VHF-station market with a new fourth VHF station now proposed to be located within a 35-mile radius of Battle Creek.

The expectation of the all channel receivers within a reasonable period from the start of television operations was not forthcoming. Instead, a penalty was imposed by the additional cost of UHF on new sets sold in the area. So-called cheap UHF conversions were nonexistent. Conversion costs averaged $50 or more per set. New sets design with comparable sensitivity and noise figures did not materialize and are not even now on the horizon.

Practical increases in power of UHF transmitters do not approach compensation for the sensitivity difference in receivers for the UHF-VHF bands.
The major cities—Grand Rapids, Flint, Lansing, Kalamazoo, Battle Creek, and Jackson—receive their second and third television service from VHF stations located 50 and more miles away. The local UHF stations in Battle Creek, Lansing, and Flint have been very severely hurt by this situation. Of the five operating UHF stations in Michigan, four have been losing heavily. Two of the four have ceased operations. Of eight Michigan nonoperating CP's issued, five have been returned to the Commission.

Intermixtion of VHF and UHF has proved disastrous for UHF station operators in that the incentive for conversion is very greatly reduced when programs of the two major networks are viewable, even poorly, on the VHF channels.

The only complete remedy for Michigan appears to me to be only in the complete use of the VHF band for all by reduction of power, beam tilting, and deterioration of the extensive grade B service of existing VHF stations. Otherwise the death of UHF in Michigan is easily foretold and with it the democratic system of competitive TV and an extension of the clear-channel syphilis.

Very truly yours,

John L. Booth, President.

P. S. Senator, would appreciate a reply.

As one of your constituents I ask that you fight for a democratic system of competitive TV.

We should not allow a few "fat cats" with increased tower heights and increased power on VHF to kill UHF in the United States of America.

John L. Booth.

WKRG,

Senator Charles E. Potter,
Chairman, Senate Communication's Subcommittee,
Senate Office Building, Washington, D. C.

Dear Senator Potter: I wish to take this opportunity to express myself in regard to the various proposals which have been made recently before your committee in regard to television broadcasting. As a broadcaster and as a television applicant, I wish to express my objections:

1. Any freeze on the granting of television applications.
2. The proposal to move all television to UHF.
3. Proposal to regulate network and hamper their free negotiation for affiliation with stations.

We have operated WKRG-AM and FM in Mobile since 1946. Part of that time WKRG was a Mutual affiliate, for a short time it was independent, and since 1948 has been a CBS affiliate. Until 1951 WKRG was not a profitable operation and sustained substantial losses. We have never, however, entertained any idea of asking Congress or the FCC to come to our relief. We were the first applicant for television in Mobile. We still do not have a television station although there are two stations operating in Mobile, a VHF on channel 10 and UHF on channel 48. We still do not have television in spite of our being the earliest applicant because another group applied for the same channel as we did. The two existing stations had no opposition and were, therefore, granted without hearing. Because WKRG had opposition it necessitated going through hearing and we are now waiting oral argument before the Commission, and we hope a construction permit, within the next few months. We have not asked the FCC or Congress for special consideration or any new set of rules, despite the fact that we were the first television applicant and are still awaiting a grant.

The history of our application for television goes back some 4 years and has been intensely active since the lifting of the freeze some 2 years ago. We have approximately $75,000 invested to date in attempting to secure a television station on channel 5 in Mobile. Prior to the lifting of the freeze we participated in the allocations proceedings and fought to keep channel 5 in Mobile. We have a substantial investment, as you can see, in money, time, and effort in attempting to establish a station on channel 5 and need not tell you what a freeze at this time would do to us. We will start over where we were some 3 or 4 years ago. We are not asking for special consideration. We are asking merely that the status quo be maintained so that we may complete the proceedings and follow our application to its conclusion based on the rules set up 2 years ago.

48550—54—31
Television has made tremendous strides in becoming a nationwide service in the past 2 years. The television industry is having its difficulties and its growing pains, particularly those stations that have been established on the UHF channels, but the VHF stations established in 1948 and 1949 also have their difficulties and their losses. Radio, back in the twenties and thirties and even in the forties, had its difficulties and trials and its losses. FM had its trials and tribulations and its stories of large losses, and to a great extent was a failure, but heretofore no one has asked for special consideration from Congress and the Commission, or a new set of rules in the middle of the game because some operators are taking a loss. It is up to the individual applicant for a new station to make an honest appraisal of his market, the station's potential for national and local business, possibility of network affiliations and whether or not the community needs the service he is about to offer. Having made an appraisal of these factors, he invests his money and he takes a chance. If his judgment is wrong and he sustains losses it still is not a justification for a new set of rules or congressional action.

The concern of Congress and the FCC must necessarily be with the service which the public receives, not with whether or not an individual station operator and a group of station operators make money or sustain losses, no matter how large those losses or how much we may sympathize with the individual. I have heard no great hue and cry from the public in this controversy. I cannot possibly see how a freeze on the granting of new stations can possibly serve the public interest and give them more service. I cannot see how making obsolete millions of receivers in the public's hands can serve the public interest. I cannot see how eliminating 12 channels from the television band can assist in making for a greater nationwide television service or serve the public interest in any way. If any fault lies with the radio and television industry itself for the present predicament of UHF, it lies with the receiving set manufacturers. All receivers should be manufactured to receive all channels, not only a portion. Despite this, not being true in the past, almost 100 percent UHF conversion has been achieved in many markets, among them Mobile and Baton Rouge.

In summary, it is our considered opinion as an operator of AM and FM radio for some years with some experiences in losses and as a television applicant with substantial money and time invested, that a freeze at this time would not serve the public interest but would work a great hardship on applicants, such as ourselves, who have gone through long and costly proceedings and are awaiting decisions. The concern of Congress must be with the public and the service it receives. An elimination of part of the present allocated television channels would not serve the public interest or the television industry which has made unprecedented strides in providing nationwide service in a short period of time. Regulation of networks, which was not discussed in detail above, would merely hamstring the free development of both the networks and individual stations and set a tremendous precedent, perhaps putting broadcasting out of its status as a free competitive service to the public. Again we ask no special consideration, only that the rules on which we have invested our time, effort and money be maintained and not changed in the middle of the game.

Respectfully,

FRANK CONWELL, WKRG-TV, Inc.

PRICHARD & BRENNER, BERKELEY HILLS, CALIF., JUNE 11, 1954.

HON. CHARLES E. POTTER,
UNITED STATES SENATE, WASHINGTON, D. C.

DEAR SENATOR POTTER: In further reference to the statement recently filed by me with your Subcommittee on Communications on the status and development of UHF, I should like to direct the attention of the committee to activities inimical to UHF and color development engaged in by some television merchandisers in a misguided effort to sell VHF-only monochrome receivers.

I am attaching a clipping taken from a small local newspaper (the entire publication is also being enclosed with this letter), which deprecates the UHF broadcast service. The item is not only full of misinformation, but omits the very important facts that channel 22 is on the air in Los Angeles with a test pattern with the highest powered equipment available, and is about to commence commercial operations, and that three applicants are competing for the opportunity to operate the remaining channel 34.
You will note that the same page also contains a news item on the status of color television, which likewise has the effect of discouraging the purchase of color television receivers.

I am advised by the editorial staff of this paper that the news items were furnished by the Giant TV Co., a retailer of television receivers at 6161 Langarker-shim Boulevard, in North Hollywood, Calif. The newspaper staff did no independent writing or research on the matter. It is unlikely that the retailer maintains a research staff for this purpose, and the articles, undoubtedly, were developed and distributed by either an advertising agency, a manufacturer of equipment, or a distributor.

It is respectfully suggested that your committee may wish to make inquiry as to the nature and extent of the practice, and the source of such “news” stories. If it appears that persons or companies connected with the sale or merchandising of television receivers are disseminating such information, it would certainly constitute an unfair and reprehensible trade practice of great disservice of the entire industry and to the public. Those engaged in such a practice should be required to desist without further delay.

Respectfully yours,

UHF TAKES A BEATING

In the past few months, the UHF (ultra-high frequency) picture has deteriorated to an unexpected degree. Many UHF stations are in continual litigation with the Government, accusing them of “desertion” and favoring the standard VHF stations. Hundreds of applicants for UHF station permits have withdrawn. Many UHF stations have gone off the air, unable to compete with the VHF ones. And, in general, it appears that UHF is a dead or dying issue throughout most of the country.

UHF refers to the extra portion of the broadcasting band which was to accommodate additional stations which could not be fitted into the more crowded VHF (very high frequency) wavelengths. But it turned out that the VHF band was not as crowded as feared. Cities, especially the medium and smaller ones, cannot yet afford or absorb more than a few stations.

Los Angeles has one UHF station, channel 28, which is on the air for a few hours per week with noncommercial programs. Many of these are put on by students of the various colleges. It has not been determined how long channel 28 will stay on the air.

JOSEPH BRENNER.

SENATOR CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Interstate and Foreign Commerce Committee,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: In connection with the hearings which your subcommittee has been holding on Senate bill 3095, On The Air, Inc., licensee of radio station WGBF and applicant for construction permit for a television broadcast station to operate on channel 7 in Evansville, Ind., respectfully submits the following statement and requests that it be made a part of the record of your hearings on this bill.

1. The sixth report and order of the Federal Communications Commission allocated one VHF and two UHF commercial television channels to Evansville. Recognizing that the VHF channel would provide better coverage to the entire area which considers Evansville as its metropolitan center, an area this company had been serving for almost 25 years with its AM station WGBF (1280 kilocycles, 5 kilowatts (D), 1 kilowatt (N)), On The Air, Inc., promptly filed an application for construction permit for a television station on channel 7. This application was set for hearing on a comparative basis with three other applications for the same channel. The hearing commenced on May 25, 1953, and the record was closed on March 23, 1954. The time for filing of proposed findings expires June 14, 1954.

2. Several applications were filed for the two UHF channels allocated to Evansville, but as a result of dropouts, each of these channels was assigned to the present licensees on an uncontested basis. One of the UHF stations went on the air September 27, 1953, and the other on November 15, 1953. As there are no operating VHF stations closer to Evansville than 100 miles, these UHF stations have not been faced with the problem of VHF saturation and the need for persuading people to convert their sets to receive UHF.
3. On the Air, Inc., has spent to date more than $35,000 in the prosecution of its application for channel 7 in Evansville. We believe that the other two remaining applicants for this channel have spent comparable amounts.

4. On The Air, Inc., opposes the suggestion that any freeze or hiatus be imposed with regard to the continued processing and granting of television applications. We believe that the people of this area are entitled to receive the benefits of VHF television as soon as possible, and that they should not be deprived of that right because certain UHF television grantees want governmental intervention to delay or completely eliminate the VHF competition which they knew they would eventually face when they applied for UHF facilities. Furthermore, the substantial investments made by On The Air, Inc., and the other applicants for channel 7 in prosecuting their applications, investments made in reliance upon an allocation plan issued by the Federal Communications Commission after 3 years of study and hearings on the subject, entitle these applicants to prompt action on their applications with no drastic changes in the allocation plan on which their applications were based.

5. On The Air, Inc., opposes the proposal that the intermixture of VHF and UHF channels in the same community be eliminated. The Federal Communications Commission has determined that the limited number of VHF channels available for television broadcasting cannot provide a truly competitive nationwide television broadcasting system. This means that in those communities where there is an intermixture, the elimination of such an intermixture would generally be accomplished by the substitution of UHF channels for VHF channels. The elimination of the VHF channels would in many cases (such as that of Evansville) mean that the entire area which looks to a given city as its metropolitan center could not receive adequate television service from that city until such unpredictable time in the future that UHF equipment may be available and put into service which would provide the tremendous amount of power necessary to give UHF coverage equivalent to the VHF coverage which is now possible with the equipment readily available for VHF television broadcasting.

6. For the same reasons as given in paragraph 5 above On The Air, Inc., opposes the proposal that all television be shifted to the UHF band and the proposal that the authorized limits of power and antenna heights of VHF stations be reduced so that the coverage areas of VHF stations would be roughly equivalent to the coverage areas of UHF stations operating with the limited power presently available to such stations.

On The Air, Inc., does not request permission to present oral testimony in this proceeding, as we believe that sufficient factual data are available in the record and in the sixth report and order of the Federal Communications Commission to support the conclusions set forth above. However, if oral testimony is desired by your committee, we will be glad to send a representative to testify, as we feel that this is a matter of great importance, involving as it does the success or failure of a truly competitive nationwide television broadcasting system.

Respectfully submitted.

ON THE AIR, INC.,
By MARTIN L. LEICH,
Executive Vice President.

MISS FRIEDA HENNOCK,
Federal Communications Commission,
Washington, D. C.

DEAR MISS HENNOCK: It was indeed a pleasure to see you again, to talk with you and to hear the position you take.

I personally, and many others in the industry also, appreciate your forthright stands in the face of heavy odds.

Your statement before the NARTB panel meeting last Thursday morning made a weighty impression on all present even though the room was "loaded" with V operators.

I want to compliment you and encourage you in your worthy efforts. I feel somewhat akin. As the one lone UHF operator on the 15-man NARTB Television Board of Directors, I too know what odds are.

No doubt it has occurred to you, but just in case it has not, there is one large segment of folks that should be on your team. That is, those radio-station oper-
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

ators who are not in TV and who missed the boat by not filing for a V and that group of losers in the present and upcoming competitive hearings. This segment can only go the UHF route and if no UHF then no TV, ever, for them.

Most sincerely,

JOHN ESAU, President.

KTVQ,
Oklahoma City, June 2, 1954.

MISS FRIEDA HENNOKK,
Federal Communications Commission,
Washington, D. C.

DEAR MISS HENNOKK: You told me my correspondence has fallen off. I'm taking immediate remedial steps.

Before I left the NARTB convention I discovered that Mr. P. A. Sugg is to head a "V coordinating committee" to counter the U group charges.

In the attached copy of a letter to Senator Potter I tell the Oklahoma City story. As you know Mr. P. A. Sugg heads up WKY-TV, WKY, which is also the morning Daily Oklahoman, the evening Oklahoma Times, and the farm paper the Oklahoma Farmer Stockman, plus a dozen other Oklahoma City holdings. Thus, as indicated in my letter to Senator Potter, Mr. Sugg's organization in collusion with NBC is not only trying to throttle me but now steps into a national picture to take leadership in throttling all UHF.

Rumor also has it that Mr. Hal Fellows will appear before the Senate committee in opposition to suggested remedial measures. As a member of the association for 20 years, a man who served on the board when Hal Fellows was brought in from Boston, I trust that his appearance, if made, will be properly construed as individual opinion and not as association president.

The association membership has not been asked and I believe would deny Hal the appearance if polled.

Keep up the good effort. It is possible that any action will come too late for my property, however, as long as there is life there is hope, but unless the right type of blood for a transfusion is found real soon this patient will not survive.

It is possible I'll make an appearance at the hearings but I can ill afford the cost of the trip to Washington and therefore correspondence may need to suffice.

Sincerely,

JOHN ESAU, President.

KTVQ,
Oklahoma City, June 1, 1954.

SENATOR JOHN BRICKER,
United States Senator,
Senate Office Building, Washington, D. C.

DEAR SENATOR BRICKER: Attached is a copy of our letter filing in information on the UHF problem as it pertains to Oklahoma City. As noted, I am not a newcomer to the broadcasting business but never in my 20 years of experience have I seen so many inequities.

I urge action on your bill (S. 3456) now, not 6 months from now, but in this session of Congress. To many, many of us the total solution is network affiliation. Network contract for KTVQ means the difference of staying in business or going out of business, and very soon.

At last week's annual meeting of the National Association of Radio and Television Broadcasting in Chicago I was elected to that organization's television board of directors. I tell you this not to boast but to point up that the industry thinks well of my abilities.

A great deal of agitation was noticeable at this meeting. The UHF hearings are having an effect. The V operators are frankly worried. I call attention to this with the knowledge that a "V coordinating committee" is being organized to appear at the Washington hearings. Interestingly, that committee is headed up by my competitor, Mr. P. A. Sugg of WKY, WKY-TV, the morning Daily Oklahoman and evening Oklahoma Times and the farm paper Oklahoma Farmer Stockman of Oklahoma City, indicating that your bill and muds interested in corrective measures are hitting home at the monopolies most of all.

Rumor also has it that Mr. Hal Fellows, president of NARTB, will appear in opposition to the UHF pleas.
As a 20-year member of NARTB I think it important that neither Mr. Fellows nor the "V committee" represents the NARTB and many members will object to such an appearance.

I recognize that everyone is entitled to their day in court but should be qualified as individuals and not as representative of any group.

I am in complete support of, and commend you for, your efforts.

Sincerely, 

JOHN ESAU, President.

OTTOFY-JEHLING BROKERAGE CO.,
St. Louis, Mo., May 24, 1954.

HON. CHARLES E. POTTER,
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: We in St. Louis hope that you will overrule the application of WTVI for channel 4. If you will go to the trouble of investigating who owns the stock in WTVI it is not out of the realm of possibility that the St. Louis Post-Dispatch who owns KSD (VHF) have control of WTVI. For many years the St. Louis Post-Dispatch operating KSD-TV has had a monopoly and if they were in any way able to get control of outlet No. 4 VHF this monopoly would continue on. The only information we can get in St. Louis is through the St. Louis Post-Dispatch and the Globe Democrat newspapers and KSD-TV and all of the information emanating through this source is strictly New Deal, as far as the Republicans are concerned in this part of the country it is strictly a lost cause.

Your suggestion that all of the new sets be equipped with UHF is all well and good but in St. Louis there are a tremendous amount of VHF sets and to convert these sets to UHF the cost is practically all cases would be between $100 and $135. In the case of my son who is a veteran he is doing good to be able to pay for the set he already has let alone trying to convert this set at additional expense.

It has come to my attention that throughout the country UHF stations are closing faster than they are opening and in other cities they have as high as 6 or 7 VHF stations why in St. Louis we have been forced to accept 1 station St. Louis Post-Dispatch KSD-TV it is beyond my comprehension.

Anything you can do to correct this very unfair condition will certainly be appreciated by St. Louisians.

It does seem to me that in these troubled times when people seek diversion through looking at their television sets that it certainly is an imposition to have these colored TV programs on when they ruin the reception for the poorer people looking at black and white.

I am,

Yours very truly,

Frank B. Ottofy.

The Potter Committee,
Senate Office Building, Washington, D. C.

GENTLEMEN: We are unalterably opposed at any effort on the part of the UHF group or their advocates to change the present manner of operating VHF television stations. The risks of television have been well-known to every professional broadcaster since its inception and this belated effort by the Government to step in and eliminate the risks of UHF broadcasters smacks of socialism in its worst form.

We support any effort to better serve the public with television reception, but this move by the UHF broadcasters is an all-out effort by some people in the industry to have a Government committee put them in a position to reap greater financial rewards than they first thought possible.

Our VHF channel 8 station serving Monterey-Salinas, Calif., risked approximately $300,000 with no network contracts, with no network advertisers, and with no assurance that we could appeal to the Government in case we did not make as much money as we had anticipated.

Our losses for the first 8 months of our operation amount to approximately $30,000. We have built VHF set circulation from approximately 10,000 to 70,000
and these sets would be made obsolete if any change is made. The public is entitled to protection.

As an illustration of the fallacy of this UHF position, a man by the name of S. A. Cisler received a television grant for our area before we received our permit. Mr. Cisler specified a site in his application and our careful checking revealed that he did not have this site. To our knowledge, he did not have equipment contracts, nor did he purchase equipment. His application before the Commission does not reveal a strong cash position, so should be checked by your committee. Mr. Cisler was not a resident of Monterey County and never has been. Yet he filed a protest which delayed television in our area for many months.

If you propose to change the present system, what steps will you take to underwrite our VHF channel $ losses in Salinas—Monterey? How will you underwrite conversion of 79,000 television set purchasers who bought sets depending on channel $? Will you guarantee all television stations to make money? How will you decide what stations to eliminate and in what cities?

The Federal Communications Commission, staffed by experts, are best qualified because of long study and thorough knowledge of television problems to handle all television. Your Potter Committee should enthusiastically support the policies of the Federal Communications Commission.

Respectfully,

John C. Cohan, President.

Dayton Educational Television Foundation,
Dayton 3, Ohio, June 1, 1954.

Senator Charles Potter,
Senate Office Building, Washington, D. C.

Dear Senator Potter: After reading press reports of the testimony of Robert J. Campbell before your subcommittee on UHF television on May 21 and then talking with Mr. Campbell following his return to Dayton, I must tell you that there are certain inaccuracies in his testimony.

As chairman of the board of trustees of the foundation, I have been instructed by the complete membership of the board to write you and to correct these inaccuracies that the record may contain proper information.

It might interest you to know that Mr. Campbell has resigned as executive director of the foundation effective July 4, 1954. It is my understanding that Mr. Campbell stated to your committee that the Dayton Educational Television Foundation was shortly to engage in a campaign for $250,000 to build a UHF station in Dayton, Ohio, for educational television purposes. This statement is not true.

Since the formation of the committee on educational television in Dayton in January 1953, and the later organization of the Dayton Educational Television Foundation, members of the board have given a good deal of thought and done much research on the possibilities of station operation here. This matter has been tabled at each one of these discussions and continues to be tabled.

After contacting various representatives of business and industry in the Montgomery County area, it is our feeling that it would be impossible to support such an operation in this area under current conditions. The estimates that we have had for construction costs to get on the air range from a minimum of $125,000 to a maximum of $250,000. Because of immediate pressures on all of our participating school systems and educational organizations, and because of the more or less immediate future need for classroom space, the participating organizations feel that it is impossible to make any major financial contribution to such a drive and that with the problems of providing adequate classroom space being uppermost that a drive for funds would be ill timed for the next year or more.

The Dayton Educational TV Foundation did present, as Mr. Campbell outlined, a number of educational television programs on all 3 commercial stations in the Dayton area during the first 3 months of 1954. With the closing down of WIFE-TV these programs were cut to a bare minimum.

We currently have 1 program on WHIO, one-half hour a week, and 1 program on WLW-D, one-half hour a week. The management of WIFE-TV went out of its way to be cooperative with the Dayton Educational Television Foundation in giving us of their time and facilities. Since they have gone off the air, we have had a firm statement of policy from the management that should they
return to the air at any time in the near future, they would allot to us as public service broadcasting, 10 percent of their total time on the air, both class A and B.

This offer, we feel, is unprecedented and should WIFE return to the air, we feel that in the light of this offer, there would be little need for us to construct a station. We do, however, feel that one of the major problems in the Dayton area is that of being a mixed market point, both a VHF and UHF center.

It is my personal belief that the answer to the current problems of UHF is in clarifying these mixed markets and bringing communities into a single status—either all UHF or all VHF.

The economic pressures and conversions and network affiliations produce a disadvantage for the UHF broadcaster in a mixed market.

The foregoing statements have been authorized by the membership of the board of the Dayton Educational Television Foundation and we respectfully request that this letter be made part of the record of the hearing, if possible.

I shall be happy to add to these comments should the committee desire it.

Sincerely,

JAMES F. CLARKE.
Chairman of the Board.

CERTIFIED TV AND APPLIANCE CO., INC.,
Norfolk, Va., May 21, 1954.

Hon. Charles Potter,
United States Senate, Washington, D. C.

Dear Sir: I felt that it was my duty to write to you regarding the problems facing UHF since I have an obligation to my customers and the stations now operating on UHF.

There were three stations operating at one time, one has discontinued operation and I understand others might be forced to do so.

In order to evaluate the conditions facing the UHF stations, I feel that an immediate freeze should be instituted preventing VHF channels from going into areas where service is now being rendered by UHF stations depriving them of revenue and network affiliations.

I would also like to recommend that there be no mixture of VHF and UHF in the same markets. It seems to me that if the facilities were equal then the stations could then compete on a program basis. This of course would also eliminate the many problems facing the receiver manufacturer of trying to produce receivers and antennas that will receive all bands.

I trust the above information is helpful to you in your study of the UHF problems. If I can be of further service, please let me hear from you.

Yours very truly,

Irving Braun, President.

Walter Reade Theatres,

Hon. Charles E. Potter,
Senate Office Building, Washington, D. C.

Dear Senator Potter: While we are represented at your current hearings by the UHF industry coordinating committee, I thought you might be interested in the attached letter which I have sent to Mr. Stanley Adams, president of ASCAP, requesting that ASCAP waive its normal fees for new struggling UHF stations and instead accept a token fee to help the stations through this current critical period.

It is our sincere hope that the current hearings will result in action beneficial to UHF stations, and particularly will result in some decision which will make set manufacturers and distributors handle only all-channel receivers.

Very respectfully yours,

Walter Reade, Jr.,
President.
WALTER READE THEATRES, INC.,

Mr. Stanley Adams,
ASCAP, 575 Madison Avenue,
New York, N. Y.

Dear Mr. Adams: You probably will recall that my association, and my company’s association with ASCAP, has been a long one. I have on my desk a contract, or should I say a license agreement, from ASCAP for our television station, WRTV channel 58, in Asbury Park, N. J.

As I read it, and understand it, you will become a partner of ours based on our gross business. Mr. Adams, I am sure that you and the rest of your associations of ASCAP are completely familiar with the problems of small television stations, in particular new UHF television stations. My experience with ASCAP, and my knowledge of your income and expense, prompted me to remind you that the main reason for ASCAP’s interest in WRTV is for licensing control rather than income. The profit and loss of our television station, as well as others, is an open book, as we must report to the FCC annually.

Would it not be well to reconsider this type of contract and instead take a token license payment, say $25 a quarter, to indicate ASCAP’s confidence in small-town TV, and to encourage us to render the community service which we are all desperately trying so hard to give? At such time as our type of station is an economic success, I am sure we will be thrilled to welcome you back as a partner, but I think it unfair and unwise for a partner to attempt to receive dividends before there are at least some prospects for profits.

May I also point out that hearings are to be held in Washington later this month by the Potter committee, the Senate Small Business Committee, with Senator Potter presiding. It would be of tremendous public relations benefit for ASCAP if it would be possible to announce at these hearings that an organization of the caliber and standing of ASCAP had the foresight to recognize the problems of the small UHF television station, and that as a means of aiding and encouraging small UHF broadcasters, had waived its normal contract requirements and instituted a token payment system until such time as this class of TV broadcasters could get out of the woods.

I would appreciate the association’s reaction to my thoughts.

Very truly yours,

Walter Reade, Jr.,
President.

WKAP,
Allentown, Pa., May 24, 1954.

Senator Charles Potter,
Senate Office Building, Washington, D. C.

Dear Senator Potter: The following telegram was sent to Miss Frieda Hennock, Commissioner, Federal Communications Commission:

“We read in Radio Daily, May 20, your five recommendations relative to VHF and UHF. We recommend their adoption in their entirety. We also recommend that all TV stations be on UHF band as alternate proposal. Copy sent to all Commissioners and Senator Charles Potter, subcommittee chairman.”

I would greatly appreciate if you will support her five recommendations, for I feel that her proposal is the best so far presented. It will permit UHF to survive.

Sincerely yours,

Queen City TV,
O. R. Davies,
Manager.

Senator Charles Potter,
Senate Subcommittee on Television,
Washington, D. C.

Honorable Sir: I know that in this controversial affair you want the experience of the ordinary citizen, too.

Lakeland has no TV station of its own, but we generally believed our area would be served adequately by WSUN-TV, a UHF station. But we soon found out that the nicest residential areas here could not pick up this St. Petersburg station without 70- or 80-foot towers, because of a ridge running north and south on which our Florida Avenue sits. And even for those willing to do this, only a mottled and unreliable picture results.
We have television here now, however, because Jacksonville's VHF station power has been raised, and a wonderful picture comes to us from this station 185 air-miles away, whereas we cannot get St. Pete's UHF less than 50 miles away. And television men tell us that we will get Orlando's VHF excellent when it comes June 1. And if this condition exists down here where everything is almost flat, consider how much better coverage VHF gives in hilly country, for the suburban, rural, and small-town receiver must be considered, too.

Thus if VHF stations are being favored, it obviously is because they have more merit in public service. American people are spreading out, and our regulating bodies must go along with those who serve best.

 Very truly yours,

JAMES E. WELLS.

WKEI,  
Kewanee, Ill., May 21, 1954.

HONORABLE SIRS: I would like to offer the following statement in regard to the television allocation problem:

There are approximately 350,000 television sets in this area, of which possibly 200 can receive UHF broadcast. I believe it would be economic suicide to go on the air with a UHF outlet. WOC-TV is basic NBC, WHBF-TV is basic CBS. So far as I can determine, in other markets, ABC and Du Mont seem to be more interested in VHF stations than UHF in their programs.

There is a possibility of another VHF channel in this area if the FCC would relax their distance separation requirements by 5 miles or permit a slightly modified directional antenna to be installed to take care of this situation; however, this would conflict with their "allocation schedule."

 Very truly yours,

WKEI BROADCASTING CO.  
E. D. SCANDRETT,  
General Manager.

KSAN-TV, THE PATTERSON STATIONS,  

FEDERAL COMMUNICATIONS COMMISSION,  
Washington, D. C.

(Attention: Rosel Hyde, Acting Chairman.)

DEAR MR. HYDE: I have returned to San Francisco from the Potter UHF Senate subcommittee hearing, and I wish to call to your attention some of the developments of KSAN-TV, the only UHF station in the San Francisco Bay area.

We are operating without a network. We find this more difficult than we first assumed it would be, due chiefly to the lack of cooperation given by the manufacturers of television sets and the sales in this territory.

We reach approximately 2½ million people with a reasonable signal, which is almost 20 percent of the entire State of California. With this important market, and our experience in engineering, management, and programming, if we cannot interest the public to buy converters without a network, I don't see how any place in the United States could.

Find enclosed the following:

(a) Our program schedule. You can see that all evening we have sports programming and most all of it live, something that cannot be had on any other television station in the bay area. With the cooperation of the manufacturers, we could get converters established, but it is a longer and harder pull than we ever anticipated, not having their full cooperation.

(b) San Francisco Chronicle of June 1, 1954. This shows the attendance of the Seals and reporting the winnings. This was the Memorial Day crowd of about 20,000.

(c) San Francisco Chronicle of June 5, 1954, which shows a Saturday afternoon game with 12,447 attendance, still winning.

(d) San Francisco Chronicle of June 7, 1954, showing the Seals still playing Oakland with an attendance of 15,279, making a total attendance for the Oakland attendance in San Francisco of 61,043, right close to the greatest record for a week's attendance ever made in San Francisco since 1948. This attendance record is expected to be topped the following week when Oakland Oaks come to
San Francisco to fight it out for second place. At the present San Francisco is leading.

During a cold, chilly, foggy night, you can anticipate the many thousands who watch KSAN-TV for the San Francisco-Oakland play-by-play telecast.

(c) San Francisco Chronicle June 5, 1954, sports page 6II, showing the harness races at Bay Meadows. The total official attendance to date is 86,000. KSAN-TV filmed important parts of these races in the afternoon, rushed the film for development, and televised them that same evening between 7 and 7:30 p.m.

You can see that KSAN-TV has spared no money or labor to bring to the television homes the fresh, live, and most programs of the greatest public interest possible. It shows that KSAN-TV, UHF Independent, is the only threat to the VHF network monopolies. We're certainly doing our very level best to carry through the suggested overall plan on our part of a nationwide full and competitive television system so arranged and suggested by the officials in Washington, and particularly the Federal Communications Commission.

I sincerely believe that such an honest effort should be recognized to be in the public interest as a grocery store on the corner. The corner grocery store has a right to apply, and expect to receive, a liberal loan from the Small Business Administration, and yet this grocery store can be duplicated many times in the same city, and certainly cannot possibly be expected to serve the entire bay area—but radio and TV, with its great importance, is refused the same consideration as the said grocery store. Why? I do not know. It looks unfair and unjust. If any individual radio-TV owner, after receiving such a loan from the Small Business Administration, were to operate improperly there are rules and regulations that could certainly control him completely; therefore, the whole industry of UHF particularly should not suffer because of a fear of one, or even a few individuals' improper operation.

With financial assistance from the Small Business Administration, UHF stations could have immediate assistance and be successful in their efforts until the major assistance may come later on. I sincerely request serious consideration of this suggestion of Small Business Administration loans to sincere and capable UHF operators. It could be possible that the members of the Federal Communications Commission, the members of the Potter committee on UHF, along with necessary Senators, could advise with the policymakers of the Small Business Administration and come rapidly to such a conclusion as I have suggested. I would appreciate an answer to this lengthy letter suggesting some kind of an action if possible.

The best surveys and other sources, indicate that there are approximately 40,000 converters and/or all channel sets in the service area of KSAN-TV. There are an average of approximately 25 requests a day coming to KSAN-TV alone for information regarding installation of converters. Other business firms and service shops receive requests also, but these installations are slow and will take a long time to fill and to secure sufficient listening audience for successful sales campaign on KSAN-TV. We believe that 100,000 sets to receive UHF will be necessary to have a successful sales effort on KSAN-TV. With immediate assistance this can be accomplished, but that assistance is needed now.

San Francisco needs the following in order to develop UHF:

1. The set manufacturer should be forced to sell nothing but UHF-VHF sets. Even the sets in his warehouse and in his dealer's warehouses and showrooms should be immediately converted to receive both UHF and VHF before offering for sale. All installations of antennas for a television set should include both UHF and VHF. They should not permit the sale of a television antenna that would receive only UHF or VHF.

2. The manufacturer should have the responsibility of converting the sets that he has in the market. At his expense these sets should be brought up to date by the addition of antennas and converters that will permit these sets to receive UHF.

3. The Government should take the excise tax on television sets and make available as grants to both the manufacturer to accomplish the point number 2 above, and to the UHF television station to sustain operation until the above can be accomplished.

4. All network programs not being released by any other network station should be available to the UHF station.

5. All television network programs should be made available to the UHF station for a second release when kinescoped at the expense of the UHF station. This would make the network programs available at other times of the day and week different from the original playing time so that people that could not see them at that time could view them at a more convenient time. This would also
permit the person to see many network programs that they would be interested in seeing that were shown originally.

The above five numbered paragraphs should be seriously considered providing the Federal Communications Commission and regulatory bodies decide to continue the operation of UHF and VHF operations in the same market. They should be considered in the light of their advantages in the interim period when a television station is either to be moved from UHF to VHF, or from VHF to UHF. There should be some consideration during this intercession period for those who have seriously attempted to establish the public service that the Federal Communications Commission has planned and proposed and granted.

Most sincerely yours,

KSAN-TV
S. H. Patterson, Owner.

WCAN-TV, CHANNEL 25,  

NICHOLAS ZAPPLE, Esq.,  
Committee on Interstate and Foreign Commerce,  
United States Senate, Washington, D. C.

DEAR NICK: You are probably up to your ears in testimony but I think this is important. It is just a start in the right direction and not the total cure. You recall that although I proposed a total transition over a 5-year period to UHF, I also suggested an interim relief. Here's a quickie.

There are supposed to be about 3 million UHF receivers in the country. Almost 50 percent of these are in 10 major markets, as follows:

Major intermixed markets (not considering allocations of CP's)

<table>
<thead>
<tr>
<th>Market</th>
<th>Total sets</th>
<th>UHF sets</th>
</tr>
</thead>
<tbody>
<tr>
<td>San Francisco (3 V's, 1 U)</td>
<td>840,000</td>
<td>70,000</td>
</tr>
<tr>
<td>Miami (1 V, 2 U's)</td>
<td>240,000</td>
<td>120,000</td>
</tr>
<tr>
<td>Louisville (2 V's, 1 U)</td>
<td>370,000</td>
<td>82,000</td>
</tr>
<tr>
<td>Portland, Maine (1 V, 2 U's)</td>
<td>90,000</td>
<td>70,000</td>
</tr>
<tr>
<td>Boston (2 V's, 1 U)</td>
<td>1,400,000</td>
<td>105,000</td>
</tr>
<tr>
<td>St. Louis (1 V, 3 U's)</td>
<td>620,000</td>
<td>215,000</td>
</tr>
<tr>
<td>Oklahoma City (2 V's, 2 U's)</td>
<td>260,000</td>
<td>83,000</td>
</tr>
<tr>
<td>Dayton (2 V's, 1 U)</td>
<td>637,000</td>
<td>32,000</td>
</tr>
<tr>
<td>Pittsburgh (1 V, 2 U's)</td>
<td>945,000</td>
<td>250,000</td>
</tr>
<tr>
<td>Milwaukee (1 V, 2 U's)</td>
<td>668,000</td>
<td>318,000</td>
</tr>
<tr>
<td>Total</td>
<td>6,068,000</td>
<td>1,345,000</td>
</tr>
</tbody>
</table>

In these markets you have serious intermixture which sets the pace for the country. There may be some "secondary" markets that I have not yet covered which can be included, but, if these markets are changed to all V or all U, whichever is predominant, you will be eliminating almost 50 percent of the problems of the country in one stroke without serious dislocation. More important, it sets up the "laboratory" for the total elimination of intermixture and reallocation.

Where there are only 2 stations presently operating in a market, like Portland, Ore., the intermixture problem is not acute. However, if any additional stations are to be licensed in such markets they should also be designated either all UHF or all VHF. There should be no further licensing of any stations whether it be black and white or color that create intermixture. By cleaning up over 50 percent in about 90 days in reallocating all UHF stations during the "hiatus" you are assured of an orderly transition in the future.

Regards.

Sincerely yours,

LOU POLLER,  
Midwest Broadcasting Company.

WESTINGHOUSE BROADCASTING CO., INC.  

HON. CHARLES E. POTTER,  
Chairman, Subcommittee No. 2 on Communications,  
Committee on Interstate and Foreign Commerce,  
United States Senate, Washington, D. C.

DEAR SENATOR POTTER: Reference is made to the hearings held by your subcommittee May 18, 1954, et seq., in the matter of VHF-UHF television broadcasting and on Senate bill 3065 dealing with multiple ownership. It is our purpose in writing to you to set forth our position on some of the suggestions made by witnesses in their testimony.

Westinghouse Electric Corp., the founder of commercial broadcasting with the advent of KDKA, November 2, 1920, has been continuously interested in radio and television both as a broadcaster and as an equipment manufacturer. Working with television methods since 1926, Westinghouse successfully demonstrated, in 1928, the first all-electronic television system, made possible by a new television tube (iconoscope) invented by Dr. Zworykin in our research laboratories. Westinghouse, in conjunction with the Glenn L. Martin Co., in 1945-49, developed and successfully demonstrated the television broadcasting system known as stratovision in which television transmitters were installed in high-
flying aircraft. At 30,000 feet television service can be rendered over an area having a radius of 200 miles. Westinghouse built a television station in Boston (WBZ-TV) in 1947 and has been operating it since that date.

We see no problems now facing the industry which are either fundamentally different from many problems previously faced and solved or any which can not be solved by American ingenuity without any drastic action necessary on the part of either the Senate subcommittee or the Federal Communications Commission.

The present allocation plan may not be perfect but it represents more than 3 years of intensive (and expensive) cooperative effort between the entire industry and the FCC. It should not be lightly or hastily cast aside because of a few protests from those who are unable or unwilling to face life in a free competitive economy.

Westinghouse, along with many other pioneers, in the early days of radio and again in the early days of television faced exactly the same problems being presented to the Senate subcommittee by UIIF protagonists. The problem then and now is an adequate number of sets in the hands of the public and attractive programming which the advertising industry is willing to support.

The Westinghouse experience in television at Boston is typical. Although our investment was approximately $1 million, we operated at a loss from sign-on in June through the balance of 1948 and all of 1949 for a total in excess of $300,000. This loss was not recovered until October 1950. We had faith in the future of the industry. Even as late as the first quarter of this year, according to FCC statistics, only 46 of 177 TV stations reporting made a profit and only 33 VHF stations (37 percent) were operating in the black. After the normal shakedown period inherent in any new industry, this condition will improve and stabilize.

It has been proposed to require all VHF stations to now reduce their existing coverage area to avoid overlap of a nearby UHF station. This would result in inestimable damage not only to the stations but to the members of the public living in the present service areas. For instance, if the coverage area of channel 4 in Washington, D.C., were so reduced, thousands of citizens living in Hagerstown, Md., and in the surrounding area, would be denied service they have been enjoying and relying upon for so many years.

These citizens (and those in any other similar community in the United States) have a right to, and will demand, a freedom of choice among multiple-program sources. Since Hagerstown has been assigned only 1 channel (and it certainly could not support more than 2), it is clear that additional programs to permit freedom of choice (and a competitive broadcasting system) must come from outside areas. This service can best be furnished by the existing VHF channels located in cities large enough to support multiple-program sources. The effect of this reduction of service area proposal on rural America would, to us, be comparable to suddenly denying them radio service by requiring all clear channel broadcasting stations to reduce power to the equivalent of a local station.

If the principle be established that the coverage of the VHF stations in Washington is limited to eliminate overlap with the UHF station in Hagerstown, then it follows that the UHF station allocated to Frederick, Md., must be limited to prevent overlap with the UHF station allocated to Hagerstown. Under such a philosophy the citizens of Washington would receive four competing services, the citizens of Frederick and Hagerstown, respectively, would each receive a single service and the vast rural audience living between these cities would be denied any service.

Furthermore, such a philosophy is physically impractical in a situation like Allentown, Bethlehem, and Easton, Pa. Two stations have been allocated to Allentown, 1 to Bethlehem and 1 to Easton Pa. Under the present plan this should afford 4 competing services to the residents of all 3 cities and the rural areas surrounding them. It seems to us inconceivable that anyone could seriously propose that the coverage areas of these stations be so reduced as not to overlap (assuming this was physically possible) thereby reducing Bethlehem and Easton to a single service and Allentown to two services. The theory becomes even more untenable when we realize that most cities in the United States have been allocated but a single television channel and the whole State of New Hampshire only 1 city gets more than 1 and in the State of New Jersey only 2 cities get more than 1 channel. The public interest lies in the direction of making every effort possible to increase the coverage of each station.

In 1928 there were approximately 600 radio stations in the United States surviving upon approximately 1 percent of the Nation's total advertising dollar.
Today there are over 3,000 stations in operation and the overall gross billing of the broadcasting industry, radio and television combined, is almost at the $1 1/2 billion mark. Many a community which does not have a local newspaper has a local radio station. We have seen this growth take place in America, under the American system, without equal coverage and without any attempt to nullify the law of physics with arbitrary restrictions on coverage.

It has been suggested that the FCC now move all television stations into the UHF band. A determination of all of the remaining applications pending before the FCC will add approximately only 100 more stations over those now in existence or authorized. As now discerned, the television industry will consist of about 670 stations in 325 communities (based upon present applications and licenses). The total dollar damage, not to mention the inconvenience, that would result to the industry and to the public should such a suggestion be approved is beyond imagination. 27 million receivers are now in the hands of the public.

It is a useless suggestion. Requiring all stations to move into the UHF band would not equalize the services. The power ratio for approximately equal coverage between the lower end of the VHF band (channels 2 to 6) and the upper VHF band (channels 7 to 13) is approximately 3 to 1. The ratio between the upper portion of the VHF band and the lower UHF band (channel 14, etc.) is again approximately 3 to 1. And the ratio between the lower UHF band and the upper UHF band is again approximately 3 to 1. Therefore, to force all existing VHF stations to abandon their present service and move to the UHF band solves nothing and destroys existing television service. Rural and suburban America will not accept such a decision.

It has been suggested that the FCC declare an immediate freeze—suspending all new station grants and existing station requests for modifications. There are now 377 TV stations operating in 287 communities in the United States and additional sums have been invested or obligated to construct many of the remaining 200 stations which have been authorized by the FCC. The bulk of the industry as it is now discernable is either on the air or has been authorized by the FCC and only about 100 new stations are awaiting disposition of hearing procedures. Such a freeze, at this time, is a useless locking of the barn door.

Furthermore, many of those awaiting final orders must be in the same position as we are. In the Portland, Oreg., TV hearing now awaiting decision, our expenses were over $270,000 and we have frozen risk capital of $1,015,000; in the Pittsburgh TV hearing now underway our expenses to date are over $150,000, and we have frozen $5 million of risk capital pending a final decision. A freeze at this time would fatally injure many applicants.

It has been suggested that compulsory network affiliation is the solution. Radio has grown from 600-odd stations to over 3,000 stations and networking has developed simultaneously under 4 national networks and many hundreds of smaller networks are serving the American public today—all without any mandatory instructions from a governmental agency.

We believe that the history of radio is conclusive proof that the public interest requires the history of television to follow the same path of free and open competition. The radio industry has seen the birth, growth, and struggle for top position among national and regional radio networks. We have seen the relative positions of networks change more than once over the years. This free play of economic forces has been in the public interest. The poorest man in the United States now enjoys free daily entertainment unavailable to the richest man in any other country in the world. And, of equal importance, this growth has taken place within the framework of our antitrust laws which, in our opinion, have proved adequate to prevent monopolies.

It has been suggested that stations be required to accept the affiliation with a predetermined network organization. This proposal, in its ultimate conclusion, means Government owned and controlled broadcasting in the United States. Assuming a station is required to affiliate with a named network and a dispute between the parties to the rate payable and acceptable, the Government will be immediately in the rate-setting business, with all of its complications—technical facilities available, coverage, constantly changing set statistics, etc. In the next step, the individual station's popularity (or lack of it) and its consequent ability to attract revenue from local advertising sources, will depend upon the program furnished by the network. Since it was required to sign the network contract, the station would surely be granted the right to require Government control of the programs. And the final step, assuming the Government required the network to produce more expensive and attractive programs, the network, under such compulsion should be able to demand Government subsidy.
The problem is neither new nor incapable of solution. The condition is identical to that which existed in the early days of radio and of VHF television. The first television receivers were designed for operation in the lower VHF (channels 1 to 6). Later, channels 7 to 13 were opened. Standards were changed (405 lines to 525 lines). The same problems of coverage and lack of receivers were faced by the industry in those days. Sets capable of receiving only certain channels were subsequently replaced by the present sets which receive all 12 channels as rapidly as the ingenuity and economics of America permitted. We believe that the current problem is identical and that the solution is inevitable—if American industry is allowed to remain free to attack the problem.

In 1953, 14.4 percent of all Westinghouse TV production featured built-in all-channel UHF–VHF tuners. In addition, more than 80 percent of our 1953 sets which did not contain built-in all-channel UHF tuners, contained provision for internal adaption to UHF and our distributors in UHF areas regularly stock coils for this internal UHF adaption. The balance accept external adapters. For the first half of 1954, approximately 24.6 percent of our Westinghouse TV production features built-in UHF tuners, and the trend is apparent.

For more than a year, our sales department has maintained market development teams in the field to assist in the development of new UHF markets. When a new UHF station is about to go on the air in an area not previously served, our market development team moves in; our sales and marketing experts aid and instruct the local distributors and dealers by bringing them up to date on the latest methods of TV merchandising, and our technical representatives train the local service technicians in modern television servicing techniques.

This development of UHF markets has not been without its problems. When the station did not open on the day predicted (in some instances opening was delayed several months) great dissatisfaction was created among purchasers, distributors, and dealers. In other cases the signals from new stations were not technically acceptable, resulting in unsatisfactory reception at consumer level. As a result, consumers blamed the set and caused untold expense to dealers, distributors, and ourselves in attempting to solve consumer problems. In cases where the signals were adequate, many programs were unattractive and the public quickly lost interest, dulling consumer desire for ownership of UHF sets. However, these problems are not new to the television industry nor are they unique. Patience and ingenuity solved them in the past and will do so again.

In our opinion the greatest "shot in the arm" that the Government could give to the UHF operators at the moment, without disrupting existing investments or changing the American broadcasting system as it is known, would be to repeal the excise tax on UHF–VHF television receivers. We endorse the position presented to the Senate subcommittee on this point by Mr. Glen McDaniel, president of RETMA. Since a UHF receiver costs more to manufacture than a VHF receiver under present-known manufacturing processes the elimination of this tax would practically eliminate the manufacturing cost differential and the set thereby becomes more attractive to manufacturer and to the purchaser.

We believe that the complete solution of all problems presently facing the industry lies in placing more UHF–VHF receiving sets in the hands of the public and more television stations on the air as quickly as possible.

Sincerely yours,

CHRIS J. WITTING, President.

STATEMENT OF JOSEPH BRENNER ON THE STATUS AND DEVELOPMENT OF THE UHF CHANNELS IN THE UNITED STATES

Mr. Chairman and members of the committee, my name is Joseph Brenner; my address is 821 South Beverly Drive, Beverly Hills, Calif. I am an attorney engaged in radio and television matters; I am a member of the FCC Bar Association and a former member of the staff of the Federal Communications Commission.

I am pleased to have been given this opportunity to express my views on matters which will assist the UHF television broadcast service.

I previously have filed with the Federal Communications Commission four petitions for amendment of the Commission's Rules which, if adopted, I believe will be of material aid to UHF broadcasters and to the television broadcast service generally. I will discuss these petitions in a moment but first desire to present some additional proposals for consideration. These additional matters were not included in the petitions on file for the reason that they did not appear to be within the jurisdiction of the Commission.
Two of these matters deal with the UHF income-tax situation.

1. First, I propose that appropriate steps be taken to give UHF station operators the opportunity to offset expenditures made in connection with the promotion and development of UHF audience circulation in the early years of operation against later earnings of the station after such circulation has been established, or, if there is an advantage in so doing, that they be permitted to treat all of such expenditures as current operating expenses.

UHF broadcasters will thus be provided the same election that newspapers are given by section 23(bb) of the Internal Revenue Code. Under that section newspapers, magazines and other periodicals may elect to treat expenditures made in establishing, maintaining, and increasing their circulation (subject to some limitation) as either current operating expenses or as charges to their capital accounts.

The effect of such provision will be to encourage UHF operators to expend funds for the specific purposes of securing and aiding conversion to the UHF service. It will result in the promotion of such service generally without the necessity of relating such expenditures to the current year's revenue. After an audience market has been built through these expenditures, with increased revenue resulting therefrom, the early expenditures may be properly regarded as a cost of securing such returns. This would appear to be one step toward a solution of the chicken-or-egg-first problem which is now besetting the UHF stations as it once did the VHF's.

The approach is comparable to the tax relief provided in Internal Revenue Code, section 107 for certain taxpayers having long-term earnings. For instance, an author is permitted to relate his royalty earnings received in a particular year back to the years in which he was engaged in writing his book or play. Similarly, a real estate broker may carry back his commission earned on the sale of property over the years that he expended funds in unsuccessful negotiations. Another approach would be to broaden and liberalize the provisions of Internal Revenue Code, section 122 to utilize carryover provisions to the same end.

2. My second tax proposal is to permit UHF the same rate of depreciation on television broadcast equipment which has been permitted VHF broadcasters up to this year but which is presently in the process of being revised. VHF operators heretofore have been able to take a straight line depreciation on television equipment on the basis of a useful life of 4 years. The Bureau of Internal Revenue now proposes to extend this over a period of 15 years.

UHF is a new service in which many developments are yet to come. The high-powered equipment which will eventually be utilized in this service is not yet even being manufactured. No one can predict the future of color development and monochrome progress. UHF operators should be permitted the same rate of depreciation that VHF operators utilized in their early days of operation.

This will result in attracting capital from persons who, because of tax advantages, will be able to withstand the heavy expenditures required in construction and operation in the UHF service. Denial of this opportunity may result in such capital being attracted to other endeavors offering more attractive tax benefits. The 4-year depreciation rate unquestionably contributed greatly to the establishment and maintenance of VHF operation in the early bleak days of commercial television.

3. My third proposal is designed to stimulate the manufacture and sale of UHF-VHF receivers. VHF-only receivers are, in view of today's allocation situation, incomplete receivers, and the public should be clearly so informed. I suggest, therefore, that manufacturers should be required to label VHF-only receivers correctly, in substantially the following manner:

"Warning.—This receiver is not capable of receiving all of the television channels which may be operating, or which have been allocated, to this and other communities."

I understand the FTC is currently considering some labeling proposals.

A more drastic approach, but a correspondingly more effective one, would be to prohibit the shipment in interstate commerce of VHF-only receivers, both monochrome and color. Such action may be justified on the basis that the incomplete TV receivers not only deceive the public, but retard the establishment of a nationwide competitive television service.

I will now discuss briefly the proposals which I have filed with the FCC for amendment of its rules. They were filed on April 29, 1954. The Commission has not yet had time to take action on them. Chairman Rosel H. Hyde of the Commission referred to these proposals in his recent testimony before you.
(a) The first one deals with subscription television. I have suggested that such service be adopted but that it be reserved for the UHF service. This will not only provide needed revenue but will also assure a competitive programing service and assist in speeding up conversion. It will provide UHF with an answer to the problem of network programing.

The utilization of existing VHF stations for subscription TV broadcasting would necessarily result in the withdrawal of some hours from the conventional broadcast service. In some cases network programs might be displaced. Such use can result only in the denial of some existing service to the public.

The utilization of UHF for subscription TV, on the other hand, can be the means of providing two new and additional services to a particular community—a subscription TV service and a conventional broadcast service. Conversion would be automatically accomplished. With every installation of a subscription decoding device, a UHF converter would necessarily be provided. Thus UHF would be enabled to secure not only subscription revenue, but advertising revenue as well from its conventional broadcast service to an increasing number of UHF receivers.

The Commission could safeguard the conventional broadcast service of UHF stations by allowing subscription television only when the station otherwise satisfies the minimum programing schedule presently required by the Commission's rules.

(b) Another petition provides for stereophonic or multichannel sound transmission restricted to UHF stations. This can be accomplished by multiplexing the television FM sound channel. A sound system superior to VHF and consistent with the superior visual image of UHF will thereby be provided.

The Commission has already proposed multiplexing methods for FM broadcast stations. The technique has been developed, demonstrated and proven, and can be readily adapted to television. Bichannel or binaural sound transmission represents an advanced system of sound transmission which is being adapted generally to music reproduction and motion pictures.

Provision for such transmission will enable UHF stations to utilize the full sound possibilities of both live and filmed programs. The bichannel transmission is compatible with existing sound transmissions and the existing receivers would receive the sound in the same manner as at present without the need of adaptation. They could however be readily adapted for the bichannel transmission at low cost, if desired.

Establishment of such a UHF sound system now will enable manufacturers to provide in their receivers prior to the time when a great number of such receivers are in the hands of users. This is particularly true in making provision for such sound in color television receivers. As the public gradually converts to color they would, at the same time, be automatically converting to the modern binaural sound.

(c) Another petition suggests that UHF stations be permitted the same privilege to program music with fixed visual images, such as test patterns, slides and still photographs, as VHF stations were permitted prior to June 1951. The purpose of this is to allow UHF stations to obtain revenue from broadcasting music with unrelated pictures or with test patterns, while assisting dealers in the demonstration and installation of UHF converters and all channel receivers.

Under existing rules, for example, television stations are prohibited from broadcasting a test pattern accompanied by musical compositions for the purpose of demonstration, sale, installation or orientation of television receivers or receiving antennae, from broadcasting music accompanying transmission of a test pattern upon which is visually imposed a clock indicating the time of day or a text which is changed at spaced intervals or from broadcasting mood music, together with still pictures or slides where the music is unrelated to the visual transmission.

The petition asks that UHF stations be given the same opportunities in this respect to enable them to meet the problem of conversion as VHF stations were previously accorded.

(d) The final proposal requests the amendment of the rules to require in effect that networks have one-third of their affiliates, after a period of 1 year, in the UHF band, and one-half of them within a 2-year period. This is designed to secure network promotion of UHF and, if we are to have intermixture, that it be on a truly competitive level. As a practical matter, the requirement will be met for the most part by expansion of the networks through the acquisition of additional stations in the UHF band.

Copies of the petitions filed with the Federal Communications Commission referred to above are attached hereto for information.

Thank you for this courtesy and for your interest.
In the Matter of the Promulgation of Rules and Standards for a Subscription Television System

PETITION FOR AMENDMENT OF RULES, REGULATIONS AND STANDARDS FOR PROMULGATION OF A SUBSCRIPTION TELEVISION SERVICE FOR UHF TELEVISION BROADCAST STATIONS

Joseph Brenner respectfully petitions for the amendment of the Commission's Rules and Regulations and the Standards of Good Engineering Practice relating to television broadcast stations and states as follows:

I

That he is an attorney at law, a member of the Bar of the Federal Communications Commission and engaged in communications practice; that he represents various UHF television broadcast stations and is interested in the amendment to the Rules proposed to be adopted herein. He files this petition as an individual member of the bar and as an individual member of the general public.

II

This petition is filed under Section 1,702 of the Commission's Rules and Regulations and is in response to informal invitations extended from time to time by the Commission for suggestions and recommendations looking to the assistance and improvement of the UHF television broadcast service.

III

Petitioner requests that appropriate amendments be made to the applicable sections of Parts 2, 3 and 4 of the Commission's Rules and Regulations and to the Standards of Good Engineering Practice so as to provide for the establishment of a subscription television service restricted to UHF television broadcast stations.

IV

The Commission presently has before it a number of petitions requesting the institution of rulemaking proceedings for promulgation of subscription television service. The purpose of this petition is to request that such subscription television service be limited to UHF television broadcast stations as a means of assisting and furthering the establishment of a nationwide competitive UHF television broadcast service.

V

That among the petitions on file with the Commission are the following:

A Petition filed by Zenith Radio Corporation dated February 25, 1952, seeking the establishment of subscription television service in which it is recited that Zenith has since 1930 engaged in an extensive and continued program of research and experimentation designed to develop the most feasible means of subscription television and the securing of information as to the public acceptance of such a system. Zenith states the authorization of subscription television would greatly encourage the larger and more effective use of radio in the public interest and provide the American public a needed and desirable service supplementary to existing services.

A petition dated August 7, 1953, by four UHF television broadcast stations: Home News Publishing Company, New Brunswick, New Jersey; Pennsylvania Broadcasting Company, Philadelphia, Pennsylvania; Stamford-Norwalk Television Corporation, Stamford, Connecticut; and Connecticut Radio Foundation, Inc., New Haven, Connecticut, which sets forth among other matters that subscription television has now been the subject of a large volume of technical study and developmental research; that the Commission has from time to time granted authorizations for development and experimentation in the subscription television field; that developmental research and experimental operations have demonstrated that subscription television is a technically feasible and practicable service; that such experimental operations and research have demonstrated that the public will accept the principle of subscription television and that
surveys made for such purposes indicate that a majority of the public is willing to make direct payments of reasonable charges for the privilege of receiving high quality television programs of a type not currently available to them on television. Said petition further recites the interests of professional baseball, college football and of the entertainment industry in subscription television. The Commission is urged to provide for subscription television service as a means of alleviating the serious economic problems facing many existing and prospective UHF broadcasters; that it is necessary for UHF broadcasters to find new ways and means of programming their stations so as to provide revenues sufficient to enable the stations to match or exceed network programs in quality and interest, and for the stimulation of conversion of VHF sets. The said petition contends that the subscription television service would provide a solution to the programming problems faced by stations with network competition and at the same time provide sufficient revenue so that the stations could devote a substantial percentage of time to sustaining programs of a type not ordinarily available to television because of the costs. The petition sets forth considerable information demonstrating the economic and competitive situation of each of the four UHF stations and how subscription television will act to alleviate the situation. 

A petition dated September 9, 1953, filed by Matta Enterprises, Atlantic City, N. J., another UHF station, suggests the institution of subscription television service as a means of overcoming the competitive disadvantage of UHF stations in relation to network affiliation. Said petition recites that such a service would provide the fundamental remedy to the unhealthy competitive situation in which UHF stations have been placed and that such subscription service will tend to diminish the importance of network affiliations in the development of the service, will expand the area of effective competition and will serve the public interest by bringing programs of widespread public interest presently beyond the economic grasp of many television licensees.

A petition filed November 19, 1953, by Northwest Television Co., Fort Dodge, Iowa, also a UHF station, suggests the institution of subscription television service and recites that the establishment of such a service would in the near future provide a solution to many economic problems faced by UHF stations.

A petition filed by Peeples Broadcasting Co., Trenton, N. J., a UHF station, urges the establishment of a subscription television service and recites that such a service would provide a solution to the problems faced by UHF stations with network competition and that such a service would provide a means of overcoming the competitive disadvantage of UHF stations in relation to network affiliation.

That in addition to the activities of the Zenith Radio Corp., related above, the Skiatron Electronics & Television Corp., New York City, has been engaged in research and development of another system for subscription television known as Subscriber-Vision; that extensive tests and demonstrations as well as surveys as to public acceptance of such a service have been made by Skiatron. Public announcement has been made that Skiatron would in the near future petition for the establishment of subscription television service and make available to the Commission results of its research and findings.

That an additional system for subscription television has been developed by the International Telemeter Corp., known as Telemeter. This corporation is affiliated with Paramount Pictures Corp., Inc. Telemeter has been also engaged in a research and development program and has engaged in tests utilizing broadcast service as well as use of a community antenna system through closed circuit technique.

That the material on file indicates that there is sufficient information available for the Commission now to undertake consideration of the establishment of subscription television service.

Petitioner respectfully suggests that the Commission undertake such consideration at the earliest possible moment as a means of aiding and assisting UHF stations in the establishment of a successful competitive nationwide UHF broadcast service; that if Commission's consideration of subscription television service is delayed longer, the benefits which can accrue to the UHF service may well
disappear and the establishment of a successful UHF broadcast service thereby impaired.

Petitioner further respectfully suggests that the subscription television service be restricted to UHF television stations so that instead of having the effect of withdrawing free broadcast service from the general public during subscription telecasts, as would be the case on most VHF stations, the subscription television service would generally be the means of providing a new and additional service to the community. The conventional broadcast service by the UHF station could be safeguarded by permitting UHF subscription television only where the station otherwise satisfies the minimum programing schedule required by section 3.651 of the Commission's rules and regulations.

Respectfully submitted.

JOSEPH BRENNER.

BEVERLY HILLS, CALIF., April 27, 1954.

The first witness this afternoon will be Mr. Raymond Kohn.

Mr. Kohn.

Mr. Kohn is president of the Penn-Alleen Broadcasting Co., of Allentown, Pa.

Is that correct?

Mr. Kohn. That is correct.

Senator Porter. We are happy to have you here, Mr. Kohn, and will be looking forward to hearing your statement.

STATEMENT OF RAYMOND F. KOHN, PRESIDENT AND GENERAL MANAGER OF THE PENN-ALLEEN BROADCASTING CO., ALLENTOWN, PA.

Mr. Kohn. Thank you, Mr. Chairman.

I ask you not to be dismayed with the weight of this. It is mostly exhibits. It isn't all testimony.

My name is Raymond F. Kohn, and I reside at 1411 Hamilton Street, Allentown, Pa. I am president and general manager of the Penn-Alleen Broadcasting Co. of Allentown, Pa., licensee of WFMZ, an FM only broadcast station, and construction permittee of WFMZ-TV, a UHF authorization for channel 67 in Allentown.

Two weeks ago at the NARTB convention in Chicago we heard a great deal about free enterprise and eloquent warnings about the grave consequences of running to Congress for more regulation. May I say to the members of this committee, with all sincerity, we are not here asking for more regulation but corrective regulation.

My company believes, and we think with abundant justification, that there is before this committee and the Nation a grave question as to whether or not we shall have a truly competitive nationwide system of television.

We do not think our purpose in appearing here is based solely on seeking a “transfusion by cutting the throats of others,” as expressed by one speaker at the convention.

We are certain that this committee, in hearing our comments will judge them as they apply to the welfare of all the people of this country and not just a few in Allentown, Pa. We do think that we have some constructive information to offer and a suggested possible procedure of action that is worthy of serious consideration and study.

We humbly believe that the experience of our 7 years of operating an FM only broadcast station allows us a small measure of validity in speaking on the subject that is before this committee.
I might add here we have no AM affiliation, newspaper affiliation. It is strictly a corporation of many stockholders.

Contrary to the Commission's expressed view in the sixth report, we are here to say that we find an alarming similarity in many, many respects with this UHF problem which the development of FM faced and is still facing. Practically all of the elements of difficulty in UHF which have been repeated over and over by other witnesses in previous testimony here were and still are present in FM—the problems of conversion, program sources, advertiser resistance, especially on the national level, lack of good receivers at competitive AM costs, and many others.

But we do not intend to burden the record with a recital of those experiences. For it is not our purpose here to weaken the cause of objectivity by playing on the sympathetic heartstrings of the members of this committee. Besides, if we may say with equal parts of humor and sobriety, we are somewhat afraid that we might destroy the credulity of our whole testimony by relating a 7-year FM saga which we know you would find exceedingly difficult to believe, true as it may be.

Suffice it to say—and we do not mean this to be facetious—we are quite convinced that if the members of the Commission could have lived with us through our experiences in FM there would have been no need for this hearing on UHF. The whole philosophy incorporated in the sixth report and order might well have been a different one, a more realistic one.

We cannot add to the record any experiences in operating a UHF station since we are not yet on the air. We are, I would say, about a hundred thousand dollars along in construction, with long-term commitments amounting to about four times that much which we hope we shall have the satisfaction of honoring in full.

As I sit here, I can hear the distant “amens” to that statement being uttered by our 250 stockholders, almost all of whom reside in and around Allentown, Pa., but I am much more aware of the pleadings of over a half million Lehigh Valley residents who, I am certain, would approve of the statements which we are making here today were all the facts made clear to them.

Before we present what we believe is a sound and workable approach to the UHF dilemma, we would like to bring out briefly, and emphasize with all the vigor at our command, one aspect of this problem that, in our opinion, should have precedence over all other considerations. It has been touched upon in other testimony, but has not yet been given the emphasis that we think it surely deserves. We refer to the two words “local expression.”

The Commission, in its sixth report, gives local expression priority 2, thereby recognizing itself the extreme importance of achieving the goal of as many outlets for local expression as can be possibly attained. In complete contradiction, the philosophy of the sixth report and its implementation since bids well to make mockery of that most desirable goal. We think we can prove this point in just a moment.

From the New England town meeting down to today the opportunity for a community to have the facilities to express itself has been a vital factor in preserving our ideals of democracy. Never has the urgency been greater than it is today to do everything in our power to perpetuate the processes of local expression.
Time was when the great fourth estate—the newspaper industry—was a highly competitive business, much for the good of the community and the Nation. Today we are witnessing the extinction of competition in the newspaper field, even in great cities like Washington, St. Louis, Atlanta and others. The medium and smaller cities now either have but one newspaper or through merger or sale competing newspapers come under common ownership.

We think it is uniformly admitted by all thinking people that this loss of competition is undesirable and leaves a vacuum in the communications field that we should strive, if at all possible, to fill.

Congress is powerless to stop the trend of monopoly in newspapers, but it can, through an agency of Government already in existence and under compulsion of an act already spelled out, help to fill the vacuum referred to above by preserving the powerful, impartial voice of television in hundreds of cities across this Nation which can and will support local television if it is but given a reasonable chance to put down its roots.

In a world fighting for its survival now, today, the Commission's reference to a nationwide competitive system of television in terms of "will eventually" or "the long range" leaves us singularly and particularly cold. An "eventual" television station in Allentown—presuming there would be one, which is a presumption which we cannot bring ourselves to accept—will be no better than the one that we can be operating this September, bringing a new, fresh and vital force of self expression to a community, which it needs and which it so rightfully deserves.

Local ownership, integration of local ownership with management, and performance of local responsibility in programs geared to the needs of the community which a station serves is one of the very foundations of judgment used by the Commission in granting and renewing television and radio licenses. No other factors in the preparation and presentation of testimony and exhibits for a competitive hearing before the Commission receive so much careful and emphatic attention by Washington's specialized, high-priced attorneys as those which could be summed up in the two words "local expression."

We don't mean that "high-priced" in a derogatory sense. I know a lot of attorneys here in Washington.

Senator Potter. You better be careful they don't raise their price to you.

Mr. Kohn. But it does cost like the devil to hire them.

Senator Pastore. Doesn't the price vary with the client?

Mr. Kohn. A hearing is expensive.

No other phrase is so familiar to broadcasters, attorneys, Commissioners, and the whole FCC staff as "the public interest, convenience, and necessity."

With this emphasis we heartily agree—wholeheartedly agree—and it is to help preserve this emphasis that we are now appearing before this committee.

We think it pertinent, but not material to this controversy, who utilizes what channels but that all channels necessary to a nationwide, truly competitive system be utilized. To achieve this objective, a fair and proper climate must be provided so that television, on the local level, shall have a reasonable change to grow in all communities across the Nation wherever the economic soil is rich enough to nurture it.
May we define briefly what, in our opinion, a local television station means to Allentown and our communities around Allentown?

We use Allentown merely as an example and we know that you will keep in mind that there are hundreds of Allentowns across the Nation to which each of our thoughts is equally applicable.

1. It means a heretofore unprecedented opportunity for our churches to spread their influence beyond the portals of the church doors. There are over 90 churches in the city of Allentown alone. Why should the ministers, the choirs, and the congregations of these churches be deprived of the opportunity to use this powerful new medium of expression?

2. It means a heretofore unprecedented opportunity for our educational system to have the means of spreading education beyond the portals of the school buildings. It means opportunity in the most graphic way yet devised to acquaint parents and taxpayers with the methods and curriculum being used to educate their children. It means opportunity to use the trained minds and special talents of teachers and school administrators on programs designed for the welfare and enlightenment of the whole community.

3. It means a heretofore unprecedented opportunity for the promotion of the activities and objectives of all our local public service institutions—the Community Chest, the Red Cross, the Medical Society, the Good Shepherd Home for Crippled Children, the Boys' Club, Little League Baseball and dozens of others.

4. It means a heretofore unprecedented opportunity to provide facilities for the enlightenment of the people before they go to the polls to vote. Television, as has been amply proved, has a peculiar knack for searching out sincerity, exposing insincerity, the face betrays many a fact that the mind and the voice would try to hide.

We think the members of this committee would be the first to agree that the caliber of local governments in thousands of communities across the Nation ultimately decides the caliber of Government and its servants in the Nation’s Capital.

And perhaps it is too obvious to mention the power and impact of television as a medium of expression for local issues—the new city tax, scandal in the police department, should the monument in the square be moved to West Park, the annexation of Lower Salisbury Township to the city, the new sewer project proposed for the west end. None of these issues are world shattering; none of them interest anyone beyond the confines of each of the thousands of communities in which they occur, but wrapped up in them is the cumulative basic worth of a whole country—the essence of the vitality which makes our democratic ideals work.

5. Television in our community means a heretofore unprecedented opportunity to promote the economic good of our area. The ability of our local and regional merchants to advertise their products and services is not only essential but necessary. No one argues television’s ability to sell goods and services. Why deprive our town and hundreds of others of the economic benefits of this new medium?

And the irony of this whole situation is that for years now the merchants in our town, in Allentown, have indeed had to compete against merchants in Philadelphia who, through high-power television, seek and do effectively draw business away from Allentown, and without local television our merchants do not now have and may never have a
fair chance to retaliate against this outside city advantage with the same medium.

There are many, many more things that television means to a community for a television station should and can be at the very center of every activity, the sounding board and the mirror of a community's whole personality.

We submit to this committee that the importance of preserving, in hundreds of communities, the element of local expression is alone enough, in itself, without any of the other considerations, to cause all concerned to work not against each other but together to find a practical and workable way to arrest and reverse the present tragic downward trend toward extinction of television in the UHF band.

And may we add here what sounds like a facetious note, but it really isn't intended to be: There are three powerful VHF stations in the city of Philadelphia which purport to render television service to our community of more than a half a million people. I say to them now that if each of these stations will submit a written statement, duly subscribed and sworn to, to this committee or the Commission, saying that they do solemnly promise to provide as many local programs, with local Allentown people participating, as WFMZ-TV has already promised under oath to do, and in the same desirable time periods, then we will here and now tear up our testimony and retire to the sidelines to watch with bated breath the greatest phenomena that has occurred in the history of broadcasting.

Senator Potter. You don't expect them to do that?

Mr. Kohn. No, sir; I do not. It would be the most impractical thing in the world because there are 6 or 8 other communities covered by the same Philadelphia signal, of which the same would have to be retired.

The exhibits which we will now present for the committee's information were prepared by four people, which is the entire present staff of our company. These exhibits took a period of approximately 3 weeks of admittedly somewhat concentrated effort. No expert lawyers or engineers had anything to do with them. We realize this statement would seem to weaken or even destroy our case, but before we finish we hope to establish that just the opposite will be true, for we believe with the deepest sense of conviction that there is a solution to this problem: that it will be founded not upon the evidence of the cold, ever-conflicting arguments of the slide-rule boys or the legal clamorings of those who will try to find solace in the Constitution, but upon the inherent, practical, good commonsense of this committee, the Commission, and all those whose sense of public interest lies above self and whose vision allows them to see the tremendous importance of a television system which best serves the growth and ideals of this country and its 160 million people.

Once the objective is set—the goal defined—the engineering slide rules can turn out the technical answers to make it work.

Even to the layman the present allocation plan contained in the sixth report is not above critical analysis; surely it cannot be an only solution upon which future development of television must live or die.

It must not be forgotten that adoption of this very same sixth report was not unanimous. It had bipartisan dissent by a Republican member and by a Democratic member of the Commission.
We have taken the approach of an average person trying hard to exercise practical commonsense. With all humility and deep respect for those experts who label this problem apparently unfathomable, we enter a small but vigorous dissenting voice.

Our first series of exhibits are planned in logical sequence to answer the following questions:

1. Just what is the present allocation plan and how does it breakdown in terms of assignments to each of the 48 States?
2. What is the service provided by (a) the VHF assignment; and (b) The UHF assignments in terms of comparative service?
3. What happens if television in the UHF band does not develop or, put another way, what kind of service will we have if only the 12 channels in the VHF band are utilized?

Under that we have commercial channels, and we treat separately educational channels.

Exhibit No. 1, which you will find in the back: This is a State-by-State breakdown of the number of commercial VHF assignments allocated, the number of cities in each state to which these VHF assignments are made, the number of educational VHF assignments made to each State, the number of UHF assignments allocated to each State together with the number of cities in which these UHF assignments are made, and the number of UHF educational channels assigned by the sixth report to each State.

I would like to interrupt here, Mr. Chairman and members of the committee, and state that there have been some changes within the Commission. We had to rely upon material at hand, but there will be very little change. I mean I believe there are more educational channels, 2 or 3 or 4 allocated since this was published.

Senator Potter. I understand there have been nine additional allocated since that was published.

Mr. Kohn. Something like that; but we did not, I am sorry to say, have the time to research out.

The same thing is true of the other exhibits, but there will not be any substantial changes.

It purports to be accurate up as far anyhow as the sixth report was made, which is the basis, fundamental basis, for the whole allocation plan.

It does not take much study before one realizes that there is a serious scarcity of VHF channels allocated to most of the States and that statewide television coverage can be best accomplished by use of the UHF band.

We have underlined in this exhibit just a few of those States. If you follow it across—for instance, Illinois has 9 commercial VHF channels, located in only 6 cities. There are 2 educational channels in the VHF band in Illinois, but in UHF there are 44 assignments in 37 cities and 5 educational channels.

There are several others there I will not take the time to go through.

Senator Pastore. You could even dramatize New Jersey. Look at New Jersey on page 2 of your exhibit, right next to New York, where they have 18, and New Jersey just 1; is that right?

Mr. Kohn. The whole State of New Jersey—— Senator Pastore. They have 1 VHF in 1 city.

Mr. Kohn. That is correct.

Senator Pastore. And they have to rely on UHF in seven cities.
Mr. Kohn. I might add that channel moved to New York City, too.
Senator Potter. So, that is not there now?
Mr. Kohn. That is right.
Senator Pastore. That VHF moved over to New York, too?
Mr. Kohn. That is right.
Senator Pastore. So, that makes none.
Mr. Kohn. That is correct.

We might point out another example, which we like to use, since it is our own State. Pennsylvania has 10 VHF allocated in 7 cities, in that large state; 1 VHF educational channel; but there are 45 UHF assignments allocated to 33 cities and 3 educational channels.

That would mean, of course, if UHF does not develop, seven cities in the whole State of Pennsylvania will be expected to give television service to the whole State. It can't possibly do it.

In exhibit No. 2 we have further analyzed this very same thing. This exhibit graphically illustrates what we mean by scarcity of VHF channels. Six States have allocations of VHF channels in but 1 city, a total of 6. We have them listed here: Delaware, District of Columbia, New Hampshire, New Jersey, Rhode Island, Vermont, or a total of six for these same States.

These same 6 States have among them UHF assignments in 29 cities. The ratio is 29 to 6, and this table does not include educational channels.

Three States have VHF assignments in but 2 cities, or a total of 6 in all for those 3 States as compared to total assignments in the UHF band in 29 communities.

One State, Kentucky, ranked 16th in population, has but 3 VHF cities and 27 UHF community assignments.

The fourth most populous State in the country, Ohio, has VHF allocated to only 5 cities; yet, there are assignments in the UHF band for 36 cities and towns.

Our own State of Pennsylvania, which I have already analyzed in the previous exhibit, has but 7 cities assigned VHF channels; yet it has 33 UHF cities and towns.

There are 33 States listed in this exhibit and all 33 have 8 or less cities assigned VHF channels.

If UHF television does not develop, 33 out of the 48 States must be content to be served by 8 or less VHF cities each; 165 cities will be all that can bring service to 70 percent of the States of the Union.

By comparison, there are UHF channels assigned to 681 cities and towns in these same 33 States.

If intermixture will not work—and we are convinced by the facts that it is not working now and cannot work—the question of which band, VHF or UHF, should be retained is rendered almost academic by these comparisons alone.

Exhibit No. 3—that is the exhibit that is turned over, the long exhibit—is an analysis of the assignments made for educational, non-commercial stations.

I beg your pardon. Exhibits 3 and 4 are turned around here.

Senator Potter. We should be referring to exhibit 4, then, rather than 3?

Mr. Kohn. That is correct.

Senator Potter. Fine.
Mr. Kohn. We will come back to that. I will take up exhibit 3 first, which you will find is the next exhibit.
You will recall that we left out educational television in the previous exhibit.
Senator Potter. Yes.
Mr. Kohn. Exhibit No. 3 takes that particular problem up.
This is an analysis of the assignments made for educational, non-commercial stations. The Commission seems to be in unanimous agreement that these assignments are both desirable and necessary, but let’s take a look at what happens to educational television if UHF does not become a successful reality. Fifteen States, with a 1950 census population of almost 54 million people, 35 percent of the Nation’s entire population, will have no educational television at all; and, ironically enough, many of these States are the wealthy ones which might be expected to best be able to support educational outlets.
We can’t resist pointing out to the members of this committee also that among these 15 States are Michigan, Nebraska, and Rhode Island.
Senator Potter. I wonder how you happened to select those three States.
Mr. Kohn. Purely coincidence, Mr. Chairman.
Senator Pastore. You know, Senator Potter, I like it.
Mr. Kohn. Fifteen more States with a population of 38,703,778 will have but 1 educational outlet each and 12 additional States with roughly 46,500,000 people will have but 2 educational channels each.
The cumulative total adds up to but 39 educational outlets in 42 States whose total population represents 92 percent of the population of the entire United States. Well over 200 of the assignments made by the Commission for educational television would go by the boards.
We are sure that this prospect is as painful to the Commission as it is to us.
Once again we see the absolute necessity of making certain that television in the UHF band survives.
I might point to an exhibit over there, the small map of the United States, which illustrates this particular exhibit 3 that is in table form.
The States colored red are those States in which there are no VHF assignments in the educational field.
The ones in yellow have one VHF.
The ones in green have but two VHF assignments in the educational band.
You can see that along the Northeastern and the North Central States is where it really is congested as far as having U’s to have educational television.
Senator Potter. I wonder how they made that selection. It seems to me in that whole area in there—Michigan, Ohio, Illinois, Kentucky, West Virginia—if they didn’t have 1 in each State, they could have put 1 or 2 in that area.
Mr. Hyde.
Chairman Hyde. Mr. Chairman, I can tell you the selection was not made on a geographical basis. That is, the Commission did not determine to put educational reservations on ultrahigh channels in certain States and to put educational reservations on VHF in others.
The formula which the Commission used is set out in the sixth report. It works something like this: What we made educational reservations as the interest shown by participation in the proceedings would justify it, and by availabilities. For instance, it would be
impossible to make an educational reservation in a community where all the VHF, all the assignments, had been assigned to a station.

Washington is an example of that. There is no VHF assignment for educational television in Washington for the simple reason that there were four commercial stations using all the assignments available at the time the sixth report was issued.

Now, that illustrates the reasons for these results that come out.

Senator Schoeppel. You mean they were all taken at the time your sixth report was out?

Chairman Hyde. That is right.

Senator Schoeppel. But somebody didn’t check the possibilities before that, however?

Chairman Hyde. The educational reservations were first made in the sixth report. There had been proposals during the rulemaking proceeding, but in the original allegation there had been no such reservation.

Commissioner Hennock. Mr. Chairman.

Senator Potter. Yes.

Commissioner Hennock. Mr. Chairman, I wanted to point out Chairman Hyde’s statement is correct as regards New York and Washington, where the VHF’s were gone, but I feel that the allocations to education were made on a superficial basis, that the joint committee representing the educators had sent out letters to various communities and had been in touch with educators, and there are two types of assignments. Educational centers got VHF in certain sparsely settled areas and where a State university or land-grant college was situated or a university particularly interested in communications, such as Urbana, Ill., where we have the University of Illinois. On the other hand, I expressed my dissent and felt the Commission itself should have gotten up a nationwide educational plan more in keeping with the population and the financial means of supporting educational television, and the sixth report and order voices my dissent to that effect.

Senator Potter. Without UHF you are not going to have a nationwide educational television system?

Commissioner Hennock. No. Sixty-five percent of our channels are in ultrahigh. The State of New York would have nothing in education. The State of Michigan would have nothing in education.

When I got out to Missouri, for instance, Kansas City, the very educators that said they didn’t want a VHF didn’t know what they were saying at the time. Now, when they have Mr. Hall of Hallmark cards ready to finance an educational station, their objections are: “It’s an ultrahigh station. Nobody wants ultrahigh. It’s folding up.”

Now, you see how unrealistic it was to take the educators who were unversed in television and take just their little letters and say, “This is an allocation plan.”

It was not done on a proper survey—educational, engineering, or any other—I voiced my dissent at the time.

However, it is so important to this country to have an integrated national system because, with 65 percent of our channels in ultrahigh, you can see what the folding up of ultrahigh will do to educational television in this country.

Senator Pastore. Following the thought that was expressed by the chairman and by Mr. Schoeppel, isn’t it a fact the congested cities,
that is, the large cities, will have to depend for their educational media on UHF rather than VHF because VHF is already taken up?

Commissioner Hennock. That is not true.

Senator Pastore. I mean that is another problem.

Commissioner Hennock. Correct.

Senator Pastore. And if we weaken UHF, we, accordingly, weaken the media of educational television broadcasting.

Senator Potter. I know when I was home recently some of the people most interested in educational TV in the State—their problem is tied in with this hearing we are having now, with what is going to happen to the UHF band—-

Commissioner Hennock. Michigan State has spent over a million and a half dollars, I think, in their plant so far in educational television, doing an excellent broadcasting service and educational television on a daily basis, I think 6 or 7 hours a day, one of the outstanding services in the country, and I know Dr. Armond Hunter, the director of the station, is on his way here to testify in these hearings.

Senator Potter. Yes.

All right, Mr. Kohn.

Mr. Kohn. I might point out in relation to that, Mr. Chairman, certainly I would say the educational UHF channels have even a less chance of making a “go” of it because they have public funds in the first place and—

Senator Potter. That is right. If they can’t do it on a commercial basis, they certainly won’t be able to do it on a nonprofit basis.

Mr. Kohn. That is right.

Senator Pastore. Mr. Chairman, may I interrupt at this point?

I know I am anticipating, but I have to go to a meeting of the Joint Atomic Energy Committee.

May I ask a question at this point?

Senator Potter. Certainly.

Senator Pastore. I have been reading a little of your statement as you have been making it. What is your comment on S. 3095, the bill before us?

Will that do the trick or won’t it do the trick?

Mr. Kohn. Is that the Bricker bill?

Senator Potter. That is the multiple-ownership bill.

Senator Pastore. That is the Johnson bill.

Mr. Kohn. I am not——

Senator Pastore. That is the legislation before us.

I am trying to crystallize the thinking here.

Mr. Kohn. This is the one that says you can own a total of, I think it is, 14 in all if you take them on a ratio basis.

Mr. Zapple. Ten.

Mr. Kohn. Yes; 10—2 to 1.

Senator Pastore. In your opinion, will this bill solve the problem, or solve part of the problem, or won’t it affect the solution of the problem at all?

Mr. Kohn. I think it is really a crumb thrown to a starving man to say that would in itself reverse this trend in the UHF because you——

Senator Pastore. Would you be willing to say it is merely another monopoly to stop another monopoly?

Mr. Kohn. I doubt, in the present state of the art, if anybody is going to take them even if they are there as far as your network owned
or store broadcasting, or any of them are going to get too interested in UHF, unless there is a reversal of the trend first. Then it might be applicable.

Senator Pastore. Do you think the Congress ought to do anything or the Commission ought to do anything to express the philosophy of encouraging more multiple ownership on the part of certain individuals?

I followed the thesis of your statement that this thing ought to be on a competitive basis, that the ownership of these stations ought to be more widespread, that they ought to be on a broader base.

Don't you think that we, as a Congress, and the Commission, as a commission, ought to discourage as much as possible multiple ownership?

Mr. Kohn. I believe this, Senator: that it weakens what we consider the most important thing, which we stated in the beginning of our testimony, that where you get more multiple ownership, that you get less local representation on channels—in other words, if they are not owned wholly, but owned by some corporation, the more channels that are owned absentee, so to speak, the less you have of the interest within that community in promoting the welfare of that community.

Locally owned stations, I think, are very desirable.

Senator Pastore. You have already spotlighted that in your exhibit 1. The people of New Jersey, so far as VHF are concerned, now must look entirely to television ownership in New York to tell them the kind of broadcasting programs they will get or will not get; isn't that a fact?

Mr. Kohn. It is at the present time.

Senator Pastore. I mean VHF now.

Mr. Kohn. That is correct.

Senator Pastore. May I be excused, Mr. Chairman?

Senator Potter. Yes; certainly.

Senator Pastore. Thank you very much.

Senator Potter. All right, Mr. Kohn.

Mr. Kohn. I don't know whether I made the last sentence in exhibit 4 or not, but even if I have to make it——

Senator Potter. Did you discuss exhibit 4?

Mr. Kohn. Exhibit 3. Excuse me.

Senator Potter. Yes.

Mr. Kohn. I got myself confused here.

Senator Potter. I think you did. I think you were going to start with exhibit 4.

Mr. Kohn. That is the educational discussion we just had.

Senator Potter. Yes.

Mr. Kohn. But in reference to the educational channels we do believe that once again we see the absolute necessity of making certain that television in the UHF band survives.

Exhibit 4: This exhibit seeks to show the answer to the question: Will there exist a monopoly if only the 12 channels in the VHF band are utilized?

We won't attempt to define monopoly, but we think the breakdown presented here brings out some startling and alarming facts. Shown in this table by population groupings are the first 115 markets in the United States and the number of VHF channel assignments, exclud-
ing educational, in each market. Here are the pertinent facts—and I think you can follow this very easily on this particular exhibit:

1. Only 6 markets have at least 4 VHF stations assigned. This is only 5.2 percent of the total of 115 markets.
2. Only these 6 markets can provide stations for ideal outlets for the 4 television networks.

Senator Potter. What was that?
Mr. Kohn. Only these 6 markets that you see that have 7 channels or 4 channels in this chart—

Senator Potter. Yes, sir.
Mr. Kohn. Can provide for each of the networks to have an outlet.
3. Twenty-five markets or 21.7 percent have only three VHF channel assignments.

That is in column 4 on the chart.

Fifteen of these markets are among the first 25 largest markets in the United States. Obviously, 2 networks must share clearance time with 1 of the stations in each of these markets.
4. Thirty-eight or 33 percent of the Nation's first 115 markets will have but 2 television stations.

I am afraid NBC and CBS have clear first mortgages in these markets.
5. Twenty-seven or 23.5 percent of the top 115 markets will have but 1 television outlet. Which networks get what in these markets is anybody's guess.
6. Nineteen or 16.5 percent of the top 115 markets will have no television outlets whatsoever.
7. Eighty-four or 73 percent of the Nation's first 115 markets will have only 2, 1, or no television stations. There is little question that this country will have but 2 television networks if only the 12 channels in VHF are utilized.

We think it quite axiomatic that no network can operate with only 16 percent of the top 115 markets.

Once again we see the absolute necessity of making certain that television in the UHF band survives.

Having amply, we believe, established this premise, we would now like to present a three-point program of action which we think will assure a nationwide, truly competitive television system on an equitable, fair, practical, workable basis. With the use of charts and overlays, we would like to illustrate why each of these three procedures is necessary and should be adopted by the Commission; but, first, before any of these procedures are put into effect, we believe the following important thing should be done: The Federal Communications Commission should immediately affirm that a crisis does indeed exist in the implementation of the nationwide, truly competitive television system which it envisaged in its Sixth Report and Order and, because such an emergency does exist, the Commission, in the public interest, is compelled to enter into certain rule-making decisions.

Once this is done, then we suggest the following three-step plan:—

Senator Potter. What rule-making decision do you mean?
Mr. Kohn. All of these would require that, sir.
Senator Potter. Oh, yes.
Mr. Kohn. Step Number 1—

Senator Scheppele. In other words, you do not think you would need new legislation to provide this change?
Mr. Kohn. I would not dare answer that question, Senator. That is for a lawyer to state specifically whether or not.

It would be my general impression, through two hearings before the Commission and what general knowledge I have, that there is enough power right now within the Commission, if it so deems, just as it did back in 1947 or 1948, when an emergency existed, to the extent of putting a freeze on that lasted for 4 years, that certainly it would have the power to do the steps that we propose here.

Step No. 1. Power and antenna heights:

At the very heart of the UHF problem we believe is the excessive power and antenna heights granted to existing VHF stations, especially in the major markets.

It is our proposal that the Commission first enter into a rulemaking proceeding which would in effect fix new antenna heights and power requirements for VHF stations, looking toward confining the influence of each signal to roughly its own metropolitan district area. This should not be a blanket requirement fixed by zones 1, 2, or 3 as is now contained in the Six report plan, but upon a market-by-market basis.

If I may ad lib there, to us, you just can’t take the northeast and say the markets are alike and say that this antenna height and this power will apply to the whole market, because there are widely dispersed areas. In the center of Pennsylvania we go for miles before you come near any population. Such a plan as we now propose would suggest that in the heavily populated areas of the northeast grade A and grade B contours would be considerably less than, for example, in the Far West, where perhaps even greater power and higher antenna heights than are even now allowed should be granted, on a practical basis, to give service to the people.

Let’s turn now to illustrations of exactly what we mean. Southeastern Pennsylvania encompasses the following markets, and this is a chart of the southeastern part of Pennsylvania. You see Maryland down here in the corner. That is not an inset; that is a State line.

Do you have a pointer there?

I would like, Mr. Chairman, if I may, to introduce my assistants here—

Senator Potter. Yes.

Mr. Kohn. Mr. Strauss and Mr. Kohn, who are both directors of Penn-Allen and stockholders.

Senator Potter. You have three-fourths of your staff here?

Mr. Kohn. No; we have very wide representation on our board of directors, but only four on the staff.

These markets are encompassed on the chart that you see before you: Allentown, Bethlehem, Easton, which is right in the center of the picture; Reading, which is just below it, to the southwest; Lancaster, still going down to your left, following that line; Harrisburg; York; Philadelphia, right over here in the center; Wilmington, Del.; Dover, Del., down below; Atlantic City, over on the coast; and Trenton, N. J.

Then, secondarily, up at the top of the picture: Wilkes-Barre; Hazleton; Scranton.
We do not mean to put them in a secondary position, except they are not included in that southeastern exhibit, on a fringe-area type.

Senator Potter. Would you identify also the difference between your red circles and your yellow circles?

Mr. Kohn. Yes, sir; I will do that now, if I may.

This chart you have before you is our proposal of cutting antenna heights and power down to 20-mile radius for the grade A contour.

I might say the red are VHF signals; the yellow UHF stations, signals, markets.

If Philadelphia is cut back to that, to a 20-mile radius, it will include all of Philadelphia, its market. Its grade B signal will go beyond that.

These areas here are a 20-mile radius.

We do not purport to get down and say just how many kilowatts that would require, but certainly it can be ascertained easily with a slide rule.

Now, we would like to show you what happens with just dropping in there an overlay which shows Philadelphia's power right now, the power of the stations from Philadelphia. There are three VHF in Philadelphia.

The purpose of this overlay is to show you—immediately within that red circle you see a great deal of the yellow disappear; in other words, it is beginning to blacken out with just that alone.

The black line around the red—

Senator Potter. Is that their present power?

Mr. Kohn. That is their present power.

That is a 46-mile, I believe.

Actually plotting under the Commission, as we took their actual antenna height and power, it is 47 miles. We arbitrarily took 46 miles to represent the three stations that were in there.

The black line outside the red circle shows the grade B contour or secondary signal covered. [Indicating.] That is Philadelphia.

Now, there is one other, as you see in the small circle there, to the left of Philadelphia, Lancaster. There is one VHF station in Lancaster, Pa. As you can see, there are nine UHF in that very same market.

One VHF will blanket out all nine of those UHF. We would propose to cut that one back also, and we will go further with that city a little later.

Now, let's drop in the fringe signals, coming in from all the other V's in the area.

There is Baltimore, New York, and Binghamton, and the UHF stations sitting by themselves, like Fort Wayne does, which is the only one in the country not affected, practically blanketed entirely out of the picture.

This, we believe, is at the core of the problem, as to why UHF is not getting its conversions and is not getting its advertising because of the influence of these outside signals on high power and high antennas.

Senator Potter. Are these UHF stations you have depicted in existence or are they allocations?

Mr. Kohn. Most of them are in existence. There are two in Harrisburg, one in Lebanon, under the Lancaster disk on the left.

Let's pick that up again, please.
Harrisburg has two stations, I think, on the air now. That is all right—right there. York has two stations on the air. Lebanon has one station on the air. Reading has two stations on the air.

Allentown has two, one of which is our assignment there. We hope to be on the air in the fall, depending—there is another assignment in Allentown. There is one on the air in Bethlehem. There is one on the air in Easton.

In Trenton I don't think anybody is going ahead with that particular assignment, nor do I think possibly they will unless something is done.

In Hazleton—it is just an assignment there. Wilkes-Barre and Scranton both have UHF on the air. I think all of them are taken now.

Incidentally, WGAL-TV in Lancaster has an application for maximum power and antenna height before the Commission now, and it is being opposed by several UHF stations in that same area. I think that is still pending before the Commission.

Now, by coincidence again, Mr. Chairman, we go up to Michigan. This shows what roughly—now, we are taking an arbitrary 20-mile radius of limiting signals in our plan generally.

We spoke before that it should be based on a market-to-market basis, and which can easily—I won't say easily, but it can be worked out.

There is what UHF and VHF looks like with their grade A signals limited to 20 miles.

Now, I know somebody is going to punch a hole in this and say, "Look at all the white areas that will have no signals."

I assure you the grade B signals—you can see the fine yellow line around the whole thing. It really scallops the whole area.

All of those areas in there will receive television service—at least to meet priority 1, which is one or more television services—I am sure.

Let's see what happens when we drop high power, high antenna height VHF into the picture. UHF practically disappears. There is Fort Wayne down there, sitting all by itself. Unfortunately, all of us can't live in Fort Wayne. The black circle again, I would point out, are class B contours. That is a 46-mile—the same as we used in Philadelphia, 46-mile radius. The next area is another very congested area, the New England area.

I am sorry Senator Pastore has left.

Senator Potter. Does this take care of Senator Pastore's problem?

Mr. Kohn. It does happen this is one of the very serious problems in the whole UHF.

This is the WFMZ-TV proposal, a 20-mile radius, limiting the power and antenna heights to such equations as would produce a 20-mile grade A contour.

Again, you can see that UHF would seem to have a very good opportunity of developing under those circumstances.

Let's drop the VHF from existing B stations.

These are existing VHF stations on the air, showing maximum, when they get to maximum power. I think some of them are already on maximum power and antenna height. Their grade B signals and grade A signals almost cover the whole area. Their grade B signals completely blanket the whole area there. We don't have Kansas here.

The next exhibit we prepared is to show this, on a nationwide scale.

Now, we don't purport to say you can take any 20 miles and make
circles like we have here of every allocation in the sixth report, that it should be a 20-mile radius. I want to make that very clear, but we do want to show it in relation to showing this plan through in its logical sequence so we won't get confused with all kind of radii and so forth.

Senator Porter. It is your testimony it should be tailored to suit the marketing area?

Mr. Kohn. Yes, sir.

Senator Porter. Is that correct, in the community?

Mr. Kohn. Yes, sir. It substantially covers or blankets secondary markets, which by itself can support television, we would consider the Commission should consider that.

Now, at this present time I believe I would be correct in saying the Commission only considers interference, technical interference, as a guide. We would perhaps carry it to the point of interference on a practical basis, that economics do enter into the picture of television.

All of the red dots you see are VHF stations allocated in the sixth report and order, 20-mile radius of each.

Senator Porter. Do I see a white space up there in the northern part of the Lower Peninsula of Michigan? That is my home.

Wouldn't we ever get television under this plan?

Mr. Kohn. Yes, sir; I believe so. This is only the grade A contour. Grade B, of course, would extend out much further.

Senator SchoeppeL Might I ask this question, Mr. Chairman.

I don't know about the technical side of this thing, except what I read and wonder about, and I get more confused all the time, but on that 20-mile radius, let's say, what would happen if you got into some of these overlapping areas?

I presume we will have someone testifying in here as to interference, the interference phase of that, or would we have interference that would in reality cut you below 20, because it is a cinch this thing doesn't go in square corners?

Mr. Kohn. I am not an engineering expert, Senator, but I will say this: There was a time when that area, for instance, from Philadelphia didn't go out any more than a grade A contour than that. For several years it did not. Now, when there are more channels, adjacent channels, and so forth—as I pointed out before here, I think once an objective—if this is a desirable objective, that there is an engineering way to figure it out.

Senator Porter. I assume the answer to that question would be the realization of more channels. You wouldn't run into the interference problem as much if you were limited to the UHF.

Mr. Kohn. That is the third step in our plan, sir.

Now, we would like to point out just for a general picture and impression—we have taken and used a general service area of 60 miles, the influence of VHF stations in those—in other words, we have overlaid each red dot on the forms map at 20 miles; we have put in a 60-mile radius at this point for every VHF station.

I think 60 miles is very conservative, to say the VHF station at maximum power and antenna height, their influence of the coverage of their station; and, as you can see, if you will just lift it up once more, about halfway, and then drop it again, your UHF, yellow stations, are practically blanketed in the Northeast—in fact, east of the Mississippi.

Now, this also illustrates that west of the Mississippi—and this is
why we think it should be done on a market-by-market basis—some
of those circles out there in the Far West, in the Midwest, I think
could very easily be a hundred miles, with their influence, to make
sure that everybody gets good competitive service.

To make it a little easier—and we will skip through these other
exhibits very quickly—what we have done is to take these various sec-
tions and to blow them up so you can see them more clearly. This is
the same map you saw there, only taken in sections and blown up by
sections. This is the 20-mile radius.

Now, let’s take that one down and show the effect of the 60-mile
radius in blanketing out those same areas. Let’s move on to the
Southeast. This is the 20-mile radius.

Unfortunately, when they blew this one up, the yellow faded out on
it; but it will show the 20 mile of the V’s, and we can get a good com-
parison of what 60 miles means on the V coverage, as far as blanketing
all of those spaces is concerned.

The B’s certainly do blanket practically all of this east of the Missis-
sippi.

This is the Far West. This is 20 miles—again using a 20-mile
radius.

I think this more graphically describes why you would have to have
in the Far West much more power, maybe higher antenna heights than
even now are prescribed.

Now, let’s see 60 miles there. Sixty miles just doesn’t fill the areas
out in that particular one.

Now, let’s go to just a pie chart, to just sum up this whole antenna
and power height situation. Let’s show it without the overlay first.
This is a VHF station overlap in the first 50 markets, with a proposed
36-mile grade B contour. That would be roughly a 20-mile grade A
contour of what would be VHF and what would be UHF.

In other words. 81 cities and towns would be covered by the VHF; 170
cities and towns would be able to have UHF; UHF allocations, 87; V’s,
with a cutback in power and antenna heights, would allow
152 UHF allocations.

In terms of population, it is red 38 mile against the yellow or the U
coverage of 40 mile.

Now, drop the overlay over.

This is VHF in those same 50 markets, with complete maximum
power and antenna heights.

In other words, we have washed out the entire—in those 50 markets
we have washed out 250 cities and towns, 239 UHF allocations, and
78,500,000 people that would get only V service if UHF does not
develop.

We would like to give these—this is a summary of step No. 1 of
WFMZ-TV’s three-point proposal of action, and we would like to give
these following reasons for its adoption, and this means cutting back
antenna and power heights:

(1) The most important consideration which we have taken into
account in proposing this plan is to allow television stations to survive
in markets large enough to support them and thus insure that hun-
dreds more communities will have the vital element of local expres-
sion.

(2) Procedurally the most important thing which we believe is
necessary at the present time is to half in its tracks the trend toward
deterioration of the television in the UHF markets, and immediately
provide the stimulus that will start UHF on a fast recovery. Cutting
back powers and antenna heights of the VHF stations alone prevents
the excessive VHF signal blanketing of nearly 300 UHF markets
across the country.

(3) We believe that this is an action for which the Commission
already has sufficient legal powers, backed by legal precedent, to
effectuate with the least possible delay.

(4) It solves to a very great extent the present dilemma of achieving
network program sources for a great many UHF stations.

Obviously, if these signals from faraway VHF's do not get into
good-sized secondary markets, the networks are going to have to
affiliate in those markets.

(5) It would bring about in many of these UHF markets an almost
overnight 100 percent conversion of sets to receive UHF signals.

Step No. 2 in our plan—the relocation of certain present VHF
assignments:

This constitutes the second step in WFMZ-TV's three-point plan
for a nationwide, truly competitive television system.

One of the basic errors we believe in the philosophy of the sixth
report was to assume that the hundred-odd prefreeze stations should
control the whole basis for assignments in their given areas. Thus,
those who received uncontested grants before the freeze were assured
that no matter what better plan might be devised, nevertheless their
rights would not be affected.

I might add there if we had not been contested we would have one
of those prefreeze stations, but we were in a hearing—we had gone
completely through hearings—for a VHF channel in our area, and
about a month after the hearings closed, before a decision was handed
down, the freeze went into effect. The VHF was washed out and 4
UHF's placed in place of that 1 VHF.

With that, we don't quarrel. Four stations are better in that area
than one station by itself would have been.

Some 30 VHF stations were, it is true, required to change from
one VHF channel to another, but none was asked to take a UHF
channel in place of its VHF. Even if in the interest of better assign-
ments, this should have been done.

That, of course, was a dilemma in the New York situation. There
were seven on the air. So, you had to start there, and that made a
scarcity of channels all through that section there.

We would like to suggest that, however belated this action is now,
that it be done anyhow, and we would like to illustrate why this action
is so important and so related to the present problem of UHF develop-
ment—and this will take a very short minute.

In other words, we refer back again to 1 VHF station sitting in
Lancaster, with 9 UHF's right in the same market.

You might consider that the same market.

You take that out, move that VHF down to Philadelphia; you give
4 to Philadelphia, which is the least ideal for 4 network outlets; give
Lancaster a UHF that is already sitting in Philadelphia that will not
be used, we are quite certain, and you have U's in that area compet-
ing against U's, and you have V's in the Philadelphia area competing
against V's. Certainly that is, I think, equal opportunity for all sta-
tions.
Once step No. 2 of our three-point plan is effectuated—incidentally, we know that can be done, but we will not take the time here. These exhibits are both in the back here. We will leave these exhibits with the committee, if they want them, for future study rather than take the time here to go through all of those other markets, to show by moving one V which has been already allocated present V's would clear up a whole new market for VHF that was already predominantly V.

Senator Potter. It would take quite a bit of capital to make that move, wouldn't it?

Mr. Kohn. Yes, sir. Somebody has to get hurt if we are going to have television on a nationwide basis, at least in our opinion.

I am sure that those that have present V's that would have to give them up would be in a position of where other V's would take the equipment with them, and they would have to get a UHF transmitter just as those in the U's are purchasing UHF.

I have just a slight bit more to say on that particular thing.

Once point 2 of our three-point plan is effectuated, the Nation will be divided essentially in VHF markets with V's competing against V's—and UHF markets with U's competing against U's.

There is also another very important reason for this action. It will allow, in our opinion, for possibly at least four VHF stations in many of the major markets, thus bringing out the important objective of preserving now insofar as regulation is possible the future 4 instead of 2 competing networks.

We anticipate that those VHF stations affected will object very strenuously to this action. However, competition on an equal, fair basis with other stations in the same areas constitutes in our opinion equal opportunity as it is known within the free enterprise system.

In that particular city of Lancaster, if there is going to be one VHF and never any other television, in the public interest I think whatever financial loss is taken there is small compared to the service that is going to be lost to a great number of people.

Point No. 3—Gradual evolution of all television stations to the UHF band:

Point 3 of WFMZ-TV's three-point plan looks to the general aims and purposes of plans submitted previously by other witness before this committee. This means a reallocation procedure which would in a given period of time bring all television into the 70 channels of the UHF band.

Specifically, point 3 of our plan proposes:

(1) Within a reasonable time, subject to procurement of necessary equipment, all VHF stations begin simulcasting on both VHF and UHF frequencies—the UHF frequency being determined by a new allocation plan for the whole country utilizing the 70 channels of the UHF band.

We suggest the period of simulcasting be in effect for a period of 5 years, at the end of which time all telecasting would revert to the UHF band.

There has been much said about shifting television to UHF. We do not want to repeat any of it except to assert a strong opinion that it can be done and that it will produce a nationwide, truly competitive television system.

We made a preliminary research study of the Nation's first 100 markets to find out just how many UHF assignments would be required to—
(a) Replace the present VHF assignments already there; and
(b) Make a total of at least 4 UHF assignments in the largest markets and at least 3 UHF assignments in the secondary markets.

Because we were so surprised ourselves at the small number of UHF assignments required to accomplish this, we thought it material to make this study available to the committee. You will find it labeled as exhibit 12.

That is the last exhibit in the book.

What we have done here is to take the present assignments in both VHF and UHF and show the number of UHF's necessary to replace VHF's in the same market and the additional number of UHF's that would be required to achieve a competitive situation in that market.

Please note that a total of only 85 UHF assignments are necessary to replace VHF assignments in the same market, that is, in the first 100 markets, and that an additional 81 UHF assignments will accomplish the competitive 4 and 3 stations per market so highly desirable.

There are over 1,300 UHF assignments now made in the UHF band. A total of only 165 assignments in the Nation's first 100 markets will accomplish the changeover to UHF on a good competitive basis; and, if you noticed, we included in that the educational allocations also. So, that would not be changed. The same places that have educational channels now would continue to have them.

May we conclude our testimony now by pleading with the committee to keep uppermost in its mind this one through: The Commission's present position with its present plan is based upon "a hope that the UHF band will be fully utilized"—the plan we have presented here is based upon facts already known.

We submit that in a matter so vitally important as a nationwide, truly competitive television system is to the future growth and welfare of this country it should not be left hanging in the balance upon such a precarious, unknown quantity as hope but should be decided upon facts that are here present in great numbers.

This thought becomes even more urgent when it is known now that there can be a nationwide, truly competitive television system within the 70-channel UHF band.

Senator Potter. Mr. Kohn, I have a letter here from Chris Witting, president of Westinghouse, and I would like to read you four paragraphs, and have you comment on the contents thereof:

It has been proposed to require all VHF stations to now reduce their existing coverage area to avoid overlap of a nearby UHF station. This would result in inestimable damage not only to the stations but to the members of the public living in the present service areas. For instance, if the coverage area of channel 4 in Washington, D. C., were so reduced, thousands of citizens living in Hagerstown, Md., and in the surrounding area would be denied service they have been enjoying and relying upon for so many years.

These citizens (and those in any other similar community in the United States) have a right to, and will demand, a freedom of choice among multiple-program sources. Since Hagerstown has been assigned only one channel (and it certainly could not support more than two), it is clear that additional programs to permit freedom of choice (and a competitive broadcasting system) must come from outside areas. This service can best be furnished by the existing VHF channels located in cities large enough to support multiple program sources. The effect of this reduction of service area proposal on rural America would, to us, be comparable to suddenly denying them radio service by requiring all clear-channel broadcasting stations to reduce power to the equivalent of a local station.
If the principle be established that the coverage of the VHF stations in Washington is limited to eliminate overlap with the UHF station in Hagerstown, then it follows that the UHF station allocated to Frederick, Md., just must be limited to prevent overlap with the UHF station allocated to Hagerstown. Under such a philosophy the citizens of Washington would receive four competing services, the citizens of Frederick and Hagerstown, respectively, would each receive a single service, and the vast rural audience living between these cities would be denied any service.

Furthermore, such a philosophy is physically impractical in a situation like Allentown, Bethlehem, and Easton, Pa. Two stations have been allocated to Allentown, one to Bethlehem and one to Easton, Pa. Under the present plan this should afford 4 competing services to the residents of all 3 cities and the rural areas surrounding them. It seems to us inconceivable that anyone could seriously propose that the coverage areas of these stations be so reduced as not to overlap (assuming that this was physically possible) thereby reducing Bethlehem and Easton to a single service and Allentown to two services.

The theory becomes even more untenable when we realize that most cities in the United States have been allocated but a single television channel and in the whole State of New Hampshire only 1 city gets more than 1 and in the State of New Jersey only 2 cities get more than 1 channel. The public interest lies in the direction of making every effort possible to increase the coverage of each station.

This was submitted by Westinghouse, and I would like to have your comment on that. It's a question you brought up in your testimony.

Mr. Koin. I hope Westinghouse in the forepart of the letter gave us credit.

I sat with one of their officials and outlined exactly what I was going to testify on here before we even came, so it would give them a chance to reply.

I think we have answered in great part, Mr. Witting's letter, and that is that we propose it on a market by market basis.

If I may take our own market, for instance, there is no thought whatsoever that Allentown, Bethlehem, and Easton would not overlap signals. There should not be. That is the same market, and that means there would be four network sources in that market, but for Philadelphia, to cover the Allentown-Bethlehem-Easton market, so that no UHF develops up there, if I may go back to the first part of my testimony, cities like Allentown that would have no means of local expression, simply because Philadelphia is afraid they will not get 9 or 10 signals rather than 4 or 5, to me does not stand up under the basis of fair judgment.

The second thought there is that we are not proposing they will not get service from Philadelphia. We are just proposing they will get approximately what they did get when television started out in that area, and in our area people put up hundred-foot antennas, thousands of them, to just bring in a snowstorm, but even then they invested in sets and very costly antennas to bring in the fringe area reception before it went on high power.

Now, what we have in our area is a noise-free picture, just as though it were sitting in our own backyard, and that occurs all over the United States.

I think what has to be weighed here is to whether or not if Philadelphia comes down regardless of how many arguments they will find about this injuring the public, that surely the Commission envisioned in their own report that everybody eventually was going to have UHF sets, and that they're not going to take away a service, that they will get service, at least, to meet priority one, that they have in their report, and as far as the people having to invest to get the service, we thought we could expect—or the Commission really thought in its
philosophy of issuing the report that would one day go 100 percent conversion in our market, so that we could compete in all the homes, instead of just what it is now, that be on the air now there for over a year, and only about 20 percent of the sets converted.

Senator Potter. If the manufacturers of television receivers should come out with all channel tuners as a standard part of their equipment, wouldn't that alleviate a lot of the difficulties that you encounter today?

Mr. Kohn. Mr. Chairman, I seem to recall that UHF-VHF sets are backing up in warehouses. They're not being sold, that the production is exceeding the demand for them and, therefore, I just don't think they are going to put them on until they see some evidence that UHF is going to——

Senator Potter. Supposing they were put on as a requirement. I think now they have to—don't they have to get a permit from the Commission in order to make sure to meet certain standards?

Mr. Kohn. Mr. Chairman——

Chairman Hyde. Not for the receiver.

Senator Potter. Not for the receiver.

Chairman Hyde. We are concerned with those receivers which have radiation characteristics, but our authority over the receiver extends only in that area of preventing interference.

Senator Potter. Just suppose by a strike of magic that all new receivers from here on in contained this all-channel tuner; wouldn't that be a big help, so that the person owning a receiver today could tune in on a UHF as well as a VHF station?

Mr. Kohn. Well, may I say this, Mr. Chairman:

In our area there isn't a receiver being sold today that isn't a combination set, and in the controls. I mean one of our stations, at least, is in serious trouble up there in that area, and I don't know about how it would develop in Allentown. It's going to take a lot of reassessment before you go ahead with things the way they look today from the resistance of the national advertiser to the program sources and all of the things which you have heard so much about already. I don't want to go into them, but I think ultimately that this committee and the Commission has to decide whether or not 12 channels are going to be the television service that we have, and I don't think that throwing bones in the form of the sets, and so forth, is the real, crucial heart of this problem with UHF.

I think it goes into many very serious things, and this overlap one, we think, is at the very core of it. We think that would start immediately, even if it were known it were being considered, it would change the psychology that is sweeping the television industry in that UHF is going out of existence, and we know from our FM experience that it's a long, hard road climbing back up again.

Senator Potter. Well, Mr. Kohn, let me congratulate you for making an excellent presentation, and a very graphic one. I have gained much information from your statement.

Mr. Kohn. Thank you. I wish I could have done it better for you.

Senator Potter. You have no need for apology. It was well done.

At this point in the record we will insert Mr. Kohn's complete prepared statement, together with the exhibits submitted. (Various exhibits not reproduced are in the official files of the committee.) Without objection, it may be inserted at this point.
(The material is as follows:)

**TESTIMONY OF RAYMOND F. KOHN, PRESIDENT AND GENERAL MANAGER OF THE PENN-ALLEN BROADCASTING CO., ALLENTOWN, PA.**

My name is Raymond F. Kohn, and I reside at 1411 Hamilton Street, Allentown, Pa. I am president and general manager of the Penn-Allen Broadcasting Co. of Allentown, Pa., licensee of WFMZ, an FM-only broadcast station, and construction permittee of WFMZ-TV, a UHF authorization for channel 67 in Allentown.

Two weeks ago at the NARTB Convention in Chicago we heard a great deal about free enterprise and eloquent warnings about the grave consequences of running to Congress for more regulation. May I say to the members of this committee, with all sincerity we are not here asking for more regulations but corrective regulation. My company believes, and we think with abundant justification, that there is before this committee and the Nation a grave question as to whether or not we shall have a truly competitive nationwide system of television. We do not think our purpose in appearing here is based solely on seeking a “transfusion by cutting the throats of others”—as one keynote speaker at the convention implied. We are certain that this committee, in hearing our comments, will judge them as they apply to the welfare of all the people of this country and not just a few in Allentown, Pa. We do think that we have some constructive information to offer and a suggested possible procedure of action that is worthy of serious consideration and all the study.

We humbly believe that the experiences of our 7 years of operating an FM-only broadcast station allows us a small measure of validity in speaking on the subject that is before this committee. Contrary to the Commission’s expressed view in the sixth report we are here to say that we find an alarming similarity in many, many respects with this UHF problem which the development of FM faced and is still facing. Practically all of the elements of difficulty in UHF which have been repeated over and over by other witnesses in previous testimony here were and still are present in FM—the problems of conversion, program sources, advertiser resistance, especially on the national level, lack of good receivers at competitive AM costs, and many others.

But we do not intend to burden the record with a recital of those experiences for it is not our purpose here to weaken the cause of objectivity by playing on the sympathetic heartstrings of the members of this committee. Besides, if we may say with equal parts of humor and sobriety, we are somewhat afraid that we might destroy the credibility of our whole testimony by relating a 7-year FM saga which we know you would find exceedingly difficult to believe—true as it is.

Suffice it to say, and we do not mean this to be facetious, we are quite convinced that, if the members of the Commission could have lived with us through our experiences in FM, there would have been no need for this hearing on UHF. The whole philosophy incorporated in the sixth report and order might well have been a different one—a more realistic one.

We cannot add to the record any experiences in operating a UHF station since we are not yet on the air. We are, I would say, about $100,000 along in construction with long-term commitments amounting to about 4 times that much which we hope we shall have the satisfaction of honoring in full. As I sit here, I can hear the distant “Amens” to that statement being uttered by our 250 stockholders, almost all of whom reside in and around Allentown, Pa. I am more aware of the pleadings of over a half million Lehigh Valley residents who, I am certain, would approve of the statements which we are making here today, were all the facts made clear to them.

Before we present what we believe is a sound and workable approach to the UHF dilemma we would like to bring out briefly, and emphasize with all the vigor at our command, one aspect of this problem that, in our opinion, should have precedence over all other considerations. It has been touched upon in other testimony, but has not yet been given the emphasis it surely deserves. We refer to the two words “local expression.” The Commission, in its sixth report, gives local expression priority 2, thereby recognizing itself the extreme importance of achieving the goal of as many outlets for local expression as can be possibly attained. In complete contradiction the philosophy of the sixth report and its implementation since bids well to make mockery of that most desirable goal. We shall prove this point in just a moment.

From the New England town meeting down to today the opportunity for a community to have the facilities to express itself has been a vital factor in pre-
serving our ideals of democracy. Never has the urgency been greater than it is today to do everything in our power to perpetuate the processes of local expression. Time was when the great fourth estate—the newspaper industry—was a highly competitive business, much for the good of the community and the Nation. Today we are witnessing the extinction of competition in the newspaper field even in great cities like Washington, St. Louis, Atlanta and others. The medium and smaller cities now either have but one newspaper or through merger or sale competing newspapers come under common ownership. We think it is uniformly admitted by all thinking people that this loss of competition is undesirable and leaves a vacuum in the communications field that we should strive, if at all possible, to fill.

Congress is powerless to stop the trend of monopoly in newspapers, but it can, through an agency of Government already in existence and under compulsion of an act already spelled out, help to fill the vacuum referred to above by preserving the powerful, impartial voice of television in the hundreds of cities across this Nation which can and will support local television—if it is but given a reasonable chance to put down its roots.

In a world fighting for its survival now—today—the Commission's reference to a nationwide competitive system of television in terms of "will eventually" or "the long range" leaves us singularly and particularly cold. An "eventual" television station in Allentown (presuming there would be one, which is a presumption we cannot bring ourselves to accept) will be no better than the one that can be operating this September—bringing a new, fresh, and vital force of self-expression to a community which it needs—and which it so rightfully deserves.

Local ownership, integration of local ownership with management, and performance of local responsibility in programs geared to the needs of the community which a station serves is one of the very foundations of judgment used by the Commission in granting and renewing television and radio licenses. No other factors in the preparation and presentation of testimony and exhibits for a competitive hearing before the Commission receive so much careful and emphatic attention by Washington's specialized, high-priced attorneys as those which could be summed up in the two words "local expression." No other phrase is so familiar to broadcasters, attorneys, Commissioners and the whole FCC staff as "the public interest, convenience and necessity."

With this emphasis we heartily agree, wholeheartedly agree, and it is to help preserve this emphasis that we are now appearing before this committee. We think it pertinent but not material to this controversy who utilizes what channels but that all channels necessary to a nationwide, truly competitive system be utilized. To achieve this objective a fair and proper climate must be provided so that television, on the local level, shall have a reasonable chance to grow in all communities across this Nation wherever the economic soil is rich enough to nurture it.

May we define briefly what, in our opinion, a local television station means to Allentown and our communities around Allentown? We use Allentown merely as an example and we know you will keep in mind that there are hundreds of Allentowns across the Nation to which each of our thoughts are equally applicable.

1. It means a heretofore unprecedented opportunity for our churches to spread their influence beyond the portals of church doors. There are over 90 churches in the city of Allentown alone. Why should the ministers, the choirs, and the congregations of these churches be deprived of the opportunity to use this powerful new medium of expression?

2. It means a heretofore unprecedented opportunity for our educational system to have the means of spreading education beyond the portals of the school buildings. It means opportunity in the most graphic way yet devised to acquaint parents and taxpayers with the methods and curriculum being used to educate their children. It means opportunity to use the trained minds and special talents of teachers and school administrators on programs designed for the welfare and enlightenment of the whole community.

3. It means a heretofore unprecedented opportunity for the promotion of the activities and objectives of all our local public service institutions: the Community Chest, the Red Cross, the Medical Society, the Good Shepherd Home for Crippled Children, the Boys' Club, Little League Baseball, dozens of others.

4. It means a heretofore unprecedented opportunity to provide facilities for the enlightenment of the people before they go to the polls to vote. Television, as has been amply proved, has a peculiar knack for searching out sincerity, exposing insincerity. The face betrays many a fact that the mind and the
voice would try to hide. We think the members of this committee would be the
first to agree that the caliber of local governments in the thousands of com-
munities across the Nation ultimately decides the caliber of government and its
servants in the Nation's Capital. And perhaps it is too obvious to mention the
power and impact of television as a medium of expression for local issues: the
mechanical controversy, the police department; should the monument in the
square be moved to West Park; the annexation of Lower Salisbury Township
to the city; the new sewer project proposed for the West End. None of these
issues are world-shattering—none of them interest anyone beyond the confines
of each of the thousands of communities in which they occur, but wrapped up
in them is the cumulative basic worth of a whole country, the essence of the
vitality which makes our democratic ideals work.
5. Television in our community means a heretofore unprecedented opportunity
to promote the economic good of our area. The ability of our local and regional
merchants to advertise their products and services is not only essential but
necessary. No one argues television's ability to sell goods and services. Why
deprive our town and hundreds of others of the economic benefits of this new
medium? And the irony of this whole situation is that for years now the
merchants in our town have indeed had to compete against merchants in Phila-
delphia who, through high power television seek and do effectively draw business
away from Allentown, and without local television our merchants do not now have
and may never have a fair chance to retaliate against this outside city advantage.
There are many, many more things that television means to a community—
for a television station should and can be at the very center of every activity—
the sounding board and the mirror of a community's whole personality.
We submit to this committee that the importance of preserving in the hundreds
of communities, the element of local expression is alone enough, in itself, without
any of the other considerations, to cause all concerned to work not against each
other but together to find a practical and workable way to arrest and reverse
the present tragic downward trend toward extinction of television in the
UHF band.
And may I add here what sounds like a facetious note, but really isn't? There
are three powerful VHF stations in the city of Philadelphia which purport to
render "television service" to our community of more than half a million people.
I say to them now that if each of these stations will submit a written state-
ment, duly subscribed and sworn to, to this committee or the Commission, say-
ning that they do solemnly promise to provide as many local programs, with
local Allentown people participating, as WMZ-TV has already promised under
oath to do, and in the same desirable time periods, then we will here and now
tear up our testimony and retire to the sidelines to watch with bated breath the
greatest phenomena that has yet occurred in the history of broadcasting.
The exhibits which we will now present for the committee's information were
prepared by 4 people, which is the entire present staff of our company, in a
period of approximately 2 weeks of admittedly somewhat concentrated effort.
No expert lawyers or engineers had anything to do with them. We realize this
statement would seem to weaken or even destroy our case, but before we finish,
we hope to establish that just the opposite will be true. For we believe with the
very deepest sense of conviction that there is a solution to this problem and that
it will be founded, not upon the evidence of the cold, ever-conflicting arguments
of the slide rule boys or the legal clamorings of those who will try to find solace
in the Constitution, but upon the inherent practical, good commonsense of this
committee, the Commission, and all those whose sense of public interest lies
above self, and whose vision allows them to see the tremendous importance of a
television system which best serves the growth and ideals of this country and its
160 million people. Once the objective is set, the goal defined, the engineering
slide rules can turn out the technical answers to make it work. Even to the lay-
man the present allocation plan contained in the sixth report is not above
critical analysis—surely it cannot be an only solution upon which future develop-
ment of television must live or die. It must not be forgotten that adoption of
this very same sixth report was not unanimous, it had bipartisan dissent, by a
Republican member and by a Democratic member of the Commission.
We have taken the approach of an average person trying hard to exercise
practical and commonsense. With all humility and due respect for those experts
who label this problem "apparently unfathomable," we enter a small but vigoro-
sously dissenting voice.
Our first series of exhibits are planned in logical sequence to answer the fol-
lowing questions:
1. Just what is the present allocation plan and how does it break down in terms of assignments to each of the 48 States?

2. What is the service provided by (a) the VHF assignment and (b) the UHF assignments in terms of comparative service?

3. Will television in the UHF band not develop? or, put another way, what kind of service will we have if only the 12 channels in the VHF band are utilized? (a) Commercial channels; (b) educational channels.

*Exhibit No. 1.*—This is a State by State breakdown of the number of commercial VHF assignments allocated, the number of cities in each State to which these VHF assignments are made, the number of educational VHF assignments made to each State, the number of UHF assignments allocated to each State together with the number of cities in which these UHF assignments are made, and, the number of UHF educational channels assigned by the sixth report to each State.

It does not take much study before one realizes that there is a serious scarcity of VHF channels allocated to most of the States and that Statewide television coverage can be best accomplished by use of the UHF band.

*Exhibit No. 2.*—This exhibit graphically illustrates what we mean by scarcity of VHF channels. Six States have allocations of VHF channels in but one city, a total of six. These same 6 States have among them UHF assignments in 29 cities. (This table does not include educational assignments.) Three States have VHF assignments in but 2 cities, or a total of 6, as compared to total assignments in the UHF band in 29 communities. One State, Kentucky (ranked sixteenth in population), has but 3 VHF cities and 27 UHF community assignments. The fourth most populous State in the country, Ohio, has VHF allocated to only 5 cities, yet there are assignments in the UHF band for 36 cities and towns. Our own State of Pennsylvania has but 7 cities assigned VHF channels, yet has 33 UHF cities and towns.

There are 33 States listed in this exhibit and all 33 have 8 or less cities assigned VHF channels. If UHF television does not develop, 33 out of the 48 States must be content to be served by 8 or less VHF cities each; 165 cities will be all that can bring service to 70 percent of the States of the Union. By comparison, there are UHF channels assigned to 681 cities and towns in these some 33 States.

If intermixtures will not work, the question of which band, VHF or UHF, should be retained is rendered almost academic by these comparisons alone.

*Exhibit No. 3.*—This is an analysis of the assignments made for educational, noncommercial stations. The Commission seems to be in unanimous agreement that these assignments are both desirable and necessary. But let’s take a look at what happens to educational television if UHF does not become a successful reality. Fifteen States, with a 1950 census population of almost 54 million people—35 percent of the Nation’s entire population—will have no educational television at all. And ironically enough, many of these States are the wealthy ones which might be expected to best be able to support educational outlets. We cannot resist pointing out to the members of this committee also that among these 15 States are Michigan, Nebraska, and Rhode Island. Fifteen more States with a population of 38,703,778 will have but 1 educational outlet each and 12 additional States with 46,573,883 people will have but 2 educational channels each. The cumulative total adds up to but 39 educational outlets in 42 States whose total population represents 92 percent of the population of the entire United States. Well over 200 of the assignments made by the Commission for educational television would “go by the board.” We are sure that this prospect is as painful to the Commission as it is to us.

Once again we see the absolute necessity of making certain that television in the UHF band survives.

*Exhibit No. 4.*—This exhibit seeks to show the answer to the question, “Will there exist a monopoly if only the 12 channels in the VHF band are utilized? We won’t attempt to define monopoly, but we think the breakdown presented here brings out some startling and alarming facts. Shown in this table by population groupings are the first 115 markets in the United States and the number of VHF channel assignments (excluding educational) in each market. Here are the pertinent facts:

1. Only 6 markets have at least 4 VHF stations assigned. This is only 5.2 percent of the total of 115 markets.

2. Only these 6 markets can provide stations for ideal outlets for the 4 television networks.

3. 25 markets or 21.7 percent have only 3 VHF channel assignments; 15 of these markets are among the first 25 largest markets in the United States. Obviously, 2 networks must share clearance time with one of the stations in each of these markets.
4. 38 or 33 percent of the Nation's first 115 markets will have but 2 television stations. NBC and CBS have clear first mortgages in these markets.
5. 27 or 23.5 percent of the top 115 markets will have but one television outlet. Which networks get what in these markets is anybody's guess.
6. 19 or 16.5 percent of the top 115 markets will have no television outlets whatsoever.
7. 84 or 73 percent of the Nation's first 115 markets will have only 2, 1 or no television stations. There is little question that this country will have but 2 television networks if only the 12 channels in VHF are utilized.

Once again we see the absolute necessity of making certain that television in the UHF band survives.

Having amply, we believe, established this premise, we would now like to present a three-point program of action which will assure a nationwide, truly competitive television system on an equitable, fair, practical, workable basis.

With the use of charts and overlays, we would like to illustrate why each one of these three procedures is necessary—and should be adopted by the Commission. But before any of these procedures are put into effect, we believe the following important thing should be done: The Federal Communications Commission should immediately affirm that a crisis does exist in the implementation of the nationwide, truly competitive television system which it envisaged in its sixth report and order, and because such an emergency does exist, the Commission, in the public interest, is compelled to enter into certain rulemaking decisions.

Once this is done, then we suggest the following three-step plan:

1. POWER AND ANTENNA HEIGHTS

At the very heart of the UHF problem we believe is the excessive power and antenna heights granted to existing VHF stations, especially in major markets. It is our proposal that the Commission first enter into a rulemaking proceeding which would in effect fix new antenna heights and power requirements for VHF stations, looking towards confining the influence of each signal to roughly its own metropolitan district area. This should not be a blanket requirement fixed by zone 1, 2 or 3 as is now maintained in the six report plan, but upon would be considerably less than, for example, in the Far West, where perhaps in the heavily populated areas of the Northeast grade A and grade B contours a market by market basis. Such a plan as we now propose would suggest that even greater power and higher antenna heights than are even now allowed should be granted. Let's turn now to illustrations of exactly what we mean:

(a) WFMZ-TV plan using a limitation to 20-mile radius for grade A contours.

(b) The same area showing influence of Philadelphia VHF coverage on maximum power and antenna heights (46-mile radius grade A contour).

(c) The same area showing influence of Philadelphia VHF's plus one VHF grant at Lancaster, Pa.—assuming maximum power and antenna height (application for maximum power and antenna height by WGAL-TV, Lancaster, is now before the Commission so is being opposed by several UHF stations in that general area.)

(d) The same area showing influence of VHF signals from Philadelphia, Lancaster, Baltimore, New York, Binghamton.

II. Application of WFMZ-TV plan as illustrated in the lower Michigan, upper Ohio and Indiana area.

III. Application of the WFMZ-TV plan to the Massachusetts-Rhode Island-Connecticut area.

IV. Application of the WFMZ-TV plan to the Northeastern, Middle Atlantic and North Central States of the United States.

V. Application of the WFMZ-TV plan to the Southeastern and South Central States of the United States.

VI. Application of the WFMZ-TV plan to the States west of the Mississippi.

Summary of point 1 of WFMZ-TV's 3-point proposal of action

We would like to give these following reasons for its adoption:

1. The most important consideration which we have taken into account in proposing this plan is to allow television stations to survive in markets large
enough to support them and thus insure that hundreds more communities will have the vital element of "local expression."

2. Procedurally the most important thing which we believe is necessary at the present time is to halt in its tracks the trend toward deterioration of television in the UHF markets, and immediately provide the stimulus that will start UHF on a fast recovery. Cutting back powers and antenna heights of the VHF stations alone uncovers excessive VHF signal blanketing of nearly 300 UHF markets across the country.

3. We believe that this is an action for which the Commission already has sufficient legal powers, backed by legal precedent, to effectuate with the least possible delay.

4. It solves to a very great extent the present dilemma of achieving network-program sources for a great many UHF stations.

5. It would bring about in many of these UHF markets an almost overnight 100 percent conversion of sets to receive UHF signals.

2. RELOCATION OF CERTAIN PRESENT VHF ASSIGNMENTS

This constitutes the second step in WFMZ-TV's three-point plan for a nationwide, truly competitive television system.

One of the basic errors we believe in the philosophy of the sixth report was to assume that the hundred-odd prefreeze stations should control the whole basis for assignments in their given areas. Thus those who received uncontested grants were assured that no matter what better plan might be devised, nevertheless their rights would not be affected. Some 30 VHF stations were, it is true, required to change from one VHF channel to another, but none were asked to take a UHF channel in place of their VHF's—even if in the interest of better assignments, this should have been done.

We would like to suggest that however belated this action is now that it be done anyhow—and we would like to illustrate why this action is so important and so related to the present problem of UHF development.

Once point II of our three-point plan is effectuated, the Nation will be divided essentially in VHF markets with V's competing against V's—and UHF markets with U's competing against U's.

There is another very important reason for this action. It will allow, in our opinion, for possibly at least 4 VHF stations in many of the major markets, thus bringing out the important objective of preserving now insofar as regulation is possible the future of 4 instead of 2 competing networks.

We anticipate that those VHF stations affected will object very strenuously to this action—however competition on an equal, fair basis with other stations in same areas constitutes in our opinion equal opportunity as it is known within the free enterprise system.

3. GRADUAL EVOLUTION OF ALL TELEVISION STATIONS TO THE UHF BAND

Point 3 of WFMZ-TV's 3-point plan looks to the general aims and purposes of plans submitted previously by other witnesses before this committee. This means a reallocation procedure which would in a given period of time bring all television into the 70 channels of the UHF band.

Specifically, point three of our plan proposes:

1. Within a reasonable time subject to procurement of necessary equipment all VHF stations begin simulcasting on both VHF and UHF frequencies—the UHF frequency being determined by a new allocation plan for the whole country, utilizing the 70 channels of the UHF band. We suggest the period of simulcasting be in effect for a period of 5 years at the end of which time all telecasting would revert to the UHF band.

There has been much said about shifting television to UHF. We do not want to repeat any of it except to assert a strong opinion that it can be done and that it will produce a nationwide, truly competitive television system.

We made a preliminary research study of the Nation's first 100 markets to find out just how many UHF assignments would be required to (a) replace the present VHF assignments already there and, (b) make a total of at least 4 UHF assignments in the largest markets and at least 3 UHF assignments in the secondary markets.

Because we were so surprised at the small number of UHF assignments required to accomplish this, we thought it material to make this study available to the committee. You will find it labeled as "Exhibit 12."
Please note that a total of only 85 UHF assignments are necessary to replace VHF assignments in the same market—and that an additional 81 UHF assignments will accomplish the competitive 4 and 3 stations-per-market so highly desirable.

There are over 1,300 UHF assignments now made in the UHF band—a total of only 165 assignments in the Nation's first 100 markets will accomplish the change-over to UHF on a good competitive basis.

May we conclude our testimony now by pleading with the committee to keep uppermost in its mind this one thought: The Commission's present position with its present plan is based upon "a hope that the UHF band will be fully utilized"—the plan we have presented here is based upon facts already known. We submit that, in a matter so vitally important as a nationwide, truly competitive television system is to the future growth and welfare of this country it should not be left hanging in the balance upon such a precarious, unknown quantity as "hope" but should be decided upon facts that are here present in great numbers. This thought becomes even more urgent when it is known now that there can be a nationwide, truly competitive television system within the 70 channel UHF band.

SUMMARY

1. The above States represent 33 of the 48 States.
2. Only 15 States would have television stations in more than 8 cities if the UHF band is not utilized.
3. In these 33 States 681 communities have assigned channels in the UHF band compared to 165 communities in the VHF band.

NOTES

1. 15 States would have no educational television outlets if UHF does not develop.
2. 35.7 percent of the people of the United States (computed on 1950 census figures) live in those 15 States and would have no service from an educational television station.

Senator Potter. Mr. Goldberg.
Mr. Goldberg is consultant for the UHF Industry Coordinating Committee.

Mr. Goldberg. Thank you, sir.
Senator Potter. It is good to see you, Mr. Goldberg.
Mr. Goldberg. Thank you, sir.

**Statement of Melvin A. Goldberg, Research Consultant, Ultrahigh Frequency Industry Coordinating Committee**

Mr. Goldberg. My name is Melvin A. Goldberg. I have been engaged by the Ultrahigh Frequency Coordinating Committee as research consultant. I was formerly research director of Television

In this presentation, we shall attempt to show that television stations, whether VHF or UHF, cannot serve the public without network programs and that UHF stations, by and large, are not and cannot obtain such programs under present conditions.

Because of these conditions, there is a serious trend toward monopoly or duopoly in the television industry—an industry where in 1953, according to Chairman Hyde’s statement, 92 prefreeze non-network-owned television stations, plus the networks, with their owned stations, showed revenues of $406.2 million, while the 215 remaining stations—postfreeze VHF and UHF—had to divide revenues of $24.6 million, and where the 92 prefreeze stations and the networks took 94.3 percent of the total television revenue during 1953.

In brief, the facts will show that:

1. Network revenue for 1953 was almost 60 percent of the total revenue of the television industry; and NBC and CBS together accounted for almost 50 percent of the revenue of the entire television industry.

2. Ninety-two prefreeze VHF’s revenue accounted for 35 percent of television revenues.

3. Two hundred fifteen postfreeze VHF and UHF stations divided the remaining 5 percent of the total television revenues.

4. More than 75 percent of the audiences of America regularly tune to two stations and two networks.

5. Seventy-three of the top one hundred markets of America have been allocated only two VHF stations—I believe the Du Mont presentation showed that.

6. Each of these VHF stations in the 73 markets have primary affiliations with NBC and/or CBS and because of this entrenchment, the likelihood of successful competitive operation of UHF stations in these markets, or in markets engulfed by the superpower of these VHF stations, is virtually nil.

Then, in answer to any claim that UHF stations are only undergoing the “growing pains” that the prefreeze stations went through, we shall point out the facts which show the fallacy of this claim.

We earnestly believe that the facts shown in this presentation will show that the American public will be limited to a narrow choice of programs, if the present monopolistic trend is not checked by immediate action looking to the establishment of a revised pattern under which greater equality of competitive opportunity to more stations and networks is assured.

Now, stations do need network programs. It is axiomatic that network programs, because of their high quality, attract the greatest viewing audience. It is for this reason that national and local spots, which are adjacent to network programs, are most popular with advertisers.

By the same token, the sponsorship of revenue-producing local programs in time segments close to those in which network programs are telecast are similarly in substantial demand; and it is generally the case that purchase of spots and sponsorship of local programs on a particular station will be attractive to advertisers, even in portions of a station’s schedule considerably removed from the time in which
the network program is carried because of the likelihood of the continued availability of a substantial part of the audience tuned for the network programs.

It may be suggested in the course of these hearings that there are available to UHF stations adequate high-quality programs that may be substituted for network programs, which would attract audiences and revenues on a basis competitive with the VHF stations having the network programs. Such a claim falls in the realm of fantasy. The tremendous costs of the popular network programs are well known. Talent costs alone are almost astronomical. Everyone here has probably seen the recent reports in the press that a weekly salary of $25,000 is being paid to one artist on a network show.

These costs are paid by the advertiser who can justify the great expenditures because the two networks can deliver high-powered stations, in all of the major markets of America, to which are apportioned the cost of the program.

A single station, or any small combination of stations, could not support such program expenditures because the costs could not be distributed among enough markets or viewers. And, in fact, the networks themselves would not sustain such talent costs unless they were paid for by large national advertisers desiring the nationwide coverage furnished by chain or national television broadcasting.

It may be suggested that films can be used by stations as a method of programing competitive with network programing. At the present time, outstanding feature-length films of a quality competitive with network programs are virtually unavailable to any station.

Such film as is made expressly for television generally gravitates to the entrenched VHF network-affiliated stations because of their greater resources and their ability to schedule such films preceding and following network programs, rather than opposite to network shows. There is a decided advantage to the film supplier and the advertiser in avoiding competition with the top network programs, because in this manner the salability of the film and continued availability of the audience is more likely to be assured.

The necessity of network programs for successful TV-station operation can be illustrated in a graphic form. Exhibit 1 reflects the revenue picture of a typical station if it was receiving 6 half-hours of sponsored network programs daily, all in class A time, and had sold all of the spots around these network shows. In this example, a class A hourly rate of $300 and a programing schedule of 35 hours weekly have been used.

Its weekly revenue then would be—I might mention, Mr. Chairman, there is a schedule of rates that is in proportion to the amount of time. For example, the half-hour costs usually 60 percent of the hourly rate, and it goes on down in that manner.

The 42 half-hours network is $2,268. The 49 20-second spots would then come to $2,058, and the 49 8-second spots would come to $1,029.

I have used an 8-second spot and a 20-second spot between each half-hour program. These are these fast commercials that you usually see with a station break.

Senator Potter. That is a common commercial.

Mr. Goldberg. Yes; that is apart from the commercial that goes with the program.

Senator Potter. Yes.
Mr. Goldberg. The amount then comes to $5,345.
I moved it down to about 23 in the number of hours; it's in the next section, Mr. Chairman, with the exhibits.
What we have done there is make as the number of hours this 100 percent so that 2 half-hour programs then add up to 1.2 hours. That is what it points out to.
Now, if we turn back to exhibit 1 and compare it with exhibit 3—actually, it should be exhibit 2; we have taken out exhibit 3—we see that networks are necessary to independently owned stations not only for revenues which result, but for reductions in costs, as well.
Now, if you notice in this exhibit 2, it points out that 3 hours of network programing daily means a saving to the station of 21 program hours for the week, or $2,100. The expenses for the week then come to $4,900. What I have done there is assumed $700 a week, $1,000 a day for expenses. This is about average for the stations.
Then in that case if you have 35 program hours, it's going to be about $100 per hour, and you just reduce it.
The expenses for the week then come to $4,900.
Thus, 21 hours of network programing weekly in this example are more than enough for the station to break even. Of course, if the station had no network programing, it would be almost impossible to sell any time—as we have seen from the number of UHF dropouts thus far.
Now, without network programs, no conversions:
It requires no argument to establish that without programing of high caliber, television-set owners will not convert their receivers to UHF. Unless the owners of a television set can receive network programing over a UHF station, regardless of the quality of the signal, it is not likely that he will convert.
His resistance to conversion is increased if there is an existence of prospective VHF station from which he can receive the popular network programs on his present set.
Table 8–A of Chairman Hyde's statistical appendix shows this quite vividly—the fewer the number of VHF signals available—and implicitly the VHF stations carry the desirable network programs—the greater the degree of conversion. Then where no VHF signals are received, 90 percent of the homes can receive UHF. Where 3 or more VHF signals are available, 26 percent of the homes have made conversions to UHF.
In exhibit 4 of the appendix to this statement this relationship is shown in another way, and I have just combined them in terms of 50 percent saturation. But no matter how it is done, where VHF signals are available and offer network programing, there will be few conversions. Basically, then, it is the intermixture, and the inequality that exists between VHF and UHF which is at the bottom of the UHF problem.
It is a cycle, actually, inequality and intermixture mean less conversions, less network programing and less revenues.
Table 9 of Chairman Hyde's statistical appendix illustrates quite clearly the UHF problem. It has been produced for this presentation and included as exhibit 5 of the appendix. That is in column 1, the percentage of homes that can receive UHF decreases; that's column 3, and revenues to UHF stations is also decreased, column 4.
In considering the network hours carried per station—shown in the last column of exhibit 5—it should be kept in mind that the averages in this exhibit do not include those stations who had to go off the air because they were unable to receive network programing. This is simply averages.

If such stations had been included, the average network hours carried by UHF stations would, of course, be much lower than those shown in this exhibit.

Now, is it true, as some have contended, that UHF stations are merely going through some of the growing pains any pioneer must expect?

Let’s see what the so-called pioneers of the prefreeze period had to contend with—

Prefreeze stations had time on their side. At the time of the freeze, September 30, 1948, there were 42 stations on the air. Most of them had come on the air in 1948. Of the remaining 66 stations, 50 came on the air in 1949. The 188 prefreeze TV stations began operations as shown below, and as you can see, 16 stations began operations before or during 1947, 32 in 1948, 50 in 1949, 9 in 1950, and 1 in 1951, for a total of 108.

However, this does not show us the true state of affairs. It would be much more pertinent to see whether these pioneer stations began construction and came on the air as soon as possible after they were granted construction permits and actually risked uncertainties as rapidly as did UHF pioneers. This is shown in exhibit 6 of the appendix. Exhibit 7, which follows, is more detailed, and shows the CP and operations dates for each station, and that is just detailed. This is a summary. You will note that for the 66 stations for which data are available, the elapsed time between the date a CP was granted and the date the station began operation averaged 21.6 months. In two cases the elapsed time went as high as 45 months.

Senator Potter. What did you mean by that? You mean the time they were granted a construction permit?

Mr. GOLDBERG. They were granted a construction permit.

Thus, of the 66 stations which were not on the air at the time the freeze was established, 41 took at least 18 months, and 27 took at least 2 years before starting operations. In fact, according to Television Magazine of October 1948, 43 CP holders did not even know when they would begin operations. Incidentally, within 20 months after the lifting of the freeze, 130 UHF stations had begun operations.

What does this mean? Simply this: These stations knew that every day they could delay coming on the air would be an advantage. Each day that passed meant one day closer to a large screen receiver at lower prices, and one day closer to network programing. You must remember that at that time stations did have a problem in programing just as UHF stations have one. Without interconnection, very little network programing was available.

However, they could be sure of receiving network programing once they were interconnected for network programing. The telephone company had set up a schedule of cable and relay construction. It was obviously to the advantage of the station to delay opening until interconnection was established, or as close to it as they could possibly get.
Thus, the future could look bright for these non-interconnected stations—unlike that of UHF stations of today. Prefreeze stations had networks on their side.

In addition to having the novelty of the new medium, and time, the prefreeze pioneer stations also had network affiliations they could count on. In fact, as of December 1950, when all the prefreeze stations but one was on the air, more than half had affiliations with two or more networks. Only 6 of these stations, 3 in New York, and 3 in Los Angeles, were receiving no network programing.

When we compare the situation then with the present status of these stations, as shown in exhibit 8, we find virtually no differences. Today, despite the substantial increase in the number of stations that have come on the air, we find that more than half of these prefreeze stations receiving programing from two or more networks.

Exhibit 9 shows the network affiliations for each prefreeze station as of December 1950, and today. There hasn't been much difference all along the line, and, in fact, actually most of them have stayed as they were.

It is obvious that today each of the major networks tends to hold on to even a secondary affiliation with a VHF station, rather than affiliate with a UHF station until another VHF is established. They are willing to share time and take it as they can get it rather than go to the UHF. In other words, a network will keep its affiliation generally with a prefreeze station which has a basic affiliation with another network, until another VHF station moves into the area.

At that point, a basic affiliation with a separate station becomes attractive to the network only because the additional VHF station is a more effective outlet for the network and its advertisers than either a secondary affiliation with the other VHF station or a basic affiliation with a UHF station.

To realize what networks meant to the prefreeze stations in terms of programing, we have only to look at exhibits 10 and 11. You will note that the median number of hours the prefreeze station programed daily when it began operation was 5.3. Of this, if you will look at table 11, 30 percent was supplied by networks.

By 1954, these prefreeze stations had increased their daily programing to 17.1 hours. This increase was accomplished, by and large, by an increase of their network programs. Today, more than half of the prefreeze station's programing is derived from networks—55.8 percent, or an increase of 86 percent. Actually, in terms of hours that would be an increase of about 600 percent, from an hour and a half of network time daily, it went up 9 hours.

At the same time as the prefreeze stations were averaging over 65 hours of network programing per week, the UHF stations were averaging 17 hours per week. Since the 17-hour average does not include UHF stations which had gone off the air, the relative position of UHF stations is, of course, even less favorable.

Exhibit 12 is included in order to show the number of hours of programing and the percent network for each of the prefreeze stations, where data were available. Exhibits 10 and 11 are summaries based on exhibit 12.

This, incidentally, was a special issue of Sponsor magazine on the pioneers, and most of this data has come from that.
It should be borne in mind that when these stations began operations, they not only had novelty on their side, but in addition they had the television set manufacturers and advertisers generally subsidizing the new medium with programing, purchasing of spots, promotional campaigns and other activities working to the benefit of the early VHF stations. Similar promotional activities on behalf of UHF have been significantly absent, even of no instance where a major set manufacturer has sponsored programs just for UHF in order to get people to buy sets.

For prefreeze stations—interconnection, that is, for network programs—meant profits; noninterconnection or no network programs meant losses.

As I mentioned previously, some of the prefreeze stations did not have network programing available to them immediately. If a station was not interconnected with New York, the only network programs available were film recordings whose quality was inferior. However, once a station became interconnected, profits almost immediately resulted.

The FCC recognized the inequalities at that time—that those with full network program facilities—that is, interconnected—would fare better than those not having equal program facilities—that is, non-interconnected.

However, everyone knew that it was temporary; that within a short time the stations would be interconnected and the networks would be feeding them programs.

Naturally, in 1950, stations that were not interconnected did suffer losses. The Commission stated in its report, "Stations in communities interconnected for network programing generally fared better than those in noninterconnected communities."

This might even be considered the understatement of the year when we consider that the 52 stations that were interconnected for the full year 1950 had an aggregate profit before taxes of $6 million, while the 27 noninterconnected stations reported an aggregate loss of $3 million. The average interconnected station, as shown in exhibit 13, showed a profit of $115,000 for the year, while the average noninterconnected station showed a loss of $113,000.

Apparently, the inequalities of interconnection then, like the inequalities of VHF and UHF today, provide the difference between profit and loss—between service and lack of service. I might even say between good and bad management.

For when we compare the postfreeze VHF stations with the UHF stations for the same period, we find the average postfreeze VHF showing a monthly loss of only $145, while the average UHF showed a monthly loss of $7,187, and this is table 6 of Chairman Hyde's statistical appendix.

The tremendous difference between the losing prefreeze stations and the present UHF stations is that the former had virtual assurance that the lack of interconnection, which was the principal reason for their economic difficulties, was only a temporary problem; but the inequality of facilities problem with which UHF stations are today saddled is not of any such temporary character. Moreover, most of the now nearly breaking even postfreeze VHF stations can see things brighter in the near future.
But as shown by table 5 of Chairman Hyde's report, most of the UHF stations cannot anticipate anything brighter as to programs. In fact, their situation can be expected to deteriorate as more VHF stations go into operation.

VHF stations have superpower and supercoverage. In addition to the problem of intermixture on a local level—that is, within the same community—the facts that the FCC has established a policy of authorizing superpower and extremely high antenna heights to the VHF stations, and has permitted location of such stations at points distant from the community to which the channel is assigned, brings intermixture beyond the immediate community, to areas up to 100 miles from such community.

The coverage of these VHF stations, usually prefreeze, has grown to such an extent that not only are the UHF stations engulfed by them, but so, too, eventually will be VHF stations in smaller communities. Thus, even where a small UHF or VHF station serves a community distant from superpower VHF stations, network programs would not be made available because of network policy against affiliating with stations in smaller communities overlapped by the superpower stations.

I should add it is contemplated by these networks that the advertisers just won't buy them. As an example of the supercoverage the FCC has granted to the VHF stations, exhibit 14 is submitted. It shows the coverage acknowledged by the prefreeze stations as of the beginning of 1954. Notice that some of them have still not gone to maximum power even though their signal radiates—and you might notice some of them have still not gone to maximum power even though this signal radiates a hundred miles, or better; Mr. Kohn in his presentation mentions 40 miles, 20 miles, and that type of thing. In Michigan, WJBK claims 100 miles radius, so that they can cover that whole area of Michigan.

Senator Potter. Does that include the so-called B area?

Mr. Goldberg. I would imagine so. This is the coverage they have said they sell. I think it does include B.

Senator Potter. My home town in northern Michigan, their receivers draw as far as from Grand Rapids, which must be 300 miles, Green Bay across the lake in Wisconsin—they have to have a pretty high antenna.

Mr. Goldberg. Yes.

Senator Potter. But they bring it in and it's pretty snowy, but at least they're getting a picture.

Mr. Goldberg. Well, ordinarily people who are a hundred miles away can use regular antennas, and get Grand Rapids, according to their statements, and we have some advertisements that they put out, which I would like to submit after my statement, showing how much they claim. They don't claim markets; they don't claim communities; they claim States.

And that's exactly what is happening, and I think we have a few of them here. They call them area stations. Here is one: The greater area station of the Southeast, WSB, claims Georgia, Alabama and Tennessee, North Carolina and South Carolina. "WSB-TV covers 18 percent more counties than Atlanta station B; 106 more counties that station C."
WTAR in Norfolk covers not only Norfolk, but the entire eastern half of Virginia, including Richmond, and all of northern North Carolina.

WNBS covers 33 essential counties. WJAR in Providence, as far as Long Island. This is the kind of coverage that is happening, WSAS, 116 counties. "The view is wonderful."

I would like to see what the Muncie man is going to do here. They are just going to high tower. When he was here they were half tower. Now they claim that. They claim Muncie, and even part of Bloomington. I mean this is all part of this stuff, and this is the kind of coverage they are now claiming.

It goes beyond just local. I would like to submit them for the record, Mr. Chairman.

Senator Potter. All right; they will be made a part of the official files of the committee.

Mr. Goldberg. Few VHF stations with unlimited power leads to limited service to the public.

Actually, the granting of unlimited coverage far beyond the market sphere of VHF stations has had a further impact. It has led to a network-advertiser policy in placing programs on a small, select list of stations in major markets, through which it is possible to reach a maximum population at relatively smaller cost than would be involved in using a greater number of stations each with lesser coverage. Twenty to twenty-five percent of the population would not be covered by these major market stations and few additional stations to serve this population could be supported without network programs, and that is notwithstanding Mr. Witting's statement on covering rural areas.

Dr. Frank Stanton, president of Columbia Broadcasting System, Inc., in a speech before the Central States group, Investment Bankers Association of America, in Chicago, March 31, 1954, gave what can be called formal notice of this trend, when he said "It is interesting to note that a lineup of about 60 stations will be sufficient to cover about 75 percent of the total television homes in the country."

At about the same time, NBC issued a press release on the occasion of the signing of the contract for the Lux Theater program. This release stated that 71 NBC affiliates scheduled to carry this hour program would cover 81 percent of the Nation's receivers.

A tabulation of CBS network shows as listed in Sponsor, May 31, 1954, showed the median number of stations per nighttime program was 74, while for daytime programs the average was 50 stations. NBC averaged 79 and 55 stations, respectively.

Chairman Hyde in his testimony before this committee said that the prefreeze VHF stations in the top 63 markets at the time the freeze was lifted covered 60 percent of the Nation's population. Since then, most of these stations have been granted superpowers and heights and probably include an ever greater portion of the population.

This apparent agreement that a limited number of stations with the preferential allocations cover most of the country leaves little opportunity for competitive service to the public by the inferior facilities or smaller markets. There can be little wonder that a philosophy has developed that this residue population and coverage appears insig-

48550—54--35
significant and uneconomic. Apparently, this 20 percent of the population doesn't need television service. In any event, they won't be able to receive it, if the present trend is allowed to continue. And the 80 percent of the population generally will have to be content with only two program sources.

I might mention here, Mr. Chairman, Mr. Witting was bringing in this rural area, and I think it's something for the committee to consider, as to whether or not 1 station or 1 network, or even 2, is within the public service. I think that's part of a basic problem here. Where does subservice begin and end, if we have one, then that is something they must accept, and I think it goes beyond just programing in terms of entertainment; I think it is very important not only from a political point of view, but from a news point of view. In the State of New Jersey, if they want to get any programing, or if the Senator from New Jersey, Mr. Smith, or any of the other Senators, or Congressmen, want to speak to their constituents, they have to go to Philadelphia or New York; there isn't any other way. They had a station in Atlantic City that is closed down because Philadelphia got superpower, and this is true throughout.

Now, it's up to the committee and the Commission, to decide whether the basic principle is one service, or whether this should be a diversity of service, and I would like to go on from there—I am sorry, Mr. Chairman.

Senator Potter. Surely; it is perfectly all right.

Mr. Goldberg. If you have VHF stations with unlimited power and coverage, it leads to monopolistic practices, it is obvious that a station that has virtually no competition which is receiving all or most of the network programs, and which has all the sponsors it can handle, may charge whatever the traffic will bear. However, this practice hurts more than the advertiser. For, as Chairman Hyde's figures show, $231.7 million in revenues went to the 4 networks and their owned stations, $174.5 million went to the 92 prefreeze stations, and the remaining $24.6 million, or 5.7 percent, was divided among 215 postfreeze stations.

As exhibit 15 shows, NBC and CBS affiliated stations charge higher rates than other stations. They can do this because they have the unnatural advantages established by the FCC allocation plan. They have superpower, superheight, coverage, programing, and no serious competition. And there is no realistic evidence that competition can be provided here by the UHF stations, as things stand now.

I would like to point out that these rates are just in those areas. I only selected where there are three VHF stations so as to provide some freedom.

Senator Potter. I don't understand the exhibit.

This is the hourly rate charged by each of the networks? Is that $205 an hour?
Mr. Goldberg. That is right.
Senator Potter. You got that?
Mr. Goldberg. That's right.
On these, and the stations in these areas, these are the rates their affiliates charge.
Actually, Du Mont would be the fourth network, and if there are four stations, then they obviously go in there, as is the case in Chicago, Denver, Los Angeles, Washington, and New York.
ABC and Du Mont, if they cannot provide outlets, cannot get advertisers. Therefore, their stations, the affiliates they can provide cannot actually compete with the others, and they have to charge lower rates.
Senator Potter. After looking at these rates, you can understand why it costs so much for politicians to run for office.
Mr. Goldberg. Exactly, and not only that. I understand CBS has just upped their New York rate to $6,000 an hour.
Now, I don't know whether they want to keep politicians off the air, but if they do, this is a good way.
Senator Potter. The only way they could have done it was to close up those hearings.
Mr. Goldberg. But it also serves to omit advertisers. You are taking that much more of the advertising budget. You can't get blood out of a stone, and if you have five-sixths of an advertising budget, the one-sixth then has to be distributed among all the others.
Senator Potter. Are the network rates the same as local rates?
Mr. Goldberg. Usually there is a difference. Actually, the network rates are for network option time. It covers roughly from 6:30 in the evening, rather—7:30 in the evening to about 11 o'clock, or 10:30. It varies. This is known as class A time.
Now, they have developed something new, double-A time. You charge more for that. Its national advertisers. Your local rate would then be either class B or class A, whichever you have. That would be roughly from 5:30 or 6:30 on.
Preceding and following the network programs, so that you are going to do pretty well on those as well, leading and following. They do differ.
I might point to an analysis that was made in 1951. In that year I did an analysis and promised Senator Schoeppel, when he asked for it, the difference between the single station markets and those stations in the multimarkets where they had competition. I might point out where there were 10,000 sets there was a difference of 10 percent. That is the single station, it is 1 station channeled 10 percent more than those stations with competition, where there were 100,000 sets, the difference was 15 percent, and where there were a million sets, the difference was 23 percent.
Senator Potter. All right; that will be made a part of the record, at this point.
Mr. Goldberg. Yes, sir.
Based on the regression equations, values of the class A hour rate were computed at 3 levels of set population.

A Average of all stations in each city, except New York where WATV was omitted.
Mr. COTTONE. Mr. Chairman, that was requested by Senator Schoep-
pel at the last session of these hearings.

Senator Potter. Oh.

Mr. GOLDBERG. He asked that of Dr. Du Mont.

Senator Potter. This will be brought to his attention.

Mr. COTTONE. Yes.

Mr. GOLDBERG. The effect of these higher rates, if continued, ob-
viously is to use up the major portion of the advertising budgets and
limit the amount of funds available for all other stations.

Now, monopoly stations mean exorbitant profits. Naturally, where
stations can charge exorbitant rates, there will also be exorbitant
profits. This is shown clearly in exhibits 16 to 19.

Mr. Chairman, this table was requested by members of the Com-
mission; and they made those available as a special publication.

In 1953, for example, 7 prefectree stations made more than 200 per-
cent on the cost of their broadcast property, even after including all
additions and improvements.

Senator Potter. A pretty good investment.

Mr. GOLDBERG. I would like to get into that.

One station even showed a return of better than 300 percent for
the 1 year. For the 1 year of 1953, the median return of all prefectree
VHF stations, including improvements and additions, was 66 percent
of their tangible investment.

For the years 1951 and 1952, the FCC made its data available on
a different basis than the data published for 1953. The average return
per station (prefreeze) for each of these years on original tangible
property investment (not including improvements) was 56 percent
in 1951 and 73 percent in 1952.

Mr. COTTONE. Yes.

Mr. GOLDBERG. The effect of these higher rates, if continued, ob-
viously is to use up the major portion of the advertising budgets and
limit the amount of funds available for all other stations.

Now, monopoly stations mean exorbitant profits. Naturally, where
stations can charge exorbitant rates, there will also be exorbitant
profits. This is shown clearly in exhibits 16 to 19.

Mr. Chairman, this table was requested by members of the Com-
mission; and they made those available as a special publication.

In 1953, for example, 7 prefectree stations made more than 200 per-
cent on the cost of their broadcast property, even after including all
additions and improvements.

Senator Potter. A pretty good investment.

Mr. GOLDBERG. I would like to get into that.

One station even showed a return of better than 300 percent for
the 1 year. For the 1 year of 1953, the median return of all prefectree
VHF stations, including improvements and additions, was 66 percent
of their tangible investment.

For the years 1951 and 1952, the FCC made its data available on
a different basis than the data published for 1953. The average return
per station (prefreeze) for each of these years on original tangible
property investment (not including improvements) was 56 percent
in 1951 and 73 percent in 1952.
It is only natural that these entrenched stations would wish to continue such a trend, to the exclusion of a truly nationwide competitive system on an equal basis. In fact, it becomes almost ridiculous to compare these prerelease stations, with their exorbitant profits, to the UHF competition. In addition to engulfing them with their superpower and coverage, and intermixture, and producing a scarcity of programing, the prerelease VHF stations also drain off 95 percent of all advertising dollars and leave 5 percent for all of the remaining stations.

What kind of service and future can be projected for the UHF stations under these circumstances?

How can anyone interested in the maximum service to the public contend that the conditions should remain unchanged—awaiting the panacea of time?

VHF stations sell for millions—UHF stations go off the air.

Lastly, if we really want to see the difference between VHF and UHF we might look at the “stock market” of television stations—where supply and demand meet and set a price. Here we find three completed UHF sales—1 for $1 (KCTY, Kansas City), which later went off the air, 1 for about $350,000 (KTVR, Little Rock) for studios because the station was forced to go off the air, and 1 (KAFY, Bakersfield, Calif.) for $85,000 for 51% percent. To complete the picture, 15 UHF stations have been forced to go off the air, with substantial losses.

At the same time, we find VHF stations sold for prices up to $8,500,000. In 1 case, a station that was on the air for less than 6 months was sold, but not yet approved, for about $4 million. It becomes apparent that it isn’t merely a station that is being sold; rather, it’s a monopolistic allocation with major network affiliation that is being bought. In reality, the right to obtain programing of a particular network is the selling point, not the station. And the major reason such a network uses the station is because the station enjoys a monopolistic position, which cements the network’s position.

In conclusion, it cannot be overemphasized that competition can never be equal as long as allocations and facilities are unequal. As long as a UHF station must face direct VHF competition, there can be no equality; and there can be no nationwide competitive television service with a two-network system.

The American public is entitled to the widest possible choice of programs for entertainment, information, and education. It cannot get this wide choice if the present television situation is allowed to continue unchanged. Neither can free choice of programs be guaranteed if halfway measures are taken. Only prompt and bold action can relieve the critical situation that is producing a duopoly of television service to the American people.

Only by establishing a single system of television with equal and comparable facilities available to all stations that seek to serve the
public can you assure at least an opportunity for the widest choice of programs and a healthy competitive system.

Now, Mr. Chairman, I have been asked by the committee to read a further statement.

Those VHF stations with superpower and superheights will tell you that any allocation change will destroy wide service coverage to rural areas of America. This is the historical and legendary battlecry of broadcasting entrenched interests who enjoy the monopolistic advantages of tremendous coverage of wide areas of our country. It may aptly be described as the coat of sugar on the pill of monopoly.

Perpetuation of the present would at best provide coverage to 75 or 80 percent of the Nation’s television receivers, according to the advocates of the present system, and its perpetuation would generally restrict such service to the public to a choice of 2 programs generally in each area, with considerable overlap between such stations carrying the 2 major network programs.

Perpetuation of the present allocation of a limited number of superpower VHF stations is accomplishing for such stations a greater concentration of power and restrictive public service than the type that the Government thwarted when one high-power station sought to lead an allocation path for a limited number of radio stations to operate with superpower of 500,000 watts in radio. And, the granting of superpower clear-channel radio assignments was stopped, even though such stations would not have enjoyed the advantage in radio that such superpower stations now enjoy in television of controlling all the viewers that do not want to spend extra money to get the inferior, weaker UHF stations without comparable lineup of full network programs.

Furthermore, since such limited number of superpower television stations can lay claim to rendering 2 services to an area generally that comprises approximately 75 to 80 percent of the Nation’s population, it must be recognized that the perpetuation of such a system has to be compared with a revised allocation that will afford wide choice of many comparable station services to America. It would seem apparent that this should be more in the public interest to more people and to more communities. And if the ultimate powers and service, foretold for UHF at the time of the lifting of the freeze, becomes realized, certainly, more choice of service will be readily available to as many, if not more, viewers of America. Only a sound allocation system will assure equality of facilities to all who seek to serve the public, rather than one with unnatural advantages to a limited number who claim wide service. But which, in reality, prevents opportunity for the maximum number of services for public choice through a claim of wide rural service that is, in fact, restrictive.
Mr. Chairman, they are referring there to the clear-channel case in which, I understand, Congress stepped in and stopped this experimental procedure. And that is the case that is happening today to VHF.

Senator Potter. I wish to thank you for your statement, Mr. Goldberg.

Mr. Goldberg. Thank you, sir.

Senator Potter. Your exhibit No. 1 will be made a part of the record.

(The exhibit referred to is as follows):

**EXHIBIT 1**

**INDEPENDENTLY OWNED STATION OPERATION**

Senator Potter. Mr. Chisman is from WVEC-TV, of Norfolk, Va.
STATEMENT OF THOMAS P. CHISMAN, WVEC-TV, NORFOLK, VA.

Mr. Chisman. My name is Thomas P. Chisman, and I appear here in behalf of Peninsula Broadcasting Corp., which owns and operates UHF station WVEC-TV, located in Hampton, Va. Our station serves the whole Norfolk area.

I should like to state that I am not a member of any UHF association or committee. I speak here today only for Station WVEC-TV, which I manage and in which I am a stockholder.

Peninsula Broadcasting Corp., which owns WVEC-TV, has been in the broadcasting business in the Hampton and Norfolk area since 1948. We operate radio station WVEC, also located in Hampton. It was, therefore, only natural that we should enter the field of television.

It was apparent to us, however, that if we filed for a VHF channel we would be involved in a long hearing which would prevent us from bringing television service to our area for a long period of time. Accordingly, we filed for the UHF on July 14, 1952. Our application was granted on February 4, 1953. We immediately began construction and we have been operating WVEC-TV since September 1953.

When we decided to apply for the UHF, we felt confident that we could get a network affiliation since there was only one other television station in operation in the large and important Norfolk-Hampton-Portsmouth-Newport News area. Our confidence was not misplaced.

The National Broadcasting Co. entered into an affiliation agreement with us whereby we could bring NBC television service to this area on a regular basis. We are a basic affiliate of the National Broadcasting Co., and we have the usual 2-year contract of affiliation, running until January 1956.

At the outset of our operation, it became obvious to us that our biggest job was one of education. We had to educate the people of our area as to the nature of the UHF and the nature of conversion. I should like to make clear that this process of education was and continues to be a gigantic job. The lack of information and the amount of misinformation which people have about UHF is unbelievable.

In cooperation with the National Broadcasting Co., a large-scale program of promotion of UHF was instituted by our station. It was the largest UHF promotion for a city of our size conducted any place in the United States. It was so effective that it even aroused the ire of the existing VHF station which had a television monopoly on our area for so many years. To indicate the kind of job we did, I can tell you that WVEC-TV together with NBC, has spent more than $100,000 in promoting UHF television. I might add that NBC has never shown any reluctance in endorsing or promoting UHF in the Norfolk area. To me, at least, they have shown complete confidence in the ultimate success of UHF stations.

After about 7 months of operation, we have lost in the neighborhood of $100,000. But we believe we have made great progress; we are now making money, and we are not concerned about the future, with the exception of one big "if."

UHF cannot be sold short in one part of the country without being sold short throughout the country. If we had made a million dollars from UHF, we still could not stand idly by and play ostrich while UHF, as a system of television transmission, was permitted to die.
We think both this committee and the Federal Communications Commission should make clear to the public that there can be no full and truly comprehensive system of television broadcasting in the United States without UHF and that UHF is here to stay—period.

There are many ways in which this committee could indicate to the public the importance of UHF. One positive way would be to instruct or recommend to the Commission that it cease adding VHF channels to areas not allocated those channels in the sixth report. Some persons would, by using phantom cities, attempt to squeeze in a VHF channel here and there. One such request which would affect our community is now pending before the Commission.

It would not surprise me if none of the members of this honorable committee has ever heard of the community of Princess Anne, Va. Princess Anne, Va., is a literal crossroads, in effect marking the place on an automobile map where two roads meet. Princess Anne has a population of about 250 persons. It has, however, a country post office. Having found a post office, some Norfolk people have now proposed to the Commission that this post office should be used as a basis for assigning VHF channel 13 to the Norfolk area on the ostensibly basis that it is assigned to Princess Anne.

We have to go out of New Bern, N. C. They have channel 13 allocated.

Senator Potter. We have three members of the Commission here that heard your statement. So we will take some cognizance of Princess Anne.

We think that this committee should make clear its disapproval of attempts to subvert the Commission’s allocation plan by adding VHF channels to phantom cities as a device for curing the problem of the UHF. If channel 13 is added to the Norfolk area on the pretense of being assigned to this phantom community of 250 persons, UHF in the Norfolk area will be dealt what may well be a death blow. Not only would the UHF operator suffer, but the many thousands who have gone to the expense of converting to receive the UHF will have in effect been defrauded by the adoption of a policy which would disregard the effect that new VHF assignments have on existing stations.

We feel that the Commission would be completely derelict in its duty—to both the public and UHF operators who have spent large sums of money in an effort to promote the UHF—if it should permit the addition of VHF channels based upon pretext assignments to phantom cities.

I know of no immediate cure for the problem facing the UHF broadcaster today. I do know of one change which, if made today, would insure more and better television for the entire country in the not too distant future. I think that the Commission should immediately rule that color television will be permitted only on UHF stations. I would like to explain the background in arriving at this conclusion.

I would like to get away from the statement for a moment.

Senator Potter. Surely.

Mr. Chisman. This is not an original idea of mine. In 1950, when Wayne Coy was Chairman of the Commission, Chairman Hyde was a member of the Commission, and Commissioner Hennock and Sterling, Jones and Walker, and another one, I believe. After they had finished with the color proposal, and before they got the alloca-
tions I believe it was Commissioner Jones who proposed what I am proposing now.

There were technical reasons why it was not adopted at that time. I have reason to believe that Commissioner Jones and Commissioner Walker and Commissioner Hennock would have favored at that time the placing of color television in the UHF. They believed, and I believe now, on the basis of good, sound engineering and legal advice that there is sufficient room in the UHF channels for this to take place.

When any change in the rules affecting radio or television stations is considered, the public must first be considered. Today there are 30 million television sets in the homes throughout the country. These sets have a life expectancy of approximately 5 years. This means that within the next 5 years there will be a complete turnover of all television sets in the country. With the advent of color, the turnover of these sets will be appreciably increased since the present television sets cannot receive color transmission. In effect, what we have here is the second opportunity to start from scratch in the development of television without any injury or cost to the public. The first opportunity was muffed when the Commission adopted an intermixture plan. Color need not be—and should not be—intermixed.

If the Commission were to switch color to the UHF frequencies today, the manufacturers would immediately step up their research in the UHF and immediately put UHF in all color television sets and, since they must be competitive, UHF receivers in the television sets would be priced in line with the VHF sets only.

I understand some manufacturers have said they will do this. But the proof of the pudding is in the eating. I'd like to see them really producing, not just in pilot models.

Those viewers who in the next 5 years do not buy color sets could for a very nominal fee convert their present sets to UHF and continue to receive, in black and white, the color transmission. I say nominal fee because I am positive that within the next 3 years UHF receivers will be just as far advanced, if not farther, than VHF receivers are today; the price will be down, and there is a good chance that no antennas will be needed by the set owner.

The VHF operators may raise a question concerning comparative coverage. I think the Commission should make it clear at this time that while this change will be made in the next 5 years, those stations desiring to hold off on the change can continue to broadcast black and white for 5 years on VHF and may wait before taking any action on the UHF until the one megawatt transmitter is available. Thus they would lose no service area presently covered.

I think it is basically wrong when a man builds something to tell him to tear it down, particularly when it is so widespread today, and it is providing a service which would have to be serviced with B coverage if forced to reduce the power.

The cost to the viewer would be practically nothing since it is my opinion that the viewers all over the United States will follow normal economic trends and buying habits in replacing their sets at least once in the next 5 years. Those who do not desire color could still buy an all-band VHF-UHF set. There may be a question raised as to why a viewer should have to buy UHF-VHF if it is not necessary. Once again, I say that the competitive situation in the television-set business will make all sets competitive, and the viewer will not have to pay a penalty for buying UHF-VHF.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS 561

There is a term that the engineers use—and dirty; and that is the way they will make them to be competitive, regardless of whether it is UHF or VHF. They will bring the price down within the reach of all those people.

Senator Potter. Isn't it true that there are so many people moving from one locality to another, there might be one locality where they are serviced by a VHF station; and they have a television set they maybe paid $400 for; and they will move to another locality where they are serviced by a UHF station. Particularly if we could have removed the tax on the UHF receivers, it seems to me that would be a big impetus to set manufacturers to include this all-channel tuner in the new sets.

Mr. Chisman. That is particularly true in my own area, where there are over 100,000 military personnel and their families; and they are constantly on the move. They come in to buy a VHF and UHF set if they don't already have one. But those people move to another area and their service is still limited to one station.

Senator Potter. What is the percentage of conversion that is taking place in your area?

Mr. Chisman. The American Research Bureau says 38 percent; and I don't buy their figures at all. I never have; I never will. I don't think it exceeds that by a great deal. I think they are probably 10 percent short.

They were 10 percent short when I could prove I had 28,000; and they said it was something 'way under that.

Senator Potter. Doesn't that affect your advertising?

Mr. Chisman. Absolutely. I would not have lost $100,000 if it had not affected it.

This would be particularly true if the tax on all-channel sets could be removed.

Now, let's look at the broadcaster's expense. Here again, I contend that the broadcaster would pay practically nothing additional for the switch to UHF. Most broadcasters today are going to color eventually and if they go to color at the same time they go to UHF the outlay is considerable. It is an expenditure, however, that they must make and would make during the normal course of business in the next 5 years.

Those who have VHF equipment now could take advantage of their amortization schedule and write off the VHF equipment in the next 5 years. If the present tax structure does not permit as rapid a write-off as this, then this committee should recommend to Congress that it change its tax regulations to permit this step to be taken.

Some persons who have appeared before this committee have defended the intermixture of UHF and VHF stations in a market on the ground that the same situation exists today in radio: 250-watt stations and a 50,000-watt station existing in one market. However, such an argument overlooks the basic fact that all radio receiving sets today can receive any radio station—no matter what its power is—broadcasting between 550 and 1600 kilocycles. Thus, the 250-watt station with good programing can get just as many listeners in his primary area as a 50,000-watt station. That is not so in television when UHF and VHF are mixed, and conversion is necessary.

There has been a great deal said about a nationwide competitive television system. I think this phrase is completely overworked and the real meaning has been lost. Most telecasters and most people think
of this competition in the terms of dollars. However, the competition which I visualize is not confined to dollars; it also relates to television's obligation to the public to serve its social, economic, and political needs.

It has been a common experience in radio for the large 50 kilowatt stations to give a general overall service, while the small 250-watt station particularizes on the communities social, economic, and political interests. A system of mixed VHF and UHF television stations, where communities and whole areas are dependent on outside television stations for coverage is completely inadequate. Stations which are 40 and 50 miles away cannot possibly serve the social, economic, and political interests of all communities within their coverage area, and a burden is placed on the viewer when he must, to receive a station in his own area, go to an external conversion, or a system that is not completely comparable to the signal received from the outside market.

There is little equity in the mixed system we have now, and if this committee fails to take strong corrective steps, this matter will come back to haunt you, or your successors on this committee, 10 years from now. I do not consider that this is a problem that can be laid at the doors of the networks, or placed solely in the hands of the operators.

This is a situation that has been thrust upon us by an error made several years ago when the theory of intermixture was adopted. Today, we not only have UHF and VHF, but a third and revolutionary factor. That factor is color, and if we make the same mistakes in color today that we did in black and white 2 years ago, we will have bungled our last opportunity to correct a very difficult problem.

Senator Porter. I wish to thank you for your statement.

Mr. Green.

Mr. Green is from the little State of Texas. Mr. Green is with KNUZ-TV of Houston, Tex.

STATEMENT OF LEON GREEN, STATION KNUZ-TV, HOUSTON, TEX.

Mr. Green. Mr. Chairman, and members of the subcommittee, my name is Leon Green. I am part owner of KNUZ-TV, located in Houston, Tex. First, I want to thank you for this chance to testify before this subcommittee of the United States Senate. We are grateful to you for holding these hearings. We hope from the matters presented in this forum that there may be a better understanding of the problems confronting those broadcasters who operate television stations on what are commonly called the ultra-high frequencies.

I have been connected with radio for the past 5 years. Prior to our venture in television, we operated KNUZ, as an independent AM facility in Houston, and enjoyed a fair measure of success. Our company is known as Veterans Broadcasting Co., and derives from the fact that four veterans of World War II, returning from combat areas, pooled our resources and applied to the Commission for a franchise to operate an AM station. Since October 1953 we have operated KNUZ-TV, on channel 39, in Houston, Tex.

In preparation for the hearings before your subcommittee, I have made several trips to New England, and the Midwest, in addition to areas in the Southwest. I have personally visited many operators of UHF television stations, and viewed their operations firsthand. I have been in communication with all UHF stations. All or prac-
tically all, UHF operators find themselves in the same situation. Too few sets converted for UHF, too little power, and too few network programs.

These conditions do not arise by virtue of any one circumstance, but rather by reason of a combination of factors. If one can generalize, it might be said that our problems are economic, but that might be said of many businesses.

However, UHF television has never tasted the fruits of economic success, and it may well be that a business with great potential good for the American people will die aborning before it ever even learns to walk. There are approximately 40 UHF television stations in this country at this very minute which may not be operating 60 days from now unless some action is taken to relieve the situation. We aren't going through a period of readjustment or recession—we never have experienced a boom, or even a short period of good business.

There are approximately 40 UHF stations which are experiencing economic difficulties. Most of these stations are holding on by the skin of their teeth—just waiting to see what will be the result of these Senate hearings.

Each of these stations represents an investment averaging about $300,000 or $400,000, or a total investment of approximately $16 million, in the stations alone. These 40 stations serve several million people. If we consider the investment of the listening public of approximately $200 million—added to the $16 million used to put these 40 stations on the air—you get some idea of the magnitude of the money put into UHF by your constituents.

I believe that this subcommittee can take notice of the fact that the two major networks in this country have now reached the point in their monopoly where they have a life-or-death strangle hold on television stations, both VHF and UHF. Even in the AM field the basis of affiliation with the two major networks was never realistic. Long-time affiliates of the networks were able successfully to block the affiliation of other stations upon the ground that the area proposed to be served already received service from the first station, when, in truth and in fact, the listeners in the area could no more tune in the station than they could fly to Mars.

It is commonly recognized in radio circles that the two big networks are not interested at all in affiliations except in the first 100 cities of the country. This means that the rest of the country who want to watch Bishop Sheen or Jack Benny can either put themselves up an expensive antenna which will pick up the distant station, or just move into a larger city. If they get the network program from the distant city, their chances of getting local programs from a local station are almost nil, because the local station cannot televise local programs without the help of some network programing.

The people are getting a little bit tired of having to rely upon distant cities for programs which they should be getting from stations in their own area and which are more likely to be responsive to their needs and tastes.

It has already been called to the attention of the subcommittee that UHF stations, which have, through their ingenuity and resources, been able to get on the air first in their community and obtain a network affiliation, have been compelled to sit by powerless while their network programs are lost to new VHF stations coming on the air.
The networks refuse to grant UHF stations the normal term contracts—it's either take a short-term deal which the network can terminate or nothing.

So, the UHF, out of necessity, signs up the network and helps build up the audience, only to lose it when VHF comes along. There can be no question but what the Federal Communications Commission has utterly failed in bringing about the intended truly competitive television system.

With the network it's a matter of dollars and cents—they have no public interest in whether people in any area will be able to get a variety of programs which include a combination of national network and local programs. The networks are not concerned with the so-called white areas—the vast sparsely settled parts of this country—inhabited by people who are just as good Americans, and entitled to the same rights, privileges, and benefits, as people in the heavily populated markets. In hundreds of such areas the people are denied, by reason of geography, the opportunity to view many of the great shows produced for television.

If the FCC can't or won't do anything about it, then the Congress should step into the picture.

I am not a lawyer. But I understand that section 307 (b) of the Federal Communications Act of 1934 provides that the Commission must insure an equitable allocation to all the States and communities of television channels. I am sure they tried to do just that by their sixth report. The question now arise: Did they succeed in carrying out this mandate of the Congress.

With 40 UHF television stations about to go on the rocks—with experienced businessmen unable to compete in the market place—I seriously question the wisdom of the Commission's allocation plan. And at this point, I'd like to add that the great majority of these men who received UHF grants are men of past radio experience—men who know broadcasting.

The FCC is charged with the responsibility of carrying out the laws as passed by the Congress. They have been described as an "arm of the legislative branch." Are we holding these hearings today because the Commission has completely and successfully carried out its responsibilities?

On the contrary, we are here today because the Commission's efforts have failed—the purpose of a television allocation plan has been and is being frustrated. It may be that the present plan could work—theoretically. But the realities of the situation have prevented it, and the attitude of the two major networks are two of the realities.

Even the manufacturers have added their bit to the plight of UHF. It is said that it is much easier to build a TV set with VHF only—and that it can be made to sell cheaper. The public will buy a set which is cheaper—and most of the public never realized when they bought these thousands of sets with VHF only that they would ultimately be obsolete because they couldn't get the programs of all the stations allocated to their towns. But that didn't seem to trouble the manufacturers. After all, if the public did not become too inquisitive, they could sell the poor sucker another set with UHF, or a converter which would cost him $40 or $50.

Most of us, when we bought our first radio sets, kept those sets for many years. And they served us well. Today, there are literally
into hearings by effective faith calamity. that stand regime of the Republican certainly serious petition and pose taxes from revenue their transmitter receive only that manufacturers enter only all-channel receivers.

I would like to pose a very simple analogy to what the manufacturers have been doing in regard to VHF-only sets. If the Commission tomorrow were to open up 50 more kilocycles for more AM stations above the present AM band in order to provide 300 or 400 more AM stations throughout the country, you can well imagine the howl that would go up if the manufacturers continued to make new sets to receive only the present AM band.

Specifically, I respectfully recommend that the Congress take action:

1. To require a complete freeze on grants for new VHF TV stations, and on the allocation of additional VHF channels.
2. To require TV stations, allocated to a particular city, to locate their transmitter sites near the principal city, and not attempt to place their transmitter sites near other cities in an effort to draw advertising revenue from the second city.
3. To require TV stations to establish studios only in the cities to which their channels are assigned.
4. To adopt Senator Edwin Johnson’s bill for the removal of excise taxes from UHF receiving sets.
5. To adopt Senator Bricker’s bill, S. 3456.
6. To require immediate reallocation proceedings having the purpose of eventually eliminating the inequalities existing between VHF and UHF stations where the two classes of stations will be in competition with each other.

It is my belief that if President Eisenhower knew of the present serious threat to nationwide competitive television service, and of the possibility that 40 UHF stations may soon close their doors, he would certainly try to see that such a calamity will not happen during the regime of the Republican Party.

Senator Potter. We have enough calamities as it is.

Mr. Green. Remember, gentlemen, there are millions of people who stand to lose an investment of approximately 200 million dollars in UHF. Through these hearings, the Congress has clearly recognized that something can and should be done to prevent this threatened calamity. You have shouldered the responsibility to do something effective to stop the threat to nationwide competitive television service.

There is now widespread whispering in the trade, recently prompted by those who want no change in the status quo to the effect that these hearings will result in nothing to help UHF. I, for one, have implicit faith that this subcommittee sincerely desires to and will, take prompt and vigorous remedial steps.

Senator Potter. Thank you very much, Mr. Green, for your statement.

Do you want the other part of your statement put in the record?

Mr. Green. Yes, sir.

Senator Potter. That additional part of the statement will be put into the record.
(The additional statement of Mr. Green is as follows:)

In view of the importance of the policy questions presented, I believe it is appropriate to submit to this committee comments filed by KNUZ Television Company, licensee of UHF station KNUZ-TV, with respect to the unfair competitive situation presented by a Galveston VHF station that has been permitted to operate as a Houston station. A copy of the comments submitted by KNUZ Television Company in Federal Communications Commission proceedings, Docket No. 10689, is attached hereto.

BEFORE THE FEDERAL COMMUNICATIONS COMMISSION

Washington 25, D.C.

Docket No. 10689

In the Matter of Amendment of Section 3.658(b) of the Commission's Rules and Regulations

COMMENTS

On behalf of KNUZ Television Company (hereinafter referred to as "KNUZ"), licensee of television station KNUZ-TV, channel 39, Houston, Tex., the following comments are filed in support of the Commission's proposed rule. In support thereof, it is stated:

1. Although KNUZ supports the proposed rule which, in its opinion, will to some extent be helpful, KNUZ nevertheless desires to make clear that this proposed rule, while it may to some extent aid, it can in no way cure the unfair competitive situation which has arisen in the city of Houston by the Commission's failure to deny the application for modification of construction permit of KGUL-TV (a VHF station), Galveston, Tex., to move its transmitter site to a location which has enabled it to place a primary signal into the city of Houston.

2. On April 30, 1954, the Commission released its memorandum opinion and order (FCC-54-564; 4807) granting the application of Spartan Radiocasting Company, Spartanburg, S. C. (File No. BMPC-2042) over the protest of two UHF stations, one located in Greenville and the other in Anderson, S. C. By this application for modification of construction permit, the Spartanburg permittee sought authority to move its transmitter site in order to enable it to send a primary signal into Greenville and Anderson, S. C. In its memorandum opinion and order granting that application, the Commission grounded its reasons for granting that application (over objections) upon the following statement:

"The instant application meets the requirements of the Commission's rules with respect to minimum signal required to be placed over Spartanburg... no substantial reason have been advanced by the objecting parties which would justify refusal to grant the subject application at this time, particularly in view of the fact that all of the allegations of the petitioners are concerned with the intentions of the applicant and since the petitioners have offered no substantive proof in support of such allegations, but only speculations, inferences and presumptions which we do not believe can properly be drawn from the application itself or from past actions of the applicant."

3. The Commission's decision in the Spartanburg case, supra, is but another recent example of the Commission's failure to recognize as an incontrovertible fact that section 3,655(a) of the Commission's rules which was designed to restrict television stations to one principal city by the requirement of a minimum signal strength, has proven impotent in achieving that objective. In contrast to the recent example of the Spartanburg situation, however, which the Commission believed to be buttressed upon mere speculations, inferences, and presumptions, KNUZ, Houston, Tex., now comes before this Commission as a living monument of the same type of Commission decision, where the Commission refused some time ago to recognize the impact of permitting KGUL-TV (a VHF station) Galveston, Tex., to invade the Houston market. Thus with this lapse of time and its resulting experiences, KNUZ can now translate into facts what has heretofore been characterized as inferences, speculations, and presumptions.

Upon information and belief KNUZ alleges the following facts:

A. If the Federal Communications Commission had not allowed KGUL-TV, channel 11, of Galveston to move its transmitter to a location which enables it to place a primary signal into the Houston market, KNUZ undoubtedly would have the CBS network, or at the very least the ABC network. As it is, the two
VHF channels serving Houston, channel 2 (KPRC), which is allocated to Houston and is the NBC outlet, and channel 11, have both CBS and ABC tied up to the point where KNUZ cannot obtain even shows which are not now being aired by either of these stations. It is KNUZ's understanding that CBS has an exclusive 2-year contract with KGUL-TV covering the Houston area, and KNUZ has been told by ABC that their arrangement is as follows: KPRC, Houston, has first choice of ABC programs; KGUL-TV, Galveston, has second choice on those KPRC cannot clear. KNUZ was told that it could have third choice of any shows not wanted by the two VHF outlets provided KNUZ could sell the advertising agencies on buying a UHF station. The ABC network made it clear it would make no sales effort in KNUZ's behalf.

B. The Dumont network, which found itself with virtually no outlet for its programming also refused to give KNUZ a basic network affiliation on the ground that its sales department could not force agencies to buy a UHF station. Dumont's top commercial shows are on KGUL-TV, and KNUZ has been relegated to Dumont's sustaining programs for which it must pay and which it attempts to sell on a participating basis.

C. While the proposed rule limiting exclusivity might help some, in the case of KGUL-TV, such a rule will not make any material difference. ABC and Dumont do not now have exclusive contracts with KGUL-TV, but they might as well have, since the availability of a VHF outlet to carry some commercial shows effectively blocks KNUZ from obtaining those top commercial shows which are valuable to the audience bulletins.

D. KGUL-TV from the beginning has considered itself a Houston station, not a Galveston station. Its major sales effort has been in Houston, not Galveston. It spends large sums on billboards in Houston, bus-card advertising, full-page advertisements in Houston newspapers, and on other promotion. It has recently concluded a lease with the Prudential Insurance Co. of America for a full floor in Houston's newest and most modern skyscraper building. Very elaborate studios are planned in this new Houston building, and it is further understood that KGUL-TV plans to move its main business and sales offices there. Compared to its very modest Galveston studios and offices, these Houston quarters are plainly the main offices and studios, where KGUL-TV's local programming and sales efforts will be concentrated.
